1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove the engine undertray.

2. REMOVAL OPERATION

Disconnect the engine cooling fan assembly resistor connectors(1) .

Remove:

- the engine cooling fan assembly resistor bolt(2) ,
- the engine cooling fan assembly resistor.

REFITTING

1. REFITTING OPERATION

Note:

The original packaging must be retained until the relay box is assembled (do not unpack the product).

Note:

Handling recommendations:

Any relay box that falls on the ground must be rejected and must not be used (risk of damage to the thermal fuse and resistor positions).

Note:

It is obligatory to handle the relay box via the plastic part. The resistor and thermal fuse parts are sensitive.

All contact is prohibited, as this may degrade the thermal protection of the product during the life of the vehicle: there is a risk of fire.

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the engine cooling fan assembly resistor,
- the engine cooling fan assembly resistor bolt.

Connect the engine cooling fan assembly resistor connectors.

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

COOLING RADIATOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Vehicle: Precautions for the repair .

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

- protection down to -25°C ± 2for cold and temperate countries,
- protection down to -40°C ± 2for "extreme cold" countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove the engine undertray.
- Remove the intercooler air outlet pipeAir inlet assembly: Exploded view .
- Unclip the intercooler air inlet pipe from the intercoolerAir inlet assembly: Exploded view .
- Move aside the intercooler air outlet pipe.
- Remove:
  - the front wheelsFront hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch linersExterior body front trim assembly: Exploded view ,
  - the front bumperFront bumper assembly: Exploded view ,
  - the headlightsFront signals - lighting assembly: Exploded view ,
  - the engine cooling fan assembly(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

2. REMOVAL OPERATION

- Separate the clips using the toolRemote operation pliers for hose clips.(Mot. 1448) from (see 19A, Cooling, Coolant circuit assembly: Exploded view) :
  - the cooling radiator inlet pipe,
  - the cooling radiator outlet pipe.
- Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the cooling radiator inlet pipe,
- the cooling radiator outlet pipe.

Remove the intercooler Air inlet assembly: Exploded view .

Remove the cooling radiator upwards (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REFITTING

1. REFITTING OPERATION

Refit the cooling radiator (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Fill and bleed the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) .

COOLINGRADIATOR:REPAIR

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

- Location and specifications (tightening torques, parts always to be replaced, etc.) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .
- Before starting any operation check that the radiator is undamaged (not drilled, distorded or shocked); there may be a risk of further leaking.

Note:

This repair method is applicable to the cooling radiator and also to the intercooler.

- Equipment required to carry out the repairs:
  - Plastic repair kit Vehicle: Parts and consumables for the repair ,
  - Radiator pin repair kit Vehicle: Parts and consumables for the repair .

REPAIR

1. REPAIR PREPARATION OPERATION

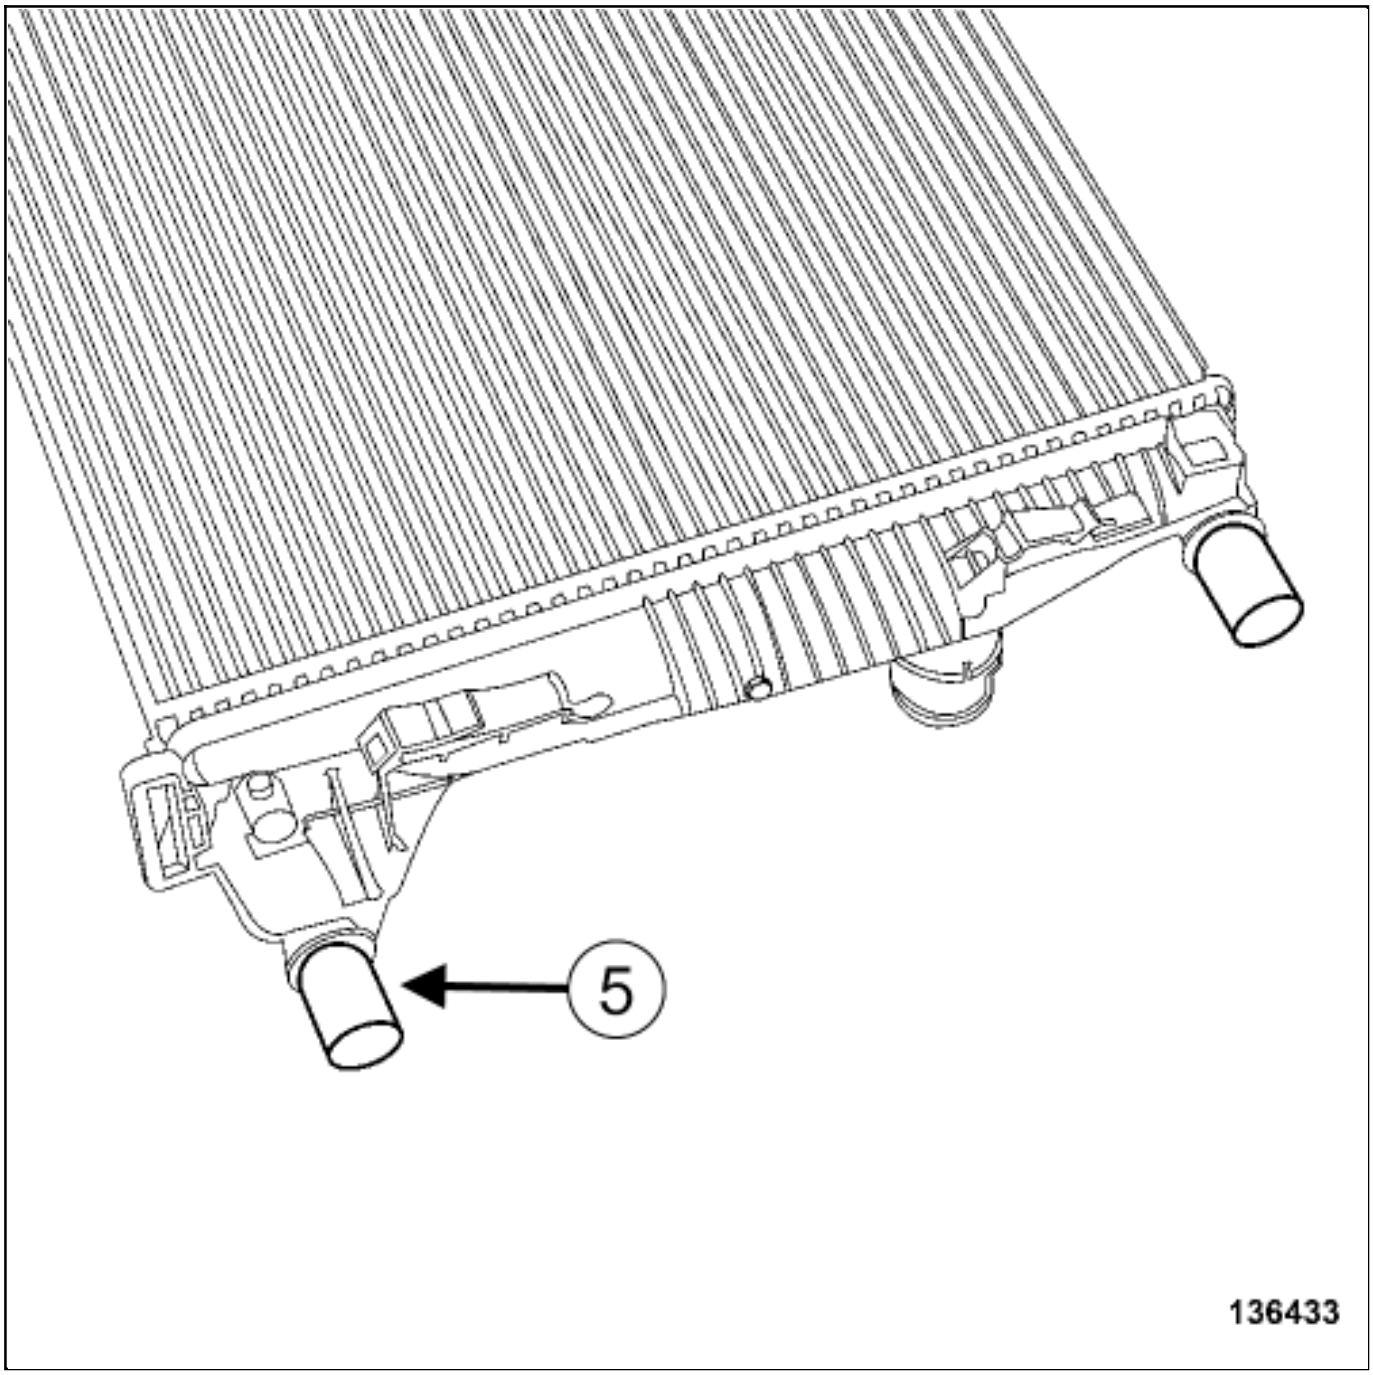
- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove the engine undertray.

- Remove the intercooler air outlet pipe Air inlet assembly: Exploded view .
- Unclip the intercooler air inlet pipe from the intercooler Air inlet assembly: Exploded view .
- Move aside the intercooler air outlet pipe.

- Remove:
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view ,
  - the headlights Front signals - lighting assembly: Exploded view ,
  - the engine cooling fan assembly (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

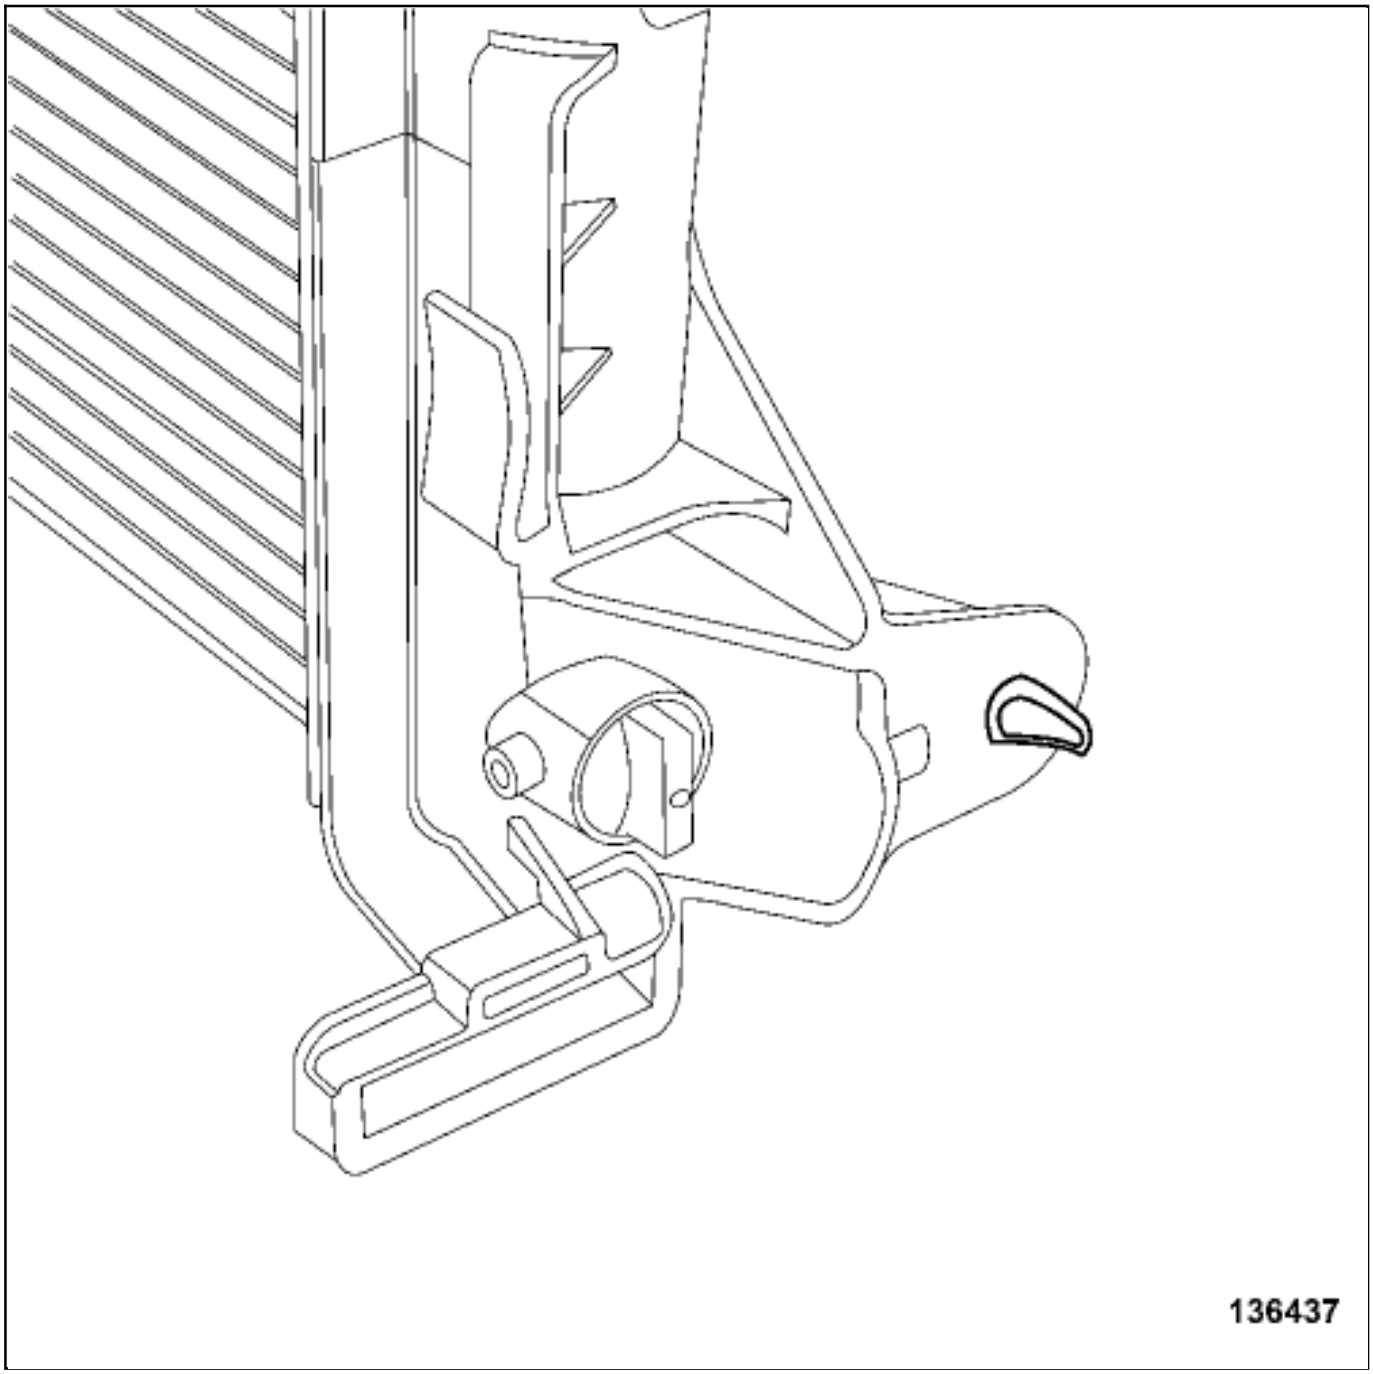
- Separate the clips using the tool Remote operation pliers for hose clips.(Mot. 1448) from (see 19A, Cooling, Coolant circuit assembly: Exploded view) :
  - the cooling radiator inlet pipe,
  - the cooling radiator outlet pipe.

- Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :
  - the cooling radiator inlet pipe,
  - the cooling radiator outlet pipe.



- Remove the intercooler Air inlet assembly: Exploded view .

- Remove the radiator (see 19A, Cooling, Cooling radiator: Removal - Refitting) .



2. REPAIR OPERATION

1- COOLING RADIATOR MOUNTING PIN REPLACEMENT

1)PREPARING THE SURFACES FOR BONDING

Remove the damaged mounting pin from the cooling radiator(1)

- Cut the remaining section of the cooling radiator mounting pin on the cooling radiator.
- File down the base of the cooling radiator mounting pin to obtain a flat surface.
- Sand the areas to be bonded using 80 gritsandpaper (dry).

Using plastic repair kit, clean the surfaces of the replacement mounting pin from the pin repair kit and clean the radiator base.

Wipe the surfaces using a lint-free cloth and blow with air.

2)BONDING

Apply the adhesive primer contained in the plastic repair kit.

Leave to dry (see product technical sheet).

Extrude:

- 20 mm of bead in order to obtain a homogenous mixture of the product before application,
- the adhesive mixture on the base of the radiator and on the base of the replacement mounting pin (pin repair kit).

Position the replacement mounting pin on the base of the radiator and leave to dry (see product technical sheet .

3. FINAL OPERATION

Refit the radiator**(see 19A, Cooling, Cooling radiator: Removal - Refitting)** .

Proceed in the reverse order to removal.

Fill and bleed the cooling system**(see 19A, Cooling, Cooling system: Draining - Refilling)** .

XSL version : 3.02 du 22/07/11

COOLINGRADIATOR:REPAIR

Note, one or more warnings are present in this procedure

Equipment required
safety strap(s)

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair .

Before starting any operation check that the radiator is undamaged (not drilled, distorded or shocked); there may be a risk of further leaking.

Note:

This repair method is applicable to the cooling radiator and also to the intercooler.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Before starting any operation check that the radiator is undamaged (not drilled, distorded or shocked); there may be a risk of further leaking.

Note:

This repair method is applicable to the cooling radiator and also to the intercooler.

Equipment required to carry out the repairs:

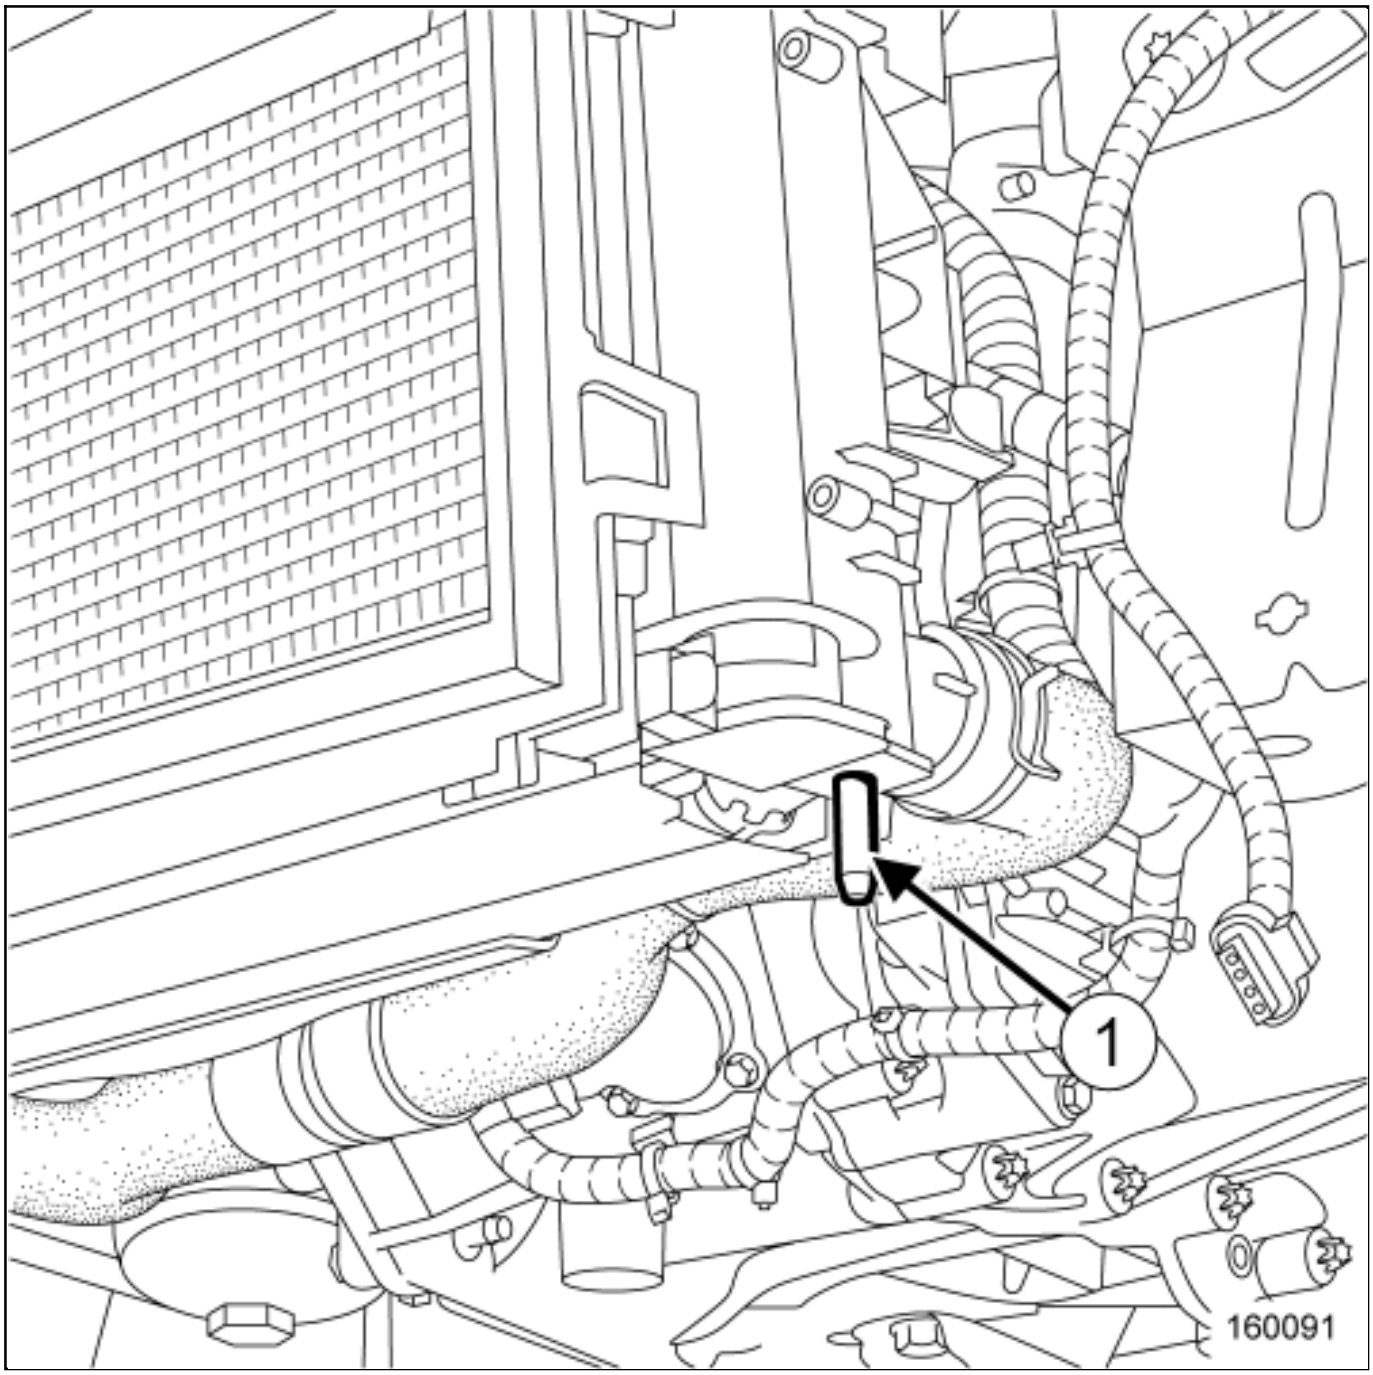
- Plastic repair kit Vehicle: Parts and consumables for the repair ,
- Radiator pin repair kit Vehicle: Parts and consumables for the repair .

REPAIR

1. REPAIR PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:



- the engine undertray,
- the front wheels Front hub carrier assembly: Exploded view ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view .

Strap the cooling radiator to the front end panel using the safety strap(s).

Remove the radiator mounting cross member Front axle assembly: Exploded view .

2. REPAIR OPERATION

1- PREPARING THE SURFACES FOR BONDING

- Remove the damaged mounting pin from the cooling radiator
- Cut the remaining section of the cooling radiator mounting pin(1) on the cooling radiator.
- File down the base of the cooling radiator mounting pin to obtain a flat surface.

Sand the areas to be bonded using 80 gritsandpaper (dry).

Using plastic repair kit, clean the surfaces of the replacement mounting pin from the pin repair kit and clean the radiator base.

2- BONDING

Apply the adhesive primer contained in the plastic repair kit.

Leave to dry (see product technical sheet).

Extrude:

- 20 mm of bead in order to obtain a homogenous mixture of the product before application,
- the adhesive mixture on the base of the radiator and on the base of the replacement mounting pin (pin repair kit).

Position the replacement mounting pin on the base of the radiator and leave to dry (see product technical sheet .

3. FINAL OPERATION

Proceed in the reverse order to removal.

COOLING SYSTEM: DRAINING - REFILLING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Instrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06	Ms. 554-07
Set of trim removal levers.	Car. 1363
Fault finding and filling - bleeding the cooling circuit.	Mot. 1700

Equipment required
compressed air nozzle
coolant recovery tray

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

- To avoid any risk of serious burns when the engine is hot:
  - do not open the expansion bottle cap,
  - do not drain the cooling system,
  - do not open the bleed screw(s).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C ± 2for cold and temperate countries,
  - protection down to -40°C ± 2for "extreme cold" countries.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

1. DRAINING

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove:
  - the expansion bottle cap(see 19A, Cooling, Coolant circuit assembly: Exploded view) ,
  - the engine undertray.

- Position the coolant recovery trayunder the vehicle.

- Remove the cooling radiator outlet pipe clip(see 19A, Cooling, Coolant circuit assembly: Exploded view) using the toolRemote operation pliers for hose clips.(Mot. 1448) .

- Open the cooling system by removing the cooling radiator outlet pipe(see 19A, Cooling, Coolant circuit assembly: Exploded view) using the toolSet of trim removal levers.(Car. 1363) .

- Use a compressed air nozzleto blow air into the system through the expansion bottle opening to remove as much coolant as possible.

2. CLEANING

- Fill the cooling system with water through the expansion bottle.

- Let the water run until the water collected by the cooling radiator outlet pipe becomes clear.

- Use a compressed air nozzleto blow air into the circuit through the expansion bottle opening to remove as much water as possible.

- Refit the previously removed hoses.

3. FILLING

Note:

- There are two procedures for filling the cooling system:
  - the procedure using the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) recommended by Renault which saves a considerable amount of time as the cooling system bleed screws do not need to be opened,
  - the procedure without a special tool.

1- FILLING PROCEDURE USING THE TOOL (MOT. 1700)

Fill the cooling system with engine coolant recommended by the manufacturer Vehicle: Parts and consumables for the repair using the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

For the use of this tool (see 19A, Cooling, Cooling system filling and diagnostic tool: Use) .

2- FILLING METHOD WITHOUT SPECIAL TOOLS

CAUTION

It is essential to open all of the bleed screws to remove as much as air as possible in the cooling system. Failure to perform this procedure may prevent the cooling system from filling properly and may damage the engine.

Open the bleed hole on (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water chamber,
- the heater matrix coolant outlet pipe.

Fill the engine cooling system via the expansion bottle with coolant recommended by the manufacturer until it overflows (see 19A, Cooling, Engine cooling system: Specifications) .

- Fill the expansion bottle until it overflows.
- Close all the bleed screws as soon as the coolant starts to flow in a continuous stream.
- Pressurise the system using the toolInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(Ms. 554-07) to check that there are no leaks(see 19A, Cooling, Engine cooling system: Check) .
- Tighten the expansion bottle cap.
- Clean any surfaces soiled by the coolant.

4. BLEEDING

CAUTION

Do not open the bleed screw whilst the engine is running; this would damage the engine.

- Deactivate the air conditioning system so that the engine cooling fan is not operating from the start of the operation.
- Start the engine.
- Maintain an engine speed of 1500 rpm, until the fan assembly starts for the second time.
- Check that the heating is operating correctly.

Allow the engine to cool until the coolant temperature is less than 50˚C.

Adjust the coolant fluid level to the "MAXIMUM" mark.

Refit the expansion bottle cap.

5. FINAL OPERATION

Remove the coolant recovery tray.

Proceed in the reverse order to removal.

COOLING SYSTEM: DRAINING - REFILLING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Instrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06	Ms. 554-07
Set of trim removal levers.	Car. 1363
Fault finding and filling - bleeding the cooling circuit.	Mot. 1700

Equipment required
compressed air nozzle
coolant recovery tray

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C ± 2 for cold and temperate countries,
  - protection down to -40°C ± 2 for "extreme cold" countries.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

1. DRAINING

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove:
  - the expansion bottle cap(see 19A, Cooling, Coolant circuit assembly: Exploded view) ,
  - the engine undertray.

- Position the coolant recovery tray under the vehicle.

- Remove the cooling radiator outlet pipe clip(see 19A, Cooling, Coolant circuit assembly: Exploded view) using the tool Remote operation pliers for hose clips.(Mot. 1448) .

- Open the cooling system by removing the cooling radiator outlet pipe(see 19A, Cooling, Coolant circuit assembly: Exploded view) using the tool Set of trim removal levers.(Car. 1363) .

Use a compressed air nozzleto blow air into the system through the expansion bottle opening to remove as much coolant as possible.

2. CLEANING

Fill the cooling system with water through the expansion bottle.

Let the water run until the water collected by the cooling radiator outlet pipe becomes clear.

Use a compressed air nozzleto blow air into the circuit through the expansion bottle opening to remove as much water as possible.

Refit the previously removed hoses.

3. FILLING

Note:

There are two procedures for filling the cooling system:

- the procedure using the toolFault finding and filling - bleeding the cooling circuit. (**Mot. 1700**) recommended by Renault which saves a considerable amount of time as the cooling system bleed screws do not need to be opened,
- the procedure without a special tool.

1- FILLING PROCEDURE USING THE TOOL (MOT. 1700)

Fill the cooling system with engine coolant recommended by the manufacturer**Vehicle: Parts and consumables for the repair** using the toolFault finding and filling - bleeding the cooling circuit.(**Mot. 1700**) .

For the use of this tool**Cooling system filling and diagnostic tool: Use** .

CAUTION

It is essential to open all of the bleed screws to remove as much as air as possible in the cooling system. Failure to perform this procedure may prevent the cooling system from filling properly and may damage the engine.

- Open the bleed hole on (see 19A, Cooling, Coolant circuit assembly: Exploded view) :
  - the water chamber,
  - the heater matrix coolant outlet pipe.
- Fill the engine cooling system via the expansion bottle with coolant recommended by the manufacturer until it overflows (see 19A, Cooling, Engine cooling system: Specifications) .
- Fill the expansion bottle until it overflows.
- Close all the bleed screws as soon as the coolant starts to flow in a continuous stream.
- Pressurise the system using the toolInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(Ms. 554-07) to check that there are no leaks Engine cooling system: Check .
- Tighten the expansion bottle cap.
- Clean any surfaces soiled by the coolant.

CAUTION

Do not open the bleed screw whilst the engine is running; this would damage the engine.

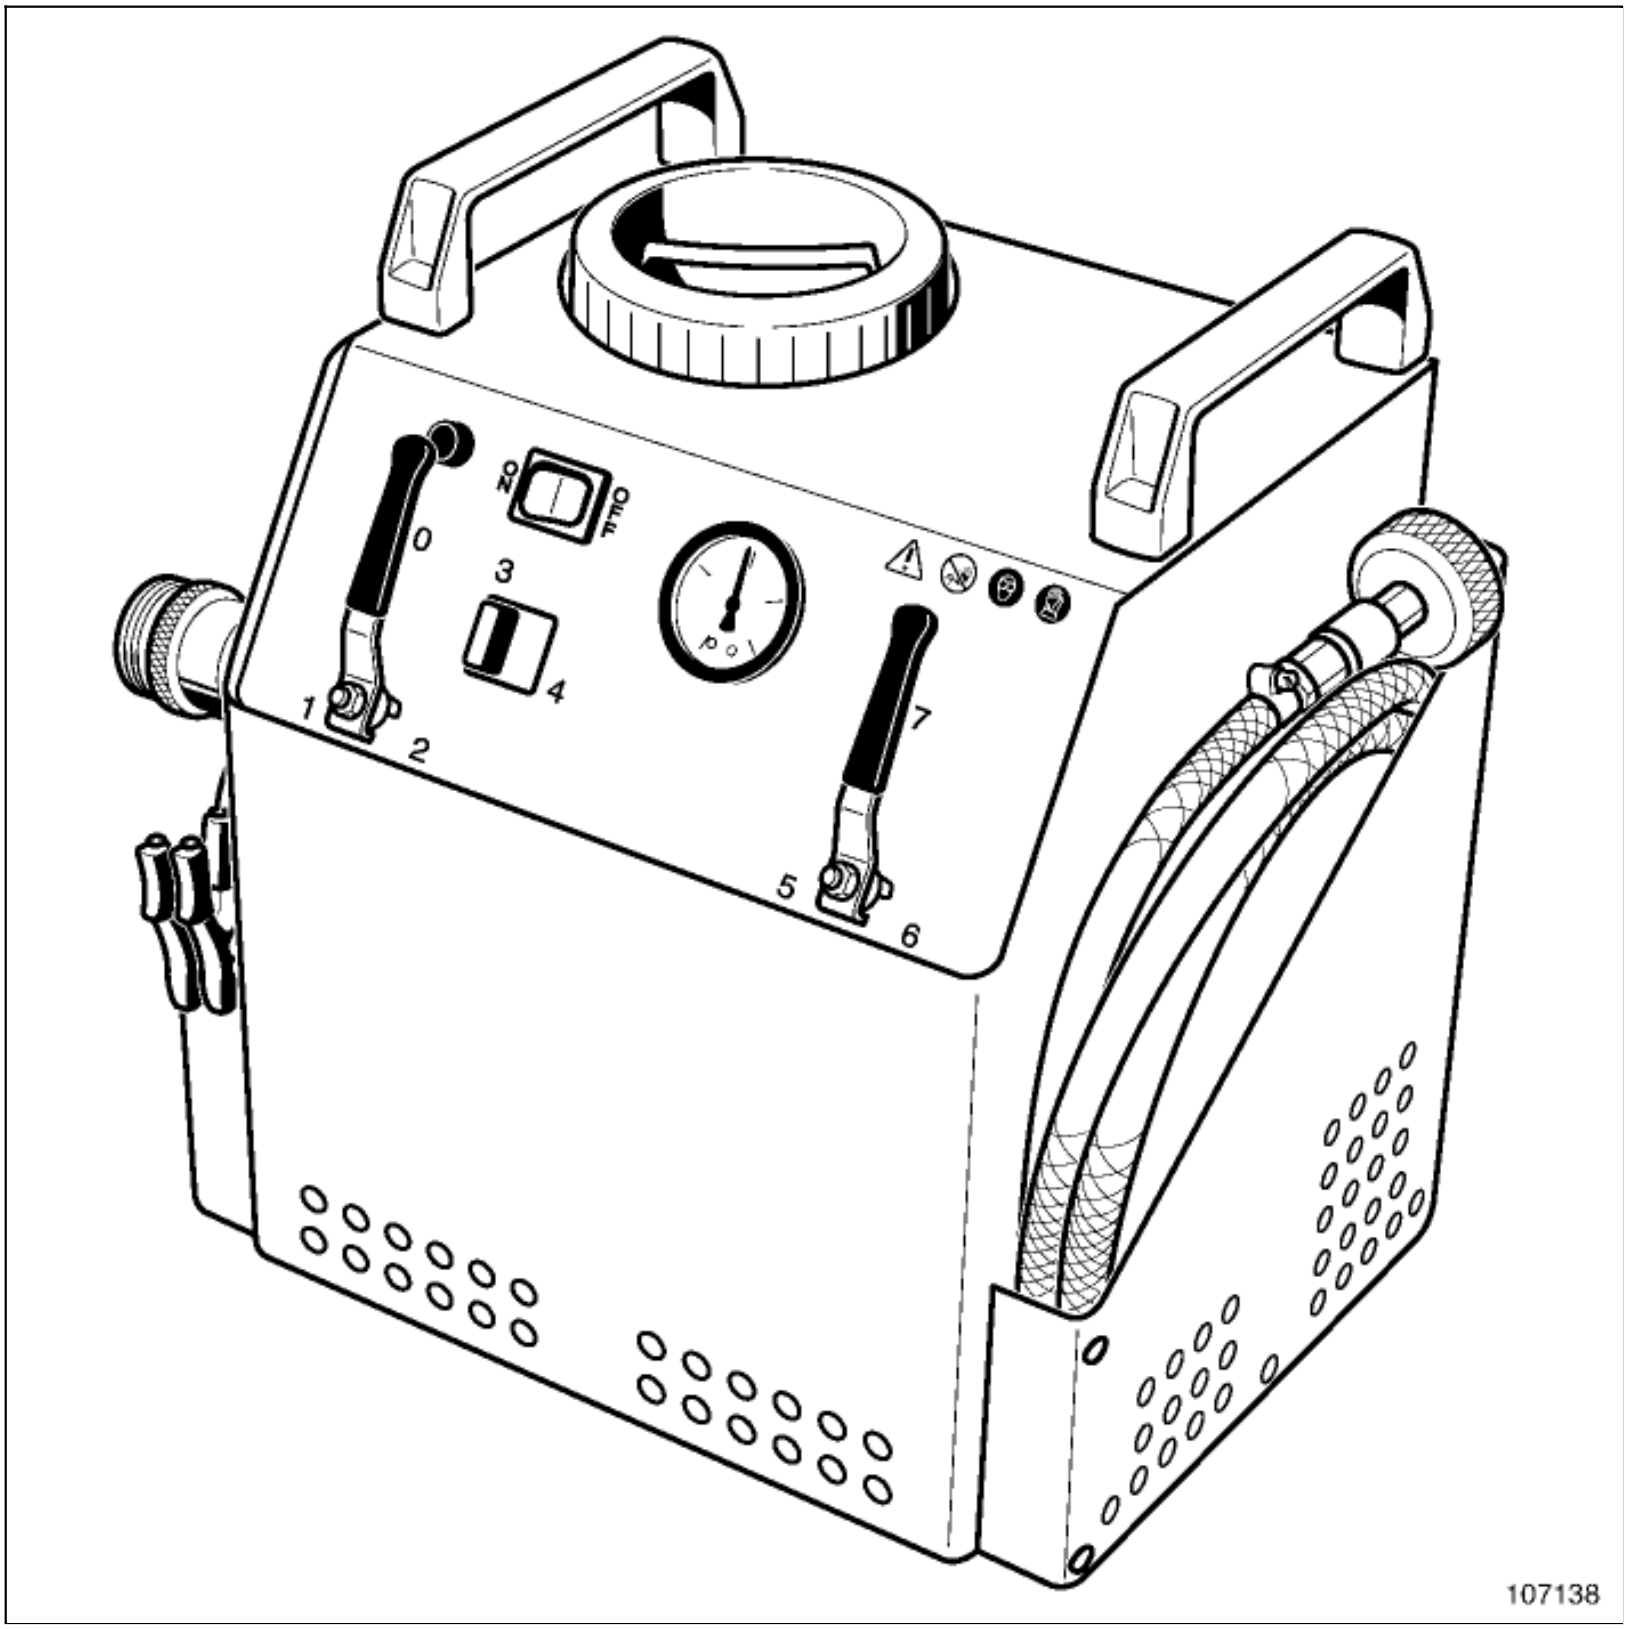
- Deactivate the air conditioning system so that the engine cooling fan is not operating from the start of the operation.
- Start the engine.
- Maintain an engine speed of 1500 rpm, until the fan assembly starts for the second time.
- Check that the heating is operating correctly.
- Allow the engine to cool until the coolant temperature is less than 50˚C.
- Adjust the coolant fluid level to the "MAXIMUM" mark.
- Refit the expansion bottle cap.

5. FINAL OPERATION

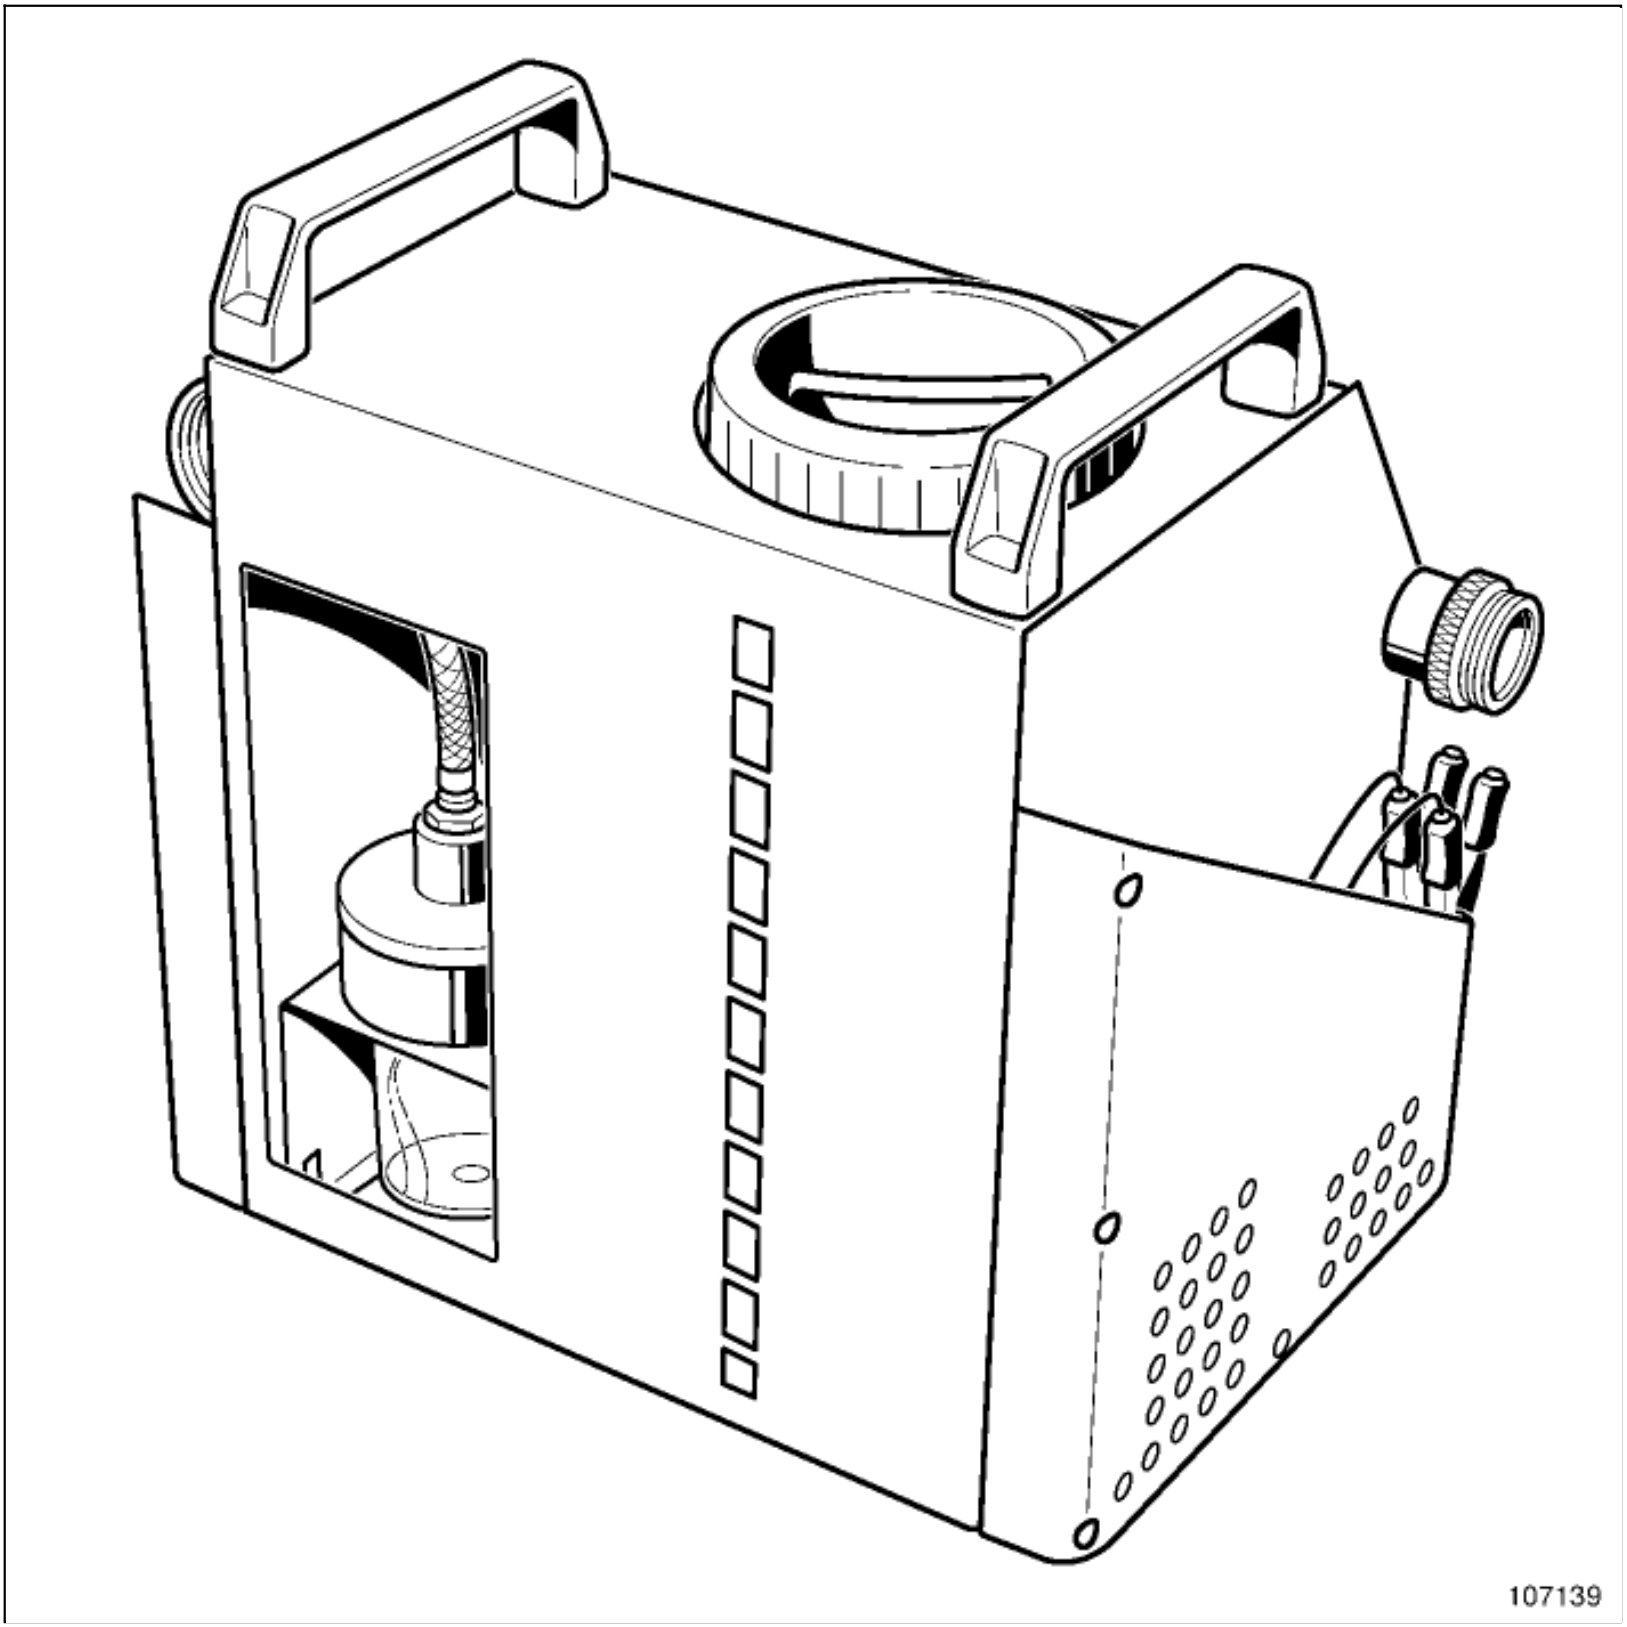
- Remove the coolant recovery tray.
- Proceed in the reverse order to removal.

COOLING SYSTEM FILLING AND DIAGNOSTIC TOOL: USE

Note, one or more warnings are present in this procedure



Special tooling required	
Fault finding and filling - bleeding the cooling circuit.	Mot. 1700



WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

DESCRIPTION OF THE TOOL MOT. 1700

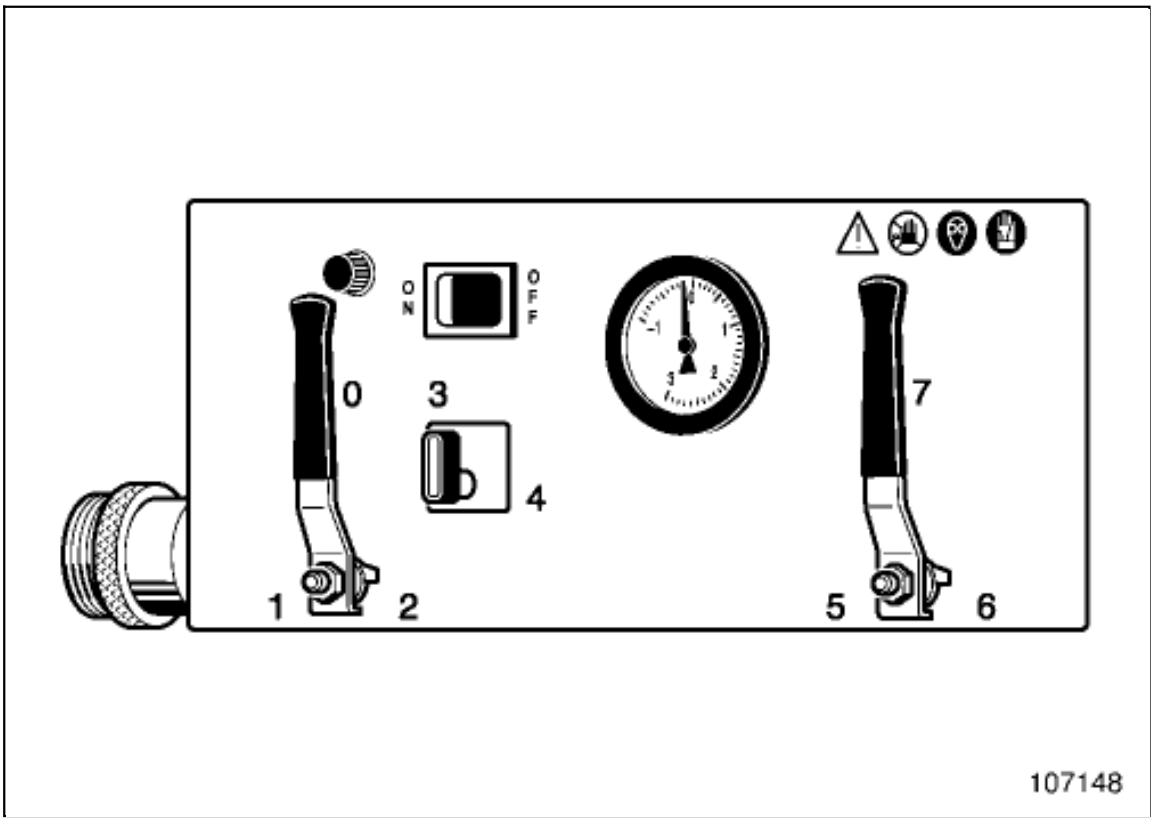
(2)	Pressure gauge
(3)	Electric pump air inlet and outlet selection control
(4)	Vacuum or pressure creation selection control
(5)	Electric supply
(6)	Socket for expansion bottle cap
(7)	Electric pump protection fuse
(8)	Electric pump stop/start switch
(9)	Connecting pipe between the vehicle's cooling system and tool Mot. 1700

107139

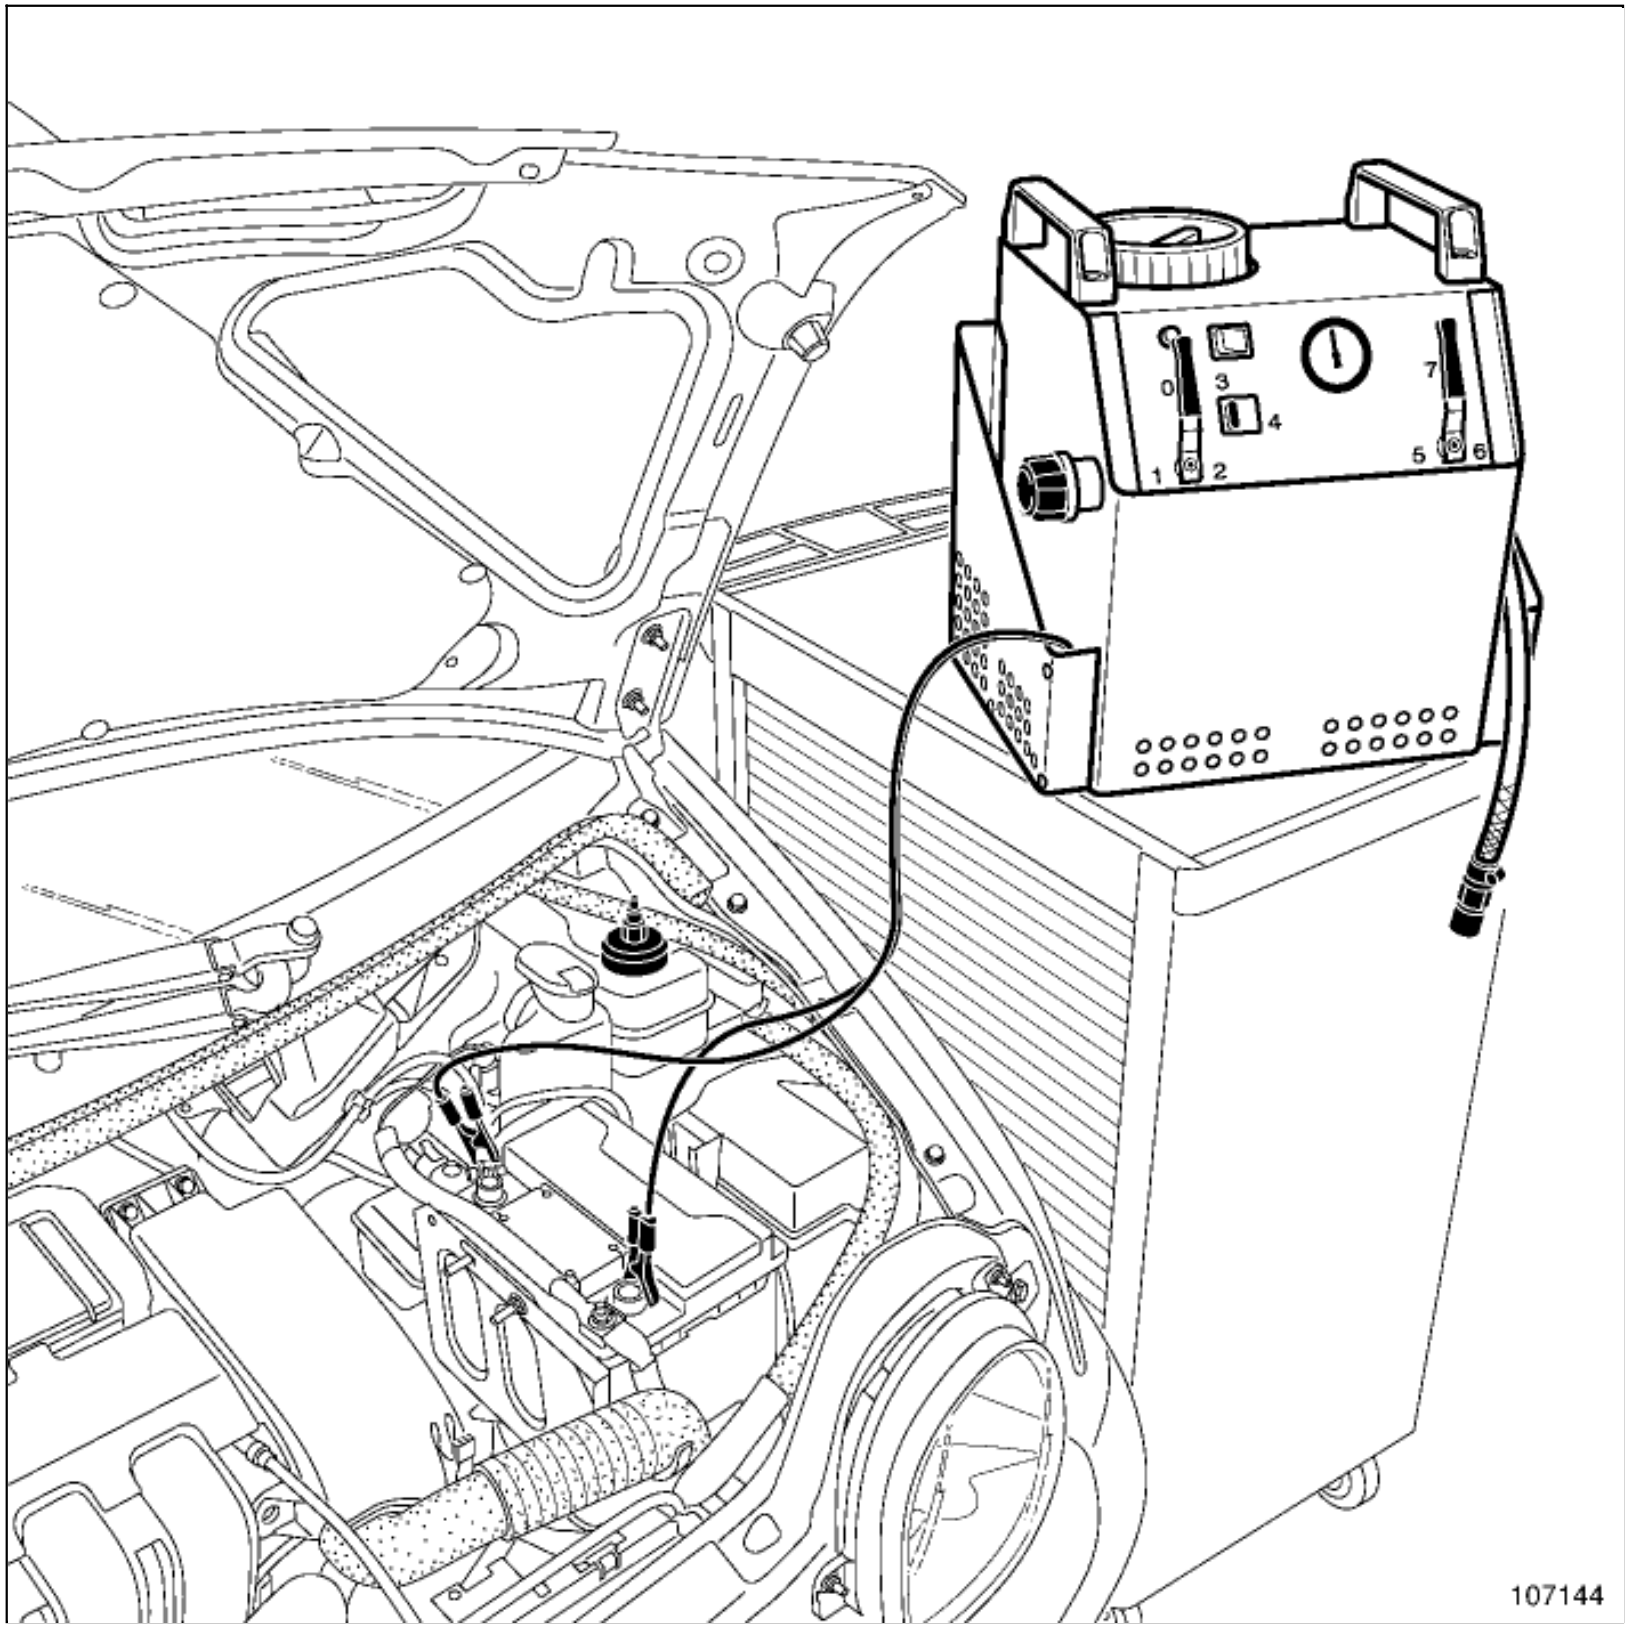


(10)	Decanting bottle
(11)	Indicator for reading the coolant level in the reservoir
(12)	Reservoir filling opening

1. FAULT FINDING PROCEDURE FOR THE ENGINE COOLING SYSTEM

CAUTION

Failure to observe the following procedure can lead to the destruction of the engine.

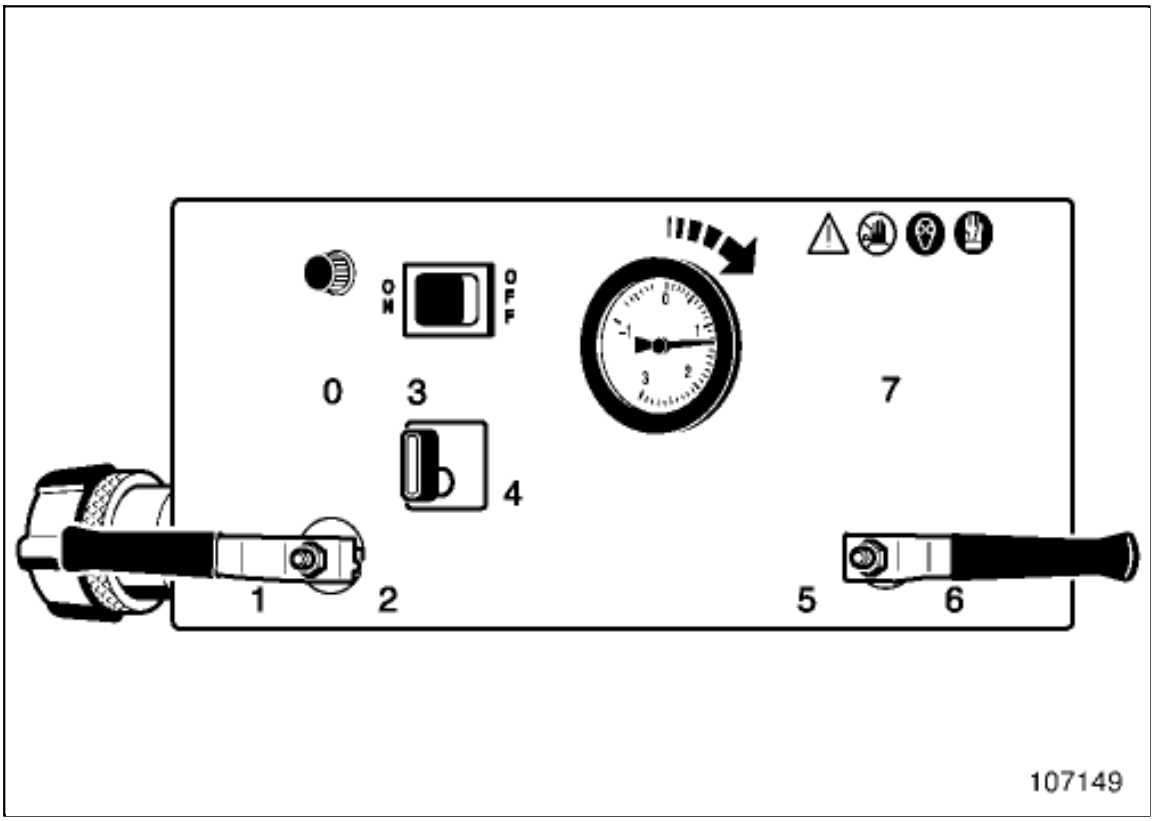


1- FAULT FINDING PROCEDURE FOR THE EXPANSION BOTTLE CAP

Position:

- Control(1) to "0" ,
- Control(2) to "3" ,
- Control(3) to "7" ,

The on/off switch(4) to "OFF" .



Screw on:

- The expansion bottle cap at(5) on the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) ,

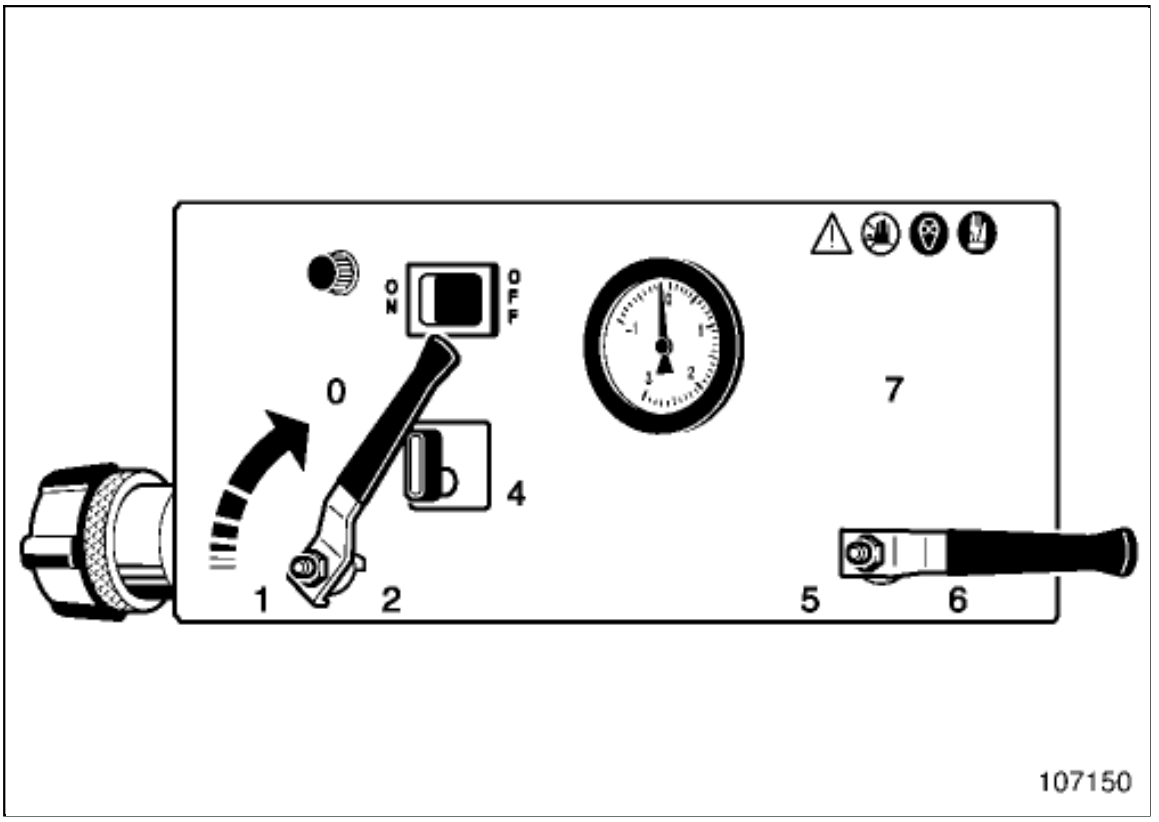
The adapter plug(6) (without the pipe) to the vehicle expansion bottle.

Connect the wires to the battery, observing the correct polarity.

Position:

- Control(1) to "1" ,
- Control(3) to "6" ,

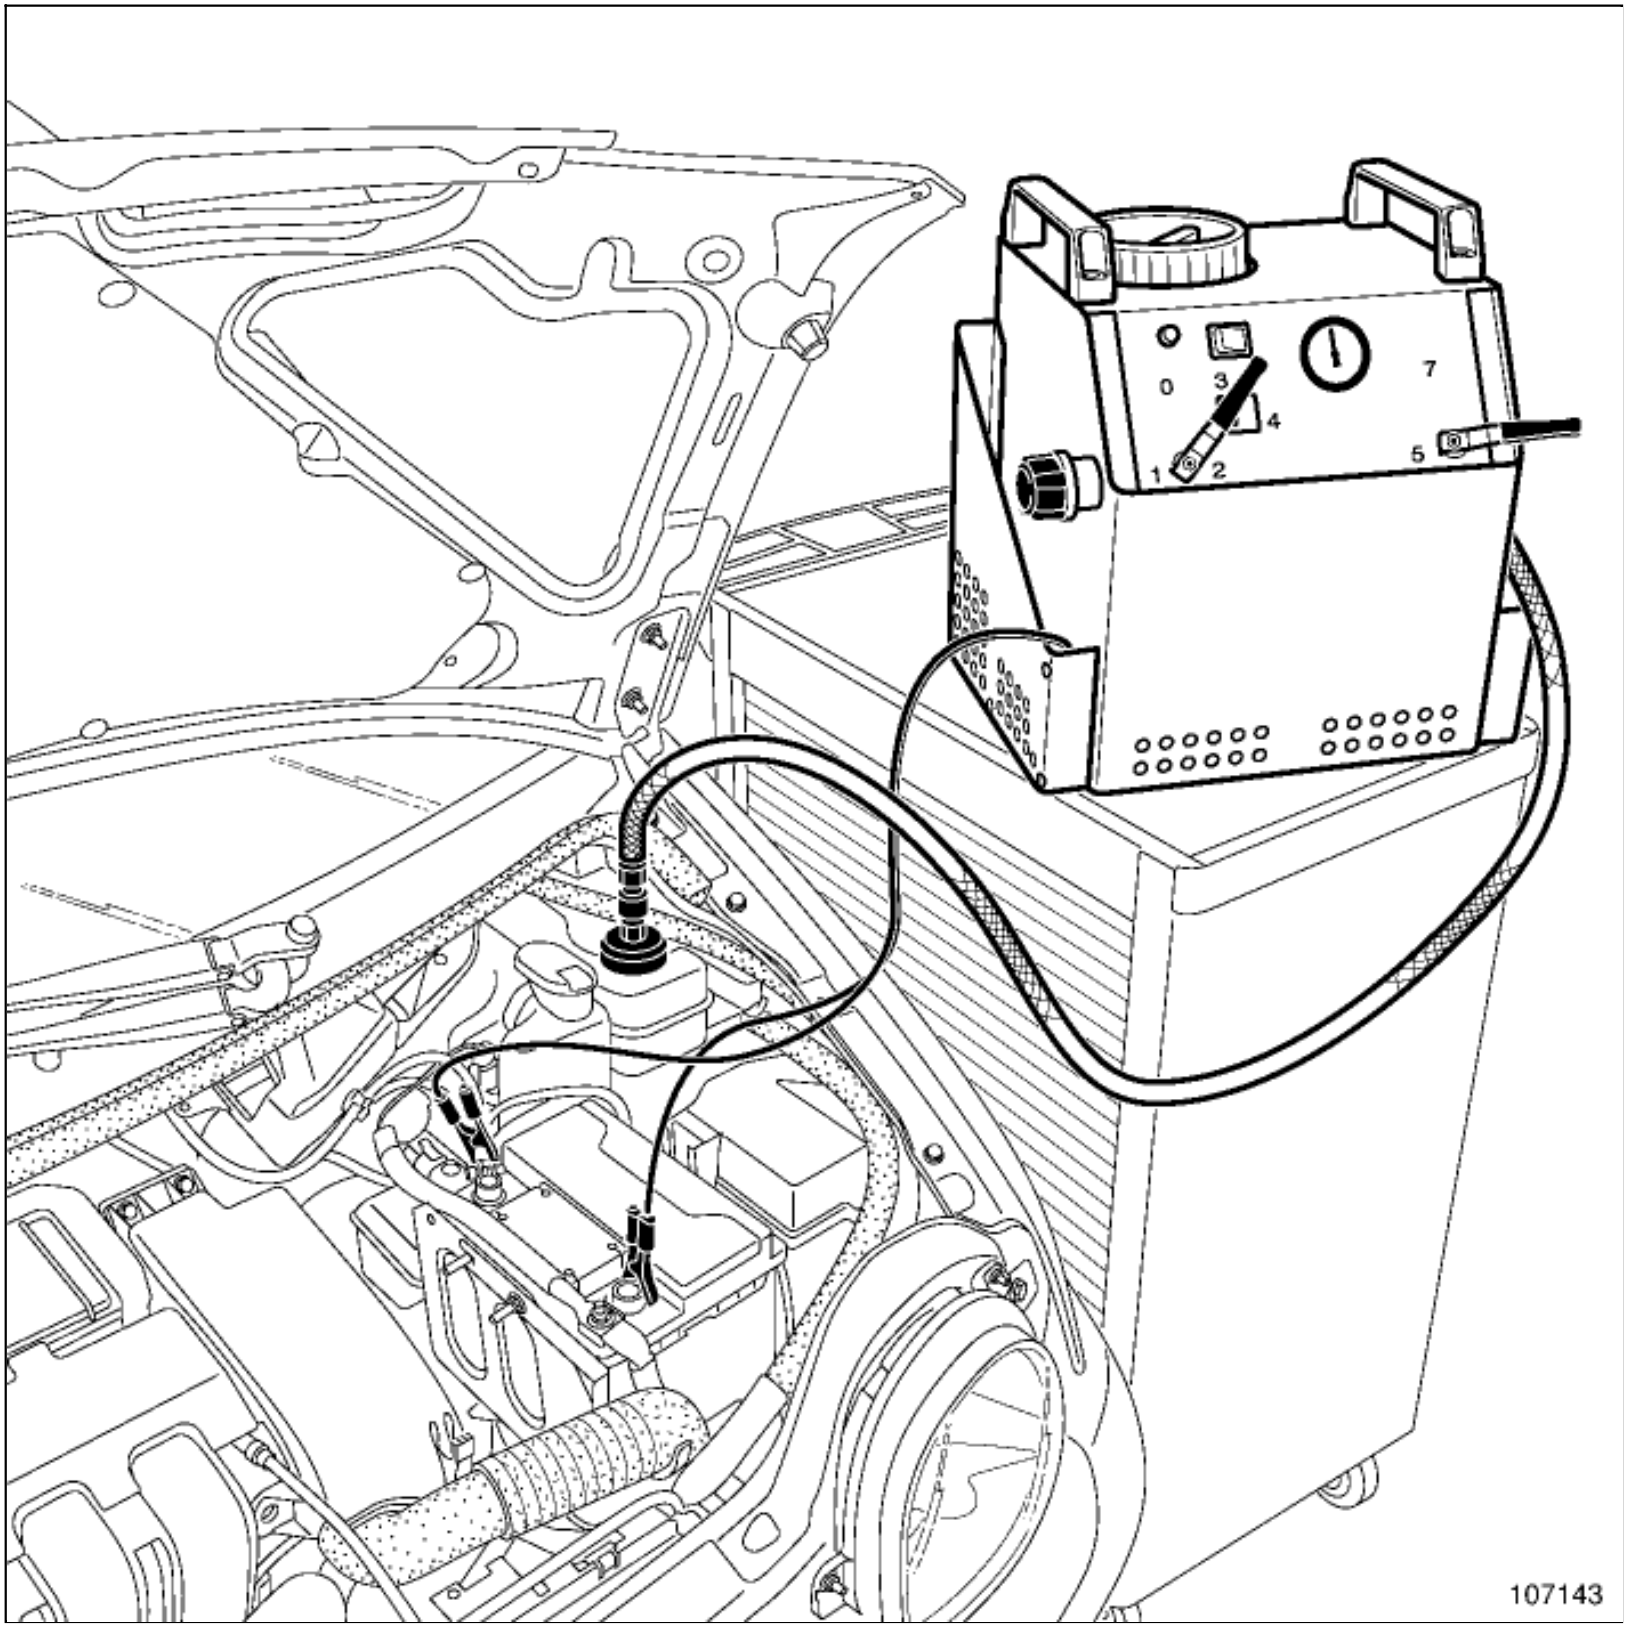
The on/off switch(4) to "ON" .



Note:

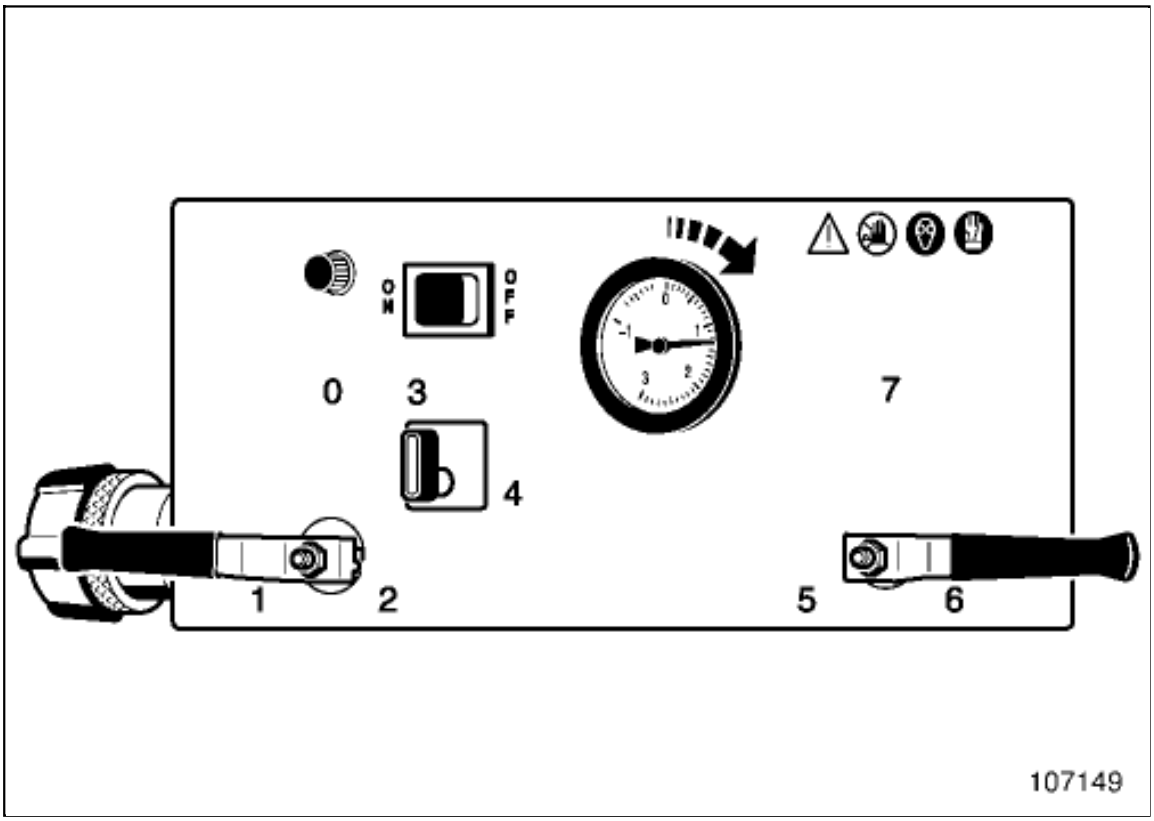
The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating. If the needle does not indicate the rating or exceeds 2 bar, replace the expansion bottle cap because the rating is incorrect.

Set the on/off switch(4) to "OFF" .



Note:

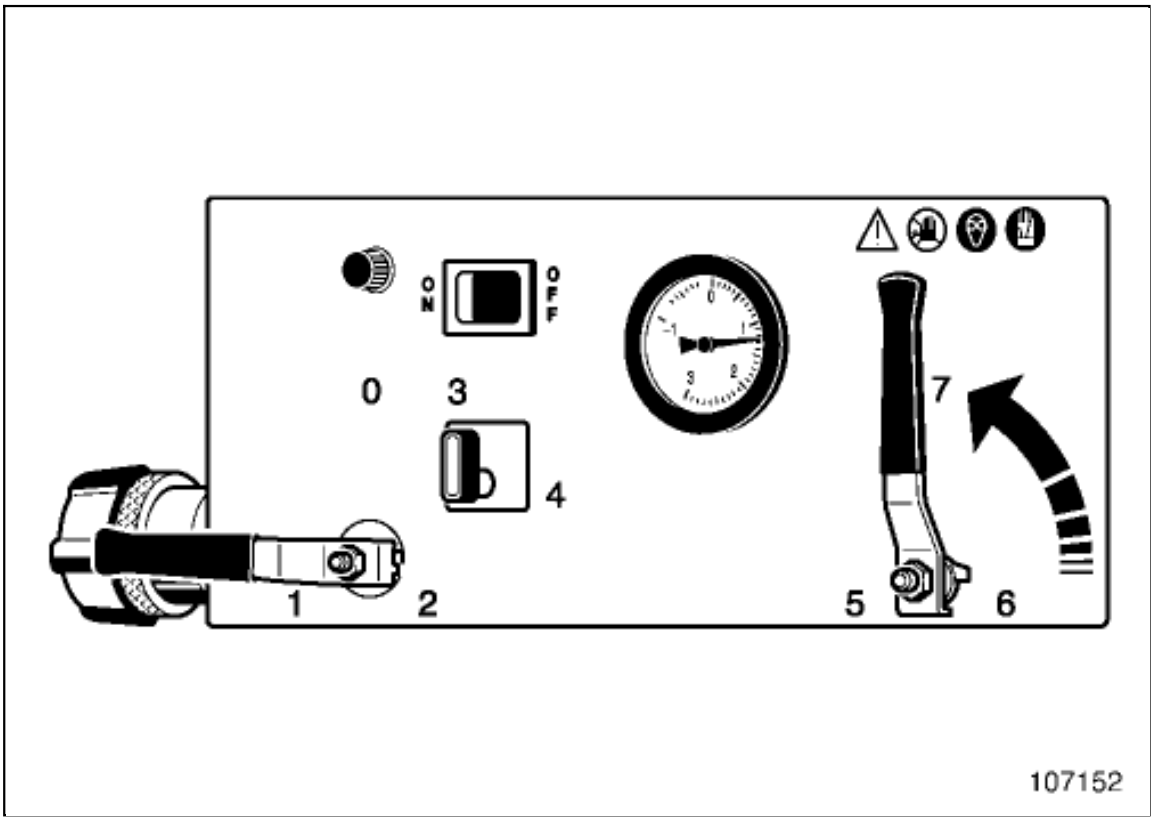
The needle of the pressure gauge must remain at the expansion bottle cap valve rating. If the needle drops back down, replace the expansion bottle cap as it is leaking.



Dump the pressure by turning the control(1) in the direction shown by the arrow.

2- FAULT FINDING PROCEDURE FOR THE ENGINE COOLING SYSTEM

Connect the pipe of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) to the adapter plug.



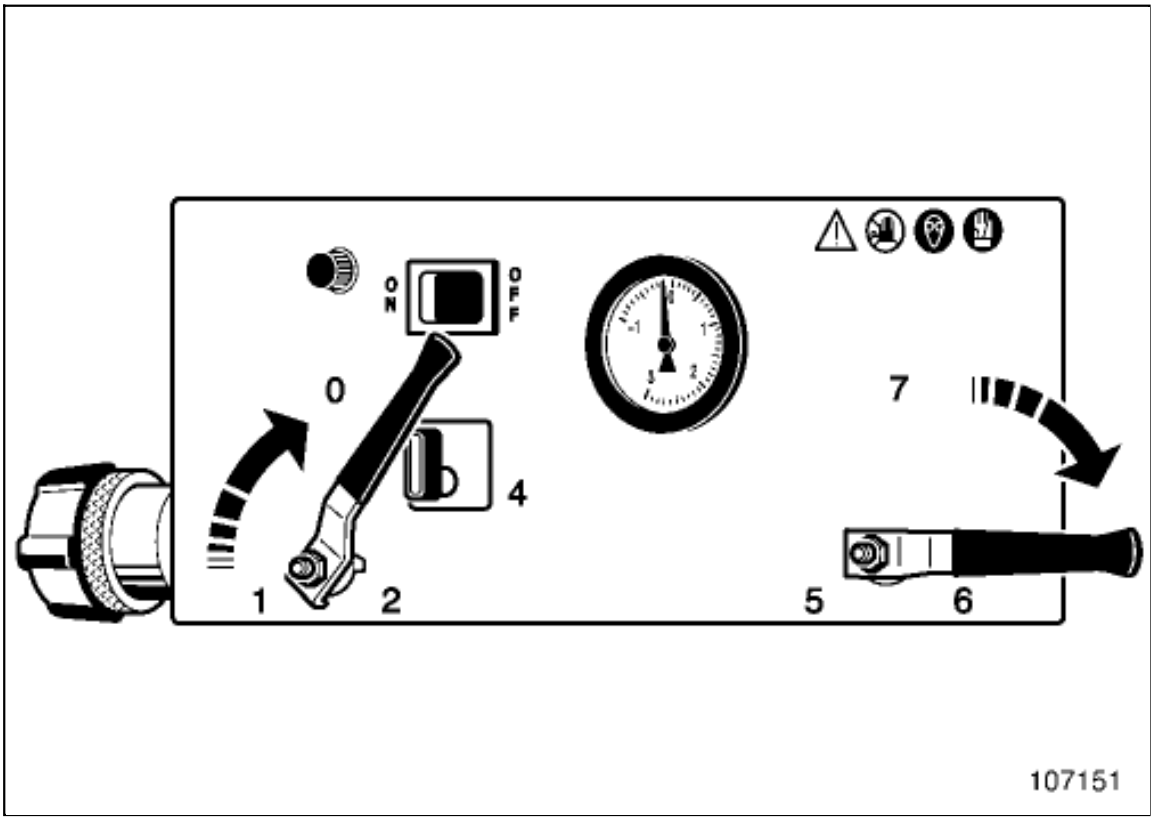
Position:

- Control(1) to "1" ,
- Control(3) to "6" ,
- The on/off switch(4) to "ON" .

Note:

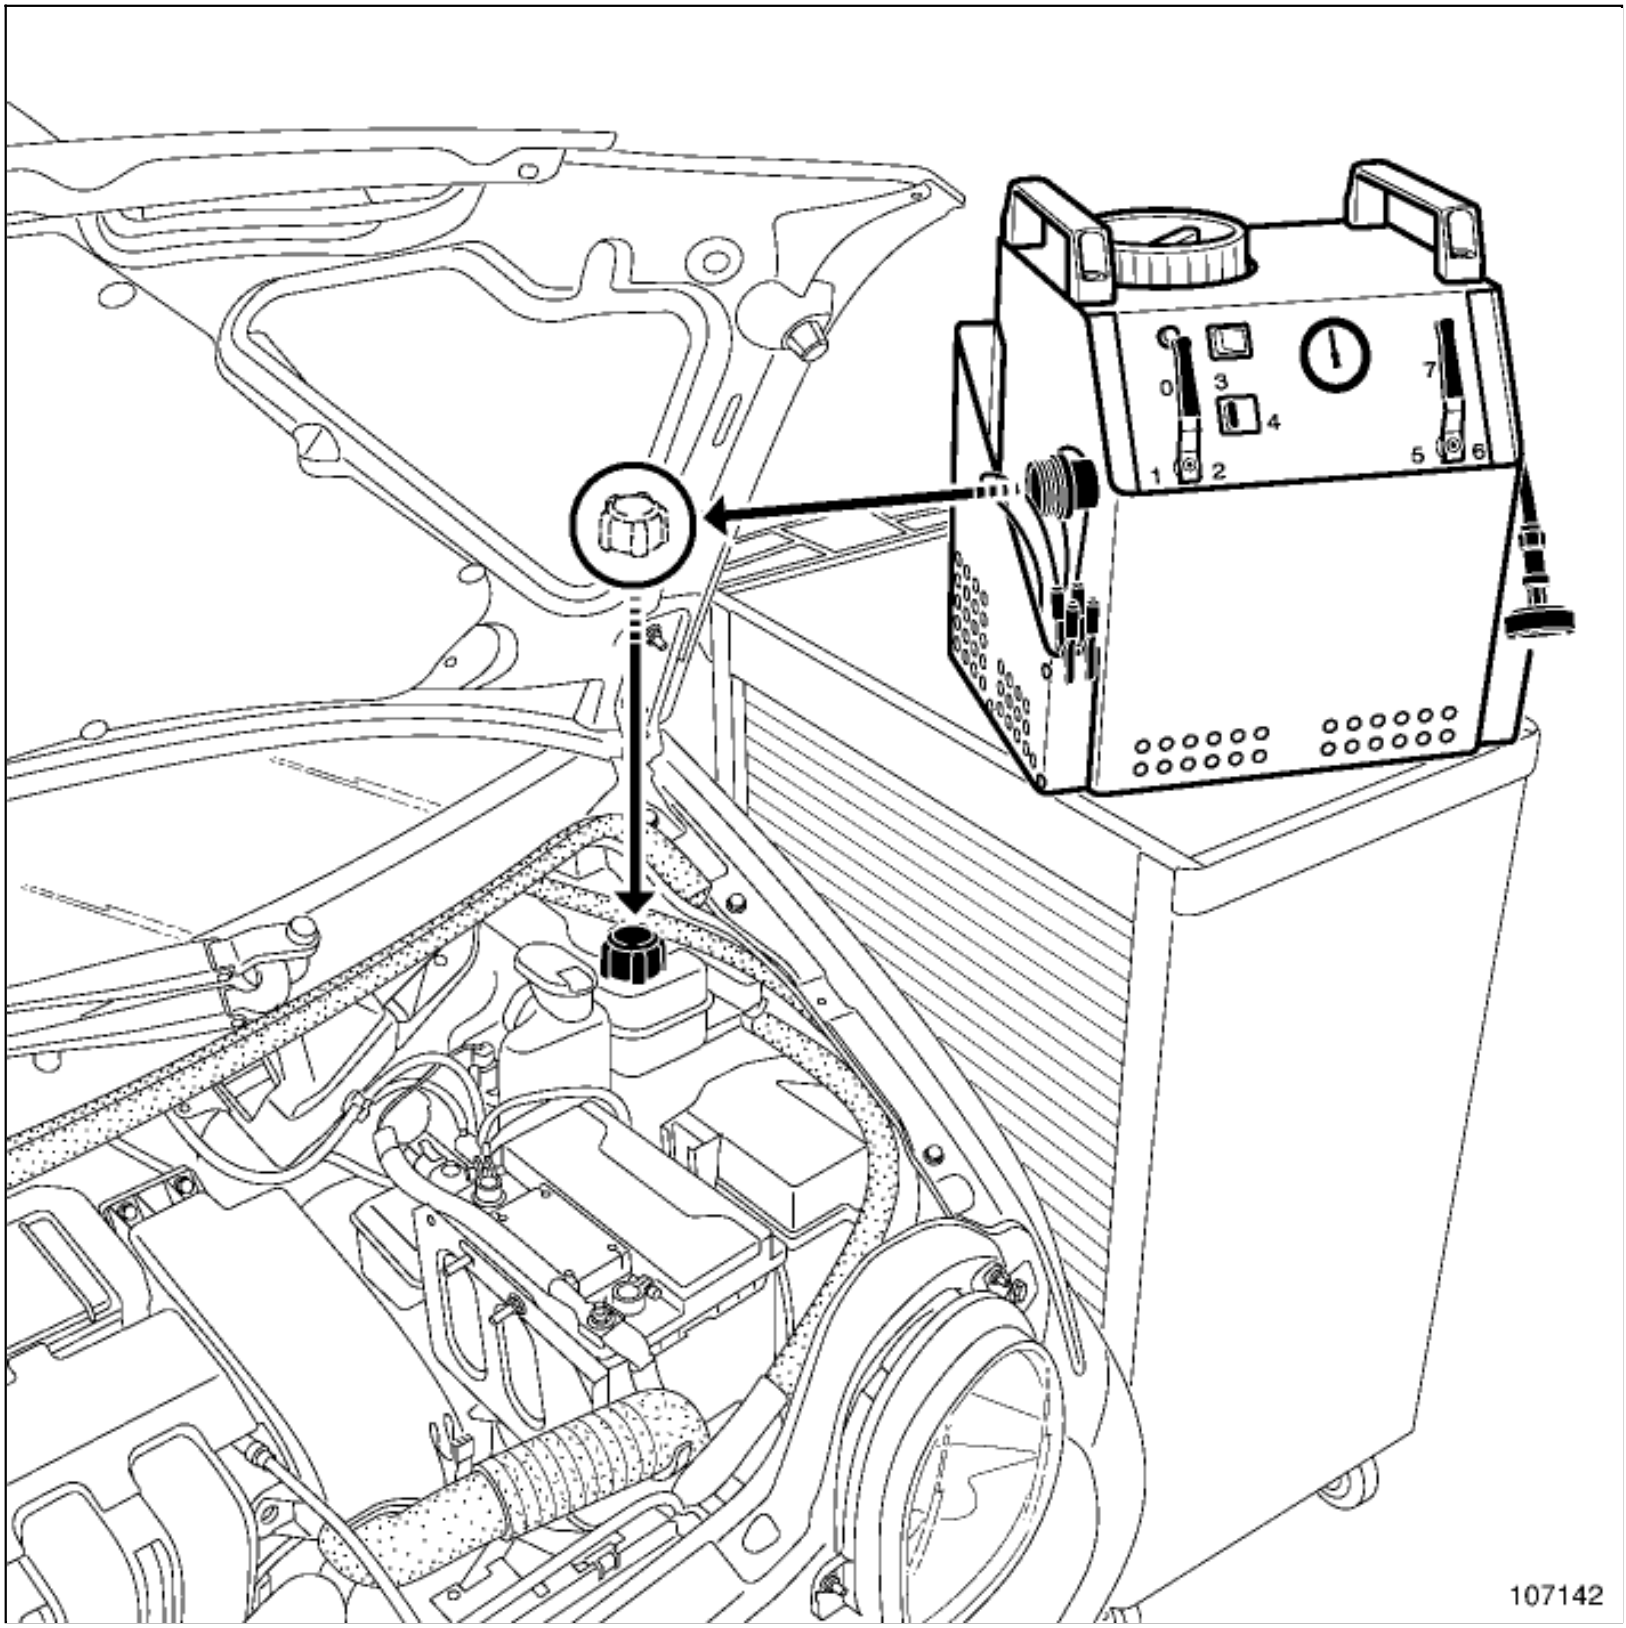
The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating.

Set the on/off switch(4) to "OFF" .



Set the control(3) to "7" .

Note:



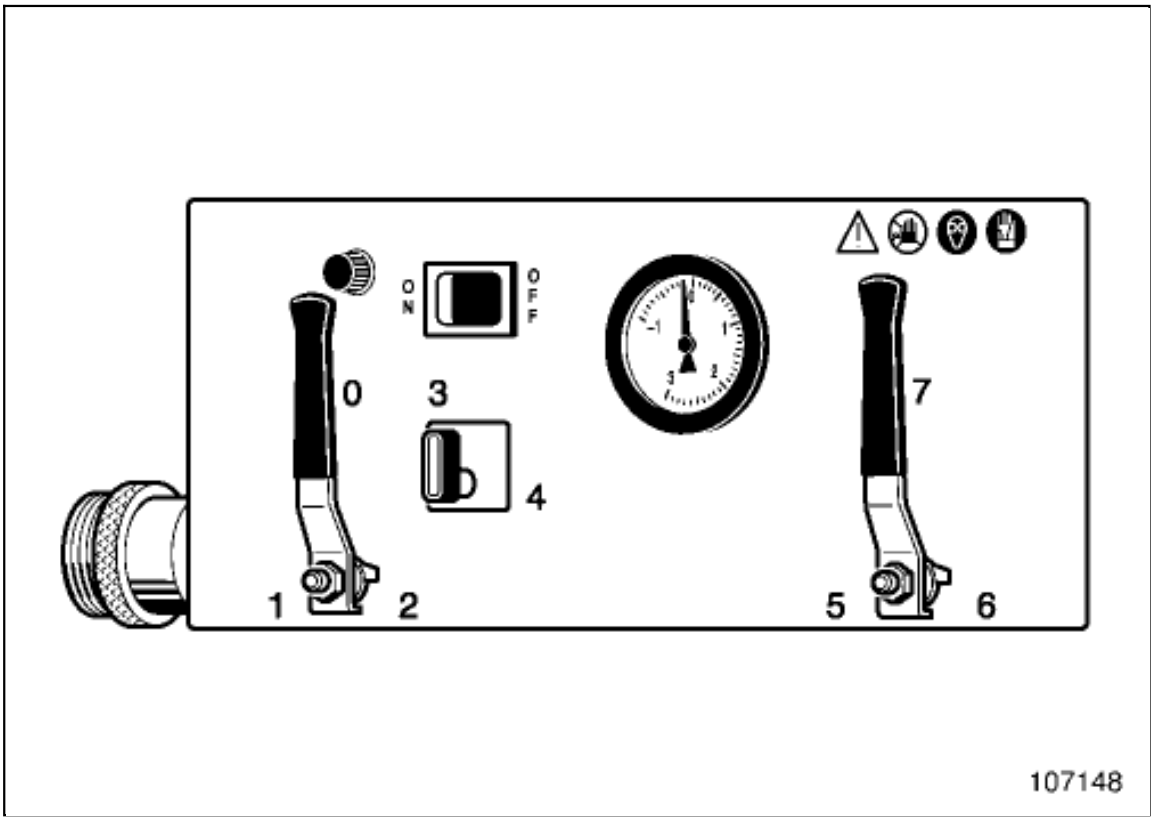
The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, repressurise the cooling circuit (by restarting the previous operations).

- Set the control(3) to "6" .

- Gradually dump the pressure by turning the control(1) in the direction shown by the arrow.

- Disconnect the tool Fault finding and filling - bleeding the cooling circuit.(Mot. 1700) from the vehicle.
- Refit the expansion bottle cap.

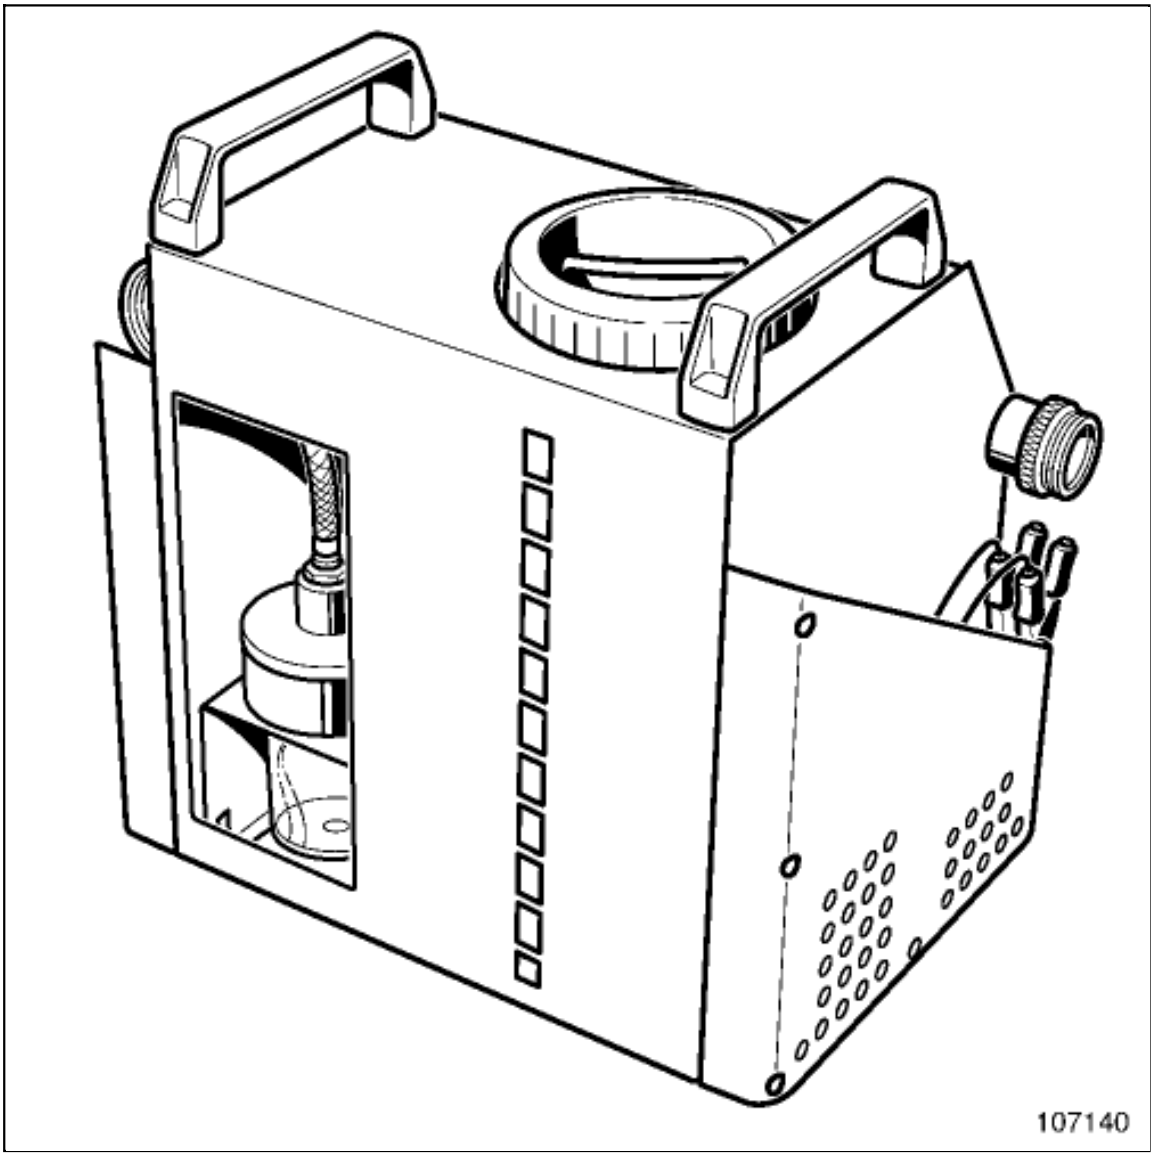


2. FILLING THE COOLING CIRCUIT

This filling operation can be carried out after the cooling circuit has been totally or partially drained, and does not need the bleed screws to be open. The cooling circuit is filled by vacuum.

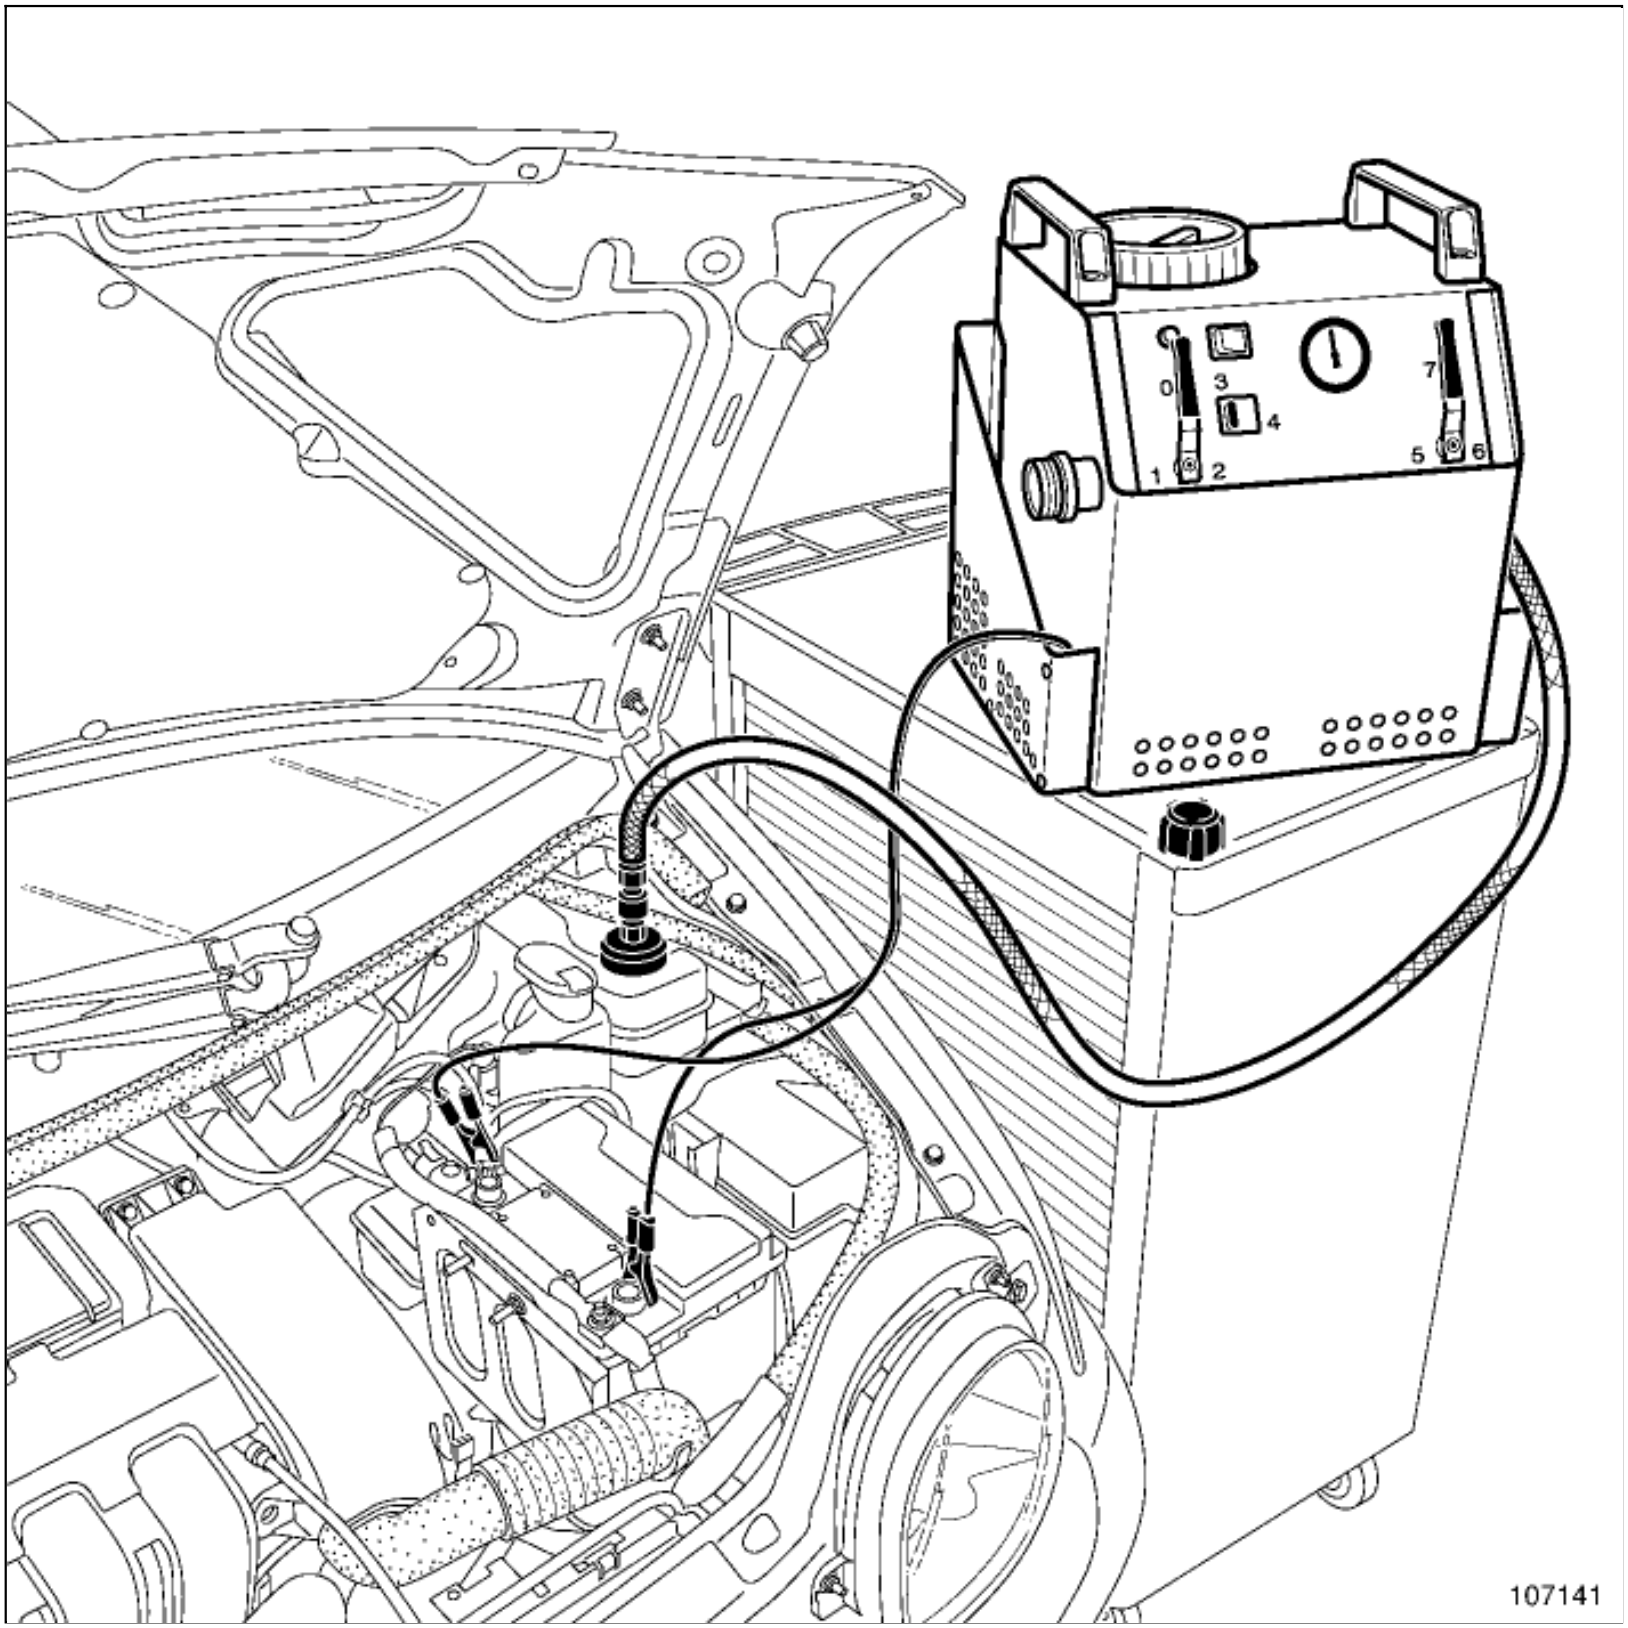
CAUTION

Failure to observe the following procedure can lead to the destruction of the engine



1- CREATING A VACUUM IN THE ENGINE COOLING SYSTEM

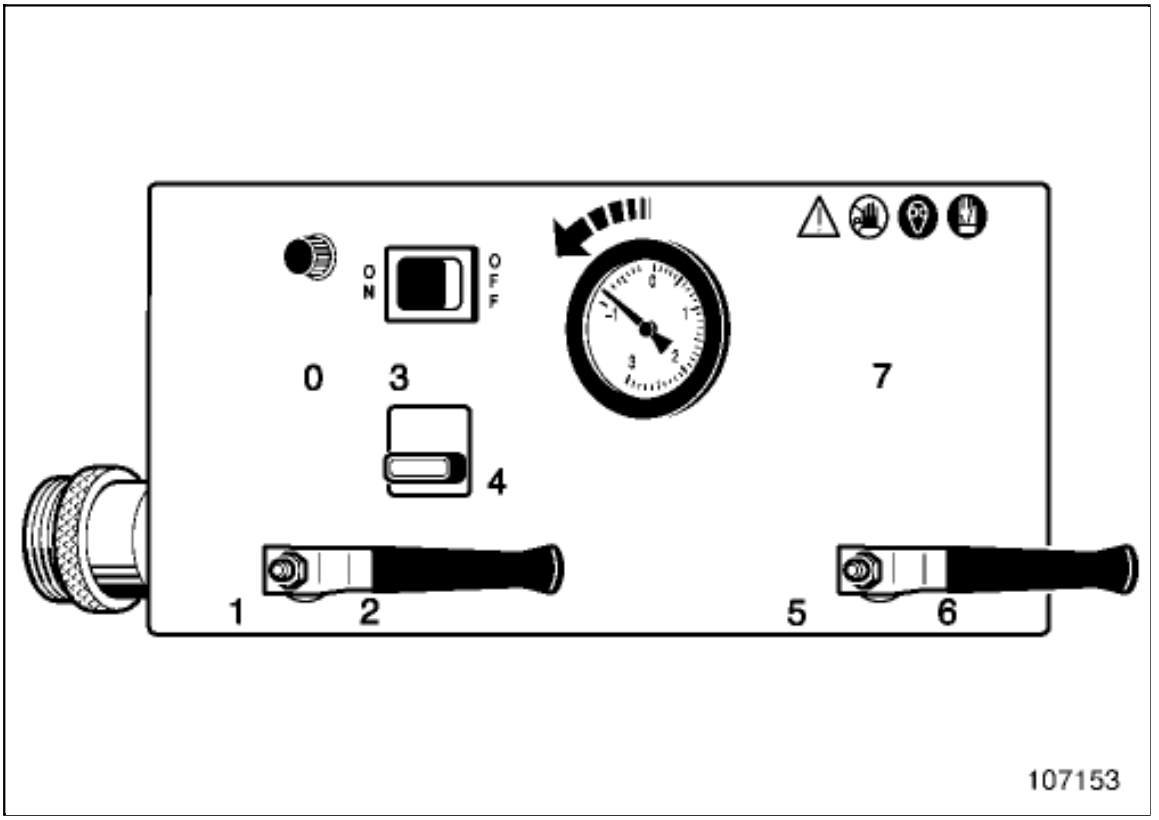
Position:



- Control(1) to "0" ,
- Control(2) to "3" ,
- Control(3) to "7" ,

The on/off switch(4) to "OFF" .

Check that:

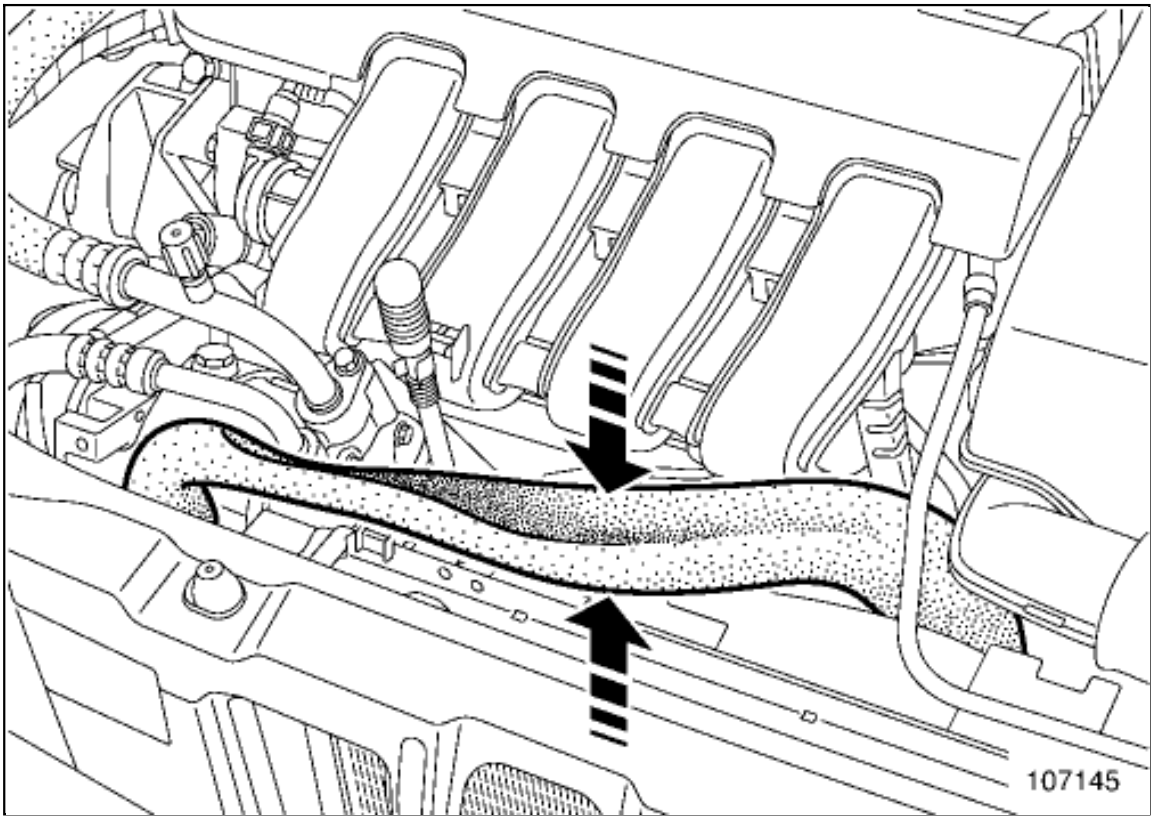


- The decanting bottle(5) is empty,
- There is enough coolant in the reservoir of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

- Fit the adapter plug to the vehicle's expansion bottle.
- Connect the pipe of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) to the adapter plug.
- Connect the wires to the battery, observing the correct polarity.

Note:

During the operation, do not fit the expansion bottle cap on tool Mot. 1700

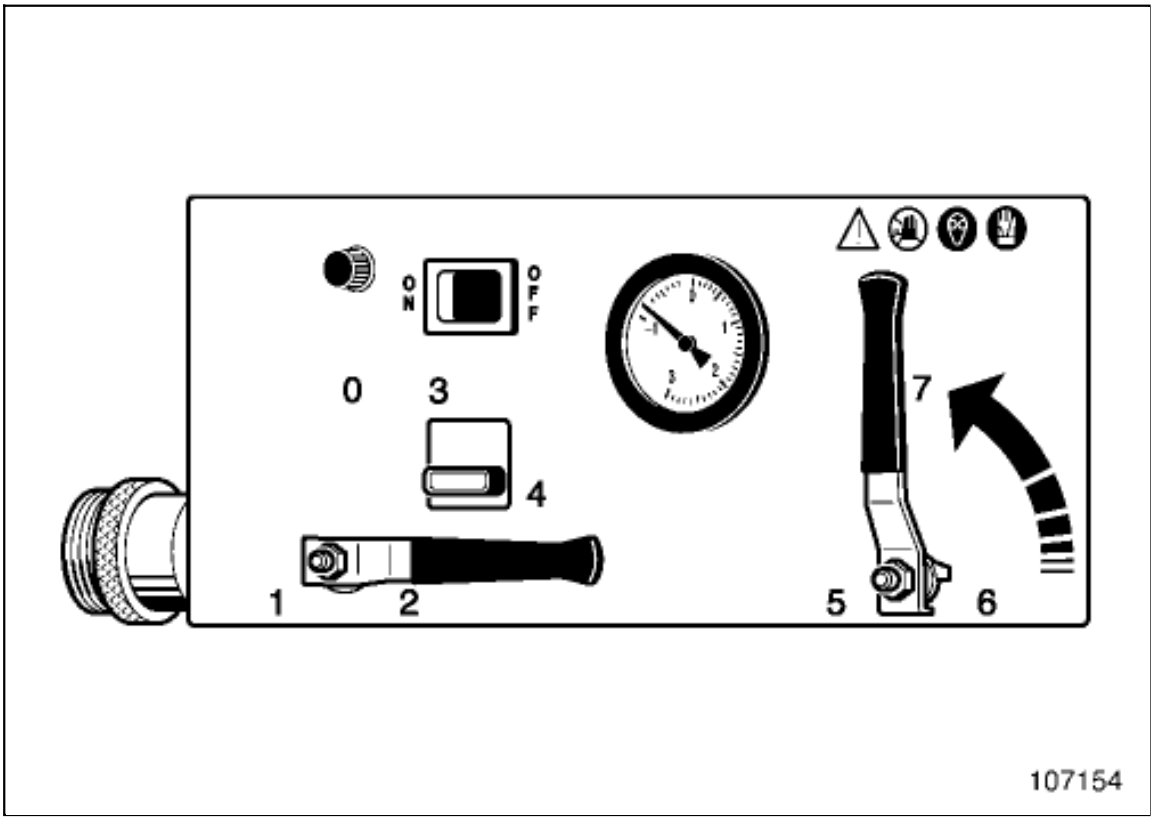


Position:

- Control(1) to "2" ,
- Control(2) to "4" ,
- Control(3) to "6" ,

The on/off switch(4) to "ON" .

Note:



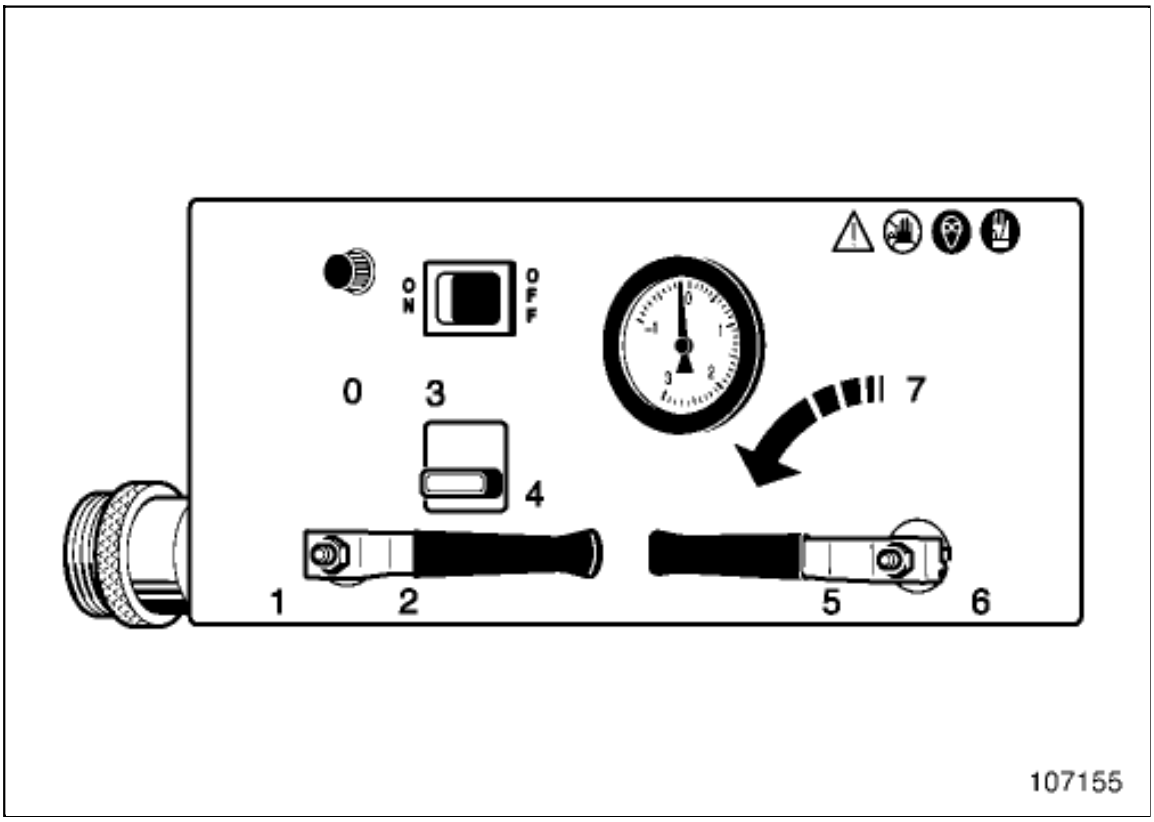
The pressure gauge needle should show a vacuum.

The cooling system hoses flatten.

Note:

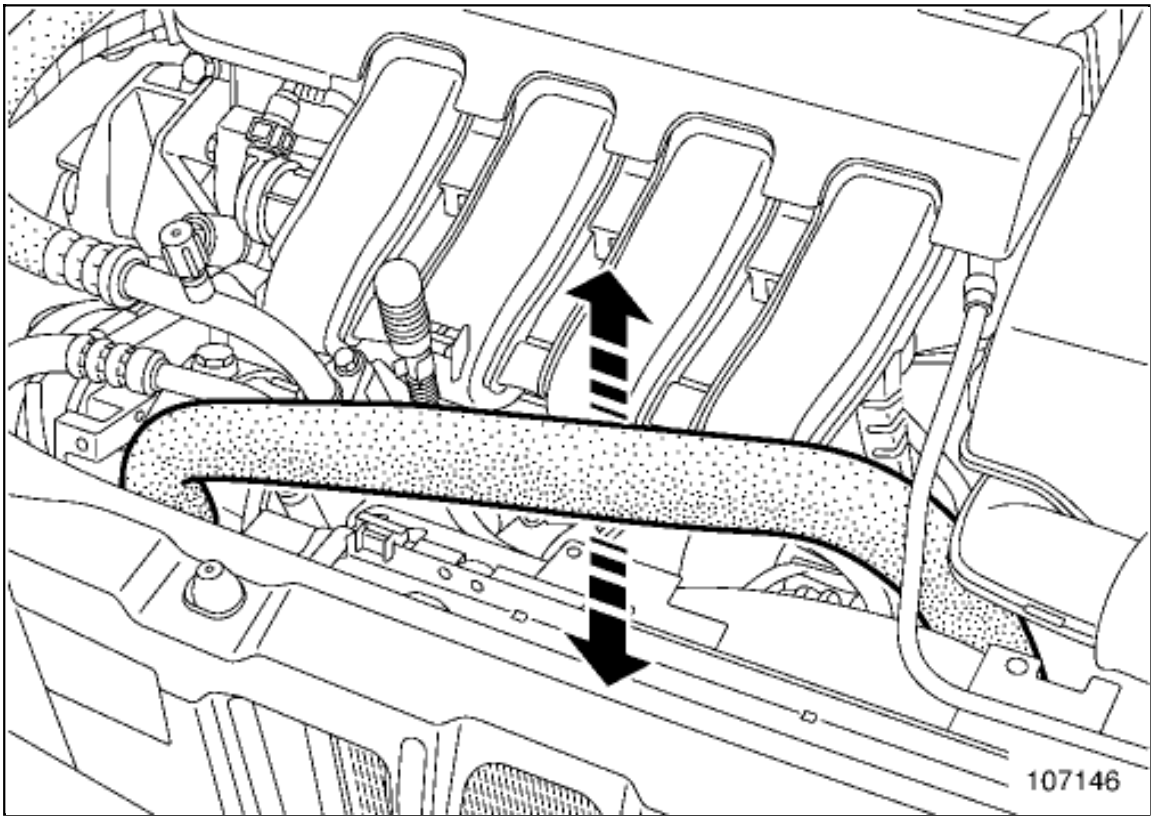
If replacing a part which not does require the cooling system to be completely drained, it is essential to position the switch (4) to "OFF" and the control (3) to "7" when the coolant starts to rise in the connecting pipe between the expansion bottle and Mot. 1700.

When the pressure gauge needle shows a vacuum of between 0.85and 0.95bar (depending on the vehicle), position:



- The on/off switch(4) to "OFF" ,
- Control(3) to "7" .

Note:



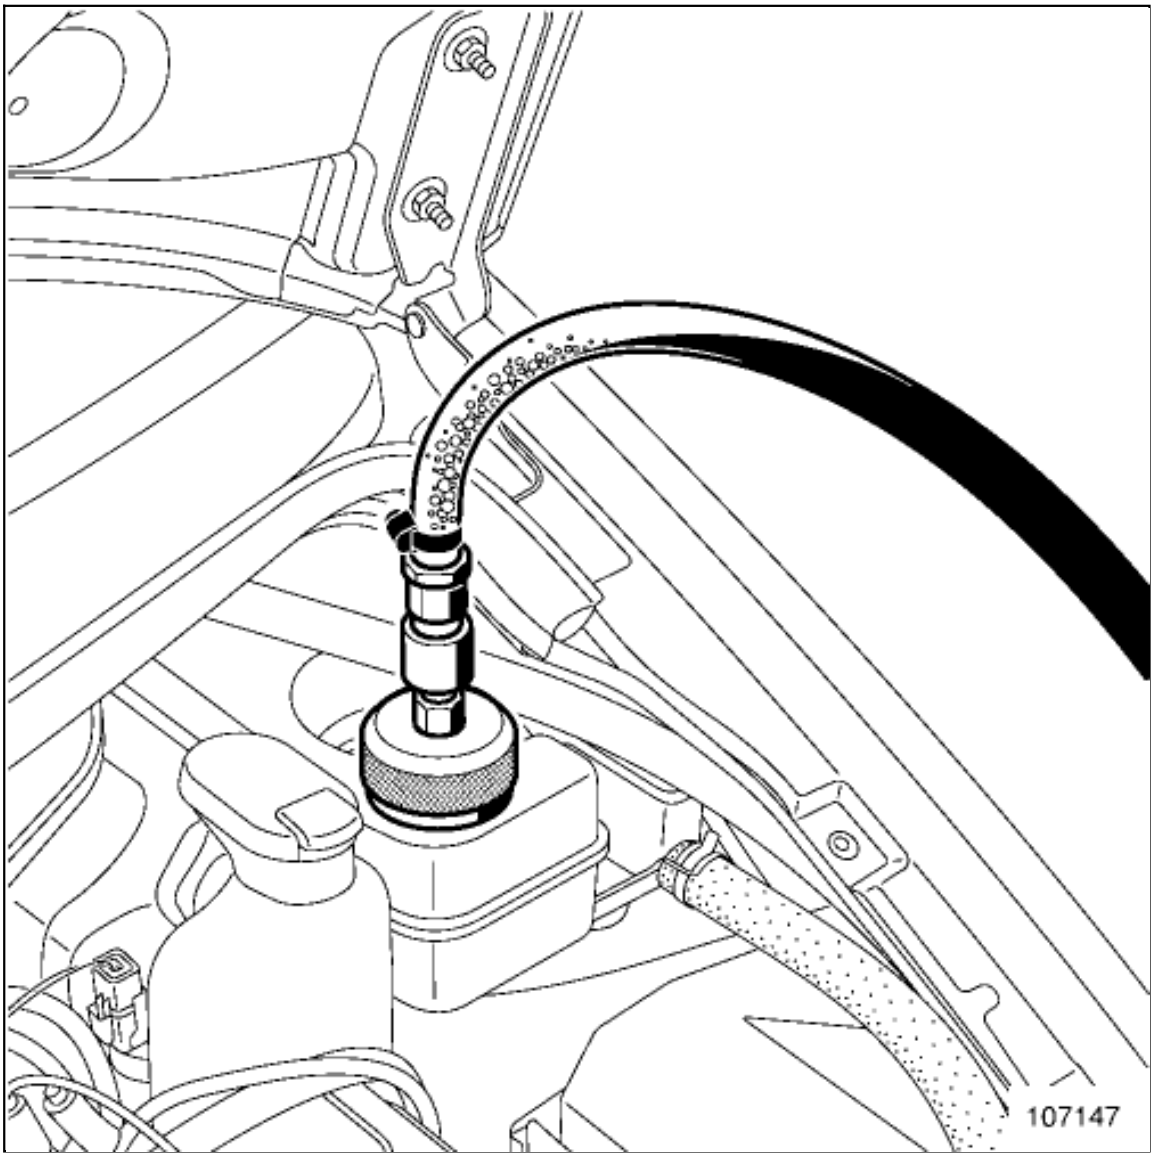
The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, create a vacuum in the cooling circuit (by restarting the previous operations).

2- FILLING THE COOLING CIRCUIT

Set the control(3) to "5" .

The hoses return to their original form.



The pressure gauge needle returns to zero.

Note:

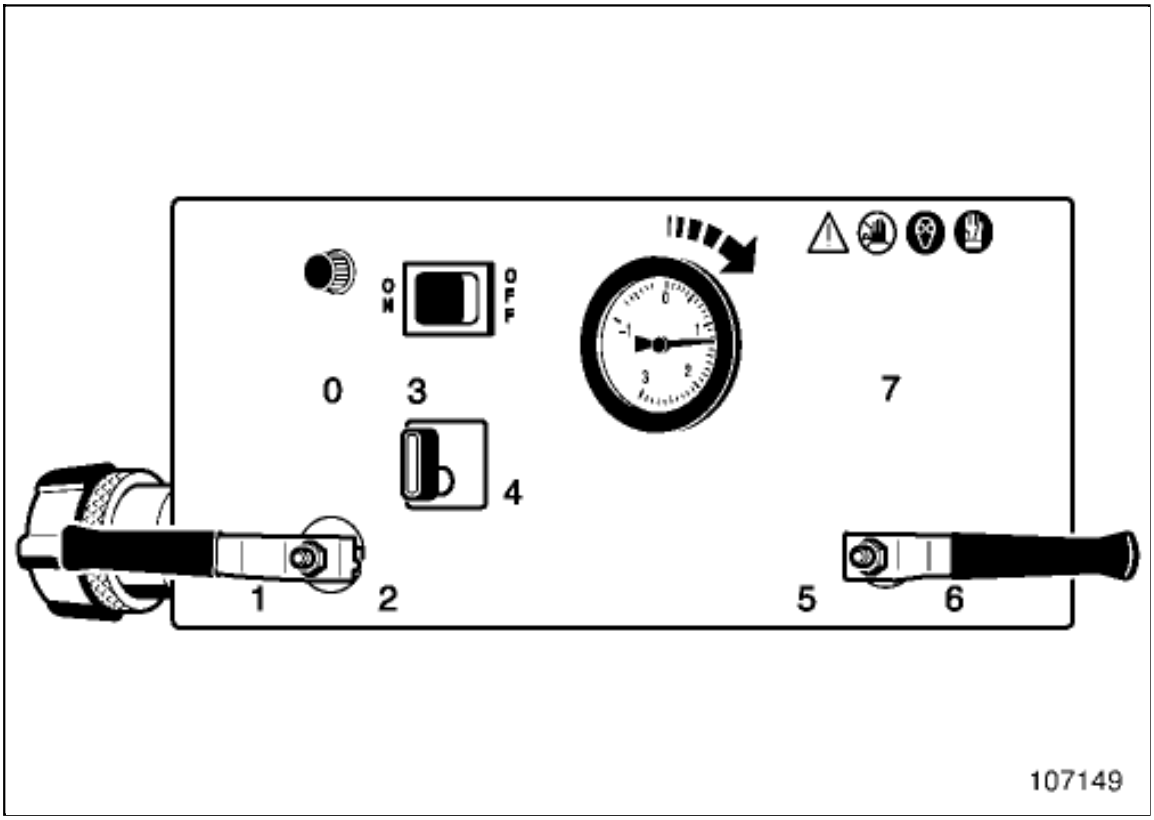
For cooling systems with a coolant capacity greater than 10 litres, stop filling the cooling system before the reservoir is empty.

To carry out this operation:

- Position the control (3) to "7" ,
- Readjust the coolant level in the reservoir.
- Set the control (3) to "5" to fill the cooling system again.

The cooling system is full once bubbles appear in the connecting pipe(7) between the expansion bottle and toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

Set the control(2) to "3" .



Disconnect the pipe (7) from the adapter plug.

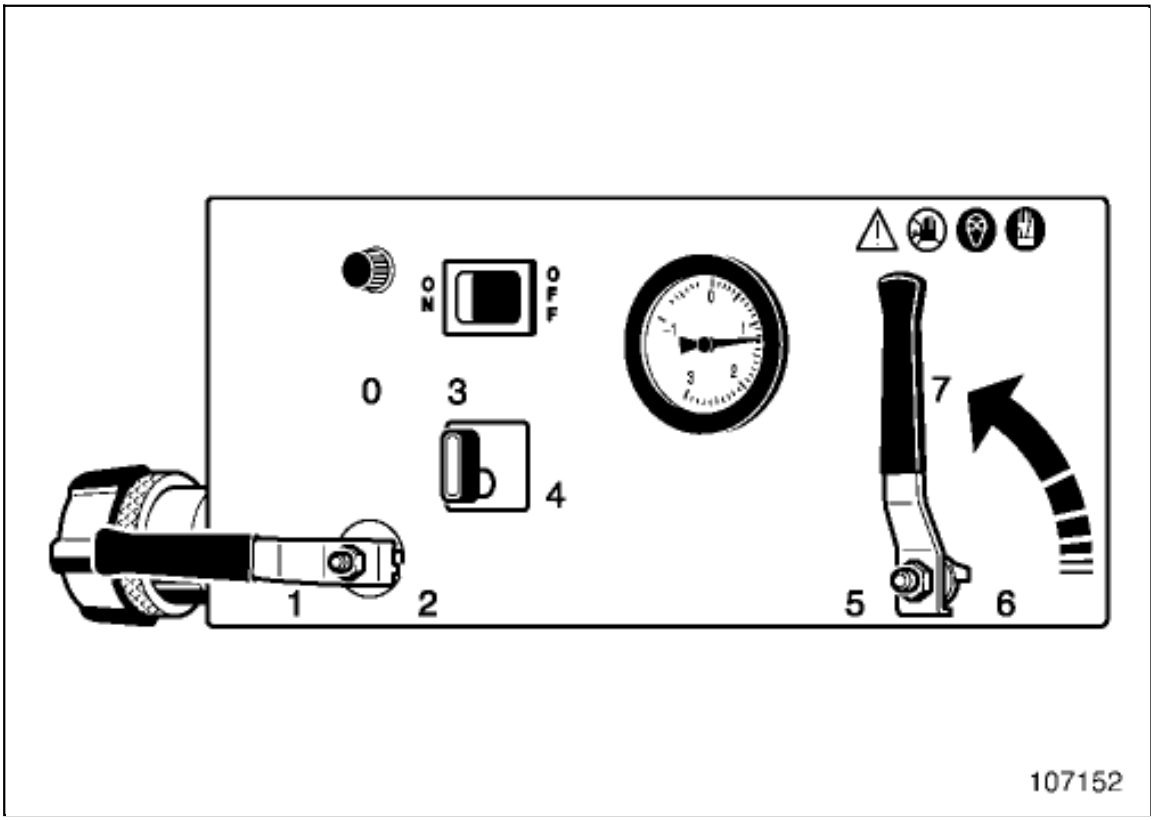
Remove the adapter plug(6) .

Connect the adapter plug to the pipe to empty the remaining liquid in the pipe into the reservoir of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

3- PRESSURIZING THE COOLING SYSTEM

Refit the adapter plug and the pipe to the vehicle's expansion bottle in order to pressurise the cooling circuit to check the cooling circuit sealing.

Refit the expansion bottle cap(8) on the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .



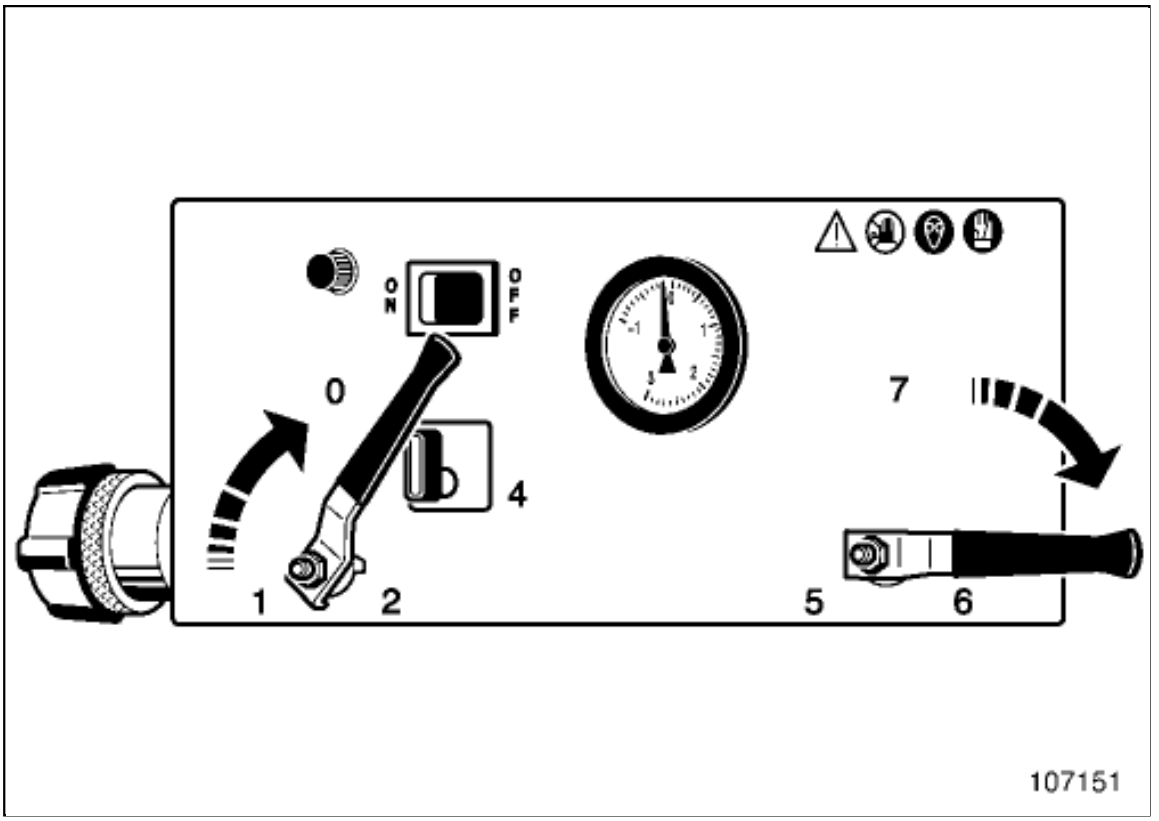
Position:

- Control(1) to "1" ,
- Control(2) to "3" ,
- Control(3) to "6" ,
- The on/off switch(4) to "ON" .

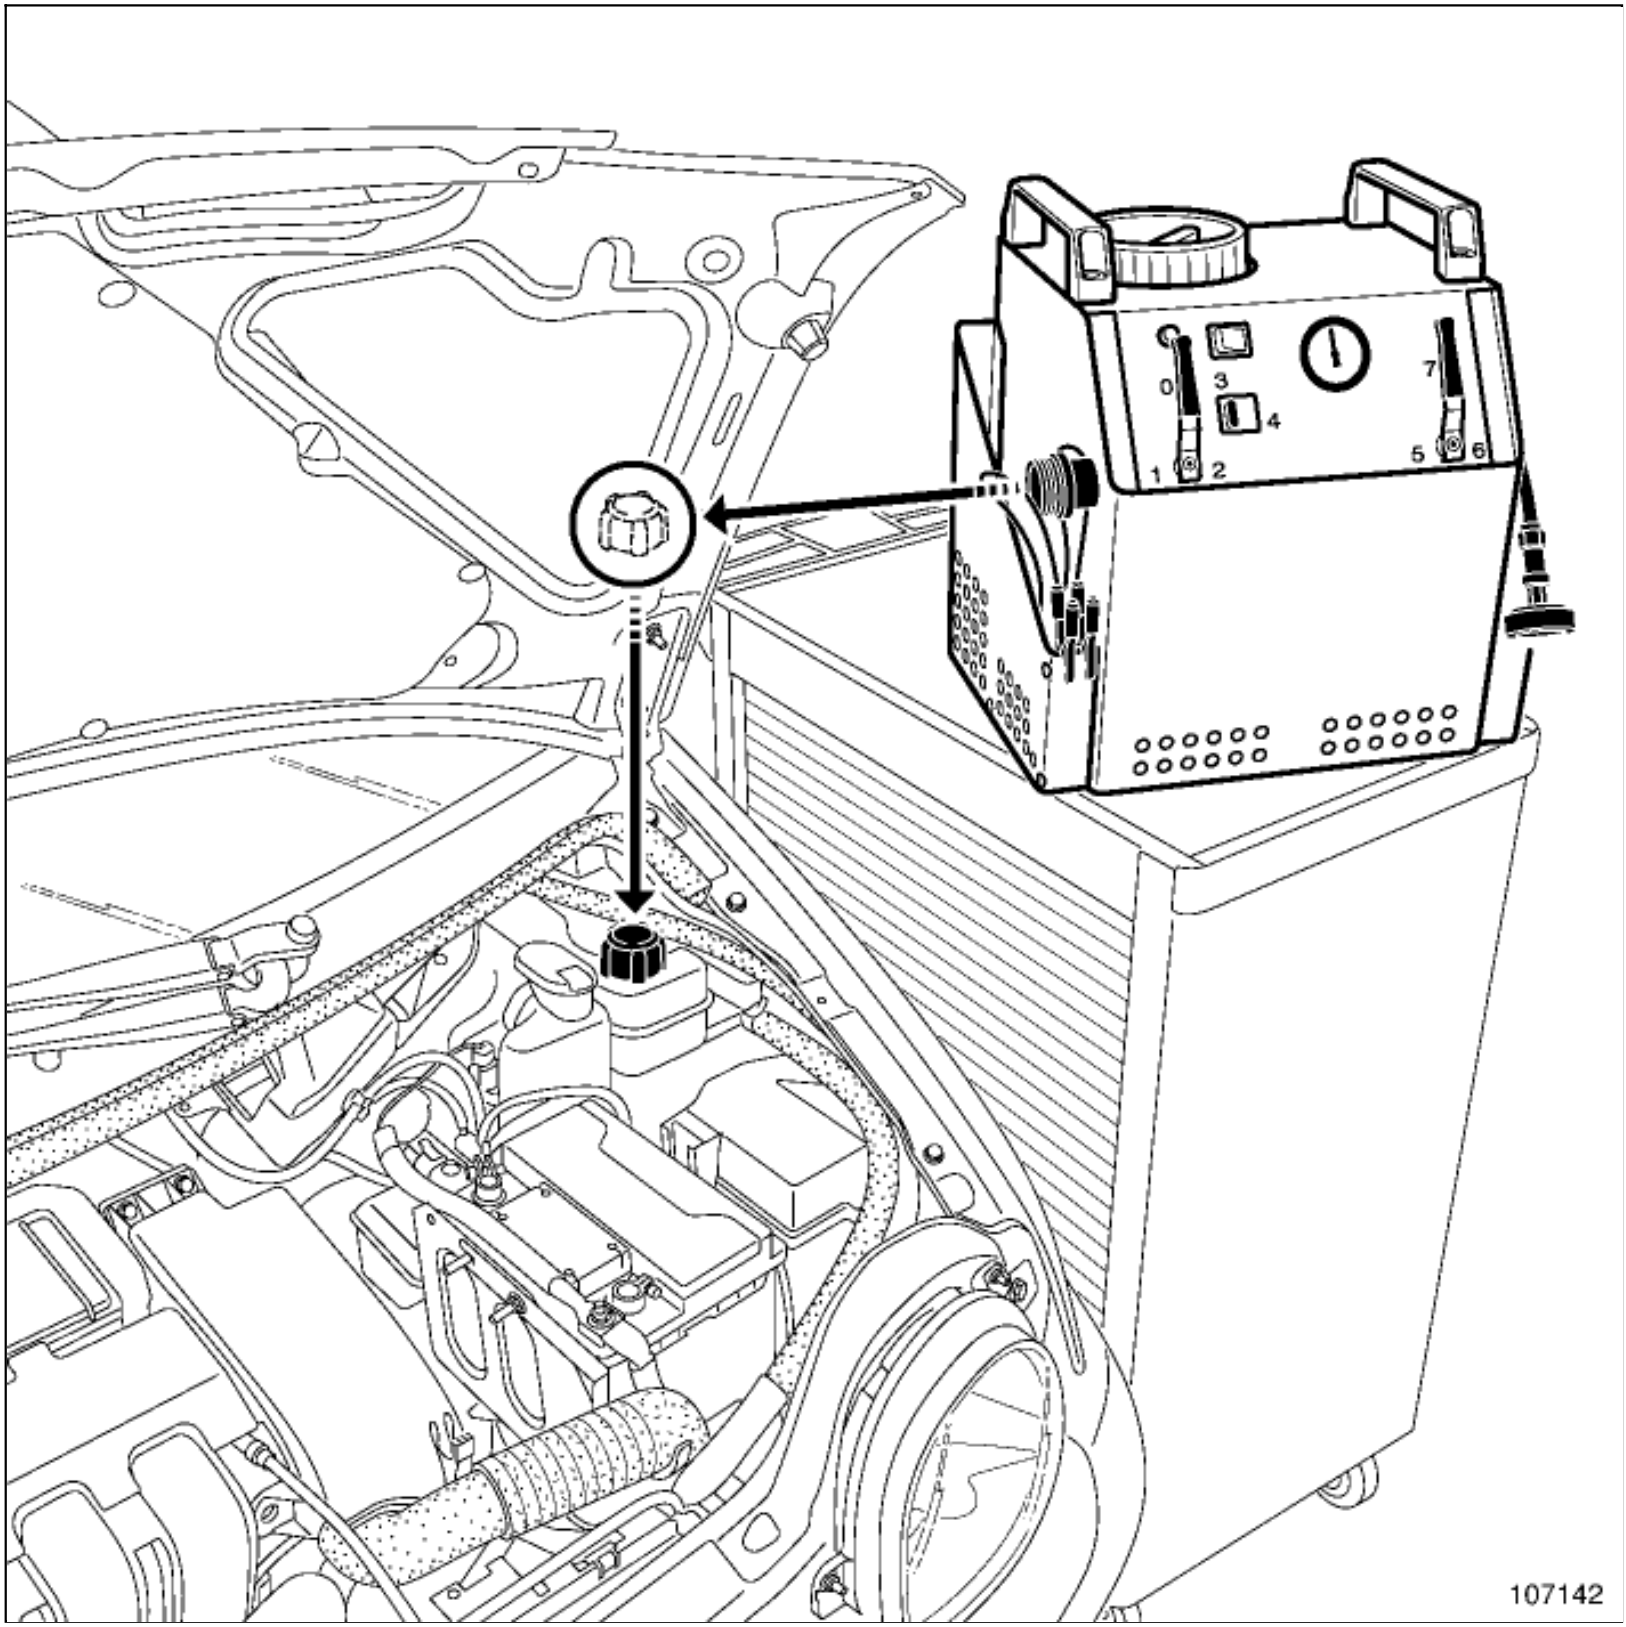
Note:

The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating.

Set the on/off switch(4) to "OFF" .



Set the control(3) to "7" .



Note:

The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, repressurise the cooling circuit (by restarting the previous operations).

- Set the control(3) to "6" .
- Gradually dump the pressure by turning the control(1) in the direction shown by the arrow.
- Disconnect the tool Fault finding and filling - bleeding the cooling circuit.(Mot. 1700) from the vehicle.
- Fill the expansion bottle to overflow (only after a total draining of the cooling system).

- Refit the expansion bottle cap.

- Bleed the engine cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

XSL version : 3.02 du 22/07/11

COOLING SYSTEM FILLING AND DIAGNOSTIC TOOL: USE

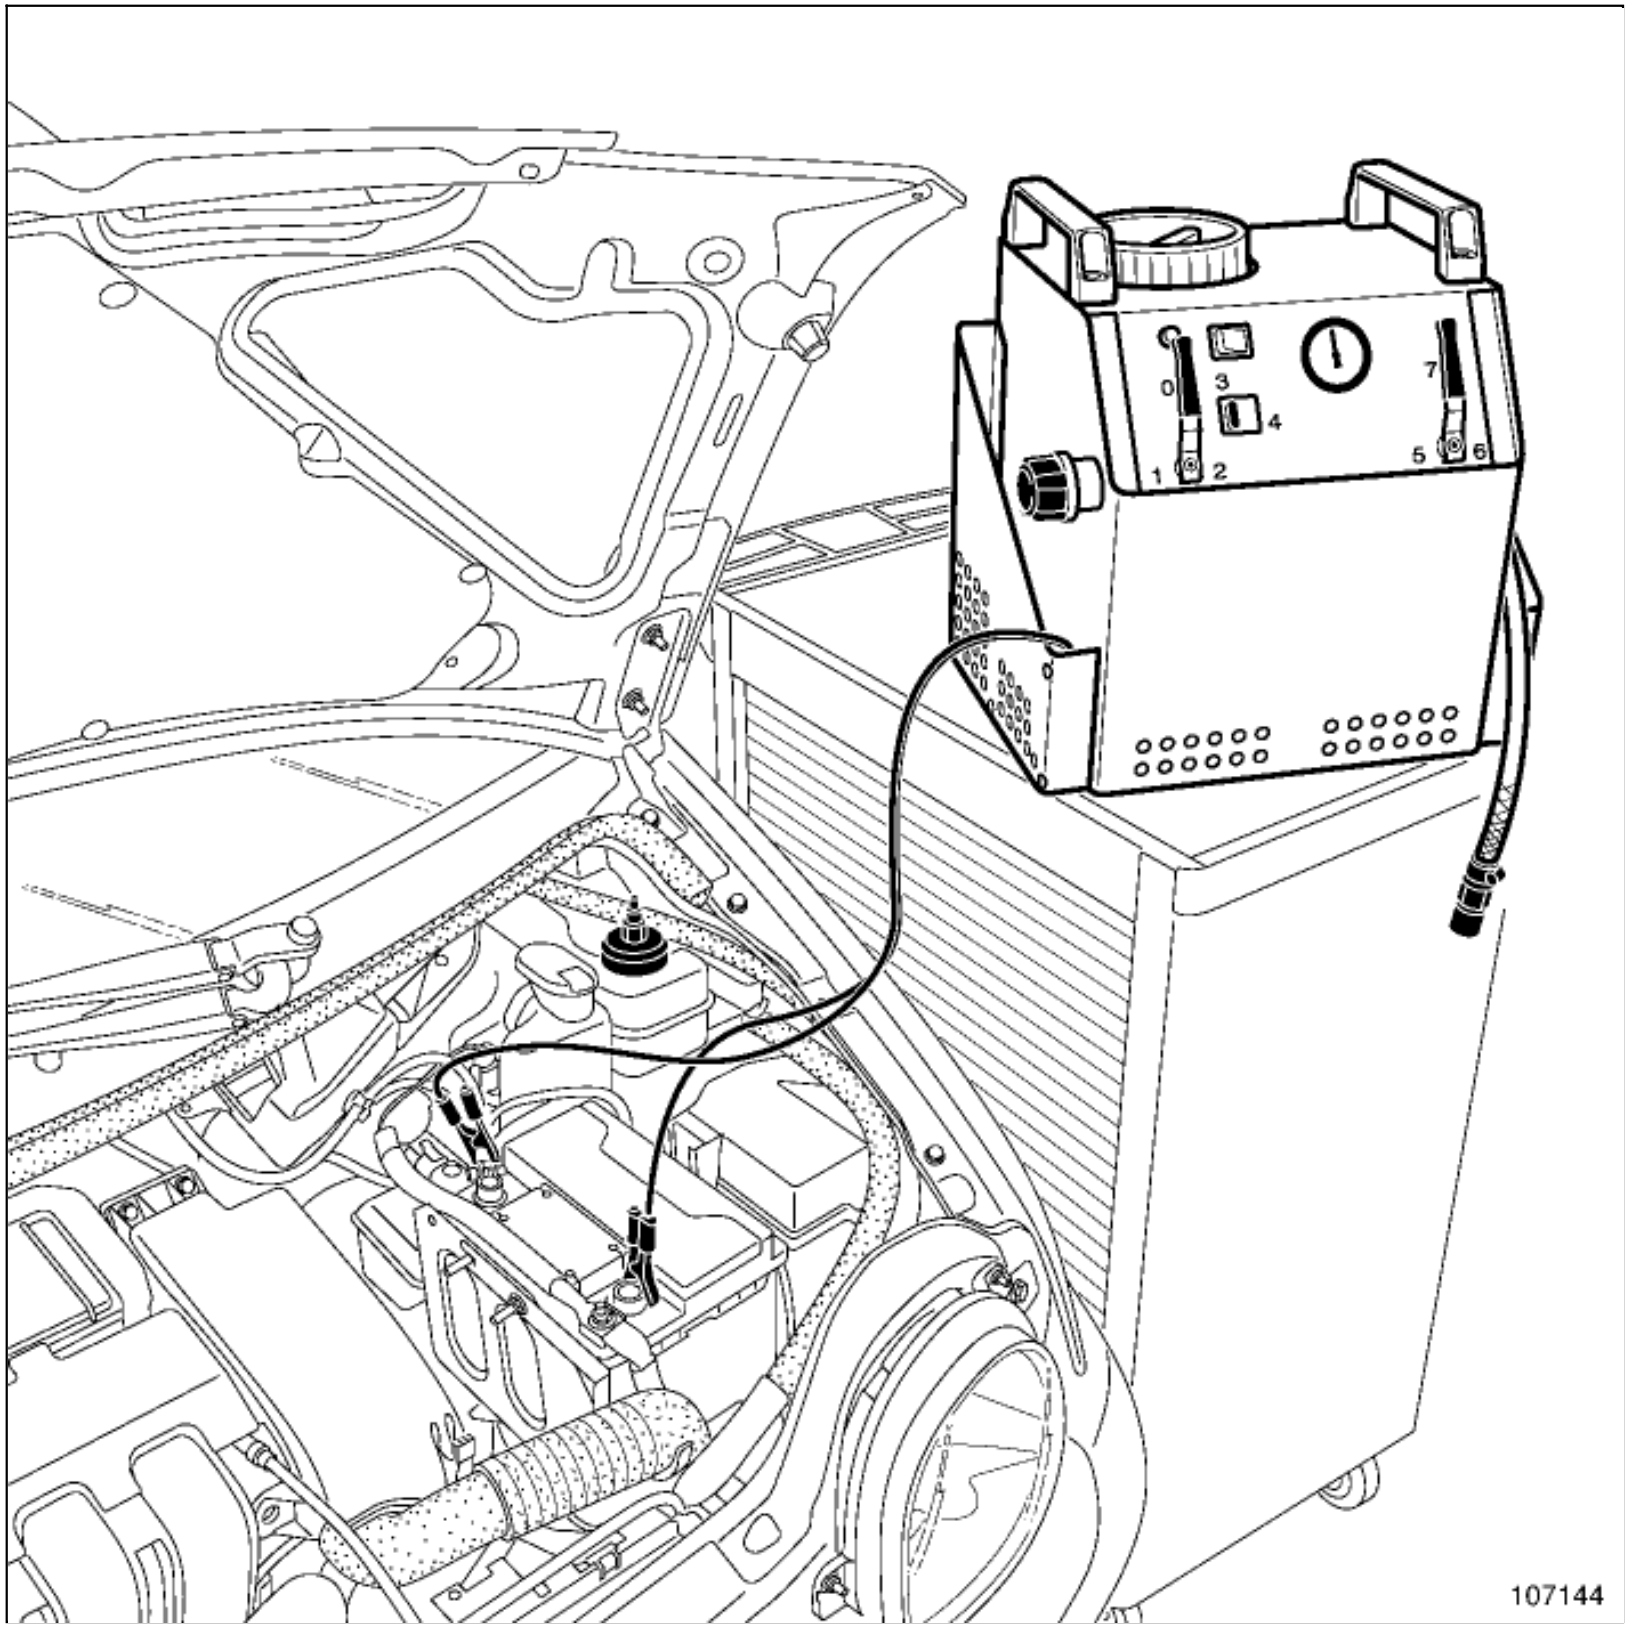
1. FAULT FINDING PROCEDURE FOR THE ENGINE COOLING SYSTEM

CAUTION

Failure to observe the following procedure can lead to the destruction of the engine.

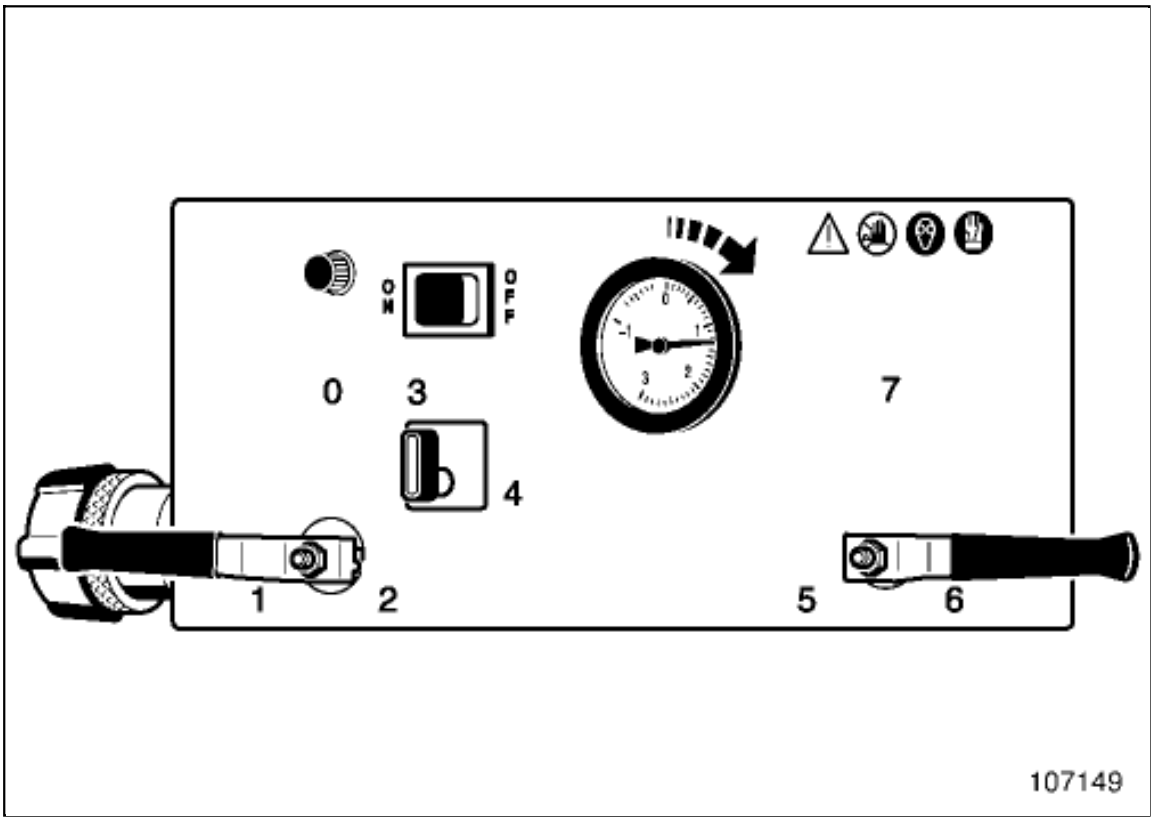


1- FAULT FINDING PROCEDURE FOR THE EXPANSION BOTTLE CAP

Position:

- Control(1) to "0" ,
- Control(2) to "3" ,
- Control(3) to "7" ,

The on/off switch(4) to "OFF" .



Screw on:

- The expansion bottle cap at(5) on the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) ,

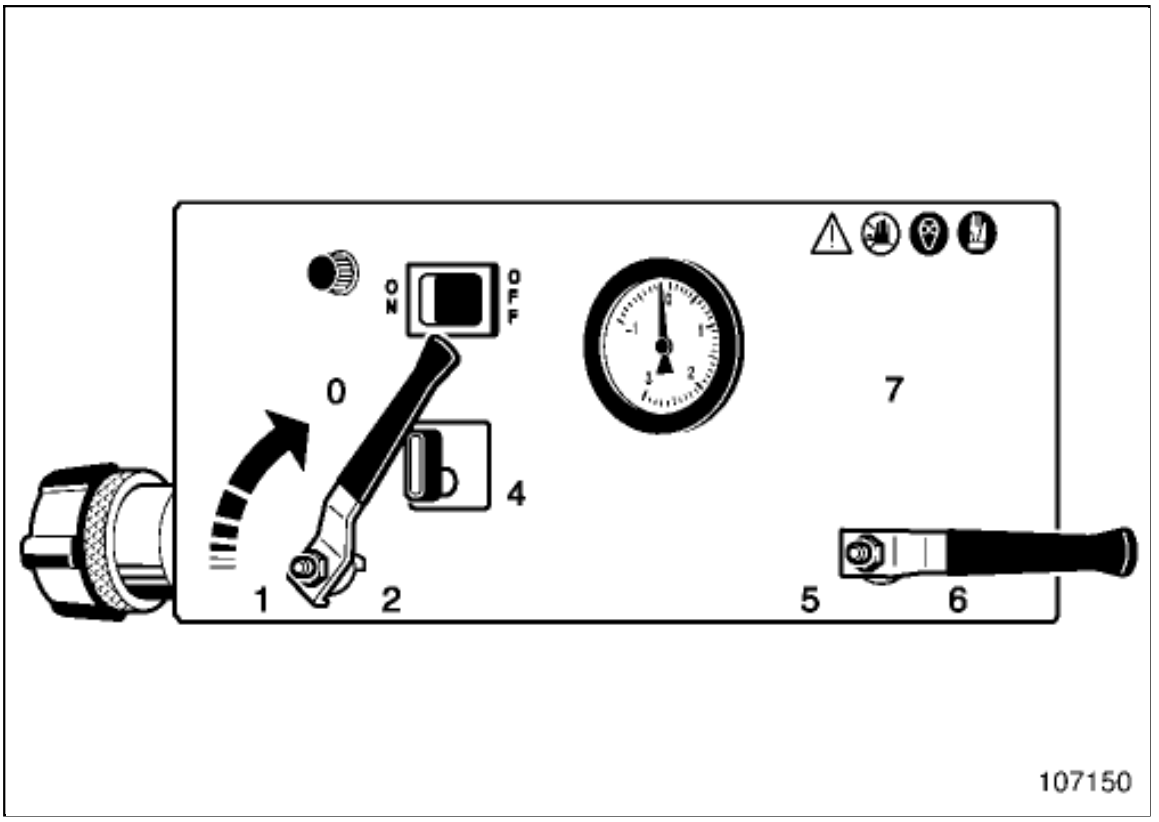
The adapter plug(6) (without the pipe) to the vehicle expansion bottle.

Connect the wires to the battery, observing the correct polarity.

Position:

- Control(1) to "1" ,
- Control(3) to "6" ,

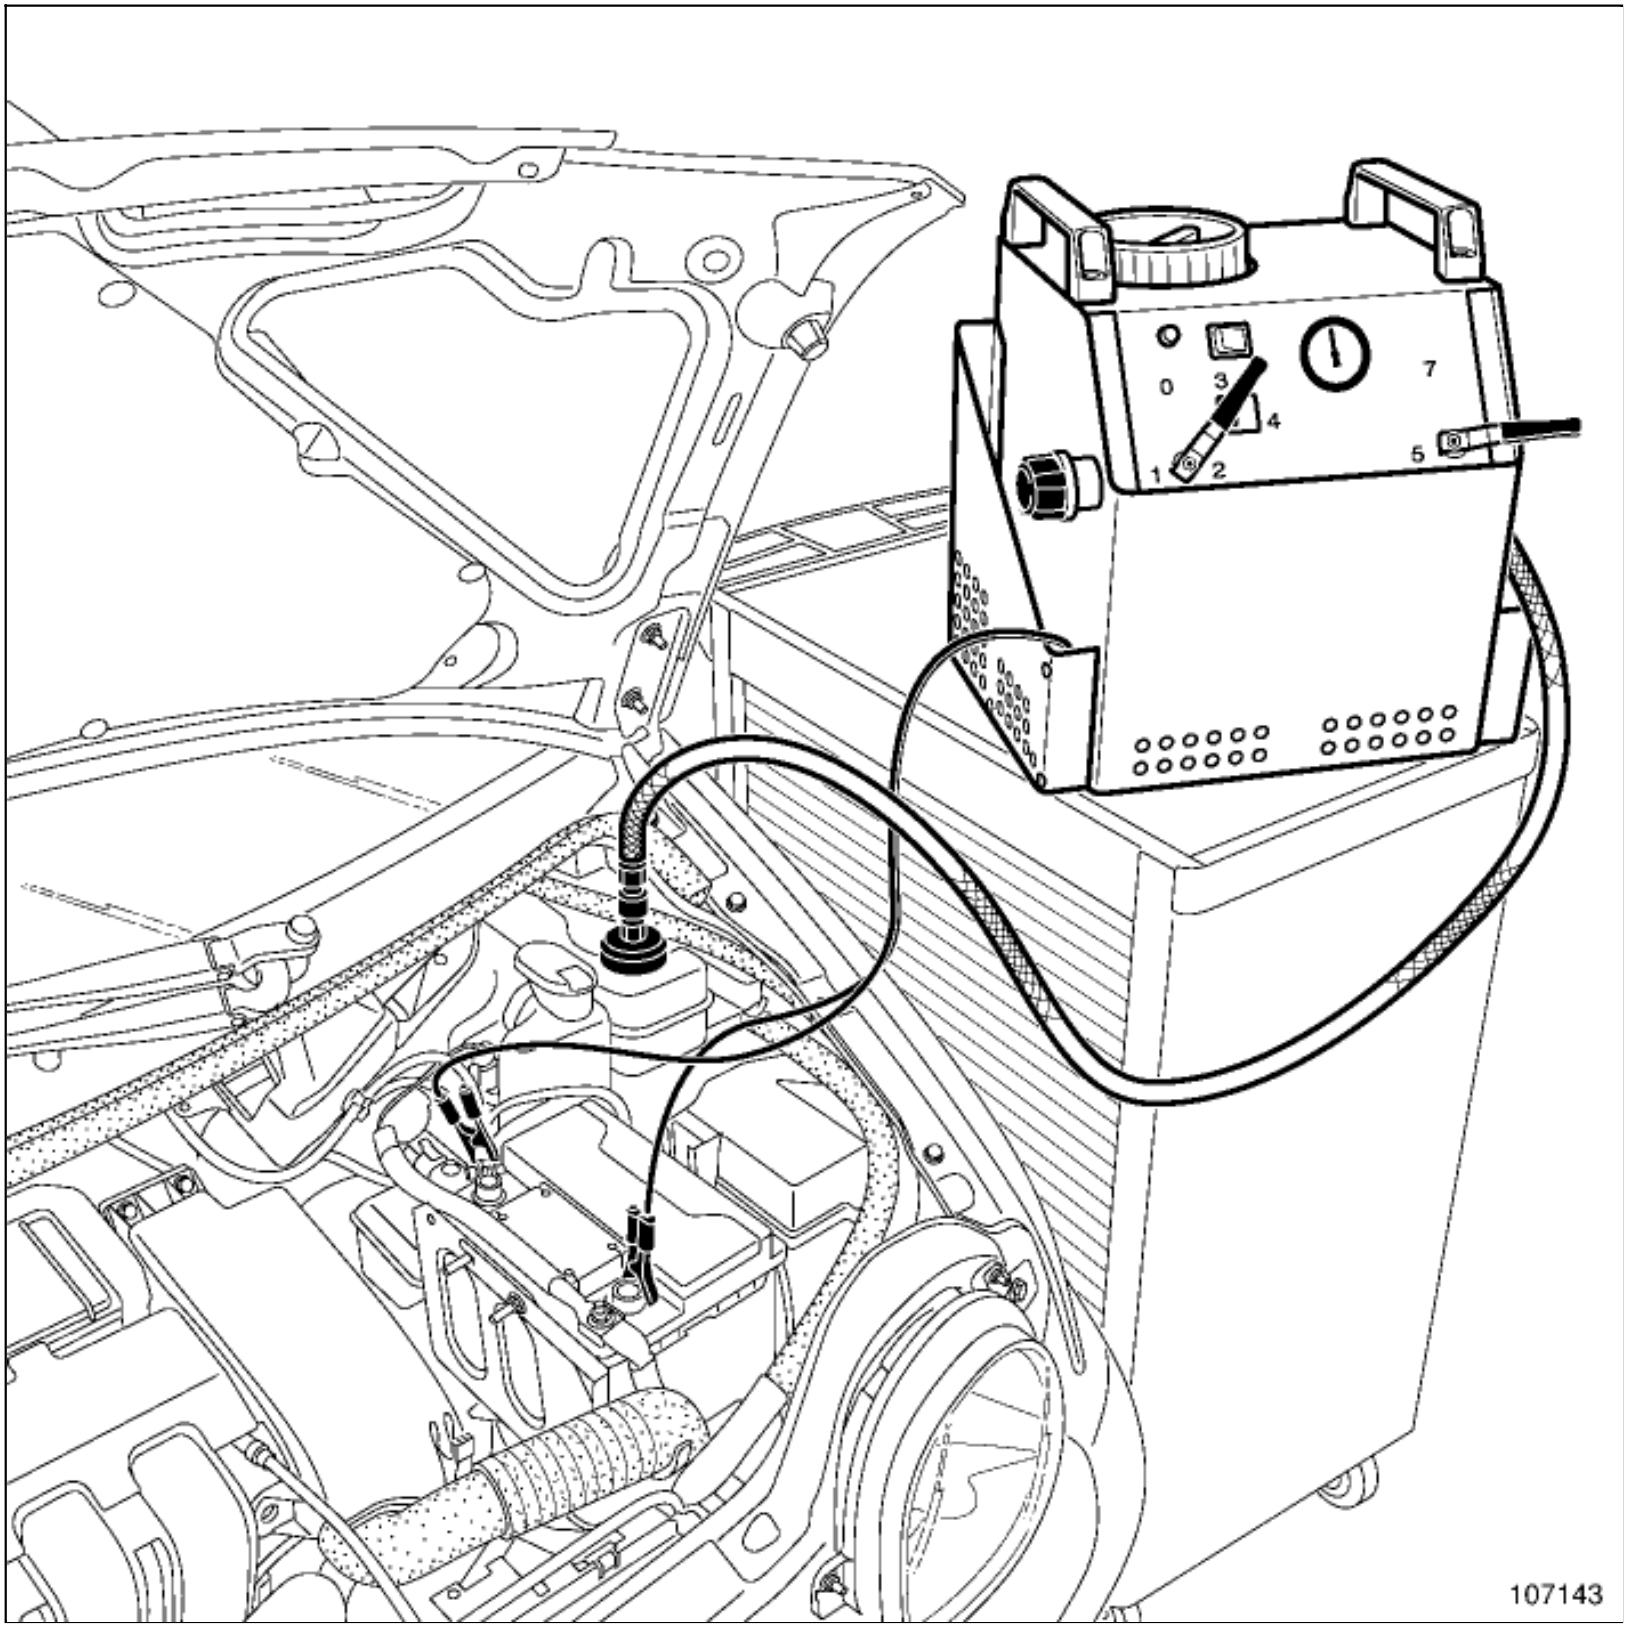
The on/off switch(4) to "ON" .



Note:

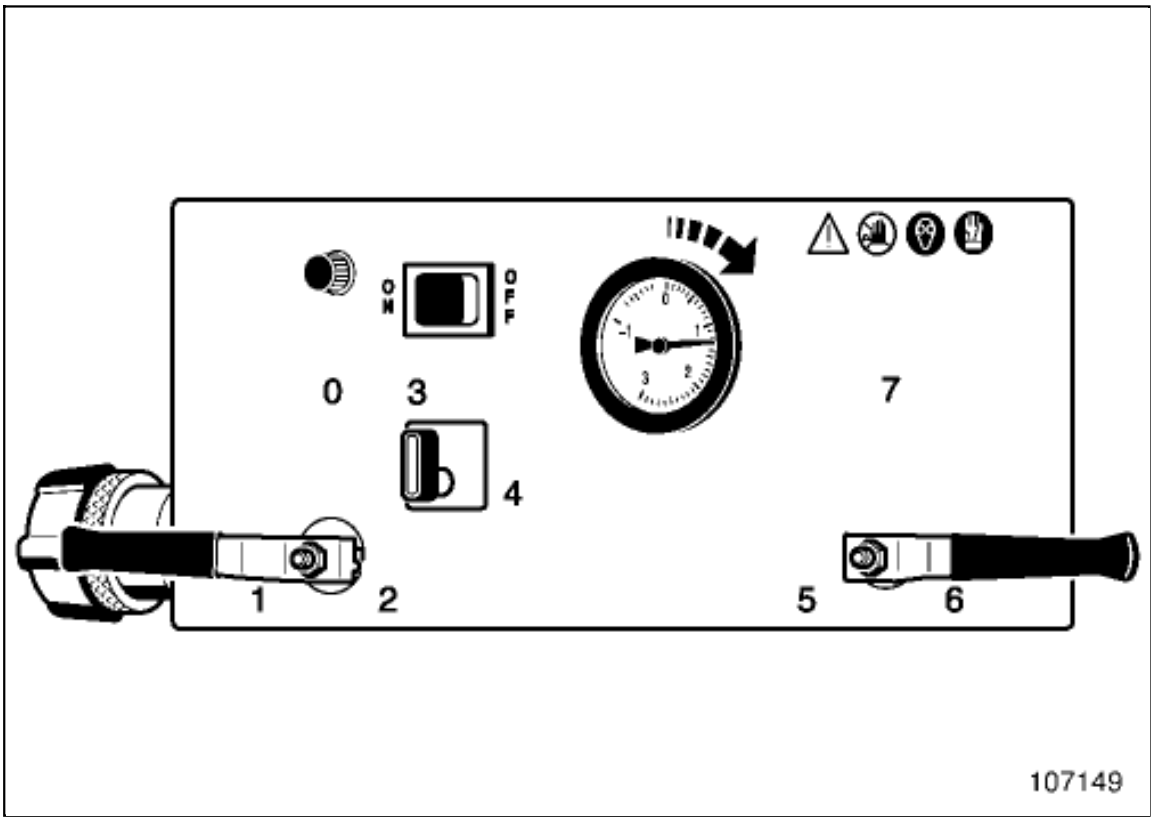
The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating. If the needle does not indicate the rating or exceeds 2 bar, replace the expansion bottle cap because the rating is incorrect.

Set the on/off switch(4) to "OFF" .



Note:

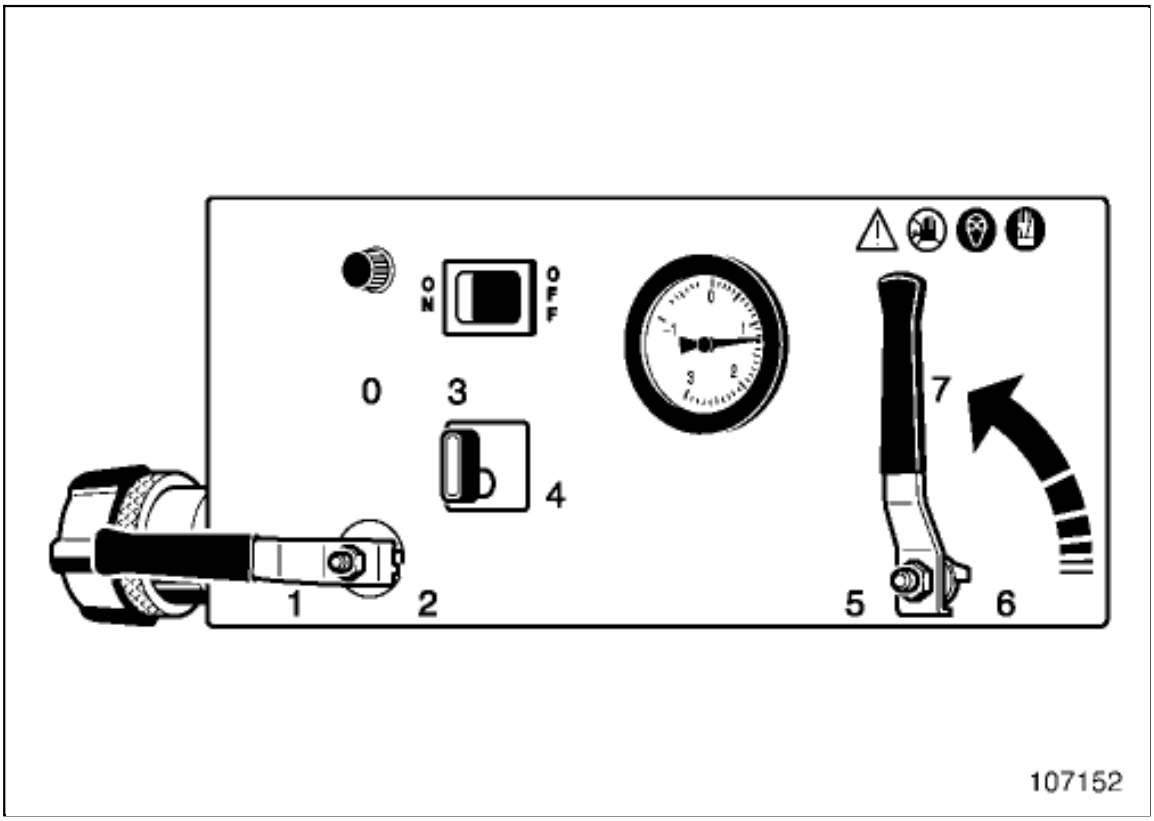
The needle of the pressure gauge must remain at the expansion bottle cap valve rating. If the needle drops back down, replace the expansion bottle cap as it is leaking.



Dump the pressure by turning the control(1) in the direction shown by the arrow.

2- FAULT FINDING PROCEDURE FOR THE ENGINE COOLING SYSTEM

Connect the pipe of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) to the adapter plug.



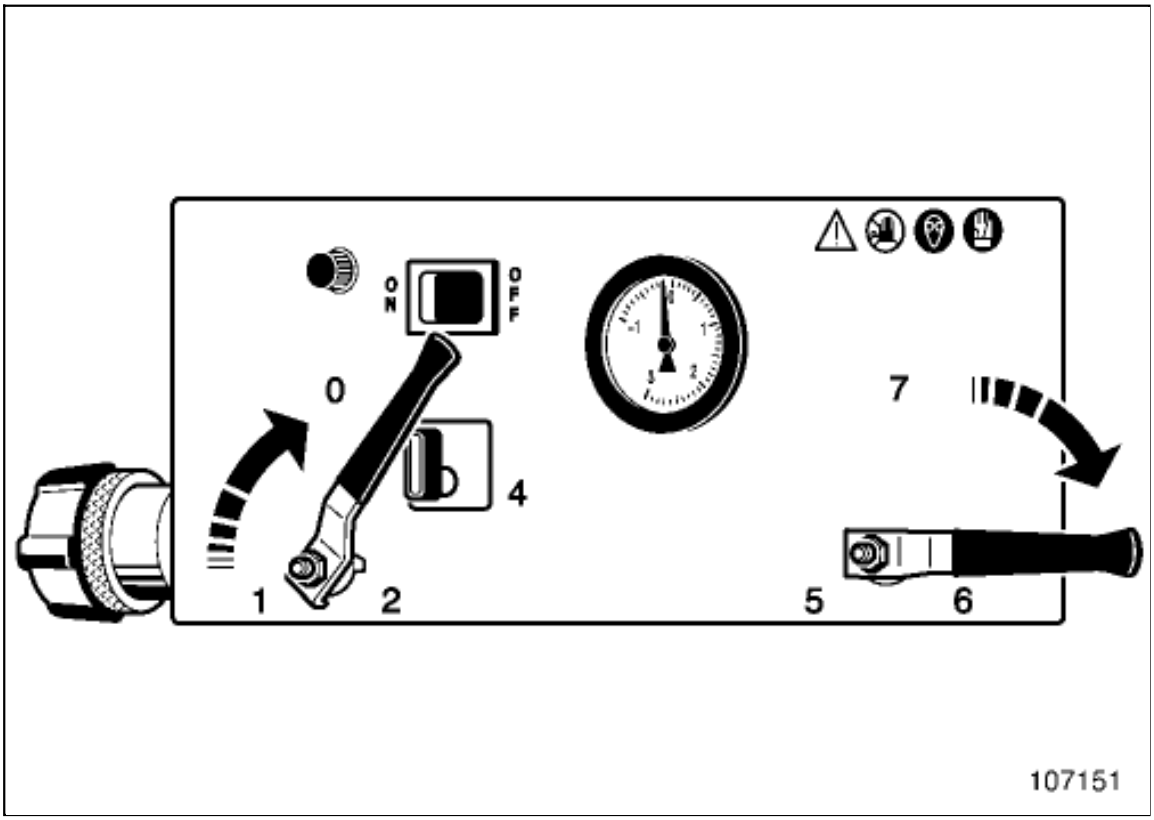
Position:

- Control(1) to "1" ,
- Control(3) to "6" ,
- The on/off switch(4) to "ON" .

Note:

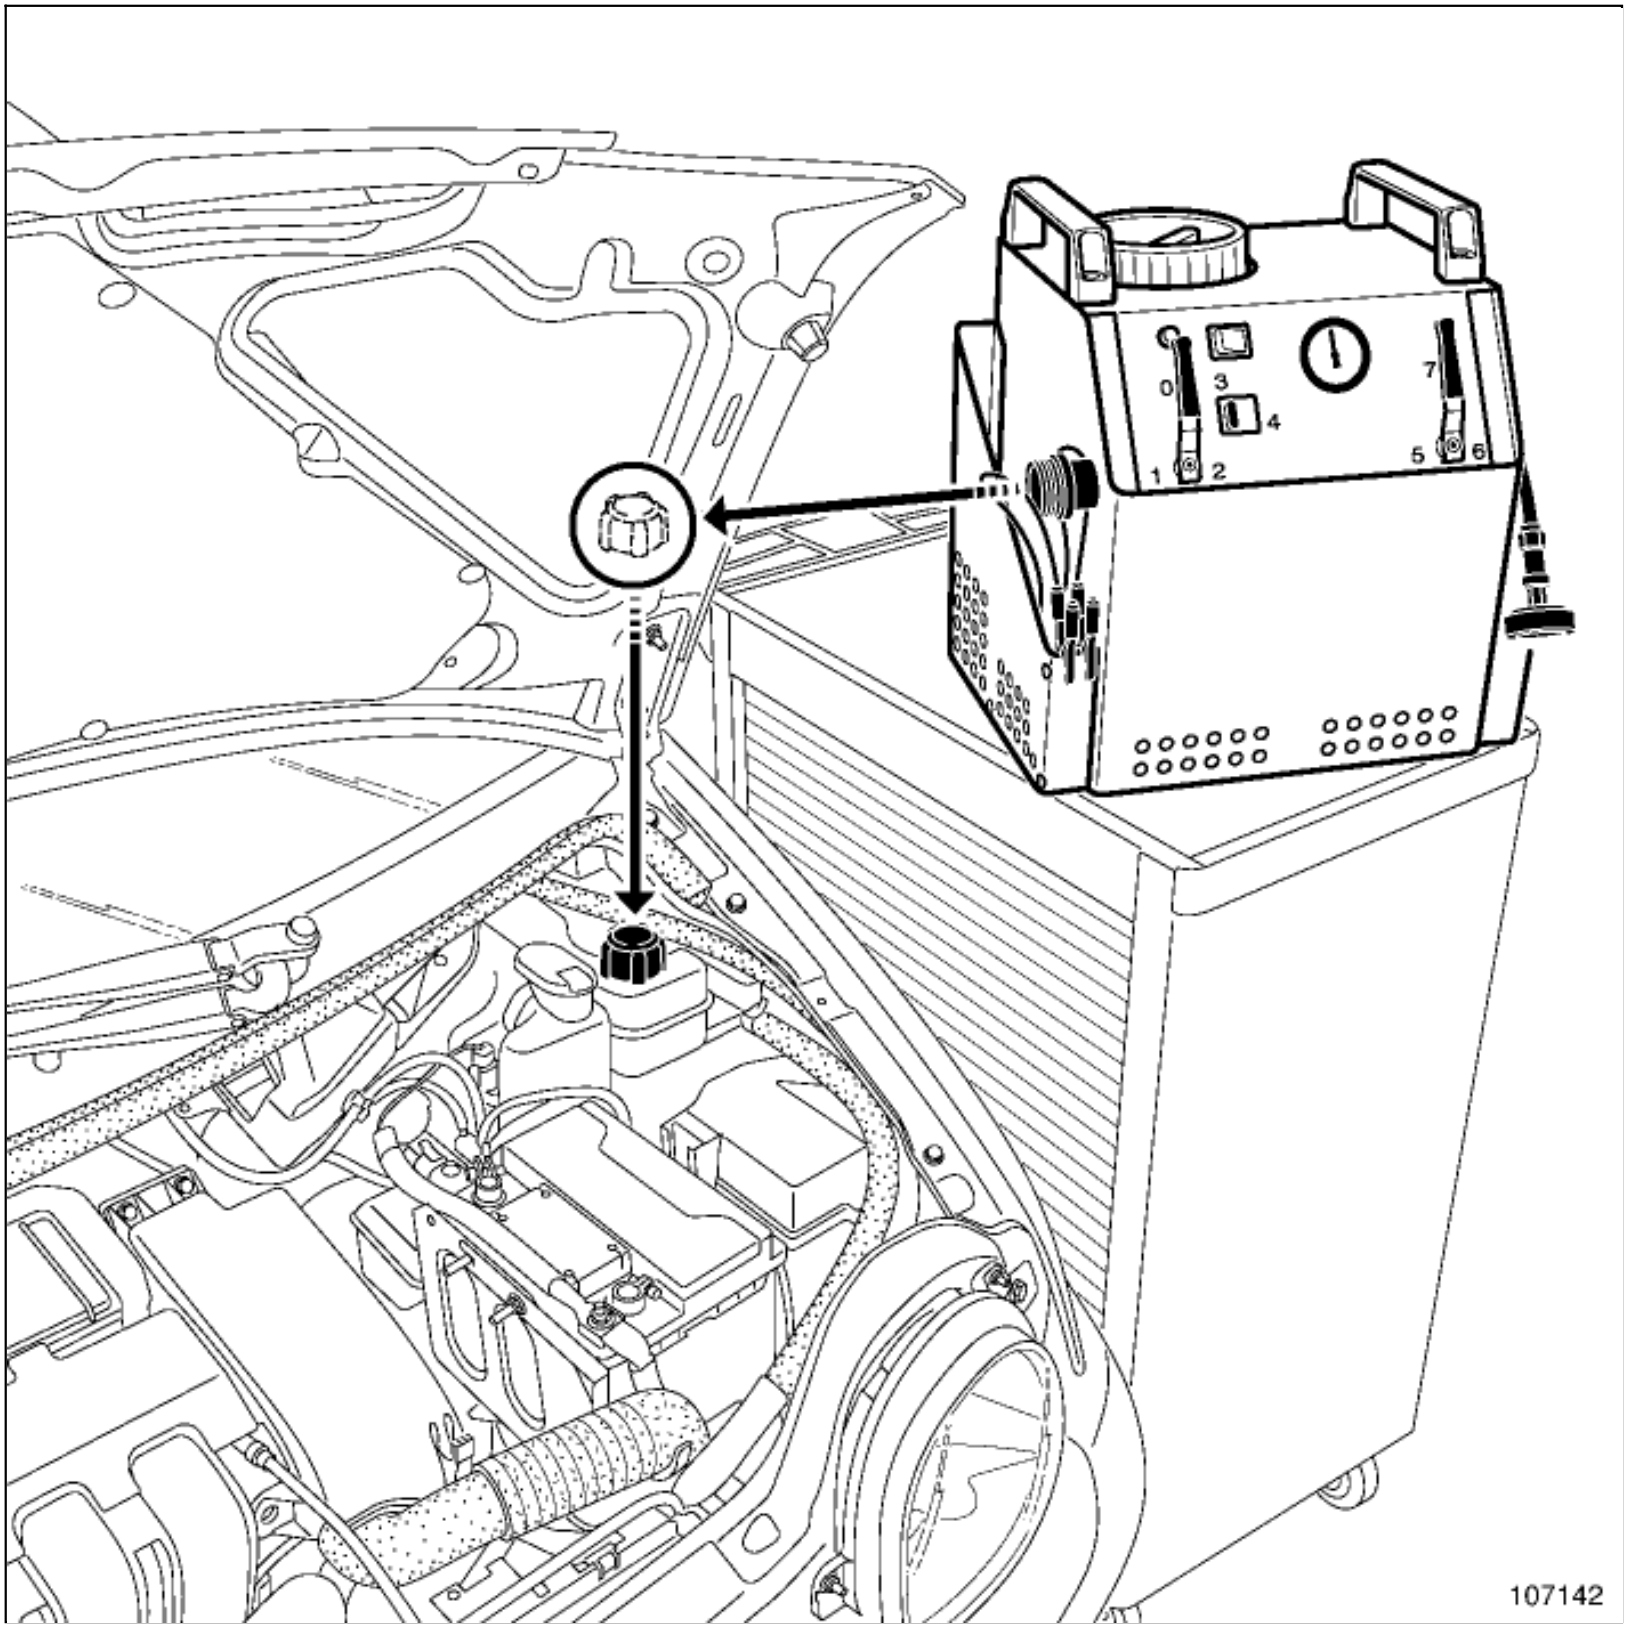
The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating.

Set the on/off switch(4) to "OFF" .



Set the control(3) to "7" .

Note:



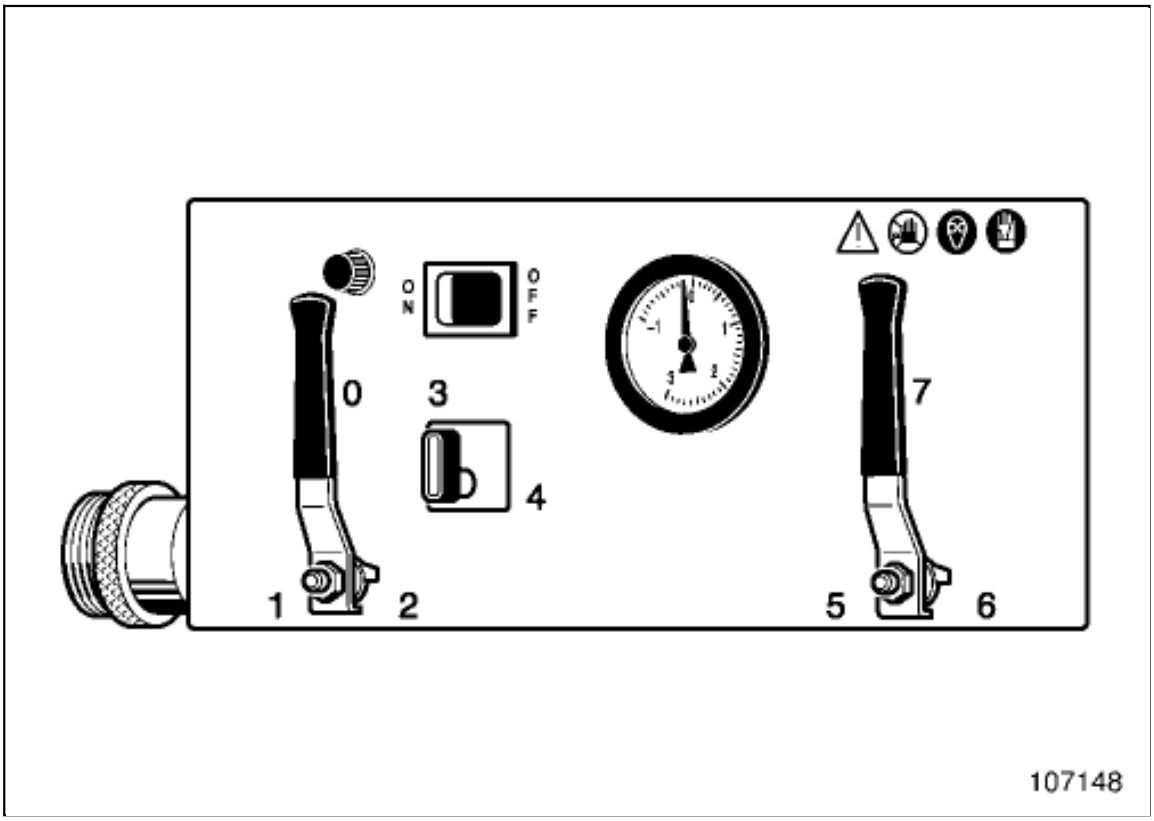
The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, repressurise the cooling circuit (by restarting the previous operations).

- Set the control(3) to "6" .

- Gradually dump the pressure by turning the control(1) in the direction shown by the arrow.

- Disconnect the tool Fault finding and filling - bleeding the cooling circuit.(Mot. 1700) from the vehicle.
- Refit the expansion bottle cap.

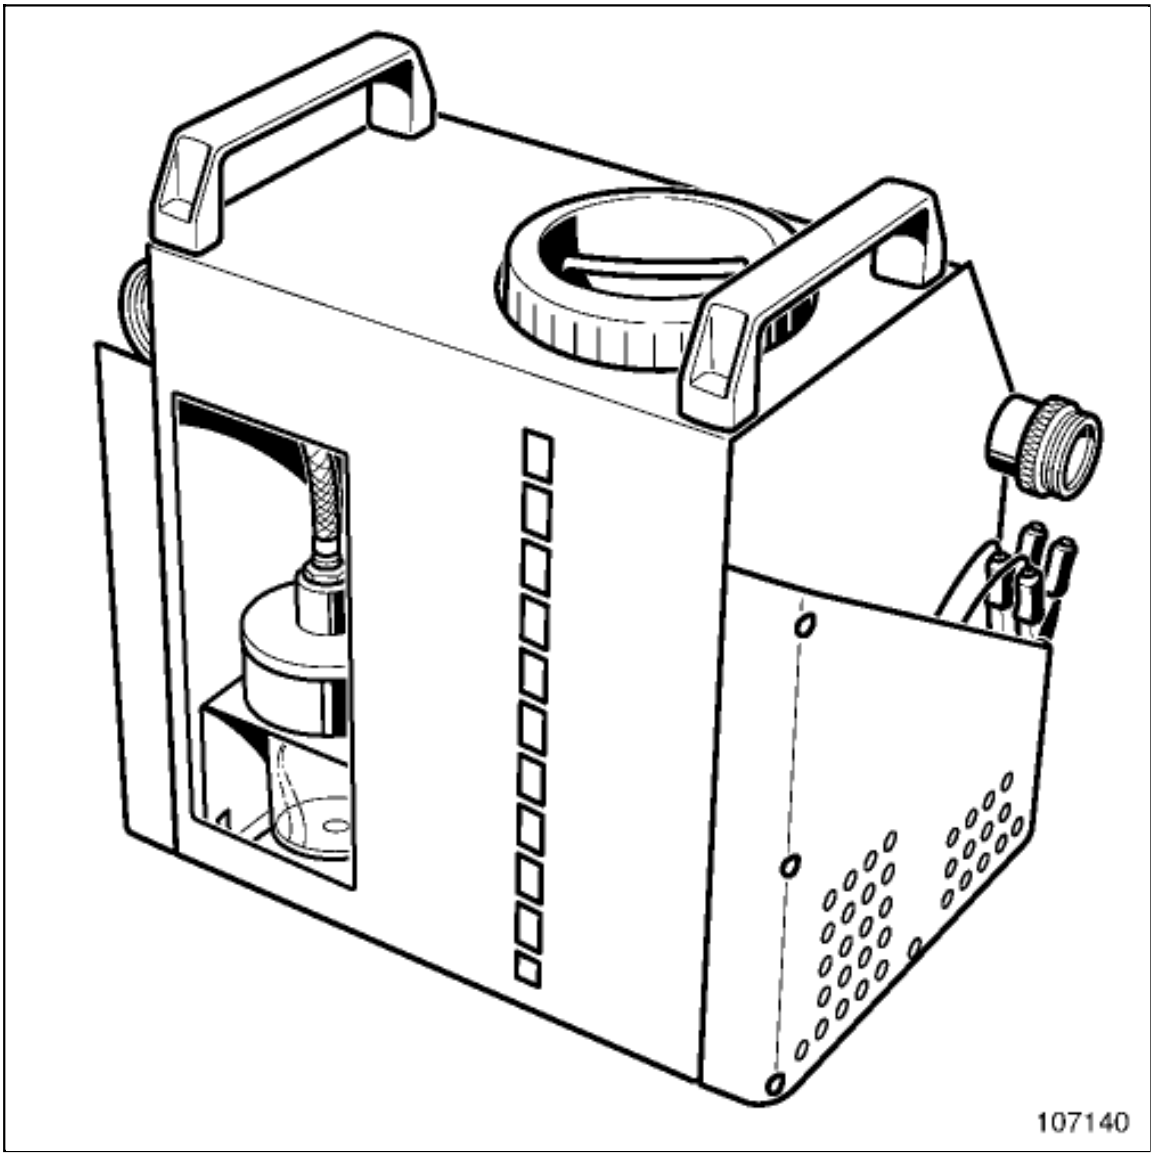


2. FILLING THE COOLING CIRCUIT

This filling operation can be carried out after the cooling circuit has been totally or partially drained, and does not need the bleed screws to be open. The cooling circuit is filled by vacuum.

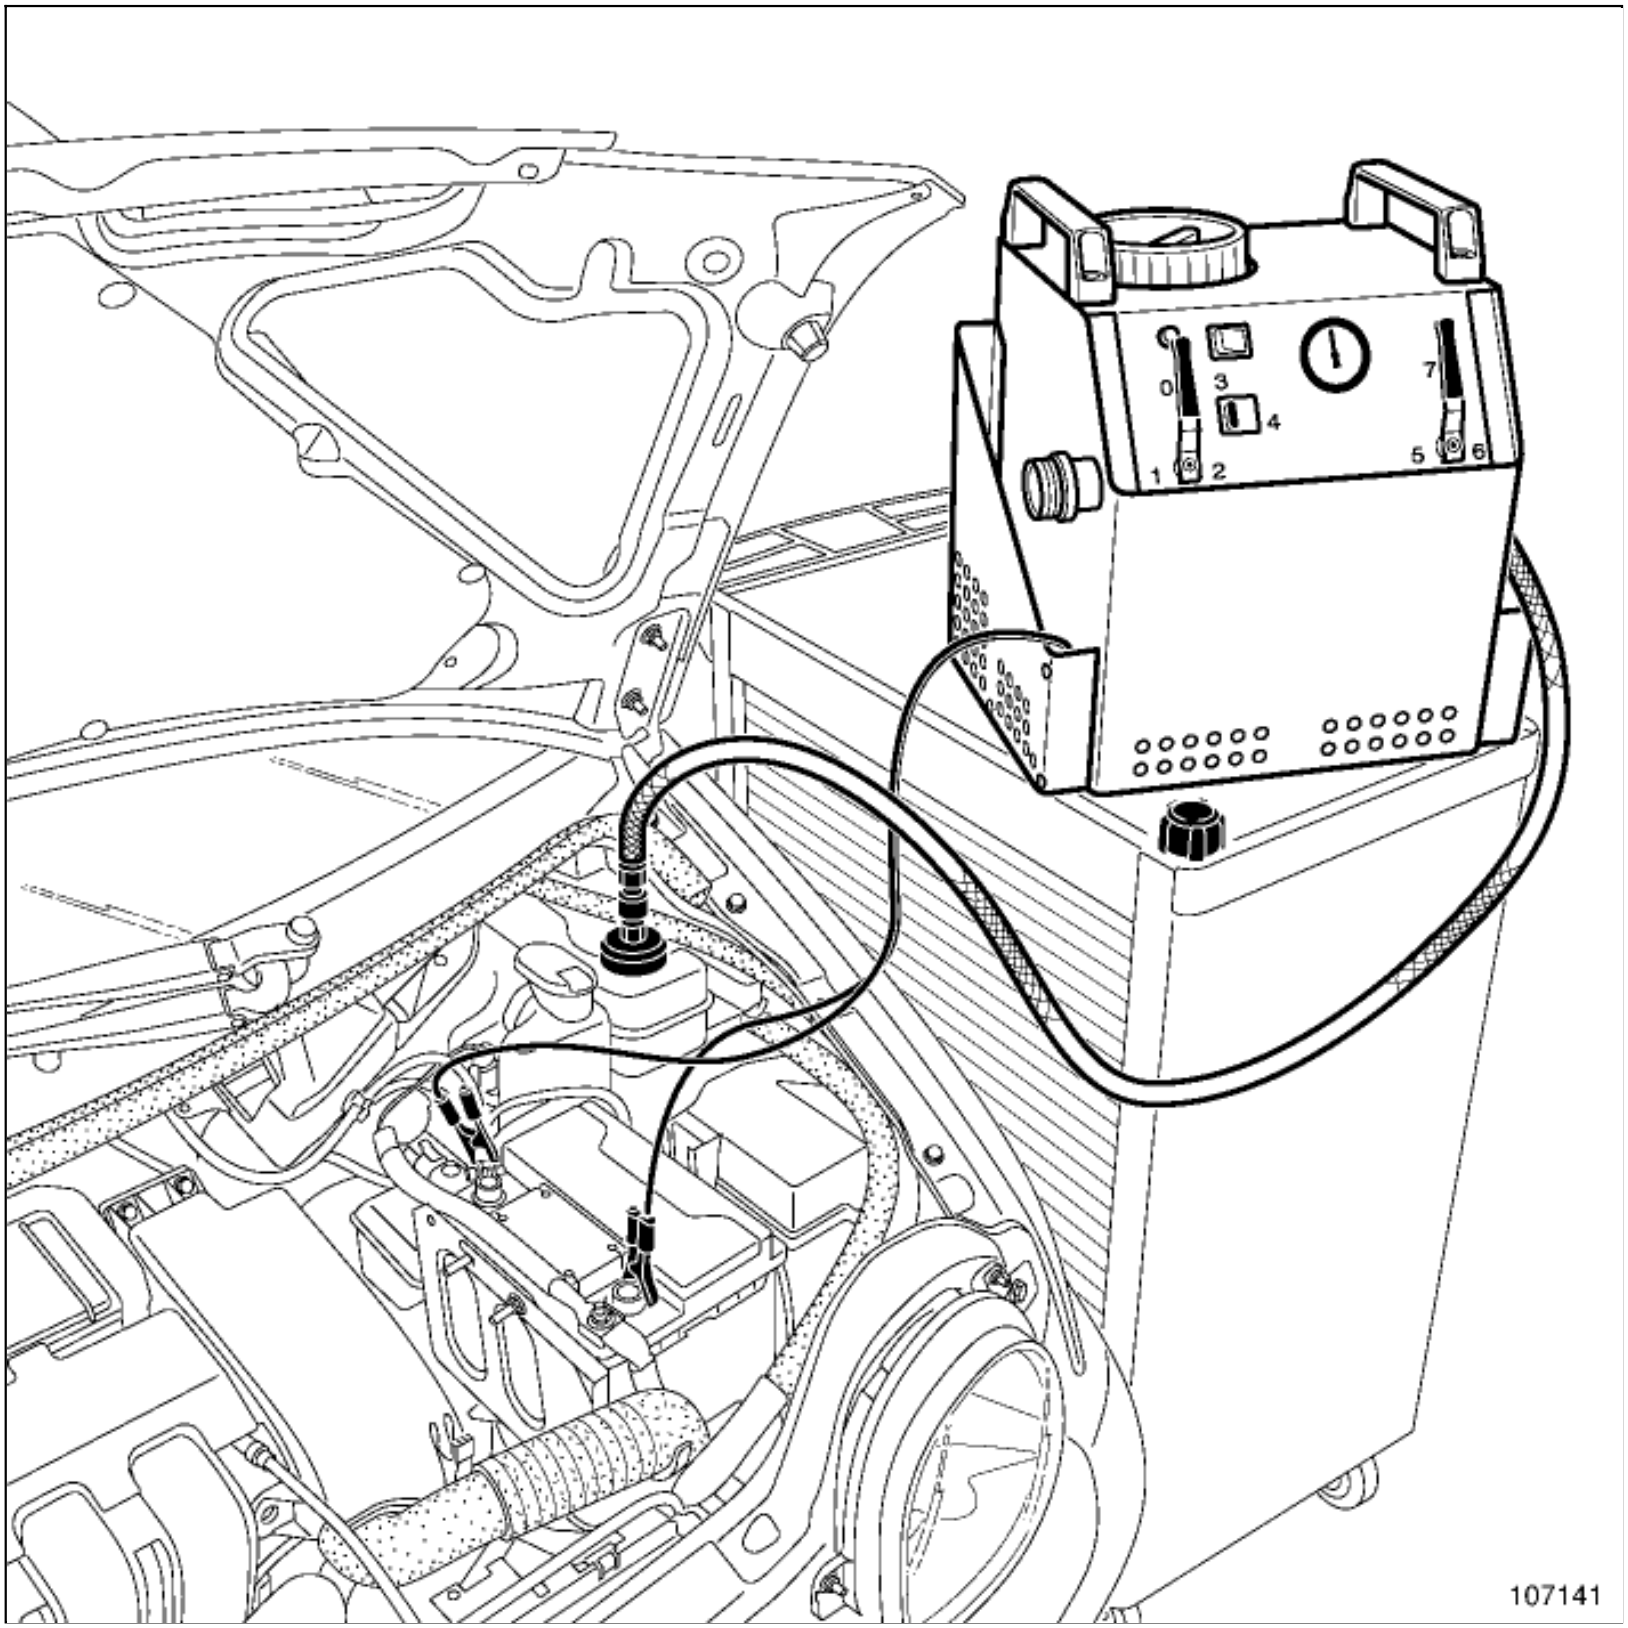
CAUTION

Failure to observe the following procedure can lead to the destruction of the engine



1- CREATING A VACUUM IN THE ENGINE COOLING SYSTEM

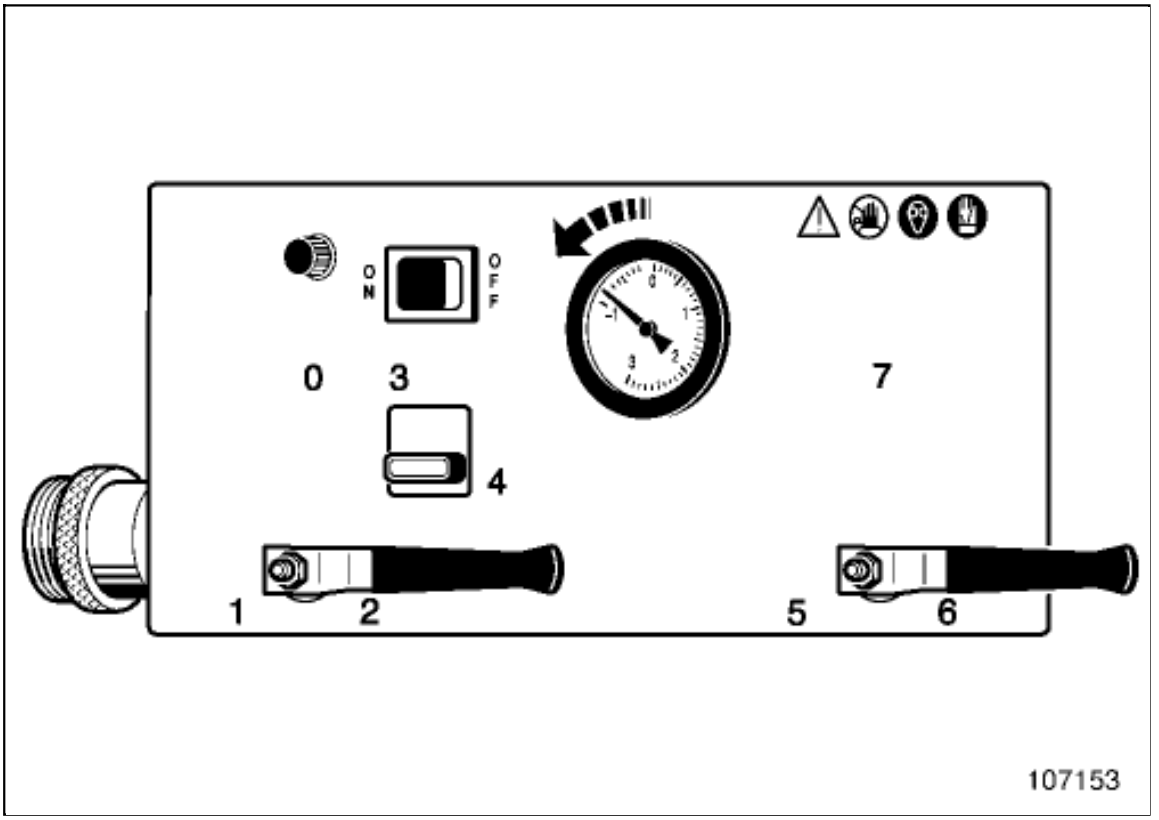
Position:



- Control(1) to "0" ,
- Control(2) to "3" ,
- Control(3) to "7" ,

The on/off switch(4) to "OFF" .

Check that:

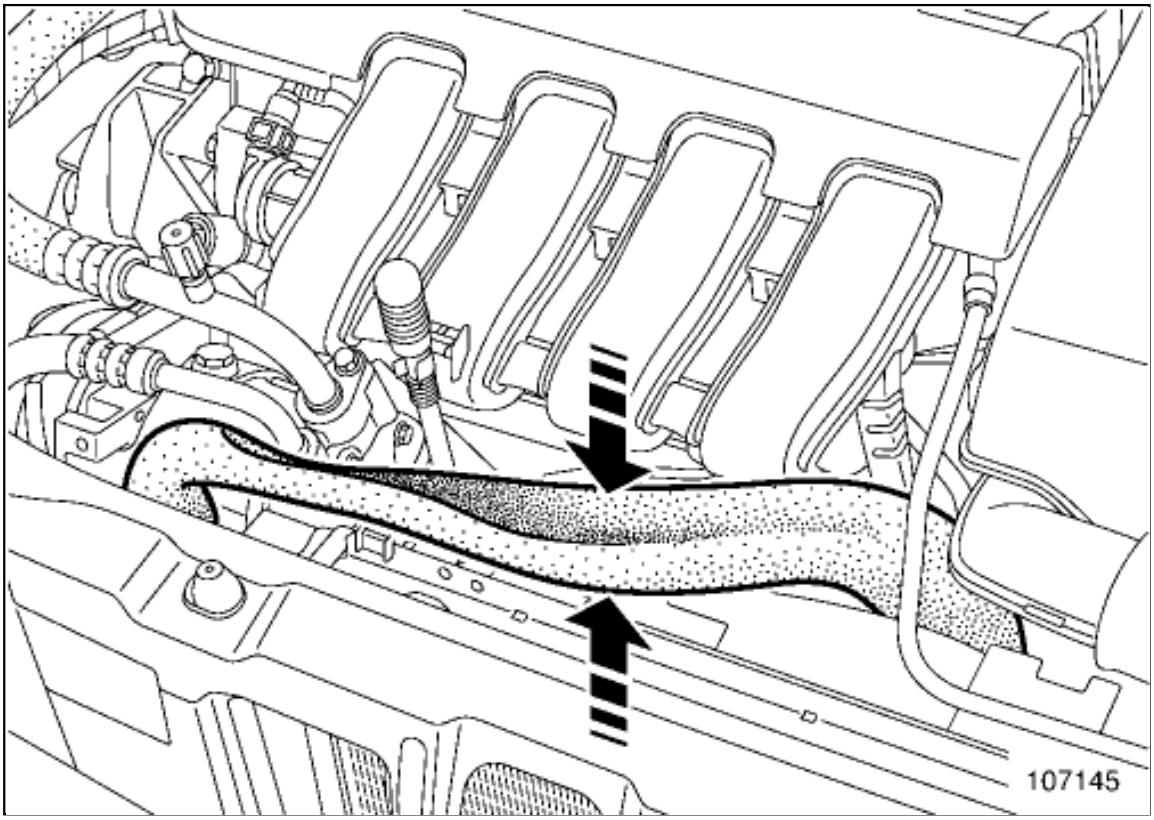


- The decanting bottle(5) is empty,
- There is enough coolant in the reservoir of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

- Fit the adapter plug to the vehicle's expansion bottle.
- Connect the pipe of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) to the adapter plug.
- Connect the wires to the battery, observing the correct polarity.

Note:

During the operation, do not fit the expansion bottle cap on tool Mot. 1700

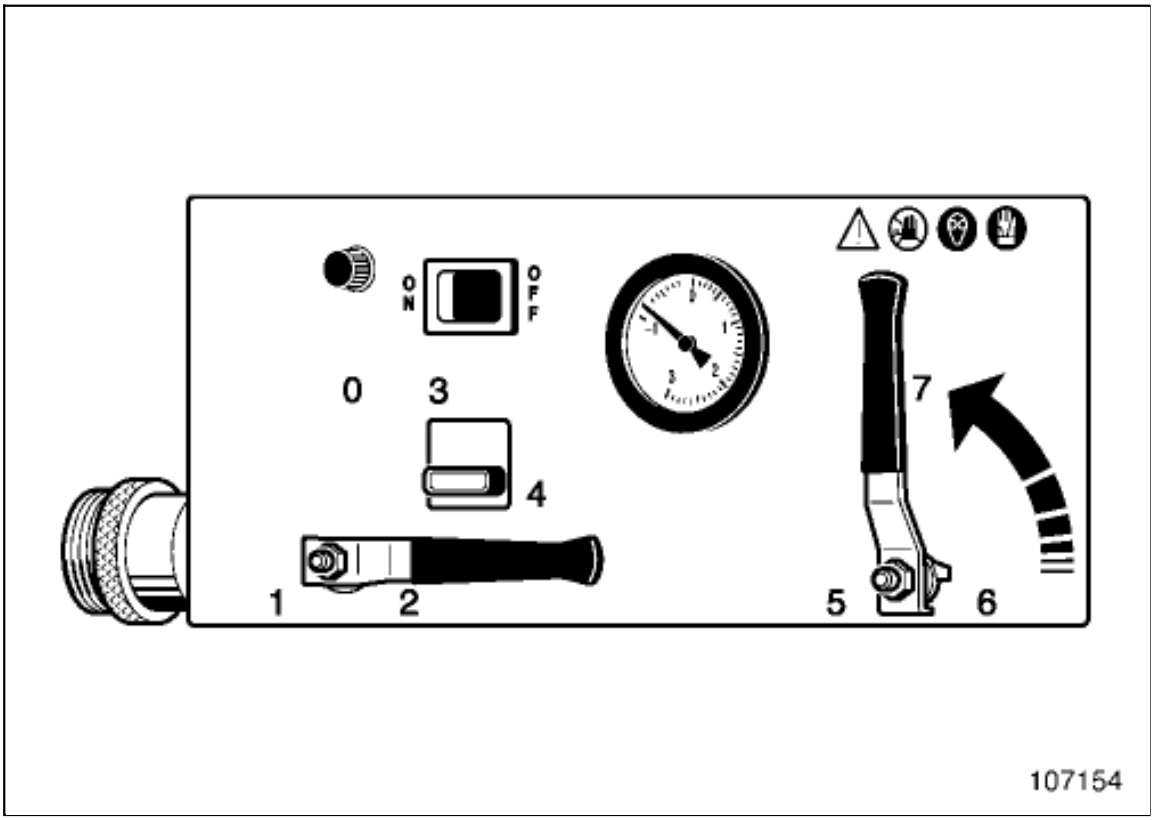


Position:

- Control(1) to "2" ,
- Control(2) to "4" ,
- Control(3) to "6" ,

The on/off switch(4) to "ON" .

Note:



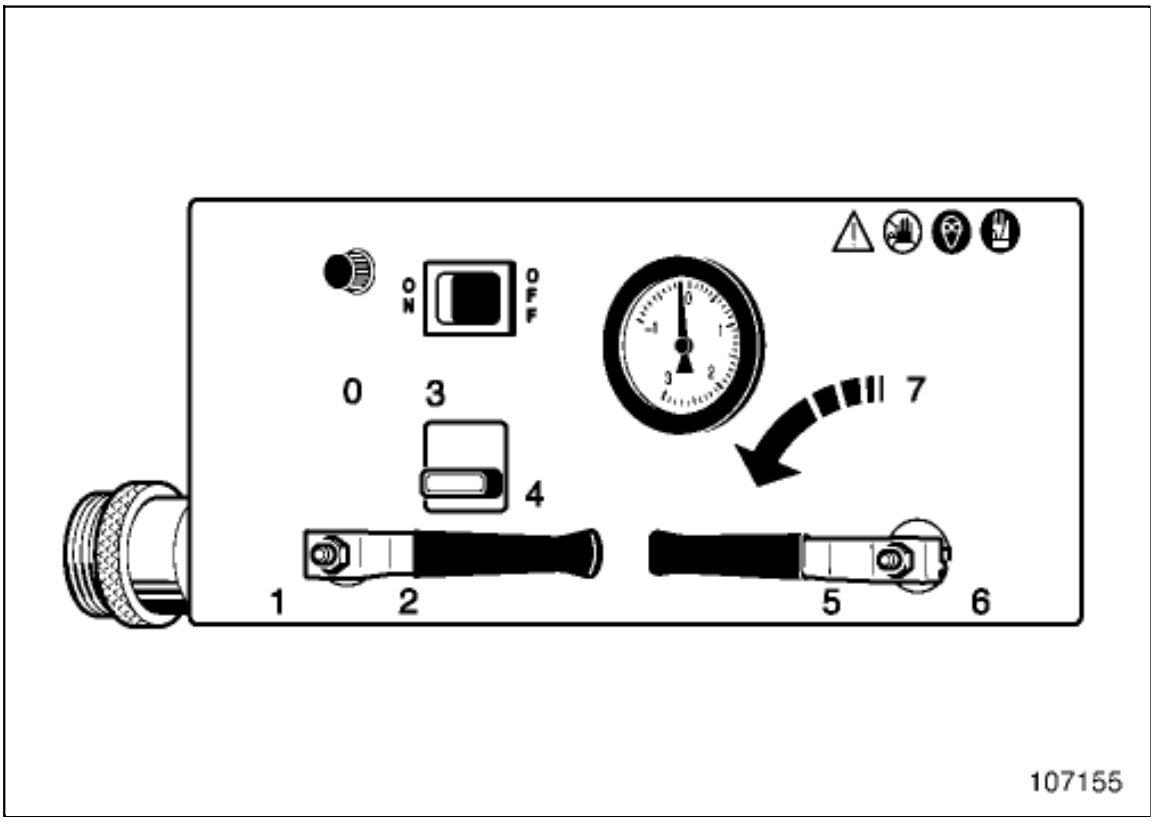
The pressure gauge needle should show a vacuum.

The cooling system hoses flatten.

Note:

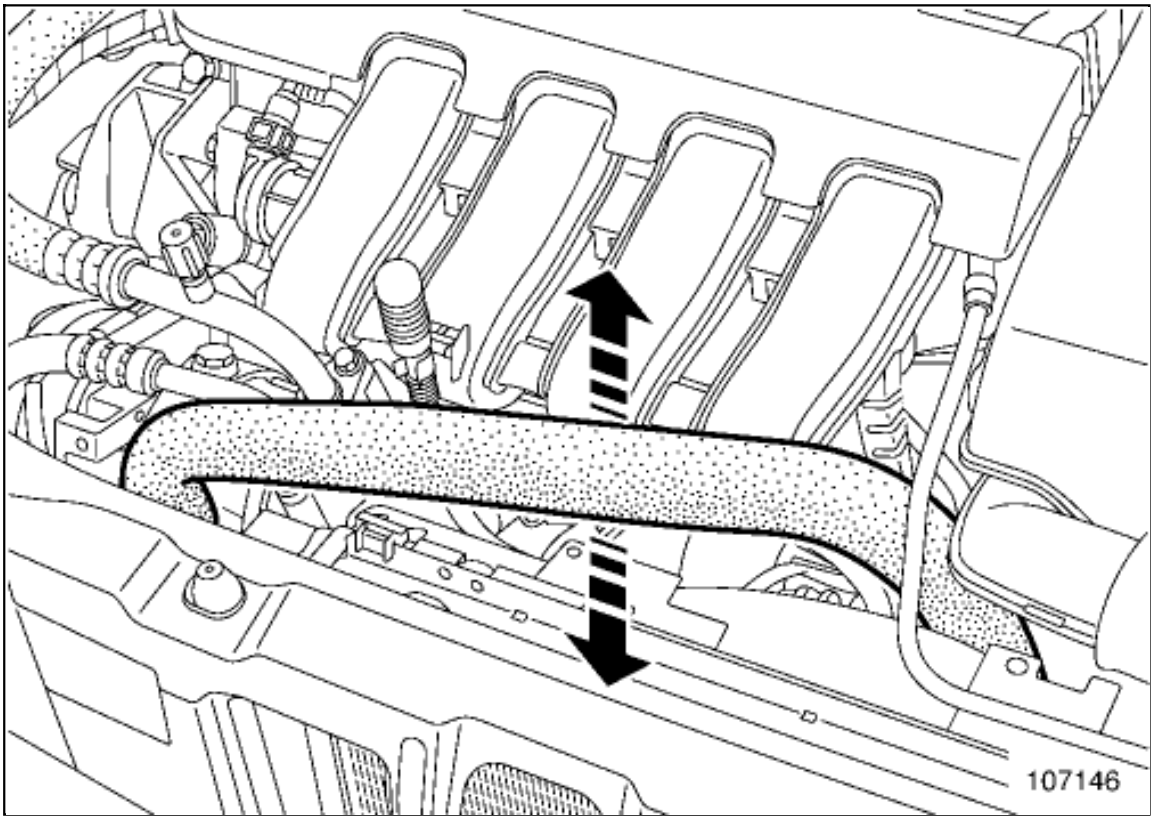
If replacing a part which not does require the cooling system to be completely drained, it is essential to position the switch (4) to "OFF" and the control (3) to "7" when the coolant starts to rise in the connecting pipe between the expansion bottle and Mot. 1700.

When the pressure gauge needle shows a vacuum of between 0.85and 0.95bar (depending on the vehicle), position:



- The on/off switch(4) to "OFF" ,
- Control(3) to "7" .

Note:



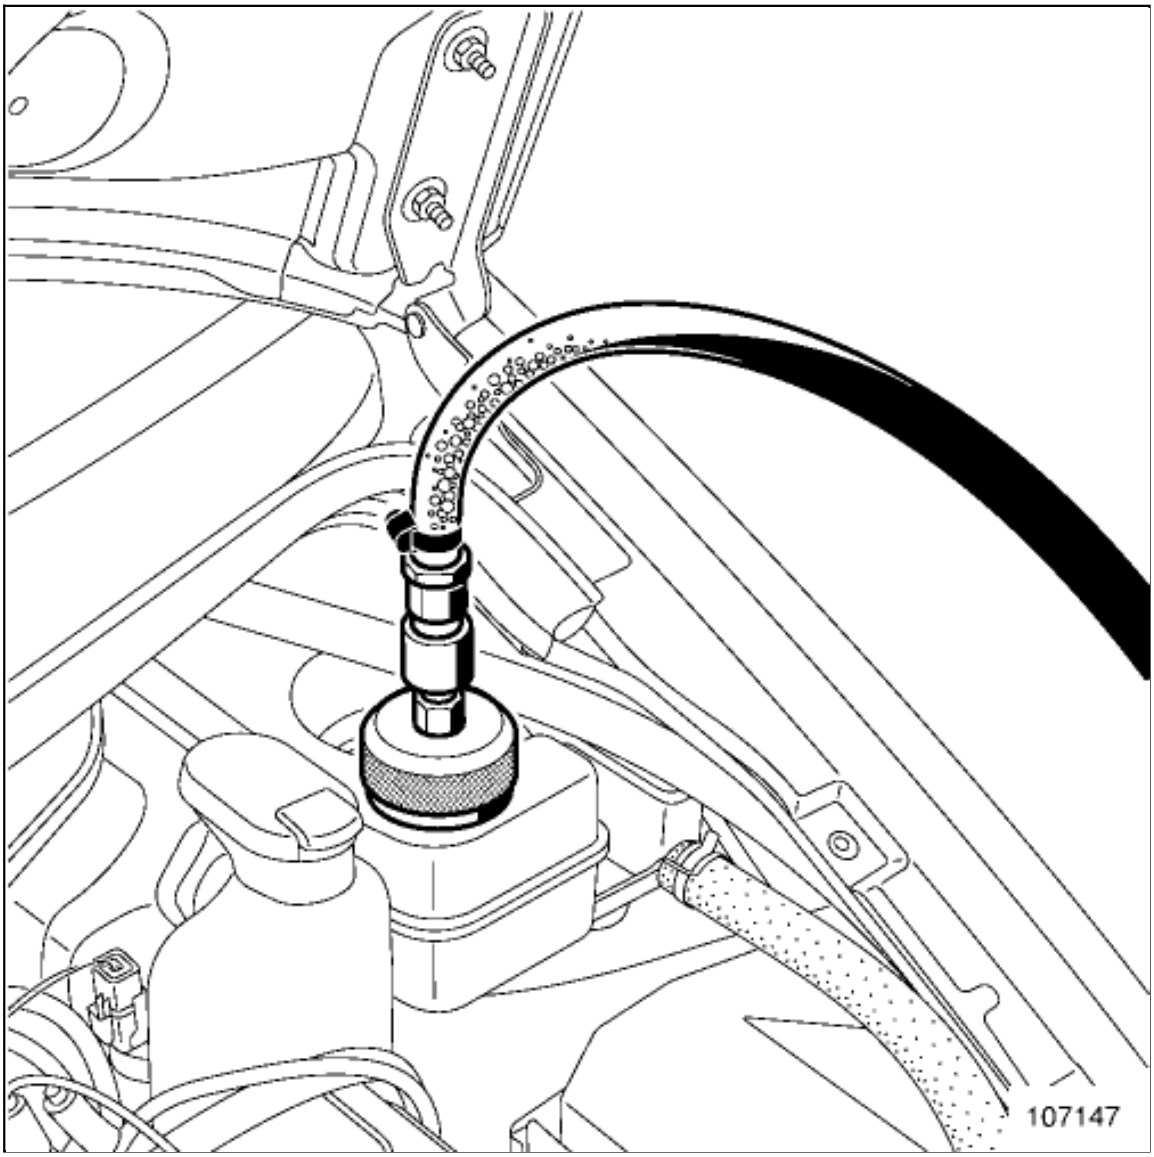
The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, create a vacuum in the cooling circuit (by restarting the previous operations).

2- FILLING THE COOLING CIRCUIT

Set the control(3) to "5" .

The hoses return to their original form.



The pressure gauge needle returns to zero.

Note:

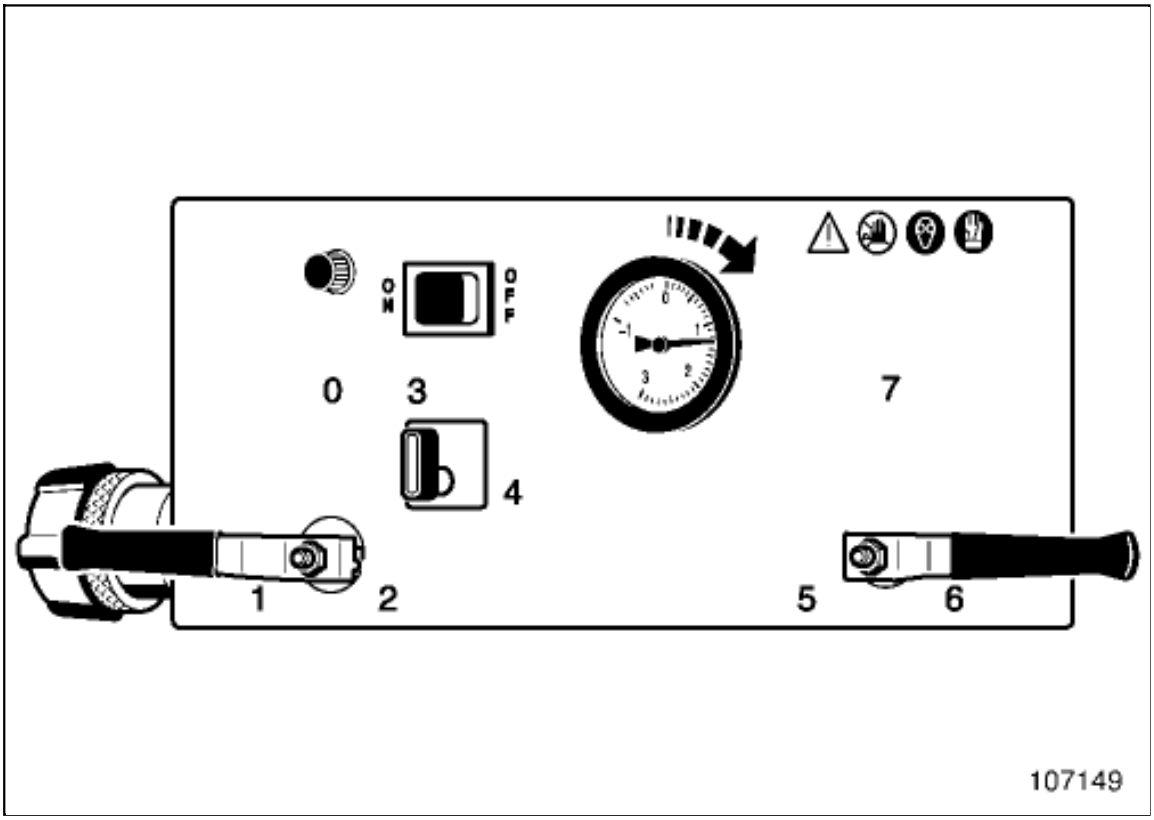
For cooling systems with a coolant capacity greater than 10 litres, stop filling the cooling system before the reservoir is empty.

To carry out this operation:

- Position the control (3) to "7" ,
- Readjust the coolant level in the reservoir.
- Set the control (3) to "5" to fill the cooling system again.

The cooling system is full once bubbles appear in the connecting pipe(7) between the expansion bottle and toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

Set the control(2) to "3" .



Disconnect the pipe (7) from the adapter plug.

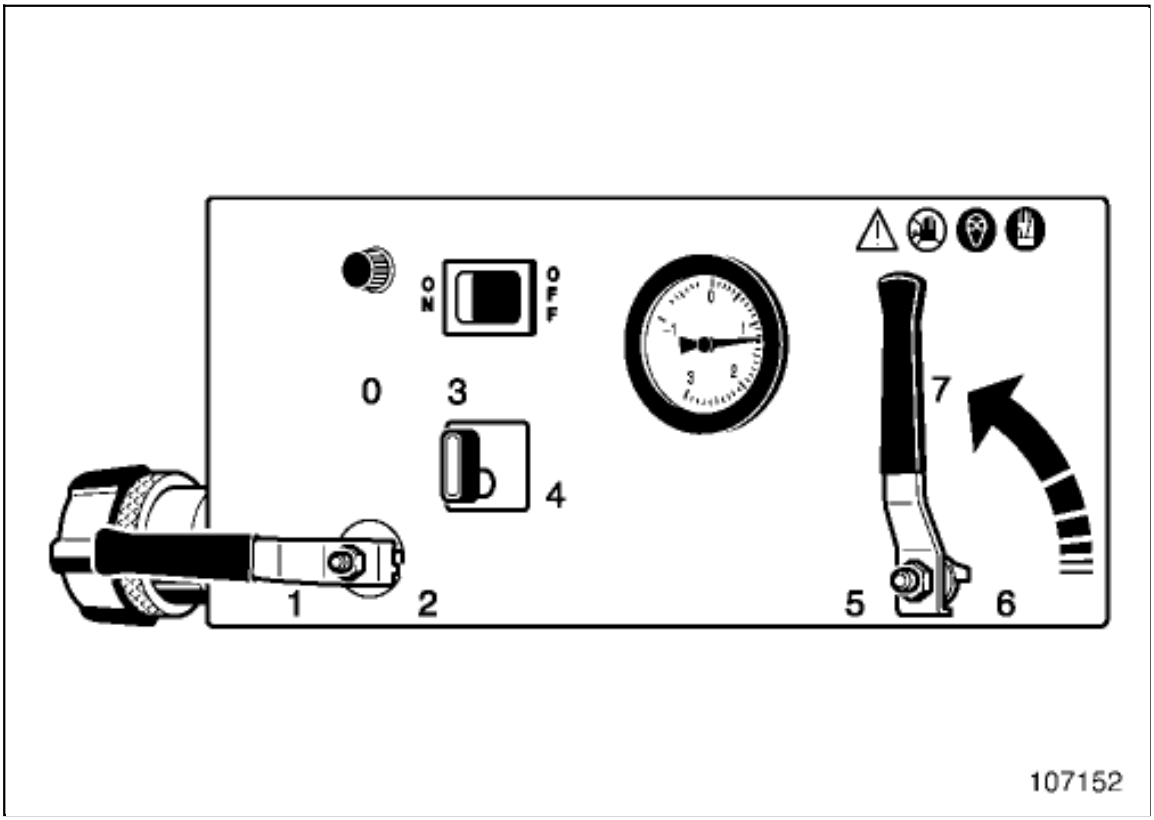
Remove the adapter plug(6) .

Connect the adapter plug to the pipe to empty the remaining liquid in the pipe into the reservoir of the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .

3- PRESSURIZING THE COOLING SYSTEM

Refit the adapter plug and the pipe to the vehicle's expansion bottle in order to pressurise the cooling circuit to check the cooling circuit sealing.

Refit the expansion bottle cap(8) on the toolFault finding and filling - bleeding the cooling circuit.(Mot. 1700) .



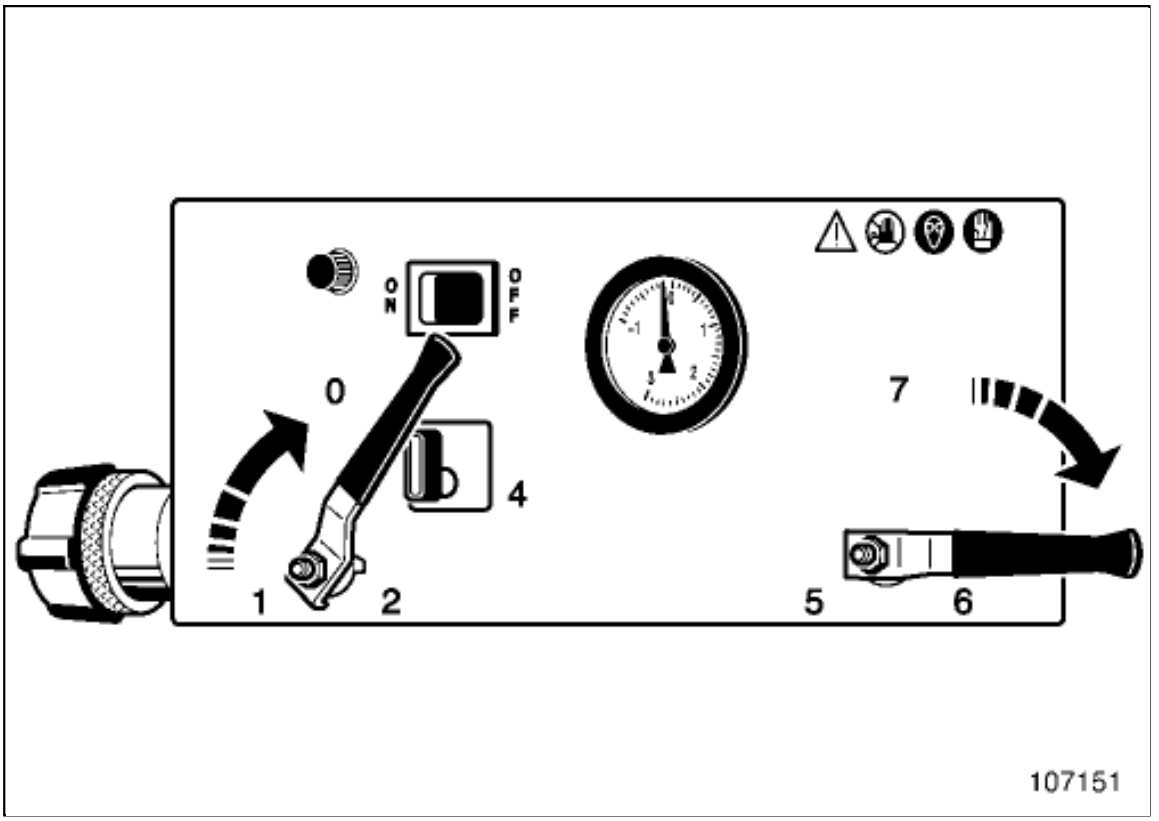
Position:

- Control(1) to "1" ,
- Control(2) to "3" ,
- Control(3) to "6" ,
- The on/off switch(4) to "ON" .

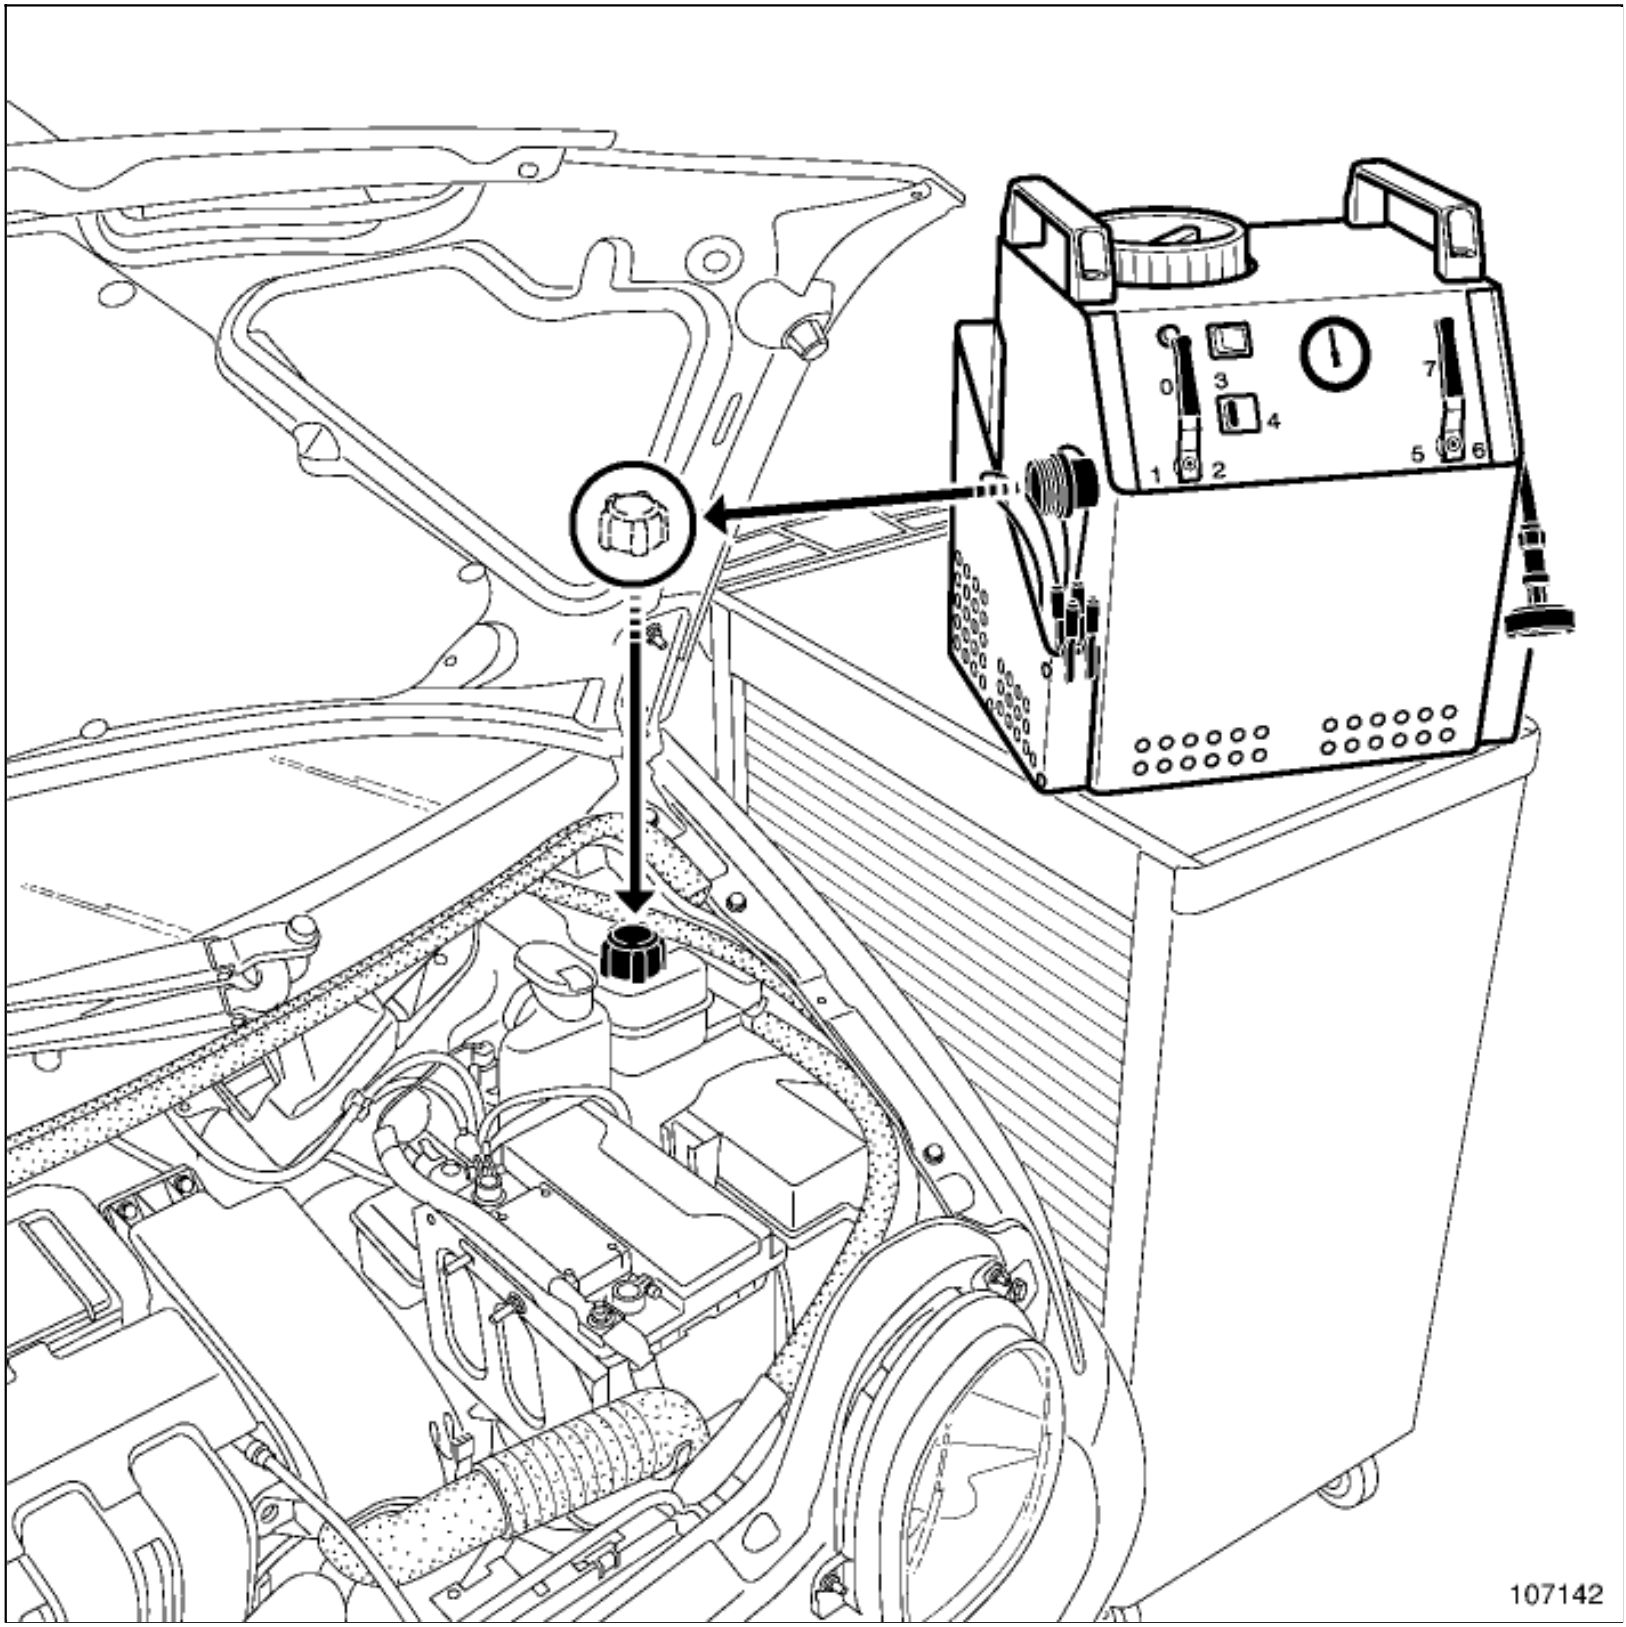
Note:

The pressure gauge needle should point to a pressure value and should settle at the expansion bottle valve cap valve rating.

Set the on/off switch(4) to "OFF" .



Set the control(3) to "7" .



Note:

The pressure gauge needle should not move. If it does not, find and repair any leaks on the cooling system.

After repair, repressurise the cooling circuit (by restarting the previous operations).

- Set the control(3) to "6" .
- Gradually dump the pressure by turning the control(1) in the direction shown by the arrow.
- Disconnect the tool Fault finding and filling - bleeding the cooling circuit.(Mot. 1700) from the vehicle.
- Fill the expansion bottle to overflow (only after a total draining of the cooling system).

- Refit the expansion bottle cap.

- Bleed the engine cooling system Cooling system: Draining - Refilling .

XSL version : 3.02 du 22/07/11

COOLING UNIT : REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

parts always to be replaced:
Cylinder head coolant outlet unit seal

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C 2for cold and temperate countries,
  - protection down to -40°C 2for very cold countries.

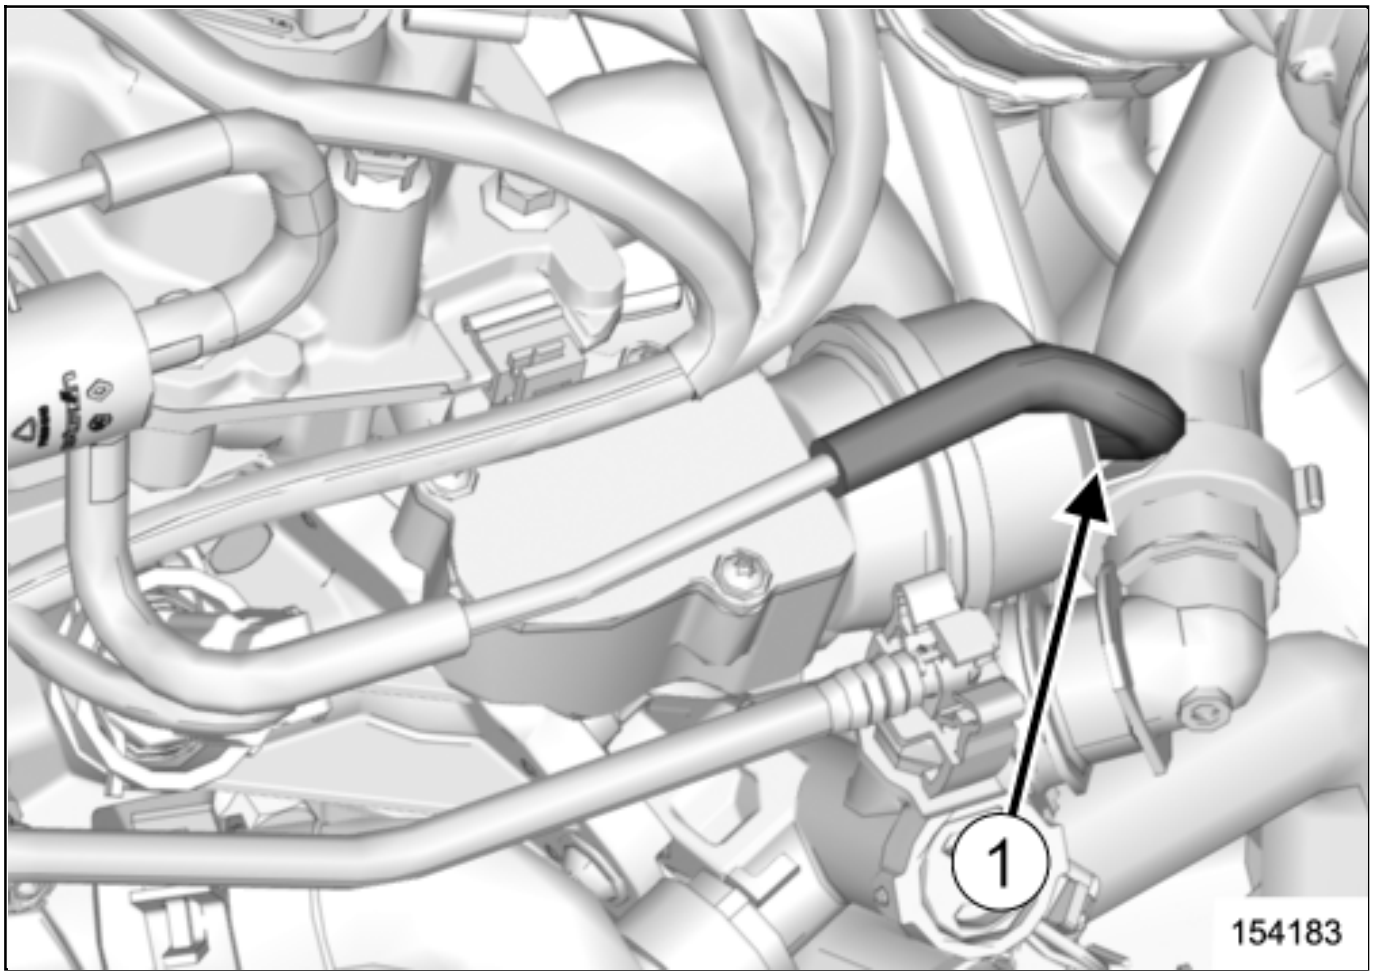
CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Locations and specifications (tightening torques, parts always to be replaced, etc)(see 19A, Cooling, Coolant circuit assembly: Exploded view)

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting ,
- Remove:
  - the battery(see **Battery: Removal - Refitting**) ,
  - the battery trayBattery tray: Removal - Refitting .
- Disconnect the air filter unit air inlet pipe fromAir inlet assembly: Exploded view :

- the front end panel,
- the air filter unit.

Remove the air filter unit air inlet pipe Air inlet assembly: Exploded view .

Remove the front bumper Front bumper assembly: Exploded view .

Drain the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) .

Disconnect the vacuum hose(1) from the water chamber.

Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the coolant temperature sensor connector,
- the degassing hose from the water chamber,
- the heater matrix hose.

Move using theRemote operation pliers for hose clips.(Mot. 1448) from the water chamber(see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the upper coolant hose clip,
- the clip from the hose between the water chamber and the electric coolant pump,
- the clip from the hose between the water chamber and the water inlet housing,
- the clip from the hose between the turbocharger coolant pipe and the water chamber.

Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the upper coolant hose clip,
- the hose between the water chamber and the electric coolant pump,
- the hose between the water chamber and the water inlet housing,
- the hose between the turbocharger coolant pipe and the water chamber.

2. REMOVAL OPERATION

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water chamber bolts,
- the water chamber,
- the water chamber seal.

1- IF REPLACING THE WATER CHAMBER

Remove the coolant temperature sensor(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Cylinder head coolant outlet unit seal .

Use SURFACE CLEANERVehicle: Parts and consumables for the repair to clean and degrease:

- the cylinder head joint face,
- the coolant outlet unit housing if it is being reused.

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

1- IF REPLACING THE WATER CHAMBER

Refit the coolant temperature sensor(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

2. REFITTING OPERATION

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water chamber fitted with a new seal,
- the water chamber bolts.

Torque tighten in order the water chamber bolts(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Fill and bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

COOLING UNIT : REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

parts always to be replaced:

Cylinder head coolant outlet unit seal

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

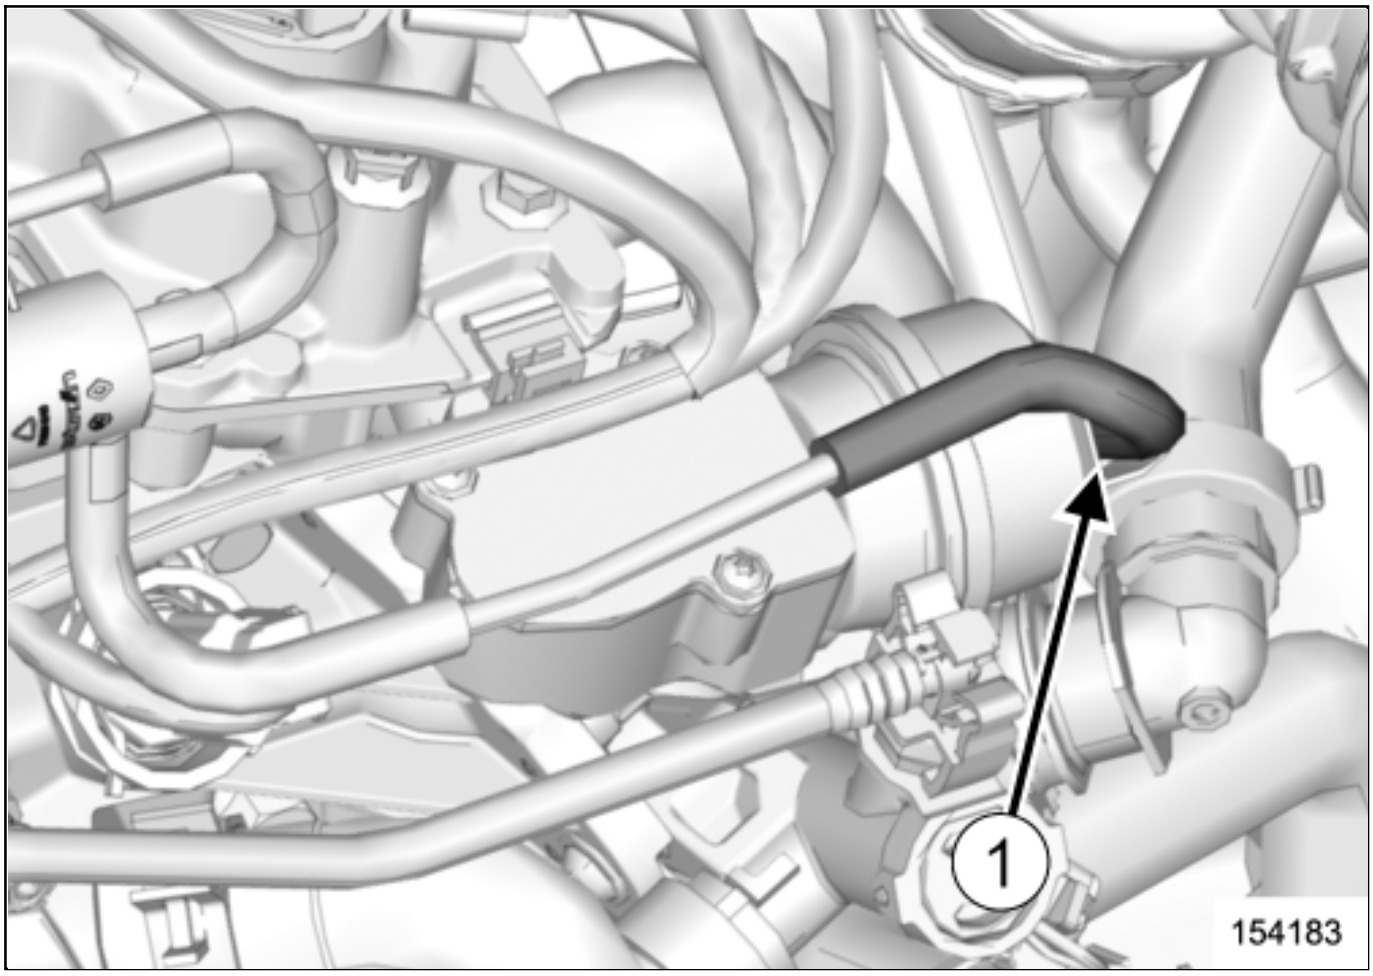
When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

- protection down to -25°C 2for cold and temperate countries,
- protection down to -40°C 2for very cold countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.



Locations and specifications (tightening torques, parts always to be replaced, etc)(see 19A, Cooling, Coolant circuit assembly: Exploded view)

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting ,
- Remove:
  - the battery(see **Battery: Removal - Refitting**) ,
  - the battery tray Battery tray: Removal - Refitting .
- Disconnect the air filter unit air inlet pipe from(see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the front end panel,
  - the air filter unit.
- Remove the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Remove the front bumper Front bumper assembly: Exploded view .

Drain the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

Disconnect the vacuum hose(1) from the water chamber.

Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the coolant temperature sensor connector,
- the degassing hose from the water chamber,
- the heater matrix hose.

Move using theRemote operation pliers for hose clips.(Mot. 1448) from the water chamber(see 19A, Cooling,

Coolant circuit assembly: Exploded view) :

- the upper coolant hose clip,
- the clip from the hose between the water chamber and the electric coolant pump,
- the clip from the hose between the water chamber and the water inlet housing,
- the clip from the hose between the turbocharger coolant pipe and the water chamber.

Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the upper coolant hose clip,
- the hose between the water chamber and the electric coolant pump,
- the hose between the water chamber and the water inlet housing,
- the hose between the turbocharger coolant pipe and the water chamber.

2. REMOVAL OPERATION

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water chamber bolts,
- the water chamber,
- the water chamber seal.

1- IF REPLACING THE WATER CHAMBER

Remove the coolant temperature sensor(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Cylinder head coolant outlet unit seal .

Use SURFACE CLEANERVehicle: Parts and consumables for the repair to clean and degrease:

- the cylinder head joint face,
- the coolant outlet unit housing if it is being reused.

CAUTION
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

1- IF REPLACING THE WATER CHAMBER

Refit the coolant temperature sensor(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

2. REFITTING OPERATION

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water chamber fitted with a new seal,
- the water chamber bolts.

Torque tighten in order the water chamber bolts(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

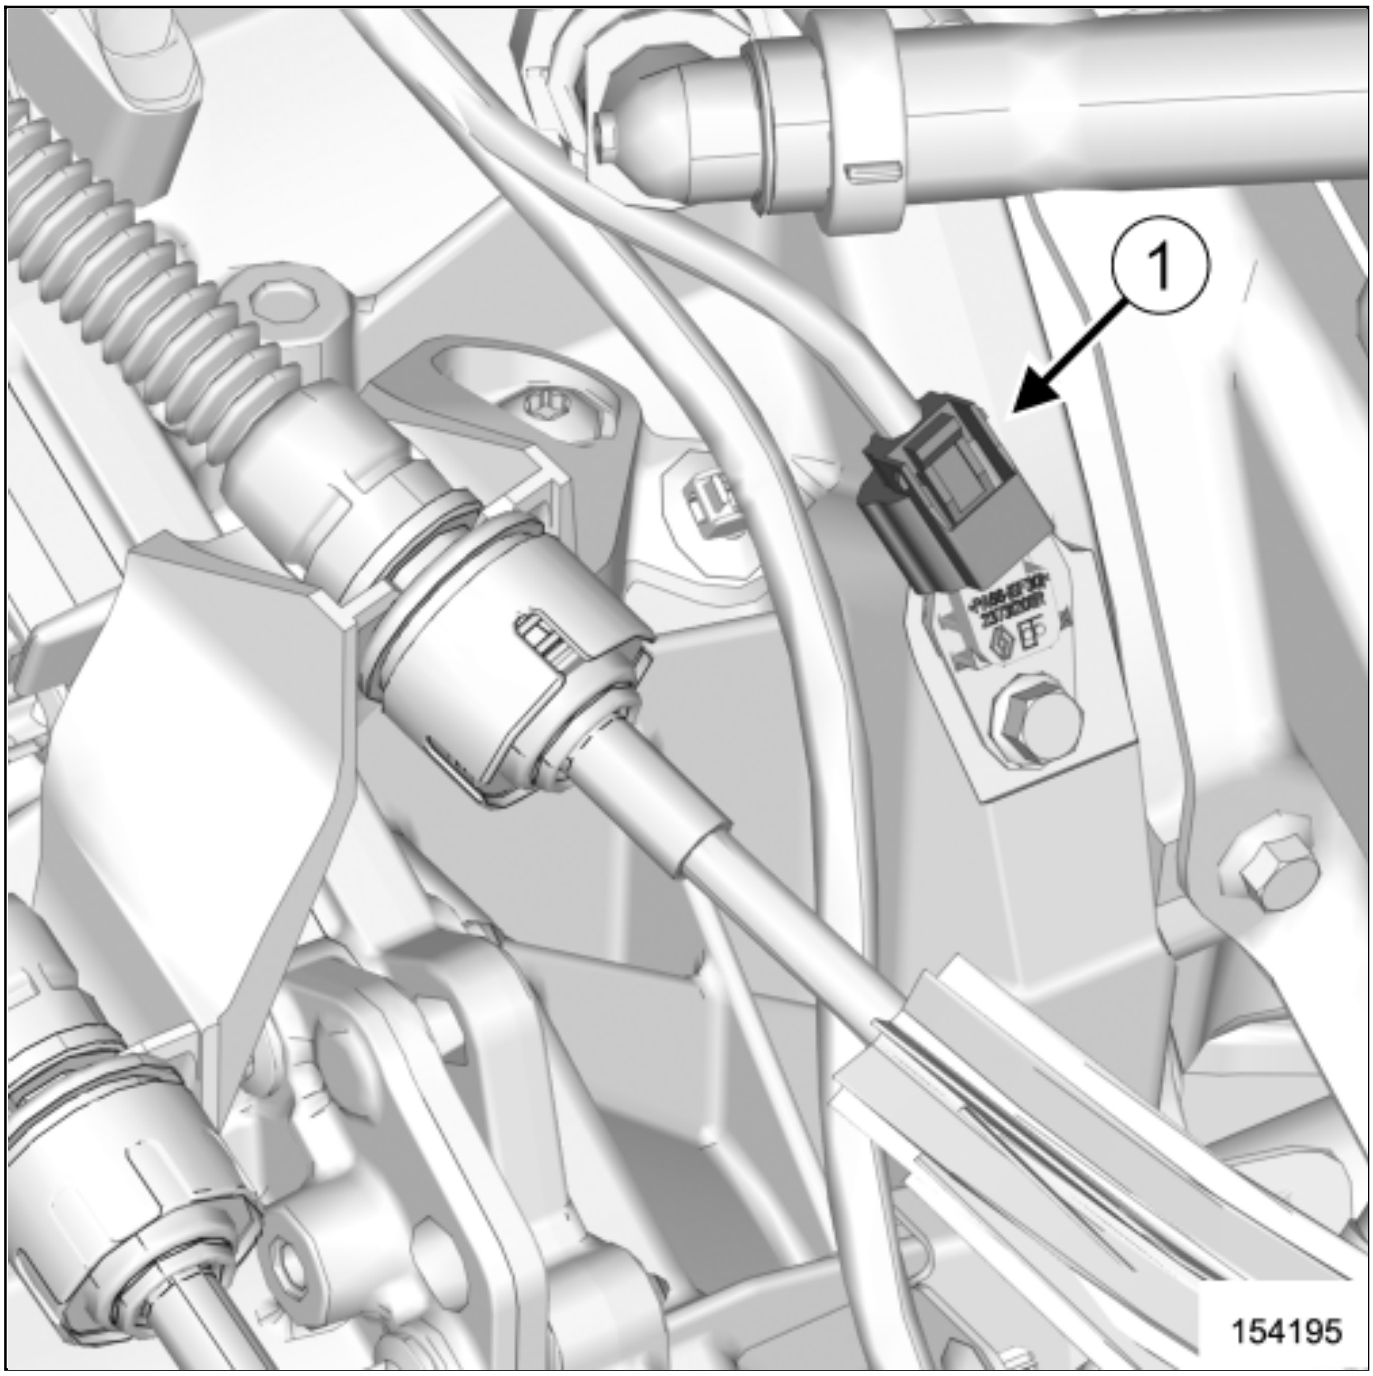
Fill and bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

CRANKSHAFT POSITION SENSOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts always be replaced, etc.).(see **Engine and transmission assembly sensors: List and location of components**)

REMOVAL



1. REMOVAL PREPARATION OPERATION

Remove:

- the battery **Battery: Removal - Refitting** ,
- the battery tray **Battery tray: Removal - Refitting** .

Remove the air filter unit **Air inlet assembly: Exploded view** .

2. REMOVAL OPERATION

Disconnect the crankshaft position sensor connector(1) .

Remove (see **Engine and transmission assembly sensors: List and location of components**) :

- the crankshaft position sensor bolt,
- the crankshaft position sensor.

REFITTING

1. REFITTING OPERATION

- Refit (see **Engine and transmission assembly sensors: List and location of components**) :
  - the crankshaft position sensor,
  - the crankshaft position sensor bolt.
- Torque tighten the crankshaft position sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) **.**
- Proceed in the reverse order to removal.
- Apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component affected by the After repair procedure:

- "Crankshaft position sensor" .

CRANKSHAFT POSITION SENSOR: REMOVAL - REFITTING

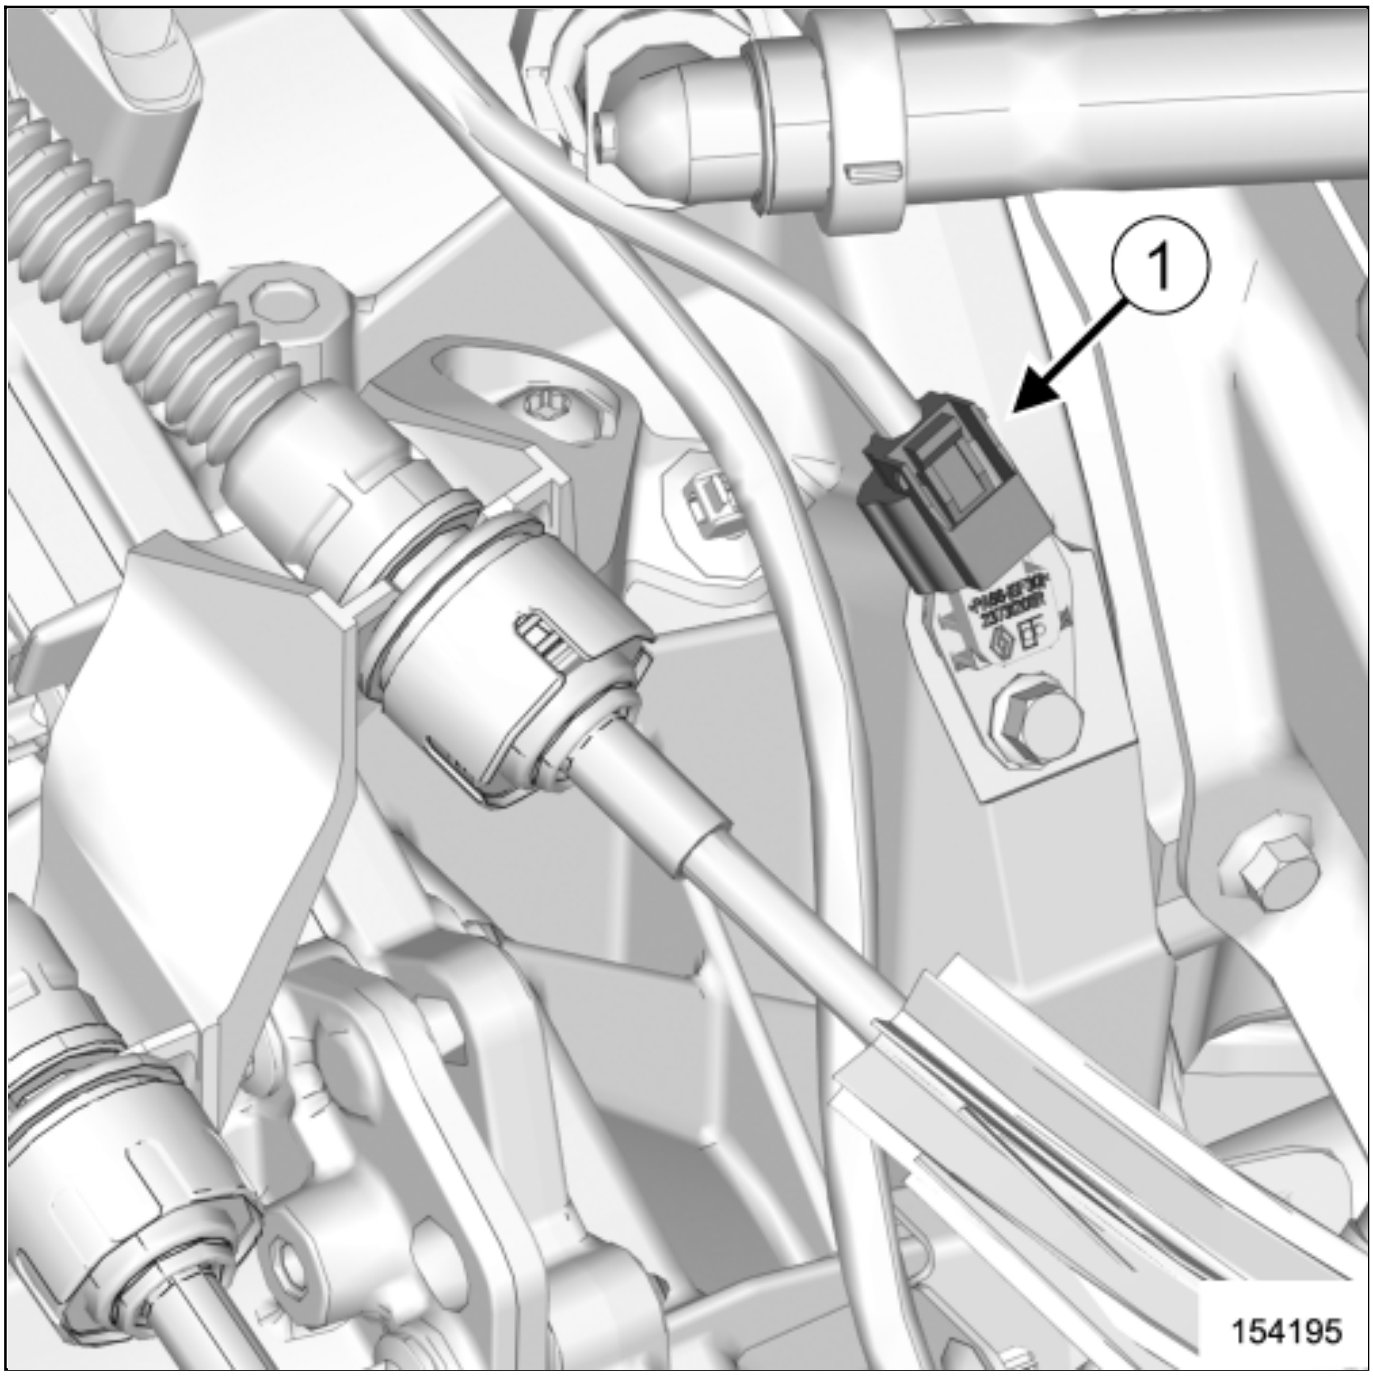
Diagnostic tool



Locations and specifications (tightening torques, parts always be replaced, etc.).(see **Engine and transmission assembly sensors: List and location of components**)

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove:
  - the battery **Battery: Removal - Refitting** ,
  - the battery tray **Battery tray: Removal - Refitting** .
- Remove the air filter unit **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** .

2. REMOVAL OPERATION

Disconnect the crankshaft position sensor connector(1) .

Remove (see **Engine and transmission assembly sensors: List and location of components**) :

- the crankshaft position sensor bolt,
- the crankshaft position sensor.

REFITTING

1. REFITTING OPERATION

- Refit (see **Engine and transmission assembly sensors: List and location of components**) :
  - the crankshaft position sensor,
  - the crankshaft position sensor bolt.
- Torque tighten the crankshaft position sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) **.**
- Proceed in the reverse order to removal.
- Apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component affected by the After repair procedure:

- "Crankshaft position sensor" .

CRANKSHAFT SEAL ON TIMING END: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Crankshaft seal fitting tool (timing end)	Mot. 1918

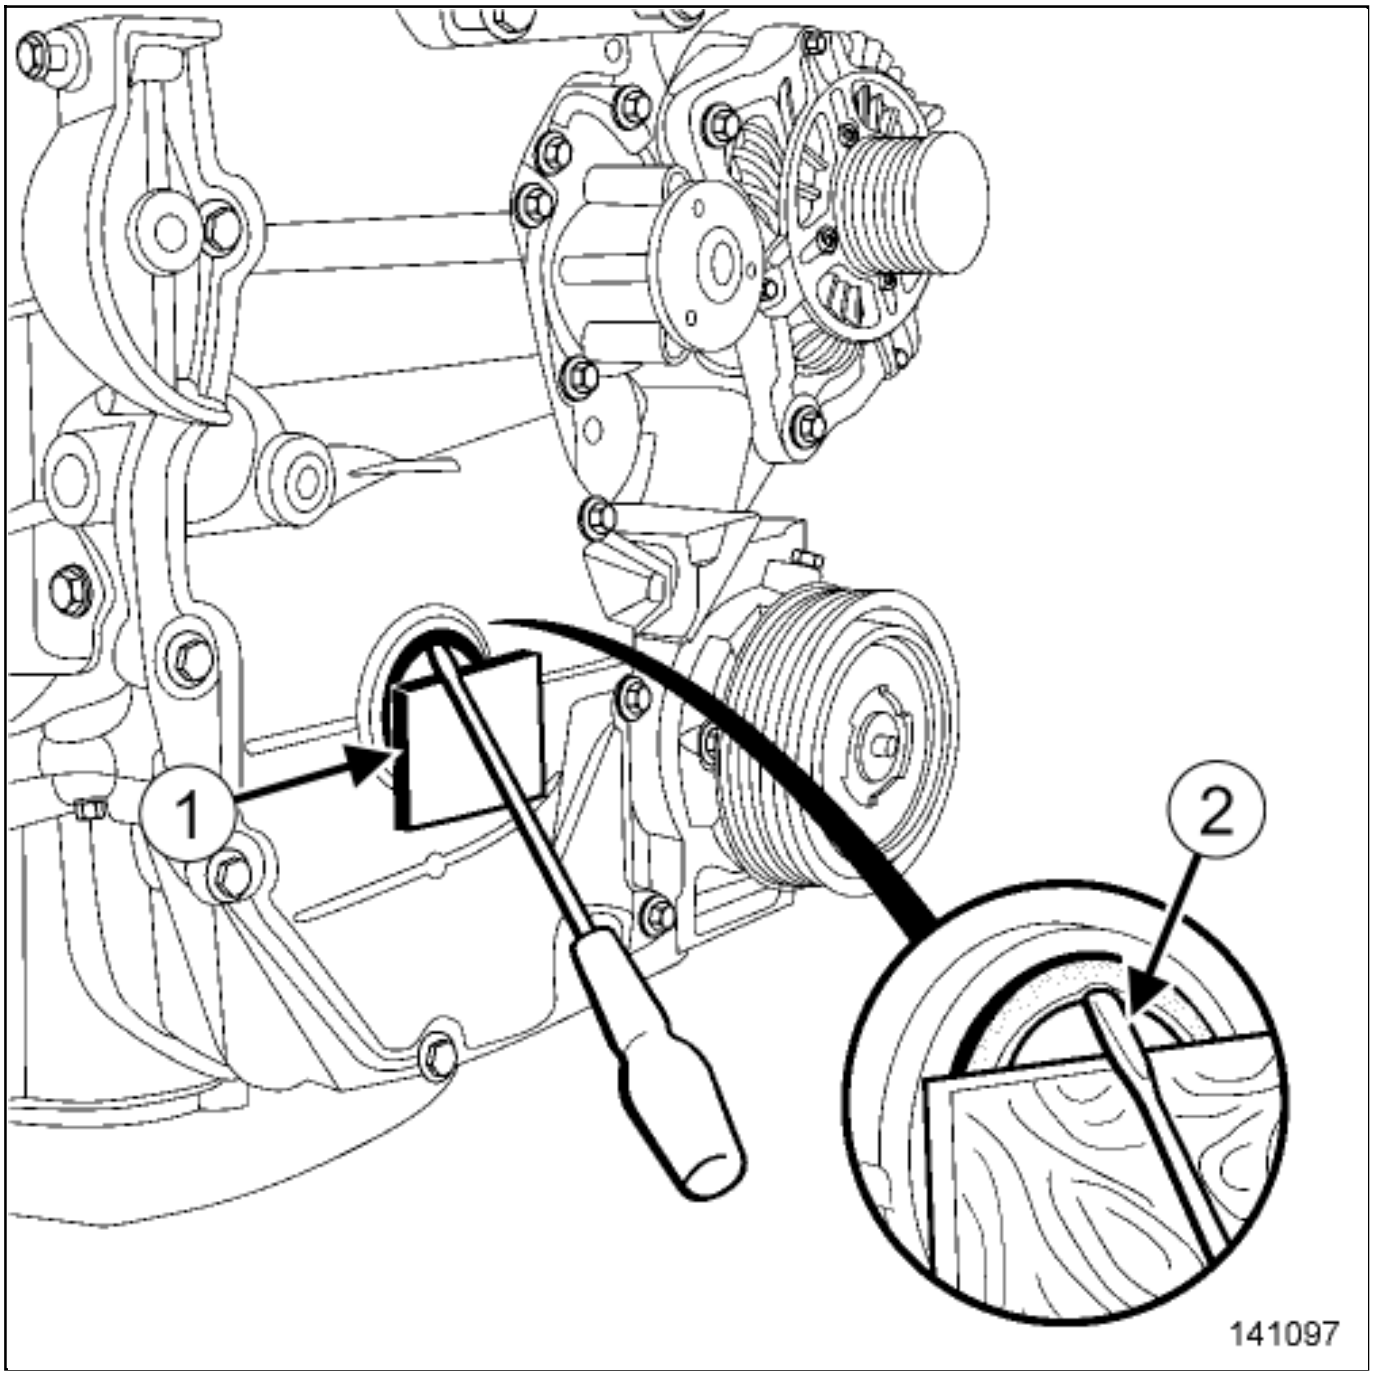
parts always to be replaced:
Crankshaft seal on timing end

Locations and specifications (tightening torques, parts always be replaced, etc.)(see 11A, Top and front of engine, Timing assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .



Remove:

- the front right-hand wheelFront hub carrier assembly: Exploded view ,
- the front section of the front right-hand wheel arch linerExterior body front trim assembly: Exploded view .

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the accessories belt,
- the crankshaft accessories pulley.

2. REMOVAL OPERATION

- Position a shim (1) on the timing cover (see 11A, Top and front of engine, Timing assembly: Exploded view) .

Note:

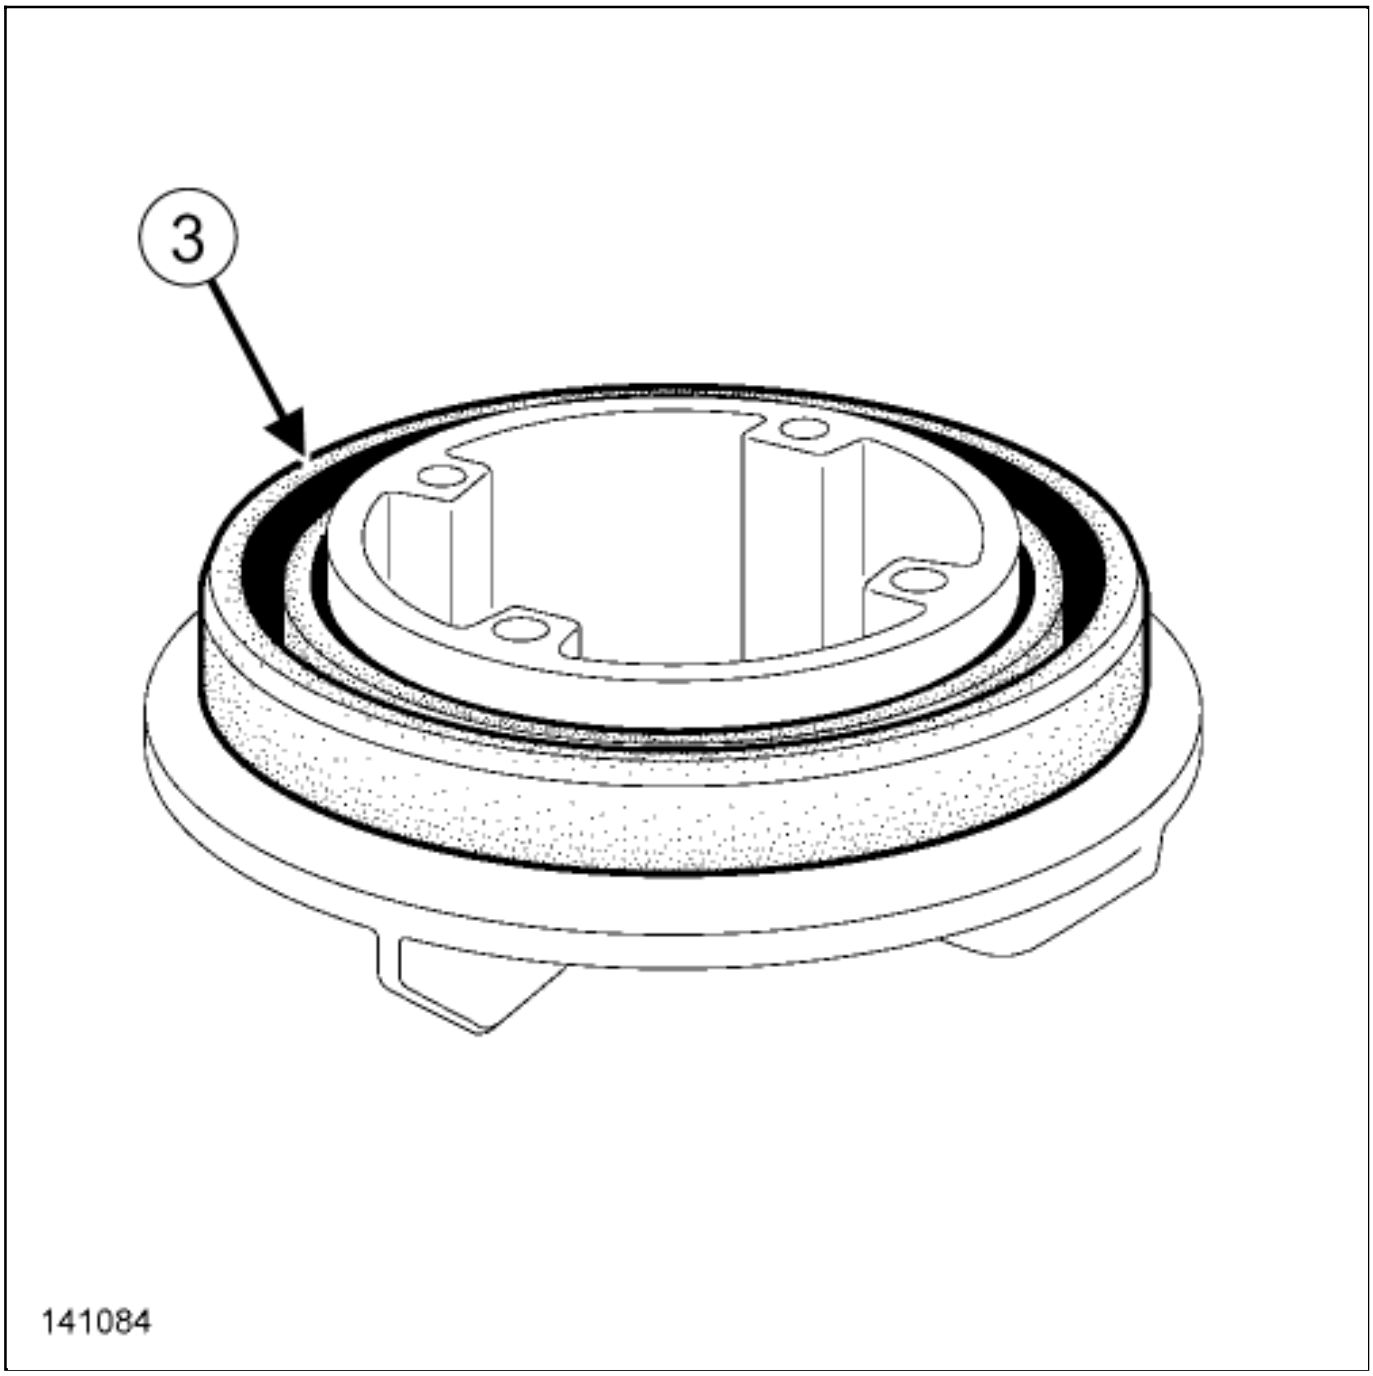
Be sure to position the flat head of the screwdriver(2) behind the outer lip of the crankshaft seal.

Remove the crankshaft seal at the timing end(see 11A, Top and front of engine, Timing assembly: Exploded view) using a flat-blade screwdriver while pressing on the shim.

REFITTING

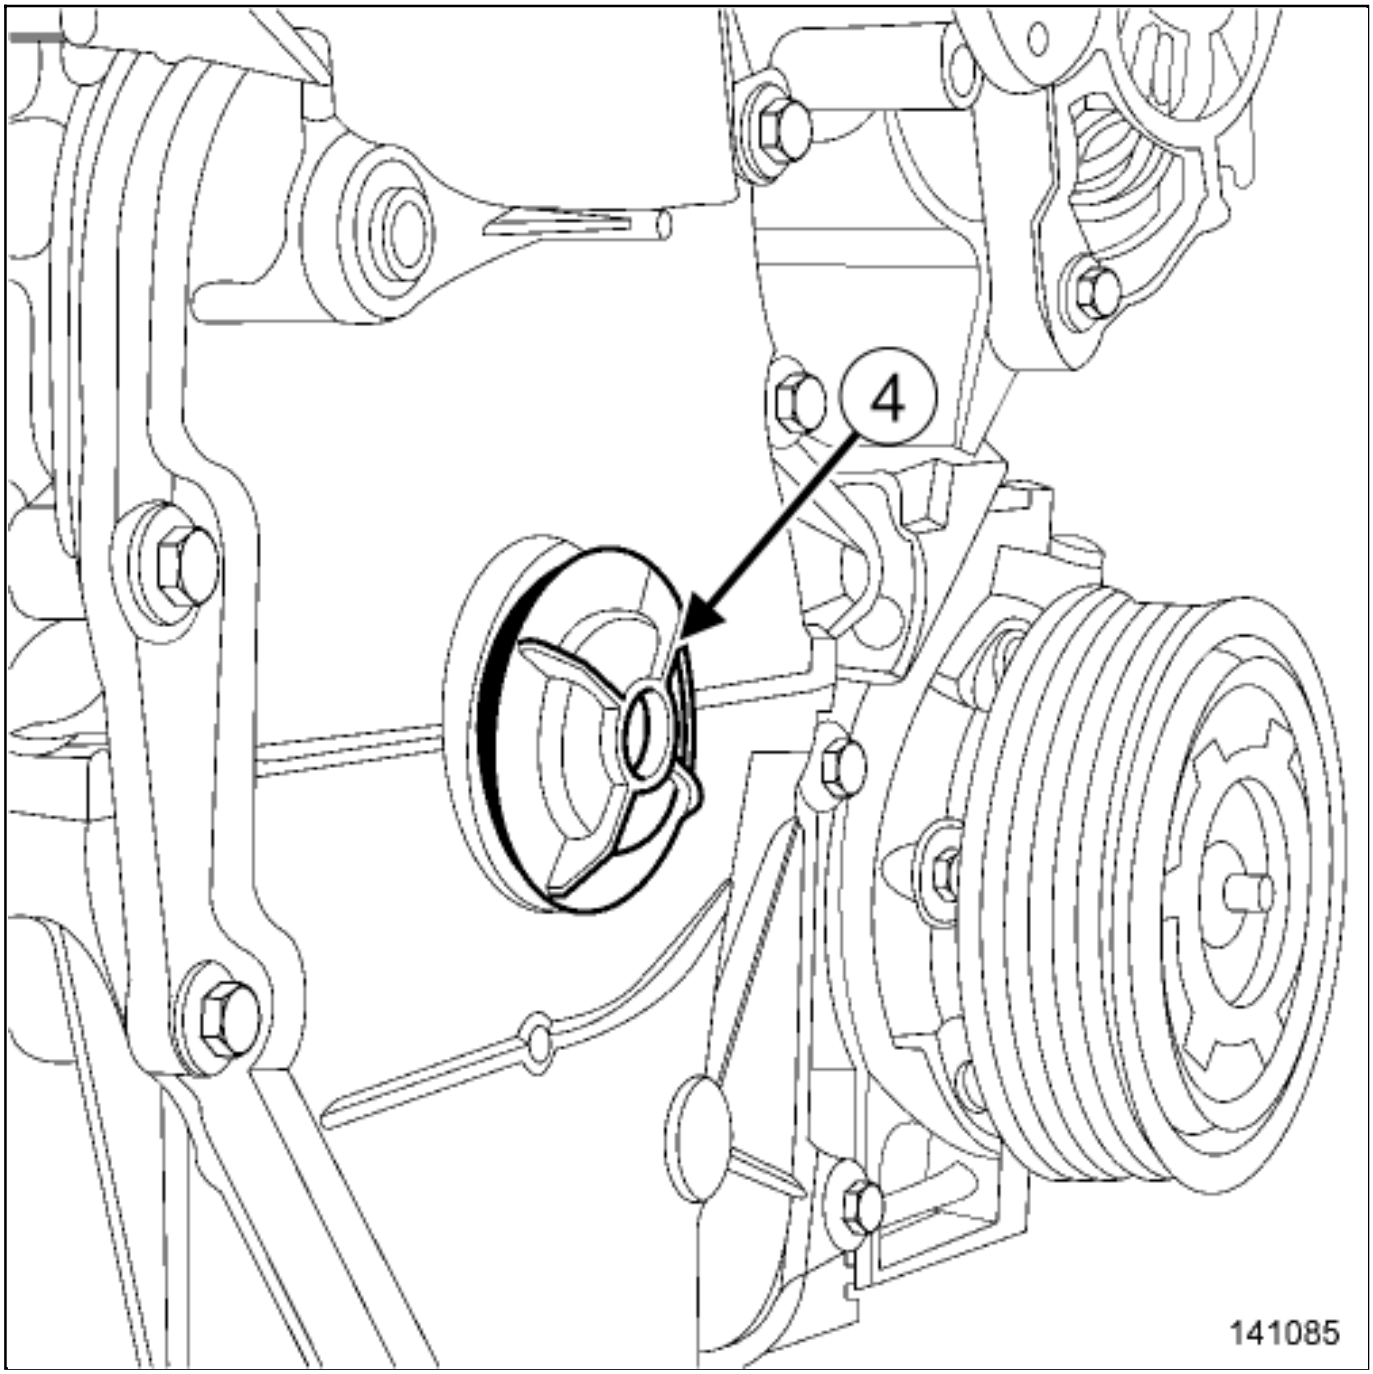
1. REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft seal on timing end .



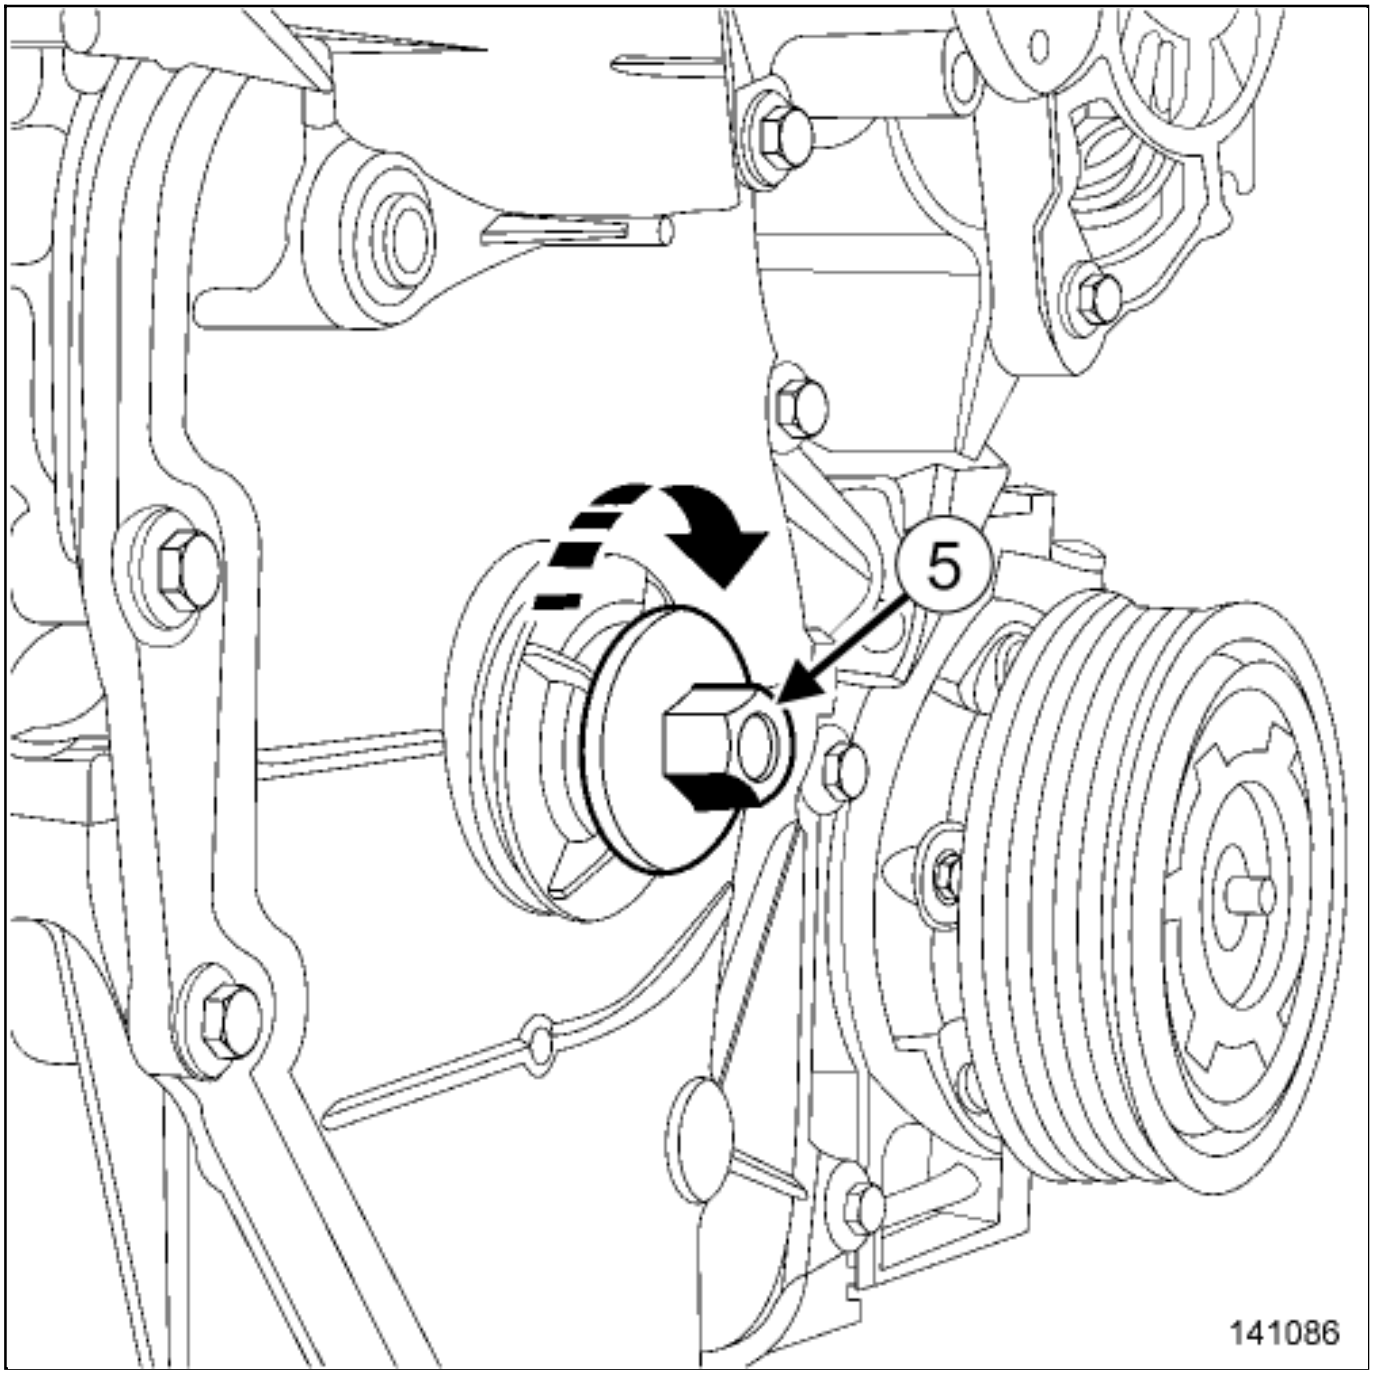
CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



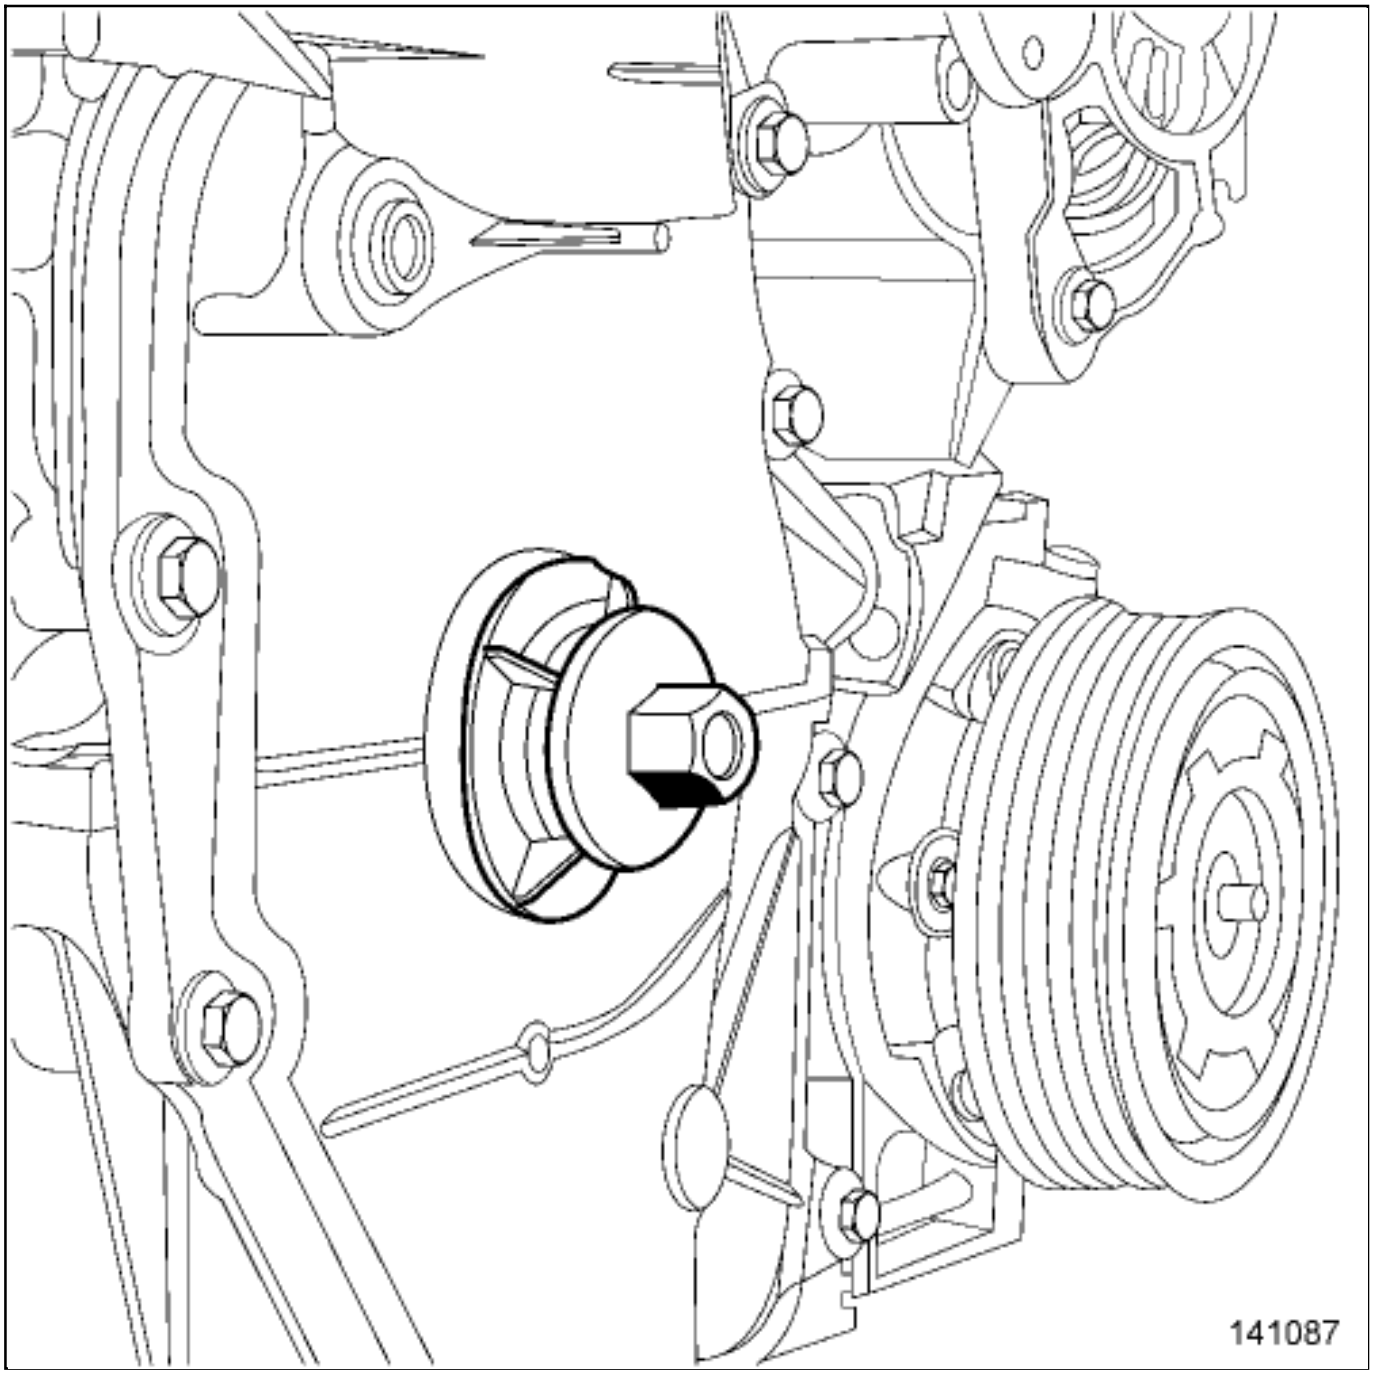
Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the seal mating face on the crankshaft accessories pulley,
- the seal housing on the timing cover.



2. REFITTING OPERATION

Fit a new crankshaft seal(3) on the timing end on the toolCrankshaft seal fitting tool (timing end) (Mot. 1918) .



Fit the "centring device - crankshaft seal on timing end"(4) assembly on the timing cover.

- Fit without tightening the crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) (5) on the crankshaft(see 11A, Top and front of engine, Timing assembly: Exploded view) .

- Tighten the crankshaft accessories pulley bolt until the toolCrankshaft seal fitting tool (timing end) (Mot. 1918) comes into contact with the timing cover.

Remove:

- the crankshaft accessories pulley bolt,
- the toolCrankshaft seal fitting tool (timing end)(**Mot. 1918**) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Repair-10x03x03x04-01x37-1-80-1.xml

XSL version : 3.02 du 22/07/11

CRANKSHAFT SEAL ON TIMING END: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Crankshaft seal fitting tool (timing end)	Mot. 1918

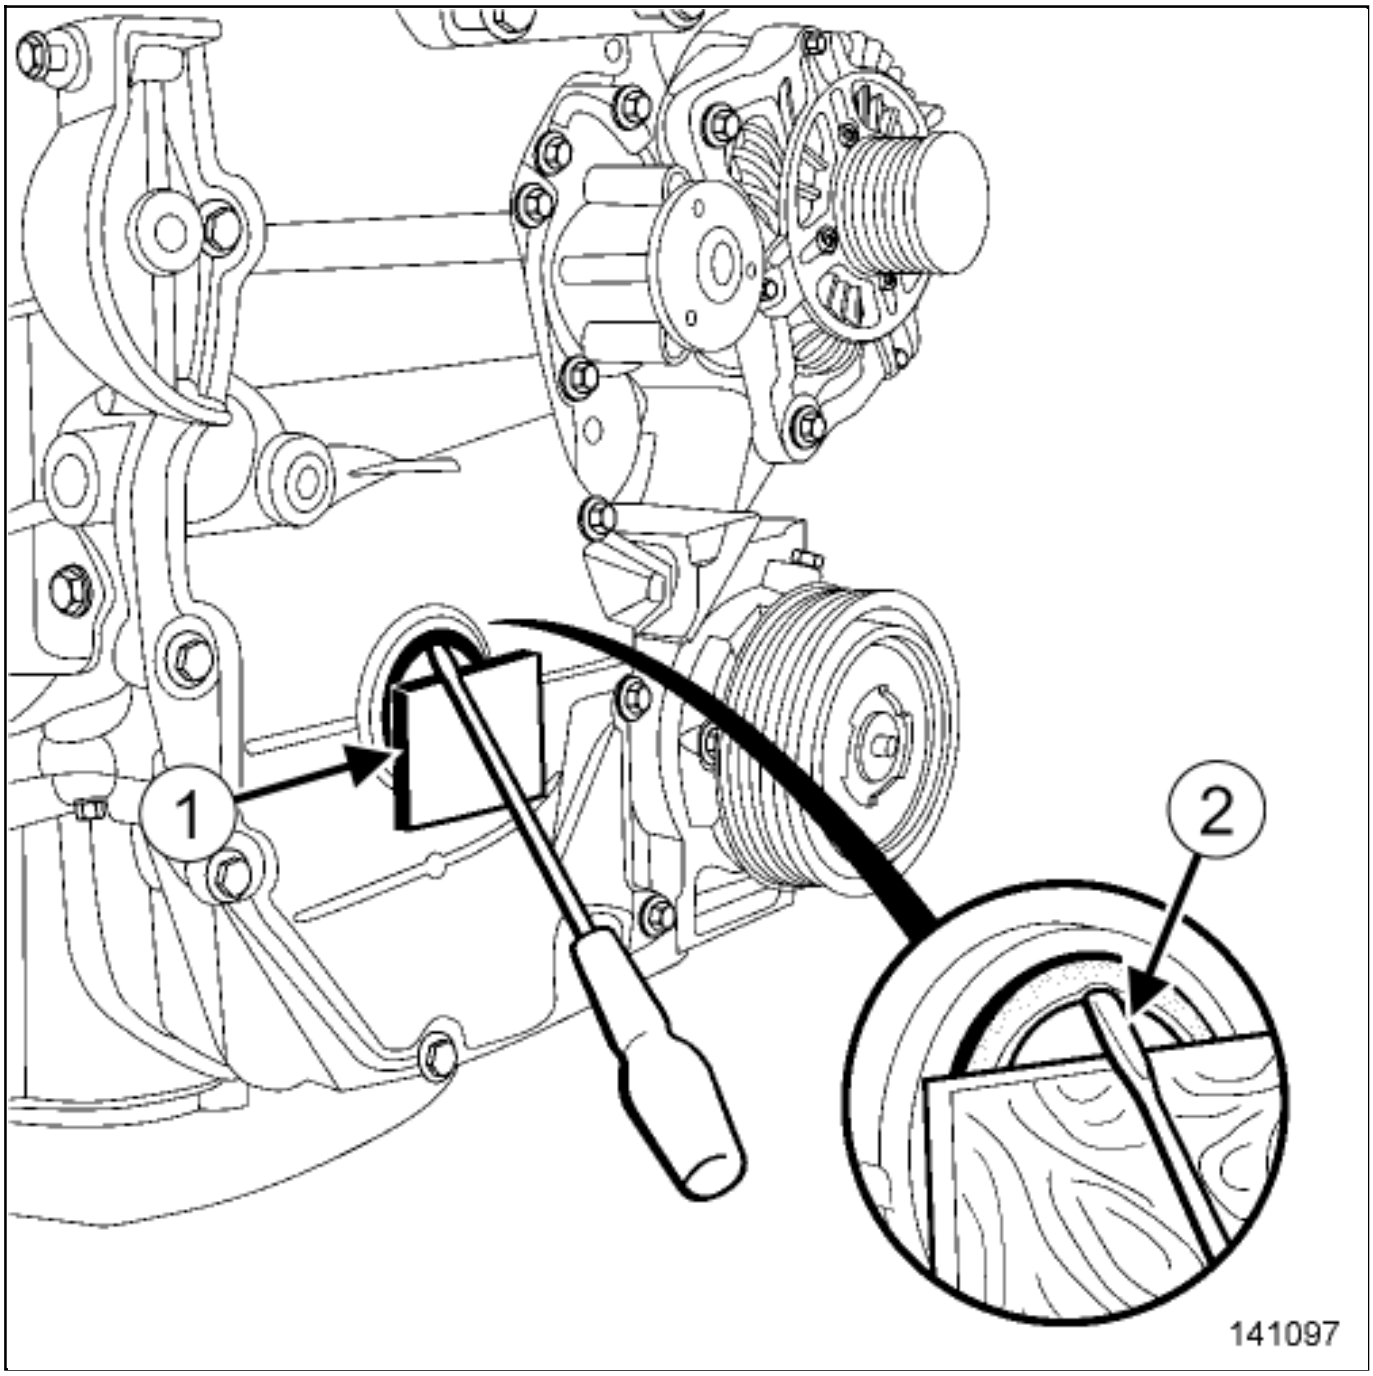
parts always to be replaced:
Crankshaft seal on timing end

Locations and specifications (tightening torques, parts always be replaced, etc.)Timing assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .



Remove:

- the front right-hand wheelFront hub carrier assembly: Exploded view ,
- the front section of the front right-hand wheel arch linerExterior body front trim assembly: Exploded view .

Remove Engine accessories assembly: Exploded view :

- the accessories belt,
- the crankshaft accessories pulley.

2. REMOVAL OPERATION

Position a shim (1) on the timing cover Timing assembly: Exploded view .

Note:

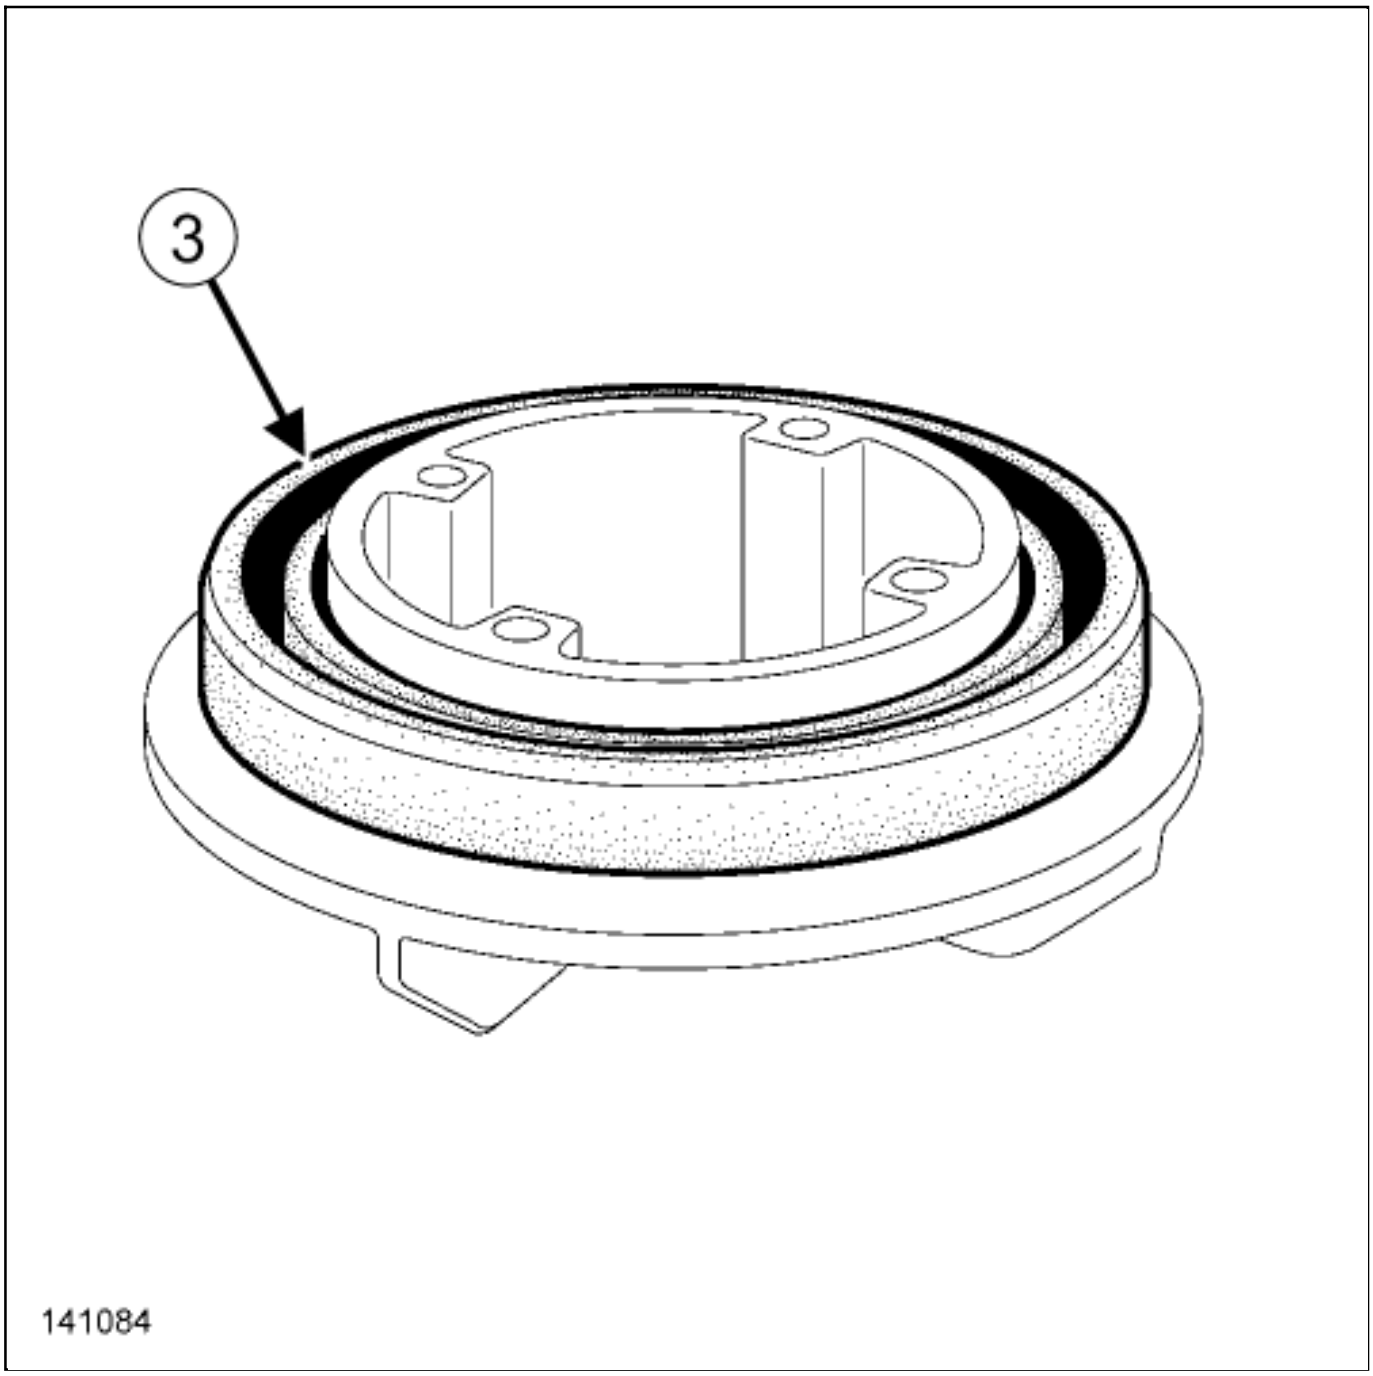
Be sure to position the flat head of the screwdriver(2) behind the outer lip of the crankshaft seal.

Remove the crankshaft seal at the timing end Timing assembly: Exploded view using a flat-blade screwdriver while pressing on the shim.

REFITTING

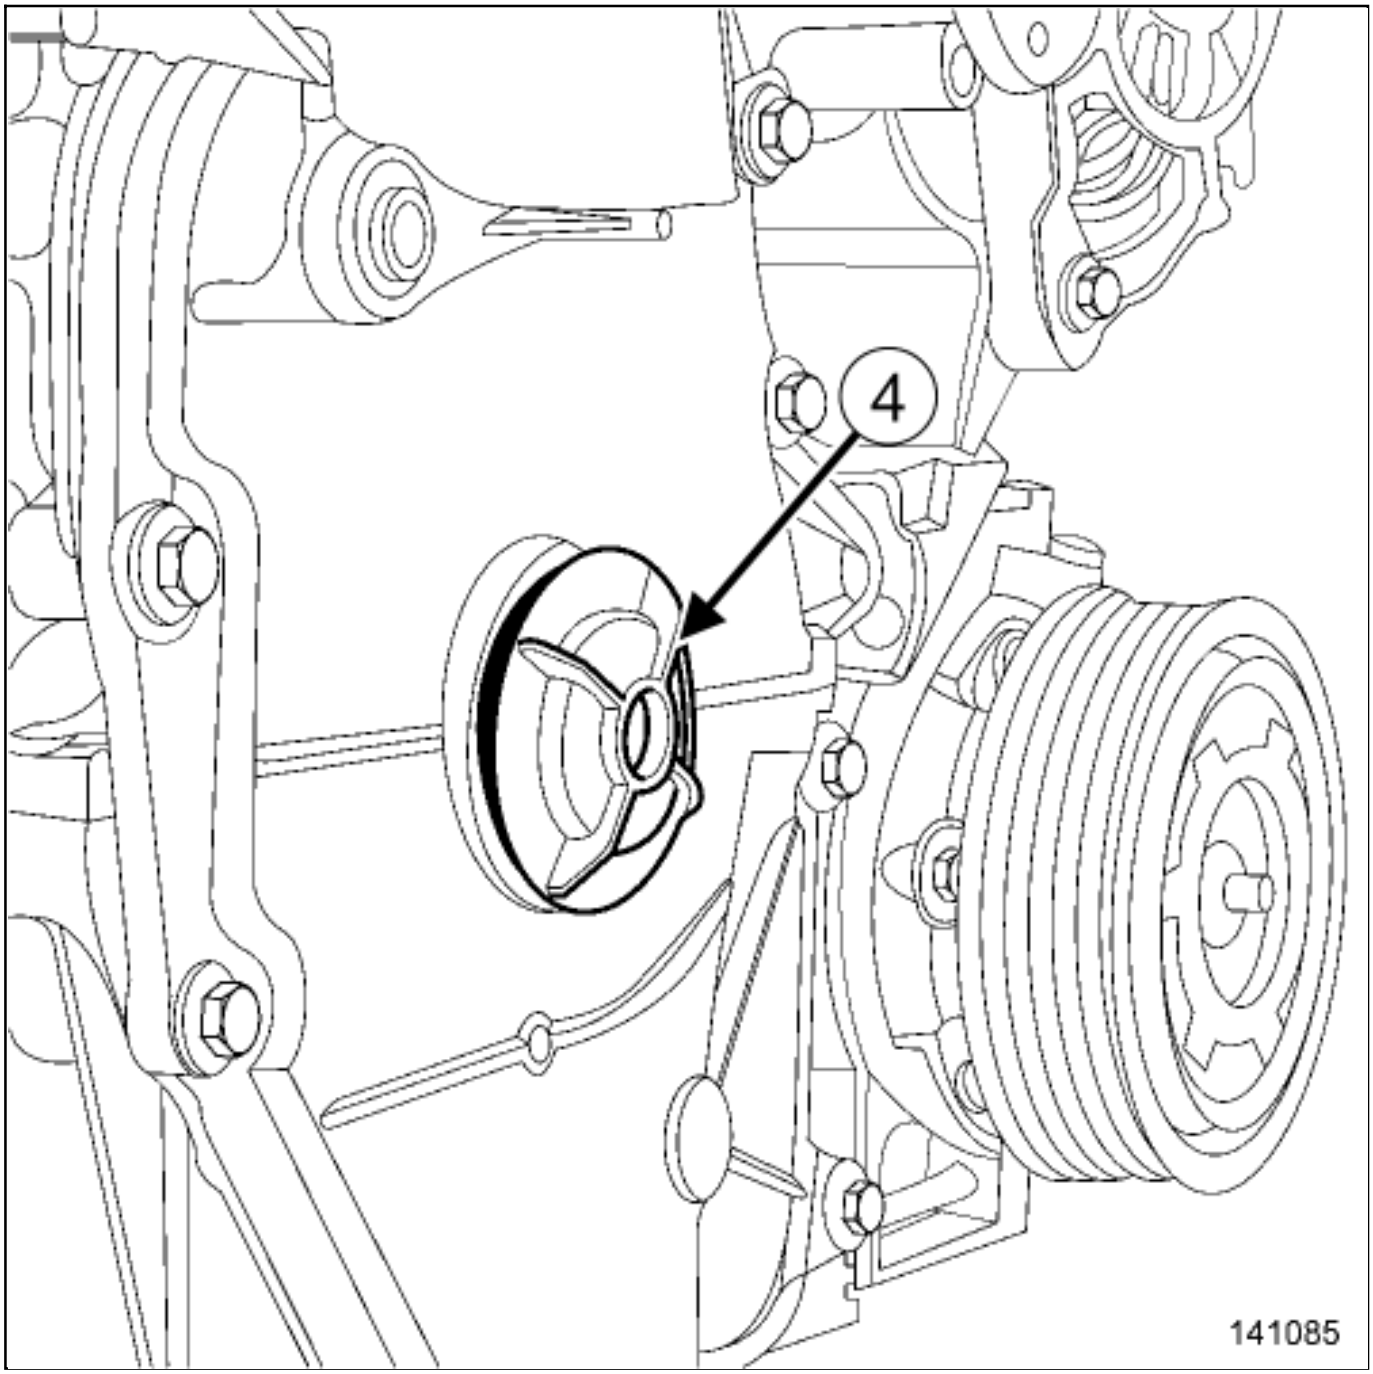
1. REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft seal on timing end .



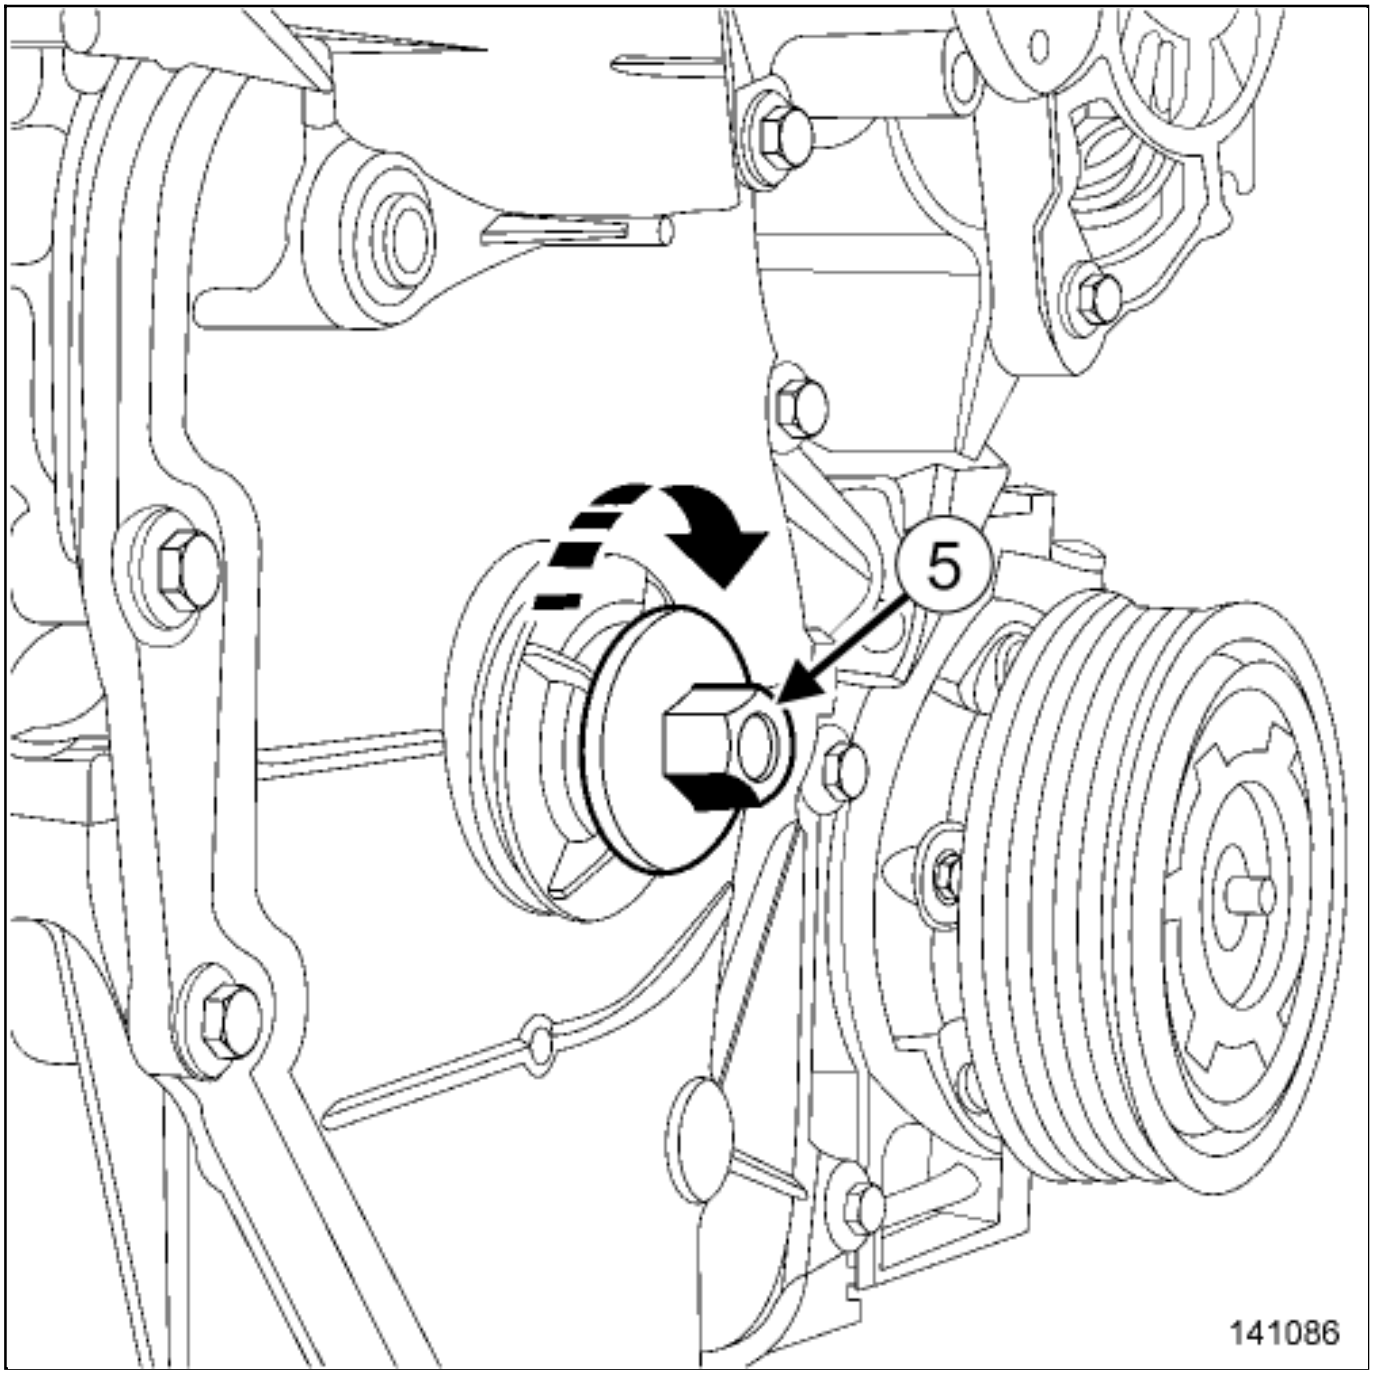
CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



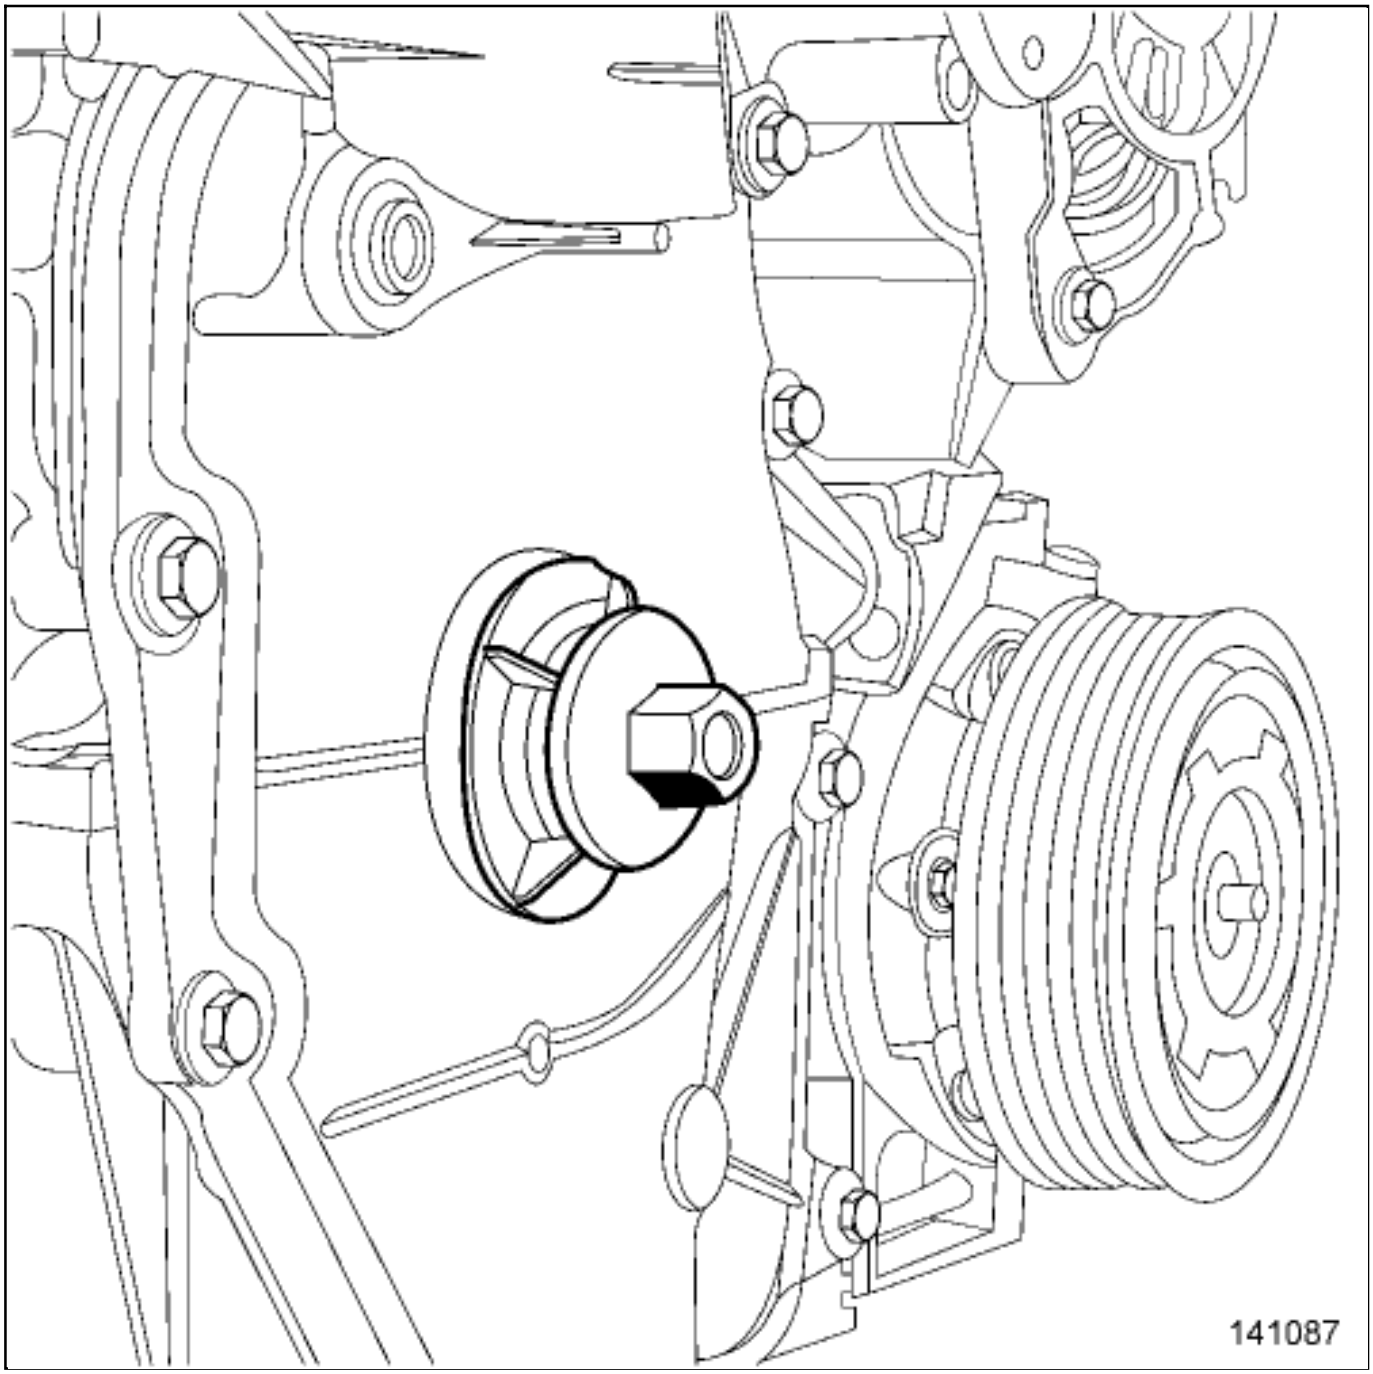
Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease:

- the seal mating face on the crankshaft accessories pulley,
- the seal housing on the timing cover.



2. REFITTING OPERATION

Fit a new crankshaft seal(3) on the timing end on the toolCrankshaft seal fitting tool (timing end) (Mot. 1918) .



Fit the "centring device - crankshaft seal on timing end"(4) assembly on the timing cover.

Fit without tightening the crankshaft accessories pulley bolt Engine accessories assembly: Exploded view (5) on the crankshaft Timing assembly: Exploded view .

Tighten the crankshaft accessories pulley bolt until the toolCrankshaft seal fitting tool (timing end) (Mot. 1918) comes into contact with the timing cover.

Remove:

- the crankshaft accessories pulley bolt,
- the toolCrankshaft seal fitting tool (timing end)(**Mot. 1918**) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Repair-10x03x03x04-01x37-1-80-1.xml

XSL version : 3.02 du 22/07/11

CRANKSHAFT SEAL, GEARBOX END: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

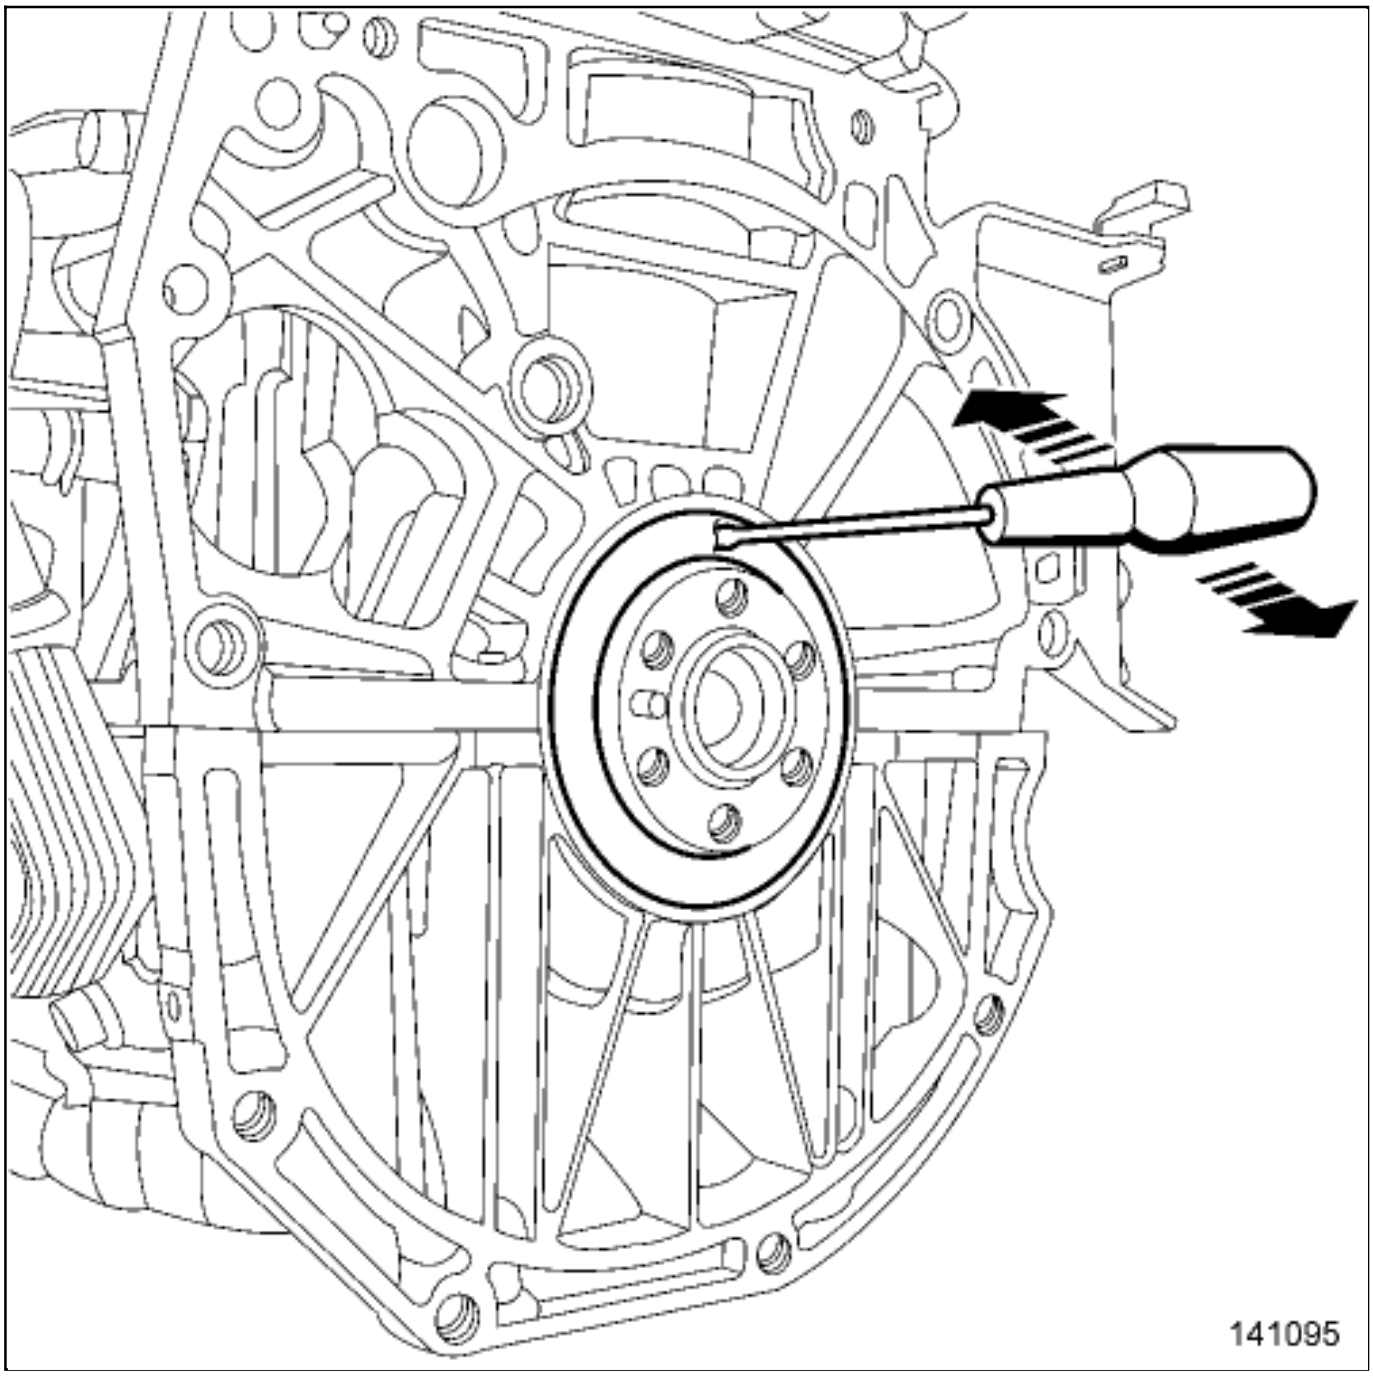
Special tooling required	
Crankshaft seal fitting tool (flywheel end)	Mot. 1919

parts always to be replaced:

Crankshaft seal on gearbox end

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove the automatic gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

- Remove the engine flywheel(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

2. REMOVAL OPERATION

Note:

Take care not to damage the mating face of the crankshaft seal on the crankshaft and the crankshaft seal housing on the cylinder block when removing the seal.

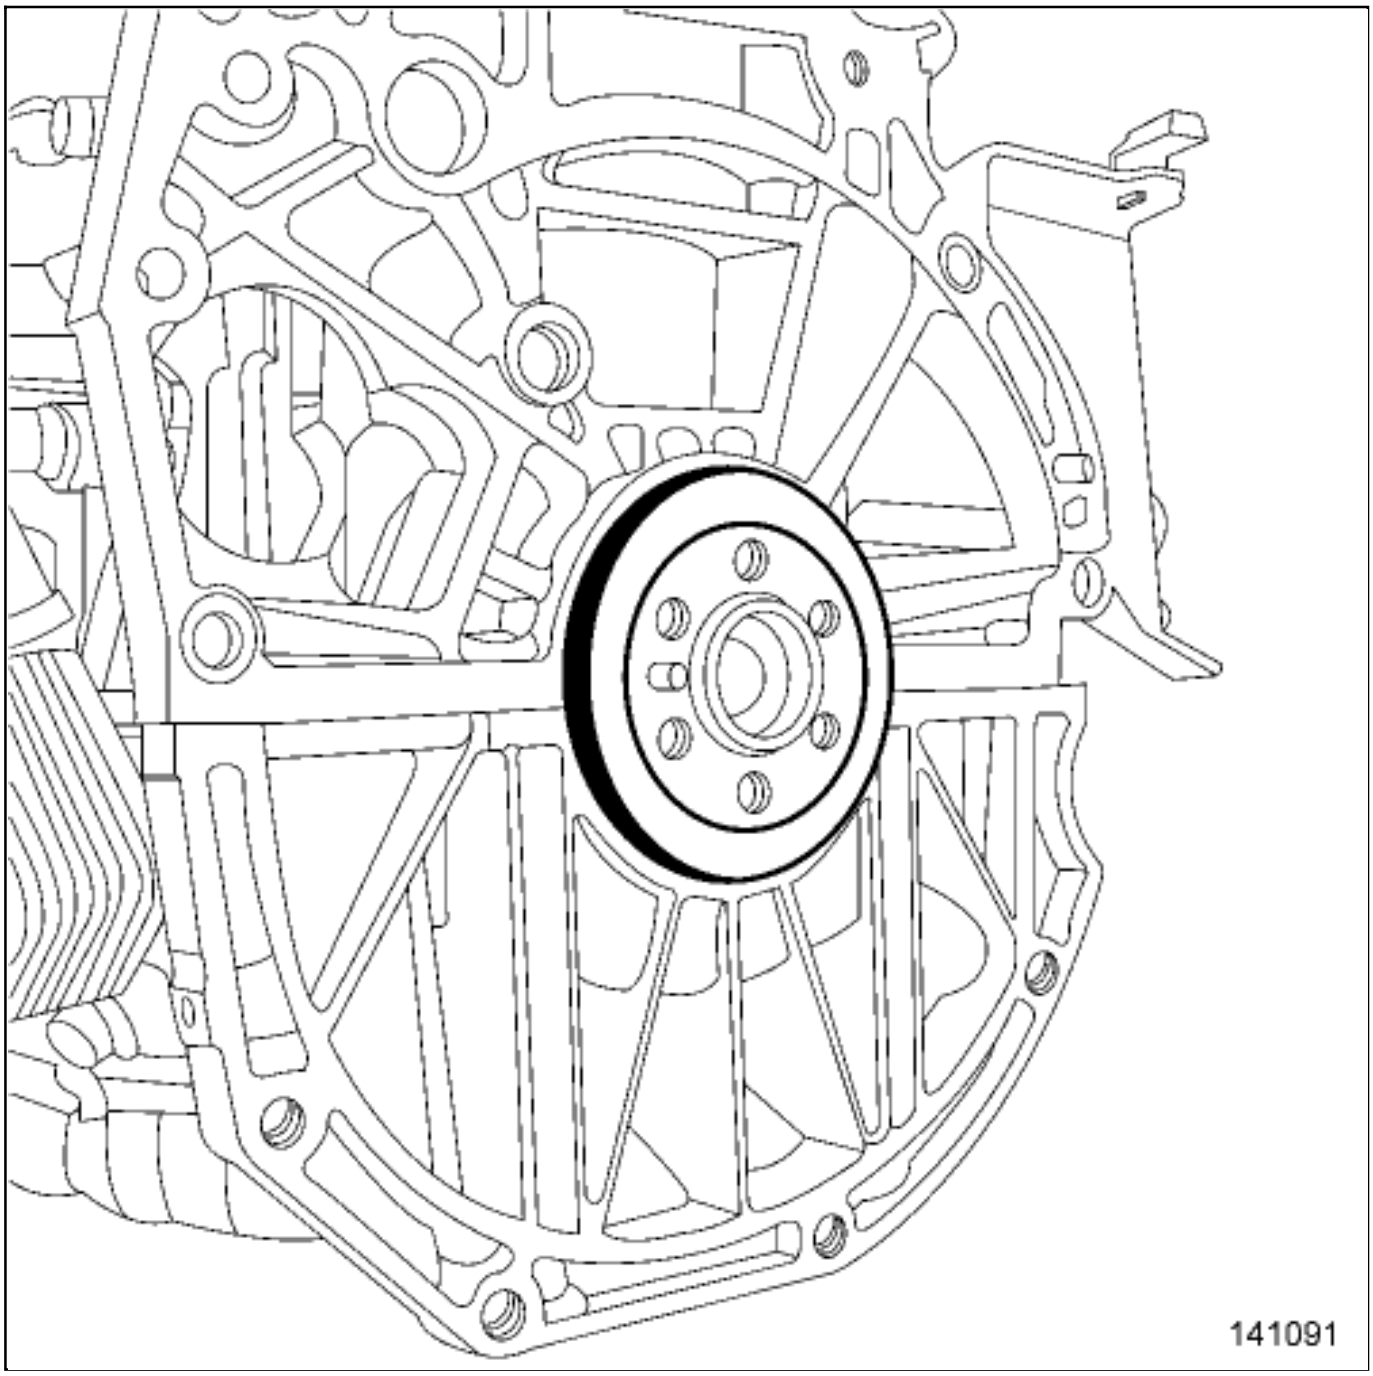
- Carefully insert a flat-blade screwdriver in the crankshaft seal on gearbox end using a mallet.

Remove the crankshaft seal on gearbox end(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) using a flat-blade screwdriver.

REFITTING

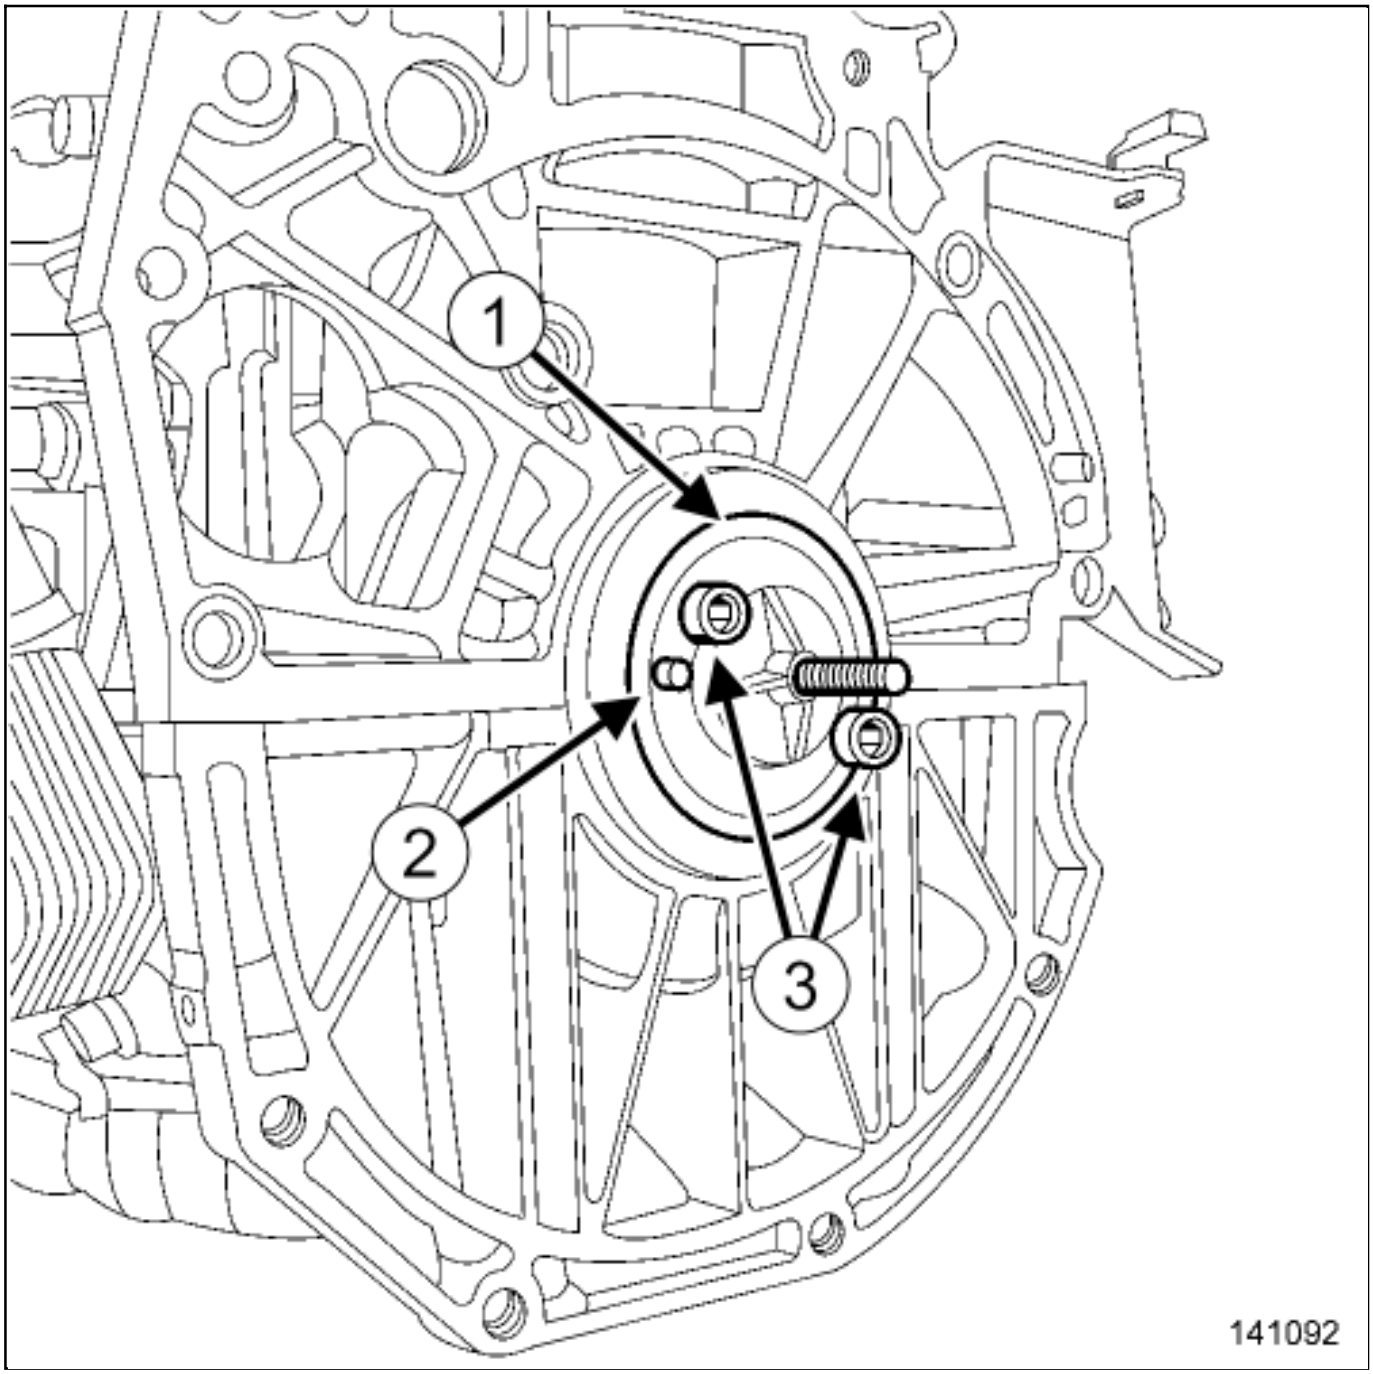
1. REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft seal on gearbox end .



CAUTION

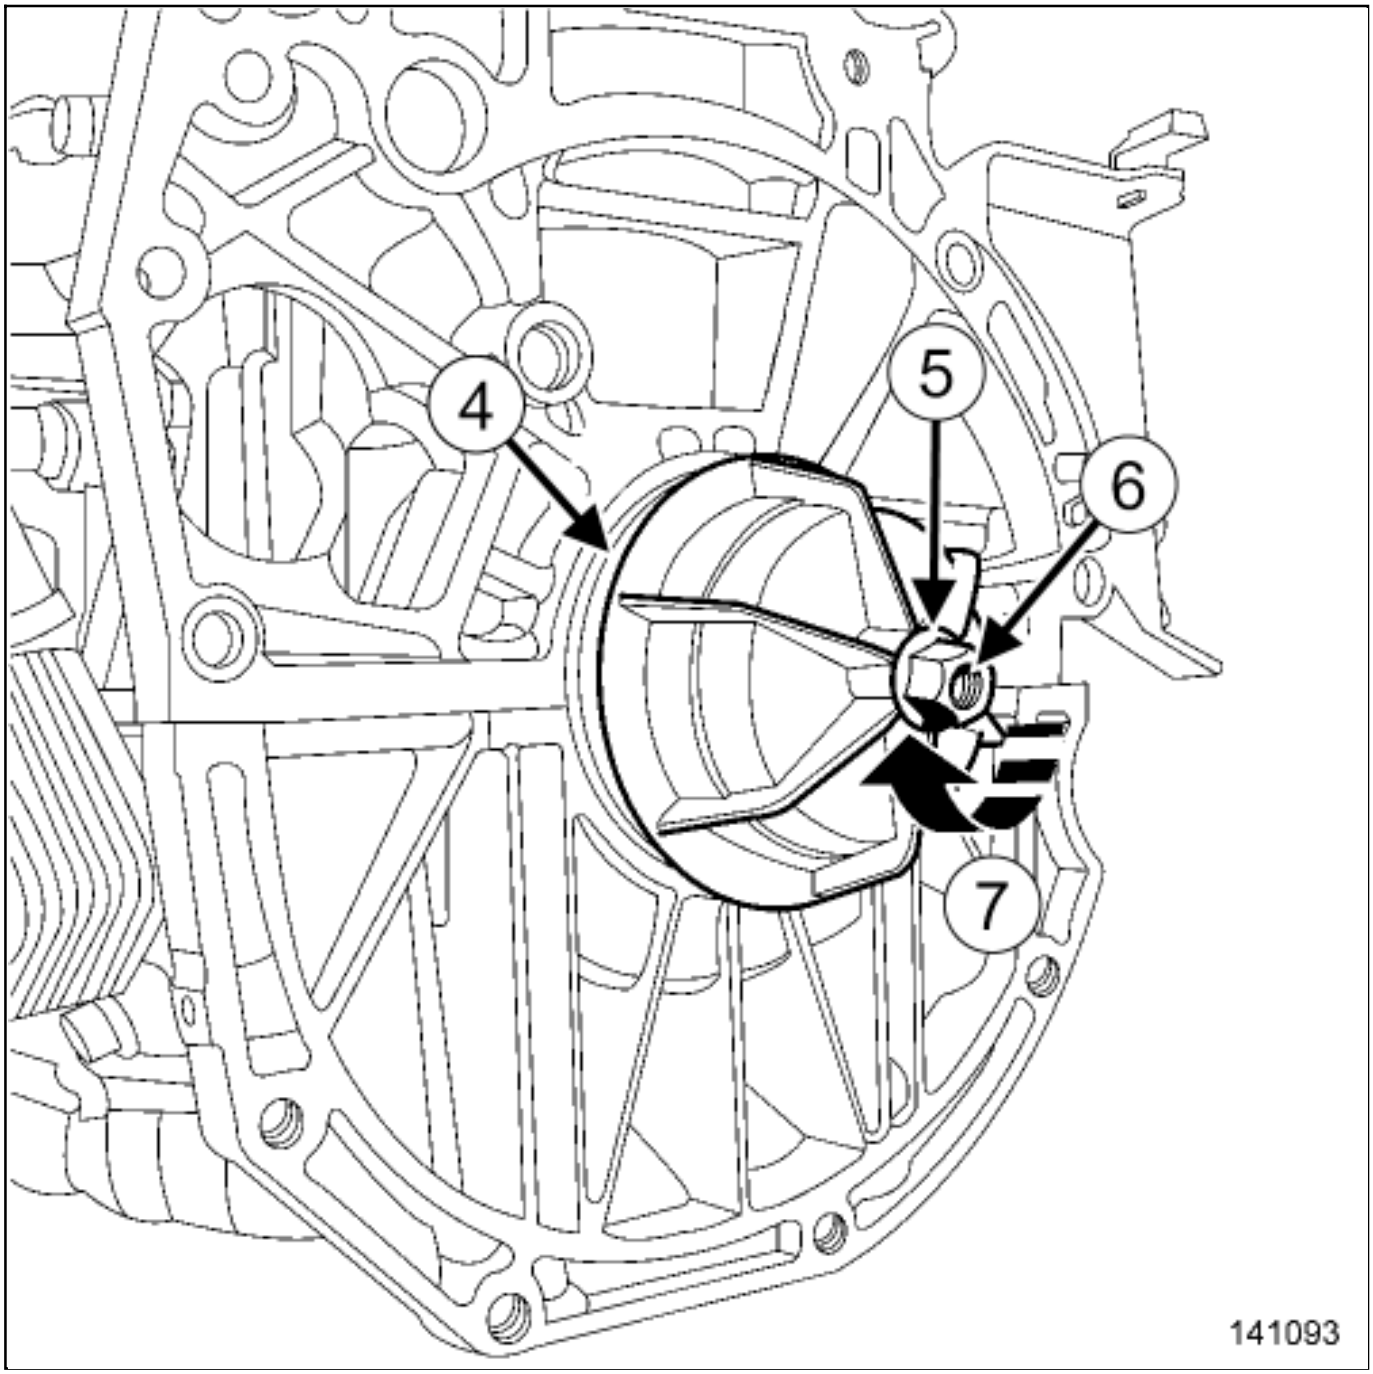
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

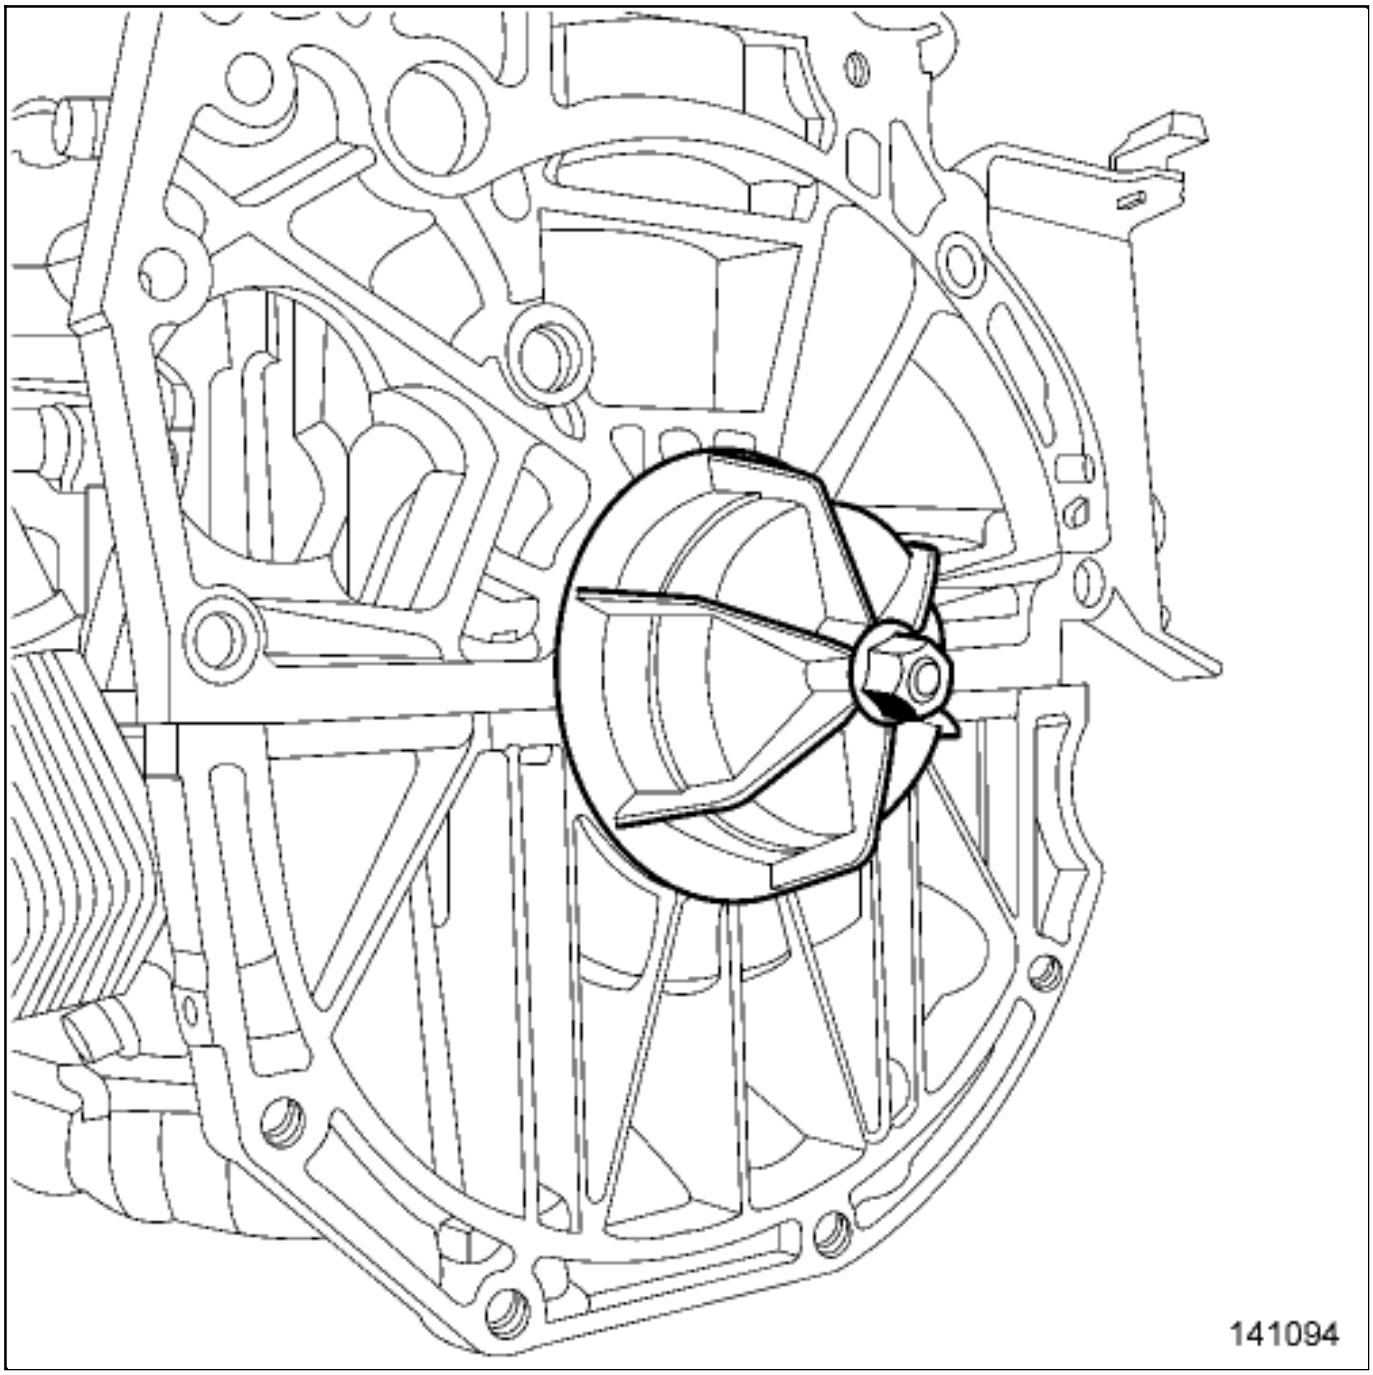
- the seal mating face on the crankshaft,
- the seal housing on the cylinder block.

2. REFITTING OPERATION



Refit a new crankshaft seal on gearbox end(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Fit the centring device(1) of the toolCrankshaft seal fitting tool (flywheel end)(Mot. 1919) on the crankshaft by positioning it on the pin(2) .



Refit two flywheel bolts(3) on the centring device of the toolCrankshaft seal fitting tool (flywheel end) (Mot. 1919) .

Fit:

- the cover(4) of the toolCrankshaft seal fitting tool (flywheel end)(Mot. 1919) ,
- the washer(5) ,
- the nut(6) .

Tighten the nut clockwise(7) until the cover touches the cylinder block.

Remove:

- the nut,
- the washer,
- the cover of the toolCrankshaft seal fitting tool (flywheel end)(**Mot. 1919**) ,

- the flywheel bolts,
- the centring device of the toolCrankshaft seal fitting tool (flywheel end)(**Mot. 1919**) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

CRANKSHAFT SEAL, GEARBOX END: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

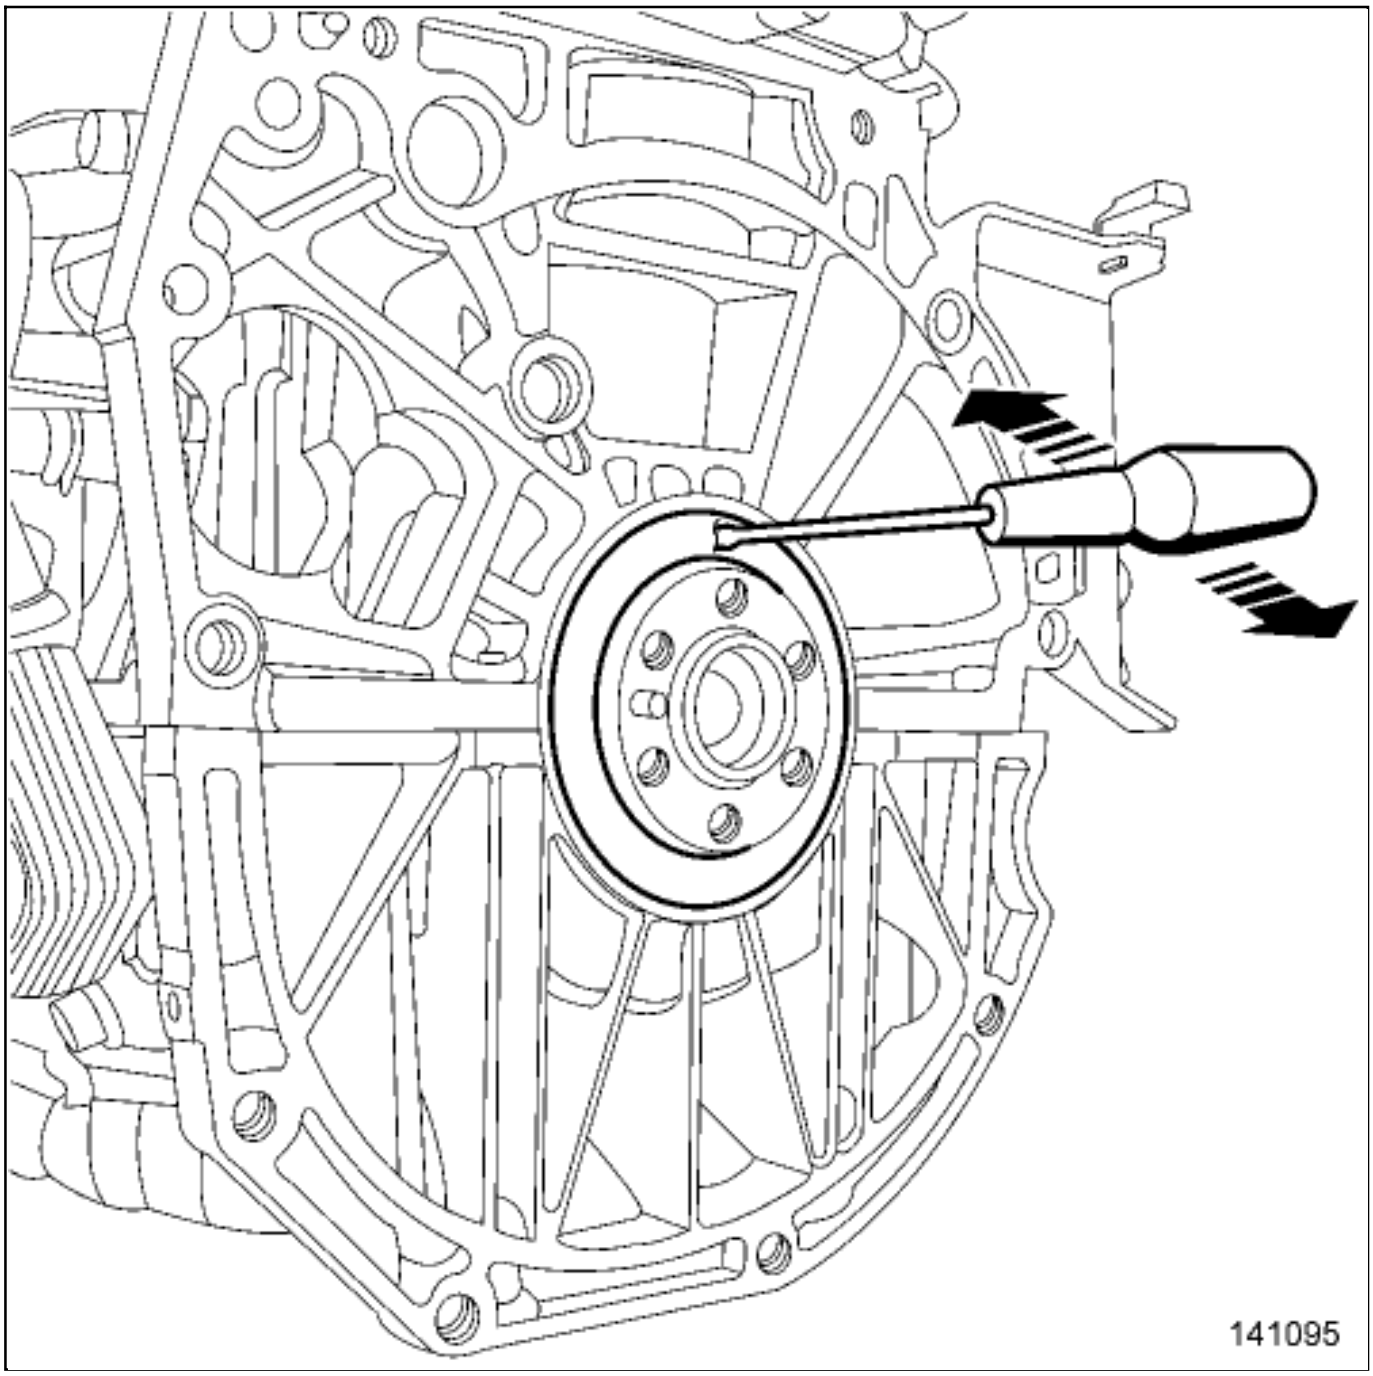
Special tooling required	
Crankshaft seal fitting tool (flywheel end)	Mot. 1919

parts always to be replaced:

Crankshaft seal on gearbox end

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove the automatic gearboxAutomatic gearbox: Removal - Refitting .

- Remove the engine flywheel(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

2. REMOVAL OPERATION

Note:

Take care not to damage the mating face of the crankshaft seal on the crankshaft and the crankshaft seal housing on the cylinder block when removing the seal.

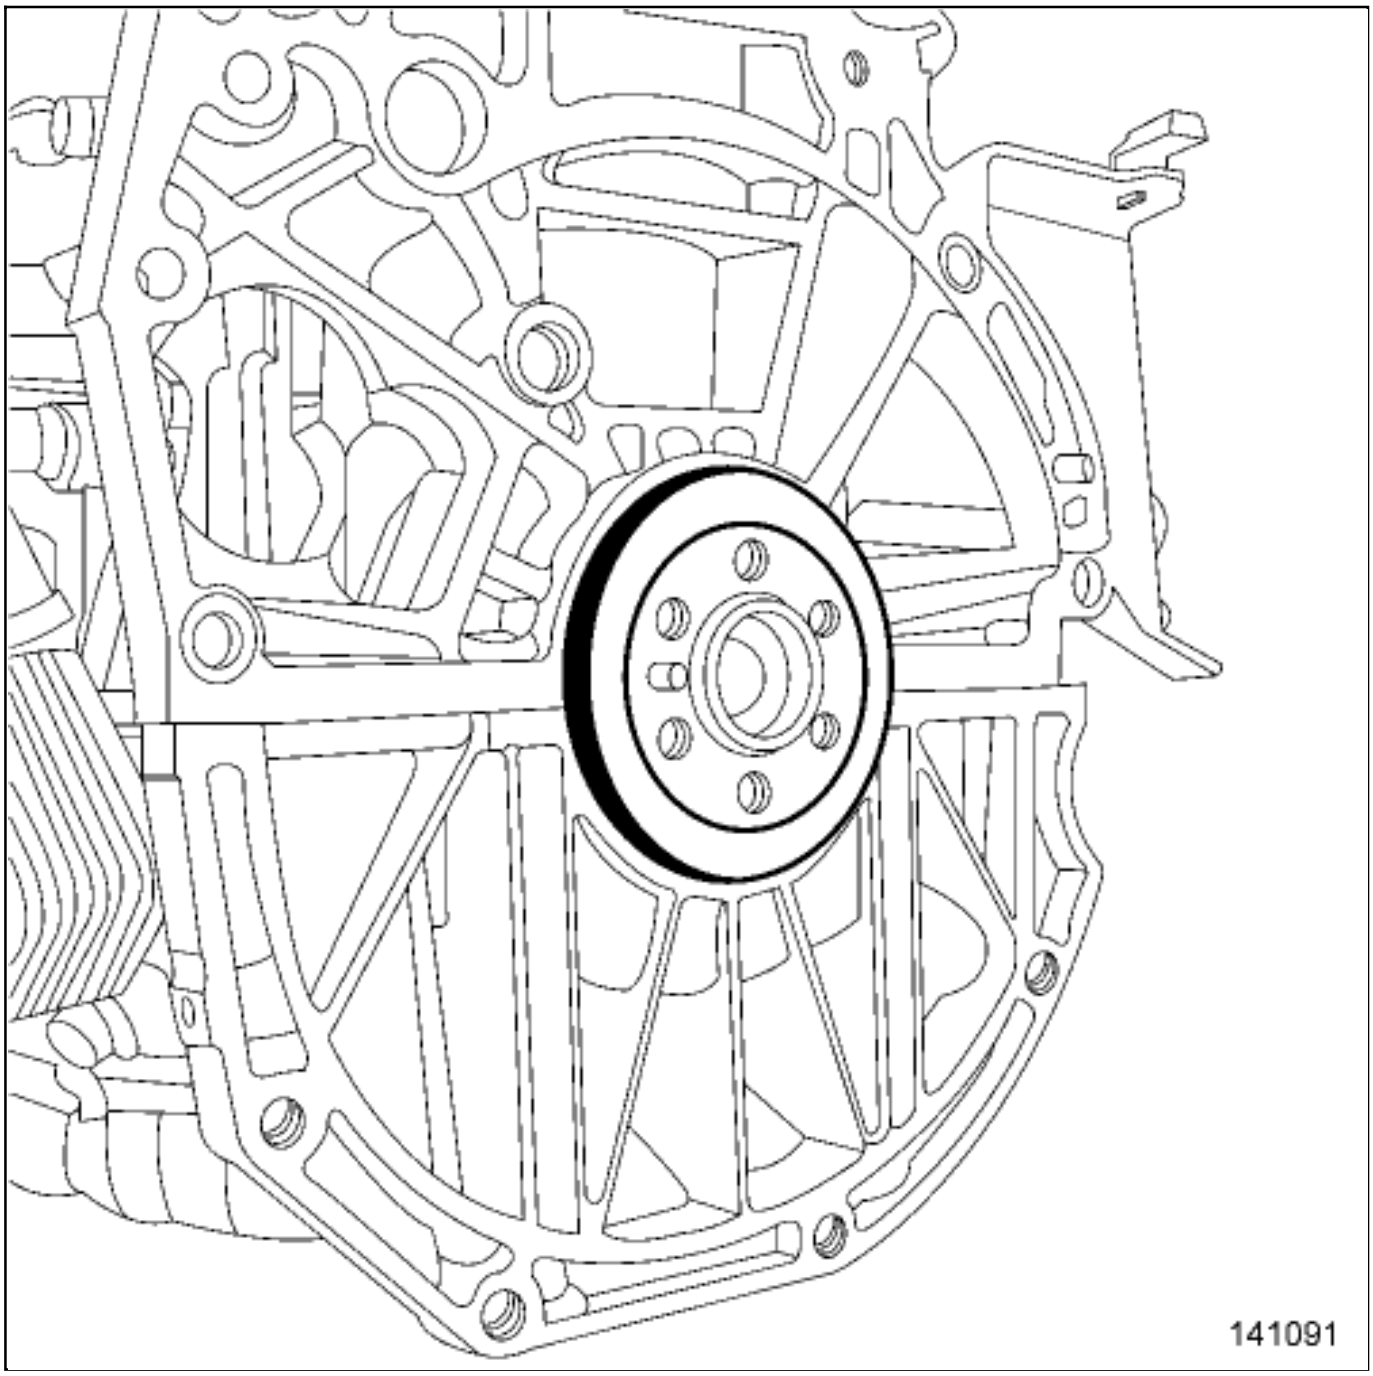
- Carefully insert a flat-blade screwdriver in the crankshaft seal on gearbox end using a mallet.

Remove the crankshaft seal on gearbox end(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) using a flat-blade screwdriver.

REFITTING

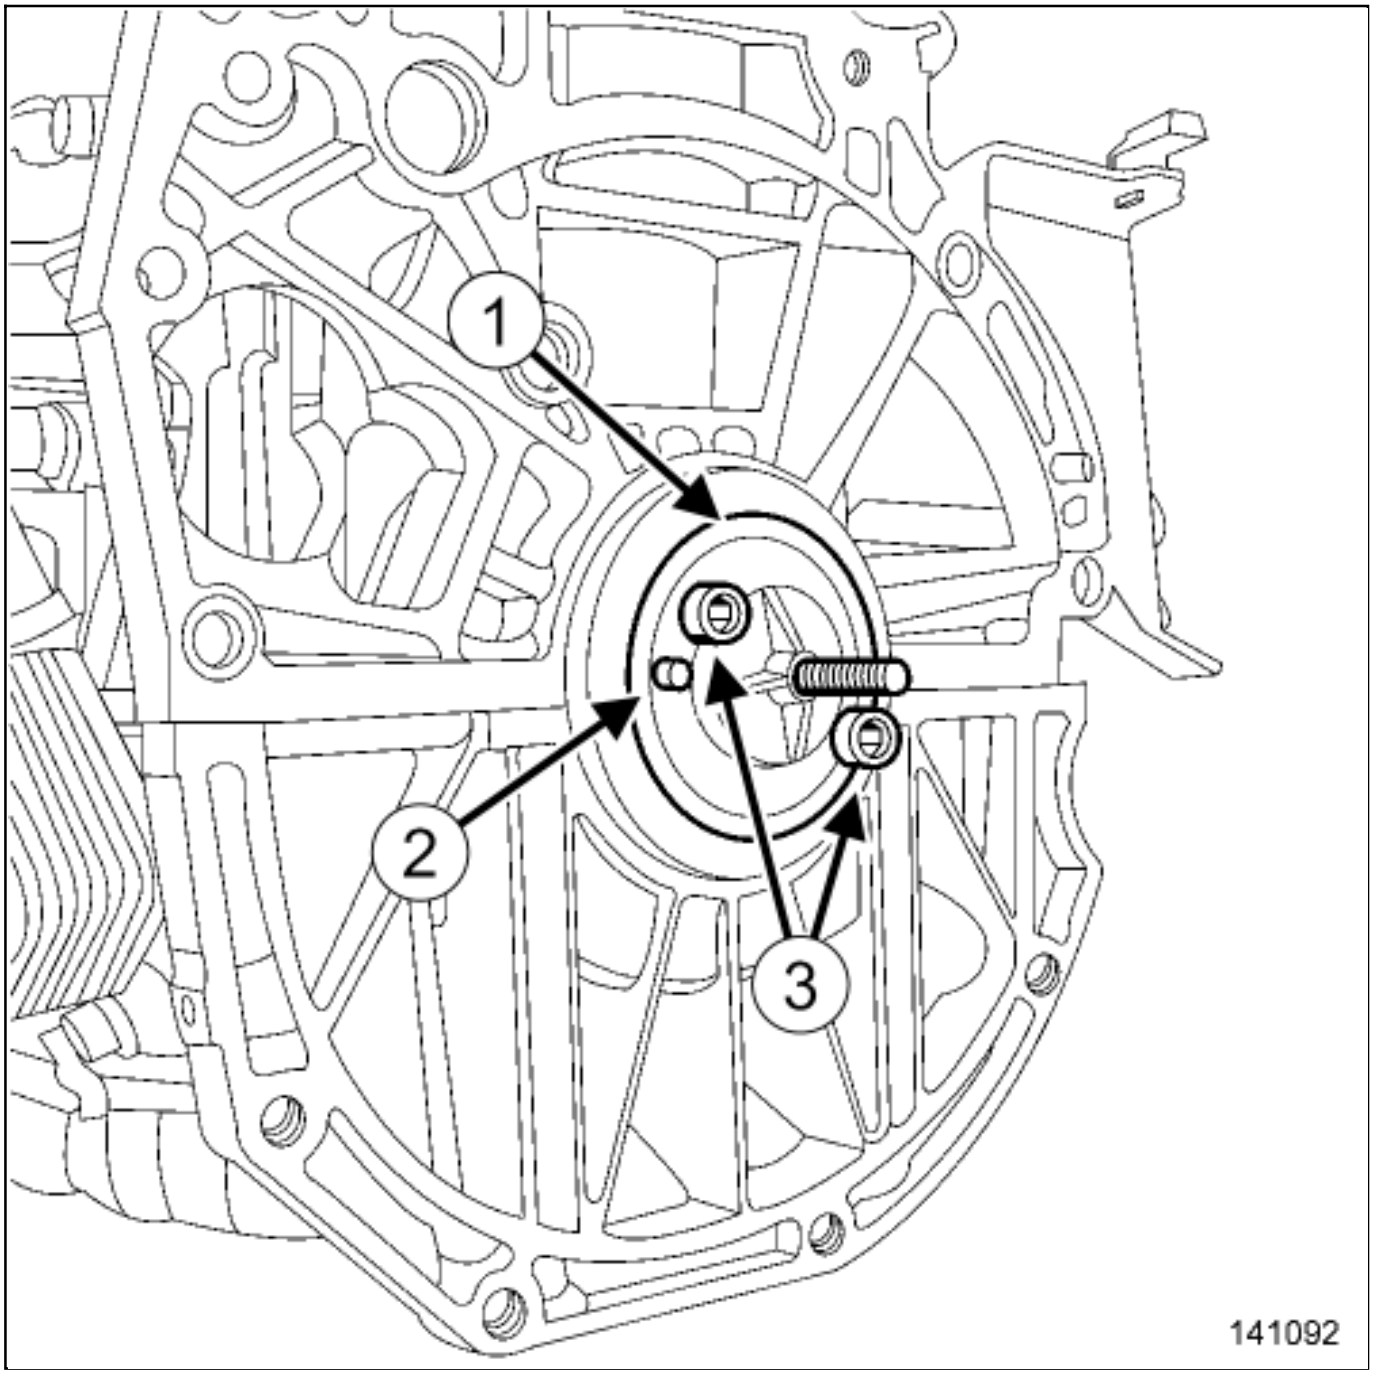
1. REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft seal on gearbox end .



CAUTION

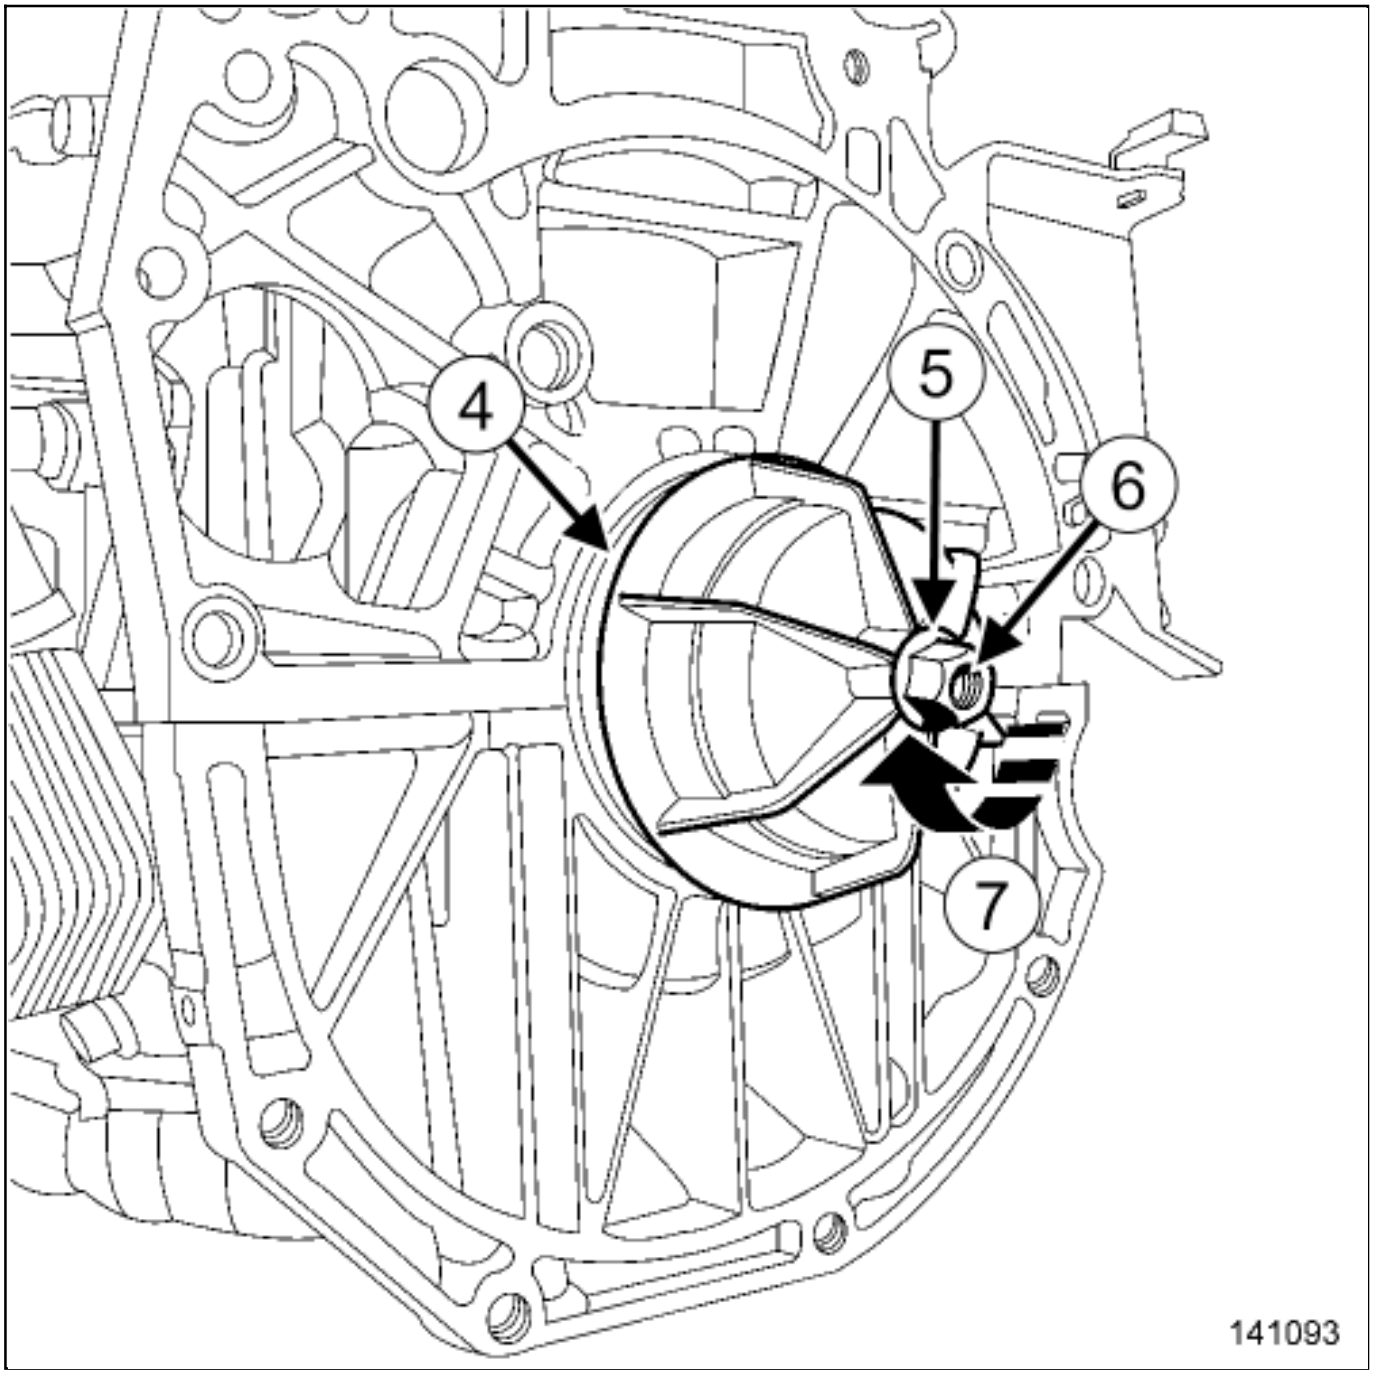
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

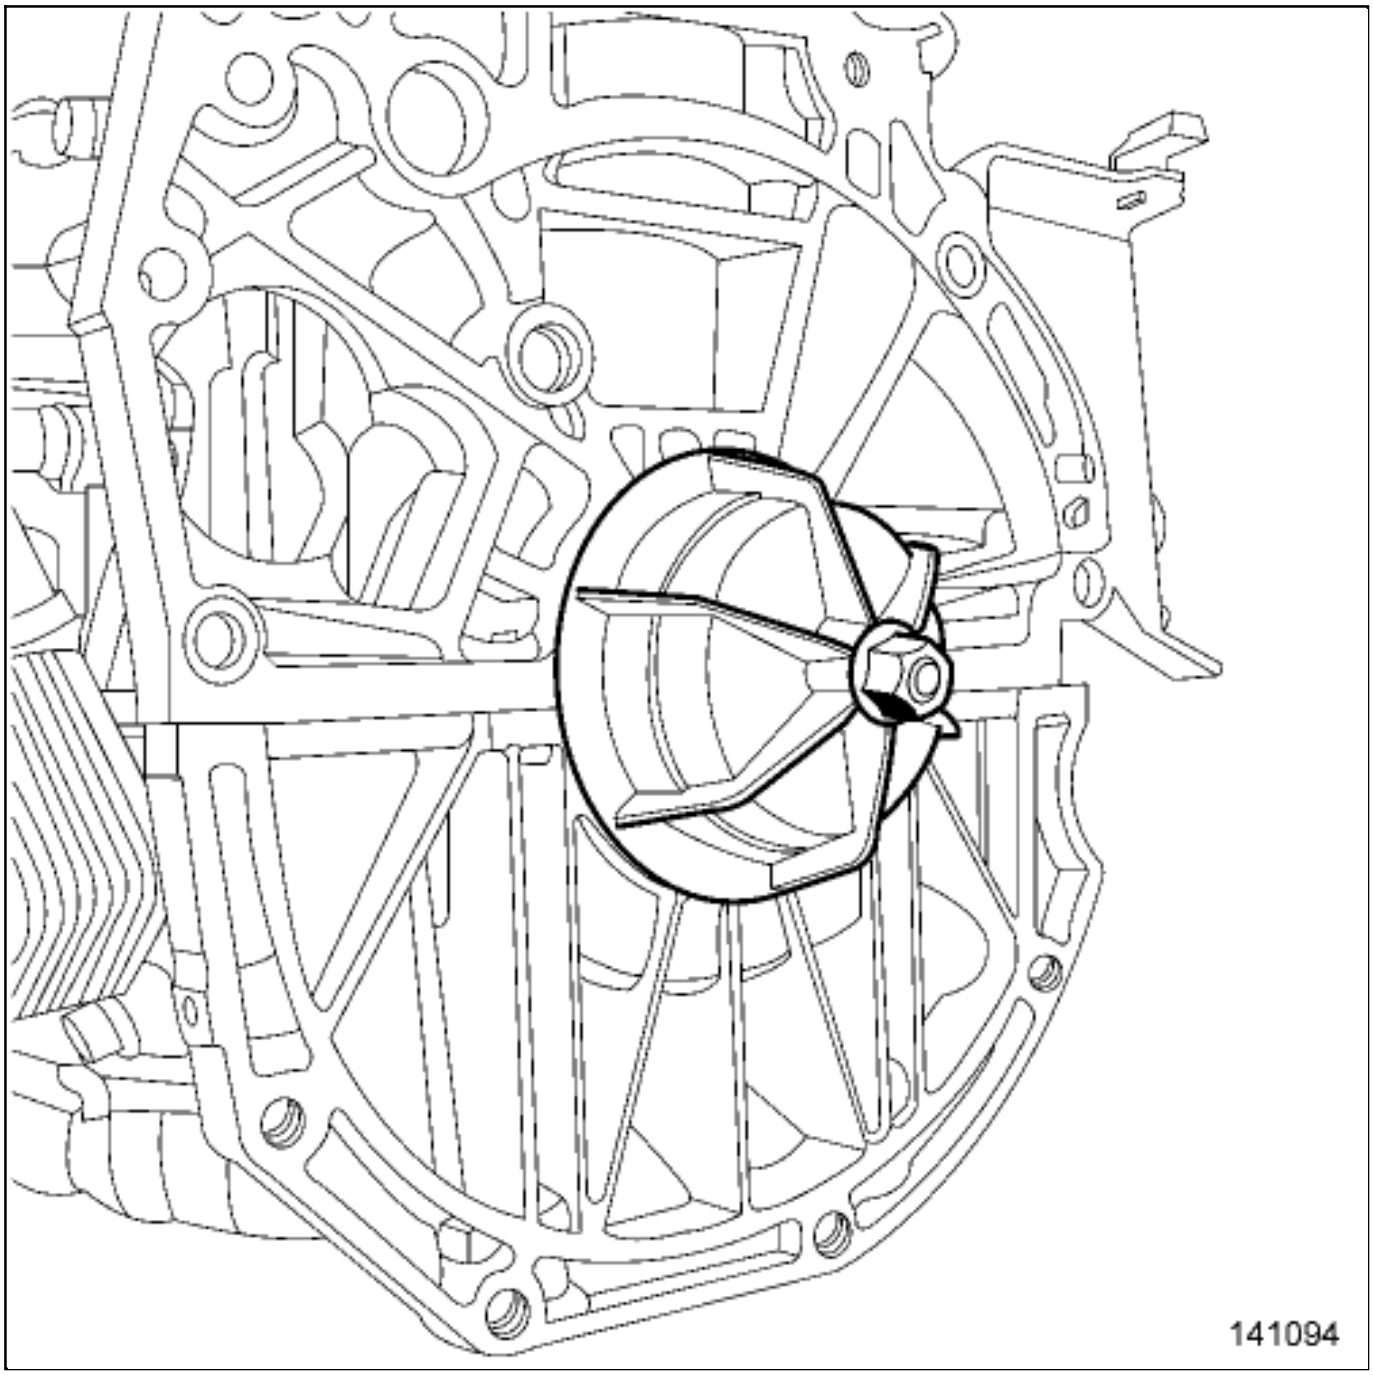
- the seal mating face on the crankshaft,
- the seal housing on the cylinder block.

2. REFITTING OPERATION



Refit a new crankshaft seal on gearbox end(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Fit the centring device(1) of the toolCrankshaft seal fitting tool (flywheel end)(Mot. 1919) on the crankshaft by positioning it on the pin(2) .



Refit two flywheel bolts(3) on the centring device of the toolCrankshaft seal fitting tool (flywheel end) (Mot. 1919) .

Fit:

- the cover(4) of the toolCrankshaft seal fitting tool (flywheel end)(Mot. 1919) ,
- the washer(5) ,
- the nut(6) .

Tighten the nut clockwise(7) until the cover touches the cylinder block.

Remove:

- the nut,
- the washer,
- the cover of the toolCrankshaft seal fitting tool (flywheel end)(**Mot. 1919**) ,

- the flywheel bolts,
- the centring device of the toolCrankshaft seal fitting tool (flywheel end)(**Mot. 1919**) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

CRUISE CONTROL - SPEED LIMITER: LIST AND LOCATION OF COMPONENTS

Equipment required

CYLINDERBLOCK:CLEANING

Note, one or more warnings are present in this procedure

1. CLEANING PREPARATION OPERATION

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

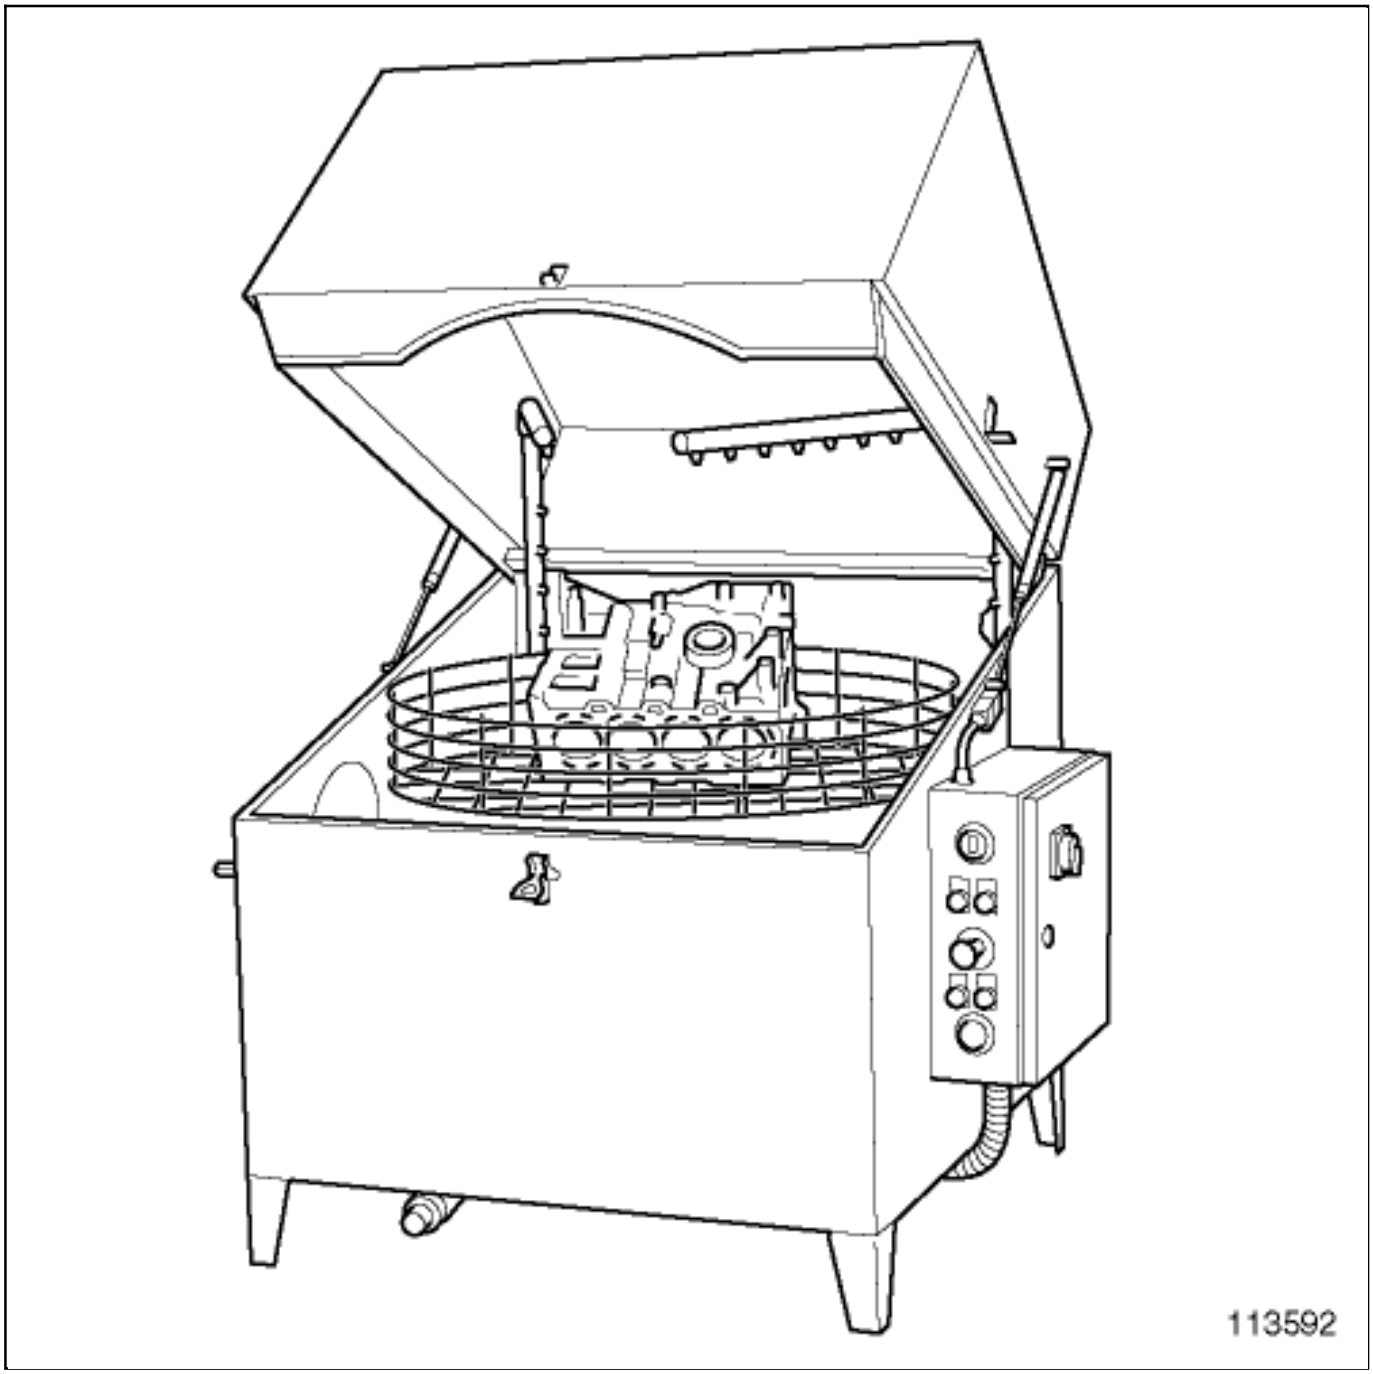
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

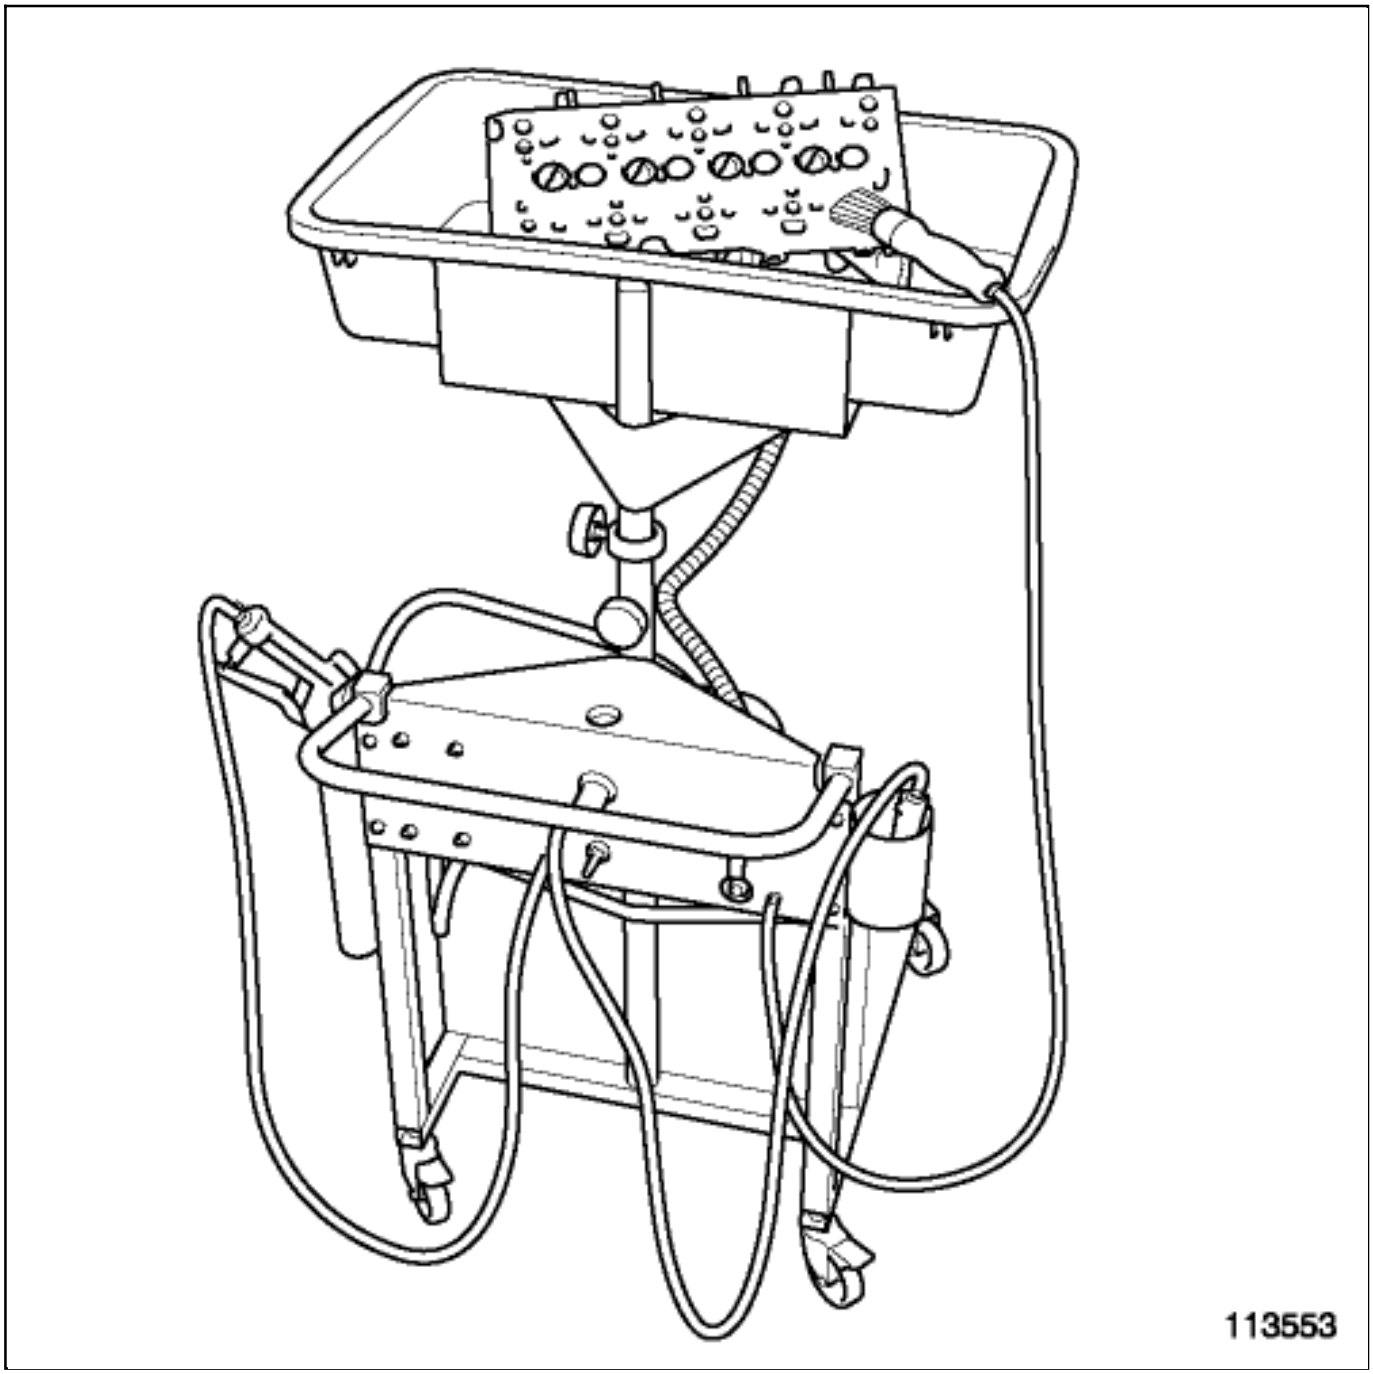
Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

Remove the engine - gearbox assemblyEngine - gearbox assembly: Removal - Refitting .

Place the engine on the component support(see 10A, Engine and cylinder block assembly, Engine support equipment: Use) .



Remove the cylinder block(see 10A, Engine and cylinder block assembly, Cylinder block: Removal - Refitting) .



2. CLEANING THE ENGINE PERIPHERALS

Clean the gasket surfaces of the cylinder block with Super cleaning agent for joint facesVehicle: Parts and consumables for the repair .

Remove the residue using a wooden spatula

Finish cleaning the parts using a grey abrasive pad, part number 77 01 405 943.

113592

Wash the cylinder block using a cleaning fountain or a heated cleaning bath.

3. FINAL OPERATION.

Refit the cylinder block(see 10A, Engine and cylinder block assembly, Cylinder block: Removal - Refitting) .

Refit the engine - gearbox assembly**Engine - gearbox assembly: Removal - Refitting** .

Repair-10x03x01x07-01x46-1-1-1.xml

CYLINDERHEAD:CLEANING

 **Note, one or more warnings are present in this procedure** 

Equipment required
component support
cleaning trough
parts washer

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

1. CLEANING PREPARATION OPERATION

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

Do not allow this product to drip onto the paintwork.

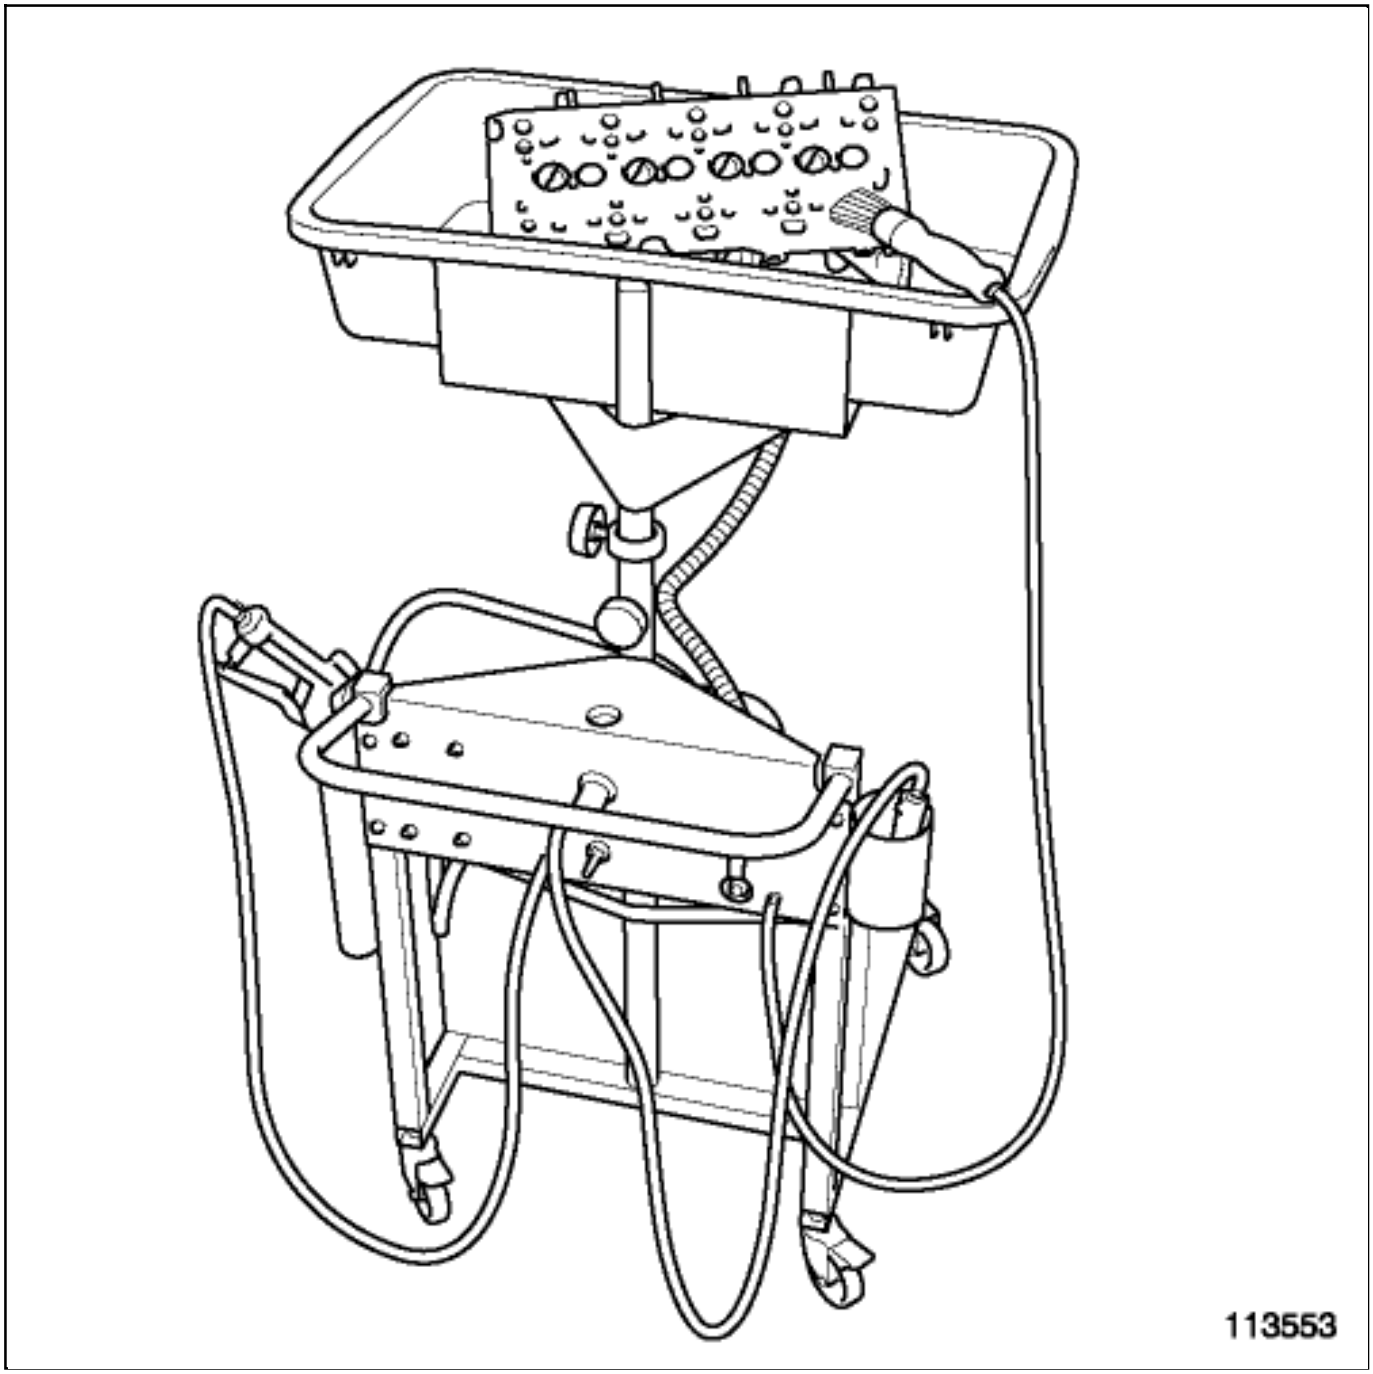
Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

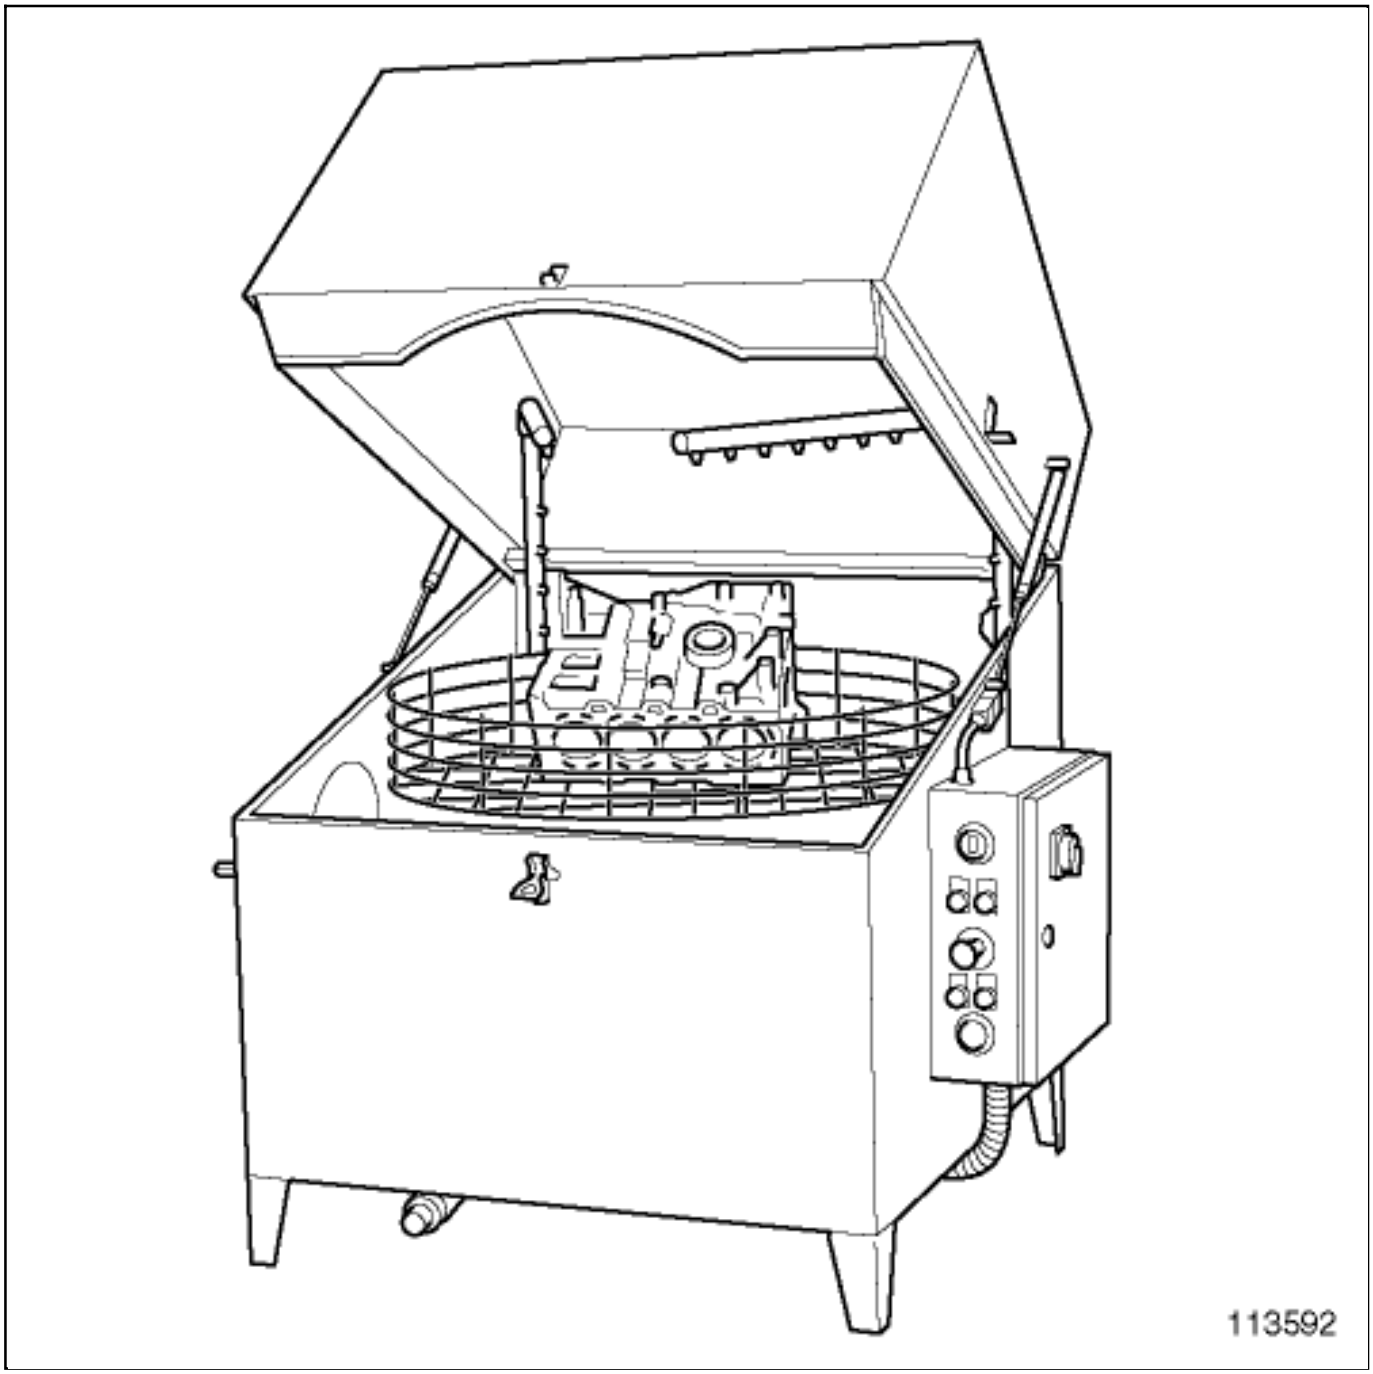
- Remove the engine - gearbox assembly Engine - gearbox assembly: Removal - Refitting .

- Position the engine on the component support (see 10A, Engine and cylinder block assembly, Engine support equipment: Use) .

- Remove the cylinder head (see 10A, Engine and cylinder block assembly, Cylinder head: Removal - Refitting) .



- Strip the cylinder head (see 10A, Engine and cylinder block assembly, Cylinder head: Stripping - Rebuilding) .



2. CLEANING THE CYLINDER HEAD

- Clean the joint face of the cylinder head using Super cleaning agent for joint faces Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

- Remove the residue using a wooden spatula

- Finish cleaning the parts using a grey abrasive pad Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

113553

Wash the cylinder head using a parts washer or a cleaning trough.

3. FINAL OPERATION

Rebuild the cylinder head (see 10A, Engine and cylinder block assembly, Cylinder head: Stripping - Rebuilding) .

Refit the cylinder head(see 10A, Engine and cylinder block assembly, Cylinder head: Removal - Refitting) .

Remove the engine from the component support(see 10A, Engine and cylinder block assembly, Engine support equipment: Use) .

Refit the engine - gearbox assemblyEngine - gearbox assembly: Removal - Refitting .

CYLINDER HEAD: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

parts always to be replaced:
Cylinder head gasket
cylinder head bolts

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced) (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly(see 10A, Engine and cylinder block assembly, Engine - gearbox assembly: Removal - Refitting) .

Separate the automatic gearbox from the engine(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

Position the engine on the component supportEngine support equipment: Use .

Drain the engine(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

Remove:

- the accessories belt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,

the crankshaft accessories pulley(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,

the crankshaft seal on timing end(see 11A, Top and front of engine, Timing assembly: Exploded view) ,

the timing chain(see 11A, Top and front of engine, Timing assembly: Exploded view) ,

the camshaft timing sprockets(see 11A, Top and front of engine, Timing assembly: Exploded view) ,

the camshafts(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,

the catalytic pre-converter(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) ,

the air conditioning compressor(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,

the alternator(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,

the engine oil dipstick(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) ,

the engine oil dipstick guide(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) ,

the multifonction support(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,

the turbo-manifold oil pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REMOVAL OPERATION

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

the cylinder head bolts,

the cylinder head,

the cylinder head gasket.

REFITTING

1. REFITTING PREPARATION OPERATION

CAUTION

Protect the oilway so that foreign bodies do not enter the oil pipes in the cylinder head.

Failure to follow this instruction could lead to the blocking of the oilways, resulting in a rapid deterioration of the camshaft.

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

- Use SUPER CLEANING AGENT FOR JOINT FACES Vehicle: Parts and consumables for the repair to clean:
  - the cylinder block gasket face,
  - the cylinder head joint face.
- Remove the residue using a plastic spatula.
- Finish cleaning the joint faces using a GREY ADHESIVE PAD Vehicle: Parts and consumables for the repair .

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

- Use SURFACE CLEANER Vehicle: Parts and consumables for the repair to clean:
  - the cylinder block gasket face,
  - the cylinder head joint face.
- parts always to be replaced: Cylinder head gasket .
- parts always to be replaced: cylinder head bolts .
- Position the pistons at mid-stroke.
- Check for the cylinder head centring dowels on the cylinder block (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .
- Refit a new cylinder head gasket (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

2. REFITTING OPERATION

CAUTION

In order to ensure that the bolts are correctly tightened, use a syringe to remove any oil which may be in the cylinder head mounting holes.

Note:

Do not oil the new bolts. Always lubricate the bolts if they are being reused.

CAUTION

Do not retighten the cylinder head bolts after applying this procedure.

Refit (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the new cylinder head gasket,
- the cylinder head,
- the new cylinder head bolts.

3. FINAL OPERATION

Proceed in the reverse order to removal.

CYLINDER HEAD: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

parts always to be replaced:
Cylinder head gasket
cylinder head bolts

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced) (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly Engine - gearbox assembly: Removal - Refitting .

Separate the automatic gearbox from the engine Automatic gearbox: Removal - Refitting .

Position the engine on the component support Engine support equipment: Use .

Drain the engine Engine oil - Oil filter : Draining - Filling .

Remove:

- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,

- the dashboard flange.

Remove:

- the bolt from the windscreen aperture cross member(4) ,
- the bolts from the cross member on each side(3) .

Remove:

- the side bolts(5) ,
- the dashboard cross member (this operation requires two people).

REFITTING

1. REFITTING OPERATION

- Refit the dashboard cross member (this operation requires two people).
- Proceed in the reverse order to removal.
- Carry out a function test on all functions.

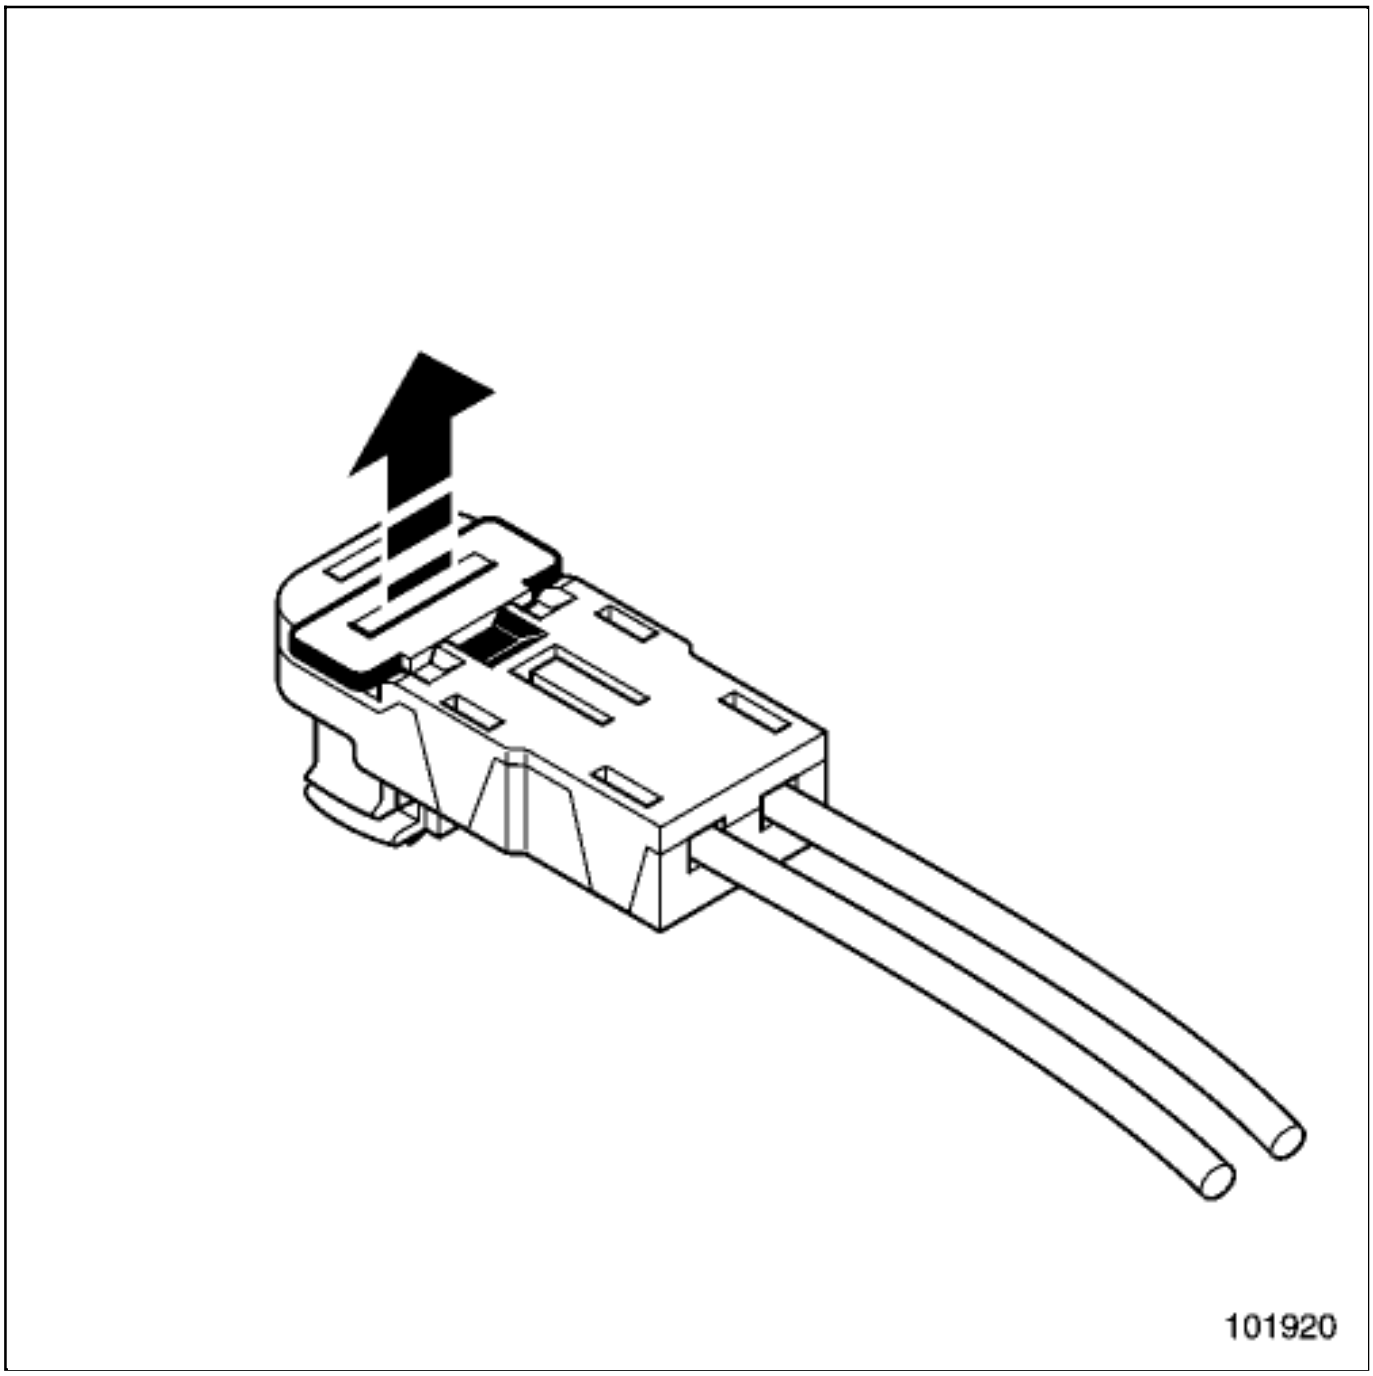
Repair-40x06x12x02-01x37-1-23-1.xml

XSL version : 3.02 du 22/07/11

DASHBOARD:REMOVAL-REFITTING

 **Note, one or more warnings are present in this procedure** 

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 57A, Interior equipment, Dashboard assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the windscreen pillar trims Interior body side trim assembly: Exploded view ,
  - the glovebox (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
  - the right-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
  - the airbag inhibitor switch Passenger compartment switches : List and location of components ,
  - the centre console,
  - the card reader Immobiliser system: List and location of components ,
  - the start button Immobiliser system: List and location of components .
- Remove:
  - the centre front panel trim (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,

- the navigation keypad Navigation: List and location of components ,
- the hazard warning lights and central door control Hazard warning lights and central door control: Removal - Refitting ,
- the radionavigation, radio or radio display Navigation: List and location of components and Radio: List and location of components ,
- the multimedia network interface unit Navigation: List and location of components ,
- the centre front panel support (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the air conditioning control panel Passenger compartment heating and ventilation assembly: Exploded view ,
- the dashboard lower trim (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the passenger compartment central unit UCH: Removal - Refitting ,
- the driver's front airbag Driver's frontal airbag: Removal - Refitting ,
- the steering wheel Steering assembly: Exploded view ,
- the under steering wheel shell (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the steering column switch assembly Control - Signals: List and location of components ,
- the left-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the dashboard centre visor (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the instrument panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the tweeters from the upper section of the dashboard (see 57A, Interior equipment, Dashboard assembly: Exploded view) .

2. REMOVAL OPERATION

- Unlock the passenger front airbag connector.
- Disconnect the passenger front airbag connector.
- Remove the passenger front airbag bolts on the cross member.
-

Remove the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .

Move the dashboard away slightly.

CAUTION

To prevent any risk of noise, premature wear, short circuits, etc. after the refitting operation, mark the wiring routing and how to connect the connectors.

Remove the dashboard (this operation requires two people).

1- IN THE EVENT OF REPLACEMENT

Remove:

- the dashboard centre air vent(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the dashboard air vents(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the passenger front airbagPassenger's frontal airbag: Removal - Refitting .

REFITTING

1. REFITTING OPERATION

Refit the wiring in the position marked during the removal operation.

CAUTION

To prevent damage to the wiring harness when refitting, observe the original routing.

Fit the dashboard (this operation requires two people).

CAUTION

To guarantee a good electrical connection, make sure that the wiring does not place any stress on the connectors or the surrounding components.

- Refit the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .
- Torque tighten the passenger front airbag bolts on the dashboard cross member12 N.m.
- Connect the passenger front airbag connectors.
- Lock the passenger's front airbag connectors.

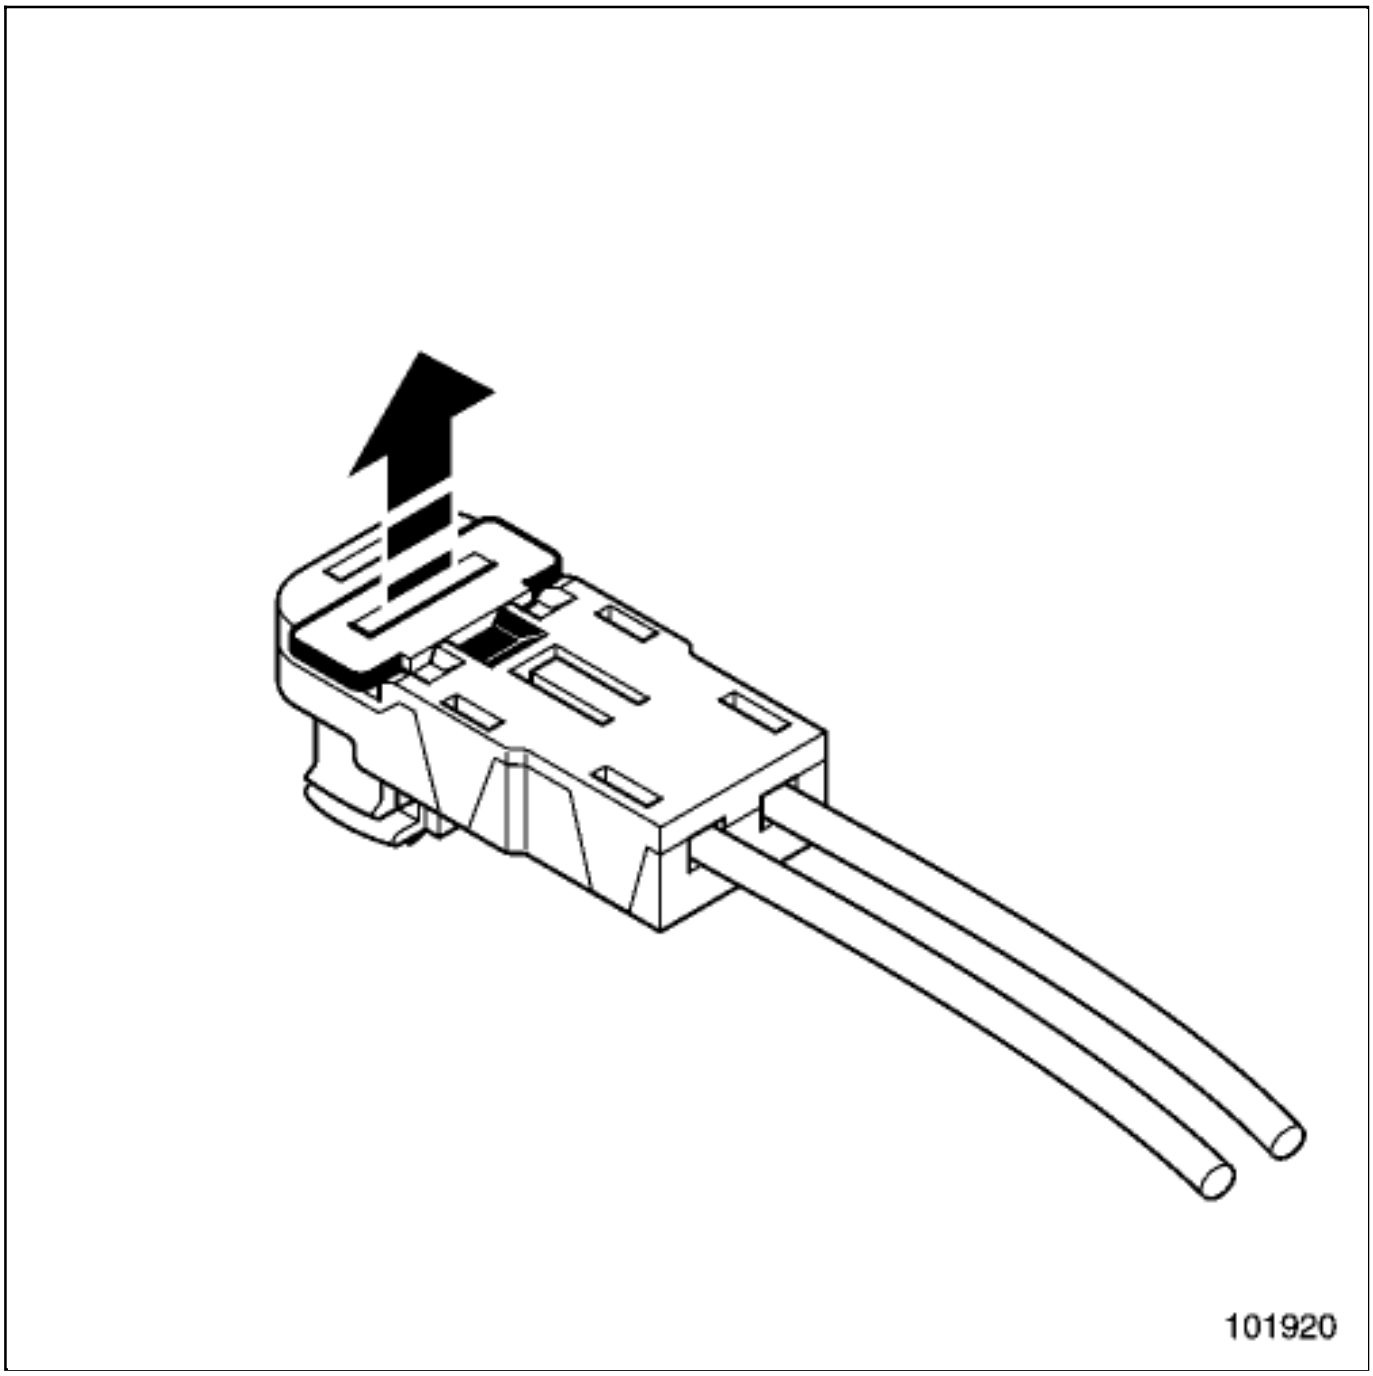
2. FINAL OPERATION

- Proceed in the reverse order to removal.
- Carry out a function test on all functions.

DASHBOARD:REMOVAL-REFITTING

 **Note, one or more warnings are present in this procedure** 

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 57A, Interior equipment, Dashboard assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the windscreen pillar trims Interior body side trim assembly: Exploded view ,
  - the glovebox (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
  - the right-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
  - the airbag inhibitor switch Passenger compartment switches : List and location of components ,
  - the centre console,
  - the card reader Immobiliser system: List and location of components ,
  - the start button Immobiliser system: List and location of components .
- Remove:
  - the centre front panel trim (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,

- the navigation keypad Navigation: List and location of components ,
- the hazard warning lights and central door control Hazard warning lights and central door control: Removal - Refitting ,
- the radionavigation, radio or radio display Navigation: List and location of components and Radio: List and location of components ,
- the multimedia network interface unit Navigation: List and location of components ,
- the centre front panel support (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the air conditioning control panel Passenger compartment heating and ventilation assembly: Exploded view ,
- the dashboard lower trim (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the passenger compartment central unit UCH: Removal - Refitting ,
- the driver's front airbag Driver's frontal airbag: Removal - Refitting ,
- the steering wheel Steering assembly: Exploded view ,
- the under steering wheel shell (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the steering column switch assembly Control - Signals: List and location of components ,
- the left-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the dashboard centre visor (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the instrument panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the tweeters from the upper section of the dashboard (see 57A, Interior equipment, Dashboard assembly: Exploded view) .

2. REMOVAL OPERATION

- Unlock the passenger front airbag connector.
- Disconnect the passenger front airbag connector.
- Remove the passenger front airbag bolts on the cross member.
-

Remove the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .

Move the dashboard away slightly.

CAUTION

To prevent any risk of noise, premature wear, short circuits, etc. after the refitting operation, mark the wiring routing and how to connect the connectors.

Remove the dashboard (this operation requires two people).

1- IN THE EVENT OF REPLACEMENT

Remove:

- the dashboard centre air vent(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the dashboard air vents(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the passenger front airbagPassenger's frontal airbag: Removal - Refitting .

REFITTING

1. REFITTING OPERATION

Refit the wiring in the position marked during the removal operation.

CAUTION

To prevent damage to the wiring harness when refitting, observe the original routing.

Fit the dashboard (this operation requires two people).

CAUTION

To guarantee a good electrical connection, make sure that the wiring does not place any stress on the connectors or the surrounding components.

- Refit the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .
- Torque tighten the passenger front airbag bolts on the dashboard cross member12 N.m.
- Connect the passenger front airbag connectors.
- Lock the passenger's front airbag connectors.

2. FINAL OPERATION

- Proceed in the reverse order to removal.
- Carry out a function test on all functions.

DASHBOARD:REMOVAL-REFITTING

 **Note, one or more warnings are present in this procedure** 

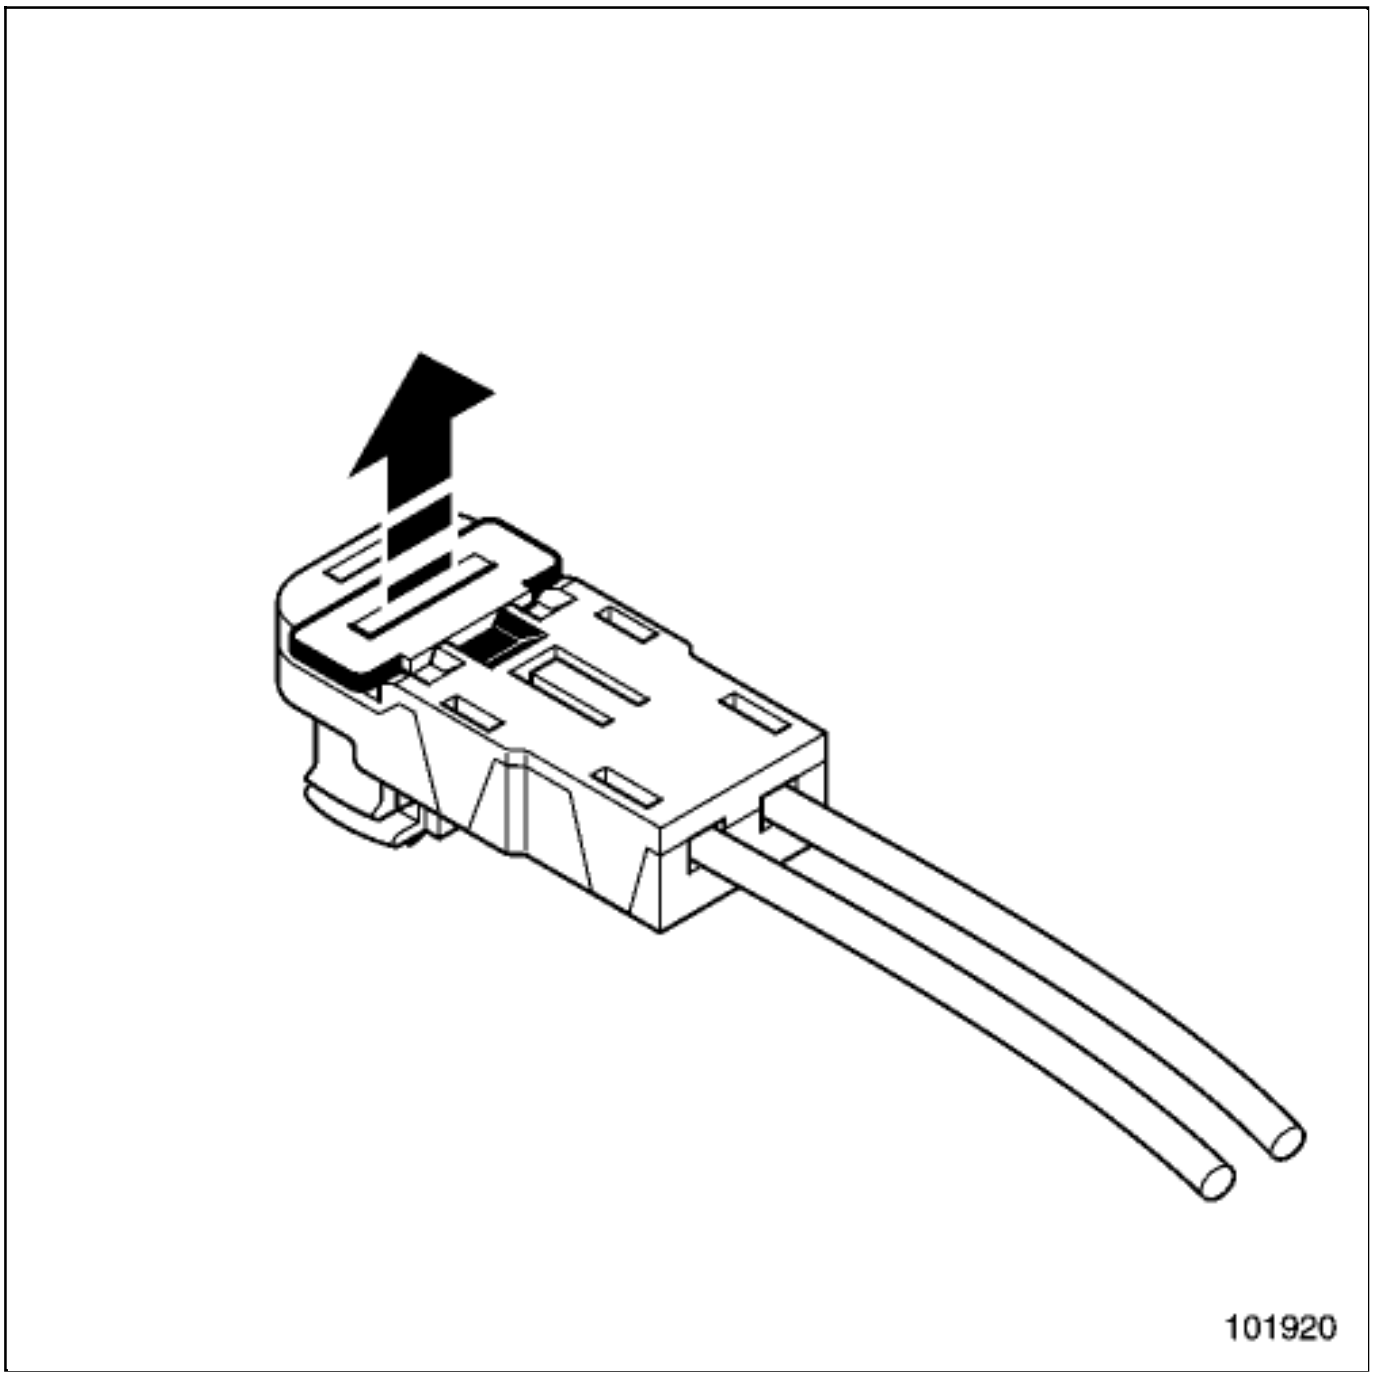
Location and specifications (tightening torques, parts always to be replaced, etc.)(see 57A, Interior equipment, Dashboard assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Disconnect the battery Battery: Removal - Refitting .

Remove:



- the windscreen pillar trims Interior body side trim assembly: Exploded view ,
- the glovebox (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the right-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the airbag inhibitor switch Passenger compartment switches : List and location of components ,
- the centre console,
- the card reader Immobiliser system: List and location of components ,
- the start button Immobiliser system: List and location of components .

Disconnect the front starting aerial connector.

Remove:

- the centre front panel trim (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the navigation keypad Navigation: List and location of components,
- the hazard warning lights and central door control Hazard warning lights and central door control: Removal - Refitting,
- the radionavigation, radio or radio display Navigation: List and location of components and Radio: List and location of components,
- the multimedia network interface unit Navigation: List and location of components,
- the centre front panel support (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the air conditioning control panel Passenger compartment heating and ventilation assembly: Exploded view,
- the dashboard lower trim (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the passenger compartment central unit UCH: Removal - Refitting,
- the driver's front airbag Driver's frontal airbag: Removal - Refitting,
- the steering wheel Steering assembly: Exploded view,
- the under steering wheel shell (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the steering column switch assembly Control - Signals: List and location of components,
- the left-hand dashboard side panel (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the dashboard centre visor (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the instrument panel (see 57A, Interior equipment, Dashboard assembly: Exploded view),
- the tweeters from the upper section of the dashboard (see 57A, Interior equipment, Dashboard assembly: Exploded view).

2. REMOVAL OPERATION

- Unlock the passenger front airbag connector.
- Disconnect the passenger front airbag connector.
-

Remove the passenger front airbag bolts on the cross member.

Remove the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .

Move the dashboard away slightly.

CAUTION

To prevent any risk of noise, premature wear, short circuits, etc. after the refitting operation, mark the wiring routing and how to connect the connectors.

Remove the dashboard (this operation requires two people).

1- IN THE EVENT OF REPLACEMENT

Remove:

- the dashboard centre air vent(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the dashboard air vents(see 57A, Interior equipment, Dashboard assembly: Exploded view) ,
- the passenger front airbagPassenger's frontal airbag: Removal - Refitting .

REFITTING

1. REFITTING OPERATION

Refit the wiring in the position marked during the removal operation.

CAUTION

To prevent damage to the wiring harness when refitting, observe the original routing.

- Fit the dashboard (this operation requires two people).

CAUTION

To guarantee a good electrical connection, make sure that the wiring does not place any stress on the connectors or the surrounding components.

- Refit the dashboard screws(see 57A, Interior equipment, Dashboard assembly: Exploded view) .
- Torque tighten the passenger front airbag bolts on the dashboard cross member12 N.m.
- Connect the passenger front airbag connectors.
- Lock the passenger's front airbag connectors.

2. FINAL OPERATION

- Proceed in the reverse order to removal.
- Carry out a function test on all functions.

DECORATIVESTRIP :REPLACEMENT

Note, one or more warnings are present in this procedure

Equipment required
heat stripper

1. REMOVAL

1- REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 55A, Exterior protection, Decorative strip : Precautions for the repair) ,
- Vehicle: Precautions for the repair .

2- REMOVAL OPERATION

Use a heat stripperto take off the decorative strips.

Note:

It is essential to move the heat stripper back and forth continously and not too close to the element, to avoid damaging the support.

Clean any traces of residual adhesive using a lint-free clothsoaked in heptaneVehicle: Parts and consumables for the repair .

Note:

It is recommended to sand and polish any paint grain on the bonding area of the decorative strip.

Wipe the bonding area using a lint-free clothsoaked in heptane**Vehicle: Parts and consumables for the repair** .

2. REFITTING

1- REFITTING PREPARATION OPERATION

Wipe the bonding area using a clean, dry lint-free clothin one direction only.

Note:

Check for any dirt on the clean, dry lint-free cloth. If any traces of dirt are found, repeat the cleaning operation.

Note:

In the event of a painting, the laying of decorative strips will be performed 48 hafter painting.

2- REFITTING

Alignment process and fitting order of the decorative strip are specific for each model. Installation instructions, depending on the model, is supplied with the decorative strip.

Two operators are required for laying of decorative strips of large surface area.

Laying a decorative strip is usually done from the middle of the support and then by swiping outward with the squeegee.

Once the alignment process has been carried out, remove the central strip to finalise the position.

After laying, a line may appear on the central strip area on the decorative strip. It will disappear a few minutes or hours in paint booth to 60˚C.

XSL version : 3.02 du 22/07/11

DECORATIVE STRIP : PRECAUTIONS FOR THE REPAIR

1. ENVIRONMENTAL RECOMMENDATIONS

1- THE LAYING OF VARIOUS DECORATIVE STRIPS WILL BE PERFORMED ACCORDING TO THE FOLLOWING CONDITIONS:

Note:

In the event of a painting, the laying of decorative strips will be performed 48 hafter painting.

- in a temperature range between 15˚Cand 30˚C,
- storage of the vehicle as well as decorative strips at workstation 6to 12 hbefore use is necessary to avoid shocks,
- avoid temperature difference at 10˚Cbetween the decorative strip and the support,
- the laying must be performed in a dust-free local, without airflow (preparation area or painting booth),
- alignment process will be provided by the installation instructions and fitting order in case of decorative strips in several elements,
- use the kit of squeegees for laying decorative strips**Vehicle: Parts and consumables for the repair** ,
- according to the size of the decorative strips (ie decorative strips for roof panel), two people are required to perform the laying.

Note:

Do not wash the vehicle before 48 hafter the operation.

XSL version : 3.02 du 22/07/11

DECORATIVE STRIP : PRECAUTIONS FOR THE REPAIR

1. ENVIRONMENTAL RECOMMENDATIONS

1- THE LAYING OF VARIOUS DECORATIVE STRIPS WILL BE PERFORMED ACCORDING TO THE FOLLOWING CONDITIONS:

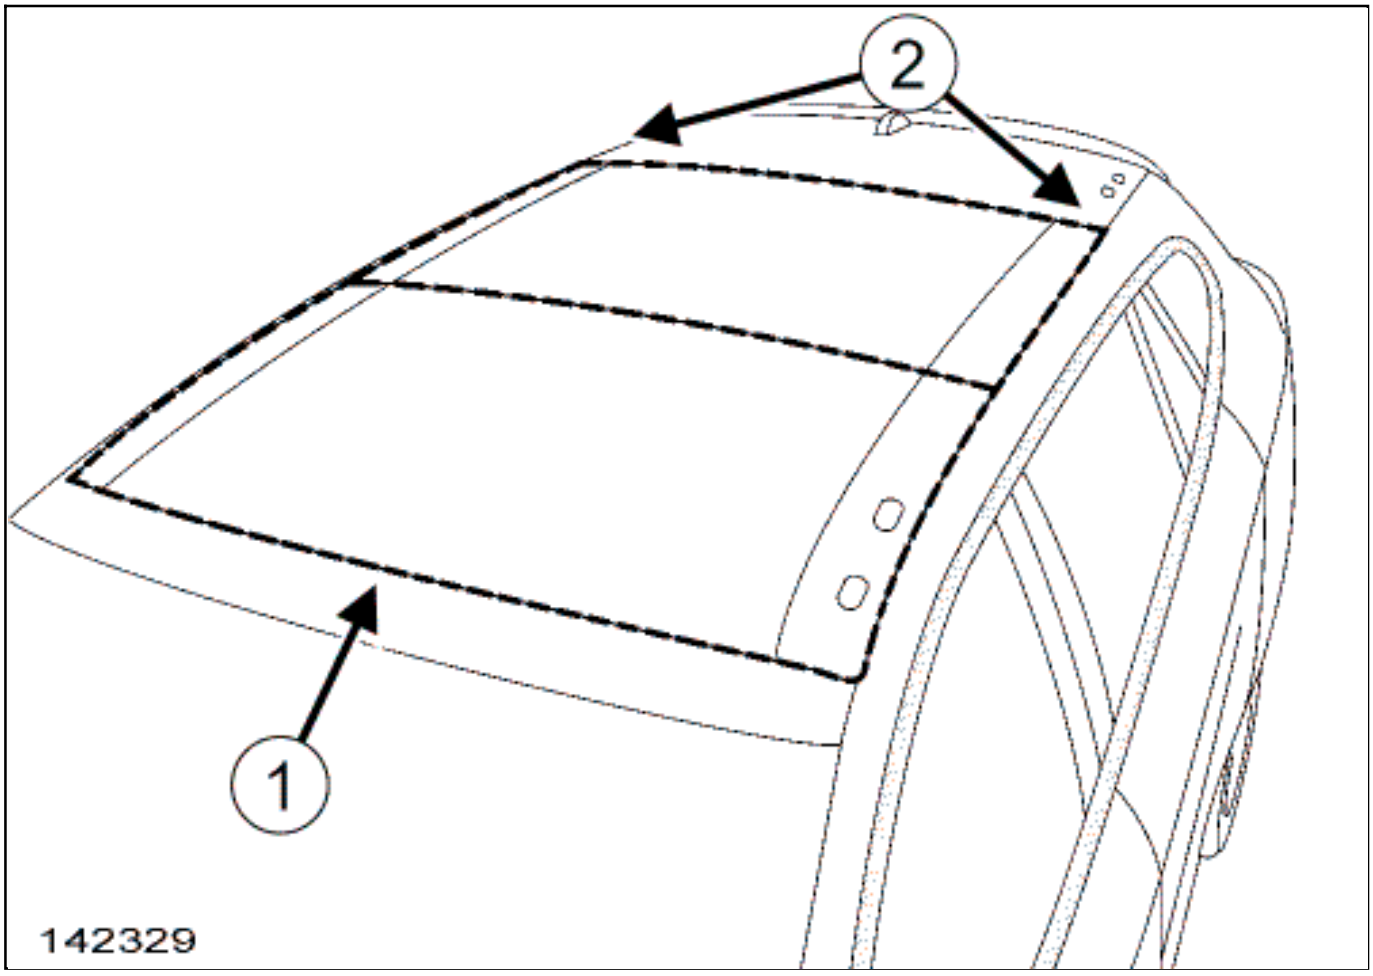
Note:

In the event of a painting, the laying of decorative strips will be performed 48 hafter painting.

- in a temperature range between 15˚Cand 30˚C,
- storage of the vehicle as well as decorative strips at workstation 6to 12 hbefore use is necessary to avoid shocks,
- avoid temperature difference at 10˚Cbetween the decorative strip and the support,
- the laying must be performed in a dust-free local, without airflow (preparation area or painting booth),
- alignment process will be provided by the installation instructions and fitting order in case of decorative strips in several elements,
- use the kit of squeegees for laying decorative strips**Vehicle: Parts and consumables for the repair** ,
- according to the size of the decorative strips (ie decorative strips for roof panel), two people are required to perform the laying.

Note:

Do not wash the vehicle before 48 hafter the operation.



XSL version : 3.02 du 22/07/11

DETACHMENT OF THE ROOF FRAMES: DESCRIPTION

Note, one or more warnings are present in this procedure

Special tooling required	
Wire insertion tool for removing bonded mirror glass.	Car. 1033

(1) Cement bead

(2) Piercing area of cement bead

1. PREPARATION

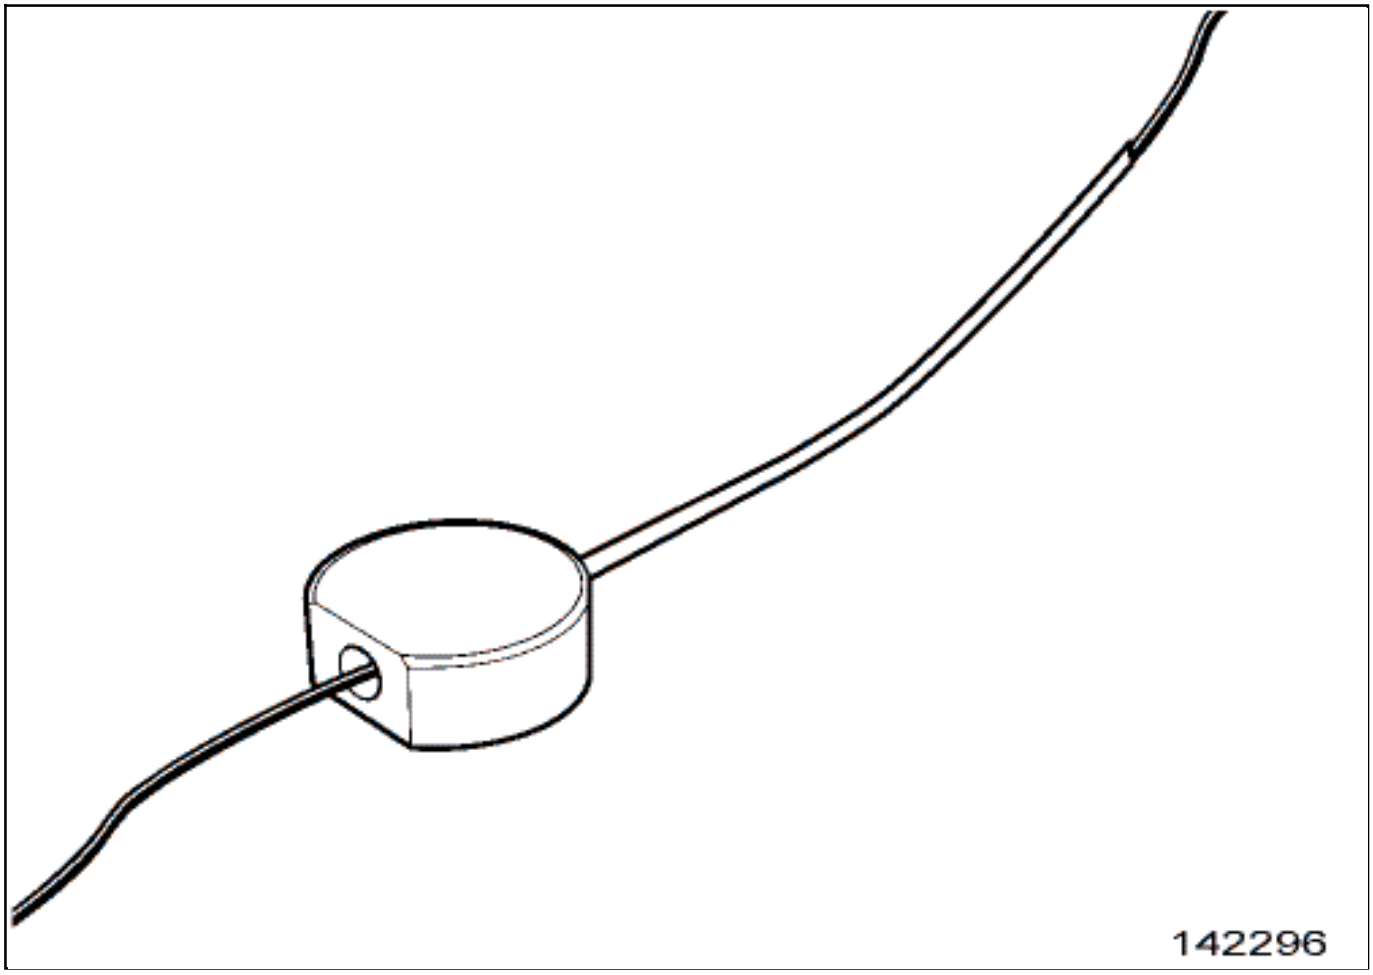
WARNING

Wear protective gloves and goggles when cutting the window or sunroof operating mechanism.

Use an appropriate work station when replacing a sunroof operating mechanism.

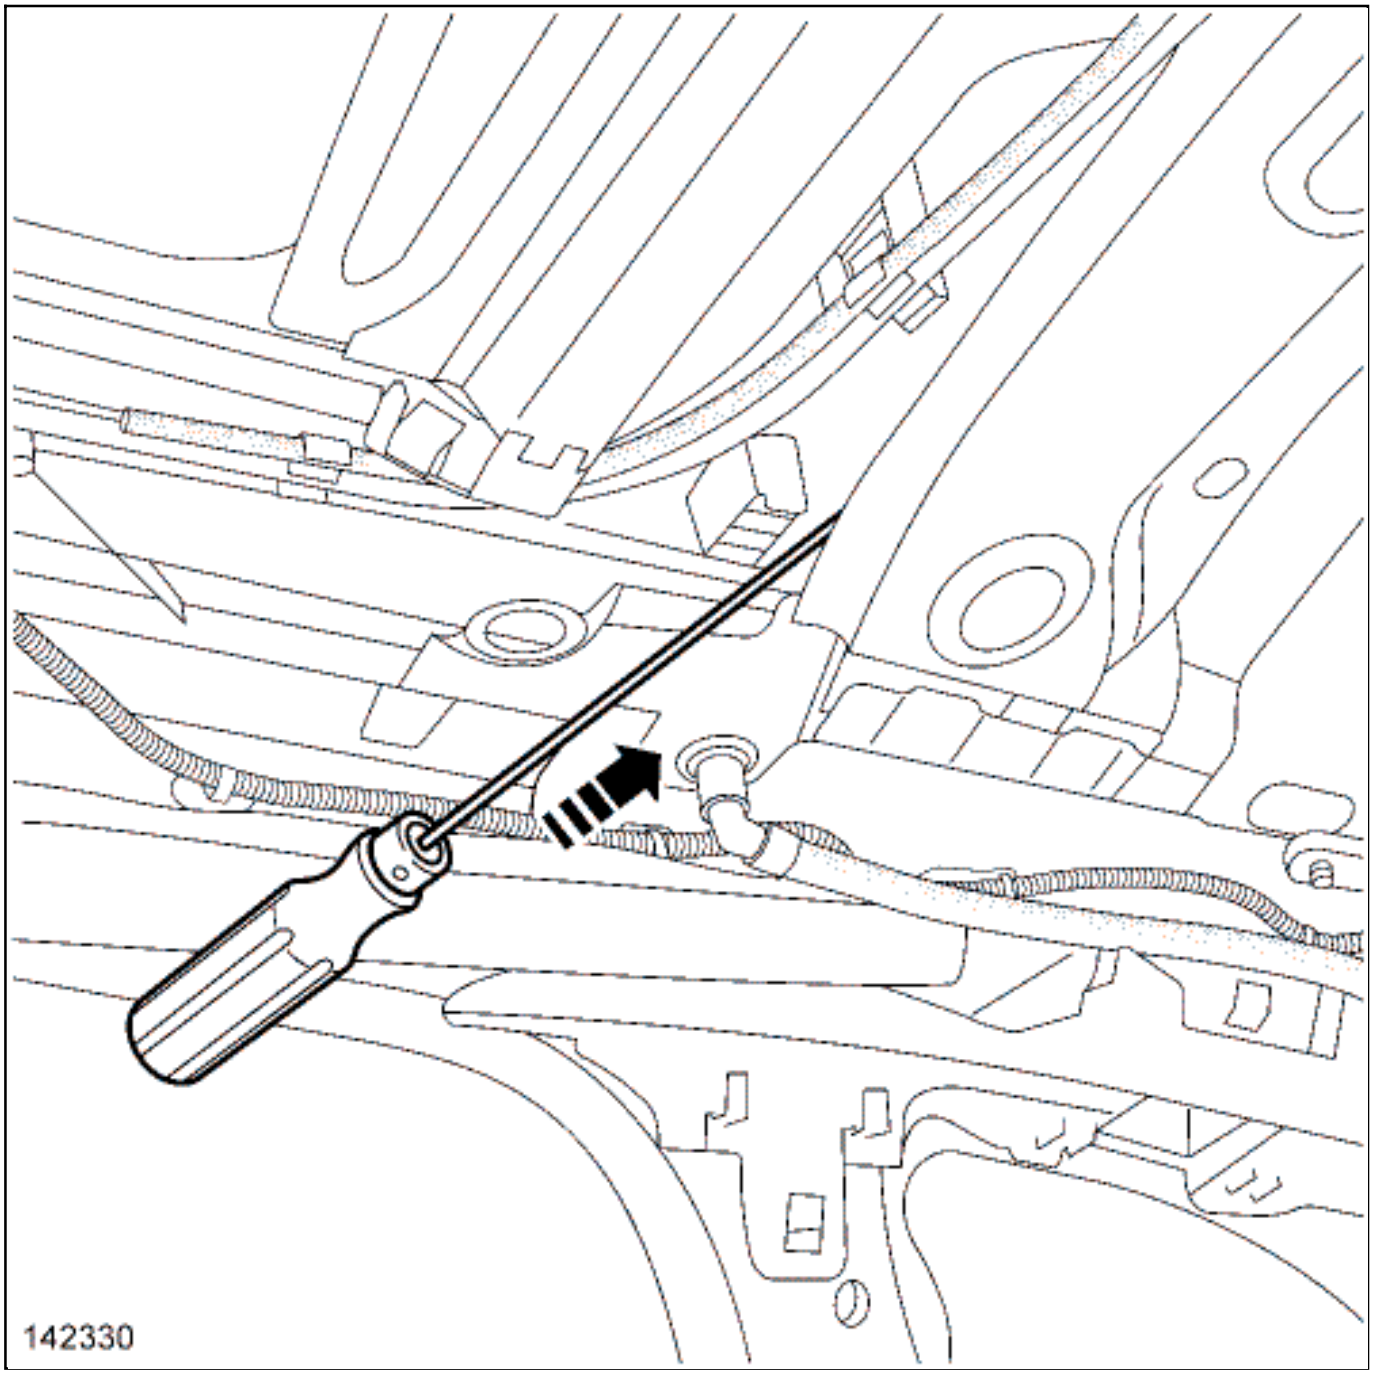
Protect the vehicle interior.

Open the mobile panel halfway.



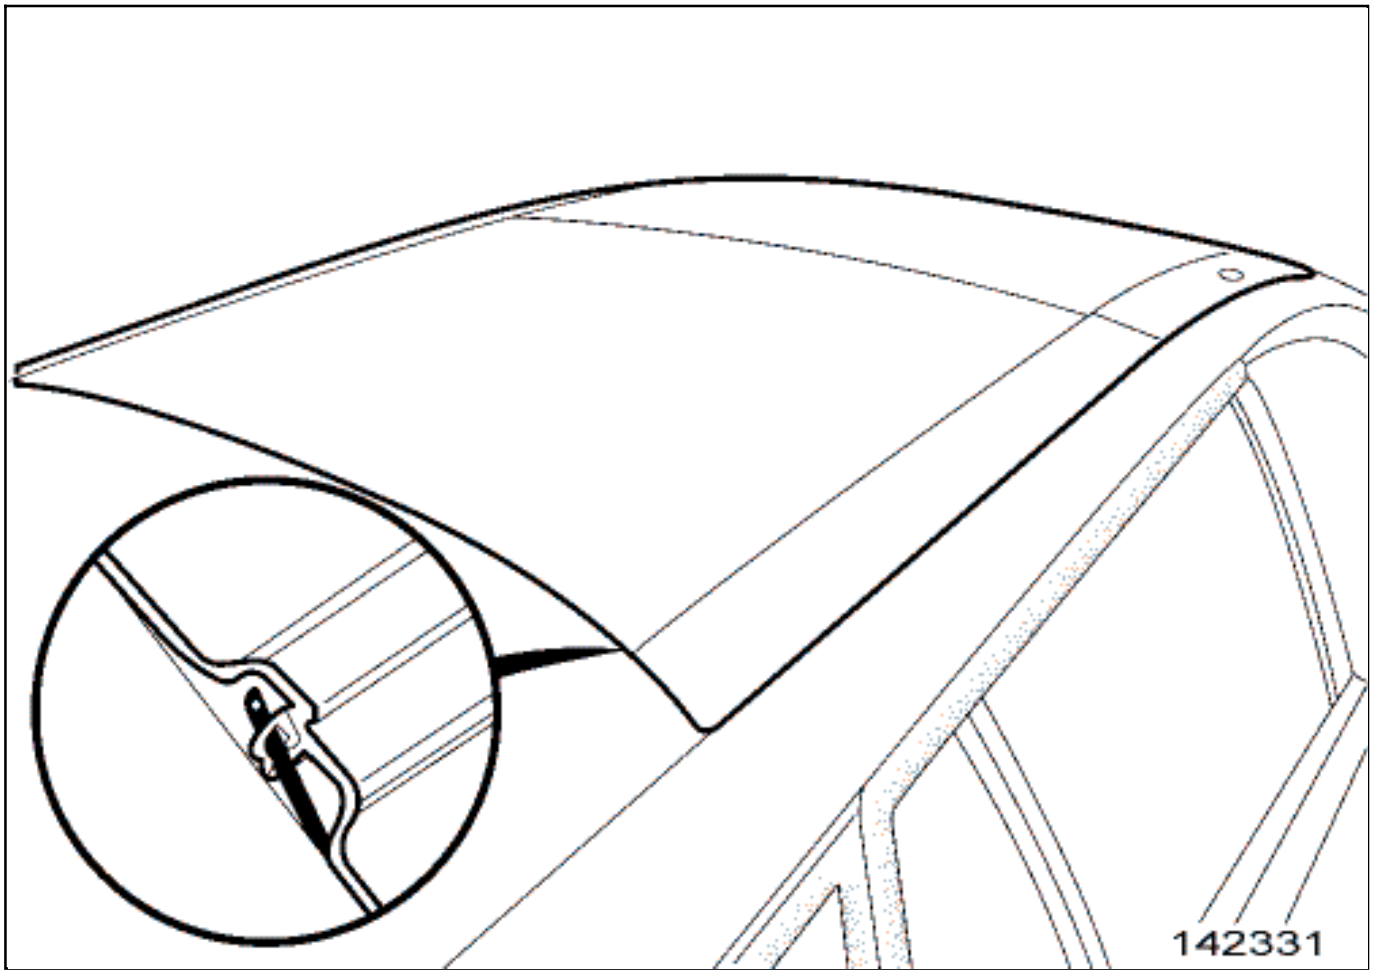
Remove the headlining (see MR for the vehicle concerned).

Protect the area around the sunroof operating mechanism with masking tape.

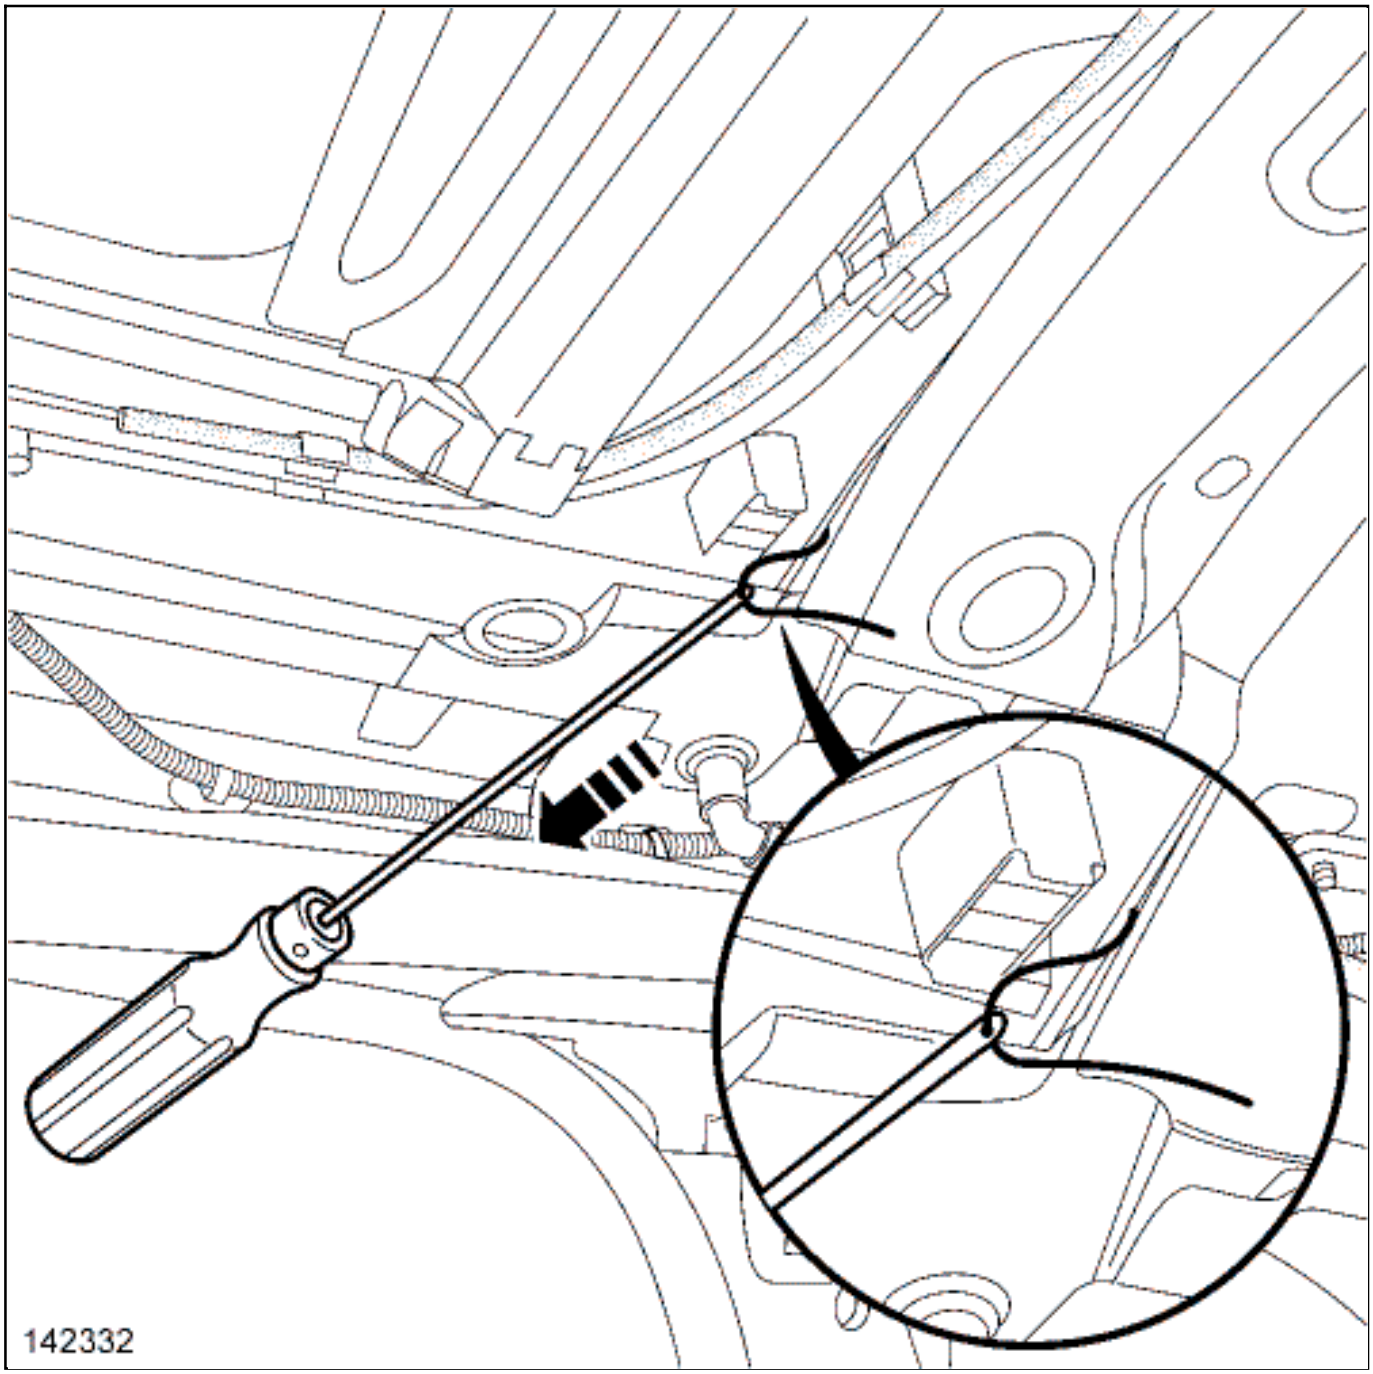


2. CUTTING

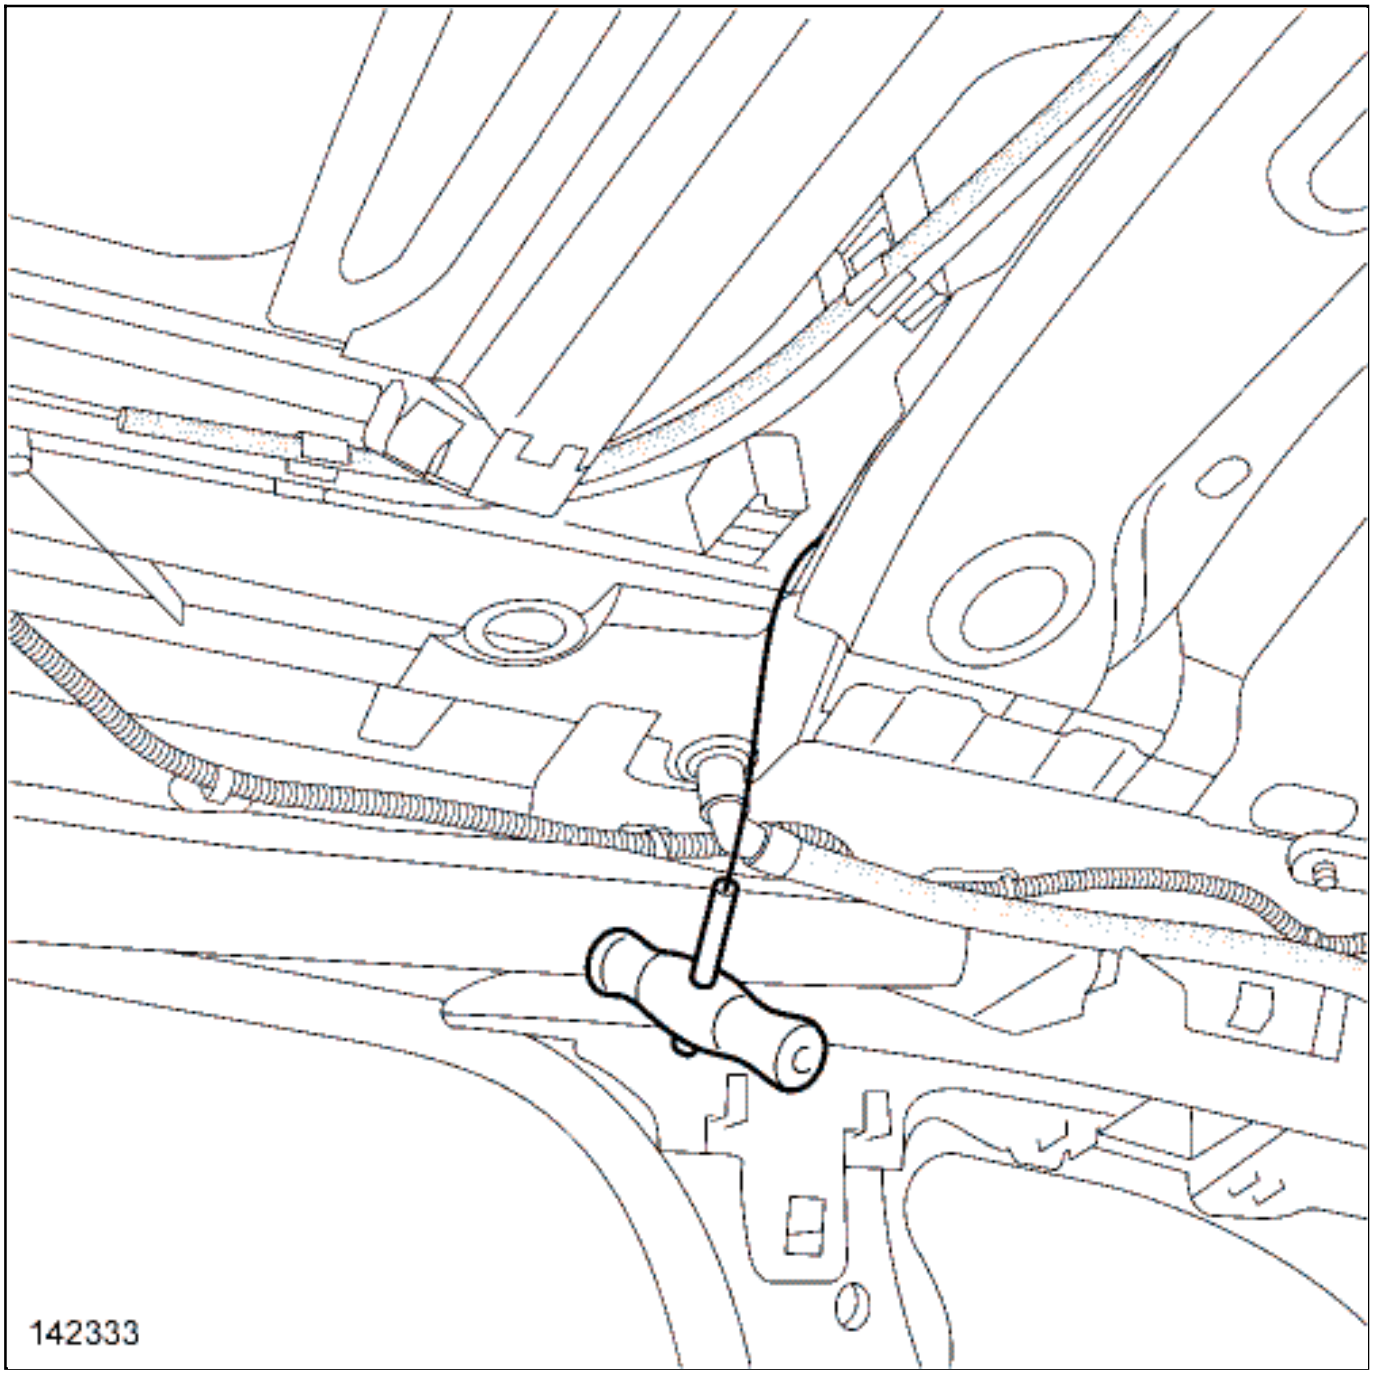
Note:



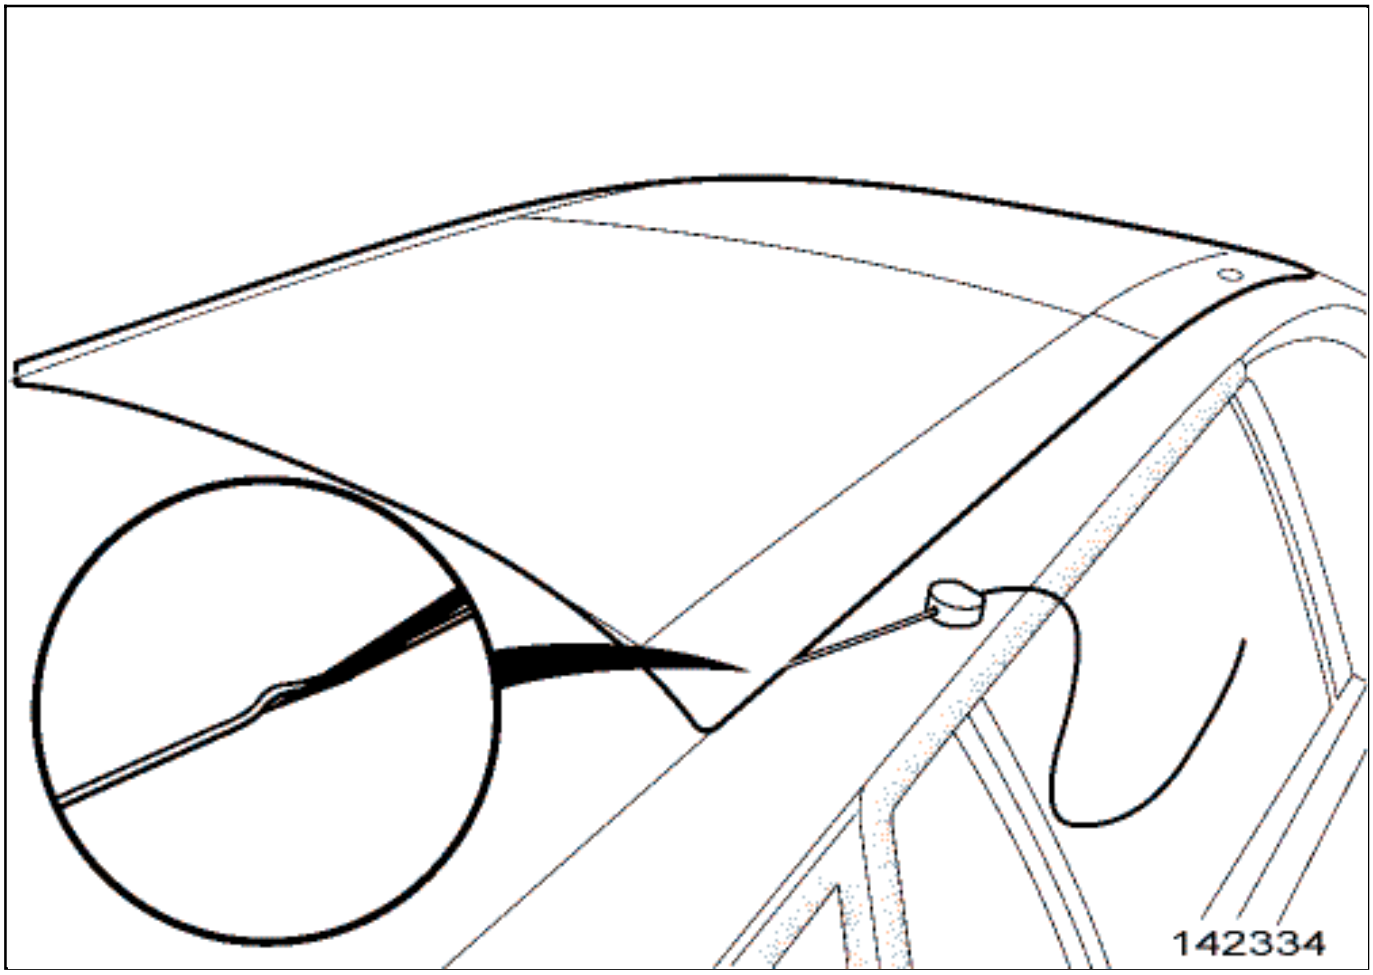
Use a cutting wire with a square cross-section.



Insert the cutting wire in the wire insertion tool, or in a small 2.5 mmdiameter tube.



Using the Wire insertion tool for removing bonded mirror glass.(Car. 1033) , pierce the cement bead of the sunroof operating mechanism at the most accessible place(2) .

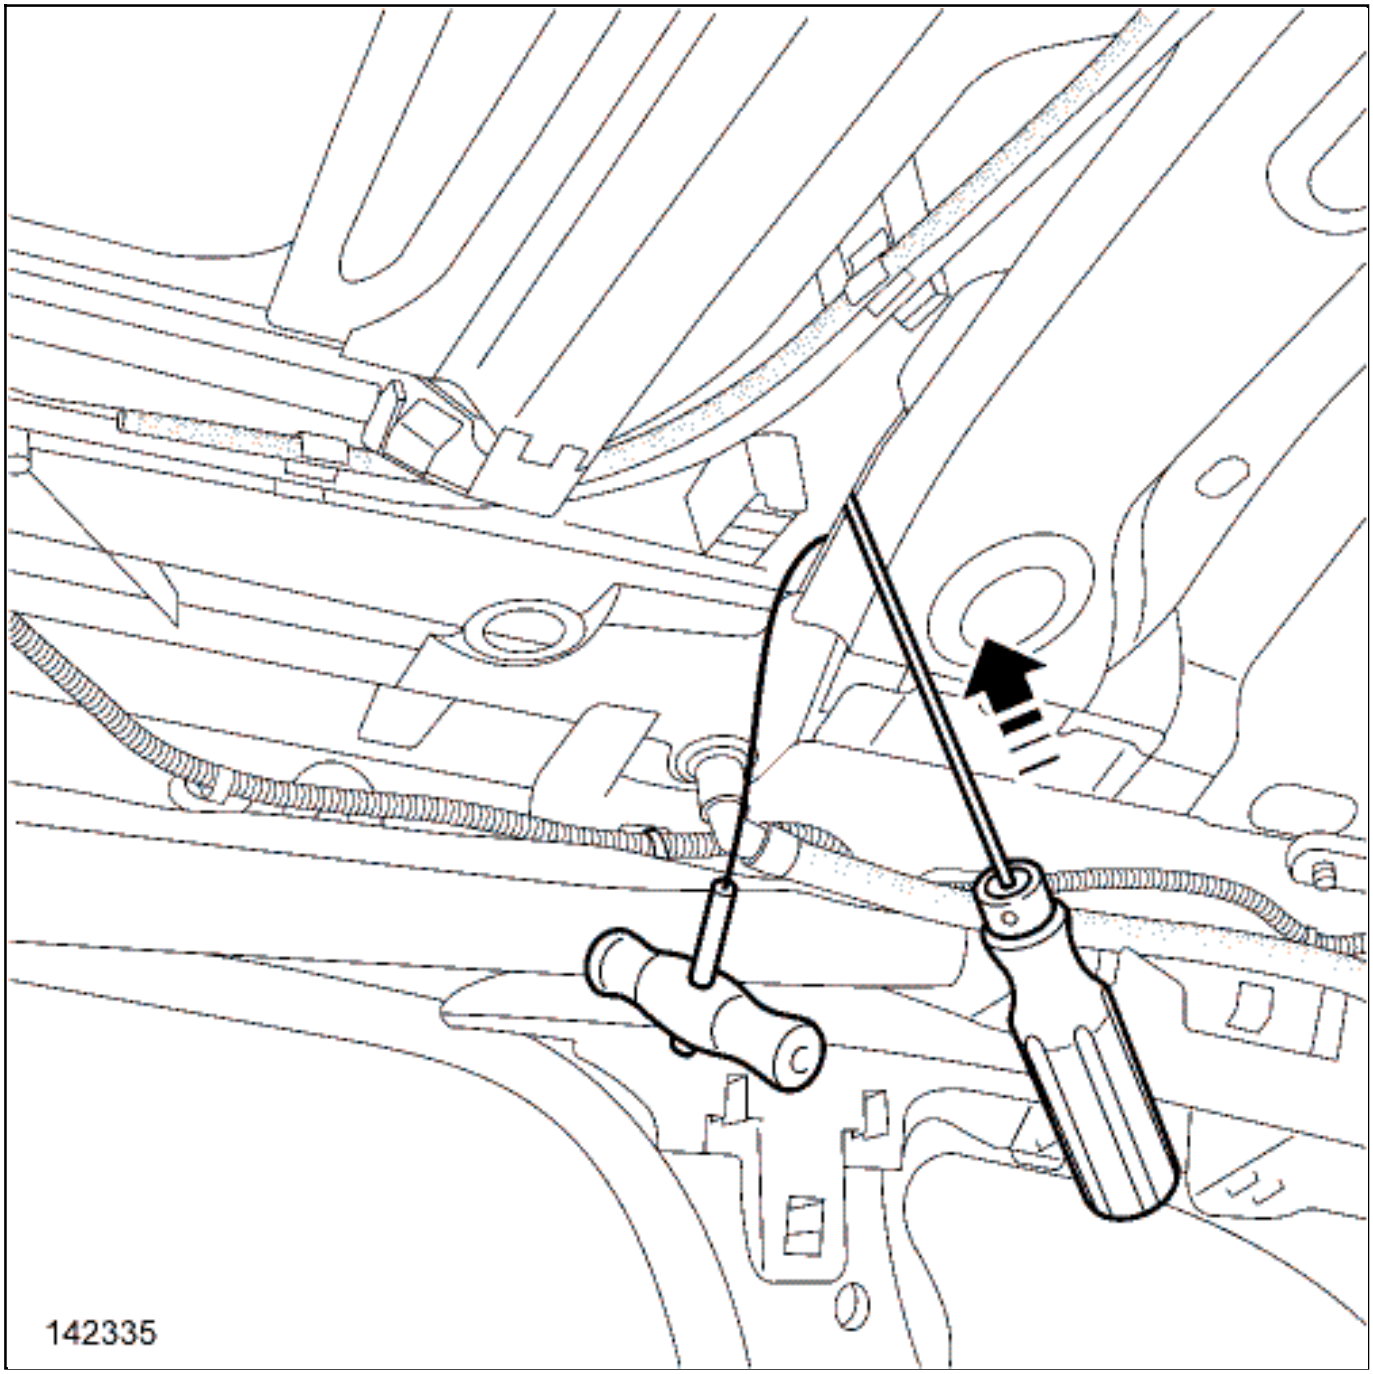


Insert the cutting wire in theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

Pass the cutting wire from the exterior towards the interior using theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

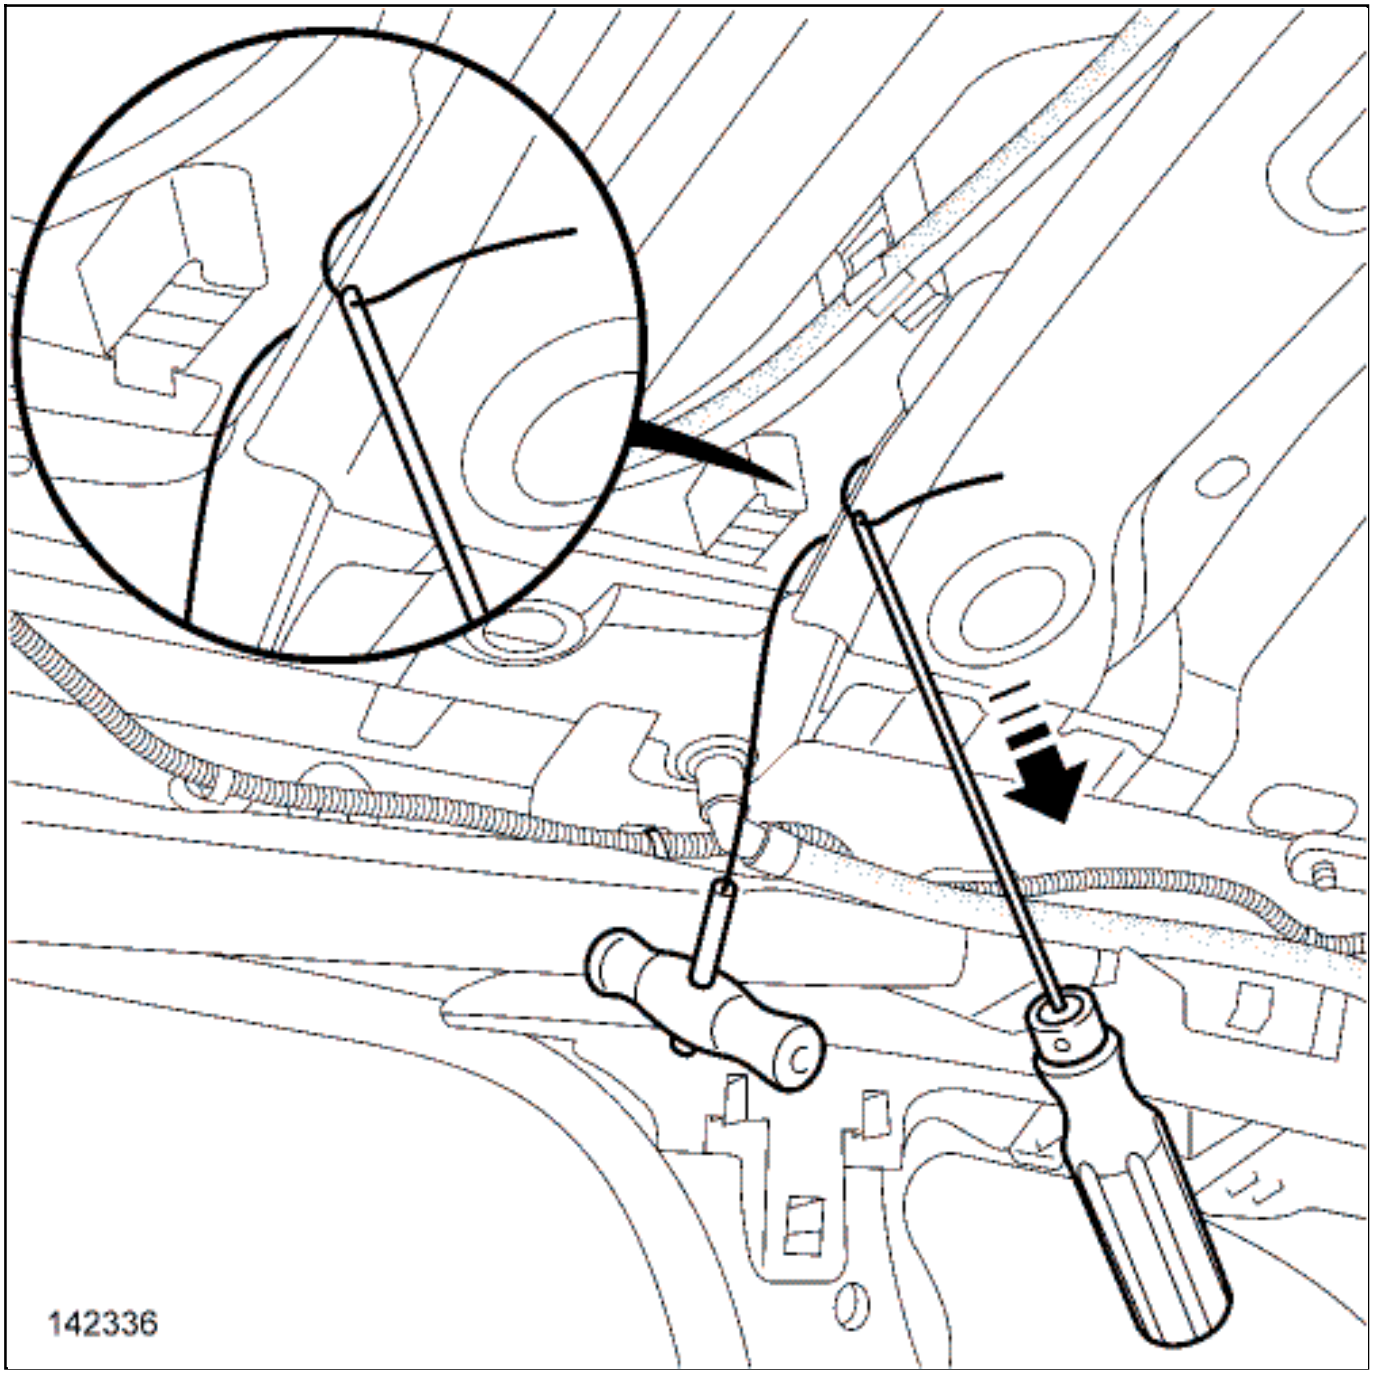
Fit the first pulling handle on the section of the cutting wire inside the vehicle.

Using the wire insertion tool, slide the cutting wire between the sunroof operating mechanism and the panelwork around the entire edge outside the vehicle.



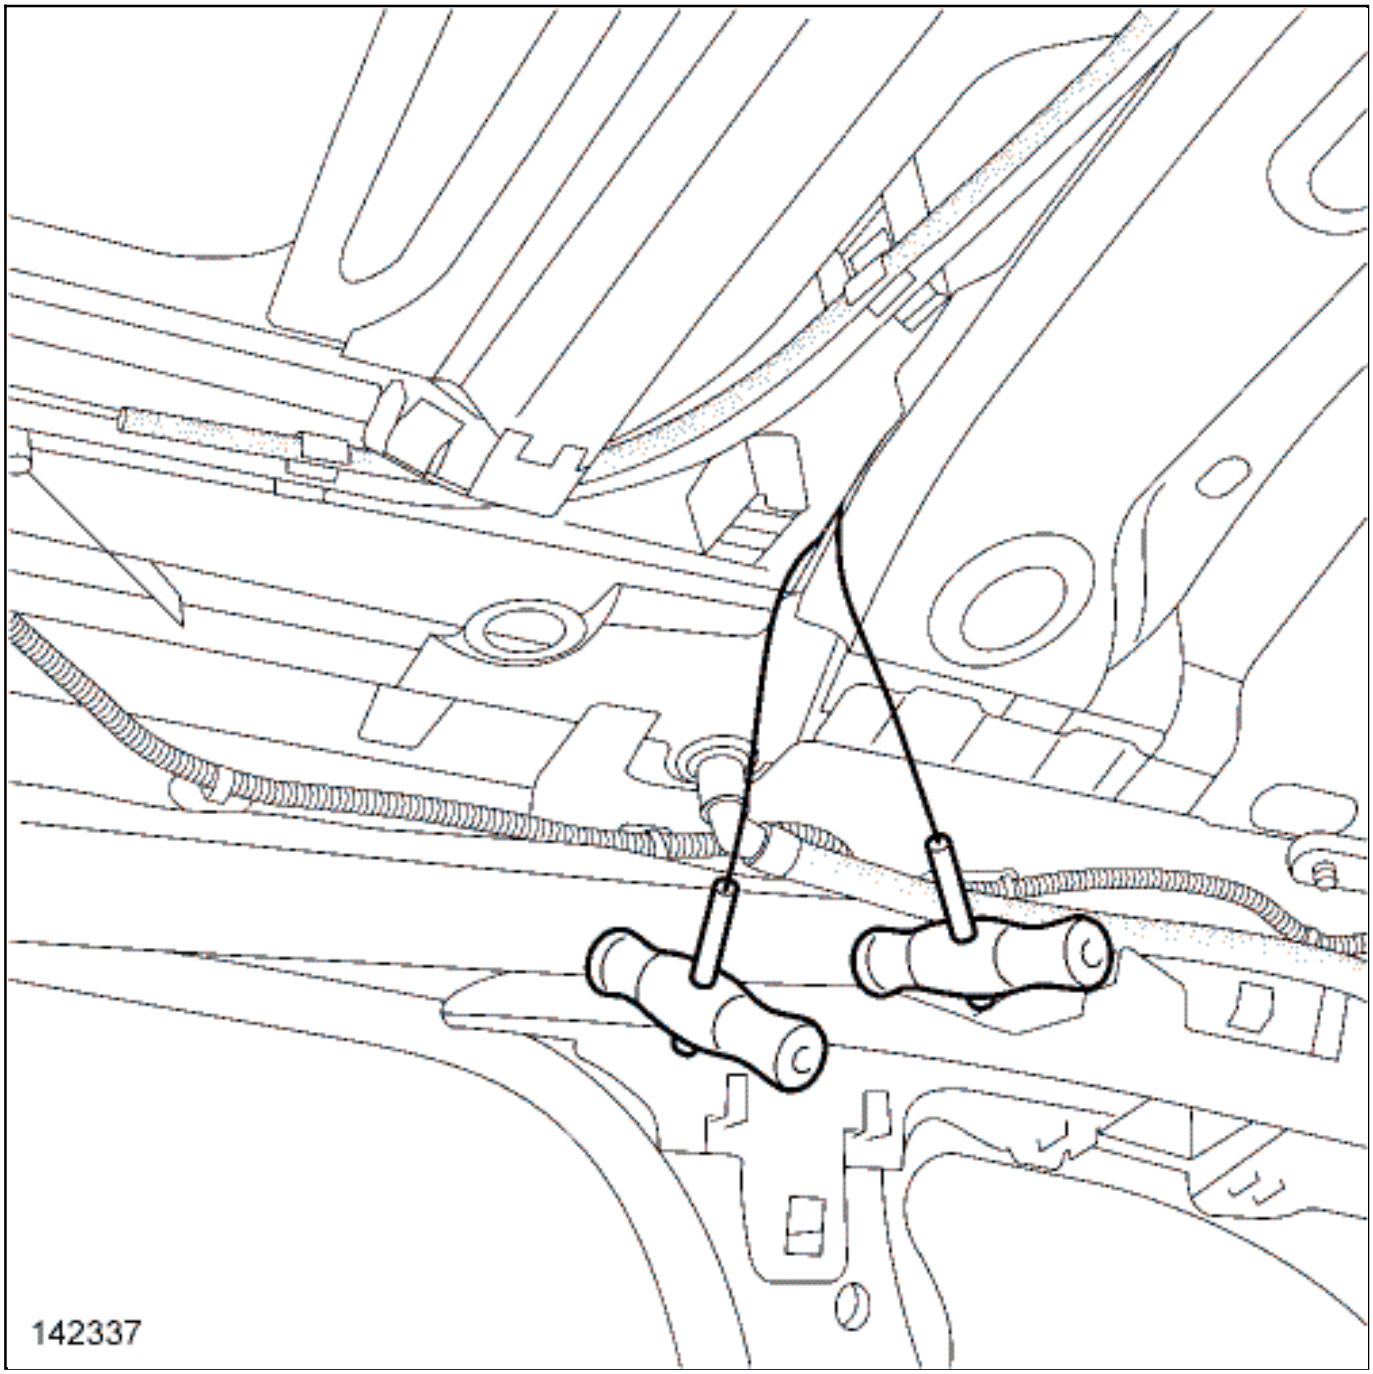
Cut a sufficient length of cutting wire.

Remove the cutting wire insertion tool.

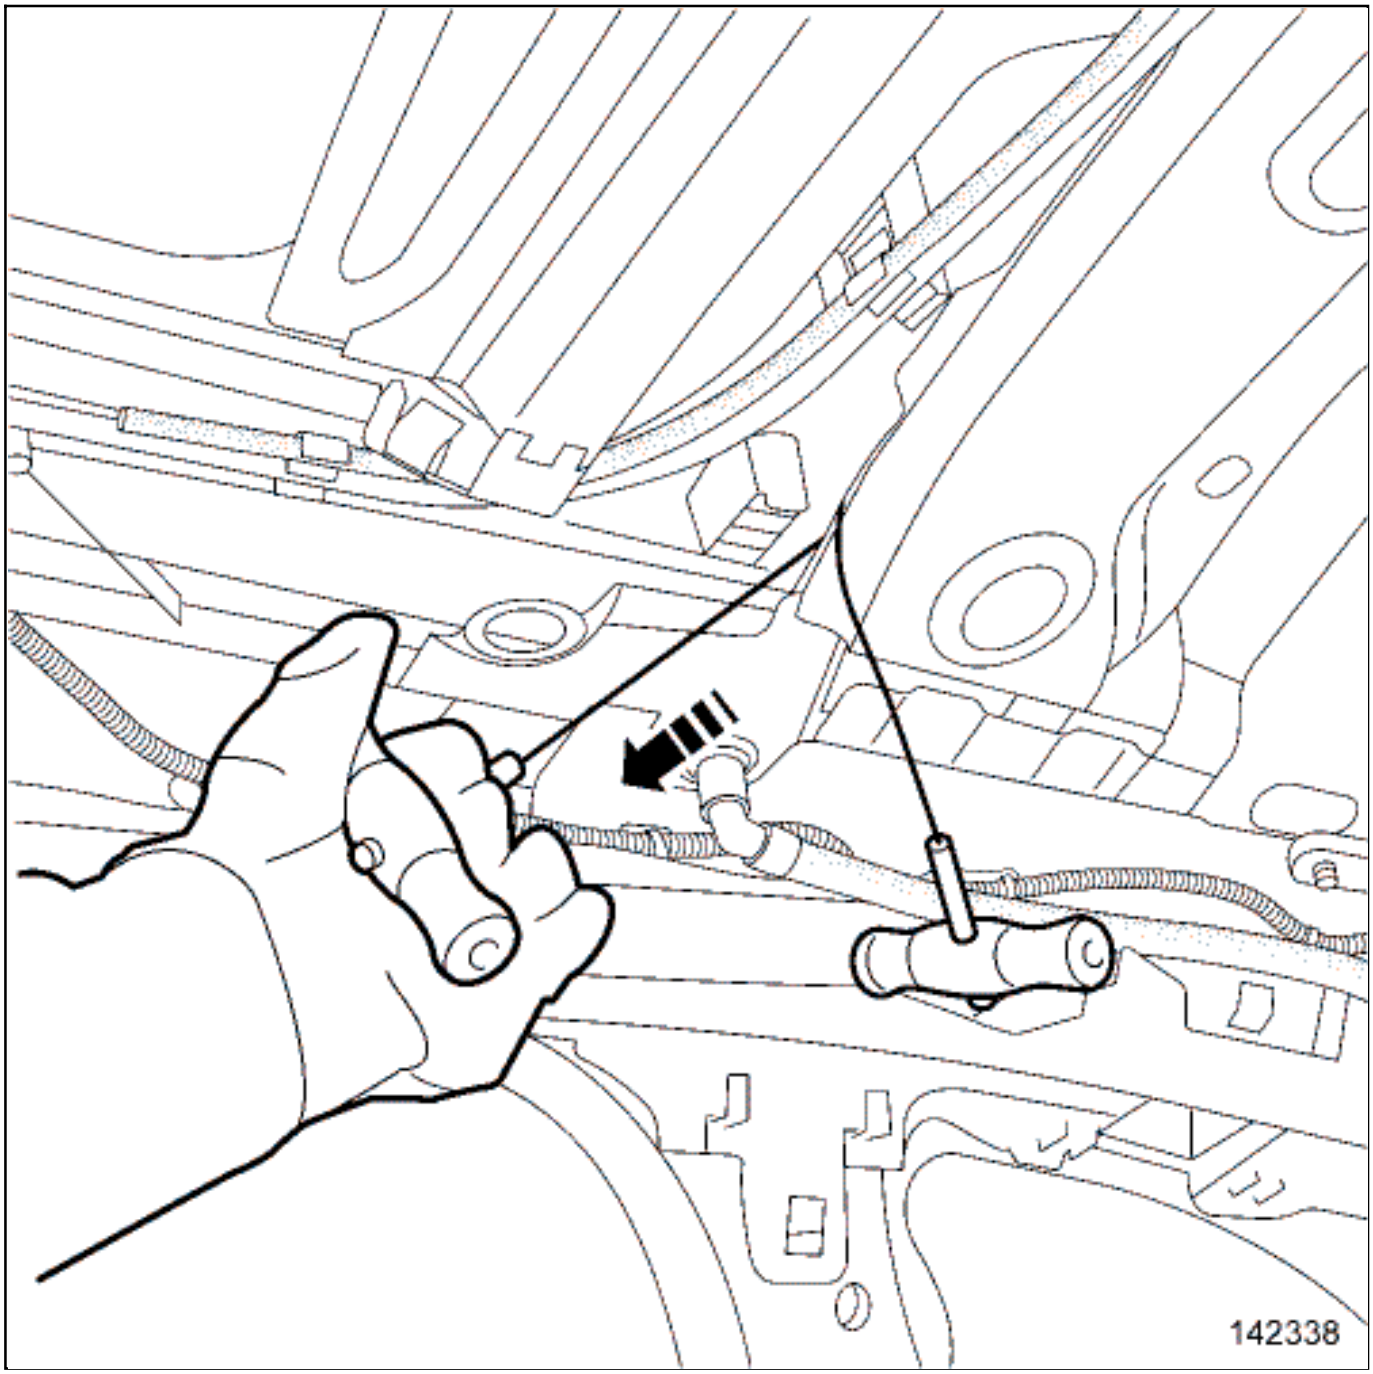


Note:

When passing the cutting wire into the vehicle interior, be careful not to cross the 2 wires.

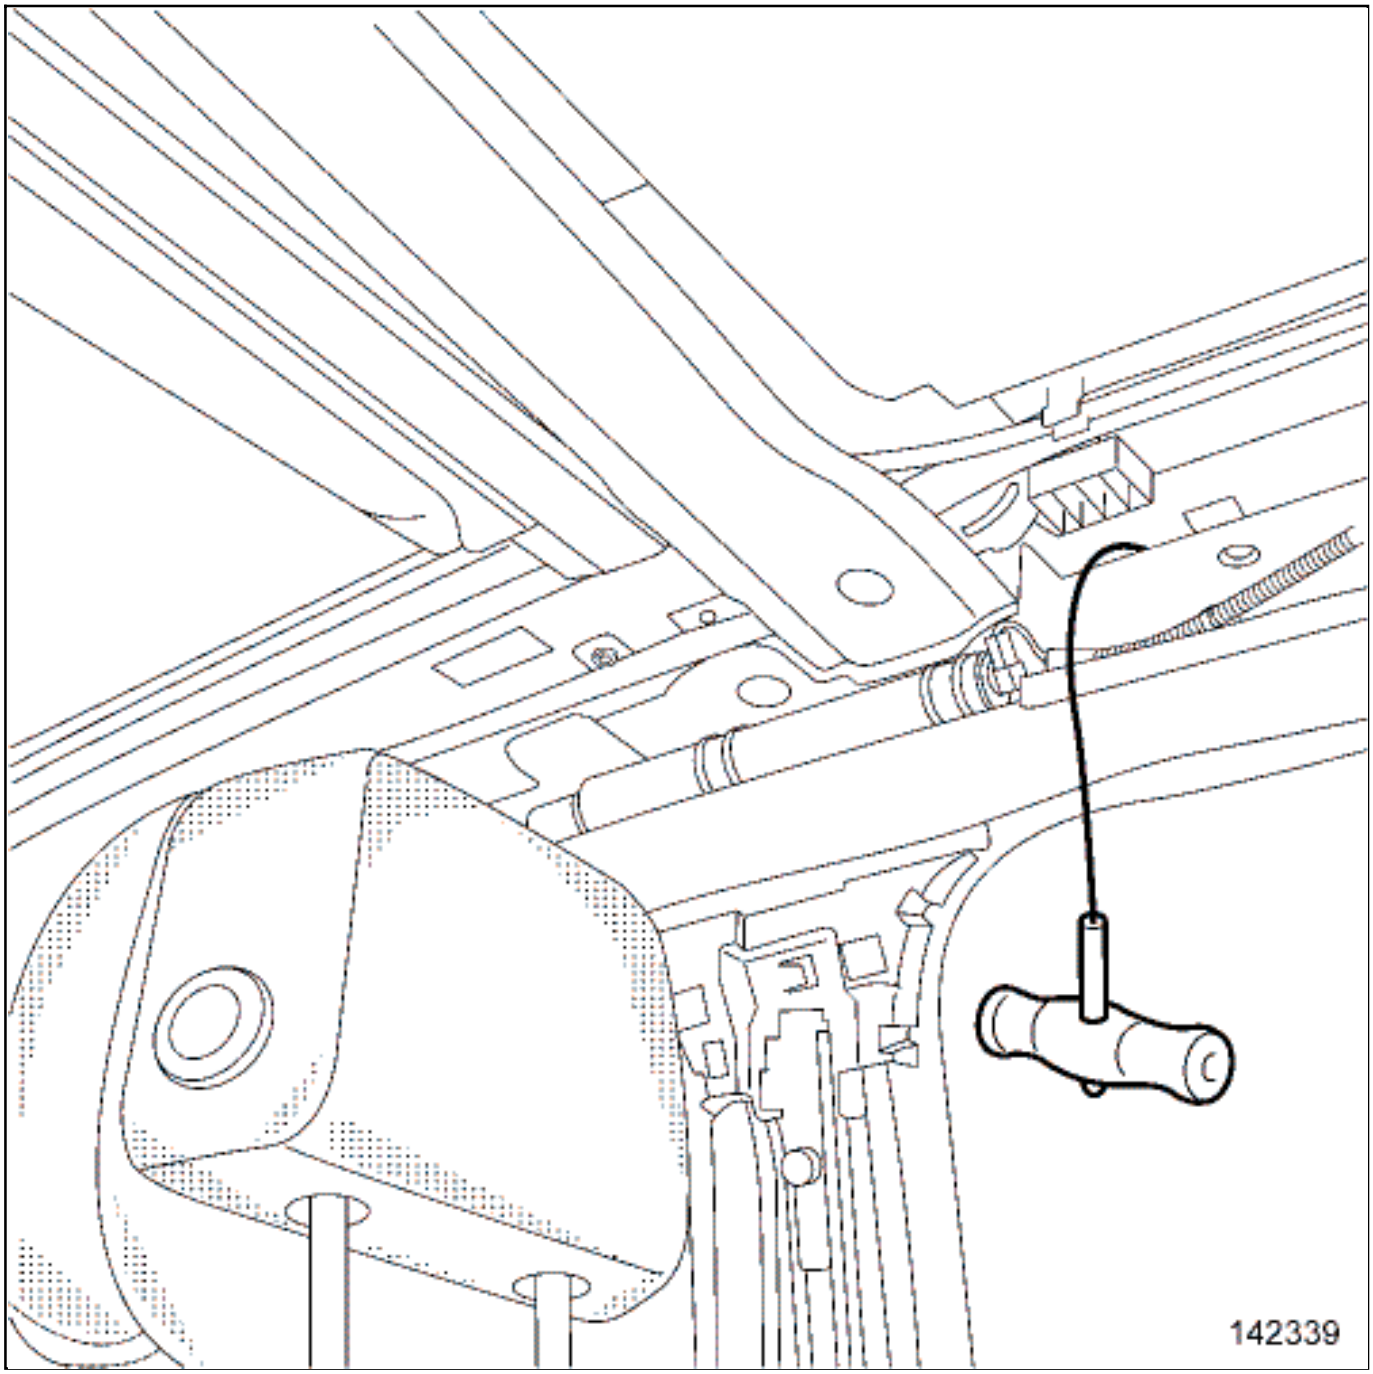


This would make cutting impossible.

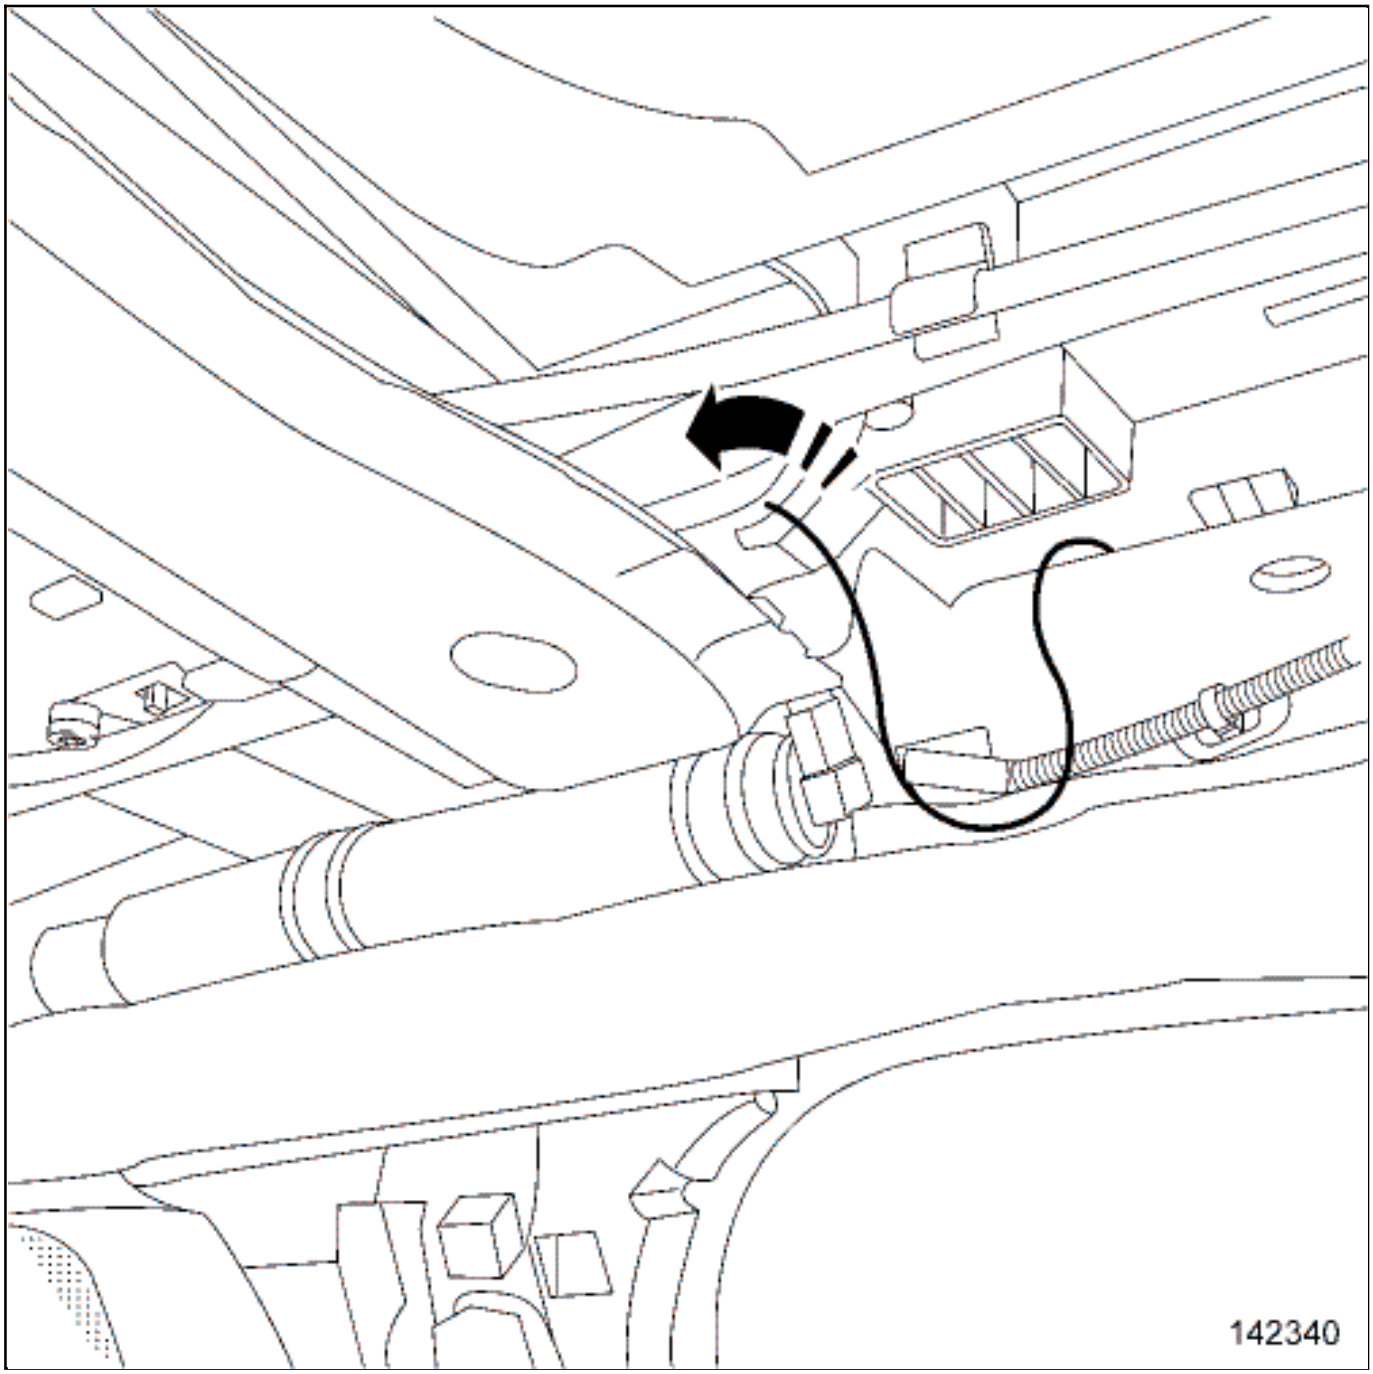


Pass the Wire insertion tool for removing bonded mirror glass.(Car. 1033) near the first piercing of the cement bead.

Pass the cutting wire from the exterior towards the interior using theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

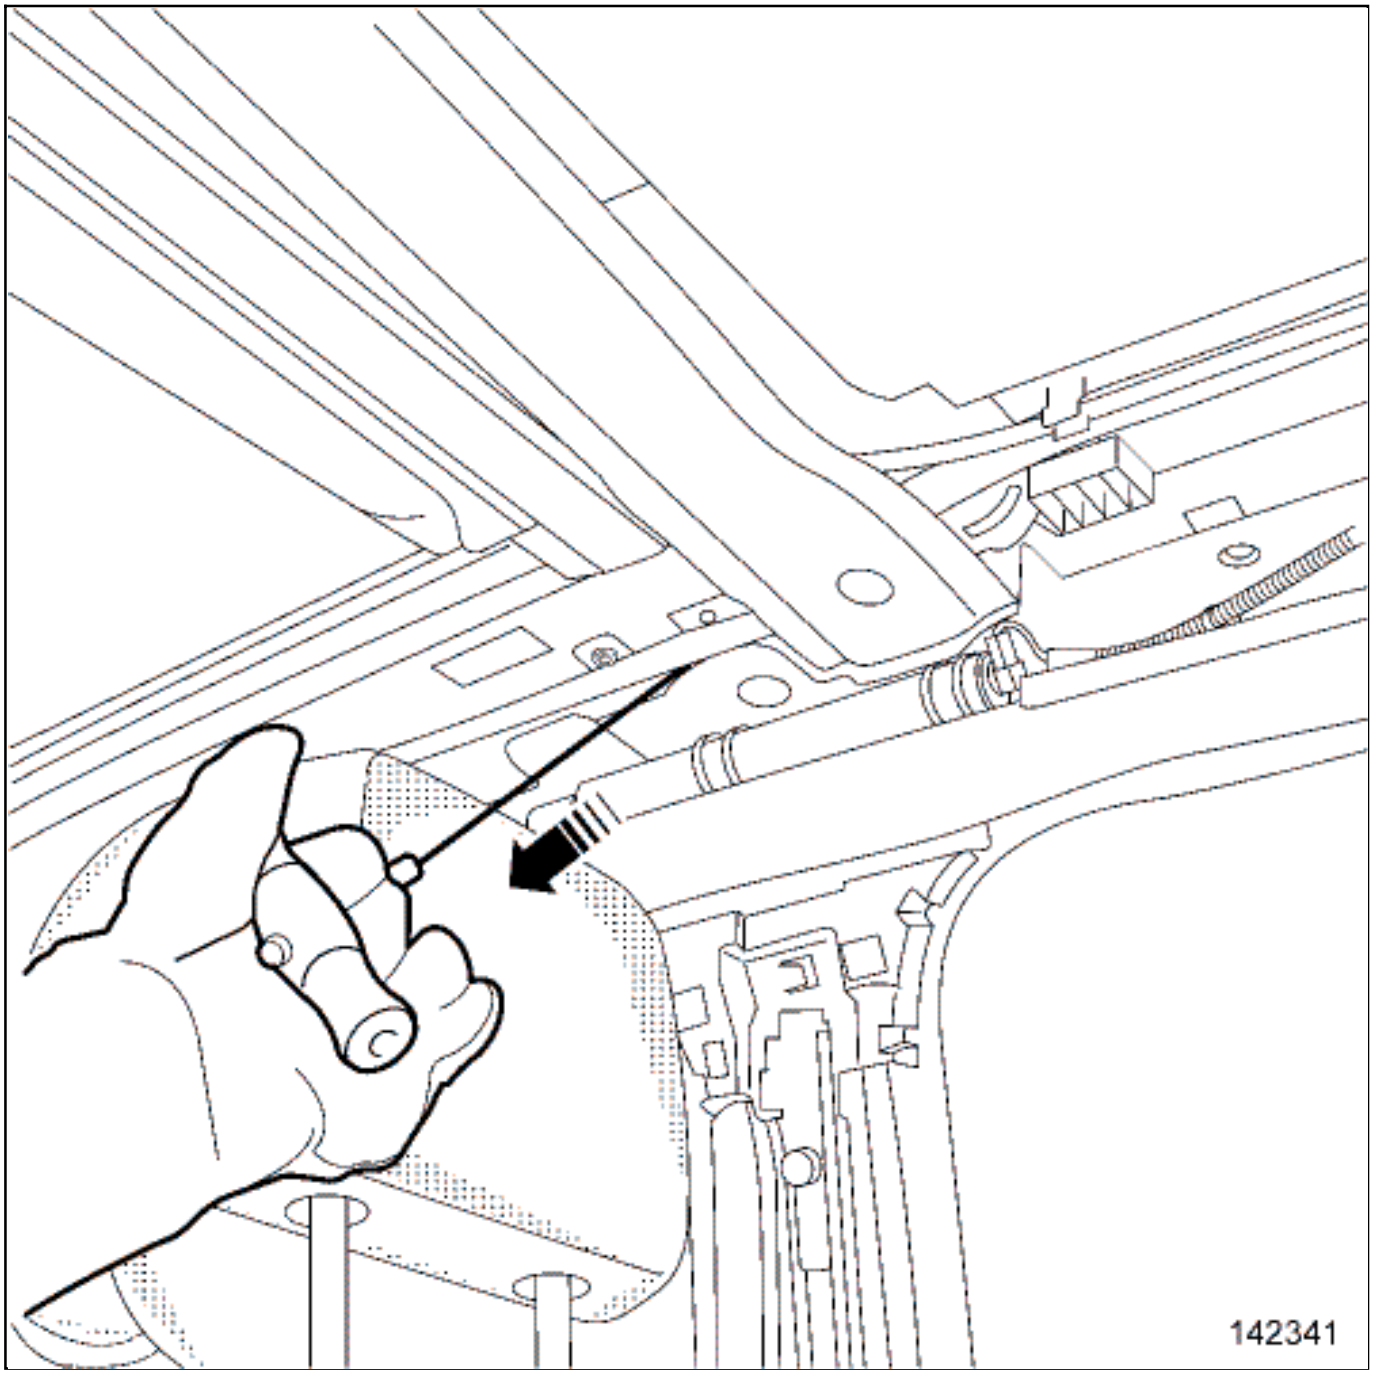


Fit the second pulling handle on the other section of the cutting wire inside the vehicle.

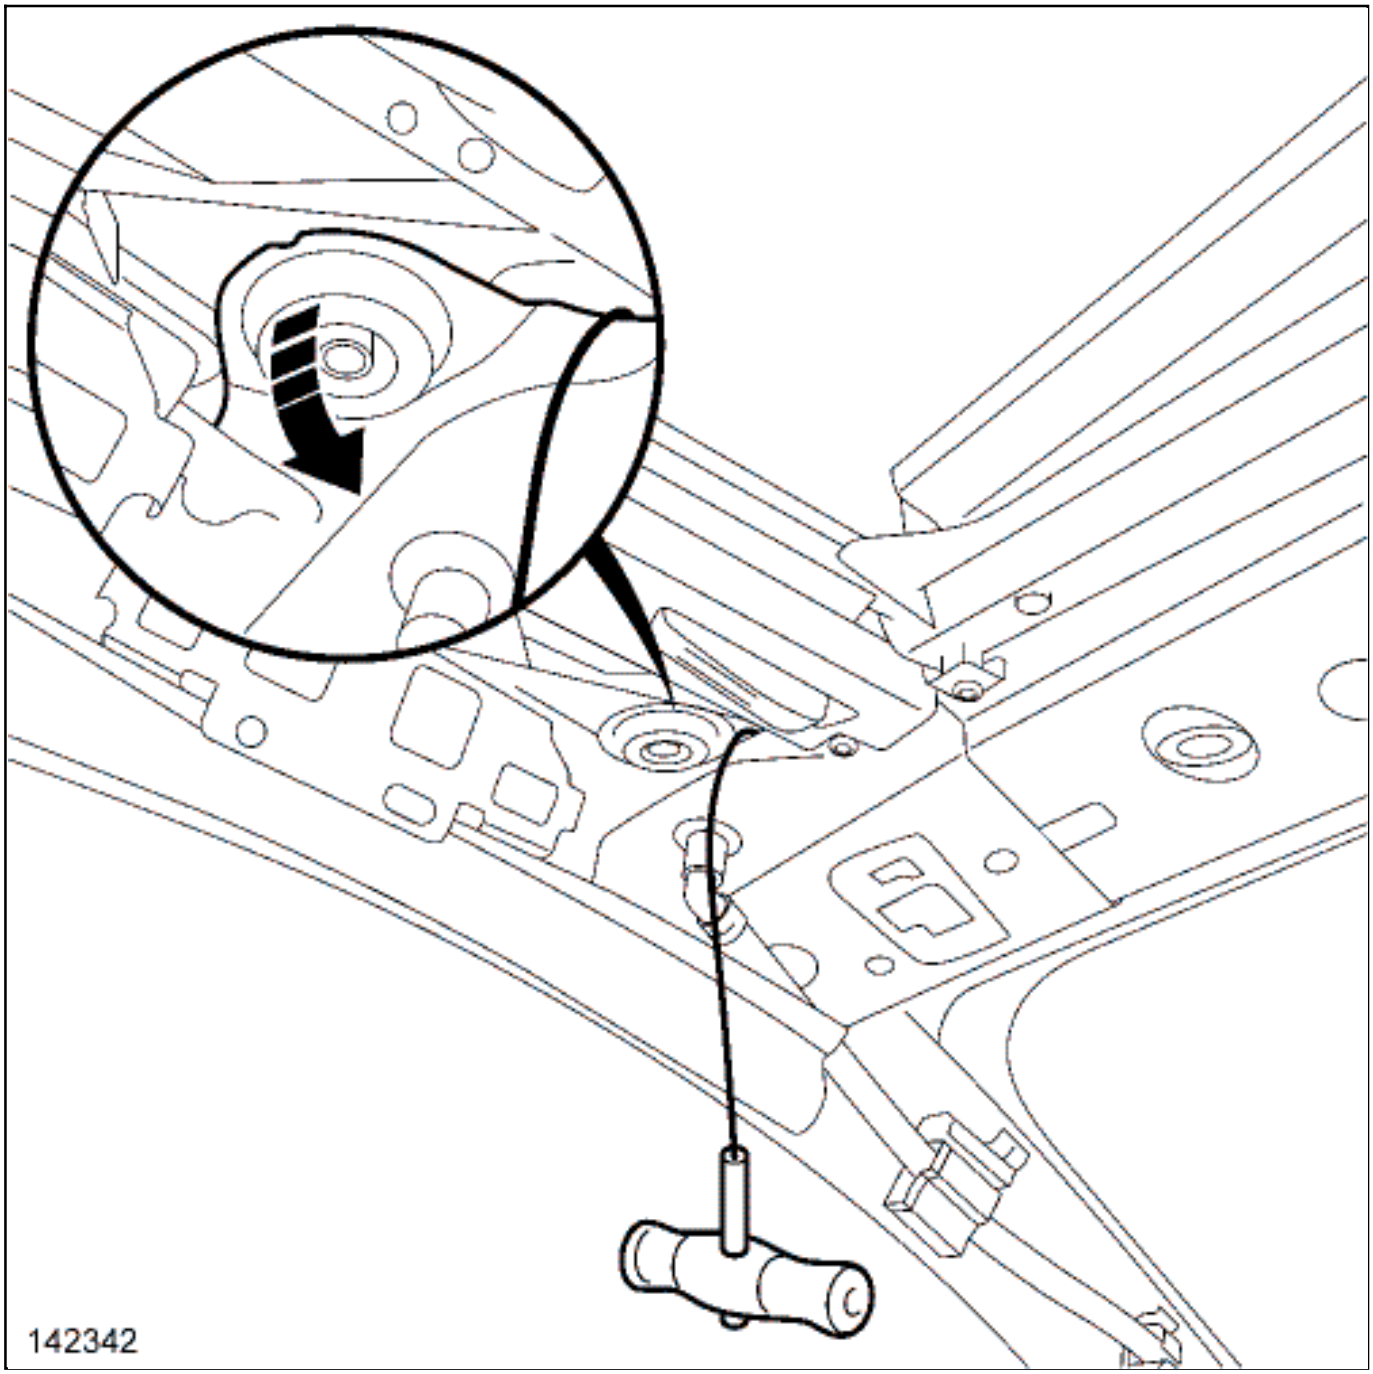


Pull on the first pulling handle until you reach the central cross member.

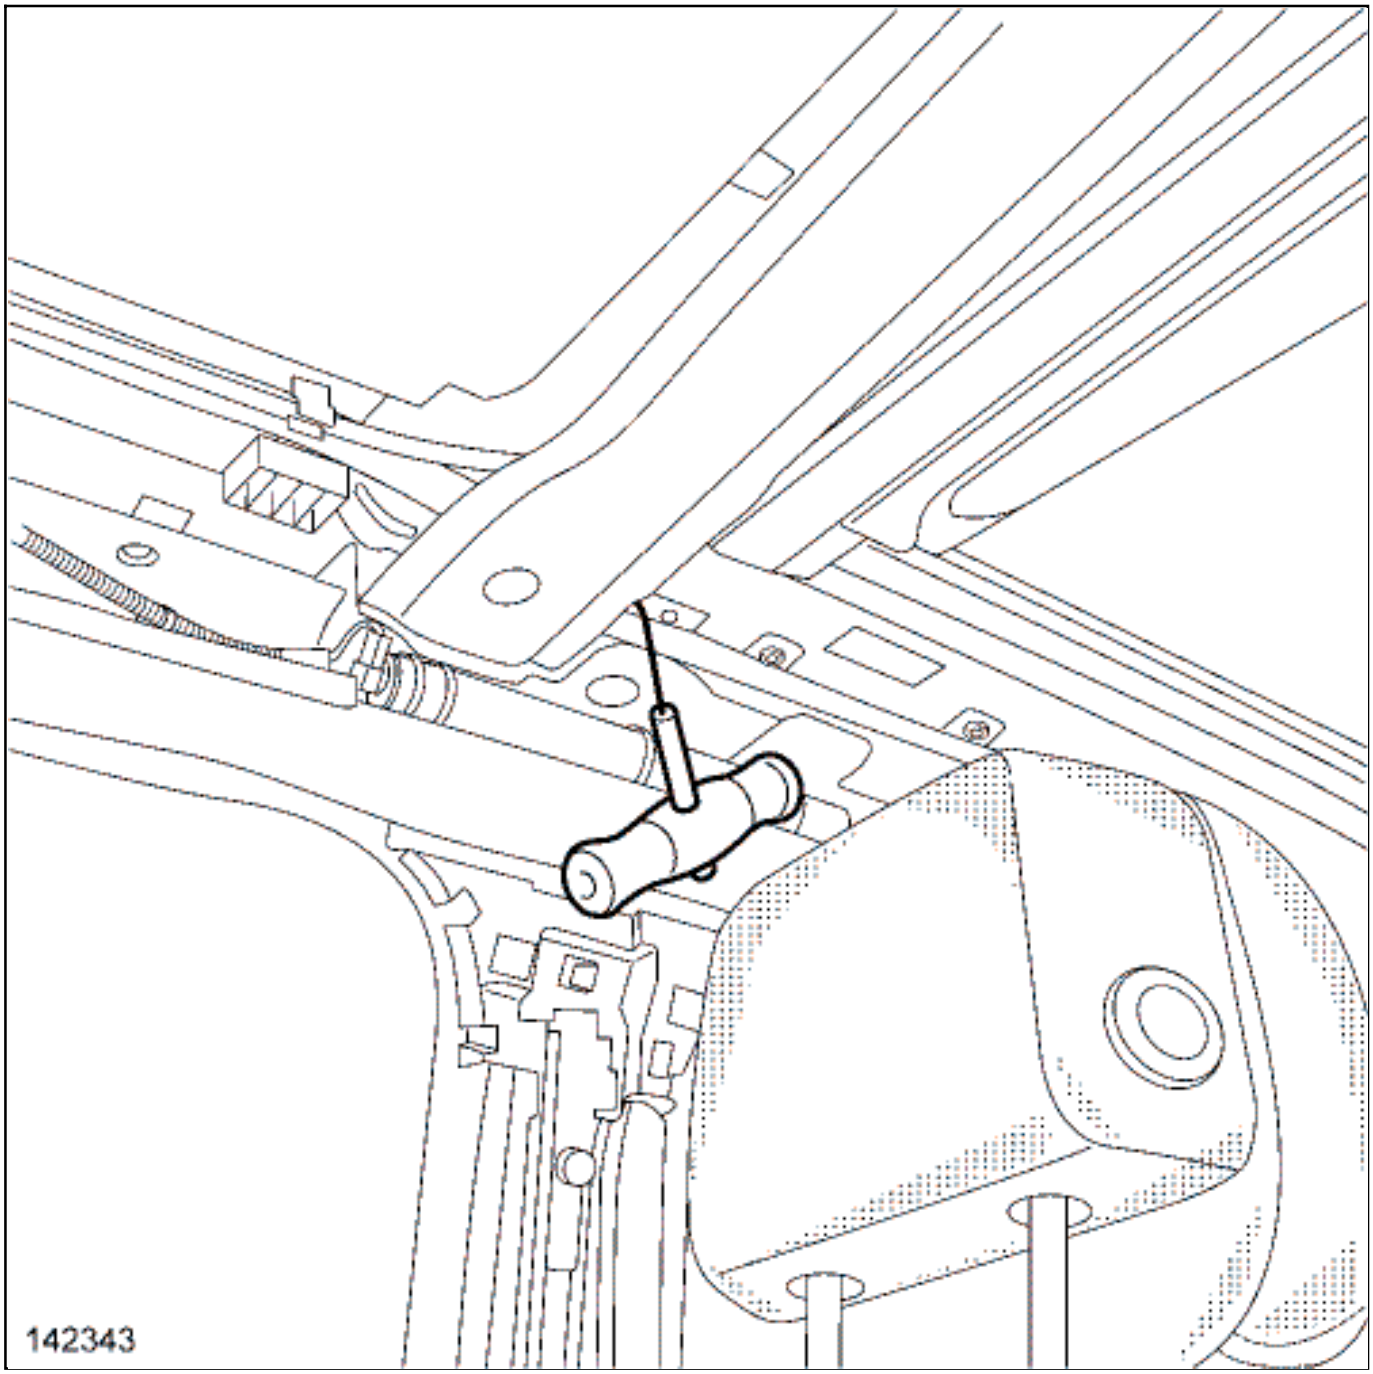
Note:



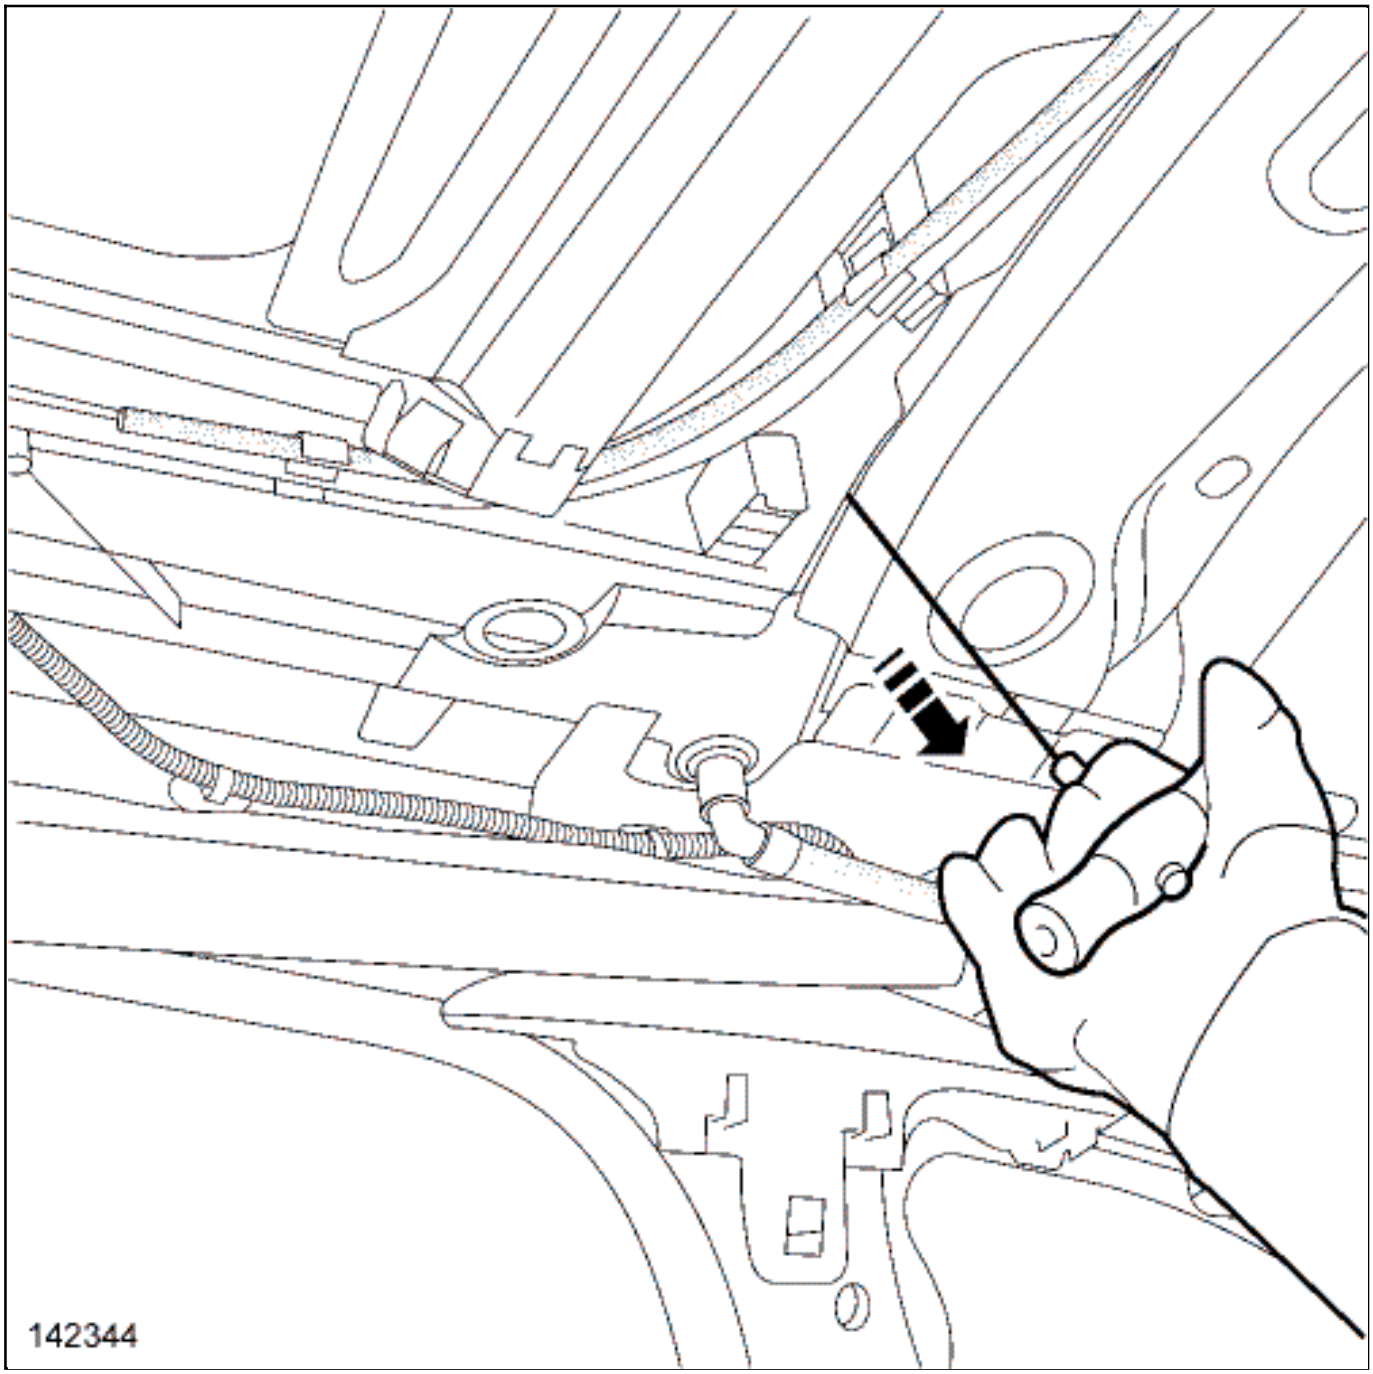
Gradually reduce the length of the cutting wire as you cut.



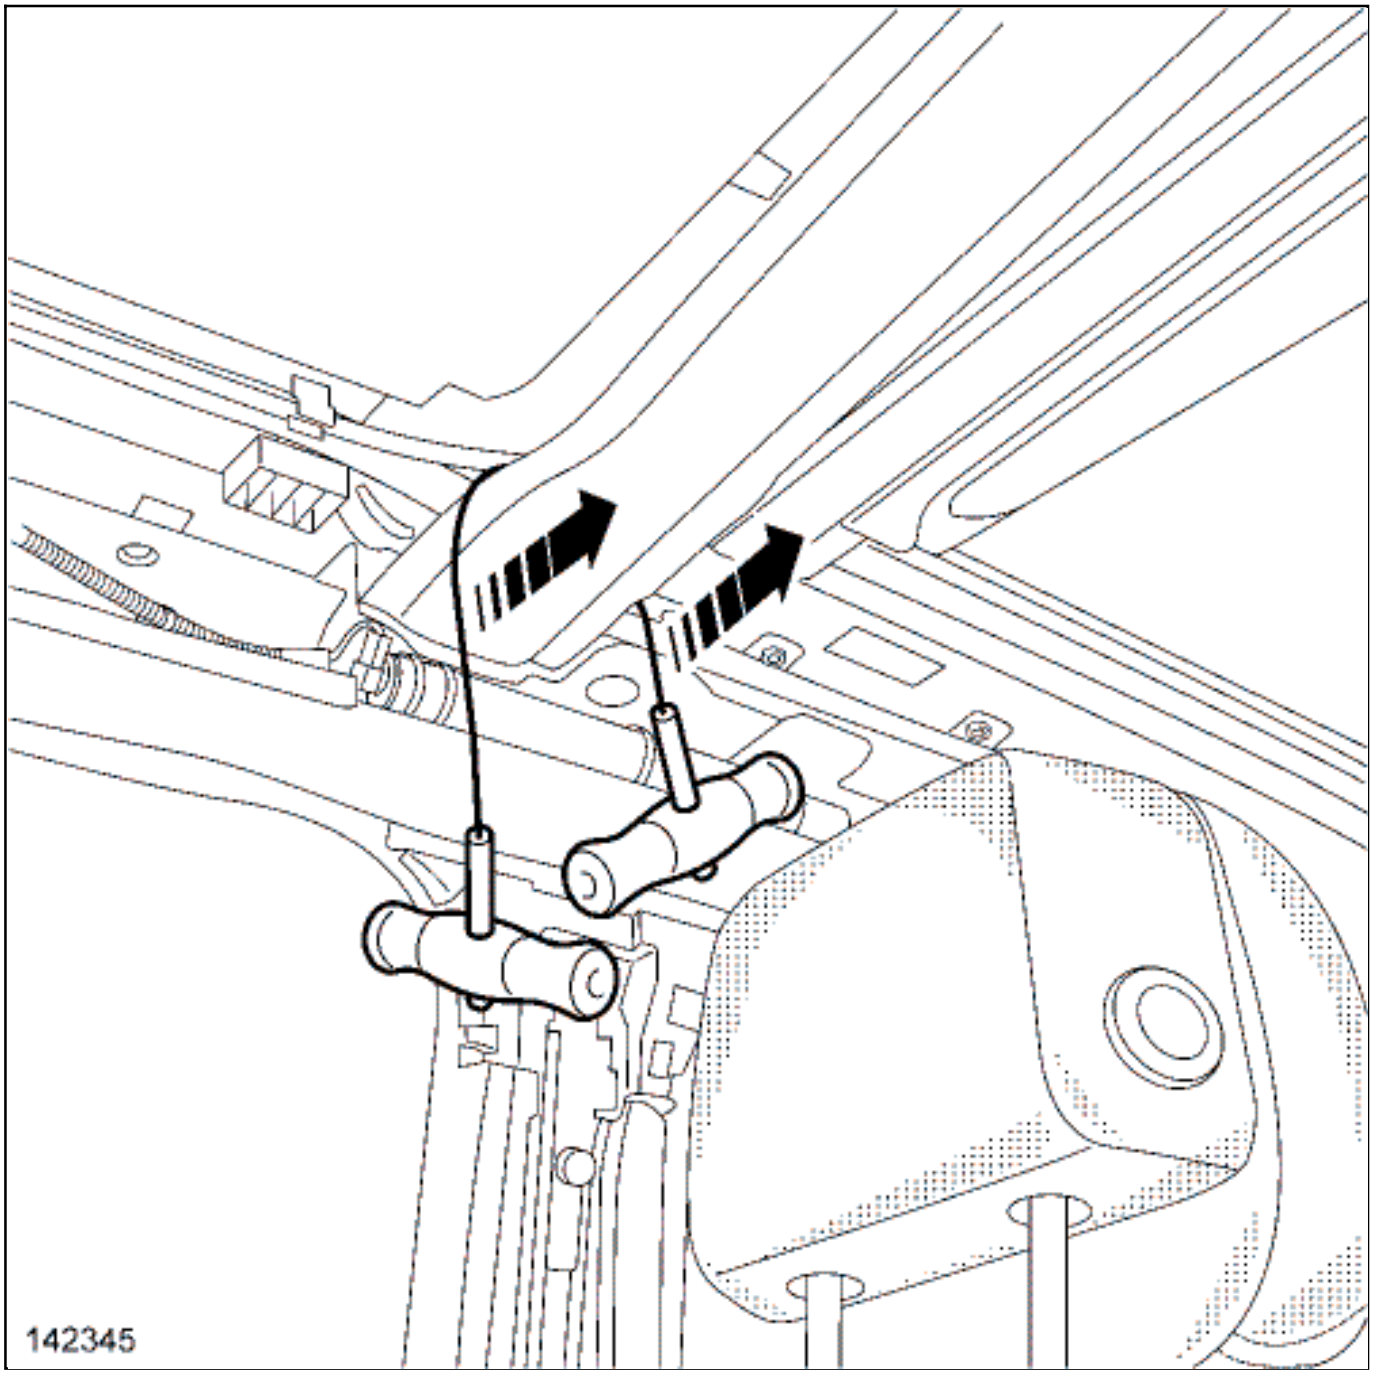
Remove the pulling handle.



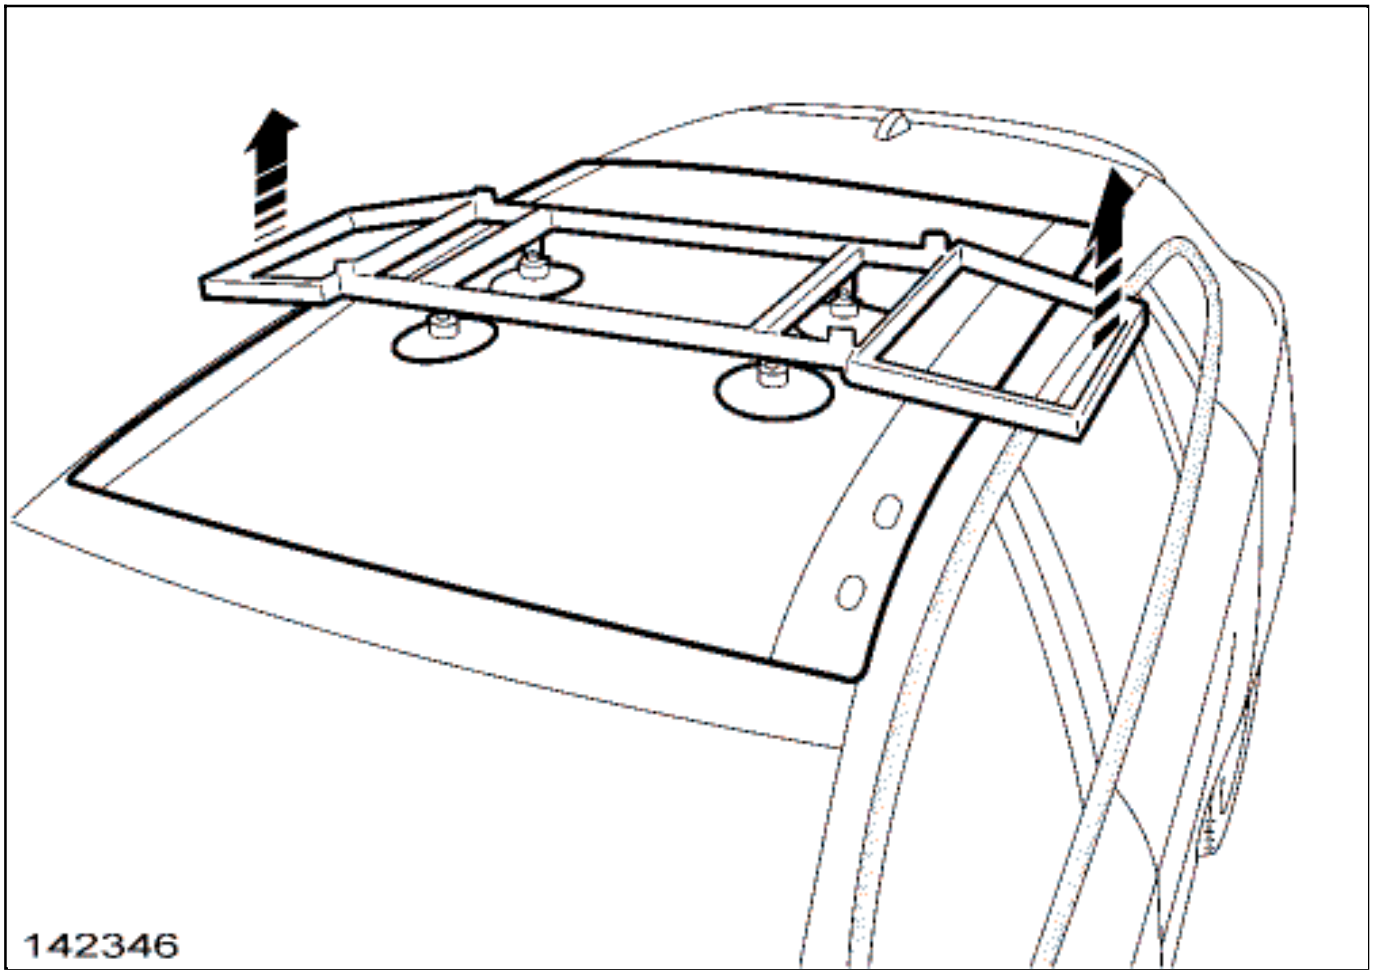
Pass the cutting wire between the central cross member and the sunroof operating mechanism.



Continue cutting the cement bead with the pulling handle.



Gently separate the panel in the area of the centring guide for the sunroof operating mechanism, in order to pass the cutting wire through.



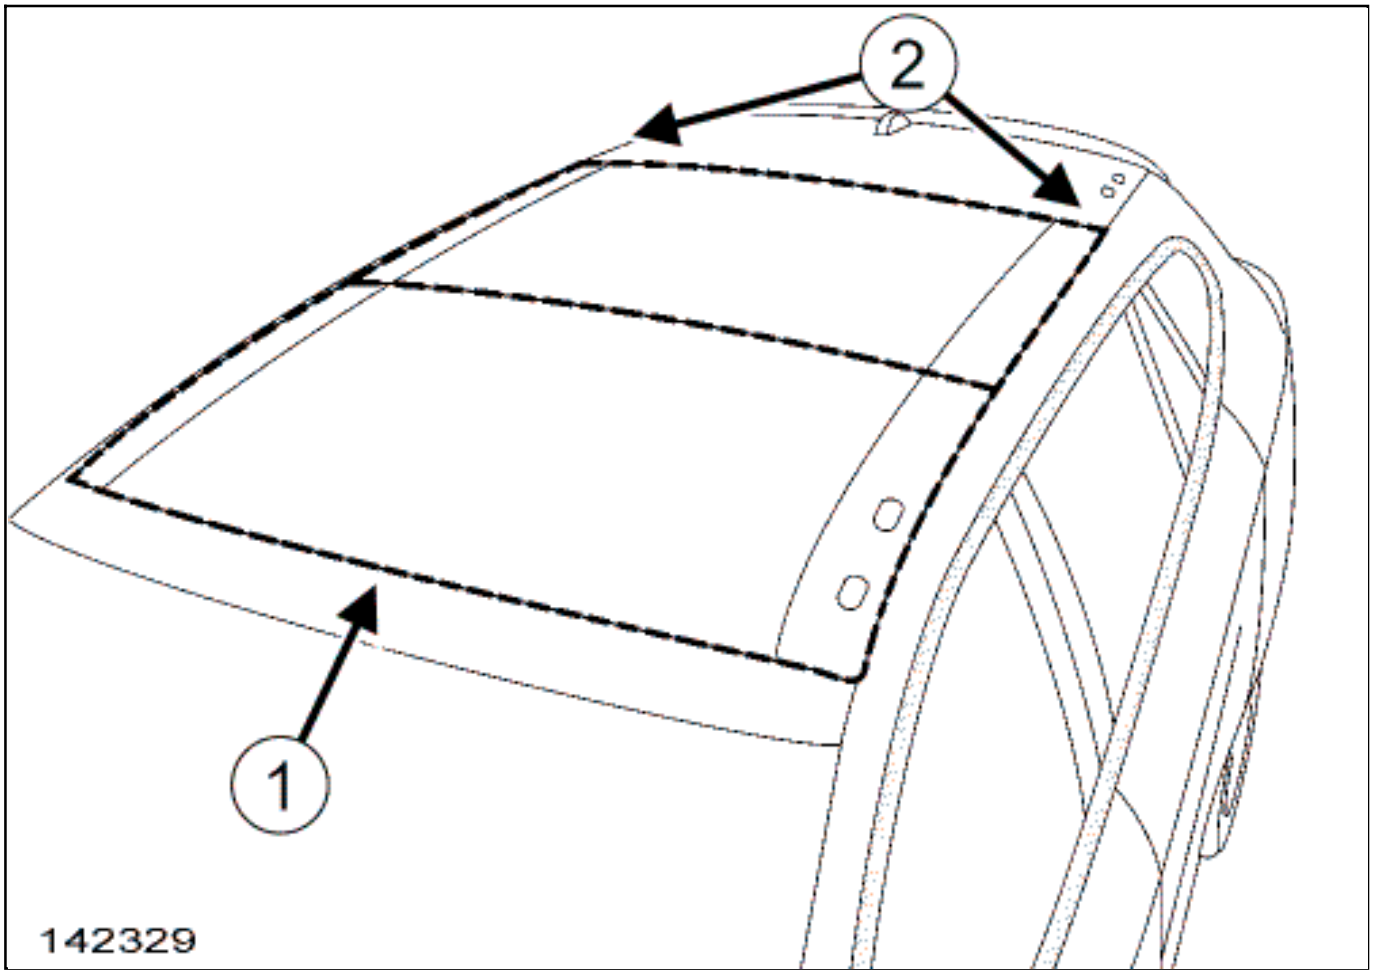
Leave the pulling handle in place at the central cross member.

Resume cutting using the second pulling handle.

Cut the cement bead of the central cross member using the two pulling handles.

Remove the sunroof operating mechanism (this operation requires two people) using the specific supports:

- Support: PARV 202,
- set of arch supports: APARV 200 ESP.



Repair-50x04x01x06-02x21-1-1-1.xml

DIAGNOSTIC SOCKET: LIST AND LOCATION OF COMPONENTS

Special tooling required	
Set of trim removal levers.	Car. 1363

1. LOCATION

Unclip the diagnostic socket cover(1) using the toolSet of trim removal levers.(Car. 1363) .

To perform an operation with the Diagnostic tool by the diagnostic socket(2) **Diagnostic tool : Use** .

DIAGNOSTIC TOOL : USE

Equipment required
Diagnostic tool

1. BEFORE / AFTER REPAIR PROCEDURE

Switch on the ignition.

Connect the Diagnostic tool.

Select the concerned computer.

Go to repair mode.

Display the "Before / After repair procedure" for the computer selected.

If necessary, select the concerned component in the "List of components stored in the computer" section.

Carry out the operations described in the "Before repair procedure" section or in the "After repair procedure" section, according to the case.

Switch off the ignition.

DIFFERENTIAL OUTPUT SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for fitting the bearing cage into the housing.	Bvi. 1419
Inertia seal extractor	Bvi. 1948
Tool for fitting differential output seals (DC4)	Bvi. 1953

parts always to be replaced:
Differential output seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

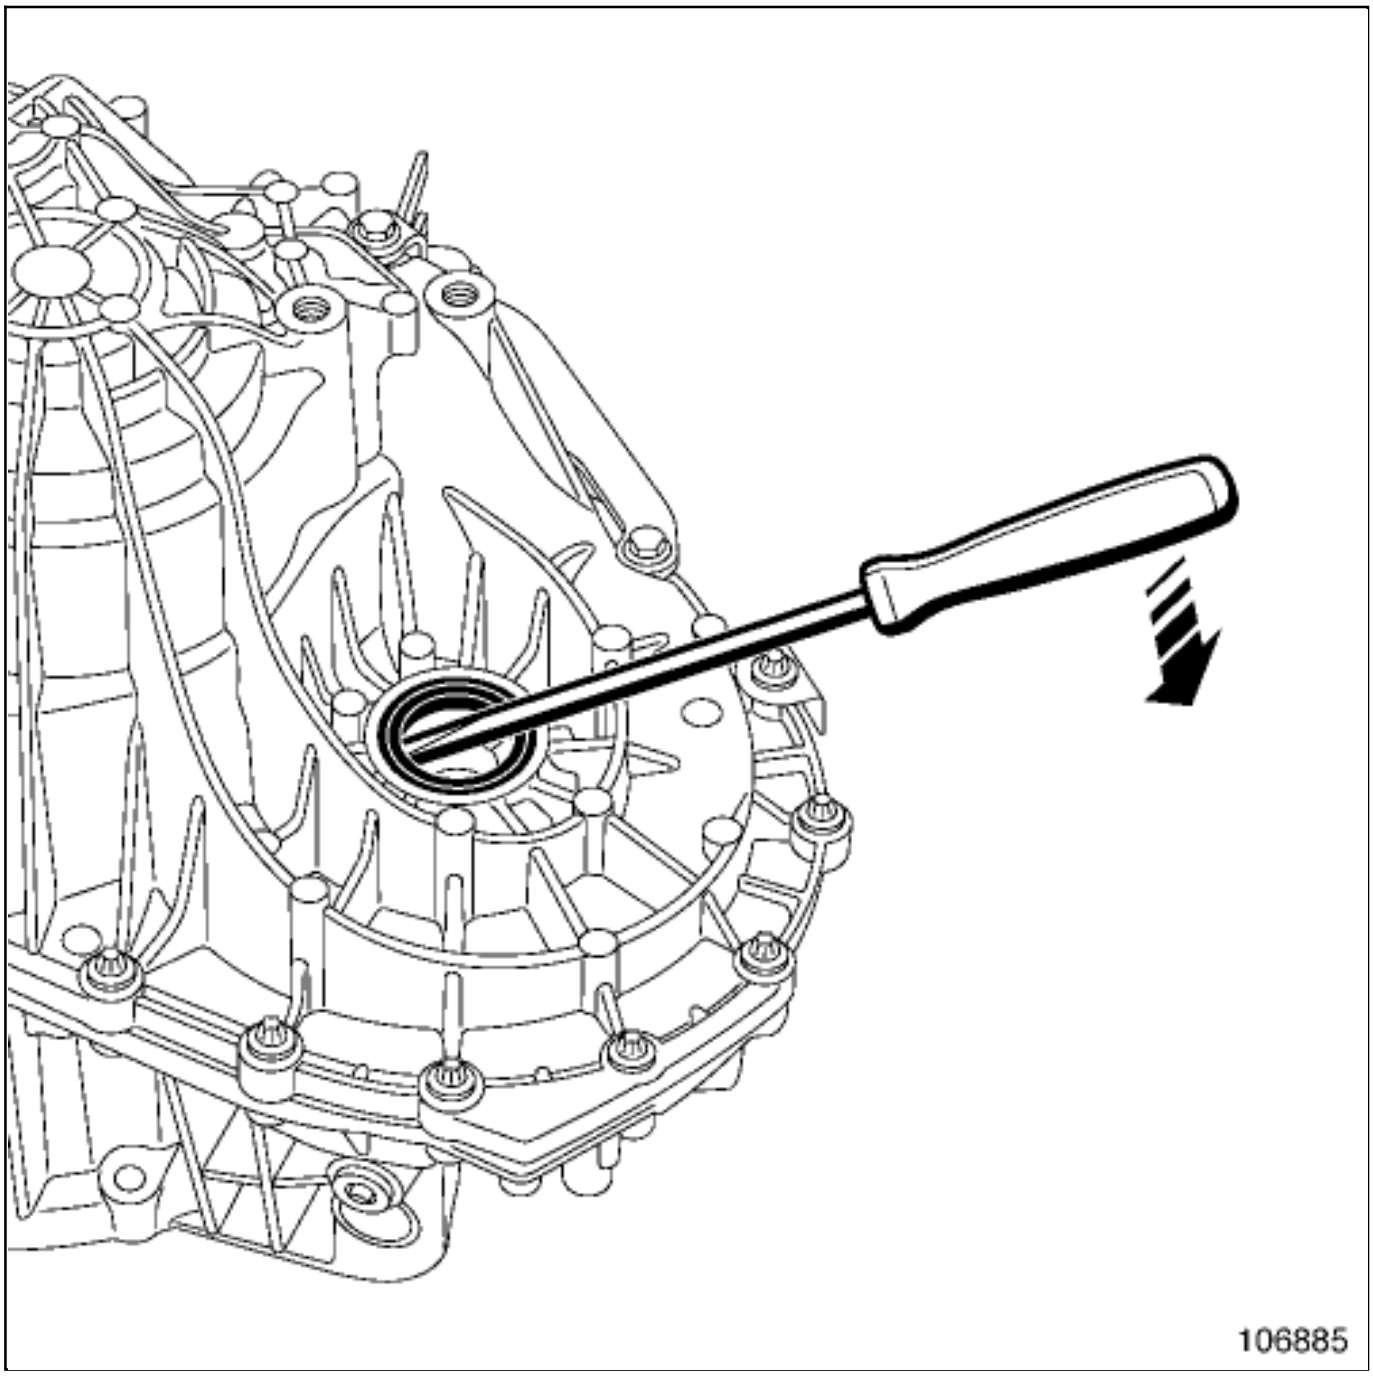
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove the engine undertray.

Drain the gearbox (see 23A, Automatic gearbox , Automatic gearbox oil: Draining - Filling) .

1- WHEN REPLACING A DIFFERENTIAL OUTPUT SEAL ON THE RIGHT-HAND SIDE

Remove:



- the front right-hand wheel Wheel: Removal - Refitting ,
- the front right-hand wheel driveshaft Front right-hand driveshaft: Removal - Refitting .

2- WHEN REPLACING A DIFFERENTIAL OUTPUT SEAL ON THE LEFT-HAND SIDE

Remove:

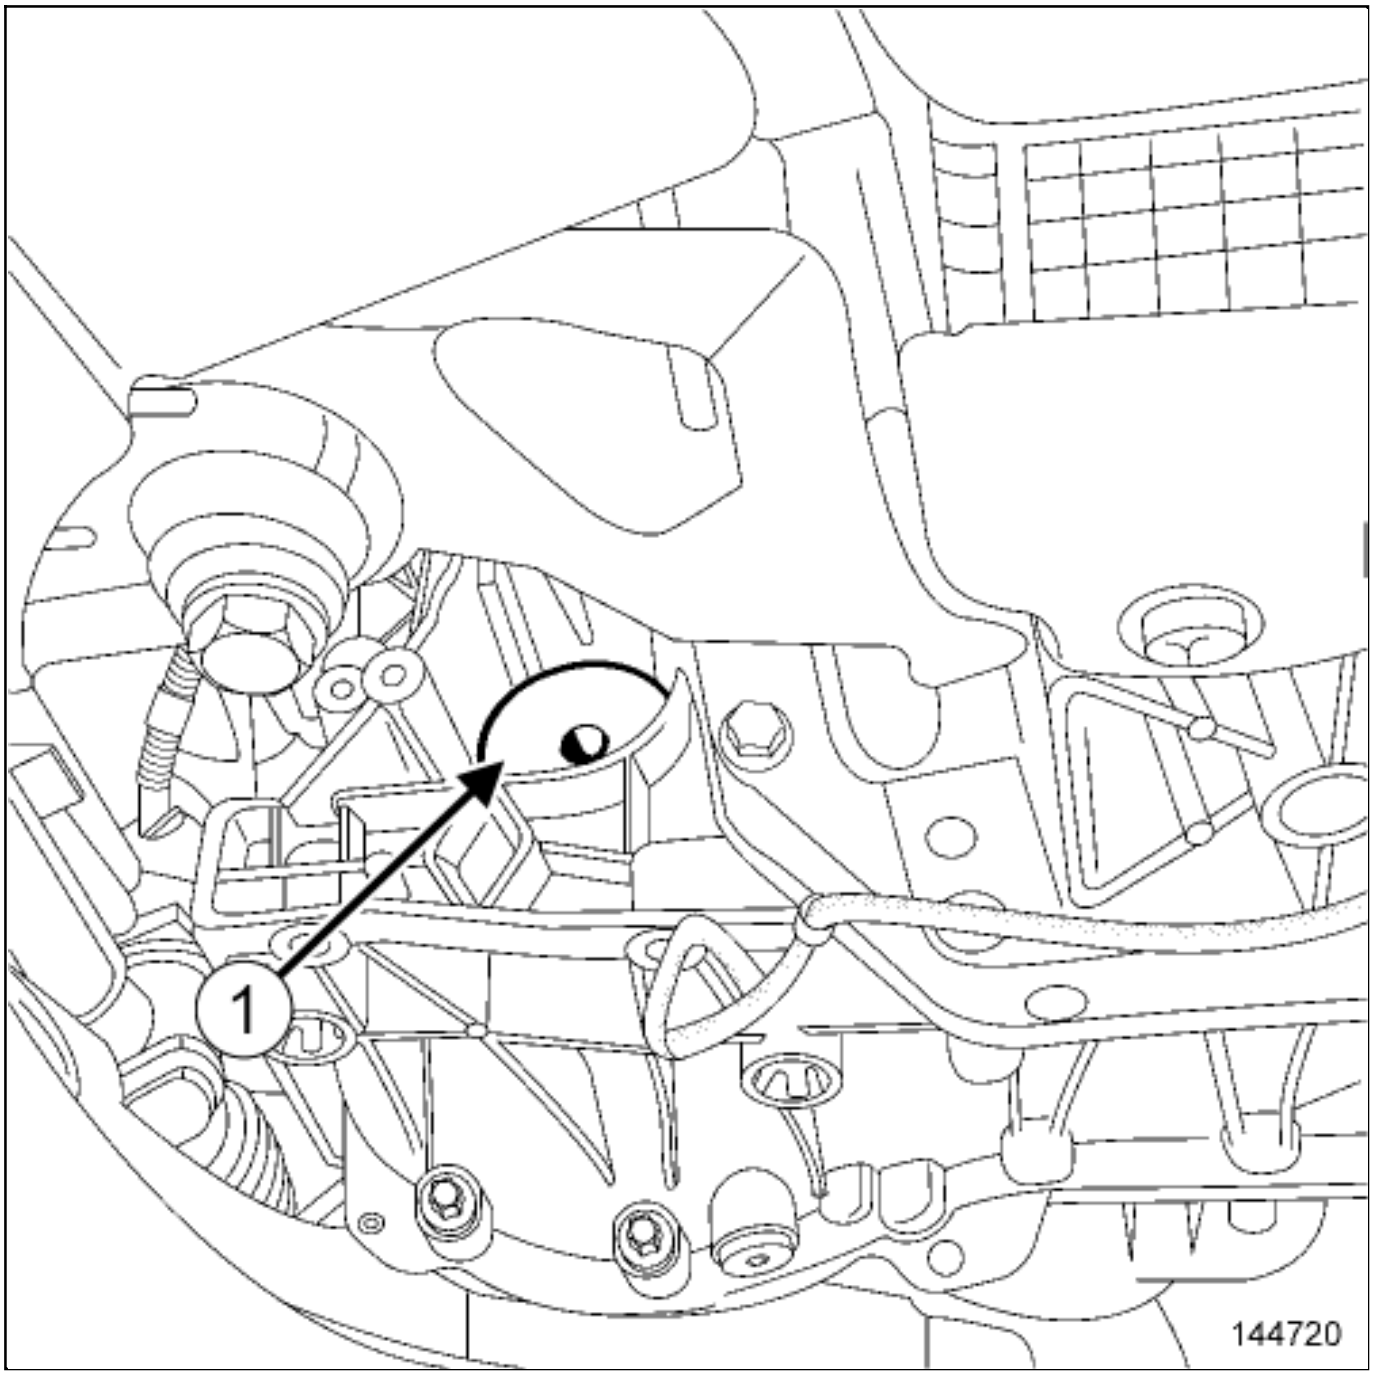
- the front left-hand wheel Wheel: Removal - Refitting ,
- the front left-hand driveshaft Front left-hand driveshaft: Removal - Refitting .

2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the left-hand seal using a screwdriver, taking care not to damage the housing.

Remove the right-hand seal using the toolInertia seal extractor(Bvi. 1948) .

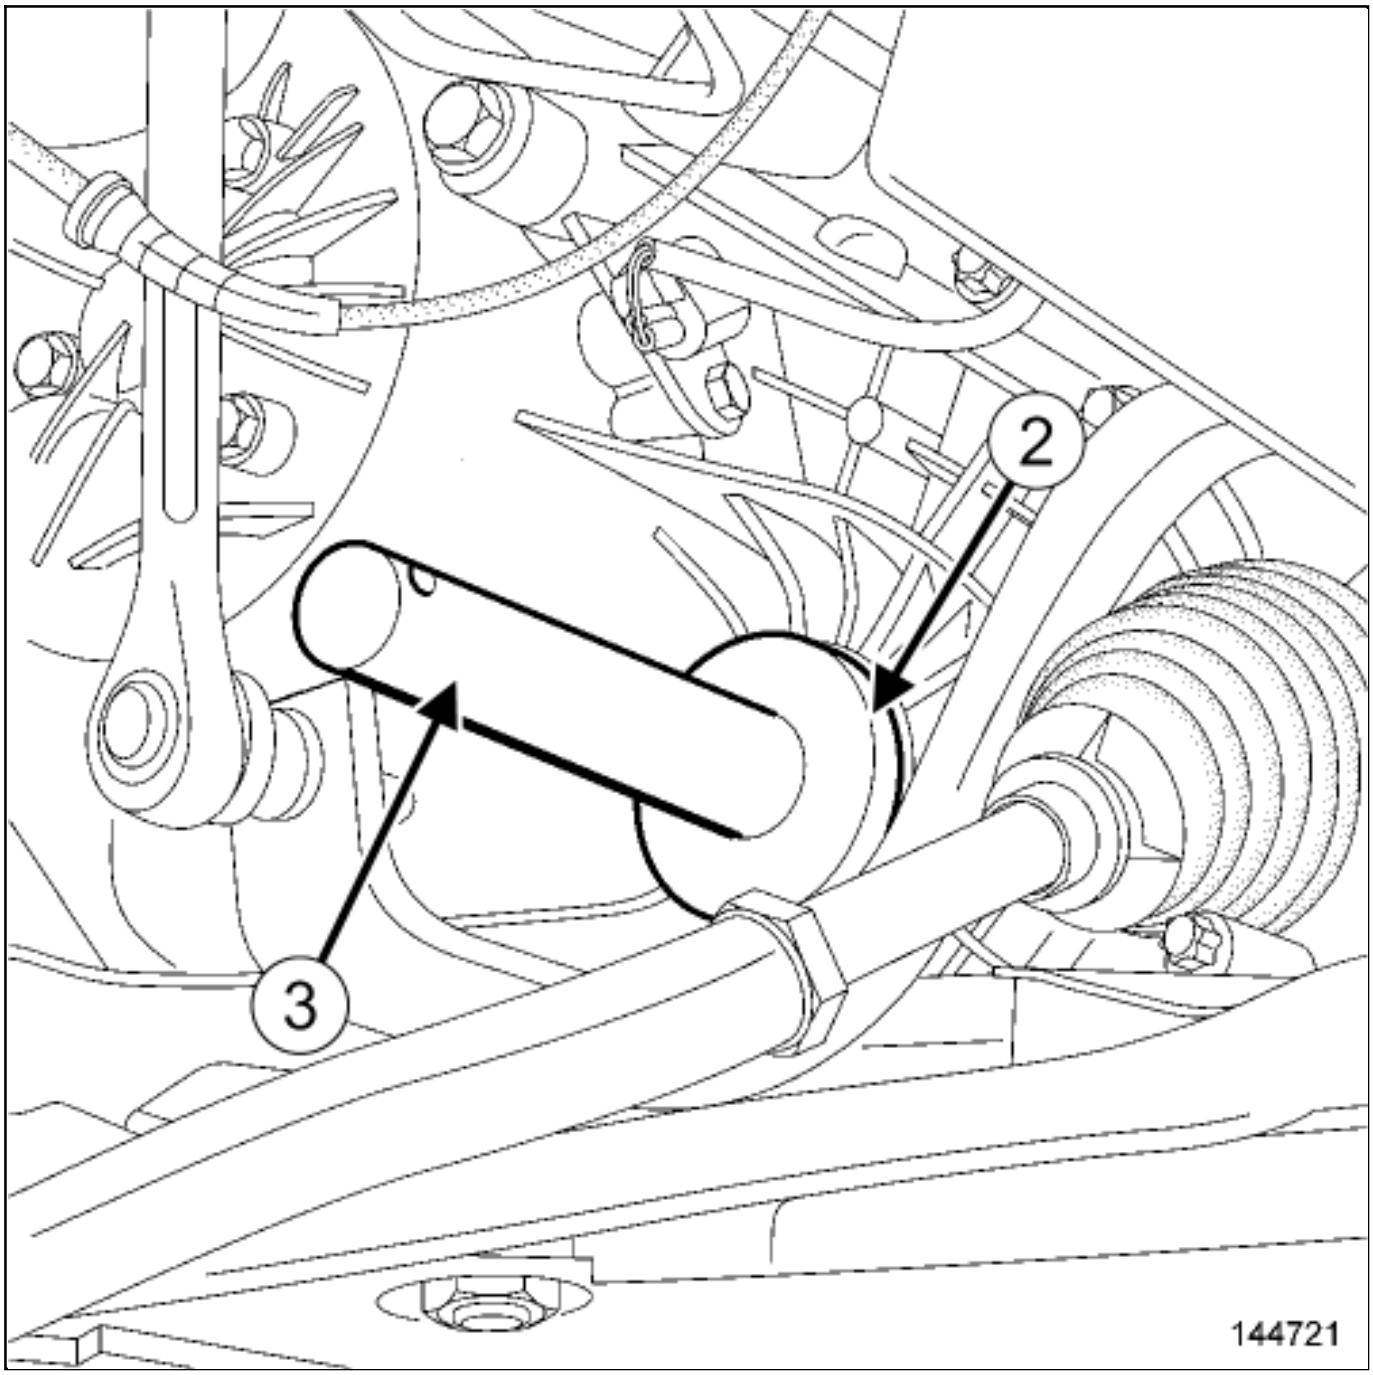
REFITTING



1. REFITTING PREPARATION OPERATION

parts always to be replaced: Differential output seal .

Use surface cleaner Vehicle: Parts and consumables for the repair to clean the mating face of the differential output seal.



2. REFITTING OPERATION FOR PART CONCERNED

1- WHEN REPLACING A DIFFERENTIAL OUTPUT SEAL ON THE RIGHT-HAND SIDE

Refit the right-hand differential output seal using the toolTool for fitting differential output seals (DC4) (Bvi. 1953) (1) .

2- WHEN REPLACING A DIFFERENTIAL OUTPUT SEAL ON THE LEFT-HAND SIDE

Refit the left-hand differential output seal using the toolTool for fitting differential output seals (DC4) (Bvi. 1953) (2) and a copper hammerTool for fitting the bearing cage into the housing.(Bvi. 1419) (3) .

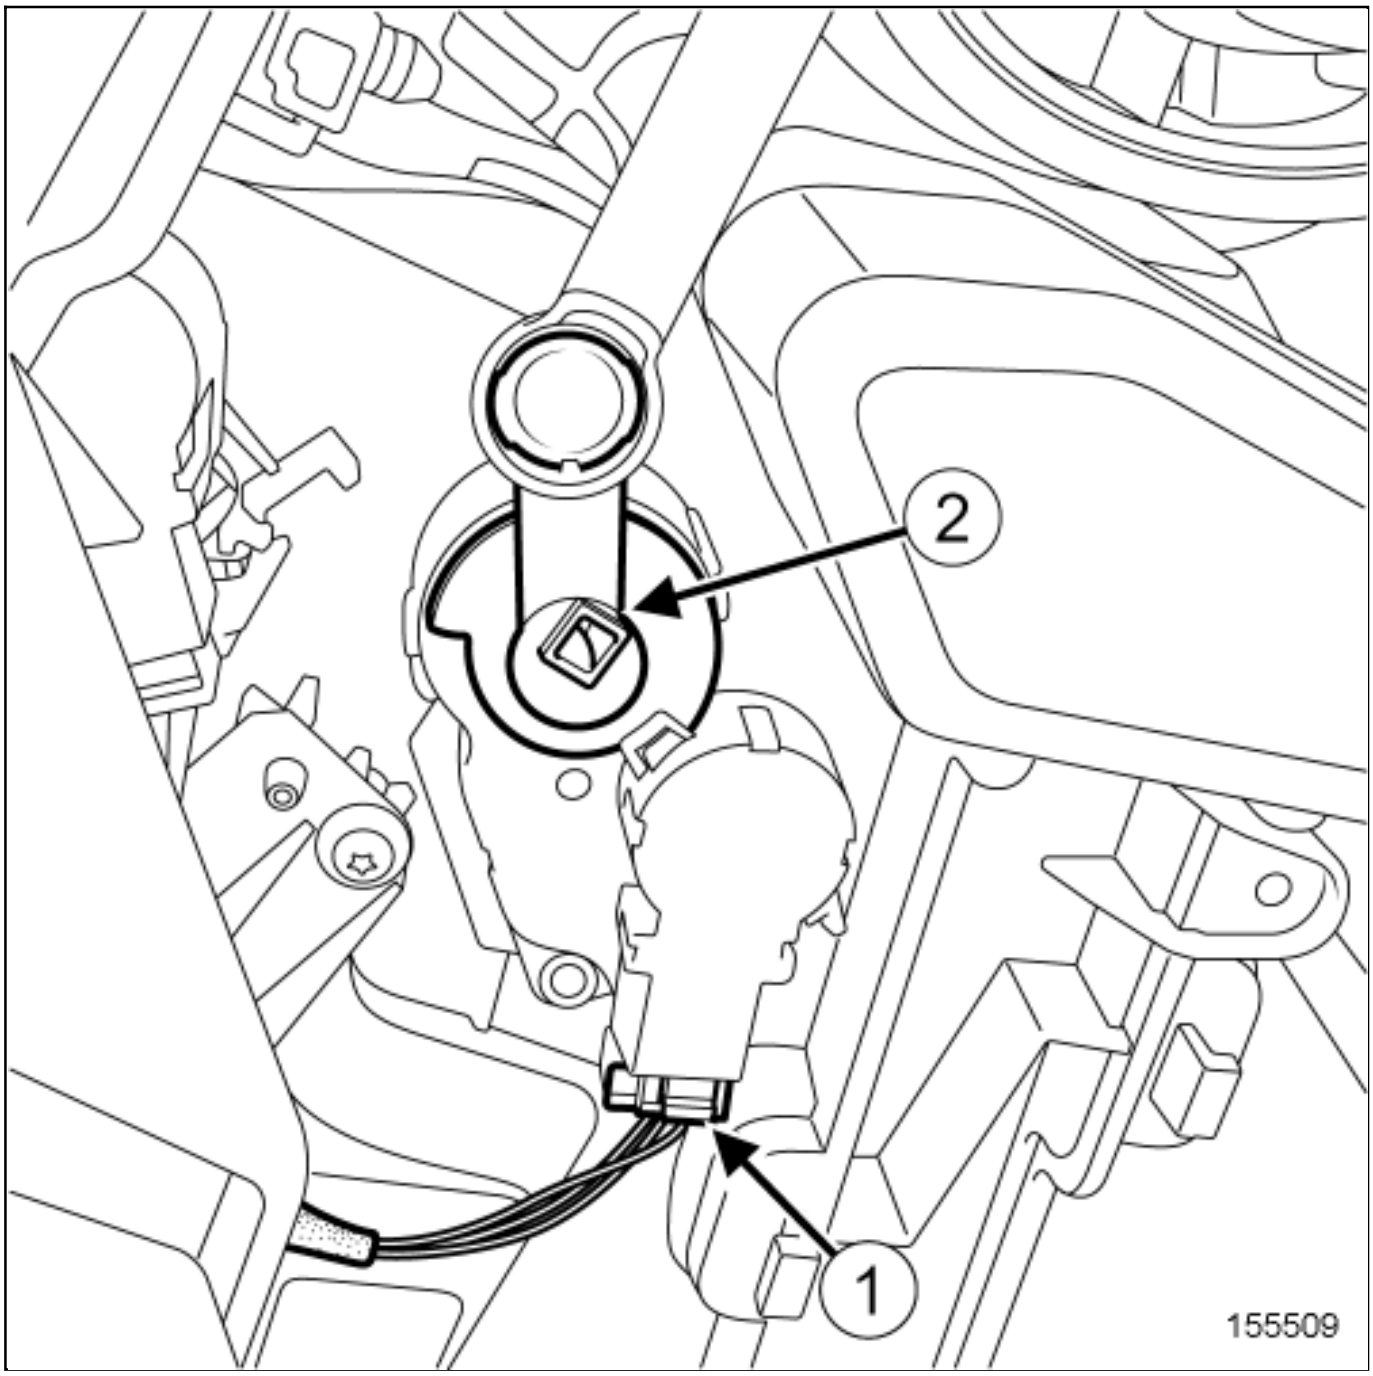
3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

DISTRIBUTION MOTOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool



Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove the glovebox Dashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Disconnect the distribution motor connector(1) .
- Move the bracket(2) from the distribution motor.
- Unclip the distribution motor from the distribution unit(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view)

REFITTING

1. REFITTING OPERATION

Position the distribution motor in relation to the flat surface of the distribution motor recess.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

"Air conditioning computer" ,

-Component affected by the After repair procedure:

"Front air distribution flap motor" .

DISTRIBUTION UNIT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583

Equipment required
refrigerant charging station

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

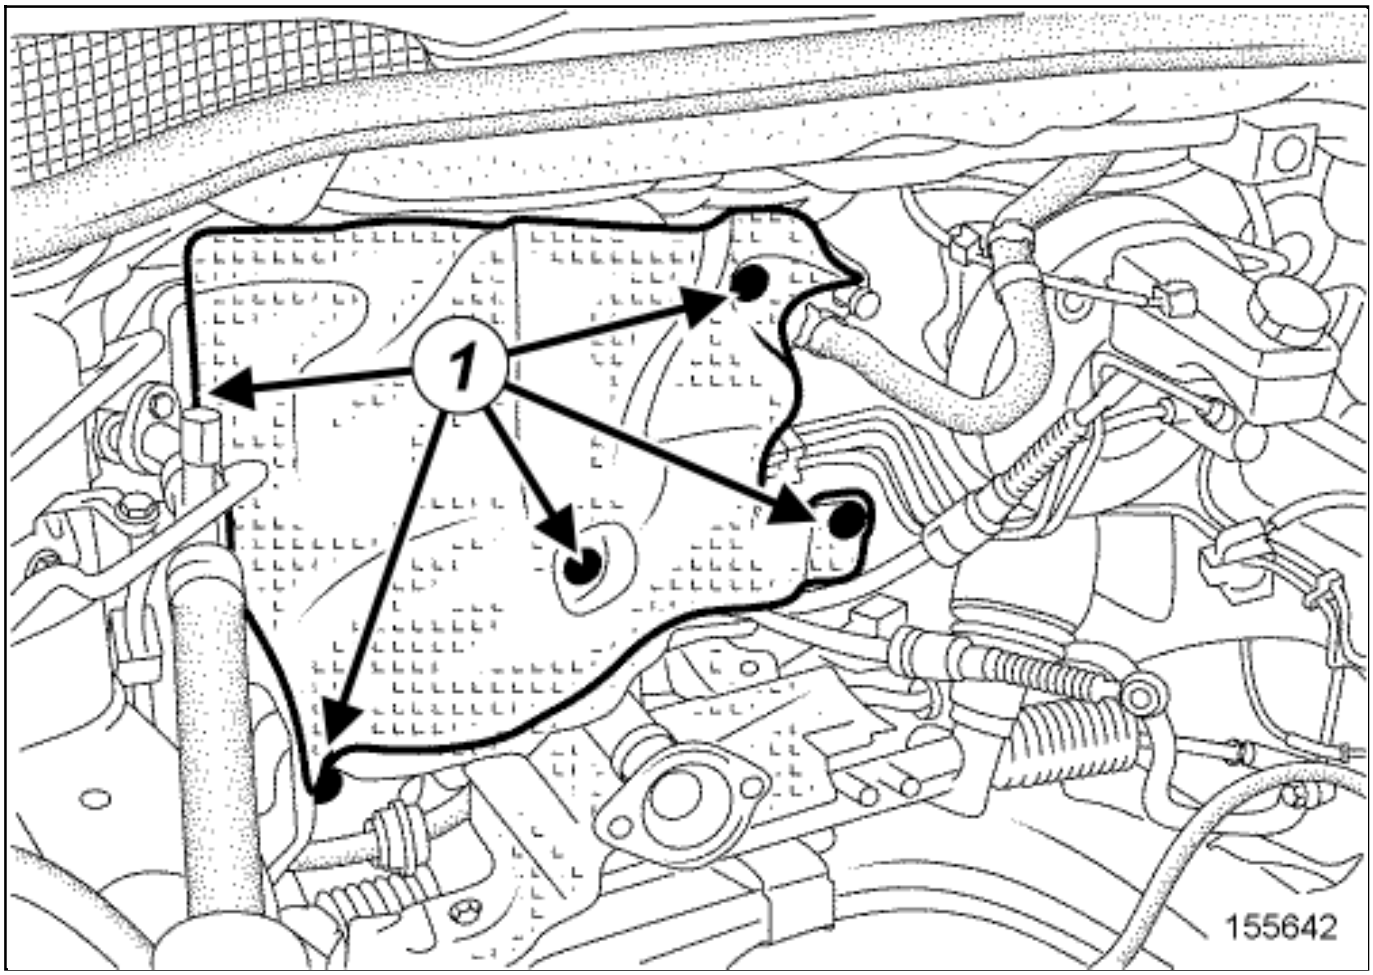
- Air conditioning: Precautions for the repair ,
- Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Note:

Use fuel blanking plugs with part to plug any openings exposed to the open air. Do not use any which have already been used to plug a fuel circuit.

REMOVAL



1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two post lift Vehicle: Towing and lifting .

Drain:

- the refrigerant circuit using the refrigerant charging station Refrigerant circuit: Draining - Filling ,
- the engine cooling system Cooling system: Draining - Refilling .

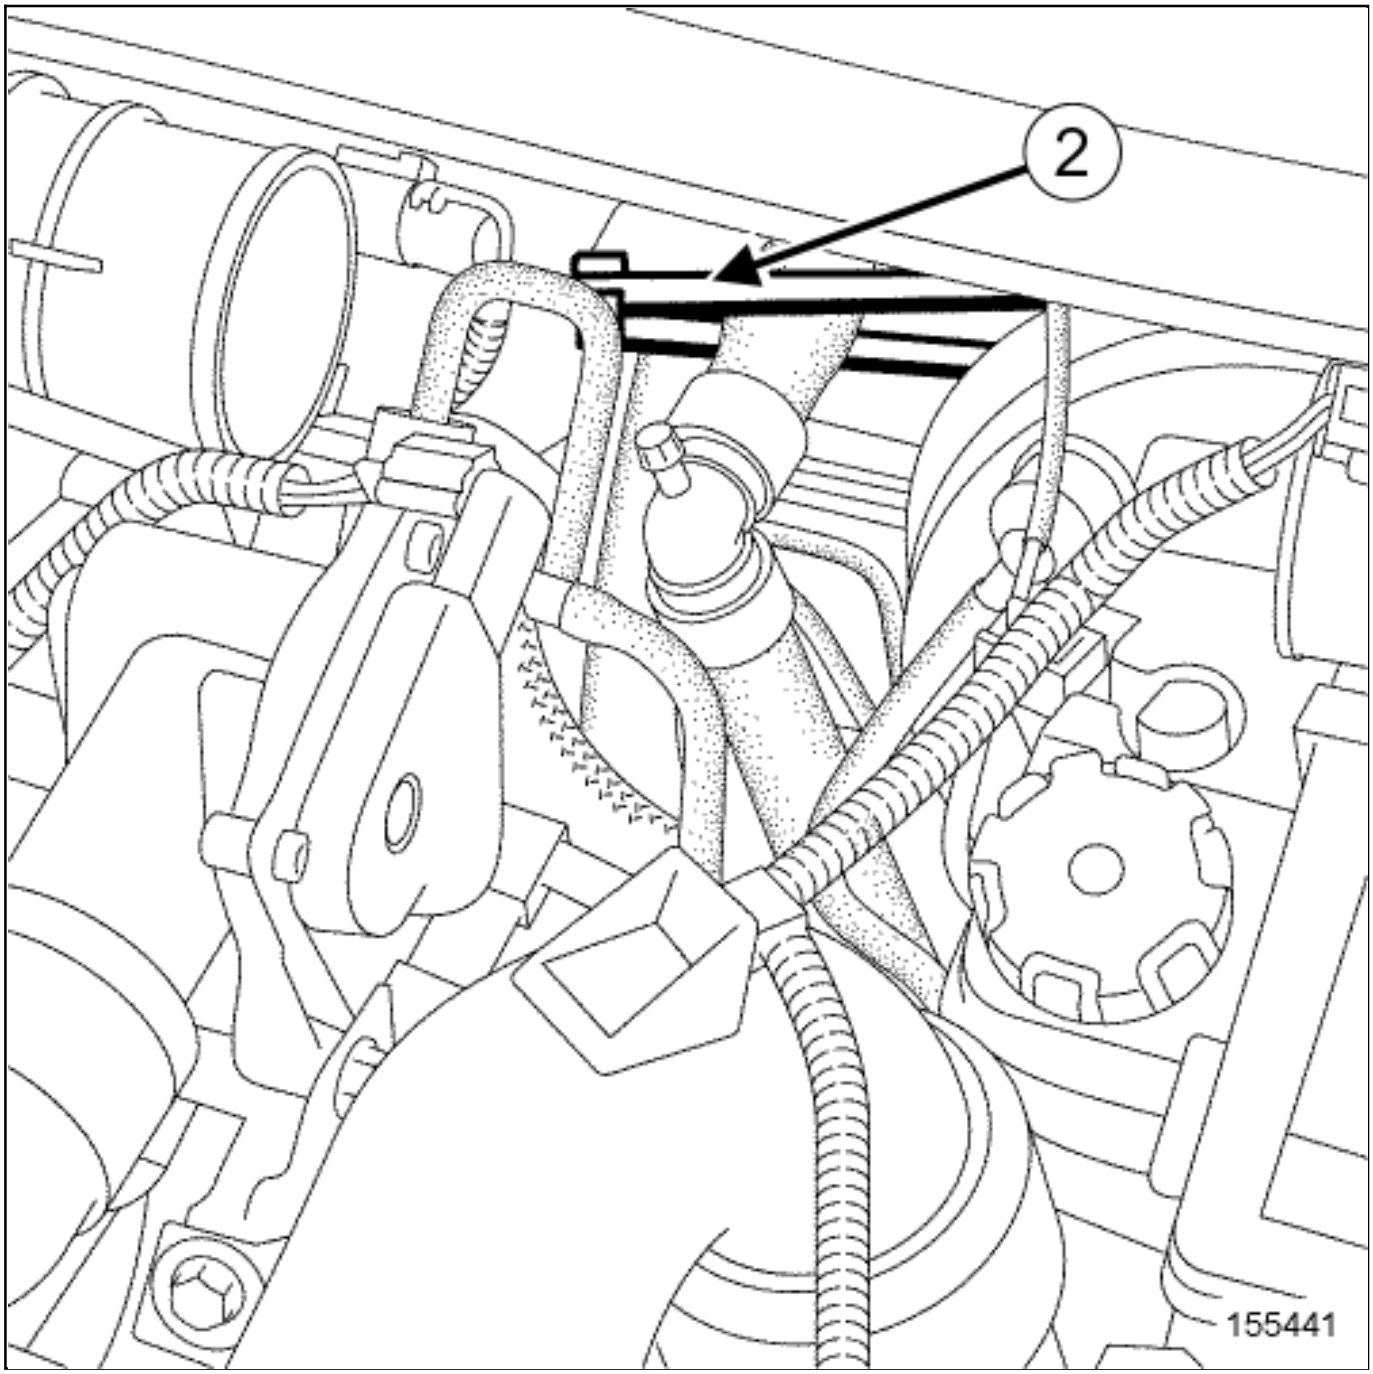
Disconnect the battery Battery: Removal - Refitting .

Remove the clips(1) from the bulkhead heat shield.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

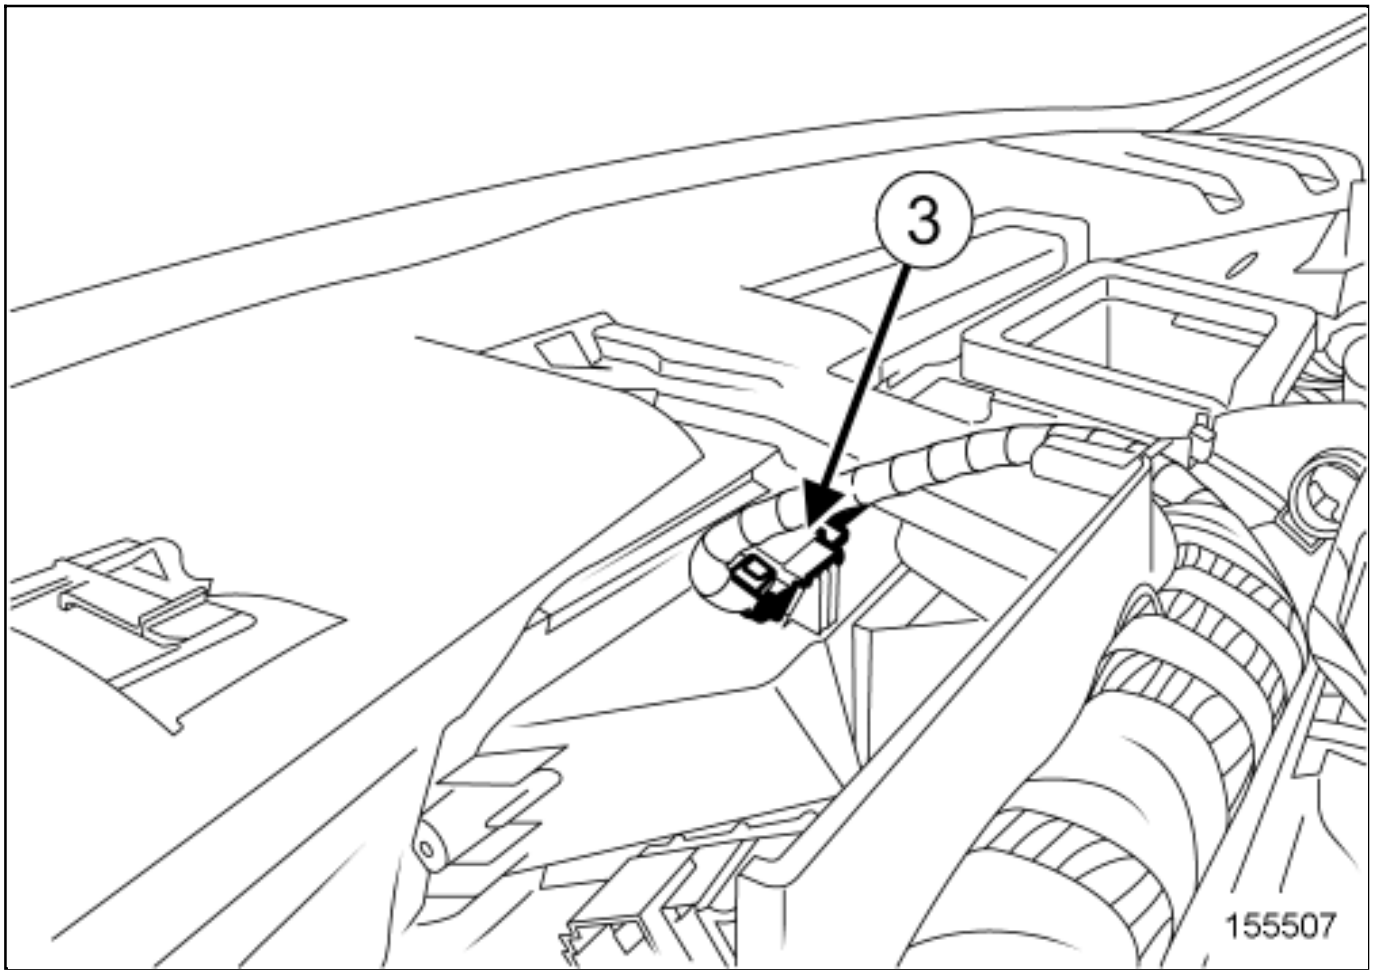


- Move the bulkhead heat shield to one side.
- Remove the bolts from the expansion valve connecting pipe bracketPassenger compartment cooling assembly: Exploded view .

CAUTION

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

- Disconnect the connecting pipes from the expansion valve.
- Move the connecting pipes away from the expansion valve.
- Fit blanking plugs on the expansion valve and on the connecting pipes.



- Fit the toolPipe clamps.(Ms. 583) (2) on the heater matrix hoses.
- Move the clips using the toolRemote operation pliers for hose clips.(Mot. 1448) .
- Disconnect the heater matrix hoses.

Remove:

- the dashboard Dashboard assembly: Exploded view ,
- the dashboard cross member (see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

2. REMOVAL OPERATION

Disconnect the supply connector(3) from the distribution unit.

Unclip the electrical wiring from the distribution unit.

Move the electrical wiring from the distribution unit.

Remove the distribution unit.

Note:

To find the location of components(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Remove the following components from the distribution unit:

- the left-hand mixer motor,
- the right-hand mixer motor,
- the distribution motor,
- the cabin filter,
- the expansion valve,
- the recirculation motor,
- the air recirculation control cable,
- the fan assembly,
- the fan assembly control unit,
- the evaporator sensor,
- the heater matrix,
- heater resistor relays,

the heating resistor.

REFITTING

1. REFITTING PREPARATION OPERATION

CAUTION

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

CAUTION

To avoid any leaks, check that the seal and the pipe surface are in good condition. The seal and the surface must be clean and scratch free.

Remove the blanking plugs.

2. REFITTING OPERATION

Refit the following components onto the distribution unit:

- the left-hand mixer motor,
- the right-hand mixer motor,
- the distribution motor,
- the cabin filter,

- the expansion valve,
- the recirculation motor,
- the air recirculation control cable,
- the fan assembly,
- the fan assembly control unit,
- the evaporator sensor,
- the heater matrix,
- heater resistor relays,
- the heating resistor.

Refit the distribution unit.

Fit the wiring onto the distribution unit.

Clip the wiring onto the distribution unit.

Connect the supply connector of the distribution unit.

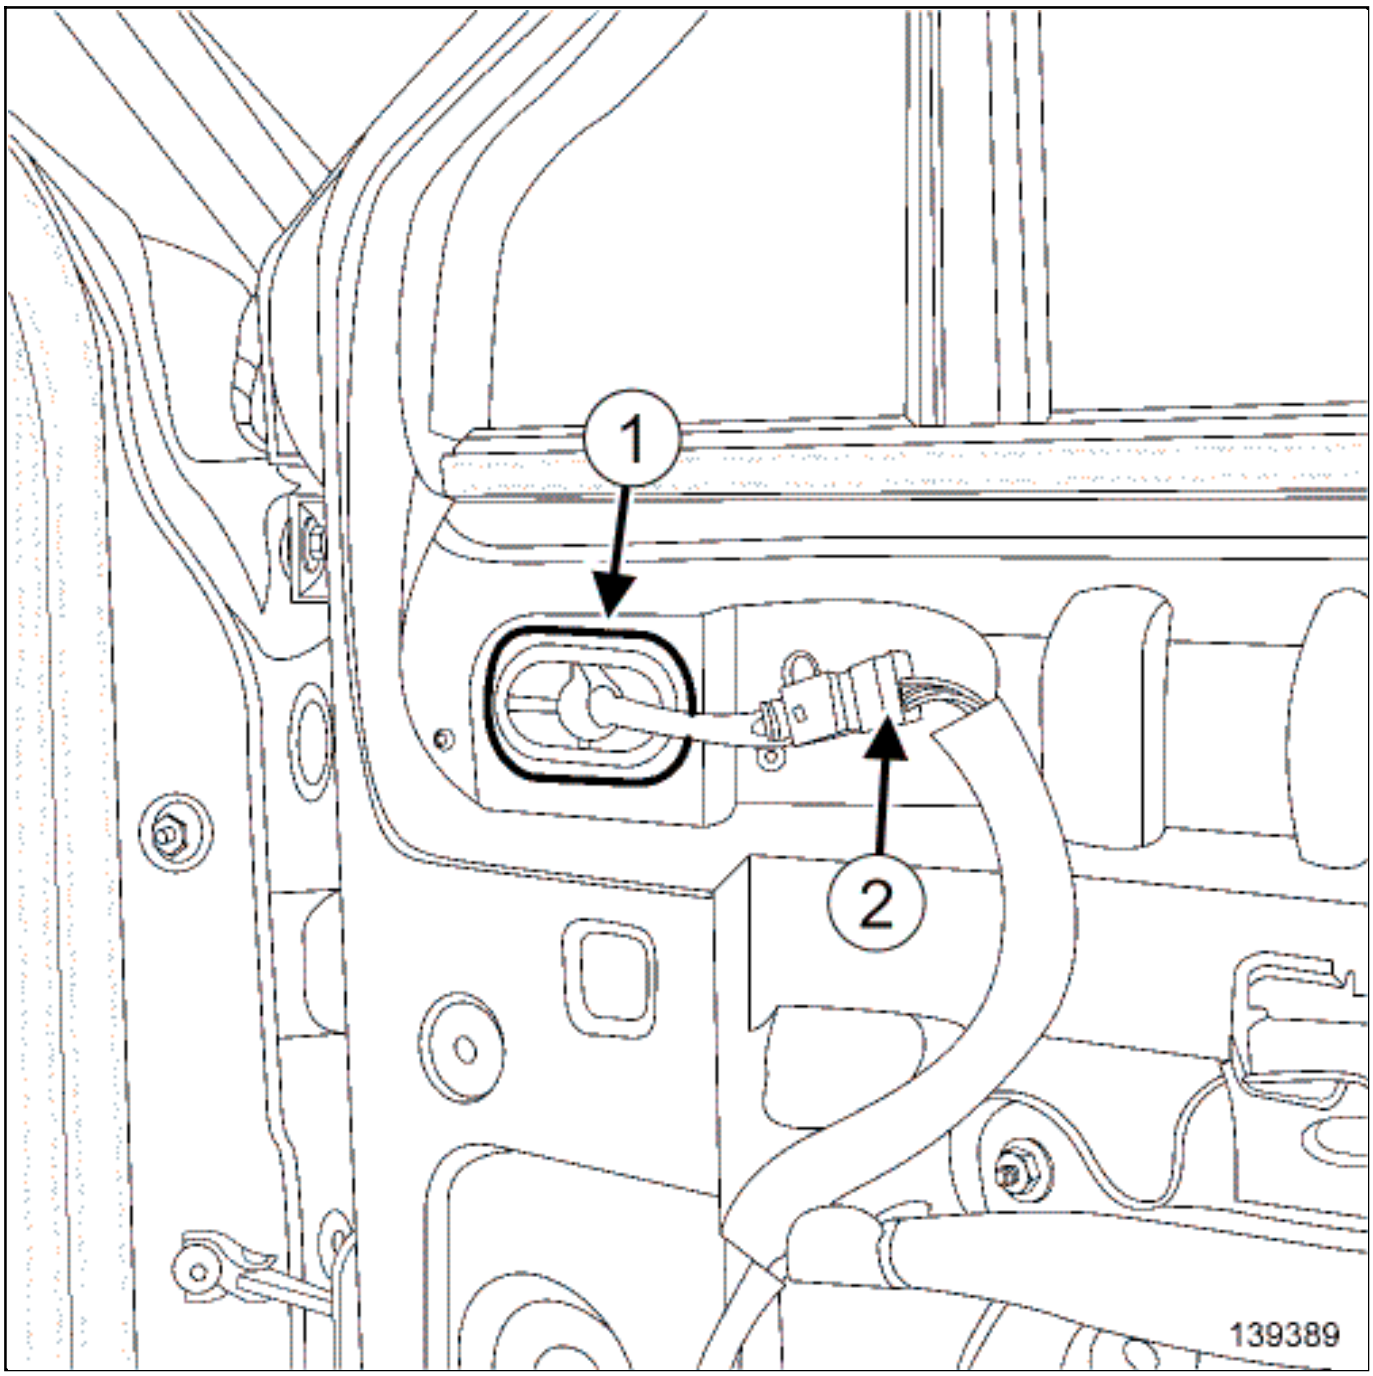
3. FINAL OPERATION

Proceed in the reverse order to removal.

Perform the following operations:

- fill the refrigerant circuit using the refrigerant charging station **Refrigerant circuit: Draining - Filling** ,
- check for leaks **Refrigerant circuit: Check** .
- top up and bleed the cooling system **Cooling system: Draining - Refilling** .

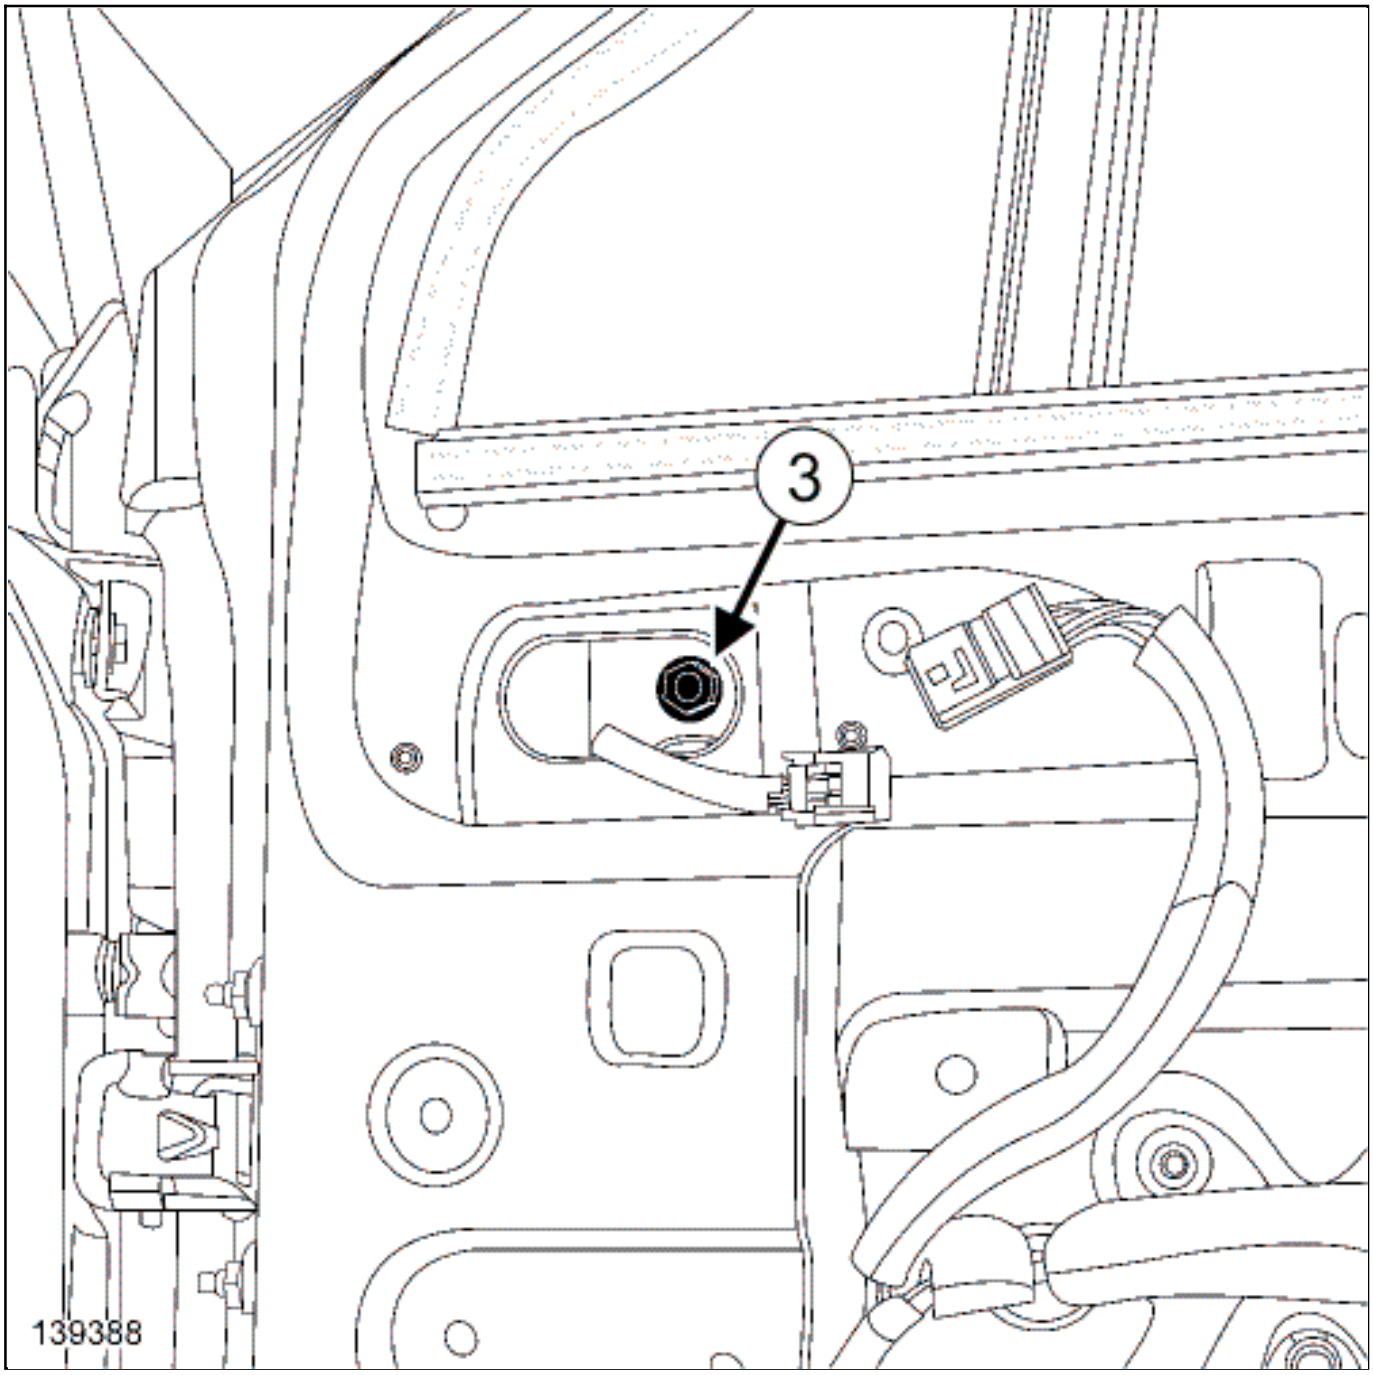
Check that the air conditioning system is operating correctly **Air conditioning: Check** .



DOOR MIRROR: REMOVAL - REFITTING

Special tooling required	
Set of trim removal levers.	Car. 1363

REMOVAL

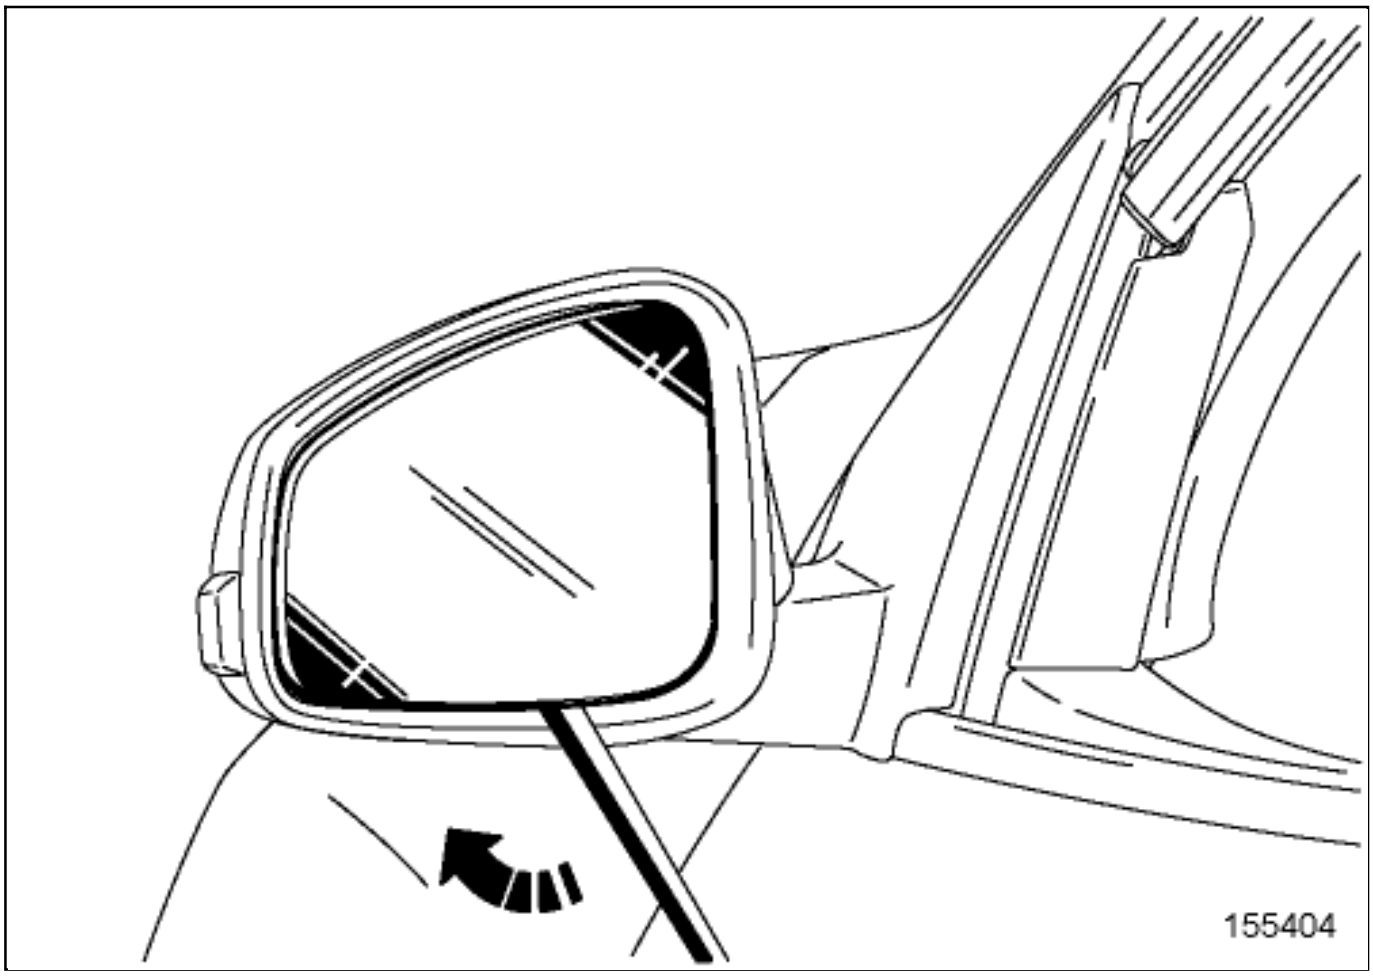


1. REMOVAL PREPARATION OPERATION

- Remove the front side door trim Front side opening element trim: Removal - Refitting .

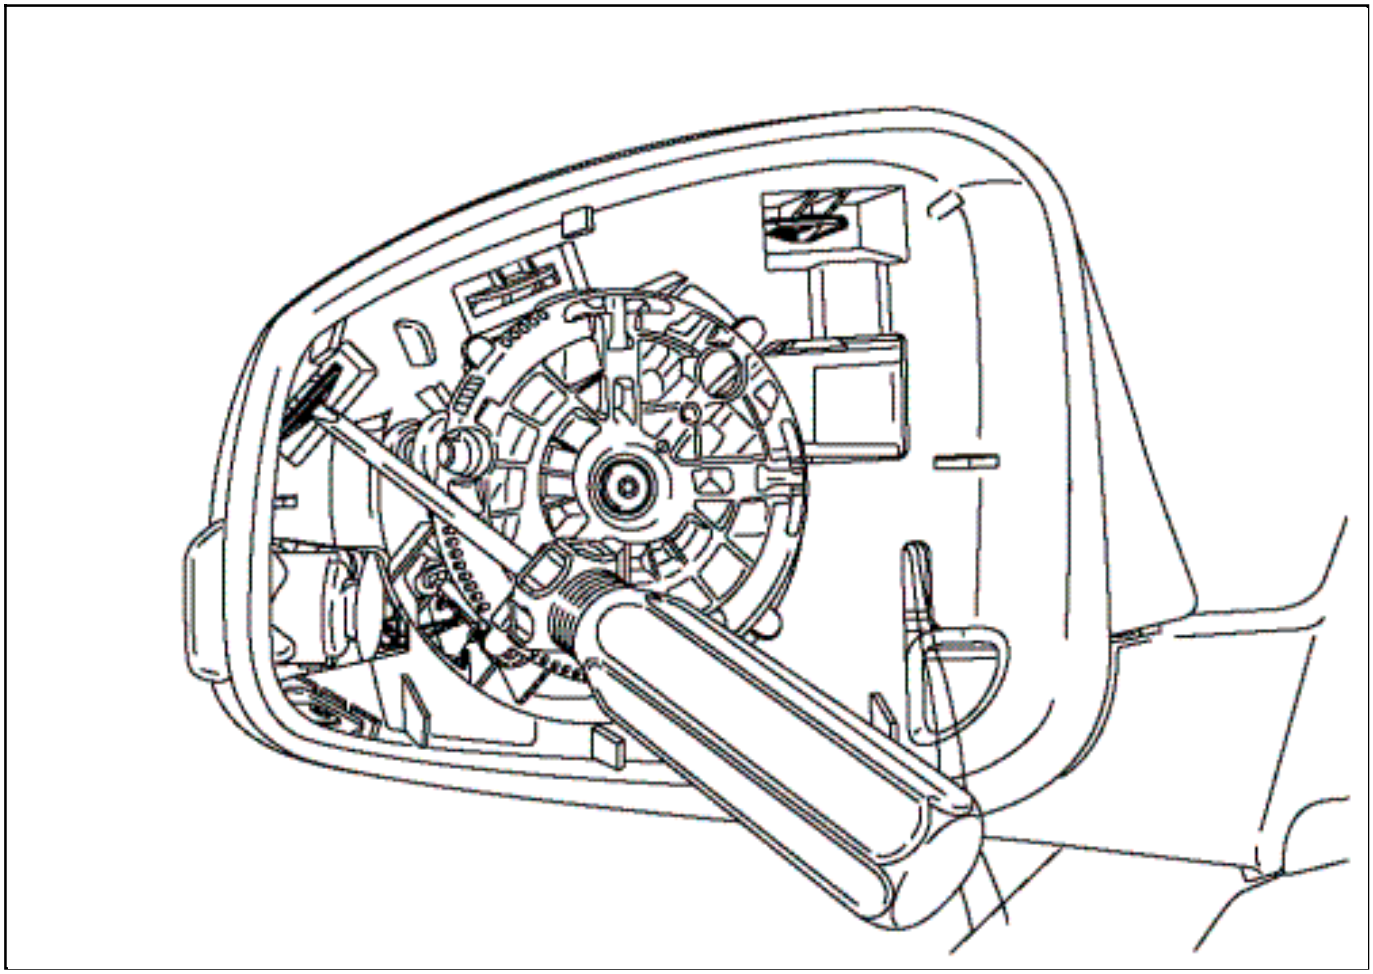
- Remove the blanking cover(1) .
- Disconnect the door mirror connector(2) .

2. REMOVAL OPERATION

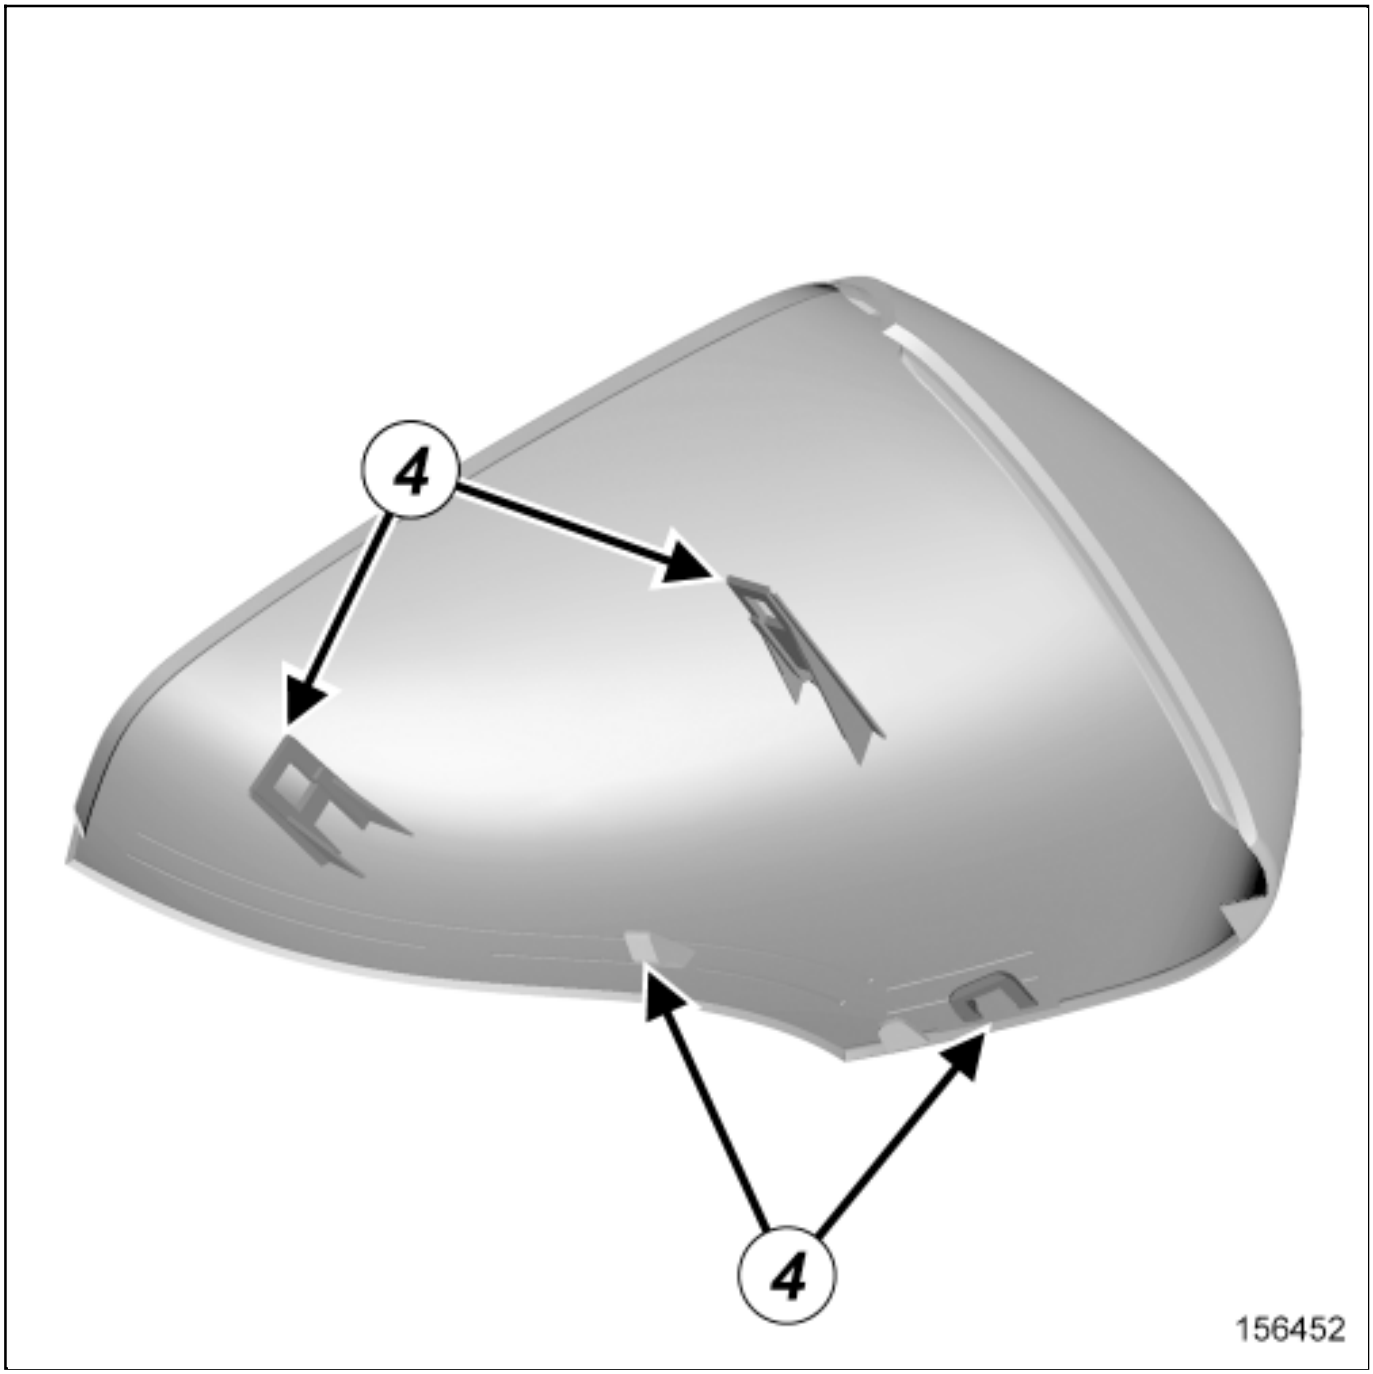


-

Remove:



■



- the door mirror nut(3) ,
- the door mirror.

1- IN THE EVENT OF A REPLACEMENT

- Protect the edges of the door mirror with masking tape.
- Unclip the door mirror glass using the toolSet of trim removal levers.(Car. 1363) .
- Disconnect the connector.

- Unclip the door mirror casing at(4) using the toolSet of trim removal levers.(Car. 1363) .

- Remove the door mirror casing.

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

2. FINAL OPERATION

Carry out a function test.

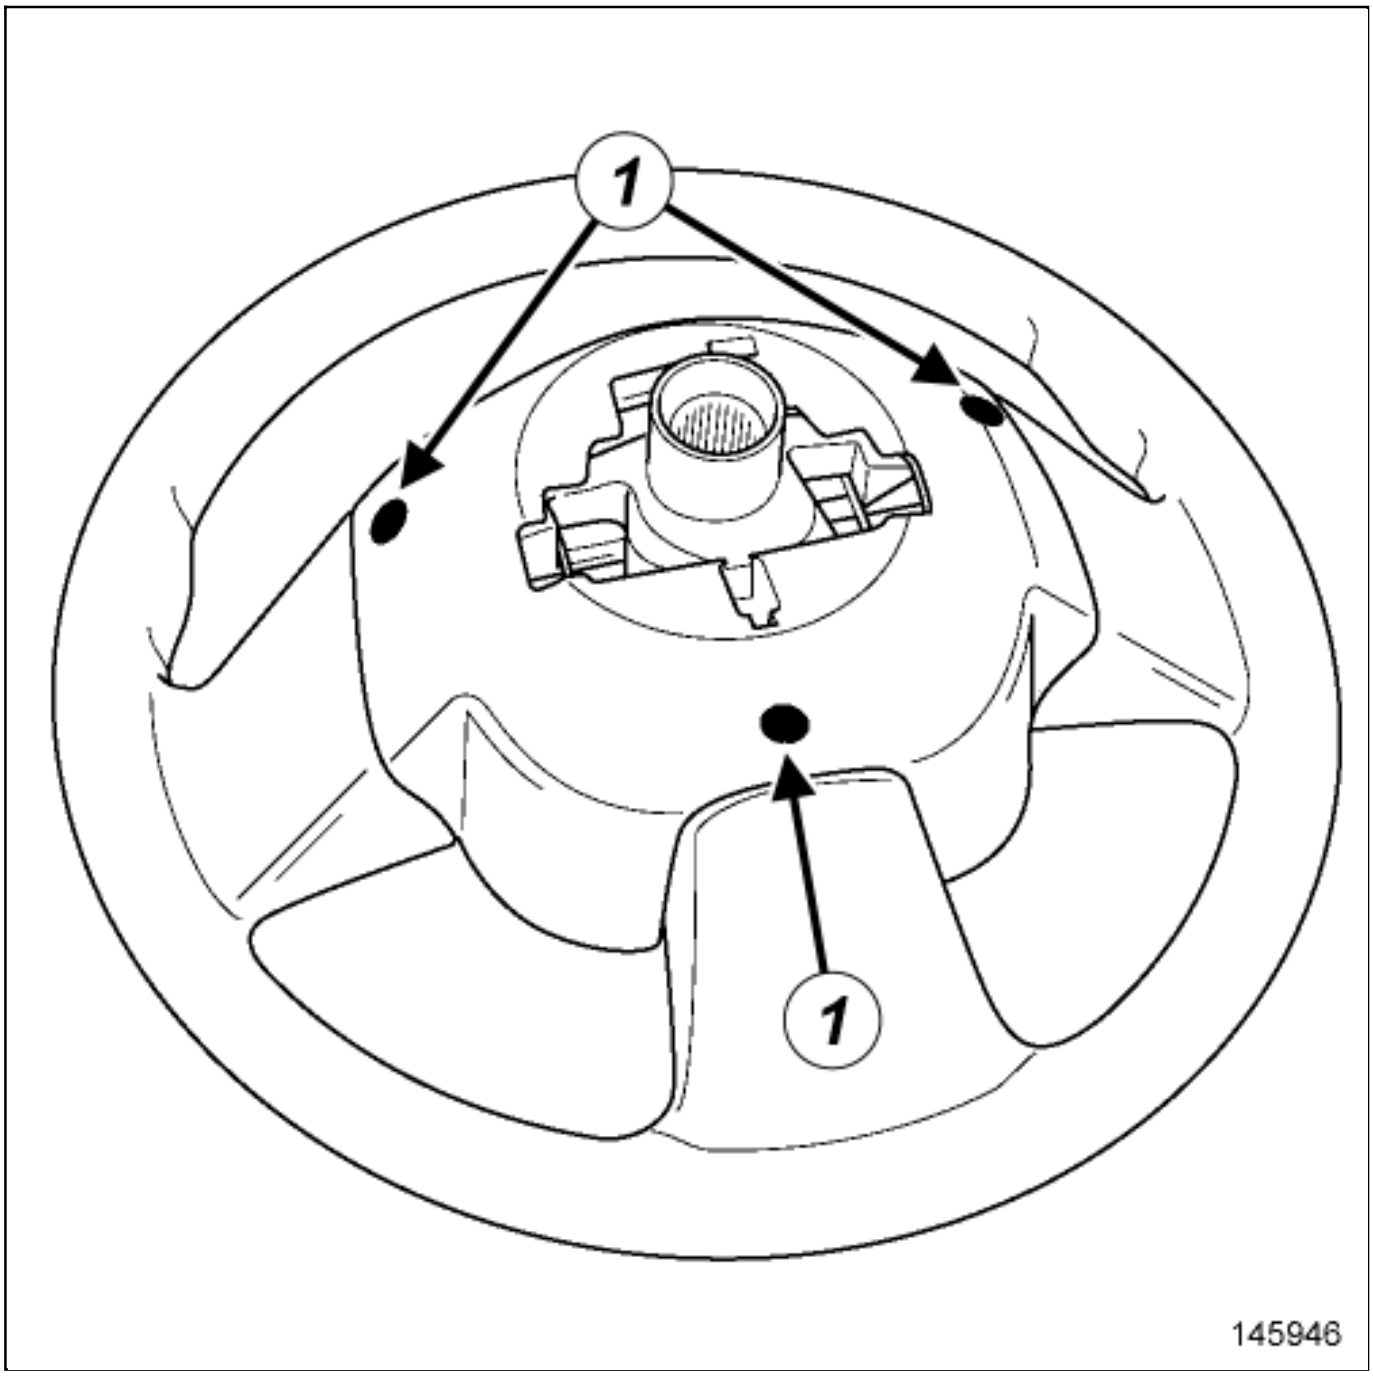
DRIVER'S FRONTAL AIRBAG: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) ,

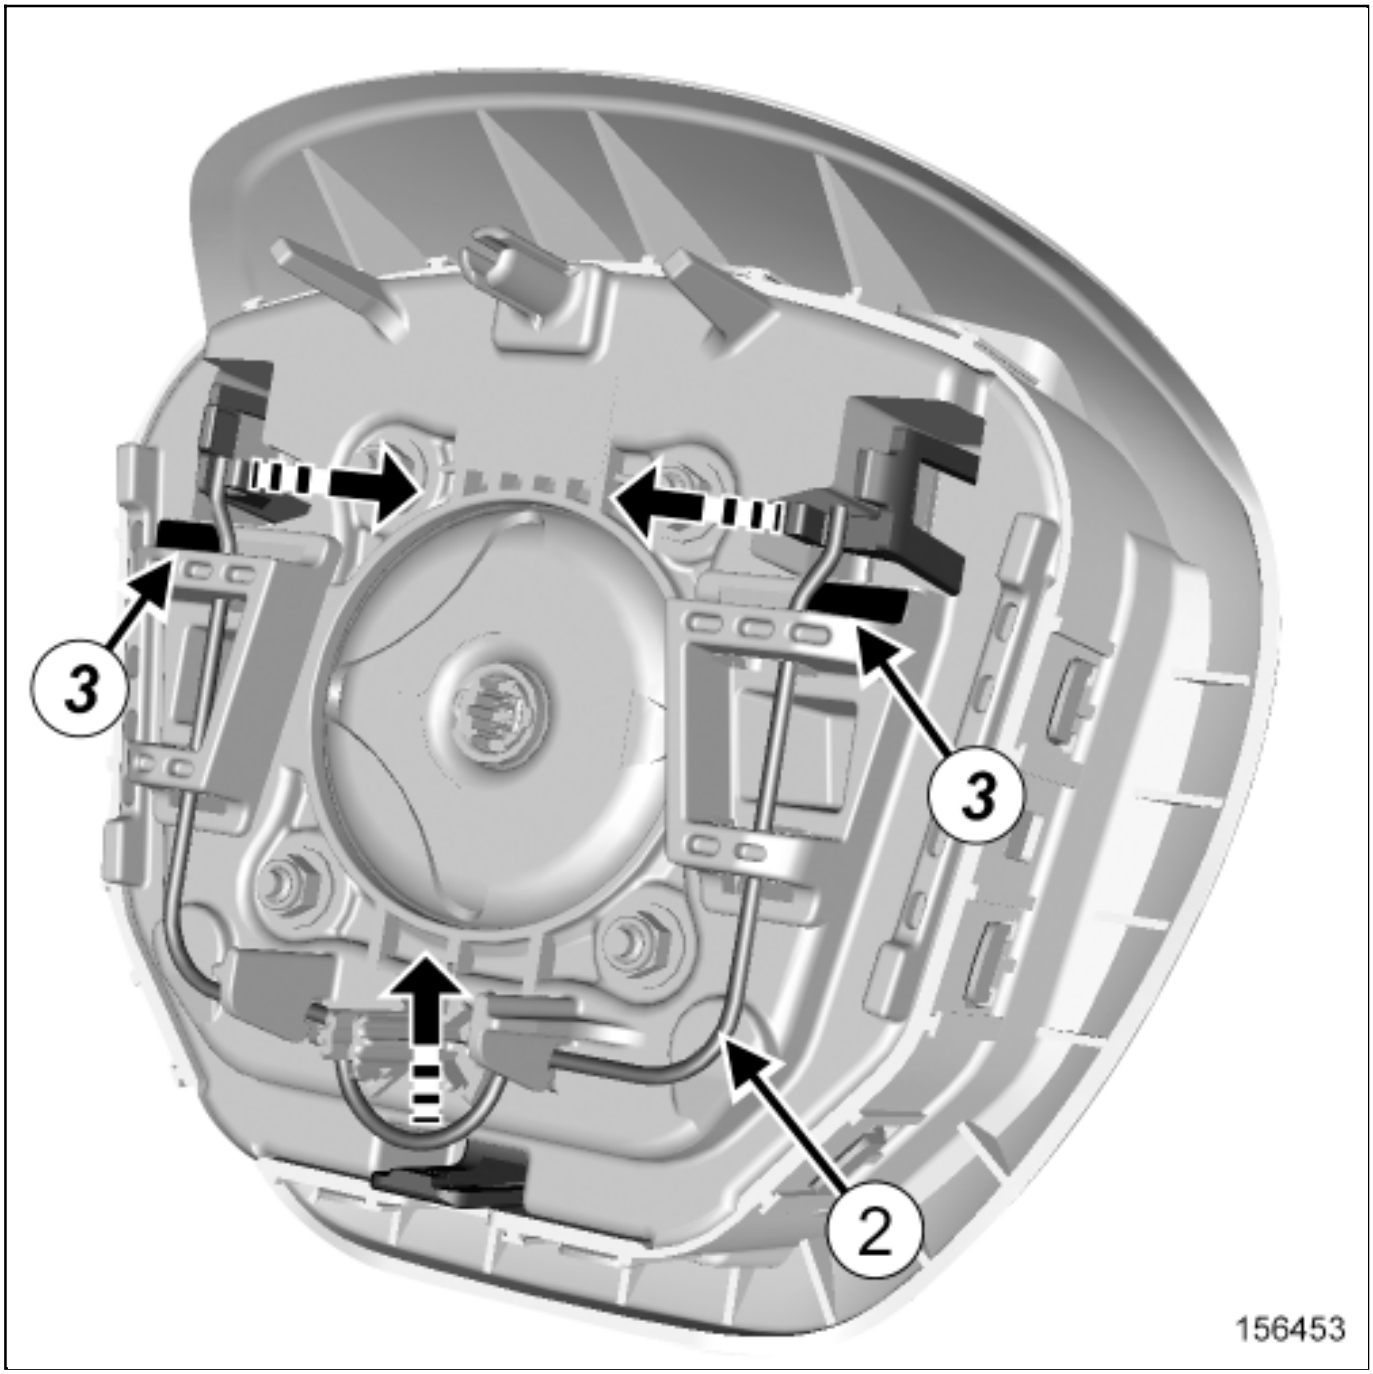


Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Apply the procedure for deactivating the safety systems(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .



2. REMOVAL OPERATION

Insert a flat-blade screwdriver into one of the openings(1) .

Note:

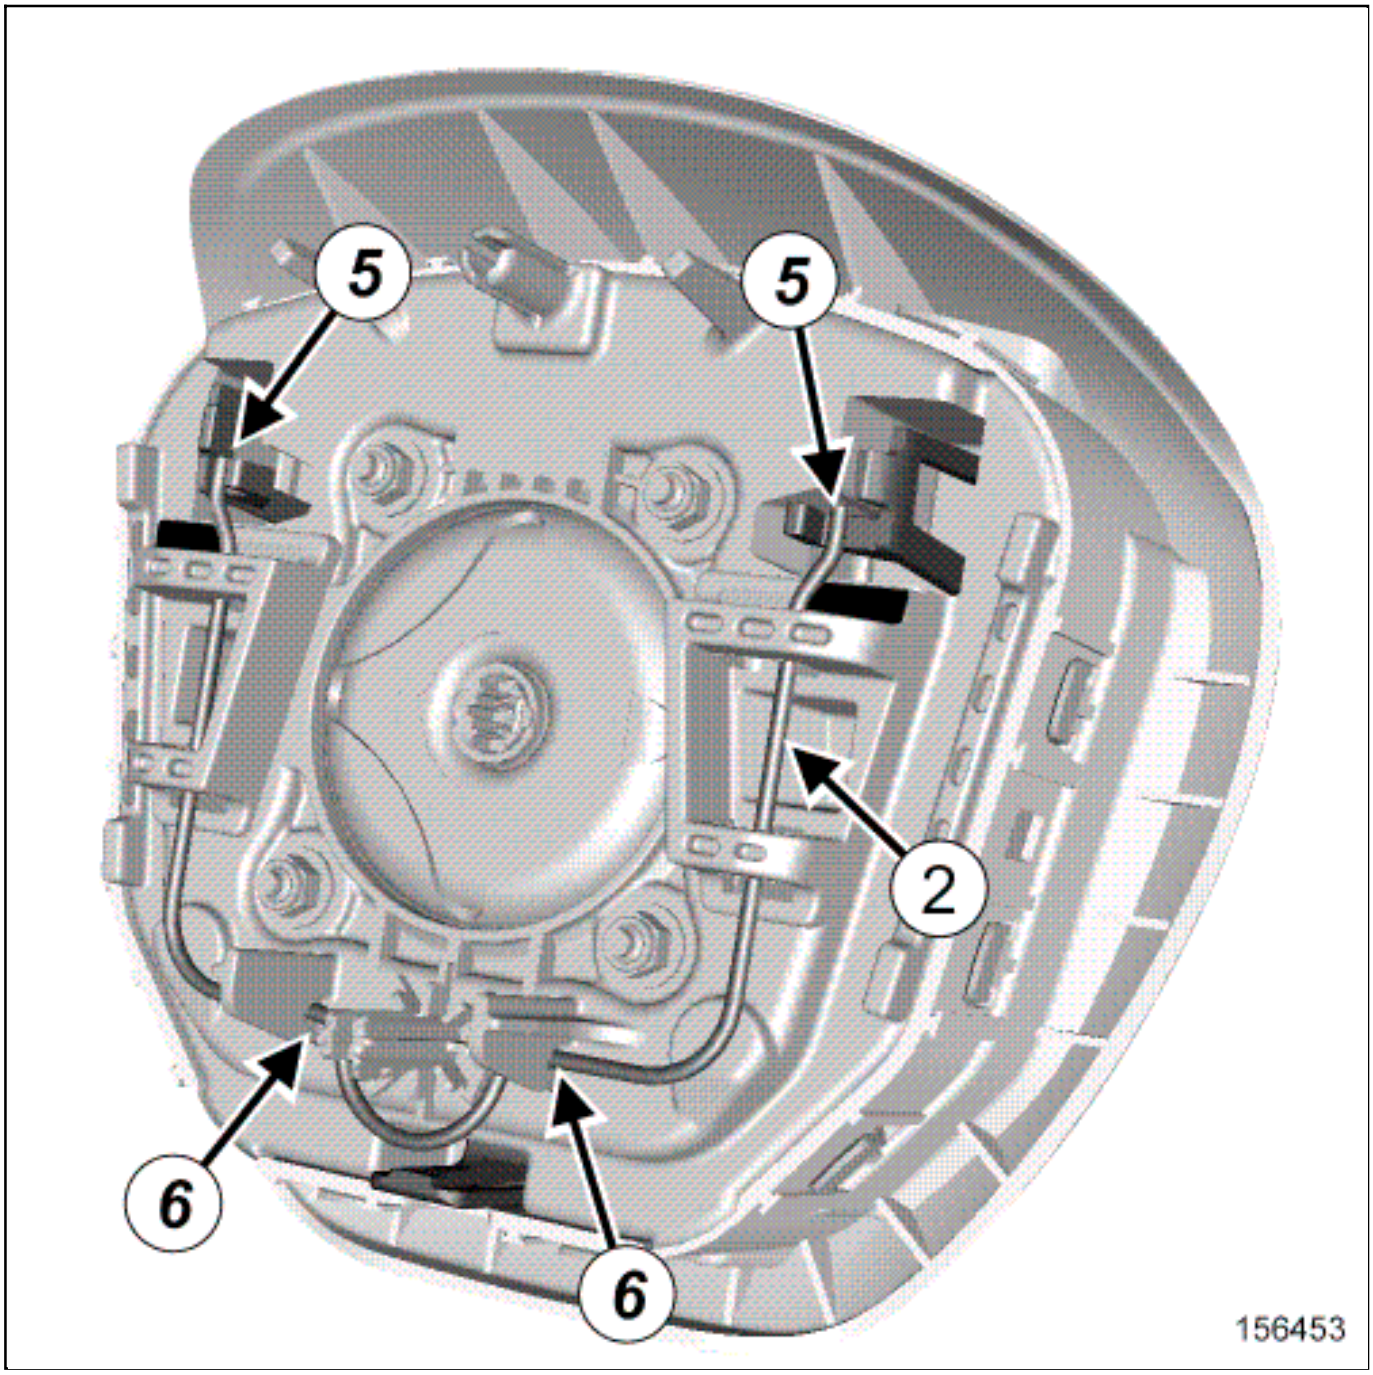
Use a screwdriver with a diameter equal to that of the hole.

Unclip the clip(2) by pushing the screwdriver on the area(3) , while pulling on the driver's frontal airbag.

Note:

Use a screwdriver with a diameter equal to that of the hole.

Proceed in the same manner to unclip the other side of the airbag.



Unlock the connector(s) of the driver's frontal airbag.

Disconnect the connector(s).

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

Ensure that the clip(2) is correctly positioned on the upper clips(5) and clipped at the lower section (6) .

Note:

The driver's front airbag will not be removable if it is refitted with the clip(2) positioned incorrectly.

2. FINAL OPERATION

Apply the procedure for activating the safety systems(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .

3. CHECKING AFTER REPAIR

Switch on the ignition.

Check that there are no faults on the instrument panel.

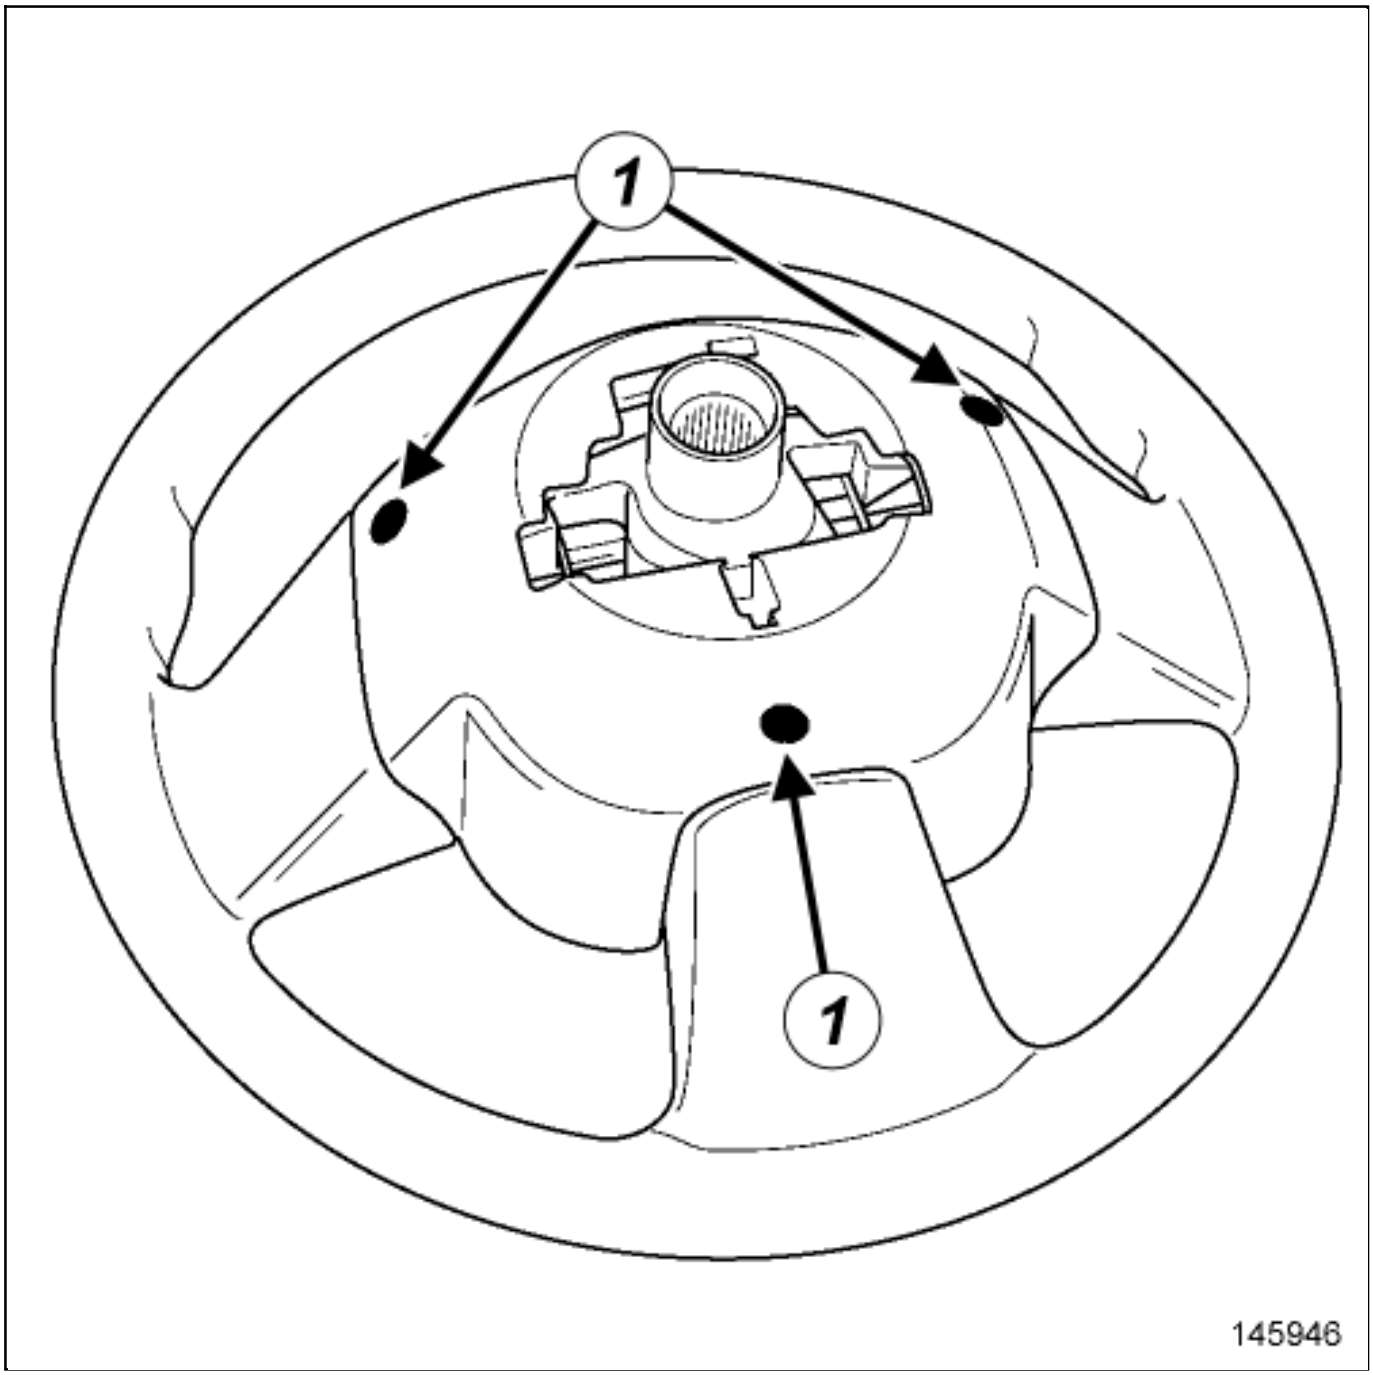
DRIVER'S FRONTAL AIRBAG: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) ,

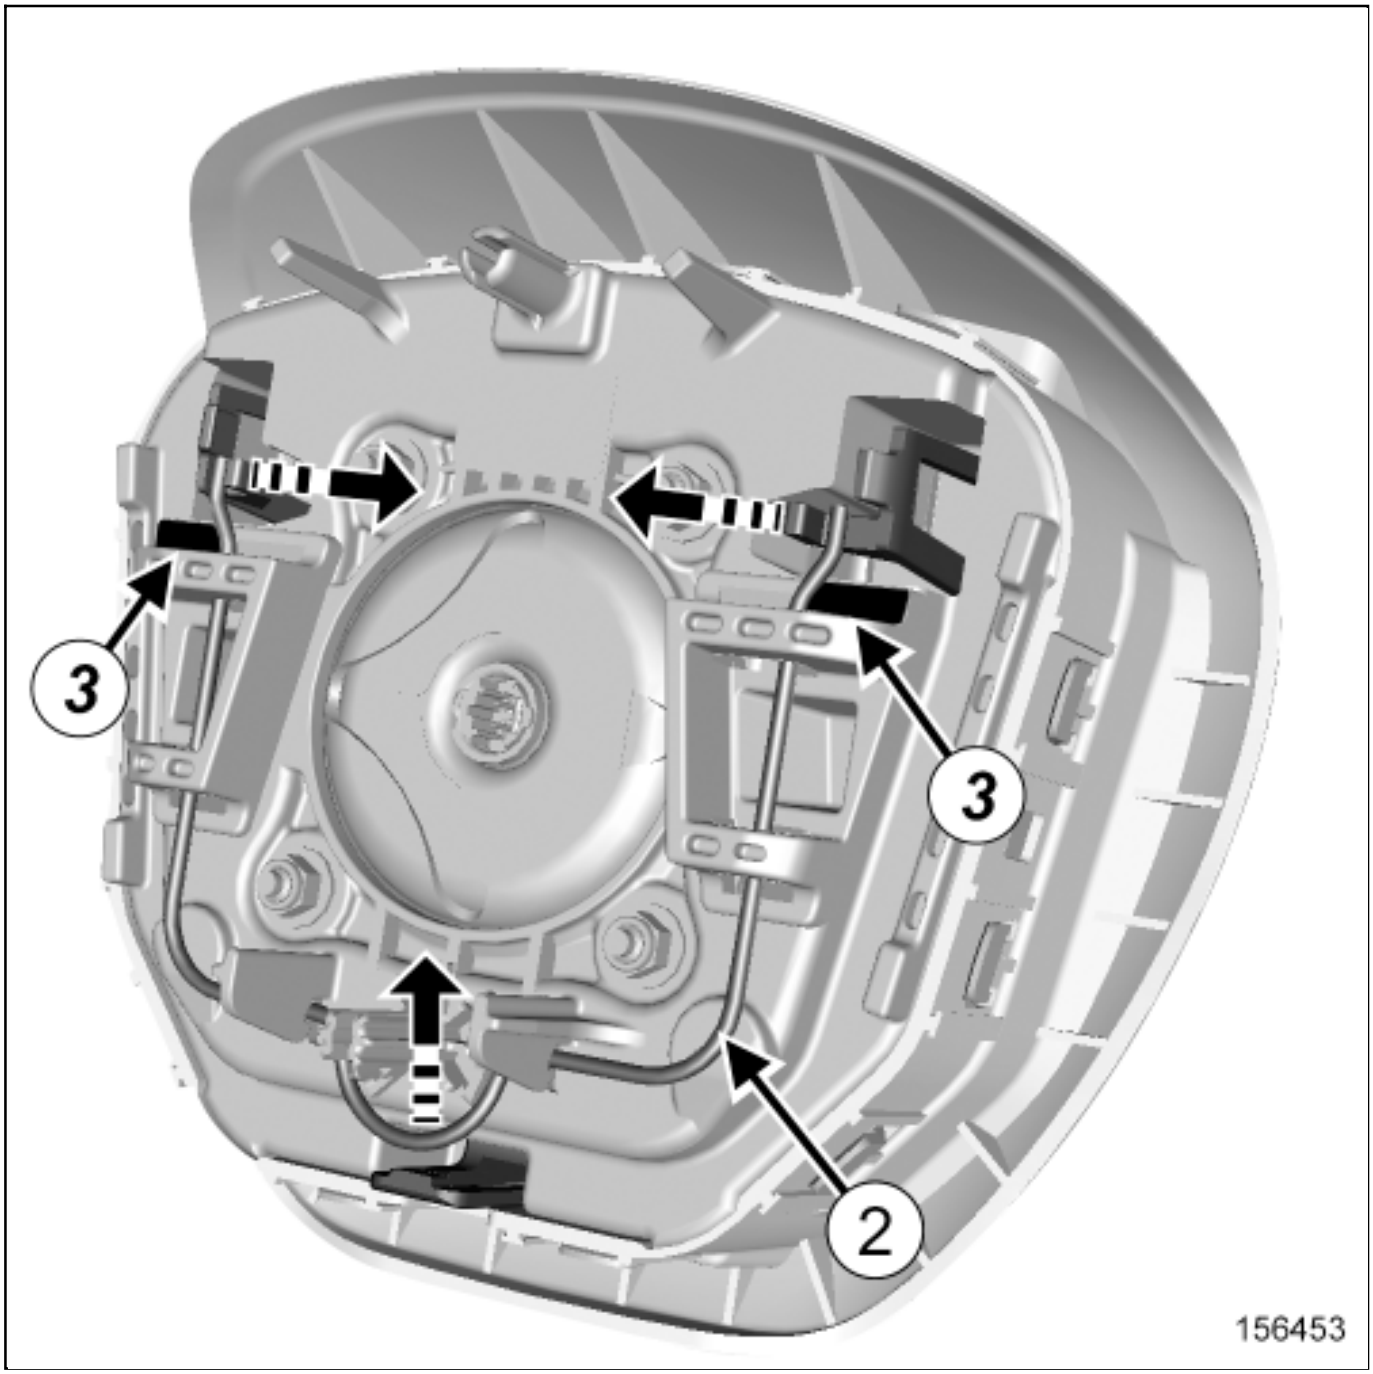


Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Apply the procedure for deactivating the safety systems(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .



2. REMOVAL OPERATION

Insert a flat-blade screwdriver into one of the openings(1) .

Note:

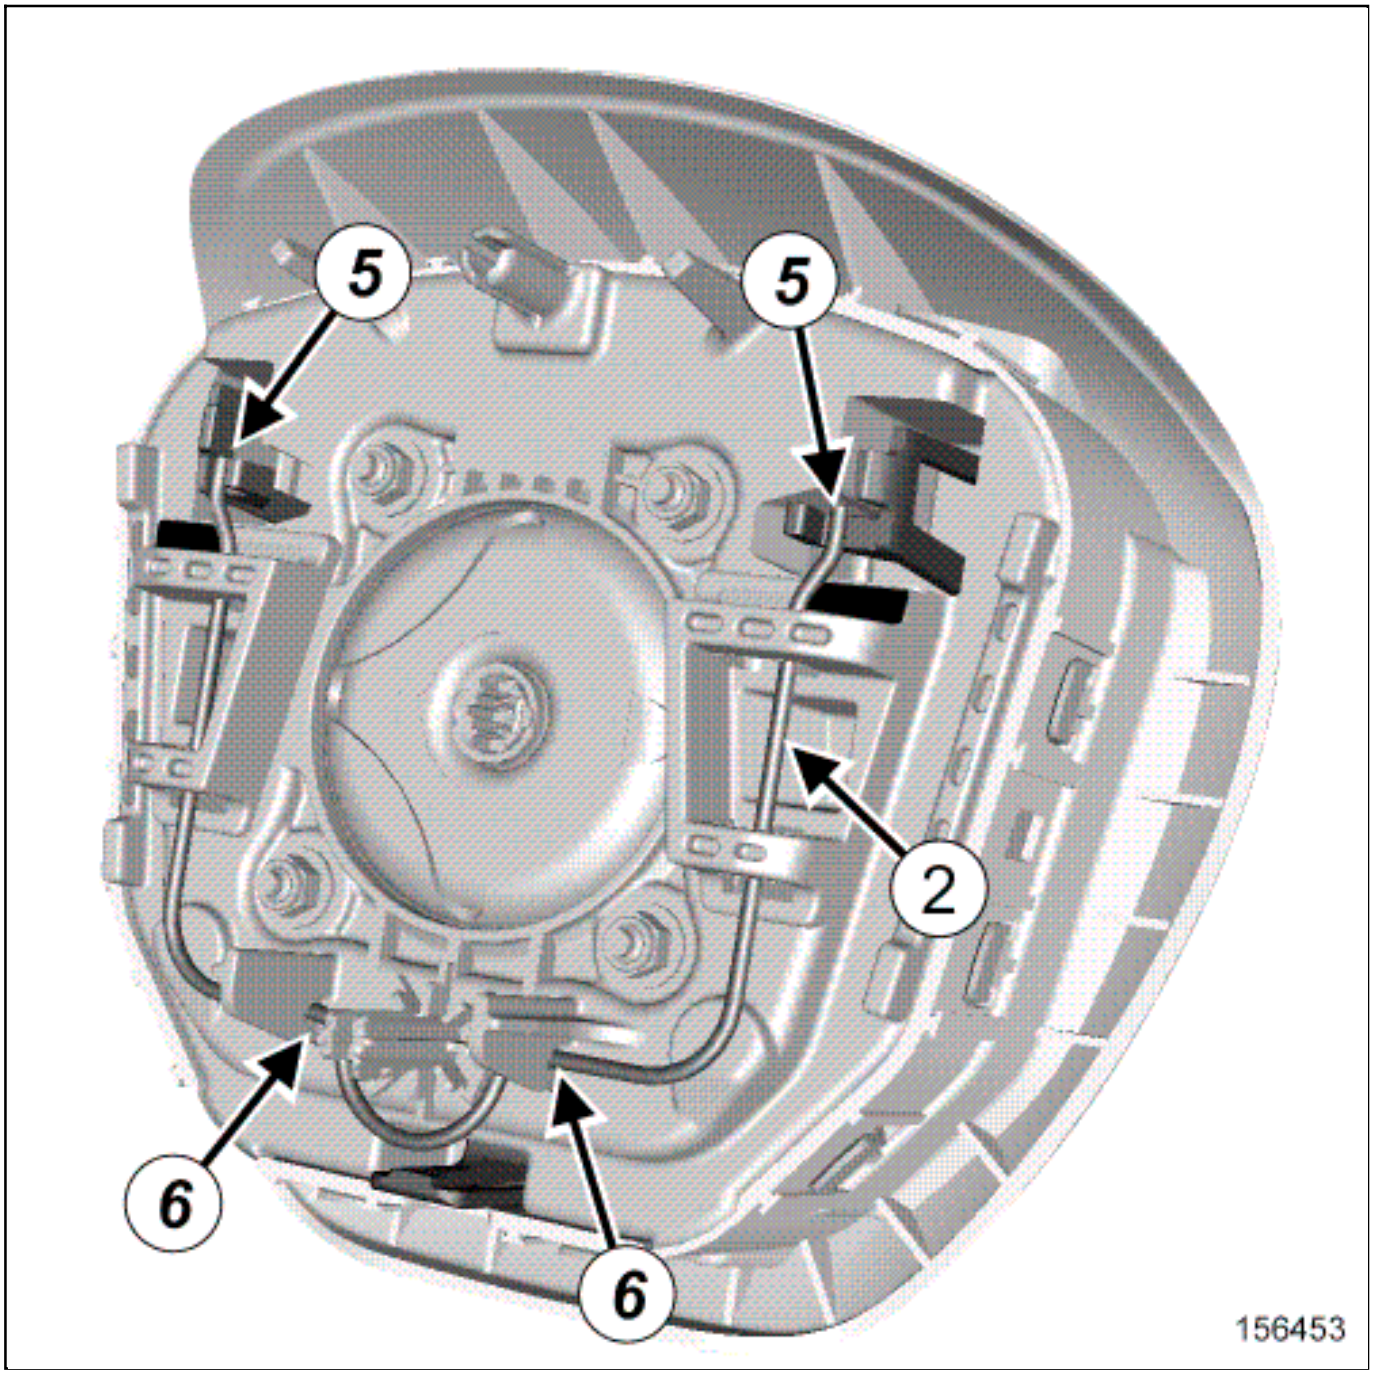
Use a screwdriver with a diameter equal to that of the hole.

Unclip the clip(2) by pushing the screwdriver on the area(3) , while pulling on the driver's frontal airbag.

Note:

Use a screwdriver with a diameter equal to that of the hole.

Proceed in the same manner to unclip the other side of the airbag.



Unlock the connector(s) of the driver's frontal airbag.

Disconnect the connector(s).

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

Ensure that the clip(2) is correctly positioned on the upper clips(5) and clipped at the lower section (6) .

Note:

The driver's front airbag will not be removable if it is refitted with the clip(2) positioned incorrectly.

2. FINAL OPERATION

Apply the procedure for activating the safety systems(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .

3. CHECKING AFTER REPAIR

Switch on the ignition.

Check that there are no faults on the instrument panel.

DRIVESHAFT: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

1. GENERAL RECOMMENDATIONS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting .

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

CAUTION

- In order to prevent irreversible damage to the front hub bearing:
  - Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
  - Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

Lubricate the base of the driveshaft bearing with BR2 + Grease Vehicle: Parts and consumables for the repair to prevent the bearing from sticking.

Make sure that the O-ring is correctly positioned in the base of the relay bearing, if the bearing has one.

Note:

A gearbox oil leak at the driveshaft may destroy it.

-

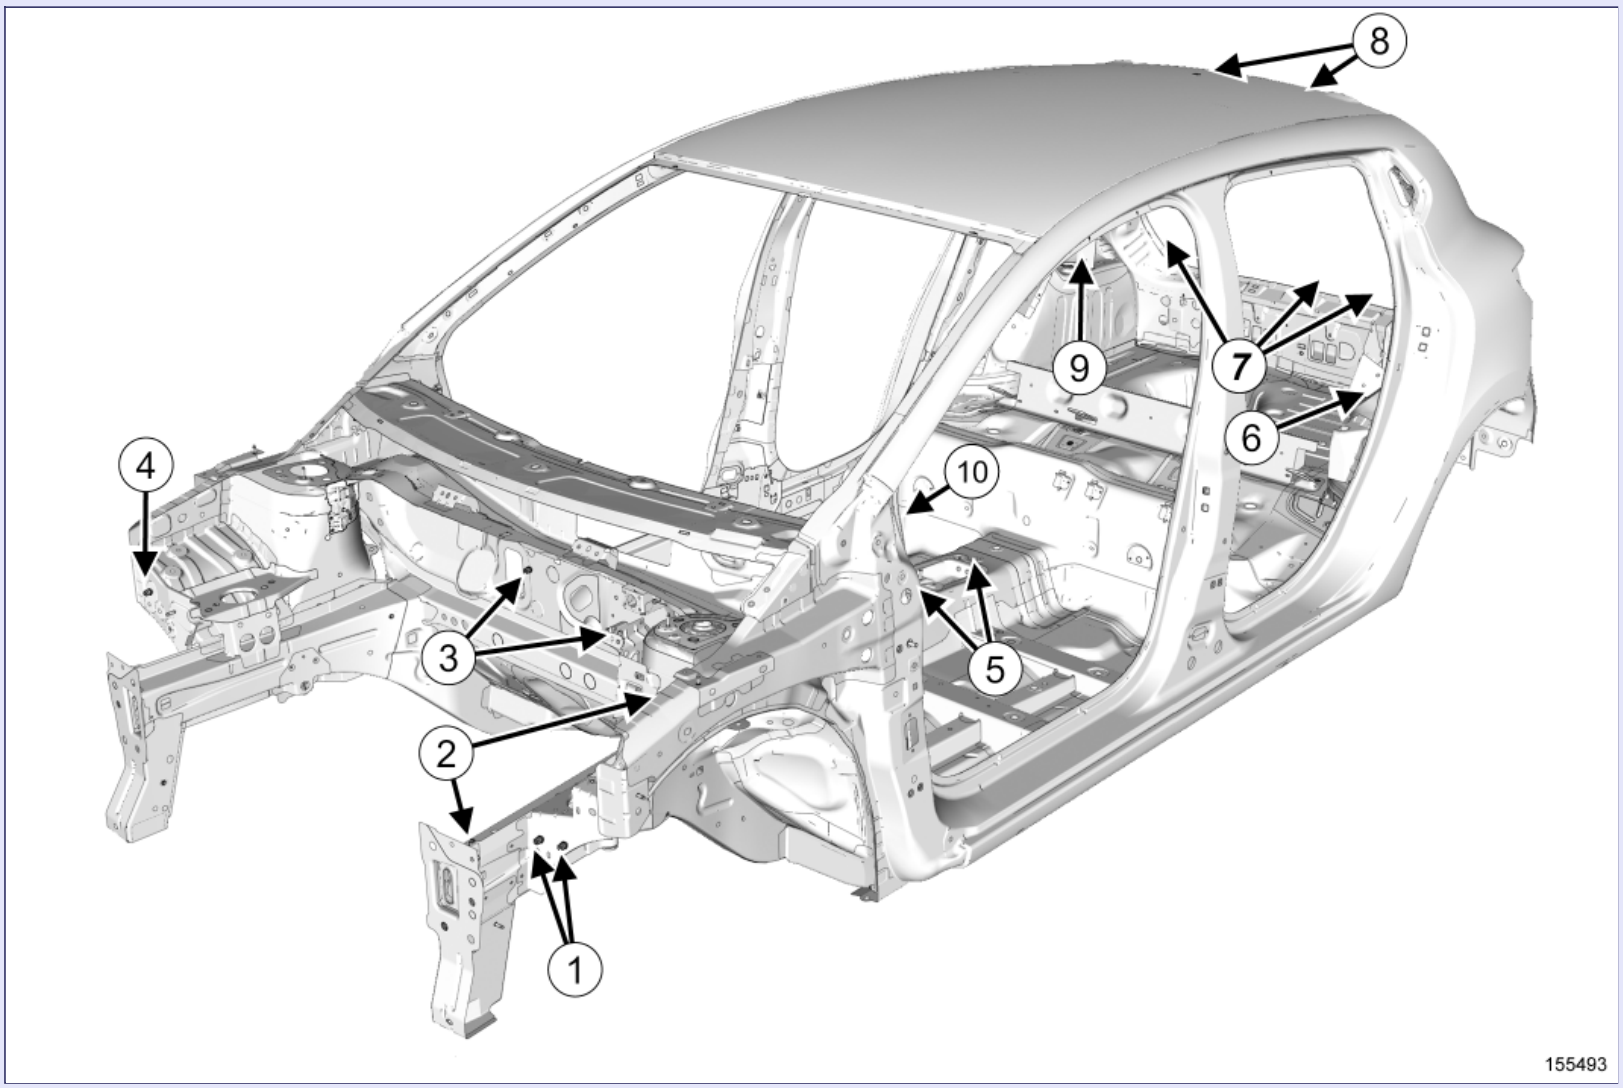
Always replace:

- the O-ring, if fitted to the bearing,
- the left-hand driveshaft locking spring ring, if the driveshaft has one,

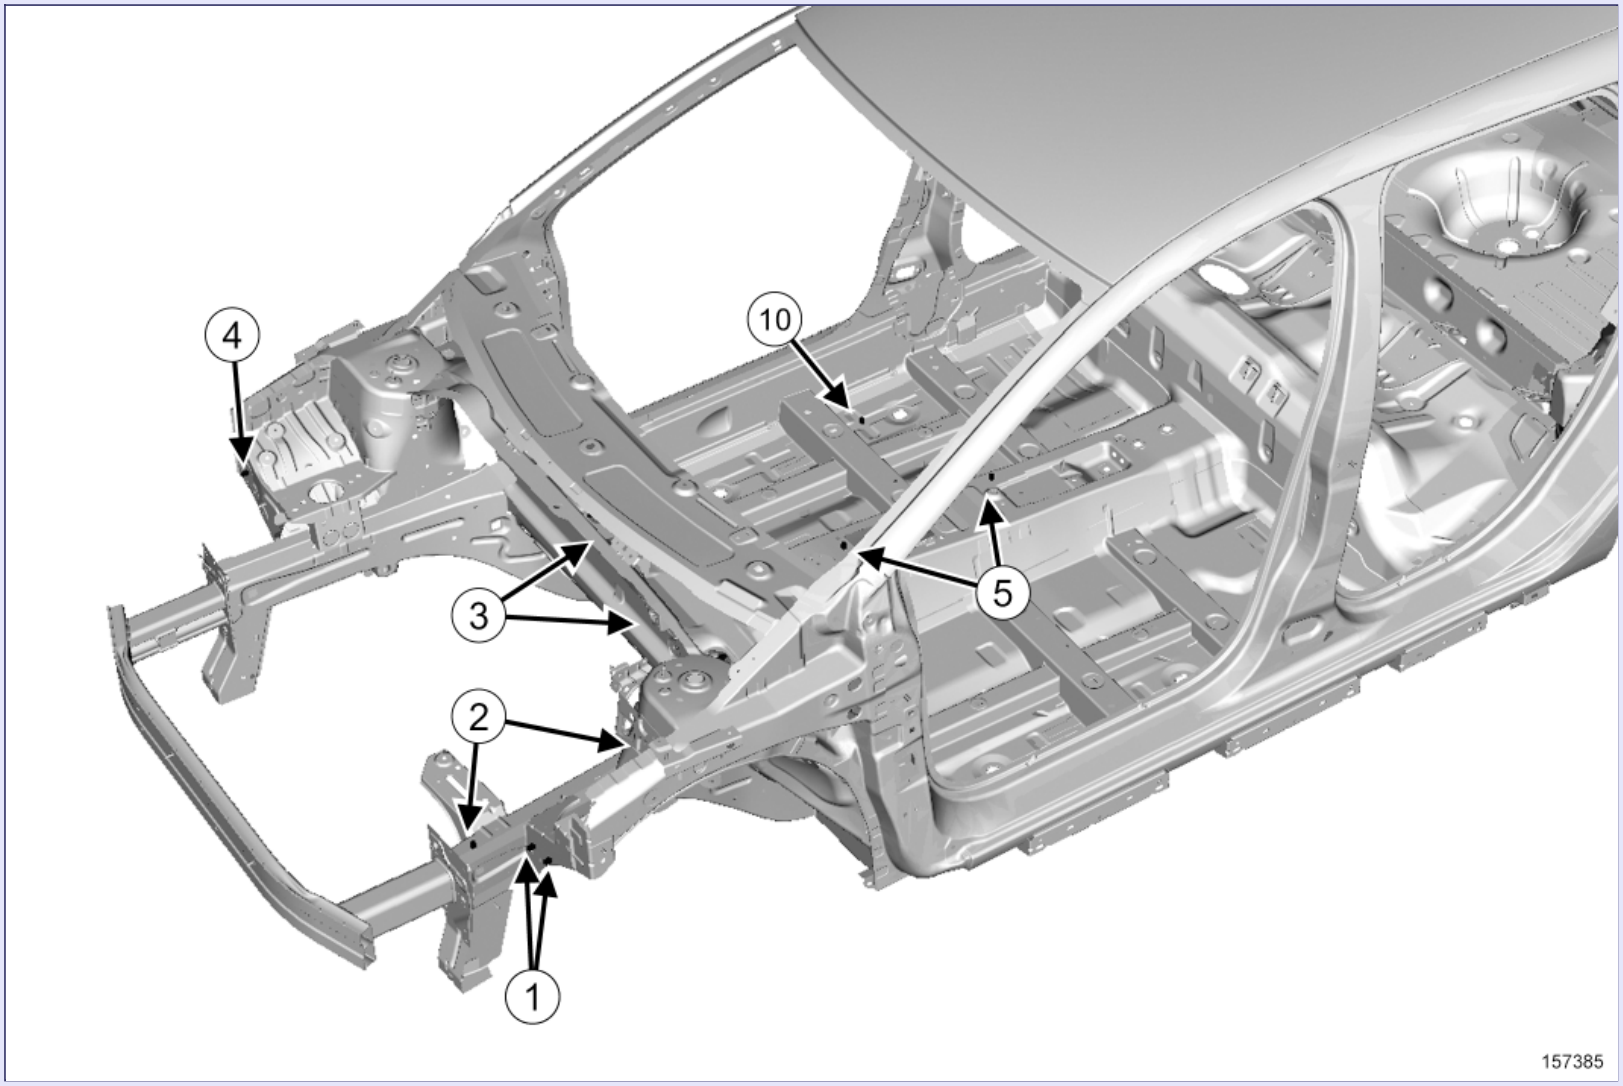
the differential output seals every time a driveshaft is removed.

EARTHS ON BODY: LIST AND LOCATION OF COMPONENTS

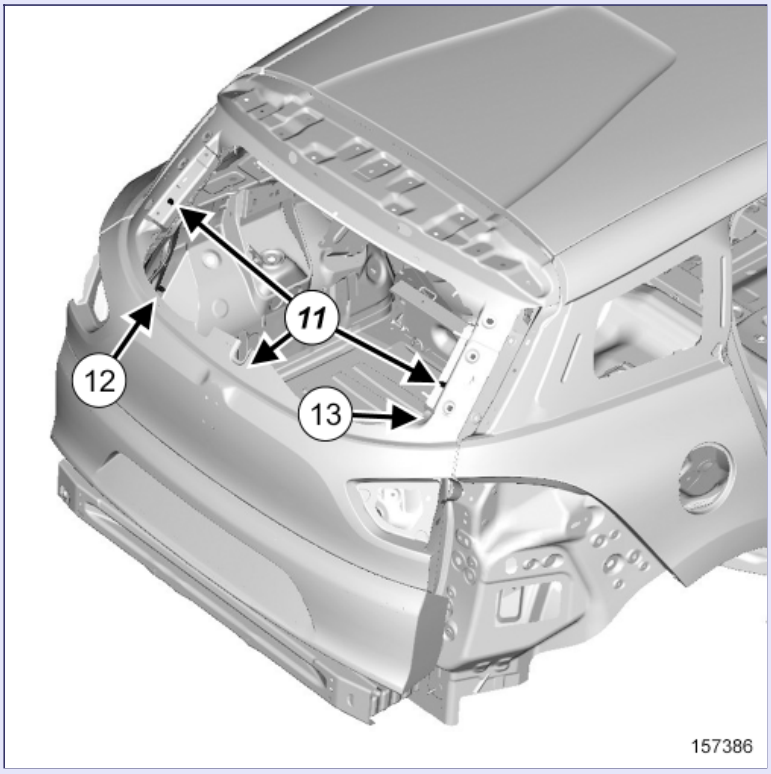
Note, one or more warnings are present in this procedure



CAUTION



To avoid damaging the vehicle's electrical and electronic components, disconnect the earths of any wiring near the weld area.



Position the welding machine earth as close as possible to the weld zone (see MR 400).

For the earth stud replacement procedure Earth screw connection: Description .

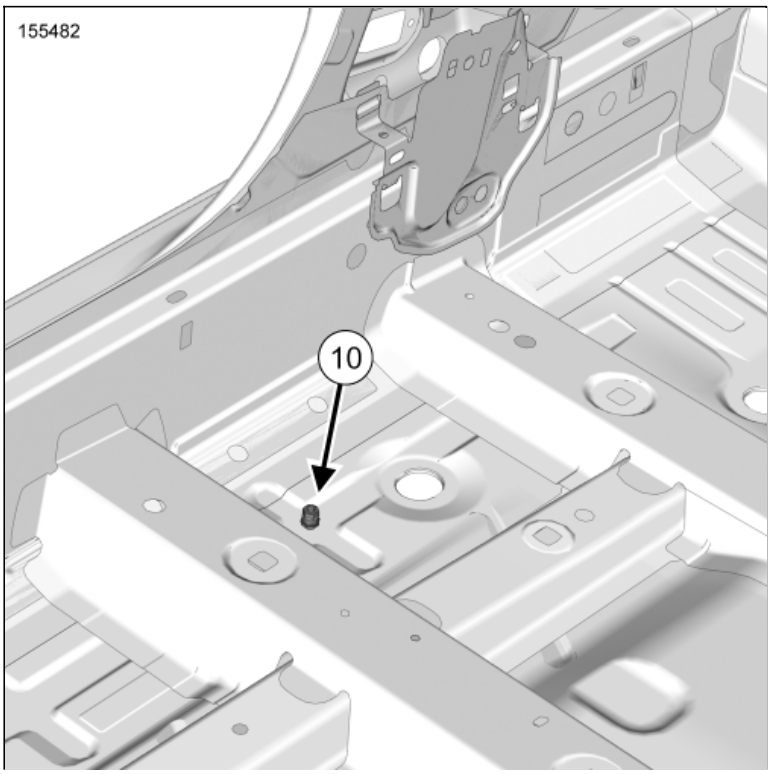
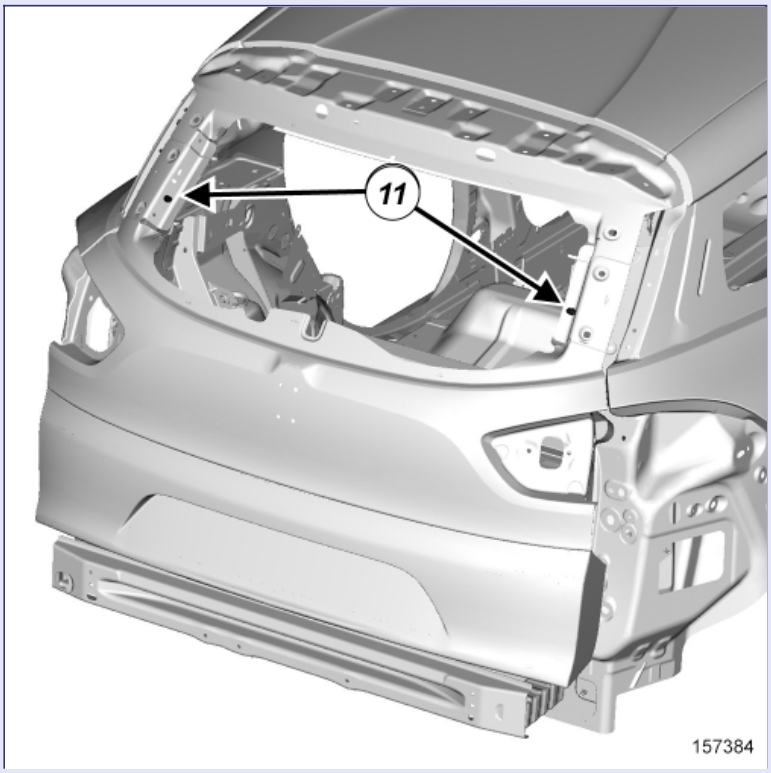
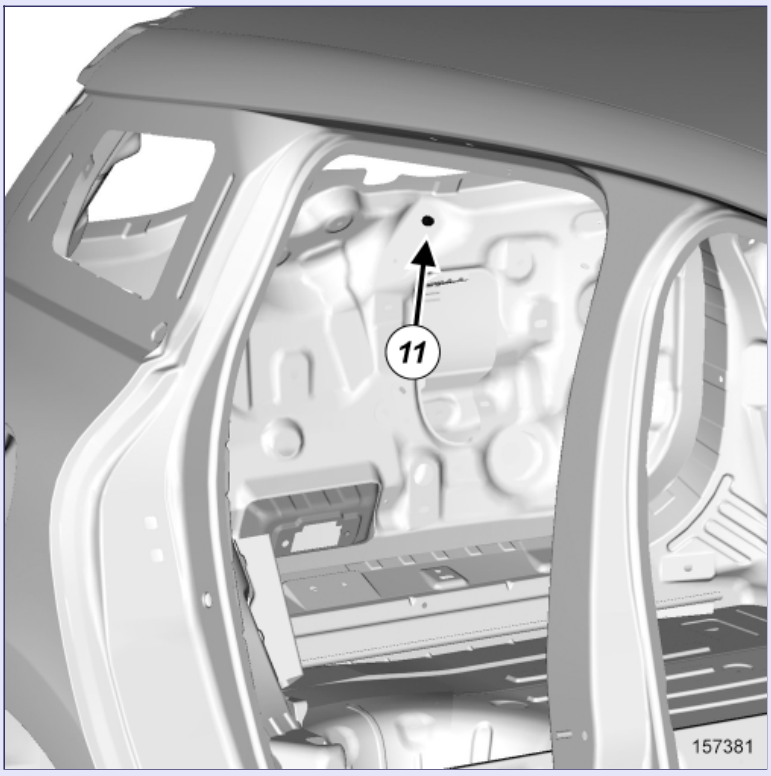
Earth stud on left -hand inner wheel arch(6).

Earth studs on the tailgate(7).



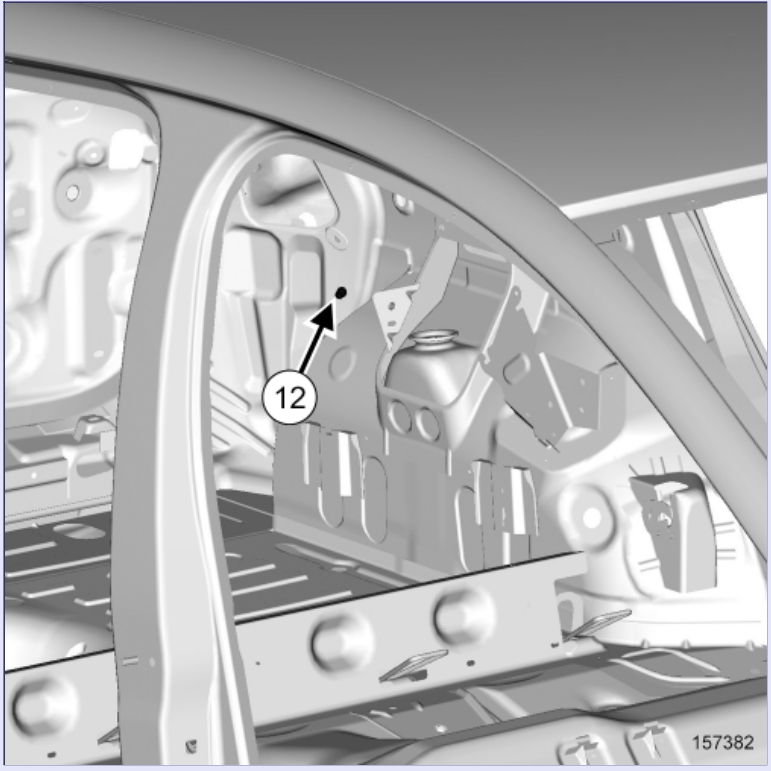
Earth studs on the roof rear cross member(8).



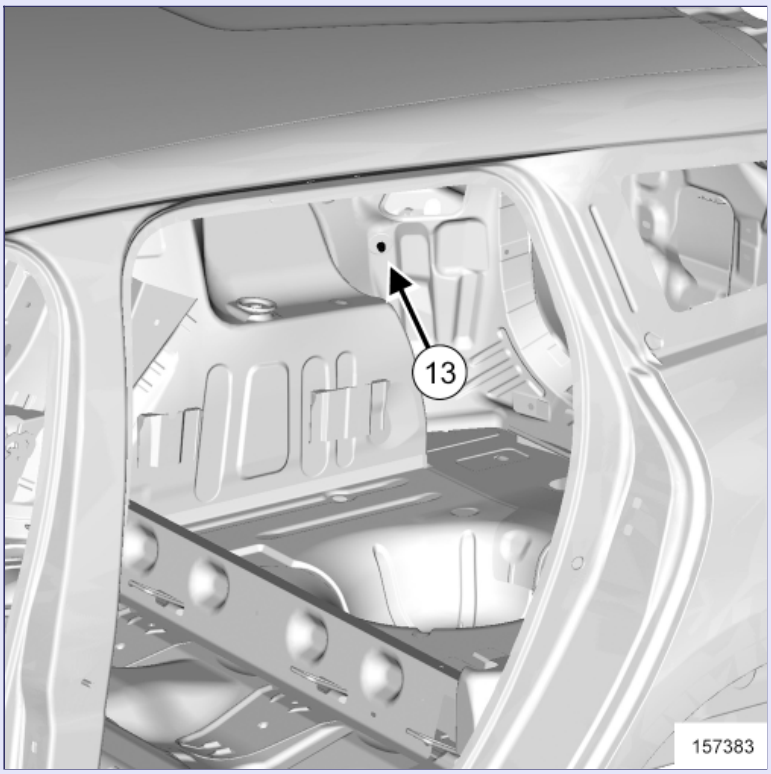


Earth stud on the tailgate(7).

Earth stud on right -hand inner wheel arch(9).

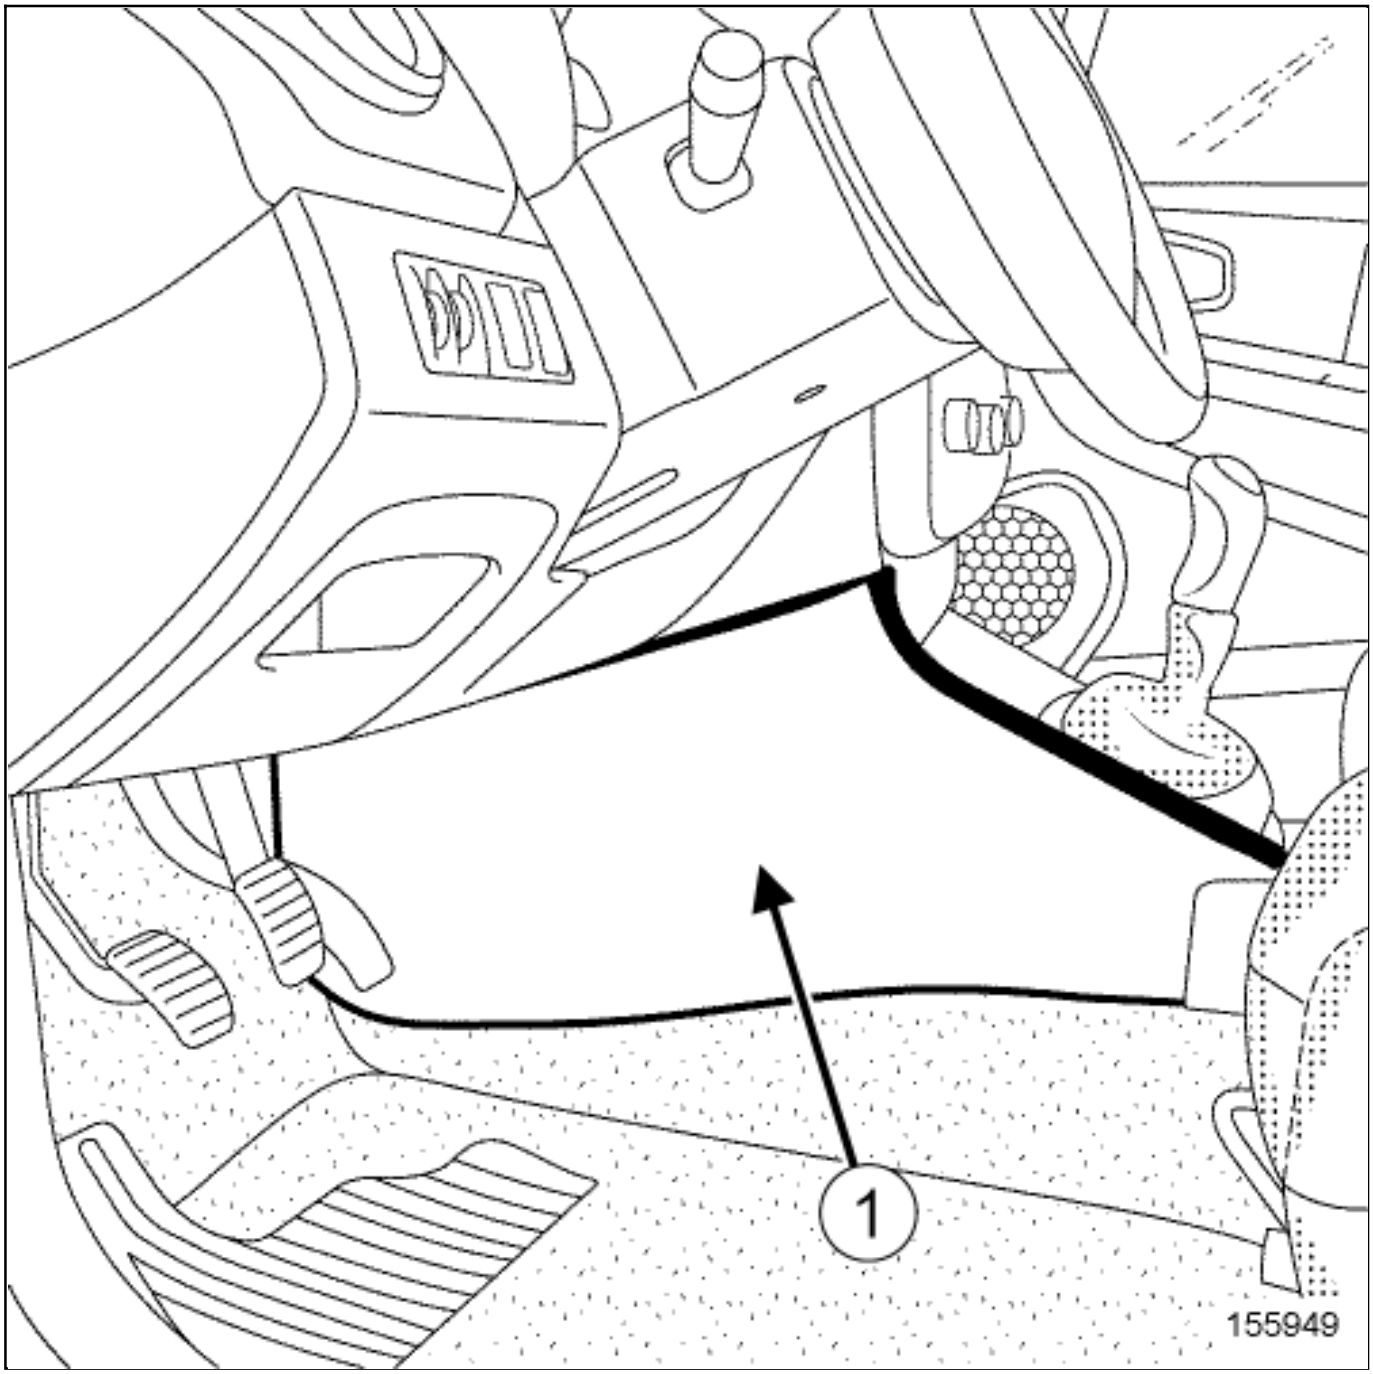


Earth stud on centre floor, side section(10).



Earth studs on the tailgate(11).

Earth stud on the left-hand rear quarter panel lining(12).

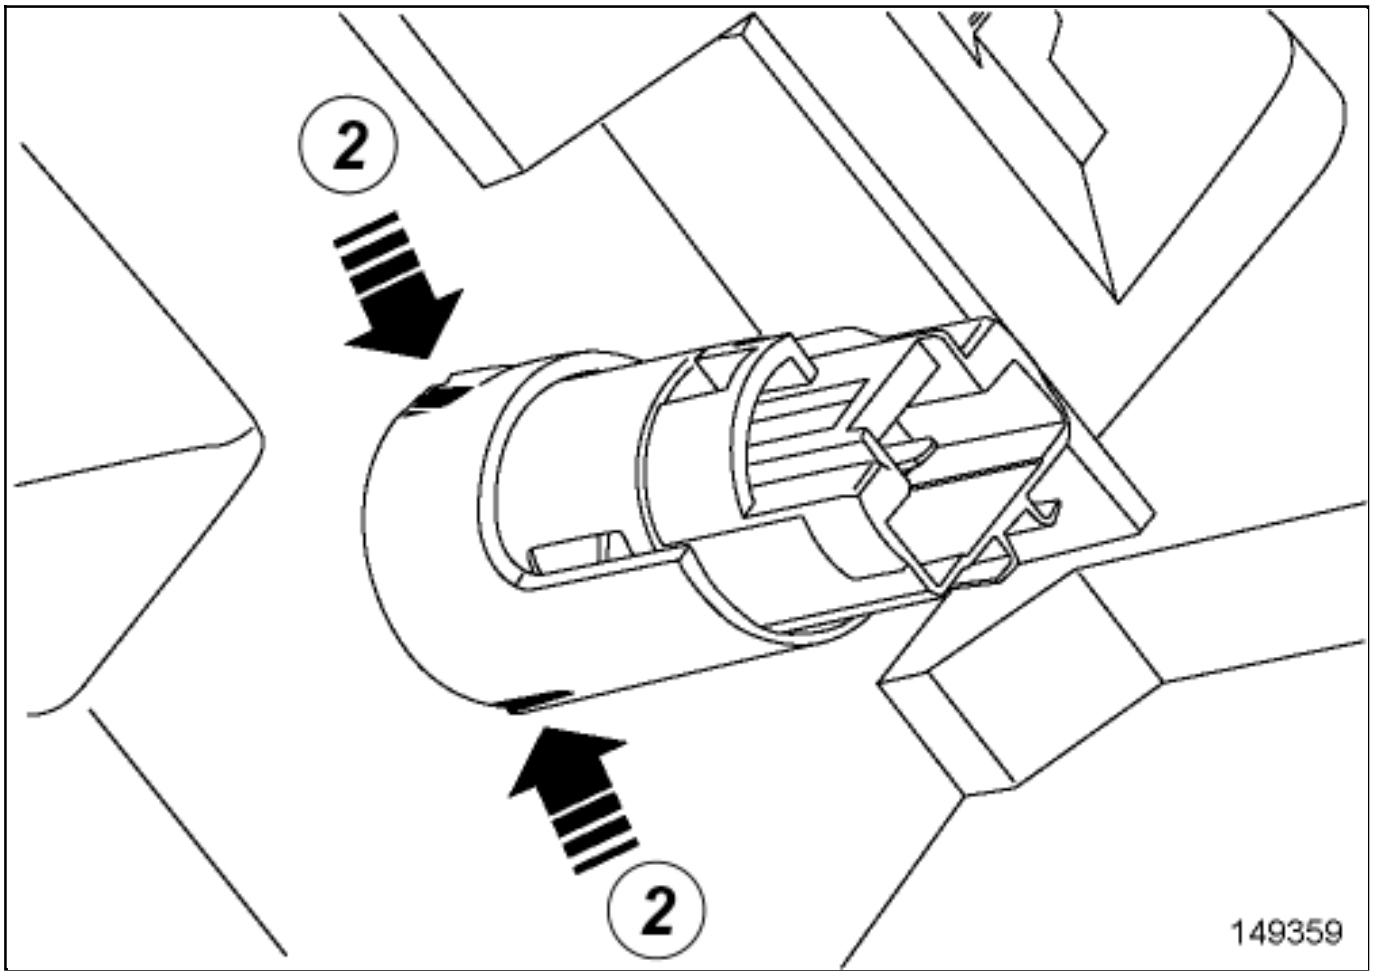


Earth stud on the right-hand rear quarter panel lining(13).

ELECTRICAL ACCESSORIES SOCKET: REMOVAL - REFITTING

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Switch off the ignition.

- Unclip the left-hand centre console trim(1) .

- Disconnect the electrical accessories socket connector.

2. REMOVAL OPERATION

-

Unclip the clips from the electrical accessories socket at(2) .

-

Remove the electrical accessories socket.

REFITTING

-

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

ELECTRICAL RESISTANCE SPOT WELDING CONNECTION: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Kit for checking weld seams.	Car. 1779
Set of replacement test pieces for tool Car. 1779	Car. 1800

1. INTRODUCTION

1-PURPOSE

the purpose of this document is to provide the information necessary for making quality resistance spot welds by describing the procedure to apply to define the correct RSW weld parameters. To this end, it includes:

- Weld pre-adjustments adapted according to the thickness and grade of the steel to be welded (mild steel, high elastic limit, very high/ultra high elastic limit).
- Peeling test.

This test alone confirms the weld parameters (Current; Time; effort) and guarantees the result in terms of the quality of the repair.

This is a destructive test from the original assembly tests; it is based on the diameter of the material rivet on pulling.

Note:

This procedure is to be used before every weld according to the stack (grade/thickness).

2- PROCEDURE

- Consult the vehicle MR: section II.
- Consult the charts with the procedure for defining the reference panel (2 and 3 thicknesses): section III.
- Perform the peeling test: sections IV and V.

- Interpret the results: section VI.
- Use the remedial procedures: section VII.
- Use the replacement solutions: section VIII.
- Tests and checks on the vehicle: section IX.

3- DEFINITION CONDITIONS OF THE TABLES

The steel selected is representative of the majority of the stacks found in collision repairs. There are 3 grades: mild steel, high elastic limit, very high/ultra high elastic limit each in two thicknesses, with a G10/10 galvanised treatment.

These pre-adjustments have been defined under certain conditions:

- electrical supply: 32 A time-lag circuit breaker graph D
- air supply: pressure of 6.5 bar

The conditions in addition to the technological performance of the welders are essential to obtain a quality result.

- electrode holder length: 120 mm
- electrode active surface diameter: 8 mm
- using a welder with INVERTERtechnology

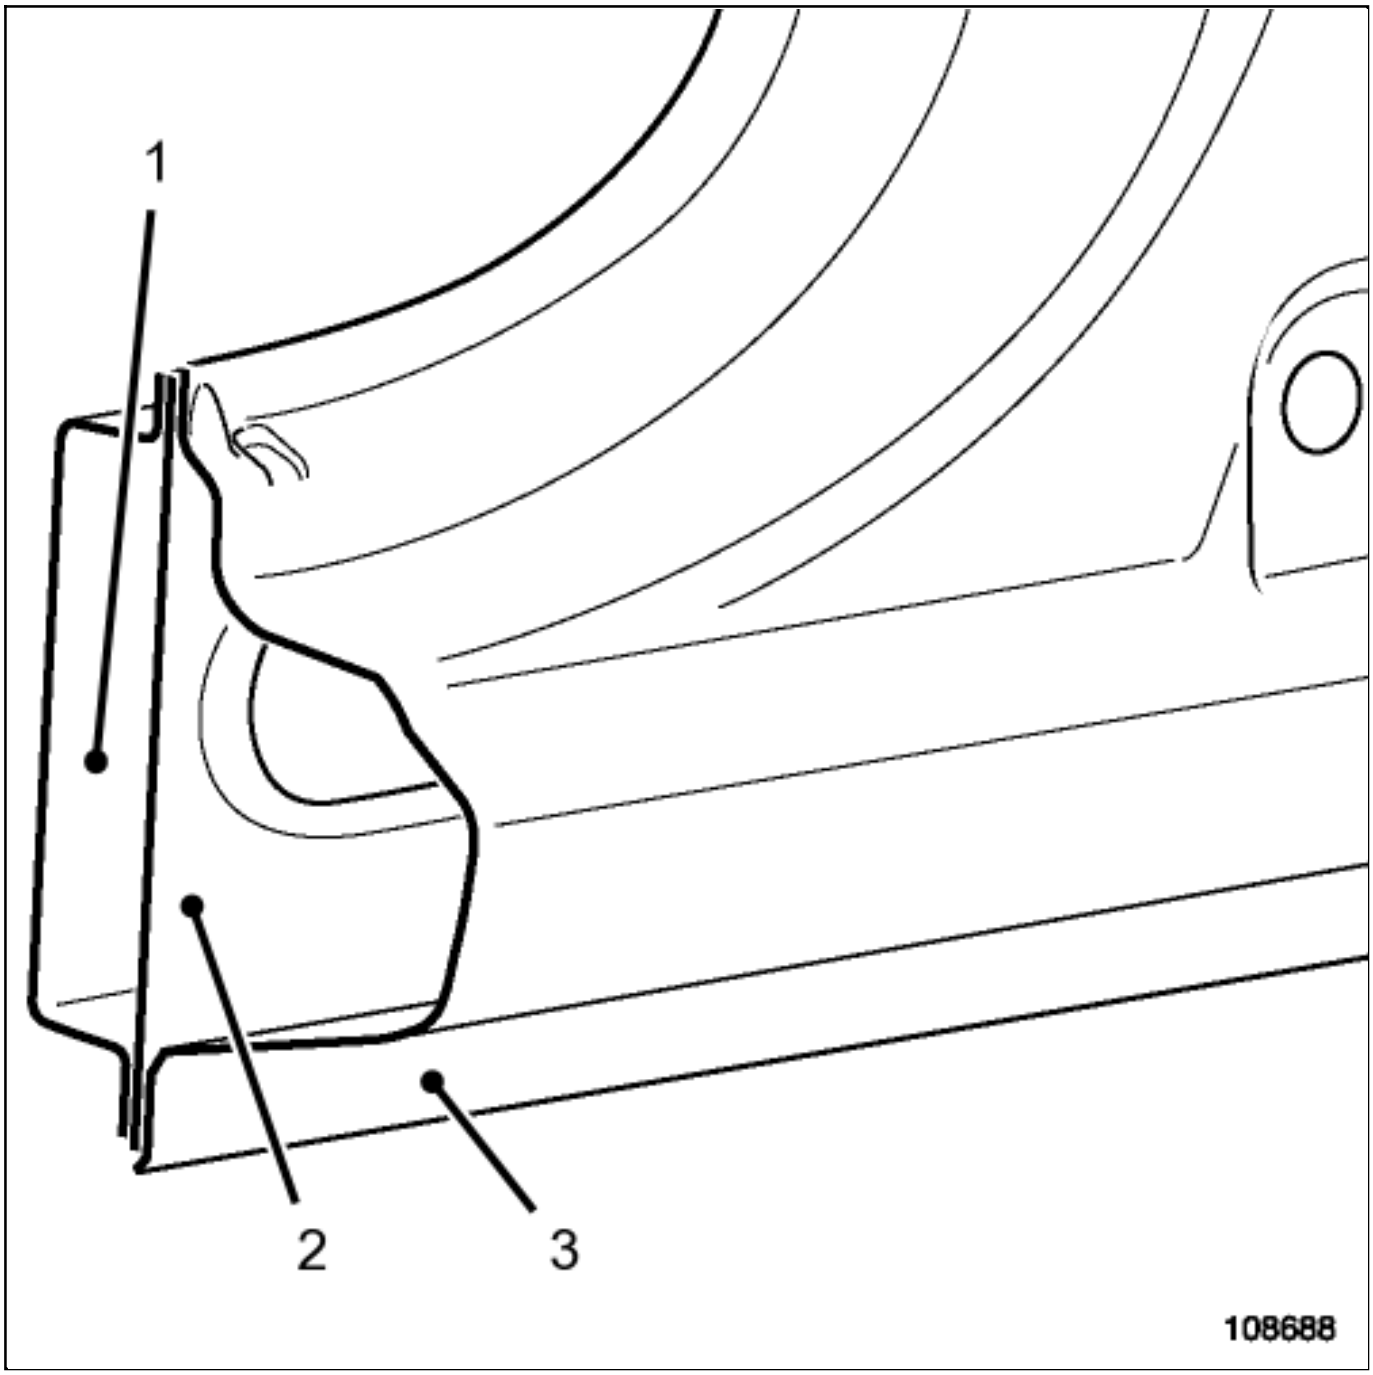
2. CONSULT THE VEHICLE'S MR

- consult the Vehicle's MR to find out the grades and thicknesses of the stack.
-

define the reference panel:

Two-panel stack : the thinnest in the stack.

Three-panel stack : when repairing, do not weld three panels at a time; assemble two panels, then the third.



Note:

For the test to be valid, carry out exactly the same operations on the vehicle:

first weld two panels, then the third panel.

Example of three-panel stack:

No.	Description	Type	Thickness (mm)
(1)	inner sill panel	HLE	0.85
(2)	sill panel reinforcement	HLE	1.5
(3)	sill panel	Mild steel	0.75

The thinnest in the stack(1) of the first two panels assembled ((1) and (2)), then the third panel in the stack (3) .

■

Select the settings that correspond most closely to the grade and thickness of the reference panel, according to the table below.

3. TABLE OF PRE-ADJUSTMENTS

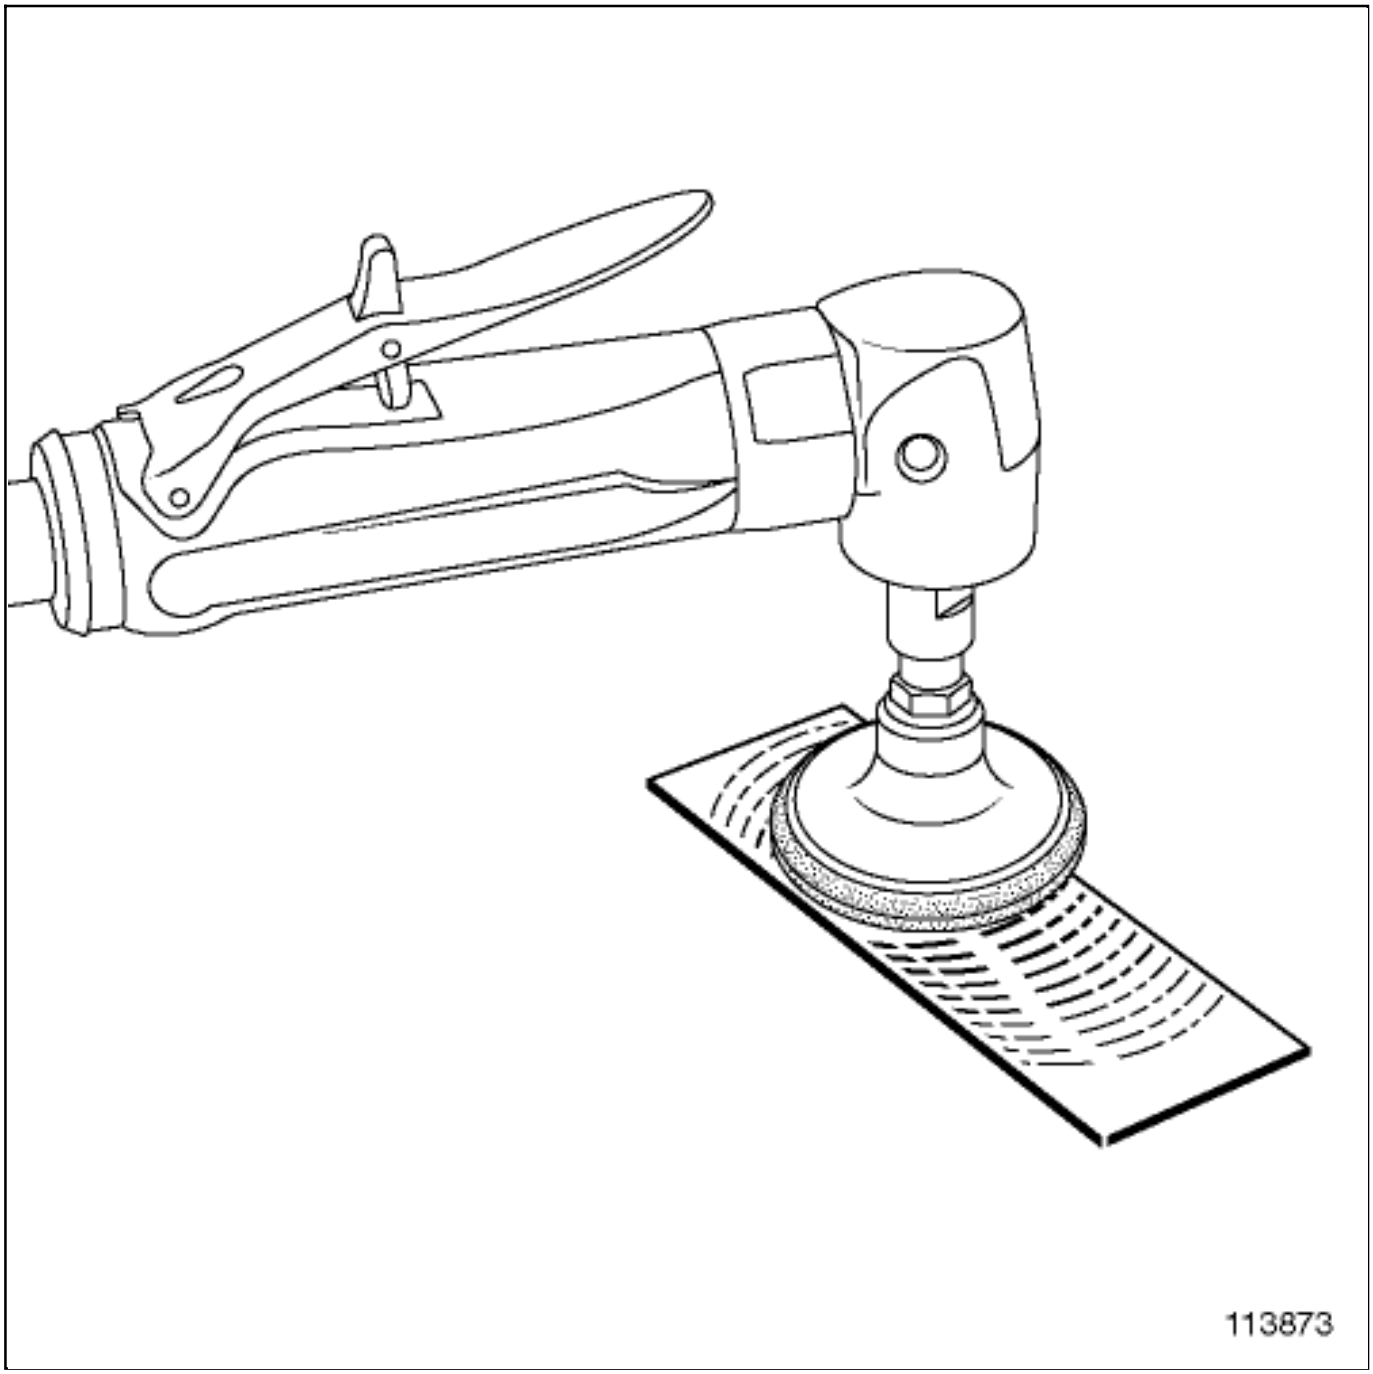
Note:

This chart should always be confirmed by a peeling test on samples according to the procedure explained in section IV.

1- CHART FOR HIGH CURRENT + SHORT TIME

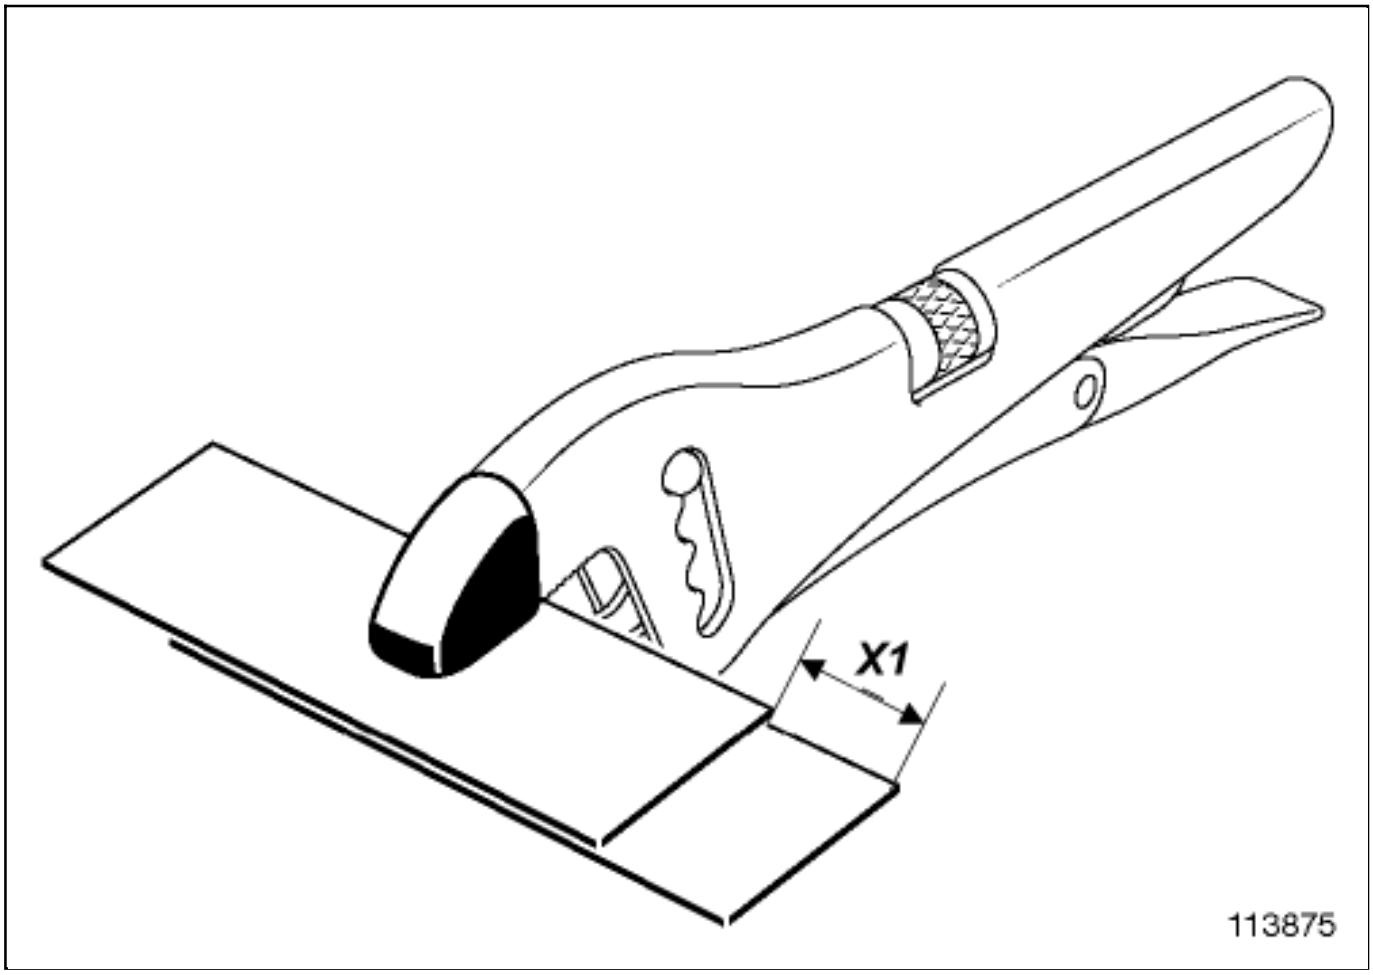
Under optimal conditions short welds (high current; short time) are preferred.

Grades	Thickness of reference panel	Current (A)	Time (ms)	Effort (daN)
Mild steel	0.7 mm	11000	200	450
	1 mm	11500	200	450
HEL steel	0.85 mm	11500	250	450
	1.5 mm	12000	250	450
Very high/ultra high elastic limit steel	1 mm	12000	300	450
	2.5 mm	12500	300	450



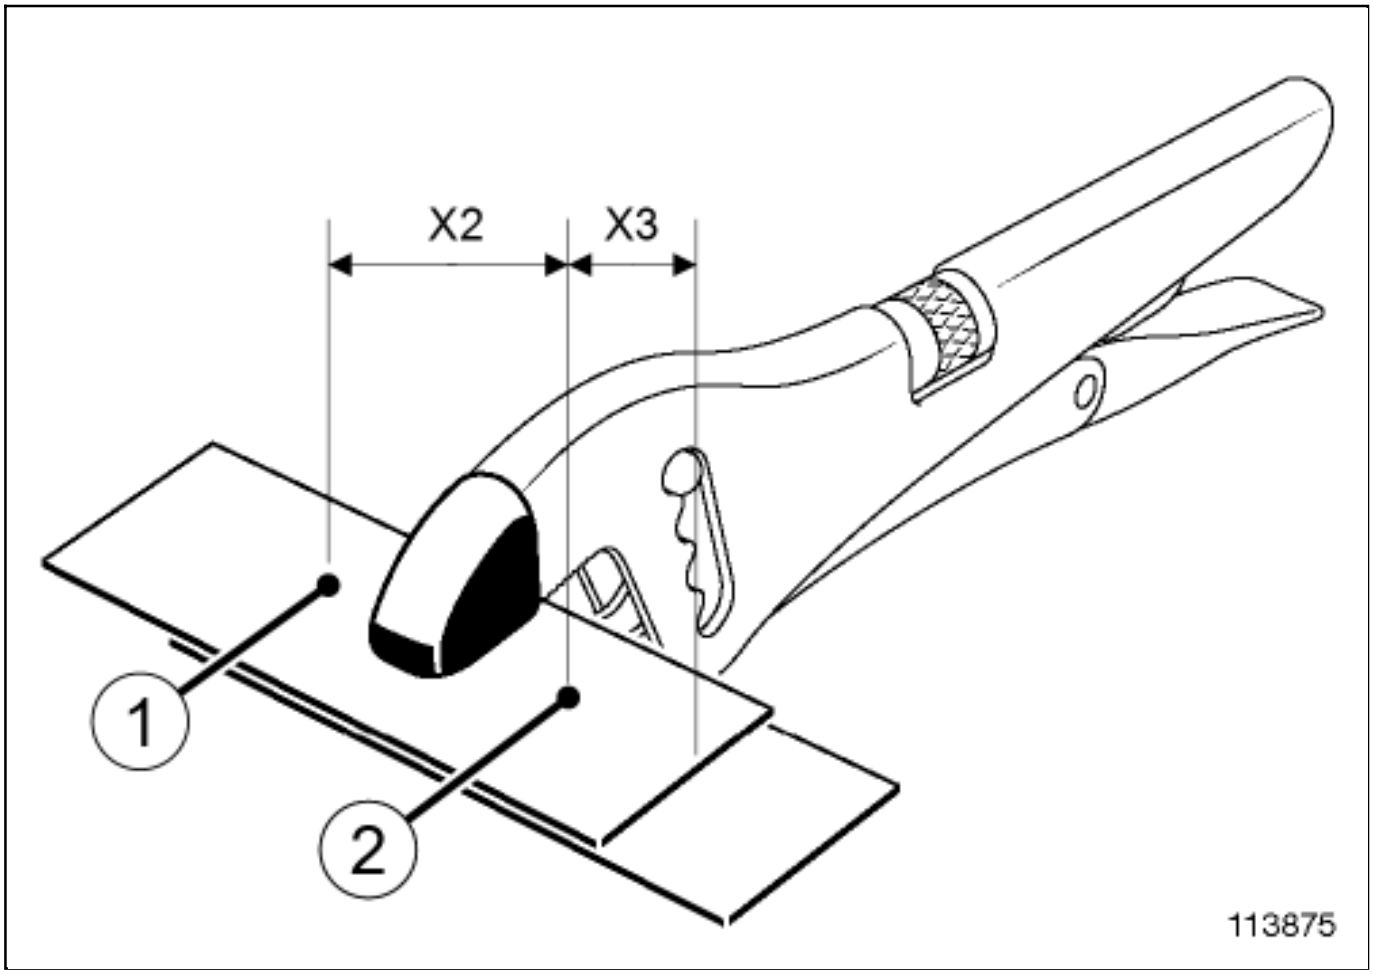
WARNING

To avoid any accidents:



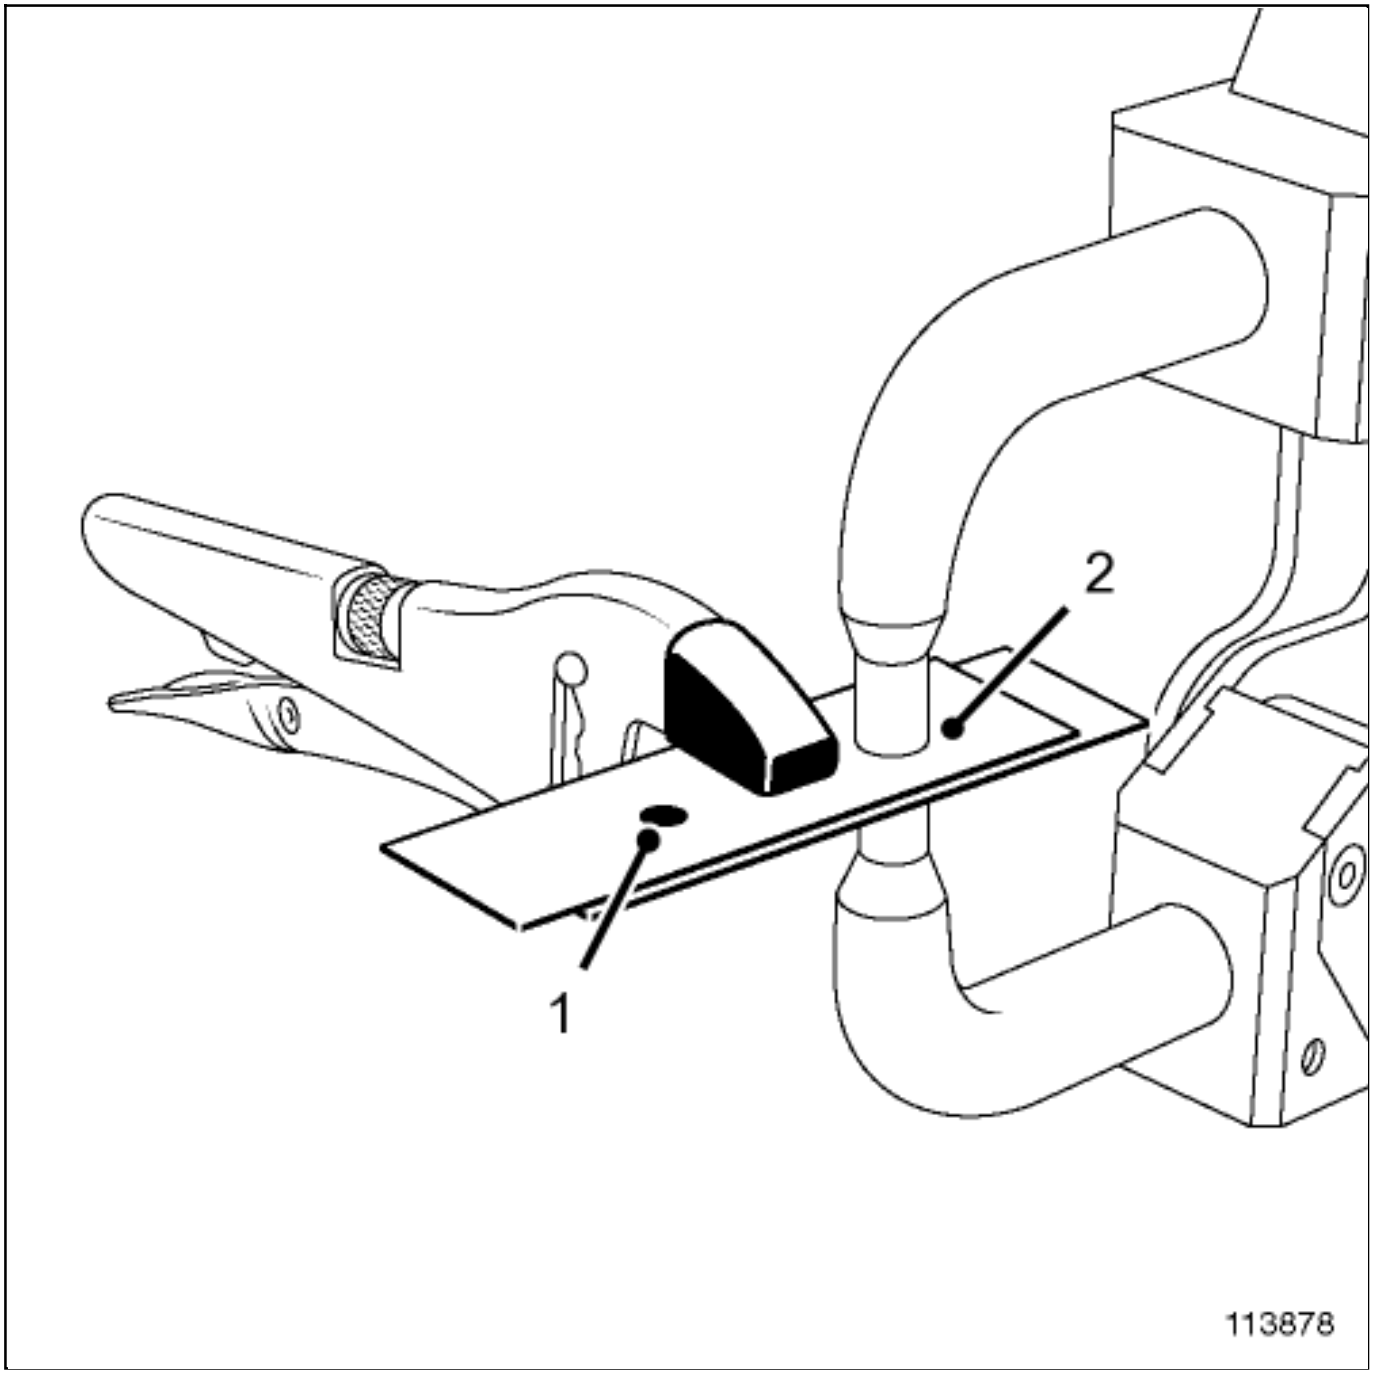
- the vice used for the test should be correctly fixed to the workbench, and the workbench fixed to the floor,
- when carrying out peeling, do not work in front of the tool, as the spot weld may suddenly give, or the jaw of the tool may slip from the test specimen.

Use samples of the same steel grade and thickness as the stacks being tested (see vehicle MR) and the peeling toolKit for checking weld seams.(Car. 1779) or sets of replacement part test specimensSet of replacement test pieces for tool Car. 1779(Car. 1800) .



Prepare the test specimens in the same way as the vehicle .

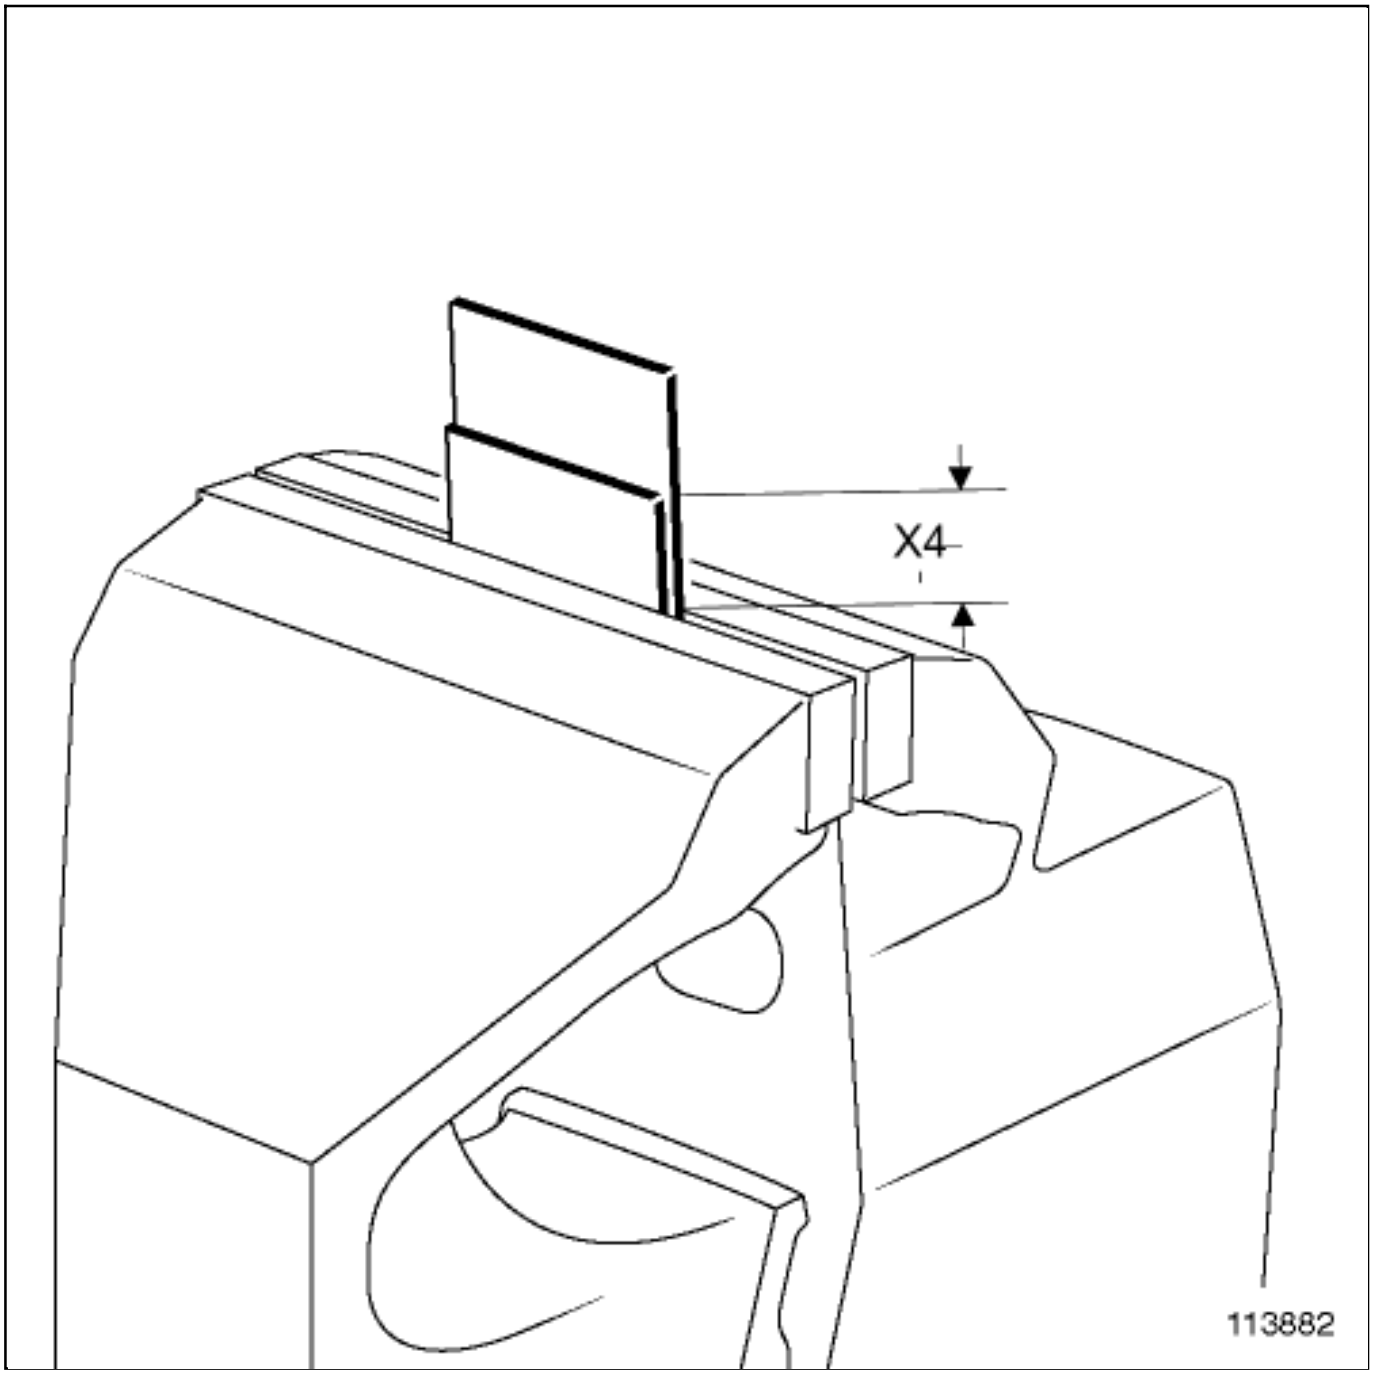
(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection with direct access: Description)



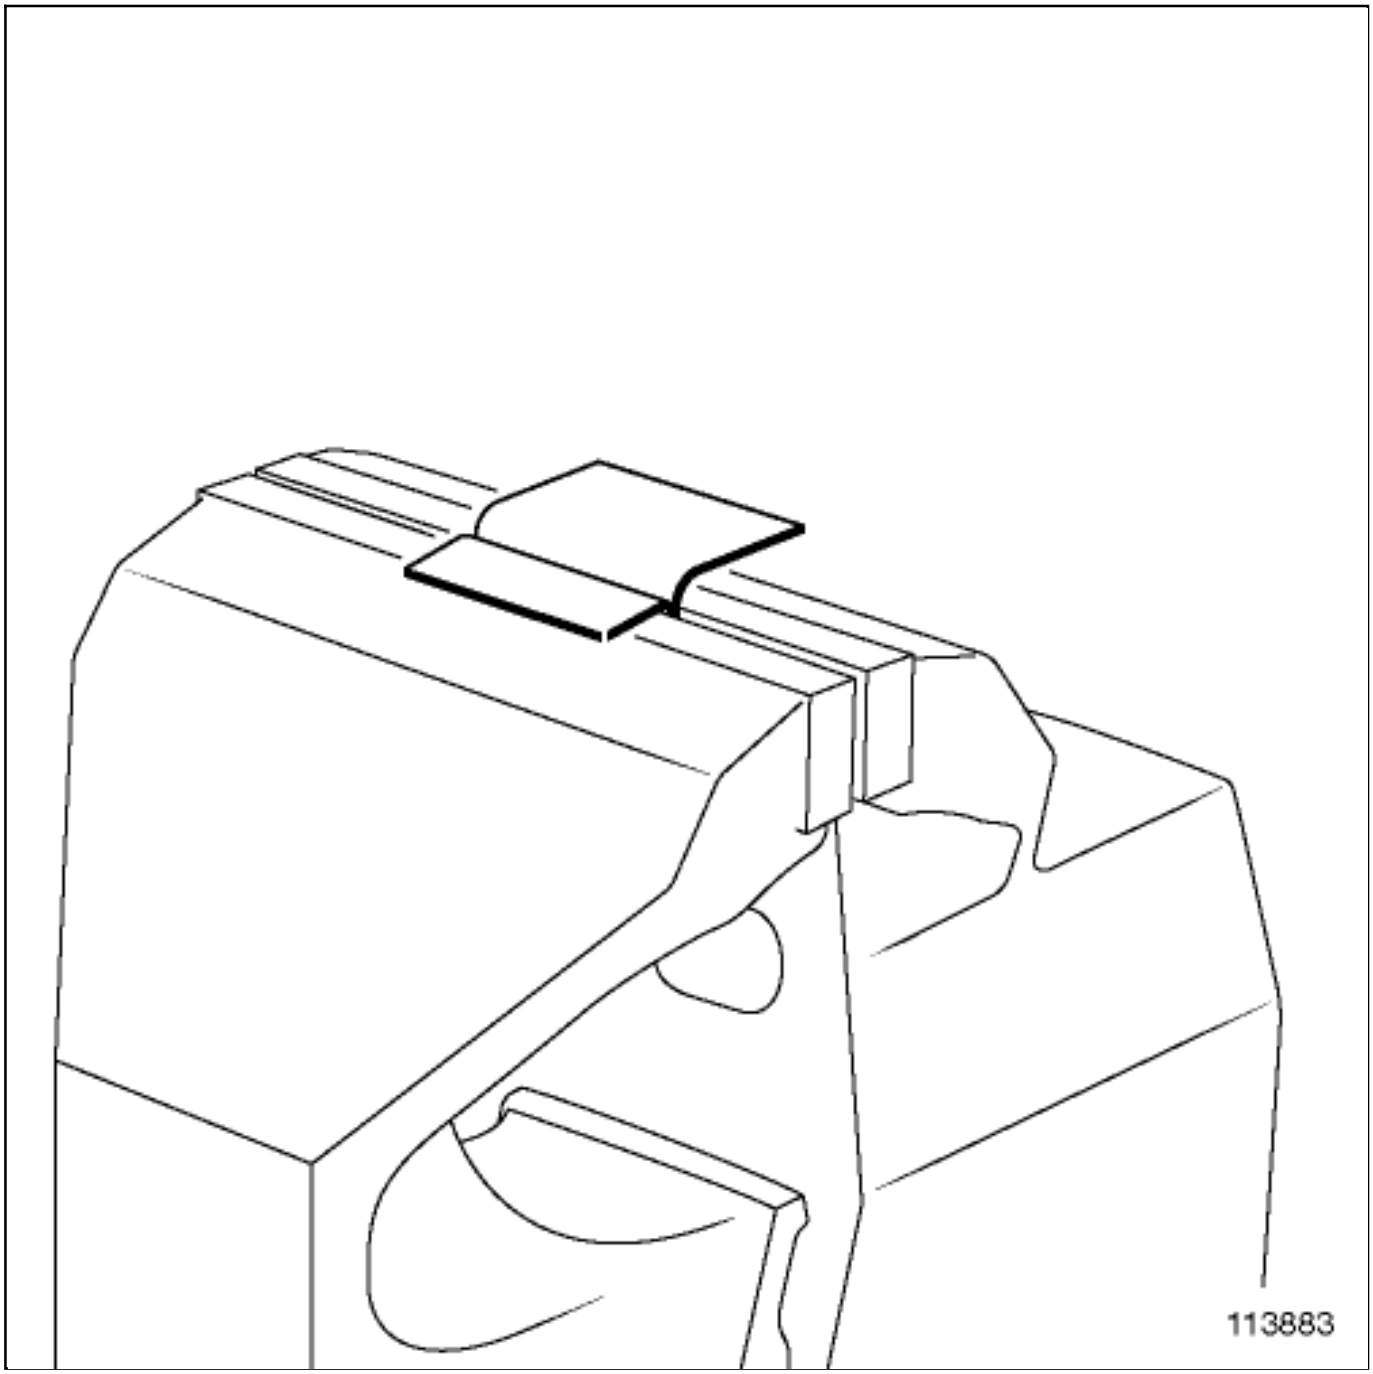
Adjust the panel test specimens by staggering them by(x_1) = 20 mm.

Hold the joint in place using locking pliers at the insulated ends.

Mark the position of the two resistance spot welds(1) and (2) on the test specimen according to the following position values:

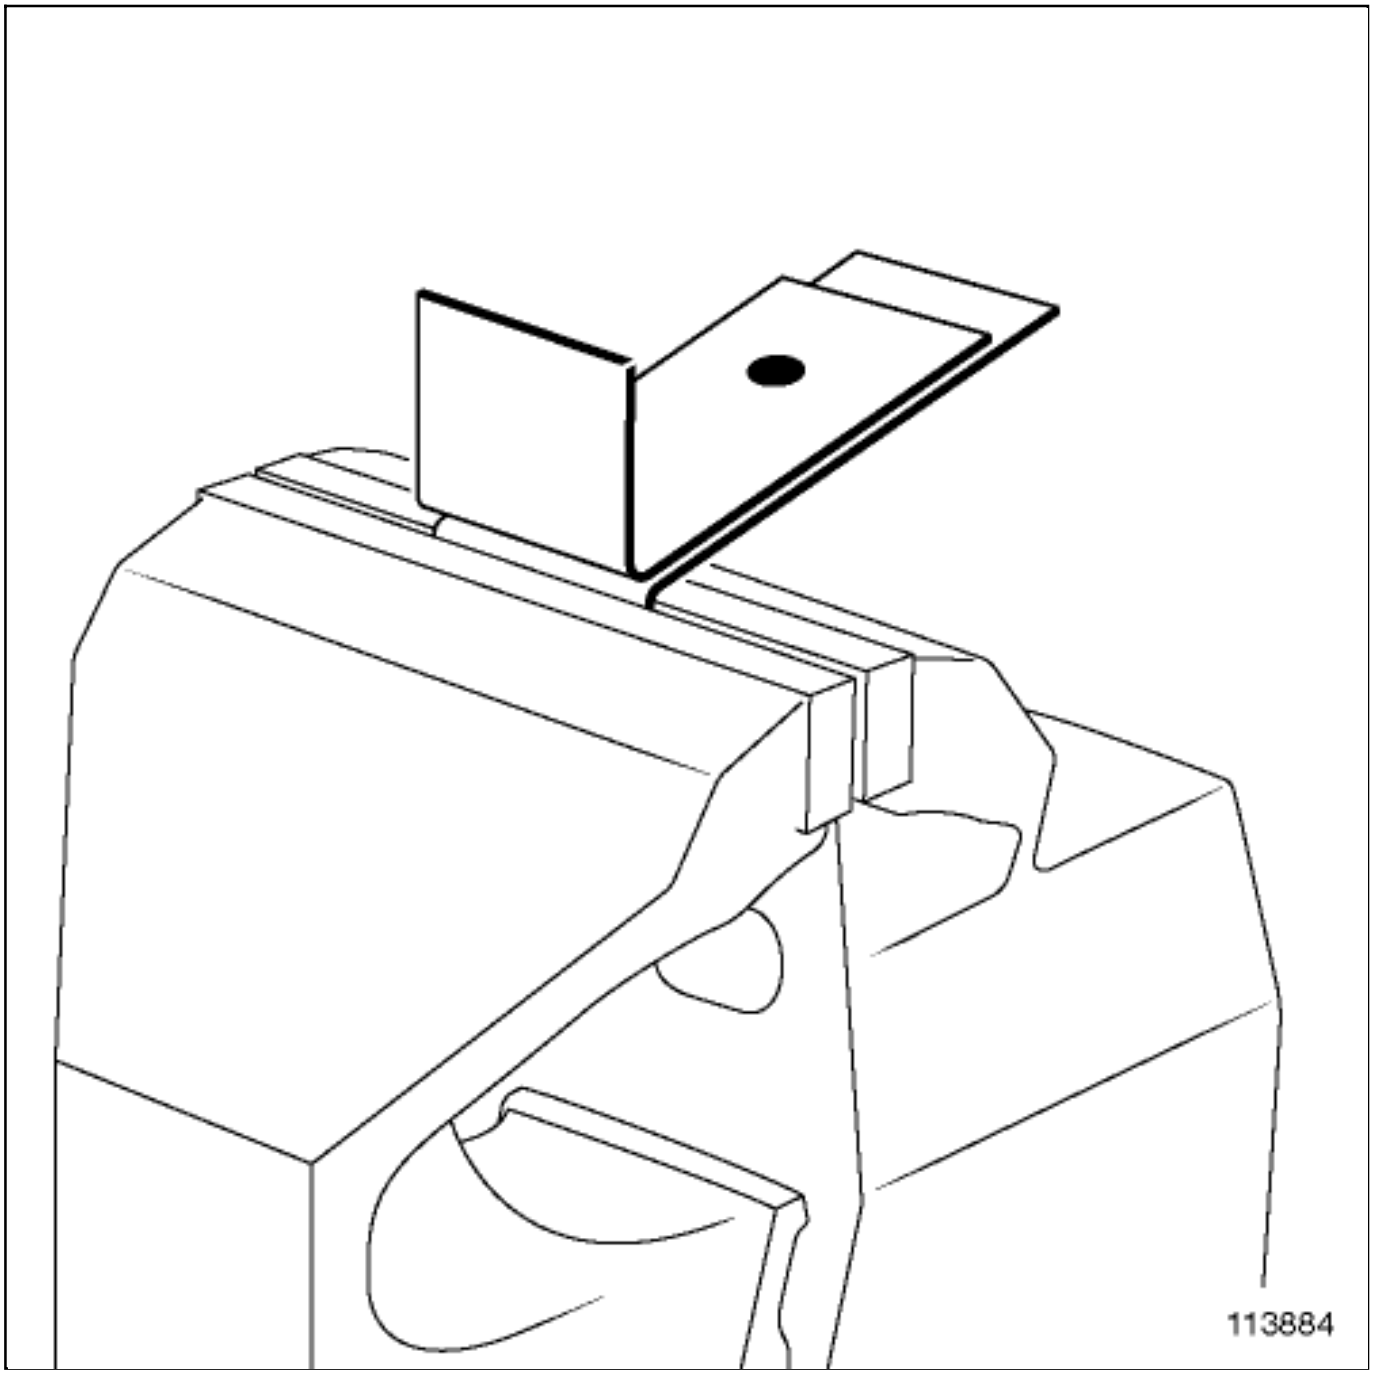


- (X2) = 40 mm
- (X3) = 20 mm

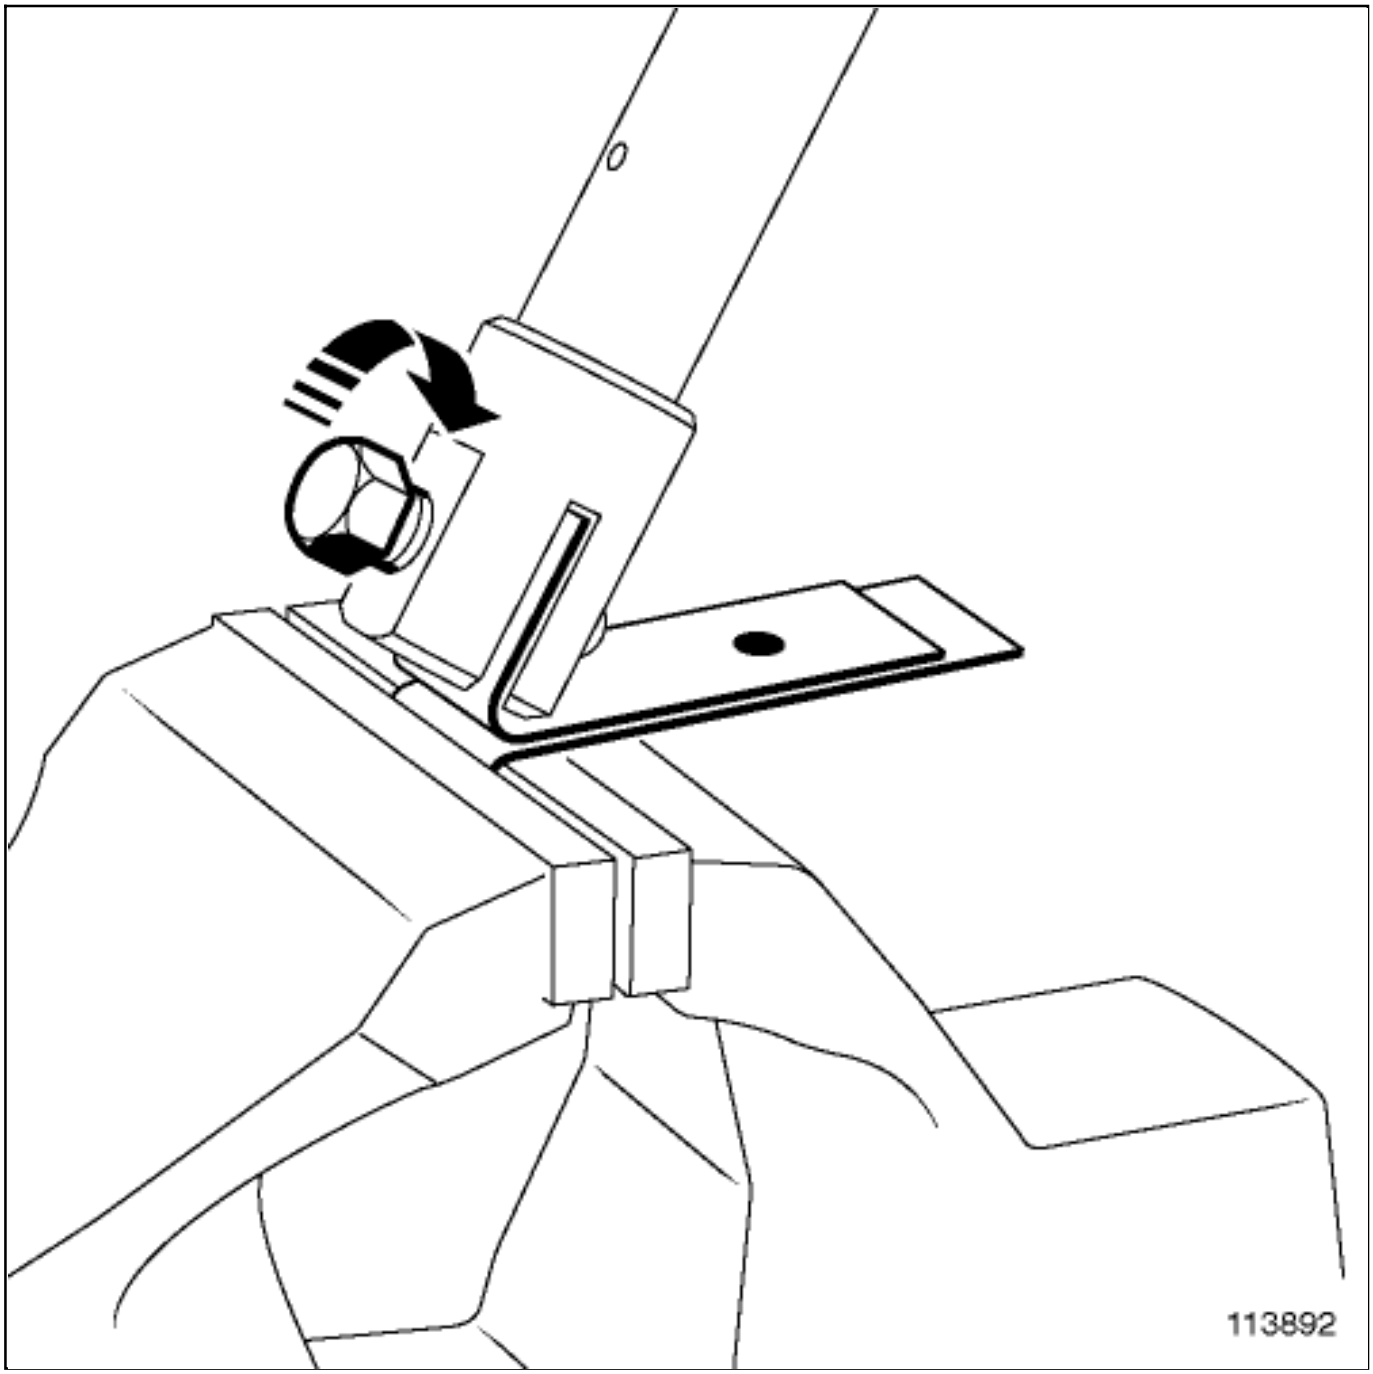


According to the adjustments defined according to the tables in section III.

Make the holding spot(1) ,

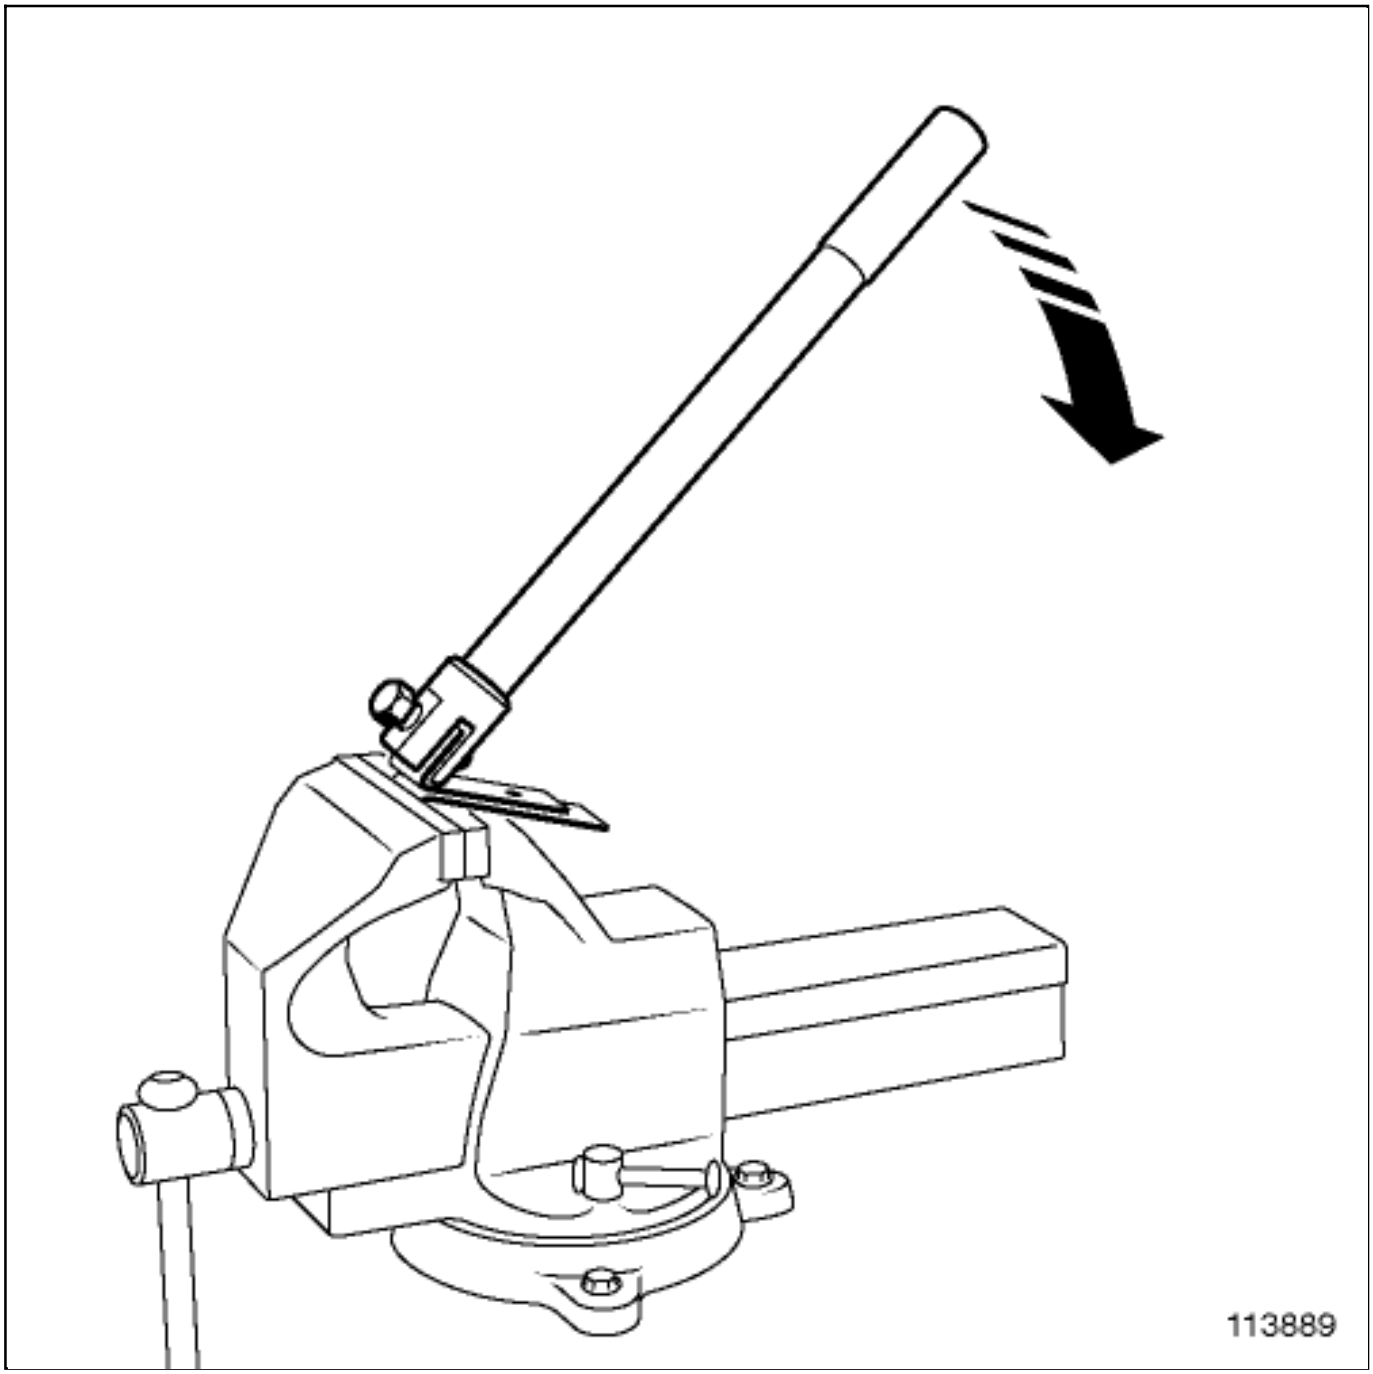


Make the peeling spot(2) .

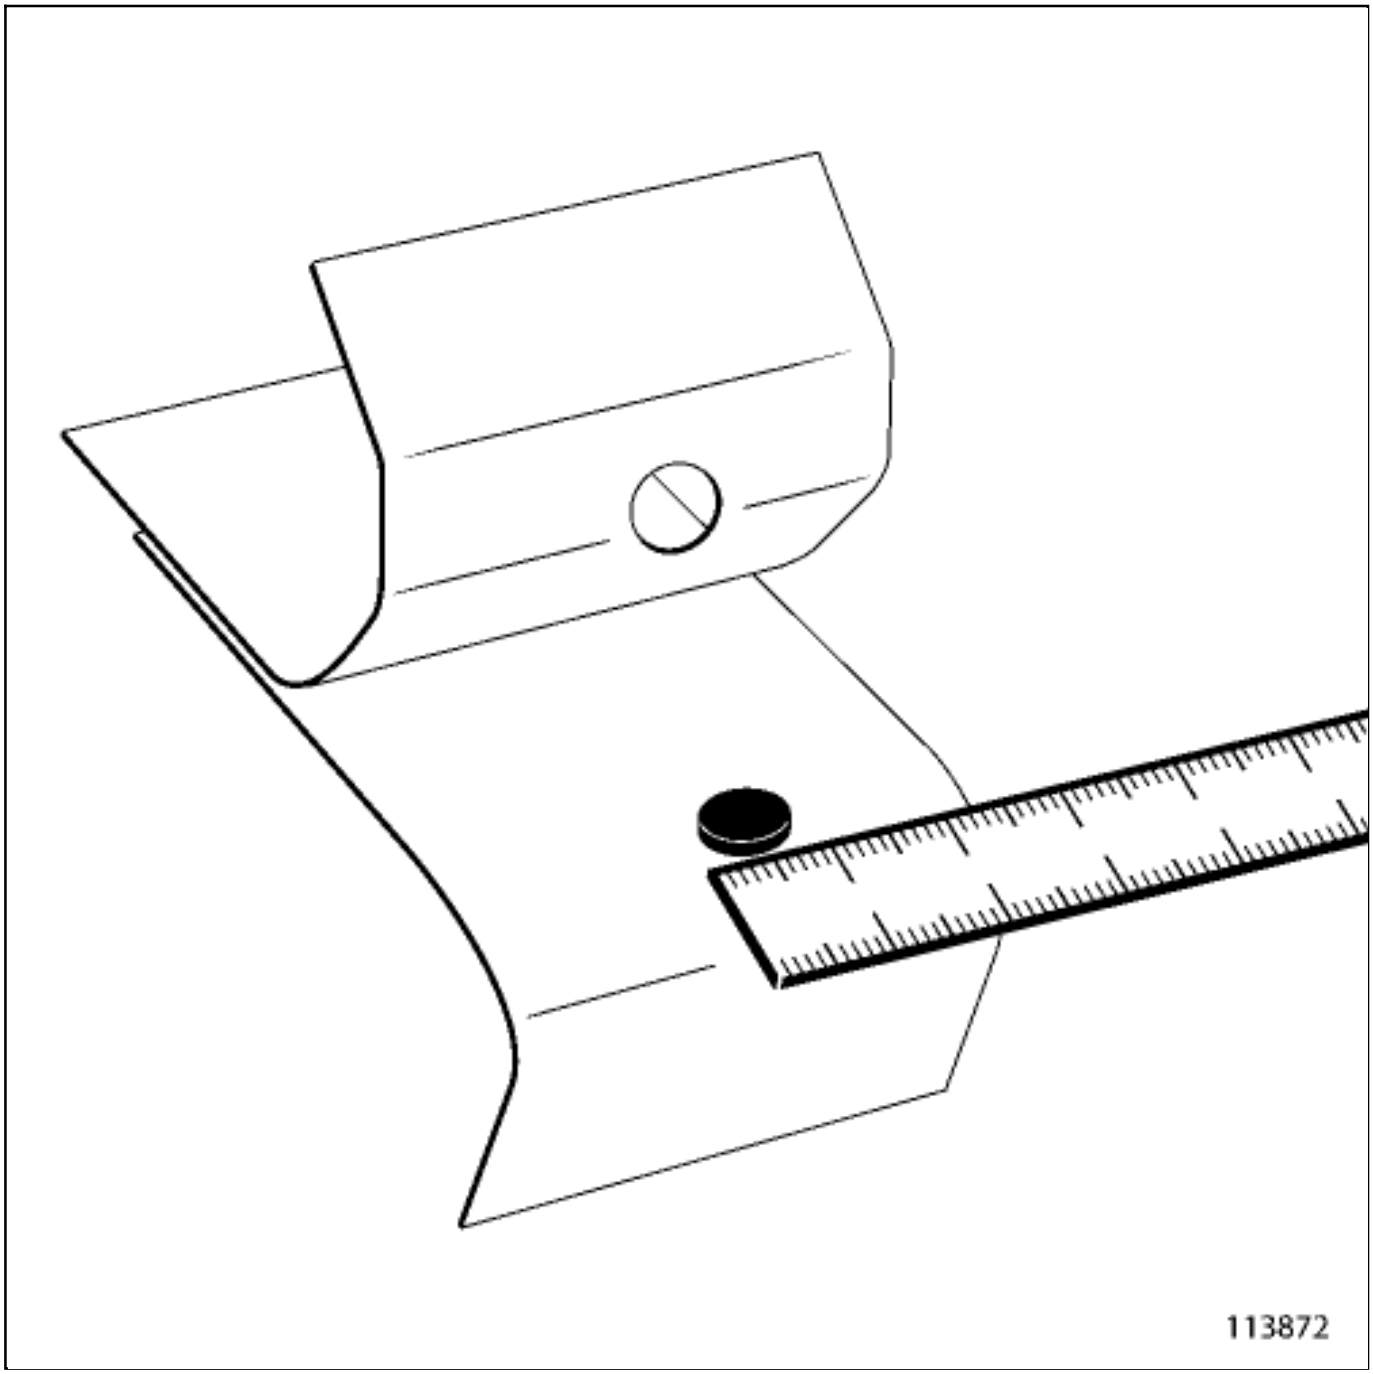


Secure the test specimens in the vice, respecting the value(x_4) = 15 mmshown in the illustration, to avoid damaging the spot weld during the following stage.

Fold down the two panel test specimens.



Secure the test specimens in the vice again as shown in the illustration.



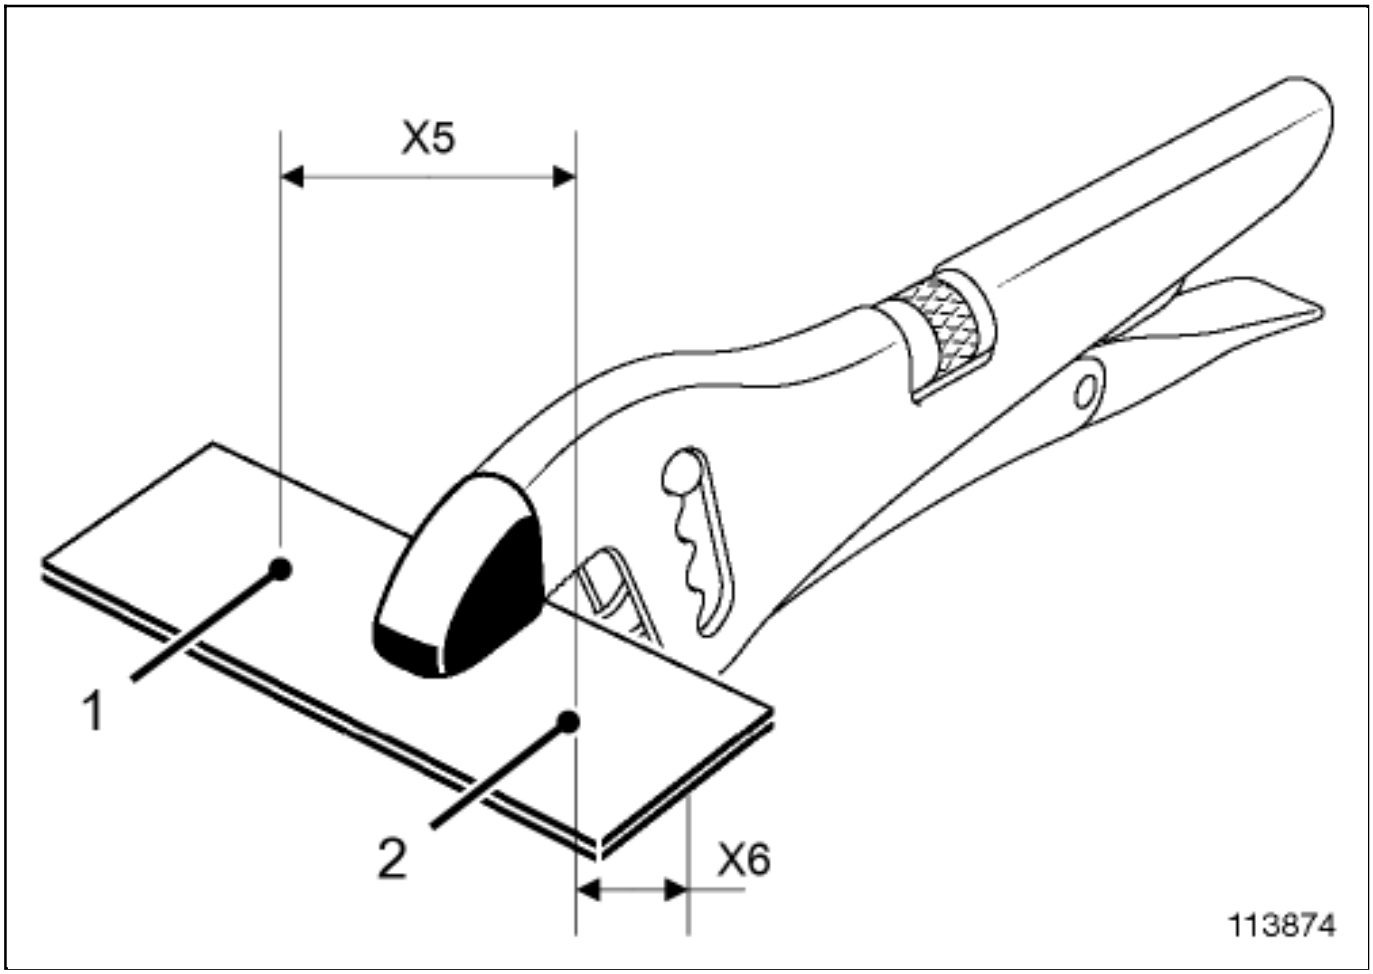
Secure the jaw of the peeling tool.

WARNING

To avoid any accidents, tighten the jaw of the tool to prevent slipping during peeling.

Peel the assembly, applying continuous pressure.

Interpreting the results: section VI.

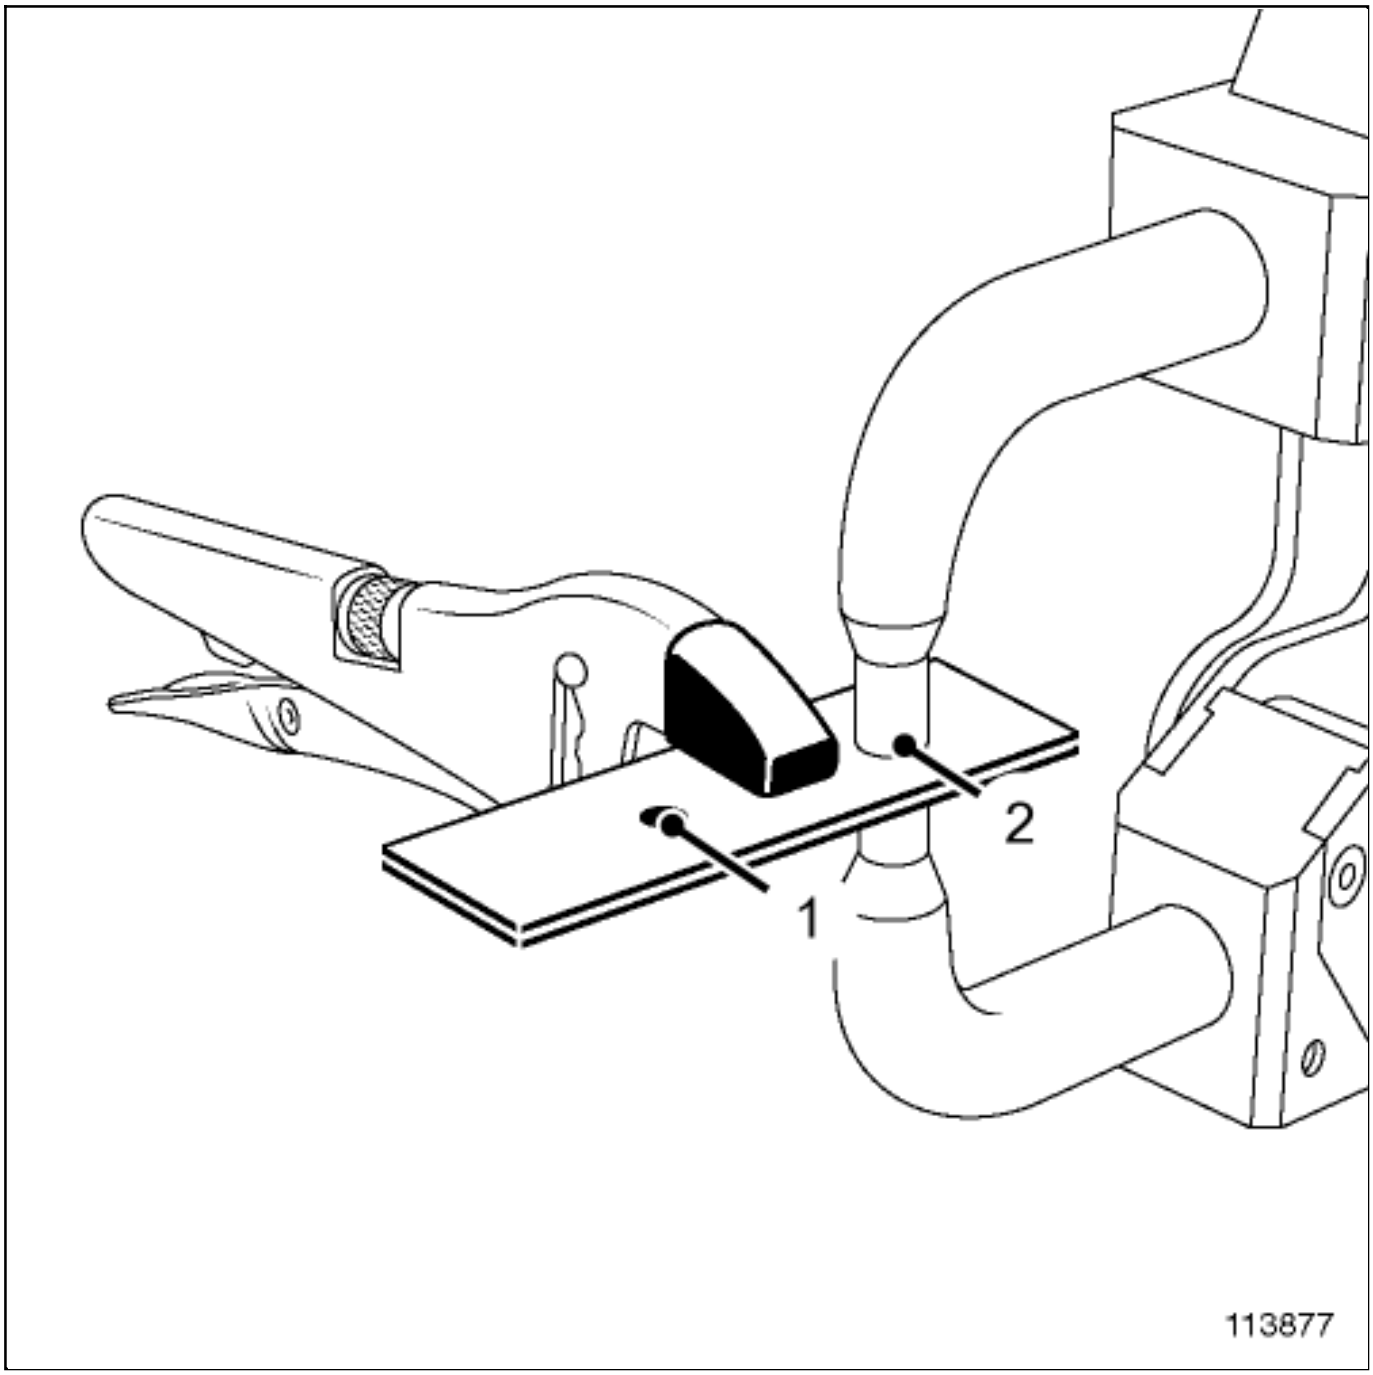


5. PEELING TEST FOR A TRIPLE-THICKNESS ASSEMBLY

Note:

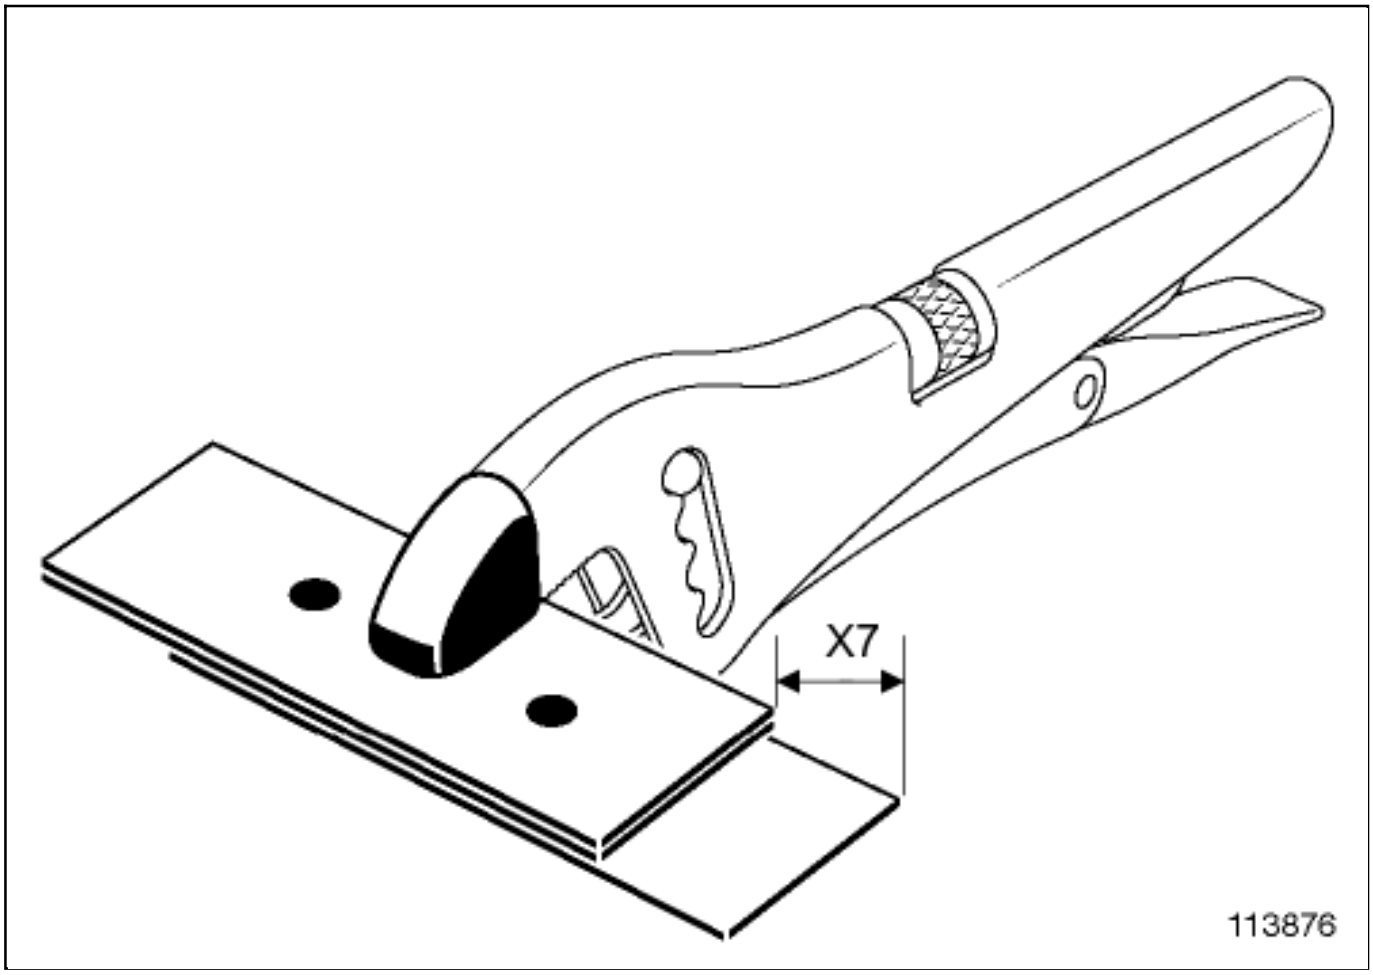
For the test to be valid, carry out exactly the same operations on the vehicle:

first weld two panels, then the third panel.



First confirm the adjustments for the first two panels following the procedure for a PEELING TEST FOR A DOUBLE THICKNESS ASSEMBLY.

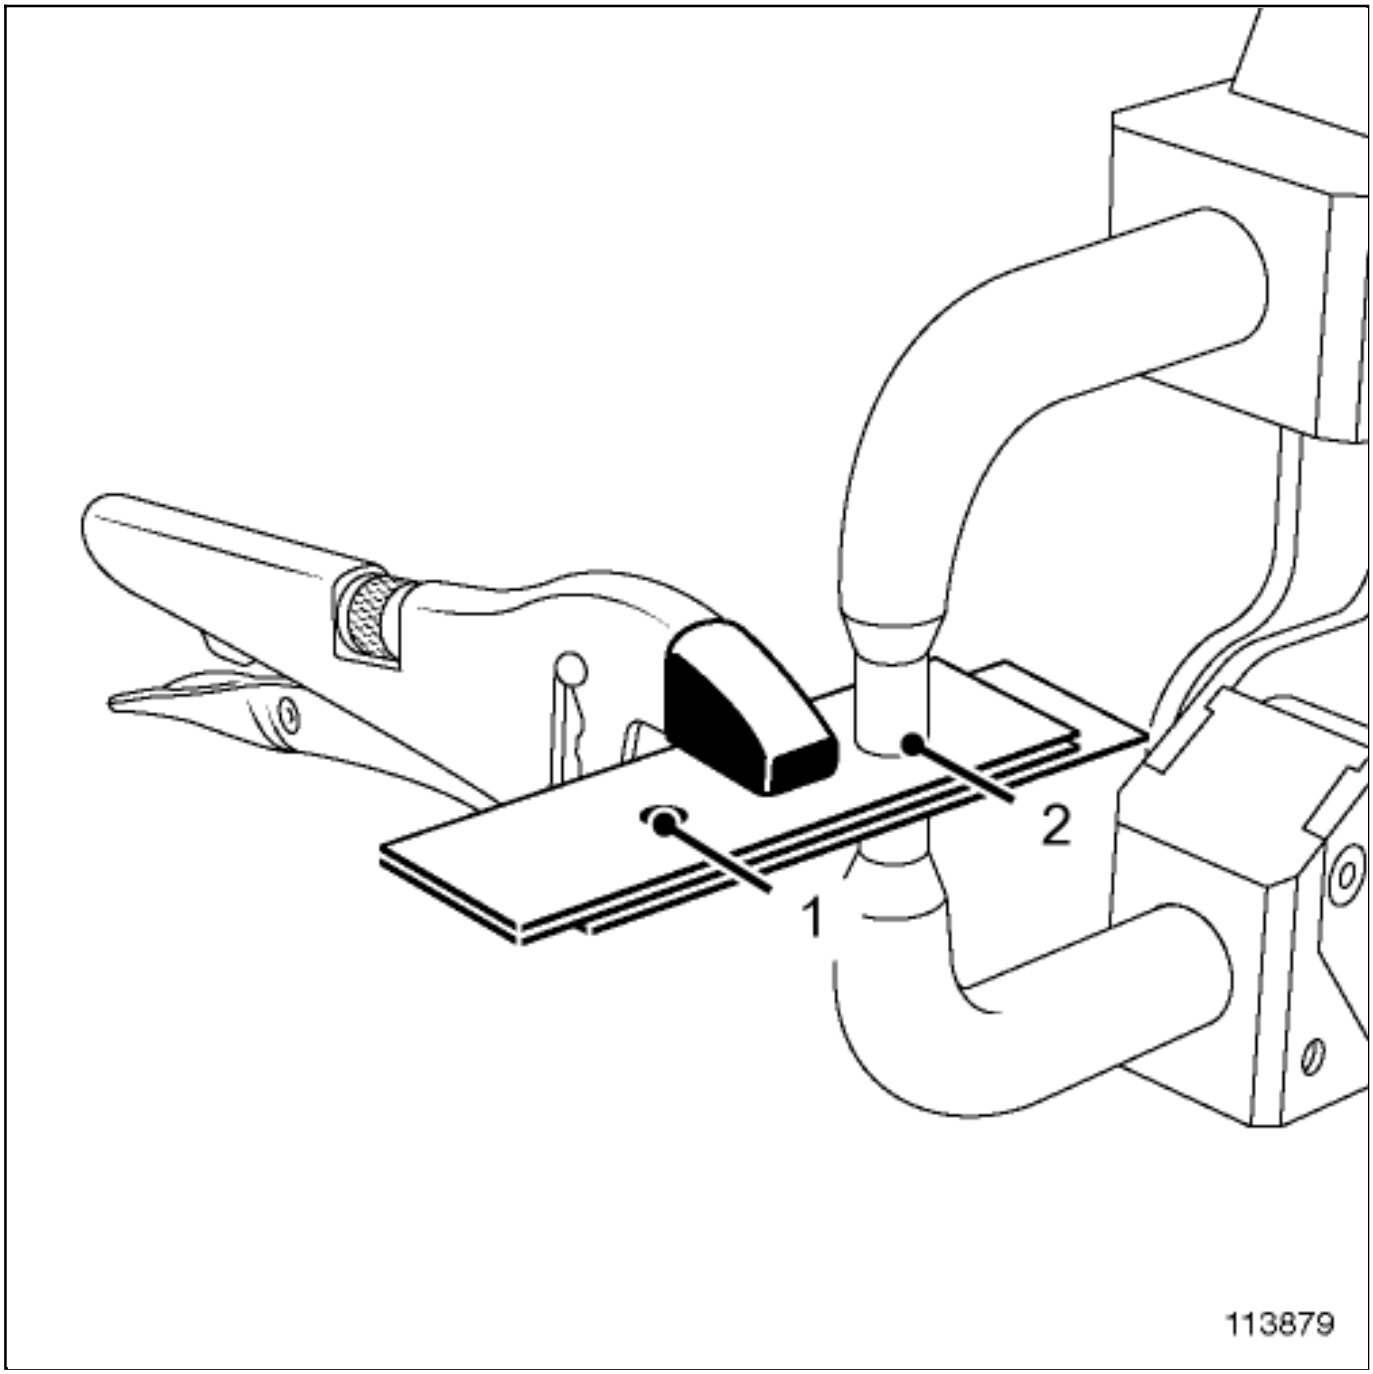
Prepare two test specimens that correspond to the first two panels, respecting the gaps between the spot welds, and aligning them exactly one on top of the other.



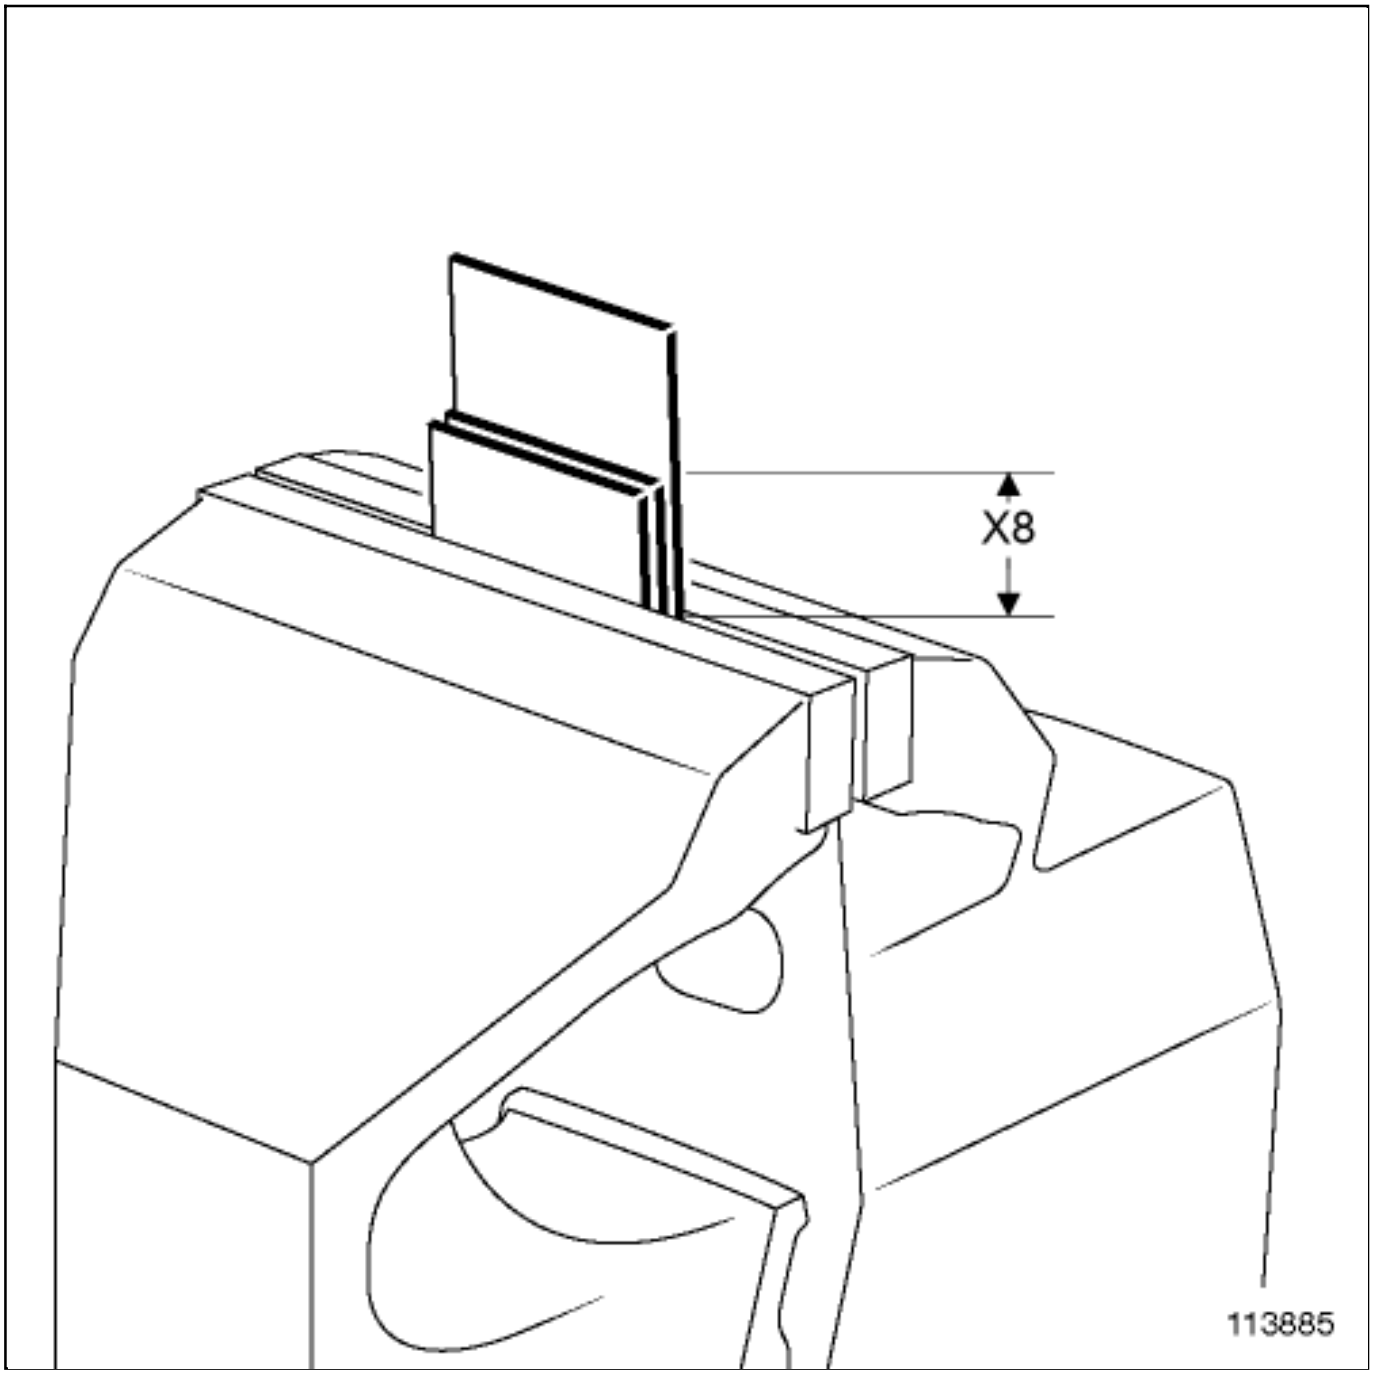
Position values of the spots:

- (X6) = 20 mm,
- (X5) = 40 mm minimum.

Make the holding spot(1) .

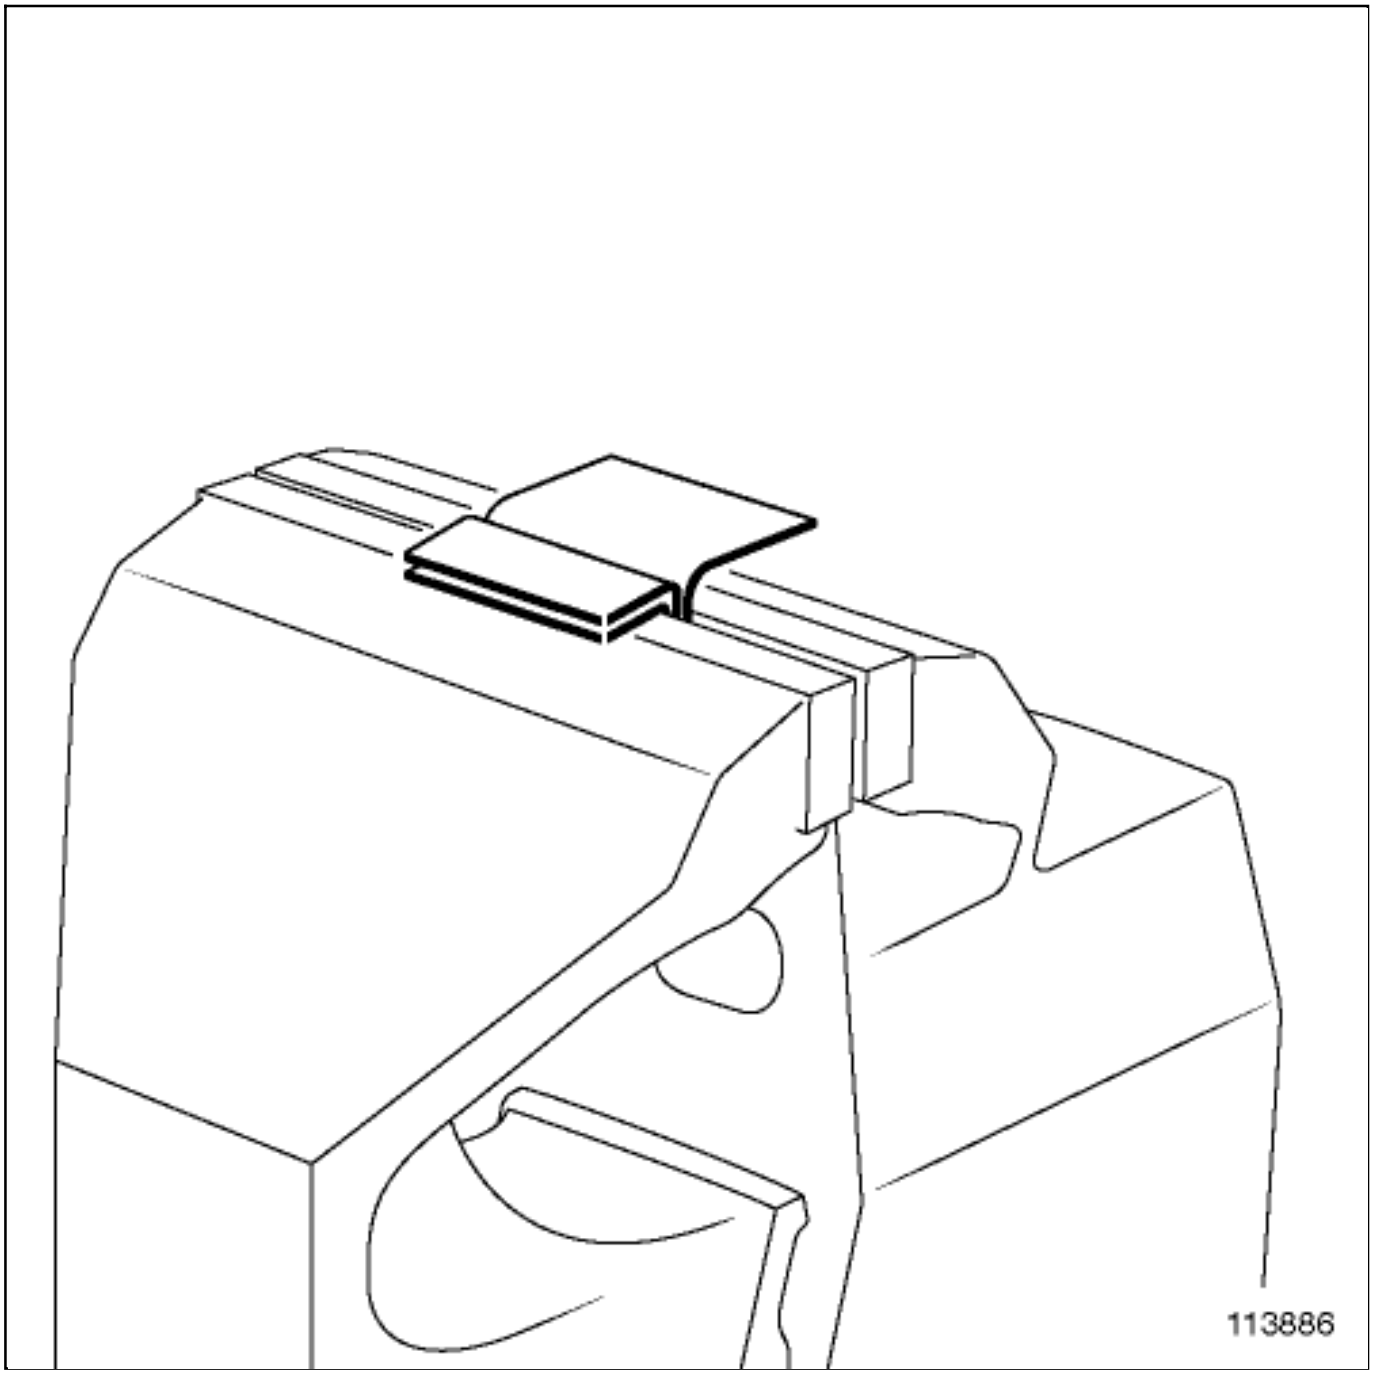


Make the peeling spot(2) , keeping to the predefined adjustments.

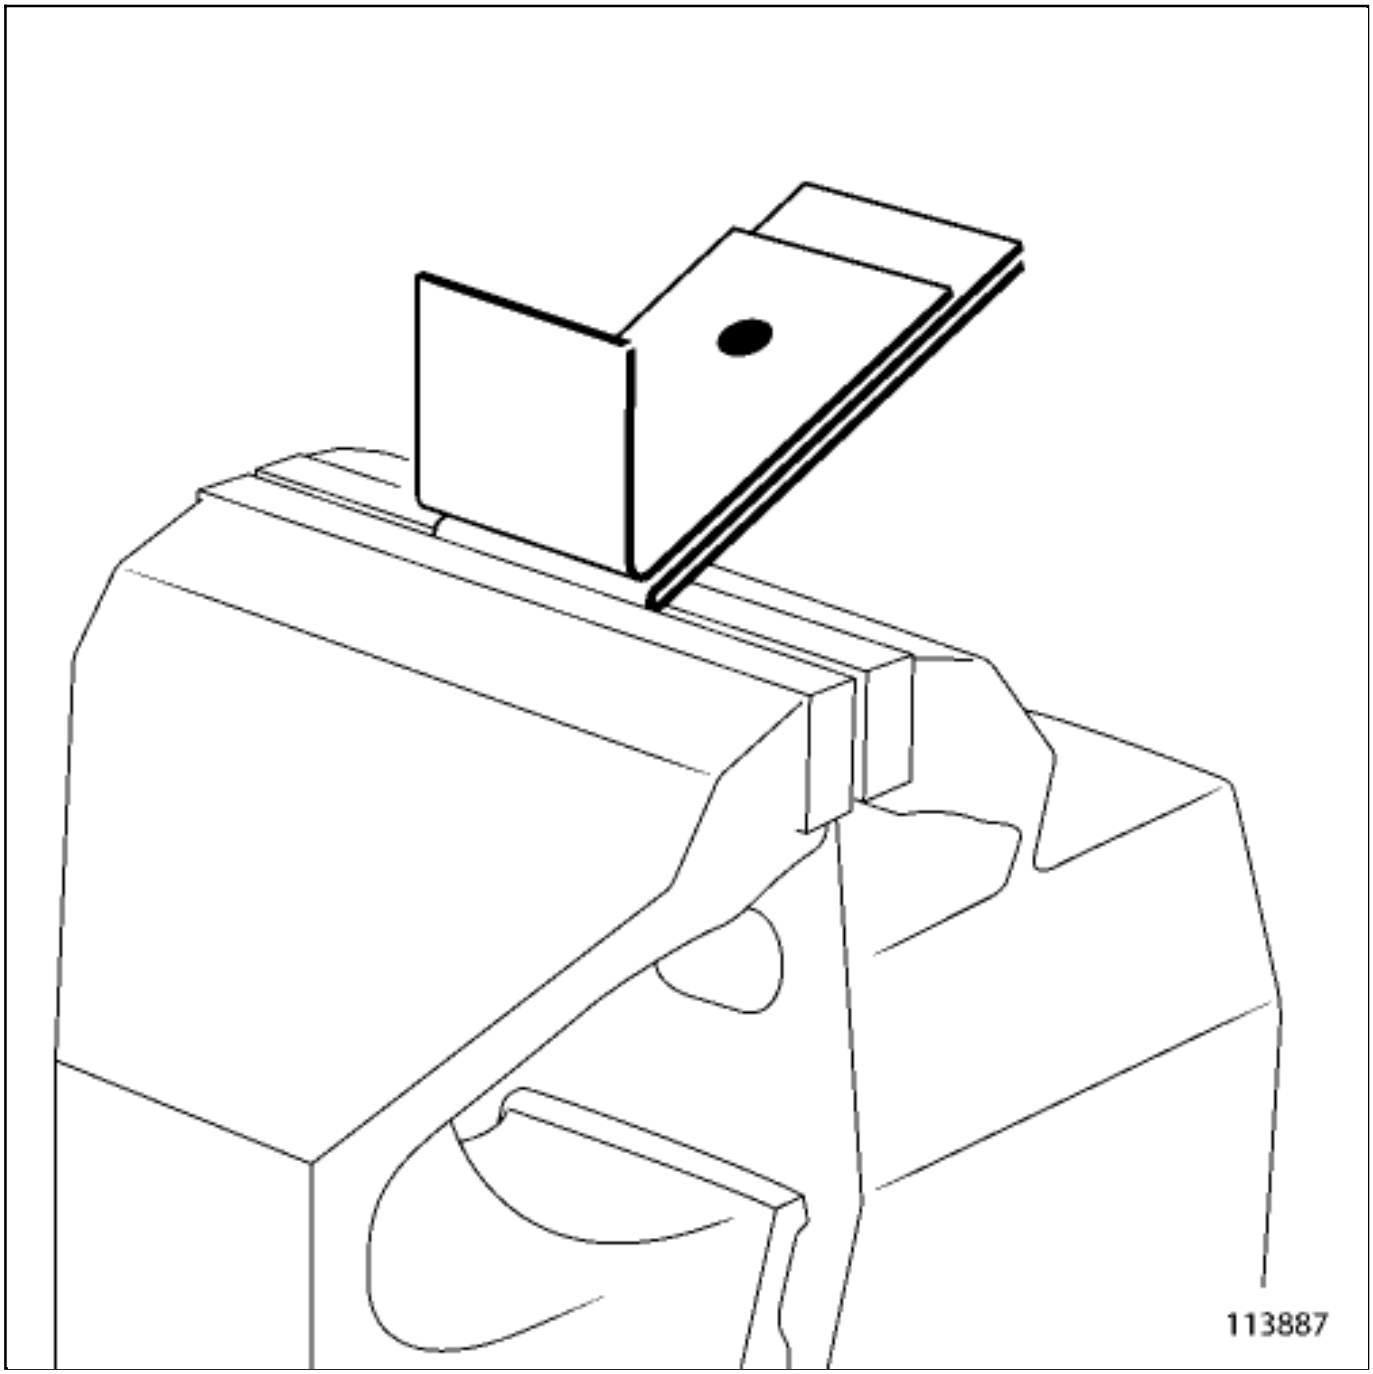


Position the third panel, respecting the stack order (thickness/grade).

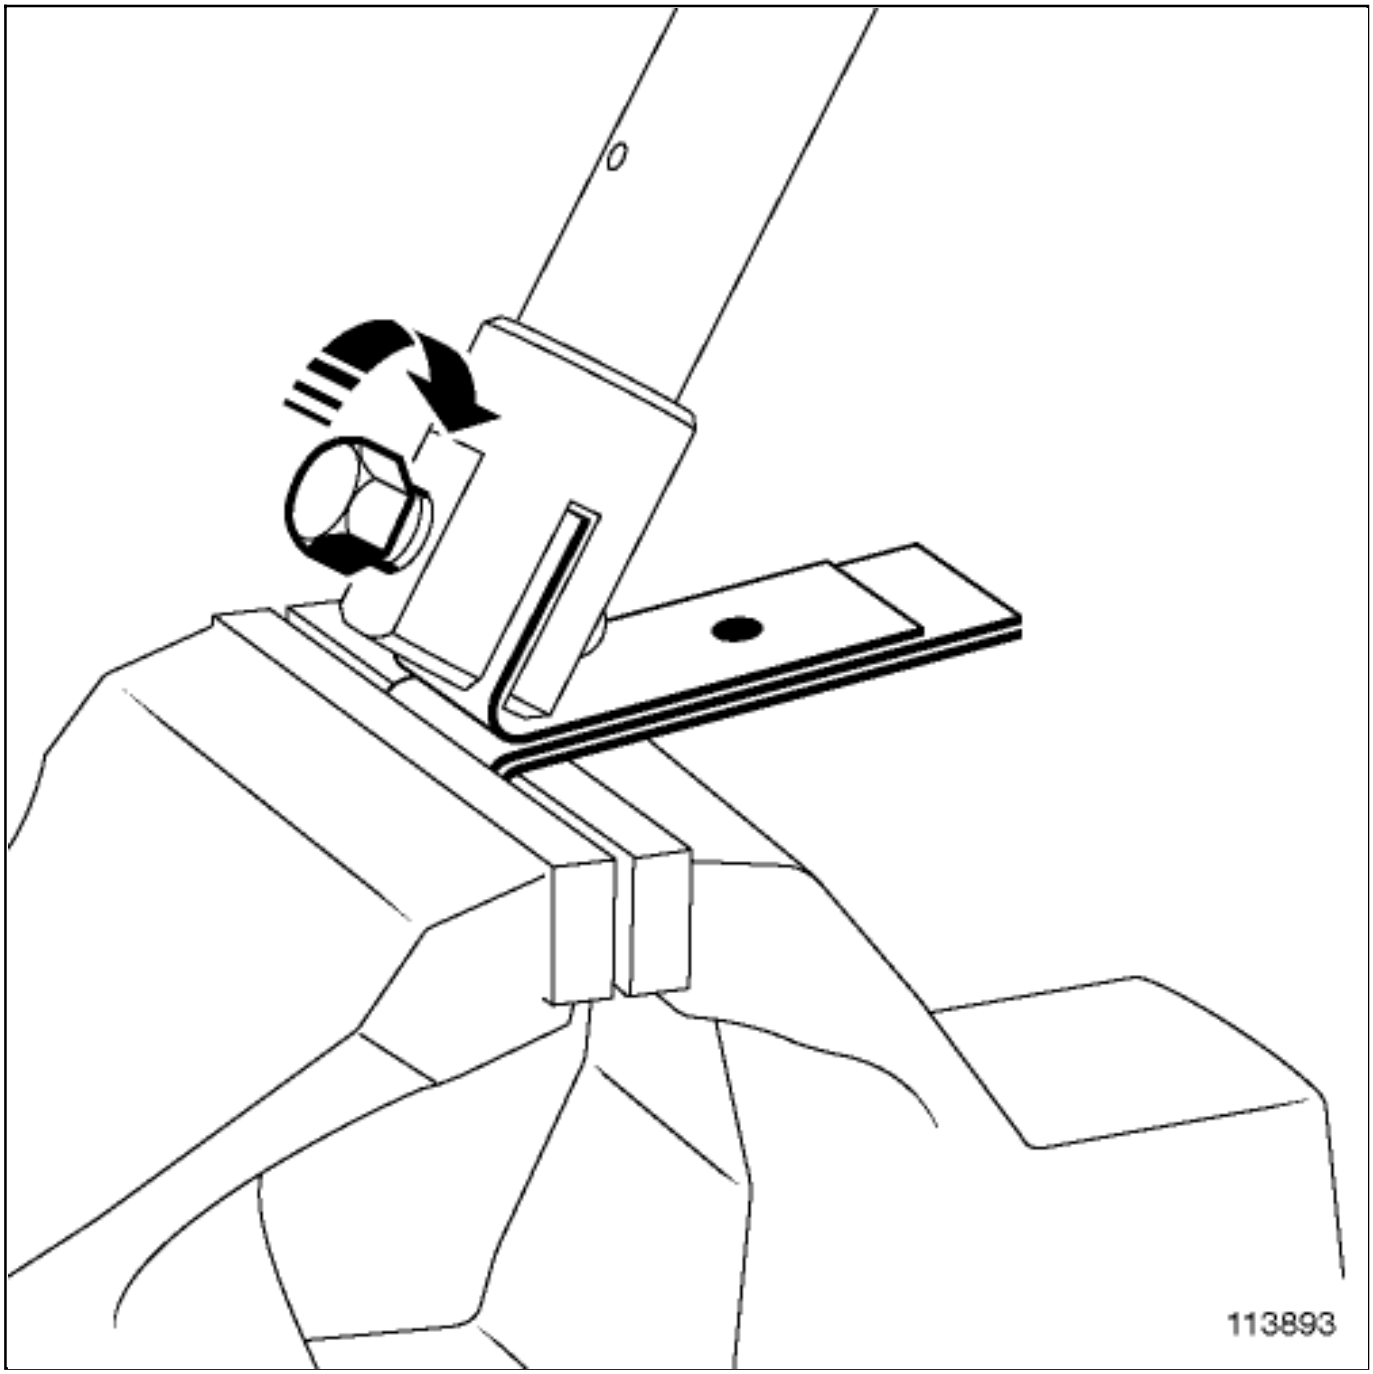
Offset the latter by(X7) = 20 mm.



Secure it using separate locking pliers.

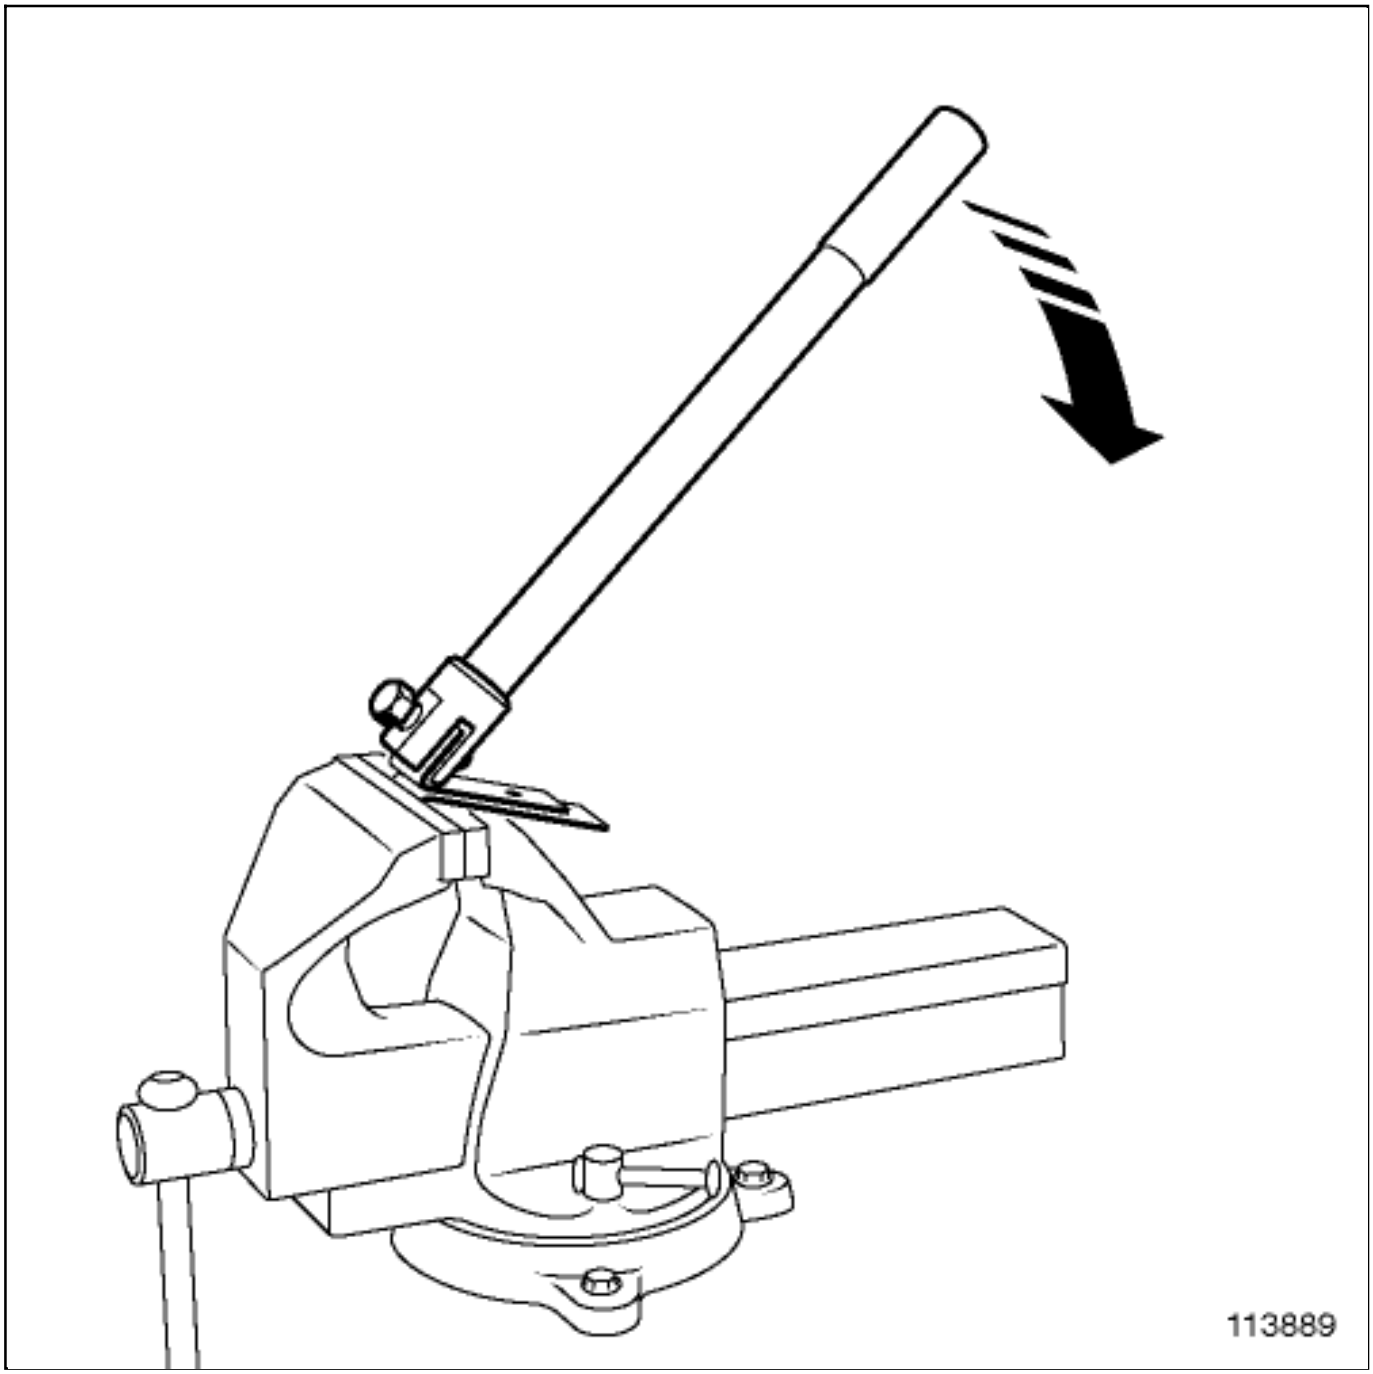


Make the spot welds(1) and (2) over the existing spots on the first two panels.

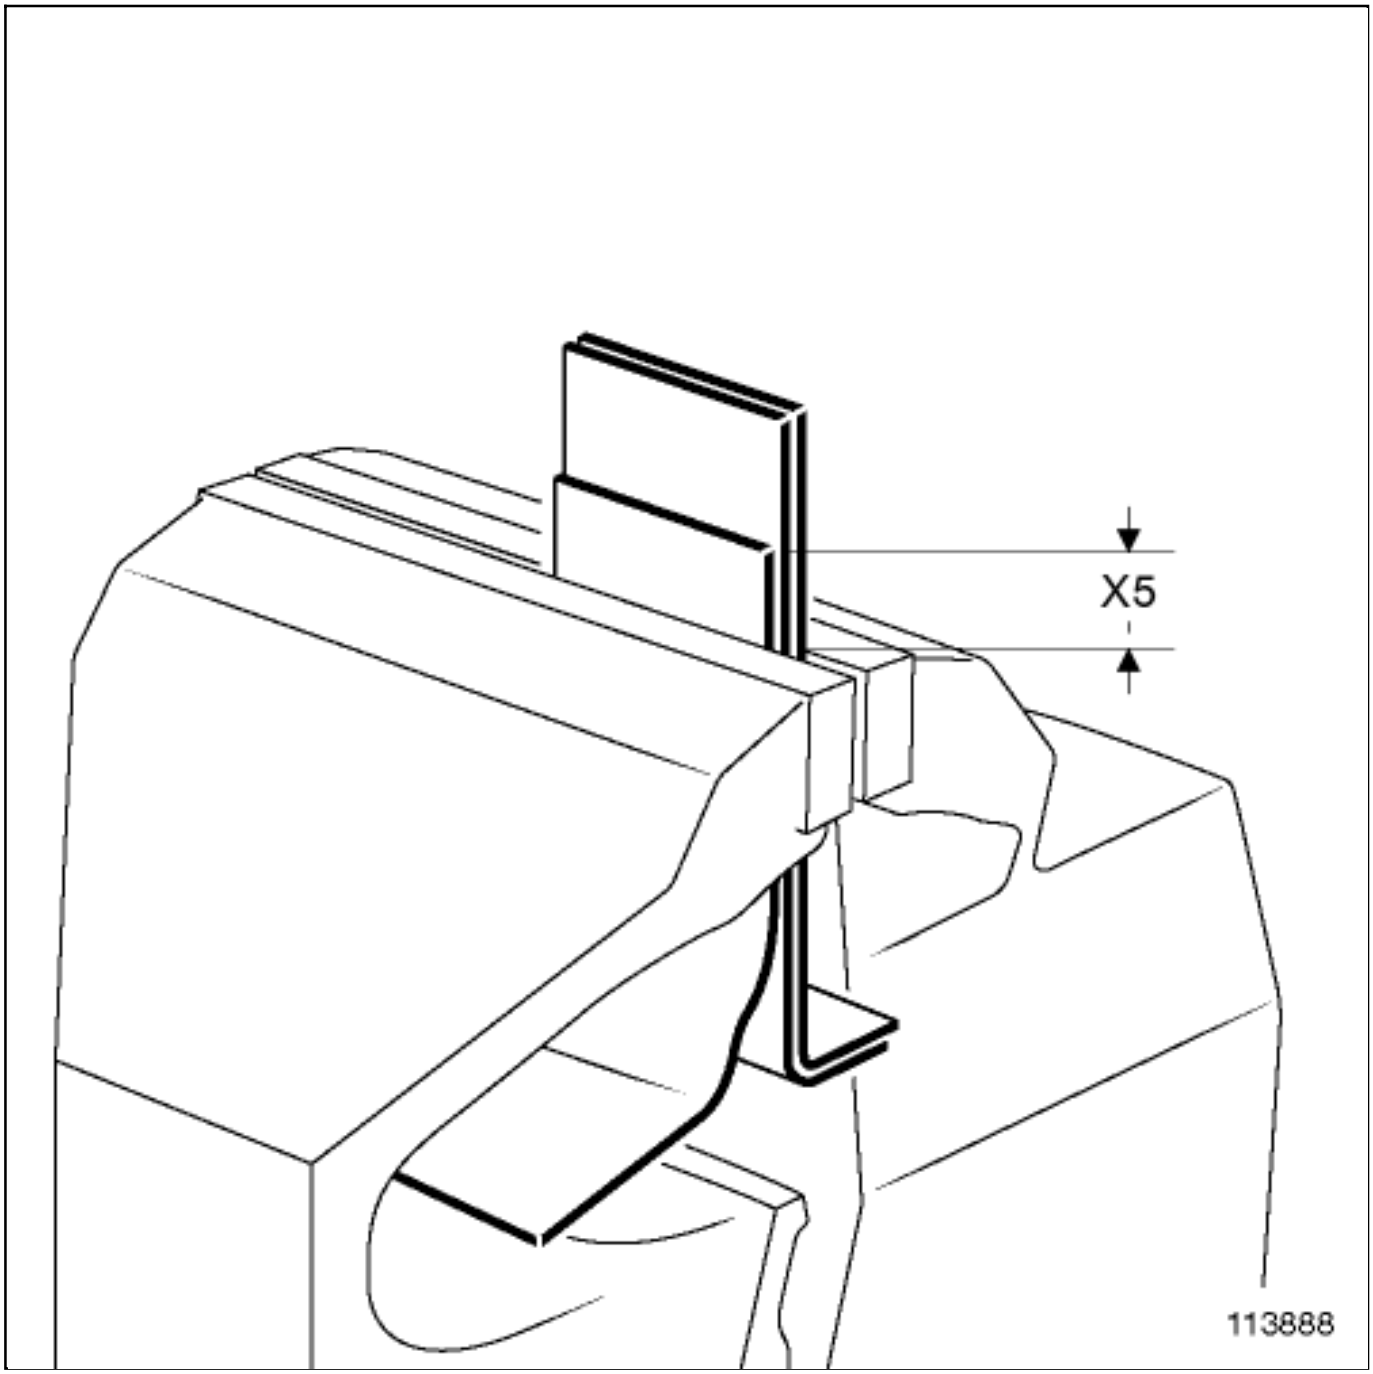


Secure the test specimens in the vice, respecting the dimension(X_8) = 15 mm.

Fold down the test specimens, as shown in the illustration.

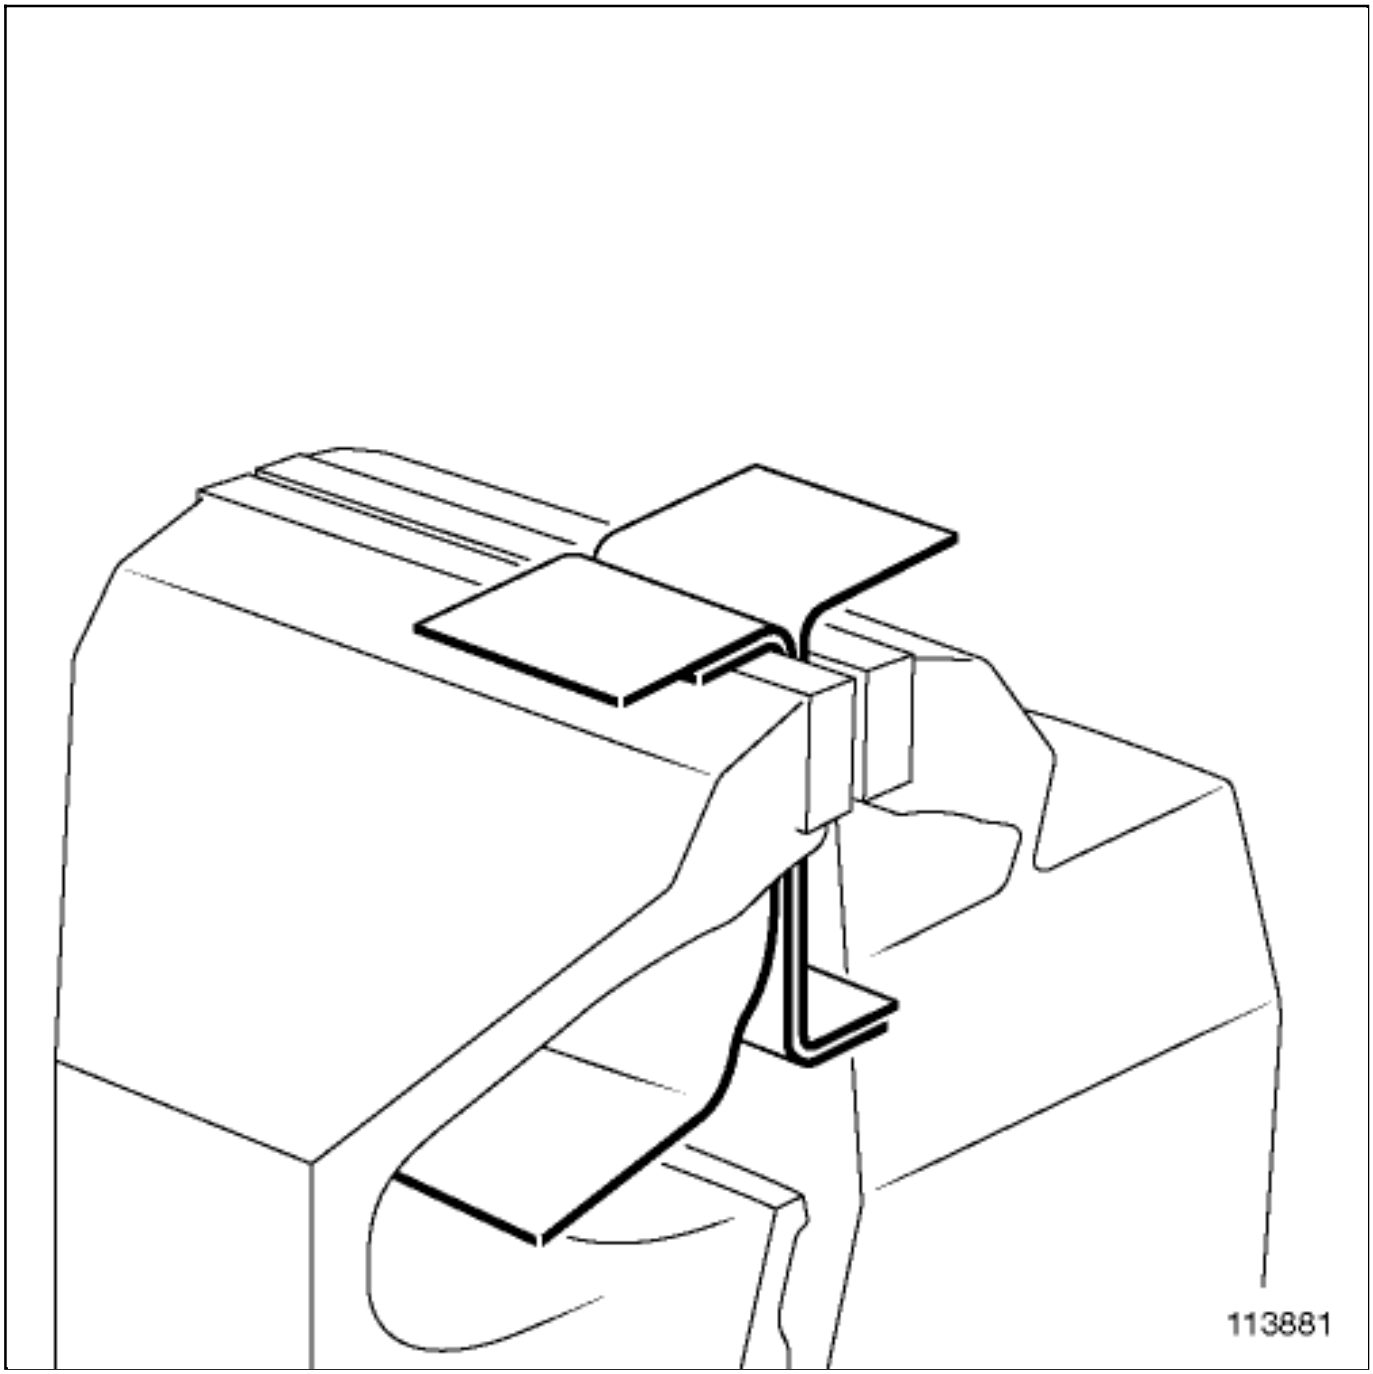


Secure the test specimens in the vice.

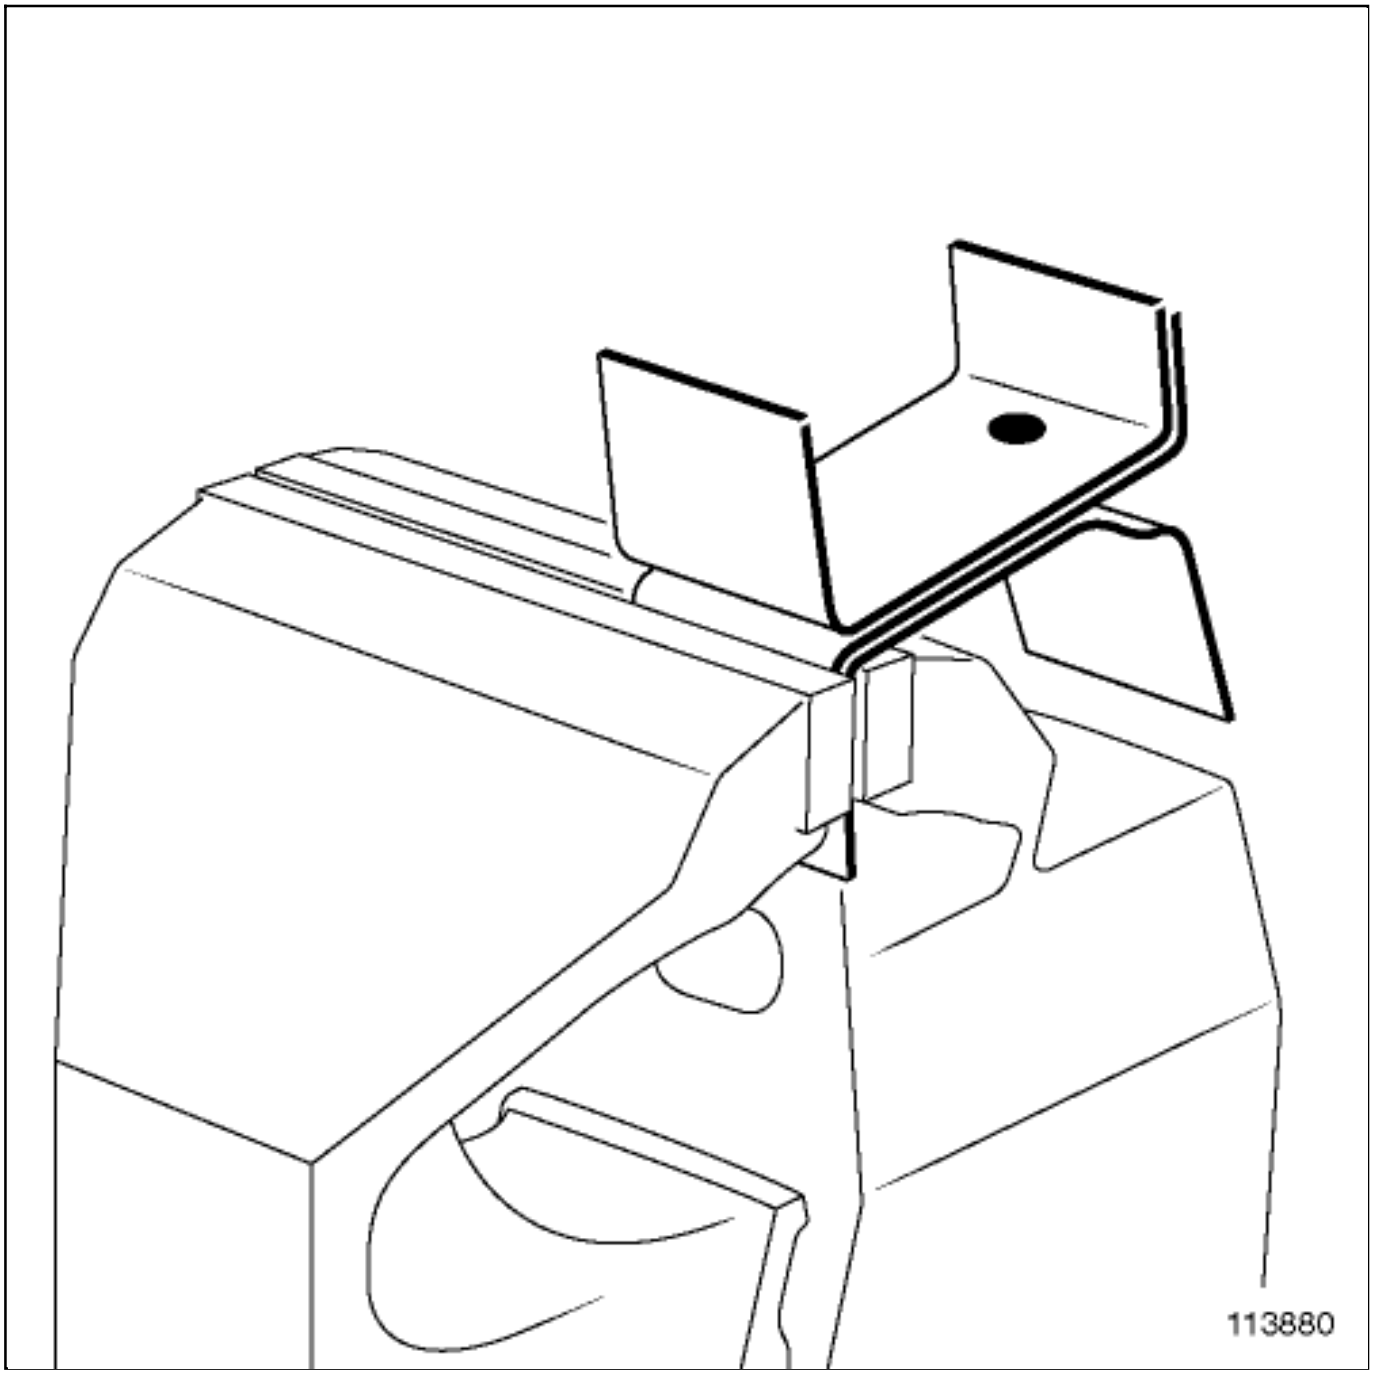


Secure the jaw of the peeling tool.

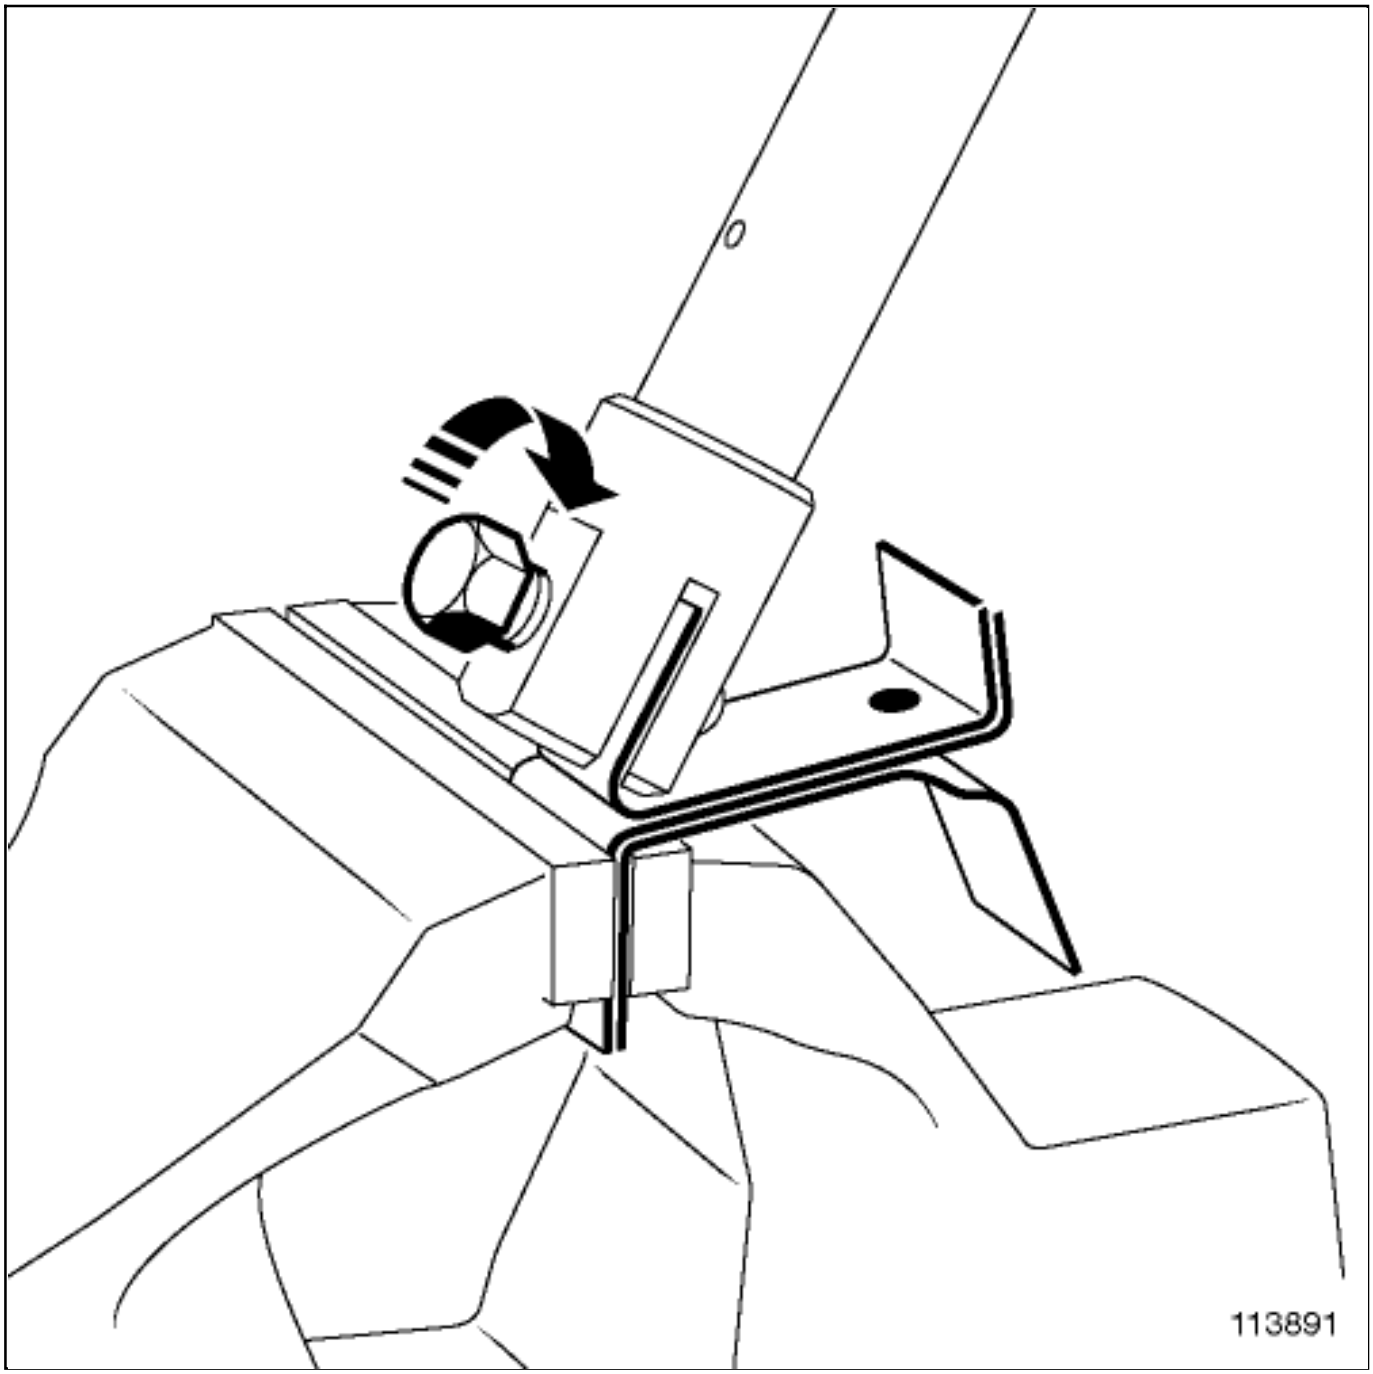
WARNING



To avoid any accidents, tighten the jaw of the tool to prevent slipping during peeling.

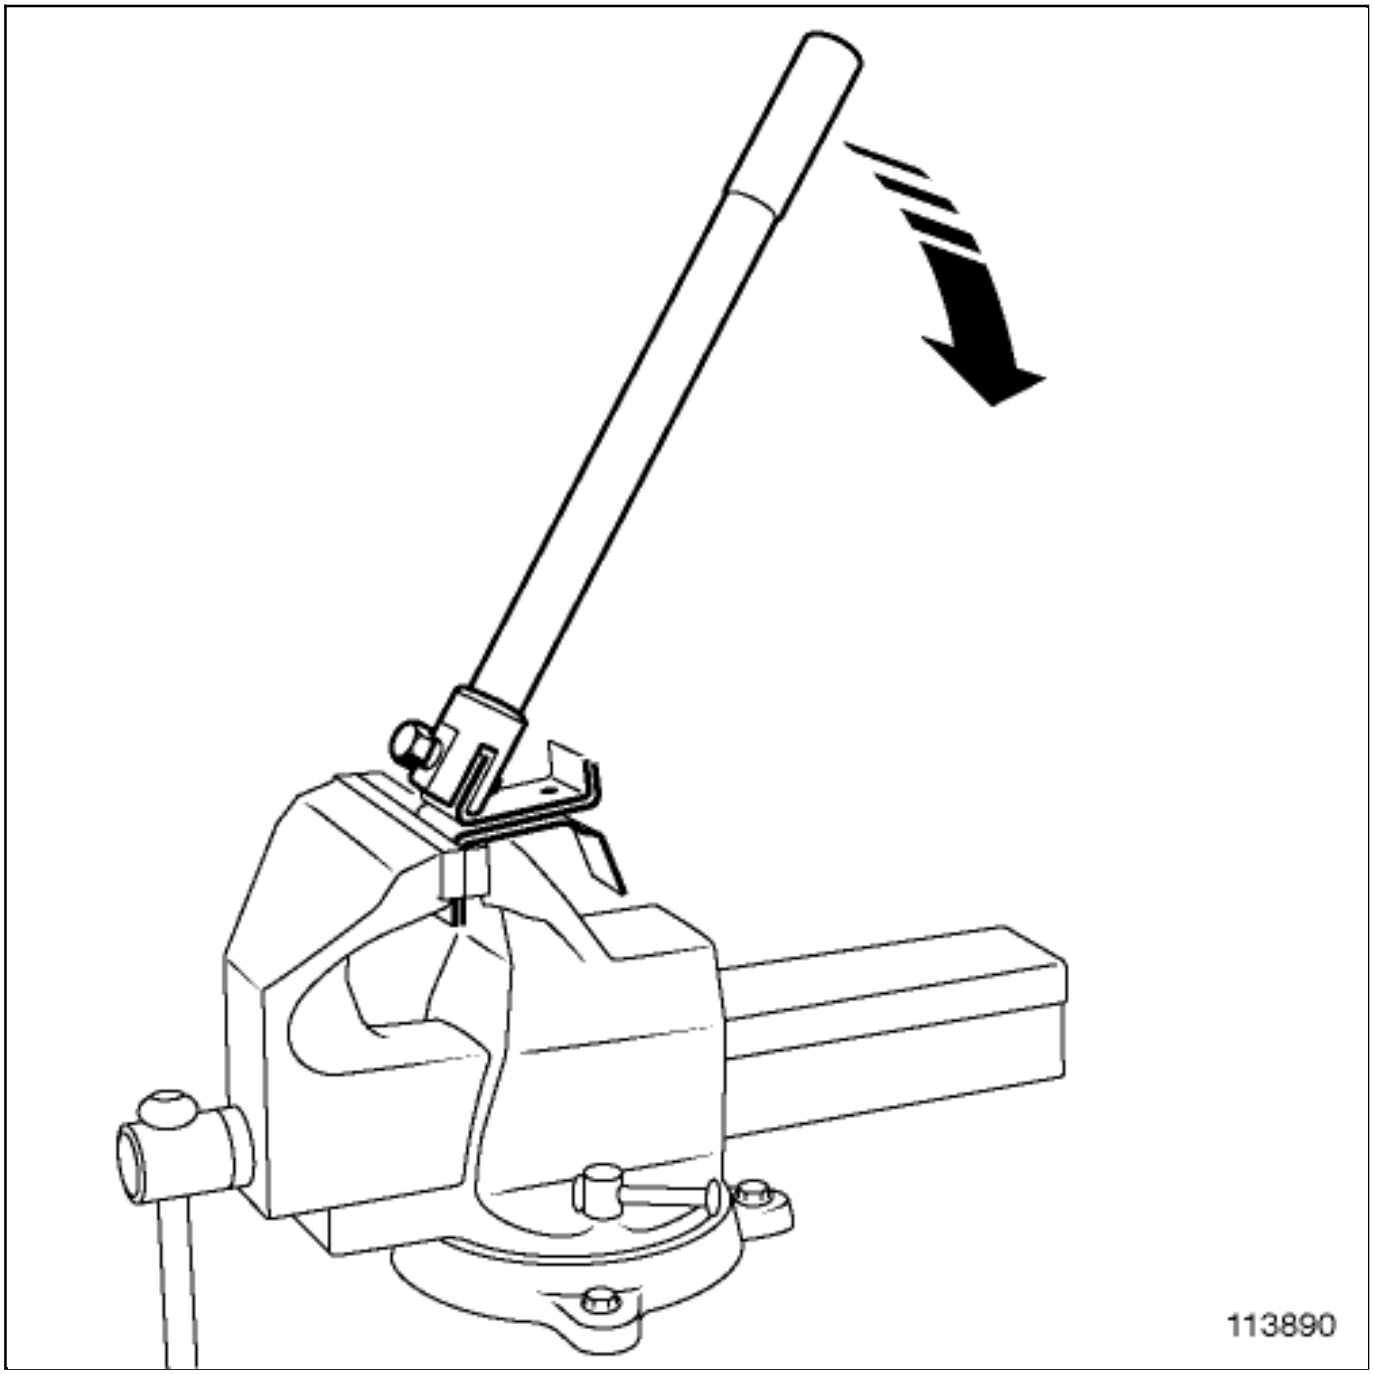


Peel the assembly, applying continuous pressure.

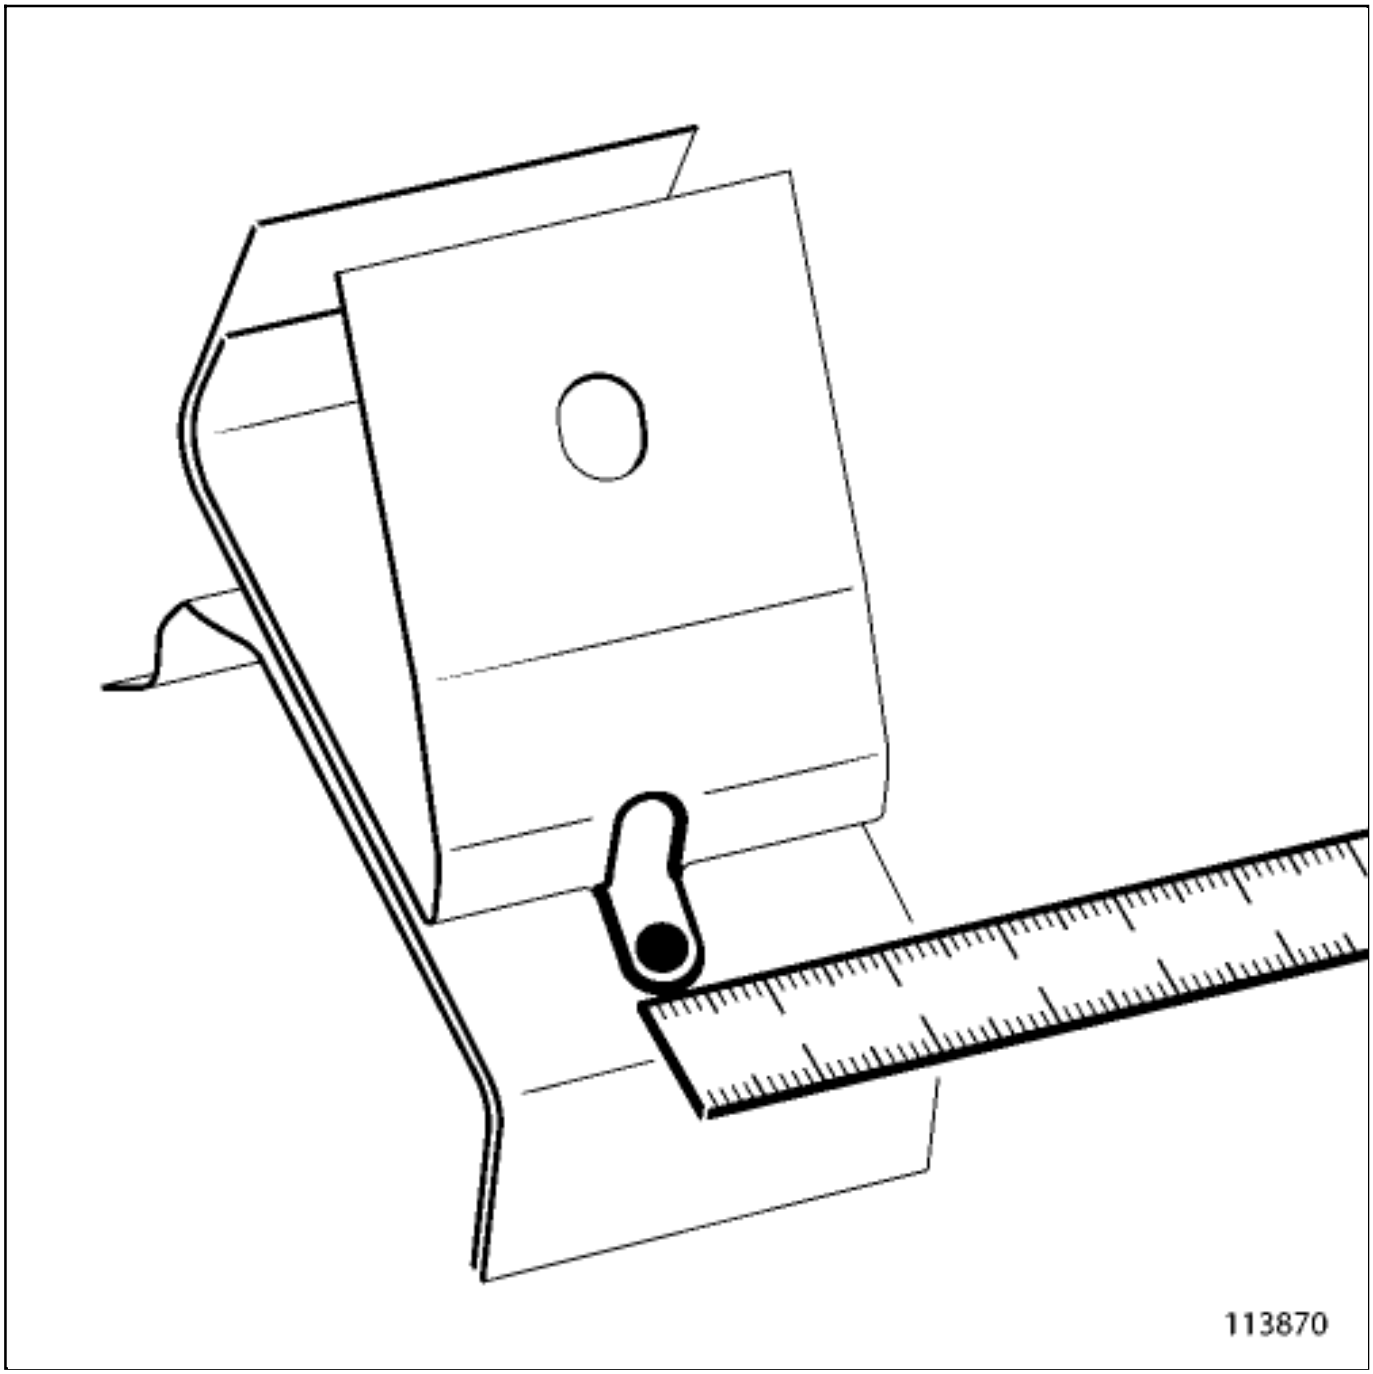


Re-secure the test specimens in the vice(X_5) = 15 mm.

Fold down the test specimens, as shown in the illustration.



Secure the test specimens in the vice.



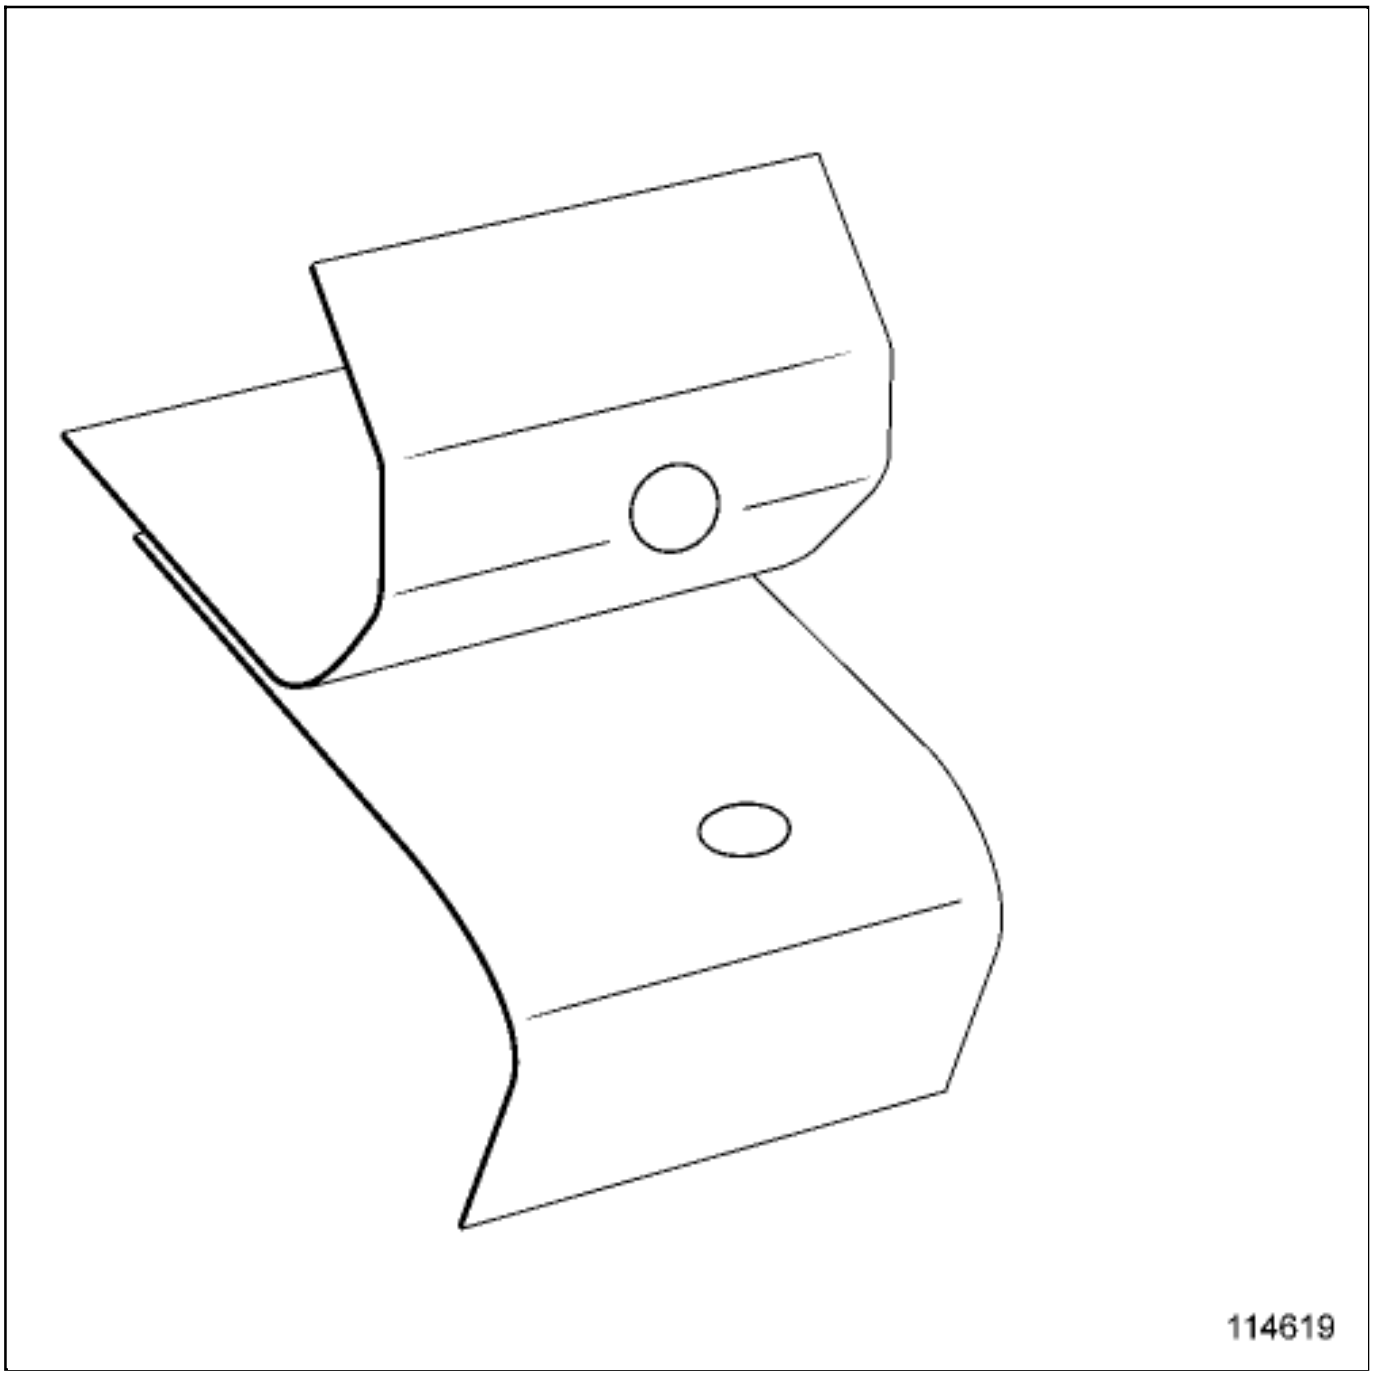
Secure the jaw of the peeling tool.

WARNING

To avoid any accidents, tighten the jaw of the tool to prevent slipping during peeling.

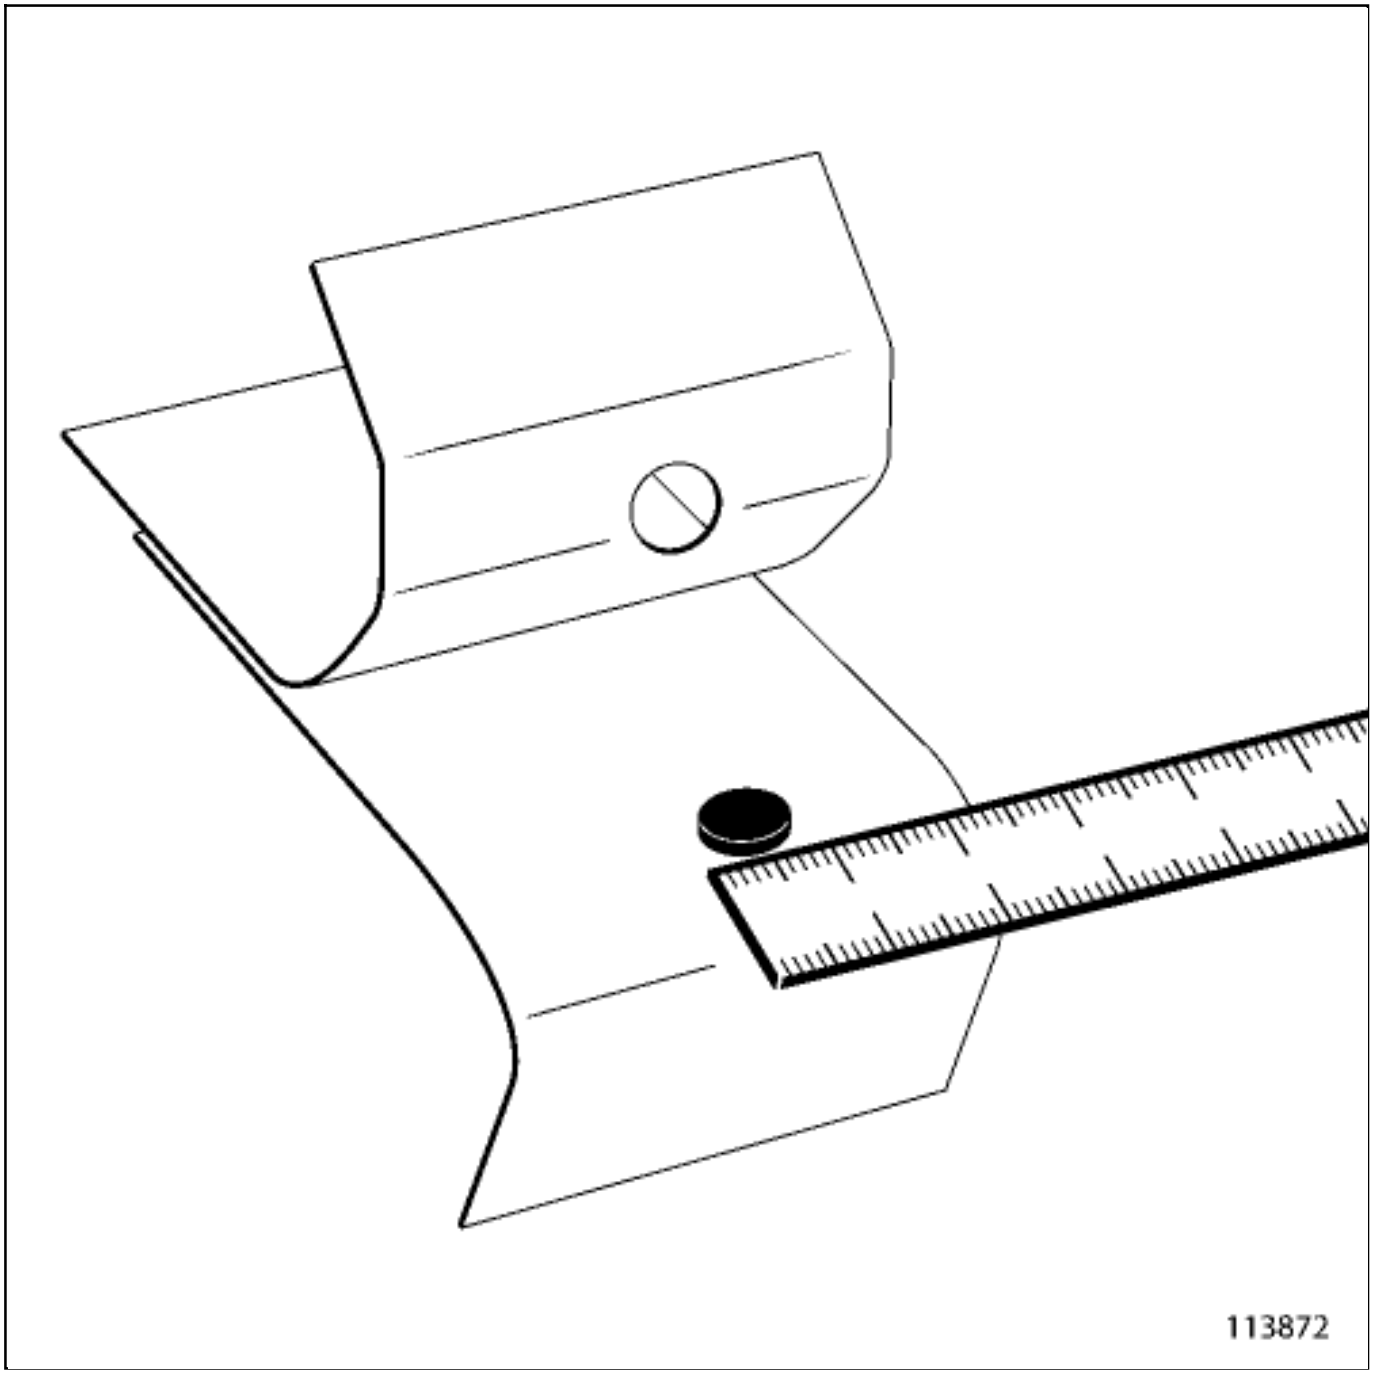
Peel the spot weld of the first joint, applying continuous pressure.

Interpreting the results: section VI.



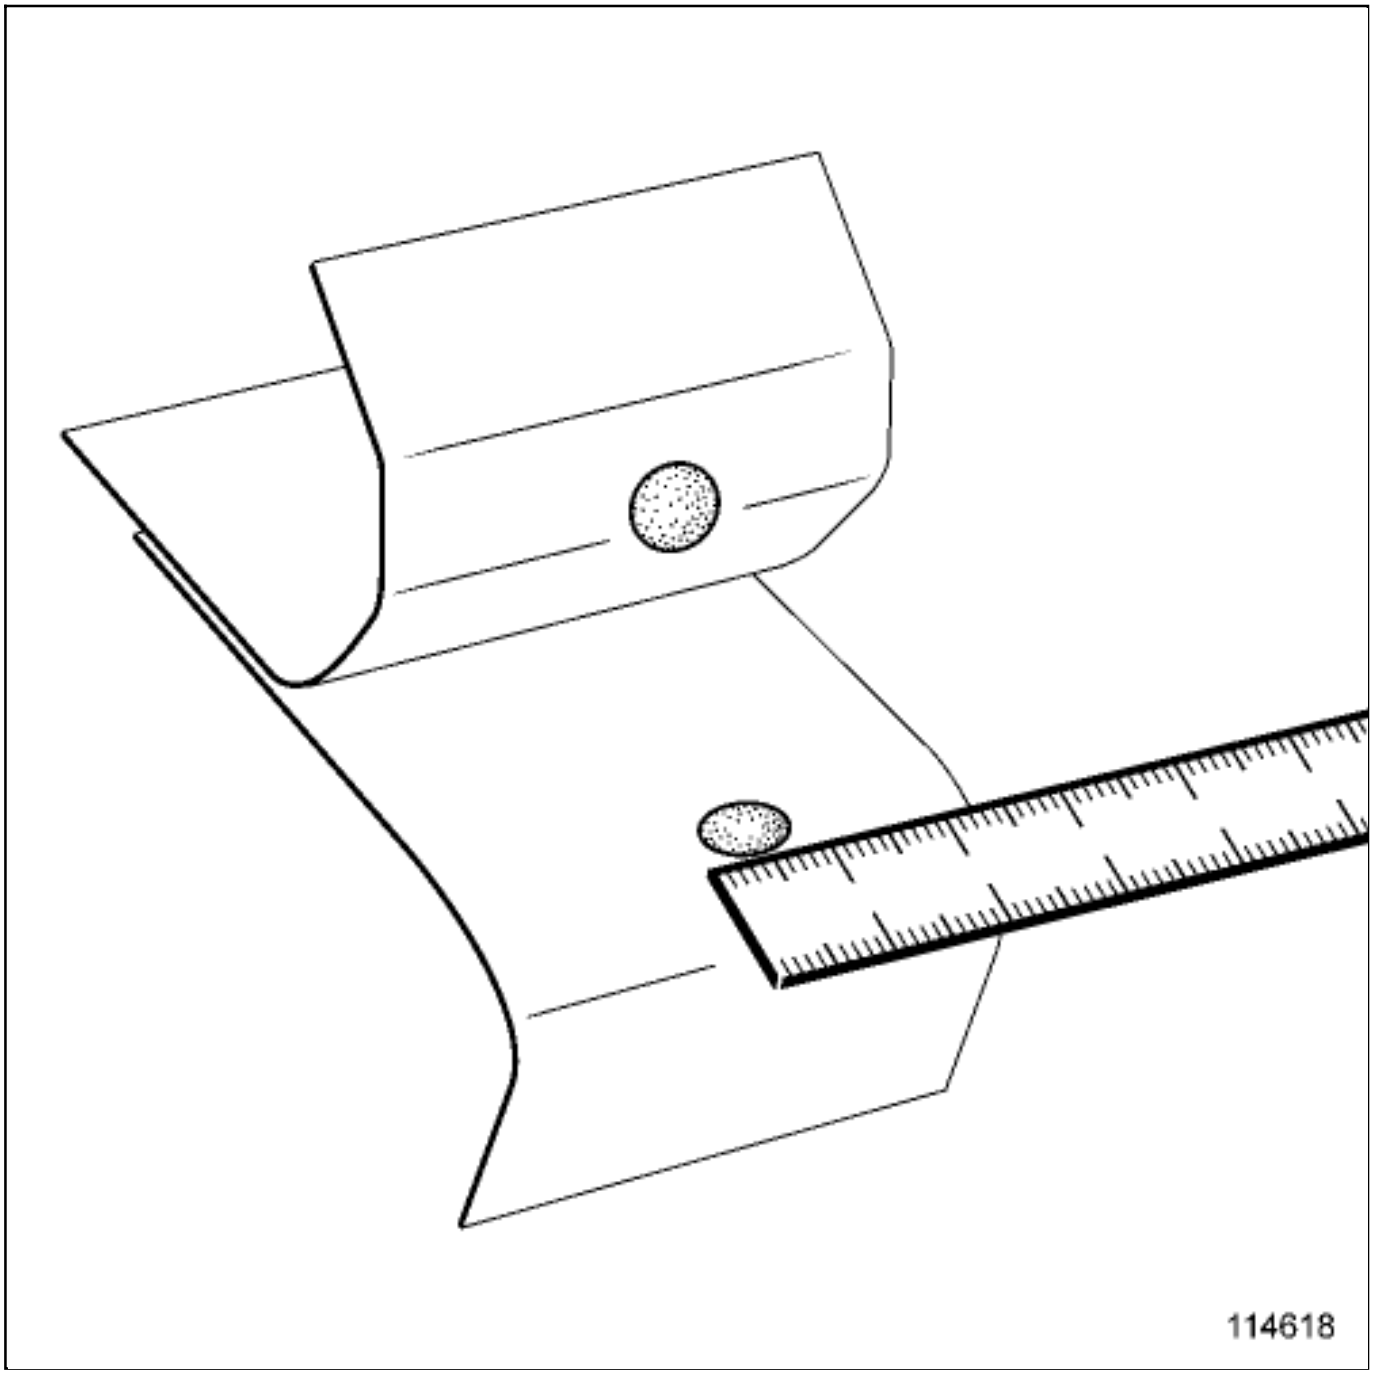
Note:

For triple-thickness assemblies, the thinnest panel on each side of the stack must always be taken into account in order to determine the right material rivet.



This test is based on the presence or absence of a material rivet after peeling of the spot weld.

1-POSSIBLE RESULTS



CEMENTED SPOT: UNACCEPTABLE

SPOT WITH MATERIAL RIVET: ACCEPTABLE, IF DIAMETER SUFFICIENT

SPOT WITH MATERIAL PULLING OFF: ACCEPTABLE, IF DIAMETER SUFFICIENT (SEE FOLLOWING TABLE)

Note:

On thick, very high/ultra high elastic limit steels, there may be no material rivet, but material pulled off at the interface; this type of spot weld is acceptable: measure the diameter of the pulled off zone and compare it to the table of values.

Check that the diameter of the material rivet meets the criteria in the following table, with regard to the reference thickness.

Thickness (thinnest panel)	Minimum diameter required
between 0.77 mm and/or equal to 1.2 mm	4 mm
between 1.2 mm and/or equal to 2 mm	6 mm
between 2 mm and/or equal to 3 mm	8 mm

2-

If the result is good:

- Apply the parameters for the joints on the vehicle,
- Carry out the vehicle tests: part IX.

If the result is incorrect (cemented spot, material rivet too small):

- Apply the remedies: part VII

7. REMEDIES

Factors leading to a poor result:

- Poor electrical and pneumatic conditions.
- The machine does not meet the required performance levels.
- Change of electrode holder.

1- ADJUSTING THE SETTINGS

If Effort cannot be guaranteed: increase Time and reduce Current.

If Current cannot be guaranteed: increase Time and reduce effort.

2- CHECKING ADJUSTMENTS

Note:

After any setting adjustments, the resistance spot weld must first be confirmed on a sample using the peeling test in section IV.

- If the result is good:
  - Apply the parameters to the vehicle,
  - Carry out the vehicle tests: part IX.
- If the result is incorrect (cemented spot, material rivet too small):
  - Apply the replacement solutions: section VIII.

8. REPLACEMENT SOLUTIONS

1- LONG TIME TABLE

If adjusting the parameters does not achieve good results, use the following table only on panelwork parts, and selectively on structural parts:

Grades	Thickness of reference panel	Current (A)	Time (ms)	Effort (daN)
Mild steel	0.7 mm	7000	600	250
	1 mm	7400	600	250
HEL steel	0.85 mm	7600	600	250
	1.5 mm	8000	600	250
Very high/ultra high elastic limit steel	1.5 mm	8600	700	250
	2.5 mm	8600	900	250

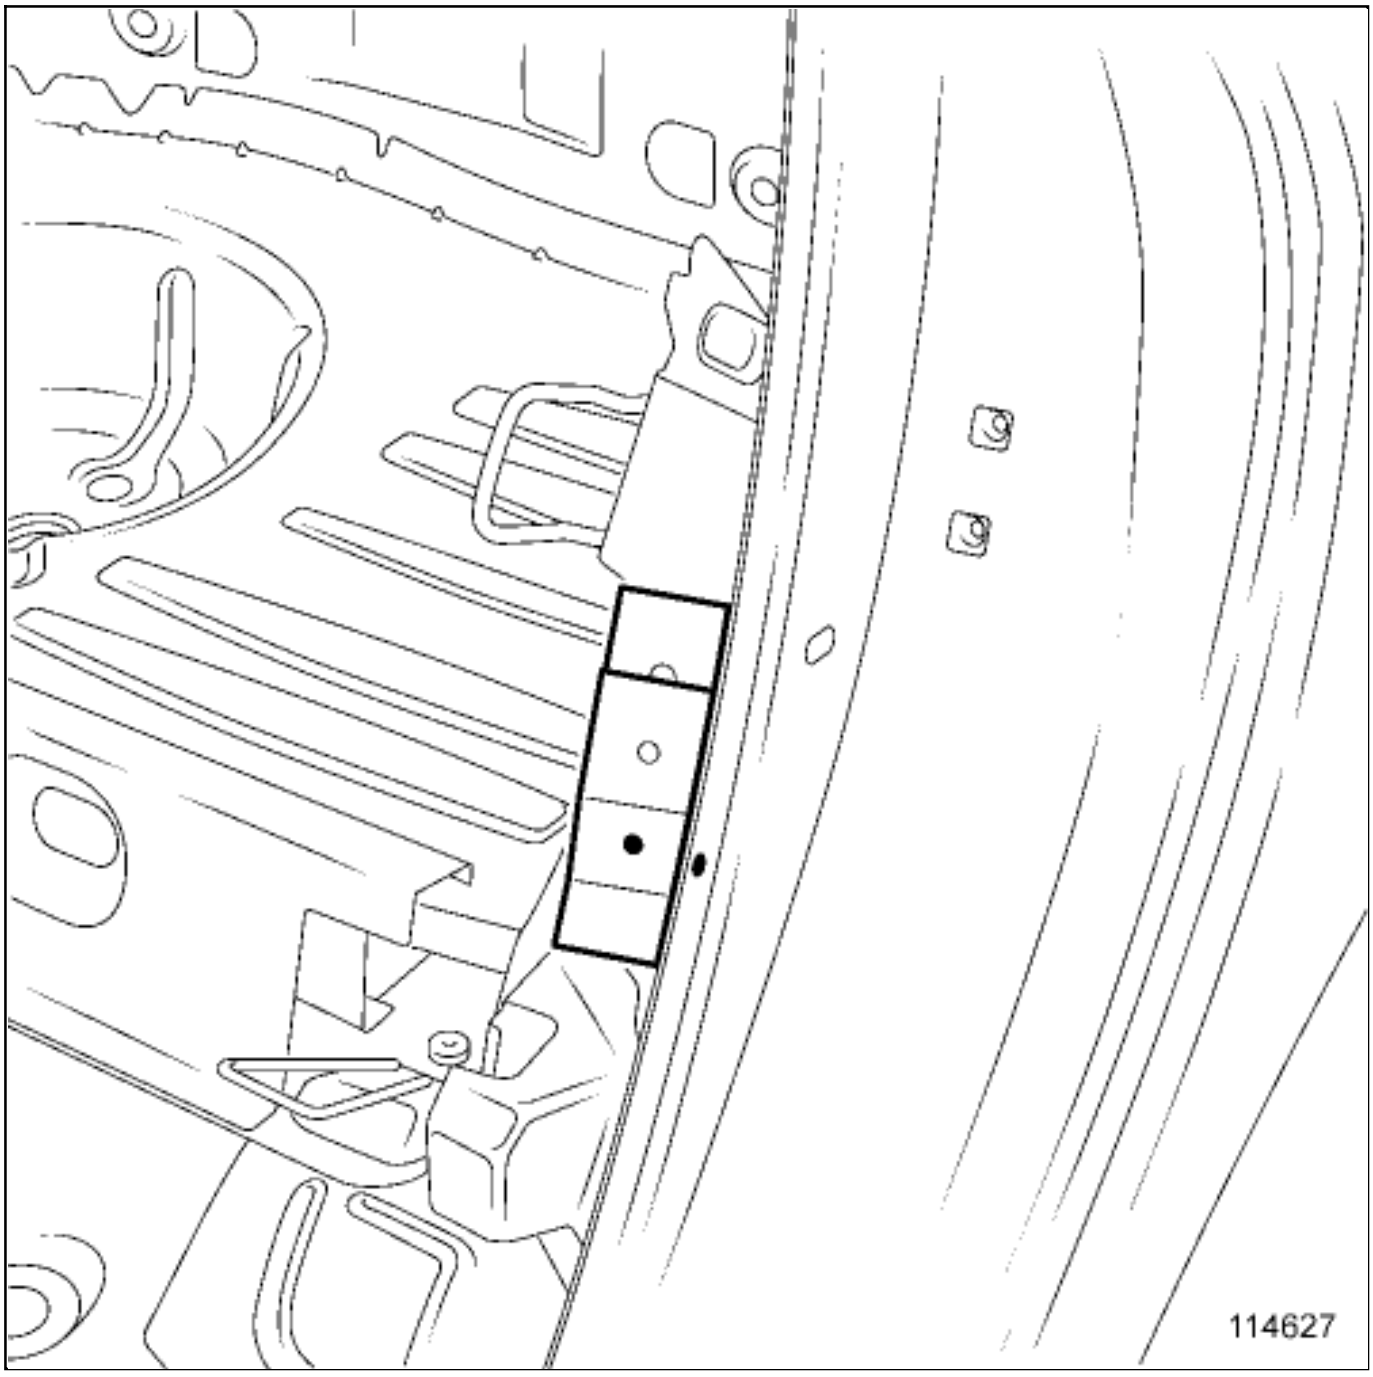
Note:

This is an exceptional case which cannot be applied generally to the whole of the repair.

In the same way as an RSW spot defined in the first chart, the RSW spot must be confirmed in advance on a sample with the peeling test from section IV.

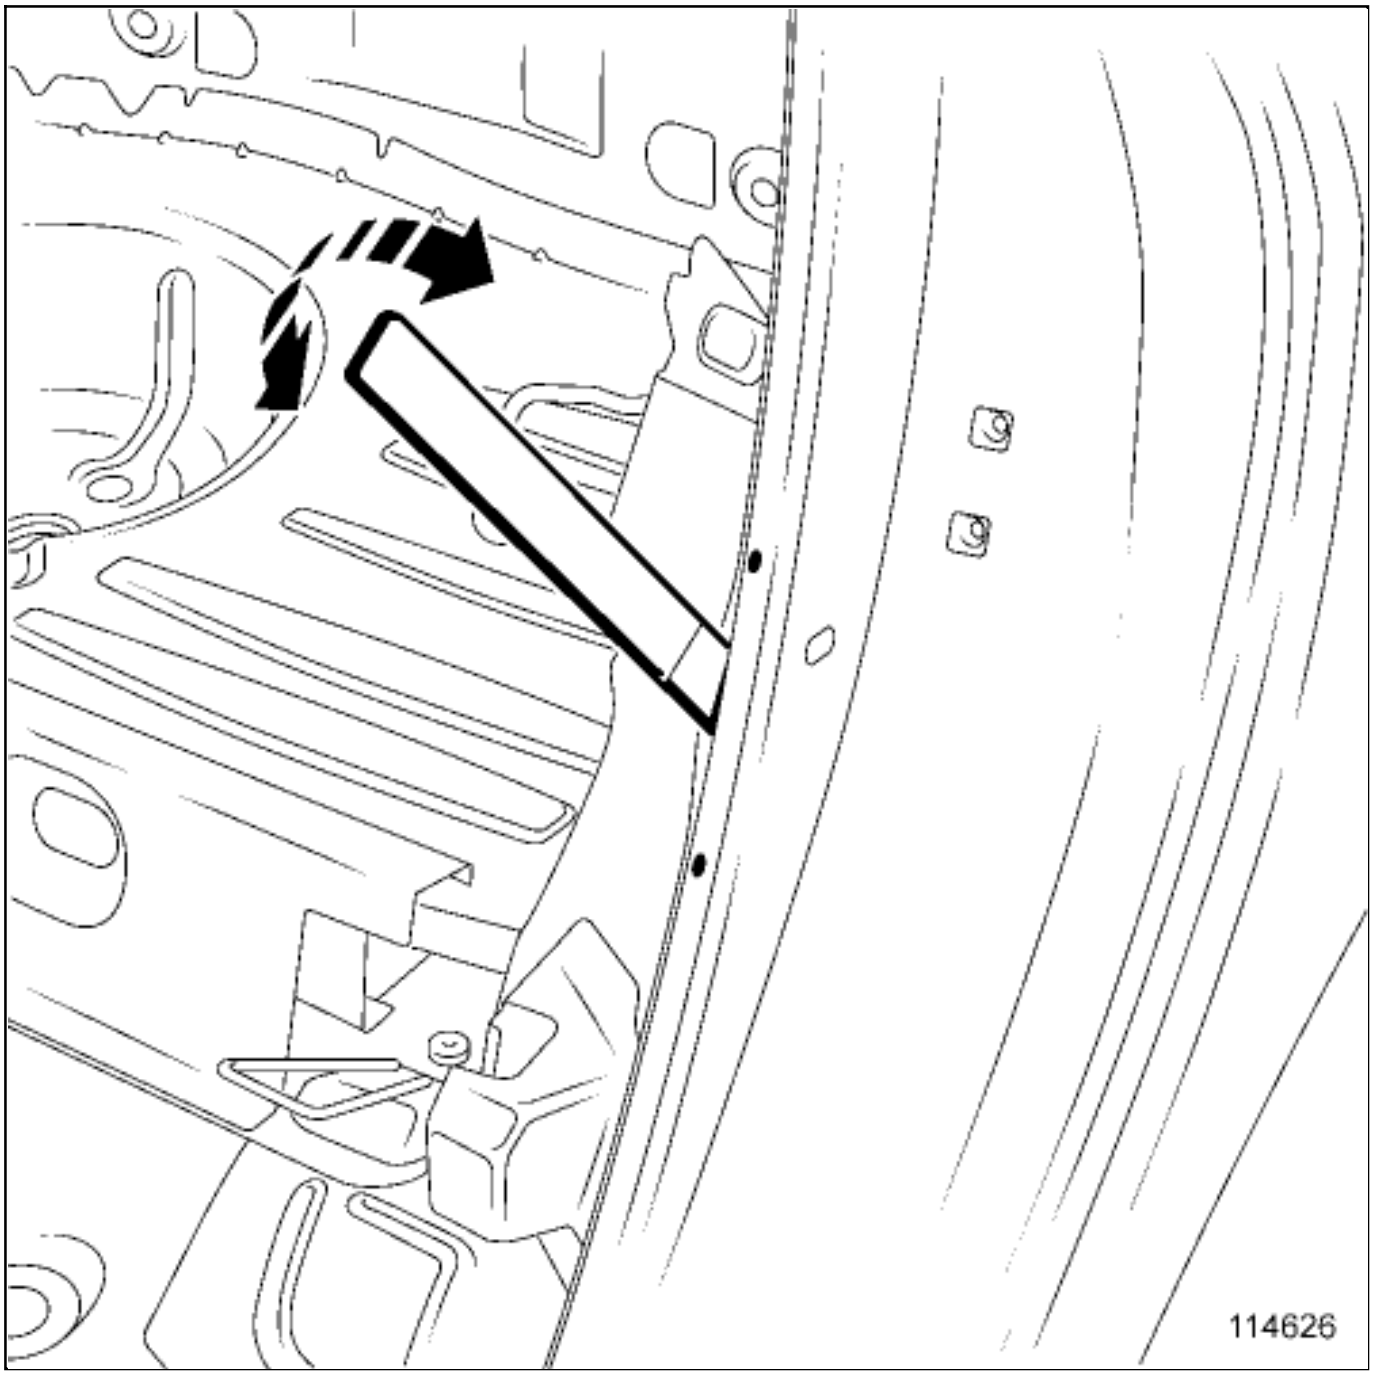
2- PLUG WELDS

If adjusting the parameters does not achieve good results, or if access is a problem, use electric welding with gas shield selectively and on all thicknesses, making plug welds.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

Note:

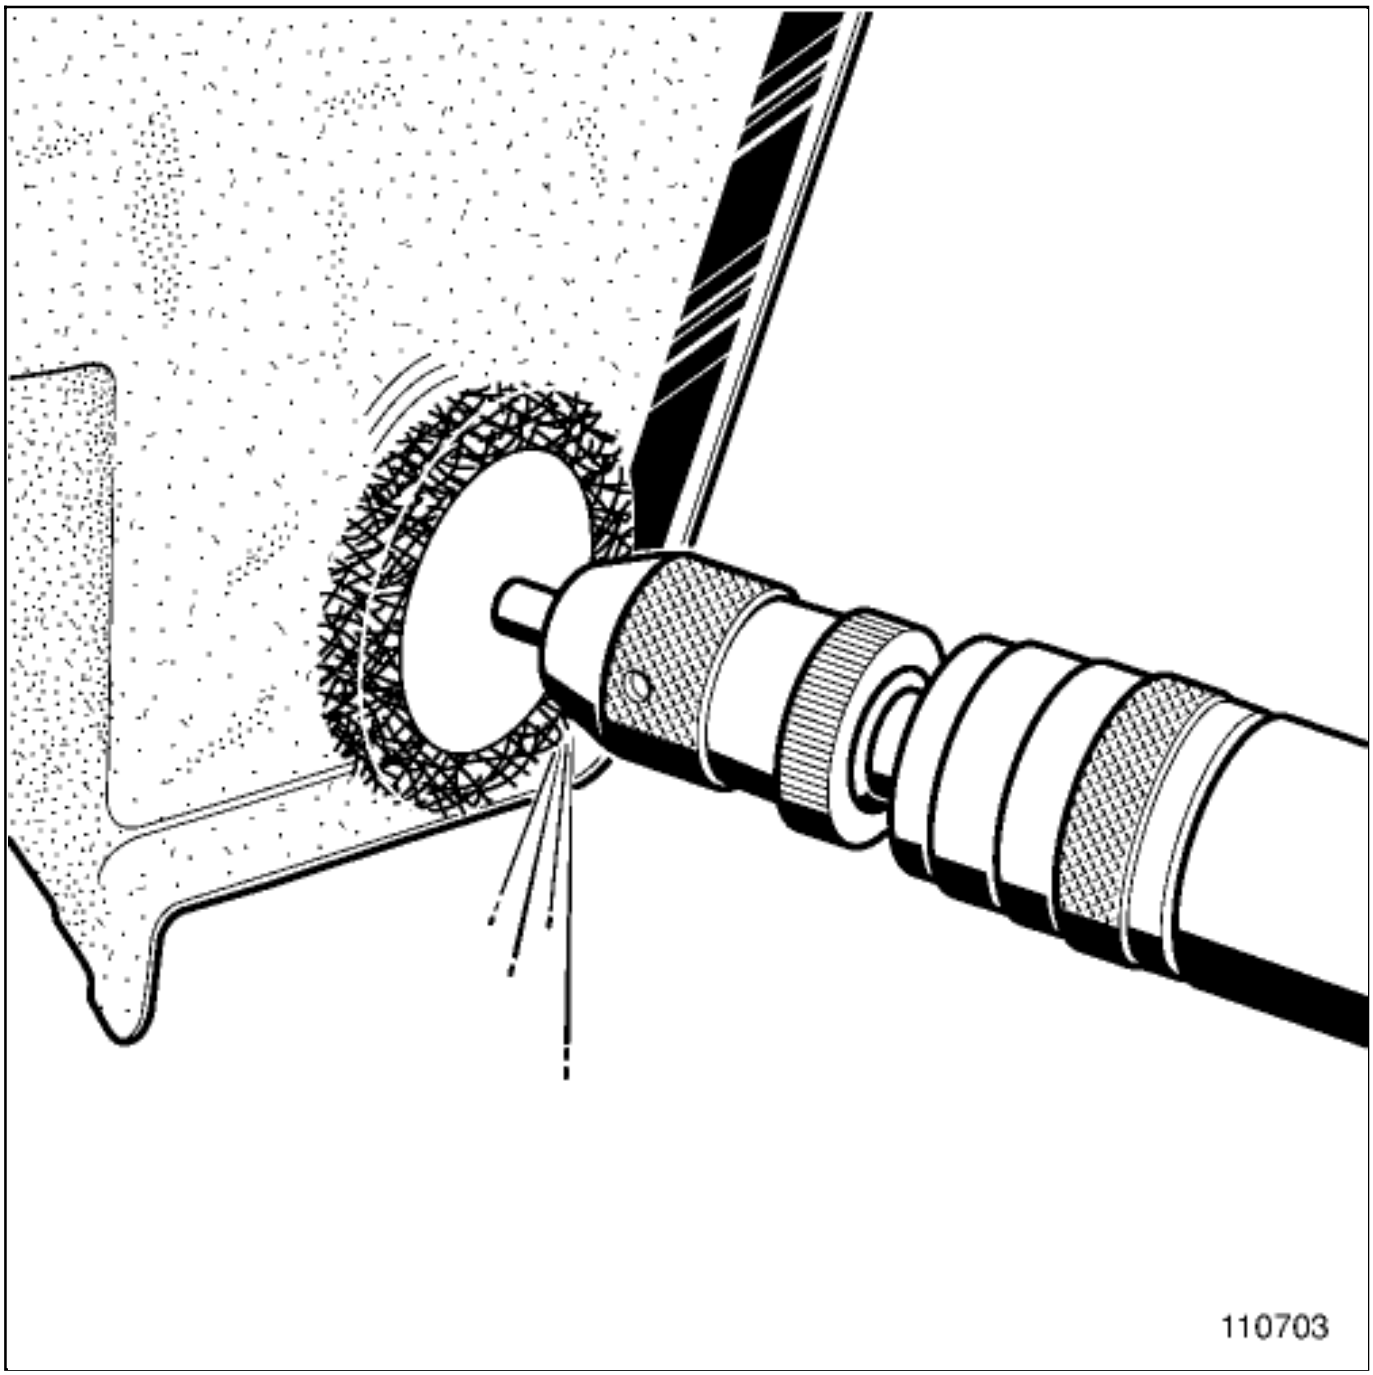


This is an exceptional case which cannot be applied generally to the whole of the repair.

In the same way as an RSW spot, a plug weld spot must be confirmed in advance on a sample with the peeling test from section IV.

9. VEHICLE TESTS

Check the external appearance of the spot on the vehicle to see if it corresponds to that on the test specimen.

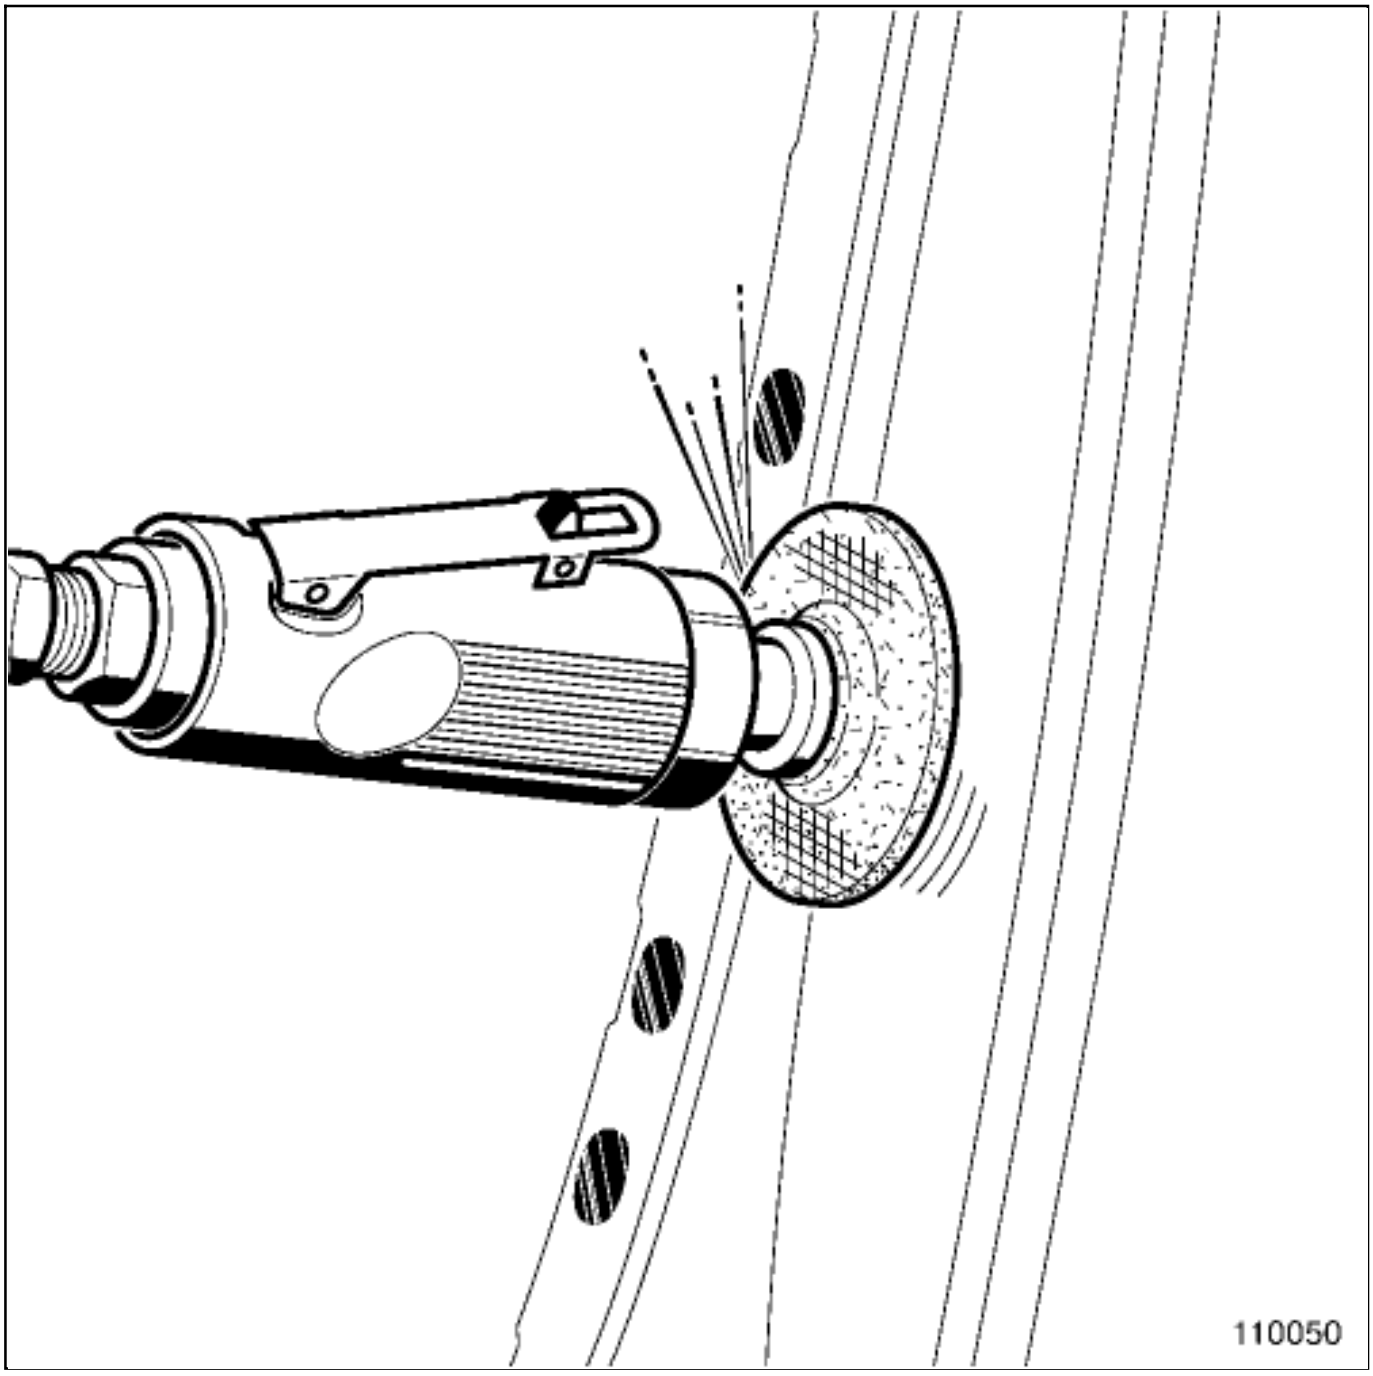


Insert a flat chisel between two spot welds to check the strength of the spots.

ELECTRICAL RESISTANCE SPOT WELDING CONNECTION WITH DIRECT ACCESS

1. DISASSEMBLY

1- SCOURING

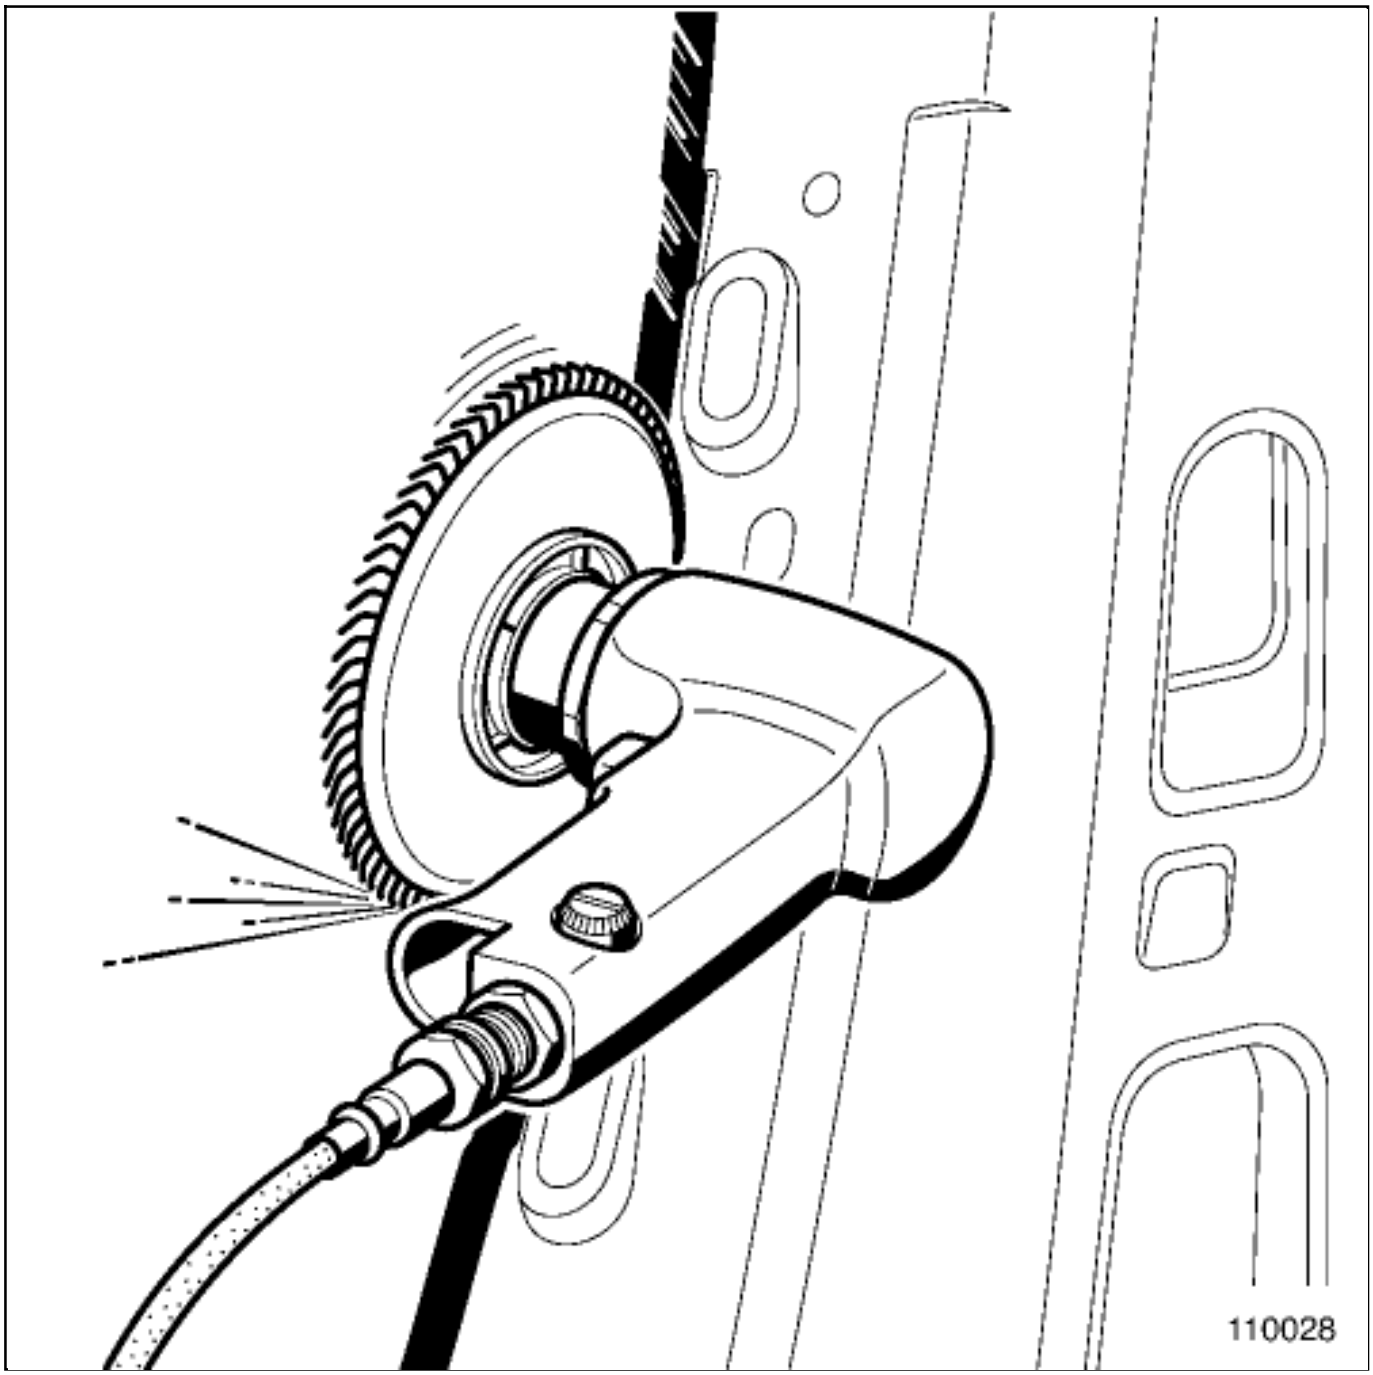


If necessary, scour the joint lines to bring out the spot welds.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- UNPICKING



Unpick the spot welds using the most appropriate tool depending on the access(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use) .

Remove the part to be replaced.

Note:

Do not strike or damage the panel.

3- GRINDING

Grind the welding residue.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

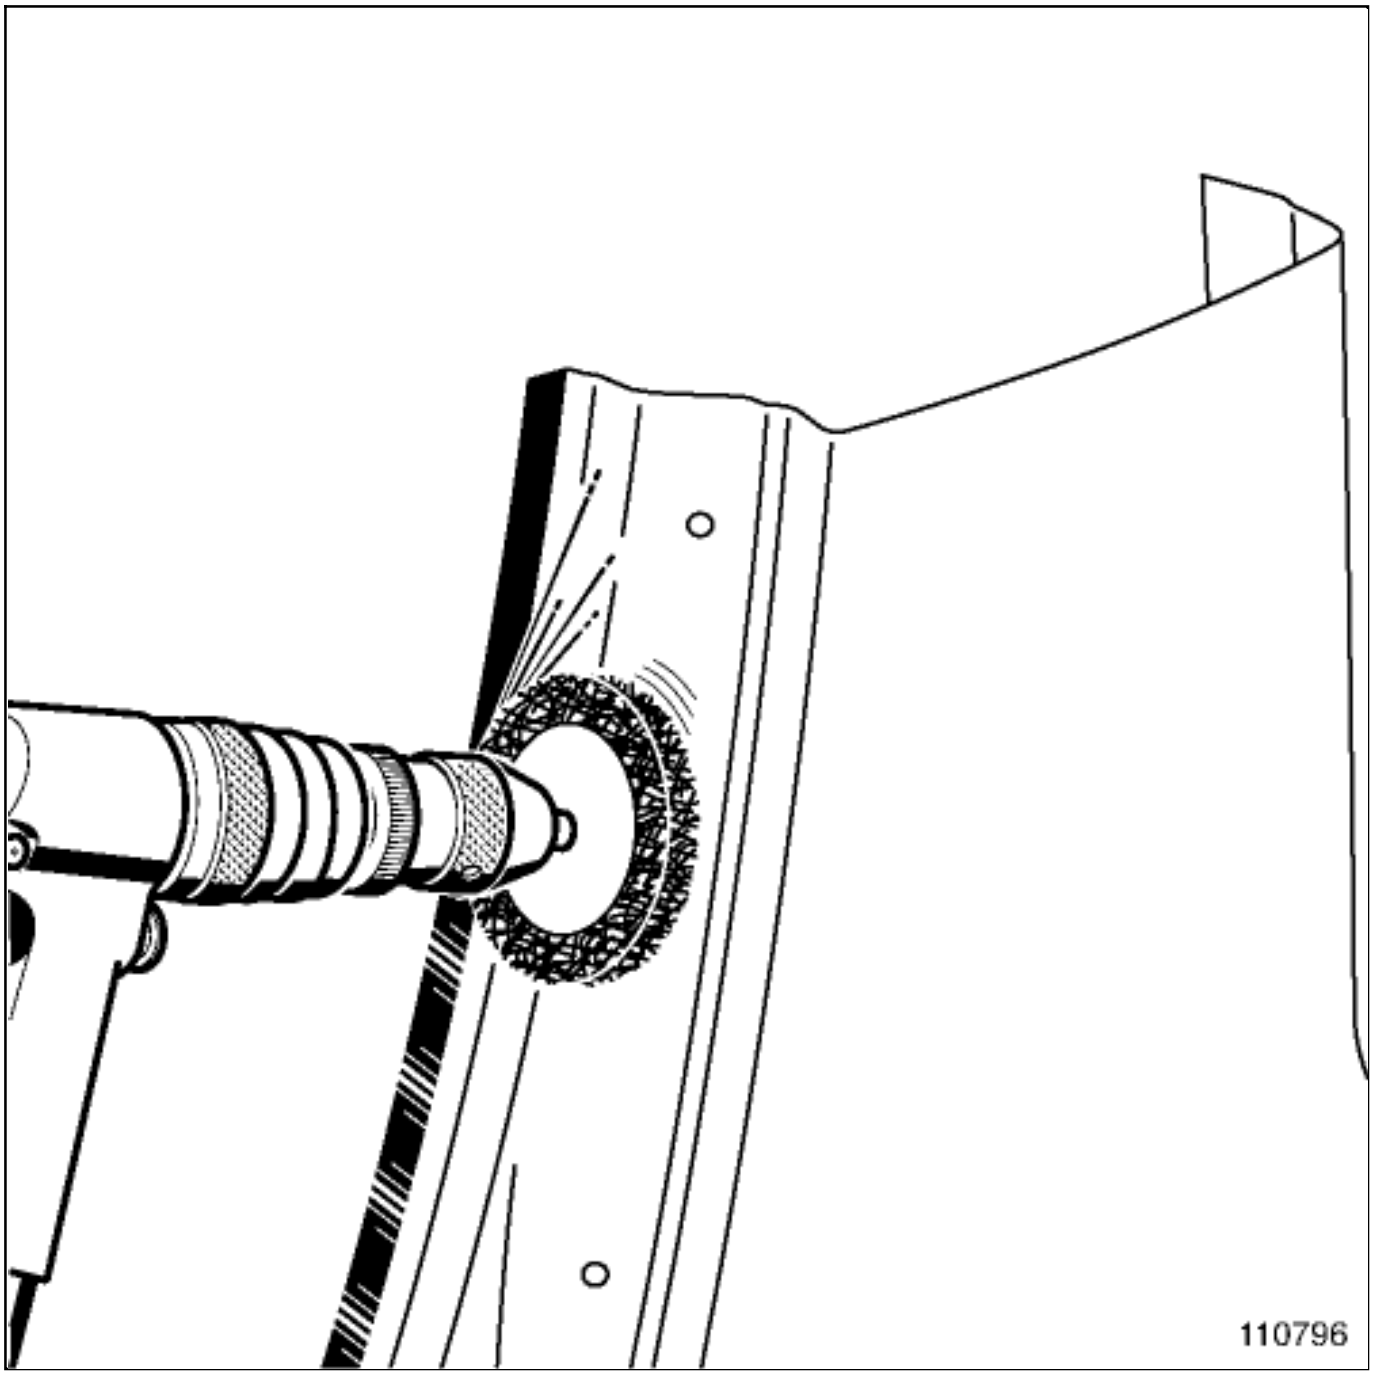
Put the support face flat so as not to penalise the joint.

2. PREPARATION BEFORE ASSEMBLY

1- POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the replacement part.

3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Scour the internal and external faces around the weld zones.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the external mating face around the weld zones.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

5- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

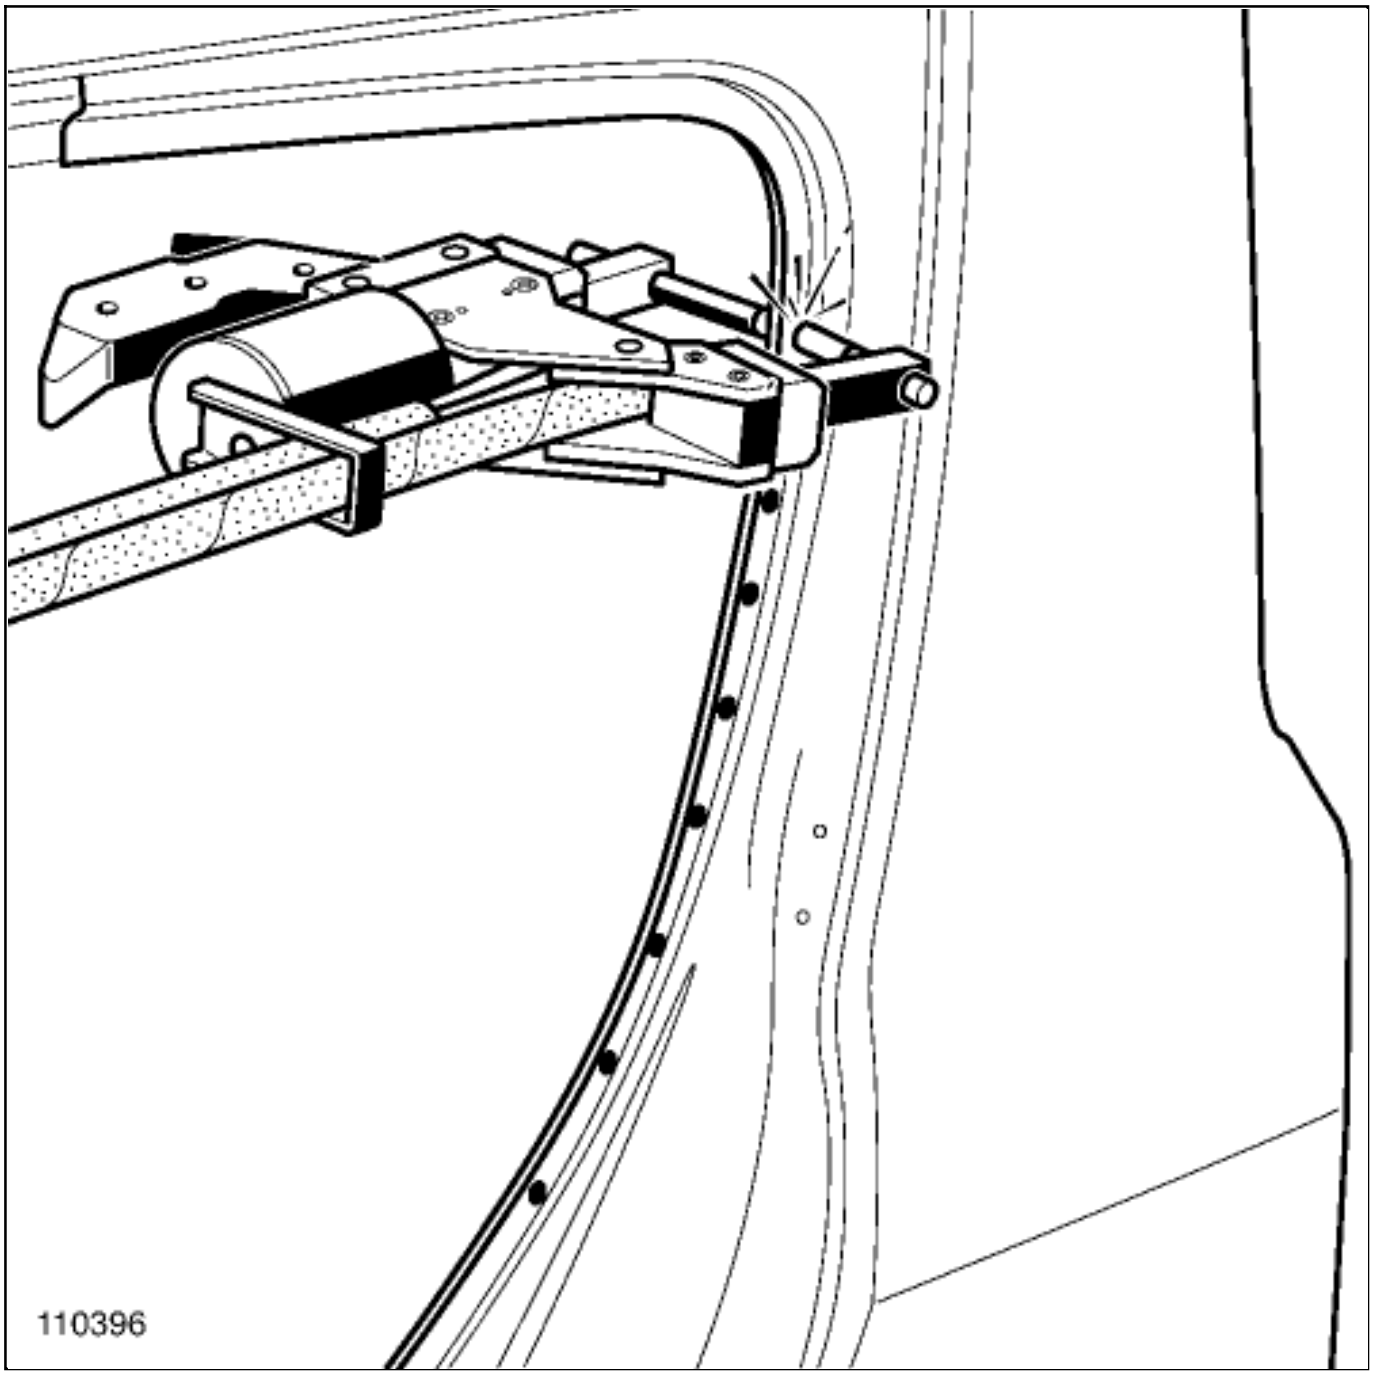
Apply the anti-corrosion protection to the internal mating faces according to the type of weld**(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)** .

3. ASSEMBLY

1- FITTING AND ADJUSTING THE REPLACED PARTS

Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- ADJUSTING THE WELDER

Before working on the vehicle, follow the procedure below:

(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection: Precautions for the repair)

3- CARRYING OUT THE WELDING

Weld the panels, holding the electrodes perpendicular to the joint surface.

4- FINISHING

There is no particular finish to be carried out on this type of weld; it must look the same as the original.

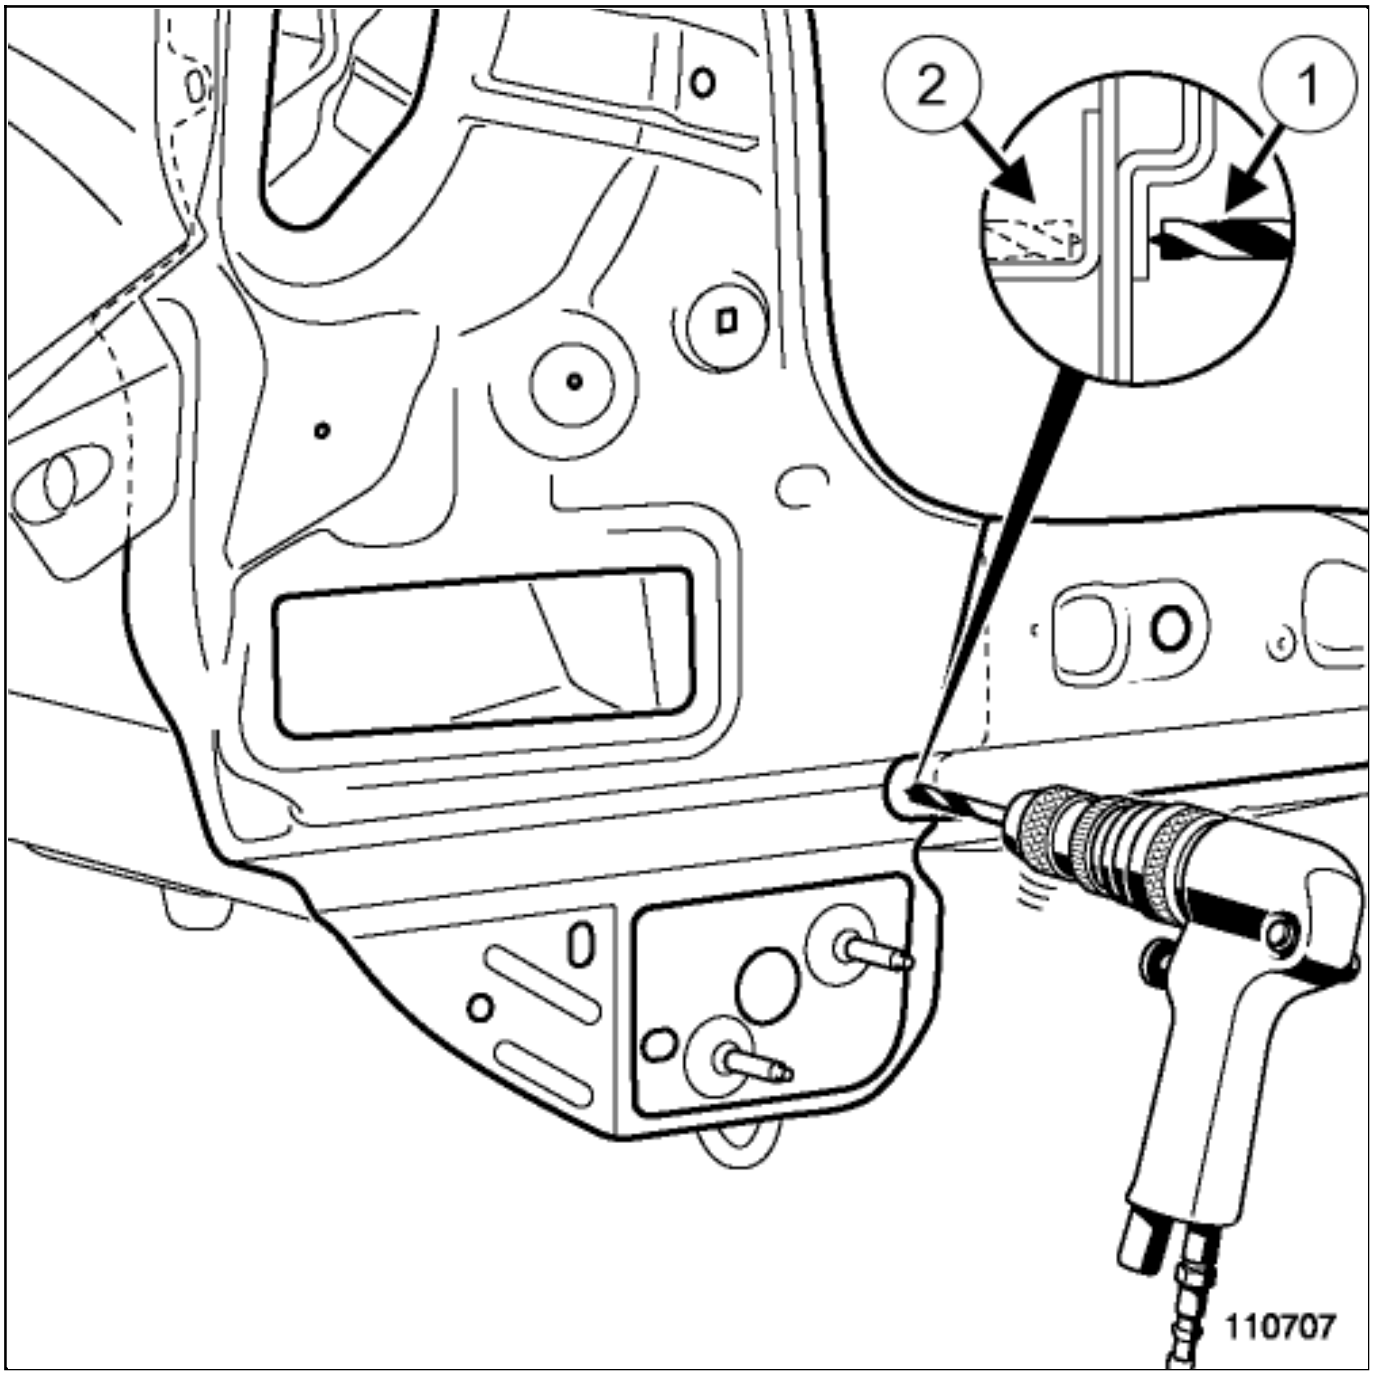
ELECTRICAL RESISTANCE SPOT WELDING CONNECTION WITH FOUR THICKNESSES

Note, one or more warnings are present in this procedure

Note:

Original welding on four thickness types is very rare. When it exists, it is only the consequence of an assembly problem. Often the panels in the stack are welded two by two and the connection between the inner panels is not done.

1. DISASSEMBLY



1- SCOURING

If necessary, scour the joint lines to make the spot weld appear on both sides of the joint.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- UNPICKING

Unpick the spot welds on each side(1) and (2) of the assembly.

Remove the damaged part.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Note:

Use a hardened steel bit to preserve the retained panels.

3- GRINDING

Level off the weld residue on the two faces(1) and (2) .

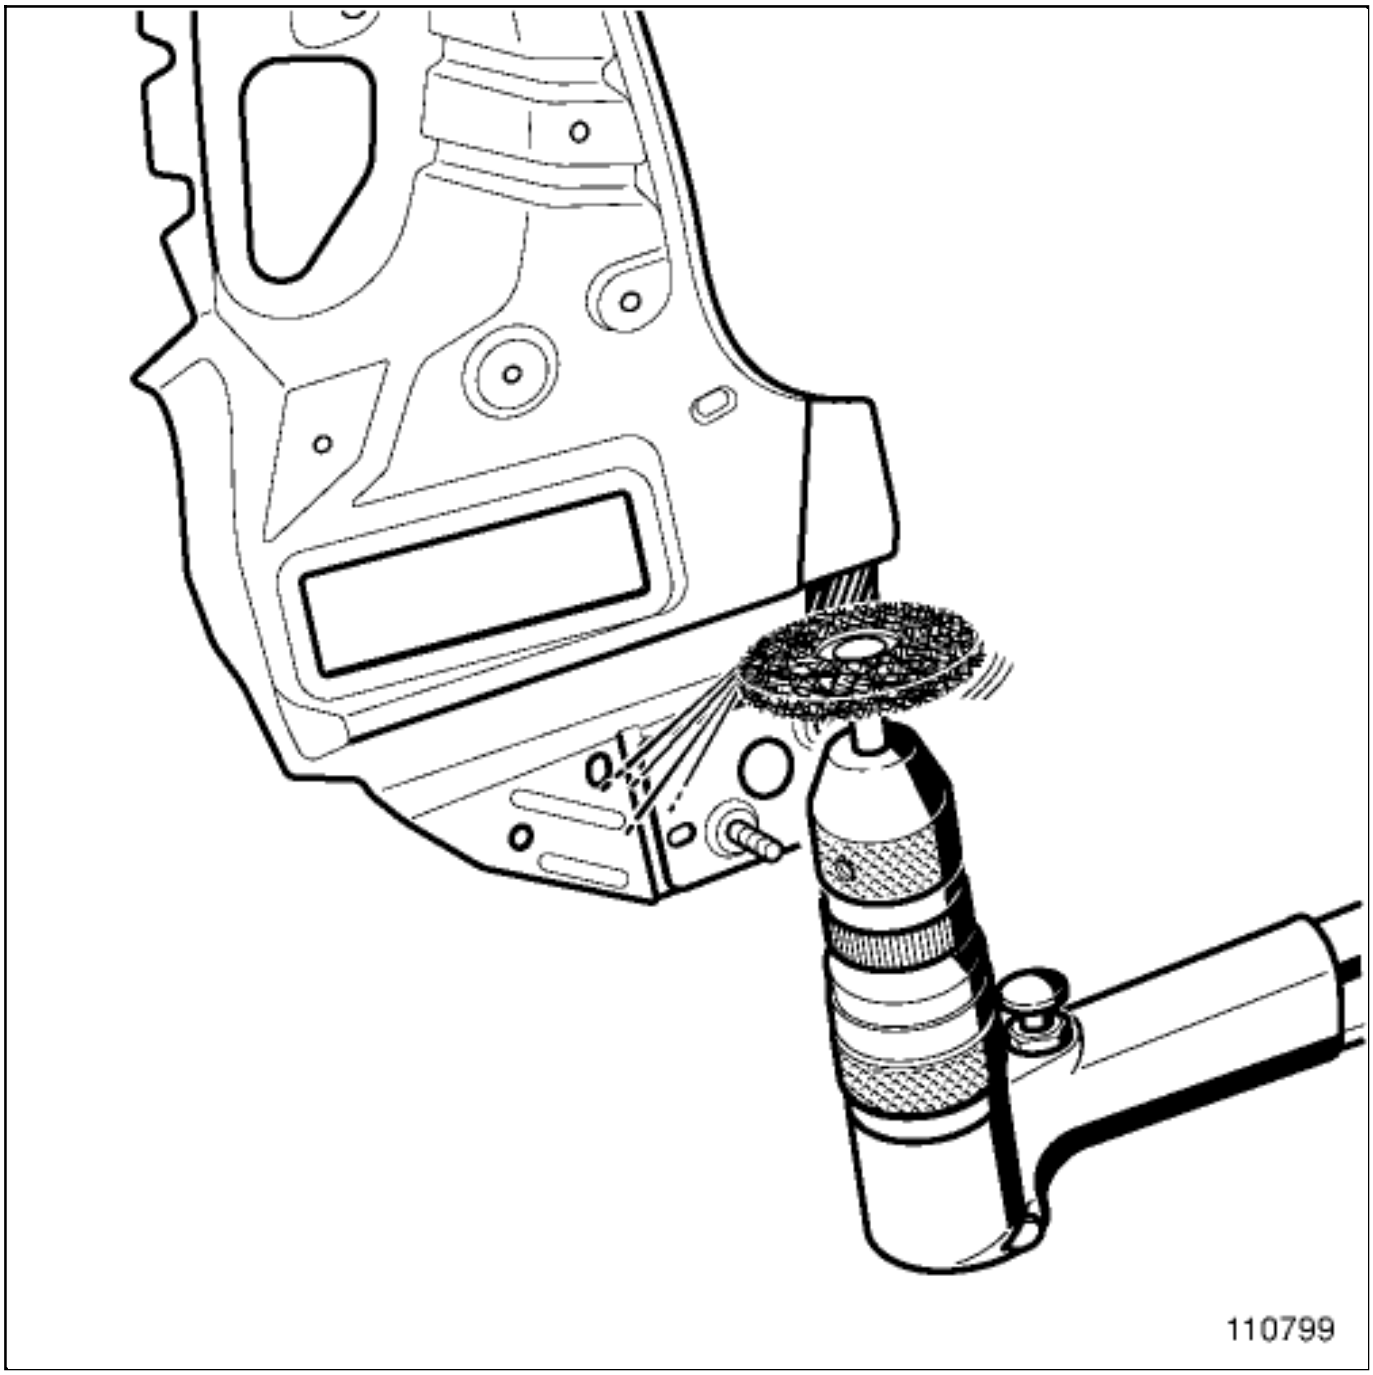
(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

2. PRESENTATION BEFORE ASSEMBLY

1- ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

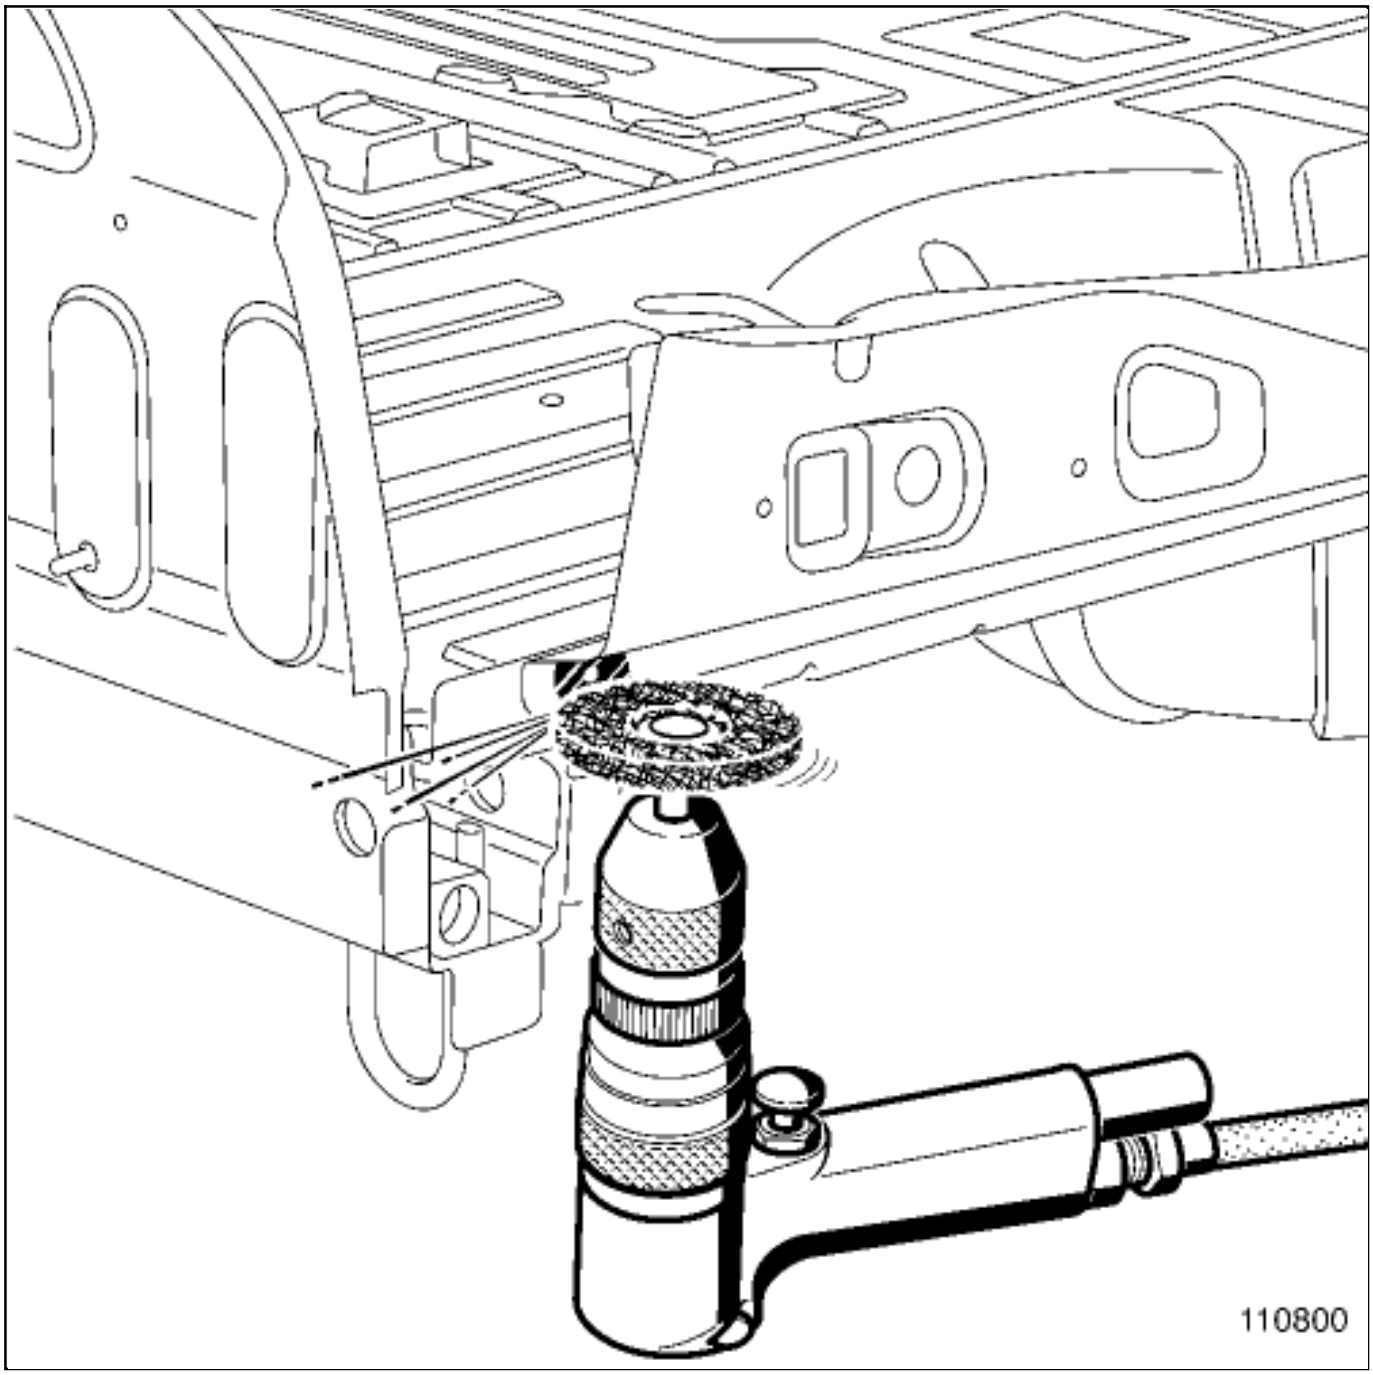


(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas, around the drilling holes.

Remove the replacement part.



3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Scour the two mating faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the two mating faces.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

5- APPLY THE PROTECTION BEFORE ASSEMBLY

Fit the sound insulation inserts into the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld.

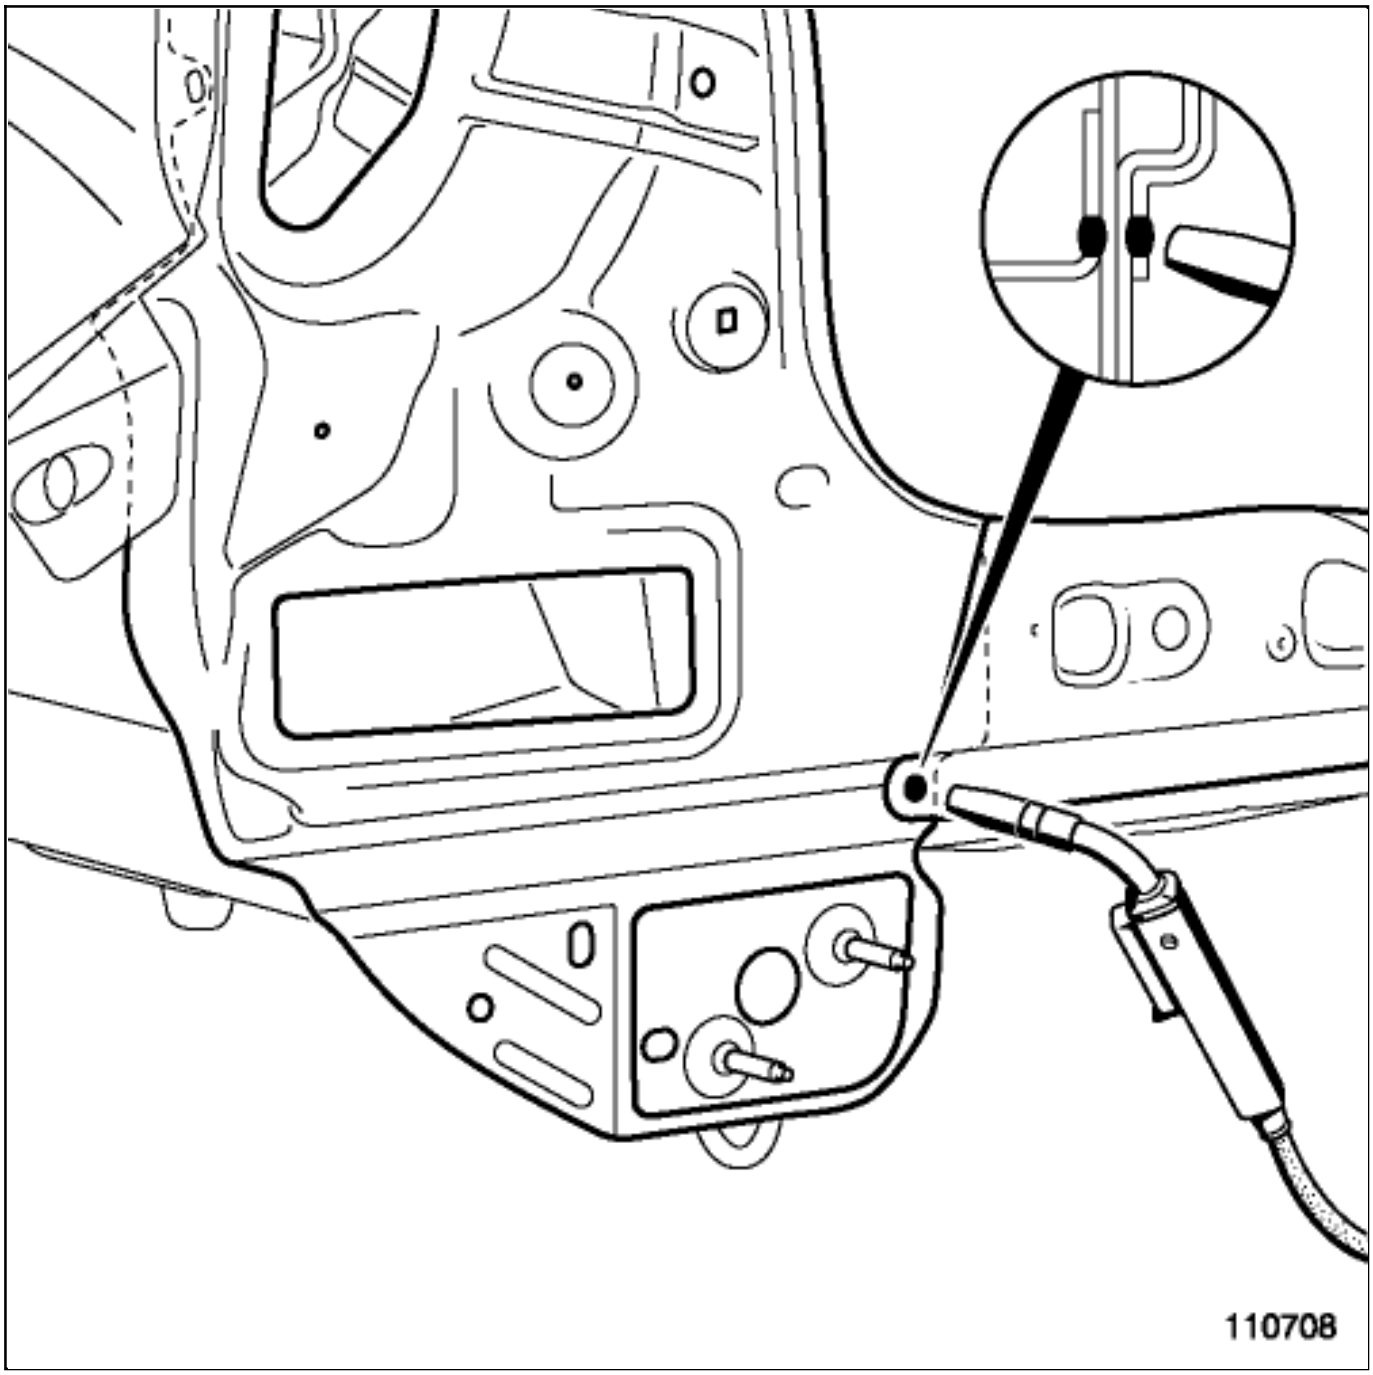
(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3. ASSEMBLY

1- FITTING AND ADJUSTING THE REPLACED PARTS

Reposition the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

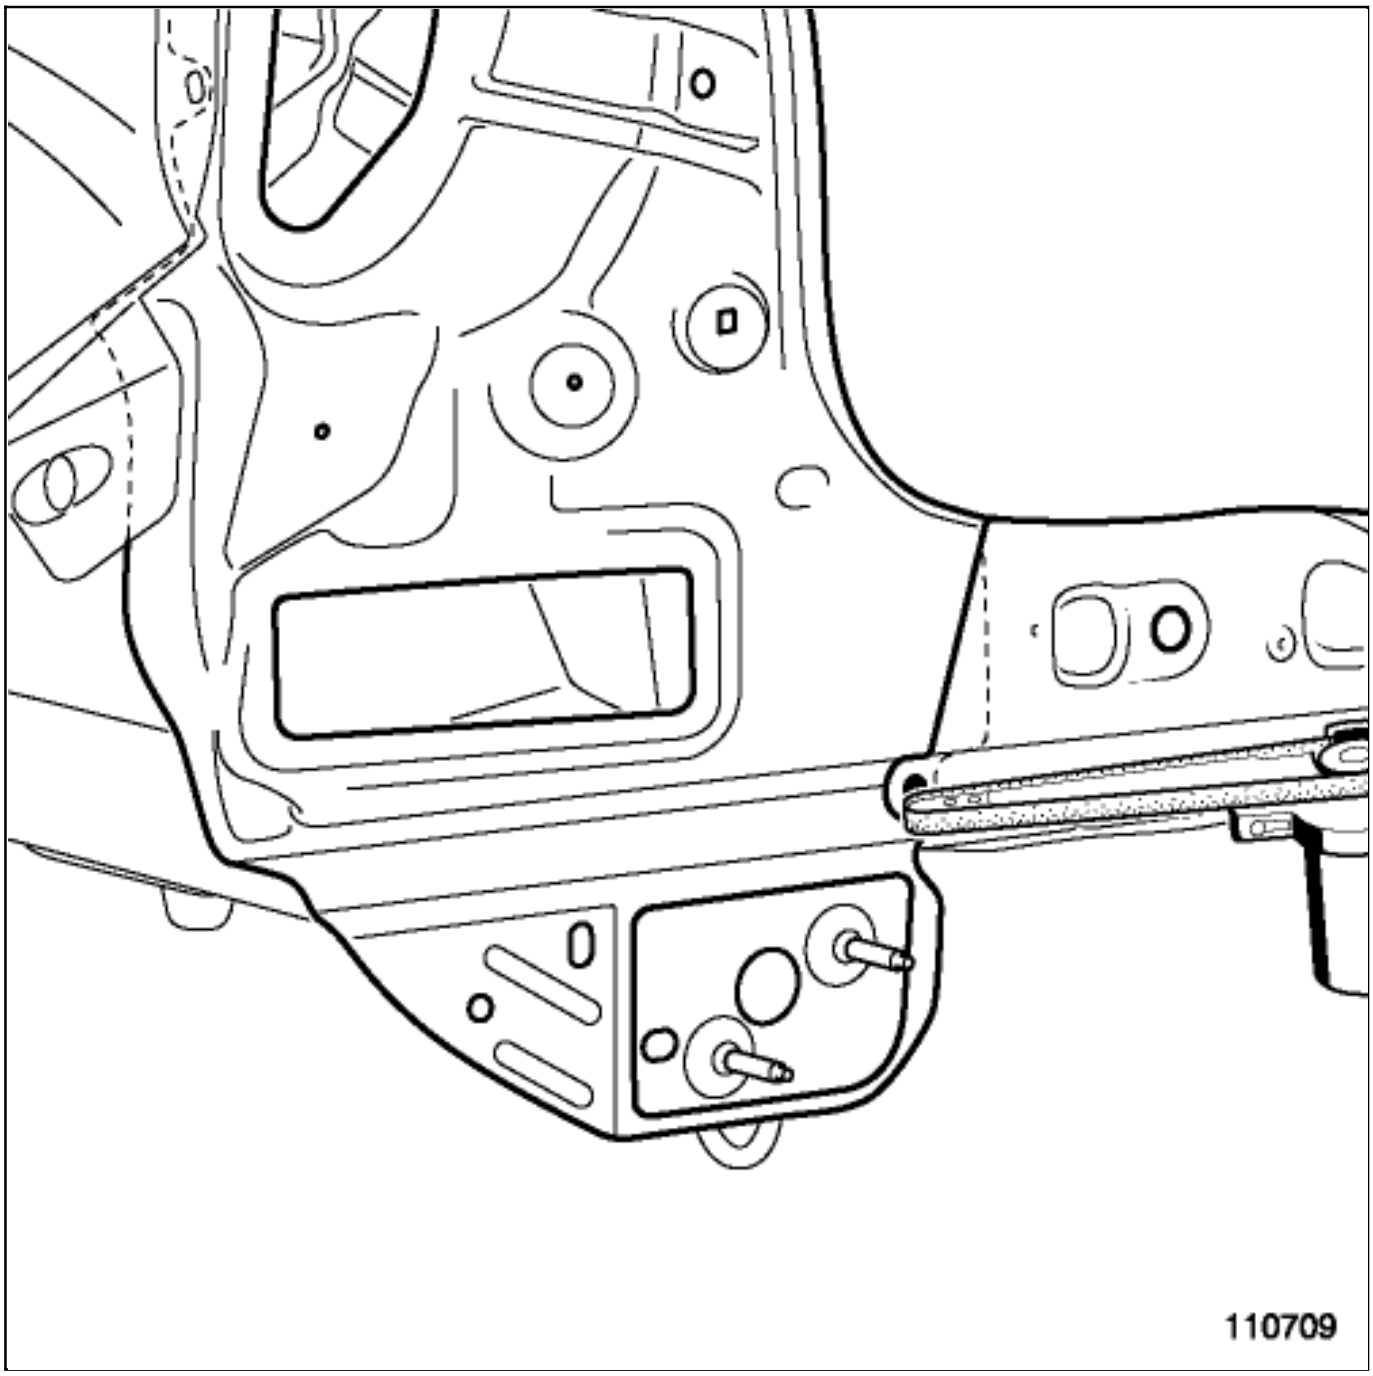
2- ADJUSTING THE WELDER

GMAW joint

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

3- CARRYING OUT THE WELDING

Do the plug welds.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the welding machine earth as close as possible to the weld zone (see MR 400).

4- FINISHING

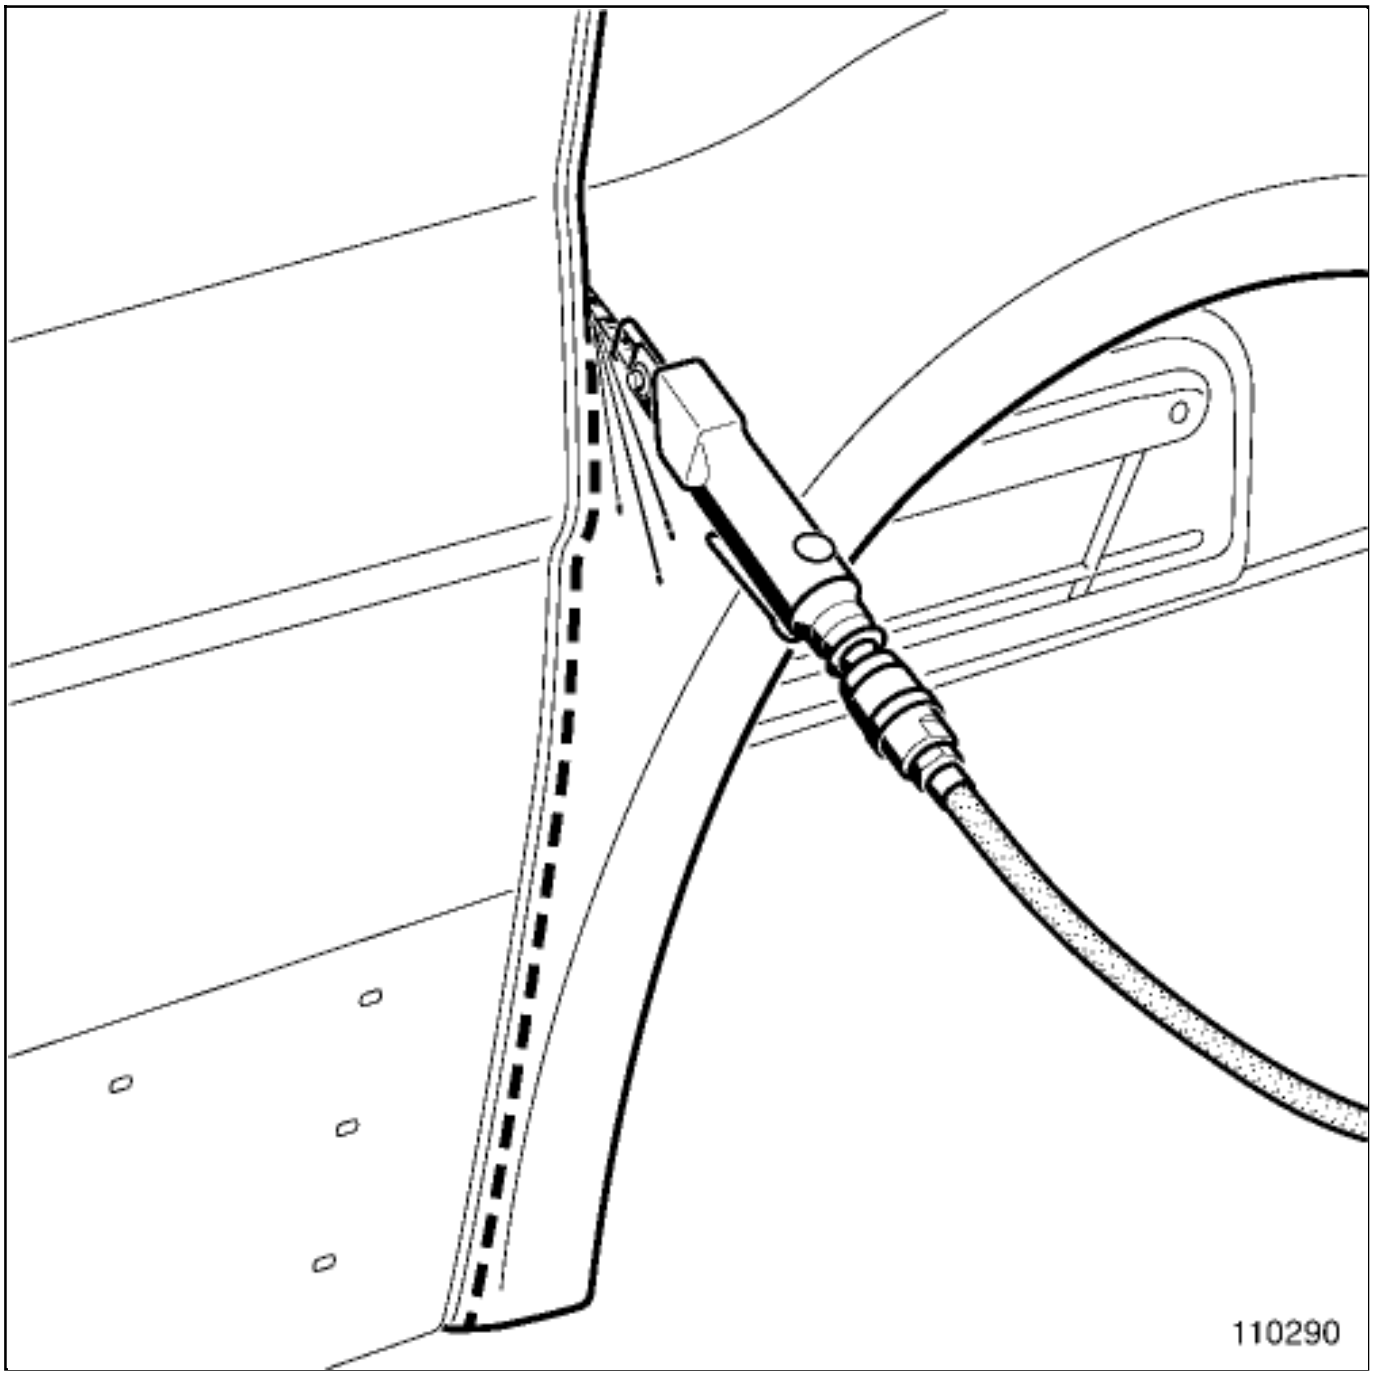
Grind the plug welds.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the shaving residue.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

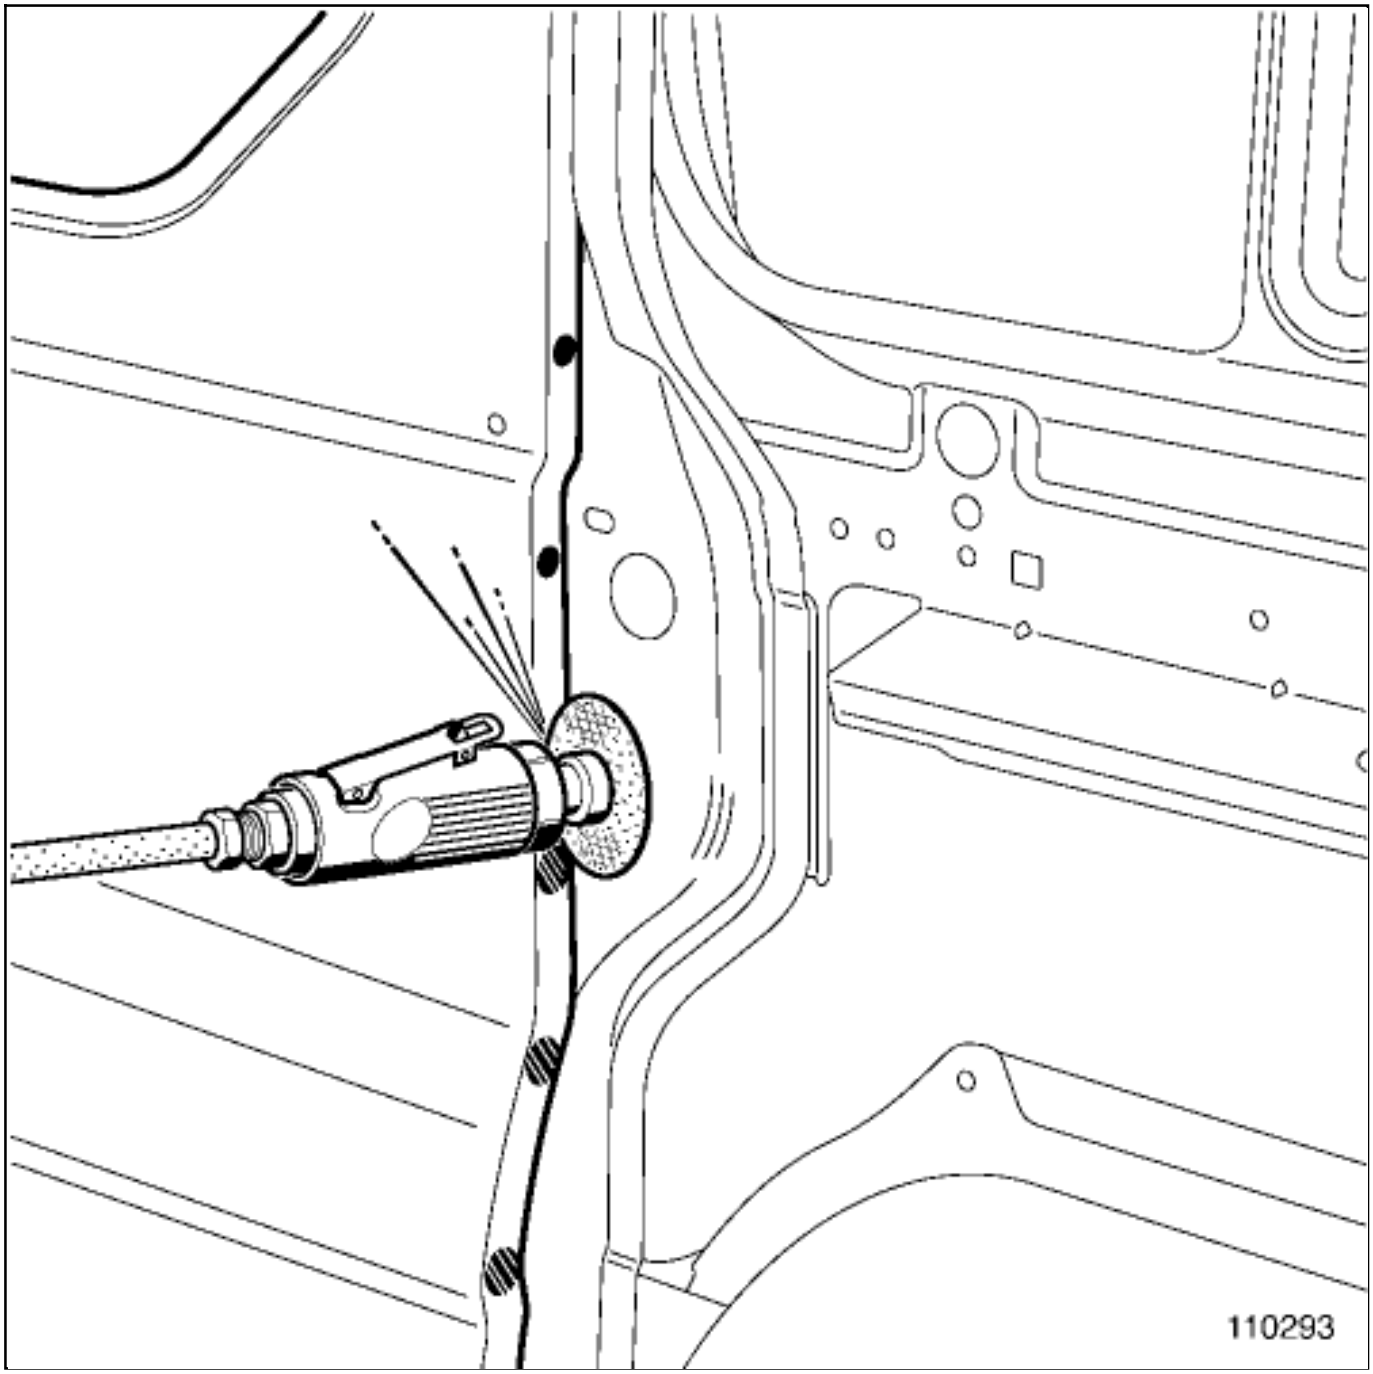


Do not strike or damage the panel.

ELECTRICAL RESISTANCE SPOT WELDING CONNECTION WITH INDIRECT ACCESS

Note, one or more warnings are present in this procedure

1. DISASSEMBLY

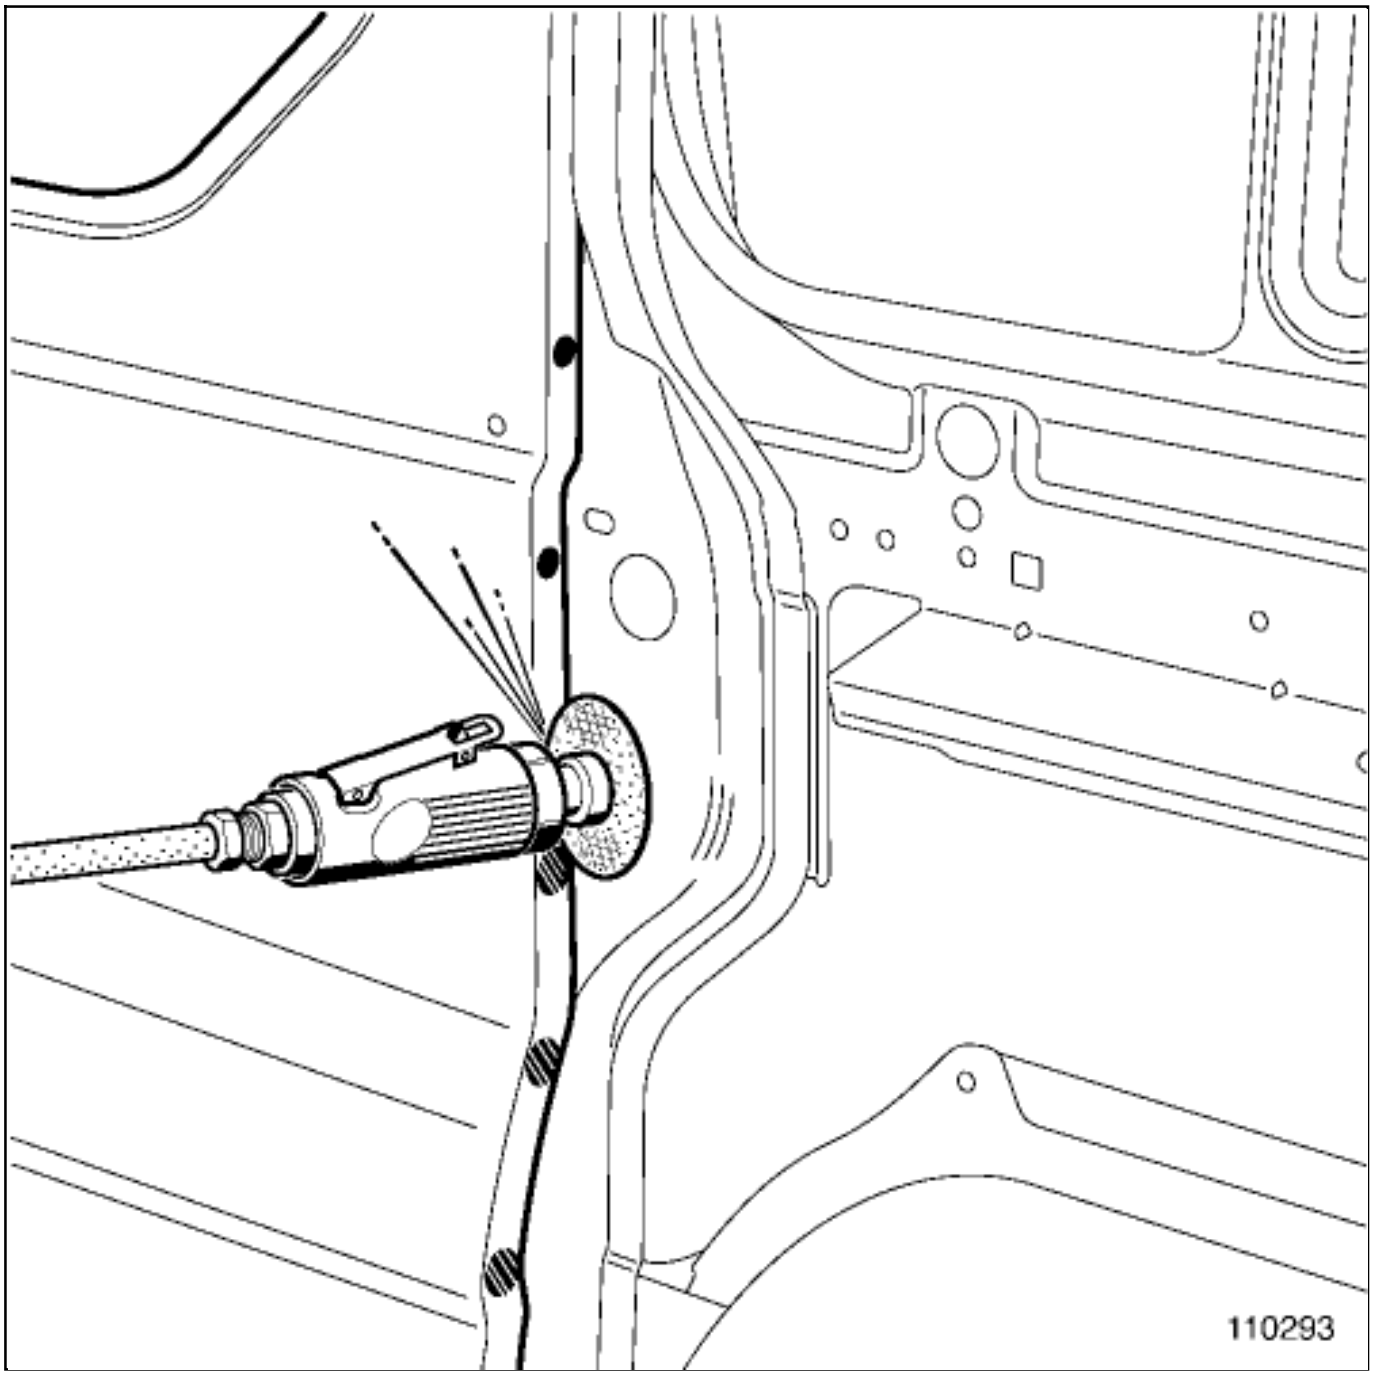


1- CUTTING

Precut the damaged part or remove the part(s) preventing access to the joint.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

2- UNPICKING



Unpick the spot welds, as in direct access.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the remaining part of the damaged part.

3- GRINDING

Grind the unpicking residue.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the joint.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

2. TYPES OF JOINT

There are three types of joints to replace an indirect access resistance welded joint:

- Bonded Joint,
- GMAW joint by bead of chain weld,
- GMAW joint by plug welds.

3. BONDED JOINT

1- PREPARATION BEFORE ASSEMBLY

1)POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it using the locking pliers.

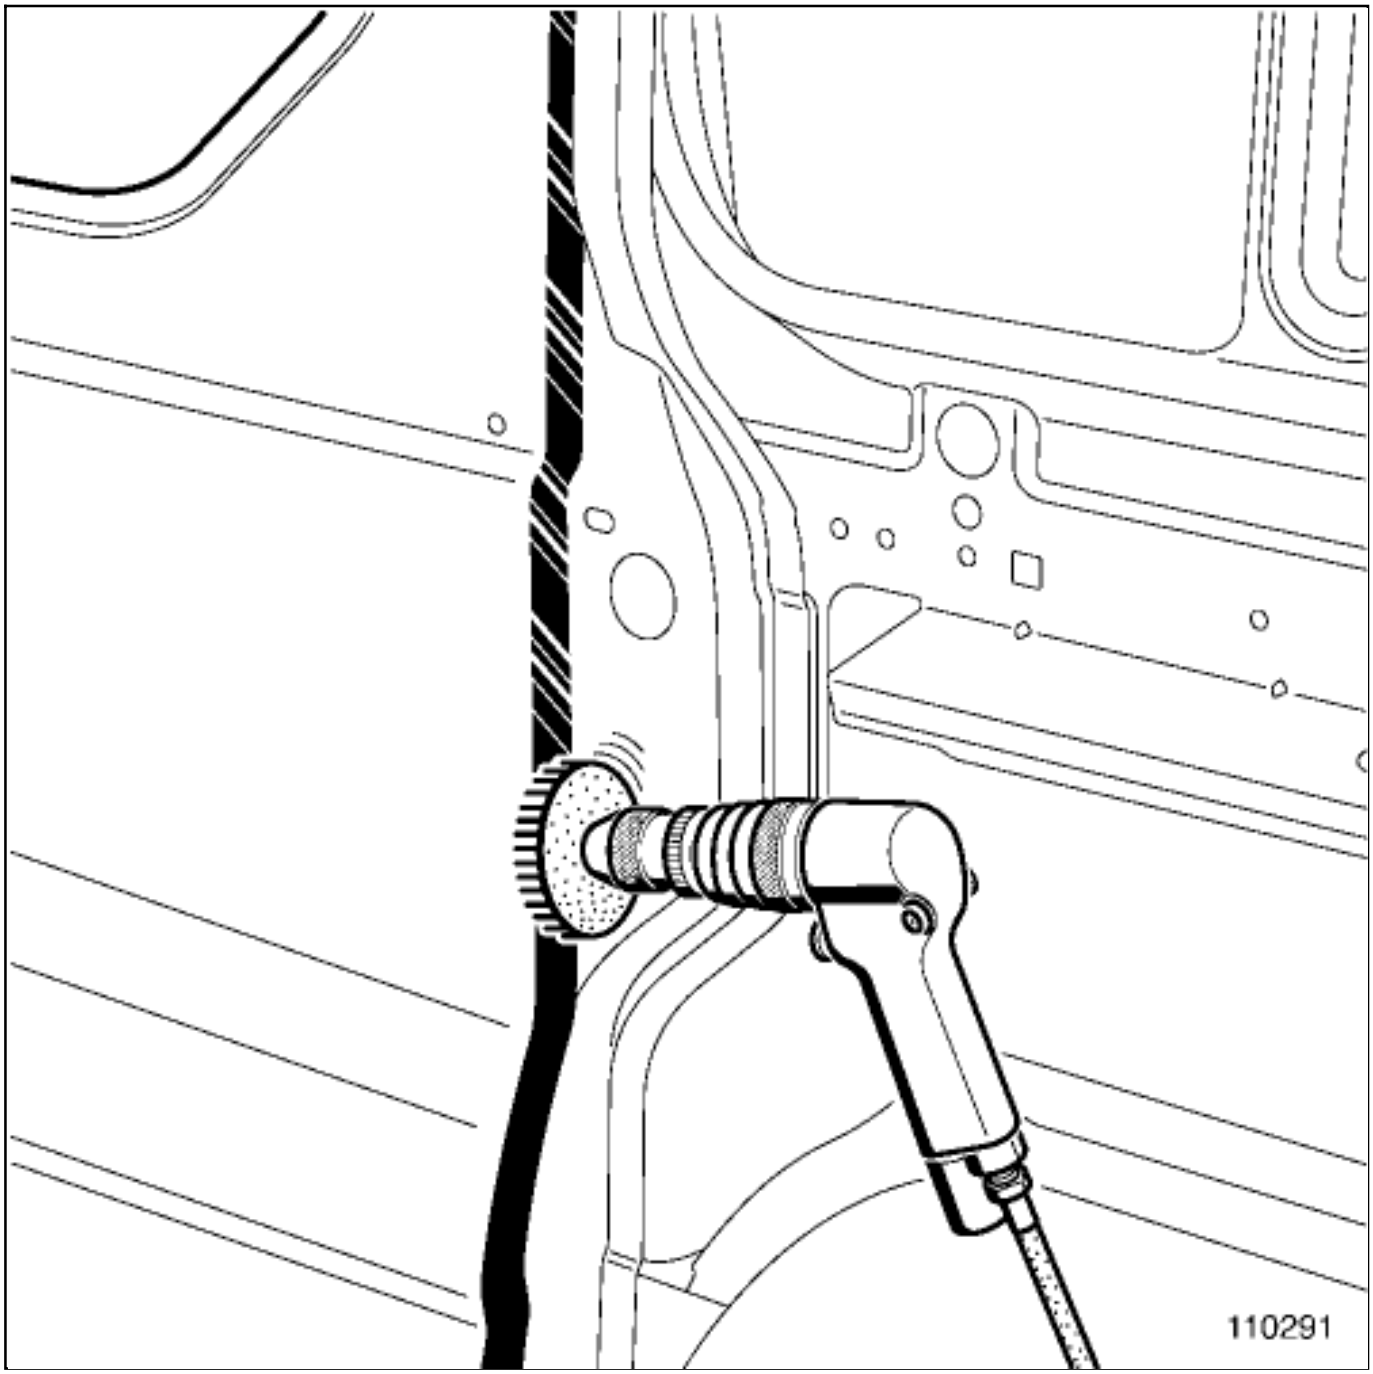
If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2)MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the part.



3)PREPARING THE MATING FACES ON THE REPLACEMENT PART

Sand the internal joint of the areas to be bonded with P320sand paper or using a sanding disc, without

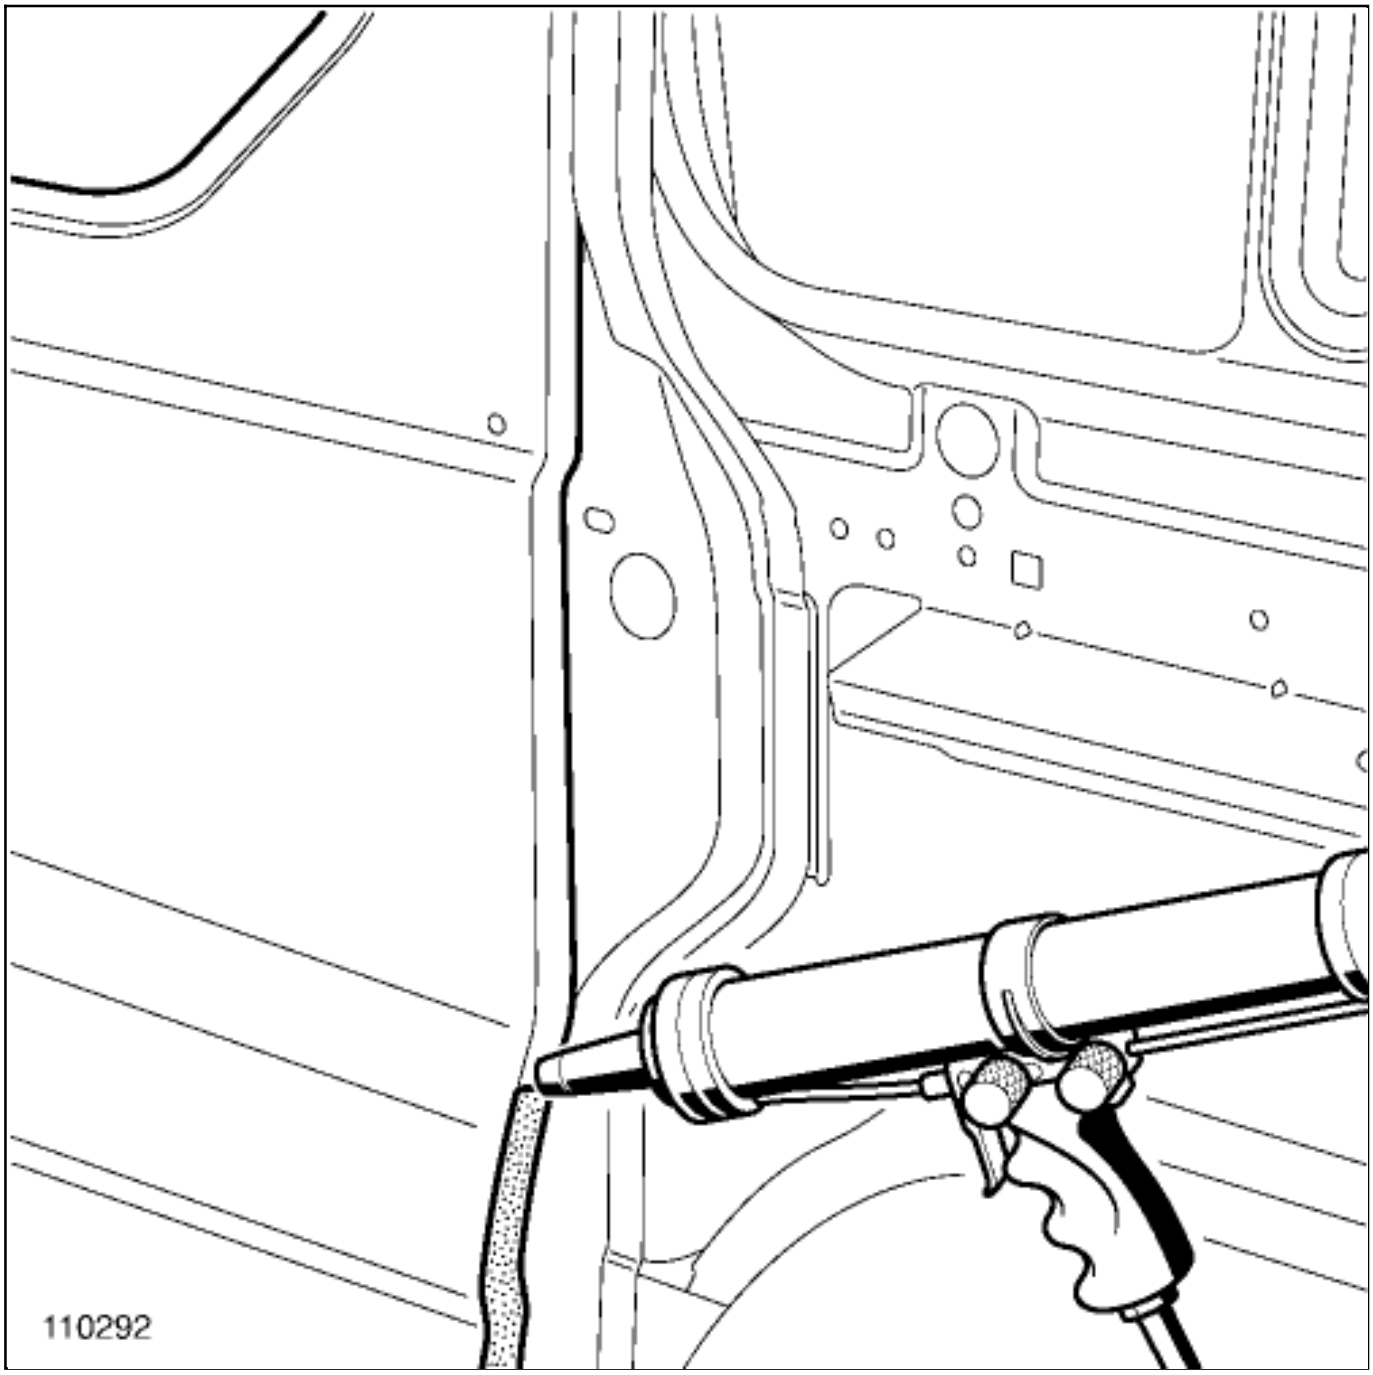
damaging the protection.

Clean the joint face with surface cleaner.

4)PREPARING THE MATING FACES ON THE VEHICLE

Scour the internal joint face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)



Clean the mating face and the areas to bonded with the surface cleaner.

2- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

3- ASSEMBLY

Apply a structural welding bead over the whole internal joint face of the vehicle.

(see 40F, Bonded connections, Connections by bonding: Precautions for the repair)

4- FITTING AND ADJUSTING THE REPLACED PARTS

Position and adjust the replacement part on the vehicle.

Hold the replacement part to secure it in position.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Get rid of the surplus bonding before it dries.

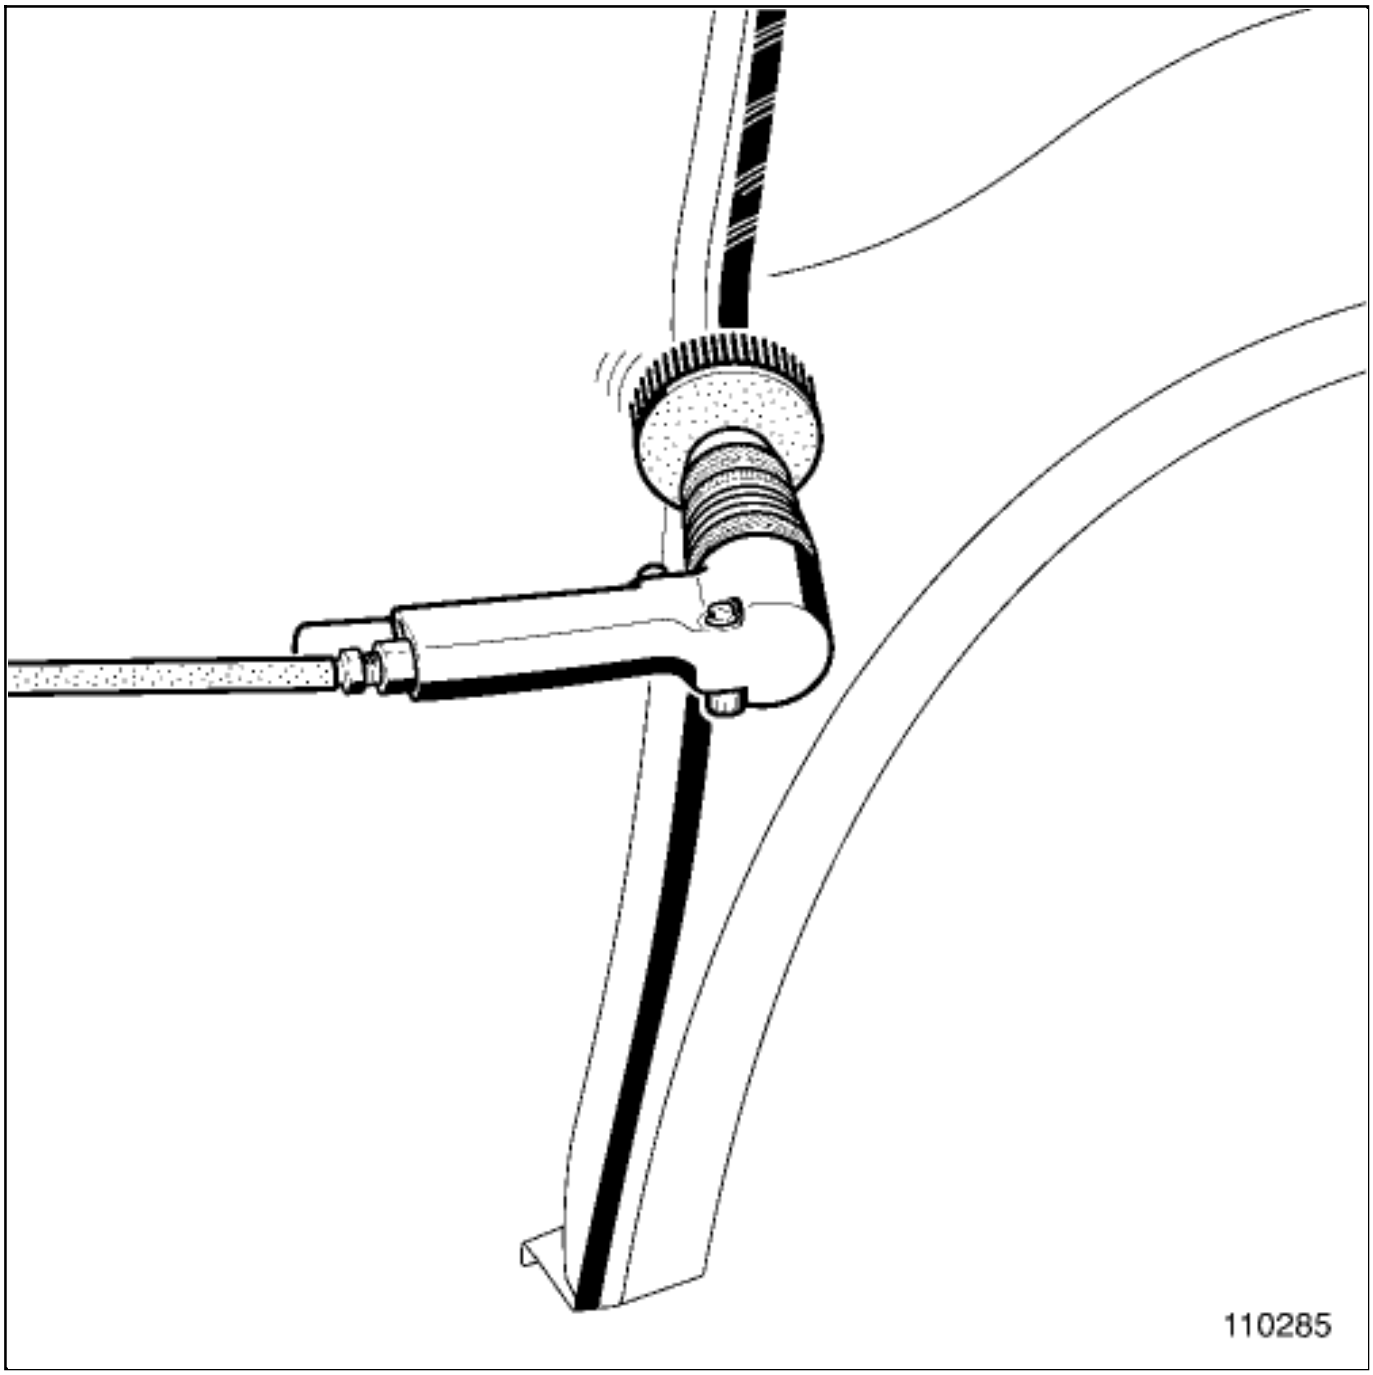
4. GMAW JOINT BY BEAD OF CHAIN WELD

1- PREPARATION BEFORE ASSEMBLY

1)POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

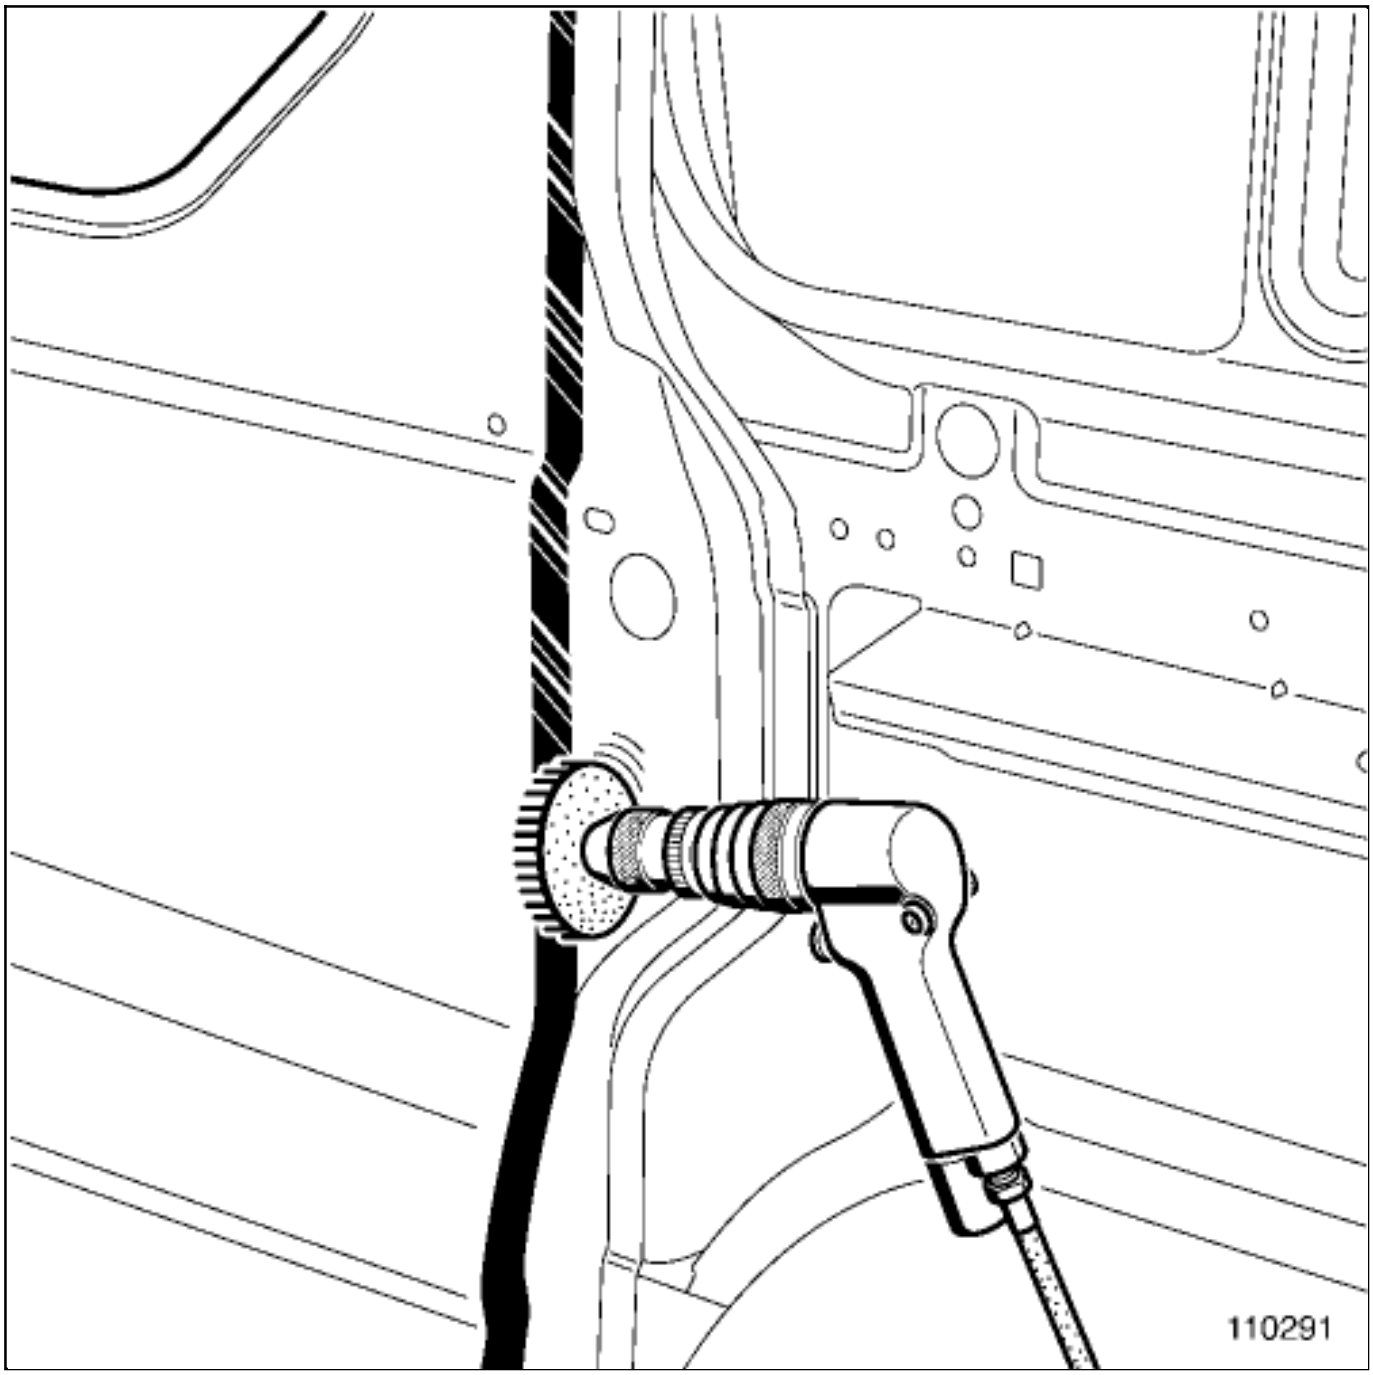


(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2)MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the part.



3)PREPARING THE MATING FACES ON THE REPLACEMENT PART

Scour the external mating face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4)PREPARING THE MATING FACES ON THE VEHICLE

Scour the internal joint face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

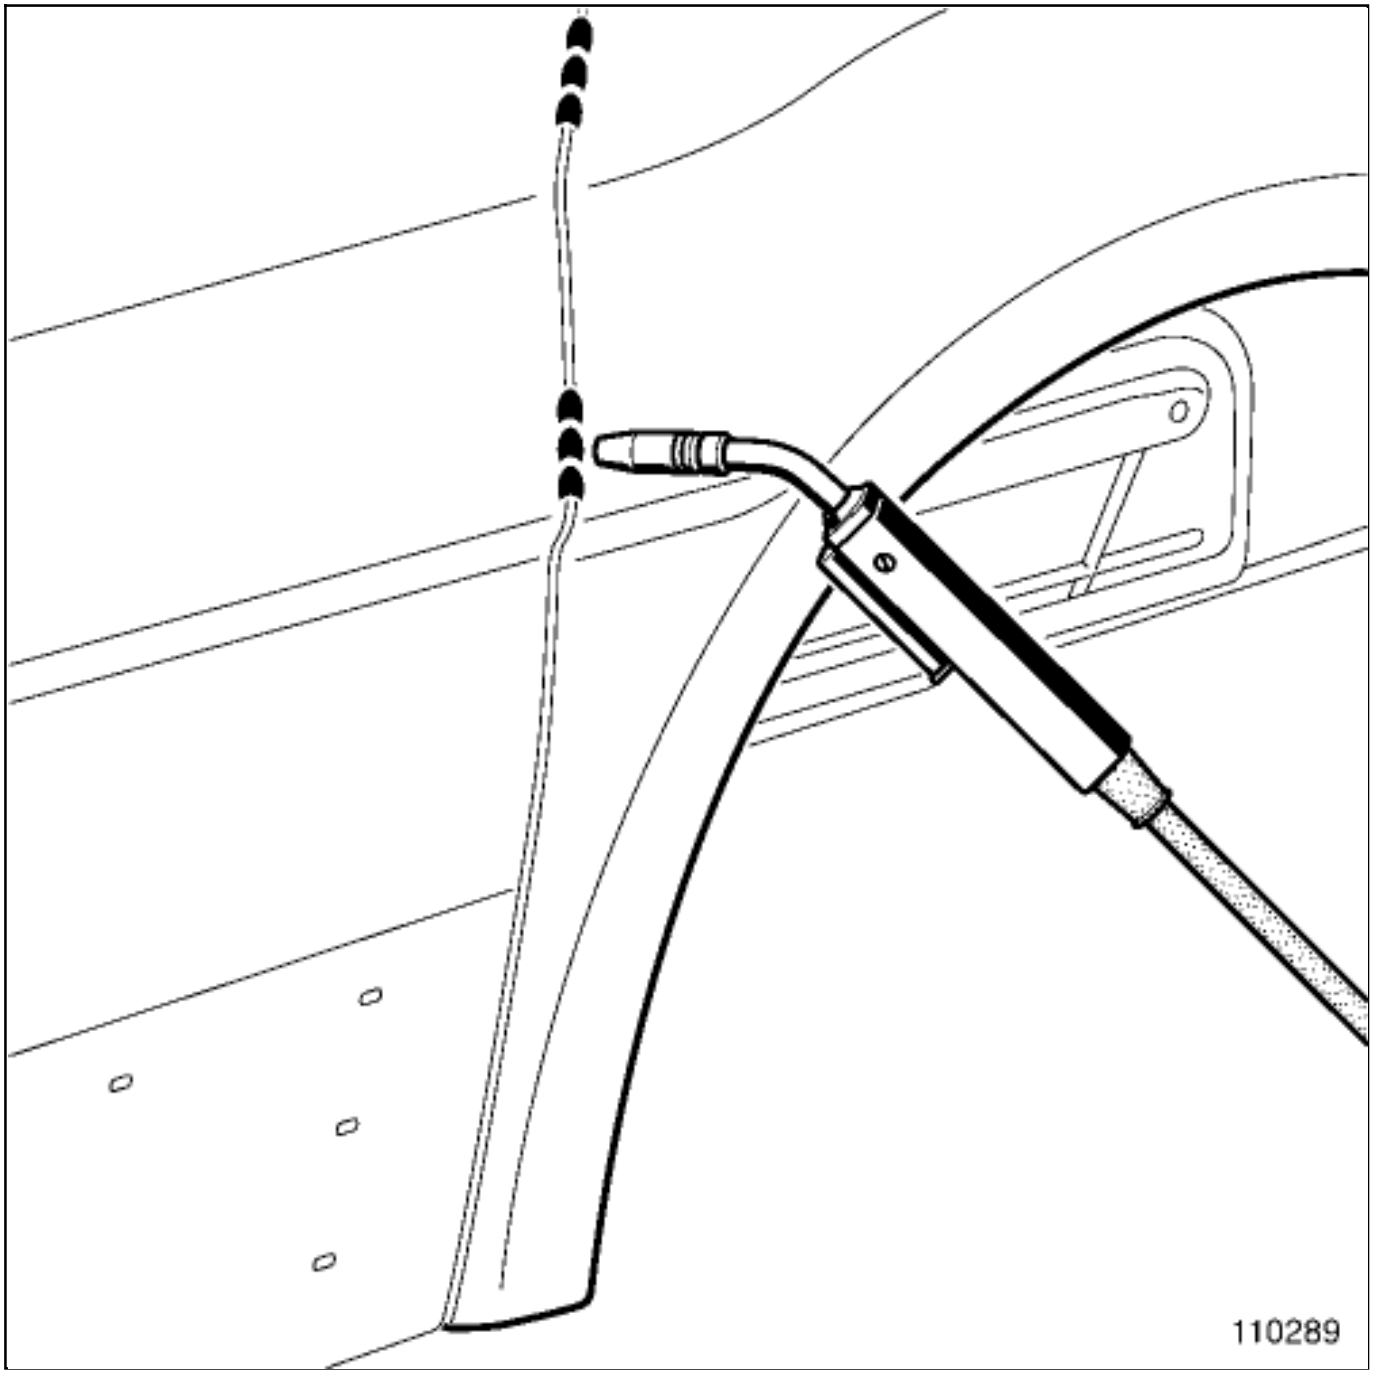
Apply the anti-corrosion protection to the internal mating faces according to the type of weld.

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3- ADJUSTING THE WELDER

Joint by GMAW bead of chain weld.

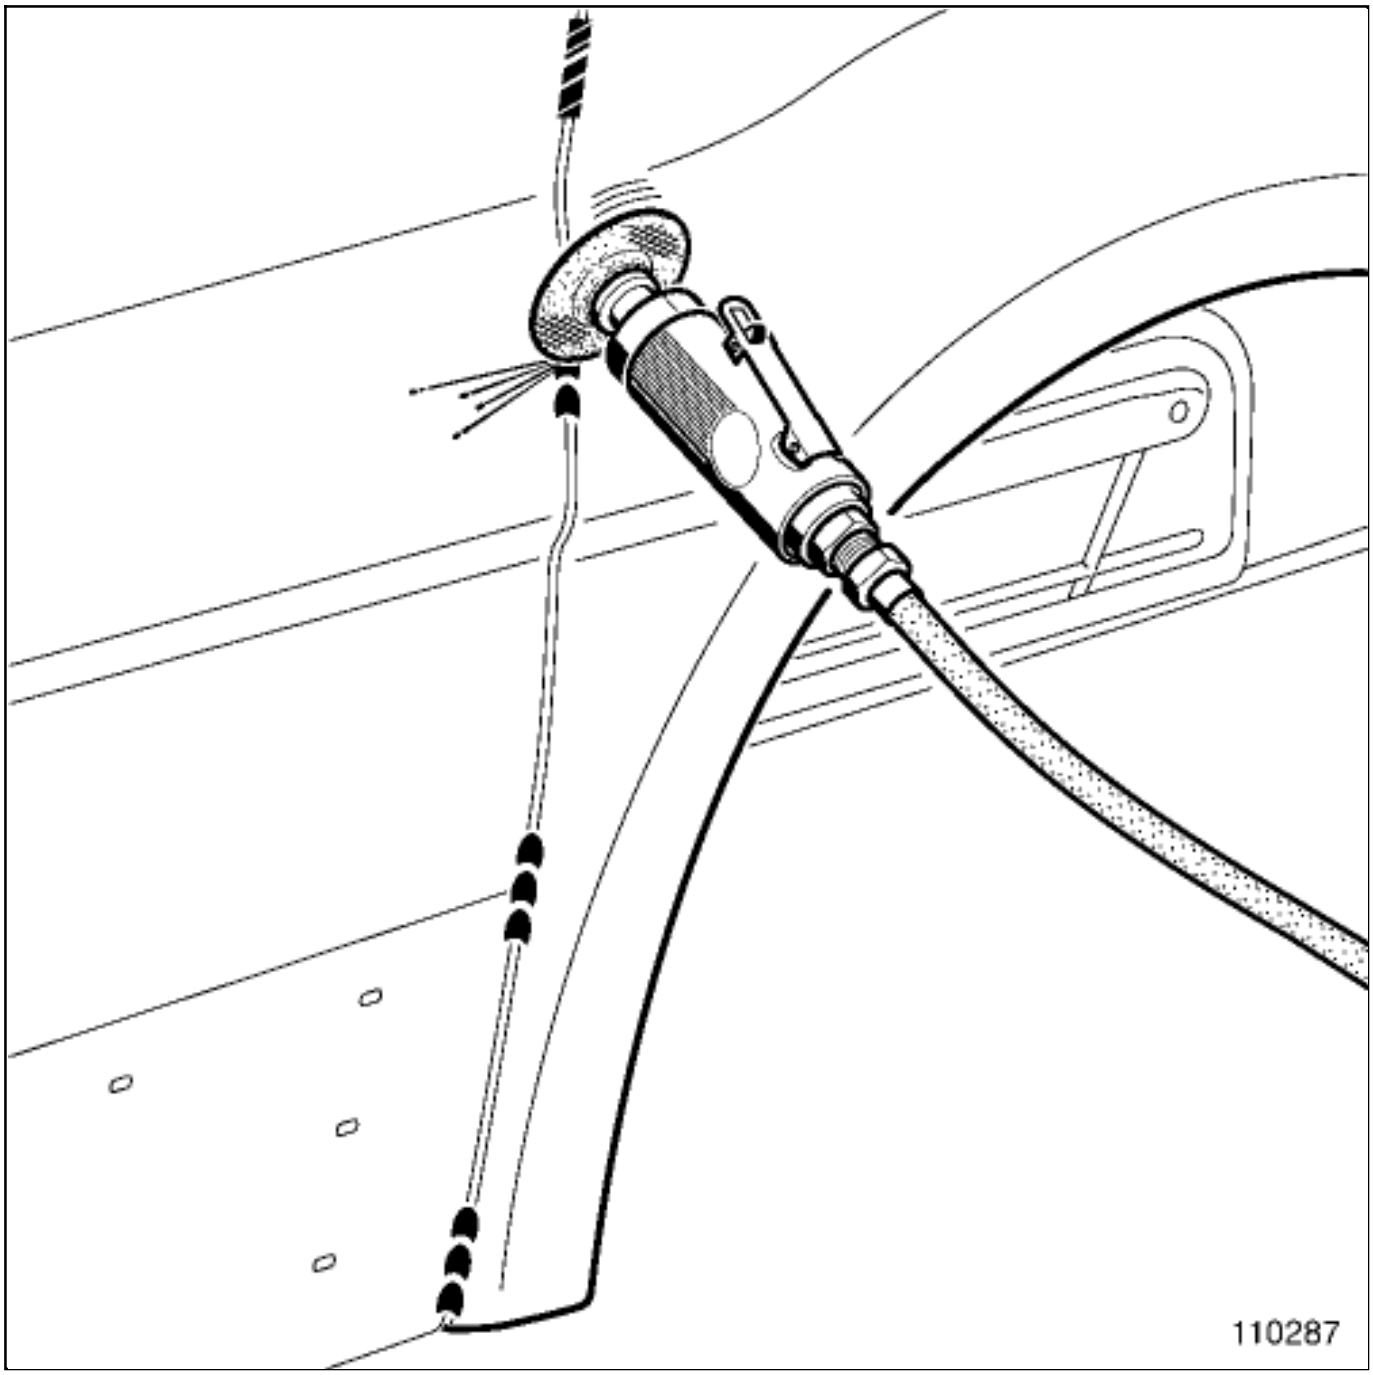
(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)



4- ASSEMBLY

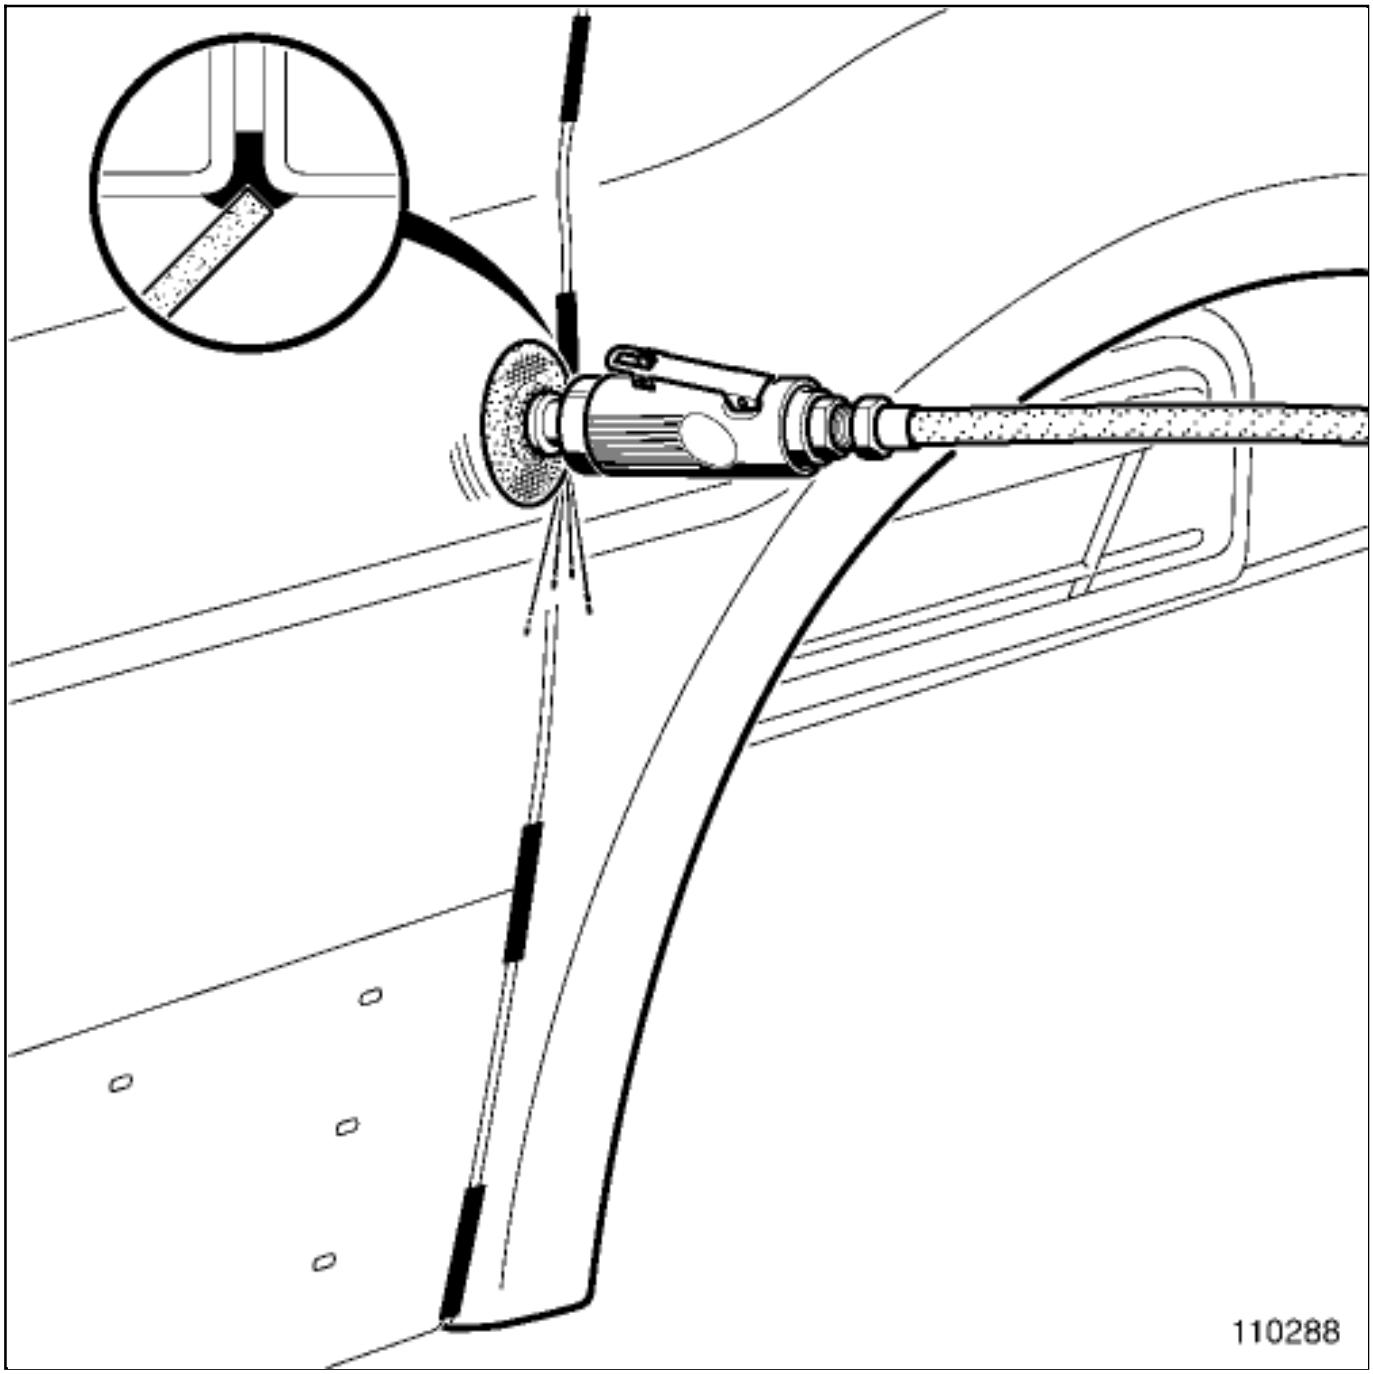
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.



Position the welding machine earth as close as possible to the weld zone (see MR 400).

Carry out the broken continuous welds.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

5- FINISHING

Grind the beads across their width.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Slightly hollow out the beads along their length.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Note:

Do not strike or damage the panel.

6- FITTING PROTECTION AFTER ASSEMBLY

Apply the acoustic protection.

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

Apply the anti-corrosion protection.

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

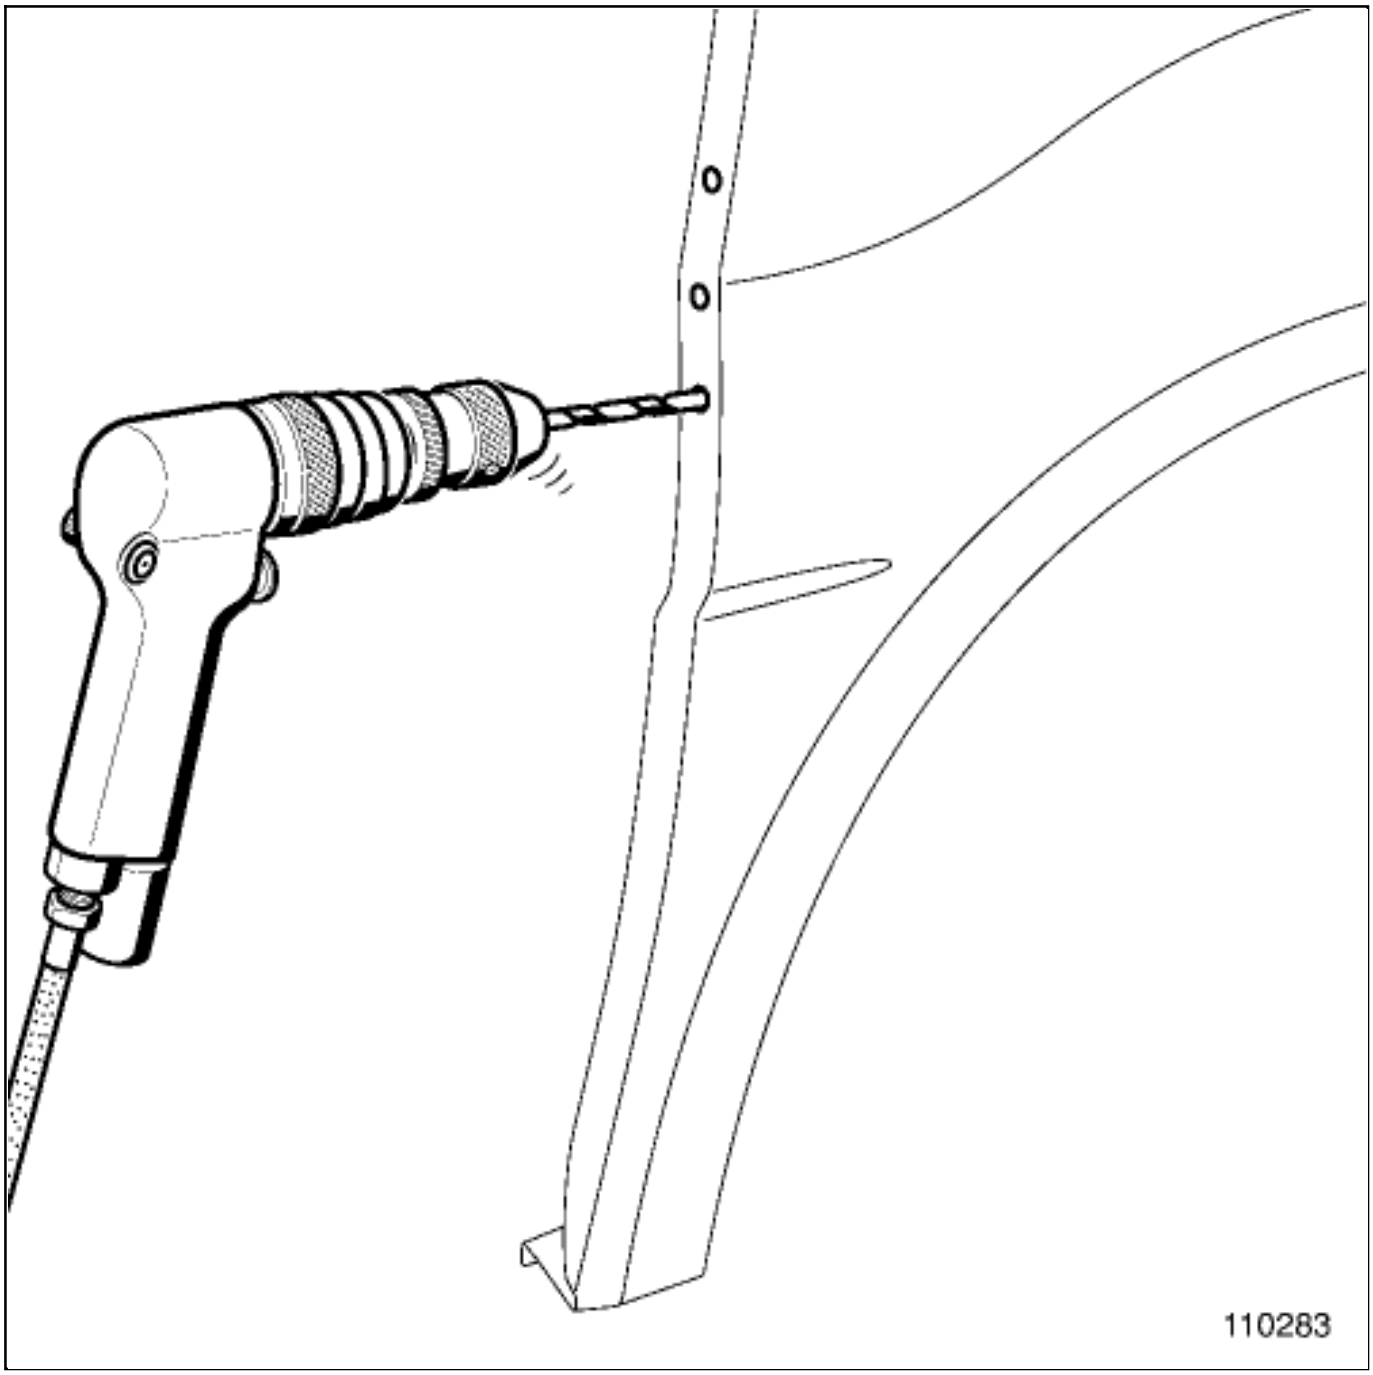
5. GMAW JOINT BY PLUG WELDS

1- PREPARATION BEFORE ASSEMBLY

1)POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it using the locking pliers.

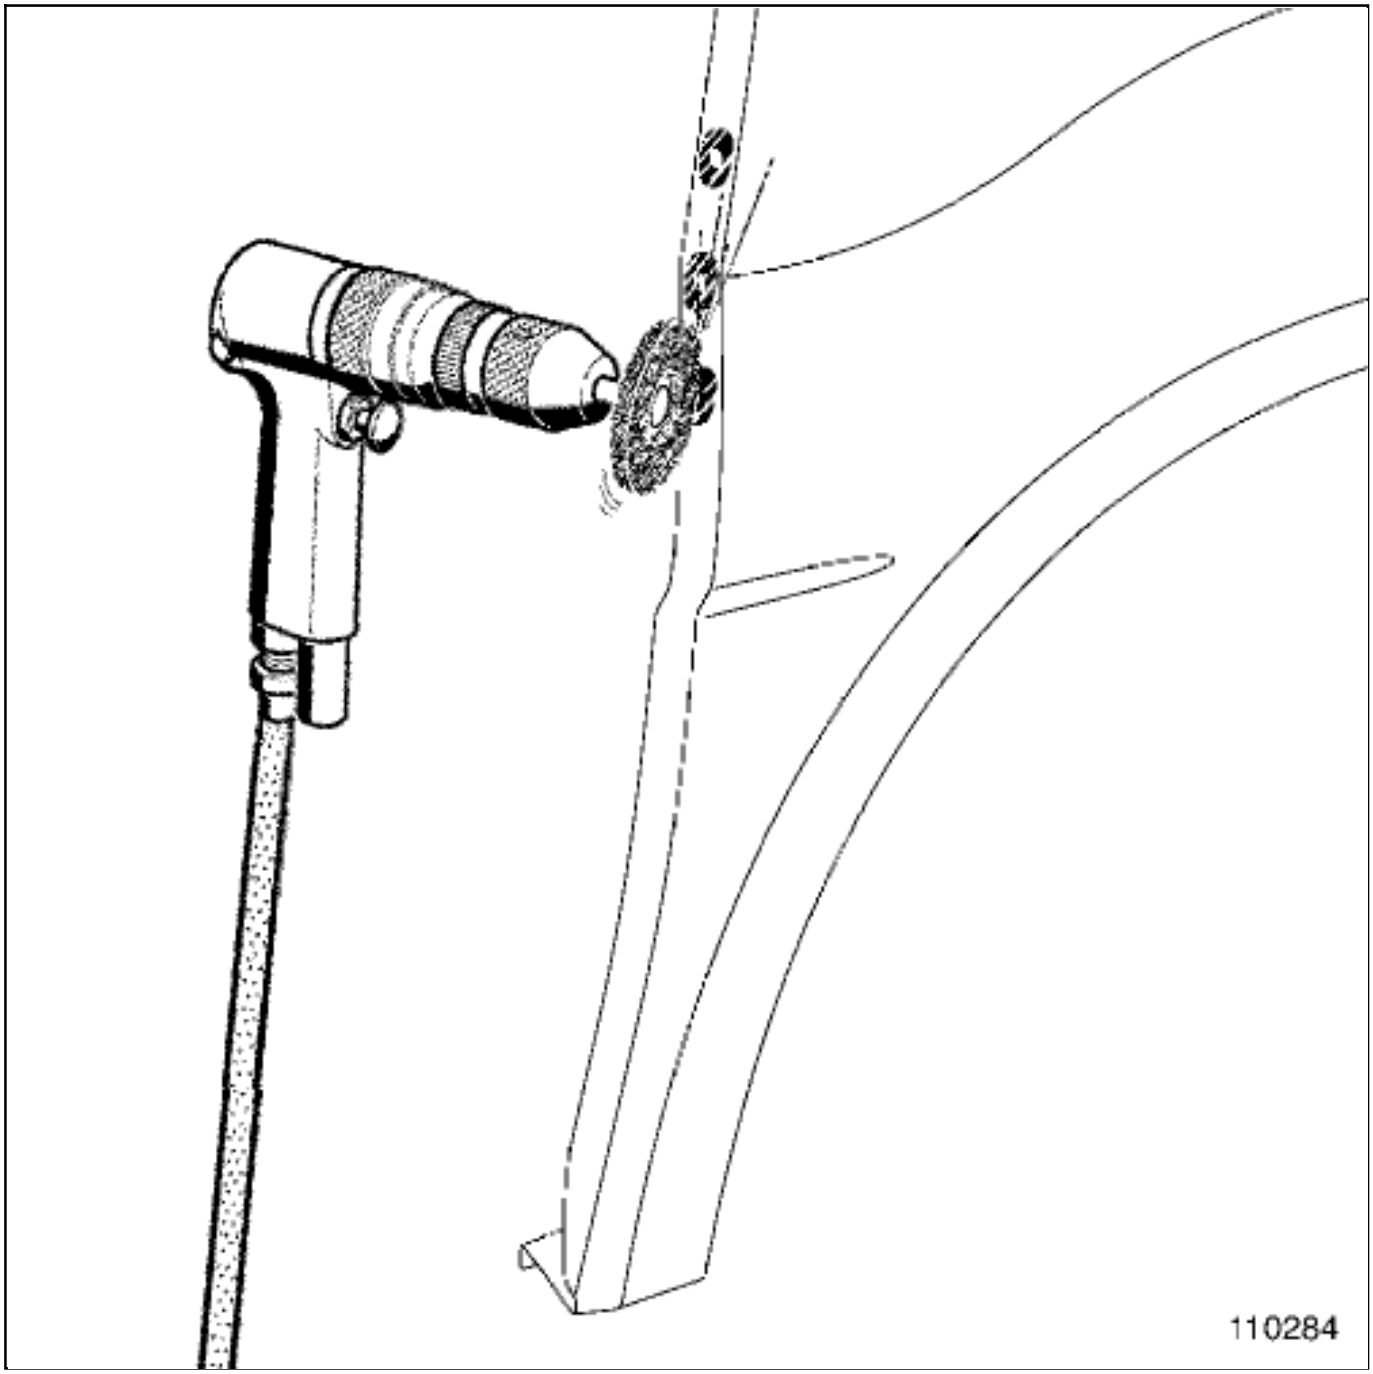
If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2)MARKING AND IDENTIFYING THE JOINTS

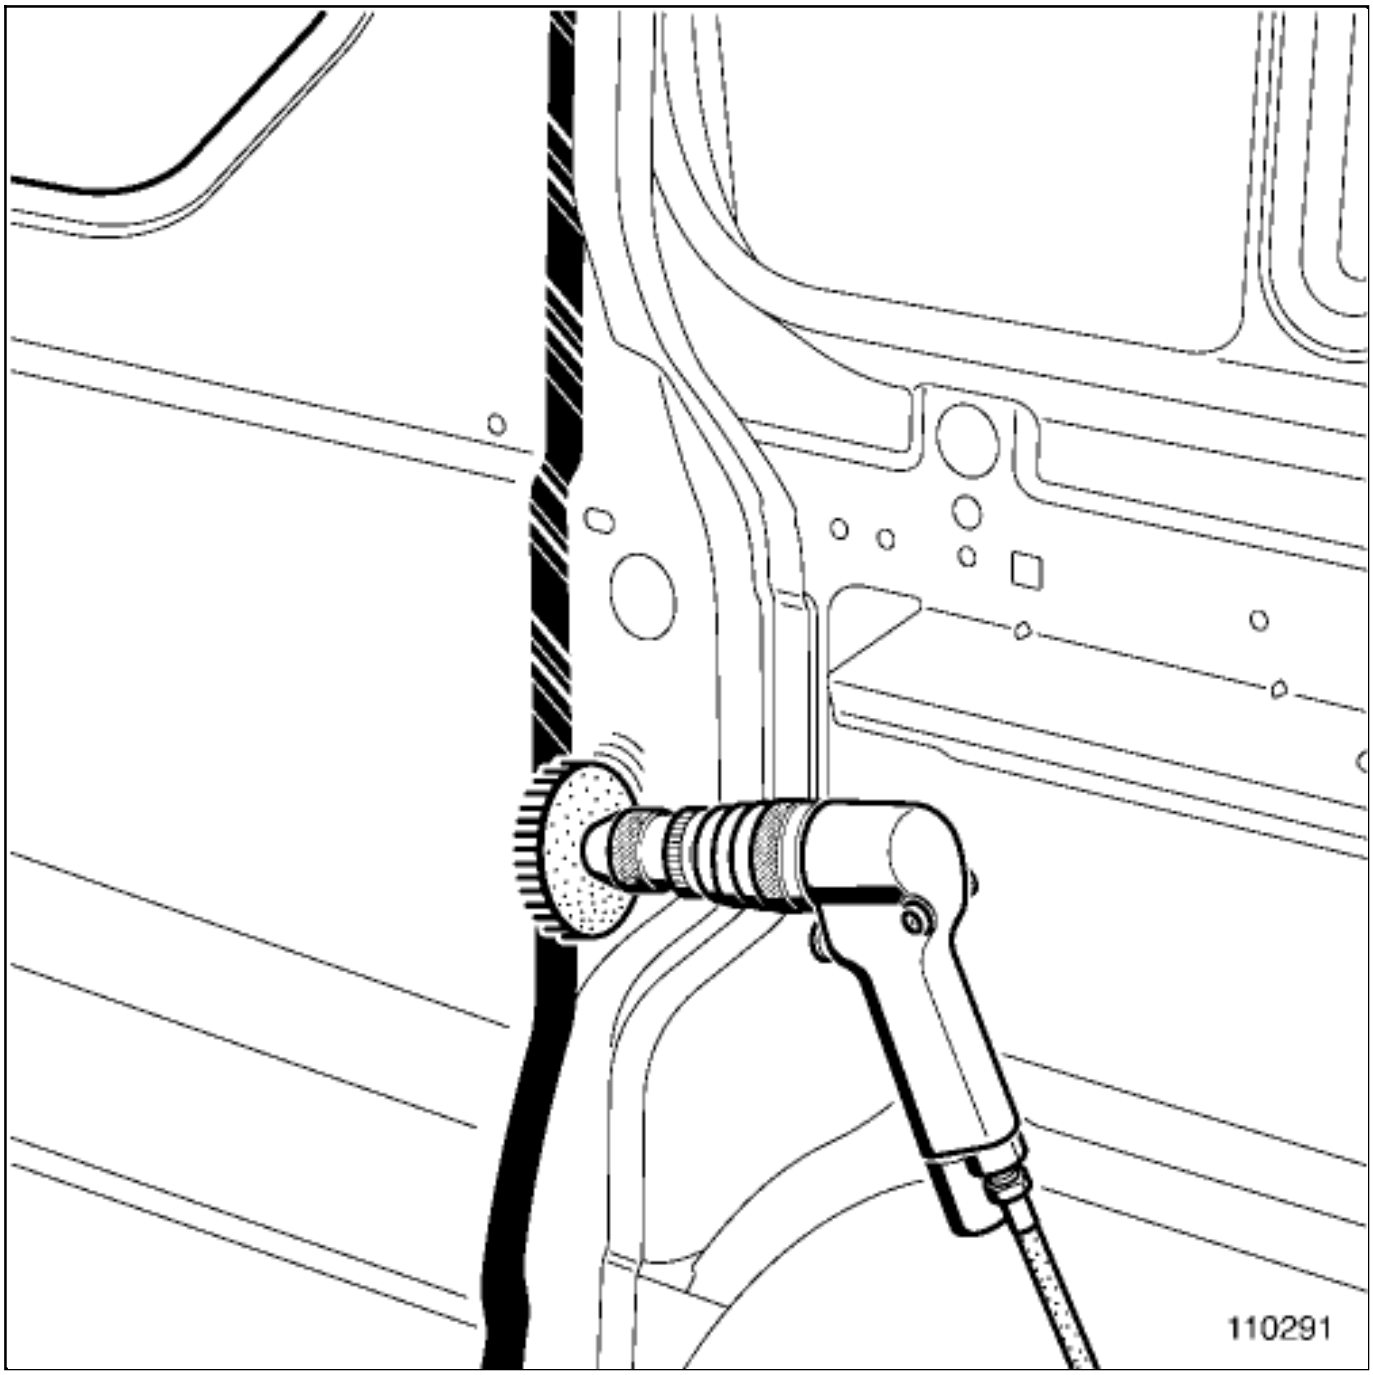
Mark the joint areas.



Remove the part.

3)PREPARING THE MATING FACES ON THE REPLACEMENT PART

Drill or pierce the support panel via the internal face of the joint for the plug welds, see table below.



Thickness (mm)	∅ drill bit (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

Scour the outline of the drilling hole via the external face of the joint.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4)PREPARING THE MATING FACES ON THE VEHICLE

Scour the internal joint face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use) .

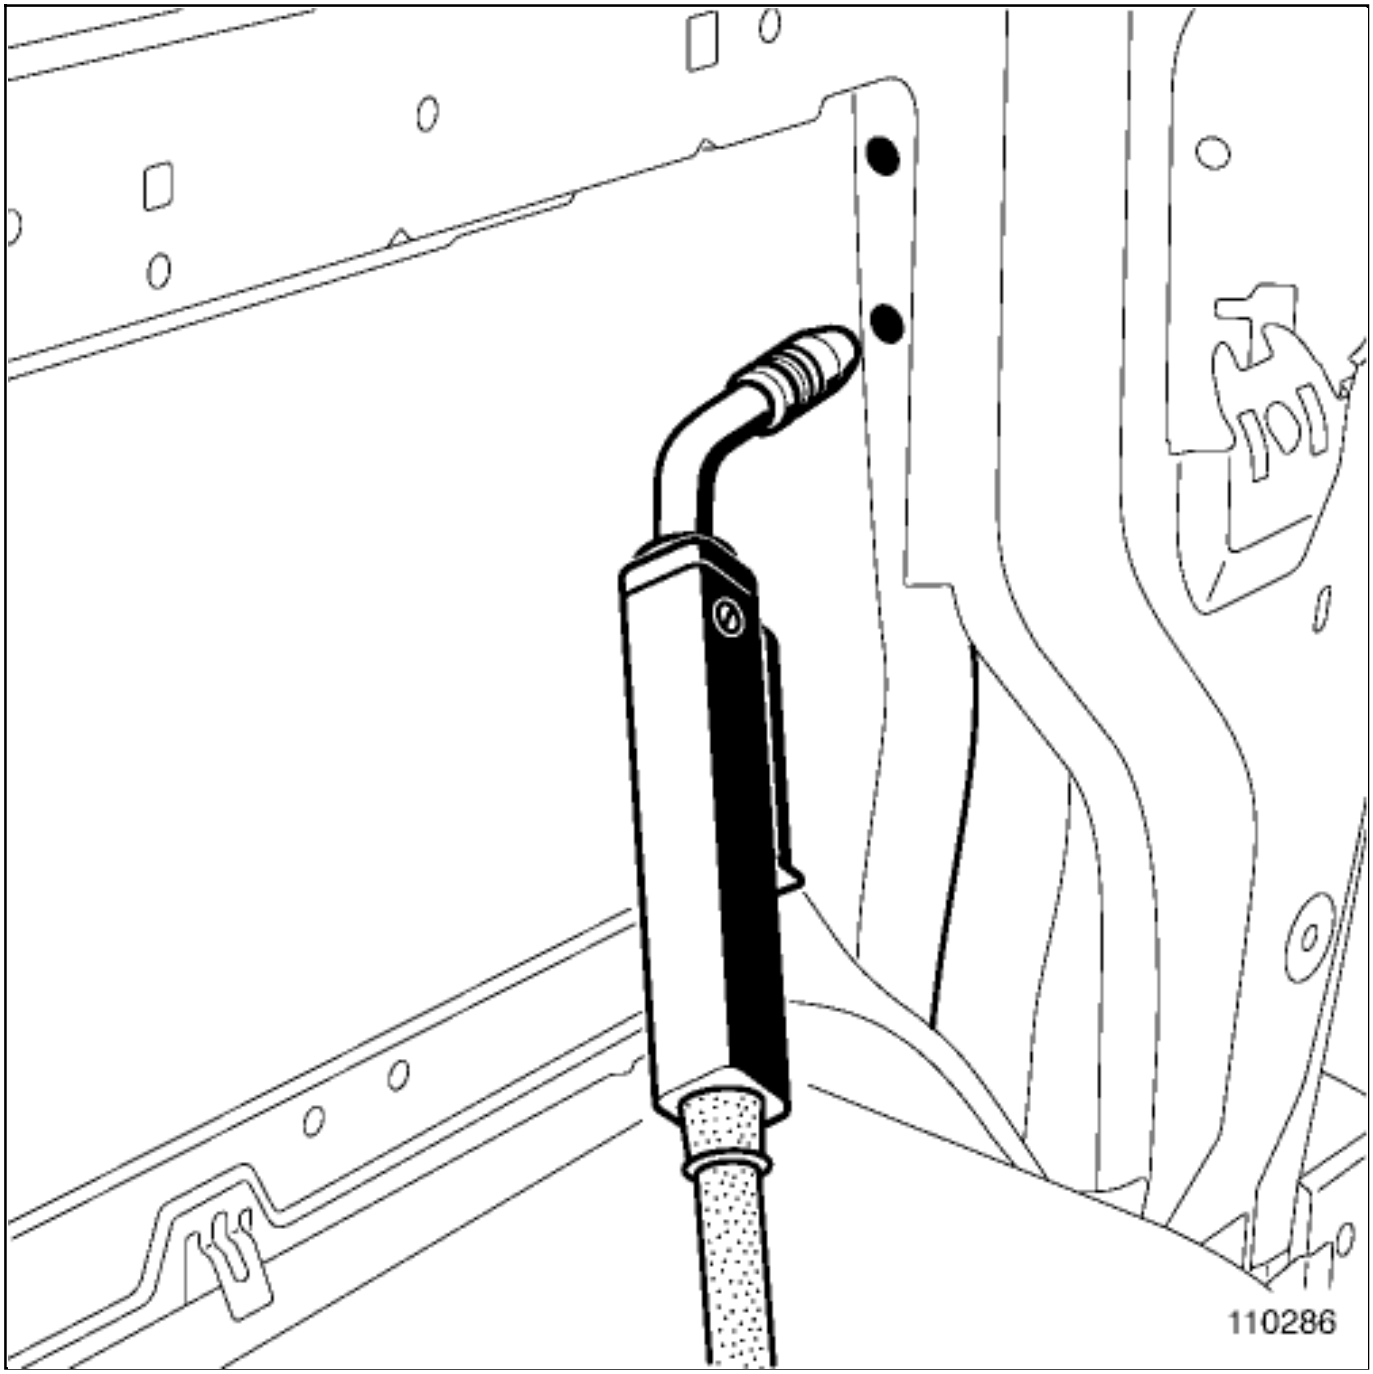
3- ADJUSTING THE WELDER

Joint by GMAW plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

4- ASSEMBLY

CAUTION



To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the welding machine earth as close as possible to the weld zone (see MR 400).

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

5- FITTING PROTECTION AFTER ASSEMBLY

Apply the acoustic protection.

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

Apply the anti-corrosion protection.

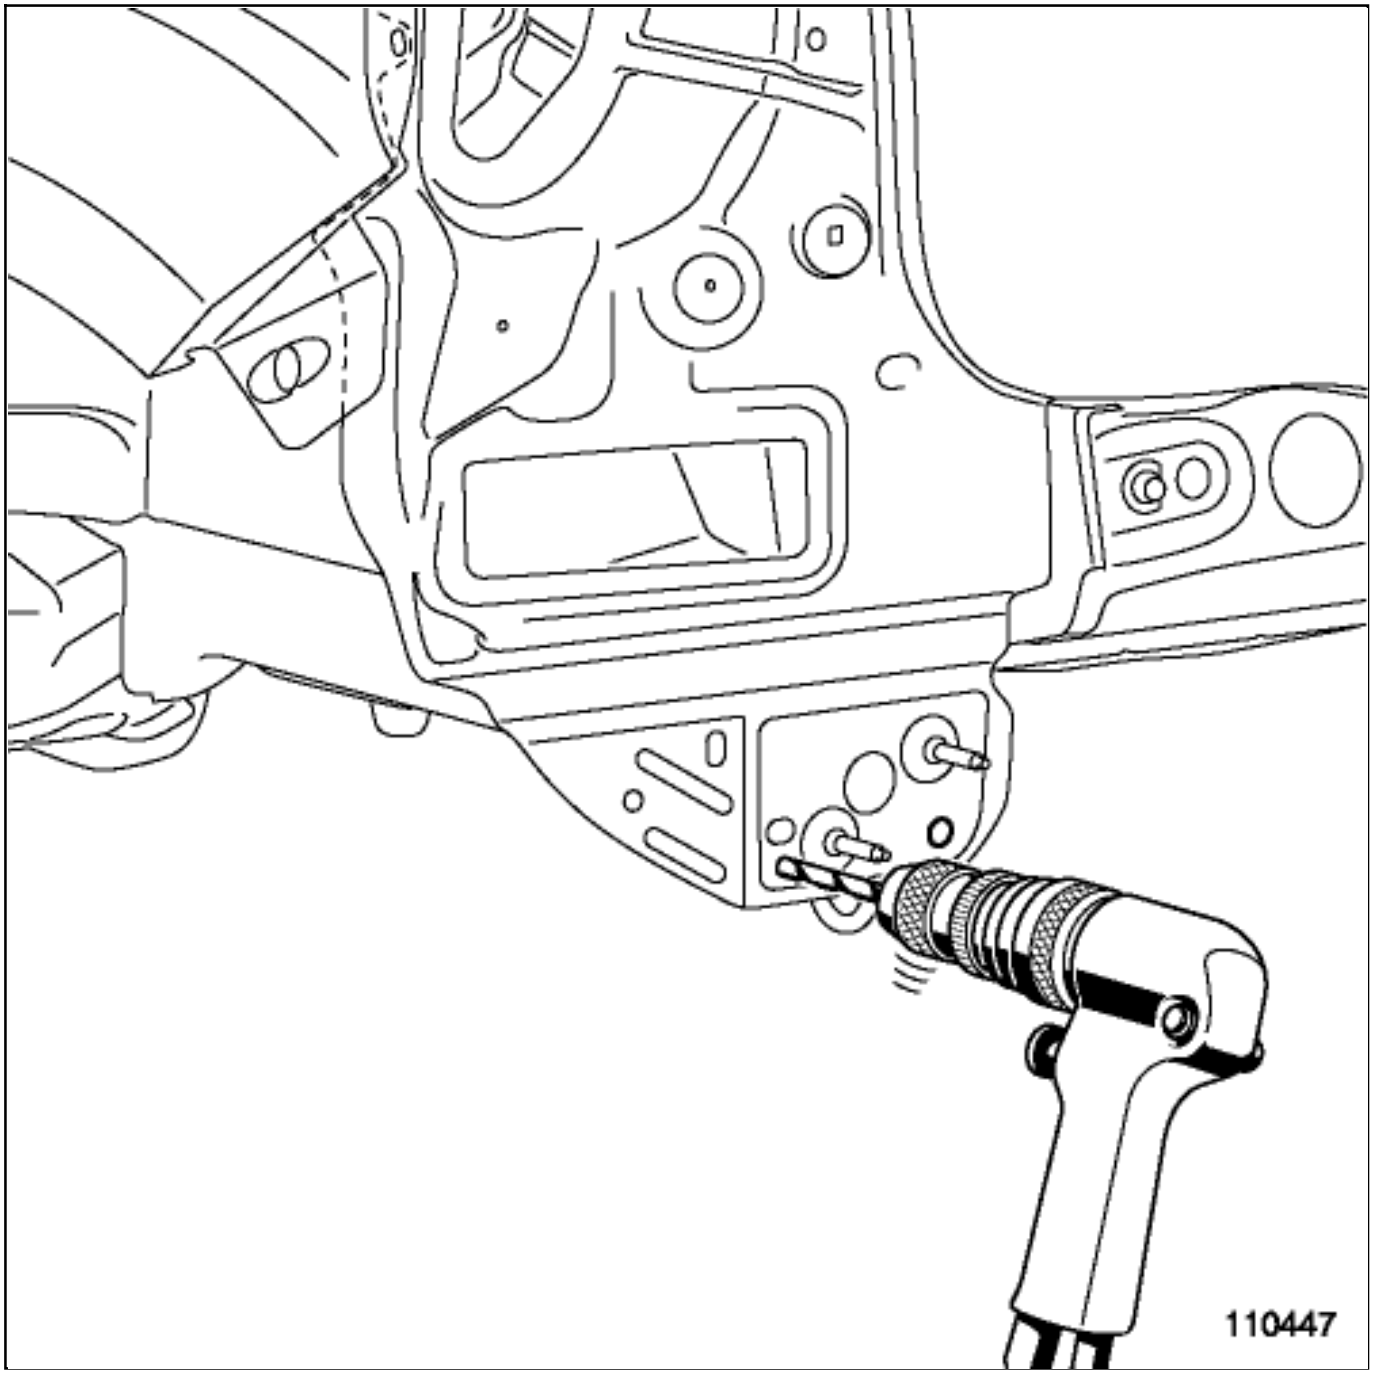
(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

XSL version : 3.02 du 22/07/11

ELECTRICAL RESISTANCE SPOT WELDING CONNECTION WITH THREE THICKNESSES

Repairing an electric resistance spot welded joint in three thicknesses depends on the panels to be replaced, as well as the stack and access.

Before working on the vehicle, mark exactly the stack of panel(s) to be replaced and the access to the joint in order to use the appropriate method.



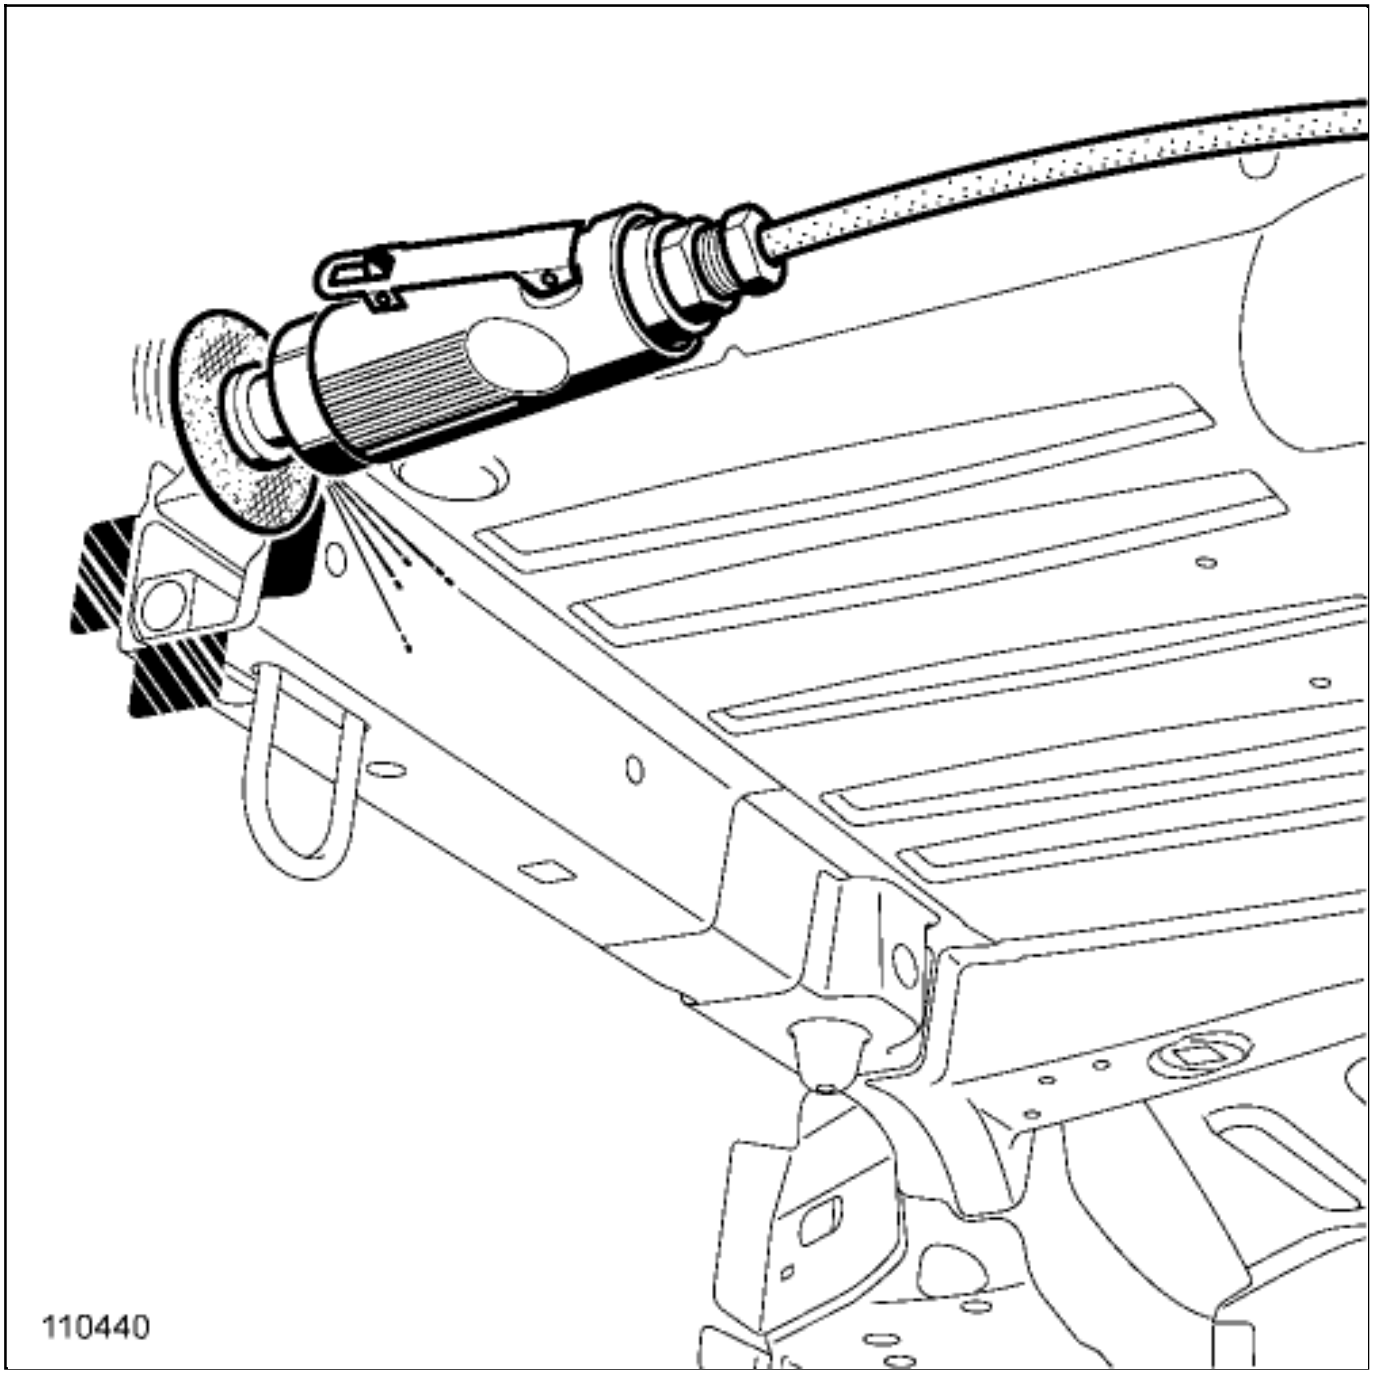
1. TWO FACE ACCESS

1- DISMANTLING

If necessary, scour the joint lines to bring out the spot welds.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)



Unpick the spot welds.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the part to be replaced.

Note:

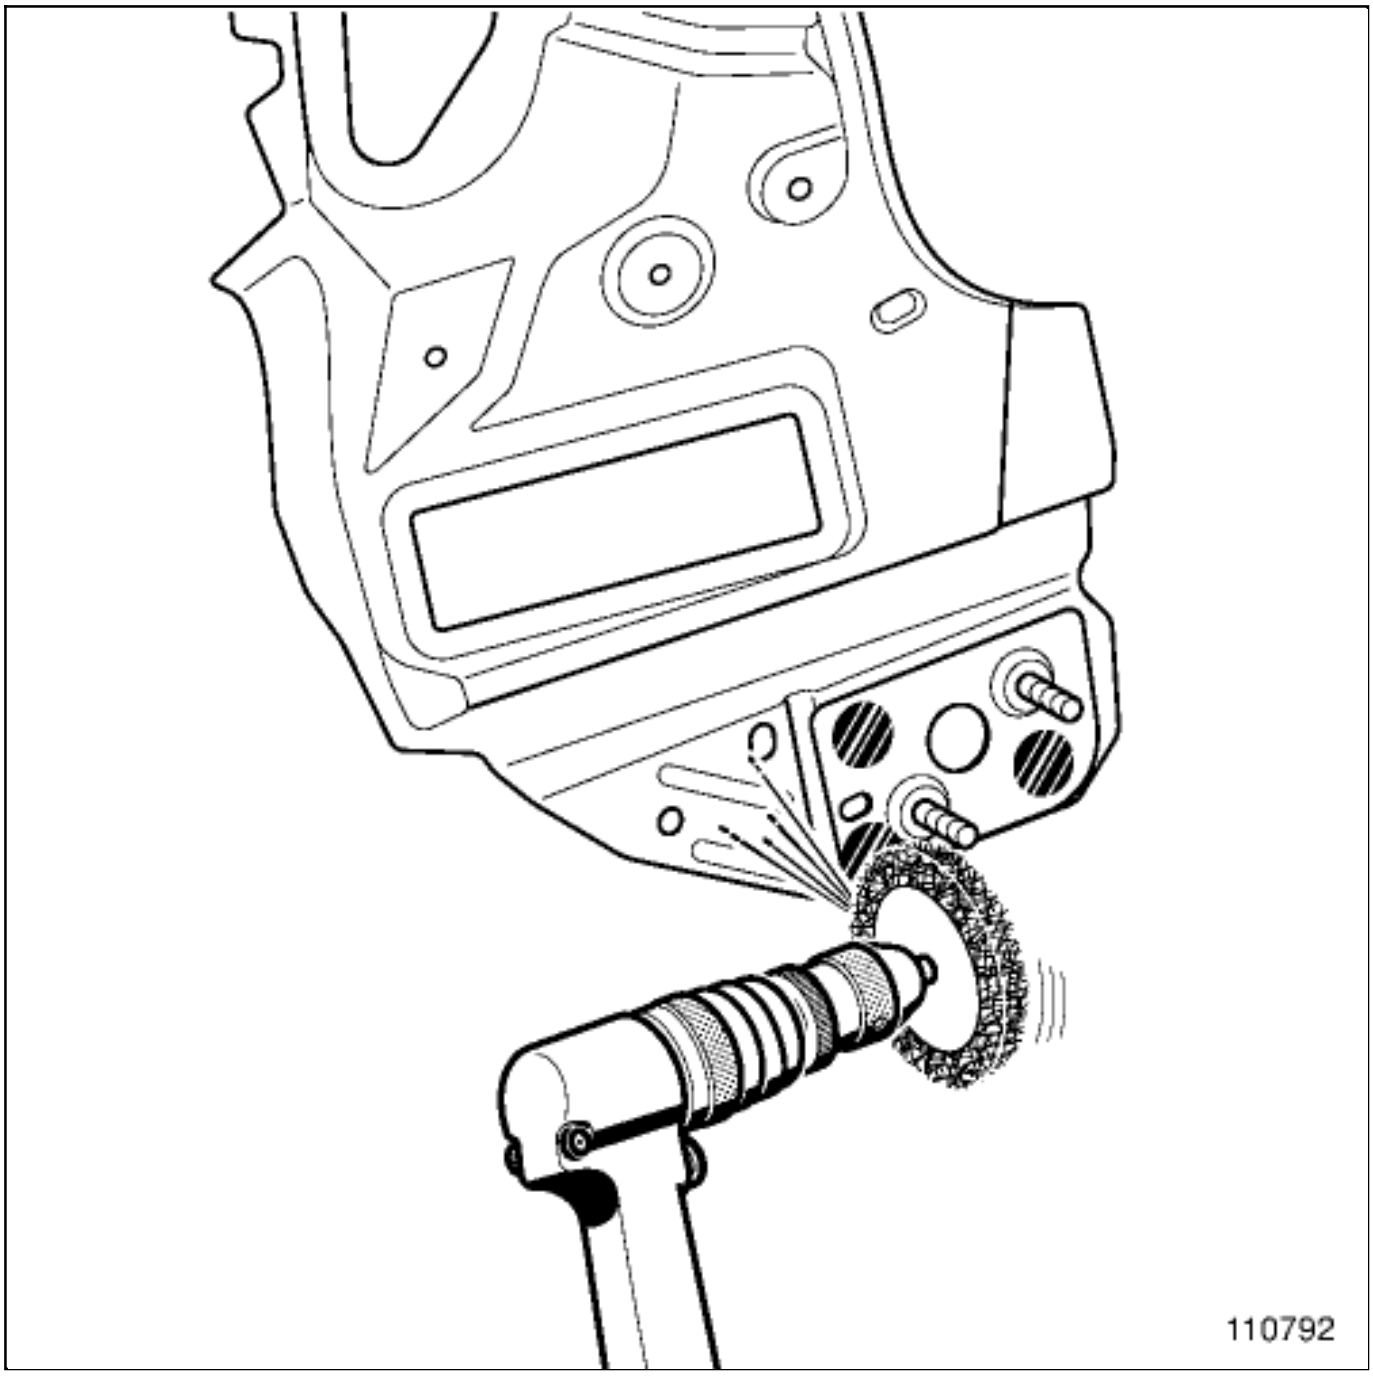
Do not strike or damage the panel.

Grind the welding residue.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.



If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE MATING FACES

Scour the internal and external faces at the weld zones on the replacement part and on the vehicle.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

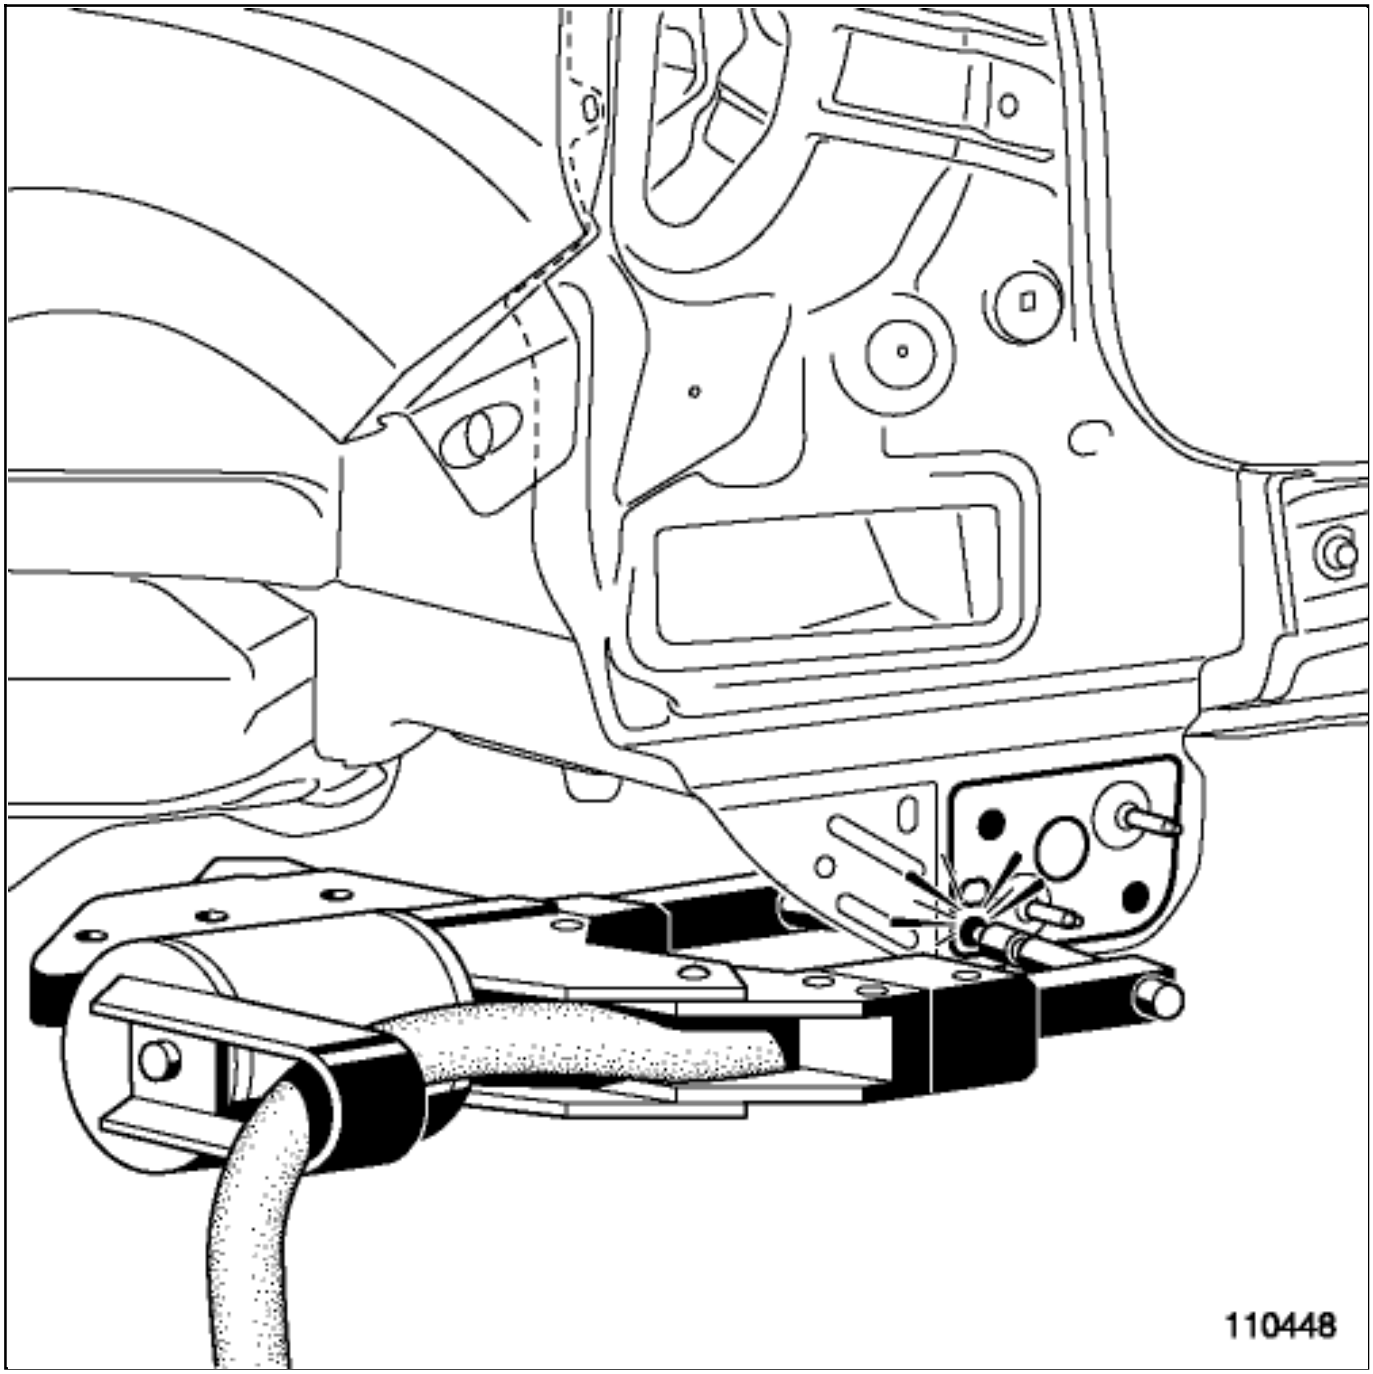
Apply the anti-corrosion protection to the internal mating faces according to the type of weld.

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3- ASSEMBLY

1)ADJUSTING THE WELDER

Resistance spot welded joints



(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection: Precautions for the repair)

2)WELDING

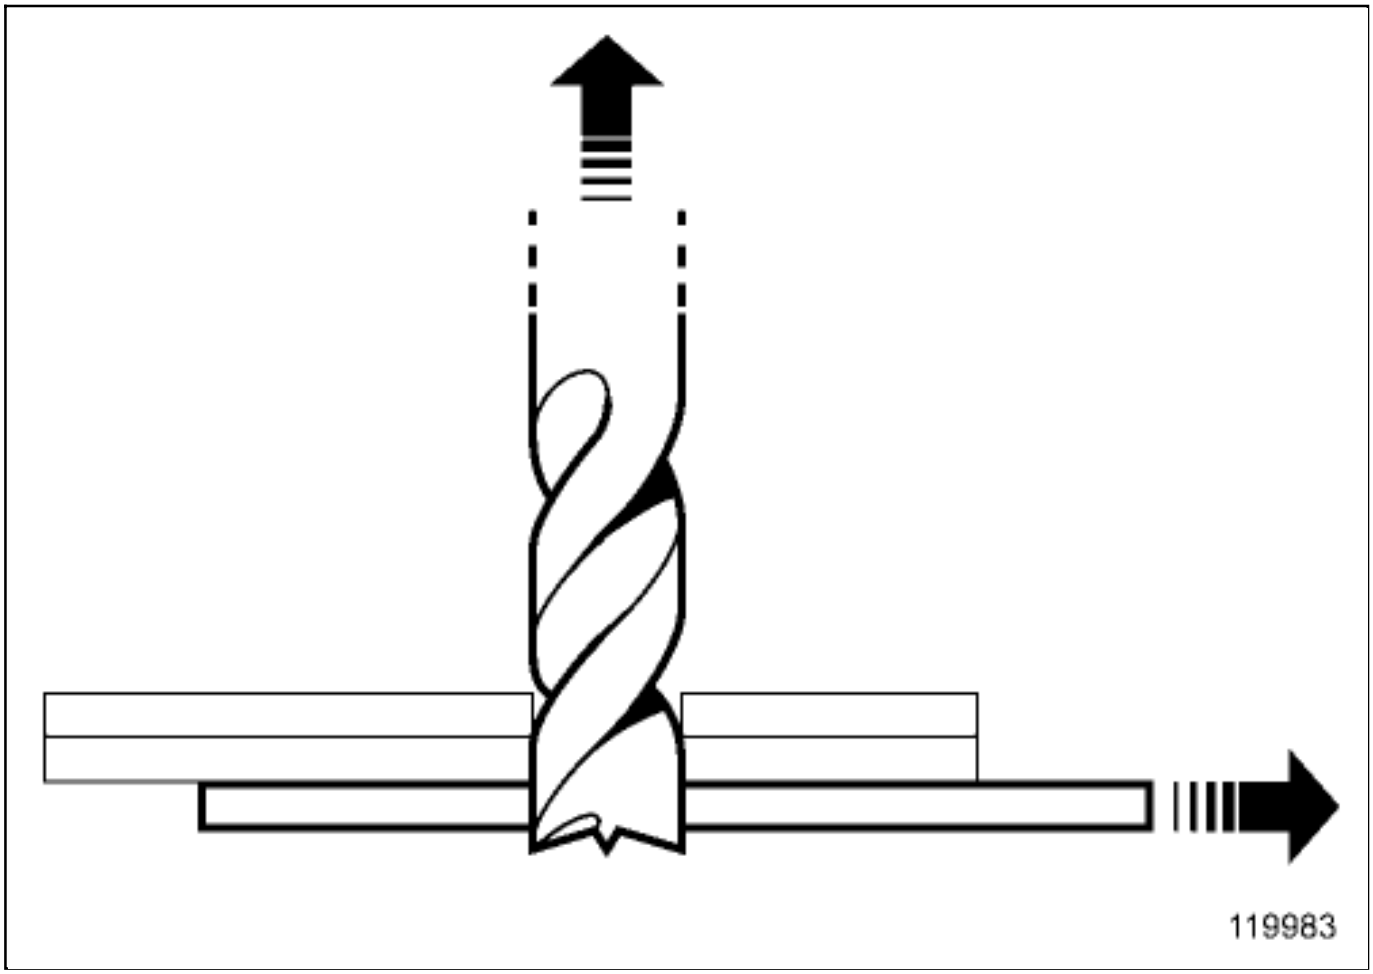
Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Weld the panels, making the points at the original locations.

There is no particular finish to be carried out on this type of weld; it must look the same as the original.



3)SPECIAL NOTE ON THE REPLACEMENT PART

The Parts Departmentprovides replacement parts with a special preparation, the points to be welded into three layers during assembly on the vehicle are pre-welded in two layers on the new part.

During welding of the end points on the vehicle, the operator must perform exactly as the points where the points existing on the part, for correctly stacking during welding.

2. SINGLE FACE ACCESS, THIRD PANEL TO BE REPLACED

1- DISMANTLING

Detach the assembly at the spot weld.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE REPLACEMENT PART

Scour the internal face at the plug welds.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)PREPARATION ON THE VEHICLE

Scour the edges of the drilling holes on the internal and external faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

3- APPLYING PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

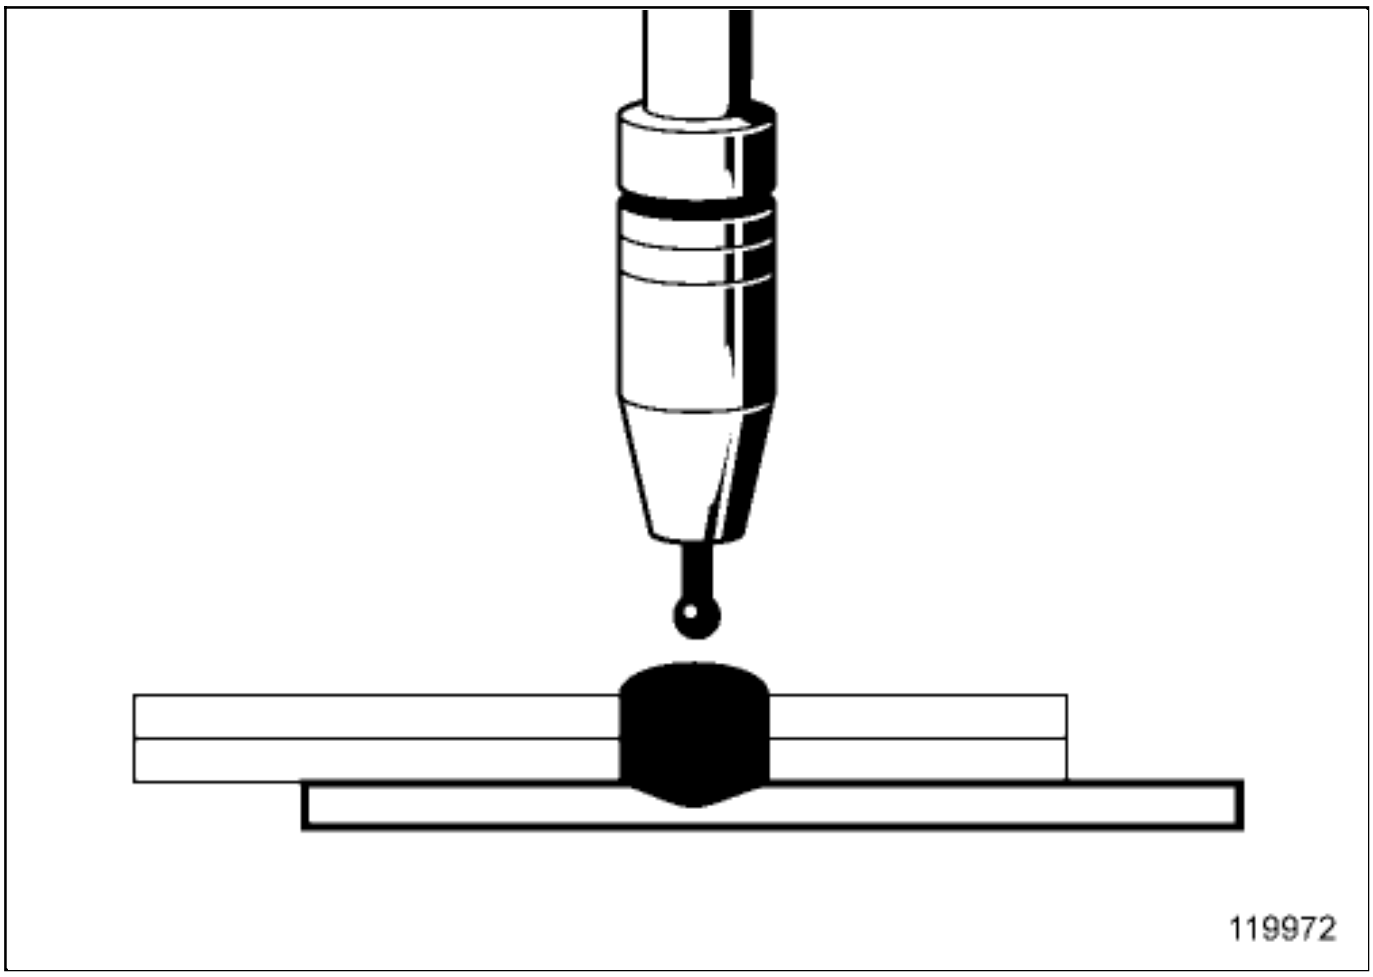
(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld**(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)** .

4- ASSEMBLY

1)ADJUSTING THE WELDER

GMAW plug welded joints.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2)CARRYING OUT THE WELDING

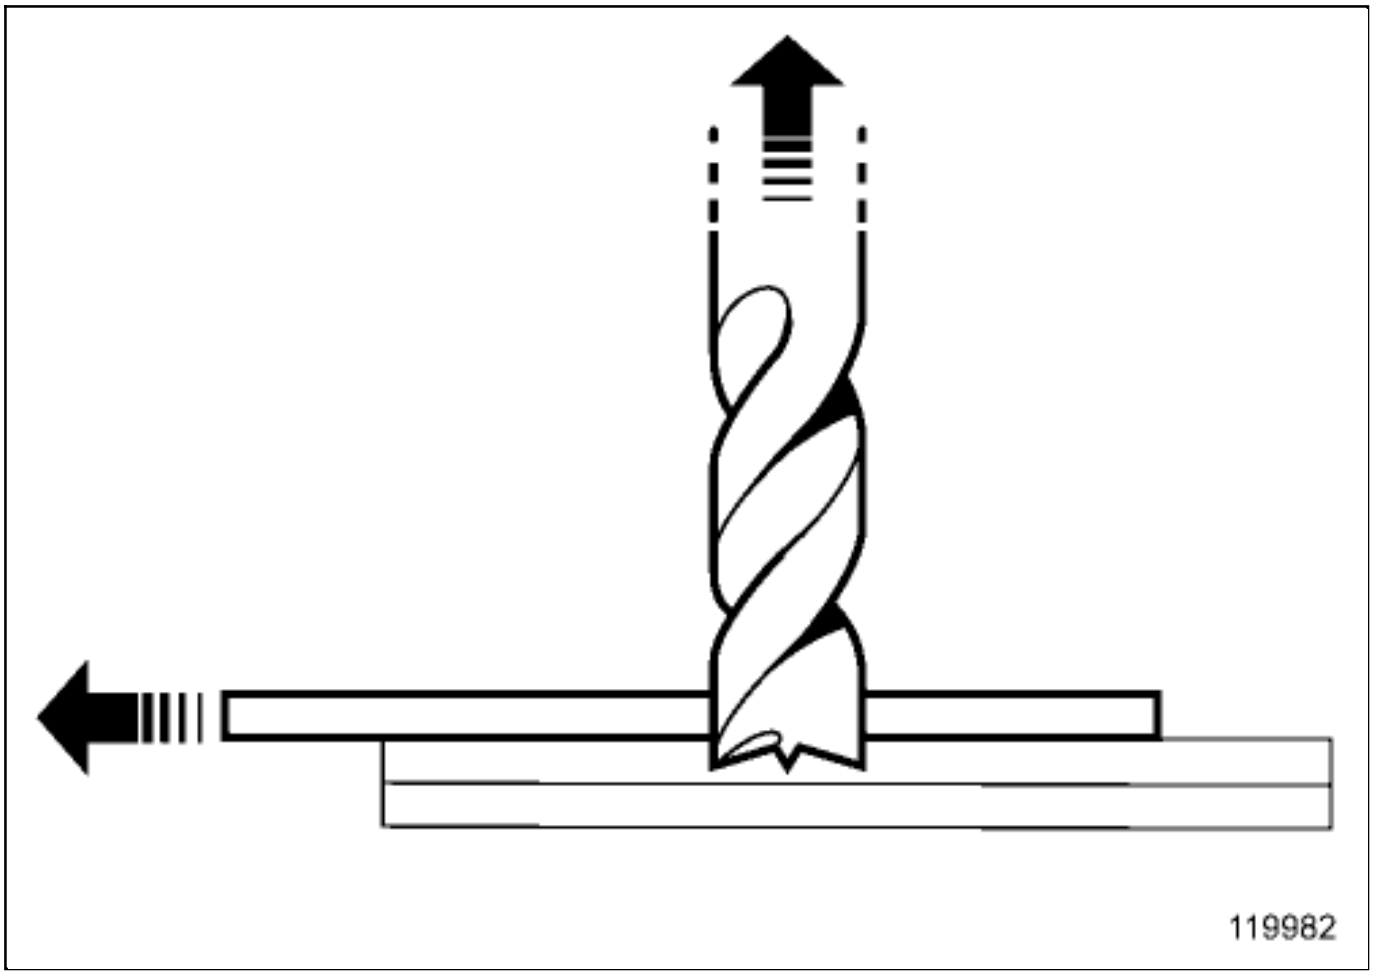
Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



5- FINISHING

Surface finishing the plug welds.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

3. SINGLE FACE ACCESS, FIRST PANEL TO BE REPLACED

1- DISMANTLING

Detach the first panel of the assembly at the spot weld.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE REPLACEMENT PART

Drill the panel via the internal face, respecting the following table:

Panel thickness (mm)	∅ drill bit (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

Scour the edges of the drilling holes on the internal and external faces

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)PREPARATION ON THE VEHICLE

Scour the internal face at the plug welds.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

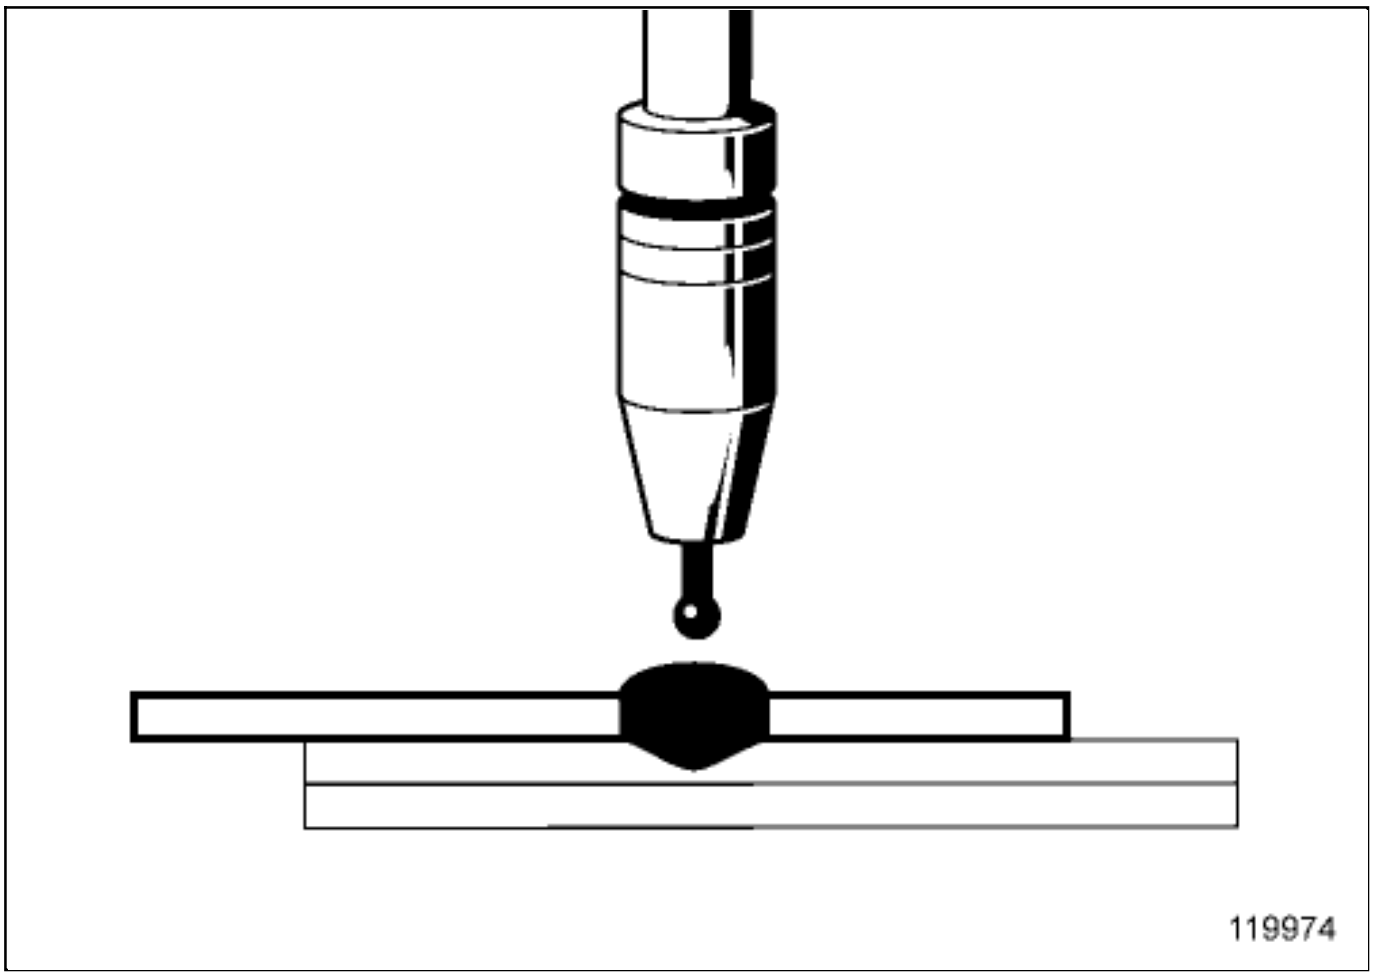
(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld**(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)** .

4- ASSEMBLY

1)ADJUSTING THE WELDER

GMAW plug welded joints.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2)CARRYING OUT THE WELDING

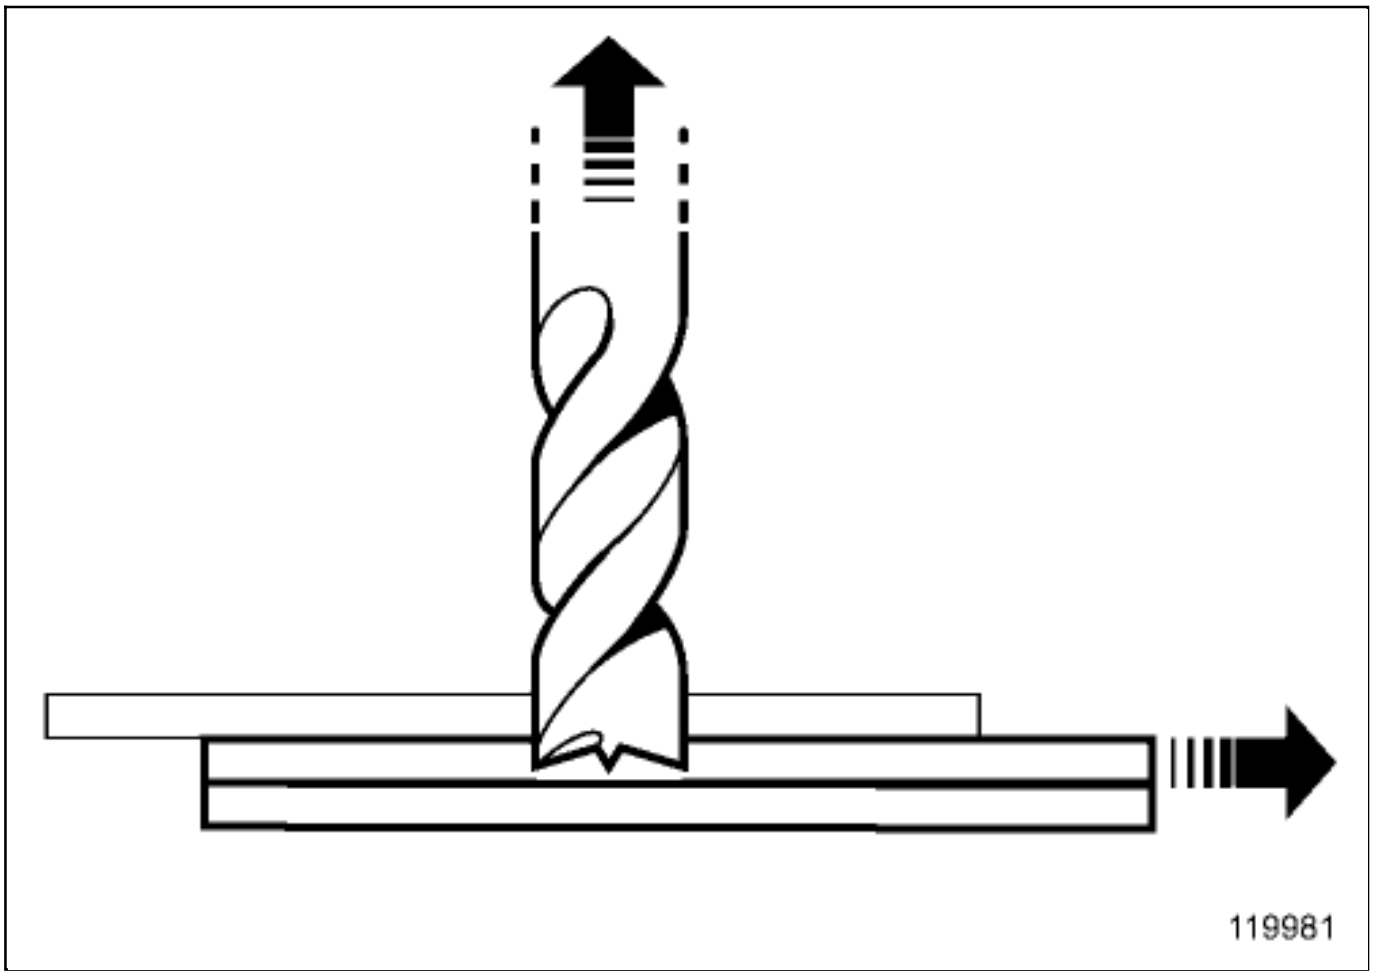
Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



5- FINISHING

Surface finishing the plug welds.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

4. SINGLE FACE ACCESS, SECOND AND THIRD PANELS TO BE REPLACED

1- DISMANTLING

Detach the first panel or the whole assembly at the spot weld.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE REPLACEMENT PART

Scour the internal face at the plug welds.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)PREPARATION ON THE VEHICLE

Scour the edges of the drilling holes on the internal and external faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- APPLYING PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

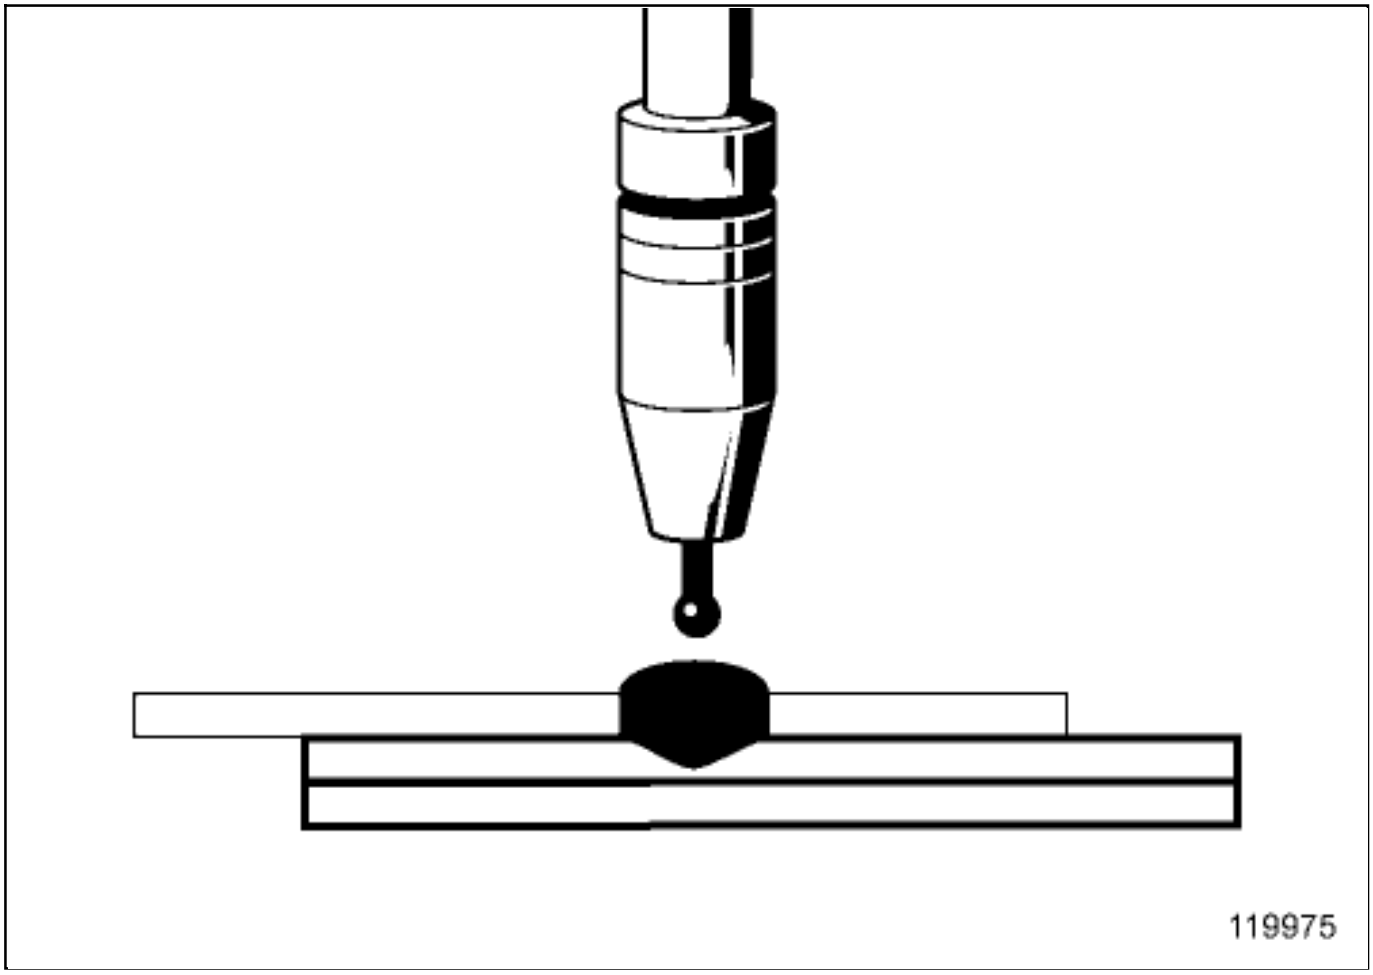
(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld**(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)** .

4- ASSEMBLY

1)ADJUSTING THE WELDER

GMAW plug welded joints.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2)CARRYING OUT THE WELDING

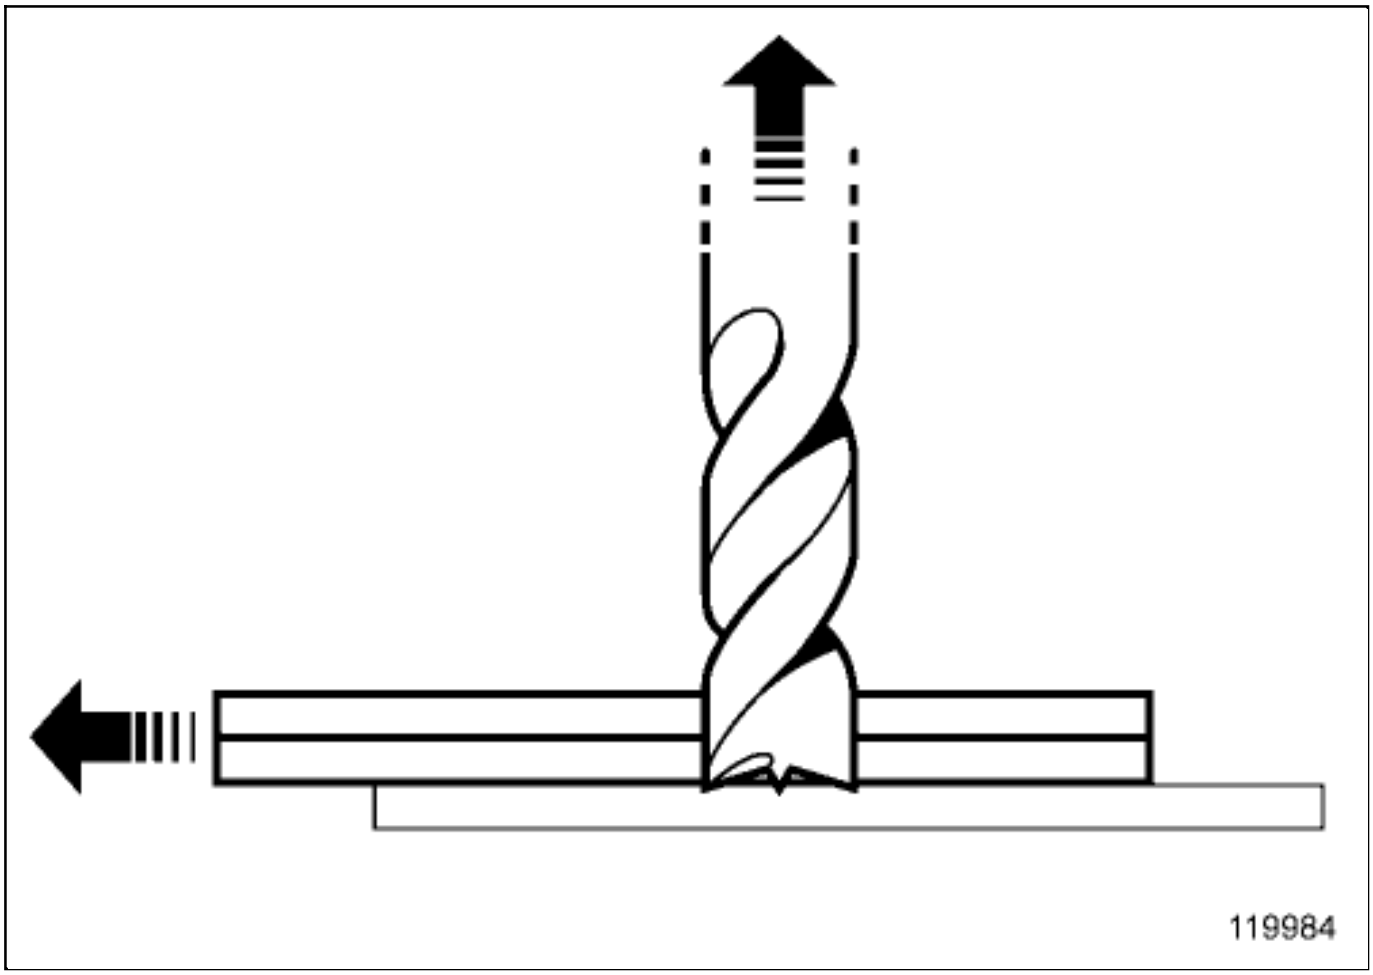
Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



5- FINISHING

Surface finishing the plug welds.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

5. SINGLE FACE ACCESS, FIRST AND SECOND PANELS TO BE REPLACED

1- DISMANTLING

Detach the first two panels of the assembly at the spot weld.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE REPLACEMENT PART

Drill the panels via the internal face at the existing joint

If there is no resistance weld spot in two thicknesses on the replacement part, drill the panels, respecting the following table:

Panel thickness (mm)	∅ drill bit (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

Scour the edges of the drilling holes on the internal and external faces

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)PREPARATION ON THE VEHICLE

Scour the internal face at the plug welds.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- APPLYING PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

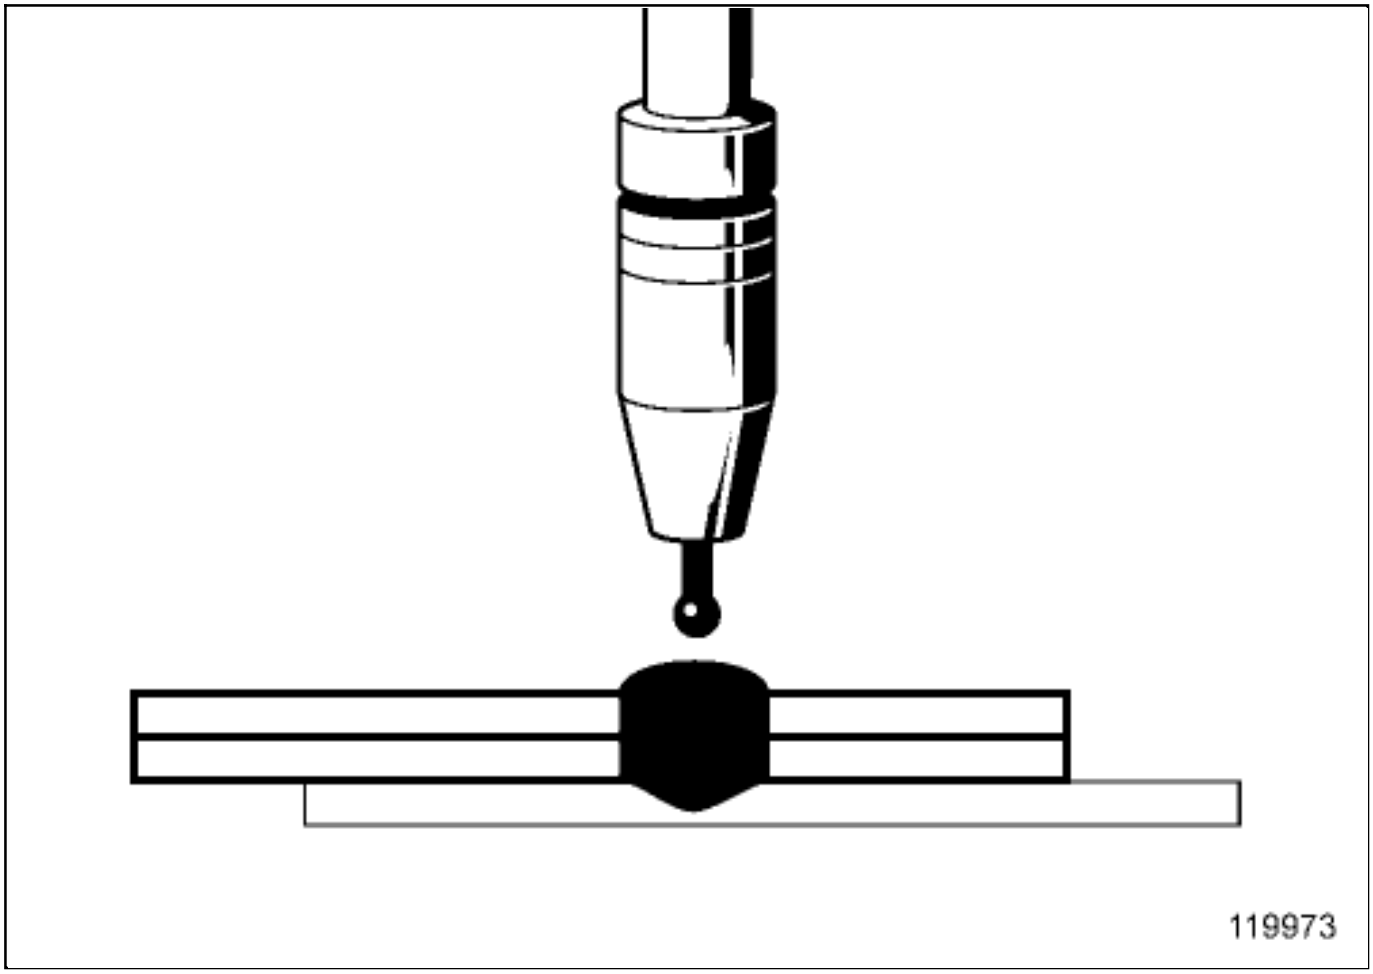
(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld**(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)** .

4- ASSEMBLY

1)ADJUSTING THE WELDER

GMAW plug welded joints.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2)CARRYING OUT THE WELDING

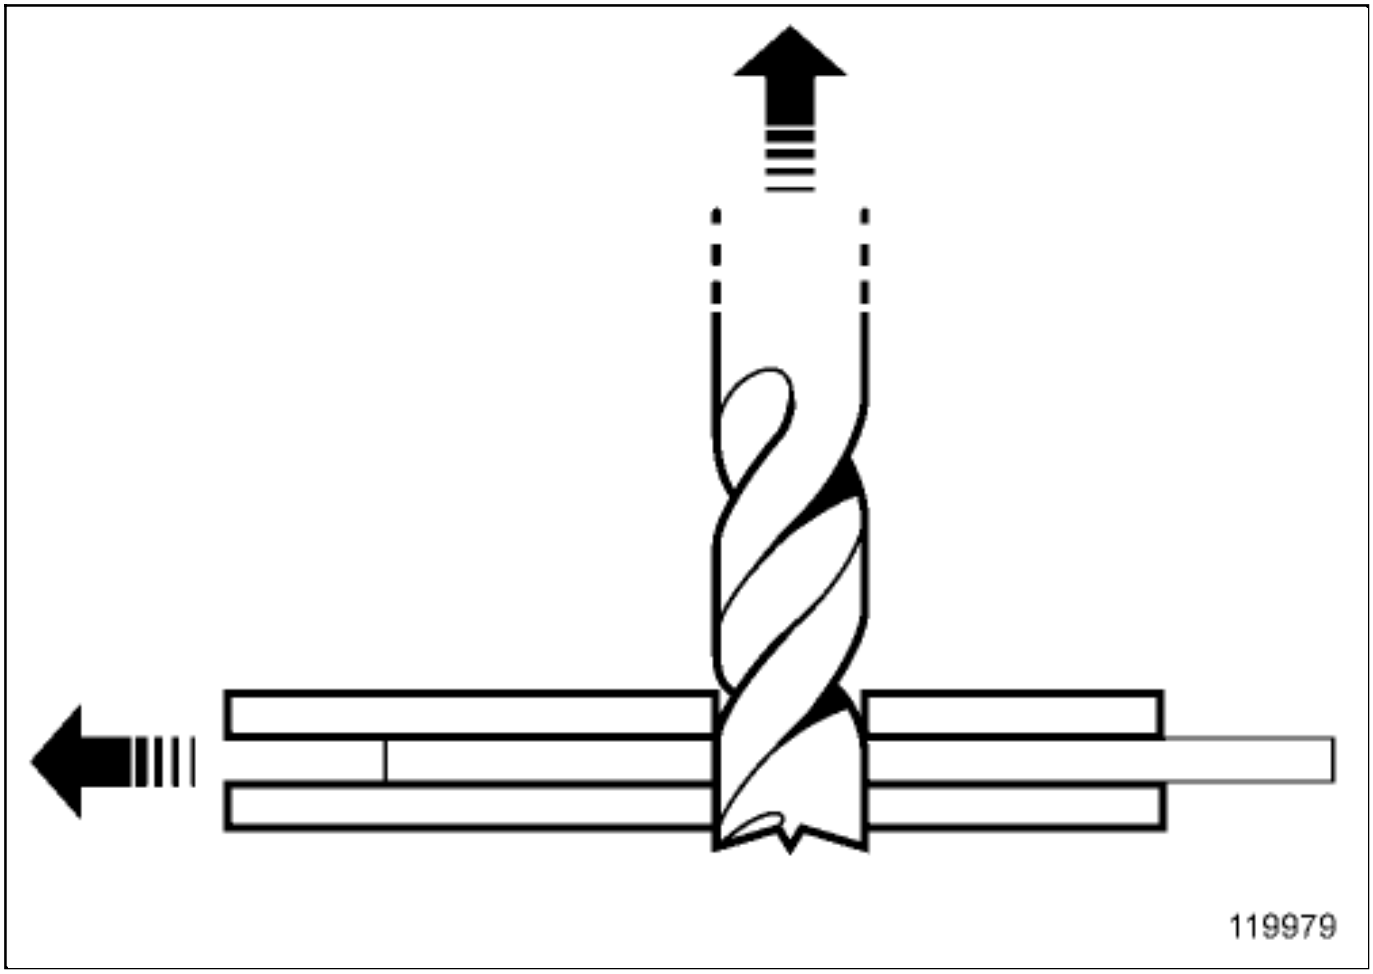
Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



5- FINISHING

Surface finishing the plug welds.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

6. SINGLE FACE ACCESS, FIRST AND THIRD PANELS TO BE REPLACED

1- DISMANTLING

Detach the assembly at the spot weld.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

2- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the joint areas.

Remove the replacement part.

1)PREPARATION OF THE REPLACEMENT PART

Drill the external panel without touching the second, respecting the following table:

Panel thickness (mm)	∅ drill bit (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

Scour the edges of the drilling holes on the external faces

If possible, scour the interface between the two panels of the replacement part, without damaging the mating faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2)PREPARATION ON THE VEHICLE

Scour the edges of the drilling holes on the internal and external faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

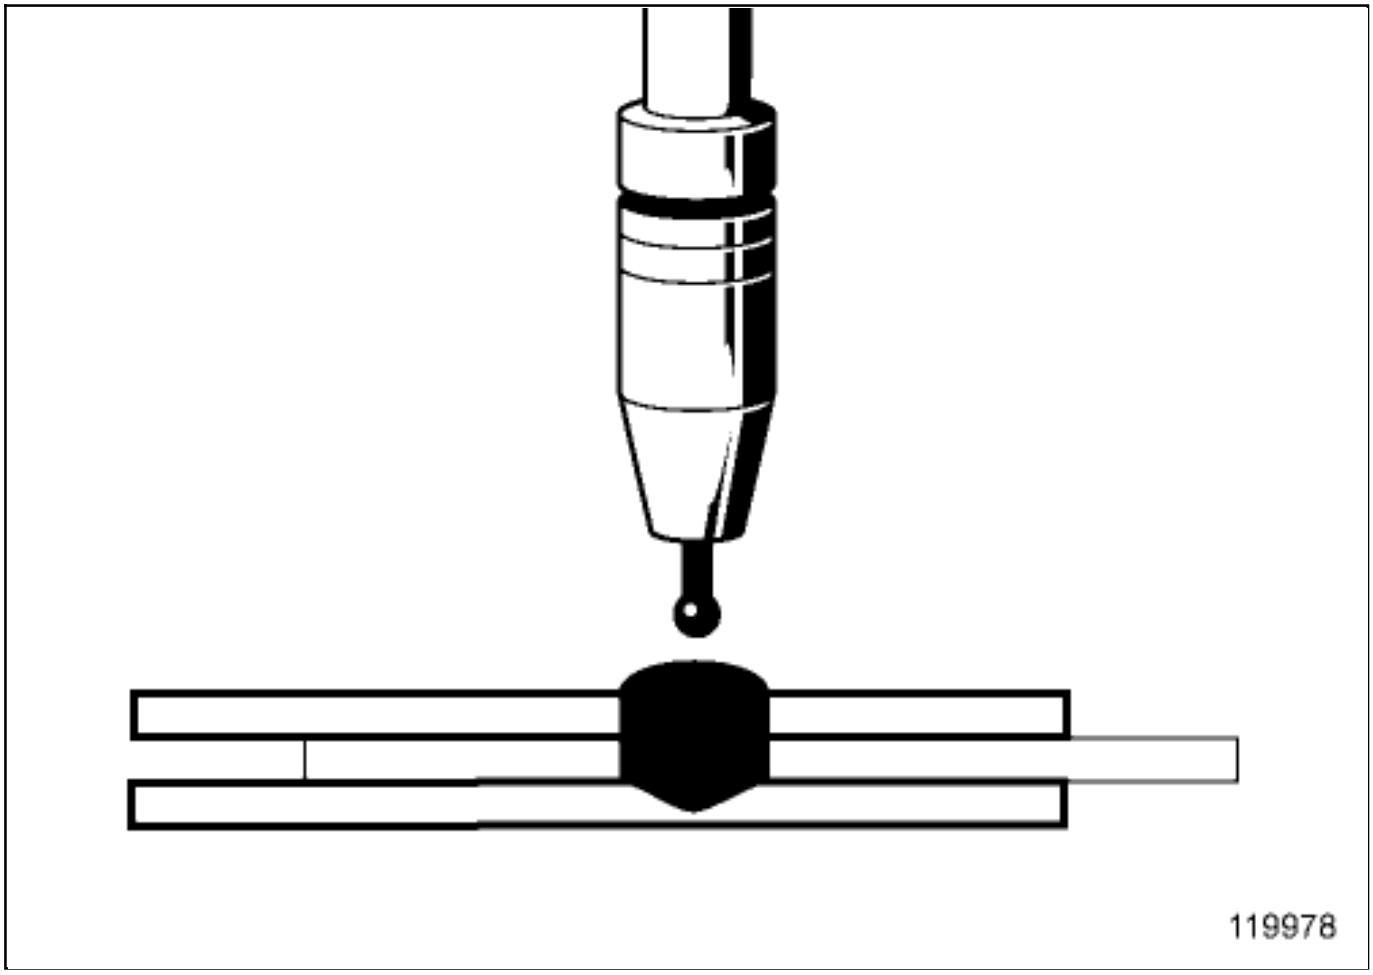
(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use) .

4- ASSEMBLY

1)ADJUSTING THE WELDER

GMAW plug welded joints.



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2)CARRYING OUT THE WELDING

Reposition the replacement part, adjust it and fix it using the locking pliers.

Reassemble the adjacent components if necessary and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

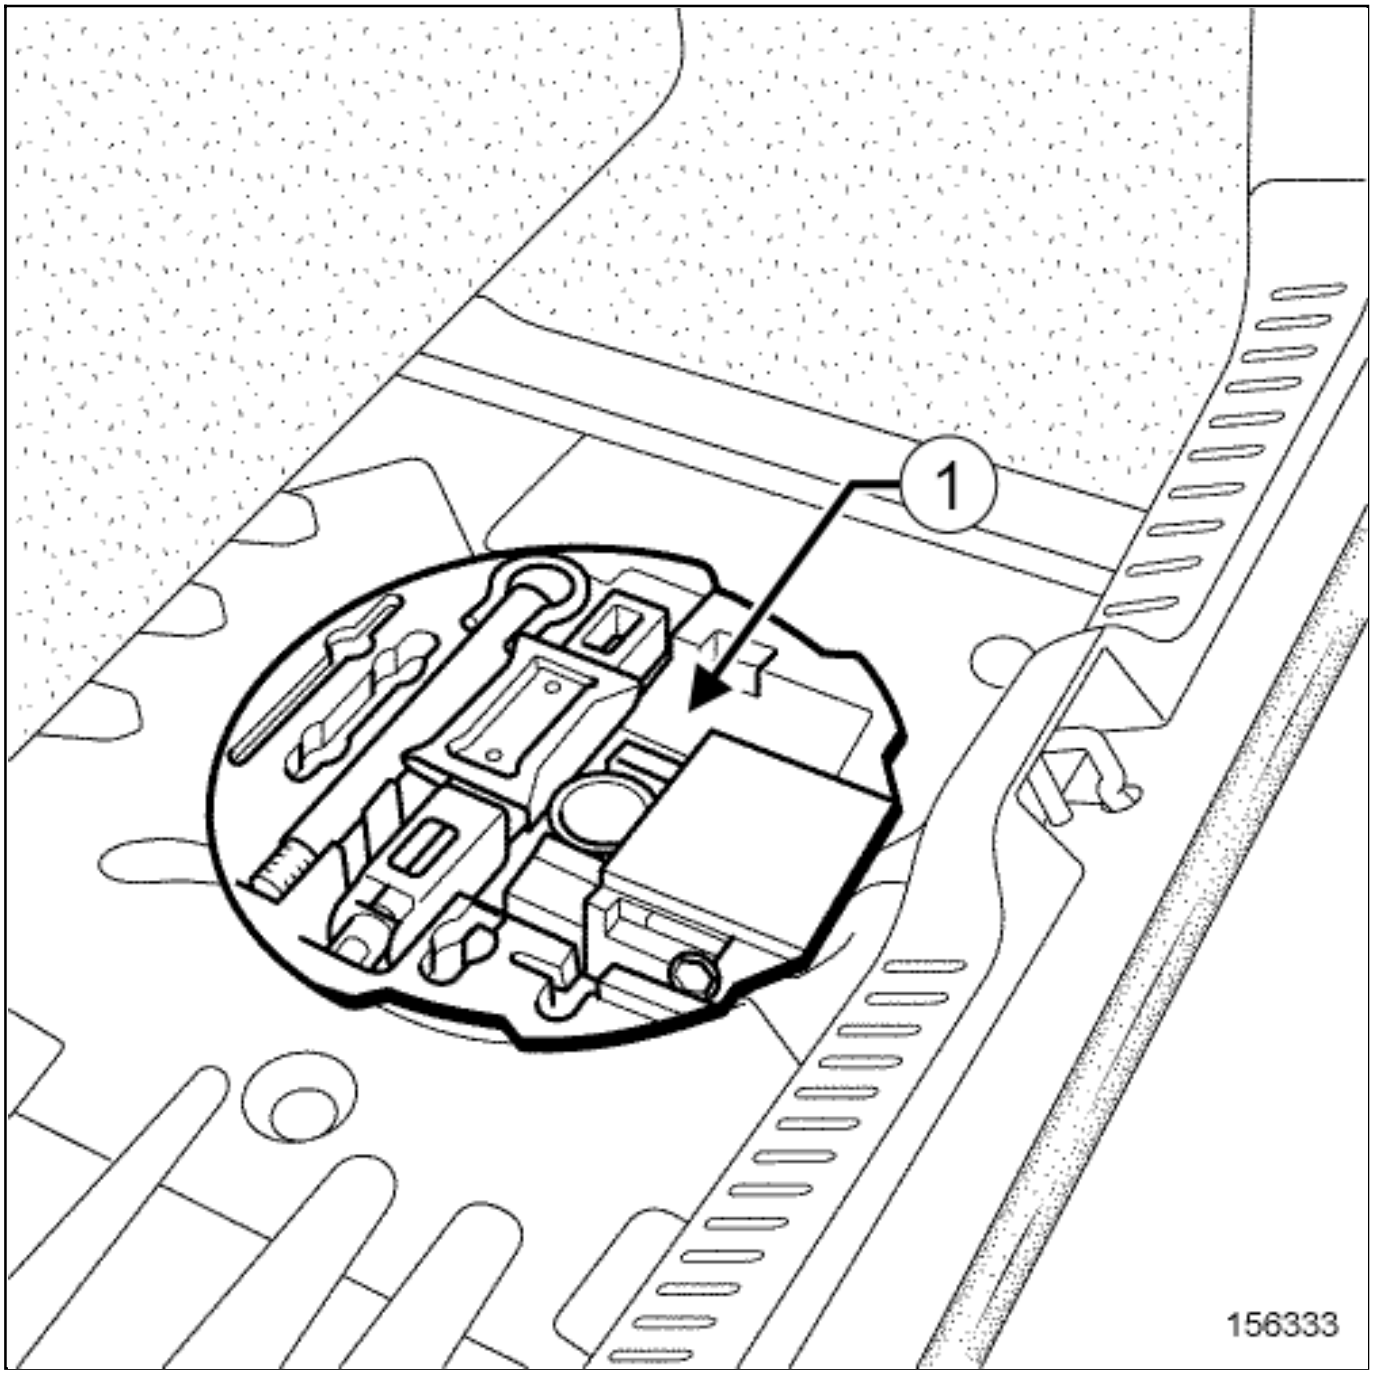
5- FINISHING

Surface finishing the plug welds.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

EMERGENCY SPARE WHEEL WINCH: REMOVAL - REFITTING

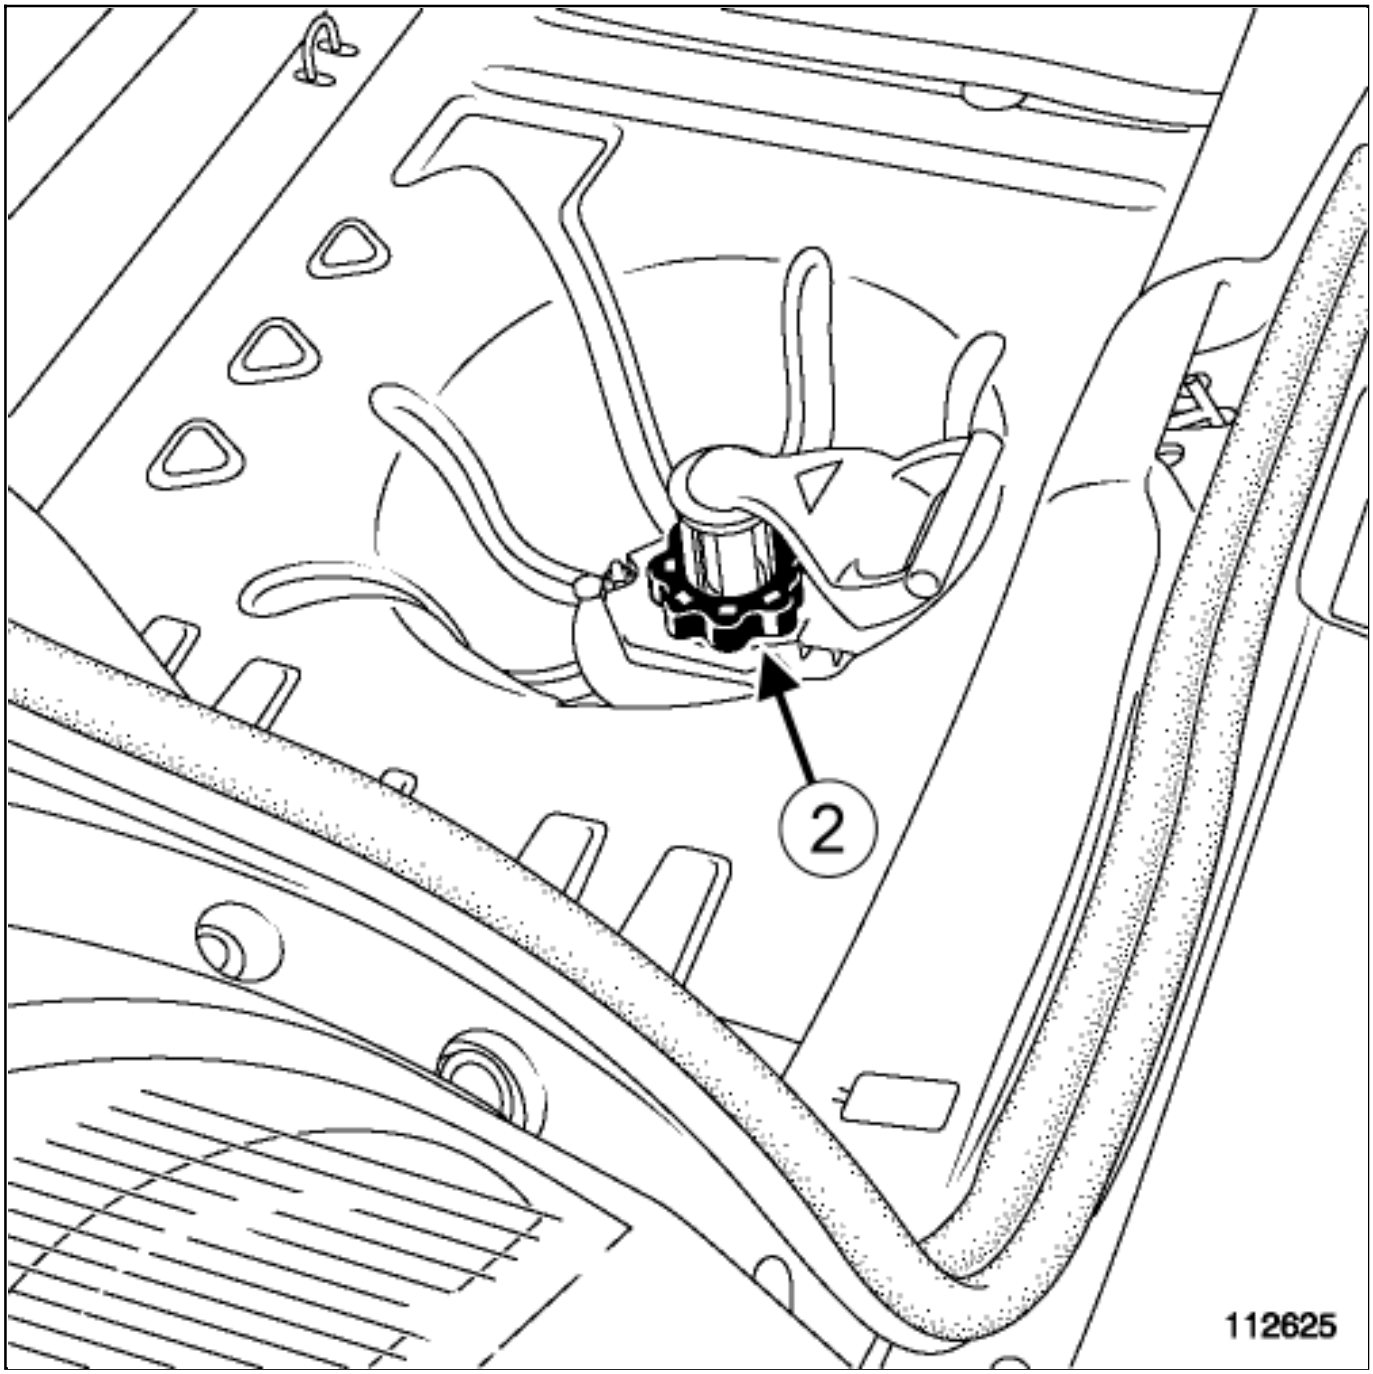
Note, one or more warnings are present in this procedure



WARNING

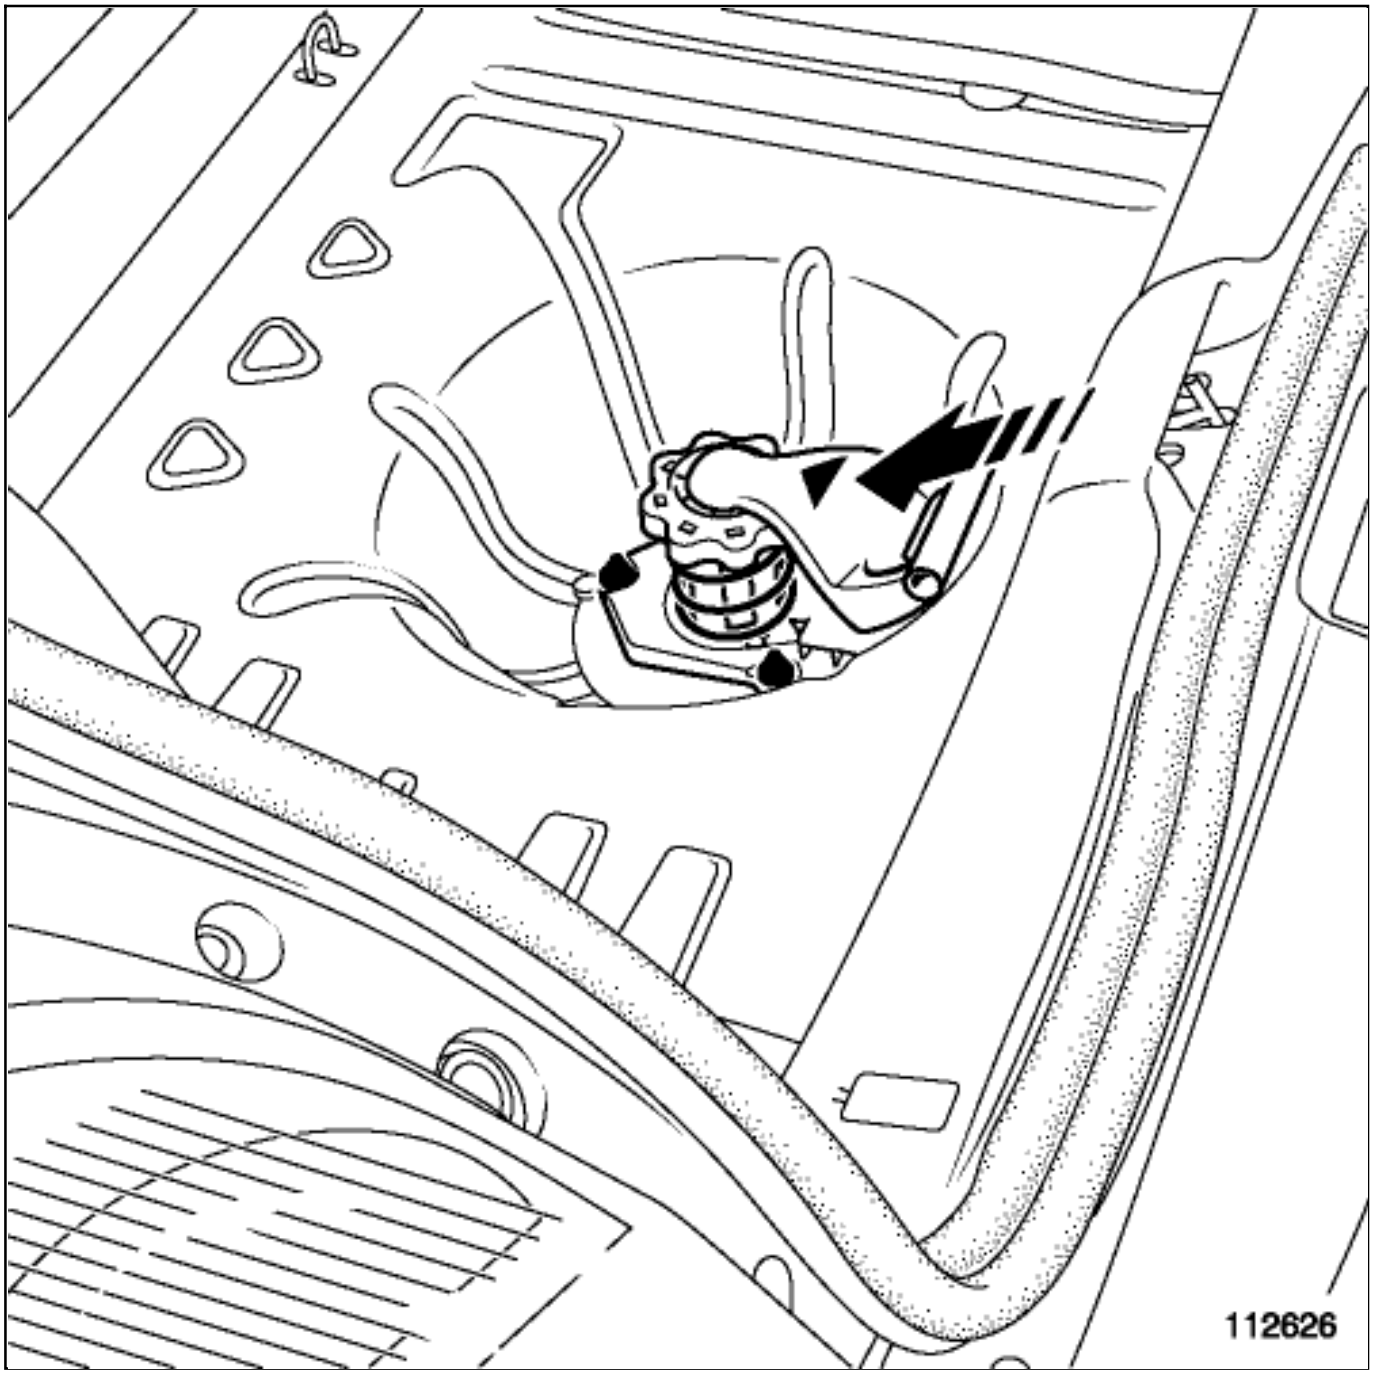
Only manipulate the emergency spare wheel lashing system when the vehicle is on the ground.

REMOVAL

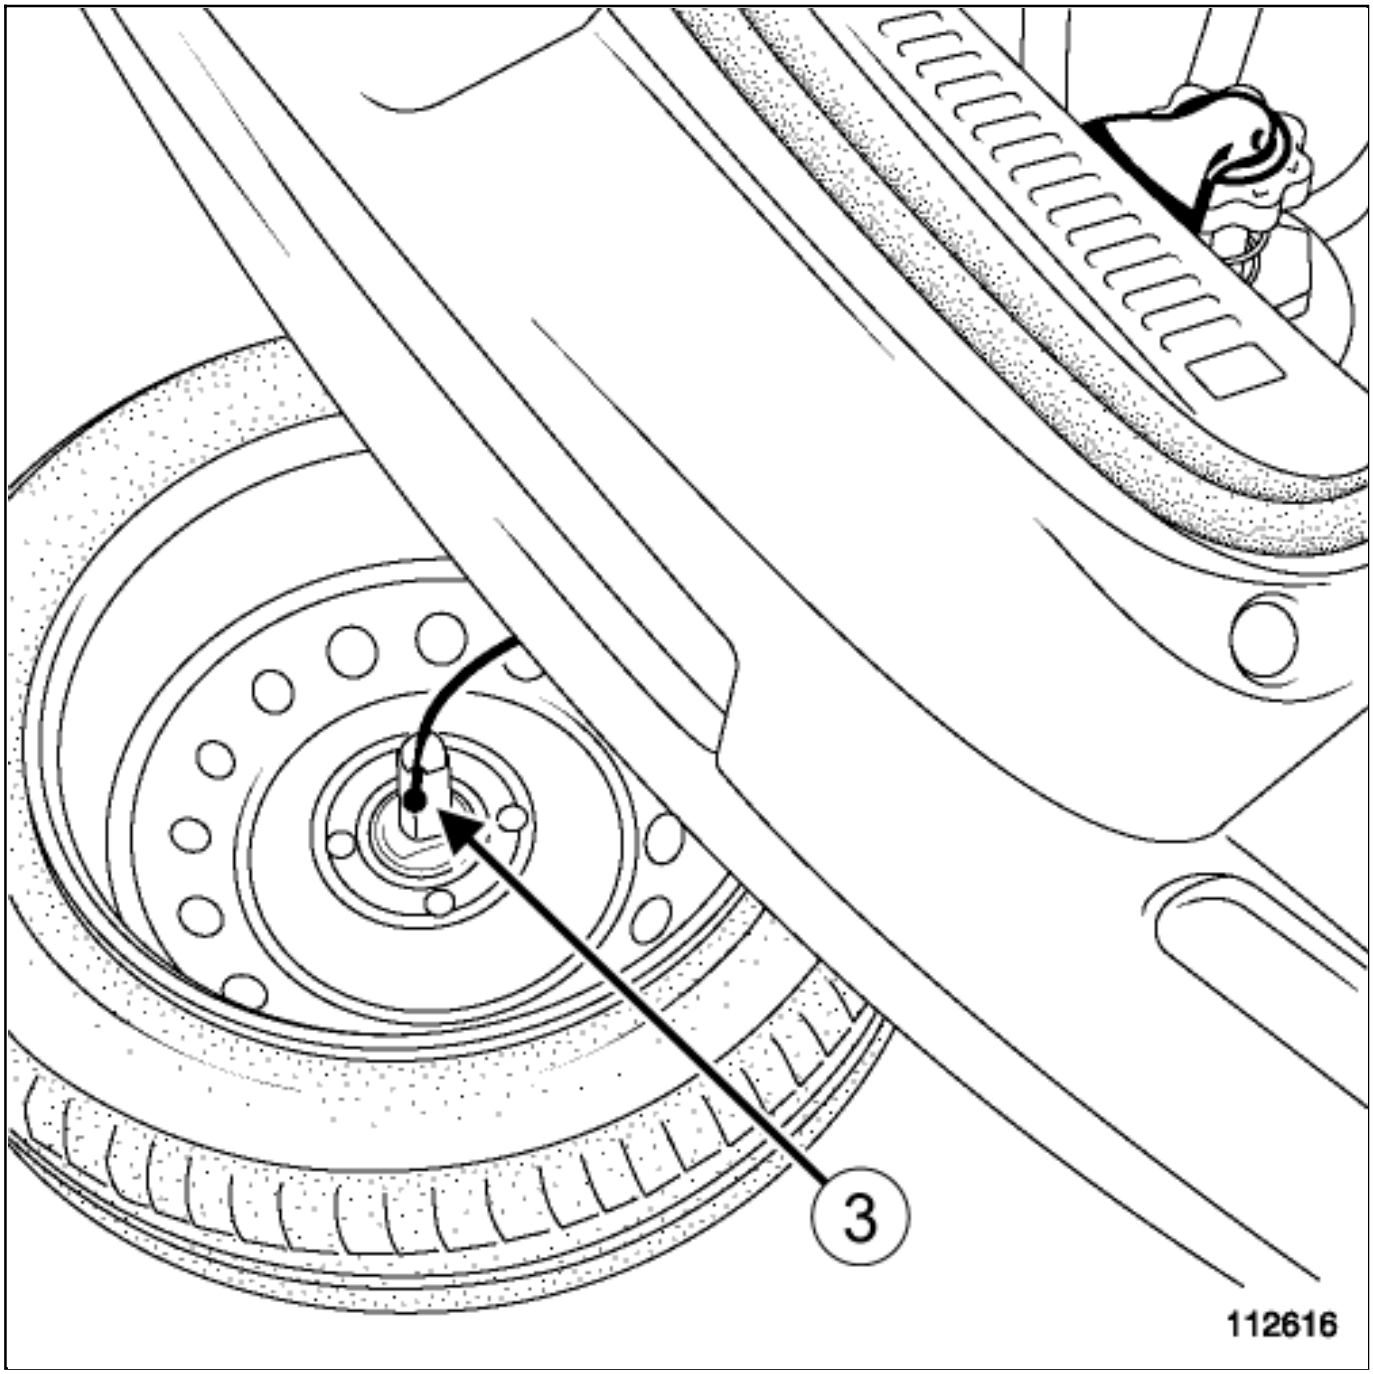


1. REMOVAL PREPARATION OPERATION

- Open the vehicle's boot.
- Lift the luggage compartment carpet.

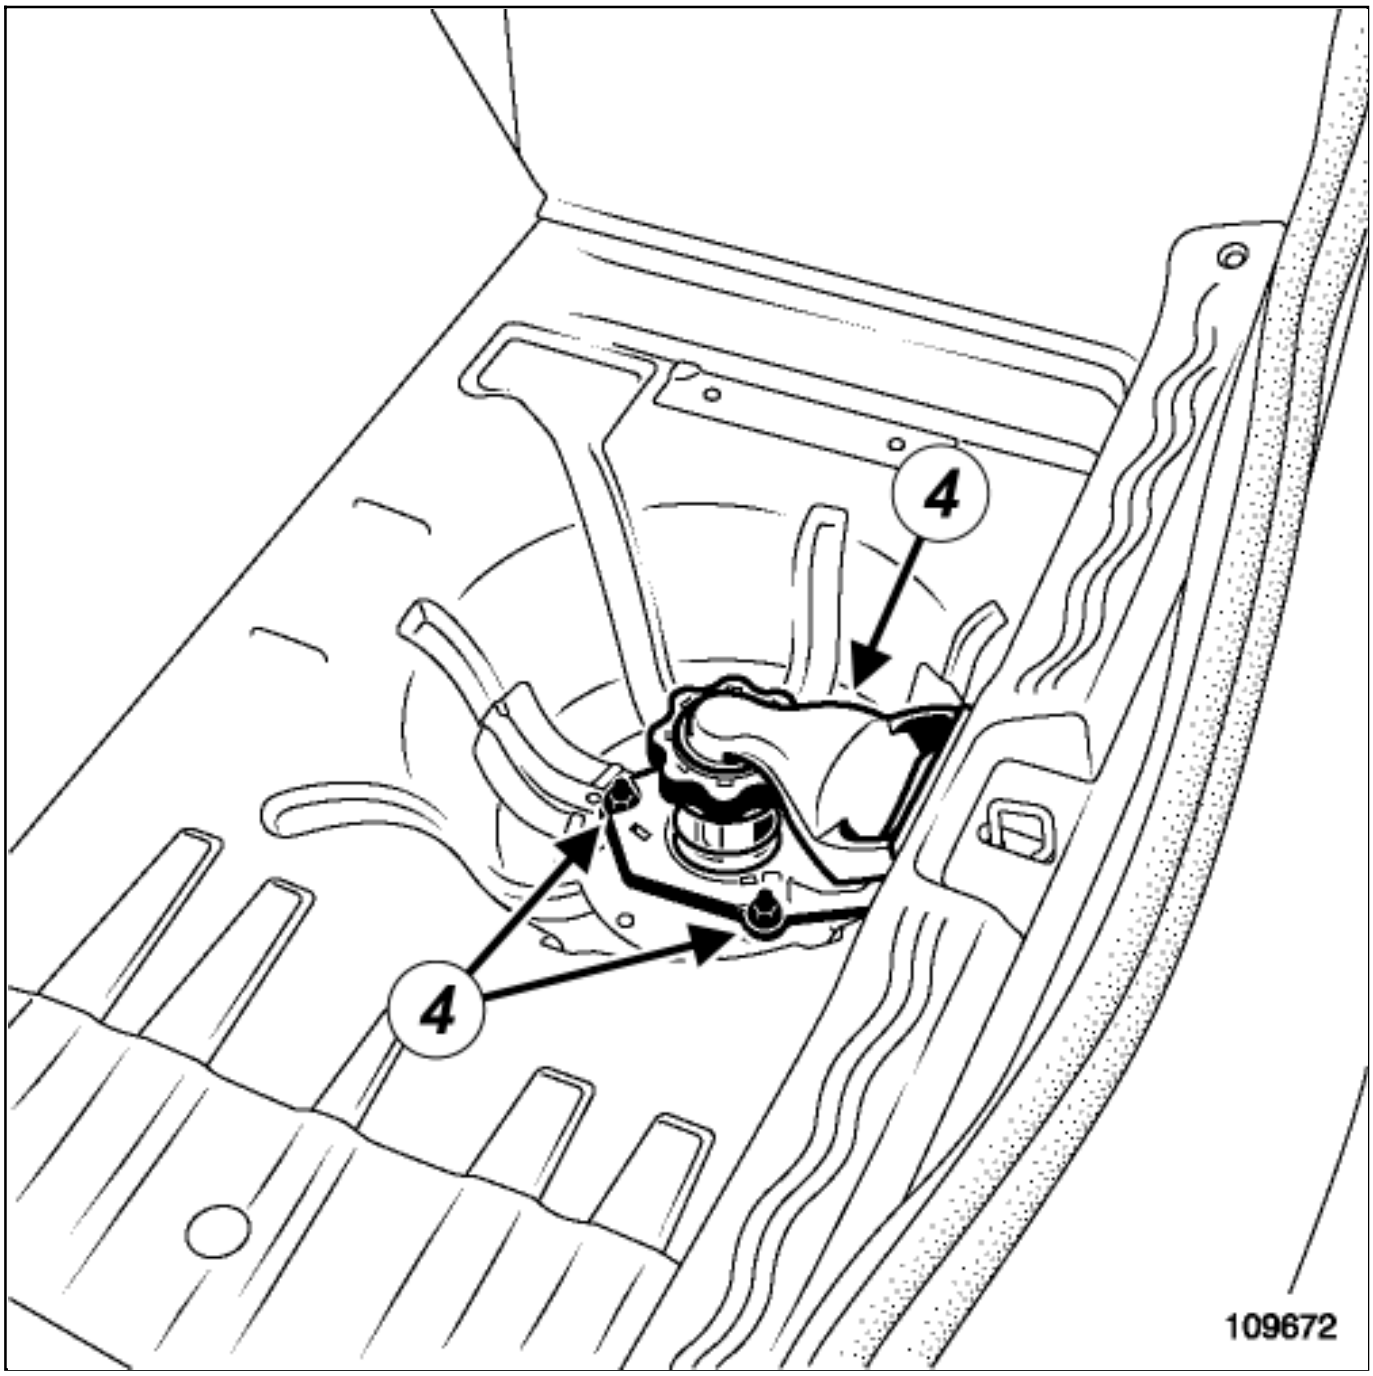


Remove:



- the emergency spare wheel cover,
- the emergency spare wheel compartment(1) .

Fully undo the white wheel(2) .



Press the arrow several times until the emergency spare wheel falls on to the ground.

- Remove the winch cable(3) from its housing.

- Remove the emergency spare wheel.

2. REMOVAL OPERATION

Remove:

- the winch mounting nuts(4) ,
- the emergency spare wheel winch.

REFITTING

1. REFITTING PREPARATION OPERATION

Note:

The handle and winch are sold unassembled when purchased as a spare part. Assemble the two components for fitting operations.

To assemble, clip the plastic cup located at the end of the cable onto the winch.

2. REFITTING OPERATION

Refit:

- the emergency spare wheel winch,
- the winch mounting nuts.

3. FINAL OPERATION

Place the winch cable back into the housing.

Pull the winch lever to reposition the emergency spare wheel.

Tighten the white wheel whilst holding the lever.

Continue tightening until you hear a click.

Check that the emergency spare wheel has been correctly attached.

Refit the emergency spare wheel cover.

Refit the boot carpet.

Close the boot.

ENGINE - GEARBOX ASSEMBLY: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Support for removal - refitting of engine - gearbox assembly	Mot. 1390

Equipment required
refrigerant charging station

parts always to be replaced:
seal between catalytic converter and exhaust downpipe hose

WARNING

Wear protective gloves during the operation.

CAUTION

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

CAUTION

To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

Locations and specifications (tightening torques, parts always to be replaced, etc.)Engine-gearbox unit support assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the battery Battery: Removal - Refitting ,
- the air filter unit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the front wheels Front hub carrier assembly: Exploded view ,
- the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the engine undertray bolts,
- the engine undertray.

Drain:

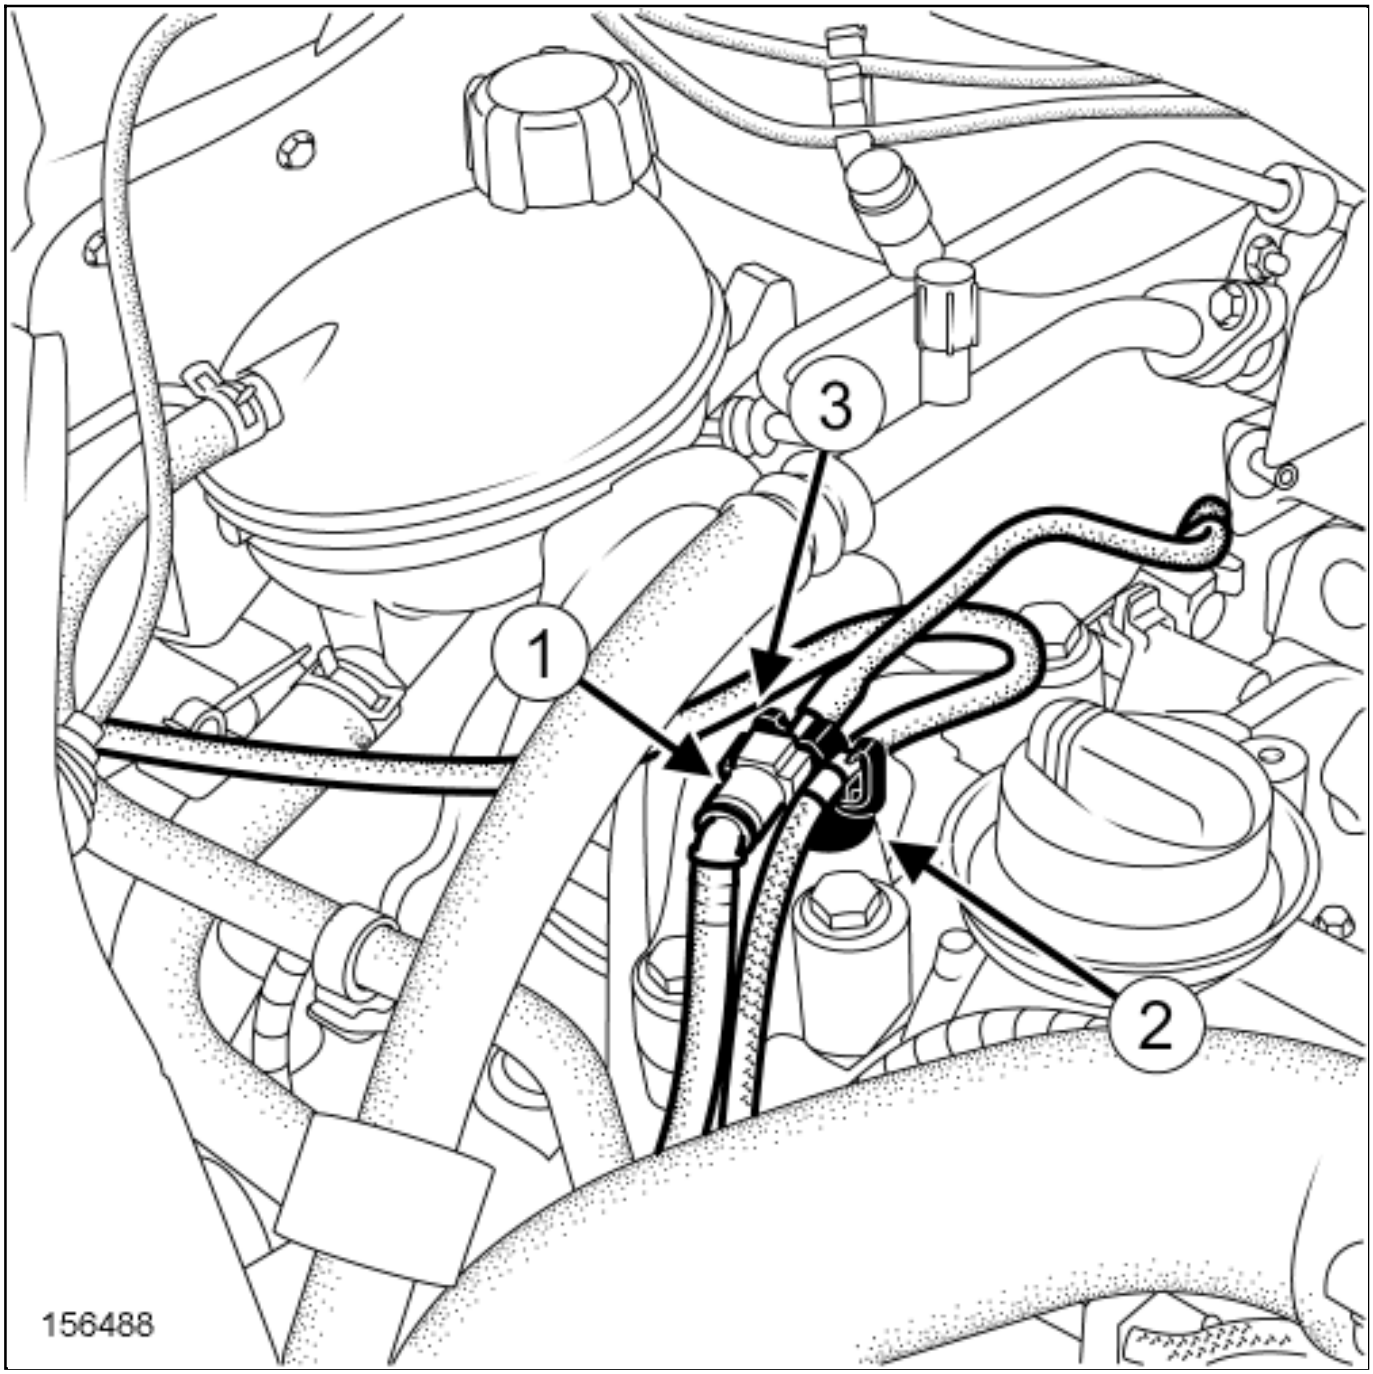
- the cooling circuit (see 19A, Cooling, Cooling system: Draining - Refilling) ,
- the automatic gearbox Automatic gearbox oil: Draining - Filling ,
- the engine oil if necessary (see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

Remove:

- the turbocharger air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the intercooler air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,

- the air inlet pressure sensor from the turbo-manifold air inlet pipe(see **Engine and transmission assembly sensors: List and location of components**) ,
- the petrol vapour rebreather pipe from the turbo-manifold air inlet pipe.

Remove using the toolRemote operation pliers for hose clips.(**Mot. 1448**) **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** :



- the upper cooling hose clip from the cooling radiator,
- the bottom cooling hose clip from the cooling radiator.

Disconnect **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** :

- the upper cooling hose from the cooling radiator,
- the bottom cooling hose from the cooling radiator.

Remove:

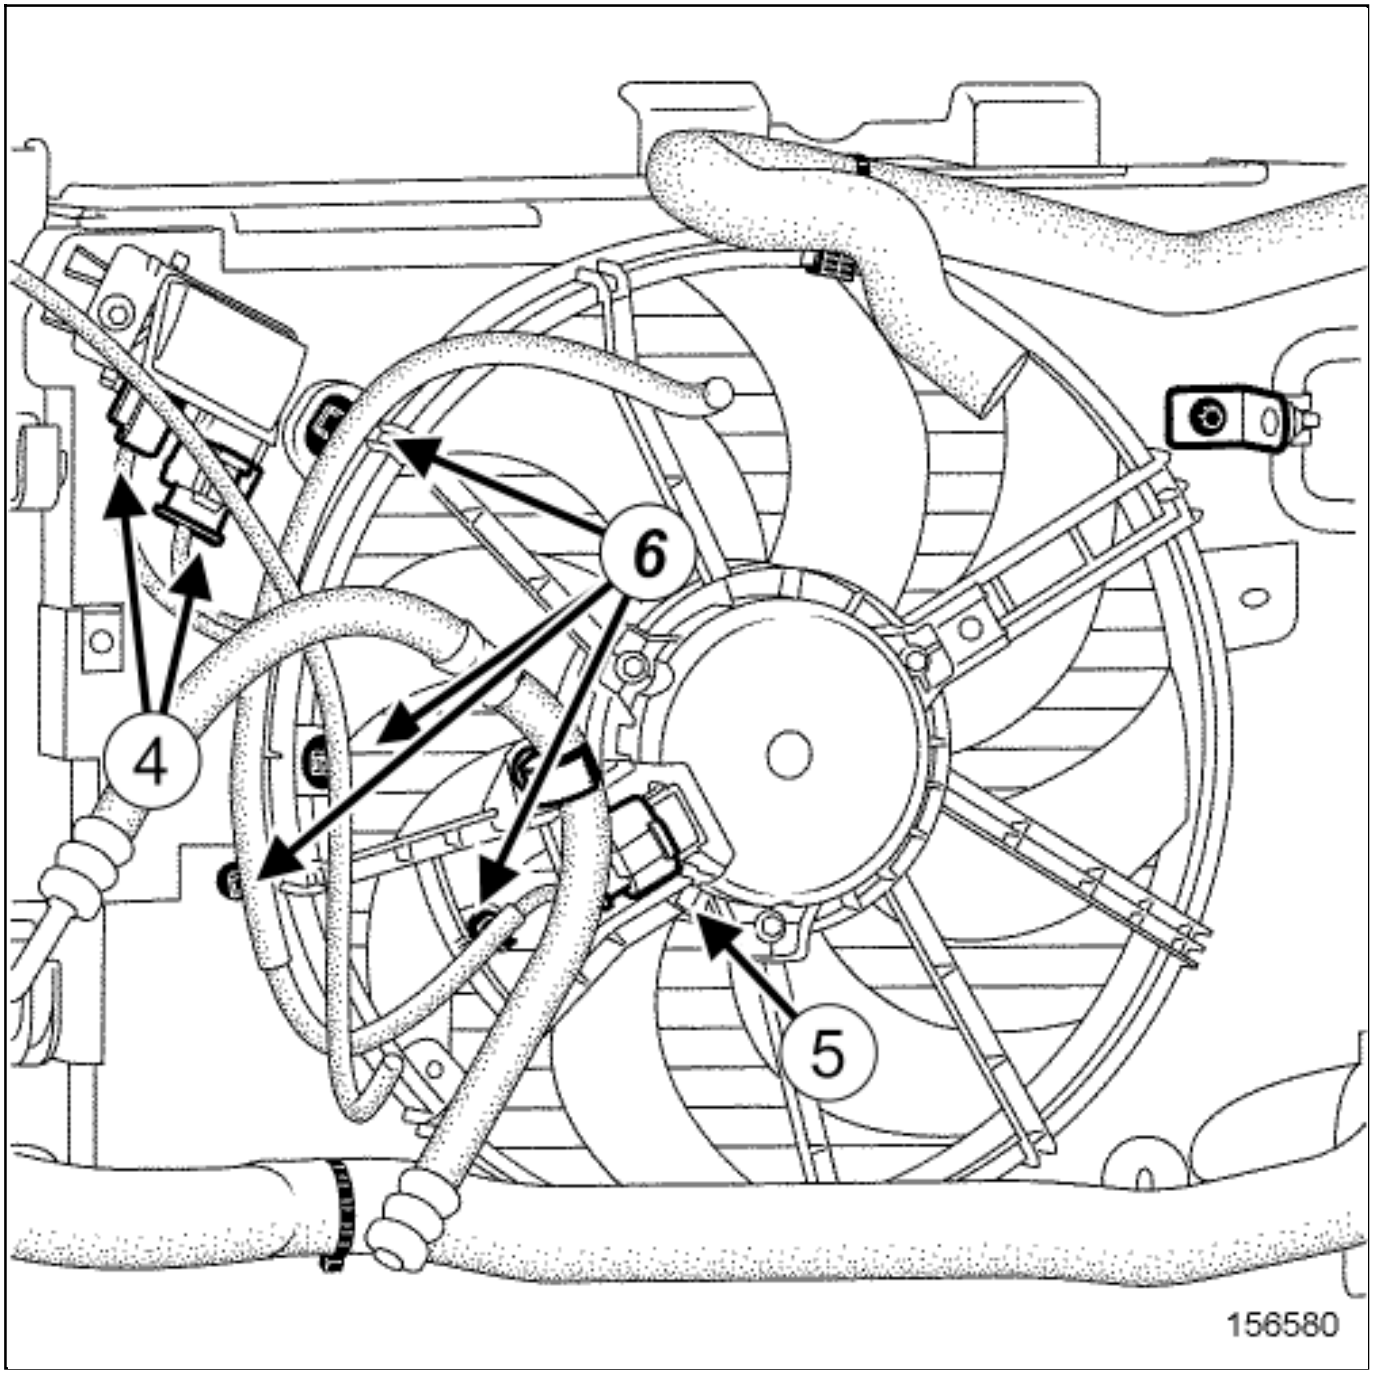
- the engine tie-bar**Engine-gearbox unit support assembly: Exploded view** ,
- the front left-hand wheel driveshaft**Front hub carrier assembly: Exploded view** ,
- the front right-hand wheel driveshaft**Front right-hand driveshaft: Removal - Refitting** .

Disconnect the fuel supply pipe(1) .

Insert the blanking plugs.

Unclip:

- the fuel vapour pipe(2) ,



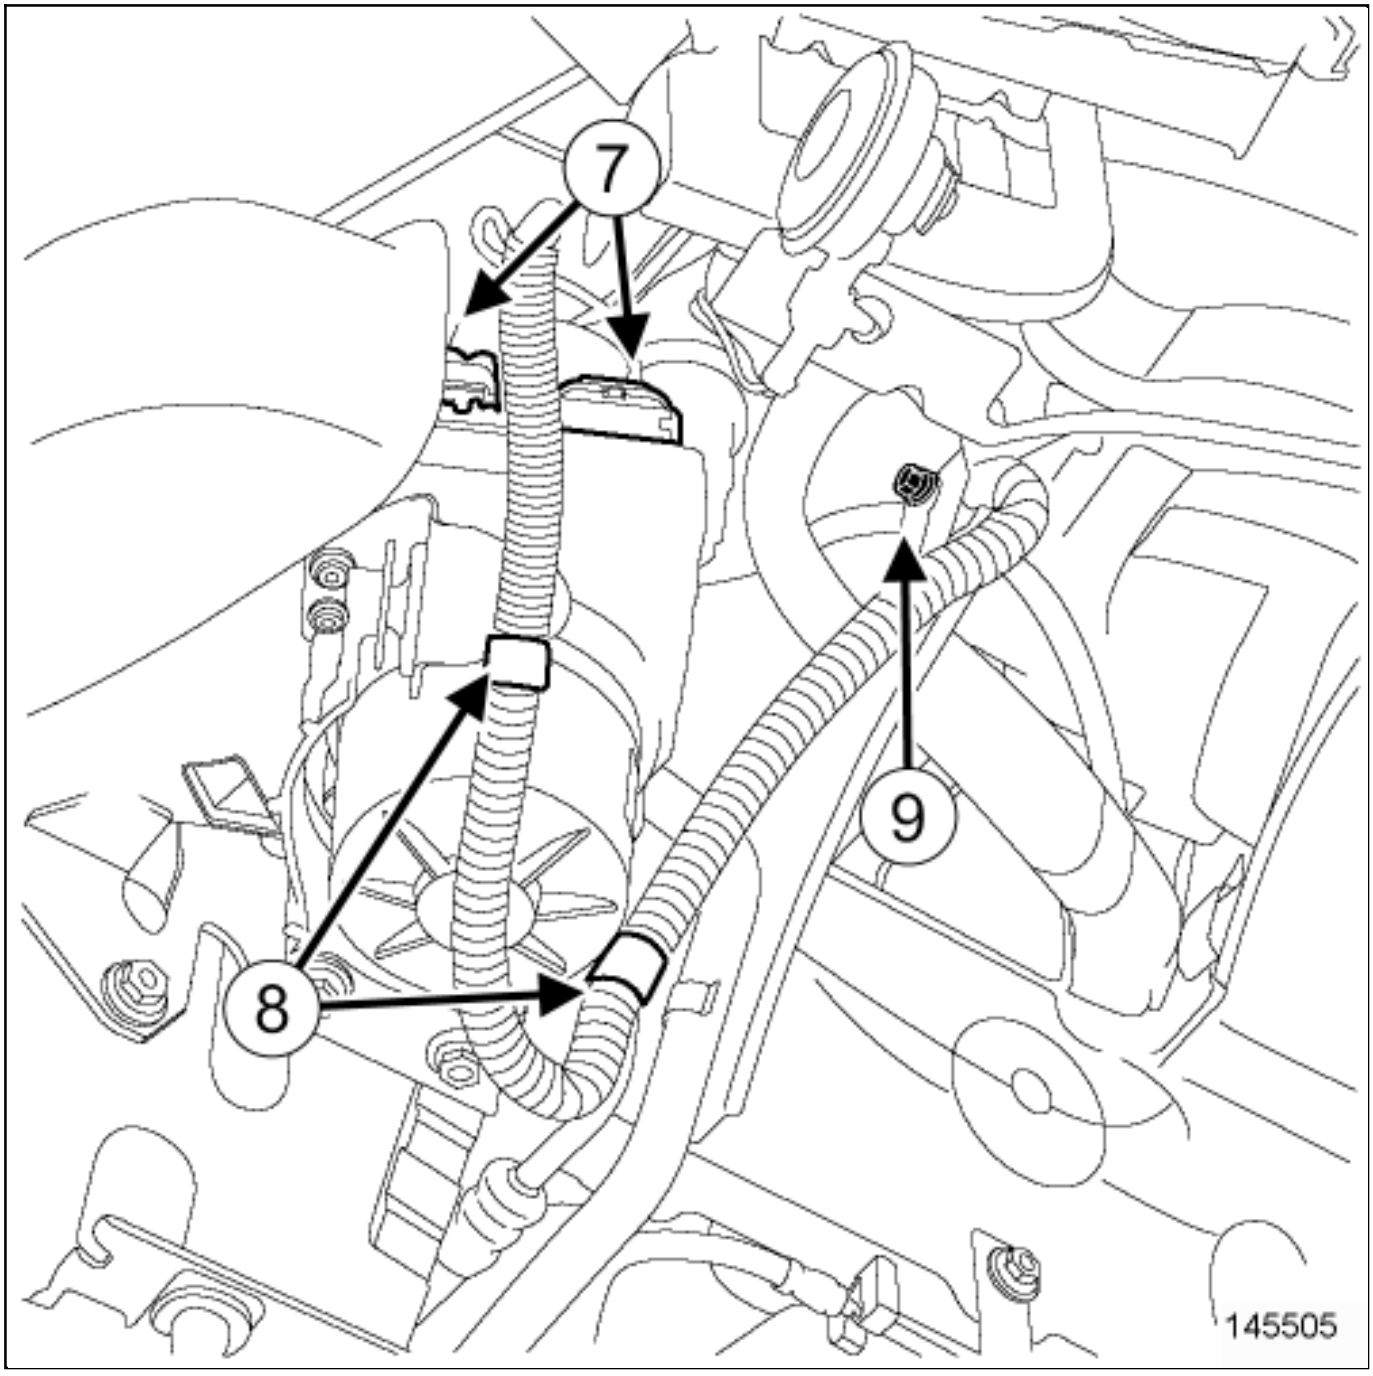
the fuel supply pipe(3) .

Disconnect:

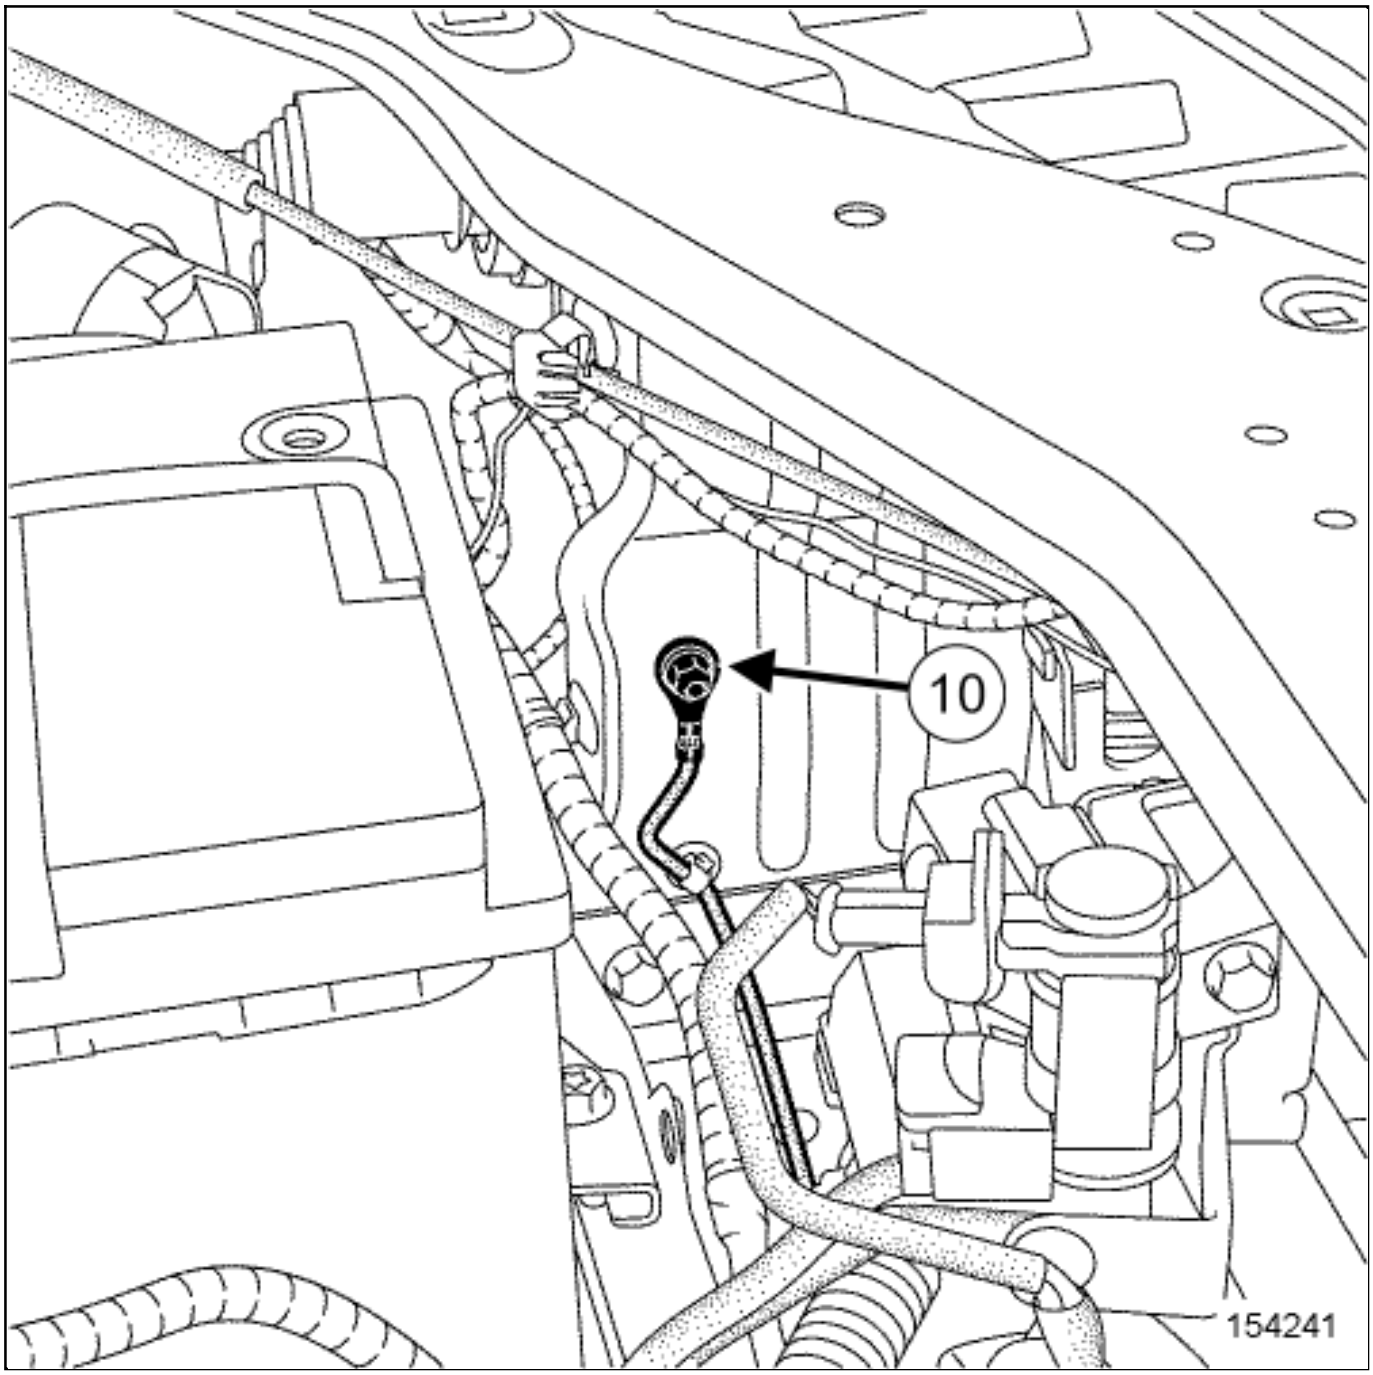
- the fuel vapour absorber pipe,
- the solenoid valve connector.

Unclip the fuel vapour absorber wiring from the support.

Move aside the wiring.

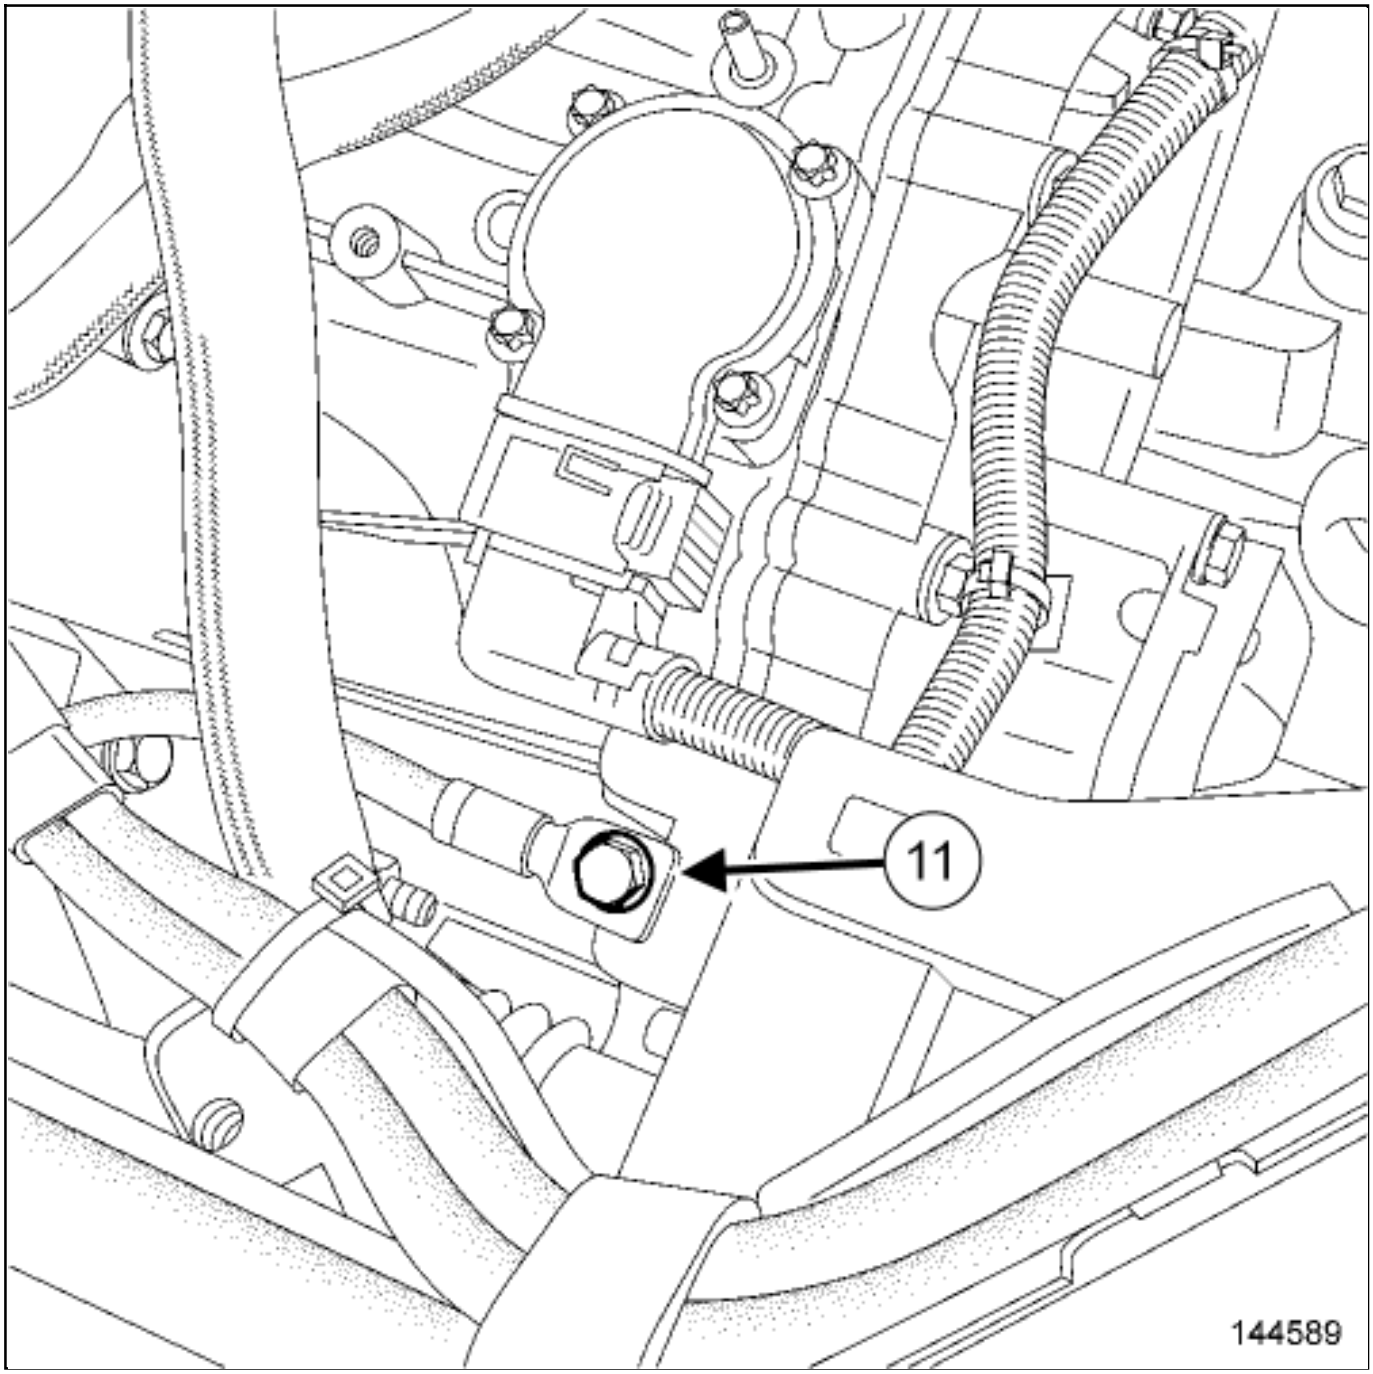


Disconnect from the cooling fan assembly:

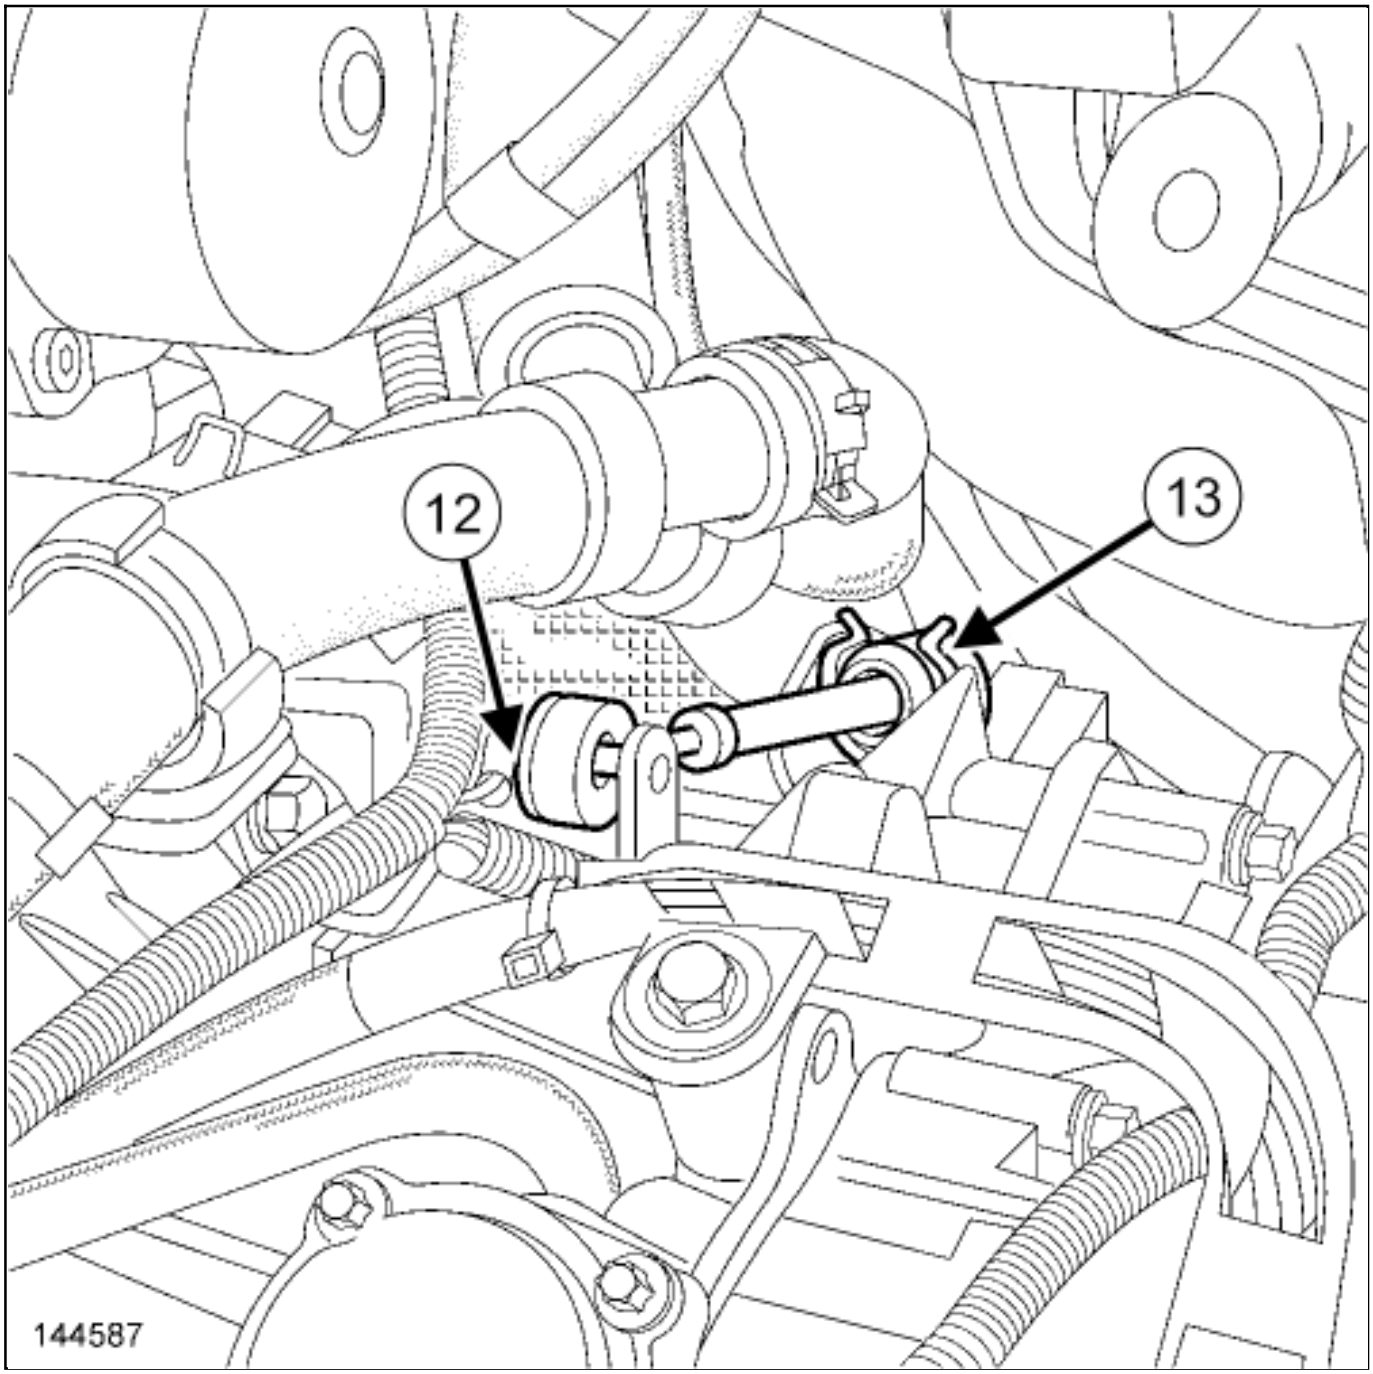


- the engine cooling fan assembly resistor connector(4) ,
- the fan connector(5) of the engine cooling fan assembly.

Unclip the cooling fan assembly wiring at(6) .

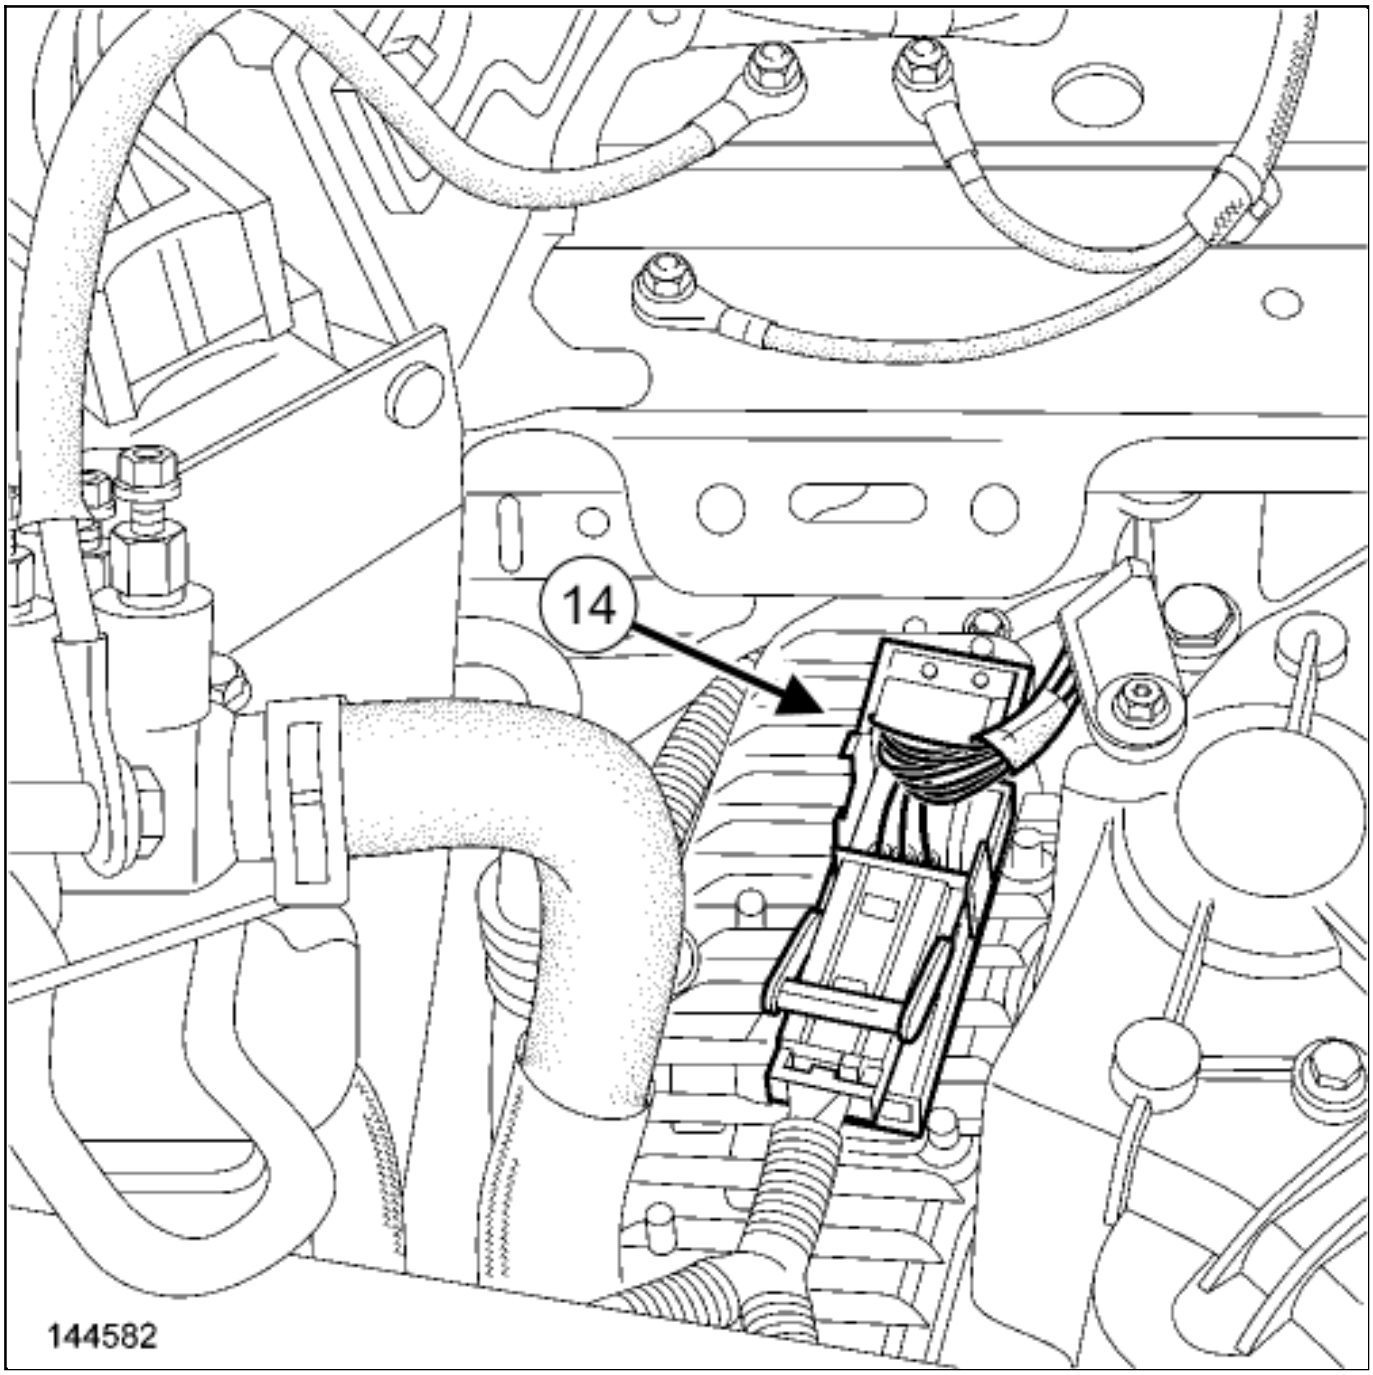


Move aside the cooling fan assembly wiring.

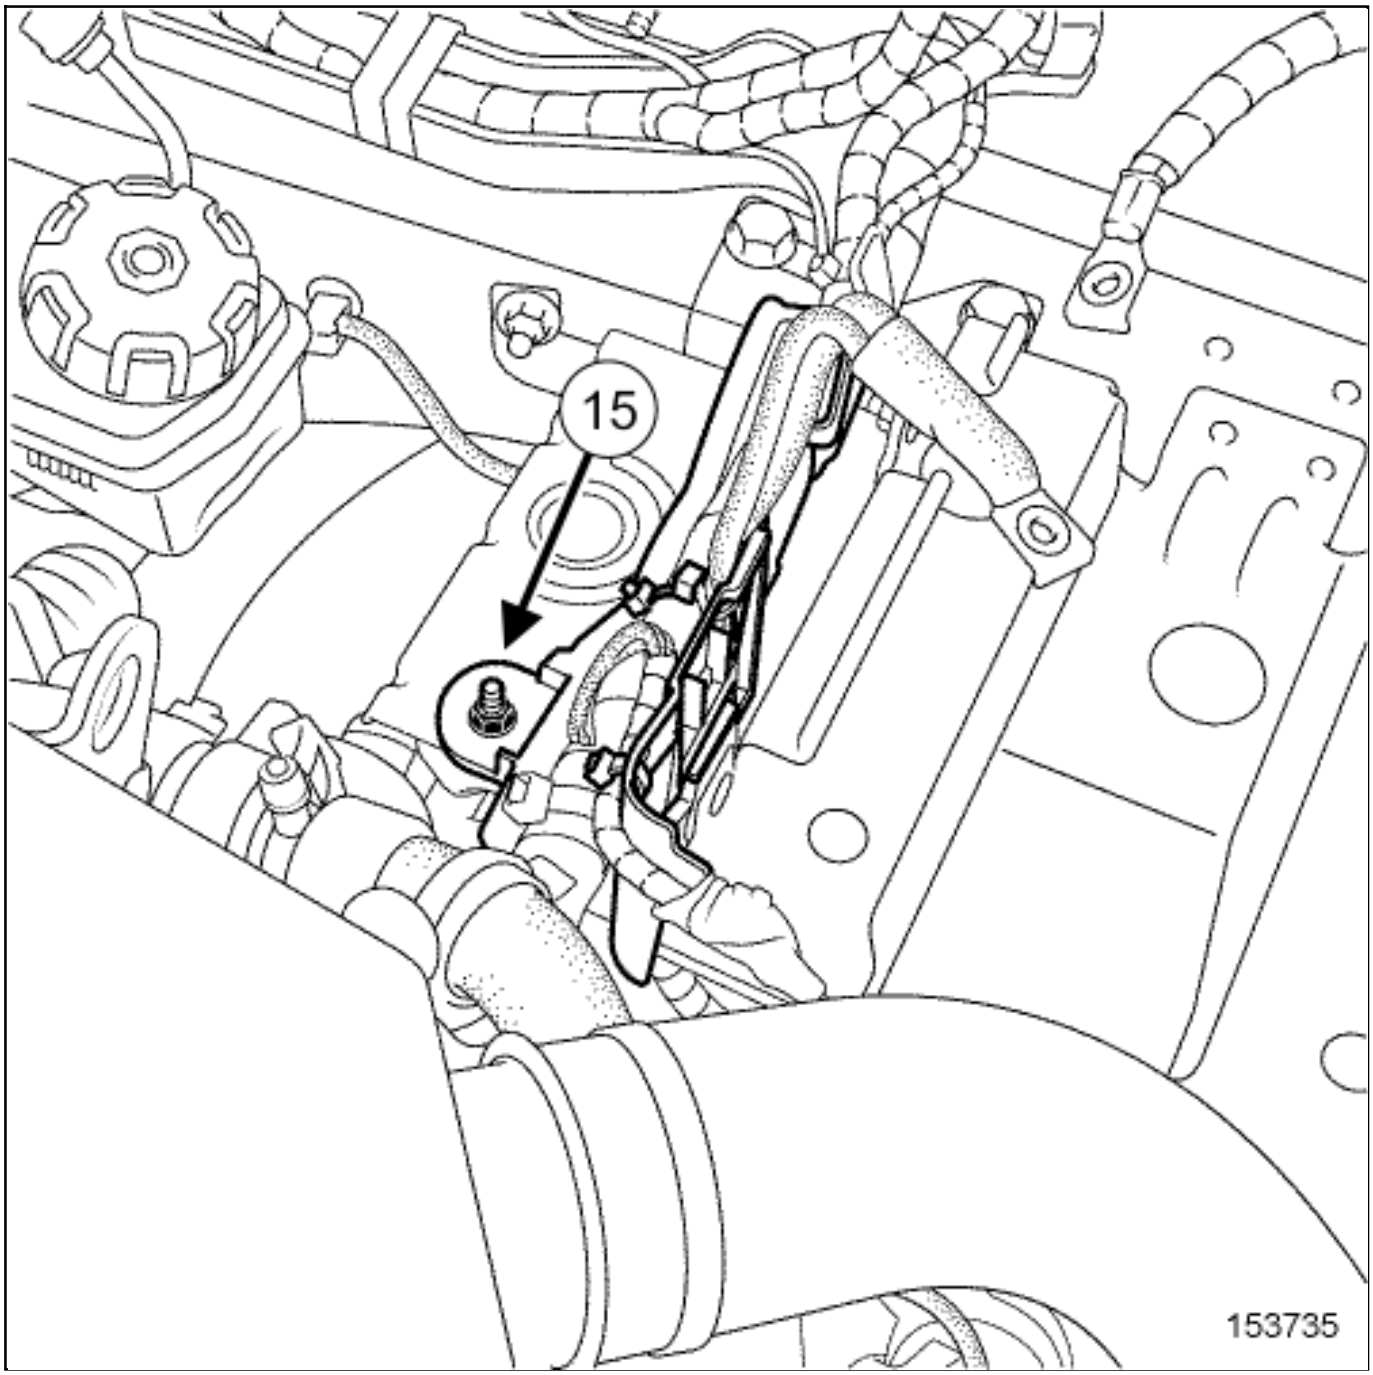


- Disconnect the pump assembly connectors(7) .
- Unclip the pump assembly wiring at(8) .
- Remove the nut(9) from the earth strap on the body.

Remove the nut(10) from the earth strap on the body.

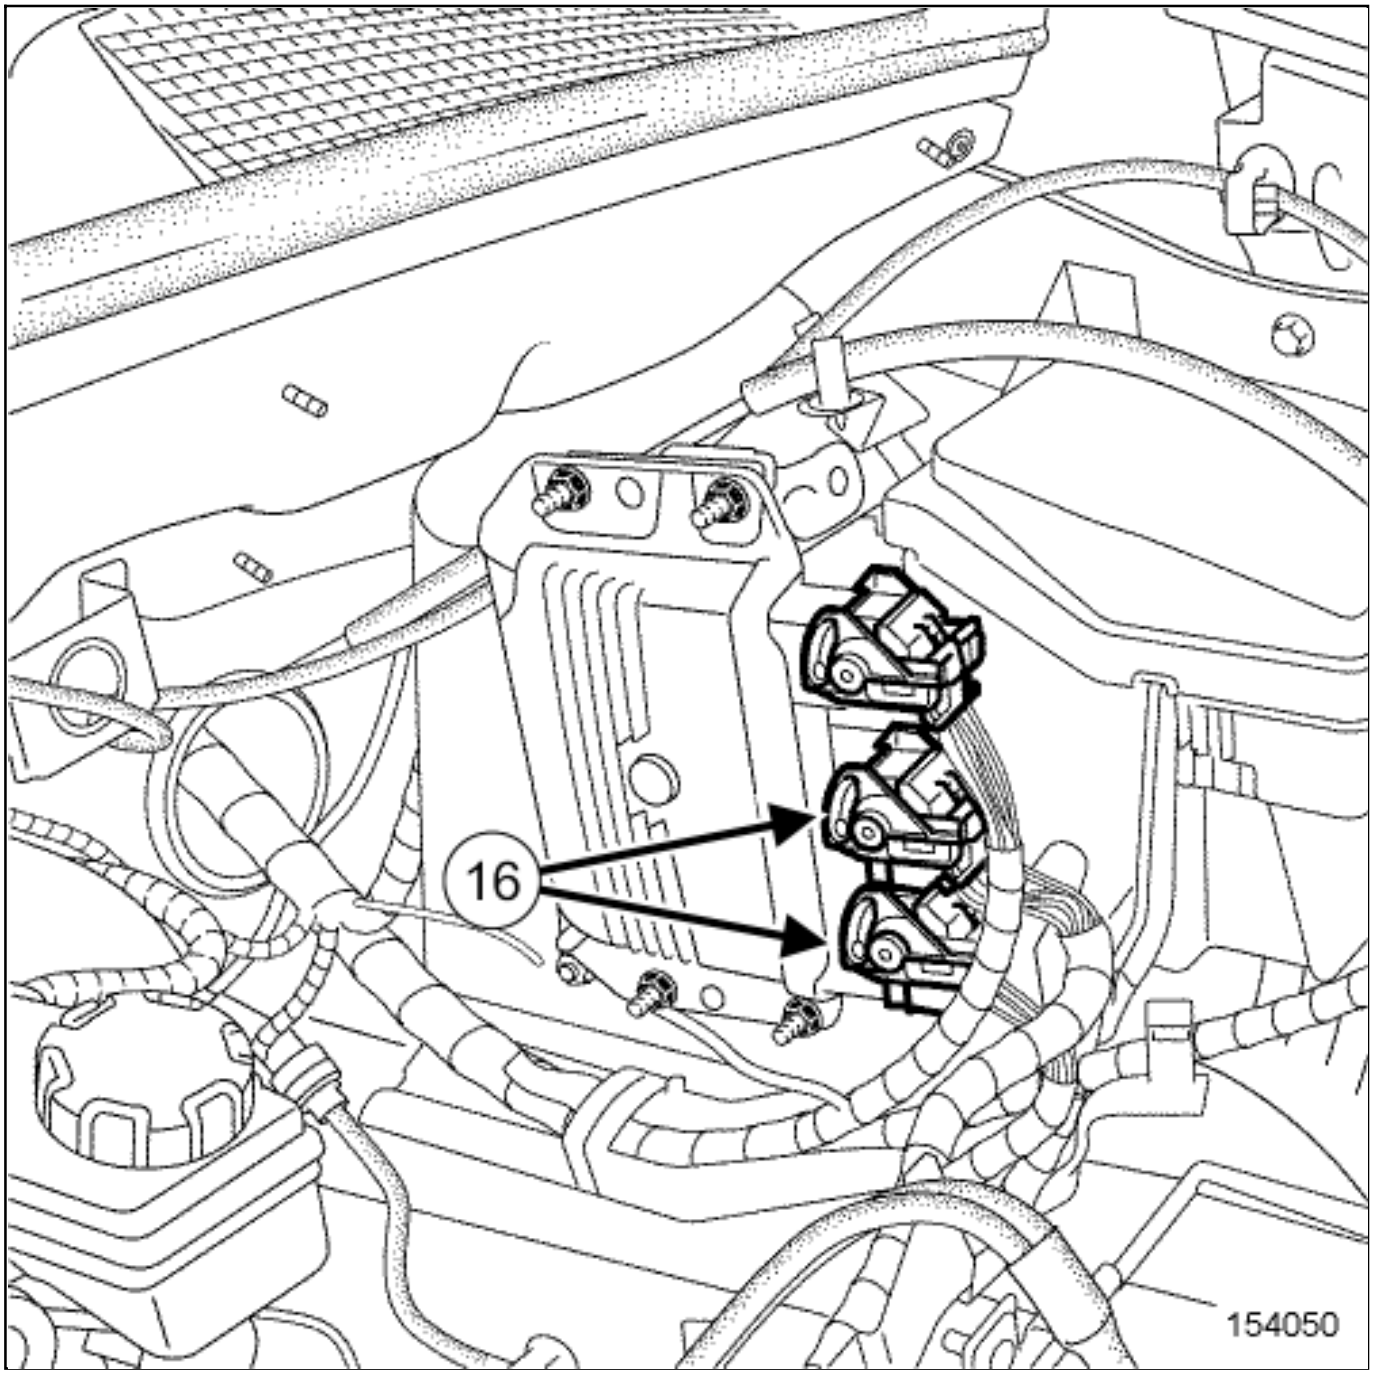


Remove the earth wire bolt(11) on the automatic gearbox.

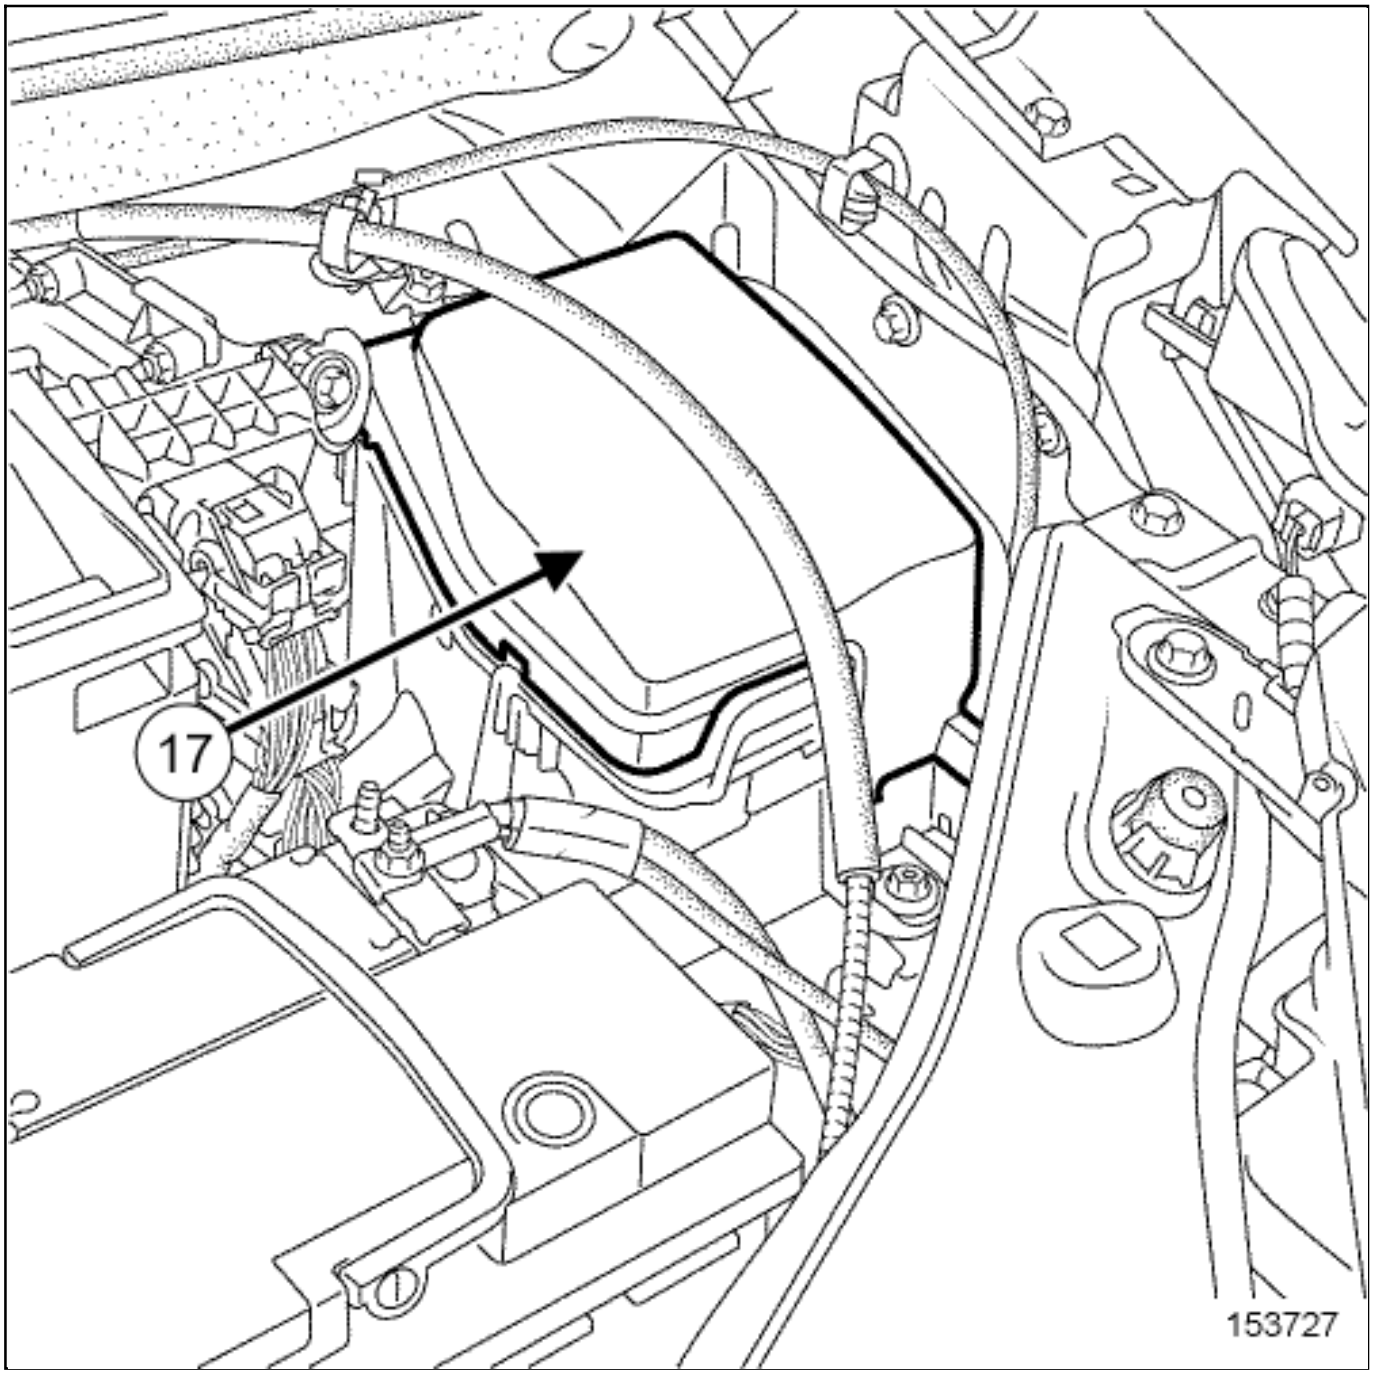


Unclip:

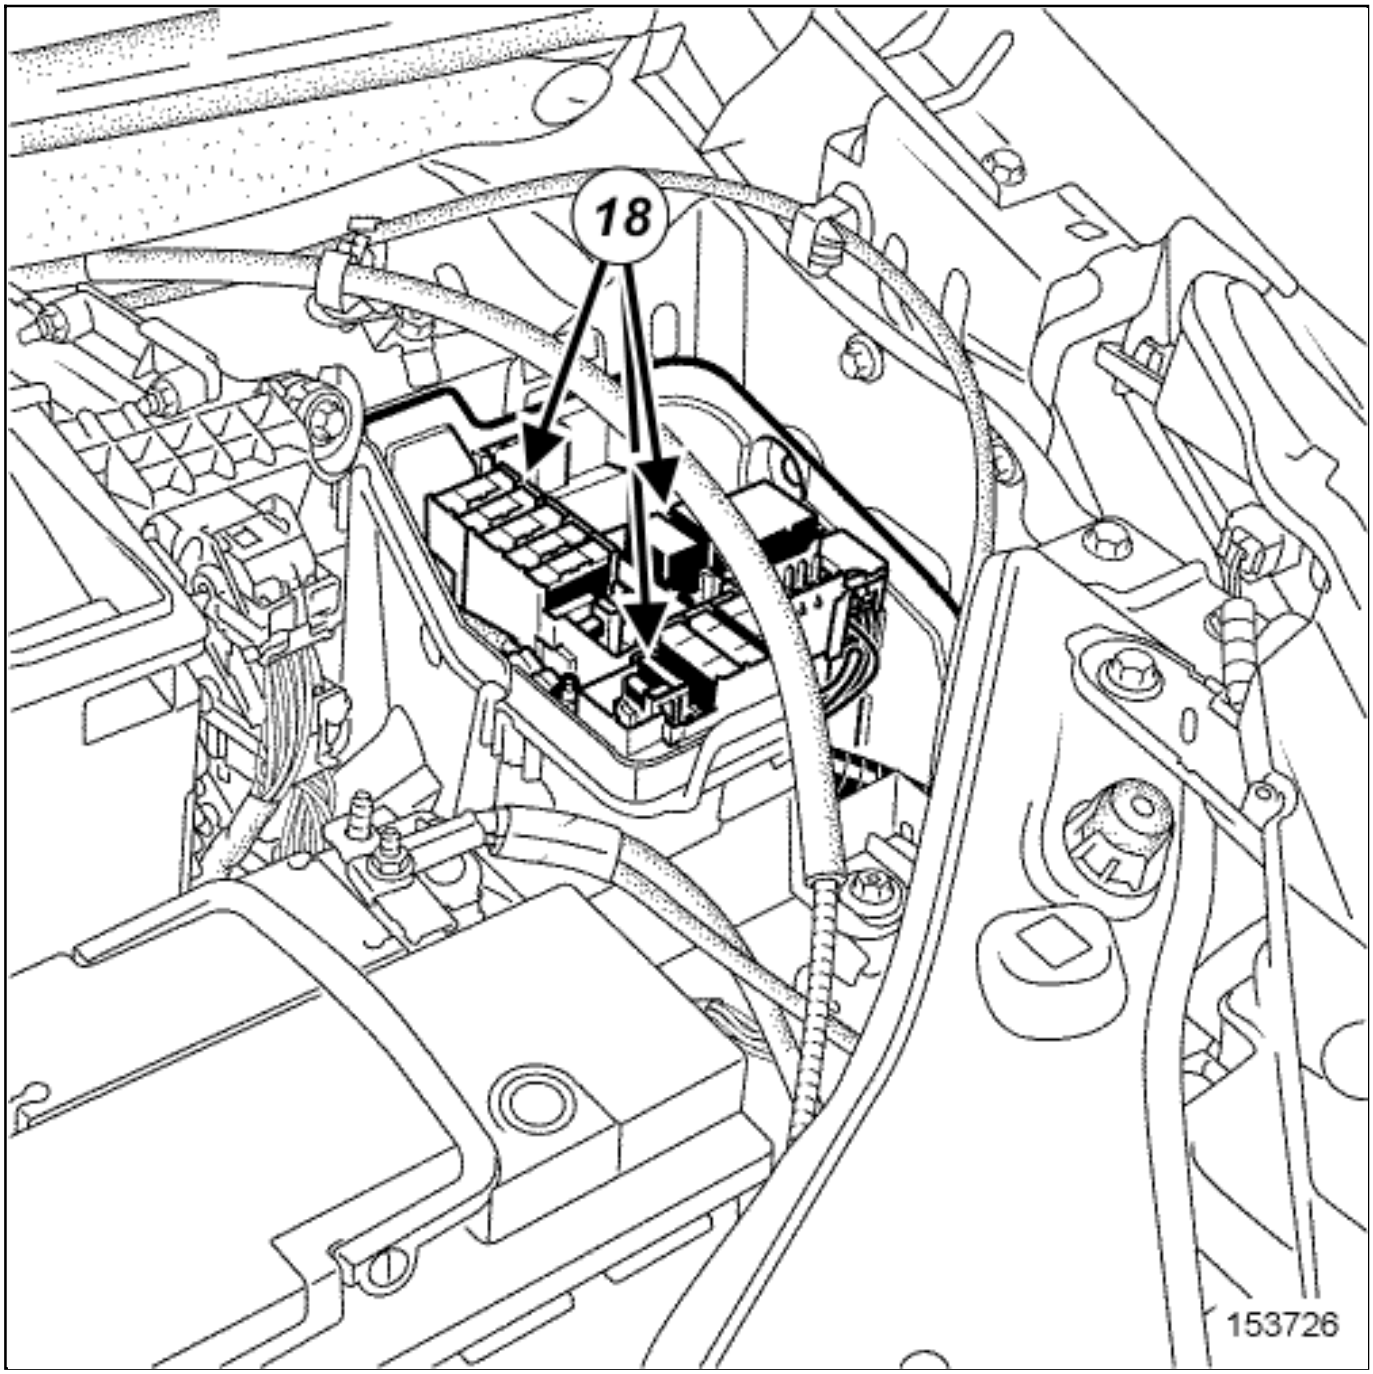
- the gear control cable(**12**) from the selector ball joint using an open-jawed spanner,
- the gear control cable(**13**) from the support.



Move aside the gear control cables.



Disconnect the connector(14) from the gearbox computer.



Remove the nut(15) .

Disconnect the injection computer connectors(16).

Remove the engine compartment connection unit cover(17) .

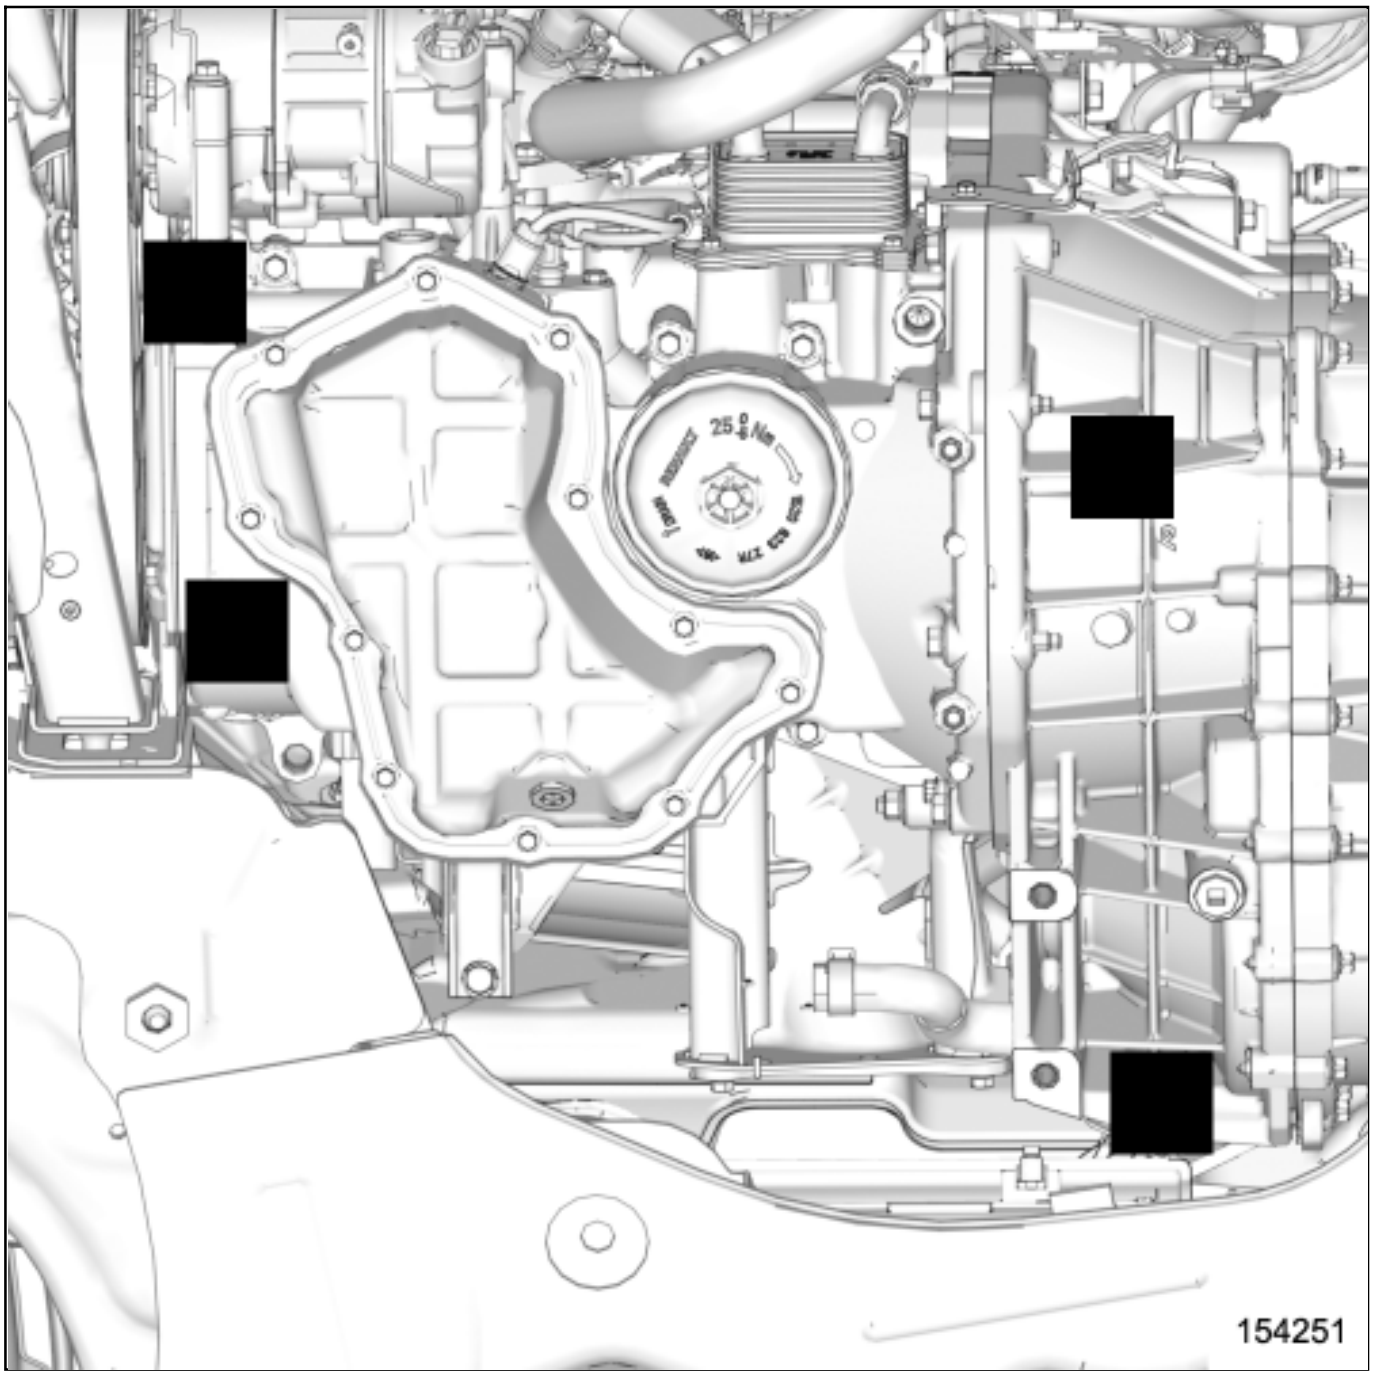
- Unclip the fuse holders and relays(18) from their mountings on the fuse and relay box in the engine compartment.

- Position the engine harness, fuses and relays on the engine.

- Disconnect the vacuum pipe from the brake servo.

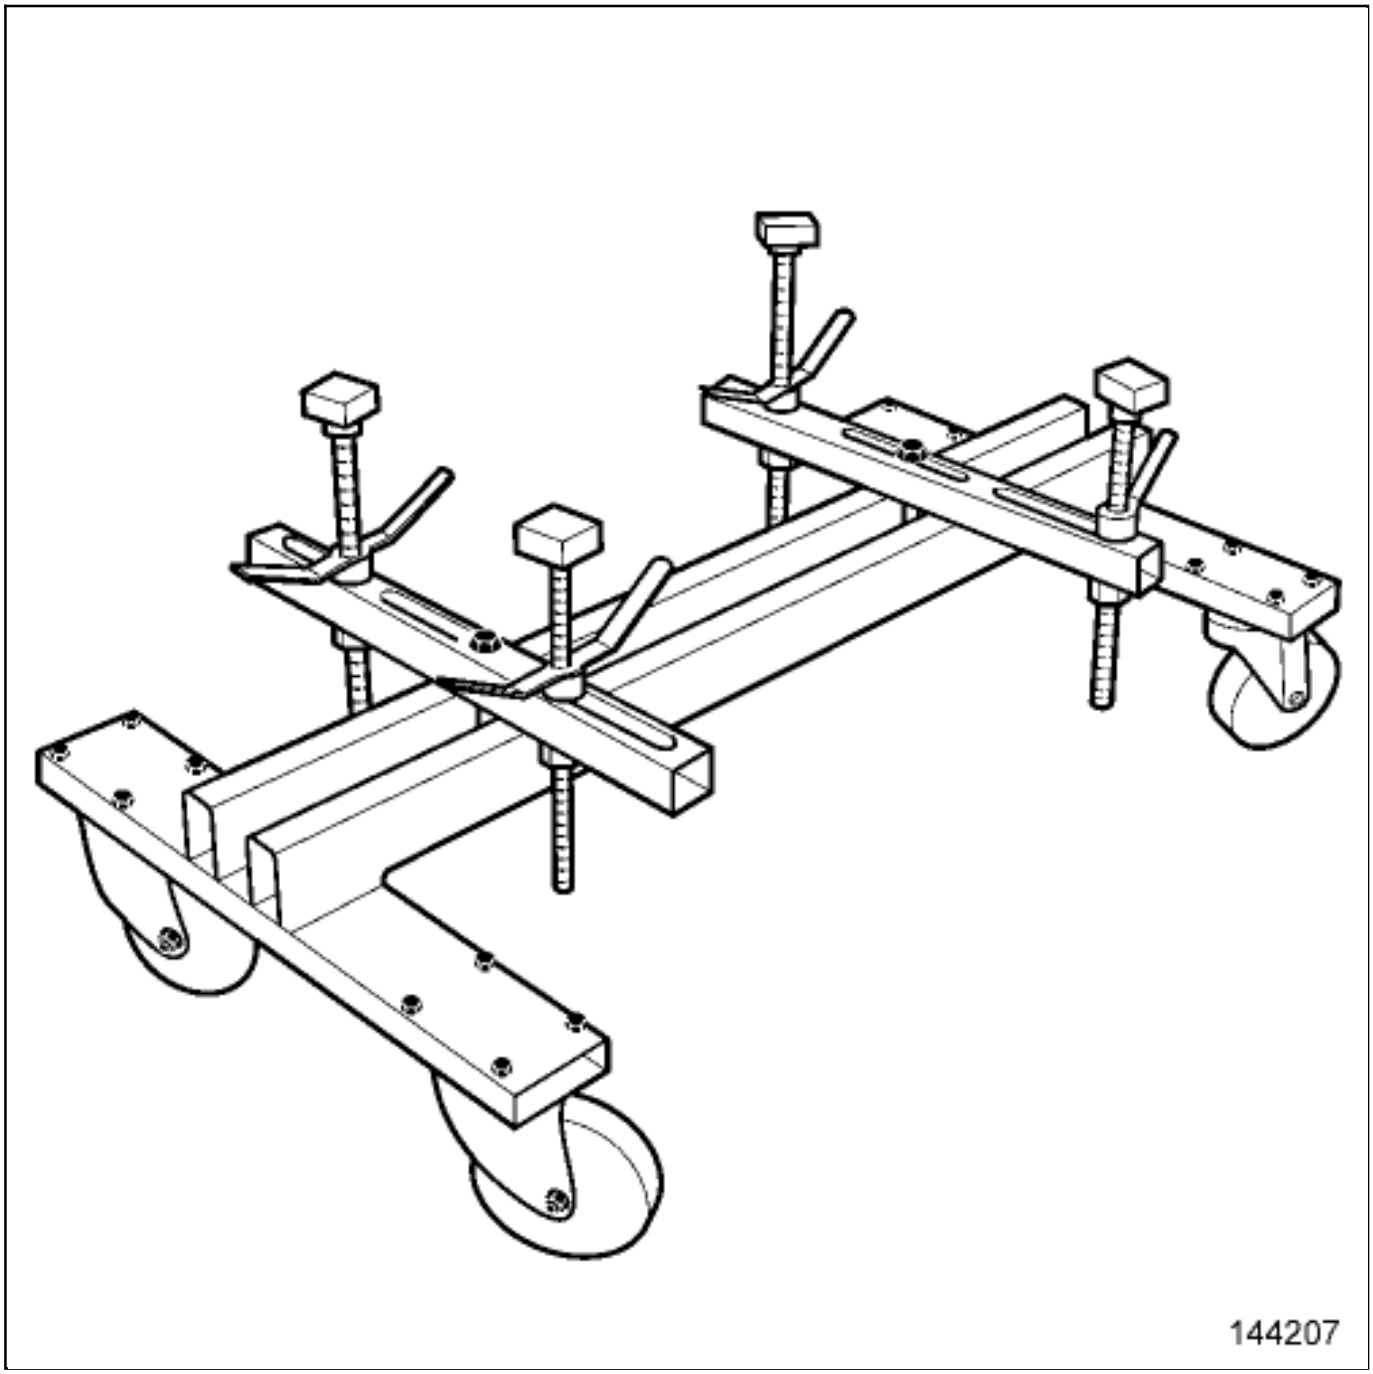
Remove using the toolRemote operation pliers for hose clips.(Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the clip of the expansion bottle outlet hose,
- the clips of the heater matrix hoses.



Disconnect (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the expansion bottle outlet hose,
- the heater matrix hoses,
- the degassing hose from the water chamber.



Remove Exhaust assembly under body: Exploded view :

- the exhaust flange nuts,
- the seal between the catalytic pre-converter and the connecting hose.

2. REMOVAL OPERATION

Mark the position of the suspended engine mountings on the body.

Support the "engine - gearbox" assembly on the engine marks with the toolSupport for removal - refitting of engine - gearbox assembly(Mot. 1390) .

Remove Engine-gearbox unit support assembly: Exploded view :

- the right-hand suspended engine mounting bolts,

the central nut of the left-hand suspended engine mounting rubber pad,

Note:

Check no component obstructs the movement of the body around the engine - gearbox assembly.

Lift the vehicle to remove the "engine and gearbox" assembly.

Remove the "engine and gearbox" assembly.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: seal between catalytic converter and exhaust downpipe hose .

CAUTION

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

2. REFITTING OPERATION

Proceed in the reverse order to removal.

Torque tighten:

- the earth nuts on the body 8 N.m,
- the earth wiring bolt on the automatic gearbox 21 N.m.

Refill:

- and bleed the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) ,
- the automatic gearbox Automatic gearbox oil: Draining - Filling ,
- the engine oil if necessary (see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

ENGINE - GEARBOX ASSEMBLY: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Support for removal - refitting of engine - gearbox assembly	Mot. 1390

Equipment required
refrigerant charging station

parts always to be replaced:
seal between catalytic converter and exhaust downpipe hose

WARNING

Wear protective gloves during the operation.

CAUTION

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

CAUTION

To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

Locations and specifications (tightening torques, parts always to be replaced, etc.)Engine-gearbox unit support assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .

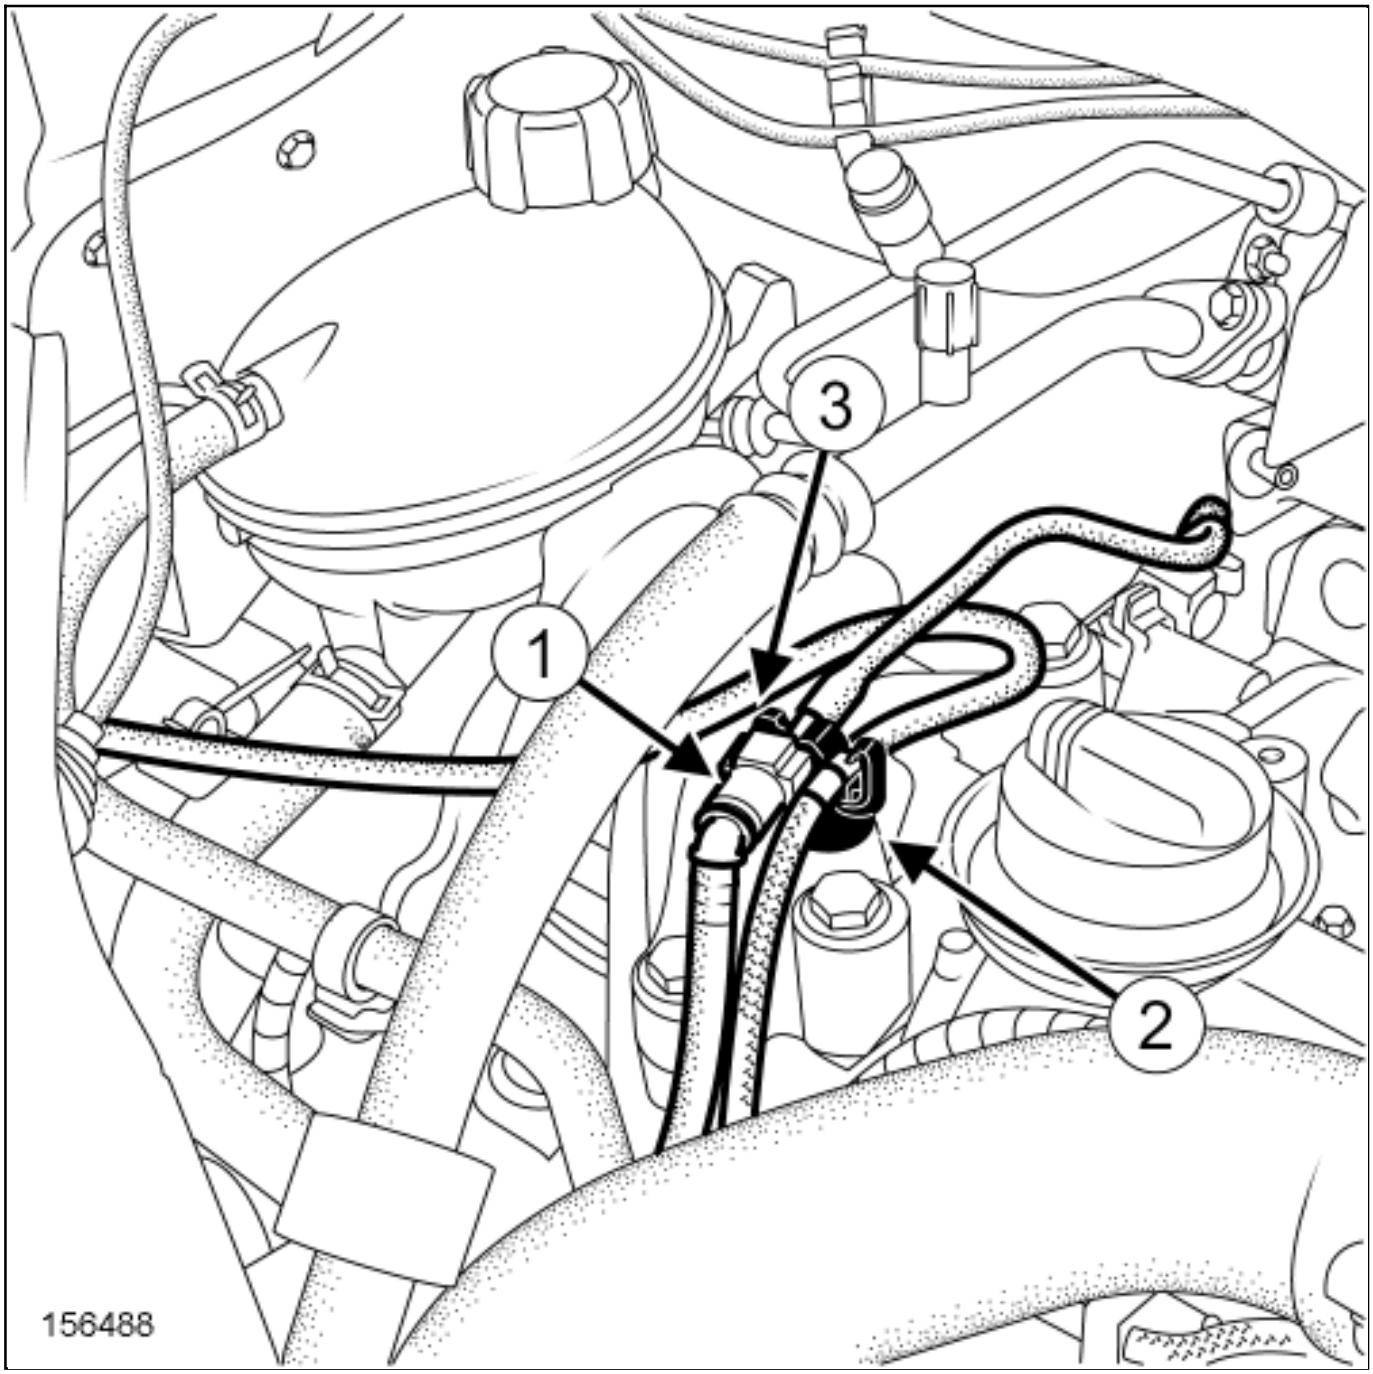
- Remove:
  - the battery Battery: Removal - Refitting ,
  - the air filter unit Air inlet assembly: Exploded view ,
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front wheel arch liners Exterior body front trim assembly: Exploded view ,
  - the engine undertray bolts,
  - the engine undertray.

- Drain:
  - the cooling circuit Cooling system: Draining - Refilling ,
  - the automatic gearbox Automatic gearbox oil: Draining - Filling ,
  - the engine oil if necessary (see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

- Remove:
  - the turbocharger air outlet pipe Air inlet assembly: Exploded view ,
  - the intercooler air outlet pipe Air inlet assembly: Exploded view ,

- the air inlet pressure sensor from the turbo-manifold air inlet pipe(see **10A**, **Engine and cylinder block assembly**, **Engine and transmission assembly sensors: List and location of components**, page) ,
- the petrol vapour rebreather pipe from the turbo-manifold air inlet pipe.

Remove using the toolRemote operation pliers for hose clips.(**Mot. 1448**) **Coolant circuit assembly: Exploded view** :



- the upper cooling hose clip from the cooling radiator,
- the bottom cooling hose clip from the cooling radiator.

Disconnect **Coolant circuit assembly: Exploded view** :

- the upper cooling hose from the cooling radiator,
- the bottom cooling hose from the cooling radiator.

Remove:

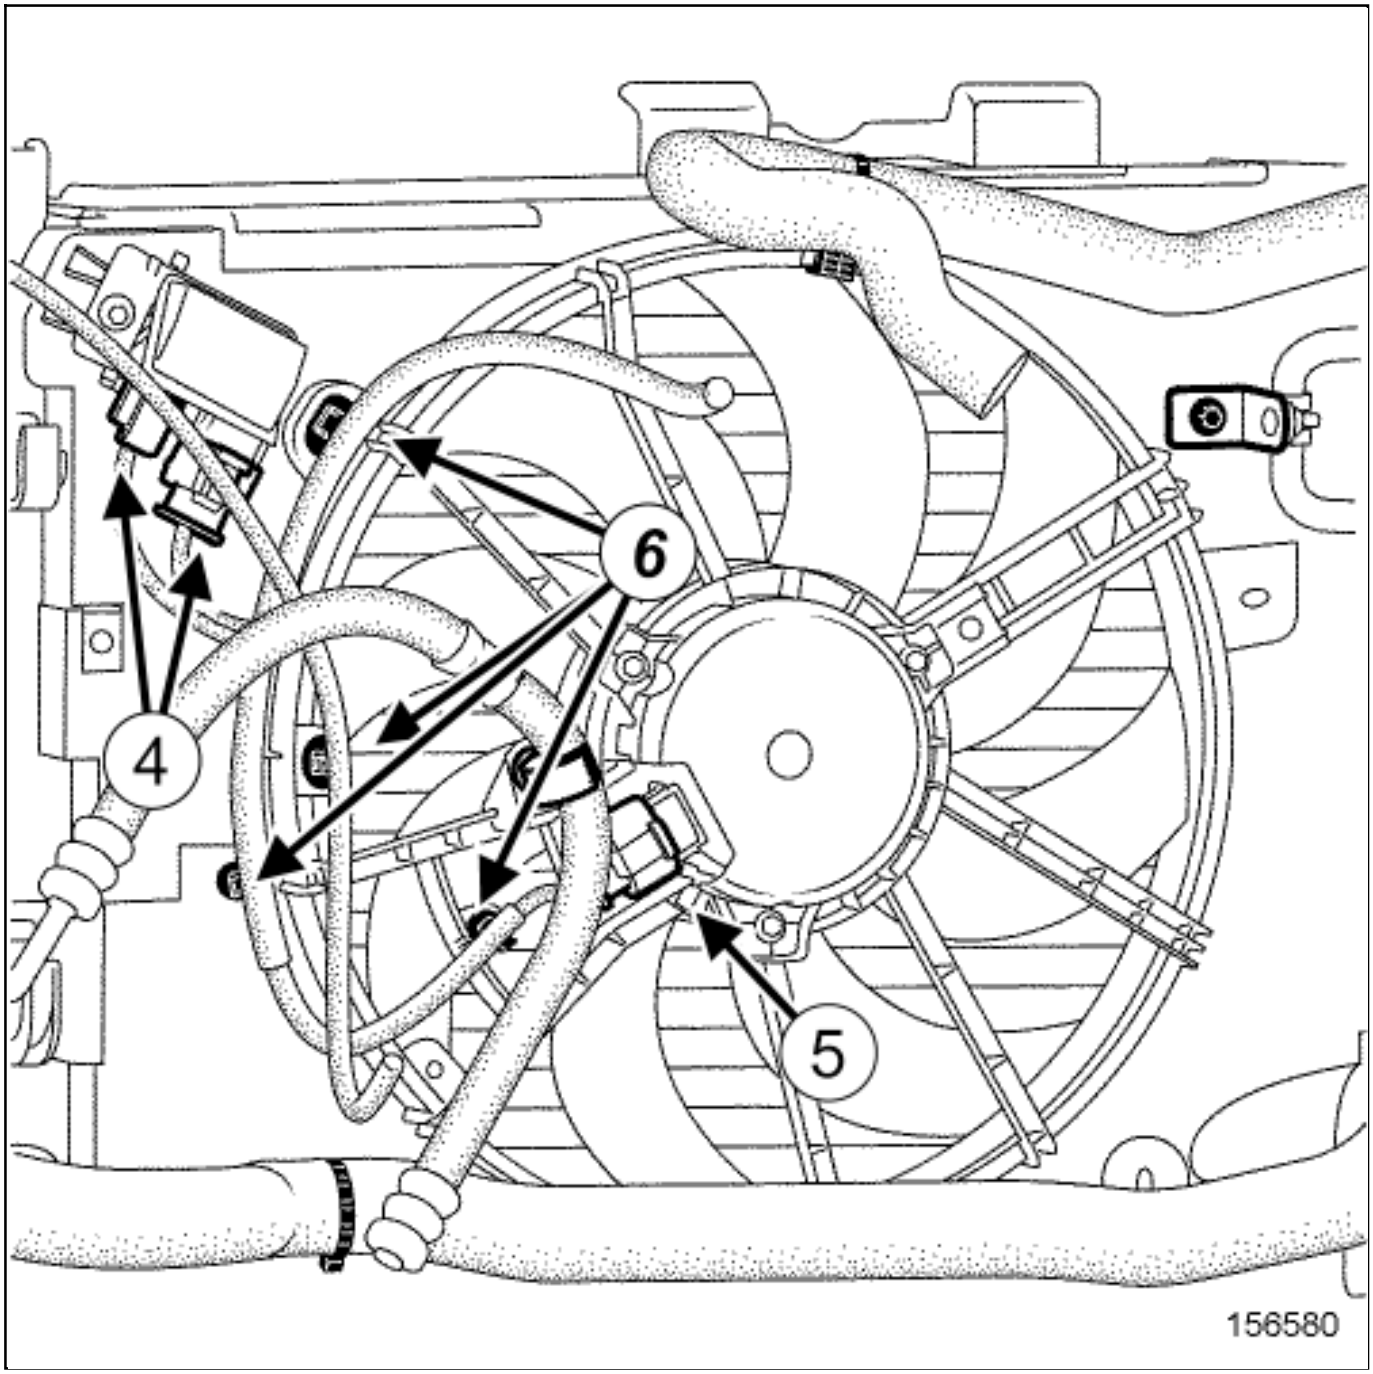
- the engine tie-bar**Engine-gearbox unit support assembly: Exploded view** ,
- the front left-hand wheel driveshaft**Front hub carrier assembly: Exploded view** ,
- the front right-hand wheel driveshaft**Front right-hand driveshaft: Removal - Refitting** .

Disconnect the fuel supply pipe(1) .

Insert the blanking plugs.

Unclip:

- the fuel vapour pipe(2) ,



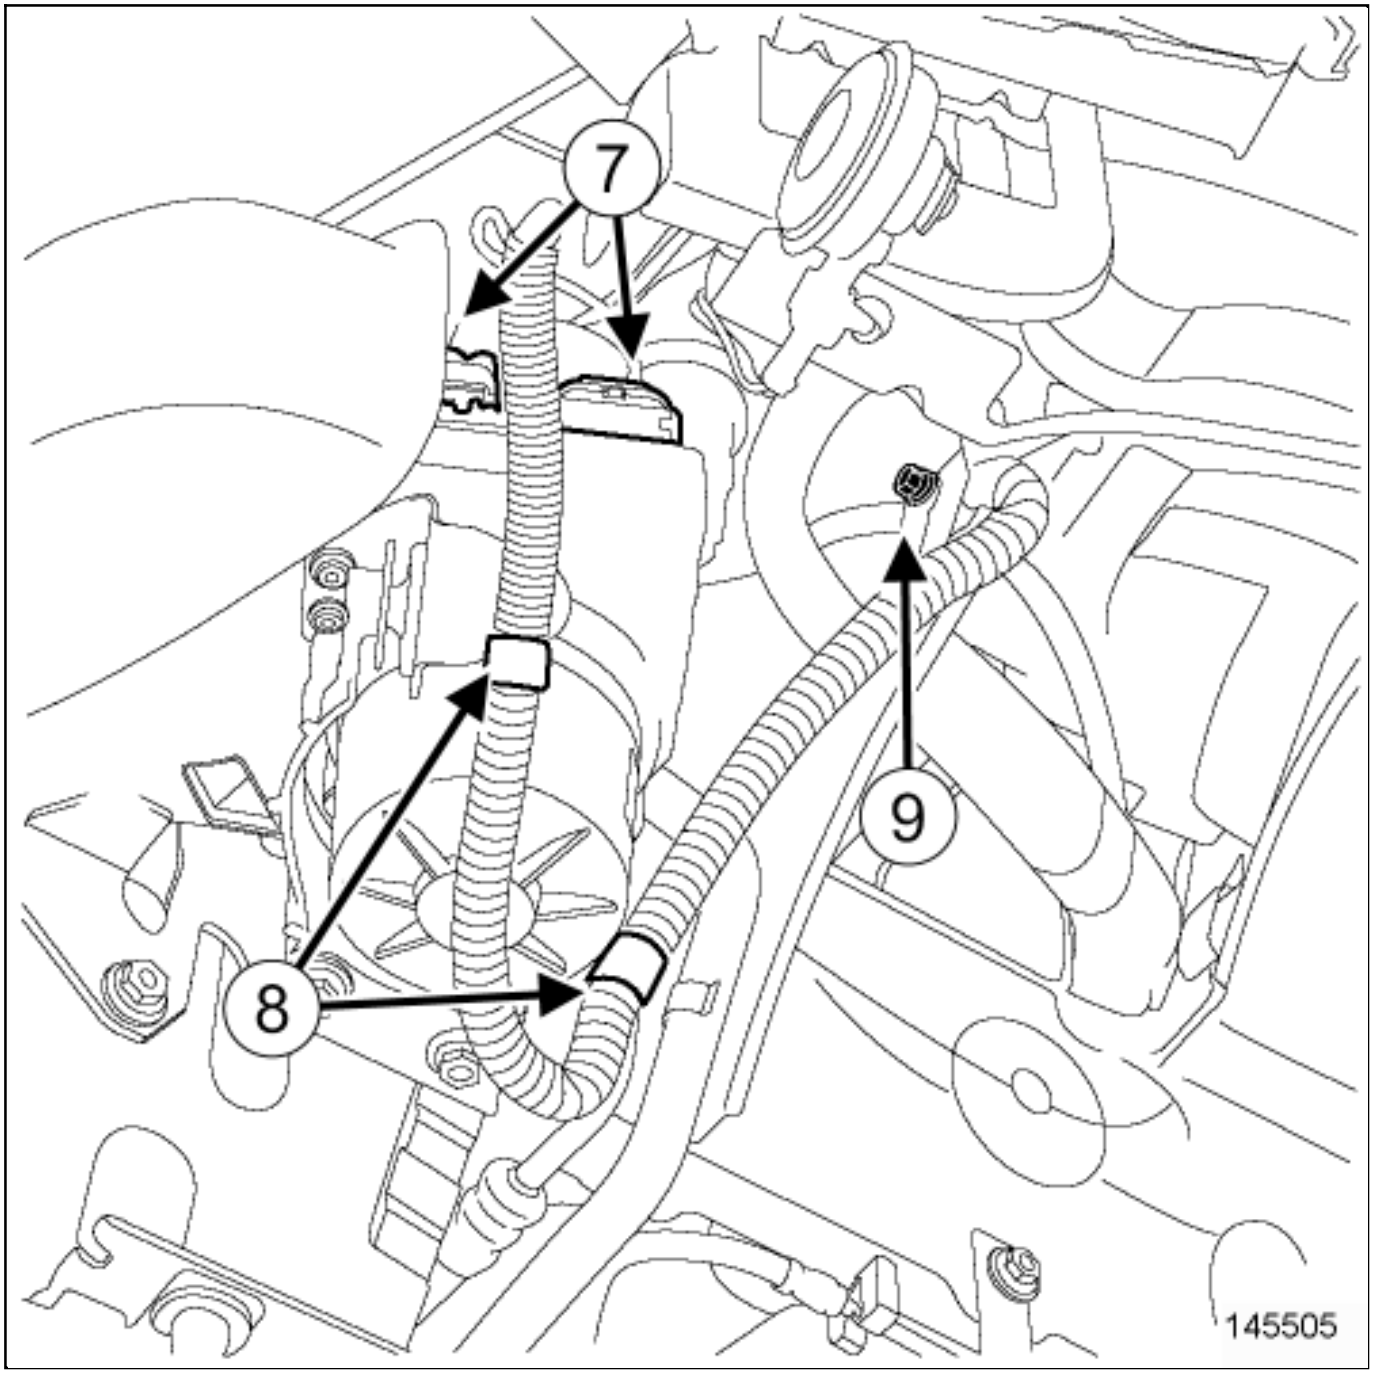
the fuel supply pipe(3) .

Disconnect:

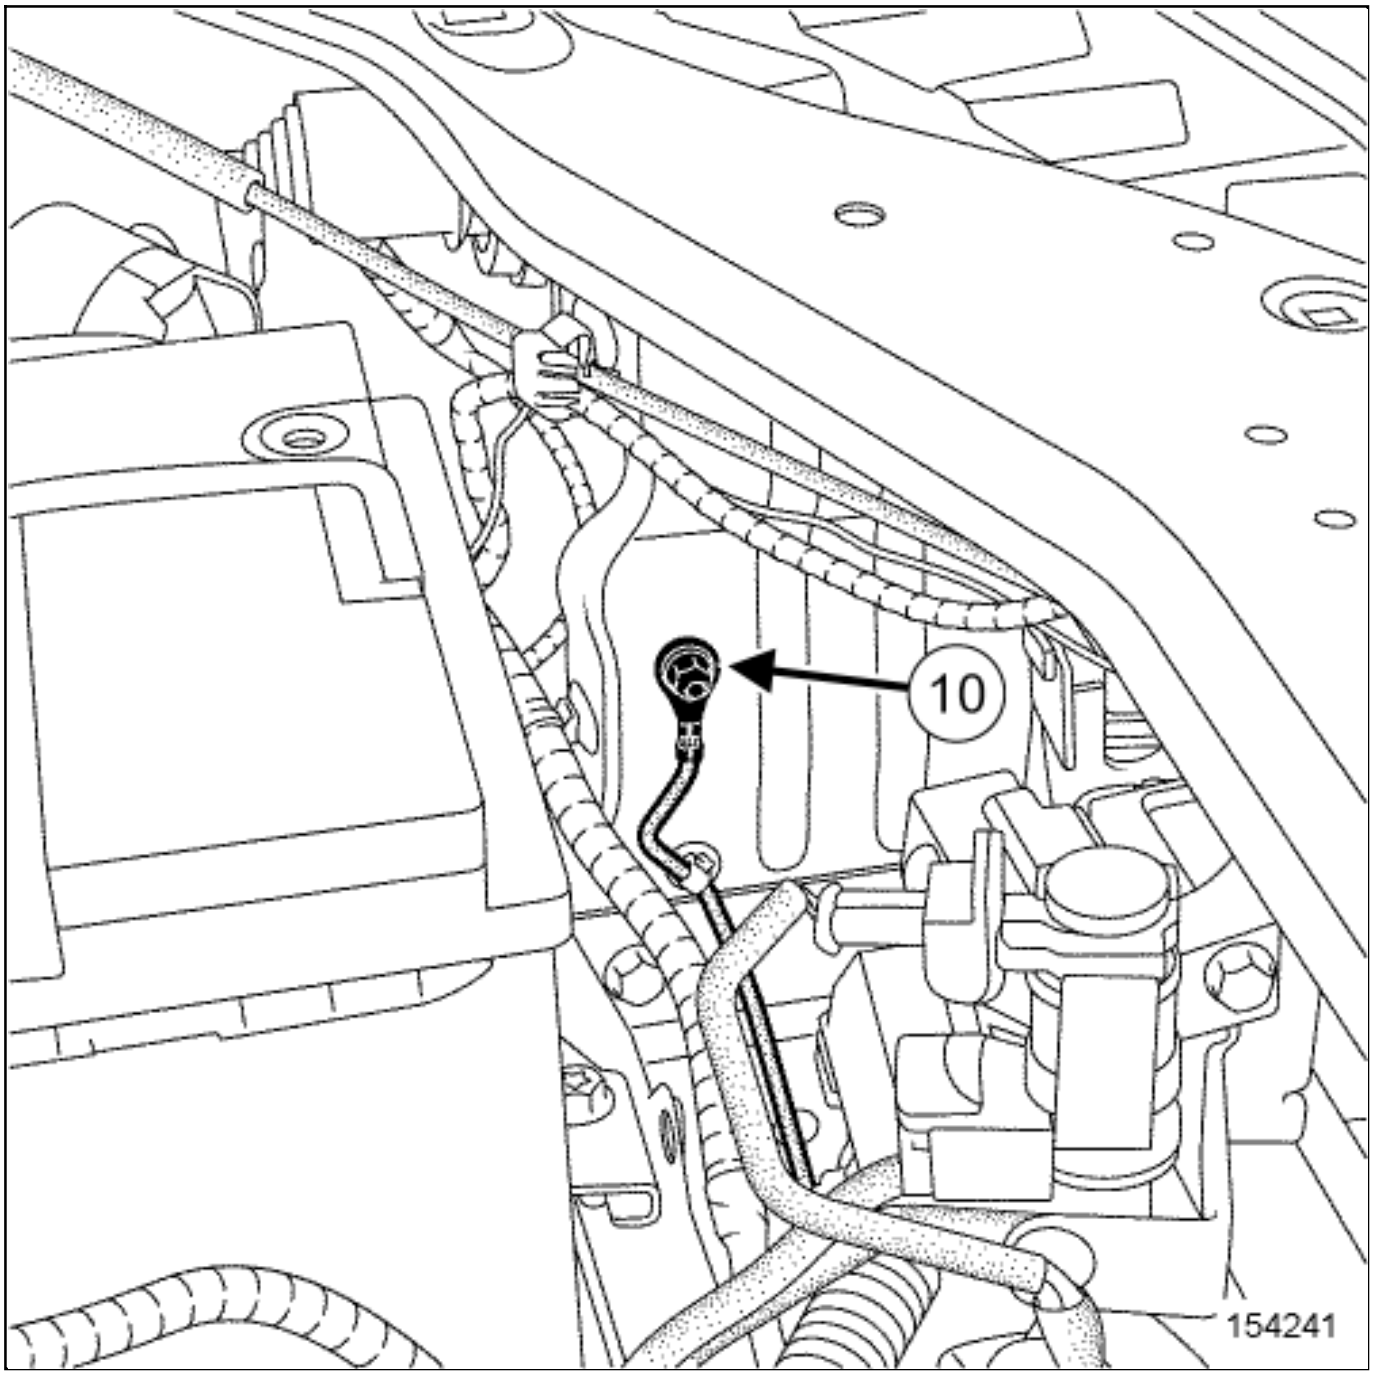
- the fuel vapour absorber pipe,
- the solenoid valve connector.

Unclip the fuel vapour absorber wiring from the support.

Move aside the wiring.

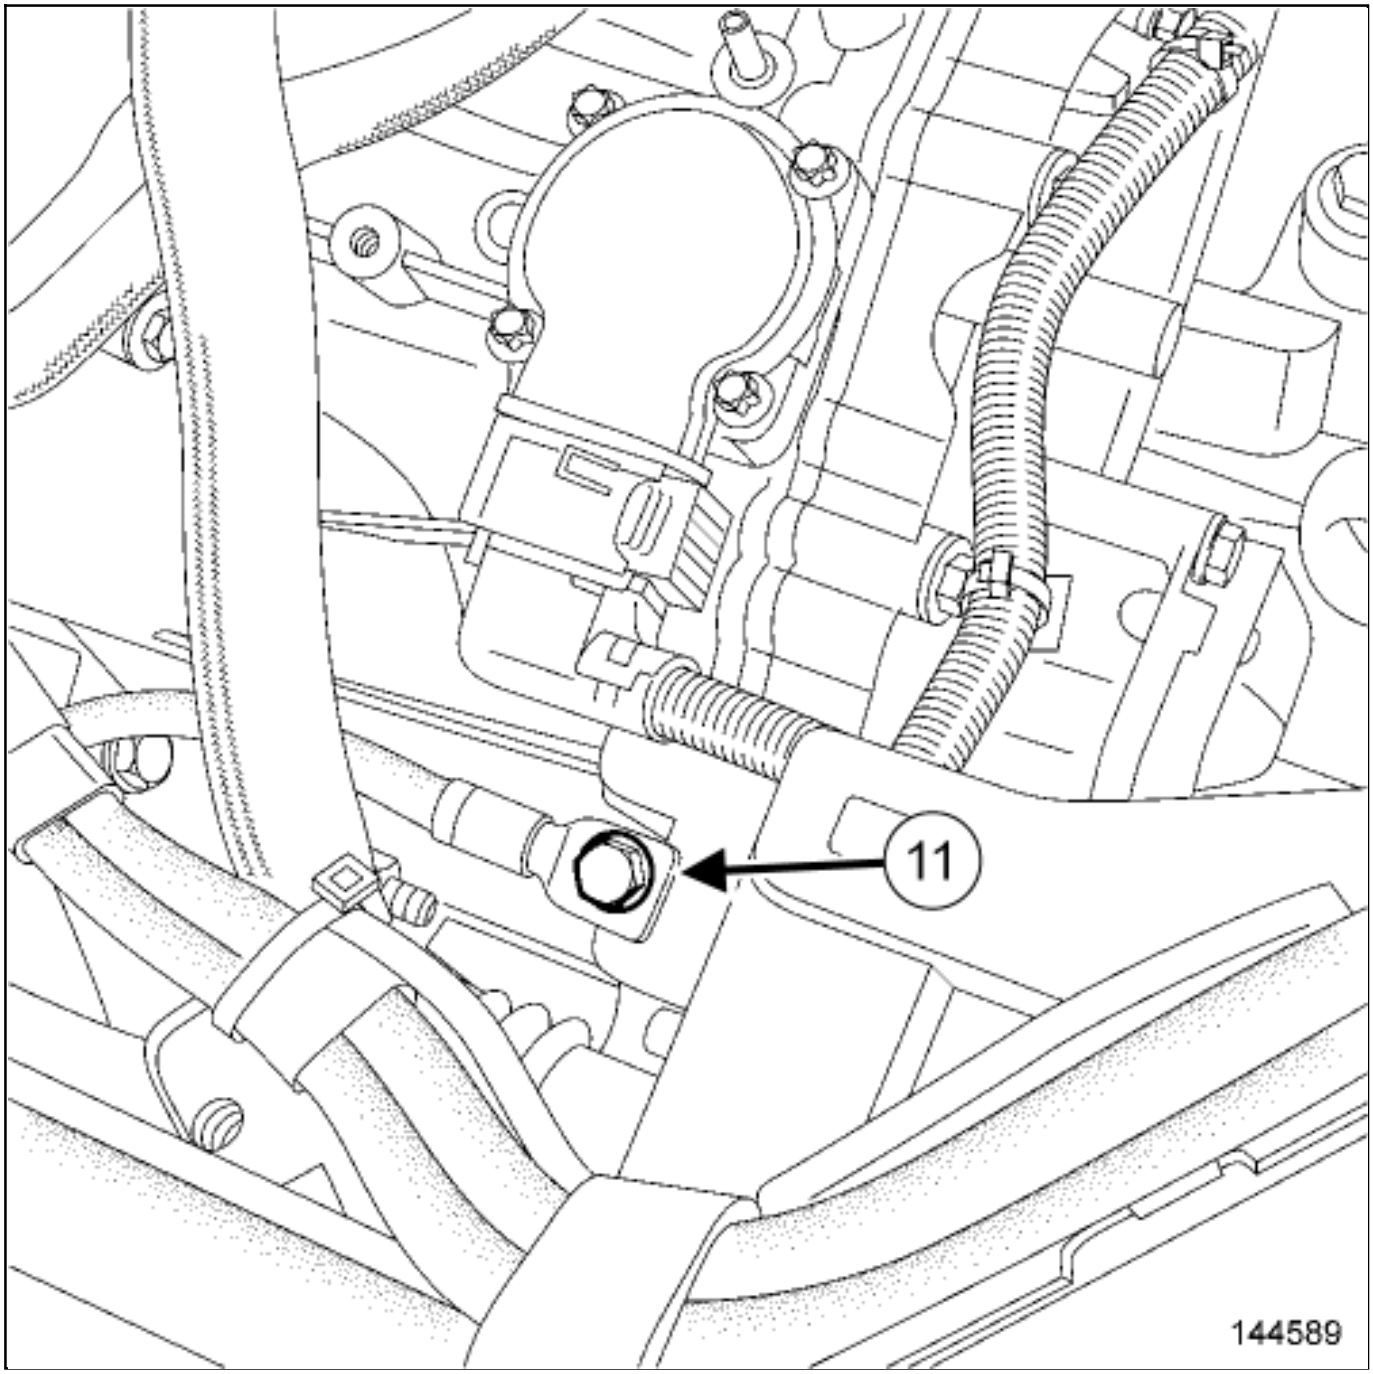


Disconnect from the cooling fan assembly:

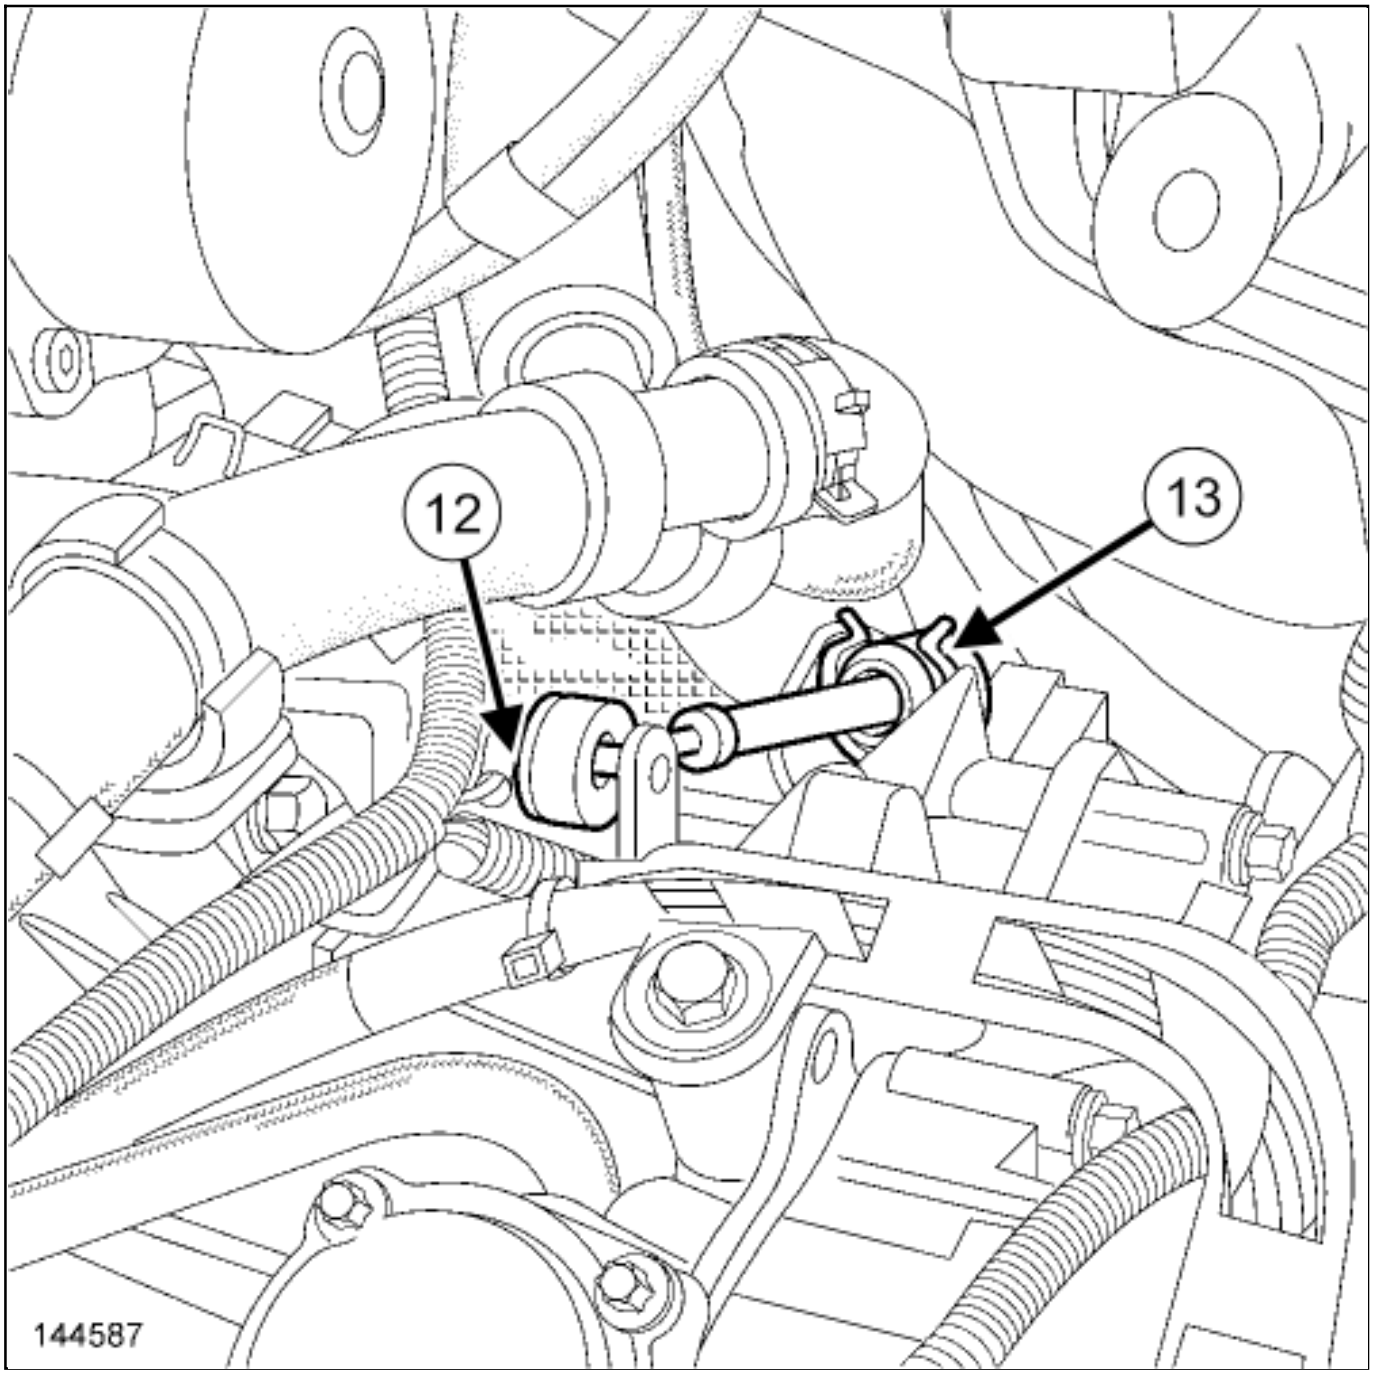


- the engine cooling fan assembly resistor connector(4) ,
- the fan connector(5) of the engine cooling fan assembly.

Unclip the cooling fan assembly wiring at(6) .

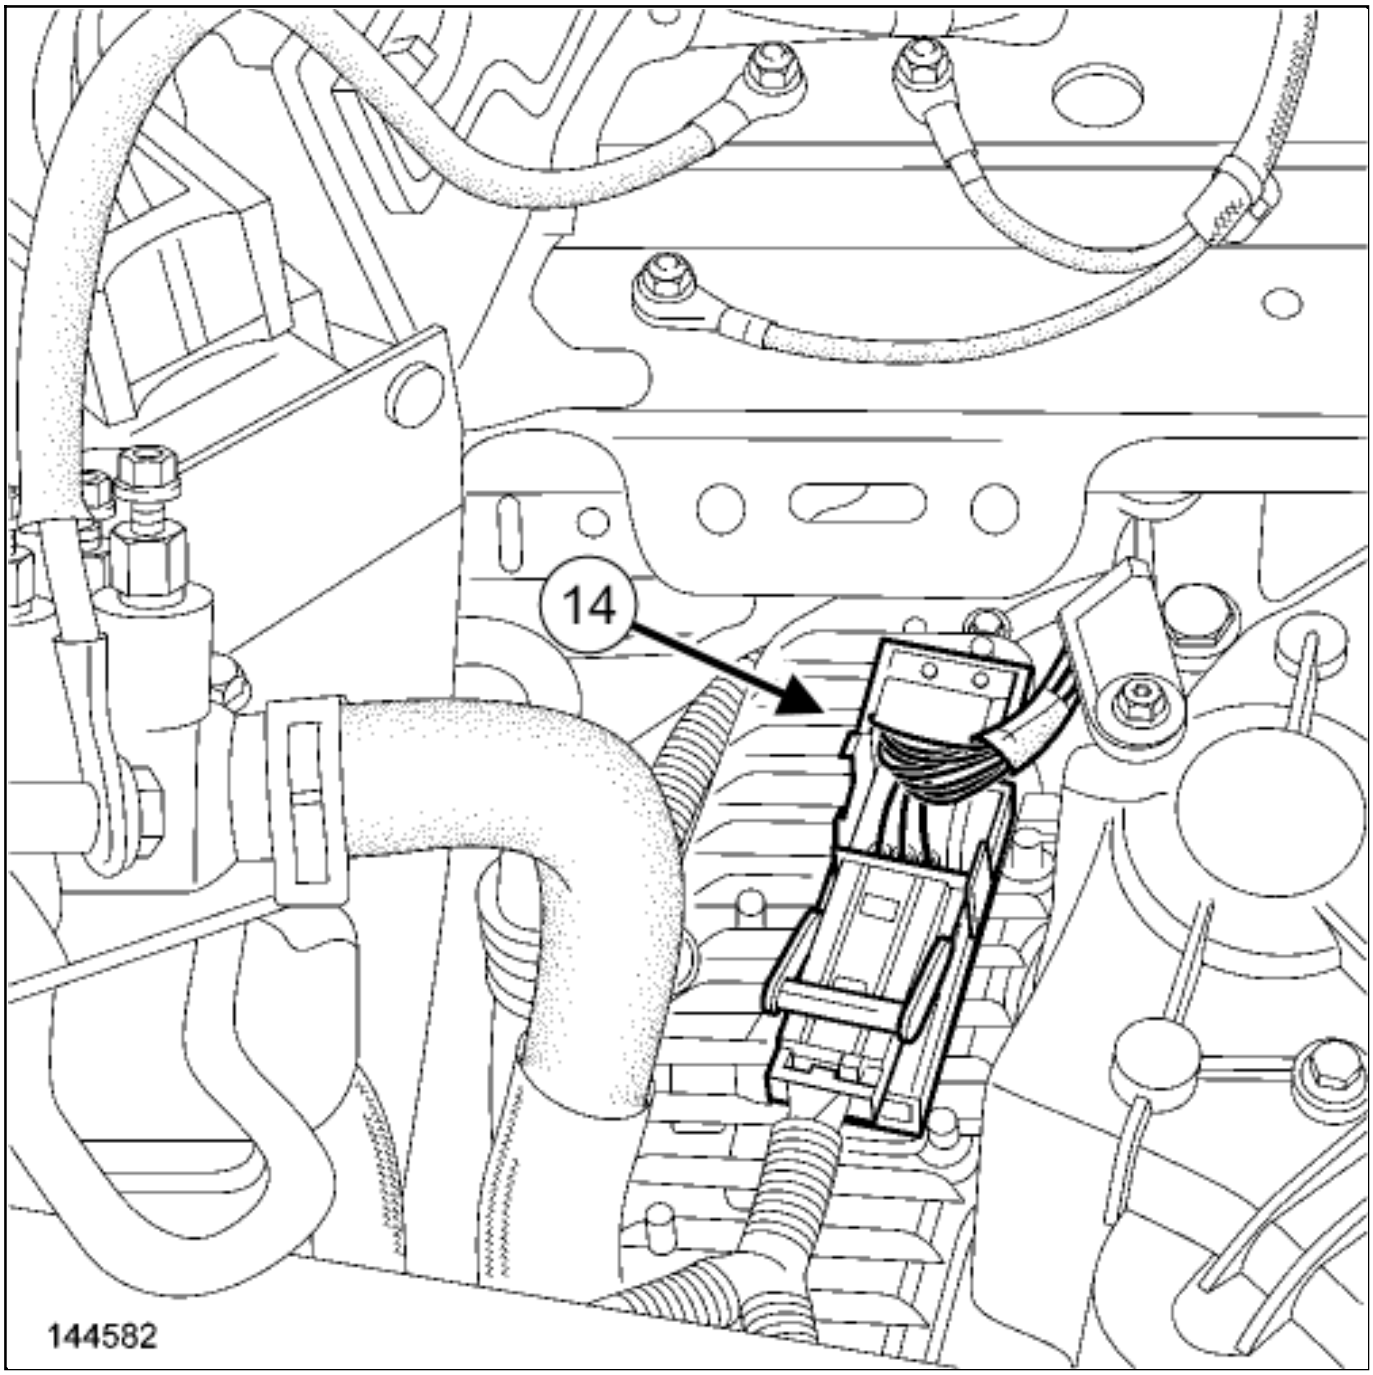


Move aside the cooling fan assembly wiring.

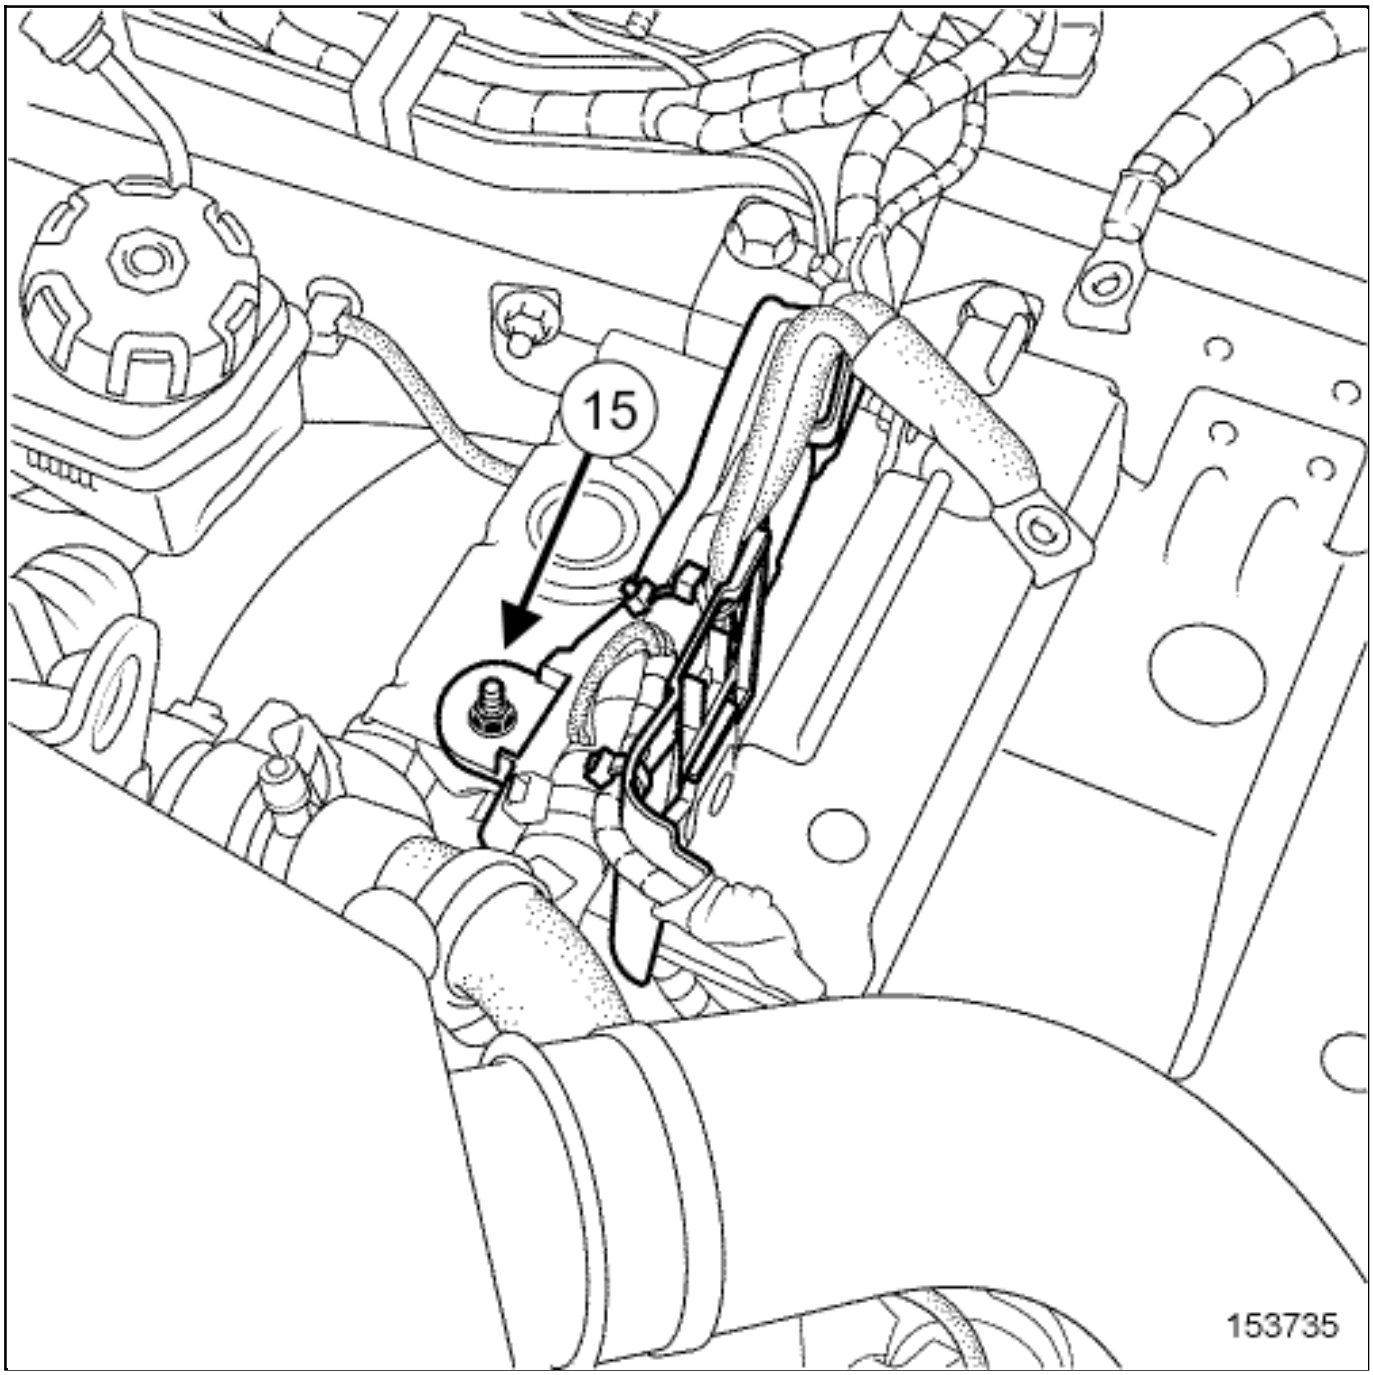


- Disconnect the pump assembly connectors(7) .
- Unclip the pump assembly wiring at(8) .
- Remove the nut(9) from the earth strap on the body.

Remove the nut(10) from the earth strap on the body.

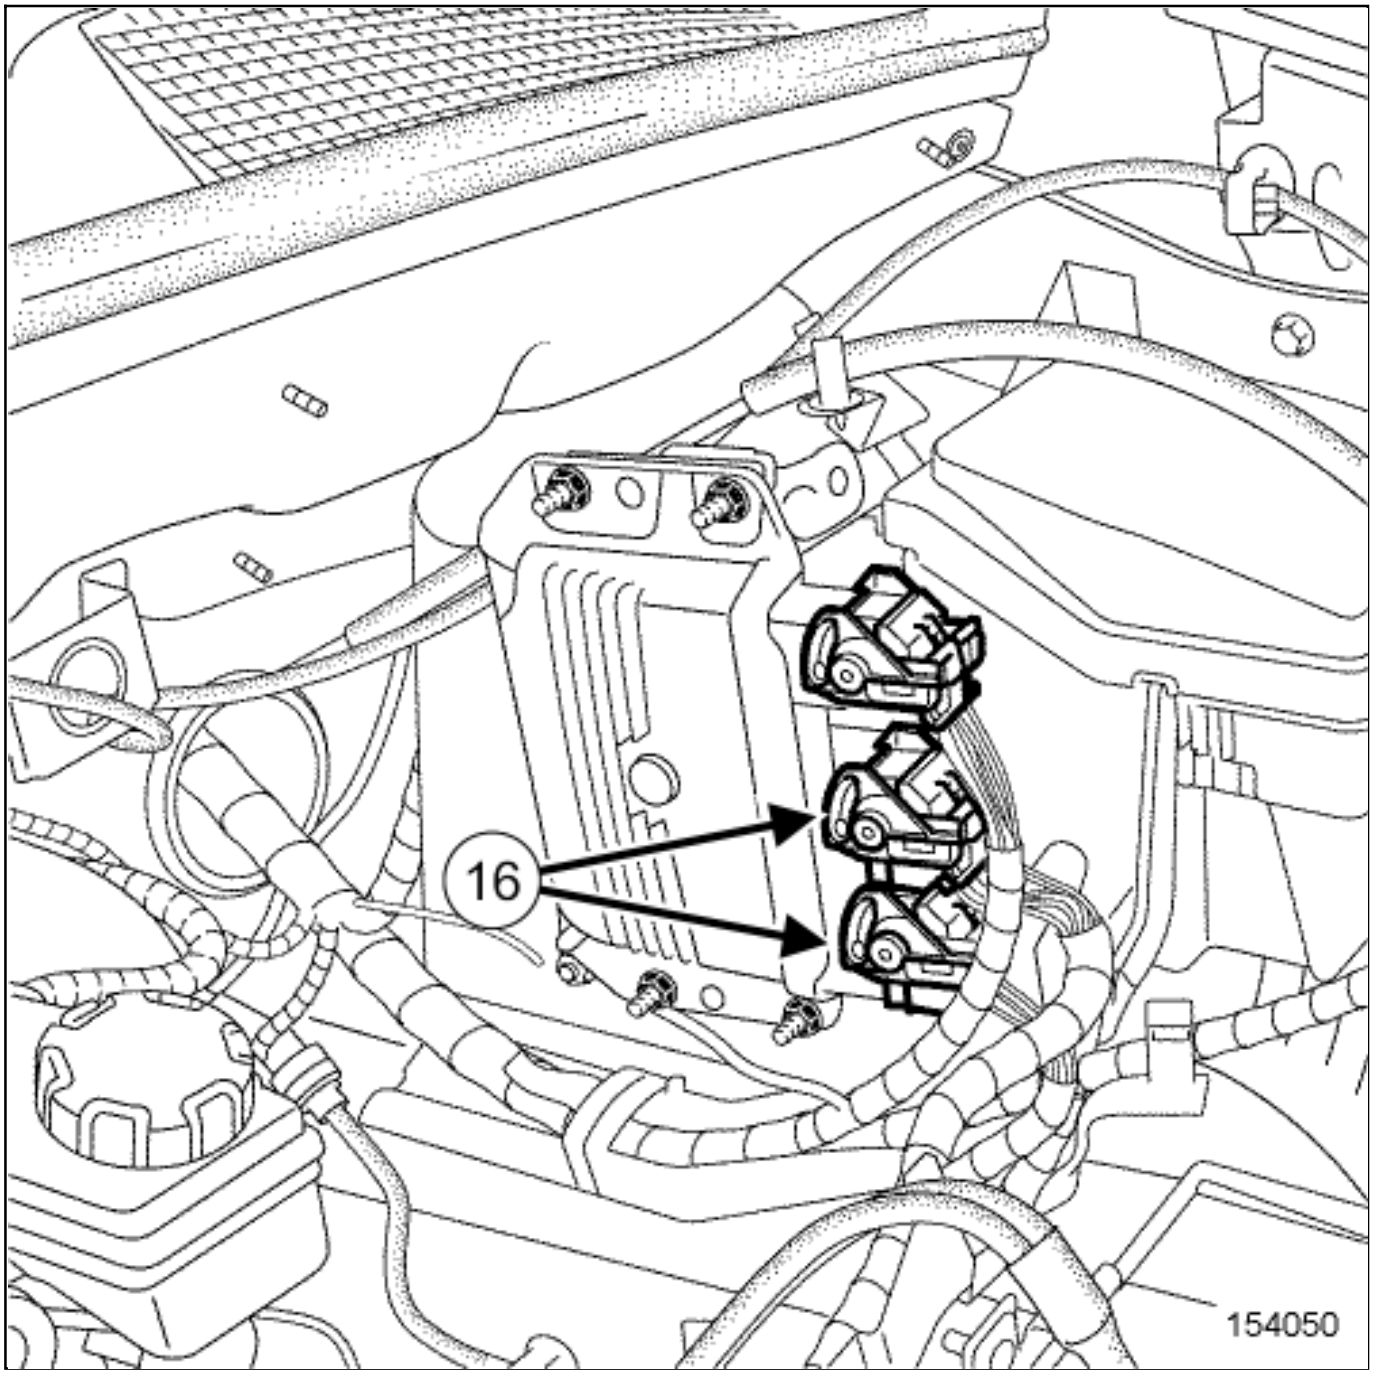


Remove the earth wire bolt(11) on the automatic gearbox.

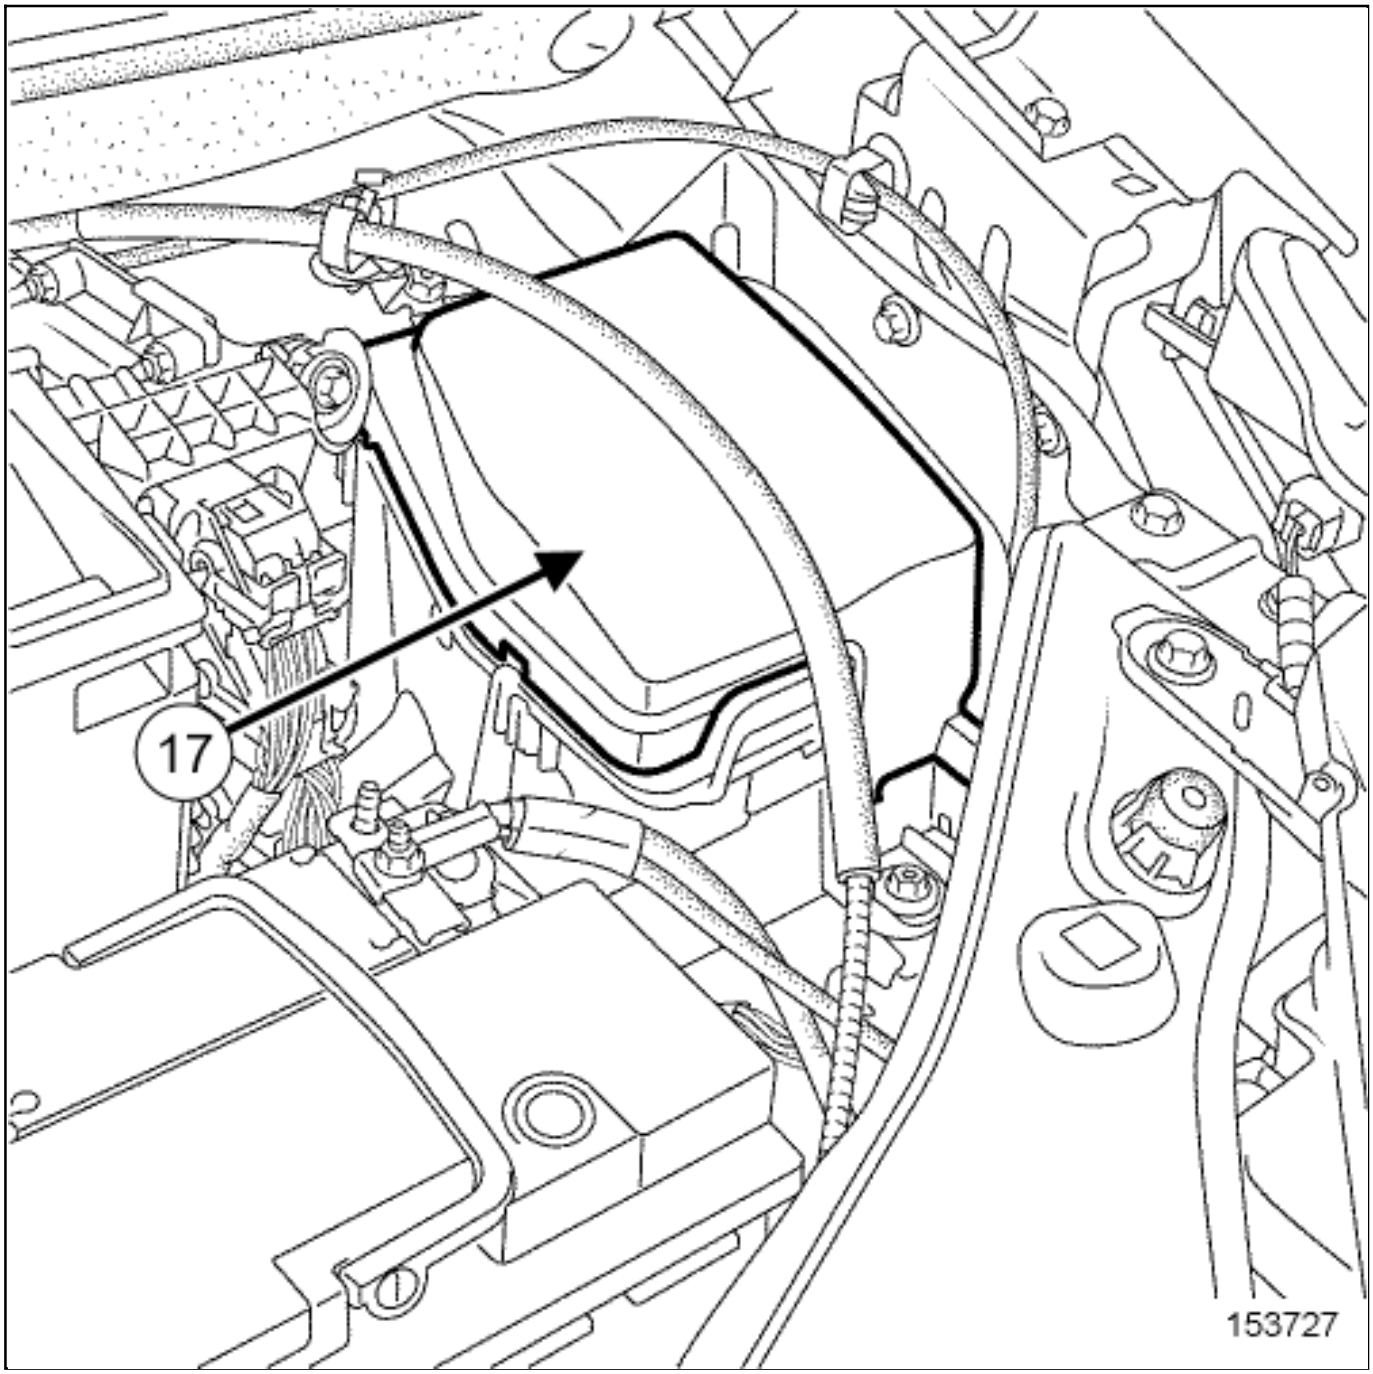


Unclip:

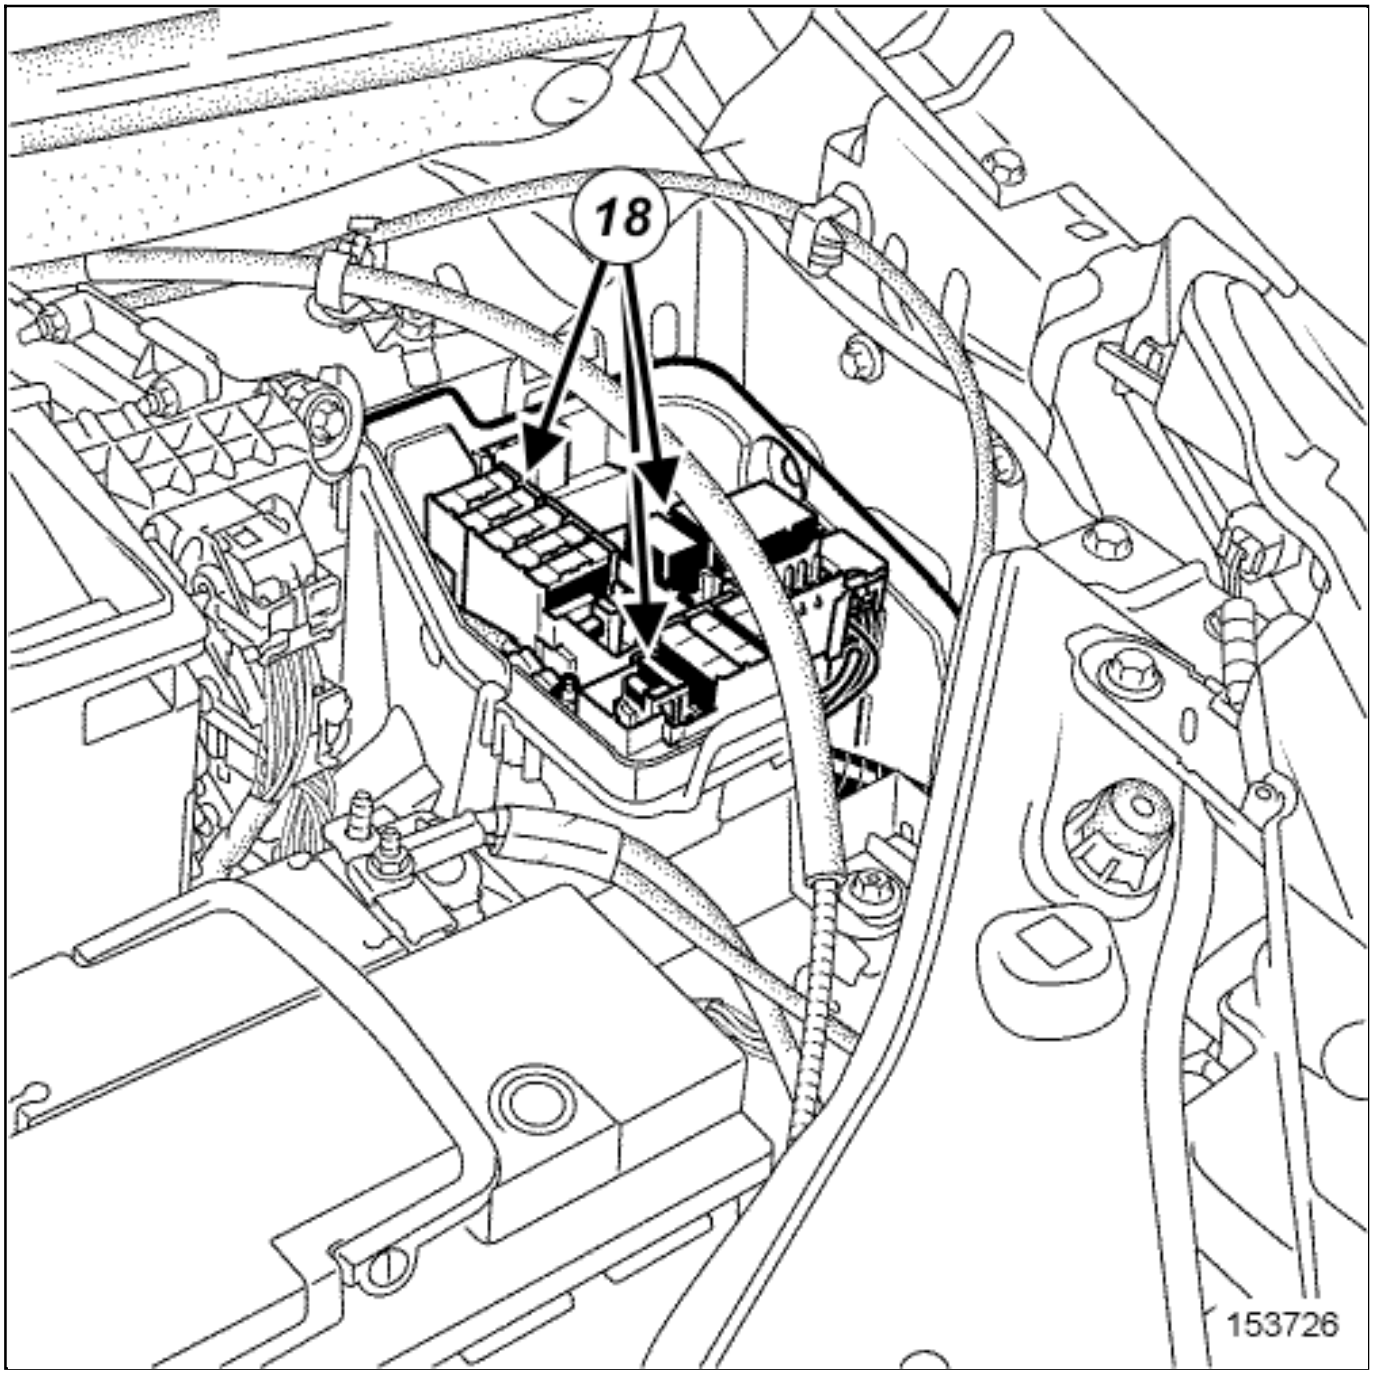
- the gear control cable(**12**) from the selector ball joint using an open-jawed spanner,
- the gear control cable(**13**) from the support.



Move aside the gear control cables.



Disconnect the connector(14) from the gearbox computer.



Remove the nut(15) .

Disconnect the injection computer connectors(16).

Remove the engine compartment connection unit cover(17) .

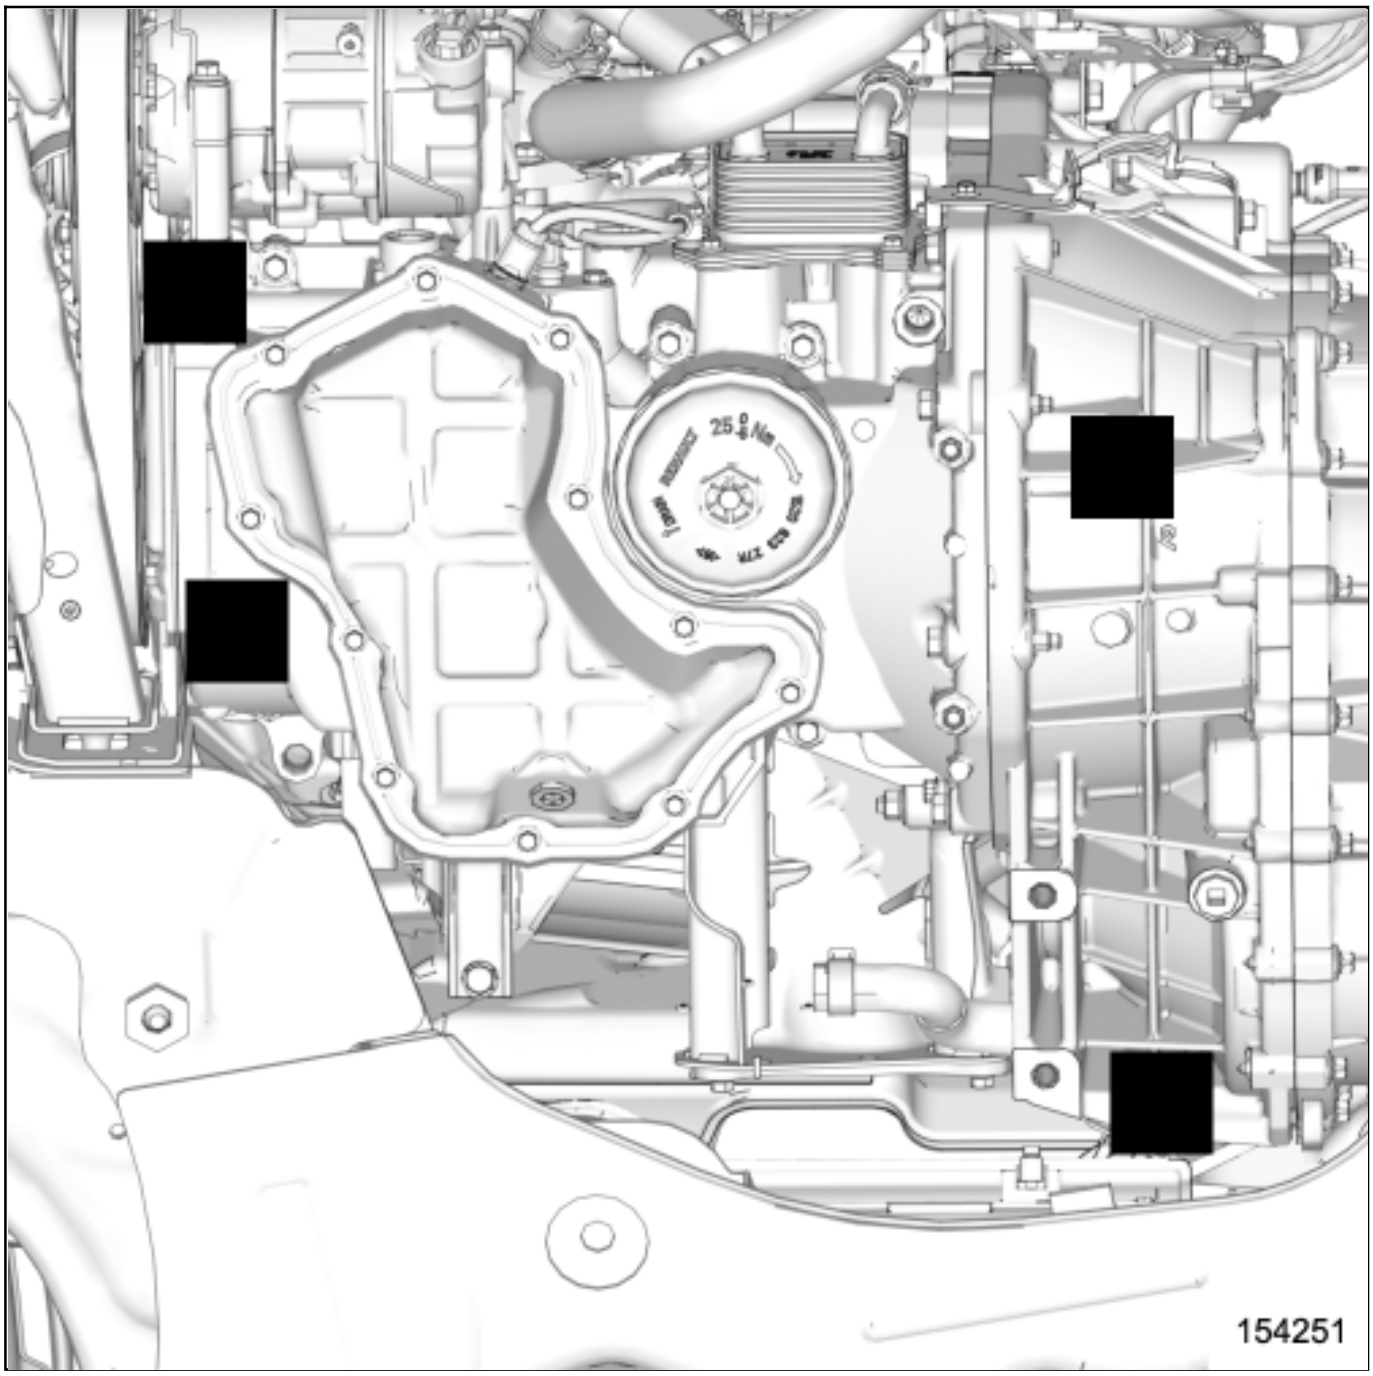
- Unclip the fuse holders and relays(18) from their mountings on the fuse and relay box in the engine compartment.

- Position the engine harness, fuses and relays on the engine.

- Disconnect the vacuum pipe from the brake servo.

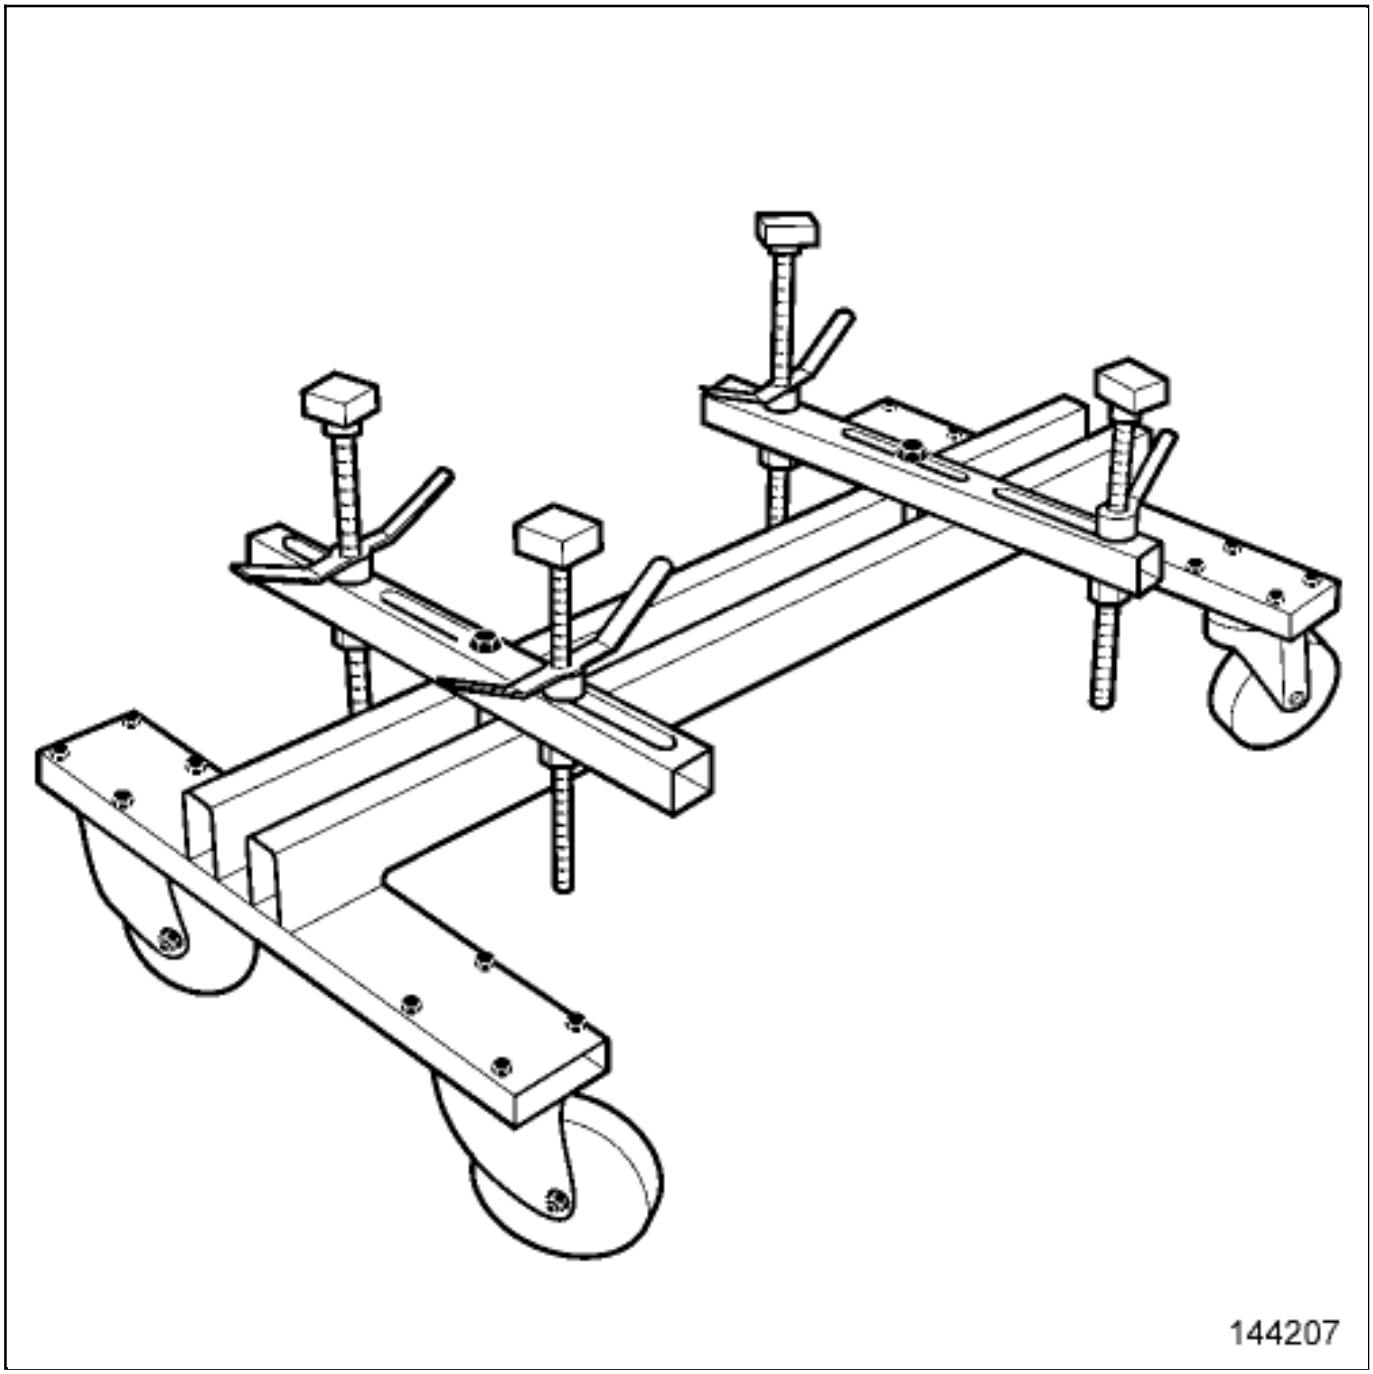
Remove using the toolRemote operation pliers for hose clips.(Mot. 1448) Coolant circuit assembly: Exploded view :

- the clip of the expansion bottle outlet hose,
- the clips of the heater matrix hoses.



Disconnect Coolant circuit assembly: Exploded view :

- the expansion bottle outlet hose,
- the heater matrix hoses,
- the degassing hose from the water chamber.



Remove Exhaust assembly under body: Exploded view :

- the exhaust flange nuts,
- the seal between the catalytic pre-converter and the connecting hose.

2. REMOVAL OPERATION

Mark the position of the suspended engine mountings on the body.

Support the "engine - gearbox" assembly on the engine marks with the toolSupport for removal - refitting of engine - gearbox assembly(Mot. 1390) .

Remove Engine-gearbox unit support assembly: Exploded view :

- the right-hand suspended engine mounting bolts,

the central nut of the left-hand suspended engine mounting rubber pad,

Note:

Check no component obstructs the movement of the body around the engine - gearbox assembly.

Lift the vehicle to remove the "engine and gearbox" assembly.

Remove the "engine and gearbox" assembly.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: seal between catalytic converter and exhaust downpipe hose .

CAUTION

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

2. REFITTING OPERATION

Proceed in the reverse order to removal.

Torque tighten:

- the earth nuts on the body 8 N.m,
- the earth wiring bolt on the automatic gearbox 21 N.m.

Refill:

- and bleed the cooling system **Cooling system: Draining - Refilling** ,
- the automatic gearbox **Automatic gearbox oil: Draining - Filling** ,
- the engine oil if necessary **(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling)** .

ENGINE COMPARTMENT CONNECTION UNIT: LIST AND LOCATION OF COMPONENTS

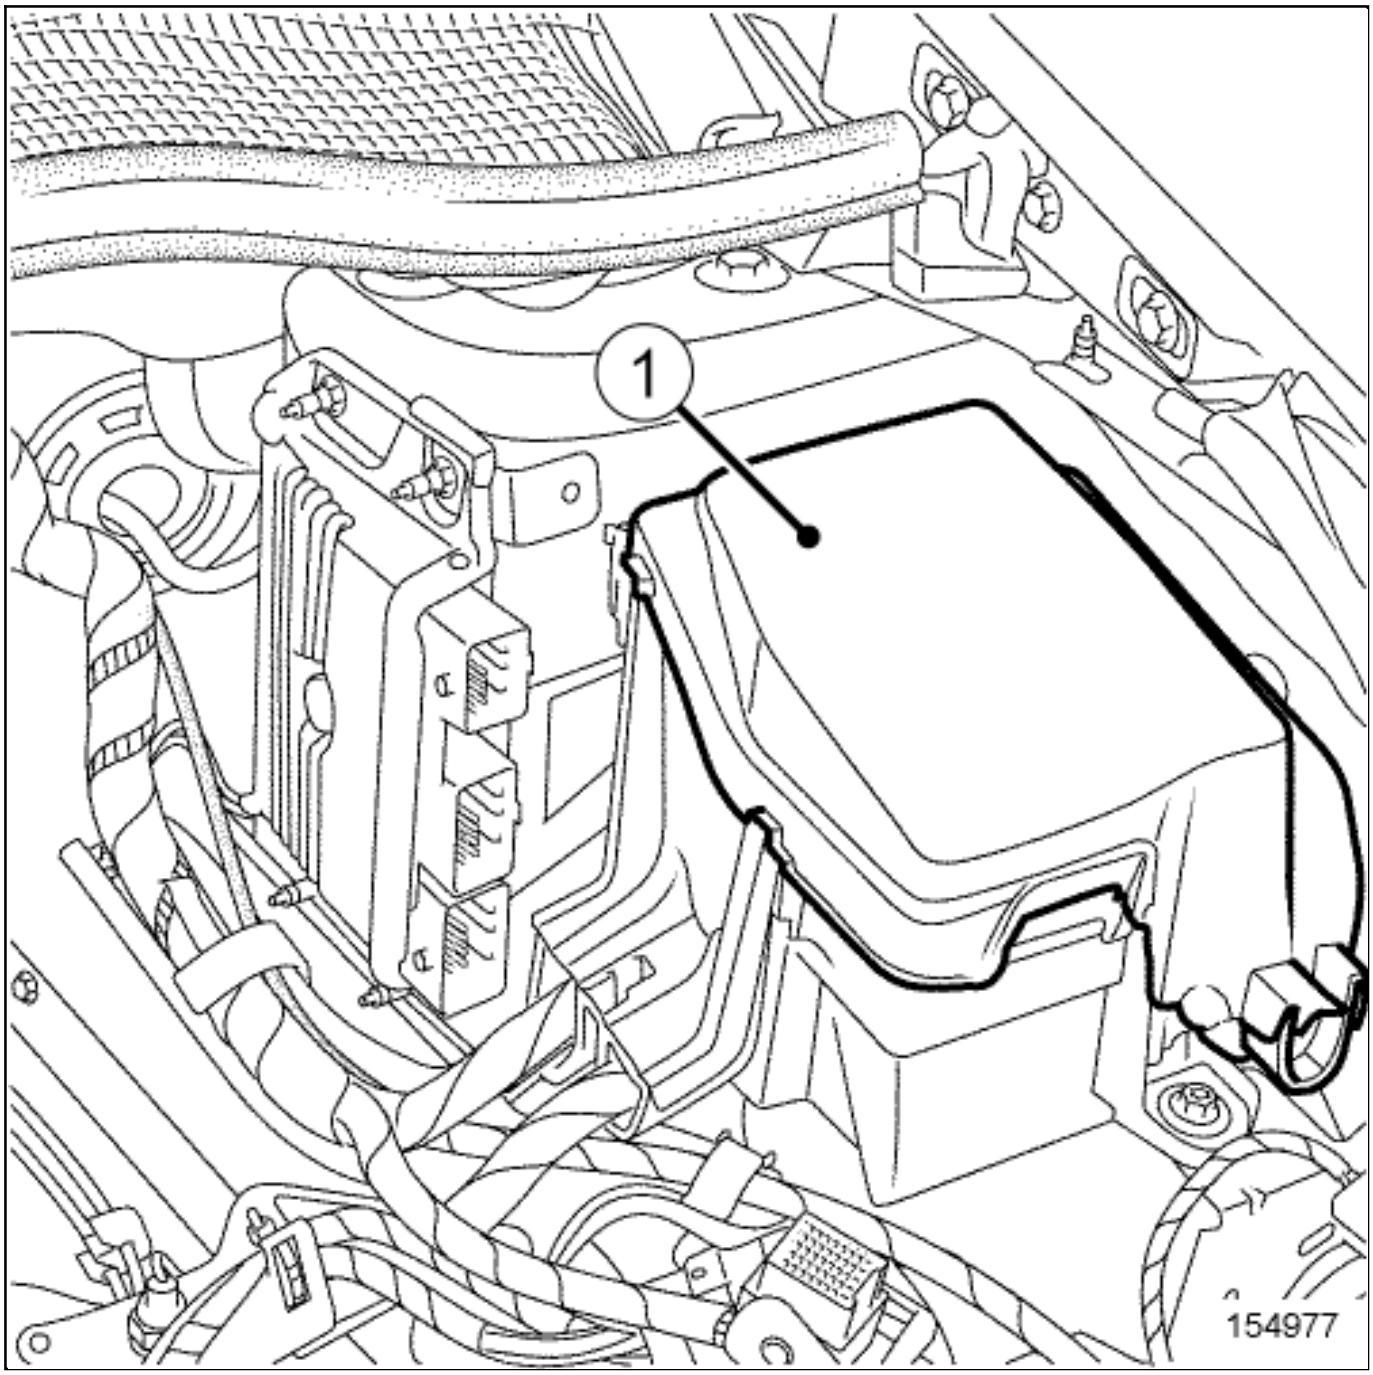
 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool

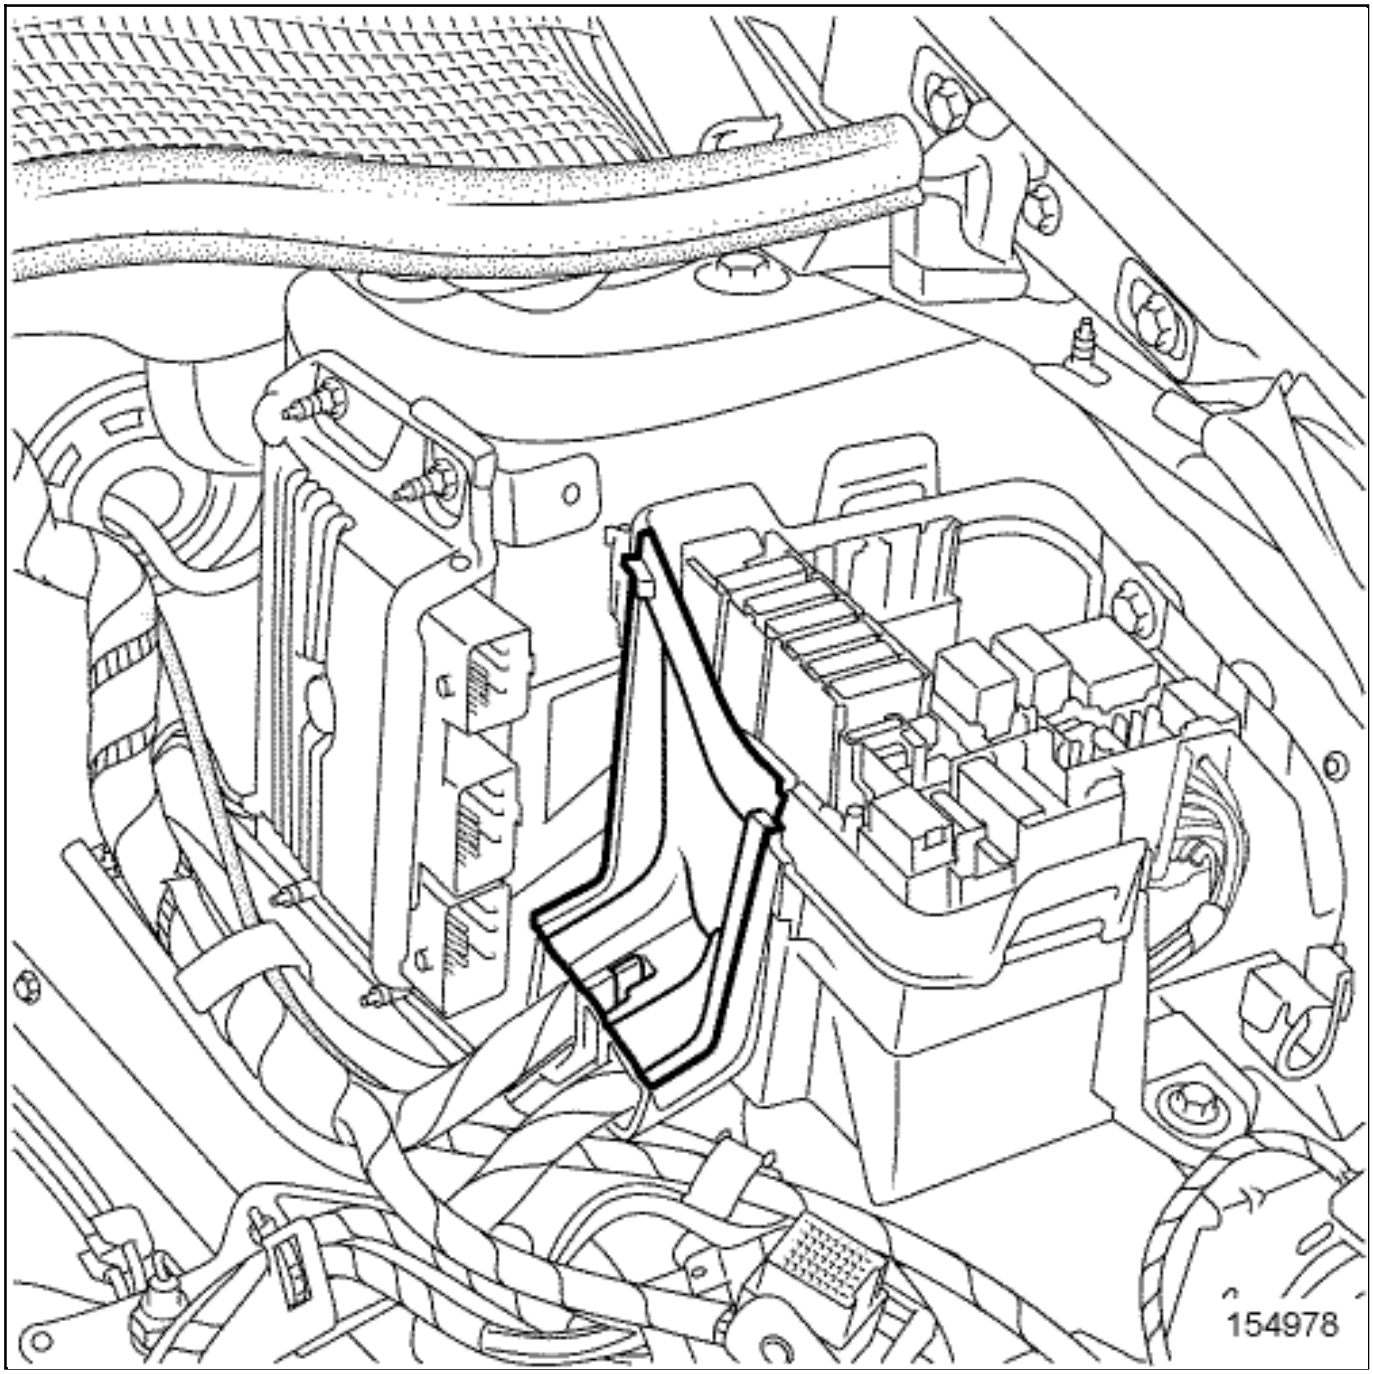
1. LIST OF COMPONENTS

1- THE ENGINE COMPARTMENT CONNECTION UNIT IS COMPOSED OF:

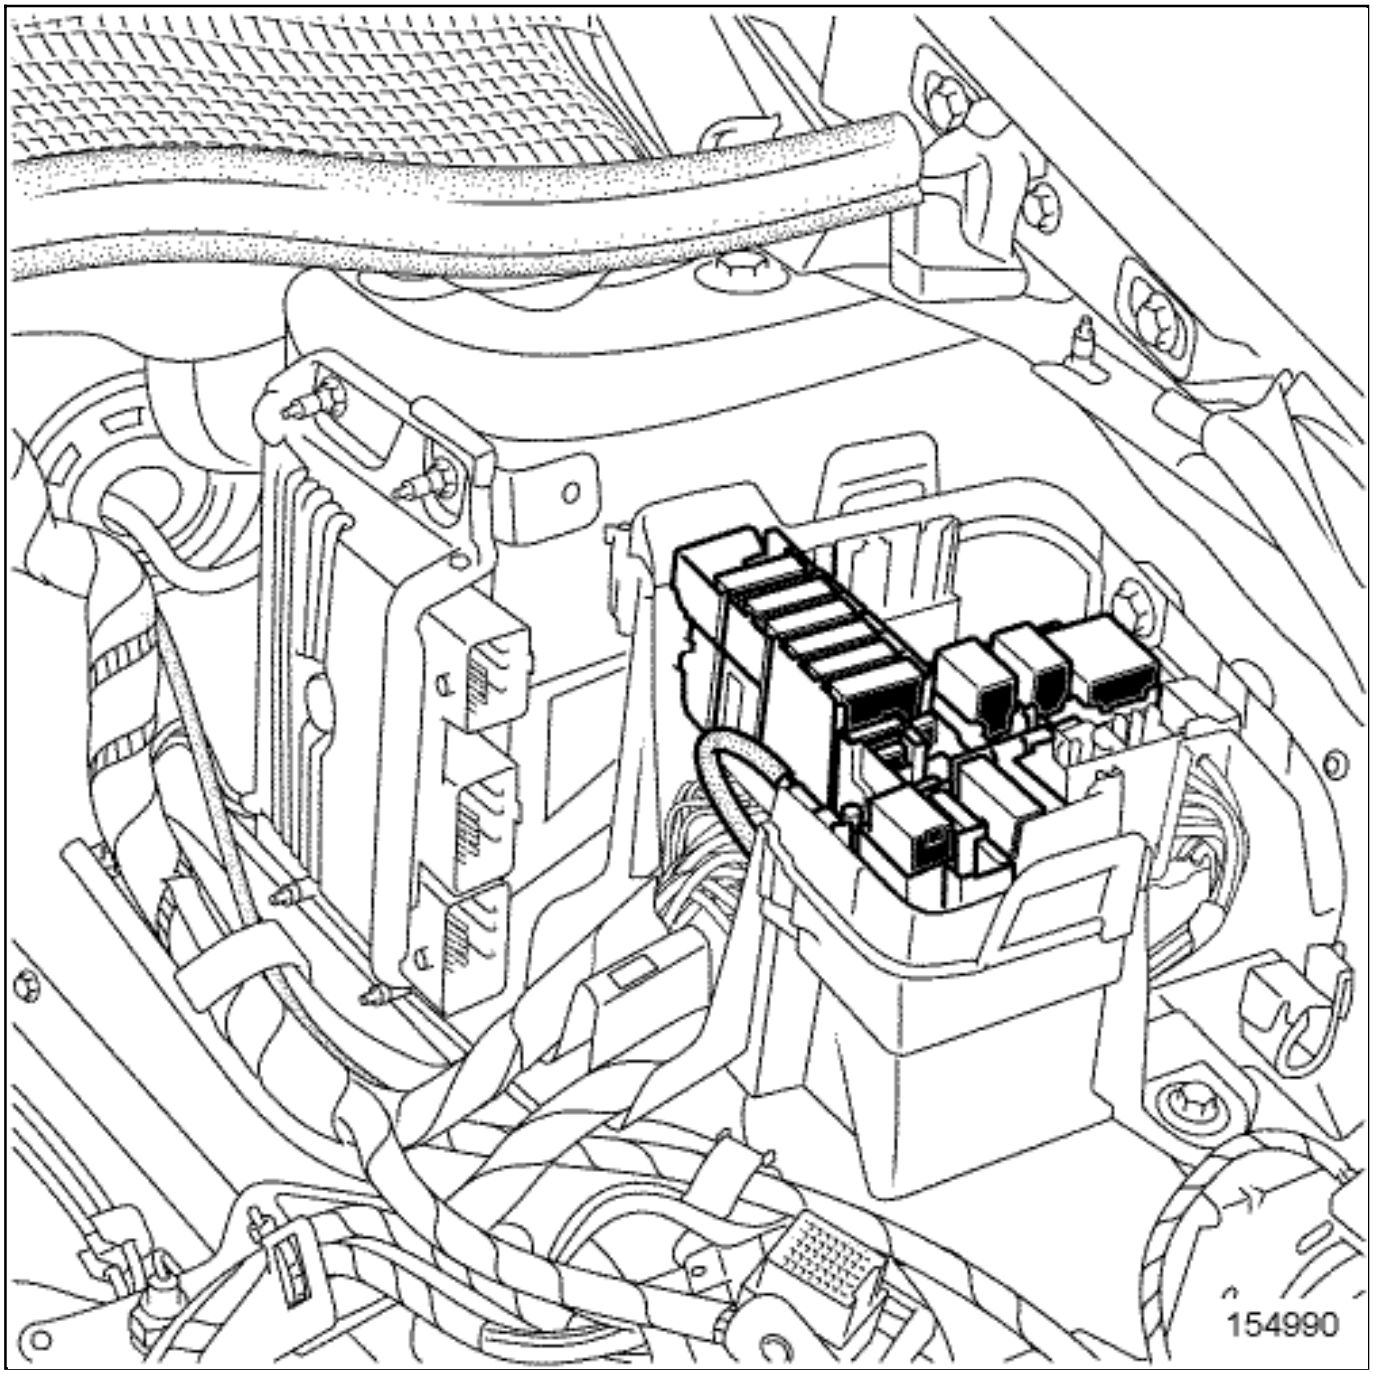
- an engine compartment connection unit
- a Protection and Switching Unit



2. LOCATION OF COMPONENTS

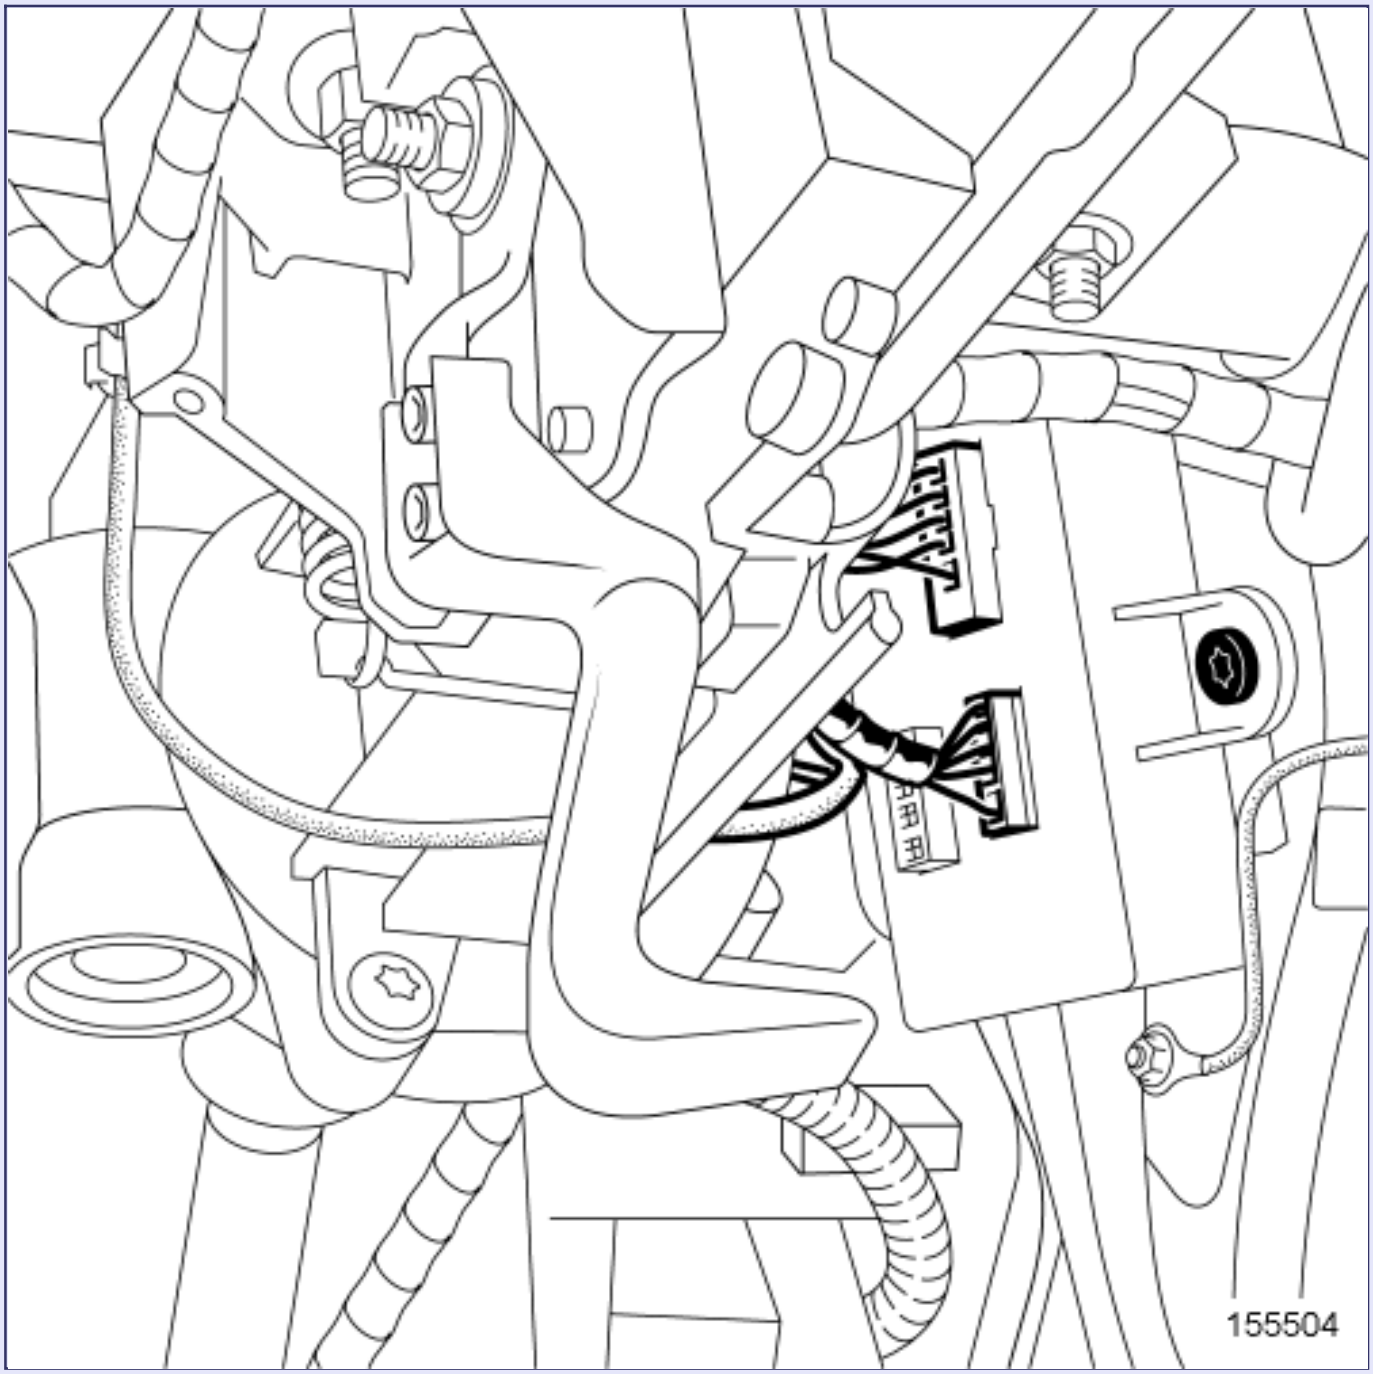


CAUTION



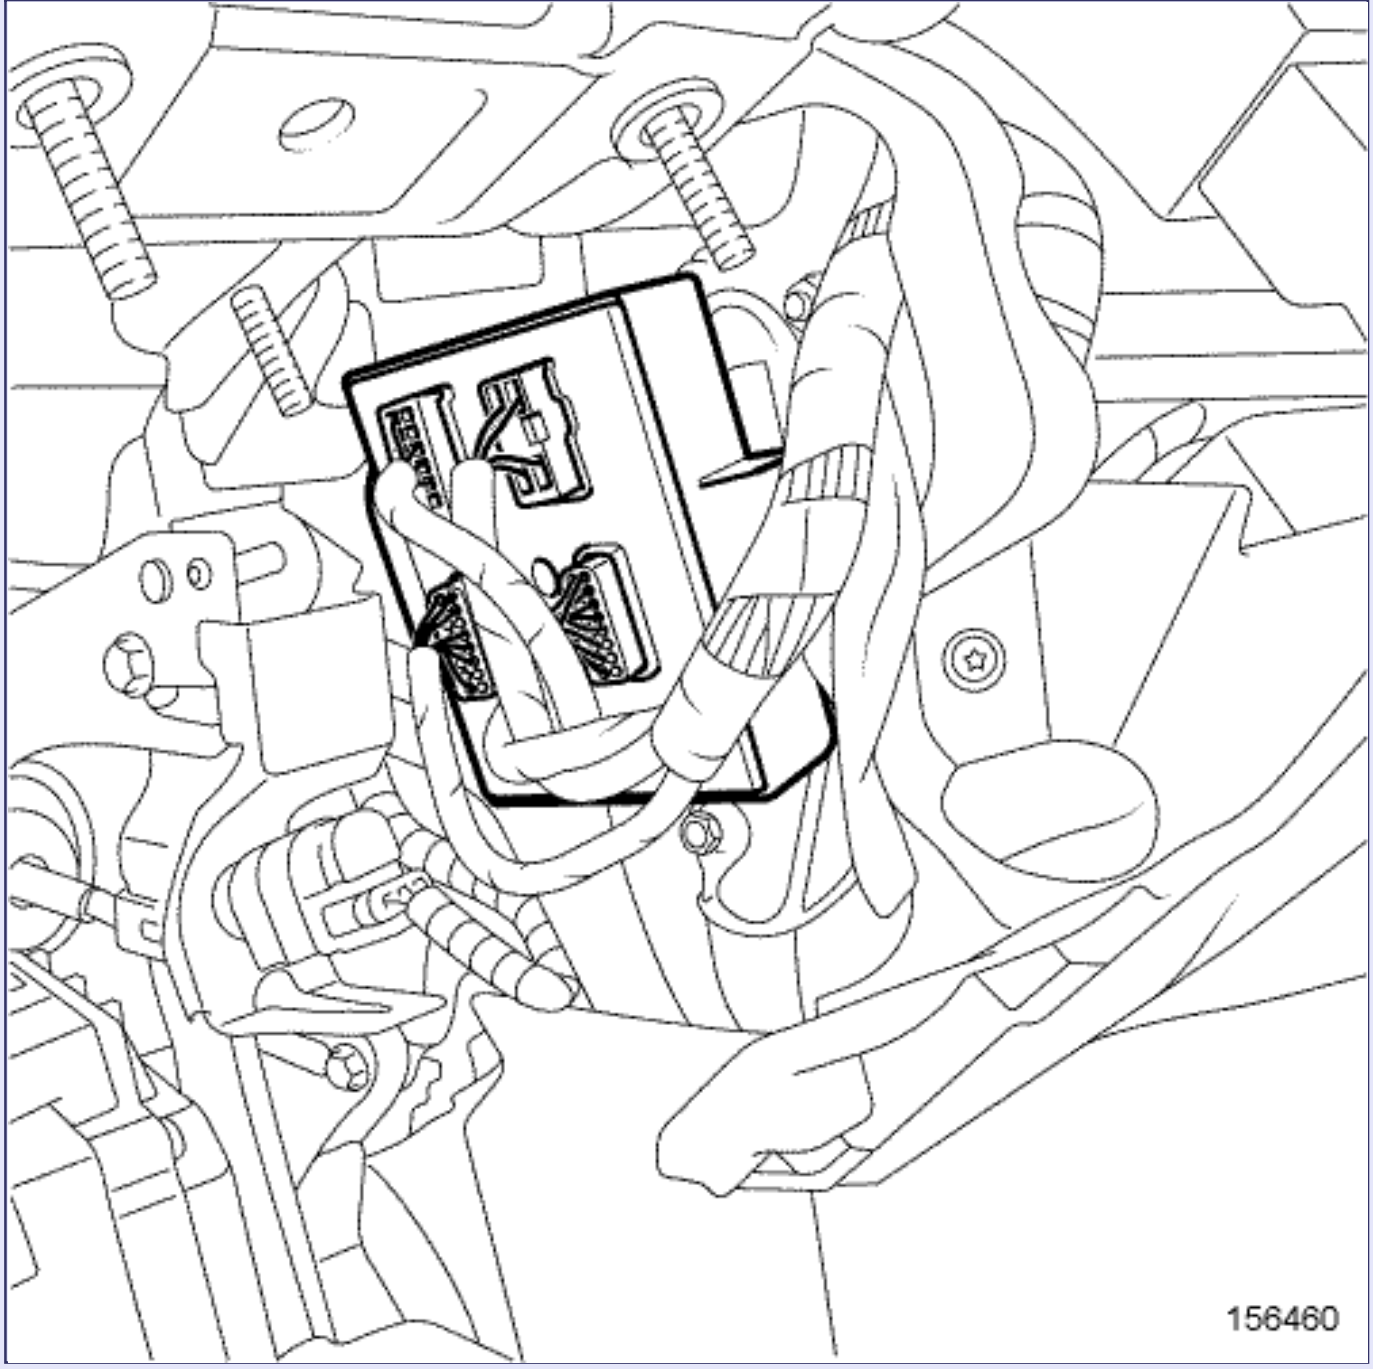
To prevent damage to the wiring harness when refitting, observe the original routing.

1- ENGINE COMPARTMENT CONNECTION UNIT



Unclip the cover(1) to access the engine compartment connection unit.

154978



2- PROTECTION AND SWITCHING UNIT

WITHOUT ENERGY SMART MANAGEMENT(SSESM)

The Protection and Switching Unit is located behind the lower dashboard trim.

WITH ENERGY SMART MANAGEMENT(AVESM)

The Protection and Switching Unit is located behind the lower dashboard trim.

1)REMOVAL OPERATION

In the event of replacement, apply the before repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the Before repair procedure:

"Protection and Switching Unit" .

Disconnect the batteryBattery: Removal - Refitting .

Remove the lower dashboard trim Dashboard assembly: Exploded view .

Disconnect and unclip the unit.

2)REFITTING OPERATION

Proceed in the reverse order to removal.

In the event of replacement, apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Protection and Switching Unit" .

WITH STOP AND START (STOSTA)

Apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Protection and Switching Unit" ,
-Component controlled by this computer concerned by the After repair procedure:

"Stop&Start management module" .

ENGINE COMPARTMENT CONNECTION UNIT: LIST AND LOCATION OF COMPONENTS

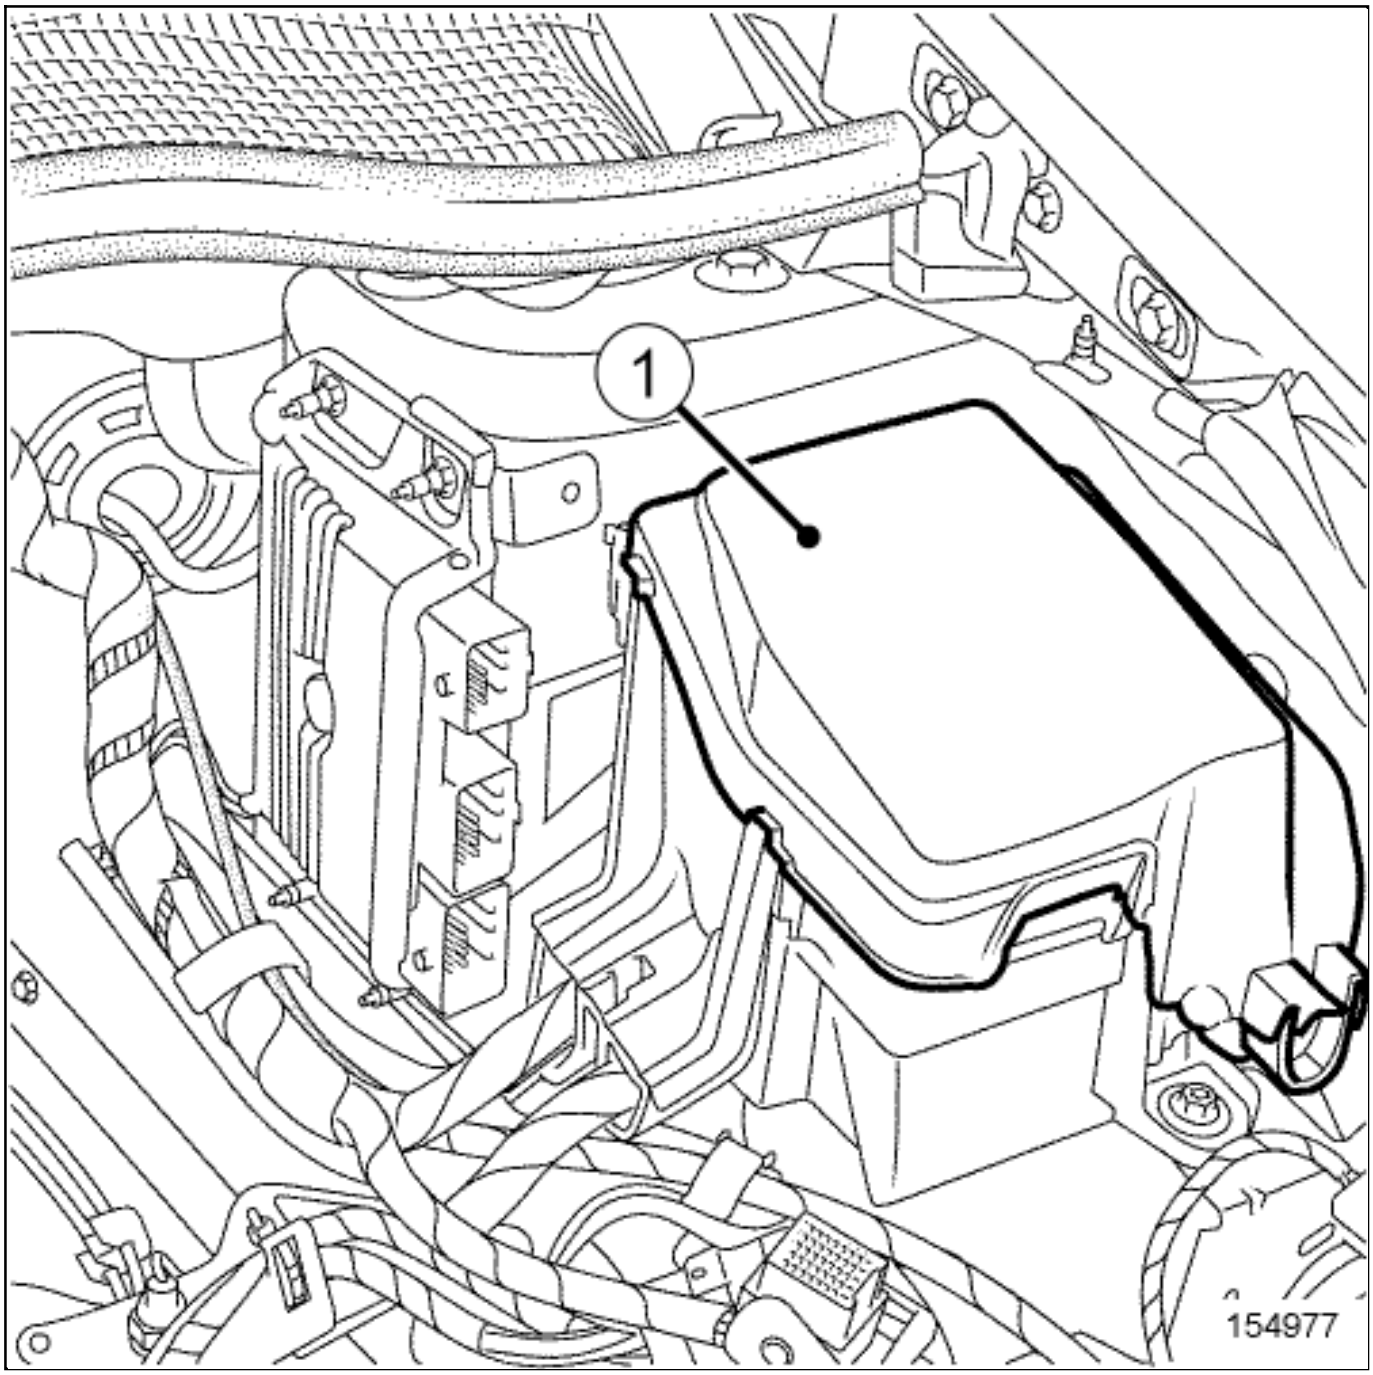
Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

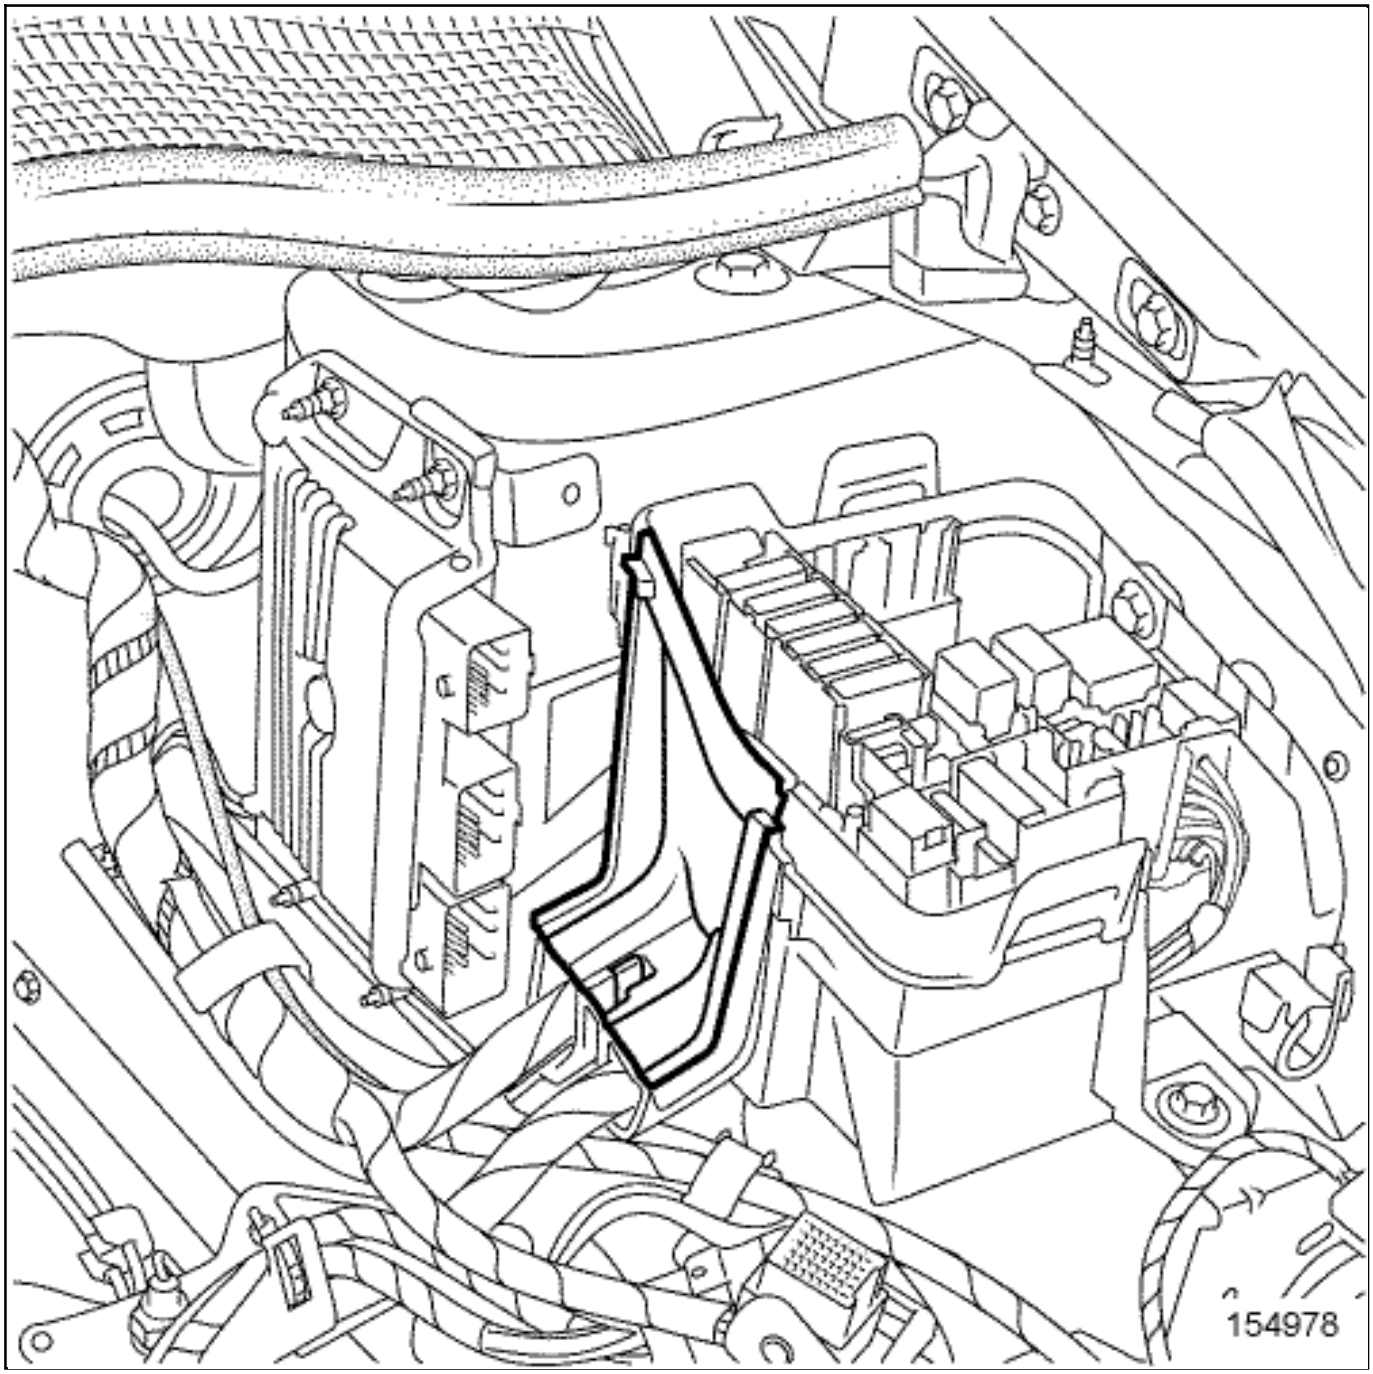
1. LIST OF COMPONENTS

1- THE ENGINE COMPARTMENT CONNECTION UNIT IS COMPOSED OF:

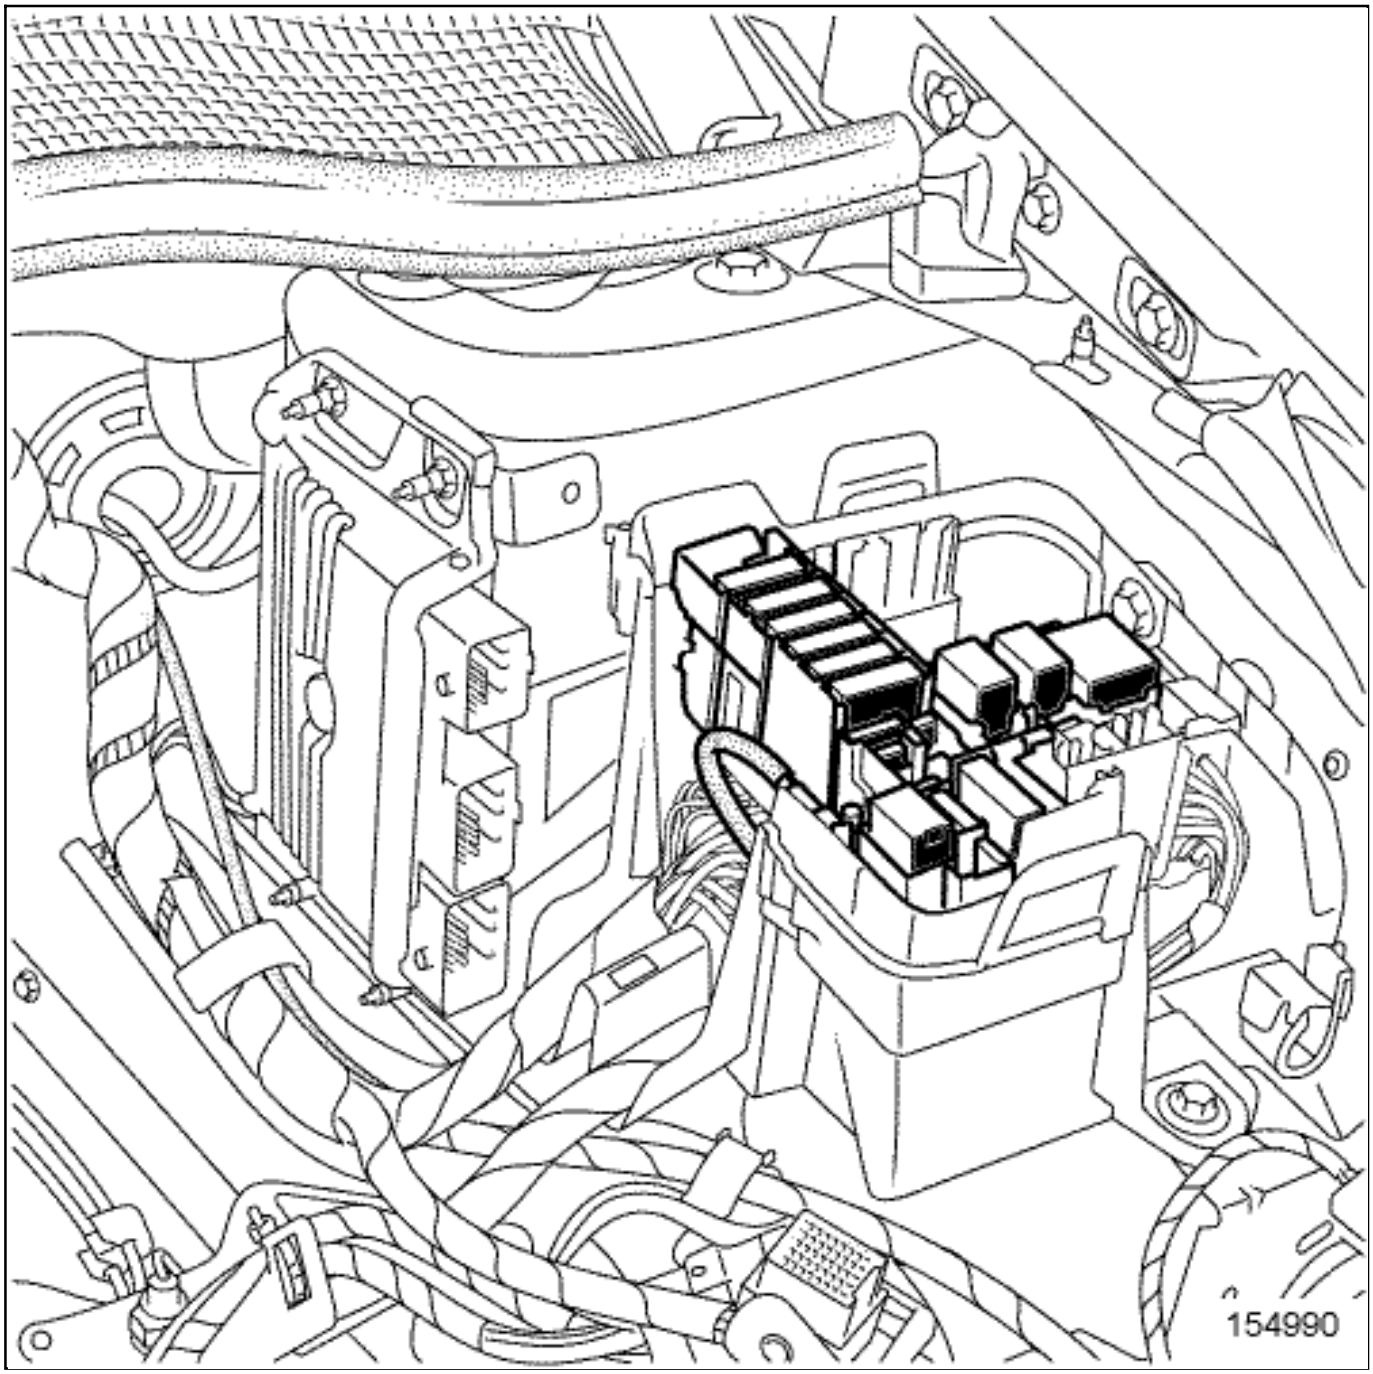
- an engine compartment connection unit
- a Protection and Switching Unit



2. LOCATION OF COMPONENTS

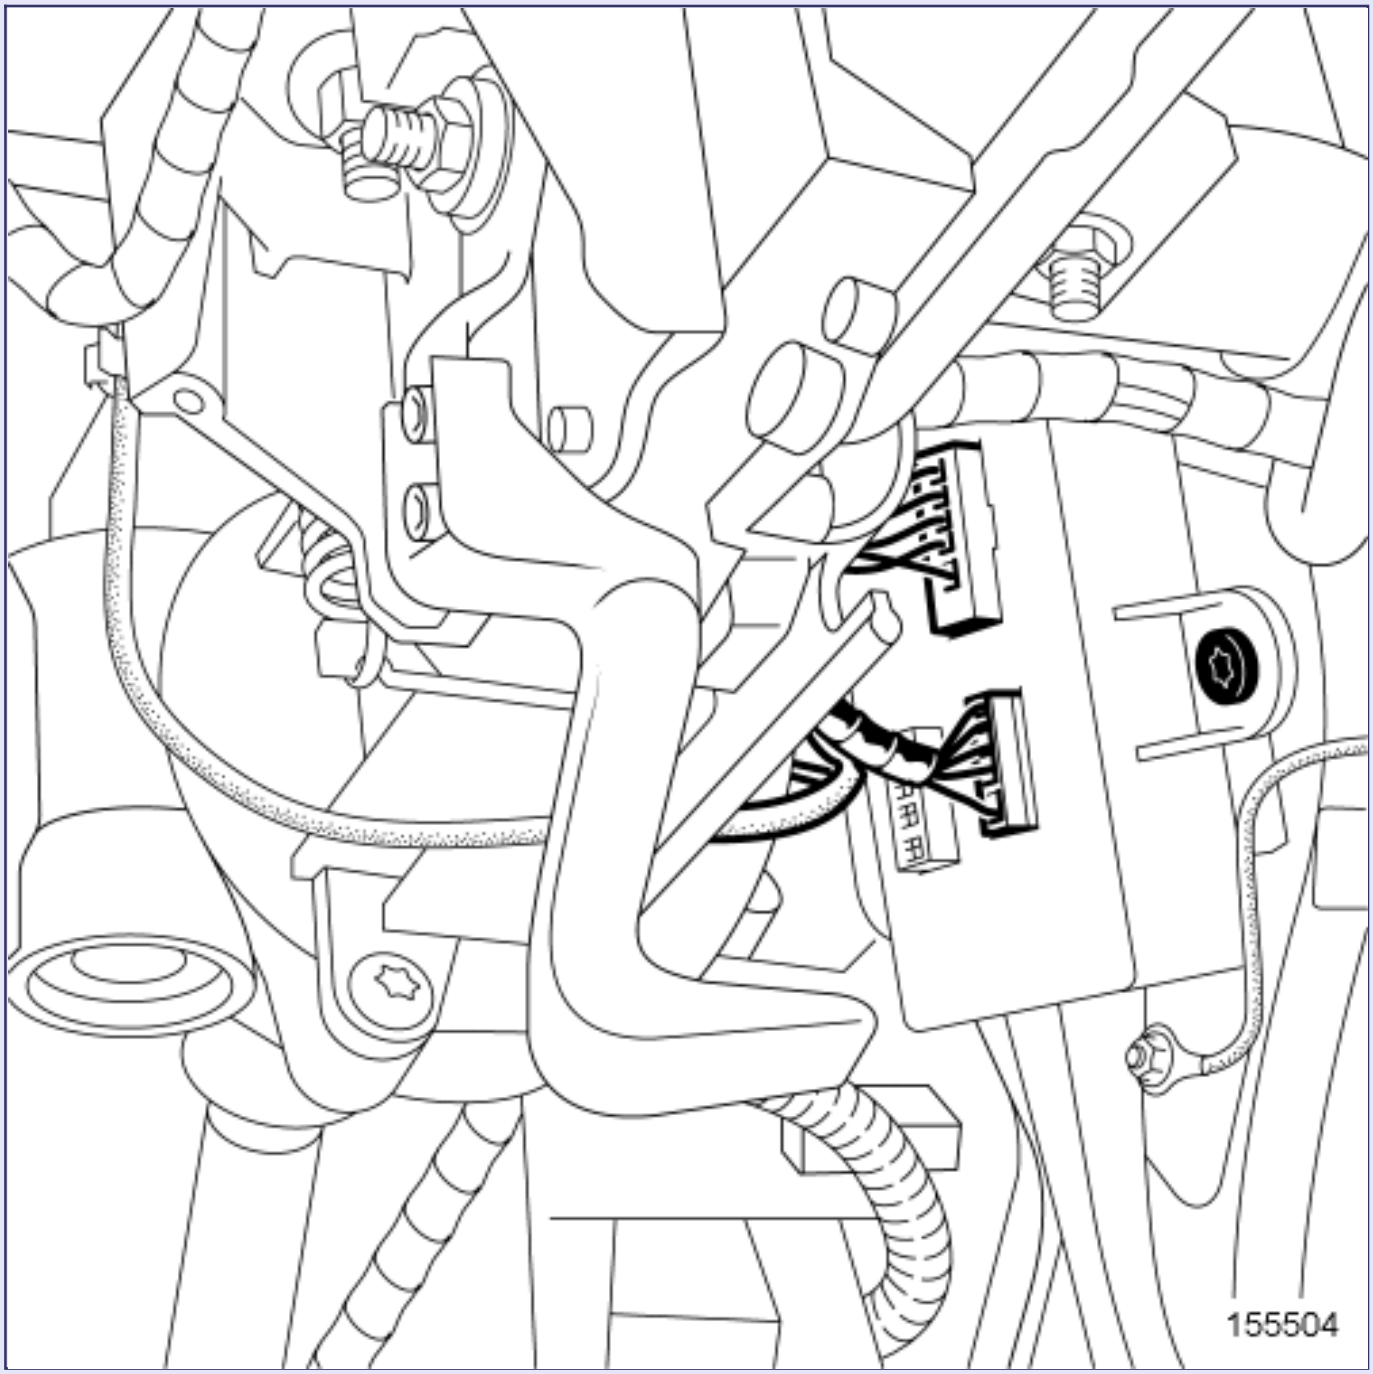


CAUTION



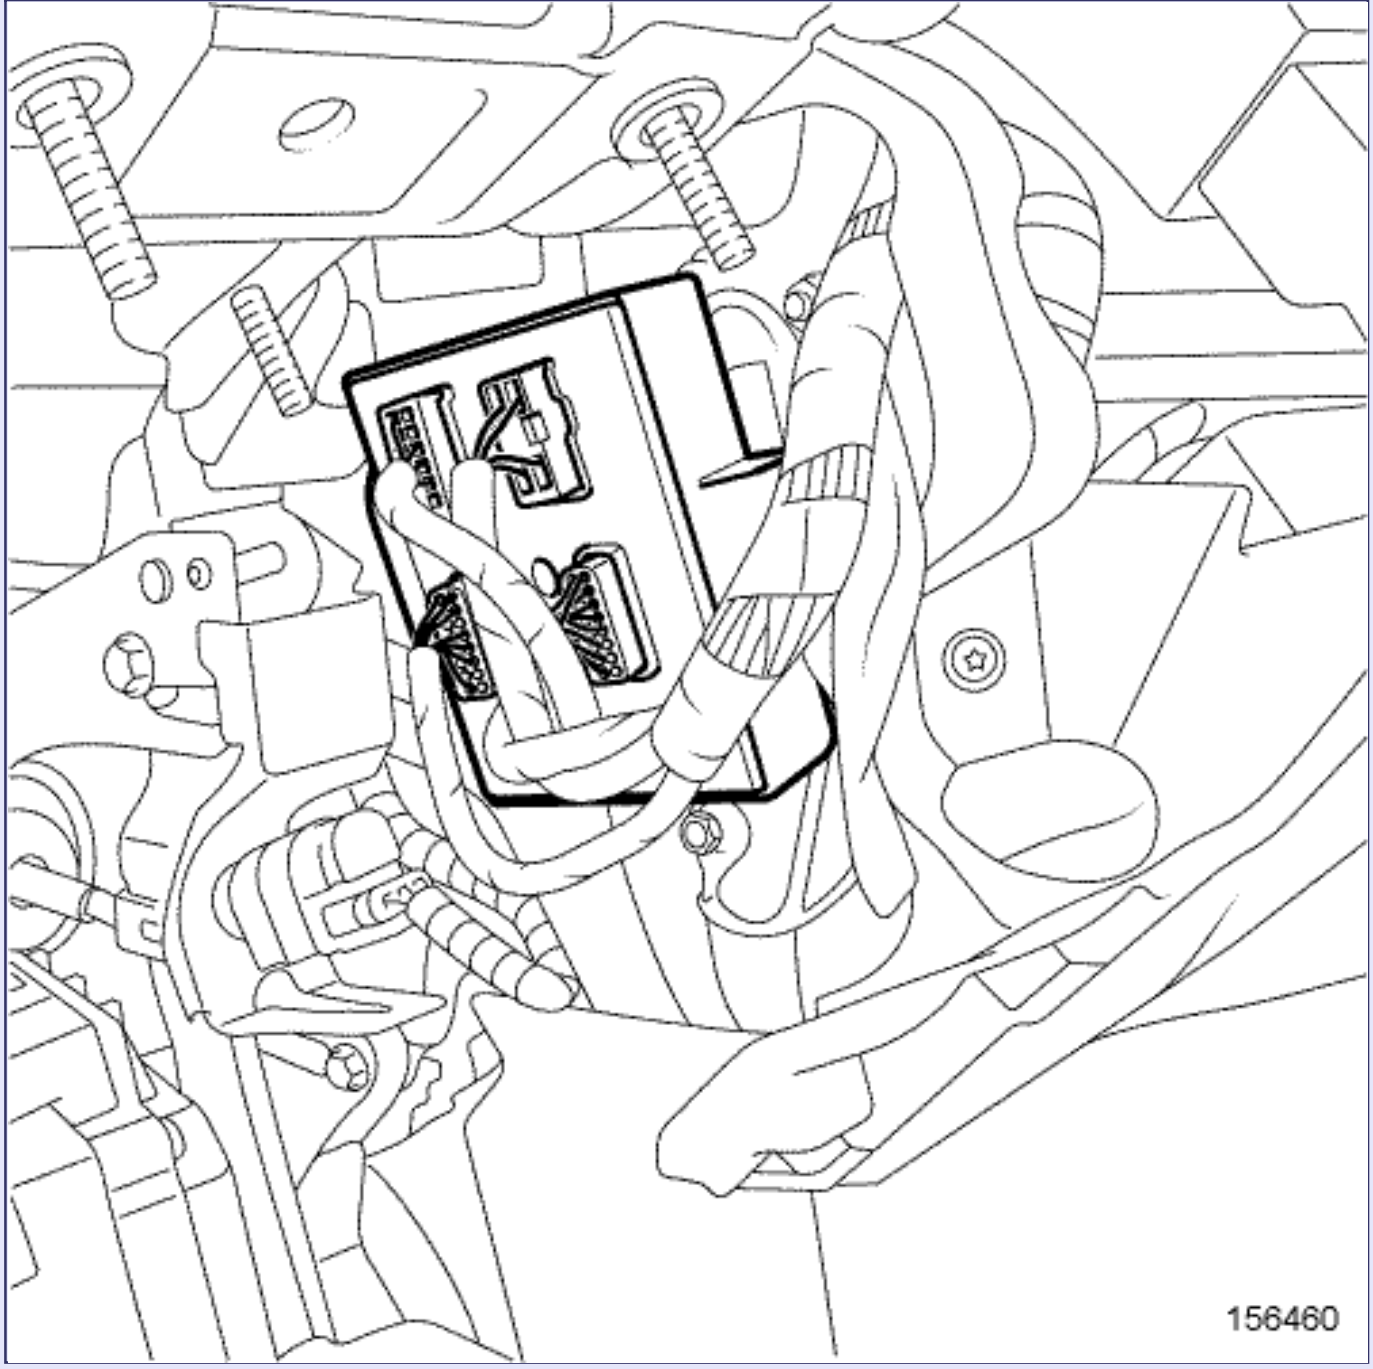
To prevent damage to the wiring harness when refitting, observe the original routing.

1- ENGINE COMPARTMENT CONNECTION UNIT



Unclip the cover(1) to access the engine compartment connection unit.

154978



2- PROTECTION AND SWITCHING UNIT

WITHOUT ENERGY SMART MANAGEMENT(SSESM)

The Protection and Switching Unit is located behind the lower dashboard trim.

WITH ENERGY SMART MANAGEMENT(AVESM)

The Protection and Switching Unit is located behind the lower dashboard trim.

1)REMOVAL OPERATION

In the event of replacement, apply the before repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the Before repair procedure:

"Protection and Switching Unit" .

Disconnect the batteryBattery: Removal - Refitting .

Remove the lower dashboard trim Dashboard assembly: Exploded view .

Disconnect and unclip the unit.

2)REFITTING OPERATION

Proceed in the reverse order to removal.

In the event of replacement, apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Protection and Switching Unit" .

WITH STOP AND START (STOSTA)

Apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Protection and Switching Unit" ,
-Component controlled by this computer concerned by the After repair procedure:

"Stop&Start management module" .

ENGINE COOLING FAN ASSEMBLY: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

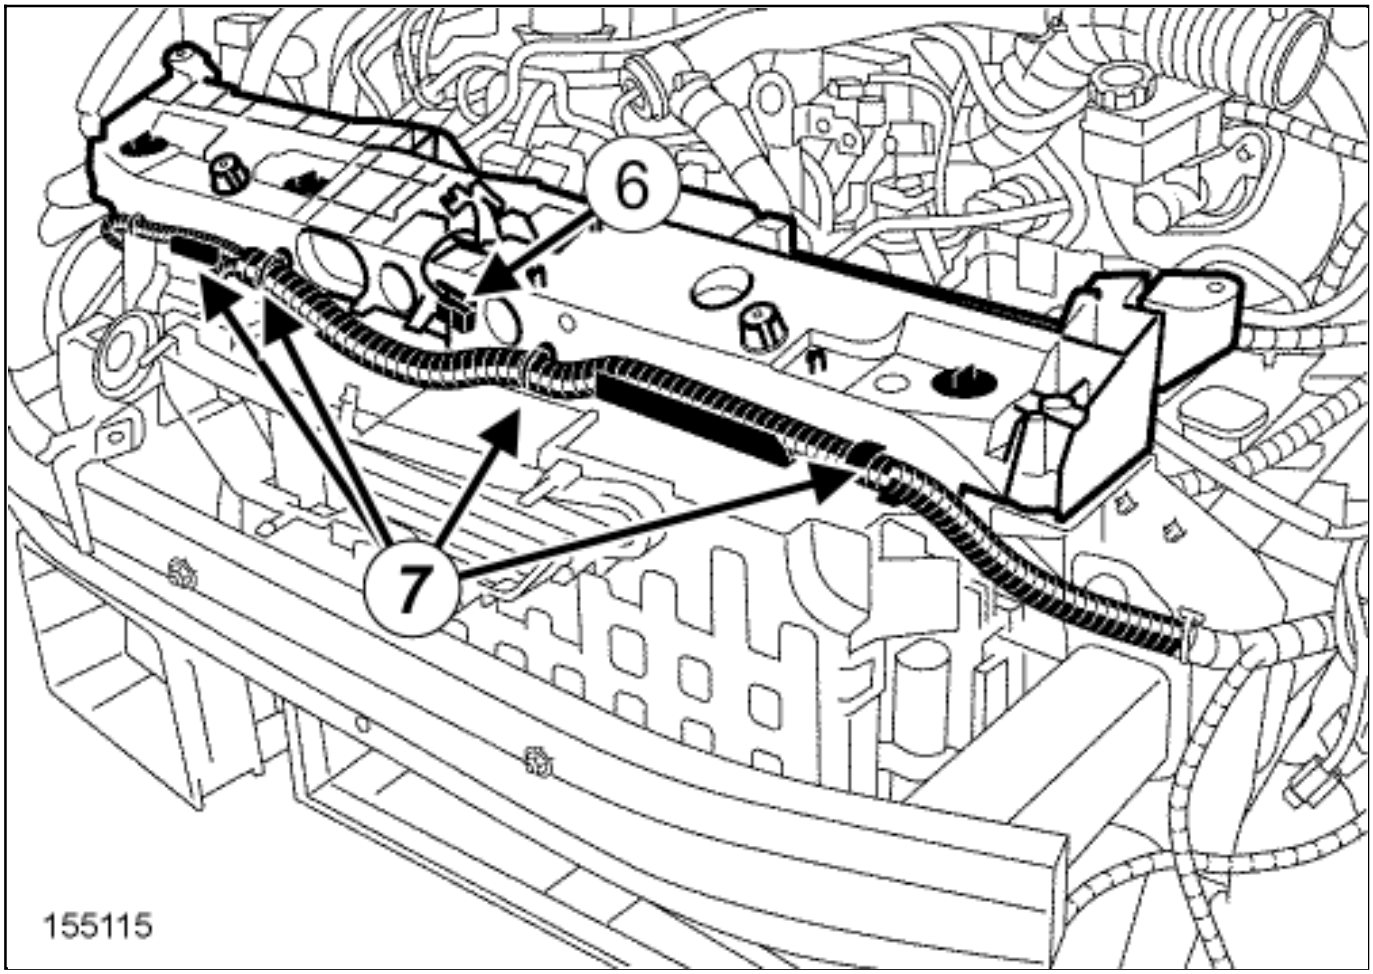
- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

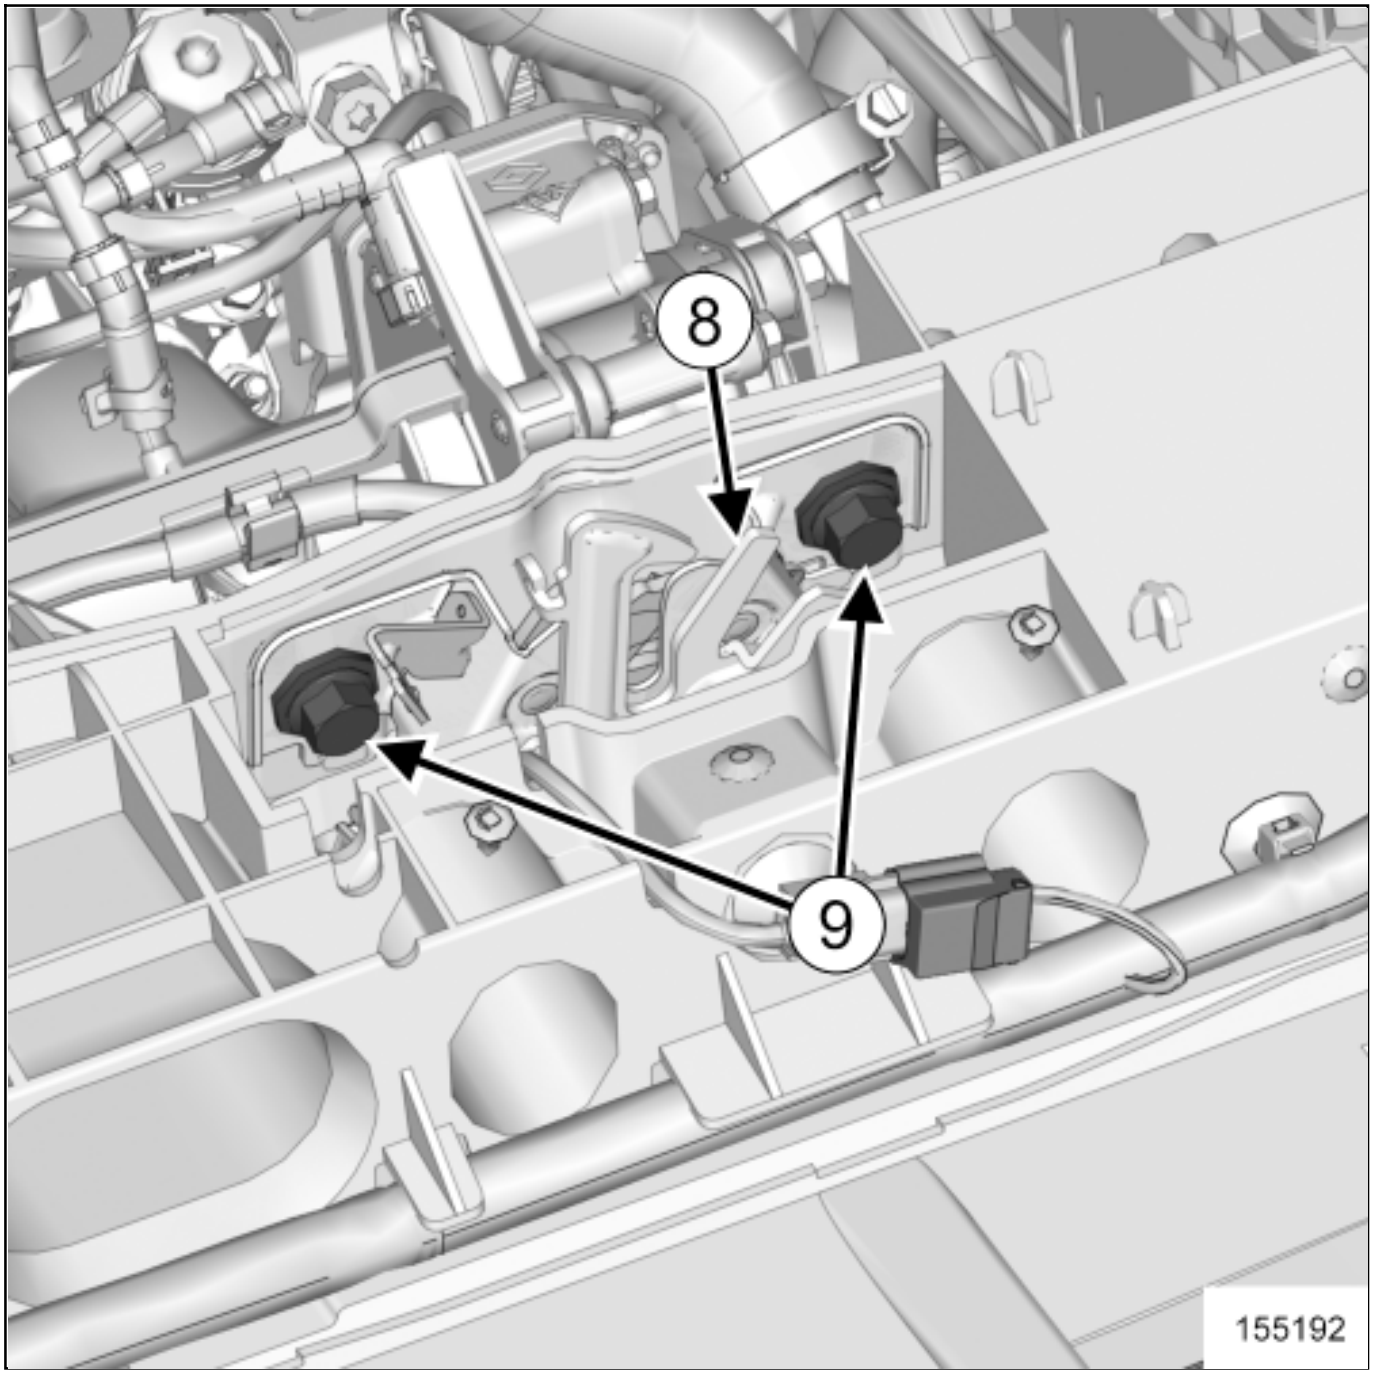


Disconnect the batteryBattery: Removal - Refitting .

Remove:

- the engine undertray,

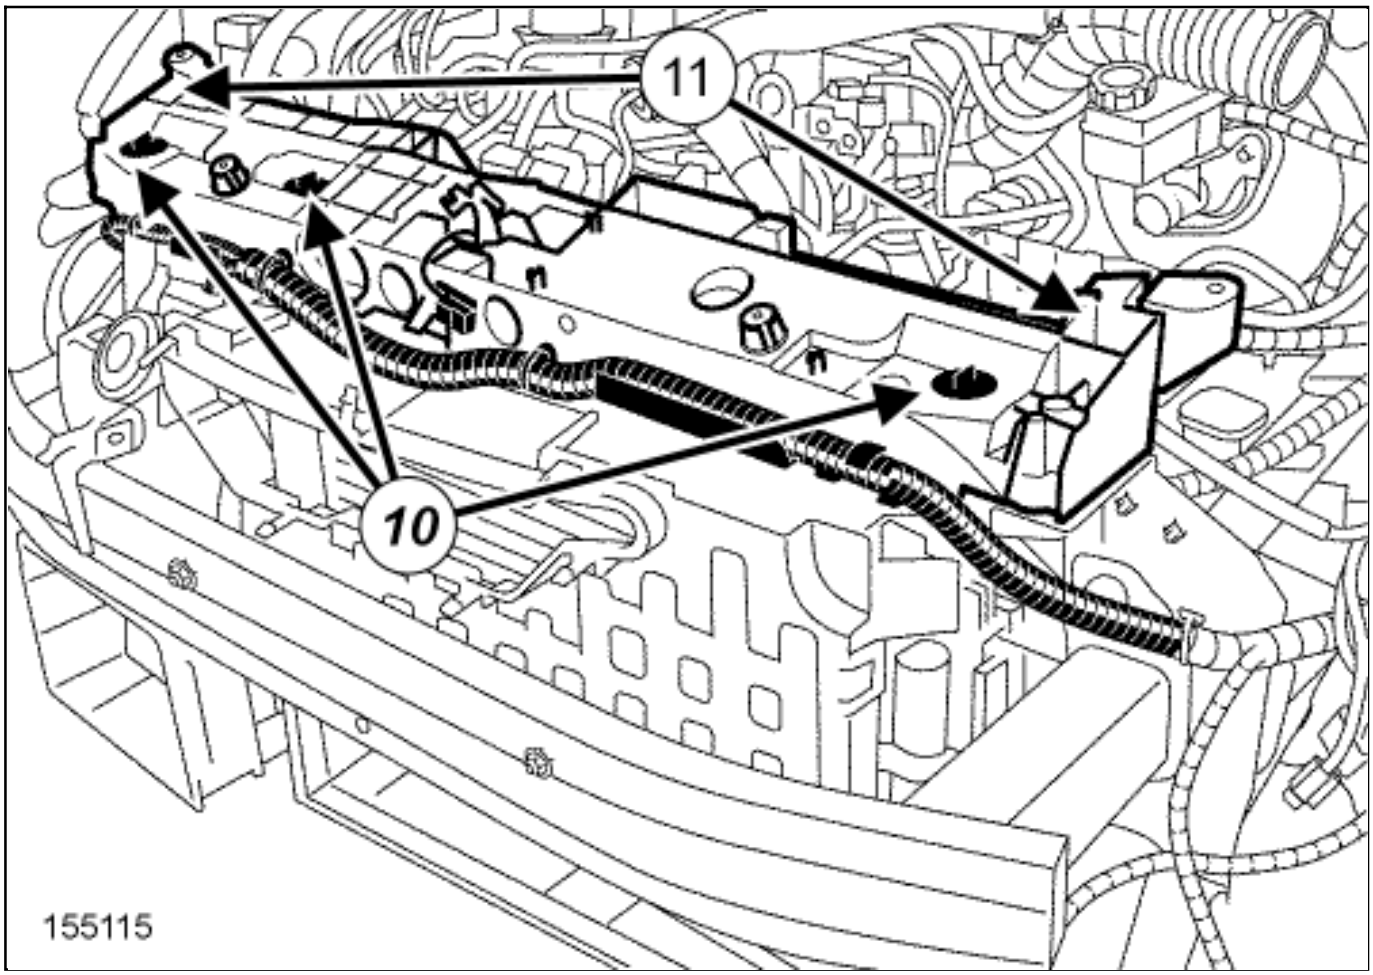
- the front wheels Front hub carrier assembly: Exploded view ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,
- the headlights Front signals - lighting assembly: Exploded view .



Remove the air filter air inlet pipe Air inlet assembly: Exploded view .

Disconnect the bonnet catch connector(6) .

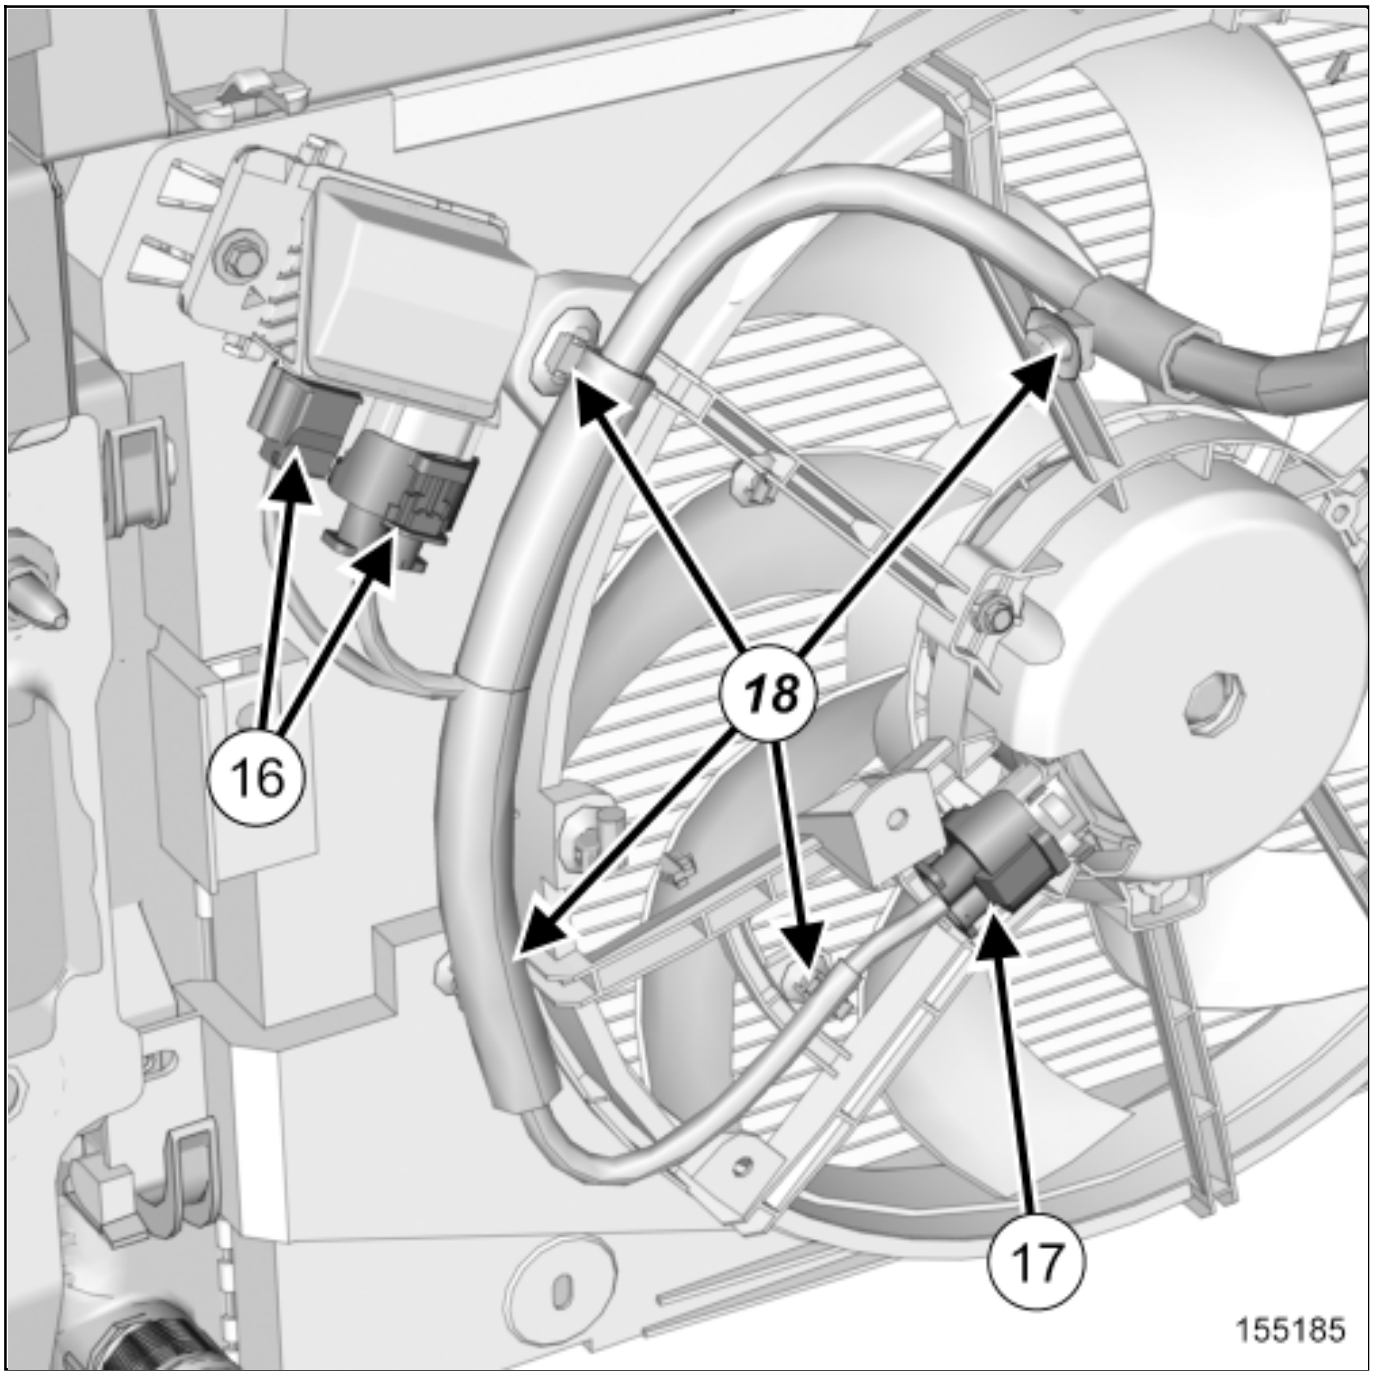
Unclip the wiring at(7) .



Move aside the wiring from the front upper cross member.

Disconnect the bonnet opening cable(8) .

Remove:



- the bonnet catch bolts(9) ,
- the bonnet catch.

Remove:

- the centring pins(10) ,
- the front upper cross member bolts(11) ,
- the front upper cross member.

2. REMOVAL OPERATION

Disconnect:

- the engine cooling fan assembly resistor connectors(**16**) ,
- the engine cooling fan connector(**17**) .

Unclip the fan assembly wiring from the fan assembly at(**18**) .

Unclip the engine cooling fan assembly from the cooling radiator(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Remove the engine cooling fan assembly upwards(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REFITTING

Proceed in the reverse order to removal.

ENGINE COOLING FAN ASSEMBLY: REMOVAL - REFITTING

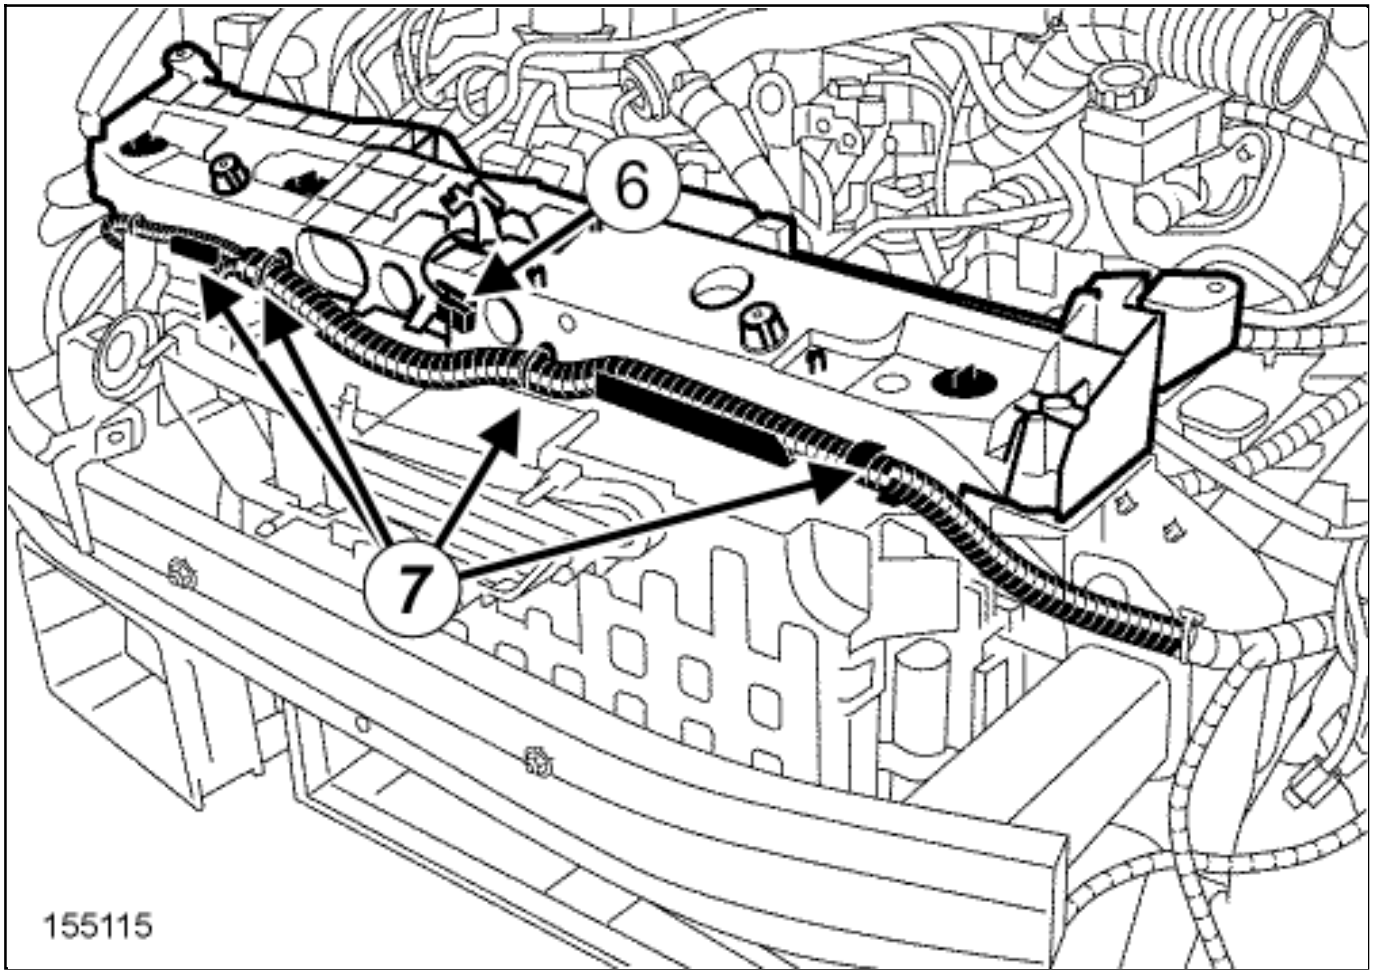
Note, one or more warnings are present in this procedure

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

- To avoid any risk of serious burns when the engine is hot:
  - do not open the expansion bottle cap,
  - do not drain the cooling system,
  - do not open the bleed screw(s).

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

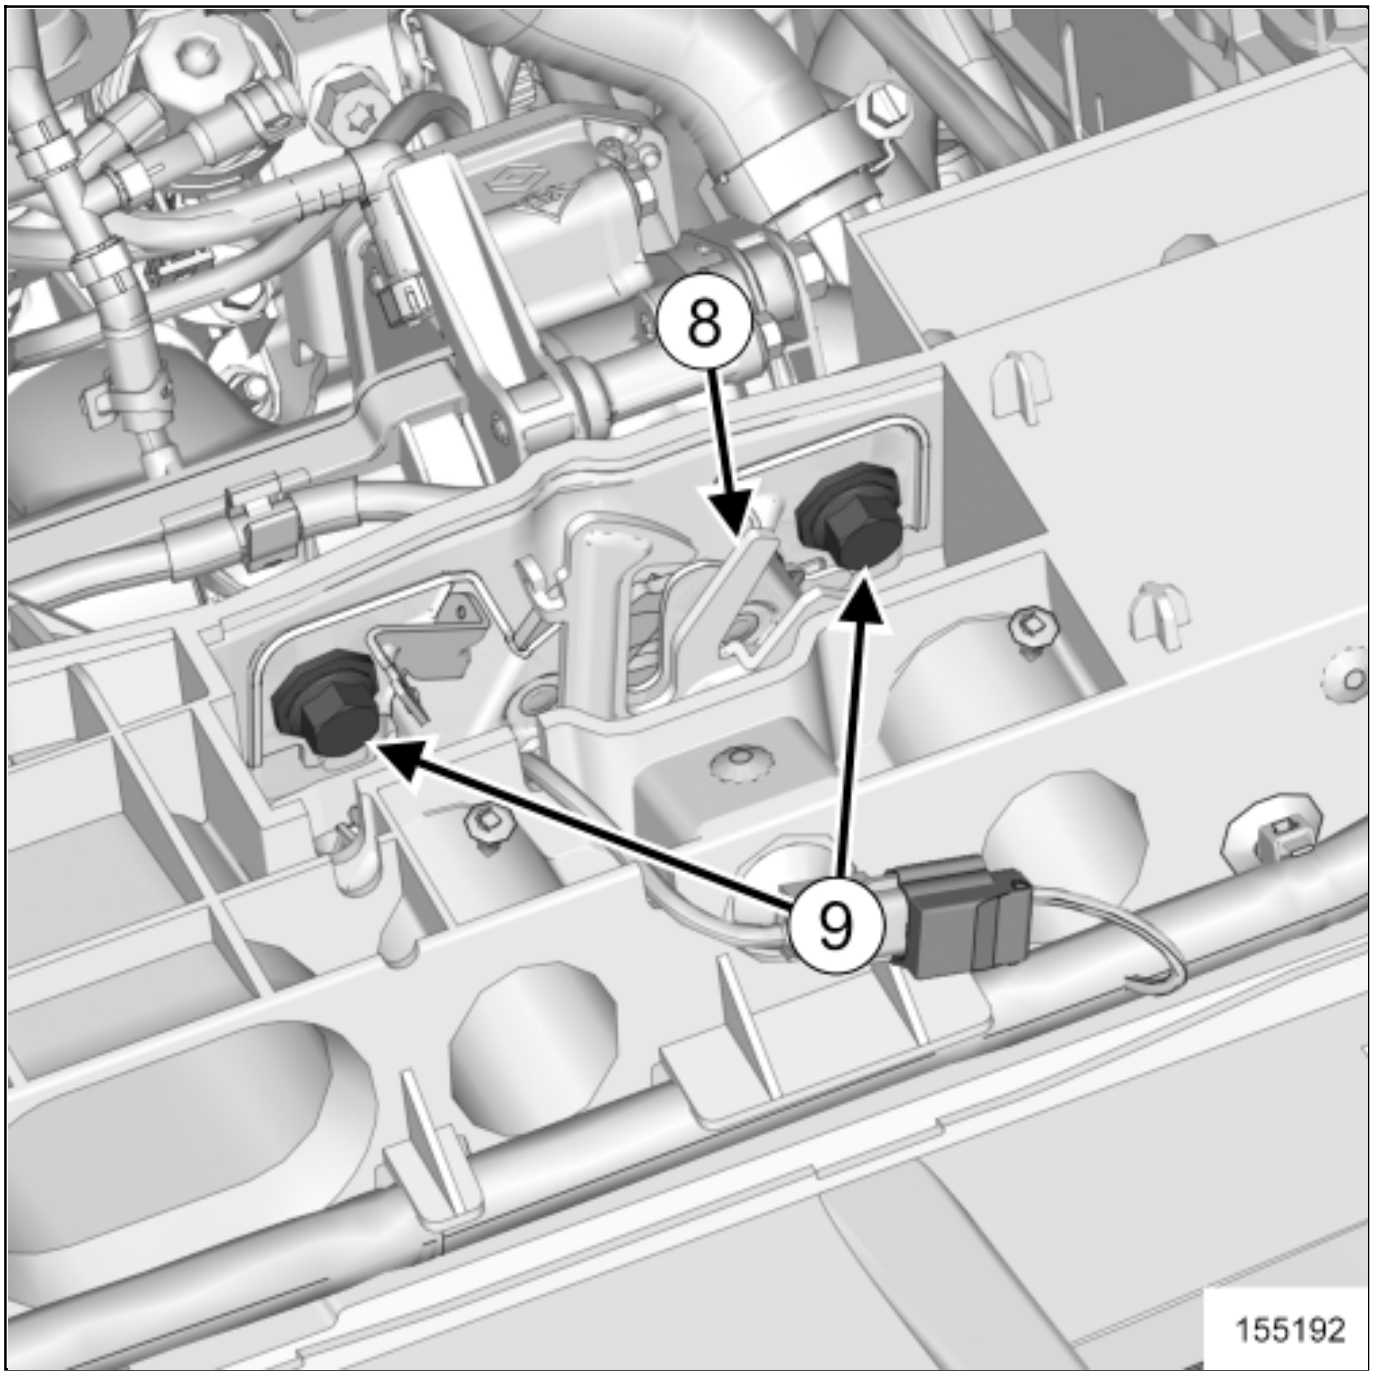


REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the engine undertray,
  - the front wheelsFront hub carrier assembly: Exploded view ,

- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,
- the headlights Front signals - lighting assembly: Exploded view .

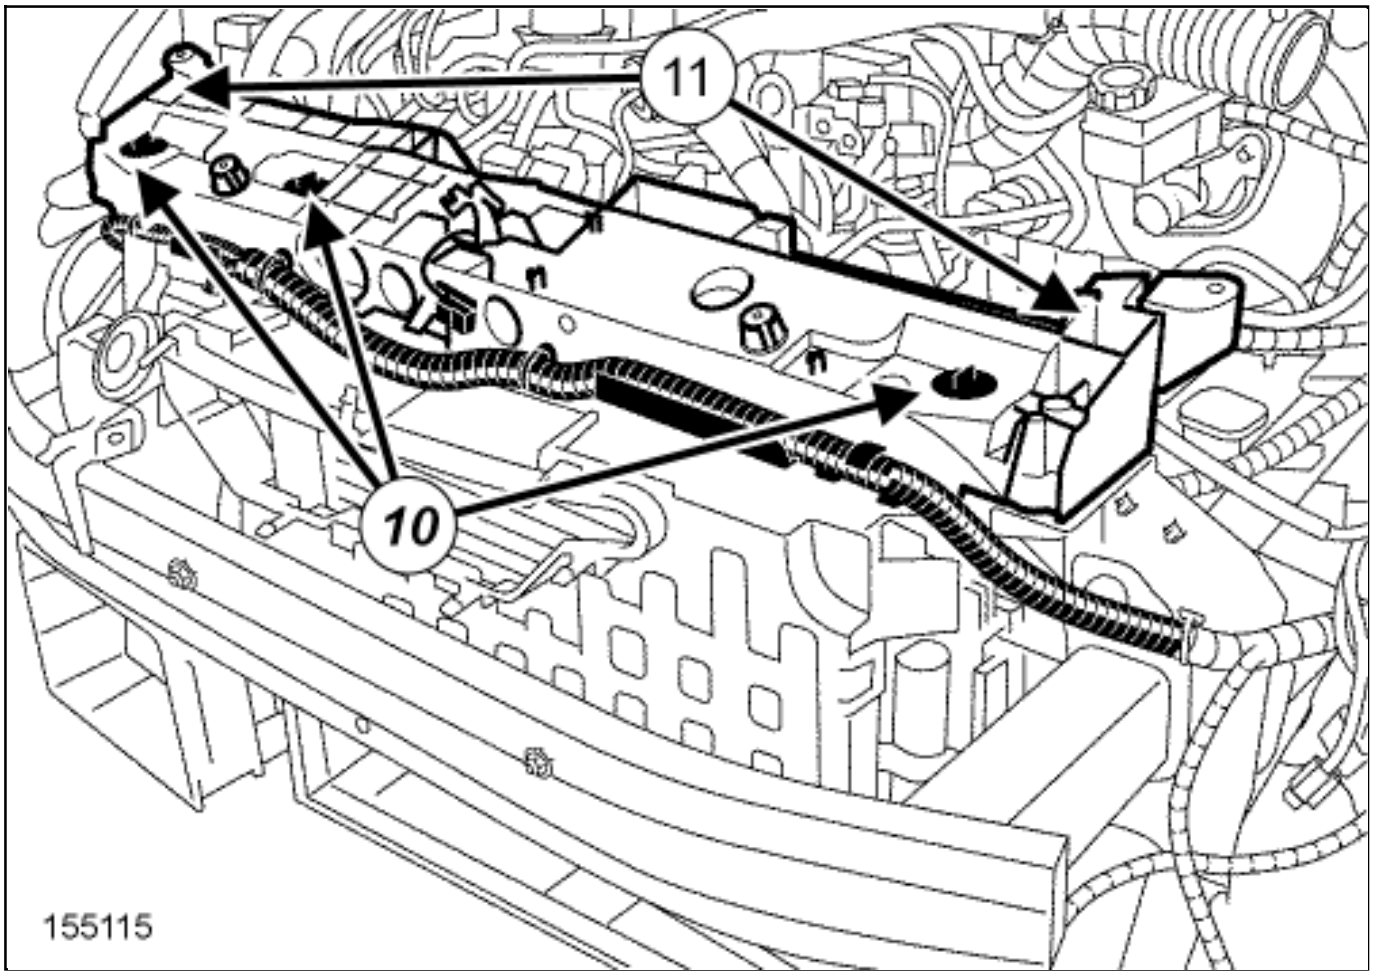


Remove the air filter air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Disconnect the bonnet catch connector(6) .

Unclip the wiring at(7) .

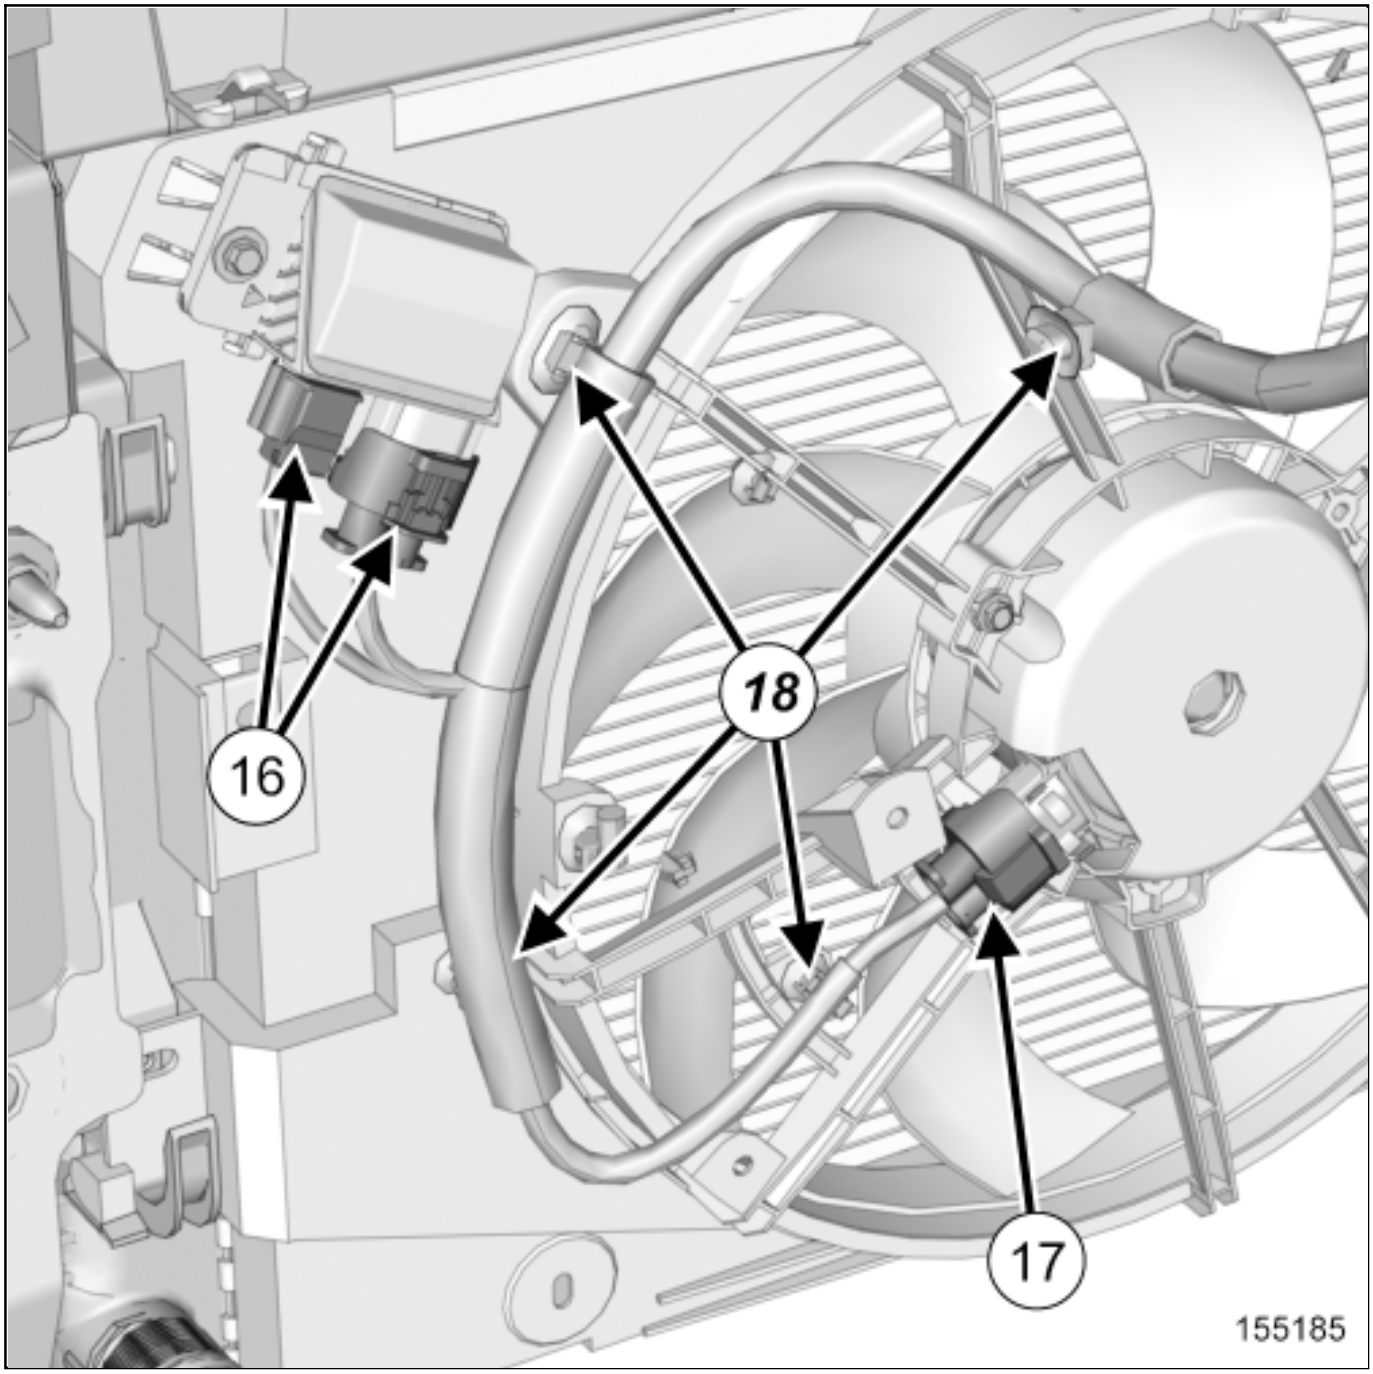
Move aside the wiring from the front upper cross member.



Disconnect the bonnet opening cable(8) .

Remove:

- the bonnet catch bolts(9) ,



- the bonnet catch.

Remove:

- the centring pins(**10**) ,
- the front upper cross member bolts(**11**) ,
- the front upper cross member.

2. REMOVAL OPERATION

Disconnect:

- the engine cooling fan assembly resistor connectors(16) ,
- the engine cooling fan connector(17) .

Unclip the fan assembly wiring from the fan assembly at(18) .

Unclip the engine cooling fan assembly from the cooling radiator(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Remove the engine cooling fan assembly upwards(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REFITTING

Proceed in the reverse order to removal.

ENGINE COOLING SYSTEM: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
Instrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06	Ms. 554-07
Fault finding and filling - bleeding the cooling circuit.	Mot. 1700

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

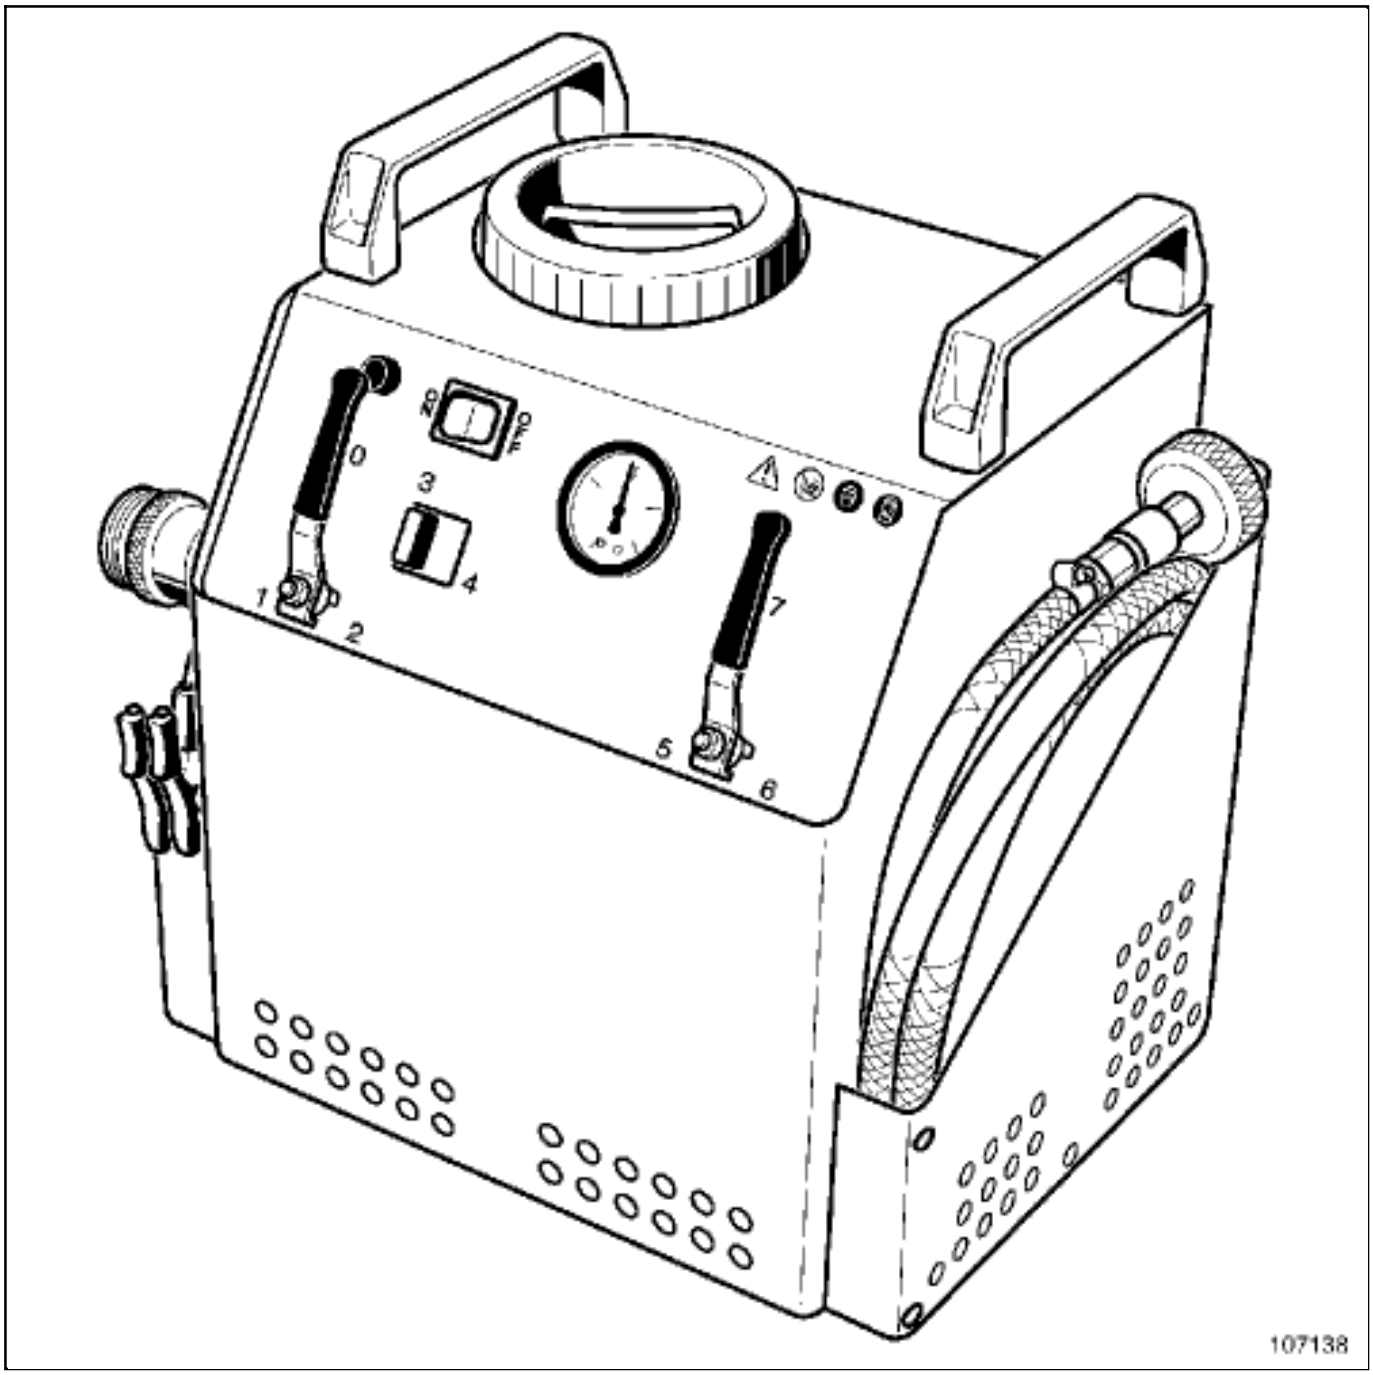
- To avoid any risk of serious burns when the engine is hot:
  - do not open the expansion bottle cap,
  - do not drain the cooling system,
  - do not open the bleed screw(s).

Note:

- There are two procedures for checking the cooling system:
  - the procedure using theFault finding and filling - bleeding the cooling circuit.(Mot. 1700) ,
  - the procedure using theInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(Ms. 554-07) .

EXPANSION BOTTLE CAP VALVE RATING:

Expansion bottle cap with ...	Valve rating
... a brown circle	1.2 bar
... a yellow marking	1.4 bar
... a white marking	1.6 bar
... a grey marking	1.8 bar



1. CHECKING THE COOLING SYSTEM USING THE TOOL (MOT. 1700)

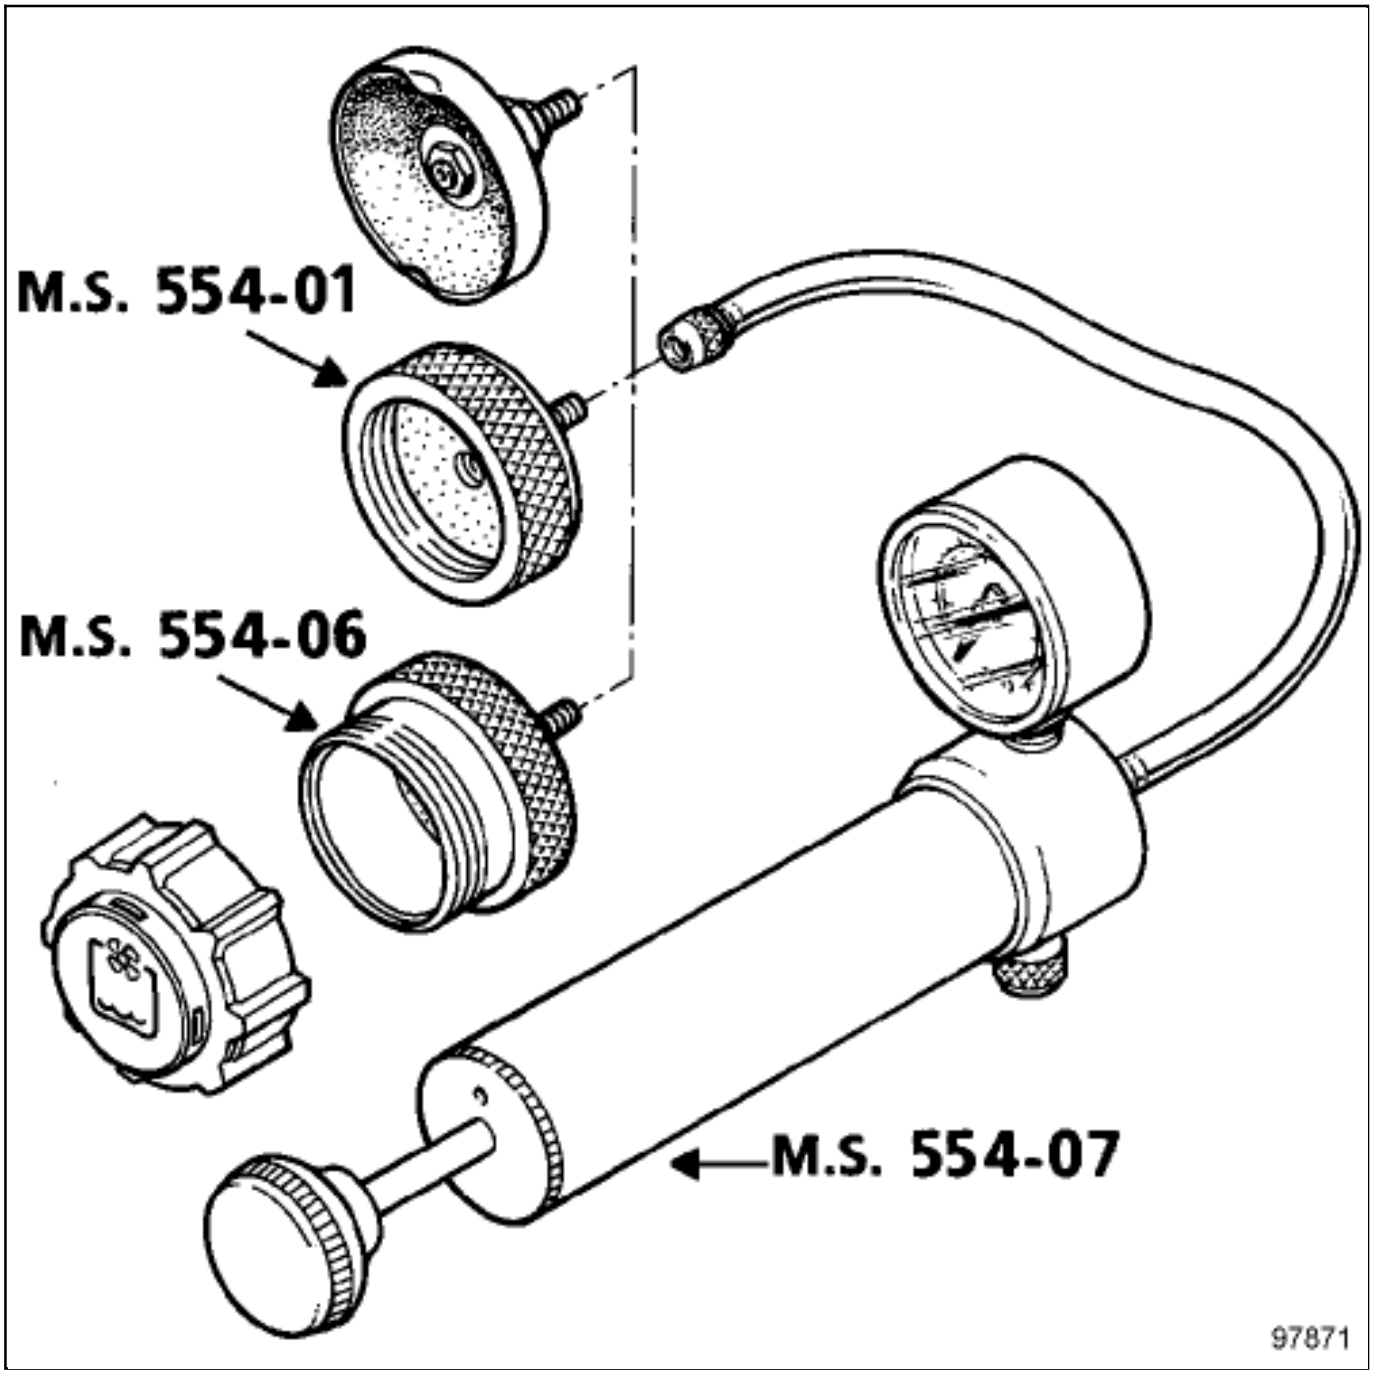
CAUTION

If the coolant is leaking from the expansion bottle cap, replace the valve.

1- CHECKING THE EXPANSION BOTTLE CAP VALVE

Use the cooling system filling and diagnostic toolFault finding and filling - bleeding the cooling circuit. (Mot. 1700) . Consult the user's manual for this tool(see 19A, Cooling, Cooling system filling and diagnostic tool: Use) (Technical Note 3857A, 19A, Cooling).

2- CHECKING THE SEALING OF THE COOLING CIRCUIT



Use the cooling system filling and diagnostic toolFault finding and filling - bleeding the cooling circuit. (Mot. 1700) . Consult the user's manual for this tool(see 19A, Cooling, Cooling system filling and diagnostic tool: Use) (Technical Note 3857A, 19A, Cooling).

2. CHECKING THE COOLING SYSTEM USING THE TOOL (MS. 554-07)

CAUTION

If the coolant is leaking from the expansion bottle cap, replace the valve.

1- CHECKING THE EXPANSION BOTTLE CAP VALVE

Fit onto the testerInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(Ms. 554-07) , the adapter (Ms. 554-06).

- Fit the expansion bottle cap to the adapter (Ms. 554-06).

Note:

The pressure should not drop; if it does, look for the leak.

- Pump with theInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(**Ms. 554-07**) , the pressure should stabilise at the expansion bottle cap valve rating with a test tolerance of ± 0.1 bar.

2- CHECKING THE SEALING OF THE COOLING CIRCUIT

- Replace the expansion bottle cap with the adapter (Ms. 554-01).

- Connect on the adapter (Ms. 554-01)the toolInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(**Ms. 554-07**) .

- Pump with theInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(**Ms. 554-07**) to put the cooling circuit under pressure.

- Stop pumping at 0.1 barbelow the valve rating for the expansion bottle cap valve.

Note:

The pressure should not drop; if it does, look for the leak.

- Gradually unscrew the union of theInstrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06(**Ms. 554-07**) to decompress the cooling system then remove the adapter (Ms. 554-01)and refit the expansion bottle cap.

ENGINECOOLINGSYSTEM:SPECIFICATIONS

Vehicles in the current range have cooling systems with the following basic specifications:

- hermetically-sealed pressurised circuit (expansion chamber valve),
- circuit using a COOLANT (type D)Vehicle: Parts and consumables for the repair ,
- passenger compartment heating systems equipped with a "heater matrix" type radiator located under the dashboard which helps to cool the engine.

Special notes:

- protection down to -25˚C ± 2for cold and temperate countries,
- protection down to -37˚C ± 2for very cold countries.

VOLUME OF COOLANT

Engine	Quantity (litres)	Grade
D4F	5	COOLANT (type D)
K9K		
H4B		
M5M	8	

THERMOSTAT

Engine	Start of opening (°C)	Fully open (°C)
H5F 400 not powered	95 +0/-3	105
H5F 400 powered	80 +0/-3	90
H4B 400 not powered	95 +0/-4	107
H4B 400 powered	83 +0/-4	
H4B without thermo-management	83	95
D4F 740	89 +0/-3	101
K9K 608	83 ± 2	95
K9K 612	83 +0/-3	95
K9K 830	83 +0/-3	95
K9K 838	83 +0/-3	95
M5M 400	Cylinder block thermostat	
	83.5 +0/-3	95
	Cylinder head thermostat	
	95 ± 1.5	108

ENGINE OIL - OIL FILTER : DRAINING - FILLING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Oil filter removing tool (76 mm diameter)	Mot. 1329
Oil filter removing tool (66 mm diameter).	Mot. 1330

Equipment required
oil change wrench
oil recovery tray

parts always to be replaced:
Oil filter
Oil filter

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When filling up the engine oil, always leave at least 10 minutesfor the oil to drain down before checking the level with a dipstick.

When removing the oil filter, check that the oil filter seal is not still stuck to the cylinder block or the oil filter support.

DRAINING

1. ENGINE OIL DRAINING PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove the engine undertray.

2. ENGINE OIL DRAINING OPERATION

Remove (see **Lubrication circuit: Operating diagram**) :

- the engine oil filler cap,
- the engine oil level guage,
- the drain plug,
- the drain plug seal.

Let the oil run into a oil recovery tray.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Remove the engine undertray.
- Fit a oil recovery tray under the engine.

2. REMOVAL OPERATION

REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced:  Oil filter  seal.
- parts always to be replaced:  Oil filter  .
- Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease the oil filter joint face.
- Lubricate the oil filter seal with new engine oil.

2. REFITTING OPERATION

- Refit (see **Lubrication circuit: Operating diagram**) :
  - the new oil filter,
  - the new oil filter cover seal,
  - the oil filter cover.

3. FINAL OPERATION

- Remove the oil recovery tray.
- Wipe any oil run-off with a cloth.
- Fill the engine with engine oil, observing:
  - the quantity **Maintenance values: Description** ,
  - the type of engine oil recommended by the manufacturer **Engine oil: Specifications** .
- Start the engine and wait until the oil pressure warning light goes out on the instrument panel.
- Check for leaks from the oil filter.
- Wait for at least 10 minutes.

Check the oil level using the dipstick.

Adjust the engine oil level if necessary.

Proceed in the reverse order to removal.

FILLING

1. ENGINE OIL FILLING OPERATION

Refit (see **Lubrication circuit: Operating diagram**) :

- the drain plug seal,
- the drain plug.

Position the vehicle back on the ground.

Fill the engine with engine oil, observing:

- the quantity **Maintenance values: Description** ,
- the type of engine oil recommended by the manufacturer **Engine oil: Specifications** .

Wait for at least 10 minutes.

Refit (see **Lubrication circuit: Operating diagram**) :

- the engine oil filler cap,
- the engine oil level guage.

Check the oil level using the dipstick.

Adjust the engine oil level if necessary.

2. FINAL OPERATION

Proceed in the reverse order to removal.

ENGINE OIL - OIL FILTER : DRAINING - FILLING

Note, one or more warnings are present in this procedure

Special tooling required	
Oil filter removing tool (76 mm diameter)	Mot. 1329
Oil filter removing tool (66 mm diameter).	Mot. 1330

Equipment required
oil change wrench
oil recovery tray

parts always to be replaced:
Oil filter
Oil filter cover seal
engine oil strainer seal

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When filling up the engine oil, always leave at least 10 minutesfor the oil to drain down before checking the level with a dipstick.

When removing the oil filter, check that the oil filter seal is not still stuck to the cylinder block or the oil filter support.

DRAINING

1. ENGINE OIL DRAINING PREPARATION OPERATION

Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .

Remove the engine undertray.

Fit a oil recovery trayunder the engine oil sump.

2. ENGINE OIL DRAINING OPERATION

Remove (see **Lubrication circuit: Operating diagram**) :

- the engine oil filler cap,
- the engine oil dipstick,
- the drain plug using an oil change wrench,
- the drain plug seal.

Let the oil run into the oil recovery tray.

3. OIL FILTER REMOVAL OPERATION

Remove (see **Lubrication circuit: Operating diagram**) :

- the oil filter cover,
- the oil filter cover seal,
- the oil filter.

FILLING

1. OIL FILTER REFITTING PREPARATION OPERATION

parts always to be replaced: **Oil filter**

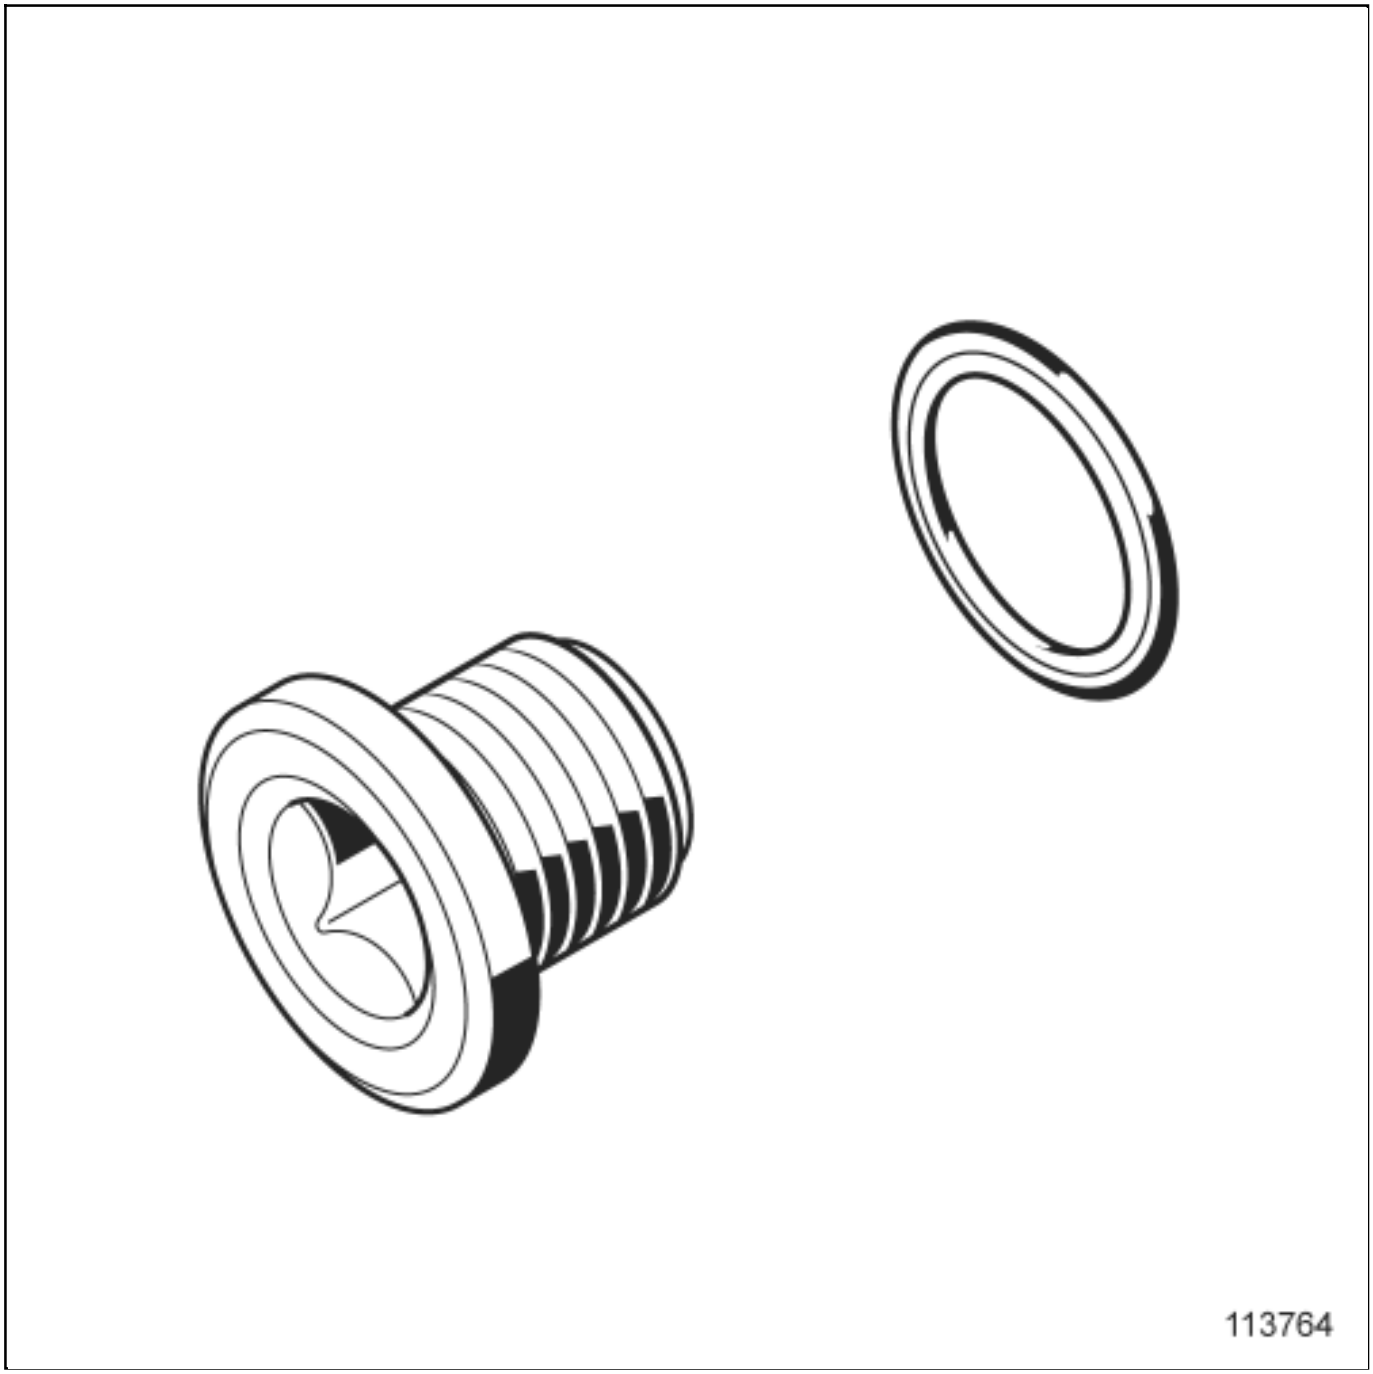
parts always to be replaced: **Oil filter cover seal**

Use surface cleaner**Vehicle: Parts and consumables for the repair** to clean and degrease the oil filter joint face.

Lubricate the oil filter seal with new engine oil.

2. OIL FILTER REFITTING OPERATION

Refit (see **Lubrication circuit: Operating diagram**) :



- the new oil filter,
- the new oil filter cover seal,
- the oil filter cover.

Torque tighten the oil filter cover(see **Lubrication circuit: Operating diagram**) **.**

3. ENGINE OIL FILLING PREPARATION OPERATION

parts always to be replaced: engine oil strainer seal

- Fit a new seal on the drain plug, positioning the groove towards the plug.
- Refit the drain plug(see **Lubrication circuit: Operating diagram**) .
- Torque tighten the drain plug(see **Lubrication circuit: Operating diagram**)

4. ENGINE OIL FILLING OPERATION

- Remove the oil recovery tray.
- Wipe any oil run-off with a cloth.
- Position the vehicle back on the ground.
- Fill the engine with engine oil, observing:
  - the quantity **Maintenance values: Description** ,
  - the type of engine oil recommended by the manufacturer **Engine oil: Specifications** .
- Refit (see **Lubrication circuit: Operating diagram**) :
  - the engine oil filler cap,
  - the engine oil dipstick.
- Wait for at least 10 minutes.
- Start the engine and wait until the oil pressure warning light goes out on the instrument panel.
- Check for leaks from the oil filter.
- Stop the engine.
- Wait for at least 10 minutes.

Check the oil level using the dipstick.

Adjust the engine oil level if necessary.

ENGINEOIL:SPECIFICATIONS

Note, one or more warnings are present in this procedure

Note:

A Engine oil quality is always a oil grade and a oil specification (for example : 5W40 RN0710).

INSTRUCTIONS FOR USING THE TECHNICAL NOTE :

(A) Section 3 concerns RENAULT vehicles manufactured before 01/01/2001

(B) Section 2 concerns RENAULT vehicles manufactured between 01/01/2001 and 08/10/2007

(C) Section 1 concerns RENAULT vehicles manufactured after 08/10/2007

For DACIA vehicles, see directly section 4

For optimum usage of this note, it is essential to follow the instructions below scrupulously step by step:

- Select the section according to the manufacturing date of the vehicle (see above).
- Select the country.
- Select the engine type and / or the vehicle type depending on the case.
- Select the oil quality according to the information indicated in the tables.

RENAULT recommends ELF.

GENERAL CONTENTS

Section 1	Oil quality for RENAULT vehicles manufactured after 08/10/2007
Section 2	Oil quality for RENAULT vehicles manufactured between 01/01/2001 and 08/10/2007 (not inclusive):
Section 3	Oil quality for RENAULT vehicles manufactured before 01/01/2001
Section 4	Oil quality for DACIA vehicles
Section 5	Tables of oil interchangeability

1. OIL QUALITY FOR RENAULT VEHICLES MANUFACTURED AFTER 08/10/2007

CONTENTS OF SECTION 1	
1	For Andorra, Austria, Belgium, Croatia, Denmark, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, Ireland, Iceland, Israel, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Czech Republic, Slovakia, Slovenia, Spain, Sweden, Switzerland
a	General (excluding special cases)
b	Special cases
2	For French overseas territories (French Guiana, Guadeloupe, Martinique, Réunion)
3	For Bulgaria, Romania and vehicles manufactured after 01/06/08
a	vehicles manufactured after 01/06/08 and delivered before 01/01/11
b	vehicles manufactured after 01/06/08 and delivered since 01/01/11
4	For Russia, Ukraine and vehicles manufactured after 01/06/08
5	For Turkey and vehicles manufactured after 01/06/08
a	vehicles manufactured after 01/06/08 and delivered before 01/01/11
b	vehicles manufactured after 01/06/08 and delivered since 01/01/11
6	For Algeria, Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, Tunisia, United Arab Emirates, and vehicles manufactured after 01/06/08
7	For Morocco and vehicles manufactured after 01/02/09
8	For Albania, Argentina, Bermuda, Bosnia-Herzegovina, Chile, Greek Cyprus, Kosovo, Mauritius, Japan, Lesotho, Macedonia, Malta, Montenegro, Mexico, New Caledonia, New Zealand, Serbia, Singapore, South Korea, Swaziland, Taiwan, Thailand, Turkish Cyprus and vehicles manufactured after 01/06/08
9	For South Africa and vehicles manufactured after 01/01/08
10	For other countries and other vehicles manufactured after 08/10/07 which are not listed above.

1- FOR ANDORRA, AUSTRIA, BELGIUM, CROATIA, DENMARK, ESTONIA, FINLAND, FRANCE, GERMANY, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ISRAEL, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SPAIN, SWEDEN, SWITZERLAND :

RENAULT recommends, for both filling and changing, using engine oil which follows the recommendations below for general cases or special cases.

1)GENERAL (EXCLUDING SPECIAL CASES) :

	specifications	Grades to use according to the external temperature (T)		
		if T > -20˚C	**if T > -25˚C**	**if T > -30˚C**
PETROL engine				
Naturally aspirated petrol (except Renault Sport petrol engine) Naturally aspirated E85	RN0700	10W40 5W30 5W40 0W30 0W40	5W30 5W40 0W30 0W40	0W30 0W40
Renault Sport Petrol Turbocharged petrol	RN0710	5W40 0W40		0W40
DIESEL engine				
Diesel without particle filter	RN0710	5W40 0W40		0W40
Diesel equipped with particle filter	RN0720	5W30 5W40		

2)SPECIAL CASES :

	specifications	Grades to use according to the external temperature (T)		
		if T > -20˚C	**if T > -25˚C**	**if T > -30˚C**
PETROL engine				
CLIO III K4M with power greater than 120 hp (88 kW)	RN0710	5W40 0W40		0W40
DIESEL engine				
G9T engine with particle filter	RN0710	5W40 0W40		0W40
K9K engine without particle filter with RENAULT service interval every 12,000 miles (20,000 km) or 1 year	RN0700	10W40 5W40 0W40	5W40 0W40	0W40
KANGOO II K9K without particle filter with power greater than 100 hp (73 kW) manufactured before 08/09/2008 and Laguna III K9K manufactured before 28/05/2008	ACEAC3 RN0720	5W30 0W30		0W30
MASTER II PROPULSION	ACEA E7	10W30	5W30	NC

2- FOR FRENCH OVERSEAS TERRITORIES (FRENCH GUIANA, GUADELOUPE, MARTINIQUE, RÉUNION) :

	specifications	Grades to use according to the external temperature (T)			
		if T > -15˚C	**if T > -20˚C**	**if T > -25˚C**	**if T > -30˚C**
PETROL engine					
Naturally aspirated petrol engine (except Renault Sport petrol engine)	RN0700	10W40		5W30 5W40	0W30 0W40
	ACEA A3/B4 ACEA A5/B5				5W30 5W40
Turbocharged or Renault Sport petrol engine (except turbocharged D4F and H4J)	RN0710	5W40			0W40
	ACEA A3				
Turbocharged D4F and H4J	RN0710	5W40			0W40

2. OIL QUALITY FOR RENAULT VEHICLES MANUFACTURED BETWEEN 01/01/2001 AND 08/10/2007 (NOT INCLUSIVE)

CONTENTS OF SECTION 2

1	For Andorra, Austria, Belgium, Croatia, Denmark, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, , Israel, Ireland, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Czech Republic, Spain, Slovakia, Slovenia, Sweden, Switzerland and French overseas territories
2	For other countries

1- FOR ANDORRA, AUSTRIA, BELGIUM, CROATIA, DENMARK, ESTONIA, FINLAND, FRANCE, GERMANY, GREAT BRITAIN, GREECE, HUNGARY, , ISRAEL, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SPAIN, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND AND FRENCH OVERSEAS TERRITORIES

Note:

The RN specification oils are better quality oils than the ACEA specification. It is thus possible to use an RN specification oil as a substitute for the recommended ACEA specification oil. On the other hand, it is forbidden to replace a recommended RN specification oil with an ACEA specification (see the table of oil interchangeability to know the equivalents).

RENAULT recommends, for both filling and changing, using engine oil which follows the recommendations below.

Instructions for tables:

- when the grades are specified in the table below, only use one of them depending on the external temperature of the country (see graphs under the table to identify the operating temperatures of the grades),
- when the grades are not specified in the table (presence of an "X" in the box), refer to the graphs under the table to find the grade authorised according to the fuel used.

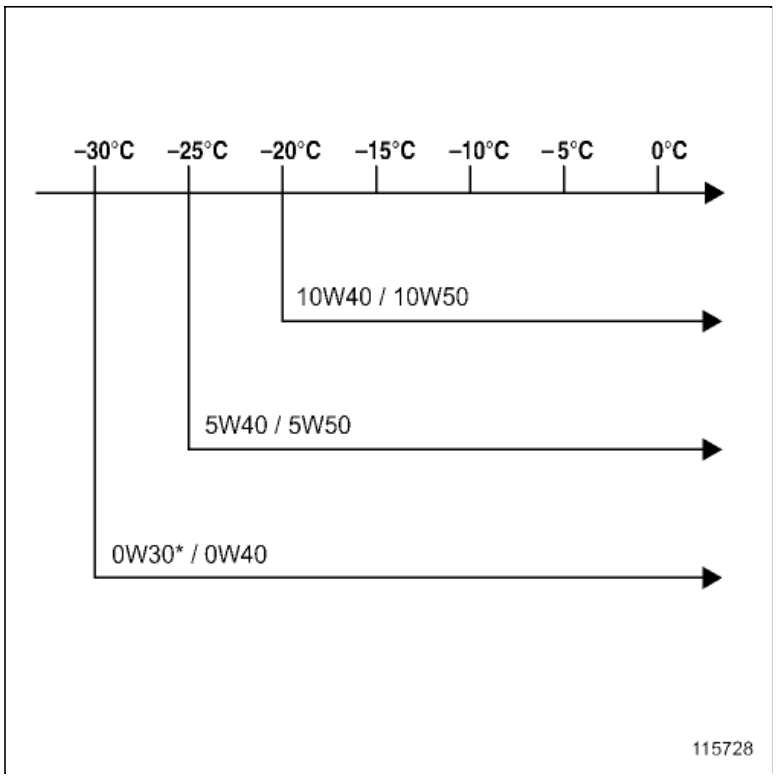
2)PETROL ENGINE AND E85



In order to find the oil grade for the external temperature, refer to the graph below.

* Except for turbocharged engines, F7P, F7R, Renault Sport F4R, Renault Sport Turbocharged F4R and Renault Sport L7X.

3)DIESEL ENGINE

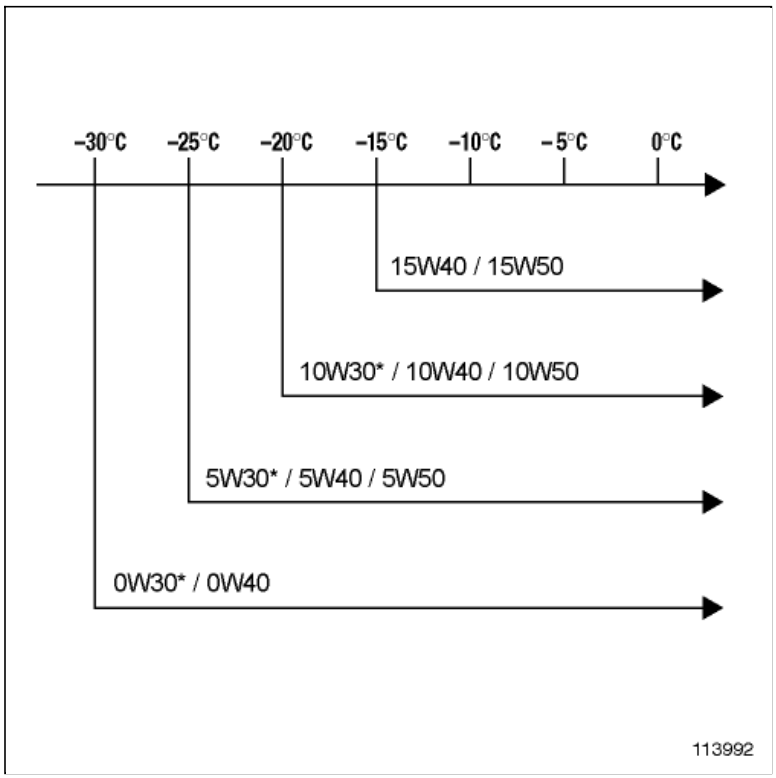
In order to find the oil grade for the external temperature, refer to the graph below.

* Only with specifications ACEA B4or ACEA C3.

Note:

If an engine oil grade is not available or has been discontinued, please refer to the "Table of oil interchangeability" section.

Note:



ACEA B1 specification oils should not be used for DIESEL engines under any circumstances.

2- FOR OTHER COUNTRIES

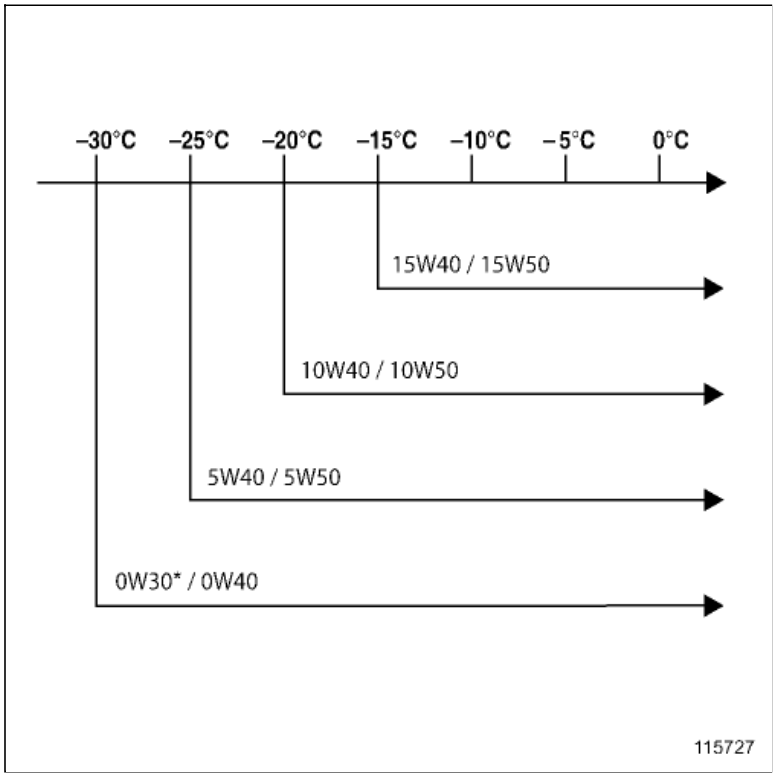
1)PETROL ENGINE AND E100

RENAULT recommends, for both filling and changing the oil, that ACEA A1*, ACEA A3or ACEA A5* specificationengine oil is used, or if this is not available ACEA A2, API SJ, API SLor API SM specification .

To find out which oil grade to choose, please refer to the graph below.

* Except for turbocharged engines, F7P, F7R, Renault Sport F4R, Renault Sport turbocharged F4R and Renault Sport L7X.

-Special cases:



■For RENAULT CLIO SPORT F4R, RENAULT CLIO SPORT L7X, RENAULT MEGANE II SPORT turbocharged F4R, turbocharged F4R engines, LAGUNA GT/CELSIUM turbocharged F4R, and Electric KANGOO, only use ACEA A3 specification of 5W40 grade(or 0W40 gradedepending on the external temperature).■For turbocharged D4F engines, only use oil which is ACEA A3 specificationand 5W40 grade(or 0W40or 0W30 gradedepending on the external temperature), or ACEA A5 specificationand 5W30 grade(or 0W40or 0W30 gradedepending on the external temperature).

2)DIESEL ENGINE

RENAULT recommends, for both filling and changing the oil, that ACEA B3, ACEA B4, ACEA C3* specificationengine oil is used, or if this is not available ACEA B2or API CF specification.

* ACEA C3 specificationengine oils can only be used in the following special cases.

To find out which oil grade to choose, please refer to the graph below.

* Only with ACEAspecification.

-Special cases:

■For G9T engines with particle filters, only use oil which is B4 specificationand 5W40 grade(or 0W40 gradedepending on the external temperature).■For P9X engines, LAGUNA II F9Q, ESPACE IV Diesel without particle filter, only use oil which is B4 specificationand 5W40 grade(or 0W30 gradeor 0W40 gradedepending on the external temperature).■F9Q engines fitted with particle filter, M9R engines fitted with particle filter, K9K engines fitted with particle filter, G9U engines fitted with particle filter, only use oil which is ACEA C3 specificationand 5W30 grade(or 0W30 gradedepending on the external temperature).■For LAGUNA III K9K without particle filter and LAGUNA III M9R without particle filter, use oil which is RN0710 specification and 5W40 grade(or 0W40depending on the external temperature).■LAGUNA III M9R equipped with a particle filter, use only oil which is RN0720 specificationand 5W40or 5W30 grade.

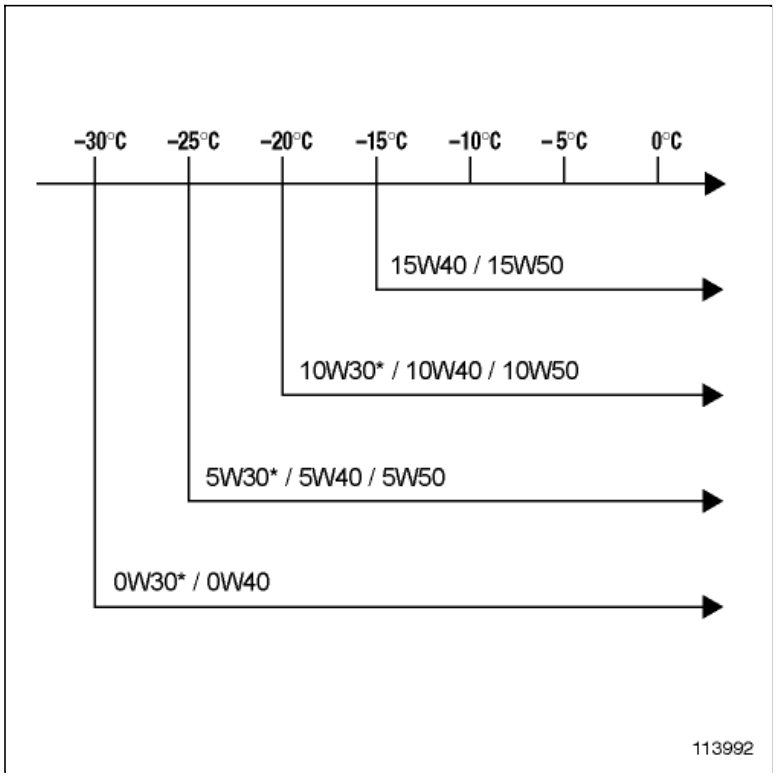
3. OIL QUALITY FOR RENAULT VEHICLES MANUFACTURED BEFORE 01/01/2001

CONTENTS OF SECTION 3	
1	For EUROPE (Andorra, Austria, Belgium, Croatia, Denmark, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, Ireland, Iceland, Israel, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Czech Republic, Slovakia, Slovenia, Spain, Sweden, Switzerland)
2	For other countries

Note:

If an engine oil grade is not available or has been discontinued, please refer to the "Table of oil interchangeability" section.

Note:

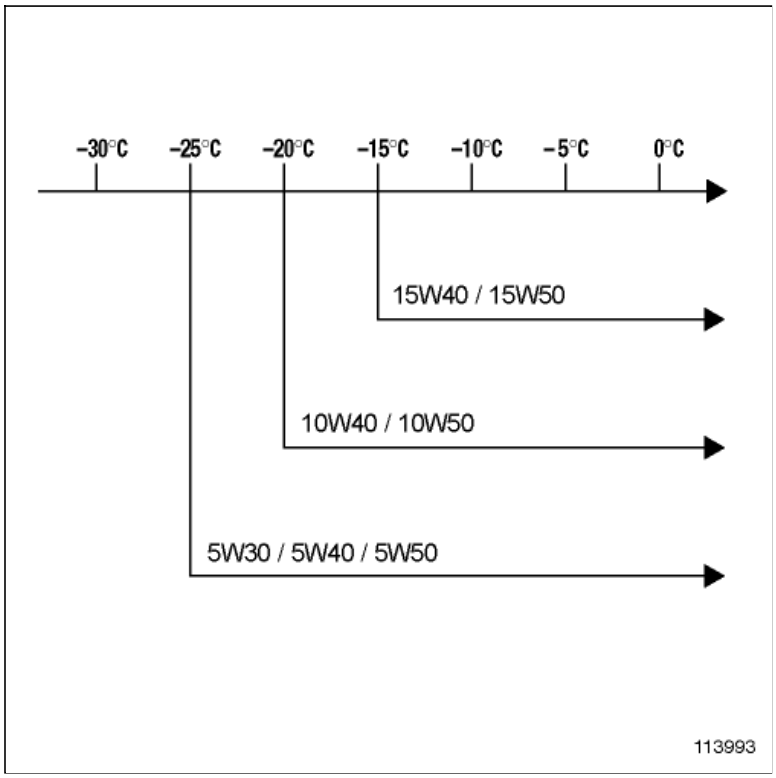


ACEA B1 specification oils should not be used for DIESEL engines under any circumstances.

1- FOR EUROPE (ANDORRA, AUSTRIA, BELGIUM, CROATIA, DENMARK, ESTONIA, FINLAND, FRANCE, GERMANY, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ISRAEL, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SPAIN, SWEDEN, SWITZERLAND)

1)PETROL ENGINE

RENAULT recommends, for both filling and changing the oil, that ACEA A2 or ACEA A1* specification oil is used (oil enabling a reduction in fuel consumption).

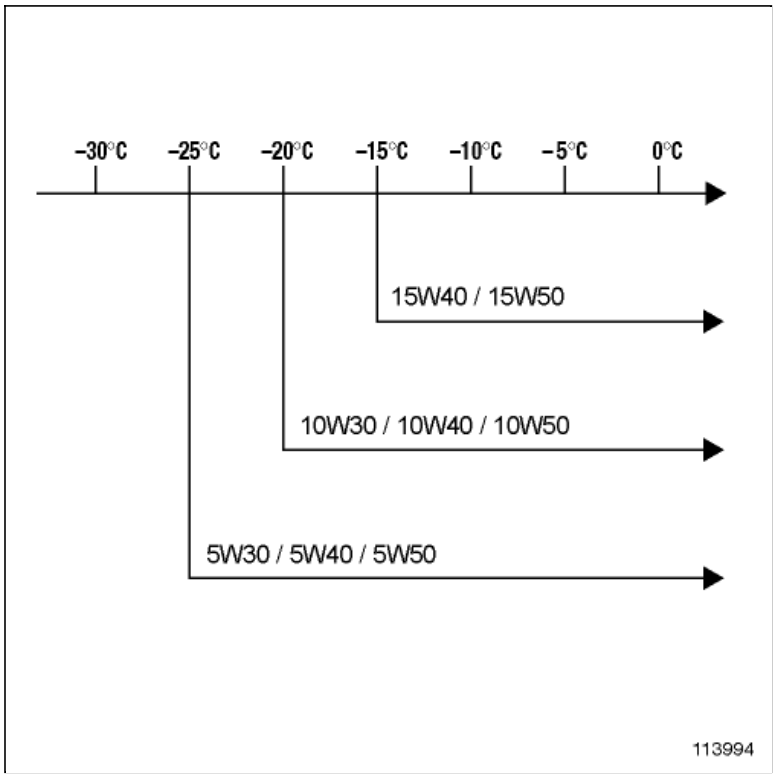


Oil grade depends on the exterior average temperature

* Except turbocharged engines, F7P and F7R.

2)DIESEL ENGINE

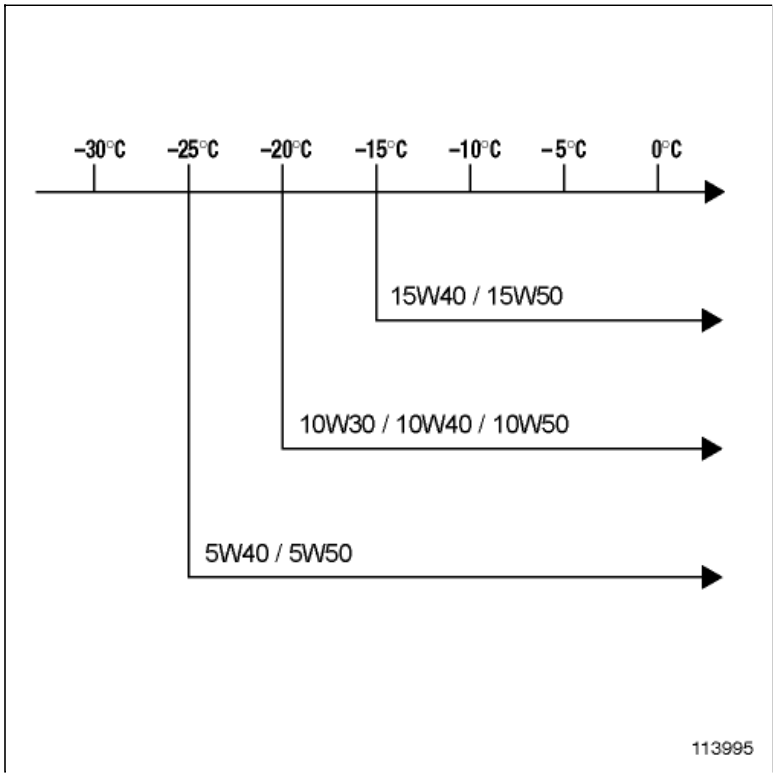
RENAULT recommends that ACEA B2 specification oil is used for both filling and changing the oil. The oil grade to use depends on the average external temperature.



2- FOR OTHER COUNTRIES:

1)PETROL ENGINE AND E100:

RENAULT recommends, for both filling and changing the oil API SHOr API SJ specificationoil.



Oil grade depends on the exterior average temperature

2)DIESEL ENGINE:

RENAULT recommends, for both filling and changing the oil API CF specificationoil.

Oil grade depends on the exterior average temperature

4. OIL QUALITY FOR DACIA VEHICLES

CONTENTS OF SECTION 4	
1	For Germany, Andorra, Austria, Belgium, Croatia, Denmark, Estonia, Finland, France, Great Britain, Greece, Hungary, Ireland, Iceland, Israel, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Czech Republic, Slovakia, Slovenia, , Spain, Sweden, Switzerland
2	For French overseas territories (French Guiana, Guadeloupe, Martinique, Réunion)
3	For Bulgaria, Romania
4	For Turkey
5	For Argentina, Brazil, Colombia, Ecuador, Egypt, Iran, Kuwait, Oman, Qatar, Russia, Ukraine, United Arab Emirates, Venezuela
6	For Morocco
7	For other countries

1- FOR GERMANY, ANDORRA, AUSTRIA, BELGIUM, CROATIA, DENMARK, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ISRAEL, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, , SPAIN, SWEDEN, SWITZERLAND:

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

VEHICLE MANUFACTURED BEFORE 13/06/2011 :

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol and E85 bioethanol engine	ACEA A3/B4 ACEA A5/B5	10W40	10W40	5W30 5W40	0W30 0W40
Diesel engine without particle filter manufactured before 12/01/2009	ACEA A3/B4	15W50	10W40 10W50	5W40 5W50	0W40
Diesel engine without particle filter manufactured from 12/01/2009	RN0710	5W40	5W40	5W40	0W40
Diesel engine with particle filter	RN0720	5W30 5W40			

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

VEHICLE MANUFACTURED AFTER 14/06/2011 :

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol and E85 bioethanol engine	ACEA A3/B4	10W40	10W40	5W40	0W40
	ACEA A5/B5	5W30	5W30	5W30	0W30
Diesel engine without particle filter	ACEA A3/B4	10W40	10W40	5W40	0W40
Diesel engine with particle filter	ACEA C3	5W30 5W40			

2- FOR FRENCH OVERSEAS TERRITORIES (FRENCH GUIANA, GUADELOUPE, MARTINIQUE, RÉUNION):

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine	ACEA A3/B4	10W40 10W50	10W40 10W50	5W40 5W50	0W40
Diesel engine without particle filter	ACEA B4	10W40 10W50	10W40 10W50	5W40 5W50	0W40
Diesel engine with particle filter	RN0720	5W30 5W40			

3- FOR BULGARIA, ROMANIA:

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine	ACEA A3/B4	10W40	10W40	5W40	5W40
Diesel engine without particle filter	ACEA B2/ ACEA B3/ ACEA B4	15W40 15W50	10W40 10W50	5W40 5W50	0W40
Diesel engine with particle filter manufactured before 13/06/2011	RN0720	5W30 5W40			
Diesel engine with particle filter manufactured after 14/06/2011	ACEA C3	5W30 5W40			

4- FOR TURKEY:

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine	ACEA A1 ACEA A2 ACEA A3	15W40 15W50	10W40 10W50	5W40	0W40
	API SL/SM				
Diesel engine without particle filter	RN0710	5W40	5W40	5W40	0W40
	ACEA A5/B5	5W30			
Diesel engine with particle filter manufactured before 13/06/2011	RN0720	5W30 5W40			
Diesel engine with particle filter manufactured after 14/06/2011	ACEA C3	5W30 5W40			

5- FOR ARGENTINA, BRAZIL, COLOMBIA, ECUADOR, EGYPT, IRAN, KUWAIT, OMAN, QATAR, RUSSIA, UKRAINE, UNITED ARAB EMIRATES, VENEZUELA :

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine and E100	RN0700	10W40	10W40	5W30 5W40	0W30 0W40
	ACEA A1 ACEA A2 ACEA A3 ACEA A5	15W40 15W50	10W30 10W40 10W50	5W30 5W40 5W50	0W30 0W40
	API SL/SM				
Diesel engine without particle filter	RN0710	5W40	5W40	5W40	0W40
	ACEA B3 ACEA B4	15W40 15W50	10W40 10W50	5W40 5W50	0W30 0W40
	API CF				0W40
Diesel engine with particle filter	RN0720	5W30 5W40			

6- FOR MOROCCO:

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine with oil change interval every 6,000 miles (10,000 km) or 1 year	ACEA A1 ACEA A2 ACEA A3 ACEA A5	15W40 15W50	10W30 10W40 10W50	5W30 5W40	0W30 0W40
	API SL/SM				
Petrol engine with oil change interval every 12,000 miles (20,000 km) or 1 year	RN0700	10W40	10W40	5W30 5W40	0W30 0W40
Diesel engine without particle filter	ACEA B2 ACEA B3 ACEA B4	15W40 15W50	10W40 10W50	5W40 5W50	0W30 0W40
	API CF				0W40
Diesel engine with particle filter	RN0720	5W30 5W40			

7- FOR OTHER COUNTRIES:

Identify the specification and grade of oil recommended for your vehicle in the table below. For oil grades, the lowest temperature (T) is indicated:

Engine	specifications	Grades to use according to the external temperature (T)			
		If T > -15˚C	If T > -20˚C	If T > -25˚C	If T > -30˚C
Petrol engine	ACEA A1 ACEA A2 ACEA A3 ACEA A5	15W40 15W50	10W30 10W40 10W50	5W30 5W40	0W30 0W40
	API SL/SM

	API CF				0W40
Diesel engine with particle filter	RN0720	5W30 5W40			

5. TABLES OF OIL INTERCHANGEABILITY

CONTENTS OF SECTION 5	
1	ACEA/RN specification
2	ACEA specification
3	API specification
4	CCMC/ACEA specification

1- TABLE OF OIL INTERCHANGEABILITY

1)ACEA/RN SPECIFICATION

CAUTION

RN specification oils are better quality oils than ACEA specification oils. It is therefore possible to substitute the ACEA specification recommended oil by the RN specifications but it is prohibited to substitute RN specification recommended oil by the ACEA specification

CAUTION

The RN grades to use are the same as those recommended initially in ACEA.

	specification	**RN specification which can replace ACEA specification**
PETROL	ACEA A3 on naturally aspirated engine	RN0700
	ACEA A3 on turbocharged engine	RN0710
	ACEA A5	RN0700
DIESEL	10W40 ACEA B4	10W40 RN0700
	5W40 ACEA B4	5W40 RN0710
	ACEA C3	RN0720

2)ACEA SPECIFICATION :

	specification	Minimum specification with which it can be replaced
PETROL	ACEA A1*	ACEA A3 or ACEA A5*
	ACEA A2	ACEA A3
	ACEA A3	-
	ACEA A5*	ACEA A3
DIESEL	ACEA B1*	ACEA B3 or ACEA B5*
	ACEA B2	ACEA B3
	ACEA B3	ACEA B4
	ACEA B4	-
	ACEA B5*	ACEA B4
	ACEA C3	-

* engine oil enabling a reduction in fuel consumption.

3)API SPECIFICATION :

	specification	Minimum specification with which it can be replaced
PETROL	API SH	API SJ
	API SJ	API SL
	API SL	API SM
	API SM	-
DIESEL	API CF	-

4)CCMC/ACEA SPECIFICATION :

	specification	Minimum specification with which it can be replaced
Petrol	CCMC G4	ACEA A2
	CCMC G5	ACEA A2
DIESEL	CCMC PD2	ACEA A2

ENGINE: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- GENERAL INFORMATION

All information contained in these manuals is intended exclusively for automotive industry professionals.

The documentation is intended to cover all vehicles in theRENAULTrange throughout the world, but may not cover equipment designed for use in specific countries.

The procedures and fault finding procedures recommended and described in this manual have been designed by automotive industry repair professionals.

1)GENERAL RECOMMENDATIONS

Observe basic principles of vehicle repair.

The quality of repair depends first and foremost on the care exercised by the person in carrying it out.

To ensure good repair:

- use recommended professional products and original parts,
- observe the tightening torques,
- observe the recommendations for parts that should always be replaced after removal, refitting or replacement operations,
-

clean and degrease the sections to be bonded, to ensure they bond correctly.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

The design quality of the vehicles demands that nothing be left to chance during repair. Consequently, parts or components must be refitted in their original positions (for example: heat shields, wiring routing, pipe routing).

Use professional products and apply them with care. For example, do not apply too much sealant to joint faces, in order to avoid plugging engine oil or coolant pipes.

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

2)SPECIAL TOOLING - EASE OF USE

The repair procedures have been designed using special tools; they must therefore be carried out using these tools to ensure a high degree of working safety and quality of repair.

The equipment we have approved has undergone careful research and testing, and must be used and maintained with care.

3)SAFETY

Certain devices and parts must be handled with particular attention to safety and cleanliness and, above all, with due care.

The safety symbol used in this manual indicates that special attention must be paid to the procedure or the tightening torque values.

Working safely:

- use suitable tools which are in good condition (use of "multi-purpose" tools, such as adjustable pliers, etc., should be avoided wherever possible),
- use supports and adopt a correct posture when performing heavy work or raising loads,
- check that the working area is clean and tidy during the operation,

- use personal protection (gloves, goggles, work shoes, masks, skin protection, etc.),
- always follow the safety instructions associated with the operation to be performed,
- do not smoke when working on vehicles,
- do not use harmful products in unventilated rooms,
- do not ingest any chemicals (brake fluid, coolant, etc.).

Respecting the environment:

- sort waste according to its particular qualities,
- do not burn discarded products (tyres, etc.).

4)CONCLUSION

The procedures contained in this document merit your attention. Please read them carefully in order to reduce the risk of injury, and avoid using incorrect procedures that could damage the vehicle or make it dangerous in use.

Following the recommended procedures will help you to provide a quality of service which will ensure the vehicles achieve the highest levels of performance and reliability.

Maintenance and repair operations must be carried out under the proper conditions to ensure that our vehicles run safely and reliably.

2. CLEANLINESS

1- RISKS RELATING TO CONTAMINATION

1)PROTECTIVE BAGS

Use hermetically-resealable plastic bags, using adhesive tape, for example, to store components which will be refitted and reused. Stored parts will therefore be less subject to the risk of contamination.

These are single-use bags: after use they must be discarded.

XSL version : 3.02 du 22/07/11

ENGINE WIRING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

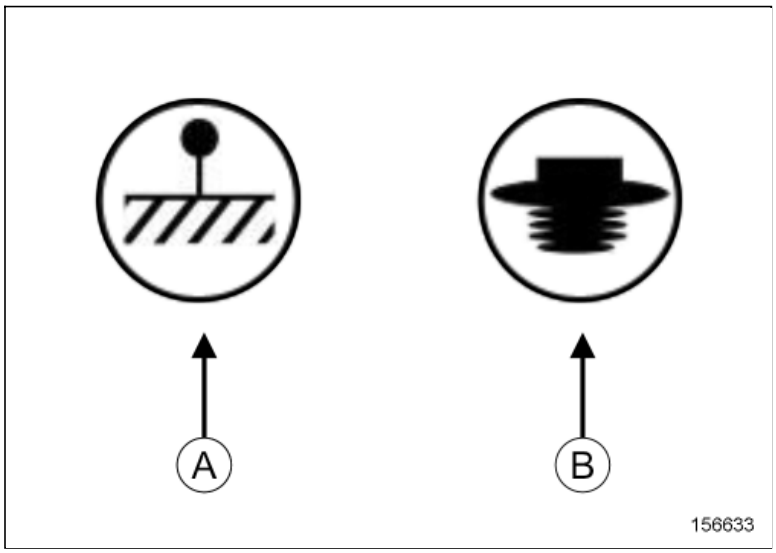
Equipment required
Diagnostic tool
indelible pencil

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 88A, Wiring harness , Wiring: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

CAUTION



To prevent damage to the wiring harness when refitting, observe the original routing.

CAUTION

Consult the disconnection procedures (see Connectors: Disconnection and reconnection) (Technical Note 6015A, 88A, Wiring) to prevent damaging the connectors.

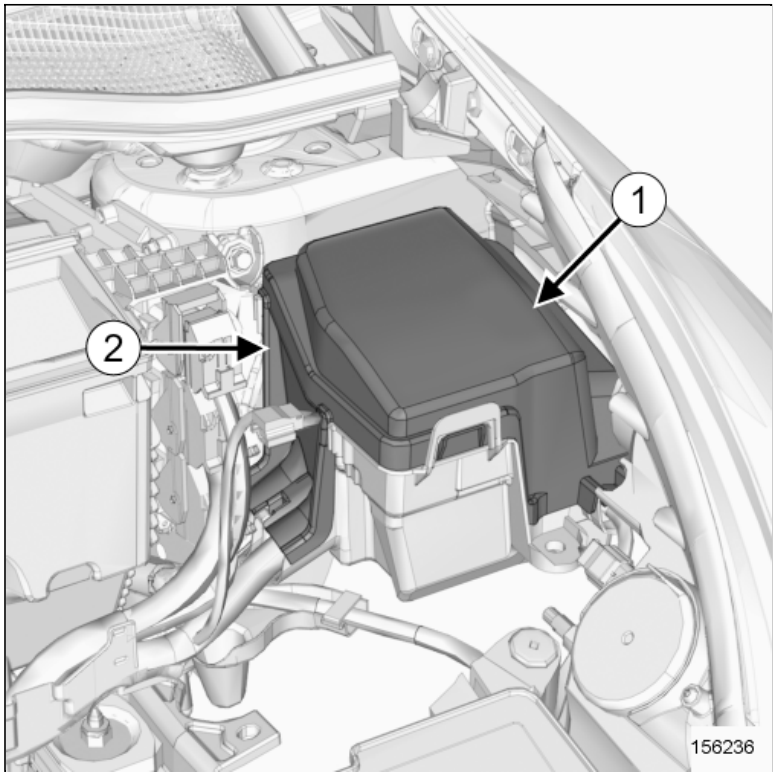
Note:

For information on instrument connectors (see Visu-Schéma).

(A) Symbol for an earth

(B) Symbol for a mounting (clip, clamp, etc.)

REMOVAL



1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Switch off the ignition.

Remove:

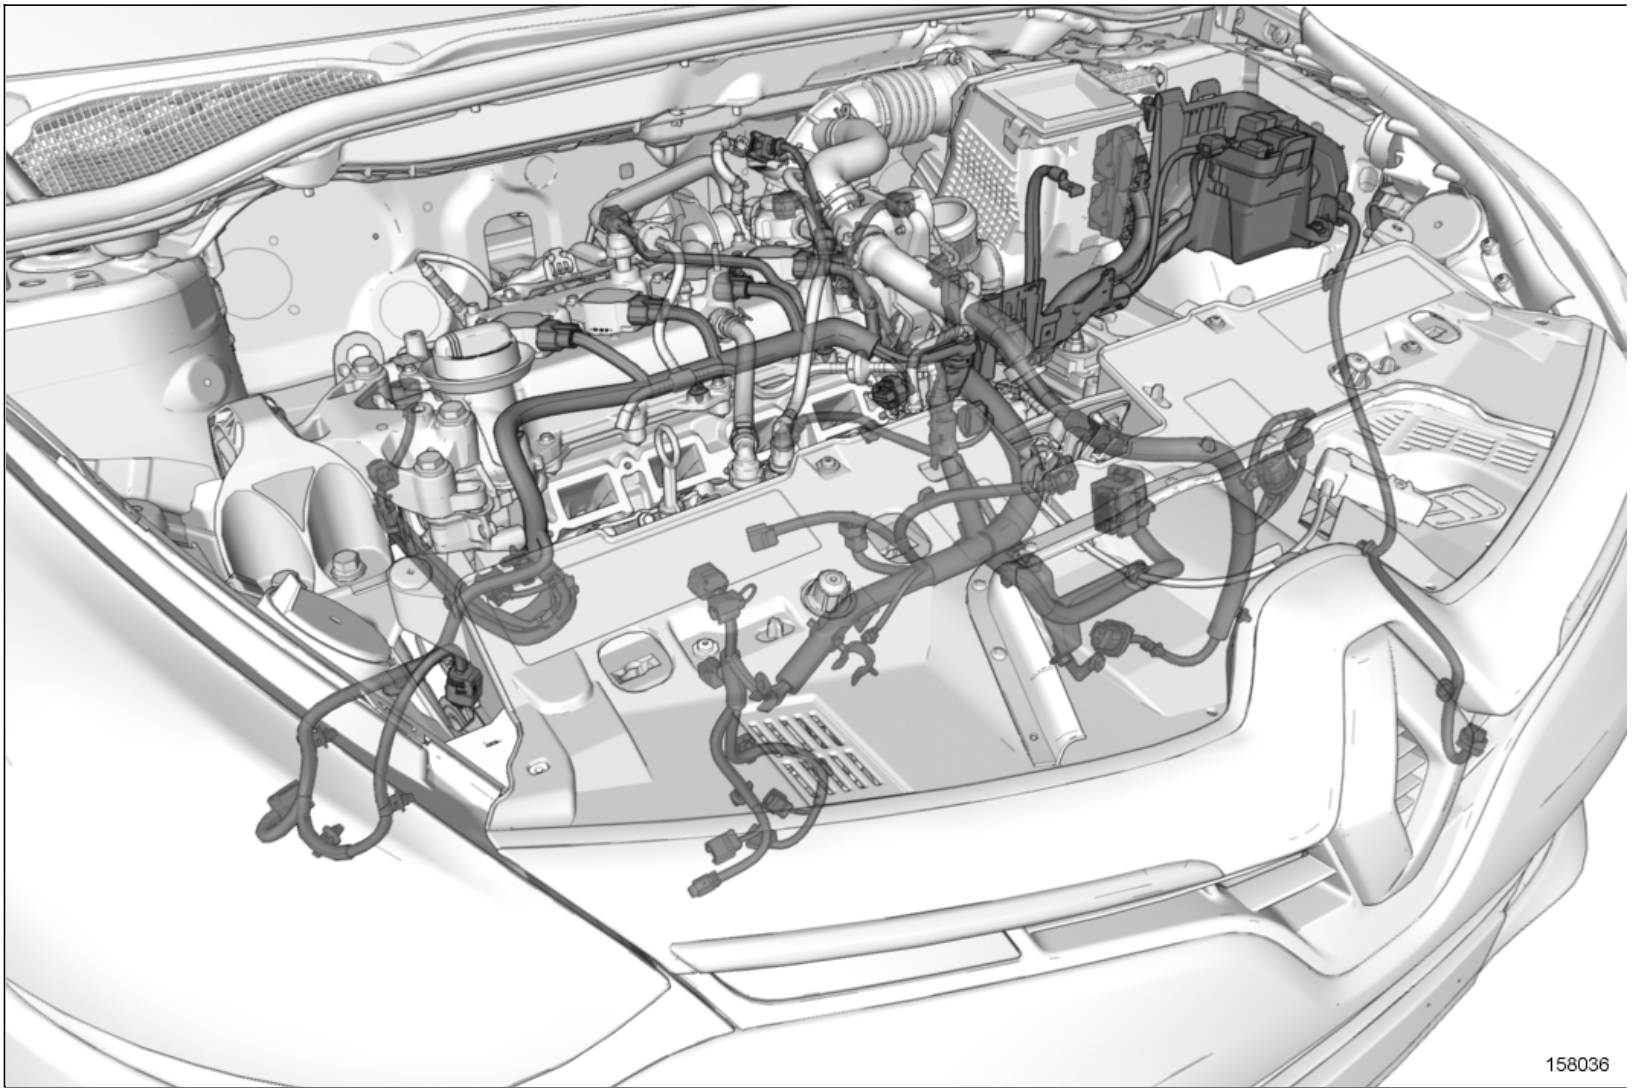
- the battery Battery: Removal - Refitting ,
- the engine undertray bolts,
- the engine undertray,
- the front wheels Front hub carrier assembly: Exploded view ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,
- the battery tray Battery tray: Removal - Refitting ,
- the air filter inlet duct Air inlet assembly: Exploded view ,
- the intercooler air inlet pipe Air inlet assembly: Exploded view ,
- the intercooler air outlet pipe Air inlet assembly: Exploded view ,
- the throttle valve Air inlet assembly: Exploded view ,
- the inlet distributor Air inlet assembly: Exploded view .

Remove:

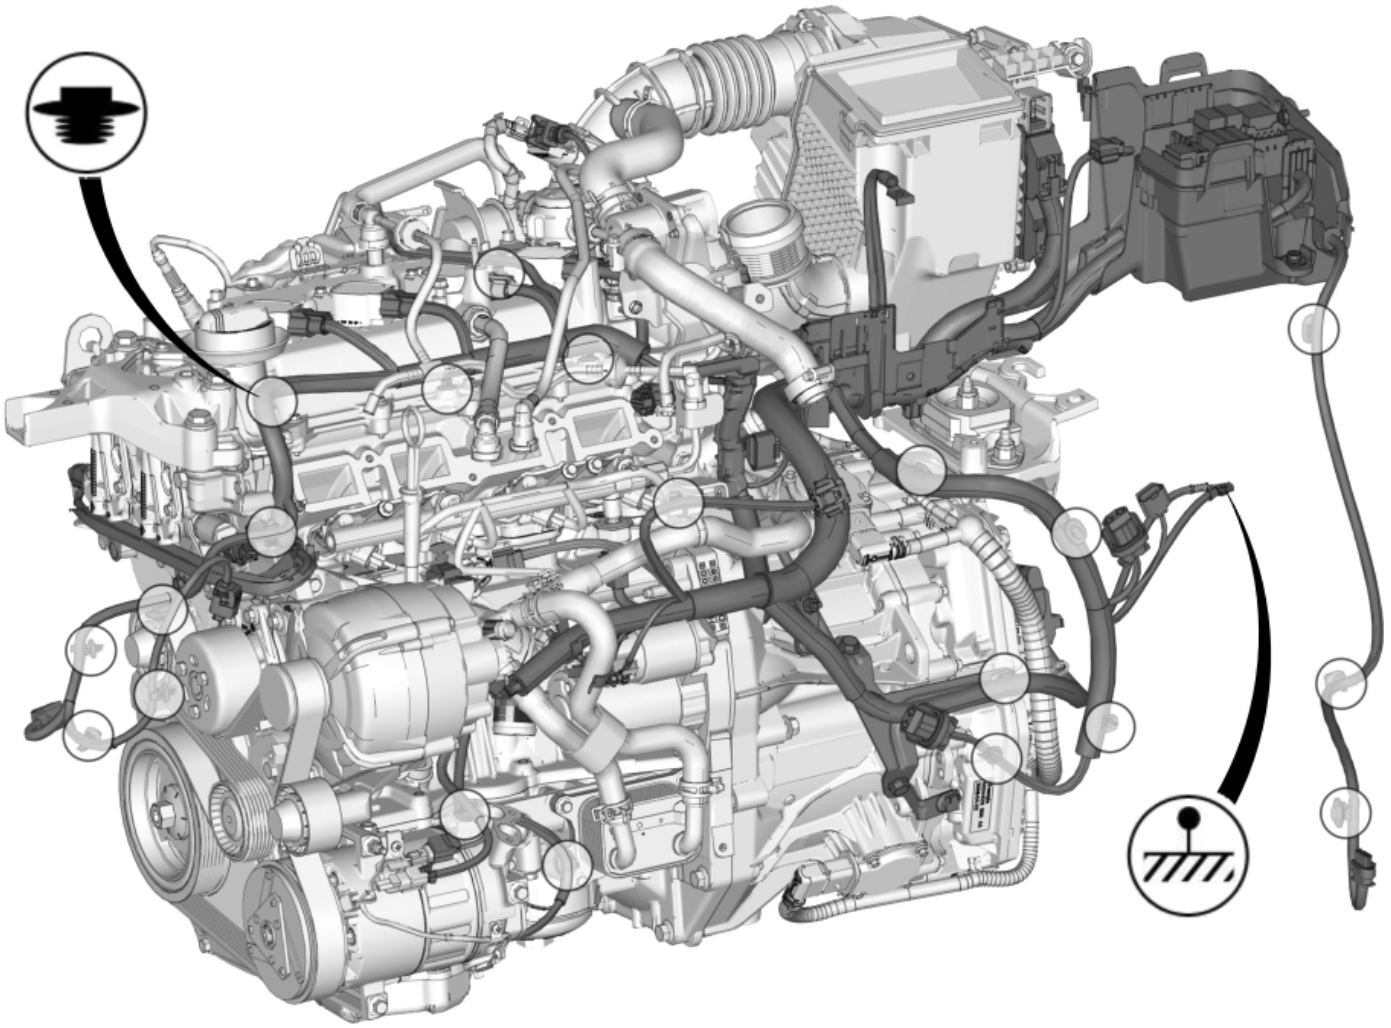
- the cover(1) of the engine compartment fuse and relay box,
- the closure panel component(2) of the engine compartment fuse and relay box.

Note:

Mark the position of the fuses and relays before removal.

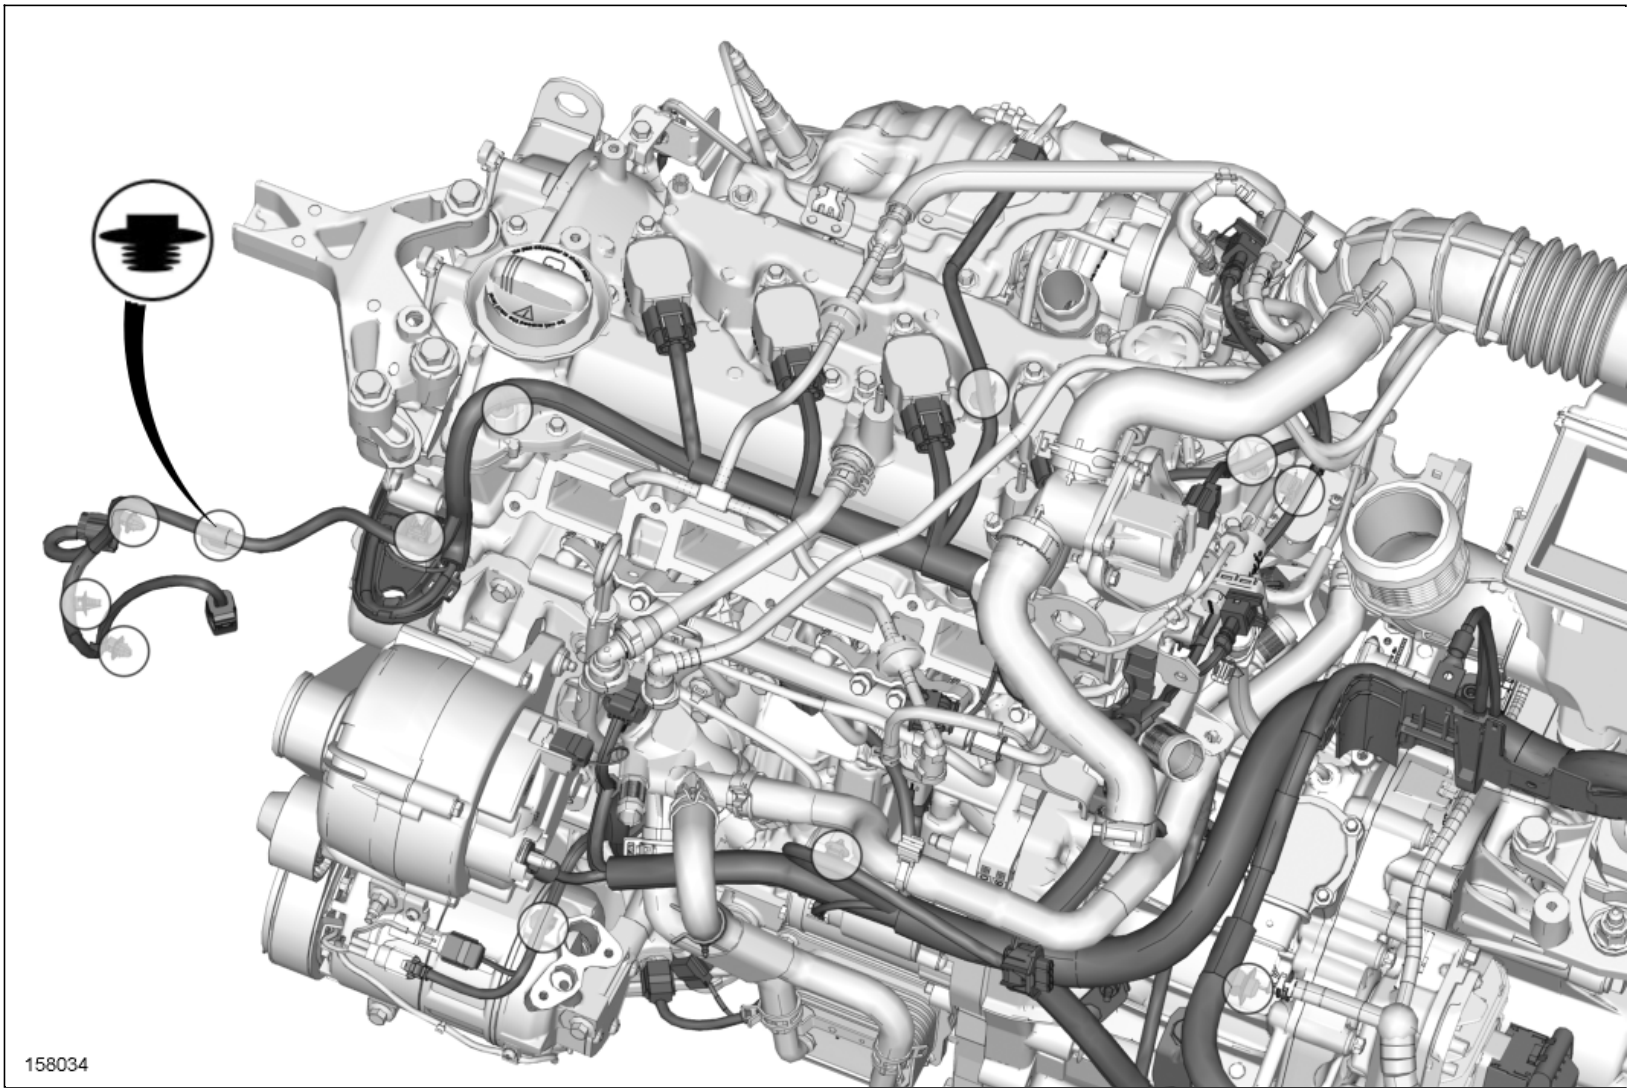


Unclip the fuse holders and the engine harness relays from their mountings.

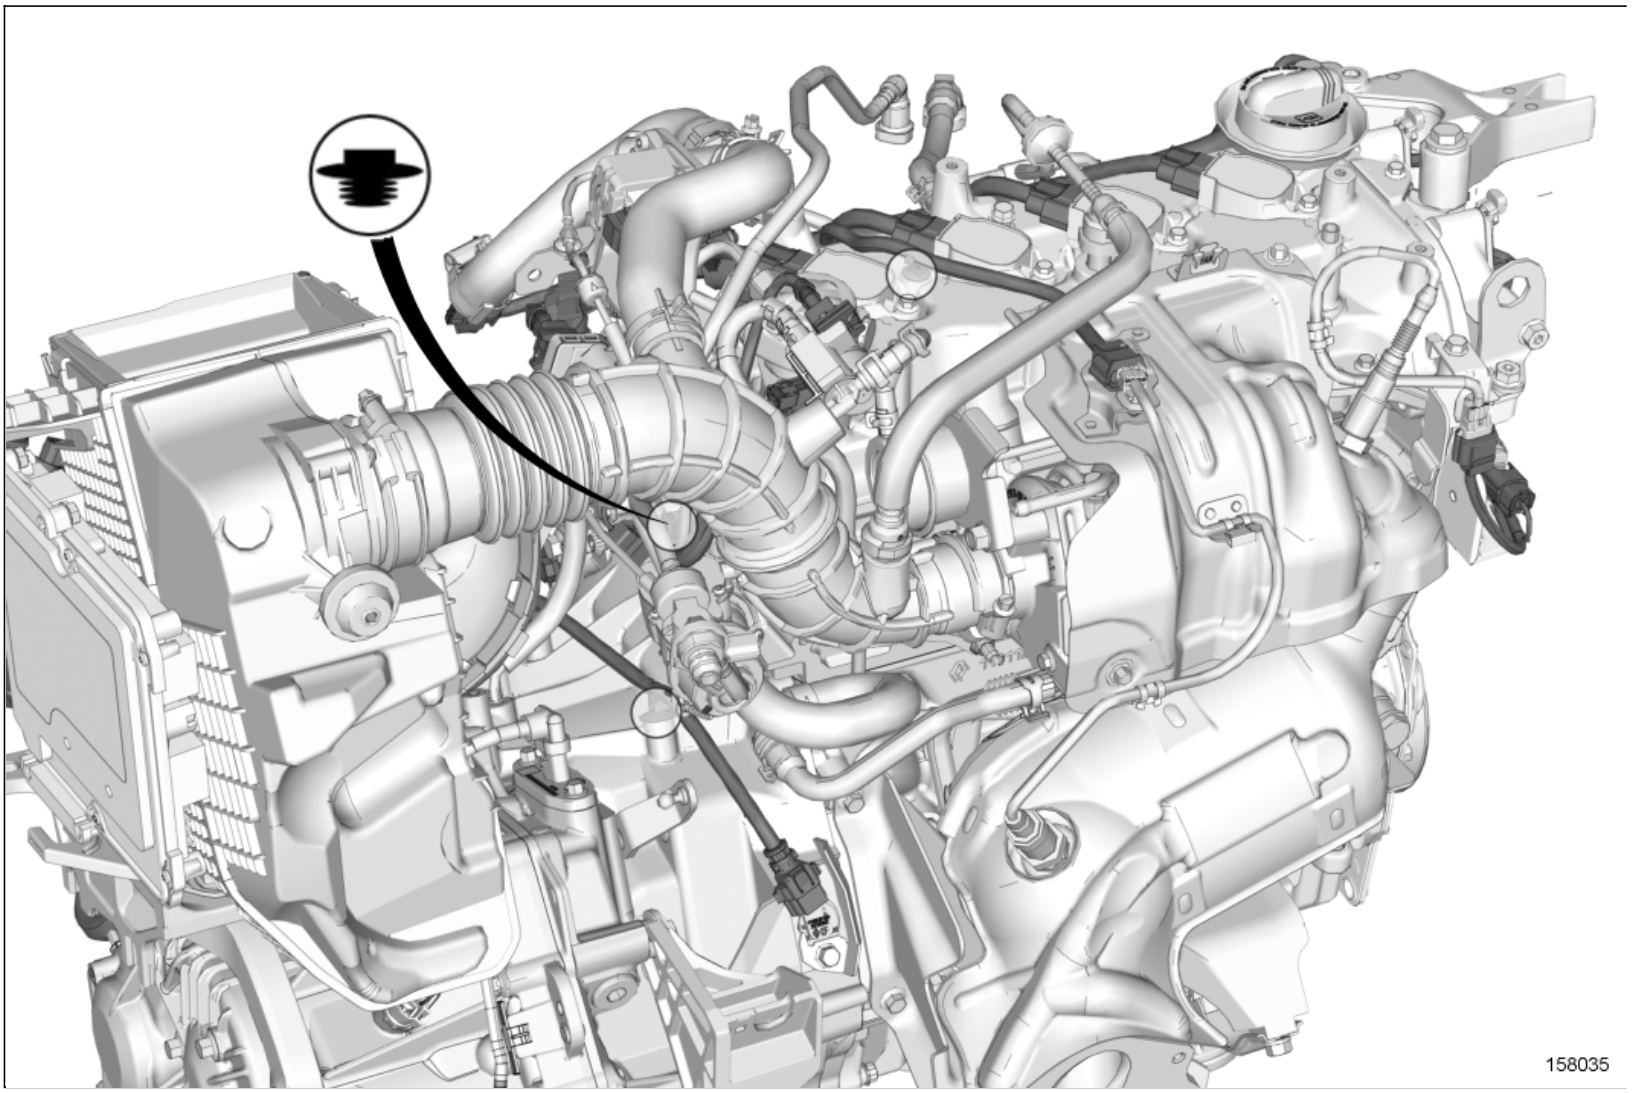


1- IF REPLACING THE ENGINE WIRING

Remove the fuses.



2. REMOVAL OPERATION



CAUTION
To prevent any risk of noise, premature wear, short circuits, etc. after the refitting operation, mark the wiring routing and how to connect the connectors.

158033

158034

- Disconnect all the connectors.
- Unclip the engine wiring where indicated.

Note:

Before removing the earth terminal, mark its position using an indelible pencil.

- Remove the earth terminal.

CAUTION

To prevent any damage during the removal operation, check that the wiring is free from its mountings (retaining clip, plastic clip, adhesive tape, connector, etc.).

- Remove the engine wiring.

REFITTING

1. REFITTING PREPARATION OPERATION

1- IF REPLACING THE ENGINE WIRING

-

Refit the fuses.

If replacing with a complete wiring harness, lock the unused connectors (see Connectors: Sealing and locking) (Technical Note 6015A, 88A, Wiring).

2. REFITTING OPERATION

Proceed in the reverse order to removal.

Note:

Refit the earth terminal, aligning the indelible marks.

When reassembling, improper positioning of the earth terminal casing could result in damage to the earth terminal or earth wiring.

Torque tighten:

- the starter excitation cable nut 5 N.m,
- the starter supply cable nut 8 N.m,
- the positive terminal nut on the alternator 21 N.m,
- the earth cable nut 8 N.m.

Connect the battery Battery: Removal - Refitting .

Switch on the ignition.

Connect the Diagnostic tool.

Check that there are no faults.

ENGINE-GEARBOX UNIT SUPPORT ASSEMBLY: EXPLODED VIEW

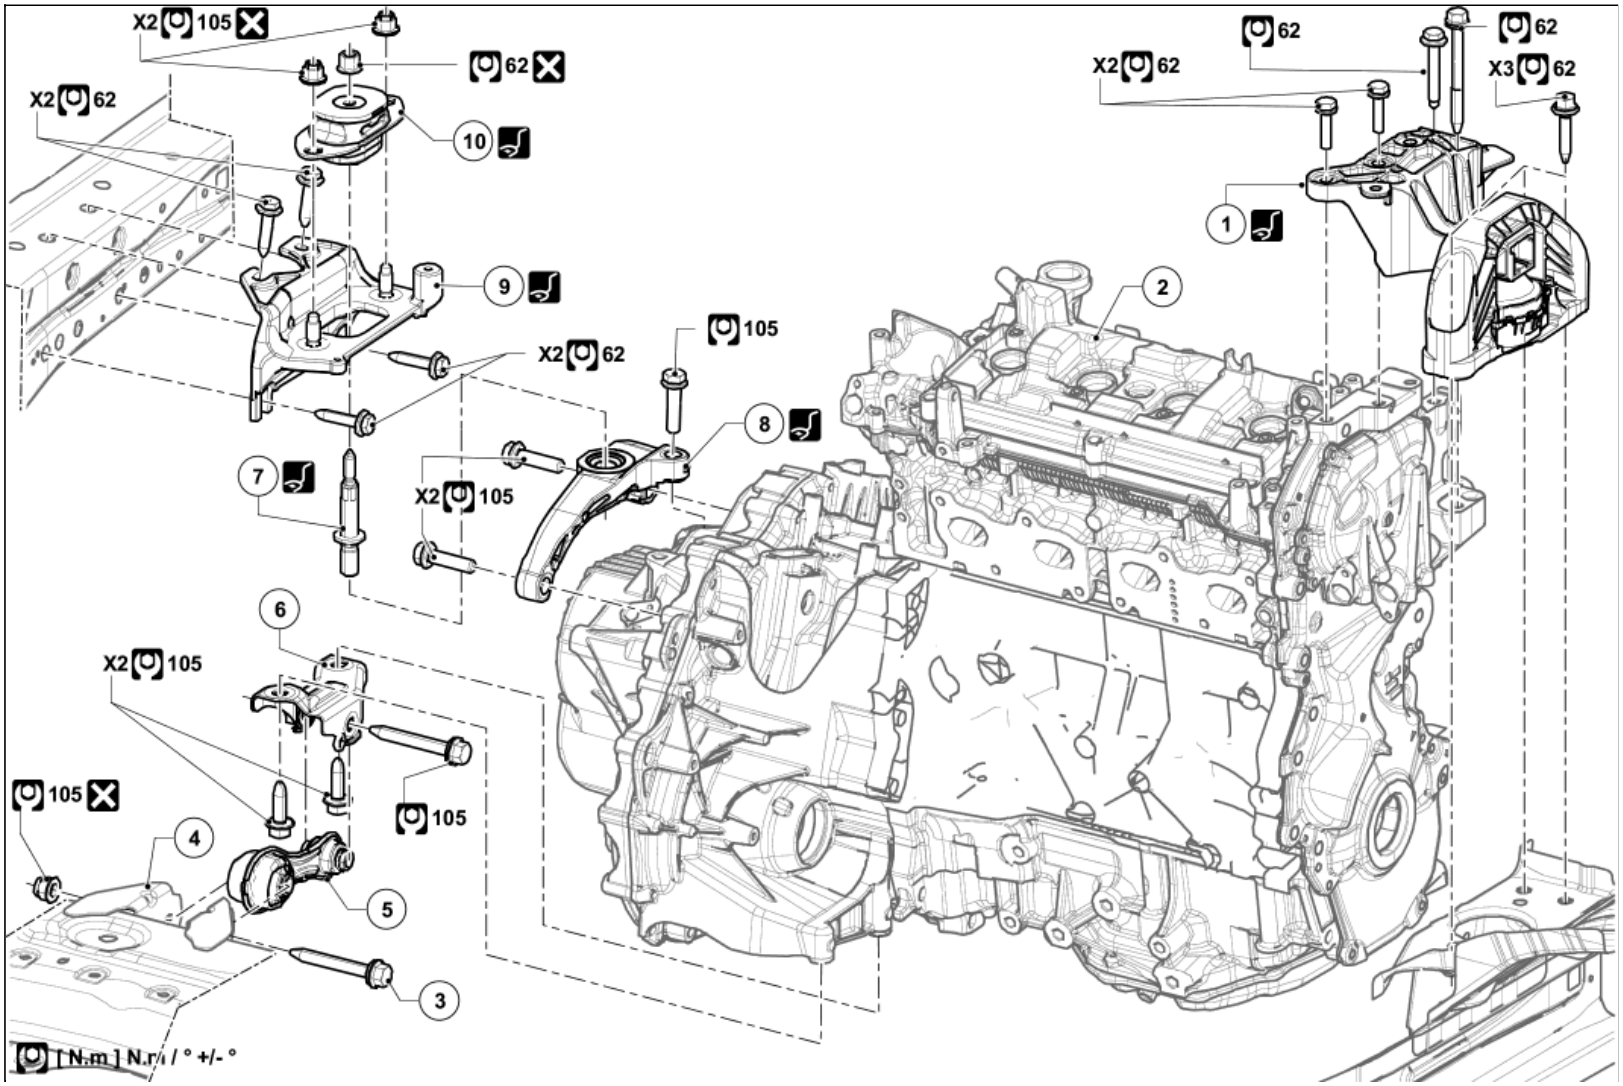


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations

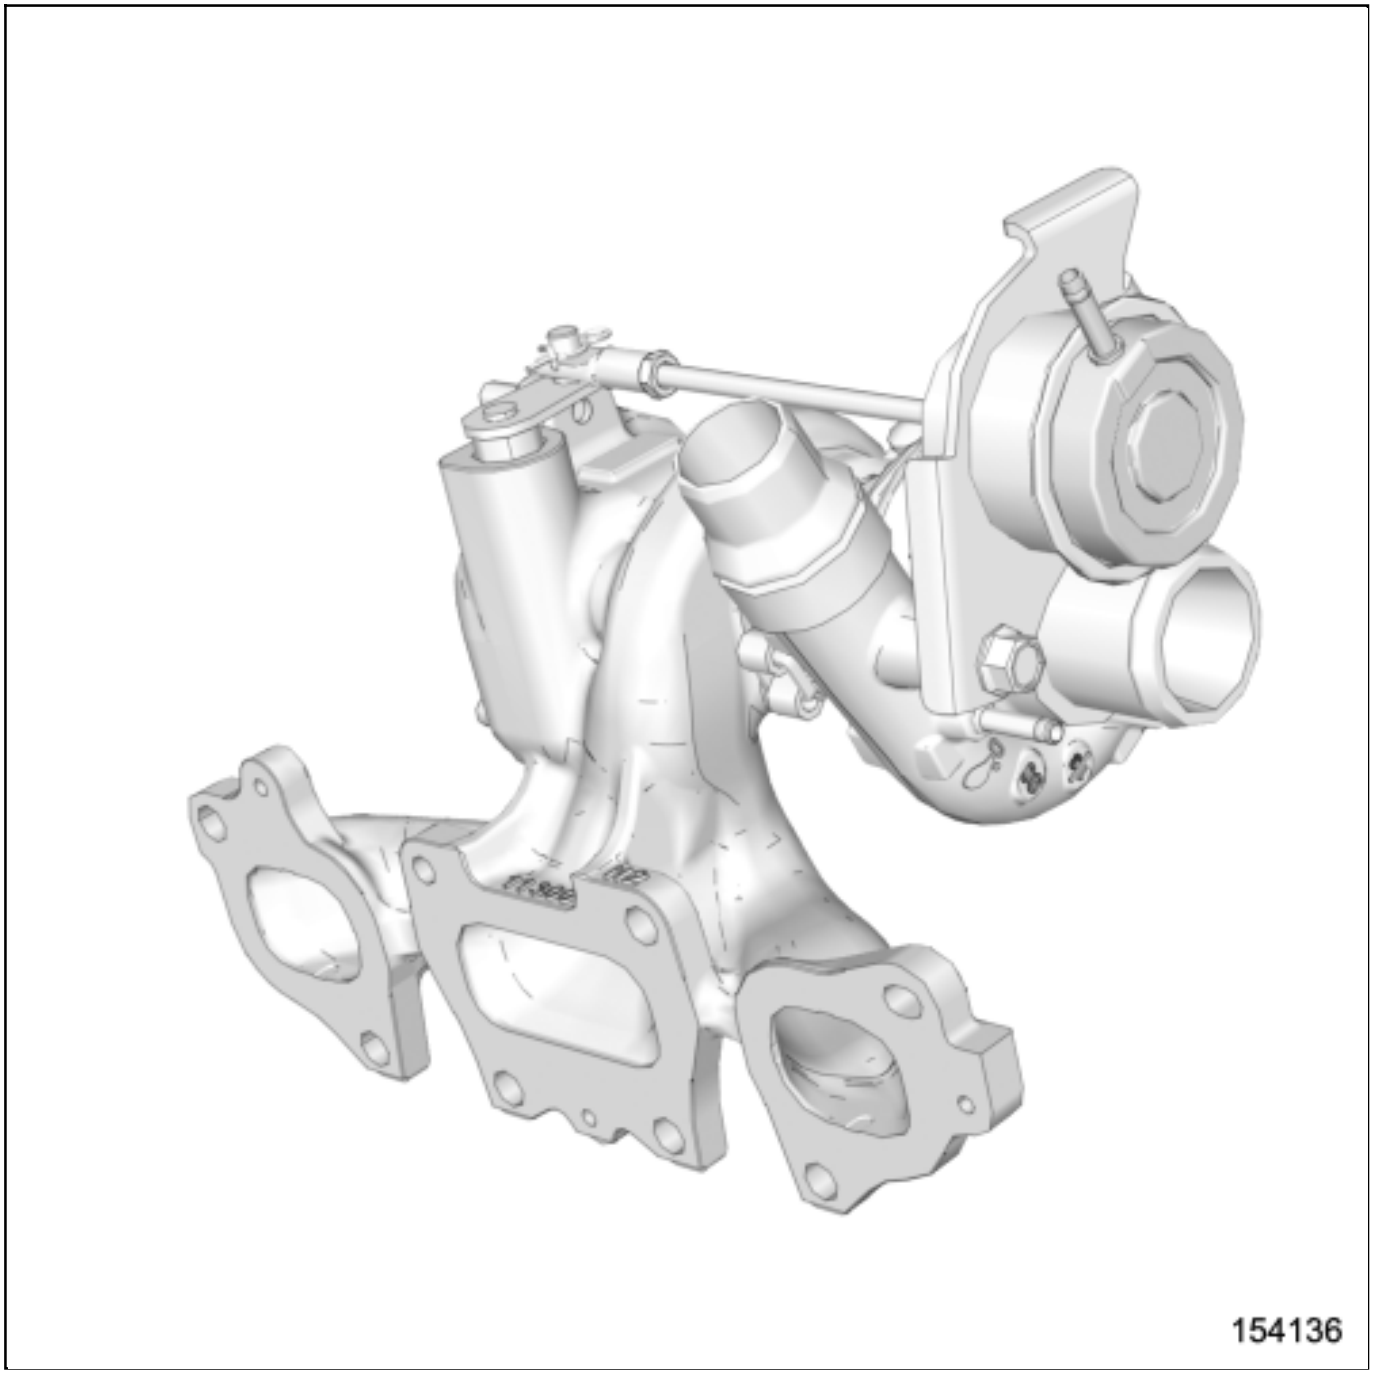
EXHAUSTMANIFOLD:REMOVAL-REFITTING



Note, one or more warnings are present in this procedure

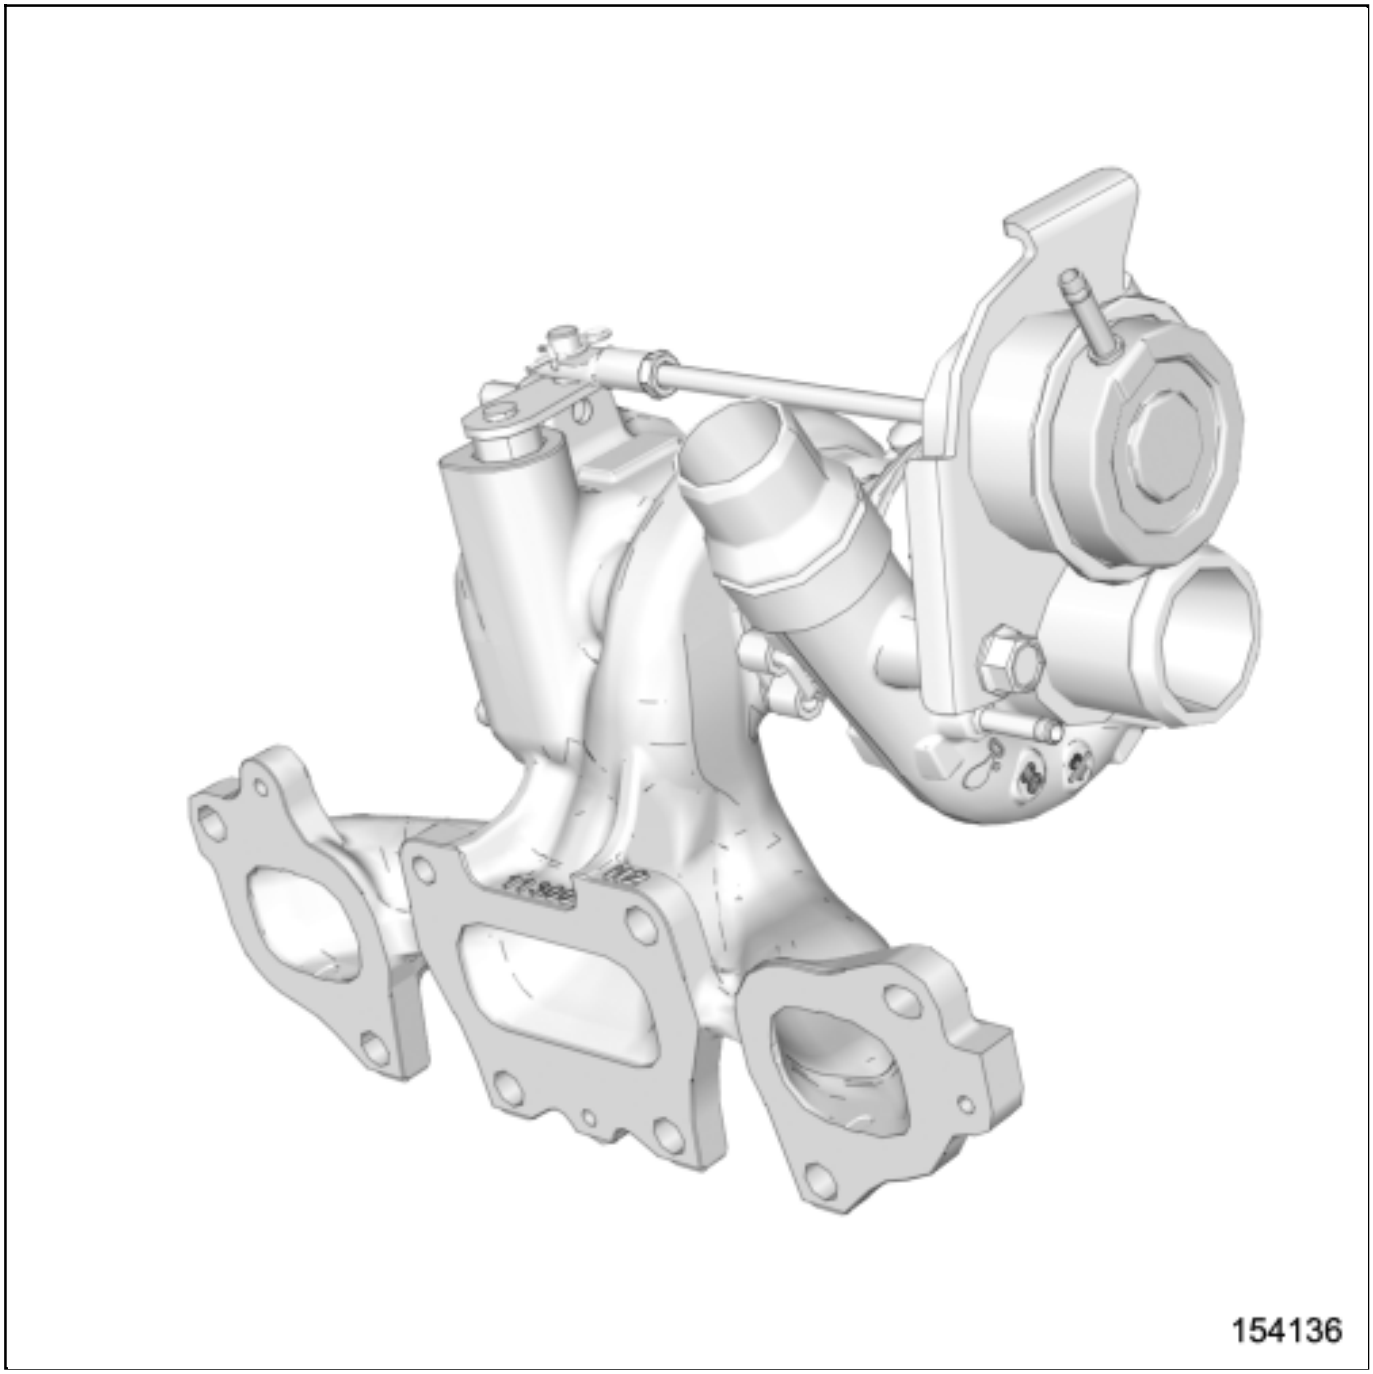
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions**Vehicle: Precautions for the repair** .

This engine is equipped with an integrated turbocharger exhaust manifold.

To remove the exhaust manifold, see the removal of the turbocharger[Turbocharger: Removal - Refitting]
.

EXHAUSTMANIFOLD:REMOVAL-REFITTING



Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions**Vehicle: Precautions for the repair** .

- This engine is equipped with an integrated turbocharger exhaust manifold.

- To remove the exhaust manifold, see the removal of the turbocharger (see 12B, Turbocharging, Turbocharger: Removal - Refitting) .

Repair-10x07x02-01x37-1-137-1.xml

XSL version : 3.02 du 22/07/11

EXHAUST: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.	Mot. 1199-01

Equipment required
component jack

1. PARTS AND CONSUMABLES FOR THE REPAIR

1- PARTS ALWAYS TO BE REPLACED:

- the exhaust sleeve (if fitted)

- the seal or sealing ring on the connection between the catalytic converter or catalytic pre-converter and the rest of the exhaust system

- the exhaust clip(s) (if fitted)

2- CONSUMABLES (SEE PART NUMBER IN TECHNICAL NOTE 5068, 04B, CONSUMABLES - PRODUCTS):

- exhaust mastic

- surface cleaner

- grey abrasive pads

2. ADVICE TO OBSERVE

WARNING

Do not park and run the engine in a place where combustible substances and materials such as grass or leaves can come into contact with the hot exhaust system.

WARNING

Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

1 - During removal and refitting, the catalytic converter or catalytic pre-converter must not receive any knocks or impacts as this could damage it.

2 - The whole exhaust pipe is made of stainless steel.

3 - After working on the bracket between the catalytic converter or catalytic pre-converter and the rest of the exhaust system, ensure that the connection is perfectly sealed.

To do this:

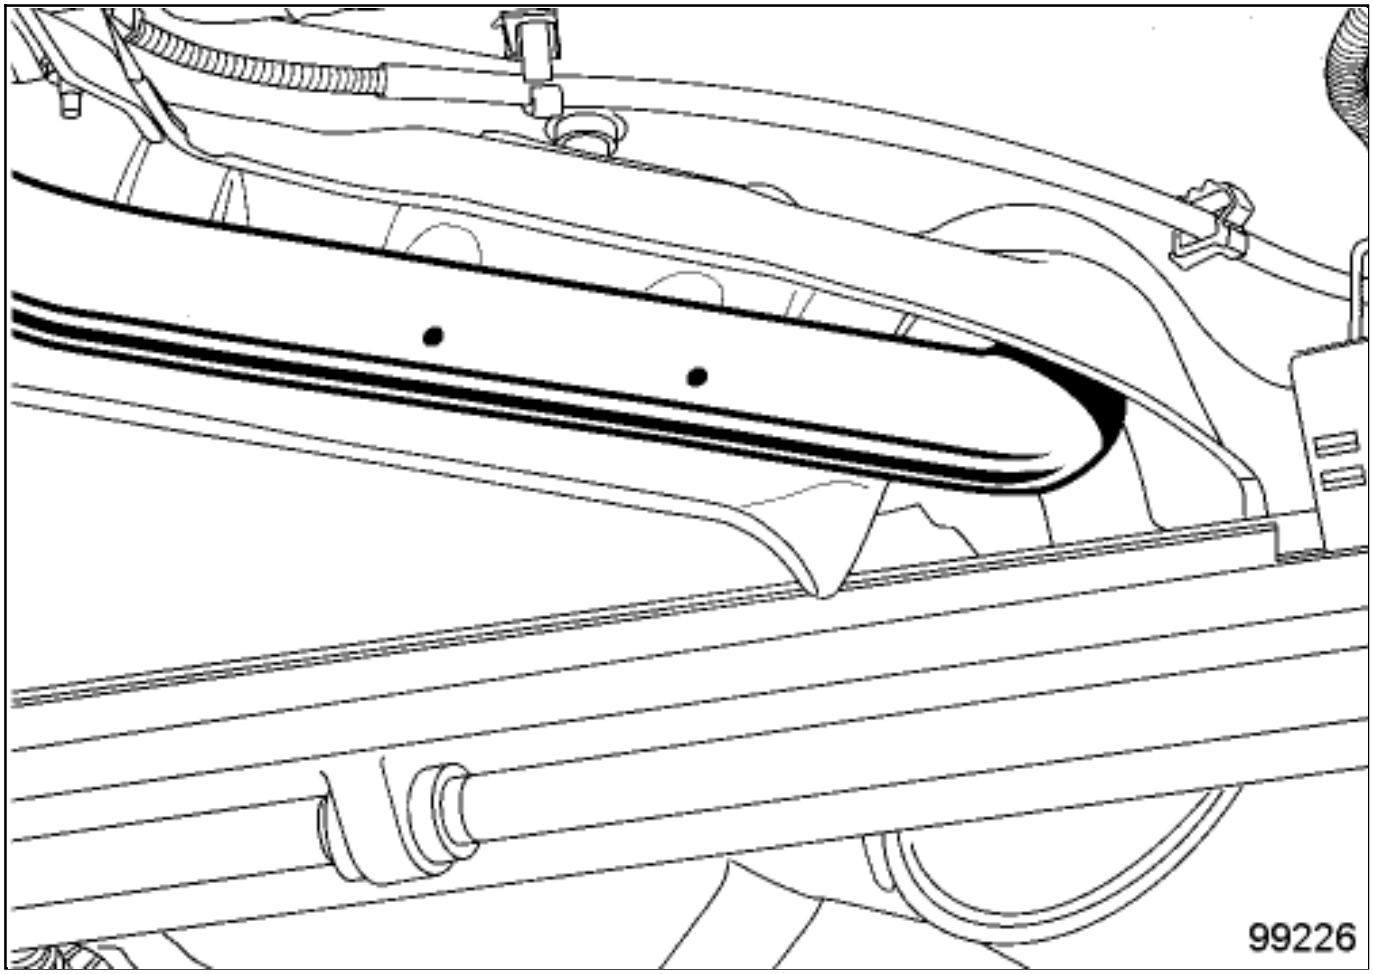
- clean the bearing faces of the connection using grey abrasive pads,
- degrease the bearing faces of the connection using surface cleanerand clean cloths,
- always replace the seal or sealing ring on the connection.

3. SPECIAL NOTES ON THE SINGLE UNIT EXHAUST PIPE

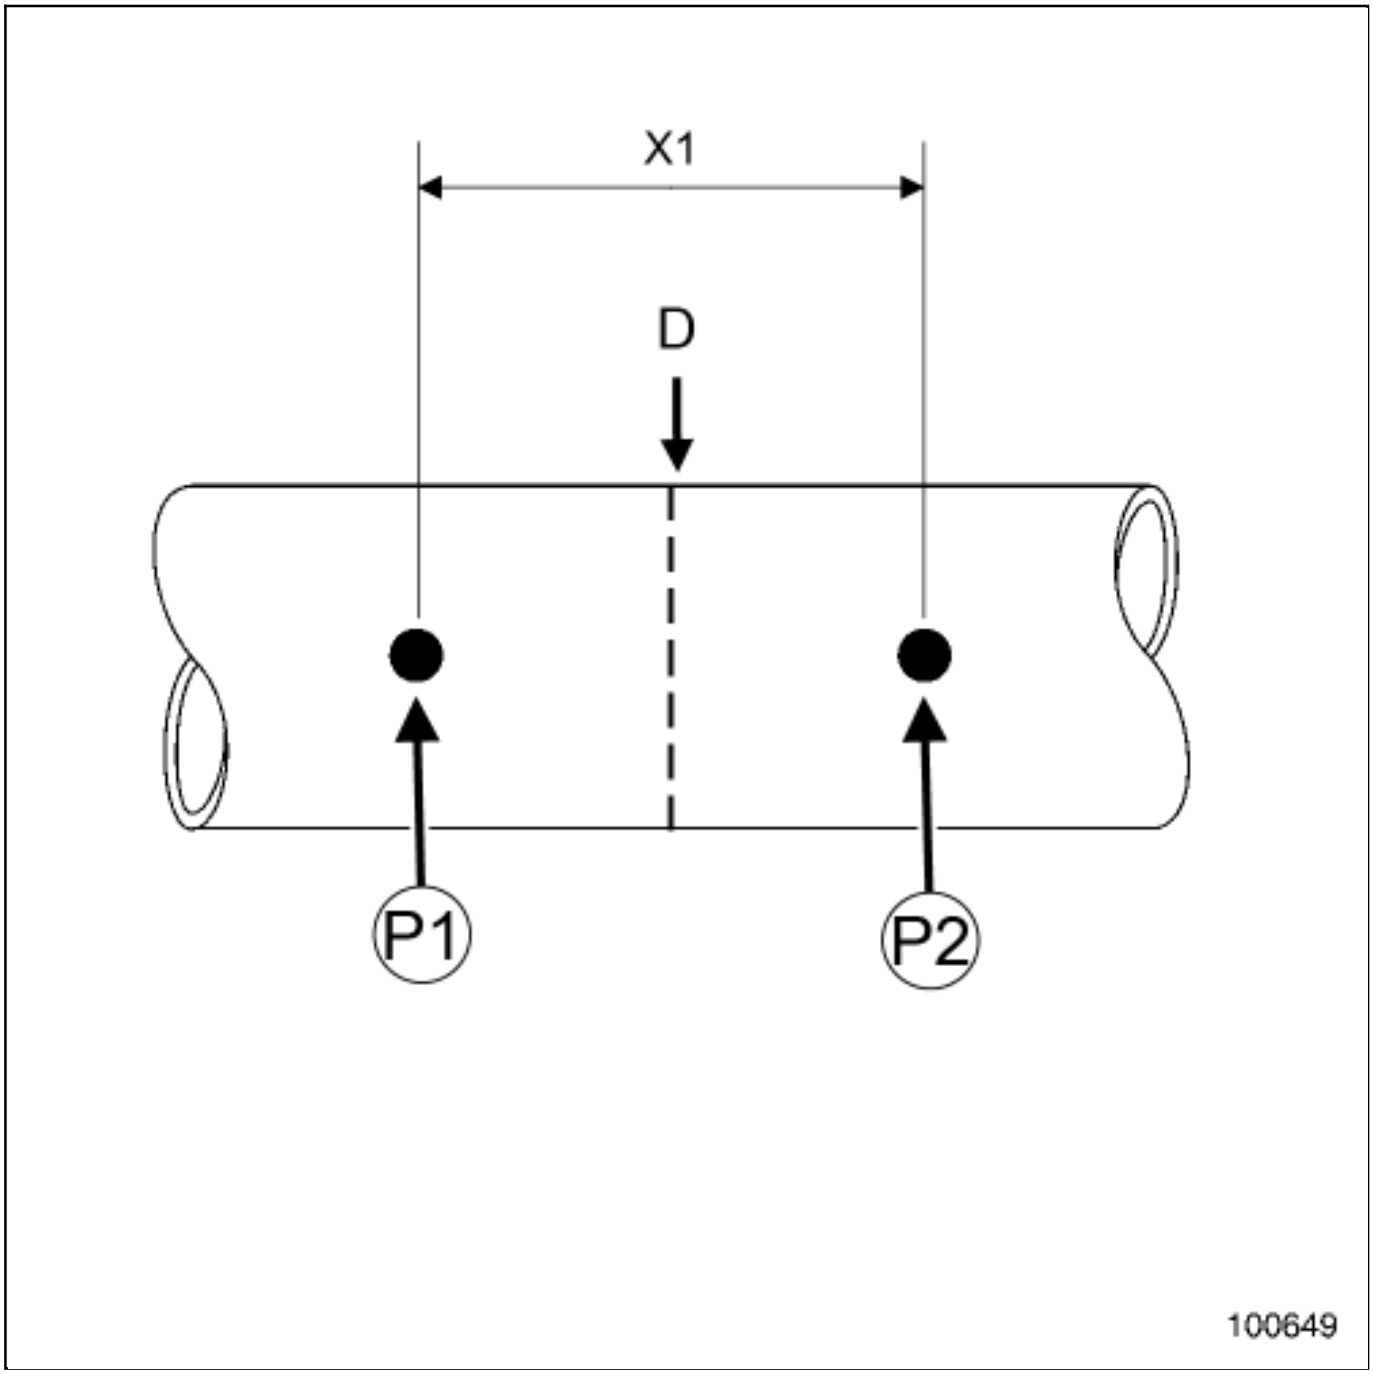
1- CUTTING THE SINGLE UNIT EXHAUST PIPE

The exhaust pipe is a "single unit type" .

To replace different parts of the exhaust system it must be cut.



To do this be sure to carry out these precautions in the following order:

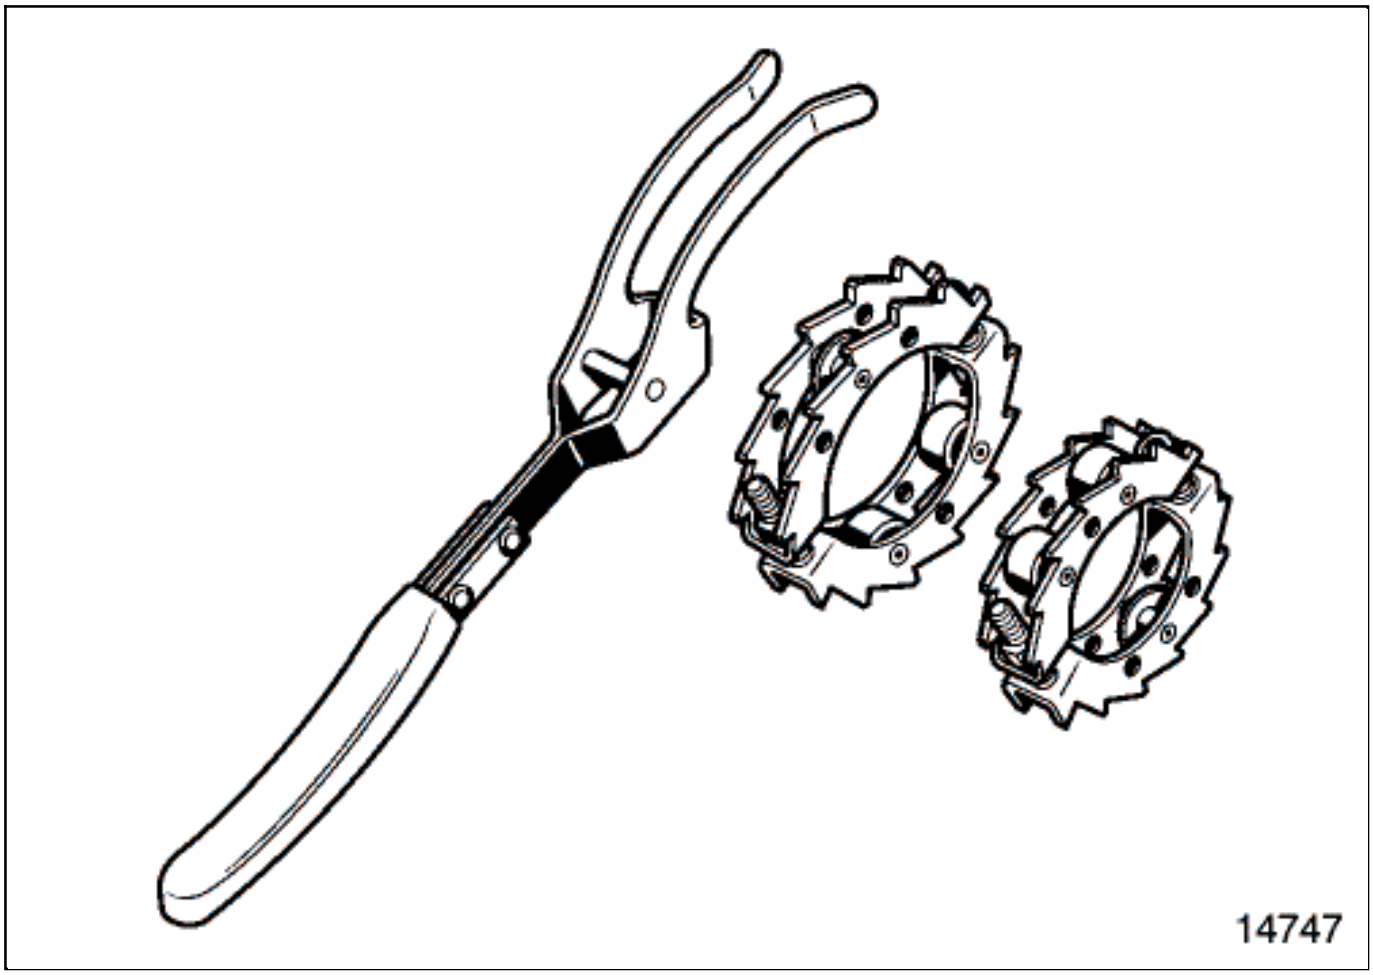


- correctly identify the area to be cut, as explained below,
- use the cutting tool correctlyExhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case. (**Mot. 1199-01**) ,
- position the exhaust sleeve correctly.

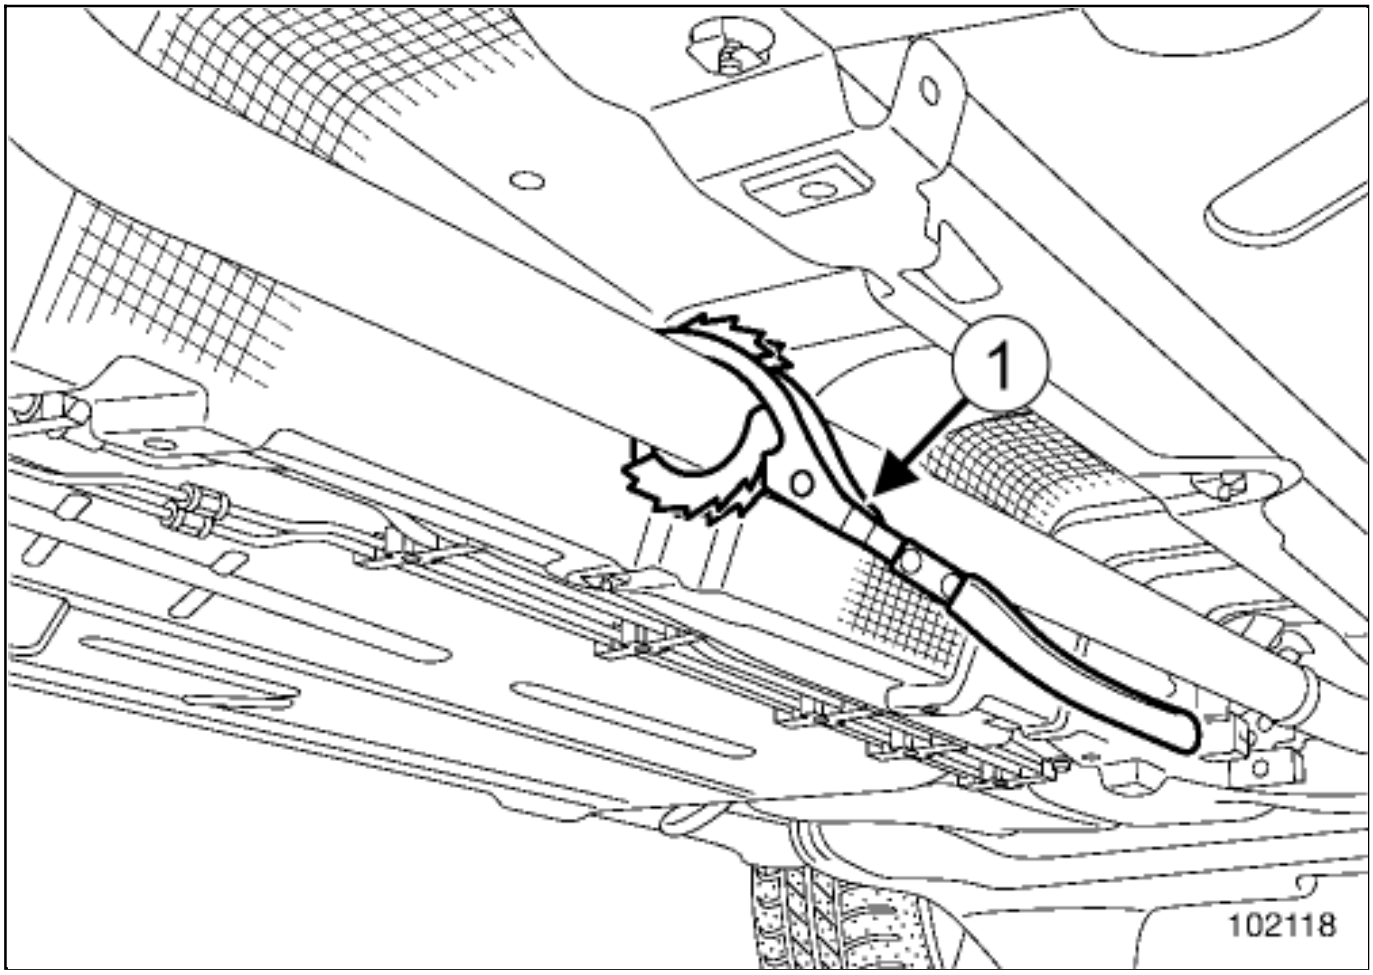
2- IDENTIFYING THE AREA OF THE EXHAUST SYSTEM TO BE CUT

Two marks made on the exhaust system define the area to be cut**(see 19B, Exhaust, Exhaust assembly under body: Exploded view)** (see MR for vehicle concerned, 19B, Exhaust).

EXAMPLE OF CUTTING AREA



99226



Before cutting the exhaust system, draw a line(D) between the two marks(P1) and (P2) .

The distance between the two marks on the exhaust pipe is(X1) : 80 mm .

3- OPERATE TOOL MOT. 1199-01

14747

Fit the Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.(Mot. 1199-01) (1) on the exhaust pipe.

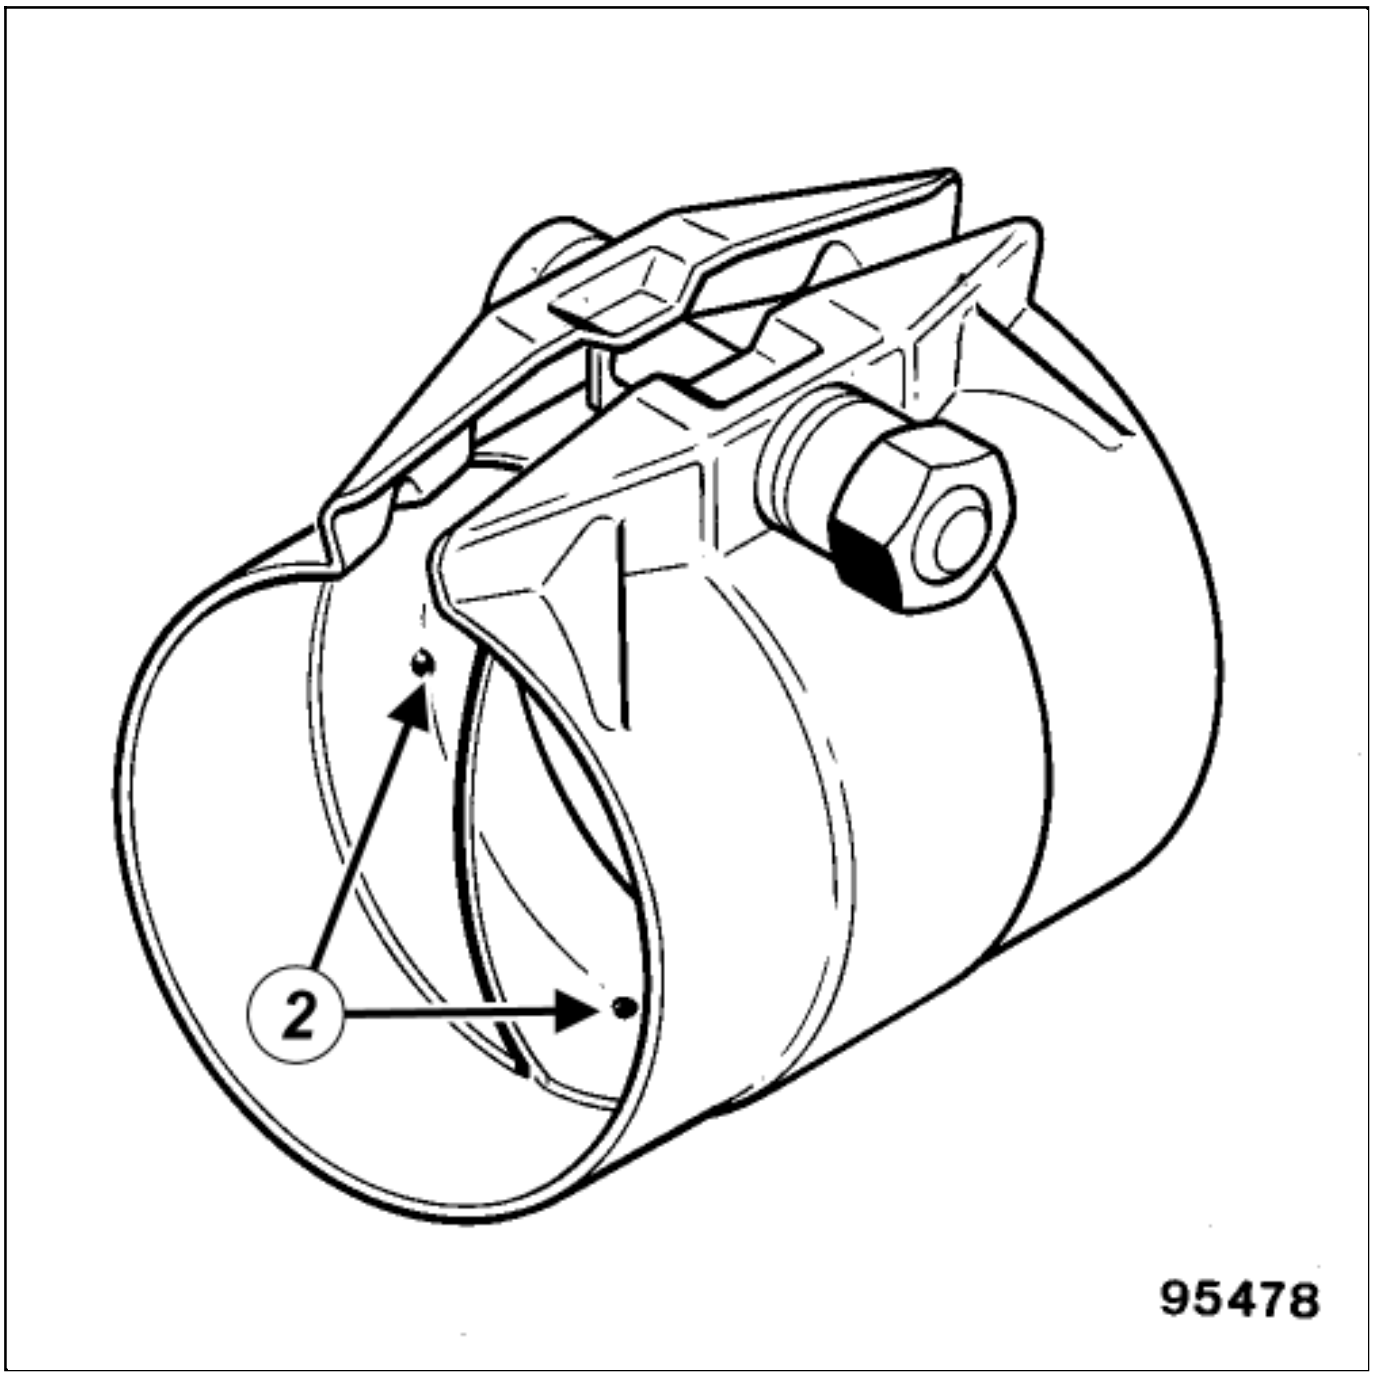
Tighten the two bolts on the tool until they touch the pipe in order to clamp the tool onto the pipe.

Turn the cutting tool using the handle and pressing it against the pipe (as indicated in the diagram above).

Tighten the two bolts on the tool whilst cutting, until the pipe is completely cut.

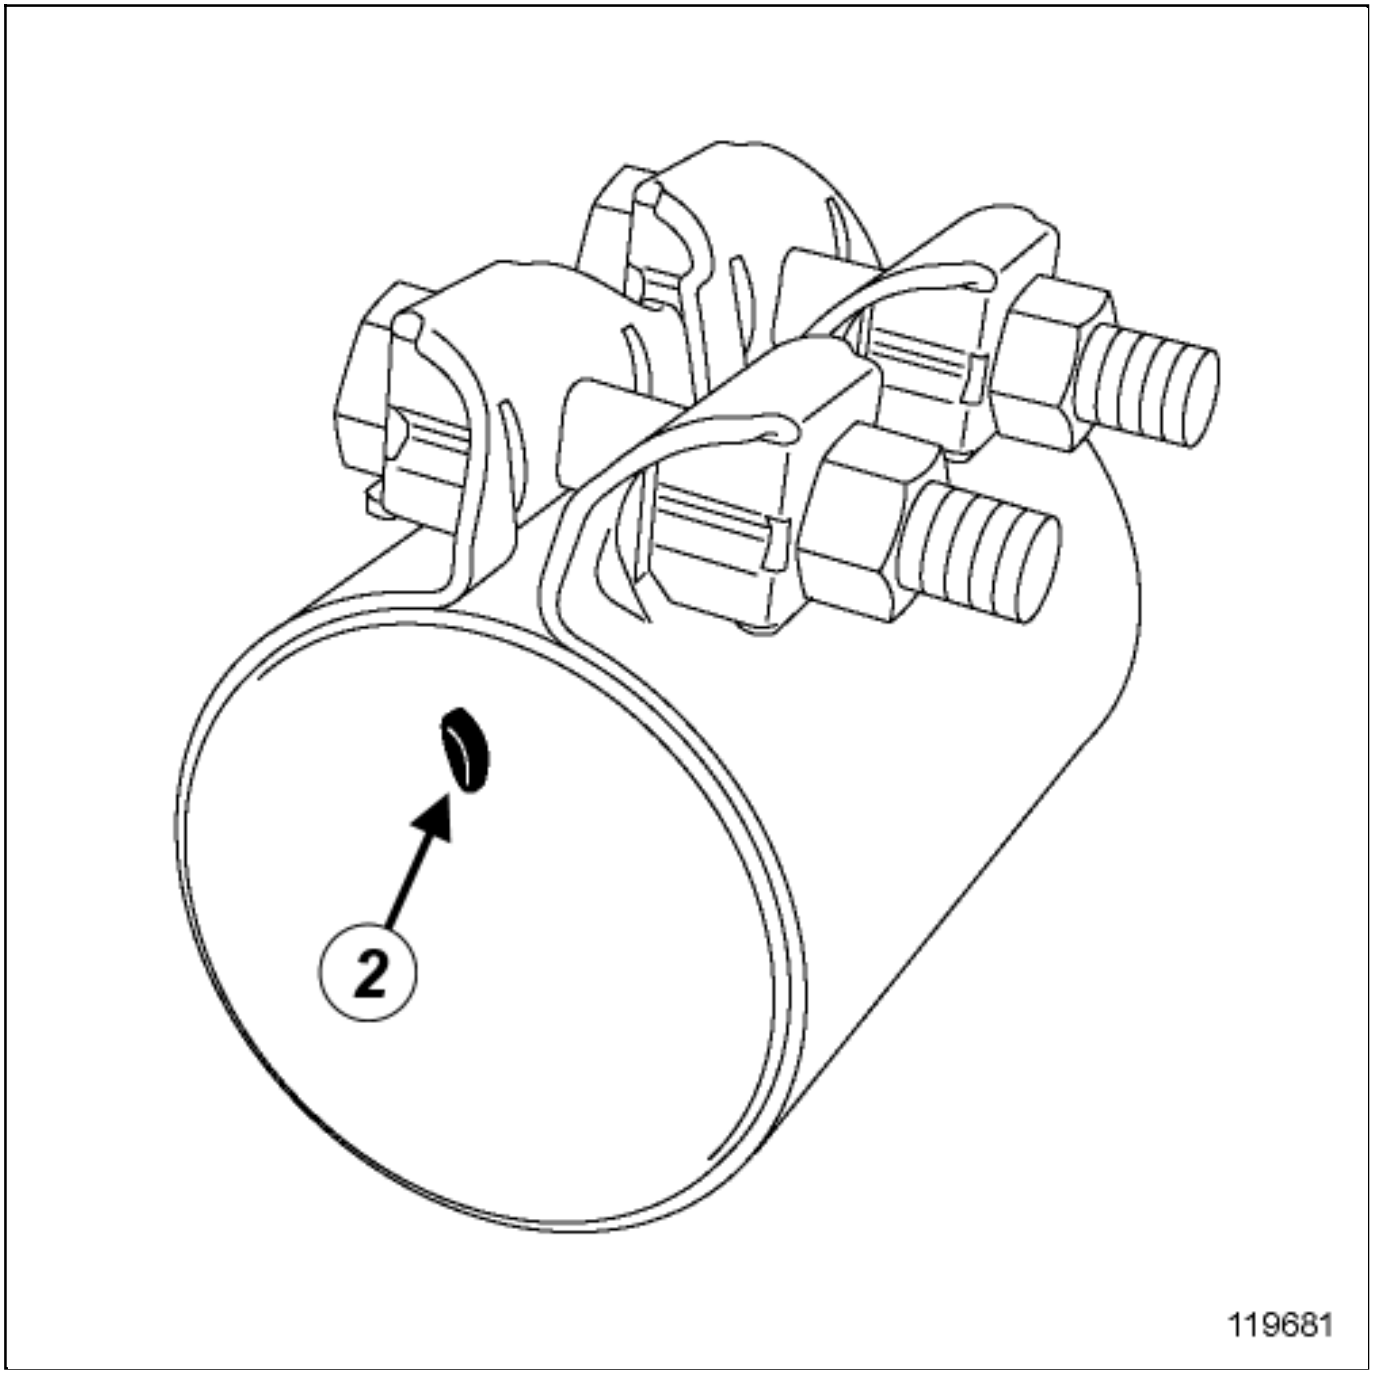
Note:

Do not over-tighten the tool onto the pipe to avoid deforming it.



Once the pipe is cut, file and deburr the end of the pipe to be used on the vehicle again.

4- POSITIONING THE EXHAUST SLEEVE



CAUTION

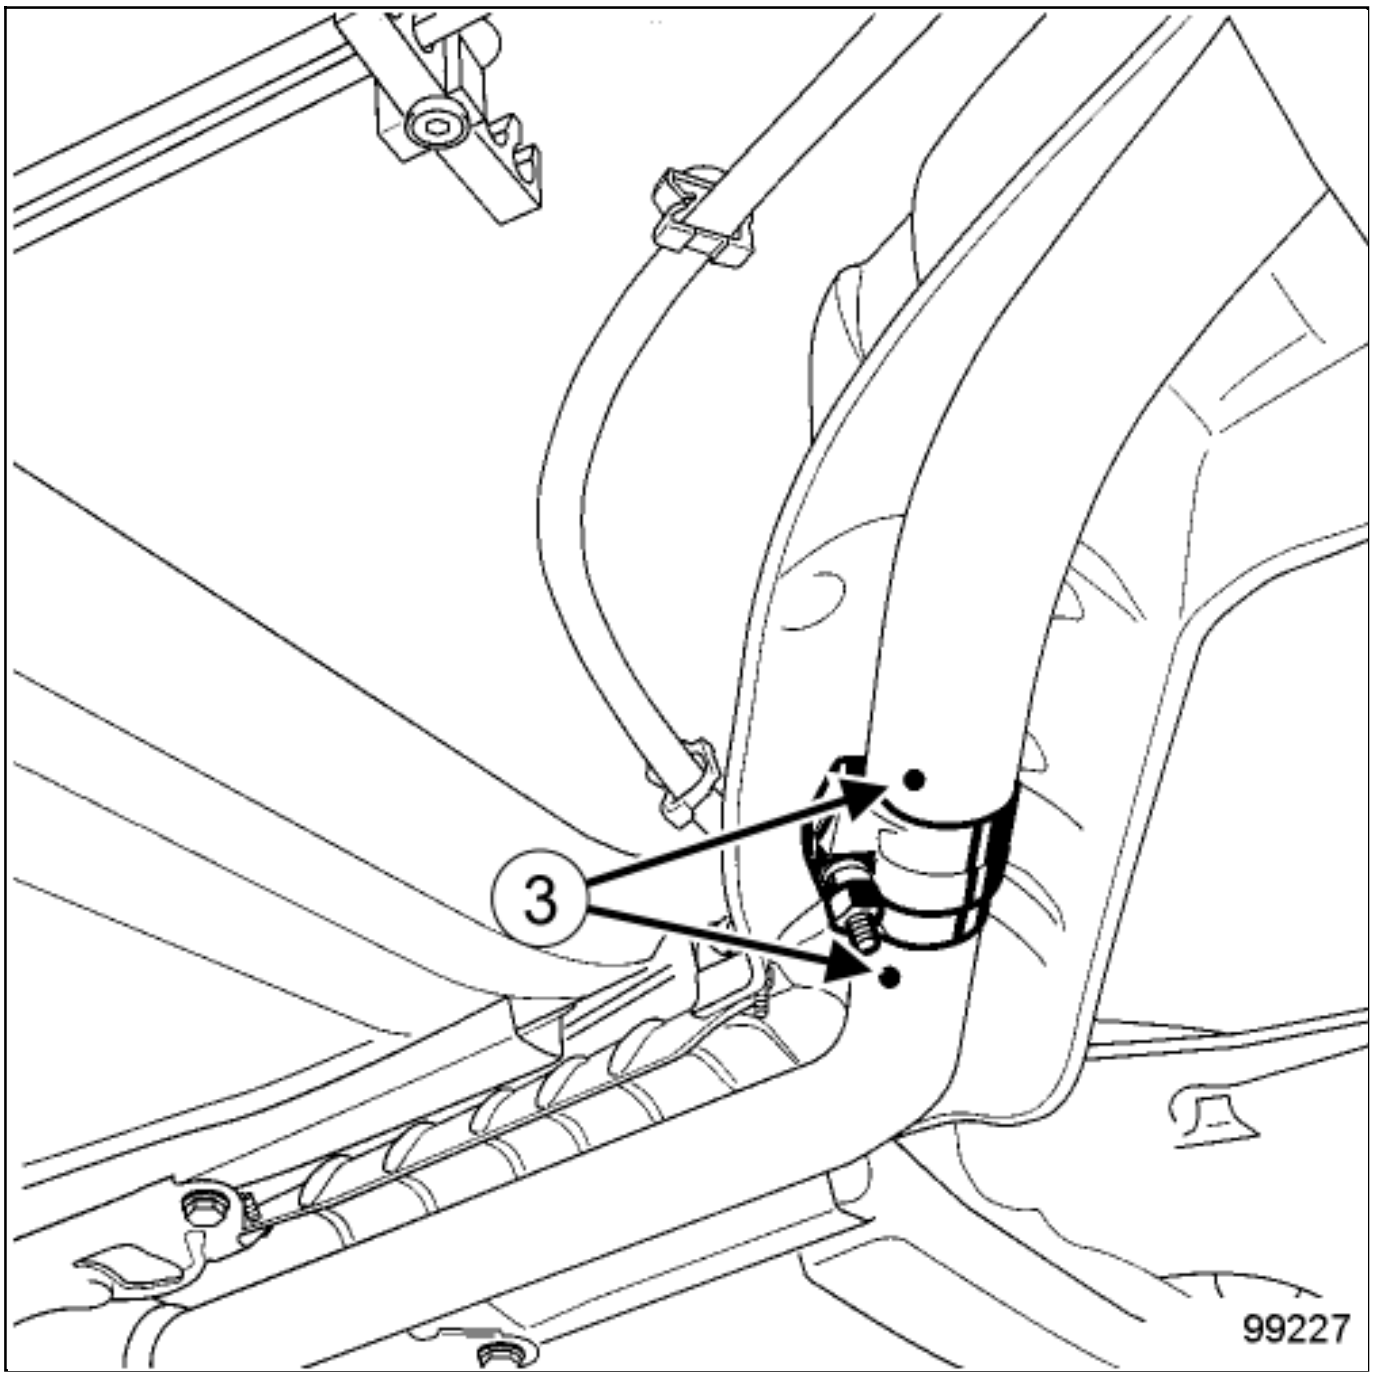
Do not reuse an old exhaust sleeve.

EXHAUST SLEEVE WITH 1 BOLT

EXHAUST SLEEVE WITH 2 BOLTS

Fit the exhaust sleeve onto the part of the exhaust system fitted to the vehicle.

Position the pipe onto the lugs(2) inside the exhaust sleeve.



Tighten the exhaust sleeve bolt(s) slightly (depending on the version).

Position the second part of the exhaust system under the vehicle, fitting it in the exhaust sleeve.

Note:

If necessary, use a component jackto lift and hold the heavy and bulky components of the exhaust system.

Position the second exhaust pipe onto the lugs inside the exhaust sleeve.

Check that the two cut marks(3) are aligned (if applicable).

Position the sleeve so that there is no risk of contact between its bolt or bolts and the heat shields.

- Torque tighten:
  - the exhaust sleeve nut with 1 bolt 25 N.m (if fitted),
  - the exhaust sleeve nuts with 2 bolts 18 N.m (if fitted).
- Check the following and deal with if necessary:
  - no underbody contact between the exhaust system and the heat shields,
  - all of the heat shields are present and secure.

Note:

Any damaged heat shields must be replaced.

Start the engine.

Check that there are no leaks: deal with any leaks.

Note:

If there are leaks from the exhaust sleeves with 1 bolt, apply exhaust masticto the sleeve (see part no. in Technical Note 5068, 04B, Consumables - Products).

- If the application of exhaust mastic does not fix the leak:
  - remove and replace the used exhaust sleeve,
  - check the condition of the exhaust pipes (condition of the pipe surface, deburring of the area cut, damage to the pipes).
  - fit the new sleeve in accordance with the instructions given before.

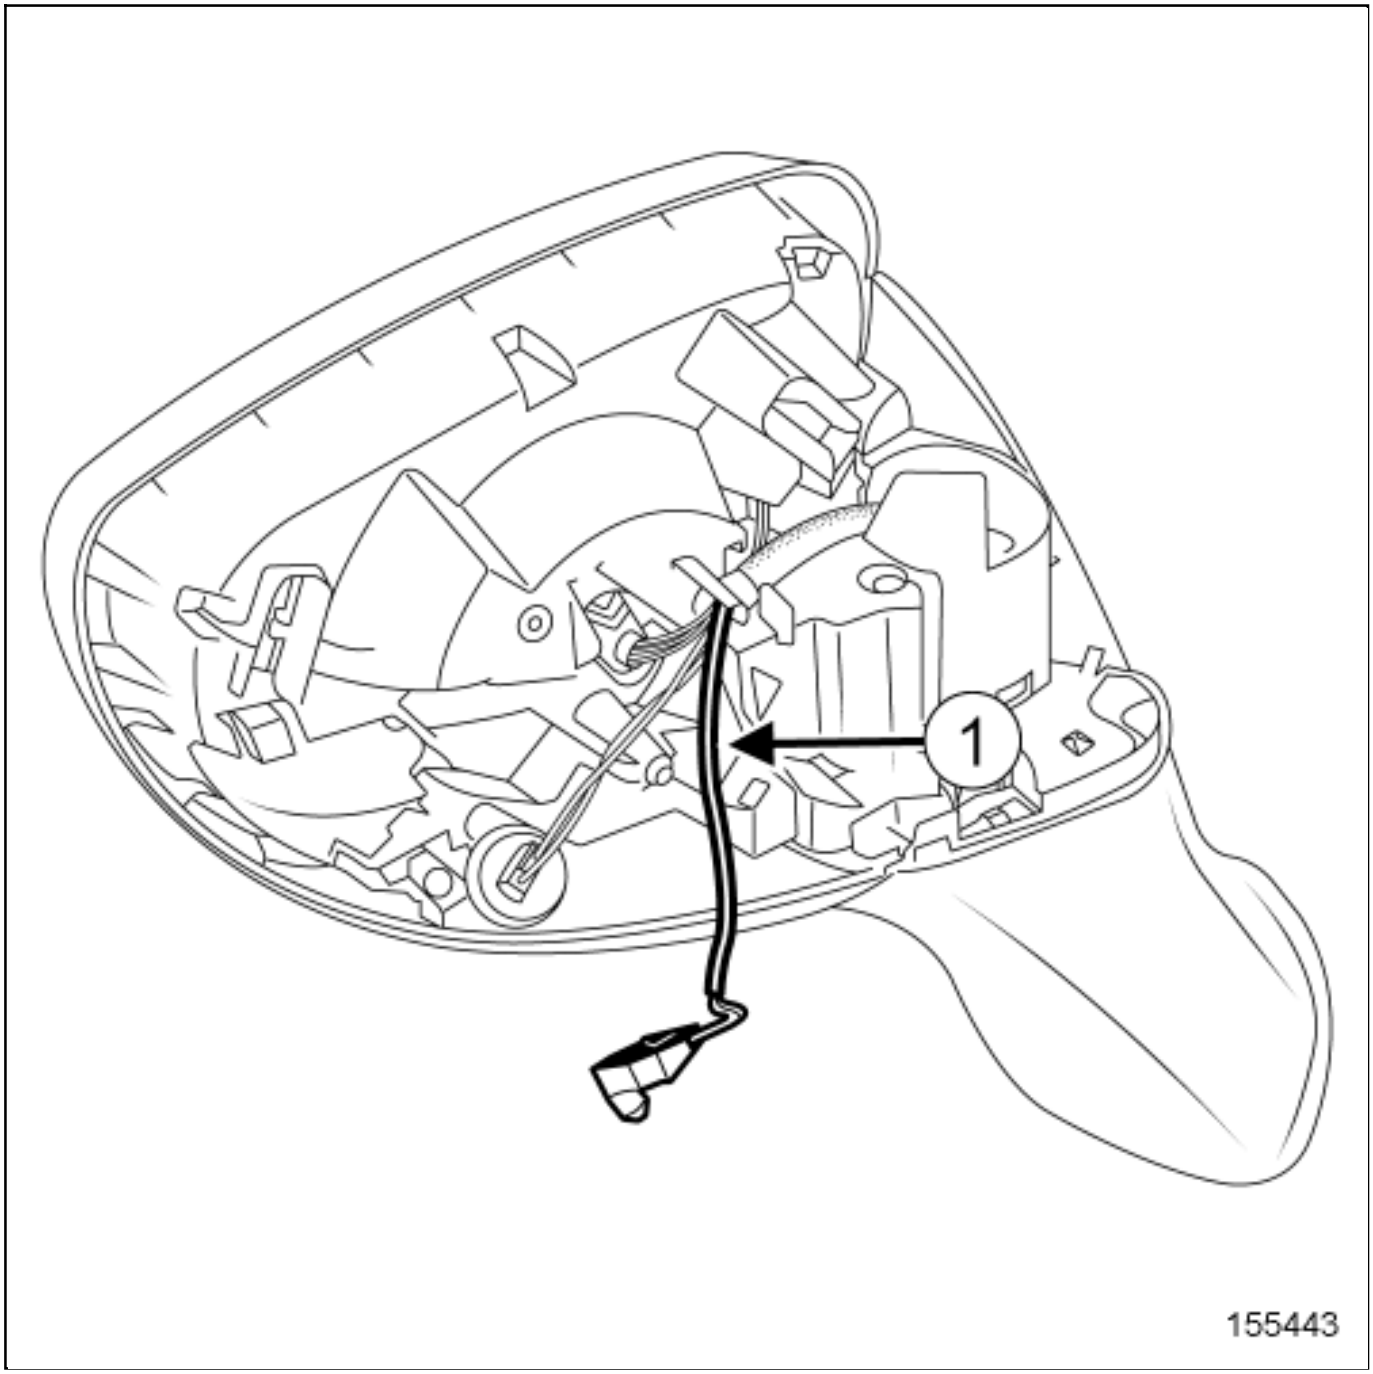
EXTERIOR TEMPERATURE SENSOR: REMOVAL - REFITTING

Note:

The exterior temperature sensor is located in the door mirror on the right-hand side.

REMOVAL



1. REMOVAL PREPARATION OPERATION

Remove Door mirror: Removal - Refitting :

- the right-hand door mirror glass,
- the right-hand door mirror casing.

2. REMOVAL OPERATION

Remove the exterior temperature sensor from its mounting.

Cut the wires(1) of the exterior temperature sensor (see Wiring: Repair) (Technical Note 6015A, 88A, Wiring).

REFITTING

1. REFITTING OPERATION

Solder the wires of the exterior temperature sensor (see Wiring: Repair) (Technical Note 6015A, 88A, Wiring).

Refit the exterior temperature sensor onto its mounting.

2. FINAL OPERATION

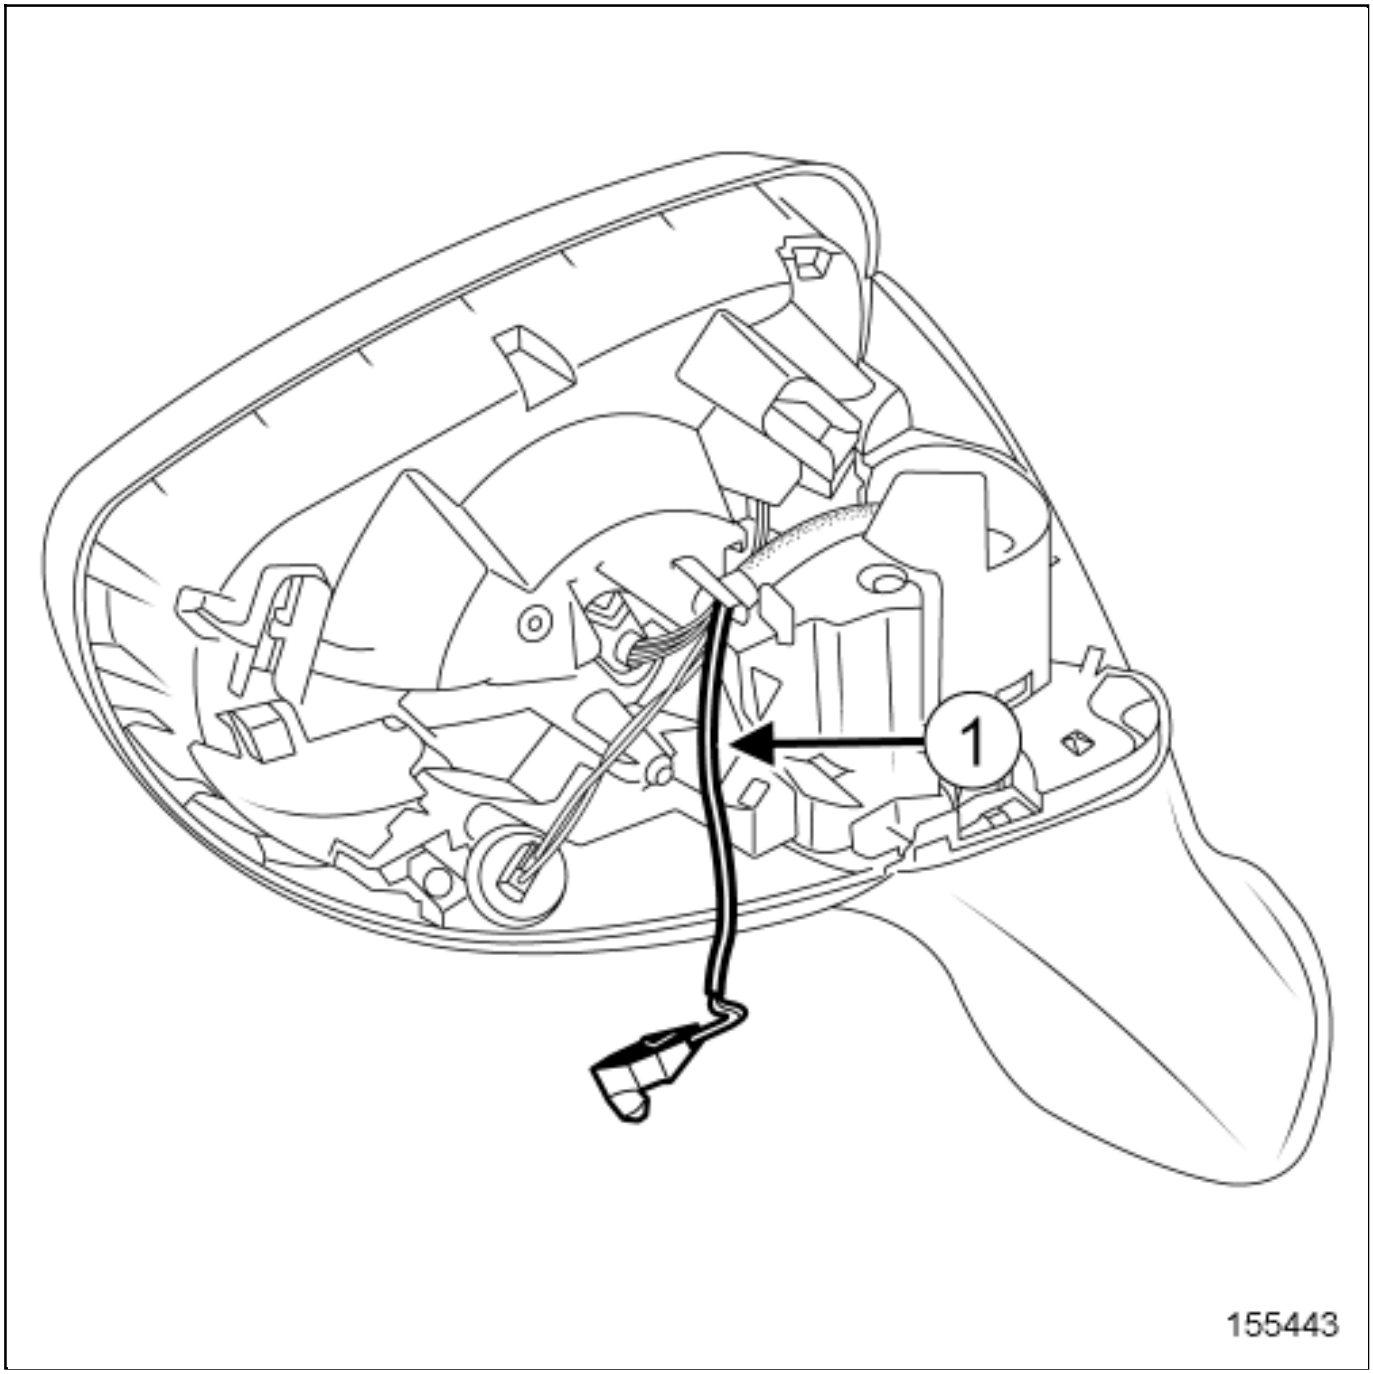
Proceed in the reverse order to removal.

EXTERIOR TEMPERATURE SENSOR: REMOVAL - REFITTING

Note:

The exterior temperature sensor is located in the door mirror on the right-hand side.

REMOVAL



1. REMOVAL PREPARATION OPERATION

Remove Door mirror: Removal - Refitting :

- the right-hand door mirror glass,
- the right-hand door mirror casing.

2. REMOVAL OPERATION

Remove the exterior temperature sensor from its mounting.

Cut the wires(1) of the exterior temperature sensor (see Wiring: Repair) (Technical Note 6015A, 88A, Wiring).

REFITTING

1. REFITTING OPERATION

Solder the wires of the exterior temperature sensor (see Wiring: Repair) (Technical Note 6015A, 88A, Wiring).

Refit the exterior temperature sensor onto its mounting.

2. FINAL OPERATION

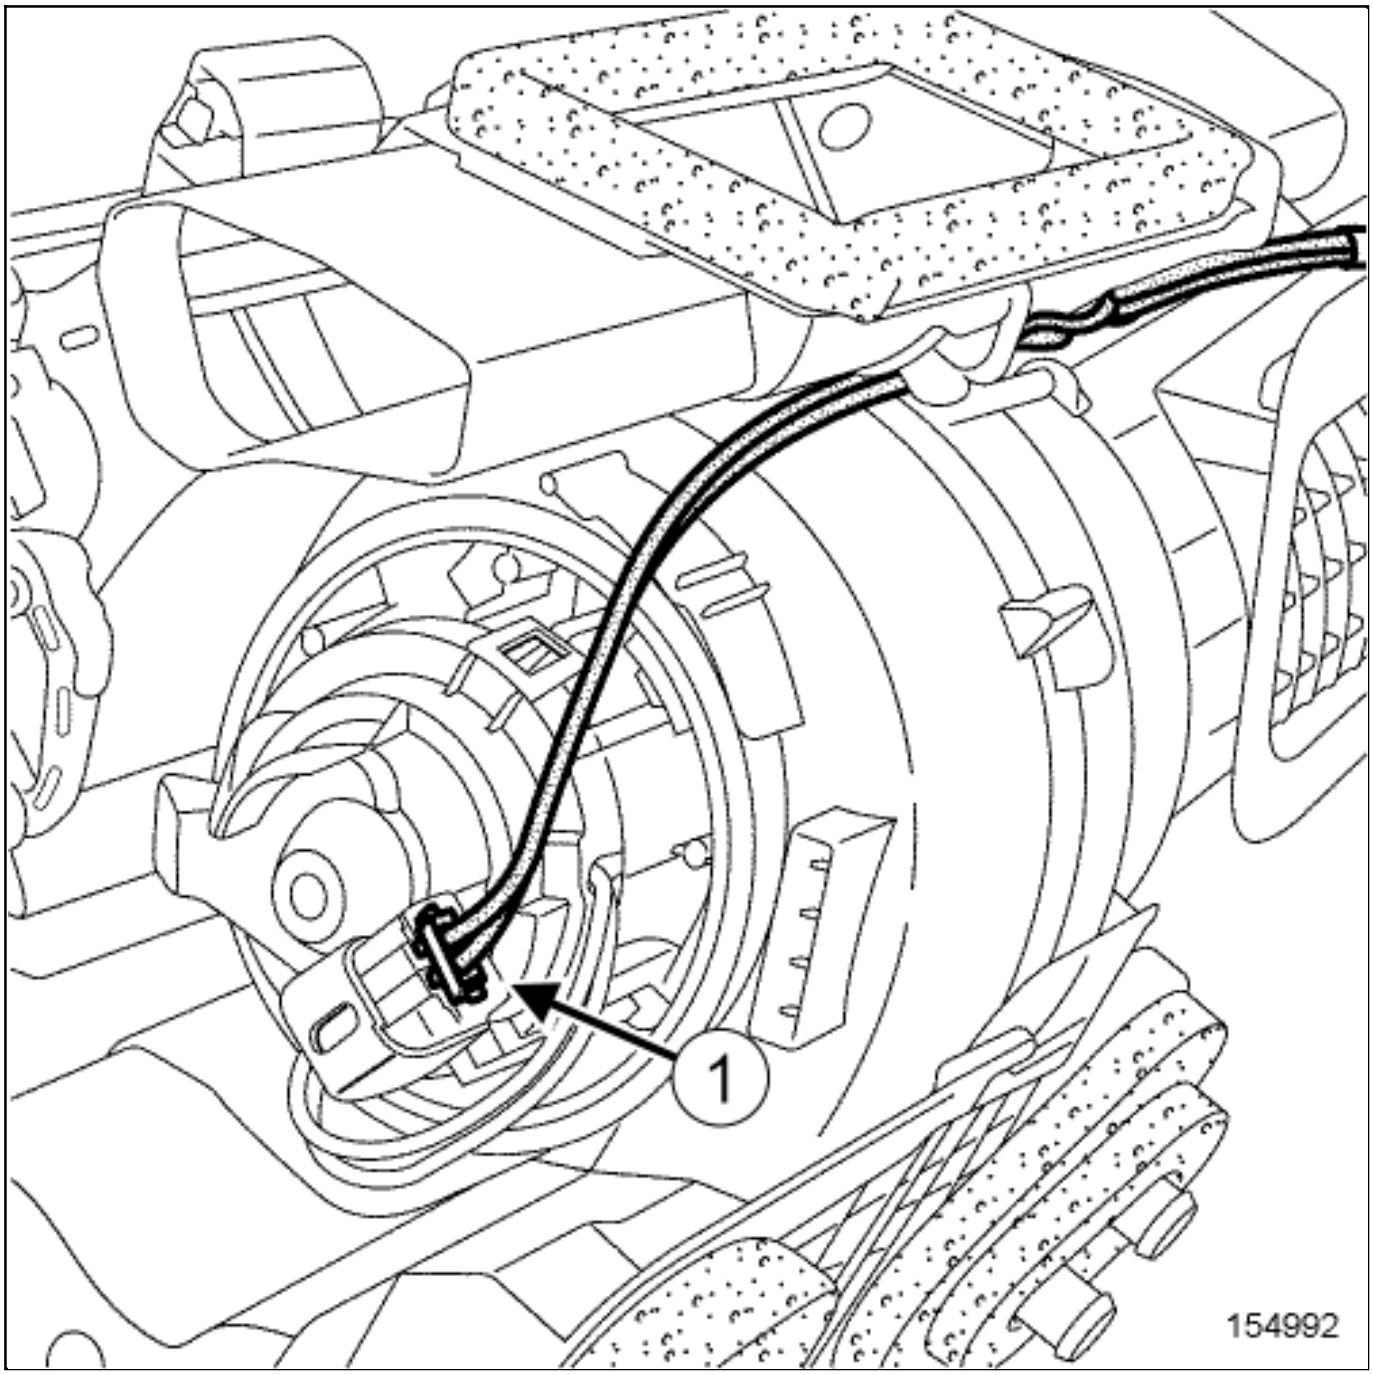
Proceed in the reverse order to removal.

FAN ASSEMBLY: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

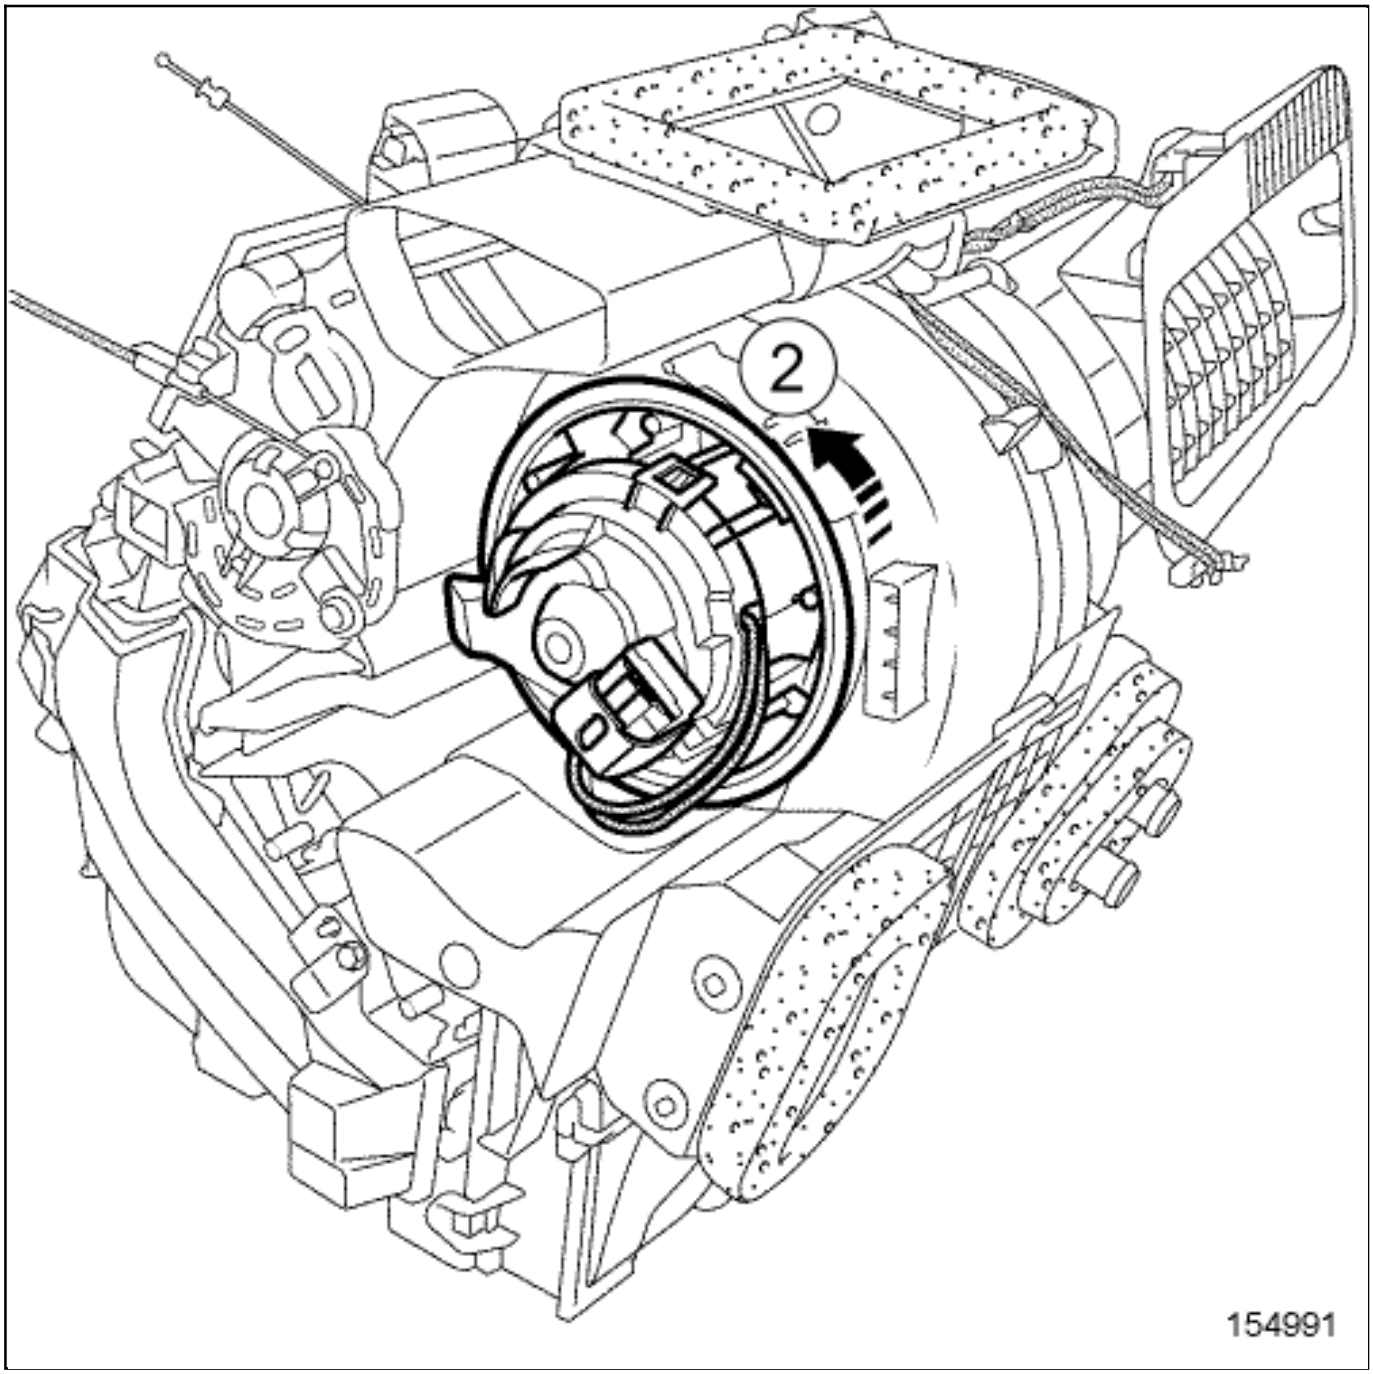
Note:

There are two types of fitting for the distribution unit: Valéo and Denso.



REMOVAL

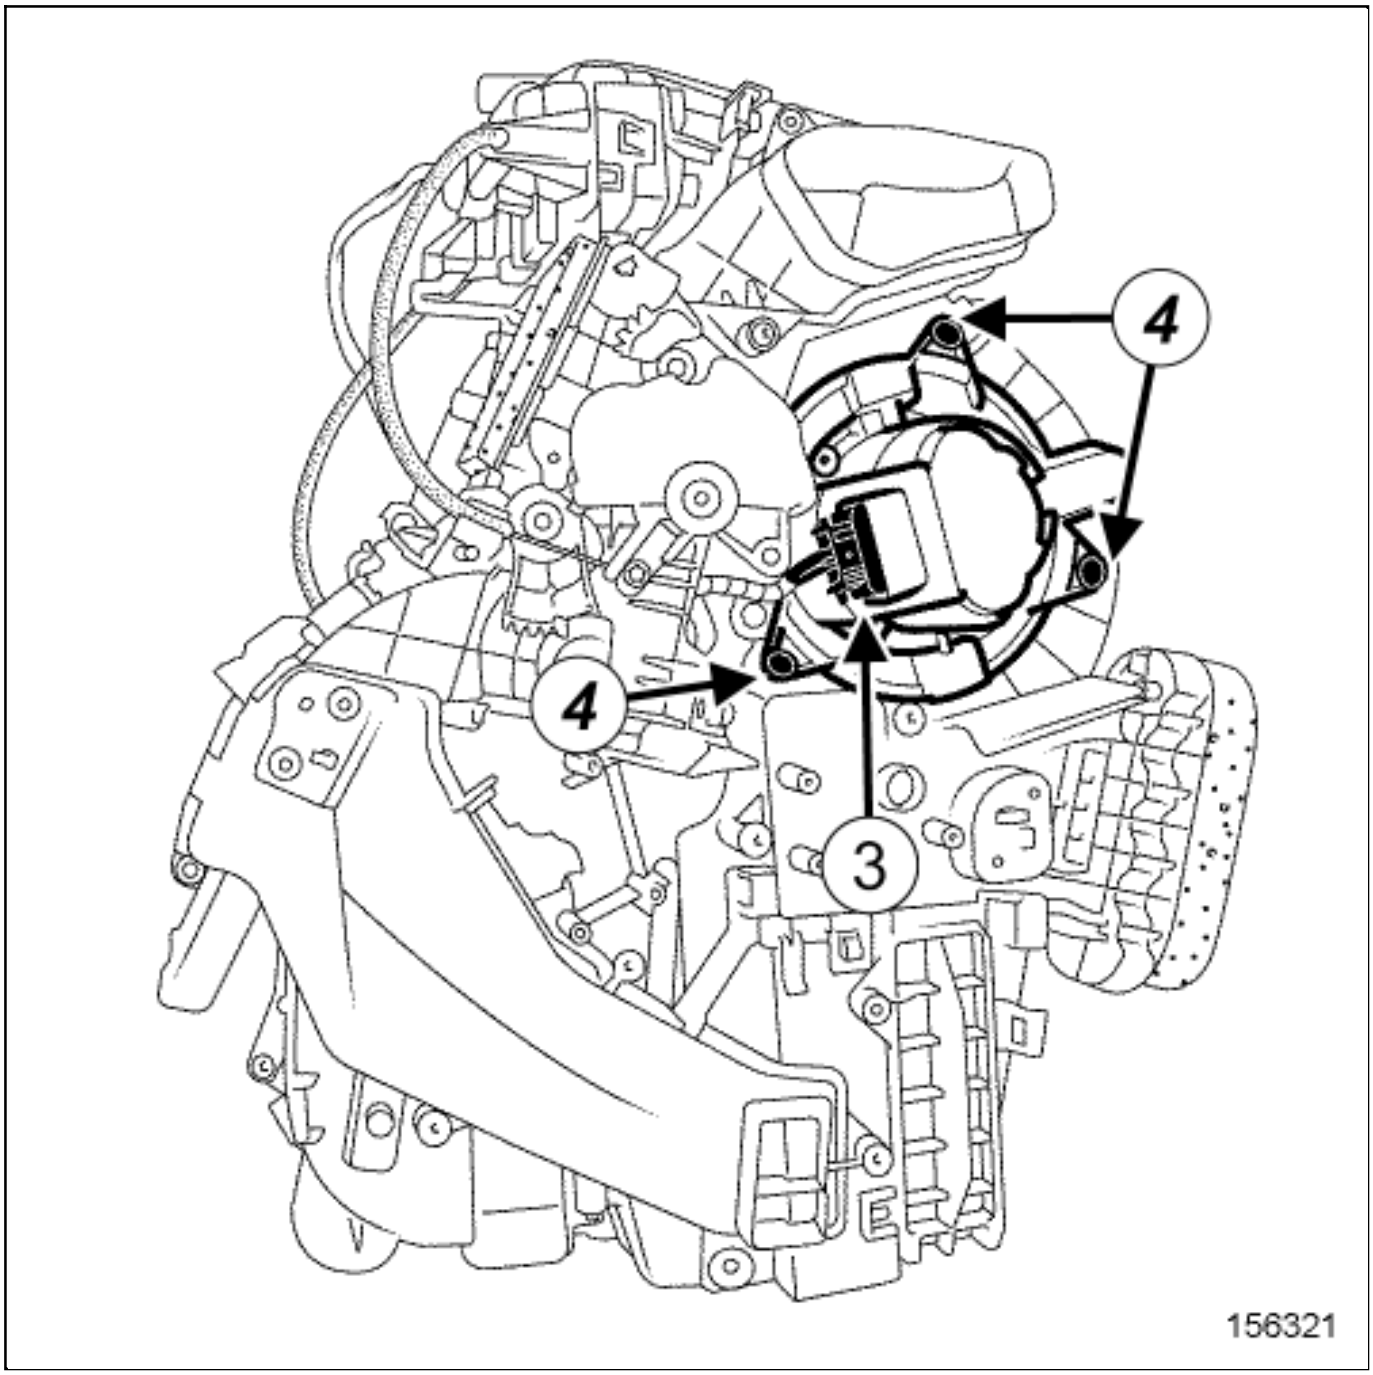
1. REMOVAL PREPARATION OPERATION



- Remove the gloveboxDashboard assembly: Exploded view .

2. REMOVAL OPERATION

1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A VALÉO DISTRIBUTION UNIT



- Disconnect the fan assembly connector(1) .

Turn the fan assembly anti-clockwise(2) .

Remove the fan assembly(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

2- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT

Disconnect the fan assembly connector(3) .

Remove:

- the fan assembly bolts(4) ,
- the fan assembly.

REFITTING

Proceed in the reverse order to removal.

RENAULT

Technical Note 3700A
XXXX

FAULT FINDING LOG

Content: Fault Finding Log

Edition 12 - February 2010 **EDITION ANGLAISE**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current
when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which its vehicles are constructed".

All copyrights reserved by Renault.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is prohibited without the prior written authority of RENAULT.

© Renault s.a.s. 2010

IMPORTANT!

WARNING
All problems involving a system must be subject to thorough diagnostics with the appropriate tools.
The FAULT FINDING LOG is an aid in the fault finding process. It allows you to have and keep a record of the fault finding carried out, and is an essential aspect in communication with the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT, AND FROM THE START OF THE OPERATION.

This log may be requested:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- which must be attached to monitored parts for which reimbursement is requested. It is therefore used to decide whether a reimbursement will be made under warranty and leads to improved analysis of the removed parts.

FAULT FINDING PROCEDURE

Repair Order:

CUSTOMER COMPLAINT	
IDENTIFICATION	

I C M	(Technical and administrative edition)					
Message for the vehicle: ❑ Yes ❑ No				Vehicle under warranty or service contract: ❑ Yes ❑ No		
History relating to the customer complaint: ❑ Yes❑ No				OTS to be carried out:❑ Yes❑ No		
Code	Symptom	Actis fault code	RC	Warnings: Actis solution, Guided fault finding, Recurrence	Normal operation	Context

1. CUSTOMER COMPLAINT CONFIRMED	❑ Yes ❑ No Symptom code confirmed ❑ Yes ❑ No

2. PRIOR TO FAULT FINDING (Visual and audible inspection, battery voltage, fuel level, determine what operates and what does not operate, etc.)	

3. ACTIS CONSULTATION AND CONSULTATION OF TECHLINE INFORMATION BEGIN BY RECORDING THE FAULTS IN THE COMPUTERS IF THE FUNCTION HAS FAULT FINDING.

– If a fault is stored in a computer: apply the occurrence conditions described in the technical documentation. On the CLIP tool, also consult the fault occurrence context and the fault occurrence counter.

Computer number	DEF	Fault designation	STATUS	Present	Stored

OBSERVE THE SAFETY INSTRUCTIONS DESCRIBED IN DIALOGYS FOR THE OPERATIONS YOU ARE PERFORMING.

4. APPLY THE ACTIS SOLUTION OR THE OTS (If an operation concerns the fault)

5. Fault finding without CLIP with Dialogys (*1)	**5. Visu Schéma fault finding (*2)**	**5. Clip Bornéo 2 / ASDE** (See following page)	**5. Bornéo 3 fault finding** (See following page)

(*1): Consult Dialogys, except with Bornéo 3. Examples: Technical Note 6511A for manual gearboxes, Technical Note 3701A for radios, Technical Note 5164A for noises, etc.
(*2): Except with Bornéo 3, for systems not having any fault finding procedure, perform a fault search using Visu Schéma. Examples: the instrument panel lighting dimmer, beam adjustment of headlights other than discharge bulb types, etc.

Workshop Repair Manual		Fault Finding Manual		Technical Notes		Wiring Diagram Note	
Clip Version		Vdiag		Program No.		Software version	

5. BORNEO 2 / ASDE (Without guided fault finding)	
INTERPRETATION OF FAULTS (If no fault, carry out a conformity check)	
CONFORMITY CHECK (Statuses / parameters / command modes)	
SEARCH BY CUSTOMER COMPLAINT	

5. BORNEO 3 (With guided fault finding) If the fault is not resolved after dealing with the symptom code, carry out fault finding by dealing with the other DTCs present.	
SYMPTOM CODES USED	
FAULT FINDING ASSOCIATED WITH THE FAULT	
UNGUIDED FAULT FINDING ❑	**FAULT FINDING BY FUNCTION ❑**

IF THE FAULT FINDING LASTS 2 HOURS, PLEASE SEND A CIR TO THE TECHLINE.

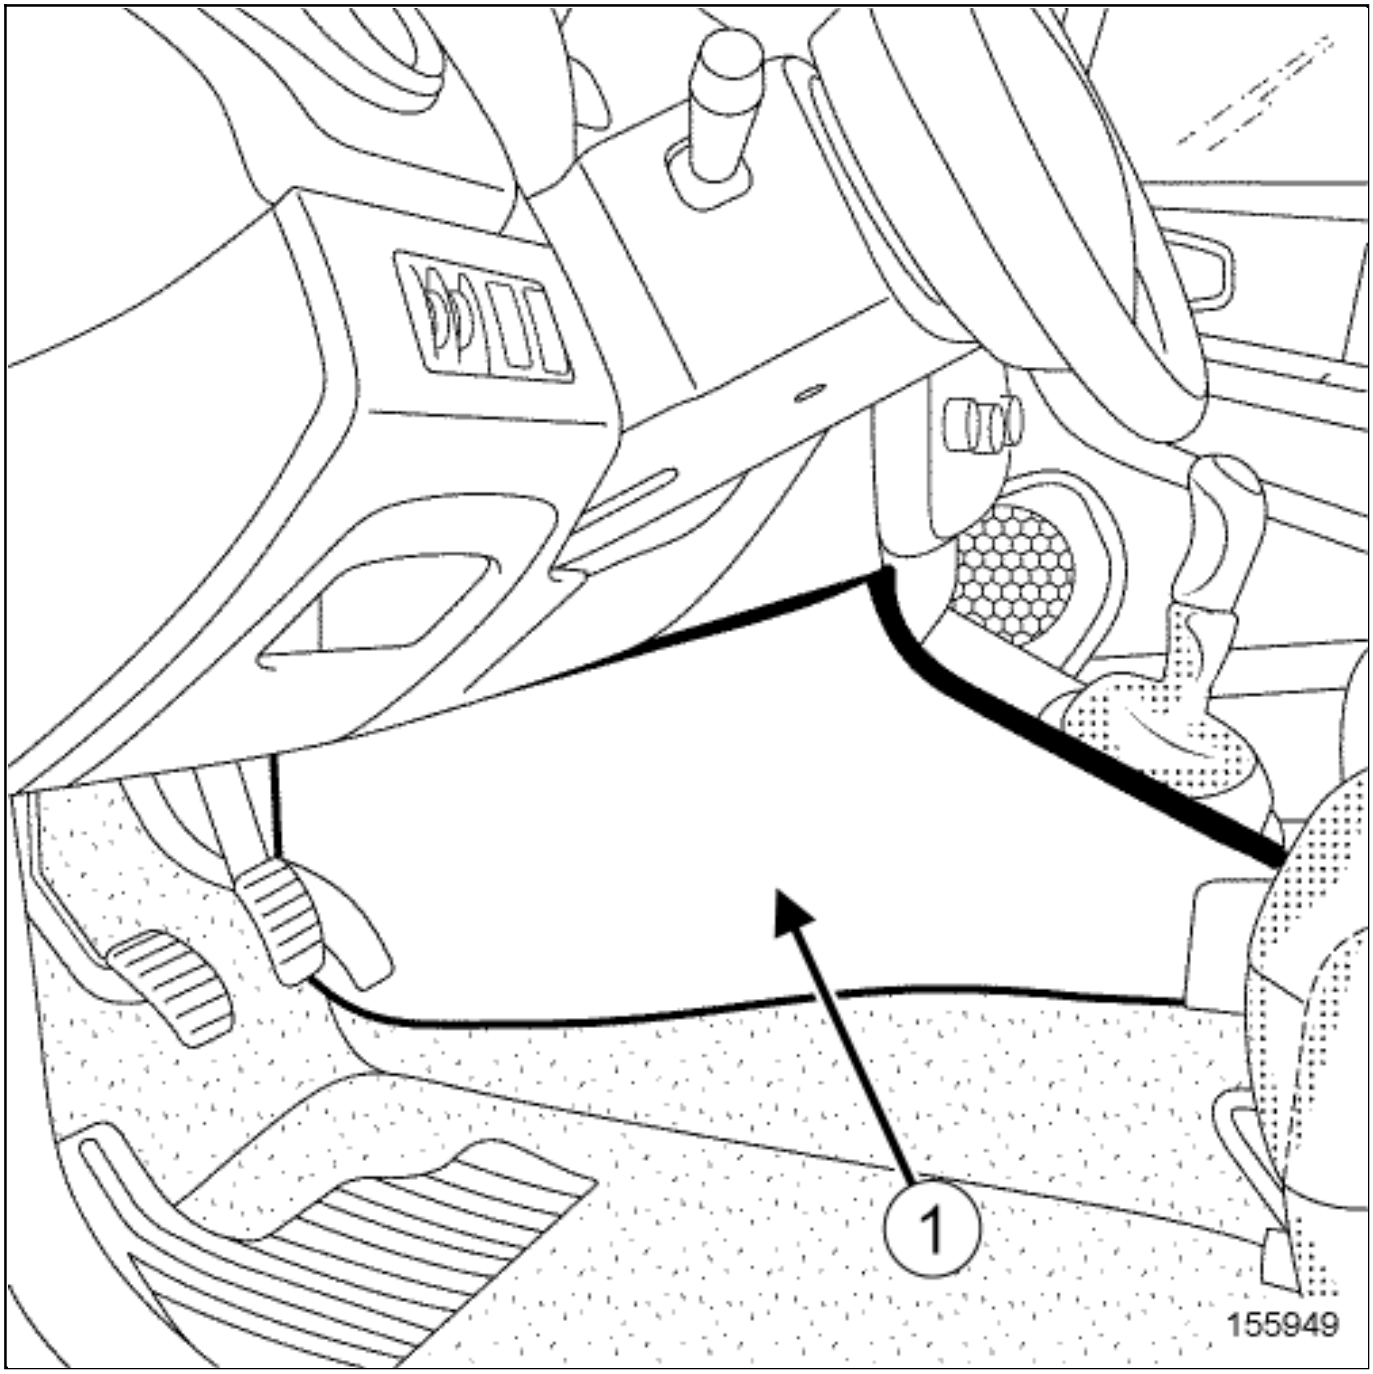
6. IDENTIFY THE ORIGIN OF THE FAULT (Check everything that could have generated the fault. Example: An oxidised terminal causes an electric malfunction, but the oxidation is due to moisture, which must be eliminated.)

7. BEFORE REPAIR (With guided fault finding: Apply the before repair procedure / Without guided fault finding: consult the repair procedures to determine the computer configurations to record, the measurements to be made on the part before dismantling, etc.)
8. REPAIR (Perform the repairs, applying the manufacturer's procedures, the tightening torques. etc.)
9. AFTER REPAIR (With guided fault finding: Apply the after repair procedure / without guided fault finding: Configure the computers, carry out system programming procedures, etc.)

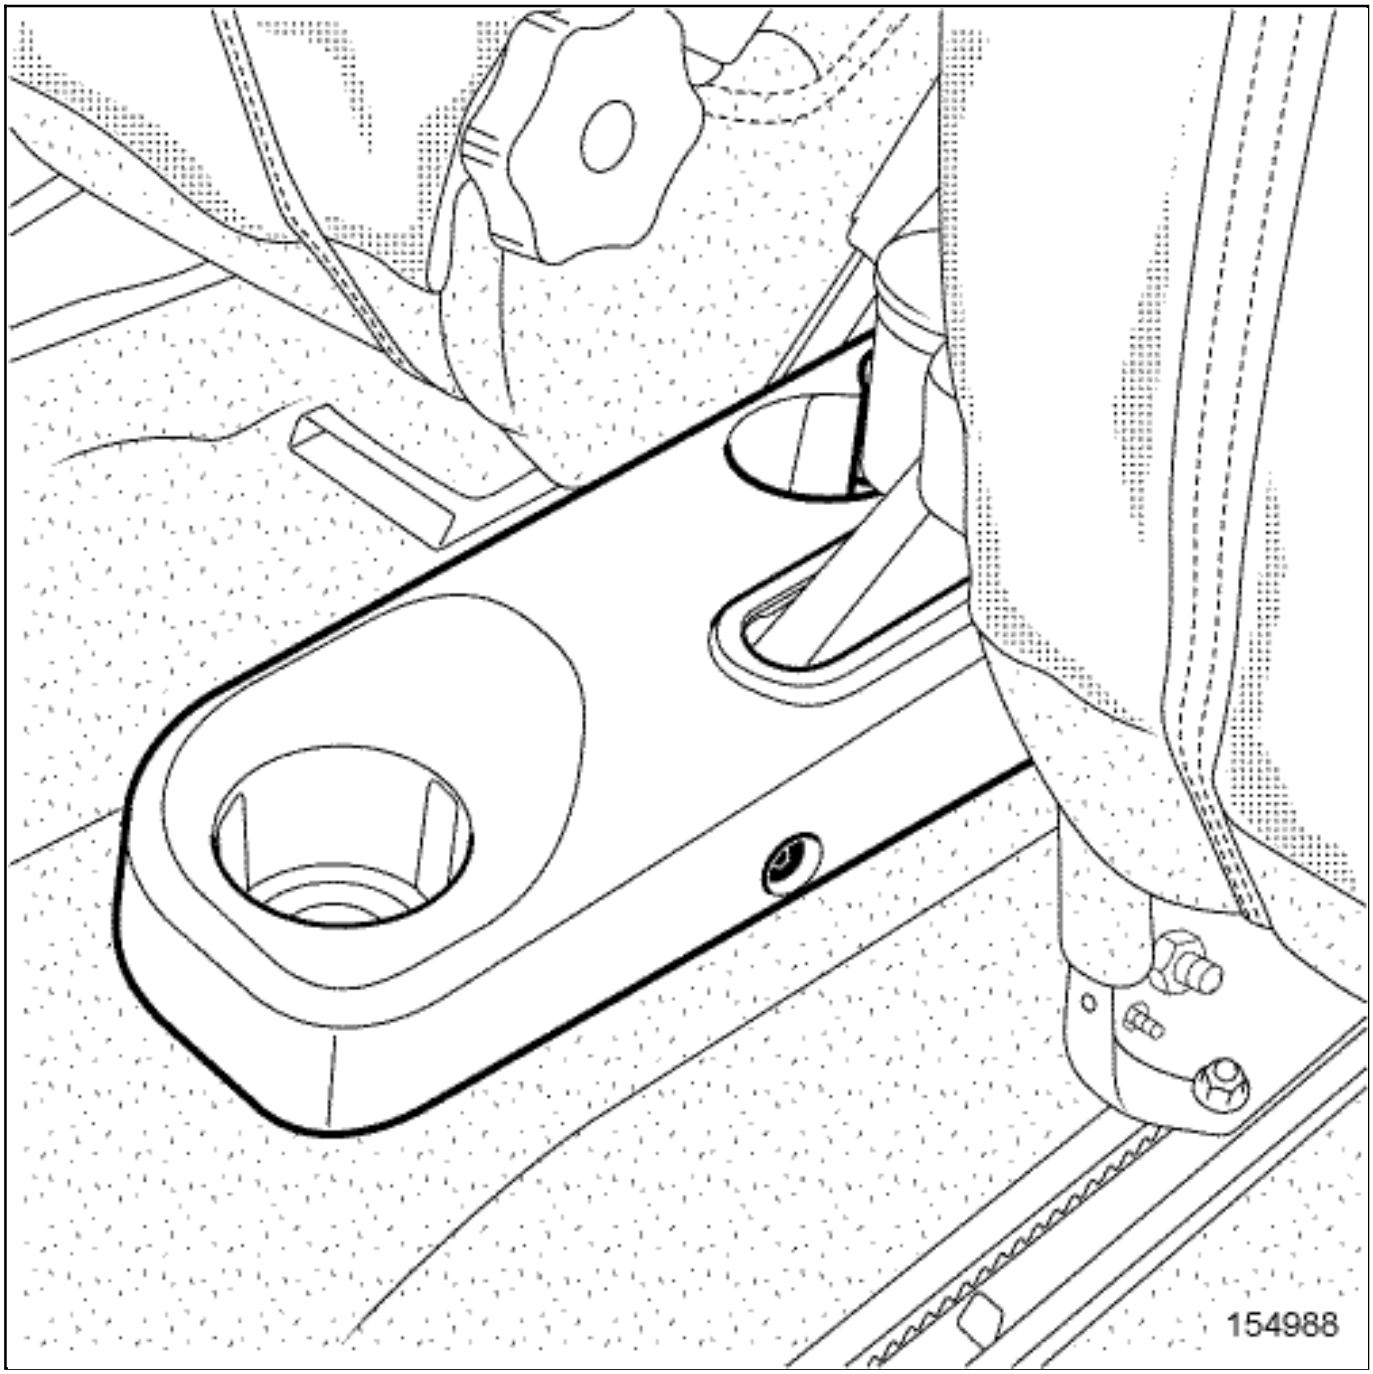
10. CONFIRM THE REPAIR	❑ The system is working properly	❑ No warning light illuminated
❑ No fault in the computers	❑ Radio operational	❑ Windows and sunroof initialised
❑ Customer notified	❑ Test certificate completed	❑ 'Alert CIR' for fault investigation or for the improvement of fault finding procedures

WARRANTY (information to be submitted)		
❑ Describe the cause of the fault	❑ Associated symptom code	❑ Approval granted
❑ Approval of fault search time		

Notes:



FLOOR CARPET: REMOVAL - REFITTING



Locations and specifications (tightening torques, parts to always be replaced, etc.)Rear bench seat assembly: Exploded view ,Front seat assembly: Exploded view and(see 71A, Body internal trim, Interior body side trim assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the B-pillar lower trims(see 71A, Body internal trim, Interior body side trim assembly: Exploded view) ,
  - the rear door sill linings(see 71A, Body internal trim, Interior body side trim assembly: Exploded view) ,
  - the front door sill linings(see 71A, Body internal trim, Interior body side trim assembly: Exploded view) ,
  - the front seats completelyFront seat assembly: Exploded view ,
  - the bench seat baseRear bench seat assembly: Exploded view .
  - the bench seatbackRear bench seat assembly: Exploded view .
  - the rear seat belt buckles Rear bench seat assembly: Exploded view .

1
155949

Remove:

- the centre console side trims(1) ,
- the centre console.

Remove the centre front panel lower trim**Dashboard assembly: Exploded view**

2. REMOVAL OPERATION

Remove:

- the floor carpet clips,
- the mounting supports of the rear bench seat base.

Remove the floor carpet.

REFITTING

Proceed in the reverse order to removal.

Repair-70x02x02x09-01x37-1-24-1.xml

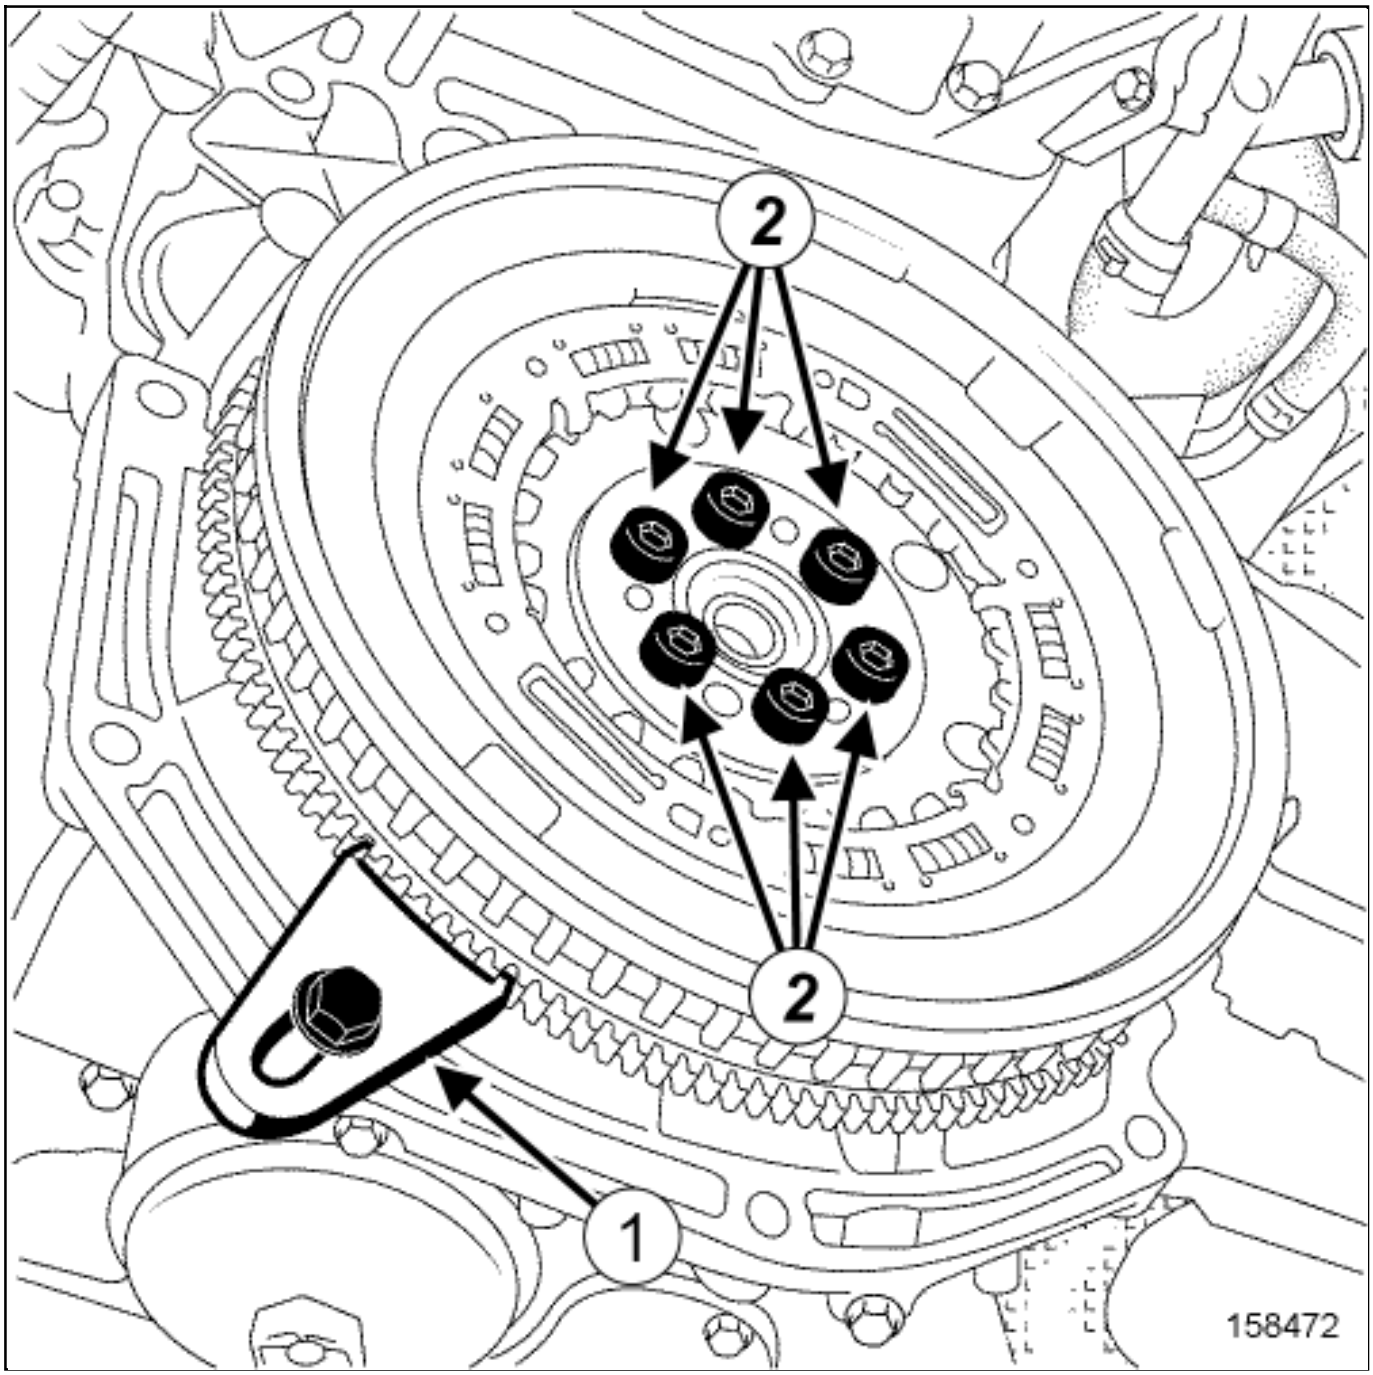
XSL version : 3.02 du 22/07/11

FLYWHEEL: REMOVAL - REFITTING

Special tooling required	
Flywheel locking tool.	Mot. 1431
Set of Torx bits: short male TP55 and female E20	Mot. 1959

parts always to be replaced:
Flywheel bolts

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove the automatic gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

2. REMOVAL OPERATION

Lock the flywheel using toolFlywheel locking tool.(Mot. 1431) (1) .

Remove (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) :

- the engine flywheel bolts(2) using the toolSet of Torx bits: short male TP55 and female E20(Mot. 1959) ,
- the engine flywheel,

the toolFlywheel locking tool.(Mot. 1431) .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Flywheel bolts .

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the flywheel bearing face if reusing,
- the crankshaft bearing face.

Check:

- the condition of the flywheel and its seal,
- that the centring dowel is in place.

2. REFITTING OPERATION

Position the engine flywheel fitted with new engine flywheel bolts(see 10A, Engine and cylinder block assembly , Cylinder block assembly: Exploded view) .

Refit the toolFlywheel locking tool.(Mot. 1431) .

Torque tighten the engine flywheel bolts(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Remove the toolFlywheel locking tool.(**Mot. 1431**) .

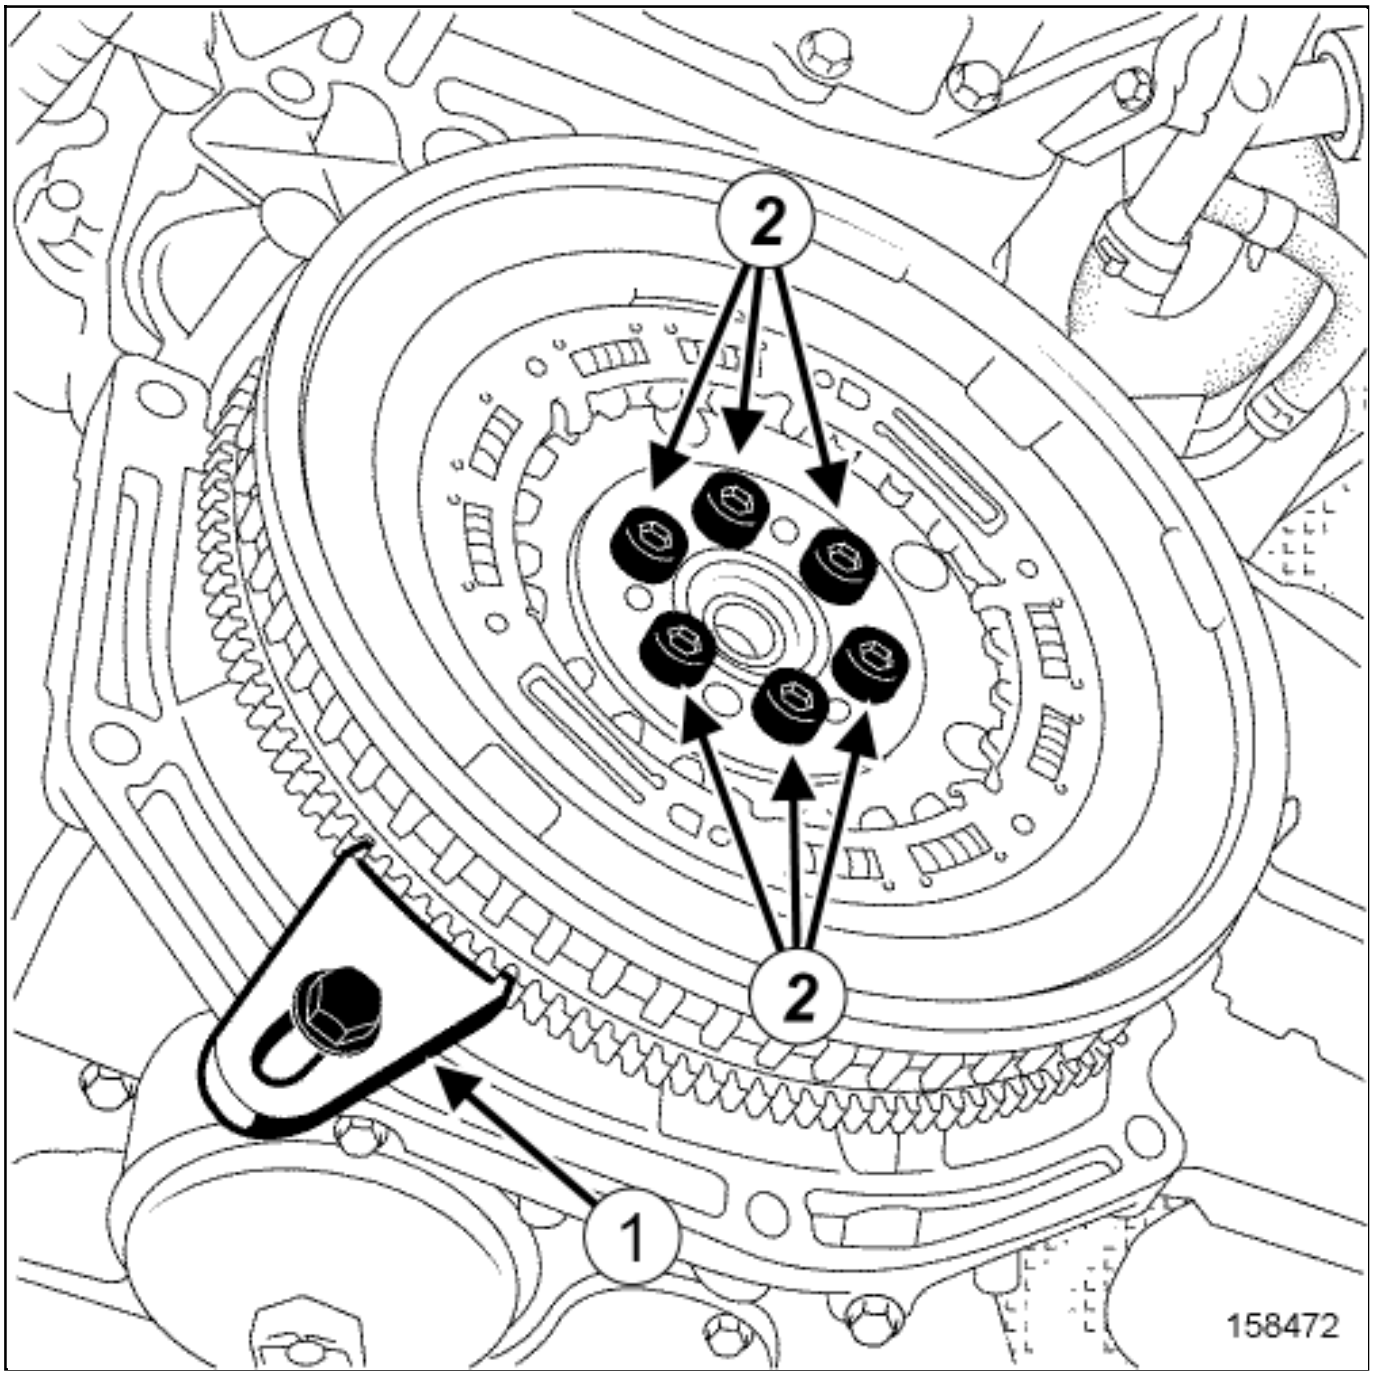
Proceed in the reverse order to removal.

FLYWHEEL: REMOVAL - REFITTING

Special tooling required	
Flywheel locking tool.	Mot. 1431
Set of Torx bits: short male TP55 and female E20	Mot. 1959

parts always to be replaced:
Flywheel bolts

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove the automatic gearboxAutomatic gearbox: Removal - Refitting .

2. REMOVAL OPERATION

- Lock the flywheel using the toolFlywheel locking tool.(Mot. 1431) (1) .
- Remove (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) :
  - the engine flywheel bolts(2) using the toolSet of Torx bits: short male TP55 and female E20(Mot. 1959) ,
  - the engine flywheel,
  - the toolFlywheel locking tool.(Mot. 1431) .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Flywheel bolts .

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the flywheel bearing face if reusing,
- the crankshaft bearing face.

Check:

- the condition of the flywheel and its seal,
- that the centring dowel is in place.

2. REFITTING OPERATION

Position the engine flywheel on the cylinder block(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Refit the new engine flywheel bolts(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Fit the toolFlywheel locking tool.(Mot. 1431) on the cylinder block.

Torque tighten the engine flywheel bolts using the toolSet of Torx bits: short male TP55 and female E20 (Mot. 1959) (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Remove the toolFlywheel locking tool.(Mot. 1431) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

FORK SHAFT RING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306

Equipment required
roll pin punch

parts always to be replaced:
Fork shaft bearing

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

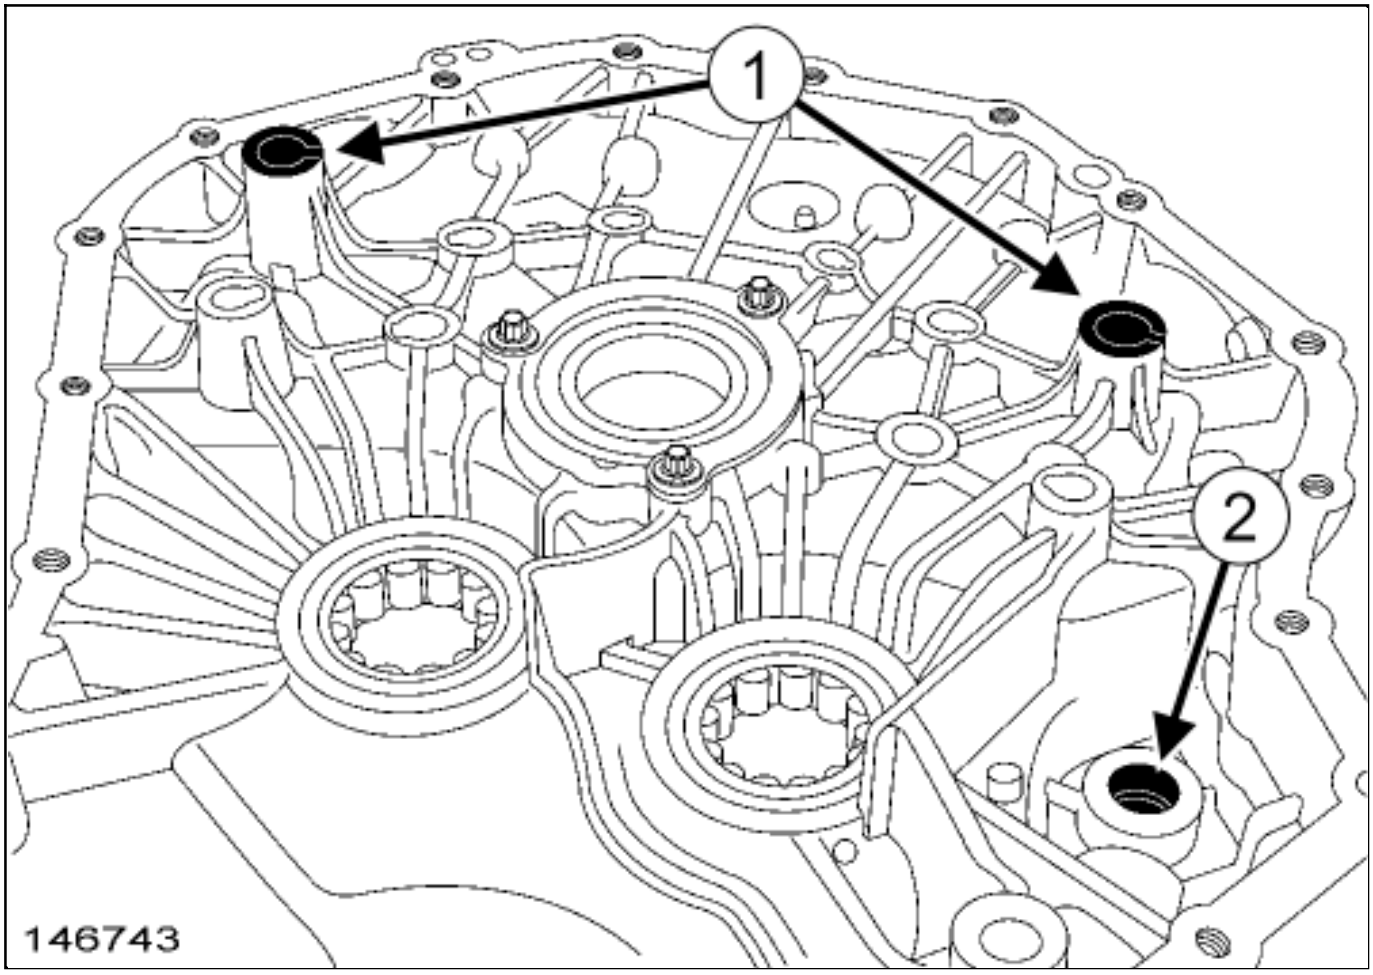
REMOVAL

1. REMOVAL PREPARATION OPERATION

1- FORK SHAFT AND PARKING BRAKE RINGS OF THE MECHANISM HOUSING:

Remove:

- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,



- the speed sensors Speed sensor: Removal - Refitting ,
- the gear engaged sensor Gear engaged sensor: Removal - Refitting ,
- the automatic transmission computer Automatic gearbox computer : Removal - Refitting ,
- the mechanism housing (see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting) .

2- FORK SHAFT AND PARKING BRAKE RINGS OF THE CLUTCH HOUSING:

Remove:

- the automatic gearbox Automatic gearbox: Removal - Refitting ,
- the automatic gearbox wiring Automatic gearbox wiring: Removal - Refitting ,
- the speed sensors Speed sensor: Removal - Refitting ,
- the gear engaged sensor Gear engaged sensor: Removal - Refitting ,
- the automatic transmission computer Automatic gearbox computer : Removal - Refitting ,
- the clutch pressure plate Clutch: Removal - Refitting ,
- the clutch actuator motors Clutch actuator motor: Removal - Refitting ,
- the clutch thrust bearing Clutch thrust bearing: Removal - Refitting ,
- the clutch forks Clutch fork: Removal - Refitting ,
- the input shaft lip seal Input shaft lip seal: Removal - Refitting ,
- the clutch housing (see 23A, Automatic gearbox , Clutch housing: Removal - Refitting) .

2. OPERATION FOR REMOVAL OF PART CONCERNED

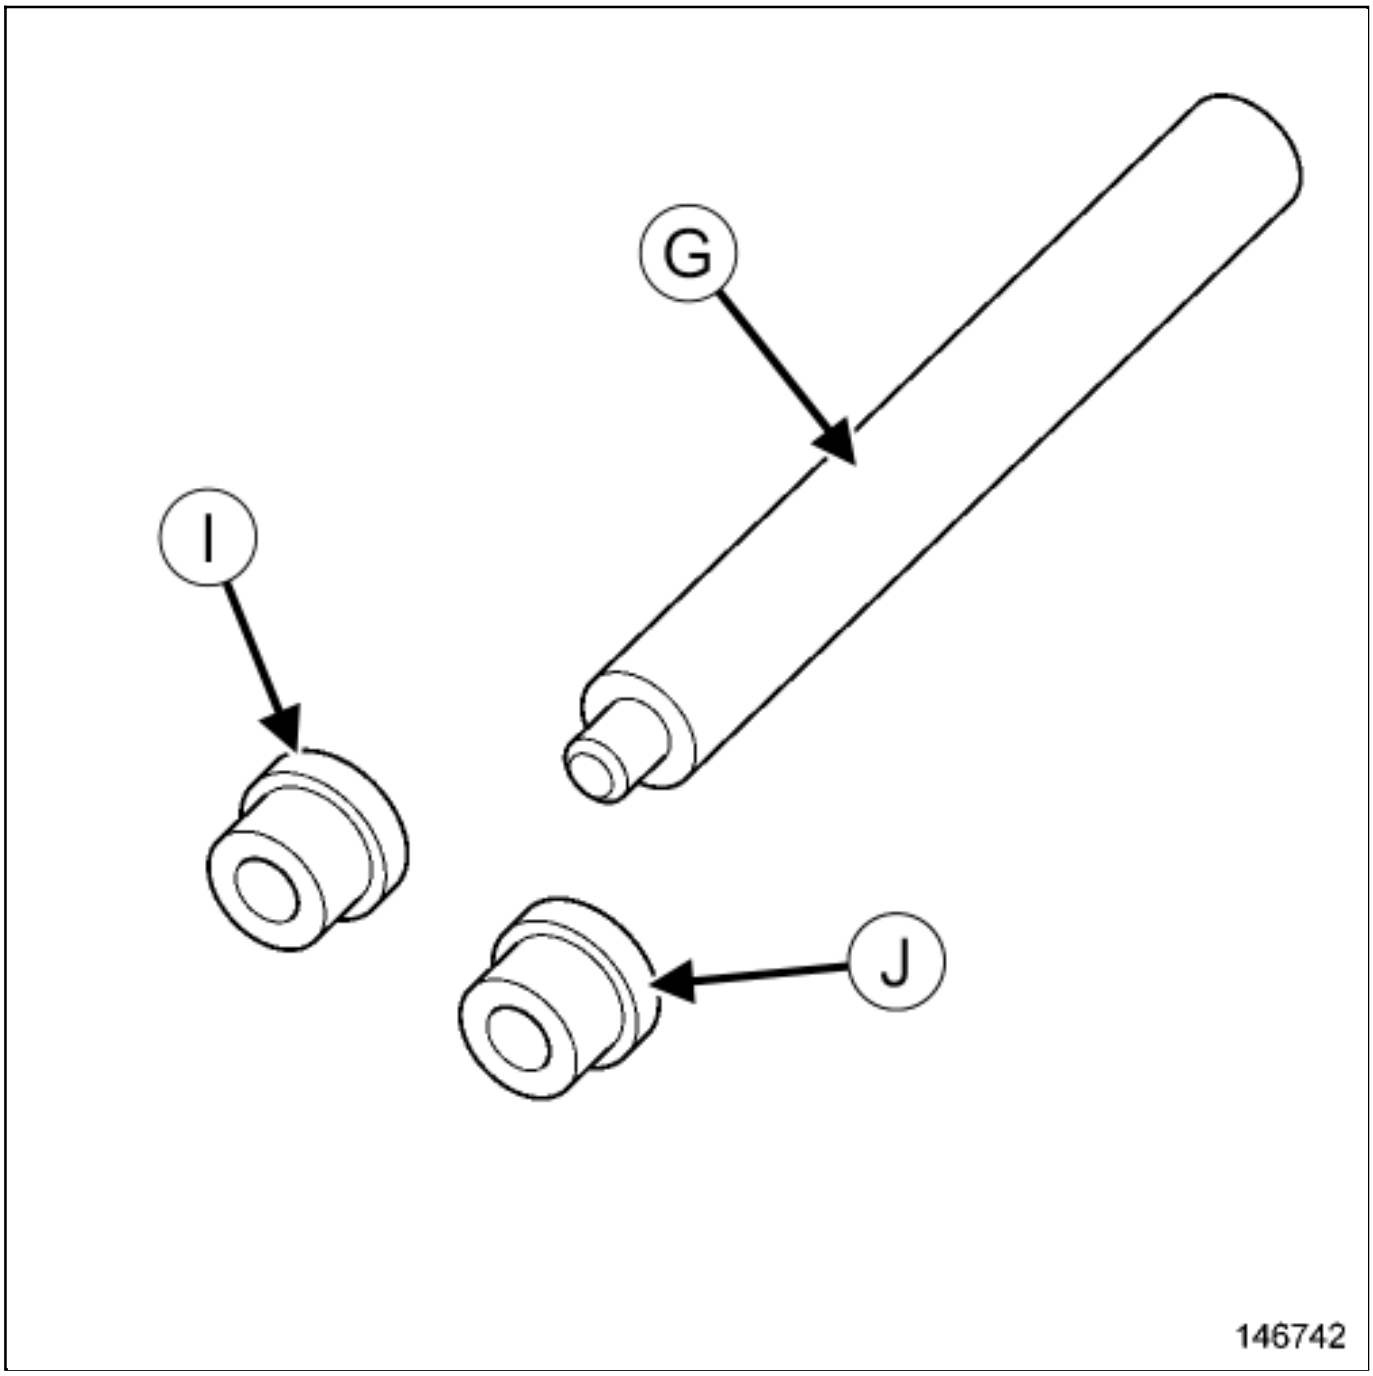
Note:

Take care not to damage the mating faces of the rings. Position the drift punch close to the slot to make extraction easier.

Remove:

- the fork shaft rings of the mechanism housing and clutch housing using a roll pin punch(1) ,
- the parking shaft rings using an inertia extractor(2) .

REFITTING



1. REFITTING PREPARATION OPERATION

Clean all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

parts always to be replaced:  Fork shaft bearing  .

Always replace the parking shaft ring.

2. REFITTING OPERATION FOR PART CONCERNED

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

FRONT AIR INLET DUCT: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Air distribution circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:

- the dashboardDashboard assembly: Exploded view ,
- the front left-hand side air duct(see 61A, Heating, Air distribution circuit assembly: Exploded view) .

2. REMOVAL OPERATION

Disconnect (see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) :

- the connector of the modulate variation of speed of fan assembly for passenger compartment (only for Valéo fitting),
- the recirculation motor connector,
- the toxicity sensor connector if equipped,
- the distribution unit supply connector.

Remove the front air inlet duct(see 61A, Heating, Air distribution circuit assembly: Exploded view) .

In the event of replacement, remove(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) :

- the modulate variation of speed of fan assembly for passenger compartment (only for Valéo fitting),

- the recirculation motor,
- the toxicity sensor if equipped.

REFITTING

Proceed in the reverse order to removal.

Repair-30x02x01x28-01x37-1-3-1.xml

XSL version : 3.02 du 22/07/11

FRONT AXLE ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 31A, Front axle components, Front axle components: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

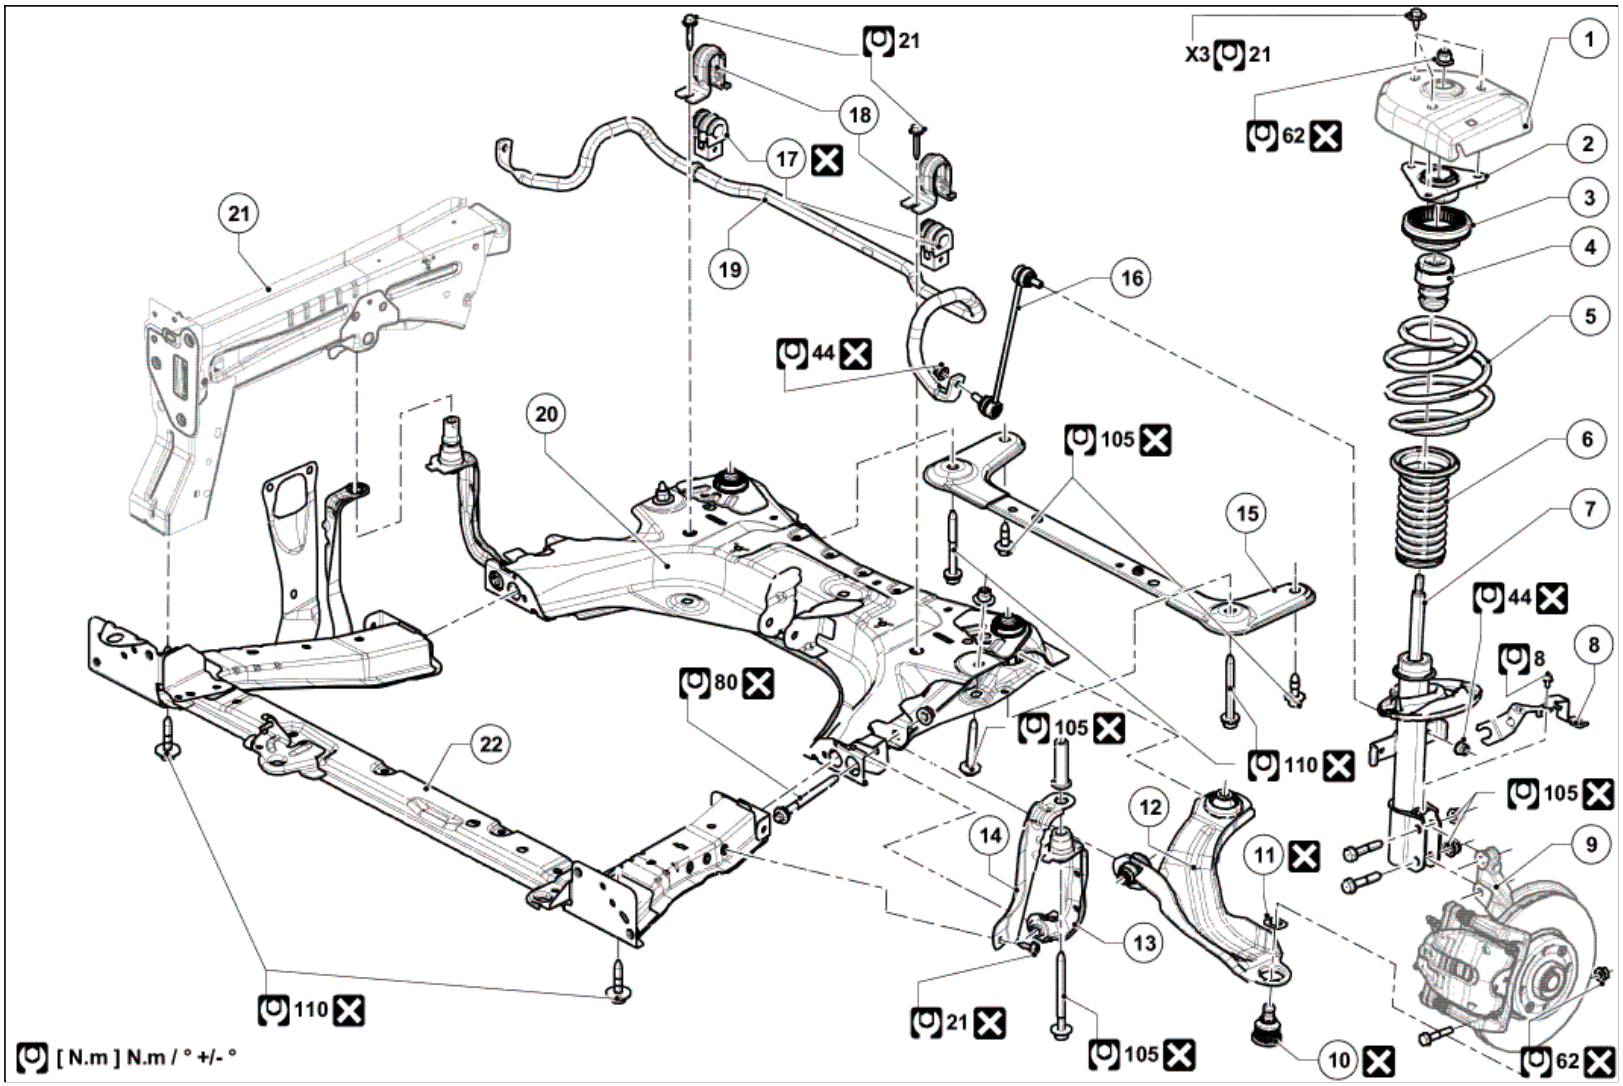


Illustration key: Description

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Shock absorber upper cup	
2	Filter block	
3	Rotating stop	
4	Impact stop	
5	Spring	(see 31A, Front axle components, Front shock absorber and spring: Removal - Refitting)
6	Shock absorber gaiter	
7	Front shock absorber	(see 31A, Front axle components, Front shock absorber and spring: Removal - Refitting)
8	Flexible brake pipe support bracket	
9	Front driveshaft hub carrier	(see 31A, Front axle components, Front hub carrier assembly: Exploded view)
10	Lower ball joint	(see 31A, Front axle components, Front driveshaft lower arm ball joint: Removal - Refitting)
11	Lower ball joint protector	
12	Front driveshaft lower arm	Ball-joint uncoupling tool : Use
13	Subframe tie-rod	
14	Radiator mounting cross member tie-rod	
15	Subframe rear cross member	
16	Front anti-roll bar tie-rod	
17	Anti-roll bar bush	
18	Anti-roll bar clamp	
19	Front anti-roll bar	
20	Front axle subframe	
21	Front side member	
22	Radiator mounting cross member	

FRONT AXLE COMPONENTS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Do not press on the brake pedal during work on the brake system.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

Brake fluid is highly corrosive. Ensure any brake fluid spilt on parts of the vehicle is cleaned off.

In case of incorrect handling, the brake fluid can cause serious injury and damage. Follow the manufacturer's instructions for brake fluid.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Clean around the braking system with brake cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

3. GENERAL RECOMMENDATIONS

1- BEARING, HUB CARRIER

CAUTION

In order to prevent irreversible damage to the front hub bearing:

- Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
- Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target on the bearing.

When removing a hub, it is essential to replace the bearing with a new one.

CAUTION

Do not press the bearing's internal bush so as to avoid damaging the bearing (very high shrink-fitting force).

It is essential to check the condition of the hub and bearing surface and the hub carrier bore before refitting the bearing.

- Use surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products) to clean:

- the new bearing's internal and external surfaces which are in contact with the hub carrier and the hub,
- the hub carrier surfaces in contact with the new bearing,
- the hub surfaces in contact with the new bearing.

Always check the surface condition of the hub carrier before refitting the "hub - bearing" assembly.

Clean the surfaces of the hub carrier that are in contact with the "hub - bearing" assembly using surface cleaner **Vehicle: Parts and consumables for the repair** (04B, Consumables - Products)

Replace any component whose contact surfaces have deep scratches or cracks.

2-SUSPENSION SPRING

When replacing the spring, ensure that the positioning and orientation of the spring and the tool cups are correct.

When replacing a spring, always replace the spring on the opposite side.

If a shock absorber is replaced, the shock absorber on the opposite side must also be replaced.

Check that the spring compressor tool is operating correctly.

In the interests of safety, do not leave a spring compressed in the spring compressor tool.

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks and tightening or positioning clamps should be equipped with rubber or plastic in order to avoid damage on the springs.

It is recommended to replace springs if:

- the paint is damaged,
- there are dents on the spring.

They are not usually symmetrical in shape and care should be taken to assemble them the right way round. This can be done using the position of the coloured markings.

CAUTION

To prevent the suspension spring from prematurely breaking, do not damage the anti-corrosion protection.

3- ANTI-ROLL BAR

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks, tightening or positioning clamps should be equipped with rubber or plastic parts so as to avoid damaging the anti roll bar.

It is recommended to replace the anti-roll bar if:

- the paint is damaged,
- the anti-roll bar has dents in it.

Note:

the most critical and sensitive zones are in the elbows.

4- FRONT AXLE

CAUTION

To prevent any damage, do not use the lower arm as support for the lifting system.

Check the condition of all the gaiters before refitting. Always replace any damaged components with new ones.

FRONT AXLE COMPONENTS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Do not press on the brake pedal during work on the brake system.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

Brake fluid is highly corrosive. Ensure any brake fluid spilt on parts of the vehicle is cleaned off.

In case of incorrect handling, the brake fluid can cause serious injury and damage. Follow the manufacturer's instructions for brake fluid.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Clean around the braking system with brake cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

3. GENERAL RECOMMENDATIONS

1- BEARING, HUB CARRIER

CAUTION

In order to prevent irreversible damage to the front hub bearing:

- Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
- Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target on the bearing.

When removing a hub, it is essential to replace the bearing with a new one.

CAUTION

Do not press the bearing's internal bush so as to avoid damaging the bearing (very high shrink-fitting force).

It is essential to check the condition of the hub and bearing surface and the hub carrier bore before refitting the bearing.

- Use surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products) to clean:

- the new bearing's internal and external surfaces which are in contact with the hub carrier and the hub,
- the hub carrier surfaces in contact with the new bearing,
- the hub surfaces in contact with the new bearing.

Always check the surface condition of the hub carrier before refitting the "hub - bearing" assembly.

Clean the surfaces of the hub carrier that are in contact with the "hub - bearing" assembly using surface cleaner **Vehicle: Parts and consumables for the repair** (04B, Consumables - Products)

Replace any component whose contact surfaces have deep scratches or cracks.

2-SUSPENSION SPRING

When replacing the spring, ensure that the positioning and orientation of the spring and the tool cups are correct.

When replacing a spring, always replace the spring on the opposite side.

If a shock absorber is replaced, the shock absorber on the opposite side must also be replaced.

Check that the spring compressor tool is operating correctly.

In the interests of safety, do not leave a spring compressed in the spring compressor tool.

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks and tightening or positioning clamps should be equipped with rubber or plastic in order to avoid damage on the springs.

It is recommended to replace springs if:

- the paint is damaged,
- there are dents on the spring.

They are not usually symmetrical in shape and care should be taken to assemble them the right way round. This can be done using the position of the coloured markings.

CAUTION

To prevent the suspension spring from prematurely breaking, do not damage the anti-corrosion protection.

3- ANTI-ROLL BAR

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks, tightening or positioning clamps should be equipped with rubber or plastic parts so as to avoid damaging the anti roll bar.

It is recommended to replace the anti-roll bar if:

- the paint is damaged,
- the anti-roll bar has dents in it.

Note:

the most critical and sensitive zones are in the elbows.

4- FRONT AXLE

CAUTION

To prevent any damage, do not use the lower arm as support for the lifting system.

Check the condition of all the gaiters before refitting. Always replace any damaged components with new ones.

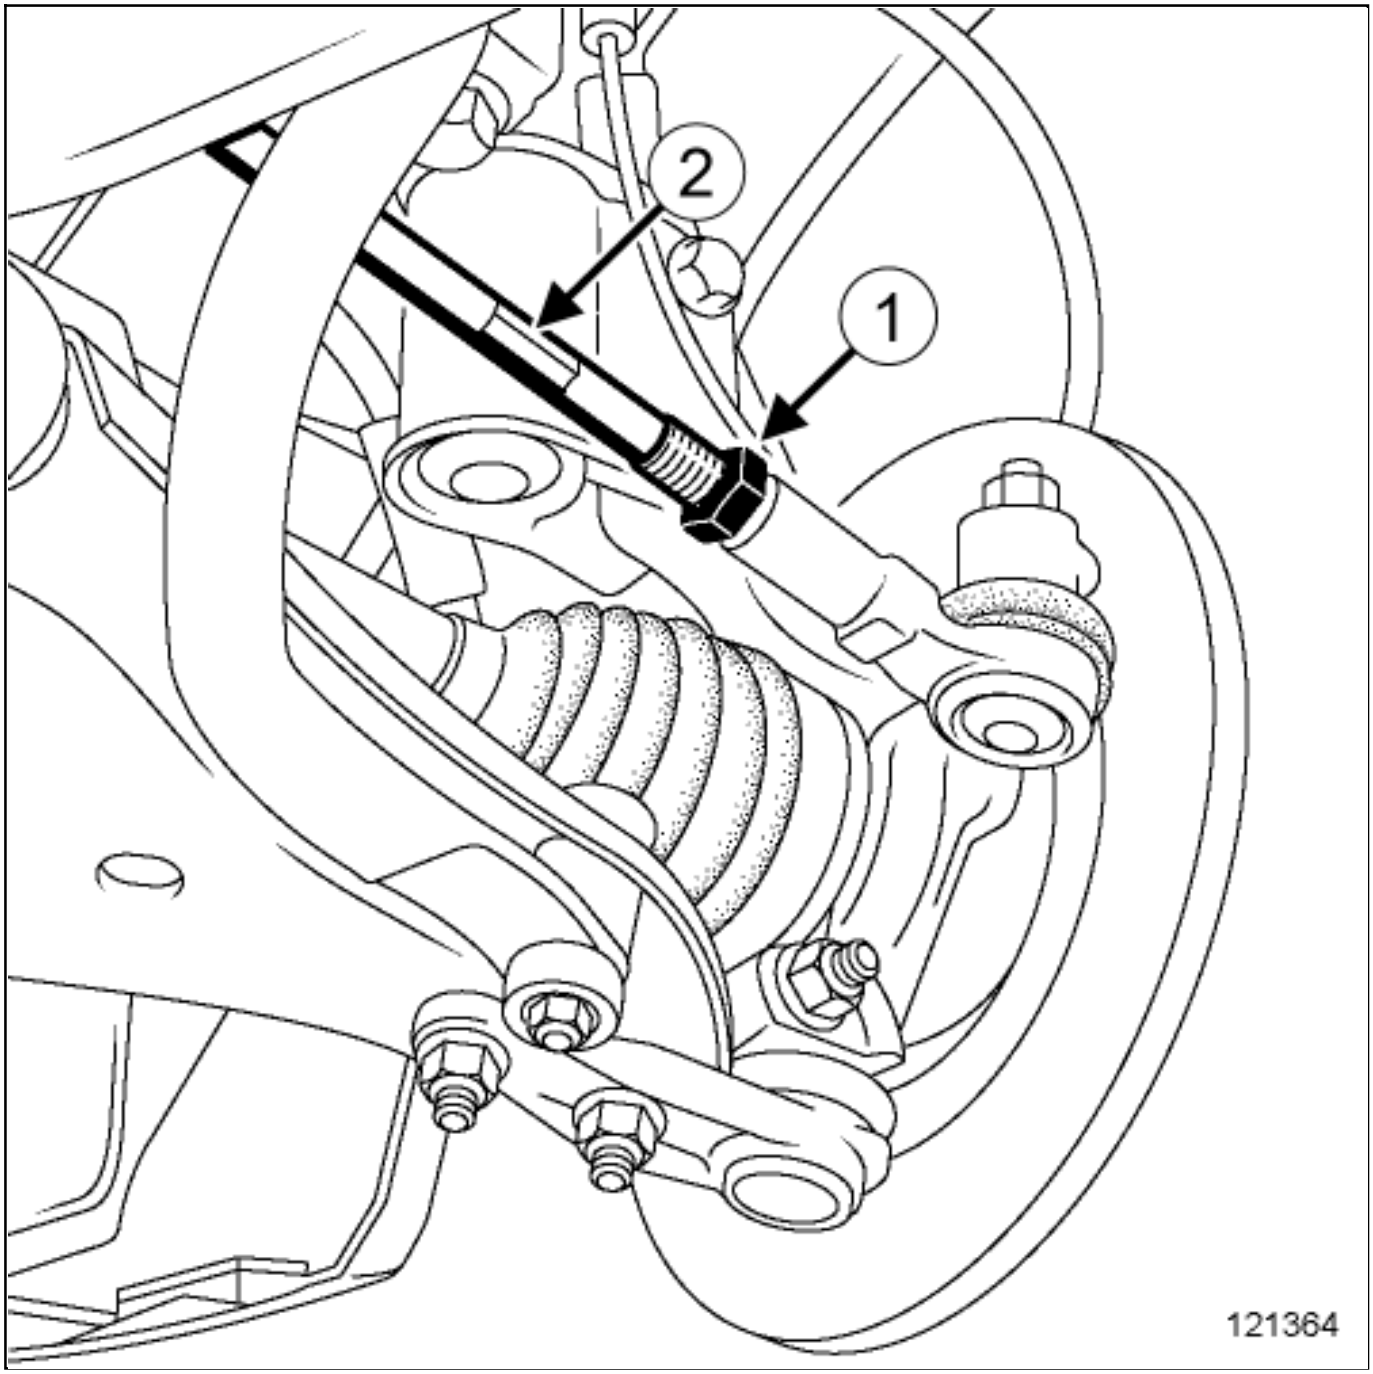
FRONT AXLE SYSTEM: ADJUSTMENT

Equipment required
Diagnostic tool
flywheel immobiliser

1. PREPARATION FOR ADJUSTMENT

Note:

- Throughout the axle assembly checking and adjustment process:
  - the Renault card must remain in the reader,
  - do not press the "START" button.



- Check the geometry (see 30A, General information, Axle assemblies: Check) .

2. ADJUSTMENT OPERATION

1- WHEEL ALIGNMENT

- Set the wheels straight ahead.

- Lock the steering wheel using a flywheel immobiliser.

Loosen the wheel alignment adjustment lock nut(1) .

Turn the track rod sleeve(2) to the required value.

2- CASTOR ANGLE

Not adjustable.

3- CAMBER

Not adjustable.

4- PIVOT

Not adjustable.

Calibrate the steering wheel angle sensor.

Apply the after repair procedure:

- connect the Diagnostic tool,
- select "Braking computer",
- go to repair mode,
- display the "Before/after repair procedure" for the computer selected,
- select "Steering wheel angle sensor" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

FRONT AXLE SYSTEM: ADJUSTMENT

XSL version : 3.02 du 22/07/11

FRONT BRAKE CALLIPER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Brake calliper piston return tool.	Fre. 1190-01

Equipment required
pedal press
indelible pencil

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 31A, Front axle components, Front brake calliper assembly: Exploded view) and(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 31A, Front axle components, Front axle components: Precautions for the repair) ,

Vehicle: Precautions for the repair .

CAUTION

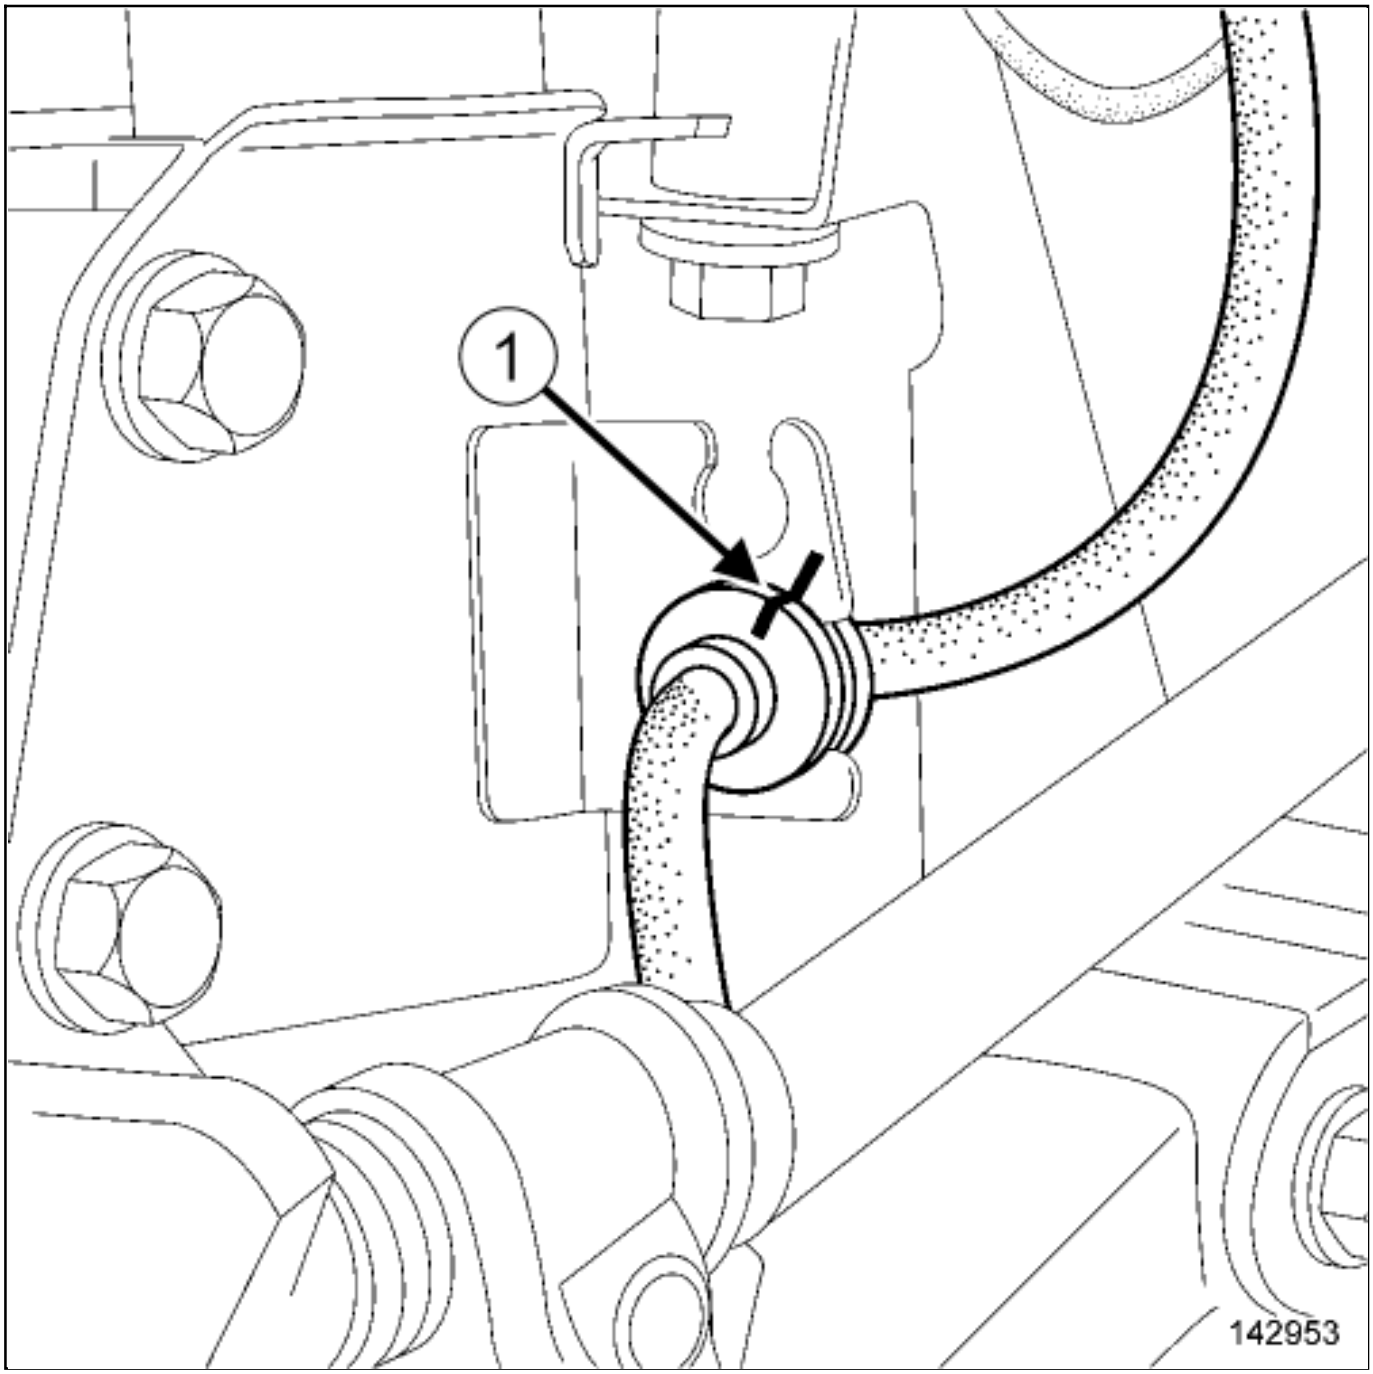
In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

REMOVAL



1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Position a pedal press on the brake pedal to limit the outflow of brake fluid.

Unlock the steering column.

Remove the front wheels (see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

- Set the wheels straight ahead.

- Mark the position of the front brake hose cap(1) on the shock absorber base using an indelible pencil .

- Unclip the front brake hose cap(1) from the shock absorber base.

2. REMOVAL OPERATION

Undo the front brake hose union on the front brake calliper(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

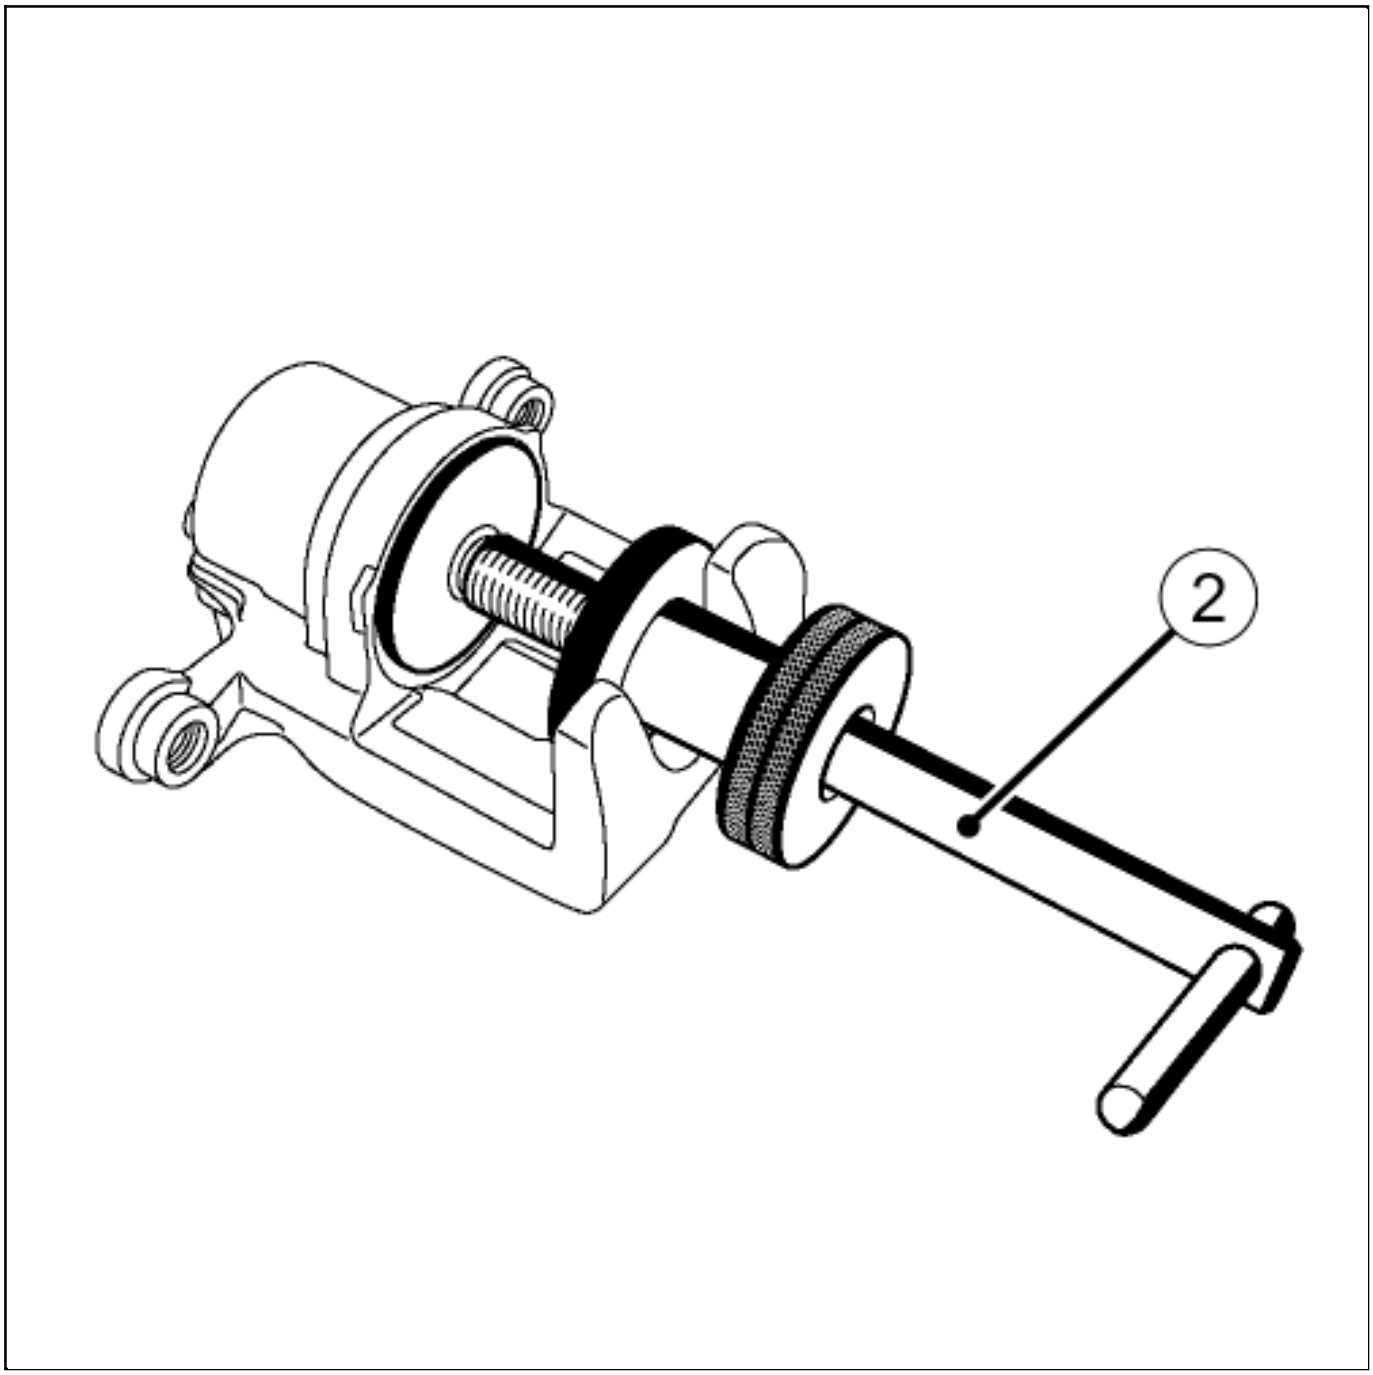
Remove (see 31A, Front axle components, Front brake calliper assembly: Exploded view) :

- the guide pin bolt caps of the front brake calliper,
- the guide pin bolts of the front brake calliper,
- the front brake calliper from the front brake calliper mounting,
- the front brake hose union from the front brake calliper,
- the front brake calliper.

REFITTING

1. REFITTING PREPARATION OPERATION

Check:



- the condition of the calliper gaiter,
- the condition of the calliper if it has any deep scratches or cracks.

Replace any faulty parts(see **Front brake calliper: Repair**) .

Clean using a wire brush and brake cleanerVehicle: Parts and consumables for the repair :

- the front brake calliper,
- the front brake calliper mounting.

2. REFITTING OPERATION

Push back the front brake calliper pistons to the bottom of their housings using the toolBrake calliper piston return tool.(Fre. 1190-01) (2) .

Proceed in the reverse order to removal.

Refit the front hose union on the front brake calliper(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

Set the wheels straight ahead.

Clip the front brake hose cap onto the base of the shock absorber by aligning the marks made at (1) .

Bleed the braking circuitBraking circuit: Bleed .

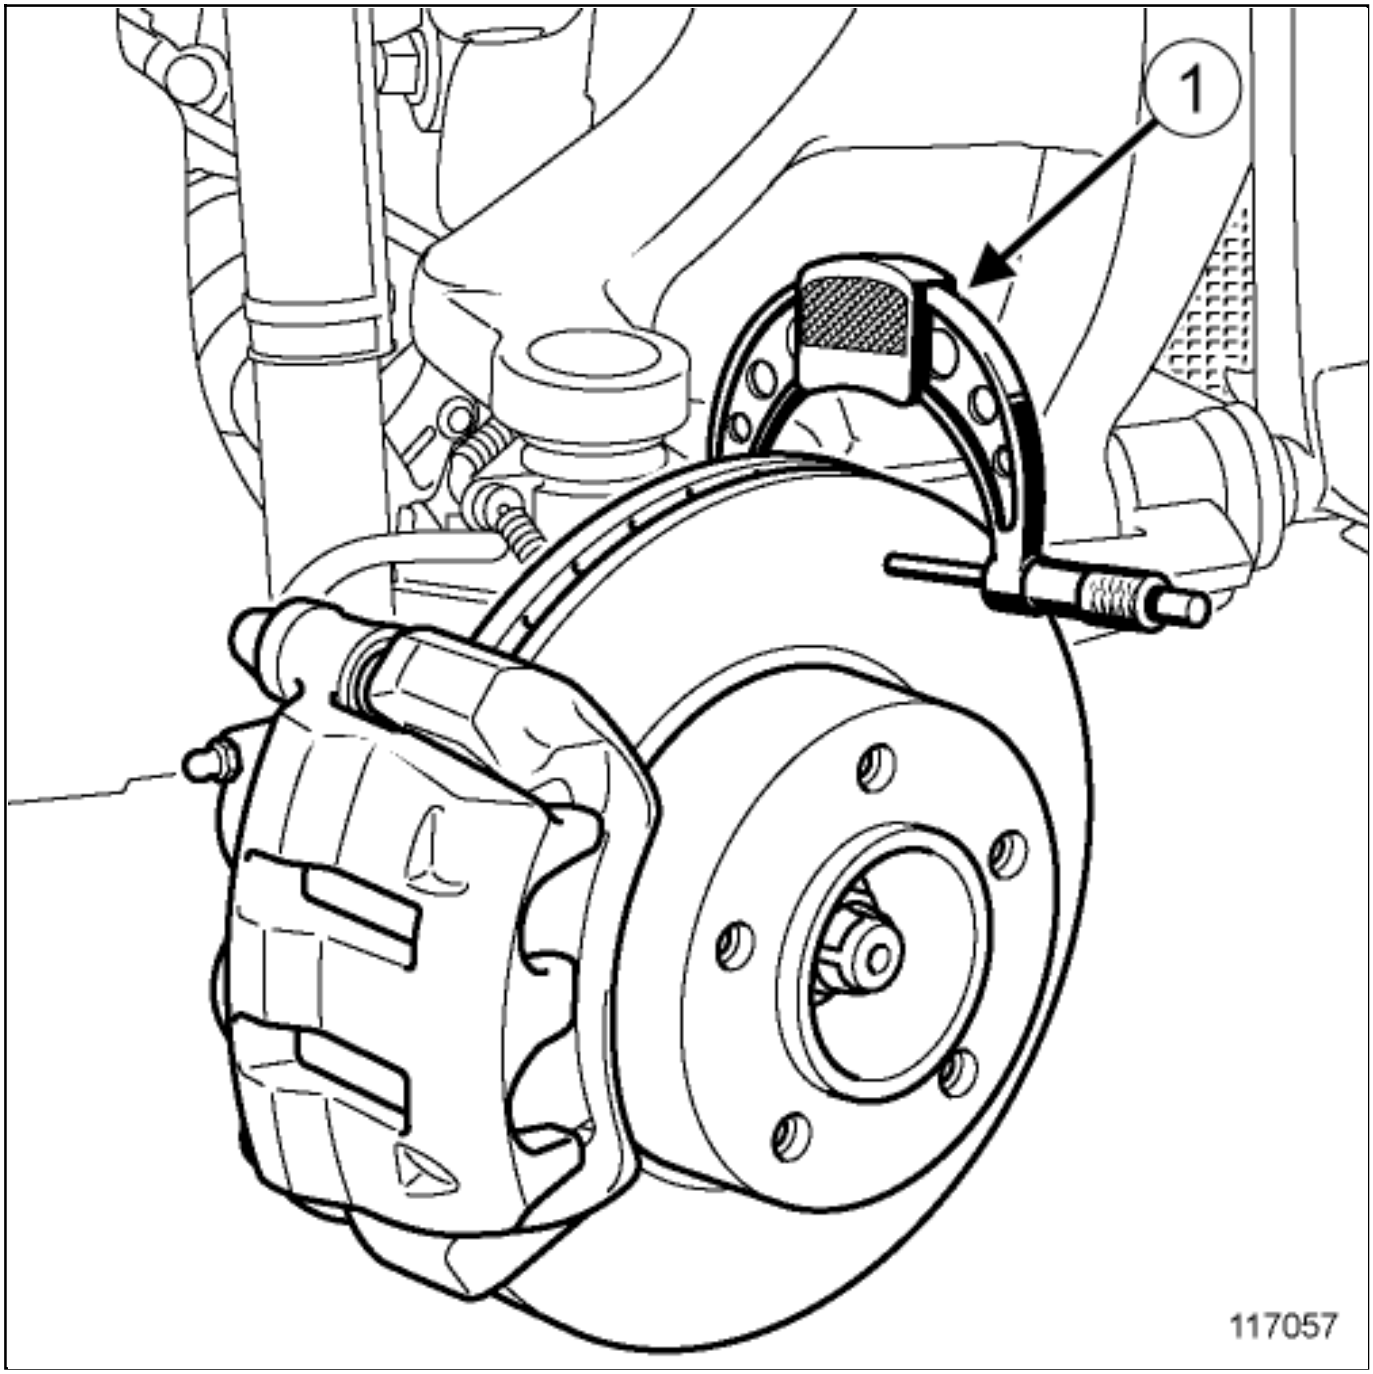
WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

FRONT BRAKE DISC: DESCRIPTION

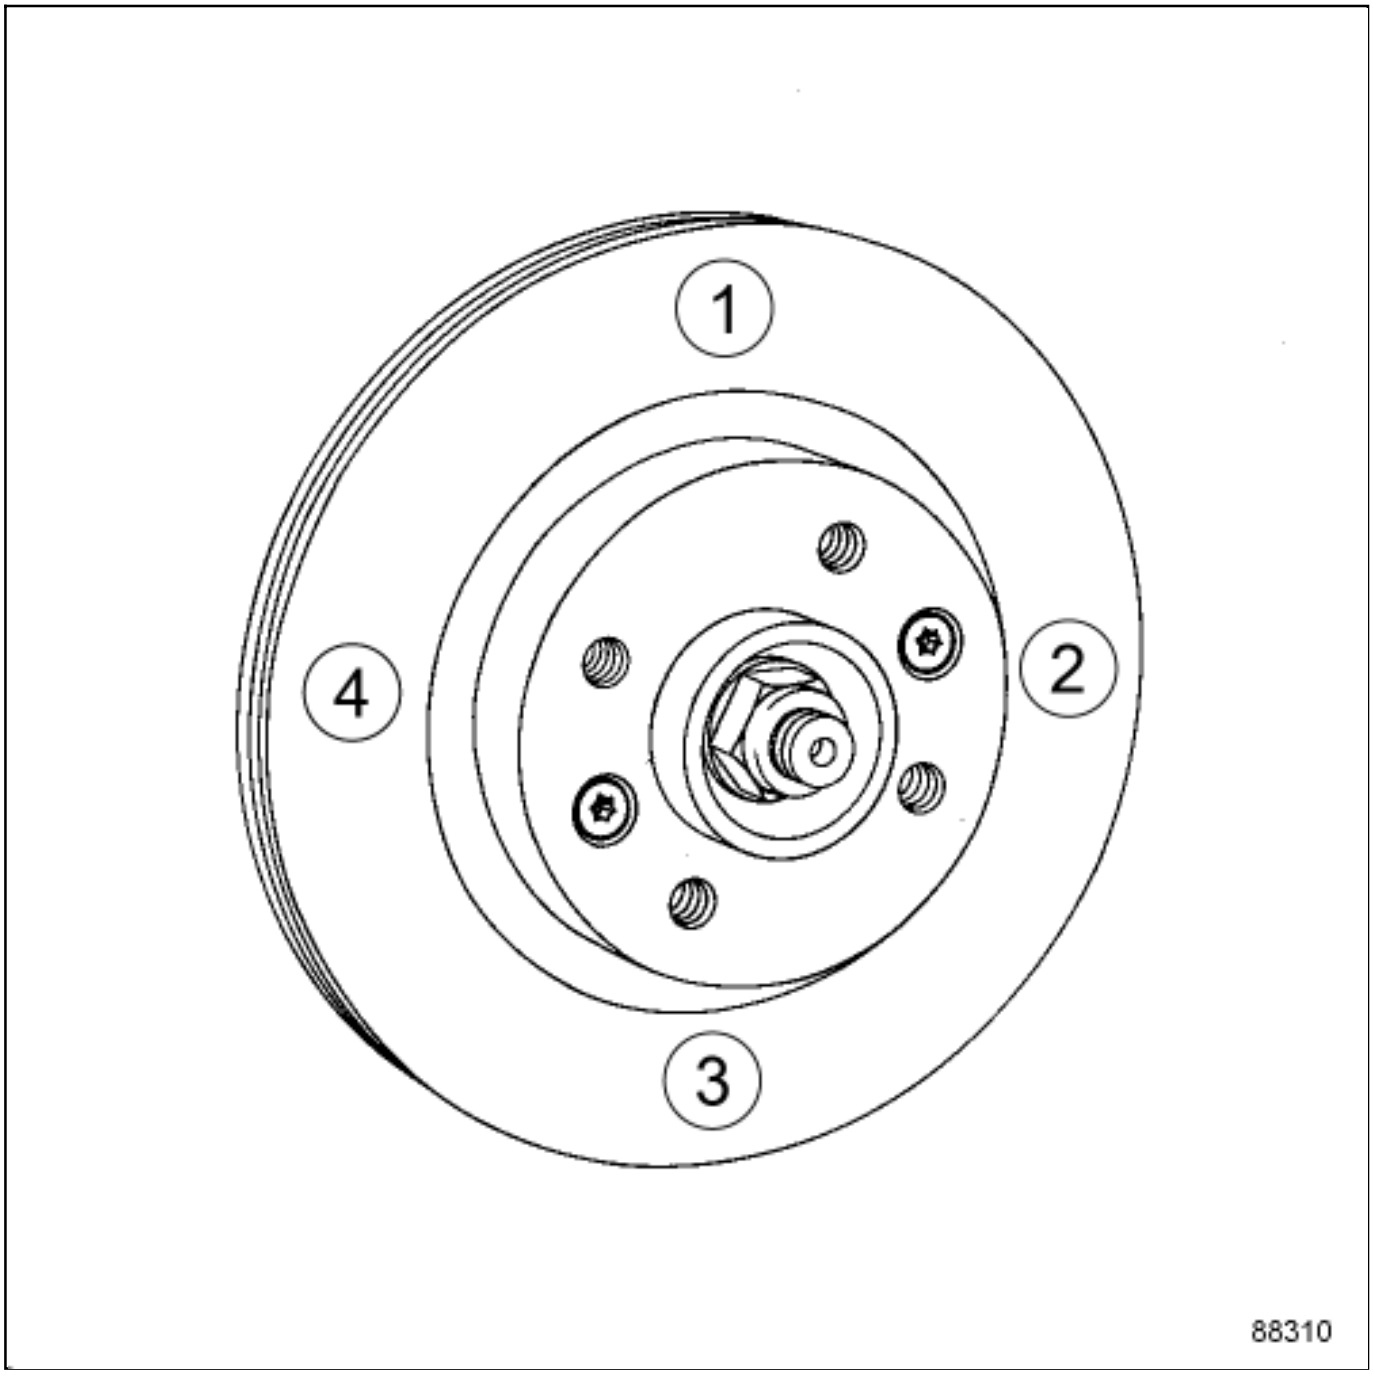
1. PREPARATION OPERATION FOR CHECK

Position the vehicle on a two-post lift Vehicle: Towing and lifting .



Remove the wheel in question Wheel: Removal - Refitting .

2. CHECKING OPERATION FOR PART CONCERNED



Note:

Use a Palmer type tool to check the thickness of the disc.

Position the Palmer tool(1) to measure the disc thickness.

Measure the thickness of the disc at 4 points in order (90˚ apart).

Compare the values with those recommended by the manufacturer**Brake: Specifications** .

3. FINAL OPERATION

Replace the discs if necessary**(see 31A, Front axle components, Front brake disc: Removal - Refitting)** .

Refit the wheel in question**Wheel: Removal - Refitting** .

Repair-13x03x03x03-02x21-1-25-1.xml

XSL version : 3.02 du 22/07/11

FRONT BRAKE DISC: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
parts washer
indelible pencil

parts always to be replaced:
Front brake disc bolt

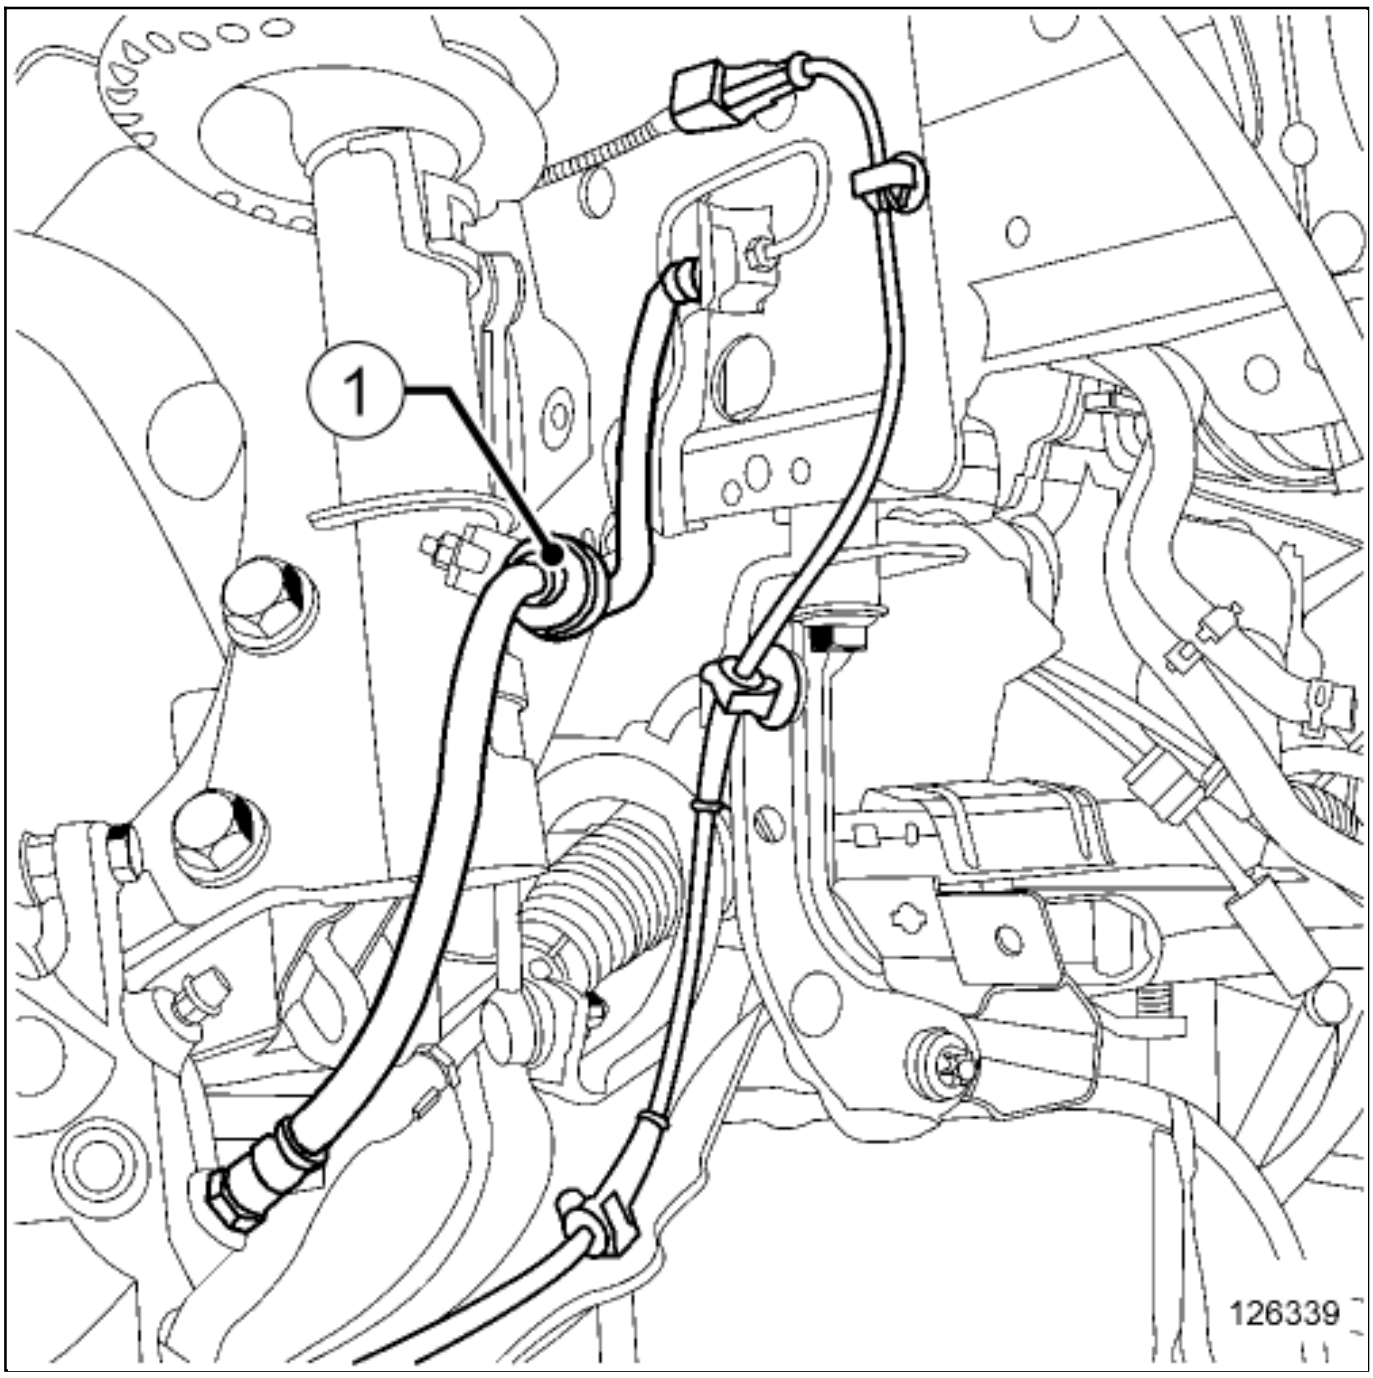
Brake discs cannot be reground. If there is excessive scoring or wear, they will need to be replaced Brake: Specifications .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Brake circuit: Precautions for the repair ,
- Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .



REMOVAL

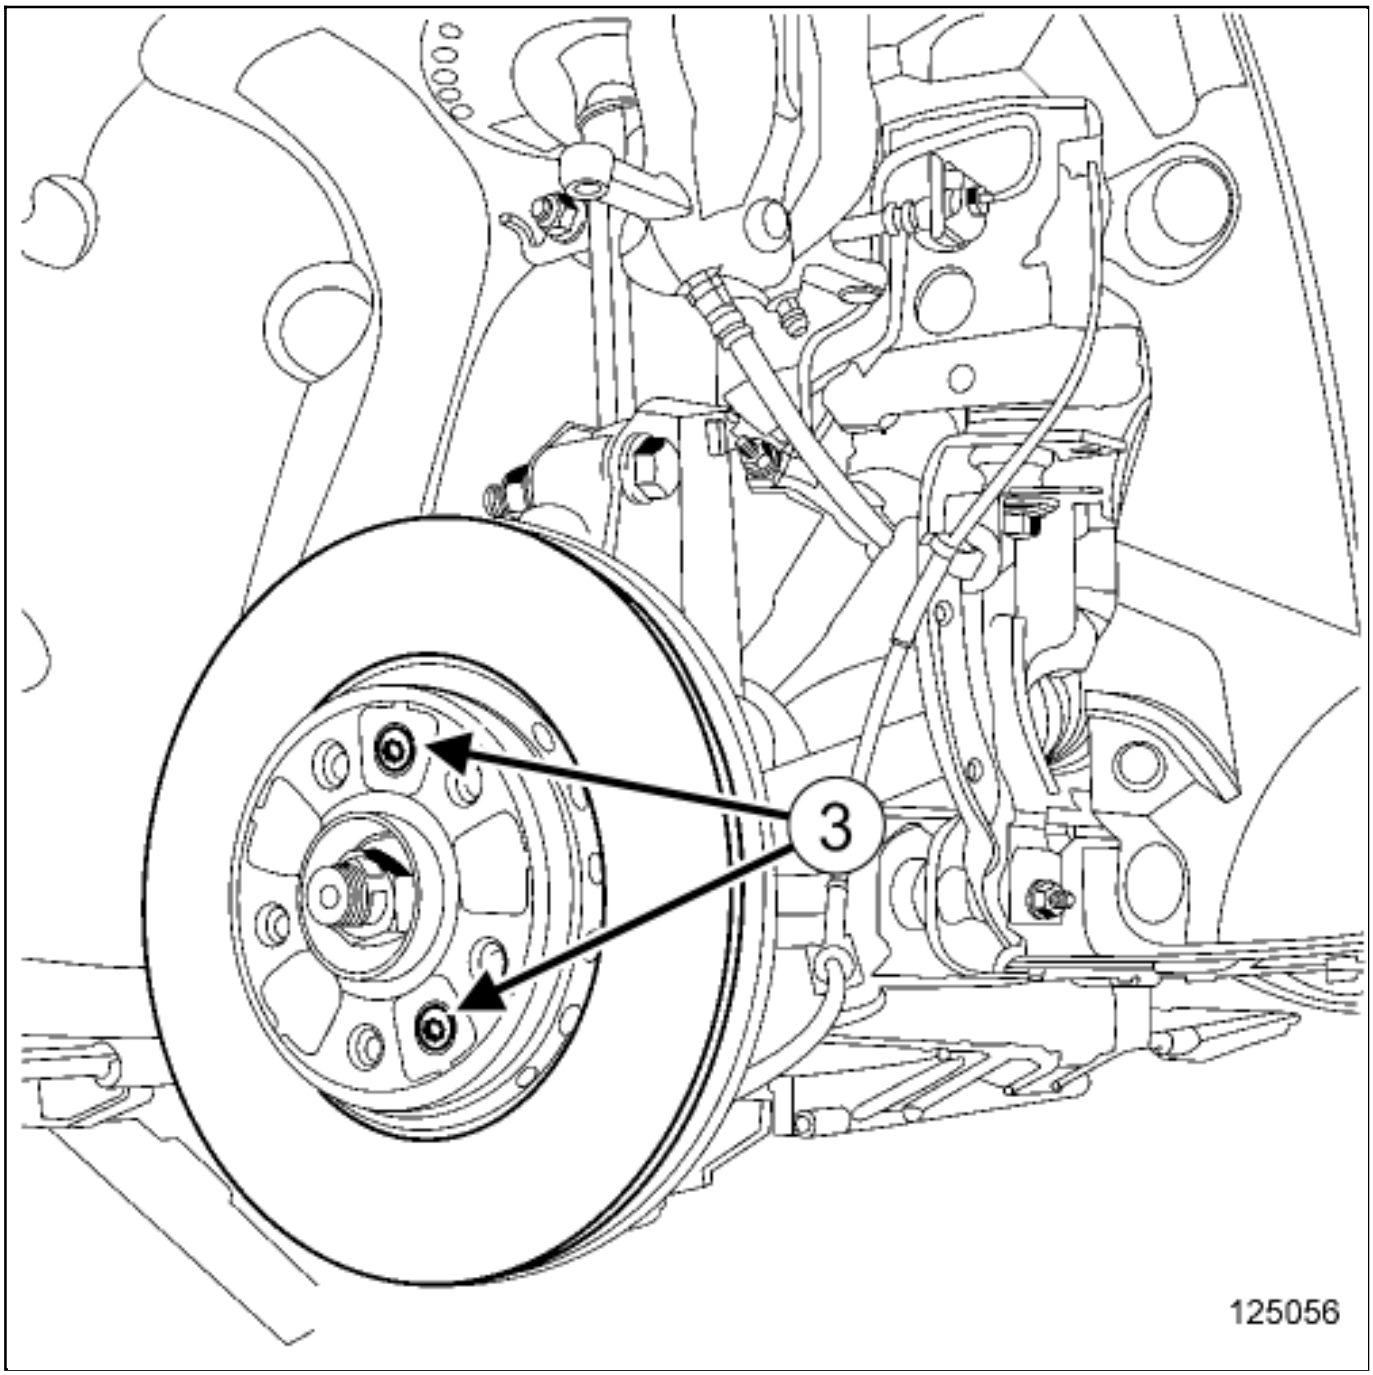
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Set the wheels straight ahead.

Remove the front wheel Wheel: Removal - Refitting .

If the vehicle is equipped:



- mark the position of the cap(1) on the base of the shock absorber using an indelible pencil,
- unclip the cap(1) from the base of the shock absorber.

Remove (see 31A, Front axle components, Front brake calliper assembly: Exploded view) :

- the brake pads,
- the "brake calliper mounting - brake calliper" assembly.

Hang the "brake calliper mounting - brake calliper" assembly(2) on the suspension spring.

2. REMOVAL OPERATION

Remove:

- the brake disc bolt or bolts(3) ,
- the brake disc.

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the brake discs using a parts washer.

Dry the surface of the discs.

Clean the mating faces of the disc on the hub using a wire brush and brake cleaner Vehicle: Parts and consumables for the repair .

parts always to be replaced: **Front brake disc bolt** .

2. REFITTING OPERATION

Refit the brake disc with new bolts.

Torque tighten the new disc mounting bolts (see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

3. FINAL OPERATION

Refit (see 31A, Front axle components, Front brake calliper assembly: Exploded view) :

- the "brake calliper mounting - brake calliper" assembly,
- the brake pads.

Set the wheels straight ahead.

If the vehicle is equipped, clip the cap onto the base of the shock absorber by aligning the marks made at (1) .

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

Refit the front wheel **Wheel: Removal - Refitting** .

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

Advise the customer to run-in the brake pads (no harsh braking).

FRONT BRAKE DISC: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
parts washer
indelible pencil

parts always to be replaced:
Front brake disc bolt

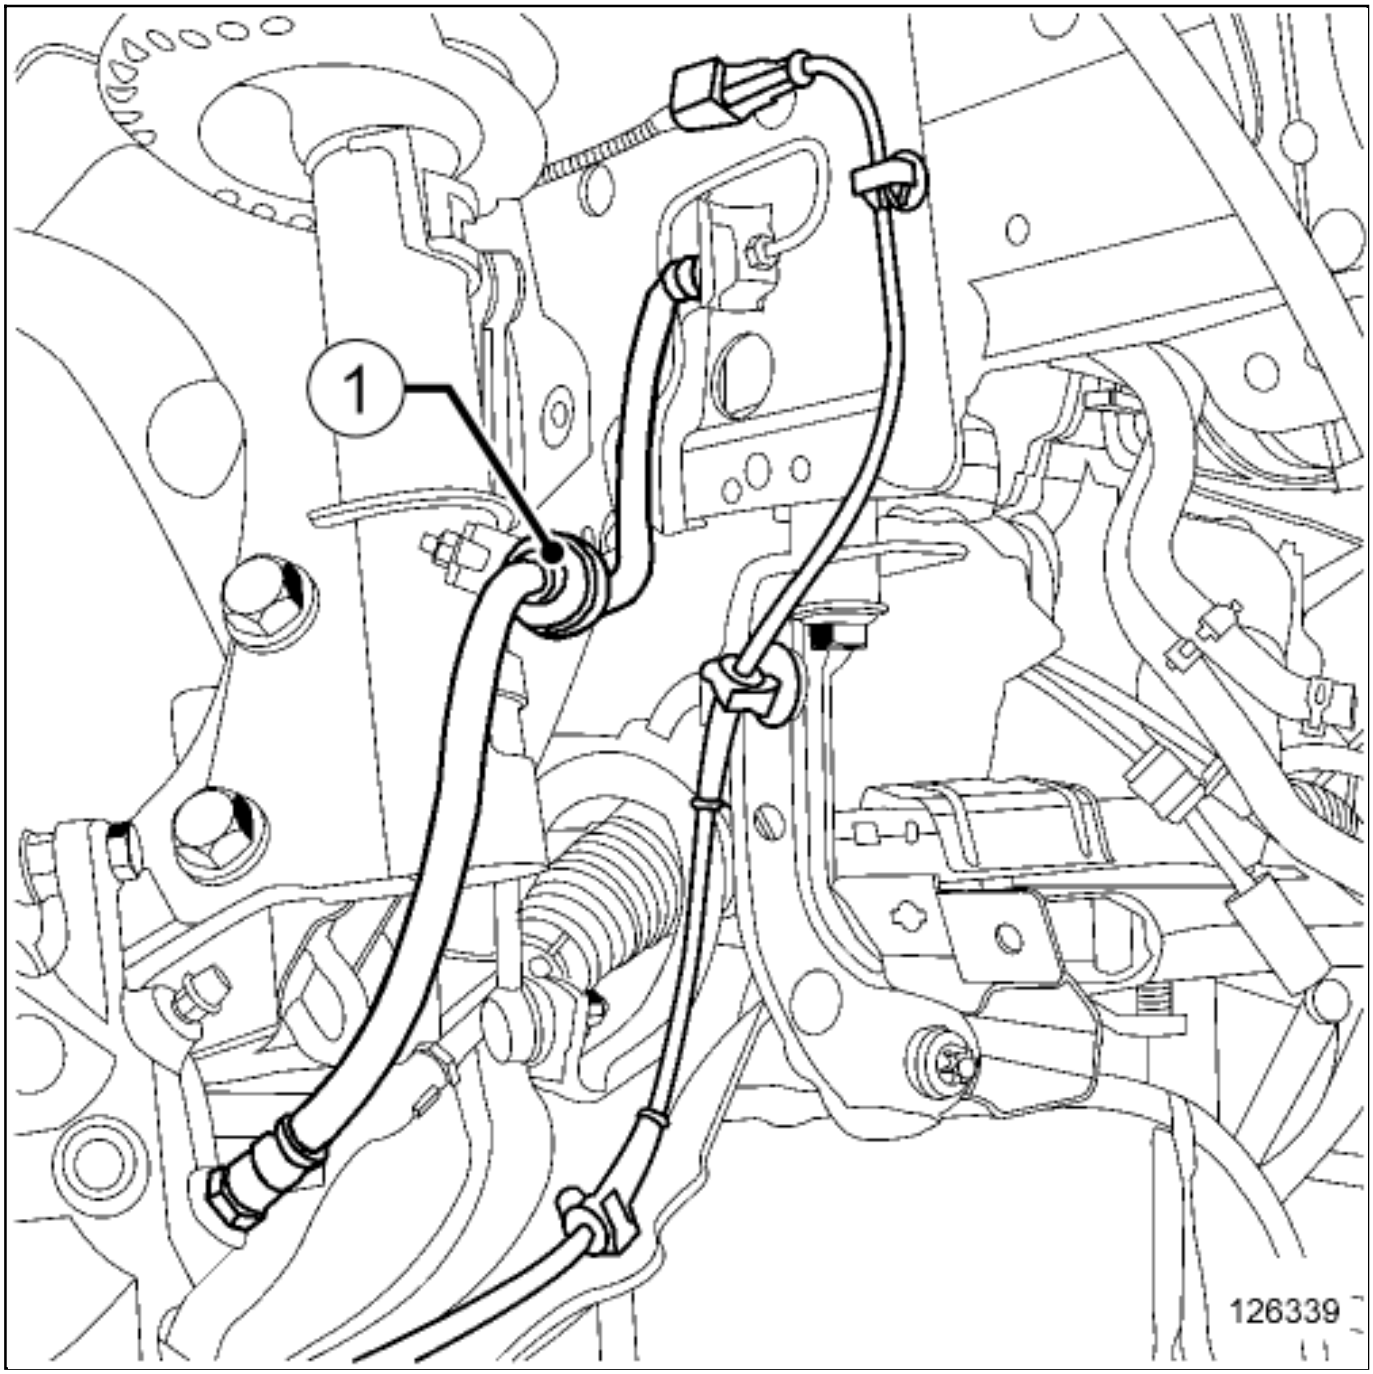
Brake discs cannot be reground. If there is excessive scoring or wear, they will need to be replaced Brake: Specifications .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Brake circuit: Precautions for the repair ,
- Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)Front brake calliper assembly: Exploded view .



REMOVAL

1. REMOVAL PREPARATION OPERATION

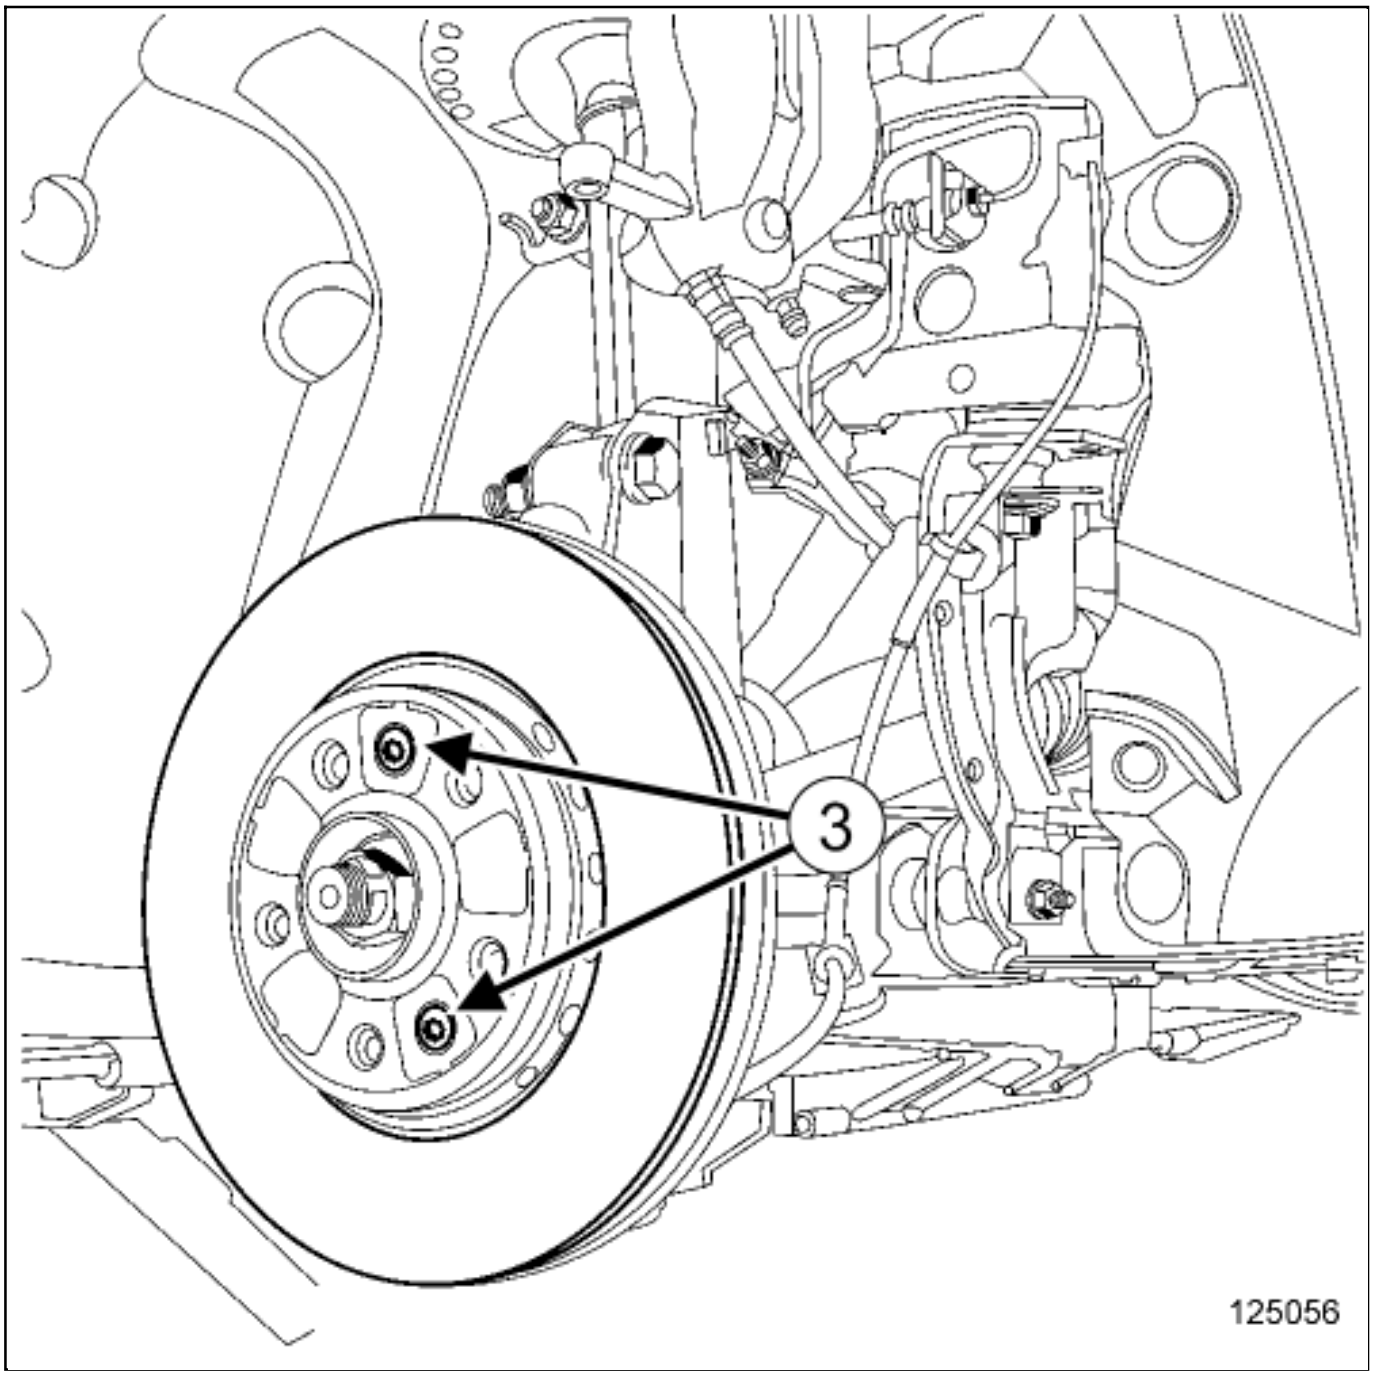
Position the vehicle on a two-post liftVehicle: Towing and lifting .

Set the wheels straight ahead.

Remove the front wheel[Wheel: Removal - Refitting] .

If the vehicle is equipped:

- mark the position of the cap(1) on the base of the shock absorber using an indelible pencil,



unclip the cap(1) from the base of the shock absorber.

Remove **Front brake calliper assembly: Exploded view** :

- the brake pads,
- the "brake calliper mounting - brake calliper" assembly.

Hang the "brake calliper mounting - brake calliper" assembly(2) on the suspension spring.

2. REMOVAL OPERATION

Remove:

- the brake disc bolt or bolts(3) ,
- the brake disc.

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the brake discs using a parts washer.

Dry the surface of the discs.

Clean the mating faces of the disc on the hub using a wire brush and brake cleaner Vehicle: Parts and consumables for the repair .

parts always to be replaced: **Front brake disc bolt** .

2. REFITTING OPERATION

Refit the brake disc with new bolts.

Torque tighten the new disc mounting bolts Front brake calliper assembly: Exploded view .

3. FINAL OPERATION

Refit Front brake calliper assembly: Exploded view :

- the "brake calliper mounting - brake calliper" assembly,
- the brake pads.

Set the wheels straight ahead.

If the vehicle is equipped, clip the cap onto the base of the shock absorber by aligning the marks made at (1) .

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

Refit the front wheel Wheel: Removal - Refitting .

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

Advise the customer to run-in the brake pads (no harsh braking).

FRONT BRAKE PADS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Brake calliper piston return tool.	Fre. 1190-01

Equipment required
indelible pencil

WARNING

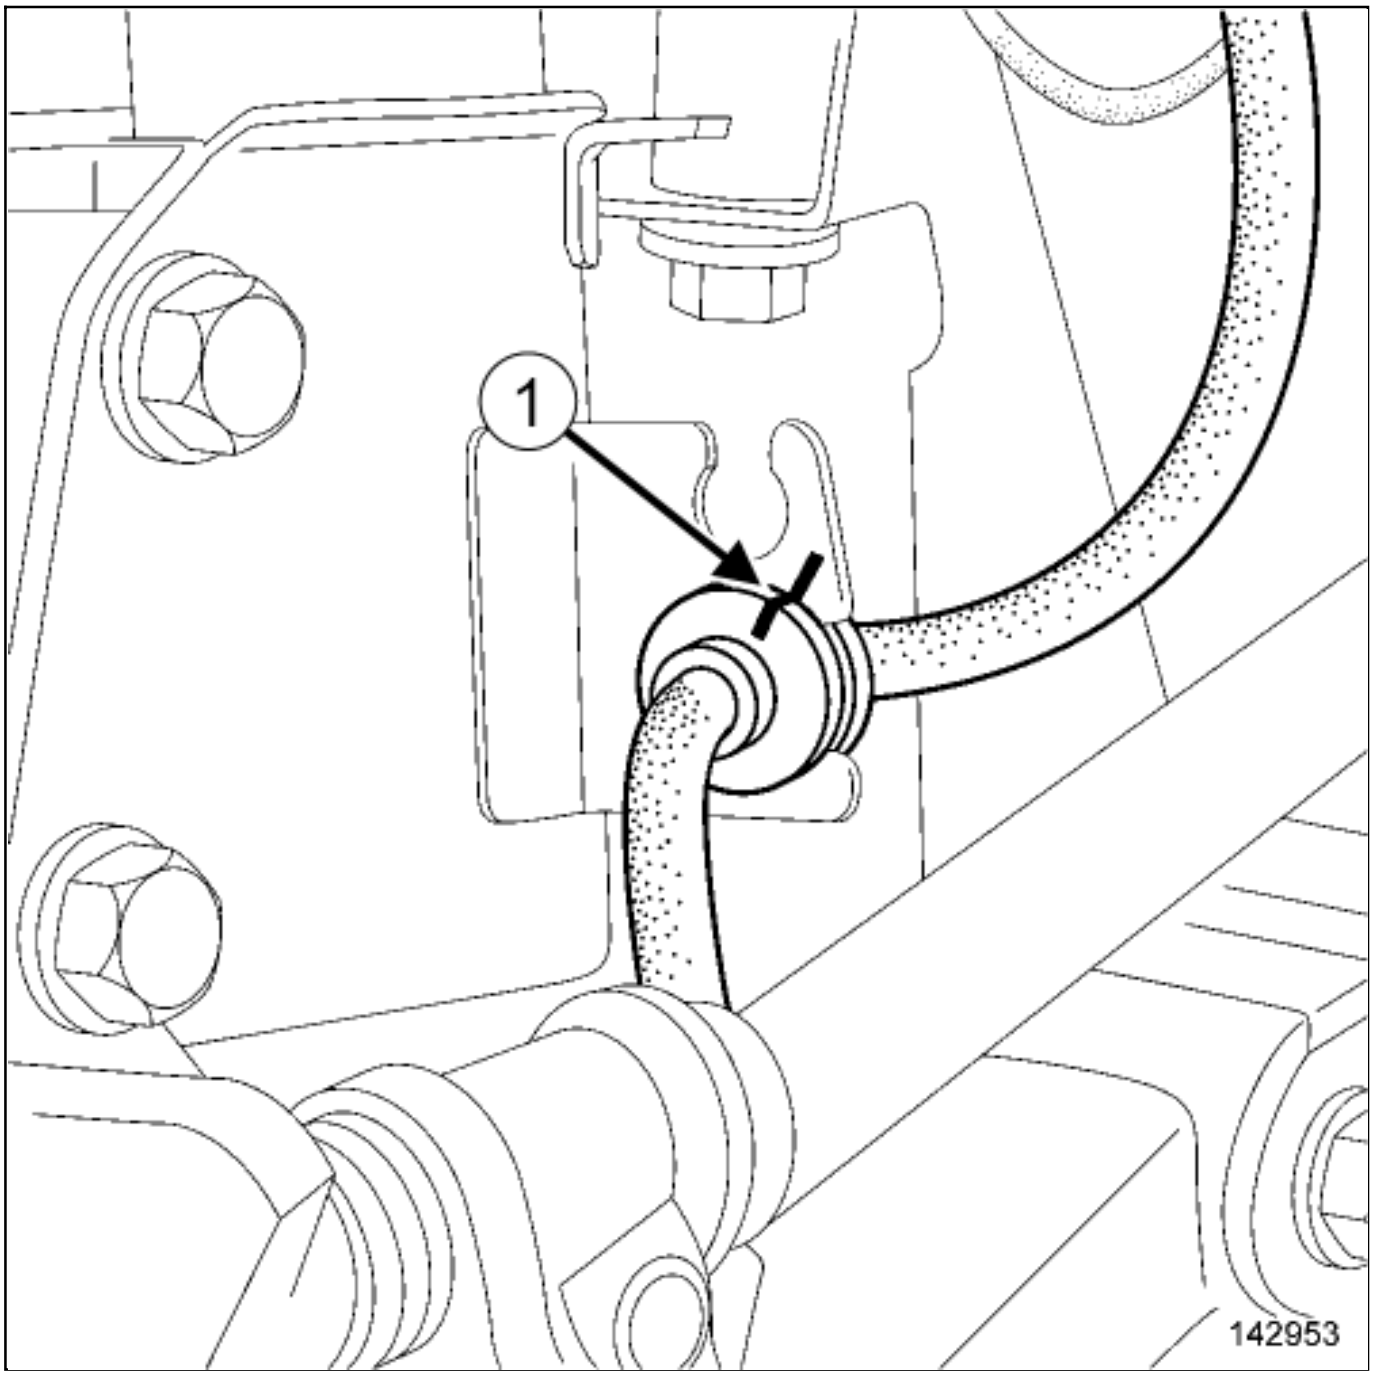
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 31A, Front axle components, Front axle components: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.



Location and specifications (tightening torques, parts always to be replaced, etc.)(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the front wheels(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

2. REMOVAL OPERATION

Set the wheels straight ahead.

Mark the position of the front brake hose cap(1) on the base of the shock absorber using an indelible pencil .

Unclip the front brake hose cap(1) from the shock absorber base.

Remove (see 31A, Front axle components, Front brake calliper assembly: Exploded view) :

- the cap of the lower guide pin bolt,
- the bolt of the lower guide pin.

Tip the front brake calliper.

Remove the front brake pads(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Measure the thickness of the brake pads and compare them with the minimum valuesBrake: Specifications .

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

Clean using a wire brush and brake cleanerVehicle: Parts and consumables for the repair :

- the front brake calliper mountings,
- the front brake callipers.

Push the front brake calliper piston fully into its housing using the toolBrake calliper piston return tool. (Fre. 1190-01) .

2. REFITTING OPERATION

Refit the front brake pads(see 31A, Front axle components, Front brake calliper assembly: Exploded view) .

Fit the front brake calliper.

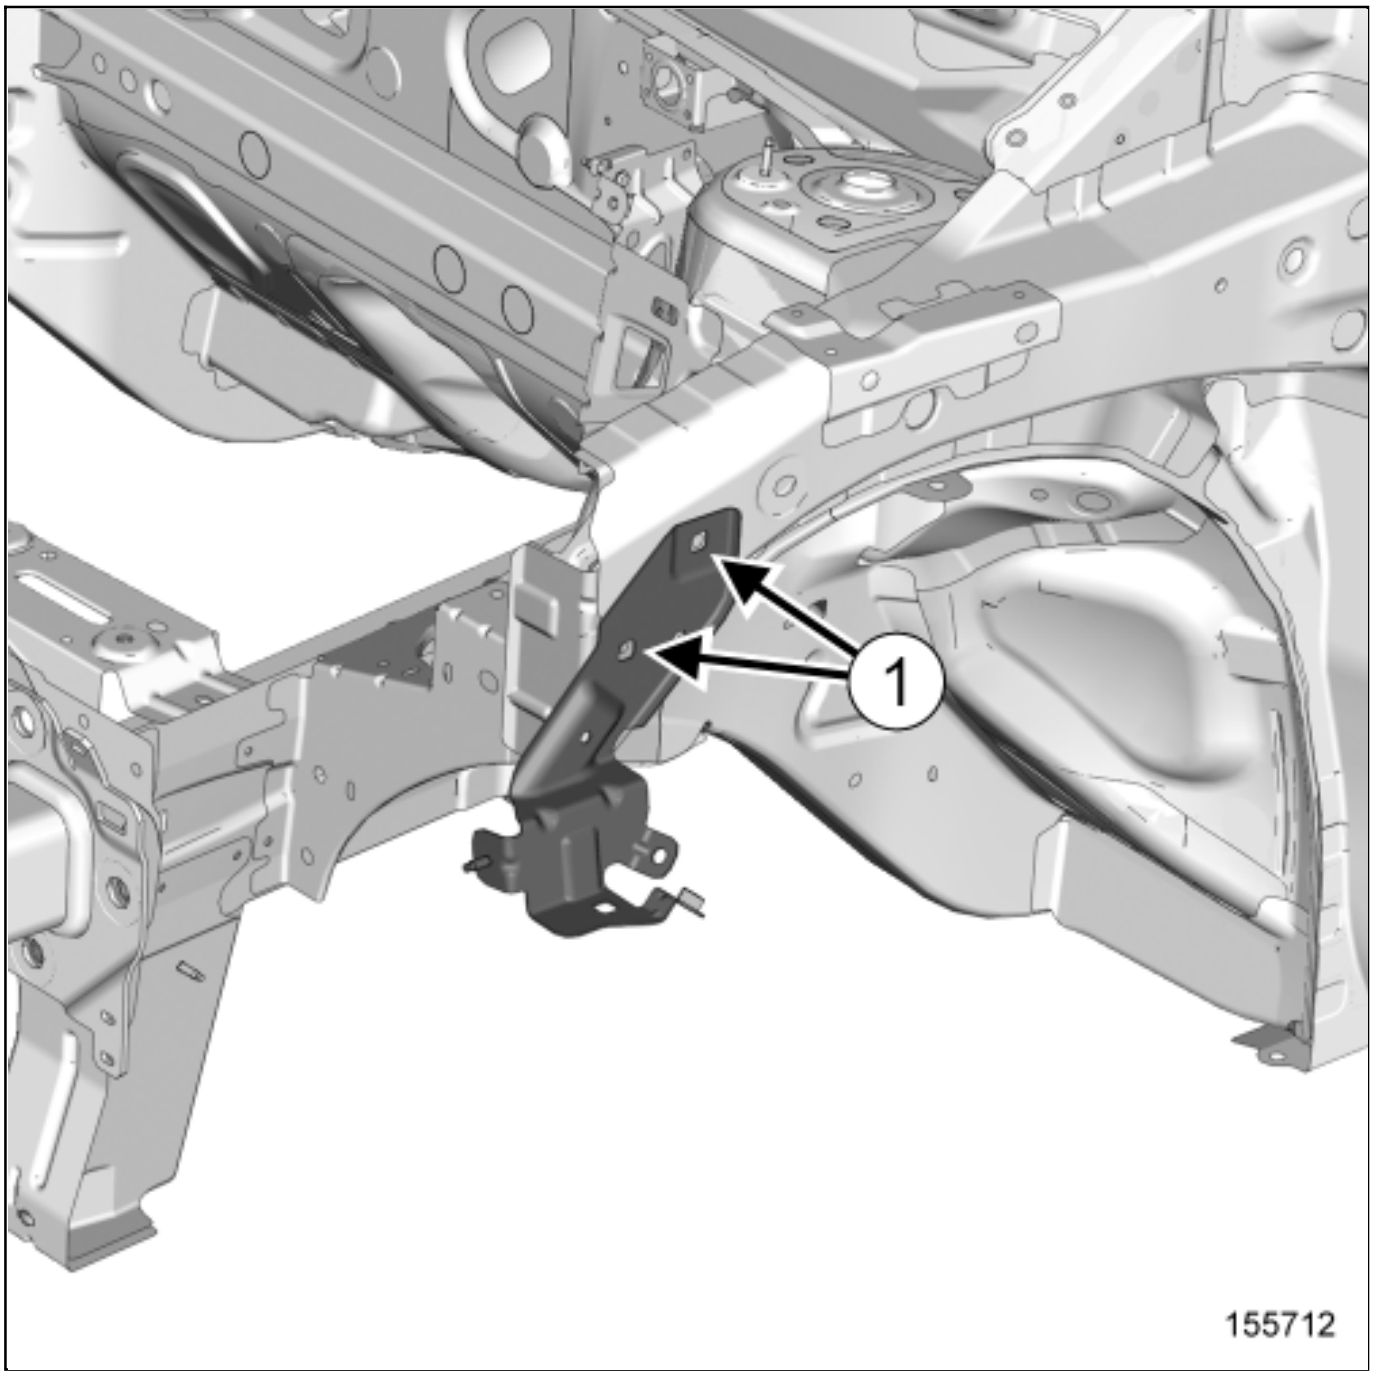
Proceed in the reverse order to removal.

Set the wheels straight ahead.

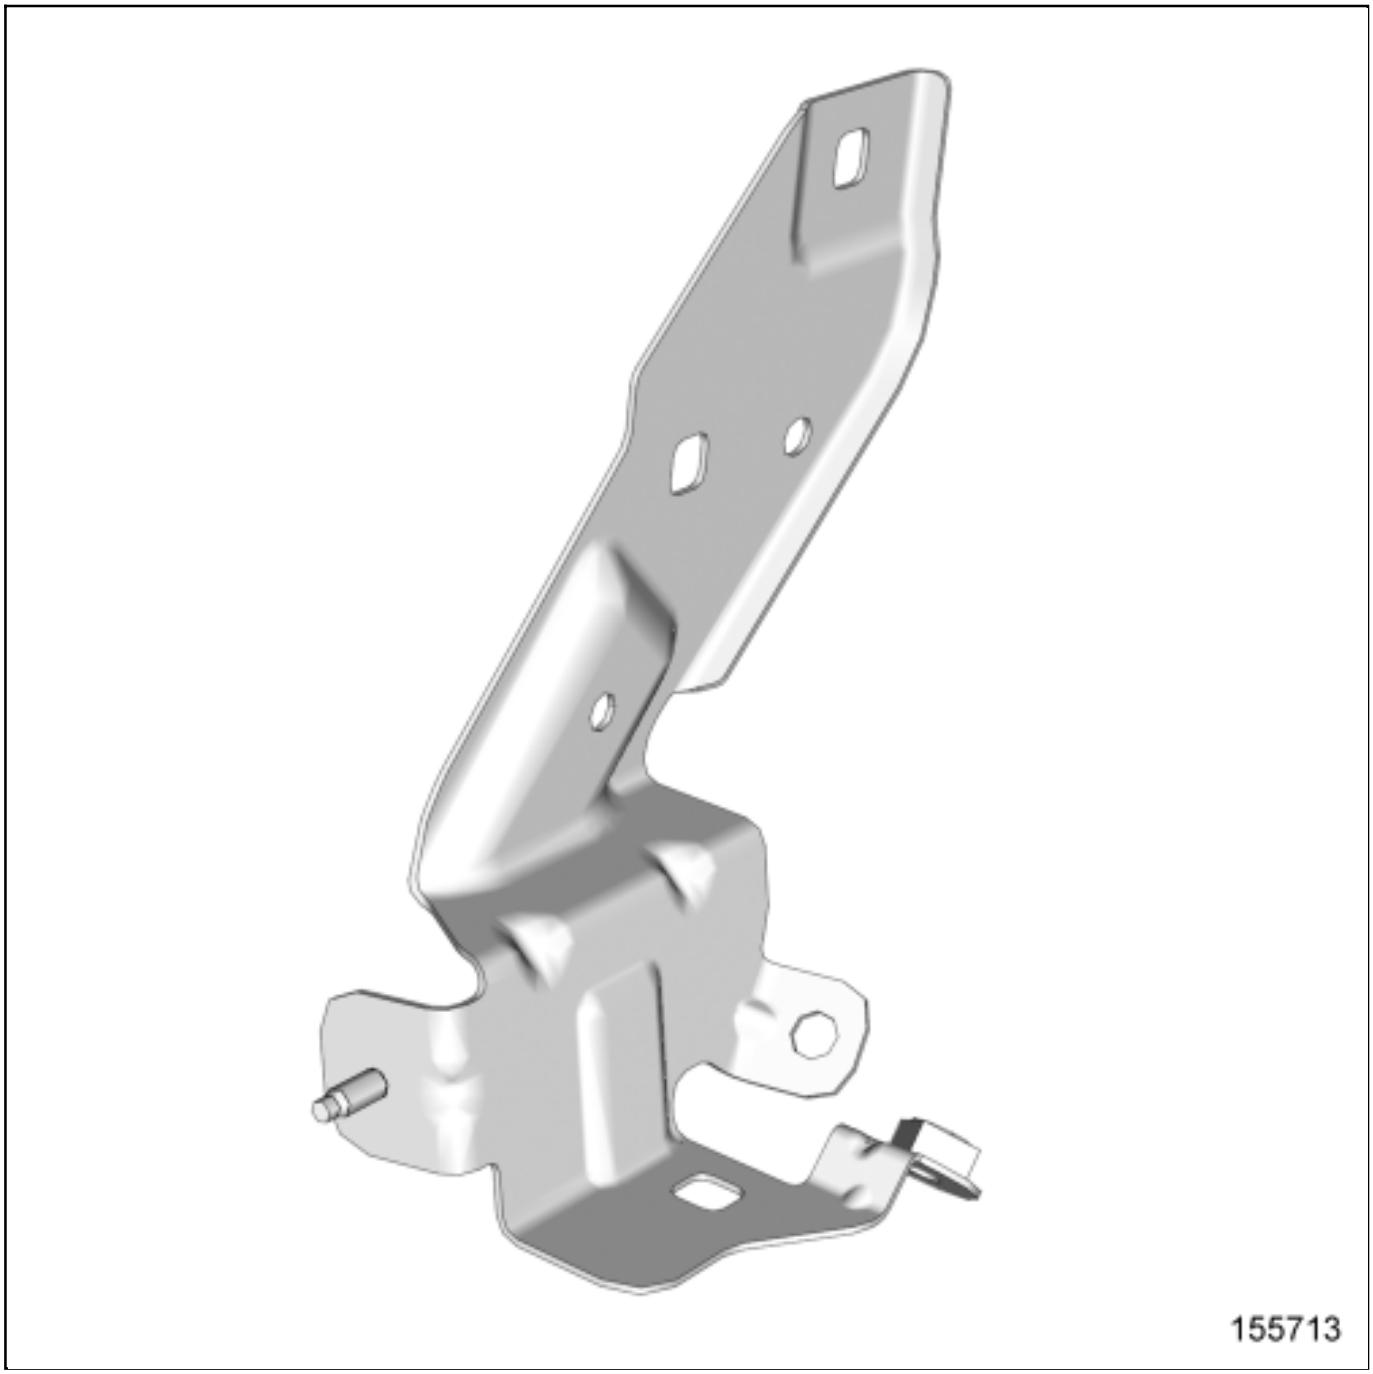
Clip the front brake hose cap onto the base of the shock absorber by aligning the marks made at (1) .

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.



FRONT BUMPER MOUNTING: REMOVAL - REFITTING



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Remove:
  - the front wheel arch liners Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view ,
  - the front headlights Front signals - lighting assembly: Exploded view .
- Remove the front wing Exterior body front trim assembly: Exploded view .

2. REMOVAL OPERATION

1
155712

Remove:

- the bolts(1) ,
- the front bumper support.

REFITTING

1. REFITTING OPERATION

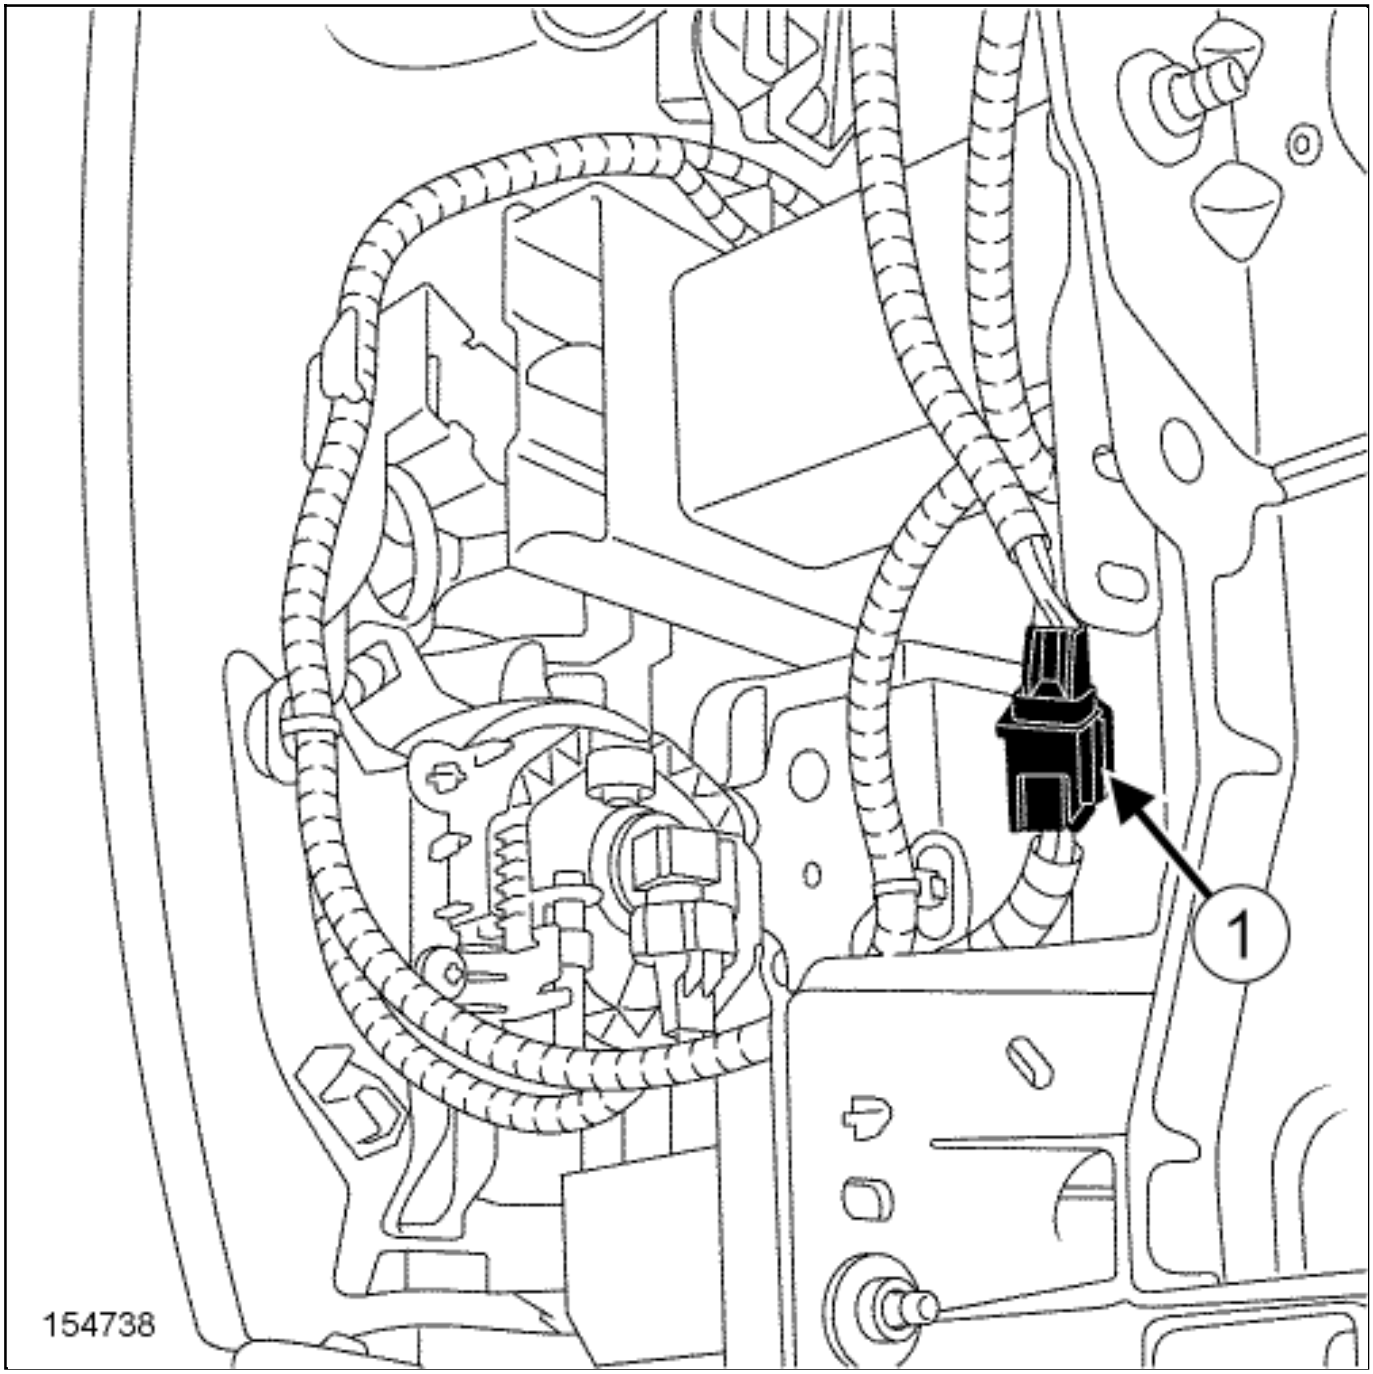
Refit:

- the front bumper support,
- the bolts.

2. FINAL OPERATION

Proceed in the reverse order to removal.

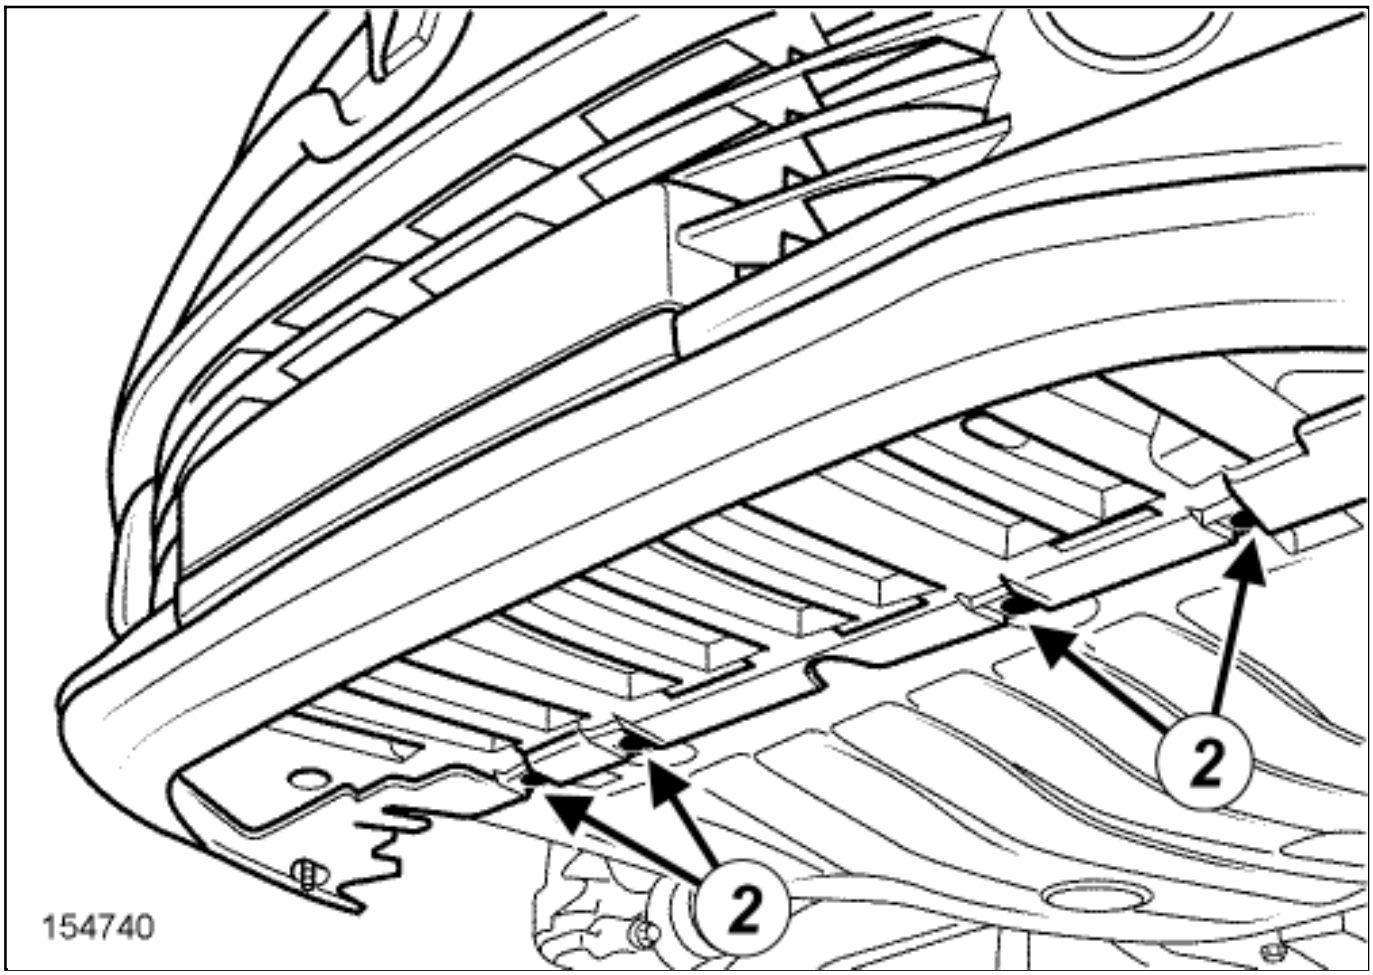
FRONT BUMPER: REMOVAL - REFITTING



Special tooling required	
Set of trim removal levers.	Car. 1363

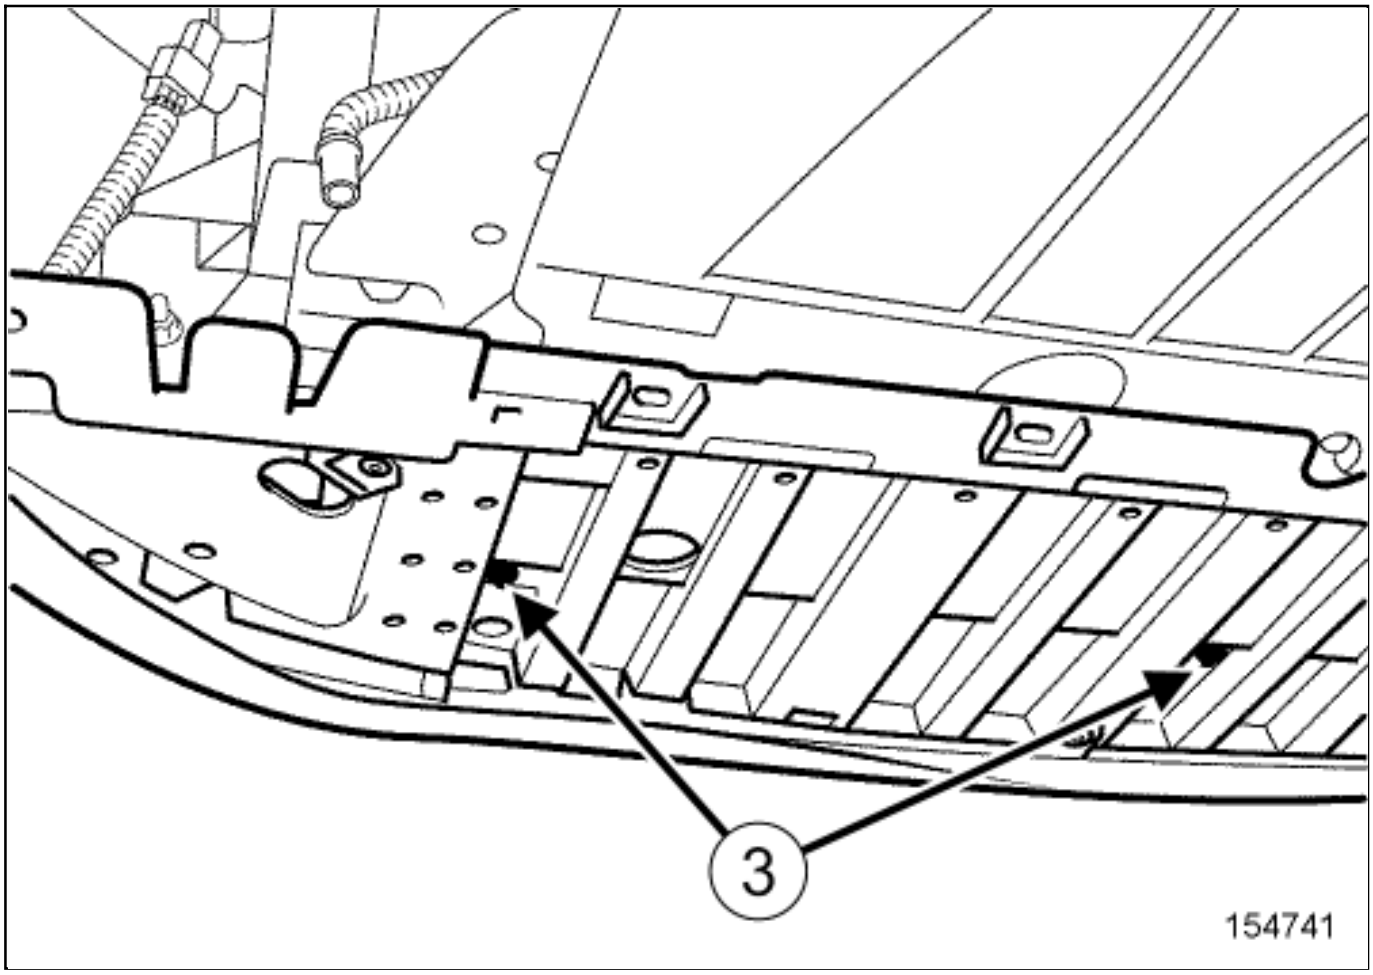
Location and specification (tightening torques, parts always to be replaced, etc.)(see 55A, Exterior protection, Front bumper assembly: Exploded view) .

REMOVAL

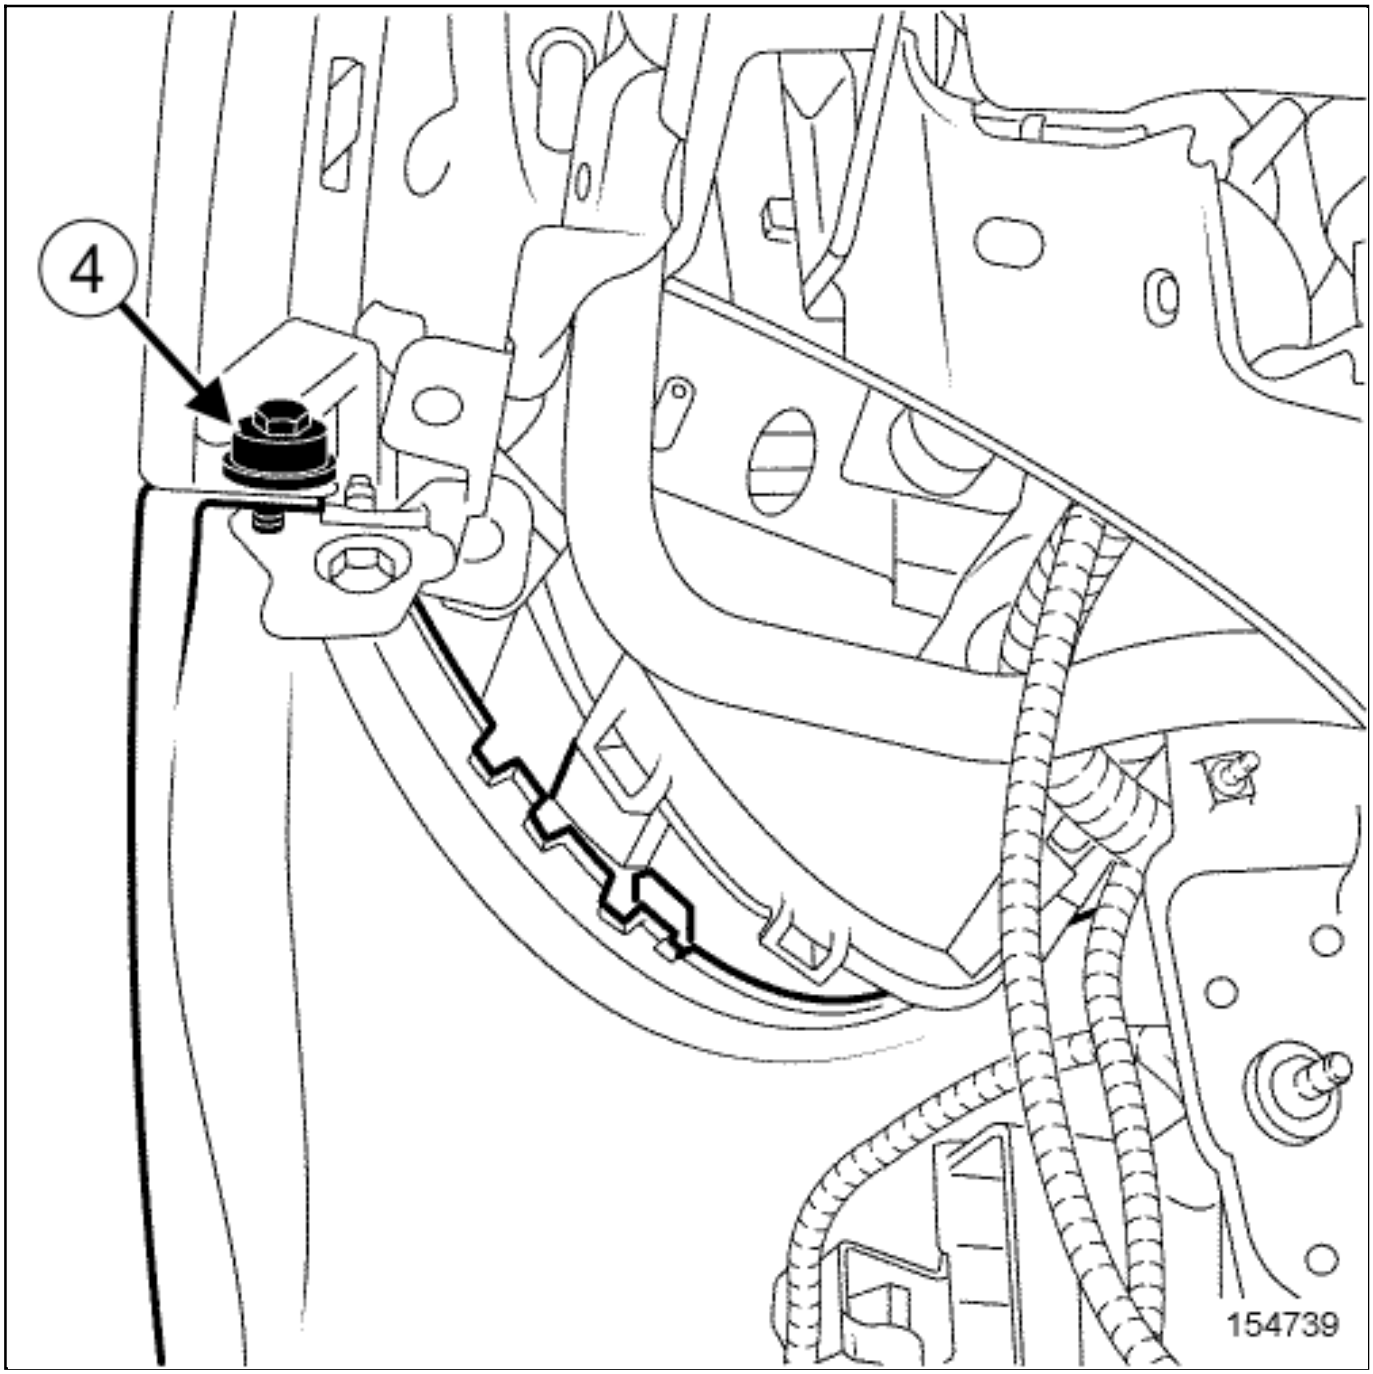


1. REMOVAL PREPARATION OPERATION

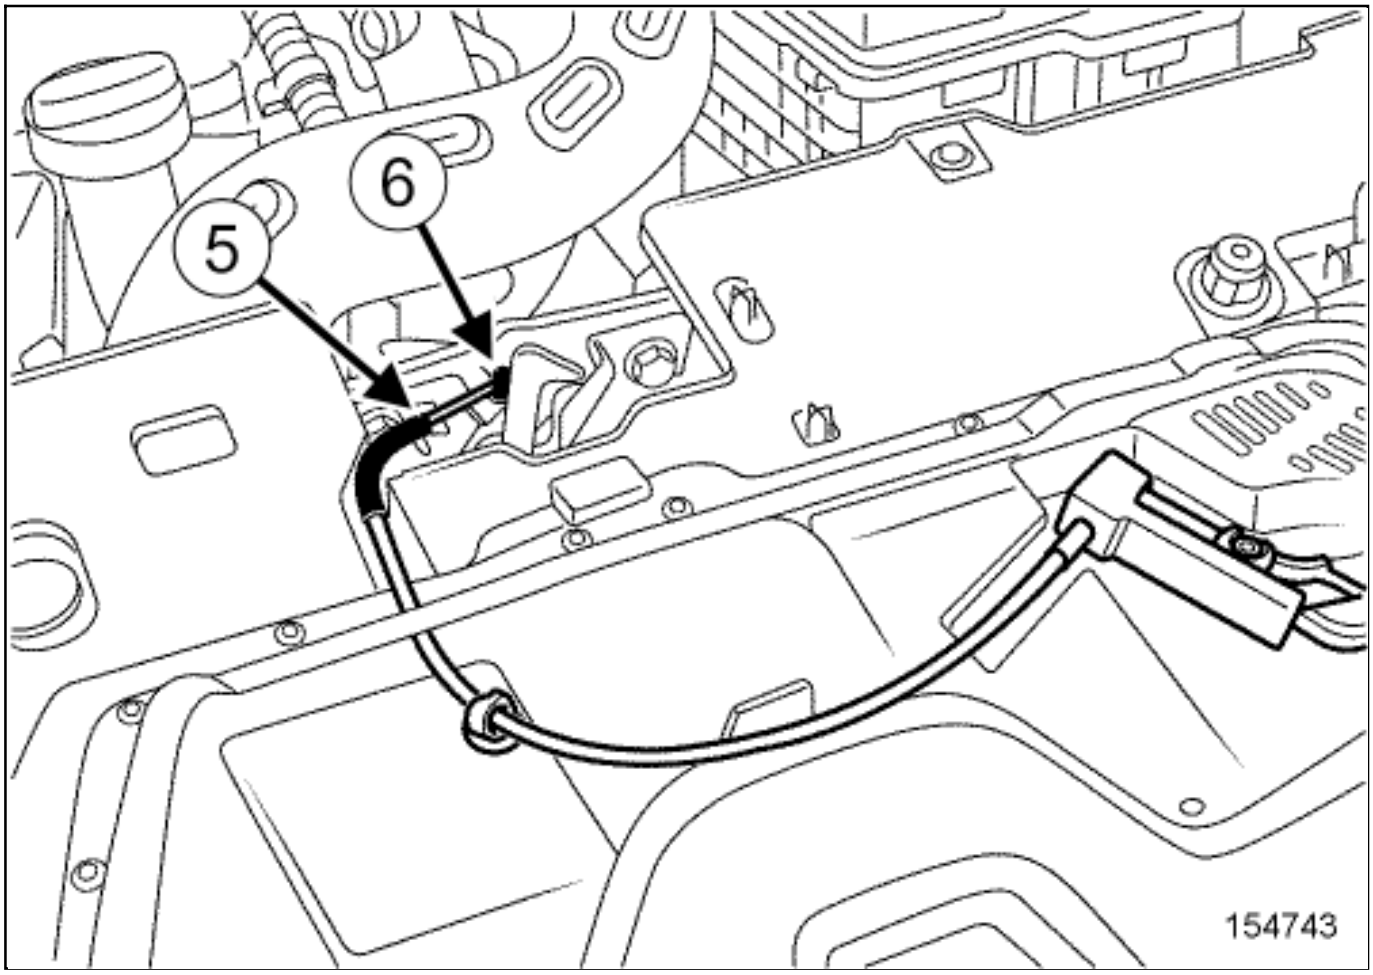
- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the front wheelsFront hub carrier assembly: Exploded view .
- Remove the front section of the front wheel arch liners(see 55A, Exterior protection, Exterior body front trim assembly: Exploded view) .



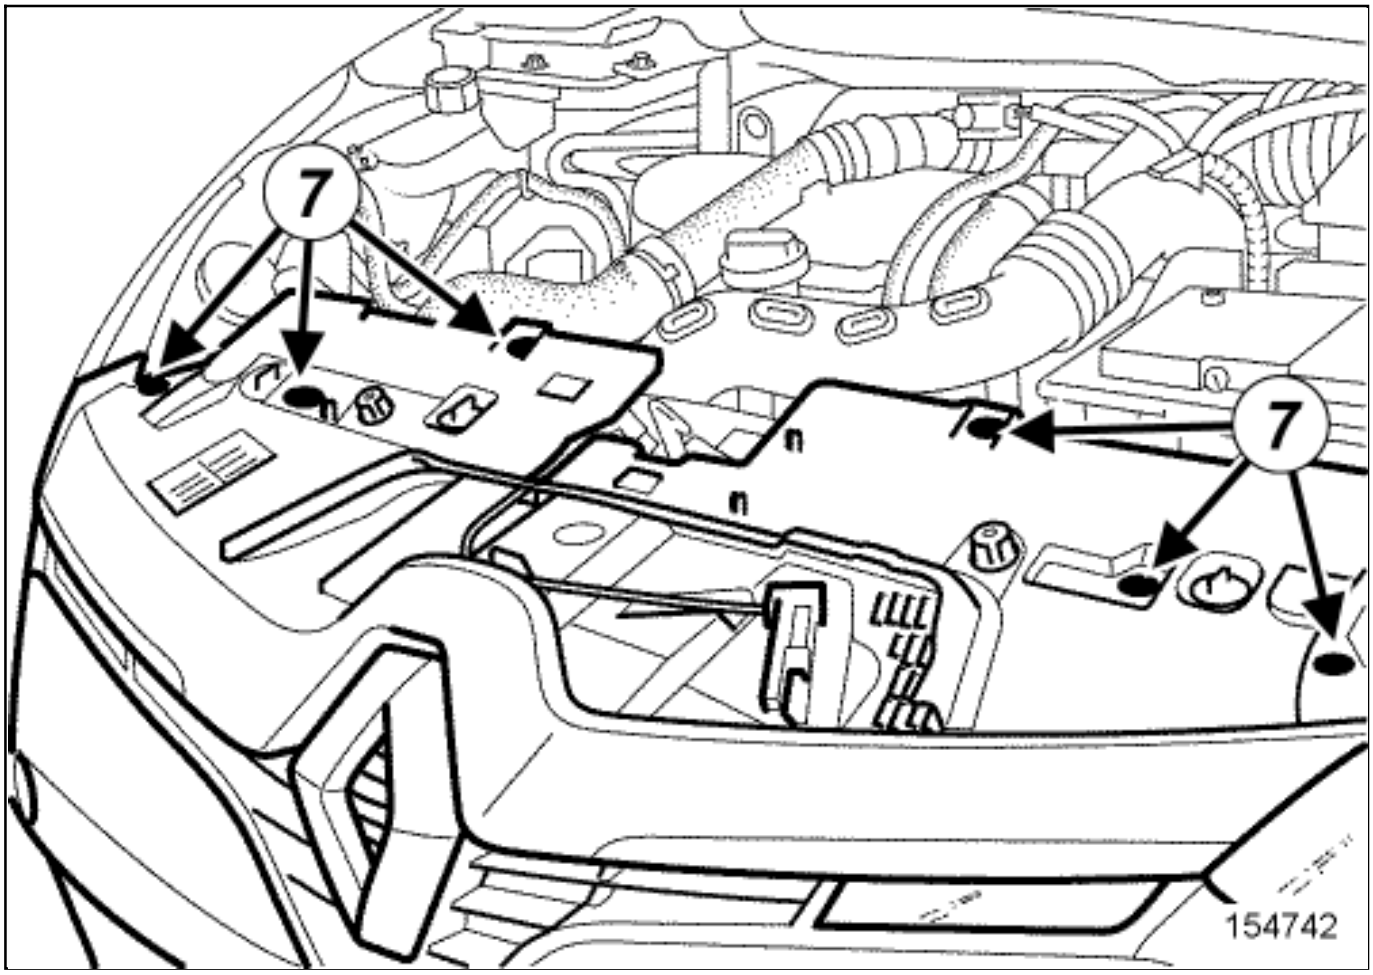
- Unclip the front bumper wiring connector(1) .
- Disconnect the front bumper wiring connector.



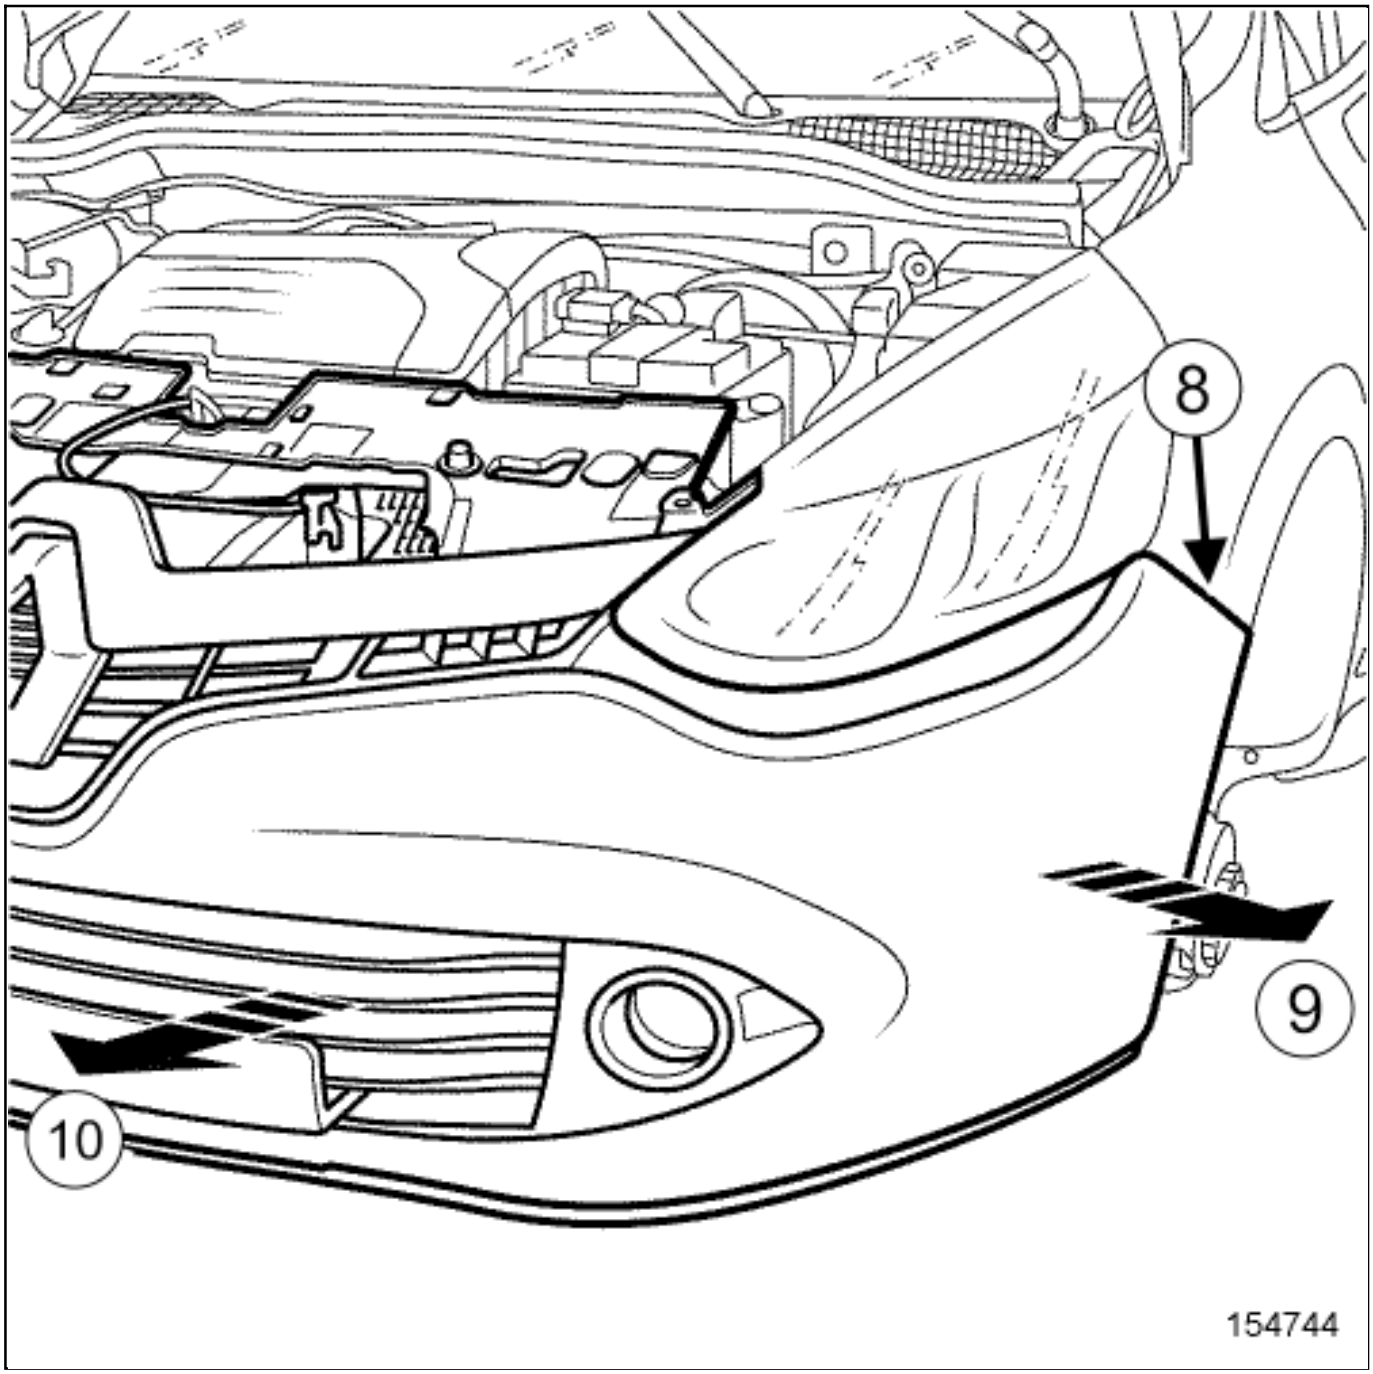
2. REMOVAL OPERATION



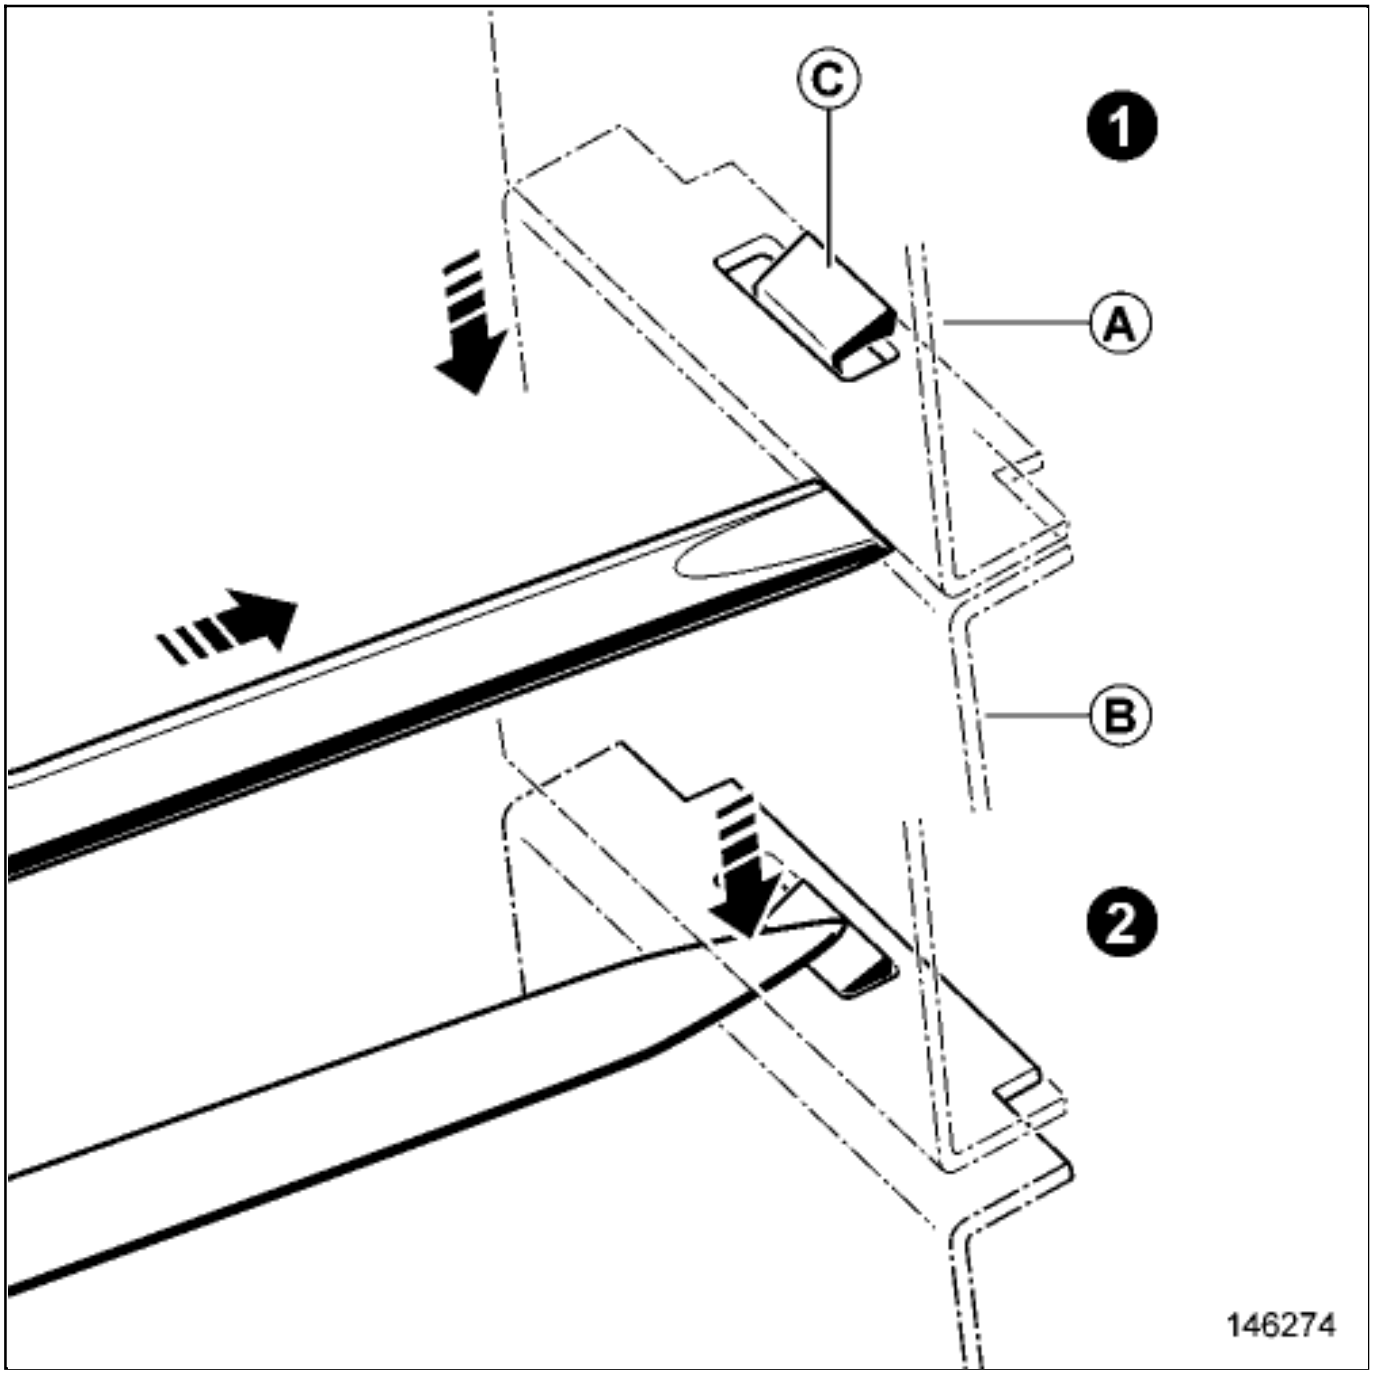
- Remove the front bumper lower diffuser bolts(2) .



- Remove the front bumper lower diffuser bolts(3) .



- Remove the side bolt from the front bumper(4) .



- Unclip the bonnet opening cable sheath stop from the opening element lock(5) .
- Unclip the bonnet opening cable stop(6) .

Remove the front bumper upper bolts(7) .

8
9
10
154744

Unclip (9) the front bumper while pressing on the lugs at(8) using the toolSet of trim removal levers. (Car. 1363) .

Slightly lift the upper section of the front bumper.

Remove the front bumper following the direction of the arrow(10) .

Remove the front bumper (this operation requires two people).

REFITTING

Proceed in the reverse order to removal.

Carry out a function test.

Repair-50x05x02-01x37-1-29-1.xml

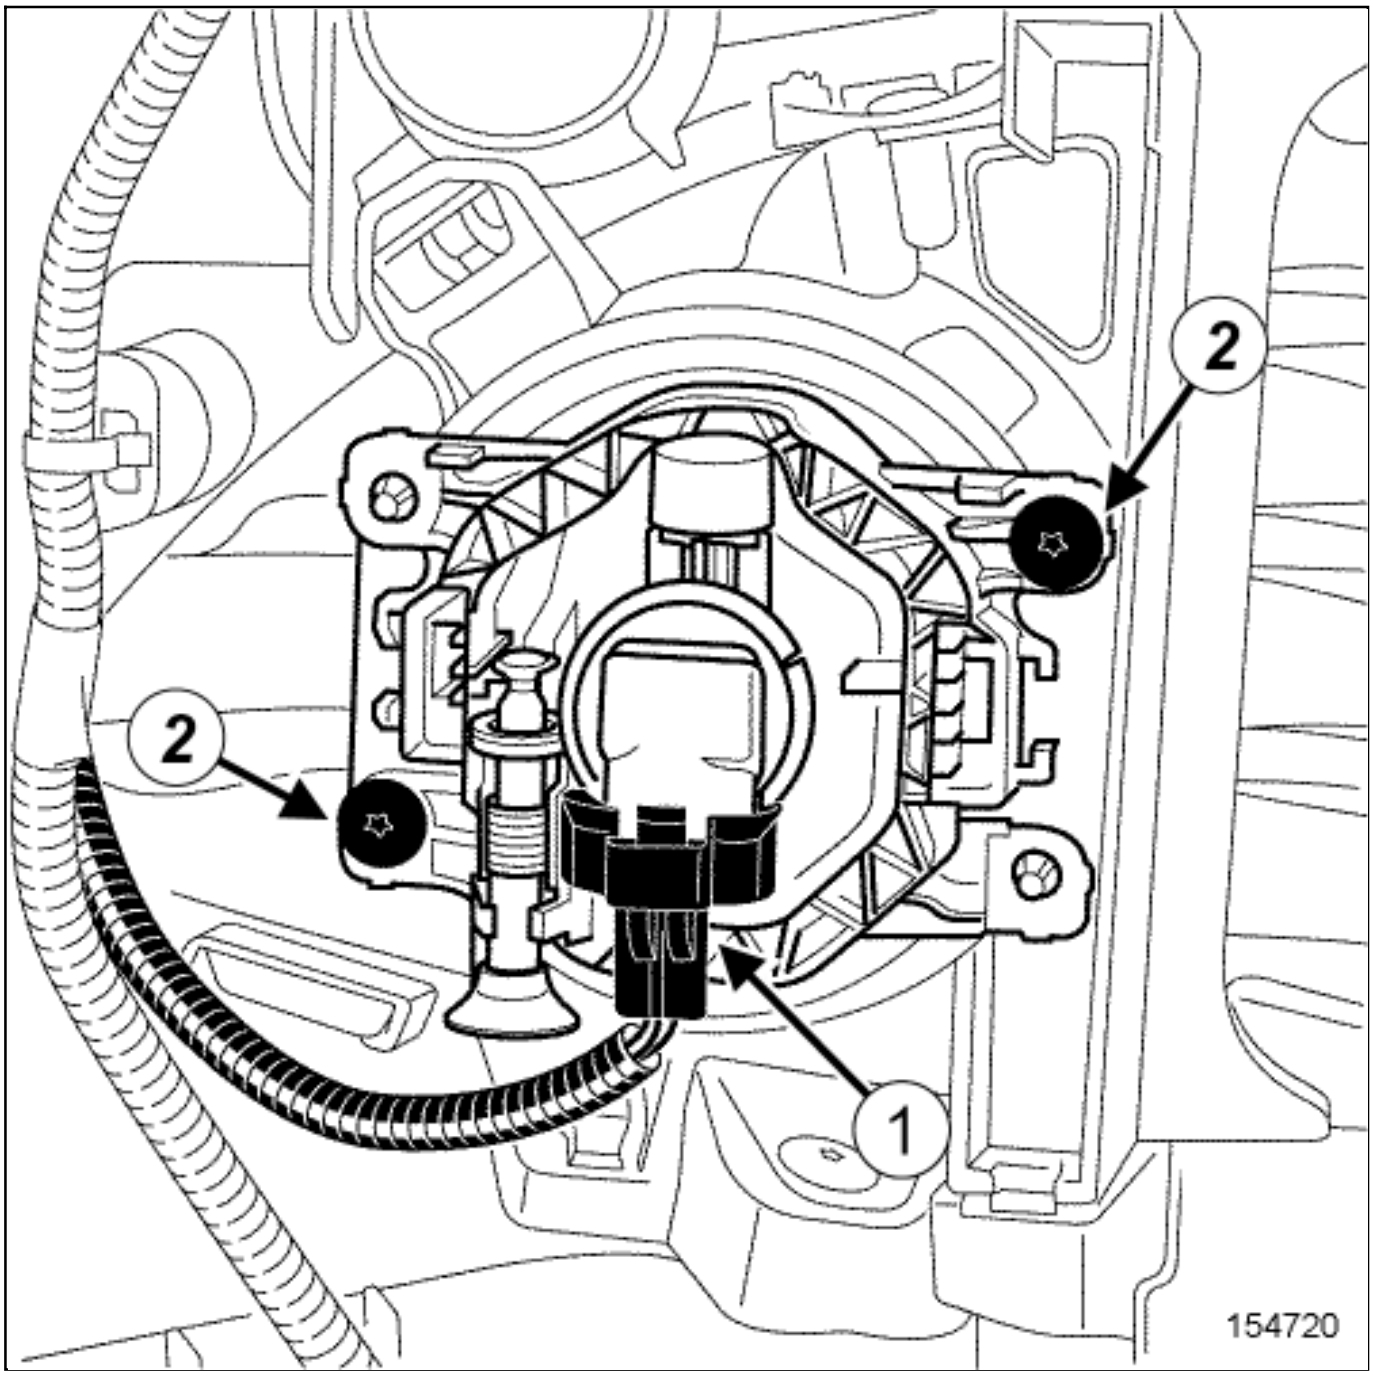
XSL version : 3.02 du 22/07/11

FRONT BUMPER: STRIPPING - REBUILDING

Special tooling required	
Set of trim removal levers.	Car. 1363

parts always to be replaced:
front bumper rivet
Front bumper clip

Location and specification (tightening torques, parts always to be replaced, etc.)(see 55A, Exterior protection, Front bumper assembly: Exploded view) .

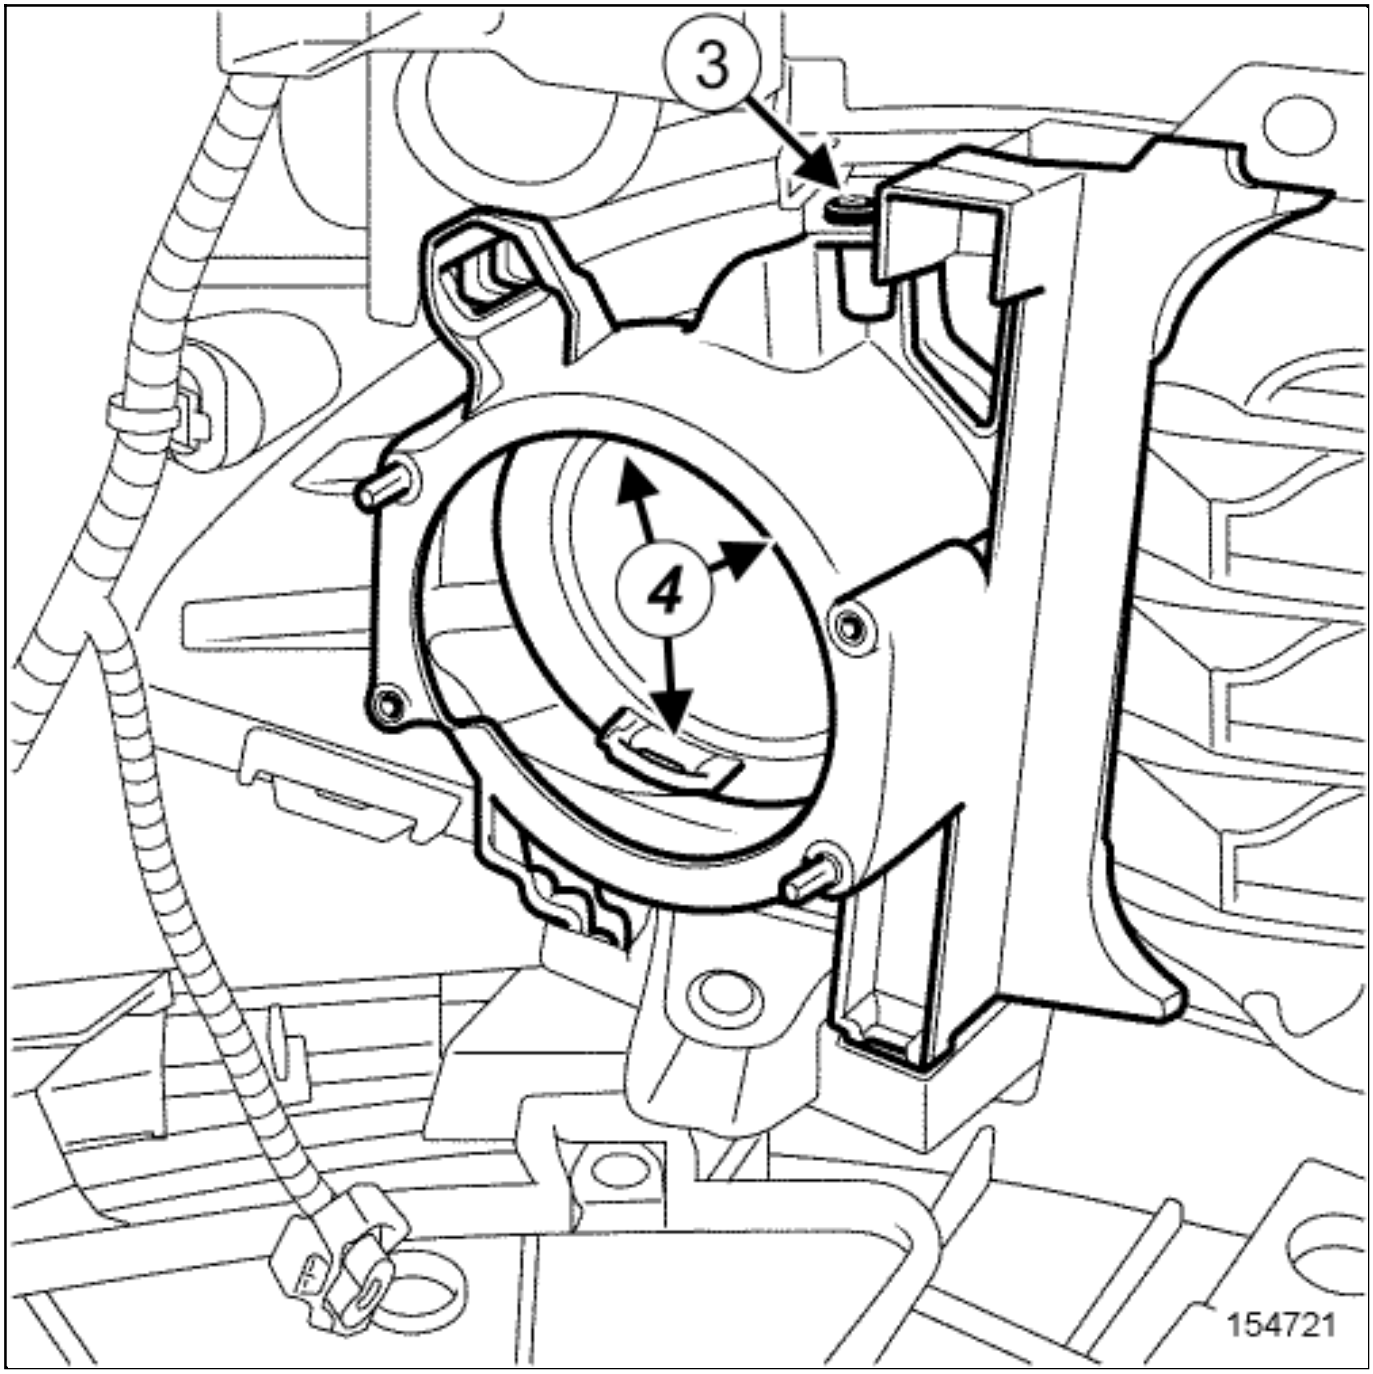


STRIPPING

1. STRIPPING PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

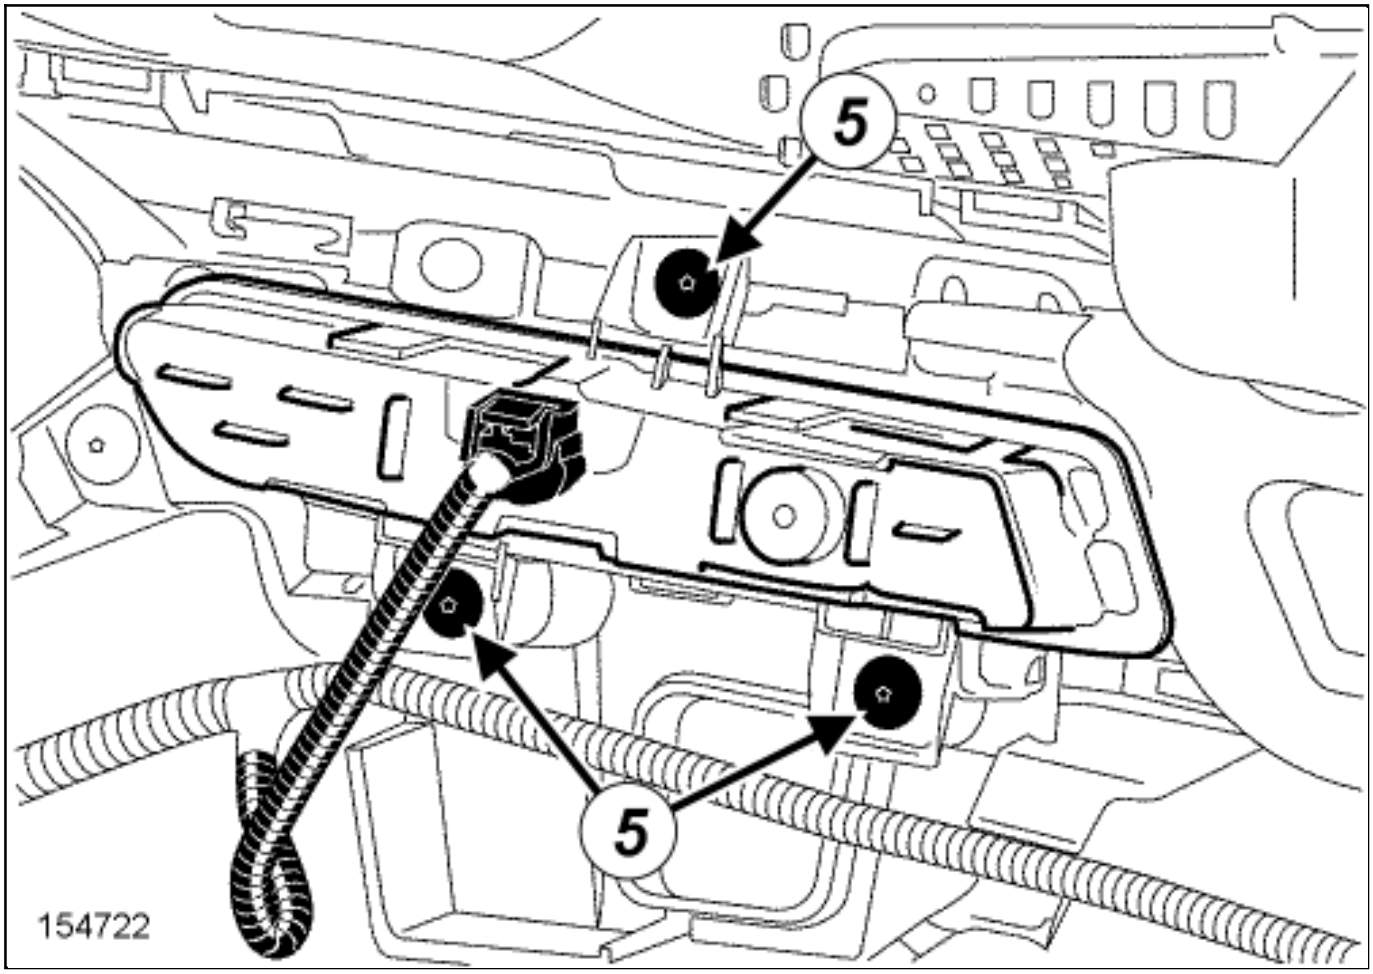
- Remove:
  - the front wheelsFront hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liners(see 55A, Exterior protection, Exterior body front trim assembly: Exploded view) ,
  - the front bumper(see 55A, Exterior protection, Front bumper assembly: Exploded view) .



2. STRIPPING OPERATION

Disconnect the fog light connector(1) .

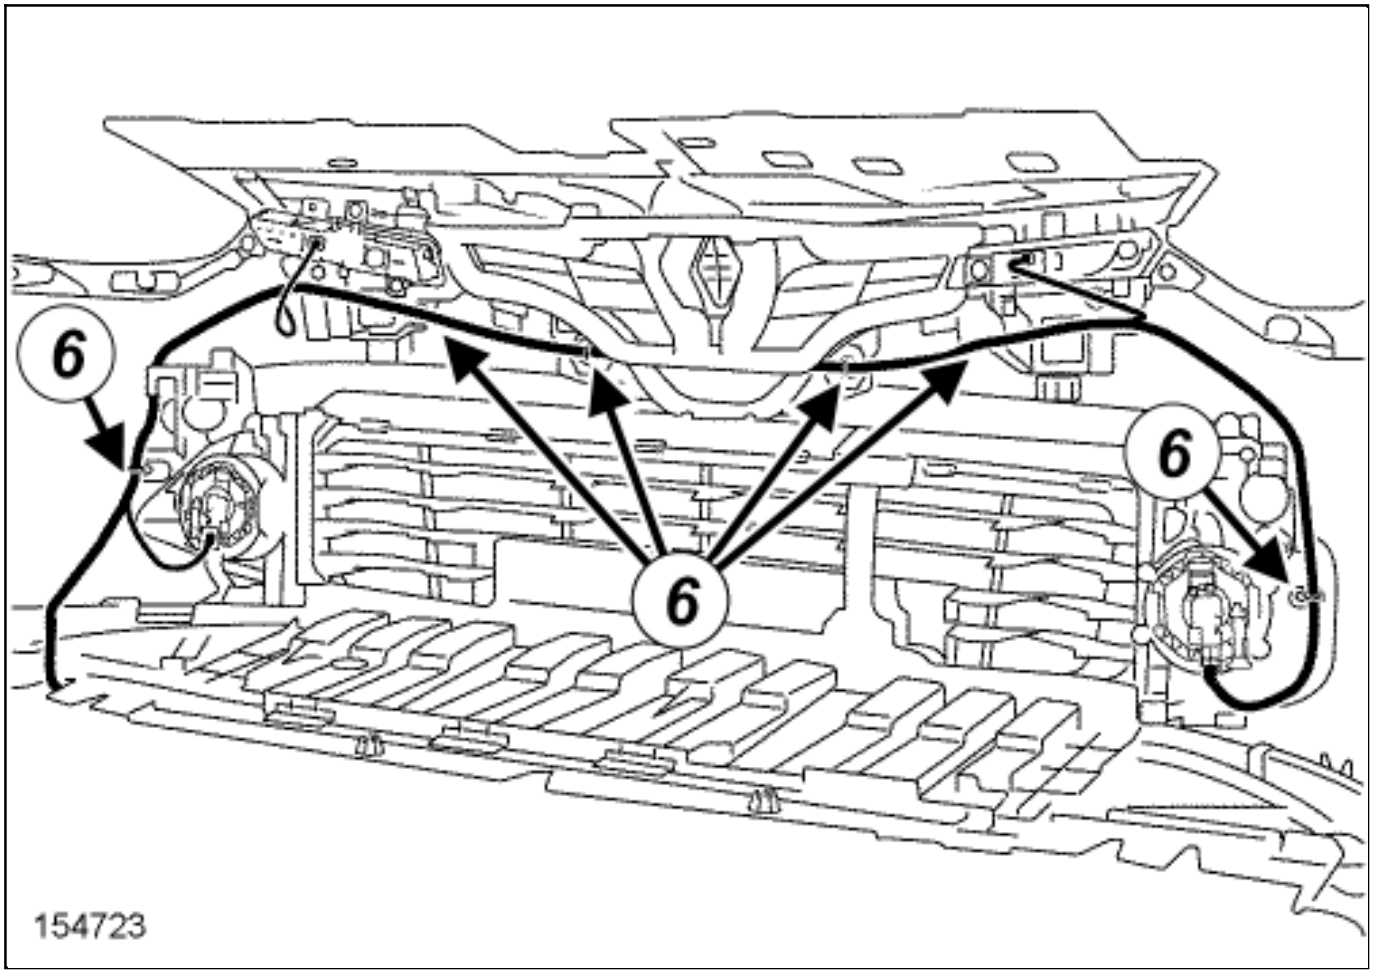
Remove:



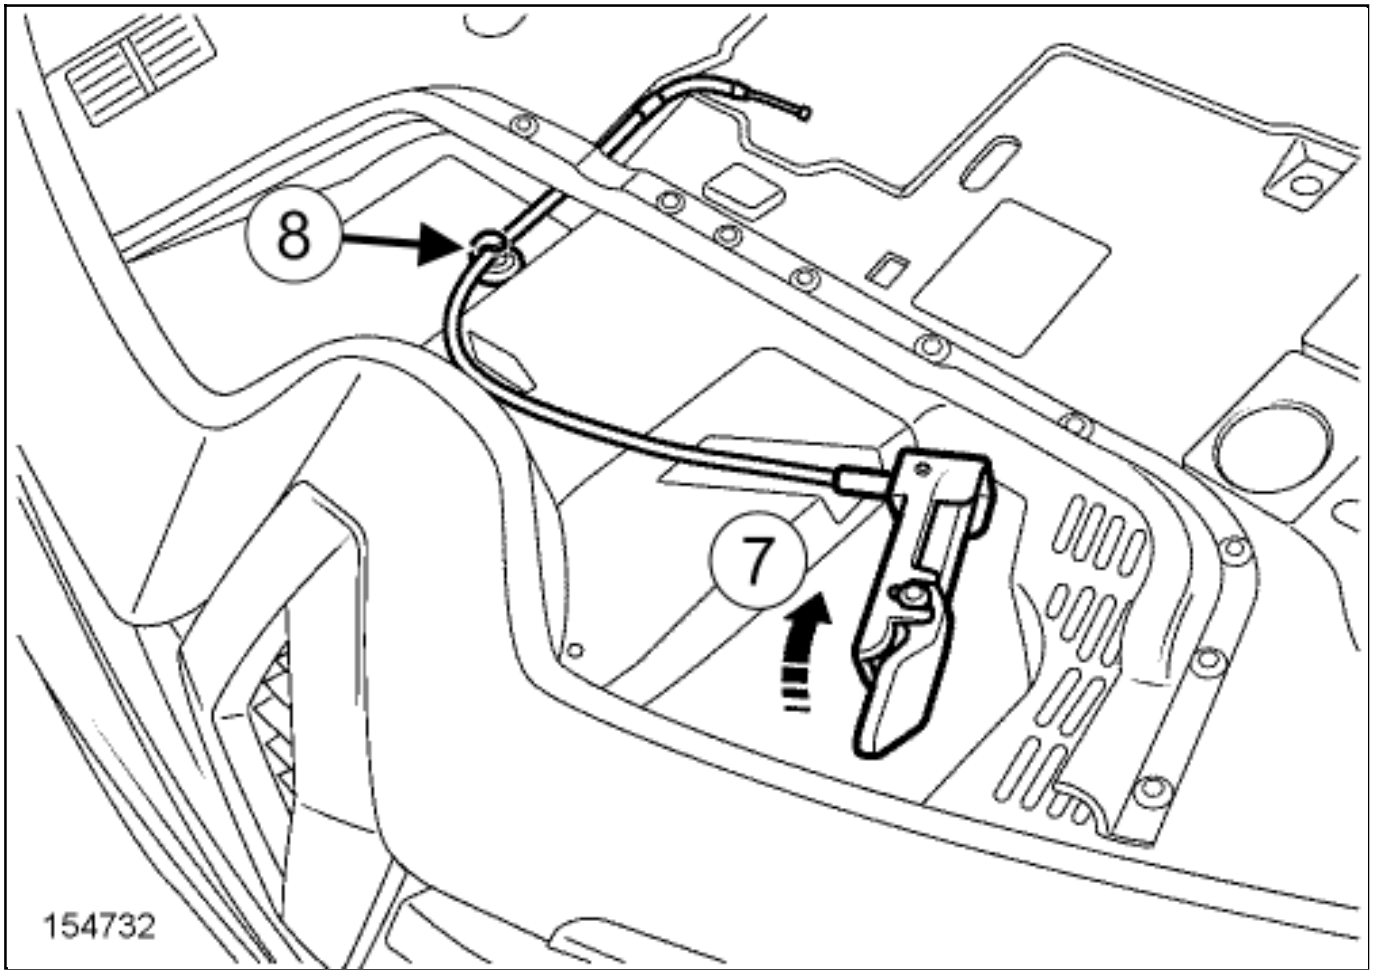
- the fog light screws(2) ,
- the fog light.

Remove the fog light mounting screw(3) .

Unclip:



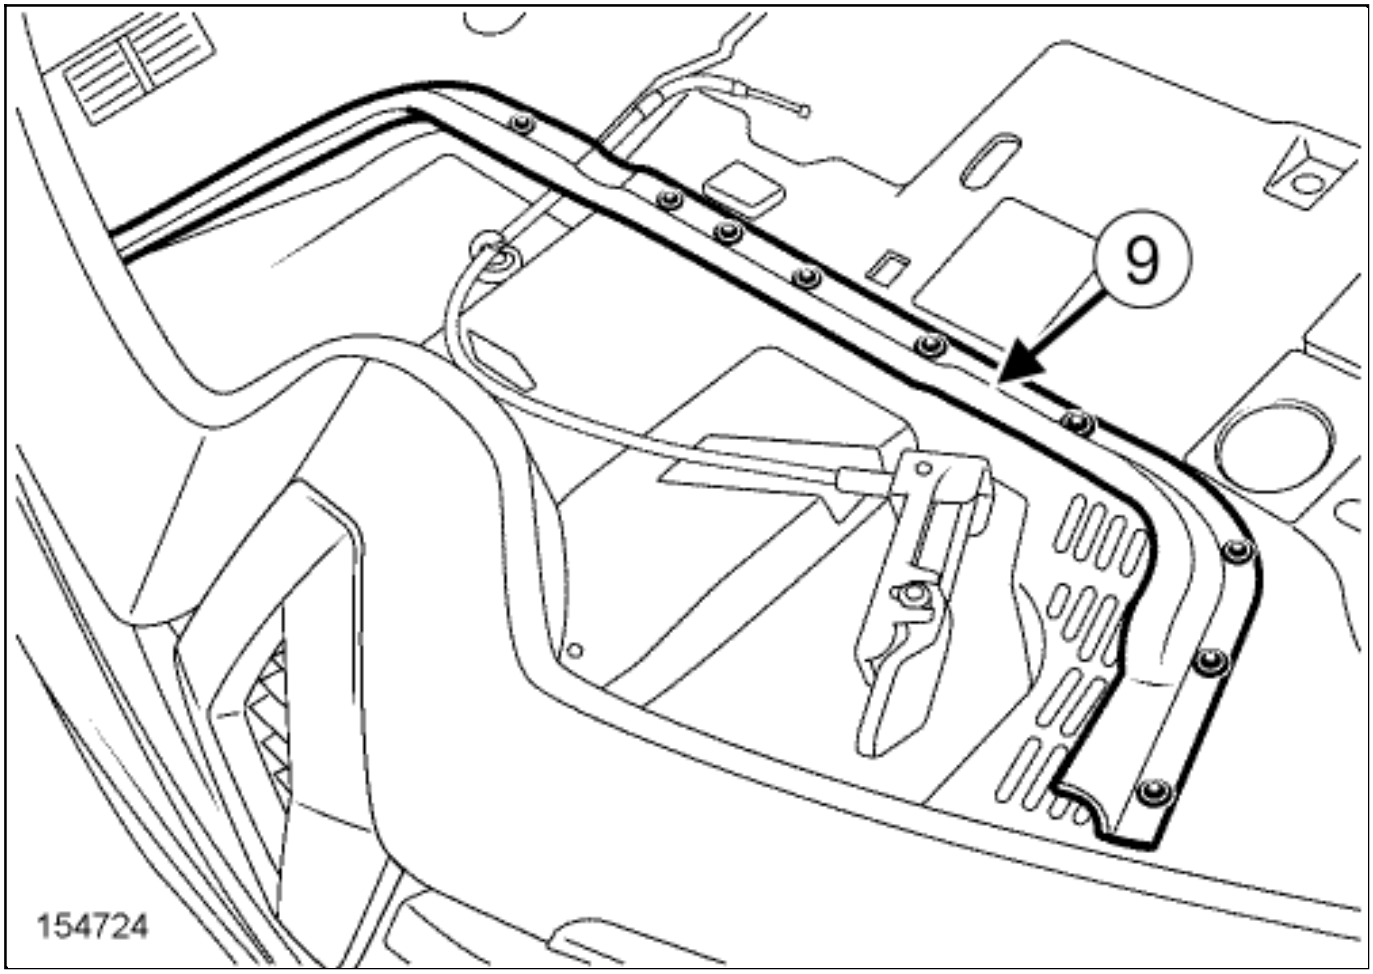
- the fog light mounting,
- the fog light trim piece at(4) .



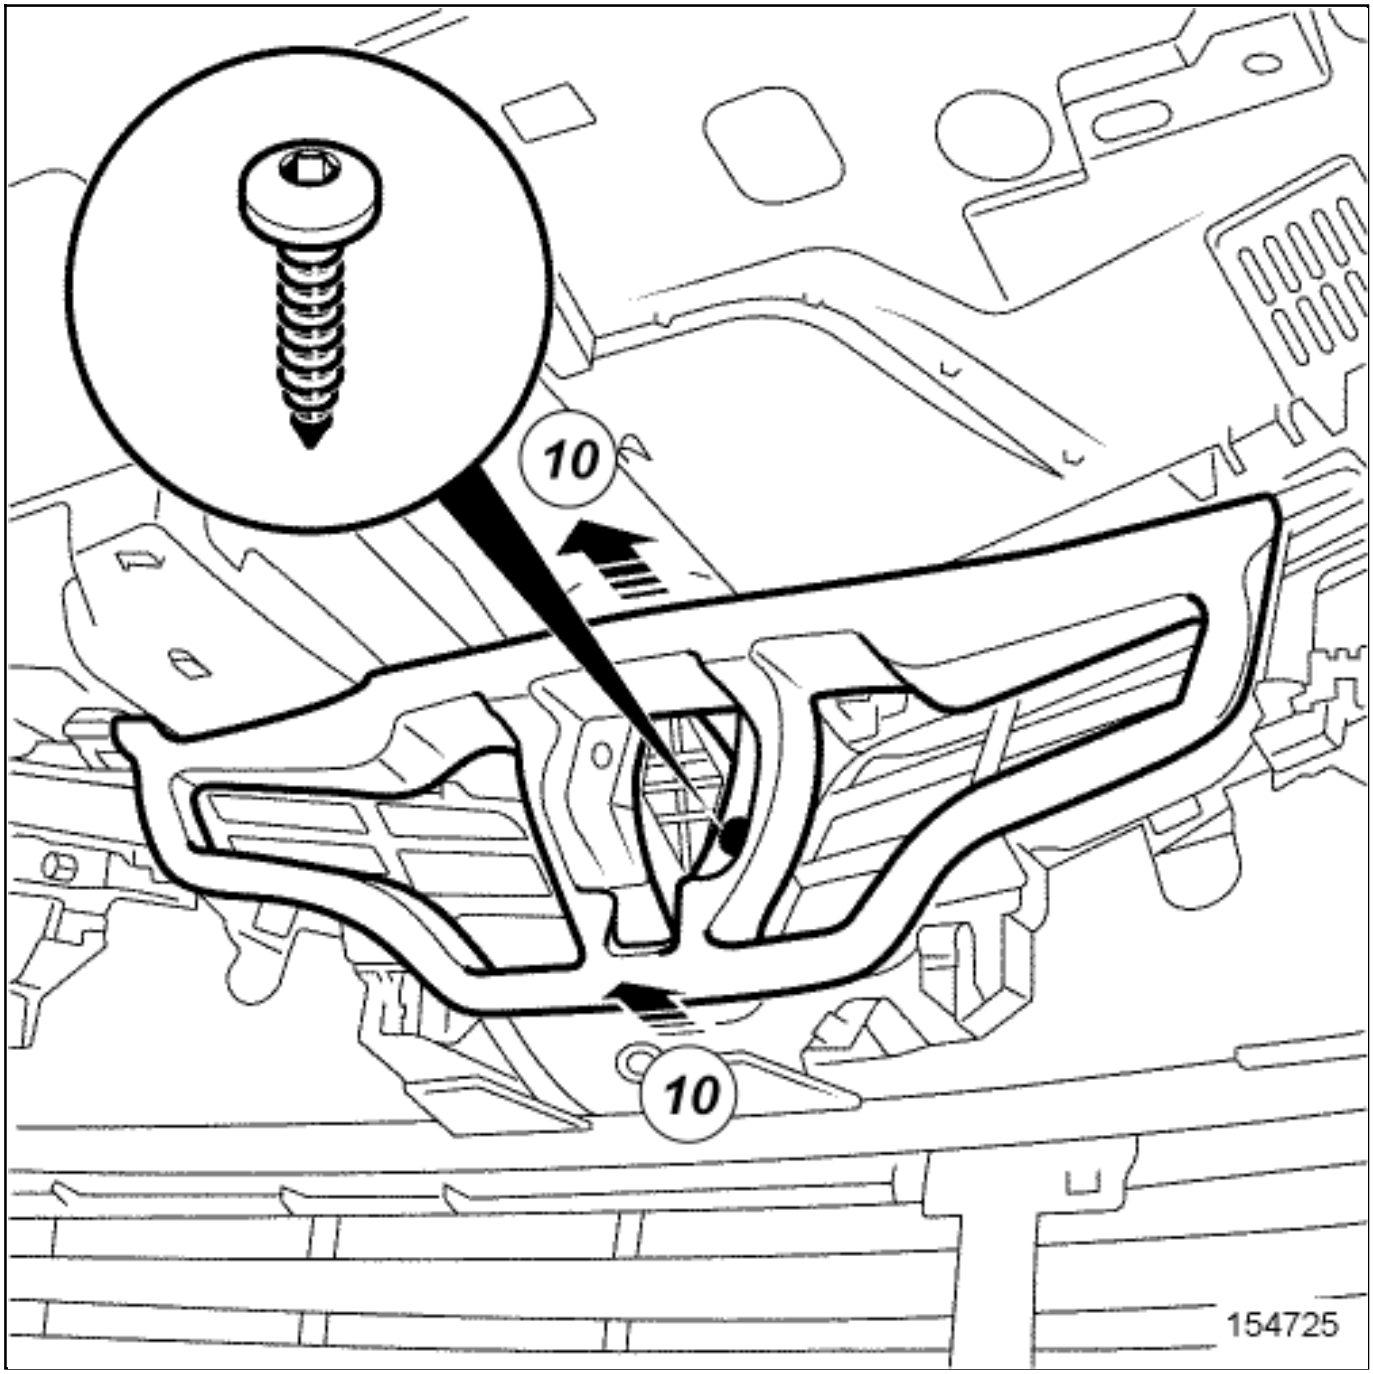
Disconnect the daytime running lights connector.

Remove:

- the daytime running lights screws(5) ,
- the daytime running lights.

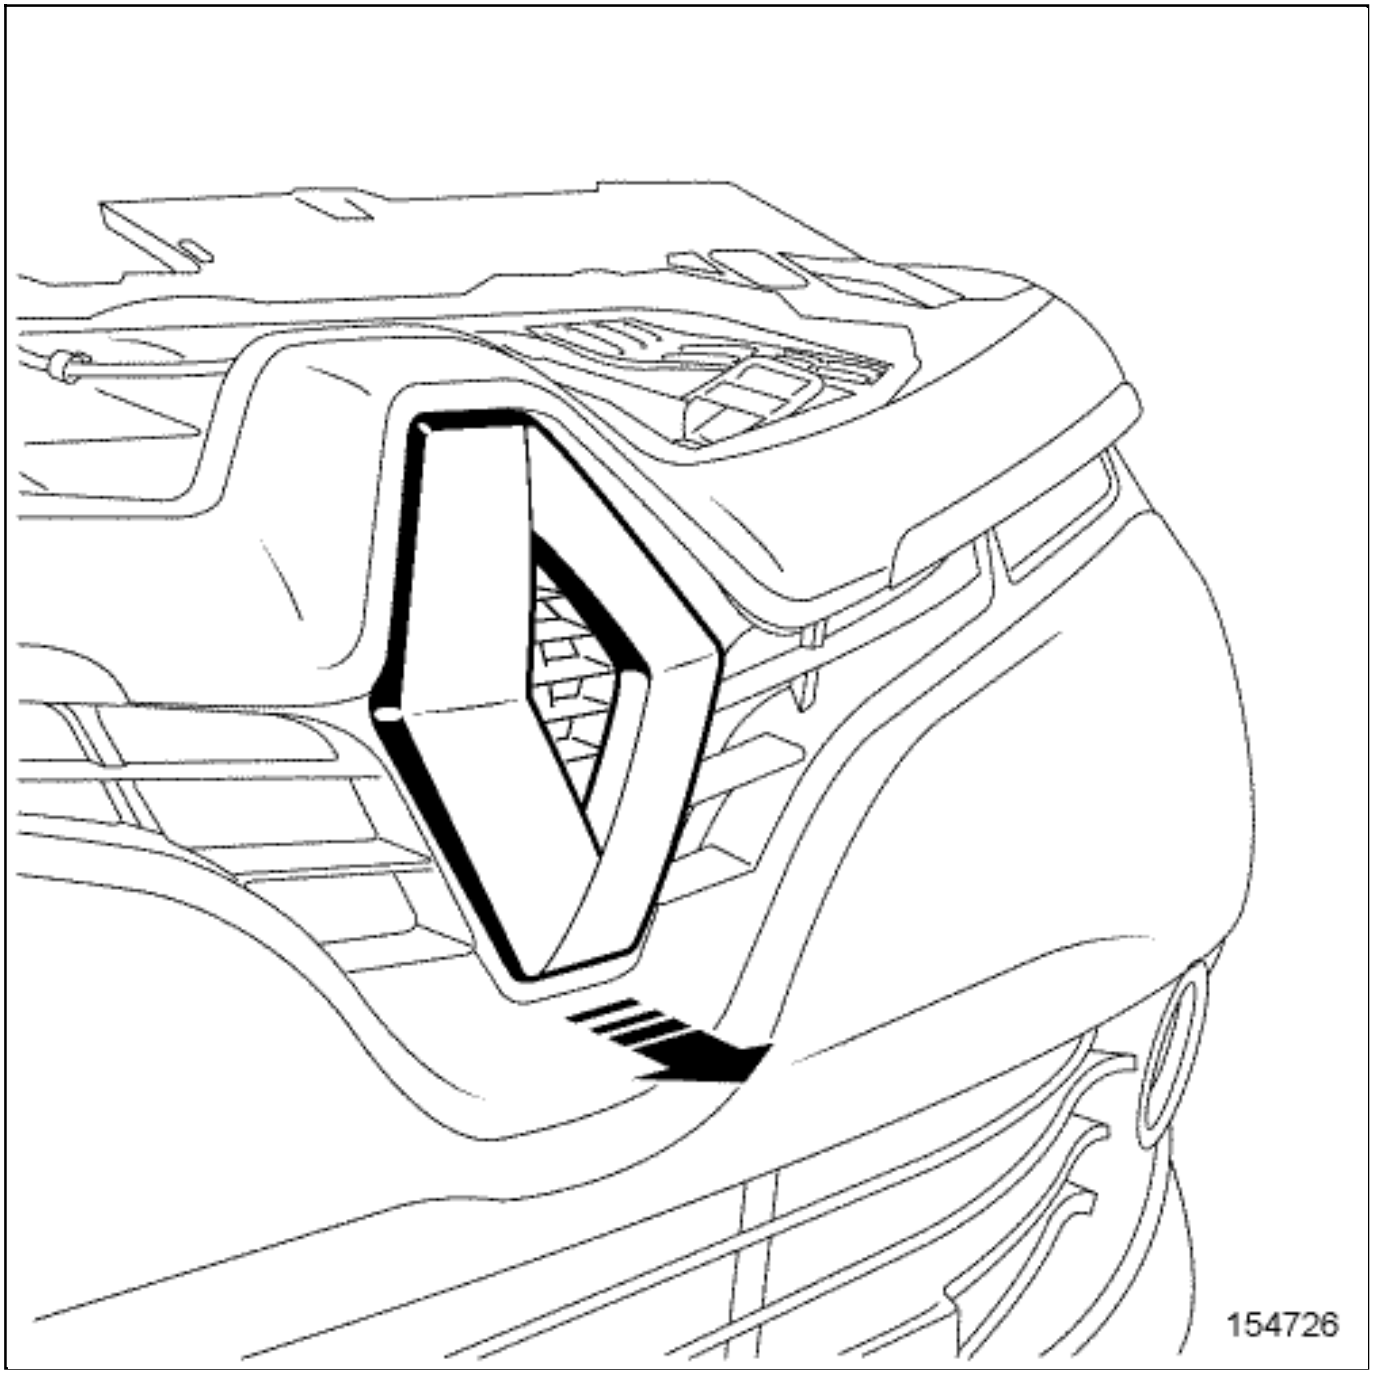


Unclip the front bumper wiring at(6) .

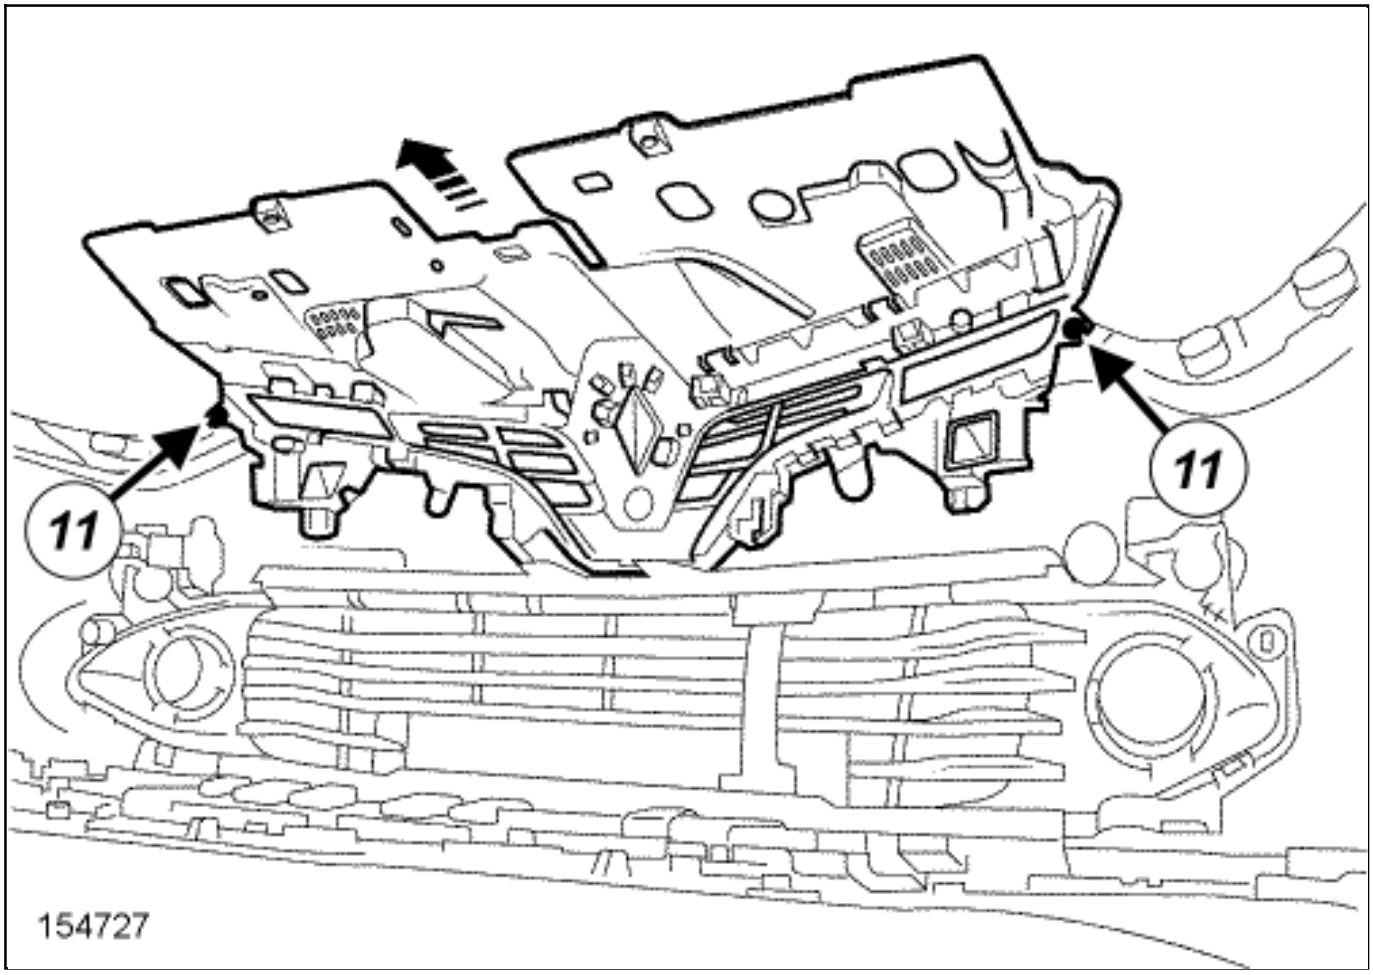


Unclip:

- the bonnet release control(7) ,
- the bonnet opening cable at(8) .



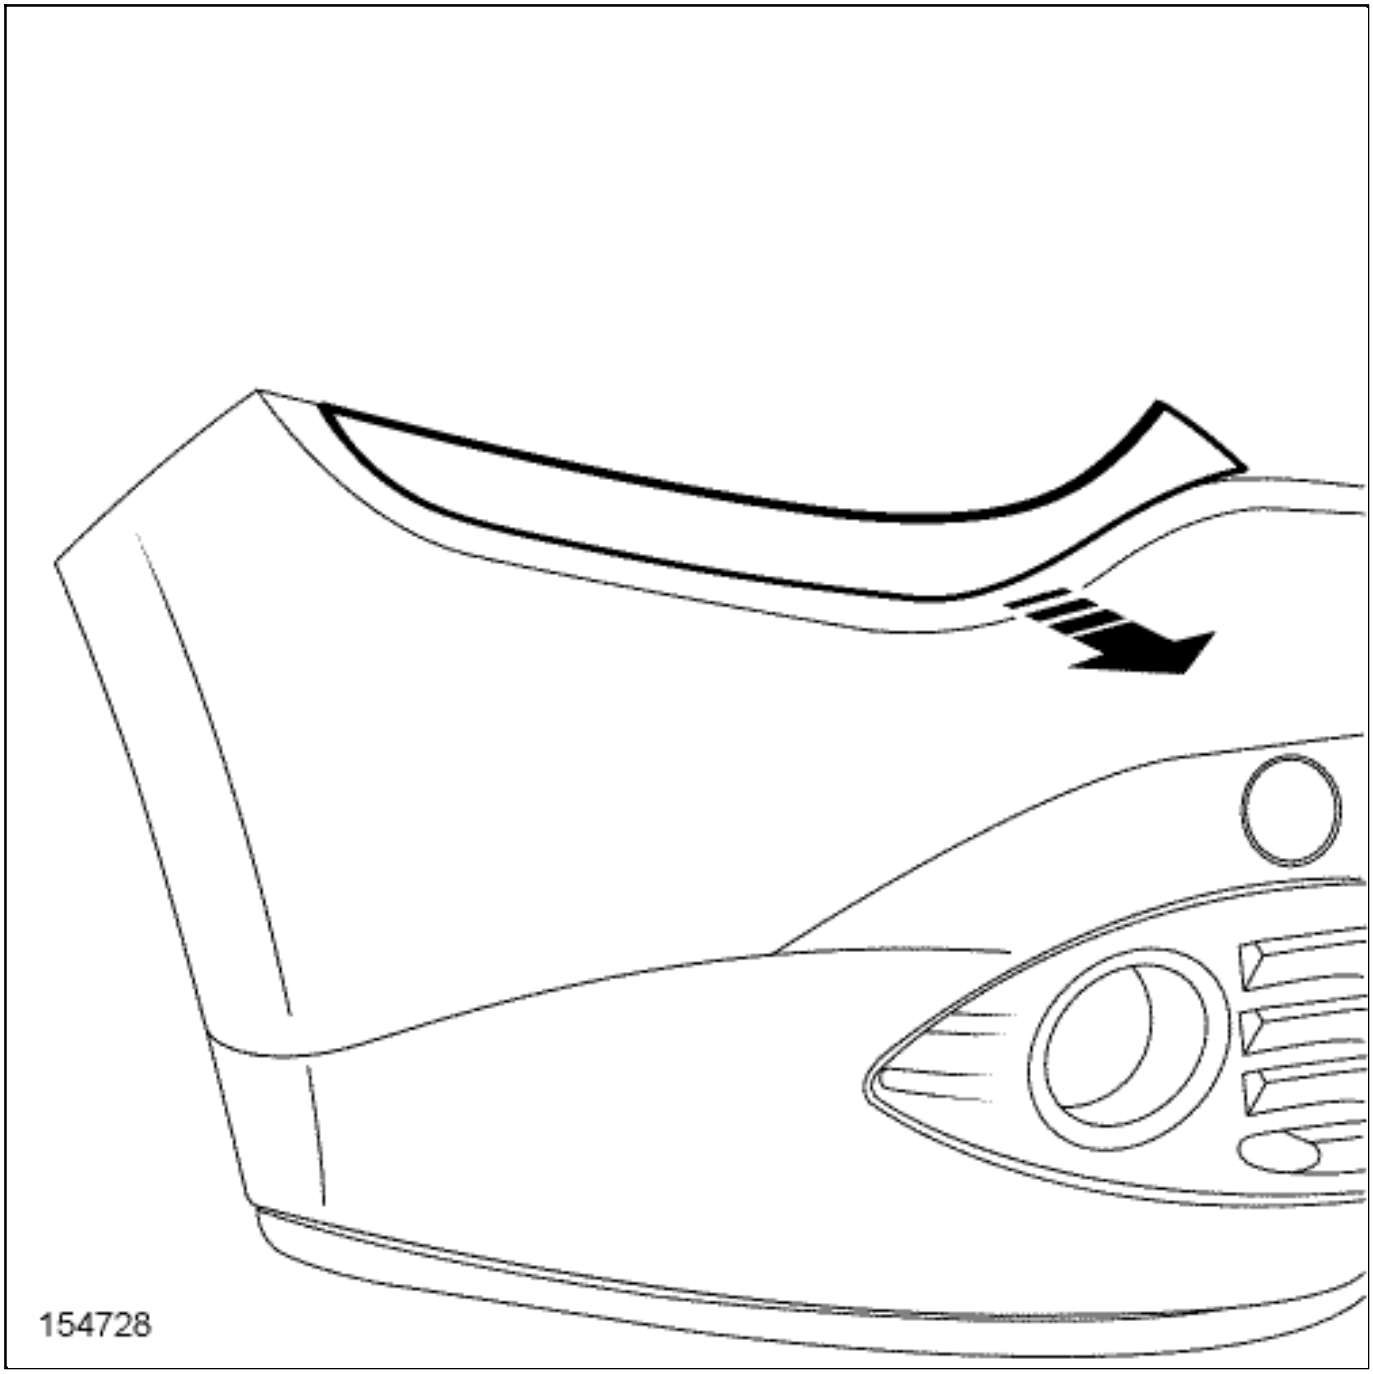
- Unclip the pins from the bonnet seal using the toolSet of trim removal levers.(Car. 1363) .
- Remove the bonnet seal(9) .



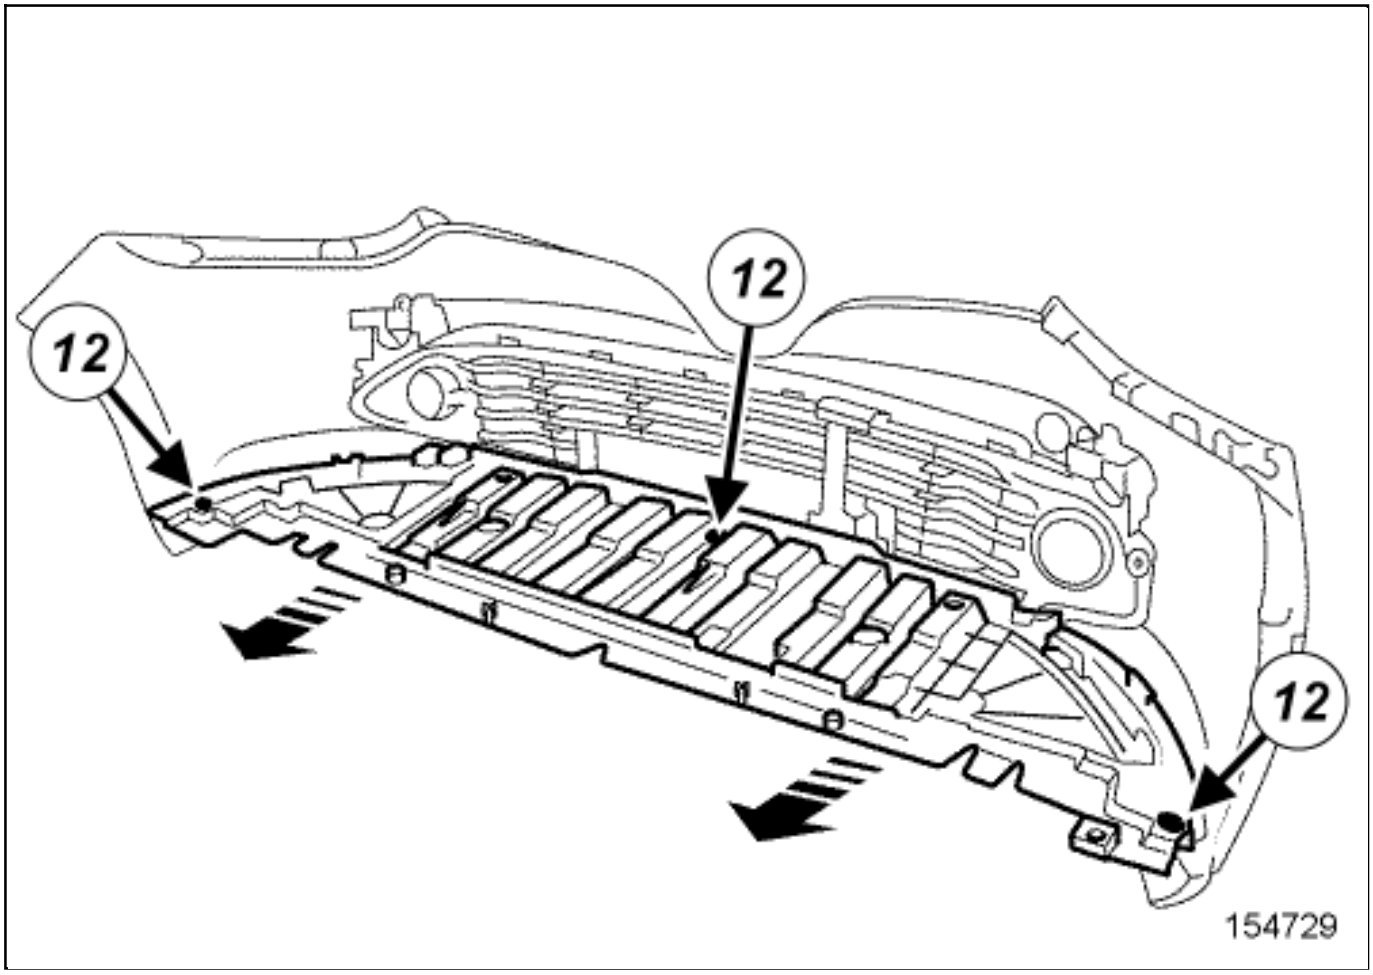
Remove the front bumper air inlet grille stiffener screw.

Unclip the front bumper air inlet grille stiffener at(10) .

Unclip the front badge following the direction of the arrow using the toolSet of trim removal levers. (Car. 1363) .



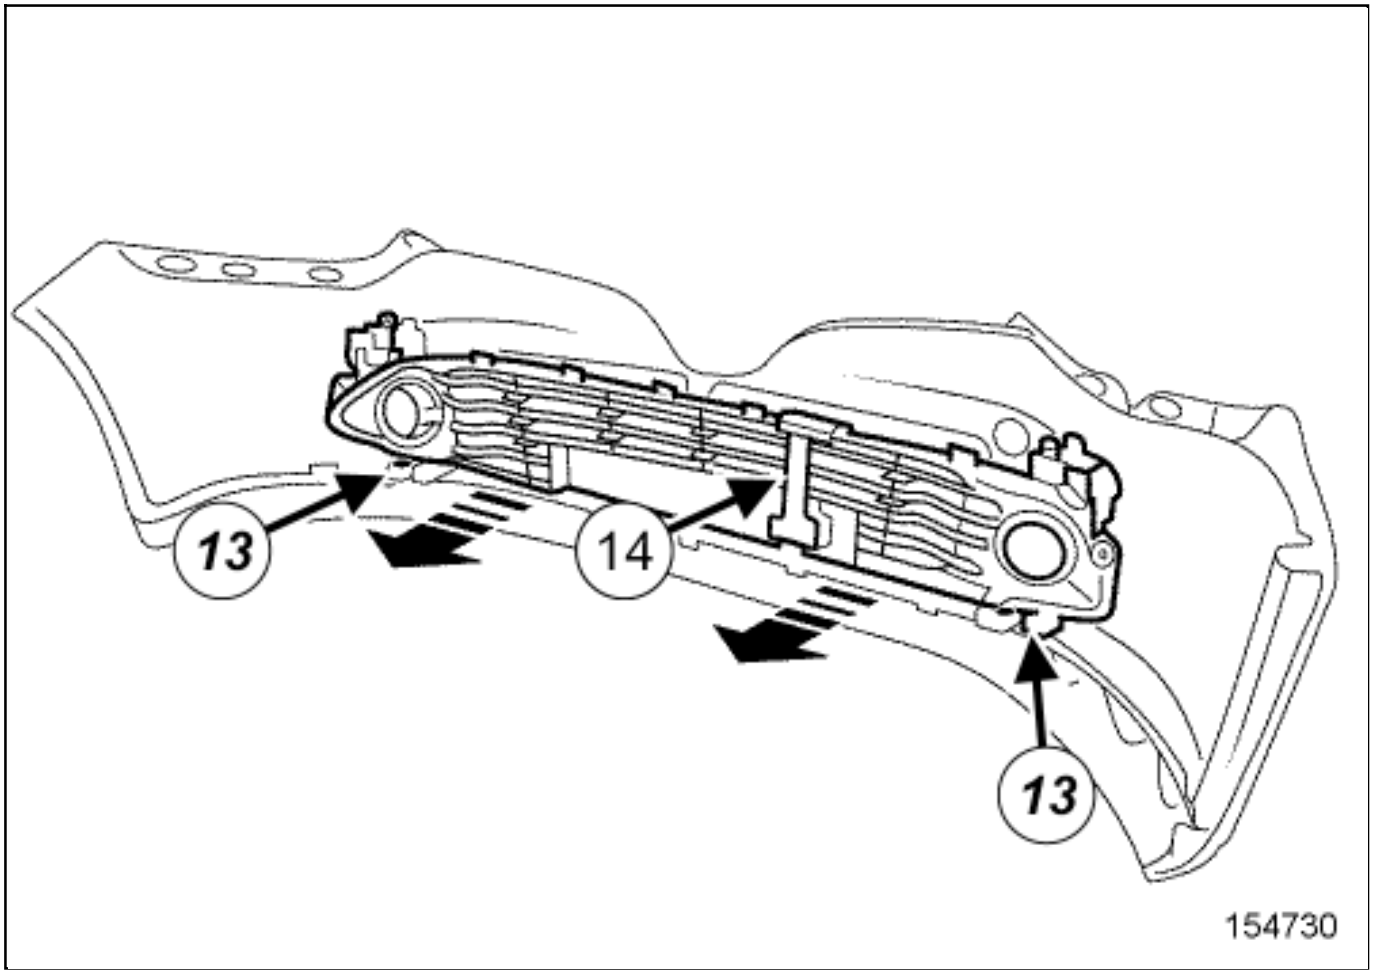
Remove the rivets(11) from the front bumper air inlet grille.



Unclip the front bumper air inlet grille.

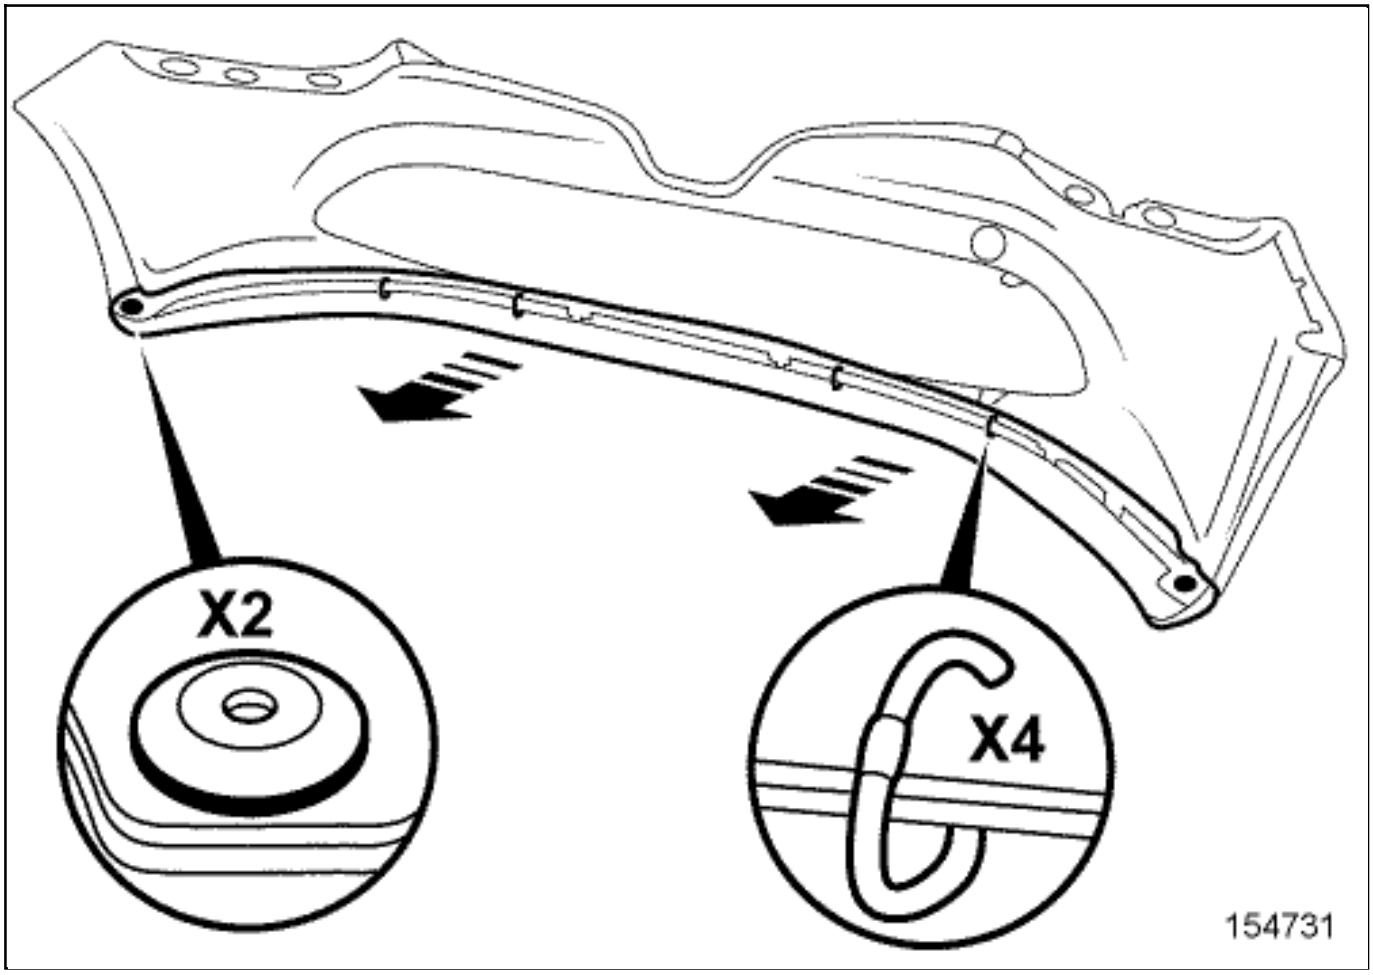
Unclip (see 55A, Exterior protection, Front bumper assembly: Exploded view) :

- the front bumper trims,
- the front bumper upper trim.



Unclip the headlight cover.

Remove the rivets(12) from the front bumper lower diffuser.



Unclip the front bumper lower diffuser.

- Remove the rivets(13) from the front bumper lower grille.

- Remove the front bumper lower grille.

- Unclip the front bumper deflector lower trim(14) .

- Cut the clips of the aerodynamic element.
- Remove the rivets from the aerodynamic element.
- Unclip the aerodynamic element.

REBUILDING

1. REBUILDING PREPARATION OPERATION

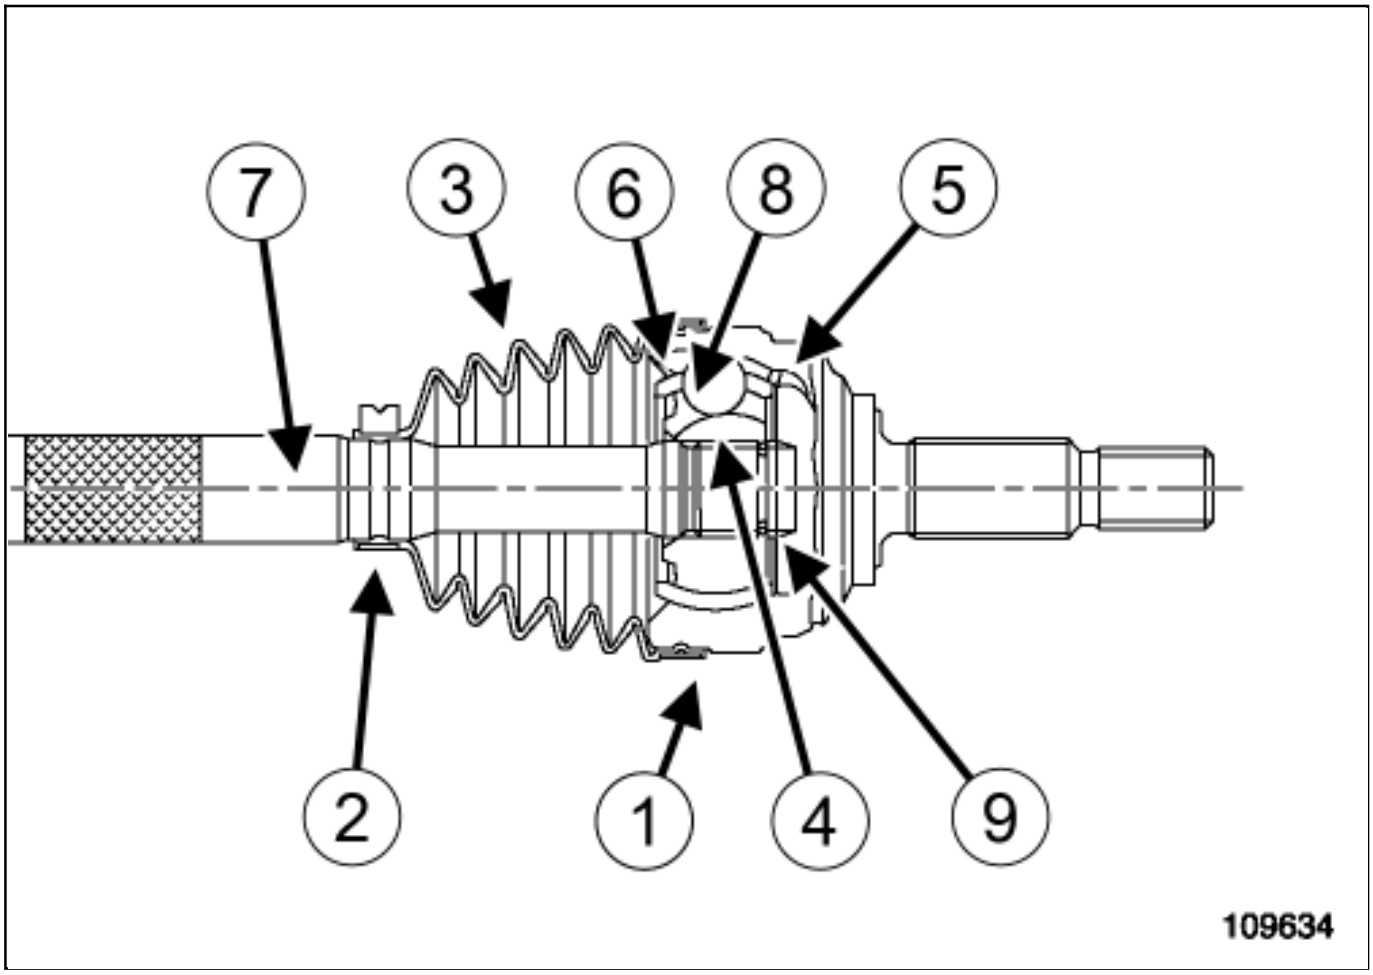
- parts always to be replaced: front bumper rivet .

parts always to be replaced: Front bumper clip .

2. REBUILDING

Proceed in the reverse order to removal.

FRONT DRIVESHAFT GAITER, WHEEL SIDE: REMOVAL - REFITTING



Note, one or more warnings are present in this procedure

Special tooling required	
Type clip pliers for driveshafts with a thermoplastic gaiter.	Tav. 1168
Pliers for the driveshaft gaiter collar.	Tav. 1784

Equipment required
steel inertia hammer
parts washer
roll pin punch

parts always to be replaced:
Front driveshaft gaiter, wheel side
wheel side front driveshaft seal locking ring

(1) Big securing clip

(2) Small securing clip

(3) Driveshaft gaiter

(4) Ball hub

(5) Stub axle bowl

(6) Ball race

(7) Driveshaft

(8) Balls

(9) Lock ring

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

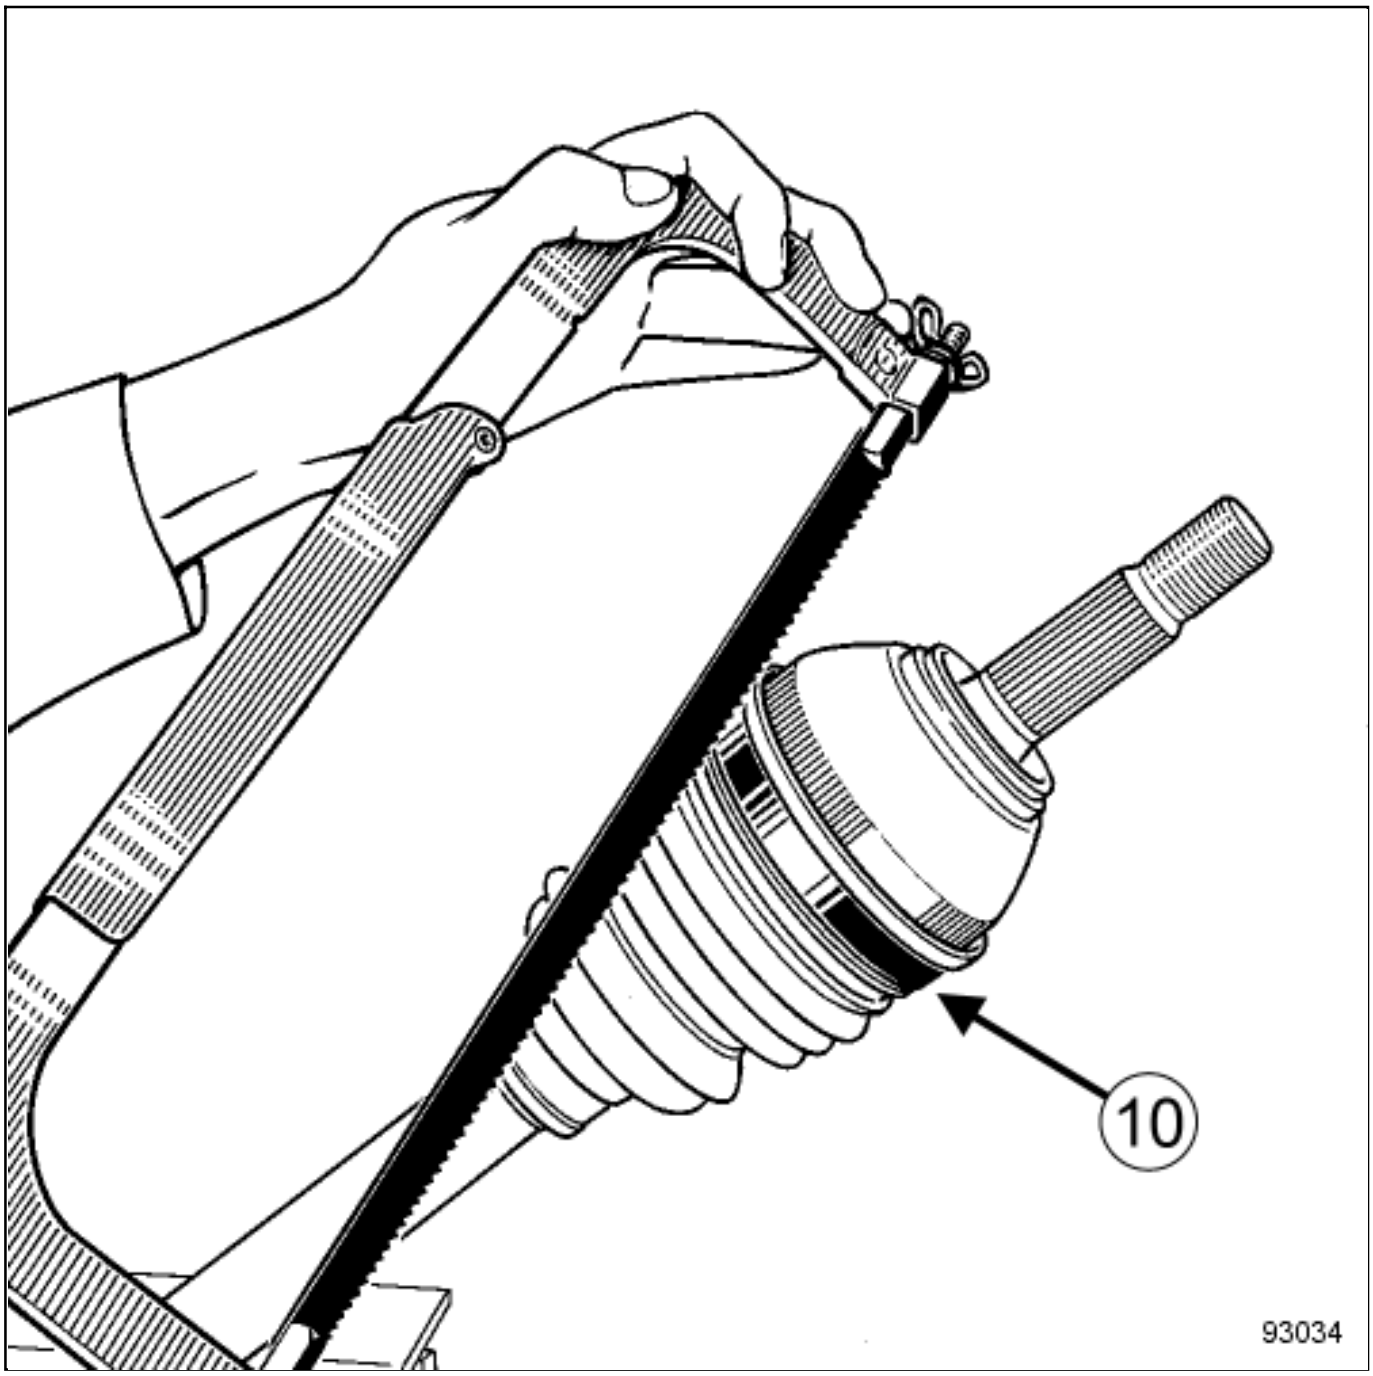
REMOVAL

1. REMOVAL PREPARATION OPERATION

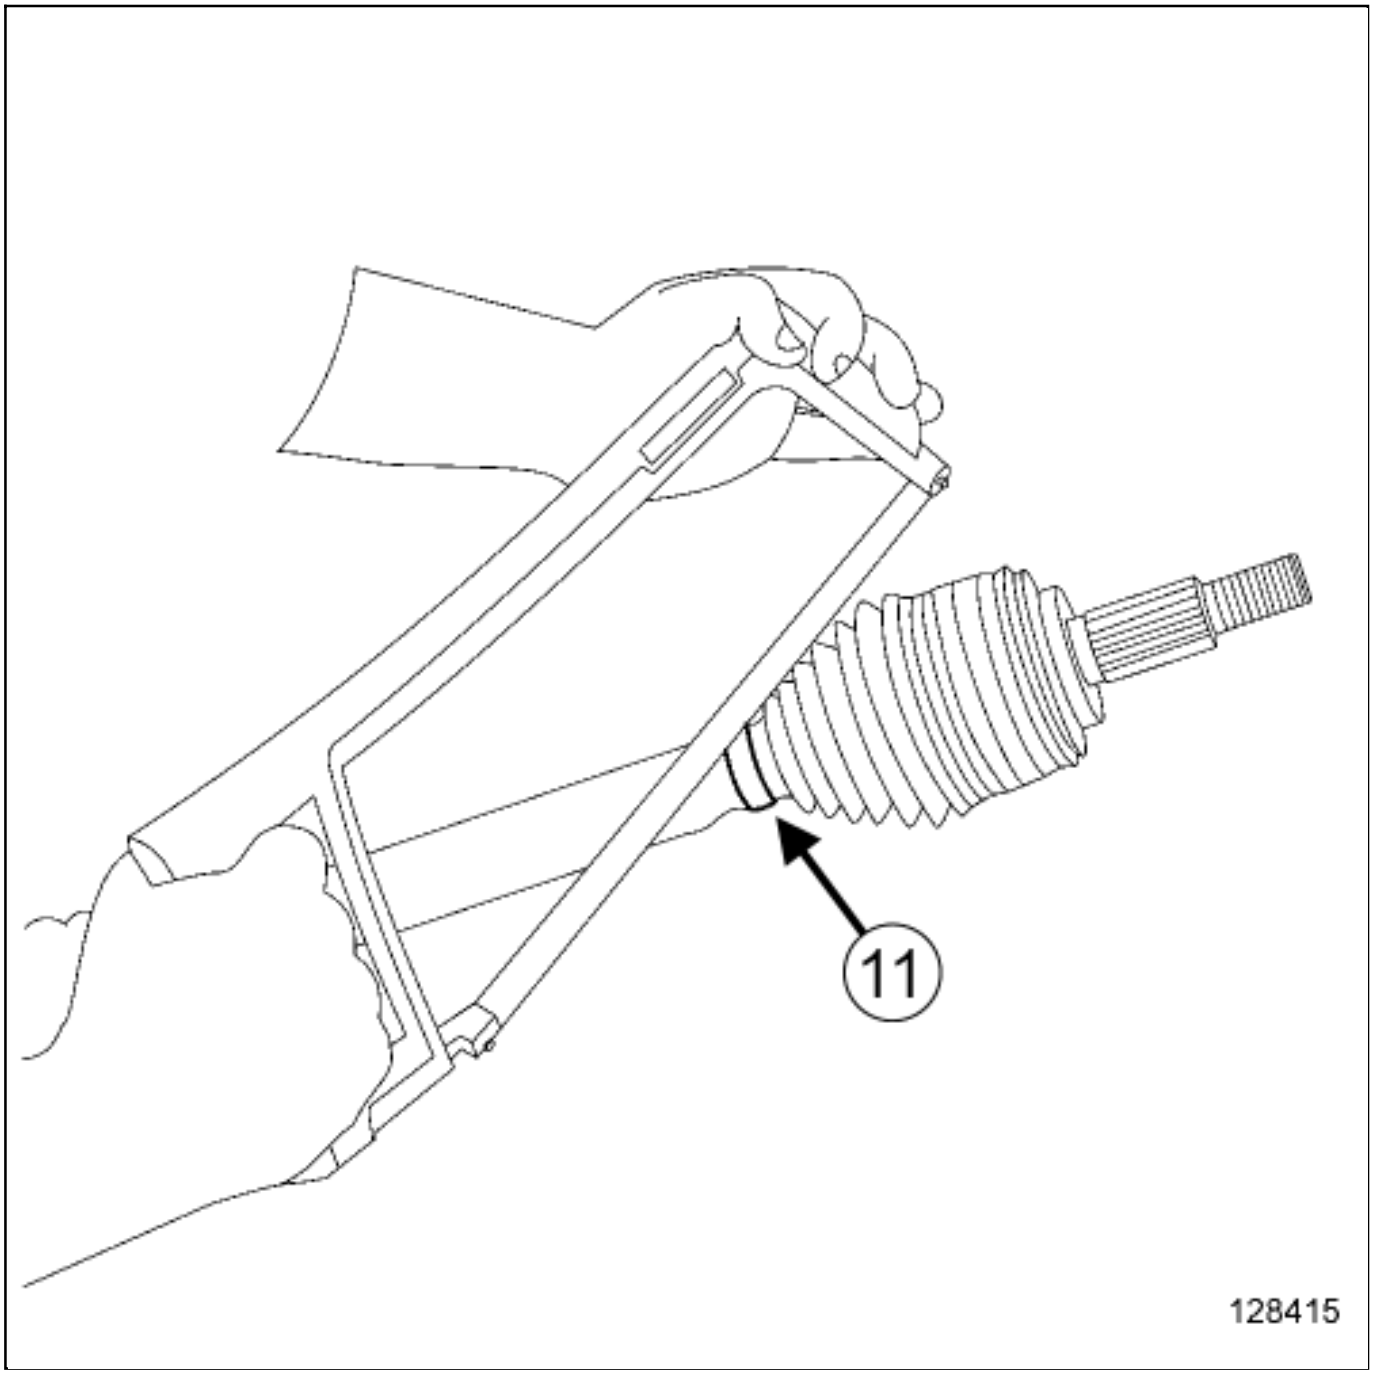
Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .

Remove:

- the engine undertray bolts,
- the engine undertray.



Drain the gearbox(see **Manual gearbox oils: Draining - Filling**) or **Automatic gearbox oil: Draining - Filling** .



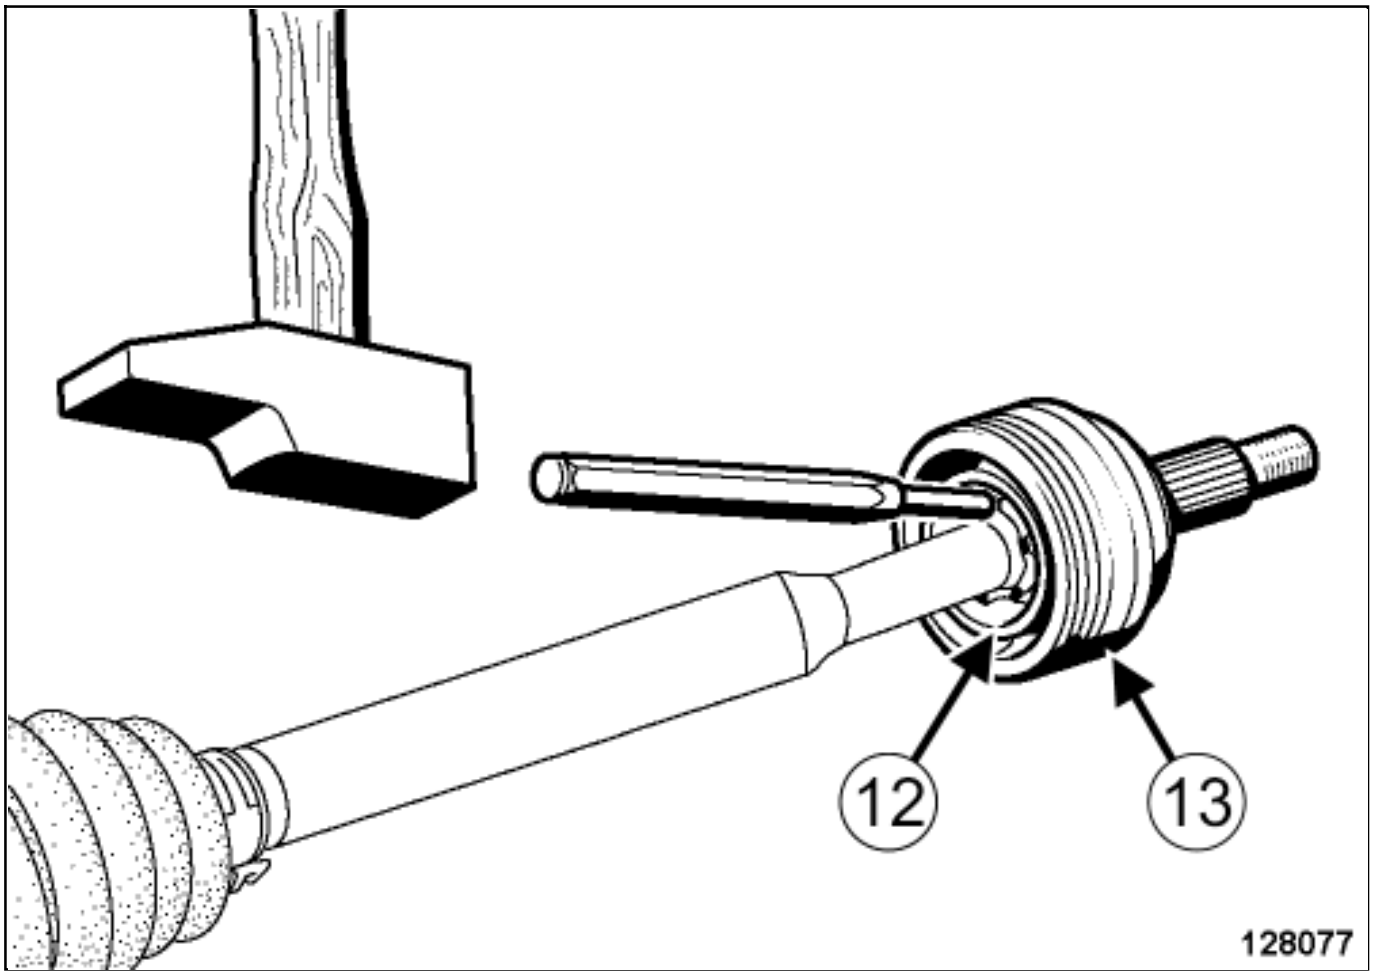
Remove:

- the wheel on the side concerned**Wheel: Removal - Refitting** ,
- the wheel driveshaft on the side concerned**(see 29A, Driveshafts , Front right-hand driveshaft: Removal - Refitting)** or**(see 29A, Driveshafts , Front left-hand driveshaft: Removal - Refitting)** .

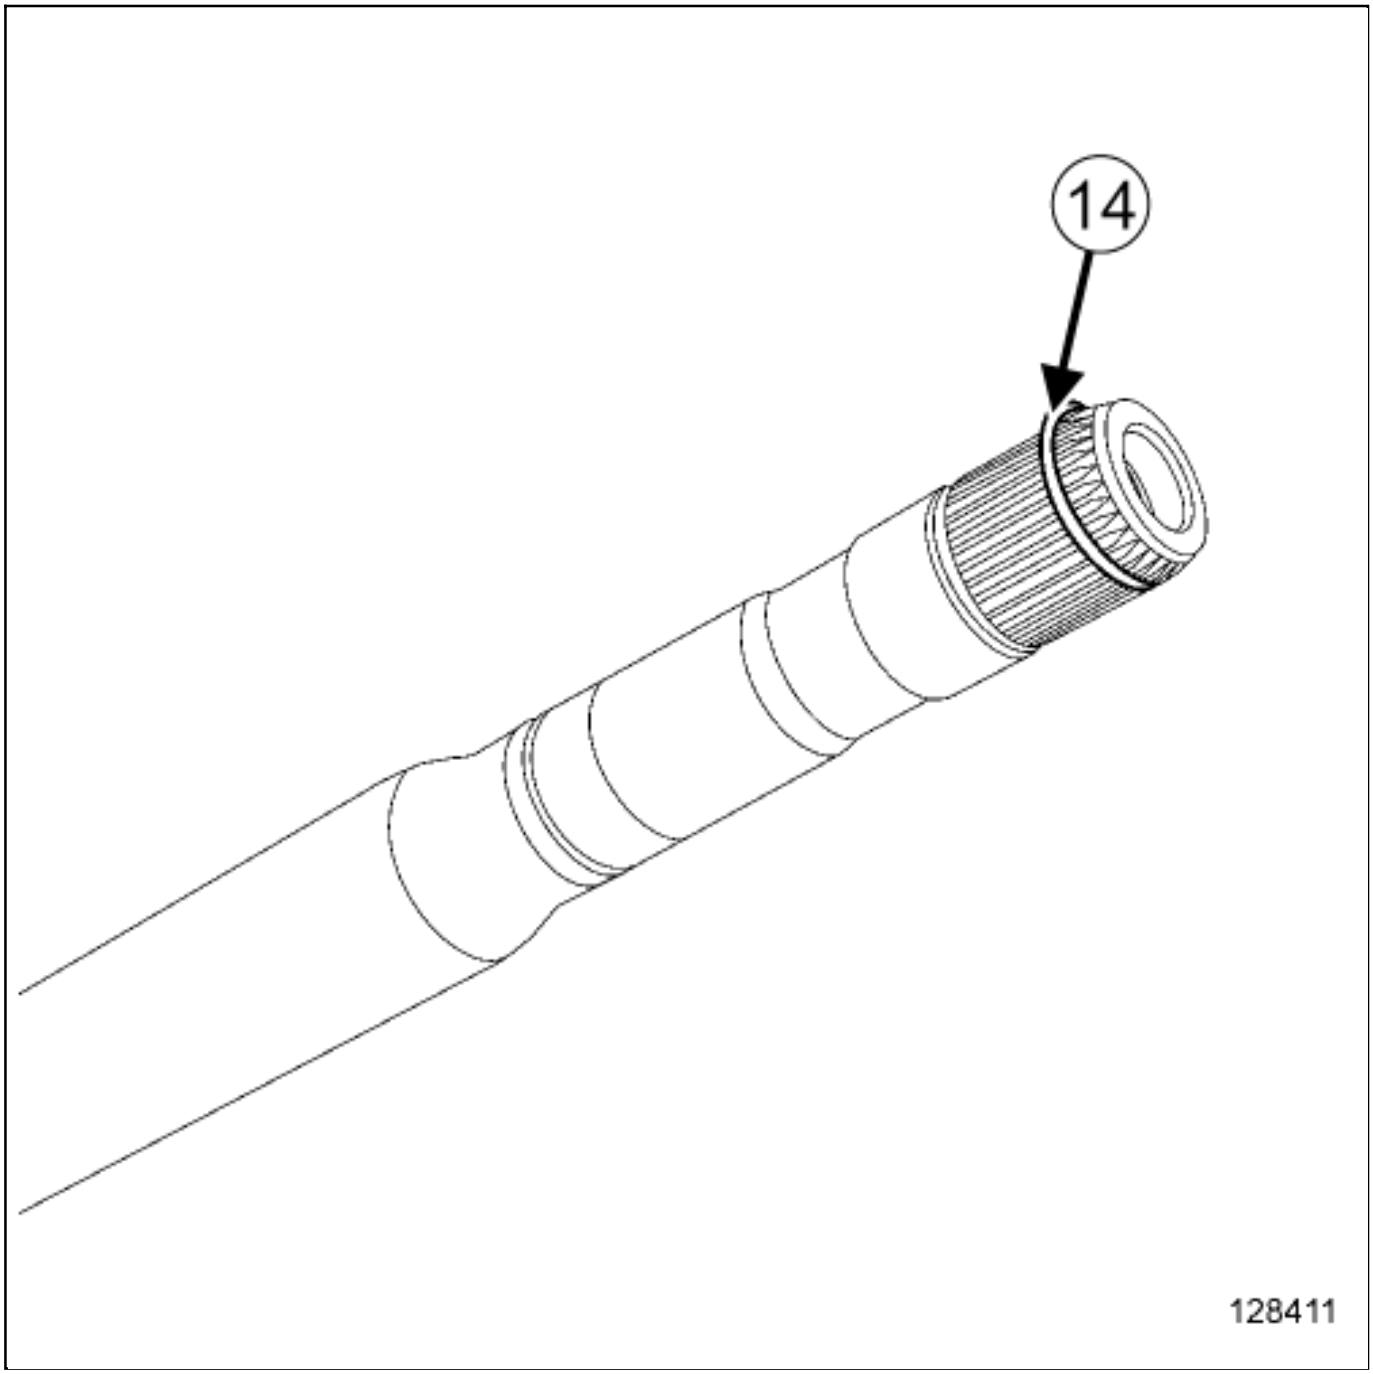
Remove the differential output seal on the side concerned(see **Differential output seal: Removal - Refitting**) .

2. REMOVAL OPERATION

10
93034



Cut the big securing clip(10) and the small securing clip(11) using cutting pliers or a metal saw, taking care not to damage the stub axle bowl and the driveshaft.



Push back the gaiter to release the stub axle bowl.

Cut the driveshaft gaiter.

Remove as much grease as possible.

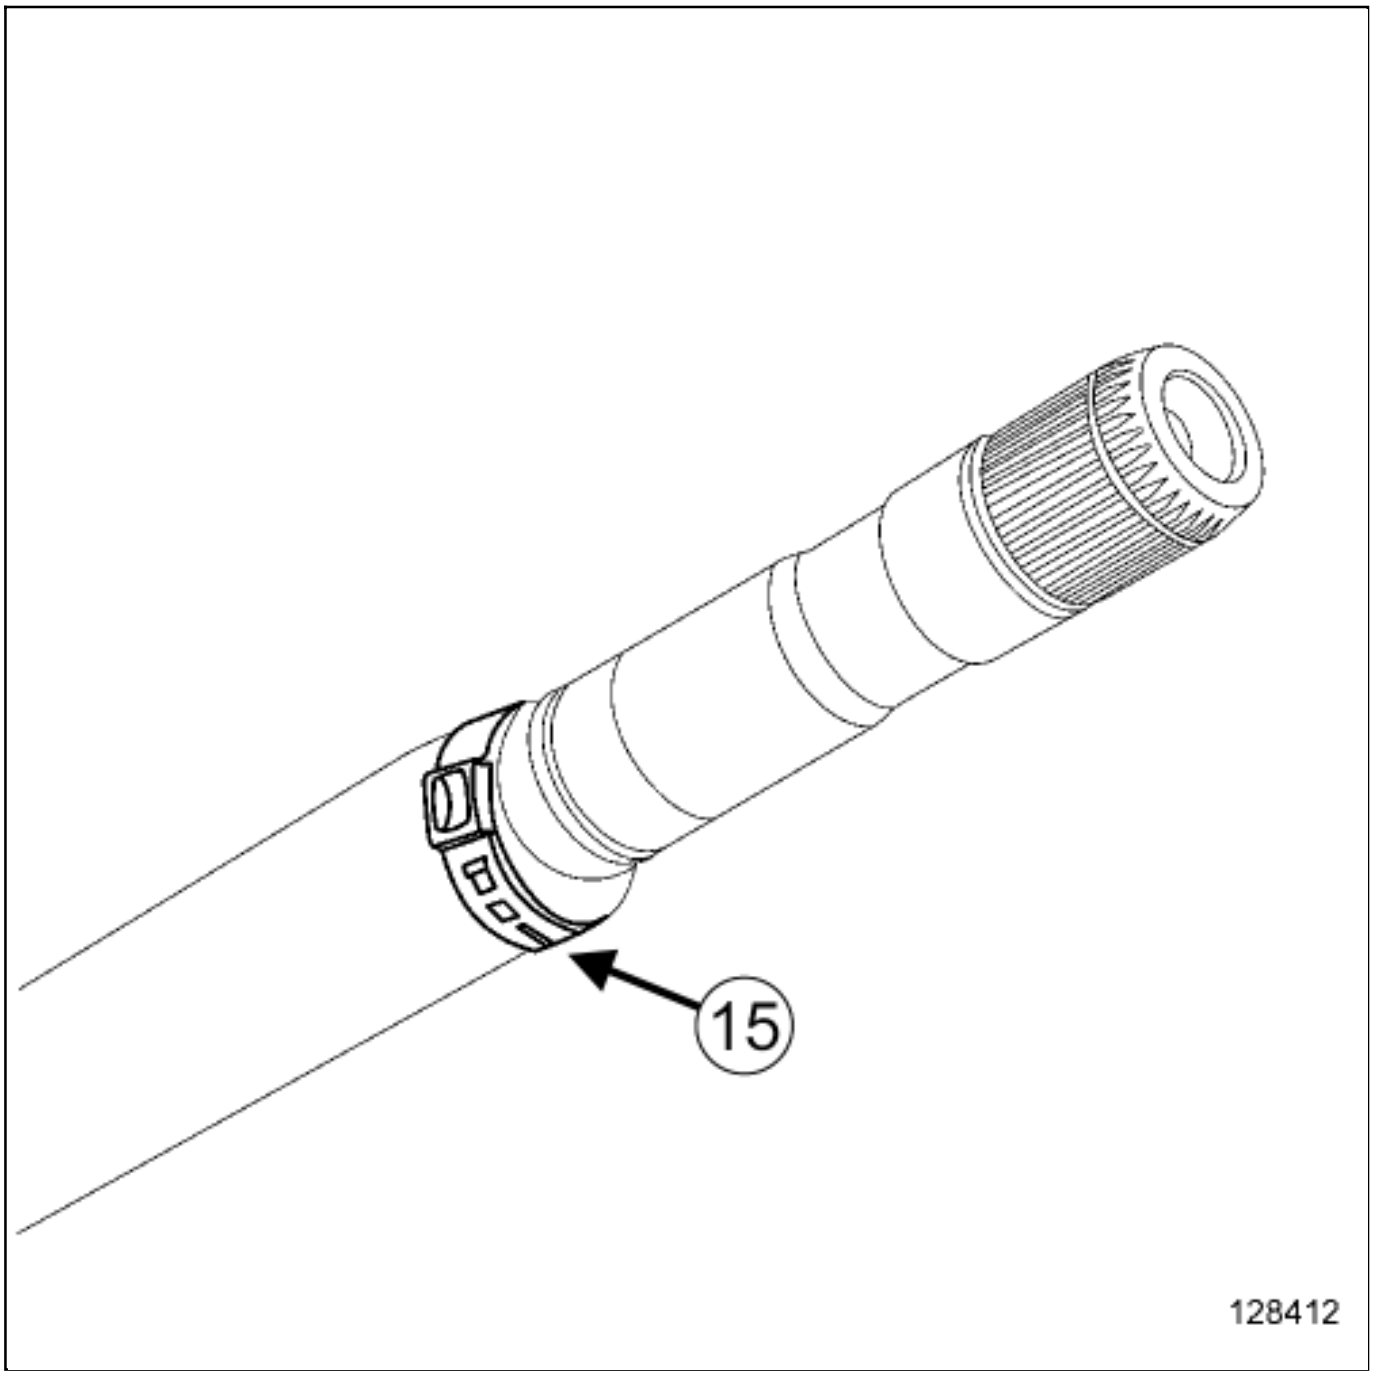
Using a steel inertia hammer and a roll pin punch, hit the ball hub(12) a few times to detach the stub axle bowl (13) from the driveshaft.

Remove the lock ring(14) .

REFITTING

1. REFITTING PREPARATION OPERATION

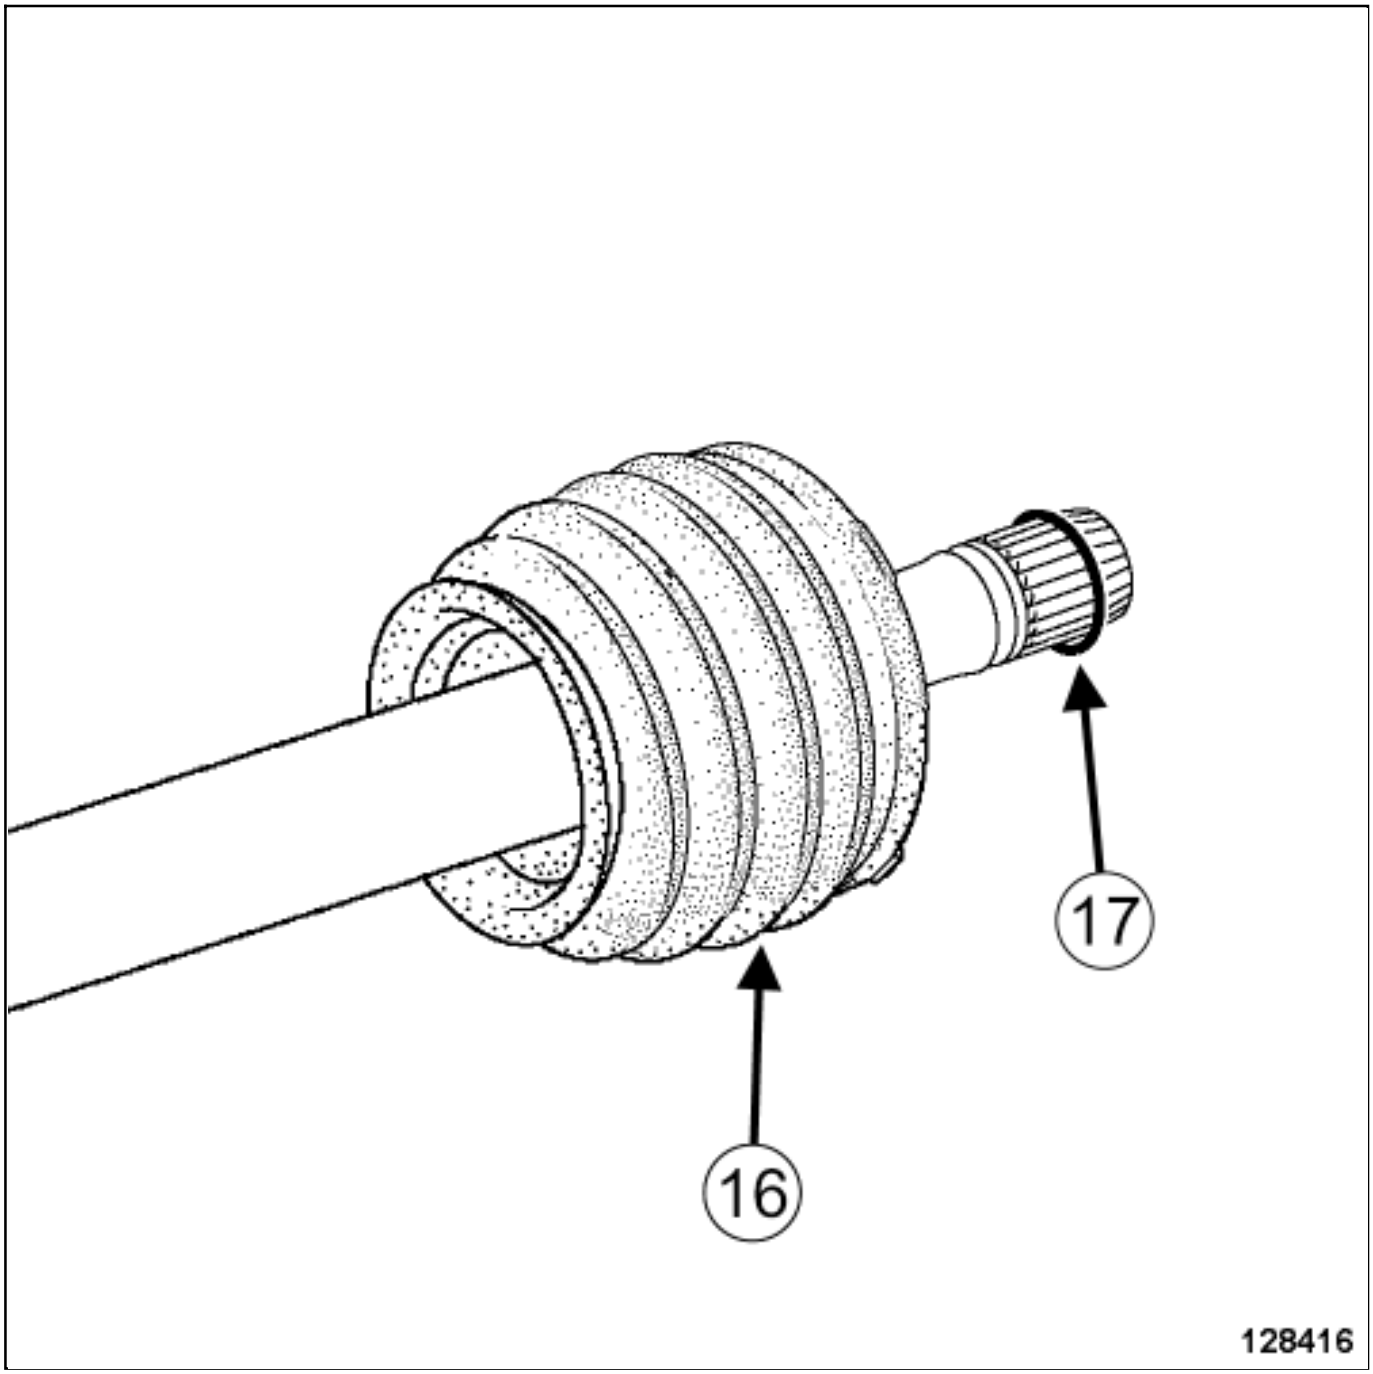
parts always to be replaced: Front driveshaft gaiter, wheel side .



parts always to be replaced: wheel side front driveshaft seal locking ring .

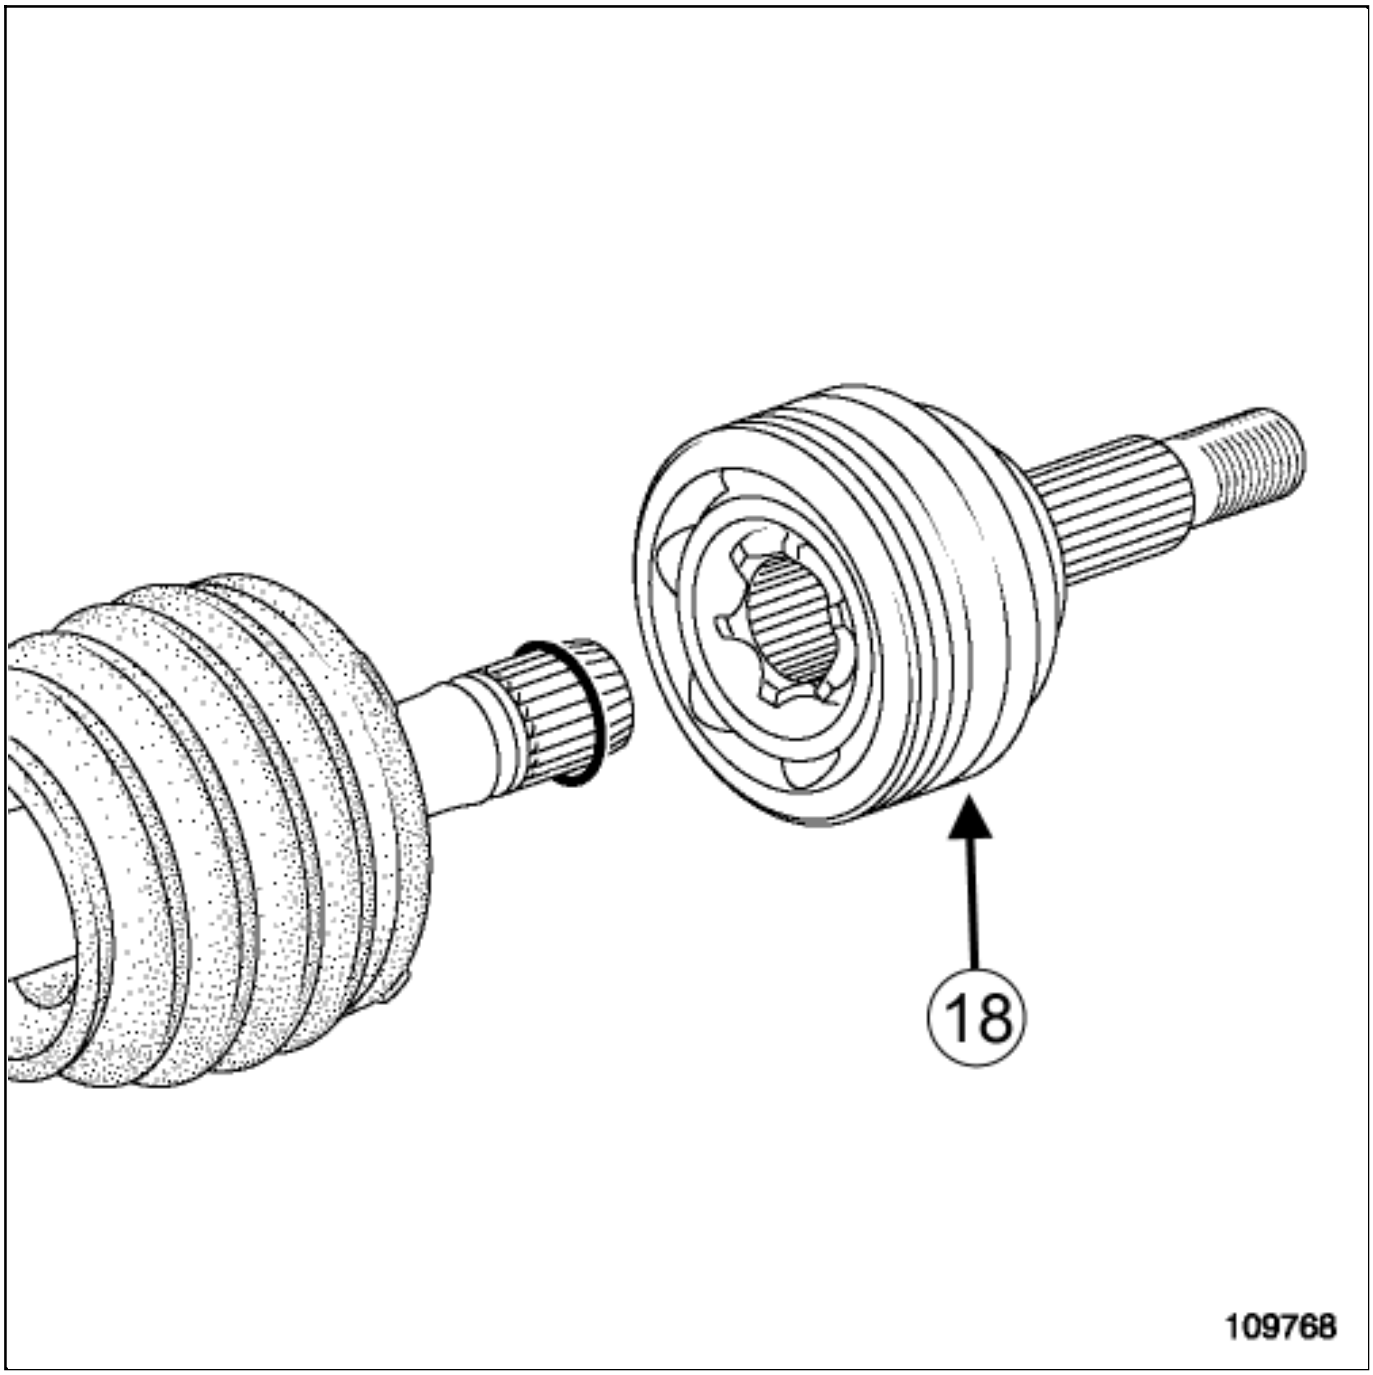
Always replace:

- the small securing clip,
- the big securing clip.



Using a parts washer, clean the driveshaft and the stub axle bowl.

2. REFITTING OPERATION FOR PART CONCERNED



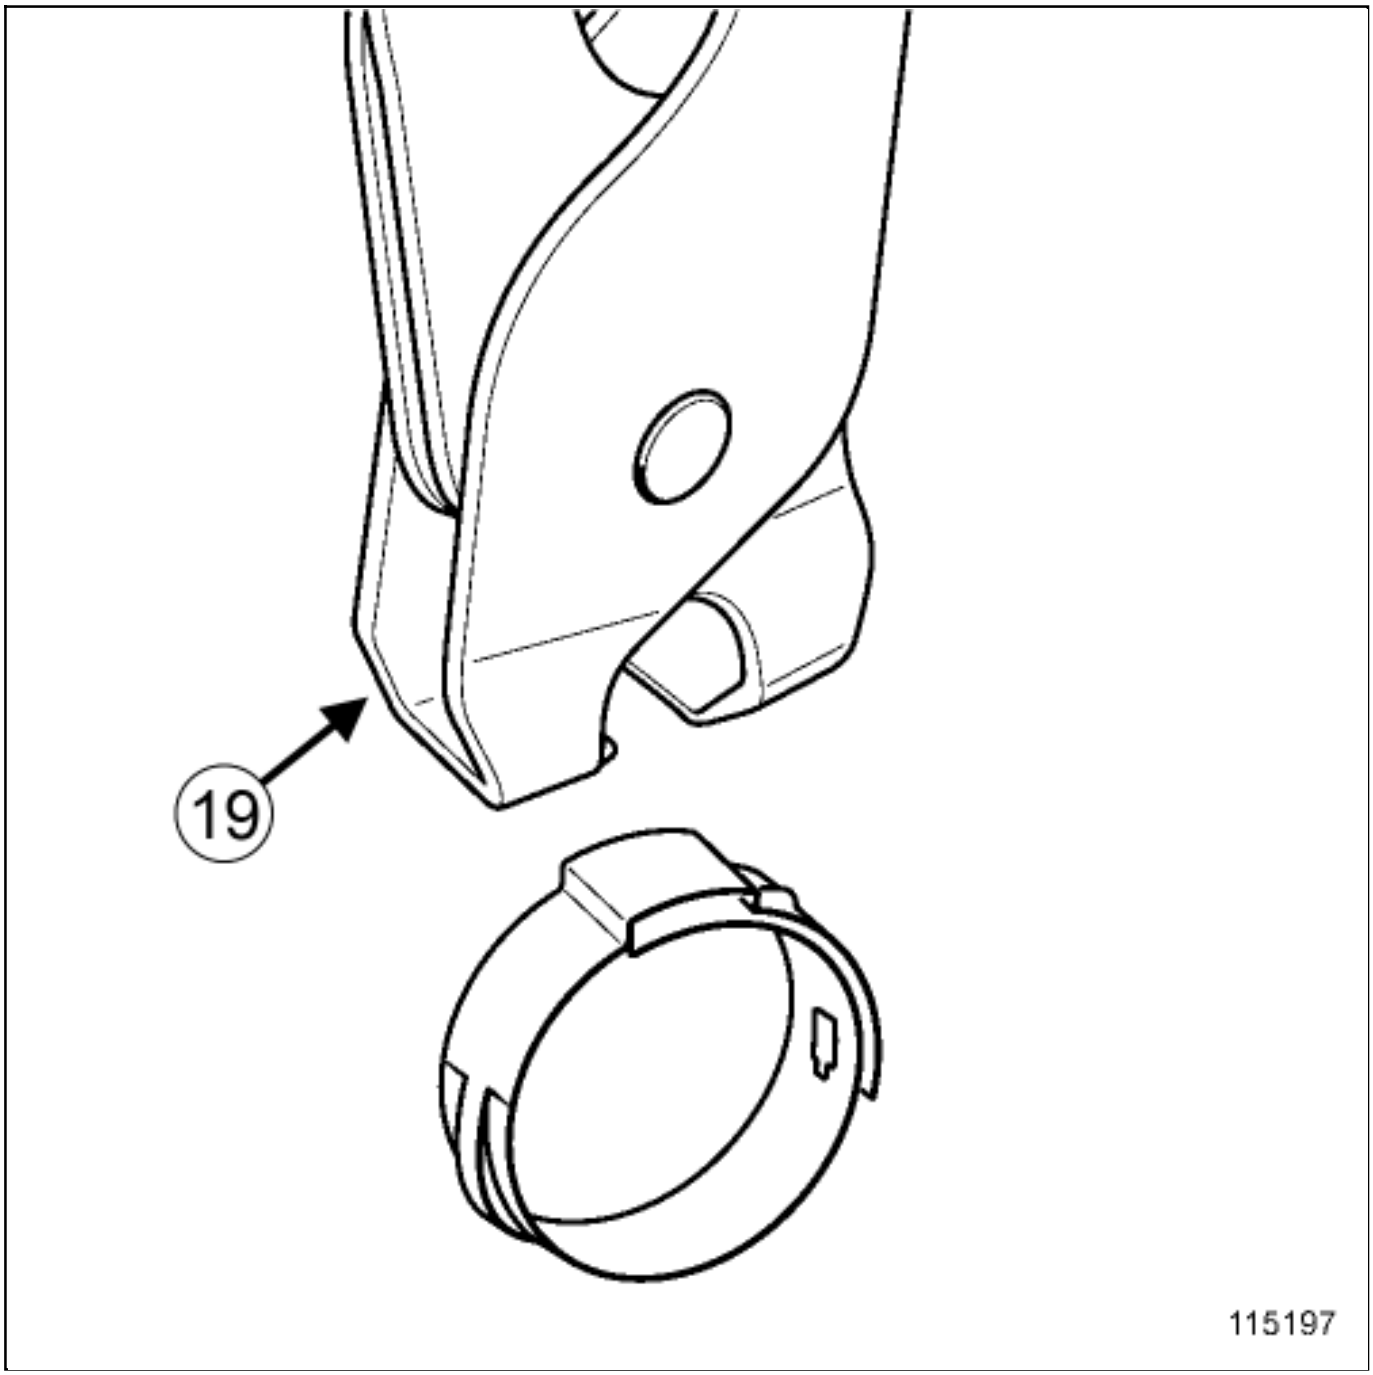
Fit the small securing clip(15) onto the driveshaft.

Lightly lubricate the driveshaft using the grease supplied with the gaiter to facilitate its fitting.

- Refit the gaiter(16) onto the driveshaft.
- Insert the gaiter lip into the groove of the driveshaft.
- Refit the lock ring(17) .
-

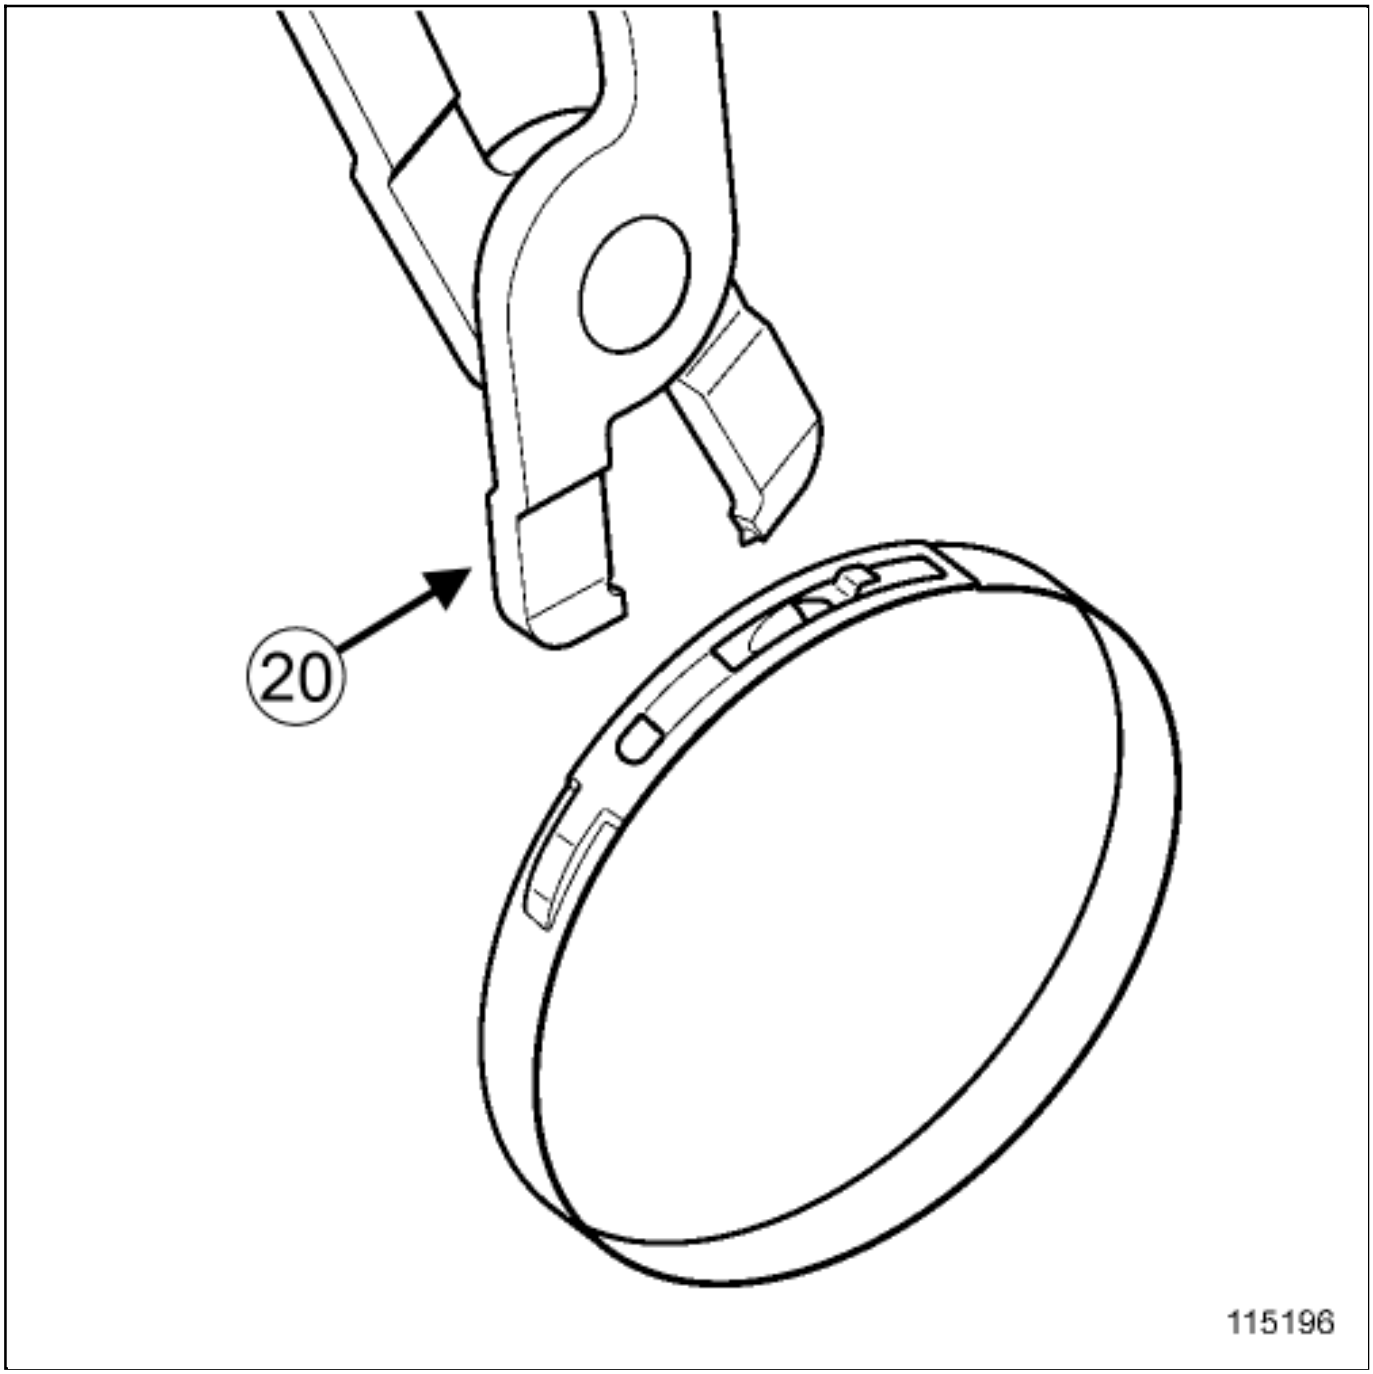
Spread the quantity of grease around the gaiter and the stub axle bowl.

Refit the stub axle bowl(18) to the driveshaft by tapping the stub axle bowl using a brass drift until the lock ring clicks into place behind the ball hub.



Fit the lip of the driveshaft gaiter into the groove on the stub axle bowl.

Note:



Check that the gaiter lip is correctly positioned in the groove of the driveshaft.

- Fit the small securing clip on the driveshaft gaiter.
- Refit the big securing clip on the driveshaft gaiter.

CLIC CLIP

CLIP WITH PROFILE END

Tighten the clips using the toolType clip pliers for driveshafts with a thermoplastic gaiter.(Tav. 1168) (19) for clic clips or the toolPliers for the driveshaft gaiter collar.(Tav. 1784) (20) for profile end clips.

3. FINAL OPERATION

Refit a new differential output seal on the side concerned(see **Differential output seal: Removal - Refitting**)
.

Refit:

- the wheel driveshaft on the side concerned(see 29A, Driveshafts , Front right-hand driveshaft: Removal - Refitting) or(see 29A, Driveshafts , Front left-hand driveshaft: Removal - Refitting) ,
- the wheel on the side concernedWheel: Removal - Refitting .

Fill up the gearbox(see **Manual gearbox oils: Draining - Filling**) or Automatic gearbox oil: Draining - Filling .

Refit the engine undertray.

FRONT DRIVESHAFT LOWER ARM BALL JOINT: CHECK

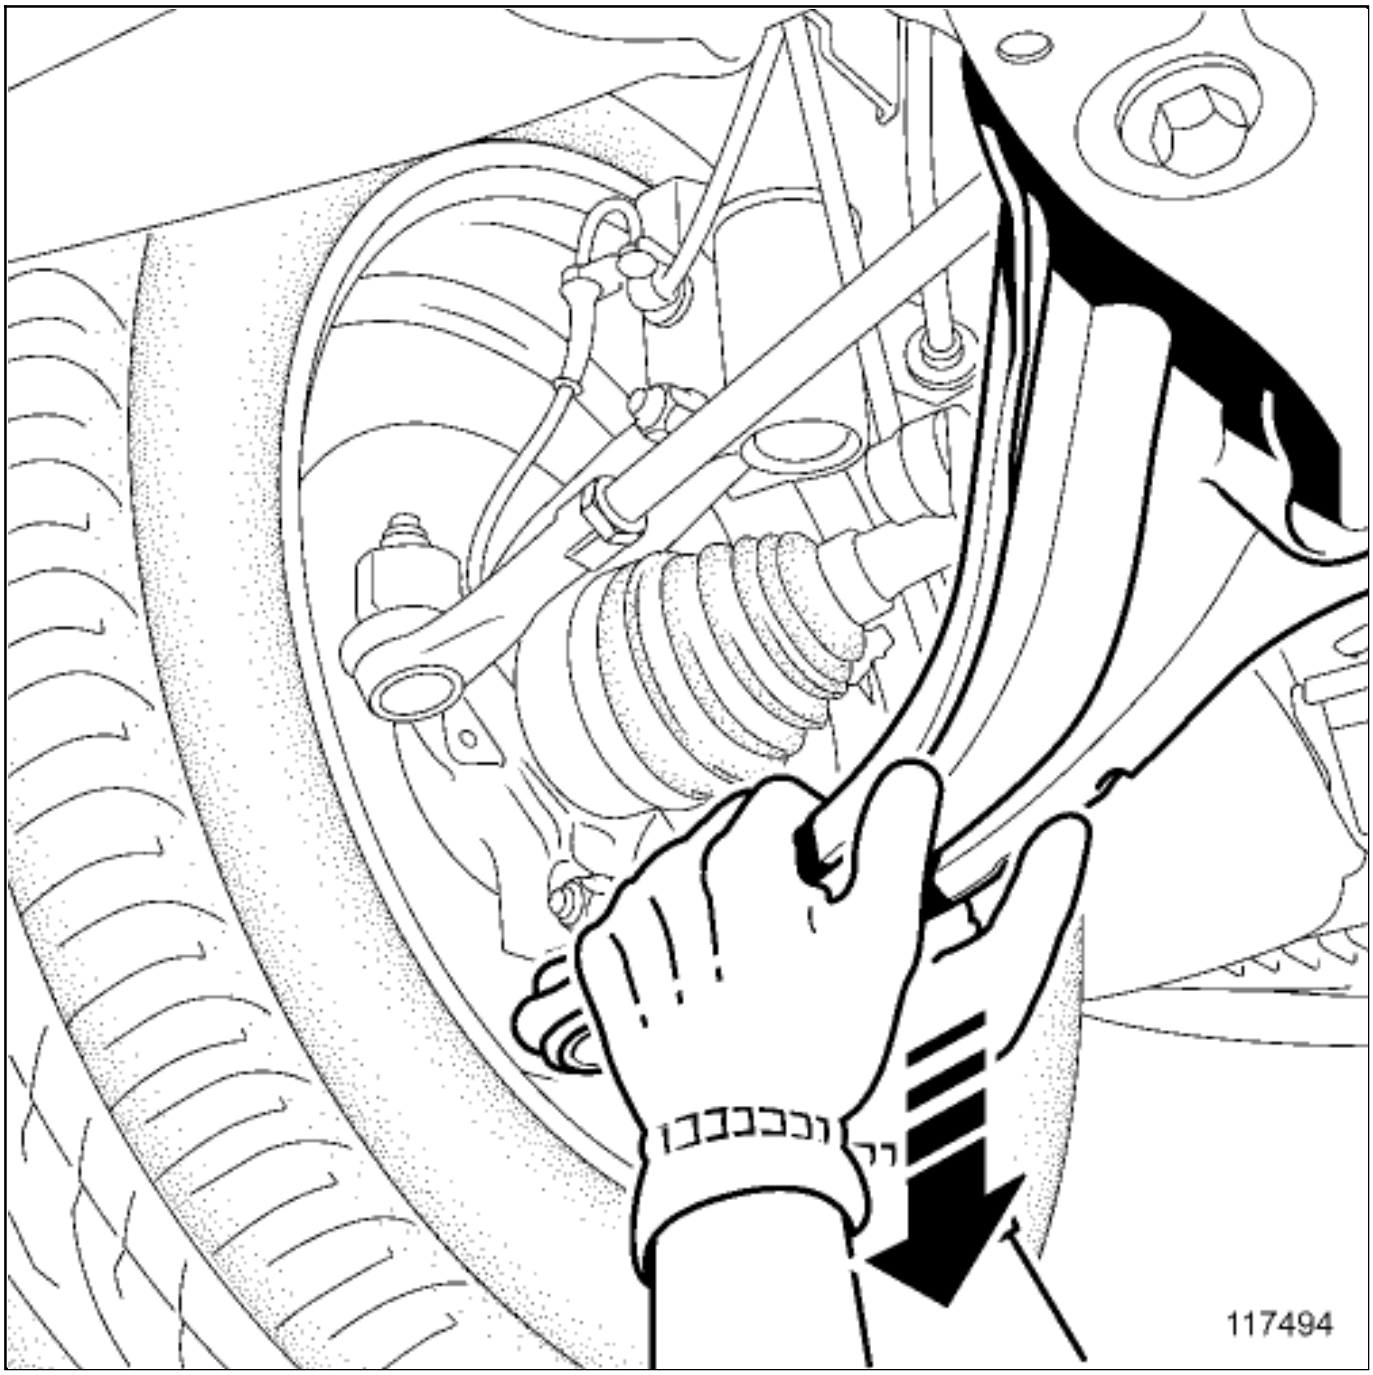
CHECK

1. CHECKING THE FRONT DRIVESHAFT LOWER ARM BALL JOINT

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .

1- CHECKING THE CONDITION OF THE LOWER ARM BALL JOINT GAITER

- If the lower arm ball joint gaiter of the front driveshaft is in poor condition or not crimped, replace the lower arm of the front driveshaft(see **Front driveshaft lower arm: Removal - Refitting**) .



- If the lower arm ball joint gaiter of the front driveshaft is in poor condition or not crimped, replace the lower arm of the front driveshaft(see **Front driveshaft lower arm: Removal - Refitting**) .

2- CHECKING THE FITTING OF THE LOWER ARM BALL JOINT

- If the lower arm ball joint is not fitted correctly, replace the lower arm ball joint(see 31A, Front axle components, Front driveshaft lower arm ball joint: Removal - Refitting) .

3- CHECKING THE LONGITUDINAL PLAY OF THE LOWER ARM BALL JOINT

4- CHECKING THE PLAY OF THE LOWER ARM BALL JOINT

- Check that there is no play in the front driveshaft lower arm ball joint:
  - from a position underneath the vehicle,
  - using both hands, hold the front driveshaft lower arm as close as possible to the wheel,
  - push downwards several times.

If there is play in the front driveshaft lower arm ball joint, replace the front driveshaft lower arm(see **Front driveshaft lower arm: Removal - Refitting**) .

2. FINAL OPERATION

Repair-13x02x03x10-01x58-1-13-1.xml

XSL version : 3.02 du 22/07/11

FRONT DRIVESHAFT LOWER ARM BALL JOINT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tooling kit for replacing lower ball joints.	Tav. 1420
Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.	Tav. 1420-01
Sockets for removing/refitting the lower arm ball joint nut	Tav. 1929

WARNING

No more than one ball joint may be replaced on the same arm. For this purpose, the replacement ball joints are marked with letter "R" engraved on the cover and have a locking spring ring on the lower arm ball joint.

- Ball joint without a locking spring ring and not marked with letter "R" = standard part: can be replaced.

Ball joint with a locking spring ring and with marking "R" = part already replaced, another replacement prohibited, always replace the complete arm.

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 31A, Front axle components, Front axle components: Precautions for the repair) ,

Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 31A, Front

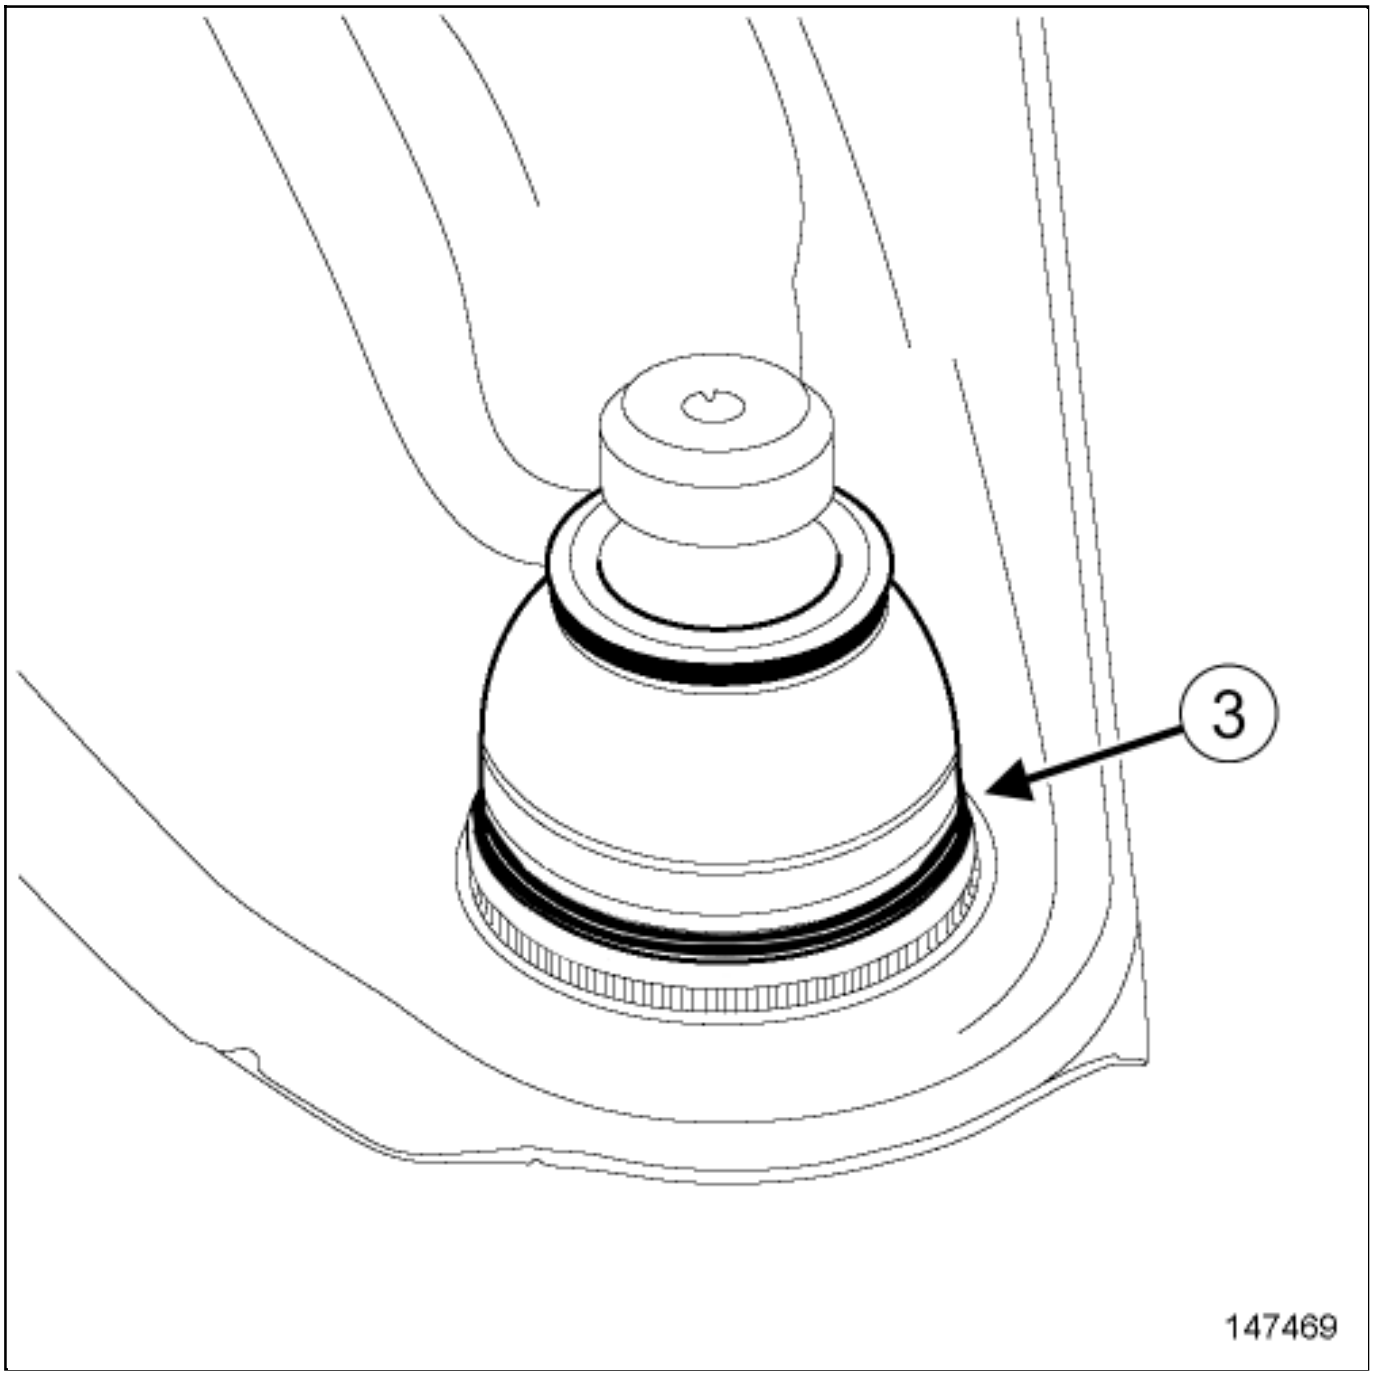
axle components, Front axle assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

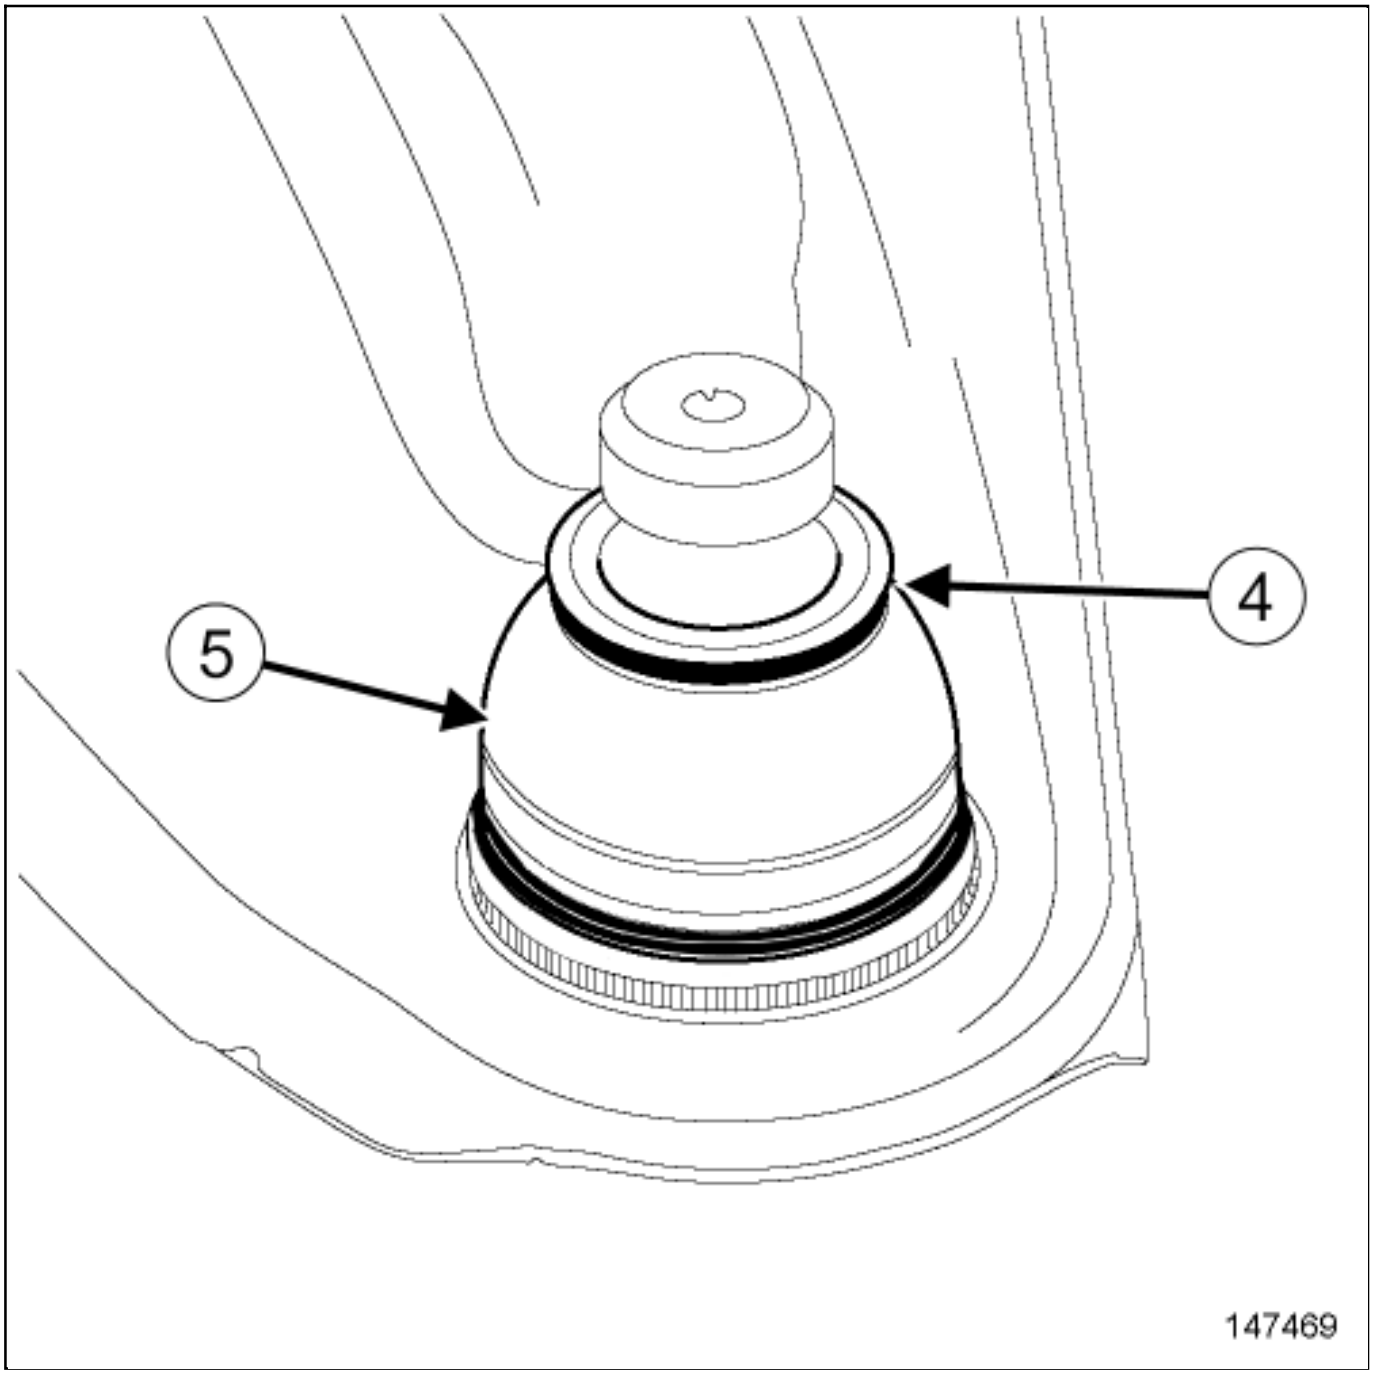
Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove the front wheel on the side concerned(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .



Remove:

- the front section of the front wheel arch linerExterior body front trim assembly: Exploded view ,
- the engine undertray,
- the front bumperFront bumper assembly: Exploded view ,
- the radiator mounting cross member(see 31A, Front axle components, Front axle assembly: Exploded view) .

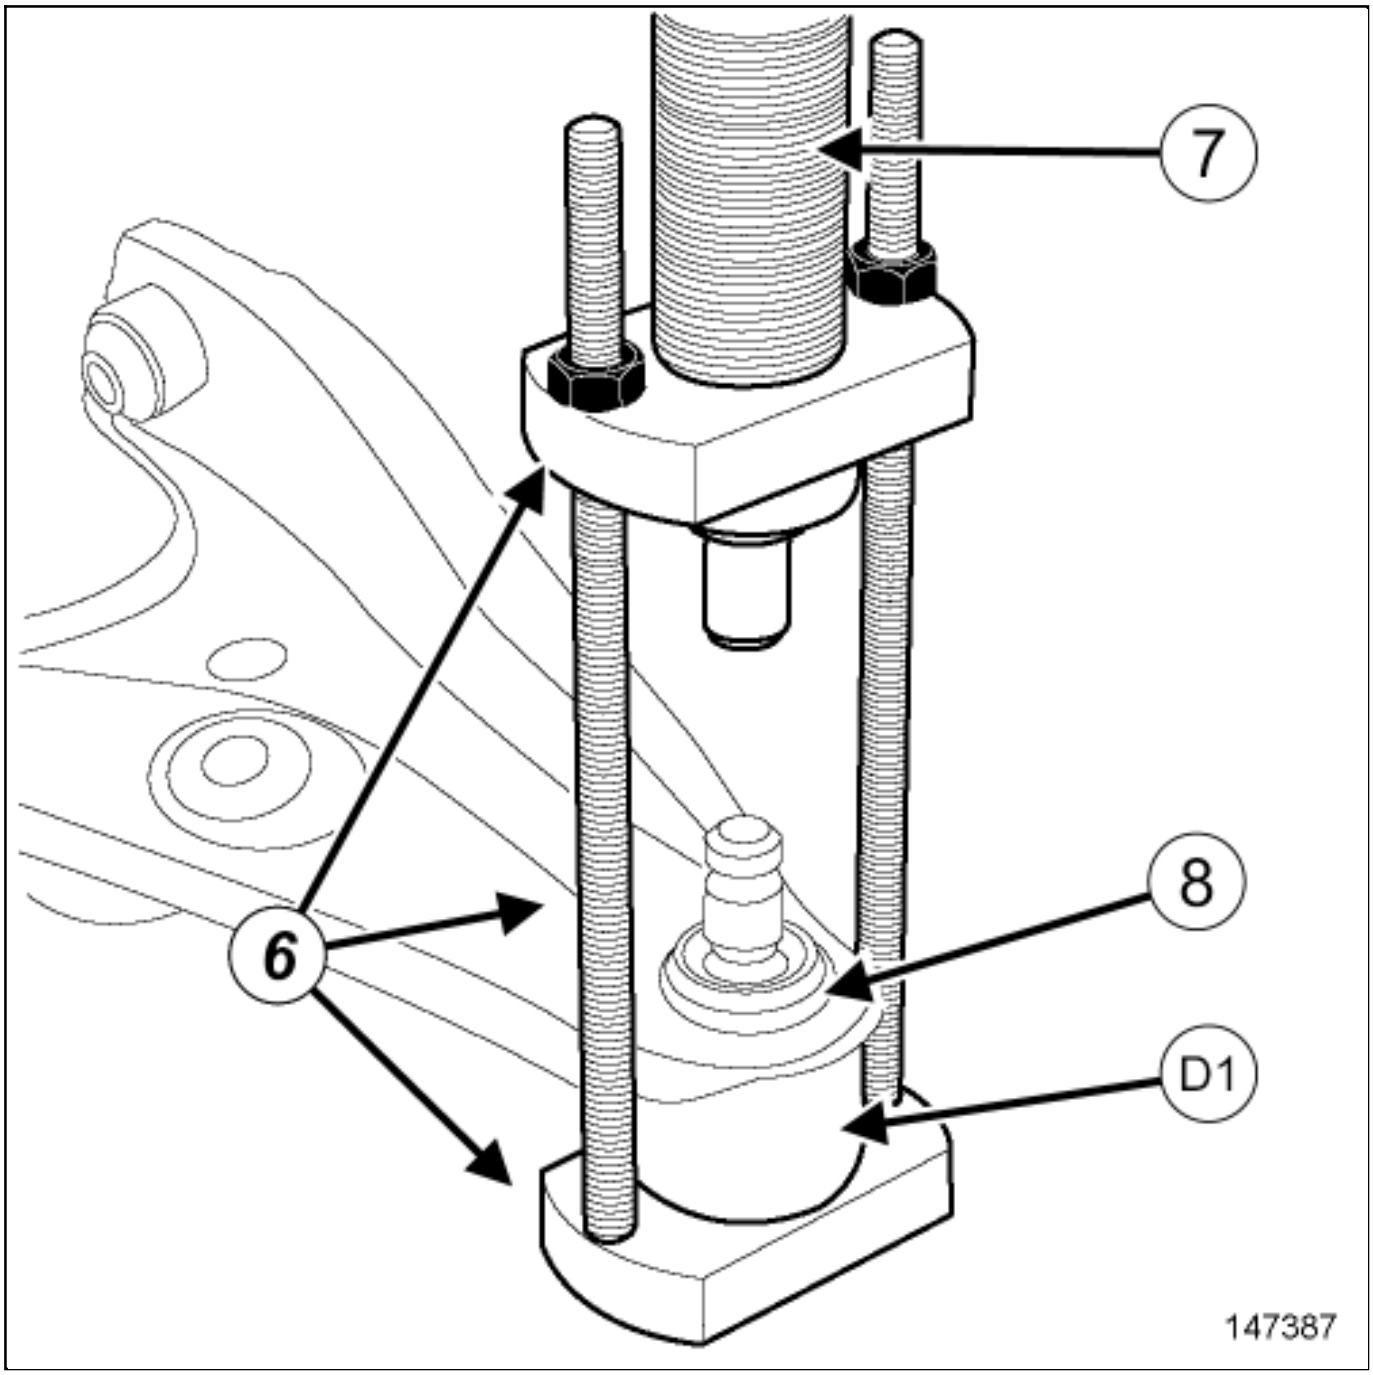


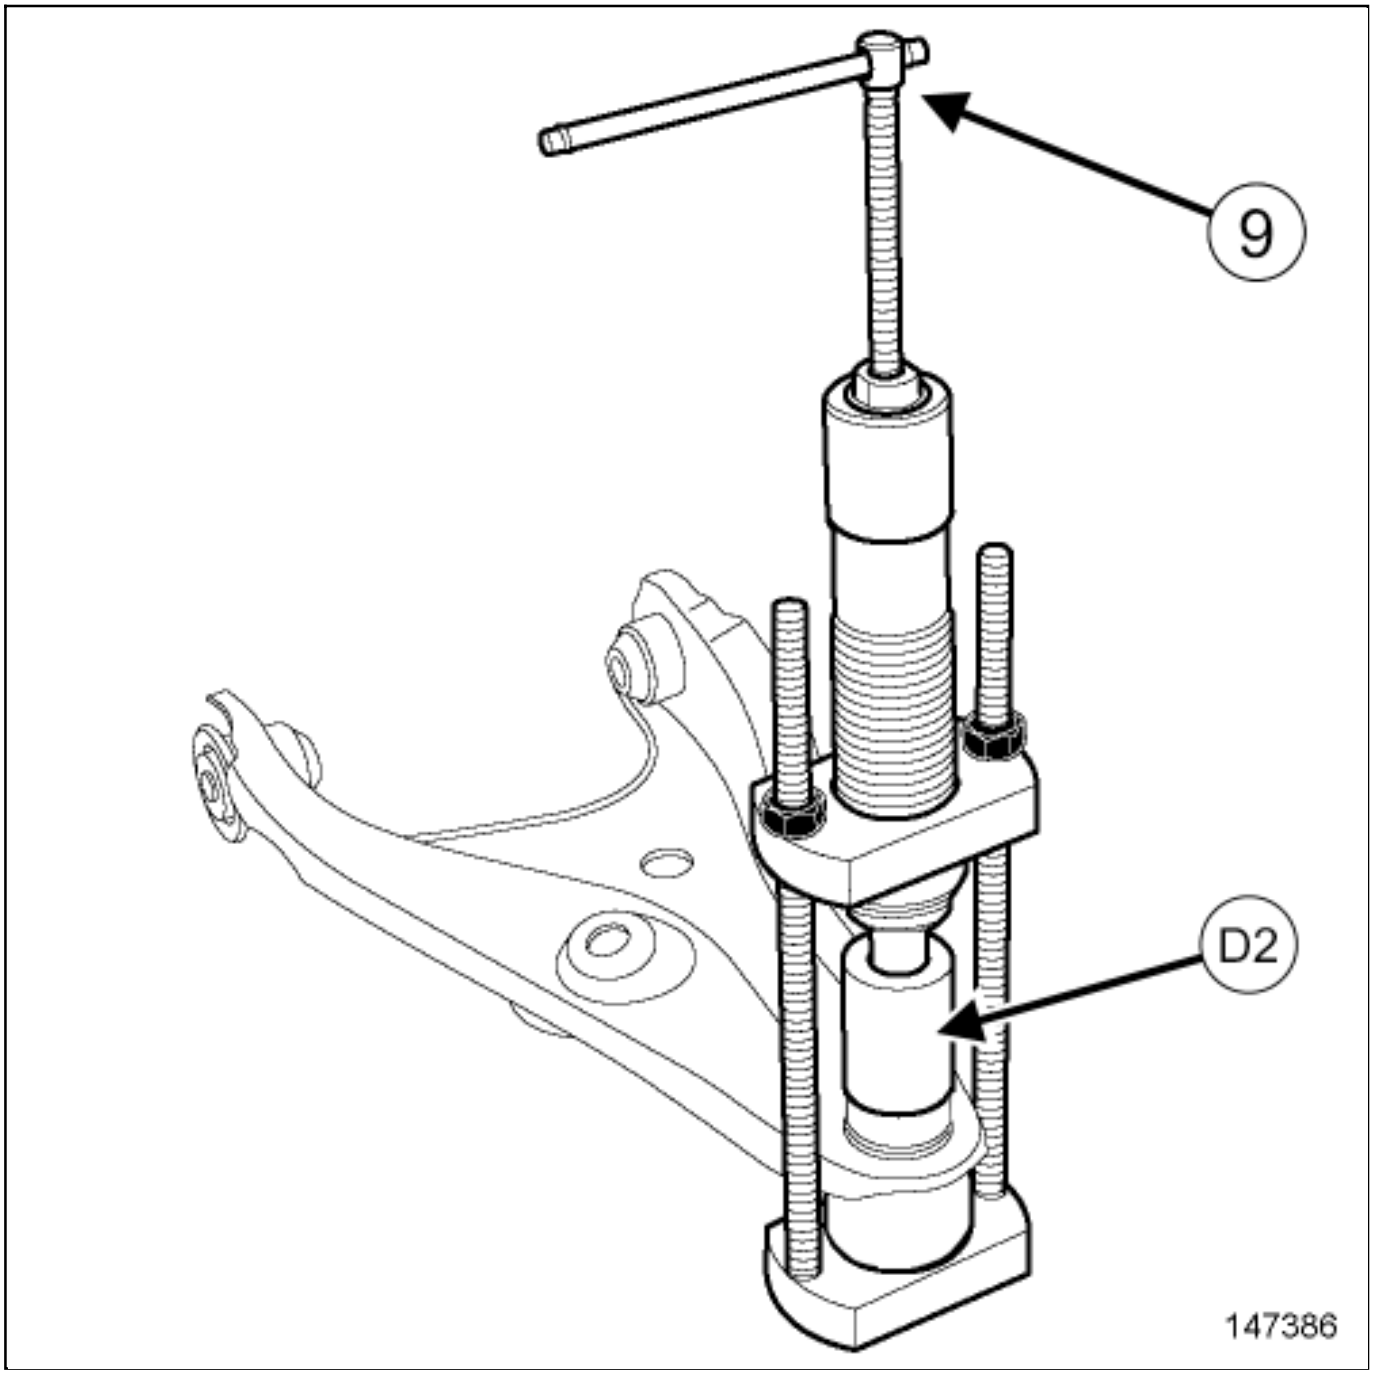
Remove the front driveshaft lower arm(see 31A, Front axle components, Front axle assembly: Exploded view) .

Clean the lower arm using a clean clothVehicle: Parts and consumables for the repair .

2. REMOVAL OPERATION

Remove the clip(3) of the ball joint gaiter using a screwdriver.





Remove:

- the clips(4) of the ball joint gaiter using a screwdriver,
- the lower arm ball joint gaiter(5) .

Note:

Cover the threaded rods using a sheath or adhesive tape in order not to damage the anti-corrosion protection of the lower arm.

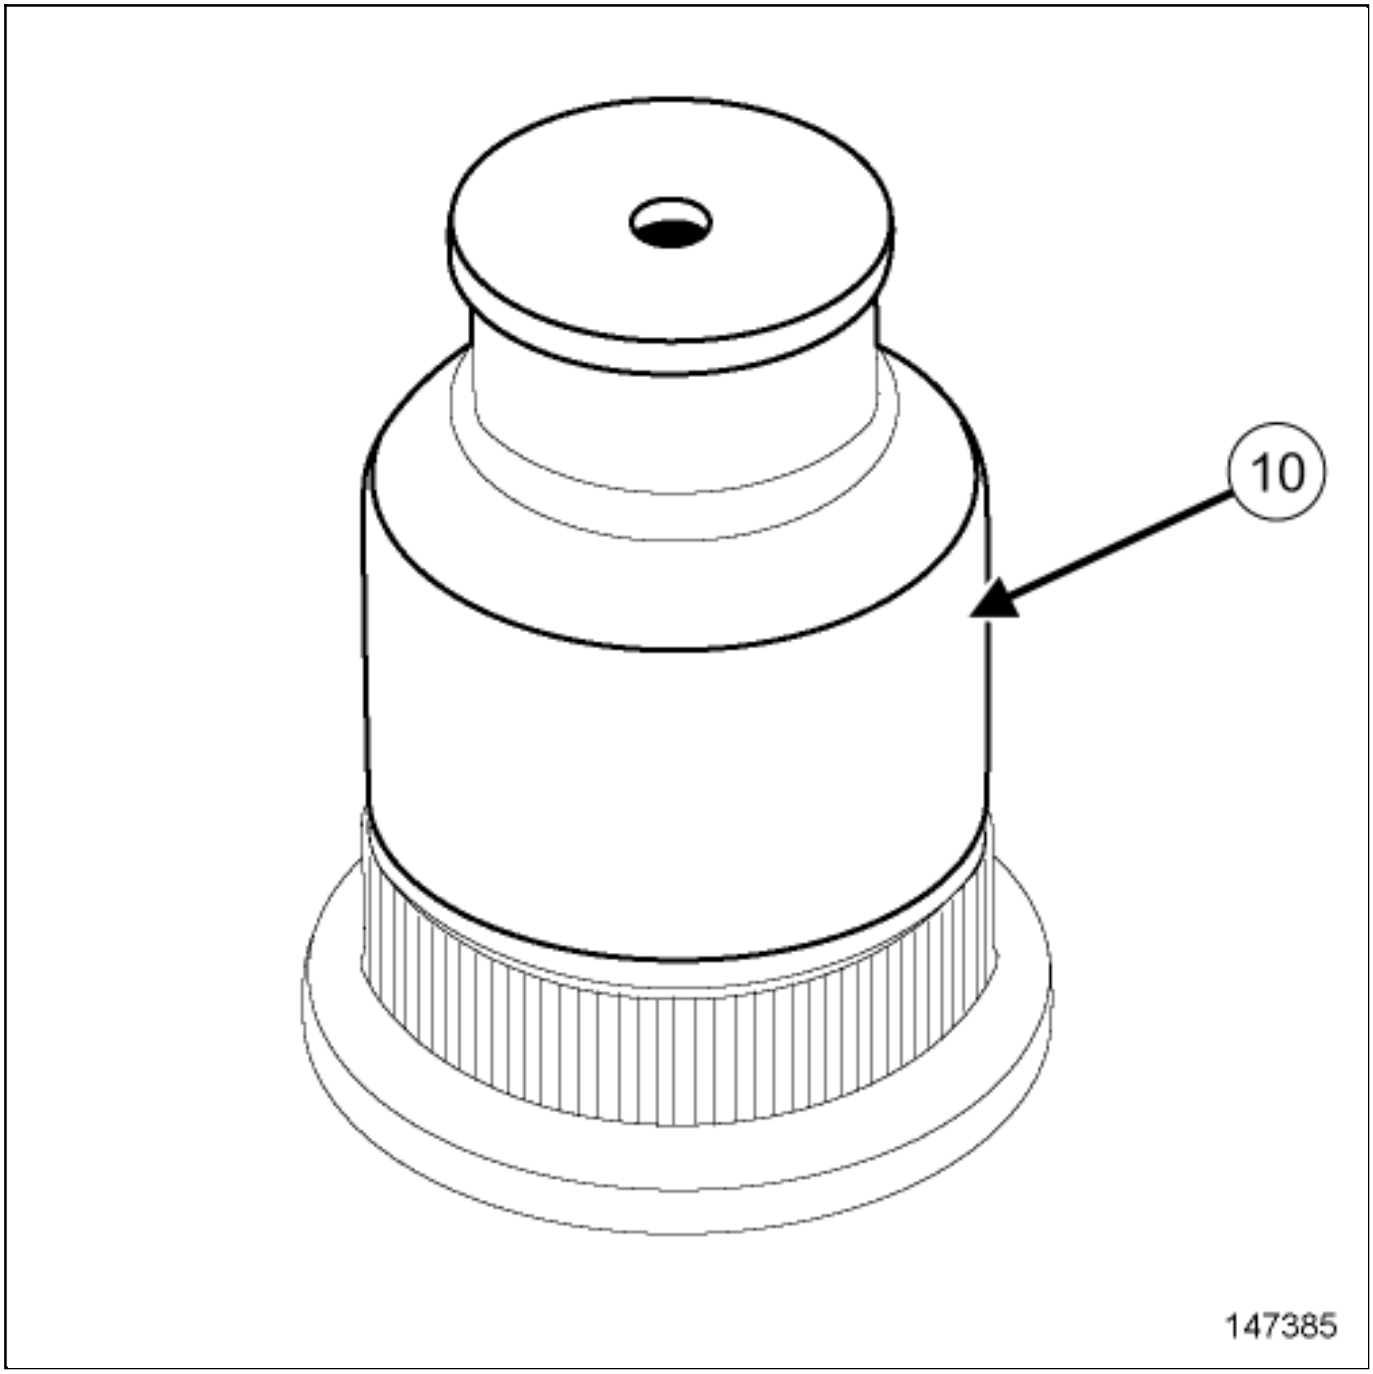
Set up the toolTooling kit for replacing lower ball joints.(Tav. 1420) (6) by assembling the two plates, the two threaded rods, and the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850. (Tav. 1420-01) (7) . Ensure that the two plates stay parallel (adjust the nuts).

Fit in the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) :

- the ring(D1) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,

- the lower arm by positioning the ball joint in the ring(D1) ,
- the ring(D2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) on the lower arm ball joint(8) .

Extract the lower arm ball joint(8) by operating the jack(9) of the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

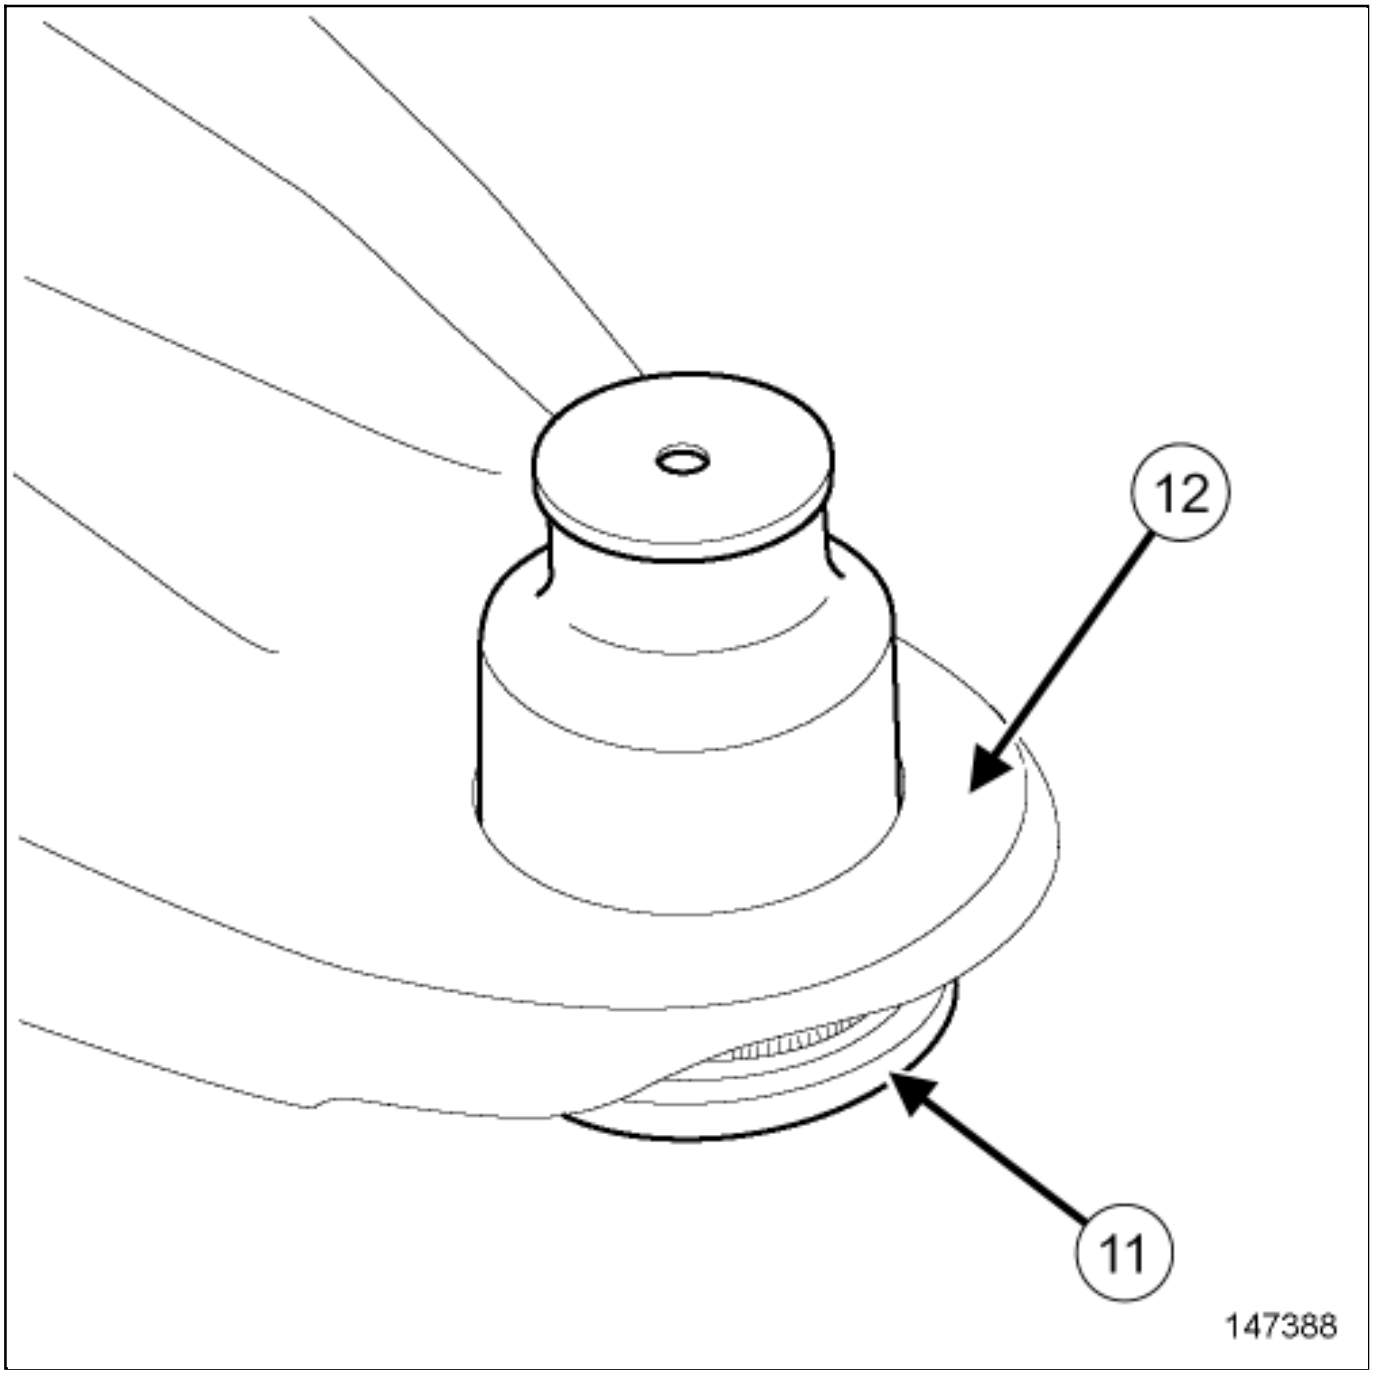


Remove:

- the rings(D1) and (D2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,
- the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

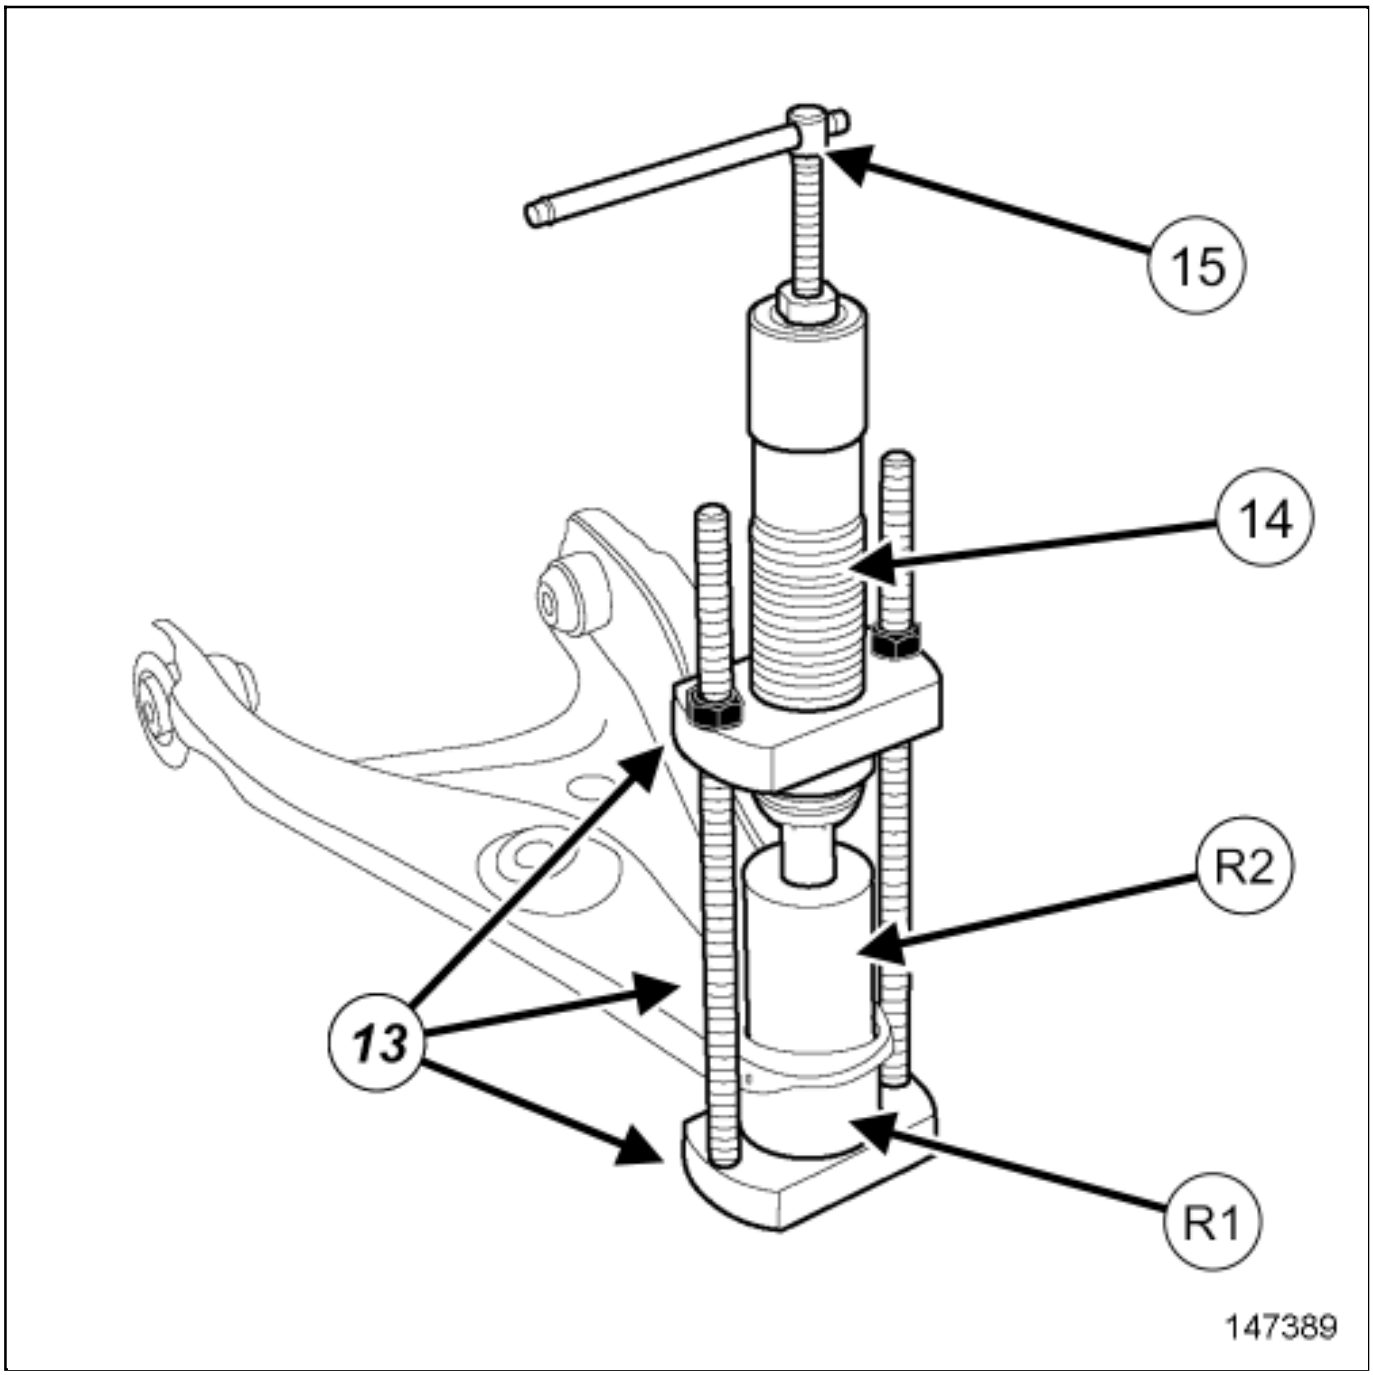
REFITTING

1. REFITTING PREPARATION OPERATION



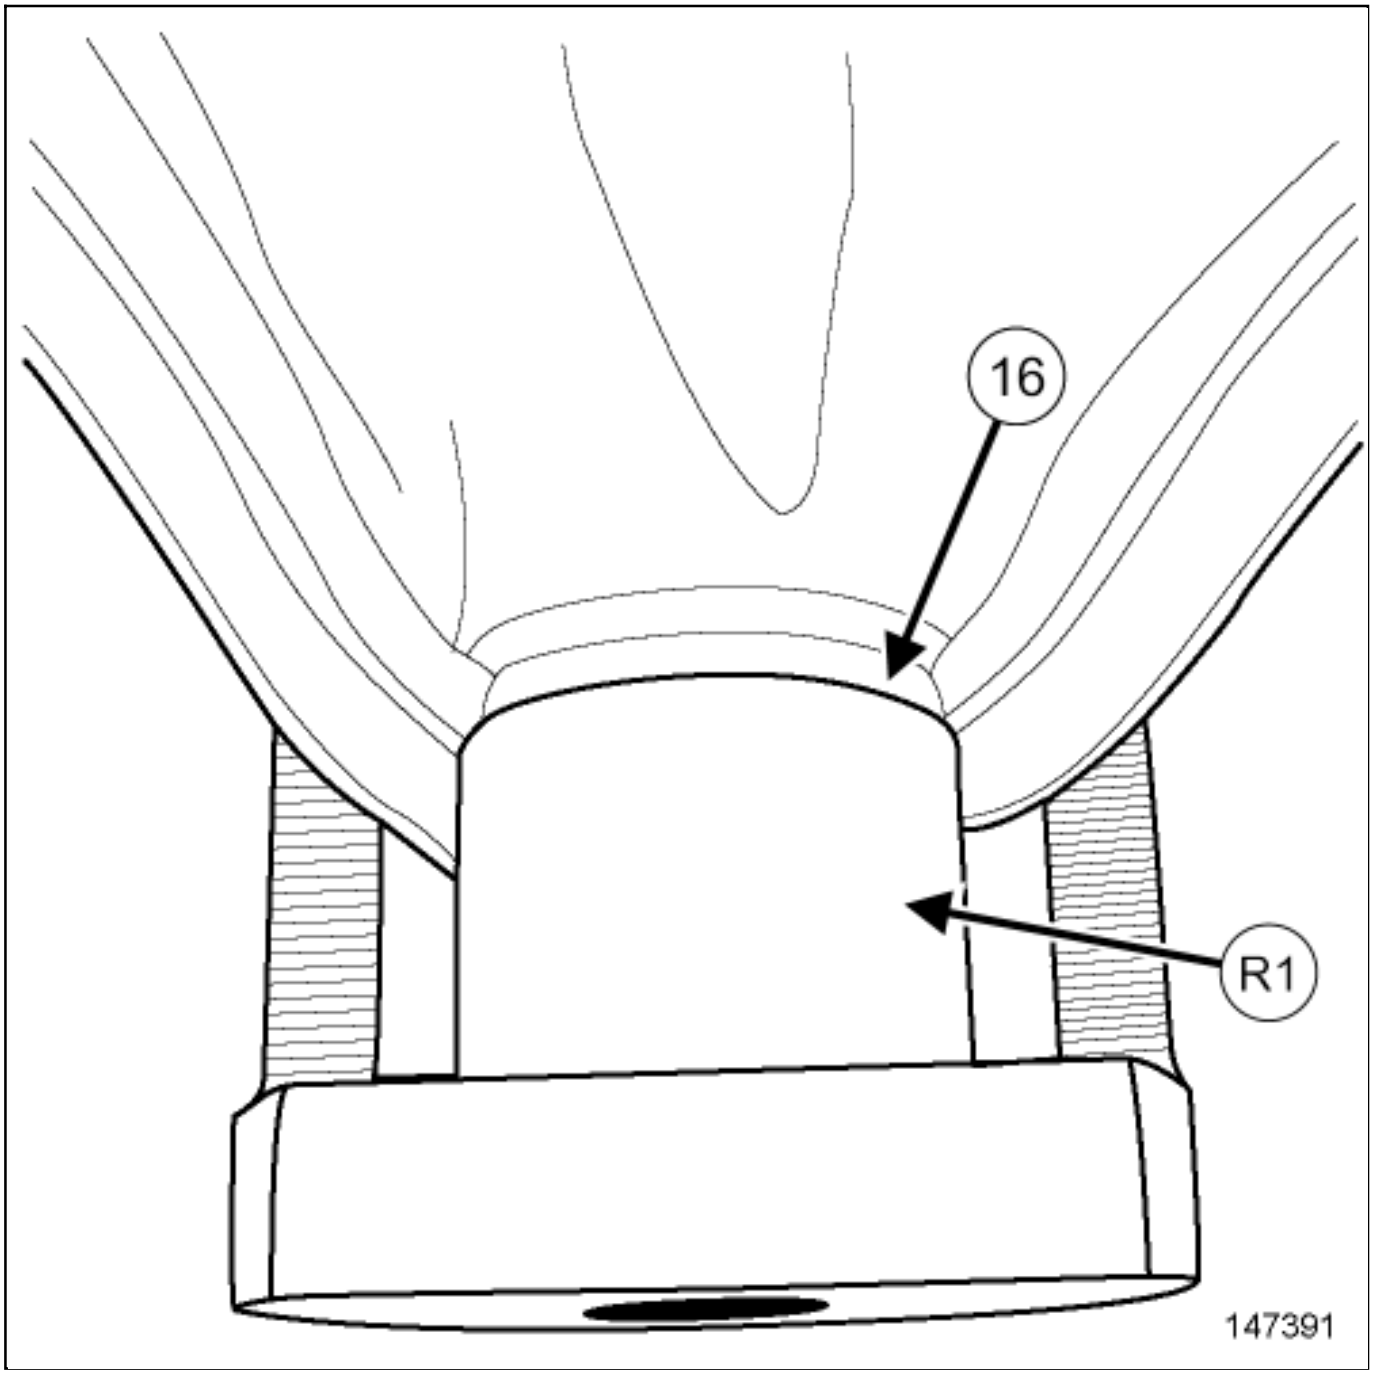
Clean the mating face of the ball joint on the lower arm using a clean clothVehicle: Parts and consumables for the repair .

Note:



The lower arm ball joint (replacement part) is equipped with a protective cover(10) .

Do not remove the protective cover before the end of the operations for refitting the ball joint.

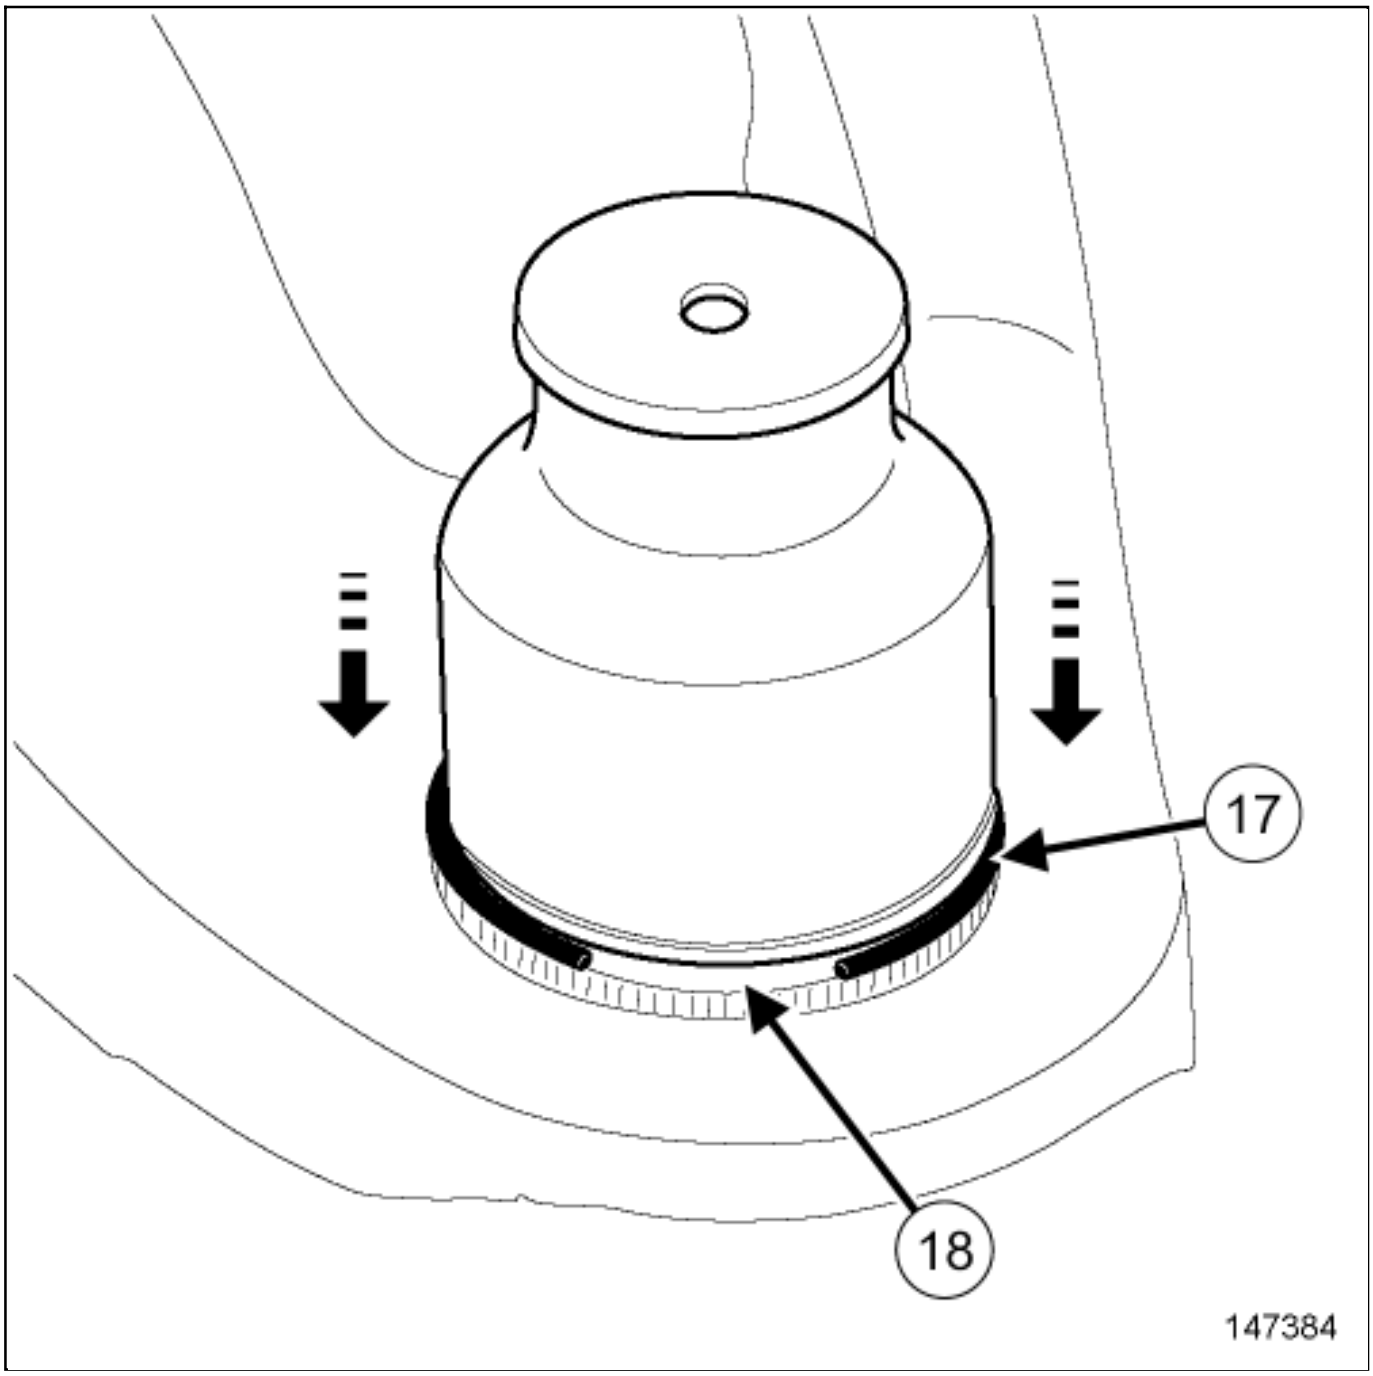


Position the new lower arm ball joint(11) on the front driveshaft lower arm(12) .

2. REFITTING OPERATION

Fit in the assembly of the toolsTooling kit for replacing lower ball joints.(**Tav. 1420**) (**13**) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(**Tav. 1420-01**) :

- the ring(**R1**) of the toolSockets for removing/refitting the lower arm ball joint nut(**Tav. 1929**) ,
- the lower arm with the new ball joint by positioning the ball joint in the ring(**R1**) ,
- the ring(**R2**) of the toolSockets for removing/refitting the lower arm ball joint nut(**Tav. 1929**) on the lower arm ball joint.



Fit the new ball joint(11) in the lower arm by operating the jack(15) of the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) until the ring(R1) contacts the lower arm at (16) .

Turn the jack(15) one additional turn to finalise the geometric position of the lower arm ball joint.

Remove:

the rings(R1) and (R2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,

the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

Fit the locking spring ring(17) in the groove(18) of the ball joint by sliding it downwards on the protective cover in the direction of the arrows.

Remove the protective cover(10) of the lower arm ball joint.

3. FINAL OPERATION

Proceed in the reverse order to removal.

FRONT DRIVESHAFT LOWER ARM BALL JOINT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tooling kit for replacing lower ball joints.	Tav. 1420
Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.	Tav. 1420-01

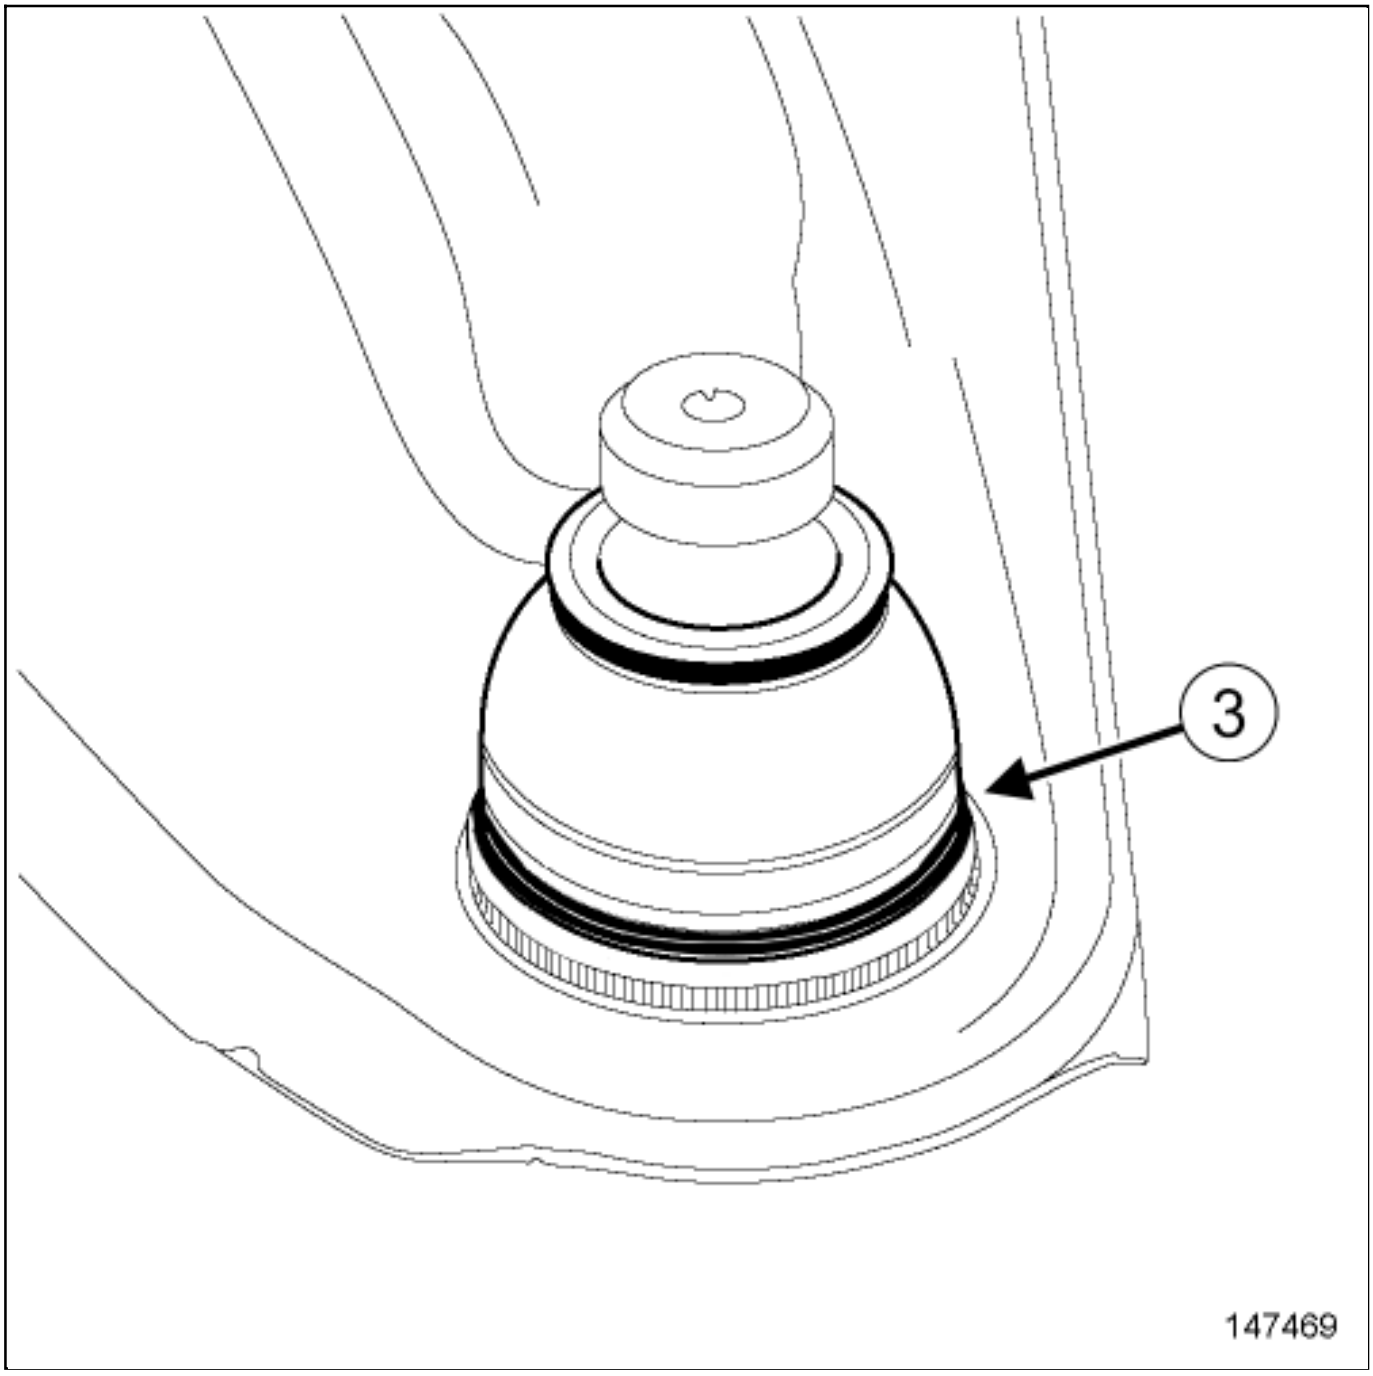
Location and specifications (tightening torques, parts always to be replaced, etc.)Front axle assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

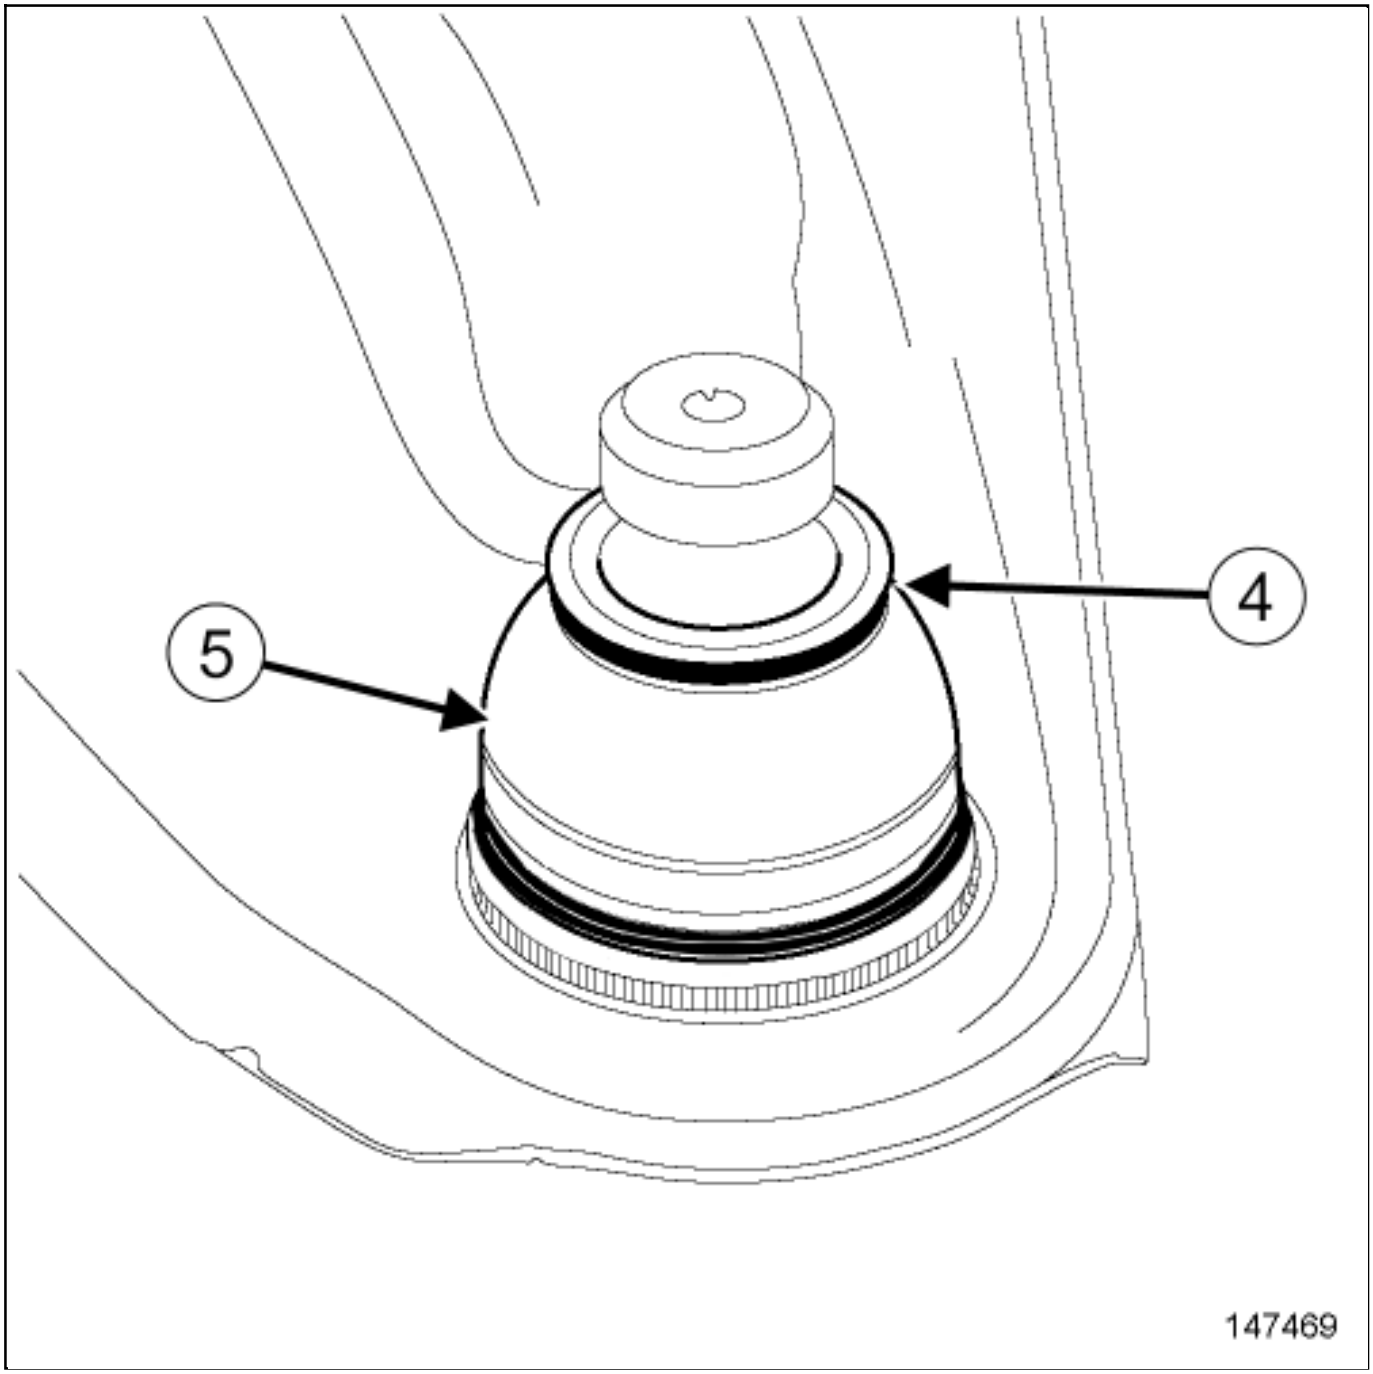
Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove the front wheel on the side concernedFront hub carrier assembly: Exploded view .



Remove:

- the front section of the front wheel arch linerExterior body front trim assembly: Exploded view ,
- the engine undertray,
- the front bumperFront bumper assembly: Exploded view ,
- the radiator mounting cross memberFront axle assembly: Exploded view .

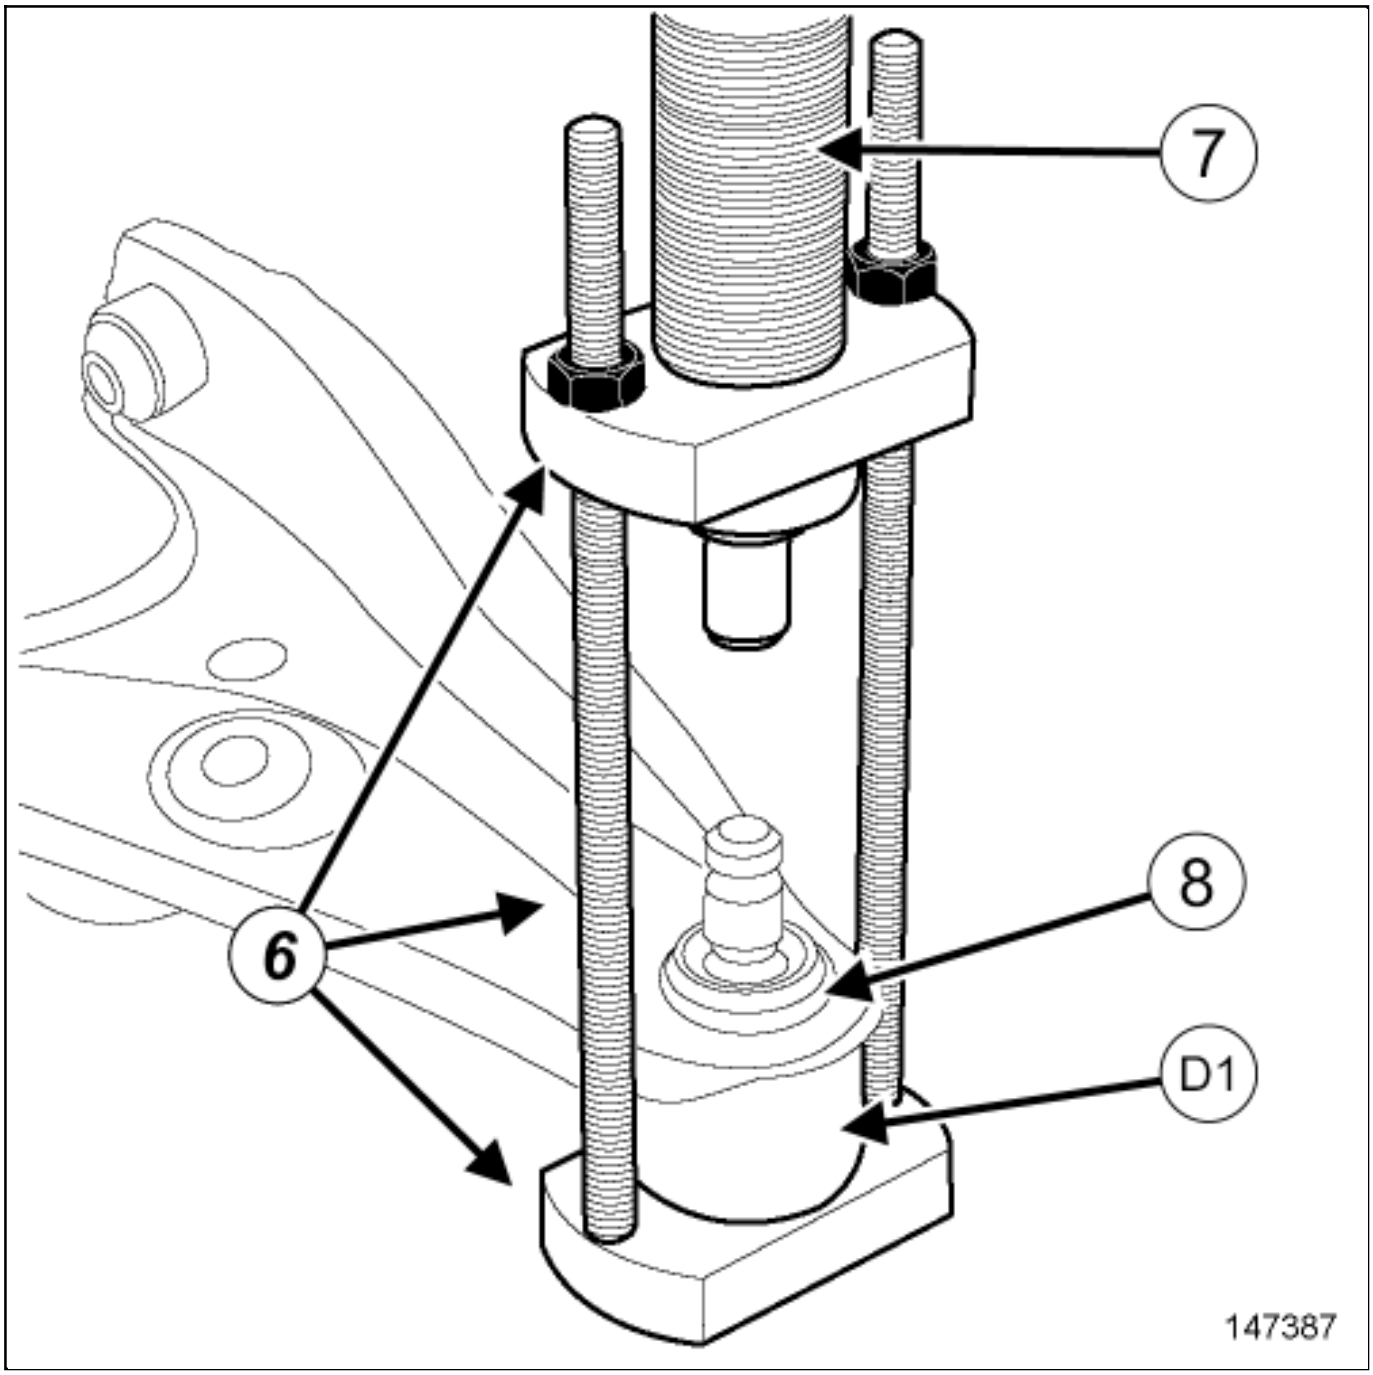


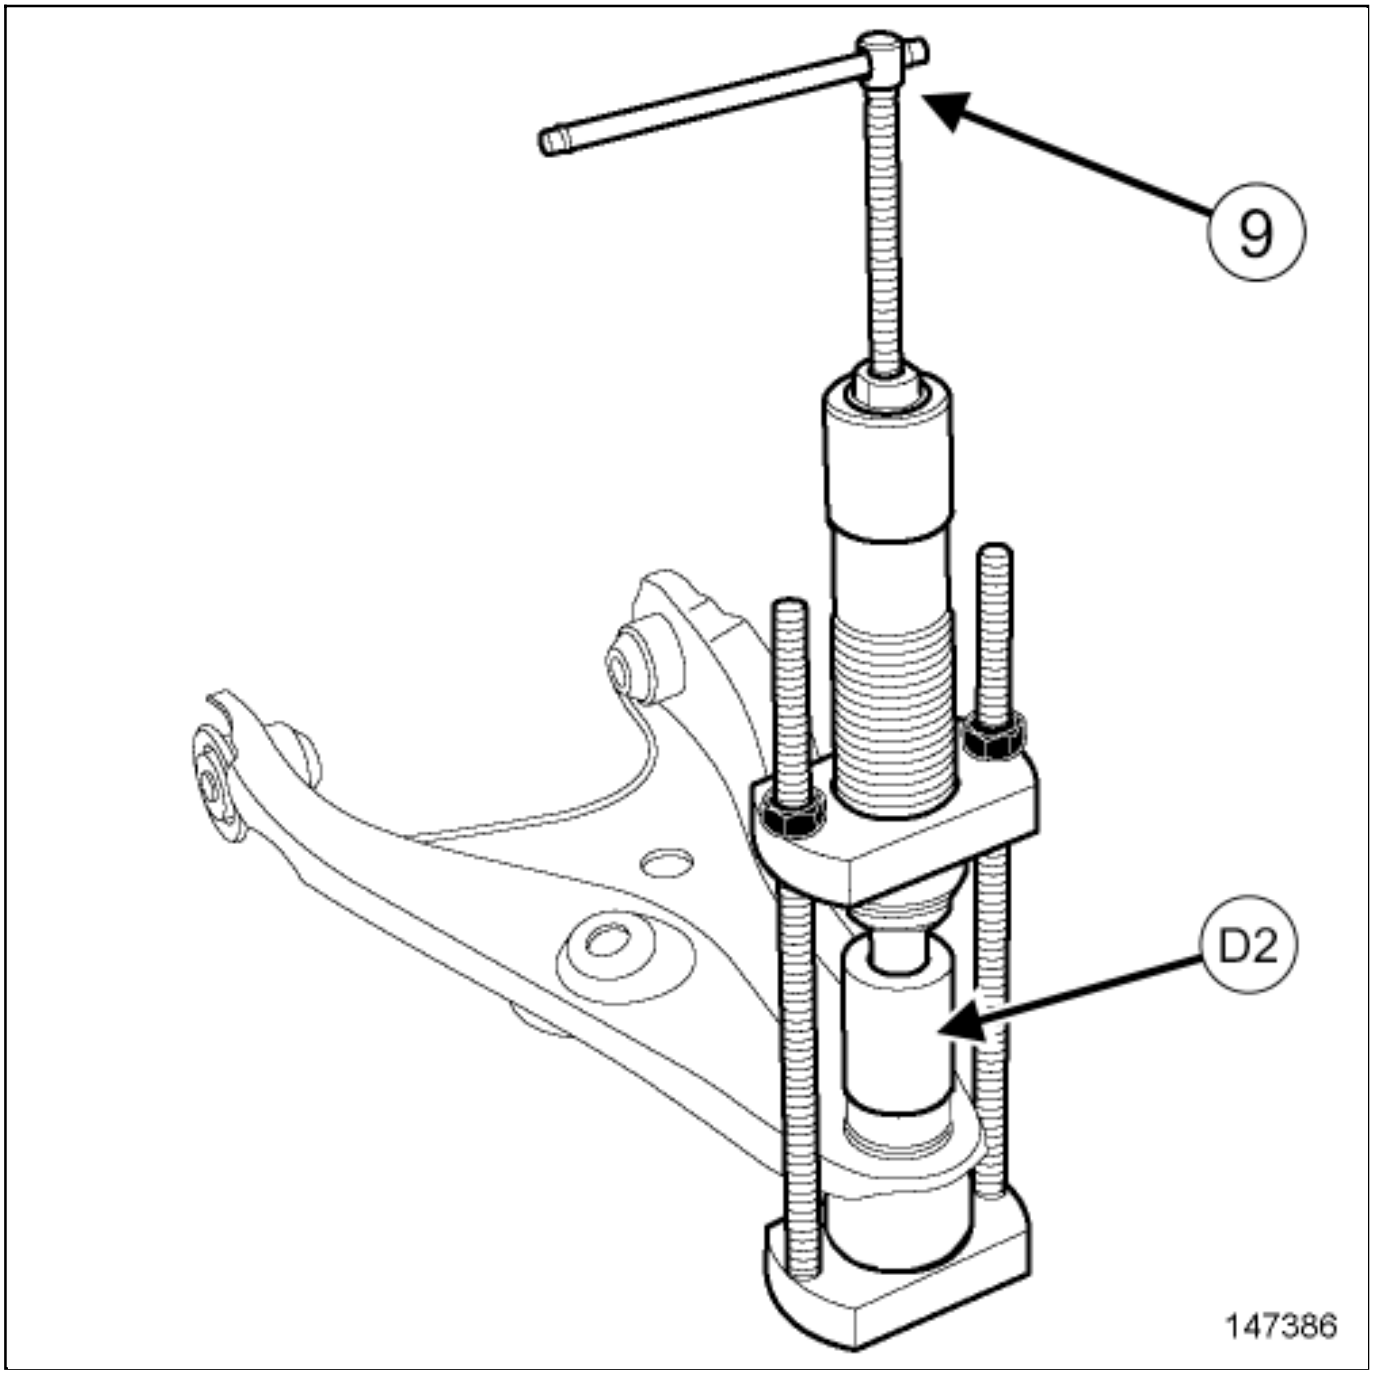
Remove the front driveshaft lower armFront axle assembly: Exploded view .

Clean the lower arm using a clean cloth[Vehicle: Parts and consumables for the repair] .

2. REMOVAL OPERATION

Remove the clip(3) of the ball joint gaiter using a screwdriver.





Remove:

- the clips(4) of the ball joint gaiter using a screwdriver,
- the lower arm ball joint gaiter(5) .

Note:

Cover the threaded rods using a sheath or adhesive tape in order not to damage the anti-corrosion protection of the lower arm.

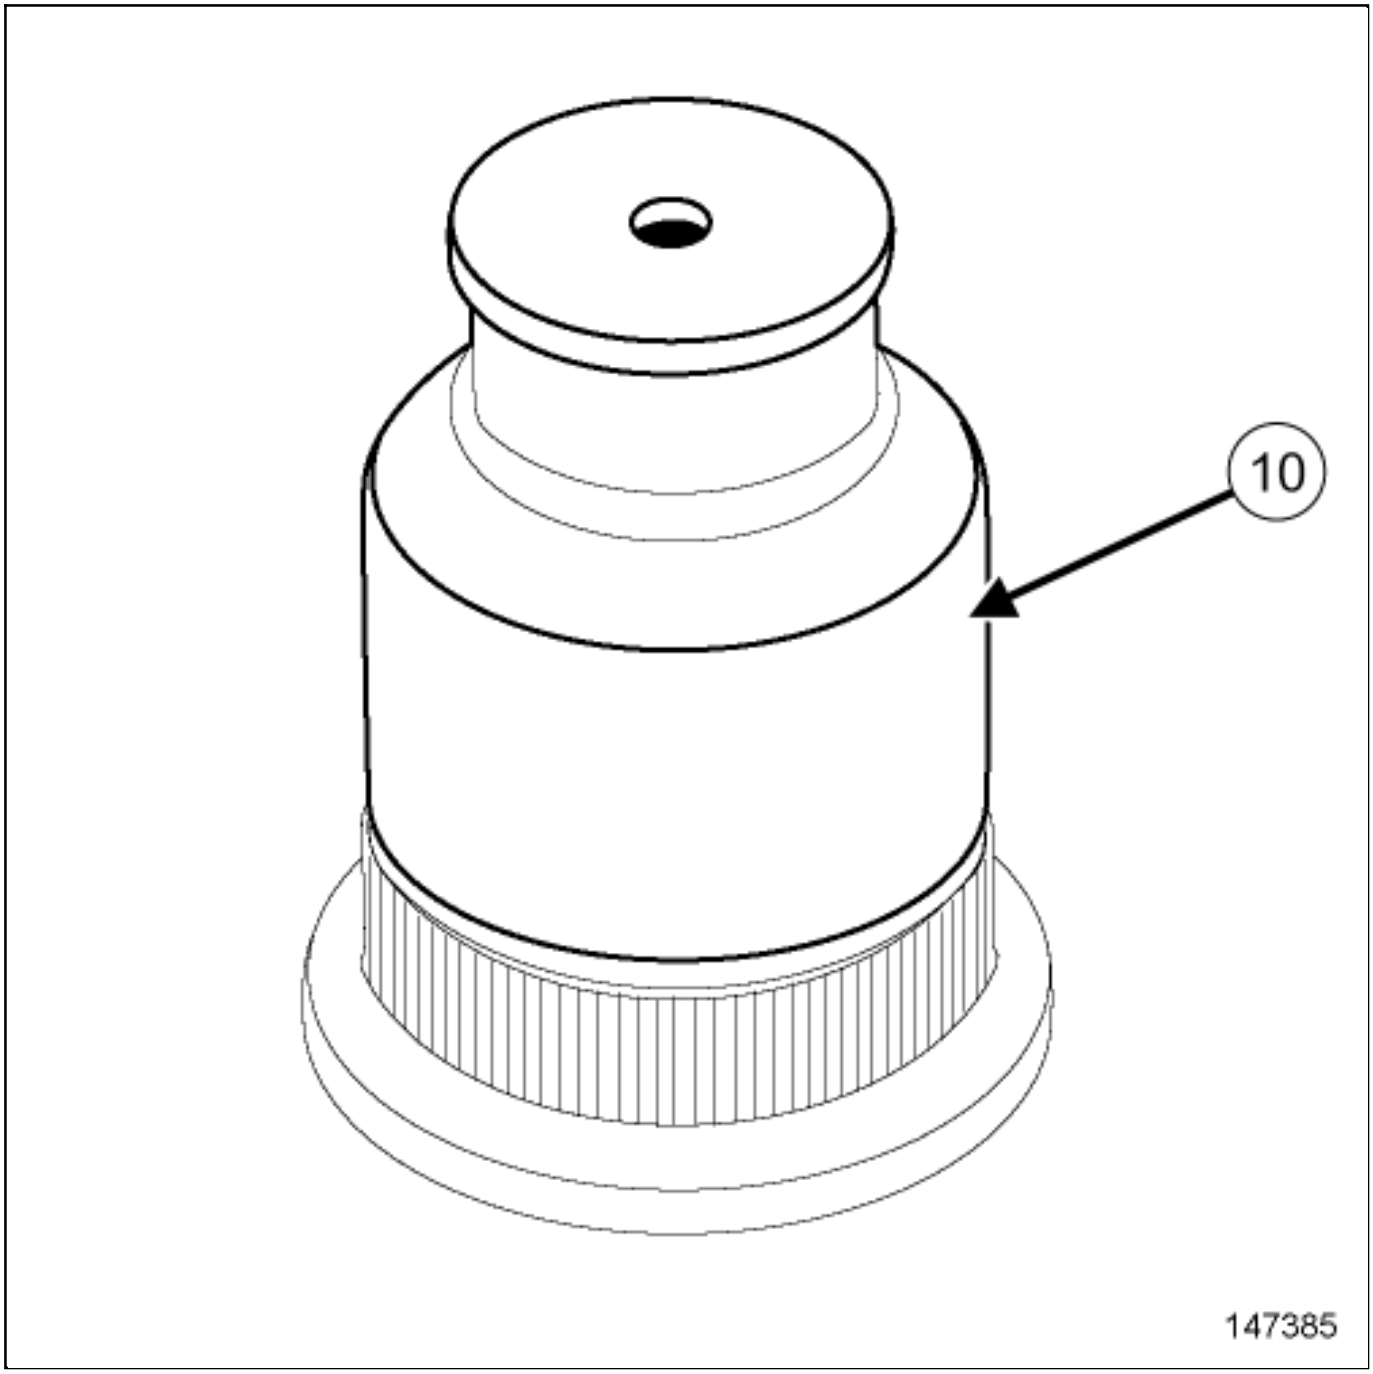
Set up the toolTooling kit for replacing lower ball joints.(Tav. 1420) (6) by assembling the two plates, the two threaded rods, and the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850. (Tav. 1420-01) (7) . Ensure that the two plates stay parallel (adjust the nuts).

Fit in the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) :

- the ring(D1) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,

- the lower arm by positioning the ball joint in the ring(D1) ,
- the ring(D2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) on the lower arm ball joint(8) .

Extract the lower arm ball joint(8) by operating the jack(9) of the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

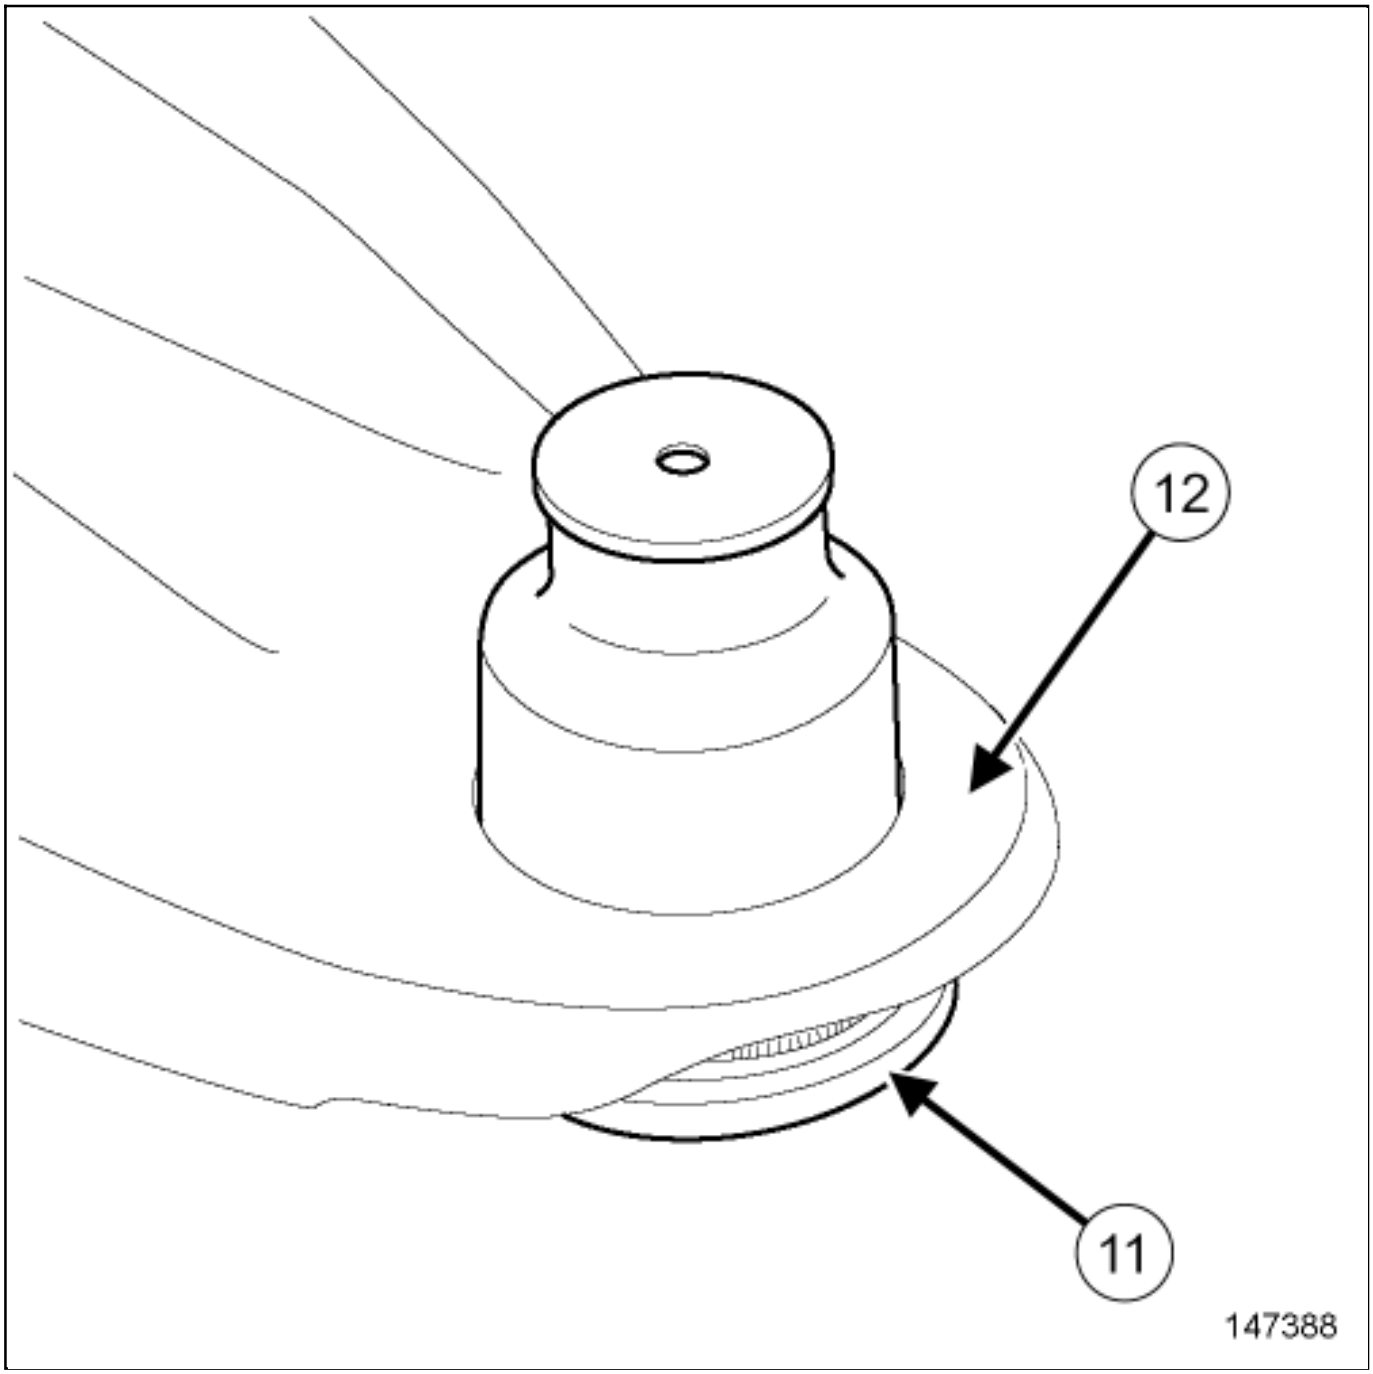


Remove:

- the rings(D1) and (D2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,
- the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

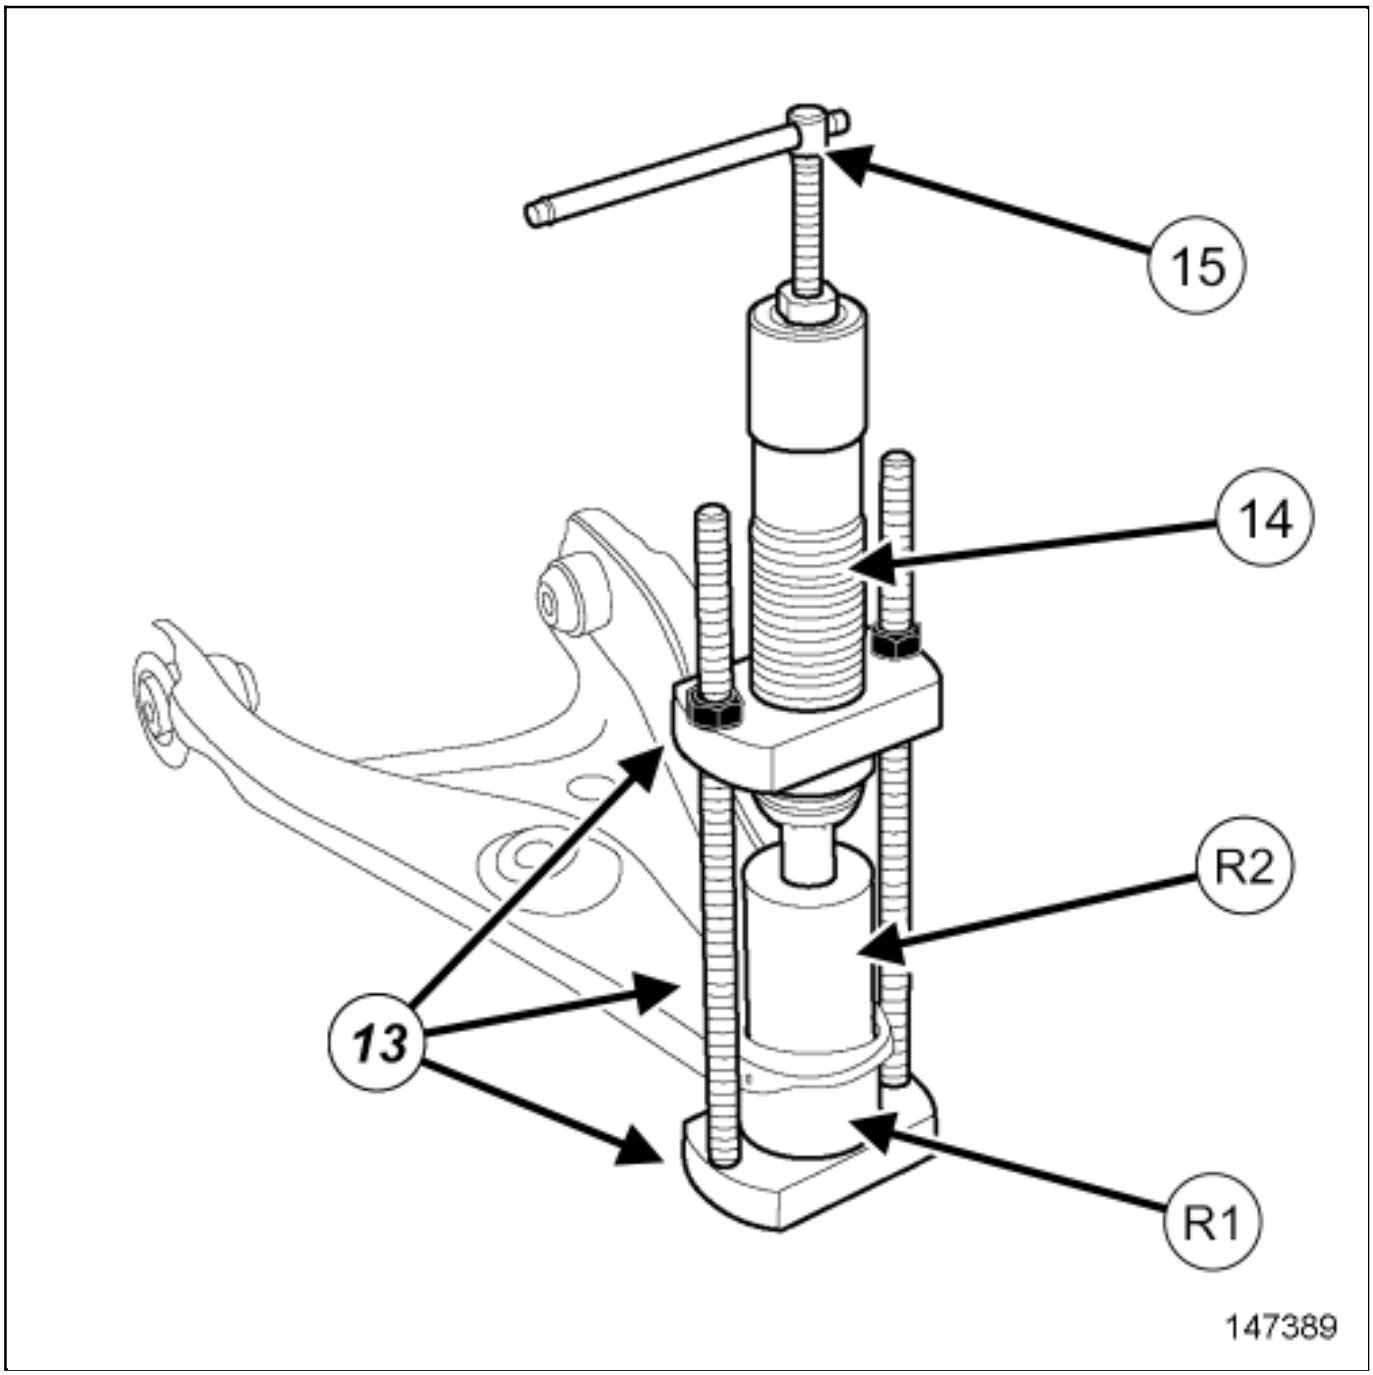
REFITTING

1. REFITTING PREPARATION OPERATION



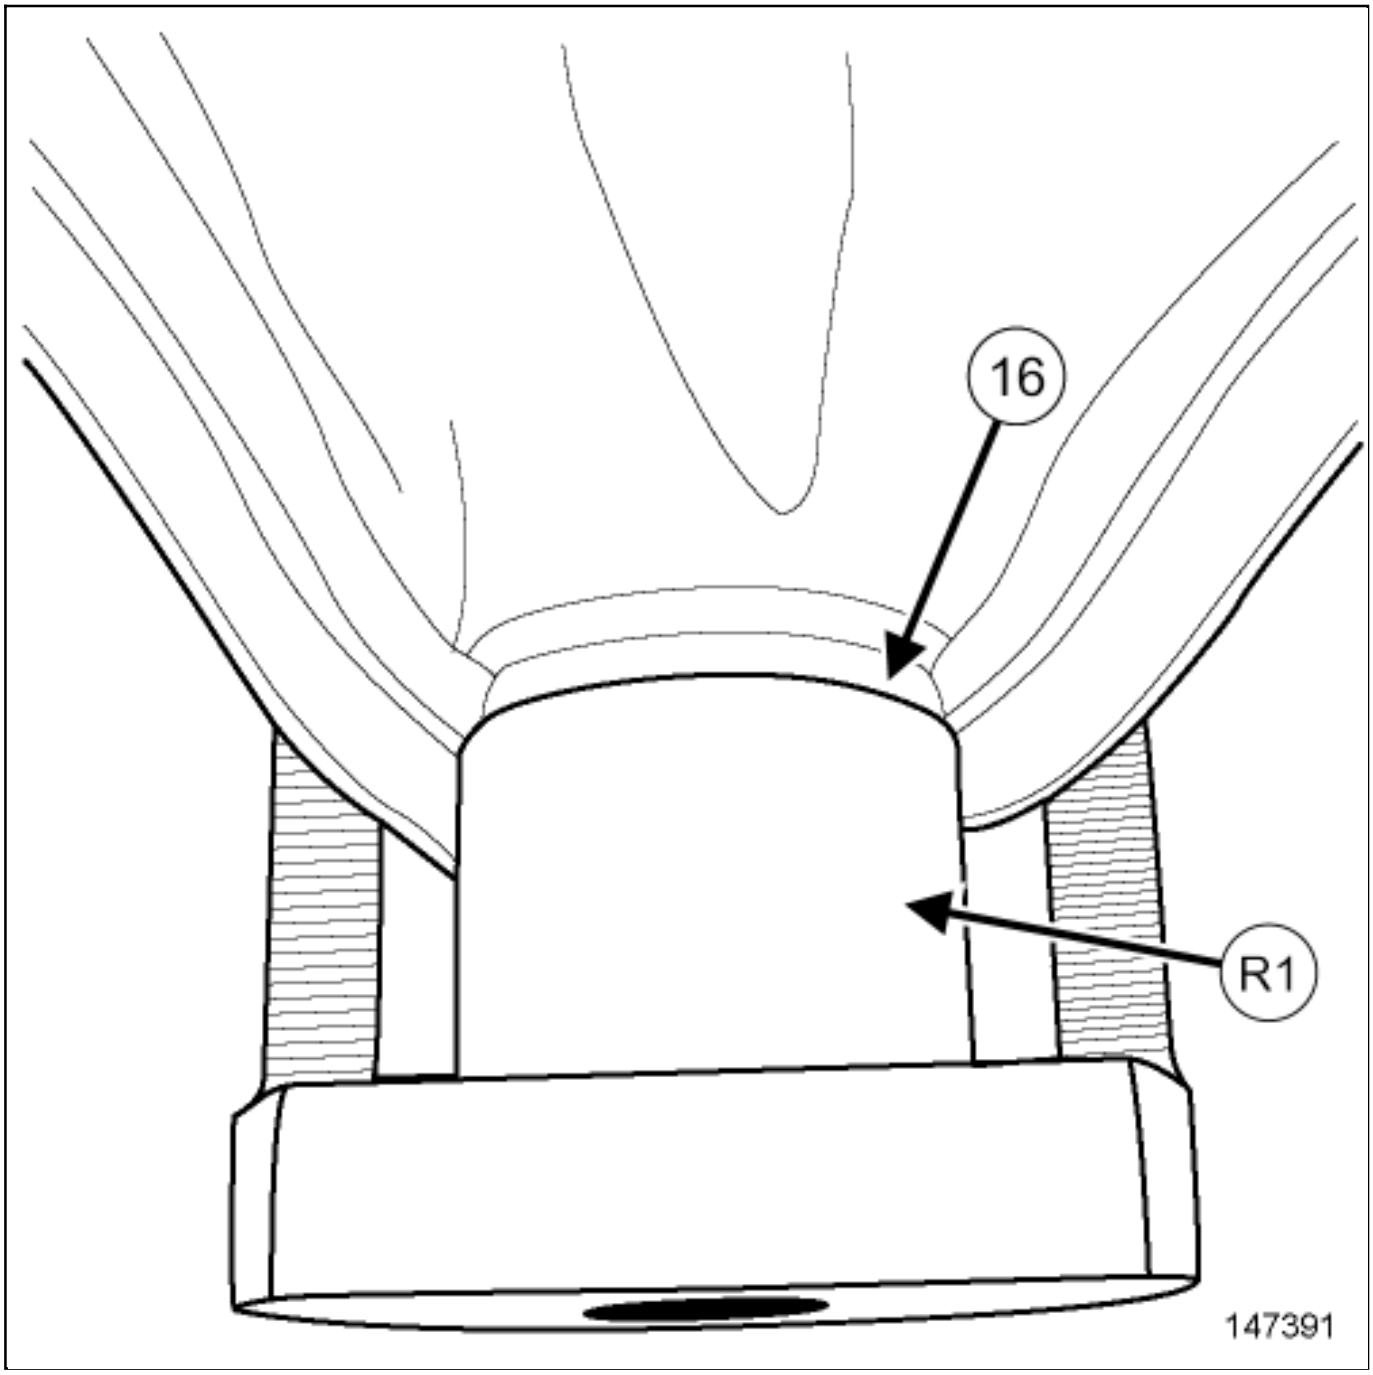
Clean the mating face of the ball joint on the lower arm using a clean clothVehicle: Parts and consumables for the repair .

Note:



The lower arm ball joint (replacement part) is equipped with a protective cover(10) .

Do not remove the protective cover before the end of the operations for refitting the ball joint.

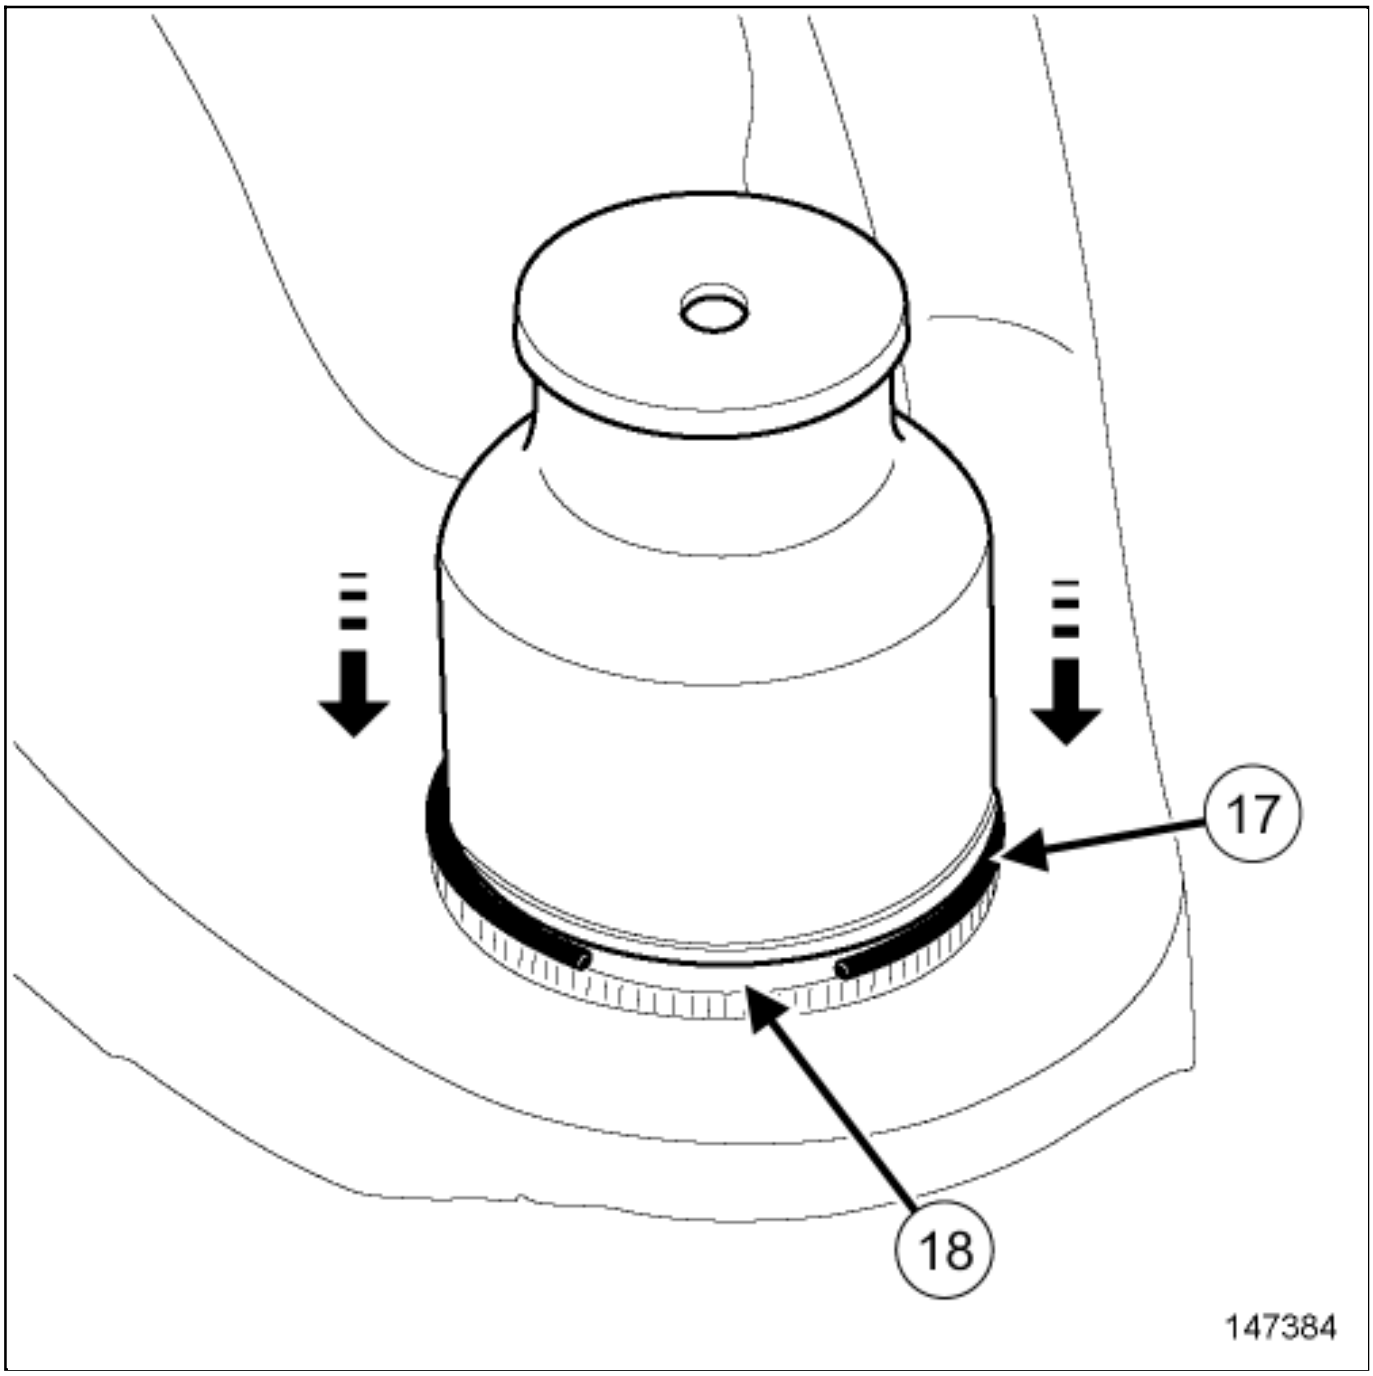


Position the new lower arm ball joint(11) on the front driveshaft lower arm(12) .

2. REFITTING OPERATION

Fit in the assembly of the toolsTooling kit for replacing lower ball joints.(**Tav. 1420**) (**13**) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(**Tav. 1420-01**) :

- the ring(**R1**) of the toolSockets for removing/refitting the lower arm ball joint nut(**Tav. 1929**) ,
- the lower arm with the new ball joint by positioning the ball joint in the ring(**R1**) ,
- the ring(**R2**) of the toolSockets for removing/refitting the lower arm ball joint nut(**Tav. 1929**) on the lower arm ball joint.



Fit the new ball joint(11) in the lower arm by operating the jack(15) of the toolScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) until the ring(R1) contacts the lower arm at (16) .

Turn the jack(15) one additional turn to finalise the geometric position of the lower arm ball joint.

Remove:

the rings(R1) and (R2) of the toolSockets for removing/refitting the lower arm ball joint nut(Tav. 1929) ,

the assembly of the toolsTooling kit for replacing lower ball joints.(Tav. 1420) and Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) .

Fit the locking spring ring(17) in the groove(18) of the ball joint by sliding it downwards on the protective cover in the direction of the arrows.

Remove the protective cover(10) of the lower arm ball joint.

3. FINAL OPERATION

Proceed in the reverse order to removal.

FRONT END PANEL AIR INLET CONTROL VALVE ASSEMBLY : EXPLODED VIEW

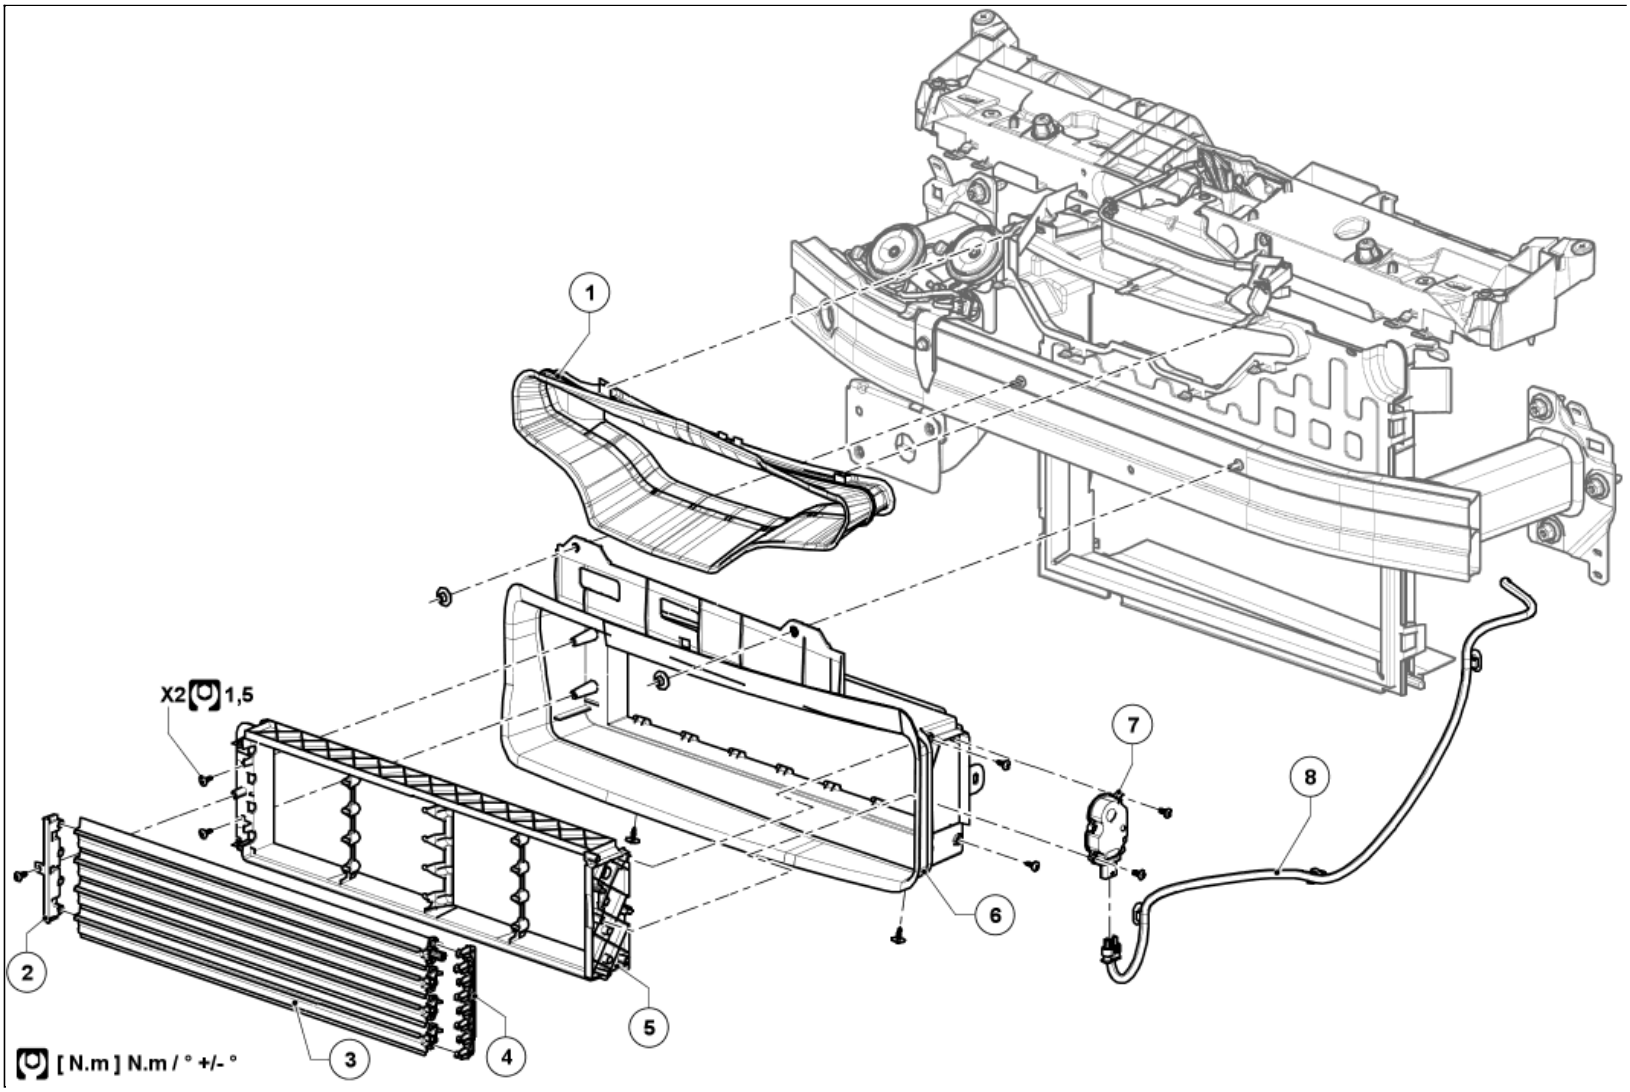


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

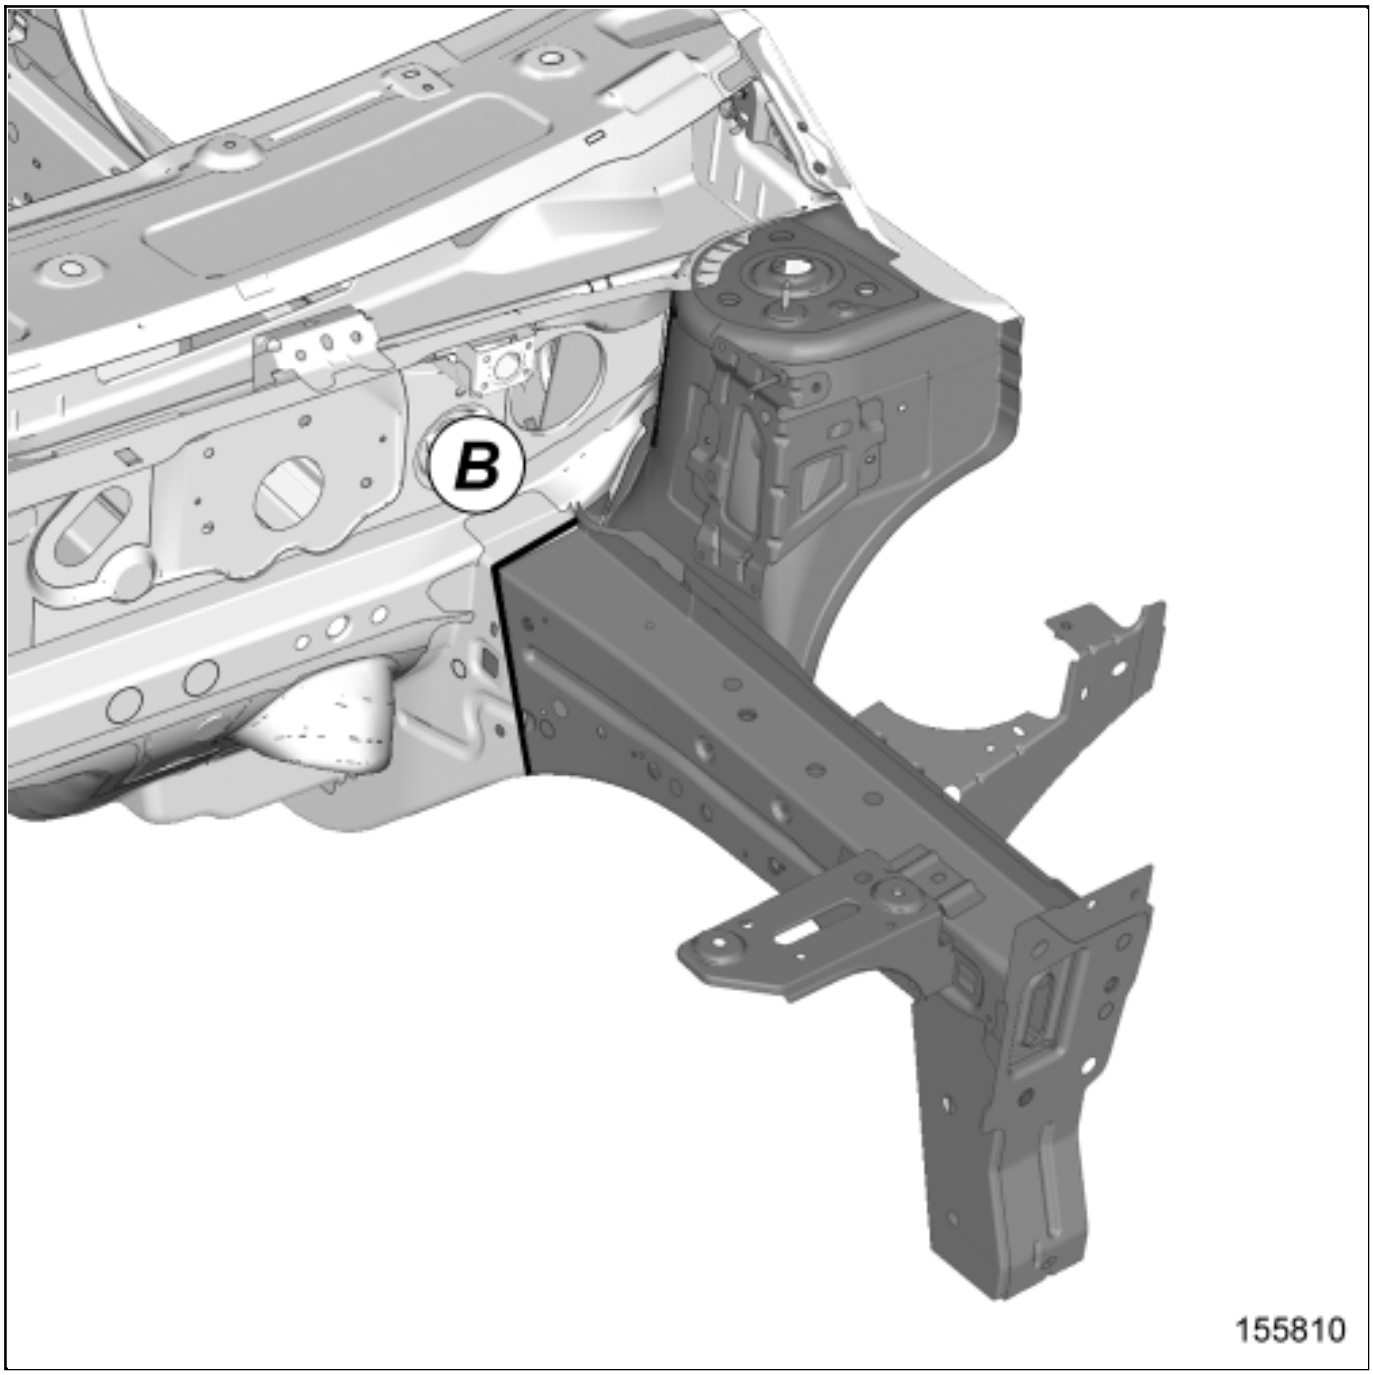
2. PRESENTATION

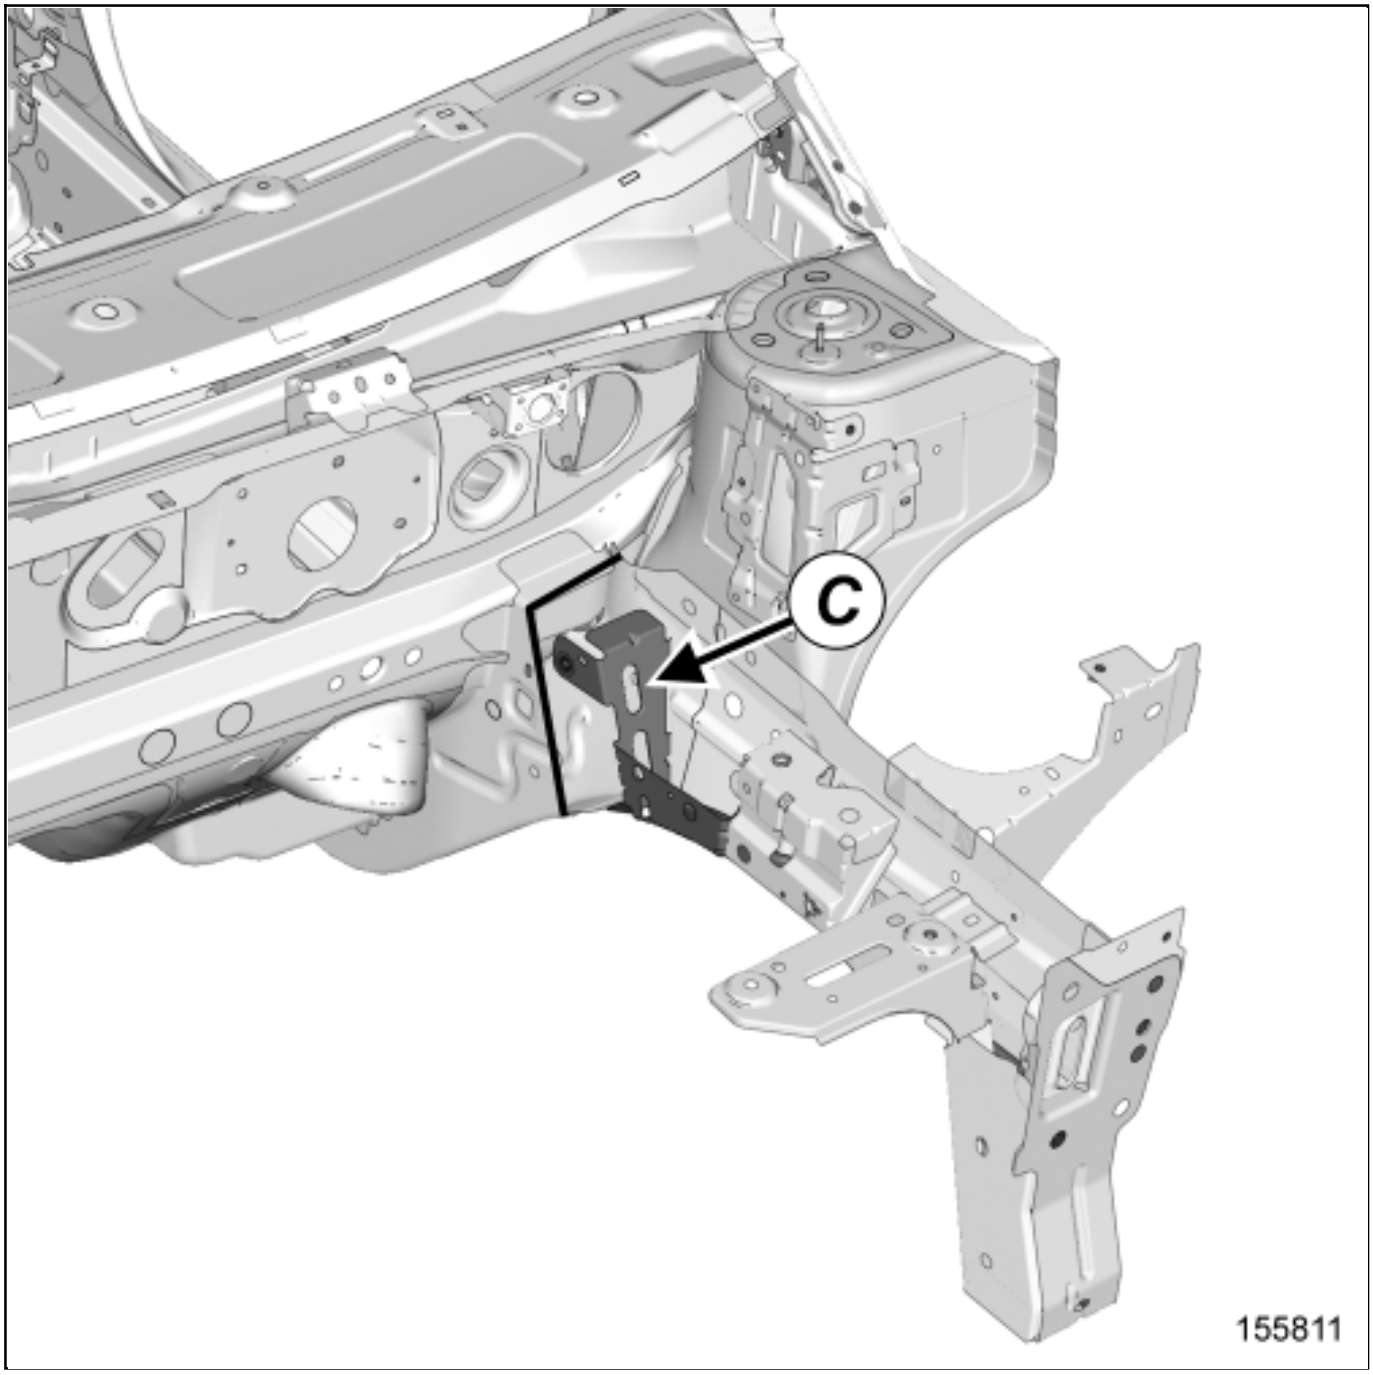
3. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

- partial replacement A-B.



WARNING



Use a repair bench to ensure the positioning of the points and the geometry of the axle assemblies.

1- FRONT LEFT-HAND PARTIAL REPLACEMENT A-B

1)PART IN POSITION

SPECIAL FEATURE OF CUT B

Note:

When cutting, be careful not to damage the rear inner reinforcement(C) .

2)POSITION OF ELECTRIC EARTHS

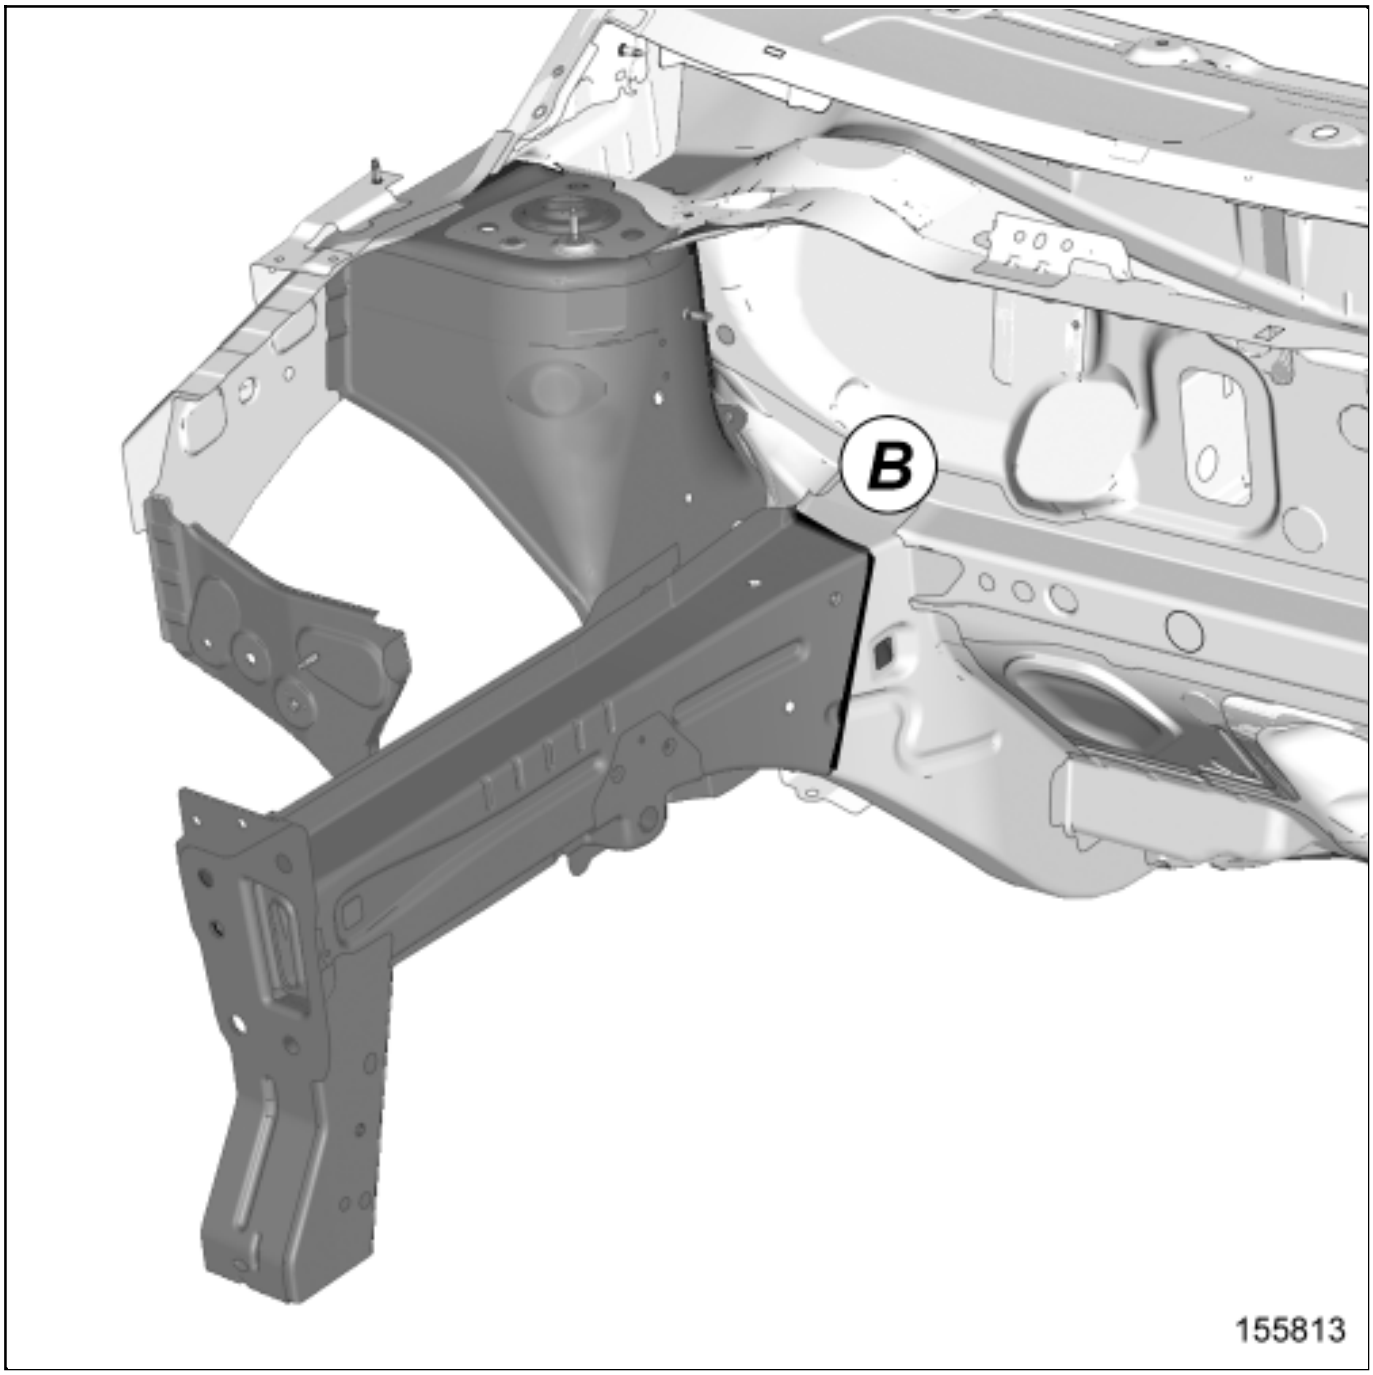
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

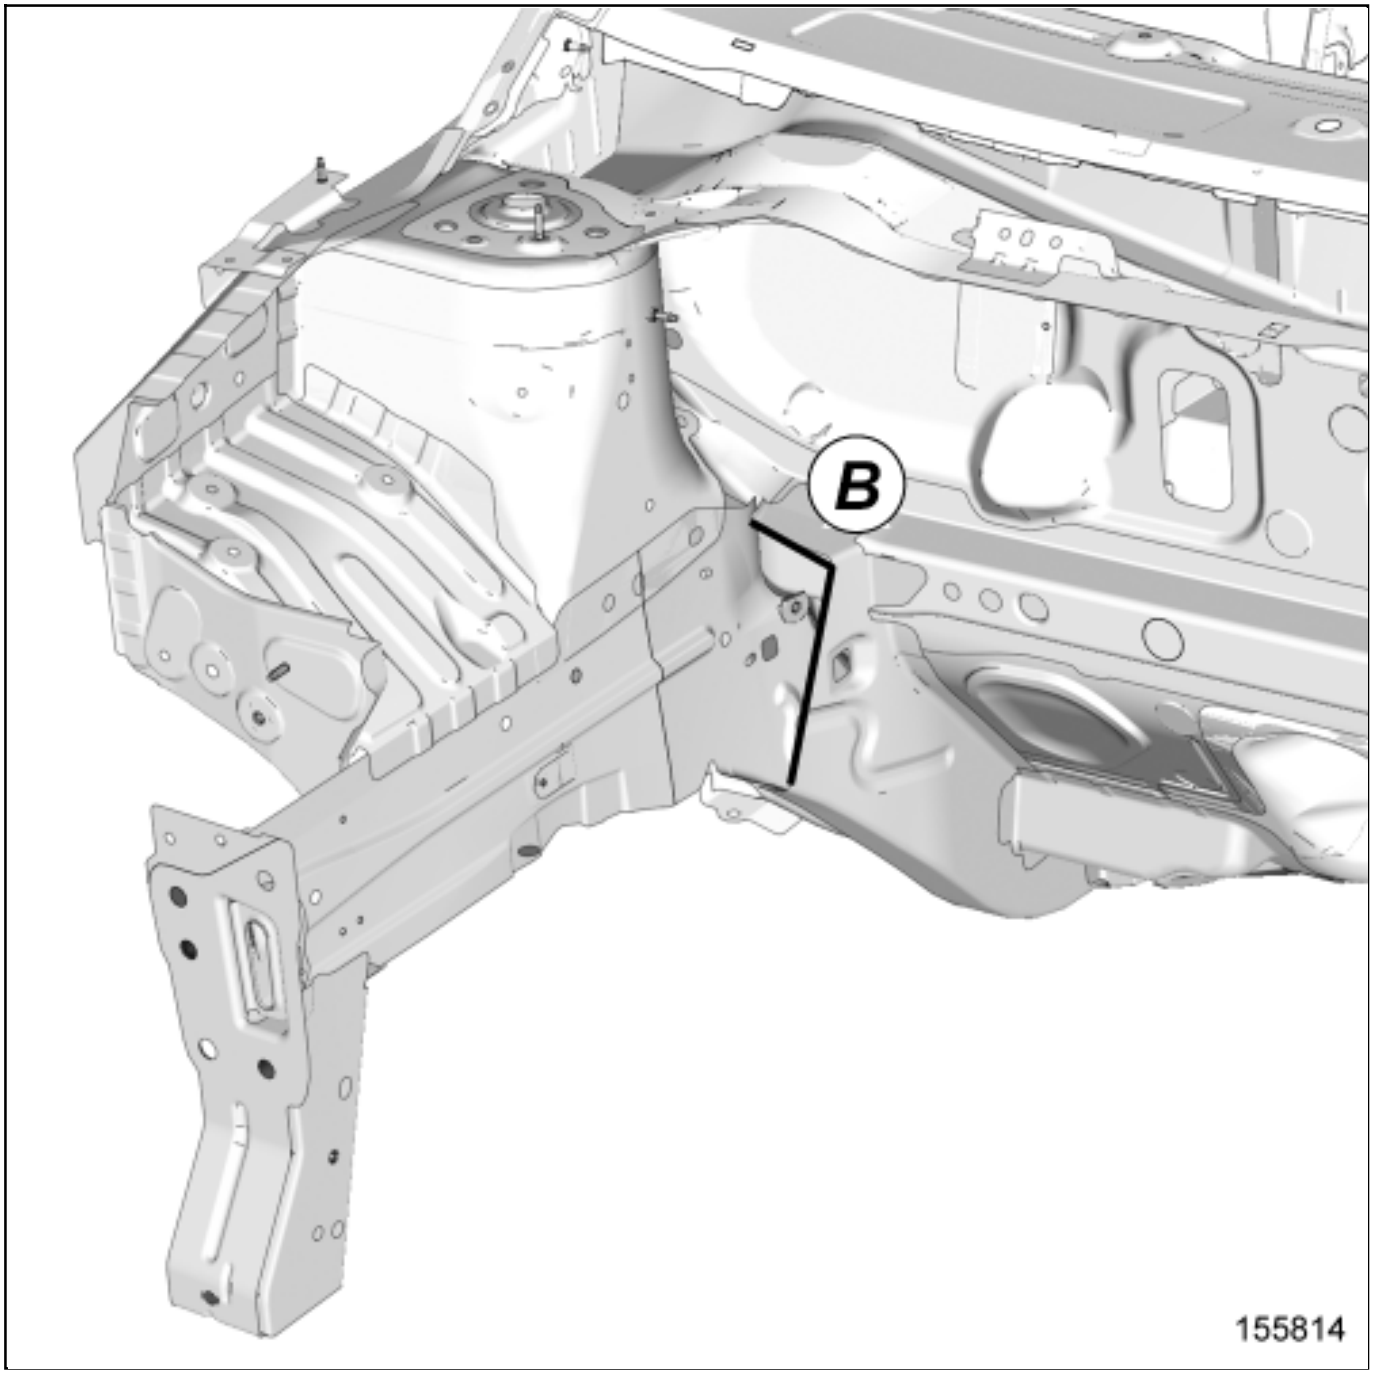
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING



CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT OF FRONT RIGHT-HAND HALF UNIT

1)PART IN POSITION

SPECIAL FEATURE OF CUT B

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

FRONT HUB CARRIER ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 31A, Front axle components, Front axle components: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

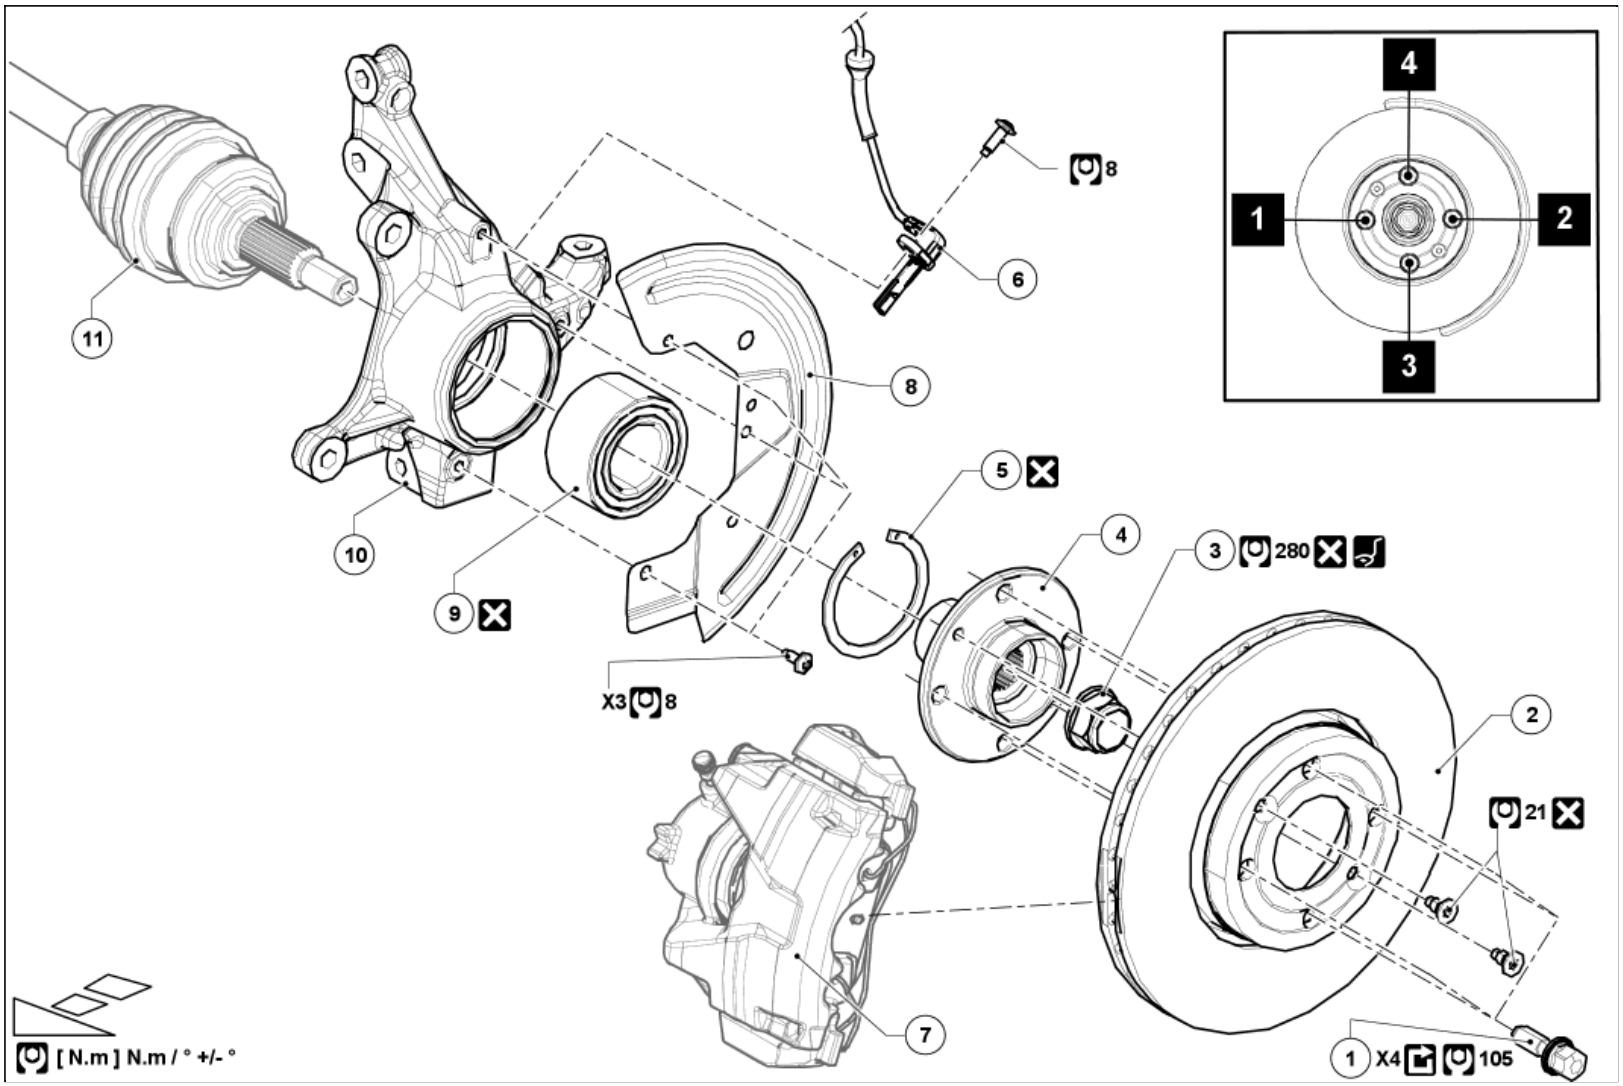


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Wheel bolts	Wheel: Removal - Refitting
2	Front brake disc	(see 31A, Front axle components, Front brake disc: Removal - Refitting)

11	Frontdriveshaft	Front left-hand driveshaft: Removal - Refitting and Front right-hand driveshaft: Removal - Refitting

FRONT HUB CARRIER BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

- To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:
  - (see 31A, Front axle components, Front axle components: Precautions for the repair) ,
  - Vehicle: Precautions for the repair .

CAUTION

- In order not to damage the brake hose:
  - do not tension the hose,
  - do not twist the hose,
  - check that there is no contact with the surrounding components.

CAUTION

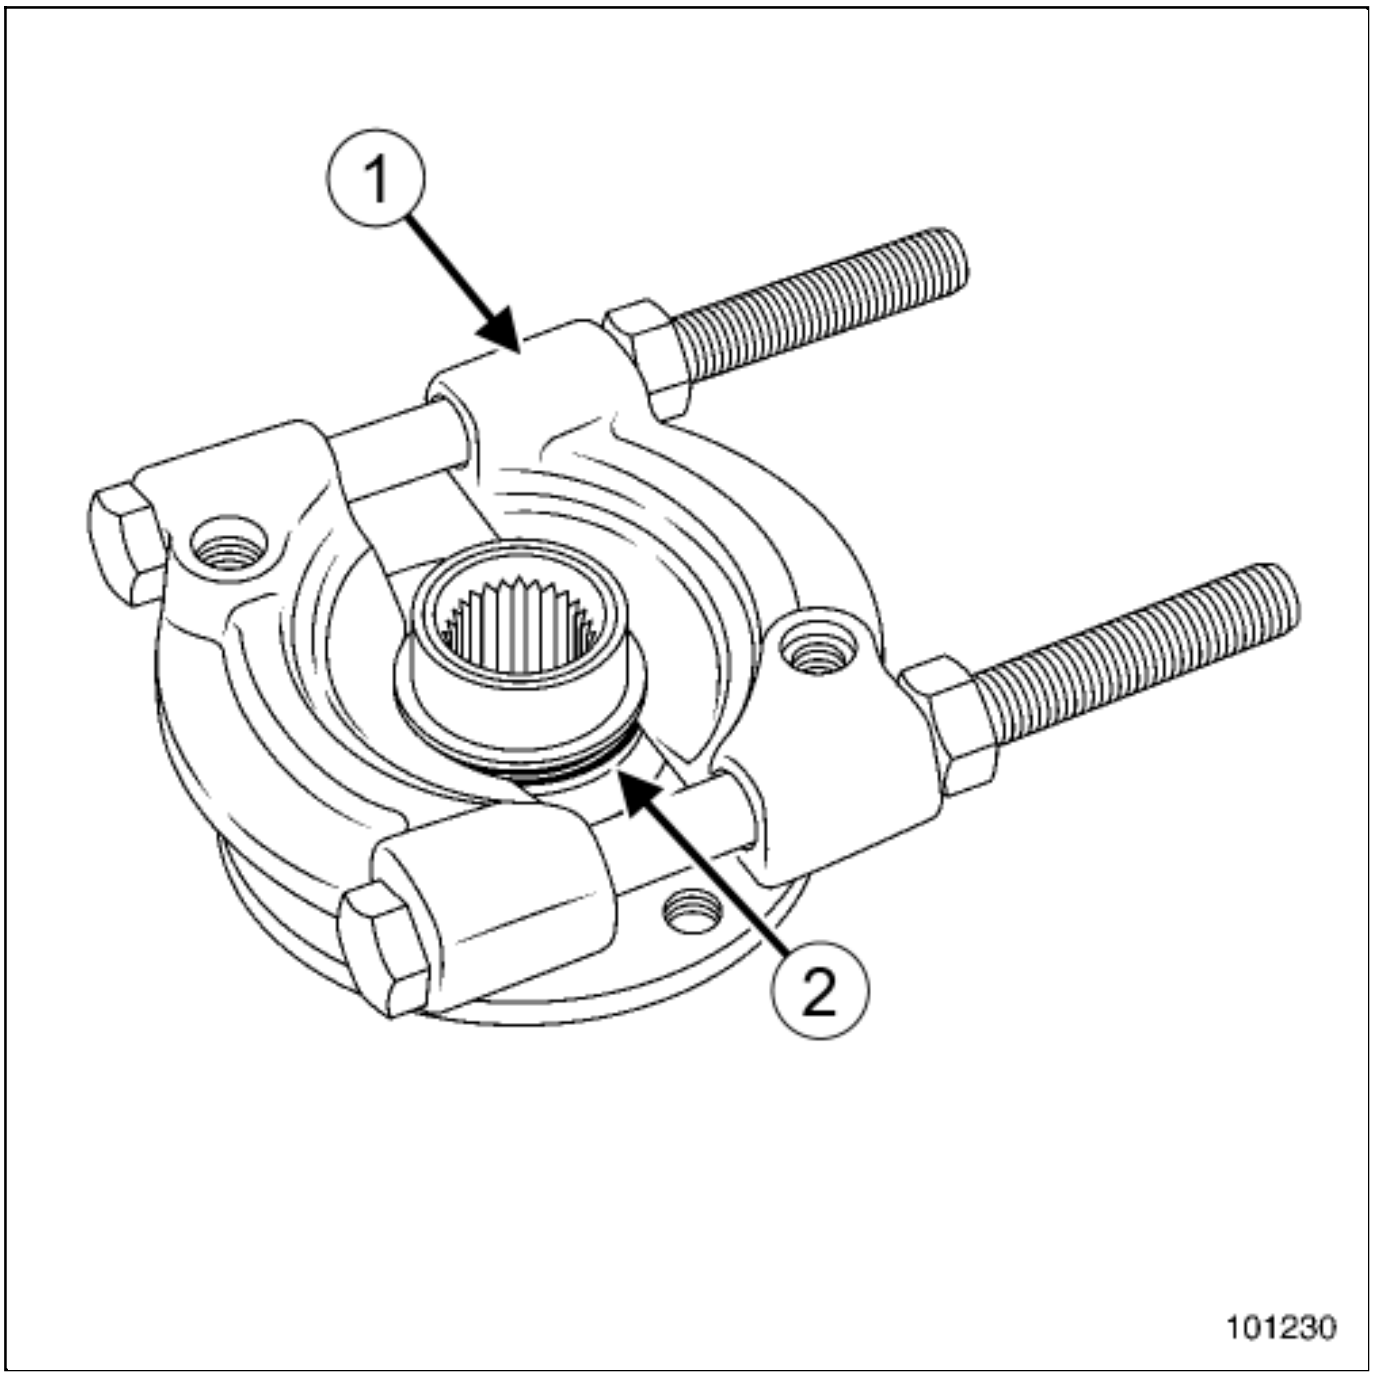
- In order to prevent irreversible damage to the front hub bearing:
  - Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
  - Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the front wheel(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .
- Remove (see 31A, Front axle components, Front brake calliper assembly: Exploded view) :
  - the front brake pads,



- the front brake calliper mounting.

Remove (see 31A, Front axle components, Front hub carrier assembly: Exploded view) :

- the front brake disc,
- the front driveshaft hub carrier.

2. REMOVAL OPERATION

Remove the elastic ring from the front driveshaft hub carrier(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

Place the extractor jaws(1) in the groove of the internal bush(2) .

REFITTING

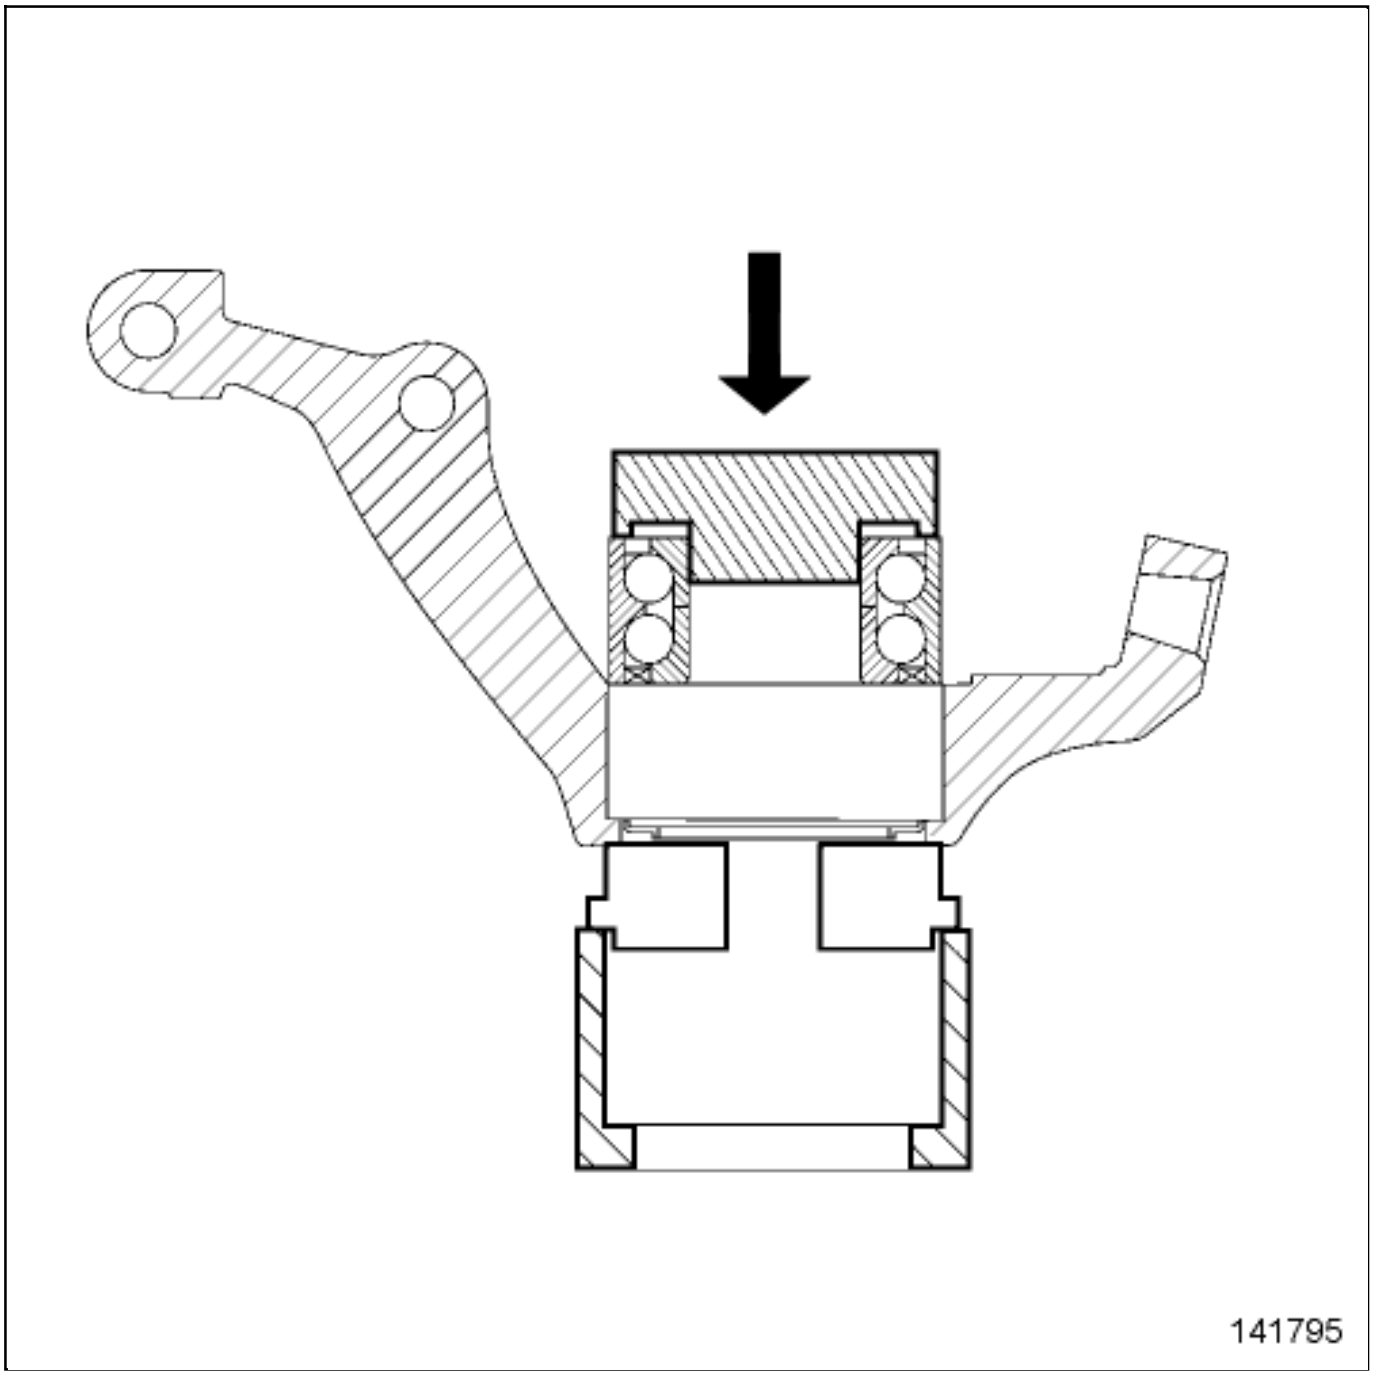
1. REFITTING PREPARATION OPERATION

Use surface cleaner[Vehicle: Parts and consumables for the repair] to clean:

- the internal and external surfaces of the bearing, in contact with the hub carrier and the hub,
- the hub carrier surfaces in contact with the bearing,
- the hub surfaces in contact with the bearing.

CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target on the bearing.



CAUTION

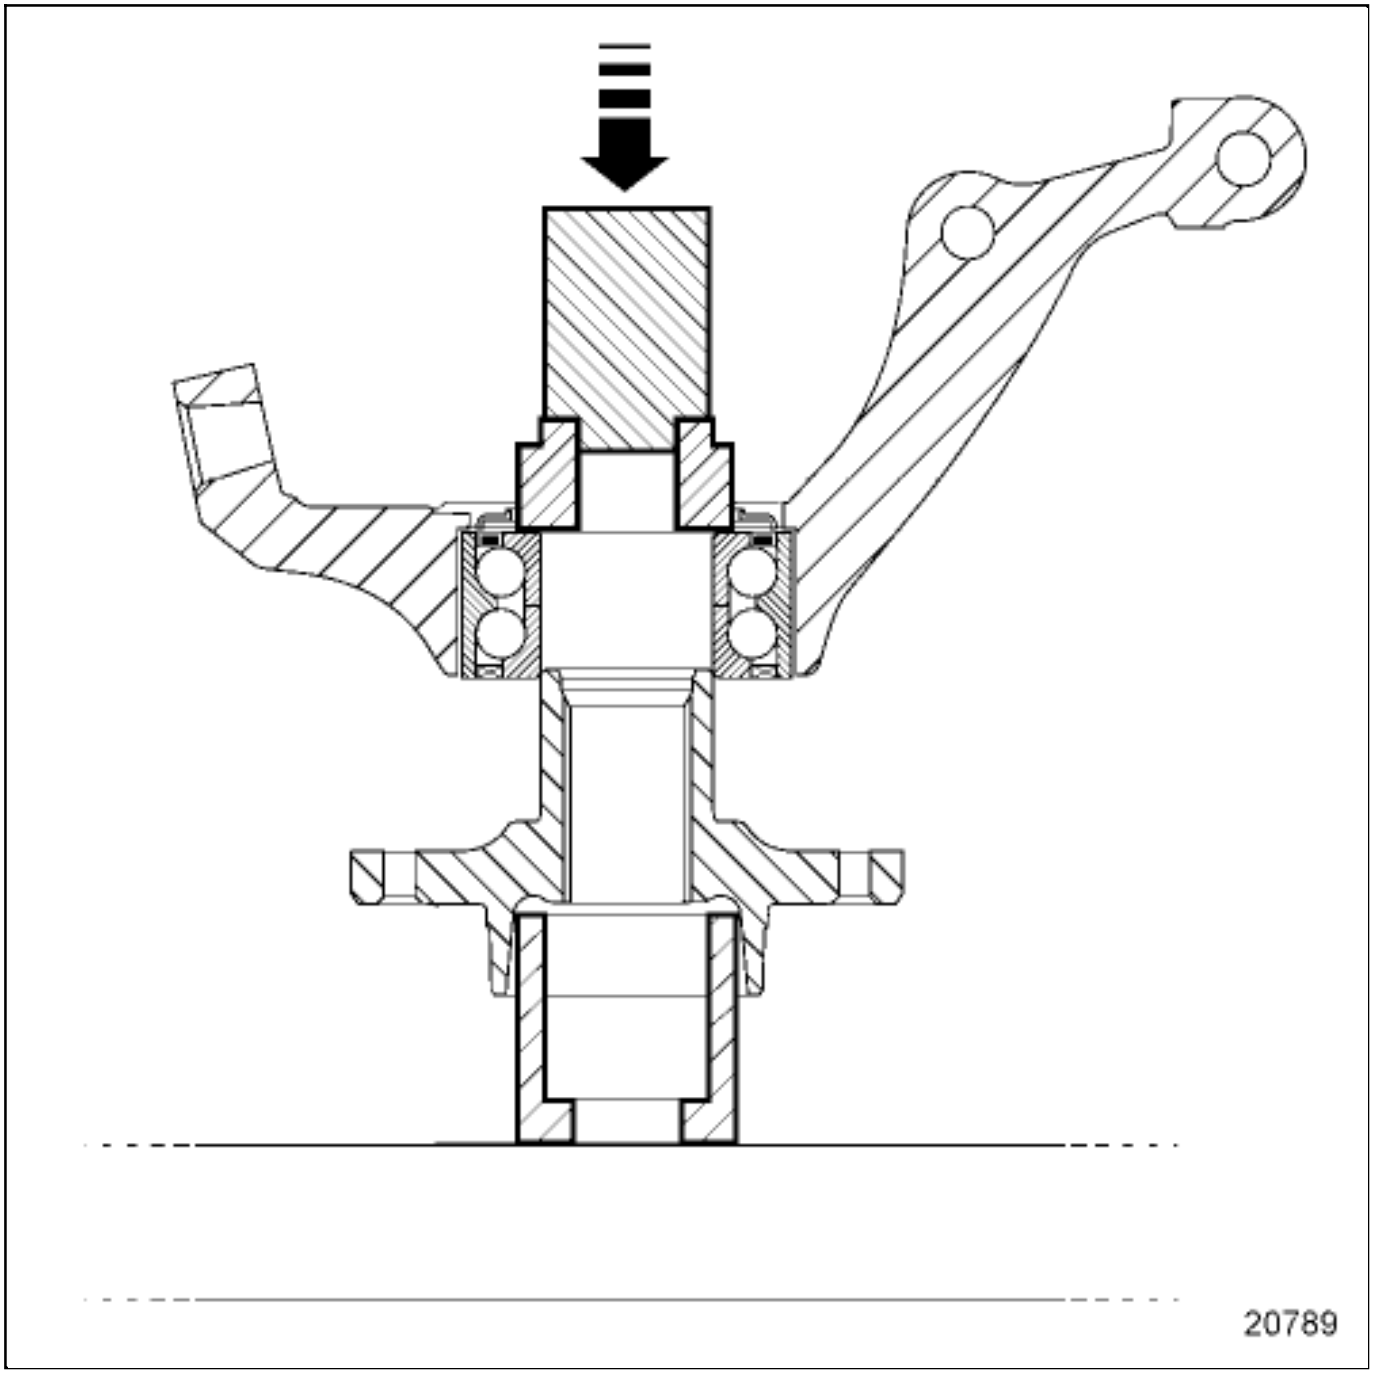
Do not press the bearing's internal bush so as to avoid damaging the bearing (very high shrink-fitting force).

Check the condition of the hub surface and the bore of the hub carrier in contact with the bearing.

Replace any component whose contact surfaces have deep scratches or cracks.

2. REFITTING OPERATION

141795



CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target (**3**) on the bearing.

Position the sensor target on the wheel side of the bearing on the hub carrier.

Apply a fitting force of 50,000 Nto ensure that the bearing is correctly fitted on the hub carrier shoulder.

Refit:

- the hub using a tube with an external diameter of 54 mm,
- the elastic ring on the front driveshaft hub carrier.

3. FINAL OPERATION

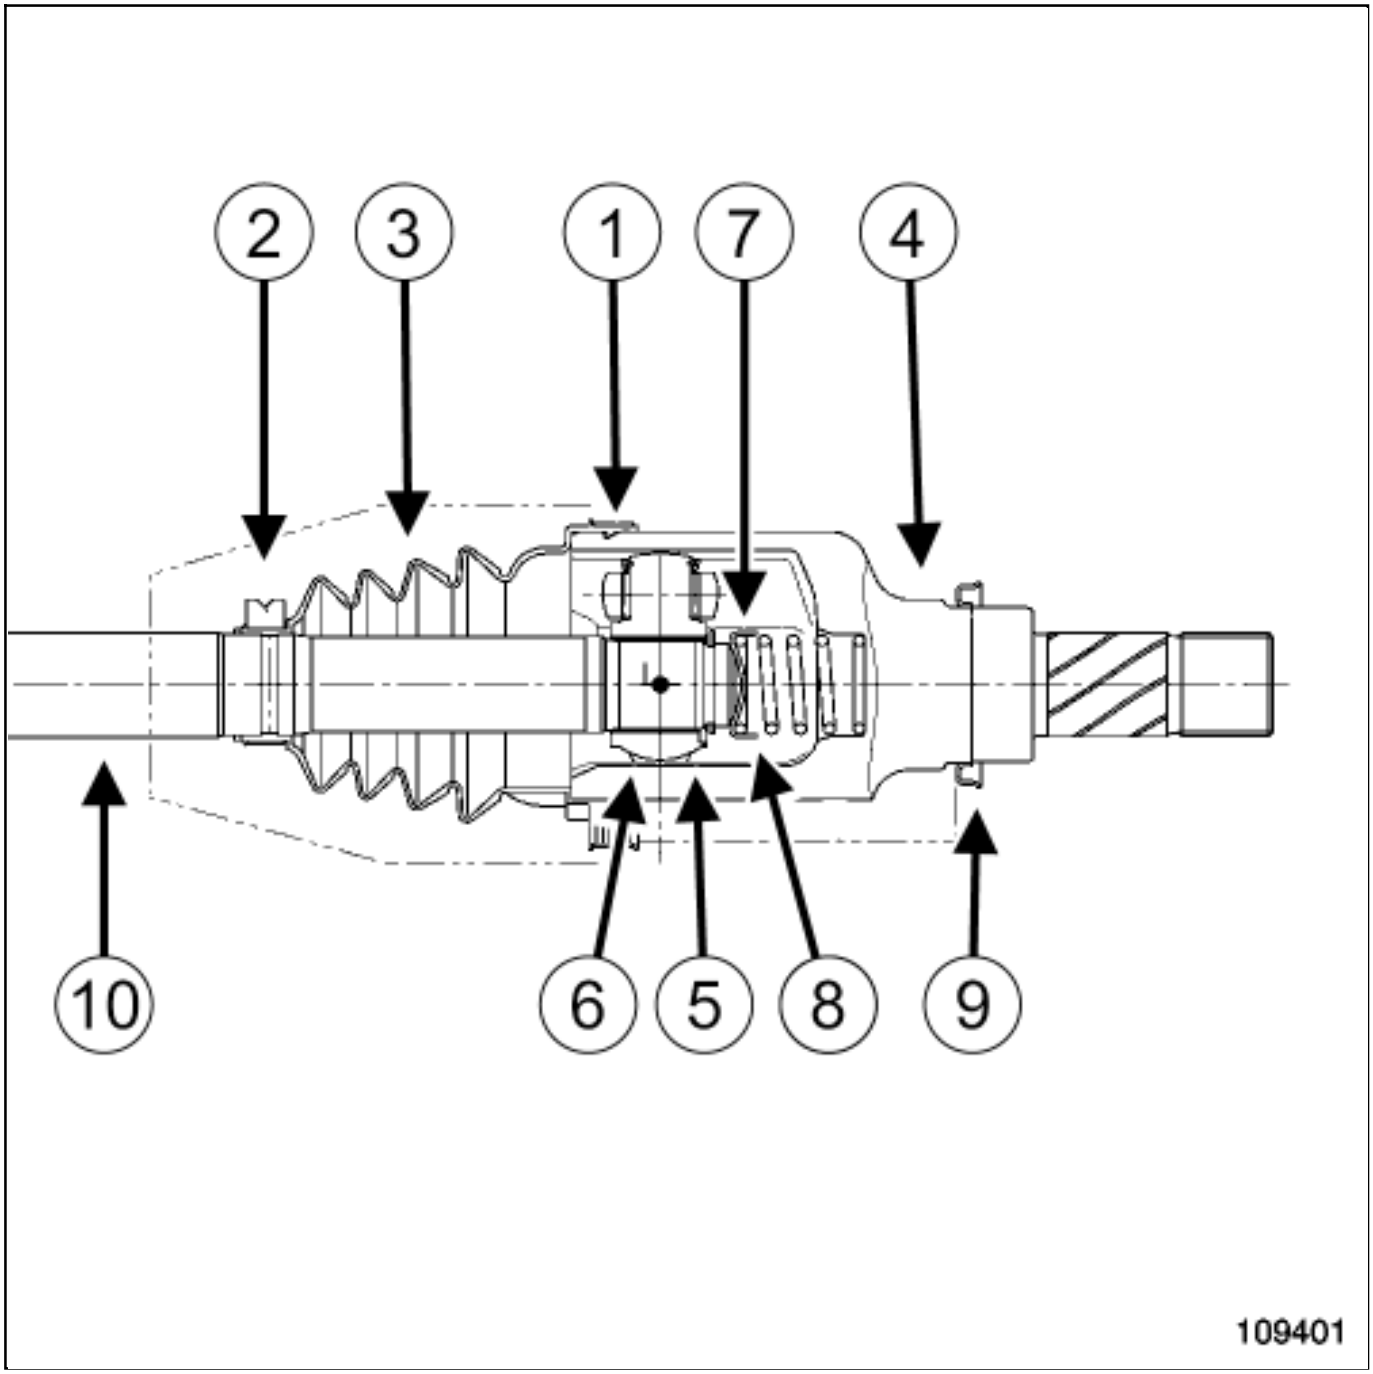
Proceed in the reverse order to removal.

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

Repair-13x02x03x15-01x37-1-39-1.xml

XSL version : 3.02 du 22/07/11



FRONT LEFT-HAND DRIVESHAFT GAITER, GEARBOX SIDE: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Type clip pliers for driveshafts with a thermoplastic gaiter.	Tav. 1168
Pliers for the driveshaft gaiter collar.	Tav. 1784

Equipment required
parts washer

parts always to be replaced:
Front left-hand driveshaft gaiter, gearbox side
gearbox side front driveshaft seal locking ring

(1) Big securing clip

(2) Small securing clip

(3) Driveshaft gaiter

(4) Driveshaft yoke sleeve

(5) Lock ring

(6) Spider

(7) Cup

(8) Cup spring

(9) Deflector

(10) Driveshaft

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

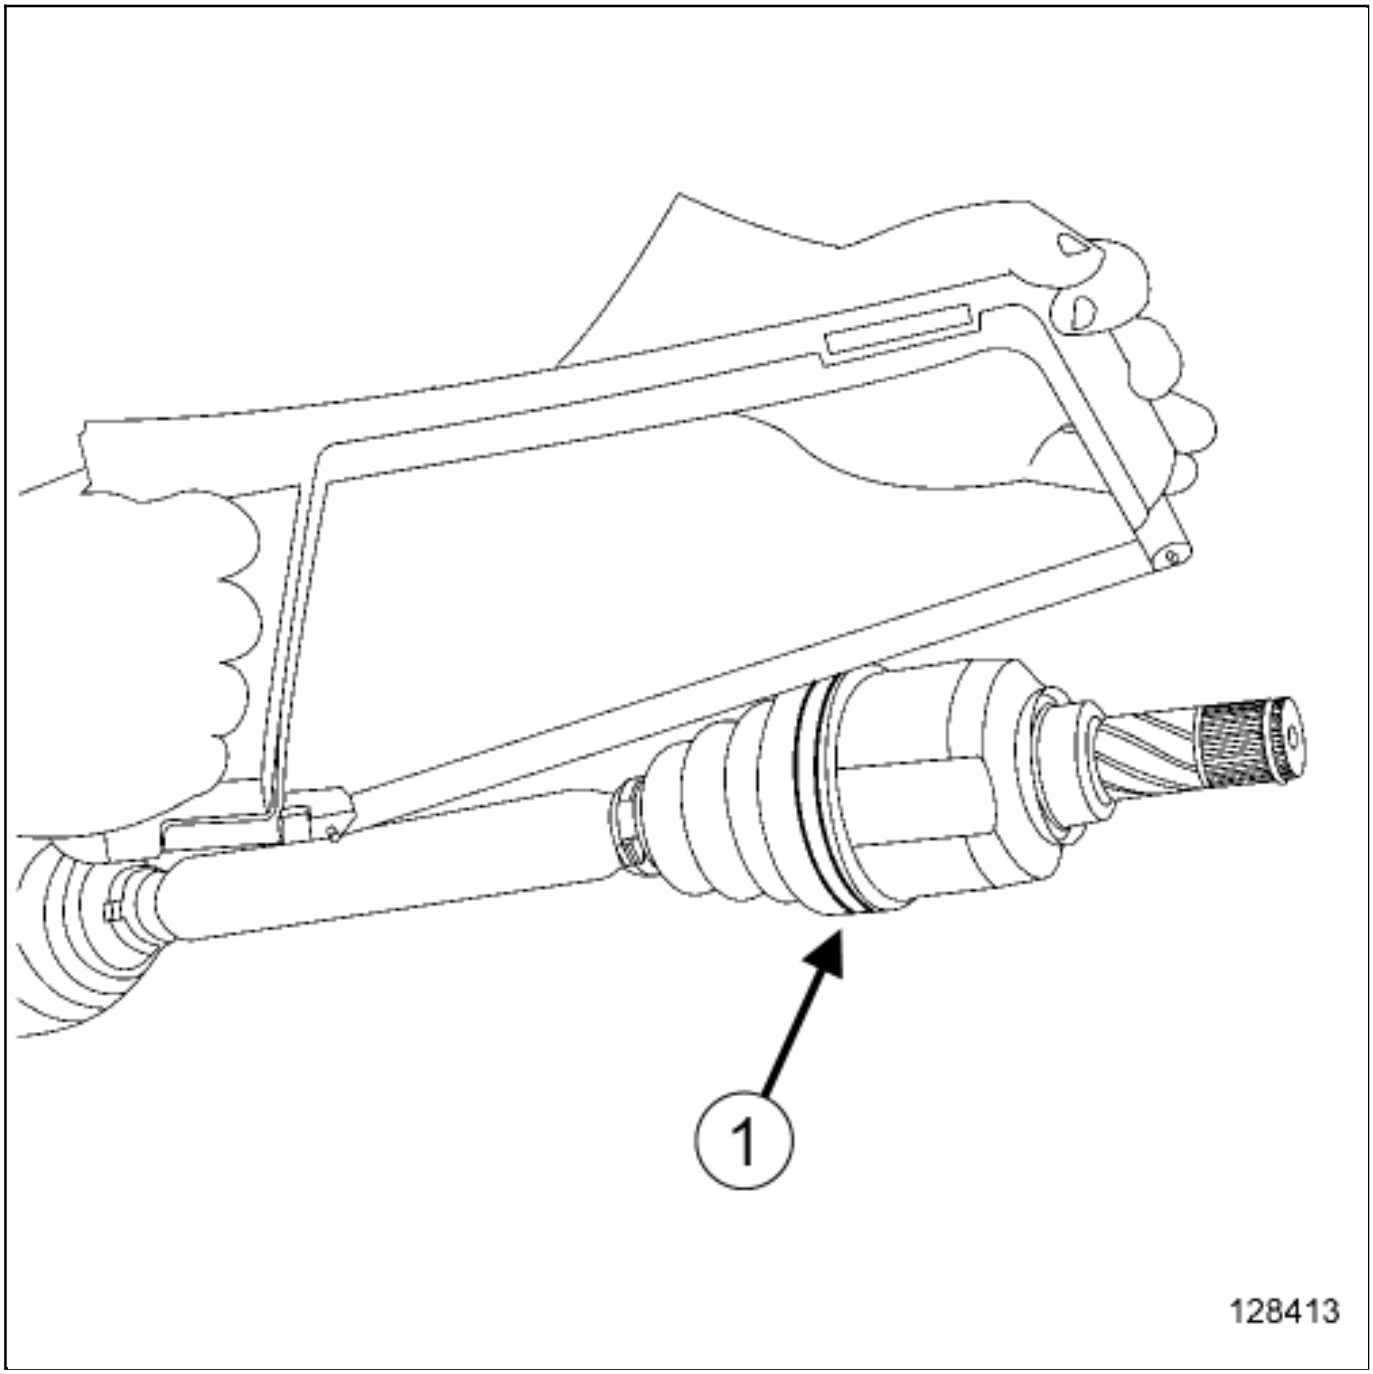
REMOVAL

1. REMOVAL PREPARATION OPERATION

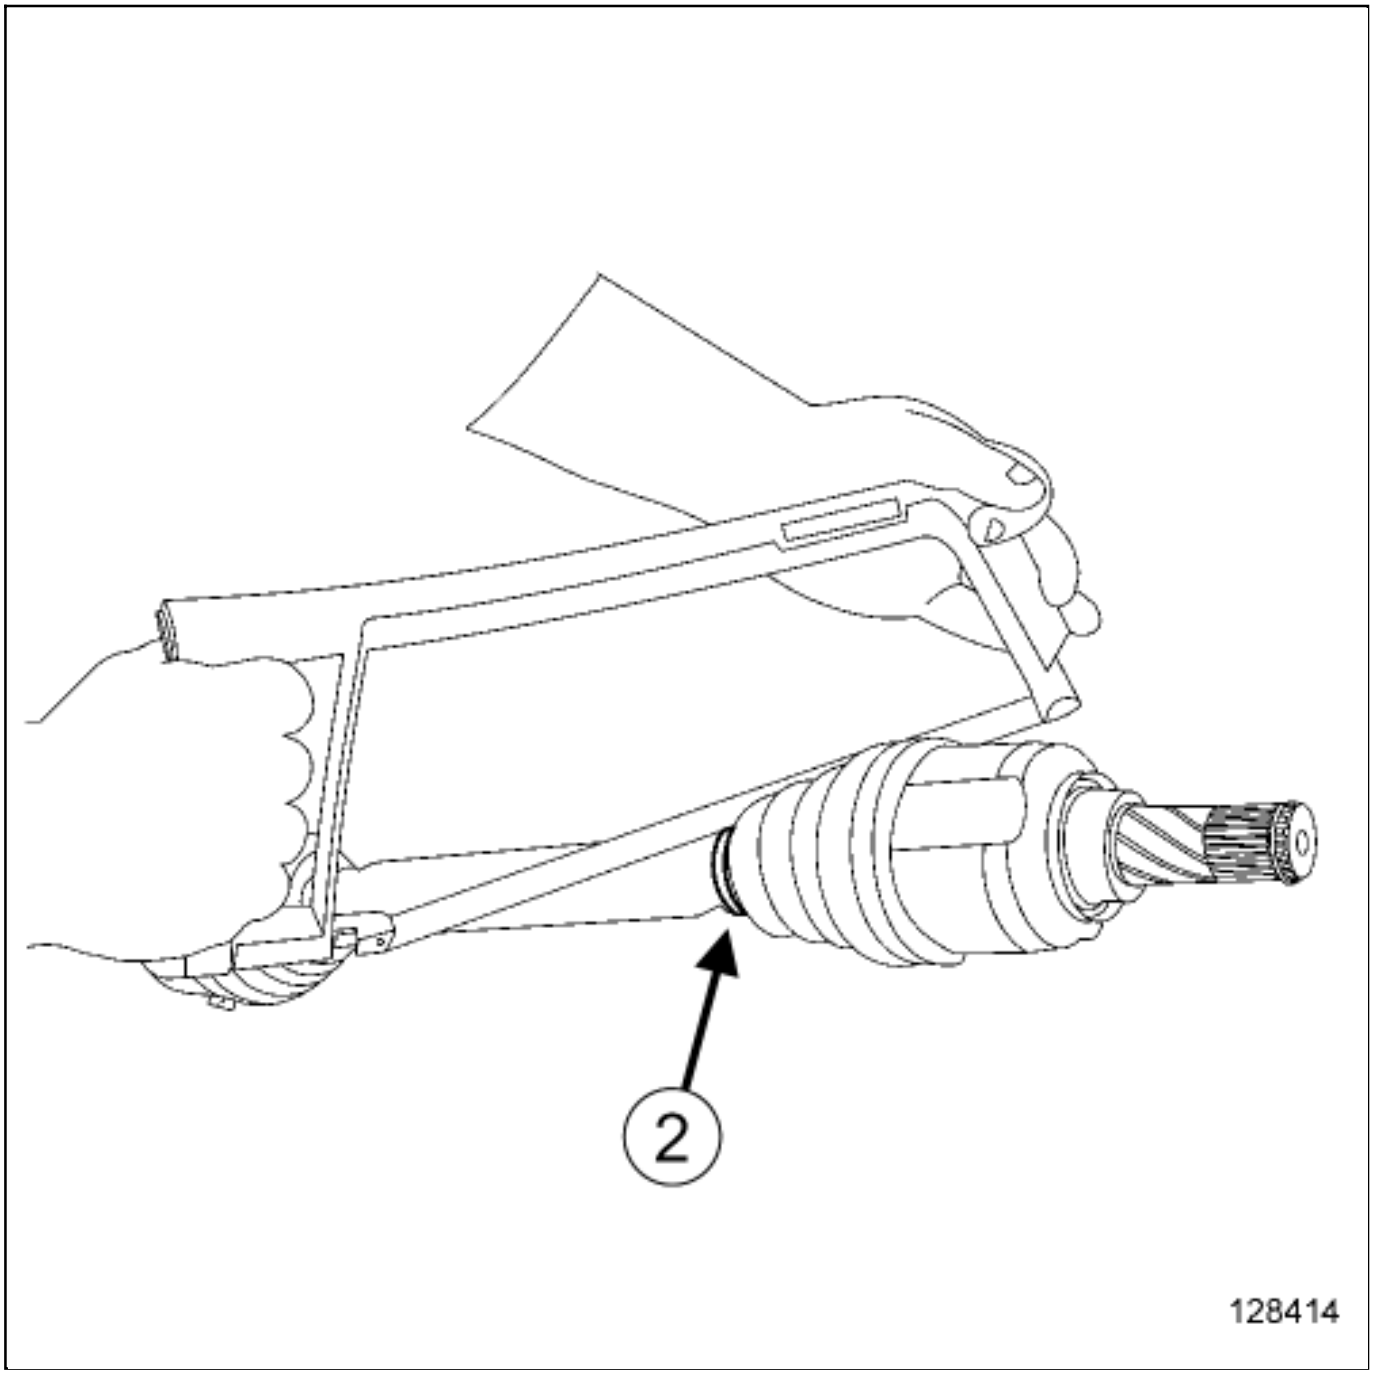
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the engine undertray bolts,
- the engine undertray.



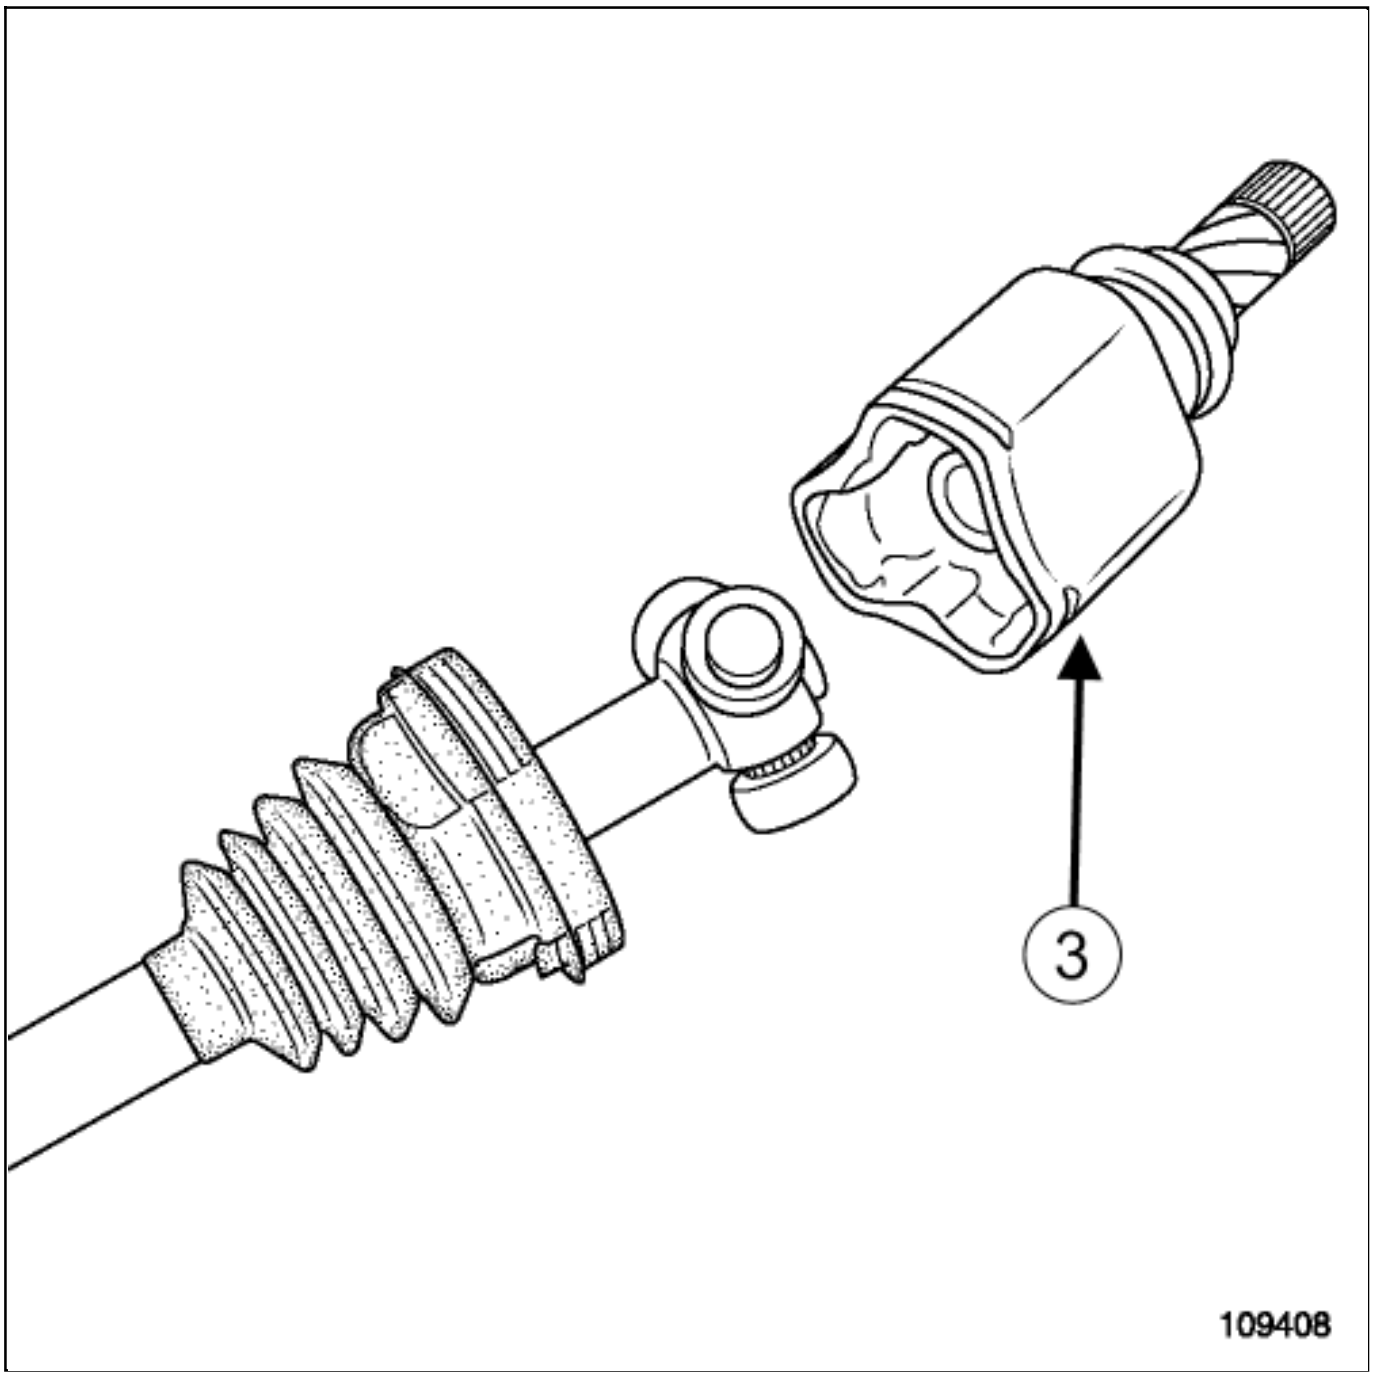
Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) or Automatic gearbox oil: Draining - Filling .



Remove:

- the front left-hand wheel Wheel: Removal - Refitting ,
- the front left-hand driveshaft (see 29A, Driveshafts , Front left-hand driveshaft: Removal - Refitting) .

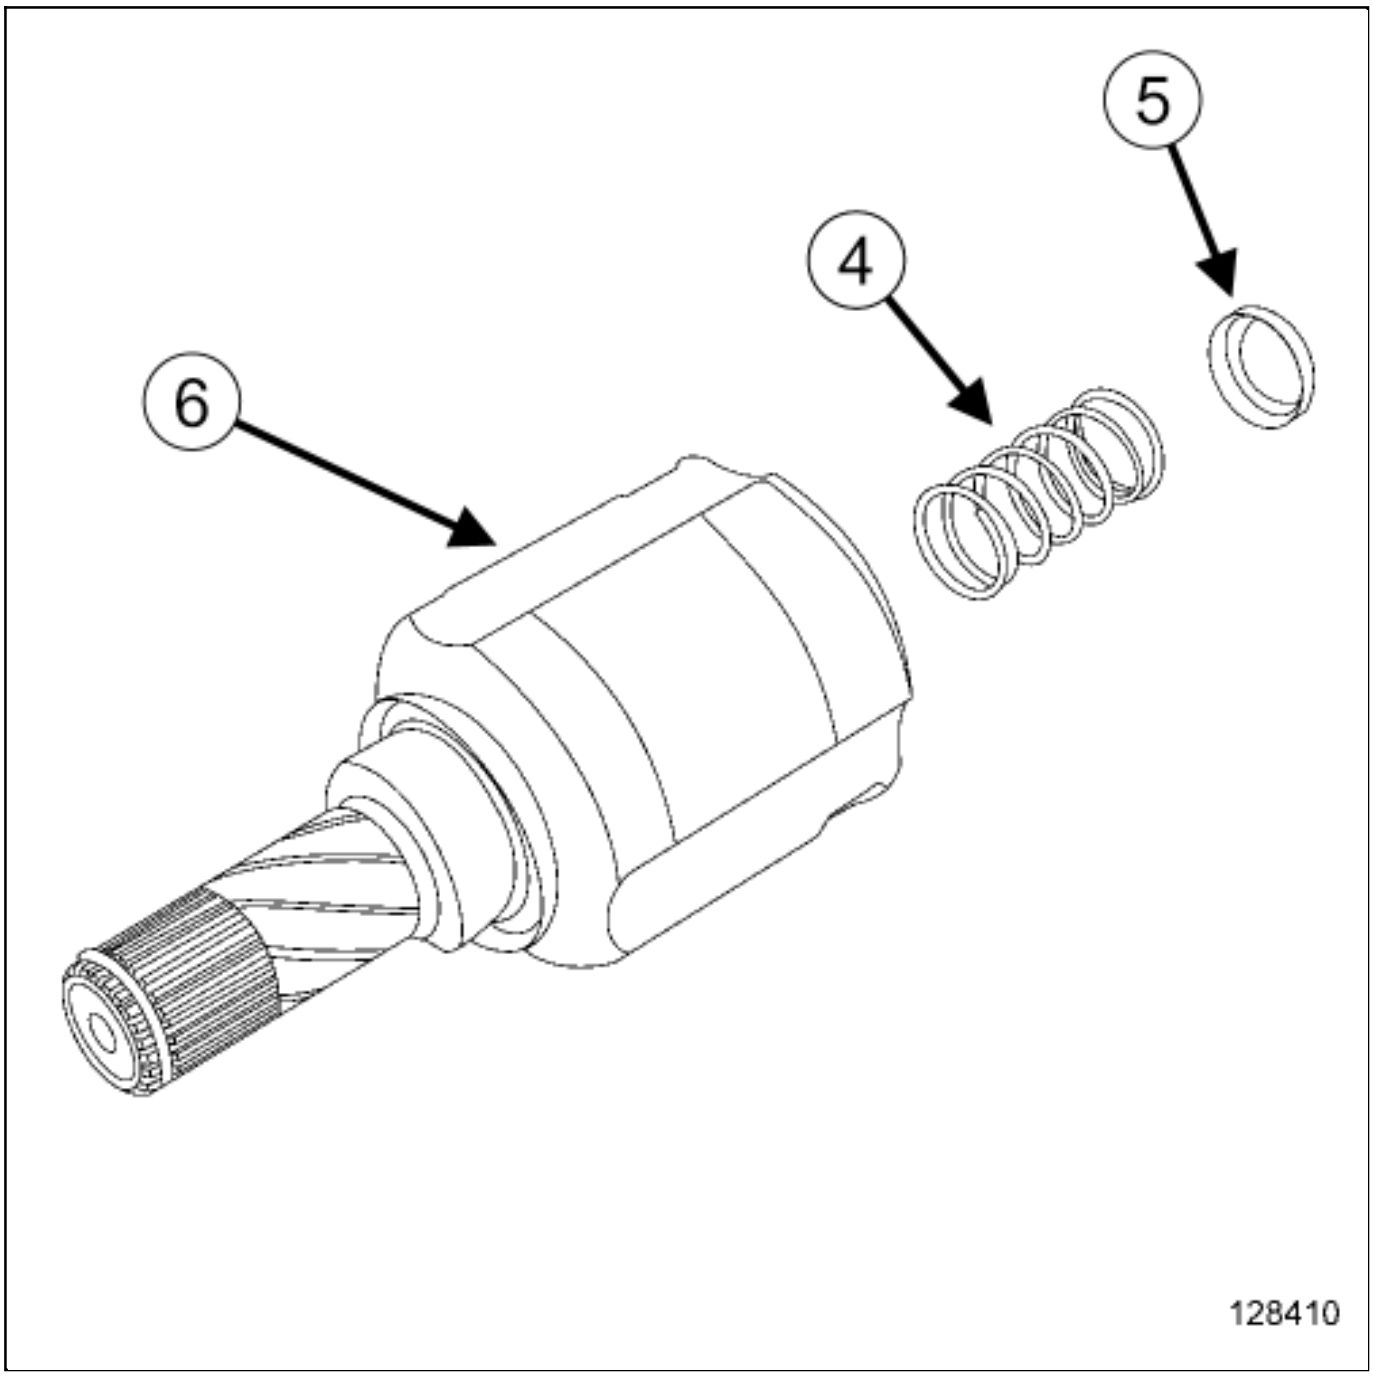
Remove the left-hand side differential output seal (see **Differential output seal: Removal - Refitting**) .



2. REMOVAL OPERATION

Cut the big securing clip(1) and the small securing clip(2) using cutting pliers or a metal saw, taking care not to damage the yoke sleeve or the driveshaft.

Push back the driveshaft gaiter to release the driveshaft yoke sleeve.

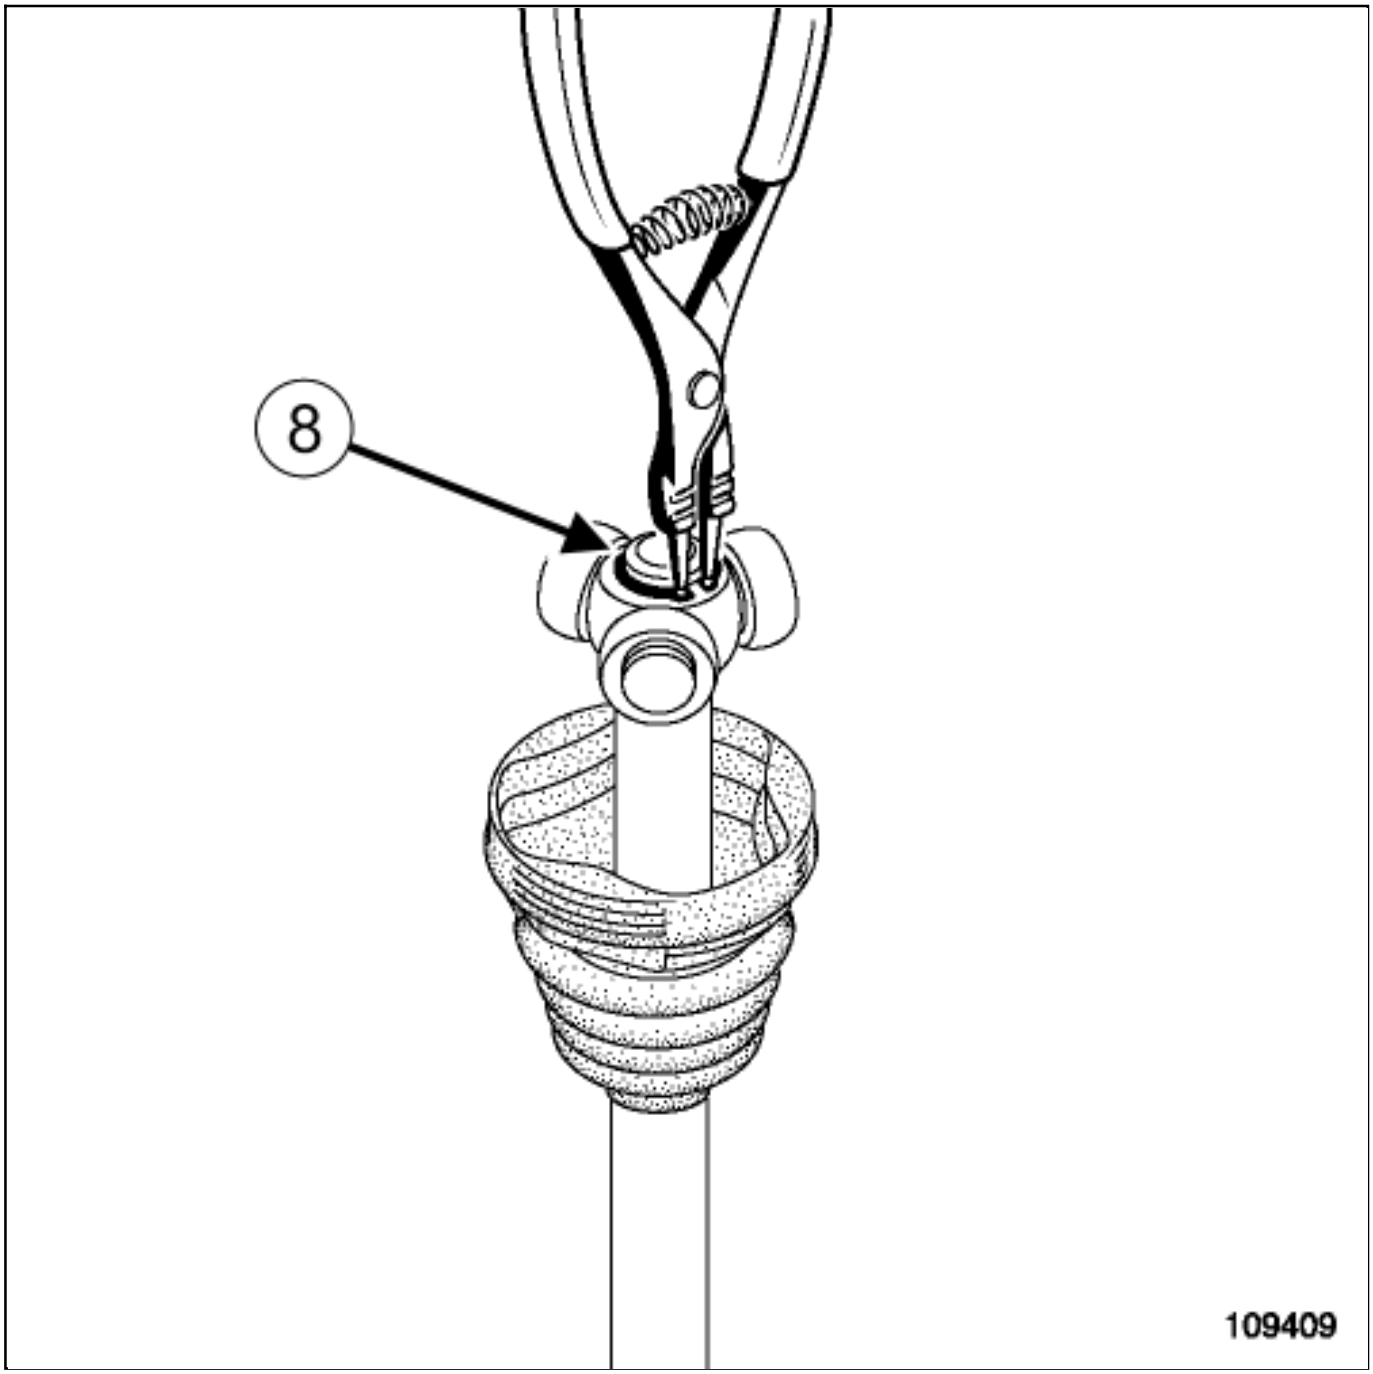


Remove the driveshaft yoke sleeve(3) .

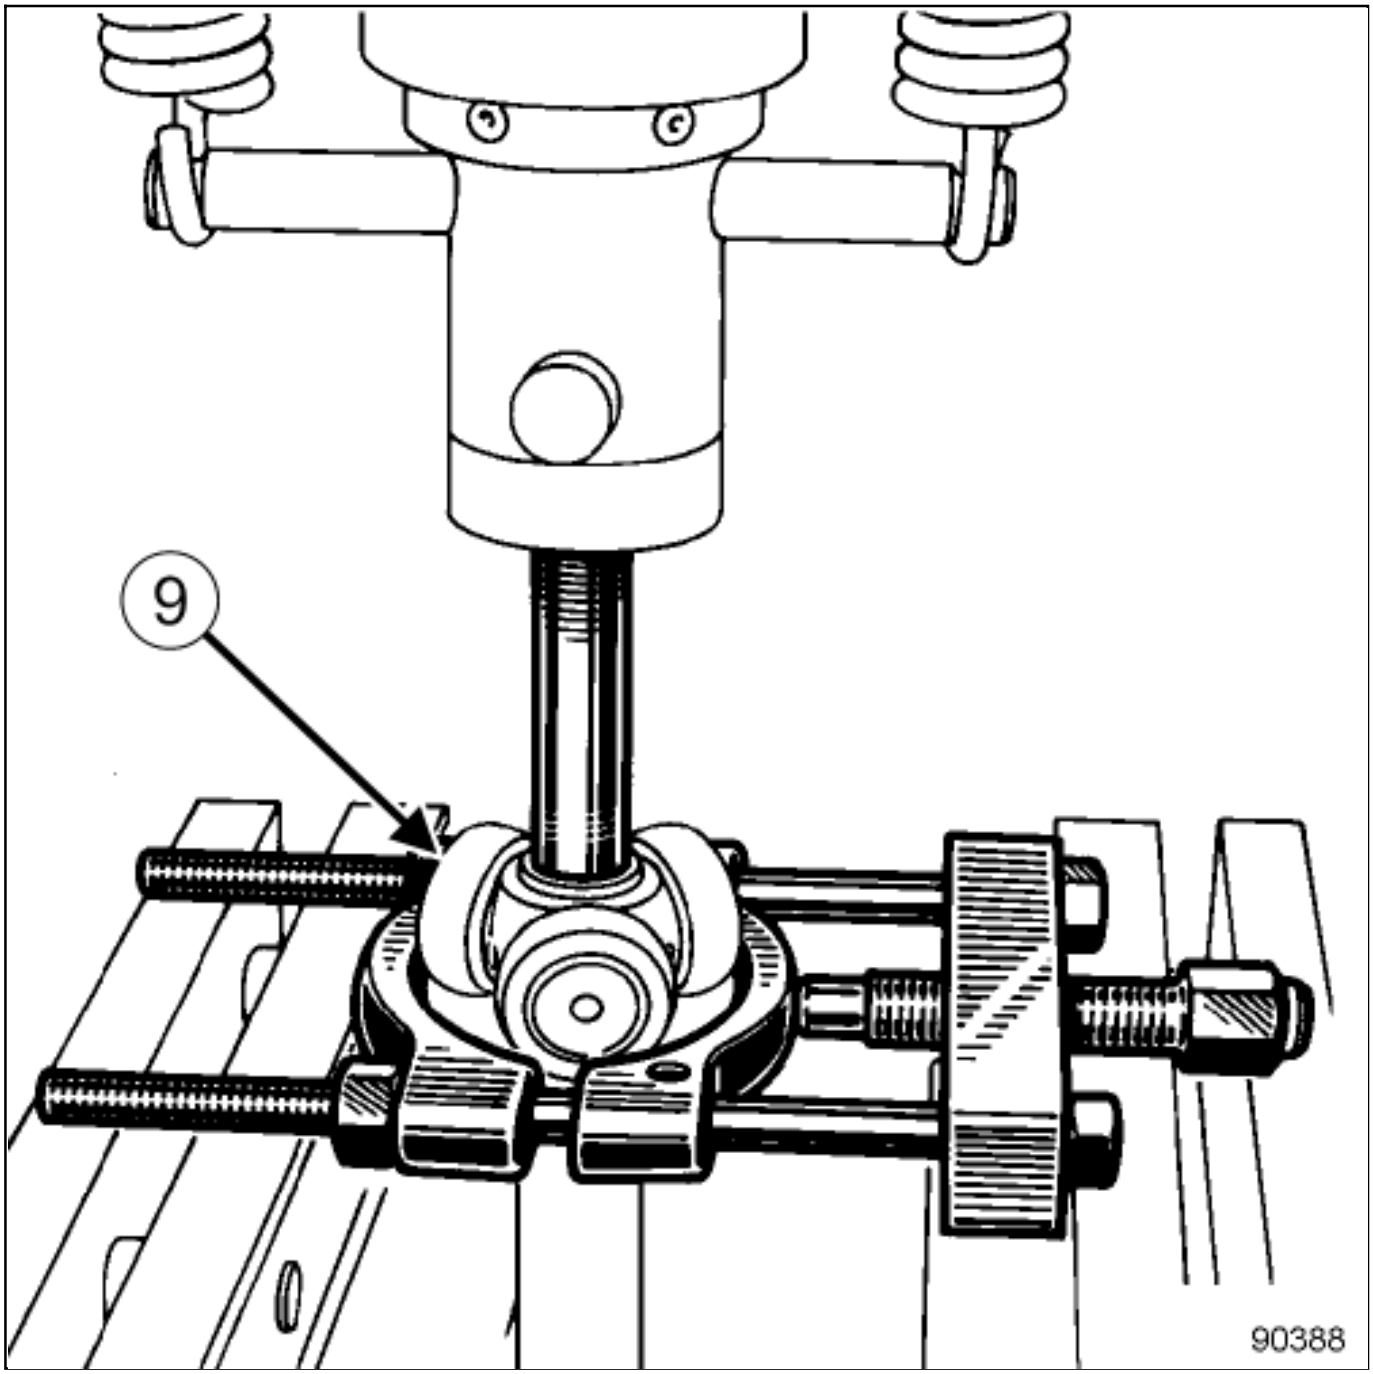
Note:

since the driveshaft yoke sleeve does not have a stop tab, it can be removed without being forced,

do not remove the rollers from their respective bushings as the rollers and needles are matched and should never be interchanged.



Remove the cup spring(4) fitted with the cup(5) from the driveshaft yoke sleeve(6) .



Remove as much grease as possible from inside the driveshaft yoke sleeve.

Note:

Never use thinner to remove grease.

Remove the lock ring(8) using circlip pliers.

Note:

Mark the position of the spider before extracting it.

Remove the spider(9) using a press and a releasing type extractor.

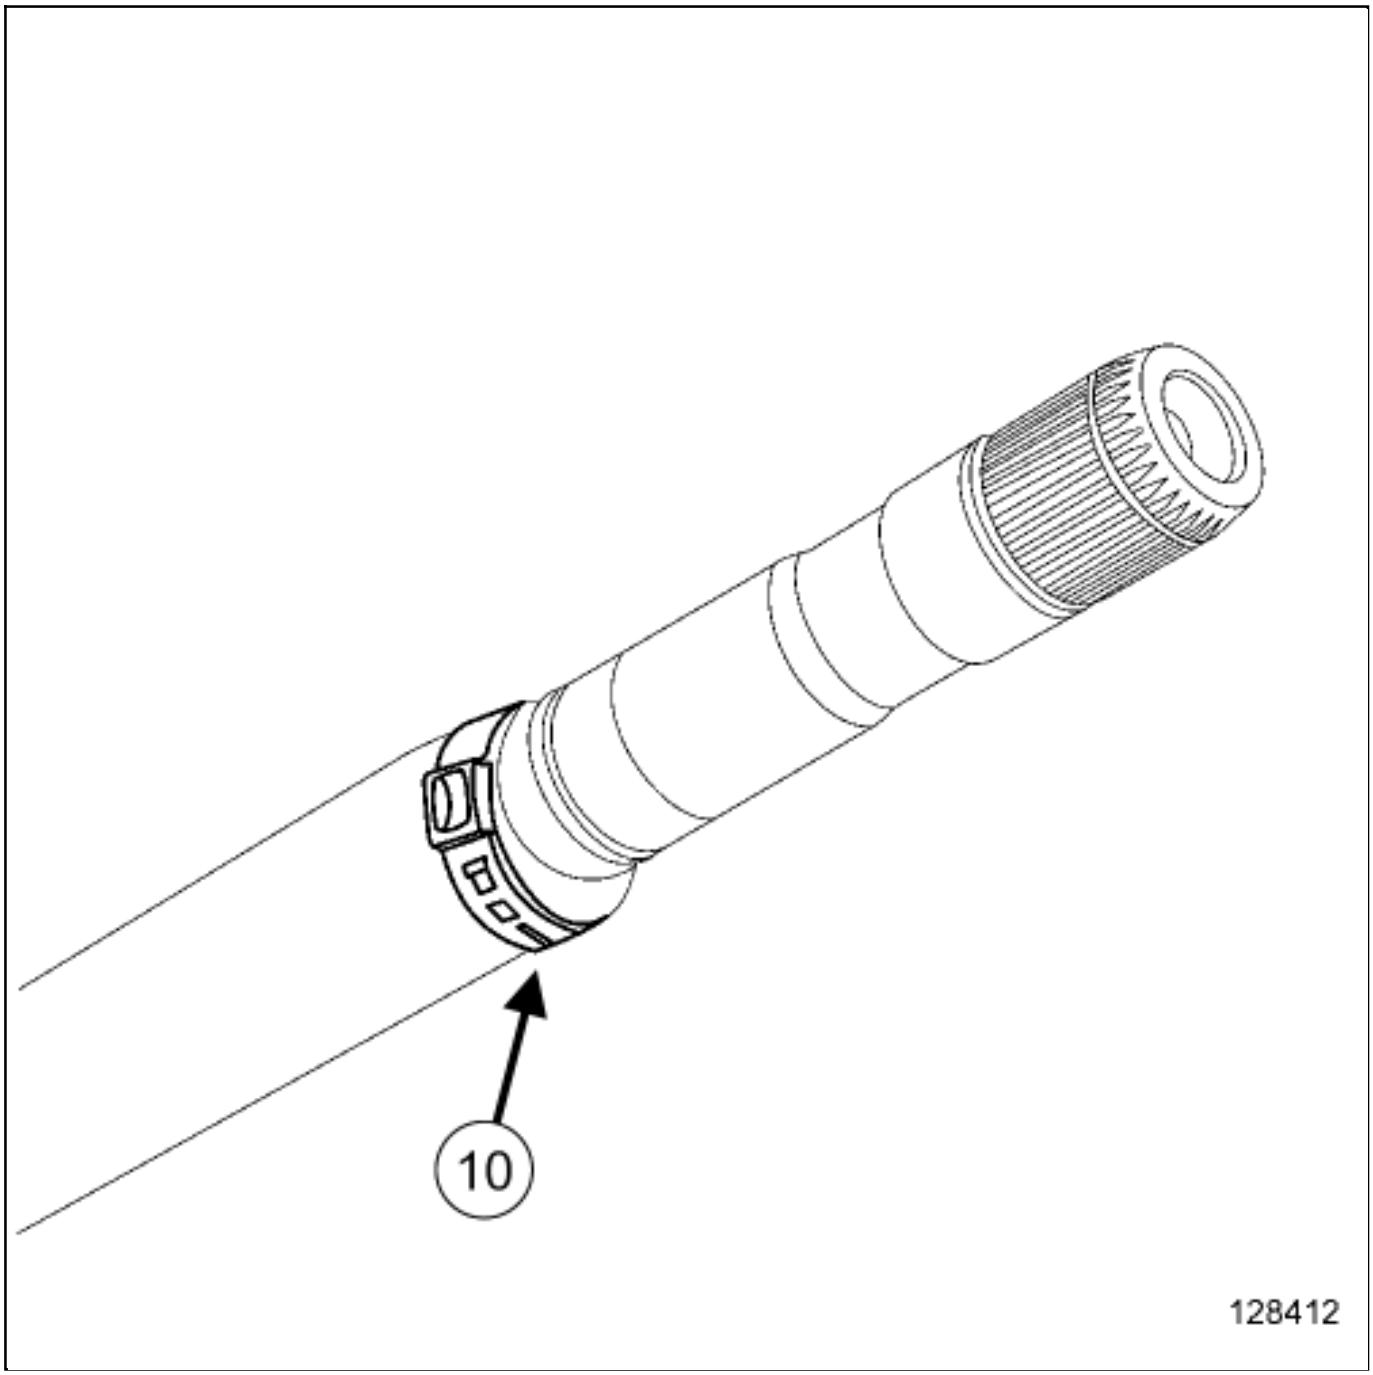
Remove:

- the gaiter from the driveshaft,
- the cup equipped with the cup spring.

REFITTING

1. REFITTING PREPARATION OPERATION

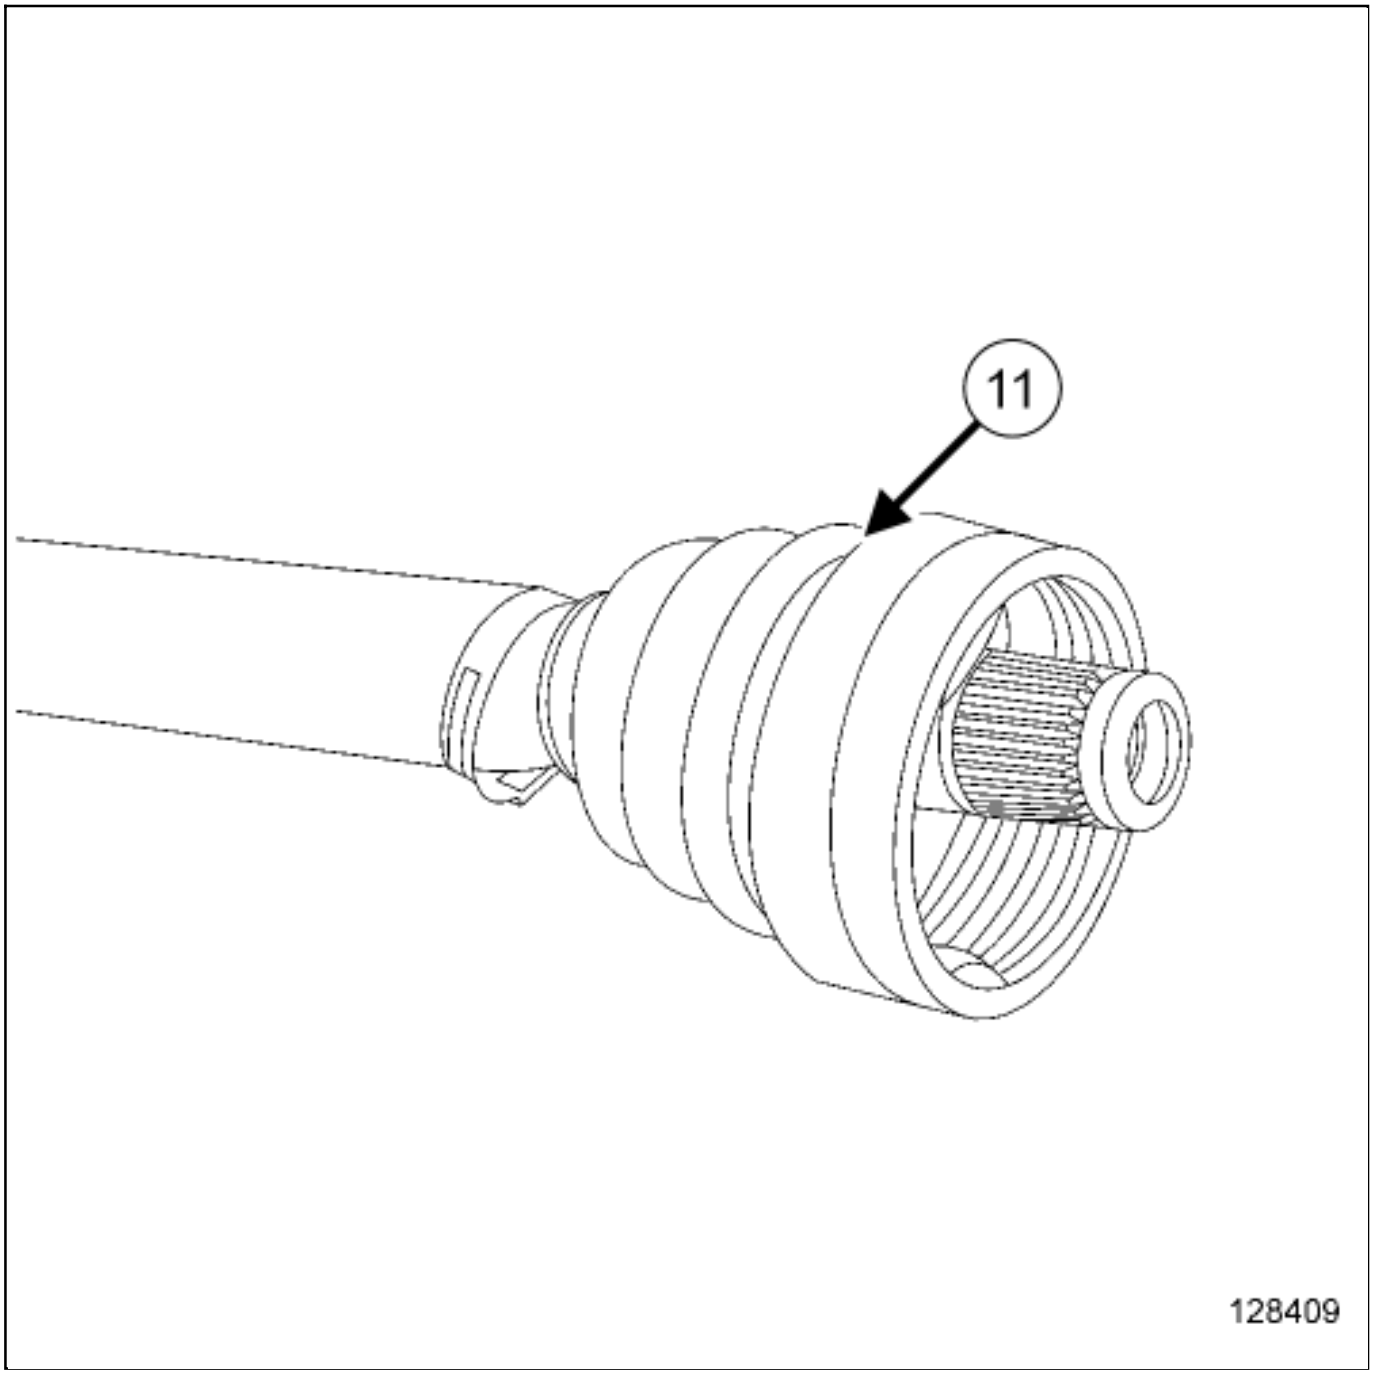
parts always to be replaced: Front left-hand driveshaft gaiter, gearbox side .



parts always to be replaced: gearbox side front driveshaft seal locking ring .

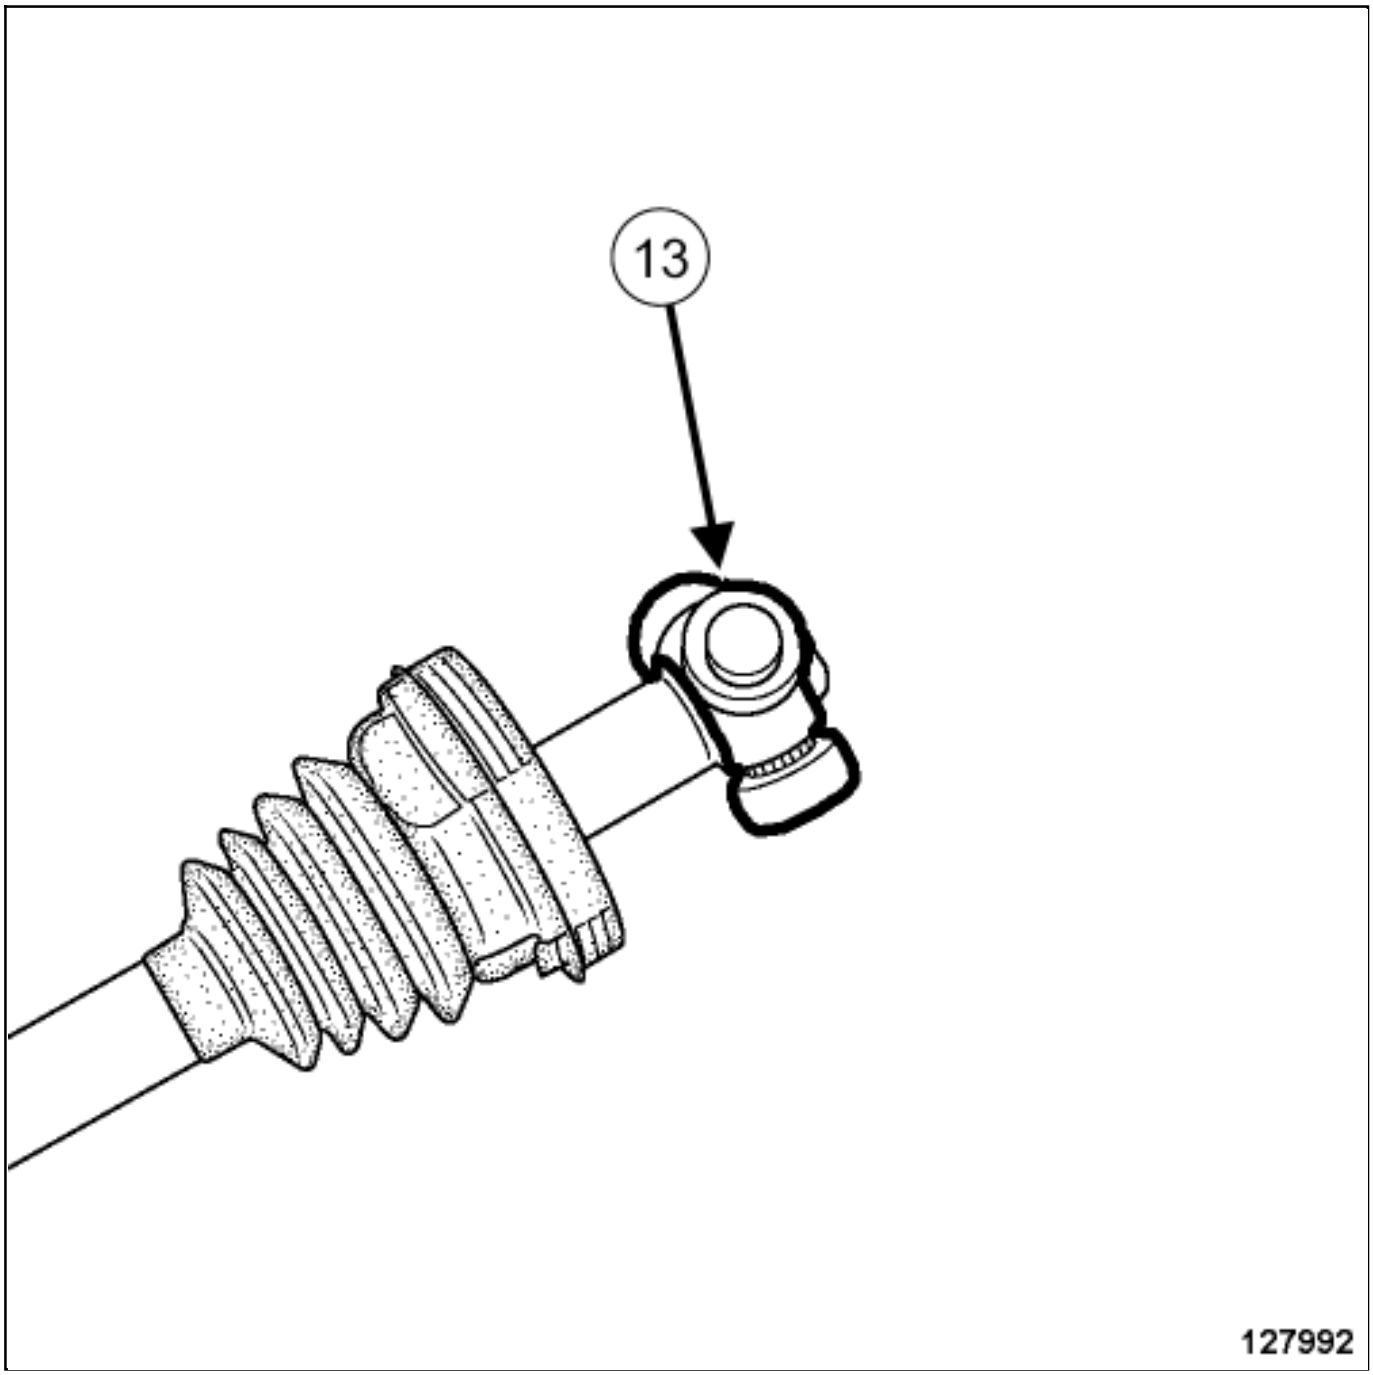
Always replace:

- the cup,
- the cup spring,
- the big securing clip,
- the small securing clip.



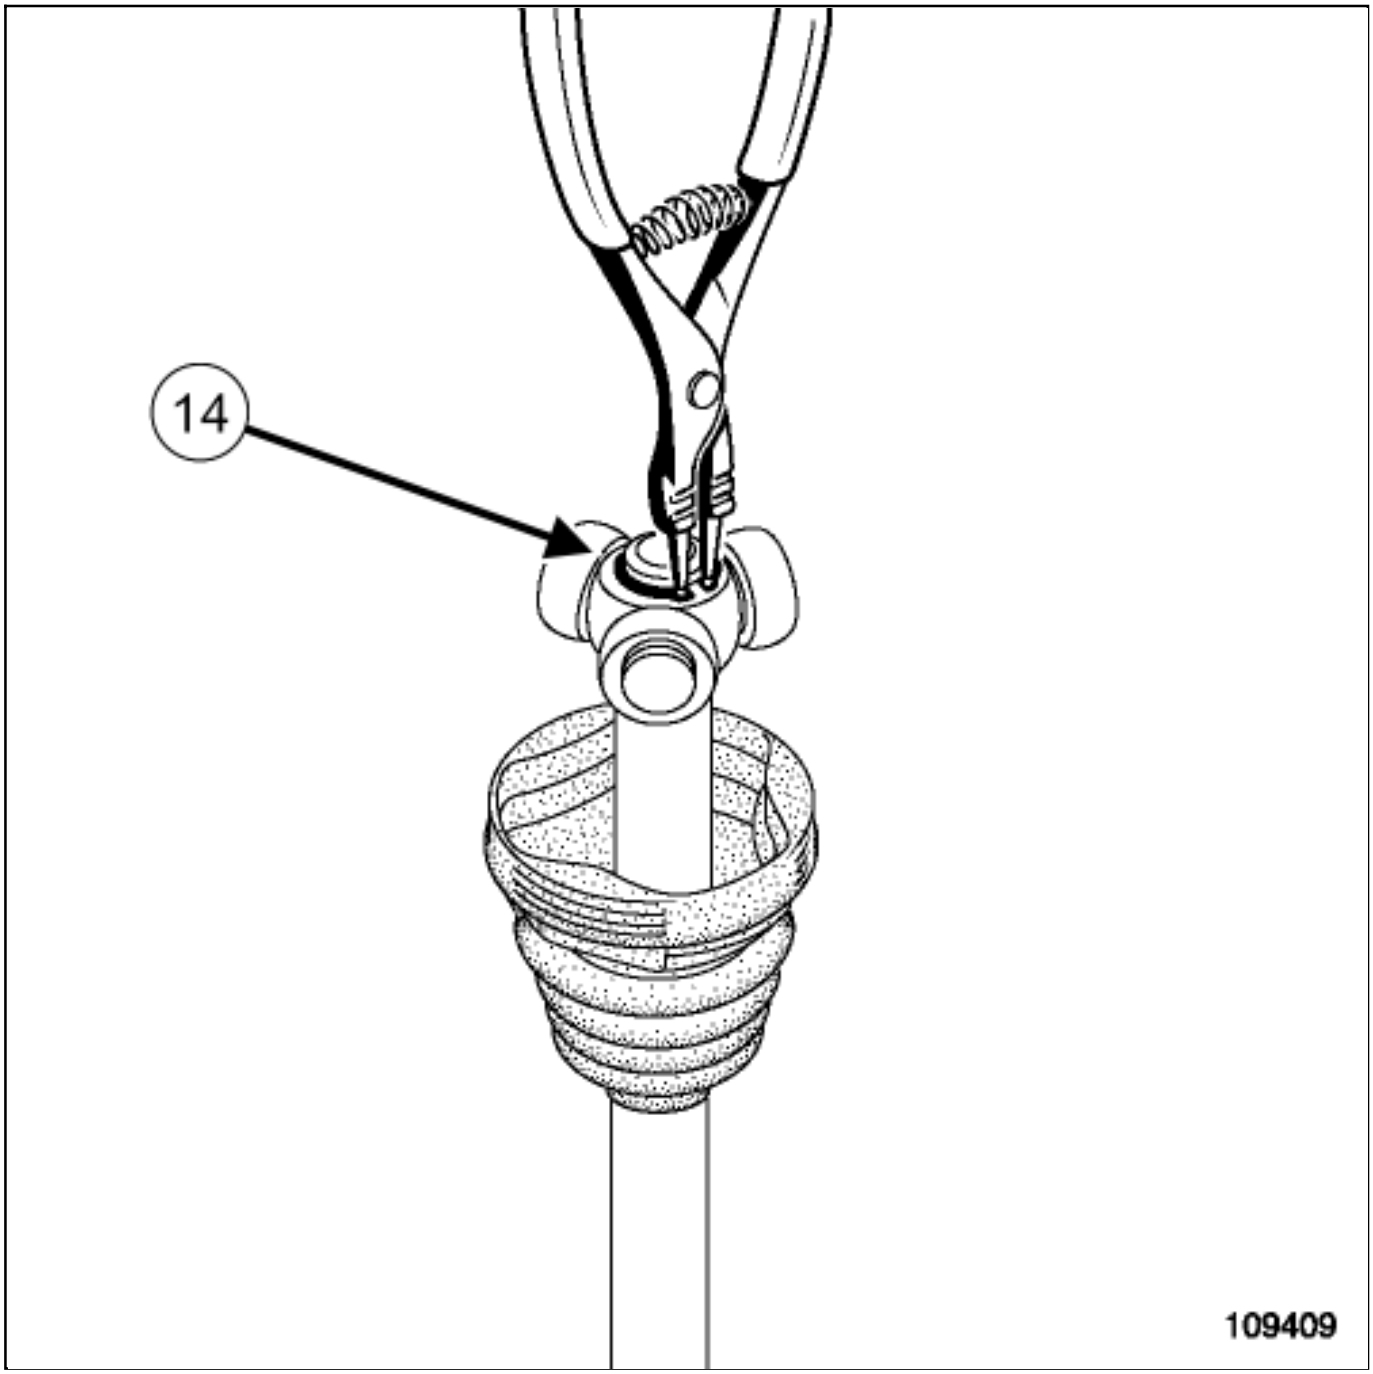
Use a parts washerto clean the driveshaft, the spider and the driveshaft yoke sleeve.

2. REFITTING OPERATION

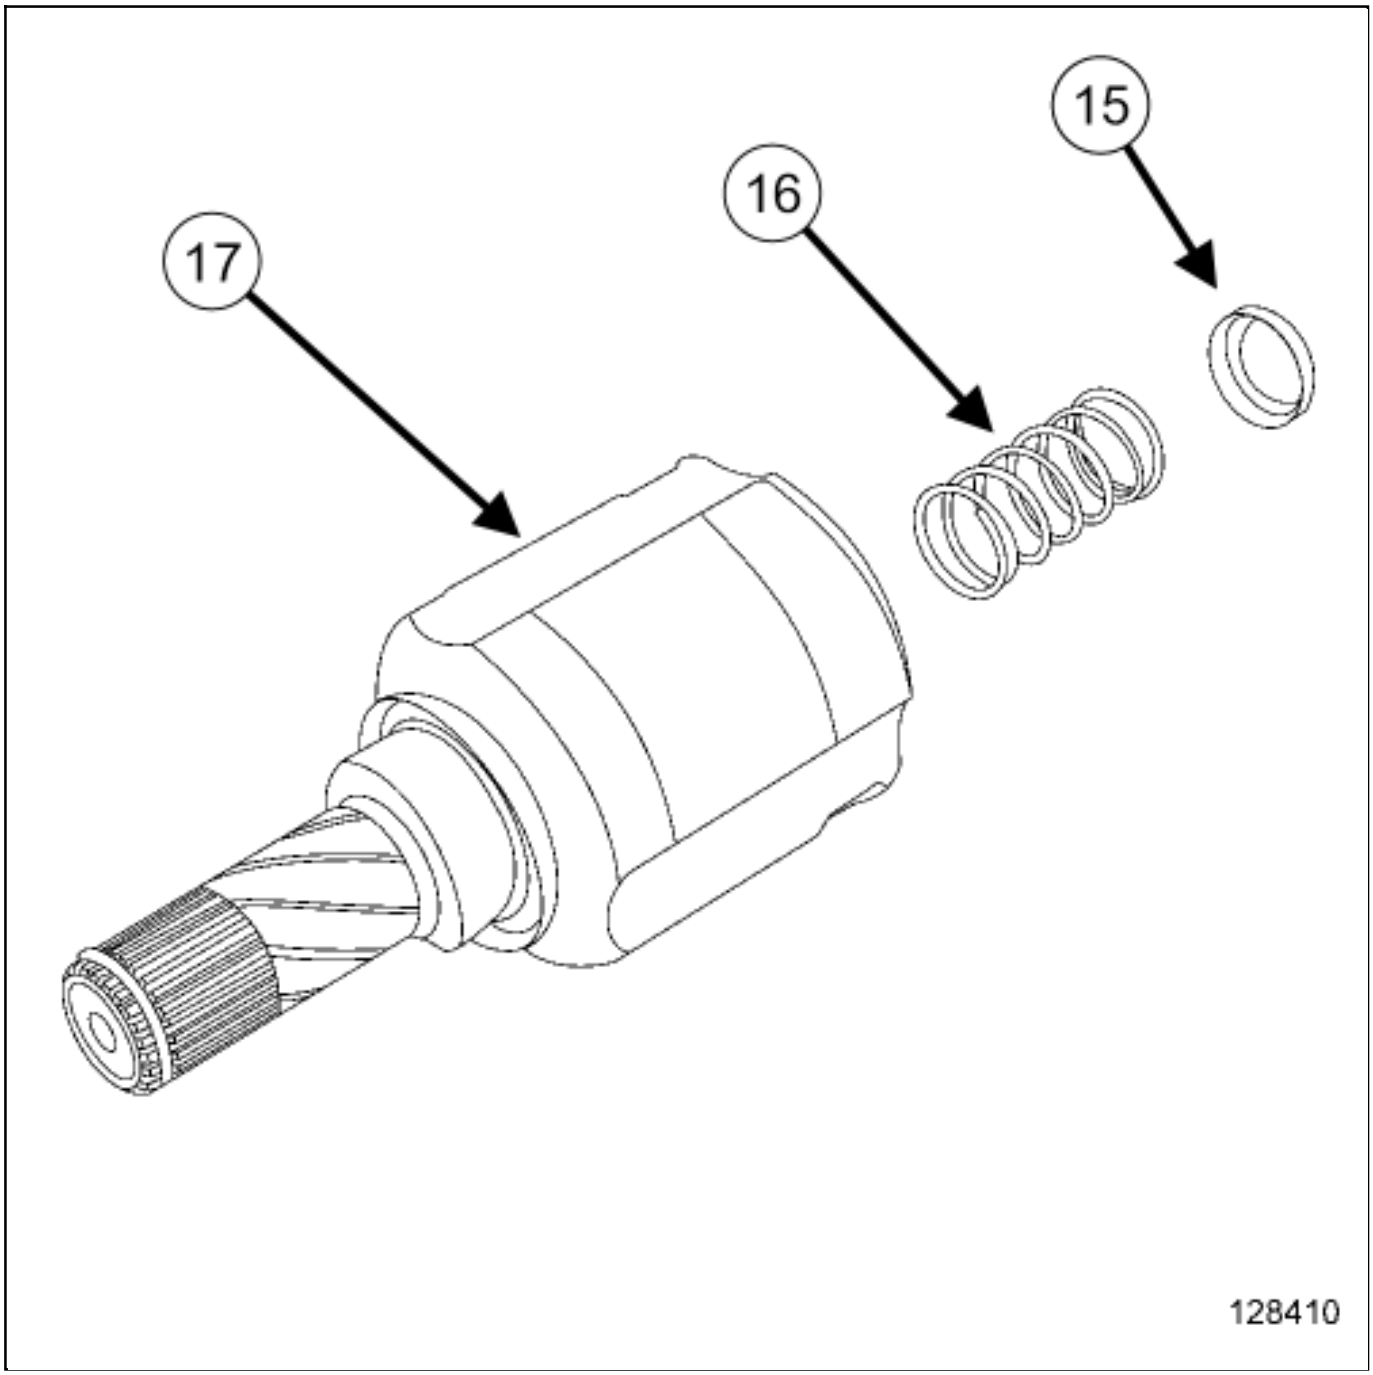


Fit the small securing clip(10) onto the driveshaft.

Lightly lubricate the driveshaft using the grease supplied with the gaiter to facilitate its fitting.

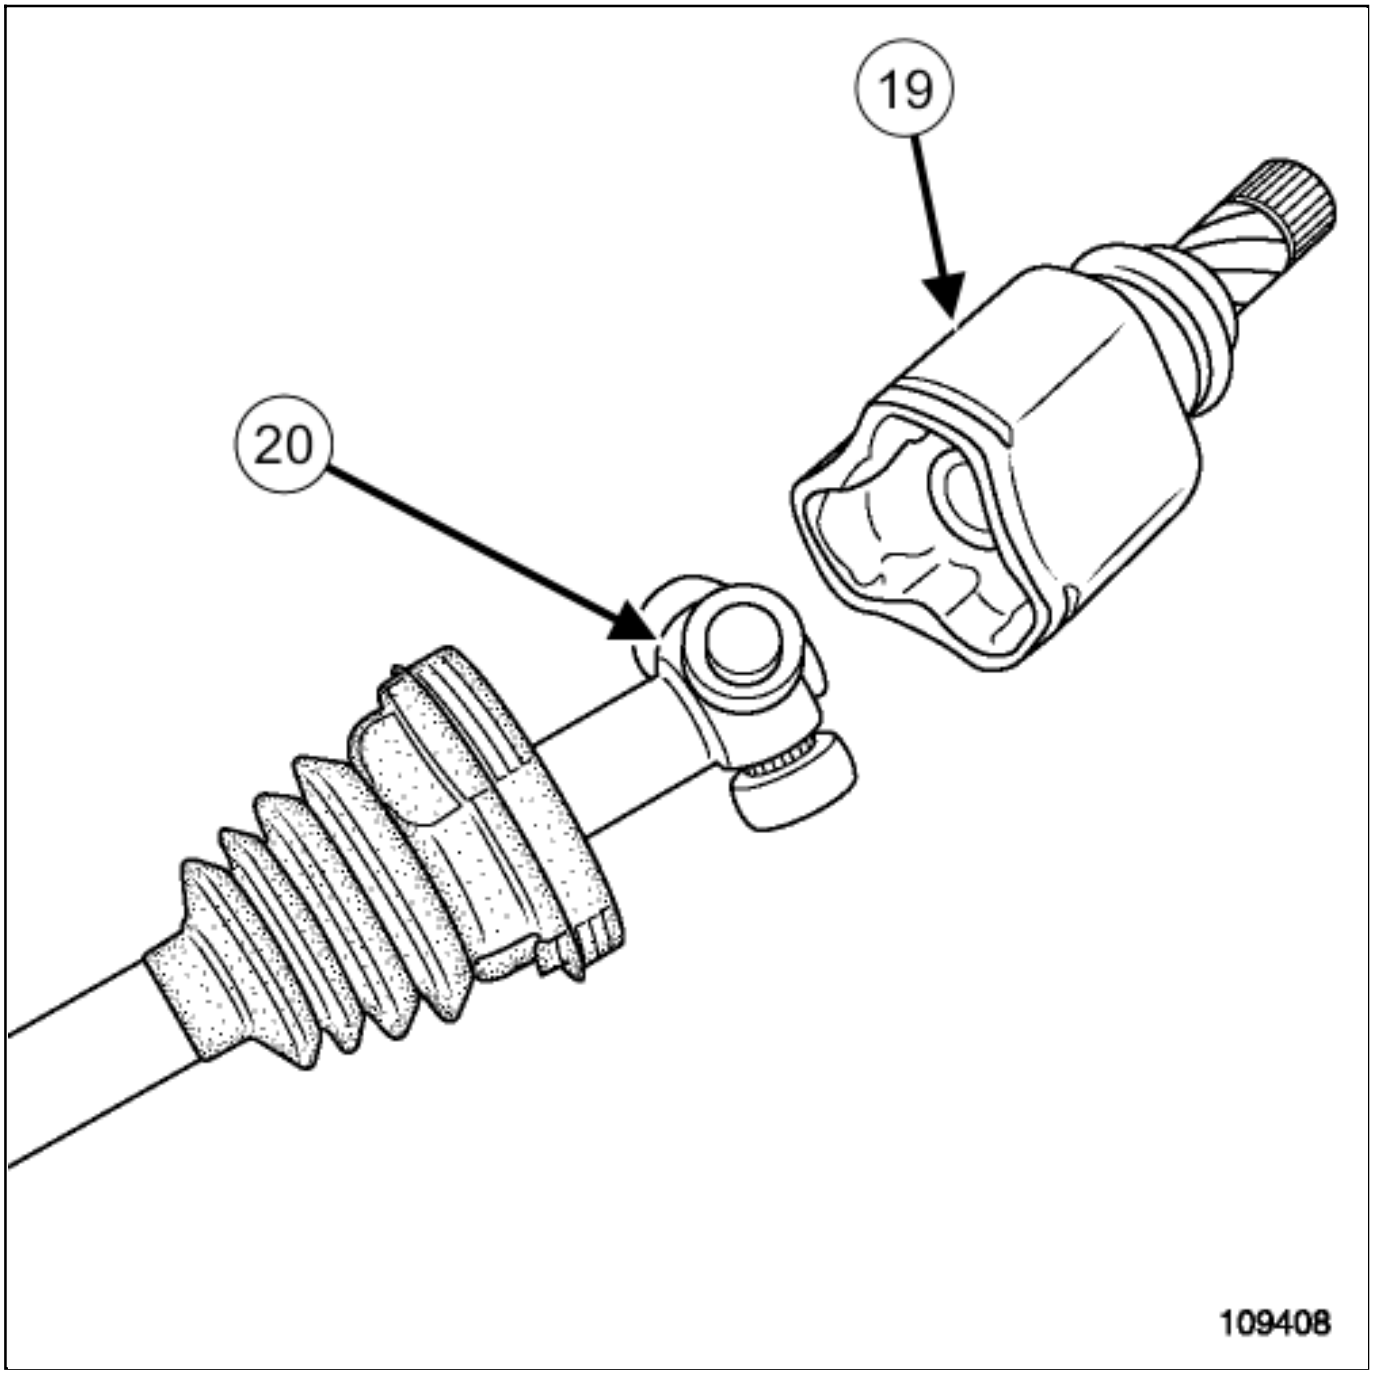


Refit the gaiter(11) onto the driveshaft.



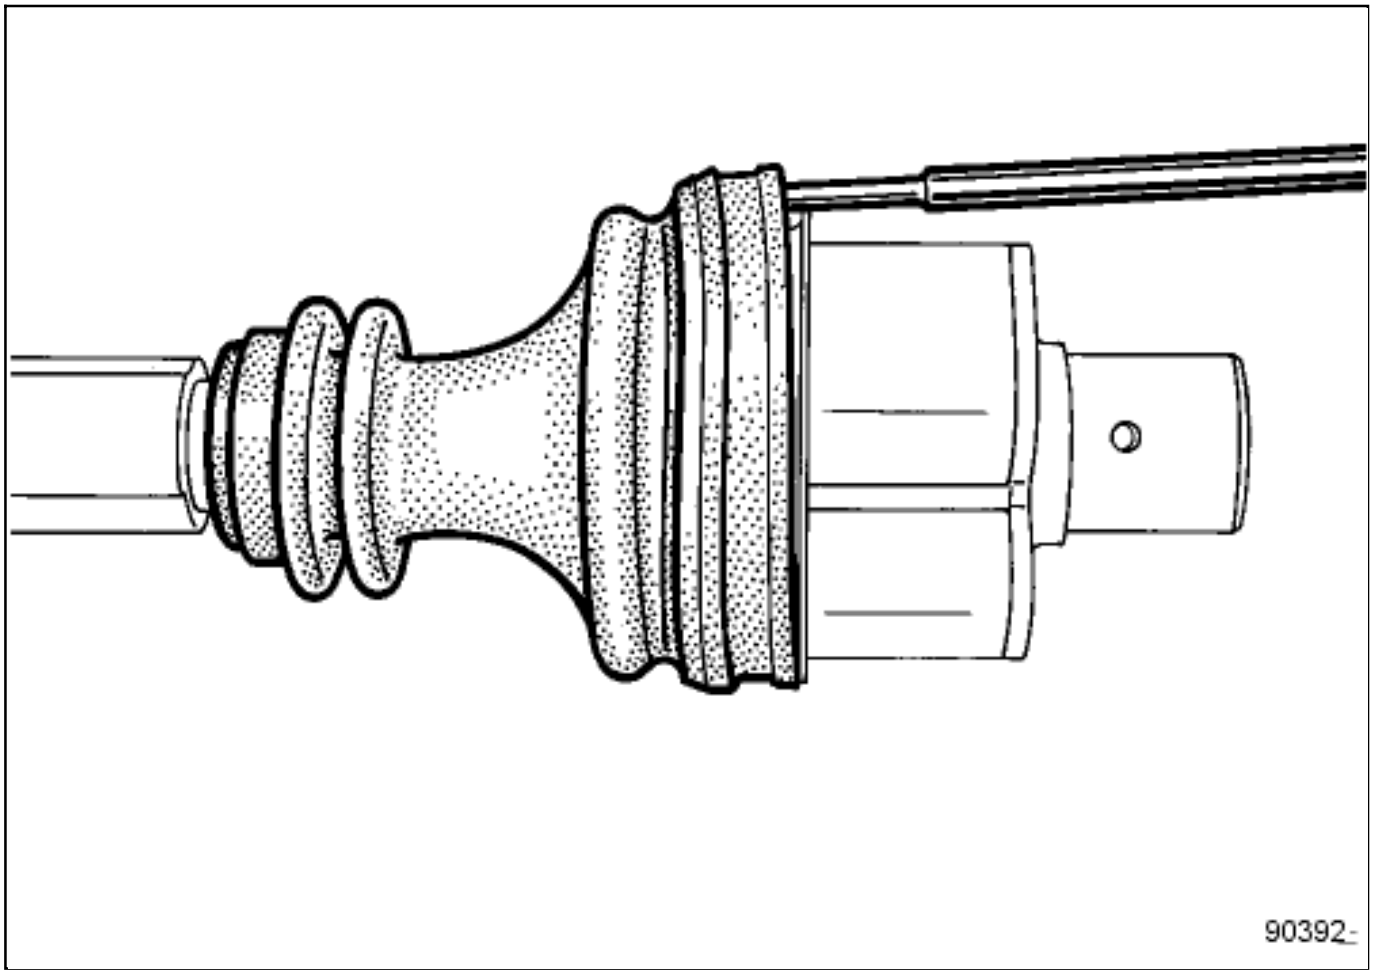
Insert the gaiter lip into the groove of the driveshaft.

Refit the spider(13) in the position marked during removal.



Fit a new lock ring(14) using circlip pliers.

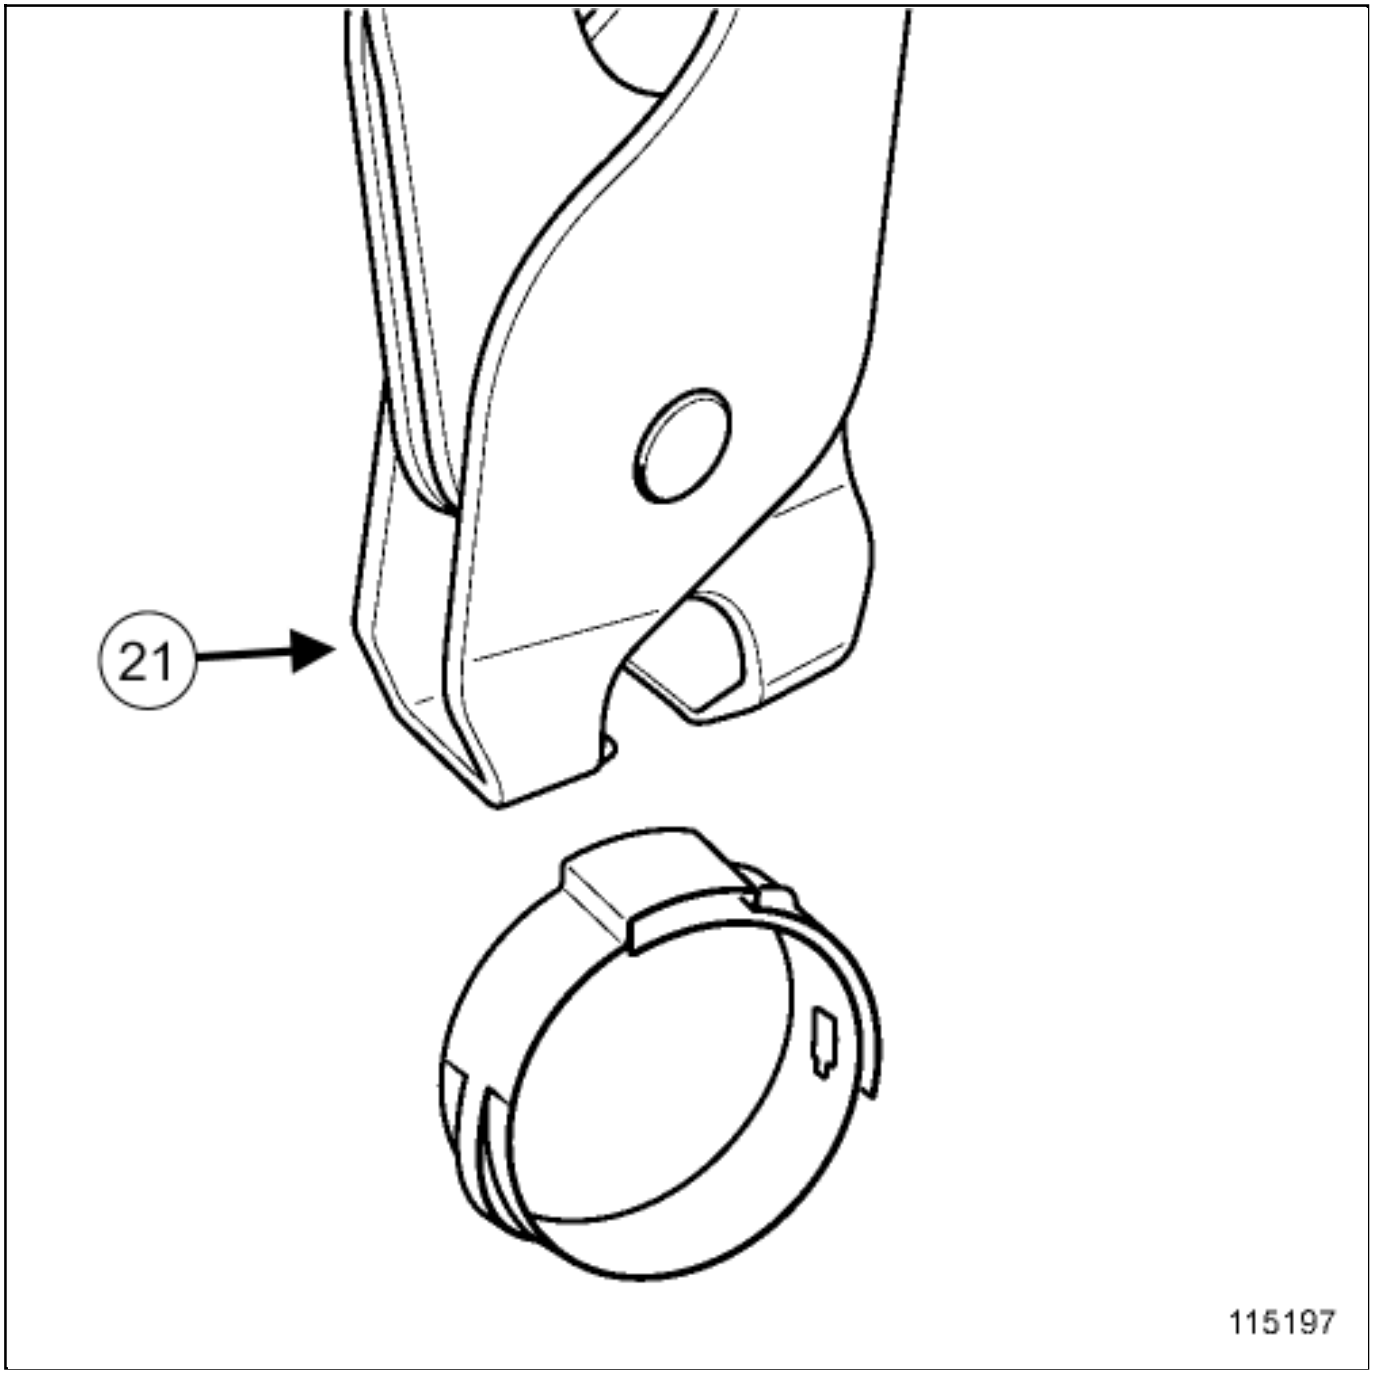
Refit:



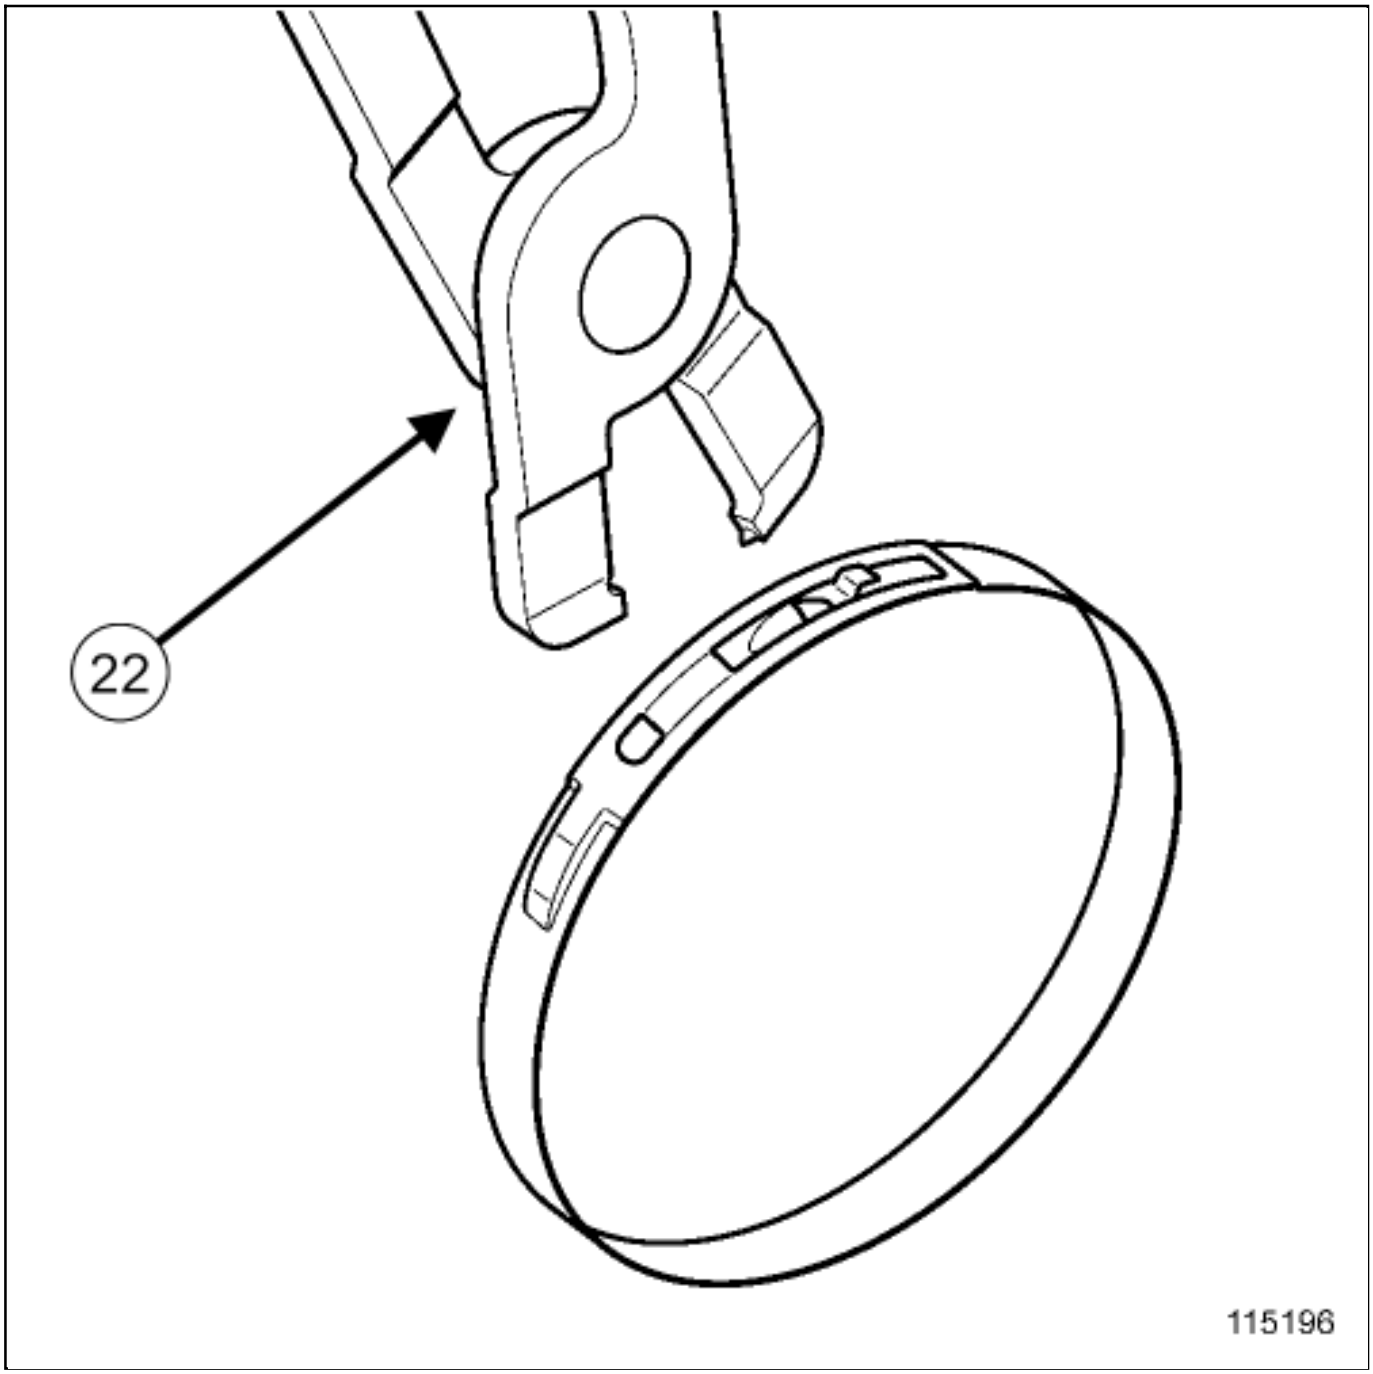
- the cup(**15**) onto the cup spring(**16**) ,
- the cup spring equipped with the cup into the driveshaft yoke sleeve(**17**) .

- Divide the quantity of grease between the driveshaft gaiter and the yoke sleeve.
- Engage the yoke sleeve(19) on the tripod(20) .
- Insert the gaiter lip into the groove of the yoke sleeve.

Note:



Check that the gaiter lip is correctly positioned in the groove of the driveshaft.



Insert a smooth rod with a rounded end between the driveshaft gaiter and the yoke sleeve to evenly distribute the volume of air contained inside the driveshaft gaiter.

Fit the small securing clip on the driveshaft gaiter.

Refit the big securing clip on the driveshaft gaiter.

21
115197

Tighten the clips using the toolType clip pliers for driveshafts with a thermoplastic gaiter.(Tav. 1168) (21) for clic clips or the toolPliers for the driveshaft gaiter collar.(Tav. 1784) (22) for profile end clips.

3. FINAL OPERATION

Refit a new left-hand differential output seal(see **Differential output seal: Removal - Refitting**) .

Refit:

- the front left-hand driveshaft (see 29A, Driveshafts , Front left-hand driveshaft: Removal - Refitting) ,
- the front left-hand wheel Wheel: Removal - Refitting .

Fill up the gearbox (see **Manual gearbox oils: Draining - Filling**) or Automatic gearbox oil: Draining - Filling .

Refit the engine undertray.

FRONT LEFT-HAND DRIVESHAFT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Hub locking tool.	Rou. 604-01
Ball joint extractor.	Tav. 476
Pin extractor tool.	Emb. 880
Universal driveshaft push back tool (plate and claws without ram).	Tav. 1050-04
Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.	Tav. 1420-01
Extraction claw for clip secured type driveshafts	Tav. 1813

parts always to be replaced:
Front wheel hub nut

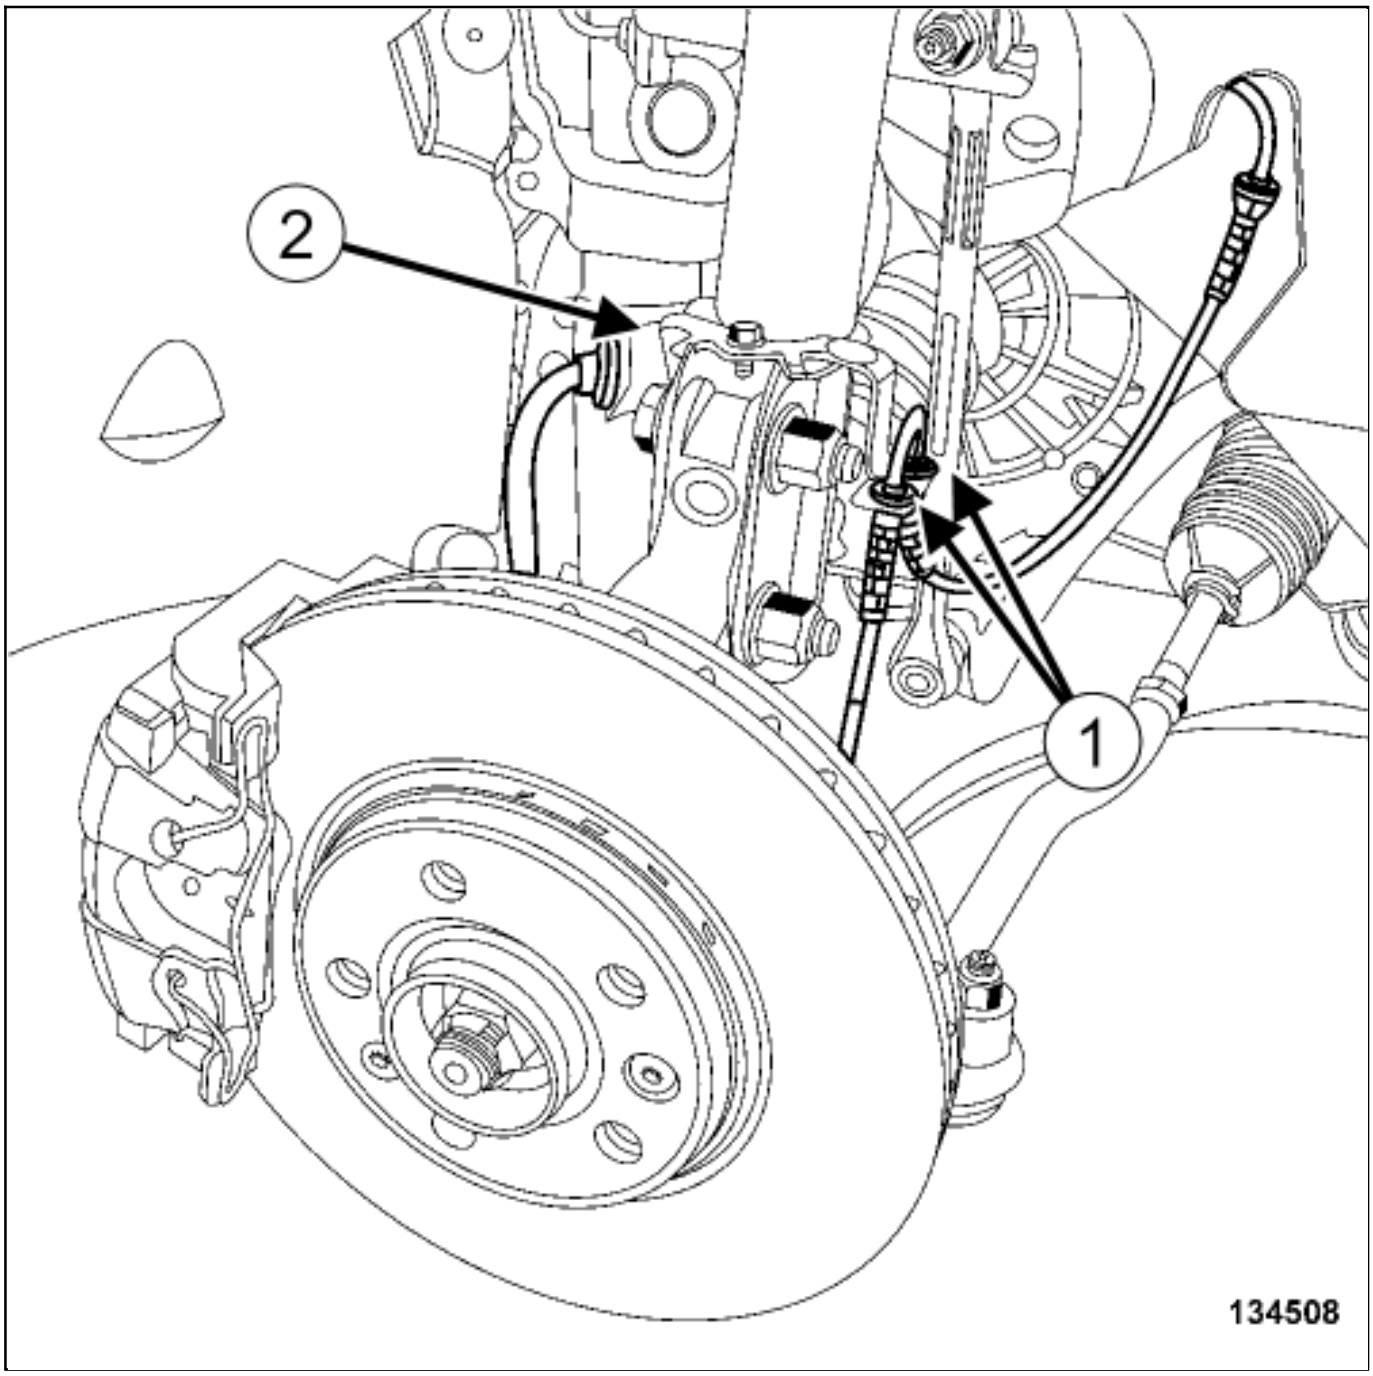
CAUTION

In order to prevent irreversible damage to the front hub bearing:

- Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
- Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

REMOVAL

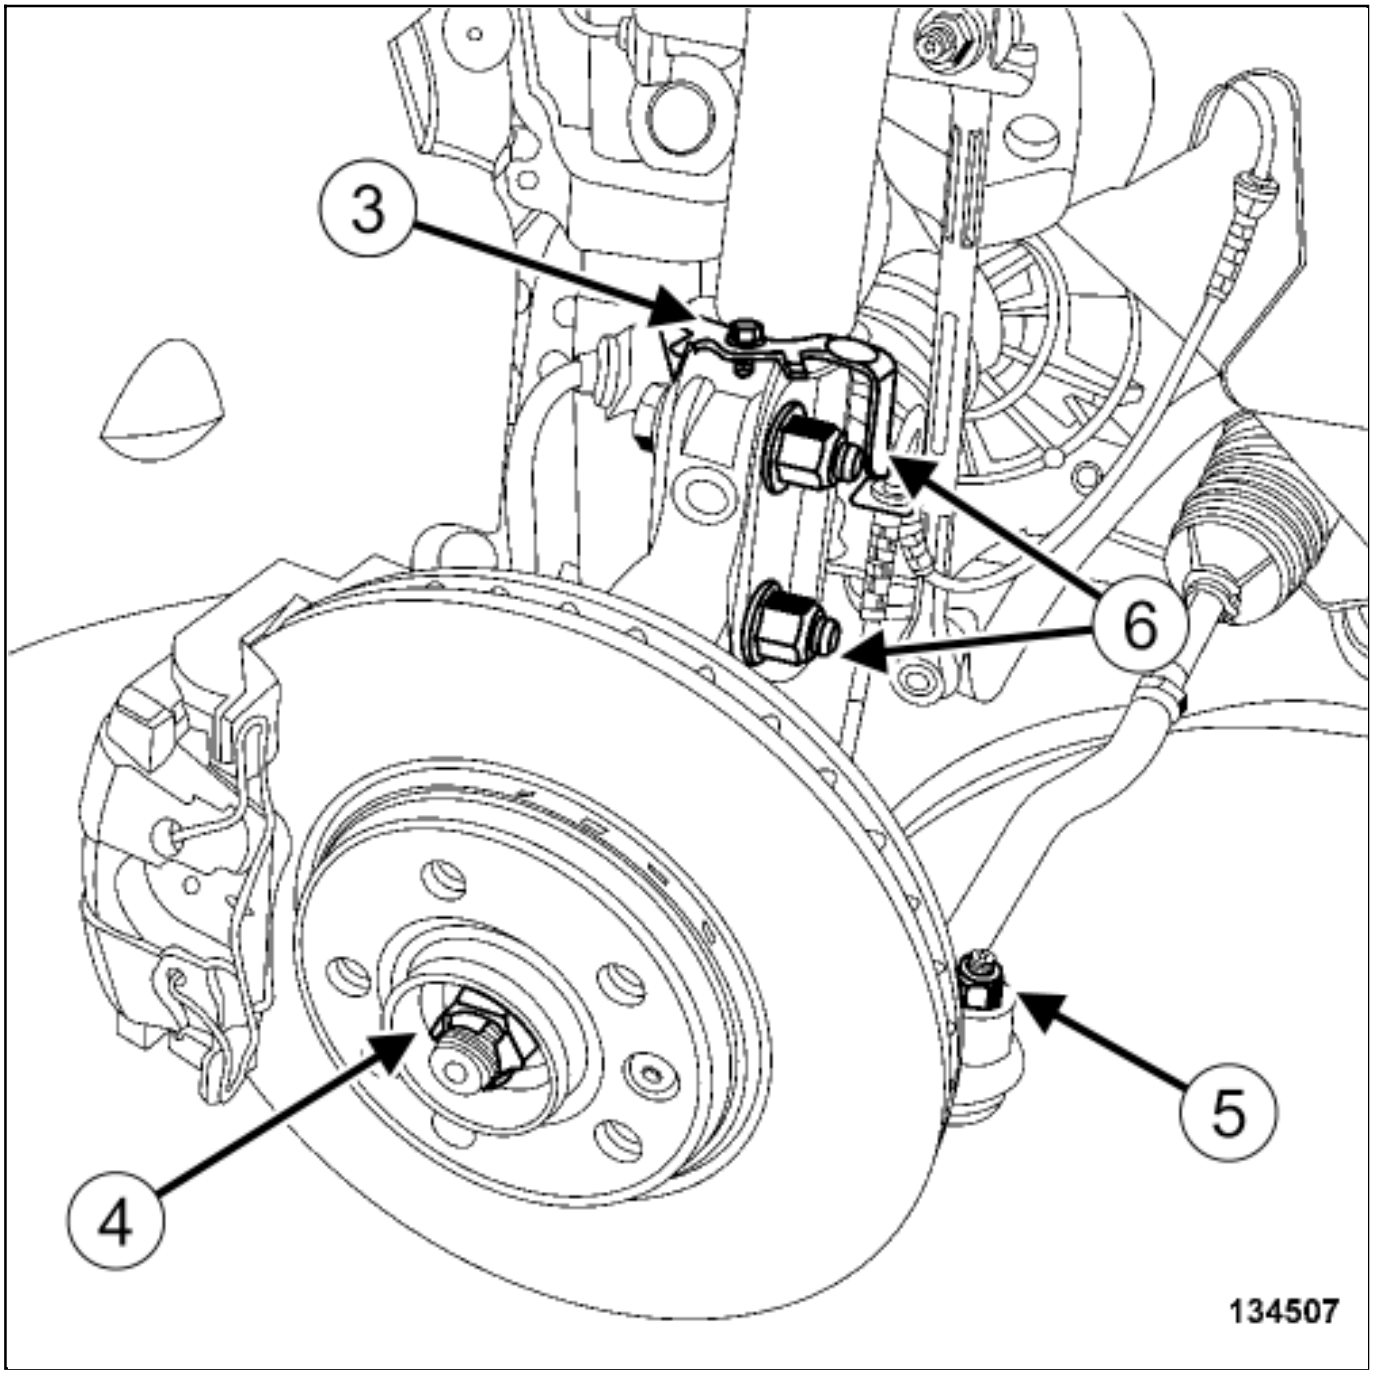
1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the engine undertray,
- the front left-hand wheel[Front hub carrier assembly: Exploded view] .

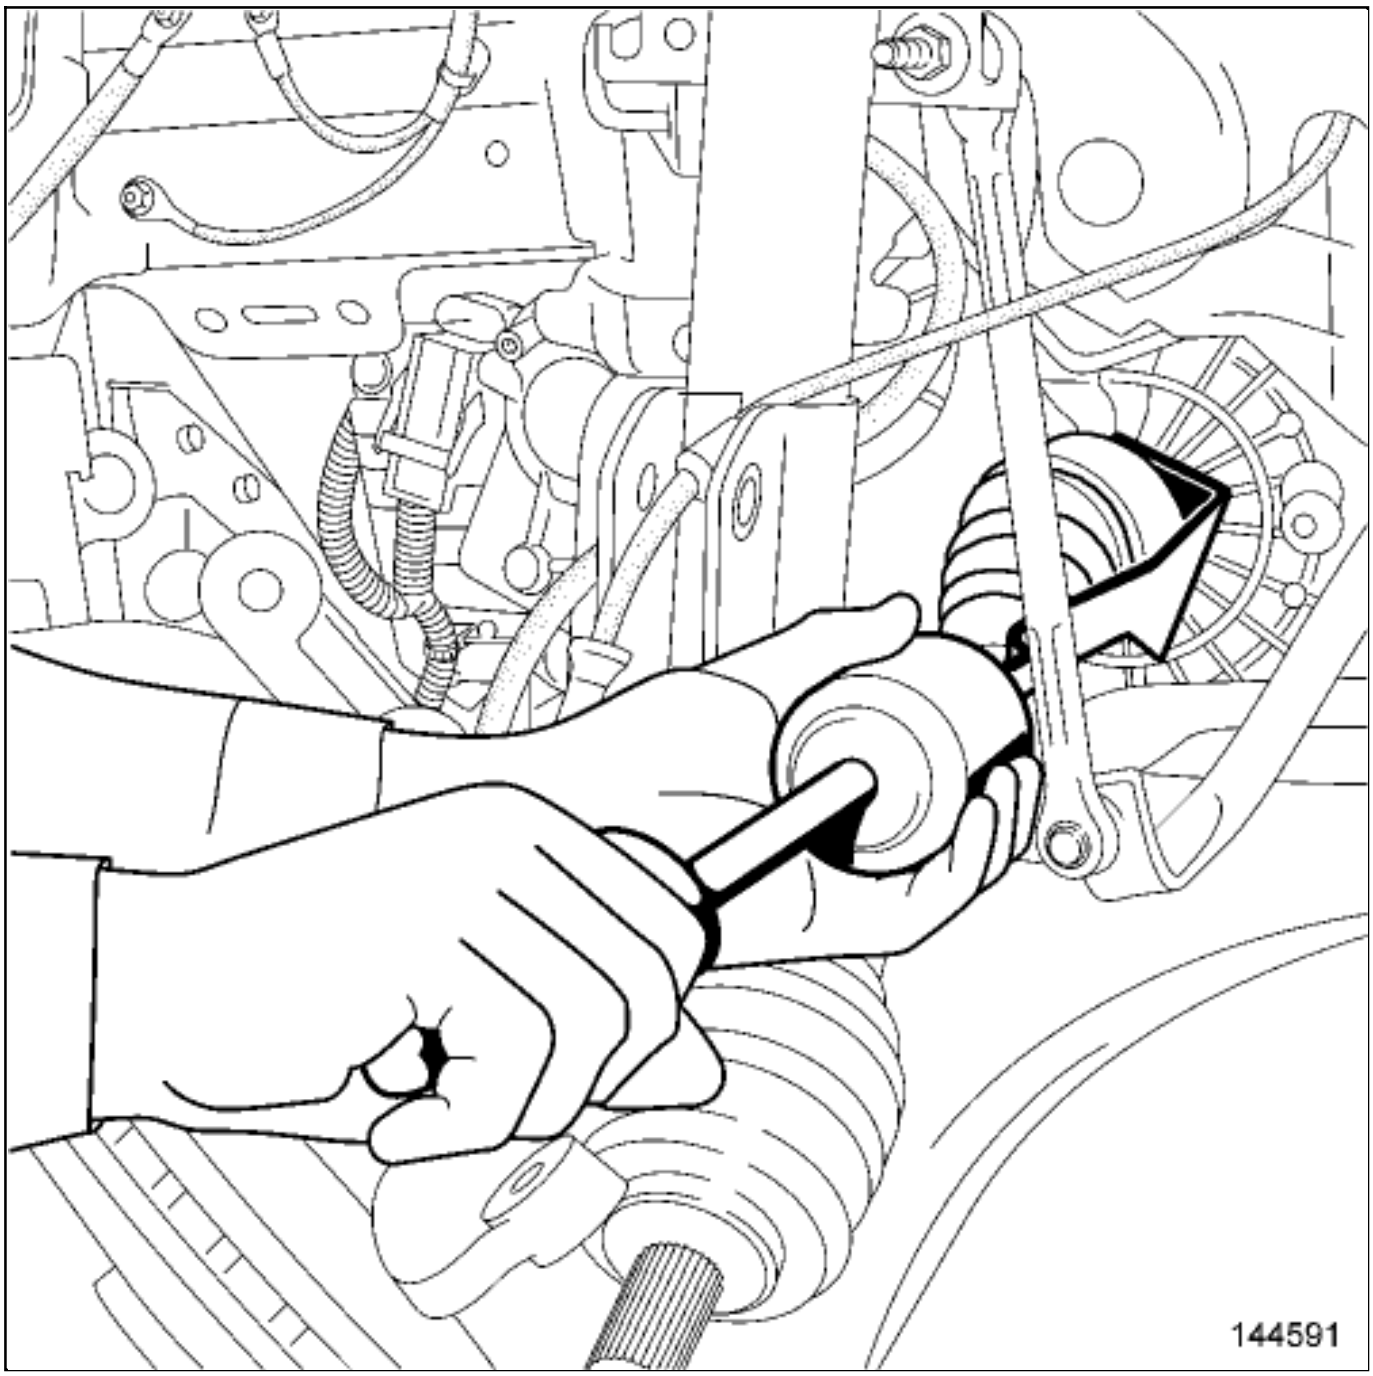


Drain the automatic gearbox oil[Automatic gearbox oil: Draining - Filling] .

2. REMOVAL OPERATION

Unclip:

- the wheel speed sensor wiring at(1) ,
- the front brake hose at(2) .



Remove:

- the bolt(3) of the brake hose and wheel speed sensor wiring support,
- the brake hose and wheel speed sensor wiring support,
- the nut(4) from the hub, immobilising the hub using the toolHub locking tool.(Rou. 604-01) ,
- the nut(5) from the track rod end,

- the track rod end from the hub carrier using the toolBall joint extractor.(Tav. 476) ,
- the shock absorber base studs(6) .

Push back the front left-hand driveshaft from the hub carrier using the assembled toolsScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) and Universal driveshaft push back tool (plate and claws without ram).(Tav. 1050-04) .

Detach the front left-hand driveshaft on the gearbox side using the toolPin extractor tool.(Emb. 880) fitted with the toolExtraction claw for clip secured type driveshafts(Tav. 1813) .

Remove:

- the front left-hand driveshaft.
- the left-hand differential output sealDifferential output seal: Removal - Refitting .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Front wheel hub nut .

2. REFITTING OPERATION

Refit a new left-hand differential output sealDifferential output seal: Removal - Refitting .

Note:

During removal, if there is threadlockon the universal joint splines and the universal joint nut. When refitting, apply threadlockto the universal joint splines and the universal joint nut.

Fit the front left-hand driveshaft into the gearbox as horizontally as possible.

Insert the front left-hand driveshaft into the hub carrier.

Note:

The driveshaft must fit freely in the hub carrier until it protrudes enough for the hub nut to be fitted.

- Refit the shock absorber base bolts.
- Torque tighten the shock absorber base bolts**Front axle assembly: Exploded view** .
- Position the track rod.
- Torque tighten the track rod end nut**Steering assembly: Exploded view** .
- Refit a new hub nut.
- Torque tighten the hub nut, while immobilising the hub using toolHub locking tool.(**Rou. 604-01**) **Front hub carrier assembly: Exploded view** .
- Refit:
  - the brake hose and wheel speed sensor wiring support,
  - the bolt of the brake hose and wheel speed sensor wiring support.
- Torque tighten the wheel speed sensor wiring support bolt**Front axle assembly: Exploded view** .
- Clip:
  - the wheel speed sensor wiring,

the brake hose.

3. FINAL OPERATION

Proceed in the reverse order to removal.

FRONT LIGHTING: LIST AND LOCATION OF COMPONENTS

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 80B, Headlights, Front signals - lighting assembly: Exploded view) and(see 80B, Headlights, Headlight assembly: Exploded view) .

1. LIST OF COMPONENTS

1- THE FRONT LIGHTING CONSISTS OF:

- headlights,
- halogen bulbs,
- side indicators,
- front fog lights,
- daytime running lights.

2. LOCATION OF COMPONENTS

1- HEADLIGHT

Position the vehicle on a two post liftVehicle: Towing and lifting .

Remove:

- the front section of the front wheel arch linersExterior body front trim assembly: Exploded view ,
- the front bumperFront bumper assembly: Exploded view .

Disconnect the headlight connectors.

Remove the headlight(see 80B, Headlights, Headlight assembly: Exploded view) .

2- HALOGEN BULBS AND SIDE INDICATOR BULBS

The headlight bulbs can be replaced without removing the headlight.

To replace any bulbs(see 80B, Headlights, Headlight assembly: Exploded view) .

3- FRONT FOG LIGHT

Position the vehicle on a two post liftVehicle: Towing and lifting .

Remove the access flap to the front fog lightFront bumper assembly: Exploded view .

Remove (see 80B, Headlights, Front signals - lighting assembly: Exploded view) :

- the front fog light bulb holder,

- the fog light bulb,
- the fog light.

4- DAYTIME RUNNING LIGHT

Position the vehicle on a two post lift**Vehicle: Towing and lifting** .

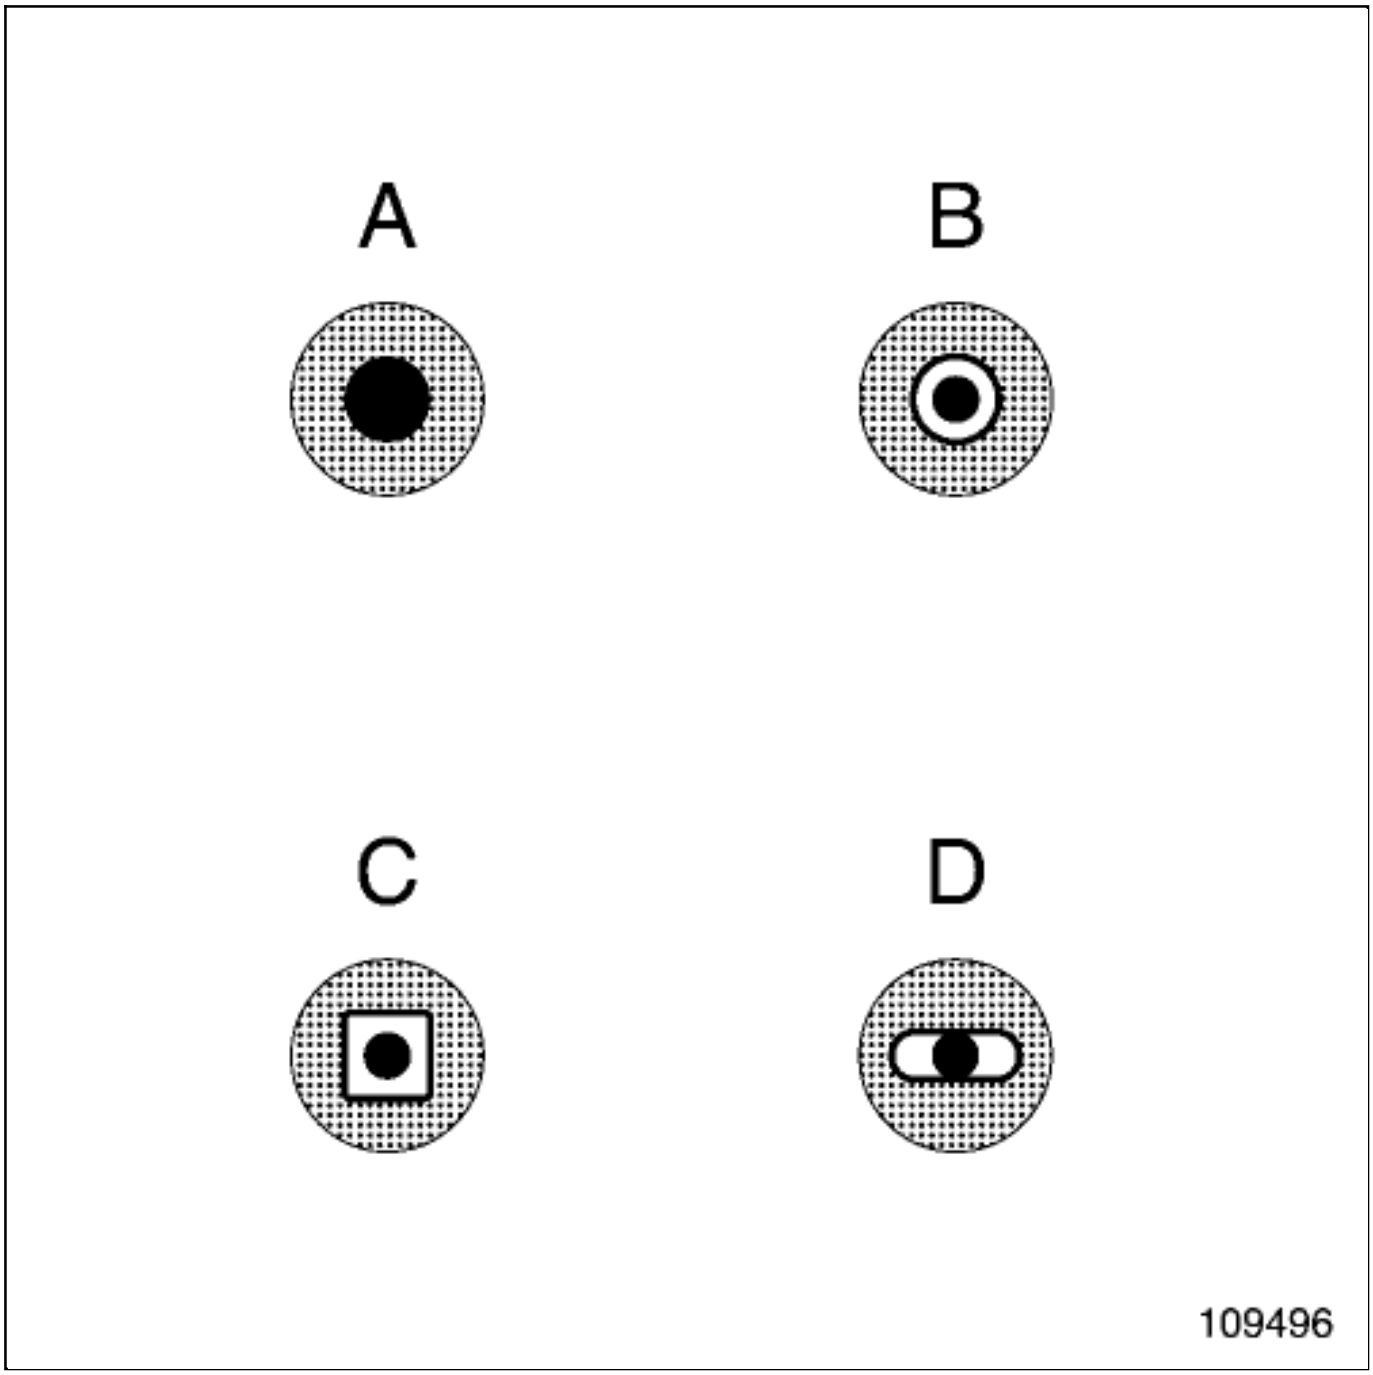
Remove:

- the front section of the front wheel arch liners**Exterior body front trim assembly: Exploded view** ,
- the front bumper**Front bumper assembly: Exploded view** .

Disconnect the daytime running connector.

Remove the daytime running light**(see 80B, Headlights, Front signals - lighting assembly: Exploded view)** .

Repair-80x02x02-02x51-1-24-1.xml



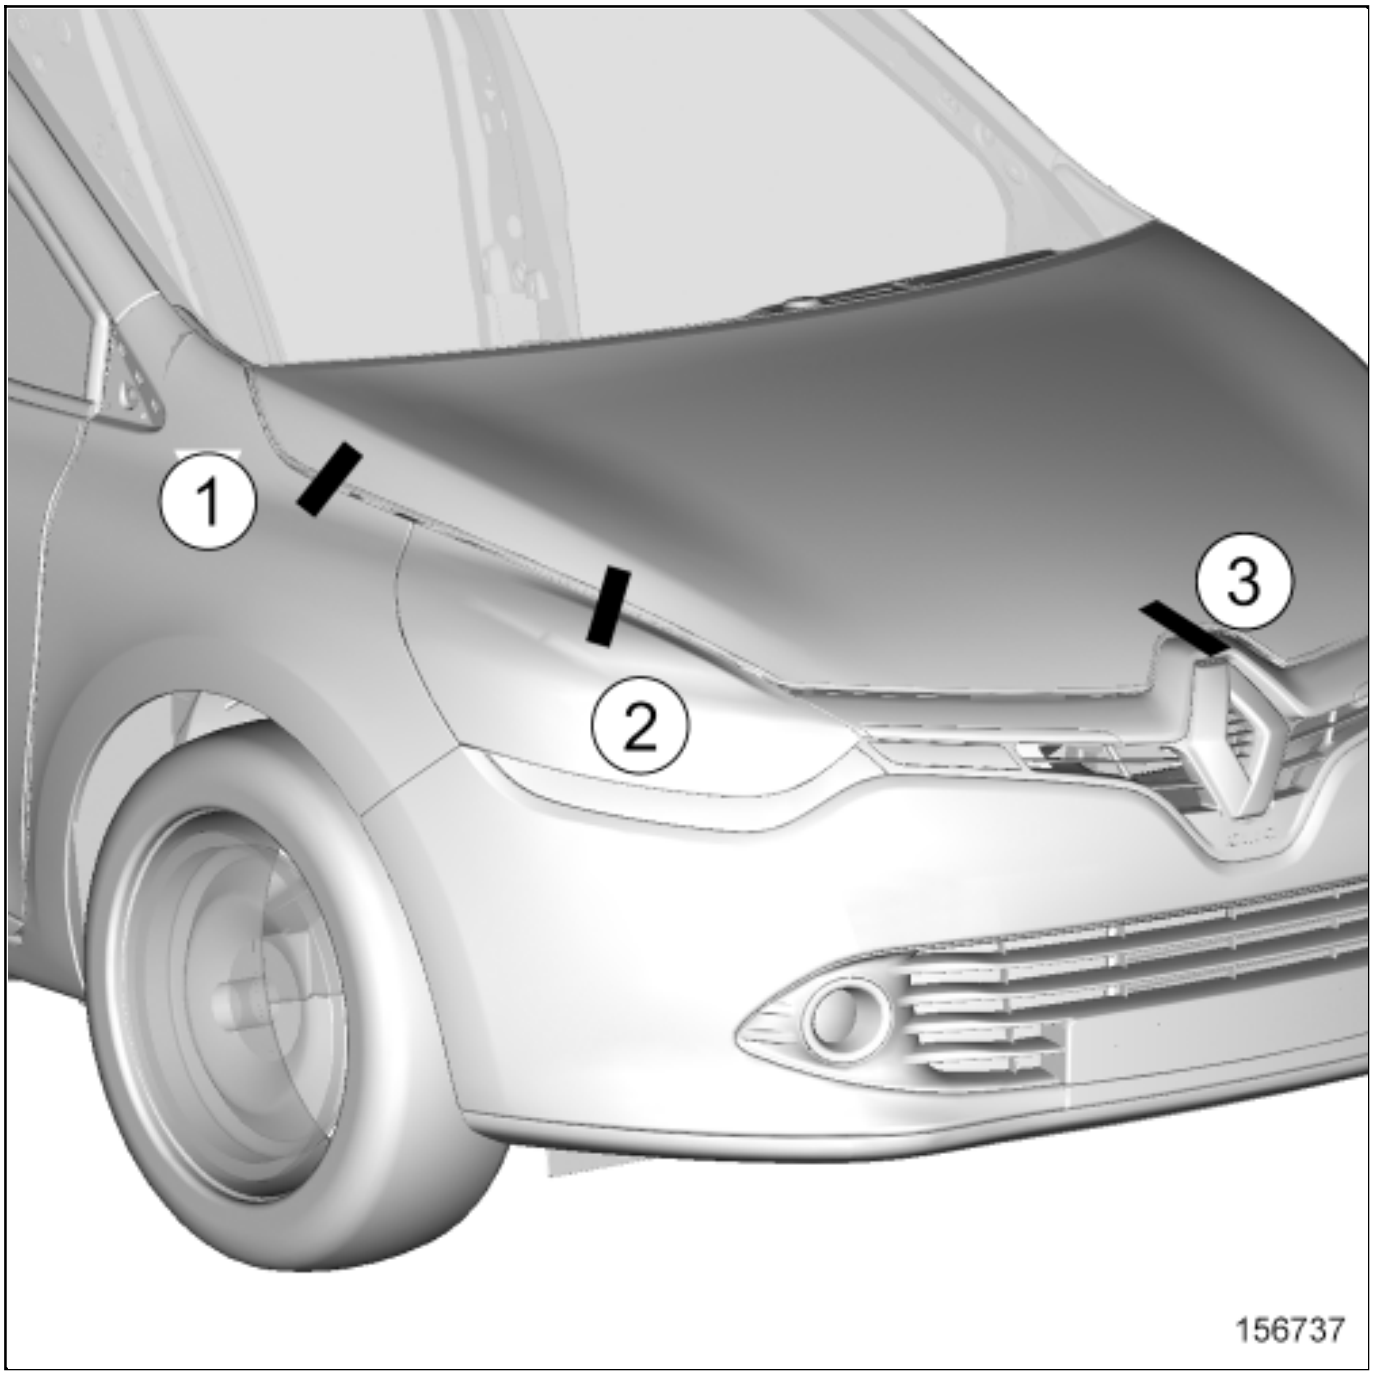
XSL version : 3.02 du 22/07/11

FRONTOPENINGELEMENT:ADJUSTMENT

Location and specifications (tightening torques, parts always to be replaced, etc.)Front opening element mechanism assembly : Exploded view .

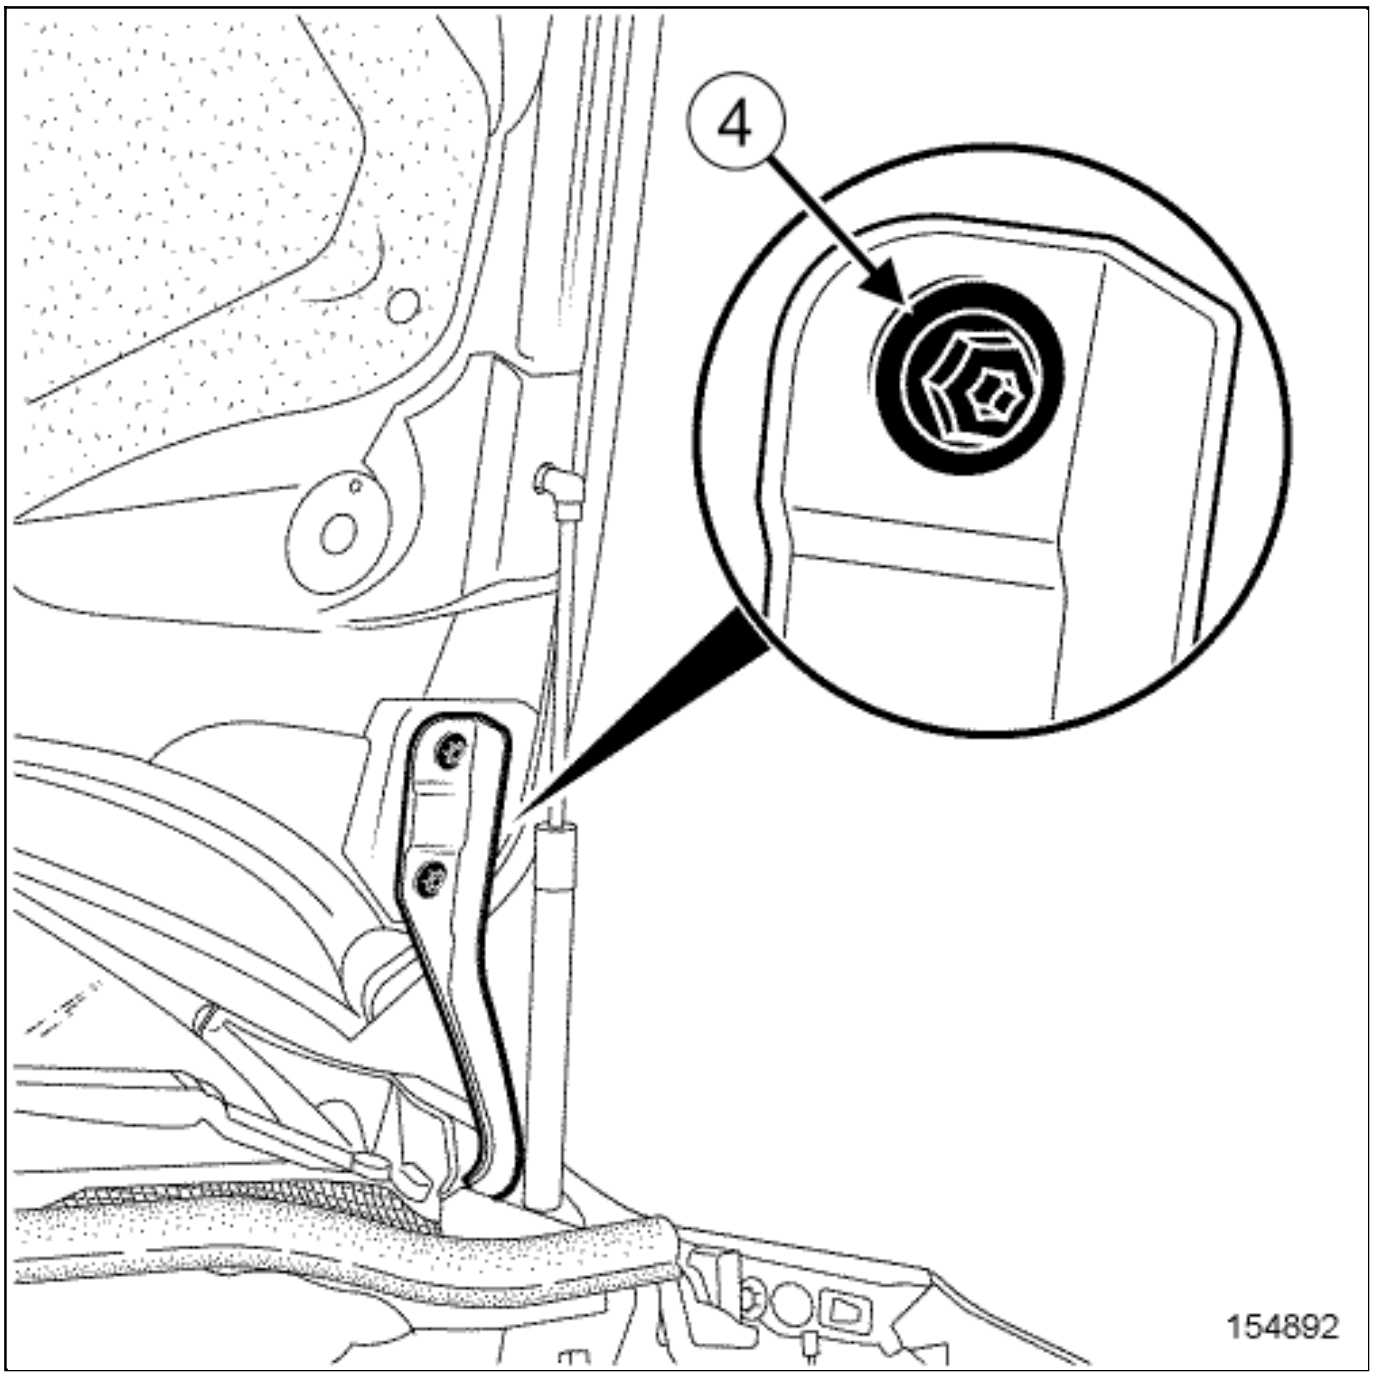
ADJUSTMENT

- For all information about bonnet adjustment valuesVehicle panel gaps: Adjustment value .

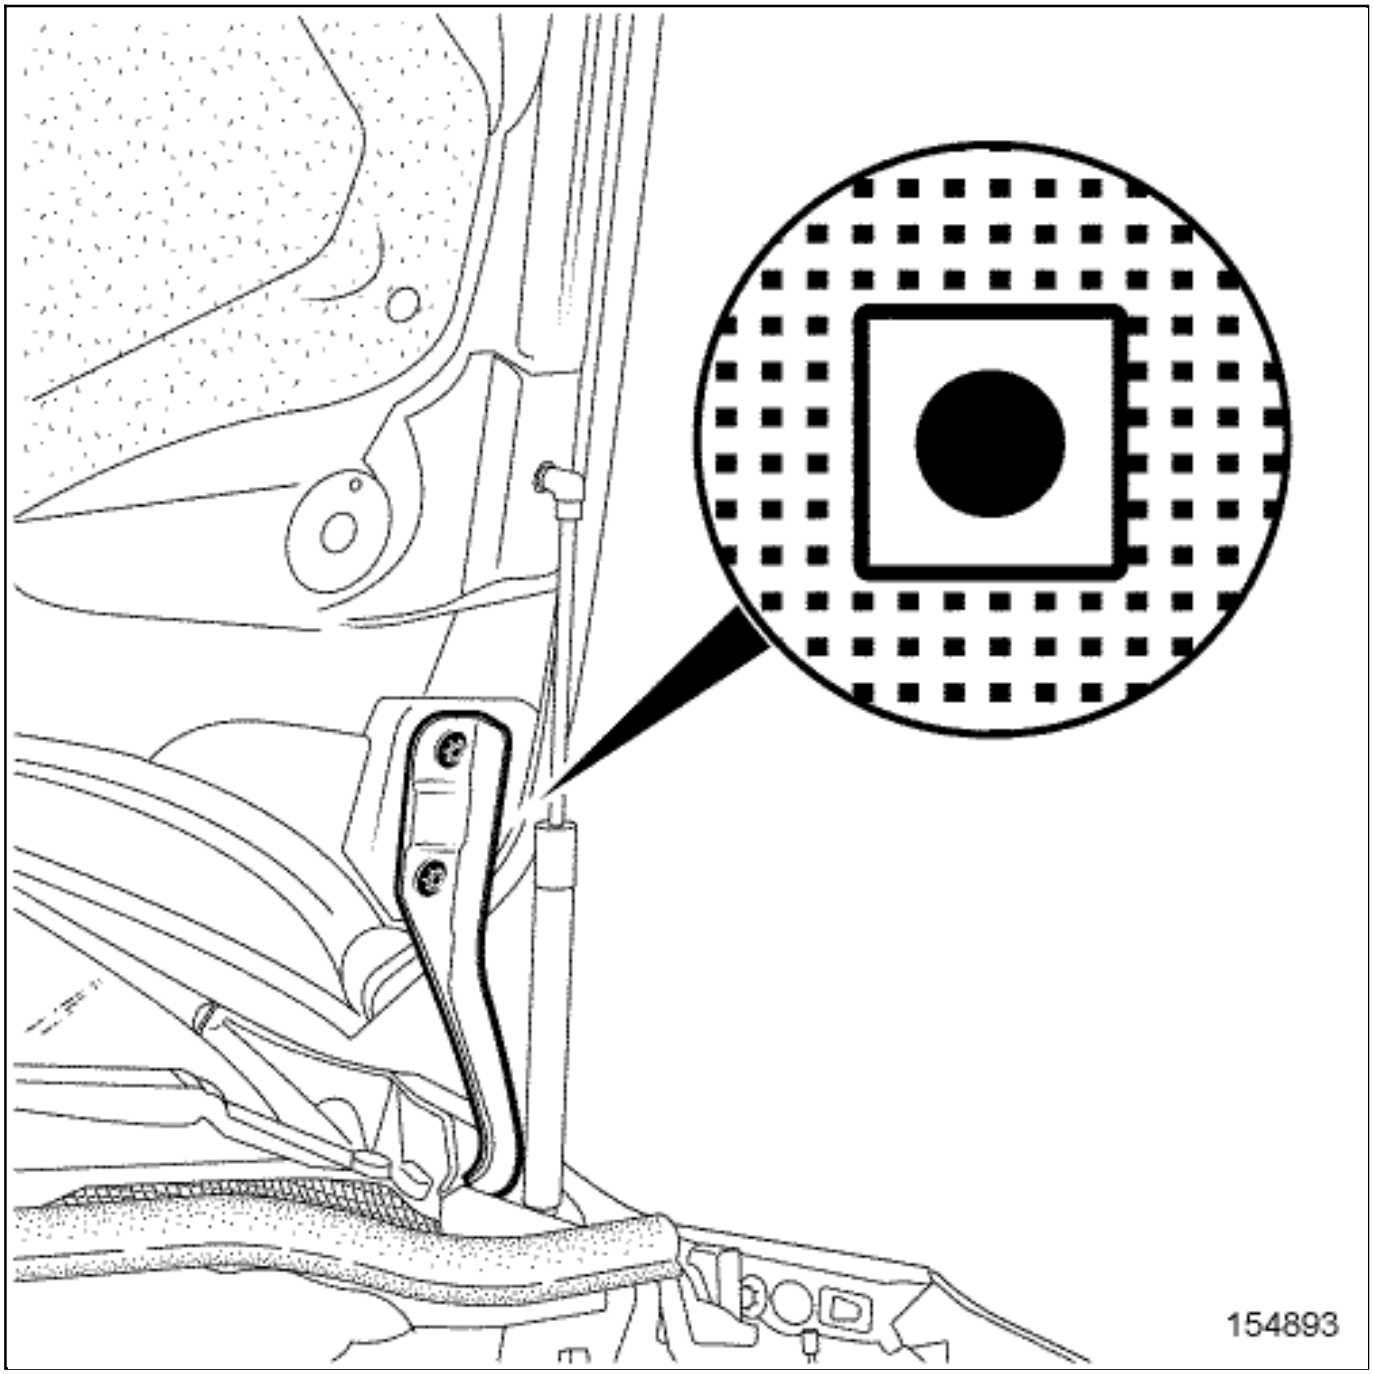


- Symbols A, B, C and D show the adjustment options.

The black dot in the centre represents the body of the bolt.



The grey section represents the component to be adjusted.



The white section represents the adjustment area.

Observe the adjustment sequence(1) , (2) and (3) .

1. ADJUSTMENT BY MEANS OF THE BONNET BOLTS

4
154892

- Loosen the bonnet bolts(4) .
- Adjust the gaps and flush fittings of the bonnet.
- Tighten the bonnet bolts(4) .

FRONT RIGHT-HAND DRIVESHAFT GAITER, GEARBOX SIDE: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Type clip pliers for driveshafts with a thermoplastic gaiter.	Tav. 1168
Pliers for the driveshaft gaiter collar.	Tav. 1784

Equipment required
parts washer

parts always to be replaced:
Front right-hand driveshaft gaiter, gearbox side
gearbox side front driveshaft seal locking ring

(1) Deflector

(2) Driveshaft

(3) Ball bearing

(4) Driveshaft yoke sleeve

(5) Spider

(6) Driveshaft gaiter

(7) Small securing clip

(8) Big securing clip

(9) Lock ring

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

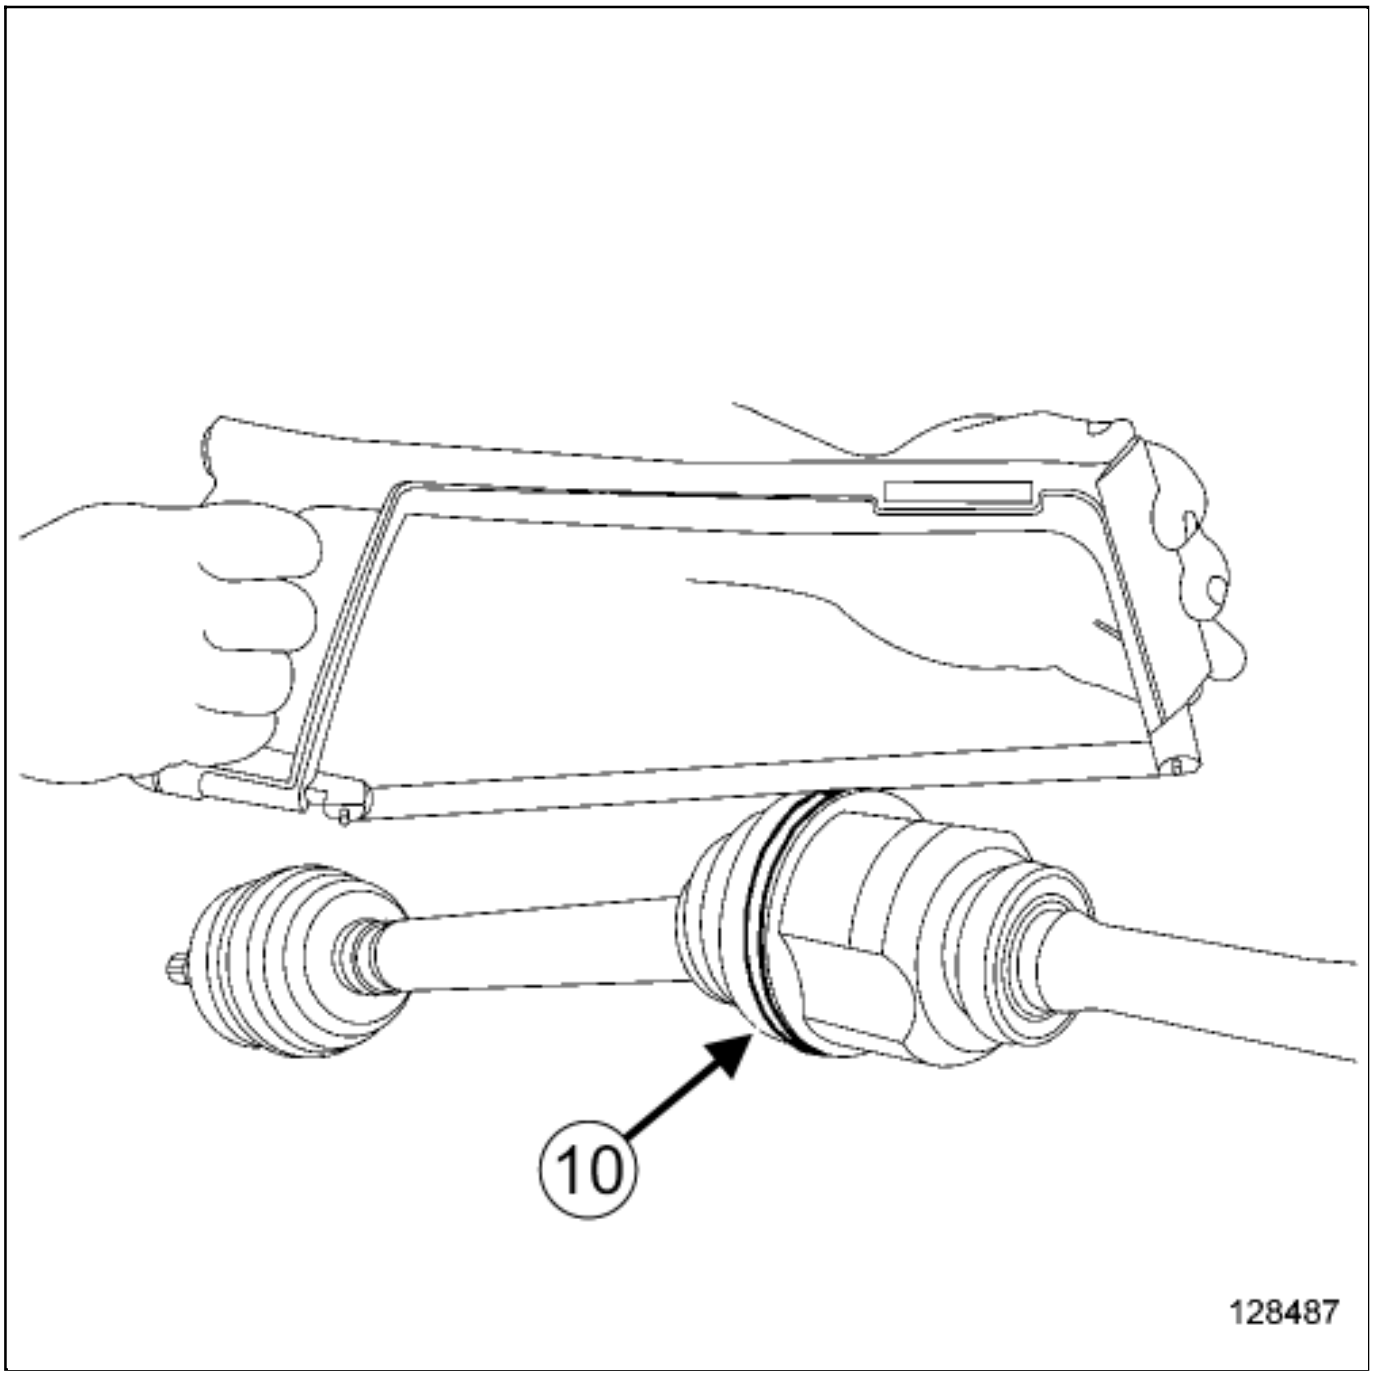
REMOVAL

1. REMOVAL PREPARATION OPERATION

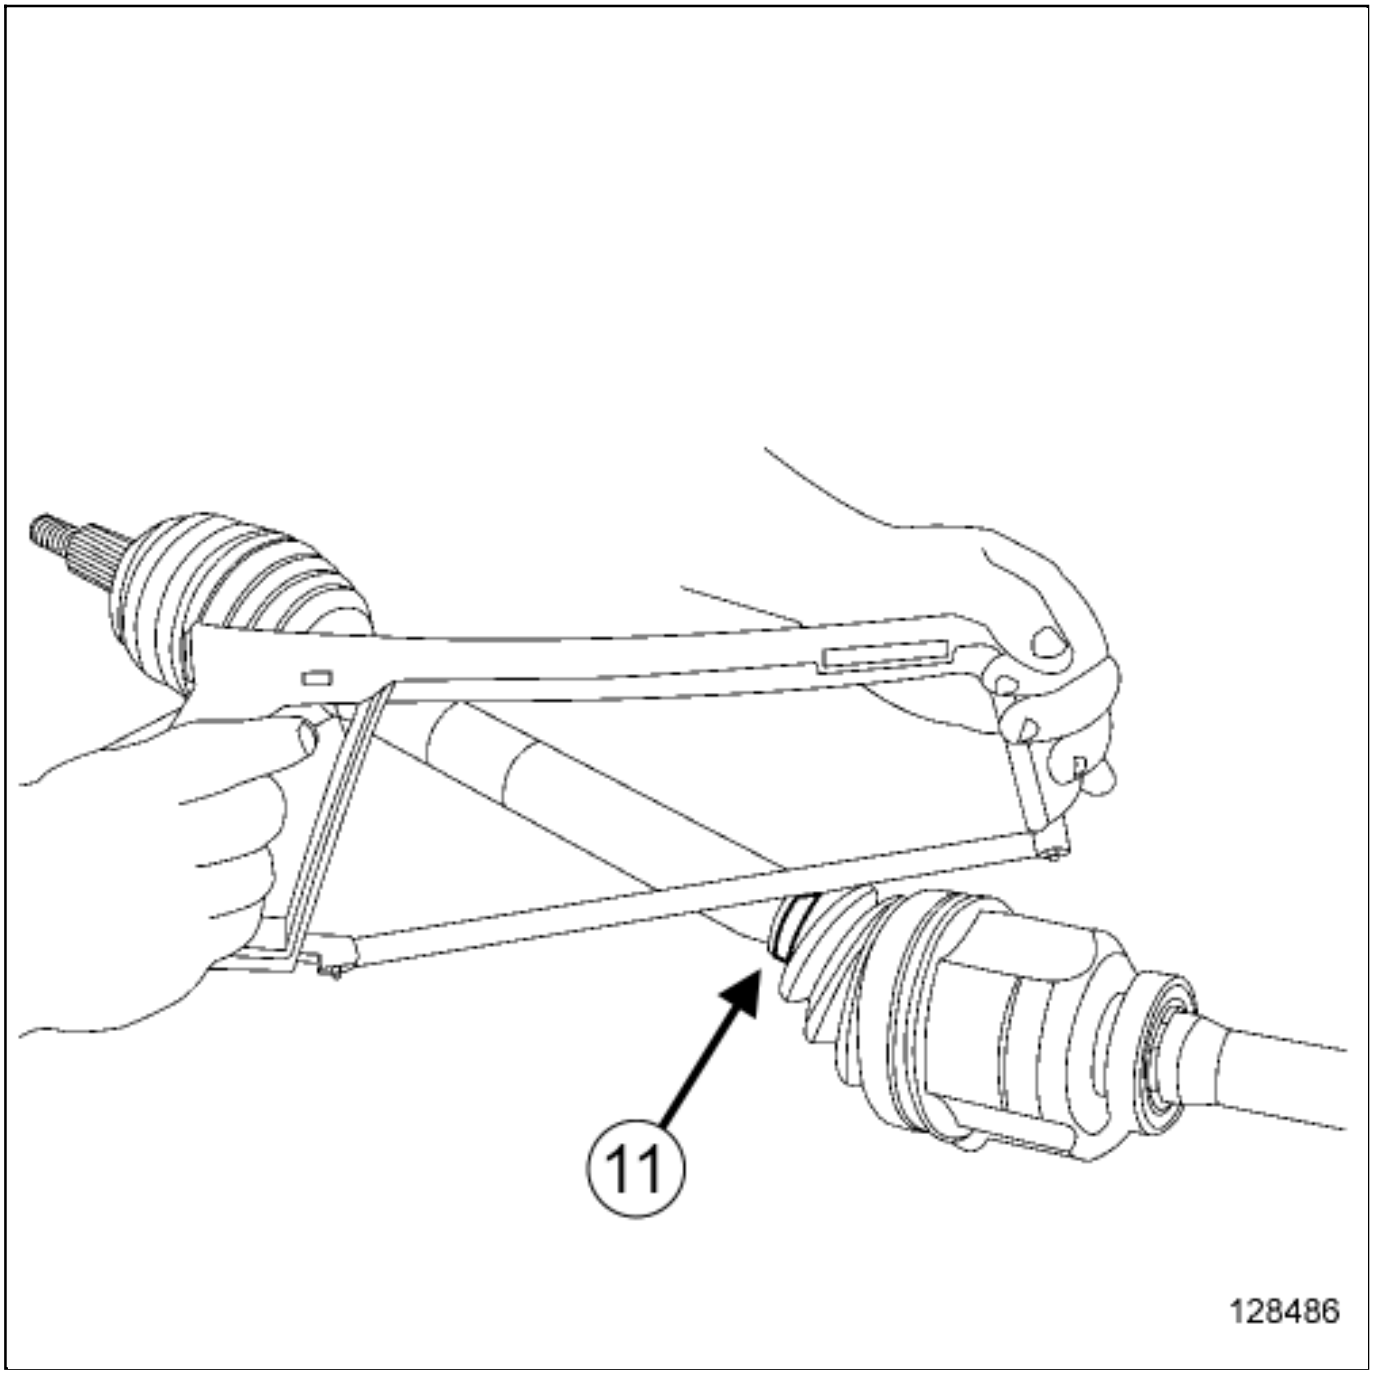
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove

- the engine undertray bolts,
- the engine undertray.



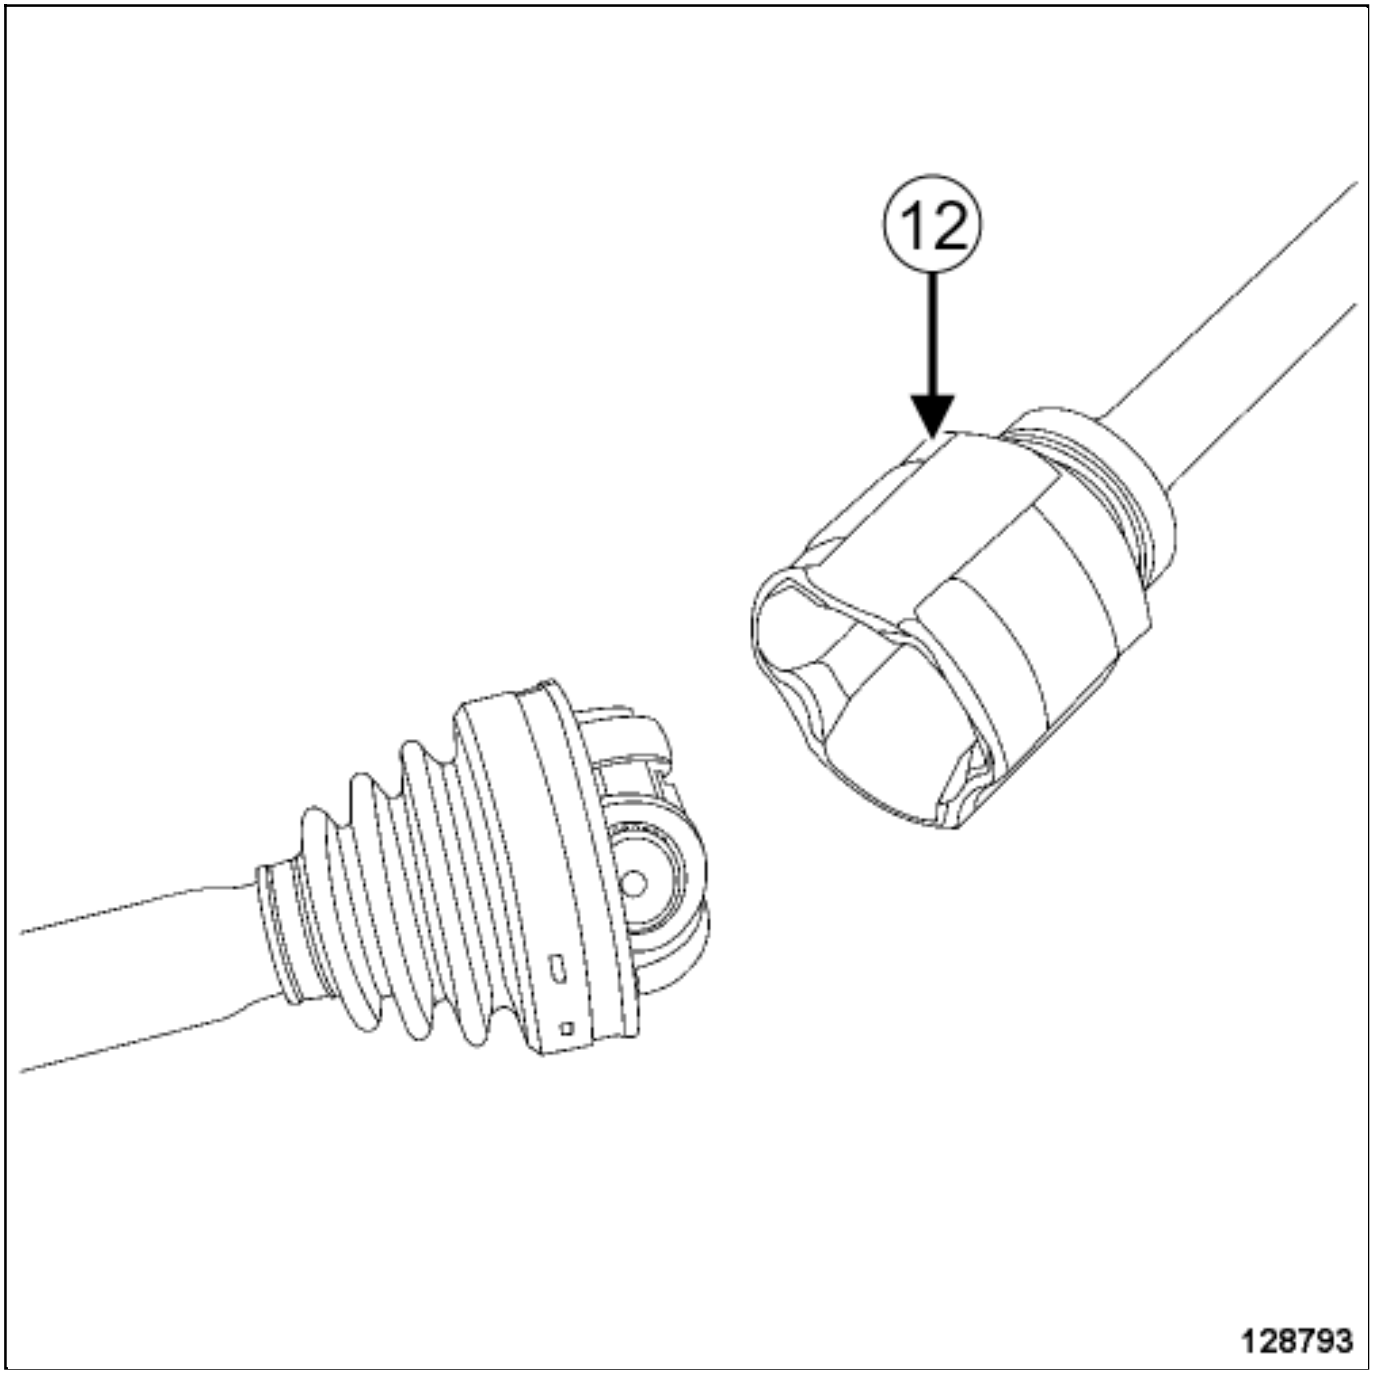
Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) or Automatic gearbox oil: Draining - Filling .



Remove:

- the front right-hand wheel Wheel: Removal - Refitting ,
- the front right-hand wheel driveshaft (see 29A, Driveshafts , Front right-hand driveshaft: Removal - Refitting) .

Remove the differential output seal (see **Differential output seal: Removal - Refitting**) .



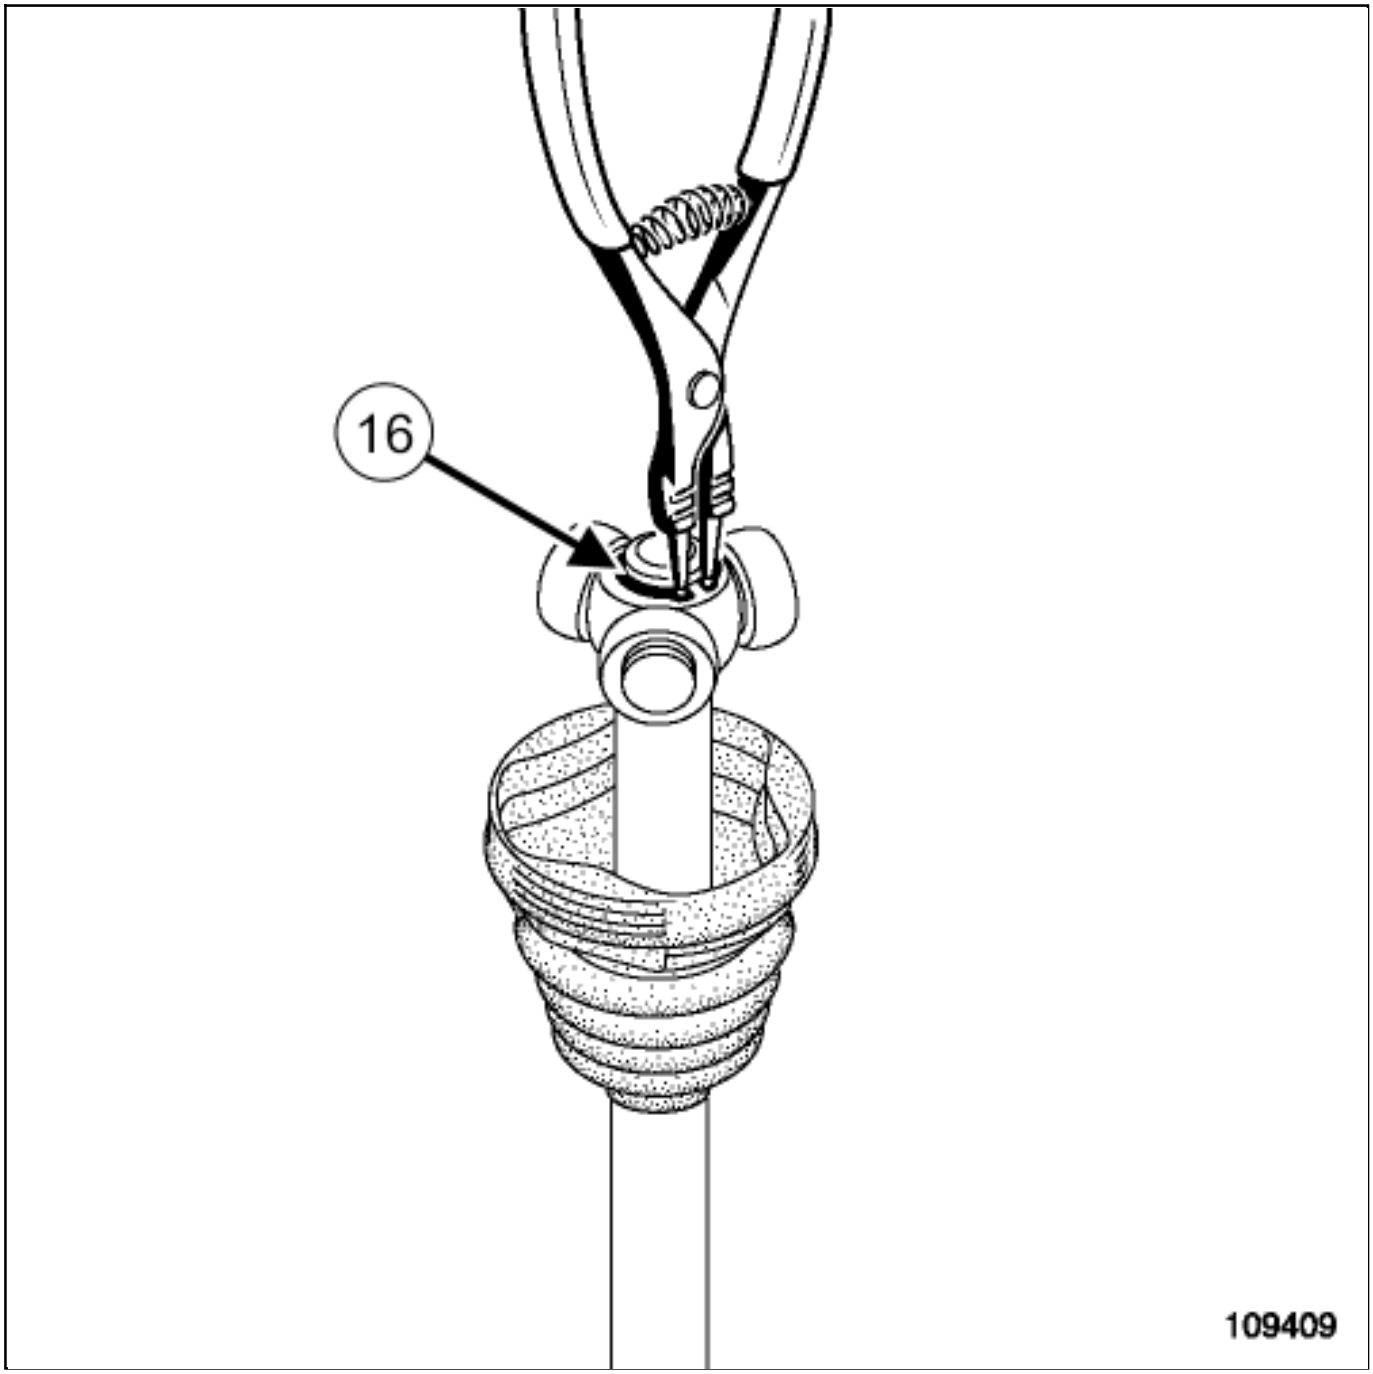
2. REMOVAL OPERATION

10
128487

Cut the big securing clip(10) and the small securing clip(11) using cutting pliers or a metal saw, taking care not to damage the yoke sleeve or the driveshaft.

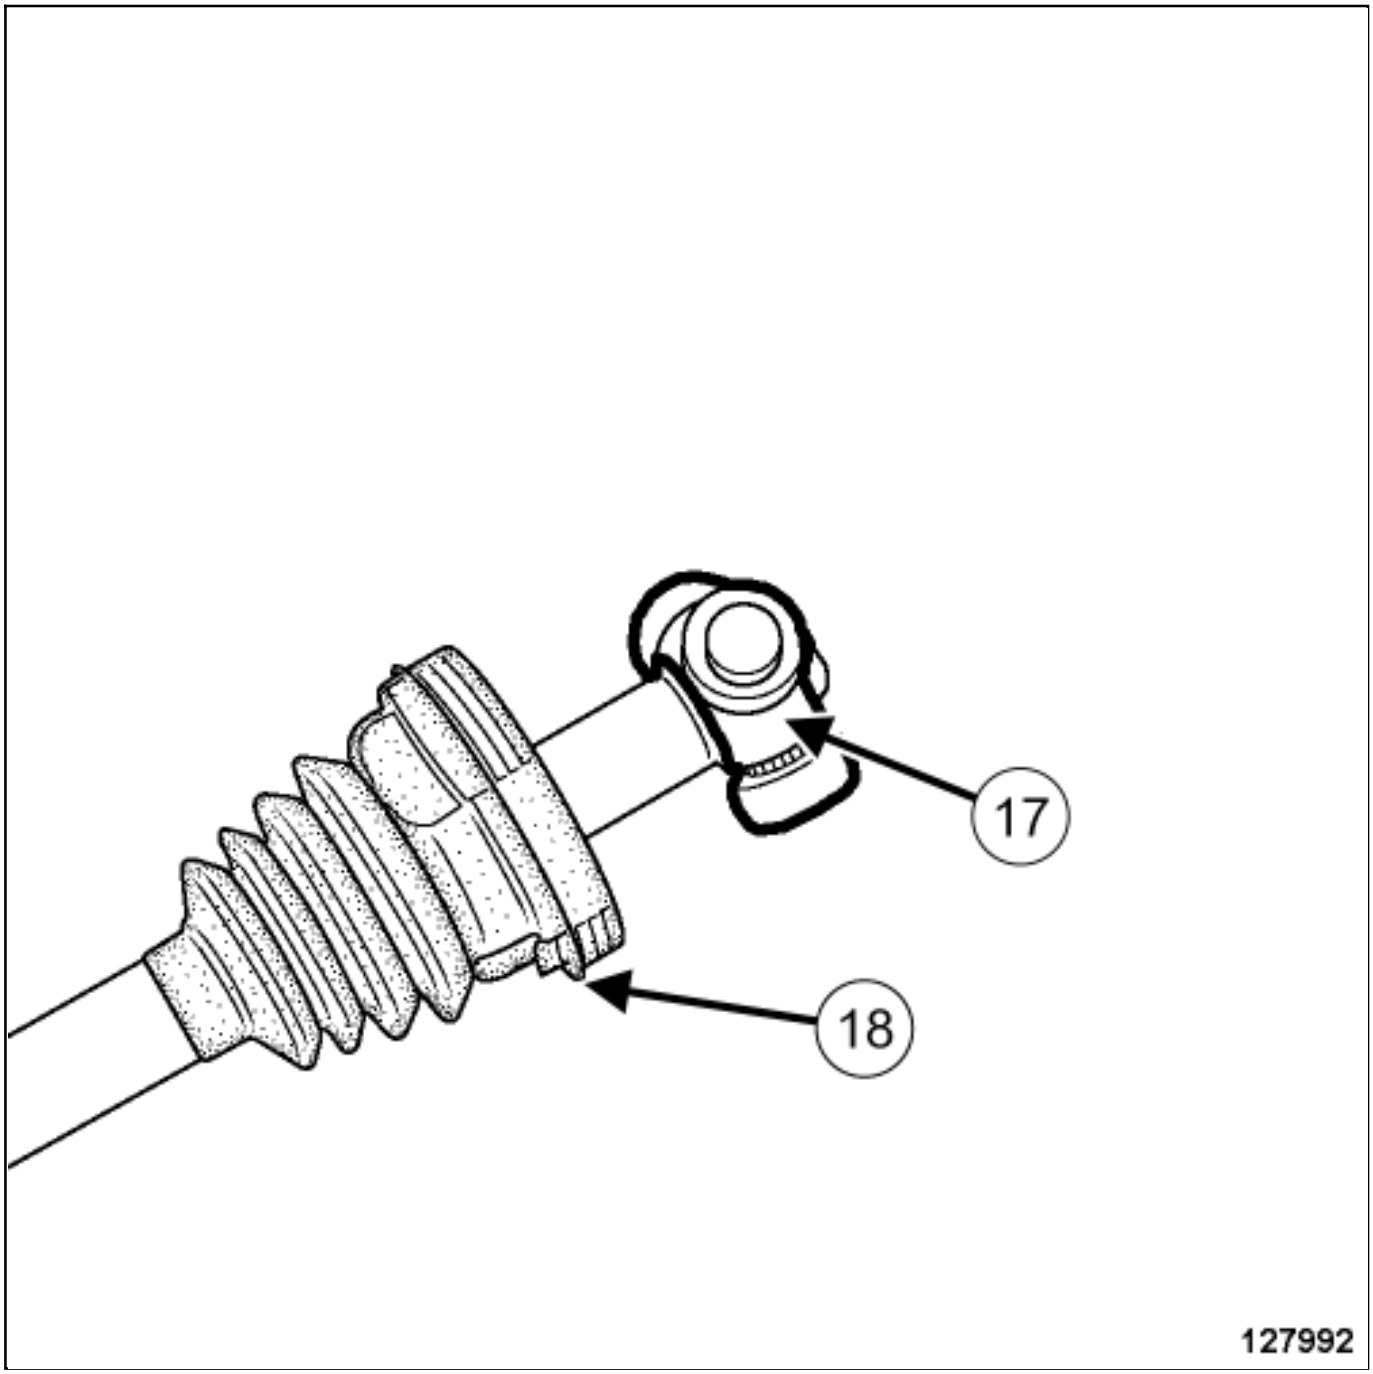
Push back the driveshaft gaiter to release the driveshaft yoke sleeve.

Remove the driveshaft yoke sleeve(12) .



Note:

- since the driveshaft yoke sleeve does not have a stop tab, it can be removed without being forced,
- do not remove the rollers from their respective bushings as the rollers and needles are matched and should never be interchanged.



Remove as much grease as possible from inside the yoke sleeve.

Note:

Never use thinner to remove grease.

Remove the lock ring(14) using circlip pliers.

Note:

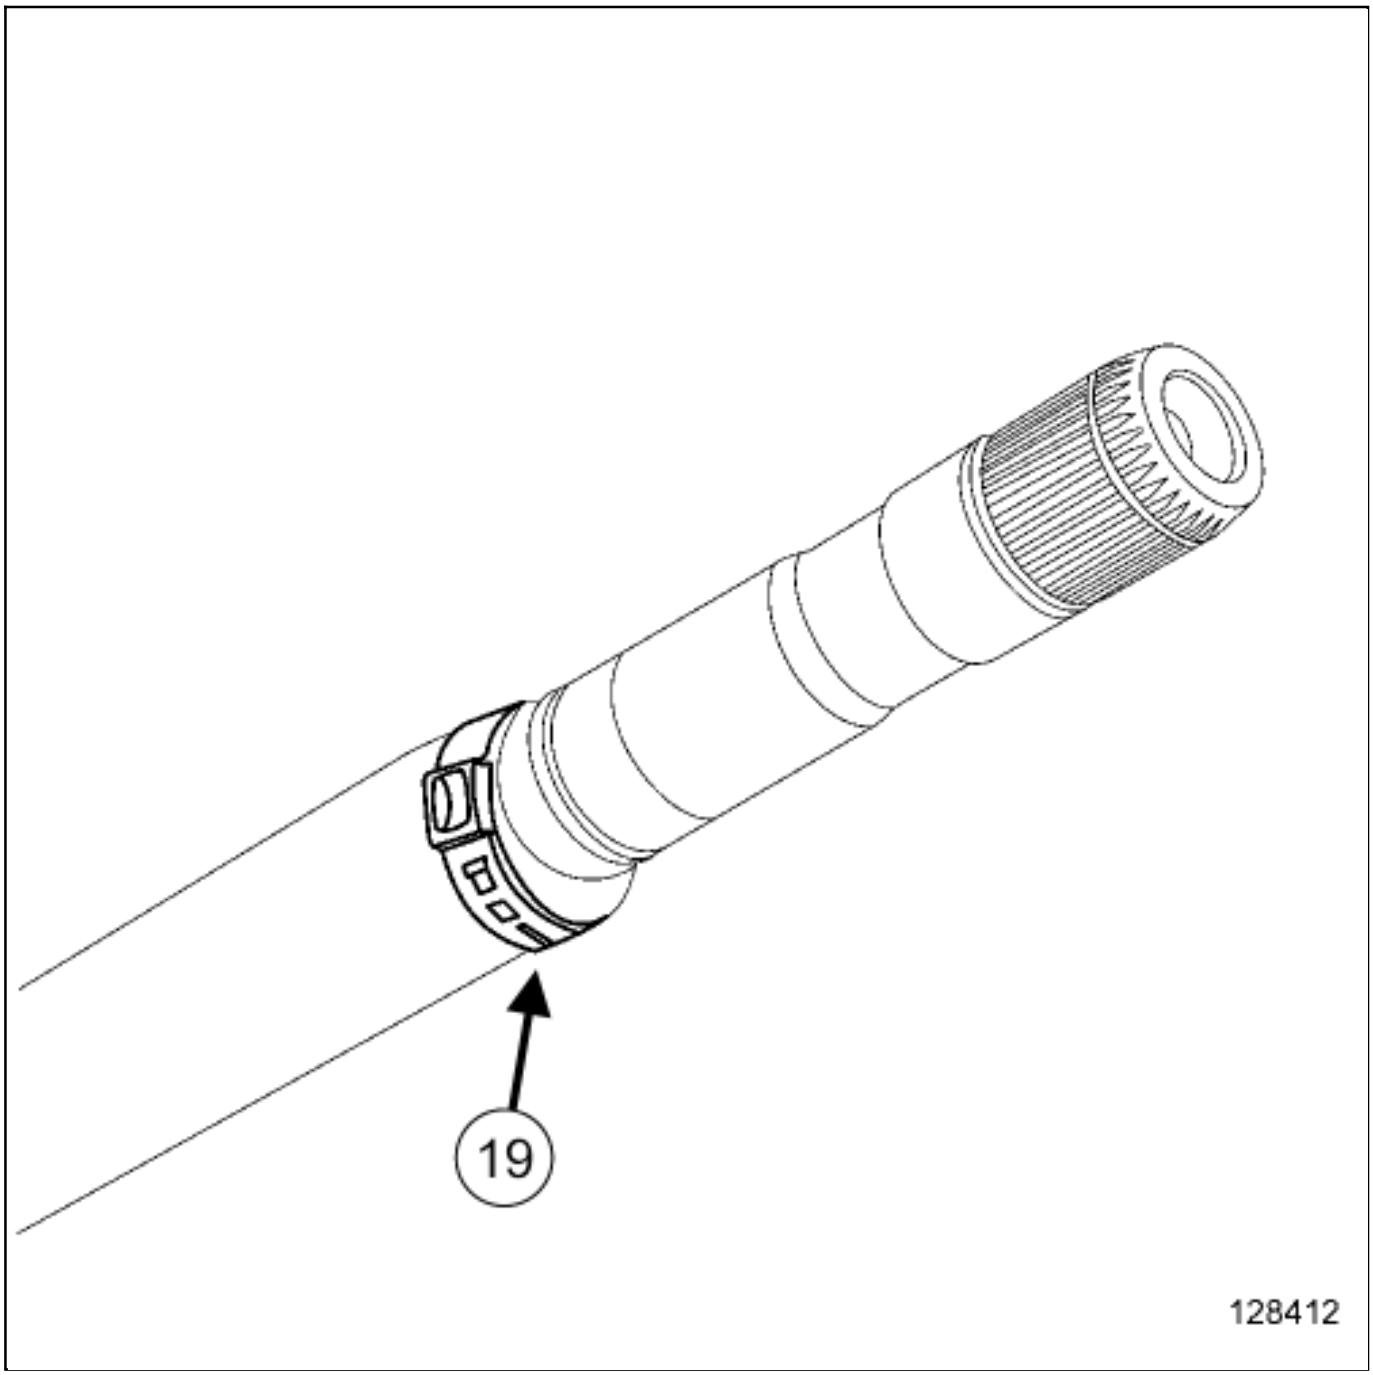
Mark the position of the spider before extracting it.

- Remove the spider(15) using a press and a releasing type extractor.
- Remove the driveshaft gaiter(16) from the driveshaft.

REFITTING

1. REFITTING PREPARATION OPERATION

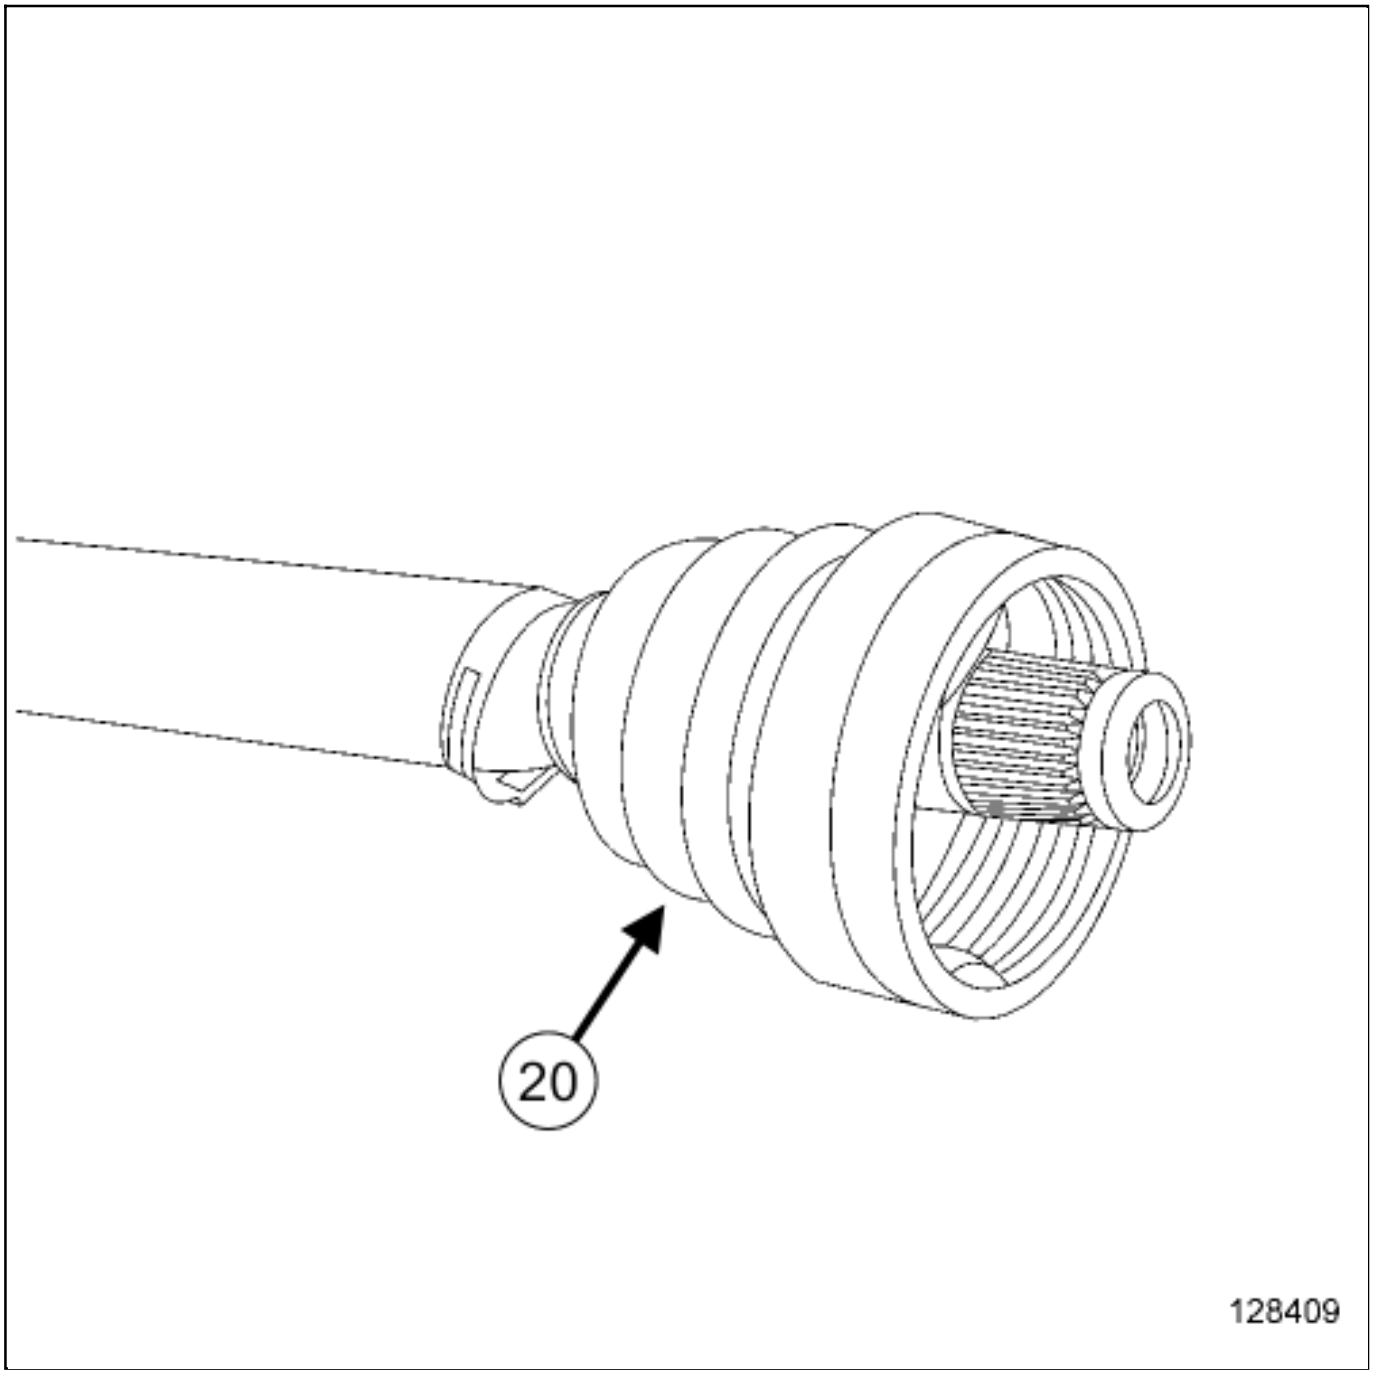
parts always to be replaced: Front right-hand driveshaft gaiter, gearbox side .



parts always to be replaced: gearbox side front driveshaft seal locking ring .

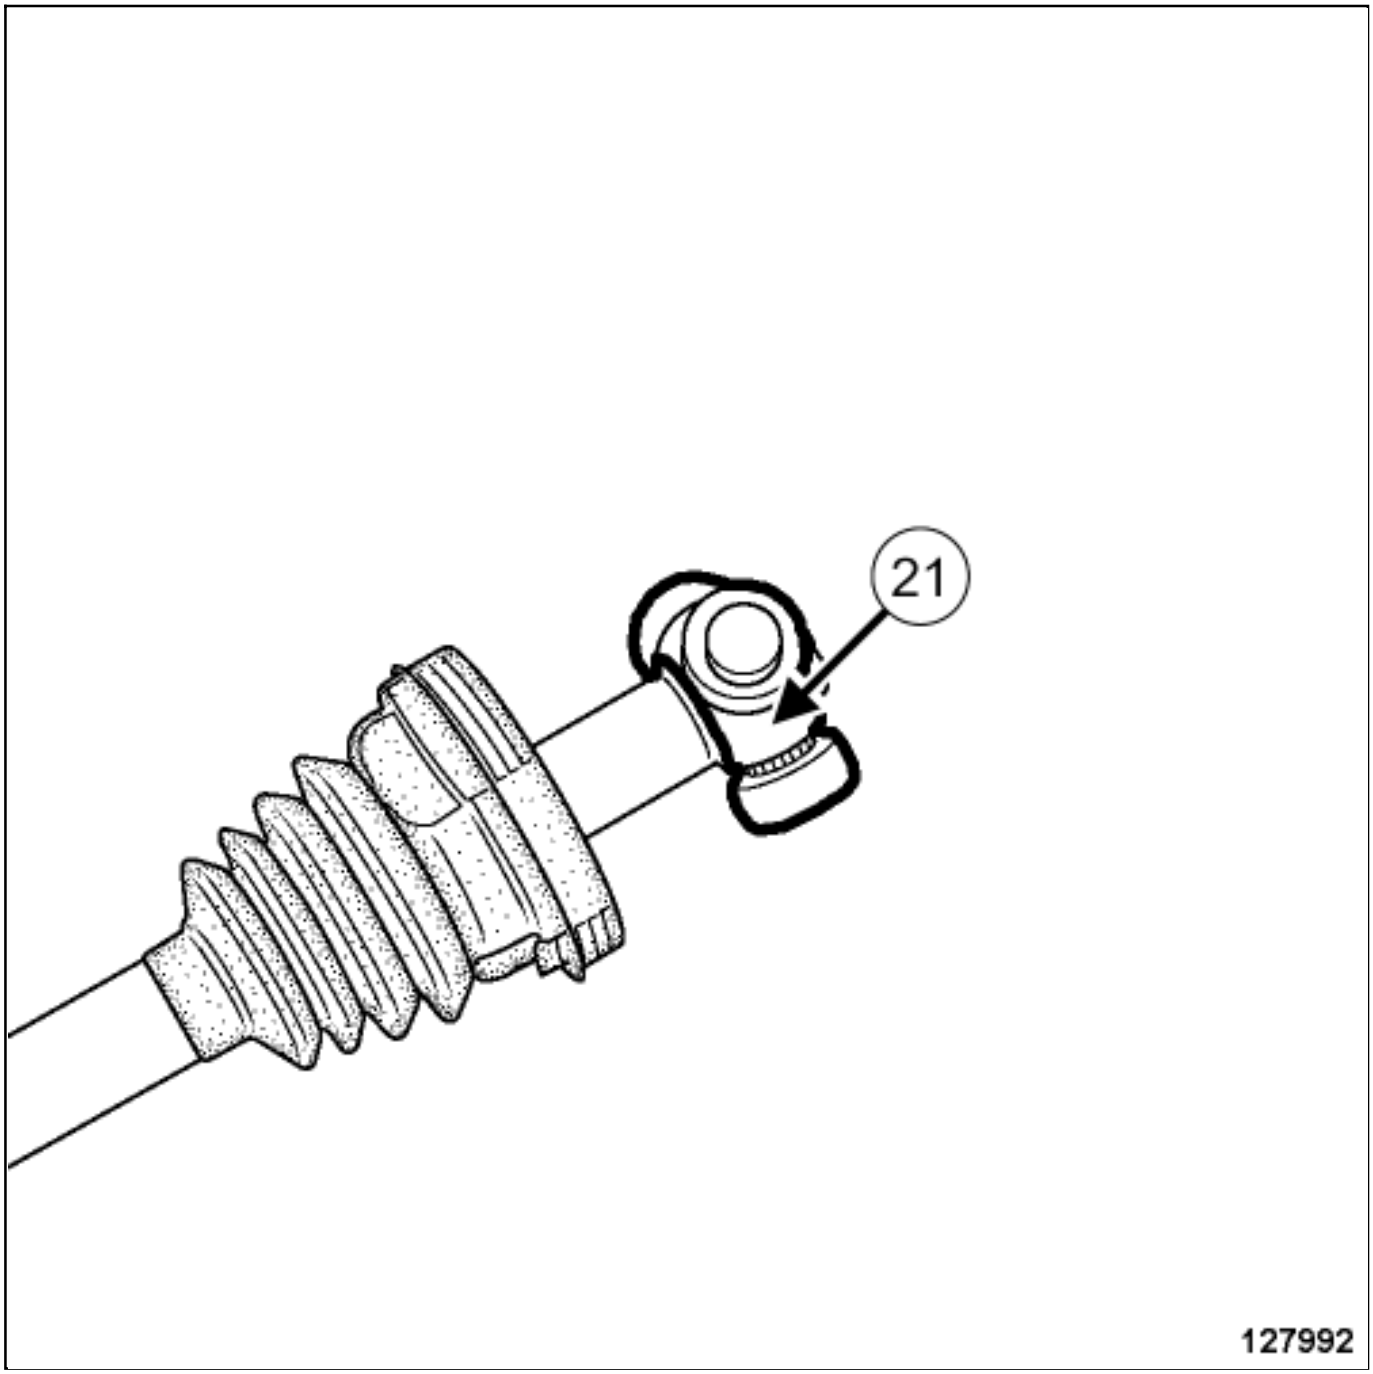
Always replace:

- the big securing clip,
- the small securing clip.



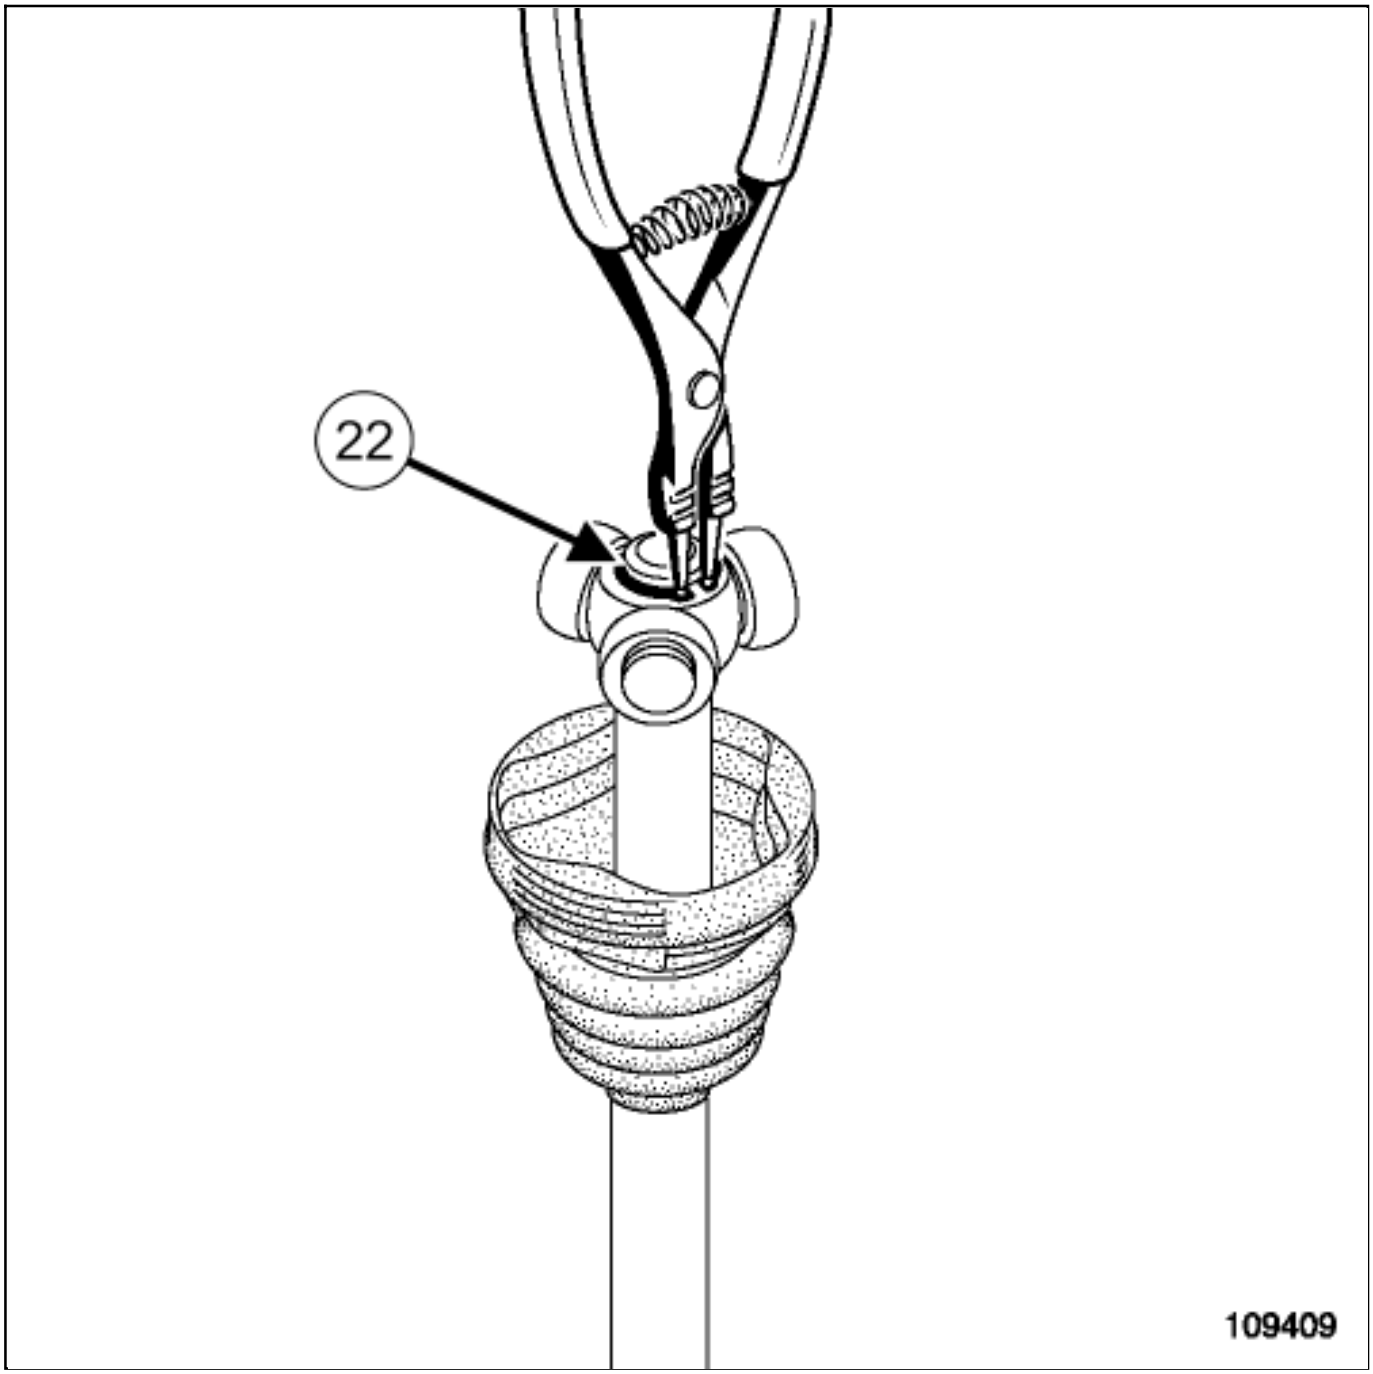
Use a parts washerto clean the driveshaft, the spider and the driveshaft yoke sleeve.

2. REFITTING OPERATION

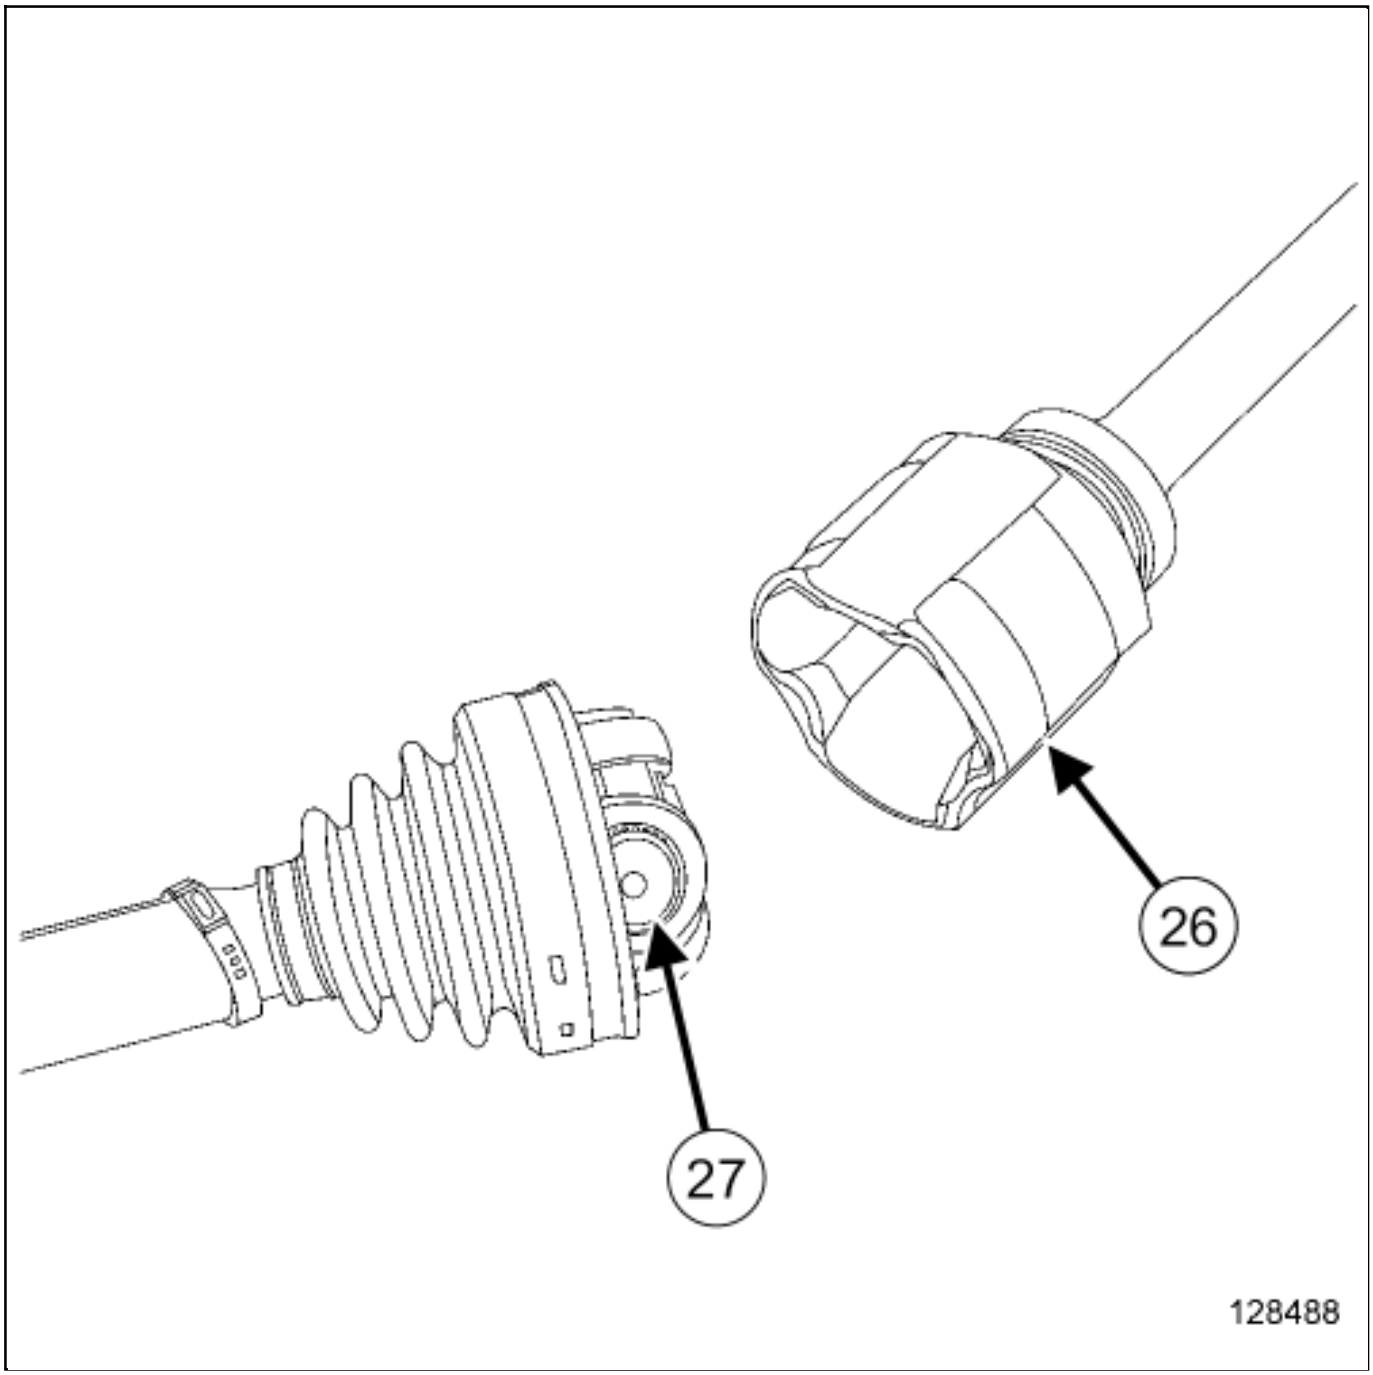


Fit the small tightening clip(17) to the driveshaft.

Lightly lubricate the driveshaft using the grease supplied with the gaiter to facilitate its fitting.



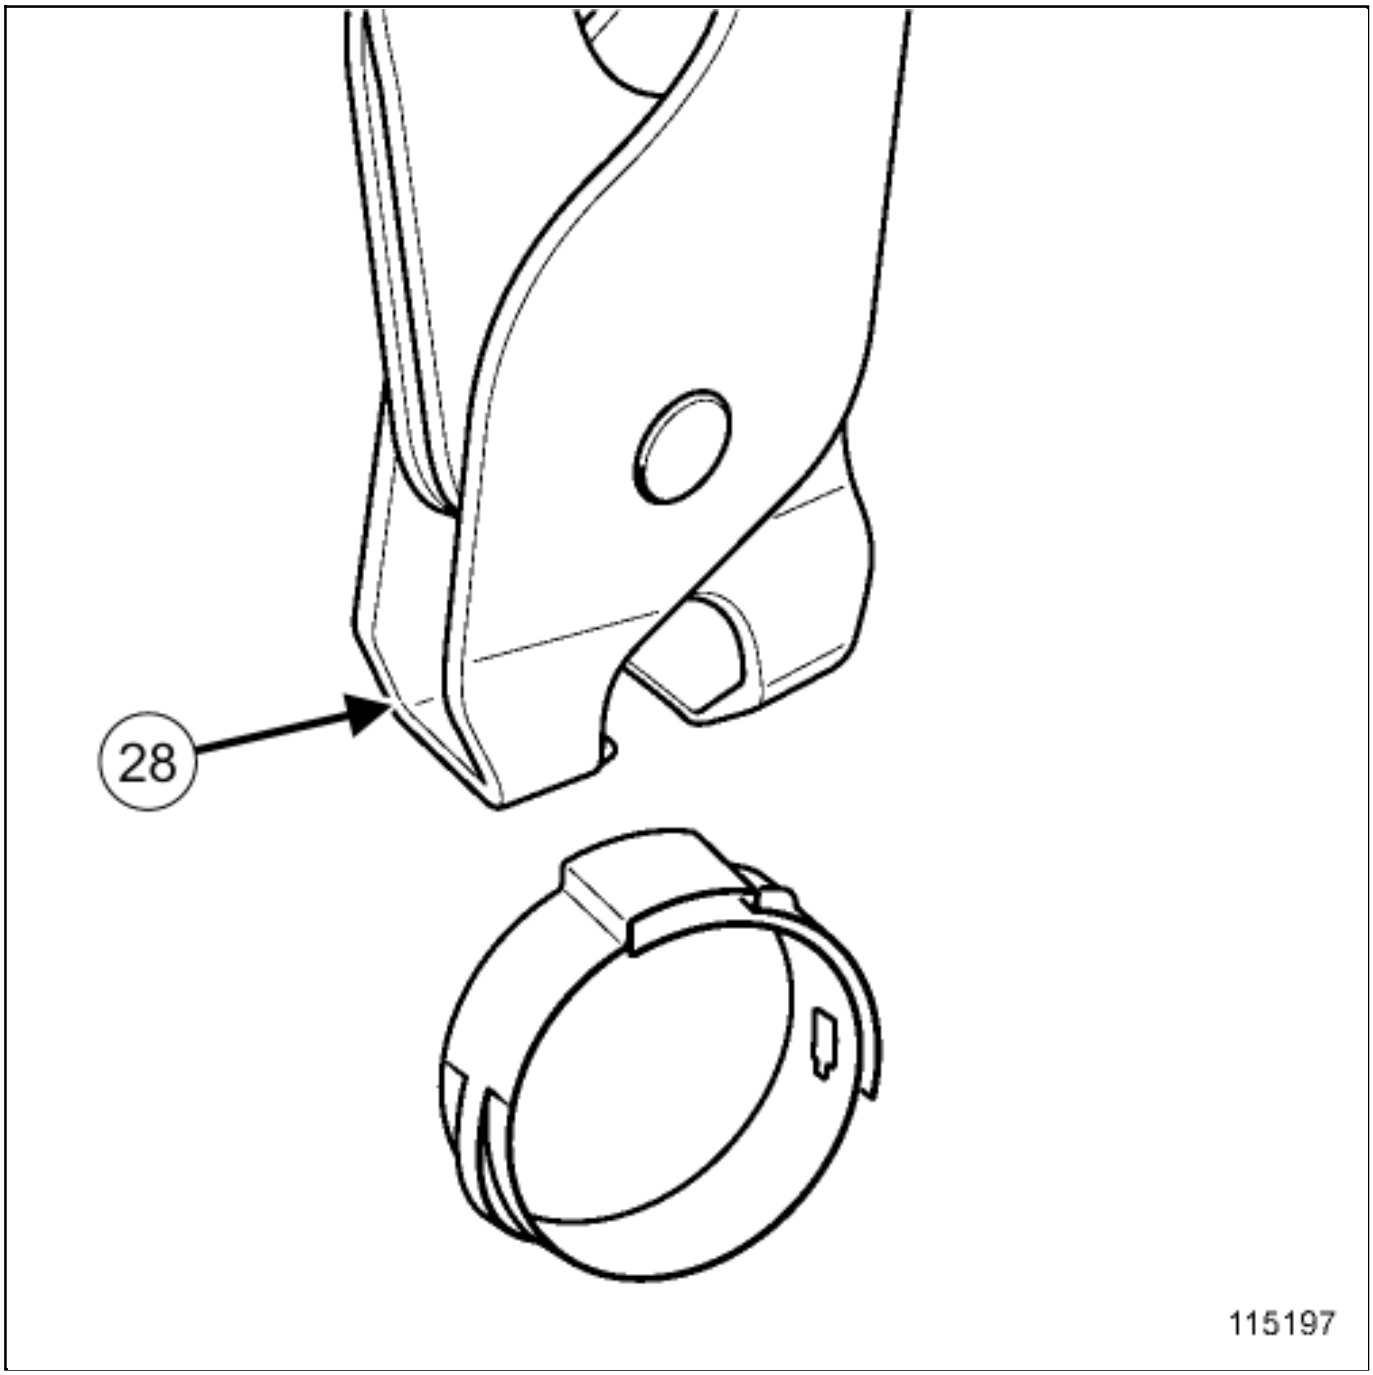
- Refit the gaiter(18) onto the driveshaft.



- Insert the gaiter lip into the groove of the driveshaft.

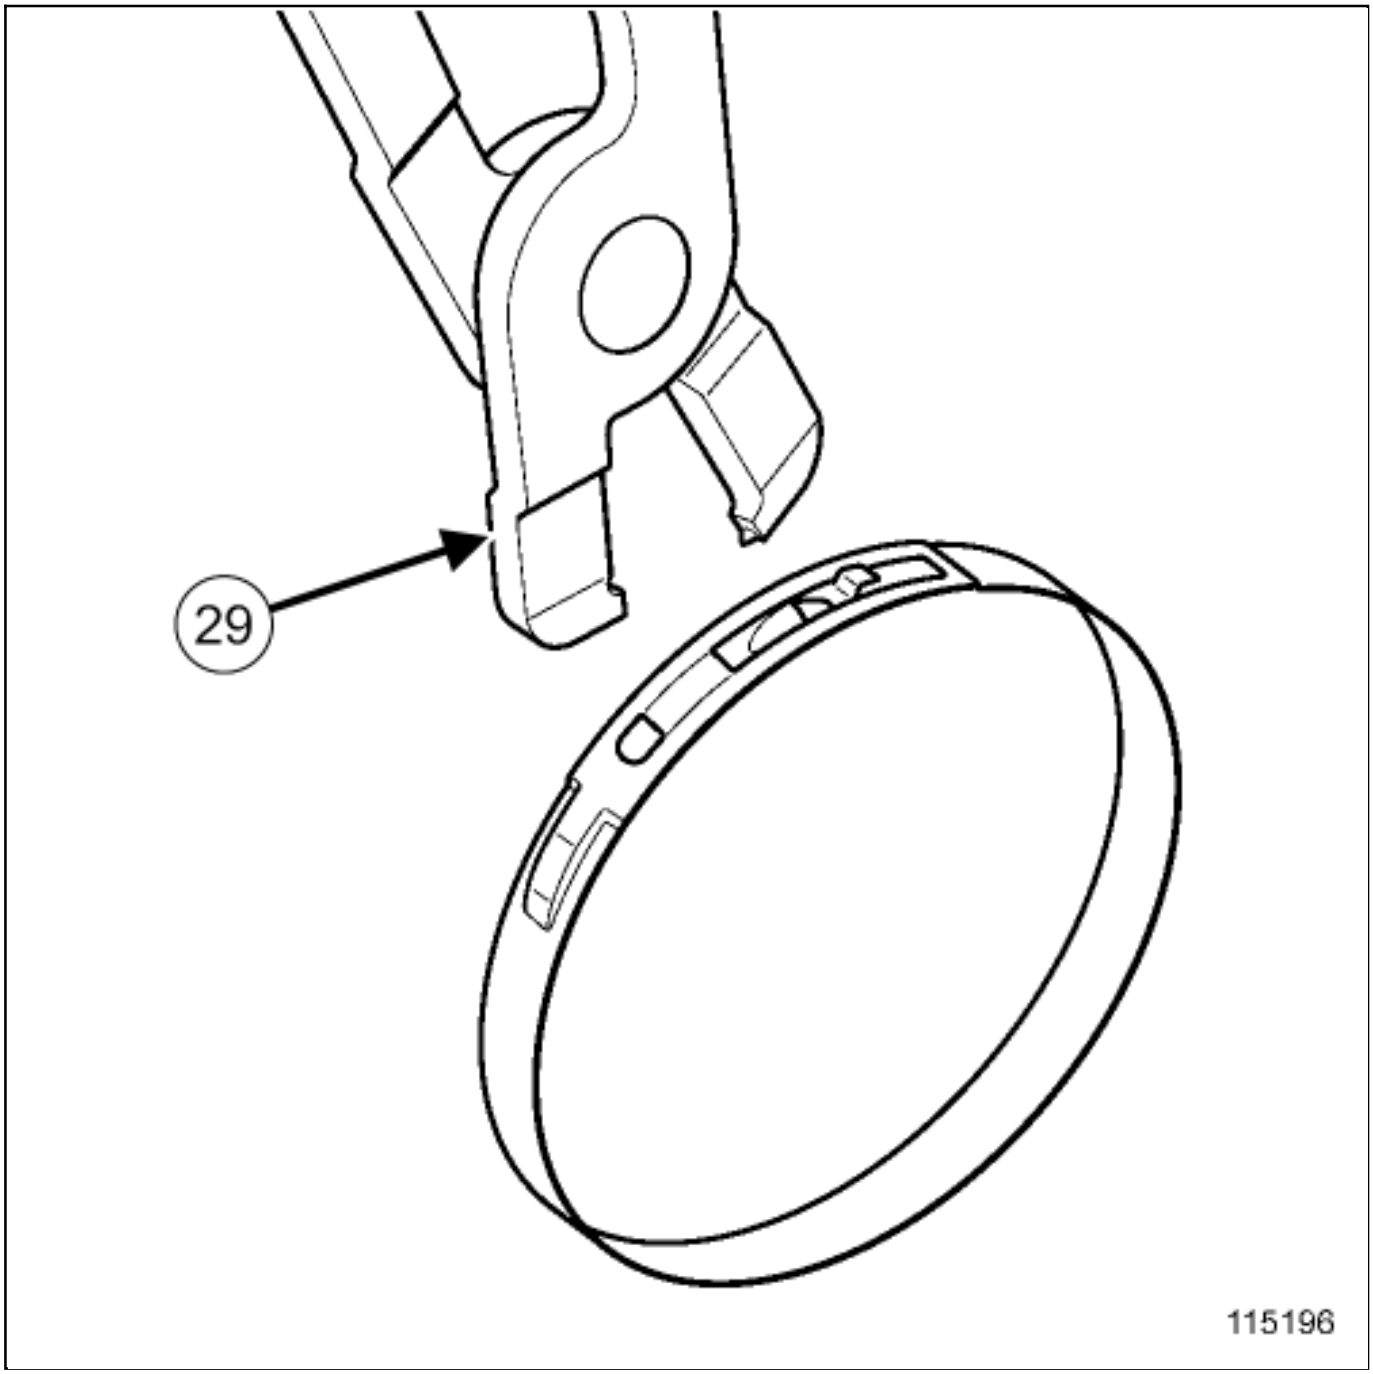
Refit the spider(19) in the position marked during removal.

Fit a new lock ring(20) using circlip pliers.



- Divide the quantity of grease between the driveshaft gaiter and the yoke sleeve.
- Engage the yoke sleeve(22) on the tripod(23) .
- Position the driveshaft gaiter lip into the groove of the yoke sleeve.

Note:



Check that the gaiter lip is correctly positioned in the groove of the driveshaft.

- Fit the small securing clip on the driveshaft gaiter.
- Refit the big securing clip on the driveshaft gaiter.

CLIC CLIP

CLIP WITH PROFILE END

Tighten the clips using the toolType clip pliers for driveshafts with a thermoplastic gaiter.(Tav. 1168) (24) for clic clips or the toolPliers for the driveshaft gaiter collar.(Tav. 1784) (25) for profile end clips.

3. FINAL OPERATION

Refit a new differential output seal(see **Differential output seal: Removal - Refitting**) .

Refit:

- the front right-hand driveshaft (see 29A, Driveshafts , Front right-hand driveshaft: Removal - Refitting) ,
- the front right-hand wheel Wheel: Removal - Refitting .

Fill up the gearbox (see **Manual gearbox oils: Draining - Filling**) or Automatic gearbox oil: Draining - Filling .

Refit the engine undertray.

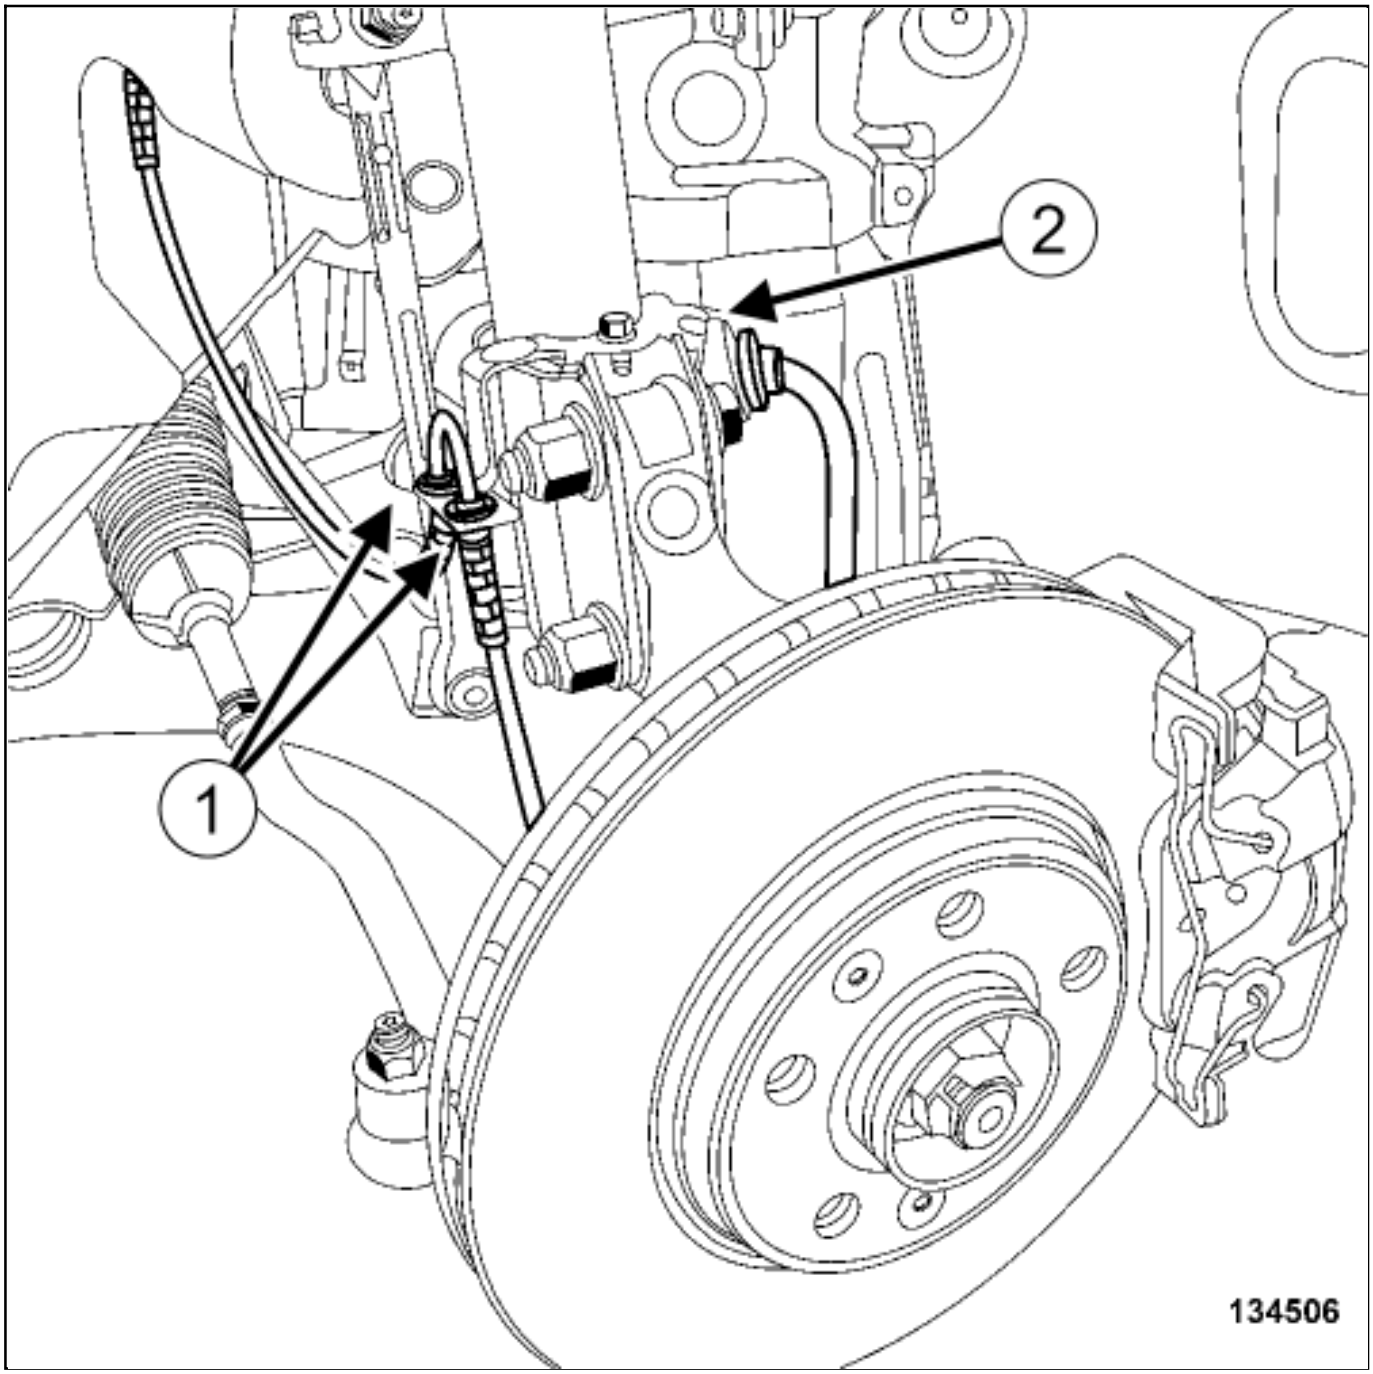
FRONT RIGHT-HAND DRIVESHAFT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Hub locking tool.	Rou. 604-01
Ball joint extractor.	Tav. 476
Universal driveshaft push back tool (plate and claws without ram).	Tav. 1050-04
Screw jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.	Tav. 1420-01

parts always to be replaced:
Front wheel hub nut
relay bearing bracket bolt

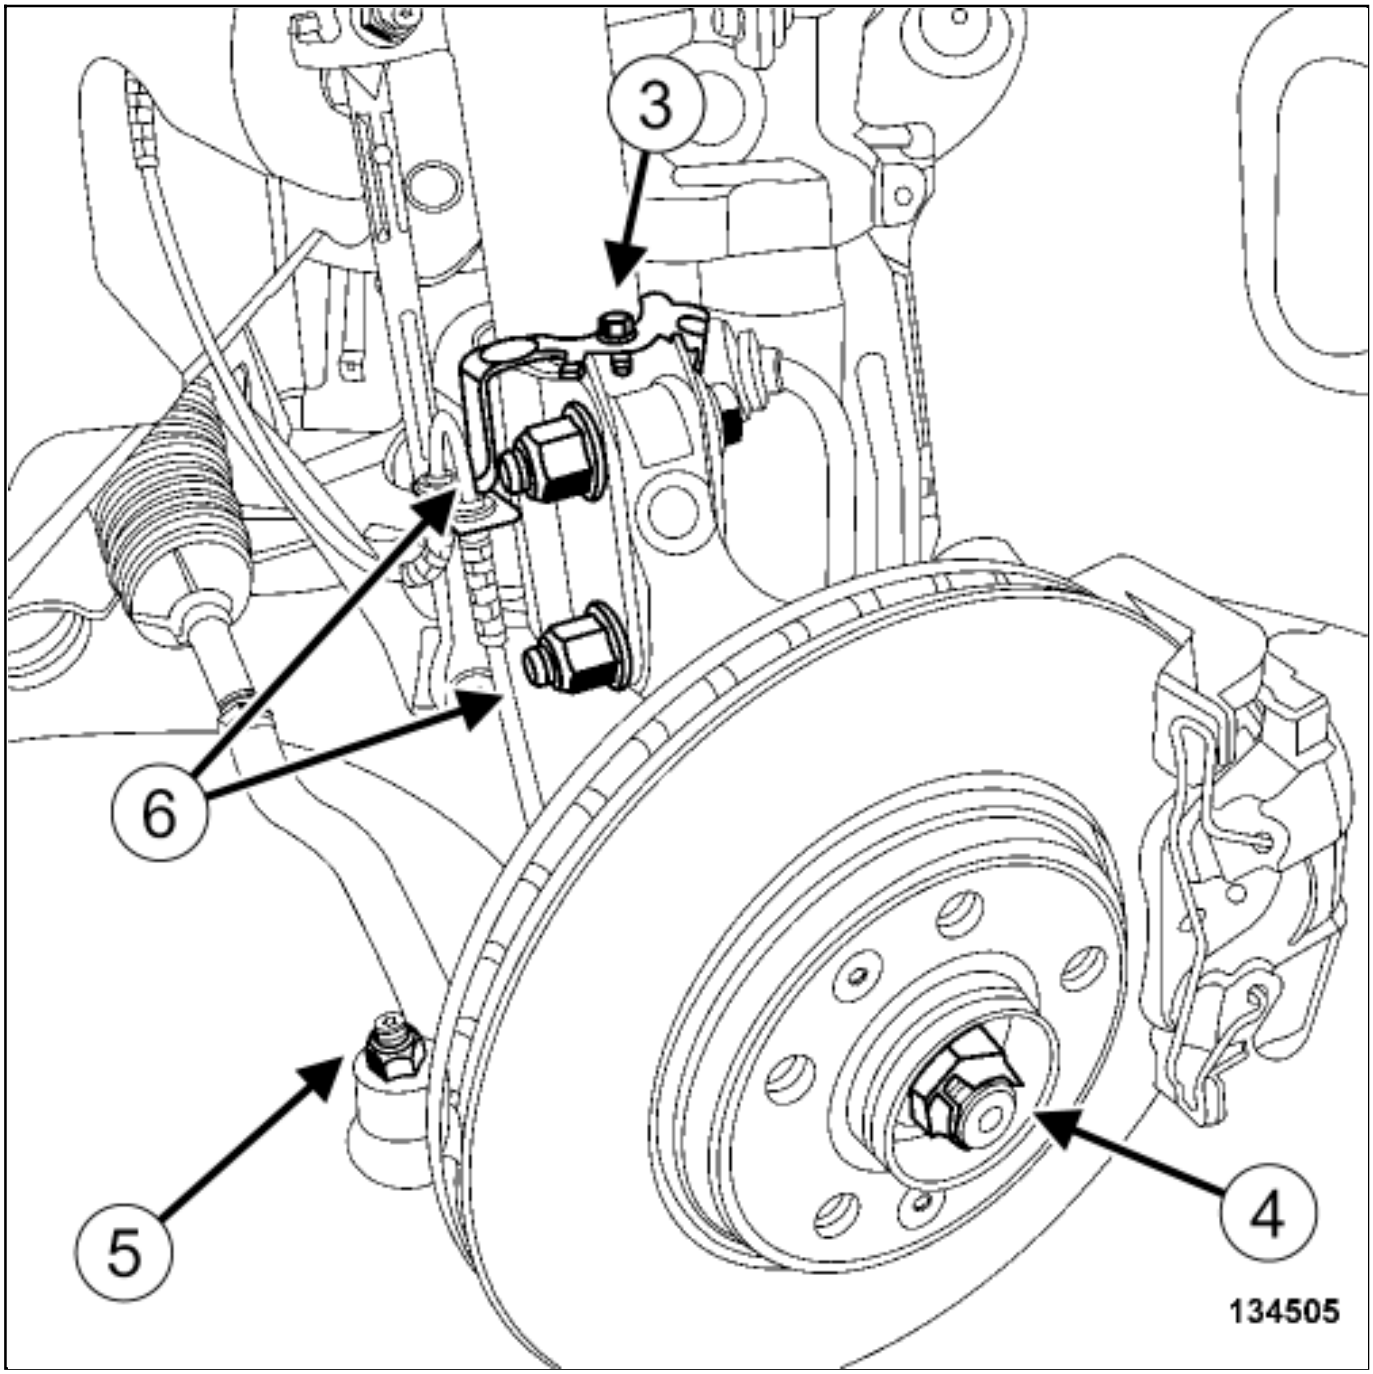
CAUTION



- In order to prevent irreversible damage to the front hub bearing:
  - Do not loosen or tighten the driveshaft nut when the wheels are on the ground.
  - Do not place the vehicle with its wheels on the ground when the driveshaft has been loosened or removed.

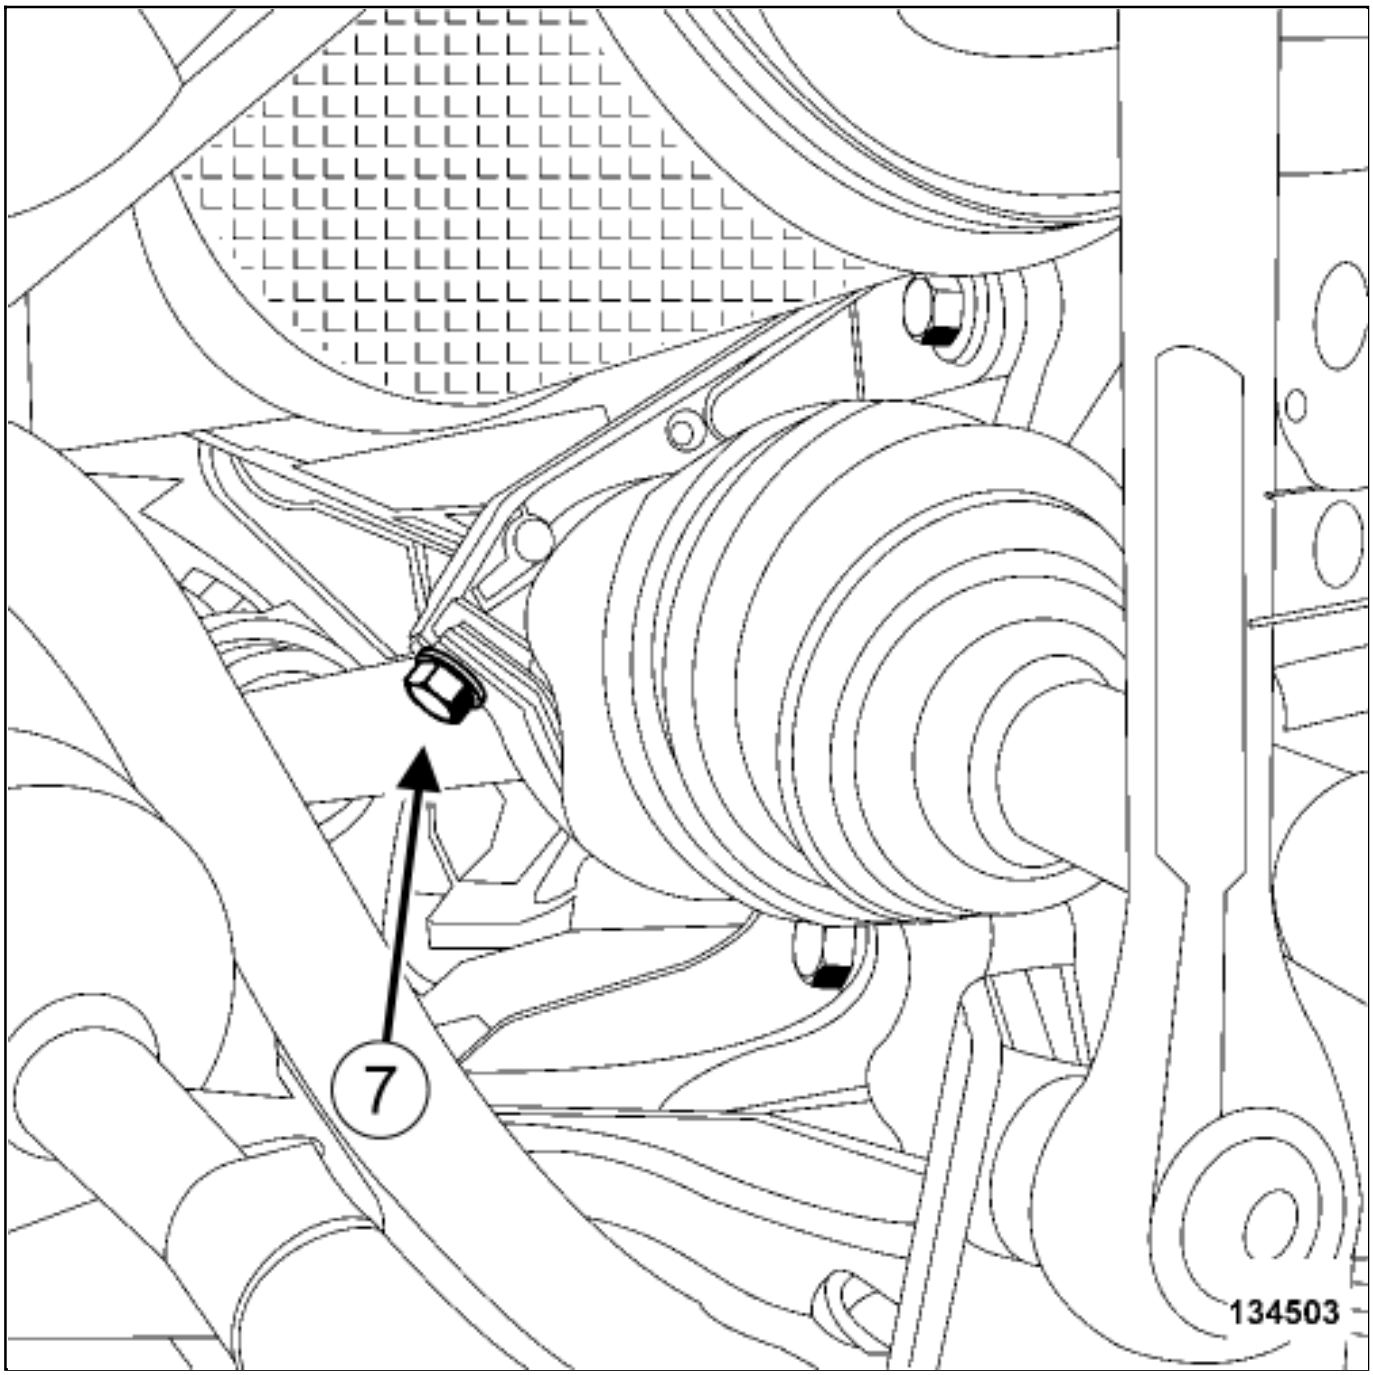
REMOVAL

1. REMOVAL PREPARATION OPERATION



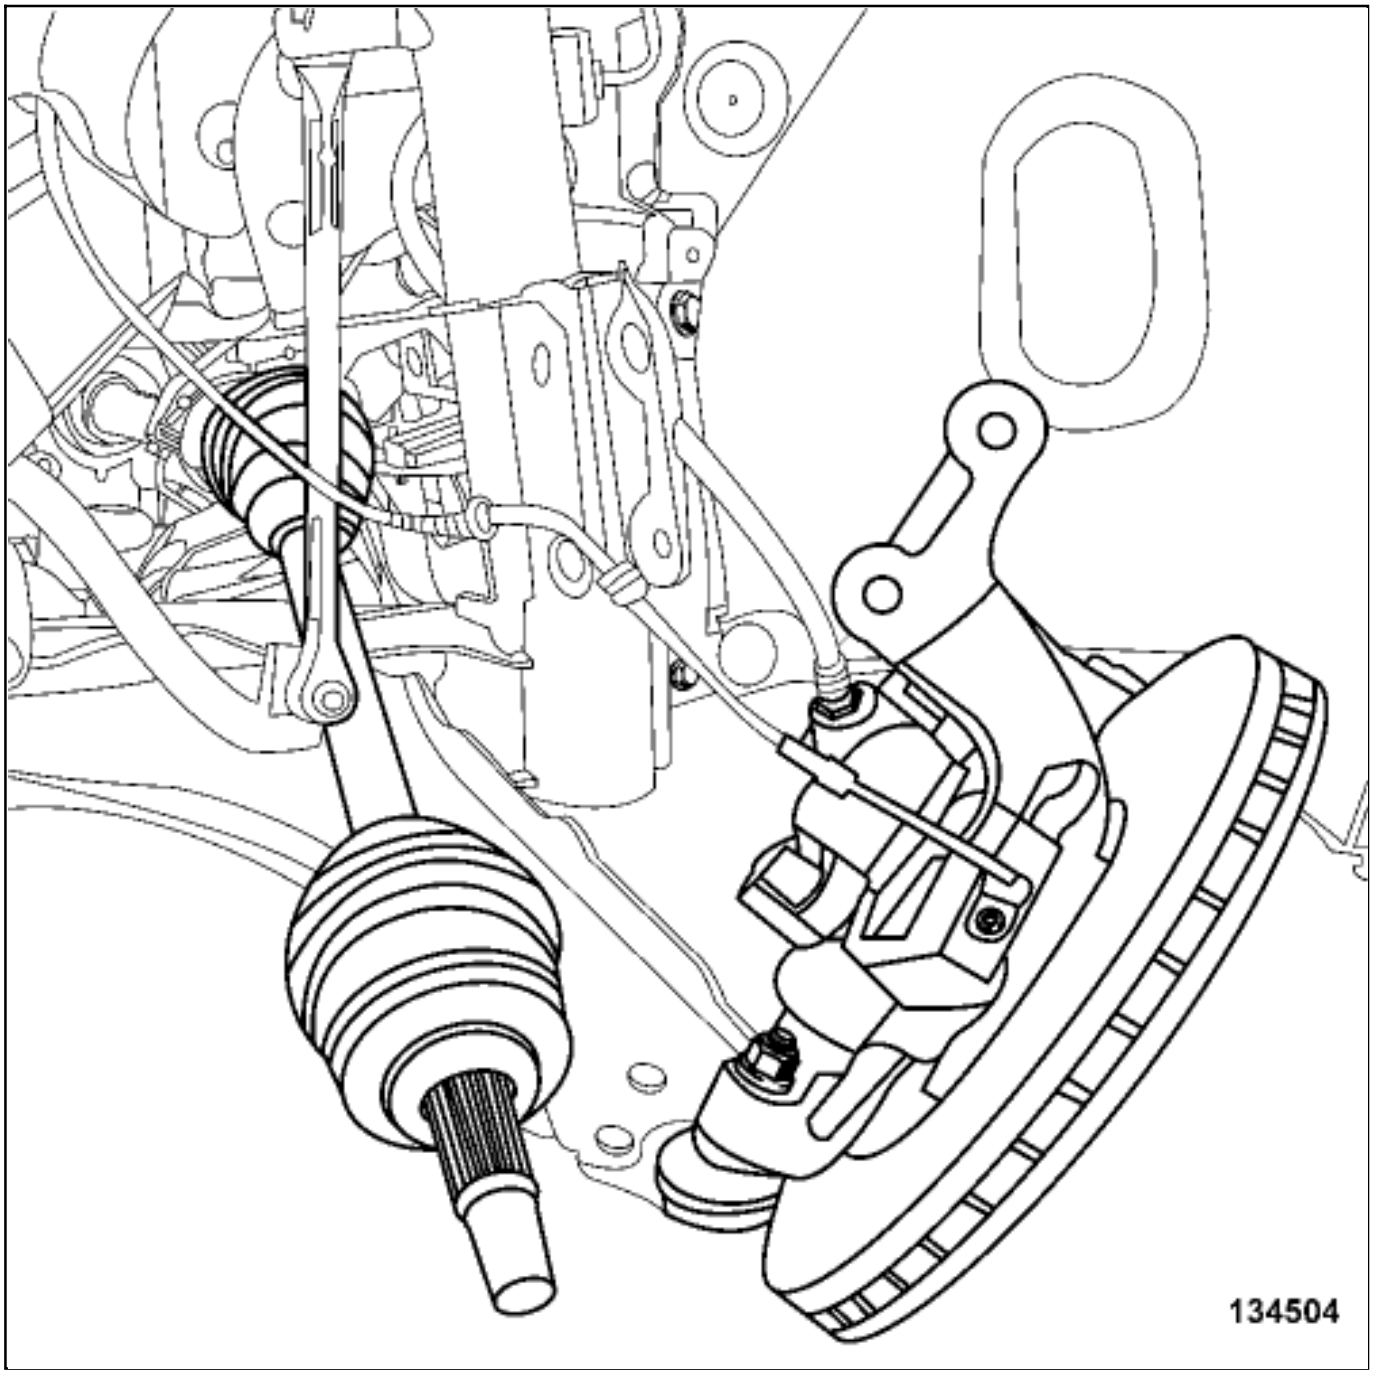
- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Remove:
  - the engine undertray,
  - the front right-hand wheel Front hub carrier assembly: Exploded view .
- Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

2. REMOVAL OPERATION



Unclip:

- the wheel speed sensor wiring at(1) ,
- the front brake hose at(2) .



Remove:

- the bolt(3) of the brake hose and wheel speed sensor wiring support,
- the brake hose and wheel speed sensor wiring support,
- the nut(4) from the hub, immobilising the hub using theHub locking tool.(Rou. 604-01) ,
- the nut(5) from the track rod end,
- the track rod end from the hub carrier using the toolBall joint extractor.(Tav. 476) ,
- the shock absorber base studs(6) .

Remove the driveshaft relay bearing bolt(7) .

Push back the front right-hand driveshaft from the hub carrier using the assembled toolsScrew jack for tools Tav. 1420, Tav.1050-04 , Tar. 1454, Tar. 1850.(Tav. 1420-01) and Universal driveshaft push back tool (plate and claws without ram).(Tav. 1050-04) .

Remove:

- the front right-hand driveshaft,

the right-hand differential output seal(see **Differential output seal: Removal - Refitting**) .

REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: Front wheel hub nut .
- parts always to be replaced: relay bearing bracket bolt .

> Note:
>
> Always replace the relay bearing self-threading bolt with a classic tapered-end bolt or a cylindrical-pilot bolt every time the right-hand driveshaft is removed (except if the entire relay bearing is replaced, in which case it is supplied with a self-threading bolt).

- Clean and grease the driveshaft relay bearing bore into which the bearing is inserted with BR2+ grease Vehicle: Parts and consumables for the repair .

2. REFITTING OPERATION

- Refit a new right-hand differential output seal(see **Differential output seal: Removal - Refitting**) .

> Note:
>
> During removal, if there is threadlockon the universal joint splines and the universal joint nut. When refitting, apply threadlockto the universal joint splines and the universal joint nut.

Fit the front right-hand driveshaft into the gearbox as horizontally as possible.

Refit:

- the front right-hand driveshaft into the relay bearing,
- a new relay bearing bolt.

Torque tighten the relay bearing bolt21 N.m.

Insert the front right-hand driveshaft into the hub carrier.

Note:

The driveshaft must fit freely in the hub carrier until it protrudes enough for the hub nut to be fitted.

Refit the shock absorber base bolts.

Torque tighten the shock absorber base boltsFront axle assembly: Exploded view .

Position the track rod.

Torque tighten the track rod end nutSteering assembly: Exploded view .

Refit a new hub nut.

Torque tighten the hub nut, while immobilising the hub using toolHub locking tool.(Rou. 604-01) Front hub carrier assembly: Exploded view .

Refit:

- the brake hose and wheel speed sensor wiring support,
- the bolt of the brake hose and wheel speed sensor wiring support.

Torque tighten the wheel speed sensor wiring support bolt[Front axle assembly: Exploded view] .

Clip:

- the wheel speed sensor wiring,
- the brake hose.

3. FINAL OPERATION

Proceed in the reverse order to removal.

FRONT SEAT ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Airbag and pretensioners: Precautions for the repair ,
- Vehicle: Precautions for the repair .

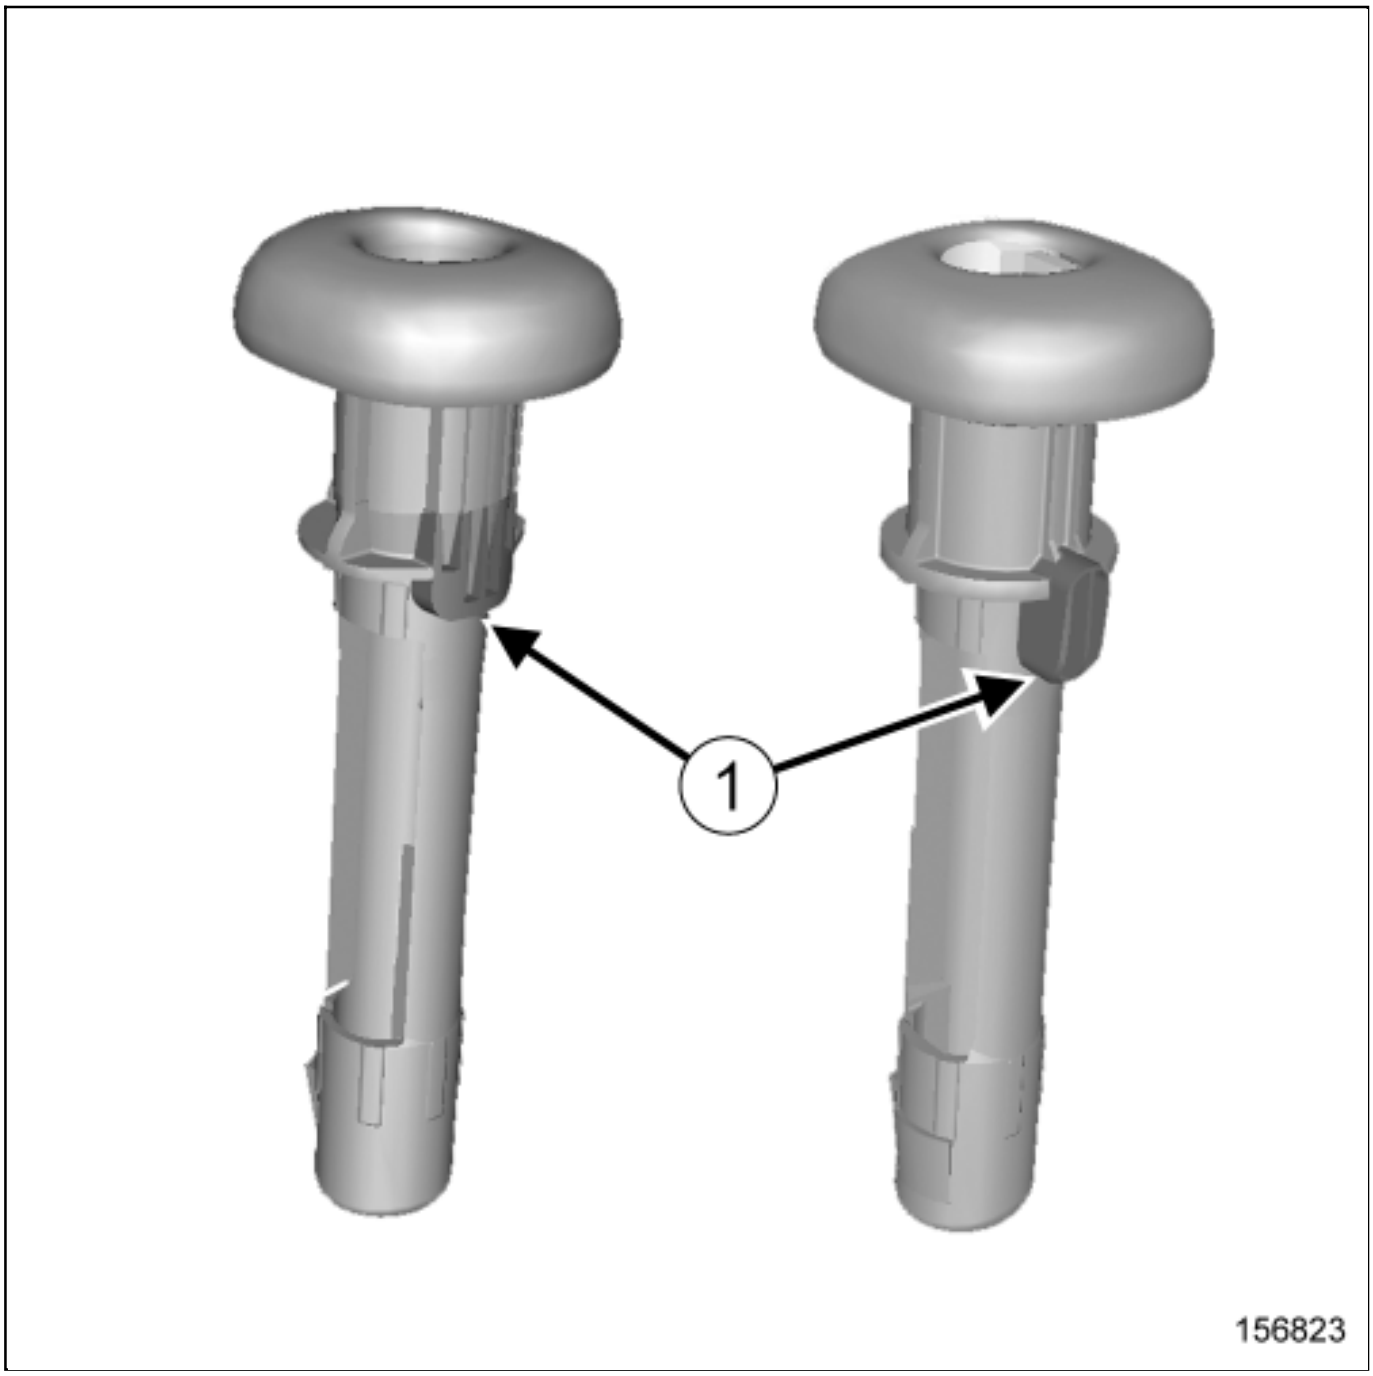
FRONT SEAT HEADREST GUIDE: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Disconnect the battery Battery: Removal - Refitting .
- Remove Front seat assembly: Exploded view :
  - the front seat headrest,
  - the front seatback cover partially.

2. REMOVAL OPERATION

- Remove the front seat headrest guides Front seat assembly: Exploded view .

REFITTING

1. REFITTING OPERATION

Refit the headrest guides fully into the front seatback frame.

Note:

To prevent the headrest guides from being mixed up, each headrest guide has a specific indexing device(1) .

Check that the headrest guides are secure in the front seatback frame.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Carry out a function test.

WARNING

To prevent the headrest coming away from the guide during a collision, check that headrest guide locking system is functioning correctly.

FRONT SEAT RUNNER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

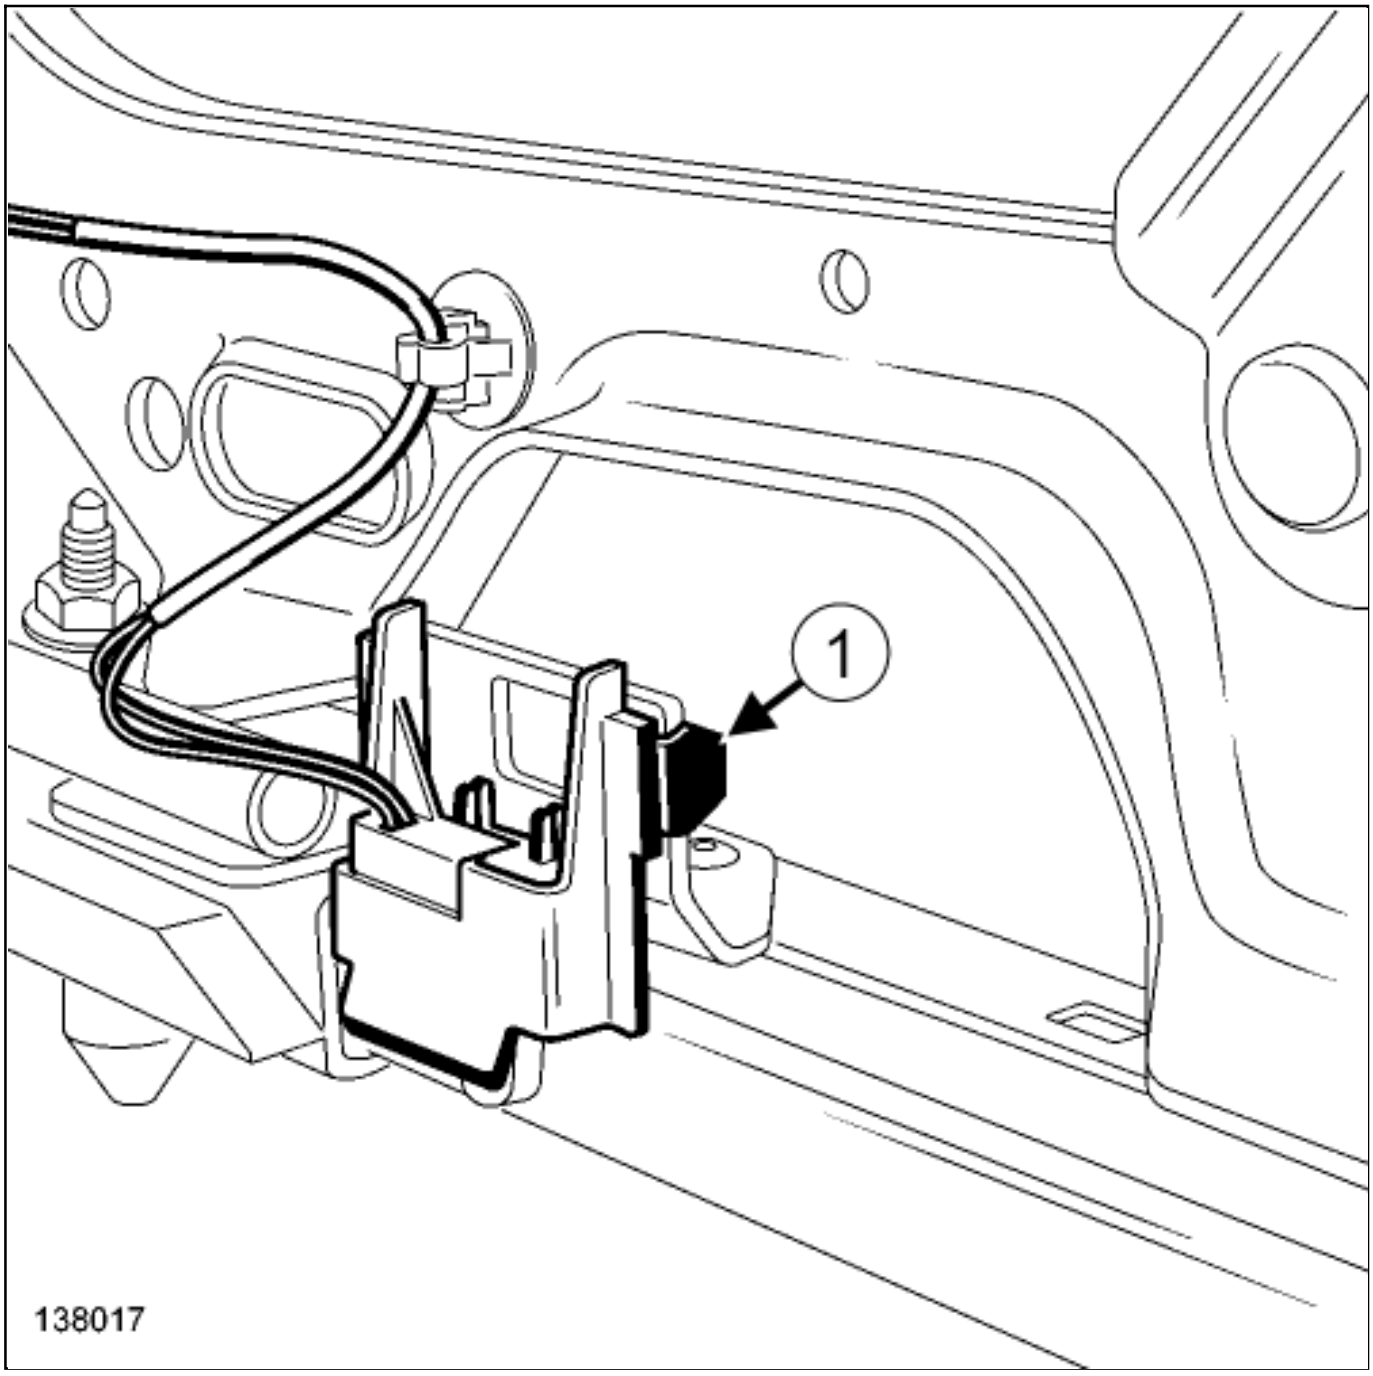
Front seat runner mounting on front seat frame

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

Location and specifications (tightening torques, parts always to be replaced, etc.) (see 75A, Front seat frames and mechanisms, Front seat assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

Disconnect the battery (see **Battery: Removal - Refitting**) .

Remove:

- the front seat headrest (see **Front headrest: Removal - Refitting**) ,
- the front seat (see **Complete front seat: Removal - Refitting**) ,
- the front seat base casings (see **Front seat lower casing: Removal - Refitting**) .

2. OPERATION FOR REMOVAL OF PART CONCERNED

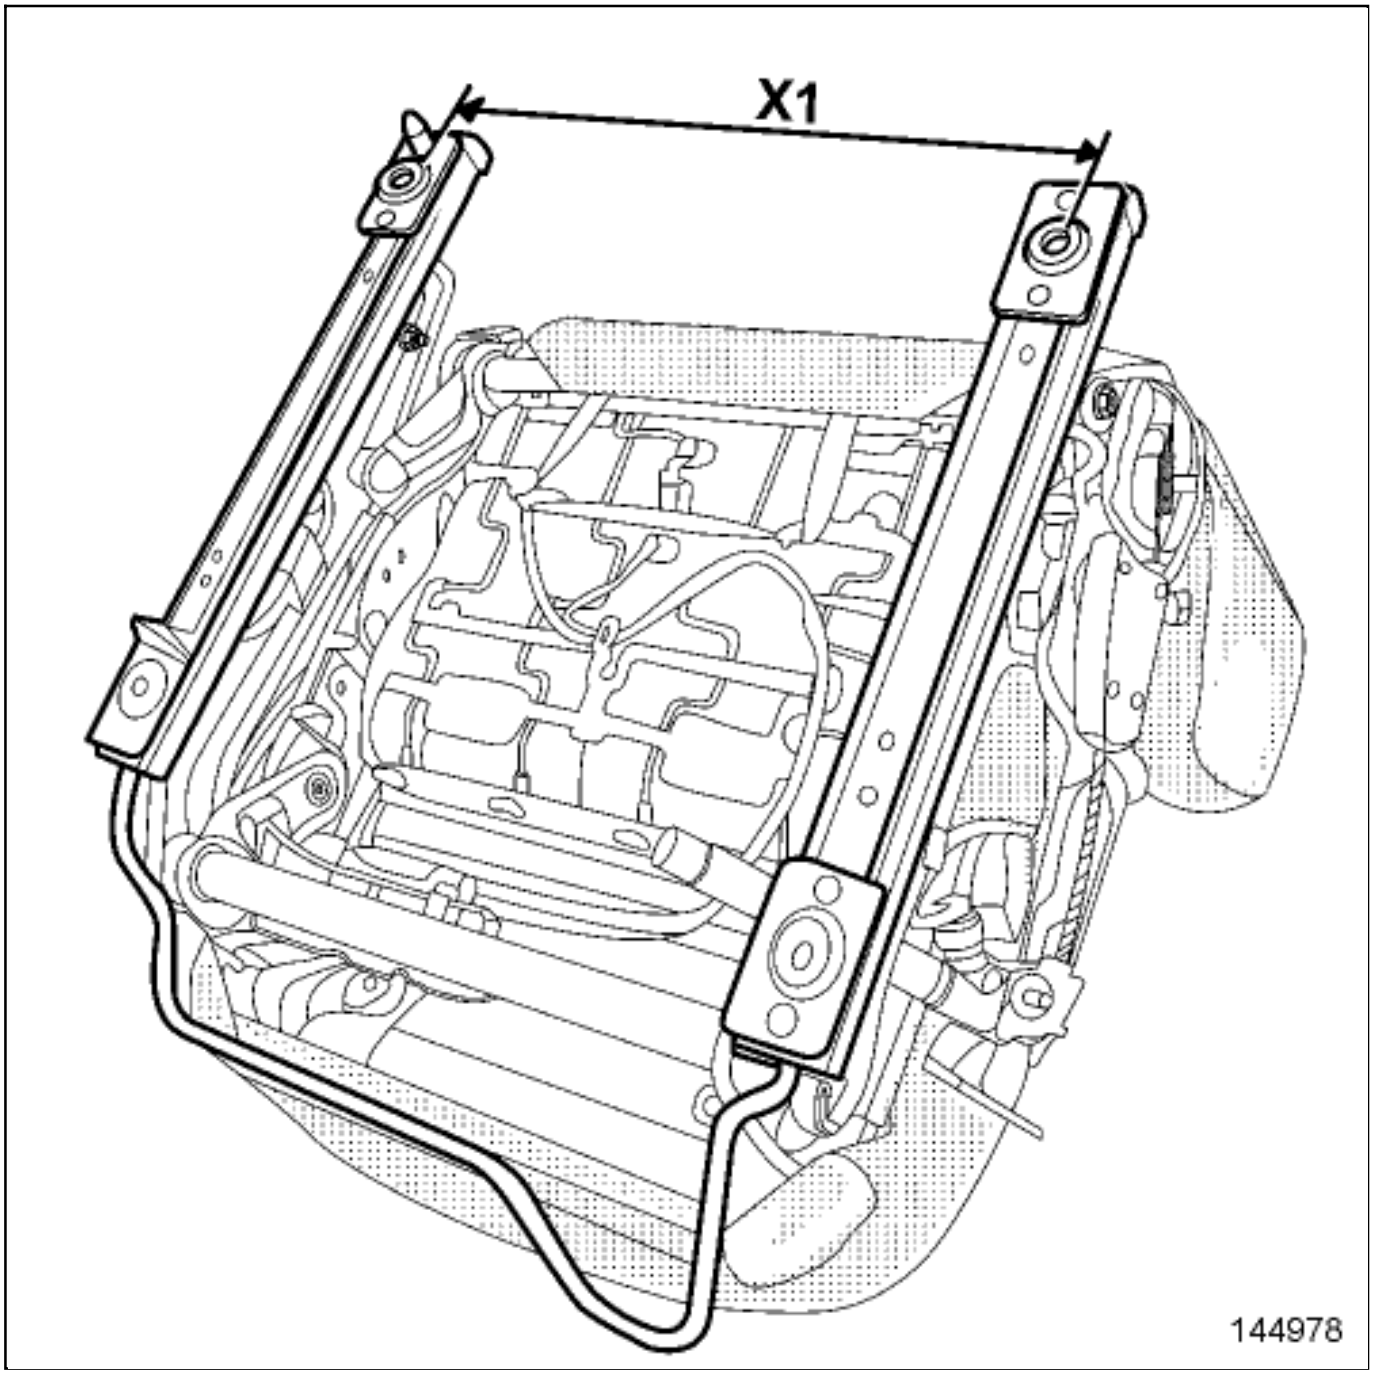
Unclip the front seat runner switch at(1) .

Remove (see 75A, Front seat frames and mechanisms, Front seat assembly: Exploded view) :

- the nuts from the front "seat base - runner" frame,

the front seat runners.

REFITTING



1. REFITTING PREPARATION OPERATION

parts always to be replaced: **Front seat runner mounting on front seat frame** .

2. REFITTING OPERATION FOR PART CONCERNED

Refit the front seat runners.

Finger tighten all the attachments.

Position the runners to ensure a centre-to-centre distance of X1 = 418 mmbetween the two front and rear mountings.

Torque tighten the new nuts of the front seat "base - runner" frame(see 75A, Front seat frames and mechanisms , Front seat assembly: Exploded view) .

3. FINAL OPERATION

Clip on the front seat runner switch.

Refit:

- the front seat base casings(see **Front seat lower casing: Removal - Refitting**) ,
- the front seat(see **Complete front seat: Removal - Refitting**) ,
- the front seat headrest(see **Front headrest: Removal - Refitting**) .

Connect the battery(see **Battery: Removal - Refitting**) .

Carry out a function test.

FRONT SECTION OF THE VEHICLE: SEALING CHECK

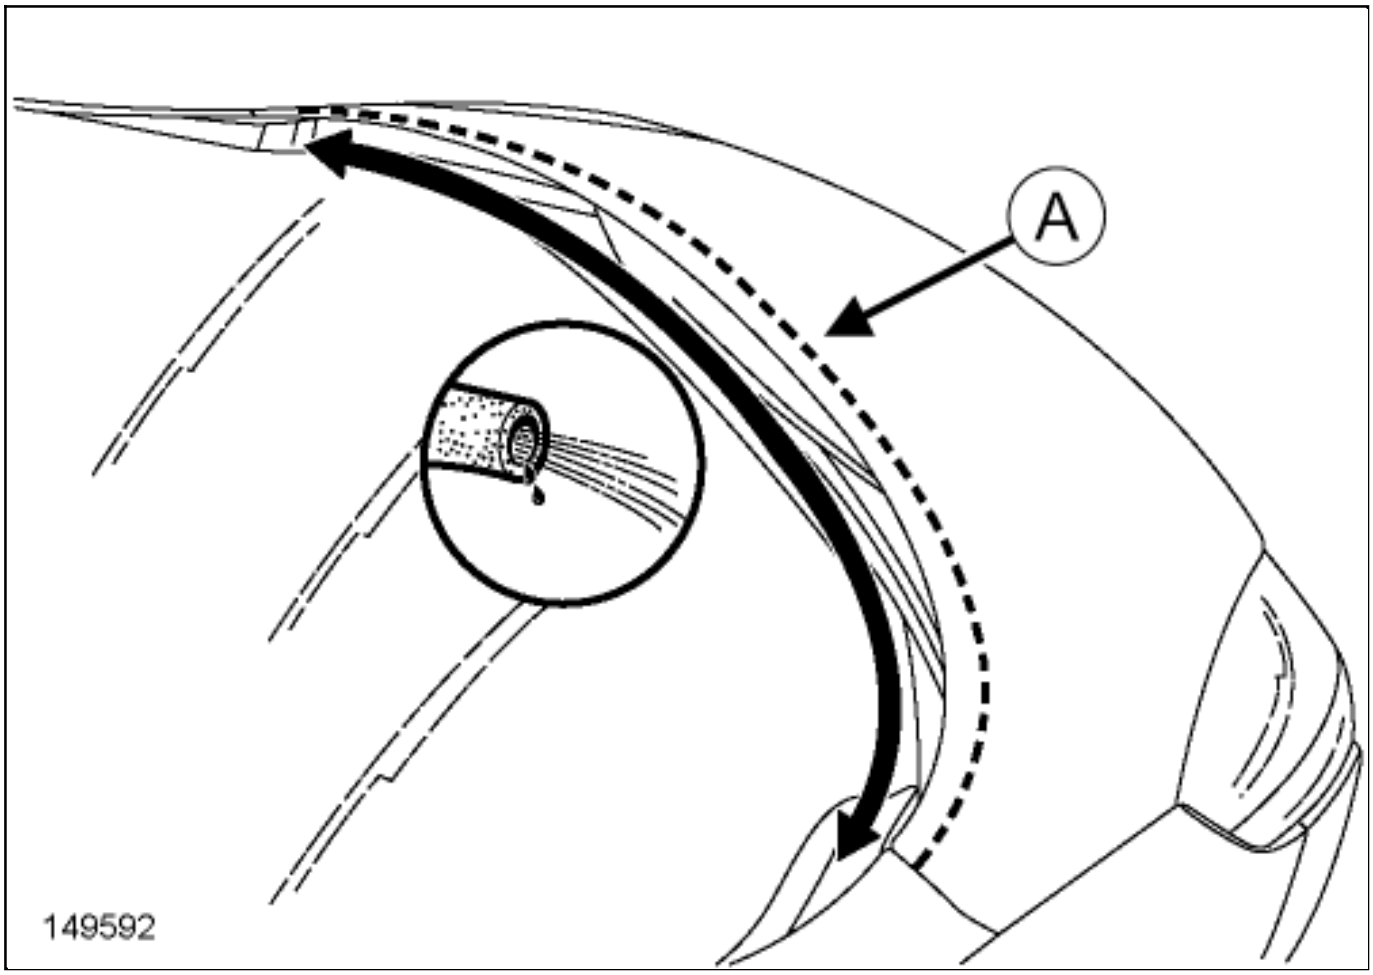
Note:

Before any operation, check the water outlets. If necessary, clean any residues which have accumulated (example: dead leaves, twigs, etc.) and check that the water flows out correctly.

Note:

The list of joint areas dealt with here is general. Additional areas may exist depending on the layout of each vehicle (see MR for the vehicle concerned).

1. PREPARATION OPERATION FOR CHECKING THE SEALING

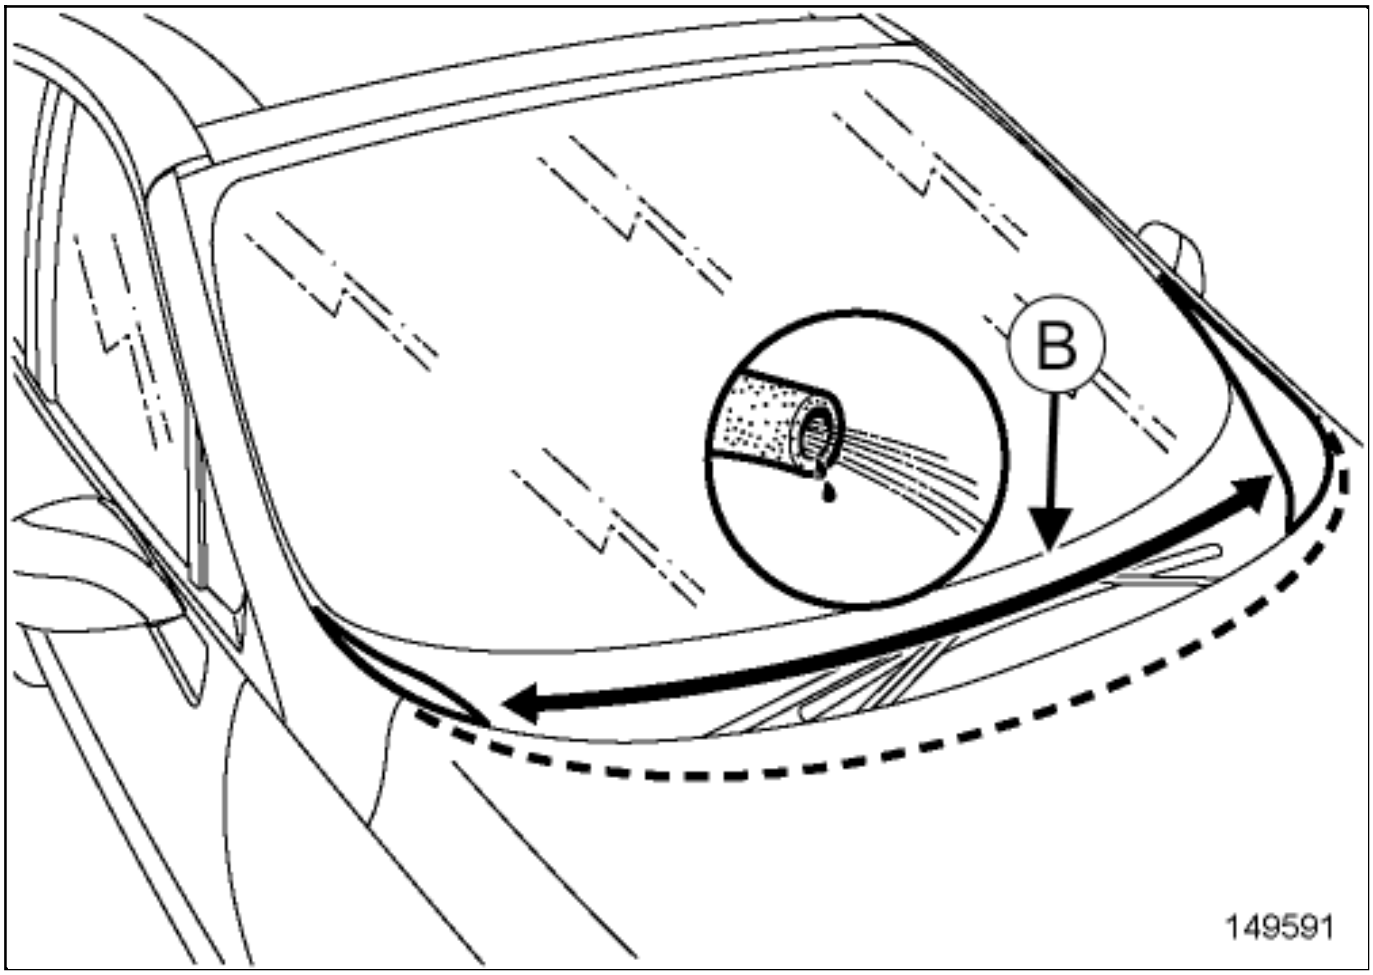


1- CONDITIONS TO RESPECT BEFORE CHECKING THE SEALING

- Position the vehicle on a level washing area(see 60A, General information, Vehicle sealing: General information) .
- Check that all the opening elements are closed(see 60A, General information, Vehicle sealing: General information) .
- Prepare the equipment to perform the operation(see 60A, General information, Sealing tools: Use) ,(see 60A, General information, Sealing tools: Description) and(see 60A, General information, Vehicle sealing: General information) .
-

  Adjust the flow of the water jet(see 60A, General information, Sealing tools: Use) .

2. OPERATION FOR CHECKING THE SEALING



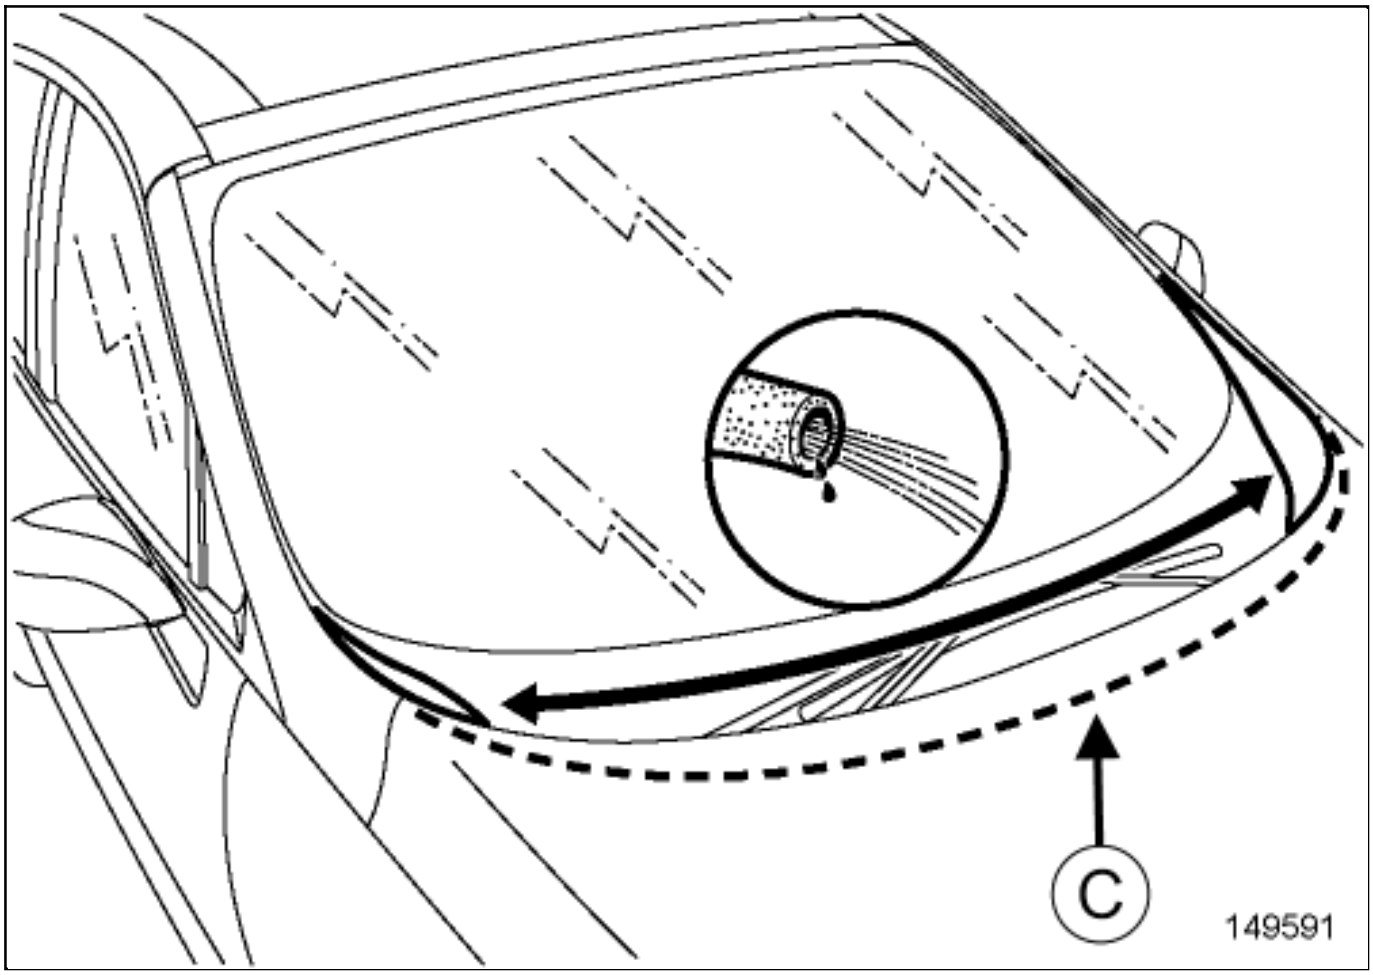
1- FRONT OPENING ELEMENT SEAL

- Spray the rear section(A) of the front opening element by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the engine compartment(see 60A, General information, Vehicle sealing: General information) .

2- SCUTTLE PANEL GRILLE AND SCOOP UNDER SCUTTLE PANEL GRILLE

Spray the upper section of the scuttle panel grille by sweeping the zone(B) from right to left.

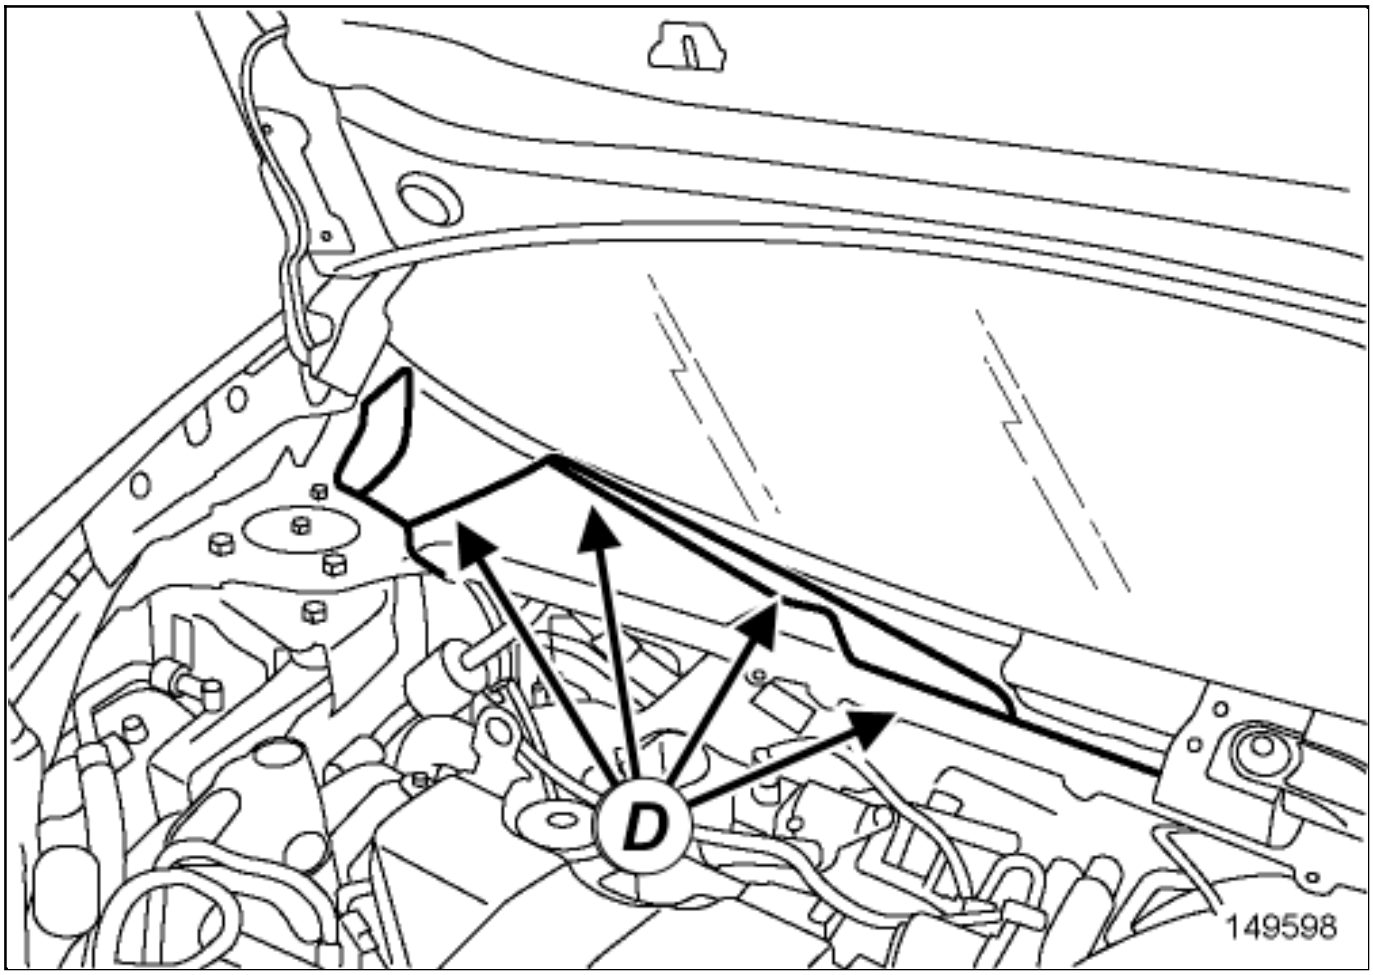


Visually inspect for the presence of water inside the engine compartment at the lower section of the scoop under the scuttle panel grille(see 60A, General information, Vehicle sealing: General information) .

Spray the mating surface of the scoop under the scuttle panel grille / bulkhead using the pressurised sprayer.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

3- SEALING THE SCUTTLE PANEL



1)FIRST METHOD: SCUTTLE PANEL GRILLE IN PLACE, BONNET CLOSED

- Spray the scuttle panel grille(C) by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

2)SECOND METHOD: SCUTTLE PANEL GRILLE REMOVED, BONNET OPEN

- Spray the mastic(D) locally using the pressurised sprayer.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

4- BULKHEAD GROMMETS AND BLANKING COVERS

- Spray around the edge of the blanking covers and grommets of the bulkhead in a circular manner using the pressurised sprayer.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

5- CHECKING THE SEALING WITH THE TRIM REMOVED

If the customer complaint could not be reproduced in accordance with the procedure, repeat the sealing check from step 1, then extend the sealing check to the surrounding zones(see 60A, General information, Vehicle sealing: General information) .

FRONT SECTION OF THE VEHICLE: SEALING REPAIR

Note:

Before repairing the sealing, check the sealing of the zone concerned(see 60A, General information, Vehicle: Sealing check) .

1. PREPARATION OPERATION FOR REPAIRING THE SEALING

1- CHECK THE POSITION AND ADJUST IF NECESSARY:

- the scuttle panel grilleScuttle panel grille: Removal - Refitting (56A, Exterior equipment),
- the scoop under the scuttle panel grilleScoop under the scuttle panel grille: Removal - Refitting (56A, Exterior equipment),
- the front side opening element seal,
- the blanking covers and grommets of the bulkhead.

Note:

If the seals are dirty, clean them in soapy water(see 60A, General information, Vehicle sealing: General information) .

2- WAS ANY ACTION PERFORMED?

- NO: move on to the next step.
- YES: check the sealing of the zone(see 60A, General information, Front section of the vehicle: Sealing check) .

☐ Was water present in the passenger compartment of the vehicle?

- YES: move on to the next step.
- NO: fault resolved.

2. SEALING REPAIR OPERATION

1- FRONT OPENING ELEMENT SEAL

Is water present in the passenger compartment after the front opening element sealing has been checked?

NO: move on to the next step.

YES:

a) if the front opening element seal is deformed, replace the front opening element seal,

b) if the front opening element seal shows signs of wear, cuts or cracks, replace the front opening element seal.

Check the sealing of the front opening element seal (see 60A, General information, Front section of the vehicle: Sealing check) .

2- SCUTTLE PANEL GRILLE AND SCOOP UNDER THE SCUTTLE PANEL GRILLE

Is water present in the passenger compartment after the sealing of the scuttle panel grille and scoop under the scuttle panel grille has been checked?

NO: move on to the next step.

YES:

a) if the scuttle panel grille is deformed, cracked or split, replace the scuttle panel grille,

b) if the clips of the scuttle panel grille are deformed or broken, replace the scuttle panel grille clips.

Check the sealing of the scuttle panel grille (see 60A, General information, Front section of the vehicle: Sealing check) .

c) if the scoop under the scuttle panel grille is deformed, cracked or split, replace the scoop under the scuttle panel grille,

d) if the sealing foam of the scoop under the scuttle panel grille is detached, cut or compressed, replace the foam of the scoop under the scuttle panel grille.

Check the sealing of the scoop under the scuttle panel grille(see 60A, General information, Front section of the vehicle: Sealing check) .

3- MASTIC FILLING OF THE BULKHEAD / SCUTTLE SIDE PANEL, BULKHEAD / BULKHEAD LOWER CROSS MEMBER, BULKHEAD / WINDSCREEN APERTURE LOWER CROSS MEMBER CLOSURE PANEL

Is water present in the passenger compartment after the sealing of the mastic filling of the bulkhead / scuttle side panel, bulkhead / lower cross member of bulkhead, bulkhead / windscreen aperture lower cross member closure panel has been checked?

NO: move on to the next step.

YES:

a) if the mastic is faulty or incorrectly positioned on the panelwork connections, apply extruded mastic to the panelwork connectionsAnti-corrosion protection products after assembly: Use (04F, Bodywork products and mountings) and (see 60A, General information, Bodywork sealing products: Description) .

Check the sealing of the mastic filling of the bulkhead / scuttle side panel, bulkhead / bulkhead lower cross member, bulkhead / windscreen aperture lower cross member closure panel(see 60A, General information, Front section of the vehicle: Sealing check) .

4- BLANKING COVERS AND GROMMETS OF THE BULKHEAD

Is water present in the passenger compartment after the sealing of the blanking covers and grommets of the bulkhead has been checked?

No: fault resolved.

Yes:

a) if the blanking covers and grommets of the bulkhead are detached, refit the blanking covers and grommets of the bulkhead.

b) if the blanking covers and grommets of the bulkhead are deformed or cracked, replace the blanking covers and grommets of the bulkhead.

■

Check the sealing of the blanking covers and grommets of the bulkhead**(see 60A, General information, Front section of the vehicle: Sealing check)** .

XSL version : 3.02 du 22/07/11

FRONT SHOCK ABSORBER AND SPRING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for removing the front shock absorber	Sus. 1925

Equipment required
spring compressor
indelible pencil

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

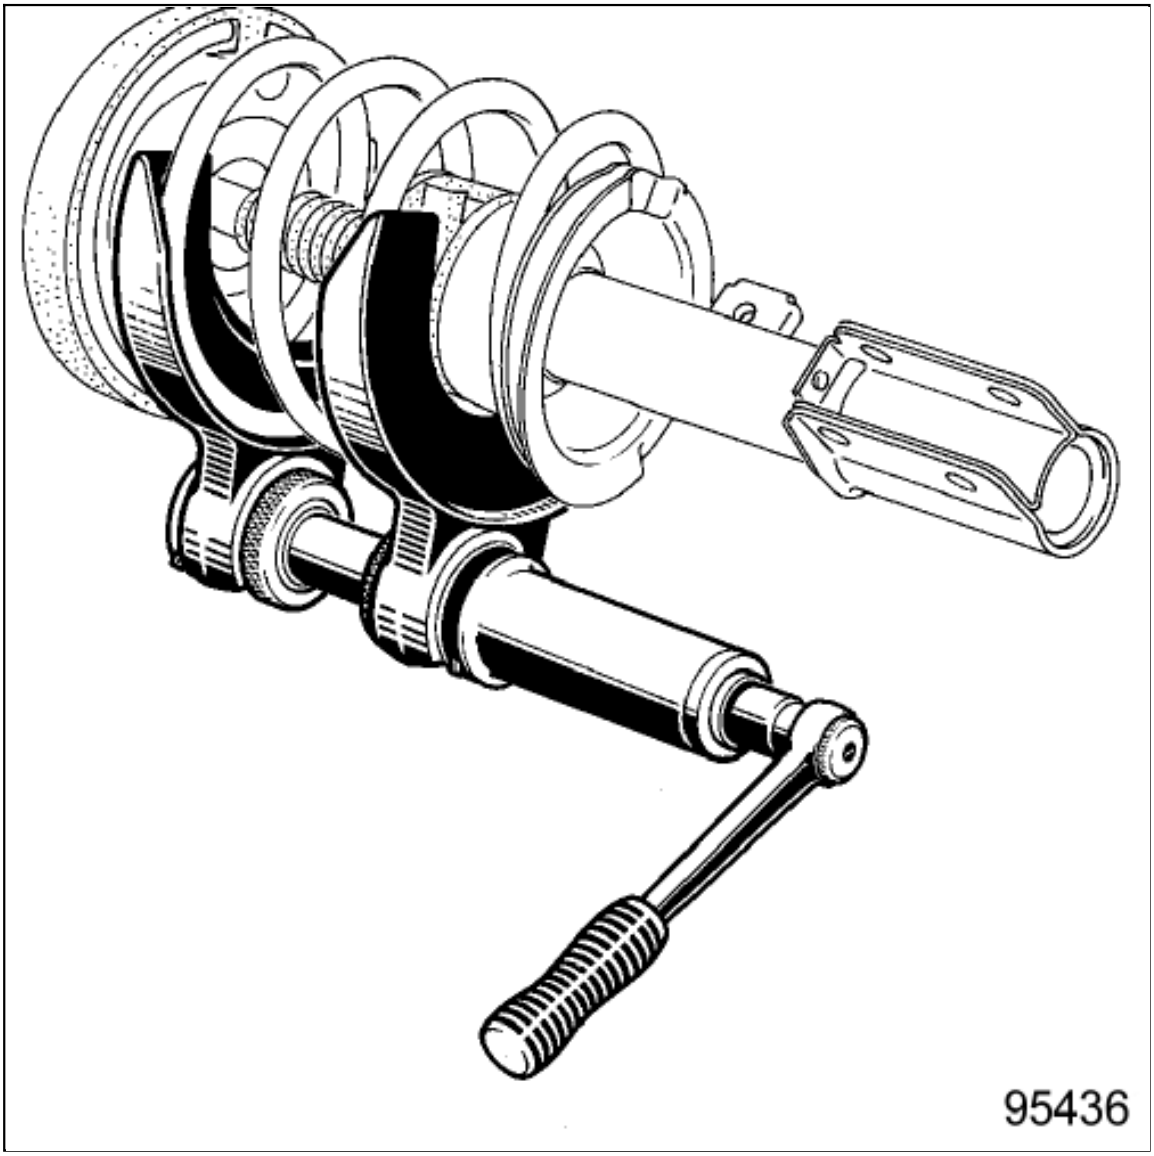
- (see 31A, Front axle components, Front axle components: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always replaced, etc.)(see 31A, Front axle components, Front axle assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .



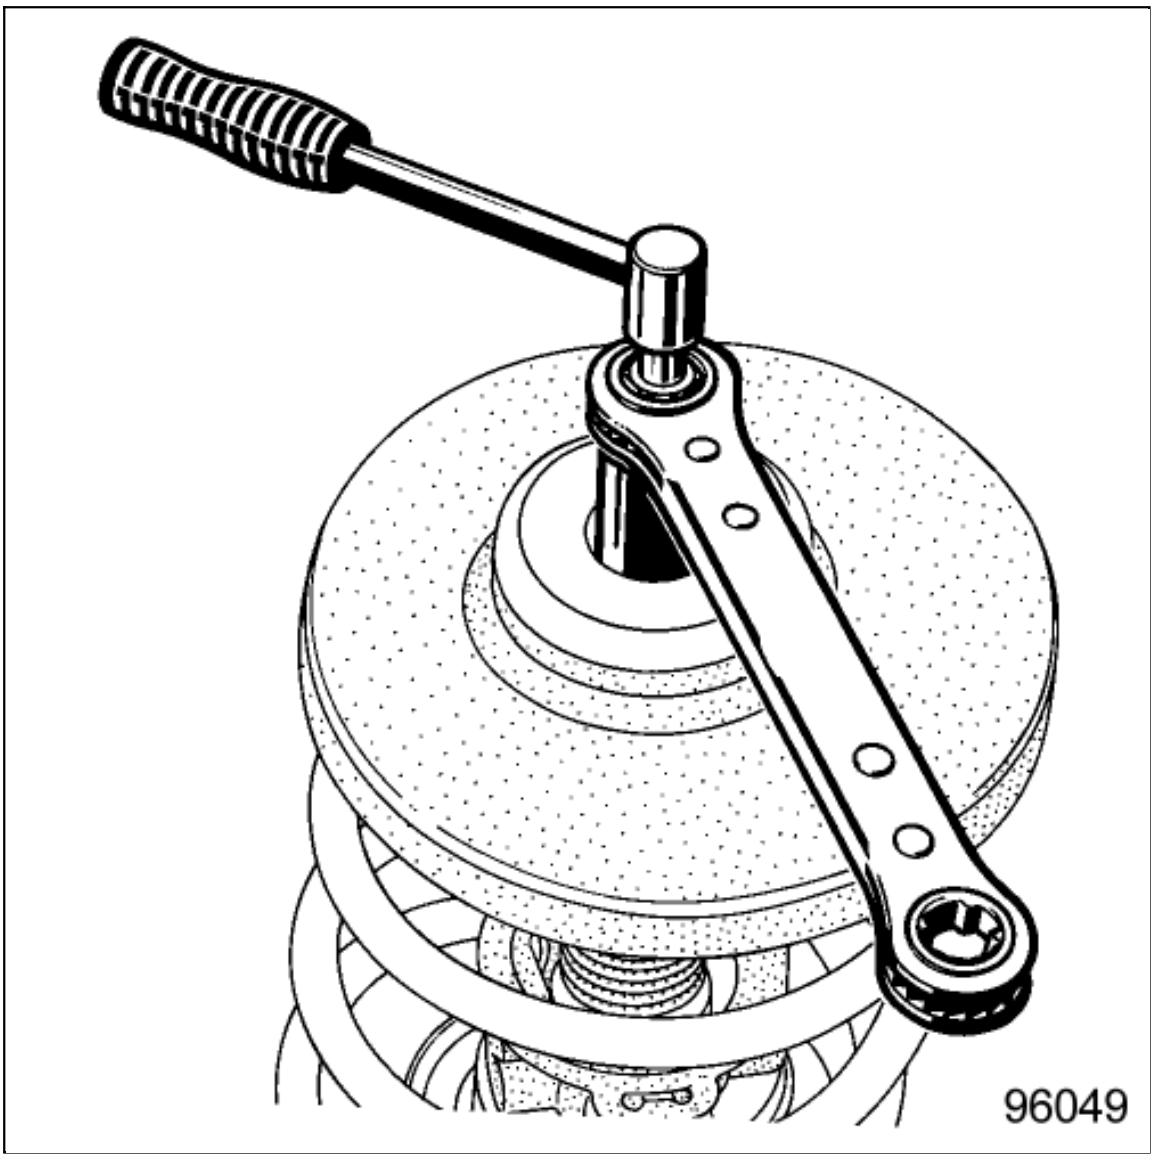
Remove:

- the windscreen wiper armsWiping and washing: List and location of components ,
- the scuttle panel grilleScuttle panel grille: Removal - Refitting ,
- the front wheel(see 31A, Front axle components, Front hub carrier assembly: Exploded view) .

2. REMOVAL OPERATION

Remove (see 31A, Front axle components, Front axle assembly: Exploded view) :

- the filter block bolts on the body,
- the "spring - shock absorber" assembly.

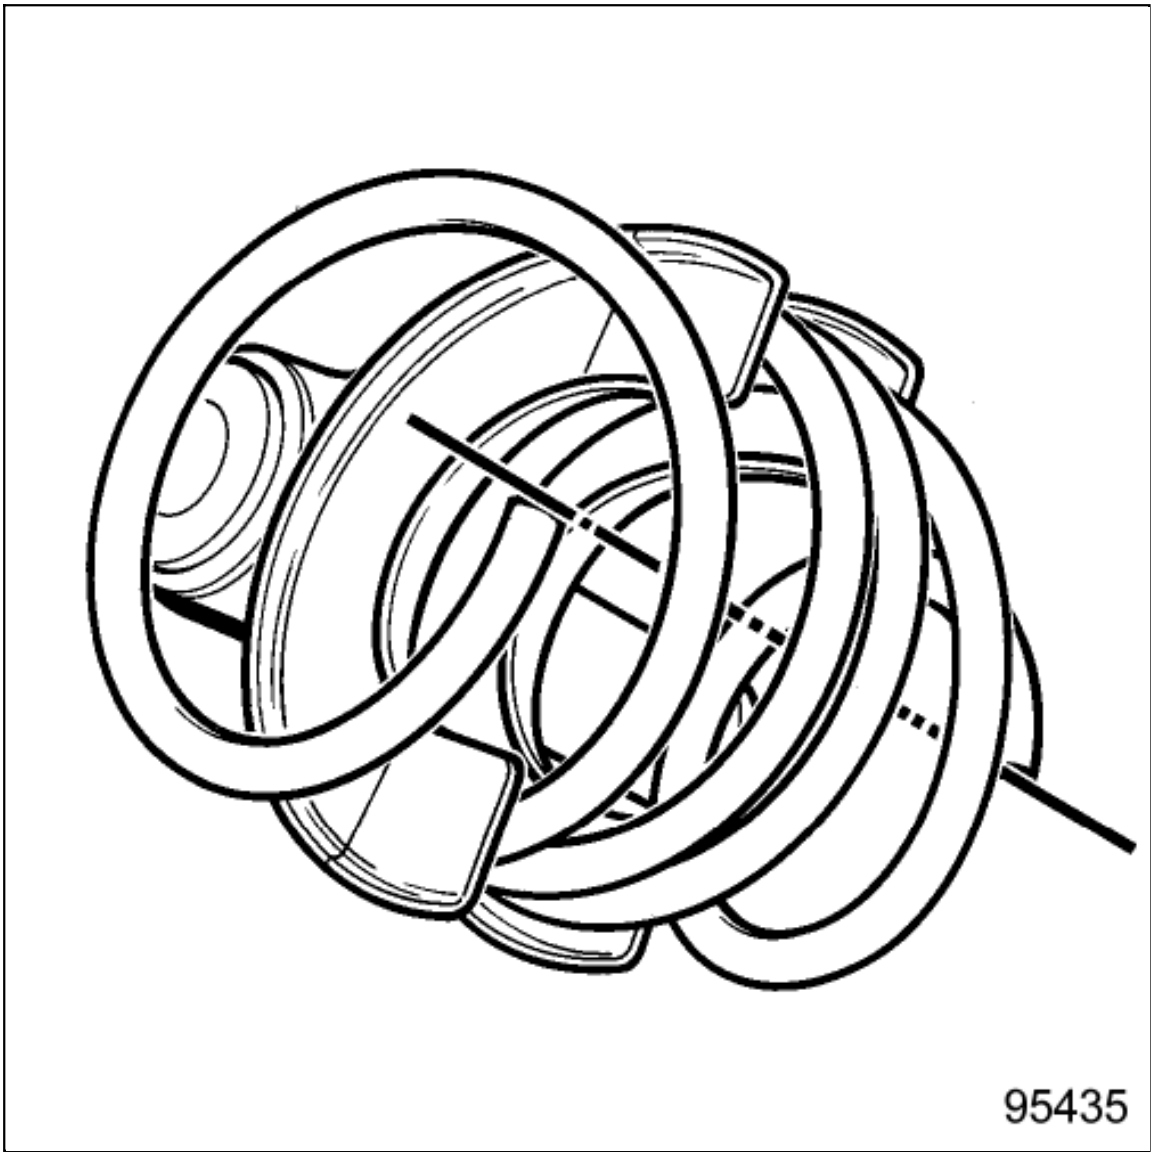


Position the appropriate cups on the spring compressor.

Position the spring compressoron the spring.

Put the "spring compressor - spring" assembly in a vice equipped with jaws.

Compress the spring using the spring compressor until the spring detaches.

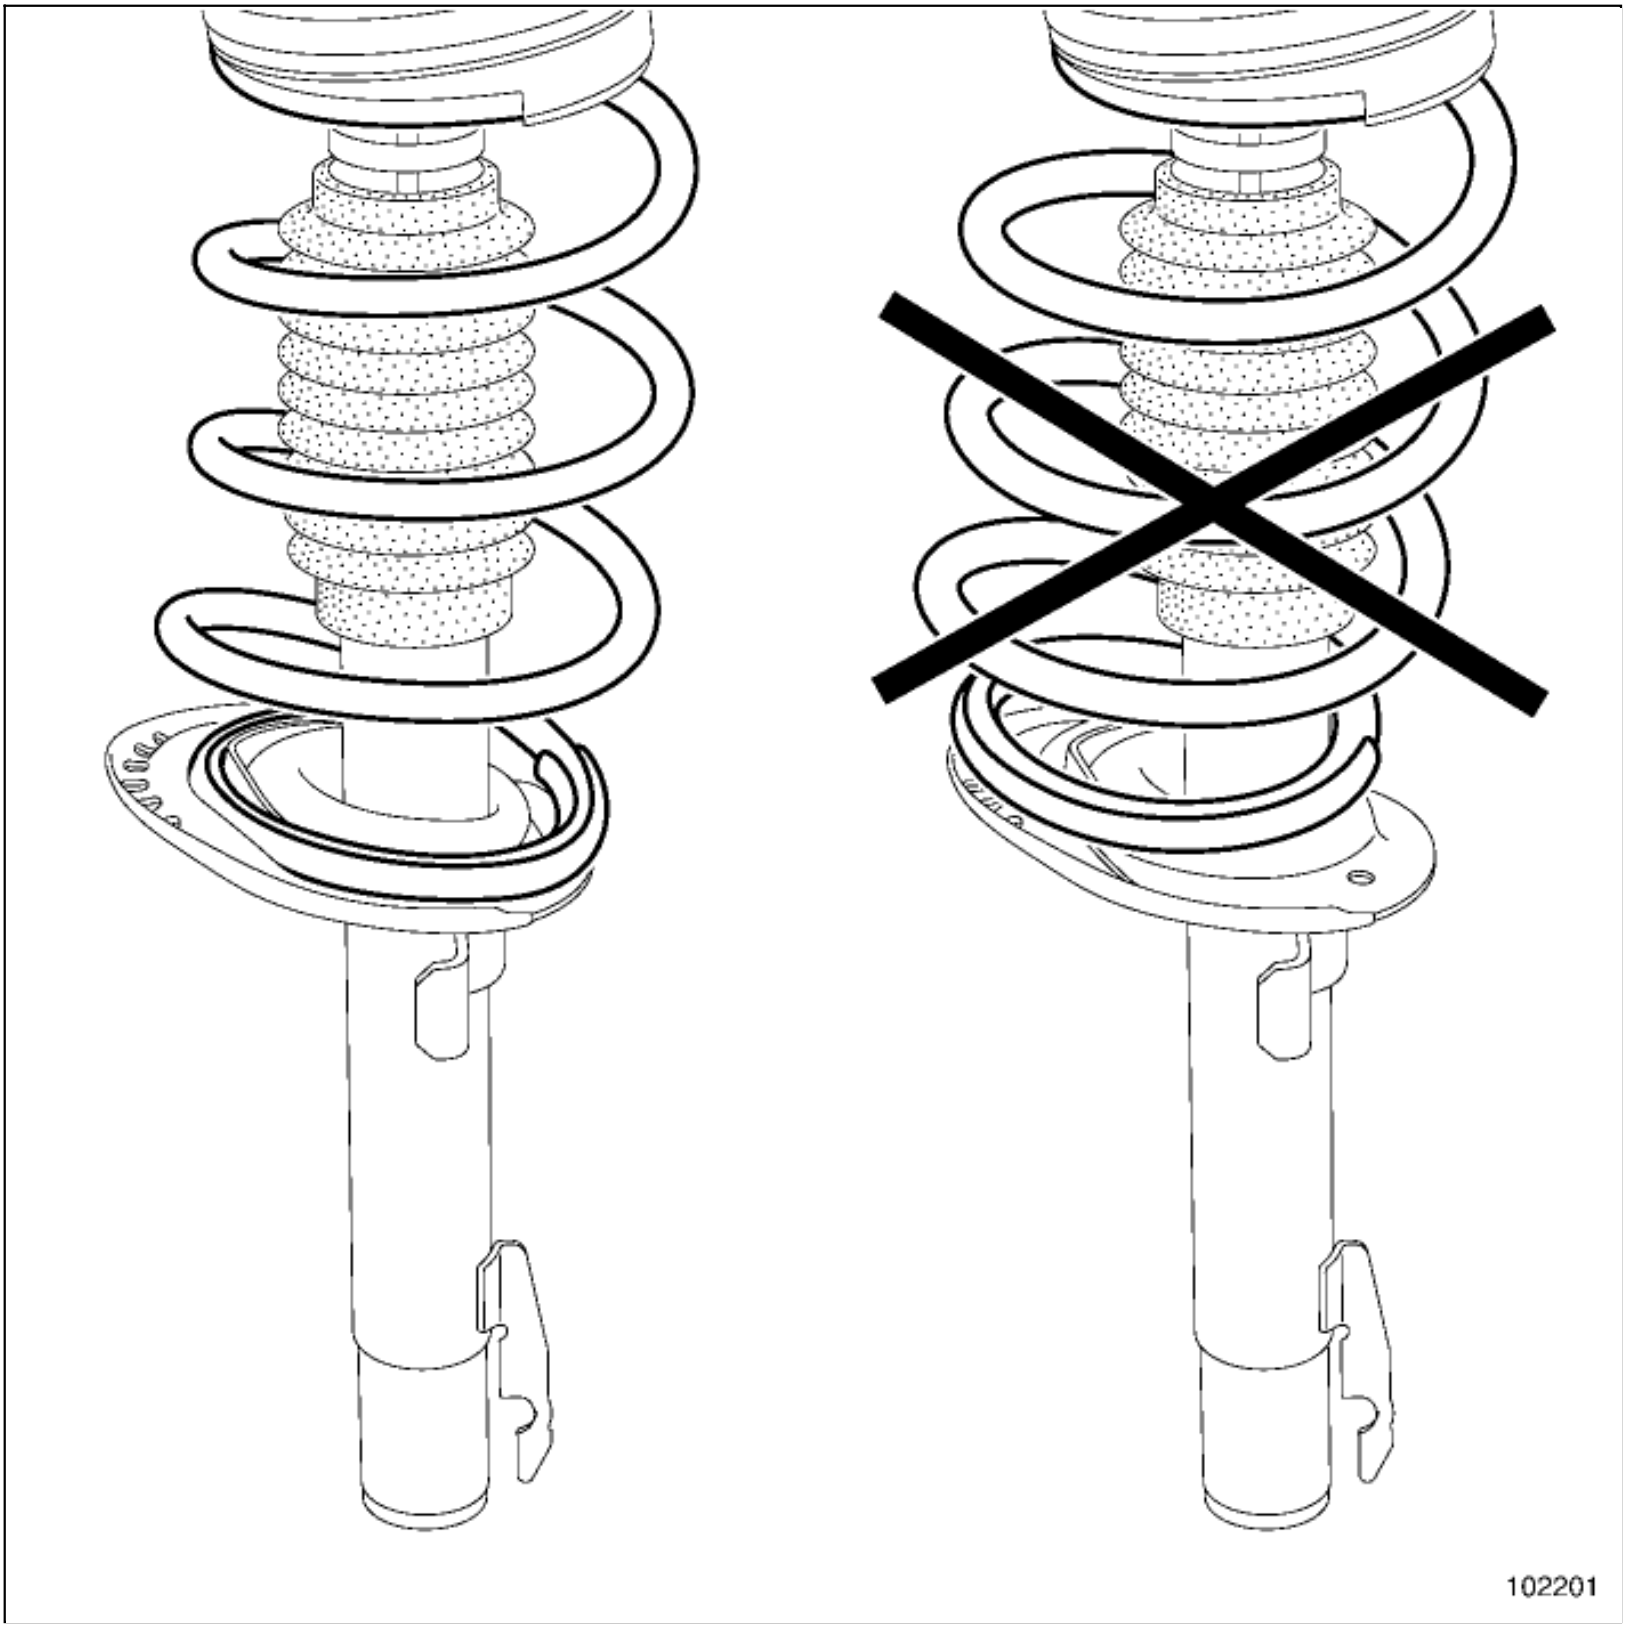


Remove the shock absorber rod nut using the spanner for shock absorber rod nut.

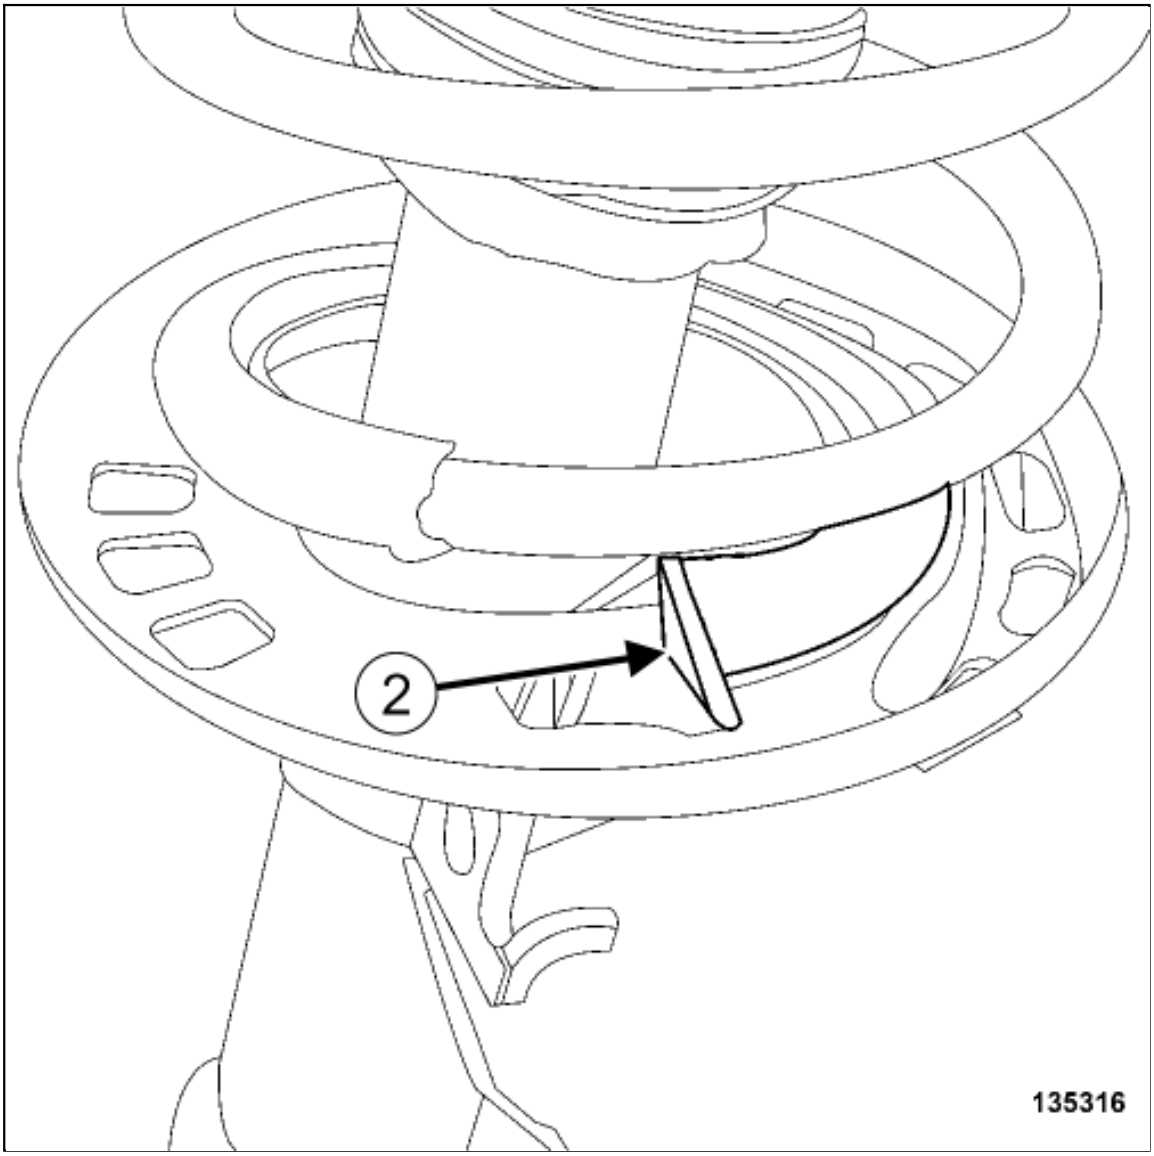
Separate the various components which make up the "spring - shock absorber" assembly.

REFITTING

1. REFITTING PREPARATION OPERATION



If necessary, replace any faulty filter unit components(see 31A, Front axle components, Front axle assembly: Exploded view) .



2. REFITTING OPERATION

Place the spring compressorin a vice equipped with jaws.

Compress the spring.

Insert the spring in the neck of the cup.

- Check that the spring is in contact against the stop(2) .
- Respect the order and direction of fitting for the constituent parts(see 31A, Front axle components, Front axle assembly: Exploded view) .
- Torque tighten the new shock absorber rod nut(see 31A, Front axle components, Front axle assembly: Exploded view) .
- Decompress the spring.
- Remove the spring compressor.

3. FINAL OPERATION

- Proceed in the reverse order to removal.
- Check the front axle geometry **Axle assemblies: Check** .
- Adjust the front axle, if necessary **Front axle system: Adjustment** .

FRONT SIDE AIR DISTRIBUTION DUCT: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Air distribution circuit assembly: Exploded view) .

REMOVAL

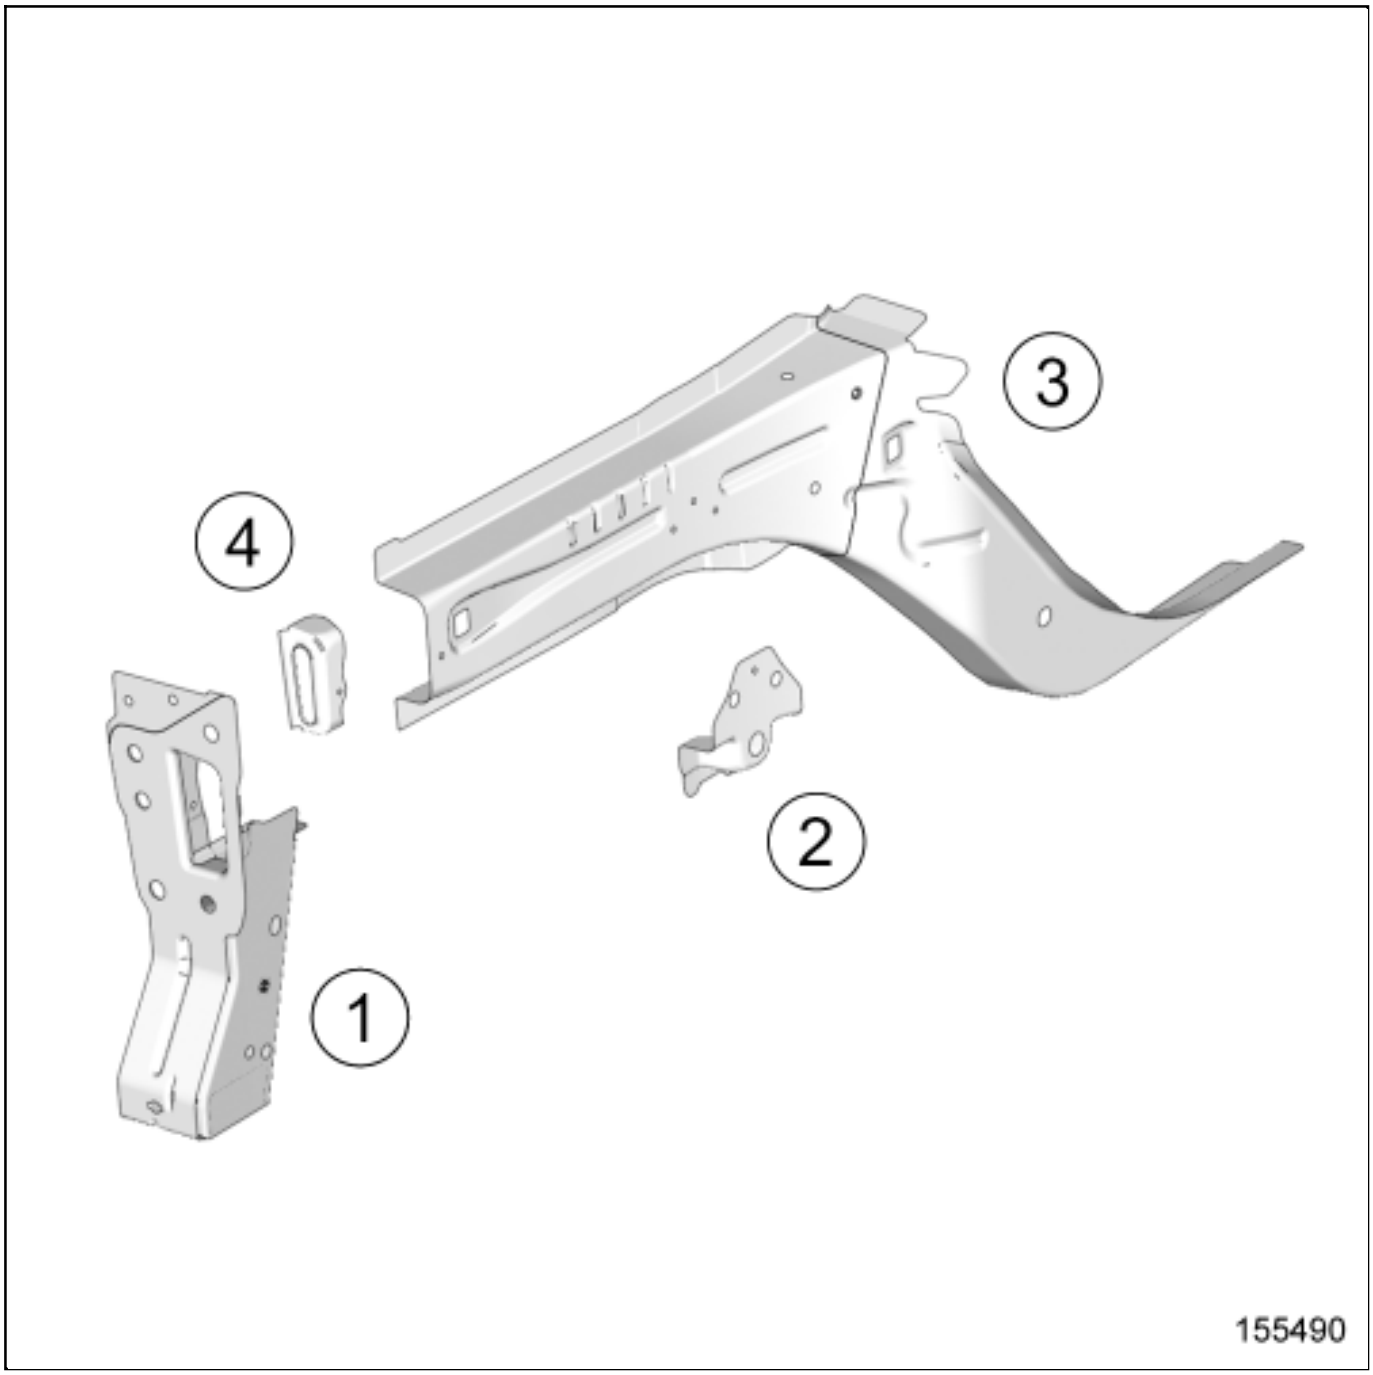
1. REMOVAL PREPARATION OPERATION

- Disconnect the batteryBattery: Removal - Refitting .
- Remove the dashboardDashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Unclip the front side air distribution ducts(see 61A, Heating, Air distribution circuit assembly: Exploded view) .
- Remove the front side air distribution ducts(see 61A, Heating, Air distribution circuit assembly: Exploded view) .

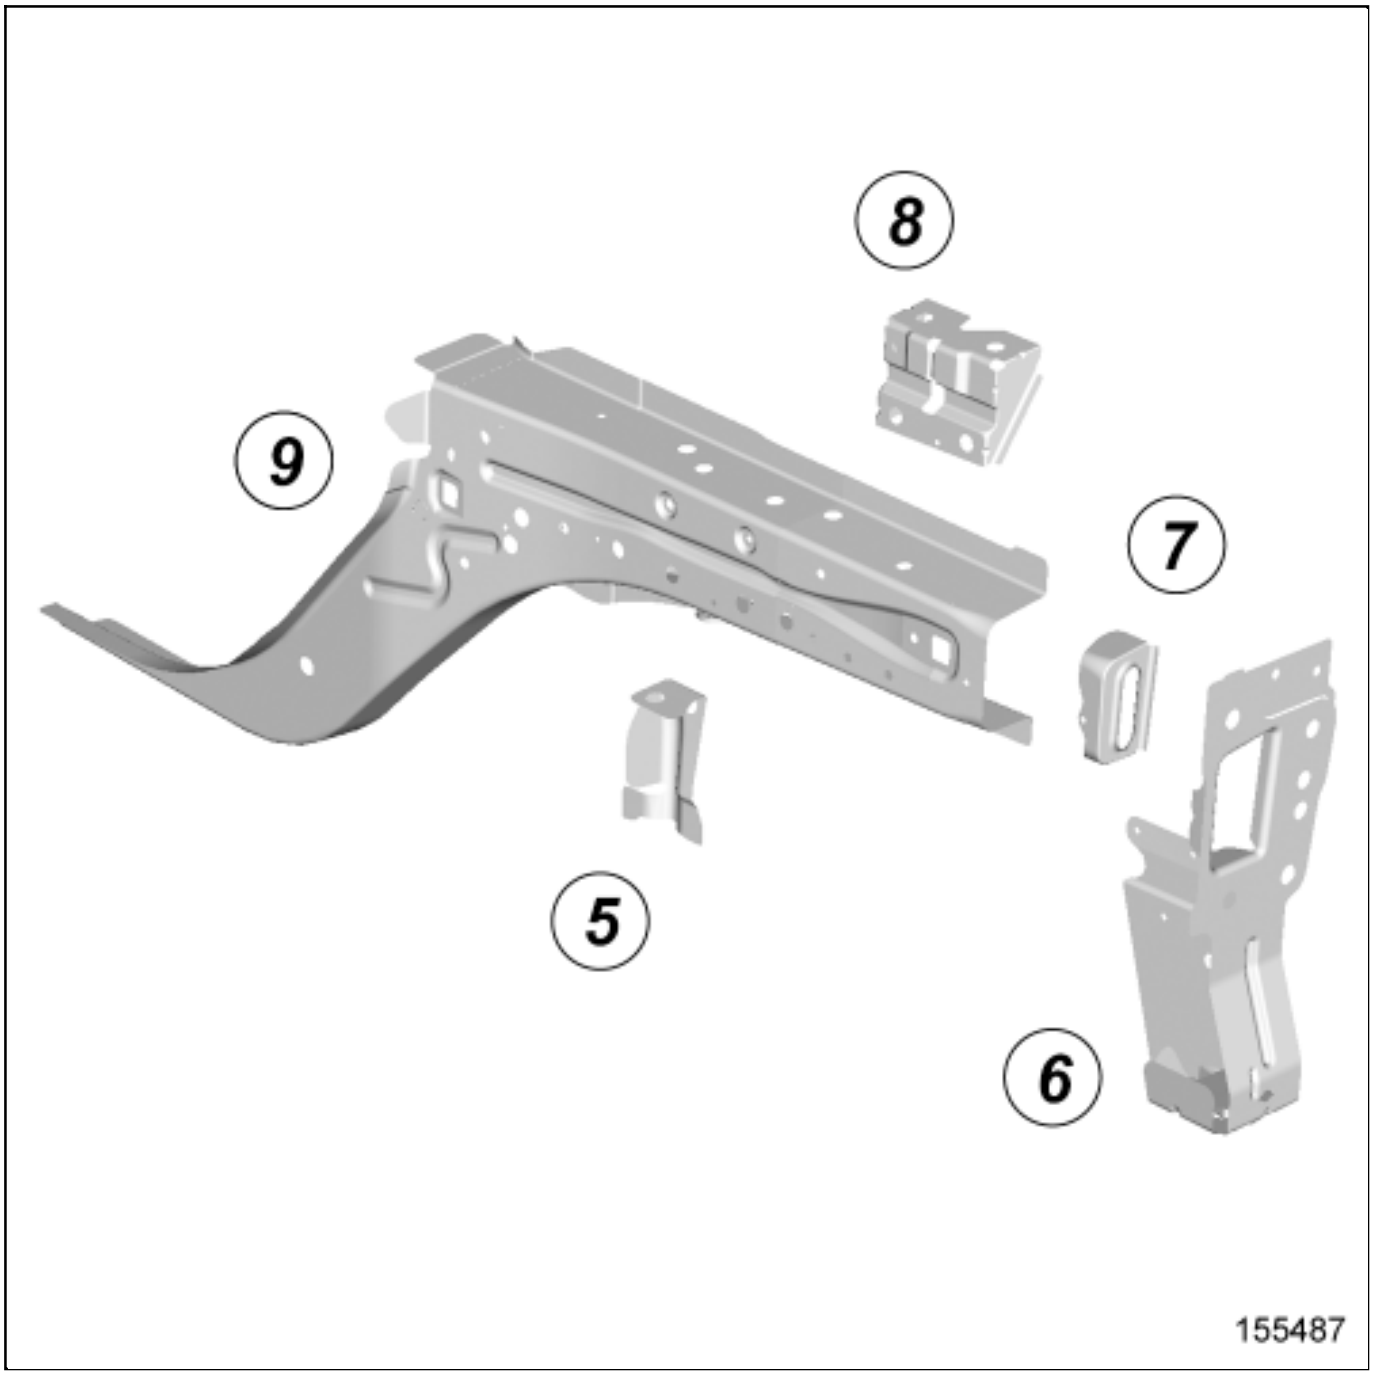
REFITTING



- Proceed in the reverse order to removal.

FRONTSIDEMEMBER:REPLACEMENT

Note, one or more warnings are present in this procedure

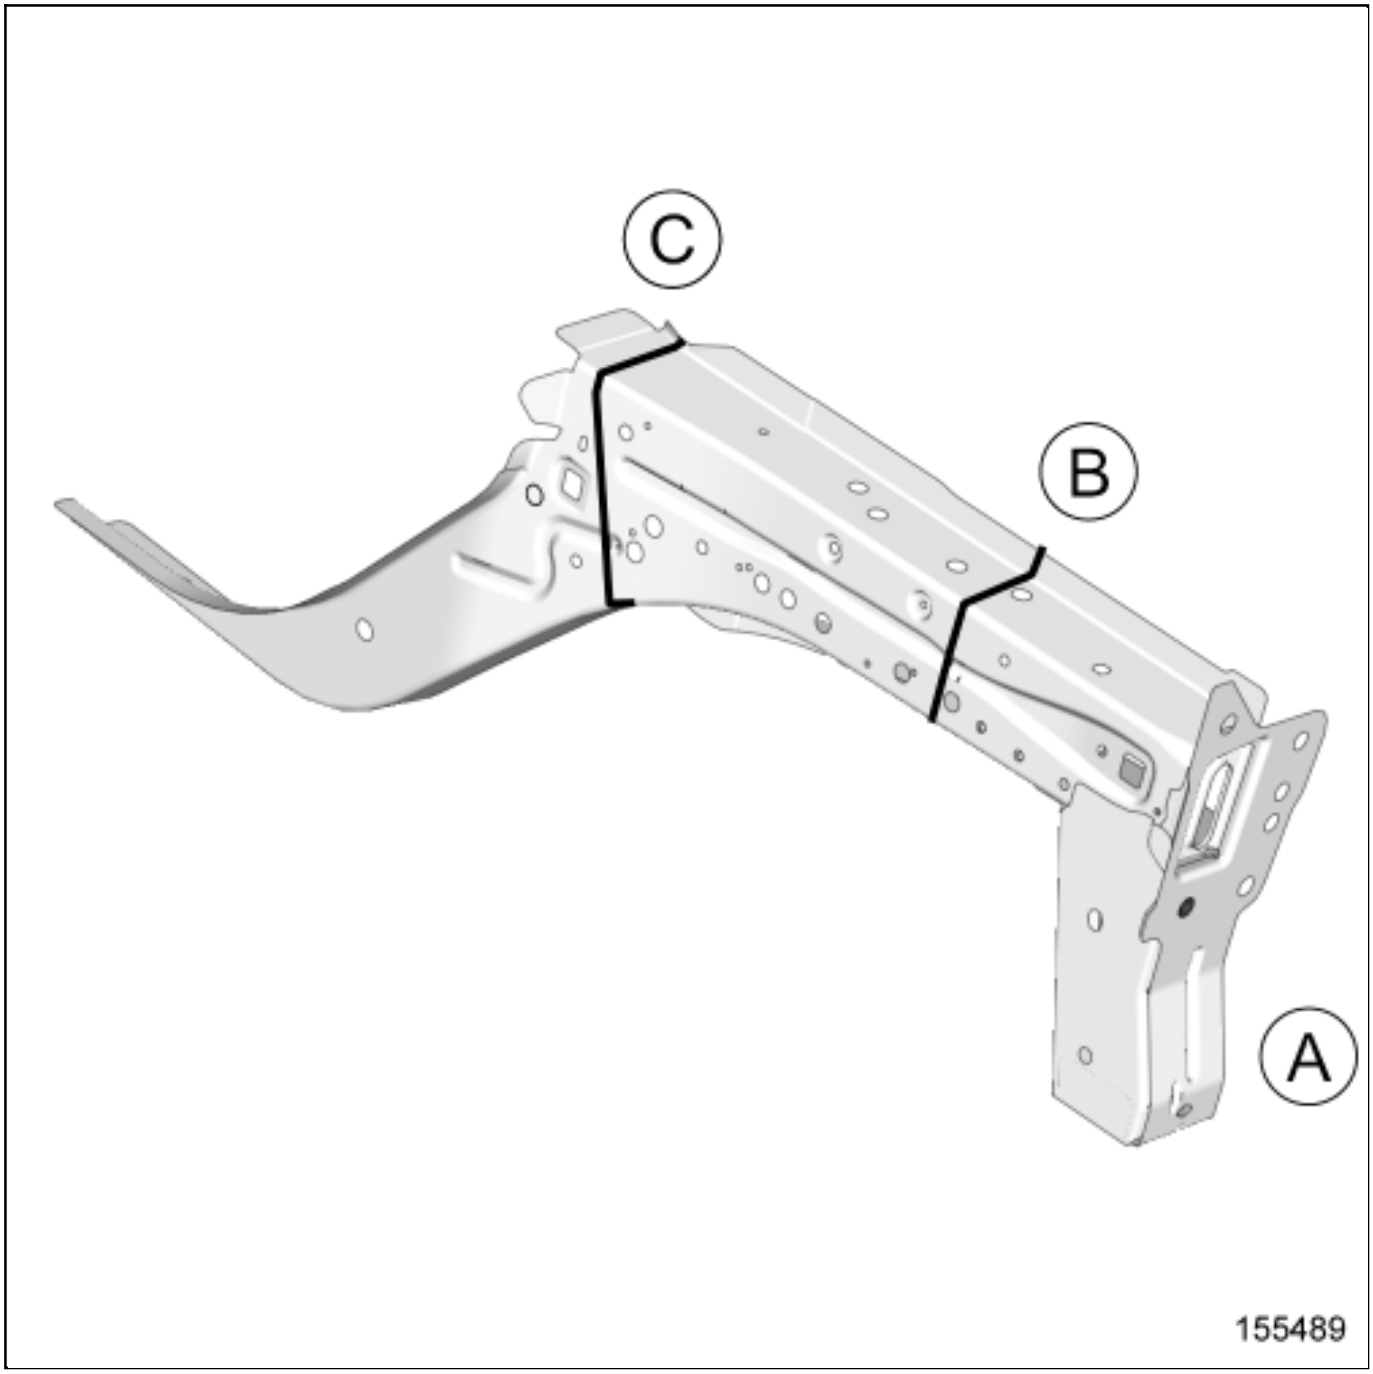


1. COMPOSITION OF THE SPARE PART

1- RIGHT-HAND SIDE

No.	Description	Type	Thickness (mm)
(1)	Right-hand radiator cross member support	HLE	2.5
(2)	Front subframe front right-hand mounting	HLE	2
(3)	Front right-hand side member	THLE	1.6/2.6
(4)	Right-hand reinforcement unit for front right-hand side member end	THLE	2

2- LEFT-HAND SIDE



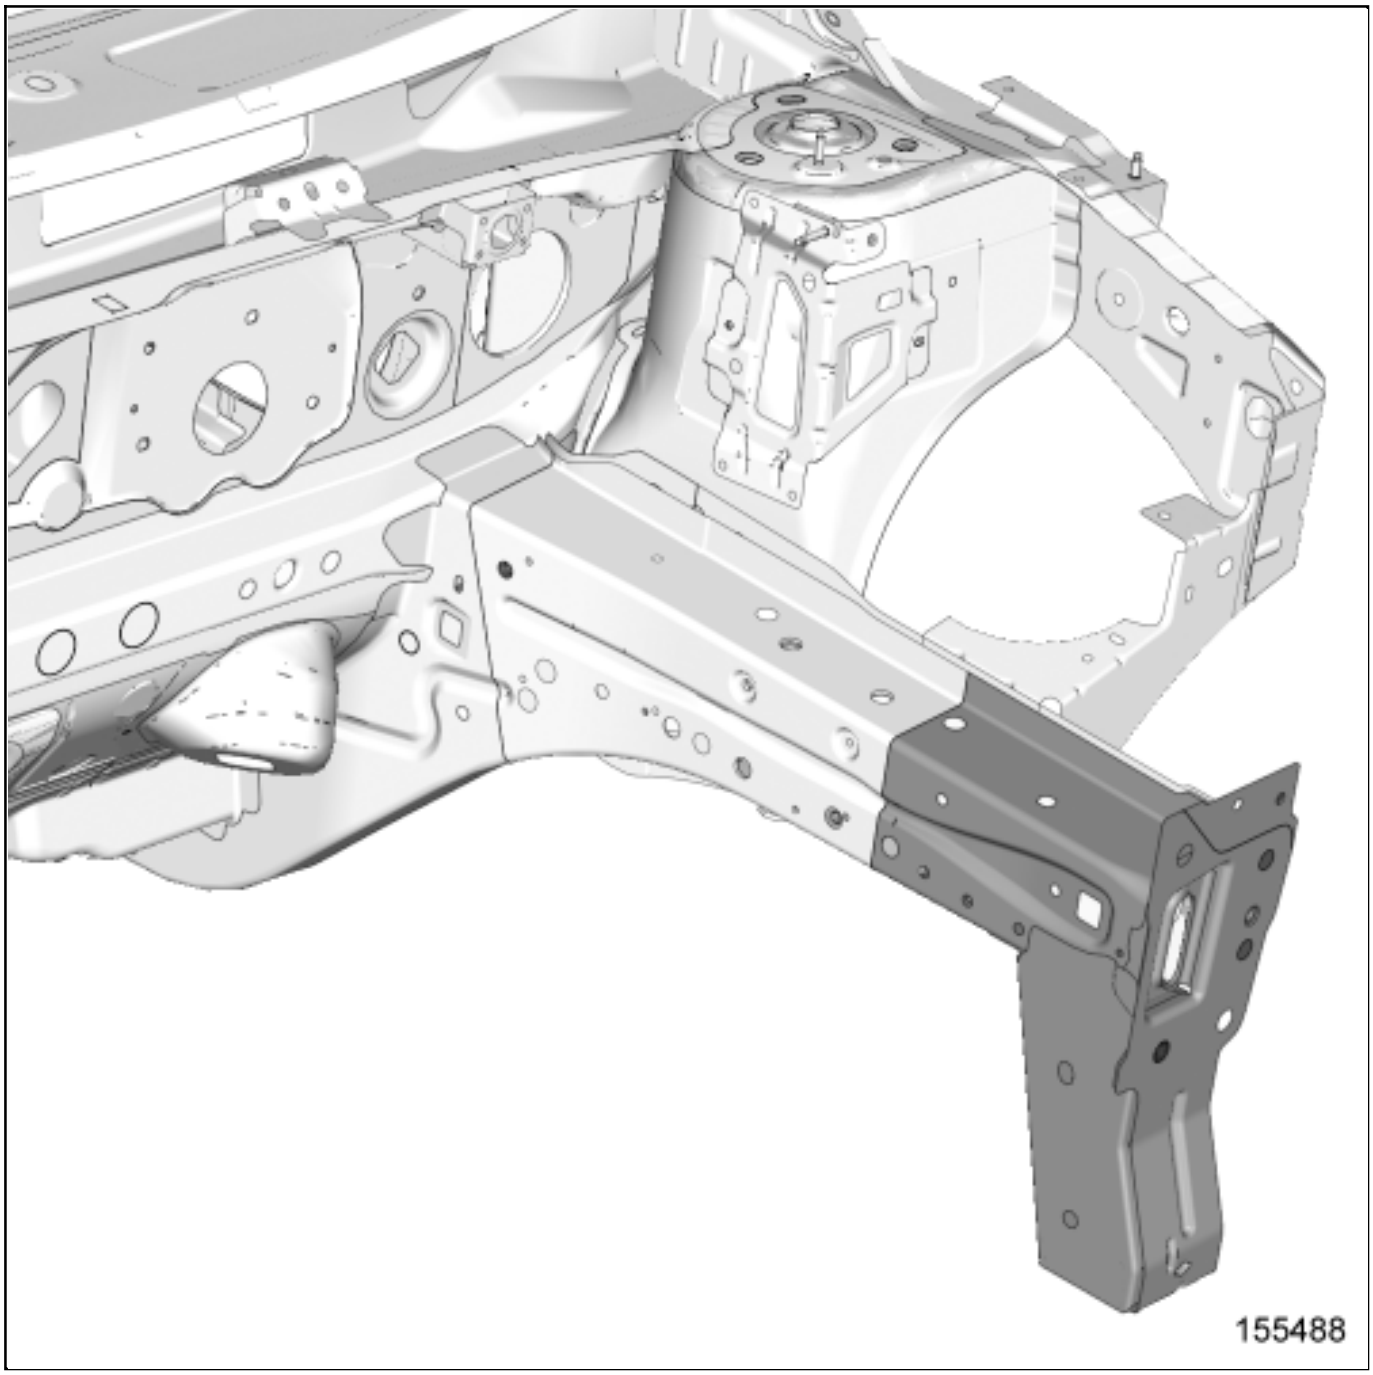
8
9
7
5
6
155487

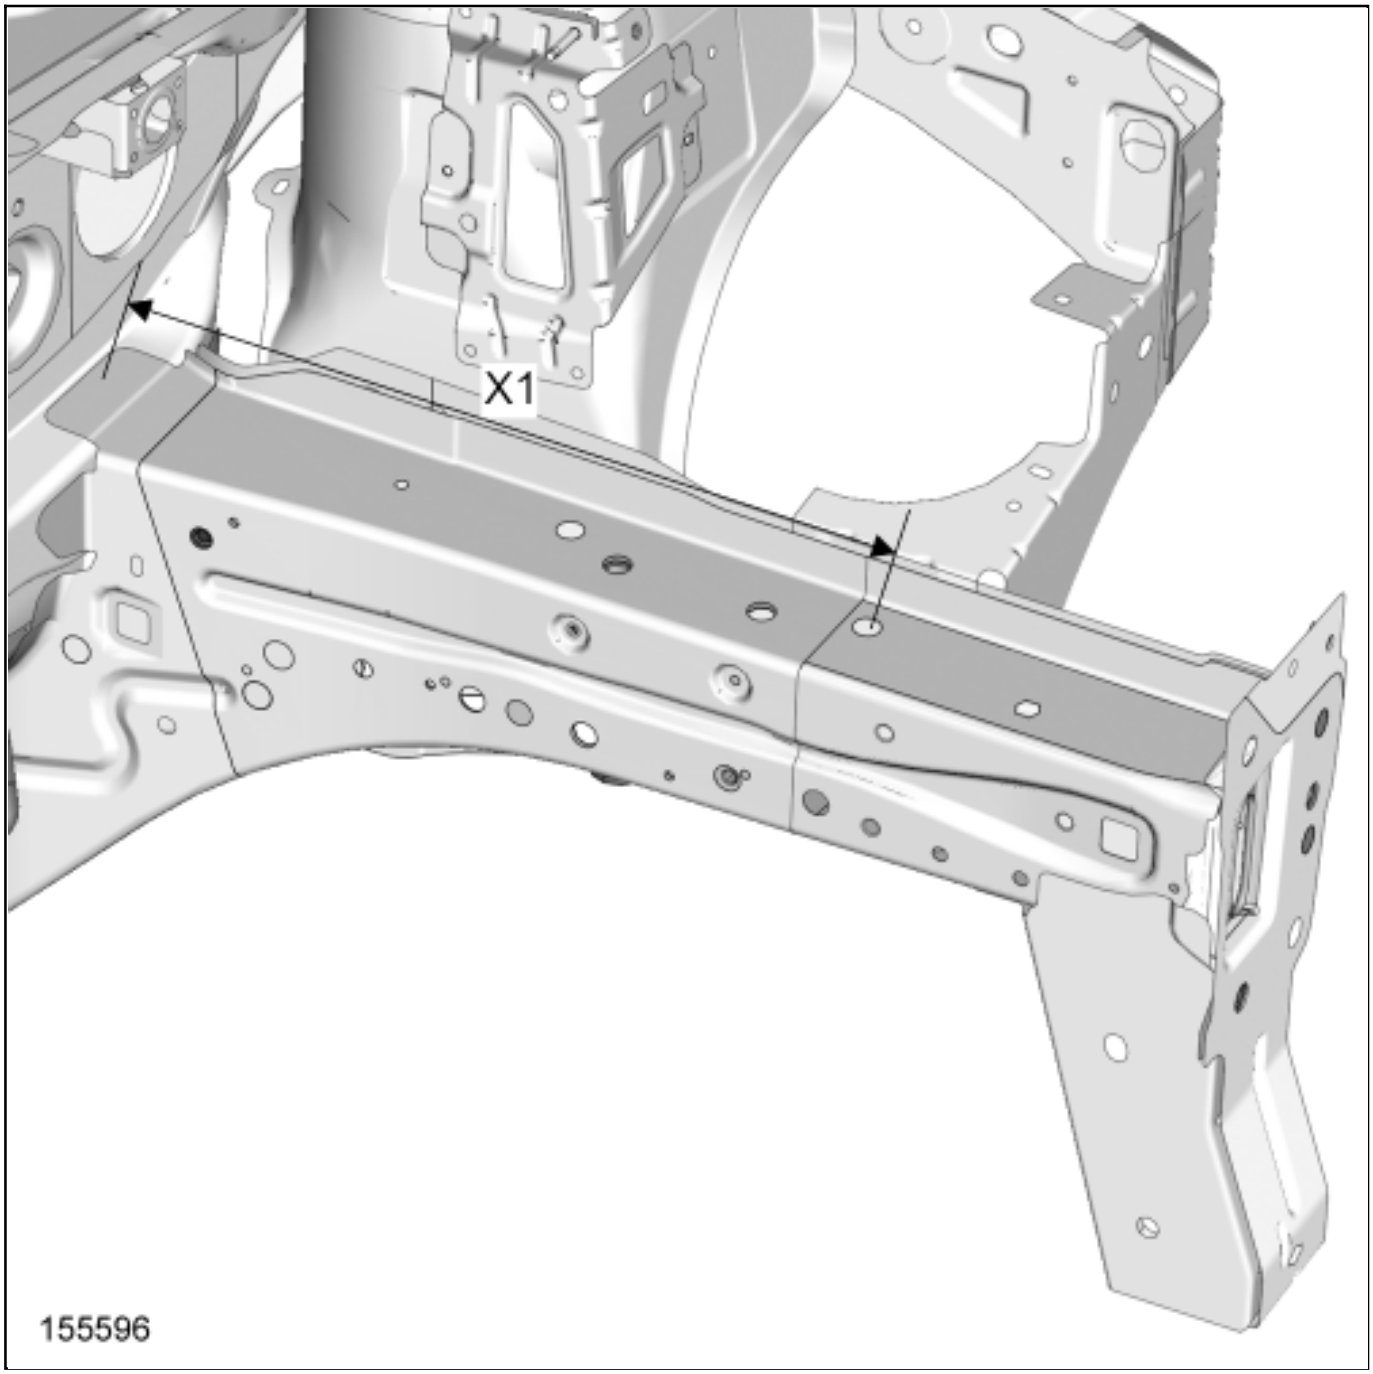
No.	Description	Type	Thickness (mm)
(5)	Front subframe front left-hand mounting	HLE	3
(6)	Left-hand radiator cross member support	THLE	1.2
(7)	Reinforcement unit of front left-hand side member end	THLE	1.8
(8)	Front gearbox reinforcement	Mild steel	1.6
(9)	Front left-hand side member	THLE	1.6/2.6

2. IN THE EVENT OF REPLACEMENT

The options for replacing this part are as follows:

- front partial replacement A-B,
- rear partial replacement A-C.

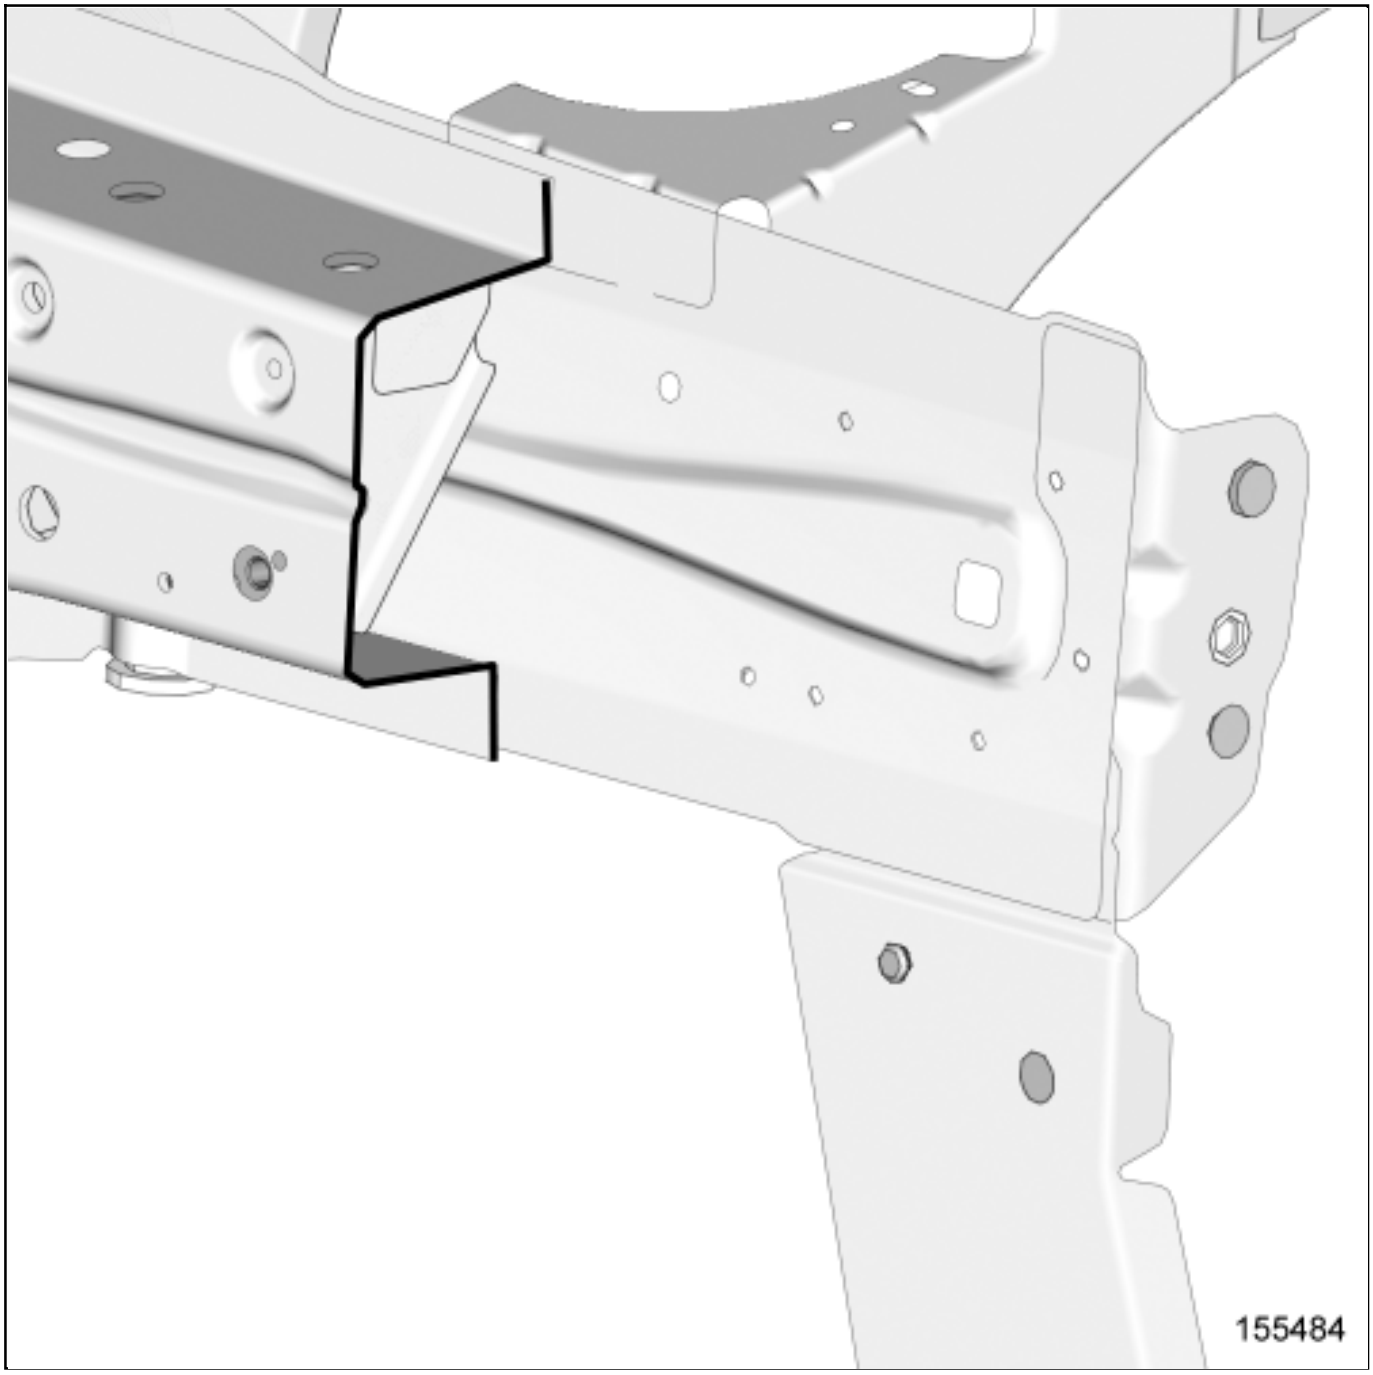




WARNING

Use a repair bench to ensure the positioning of the points and the geometry of the axle assemblies.

1- FRONT LEFT-HAND PARTIAL REPLACEMENT A-B



1)PART IN POSITION

155488

(X1) = 449.63 mm

DETAILED VIEW OF CUT B

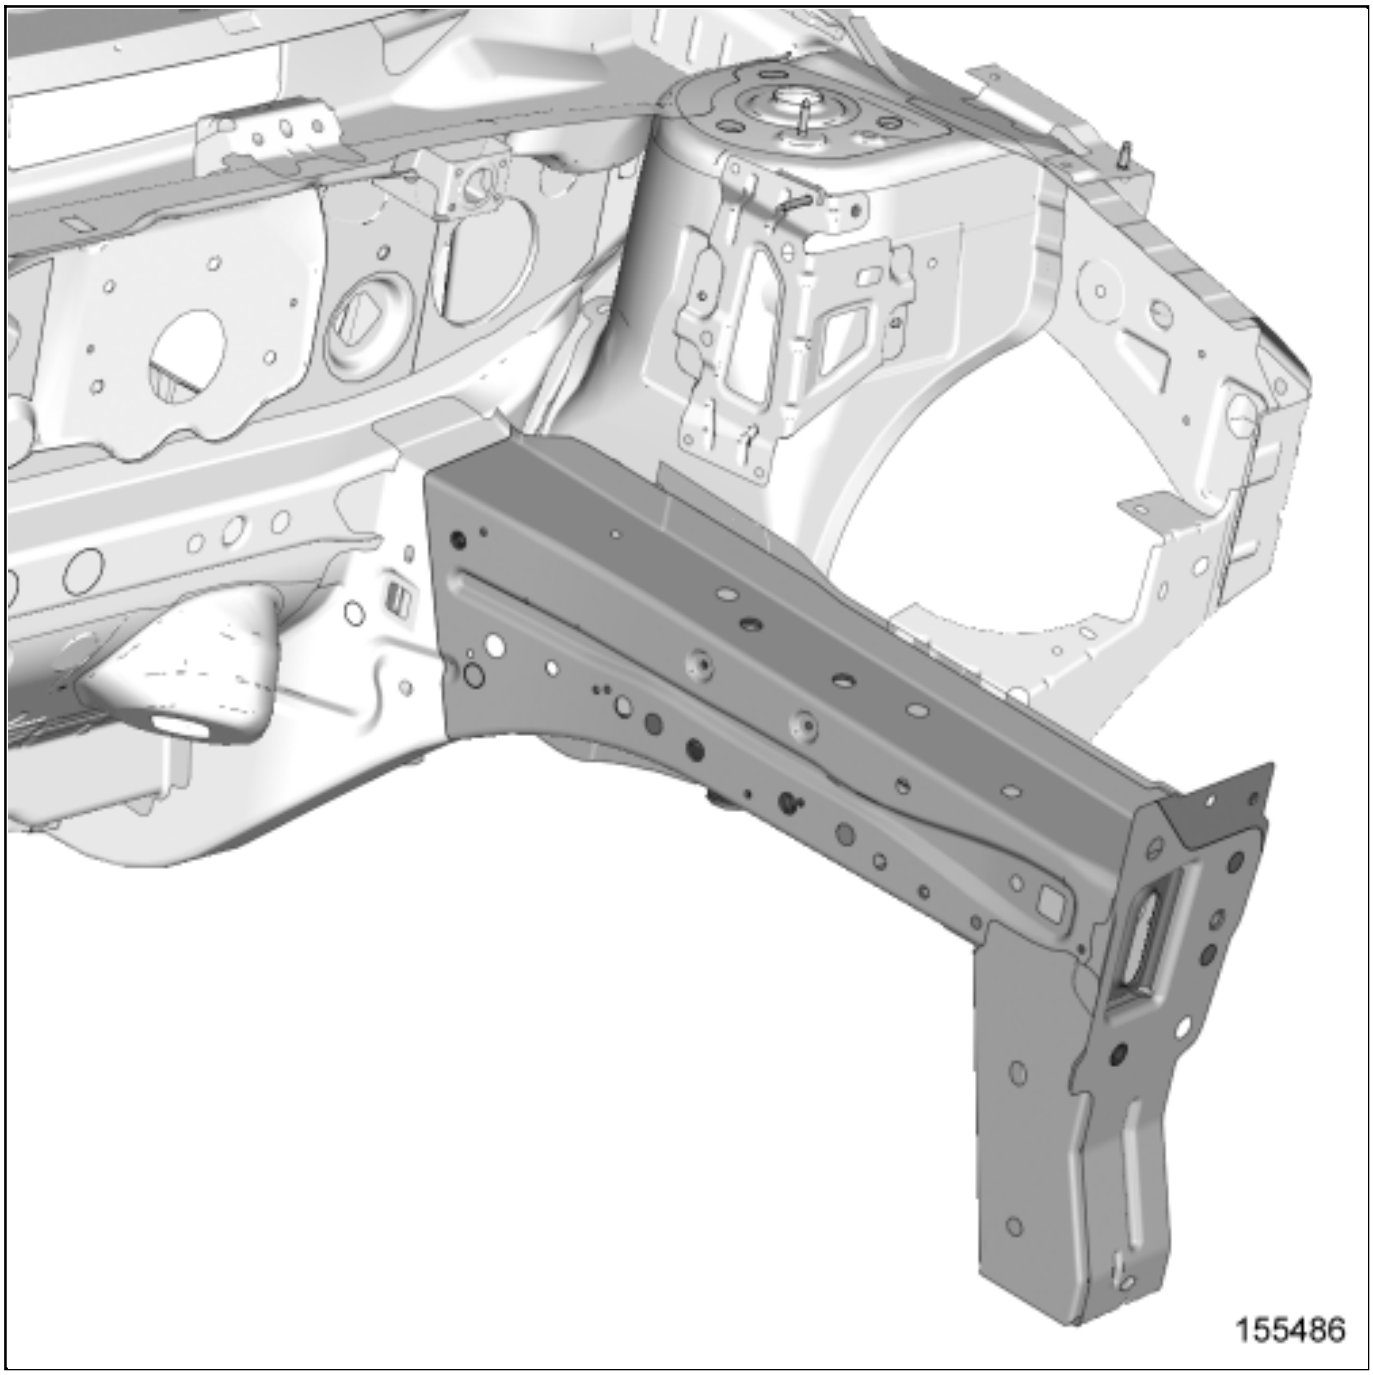
2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

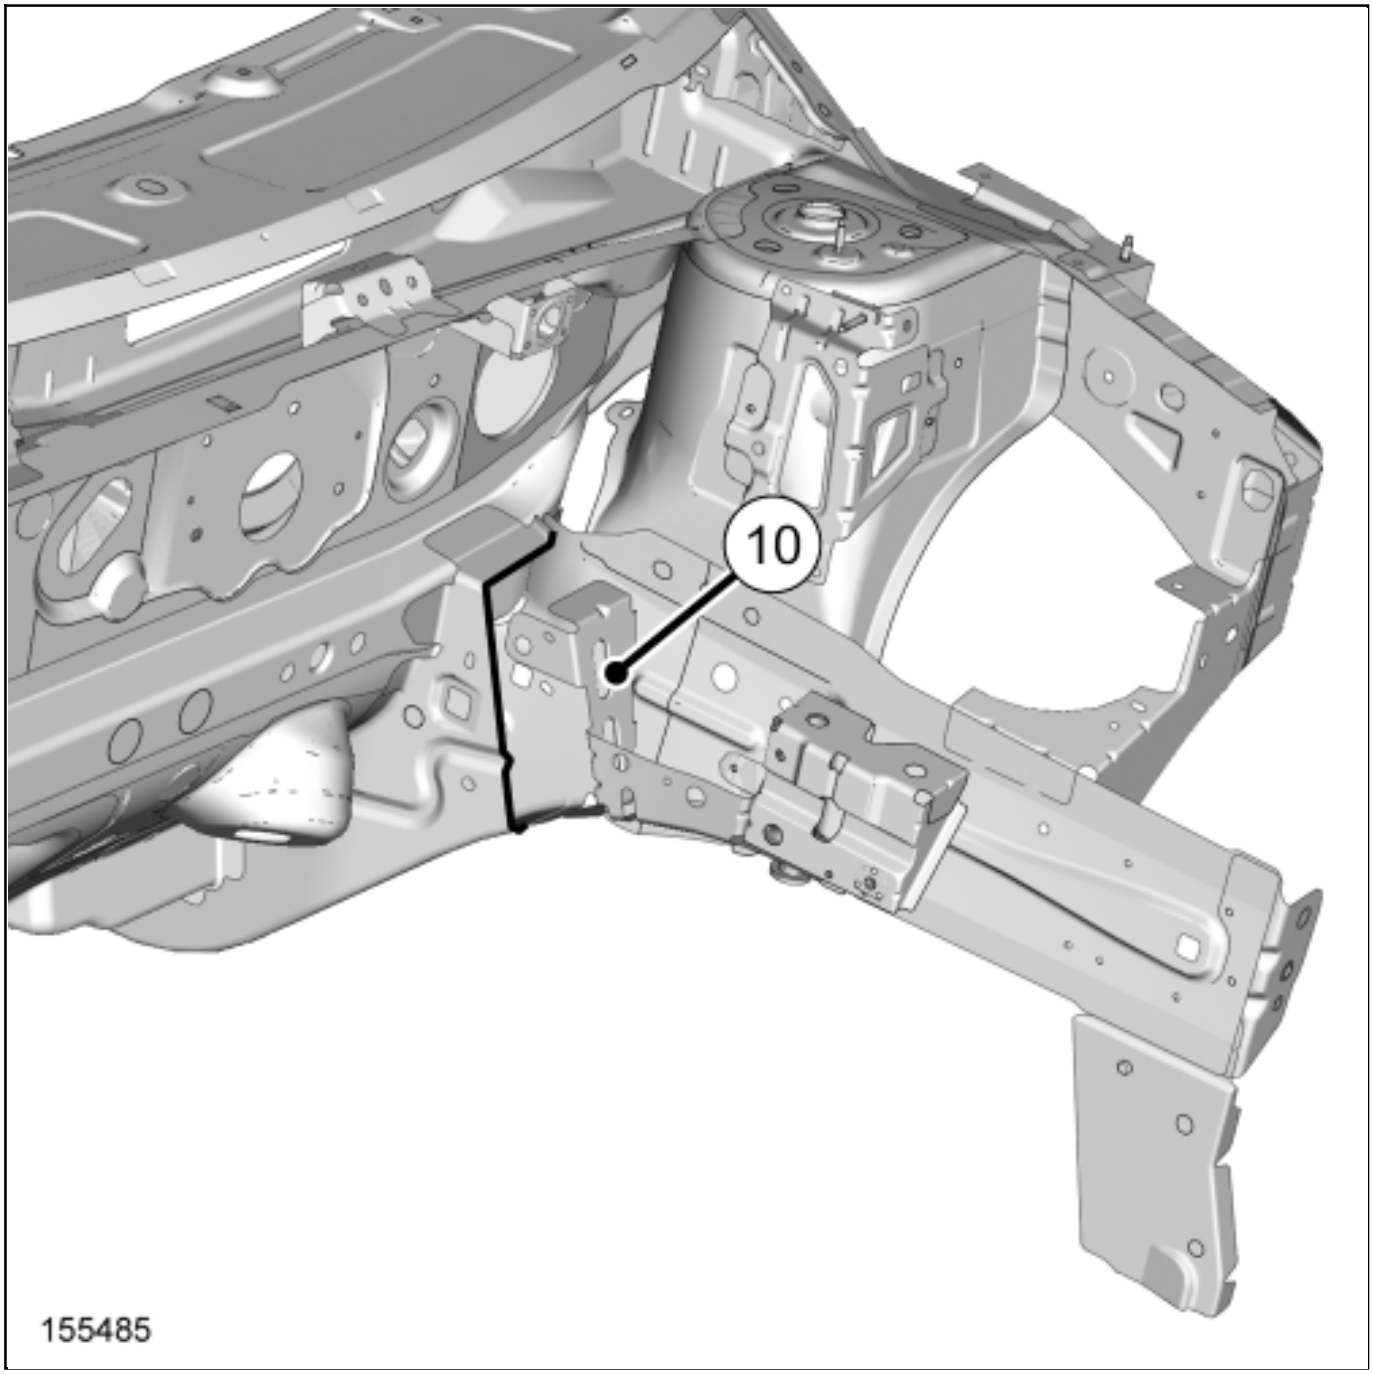
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .



3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- REAR LEFT-HAND PARTIAL REPLACEMENT A-C

1)PART IN POSITION

SPECIAL FEATURES OF CUT C

Note:

When cutting, be careful not to damage the rear inner reinforcement(10) .

2)POSITION OF ELECTRIC EARTHS

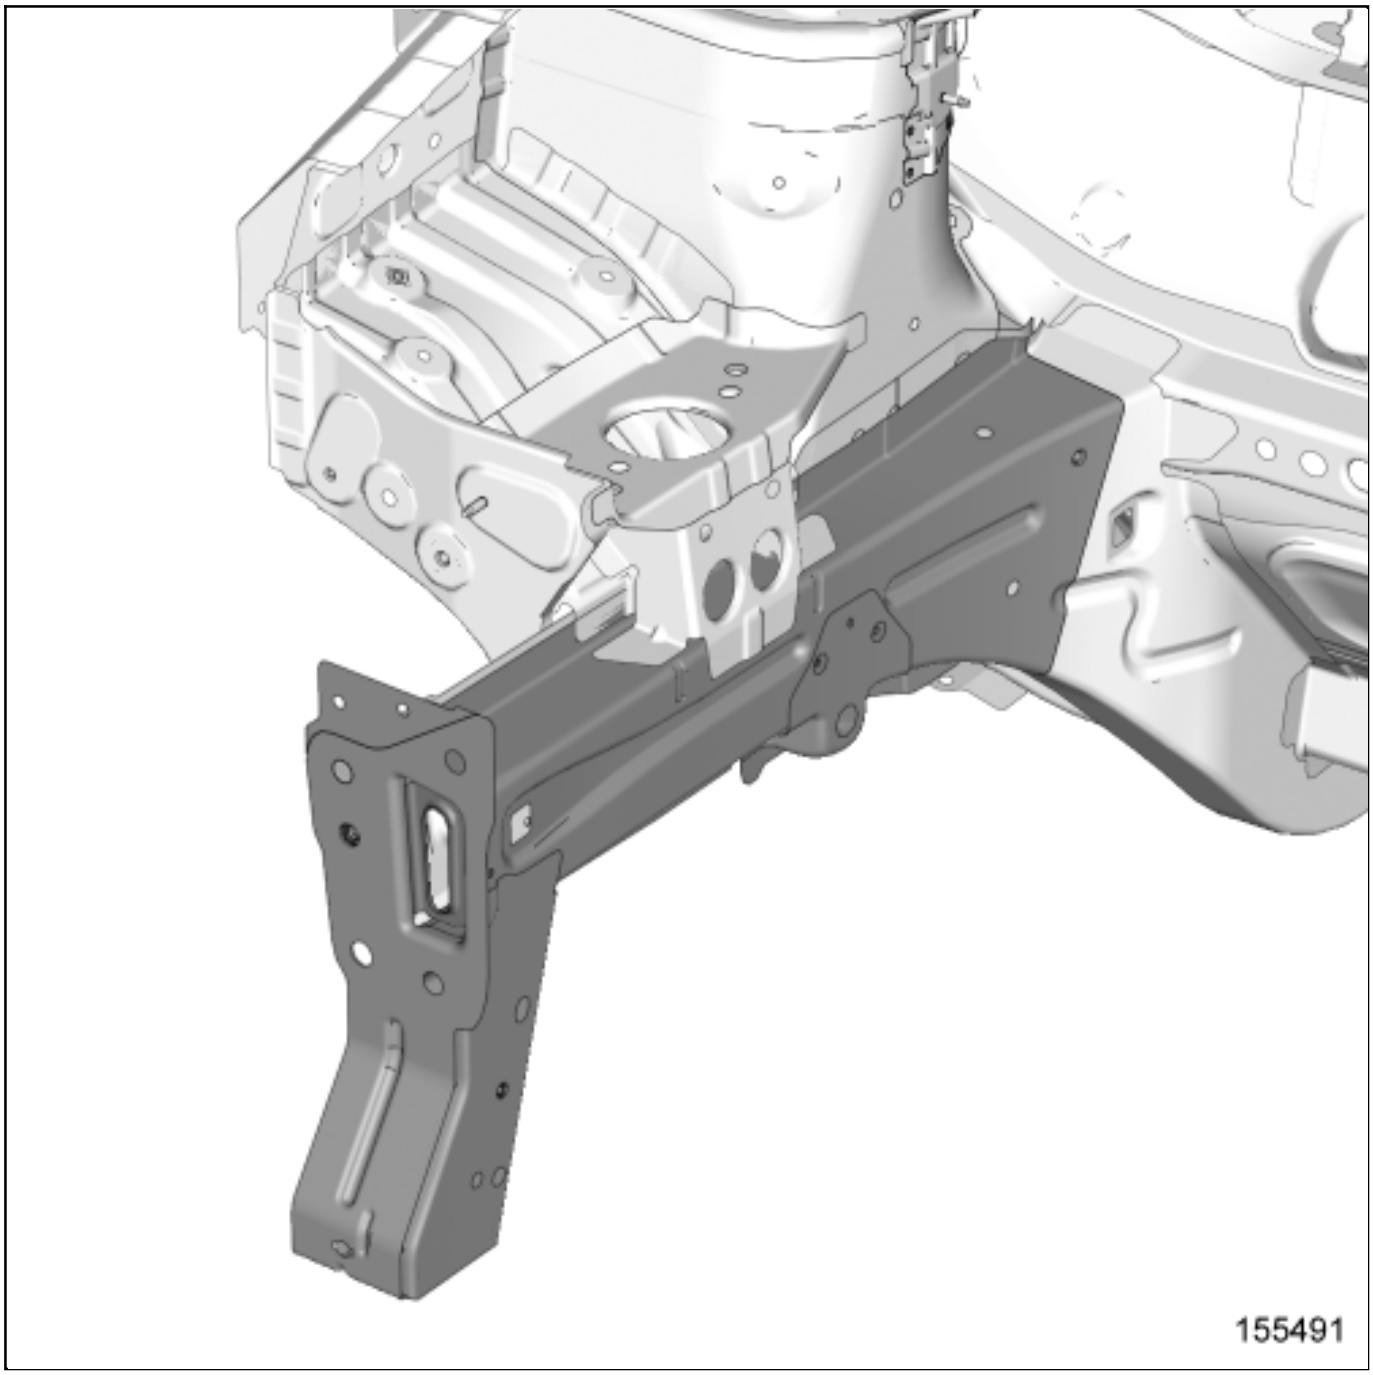
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

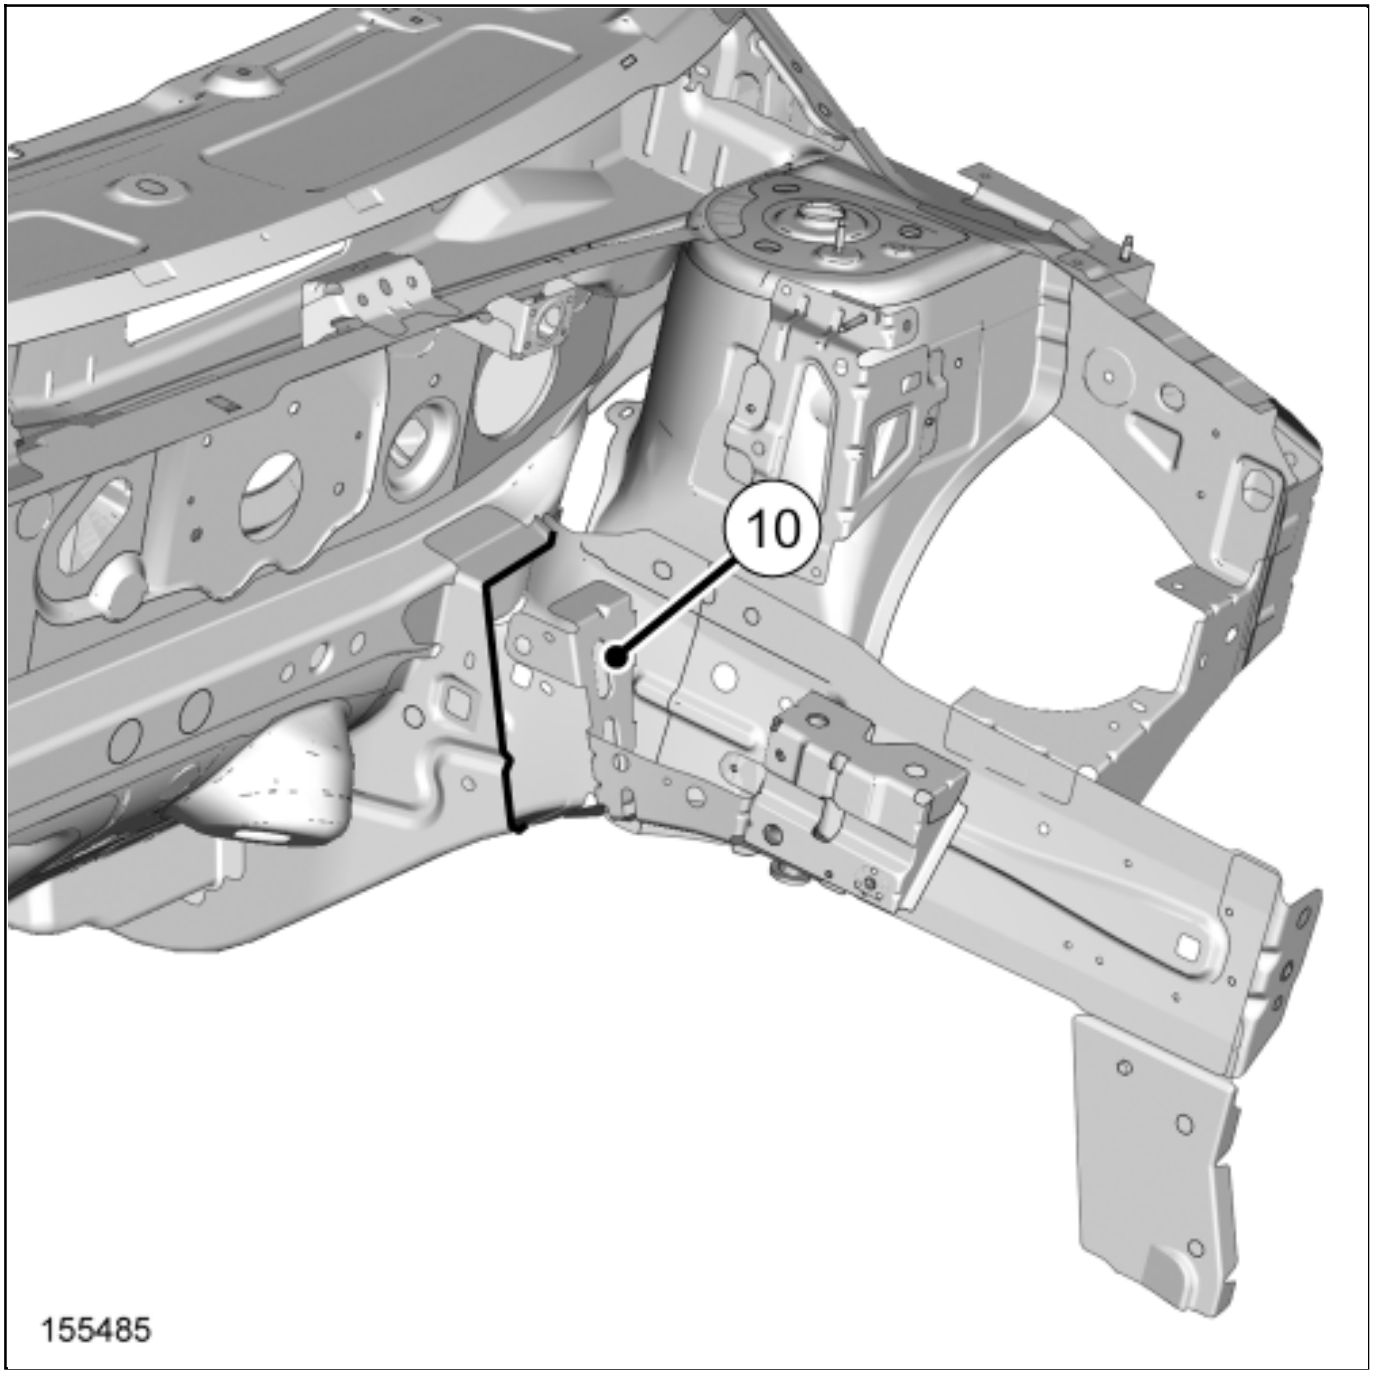
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING



CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

3- REAR RIGHT-HAND PARTIAL REPLACEMENT A-C

1)PART IN POSITION

SPECIAL FEATURES OF CUT C

Note:

When cutting, be careful not to damage the rear inner reinforcement(10) .

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

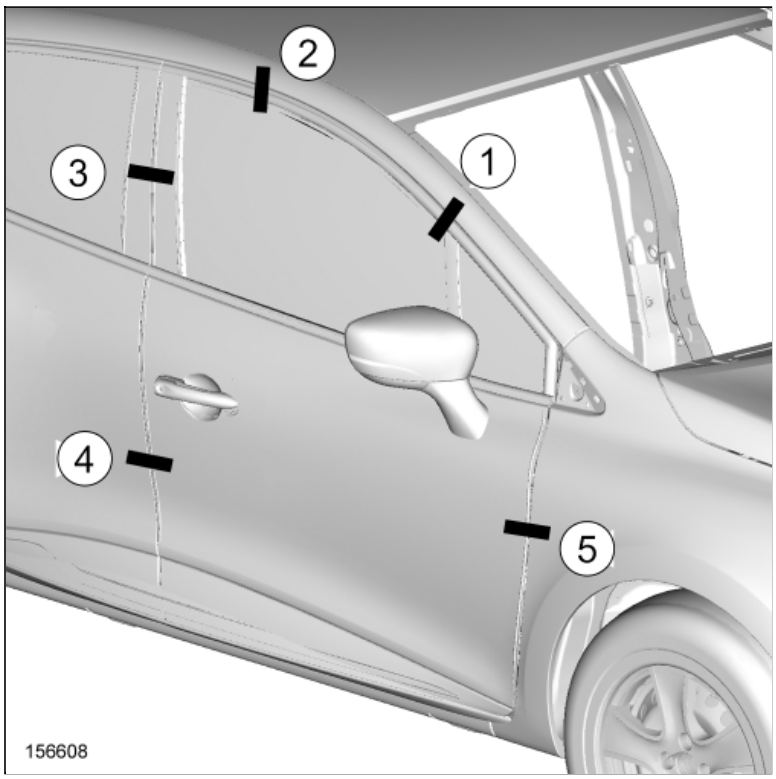
Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

FRONT SIDE OPENING ELEMENT: ADJUSTMENT

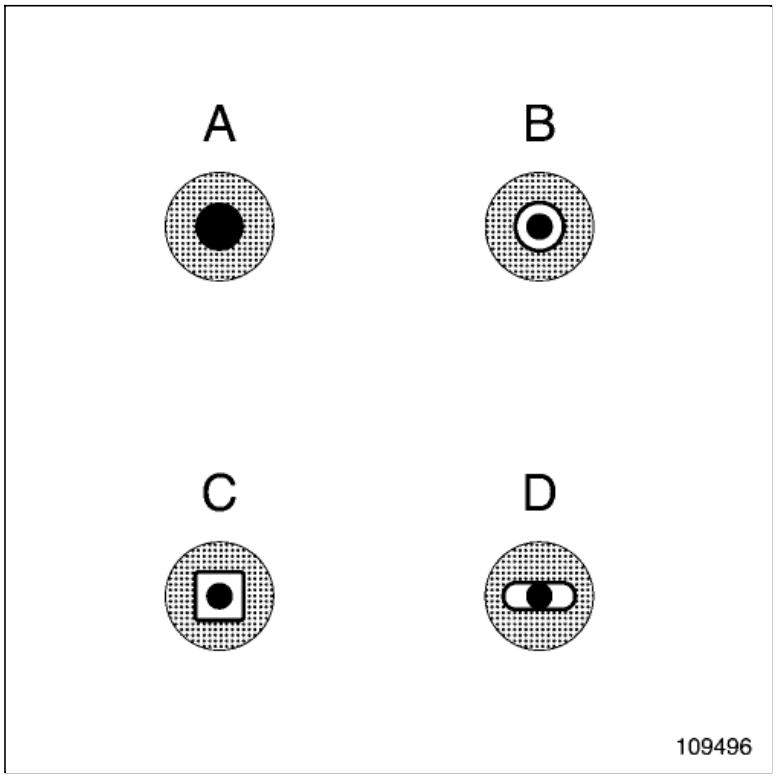


Location and specifications (tightening torques, parts always to be replaced, etc.)Opening mechanism assembly of front side opening element: Exploded view .

ADJUSTMENT VALUES

- For all information on the front side opening element adjustment valuesVehicle panel gaps: Adjustment value .

ADJUSTMENT



- There are two options for adjusting the front side door:
  - using the front side door mountings,
  - using the front side door striker plates.

- Respect the adjustment order of zones(1) , (2) , (3) , (4) and (5) .

Note:

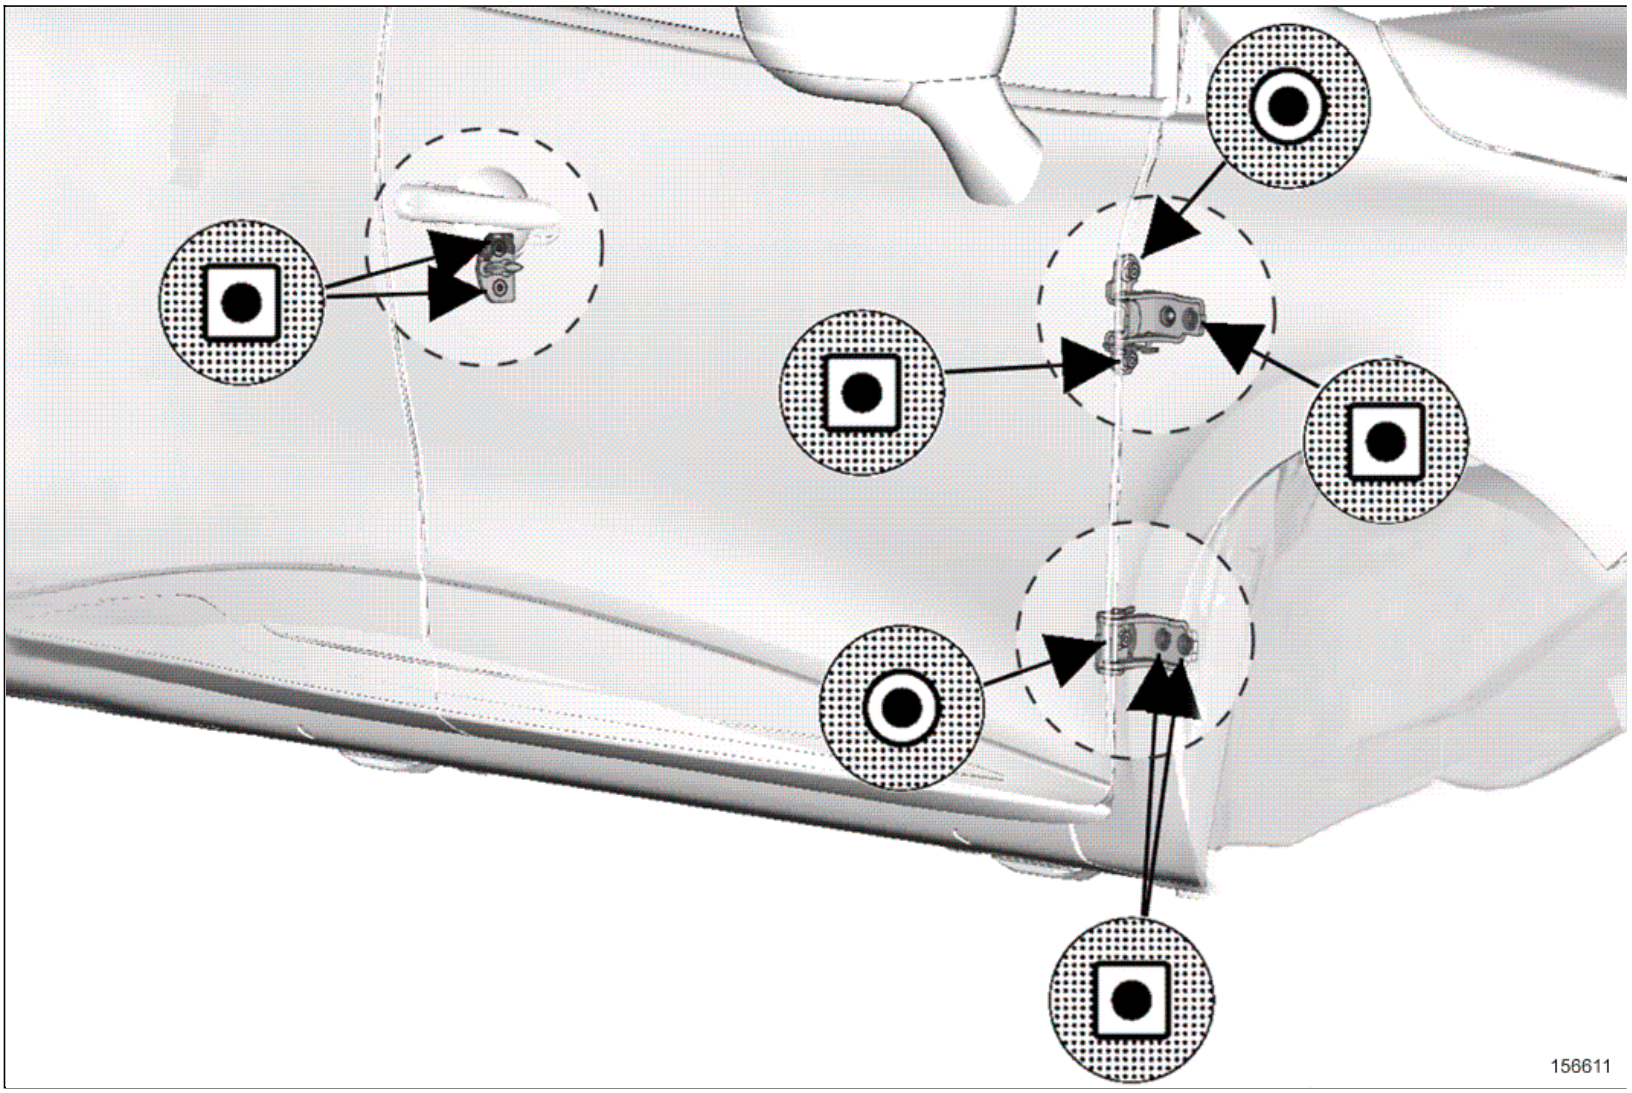
Adjustment of zones (3) and (4) is only valid if the rear side opening element is correctly adjusted.

Symbols A, B, C and D show the adjustment options.

The black dot in the centre represents the body of the bolt.

The grey section represents the component to be adjusted.

The white section represents the adjustment area.



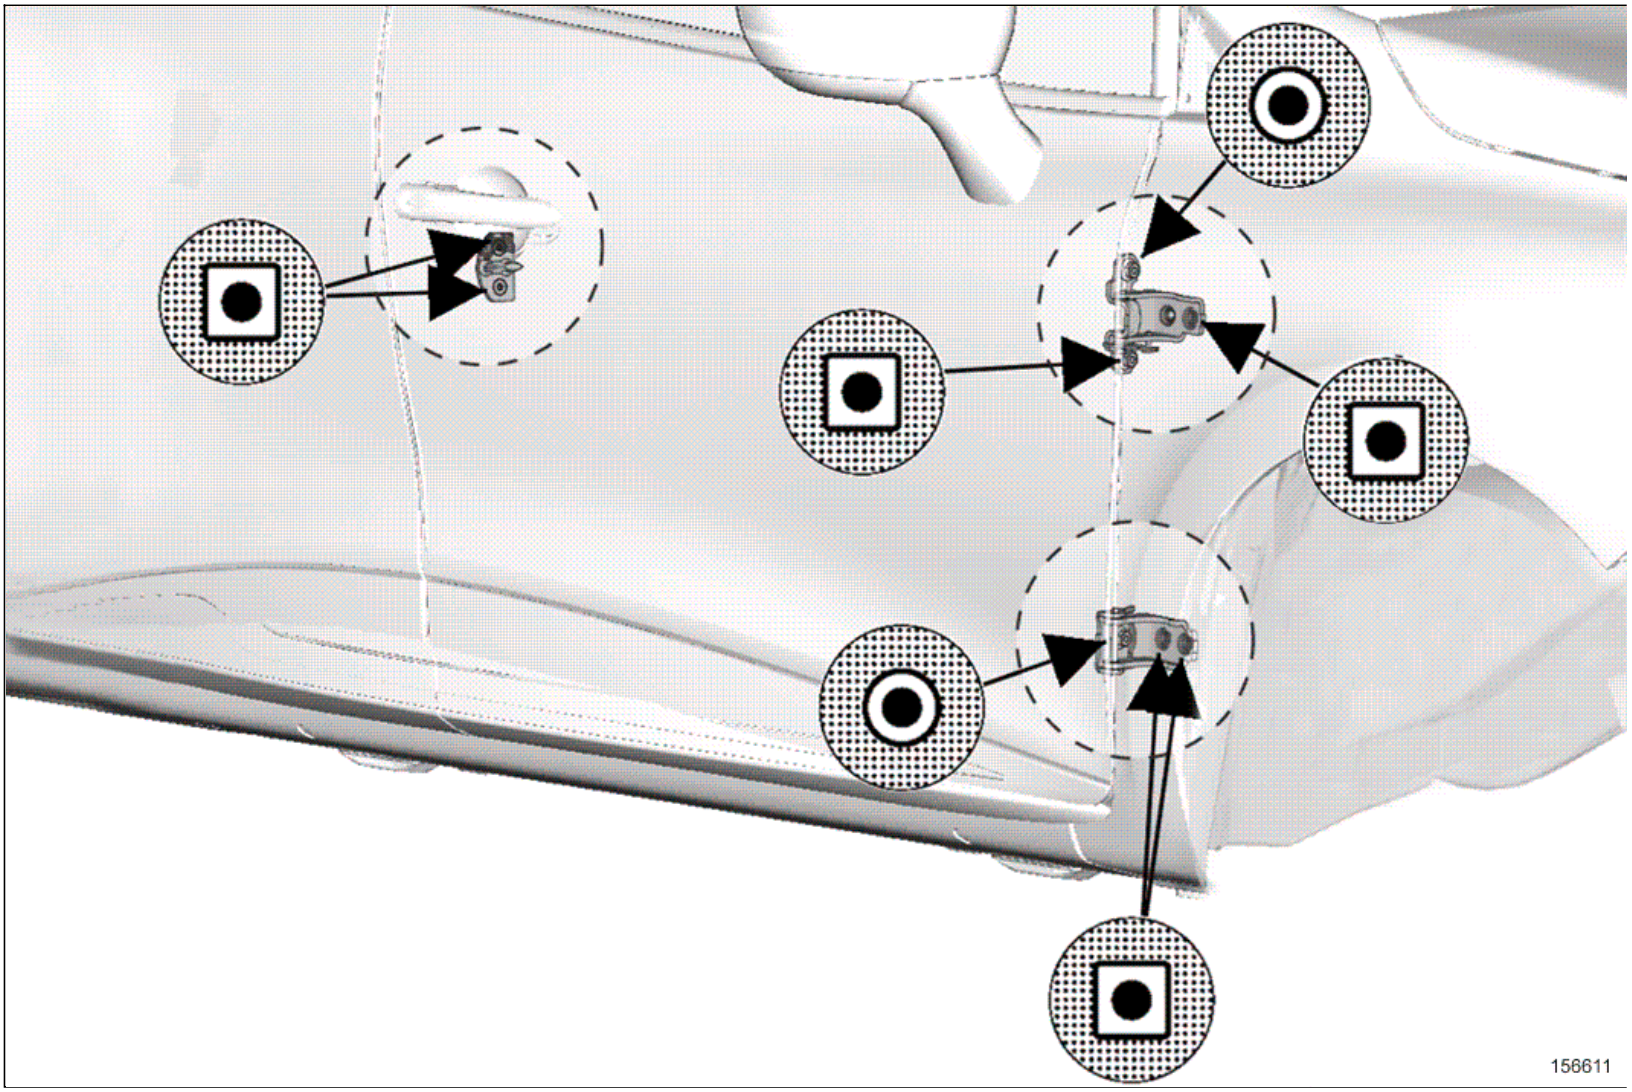
1. ADJUSTMENT PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the front wheel Front hub carrier assembly: Exploded view ,
- the front wheel arch liner Exterior body front trim assembly: Exploded view .

2. HEIGHT AND LENGTH ADJUSTMENT



Note:

Adjustment of zones (3) and (4) is dependent on the adjustment of the rear side opening element(see 47A, Side opening elements, Rear side opening element: Adjustment) .

Adjust in the following the order:

- the height of zones(1) , (2) ,
- the length of zones(3) , (4) and (5) .

3. DEPTH ADJUSTMENT

Note:

Adjustment of zones (3) and (4) is dependent on the adjustment of the rear side opening element(see 47A, Side opening elements, Rear side opening element: Adjustment) .

Note:

The original hinge mounting plates are bonded to the door box section.

To carry out the adjustment, it is necessary to remove the plate using a wooden block and a hammer.

Adhere to the following adjustment sequence:

- adjust the depth of zones(1) , (2) and (5) ,
- adjust the height of the striker panel in relation to the lock to prevent them touching,
- adjust the depth of zones(3) and (4) .

Note:

The striker plate is spot-welded on the reinforcement inside the B-pillar.

To carry out adjustments, deform the fuse brackets of the plate.

XSL version : 3.02 du 22/07/11

FRONT SIDE OPENING ELEMENT ASSEMBLY ON THE PASSENGER COMPARTMENT SIDE: EXPLODED VIEW

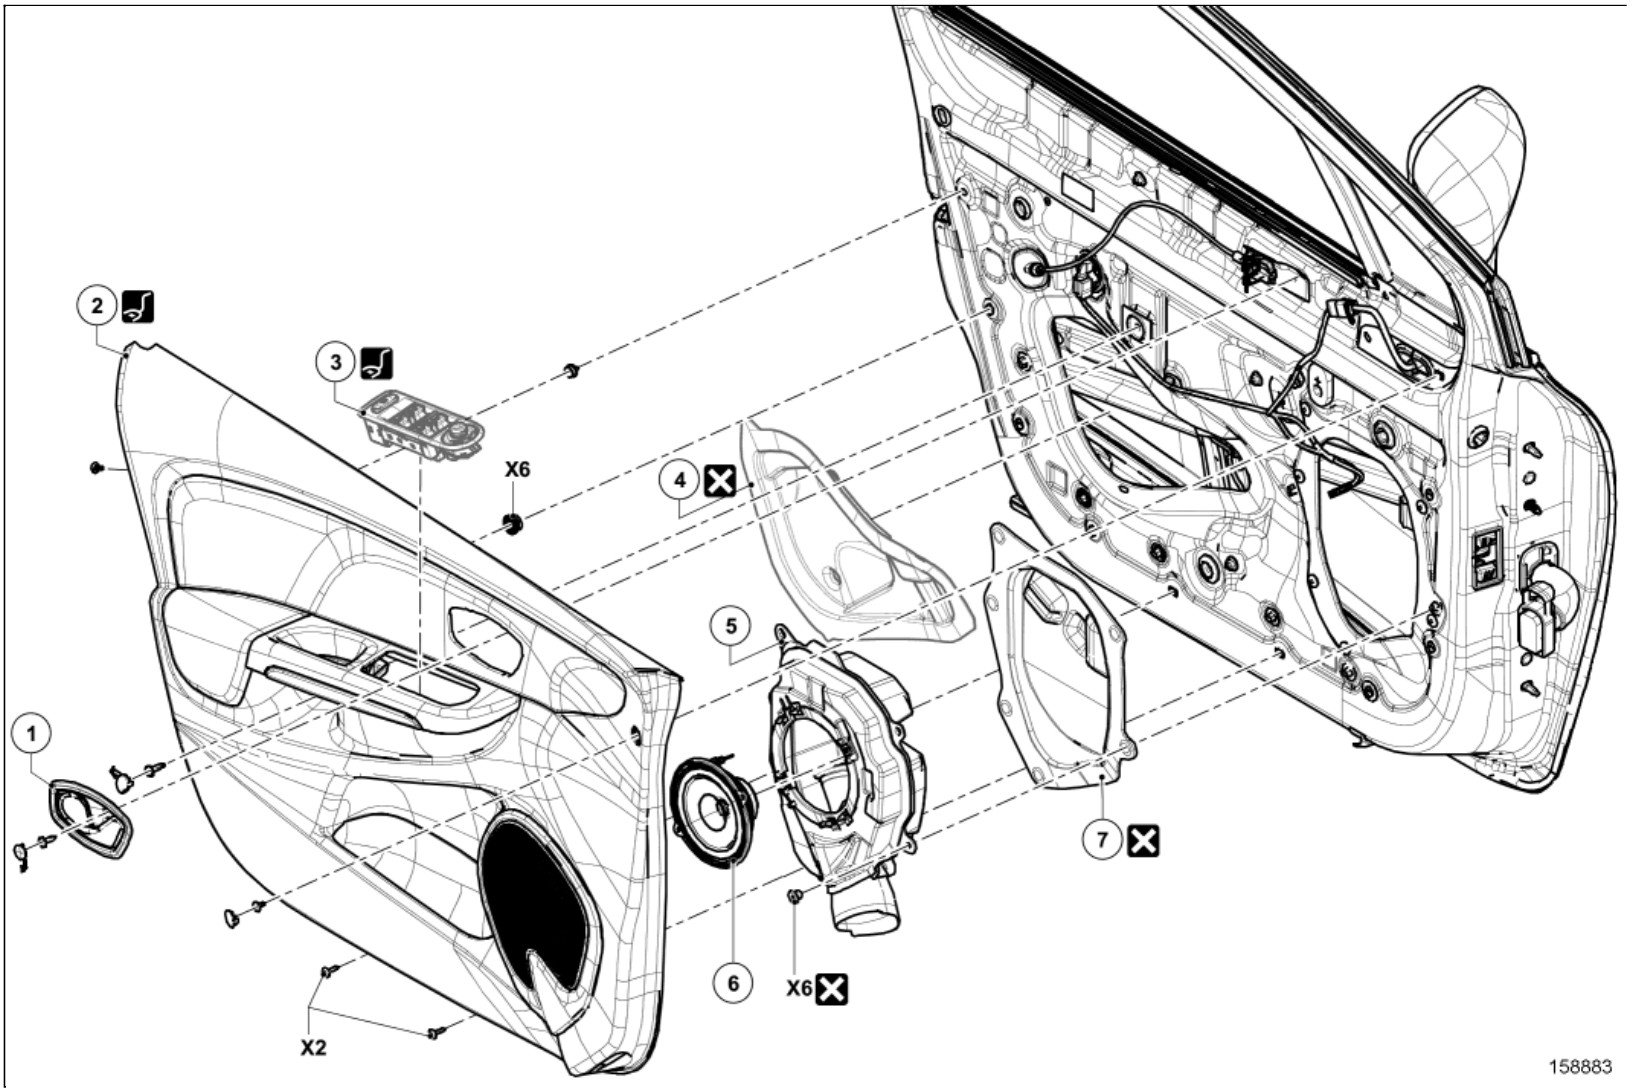


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Front side door interior opening control	(see **Front side door interior opening control: Removal - Refitting**)
2	Front side door trim	(see **Front side door trim: Removal - Refitting**) (Car. 1363)
3	Electric windows control plate	(Car. 1363)
4	Door sealing film	(see **Door sealing film: Removal - Refitting**)
5	Speaker box	
6	Speaker	
7	Door sealing film	(see **Door sealing film: Removal - Refitting**)

FRONT SIDE OPENING ELEMENT: REMOVAL - REFITTING

This operation can be carried out in two ways:

- removal without hinges: used when replacing the door.
- removal with hinges: allows the initial adjustments to be kept.

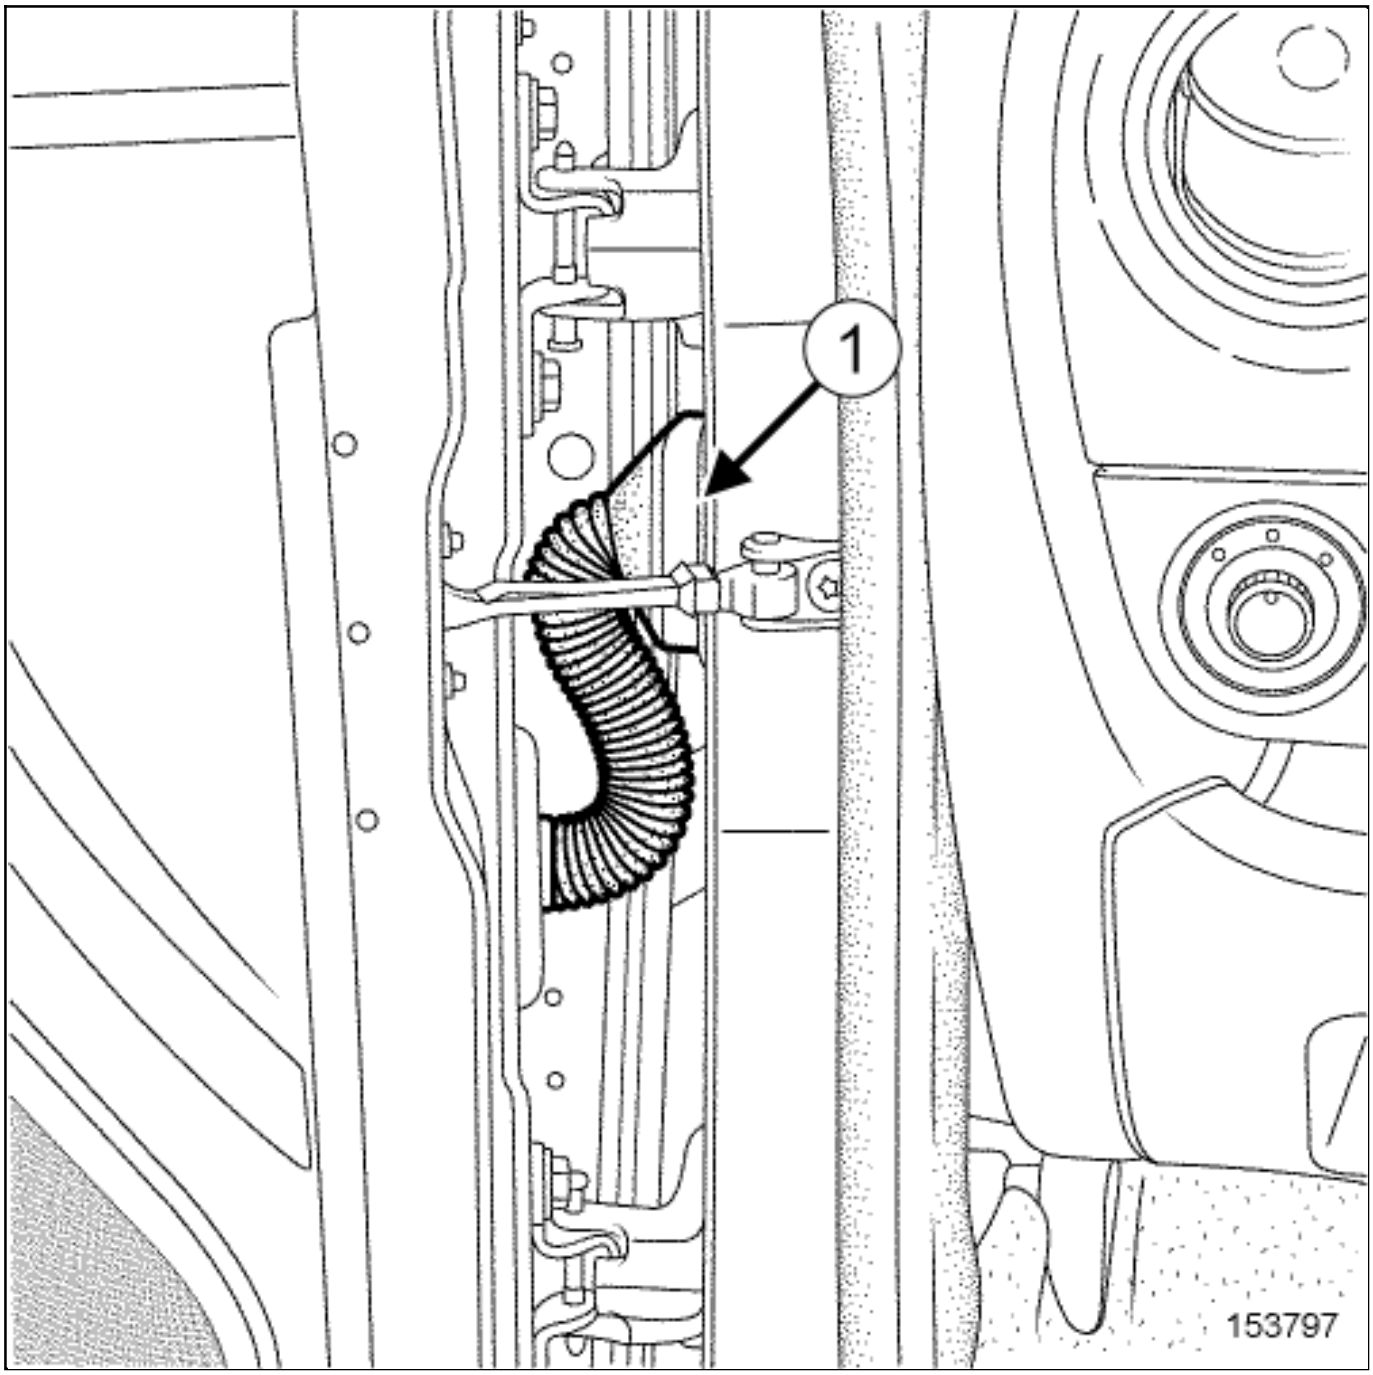
Note:

The front side door can be removed without removing the front wing.

Location and specifications (tightening torques, parts always to be replaced, etc.)Opening mechanism assembly of front side opening element: Exploded view .

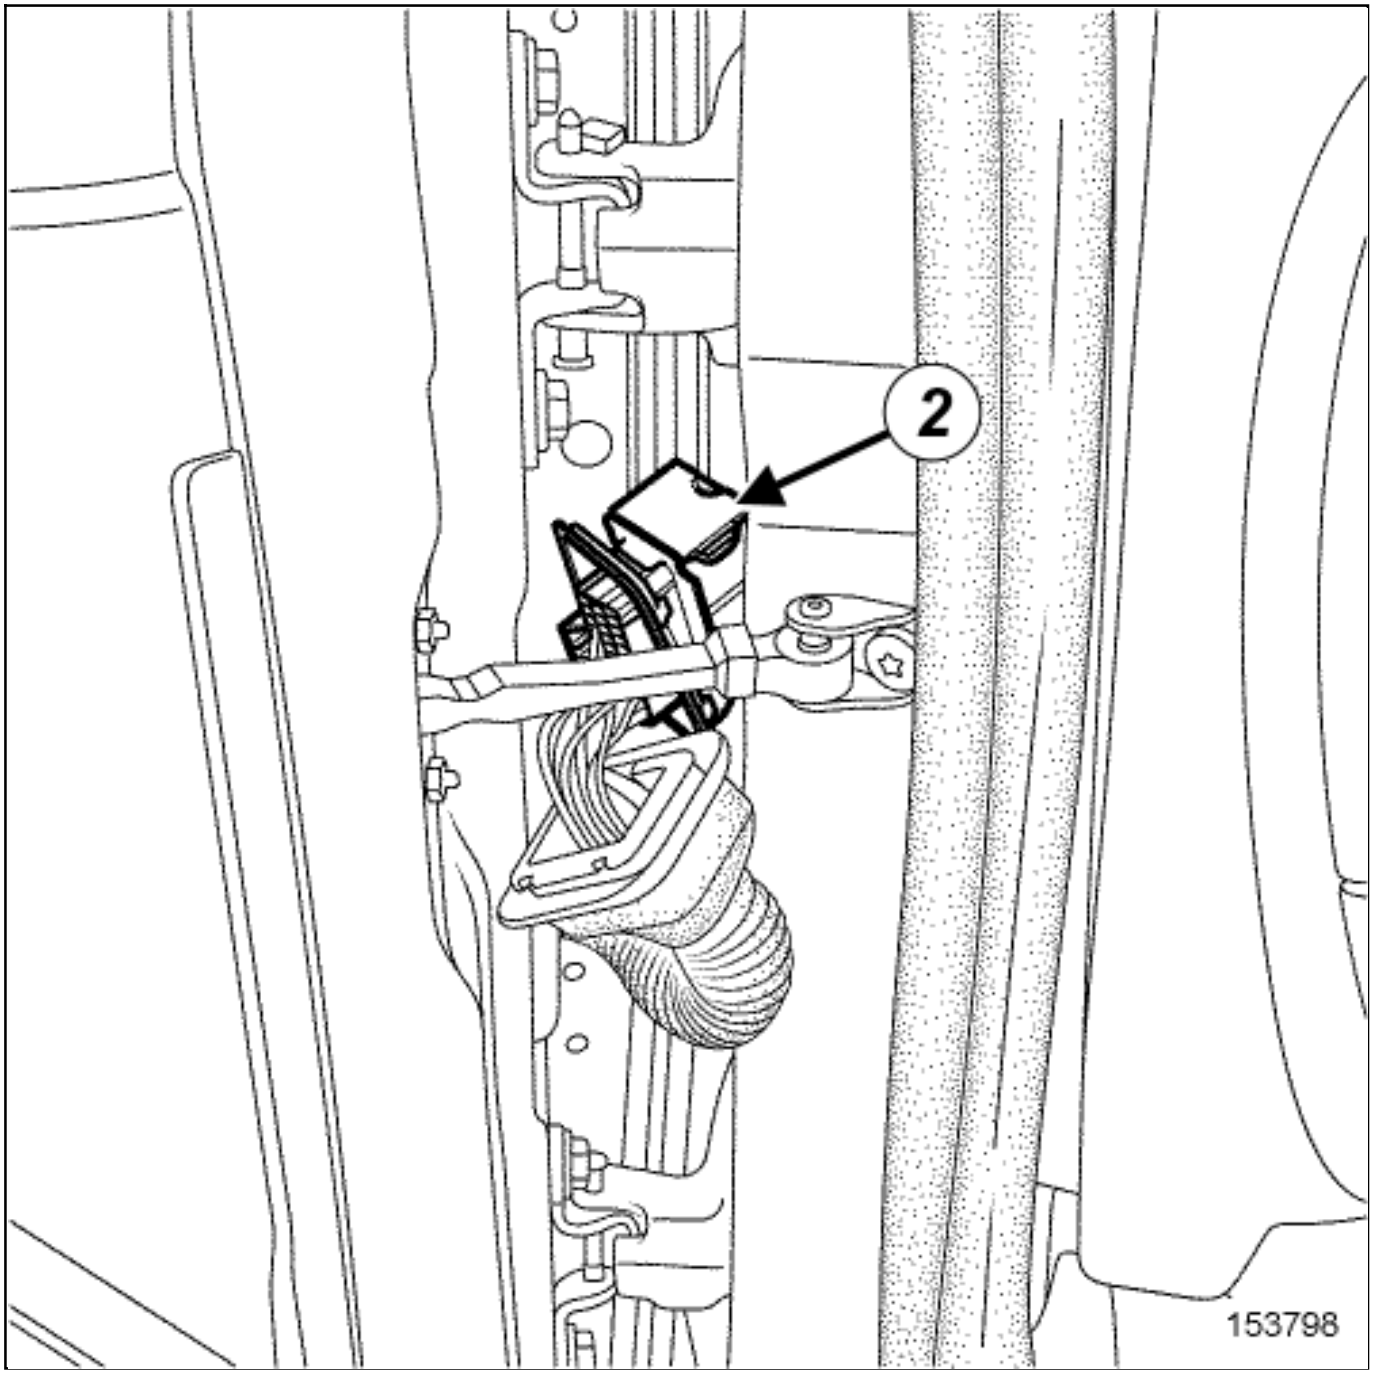
REMOVAL

1. REMOVAL PREPARATION OPERATION



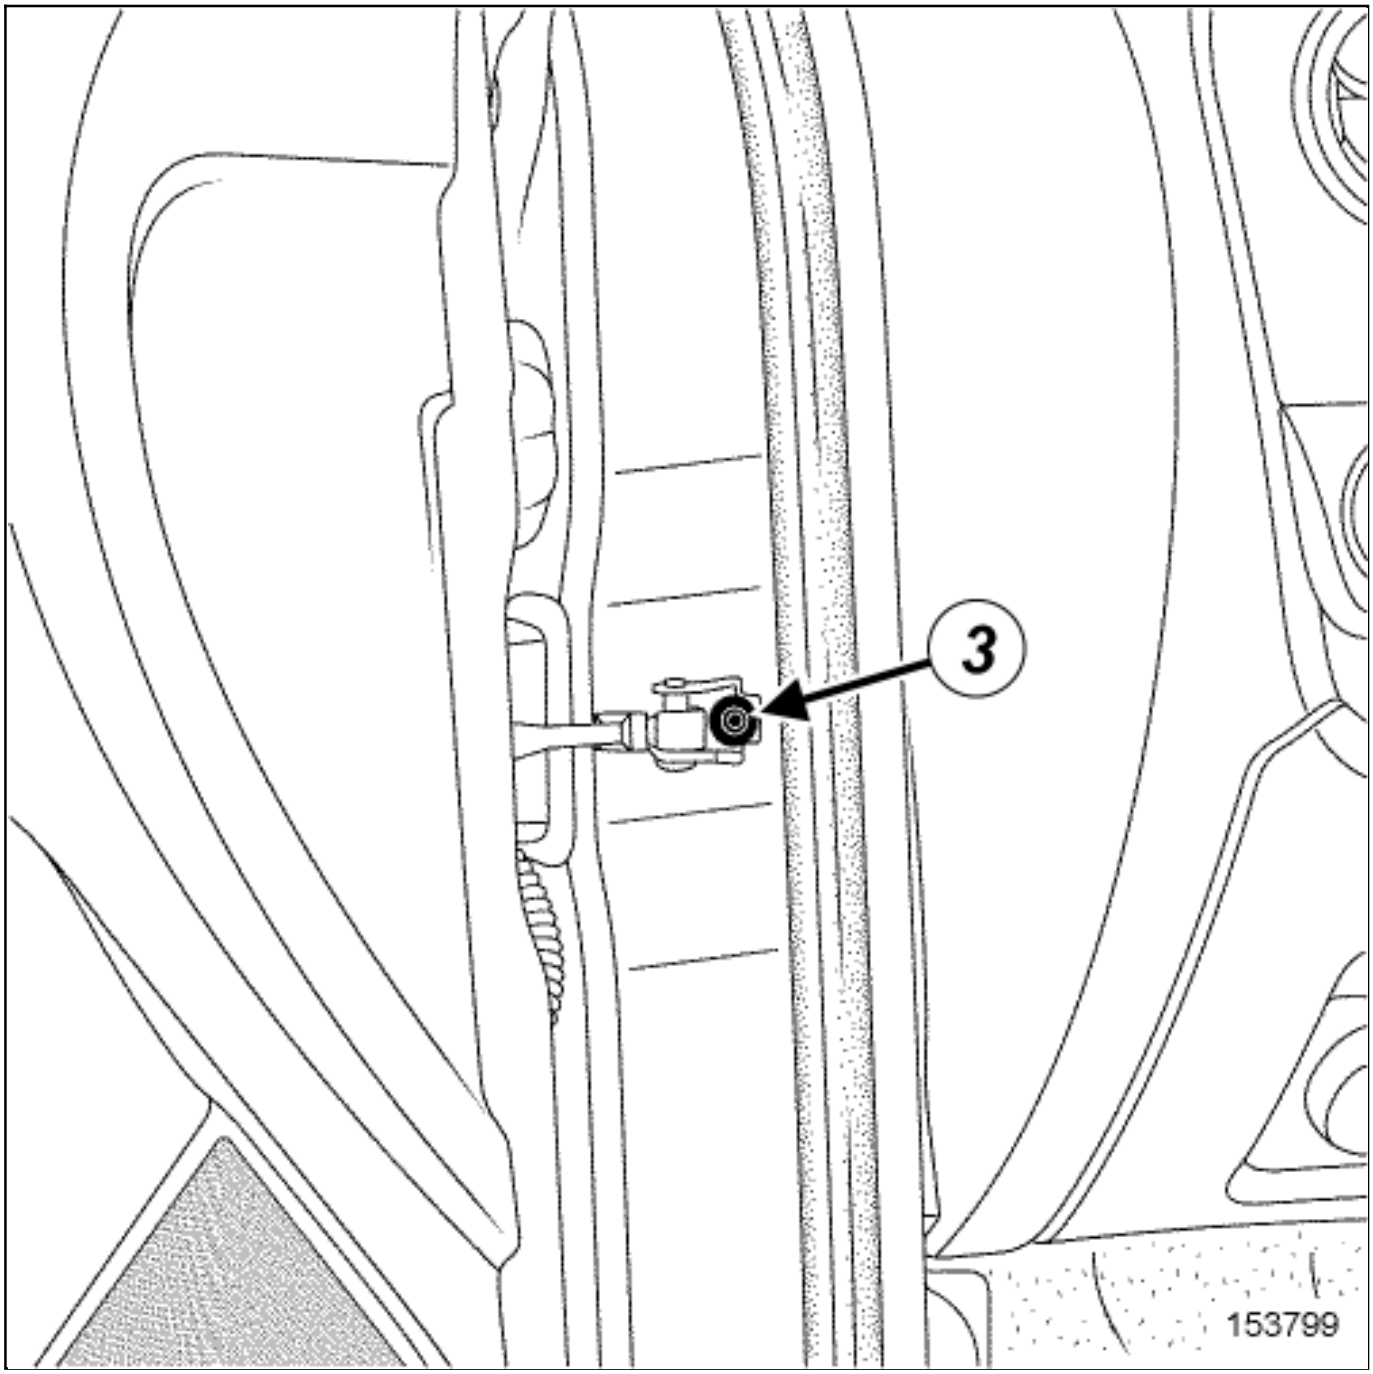
1- REMOVAL WITH HINGES

Position the vehicle on a two-post liftVehicle: Towing and lifting .



Remove:

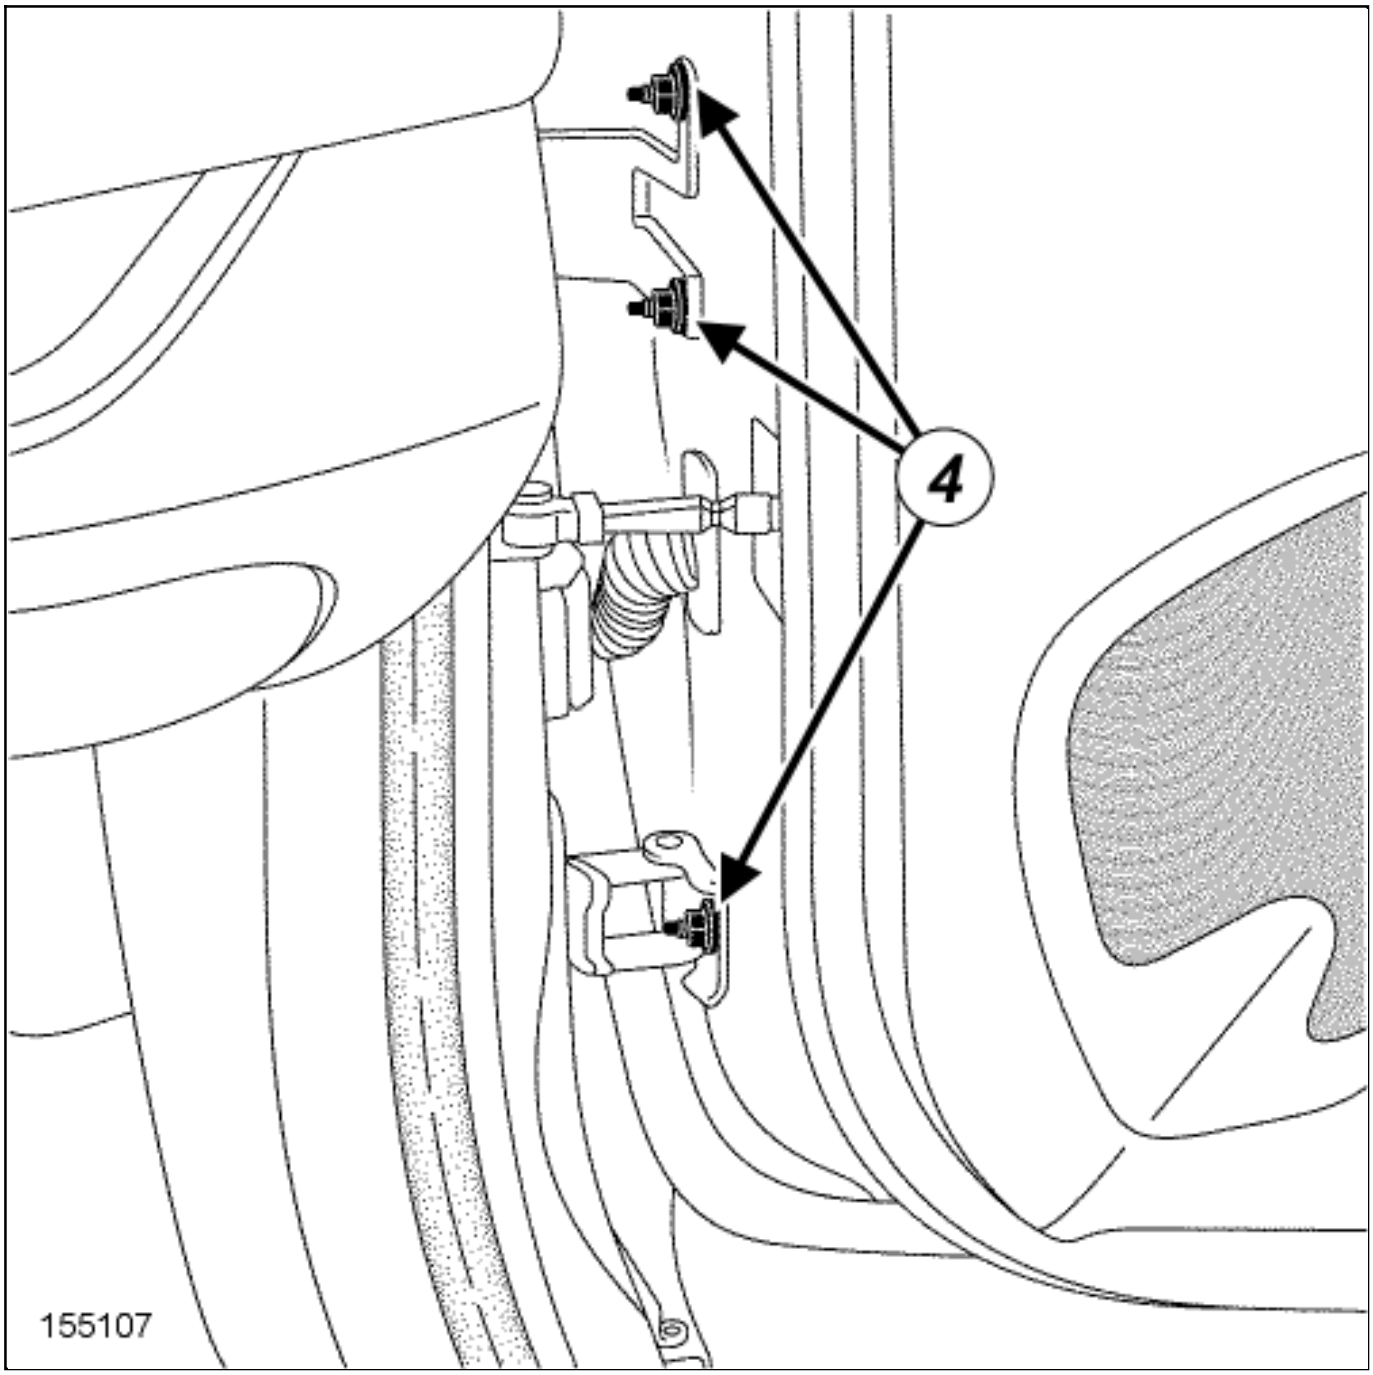
- the front wheelFront hub carrier assembly: Exploded view ,
- the front wheel arch linerExterior body front trim assembly: Exploded view .



2- SAME PROCEDURE FOR BOTH TYPES

Extract the protector(1) of the front side door wiring on the A-pillar.

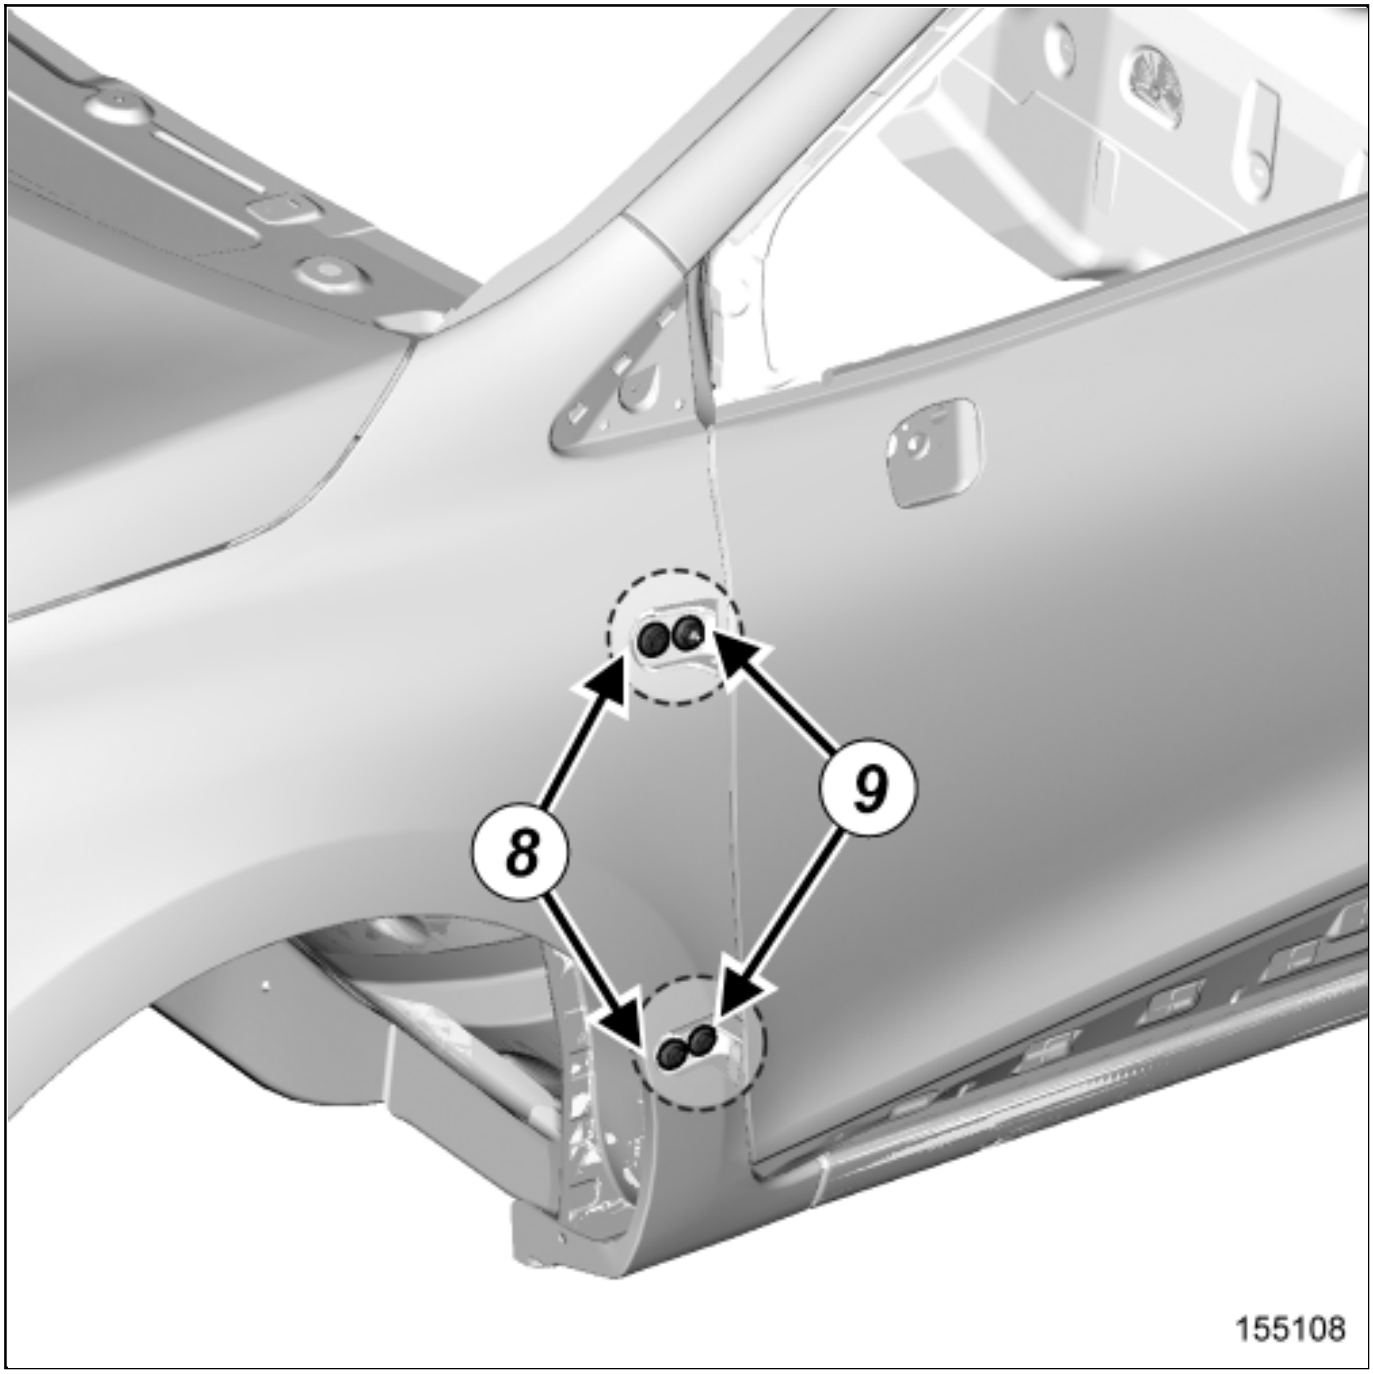
Disconnect the connector(2) of the front side door wiring.



Remove the bolt(3) of the front side door check strap on the A-pillar.

Move aside the front side door check strap.

2. REMOVAL OPERATION

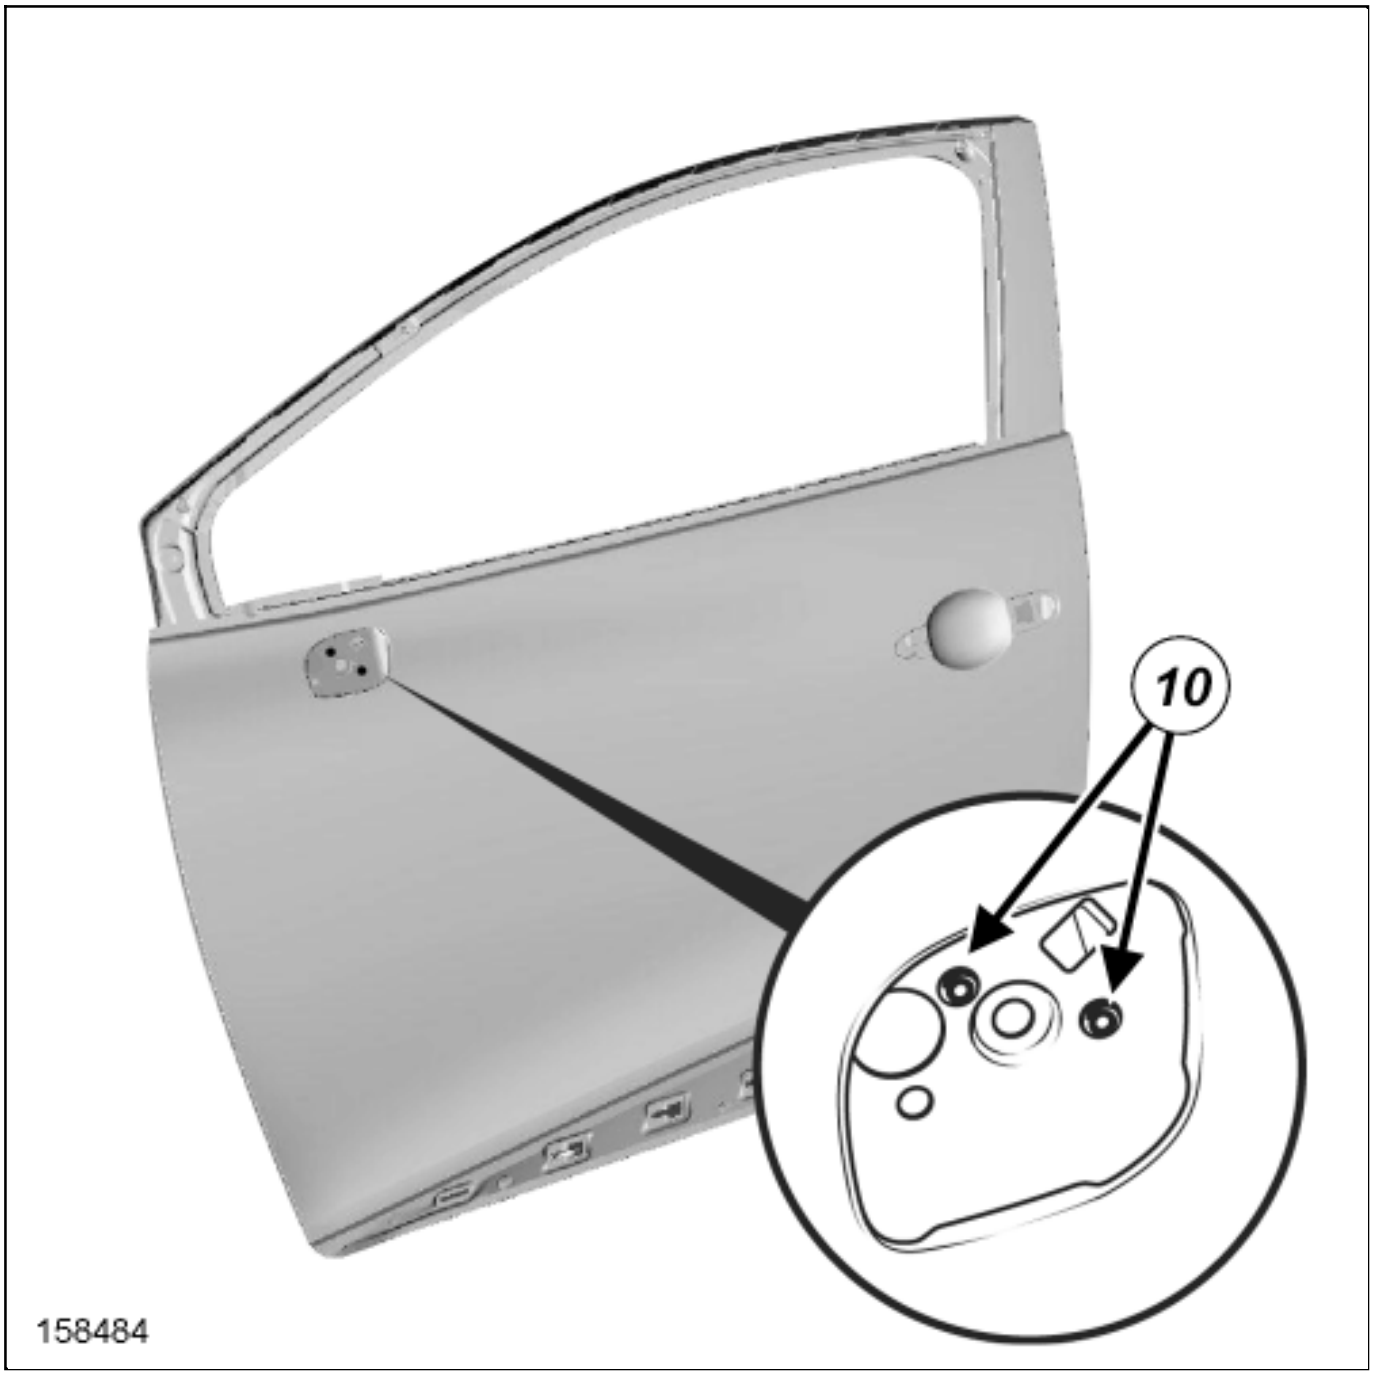


1- REMOVAL WITHOUT HINGES

Remove:

- the front side door nuts(4) ,
- the front side door (this operation requires two people).

2- REMOVAL WITH HINGES



Remove:

- the front side door bolts(**8**) ,
- the front side door nuts(**9**) ,
- the front side door (this operation requires two people).

REFITTING

1. REFITTING OPERATION

1- REFITTING PREPARATION OPERATION FOR A REPLACEMENT

In the event of a replacement:

- before painting, add two structure rivets (Ref: 77 03 072 423) on the new part,

fit the two rivets(10) on the rear-view mirror mounting as indicated in the illustration.

1- REFITTING WITHOUT HINGES

- Proceed in the reverse order to removal.

- Adjust the front side door clearances and flush fittings(see 47A, Side opening elements, Front side opening element: Adjustment) .

> Note:
>
> The original hinge mounting plates are bonded to the door box section.
>
> To carry out the adjustment, it is necessary to remove the plate using a wooden block and a hammer.

- Carry out a function test on all functions.

2- REFITTING WITH HINGES

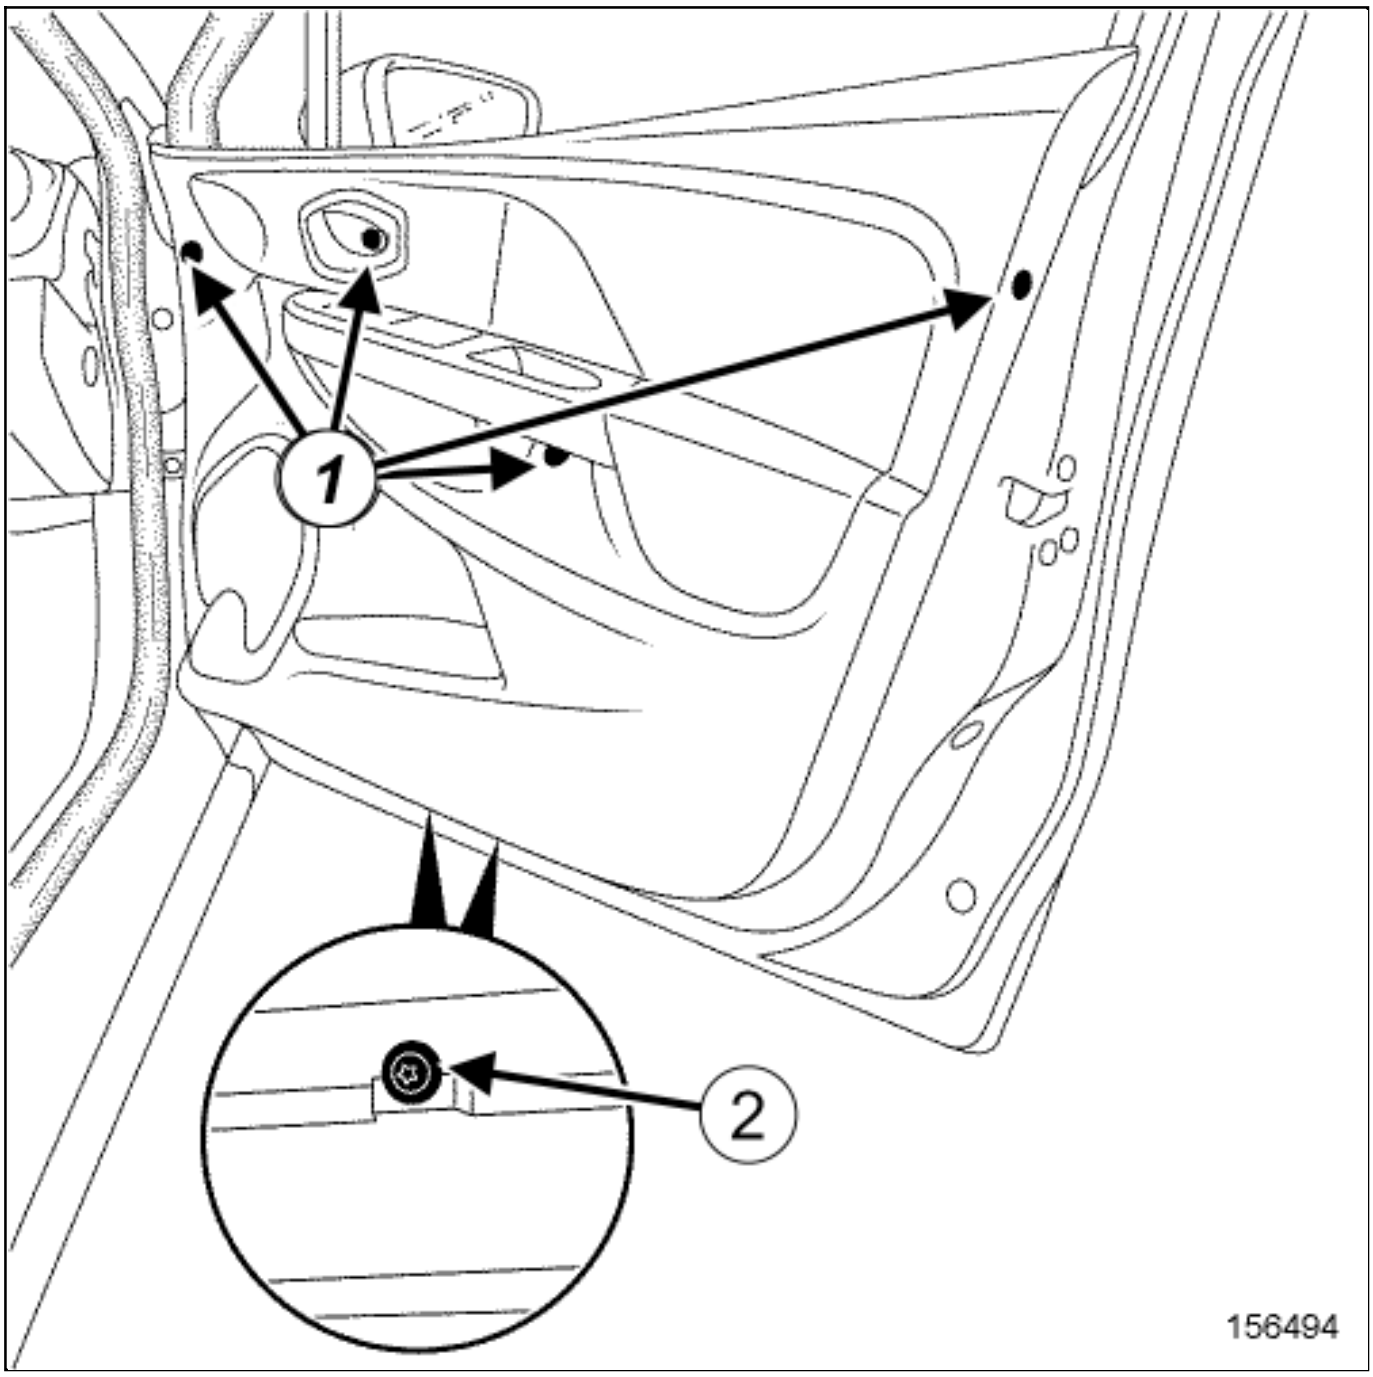
> Note:
>
> Apply a bead of sealing masticVehicle: Parts and consumables for the repair to the door hinges Anti-corrosion protection product before assembly: Use .

- Proceed in the reverse order to removal.

- Adjust the front side door clearances and flush fittings(see 47A, Side opening elements, Front side opening element: Adjustment) .

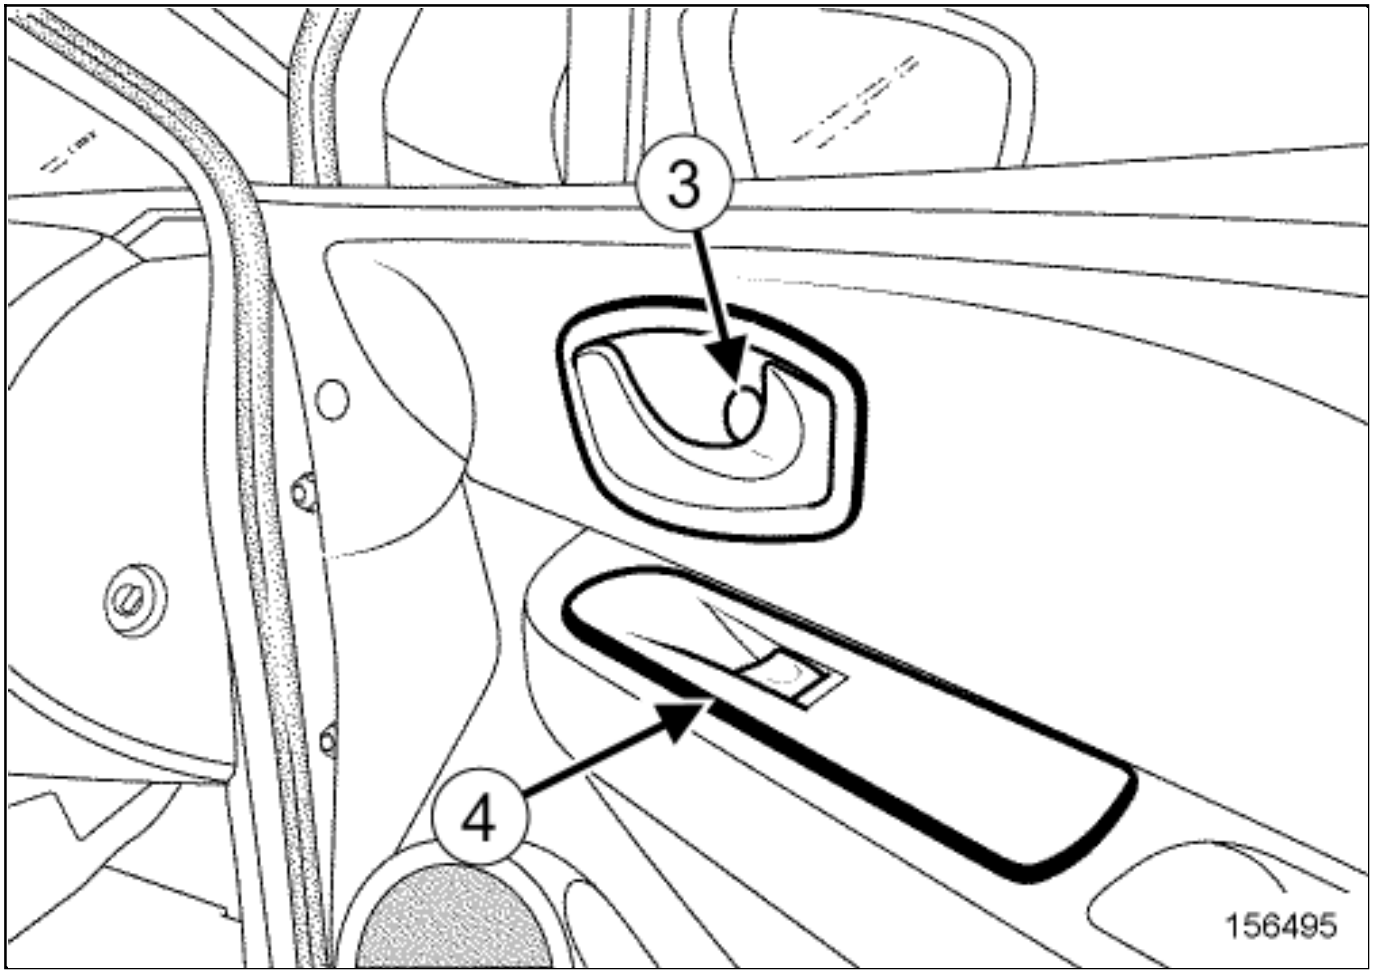
Carry out a function test on all functions.

Repair-40x10x02x08-01x37-1-4-1.xml



XSL version : 3.02 du 22/07/11

FRONT SIDE OPENING ELEMENT TRIM: REMOVAL - REFITTING



Special tooling required	
Set of trim removal levers.	Car. 1363

REMOVAL

1. REMOVAL OPERATION

- Unclip the blanking covers(1) .
- Remove the screws(1) and (2) .

- Remove:
  - the front side door interior handle screw(3) ,
  - the front side door opening handle using the toolSet of trim removal levers.(Car. 1363) .
- Unclip the electric window switch plate using the toolSet of trim removal levers.(Car. 1363) from the front side door trim(4) .
- Disconnect the front electric window switch connectors.

Remove the front side door trim using a pair of unclipping pliers.

REFITTING

1. REFITTING PREPARATION OPERATION

Check the condition of the clips and replace them if necessary.

2. REFITTING OPERATION

Proceed in the reverse order to removal.

Carry out a function test.

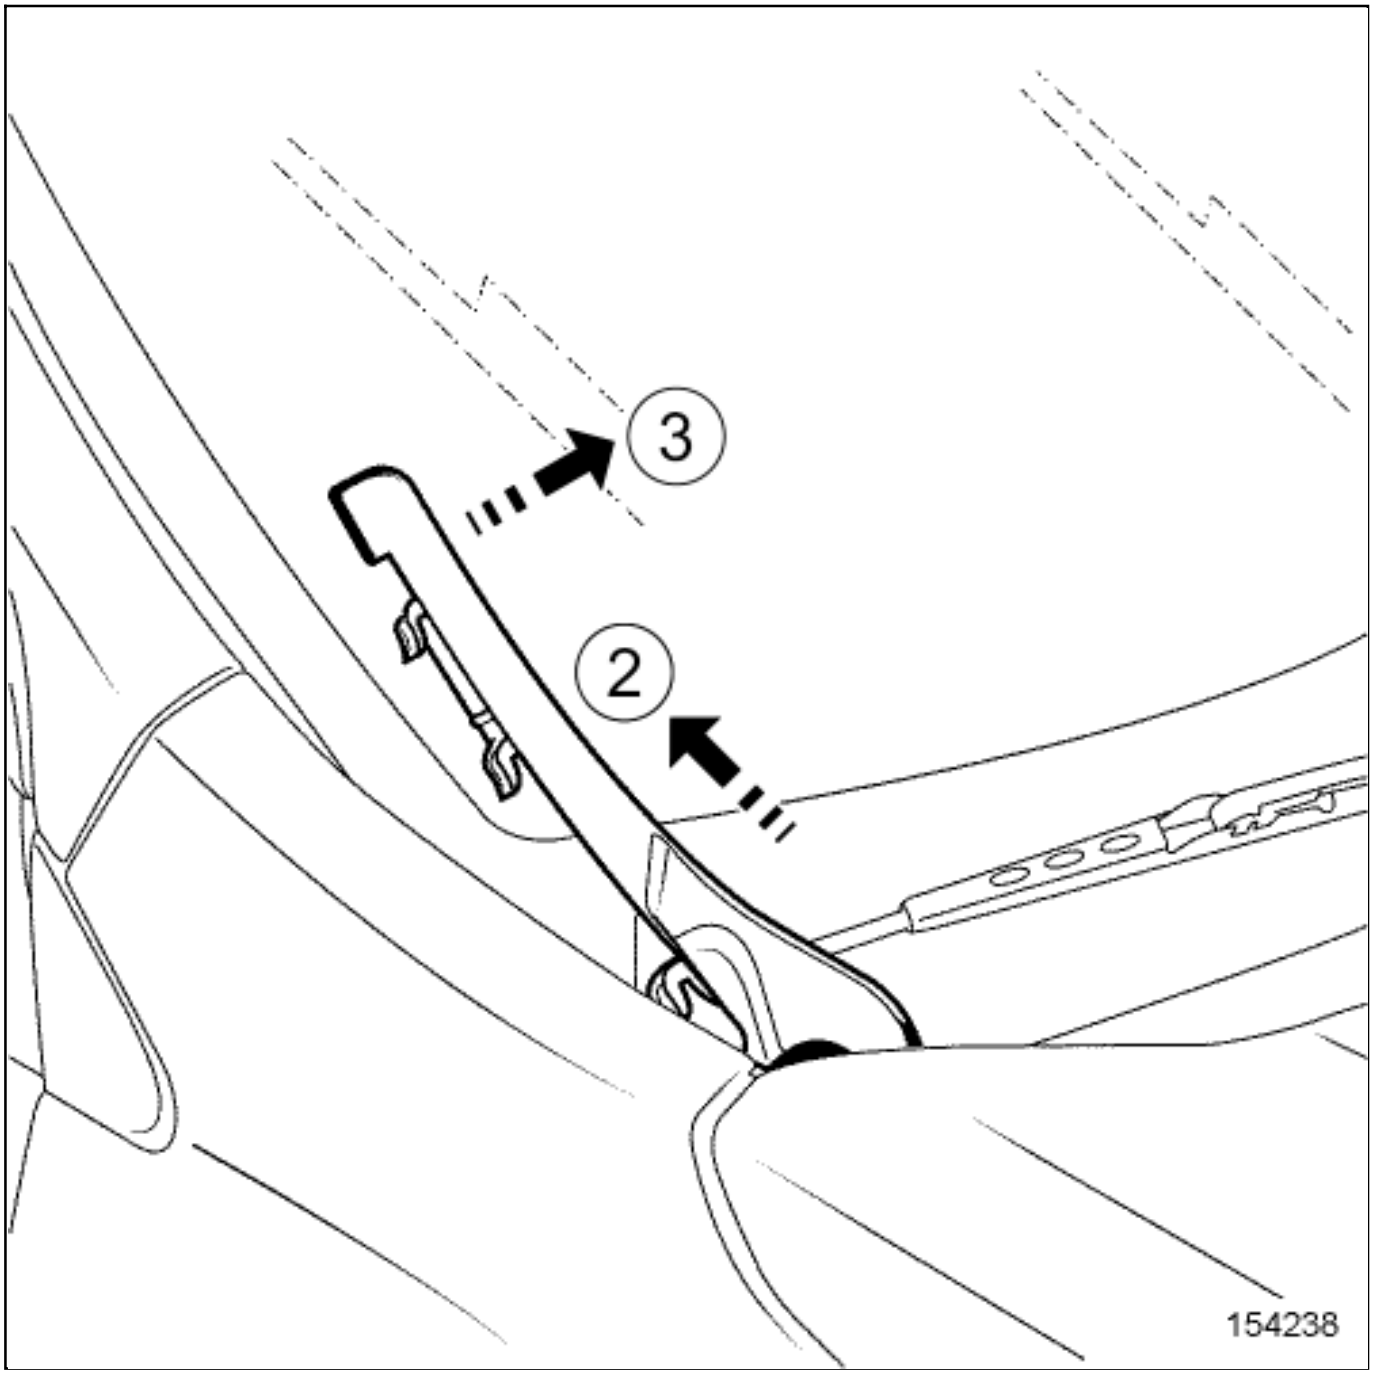
FRONT WING: REMOVAL - REFITTING



The front wing is a structural bodywork component made of thermoplastic, and can be removed.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove the windscreen trim screw(1) .

- Remove the windscreen trim by sliding at(2) and pulling at(3) .

-

Remove:

- the front wing trim Exterior body side trim assembly: Exploded view ,
- the front wheel arch liner Exterior body front trim assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,

- the windscreen wiper arms Wiping and washing: List and location of components ,
- the scuttle panel grille Scuttle panel grille: Removal - Refitting .

2. REMOVAL OPERATION

Remove Exterior body front trim assembly: Exploded view :

- the front wing interior soundproofing material,
- the front wing bolts,
- the front wing nuts,
- the front wing.

REFITTING

1. REFITTING OPERATION

Refit Exterior body front trim assembly: Exploded view :

- the front wing,
- the front wing bolts and nuts.

Adjust the shut lines of the front wing Vehicle panel gaps: Adjustment value .

Refit the front wing interior soundproofing material.

2. FINAL OPERATION

Proceed in the reverse order to removal.

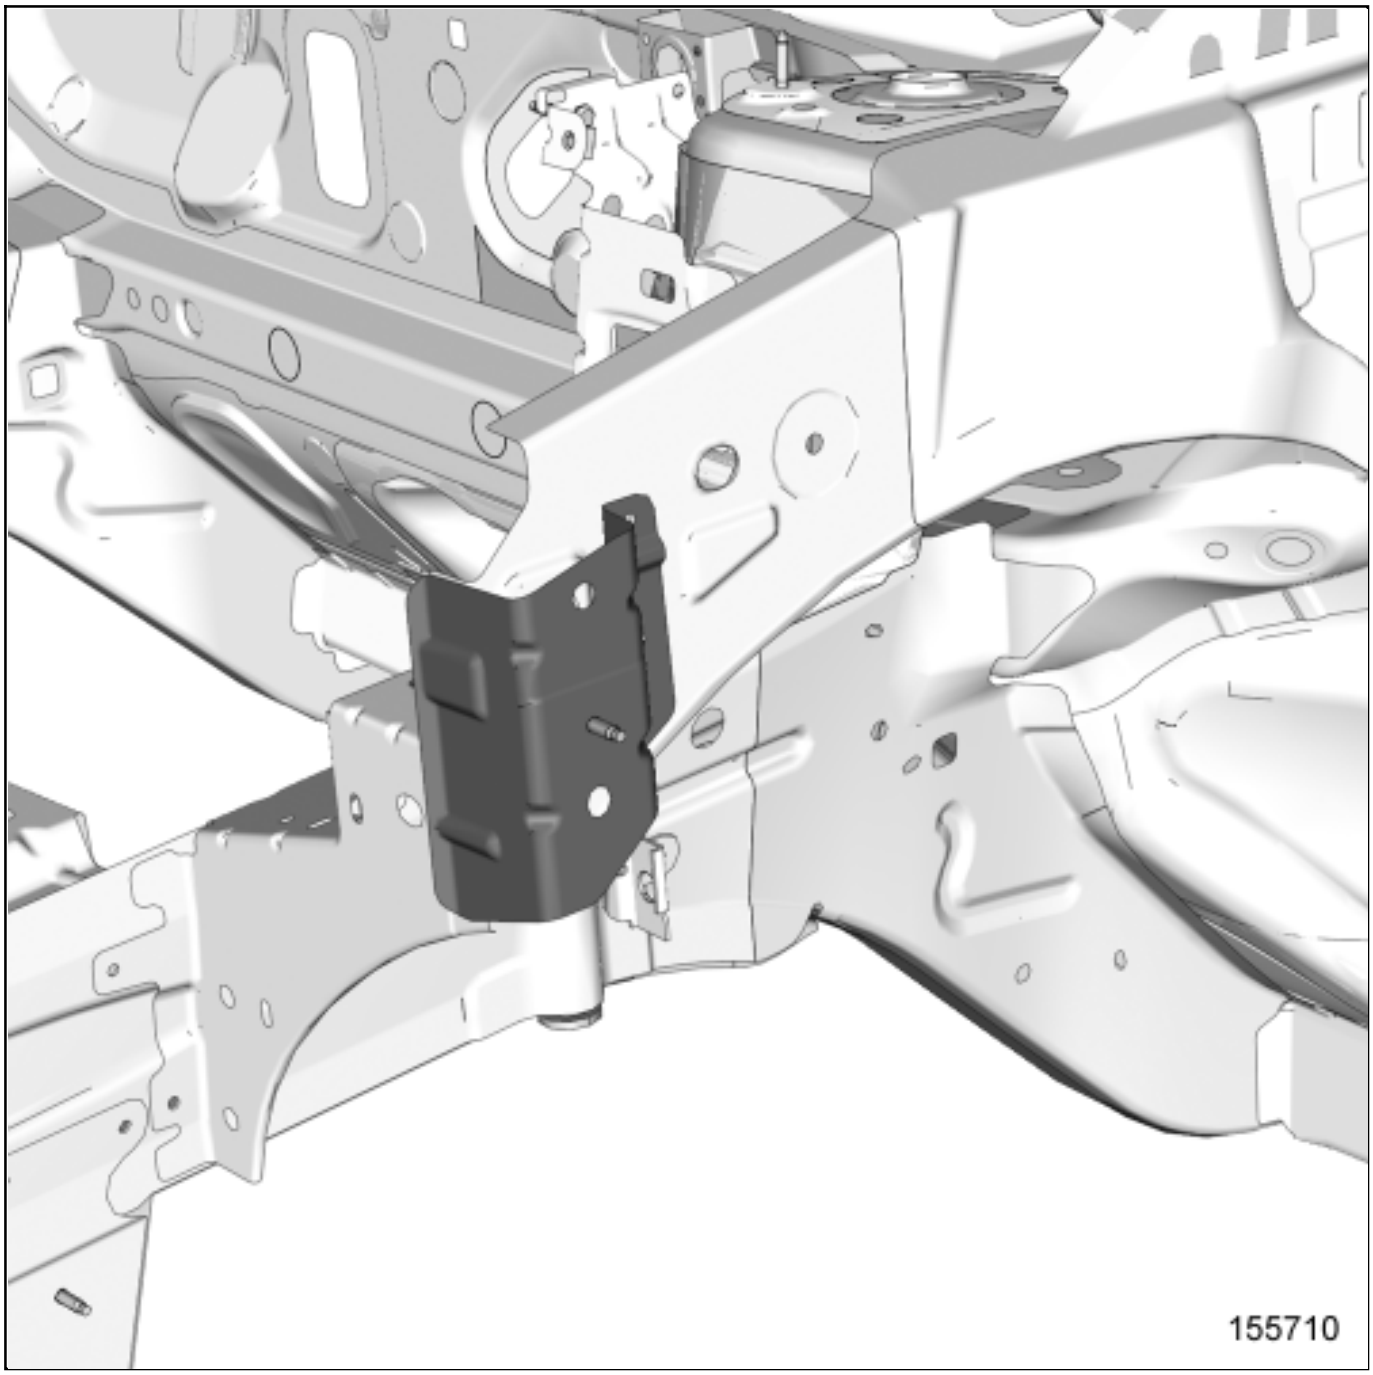
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Front wing upper mounting support	Mild steel	1.2



2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

complete replacement.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

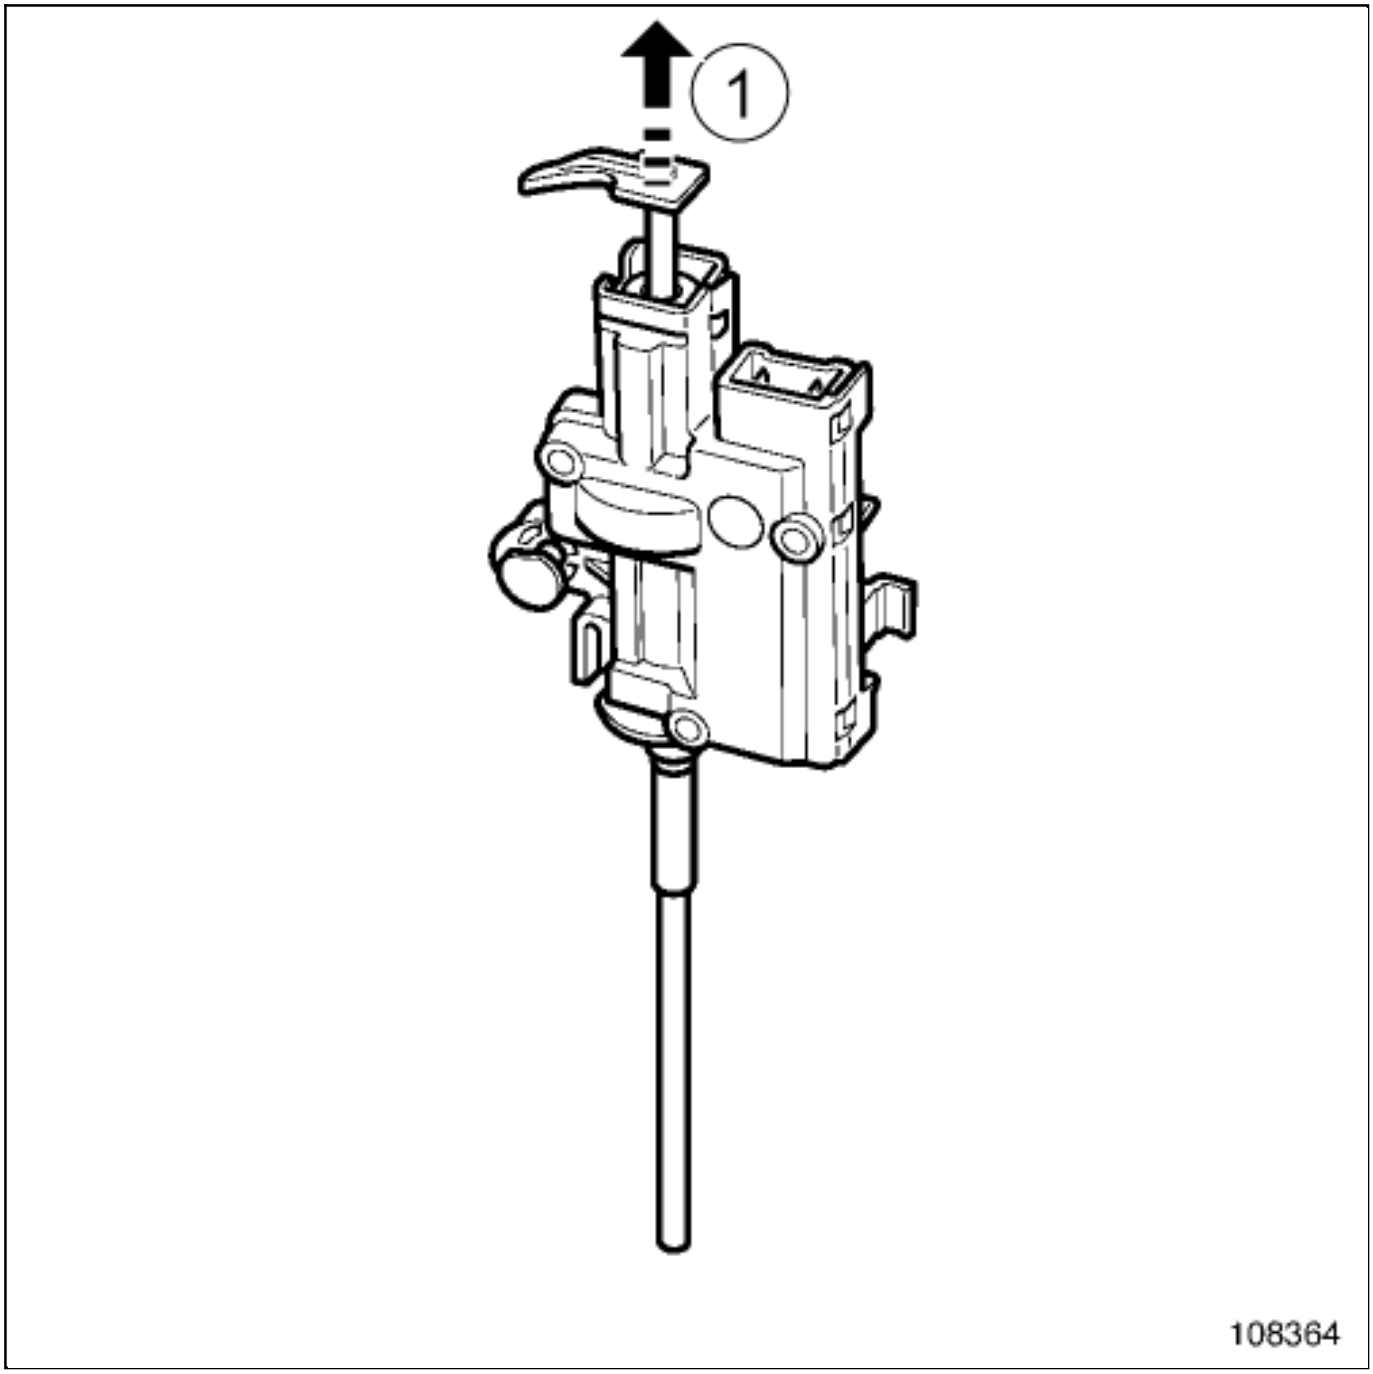
To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

CAUTION



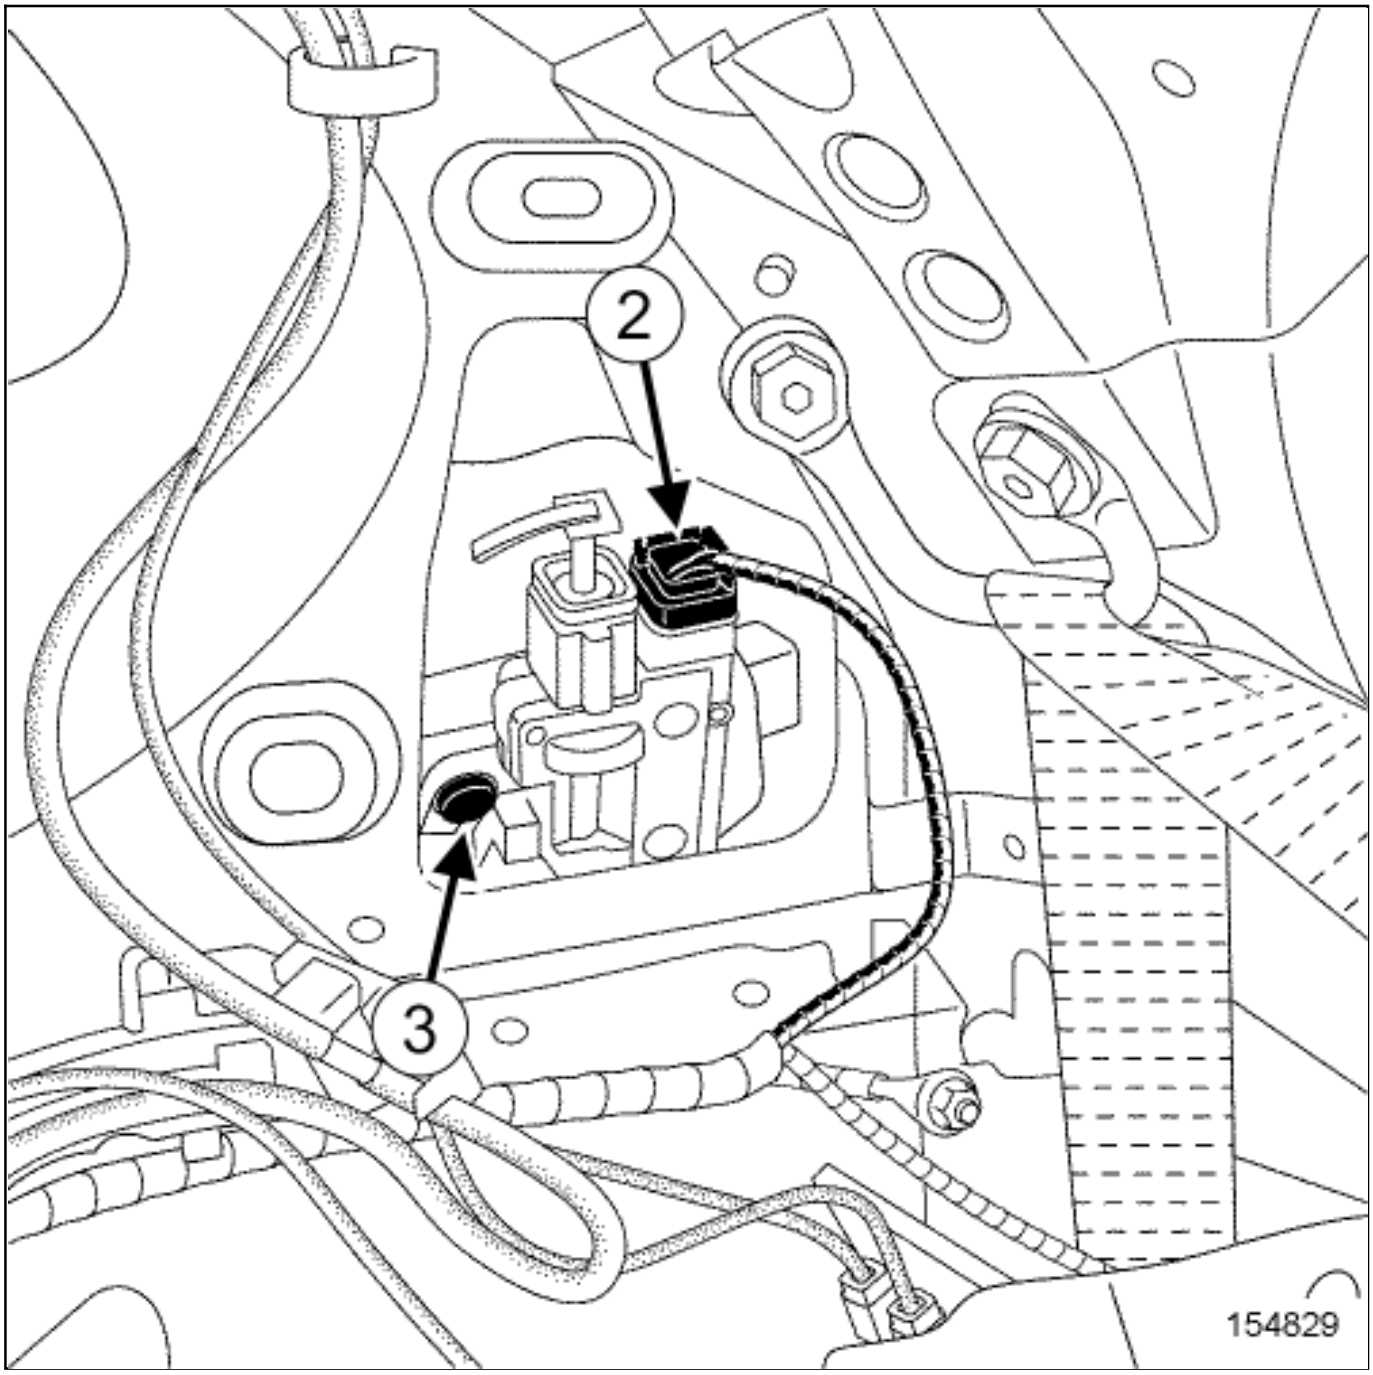
If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

FUEL FILLER FLAP LOCKING MOTOR: REMOVAL - REFITTING

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the rear quarter panel trim Interior body side trim assembly: Exploded view .



Note:

During an electrical fault, activate the motor manually by raising the catch(1) .

Check that the motor is in the correct position (fuel filler flap unlocked).

2. REMOVAL OPERATION

- Disconnect the connector(2) .
- Unfasten clip (3) .
- Remove the fuel filler flap locking motor.

REFITTING

1. REFITTING OPERATION

- Refit the fuel filler flap locking motor.
- Clip on the motor clip.
- Connect the connector.

2. FINAL OPERATION

- Proceed in the reverse order to removal.

FUEL FLOW: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
Pressure gauges and petrol pressure measuring unions.	Mot. 1311-01
Union for taking fuel pressure measurements.	Mot. 1311-08

Equipment required
graduated measuring cylinder

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair .

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

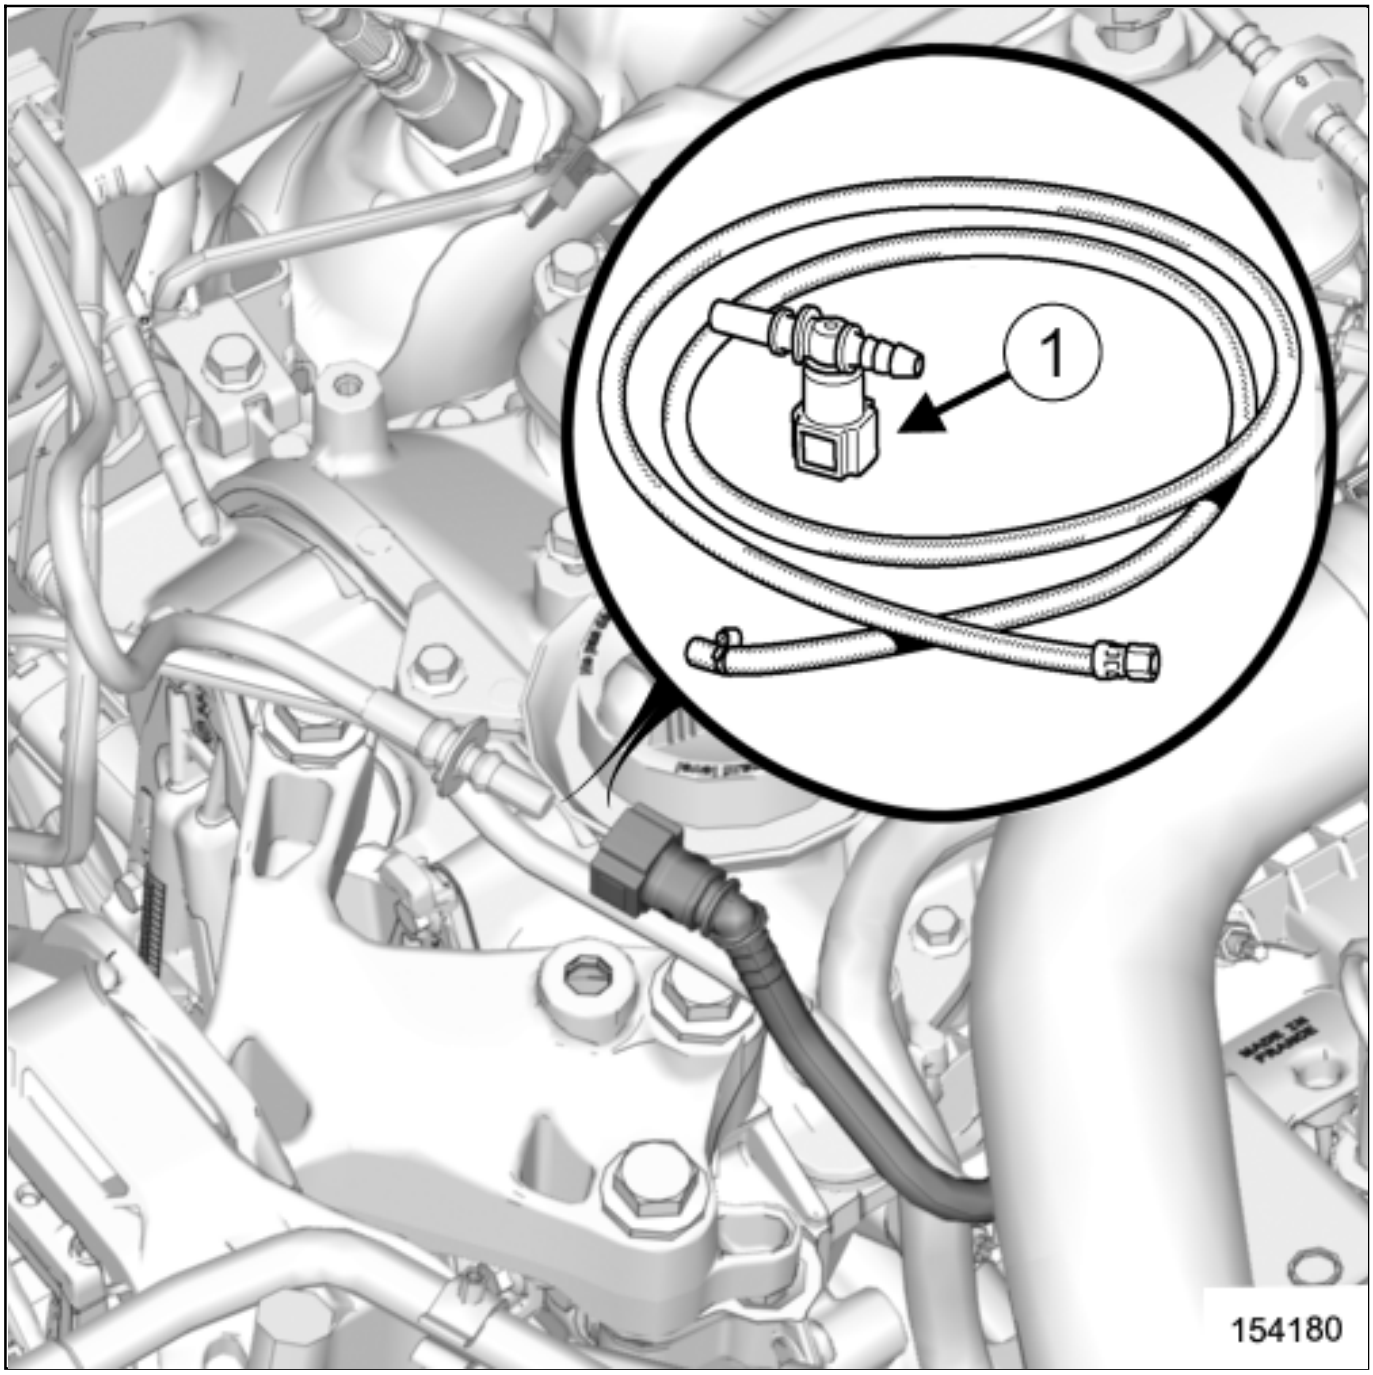
WARNING

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

Wear goggles with side protectors for this operation.

CAUTION



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CHECK

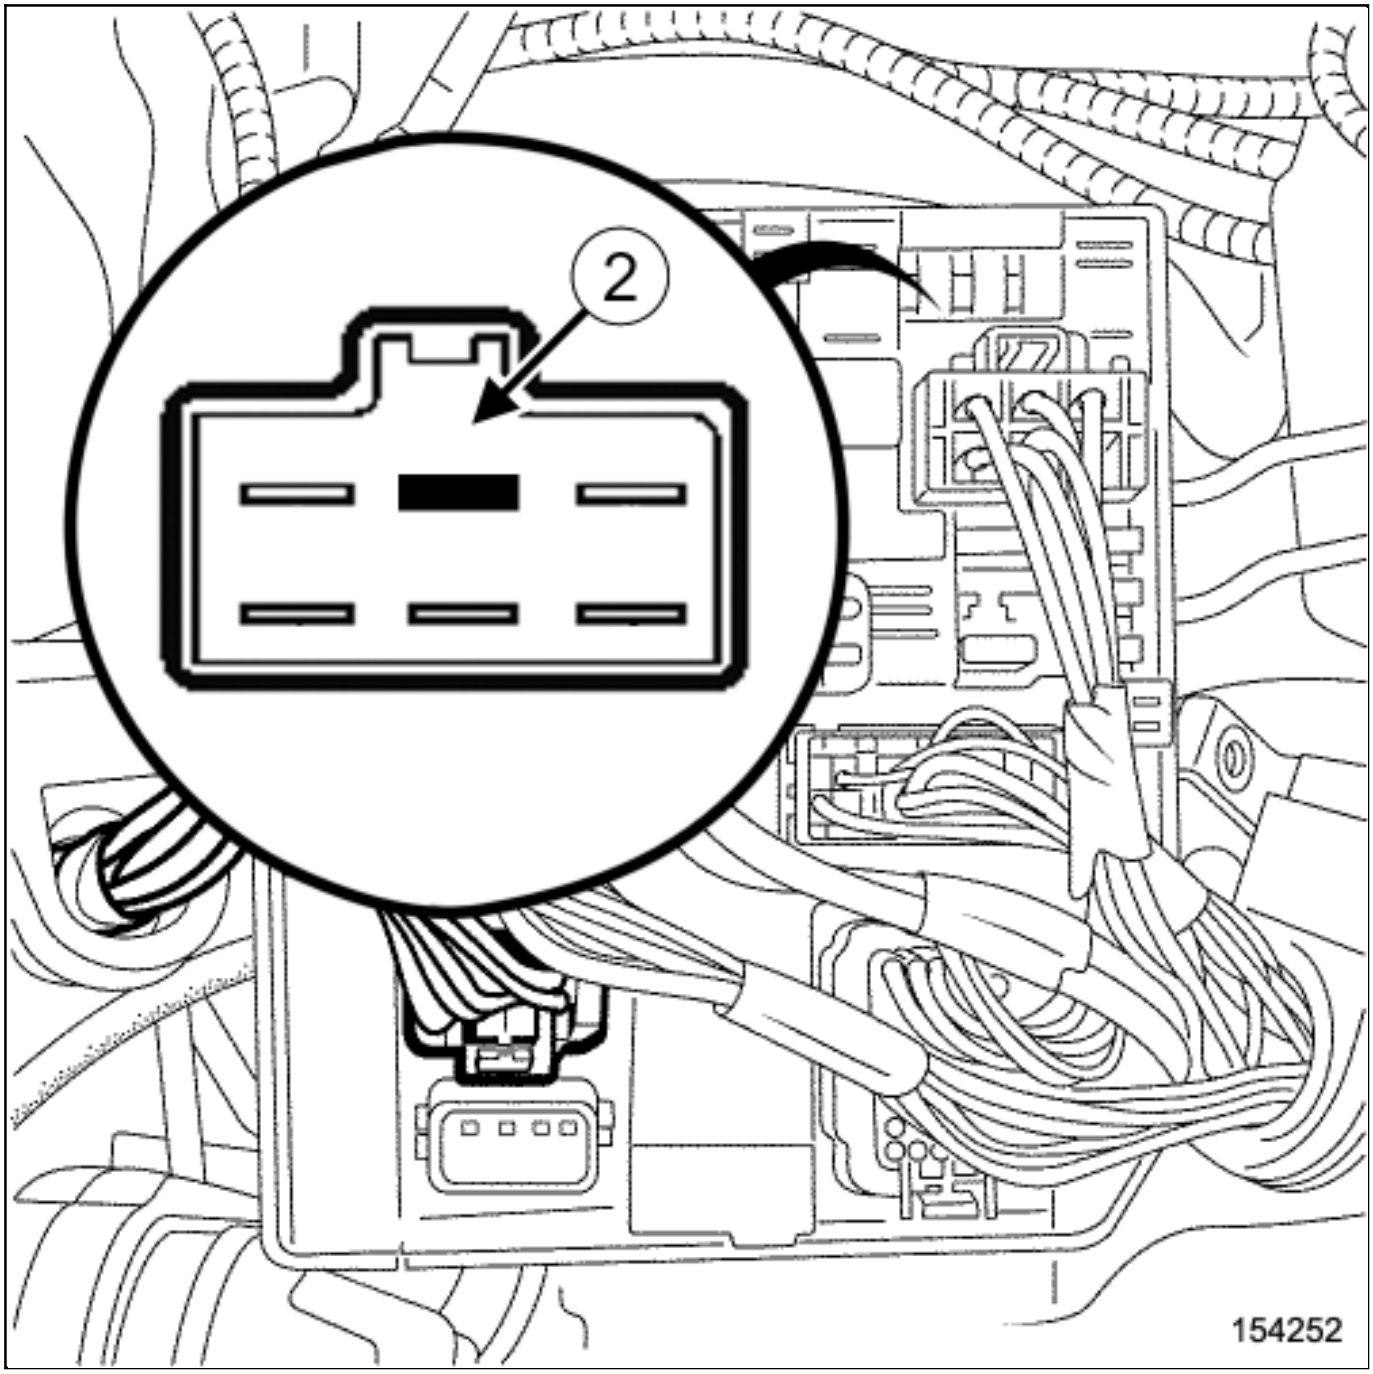
1. PREPARATION OPERATION FOR CHECK

- Ensure you have a checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) and a "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

- Assemble the long hose of the checking toolPressure gauges and petrol pressure measuring unions. (Mot. 1311-01) and the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Unclip the fuel pipe from the right-hand suspended engine mounting.

Disconnect the fuel supply union.



Connect:

- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) (1) to the injector rail,
- the fuel supply union to the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

2. CHECK

Immerse the pipe into a graduated measuring cylinder(2000 ml).

Remove the cover from the engine compartment connection unit.

- Disconnect the 6 track connector.

- Connect the terminal(2) of the connector to a + battery supply to operate the fuel pump.

Note:

The flow reading should be between 80 and 120 l/h.

Remove the + battery feed of terminal(2) from the connector.

Connect the 6-track connector.

3. FINAL OPERATION

Clip on the Protection and Switching Unit cover.

Disconnect:

- the fuel supply union from the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) ,
- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) from the injector rail.

Connect the fuel supply union.

Separate the checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) from the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

FUEL FLOW: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
Pressure gauges and petrol pressure measuring unions.	Mot. 1311-01
Union for taking fuel pressure measurements.	Mot. 1311-08

Equipment required
graduated measuring cylinder

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair .

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

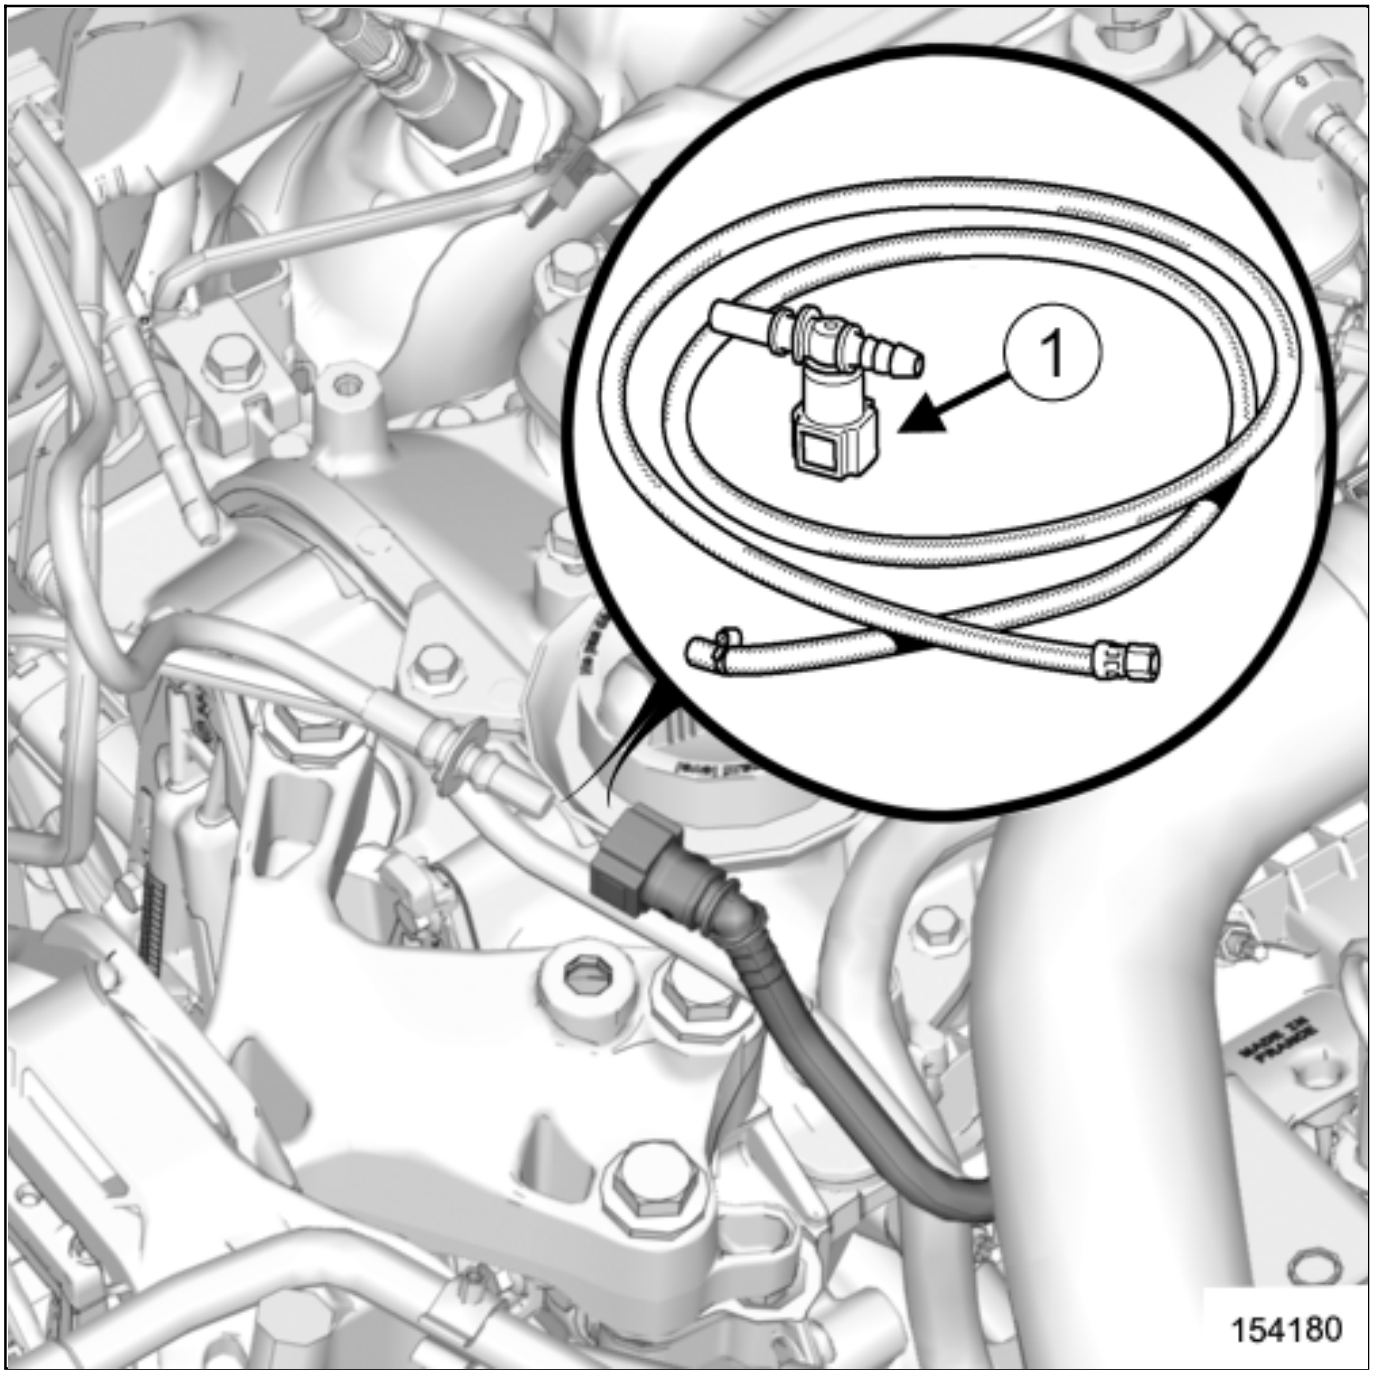
WARNING

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

Wear goggles with side protectors for this operation.

CAUTION



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CHECK

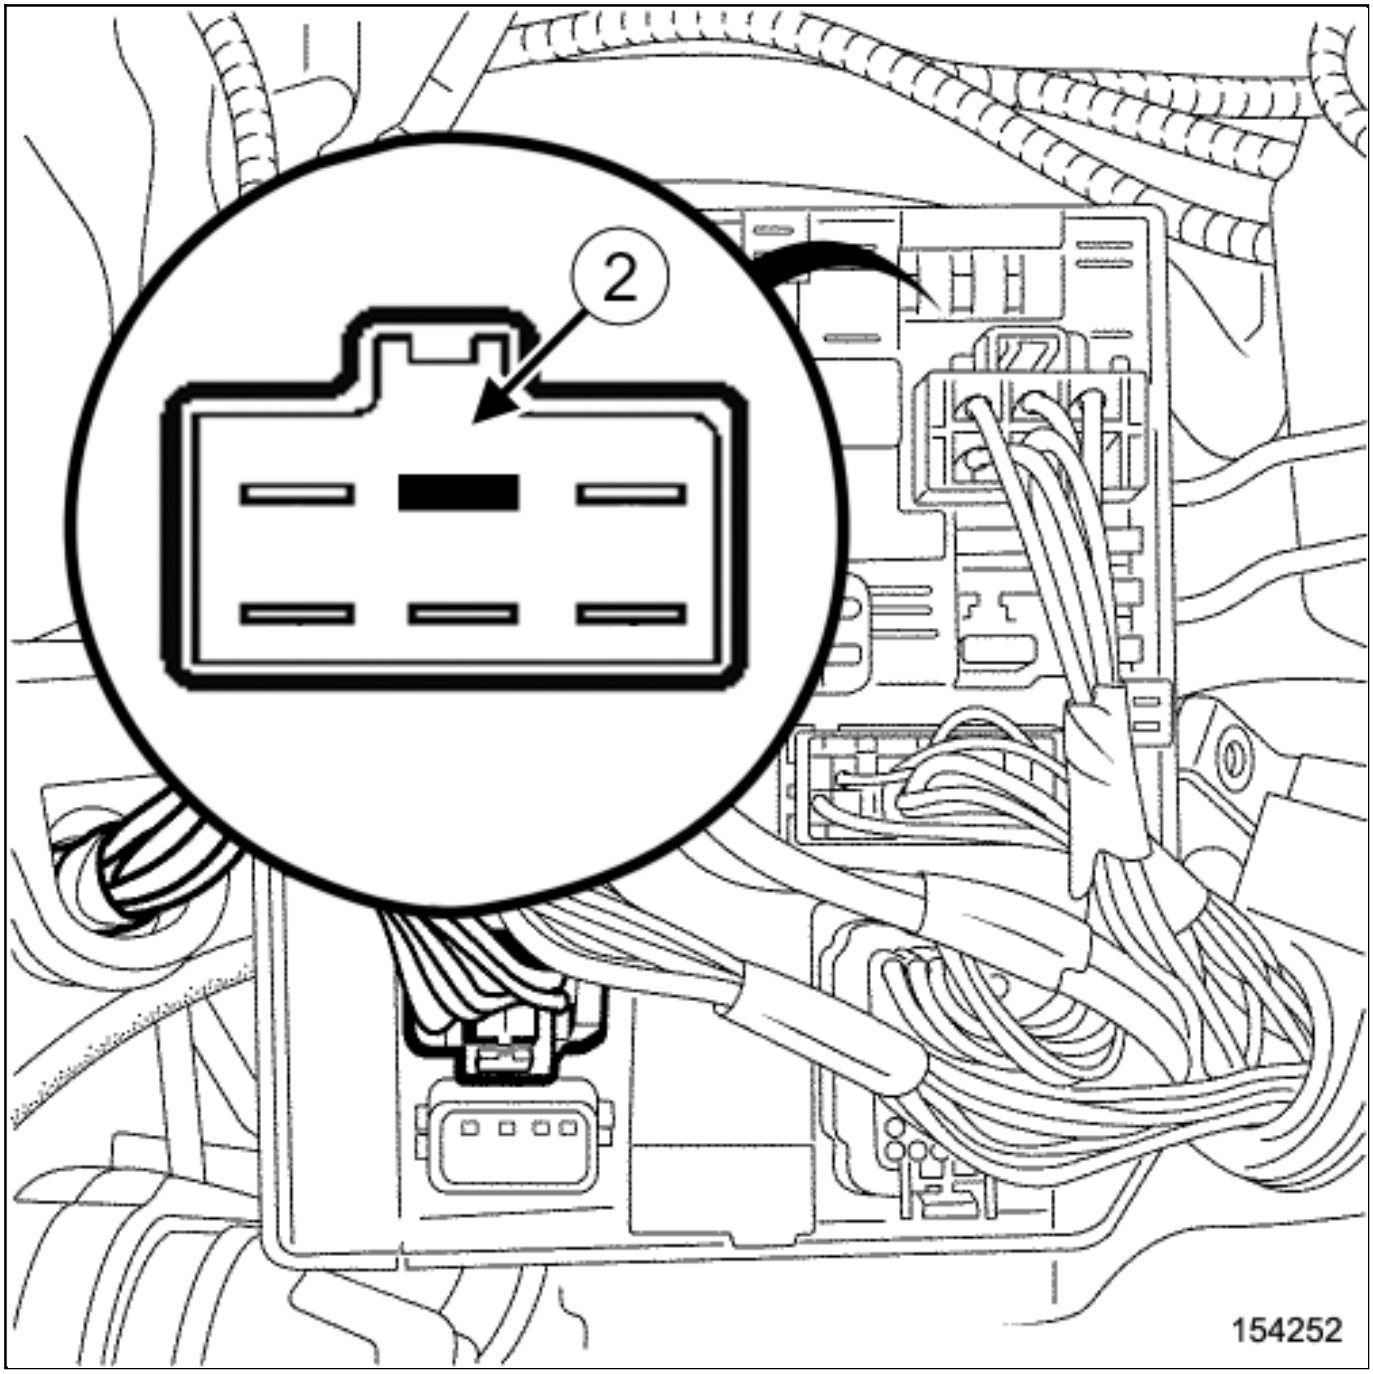
1. PREPARATION OPERATION FOR CHECK

- Ensure you have a checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) and a "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

- Assemble the long hose of the checking toolPressure gauges and petrol pressure measuring unions. (Mot. 1311-01) and the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Unclip the fuel pipe from the right-hand suspended engine mounting.

Disconnect the fuel supply union.



Connect:

- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) (1) to the injector rail,
- the fuel supply union to the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

2. CHECK

Immerse the pipe into a graduated measuring cylinder(2000 ml).

Remove the cover from the engine compartment connection unit.

- Disconnect the 6 track connector.

- Connect the terminal(2) of the connector to a + battery supply to operate the fuel pump.

Note:

The flow reading should be between 80 and 120 l/h.

Remove the + battery feed of terminal(2) from the connector.

Connect the 6-track connector.

3. FINAL OPERATION

Clip on the Protection and Switching Unit cover.

Disconnect:

- the fuel supply union from the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) ,
- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) from the injector rail.

Connect the fuel supply union.

Separate the checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) from the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

FUEL LEVEL SENSOR MODULE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Universal spanner for removing fuel gauge nuts.	Mot. 1397

Equipment required
Diagnostic tool

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19C, Tank, Fuel tank assembly: Exploded view) .

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

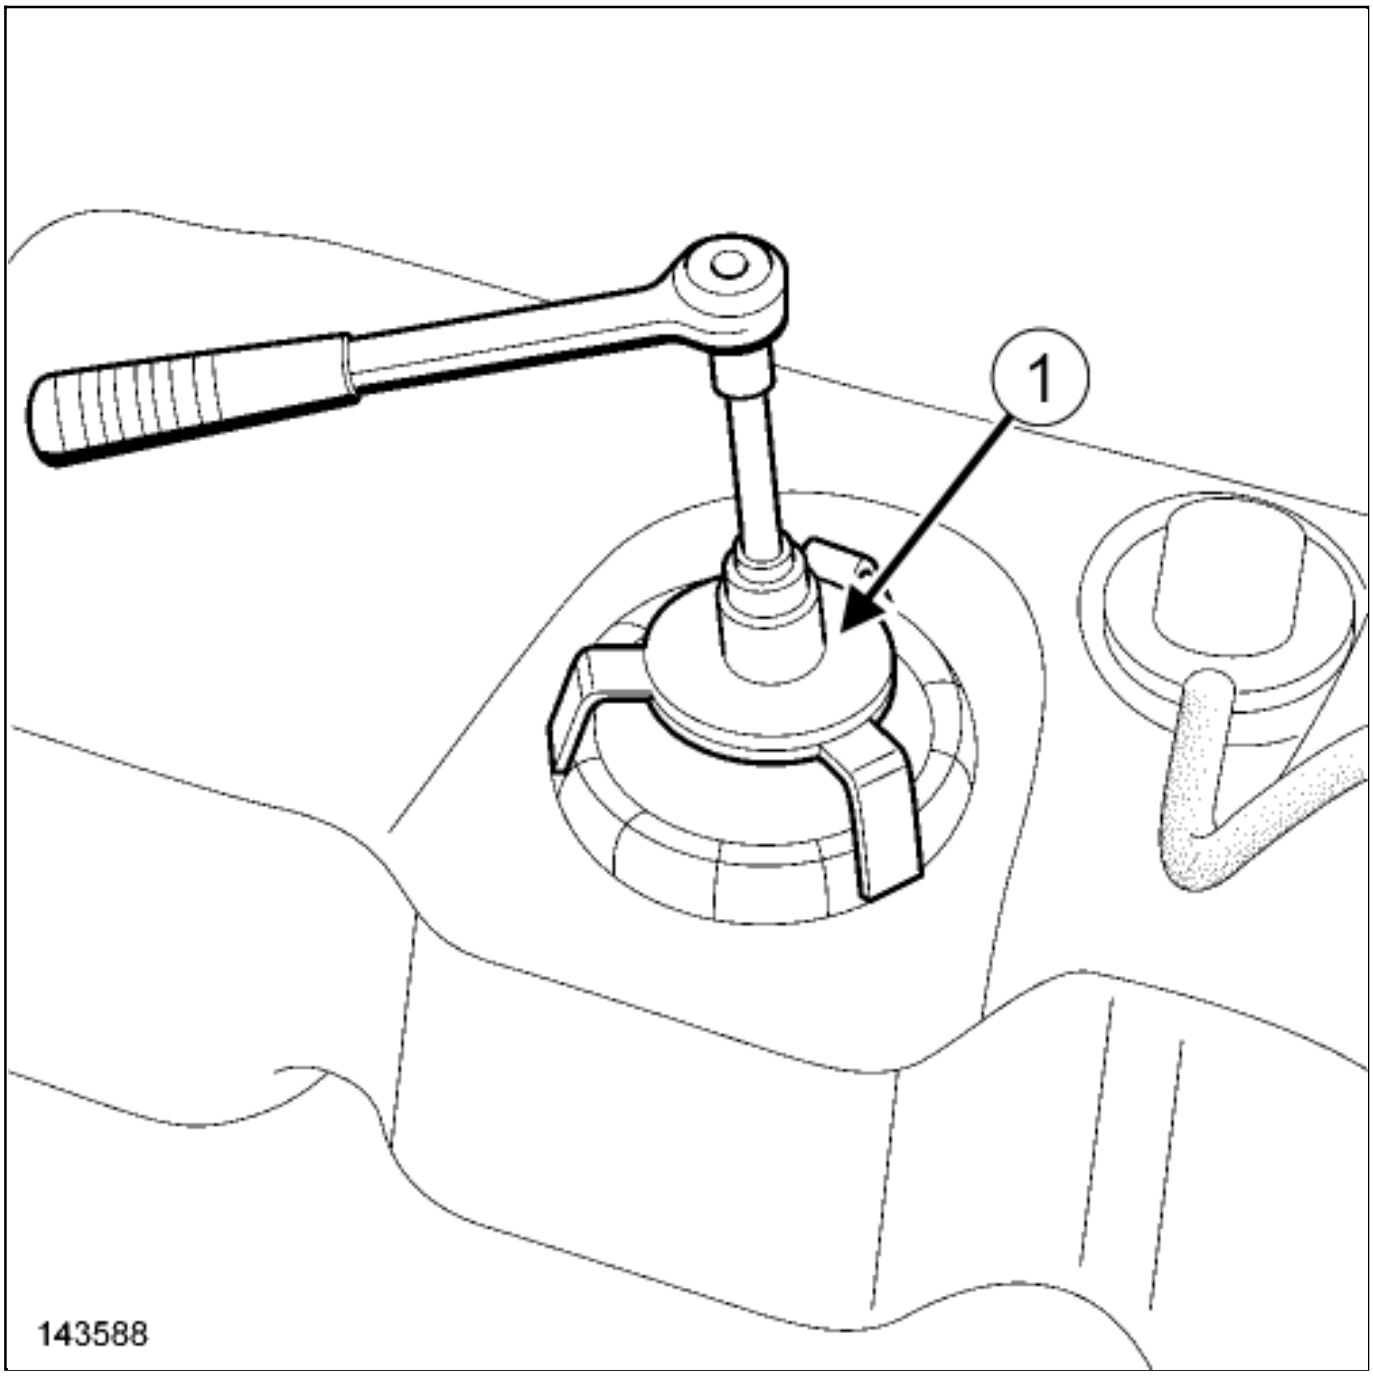
WARNING

Wear goggles with side protectors for this operation.

CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CAUTION



To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

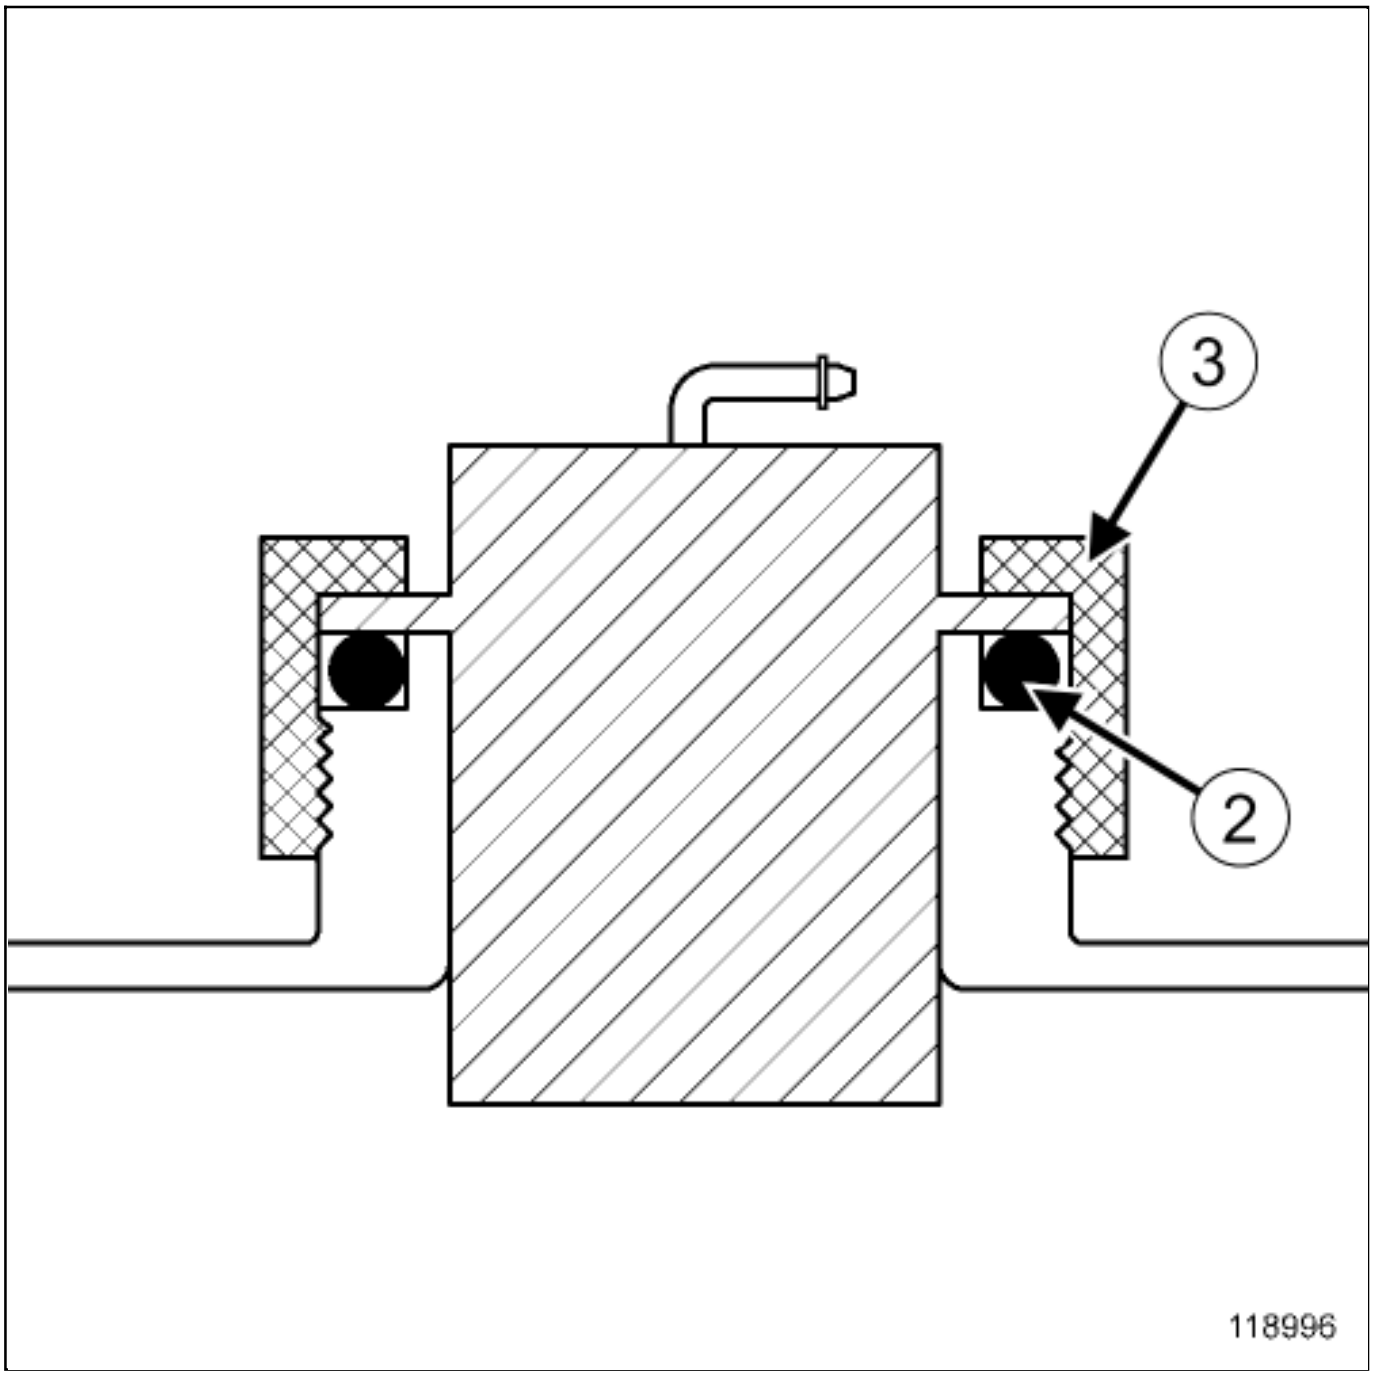
REMOVAL

1. REMOVAL PREPARATION OPERATION

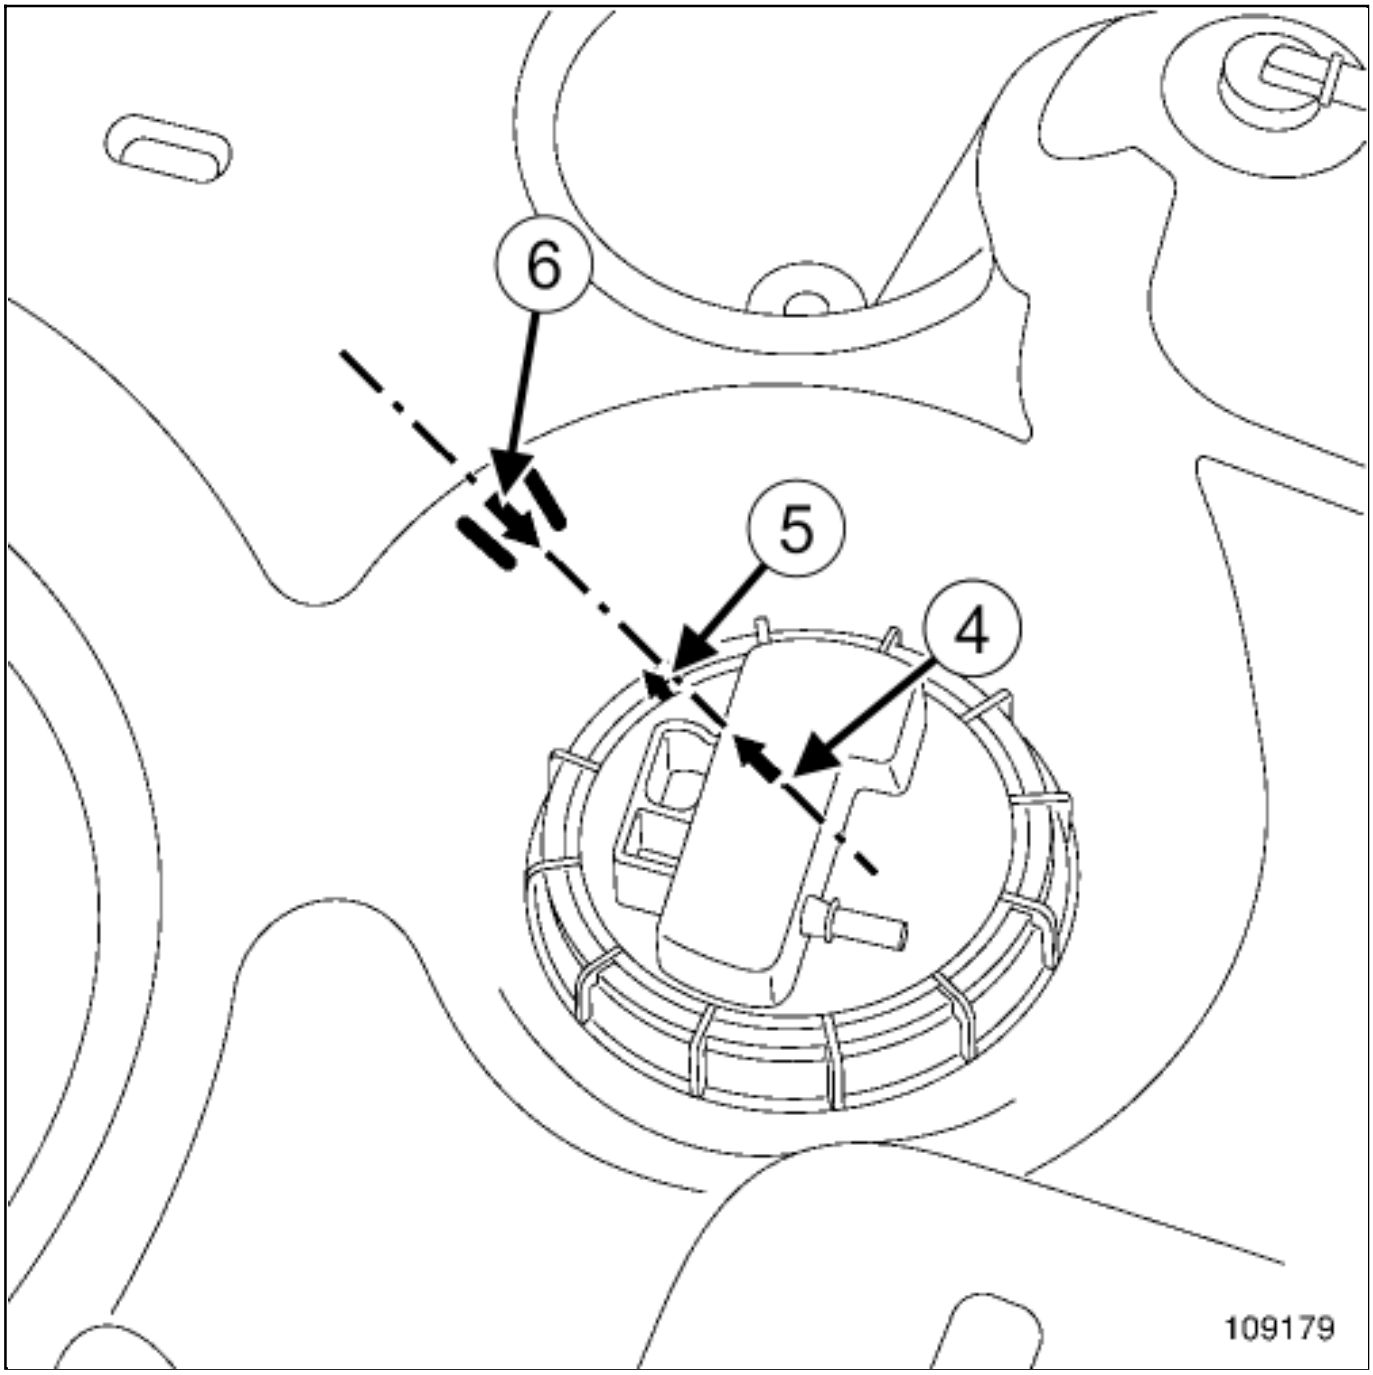
- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Drain the tank (see 19C, Tank, Fuel tank: Draining) .
- Remove the fuel tank (see 19C, Tank, Fuel tank assembly: Exploded view) .

2. REMOVAL OPERATION

Remove:



- the nut from the fuel level sensor module using the toolUniversal spanner for removing fuel gauge nuts. (**Mot. 1397**) (**1**) ,
- the fuel level sensor module, taking care not to damage the float.



CAUTION

To prevent the tank from deforming, refit the fuel level sensor module nut to the tank well immediately.

REFITTING

1. REFITTING OPERATION

Position:

- the seal(2) correctly in the neck,
- the fuel level sensor module on the tank. There a tab on the module and a recess in the tank for a single possible position, the mark(4) of the fuel level sensor must be opposite the fuel tank mark(6) .

Press the fuel level sensor module by hand (to prevent the seal from moving) and fit the nut by

hand to the tank.

Next use the toolUniversal spanner for removing fuel gauge nuts.(Mot. 1397) , tighten nut(3) until the mark(5) of the nut is opposite the mark(6) of the tank.

2. FINAL OPERATION

Proceed in the reverse order to removal.

FUEL PIPES: REPAIR

Note, one or more warnings are present in this procedure

Special tooling required	
Pliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond).	
Pipe-cutter, semi-rigid fuel pipes.	
Pliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond).	

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (nitrile type) for this operation.

CAUTION

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

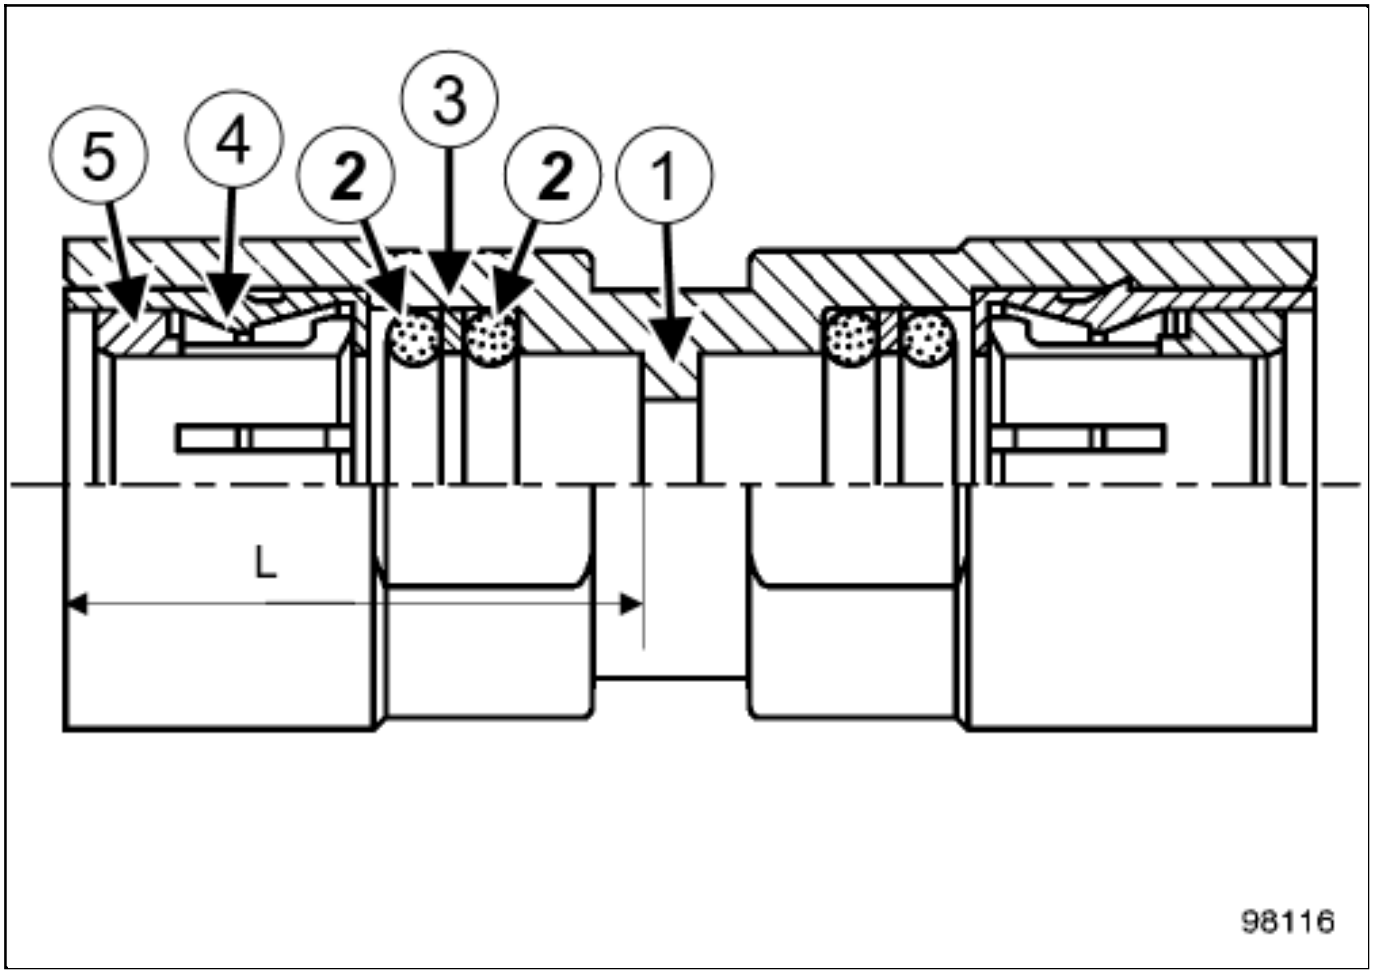
CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

1. PRESENTATION

It is possible to replace parts of the plastic pipes for petrol (fuel supply pipe going from the tank to the injection rail) and diesel fuel (supply pipe going from the tank to the fuel filter) without replacing them completely, the tools and parts required are:

: Pliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond). pliers to disconnect the quick release unions of the fuel pipe diameter 8 mm(Legris and Raymond),



: Pliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond). pliers to disconnect the quick release unions of the fuel pipe diameter 10 mm(Legris and Raymond),

: Pipe-cutter, semi-rigid fuel pipes. tube cutter, semi-rigid fuel pipes,

double union sold as a spare part diameter 8 mmor 10 mm,

tube with length 1.5 mand angled at 90°, diameter 8 mmor 10 mm,

the complete piping of the vehicle that will have to be cut according to requirements.

(1) : Body

(2) : O-rings x2

(3) : Washer

(4) : Dowel

(5) : Clip

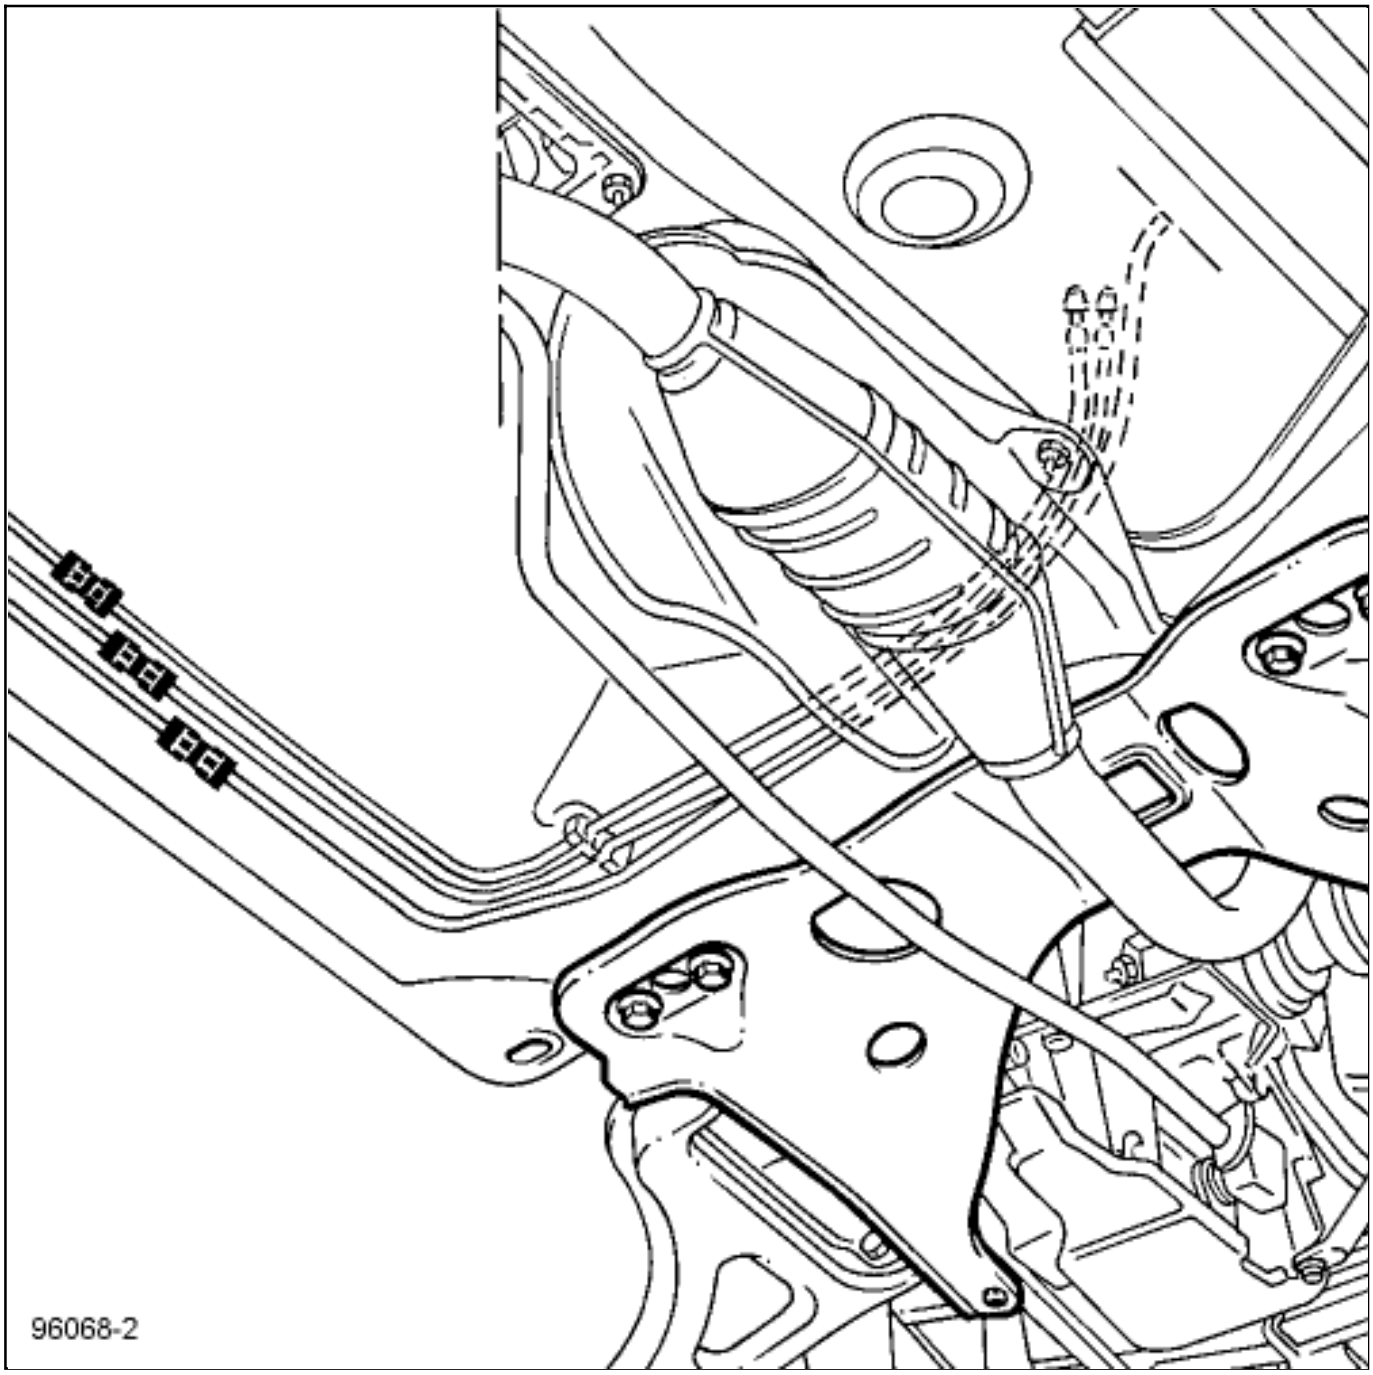
(L) : Length of insertion (L = 18.5 mm)

2. REPLACING PART OF THE PIPE

1- PIPE CUTTING

1)PREPARATION BEFORE CUTTING:

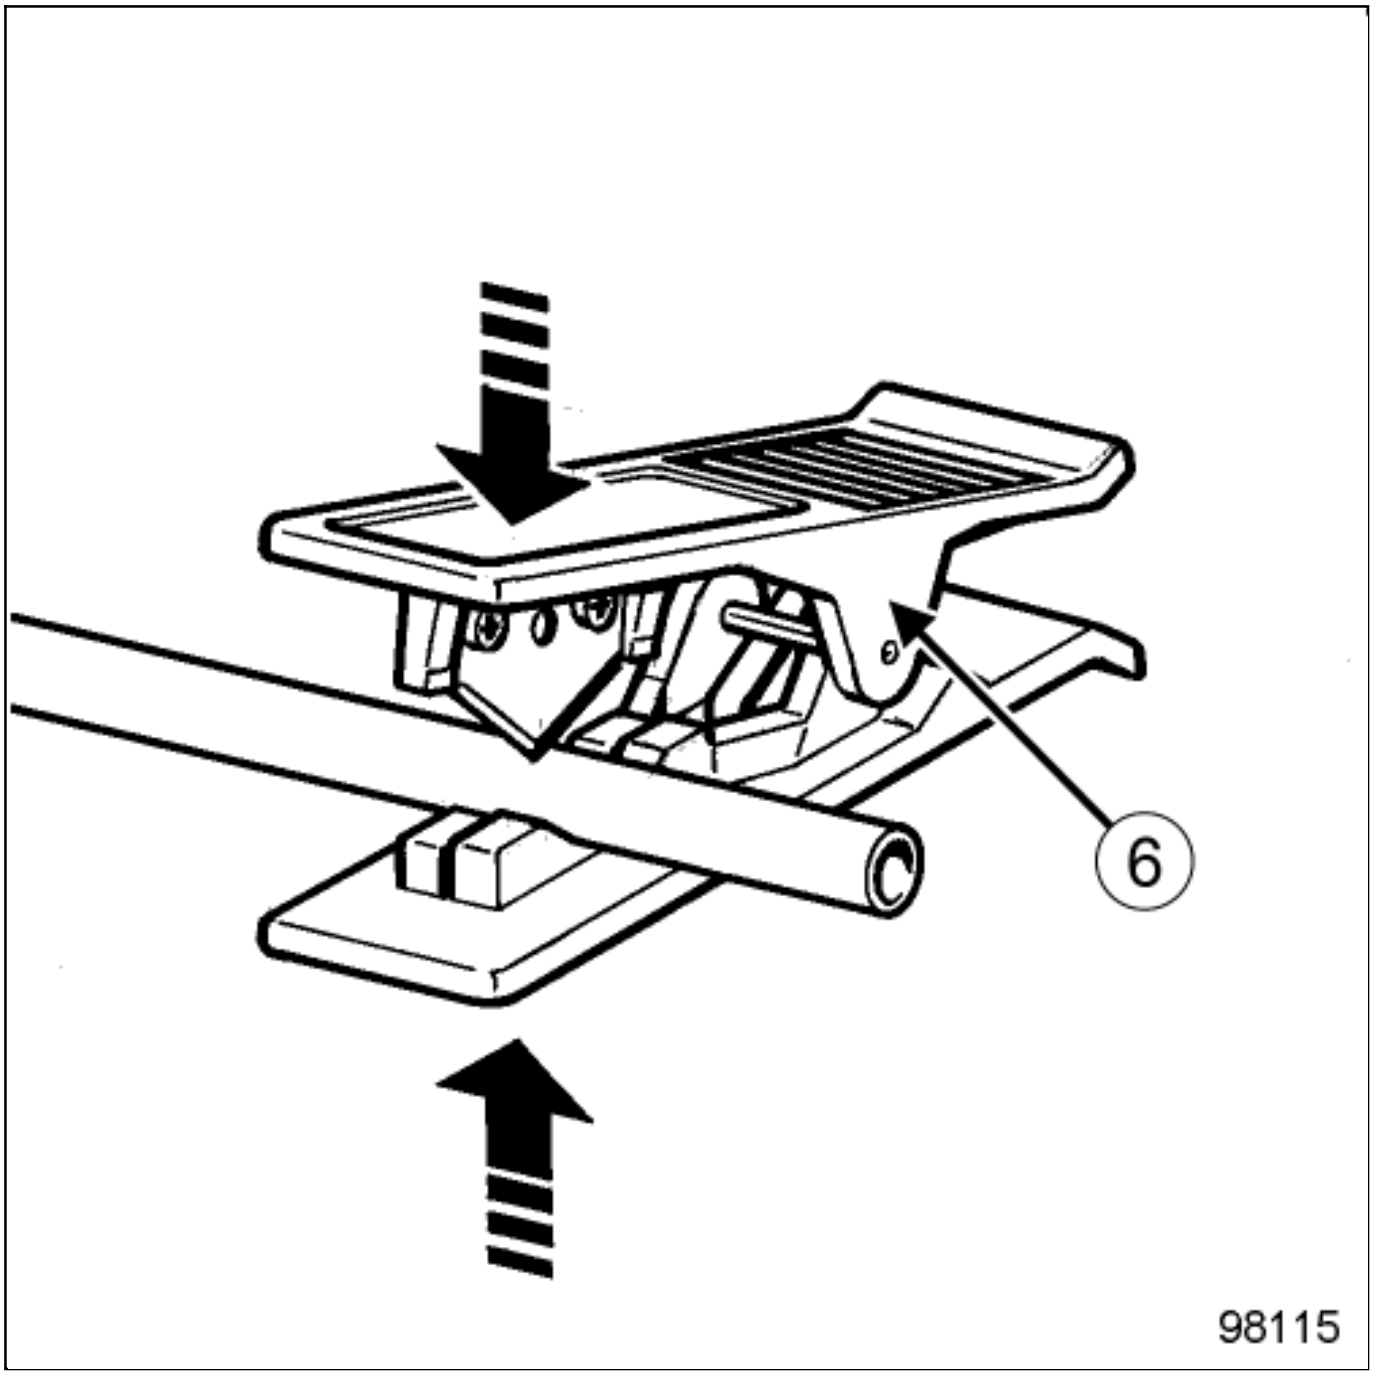
Carry out the repairs cold, after the engine has been stopped for an hour.



Disconnect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

Measure the fuel pipe diameter for selecting the correct diameter for the parts and tools.

If the cutting is done under body, to avoid siphoning the tank, for diesel pipes in particular, either they should be disconnected at the gauge module level or the oil in the tank should be emptied.



The cut will determine the location of the union. The following rules should therefore be complied with in order to determine the location of the cut:

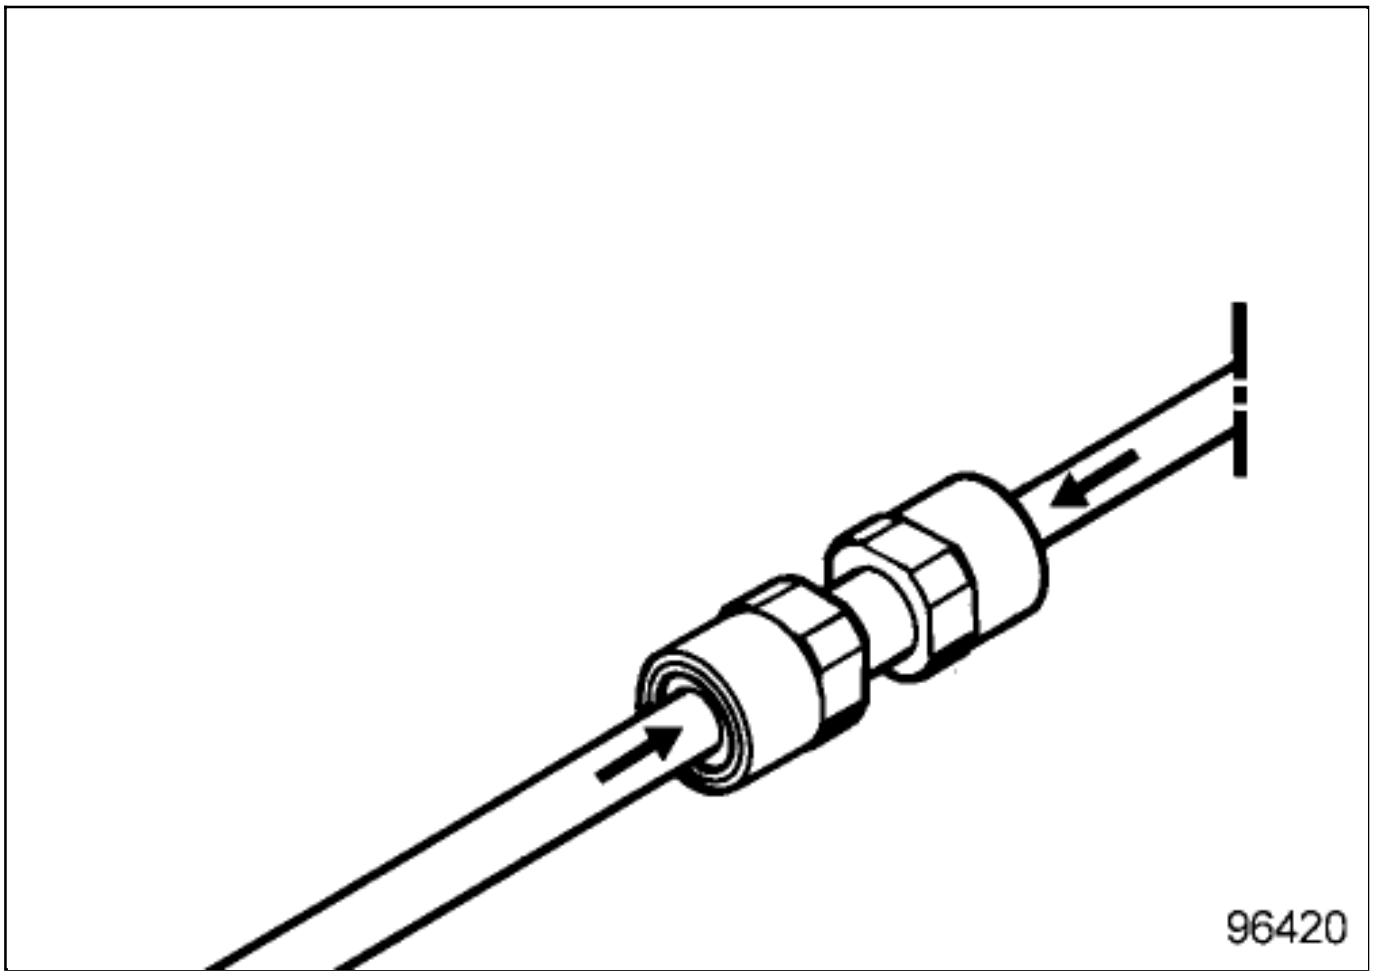
- the unions must always be in a straight line,
- only cut the pipes in straight lines,
- do not install unions within 50 cm of the catalytic converter, above very hot zones or electrical connections, on pipes in clearance between engine and body, in the zone between the engine and the catalytic converter.

When installing the unions on parallel piping, make sure to cut off-set so that the unions are positioned off-set.

2)CUTTING OPERATION FOR THE PIPE TO BE REPLACED

In order to avoid damaging the two union O-rings and to provide a perfect seal when fitting, perform the cutting operation using toolPipe-cutter, semi-rigid fuel pipes.(6) .

2- NEW PIPE CUTTING



If the part to be replaced does not have any specific union and has a straight path, you can use the tube of length 1.5 msold as a spare part. If the path is complex, use the standard pipe and cut it

according to the part to be replaced.

For a correct cut, place the pipe that you wish to replace onto the new pipe and mark the cut location.

Cut the pipe using toolPipe-cutter, semi-rigid fuel pipes. .

3- FITTING THE UNION

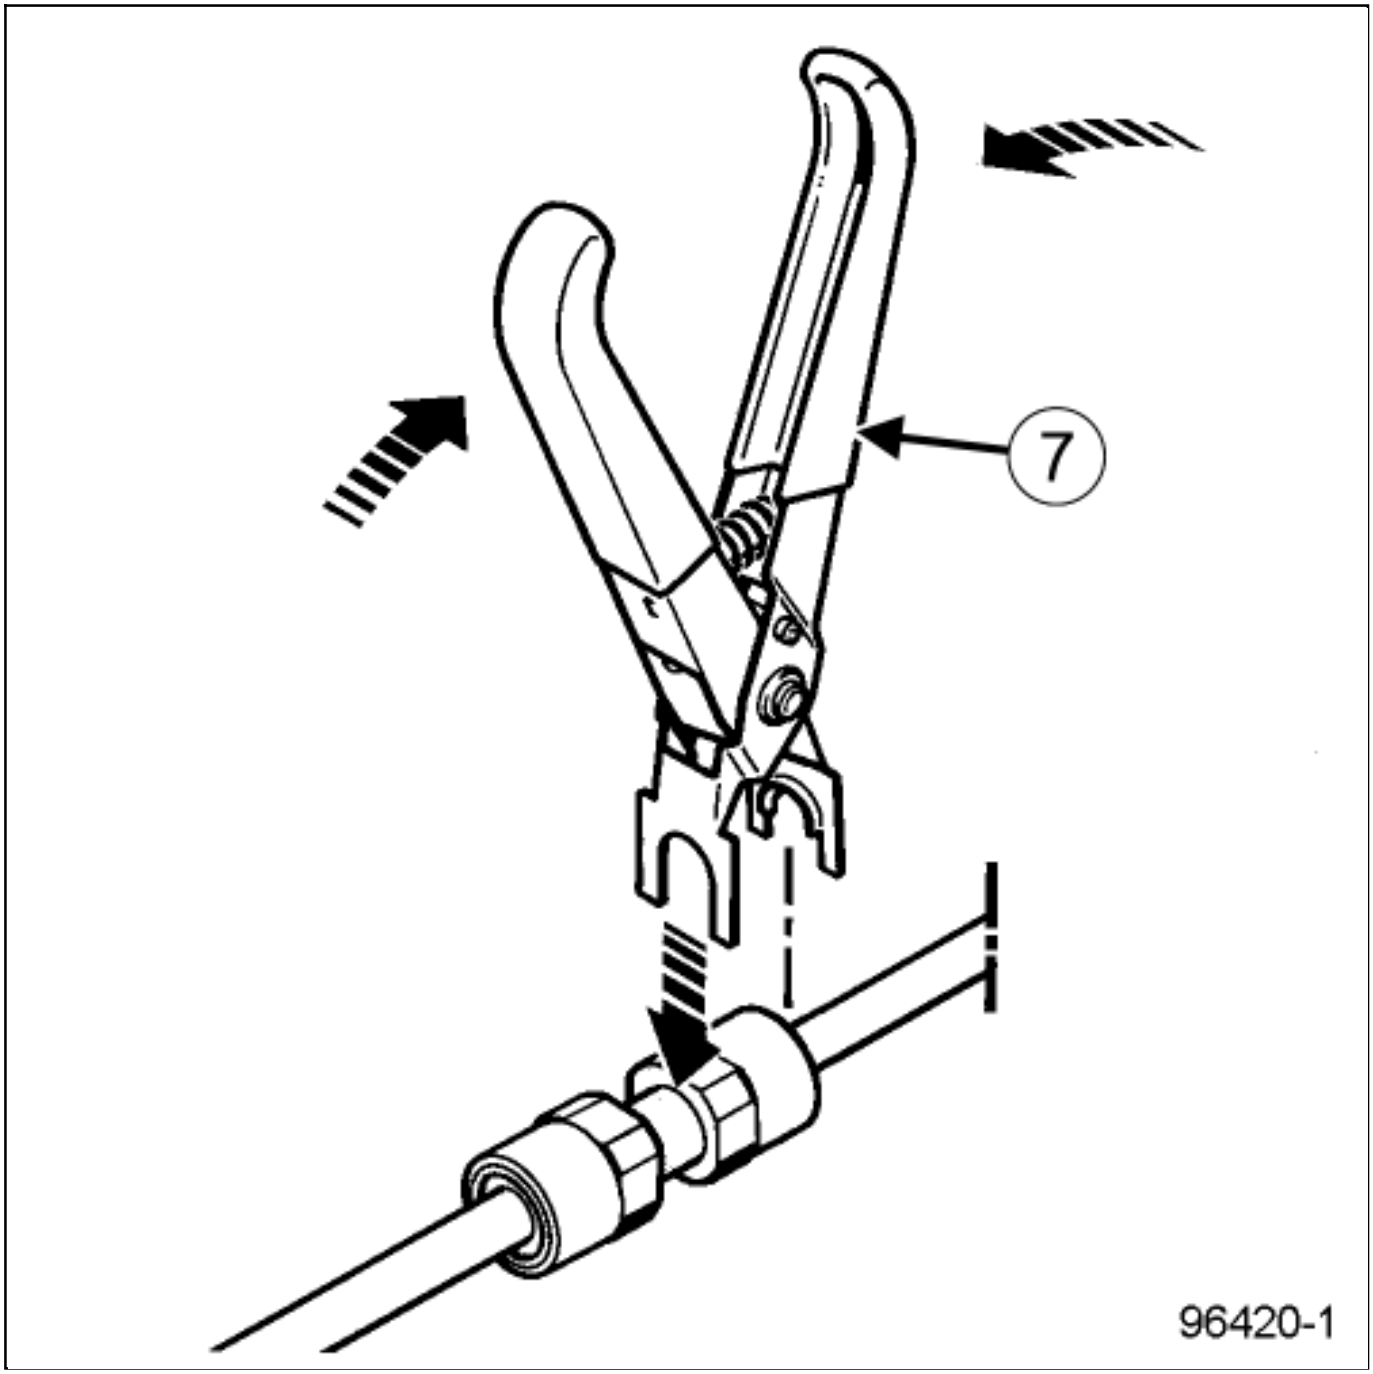
Fit directly on the corresponding piping and press the piping down well.

Connect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

After every union installation, check the seal:

- 7 -

for pressure pipes (petrol supply), run the engine and observe for 5 min. to check that there are no drips around the repaired connections.



for vacuum pipes (Diesel supply), run the engine and observe for 5 minto check that no air bubbles appear at the high pressure pump outlet, through the transparent pipes.

3. REMOVAL OF THE UNIONS

Carry out the repairs cold, after the engine has been stopped for an hour.

Disconnect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

If the cutting is done under body, to avoid siphoning the tank, for fuel pipes in particular, either they should be disconnected at the gauge module level or the oil in the tank should be emptied.

Remove the union using pliersPliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond). andPliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond). (7) which fit the pipe diameters.

FUEL PIPES: REPAIR

Note, one or more warnings are present in this procedure

Special tooling required	
Pliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond).	Mot. 1265
Pipe-cutter, semi-rigid fuel pipes.	Mot. 1352
Pliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond).	Mot. 1265-01

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

- During this operation, be sure to:
  - refrain from smoking or bringing red hot objects close to the working area,
  - be careful of fuel splashes when disconnecting the union.

WARNING

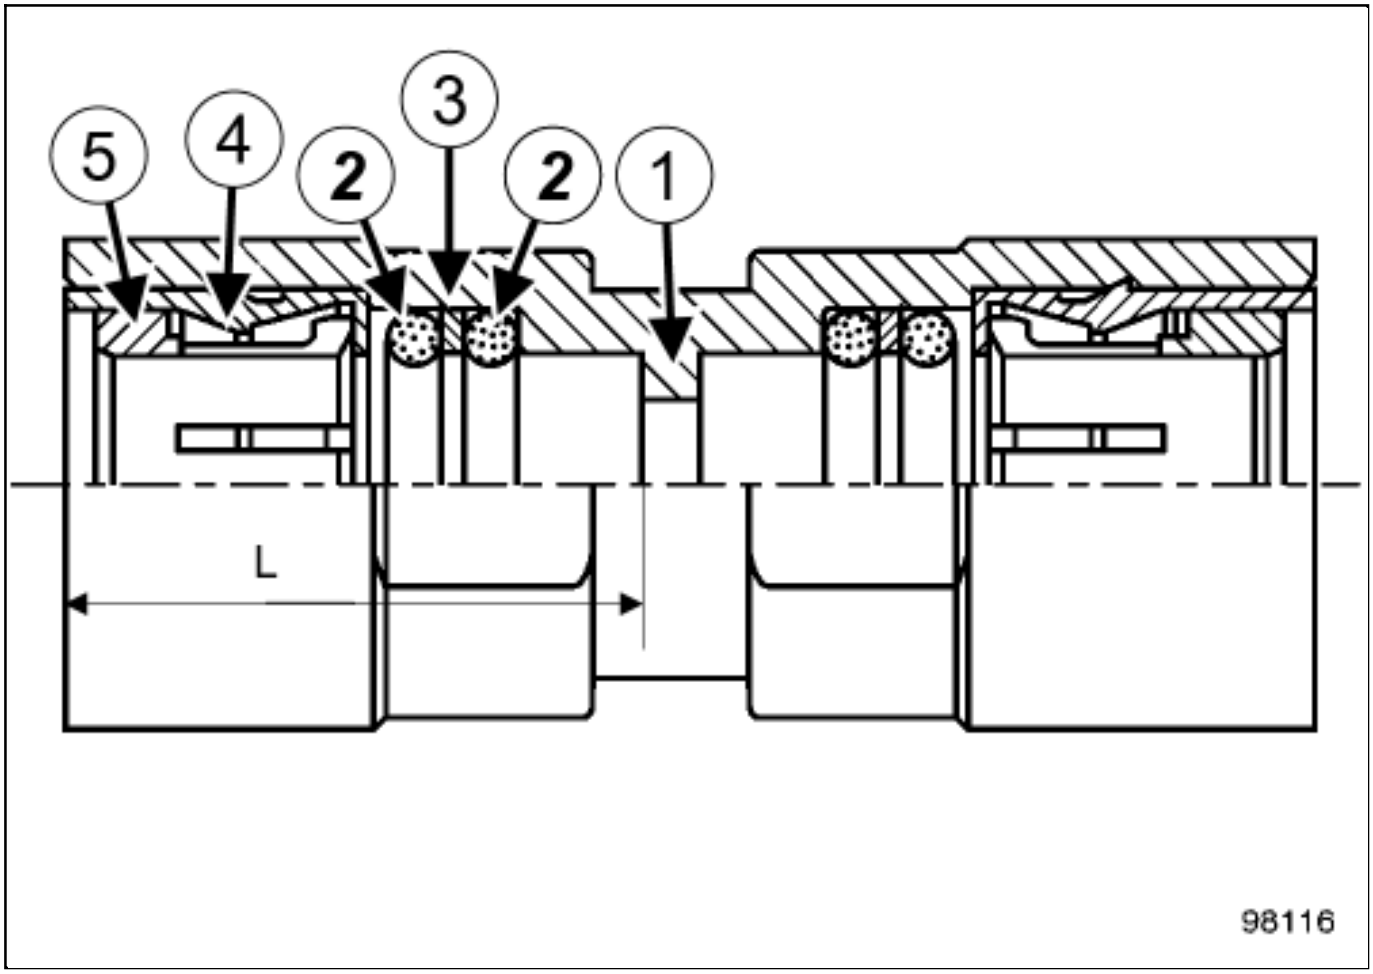
Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (nitrile type) for this operation.

CAUTION

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.



CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

1. PRESENTATION

It is possible to replace parts of the plastic pipes for petrol (fuel supply pipe going from the tank to the injection rail) and diesel fuel (supply pipe going from the tank to the fuel filter) without replacing them completely, the tools and parts required are:

- : Pliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond).(**Mot. 1265**) pliers to disconnect the quick release unions of the fuel pipe diameter 8 mm(Legris and Raymond),
- : Pliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond).(**Mot. 1265-01**) pliers to disconnect the quick release unions of the fuel pipe diameter 10 mm(Legris and Raymond),
- : Pipe-cutter, semi-rigid fuel pipes.(**Mot. 1352**) tube cutter, semi-rigid fuel pipes,
- double union sold as a spare part diameter 8 mmor 10 mm,

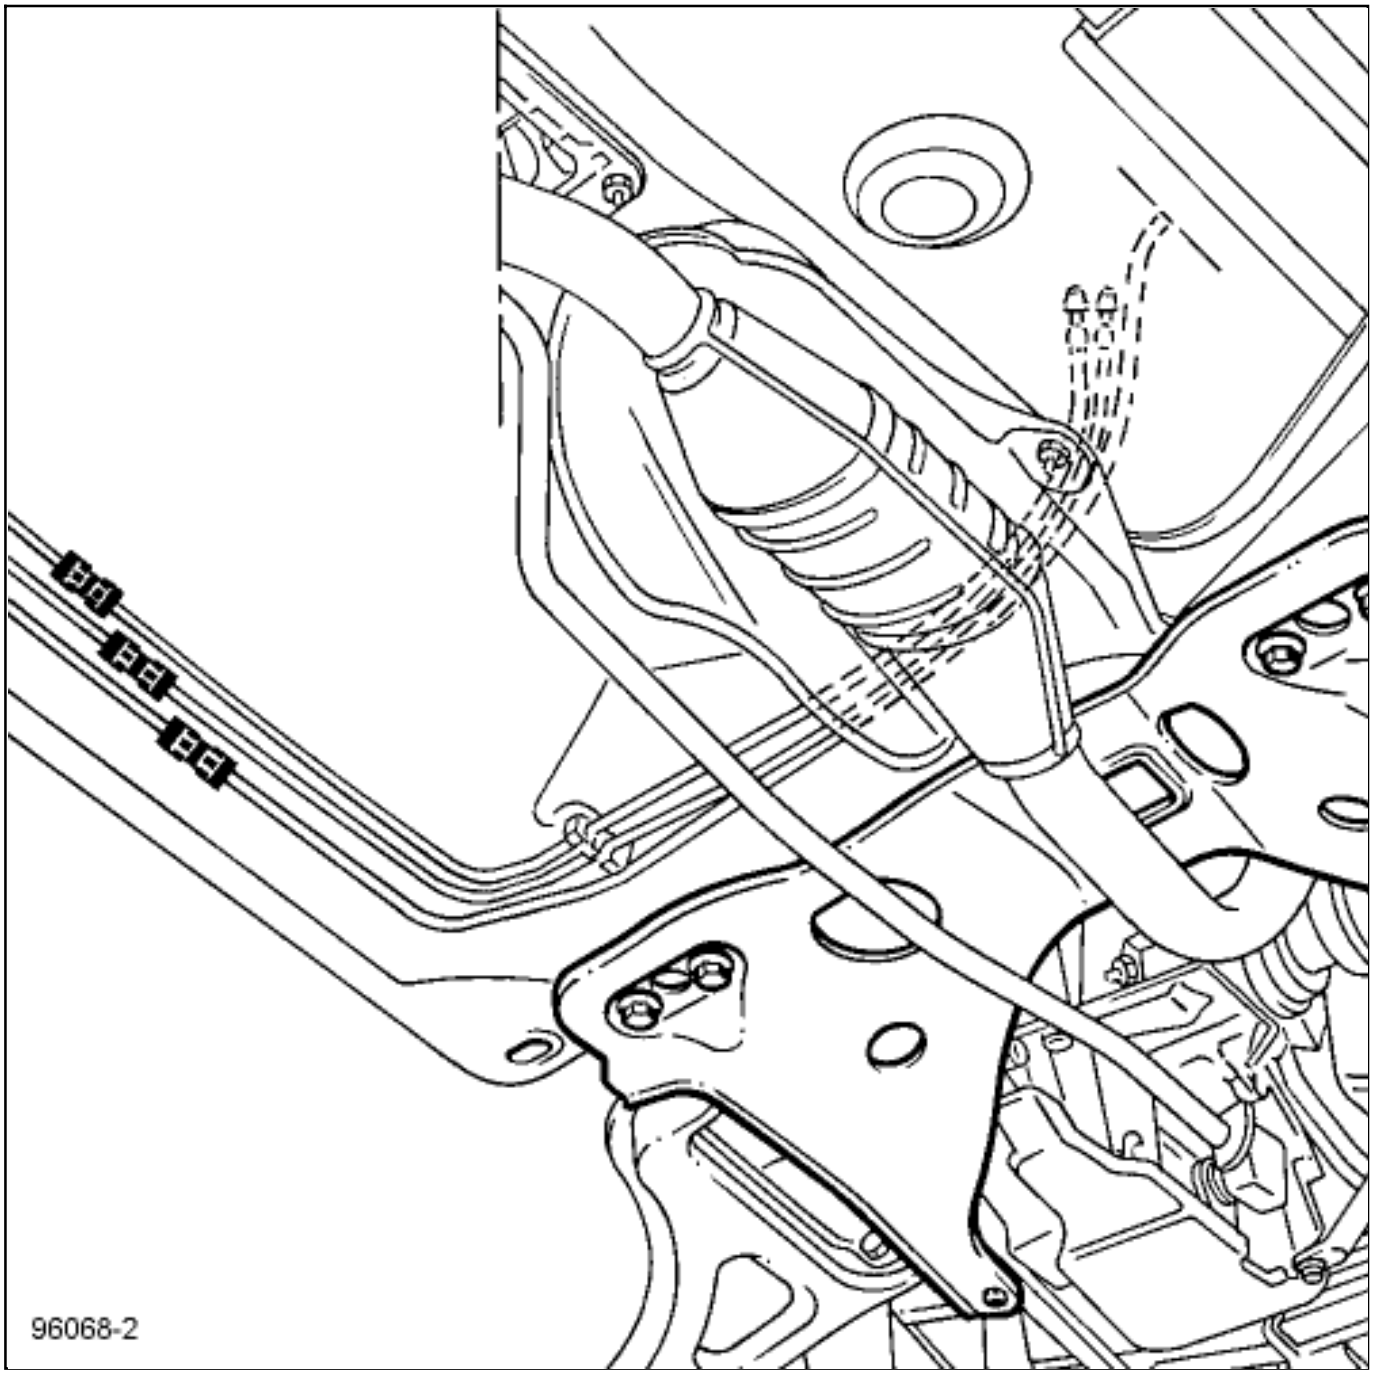
2. REPLACING PART OF THE PIPE

1- PIPE CUTTING

1)PREPARATION BEFORE CUTTING:

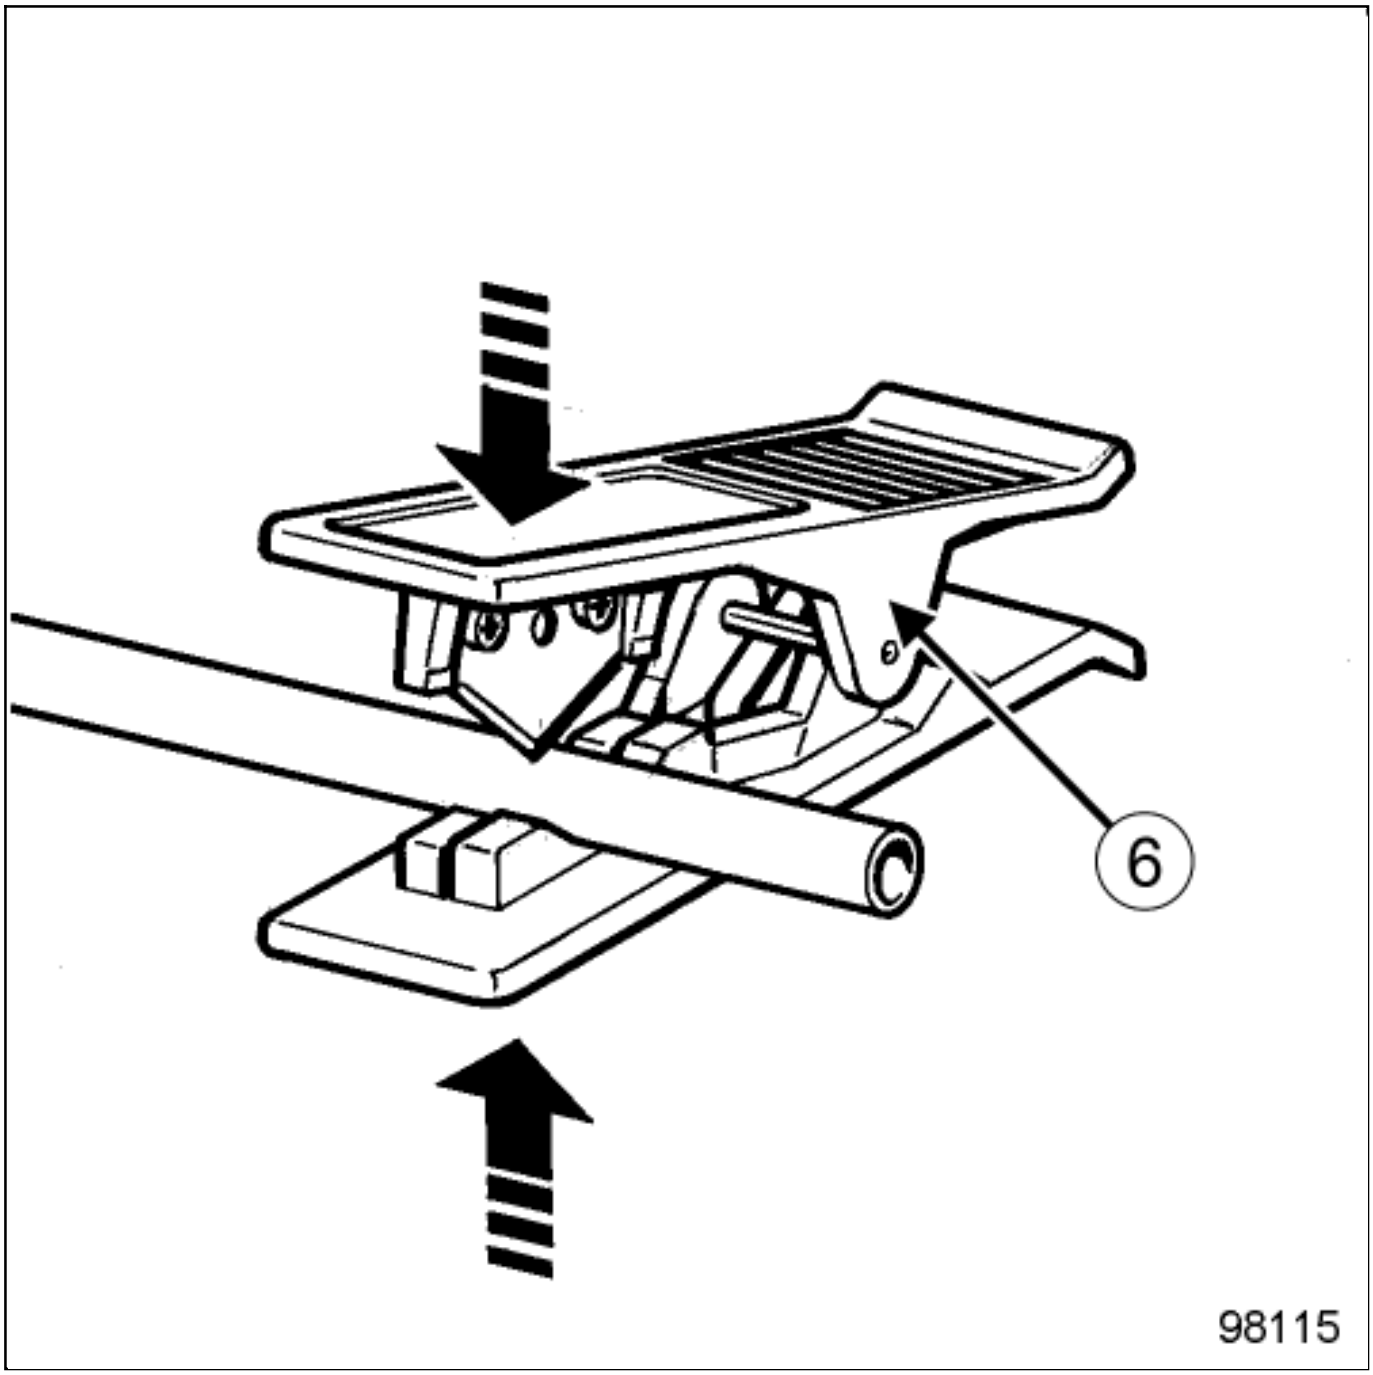
Carry out the repairs cold, after the engine has been stopped for an hour.



Disconnect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

Measure the fuel pipe diameter for selecting the correct diameter for the parts and tools.

If the cutting is done under body, to avoid siphoning the tank, for diesel pipes in particular, either they should be disconnected at the gauge module level or the oil in the tank should be emptied.



The cut will determine the location of the union. The following rules should therefore be complied with in order to determine the location of the cut:

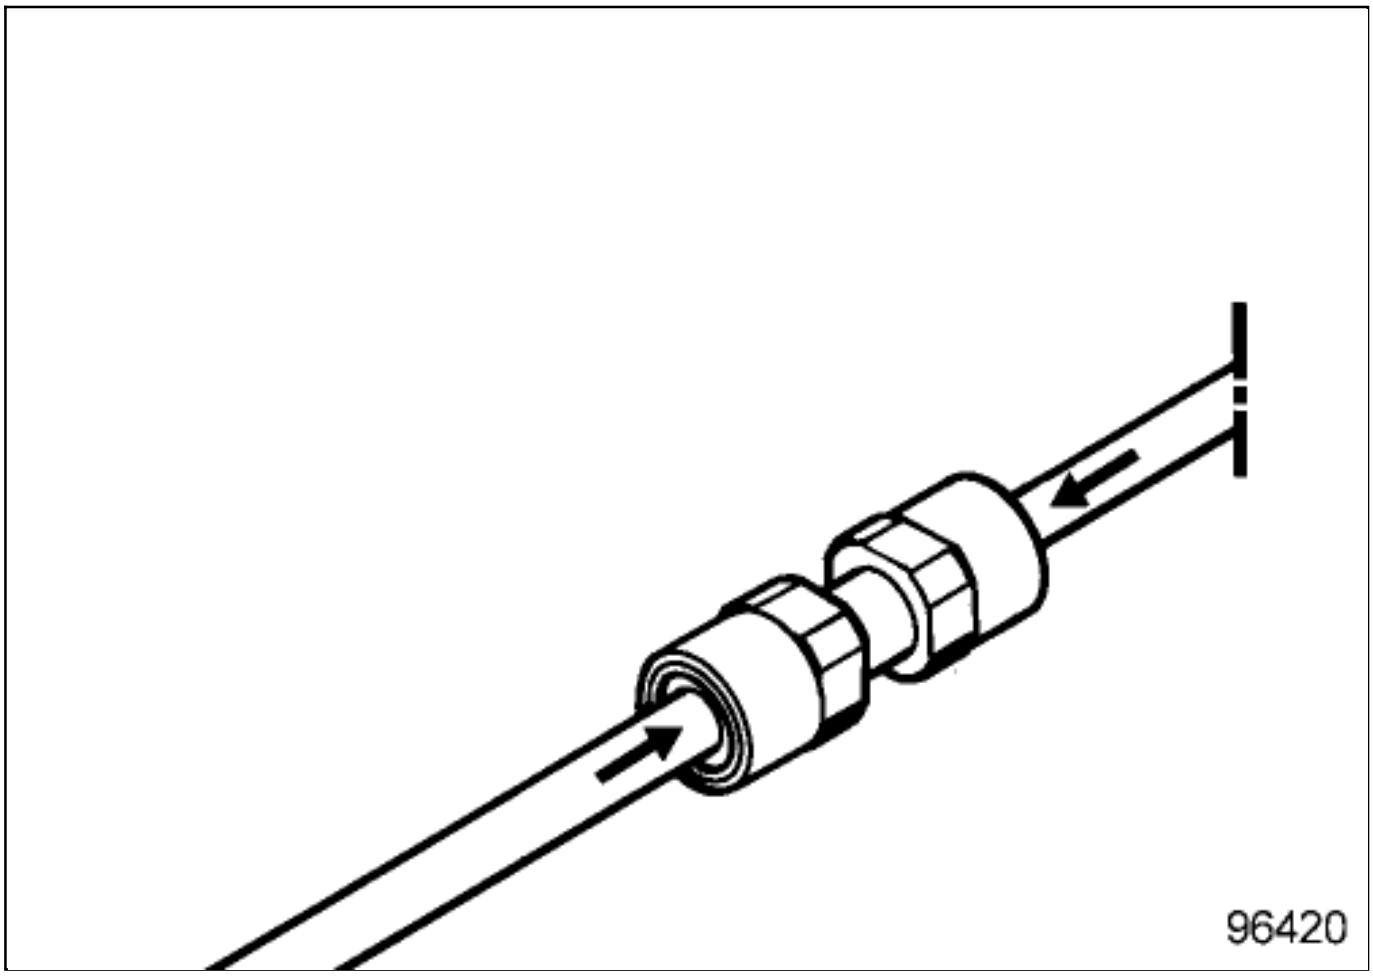
- the unions must always be in a straight line,
- only cut the pipes in straight lines,
- do not install unions within 50 cm of the catalytic converter, above very hot zones or electrical connections, on pipes in clearance between engine and body, in the zone between the engine and the catalytic converter.

When installing the unions on parallel piping, make sure to cut off-set so that the unions are positioned off-set.

2)CUTTING OPERATION FOR THE PIPE TO BE REPLACED

In order to avoid damaging the two union O-rings and to provide a perfect seal when fitting, perform the cutting operation using toolPipe-cutter, semi-rigid fuel pipes.(Mot. 1352) (6) .

2- NEW PIPE CUTTING



If the part to be replaced does not have any specific union and has a straight path, you can use the tube of length 1.5 msold as a spare part. If the path is complex, use the standard pipe and cut it

according to the part to be replaced.

For a correct cut, place the pipe that you wish to replace onto the new pipe and mark the cut location.

Cut the pipe using toolPipe-cutter, semi-rigid fuel pipes.(Mot. 1352) .

3- FITTING THE UNION

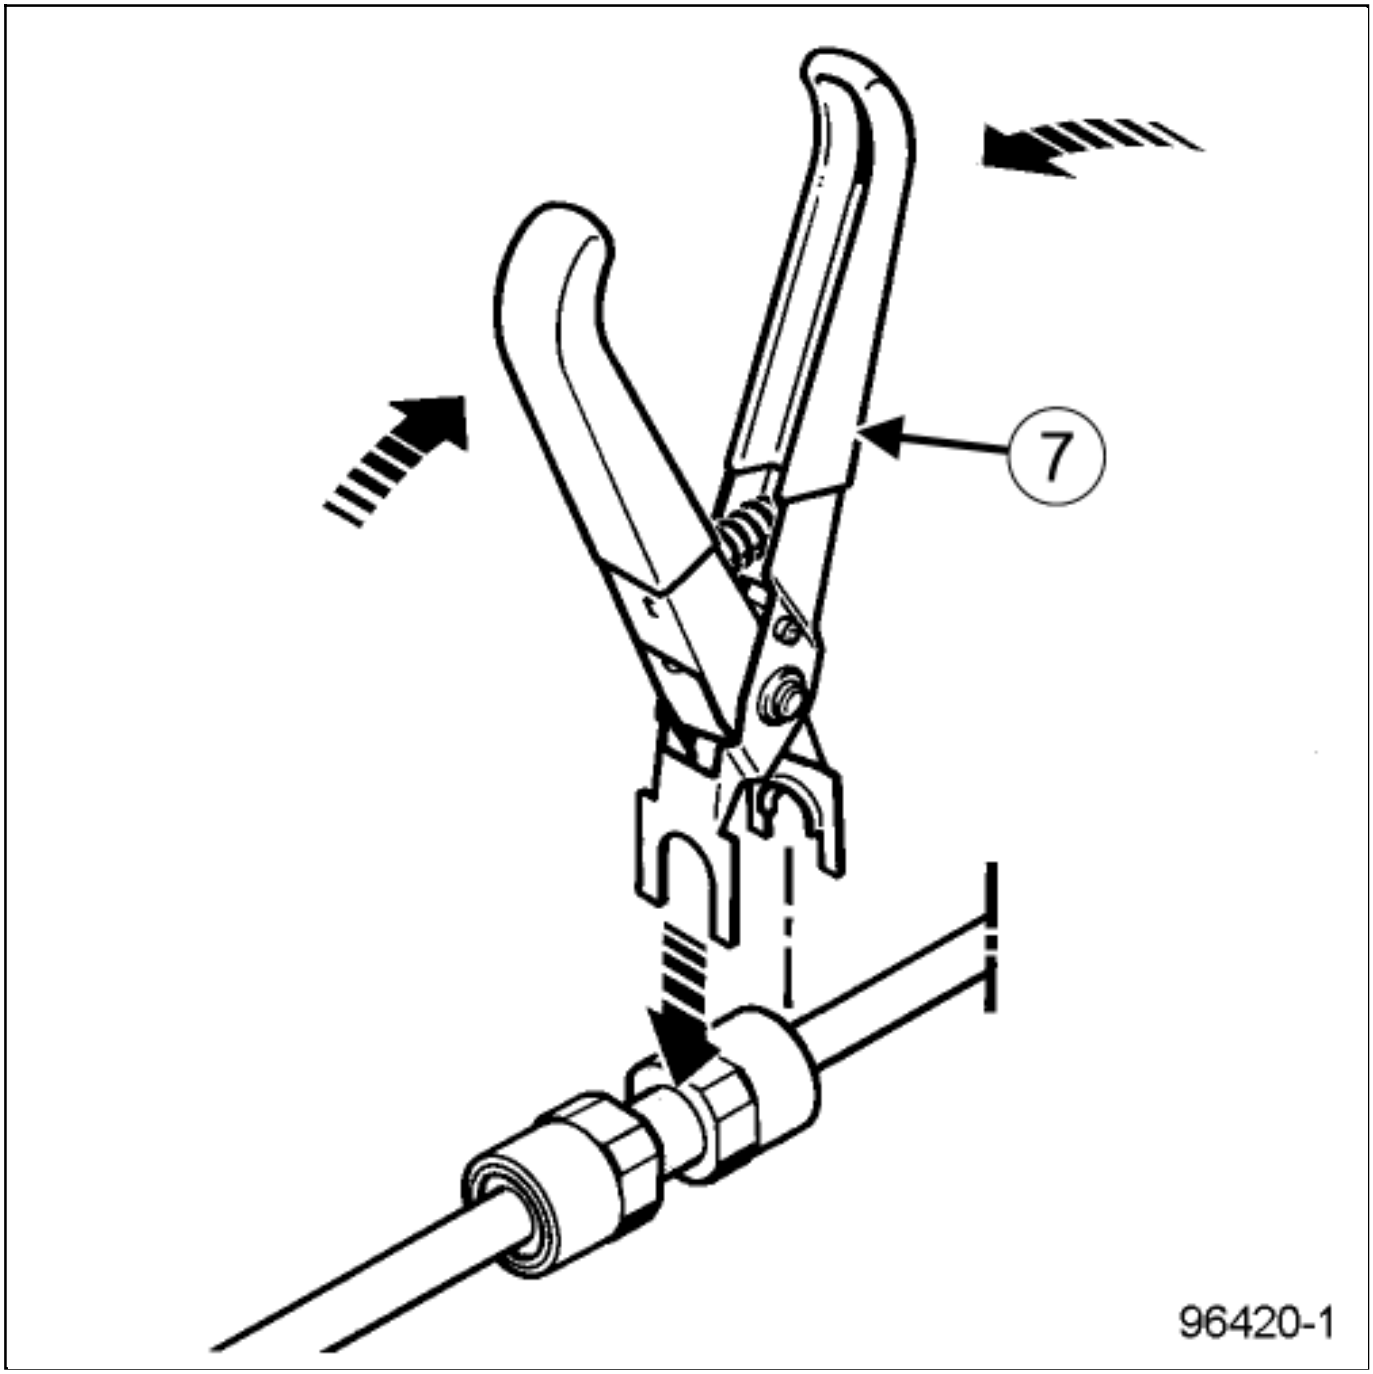
Fit directly on the corresponding piping and press the piping down well.

Connect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

After every union installation, check the seal:

- 7 -

for pressure pipes (petrol supply), run the engine and observe for 5 min. to check that there are no drips around the repaired connections.



for vacuum pipes (Diesel supply), run the engine and observe for 5 minto check that no air bubbles appear at the high pressure pump outlet, through the transparent pipes.

3. REMOVAL OF THE UNIONS

Carry out the repairs cold, after the engine has been stopped for an hour.

Disconnect the battery(see **Battery: Removal - Refitting**) (80A, Battery).

If the cutting is done under body, to avoid siphoning the tank, for fuel pipes in particular, either they should be disconnected at the gauge module level or the oil in the tank should be emptied.

Remove the union using pliersPliers for disconnecting fuel snap-fit connections, diameter 8 mm (Legris et Raymond).(Mot. 1265) and Pliers for disconnecting fuel snap-fit connections, diameter 10 mm (Legris et Raymond).(Mot. 1265-01) (7) which fit the pipe diameters.

FUEL PRESSURE: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
Pressure gauges and petrol pressure measuring unions.	Mot. 1311-01
Union for taking fuel pressure measurements.	Mot. 1311-08

WARNING

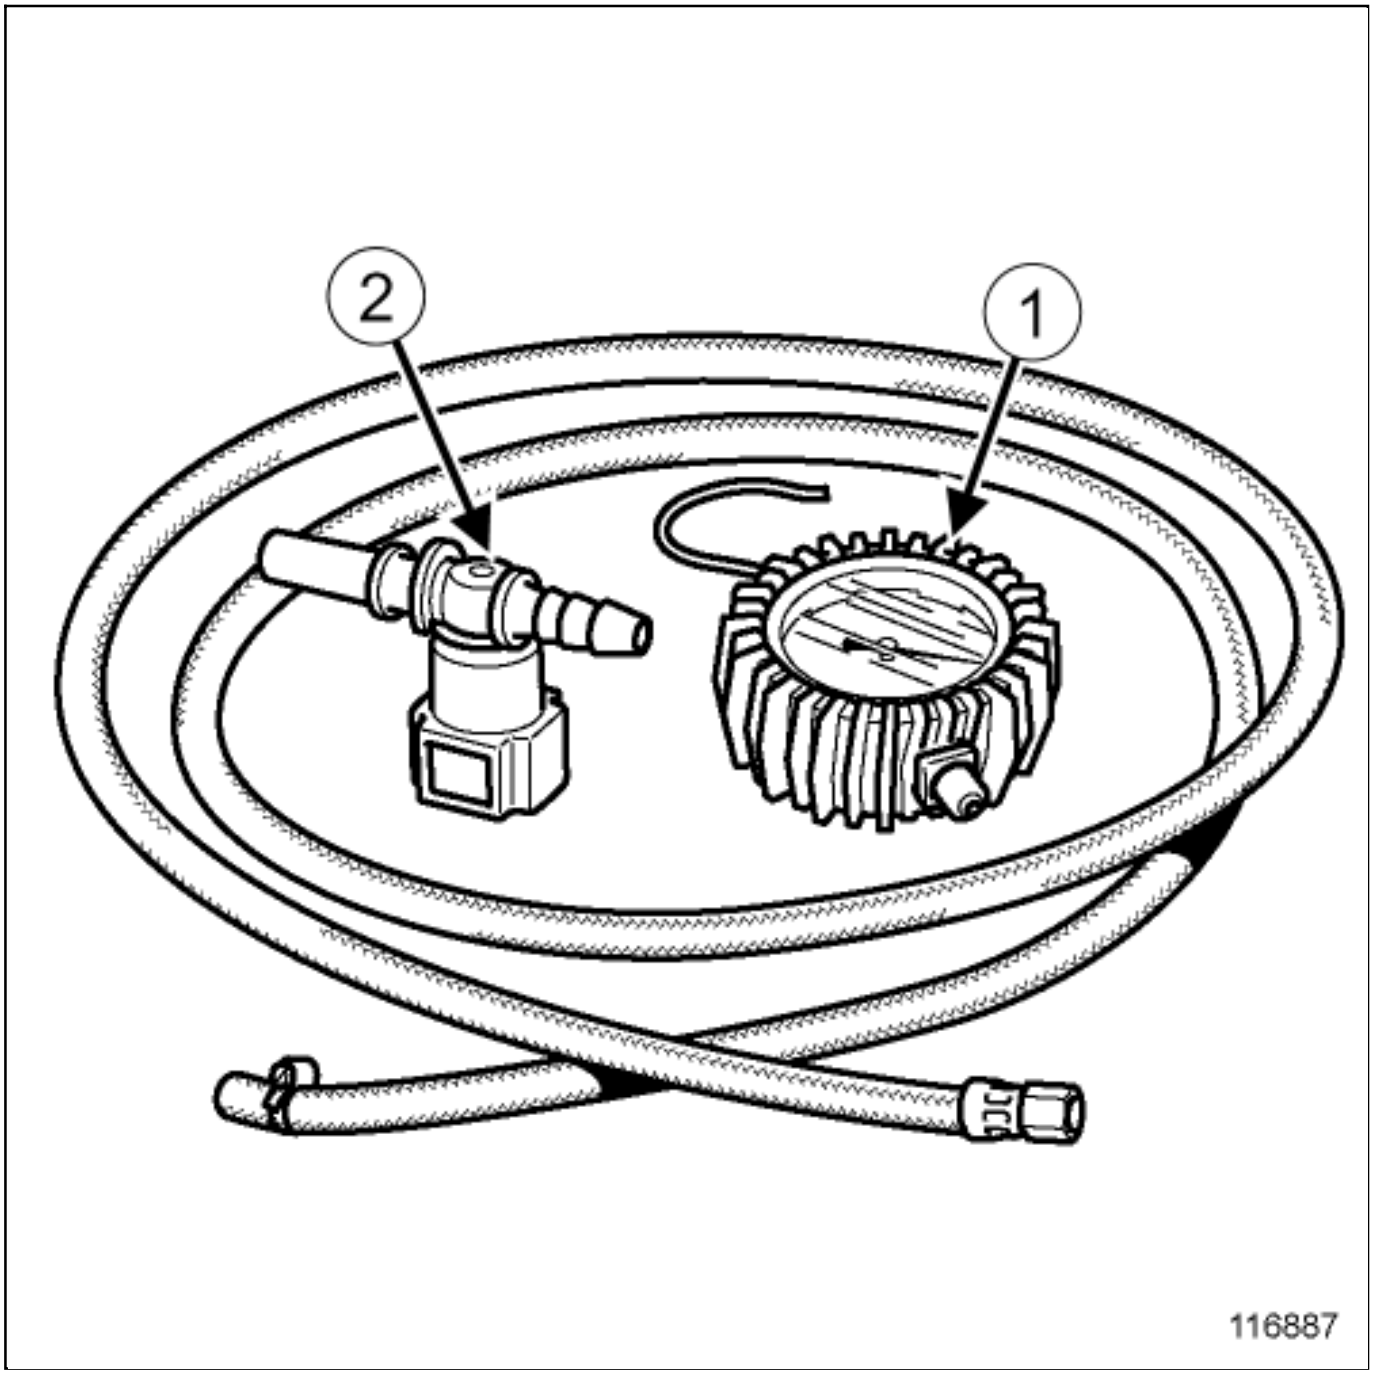
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear goggles with side protectors for this operation.

WARNING

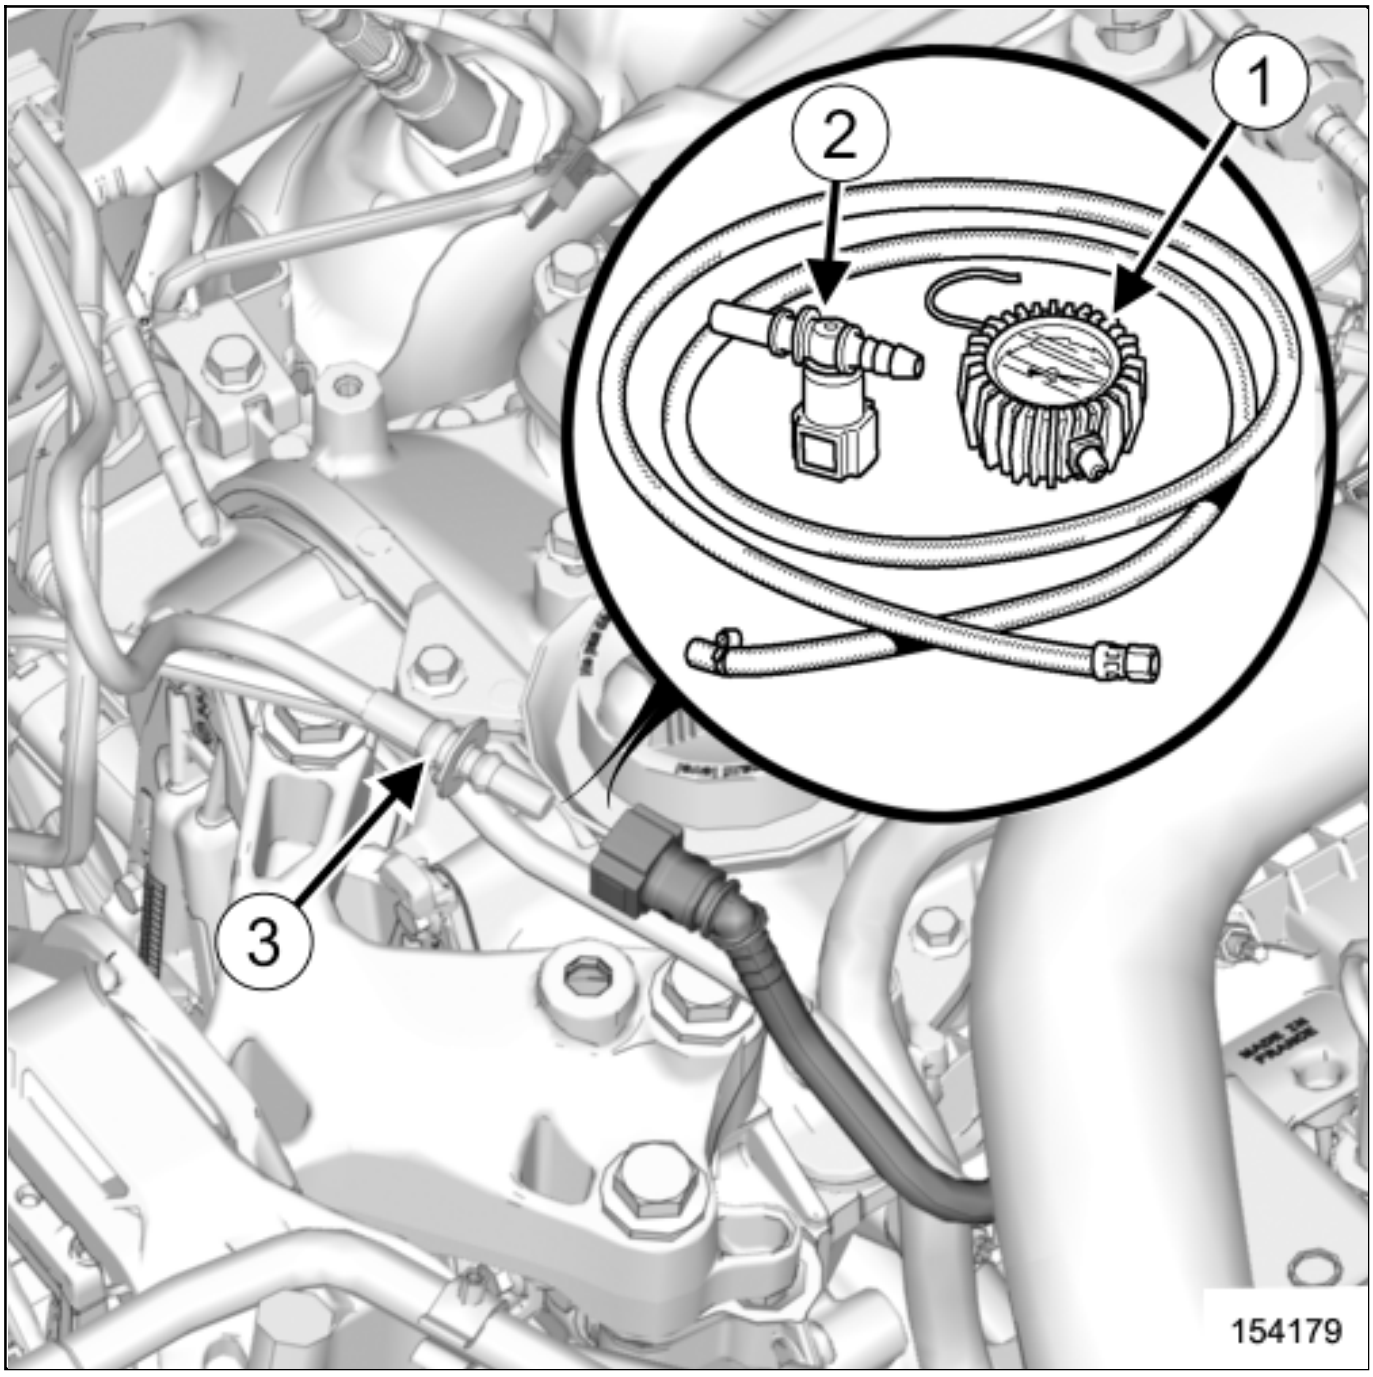


Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CHECK



1. PREPARATION OPERATION FOR THE CHECK

Ensure you have a checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) and a “T” unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

2. TEST OPERATION

Disconnect the petrol inlet duct from the injector rail[Petrol injection: List and location of components] .

Unclip the fuel pipe from the right-hand suspended engine mounting.

Connect:

- the pipe fitted with a test pressure gaugePressure gauges and petrol pressure measuring unions.(Mot. 1311-01) (1) with the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) (2) ,
- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) to the injector rail,
- the injector rail fuel supply union to the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Start the engine.

Determine the pressure:

- the pressure must be a constant 3.5 bar,
- it may take a few seconds to obtain a correct injector rail pressure reading.

Switch off the engine.

3. FINAL OPERATION

Remove the “T” unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Separate the test toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) from the "T" union.

Connect the fuel supply union to the injector rail.

XSL version : 3.02 du 22/07/11

FUEL PRESSURE: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
Pressure gauges and petrol pressure measuring unions.	Mot. 1311-01
Union for taking fuel pressure measurements.	Mot. 1311-08

WARNING

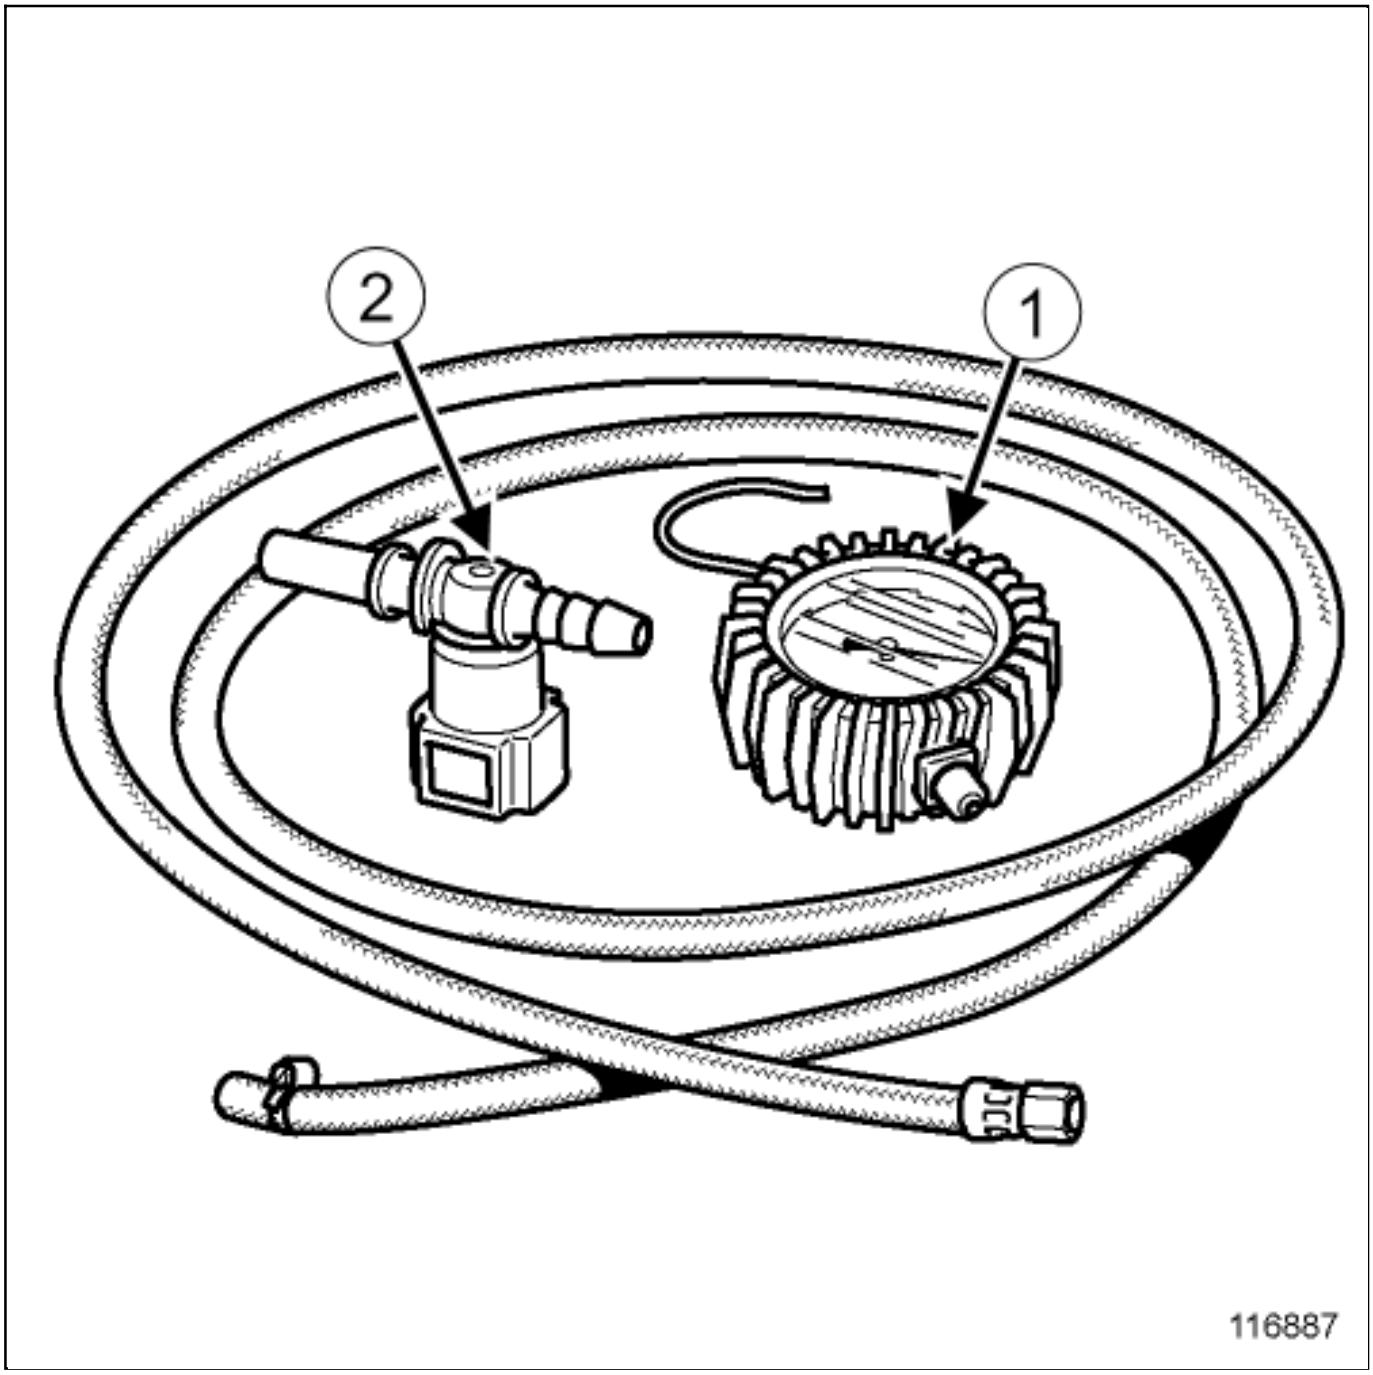
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear goggles with side protectors for this operation.

WARNING

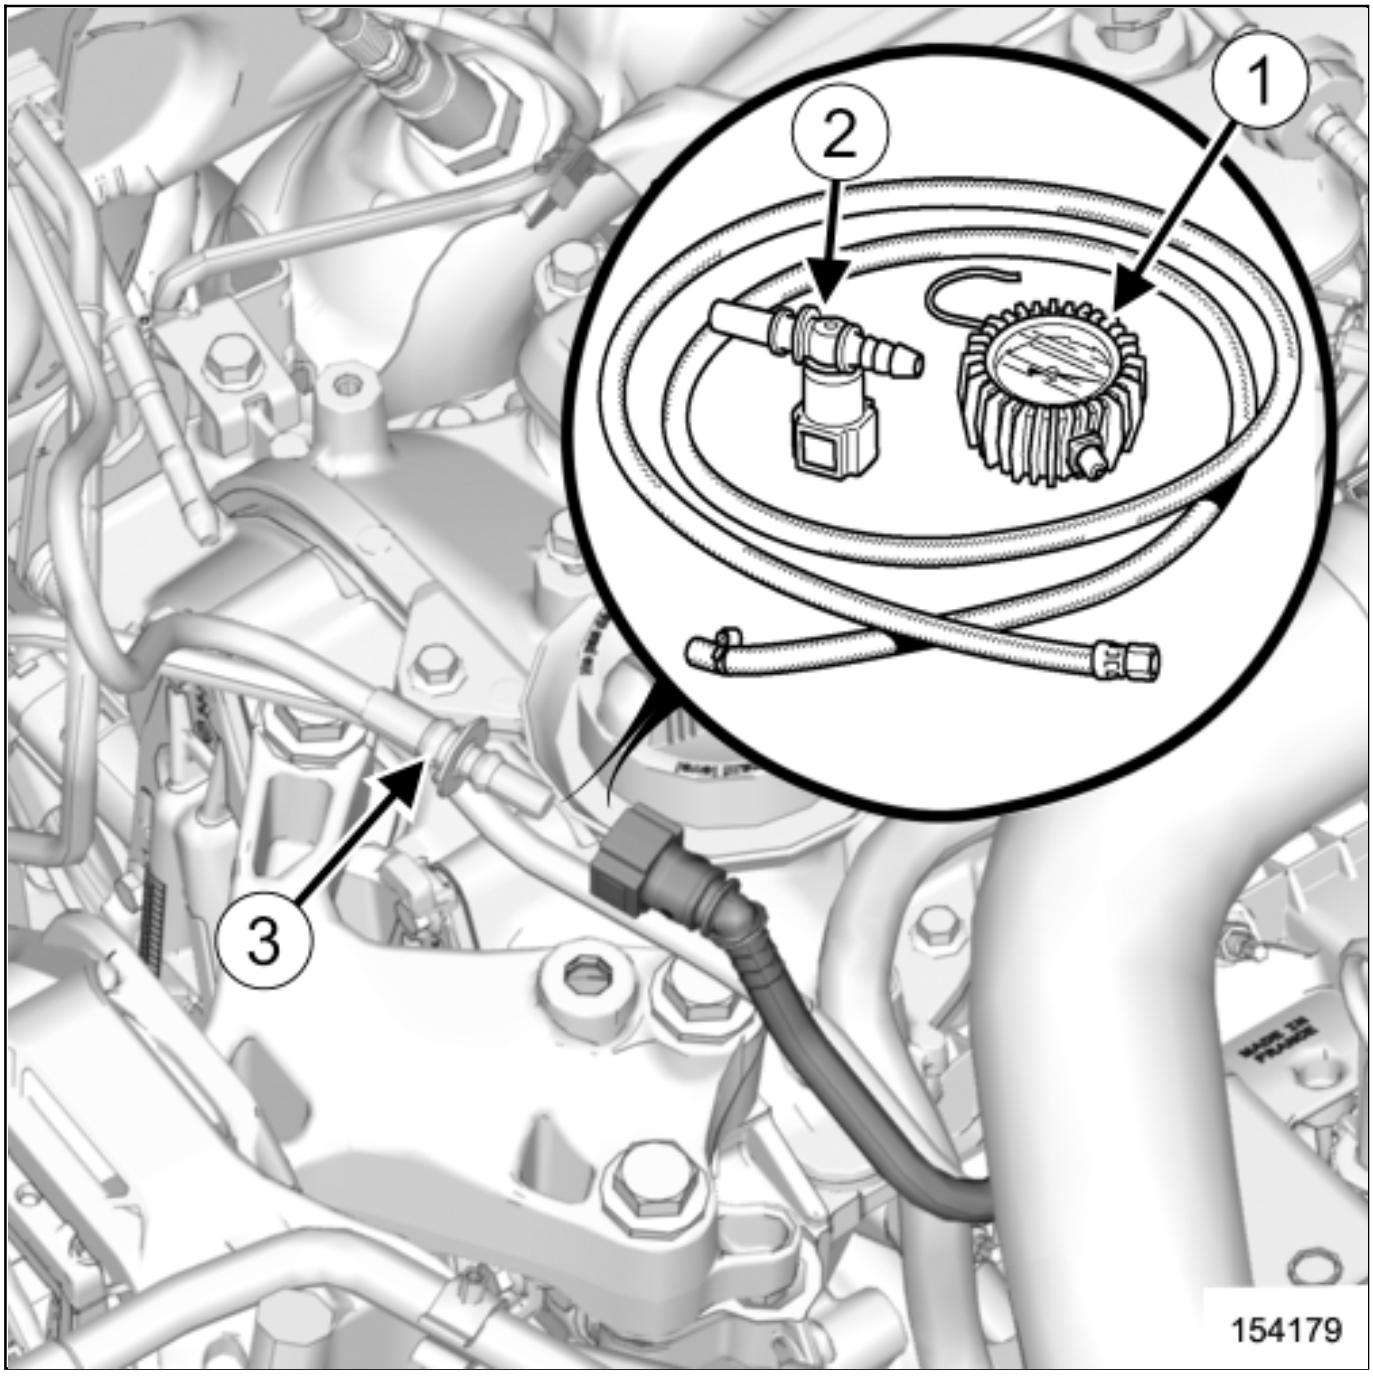


Wear leaktight gloves (Nitrile type) for this operation.

CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CHECK



1. PREPARATION OPERATION FOR THE CHECK

Ensure you have a checking toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) and a “T” unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

2. TEST OPERATION

Disconnect the petrol inlet duct from the injector rail(see **Petrol injection: List and location of components**) .

Unclip the fuel pipe from the right-hand suspended engine mounting.

Connect:

- the pipe fitted with a test pressure gaugePressure gauges and petrol pressure measuring unions.(Mot. 1311-01) (1) with the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) (2) ,
- the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) to the injector rail,
- the injector rail fuel supply union to the "T" unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Start the engine.

Determine the pressure:

- the pressure must be a constant 3.5 bar,
- it may take a few seconds to obtain a correct injector rail pressure reading.

Switch off the engine.

3. FINAL OPERATION

Remove the “T” unionUnion for taking fuel pressure measurements.(Mot. 1311-08) .

Separate the test toolPressure gauges and petrol pressure measuring unions.(Mot. 1311-01) from the "T" union.

Connect the fuel supply union to the injector rail.

FUEL TANK: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

WARNING

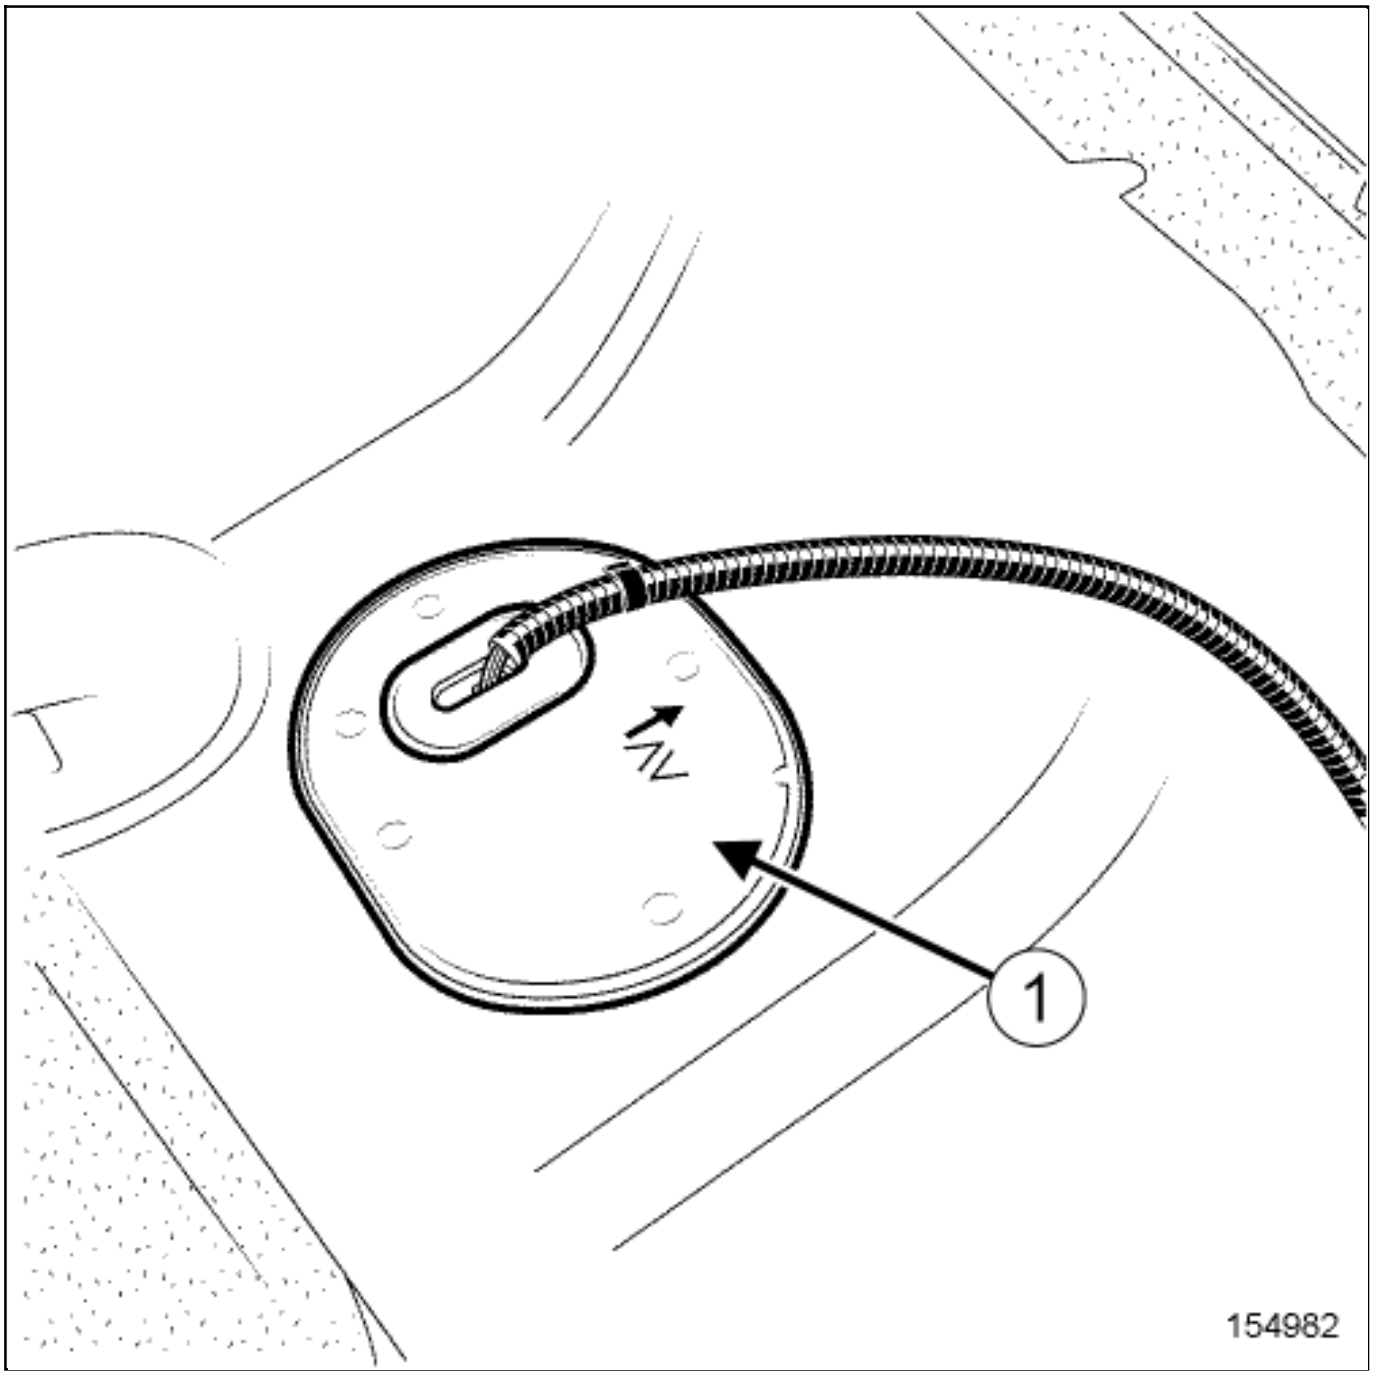
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

Wear goggles with side protectors for this operation.

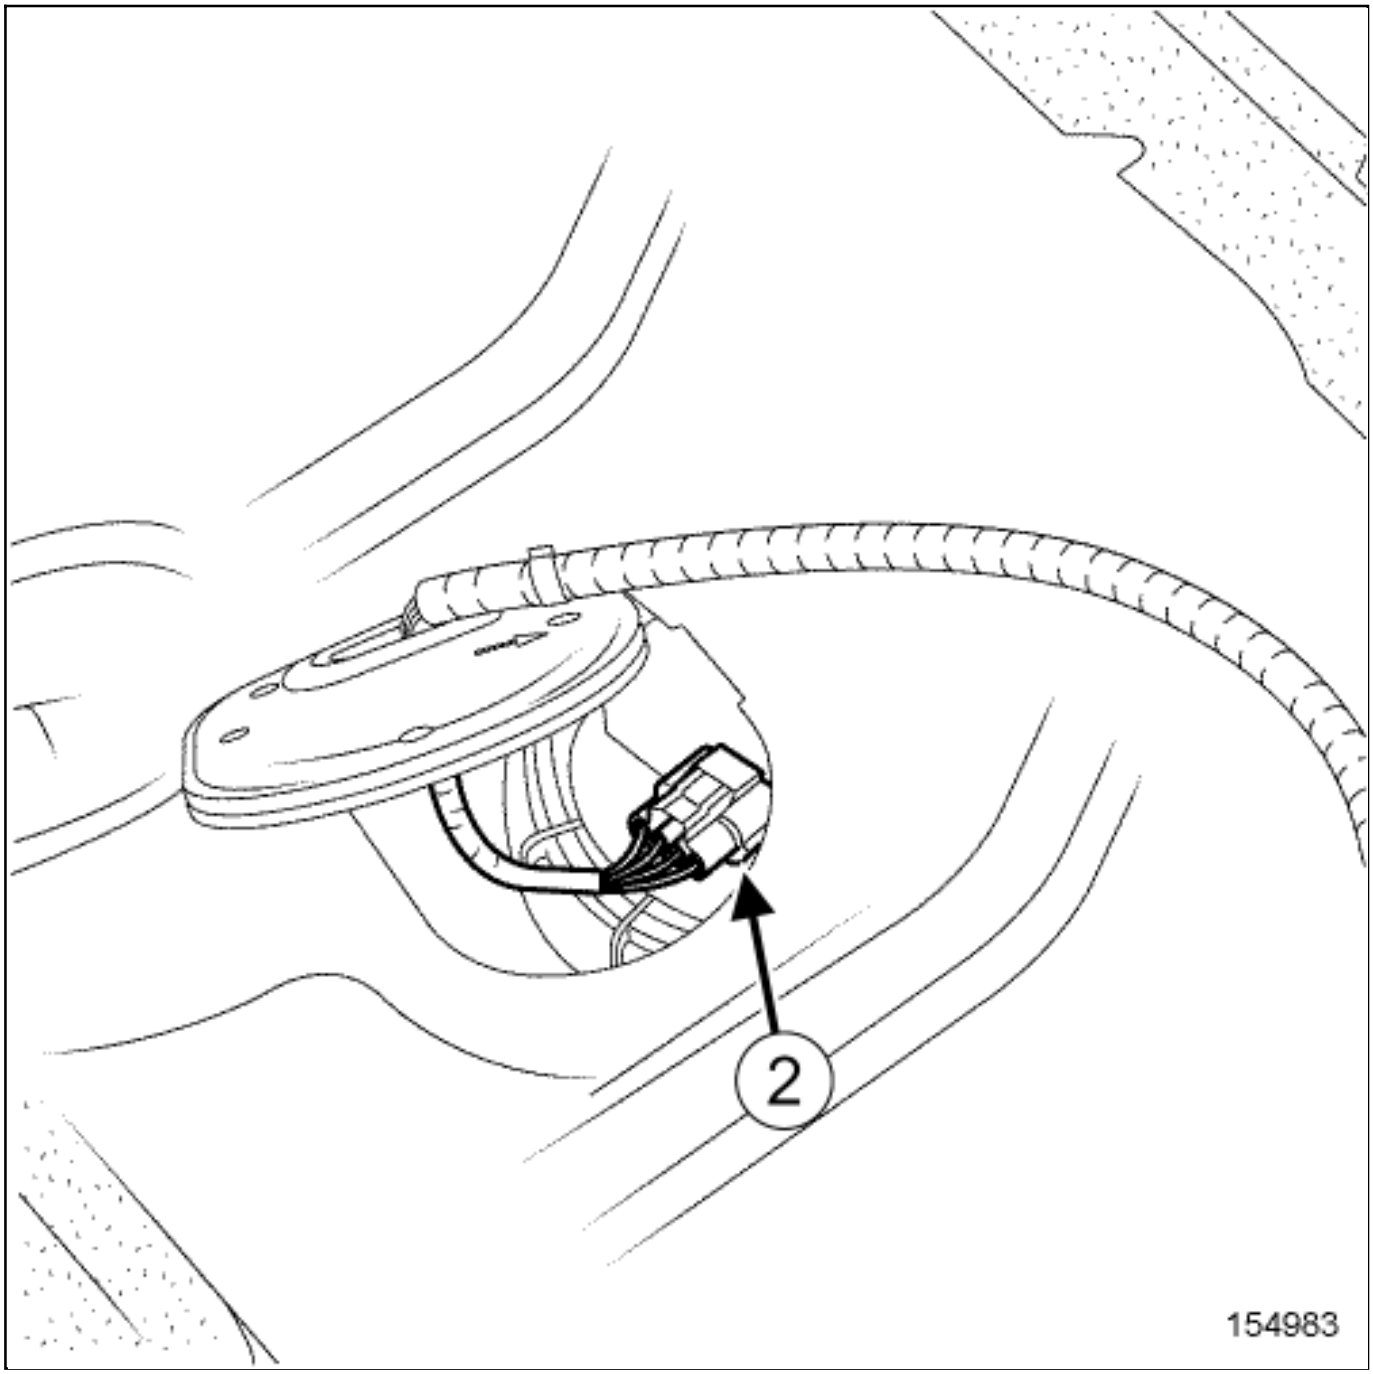
Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19C, Tank, Fuel tank assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

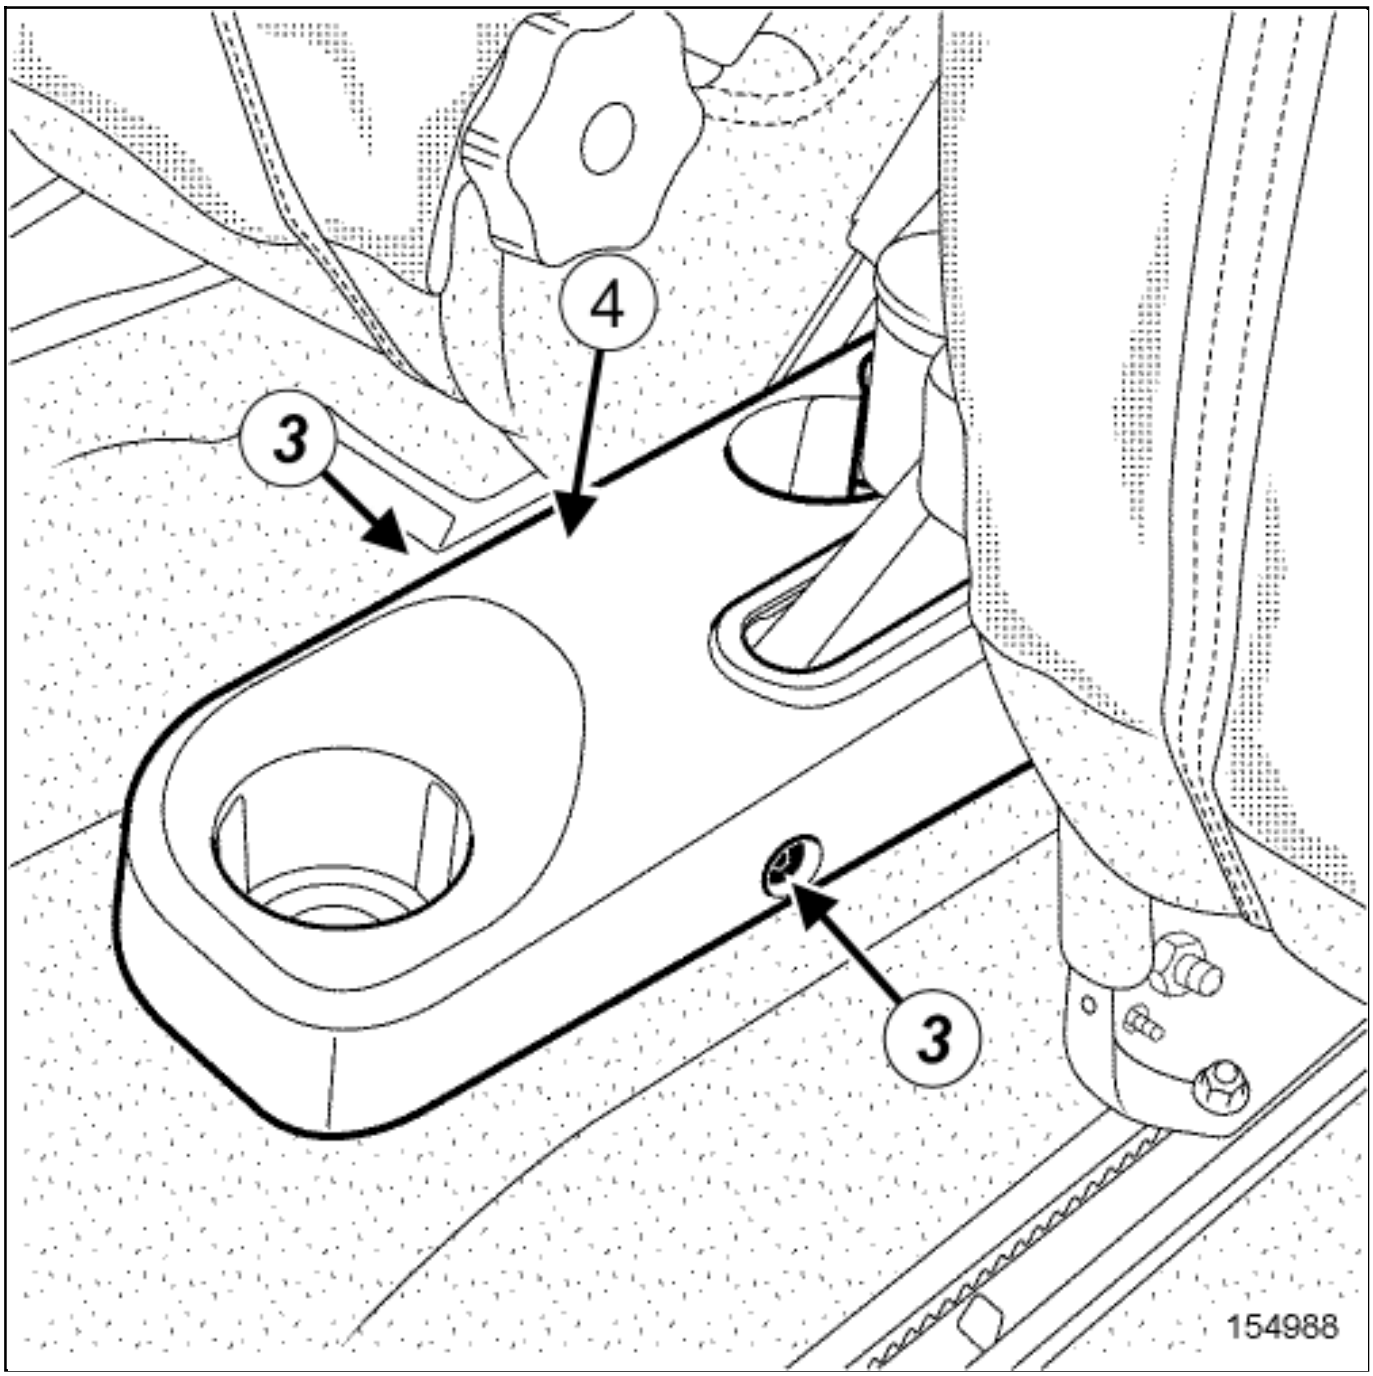


Drain the tank(see 19C, Tank, Fuel tank: Draining) .

Disconnect the batteryBattery: Removal - Refitting .

Tilt the rear bench seat base.

Remove the access flap blanking cover from the "pump - sender unit" assembly.

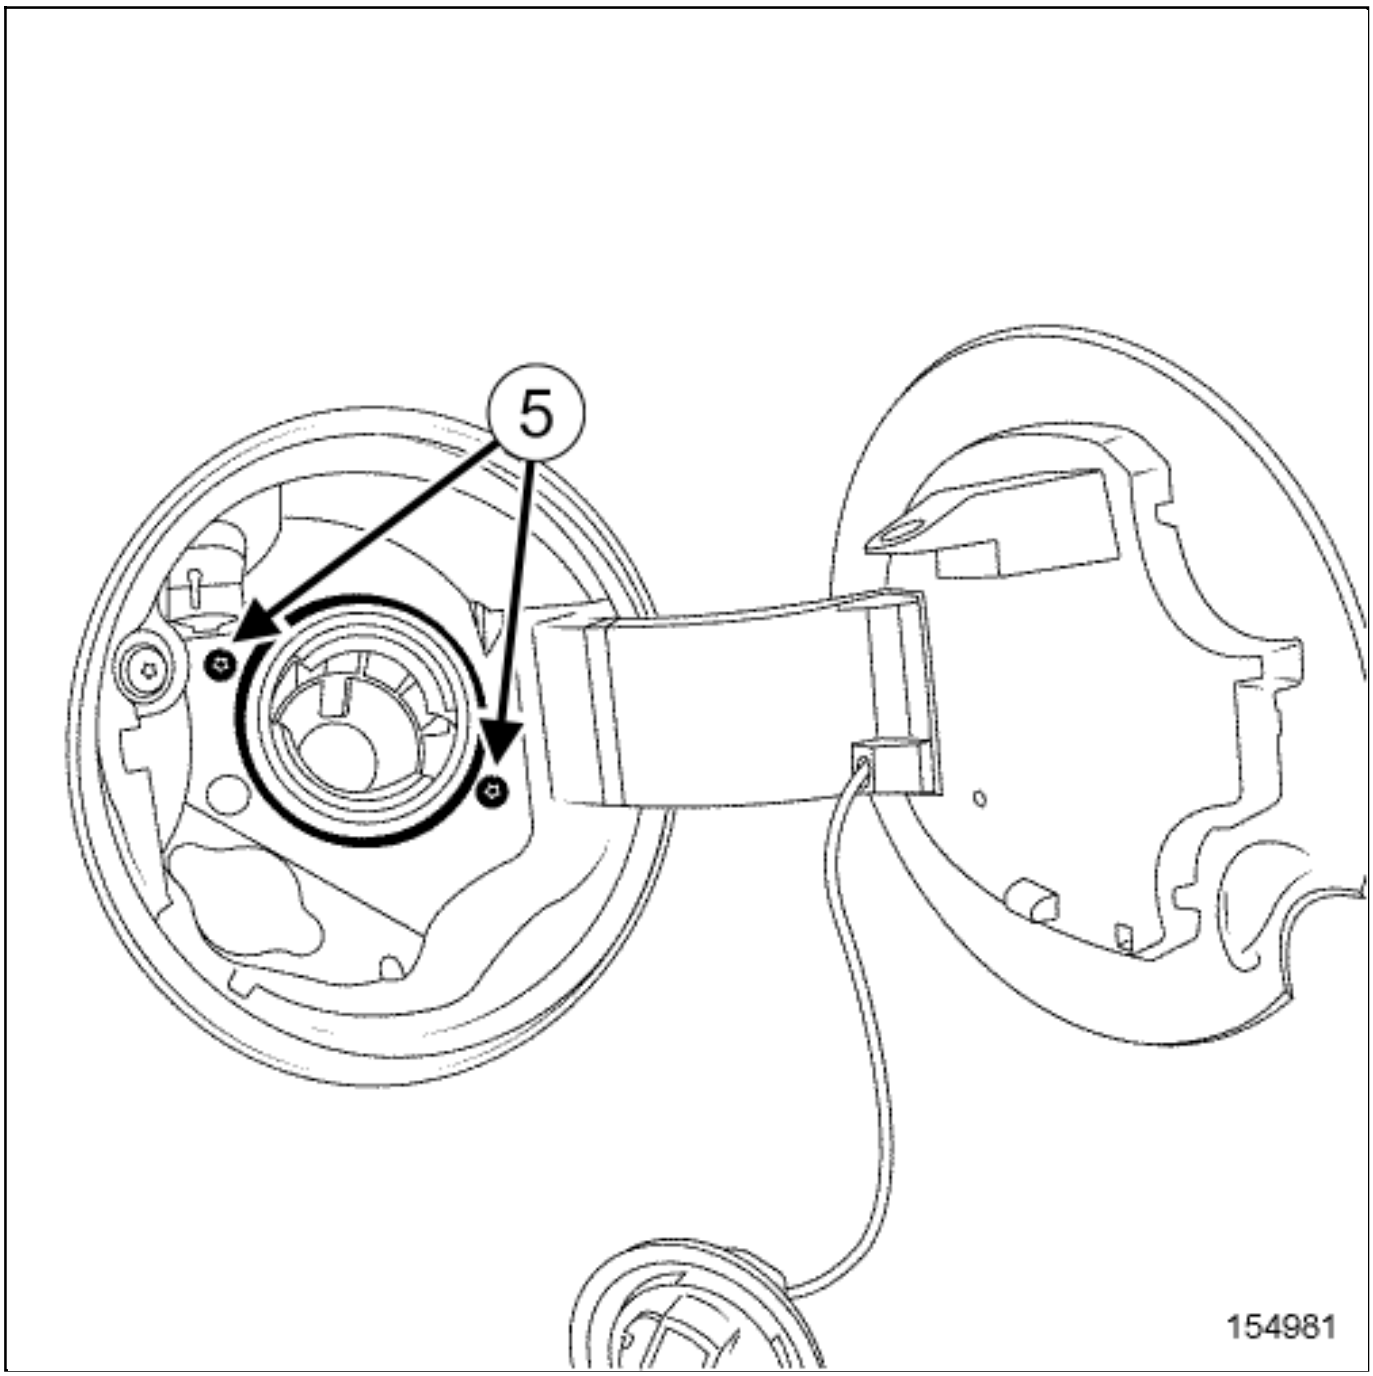


Disconnect the connector(2) from the "pump - sender unit" assembly.

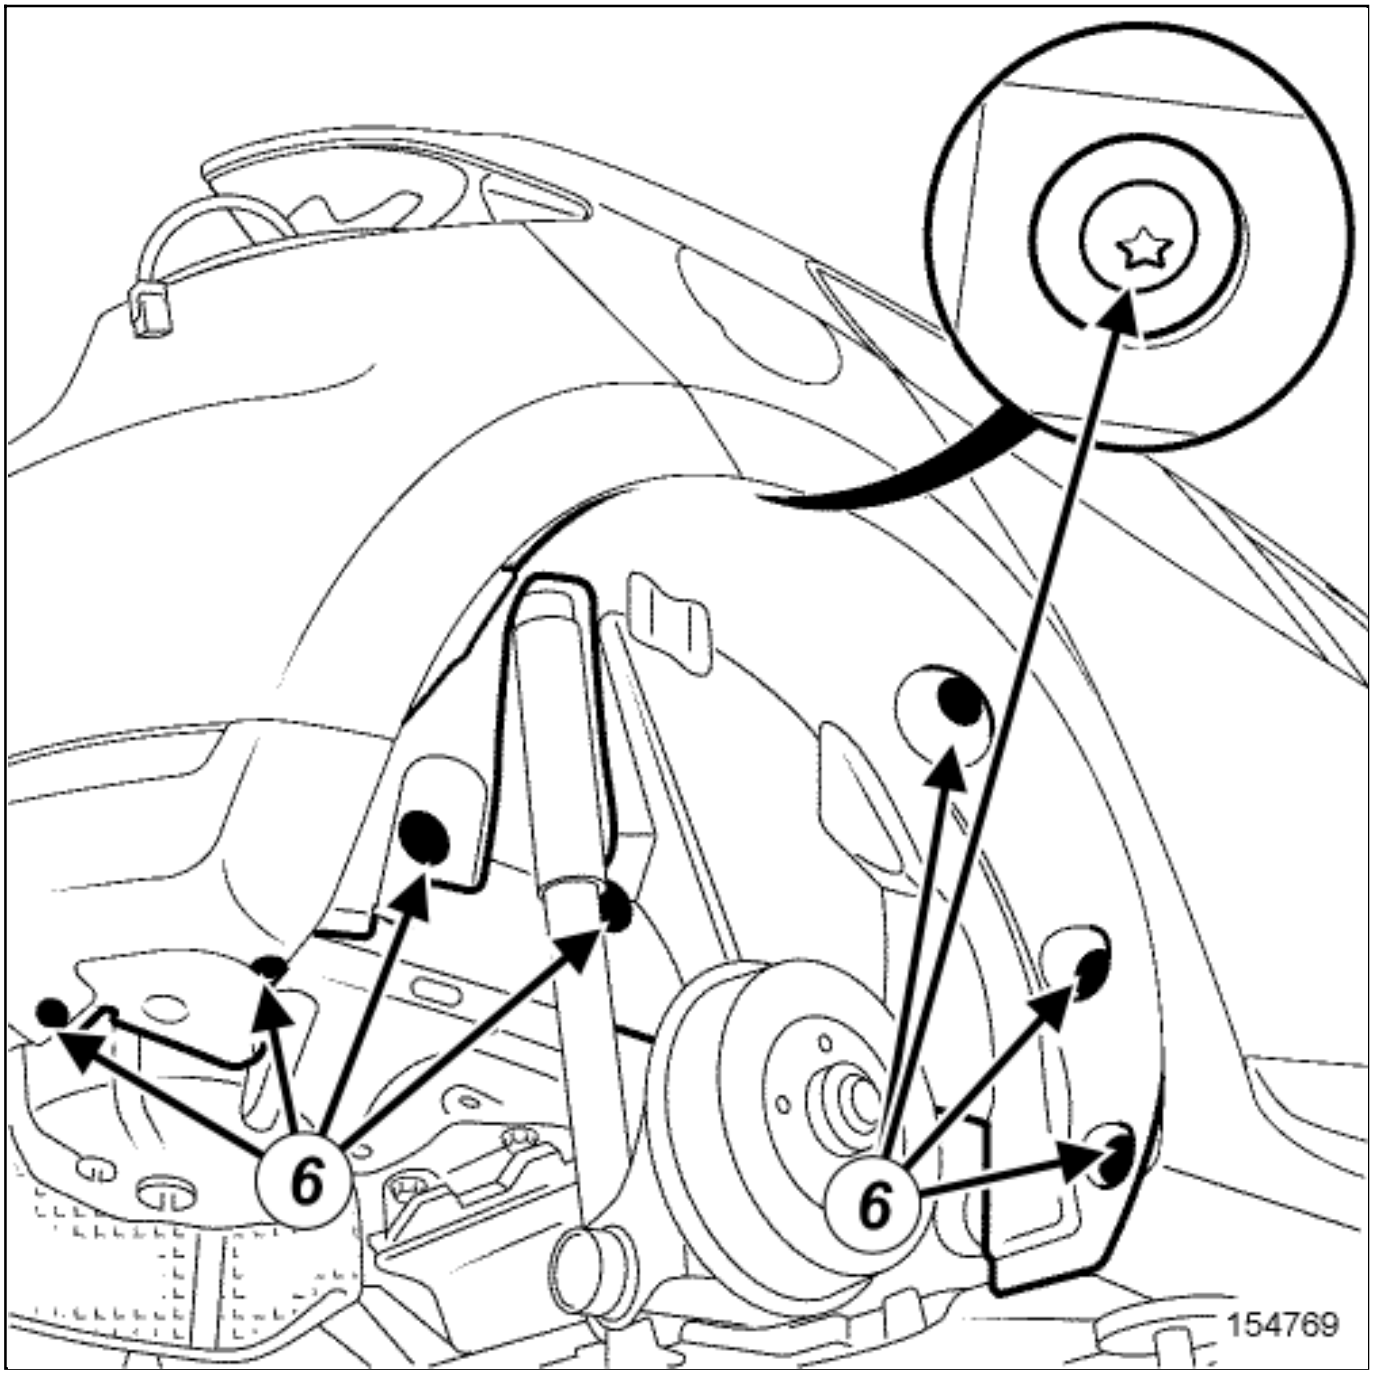
Disconnect (see 19C, Tank, Fuel tank assembly: Exploded view) :

- the fuel return pipe,
- the fuel supply pipe.

Fit a suitable blanking plugs on each open components.



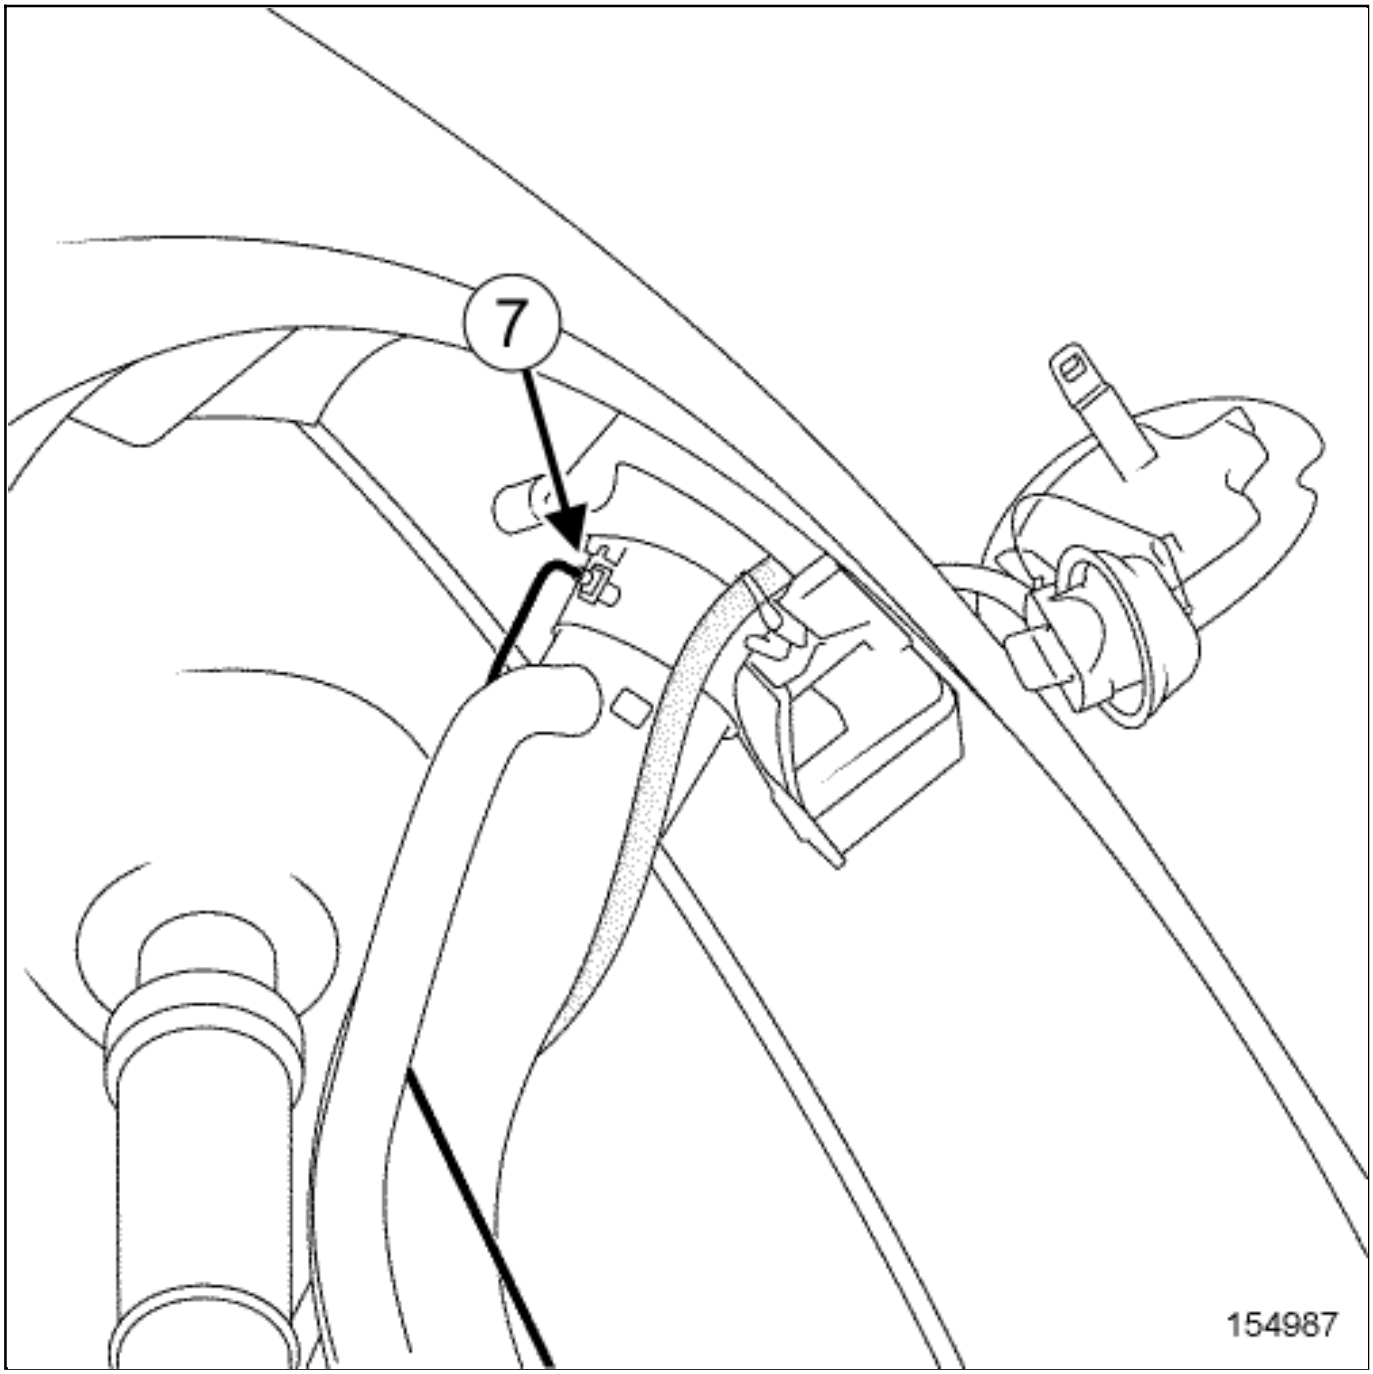
Remove the centre console screws(3) .



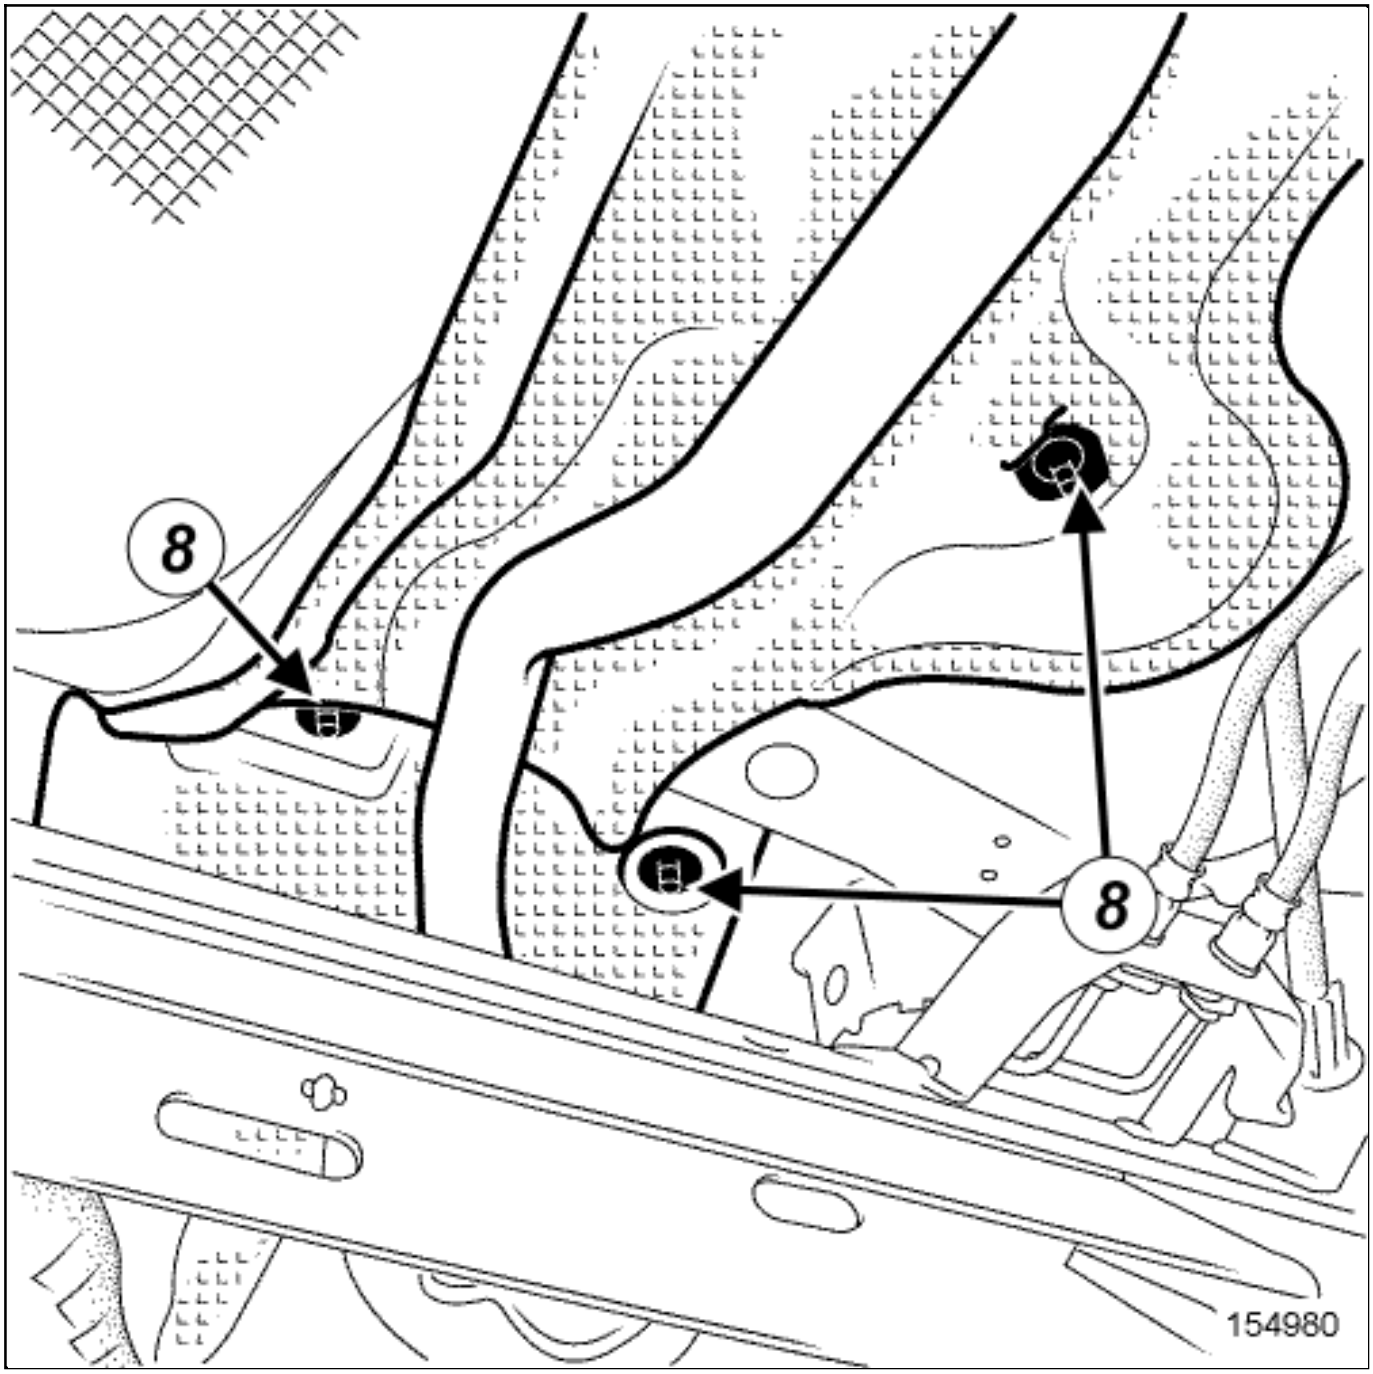
Tilt the rear section of the centre console(4) .

Disconnect the parking brake cable from the parking brake compensator and the handbrake lever mounting reinforcement **Parking brake assembly: Exploded view** .

Remove the fuel filler cap **(see 19C, Tank, Fuel tank assembly: Exploded view)** .

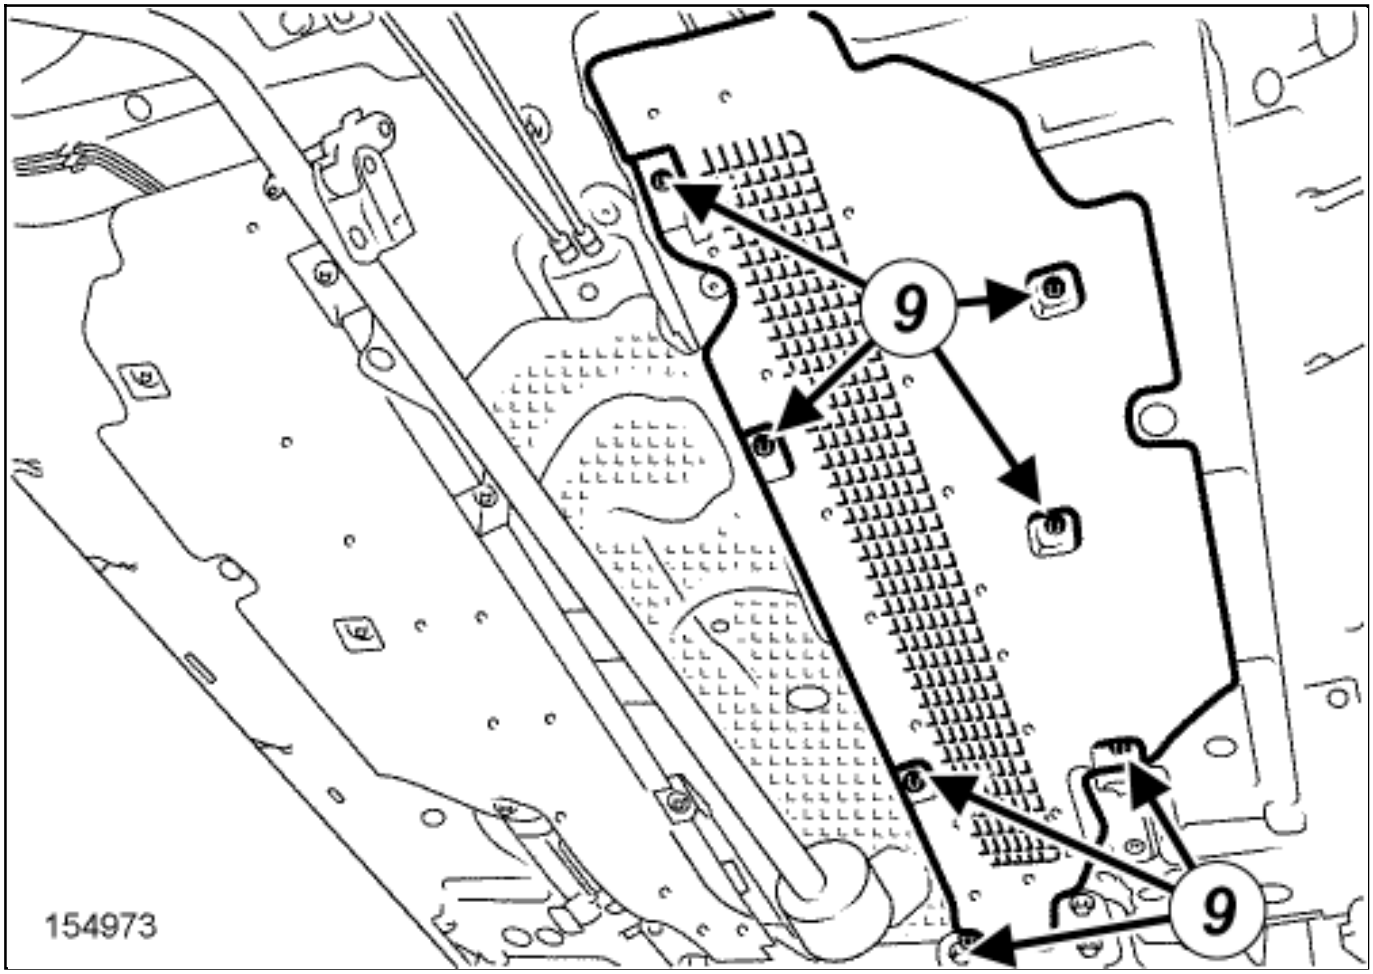


Remove the fuel filler neck screws(5) .



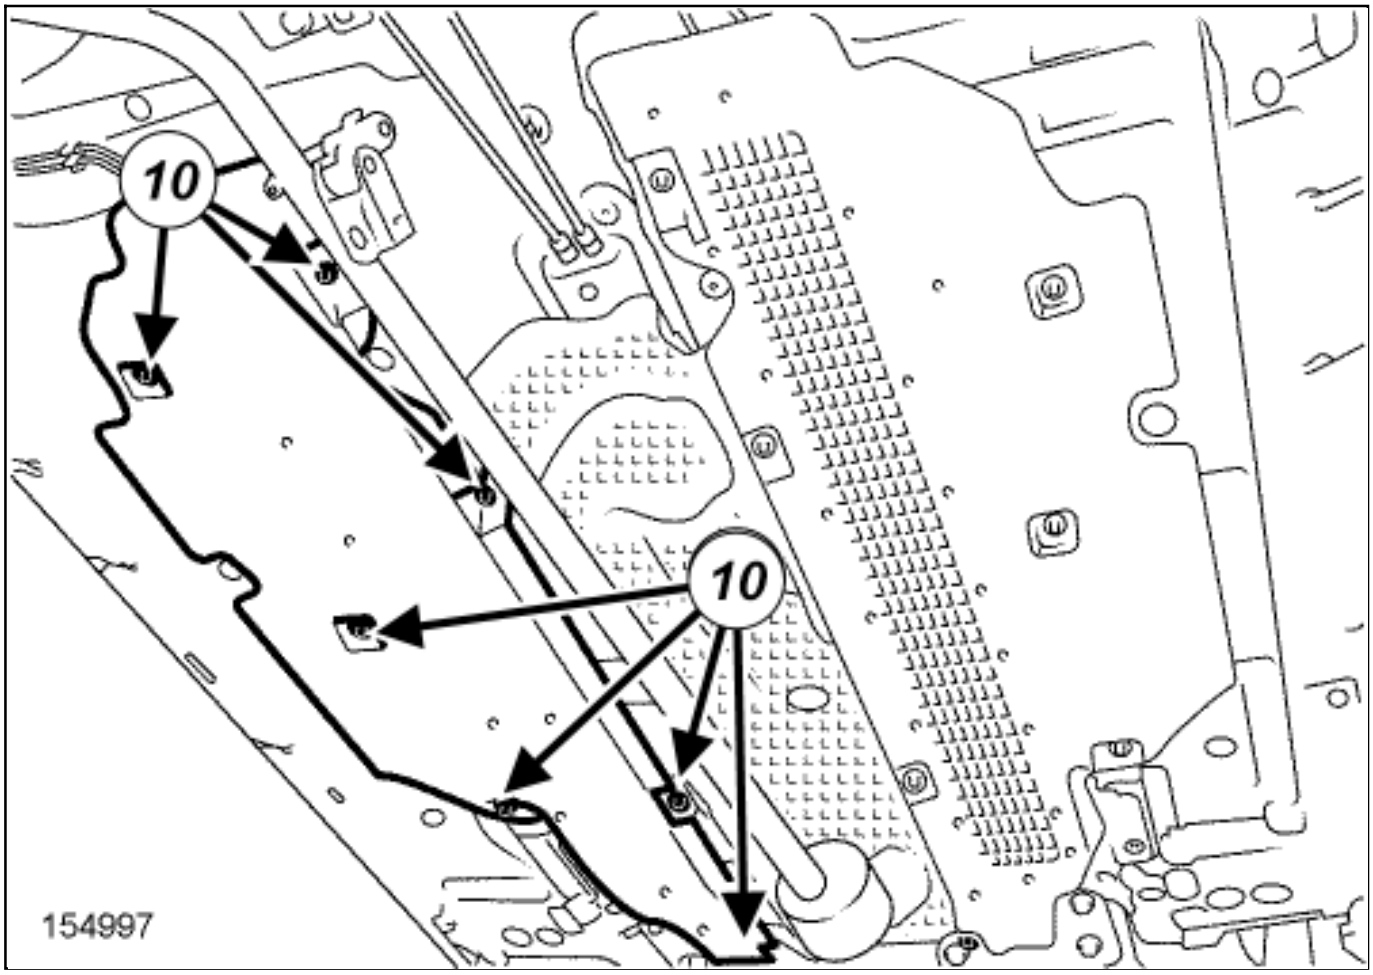
Remove:

- the rear right-hand wheel arch liner screws(6) ,
- the rear right-hand wheel arch liner.



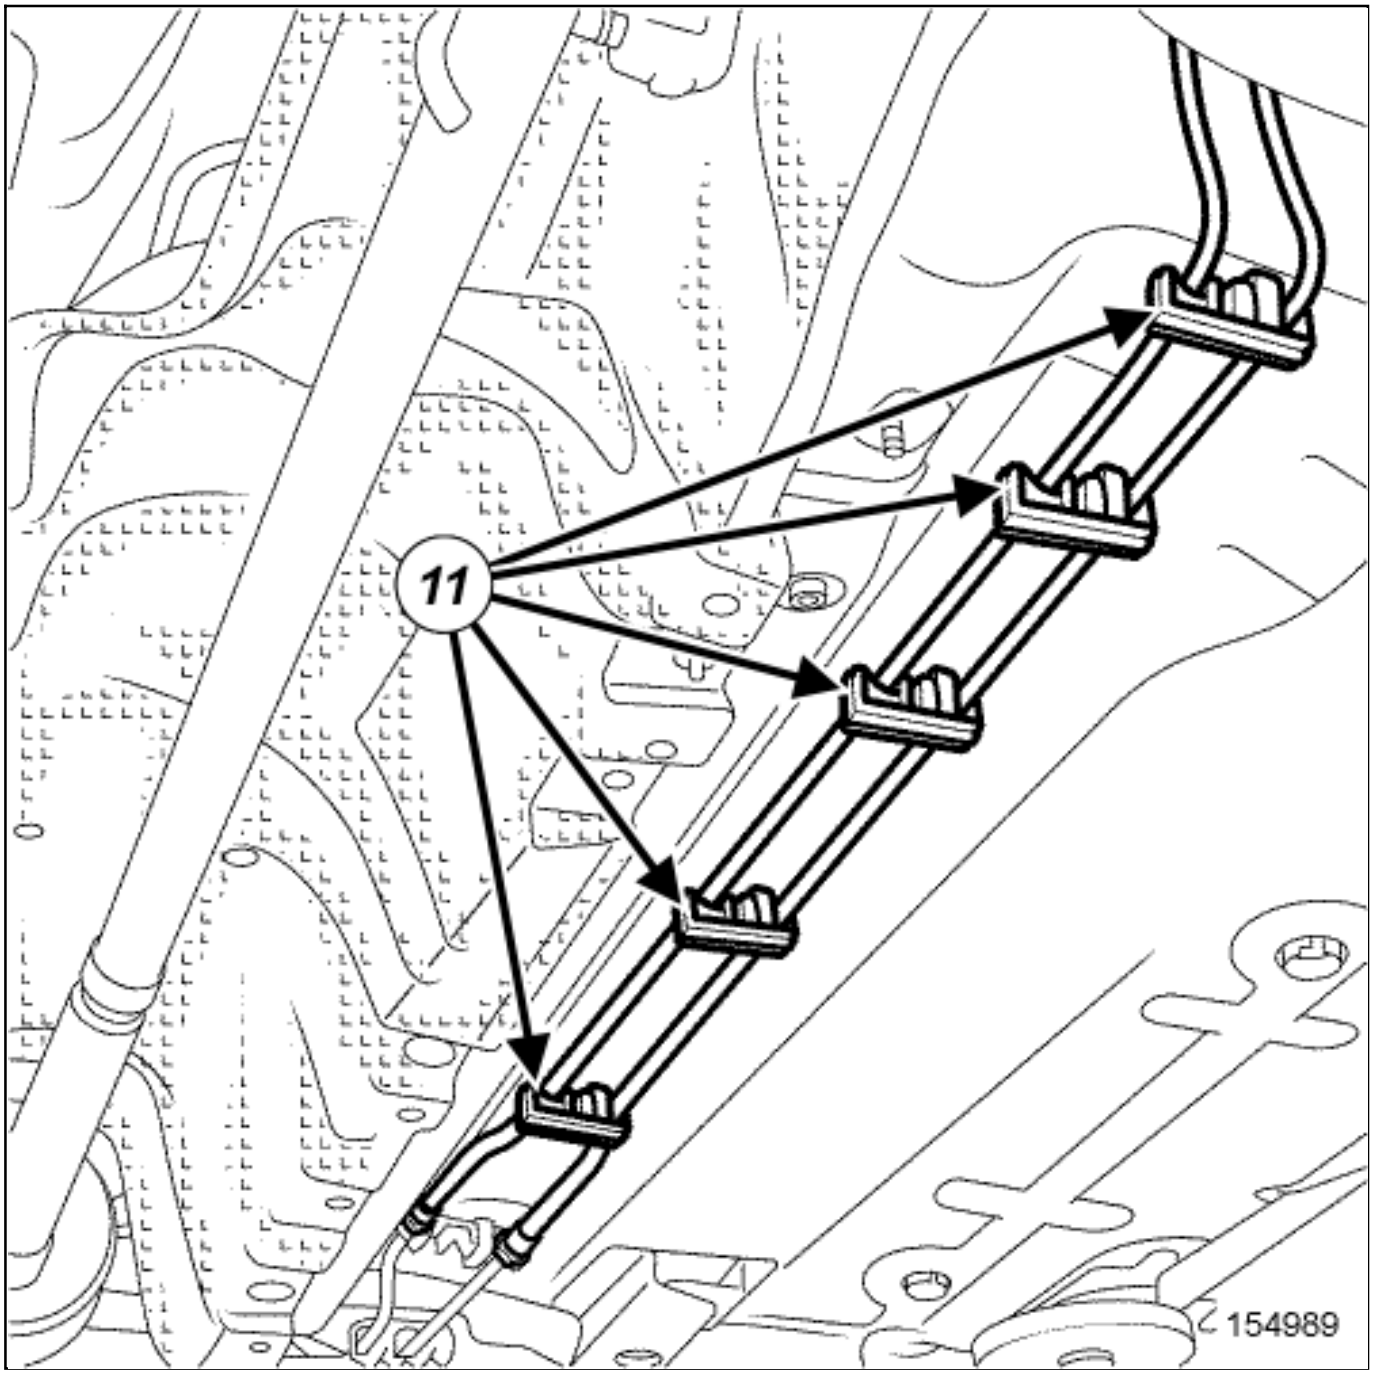
Disconnect the earth cable terminal(7) .

Remove the silencer Exhaust assembly under body: Exploded view .

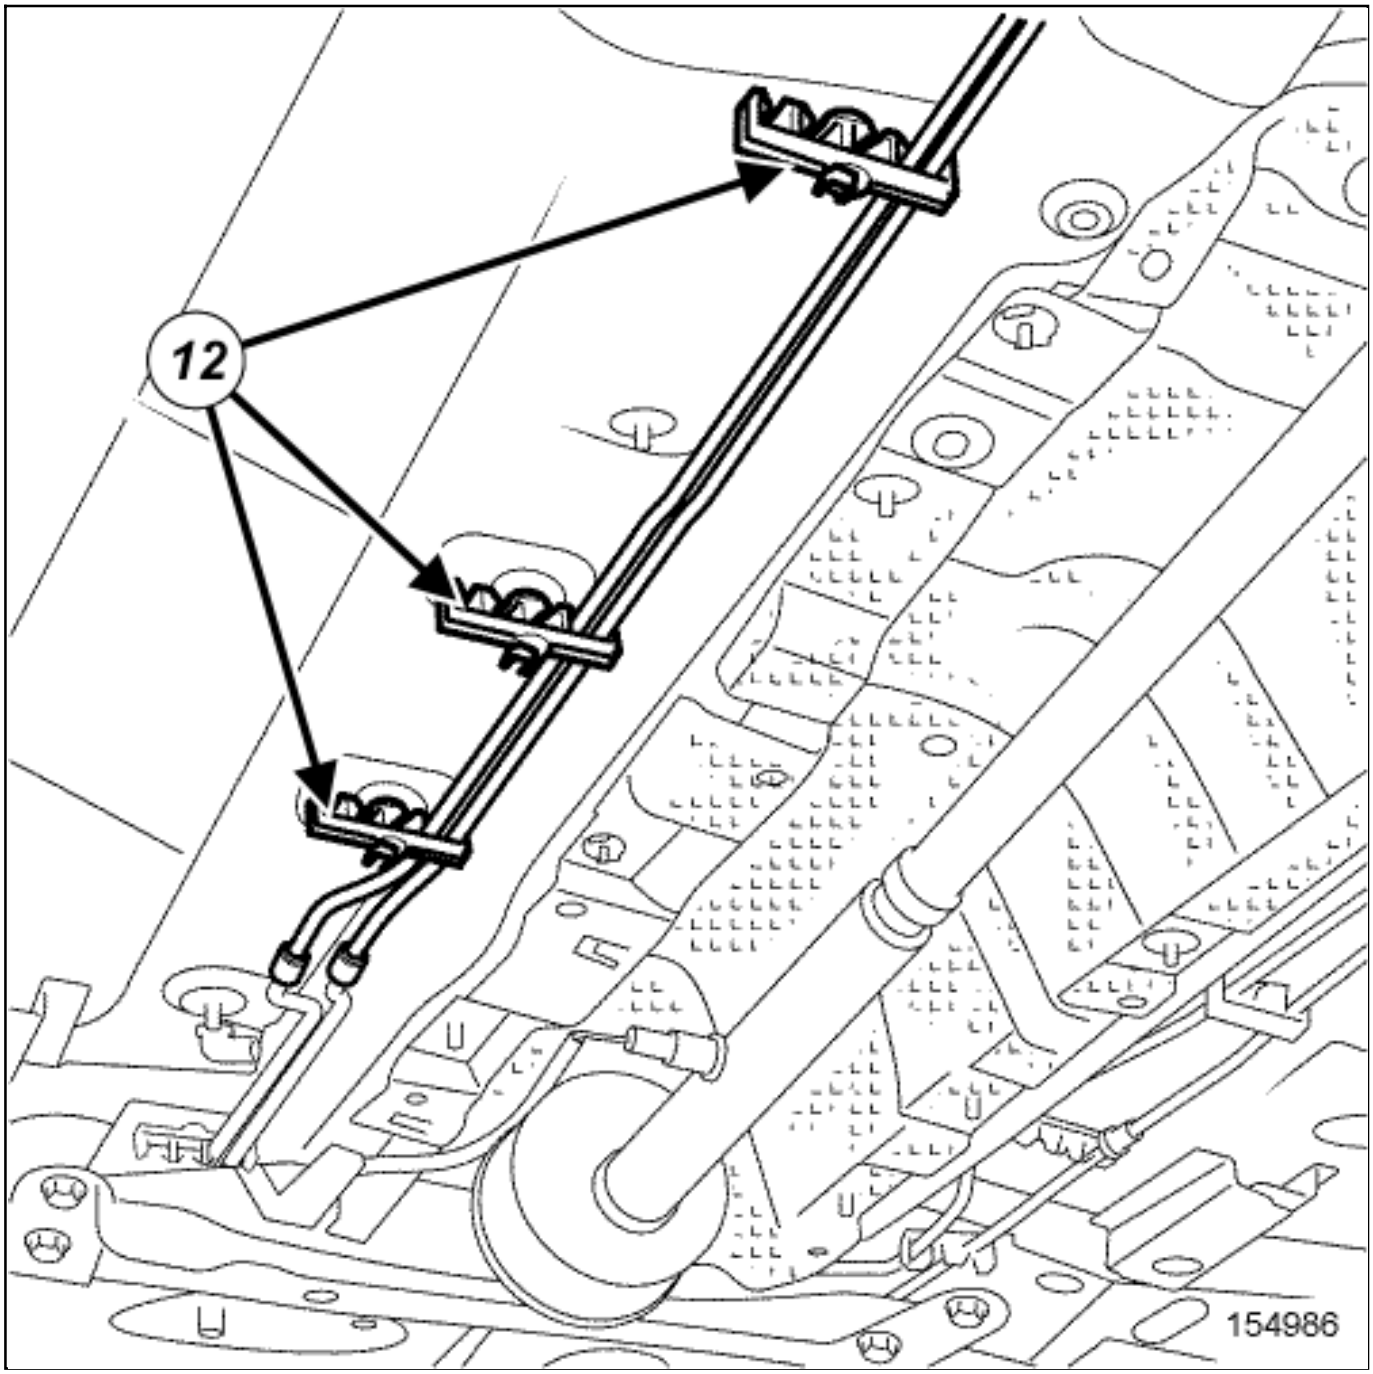


Remove:

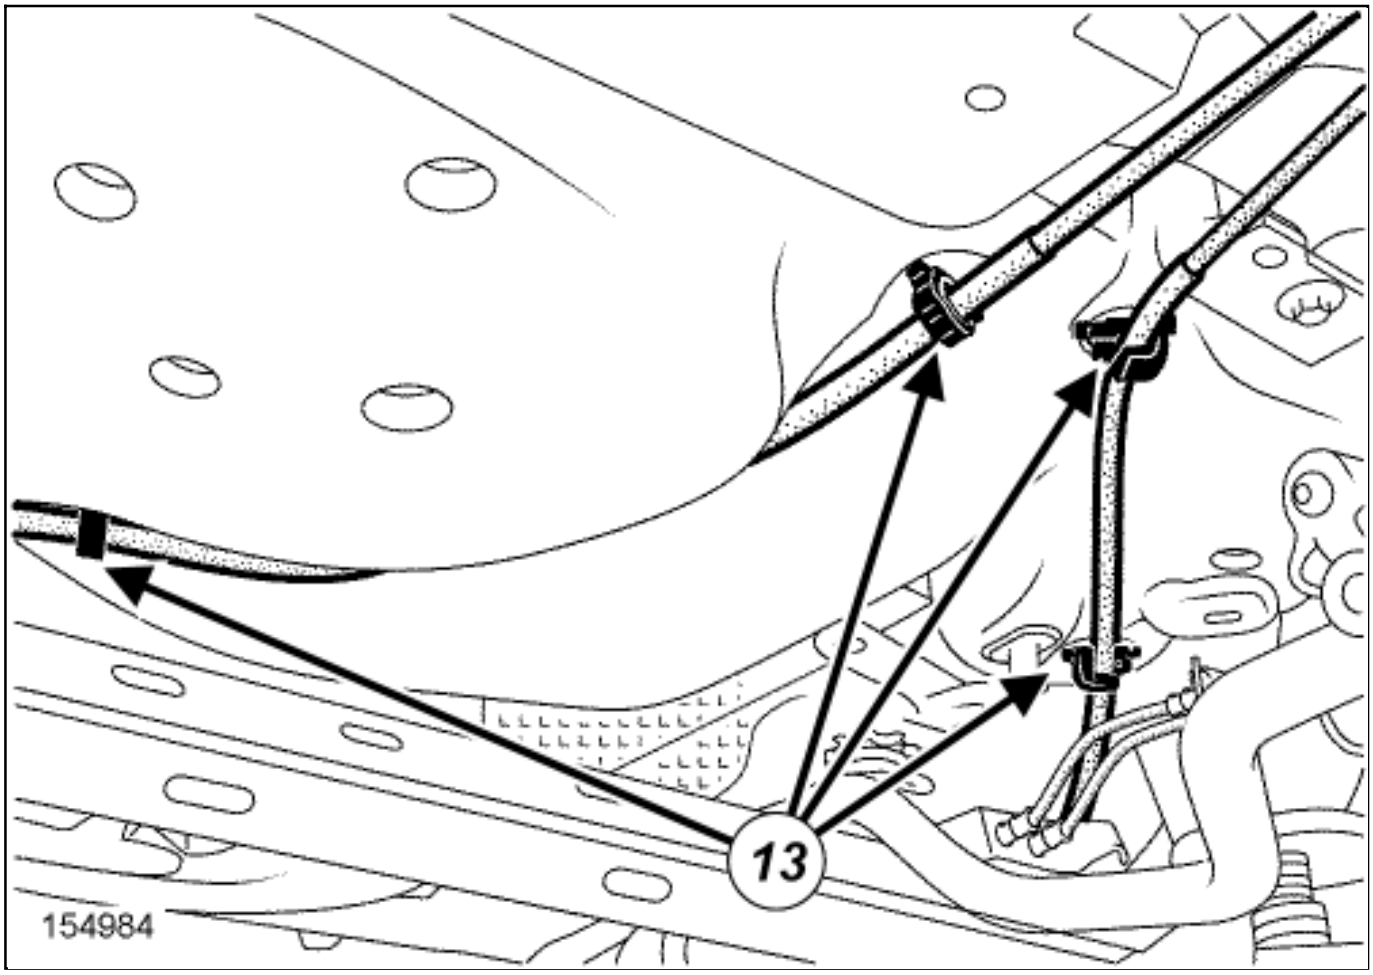
- the heat shield bolts(**8**) ,
- the heat shield.



Remove:



- the fuel pipe protection bolts(9) ,
- the fuel pipe protection.



Remove:

- the brake pipe protection bolts(**10**) ,
- the brake pipe protection.

11
154989

Unclip the fuel pipes clips(11) and brake pipes clips(12) on the body.

Unclip the parking brake cables from the fuel tank(13) .

Remove:

- the rear right-hand shock absorber Rear axle assembly: Exploded view ,
- the rear right-hand shock absorber spring Rear axle assembly: Exploded view .

2. REMOVAL OPERATION

Fit a component support under the fuel tank.

Remove the fuel tank bolts (see 19C, Tank, Fuel tank assembly: Exploded view) .

- Fit a suitable blanking plug on the opening of the fuel tank.
- Remove the fuel tank (see 19C, Tank, Fuel tank assembly: Exploded view) .

REFITTING

1. REFITTING OPERATION

- Fit a component support under the fuel tank.
- Remove the blanking plugs from the openings of the fuel tank.
- Refit (see 19C, Tank, Fuel tank assembly: Exploded view) :
  - the fuel tank,
  - the fuel tank bolts.
- Connect:
  - the snap-on unions to the tank outlet fuel pipes,
  - the earth cable terminal to the filler neck.

2. FINAL OPERATION

- Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

FUEL VAPOUR ABSORBER BLEED SOLENOID VALVE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

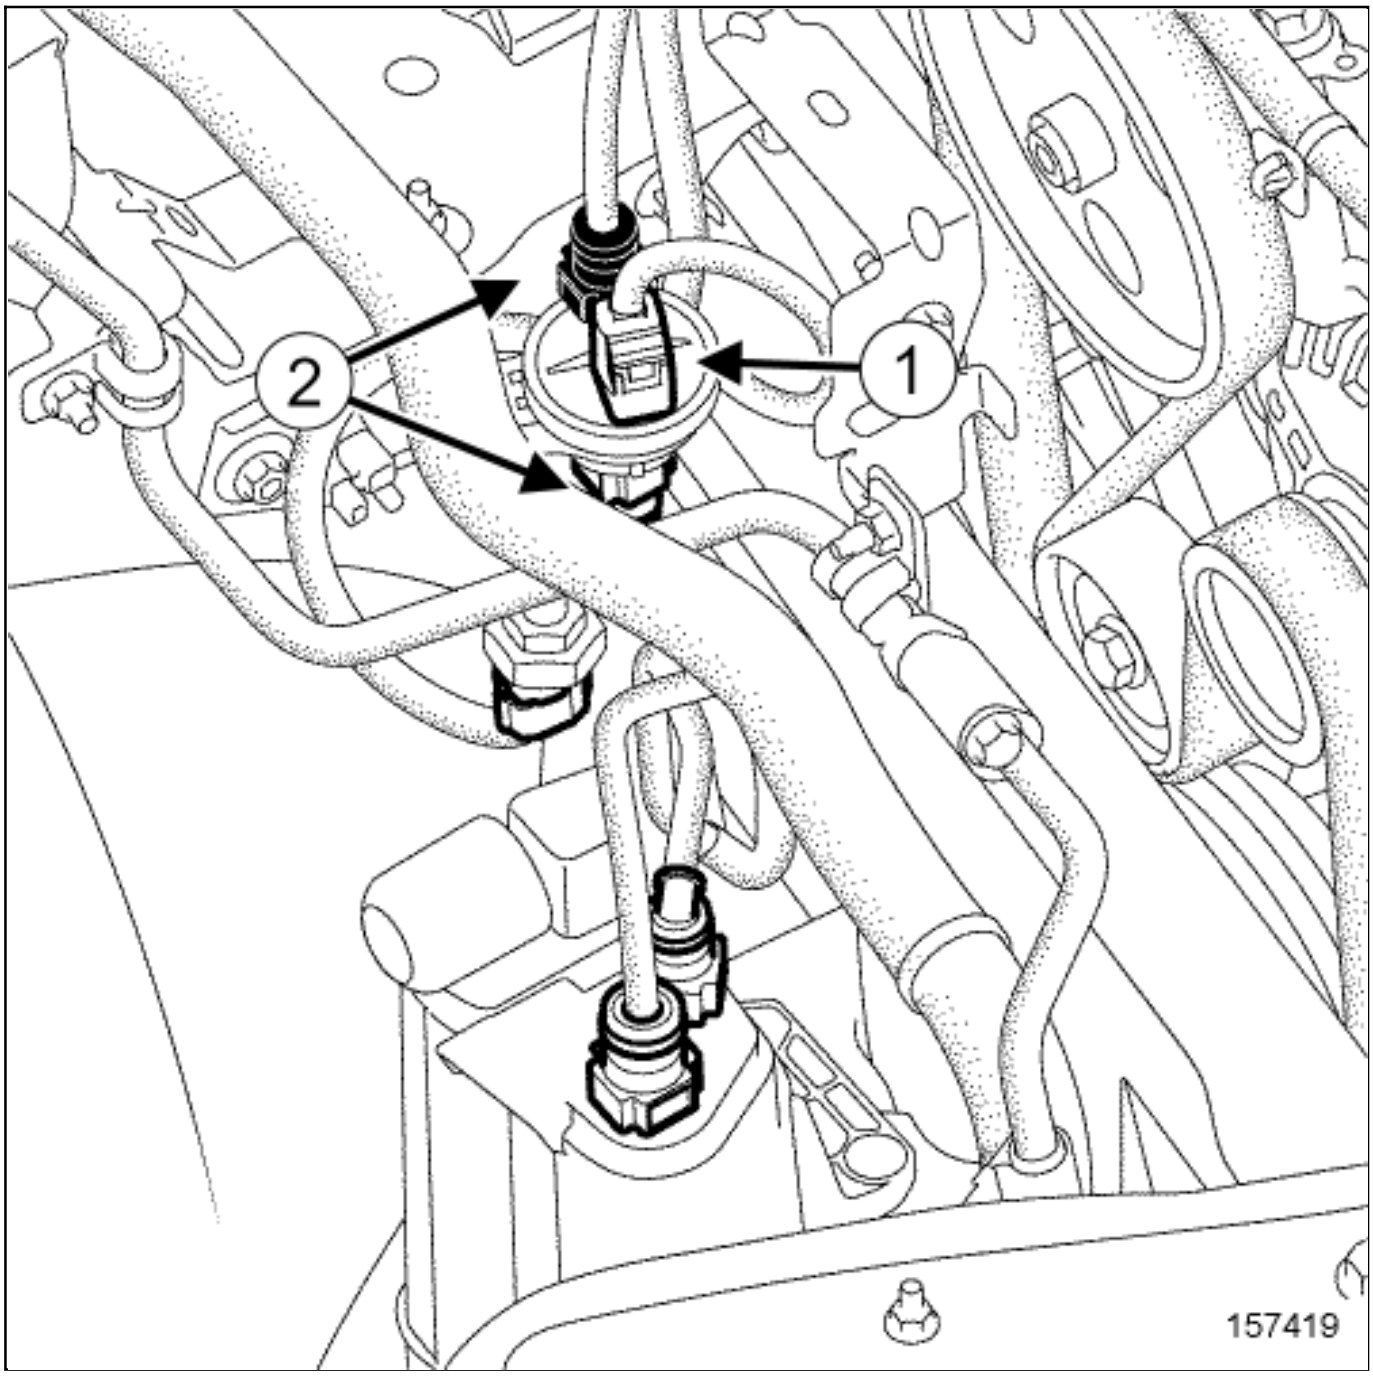
CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CAUTION

Keep the pipe unions away from contaminated areas.

CAUTION

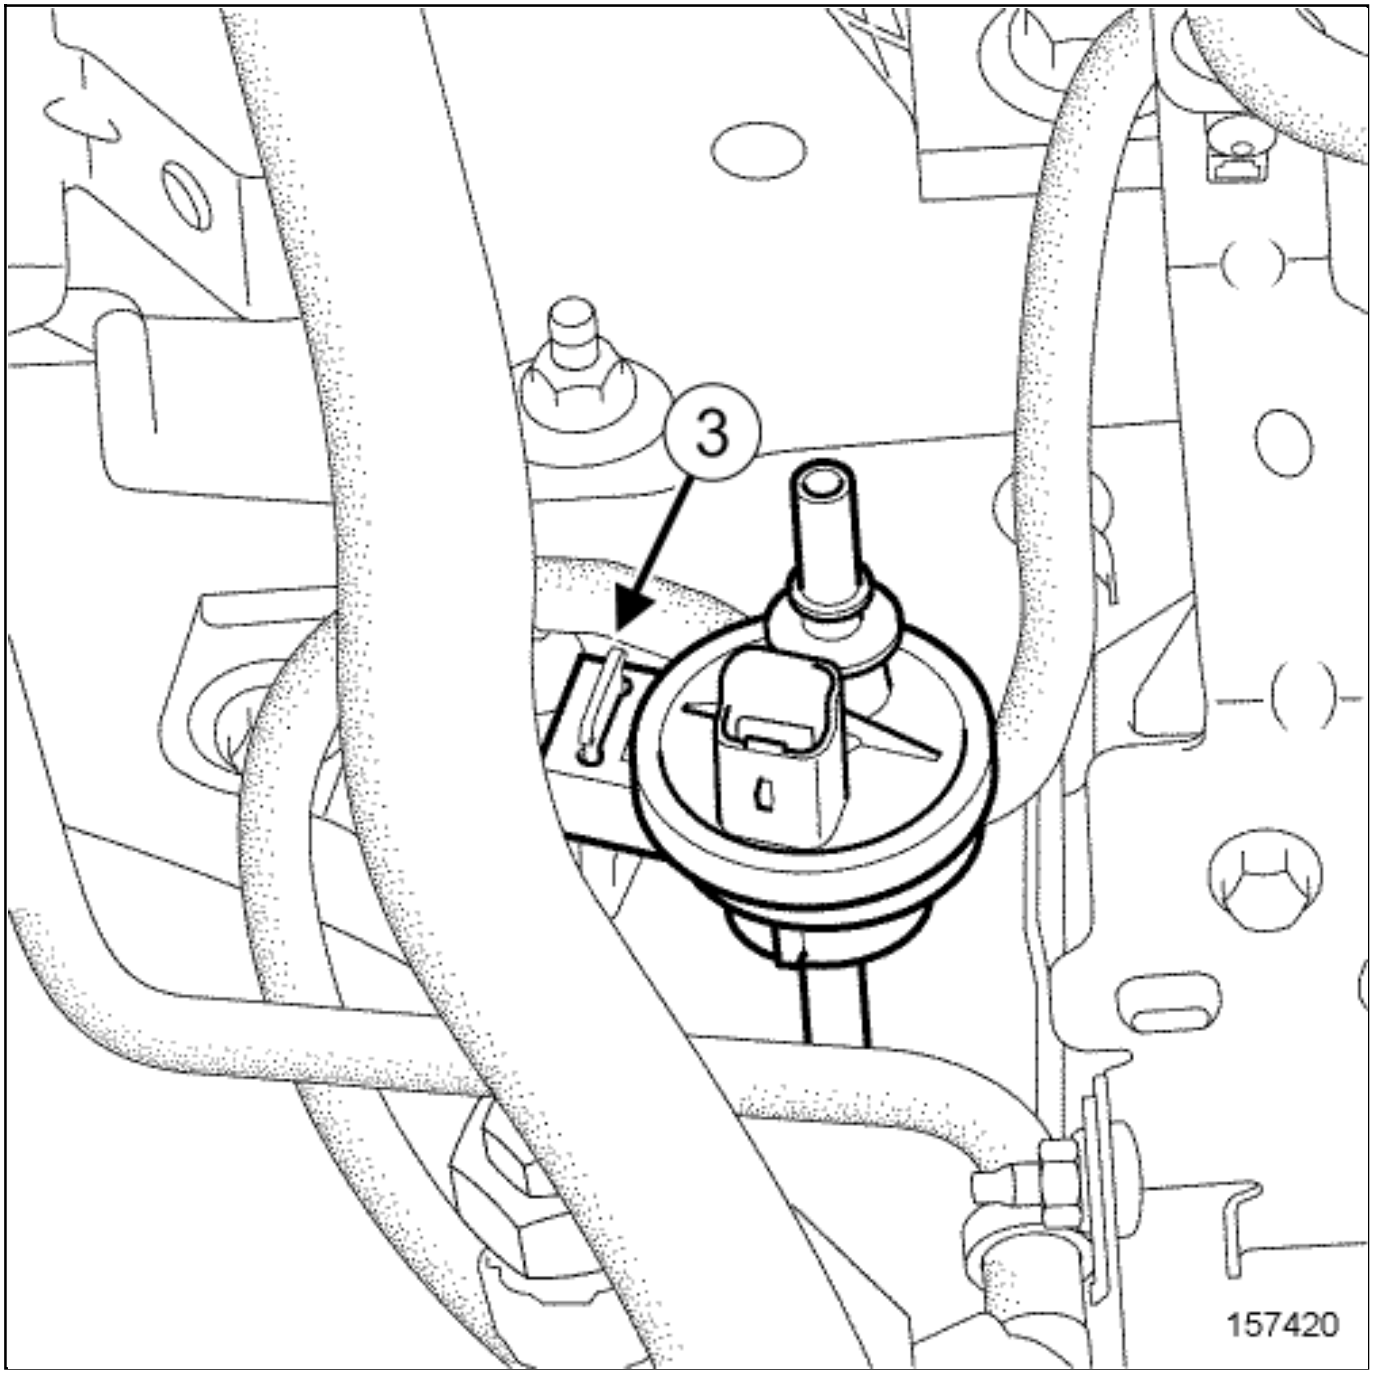


To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery Battery: Removal - Refitting .



2. REMOVAL OPERATION

Disconnect:

- the fuel vapour absorber bleed solenoid valve connector(1) ,
- the fuel vapour absorber bleed solenoid valve pipes(2) .

Insert the blanking plugs.

Unclip the fuel vapour absorber bleed solenoid valve at(3) .

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

FUEL VAPOUR ABSORBER BLEED SOLENOID VALVE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

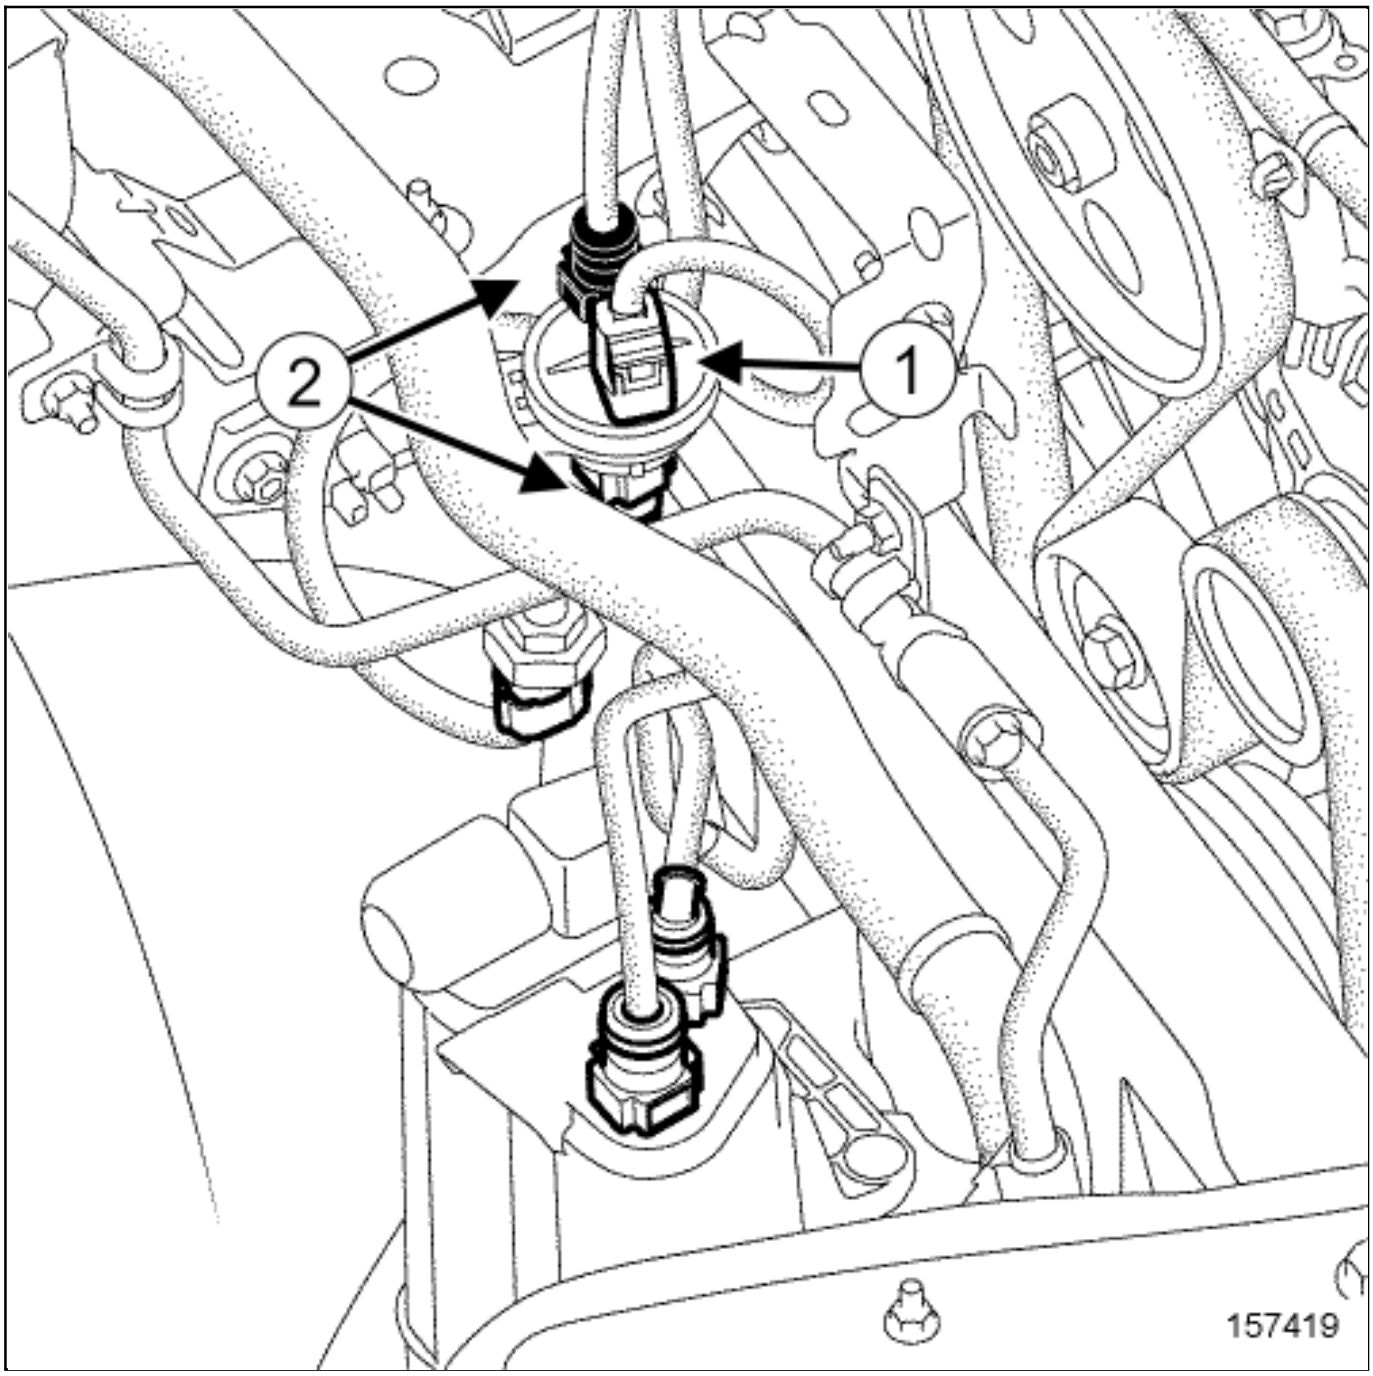
CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CAUTION

Keep the pipe unions away from contaminated areas.

CAUTION

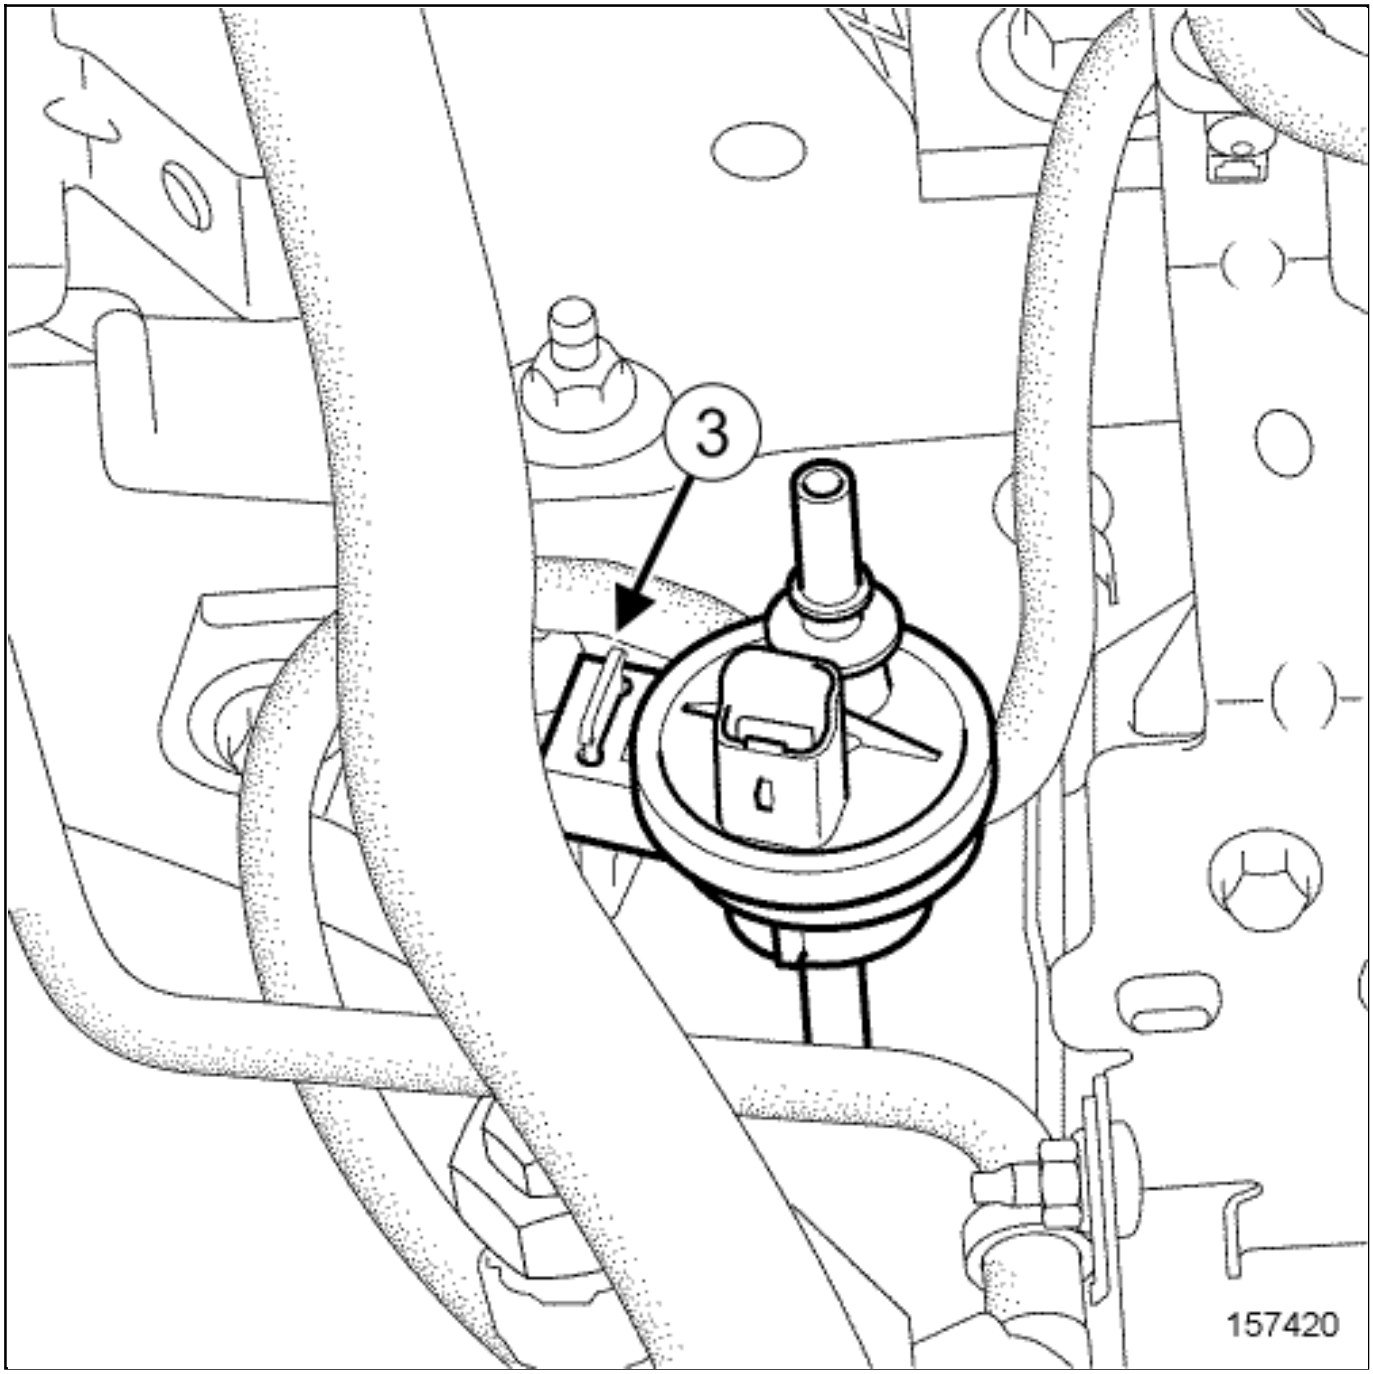


To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery Battery: Removal - Refitting .



2. REMOVAL OPERATION

Disconnect:

- the fuel vapour absorber bleed solenoid valve connector(1) ,
- the fuel vapour absorber bleed solenoid valve pipes(2) .

Insert the blanking plugs.

Unclip the fuel vapour absorber bleed solenoid valve at(3) .

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

FUEL VAPOUR ABSORBER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

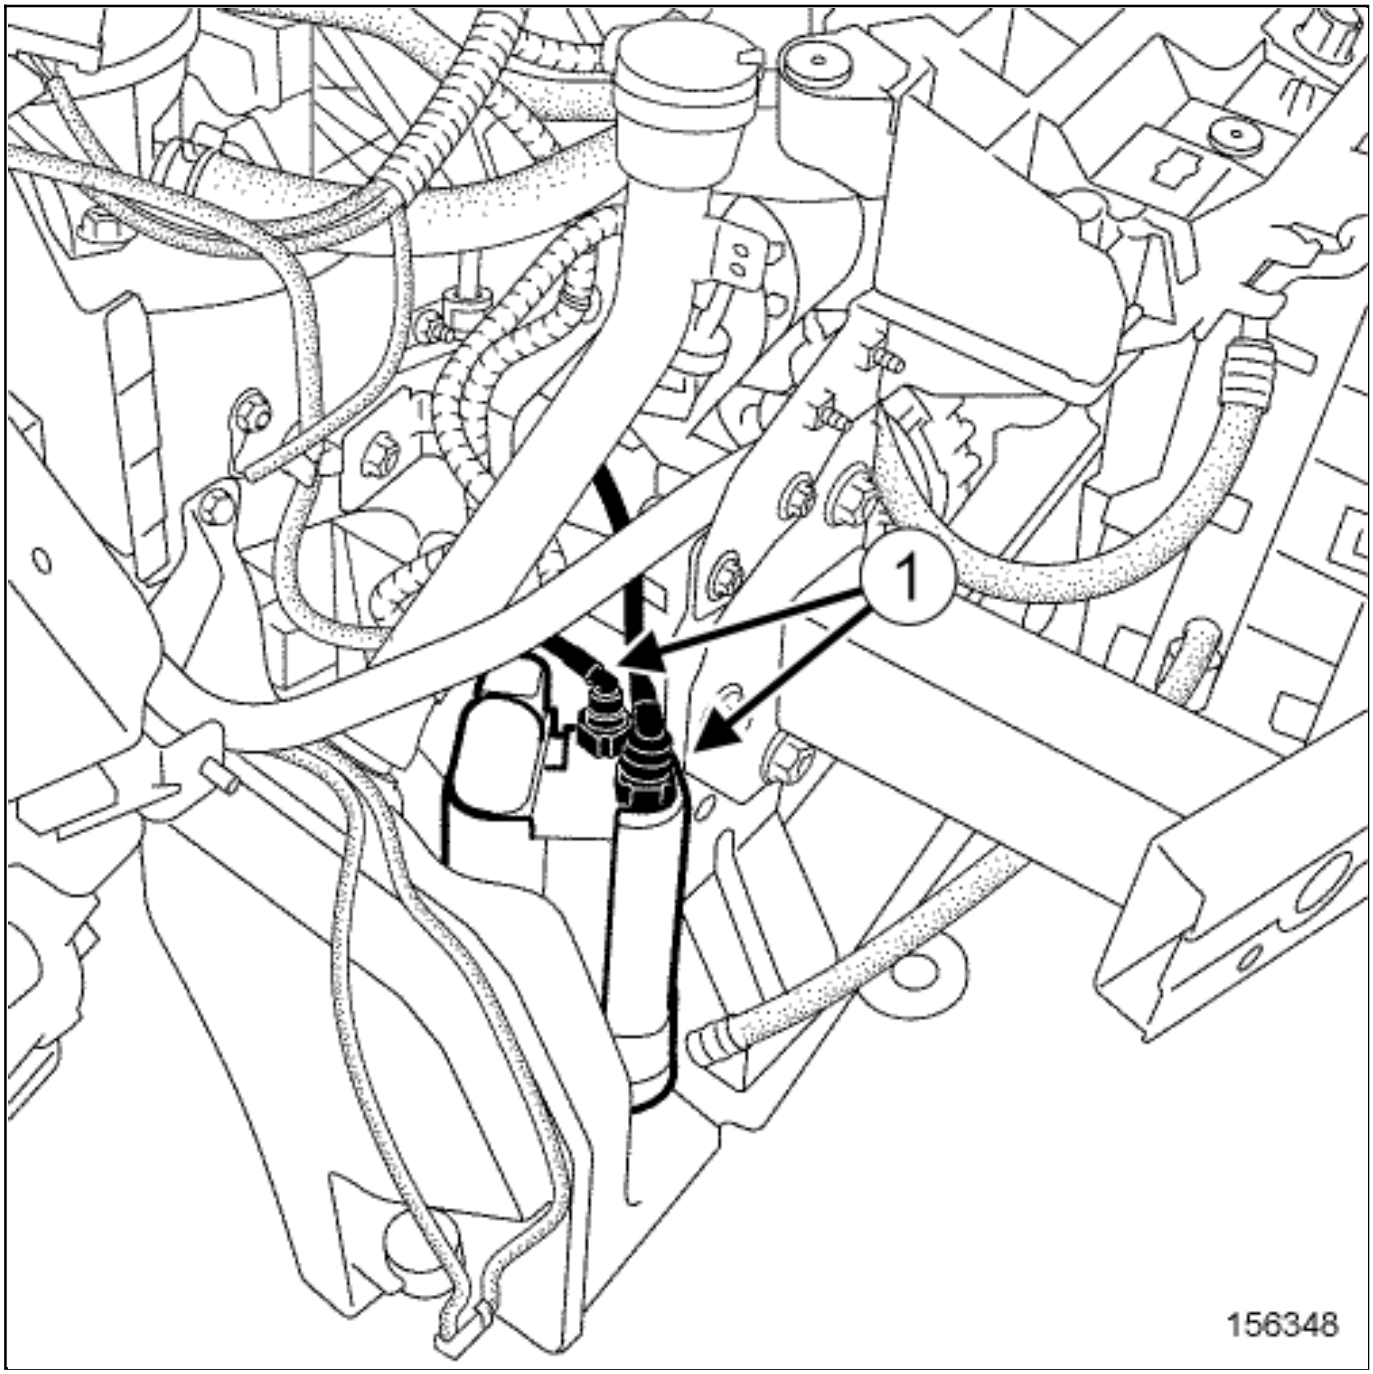
CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CAUTION

Keep the pipe unions away from contaminated areas.

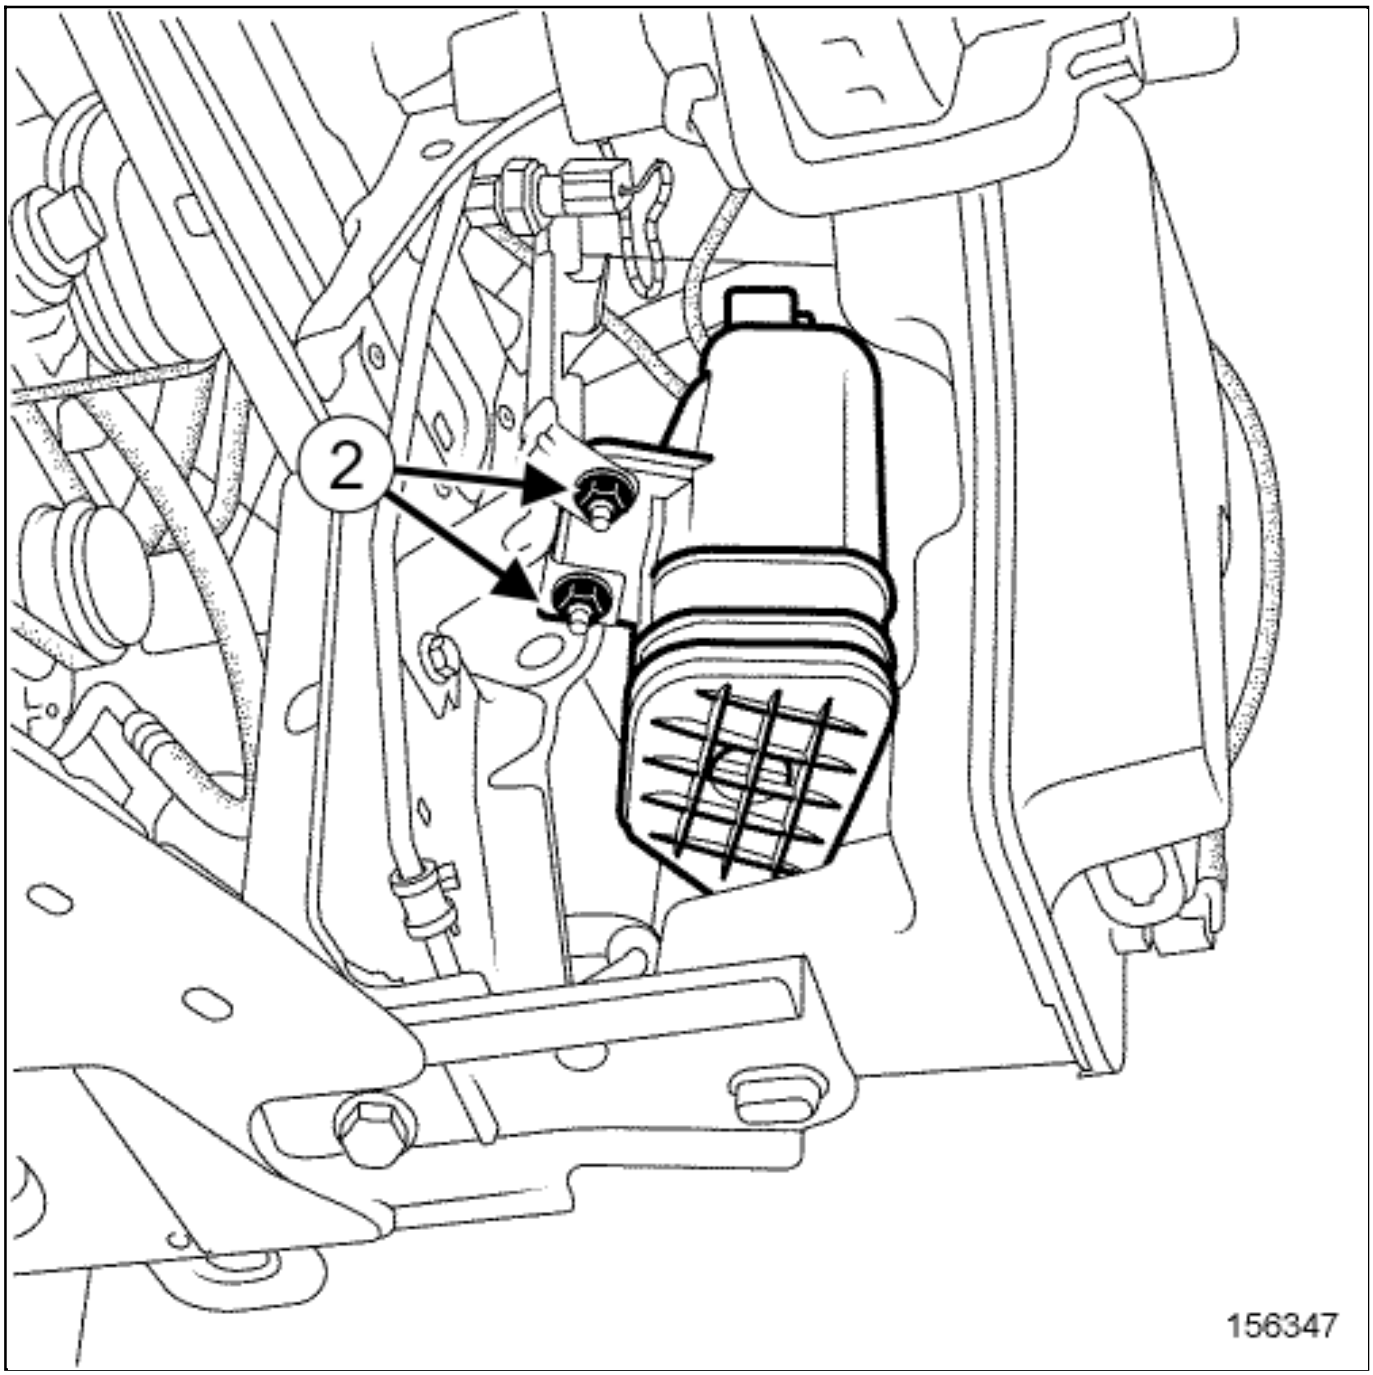
CAUTION



To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view .

2. REMOVAL OPERATION

- Disconnect the fuel vapour absorber pipes(1) .

Insert the blanking plugs.

Remove:

- the fuel vapour absorber nuts(2) ,
- the fuel vapour absorber.

REFITTING

1. REFITTING OPERATION

- Proceed in the reverse order to removal.

FUEL VAPOUR ABSORBER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

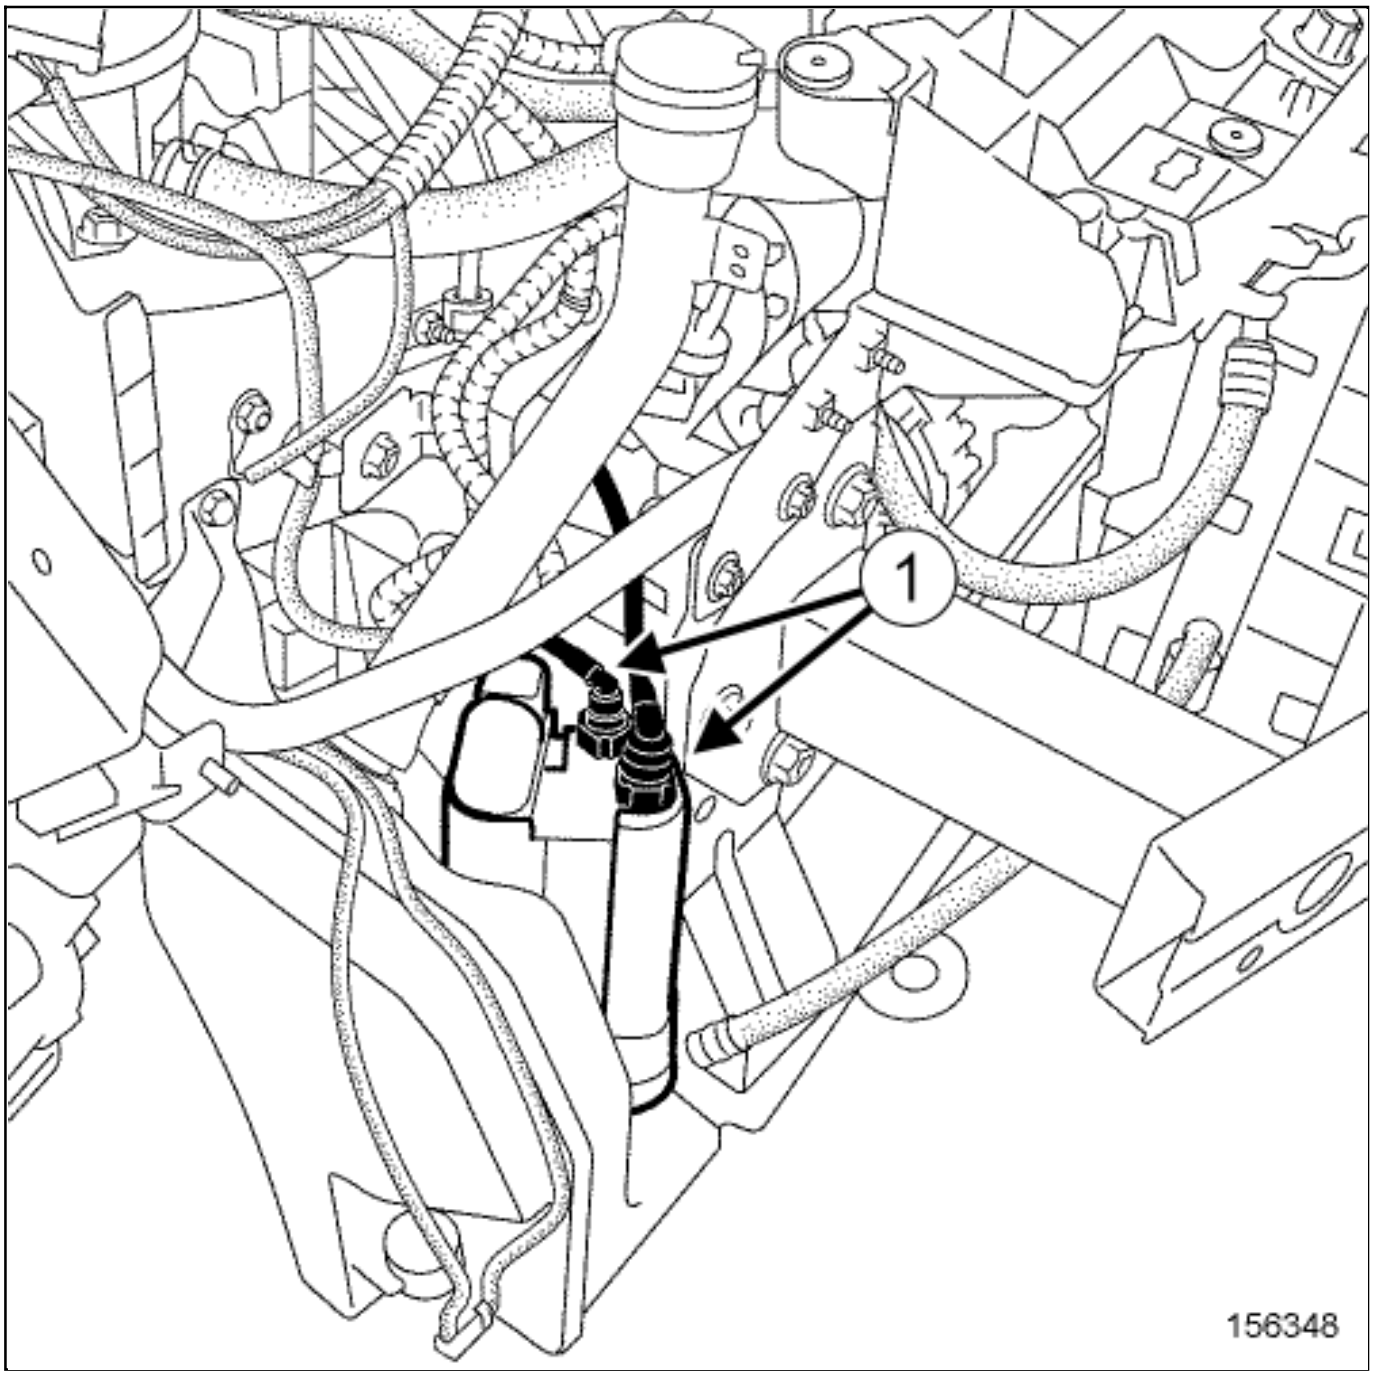
CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

CAUTION

Keep the pipe unions away from contaminated areas.

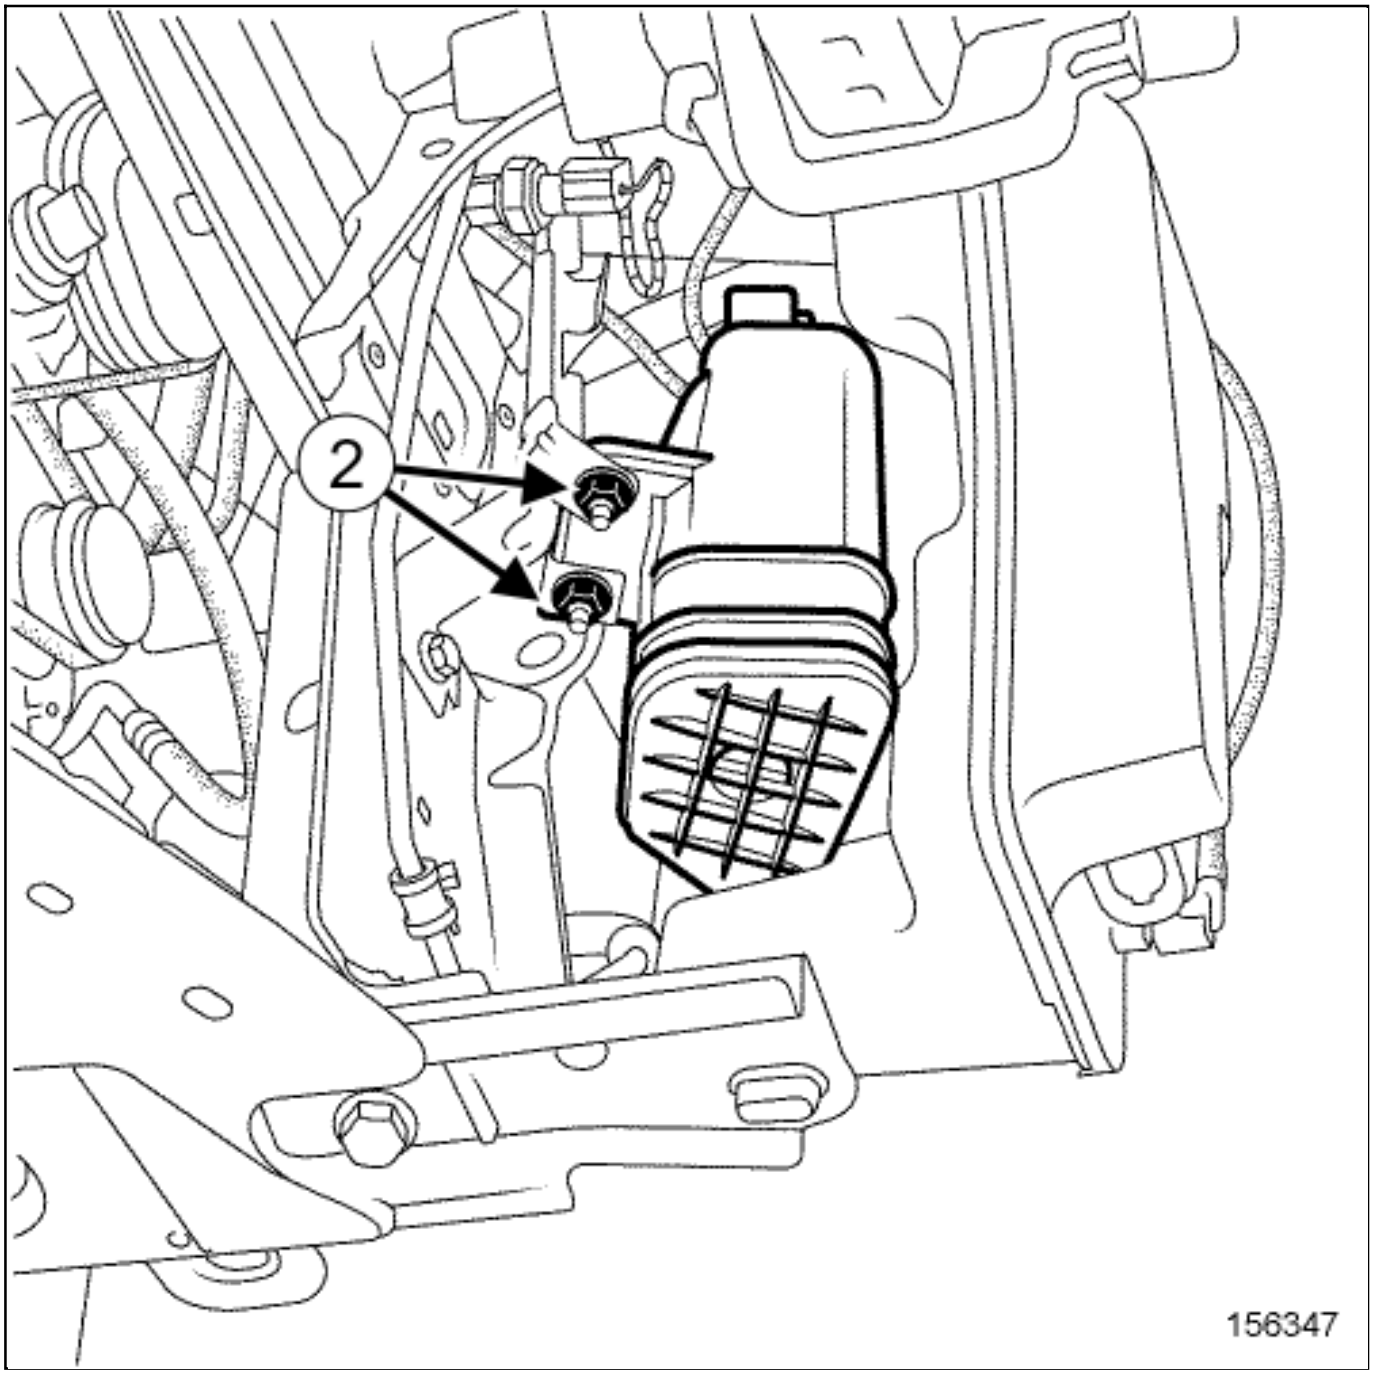
CAUTION



To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view .

2. REMOVAL OPERATION

Disconnect the fuel vapour absorber pipes(1) .

Insert the blanking plugs.

Remove:

- the fuel vapour absorber nuts(2) ,
- the fuel vapour absorber.

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

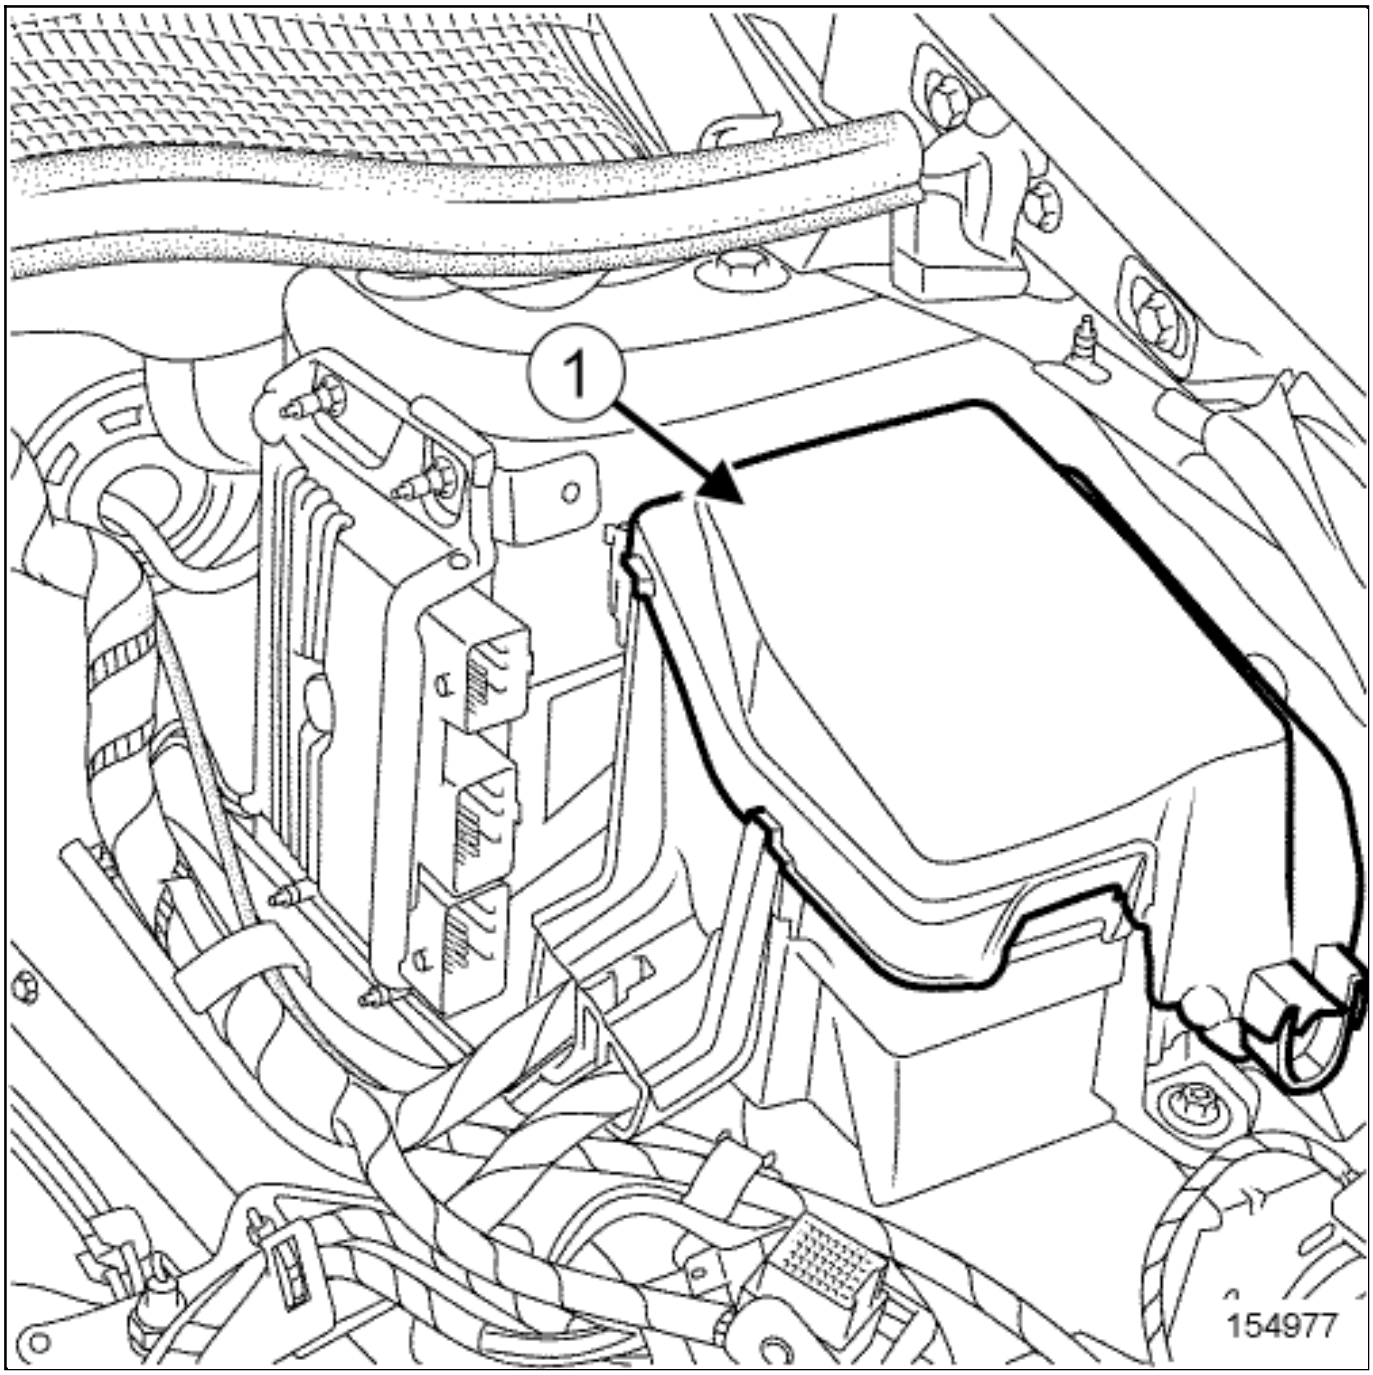
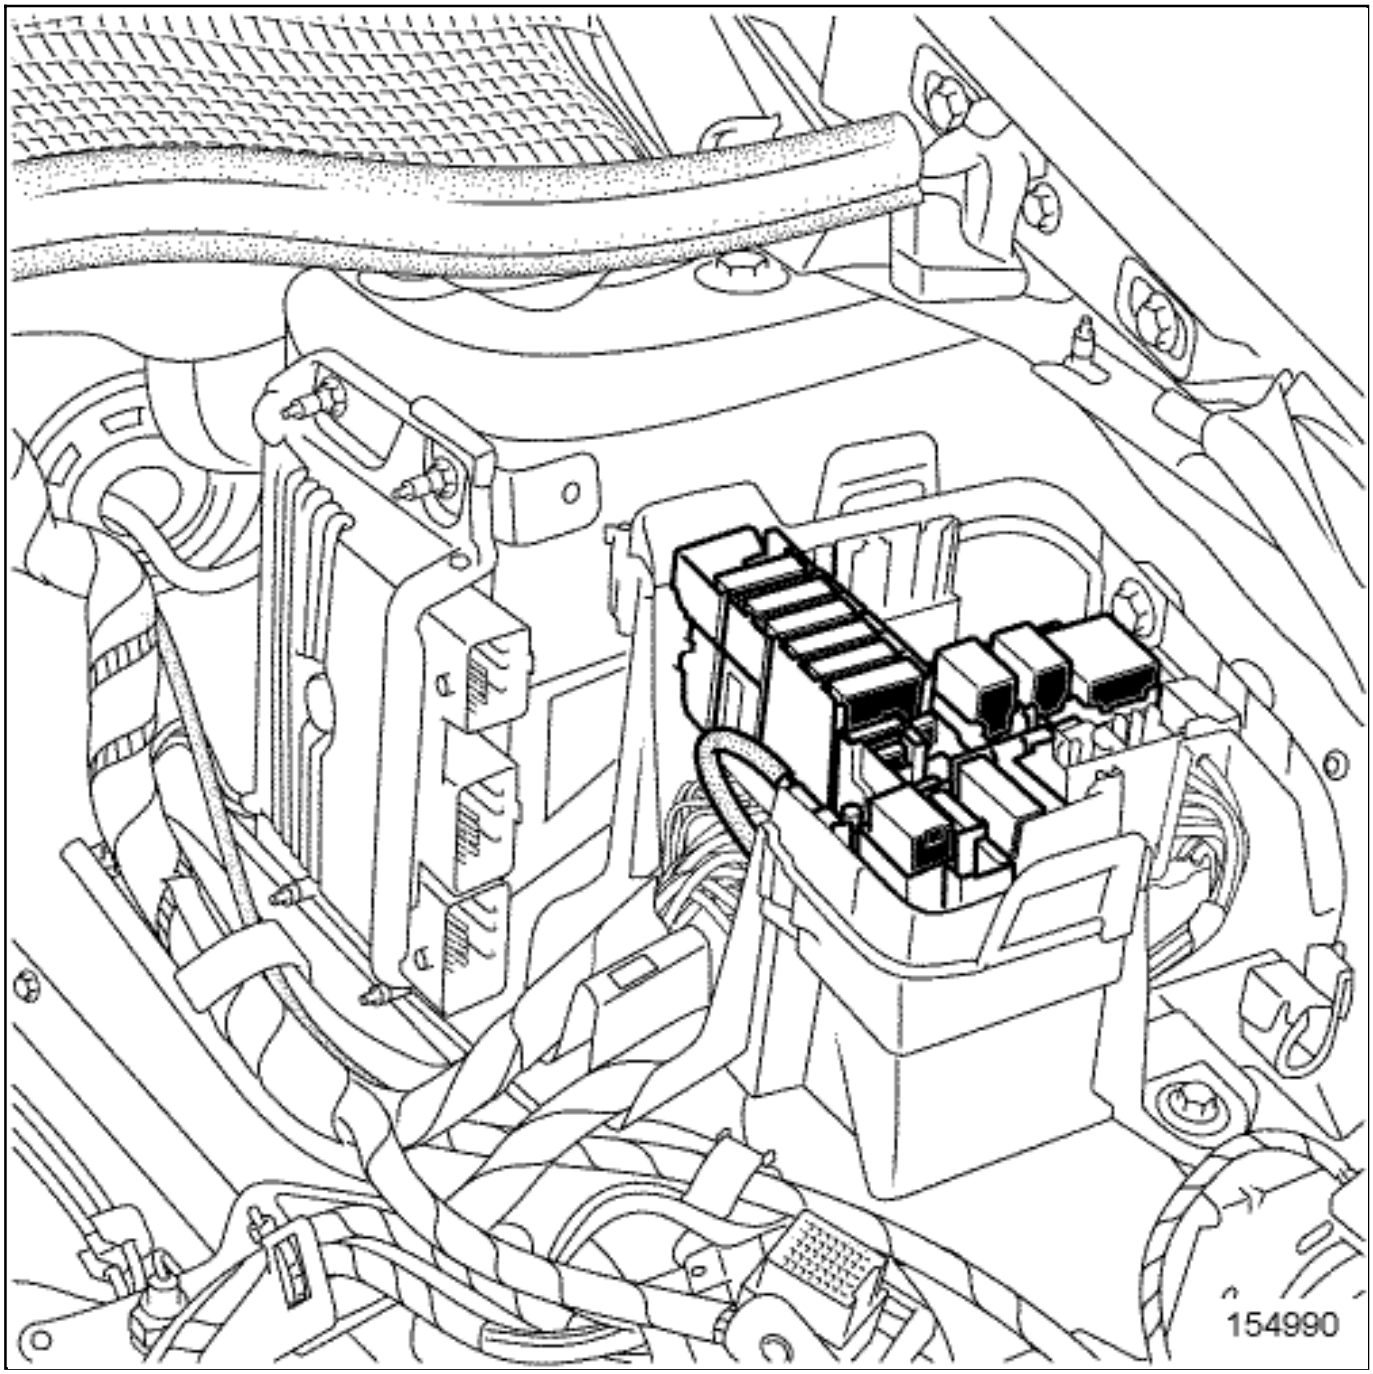
- engine fuse and relay box



2. LOCATION OF COMPONENTS



1- PASSENGER COMPARTMENT FUSE AND RELAY BOX

Unclip the fuse flap from the dashboard lower trim[Dashboard assembly: Exploded view] .

2- ENGINE FUSE AND RELAY BOX

1
154977

Unclip the cover(1) to access the engine fuse and relay box.

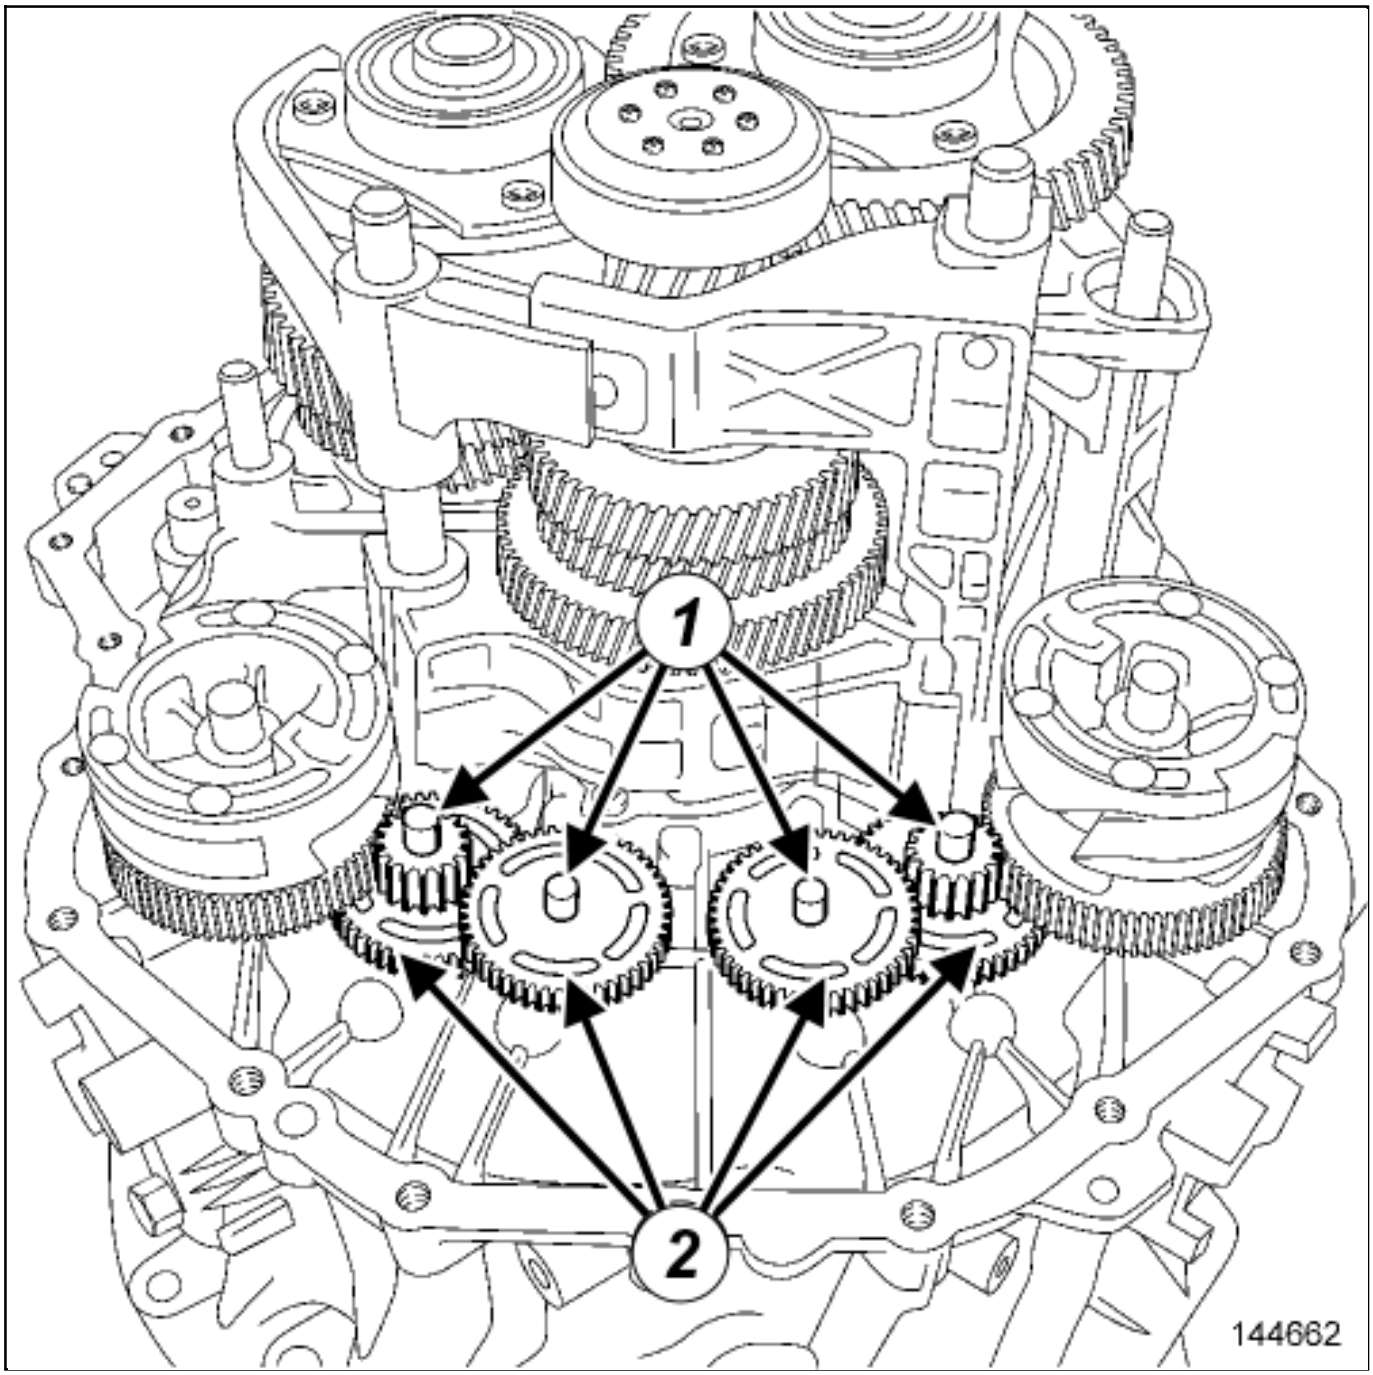
GEAR BOX CONTROL FORK: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

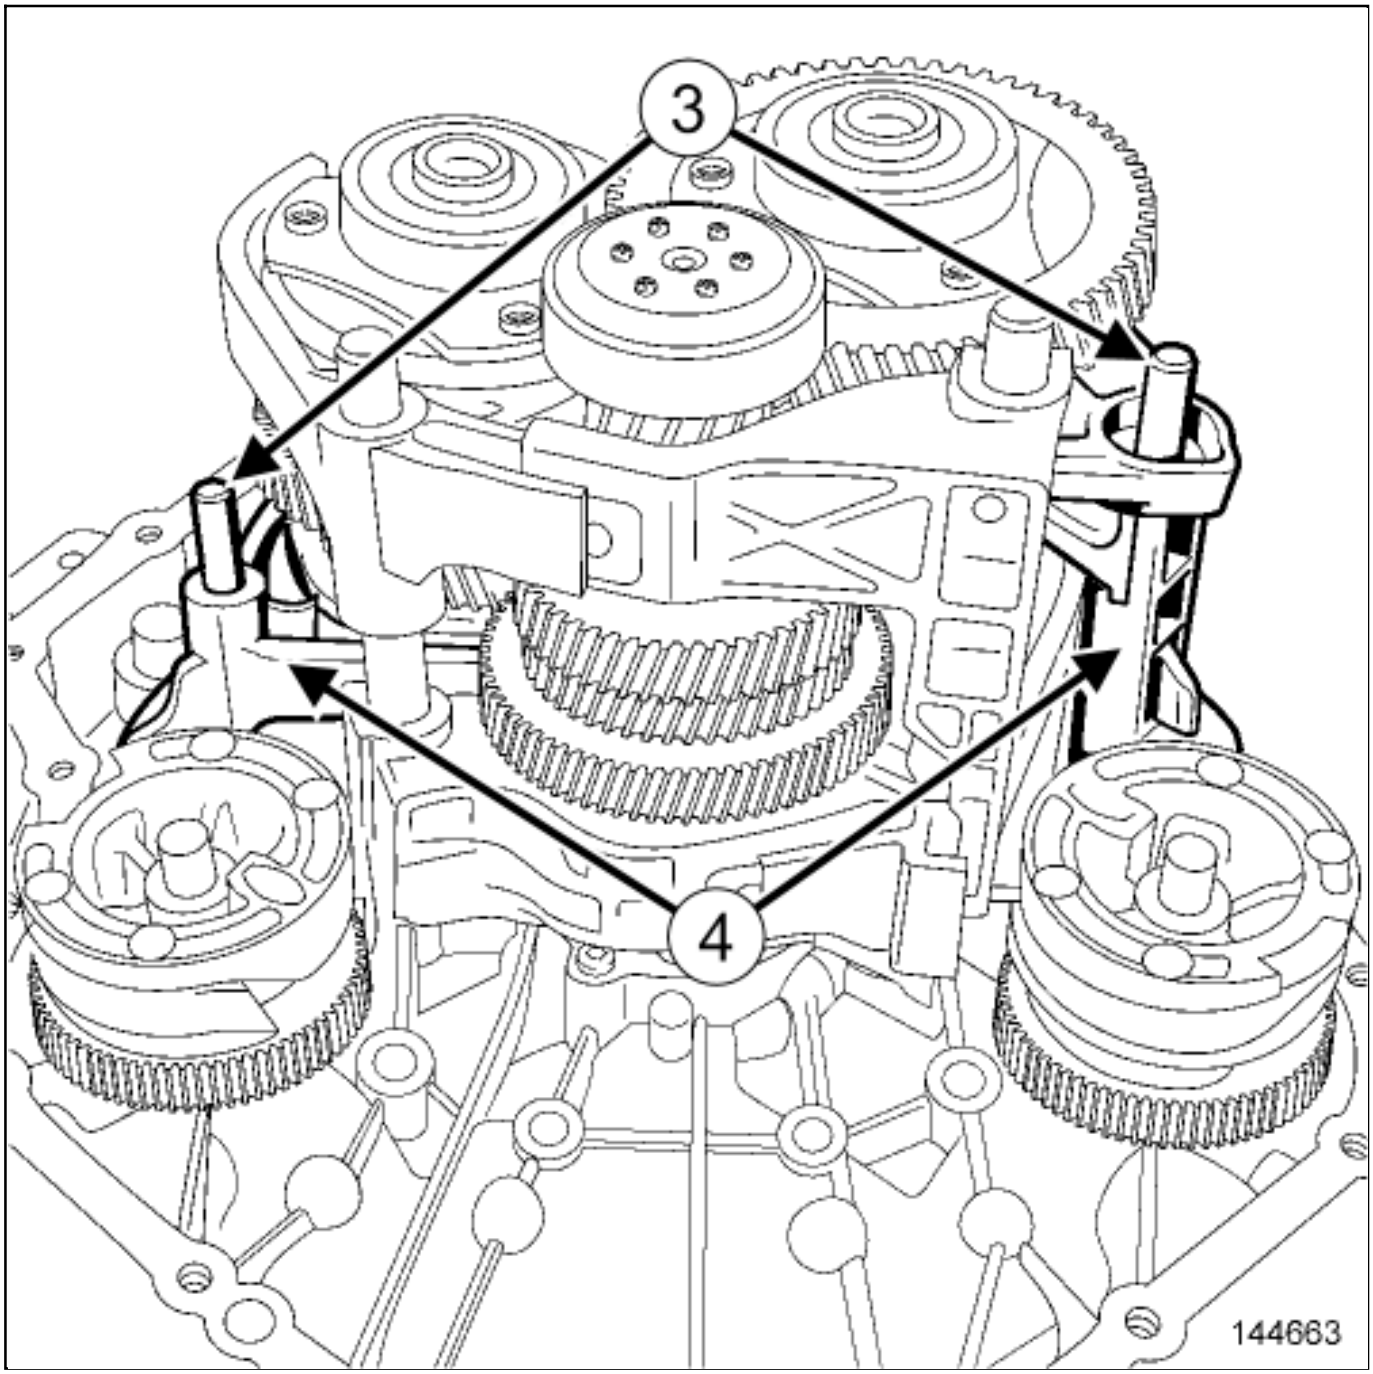
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).



REMOVAL

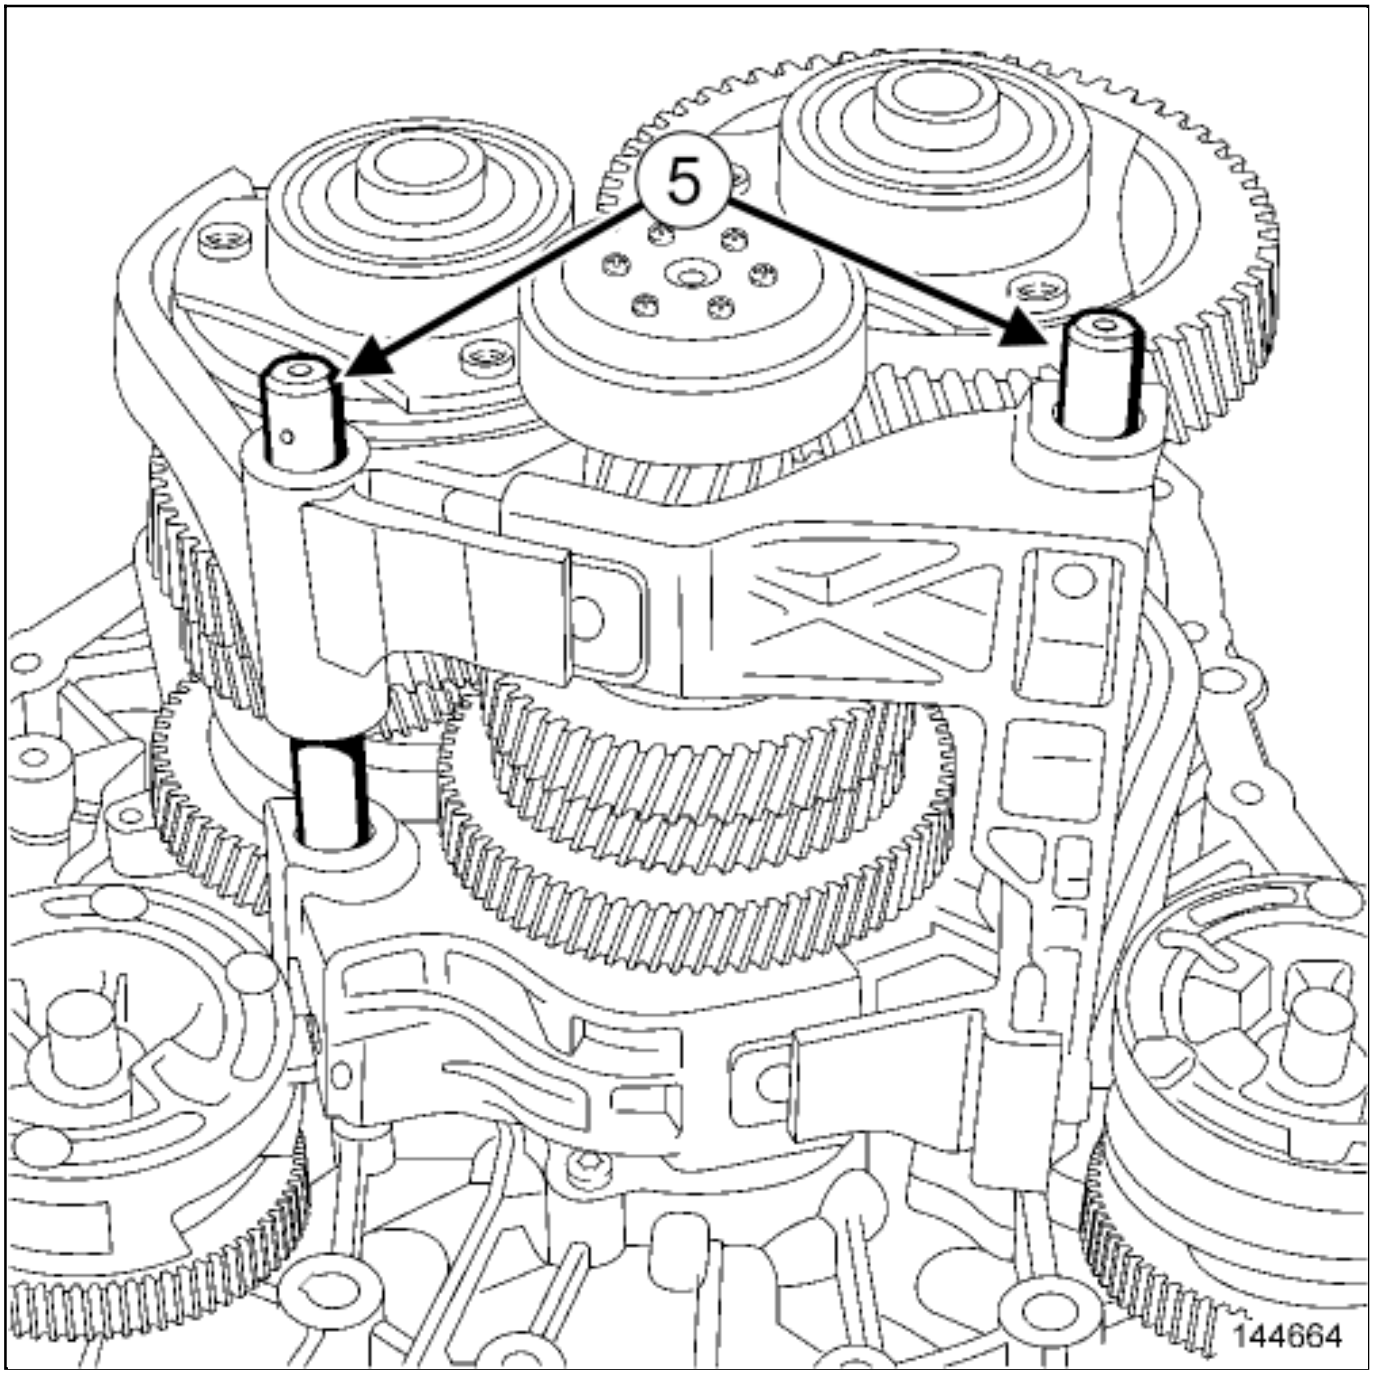
1. REMOVAL PREPARATION OPERATION



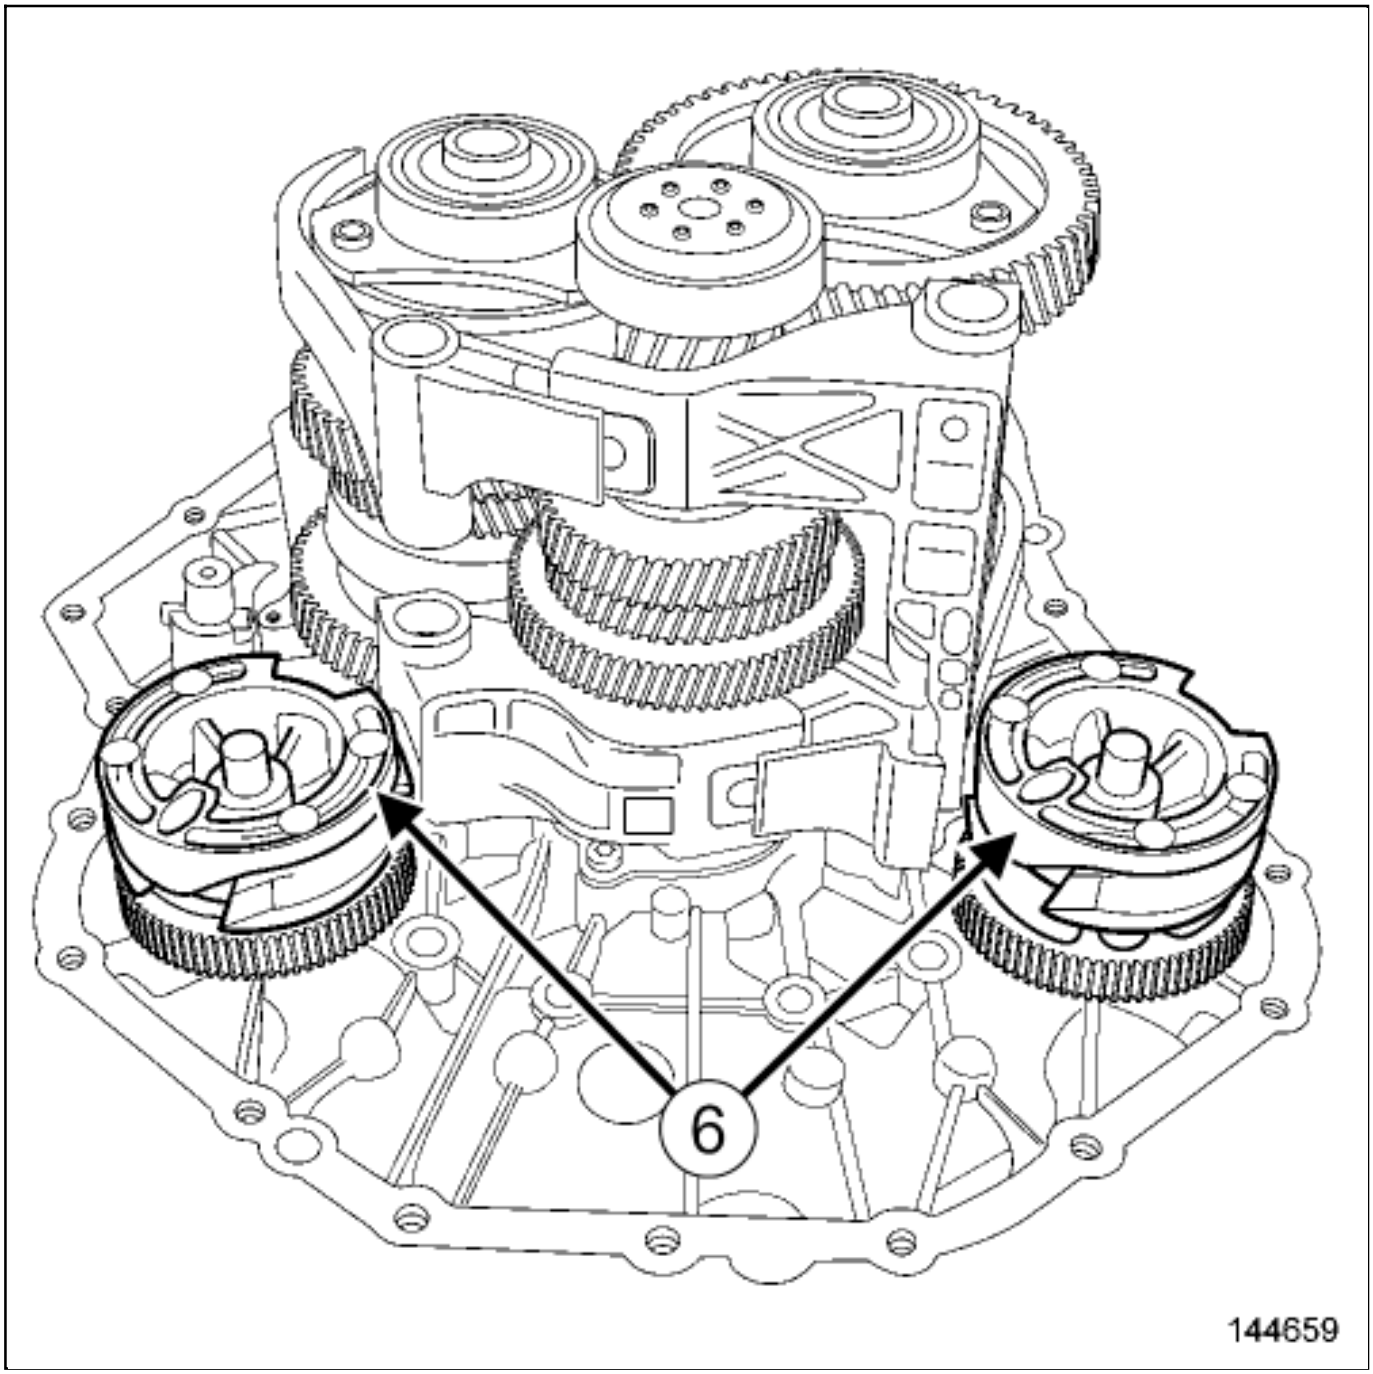
Remove:

- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,
- the speed sensorsSpeed sensor: Removal - Refitting ,
- the gear engaged sensorGear engaged sensor: Removal - Refitting ,
- the automatic transmission computerAutomatic gearbox computer : Removal - Refitting ,
- the mechanism housing(see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting) .

2. OPERATION FOR REMOVAL OF PART CONCERNED



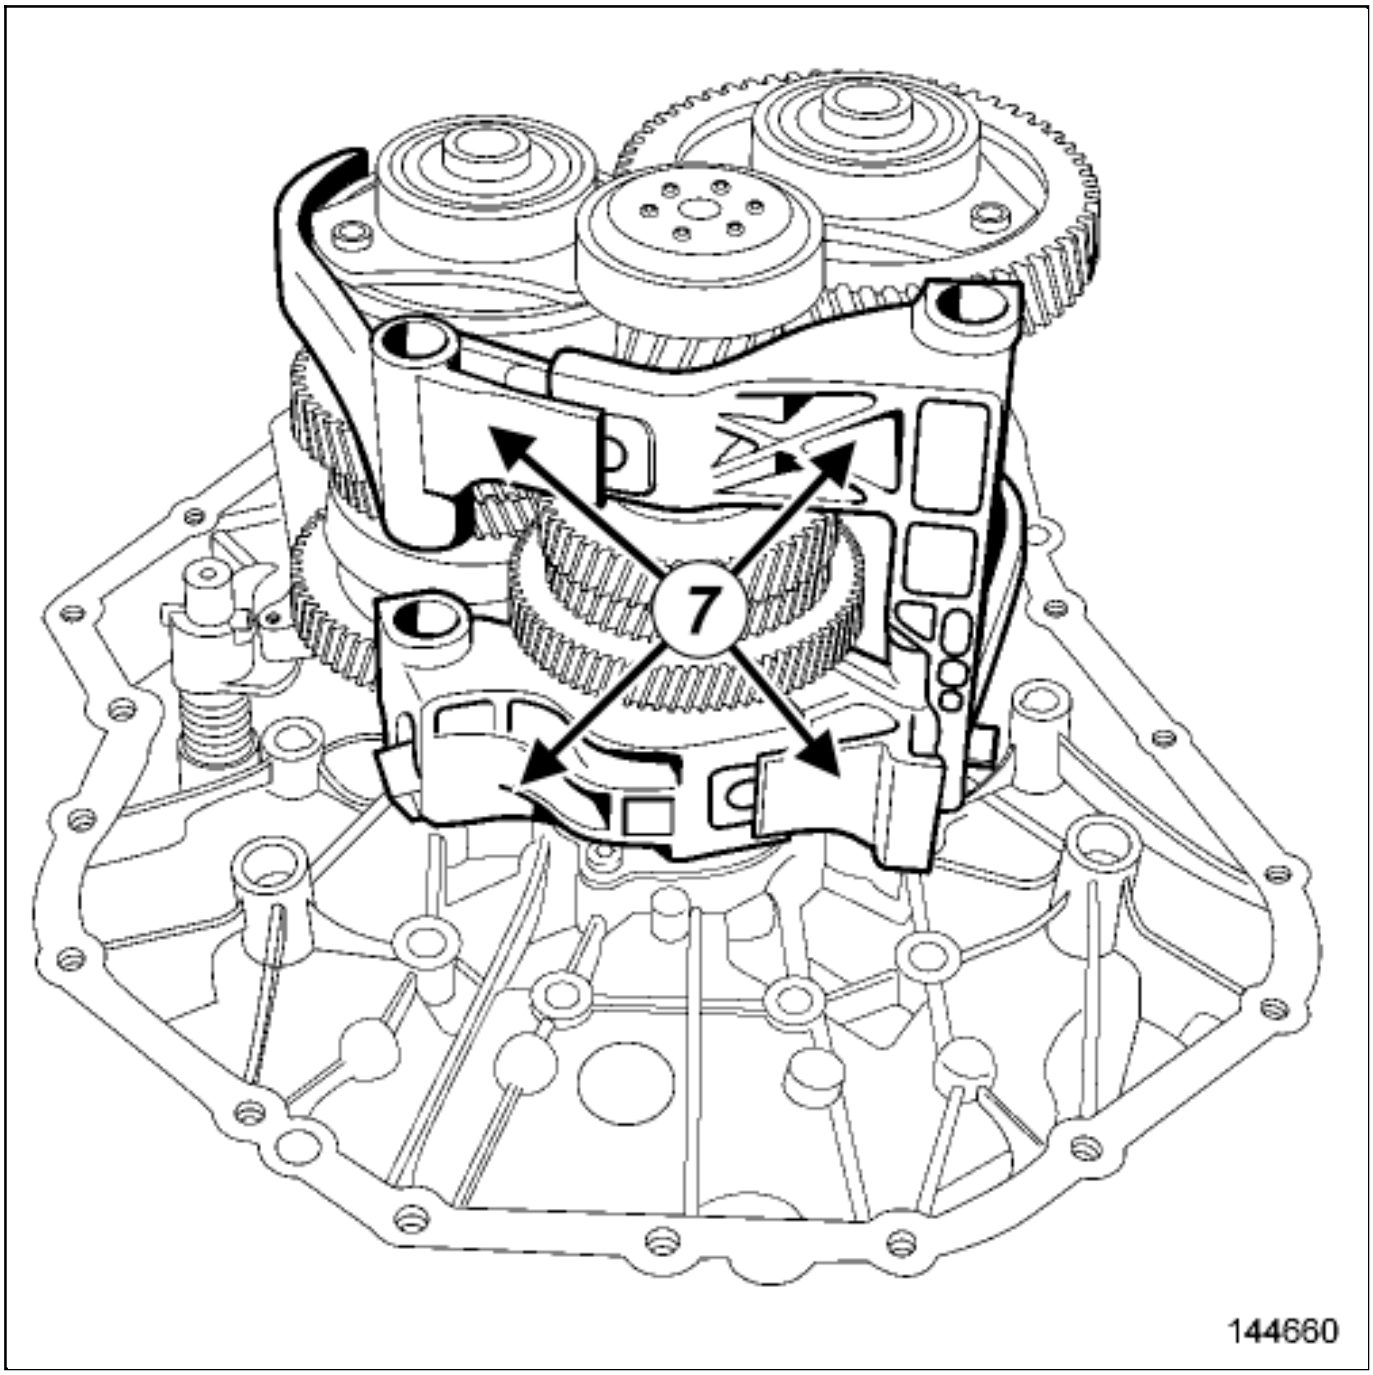
Remove the shafts(1) and the pinions(2) from the gear shift drums.



Remove:

- the small diameter shafts(**3**) from the gearbox control forks,
- the gearbox control forks(**4**) .

Remove the large diameter shafts(5) from the gearbox control forks.



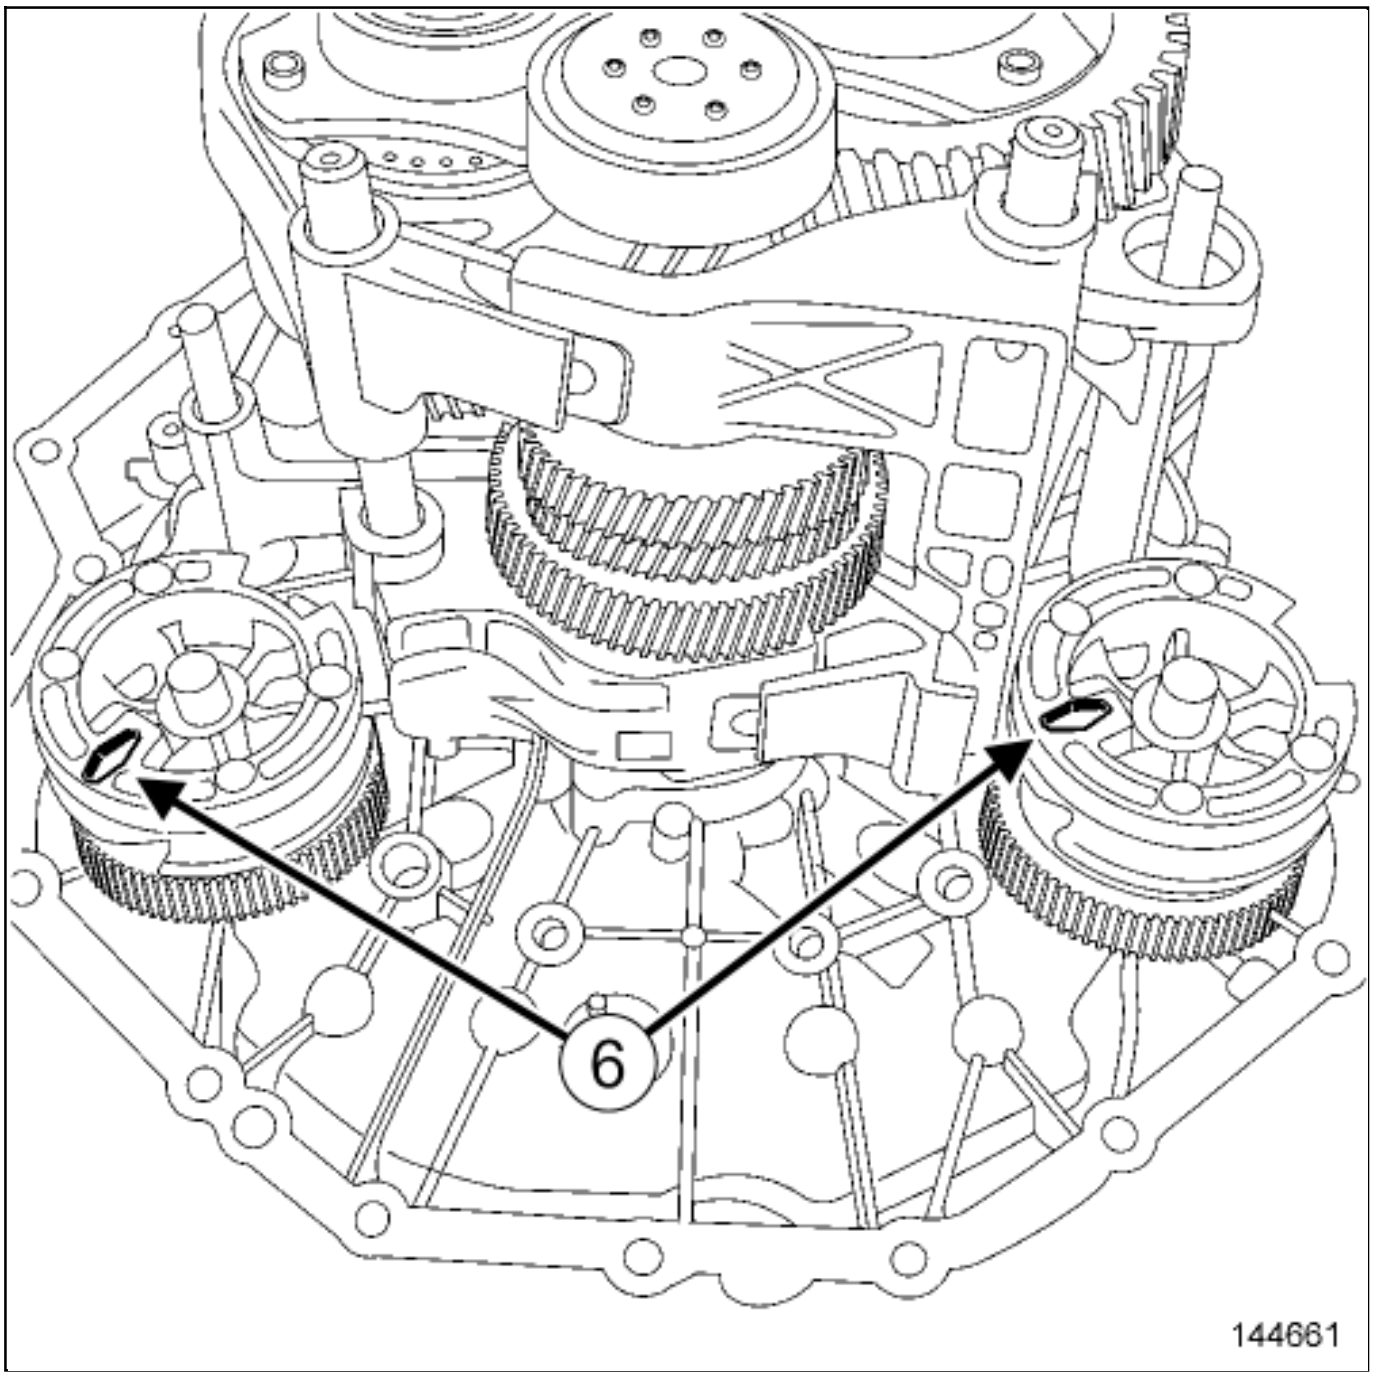
Note:

Before removing the gear shift drums, mark the position of the gear shift drums in relation to the casing by drawing a line using an indelible pen.

Incorrect positioning of the gear shift drums during refitting could result in a broken casing or a malfunction of the automatic gearbox.

Remove the gear shift drums(6) after marking them.

Remove the gearbox control forks(7) .



REFITTING

1. REFITTING PREPARATION OPERATION

Clean all the removed parts[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

2. REFITTING OPERATION FOR PART CONCERNED

Fit the gearbox control forks.

Note:

Refit the gear shift drums according to the marks made on the gearbox casing during removal.

Incorrect positioning of the gear shift drums during refitting could result in a broken casing or a malfunction of the automatic gearbox.

The gear shift drums must be positioned as shown in the picture.

Refit:

- the gear shift drums, paying attention to the position of the lugs and/or the marks made,
- the gearbox control fork shafts.

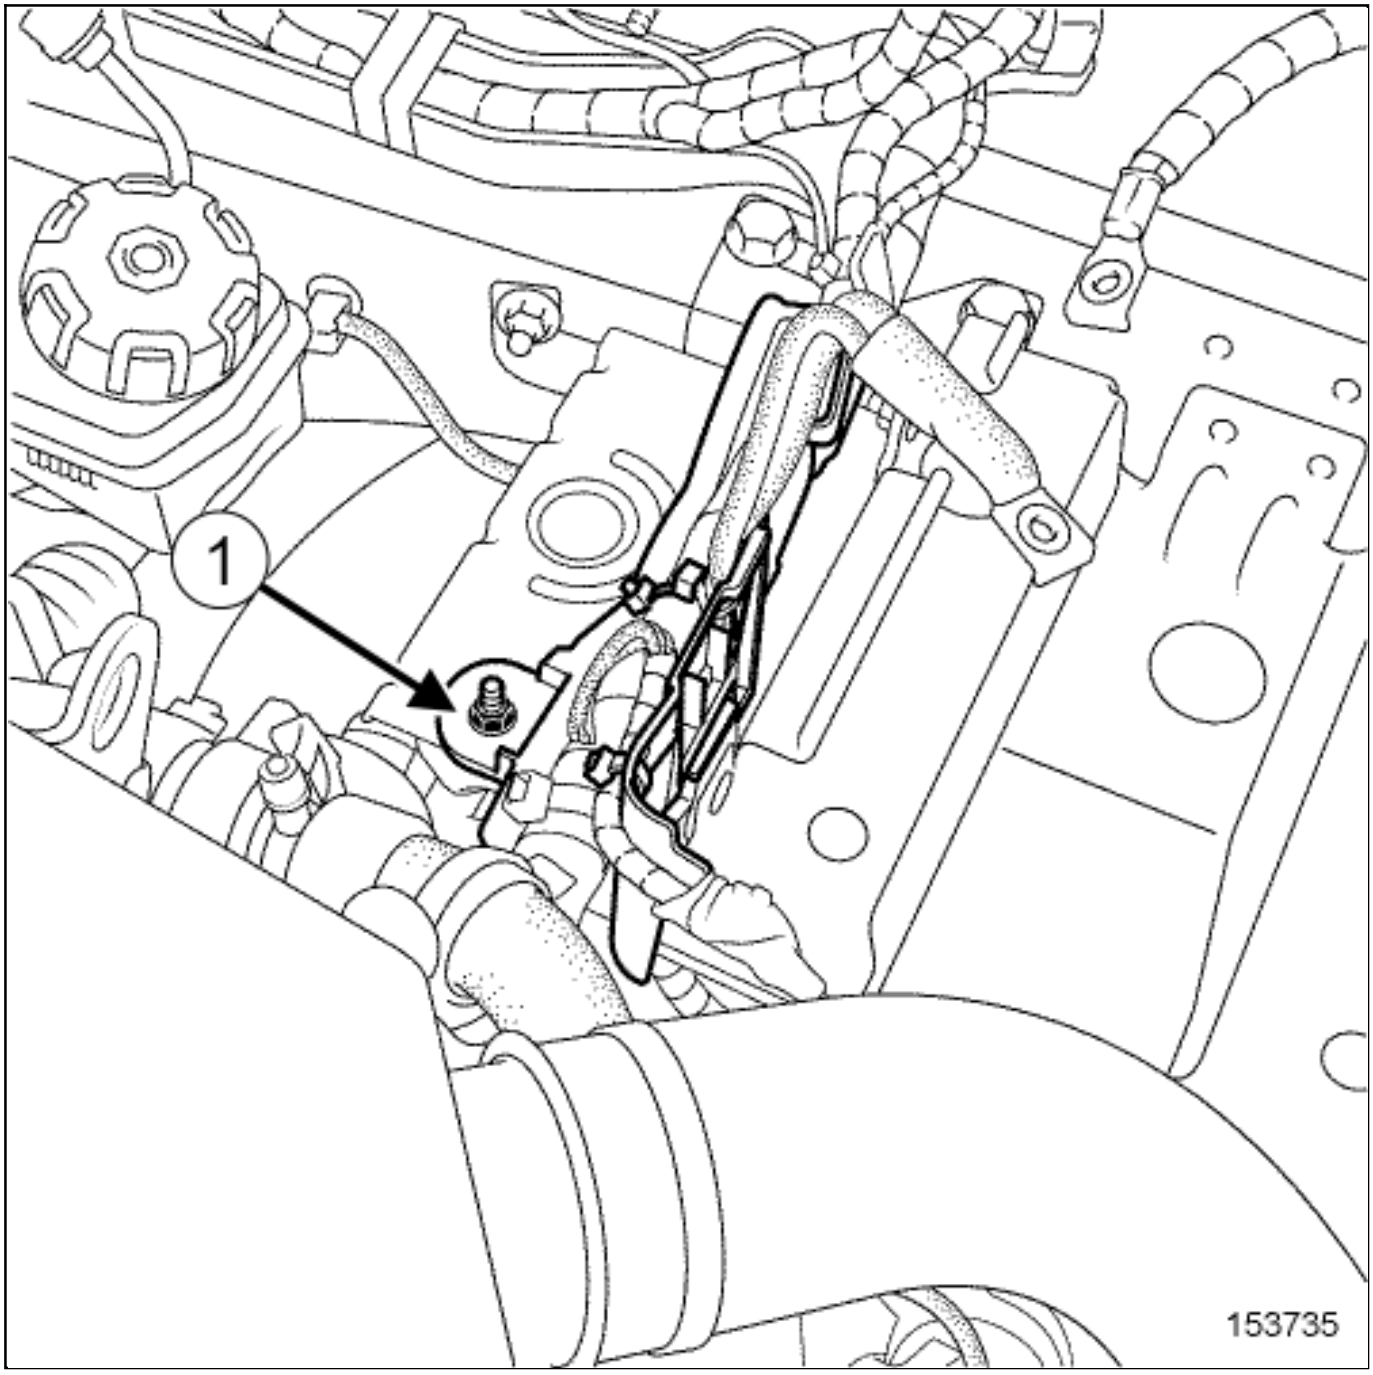
Fit the gear shift drum pinions.

Refit the gear shift drum pinion shafts.

3. FINAL OPERATION

Proceed in the reverse order to removal.

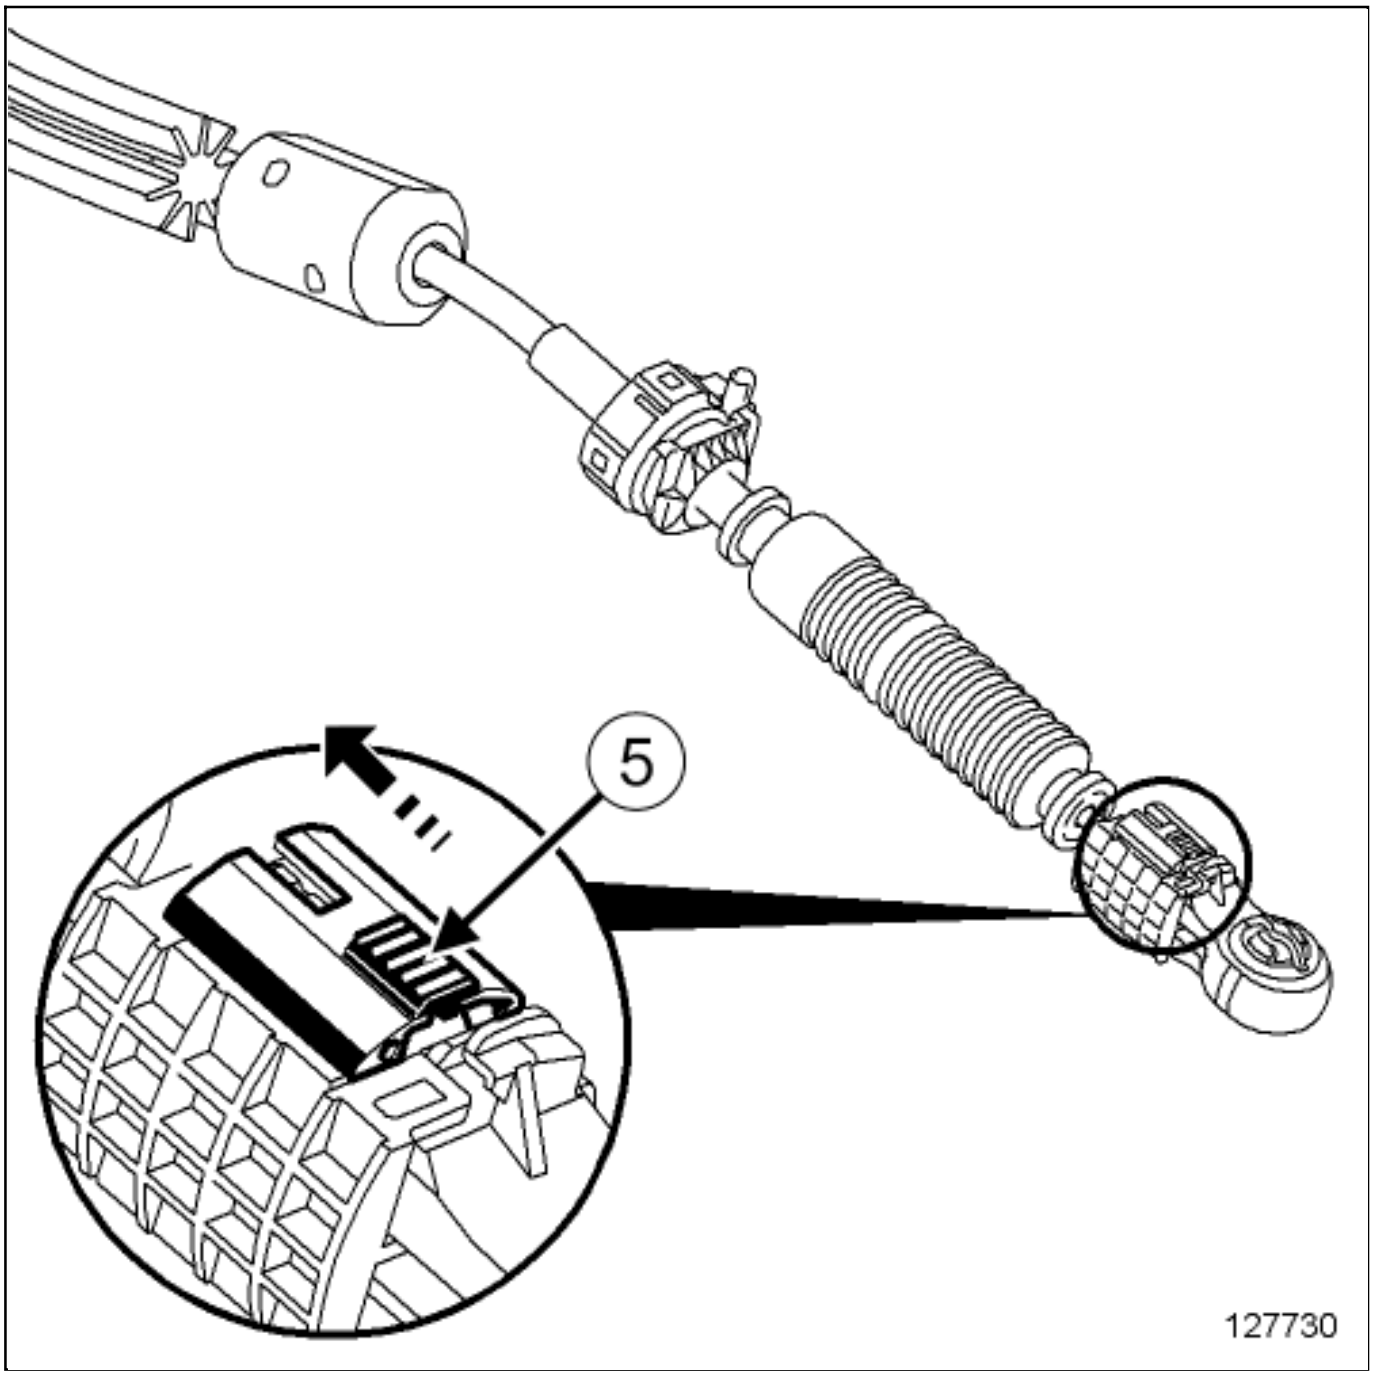
GEAR CONTROL UNIT: ADJUSTMENT



Vehicle	Type of gearbox	Adjustment values	Position of lever	Position on gearbox
X87	DC4	Automatic	D	D

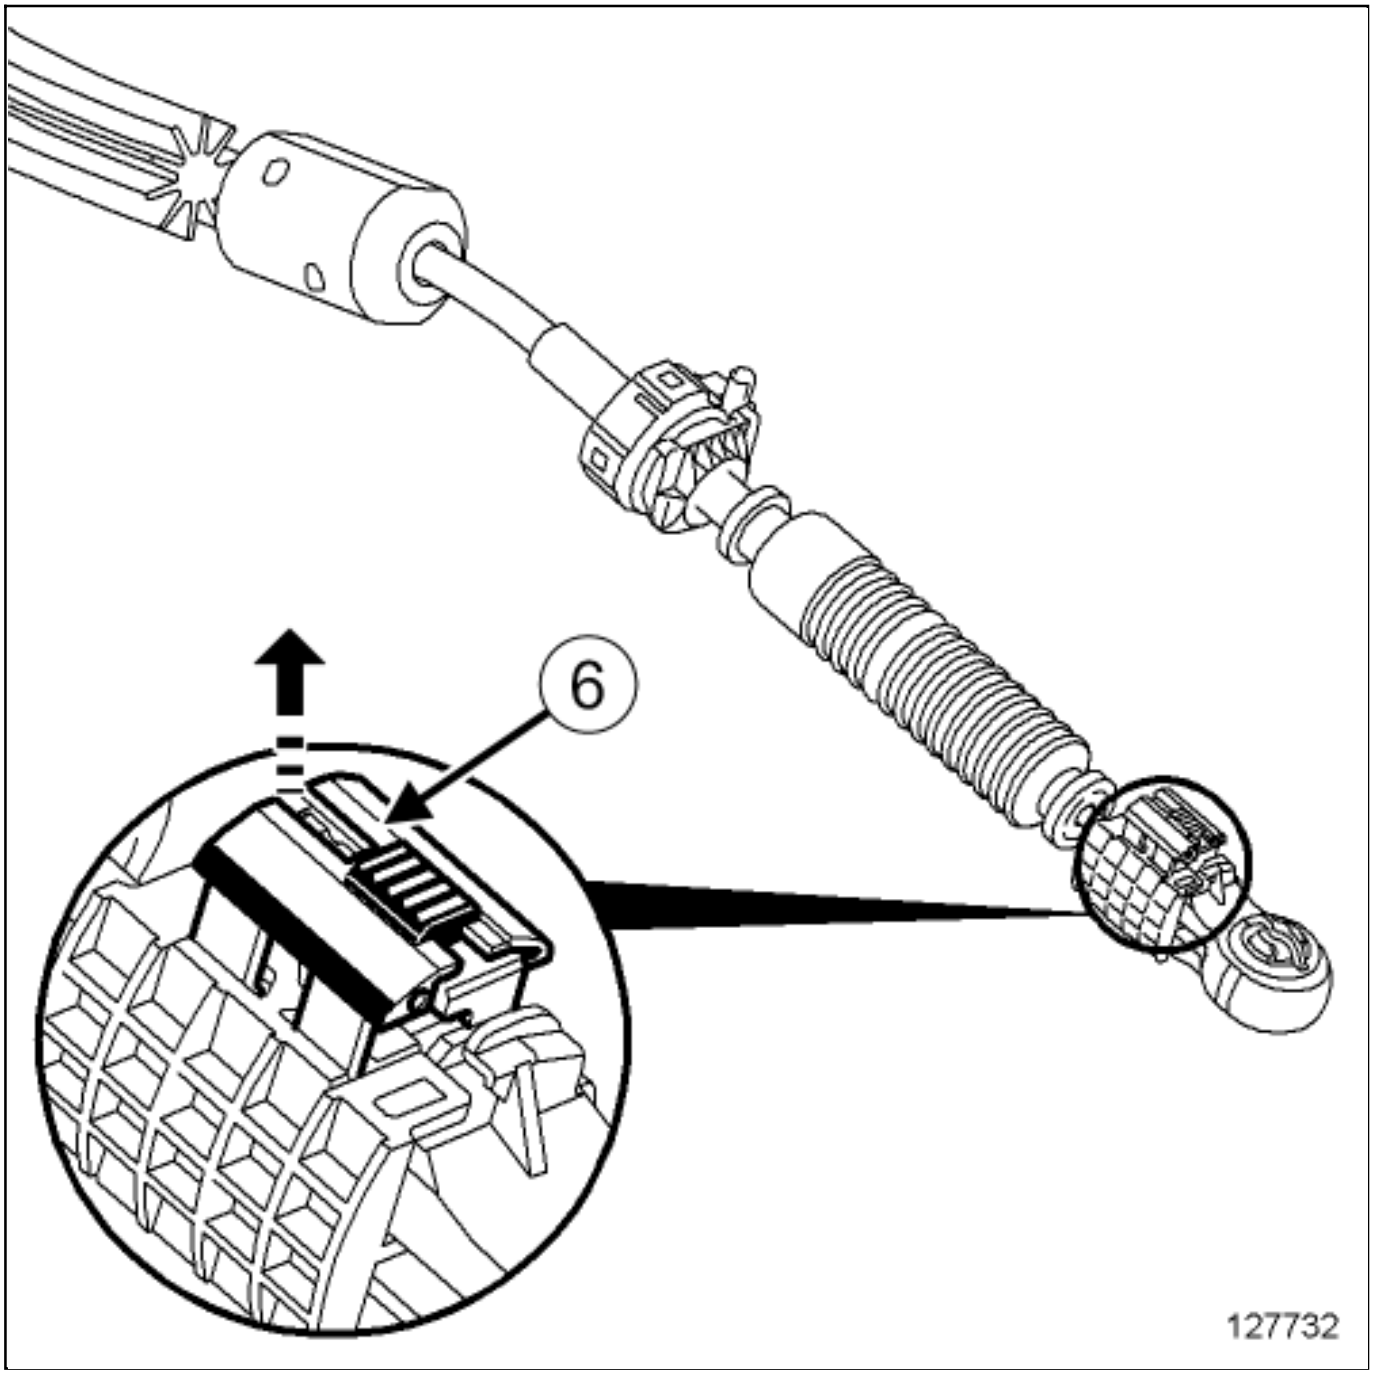
ADJUSTMENT

1. ADJUSTMENT PREPARATION OPERATION



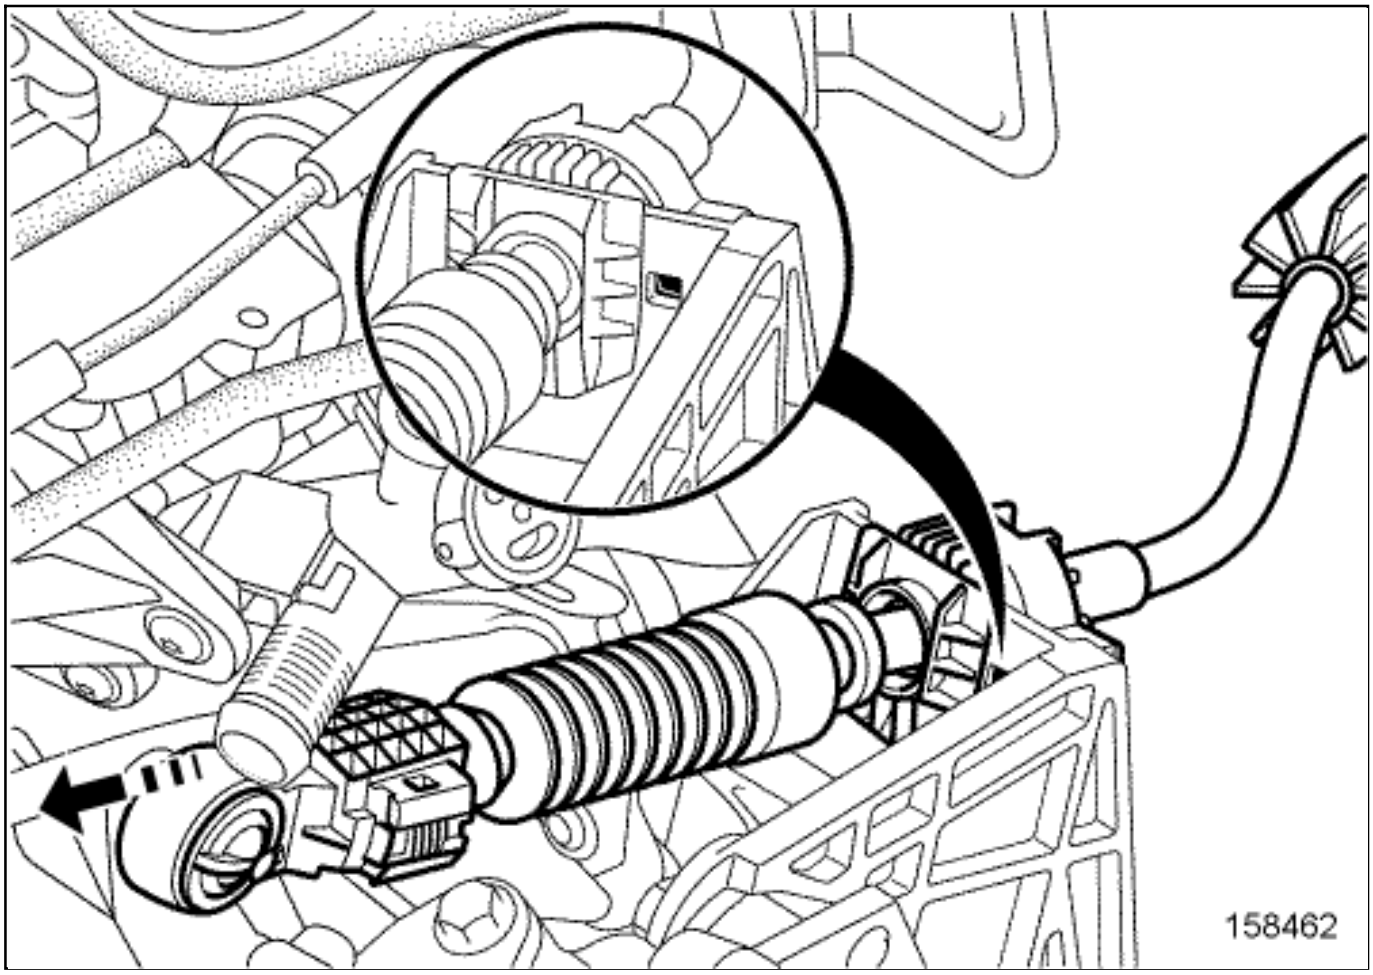
Remove:

- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting .



- Remove the nut(1) from the engine wiring.
- Move aside the wiring channel.
- Unclip the gearbox breather hose.

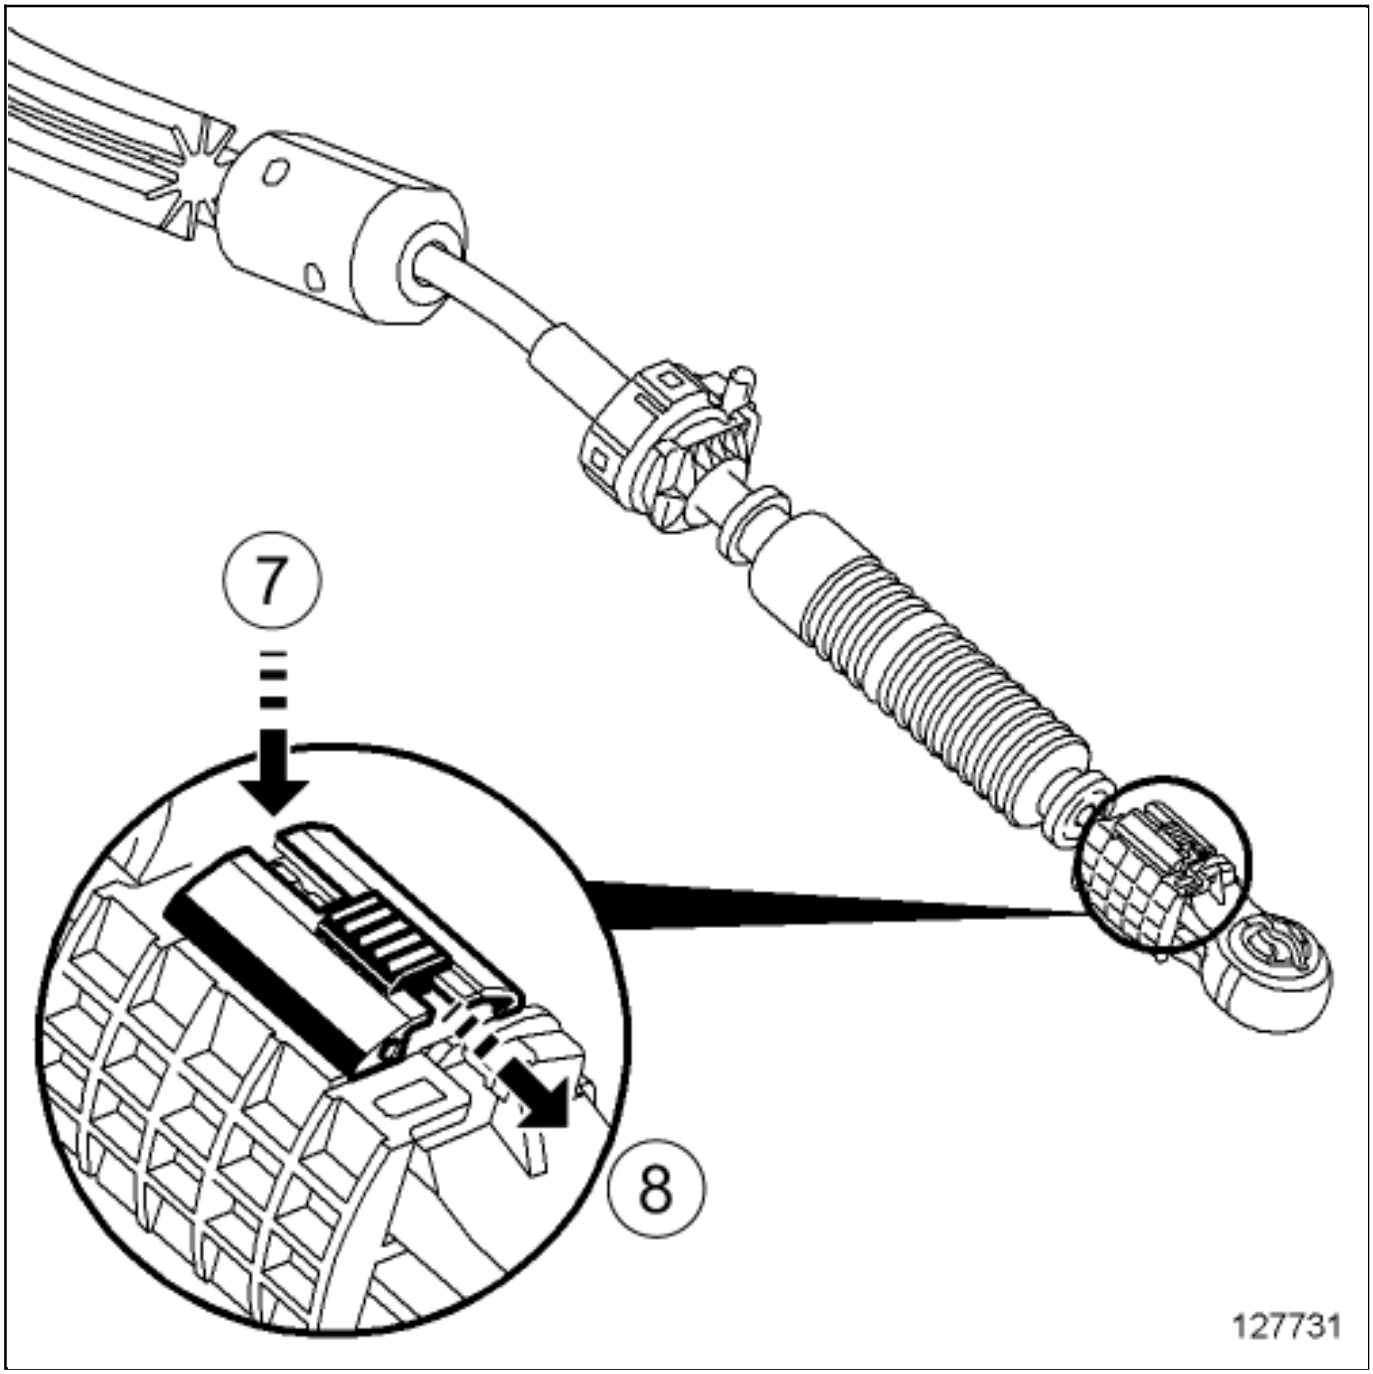
2. ADJUSTMENT OPERATION



Unlock the cable end by pushing the safety clip(5) in the direction of the arrow until it clicks.

Lift the catch(6) upwards.

Note:



In this position, the end of the cable is free to slide axially.

Put the gearbox lever in position D.

Note:

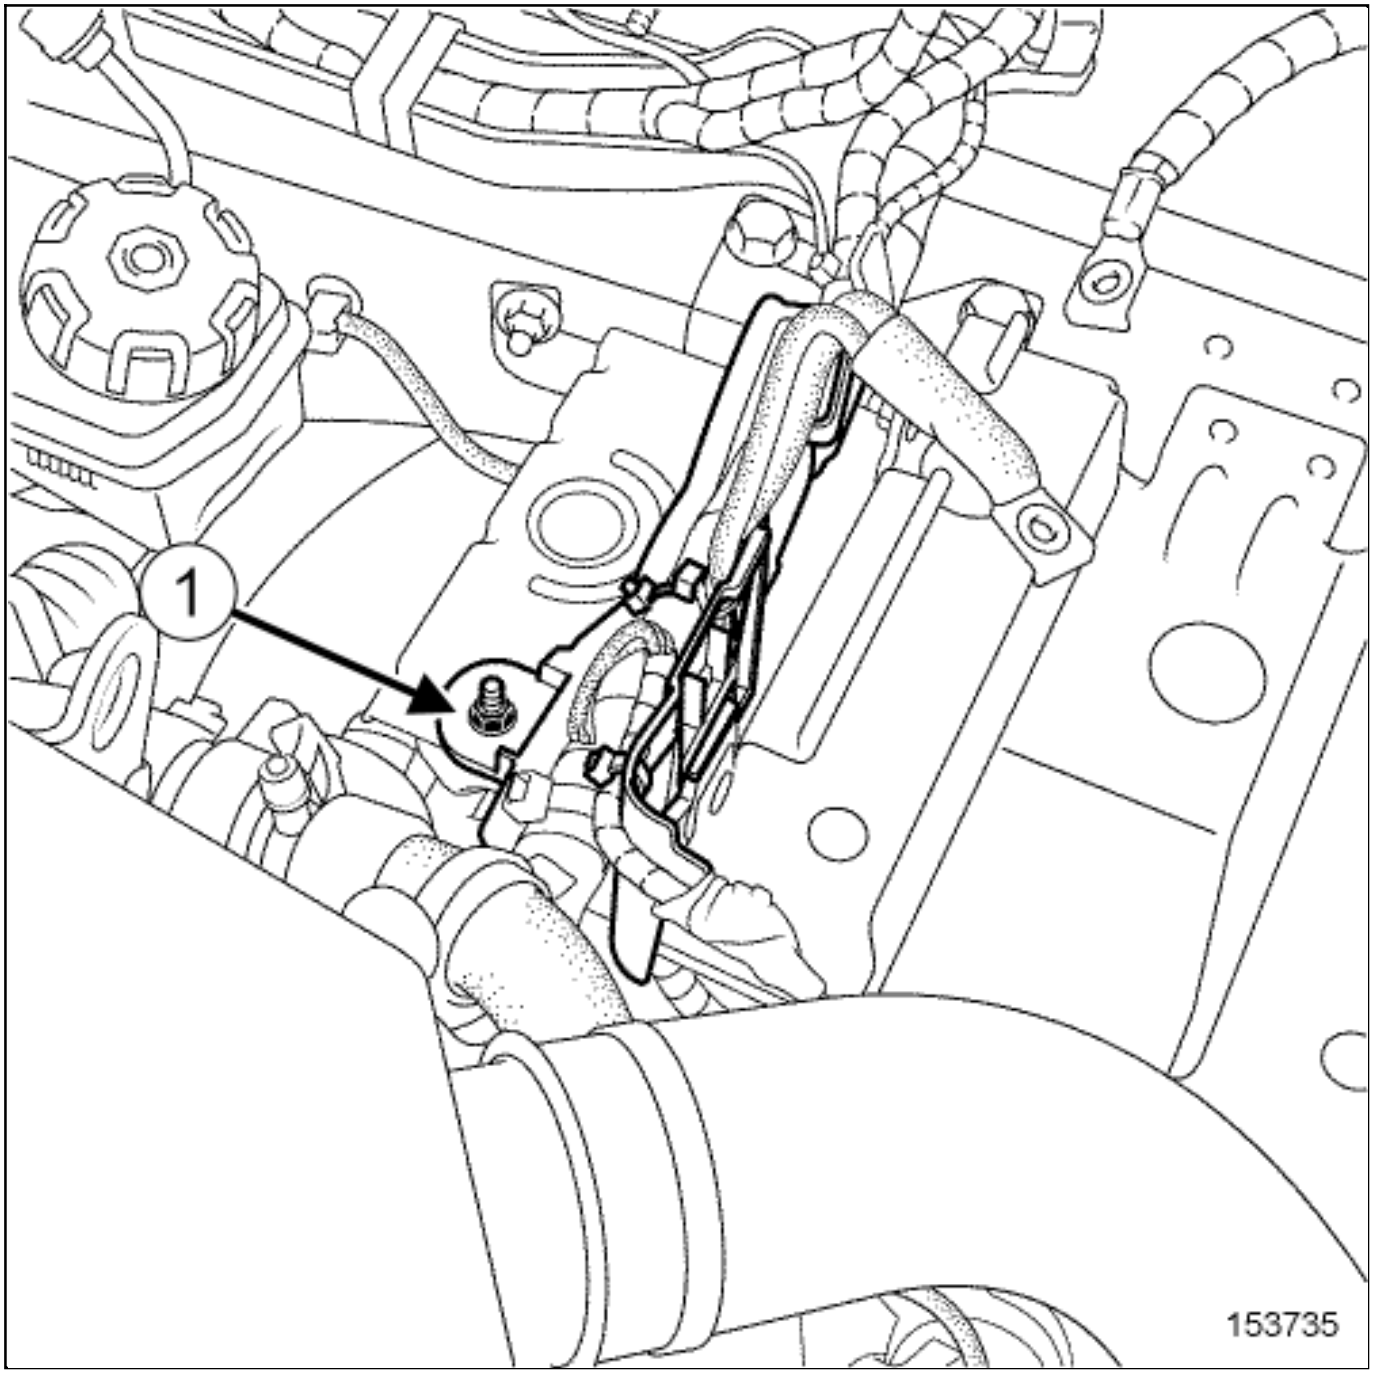
D position: the last position towards the front of the vehicle.

Press the catch in the direction of the arrow(7) to release the safety clip.

Lock the cable end by pressing the safety clip in the direction of the arrow(8) until it clicks.

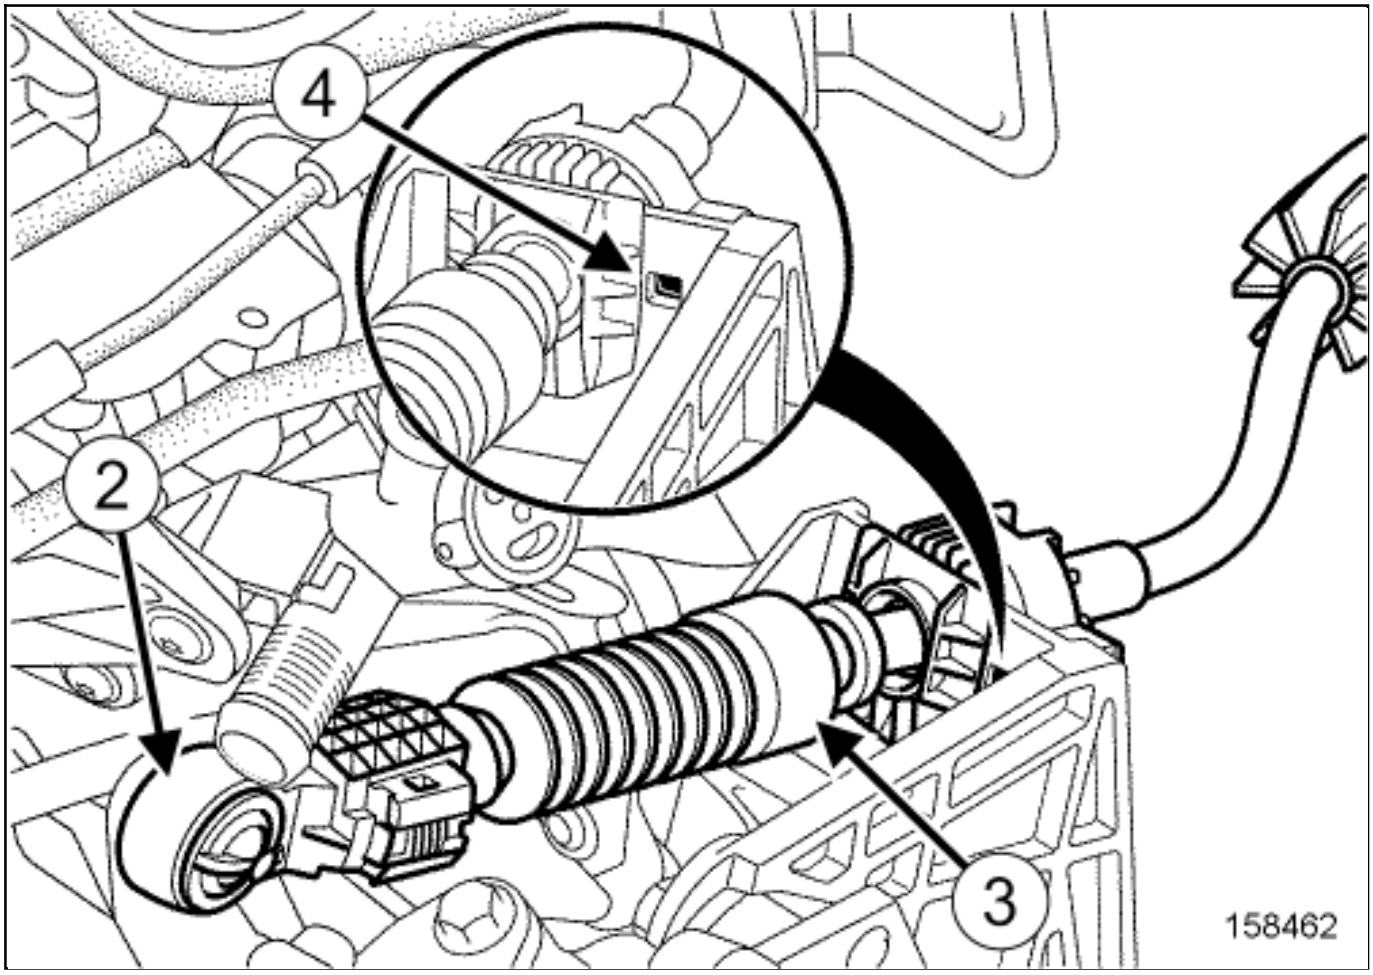
3. FINAL OPERATION

Proceed in the reverse order to removal.



Check that the system and gear selection are working correctly.

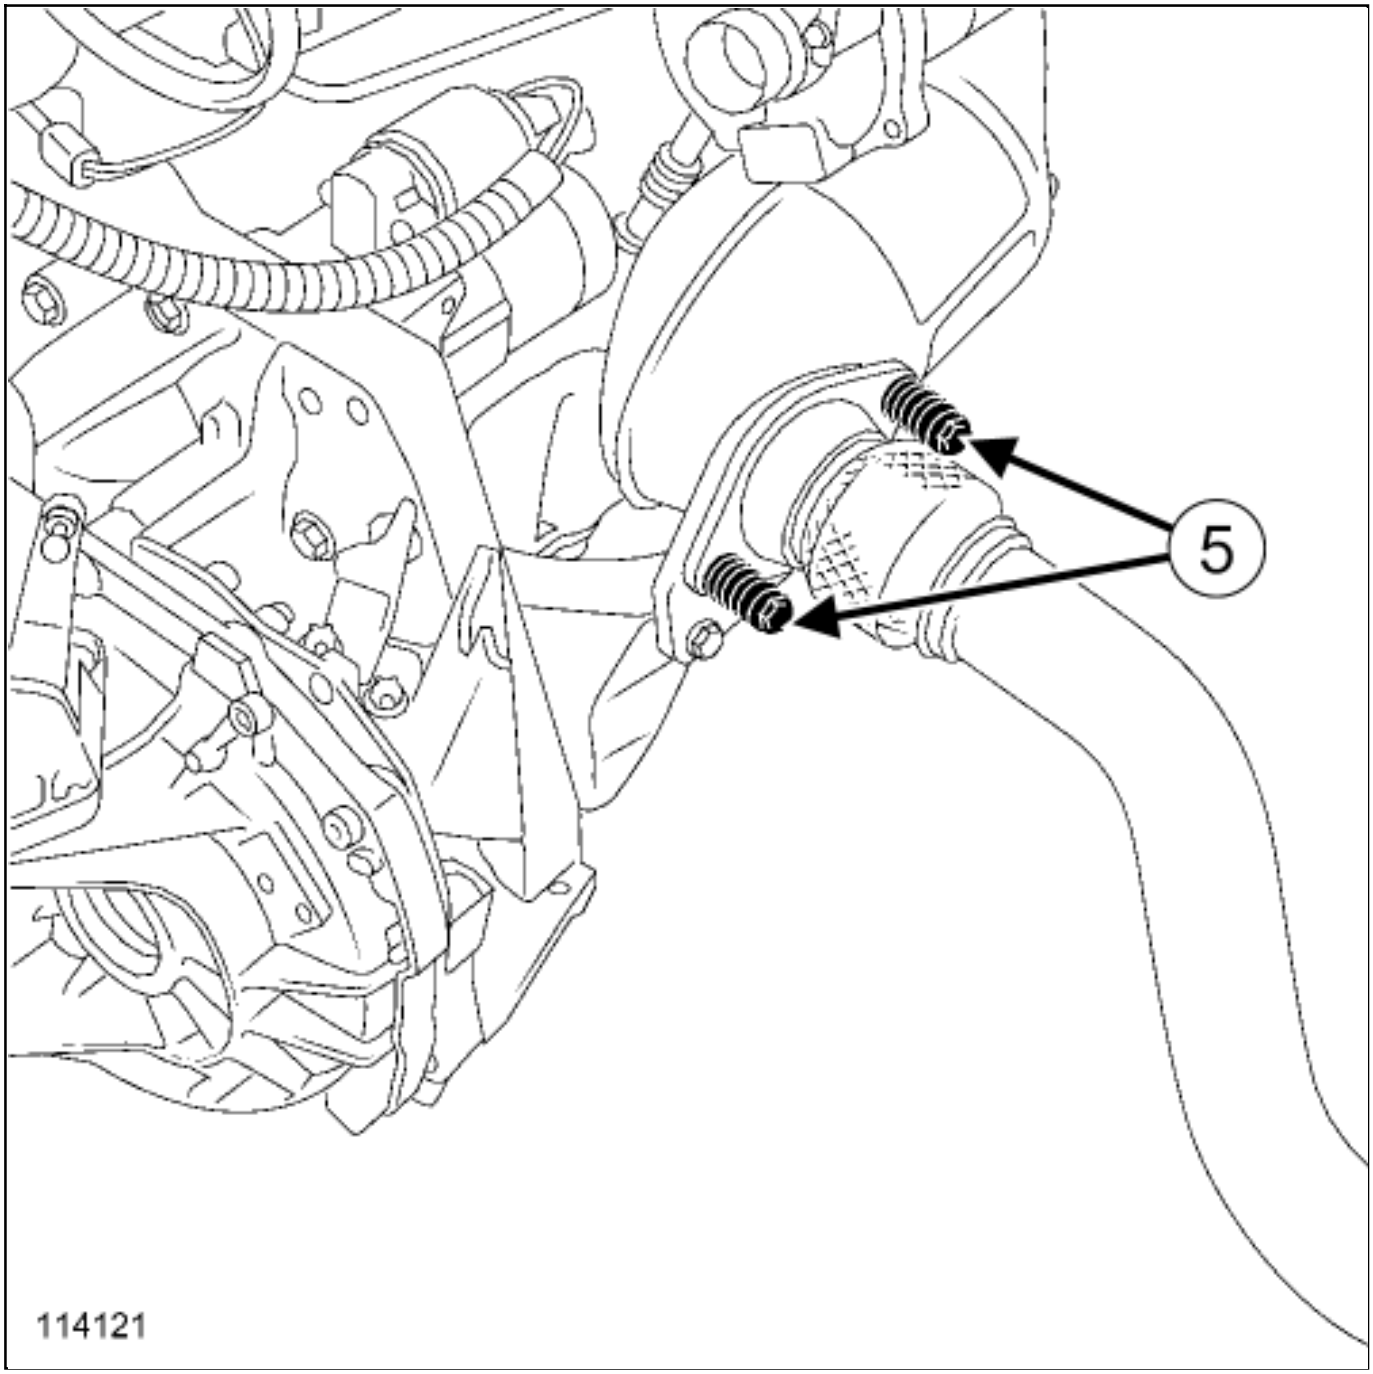
GEAR CONTROL UNIT: REMOVAL - REFITTING



REMOVAL

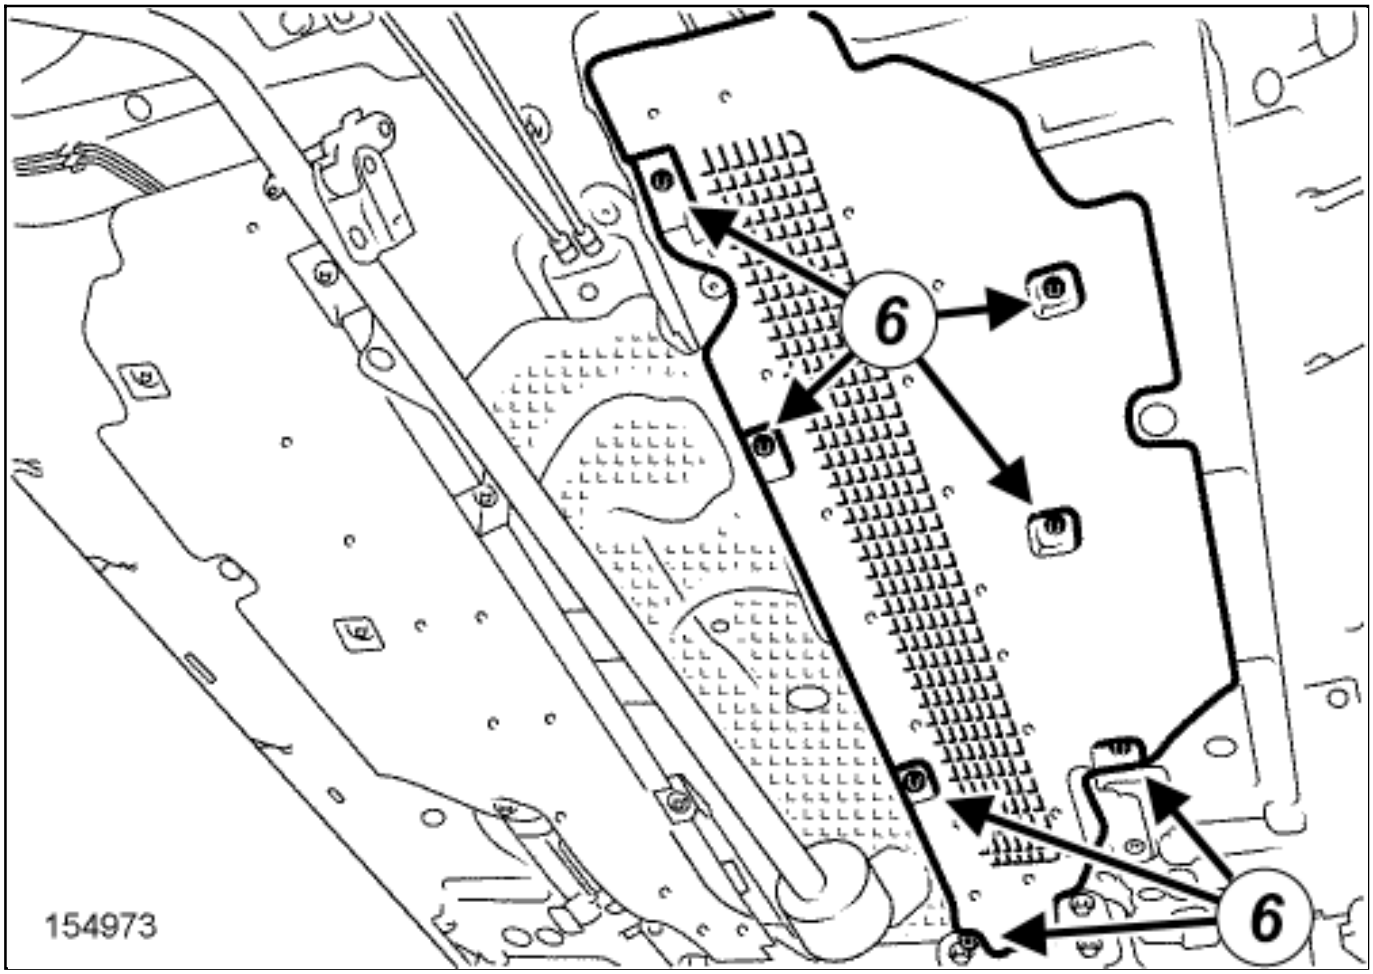
1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift **Vehicle: Towing and lifting** .
- Place the gear selector in position D.
- Remove:
  - the battery **Battery: Removal - Refitting** ,
  - the battery tray **Battery tray: Removal - Refitting** .



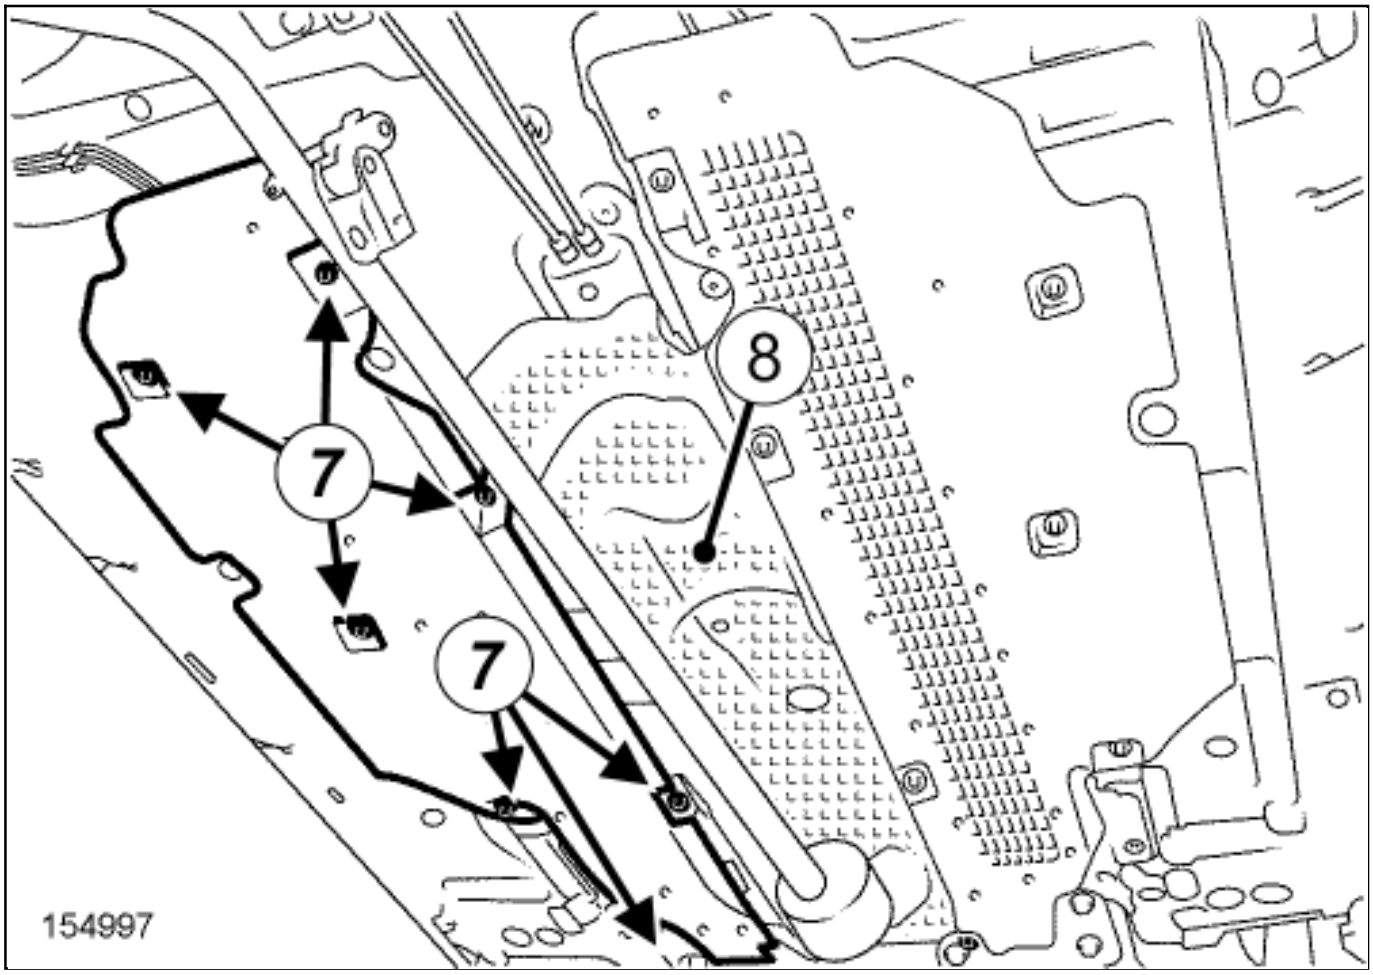
- Remove the nut(1) from the engine wiring.
- Move aside the wiring channel.
- Unclip the gearbox breather hose.

Unclip:



- the gearbox control cable from the selector ball joint(**2**) ,
- the gear control cable(**3**) from its support by pressing the clip(**4**) .

Move the automatic gearbox control cable to one side.

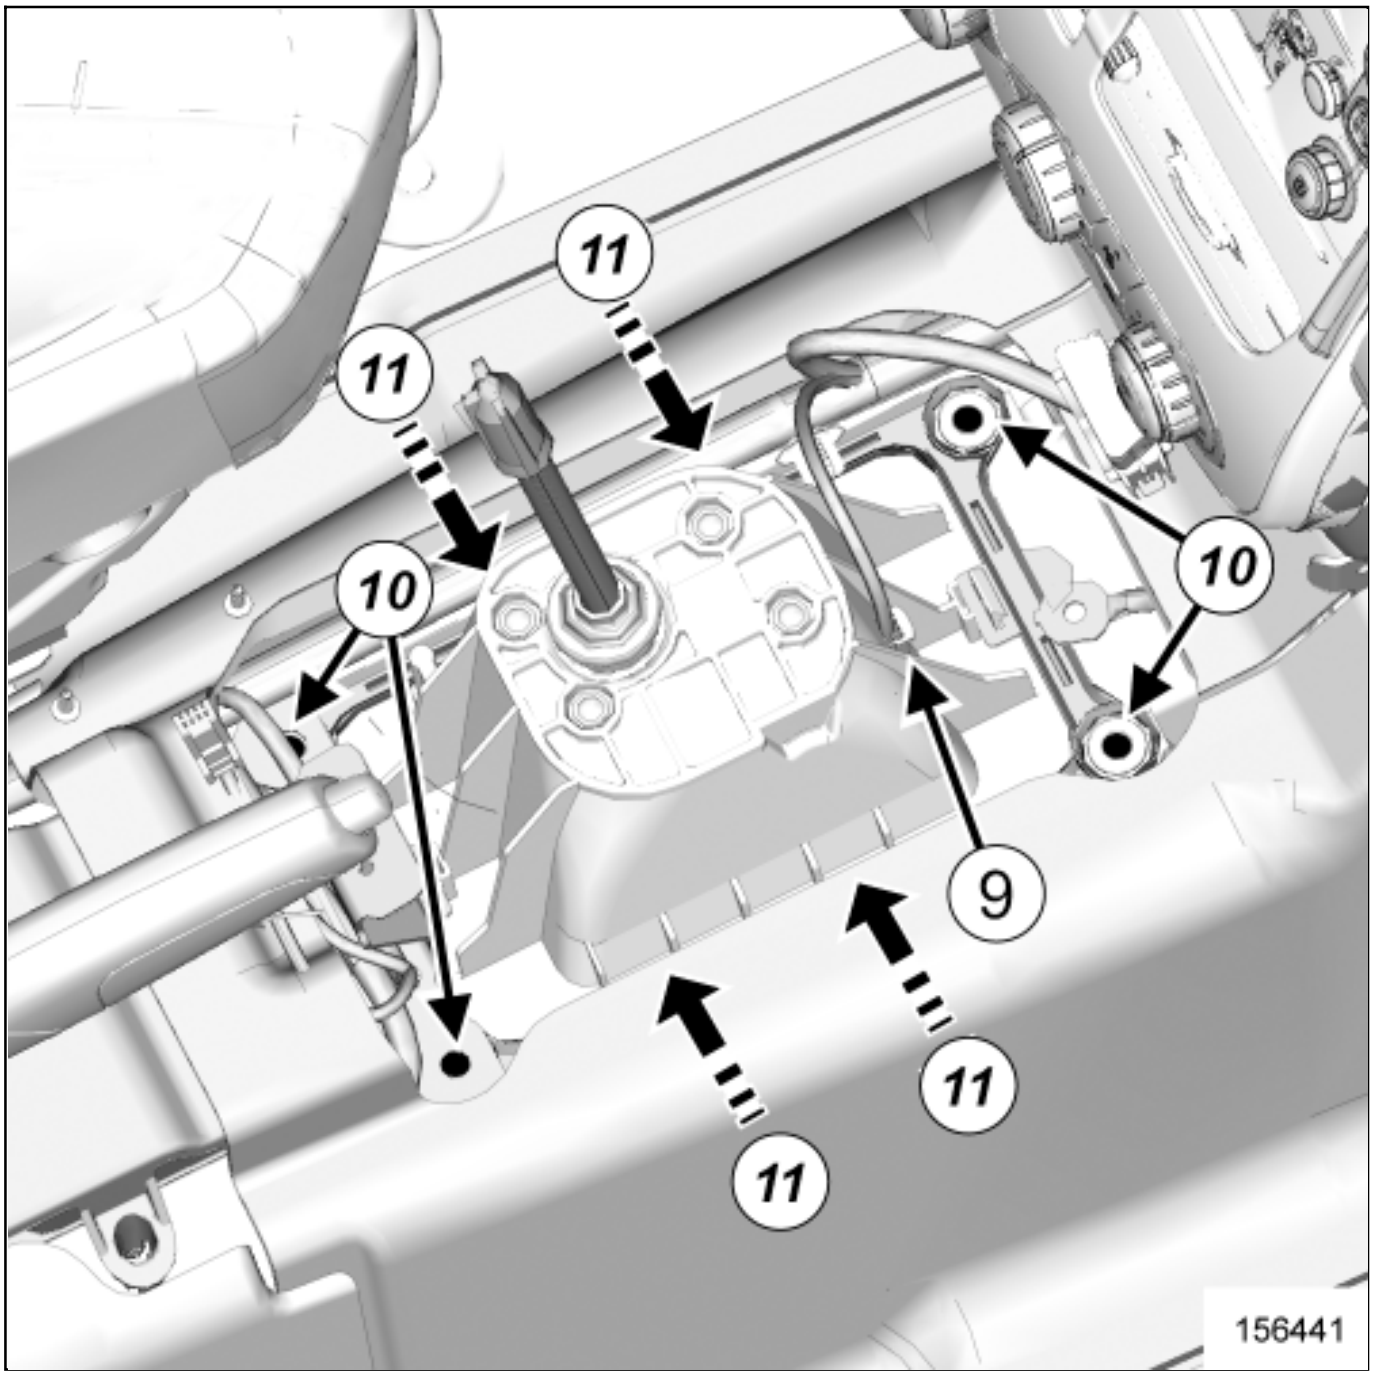


Remove the exhaust pipe mountings(5) from the catalytic converter.

Move aside the exhaust pipe.

Remove:

- the fuel pipe protection bolts(6) ,
- the fuel pipe protection.



Remove:

- the brake pipe protection bolts(7) ,
- the brake pipe protection,
- the tunnel heat shield(8) .

Remove the central consoleCentre console: Removal - Refitting .

2. REMOVAL OPERATION

Disconnect the connector(9) from the gear control unit.

Remove the gear control unit bolts(10) .

Unclip the gear control unit from the floor at(11) .

Lower the gear control unit so that it is resting on the exhaust.

Remove the gear control unit by feeding it out between the exhaust and the tunnel.

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

Torque tighten:

- the control unit bolts 21 N.m.
- the exhaust pipe bolts on the catalytic converter Exhaust assembly under body: Exploded view .

Adjust the gear control unit (see 37A, Mechanical component controls, Gear control unit: Adjustment) .

GEAR ENGAGED SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

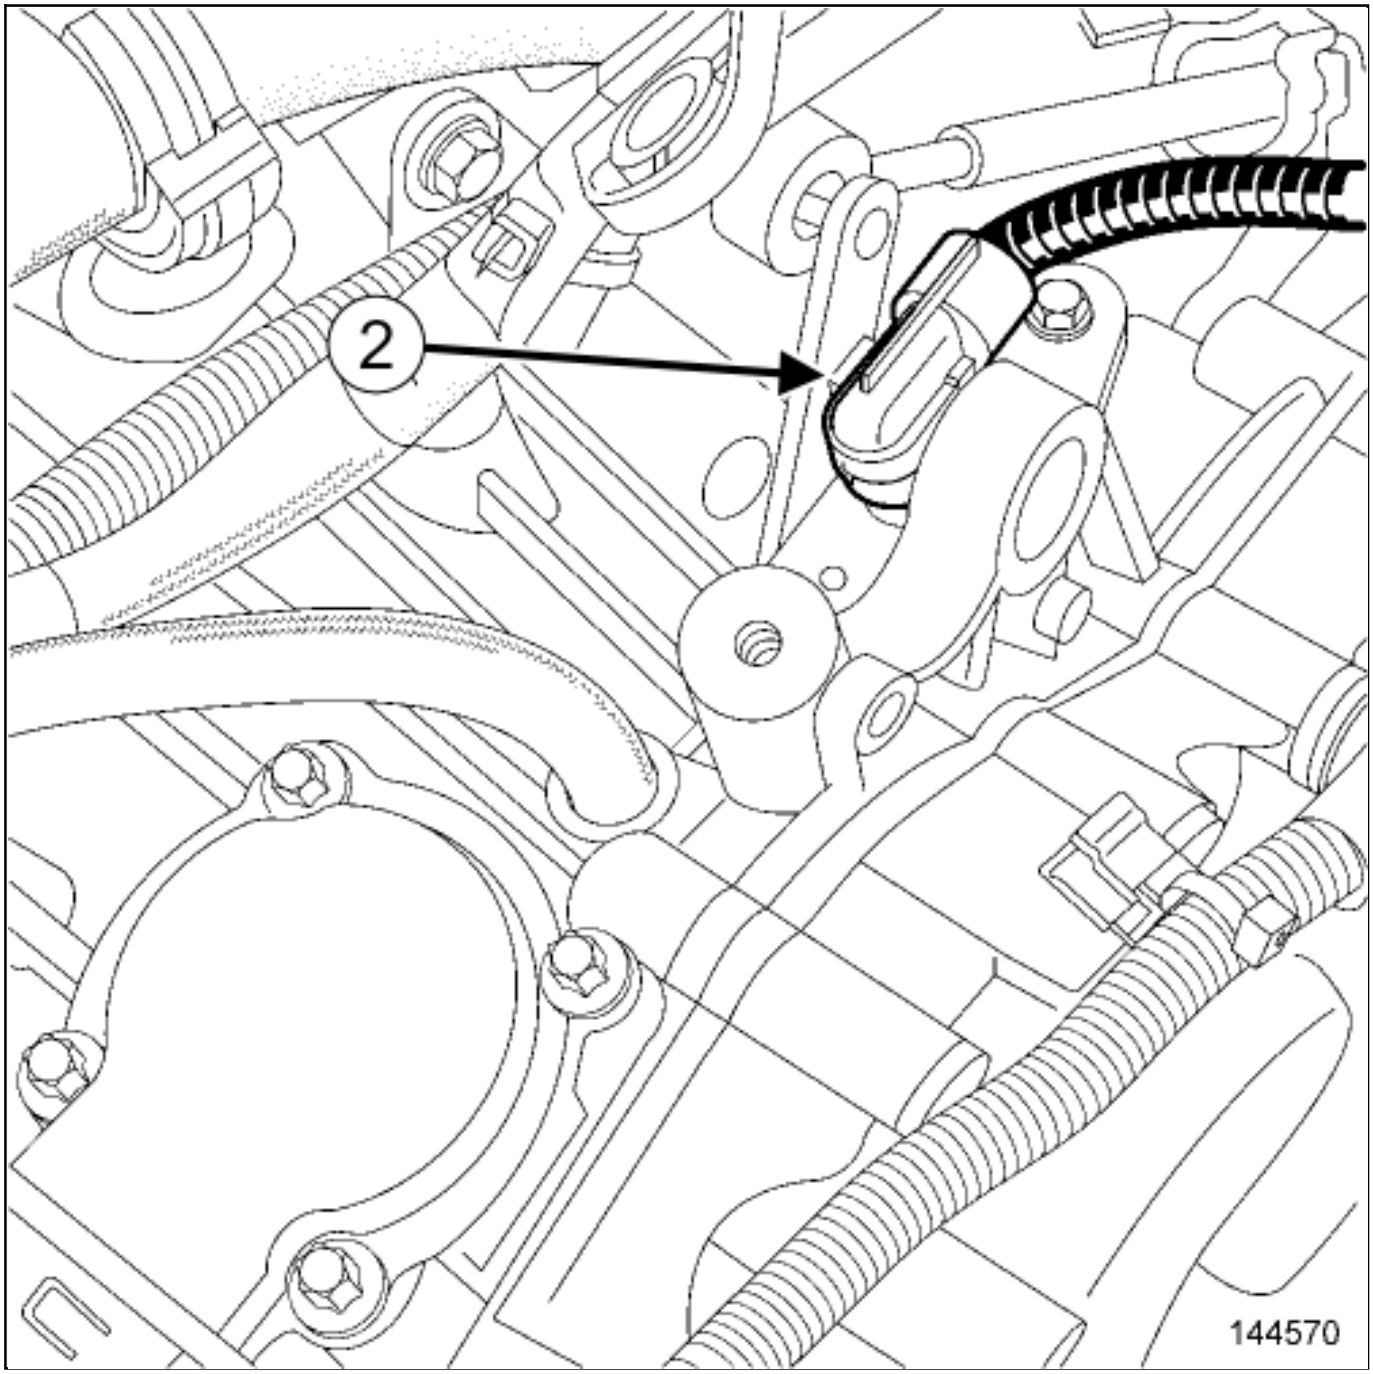
REMOVAL

1. REMOVAL PREPARATION OPERATION

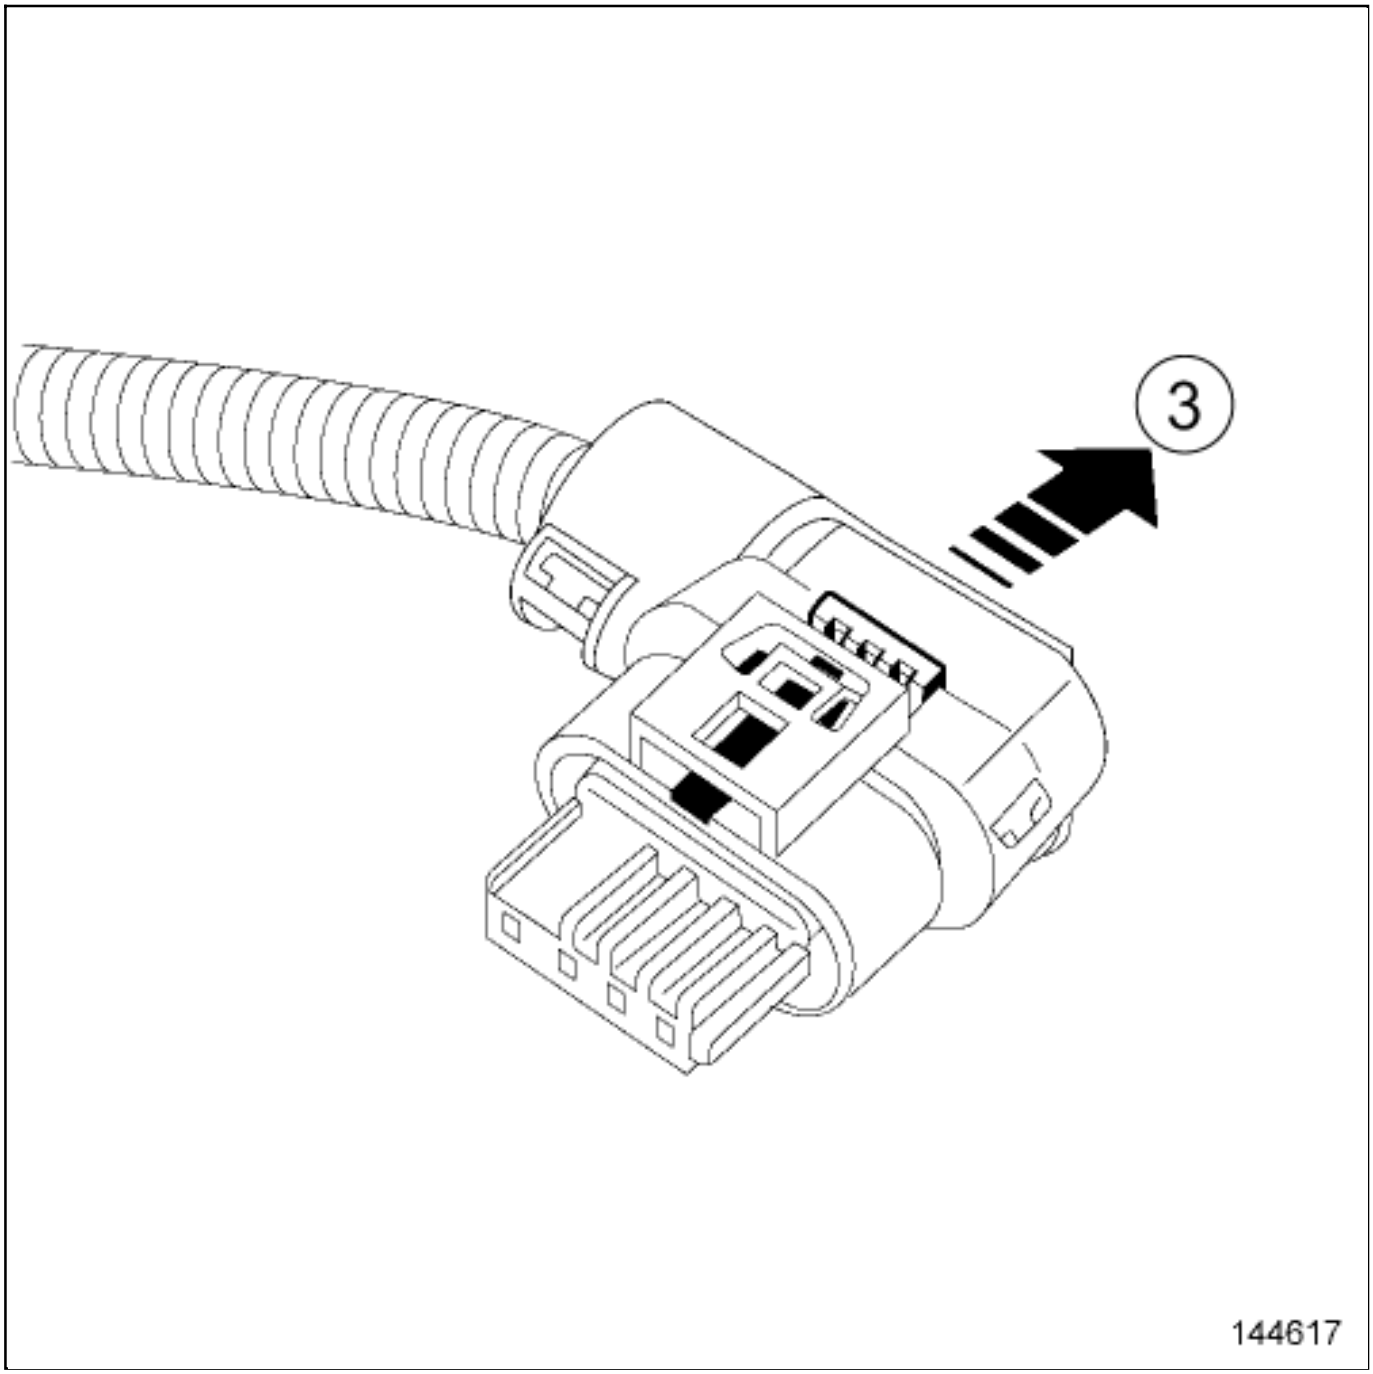
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

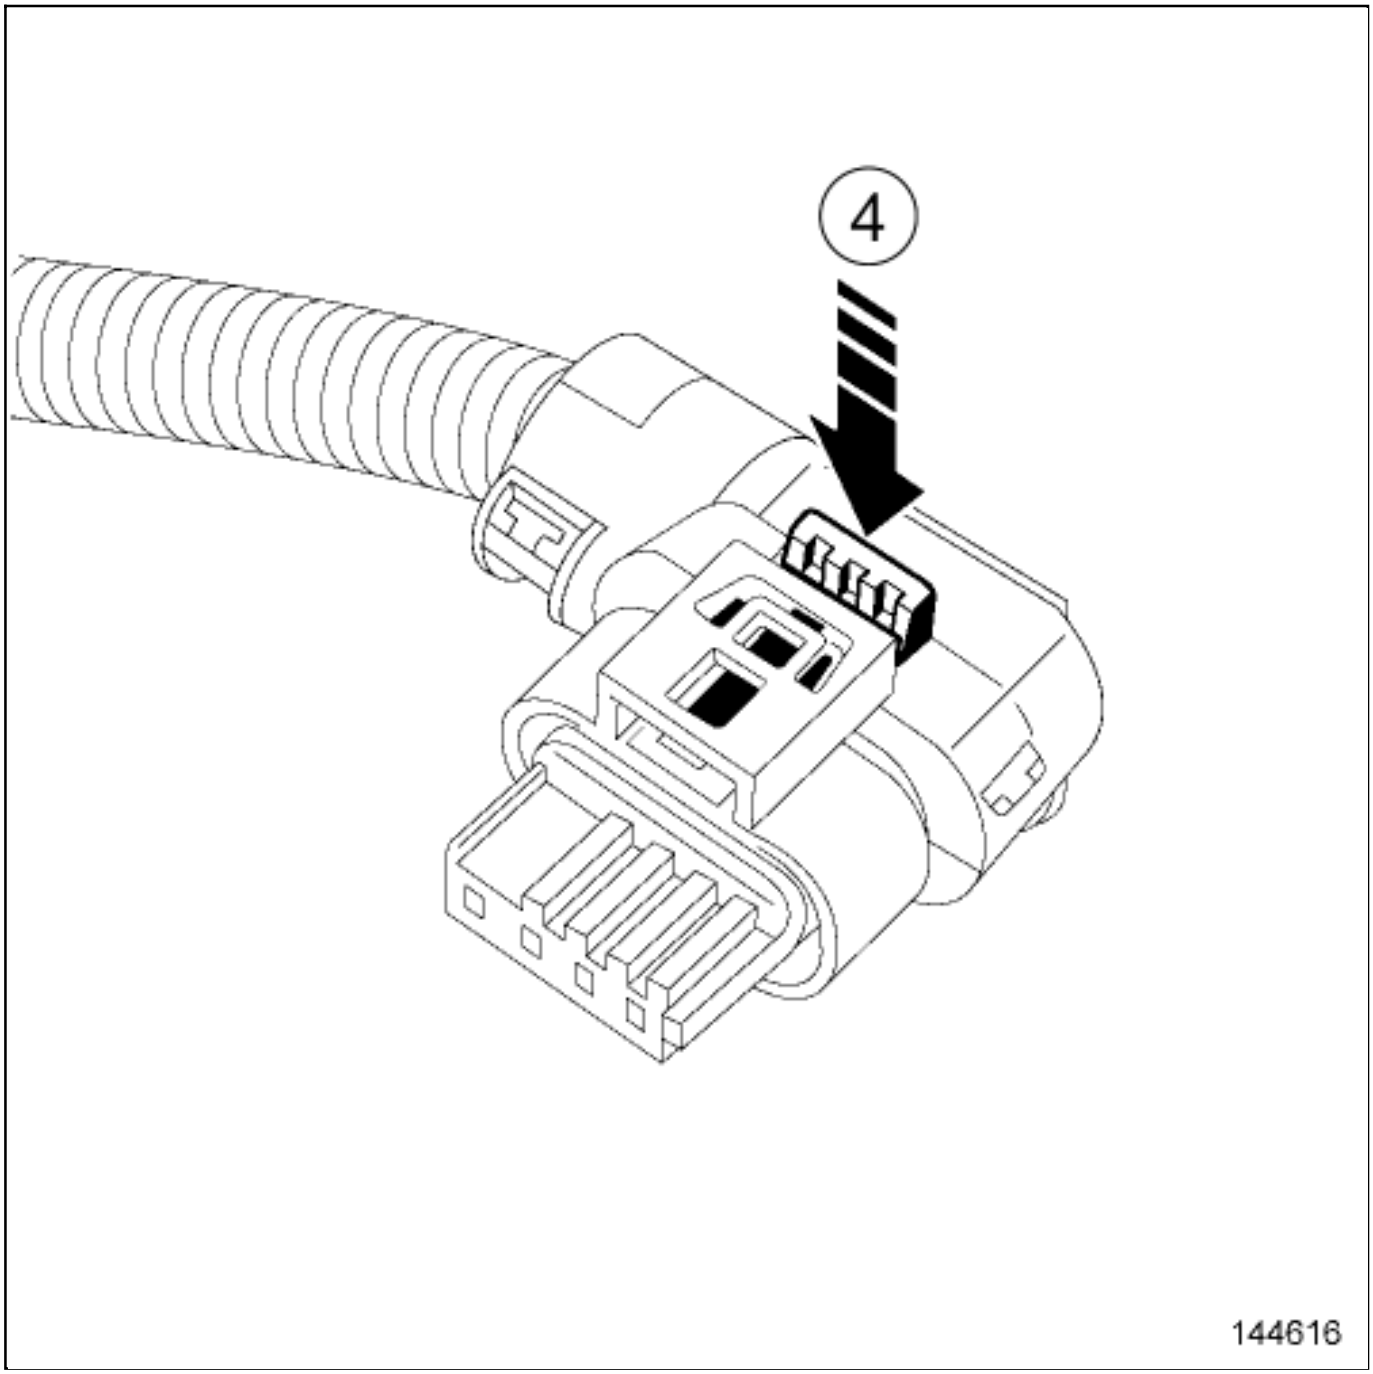
- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting .



2. REMOVAL OPERATION



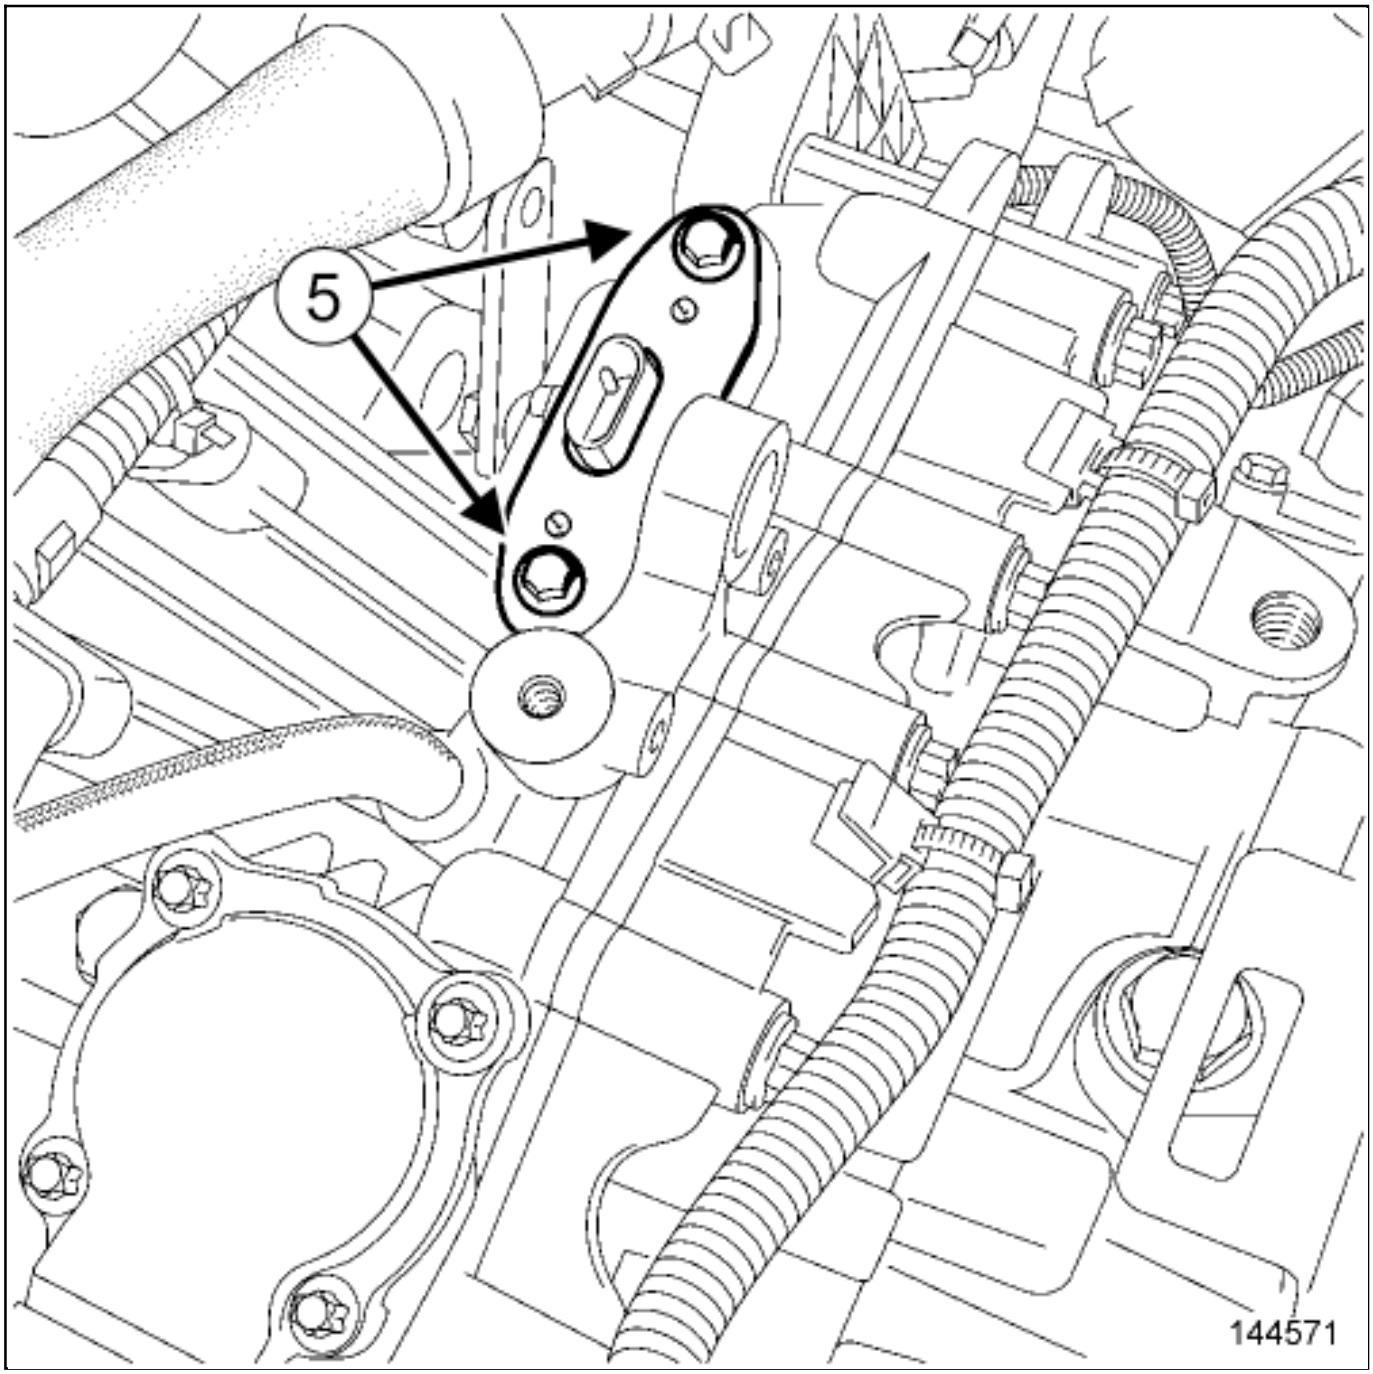
Note:



The connector has a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



2
144570

3
144617

Disconnect the gear engaged sensor connector(2) by:

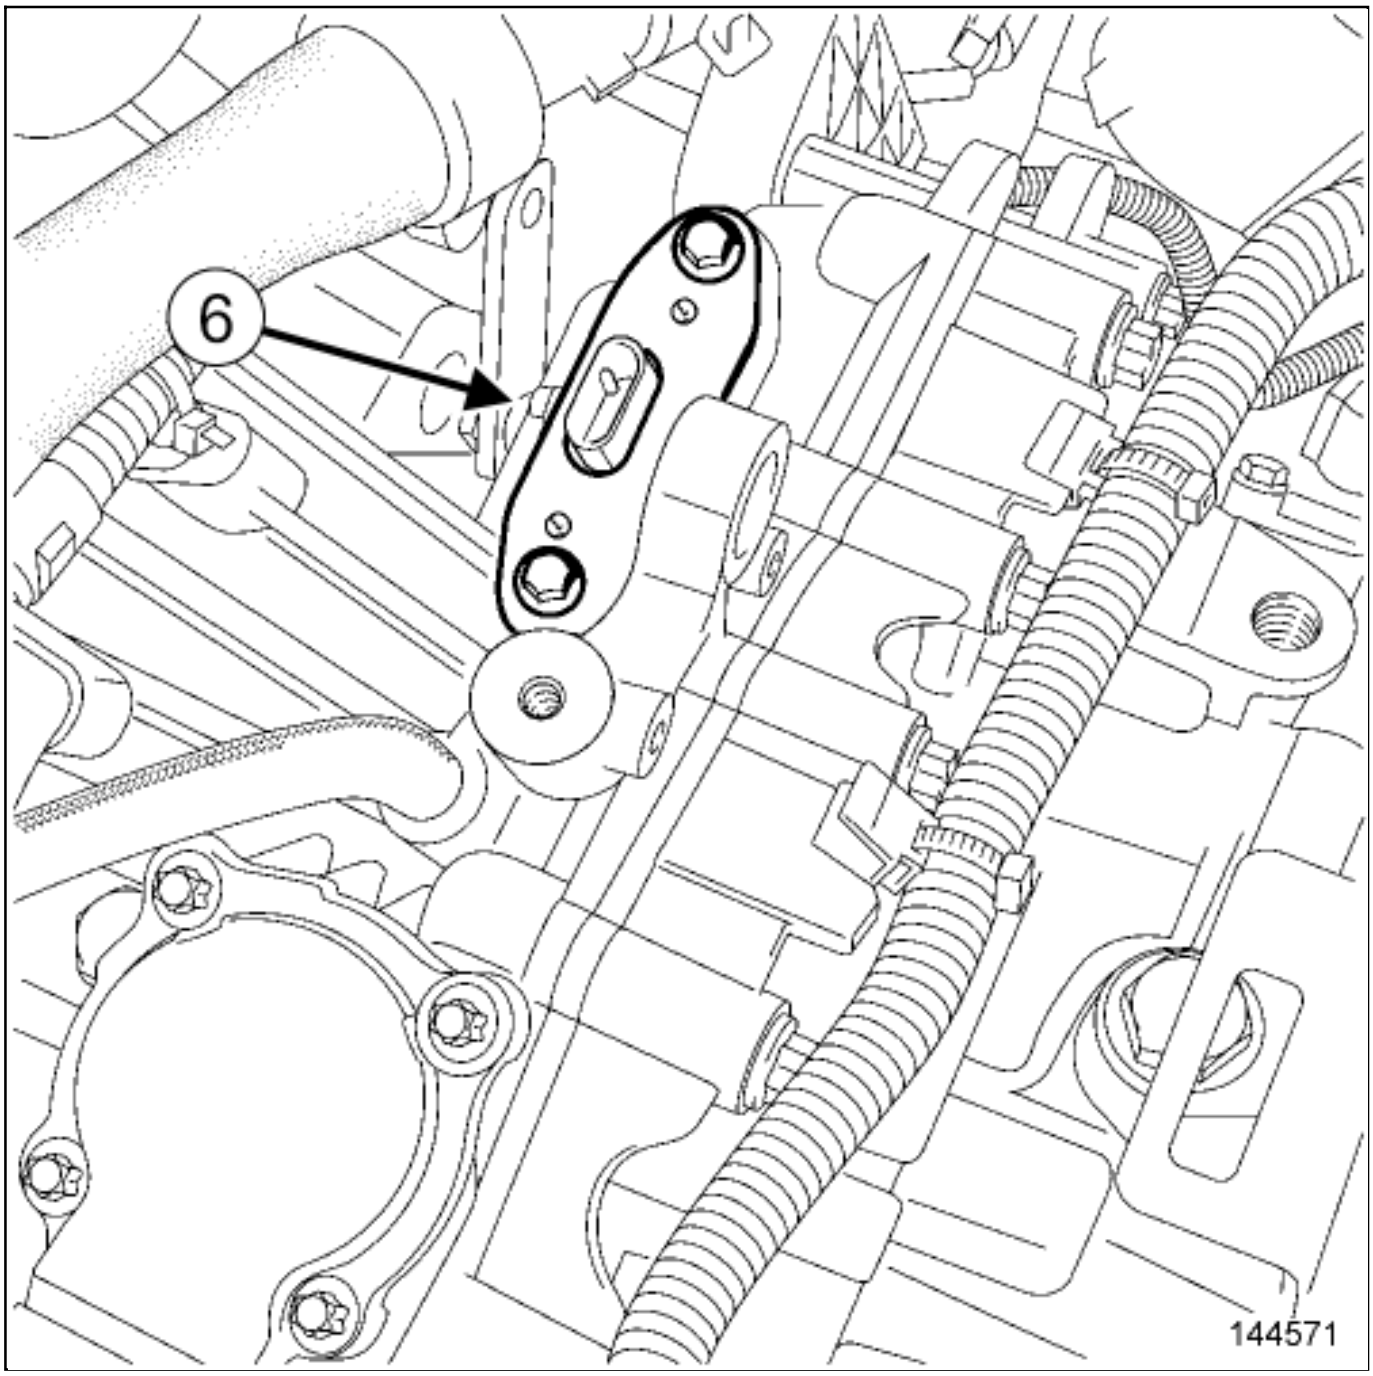
- unlocking the connector locking system(3) ,
- pressing the tab(4) .

Note:

Take the necessary precautions in order not to introduce any foreign bodies into the gearbox.

Remove:

- the bolts(5) of the gear engaged sensor,



- the gear engaged sensor,
- the seal of the gear engaged sensor.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint face of:
  - the gear engaged sensor,
  - the gearbox casing.

2. REFITTING OPERATION

Check for the presence of a new seal on the gear engaged sensor.

Refit the gear engaged sensor, positioning the lug(6) on the engine side.

Connect the gear engaged sensor connector.

Reclip the connector lock.

Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gear engaged sensor" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

GEAR ENGAGED SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

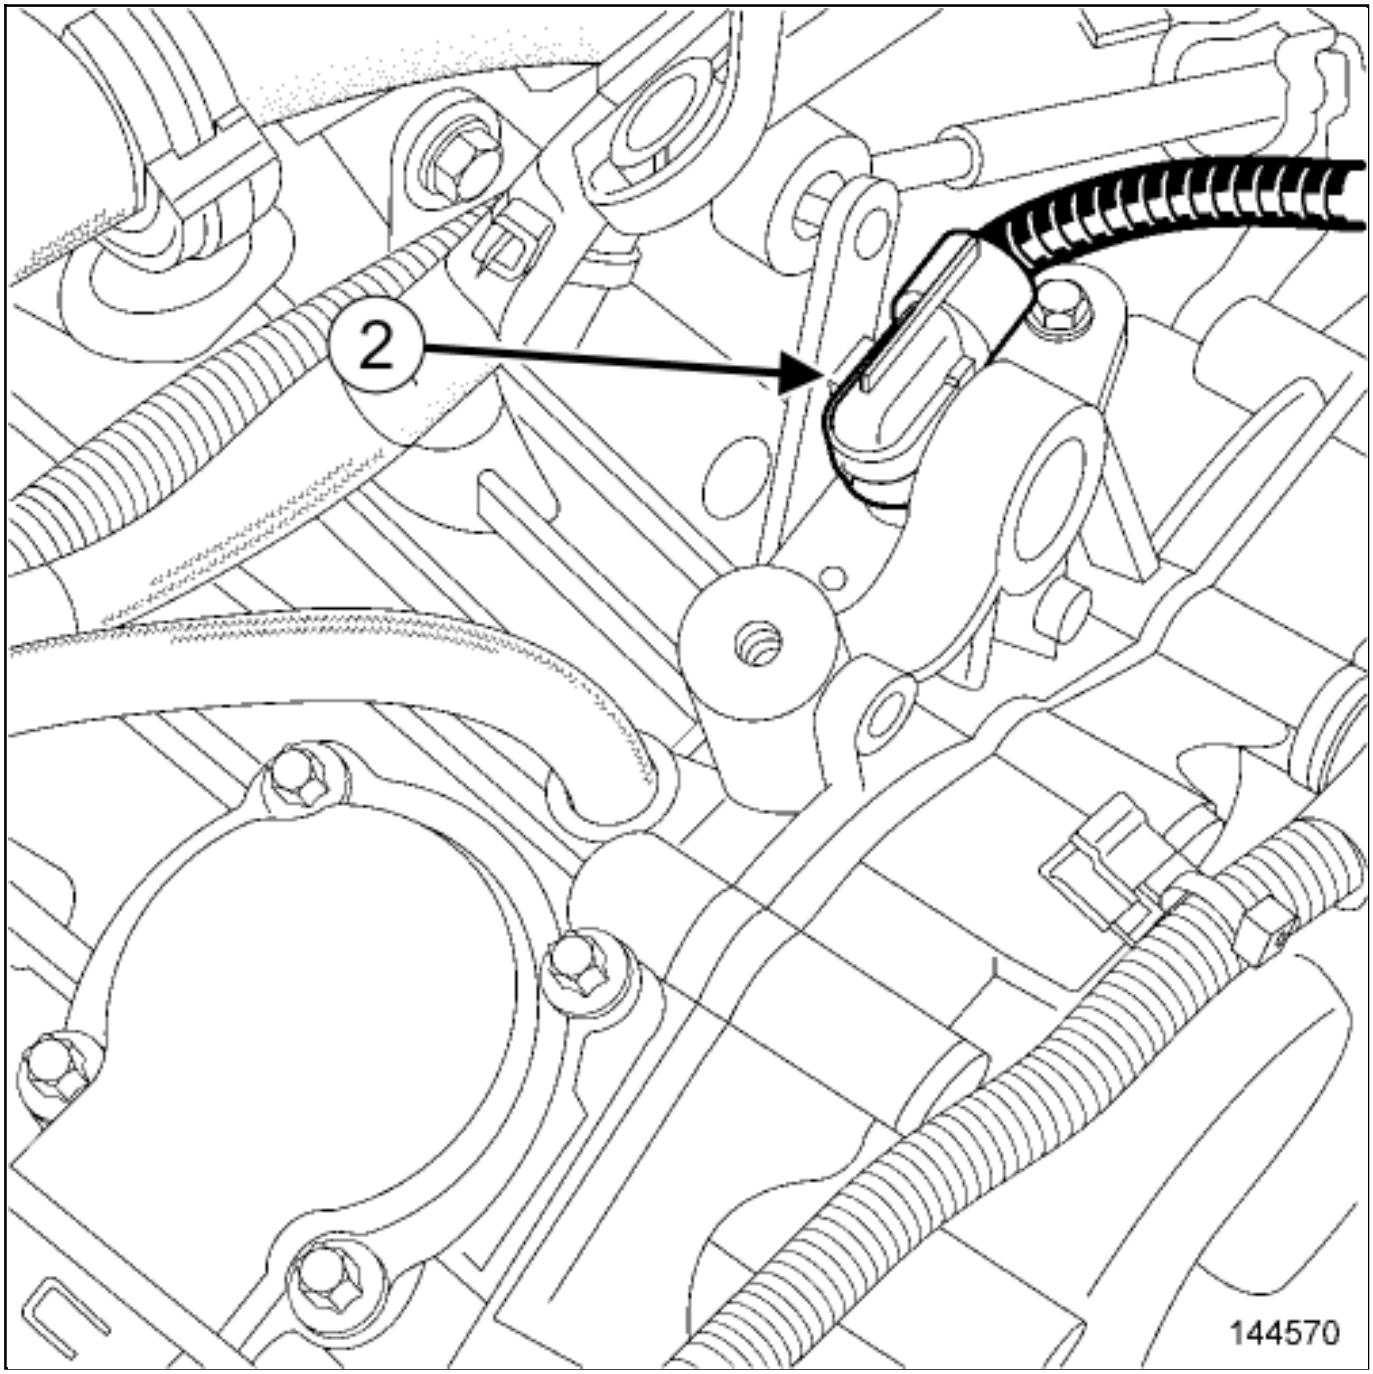
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

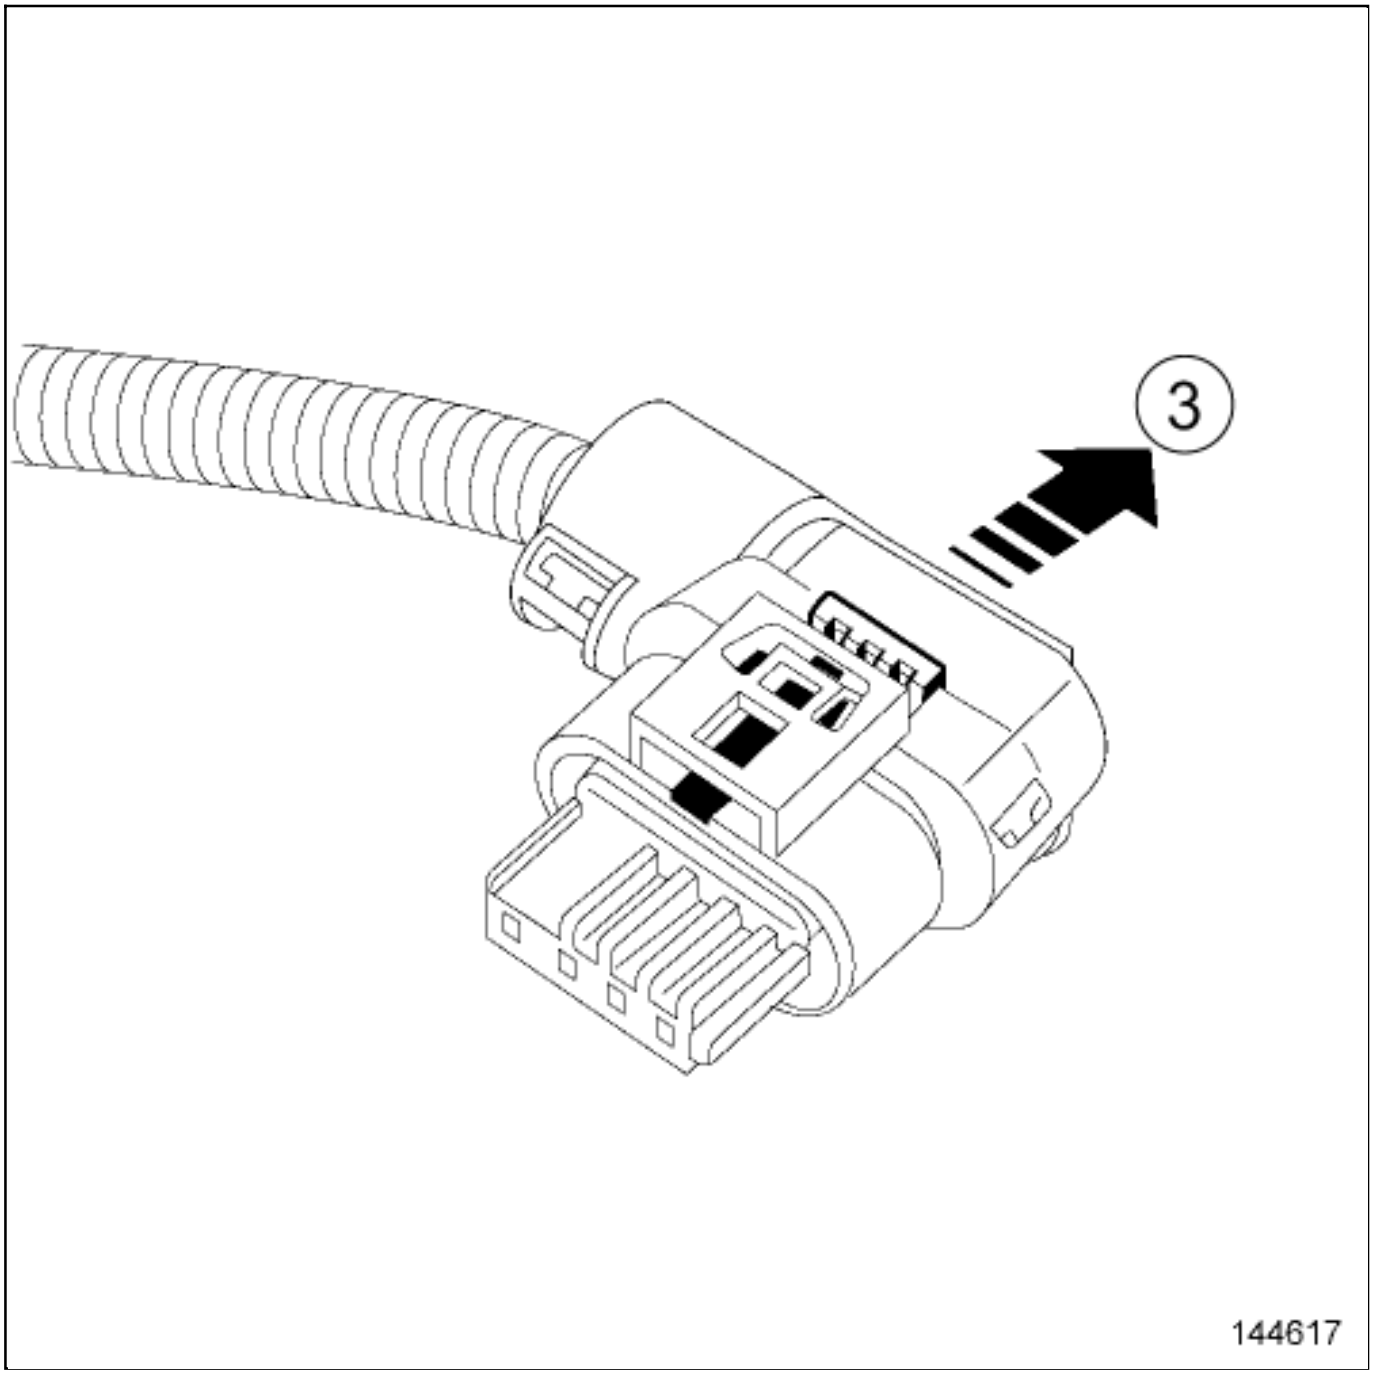
- the battery Battery: Removal - Refitting ,

the battery tray**Battery tray: Removal - Refitting** .

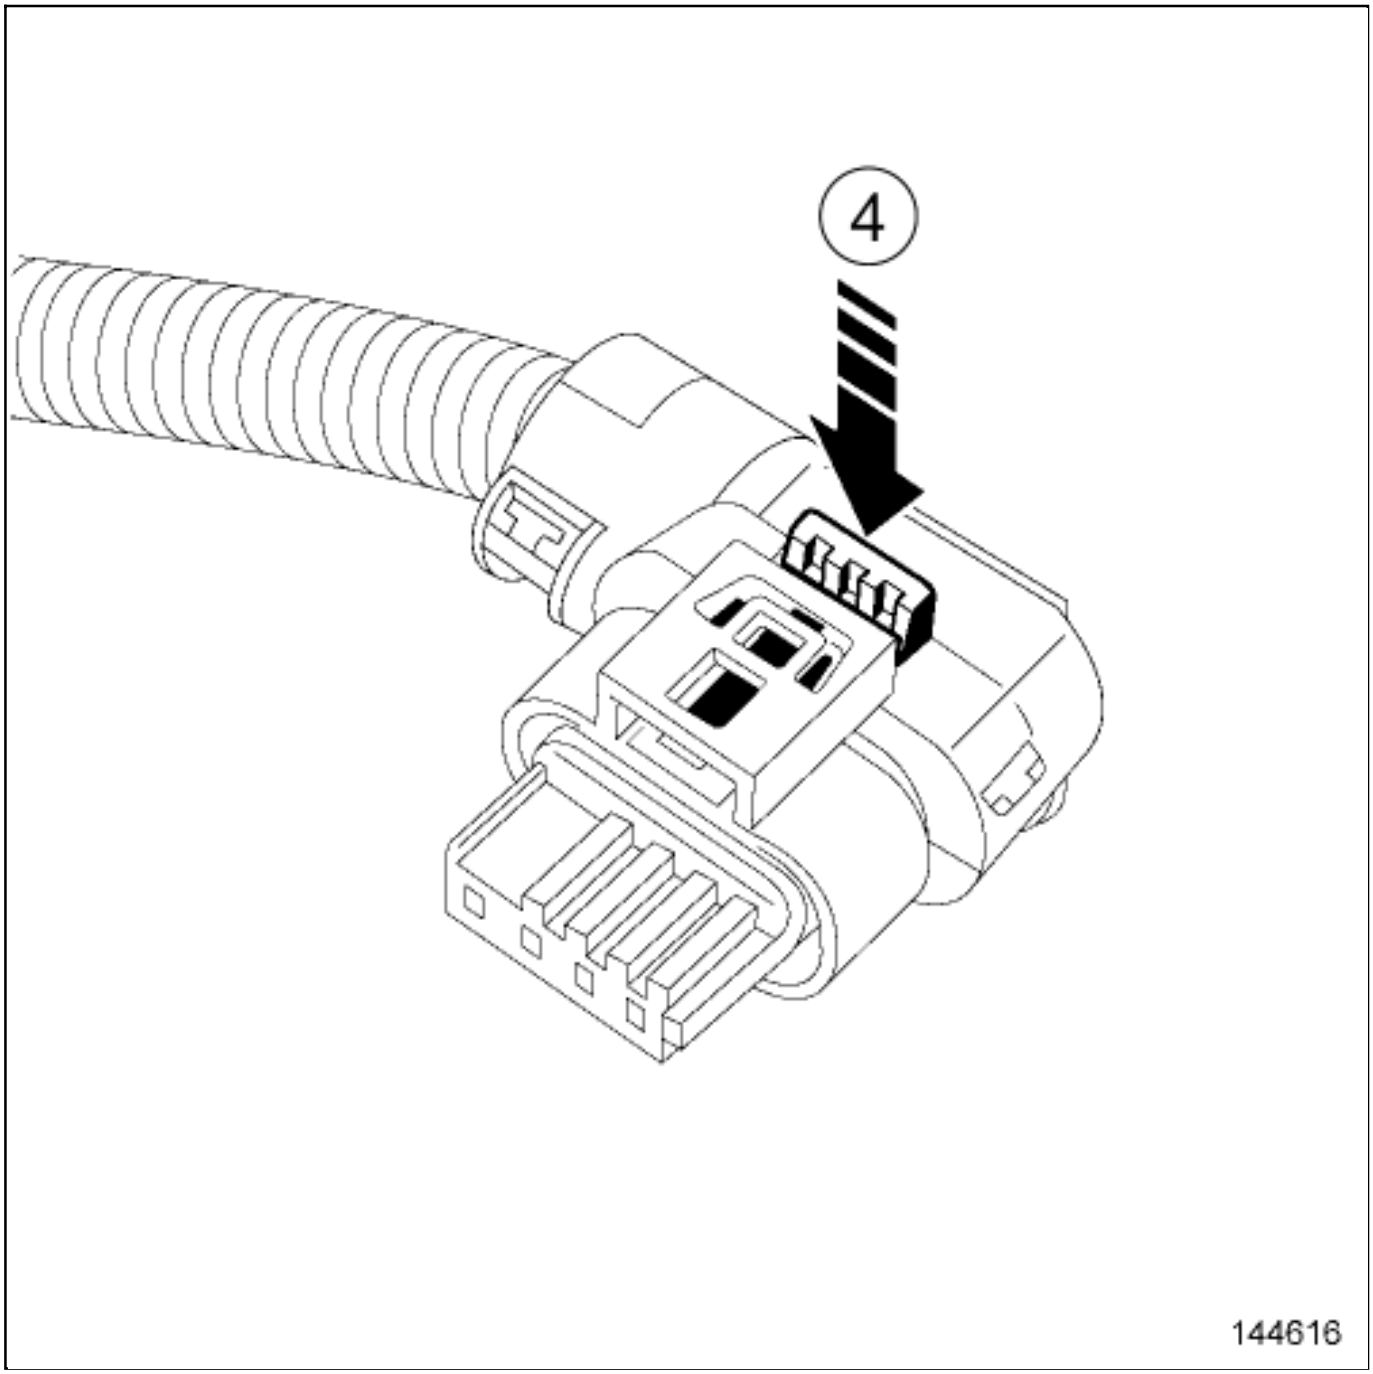
2. REMOVAL OPERATION



Note:

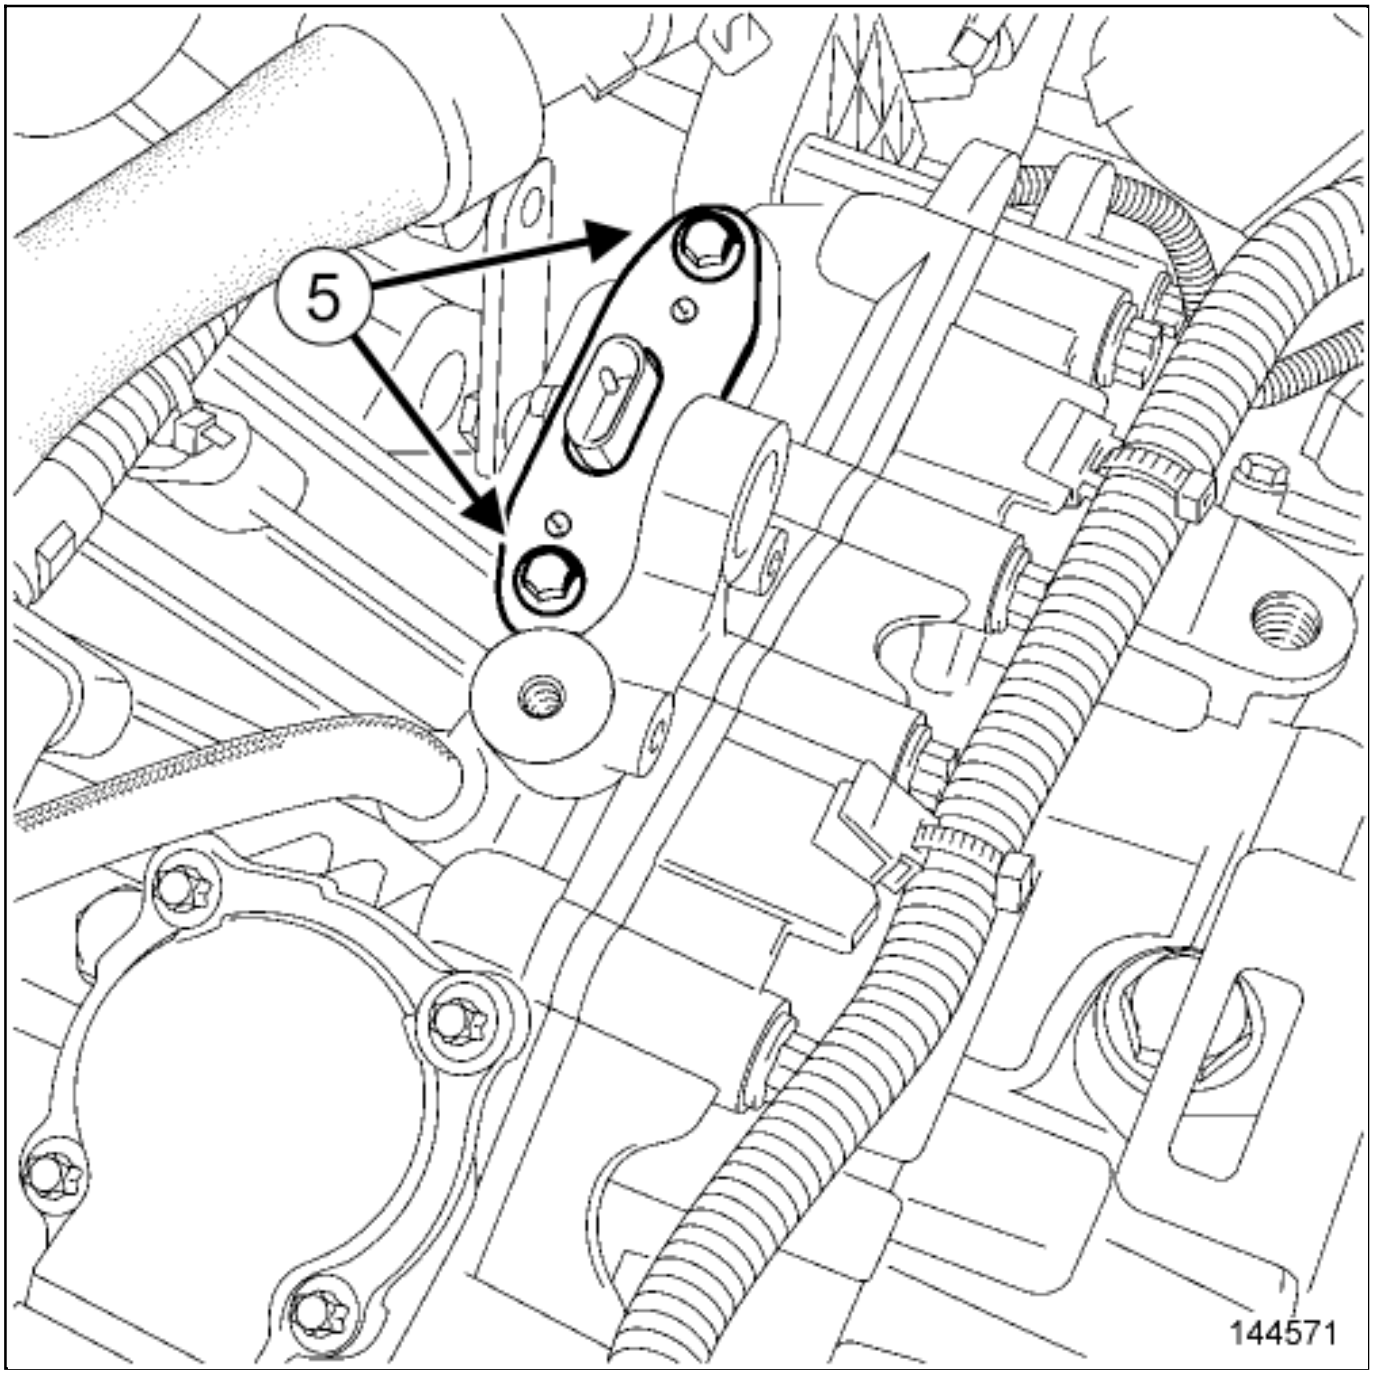


The connector has a locking system.



CAUTION

Failure to observe the following procedure could damage the connector.



2
144570

3
144617

Disconnect the gear engaged sensor connector(2) by:

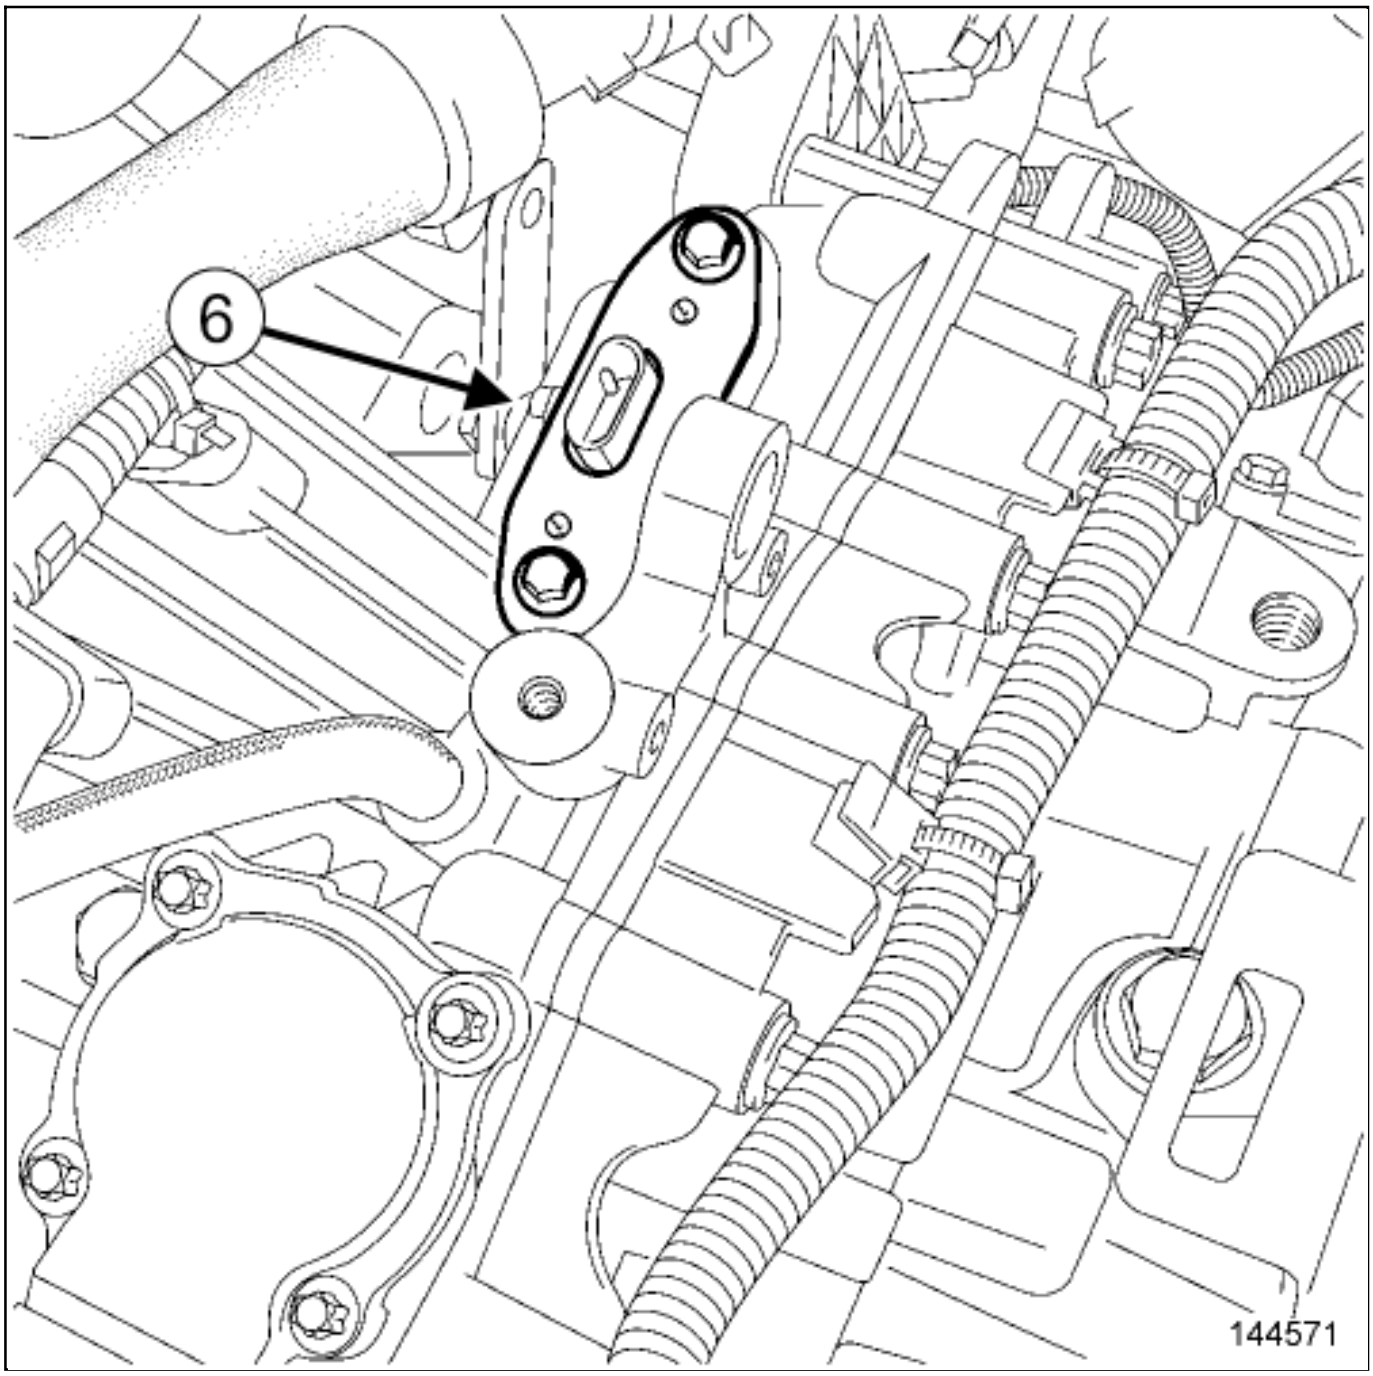
- unlocking the connector locking system(3) ,
- pressing the tab(4) .

Note:

Take the necessary precautions in order not to introduce any foreign bodies into the gearbox.

Remove:

- the bolts(5) of the gear engaged sensor,



- the gear engaged sensor,
- the seal of the gear engaged sensor.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint face of:
  - the gear engaged sensor,
  - the gearbox casing.

2. REFITTING OPERATION

Check for the presence of a new seal on the gear engaged sensor.

Refit the gear engaged sensor, positioning the lug(6) on the engine side.

Connect the gear engaged sensor connector.

Reclip the connector lock.

Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

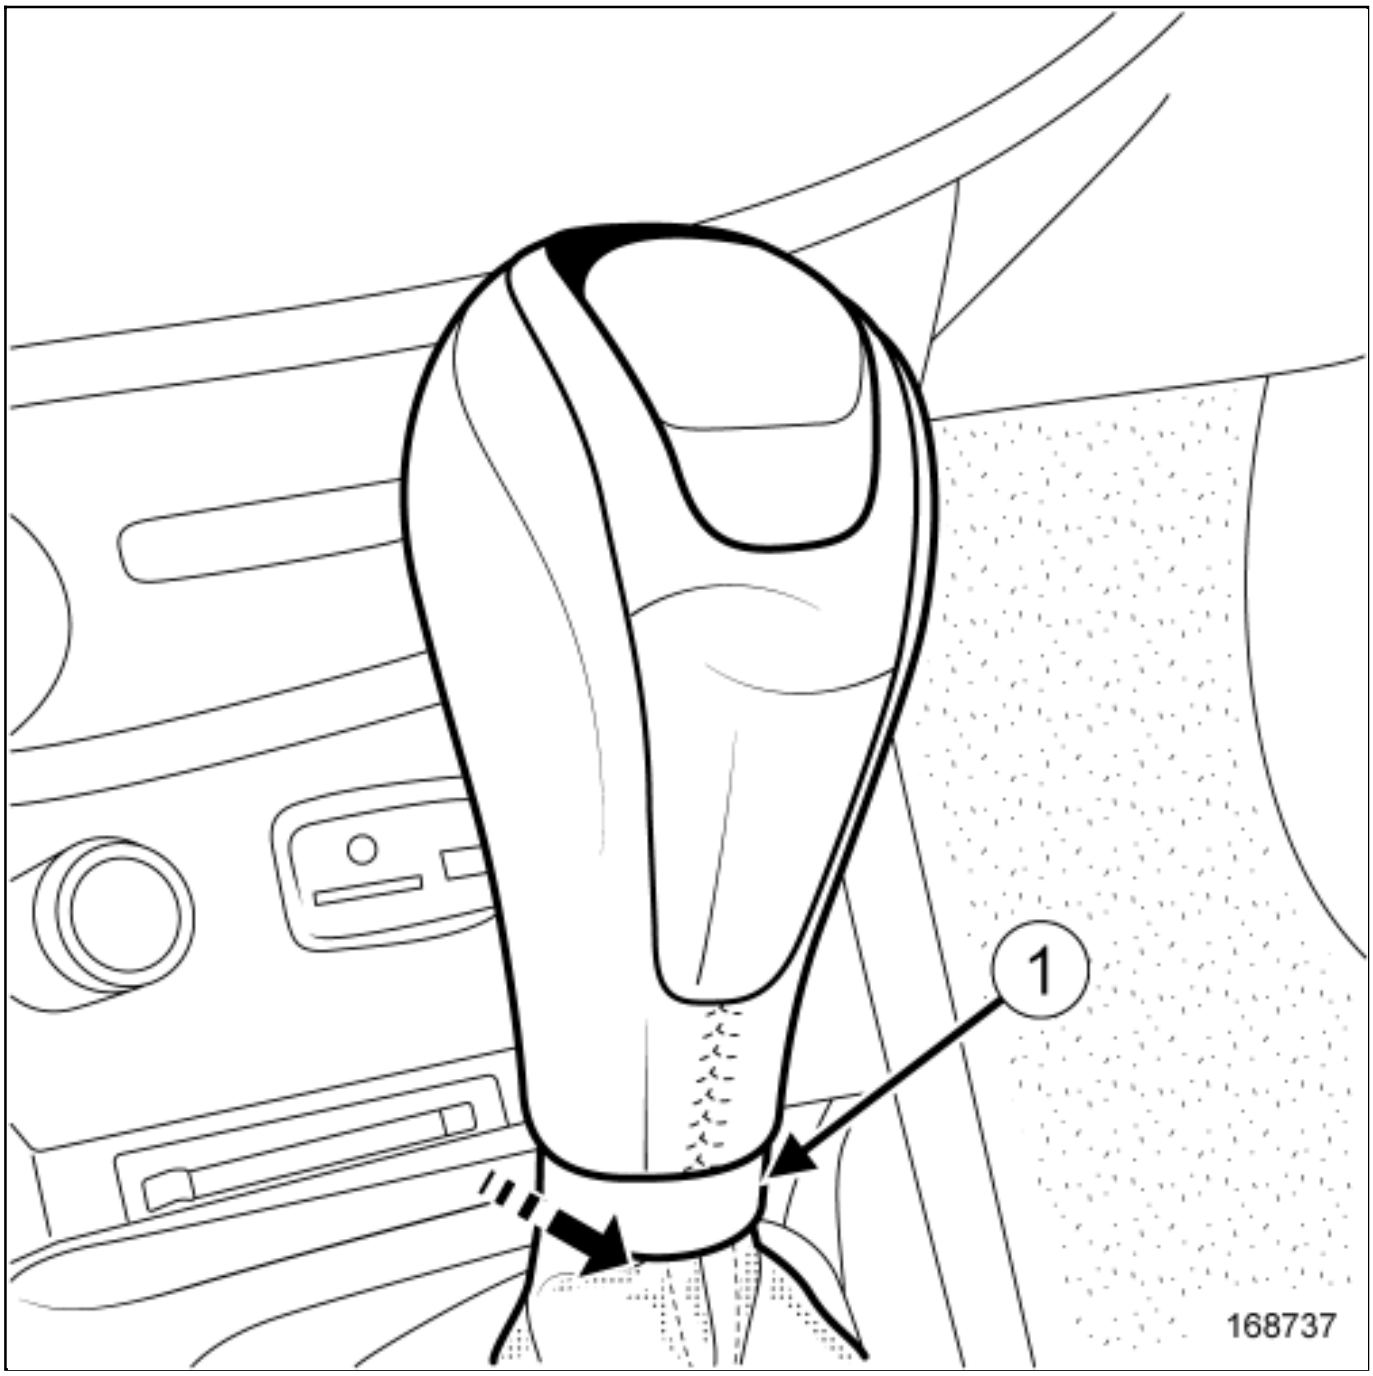
- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gear engaged sensor" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

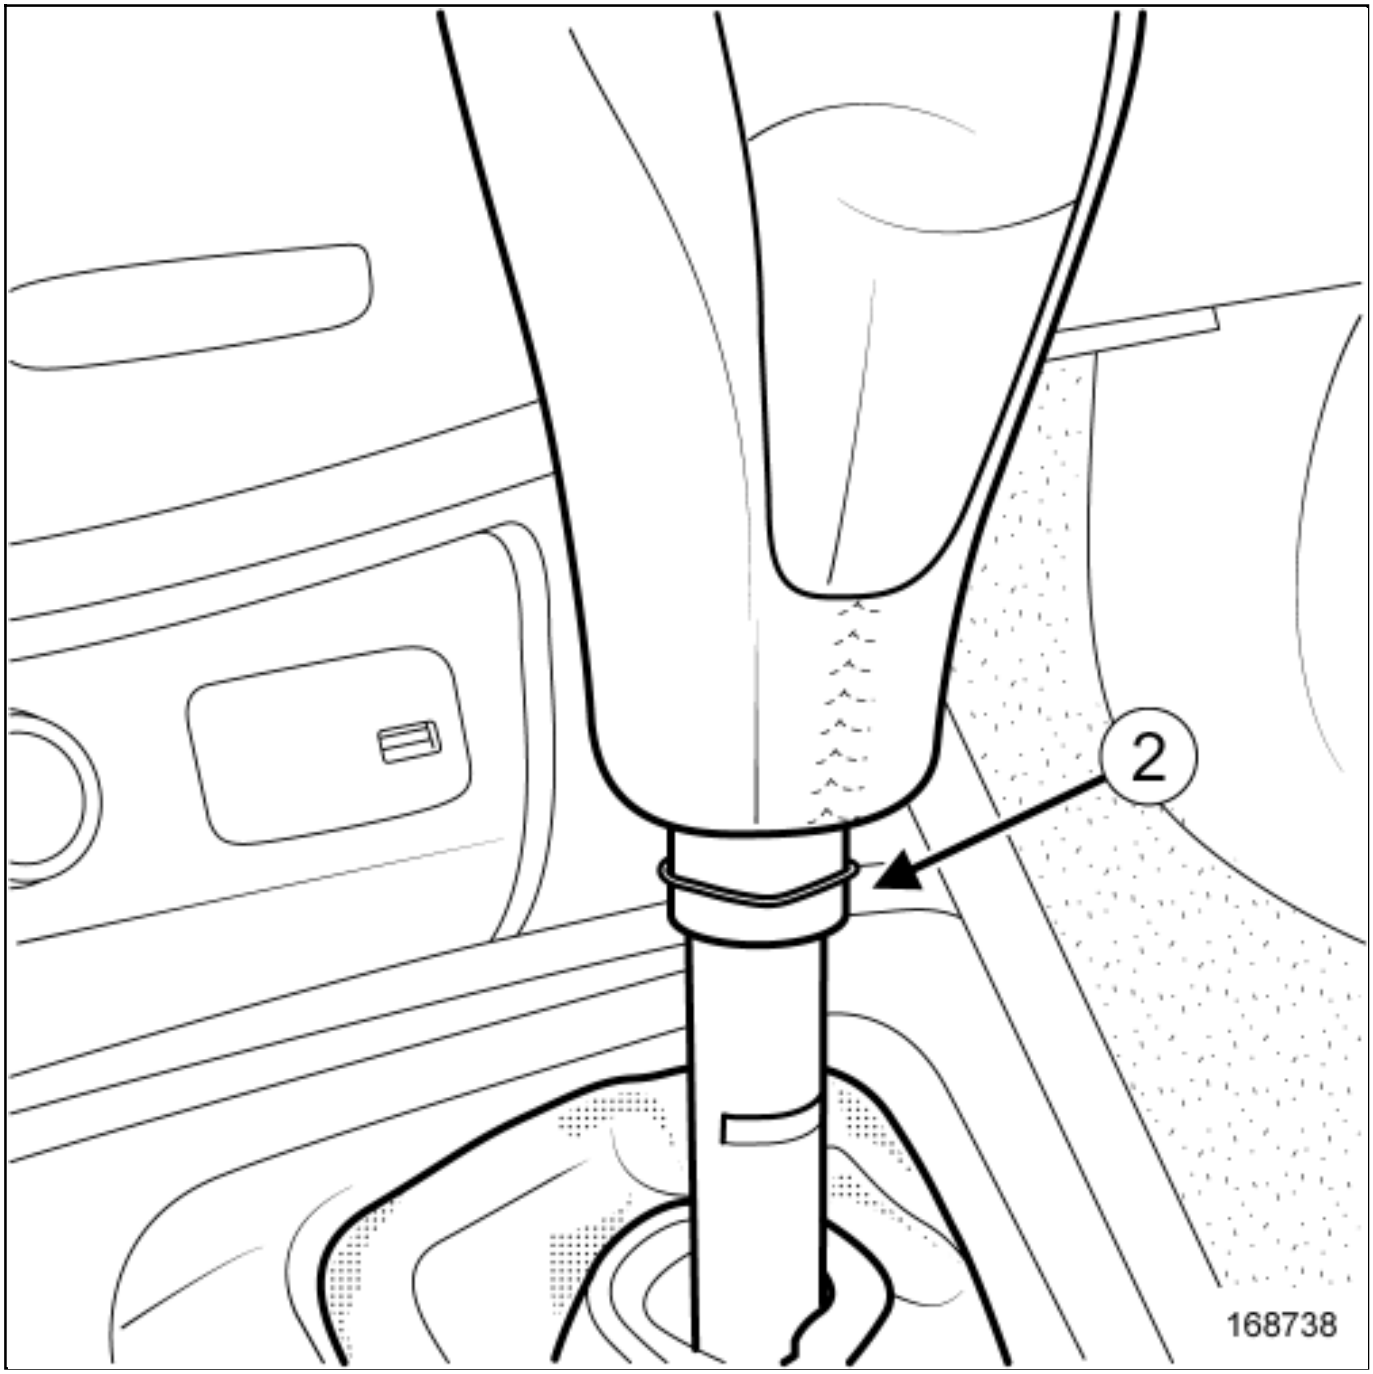
GEAR LEVER KNOB: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING



To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



Vehicle: Precautions for the repair

REMOVAL

1. REMOVAL OPERATION

Turn the knob sleeve(1) by a quarter of a turn counterclockwise.

- Remove the clip(2) .

- Remove the gear lever knob

REFITTING

1. REFITTING PREPARATION OPERATION

Refit the clip on the lever knob.

Refit the equipped gear lever knob.

Proceed in the reverse order to removal.

Repair-12x02x01x04-01x37-1-2-1.xml

XSL version : 3.02 du 22/07/11

GEARBOX SHAFT: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306

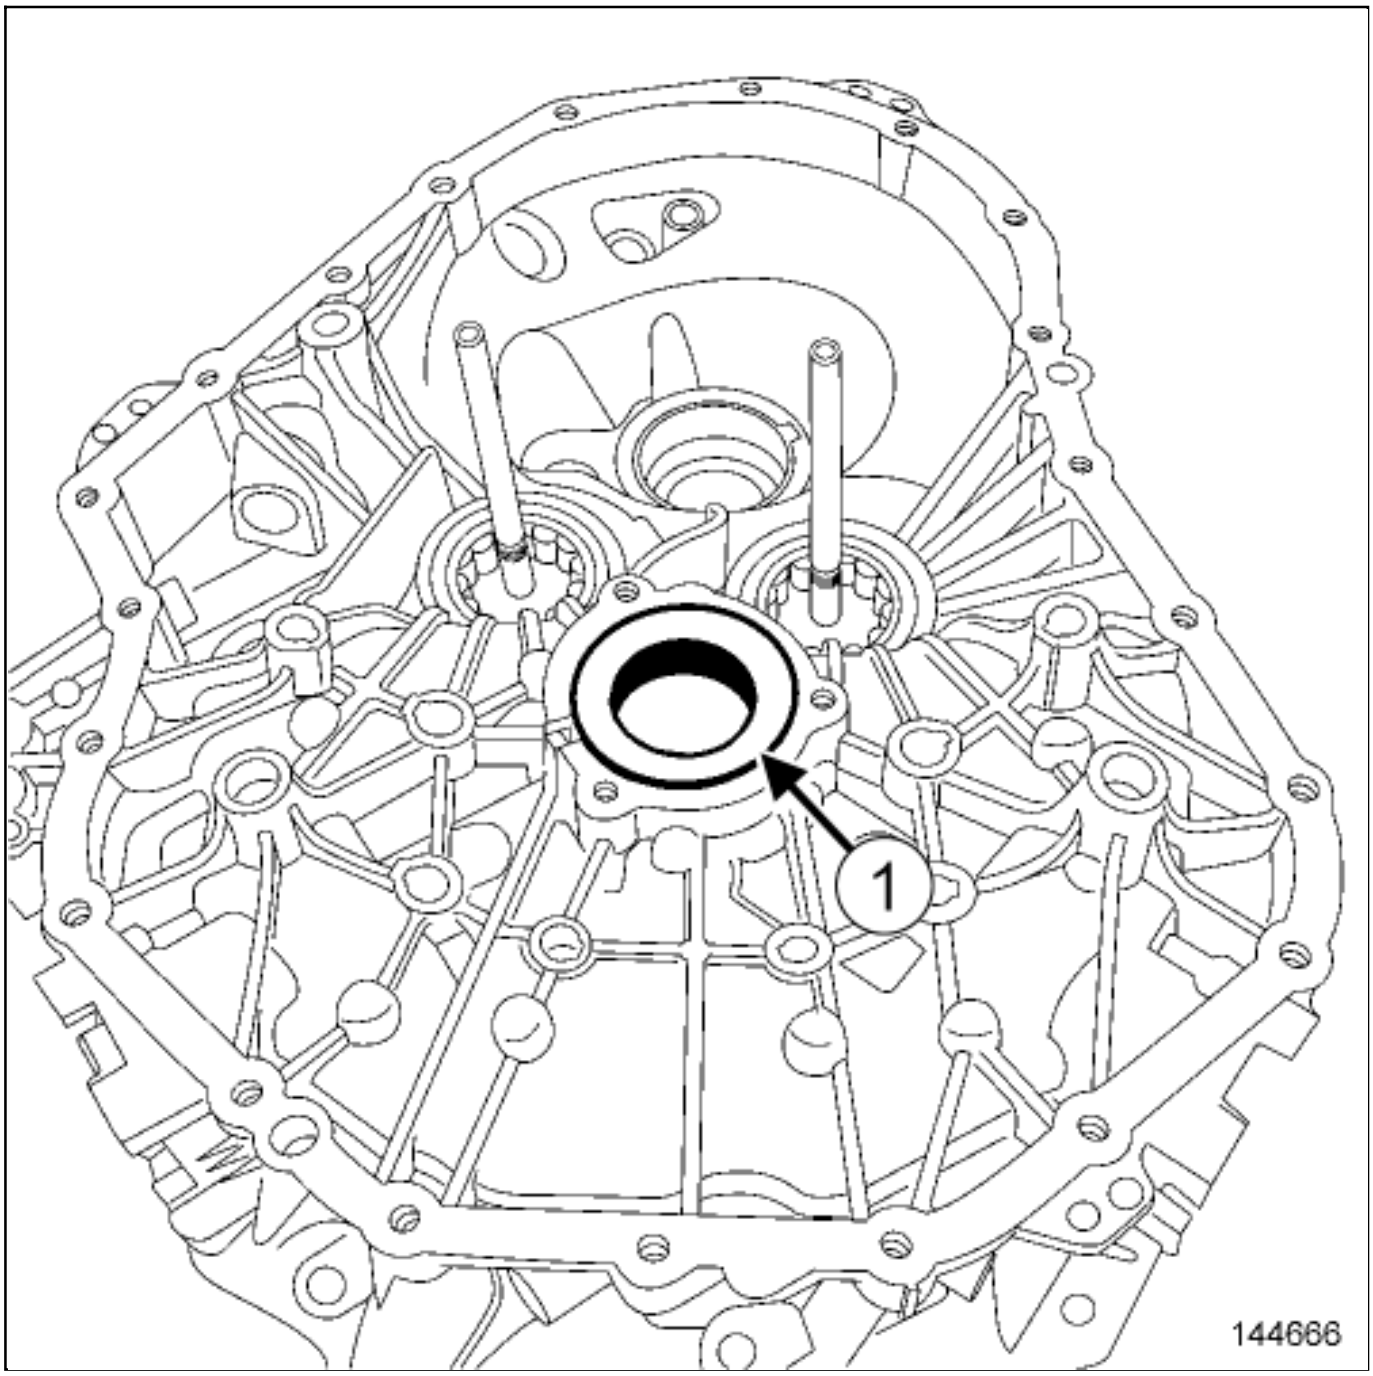
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

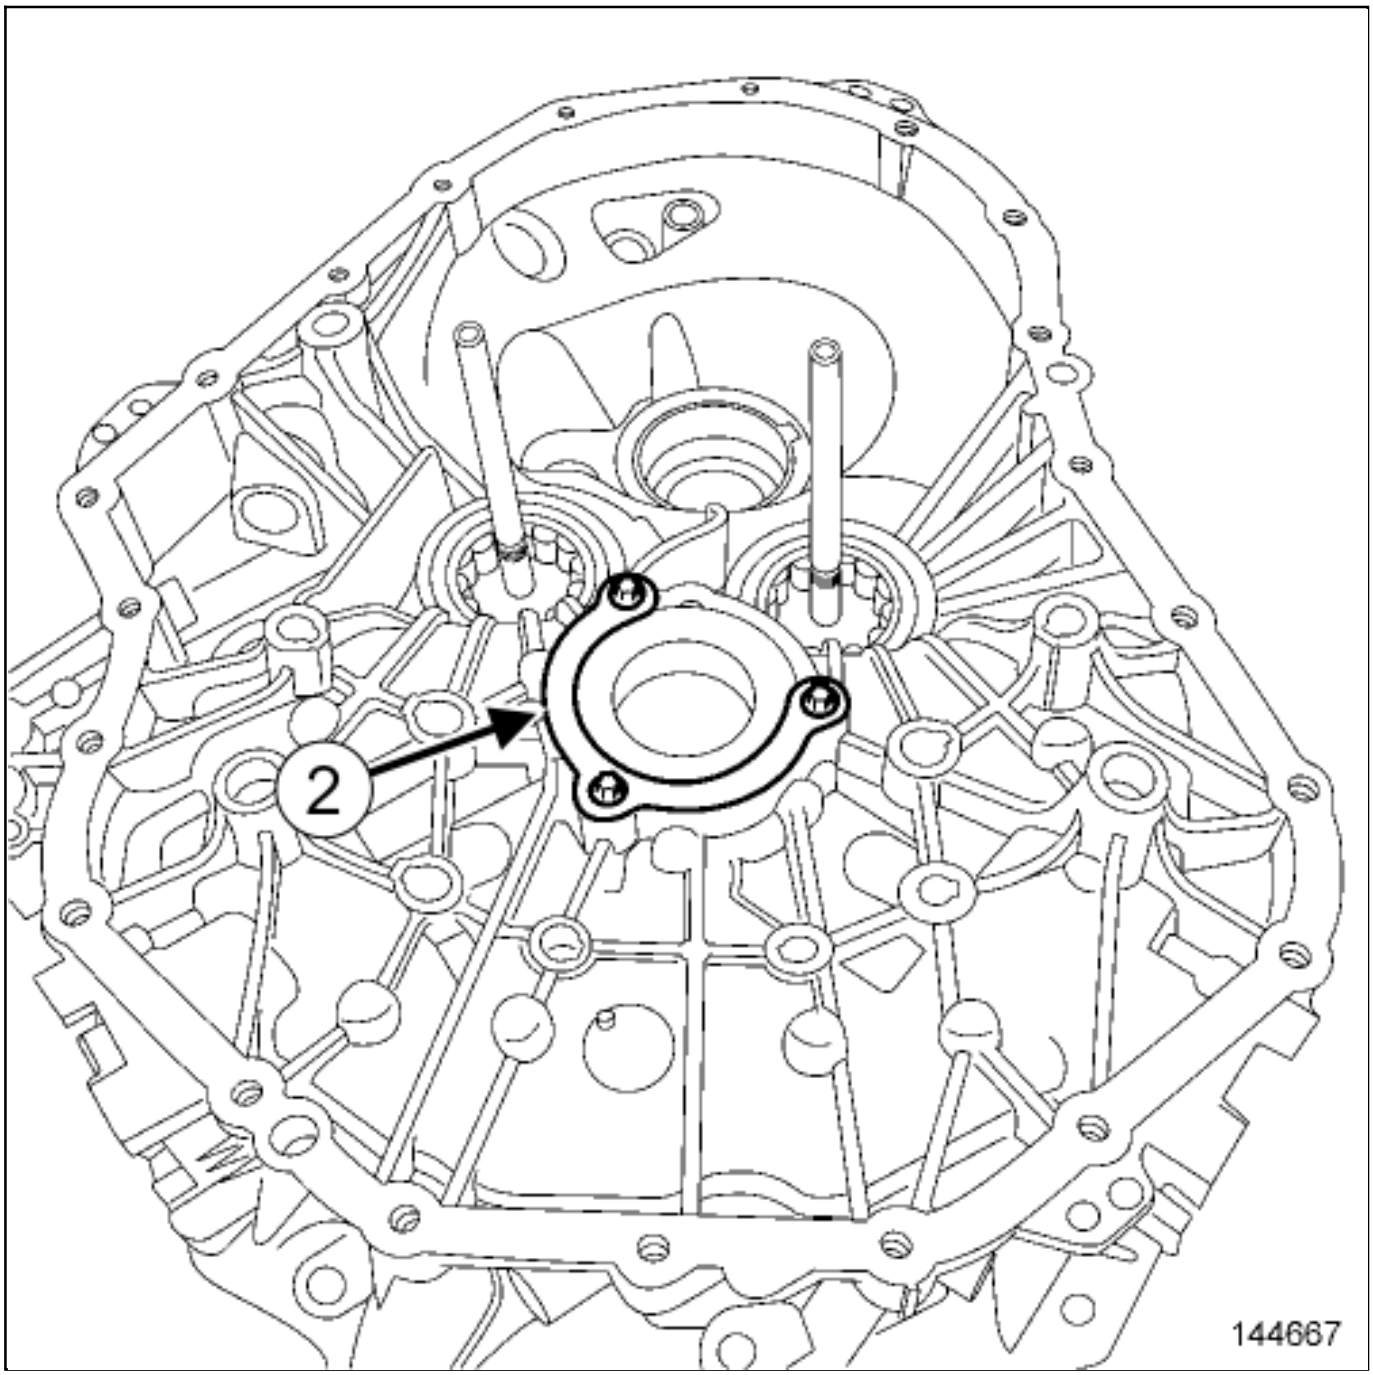
- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

REMOVAL

1. REMOVAL PREPARATION OPERATION



Remove:



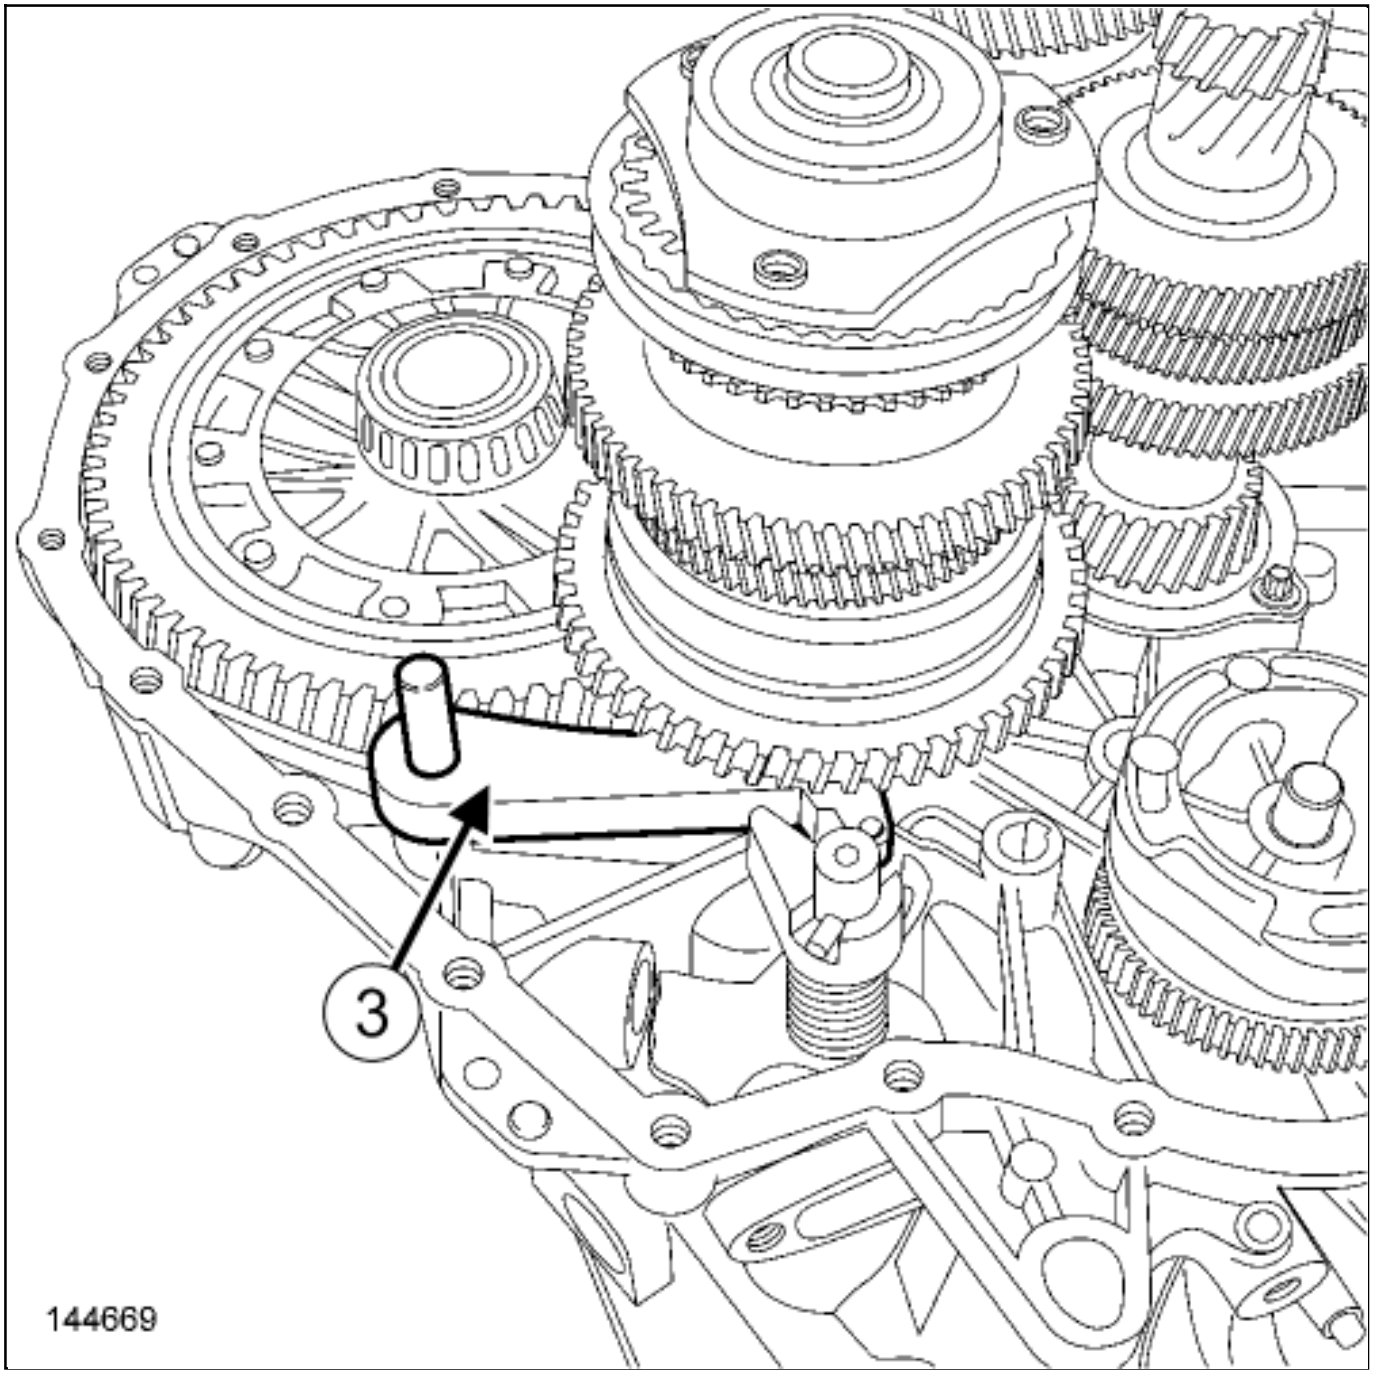
- the automatic gearbox Automatic gearbox: Removal - Refitting ,
- the automatic gearbox wiring Automatic gearbox wiring: Removal - Refitting ,
- the speed sensors Speed sensor: Removal - Refitting ,
- the gear engaged sensor Gear engaged sensor: Removal - Refitting ,
- the automatic transmission computer Automatic gearbox computer : Removal - Refitting ,

- the clutch pressure plate **Clutch: Removal - Refitting** ,
- the clutch actuator motors **Clutch actuator motor: Removal - Refitting** ,
- the clutch thrust bearing **Clutch thrust bearing: Removal - Refitting** ,
- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** ,
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** ,

the input shaft bearing on the clutch housing **(see 23A, Automatic gearbox , Clutch housing bearing: Removal - Refitting)** .

2. OPERATION FOR REMOVAL OF PART CONCERNED

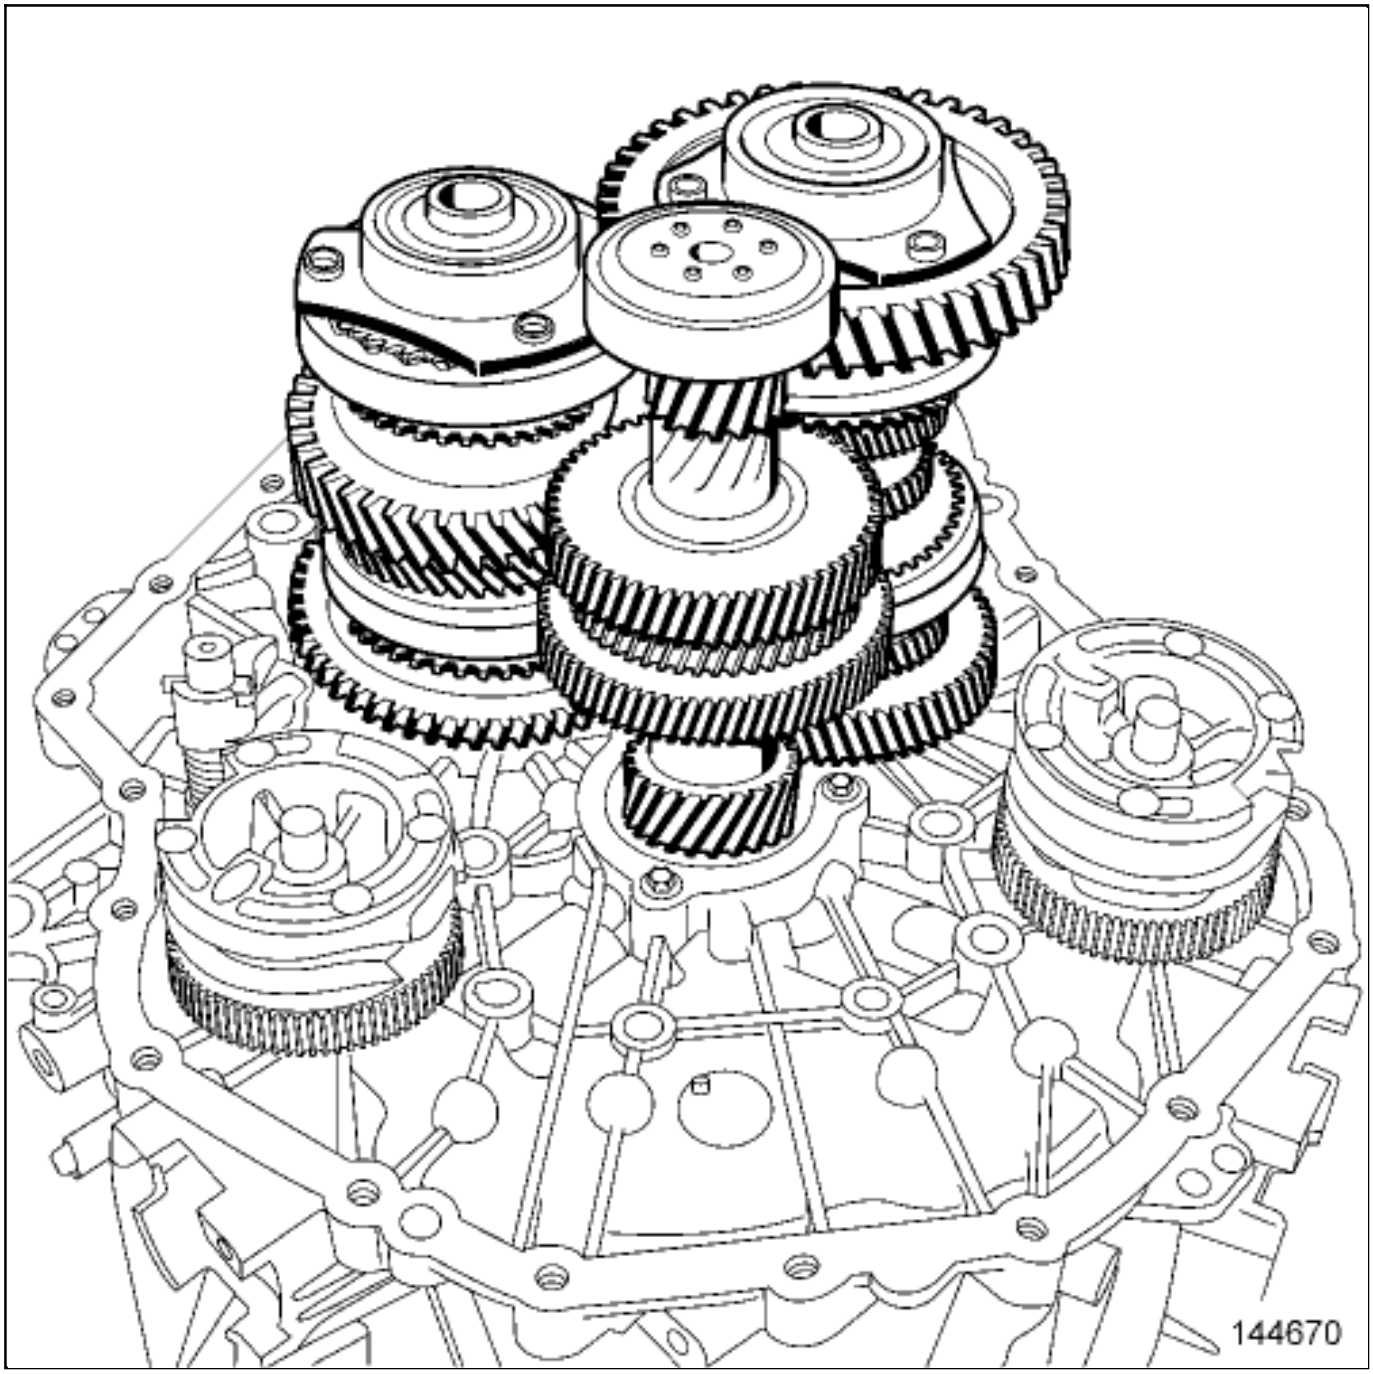
1
144666



Refit:

- the bracket(2) of the input shaft bearing,
- the clutch housing without fitting the housing bolts.

Turn over the automatic gearbox.

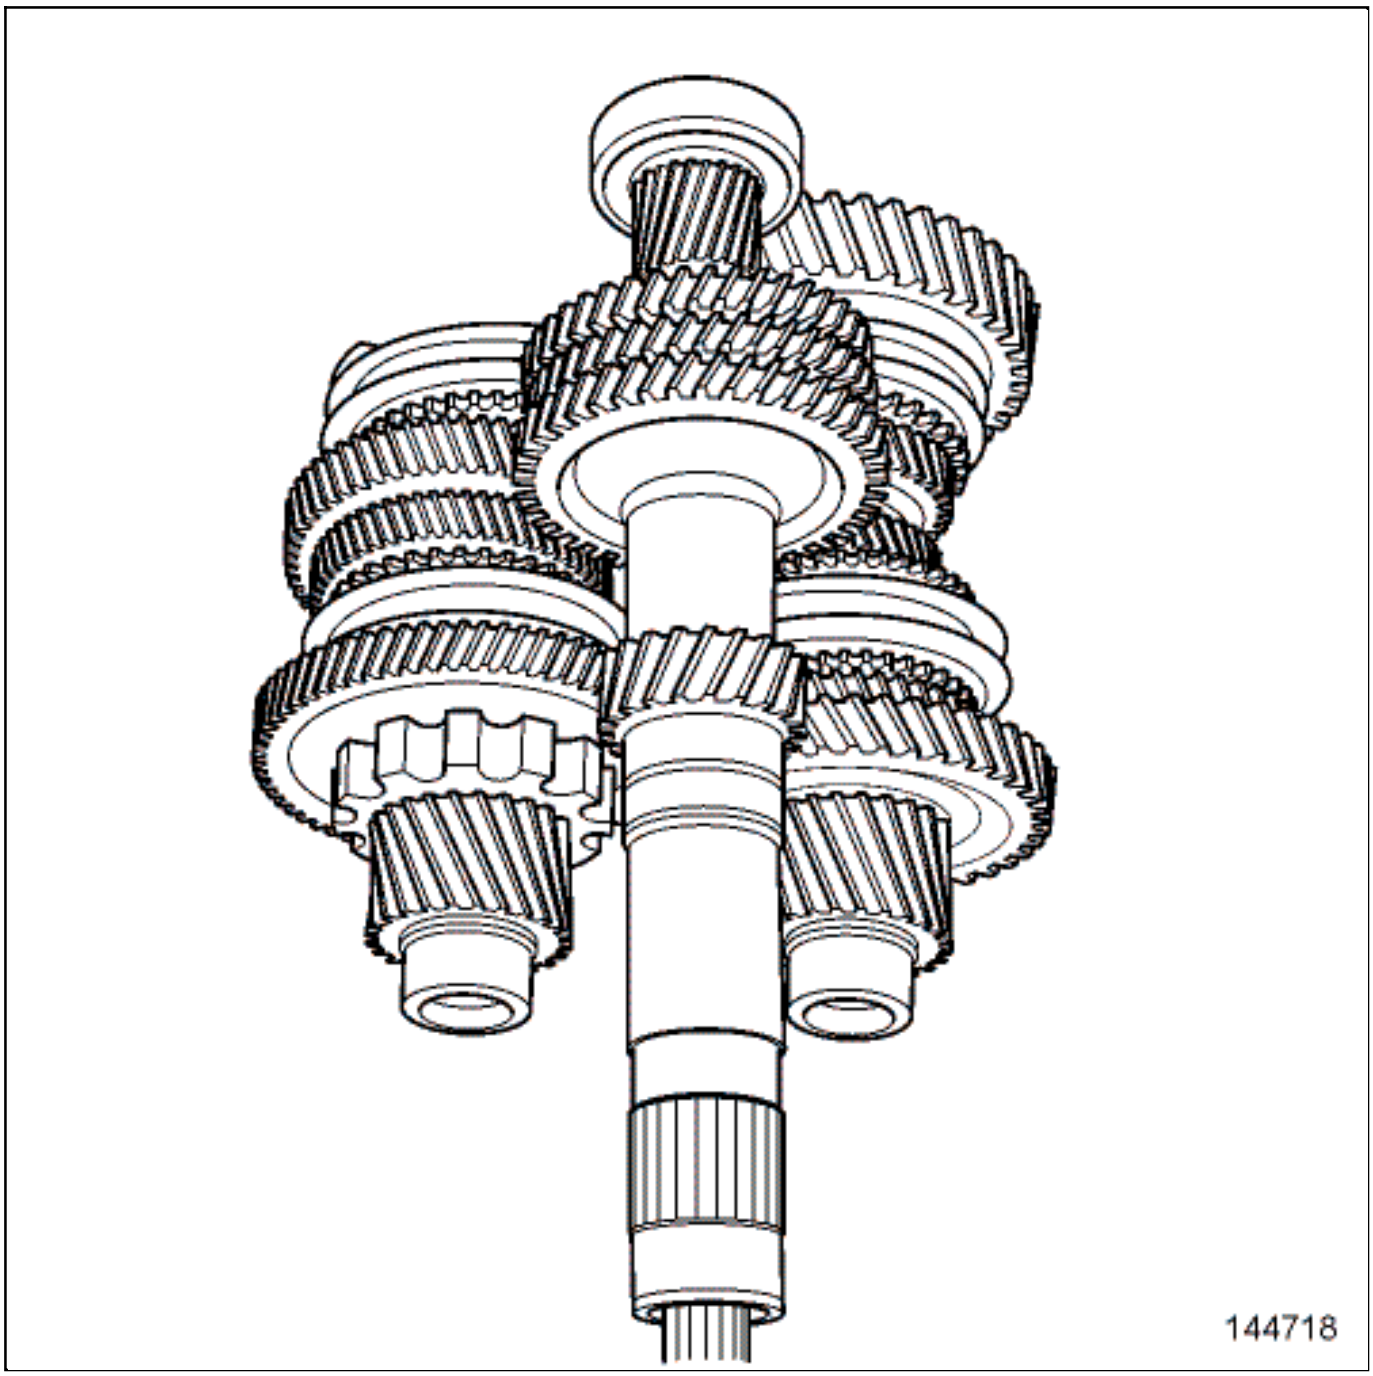


Remove:

- the six retaining bolts of the output shafts,
- the mechanism housing,
- the gearbox control forks (see 23A, Automatic gearbox , Gear box control fork: Removal - Refitting) .

Shift the output shaft slightly.

Remove the parking finger(3) .



Remove the gearbox shaft assembly.

REFITTING

1. REFITTING PREPARATION OPERATION

Clean all the removed parts[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

2. REFITTING OPERATION FOR PART CONCERNED

Fit the gearbox shafts on the workbench.

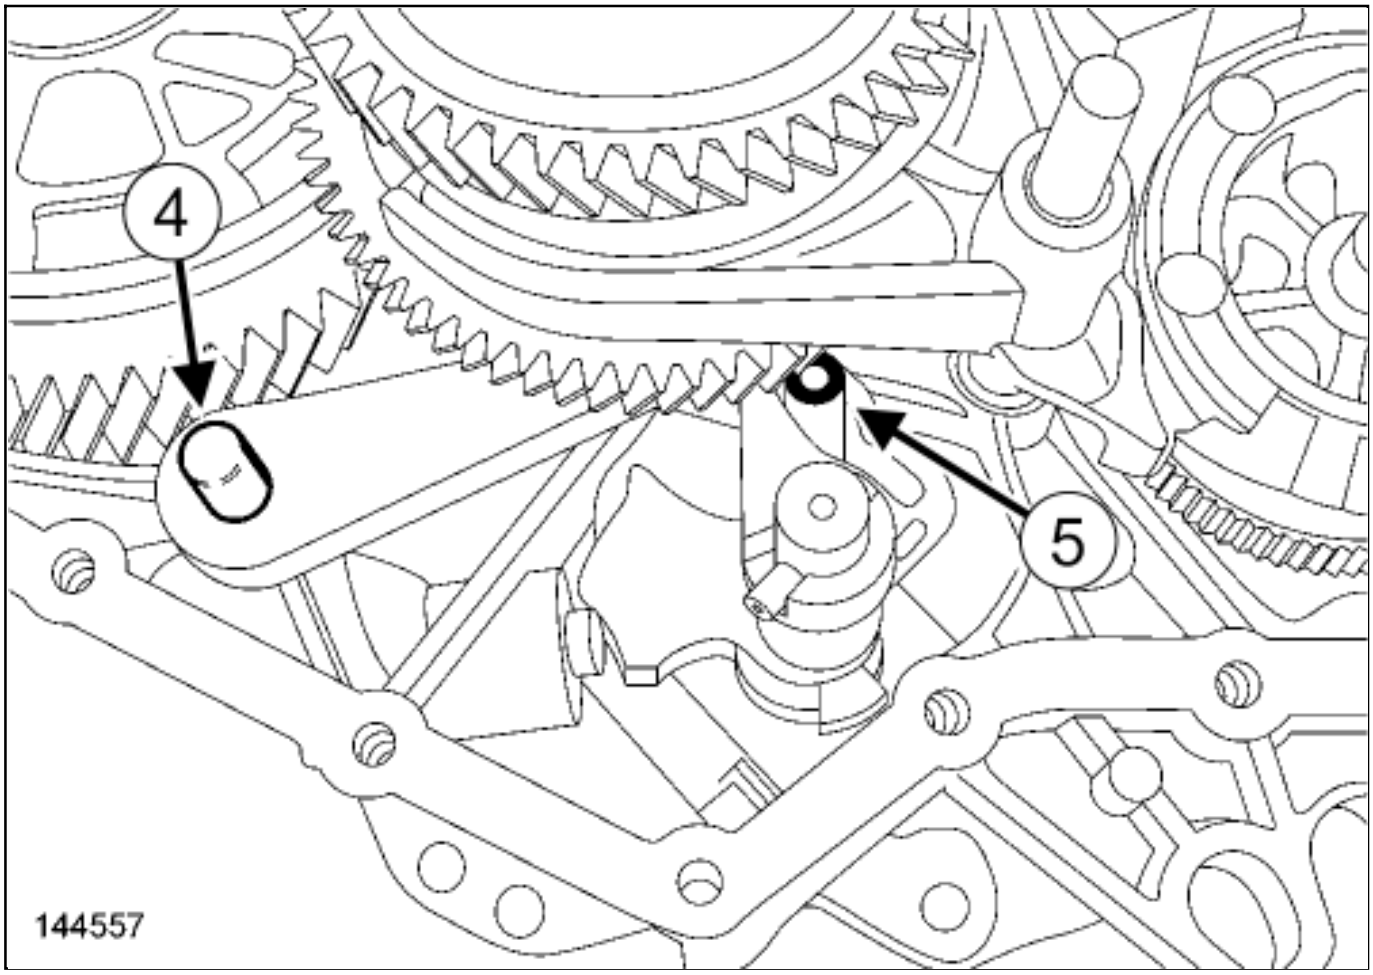
Note:

Take care not to knock the gearbox shafts in order not to damage the pinion teeth.

Refit the shafts simultaneously.

Note:

Take care not to damage the lubrication channels.



Shift the output shaft slightly.

Refit the parking finger.

CAUTION

Failure to observe the following procedure could damage the parking mechanism.

Check the presence and correct position of the parking finger shaft(4) as well as the parking finger pin which must be in the opening of the parking lever shaft(5) .

Refit:

- the gearbox control forks(see 23A, Automatic gearbox , Gear box control fork: Removal - Refitting) .
- the mechanism housing,
- the six retaining bolts of the output shafts.

Torque tighten the bolts of the output shafts(see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting)

Turn over the automatic gearbox.

3. FINAL OPERATION

Proceed in the reverse order to removal.

HAZARD WARNING LIGHTS AND CENTRAL DOOR CONTROL: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)Dashboard assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Switch off the ignition.
- Remove the centre front panel trimDashboard assembly: Exploded view .
- Disconnect the air conditioning control panel connector.
- Remove Dashboard assembly: Exploded view :
  - the centre front panel support screws,
  - the centre front panel support.
- Disconnect the hazard warning light and central door locking switch connectors.

2. REMOVAL OPERATION

- Unclip the hazard warning light and central door locking button by pressing on the clips.

REFITTING

- Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

HEADLIGHT ASSEMBLY: EXPLODED VIEW

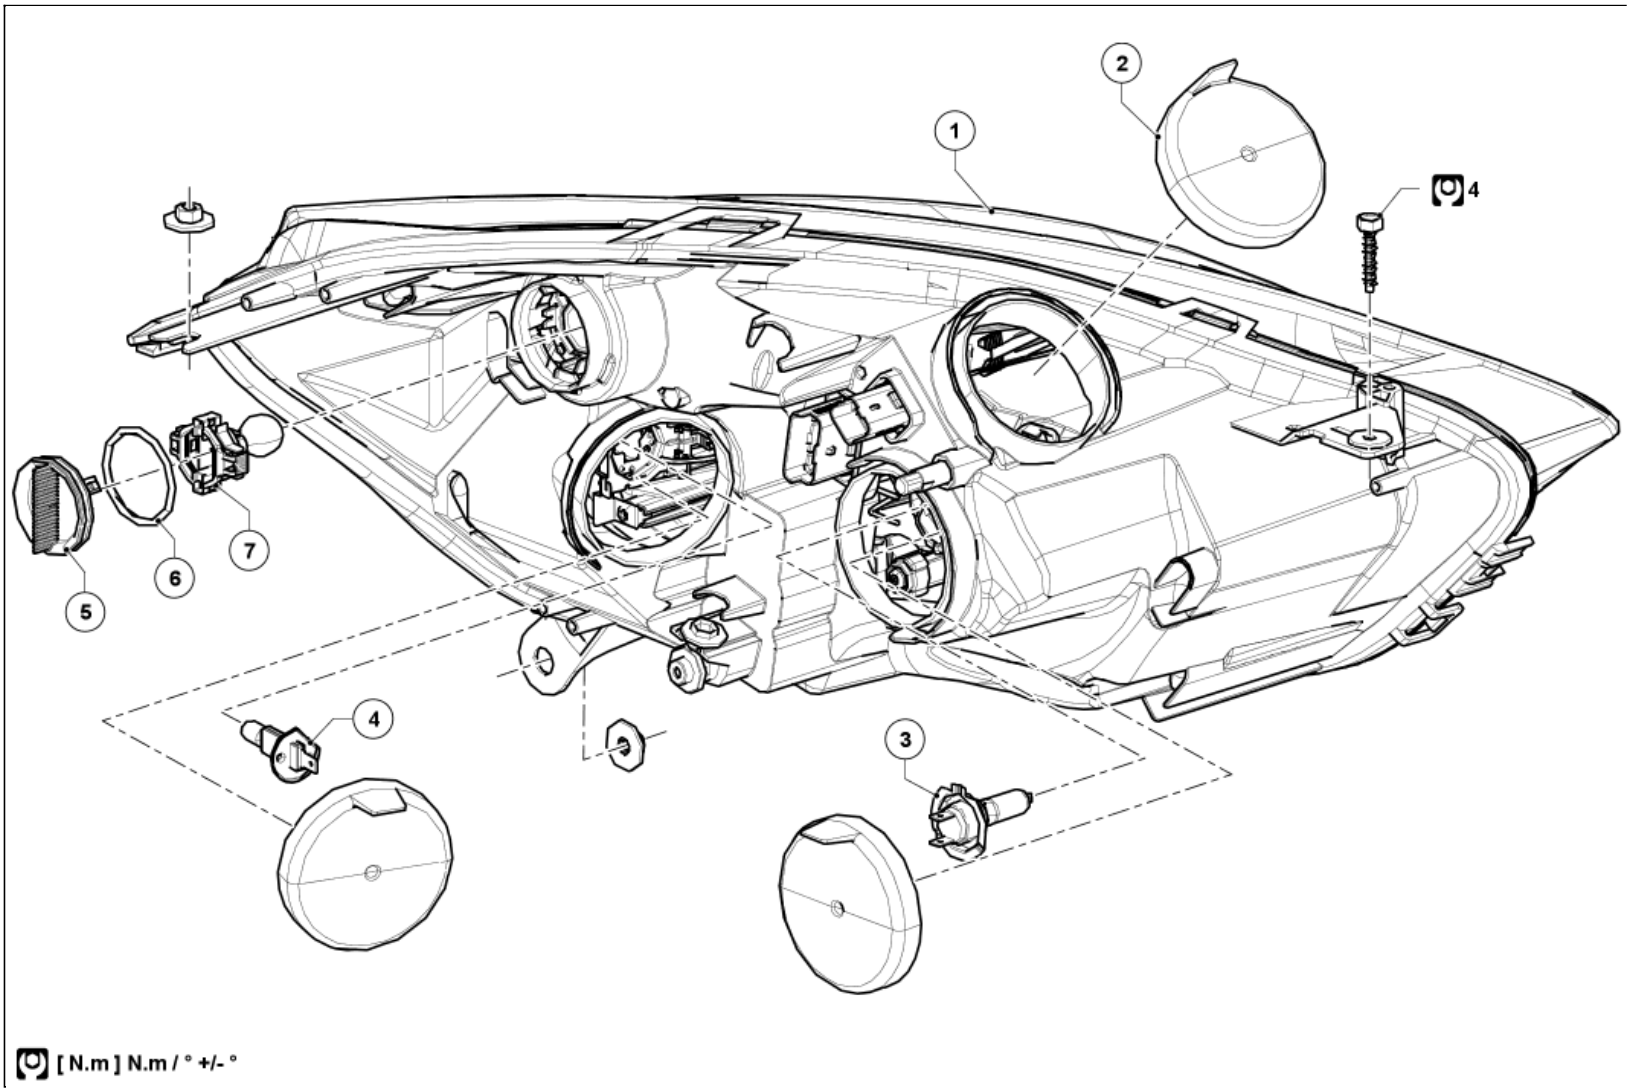

Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Headlight	(see 80B, Headlights, Front lighting: List and location of components)
2	Bulb seal cover	
3	Main beam headlight bulb	(see 80B, Headlights, Front lighting: List and location of components)
4	Dipped beam headlight bulb	(see 80B, Headlights, Front lighting: List and location of components)

HEADLIGHT: ADJUSTMENT

 **Note, one or more warnings are present in this procedure** 

Equipment required
headlight adjustment and checking tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair .

ADJUSTMENT

1. PREPARATION OPERATION FOR CHECK

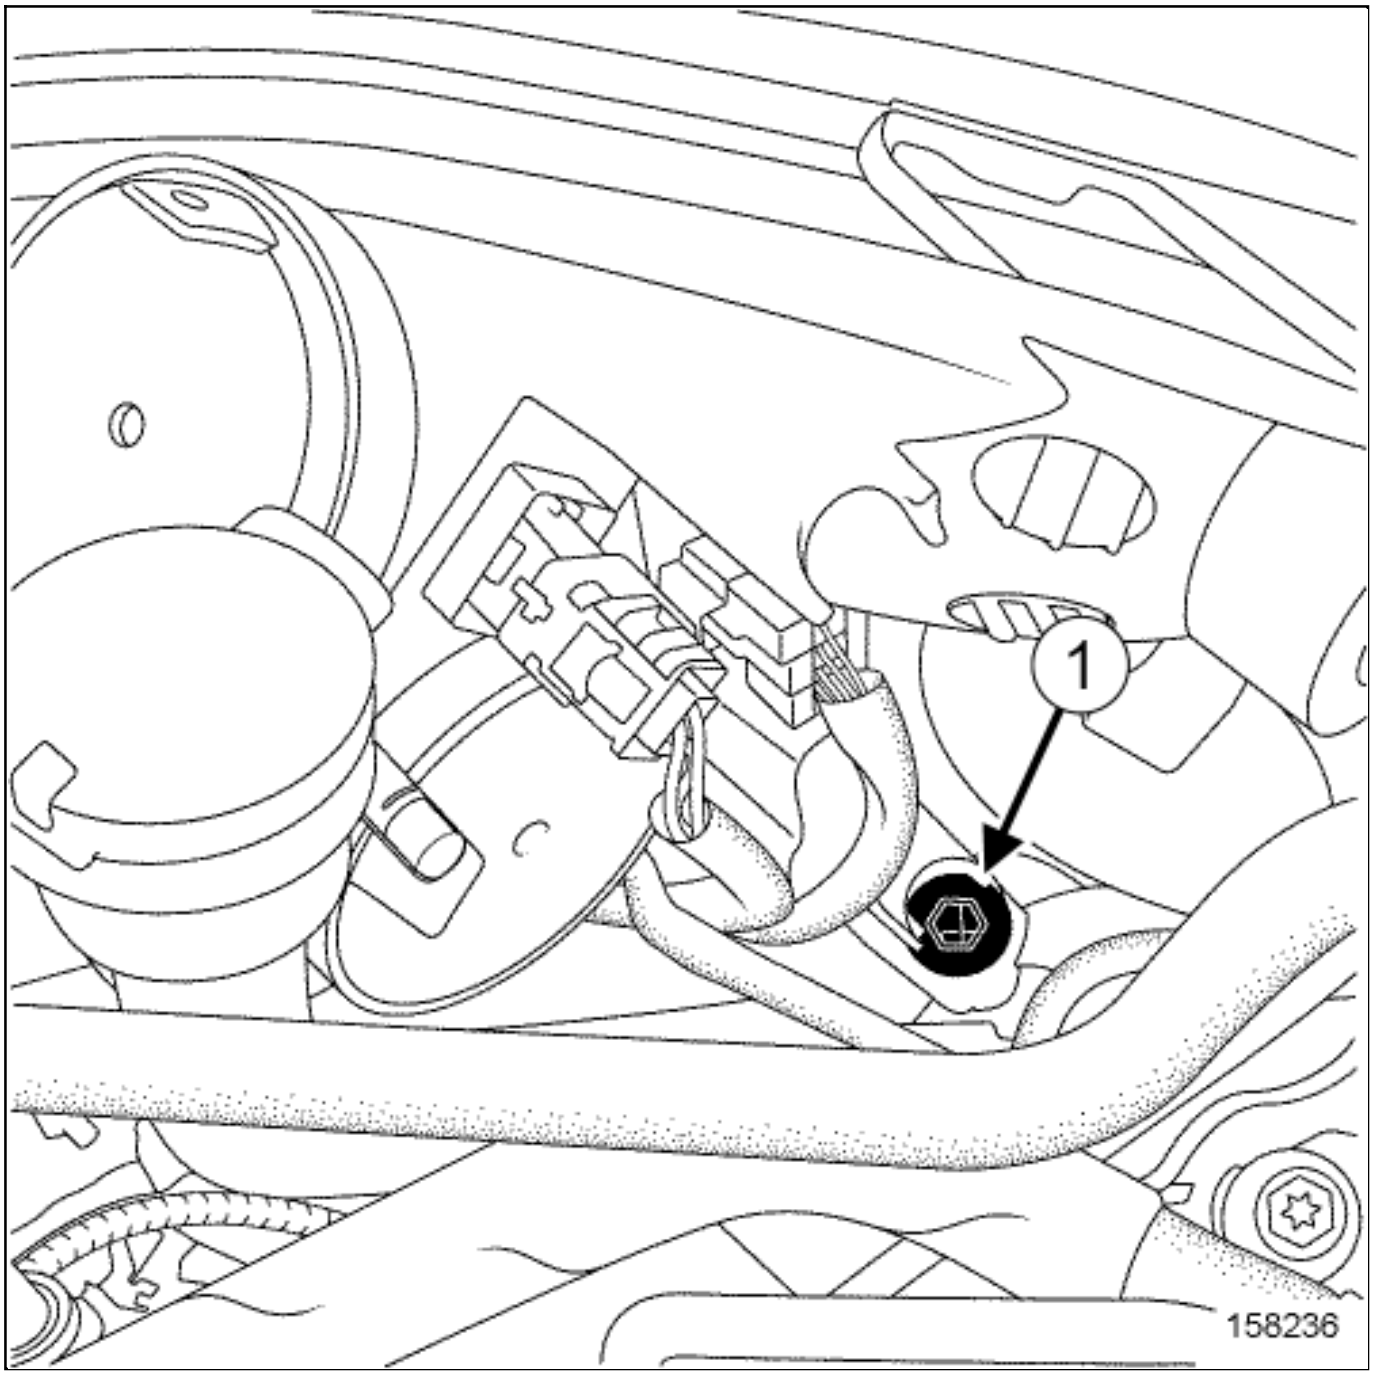
- Place the vehicle on a level horizontal working area.
- Do not apply the parking brake.
- Check and inflate the tyres(see **Tyre pressure: Identification**) .
- Open the bonnet.
- Check:
  - that the luggage compartment is empty,
  - that the headlights are clean.

Note:

Do not get into the vehicle throughout the operation.

- Position the headlight beam remote adjustment control on 0.
- Switch on the dipped headlights.

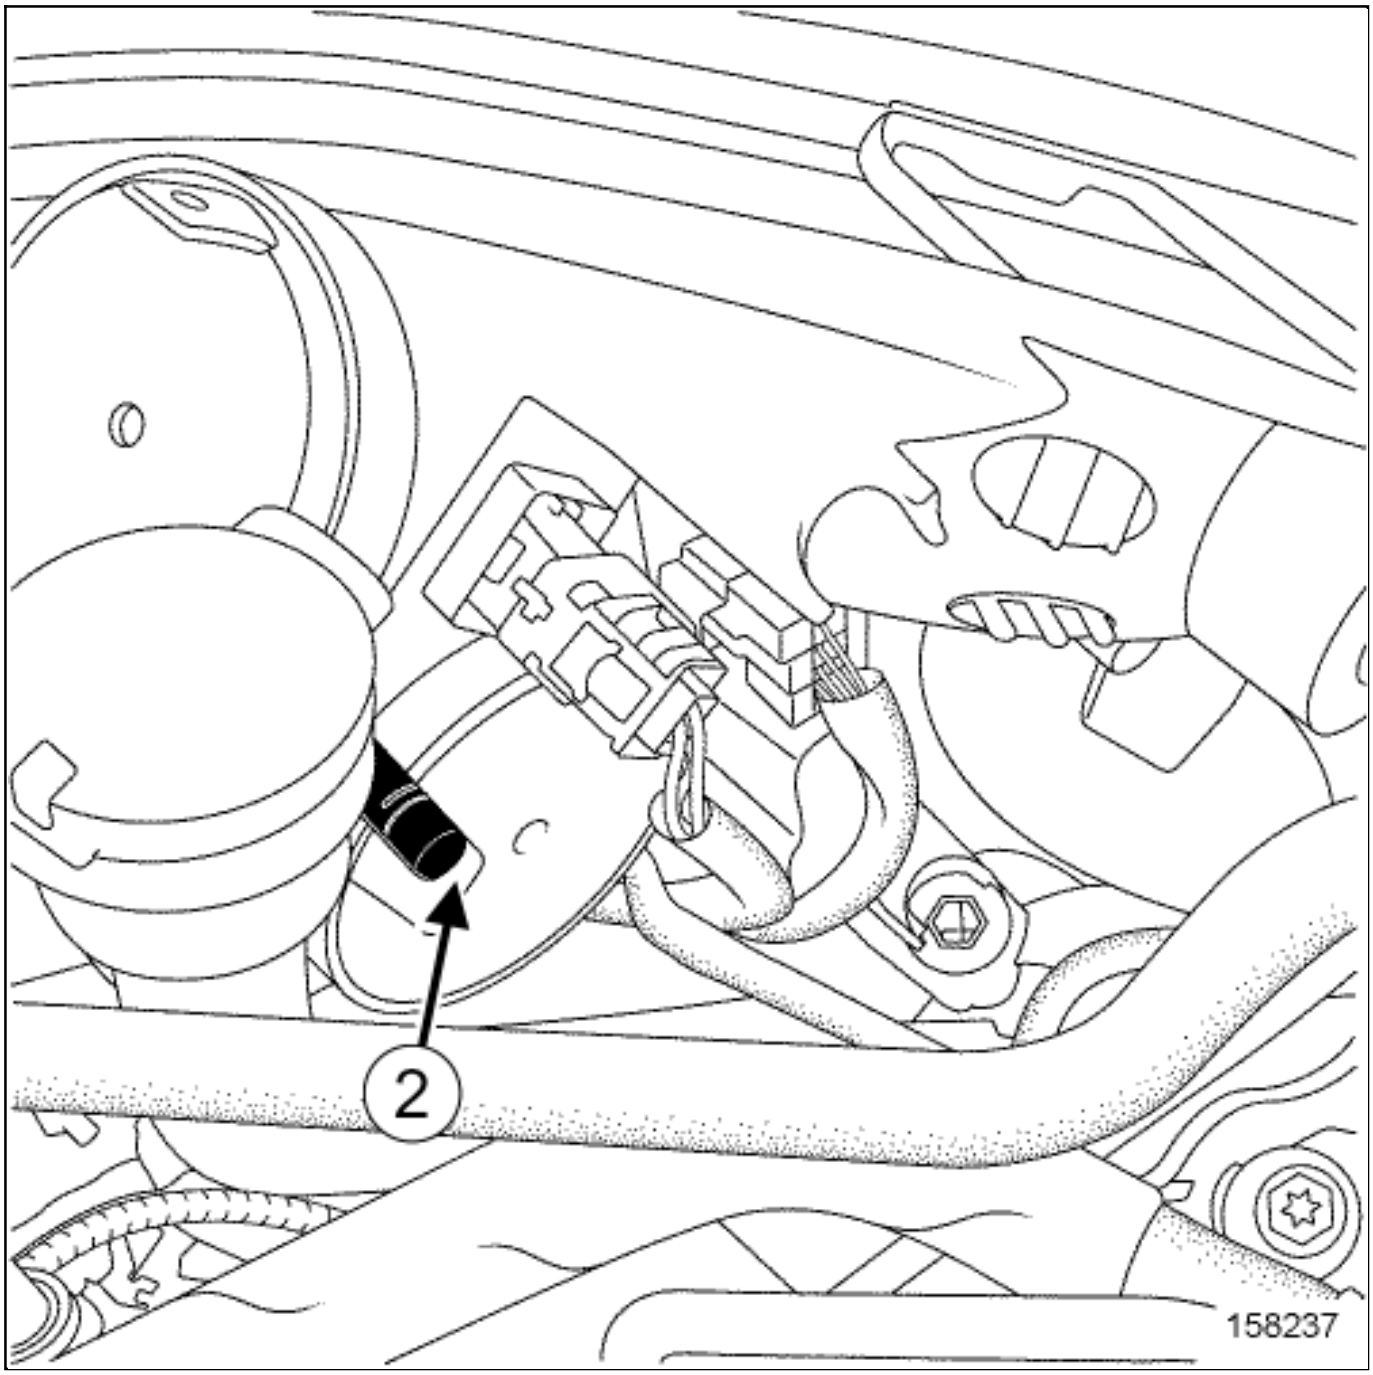
2. TEST OPERATION



CAUTION

Consult the device's operating manual to avoid incorrect use.

- Place the headlight adjustment and checking tool adjusted to -1% in front of the vehicle.
- Using the headlight adjustment and checking tool, check the headlight beam adjustment.



3. ADJUSTMENT OPERATION

1- BEAM ADJUSTMENT

Adjust the headlight beam using the headlight adjustment and checking toolandand by turning the screw(1)
.

2- HORIZONTAL ADJUSTMENT

Use the headlight adjustment and checking tool to horizontally adjust the headlight by turning the screw (2) .

4. FINAL OPERATION

Close the bonnet.

XSL version : 3.02 du 22/07/11

HEADLINING:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Airbag and pretensioners: Precautions for the repair ,
- Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 71A, Body internal trim , Roof trim assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Disconnect the battery Battery: Removal - Refitting .

Move:

- the front door seals,
- the rear door seals,
- the luggage compartment seal.

Unclip the B-pillar lower trims(see 71A, Body internal trim, Interior body side trim assembly: Exploded view)

Remove the front seat belts Front seat assembly: Exploded view .

Unclip the B-pillar upper trims(see 71A, Body internal trim, Interior body side trim assembly: Exploded view) .

Remove Rear bench seat assembly: Exploded view :

- the rear bench seat base,
- the rear seat belts,
- the rear bench seatback.

Remove:

- the luggage compartment carpet,
- the rear end panel lining.

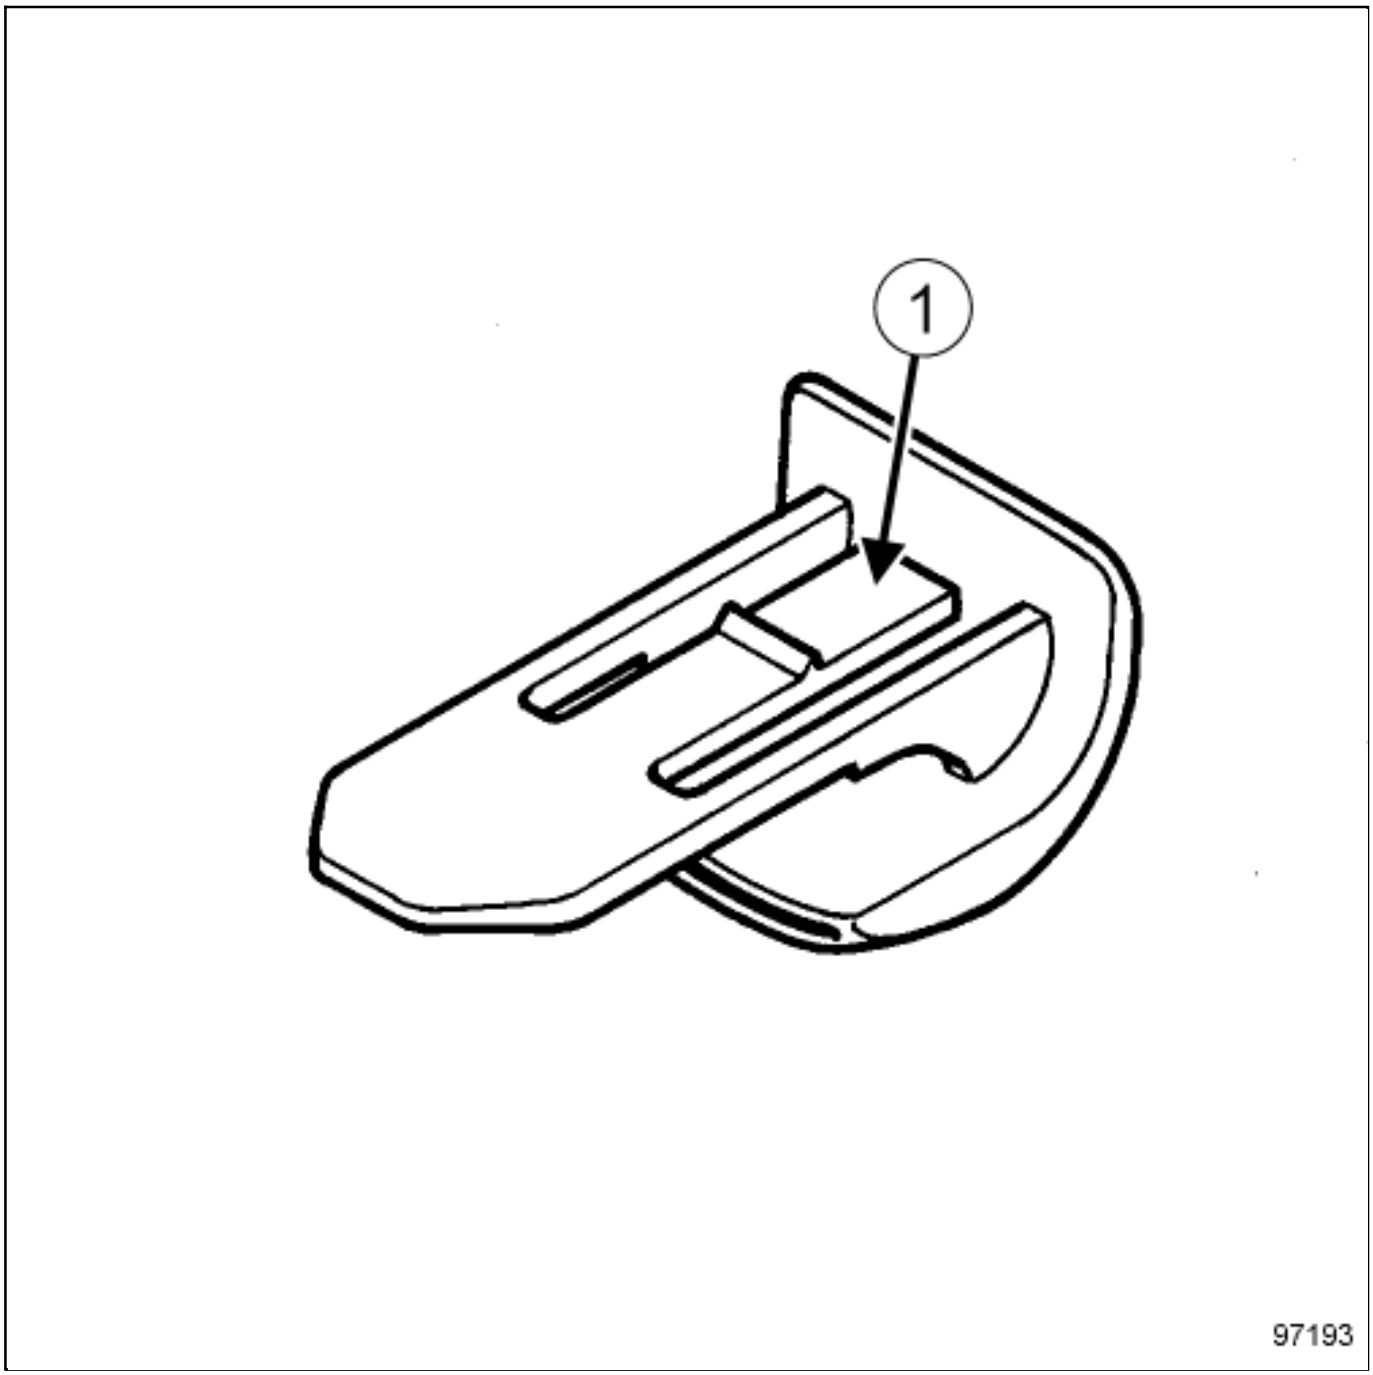
Remove (see 71A, Body internal trim, Interior body side trim assembly: Exploded view) :

- the rear inner sill upper trim,
- the rear door sill lining,
- the rear parcel shelf side trims,
- the rear wheel arch interior trims,
- the rear quarter panel trims,
- the windscreen pillar trims.

Remove (see 71A, Body internal trim, Roof trim assembly: Exploded view) :

- the sun visors,

the grab handles.



Remove:

- the interior rear-view mirror,
- the interior light **Interior lighting: List and location of components** ,
- the windscreen wiper arms (see **Wipers/washing assembly : Exploded view**) ,
- the scuttle panel grille **Scuttle panel grille: Removal - Refitting** ,
- the scoop under the scuttle panel grille,
- the windscreen **Windscreen: Removal - Refitting** .

Remove:

- the cover of the centre seat belt return mechanism bolt,
- the centre seat belt return mechanism mounting.

2. REMOVAL OPERATION

Remove (see 71A, Body internal trim, Roof trim assembly: Exploded view) :

- the rear clips by pressing on the clip(1) using a small flat-blade screwdriver,
- the headlining by removing from the front (this operation requires two people).

REFITTING

Proceed in the reverse order to removal.

Repair-70x02x04x02-01x37-1-31-1.xml

XSL version : 3.02 du 22/07/11

HEATERBULKHEAD:REPLACEMENT

 **Note, one or more warnings are present in this procedure** 

1. COMPOSITION OF THE SPARE PART

No.	Description	Thickness (mm)
	Heater bulkhead rear section	0.7
	Windscreen aperture lower cross member bracket	1.2
	Heater bulkhead front section	1.5
	Left heater bulkhead reinforcement	1.5
	Air filter mounting support	1
	Left wiper mounting bridging piece	1.6
	Right wiper mounting bridging piece	1.5
	Right Heater bulkhead reinforcement	1.5

2. IN THE EVENT OF REPLACEMENT

The options for replacing this part are as follows:

- complete replacement

CAUTION

If the mating faces of the parts to be welded are not accessible, make EGW plug welds to replace the original resistance welds (see MR 400).

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area (see MR 400).

Locate the earths located near to the weld area.Earths on body: List and location of components

1- COMPLETE REPLACEMENT

1)PART IN POSITION

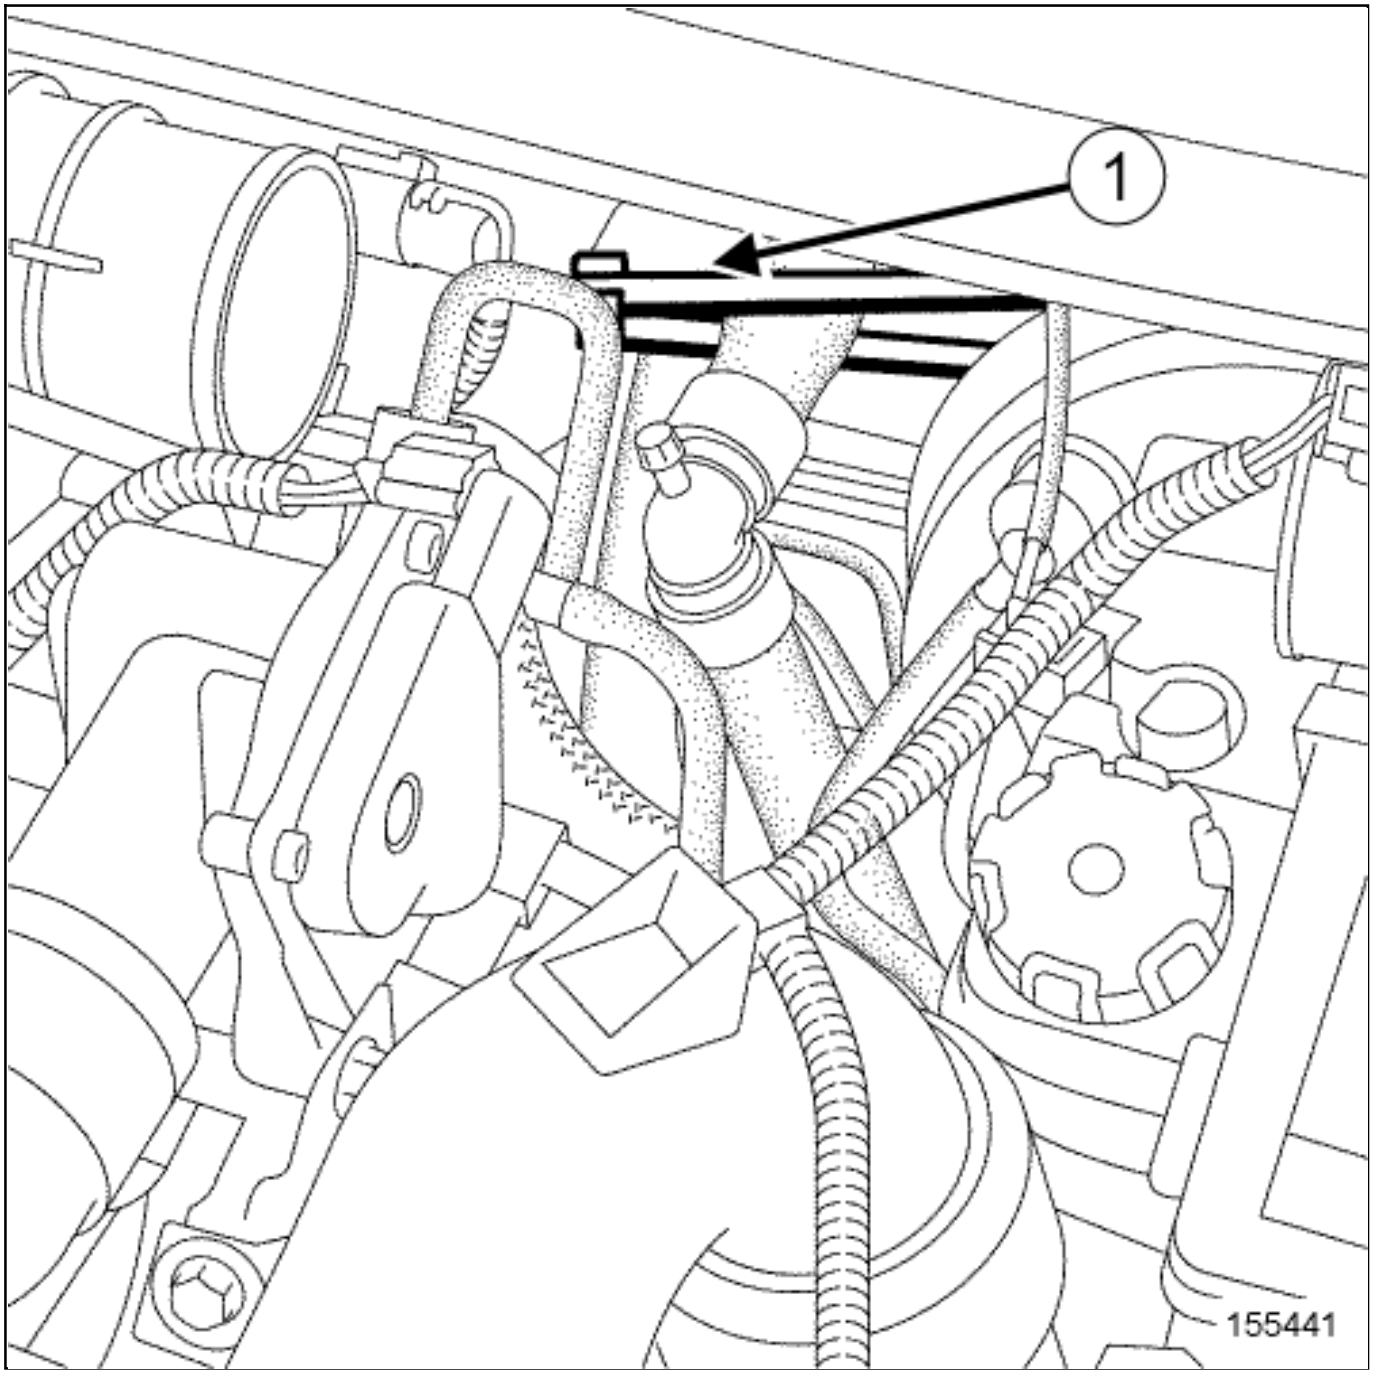
HEATER MATRIX: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Pipe clamps.	Ms. 583

parts always to be replaced:
heater matrix coolant pipe seal

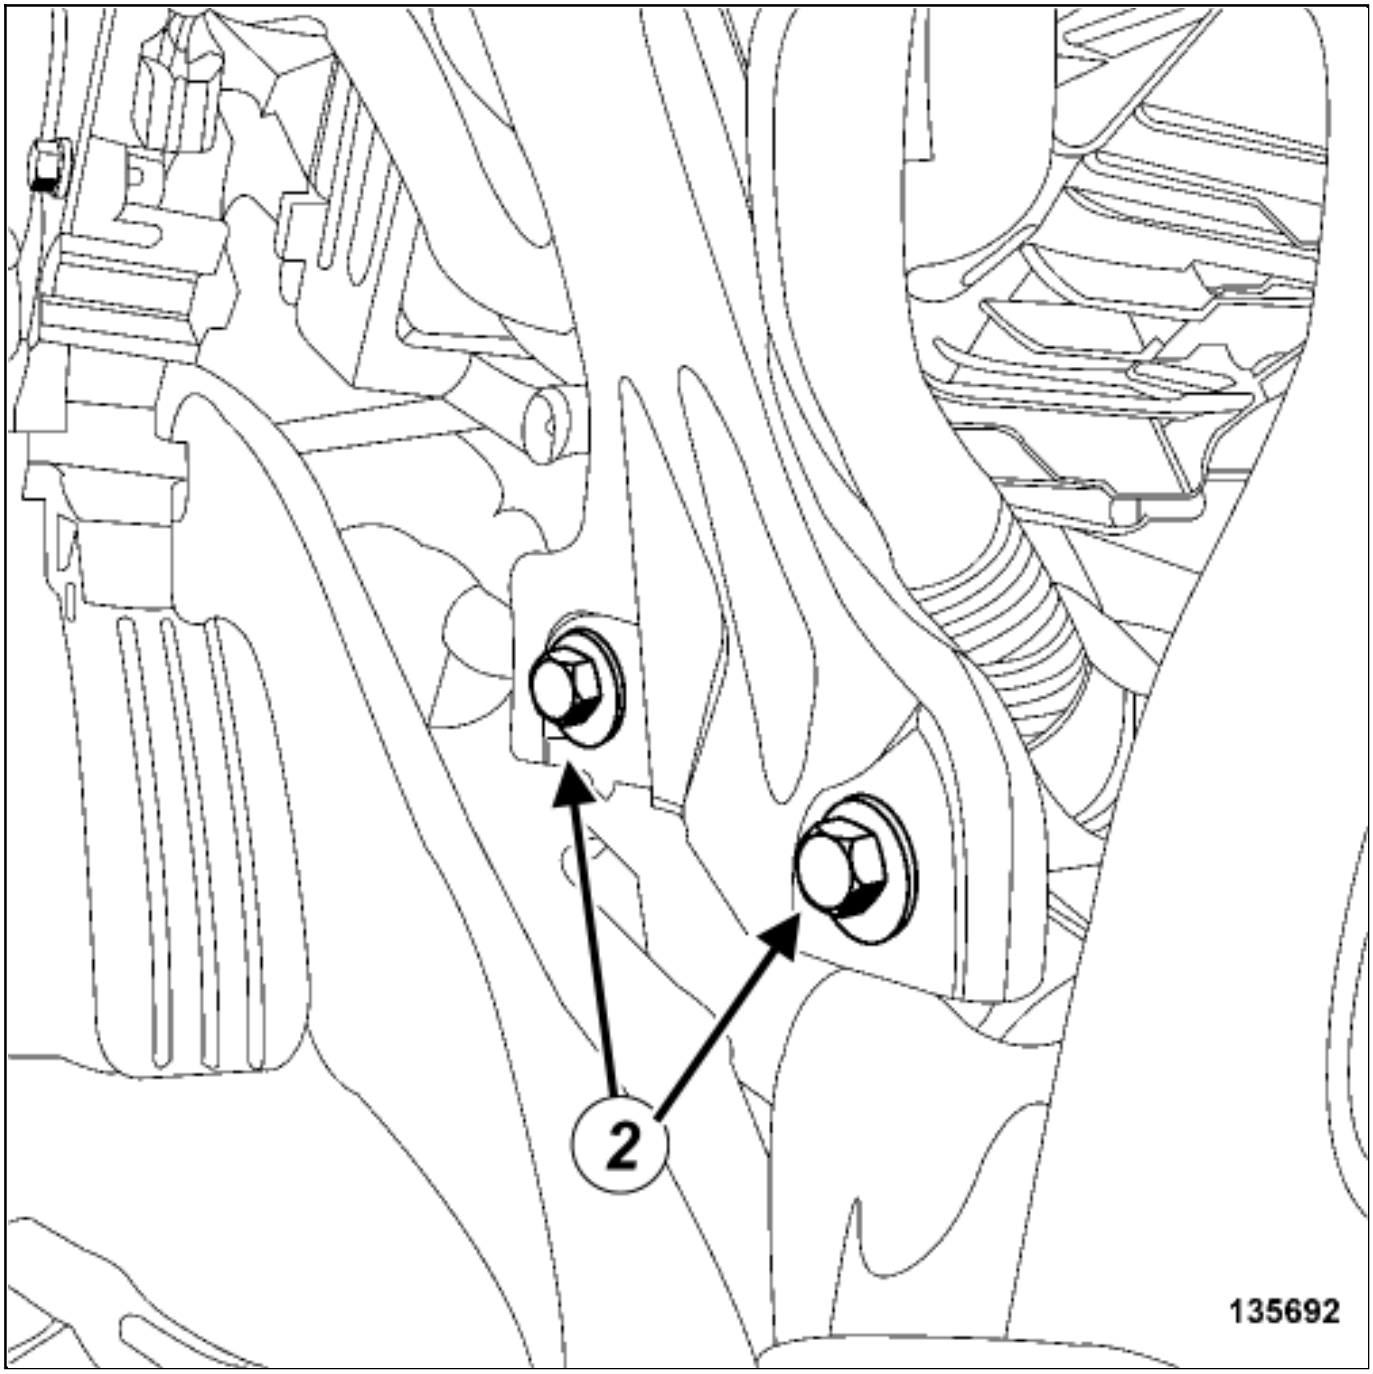
Locations and specifications (tightening torques, parts to always be replaced, etc.).(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .



Note:

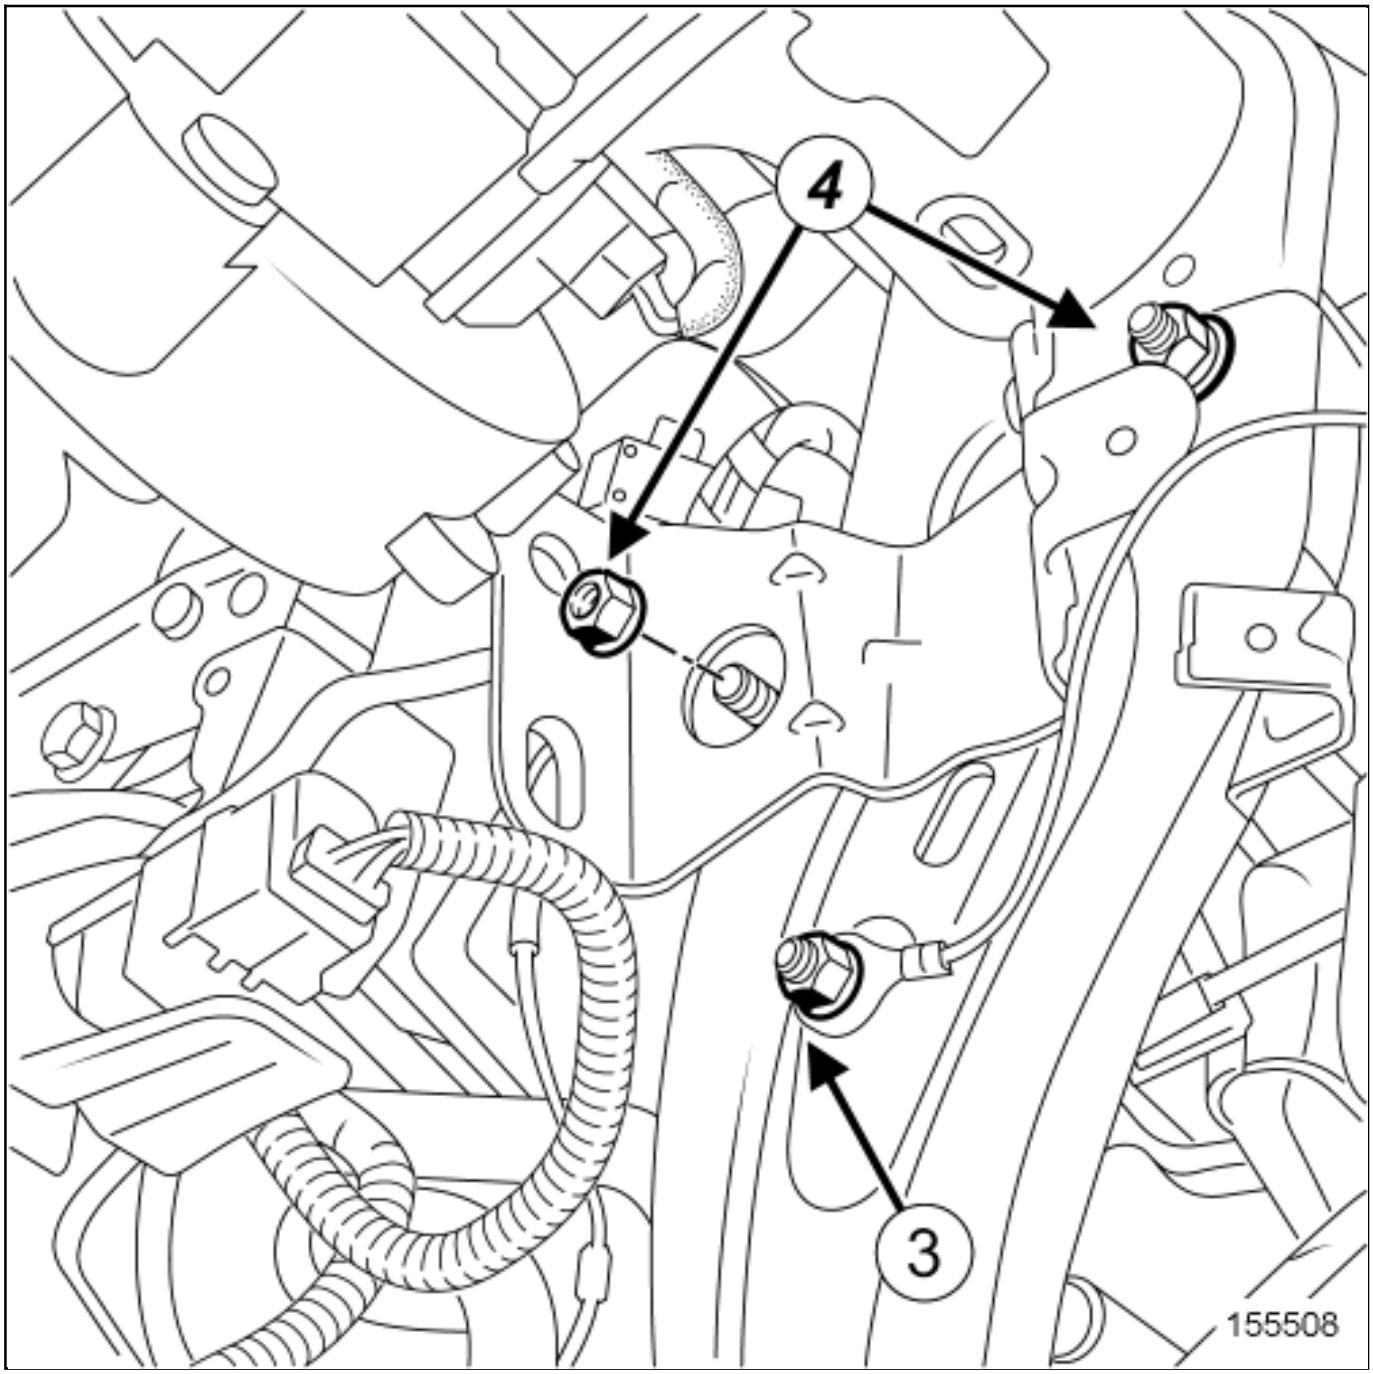
There are two types of fitting for the distribution unit: Valéo and Denso.

REMOVAL



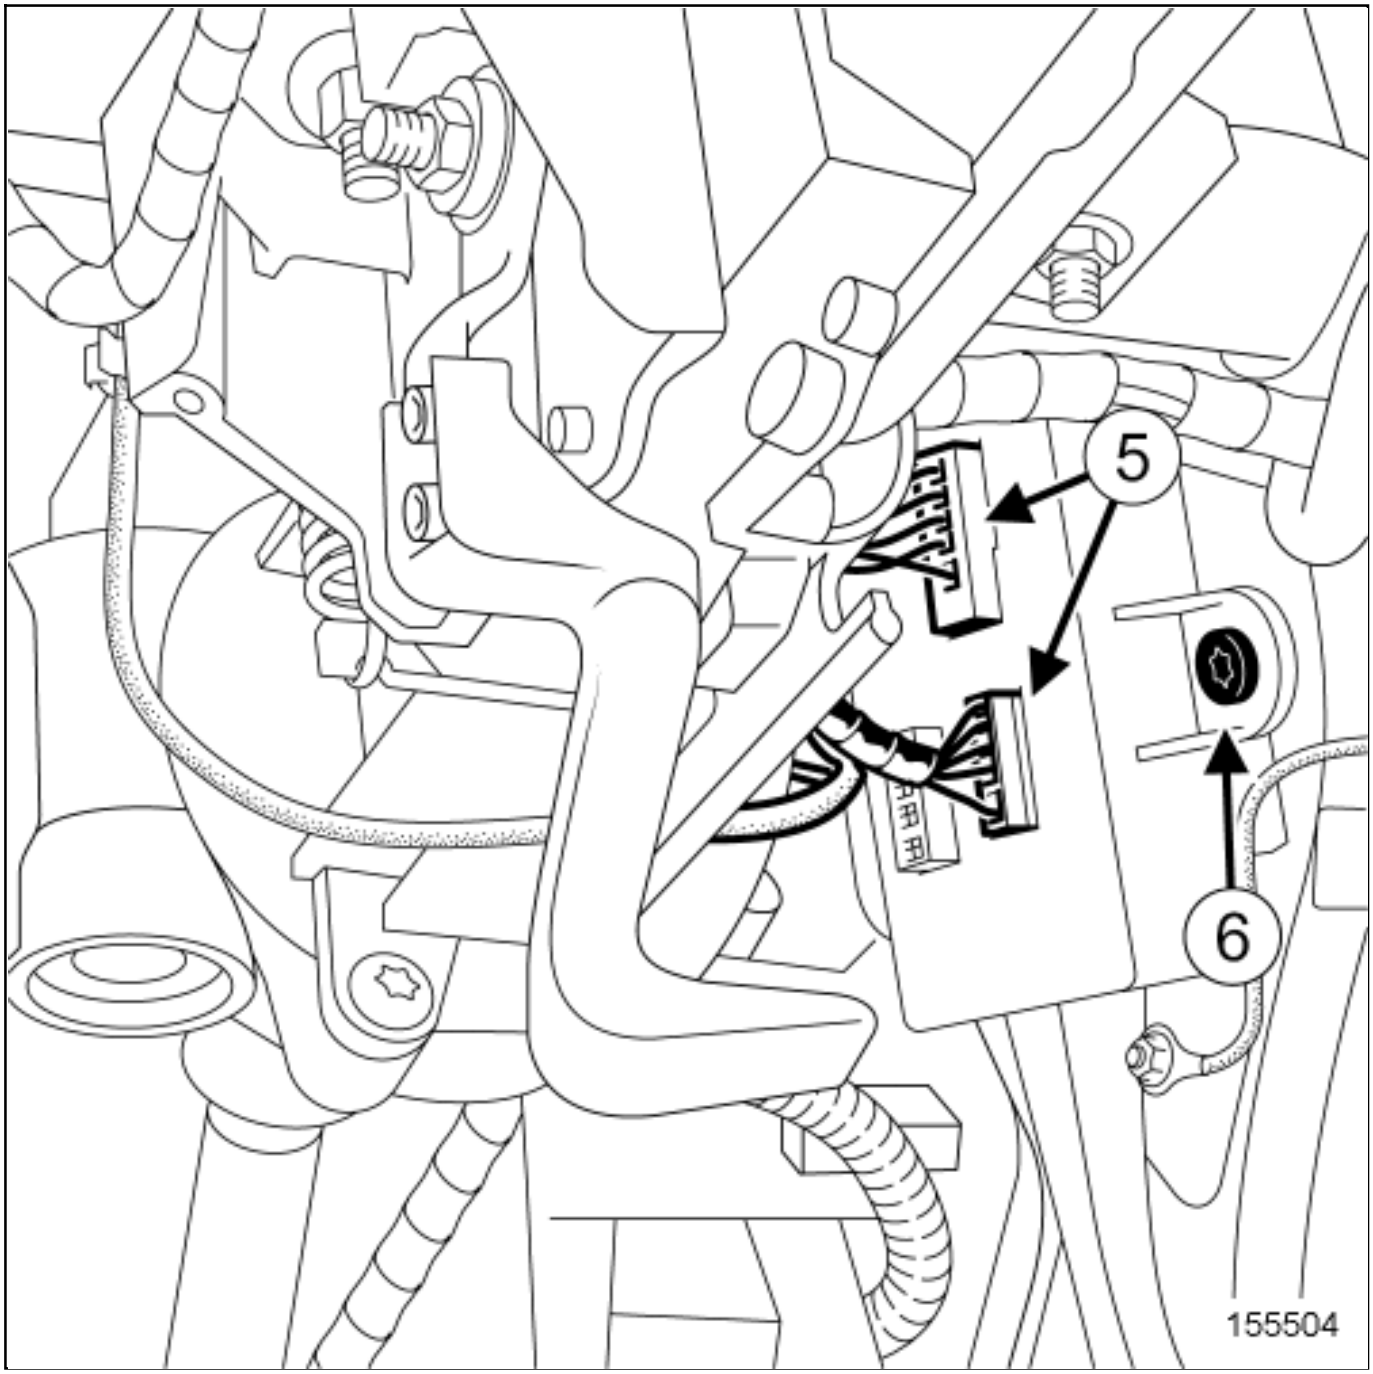
1. REMOVAL OPERATION

Loosen the clip of the air filter unit air outlet pipe.



Fit the toolPipe clamps.(Ms. 583) (1) on the heater matrix hoses.

Remove the dashboard lower trimDashboard assembly: Exploded view .



Remove the lower bolts(2) from the dashboard cross member reinforcement.

Remove:

- the earth nut(**3**) from the dashboard cross member reinforcement,
- the upper nuts(**4**) from the dashboard cross member reinforcement,
- the dashboard cross member reinforcement.

Disconnect the UPC connectors(5) .

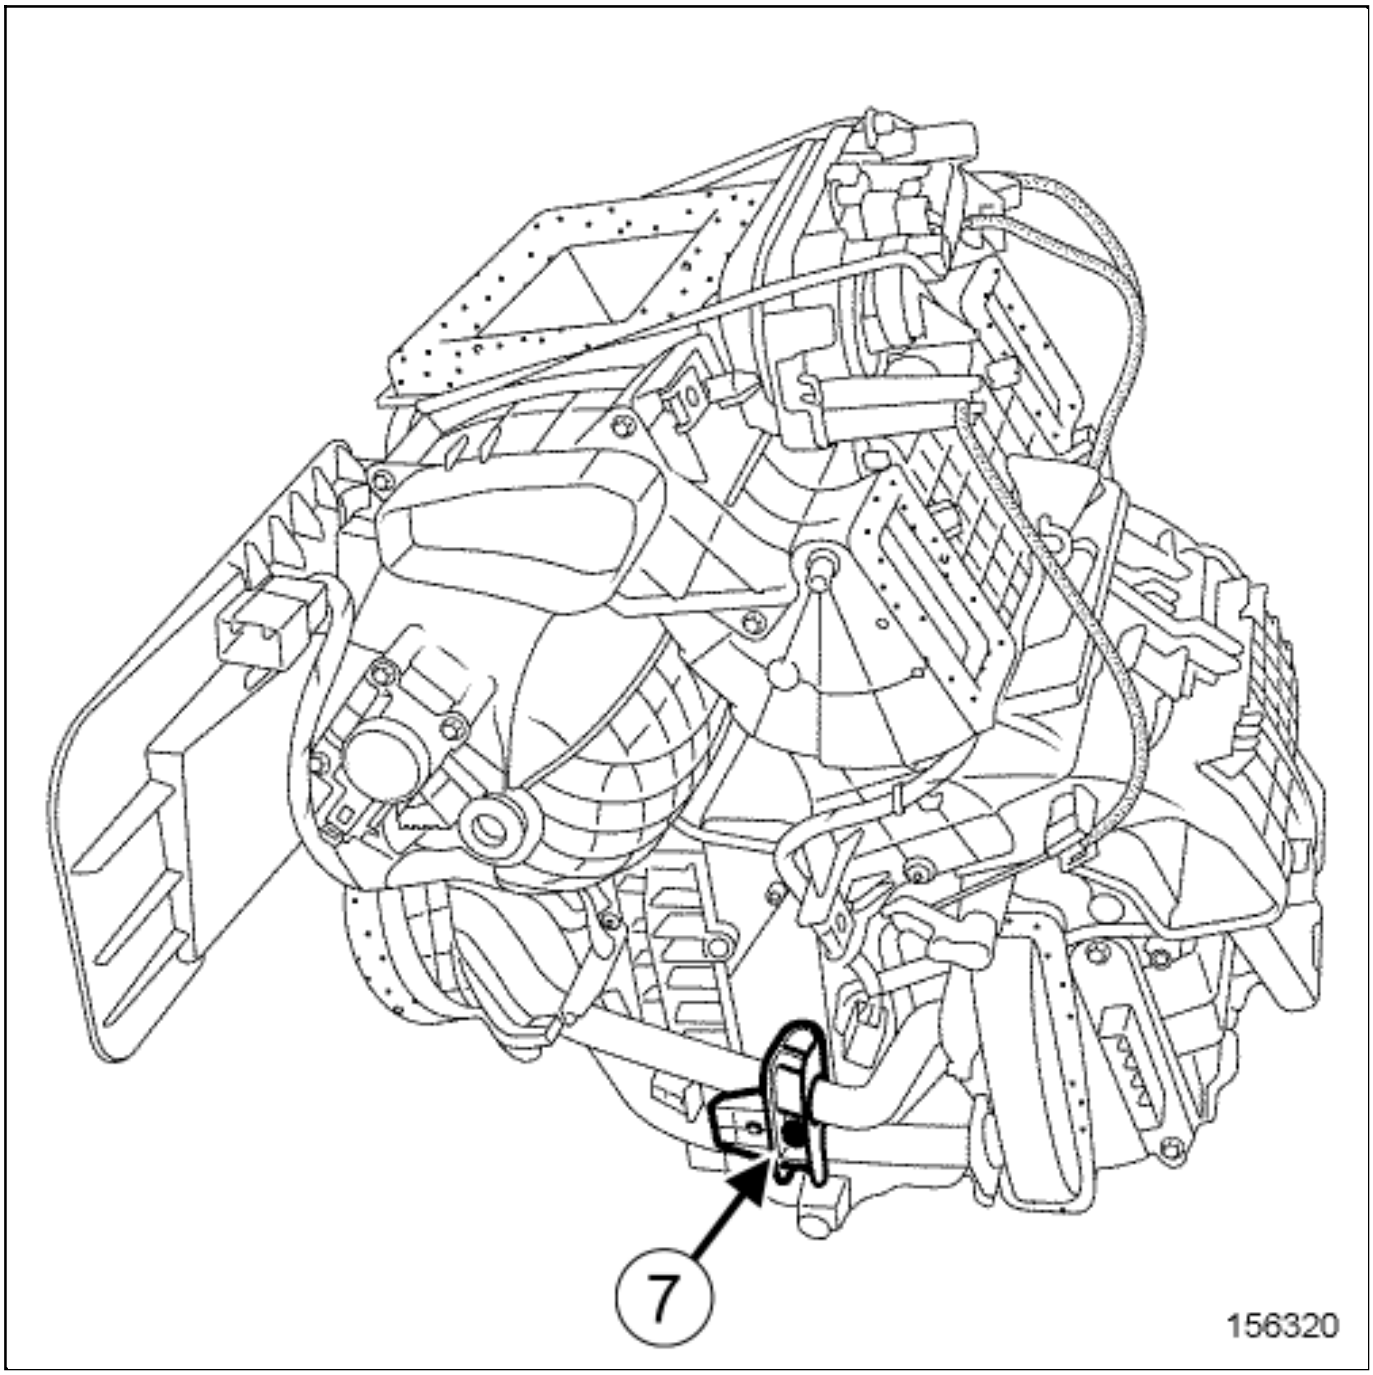
Remove:

- the UPC bolt(6) ,
- the UPC.

2. REMOVAL OPERATION

1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A VALÉO DISTRIBUTION UNIT

- Remove the clips from the heater matrix rigid pipes(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .



CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

- Put a protective cover on the floor carpet.
- Position a container to collect the coolant under the rigid pipes.
- Move the heater matrix rigid pipes aside.
- Remove the seals from the heater matrix rigid pipes.
- Remove (see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) :
  - the heater matrix trim bolts,
  - the heater matrix trim,
  - the heater matrix.

2- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT

- Remove the bolt(7) from the rigid pipes bracket.

- Remove the clips from the heater matrix rigid pipes(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

- Put a protective cover on the floor carpet.
- Position a container to collect the coolant under the rigid pipes.
- Move the heater matrix rigid pipes aside.
- Remove the seals from the heater matrix rigid pipes.
- Remove the heater matrix.

REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: heater matrix coolant pipe seal .
- Always replace the heater matrix rigid pipe clips.

CAUTION

To avoid any leaks, check that the pipe surface is sound before positioning the new seal. The surface must be clean and scratch free.

2. REFITTING OPERATION

Refit (see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) :

- the heater matrix,
- the heater matrix trim (only for Valéo fitting).

Fit:

- new seals on the heater matrix rigid pipes,
- the heater matrix rigid pipes on the heater matrix.

Refit new clips on the rigid pipes of the heater matrix(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Refit the rigid pipes bracket (only for Denso fitting).

Remove:

- the container for recovering coolant under the rigid pipes,
- the protective cover on the floor carpet.

3. FINAL OPERATION

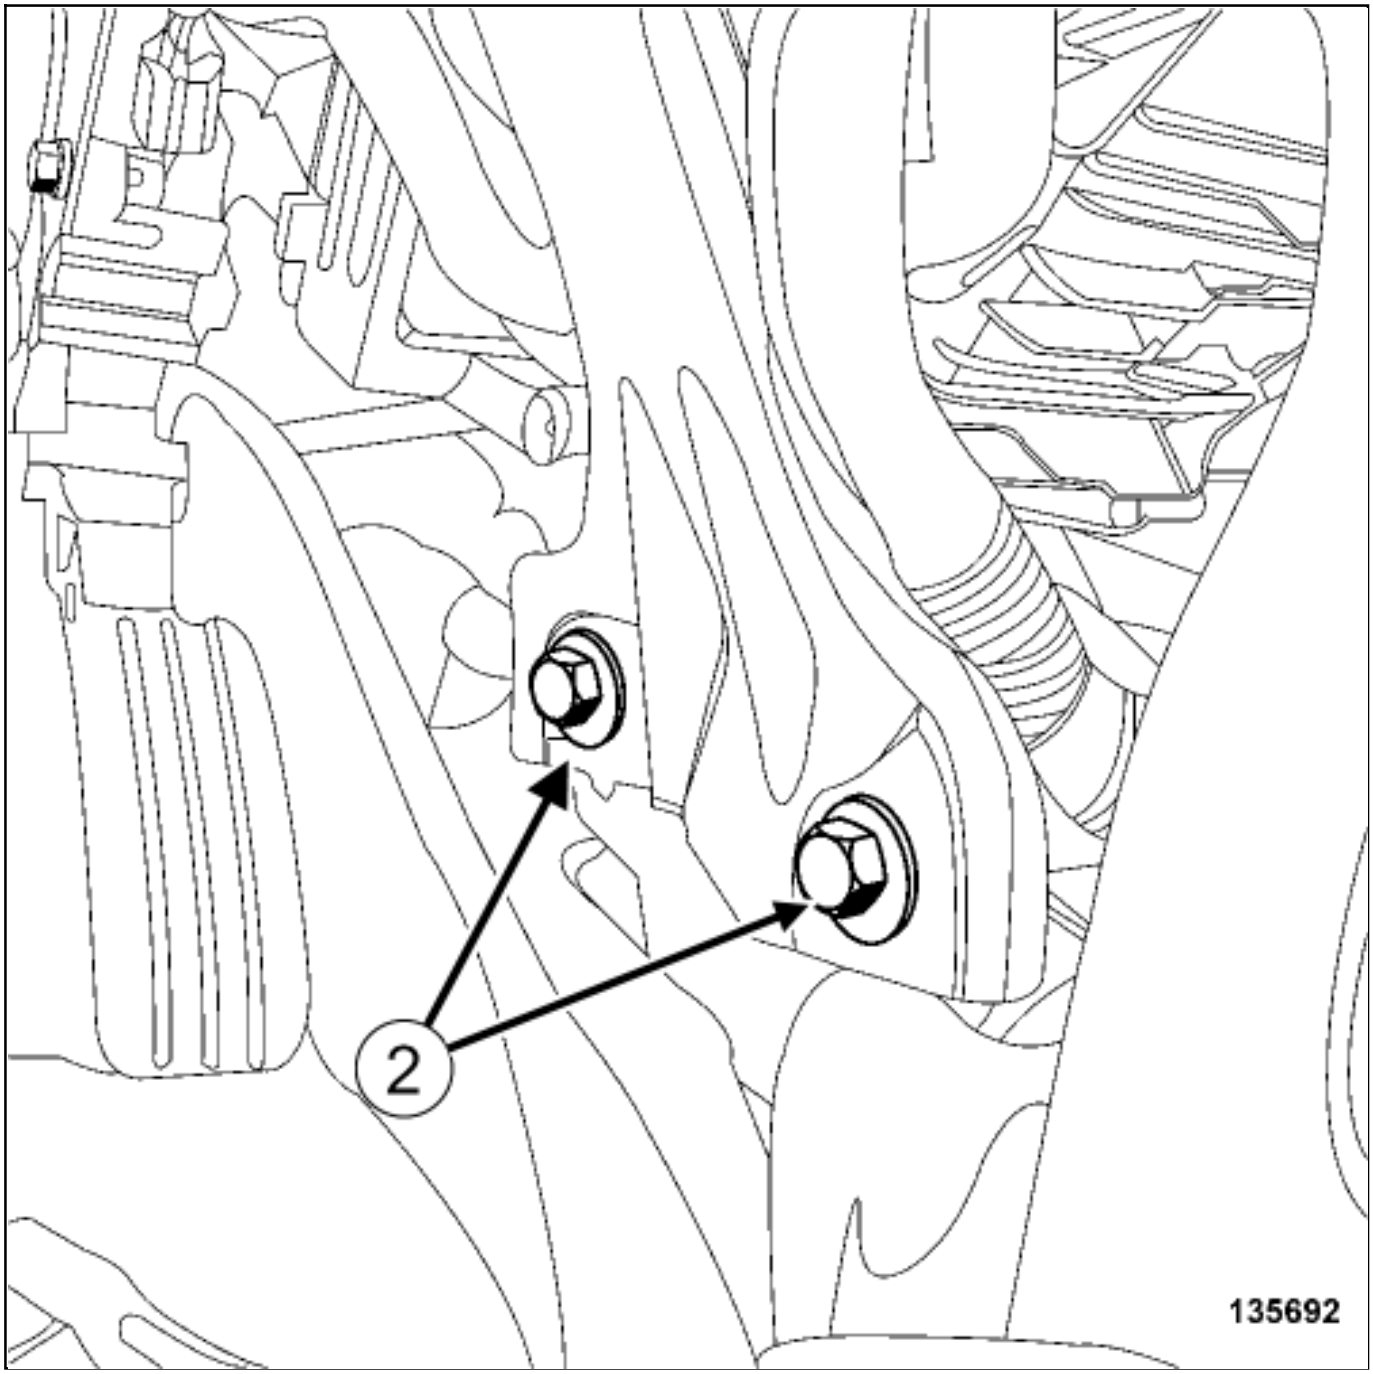
Proceed in the reverse order to removal.

Tighten to torque:

- the dashboard cross member reinforcement upper nuts21 N.m,
- the dashboard cross member reinforcement lower bolts21 N.m,

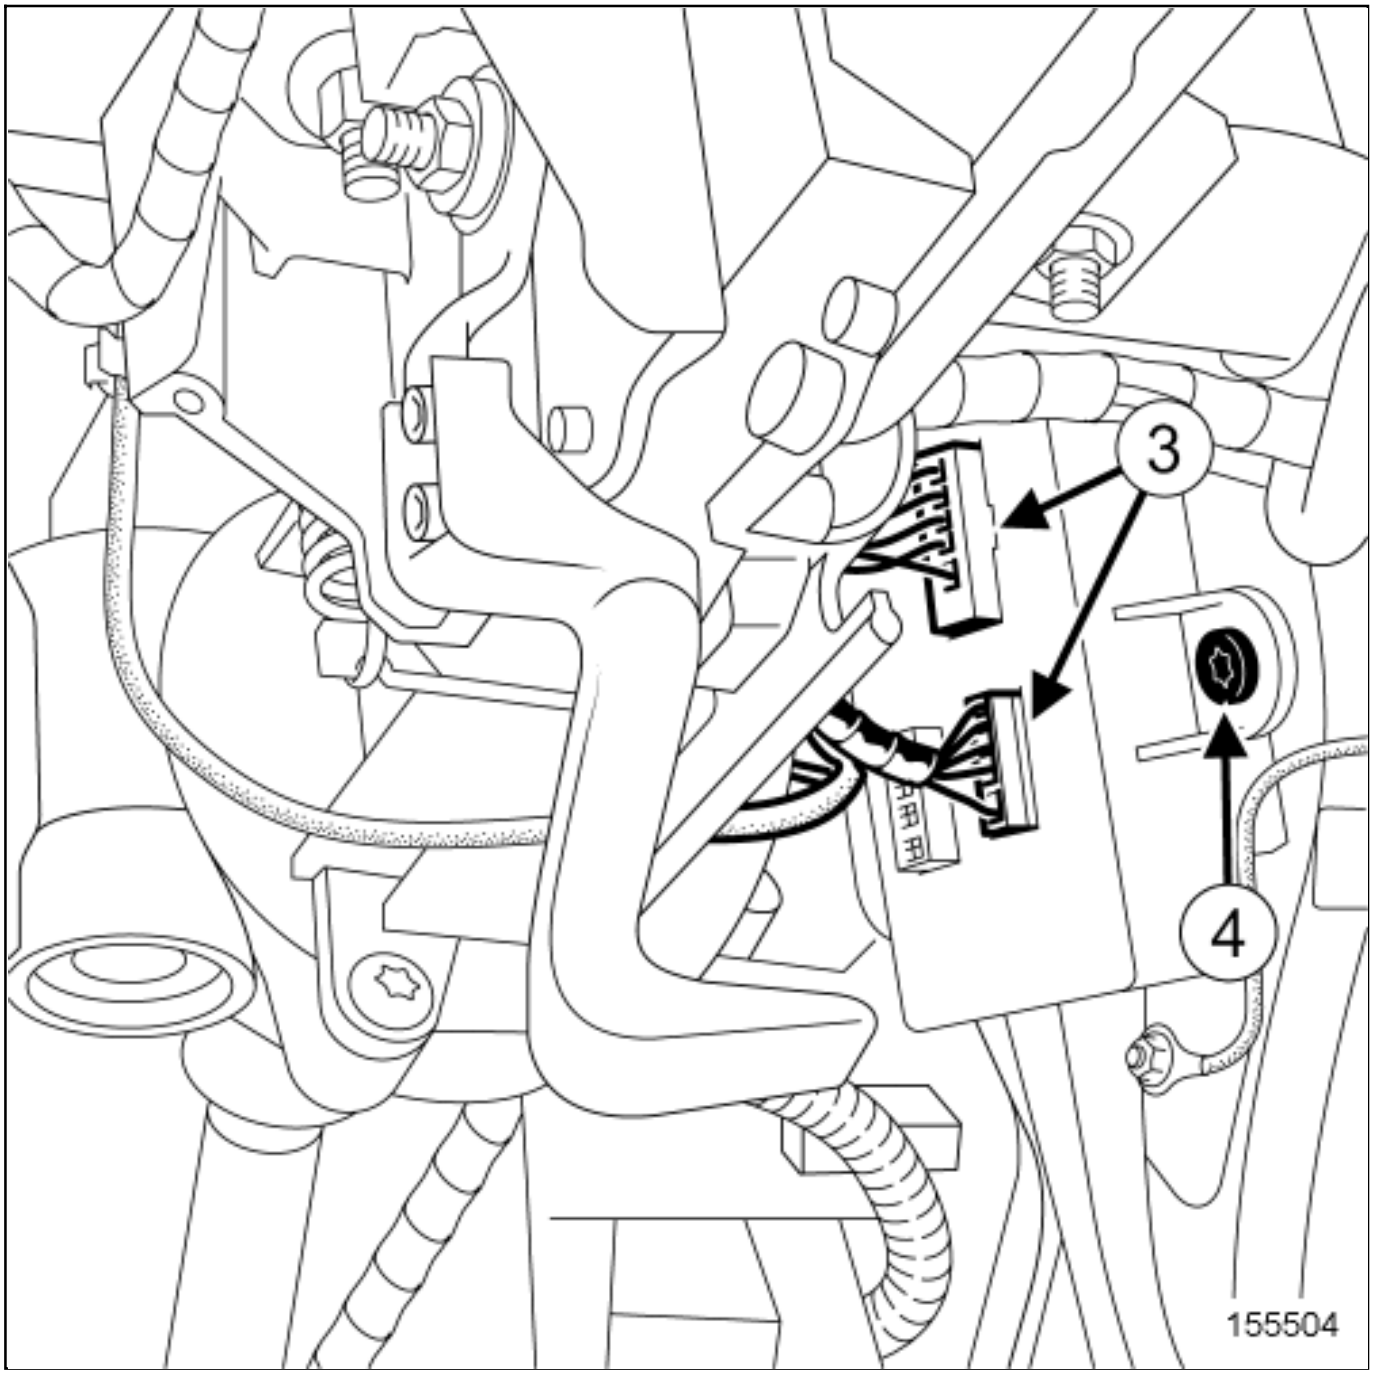
the earth nut on the dashboard cross member reinforcement8 N.m.

Top up and bleed the cooling circuit**Cooling system: Draining - Refilling** .



HEATING RESISTORS: REMOVAL - REFITTING

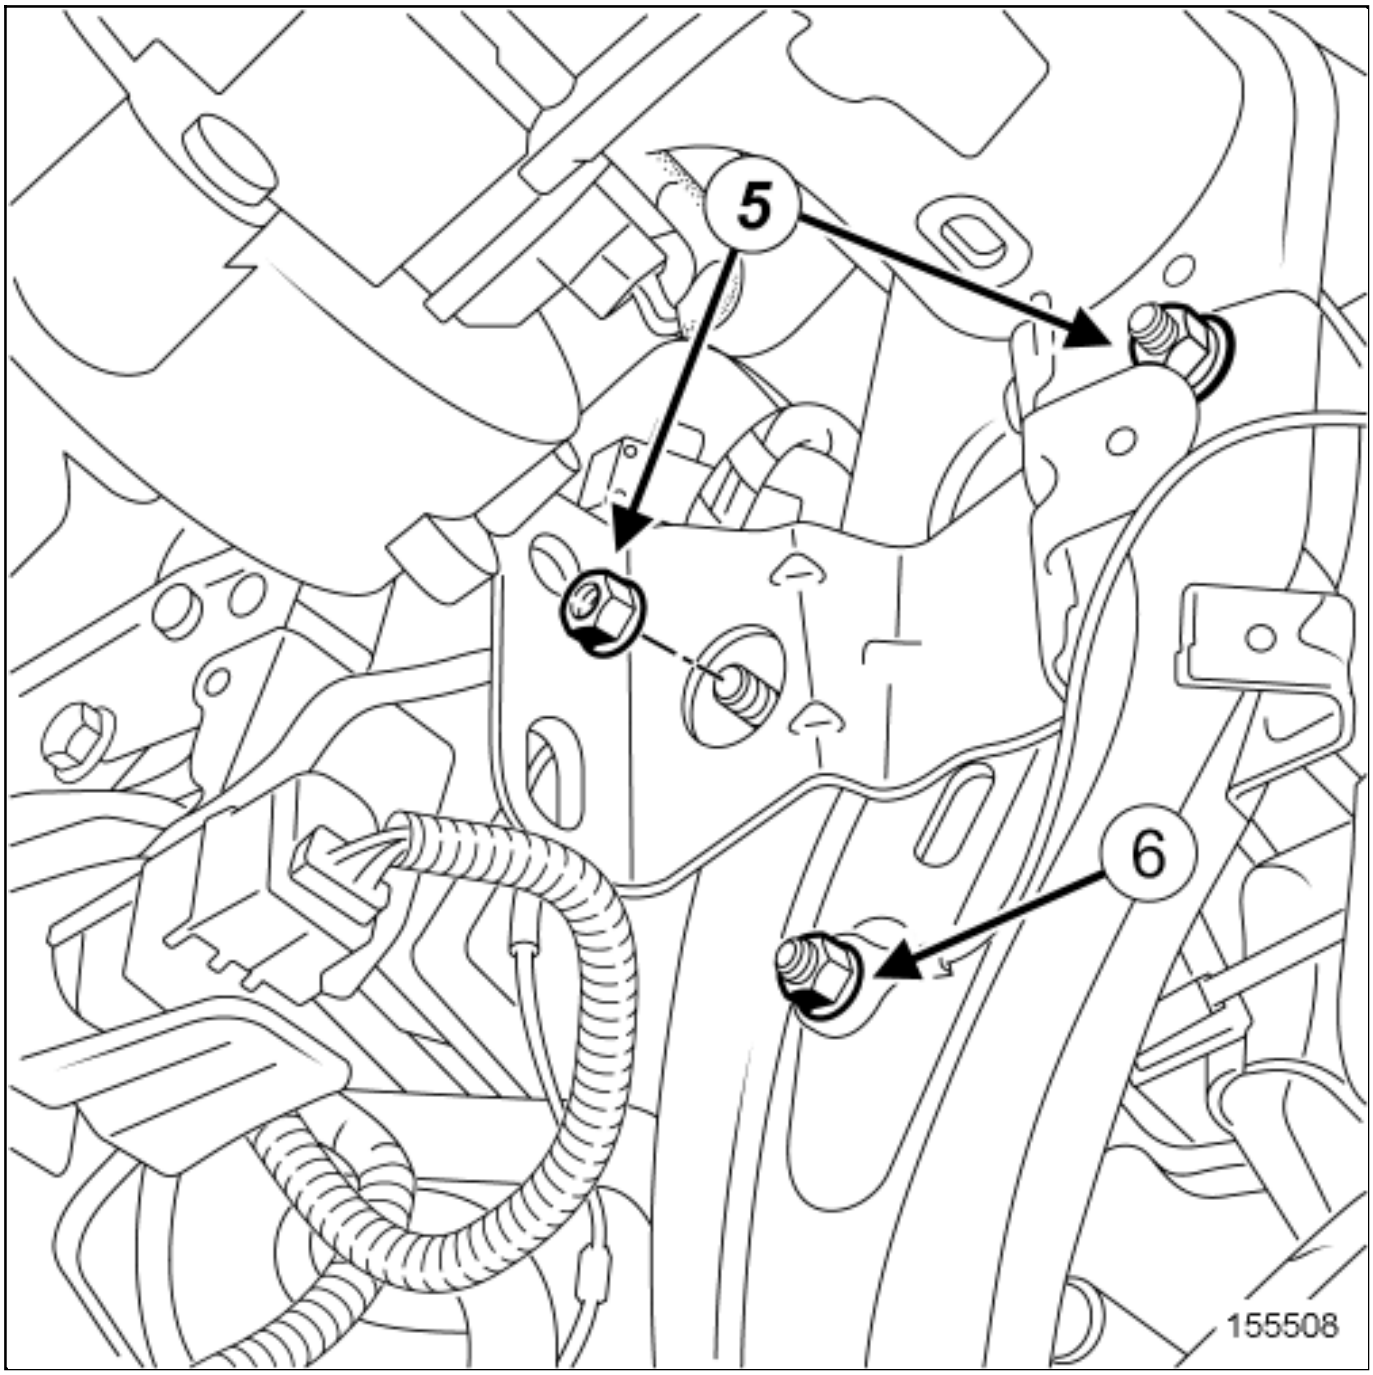
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .



REMOVAL

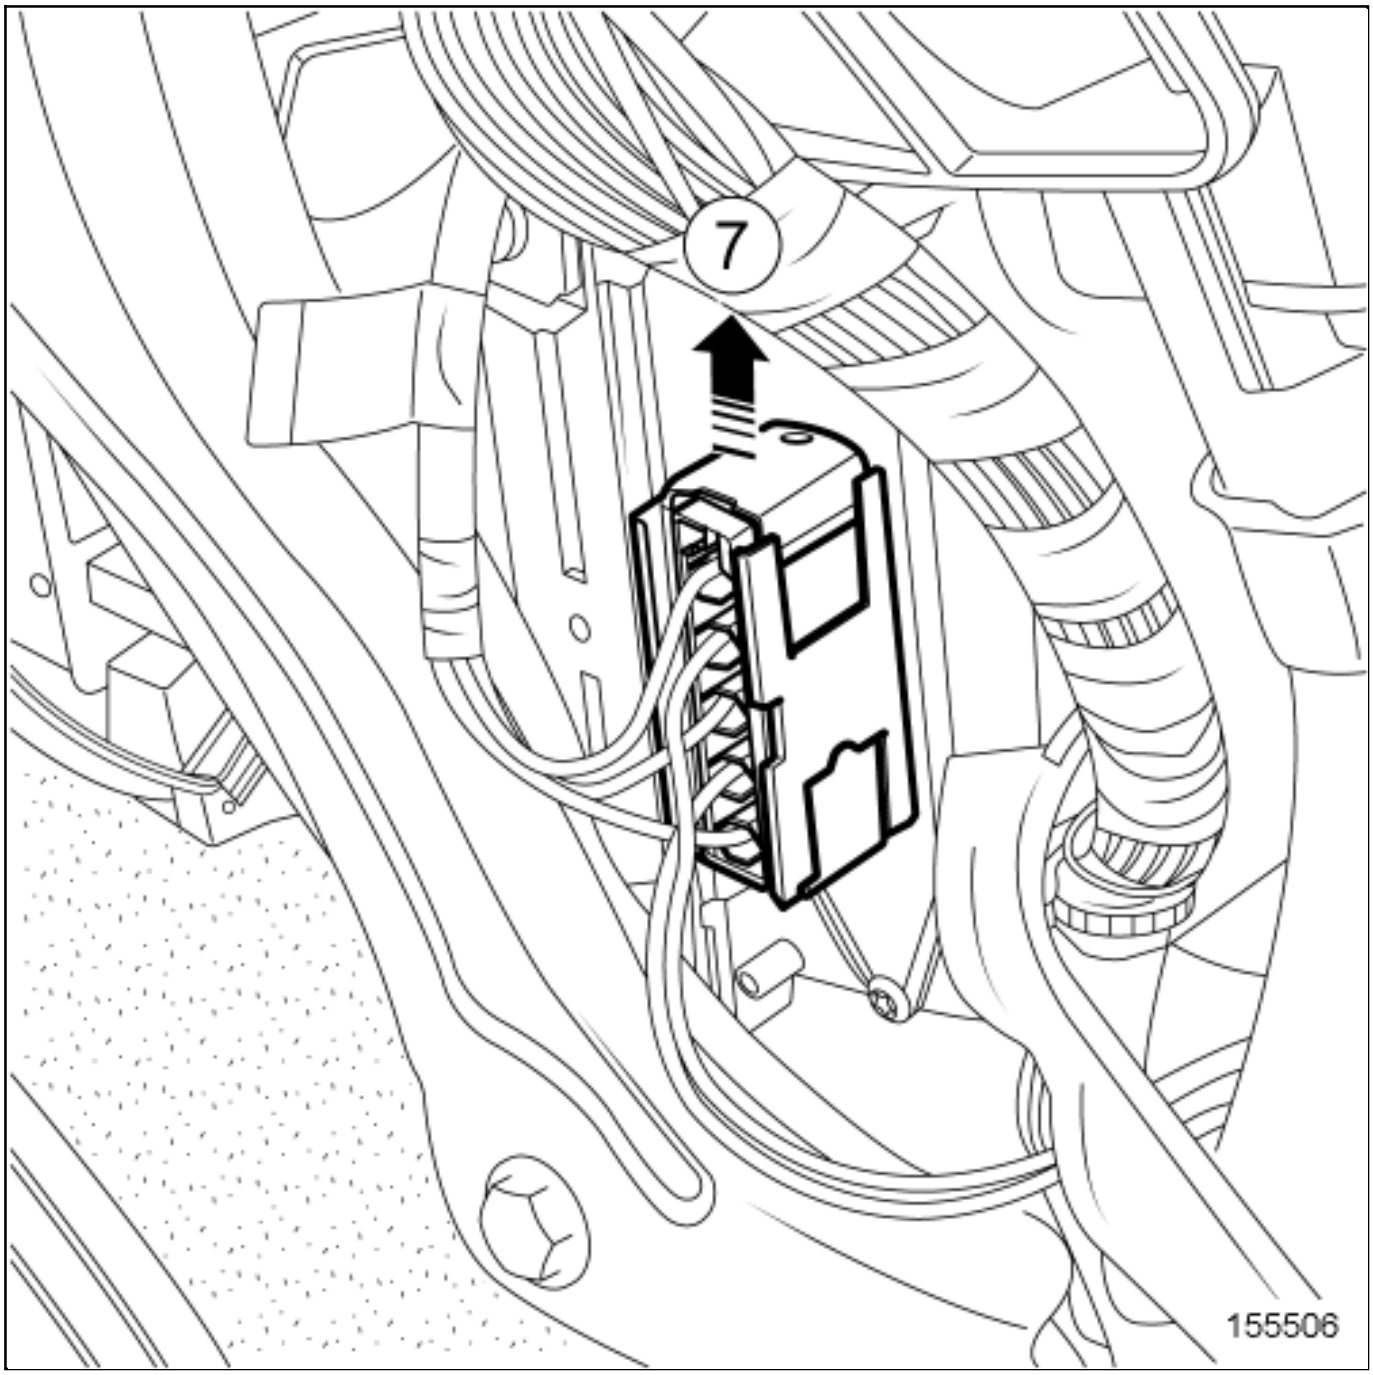
1. REMOVAL PREPARATION OPERATION

- Unclip the left-hand panel from the centre console.
- Remove the dashboard lower trim Dashboard assembly: Exploded view
- Unclip the wiring from the dashboard cross member reinforcement.



Remove the lower bolts(2) from the dashboard cross member reinforcement.

Disconnect the UPC connectors(3) .



Remove:

- the UPC bolt(4) ,
- the UPC.

Remove:

- the earth nut(**6**) from the dashboard cross member reinforcement,
- the upper nuts(**5**) from the dashboard cross member reinforcement,
- the dashboard cross member reinforcement.

Disconnect (7) the heating resistors connector.

Remove the heating resistors bolts(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Take the heating resistors out of its housing(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REFITTING

1. REFITTING OPERATION

Refit the heating resistors.

Connect the heating resistors connector.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Tighten to torque:

- the dashboard cross member reinforcement upper nuts 21 N.m,
- the dashboard cross member reinforcement lower bolts 21 N.m,
- the earth nut on the dashboard cross member reinforcement 8 N.m.

HOLLOW SECTION INSERTS: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

The expanding inserts ensure that the vehicle cavities are sealed and soundproofed. They react to the temperature when the bodywork is immersed in the cataphoretic bath at the factory. These conditions cannot be reproduced on the bodywork.

As inserts are not recoverable, always replace expanding inserts.

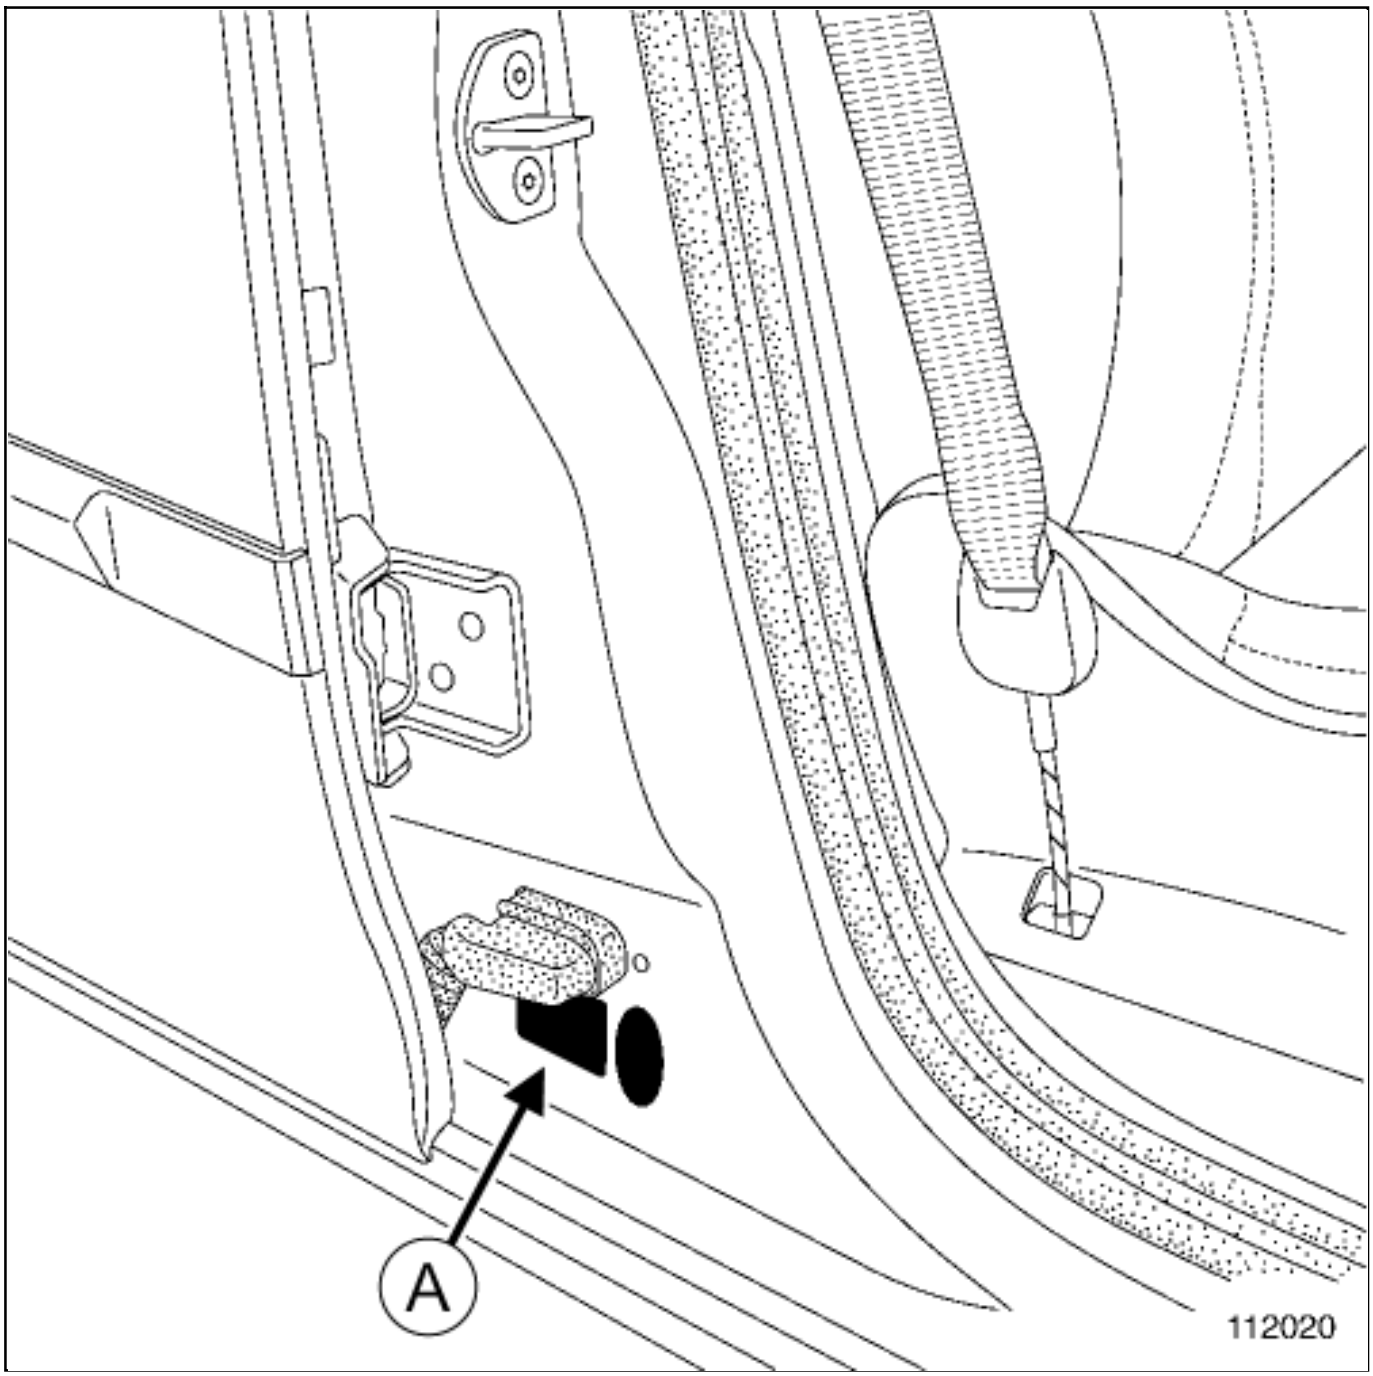
The inserts supplied by the Parts Departmentare identical to the original parts.

To obtain the same sealing and soundproofing properties, carry out the following operations:

- clean the bonding surfaces with heptane,
- if necessary, block the holes in the insert using pieces cut from a soundproofing pad,
- apply a bead of preformed trim sealing mastic around and inside the insert holes,
- fit the insert by compressing the mastic.

CAUTION

Do not refit the part after compressing the bead.



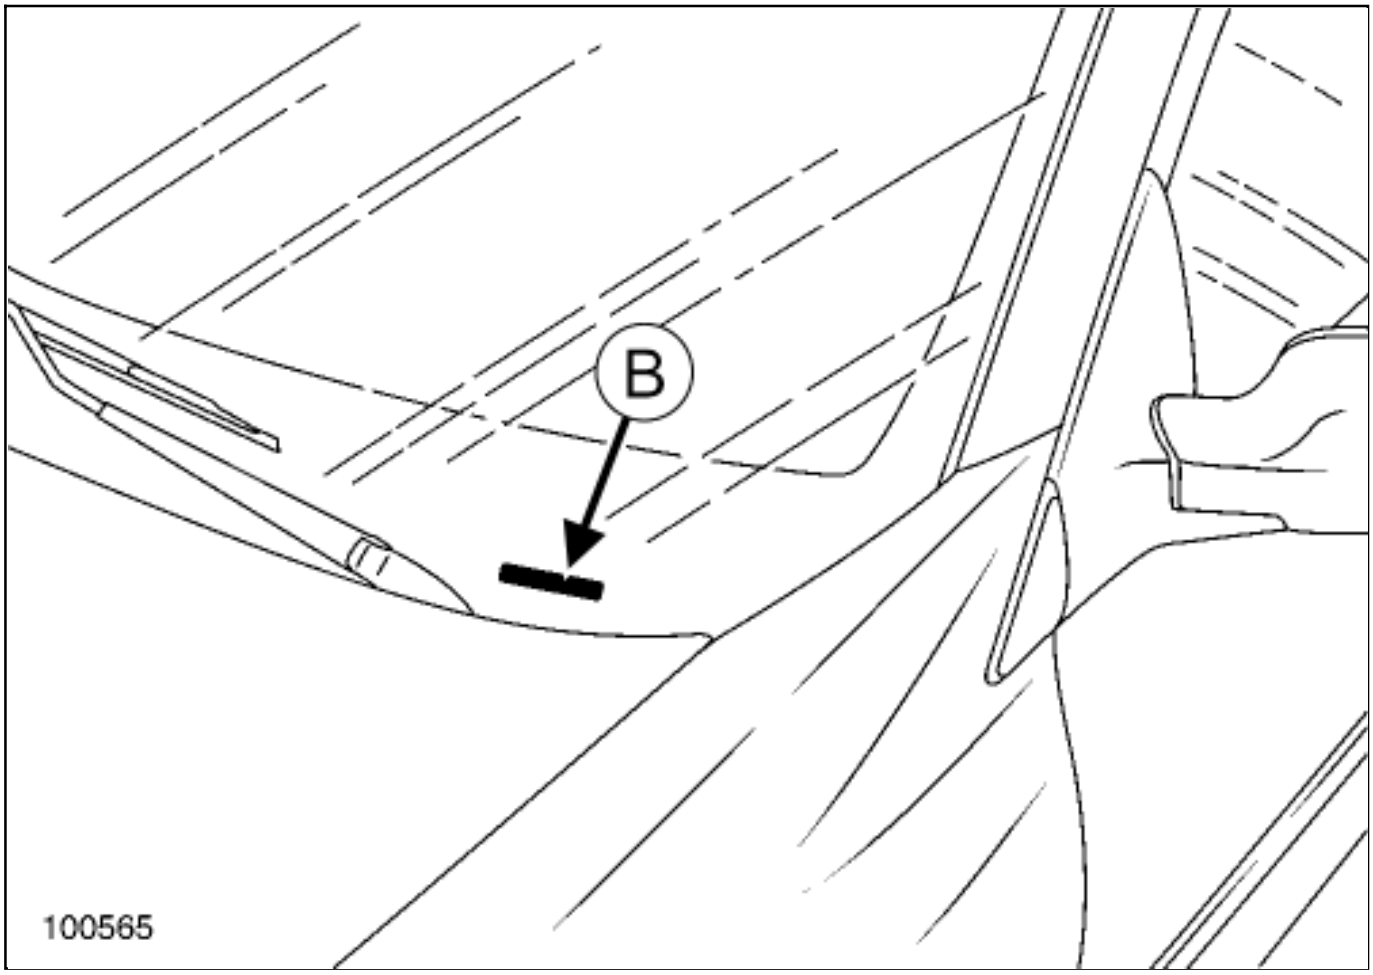
When EGW welding, protect the inserts from spatter and heat dispersion.

For example, use a heat shield.

In some cases, it is possible to replace the accessible part of the insert only, which must be cut out of the replacement part.

IDENTIFICATION

1. LOCATIONS OF THE VEHICLE IDENTIFICATION PLATE



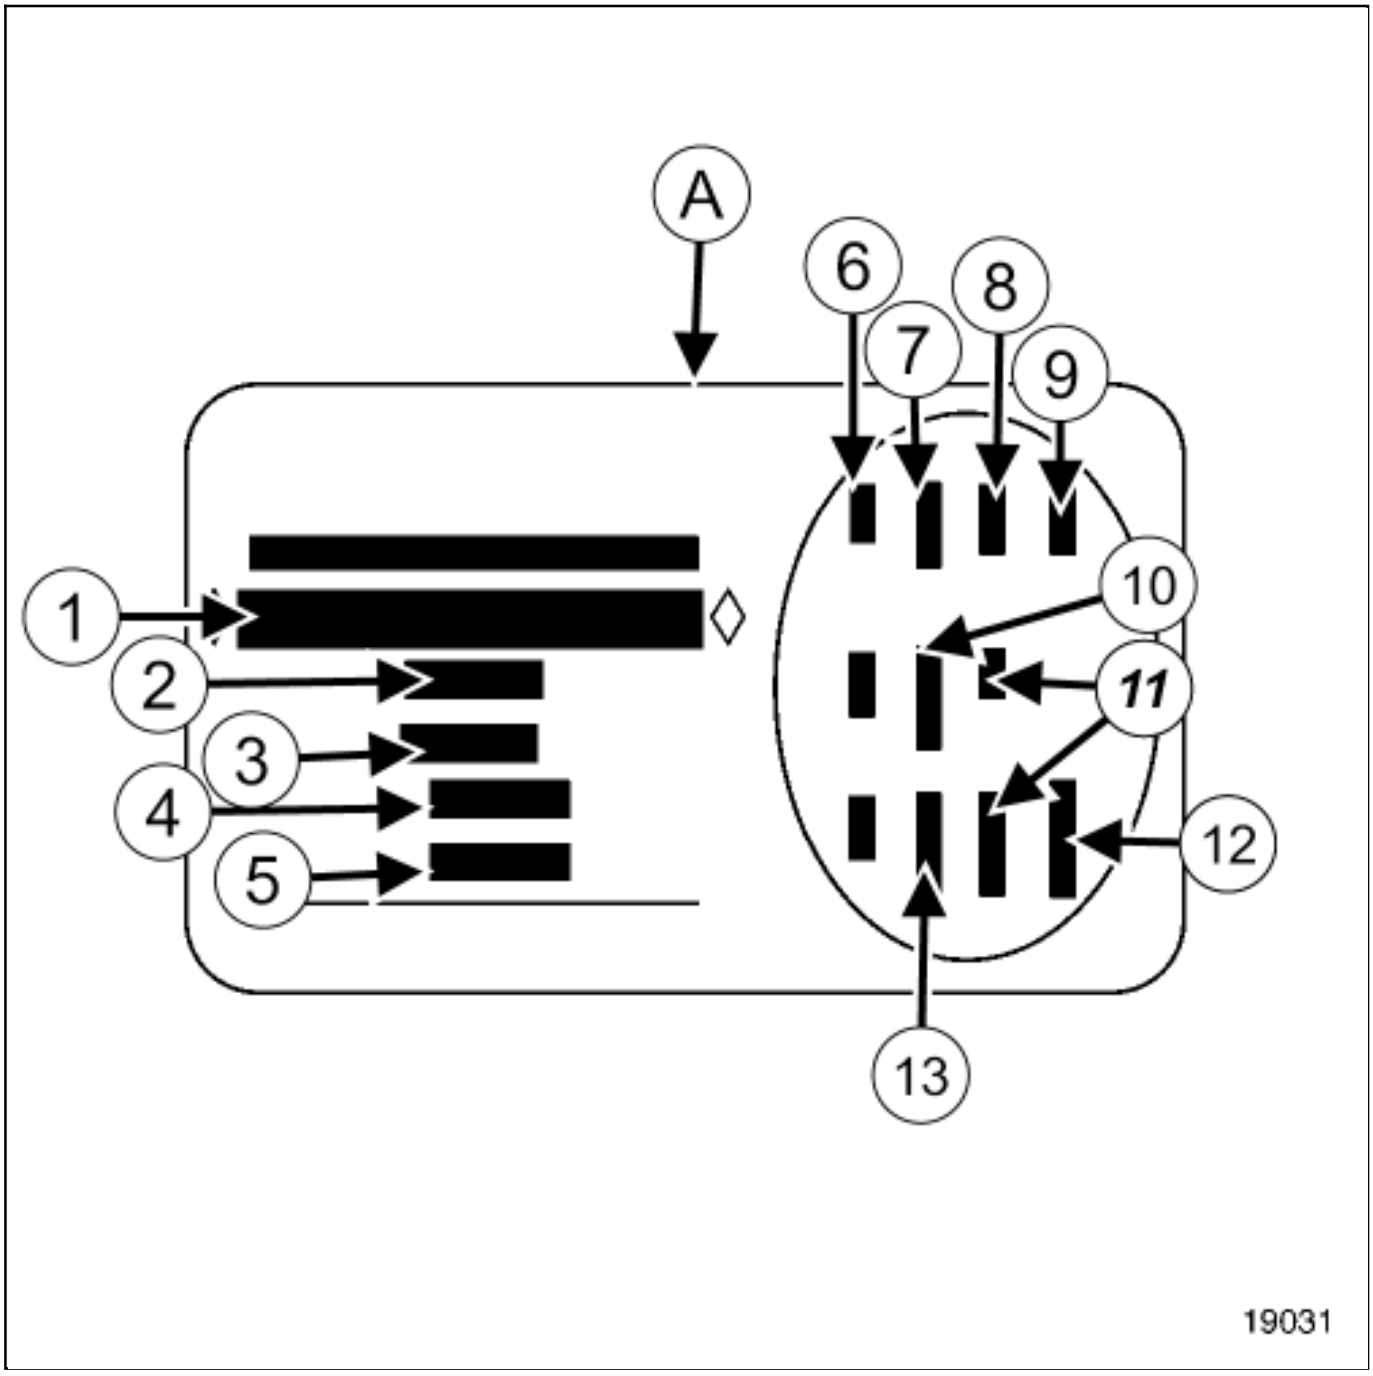


PLATE (A):

(1) Vehicle type mine and type number; this information also appears on marking (B)

(2) MGVW (Maximum Gross Vehicle Weight)

(3) GTW (Gross train weight, vehicle under load with trailer)

(4) Maximum permissible front axle load

(5) Maximum permissible rear axle load

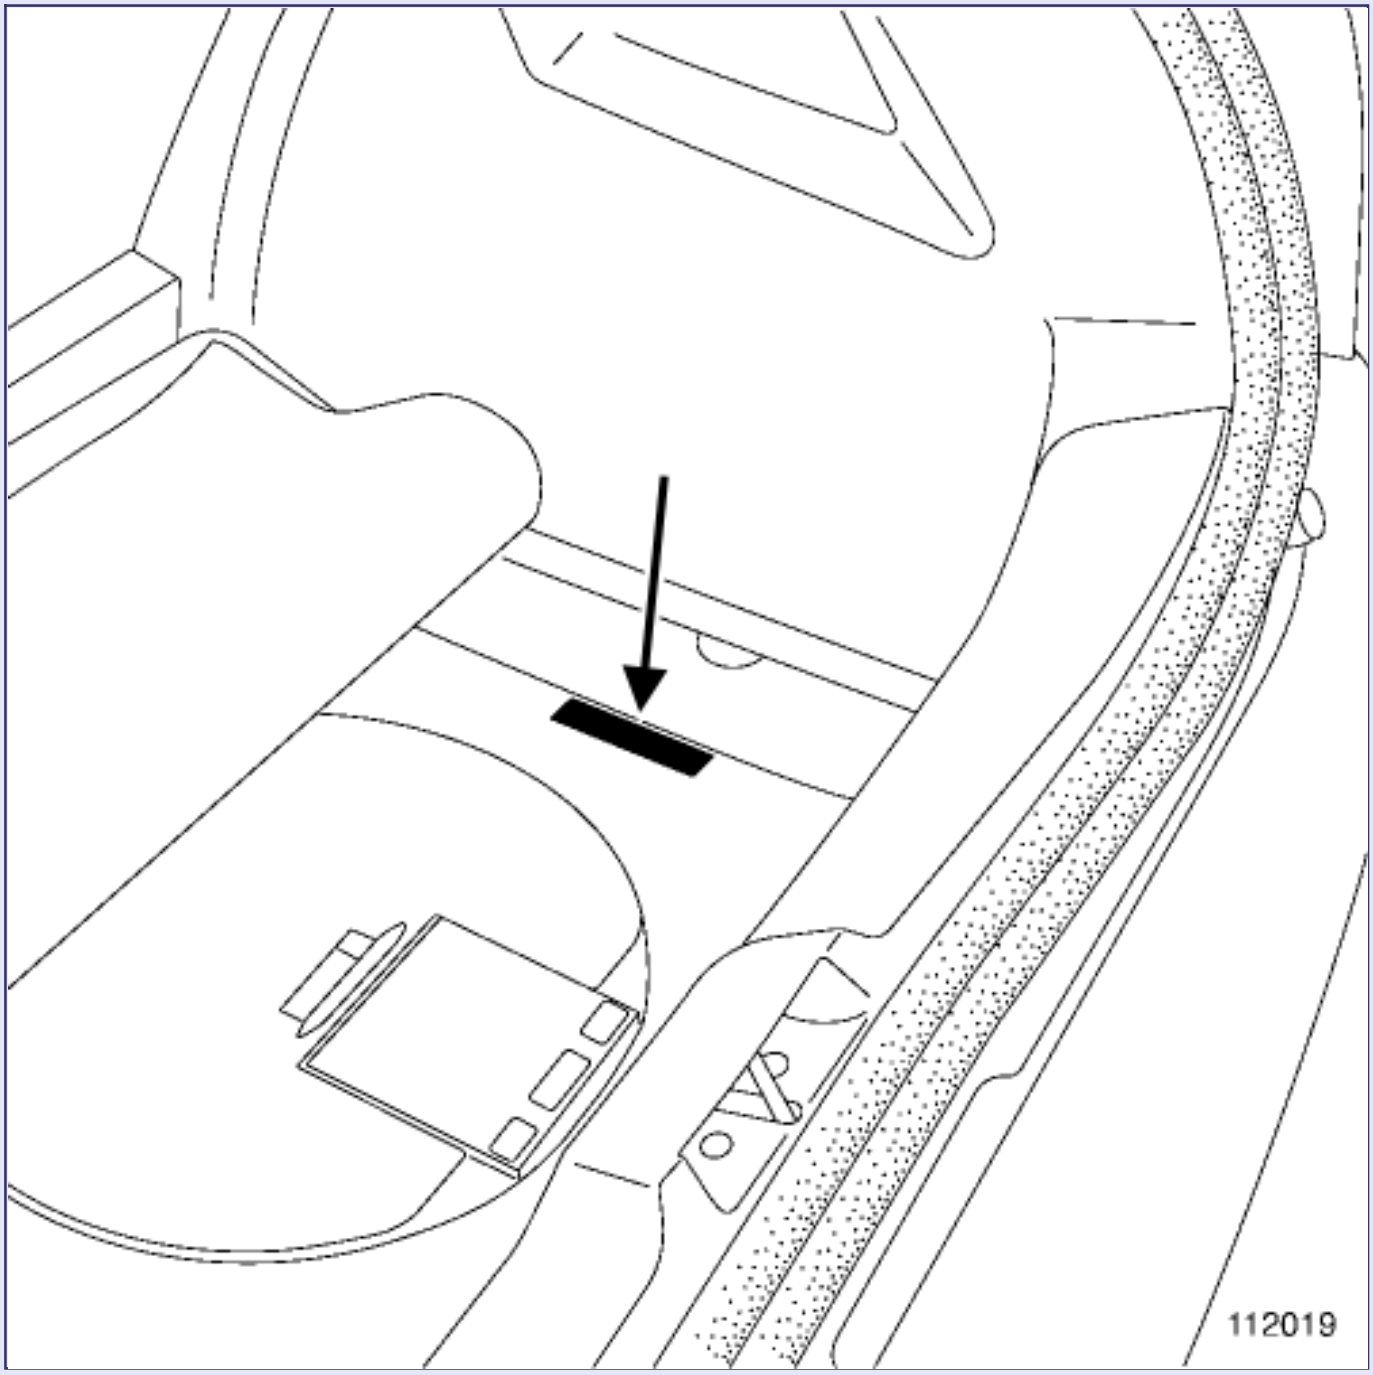
(6) Vehicle technical specifications

(7) Paintwork reference number

(8) Equipment level

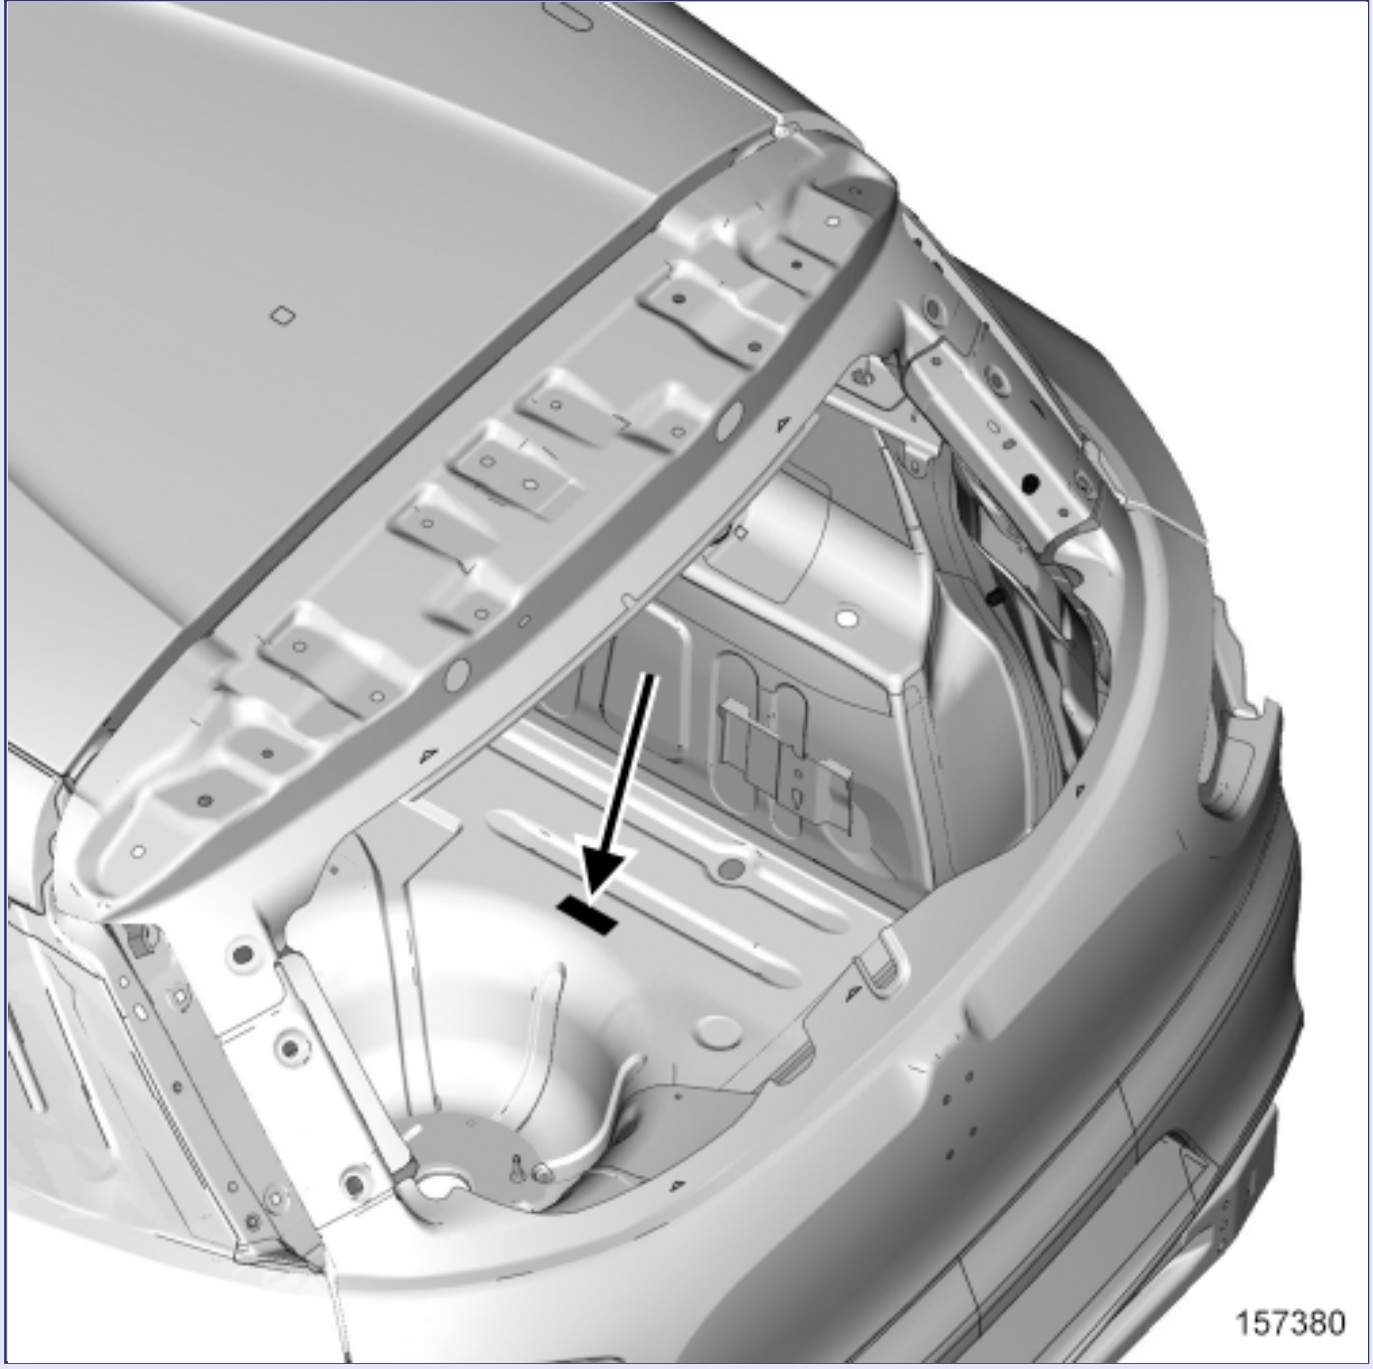
(9) Vehicle type

(10) Upholstery code



(11) Additional equipment details

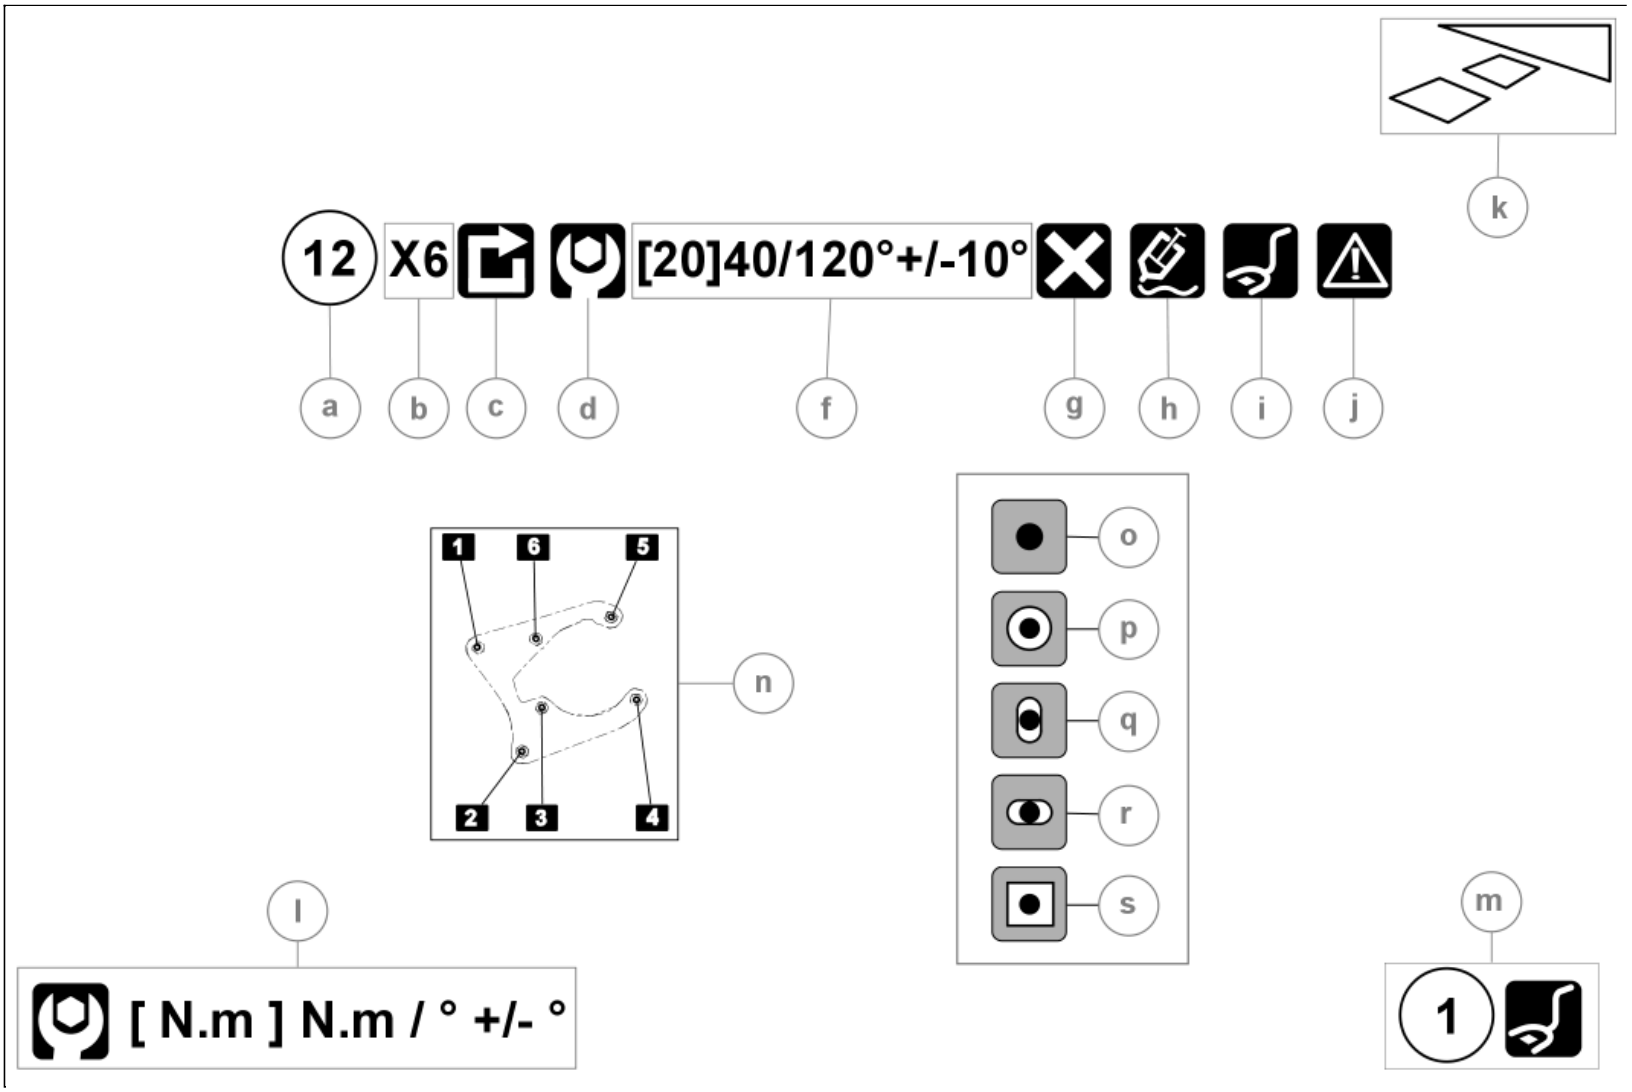
(12) Fabrication number



(13) Interior trim code

2. COLD-MARKING OF THE BODY

B98(B98)



K98(K98)

Note:

If the complete body is being replaced, it must be marked in compliance with the current regulations.

LEGEND FOR ICONS

a	No.
b	Part number
c	A tightening order must be respected
D	Non-standard tightening torque / angle
f	[Initial torque] tightening torque / tightening angle +/- tightening angle tolerance
g	Part always to be replaced
h	Product / Consumable
i	Special tooling / Equipment required
j	Safety precaution
k	Front of the vehicle
l	Tightening units
m	Special tooling / Equipment required to use on all of the assembled parts
n	Tightening order to be respected

The following icons represent the adjustment possibilities for the bodywork components:

- the black dot in the centre represents the body of the bolt,

- the grey section represents the component to be adjusted,

- the white section represents the adjustment area.

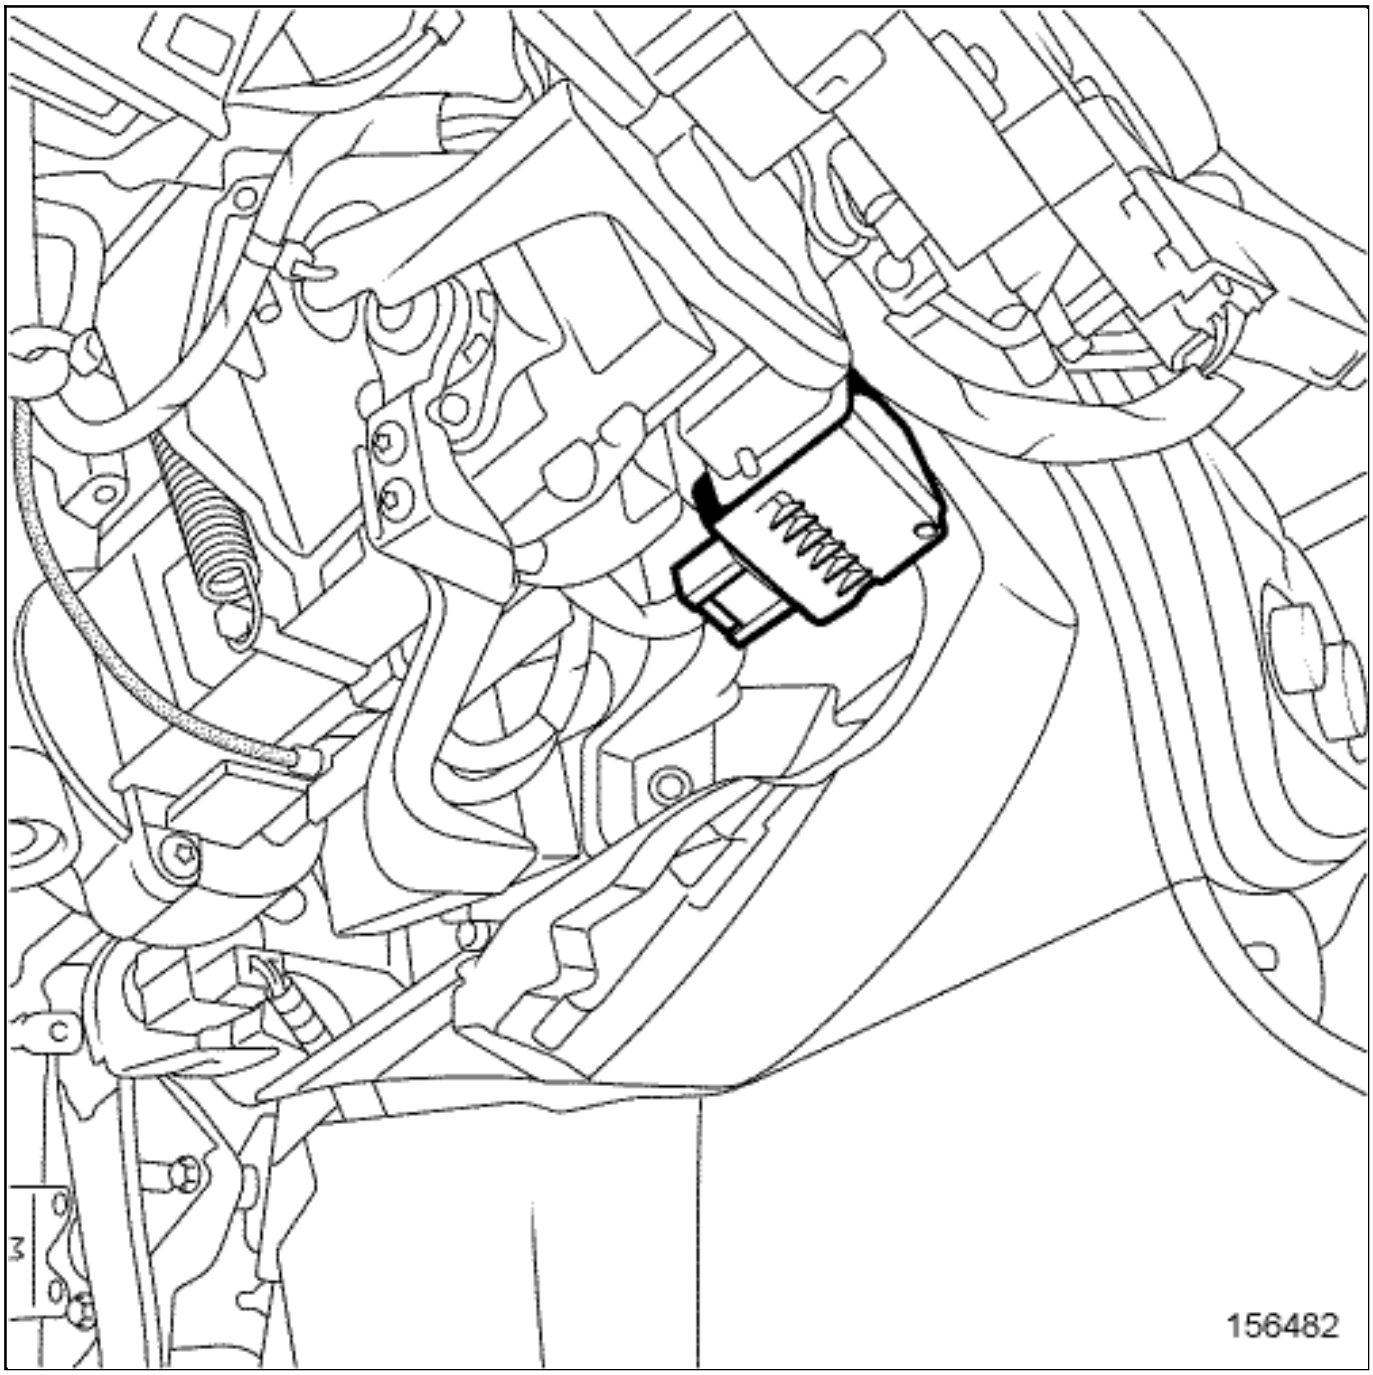
o	No adjustment possible
p	Adjustment possible along all axis
q	Adjustment possibly only along vertical axis
r	Adjustment possibly only along horizontal axis
s	Adjustment possible along all axis

IMMOBILISER SYSTEM: LIST AND LOCATION OF COMPONENTS

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Set of trim removal levers.	Car. 1363

Equipment required
Diagnostic tool



1. LIST OF COMPONENTS

1- THE IMMOBILISER SYSTEM CONSISTS OF:

- an electric steering column lock
- two remote door locking controls ("Renault" card)
- an engine start button
- a card reader

2. LOCATION OF COMPONENTS

1- ELECTRIC STEERING COLUMN LOCK

Note:

To remove the electric steering column lock, the airbag computer must be locked.

This operation enables the steering column to be unlockedAirbag and pretensioners: Precautions for the repair .

Note:

Do not fit a steering column lock that shows signs of impact (risk of an immobilising fault).

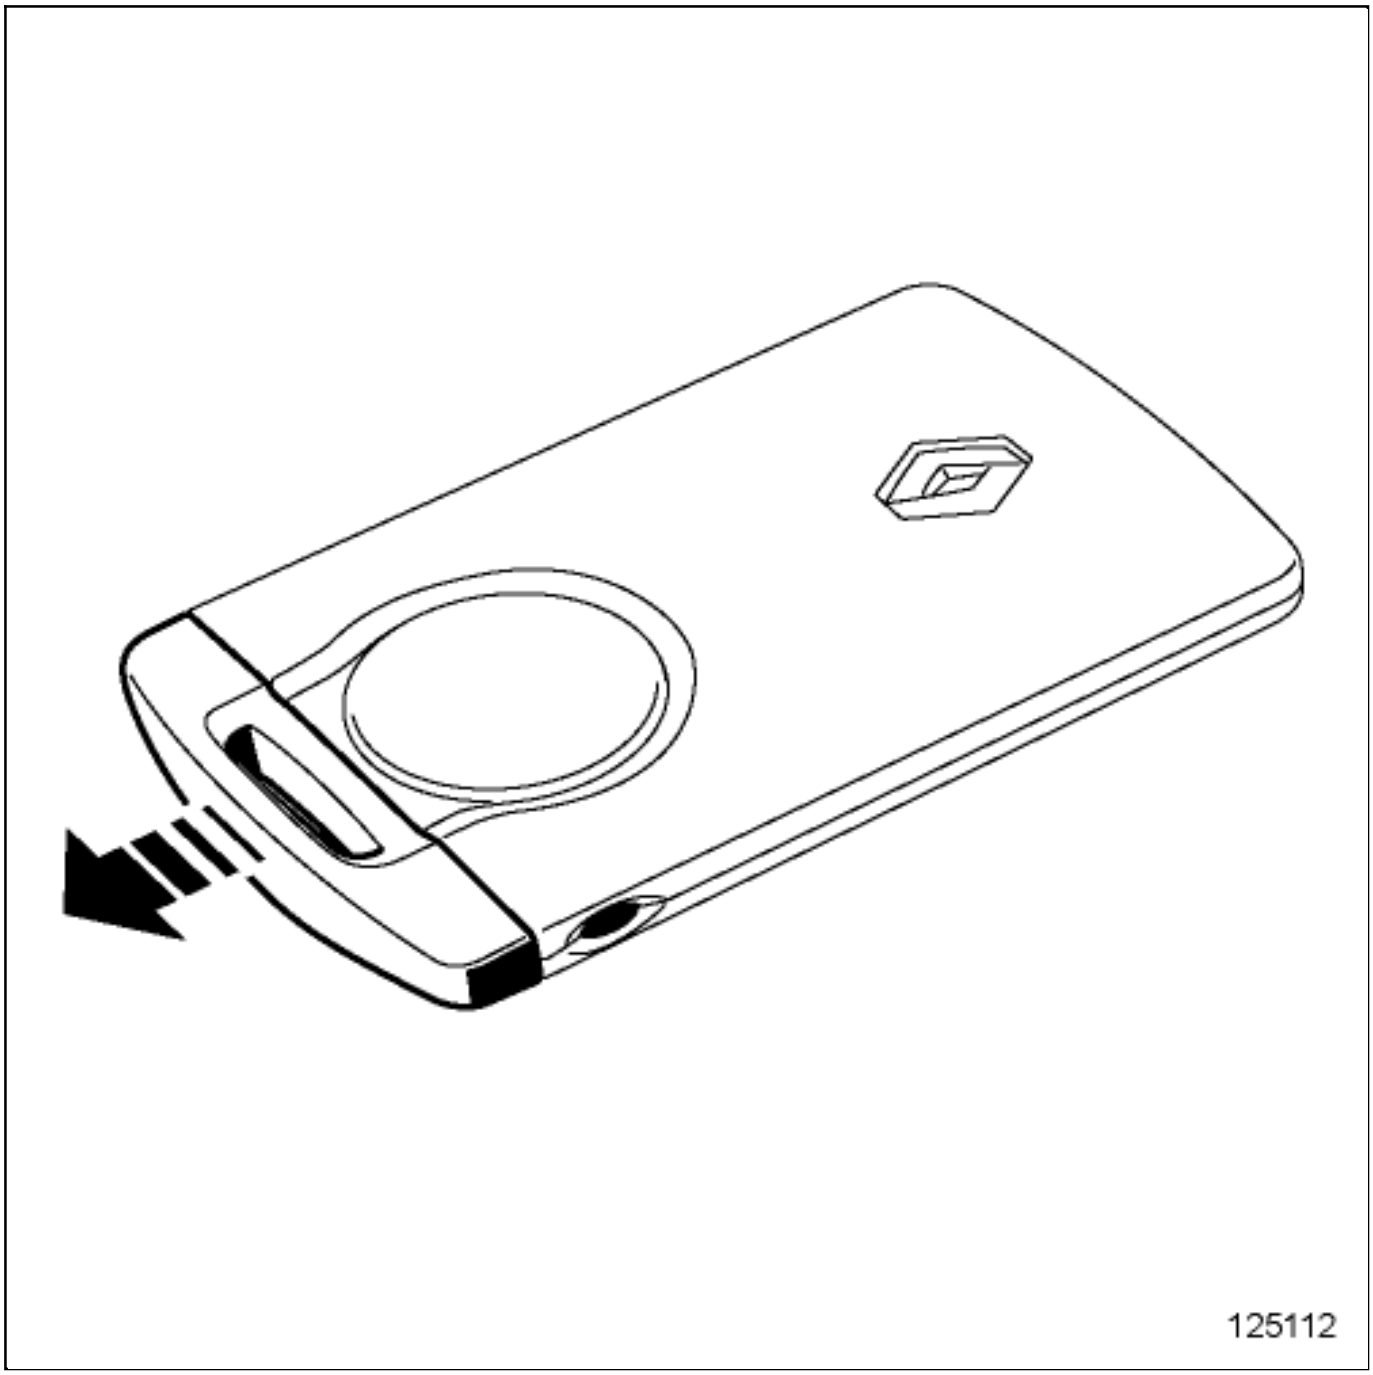
CAUTION

The bolt for the electric steering column lock has a left-hand thread. It unscrews in a clockwise direction.

Always replace the bolt of the electric steering column lock.

Torque tighten the electric steering column lock bolt8 N.m.

Apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :



-Computer concerned by the After repair procedure:

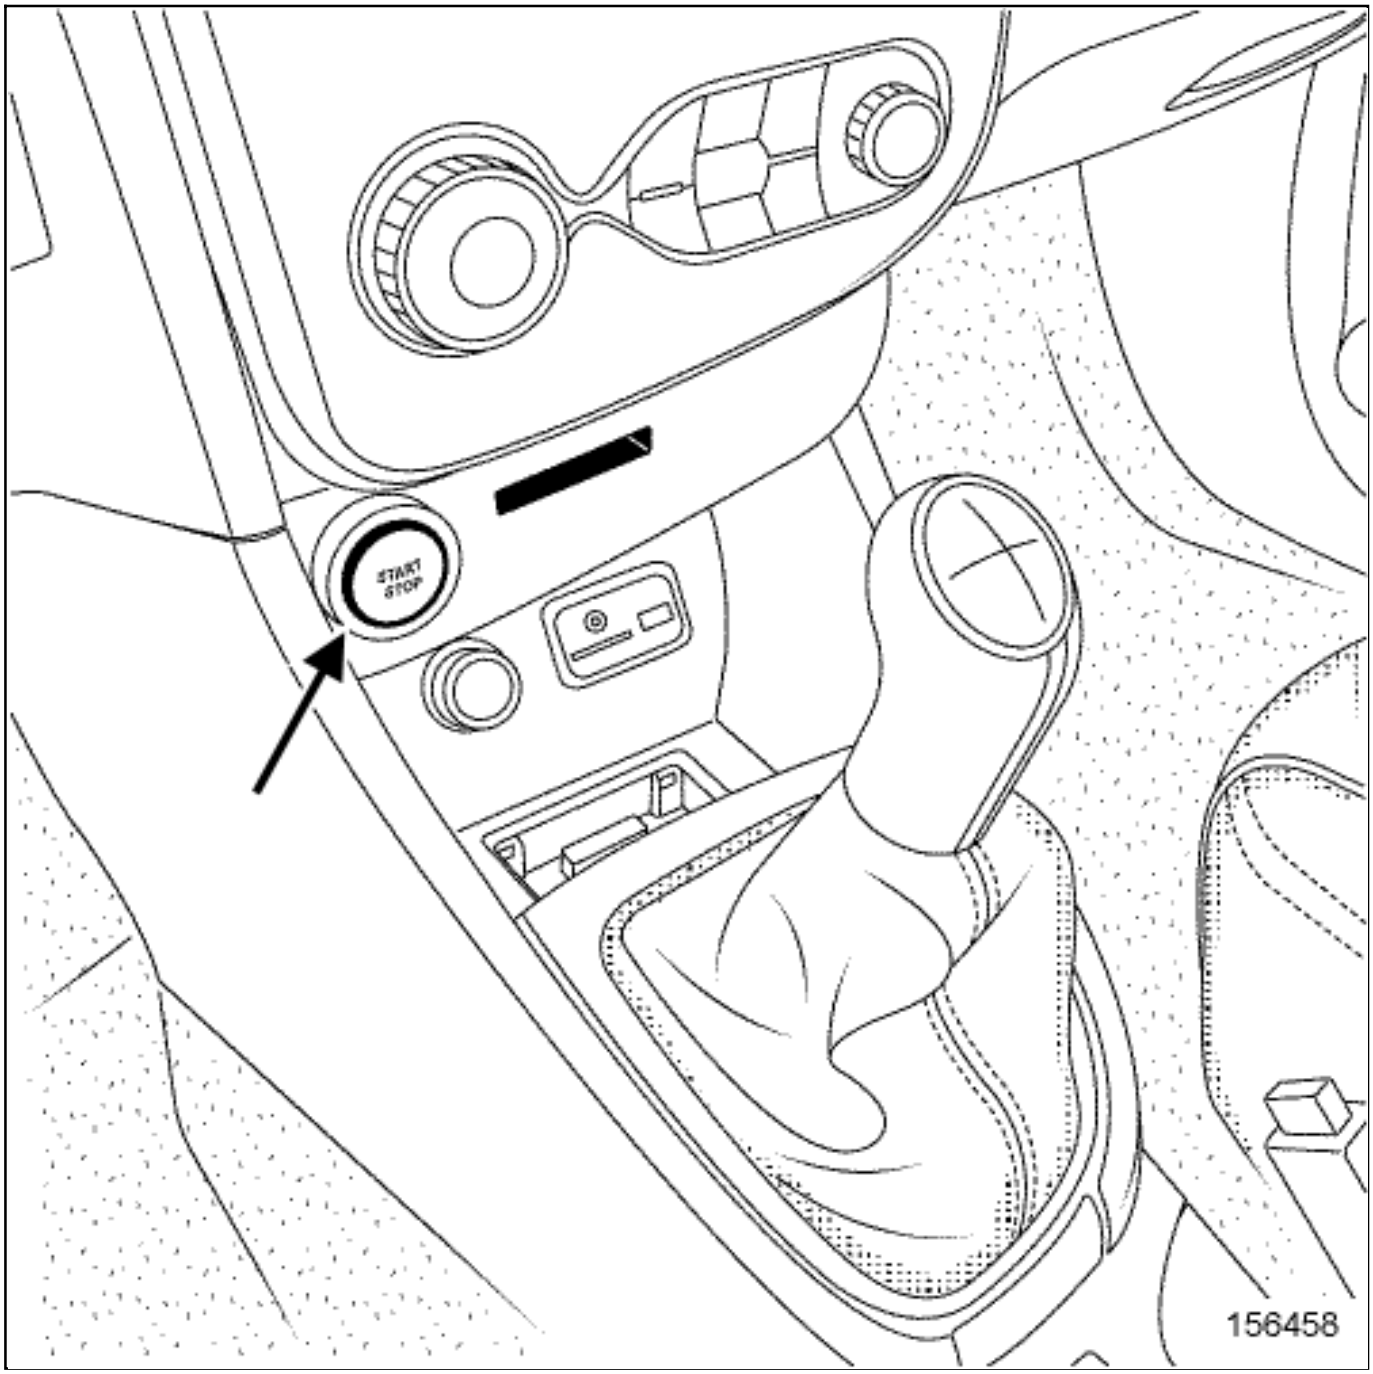
"HFM" ,

-Component controlled by this computer concerned by the After repair procedure:

"Steering column lock" .

2- REMOTE DOOR LOCKING CONTROL ("RENAULT" CARD)

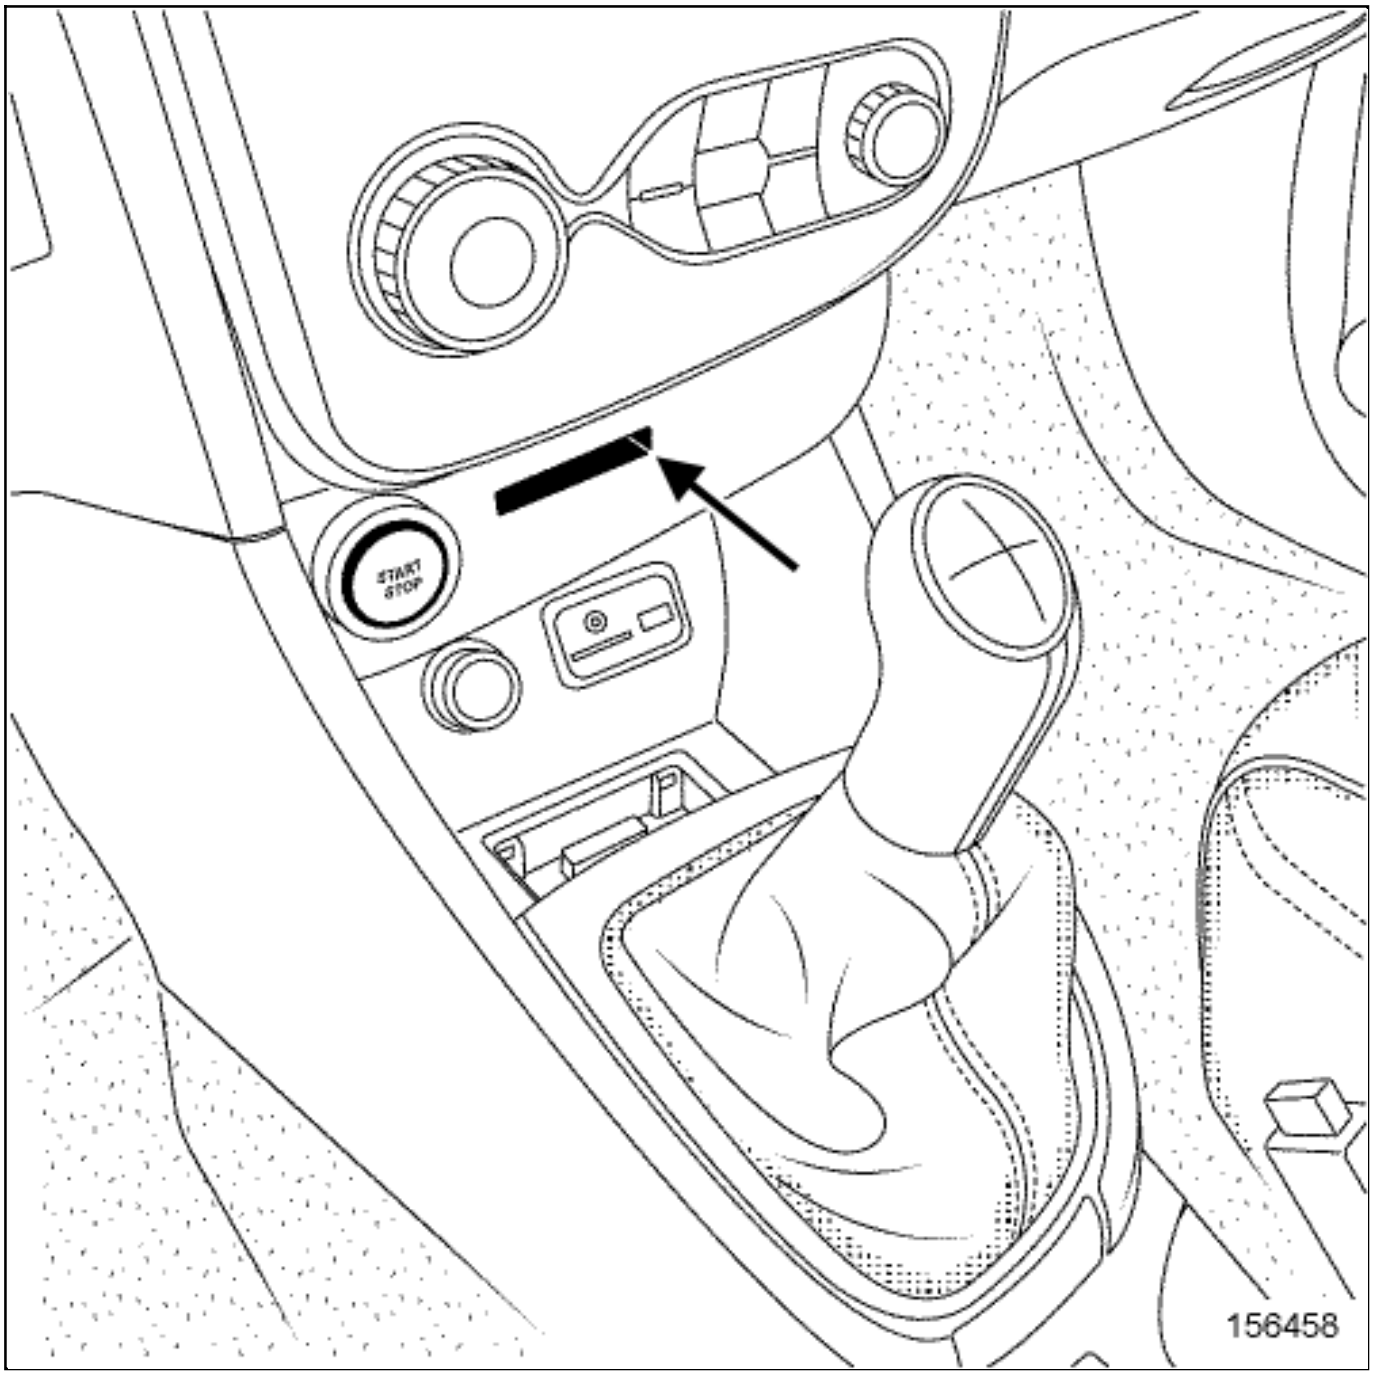
Apply the after repair procedure using the Diagnostic tool[Diagnostic tool : Use] :



-Computer concerned by the After repair procedure:

"HFM" ,

-Component controlled by this computer concerned by the After repair procedure:



"RENAULT Card" .

3- START BUTTON

Dashboard assembly: Exploded view

4- CARD READER

Dashboard assembly: Exploded view

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

"HFM" ,

XSL version : 3.02 du 22/07/11

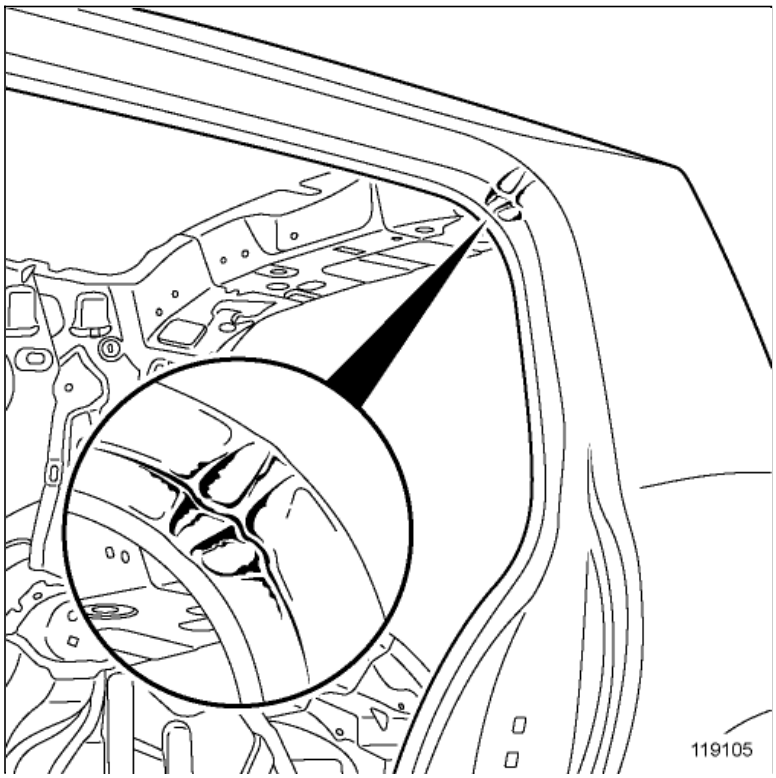
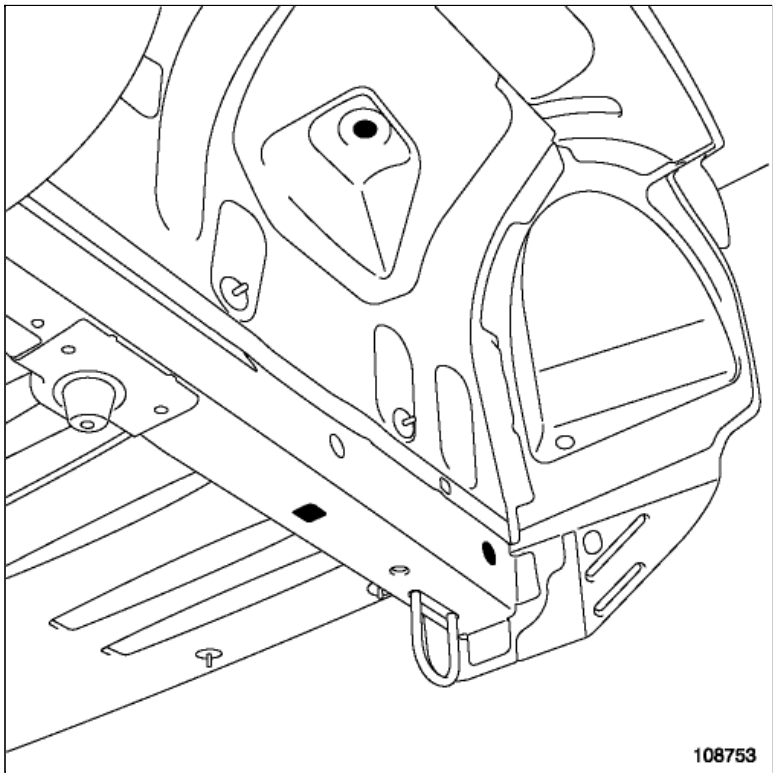
IMPACTFAULTFINDING:DESCRIPTION



1.INTRODUCTION

Before undertaking bodywork repairs on a vehicle, carry out a series of checks in order to determine:

- firstly, whether the vehicle's road holding and behaviour has been affected by the impact,
- the type of equipment to use according to the deformity found on the subframe,
- the parts to order for the repairs.



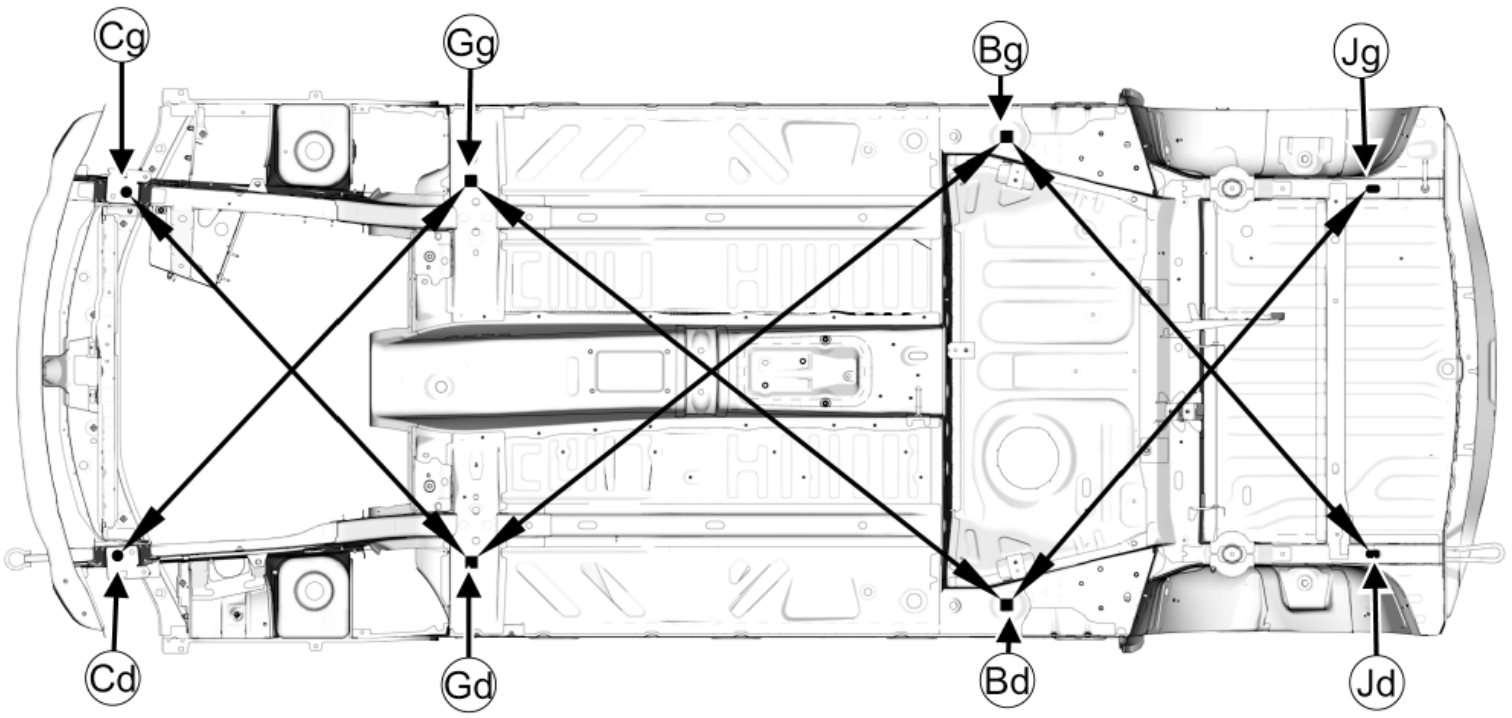
The checks consist of examining the vehicle structure in order to detect any significant crumpling or blistering.

2. VISUAL INSPECTION OF THE UPPER STRUCTURE

With the vehicle on the ground, check the edge clearances of the opening elements and remove the door entry seals to check for any damage to the door frame angles.

3. VISUAL INSPECTION OF THE SUBFRAME

It is preferable to position the vehicle on a two-post lift and examine the side members around the original crumple zones, mechanical component mountings (engine, gearbox, subframe, shock absorber cups) and then the floors.



Note:

For small impacts or "contentious" impacts, the subframe check may be supplemented by:

- a comparison measurement using a mechanical gauge,
- a three-dimensional measurement with an expert report (be sure to measure several points on the component being checked in order to reveal the tendency for deformation, to confirm the fault finding), followed by a check of the axle assemblies before any repairs, on a special 4-post lift.

For impacts to the wheels without any visible structural damage, begin fault finding by checking the axle geometry, after having replaced the damaged wheels.

4. CHECKING THE SUBFRAME USING A MEASURING TOOL

125996

Chronological order of checks:

Front impact

(Bg) - (Gd) = (Bd) - (Gg)

(Bg) - (Jd) = (Bd) - (Jg)

Rear impact

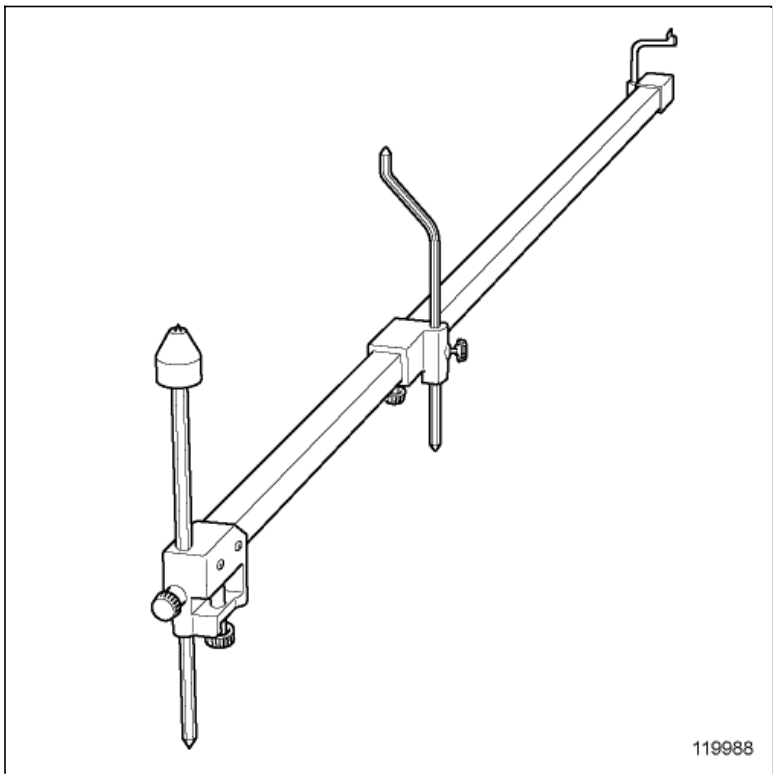
(Bg) - (Gd) = (Bd) - (Gg)

(Gg) - (Cd) = (Gd) - (Cg)

5. TYPE OF REPAIRS

Three main categories:

- cosmetic damage only: dent removal without the need for jacking,
- damage with slight deformation of the end of a side member requiring some jacking, without risk to the vehicle's road holding,
- damage with deformation of the subframe geometry likely to have affected the vehicle's road holding(see 40A, General information, Straightening a component: Description) .

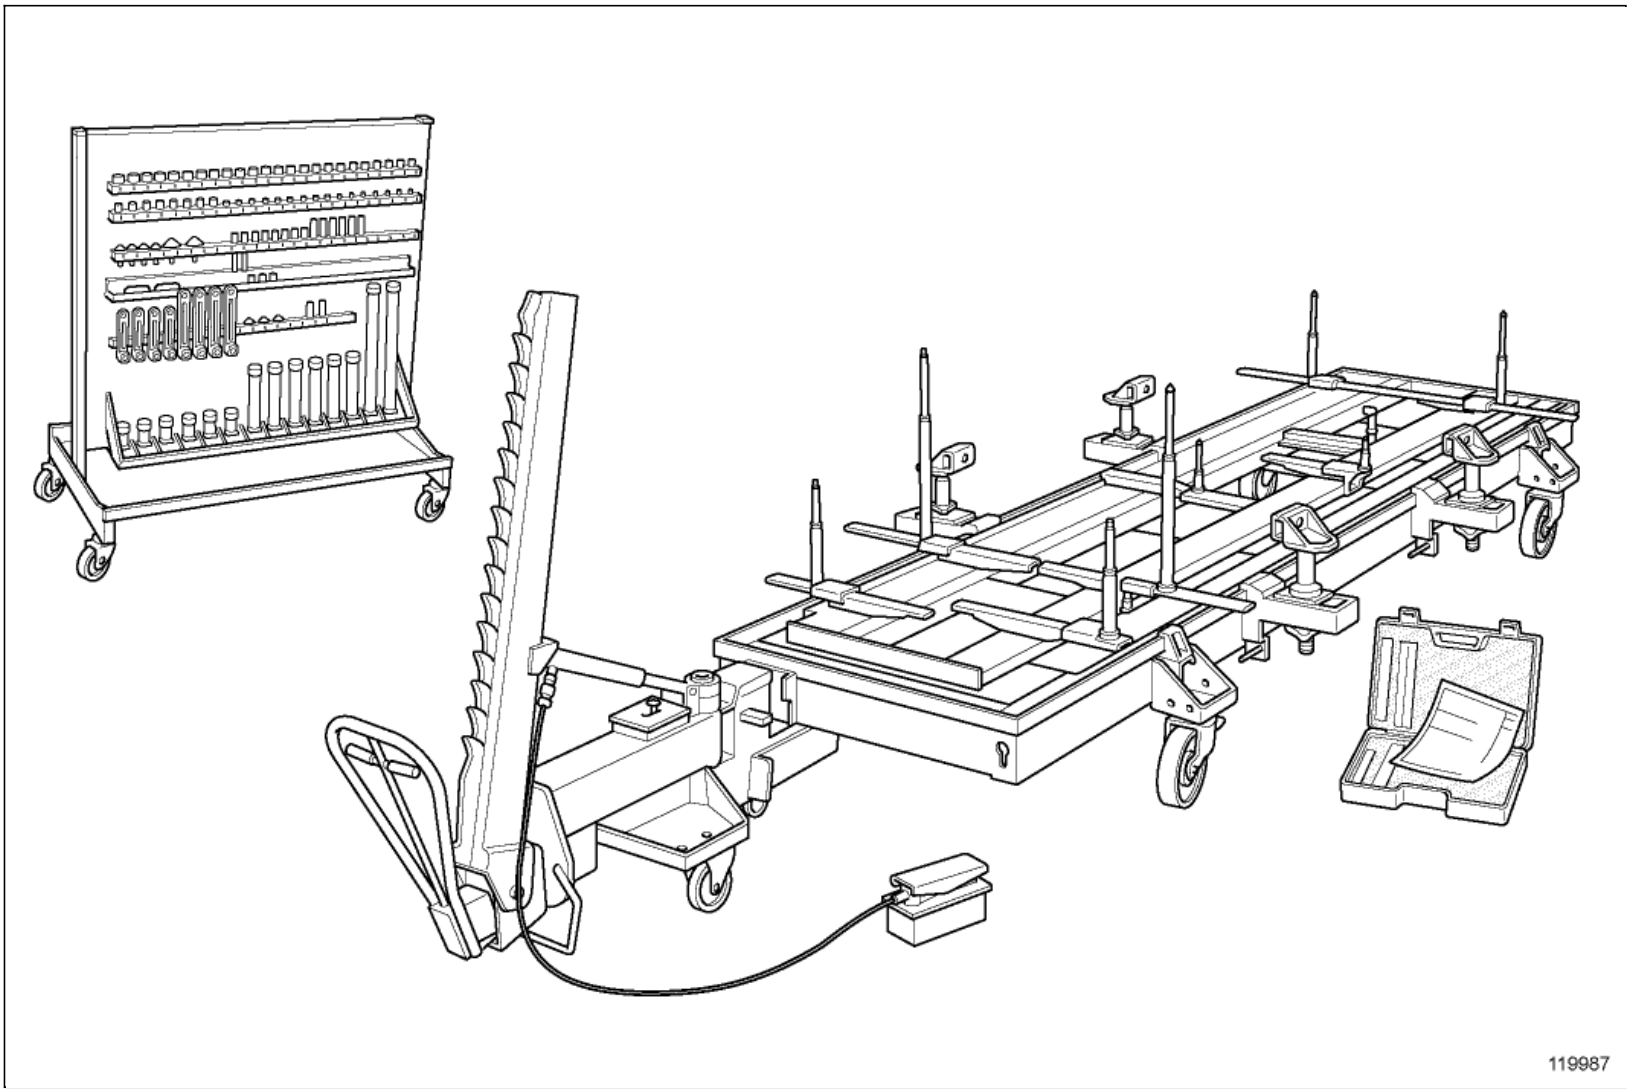


Note:

The indications necessary for identifying the points on the subframe which affect the vehicle's road holding are given in the MR for each vehicleStructural components to be positioned on the repair bench: Description .

XSL version : 3.02 du 22/07/11

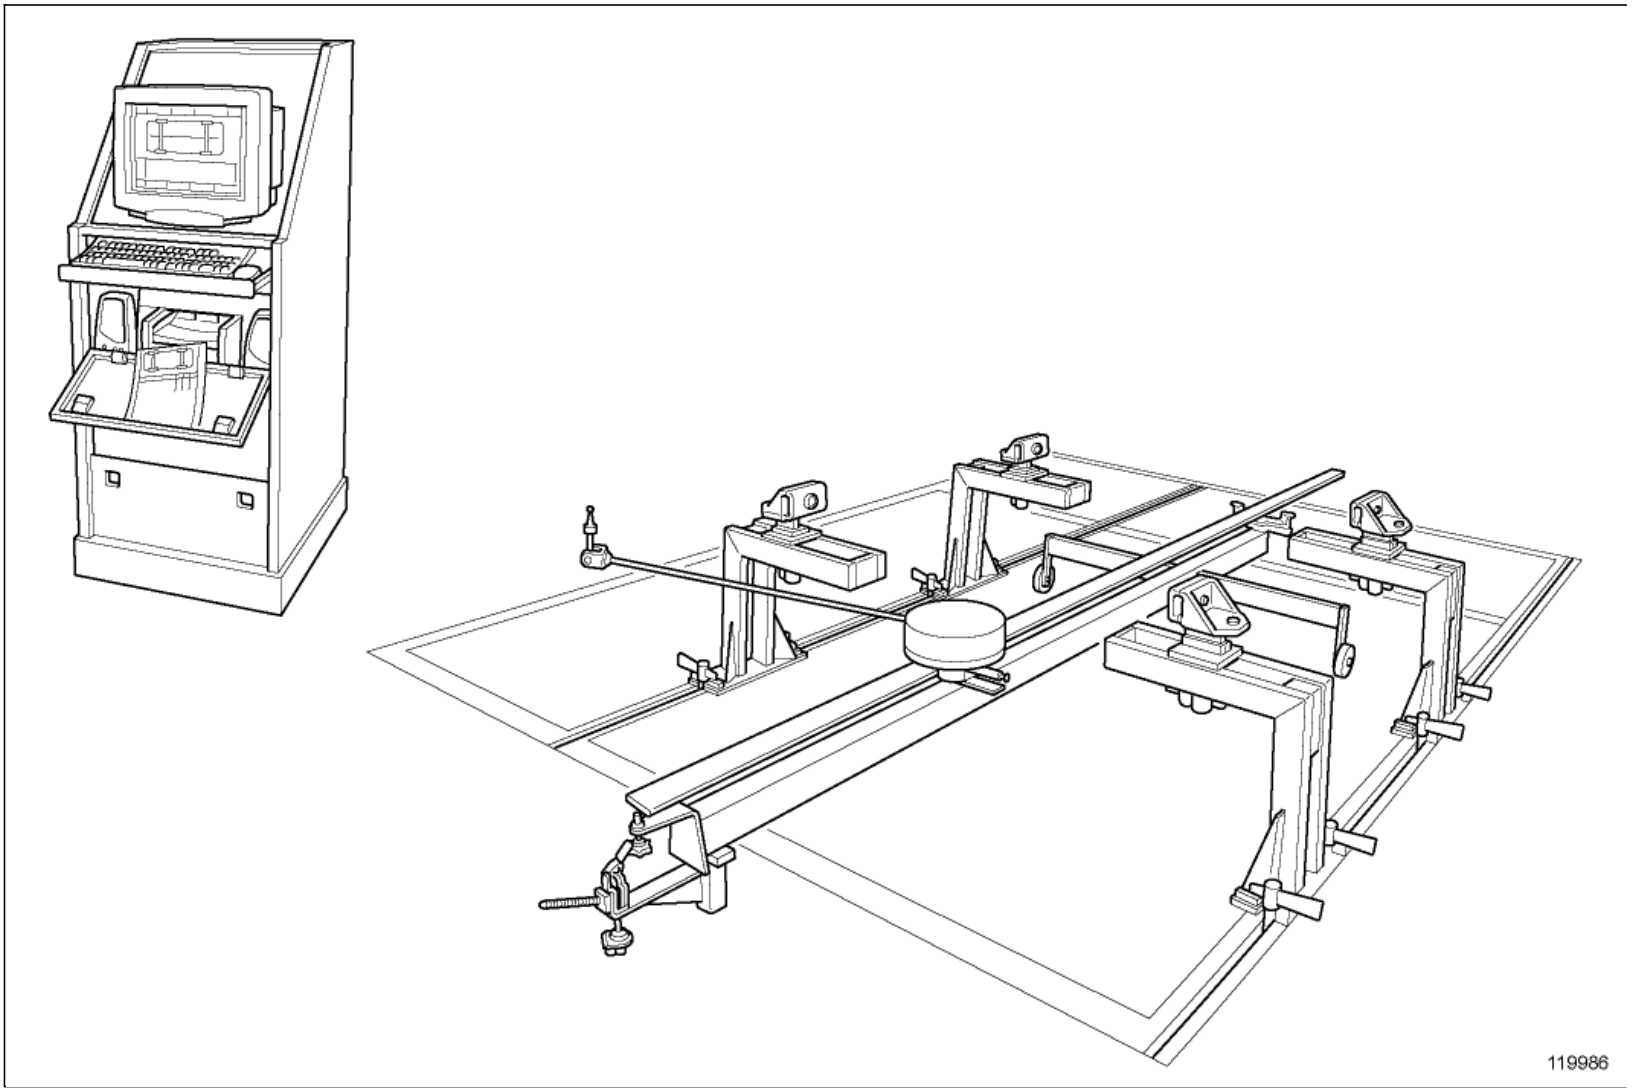
IMPACT FAULT FINDING EQUIPMENT: USE



1. MANUAL TRAMMEL GAUGE

Checking by symmetrical comparison of geometric deformation of the ends of side members or other points on the bodywork.

- Advantages:
  - simple, precise method.
- Disadvantages:
  - cannot be used to take measurements as coordinates (X; Y; Z),
  - cannot be used to measure asymmetric points.



2. MECHANICAL MEASURING SYSTEM

For measuring the understructure of a vehicle as a whole, with or without its mechanical components.

- Advantages:
  - enables geometric alignment of the parts.
- Disadvantages:
  - time-consuming to run fault finding procedure.

3. CAE MEASURING SYSTEM

For measuring the understructure of a vehicle as a whole, with or without its mechanical components.

Advantages:

- can be implemented quickly,
- best method for fault finding,
- gives a measurement report.

Disadvantage:

- Does not enable geometric alignment of the parts.

Repair-00x04x03x25-01x79-1-1-1.xml

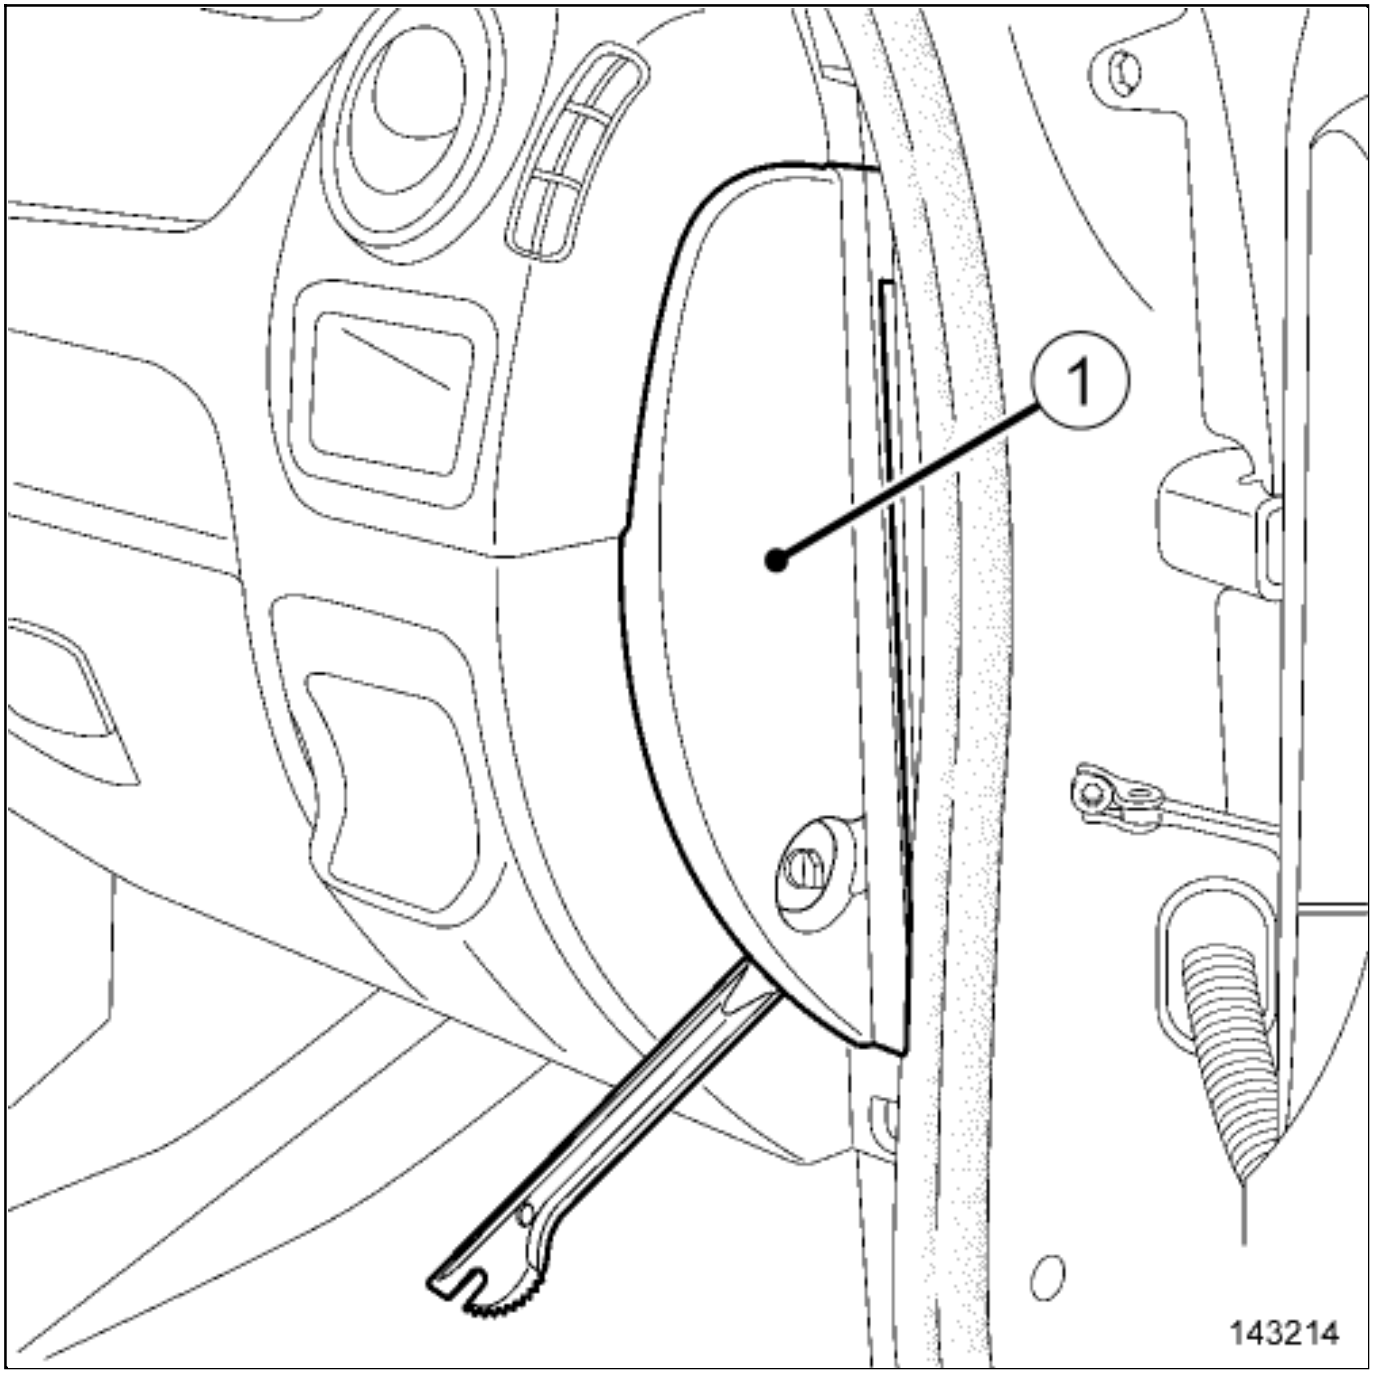
INHIBITOR SWITCH: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Set of trim removal levers.	Car. 1363

WARNING

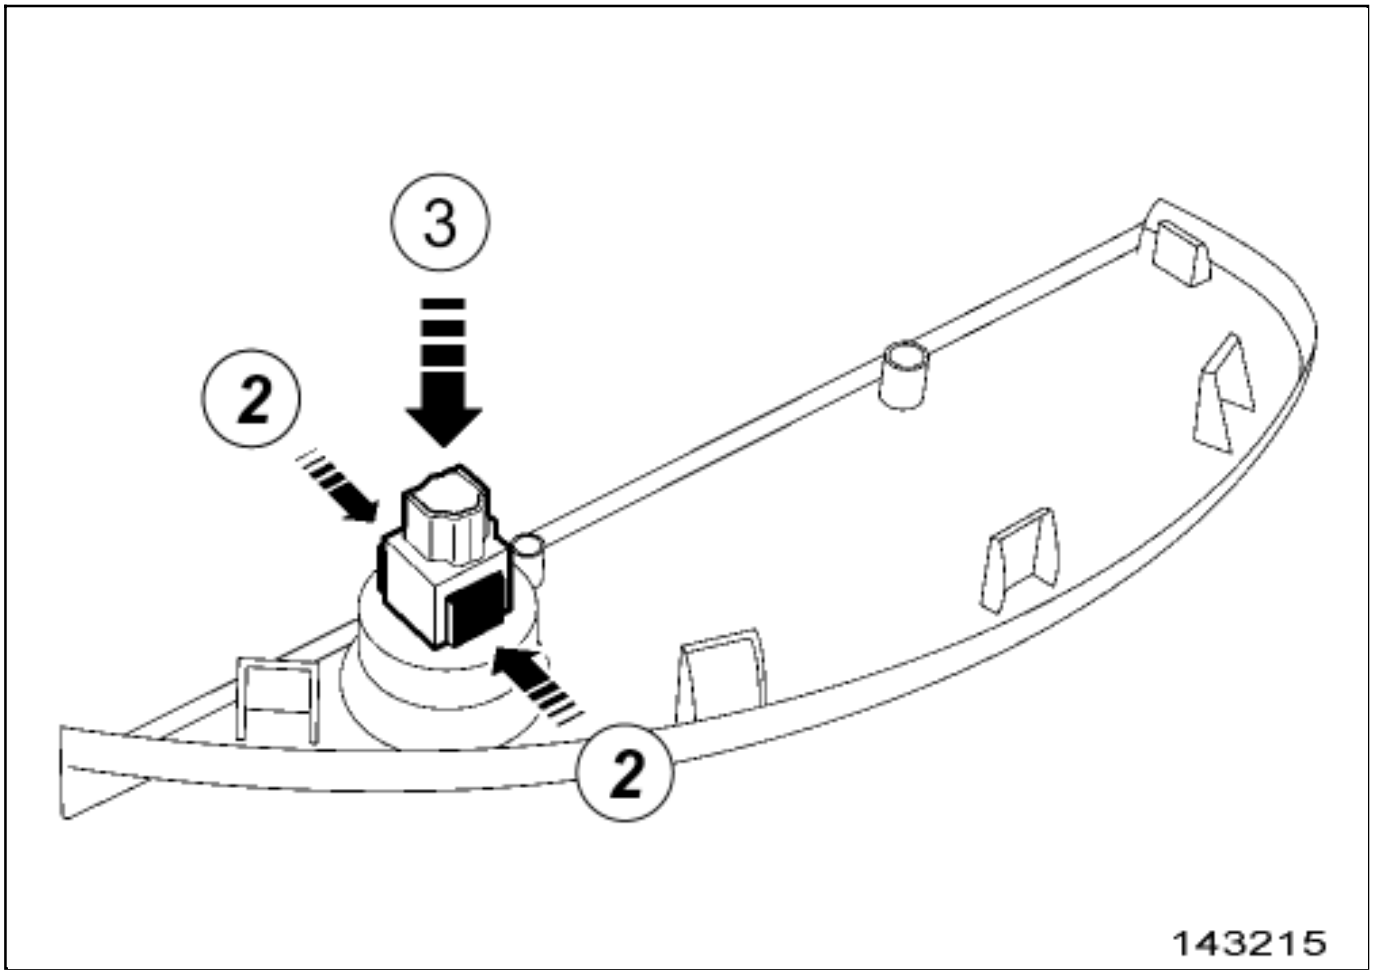
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair)

Vehicle: Precautions for the repair

REMOVAL



1. REMOVAL PREPARATION OPERATION

Apply the procedure for deactivating the safety systems.(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair)

- Partially remove the front side door seal (if equipped).
- Unclip the dashboard side panel(1) using the Set of trim removal levers.(Car. 1363) .
- Disconnect the inhibitor switch connector.

2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the inhibitor switch by pressing on the clips(2) and pushing towards(3) .

REFITTING

1. REFITTING OPERATION FOR PART CONCERNED

Proceed in the reverse order to removal.

2. FINAL OPERATION

Apply the procedure for activating the safety systems(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .

3. CHECKING AFTER REPAIR

Perform an operational check by moving the switch from the "ON" position to the "OFF" position.

In the "OFF" position, check the appearance of the "airbag OFF" message on the instrument panel.

Repair-31x02x01x25-01x37-1-18-1.xml

INJECTOR RAIL - INJECTORS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for removing high pressure pipes.	
Tool for fitting and pretightening the injector seal. Petrol Direct Injection.	Mot. 1533
Offset wrench for tightening High Pressure pump pipes.	Mot. 1746

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

Wear goggles with side protectors for this operation.

WARNING

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

Be careful when removing the injectors or the injection rail as there will be a quantity of fuel in the rail and the union.

WARNING

Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the rail is not under pressure,
- that the fuel temperature is not too high.

Working on the circuit with the engine running is strictly forbidden.

CAUTION

It is forbidden to directly test the injectors 12V.

Note:

For each parts, use the correct blanking plug available in the set of blanking plug.

Location and specifications (tightening torques, parts always to be replaced, etc...)(see **17B**, **Petrol injection** , **Petrol injection: List and location of components**, page) .

	is replaced by	High pressure pump	Injector rail + original pipe (grey nut)	After-sales pipe (black nut)	Tightening torques of the pipe
Part removed					
High pressure pump + original pipe (grey nut)		X		X	35 N.mon the pump, 35 N.mon the injector rail
High pressure pump + after-sales pipe (black nut)		X	X		35 N.mon the high pressure pump, 25 N.m on the injector rail
Injector rail + original pipe (grey nut)			X		35 N.mon the high pressure pump, 25 N.m on the injector rail
Injector rail + after-sales pipe (black nut)			X		35 N.mon the high pressure pump, 25 N.m on the injector rail
Original pipe (grey nut)				X	35 N.mon the high pressure pump, 35 N.m on the injector rail
After-sales pipe (black nut)			X		35 N.mon the high pressure pump, 25 N.m on the injector rail

REMOVAL

1. REMOVAL PREPARATION OPERATION

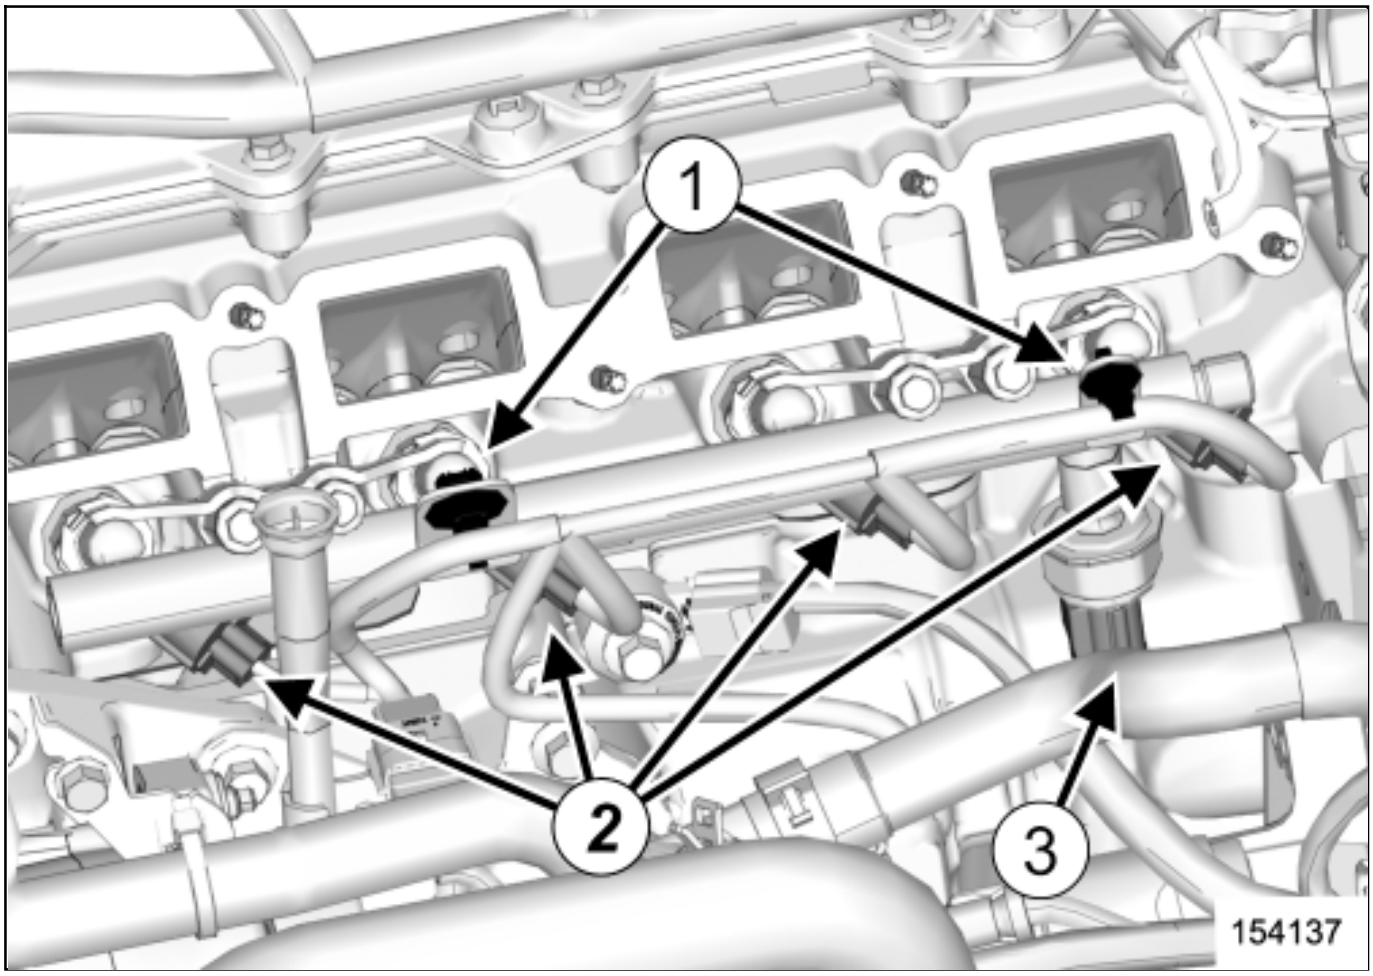
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Disconnect the battery Battery: Removal - Refitting .

Remove:

- the engine undertray bolts,
- the engine undertray,
- the turbocharger air outlet pipe Air inlet assembly: Exploded view ,
- the throttle valve Air inlet assembly: Exploded view ,
- the inlet distributor Air inlet assembly: Exploded view .

2. REMOVAL OPERATION



CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

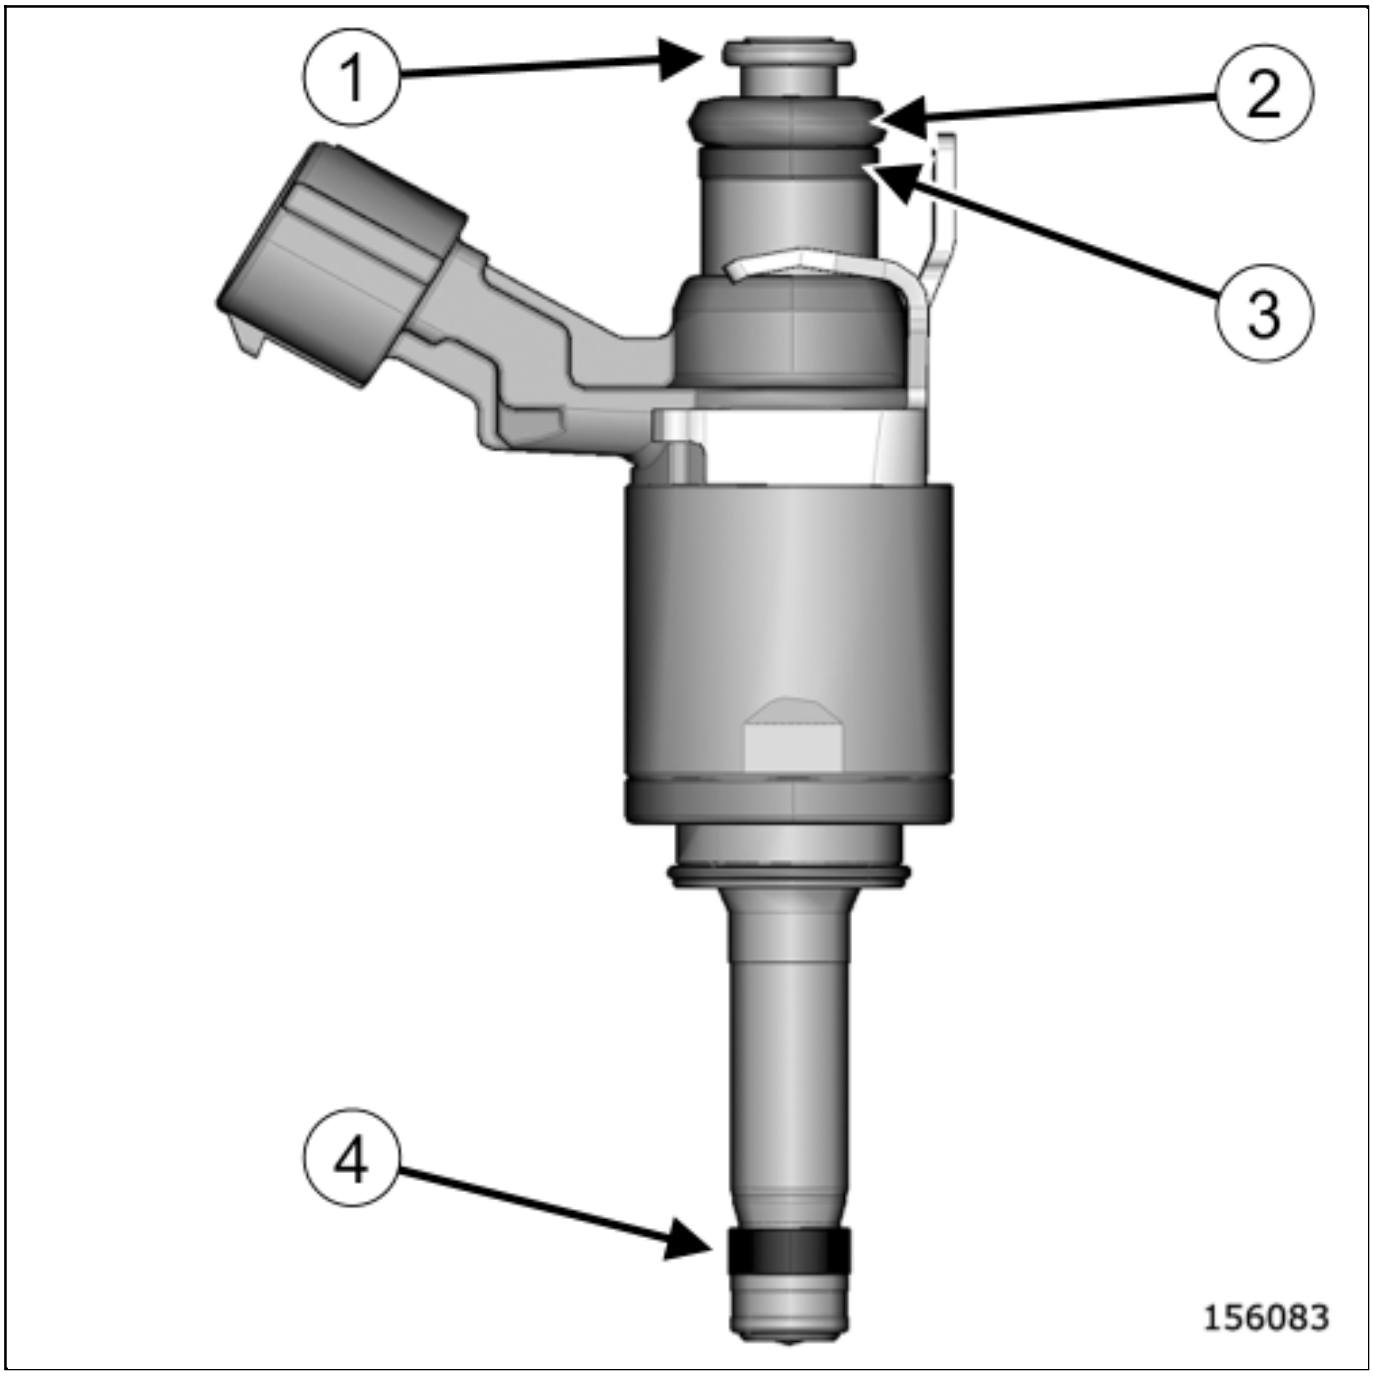
Remove (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the gasoline inlet high pressure pipe from the injector rail,
- the gasoline inlet high pressure pipe from the high pressure pump,
- the gasoline inlet high pressure pipe nut,
- the gasoline inlet high pressure pipe.

Unclip the injection wiring(1) from the injector rail.

Disconnect:

- the connector from each injectors(2) ,
- the rail pressure sensor connector(3) .



Remove (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the "injector rail - injectors" assembly bolts,
- the "injector rail - injectors" assembly.

Note:

The injector is held neither on the rail nor on the cylinder head.

Be careful never to shock the injector.

(1) Ring stopper

(2) Seal o-ring

(3) Thrust washer

(4) Teflon ring seal

Remove (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the injectors from the injector rail,
- the seal o-ring from the injector,
- the thrust washer from the injector,
- the ring stopper from the injector,
- the rail pressure sensor from the injector rail.

1- REMOVAL OF THE INJECTOR NOZZLE TEFLON RING SEAL

Clean the injector using the surface cleaner Vehicle: Parts and consumables for the repair .

Note:

it is forbidden to use a wire brush, sandpaper, etc...

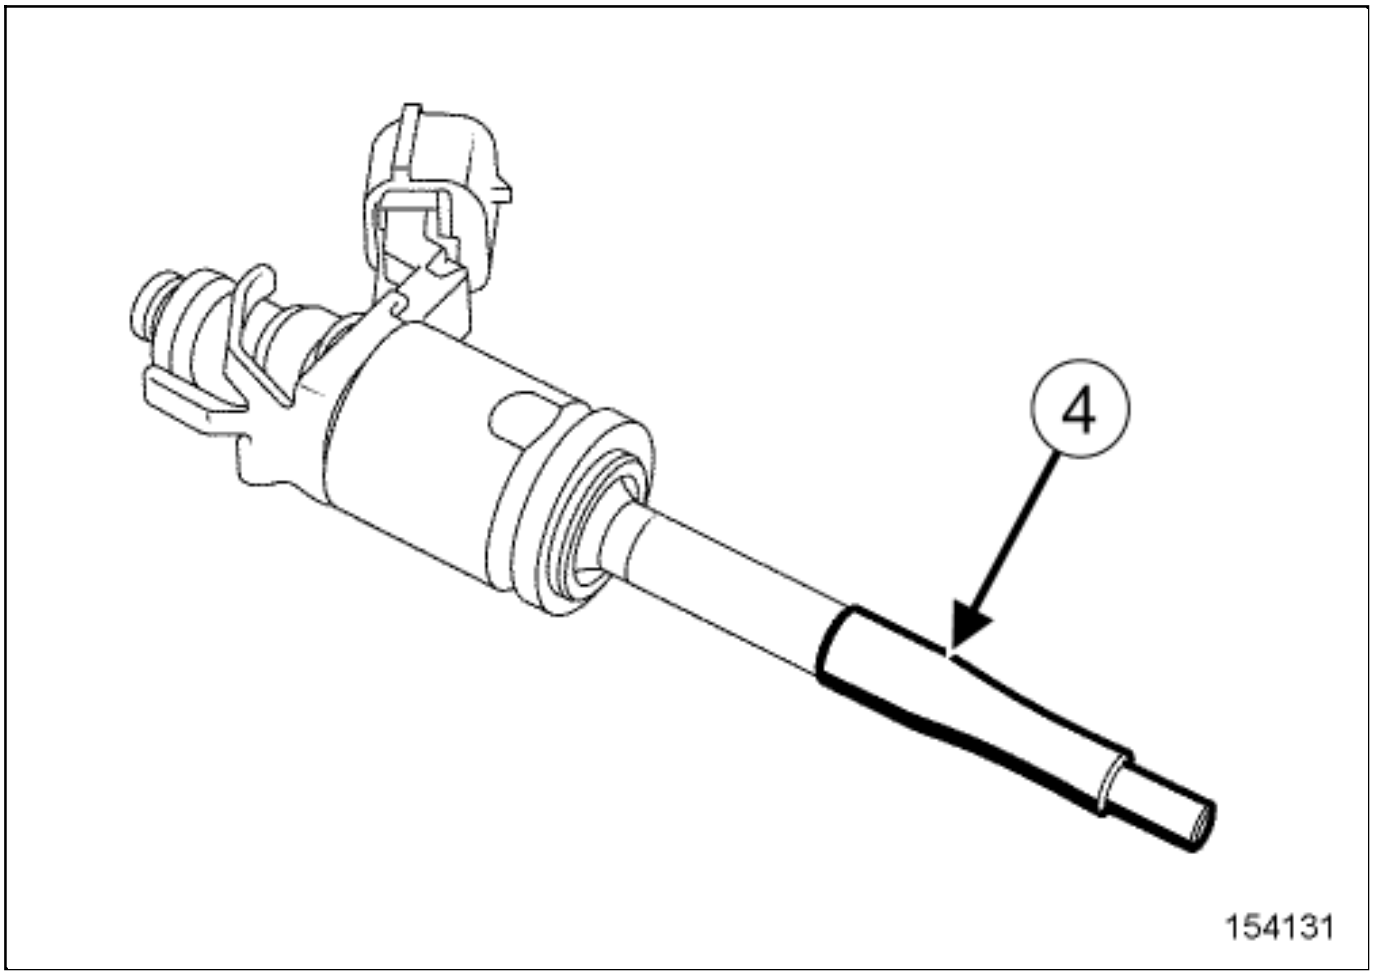
Cut the injector nozzle teflon ring seal with a pliers circlip.

Note:

Pay attention to the injector when cutting the injector nozzle teflon ring seal.

REFITTING

1. REFITTING PREPARATION OPERATION

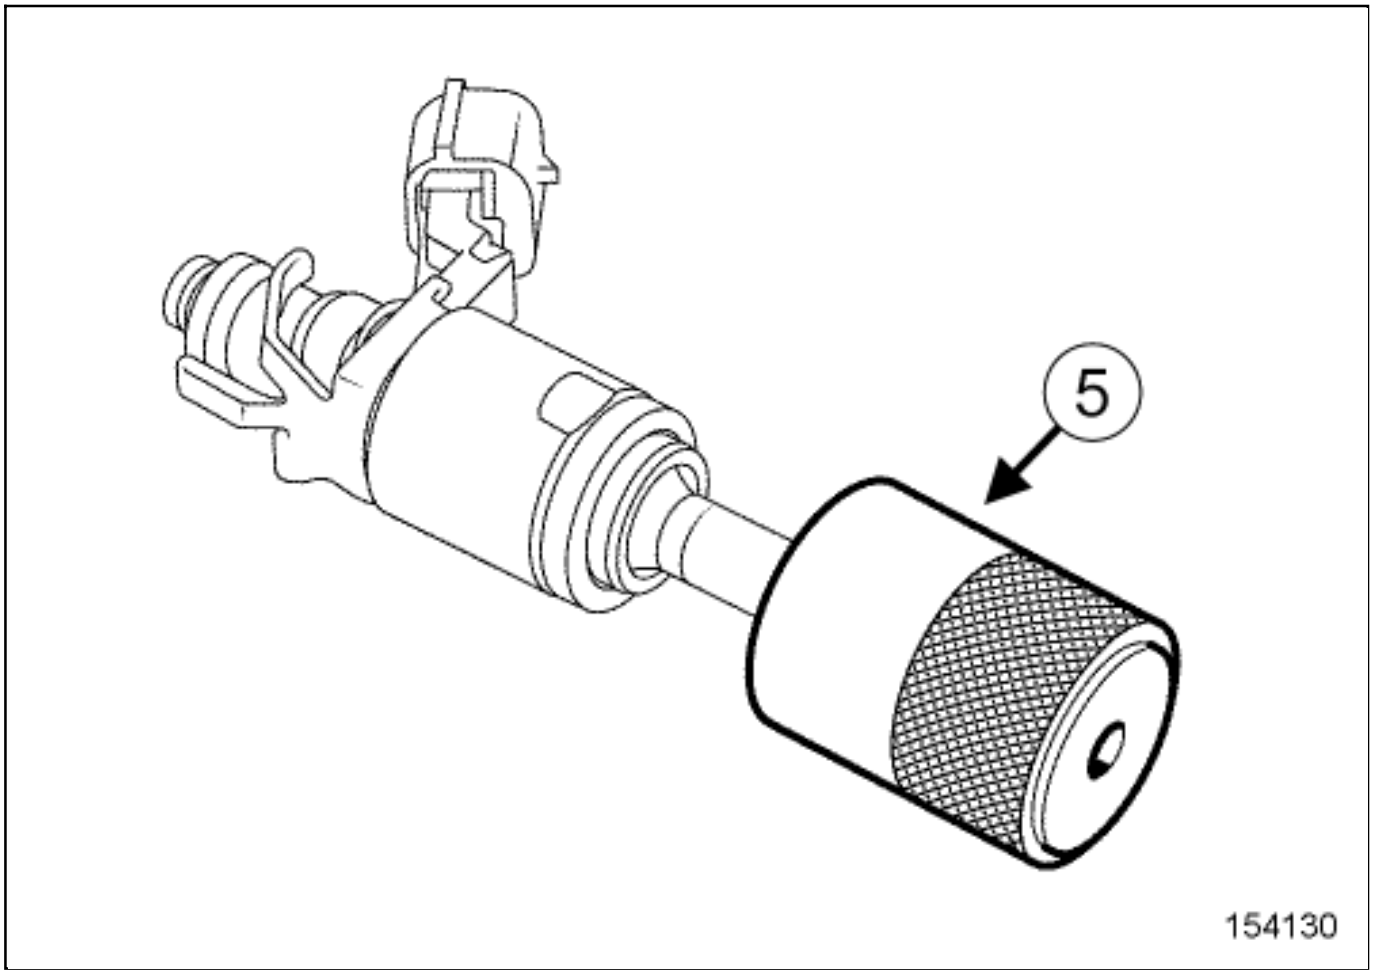


Parts always to be replaced:

- the injector nozzle teflon ring seal,
- the thrust washer,
- the seal o ring,
- the ring stopper from the injector,
- the gasoline inlet high pressure pipe (see table above),
- the injector rail (see table above).

Refit (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the new seal o ring on the injector,
- the new thrust washer on the injector,
- the new ring stopper on the injector.



1- REFITTING OF THE INJECTOR NOZZLE TEFLON RING SEAL

Fit:

- the cone of the toolTool for fitting and pretightening the injector seal. Petrol Direct Injection.(**Mot. 1533**) (**4**) on the injector,
- the new injector nozzle teflon ring seal on the cone.

Push the injector nozzle teflon ring seal into its groove.

Remove the cone of the toolTool for fitting and pretightening the injector seal. Petrol Direct Injection. (Mot. 1533) (4) .

Push the reforming tool(5) around the injector nozzle to retract the seal during minimum 30 seconds to set correct outside diameter for teflon ring seal.

Refit (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the injectors on the new injector rail,
- the rail pressure sensor on the new injector rail.

Torque tighten the rail pressure sensor(see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) **.**

2. REFITTING OPERATION

Refit (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the "injector rail - injectors" assembly,
- the "injector rail - injectors" assembly bolts.

Note:

The injector is held neither on the rail nor on the cylinder head.

Be careful never to shock the injector.

Torque tighten in the order the "injector rail - injectors" assembly bolts(see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) **.**

Connect:

- the connector of each injectors,
- the rail pressure sensor connector.

Clip the injection wiring on the injector rail.

Refit (see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) :

- the gasoline inlet high pressure pipe,
- the gasoline inlet high pressure pipe nut,

- the gasoline inlet high pressure pipe on the injector rail,
- the gasoline inlet high pressure pipe on the high pressure pump.

Torque tighten(see **17B**, **Petrol injection**, **Petrol injection: List and location of components**, page) using the tool Tool for removing high pressure pipes. and the toolOffset wrench for tightening High Pressure pump pipes.(**Mot. 1746**) :

- the gasoline inlet high pressure pipe nut,
- the gasoline inlet high pressure pipe on the injector rail,
- the gasoline inlet high pressure pipe on the high pressure pump.

WARNING

After any intervention, check for leaks in the fuel system. Run the engine at idle speed until the start of the group cooling fans, and make several acceleration cycles. Check for leaks.

Proceed in the reverse order to removal.

INJECTOR RAIL - INJECTORS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for removing high pressure pipes.	
Tool for fitting and pretightening the injector seal. Petrol Direct Injection.	Mot. 1533

Original pipe (grey nut)				X	35 N.mon the high pressure pump, 35 N.m on the injector rail
After-sales pipe (black nut)			X		35 N.mon the high pressure pump, 25 N.m on the injector rail

REMOVAL

1. REMOVAL PREPARATION OPERATION

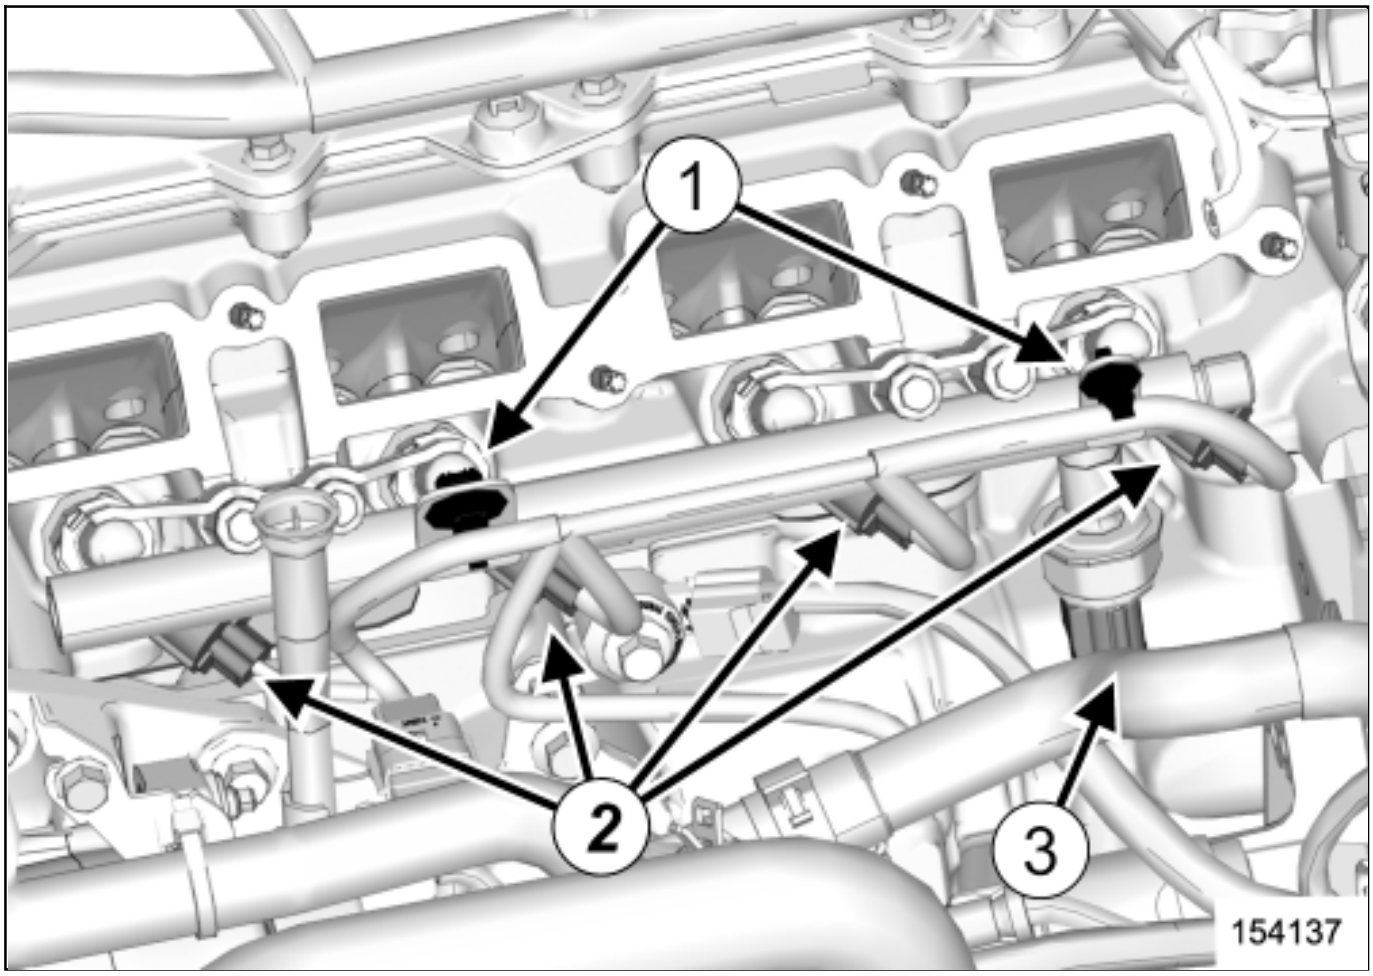
Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Disconnect the battery Battery: Removal - Refitting .

Remove:

- the engine undertray bolts,
- the engine undertray,
- the turbocharger air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the throttle valve (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the inlet distributor (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REMOVAL OPERATION



CAUTION

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

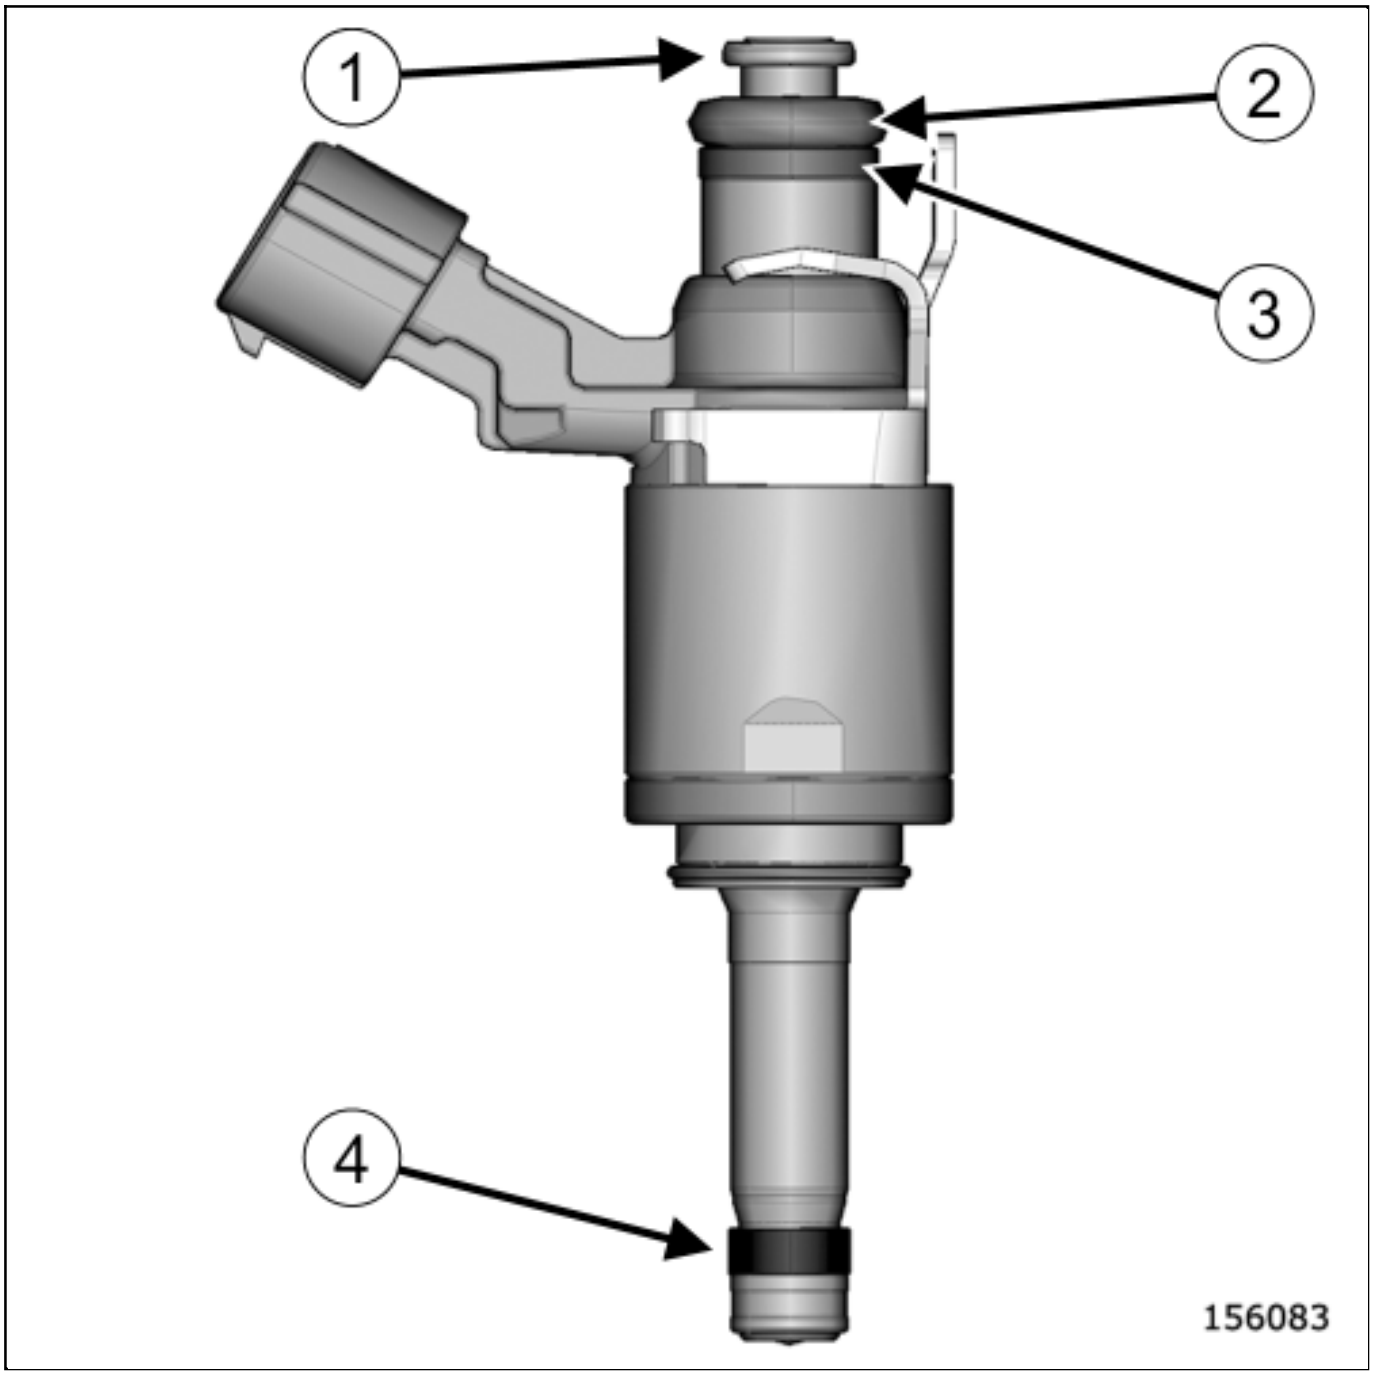
Remove (see **Petrol injection: List and location of components**) :

- the gasoline inlet high pressure pipe from the injector rail,
- the gasoline inlet high pressure pipe from the high pressure pump,
- the gasoline inlet high pressure pipe nut,
- the gasoline inlet high pressure pipe.

Unclip the injection wiring(1) from the injector rail.

Disconnect:

- the connector from each injectors(2) ,
- the rail pressure sensor connector(3) .



Remove (see **Petrol injection: List and location of components**) :

- the "injector rail - injectors" assembly bolts,
- the "injector rail - injectors" assembly.

Note:

The injector is held neither on the rail nor on the cylinder head.

Be careful never to shock the injector.

(1) Ring stopper

(2) Seal o-ring

(3) Thrust washer

(4) Teflon ring seal

Remove (see **Petrol injection: List and location of components**) :

- the injectors from the injector rail,
- the seal o-ring from the injector,
- the thrust washer from the injector,
- the ring stopper from the injector,
- the rail pressure sensor from the injector rail.

1- REMOVAL OF THE INJECTOR NOZZLE TEFLON RING SEAL

Clean the injector using the surface cleaner[Vehicle: Parts and consumables for the repair] .

Note:

it is forbidden to use a wire brush, sandpaper, etc...

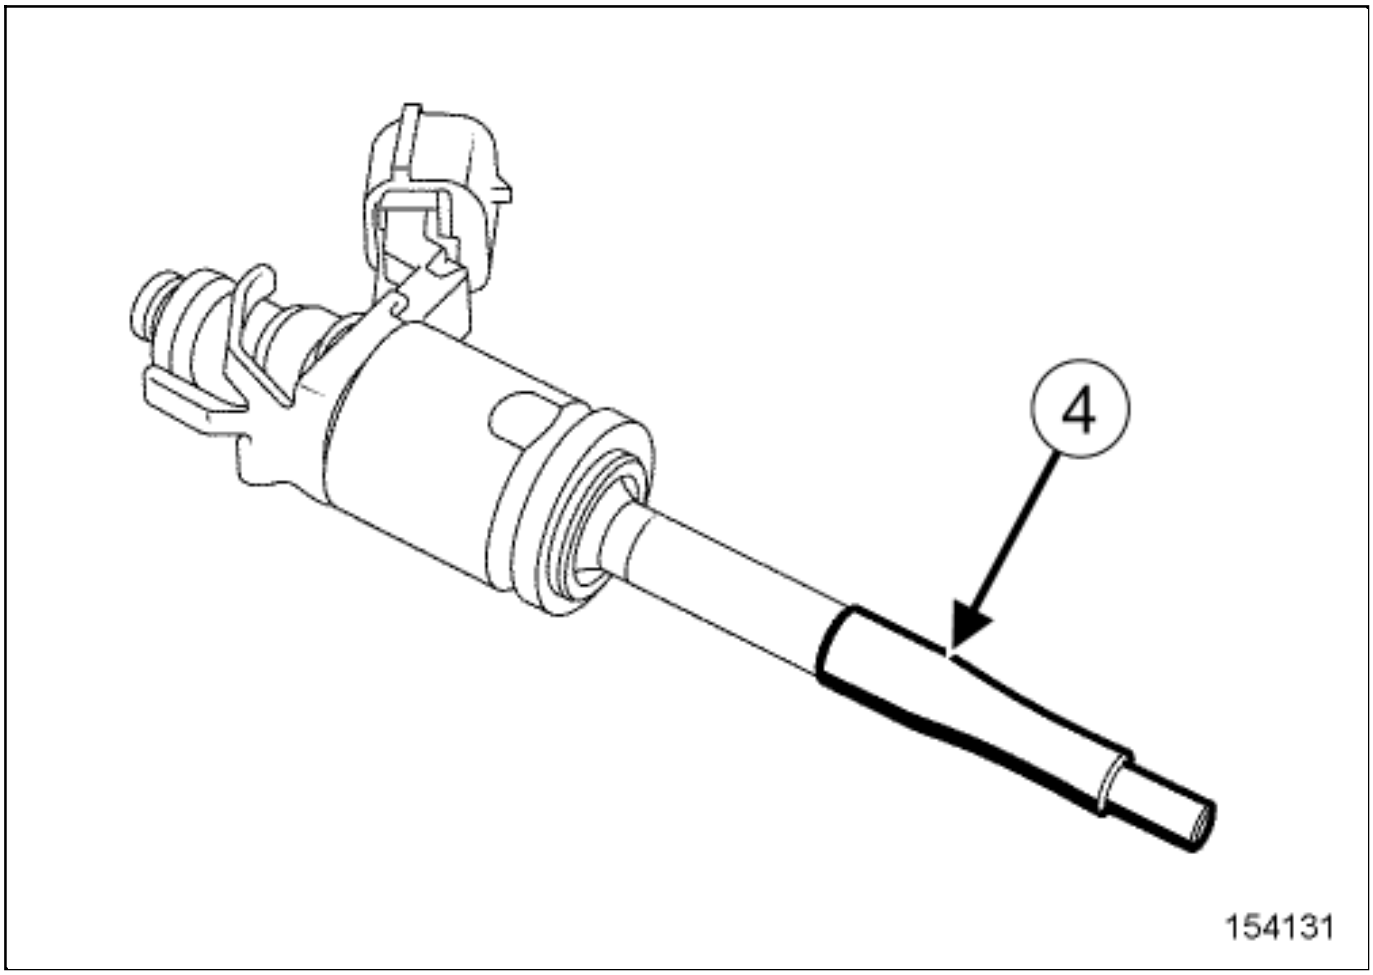
Cut the injector nozzle teflon ring seal with a pliers circlip.

Note:

Pay attention to the injector when cutting the injector nozzle teflon ring seal.

REFITTING

1. REFITTING PREPARATION OPERATION

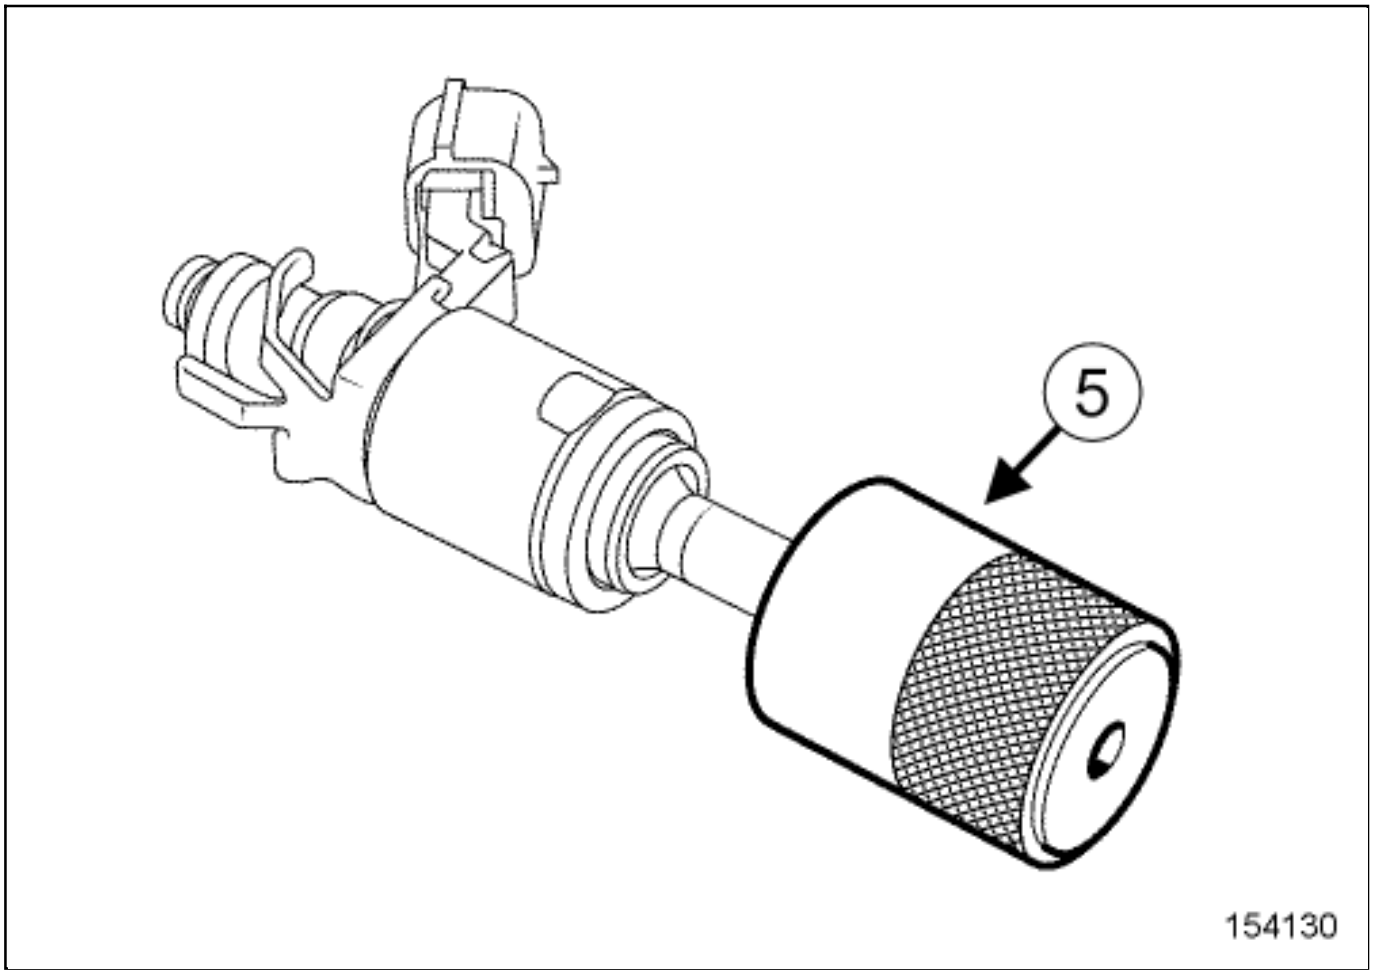


Parts always to be replaced:

- the injector nozzle teflon ring seal,
- the thrust washer,
- the seal o ring,
- the ring stopper from the injector,
- the gasoline inlet high pressure pipe (see table above),
- the injector rail (see table above).

Refit (see **Petrol injection: List and location of components**) :

- the new seal o ring on the injector,
- the new thrust washer on the injector,
- the new ring stopper on the injector.



1- REFITTING OF THE INJECTOR NOZZLE TEFLON RING SEAL

Fit:

- the cone of the toolTool for fitting and pretightening the injector seal. Petrol Direct Injection.(**Mot. 1533**) (**4**) on the injector,
- the new injector nozzle teflon ring seal on the cone.

Push the injector nozzle teflon ring seal into its groove.

Remove the cone of the toolTool for fitting and pretightening the injector seal. Petrol Direct Injection. (Mot. 1533) (4) .

Push the reforming tool(5) around the injector nozzle to retract the seal during minimum 30 seconds to set correct outside diameter for teflon ring seal.

Refit (see **Petrol injection: List and location of components**) :

- the injectors on the new injector rail,
- the rail pressure sensor on the new injector rail.

Torque tighten the rail pressure sensor(see **Petrol injection: List and location of components**) .

2. REFITTING OPERATION

Refit (see **Petrol injection: List and location of components**) :

- the "injector rail - injectors" assembly,
- the "injector rail - injectors" assembly bolts.

Note:

The injector is held neither on the rail nor on the cylinder head.

Be careful never to shock the injector.

Torque tighten in the order the "injector rail - injectors" assembly bolts(see **Petrol injection: List and location of components**) .

Connect:

- the connector of each injectors,
- the rail pressure sensor connector.

Clip the injection wiring on the injector rail.

Refit (see **Petrol injection: List and location of components**) :

- the gasoline inlet high pressure pipe,
- the gasoline inlet high pressure pipe nut,

- the gasoline inlet high pressure pipe on the injector rail,
- the gasoline inlet high pressure pipe on the high pressure pump.

Torque tighten(see **Petrol injection: List and location of components**) using the toolTool for removing high pressure pipes. and the toolOffset wrench for tightening High Pressure pump pipes.(**Mot. 1746**) :

- the gasoline inlet high pressure pipe nut,
- the gasoline inlet high pressure pipe on the injector rail,
- the gasoline inlet high pressure pipe on the high pressure pump.

WARNING

After any intervention, check for leaks in the fuel system. Run the engine at idle speed until the start of the group cooling fans, and make several acceleration cycles. Check for leaks.

Proceed in the reverse order to removal.

INLET DISTRIBUTOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

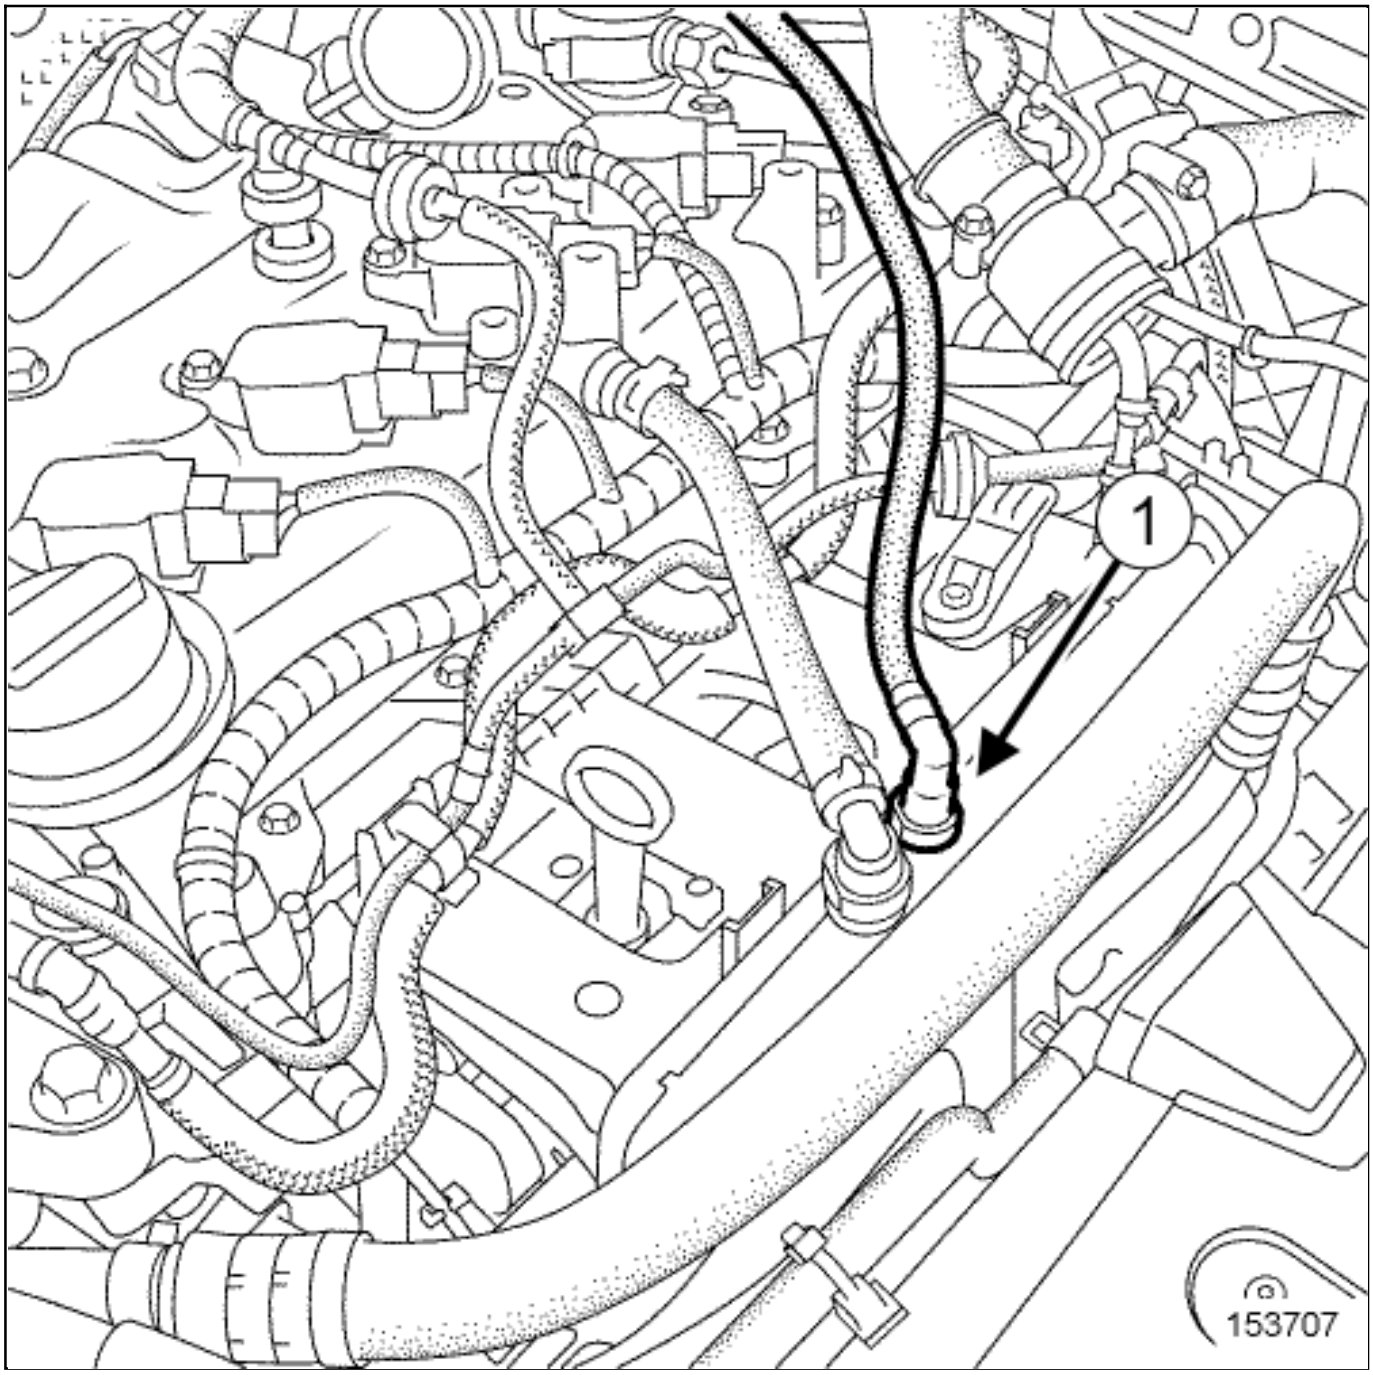
parts always to be replaced:

inlet distributor seal

WARNING

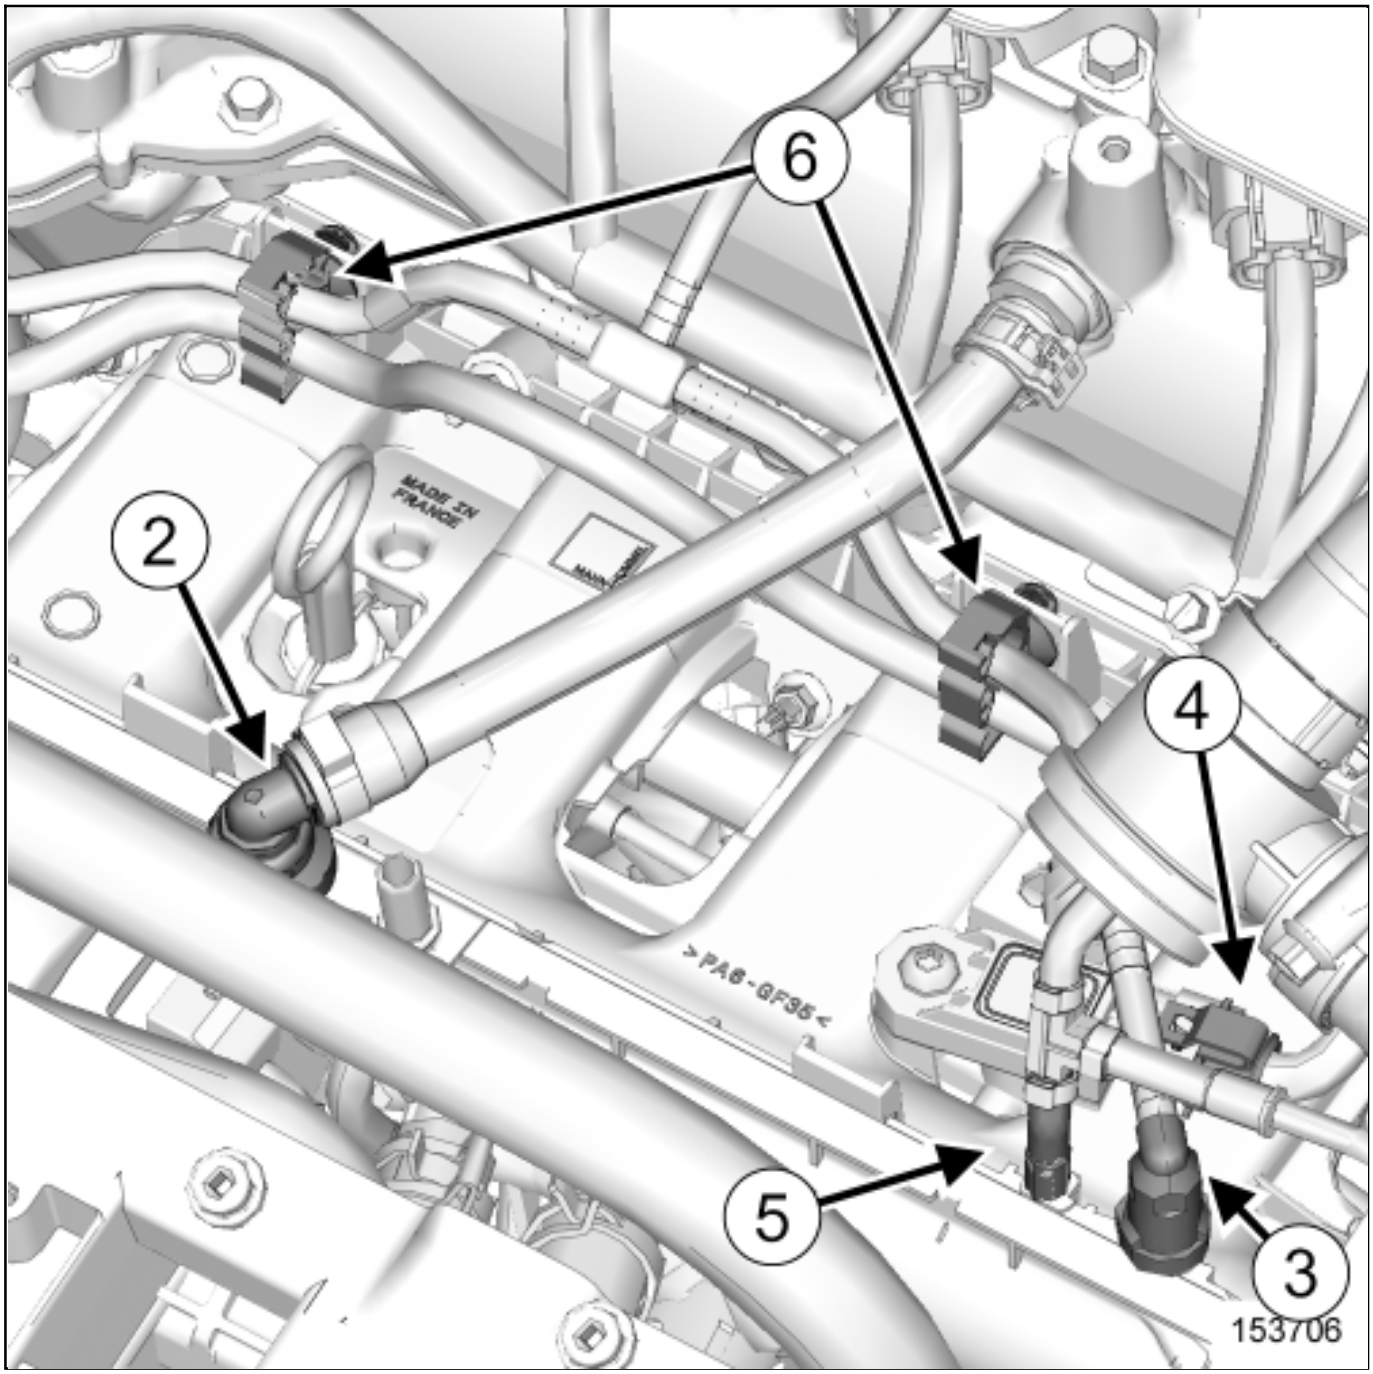
Wear leaktight gloves (Nitrile type) for this operation.

CAUTION



To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .



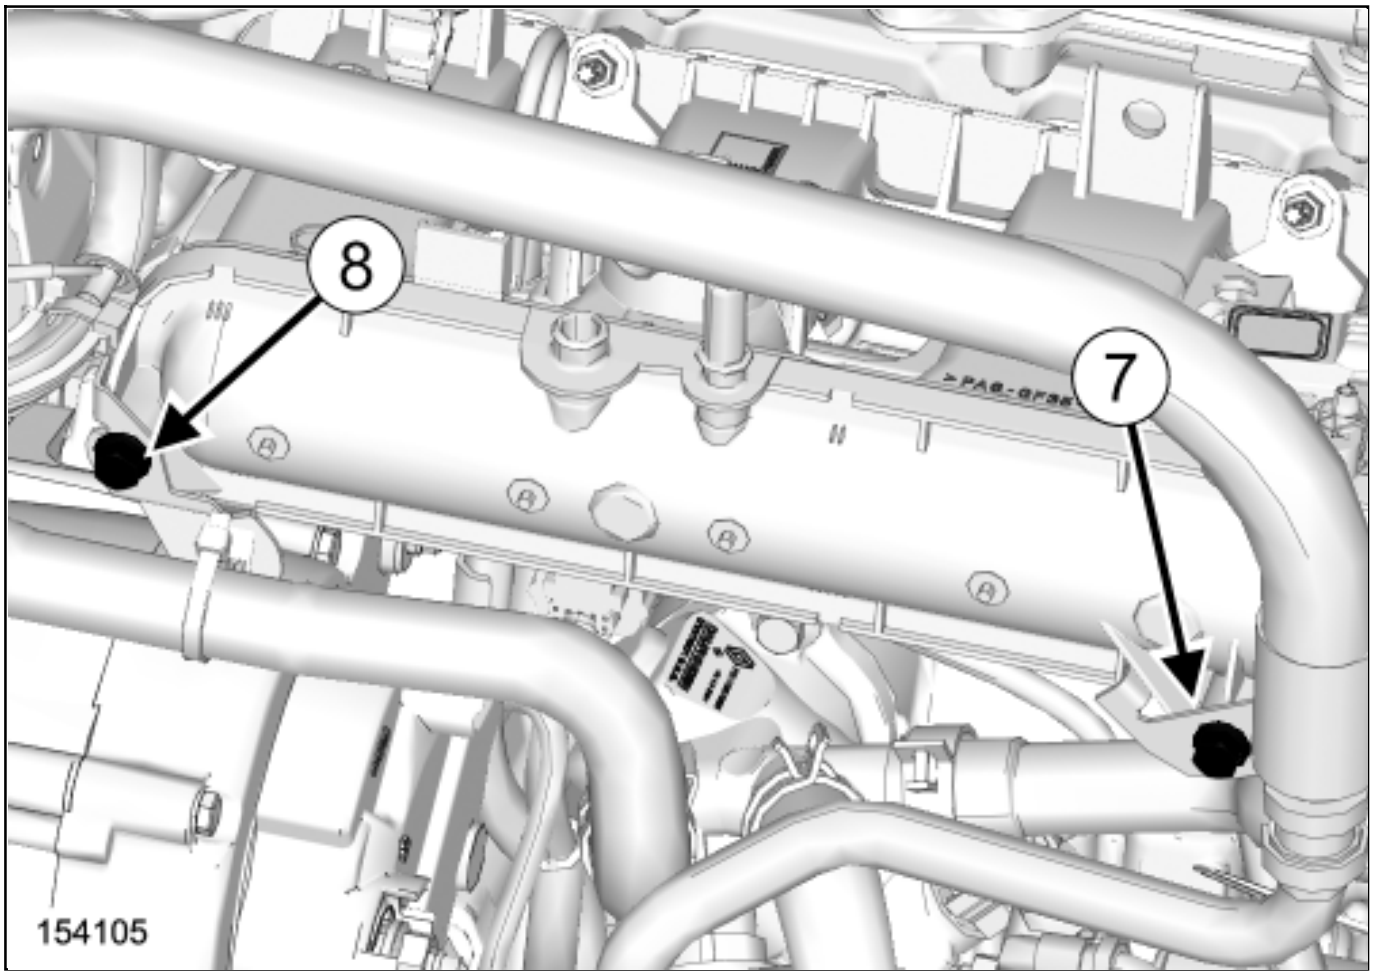
REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the intercooler air inlet pipe,
  - the intercooler air outlet pipe,
  - the throttle valve.

Disconnect the vacuum pipe(1) from the brake servo.

Disconnect:



- the oil vapour rebreathing pipe(2) ,
- the petrol vapour rebreather pipe(3) ,
- the turbocharging pressure sensor connector(4) .

Move aside the discharge valve vacuum pipe clip.

Disconnect the discharge valve vacuum pipe(5) .

Unclip from the clips(6) :

- the petrol vapour rebreather pipe,
- the fuel inlet pipe.

Remove from the inlet distributor:

- the bolt(7) of the air conditioning pipe support,
- the bolt(8) of the cooling hose support.

Unclip the cooling hose from the inlet distributor.

Remove the engine oil dipstick[Engine oil circuit assembly: Exploded view] .

2. REMOVAL OPERATION

Remove [(see 12A, Fuel mixture, Air inlet assembly: Exploded view)] :

- the inlet distributor nuts,
- the inlet distributor,
- the inlet distributor seals.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: inlet distributor seal .

Use surface cleaner[Vehicle: Parts and consumables for the repair] to clean and degrease:

- the housing of each inlet distributor seal,
- the joint face on the cylinder block.

Fit new seals to the inlet distributor.

Note:

If a stud becomes loose during the removal operation, torque tighten the inlet distributor studs 6 N.m.

1- IN THE EVENT OF REPLACEMENT

- Refit the inlet air temperature sensor.
- Connect the pressure measurement pipe of the pressure regulator.
- Fit the clip to the pressure measurement pipe of the pressure regulator.

Note:

For "temperate climate" version, remove the heated oil vapour sensor.

2. REFITTING OPERATION

- Refit the inlet distributor(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Torque tighten the inlet distributor nuts(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Proceed in the reverse order to removal.

INLET DISTRIBUTOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

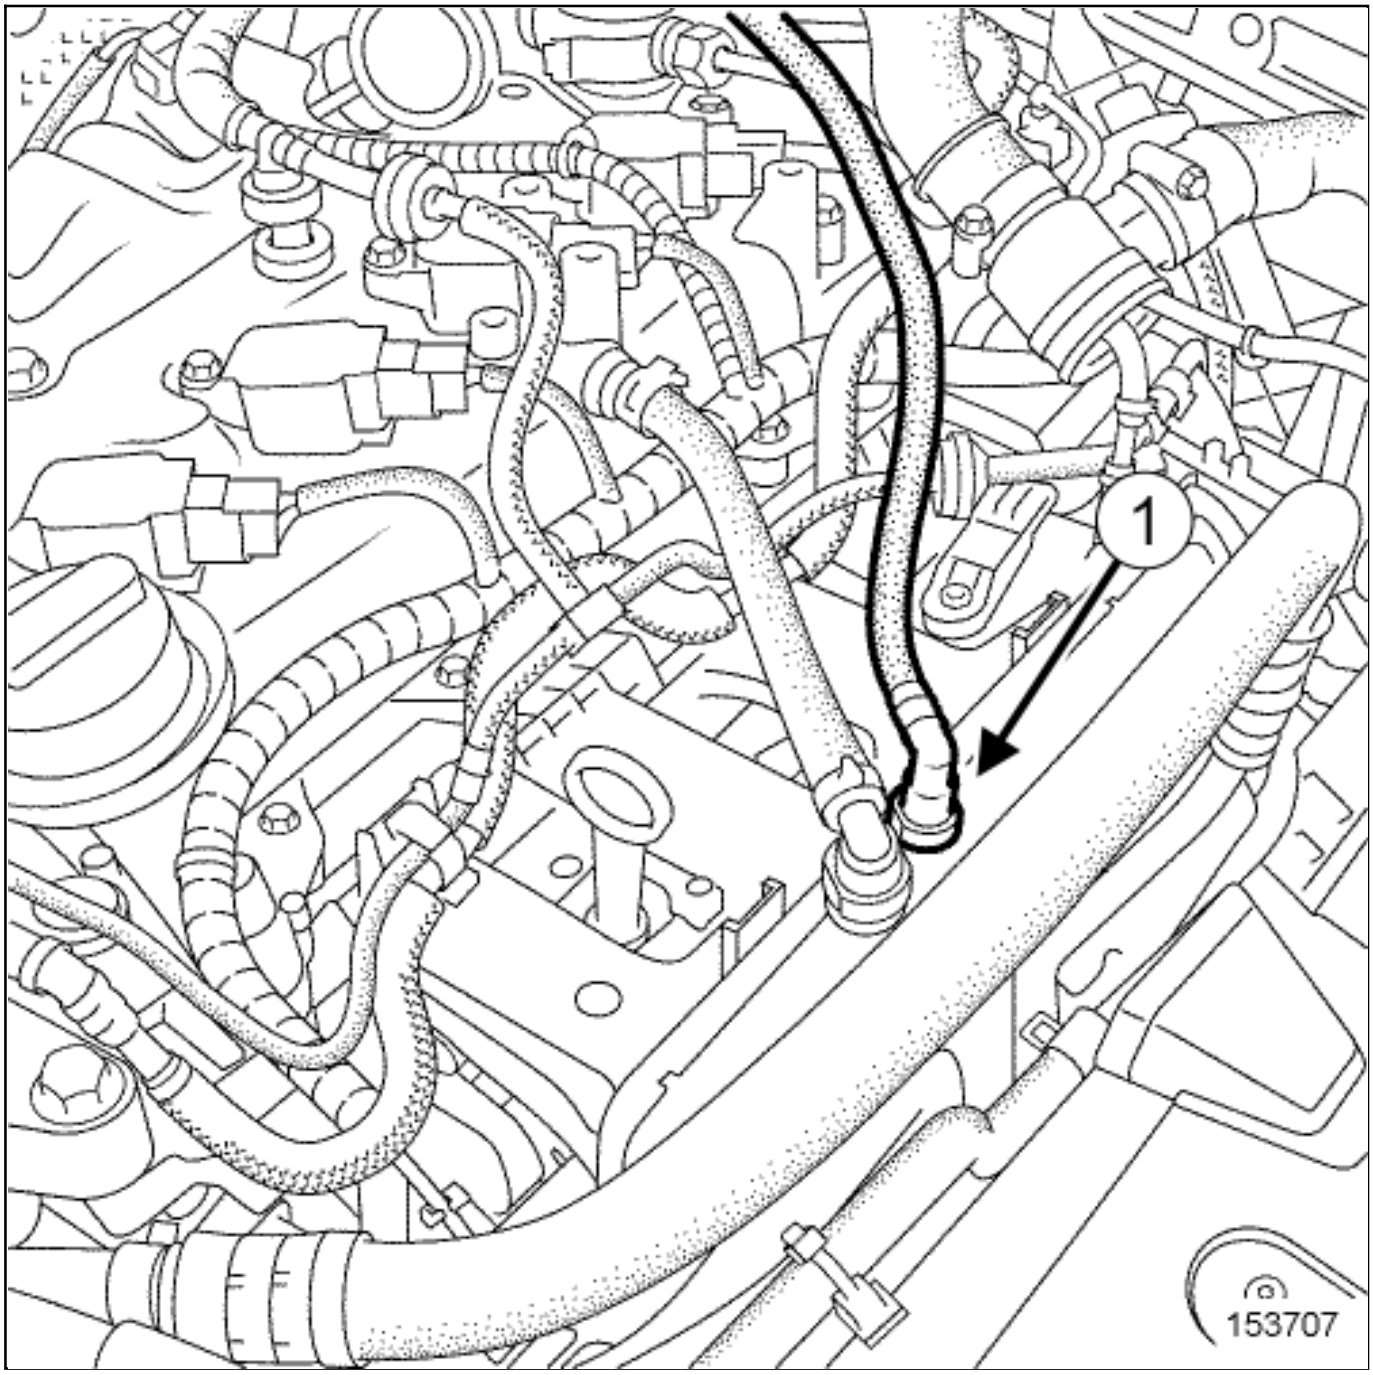
parts always to be replaced:

inlet distributor seal

WARNING

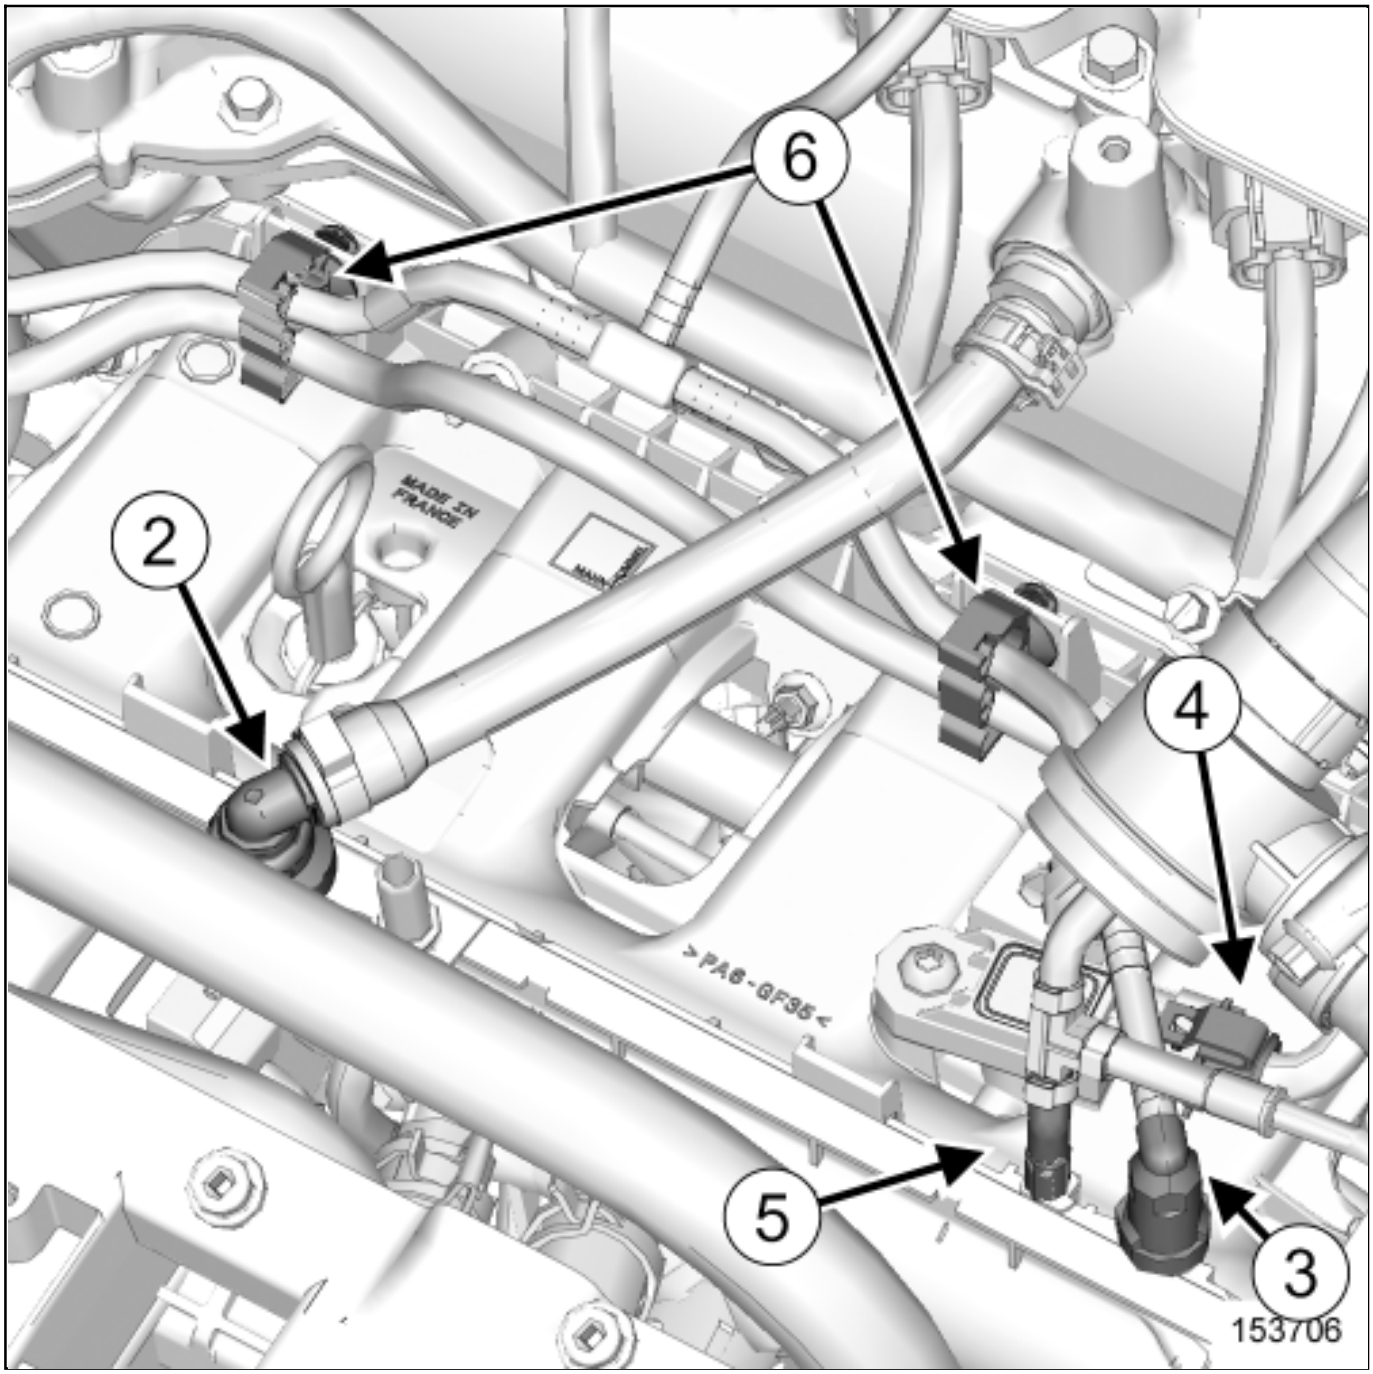
Wear leaktight gloves (Nitrile type) for this operation.

CAUTION



To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .



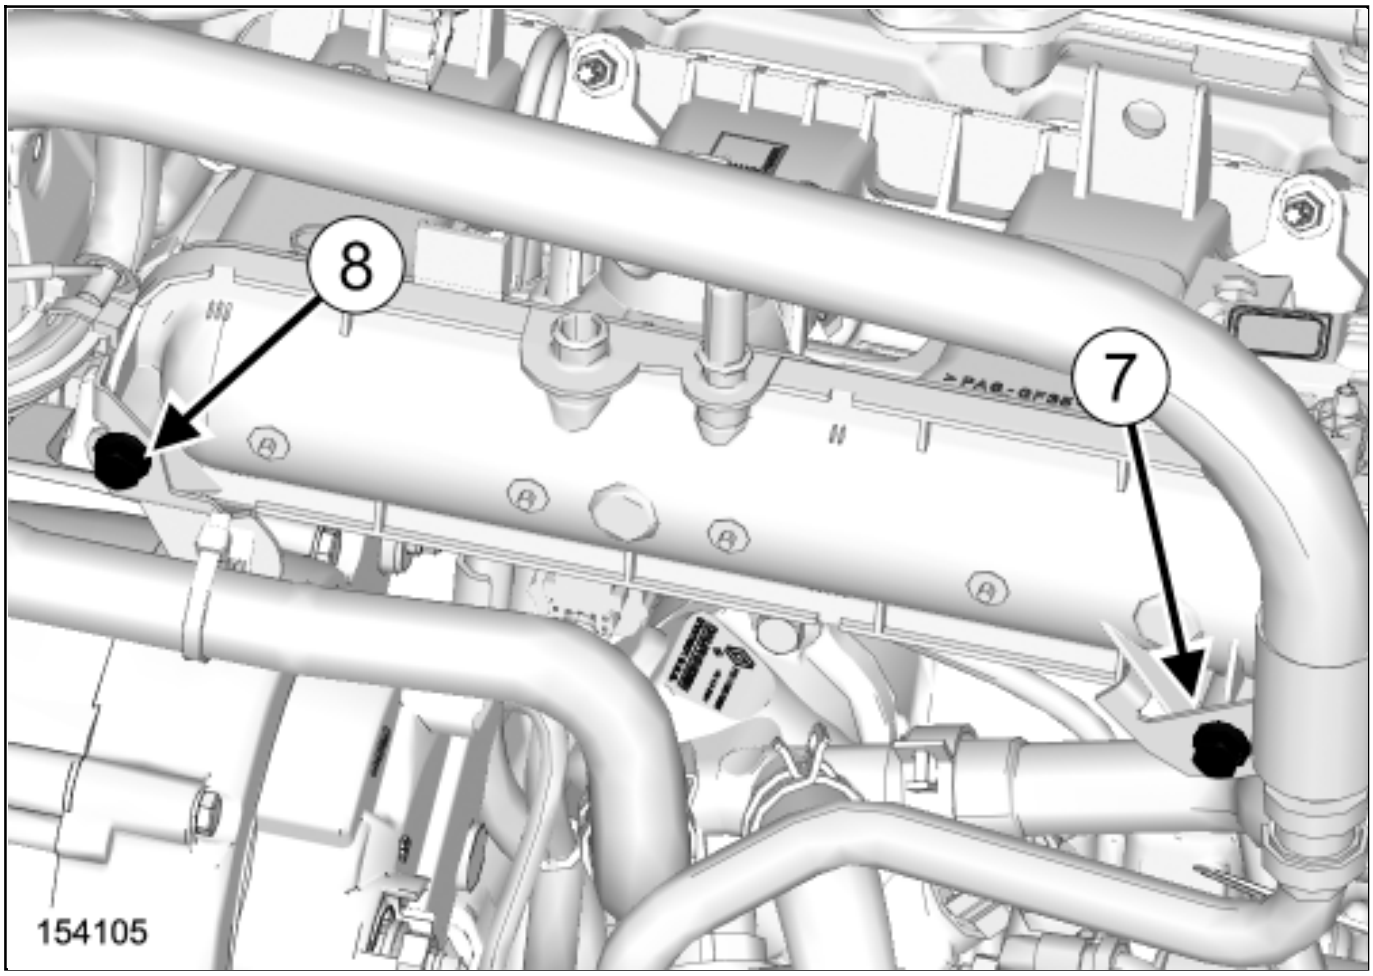
REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the intercooler air inlet pipe,
  - the intercooler air outlet pipe,
  - the throttle valve.

Disconnect the vacuum pipe(1) from the brake servo.

Disconnect:



- the oil vapour rebreathing pipe(2) ,
- the petrol vapour rebreather pipe(3) ,
- the turbocharging pressure sensor connector(4) .

Move aside the discharge valve vacuum pipe clip.

Disconnect the discharge valve vacuum pipe(5) .

Unclip from the clips(6) :

- the petrol vapour rebreather pipe,
- the fuel inlet pipe.

Remove from the inlet distributor:

- the bolt(7) of the air conditioning pipe support,
- the bolt(8) of the cooling hose support.

Unclip the cooling hose from the inlet distributor.

Remove the engine oil dipstick(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

2. REMOVAL OPERATION

Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :

- the inlet distributor nuts,
- the inlet distributor,
- the inlet distributor seals.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: inlet distributor seal .

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the housing of each inlet distributor seal,
- the joint face on the cylinder block.

Fit new seals to the inlet distributor.

Note:

If a stud becomes loose during the removal operation, torque tighten the inlet distributor studs 6 N.m.

1- IN THE EVENT OF REPLACEMENT

- Refit the inlet air temperature sensor.
- Connect the pressure measurement pipe of the pressure regulator.
- Fit the clip to the pressure measurement pipe of the pressure regulator.

Note:

For "temperate climate" version, remove the heated oil vapour sensor.

2. REFITTING OPERATION

- Refit the inlet distributor (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Torque tighten the inlet distributor nuts (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Proceed in the reverse order to removal.

INPUT SHAFT LIP SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Inertia seal extractor	Bvi. 1948
Tools for removal - refitting of input shaft seals (DC4)	Bvi. 1954

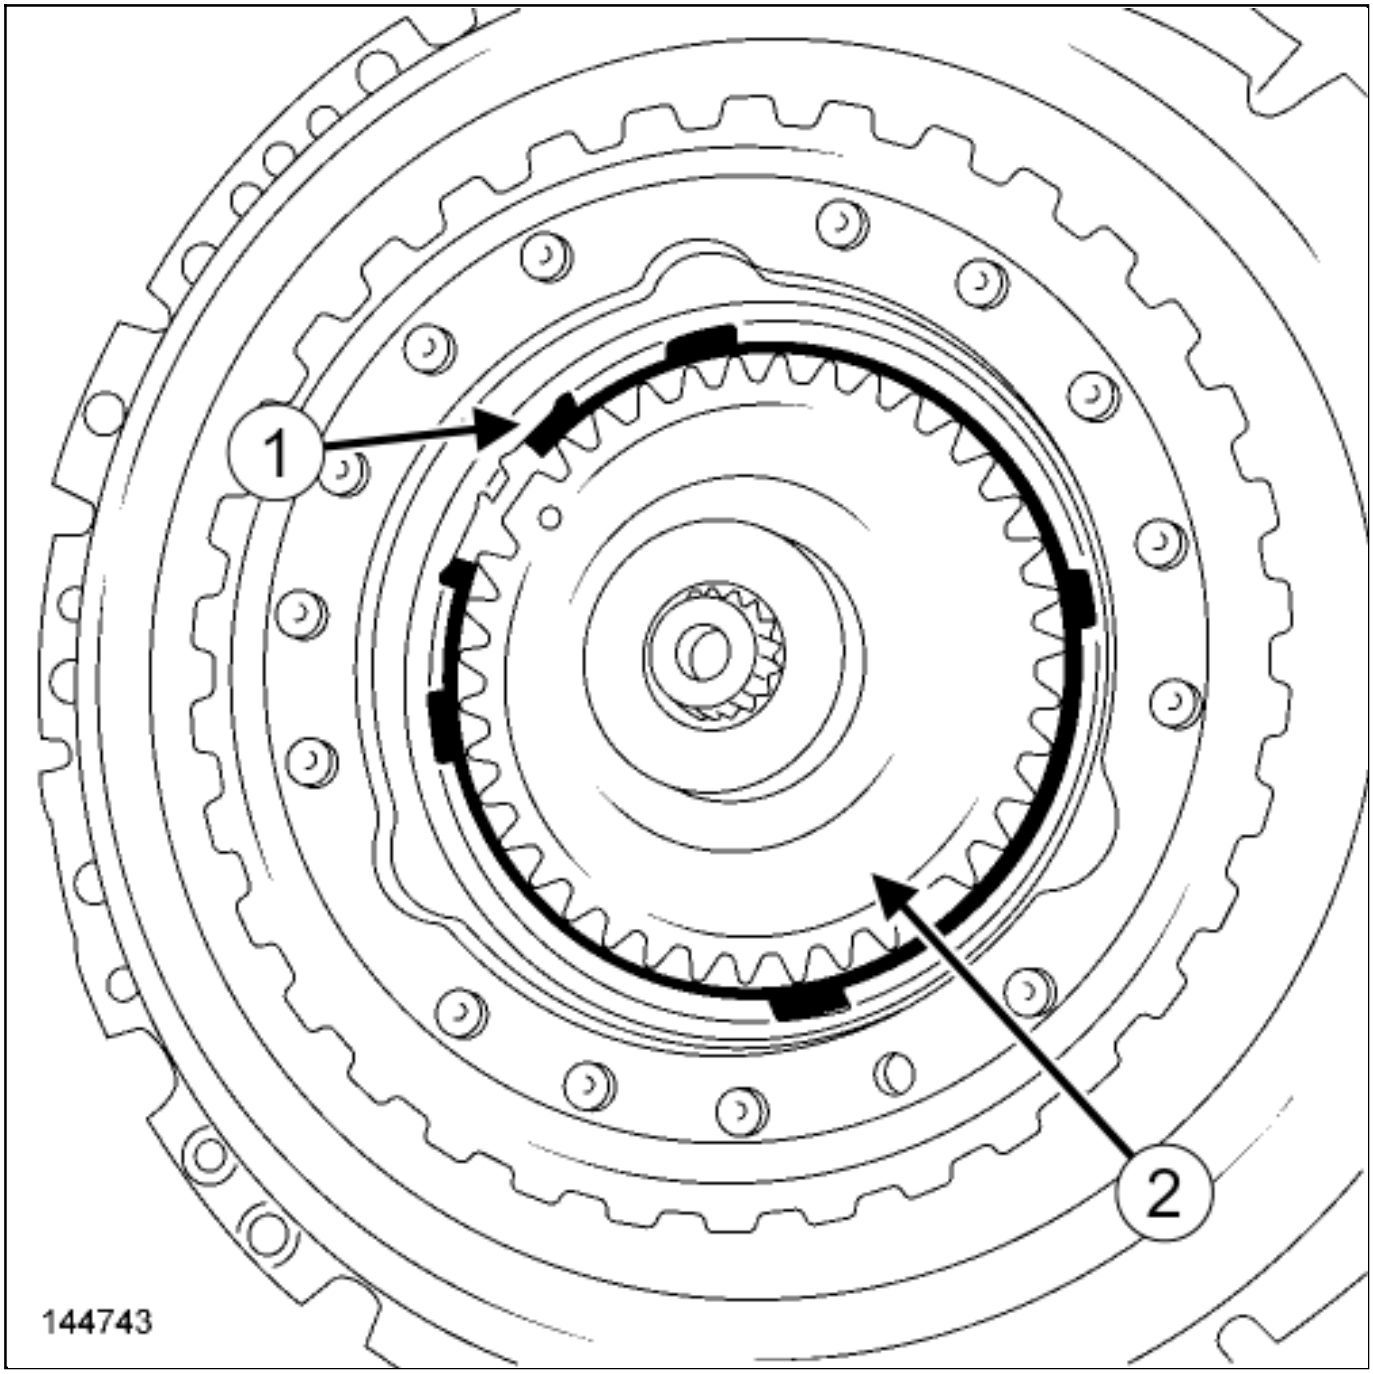
parts always to be replaced:
Input shaft lip seal
Input shaft lip seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



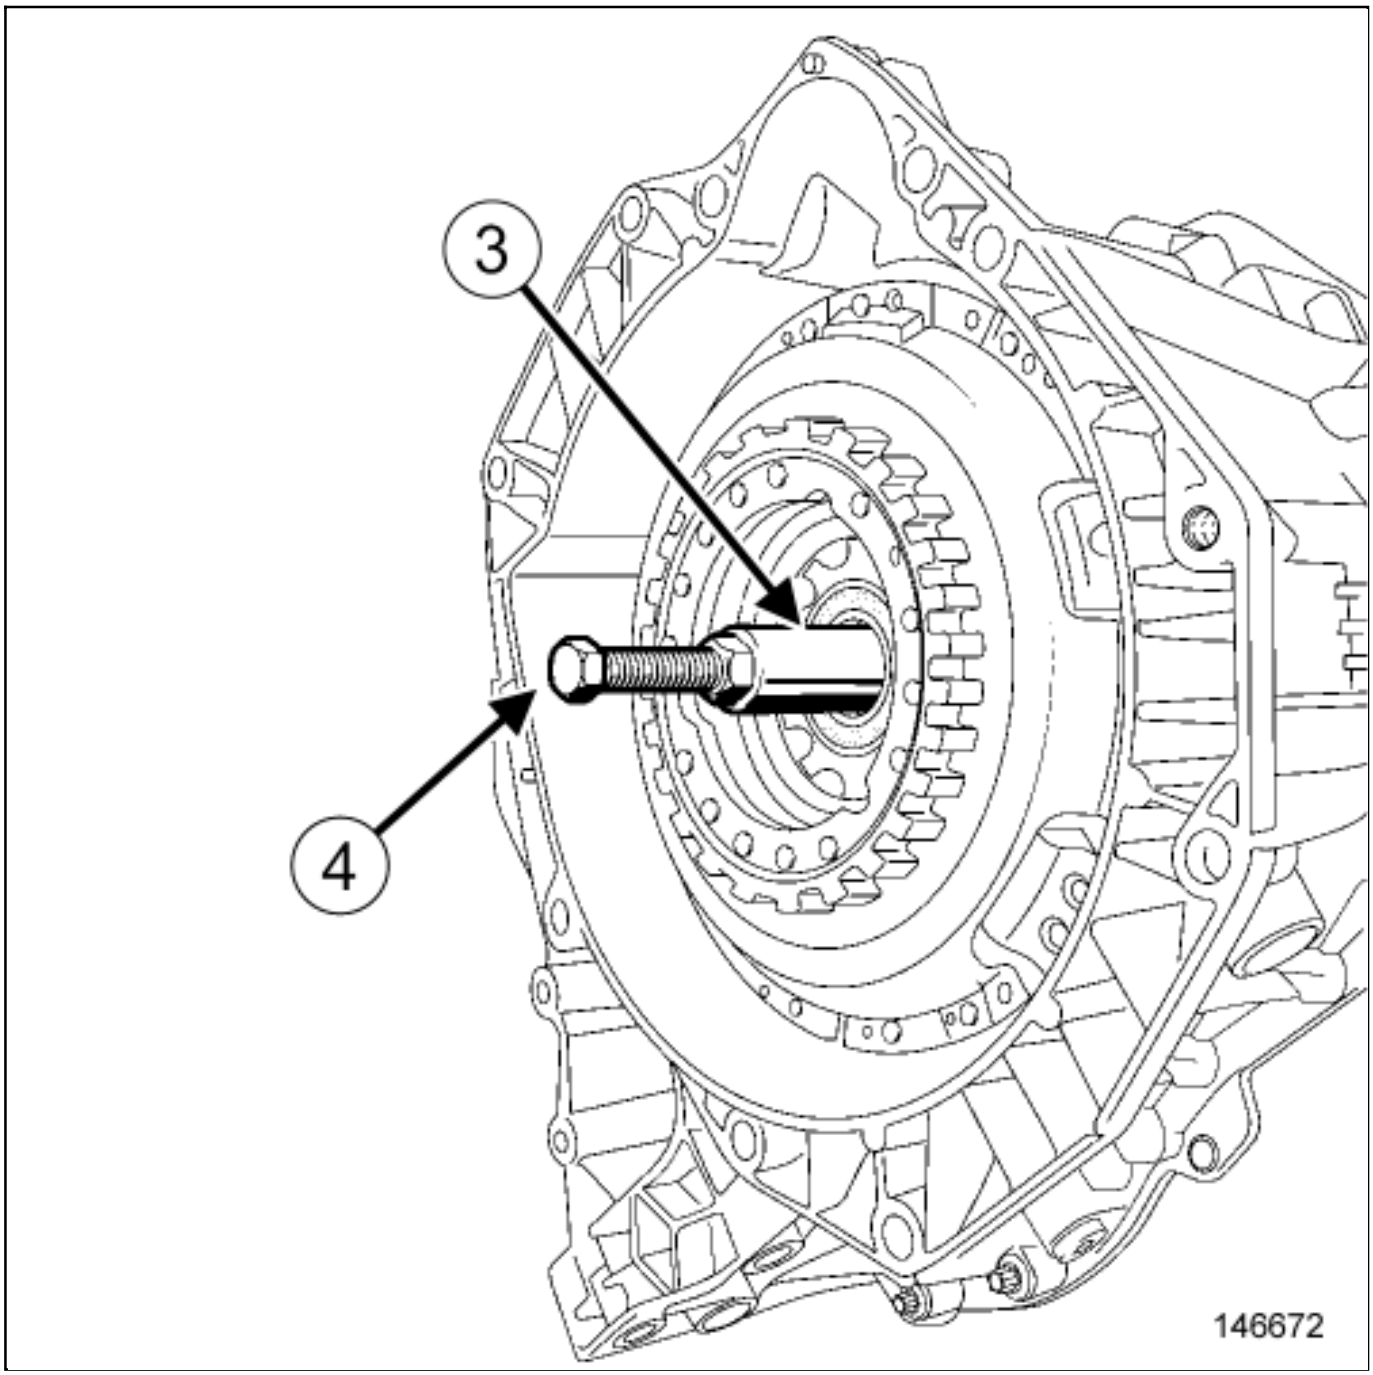
(see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,

Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .



Remove:

- the clip(1) of the crownwheel connecting the small input shaft and the clutch plate,
- the crownwheel(2) connecting the small input shaft and the clutch plate.

2. REMOVAL OPERATION

CAUTION

Failure to adhere to the following procedure may damage the gearbox.

Note:

Perform the operation with the gearbox positioned horizontally in order to prevent foreign bodies from entering between the two input shafts.

After removing the lip seal, check that the lip seal compression spring came out with the seal.

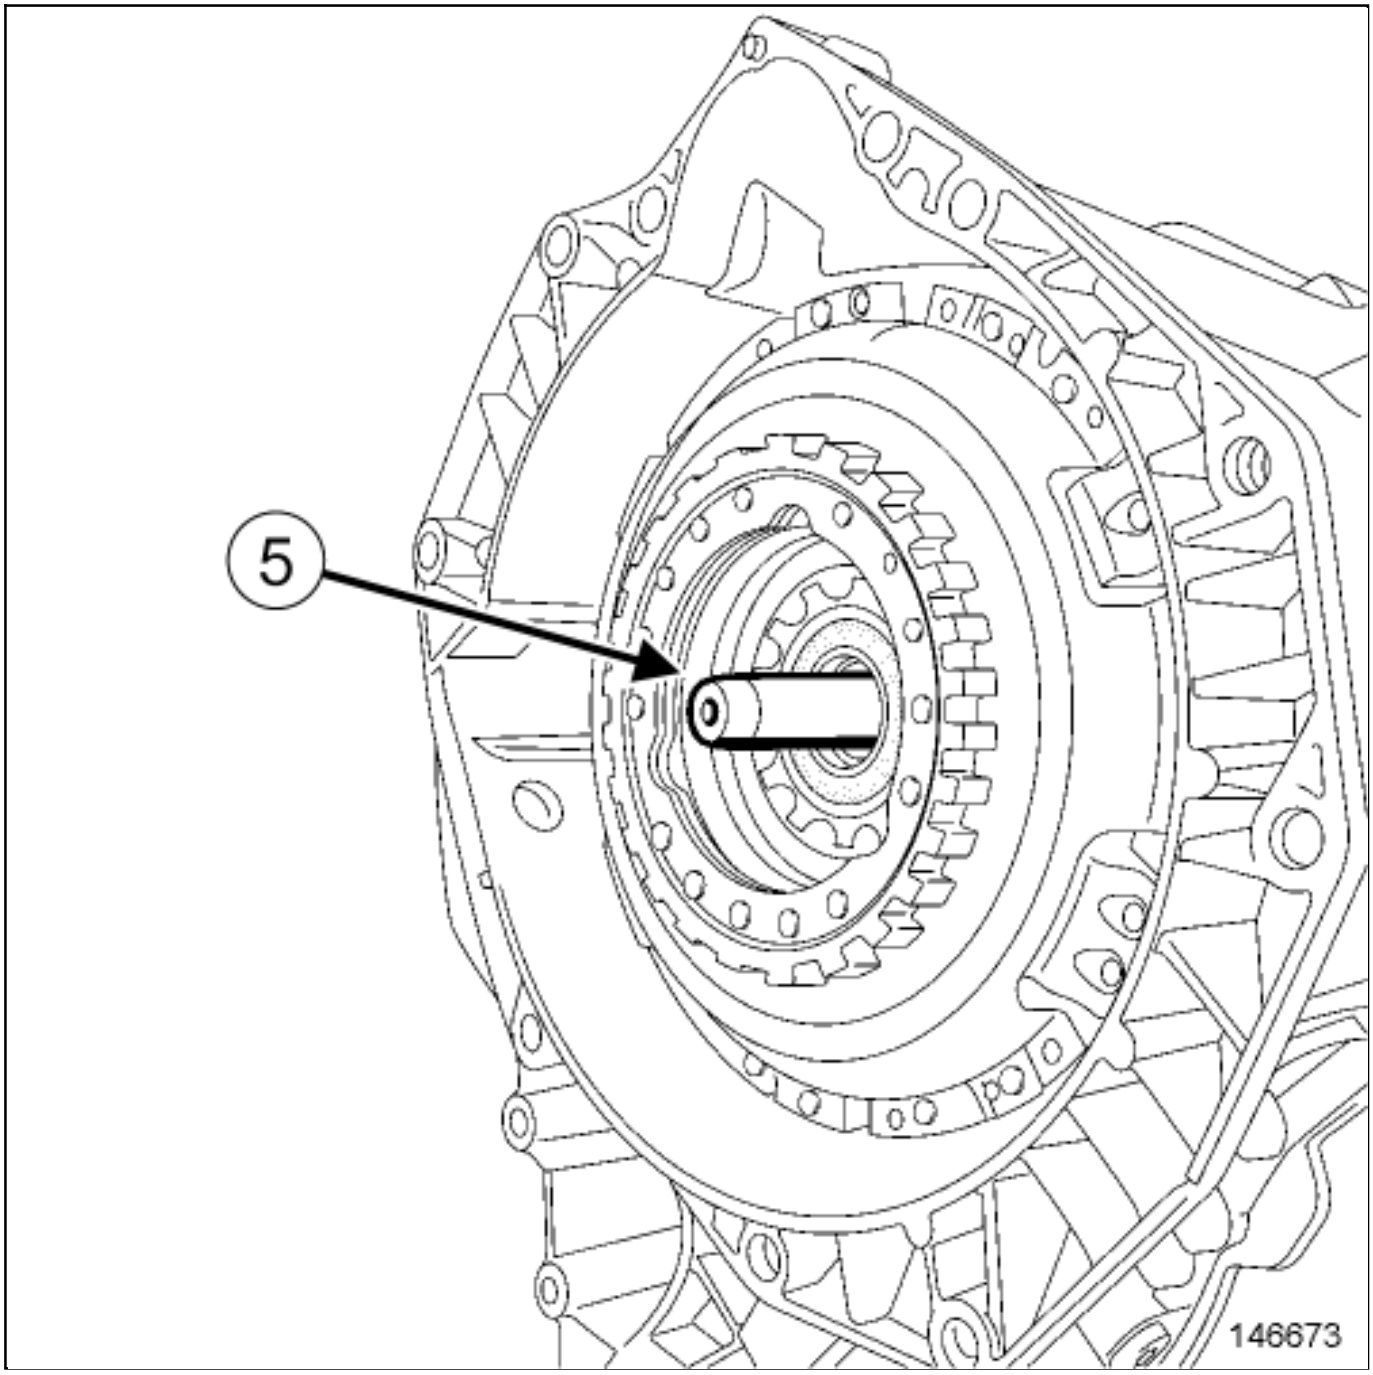
Insert the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (3) on the small input shaft until contact is made with the lip seal.

Turn the body(3) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) by pressing on it to fit the lip seal on the tool.

Turn the bolt(4) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) .

Remove the lip seal of the small diameter input shaft.

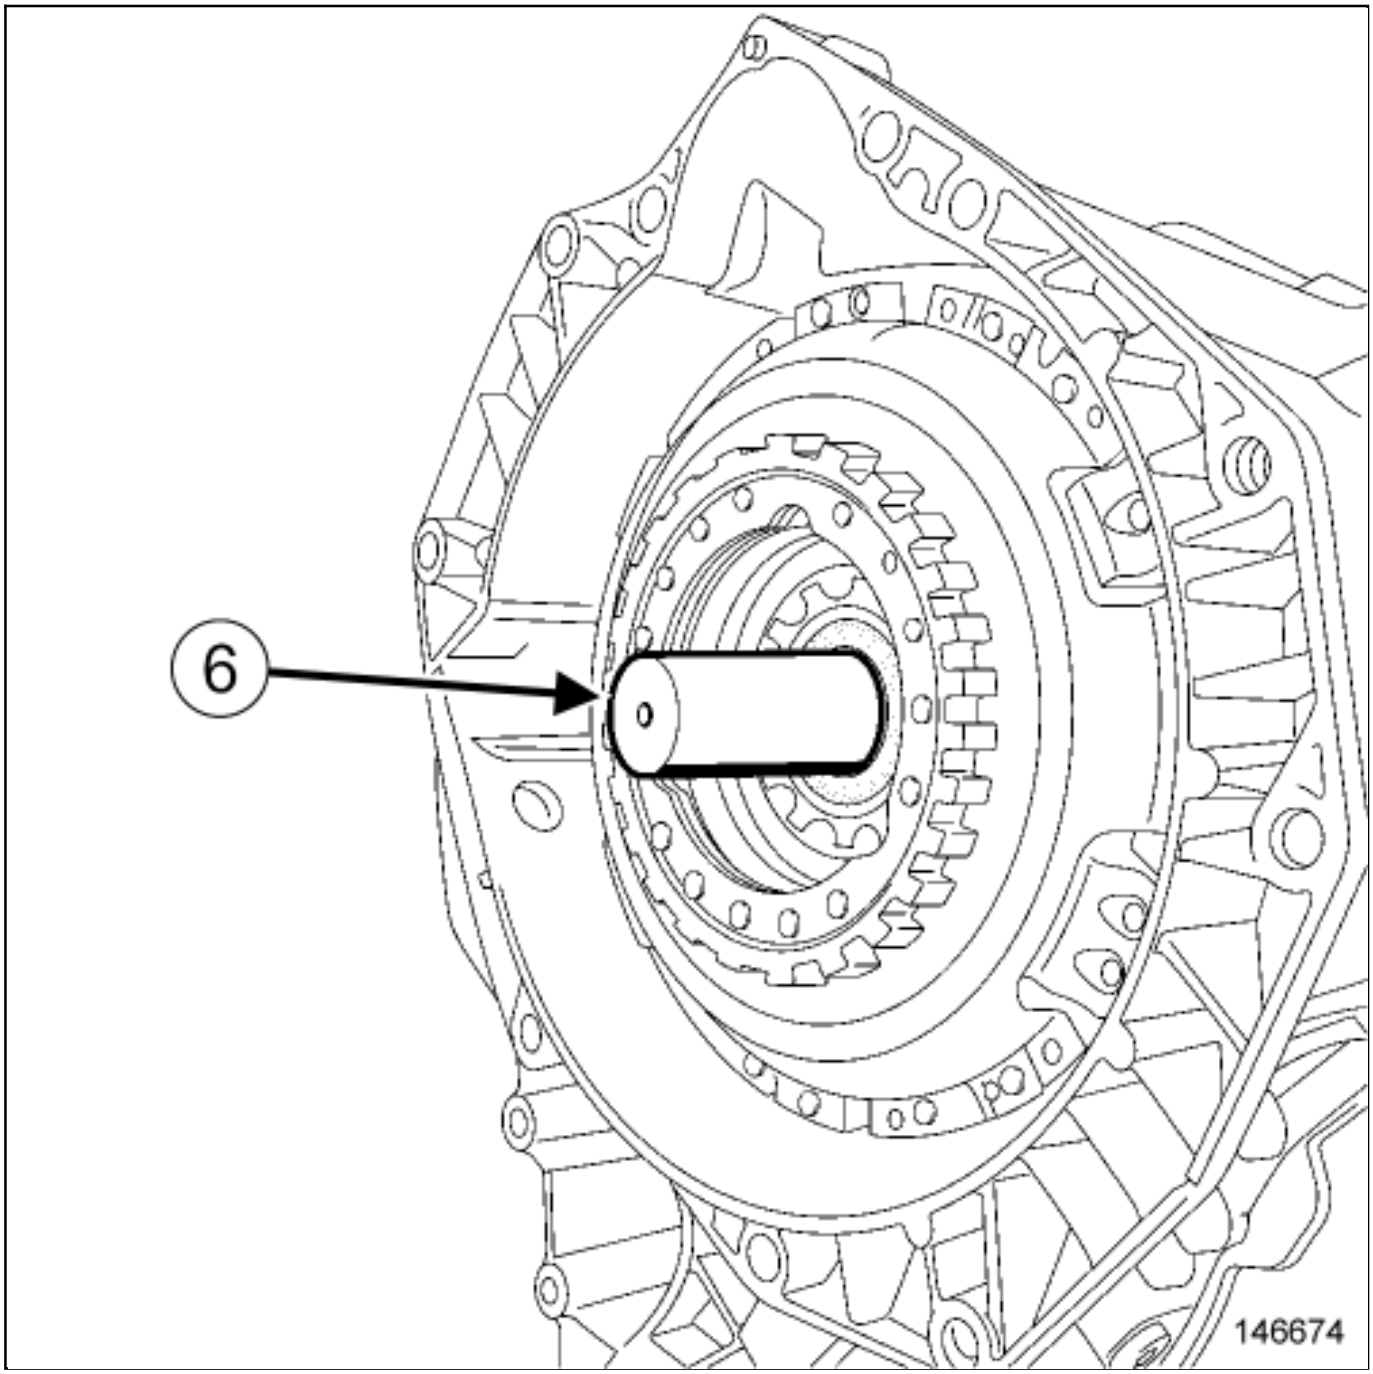
REFITTING



1. REFITTING PREPARATION OPERATION

Use surface cleanerVehicle: Parts and consumables for the repair to clean the seal mating faces.

parts always to be replaced: Input shaft lip seal .



Always replace the clip of the crownwheel connecting the small input shaft and the clutch plate.

2. REFITTING OPERATION

Fit the protection tube(5) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) on the small diameter input shaft.

Fit the input shaft seal on the protection tube after having lubricated the seal with suitable gearbox oil Automatic gearbox oil: Specifications .

Refit the lip seal for the small diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (6) .

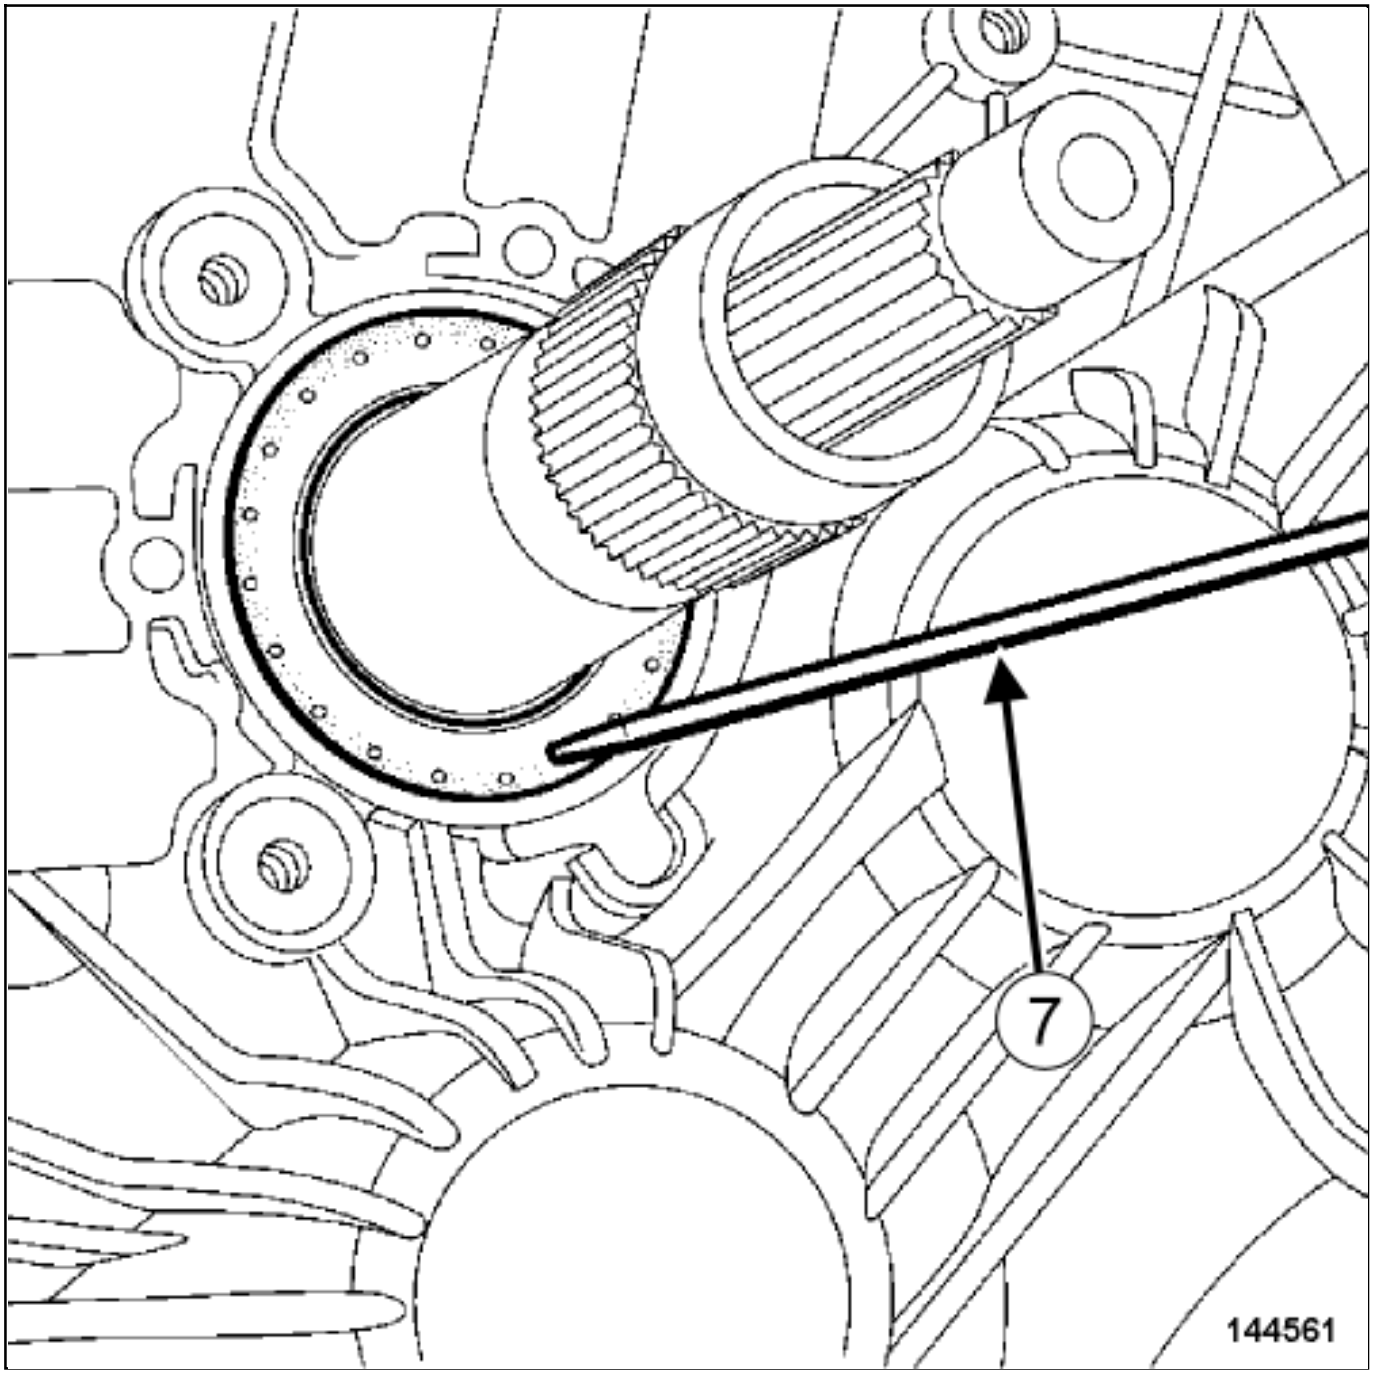
3. FINAL OPERATION

Proceed in the reverse order to removal.

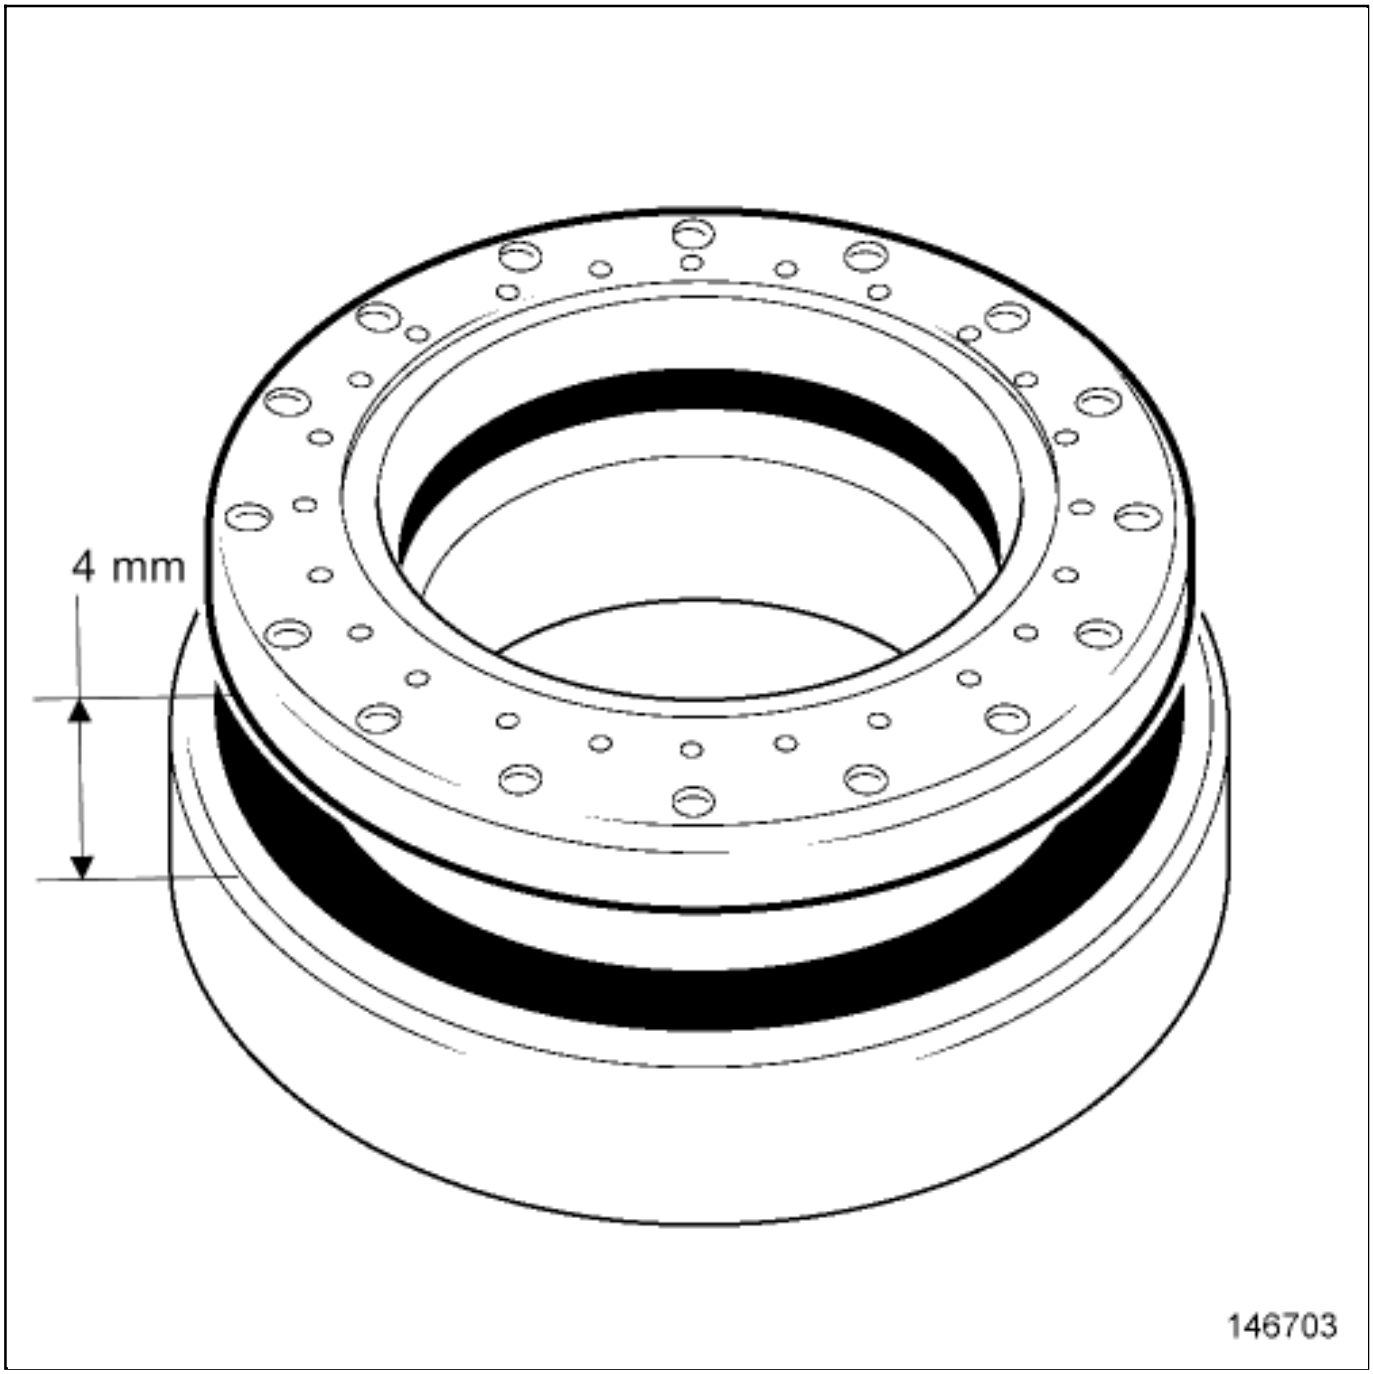
REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:



- the gearbox (see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) ,
- the clutch pressure plate Clutch: Removal - Refitting ,
- the clutch actuator motors Clutch actuator motor: Removal - Refitting ,
- the clutch thrust bearing Clutch thrust bearing: Removal - Refitting ,
- the clutch forks Clutch fork: Removal - Refitting .



2. REMOVAL OPERATION

CAUTION

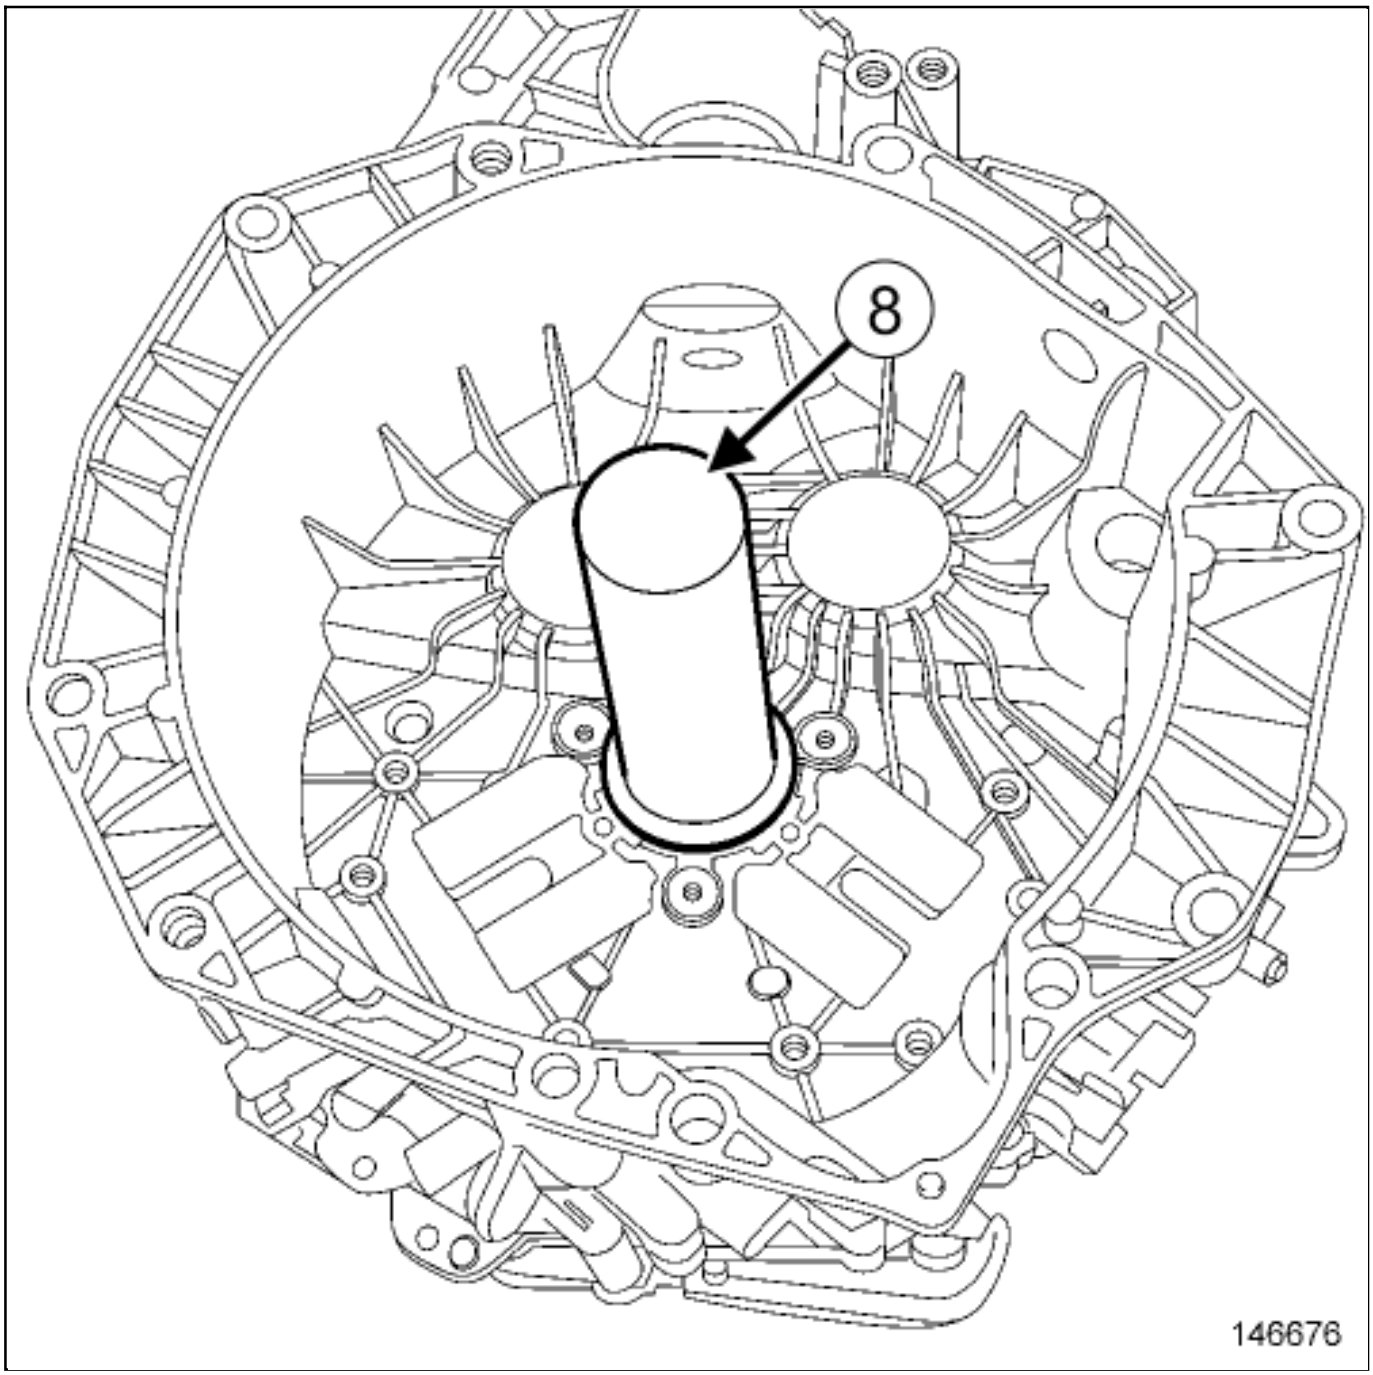
Failure to adhere to the following procedure may damage the gearbox.

7
144561

Note:

Take care to insert the seal extraction gimlet no further than(4 mm) in order not to damage the lip seal of the input shaft bearing just behind the seal.

Remove the lip seal of the large diameter input shaft using the toolInertia seal extractor(Bvi. 1948) (7) .



REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the seal mating faces.

-  parts always to be replaced: Input shaft lip seal  .

2. REFITTING OPERATION

Refit the lip seal for the large diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (8) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

INPUT SHAFT LIP SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

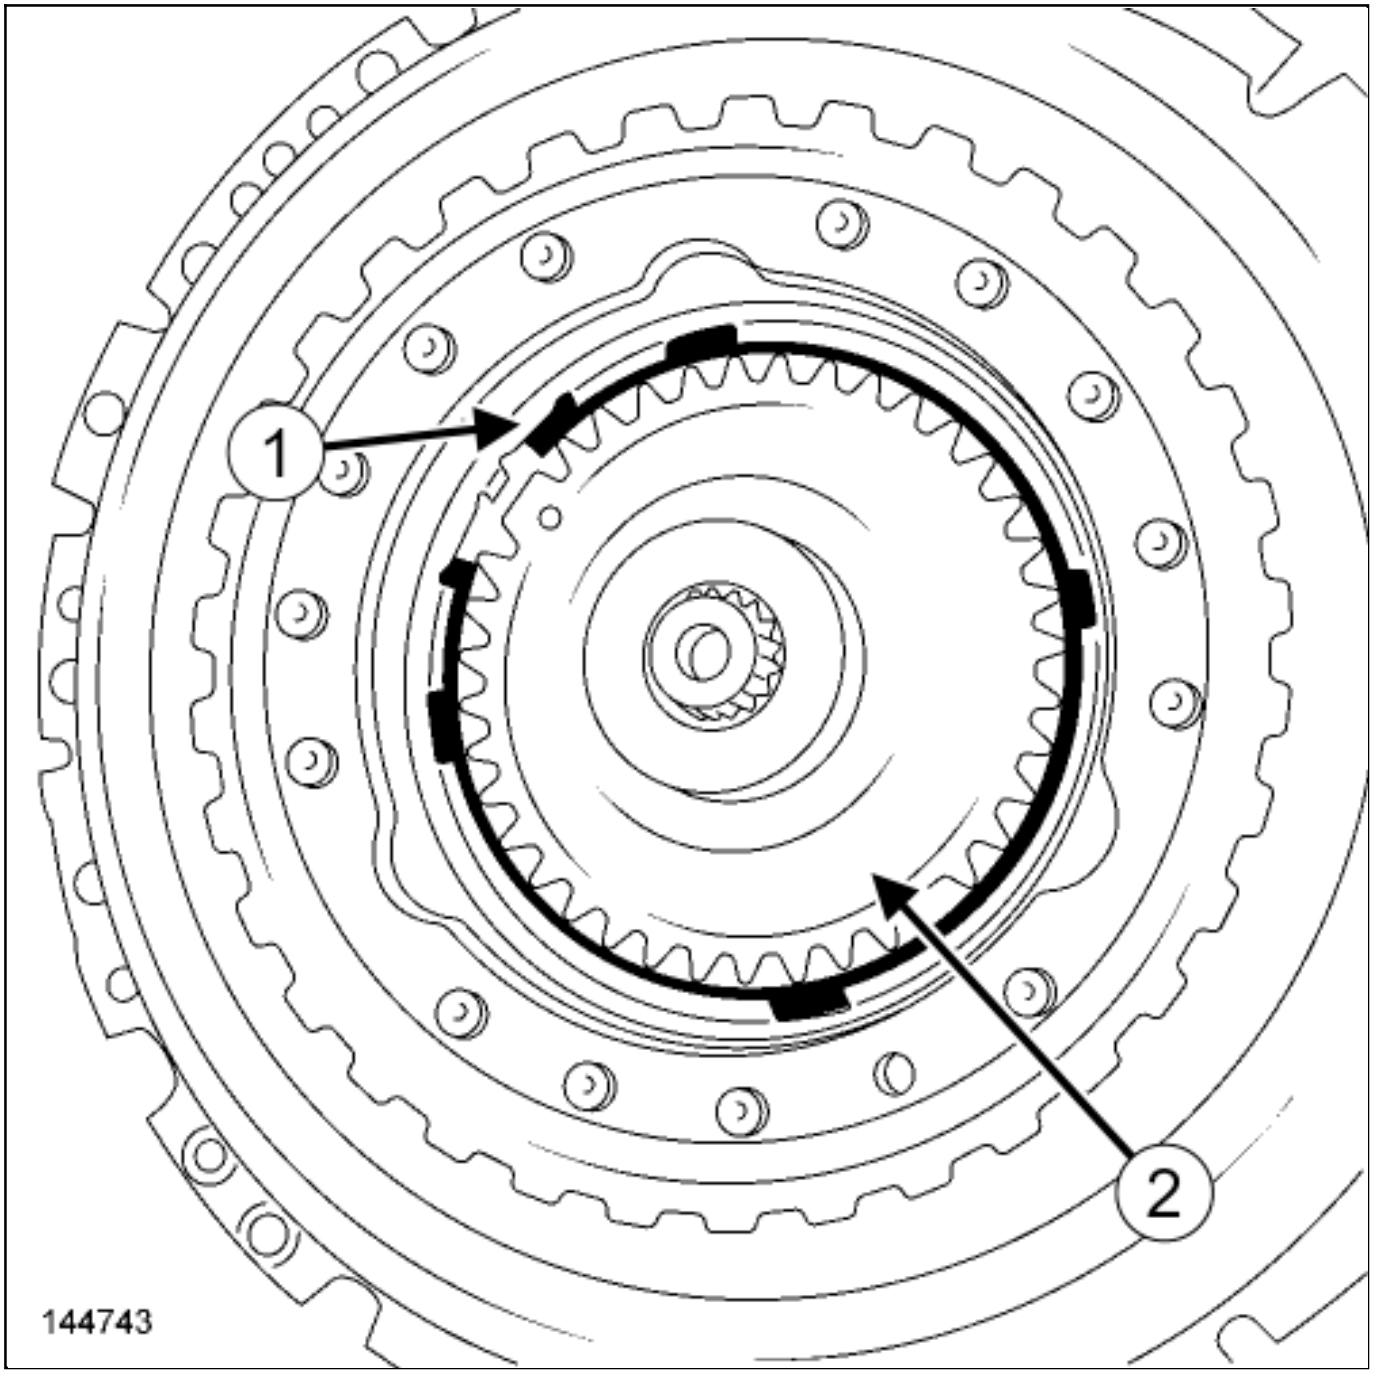
Special tooling required	
Inertia seal extractor	Bvi. 1948
Tools for removal - refitting of input shaft seals (DC4)	Bvi. 1954

parts always to be replaced:
Input shaft lip seal
Input shaft lip seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING



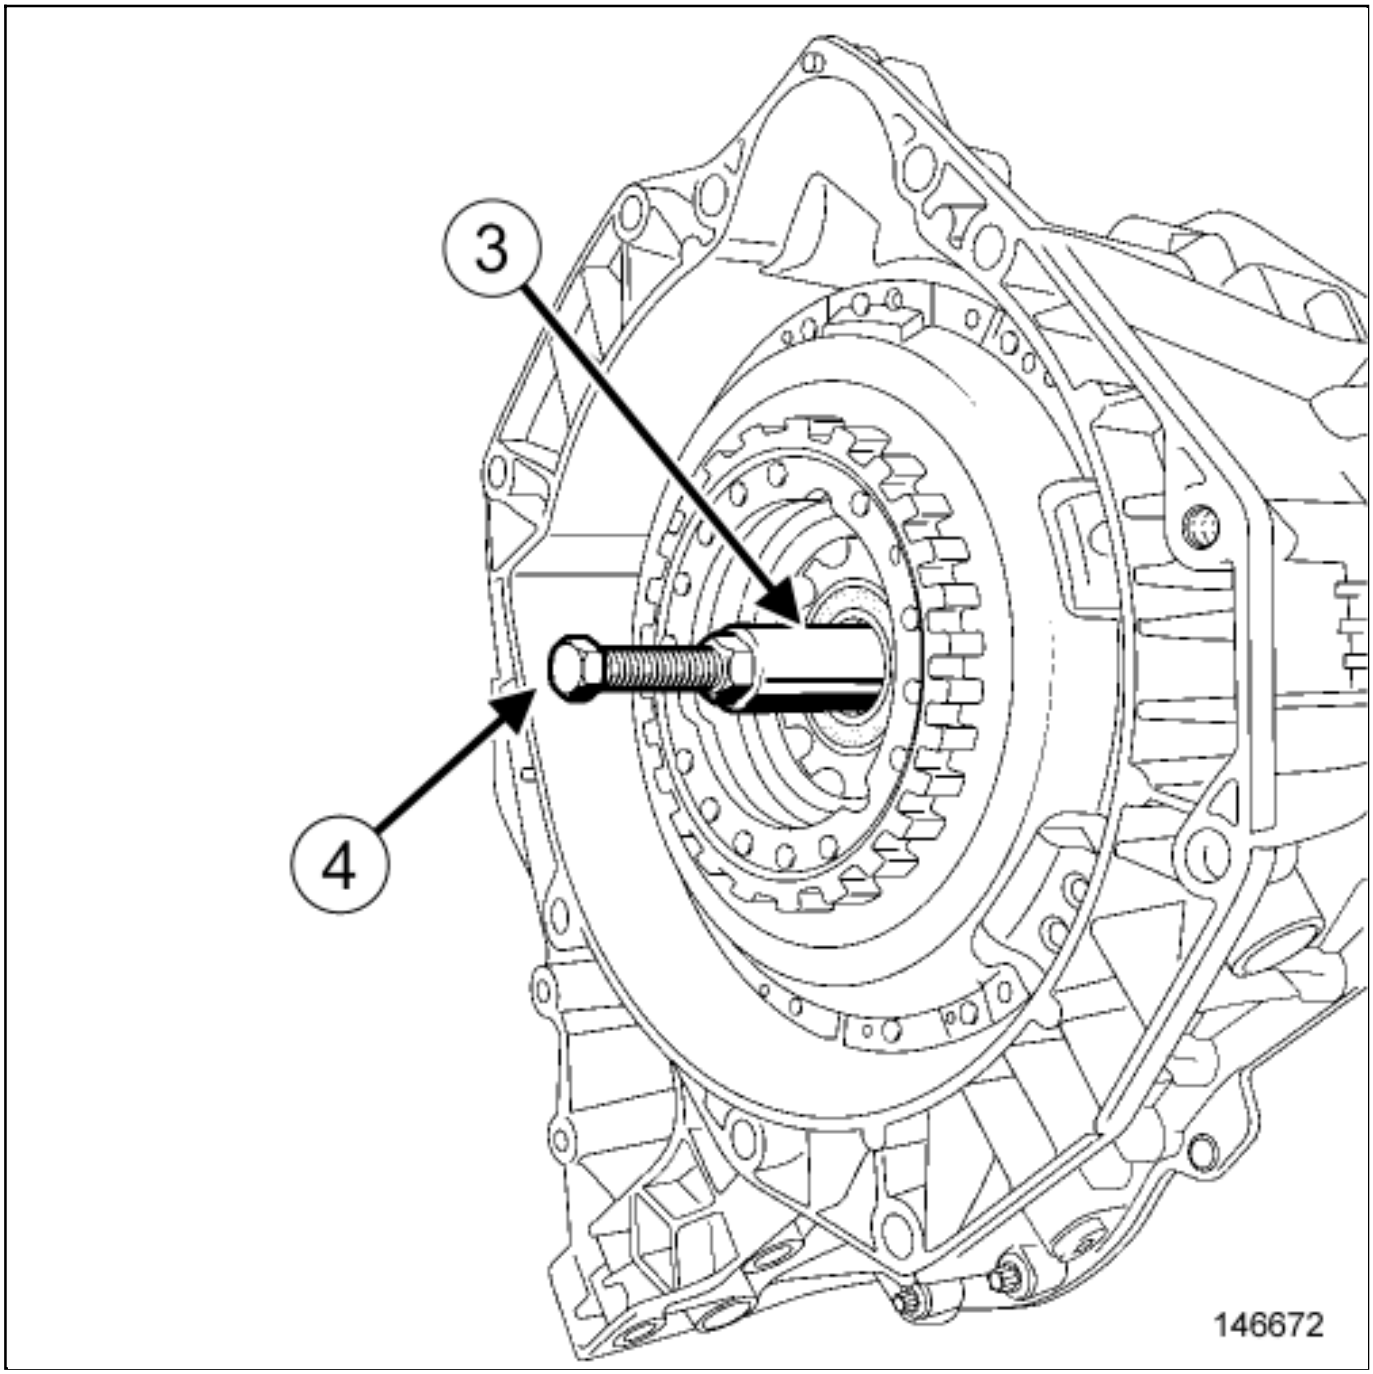
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .



Remove:

- the clip(1) of the crownwheel connecting the small input shaft and the clutch plate,
- the crownwheel(2) connecting the small input shaft and the clutch plate.

CAUTION

Failure to adhere to the following procedure may damage the gearbox.

Note:

Perform the operation with the gearbox positioned horizontally in order to prevent foreign bodies from entering between the two input shafts.

After removing the lip seal, check that the lip seal compression spring came out with the seal.

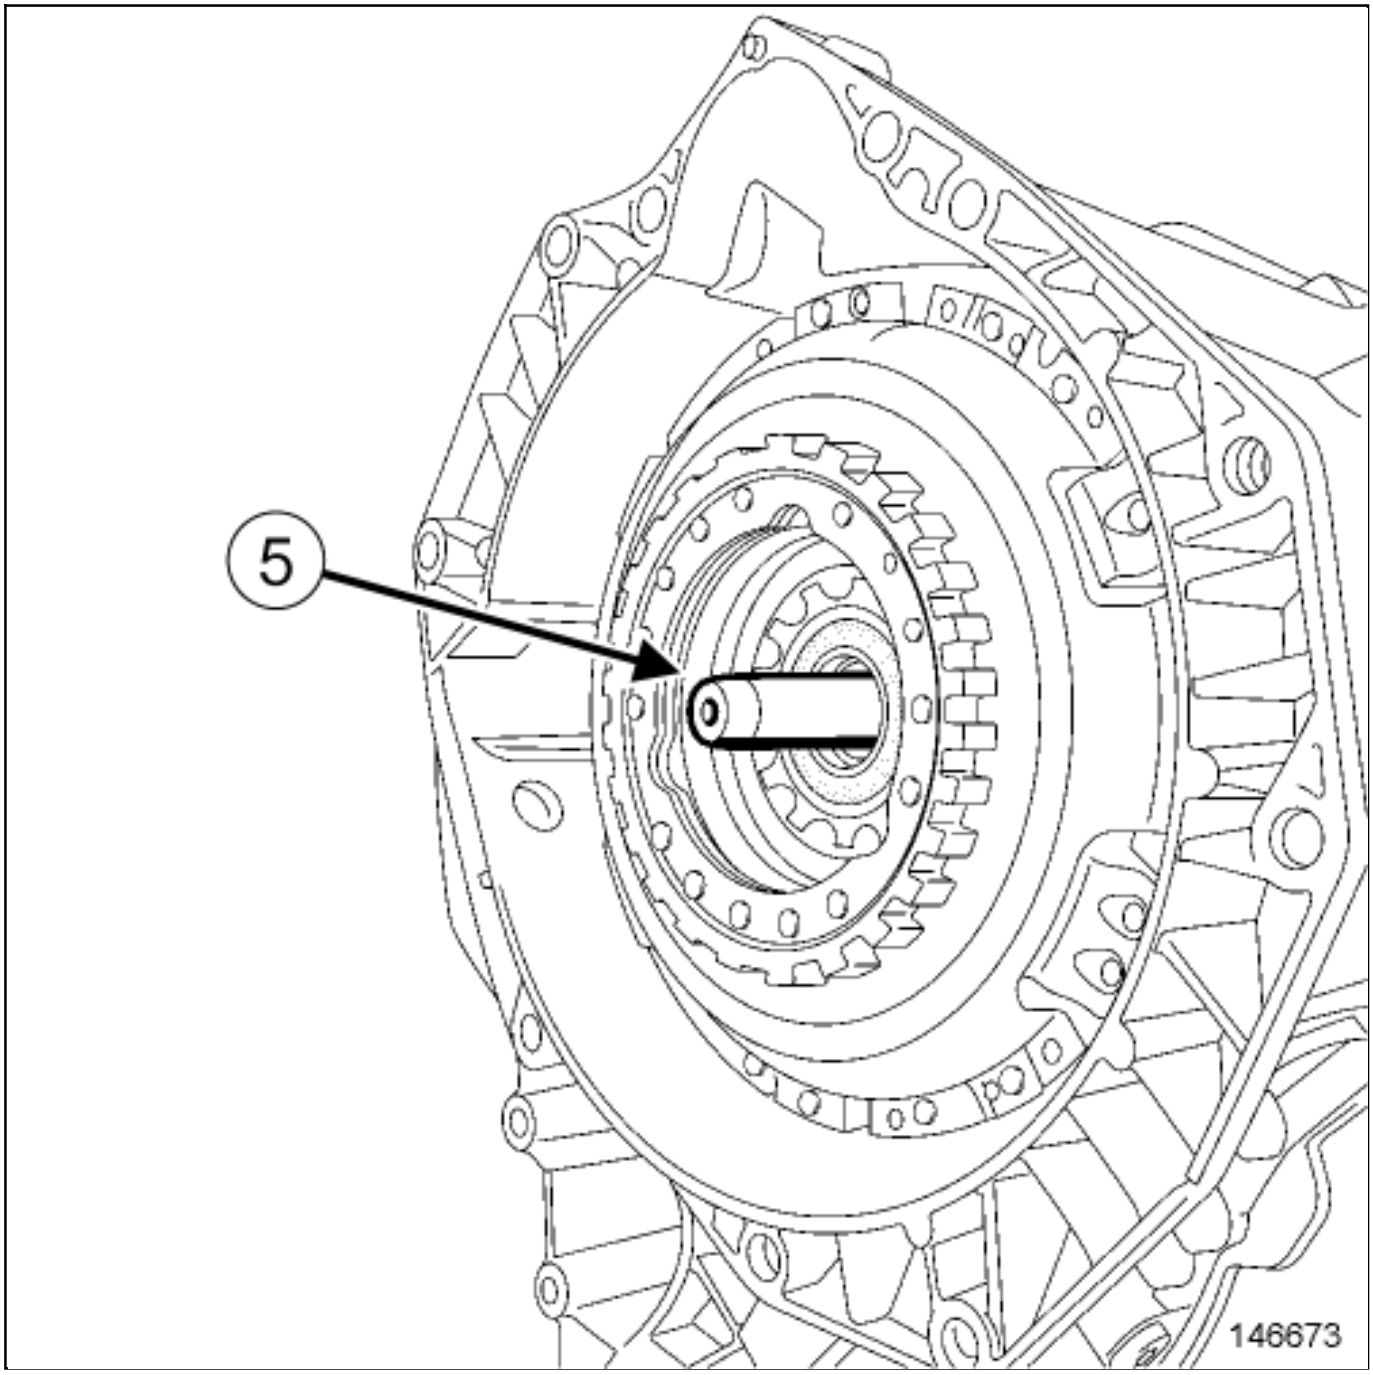
Insert the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (3) on the small input shaft until contact is made with the lip seal.

Turn the body(3) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) by pressing on it to fit the lip seal on the tool.

Turn the bolt(4) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) .

Remove the lip seal of the small diameter input shaft.

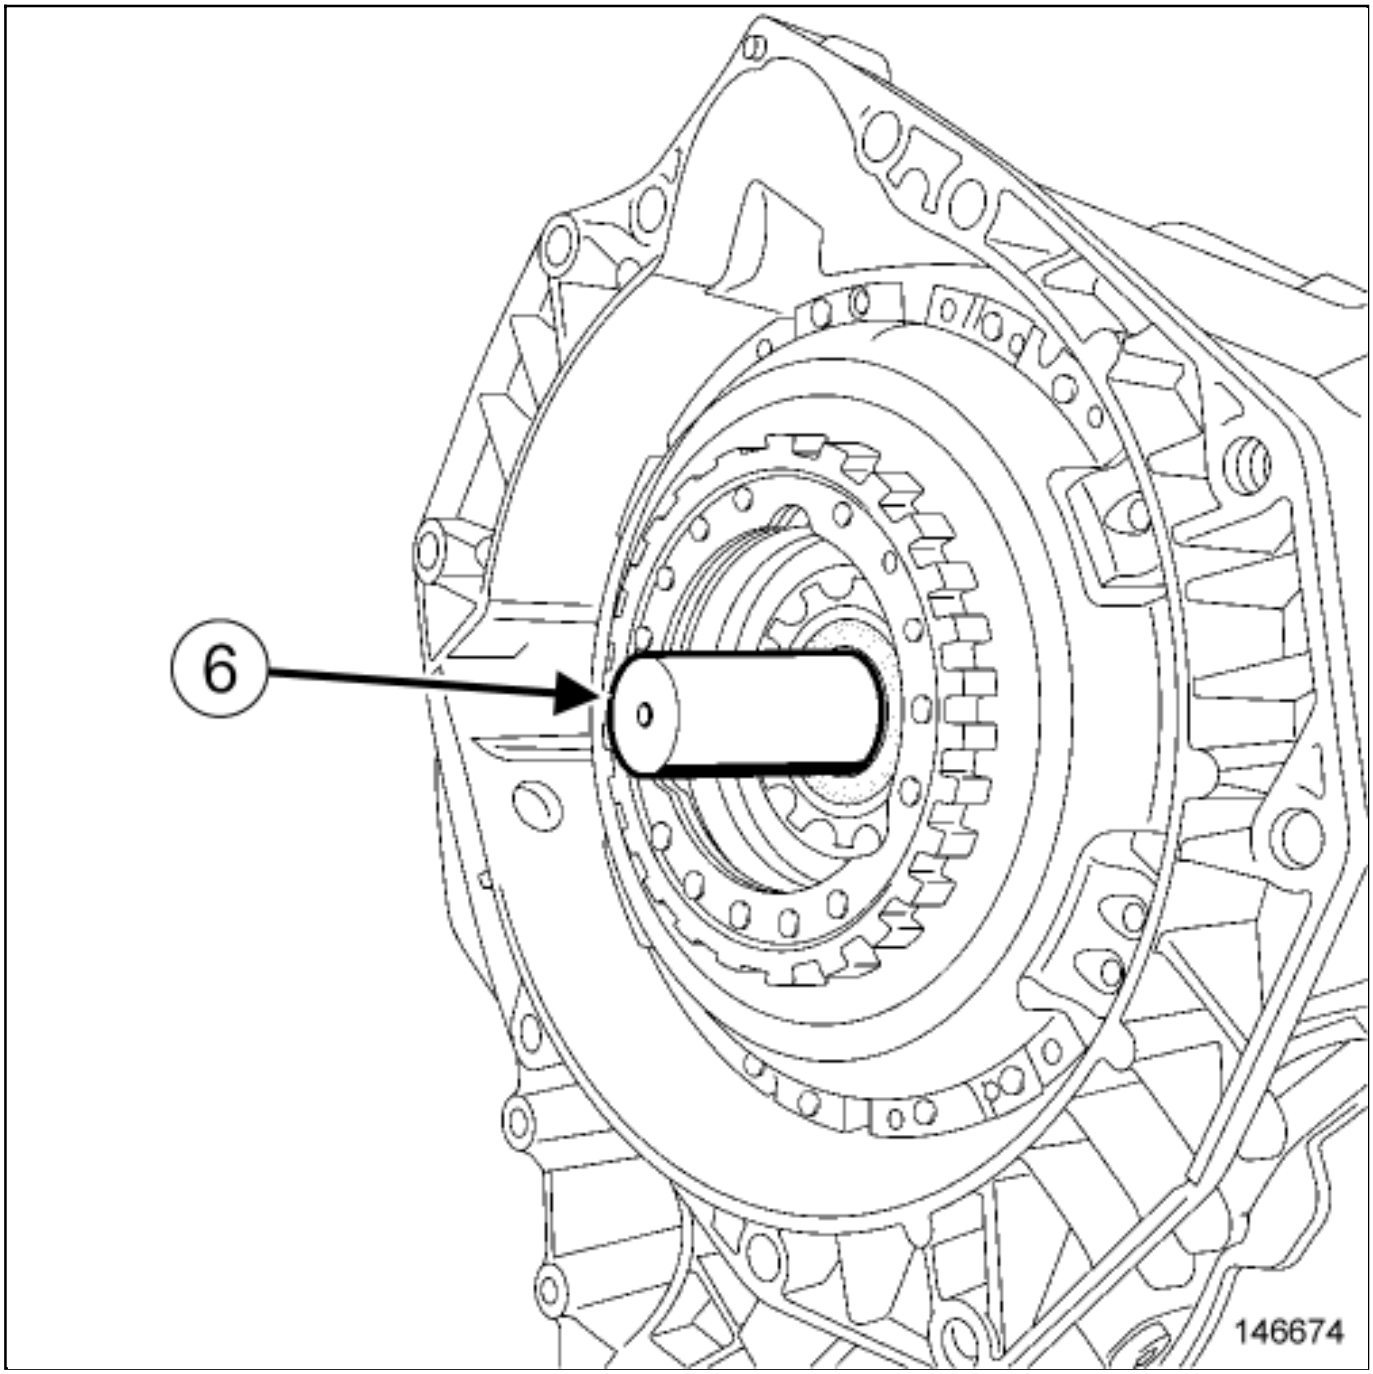
REFITTING



1. REFITTING PREPARATION OPERATION

Use surface cleanerVehicle: Parts and consumables for the repair to clean the seal mating faces.

parts always to be replaced: Input shaft lip seal .



Always replace the clip of the crownwheel connecting the small input shaft and the clutch plate.

2. REFITTING OPERATION

Fit the protection tube(5) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) on the small diameter input shaft.

Fit the input shaft seal on the protection tube after having lubricated the seal with suitable gearbox oil Automatic gearbox oil: Specifications .

Refit the lip seal for the small diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (6) .

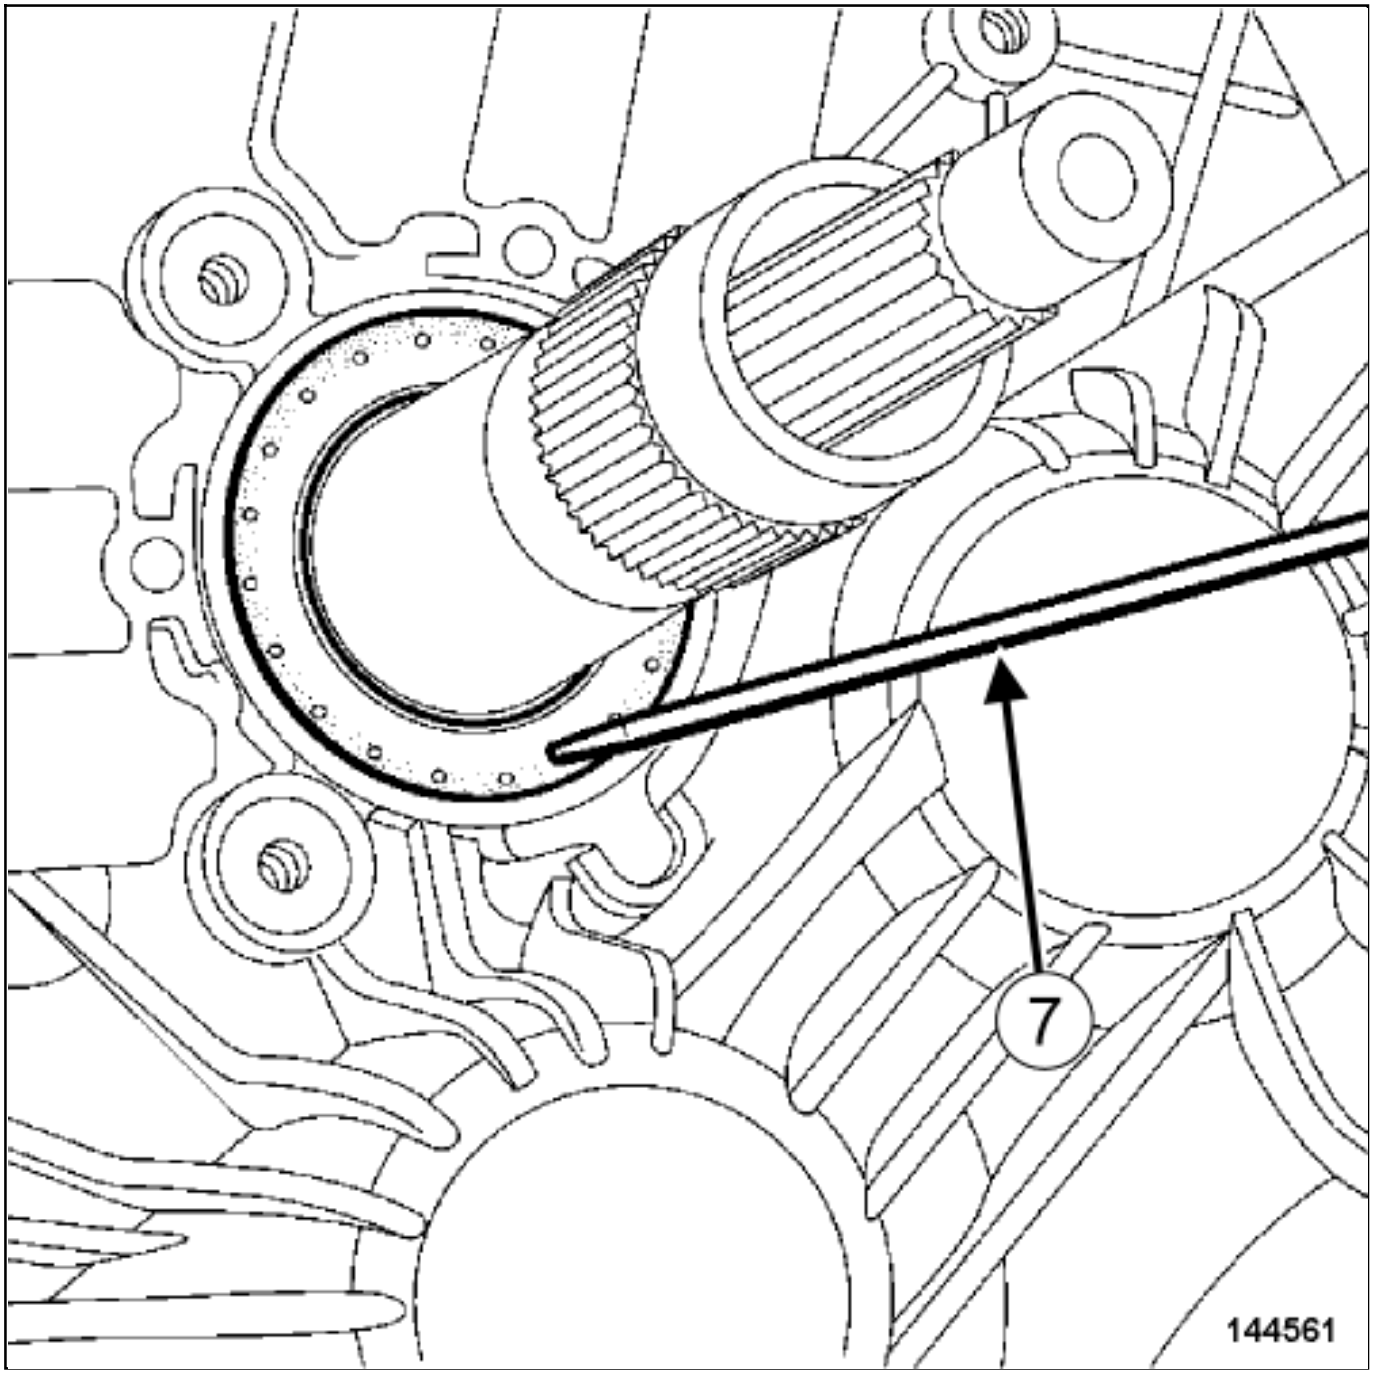
3. FINAL OPERATION

Proceed in the reverse order to removal.

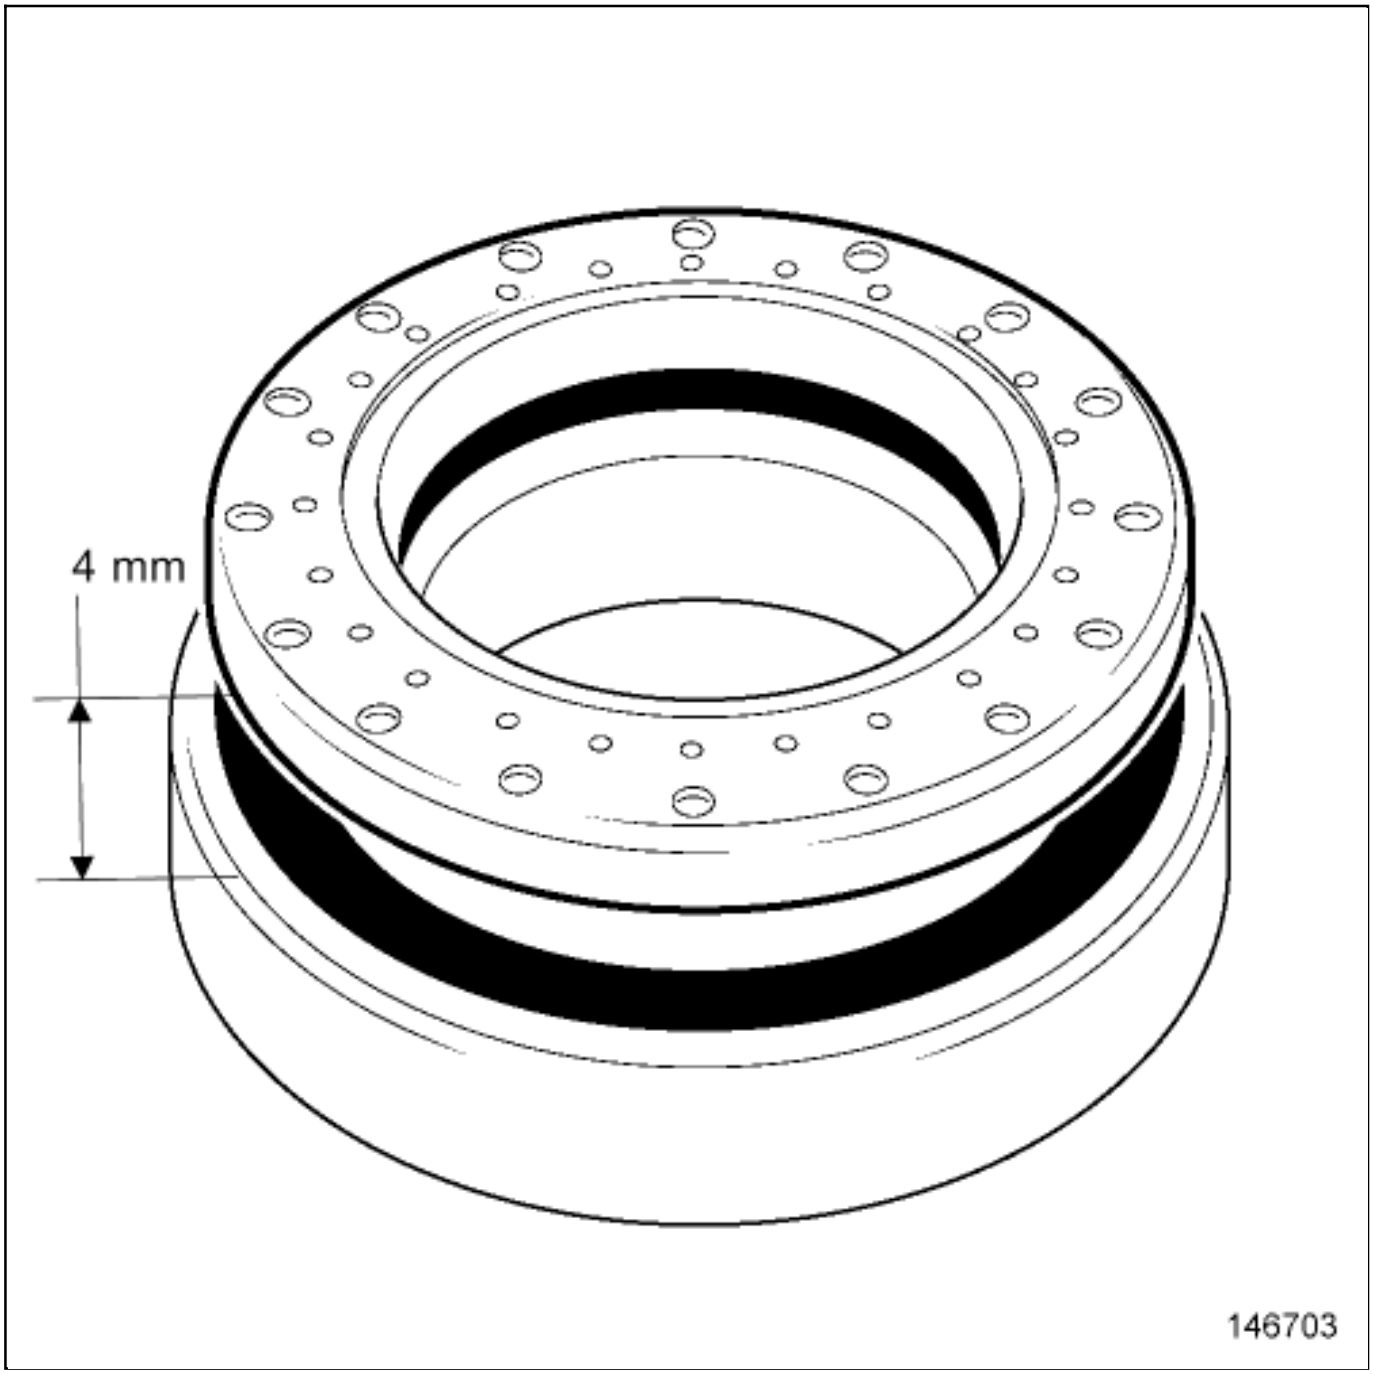
REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:



- the gearbox (see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) ,
- the clutch pressure plate Clutch: Removal - Refitting ,
- the clutch actuator motors Clutch actuator motor: Removal - Refitting ,
- the clutch thrust bearing Clutch thrust bearing: Removal - Refitting ,
- the clutch forks Clutch fork: Removal - Refitting .



2. REMOVAL OPERATION

CAUTION

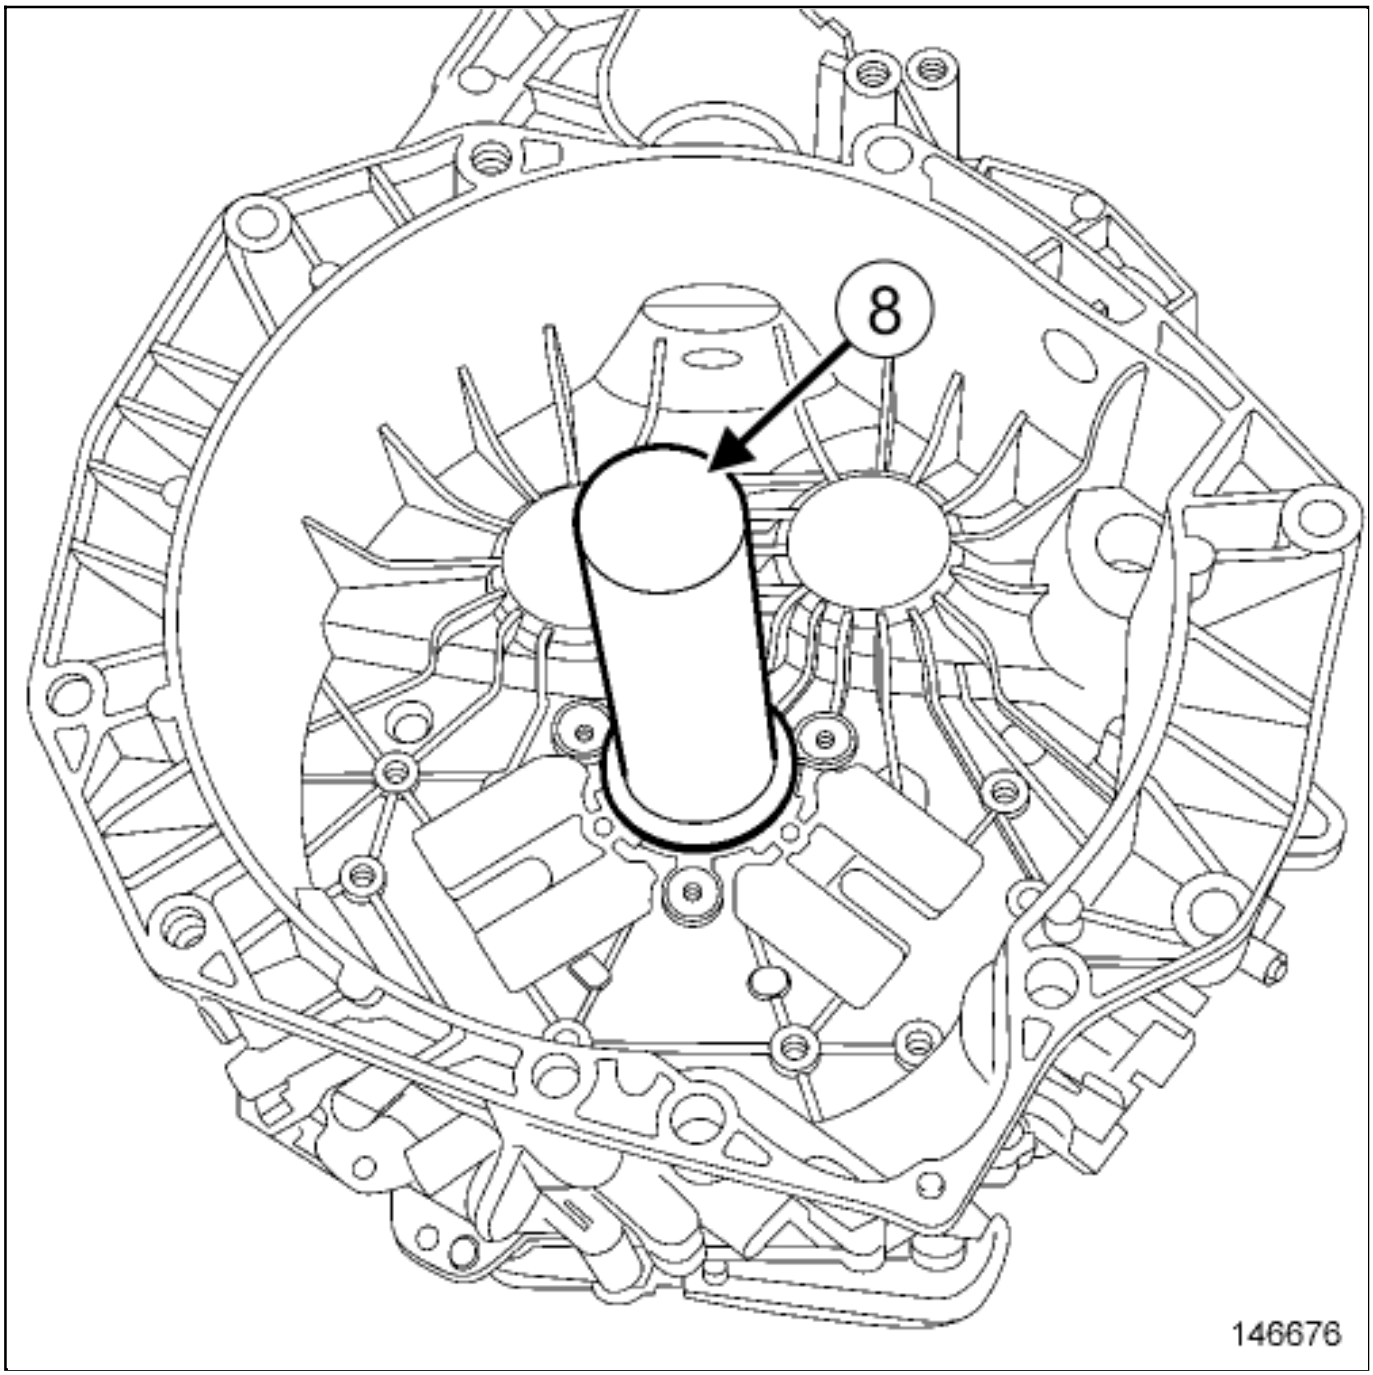
Failure to adhere to the following procedure may damage the gearbox.

7
144561

Note:

Take care to insert the seal extraction gimlet no further than(4 mm) in order not to damage the lip seal of the input shaft bearing just behind the seal.

Remove the lip seal of the large diameter input shaft using the toolInertia seal extractor(Bvi. 1948) (7) .



REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the seal mating faces.

-  parts always to be replaced: Input shaft lip seal  .

2. REFITTING OPERATION

Refit the lip seal for the large diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (8) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

INPUT SHAFT LIP SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Inertia seal extractor	Bvi. 1948

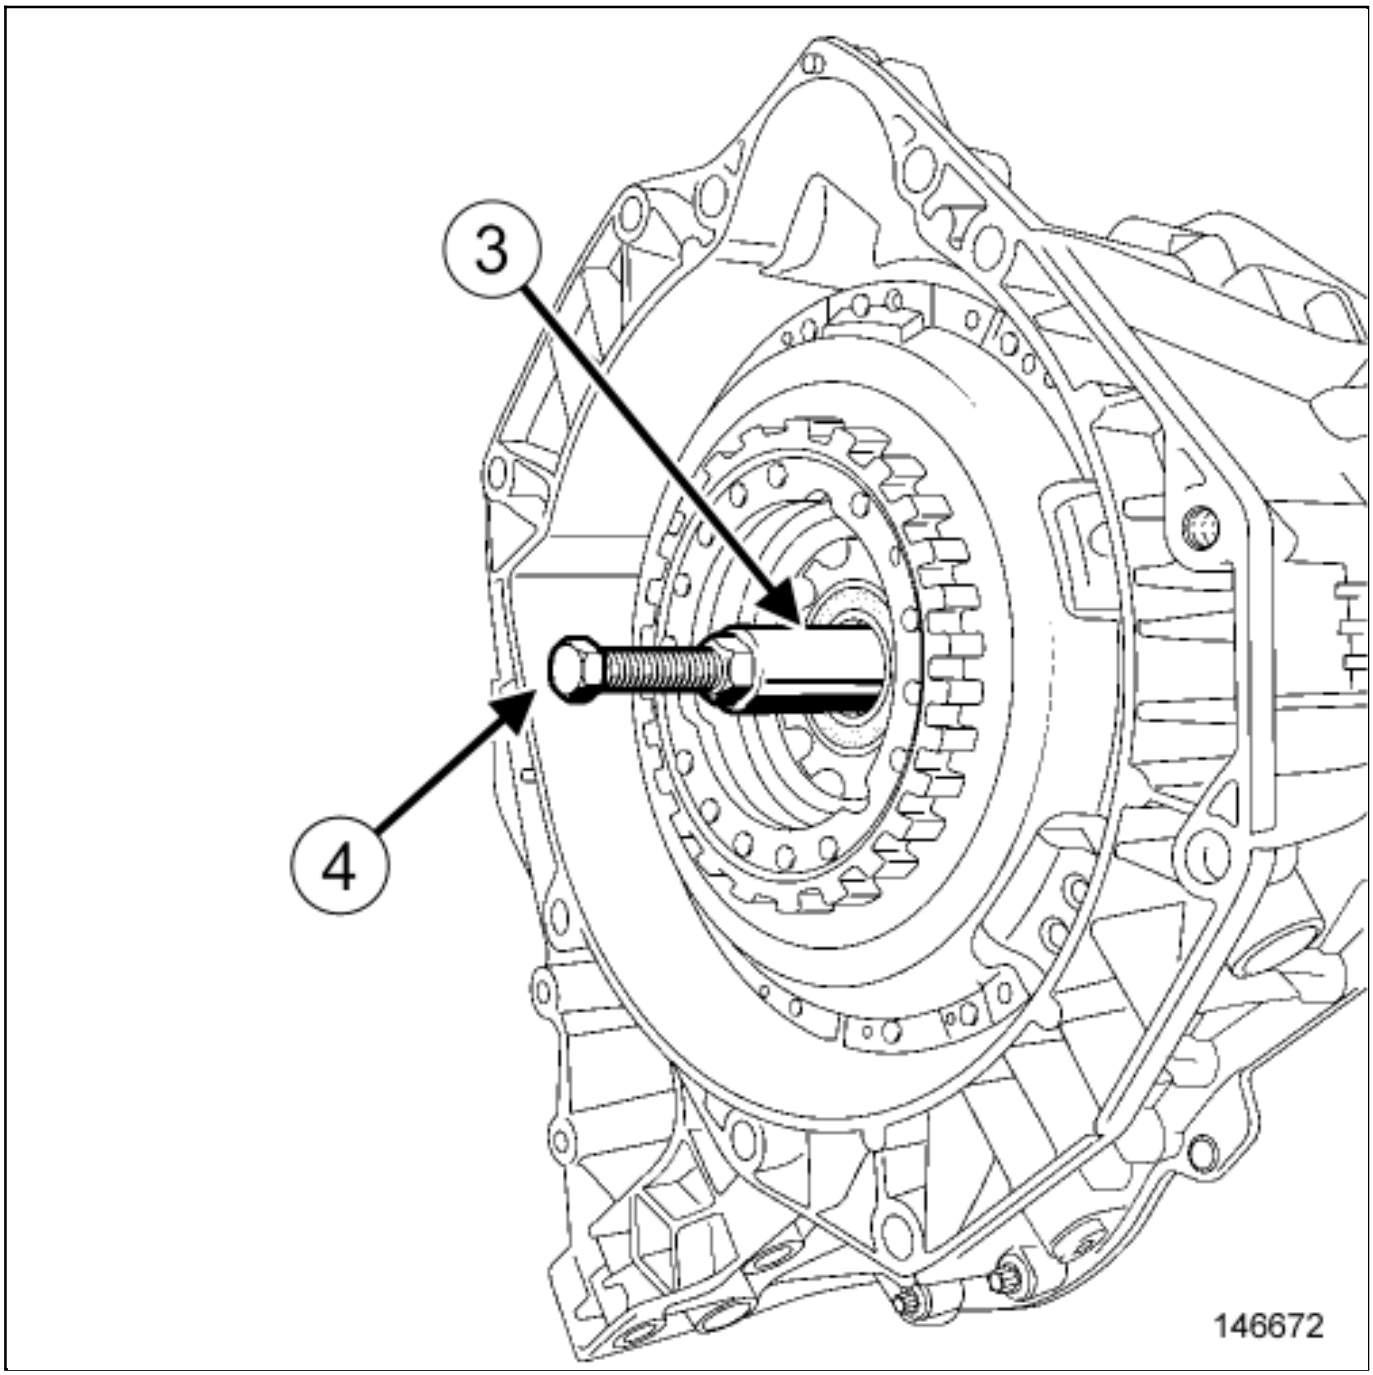
REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .



Remove:

- the clip(1) of the crownwheel connecting the small input shaft and the clutch plate,
- the crownwheel(2) connecting the small input shaft and the clutch plate.

2. REMOVAL OPERATION

CAUTION

Failure to adhere to the following procedure may damage the gearbox.

Note:

Perform the operation with the gearbox positioned horizontally in order to prevent foreign bodies from entering between the two input shafts.

After removing the lip seal, check that the lip seal compression spring came out with the seal.

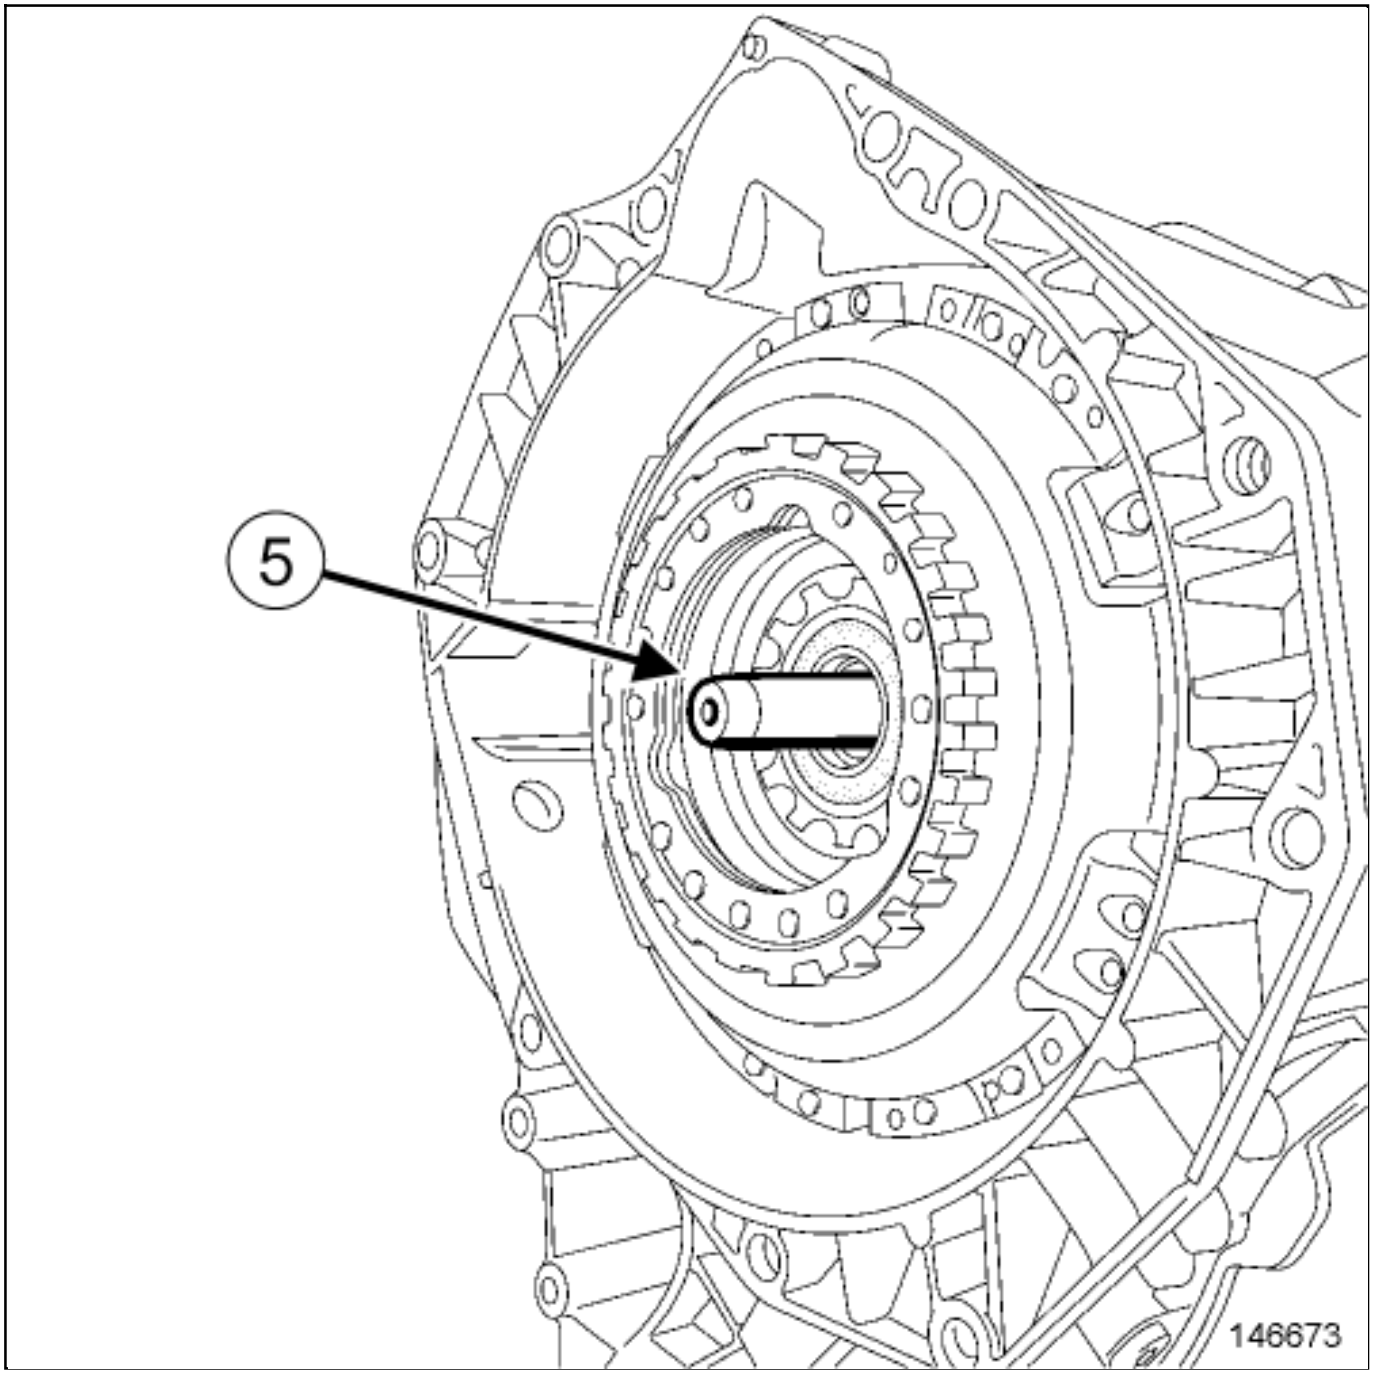
Insert the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (3) on the small input shaft until contact is made with the lip seal.

Turn the body(3) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) by pressing on it to fit the lip seal on the tool.

Turn the bolt(4) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) .

Remove the lip seal of the small diameter input shaft.

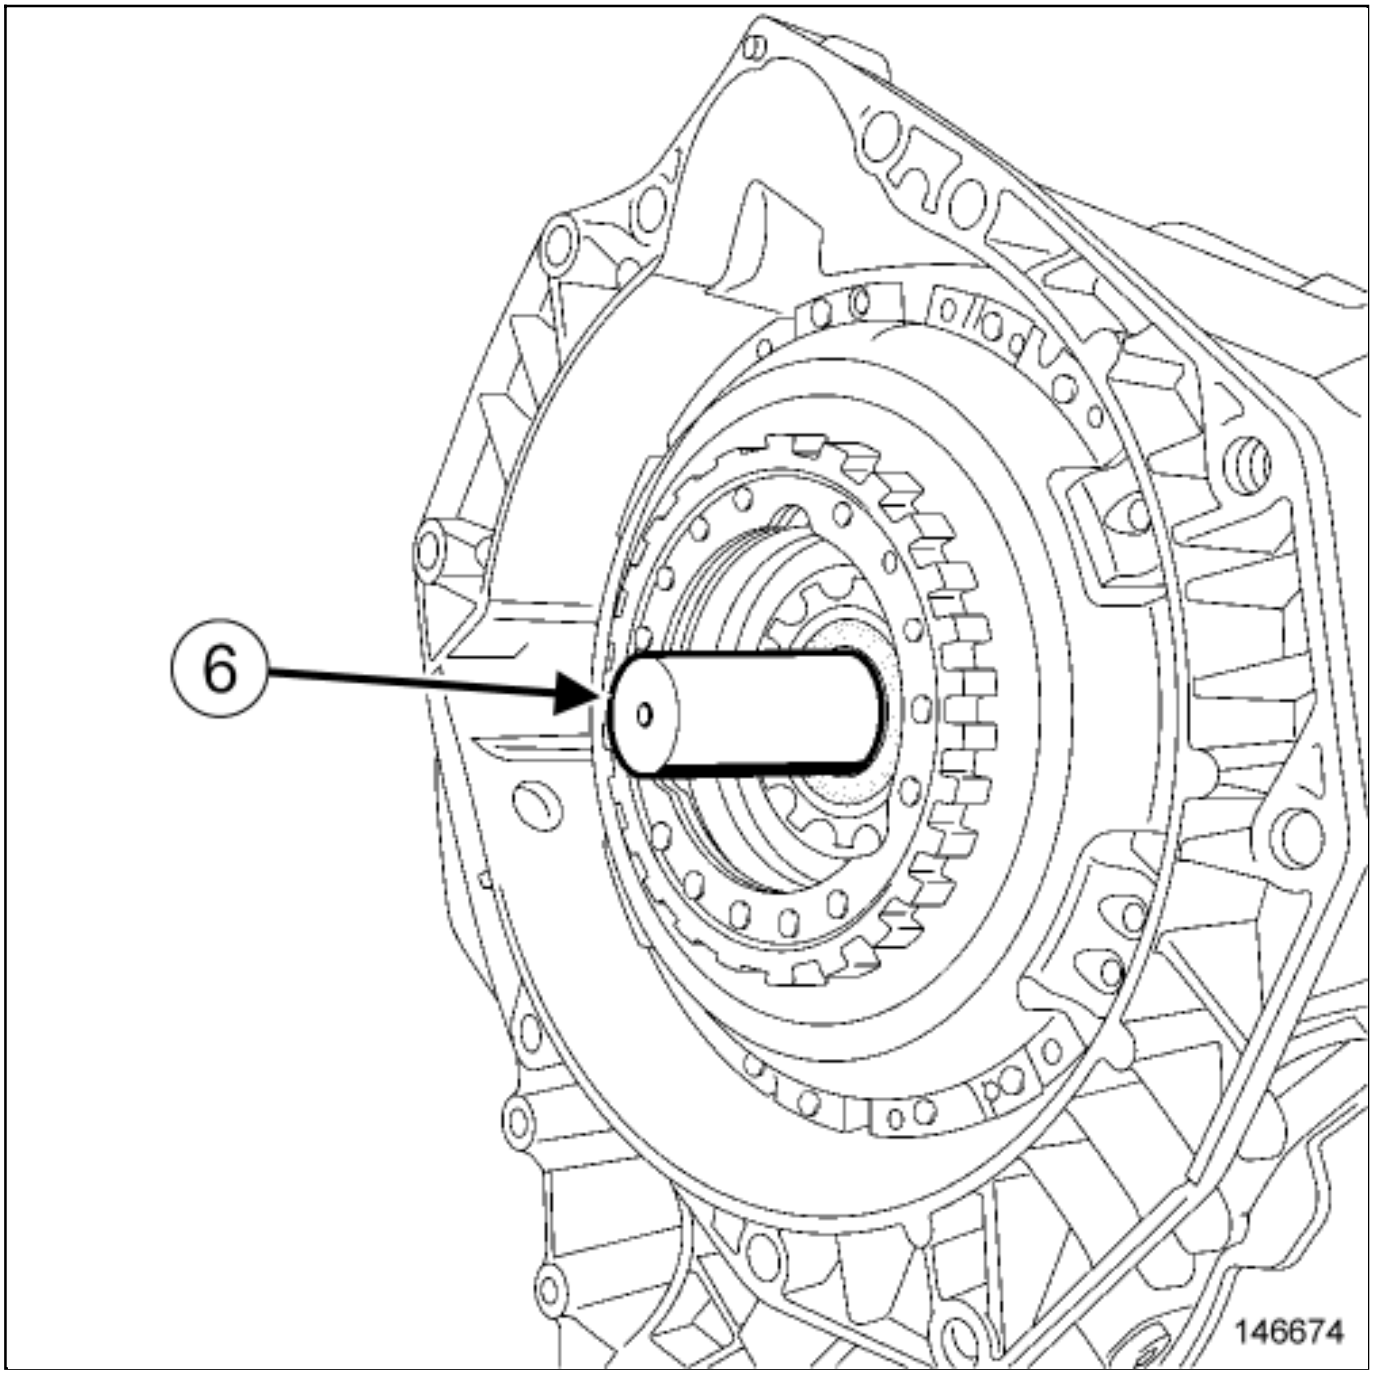
REFITTING



1. REFITTING PREPARATION OPERATION

Use surface cleanerVehicle: Parts and consumables for the repair to clean the seal mating faces.

parts always to be replaced: Input shaft lip seal .



Always replace the clip of the crownwheel connecting the small input shaft and the clutch plate.

2. REFITTING OPERATION

Fit the protection tube(5) of the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) on the small diameter input shaft.

Fit the input shaft seal on the protection tube after having lubricated the seal with suitable gearbox oil Automatic gearbox oil: Specifications .

Refit the lip seal for the small diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (6) .

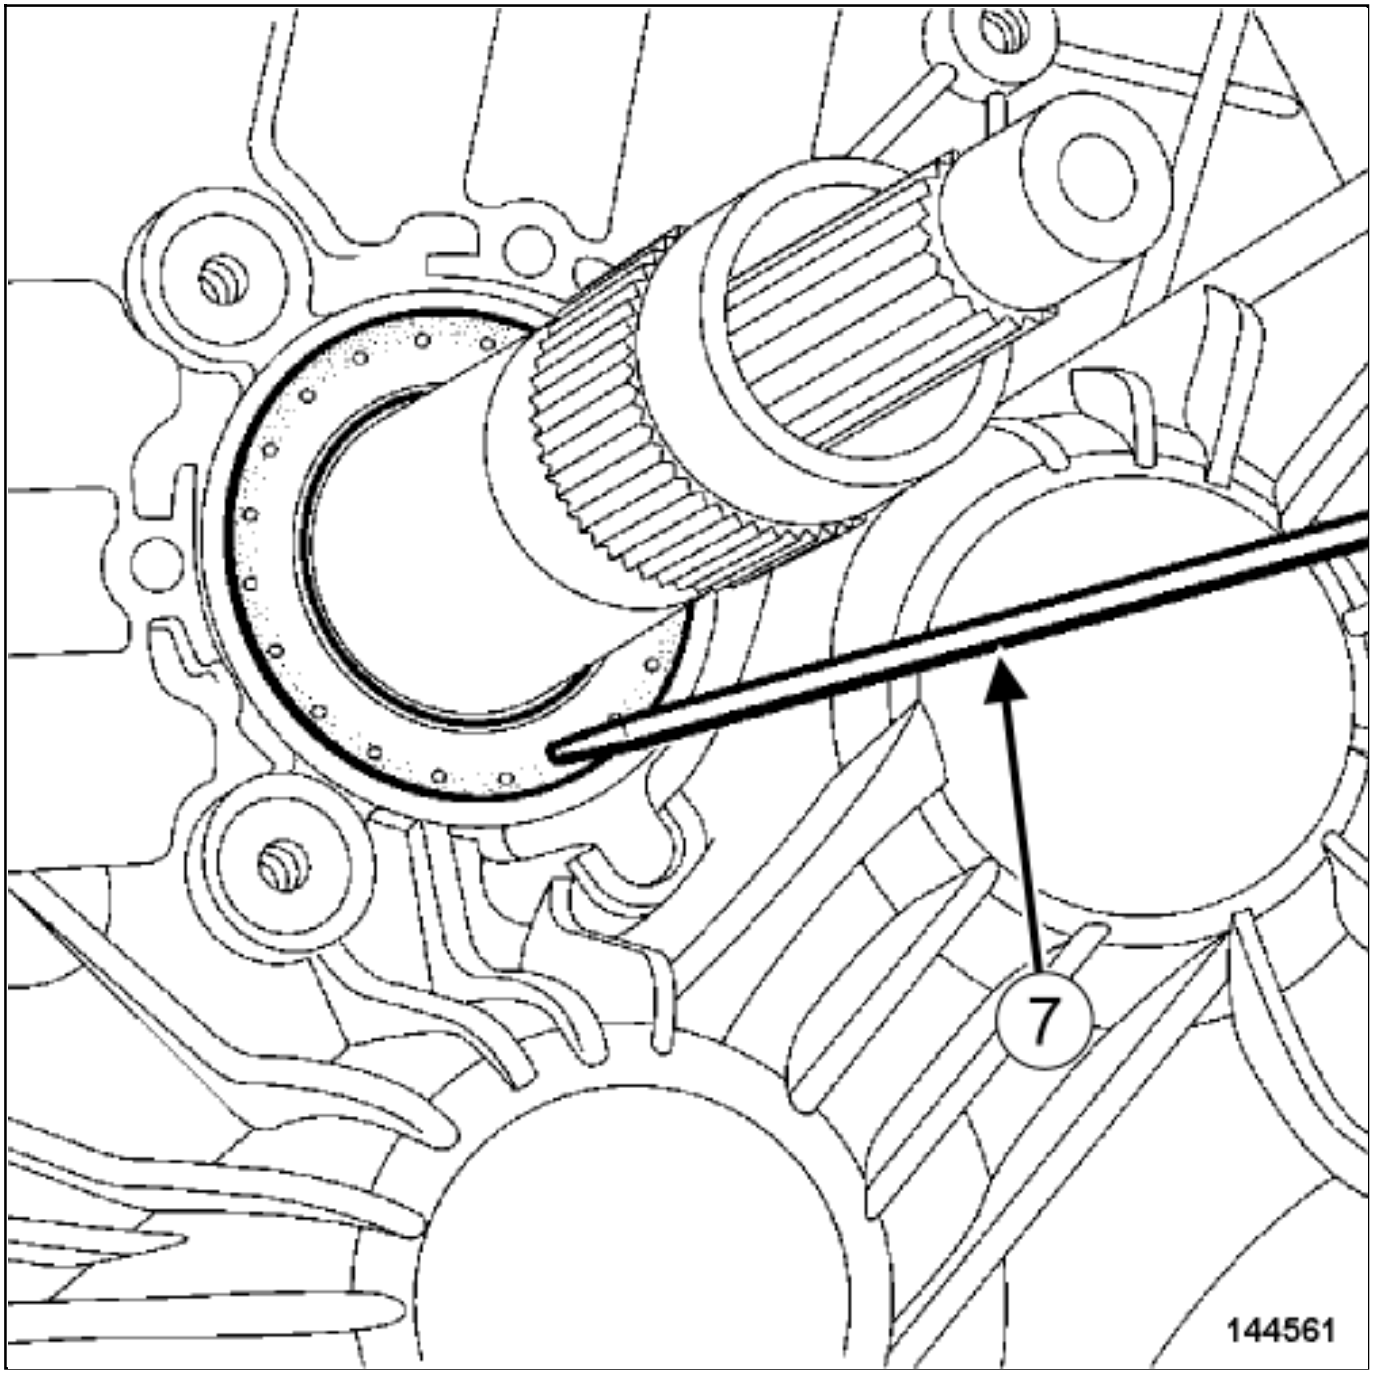
3. FINAL OPERATION

Proceed in the reverse order to removal.

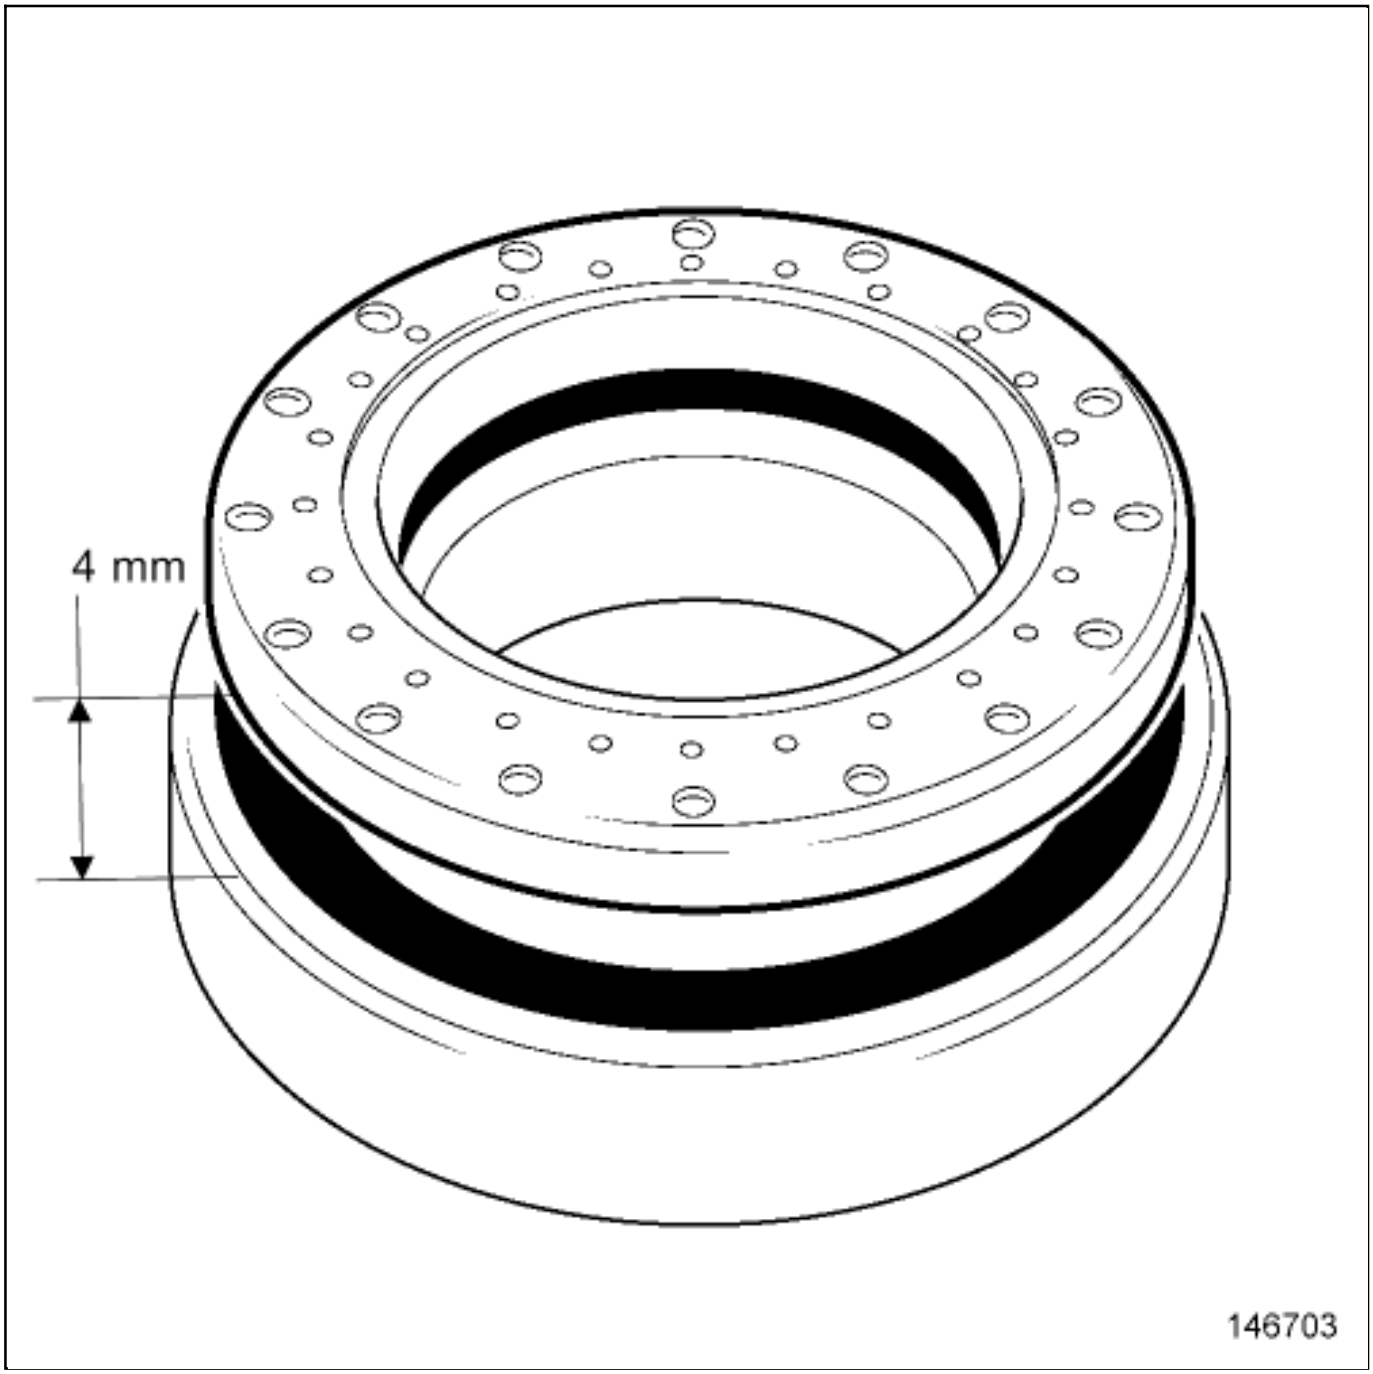
REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:



- the gearbox (see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) ,
- the clutch pressure plate Clutch: Removal - Refitting ,
- the clutch actuator motors Clutch actuator motor: Removal - Refitting ,
- the clutch thrust bearing Clutch thrust bearing: Removal - Refitting ,
- the clutch forks Clutch fork: Removal - Refitting .



2. REMOVAL OPERATION

CAUTION

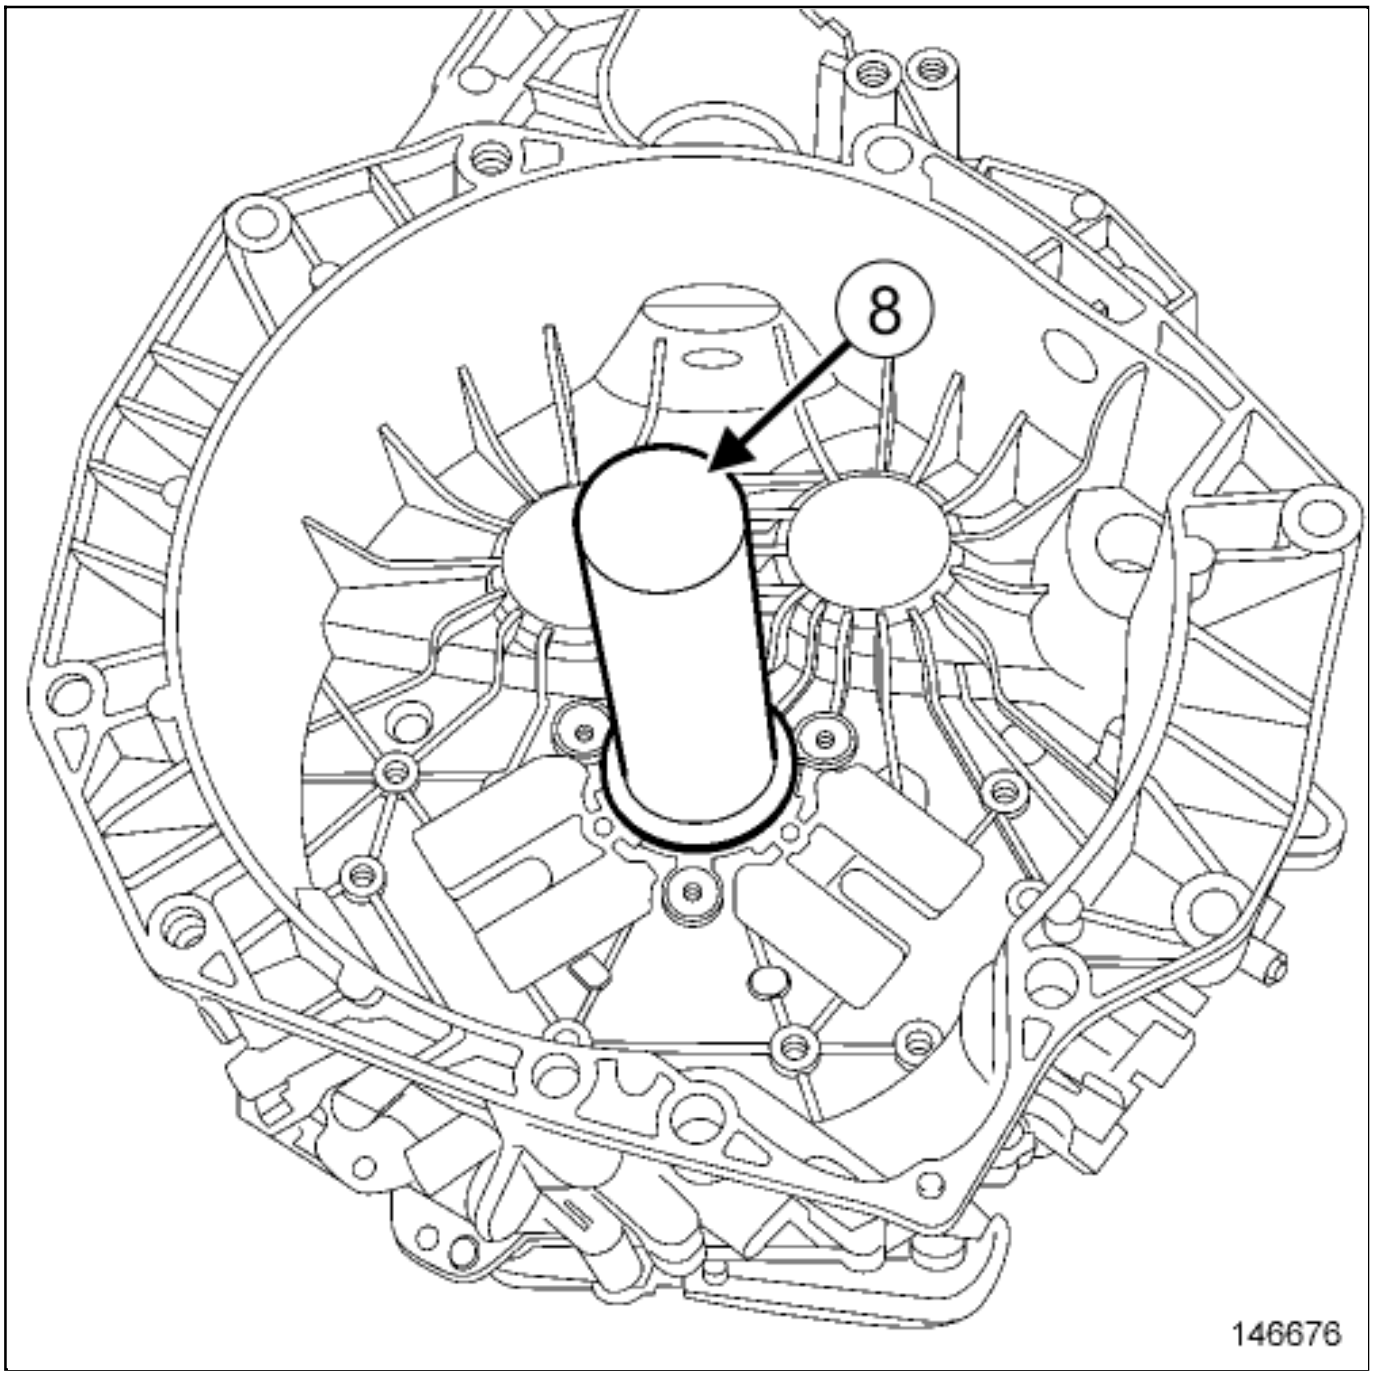
Failure to adhere to the following procedure may damage the gearbox.

7
144561

Note:

Take care to insert the seal extraction gimlet no further than(4 mm) in order not to damage the lip seal of the input shaft bearing just behind the seal.

Remove the lip seal of the large diameter input shaft using the toolInertia seal extractor(Bvi. 1948) (7) .



REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the seal mating faces.

-  parts always to be replaced: Input shaft lip seal  .

2. REFITTING OPERATION

Refit the lip seal for the large diameter input shaft using the toolTools for removal - refitting of input shaft seals (DC4)(Bvi. 1954) (8) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

INPUT SHAFT: STRIPPING - REBUILDING

Note, one or more warnings are present in this procedure

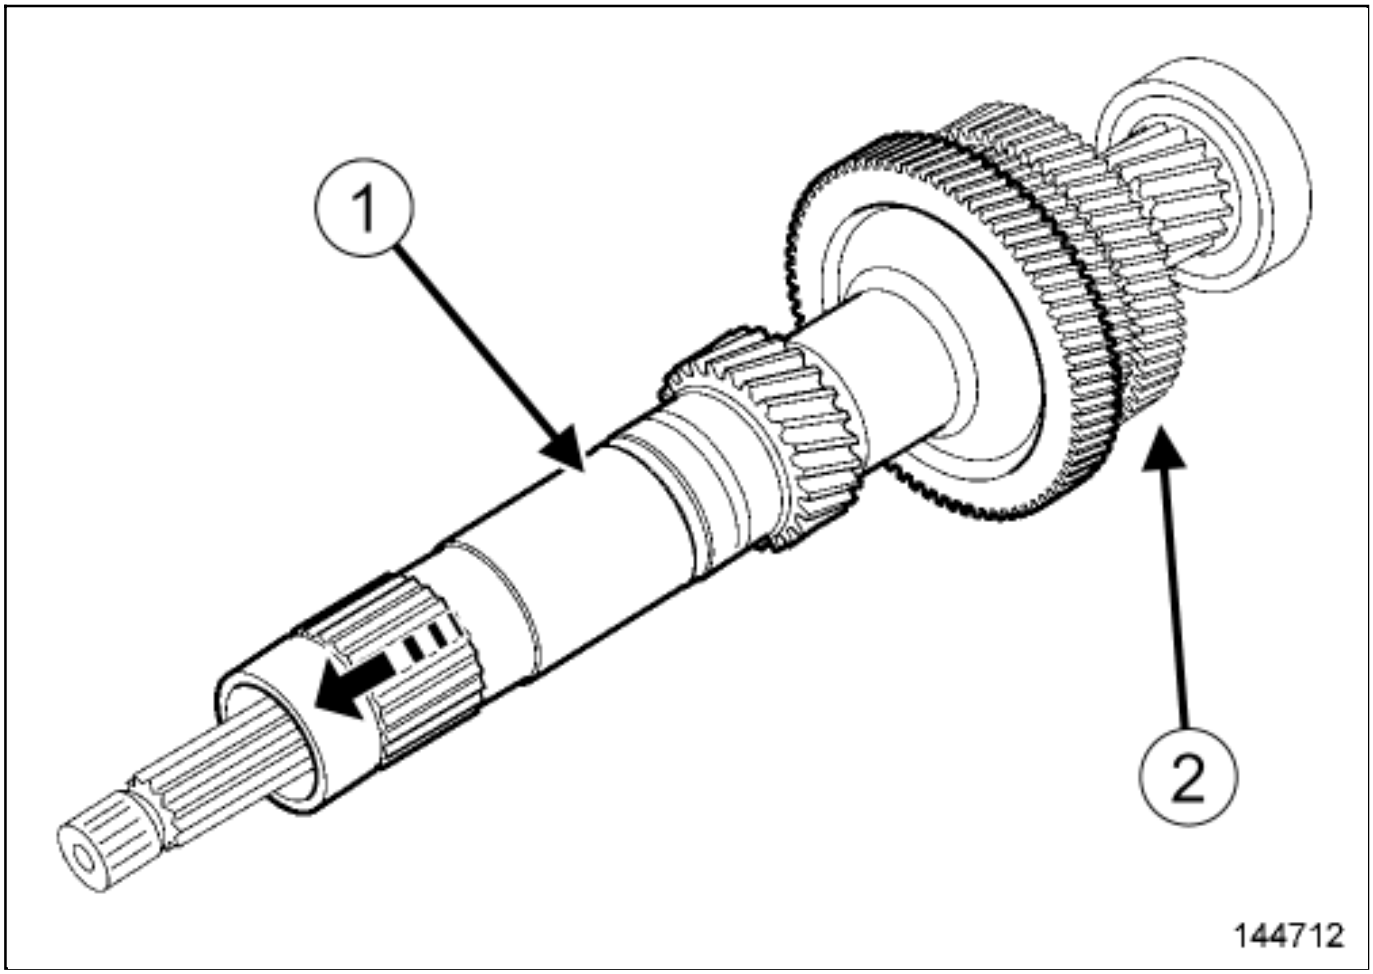
Special tooling required	
Tools for removal - refitting of input shaft seals (DC4)	Bvi. 1954
DC4 gearbox internal renovation kit	Bvi. 1956
Tools for removal - refitting of input shaft seals	RSM. 9305
DC4 gearbox internal renovation	RSM. 9306

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

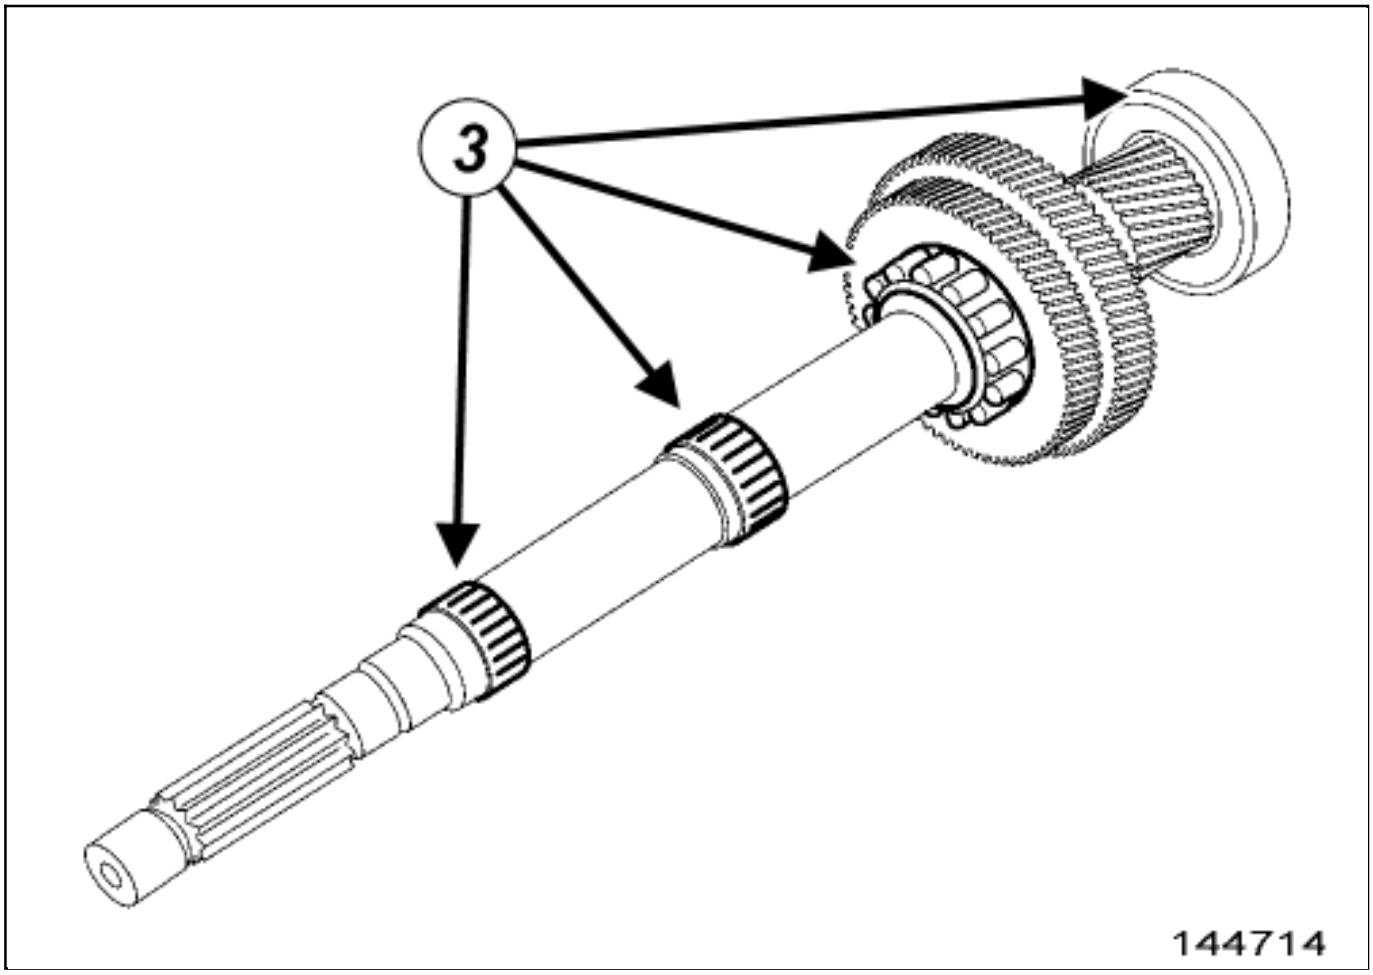
- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

STRIPPING



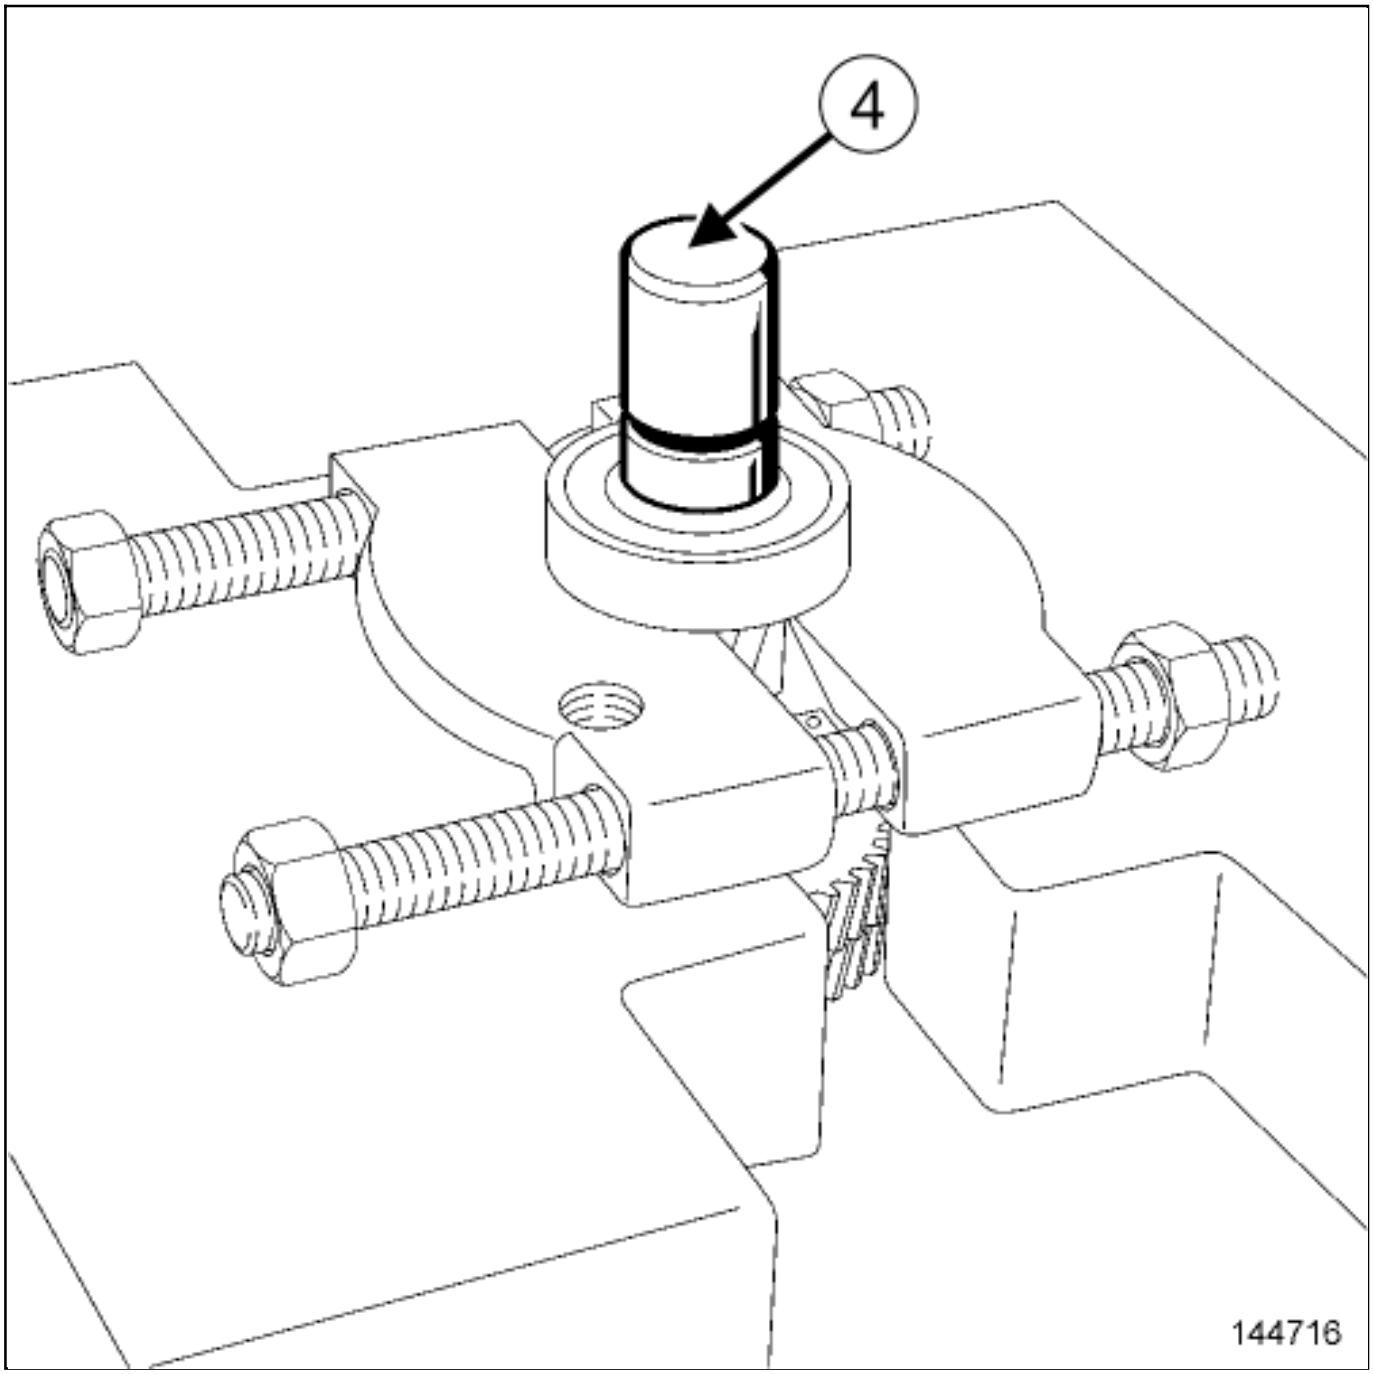
1. STRIPPING PREPARATION OPERATION

Remove:



- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,
- the speed sensorsSpeed sensor: Removal - Refitting ,
- the gear engaged sensorGear engaged sensor: Removal - Refitting ,
- the automatic transmission computerAutomatic gearbox computer : Removal - Refitting ,
- the clutch pressure plateClutch: Removal - Refitting ,
- the clutch actuator motorsClutch actuator motor: Removal - Refitting ,
- the clutch thrust bearingClutch thrust bearing: Removal - Refitting ,
- the clutch forksClutch fork: Removal - Refitting ,

- the input shaft lip seals **Input shaft lip seal: Removal - Refitting** ,
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** ,
- the input shaft bearing on the clutch housing **(see 23A, Automatic gearbox , Clutch housing bearing: Removal - Refitting)** ,
- the gearbox shafts **(see 23A, Automatic gearbox , Gearbox shaft: Removal - Refitting)** .



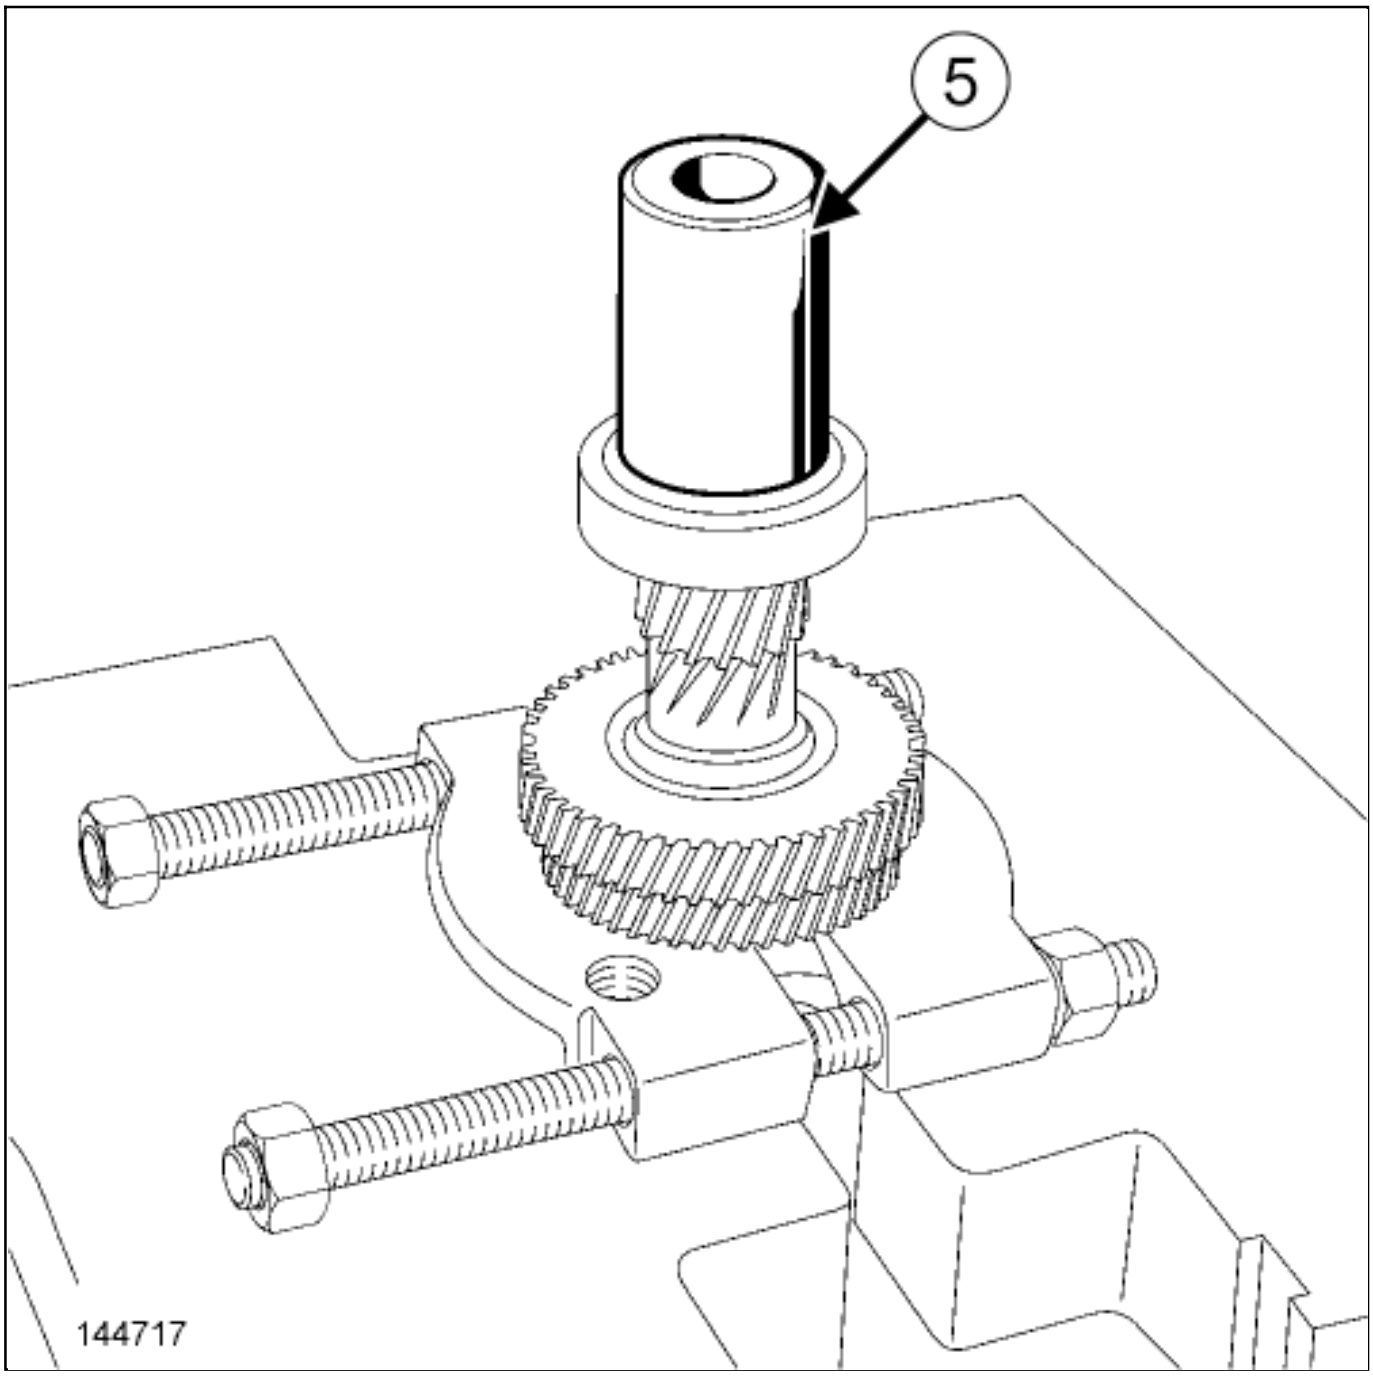
2. STRIPPING OPERATION FOR PART CONCERNED

Dismantle the 2 input shafts(1) and (2) .

Remove the bearings(3) from the input shaft.

Fit a separator under the input shaft bearing.

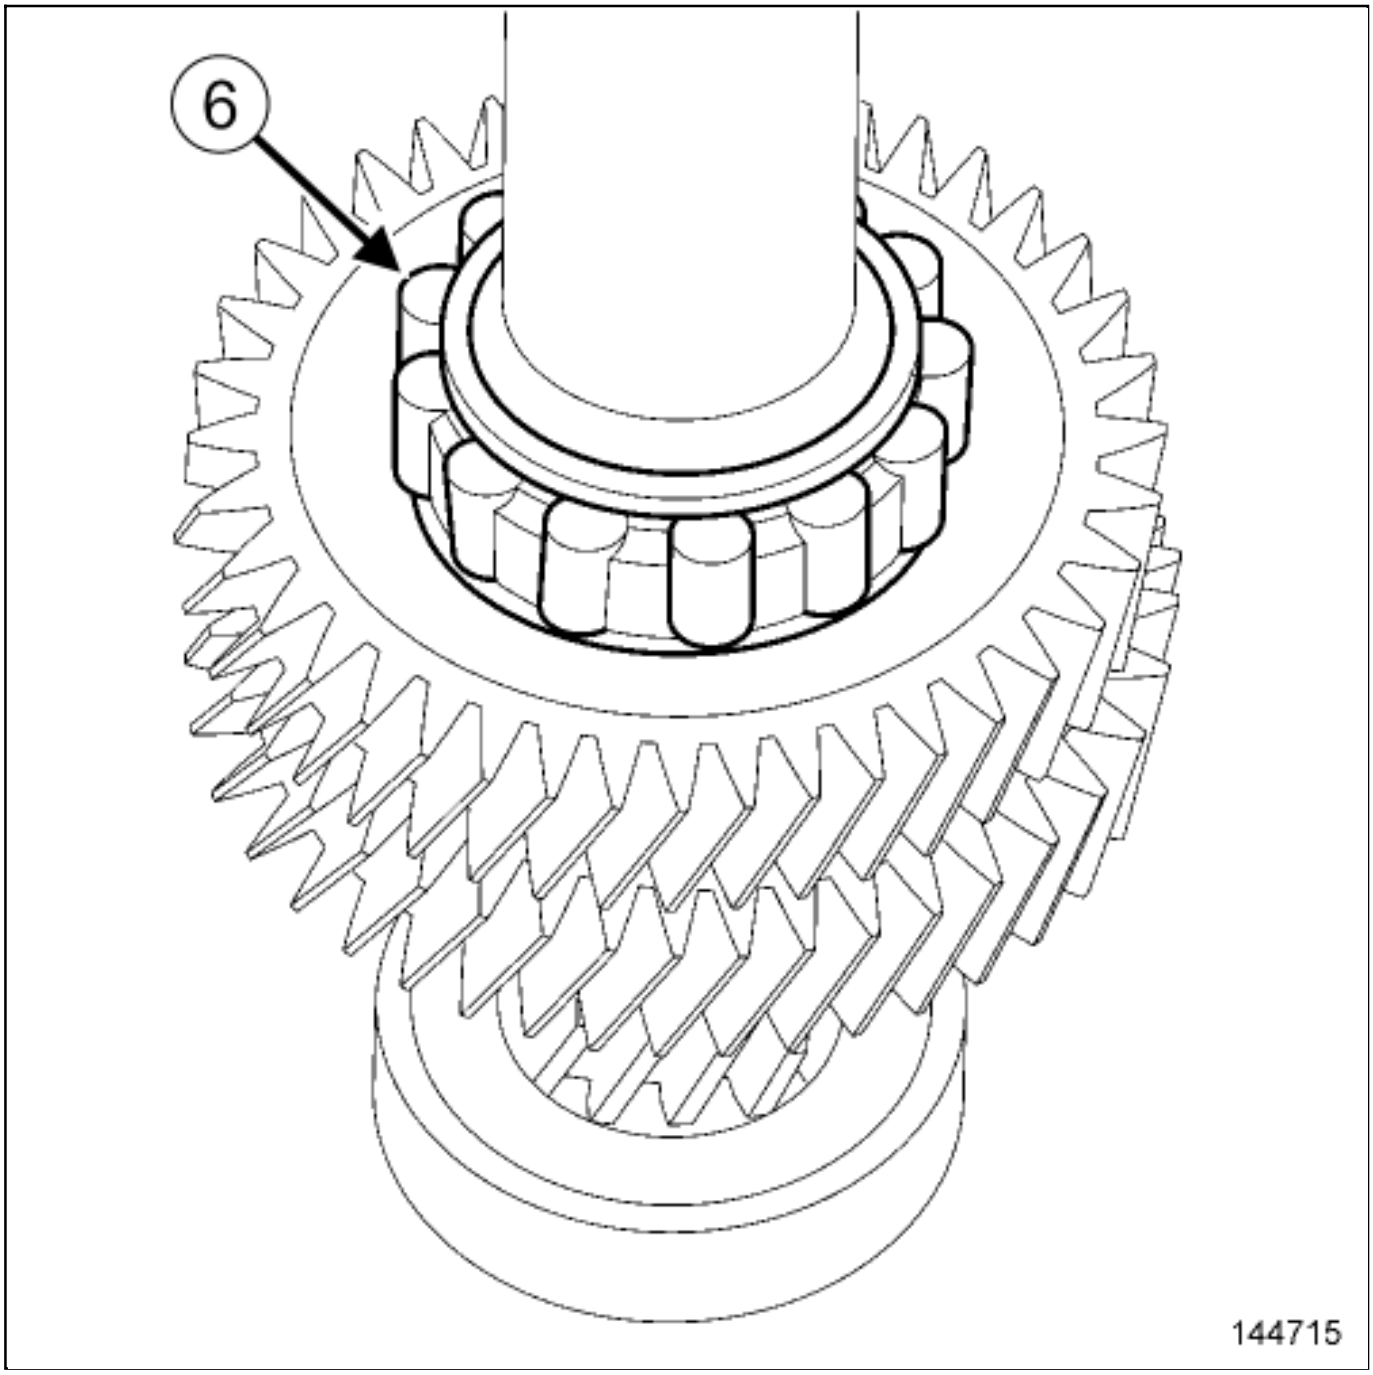
Remove the input shaft bearing using a press and the toolDC4 gearbox internal renovation kit (Bvi. 1956) E (4) .



REBUILDING

1. REBUILDING PREPARATION OPERATION

- Clean all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products).



- Always replace the removed rings.

2. REBUILDING OPERATION FOR PART CONCERNED

Fit a separator under the 3rd gear pinion.

Refit a new input shaft bearing using a press and the toolDC4 gearbox internal renovation kit (Bvi. 1956) D (5) .

Note:

The large diameter bearing(6) has a direction of fitting. Make sure that it is refitted in the correct direction.

Refit new input shaft bearings.

Note:

In order not to damage the input shaft seal, it is necessary to use the seal protection tube when assembling the 2 input shafts.

- Fit the protection tube of the toolTools for removal - refitting of input shaft seals (DC4)(**Bvi. 1954**) on the small input shaft.

- Assemble the 2 input shafts.

- Remove the protection tube.

3. FINAL OPERATION

- Proceed in the reverse order to removal.

INSTRUMENT PANEL: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts to always be replaced, etc.)Dashboard assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Apply the before repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the Before repair procedure:

■"Instrument panel" .

- Switch off the ignition.
- Remove the dashboard centre visorDashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Remove the instrument panel screwsDashboard assembly: Exploded view .
- Disconnect the instrument panel connector.
- Remove the instrument panel.

REFITTING

1. REFITTING OPERATION

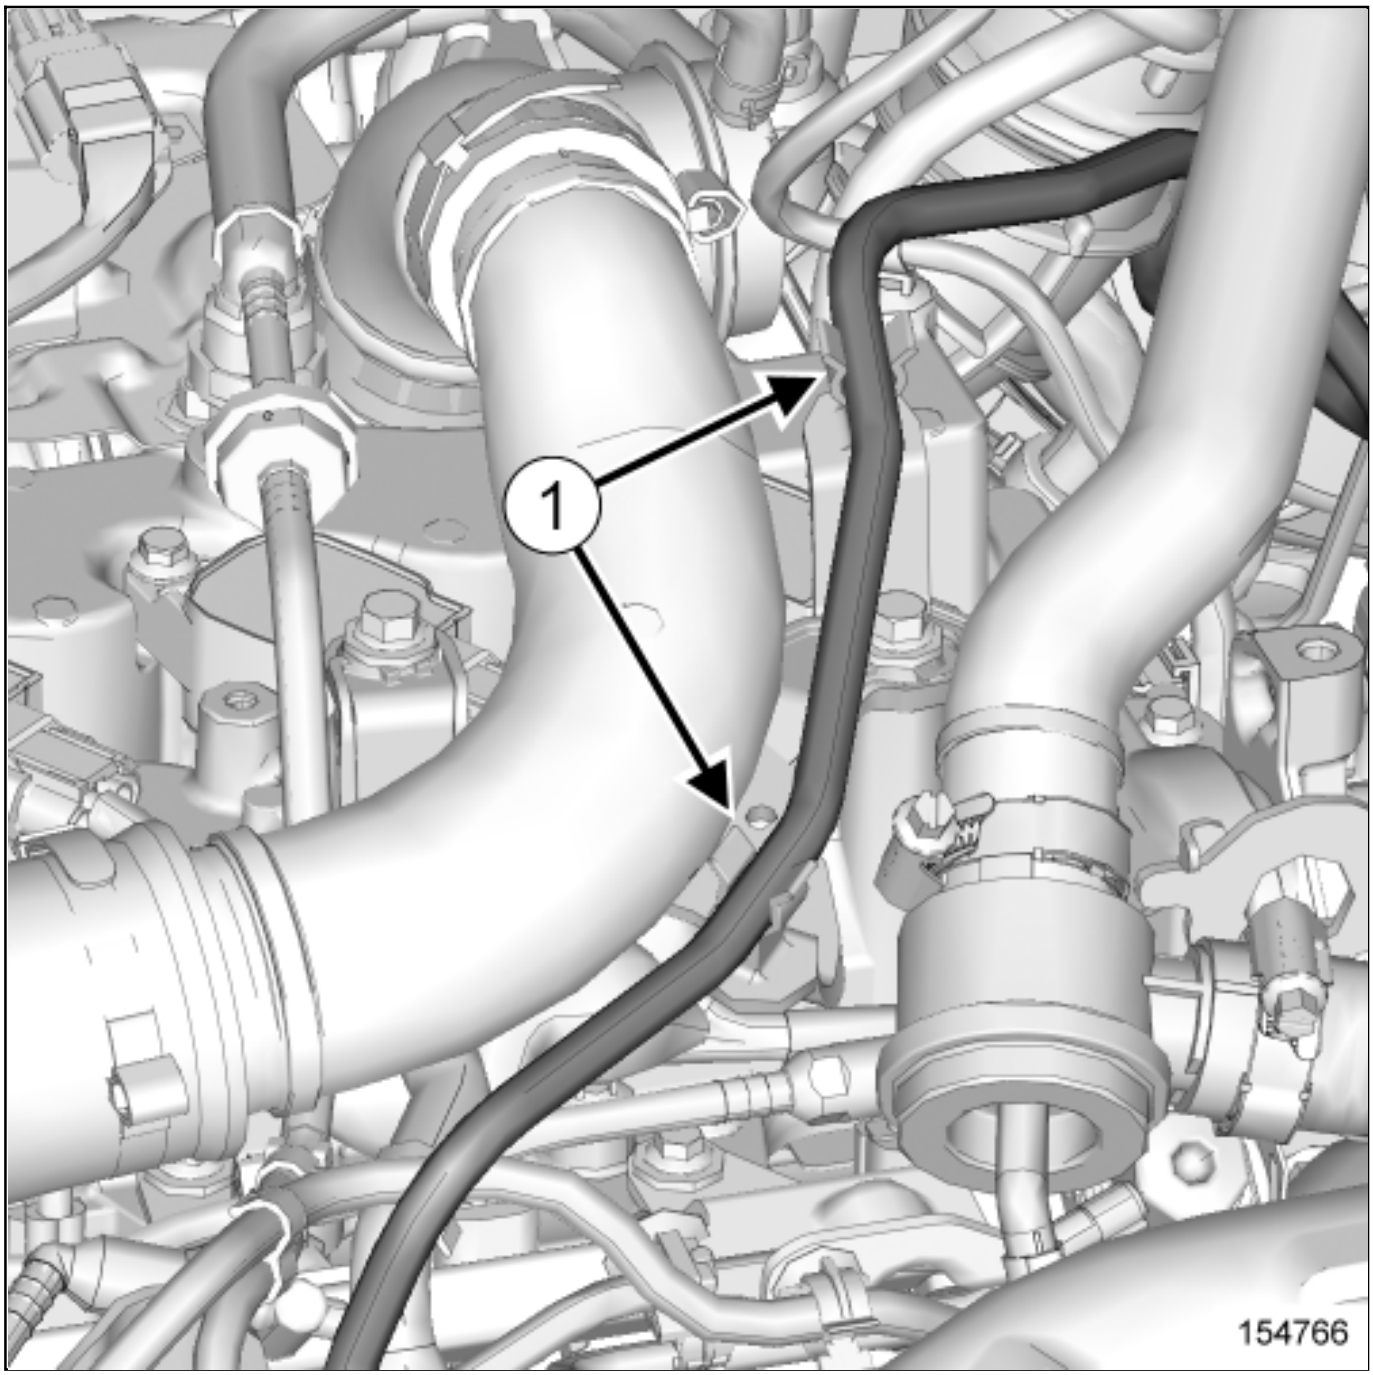
- Proceed in the reverse order to removal.

2. FINAL OPERATION

Switch on the ignition.

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

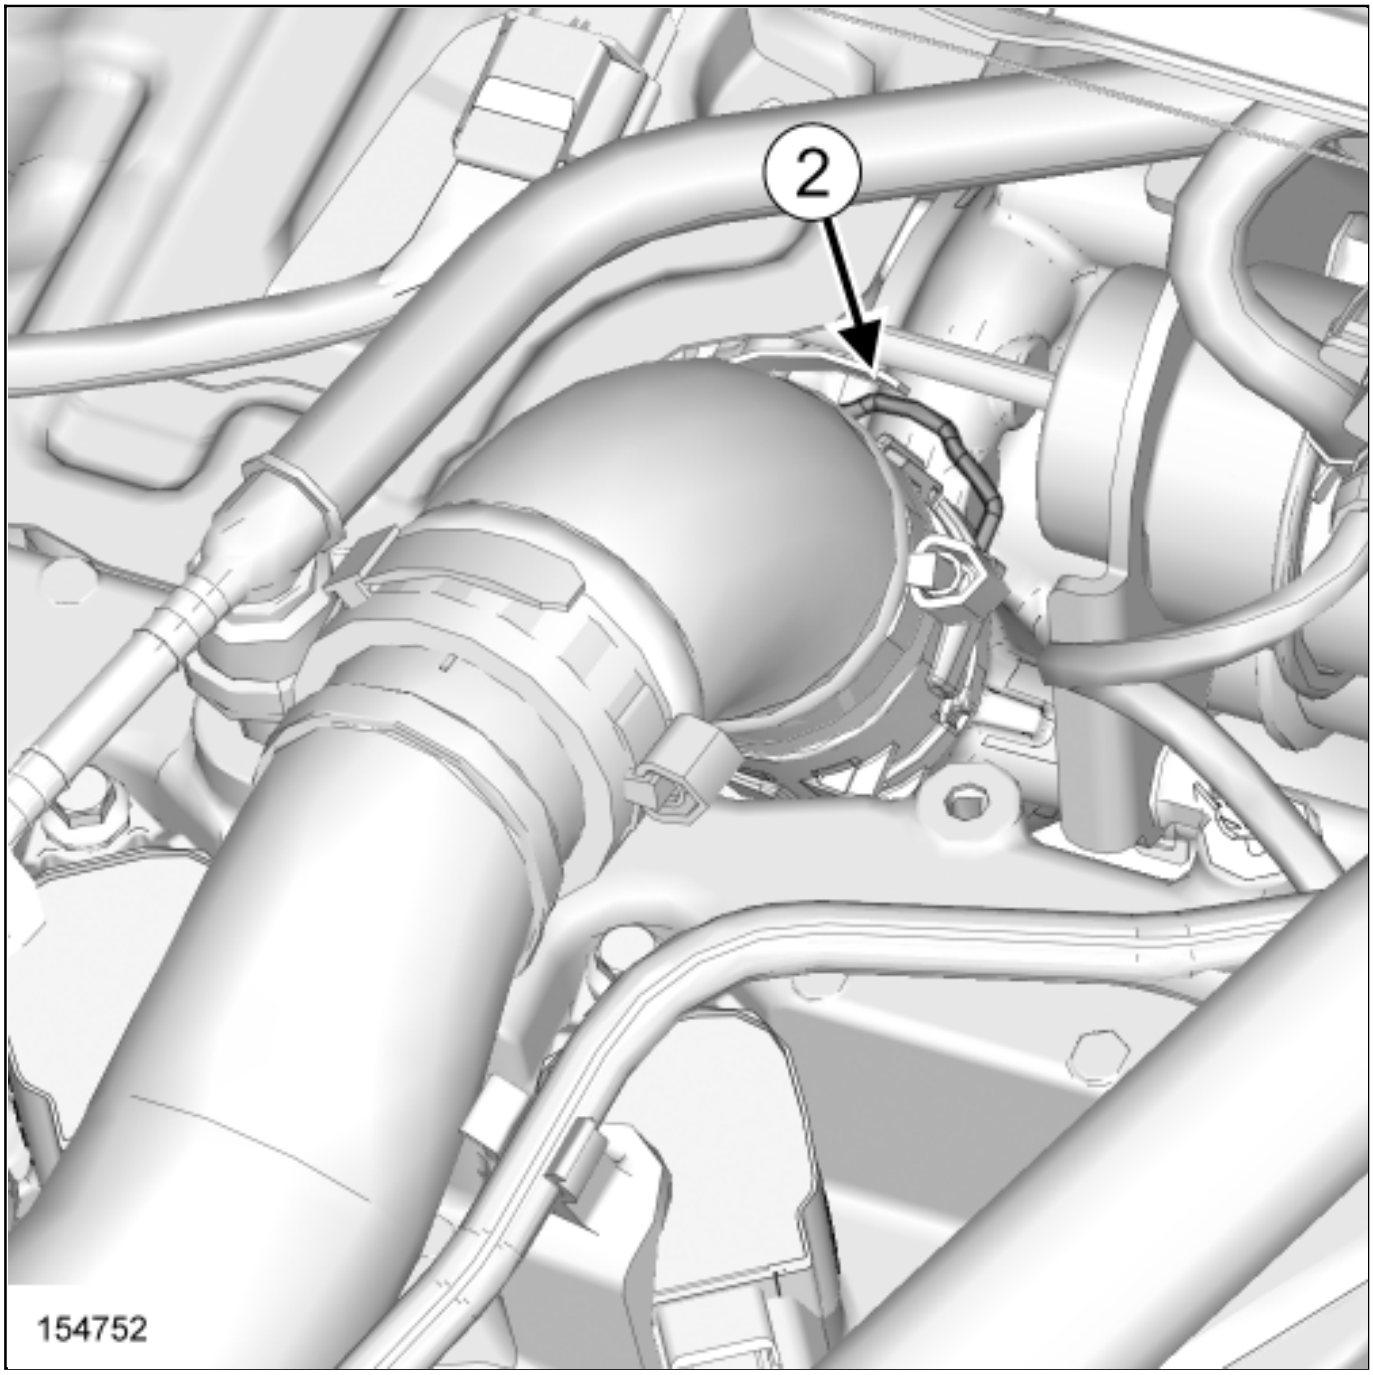


"Instrument panel" .

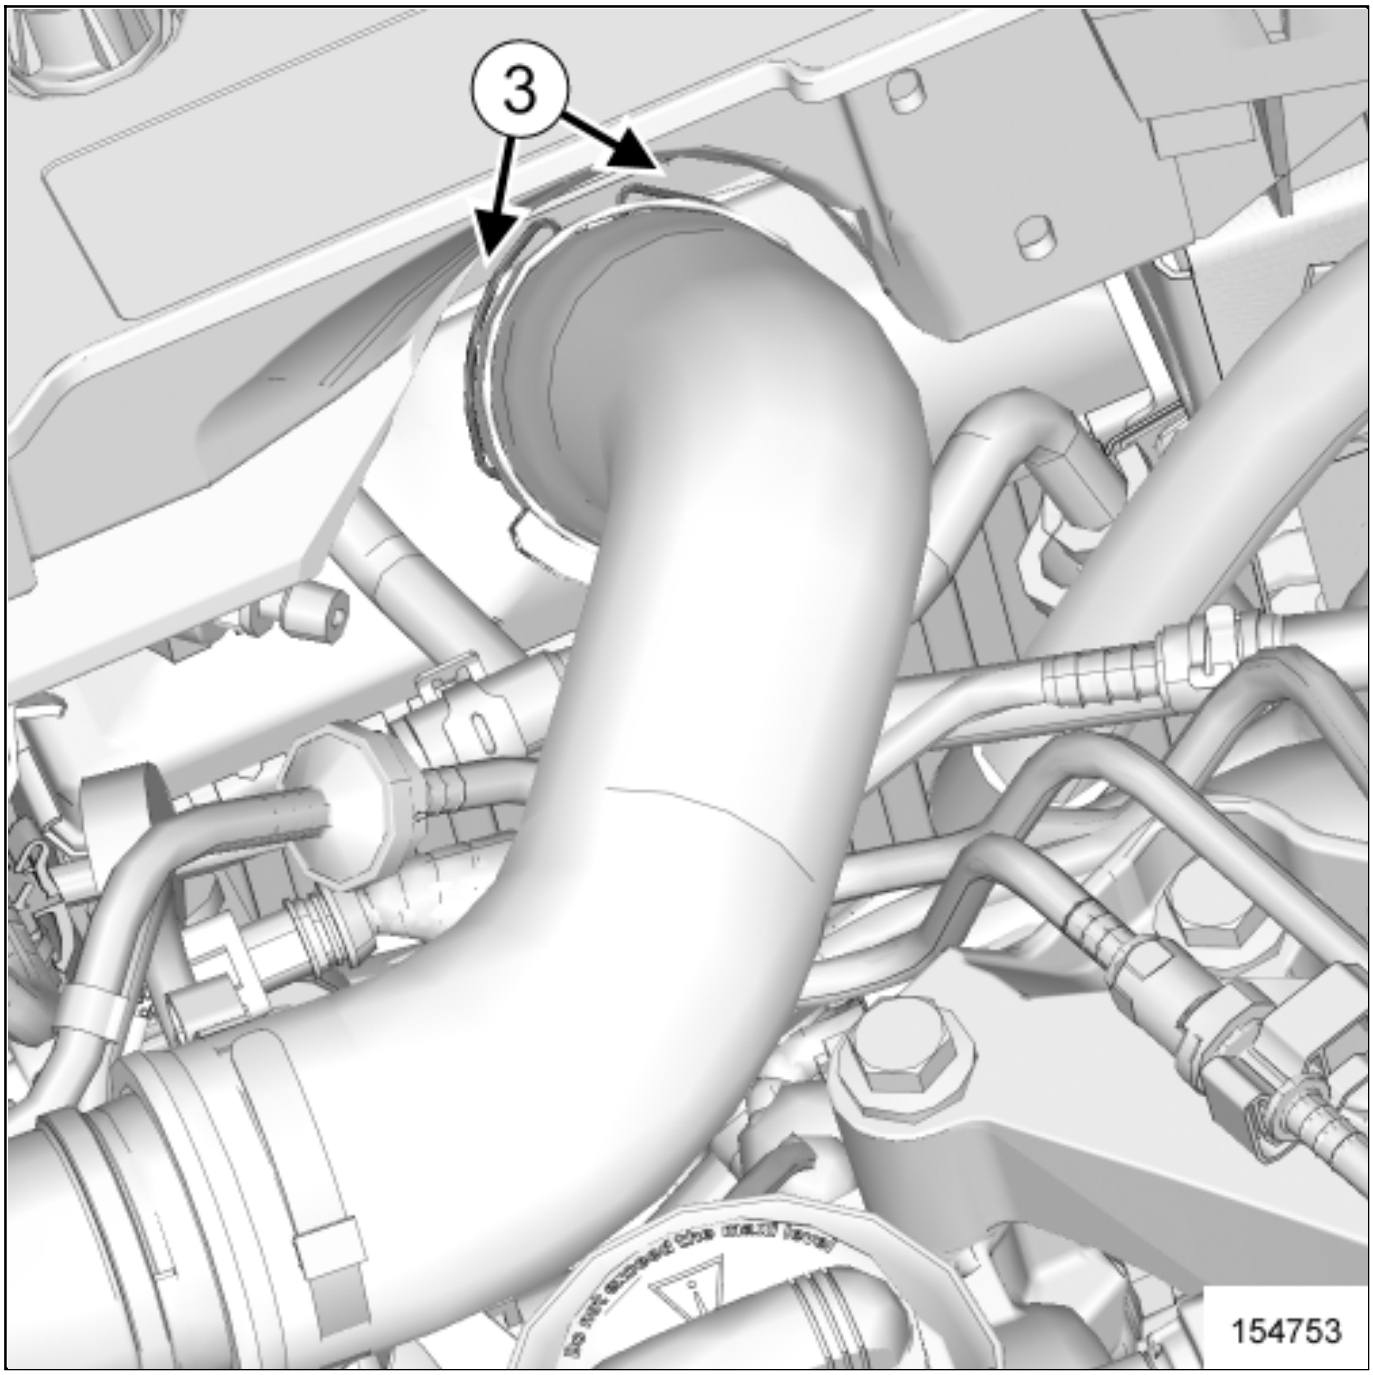
INTERCOOLER AIR INLET PIPE: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts always to be replaced, etc.)Air inlet assembly: Exploded view .

REMOVAL



1. REMOVAL PREPARATION OPERATION



Unclip the brake servo pipe at(1) .

2. REMOVAL OPERATION

Remove the intercooler air inlet pipe nuts Air inlet assembly: Exploded view .

Remove the turbocharger air outlet pipe clip(2) by pulling on the clip.

Remove:

- the intercooler air inlet pipe clip by pulling on both ends(3) of the clip,
- the intercooler air inlet pipe[Air inlet assembly: Exploded view] .

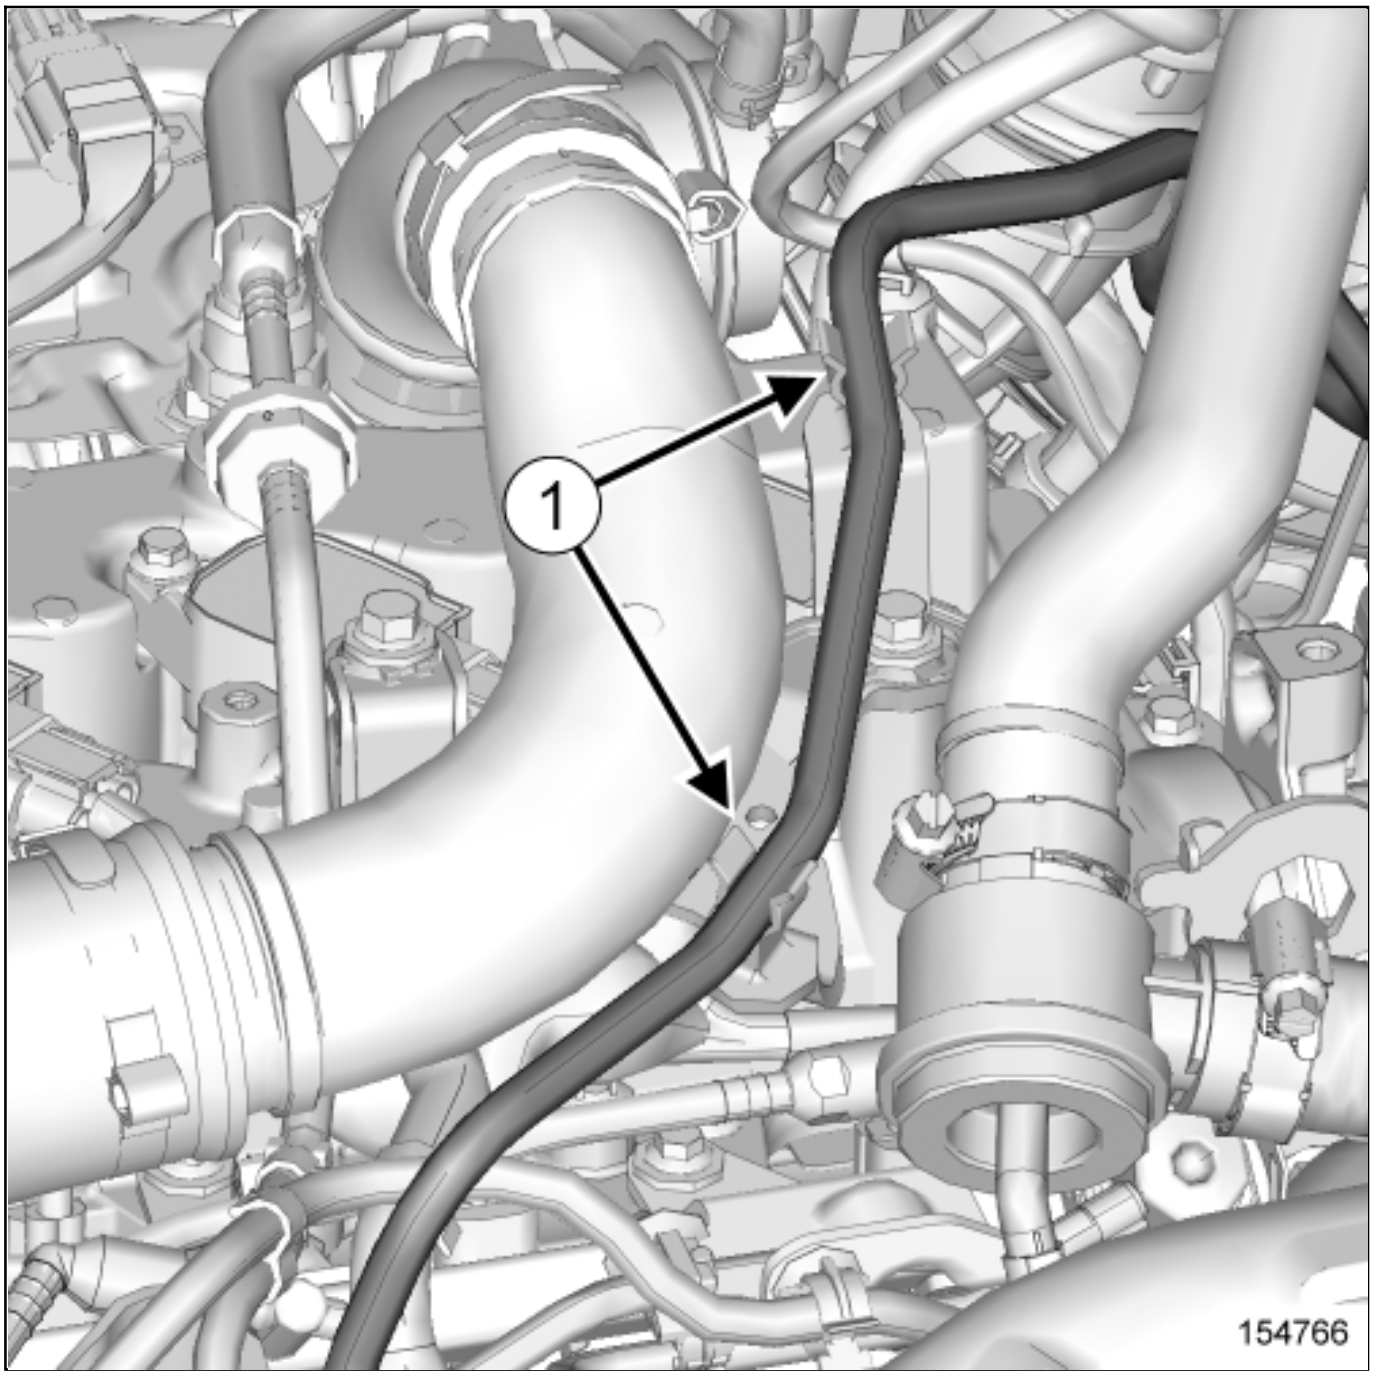
REFITTING

1. REFITTING PREPARATION OPERATION

Note:

In case of damage to the turbocharger air outlet pipe seal, replace the seal.

2. REFITTING OPERATION

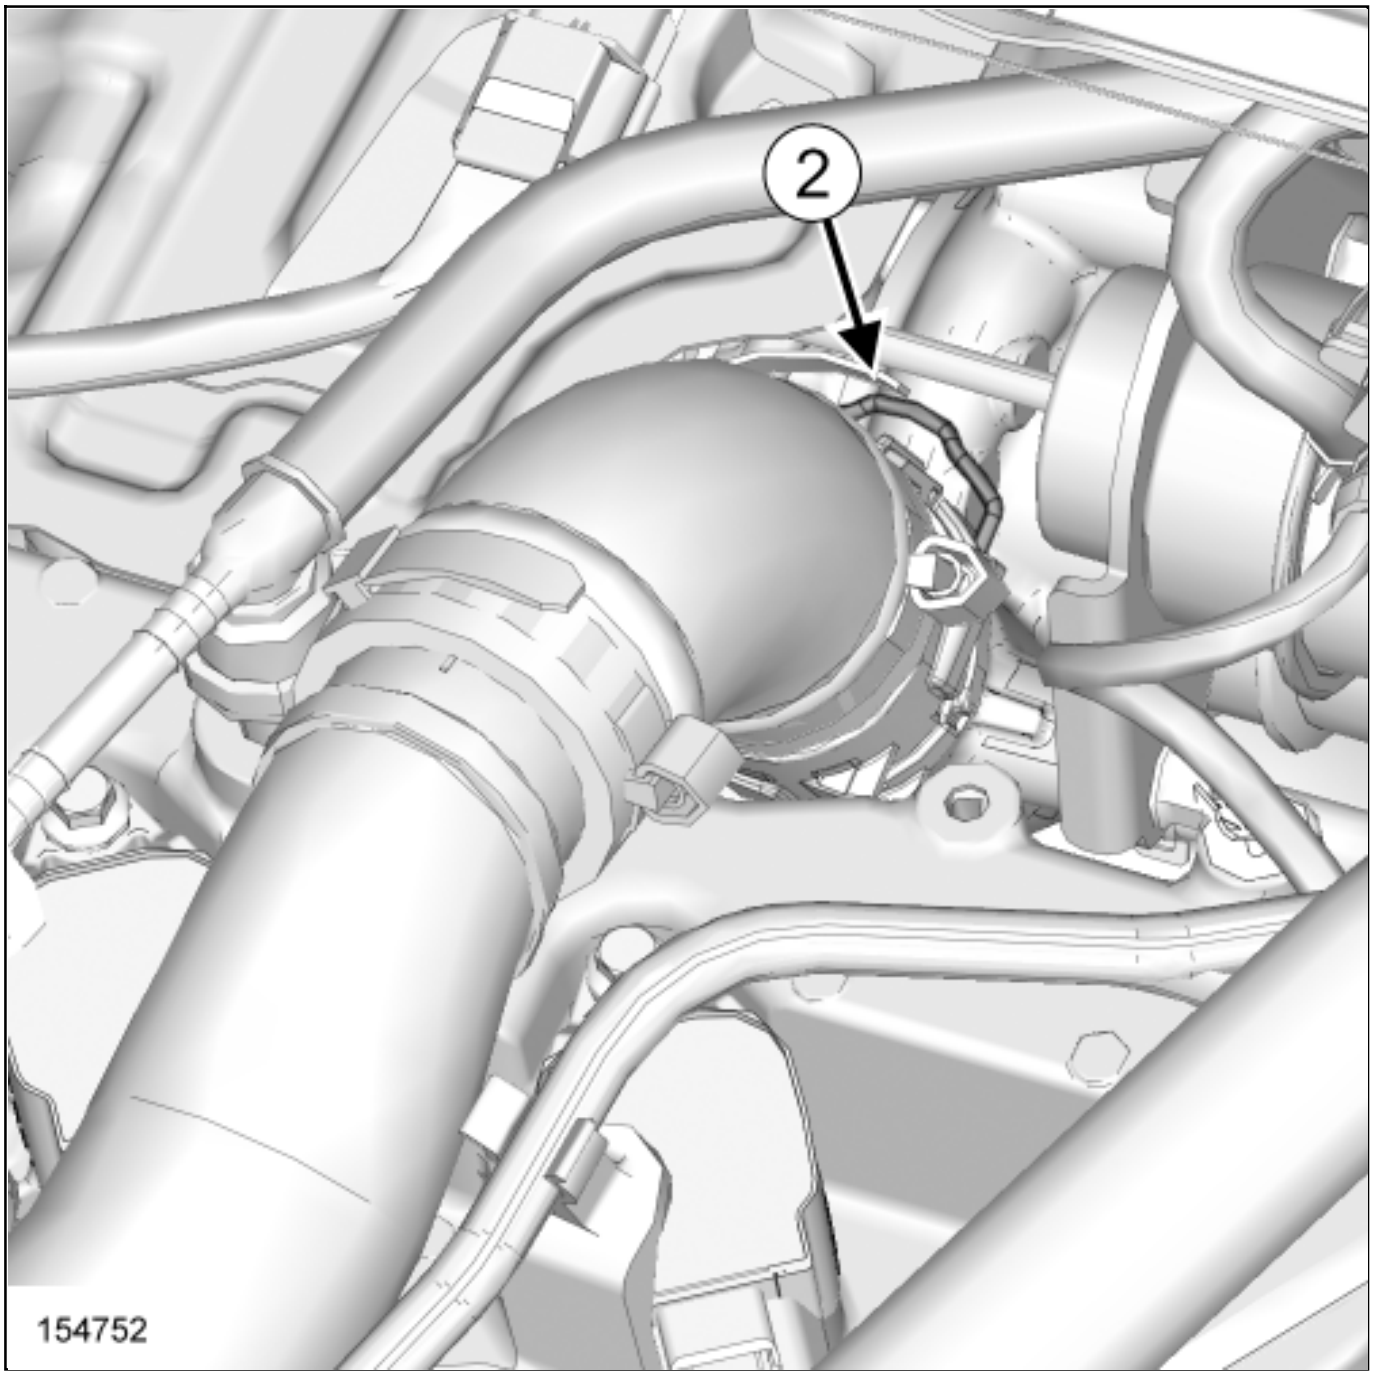


- Refit the intercooler air inlet pipe Air inlet assembly: Exploded view .
- Fit the clips onto the intercooler air inlet pipe.
- Clip the intercooler air inlet pipe onto:
  - the intercooler,
  - the turbocharger.
- Refit the intercooler air inlet pipe nuts Air inlet assembly: Exploded view .
- Torque tighten the intercooler air inlet pipe nuts Air inlet assembly: Exploded view .
- Proceed in the reverse order to removal.

INTERCOOLER AIR INLET PIPE: REMOVAL - REFITTING

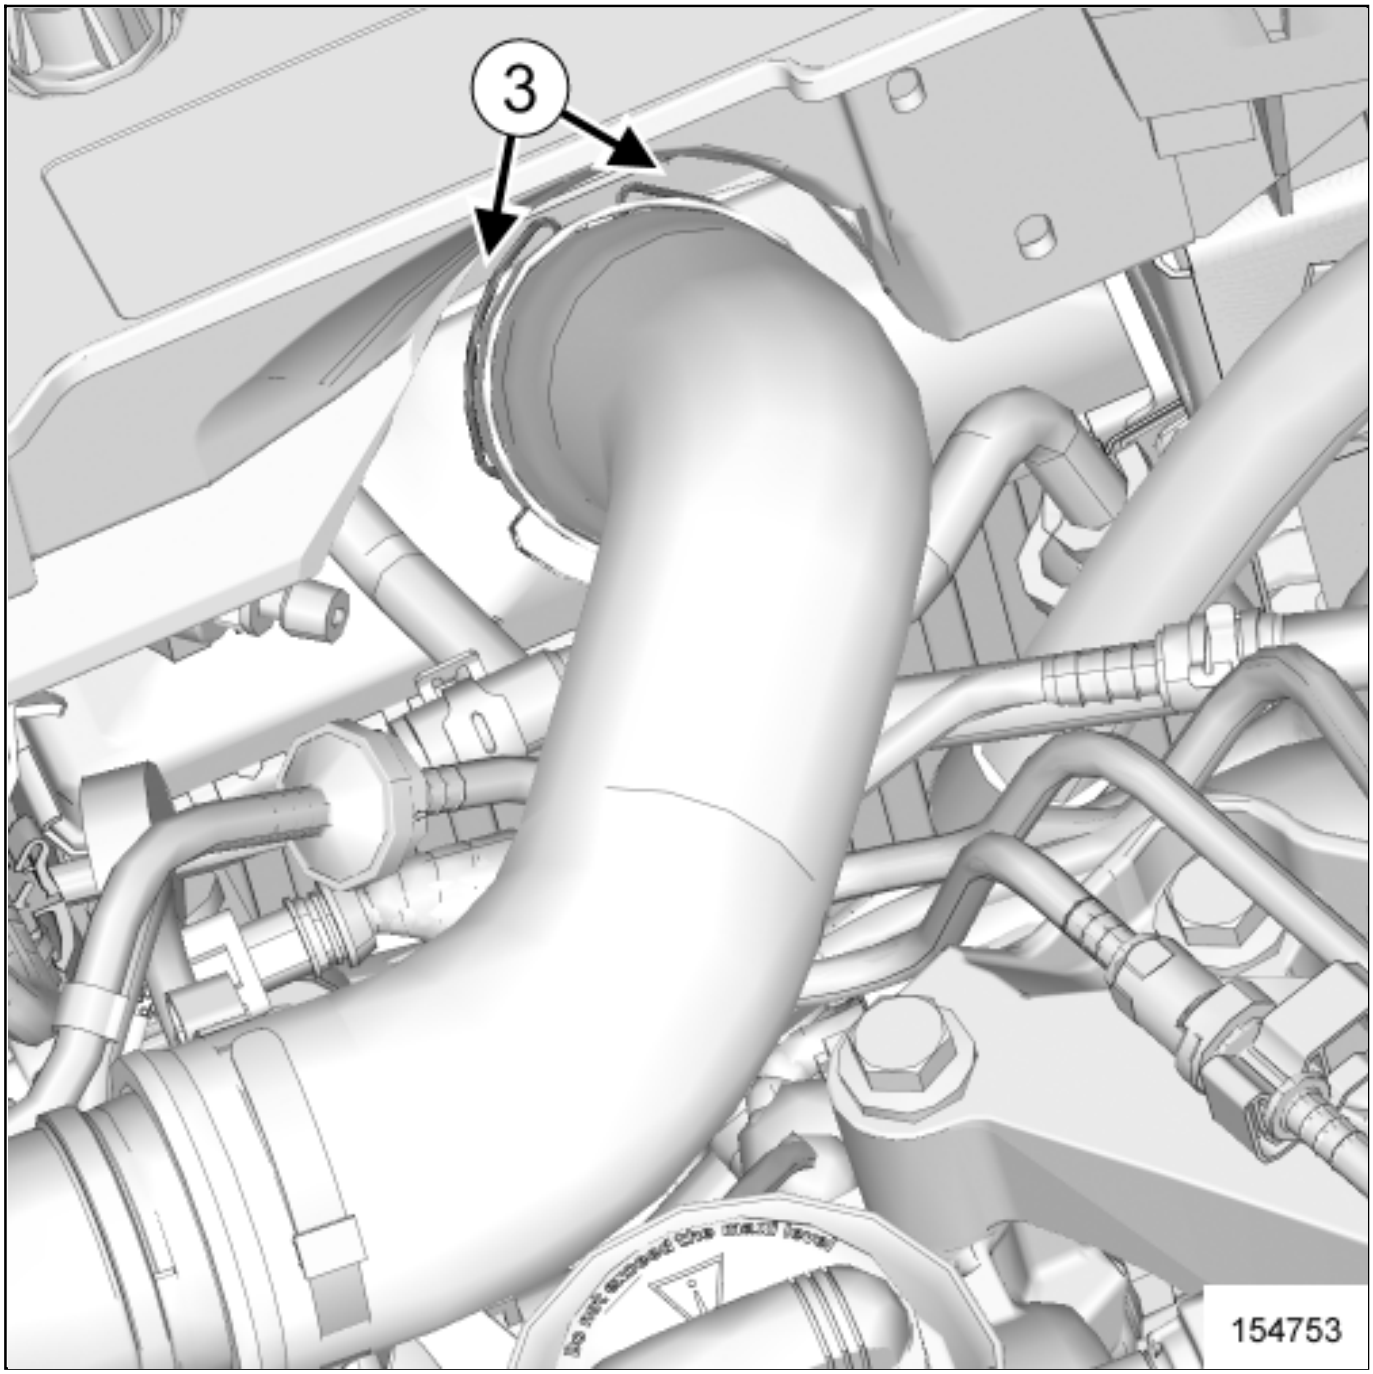
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

- Unclip the brake servo pipe at(1) .



2. REMOVAL OPERATION

- Remove the intercooler air inlet pipe nuts(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

-

Remove the turbocharger air outlet pipe clip(2) by pulling on the clip.

Remove:

- the intercooler air inlet pipe clip by pulling on both ends(3) of the clip,
- the intercooler air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

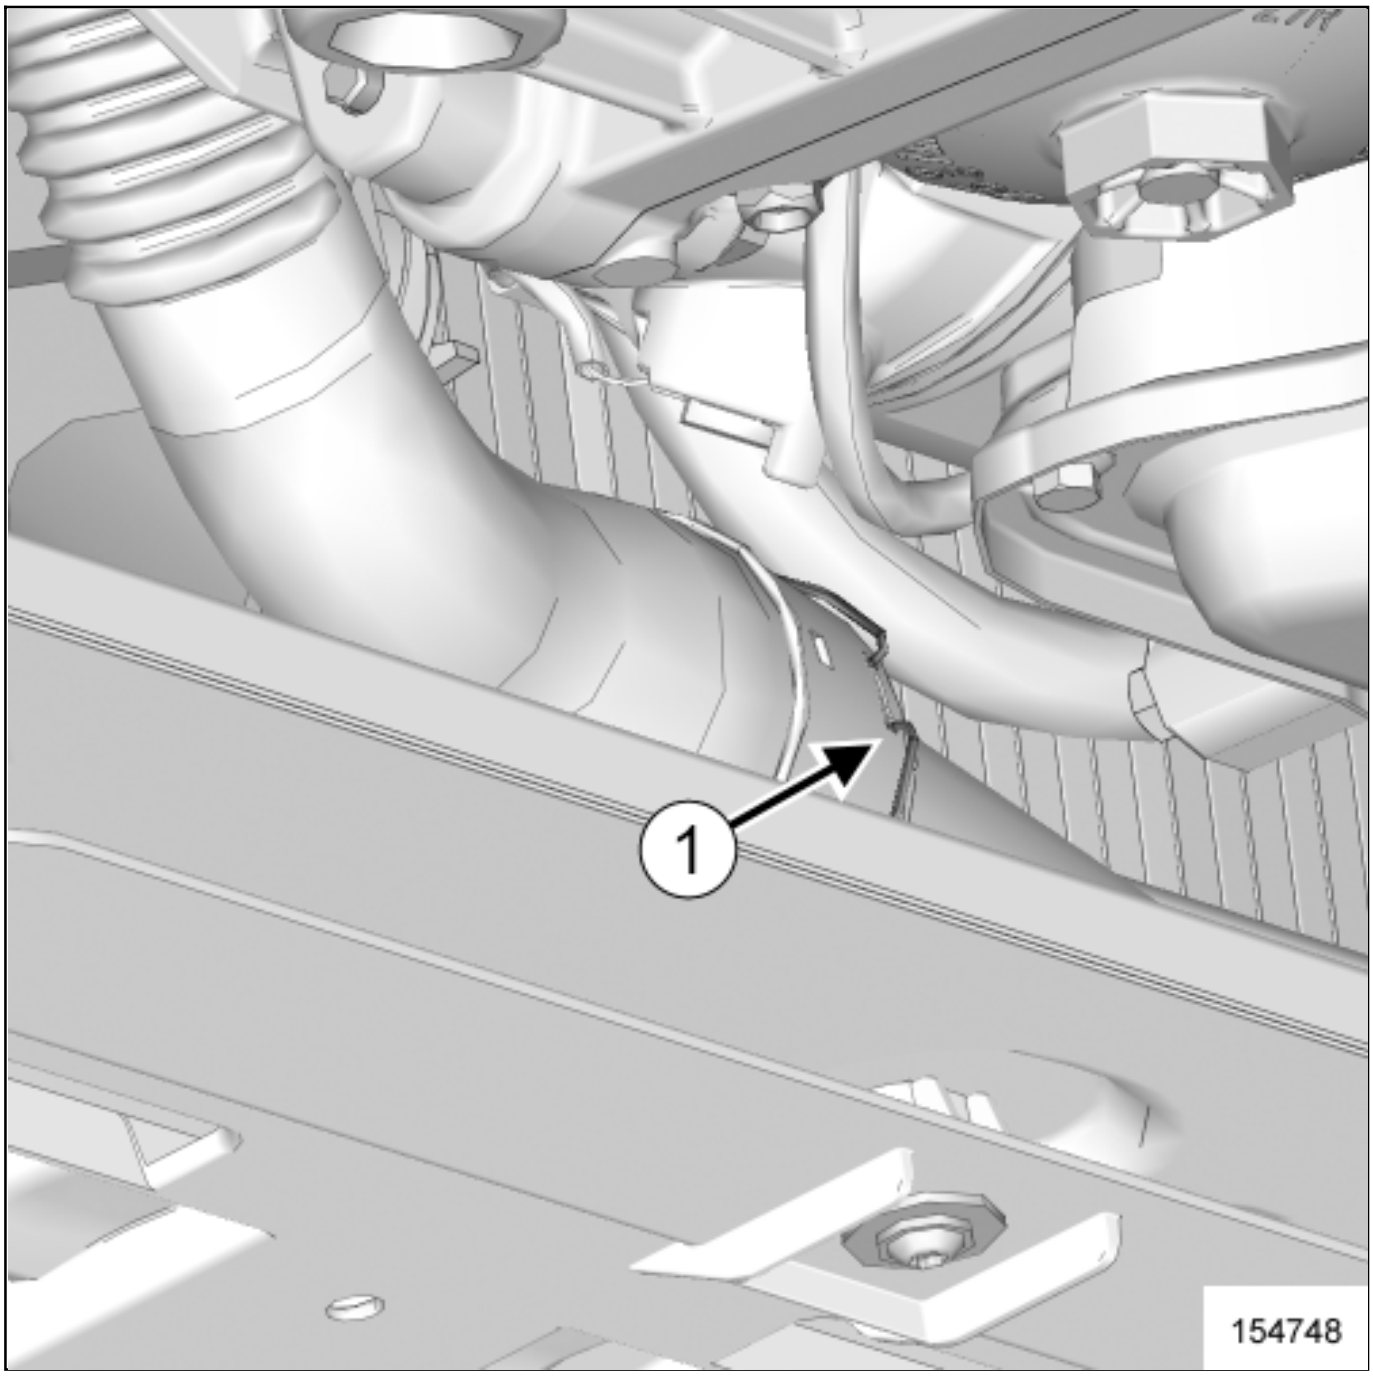
Note:

In case of damage to the turbocharger air outlet pipe seal, replace the seal.

2. REFITTING OPERATION

- Refit the intercooler air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Fit the clips onto the intercooler air inlet pipe.
- Clip the intercooler air inlet pipe onto:
  - the intercooler,
  - the turbocharger.
- Refit the intercooler air inlet pipe nuts (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Torque tighten the intercooler air inlet pipe nuts (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Proceed in the reverse order to removal.

INTERCOOLER AIR OUTLET PIPE: REMOVAL - REFITTING

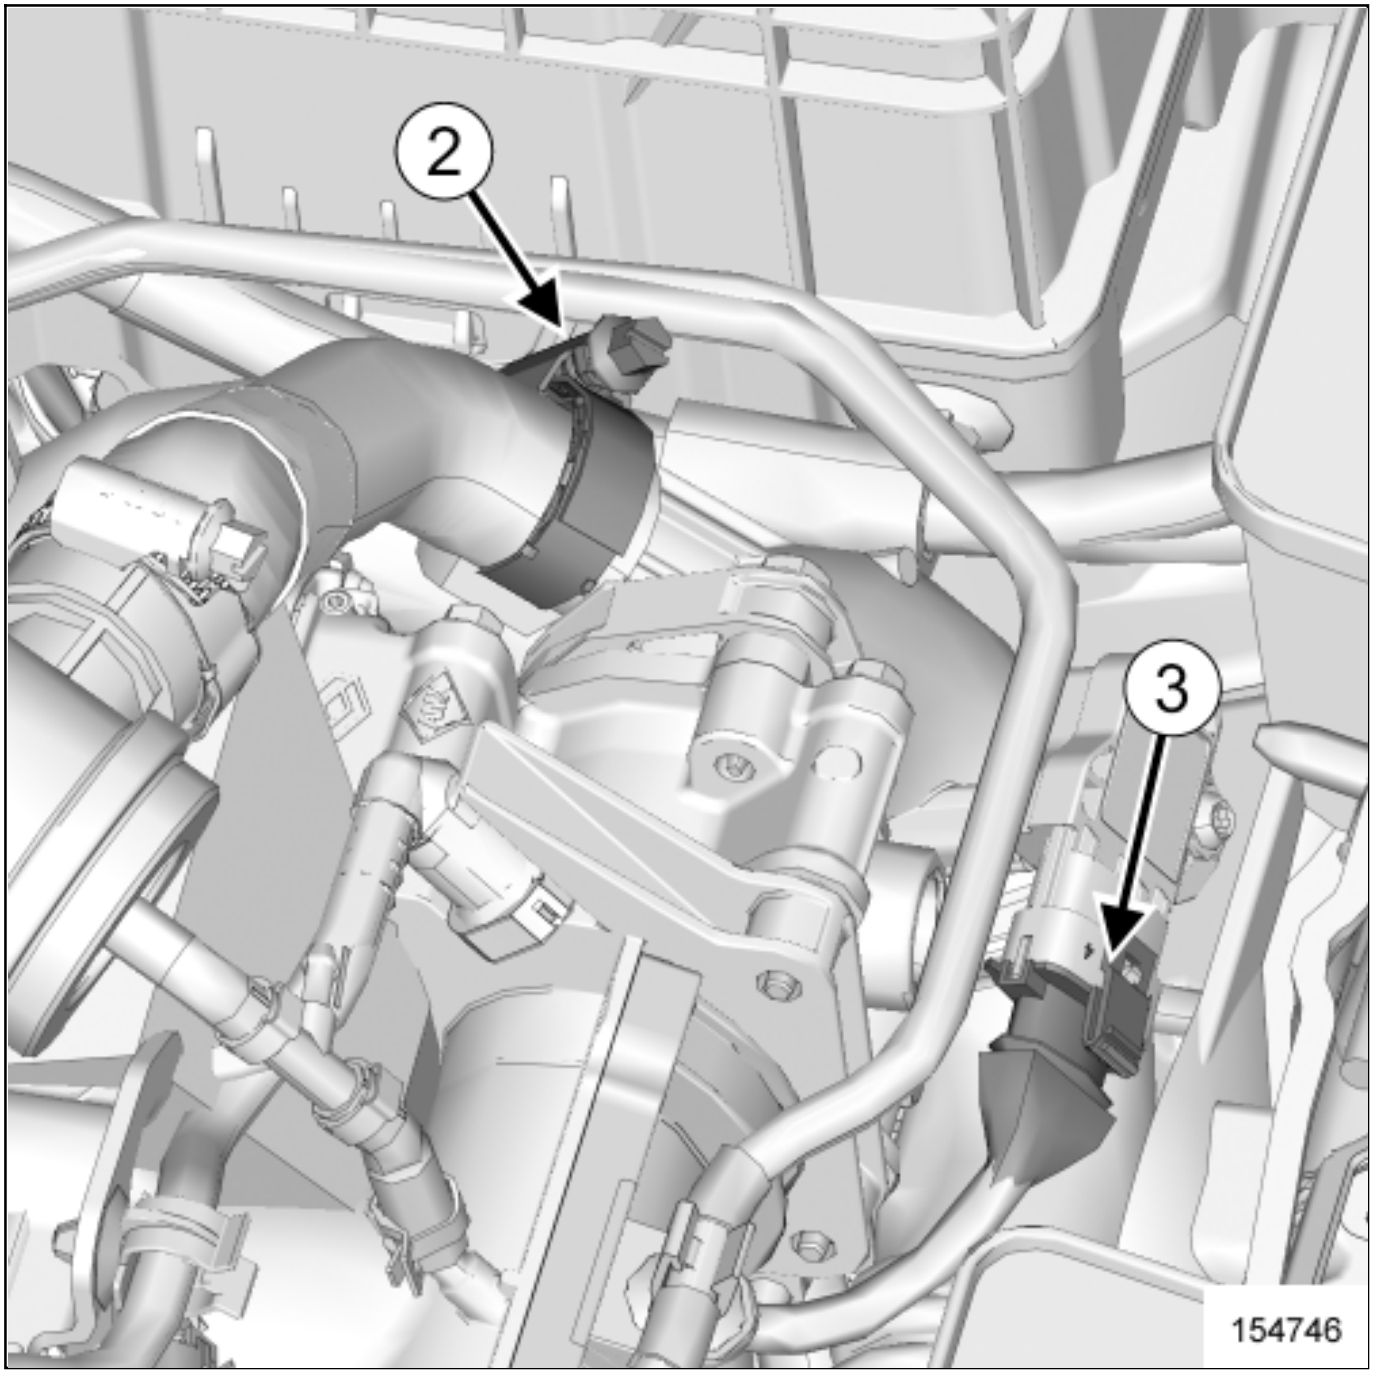


Locations and specifications (tightening torques, parts always to be replaced, etc.)Air inlet assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the engine undertray.
- Unclip the air filter unit air inlet pipe:
  - from the front end panel,
  - from the air filter unit.
- Remove the air filter unit air inlet pipeAir inlet assembly: Exploded view .



2. REMOVAL OPERATION

Move the clip(1) on the intercooler air outlet pipe aside by pulling on both ends of the clip.

Remove Air inlet assembly: Exploded view :

- the intercooler air outlet pipe support bolt from the engine cooling fan assembly,
- the intercooler air outlet pipe support bolt from the throttle valve.

Loosen the clip(2) from the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

Disconnect:

- the air duct link between the intercooler air outlet pipe and the high pressure discharge valve,
- the air temperature and pressure sensor connector(3) .

Remove Air inlet assembly: Exploded view :

- the intercooler air outlet pipe bolts from the throttle valve,
- the intercooler air outlet pipe.

REFITTING

1. REFITTING PREPARATION OPERATION

Note:

In case of damage to the intercooler air outlet pipe seal, replace the seal.

2. REFITTING OPERATION

Refit Air inlet assembly: Exploded view :

- the intercooler air outlet pipe,
- the intercooler air outlet pipe bolts on the throttle valve.

Torque tighten the intercooler air outlet pipe bolts on the throttle valve Air inlet assembly: Exploded view .

Connect:

- the air temperature and pressure sensor connector,
- the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

Tighten the clip on the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

Refit **Air inlet assembly: Exploded view** :

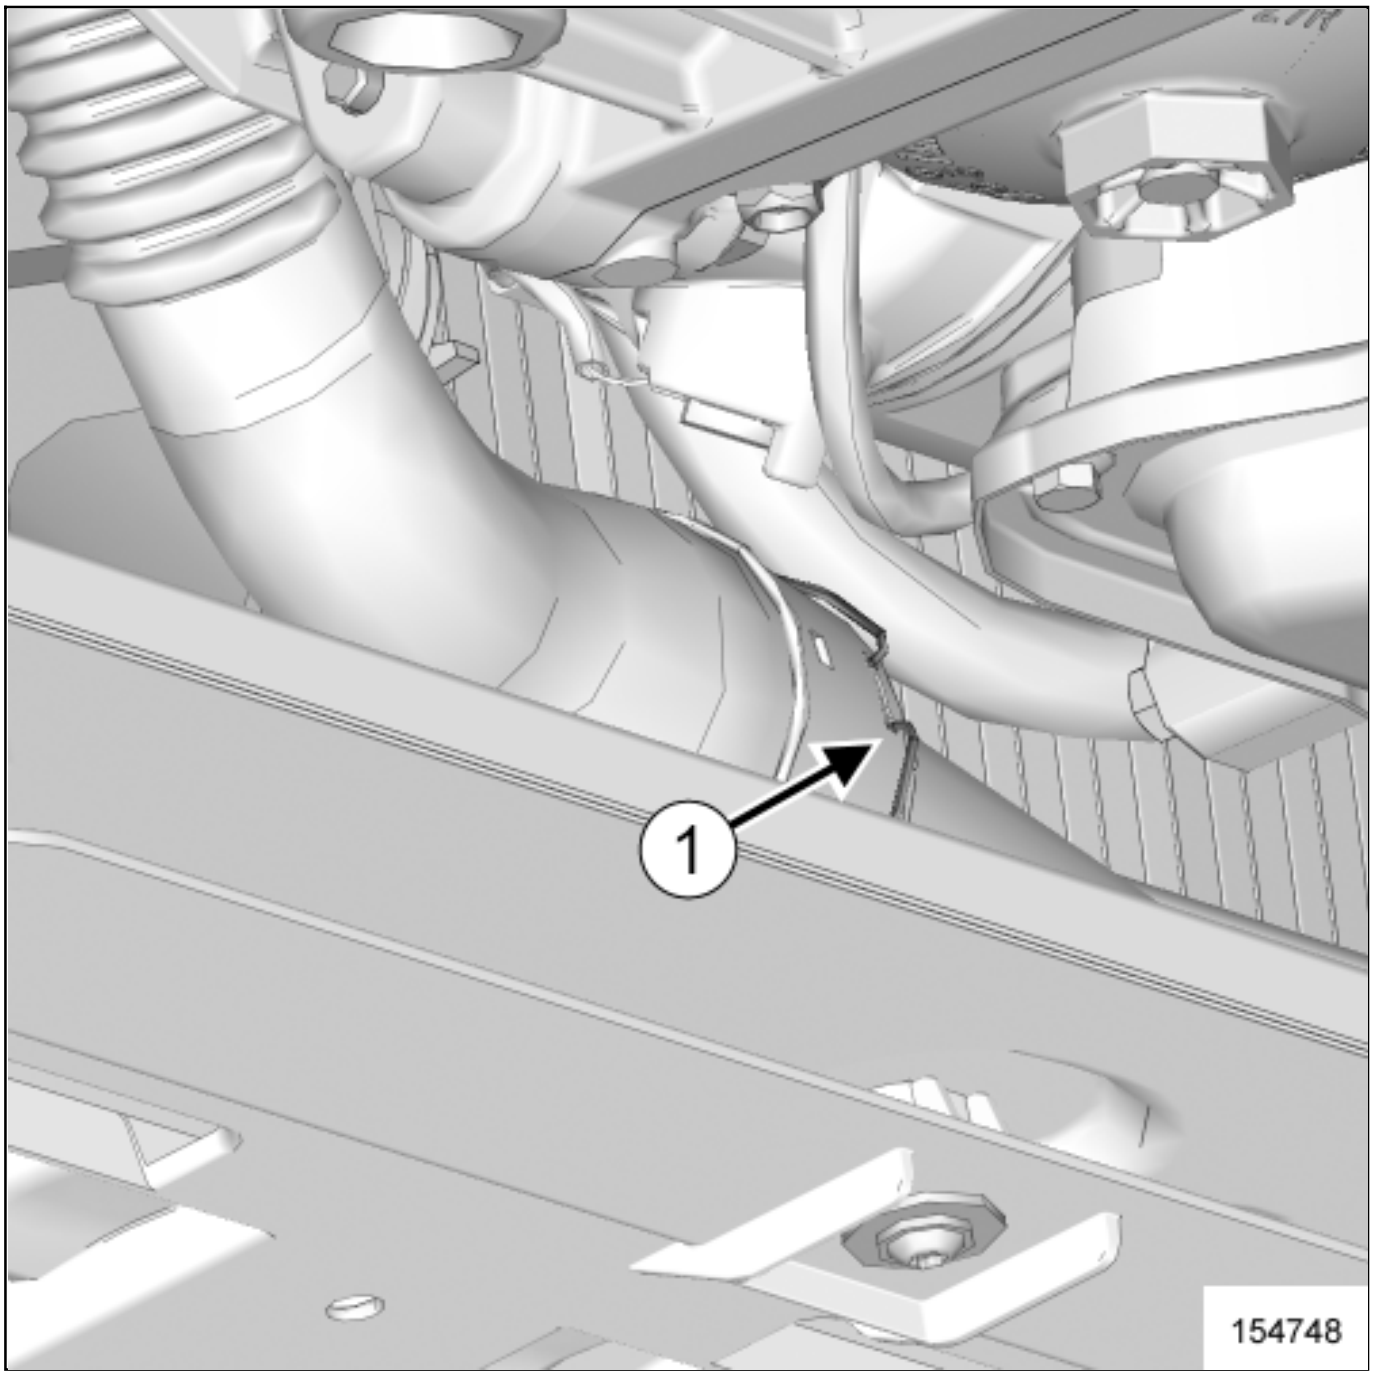
- the intercooler air outlet pipe support bolt on the throttle valve,
- the intercooler air outlet pipe support bolt on the engine cooling fan assembly.

Torque tighten **Air inlet assembly: Exploded view** :

- the intercooler air outlet pipe support bolt on the throttle valve,
- the intercooler air outlet pipe support bolt on the engine cooling fan assembly.

Proceed in the reverse order to removal.

INTERCOOLER AIR OUTLET PIPE: REMOVAL - REFITTING

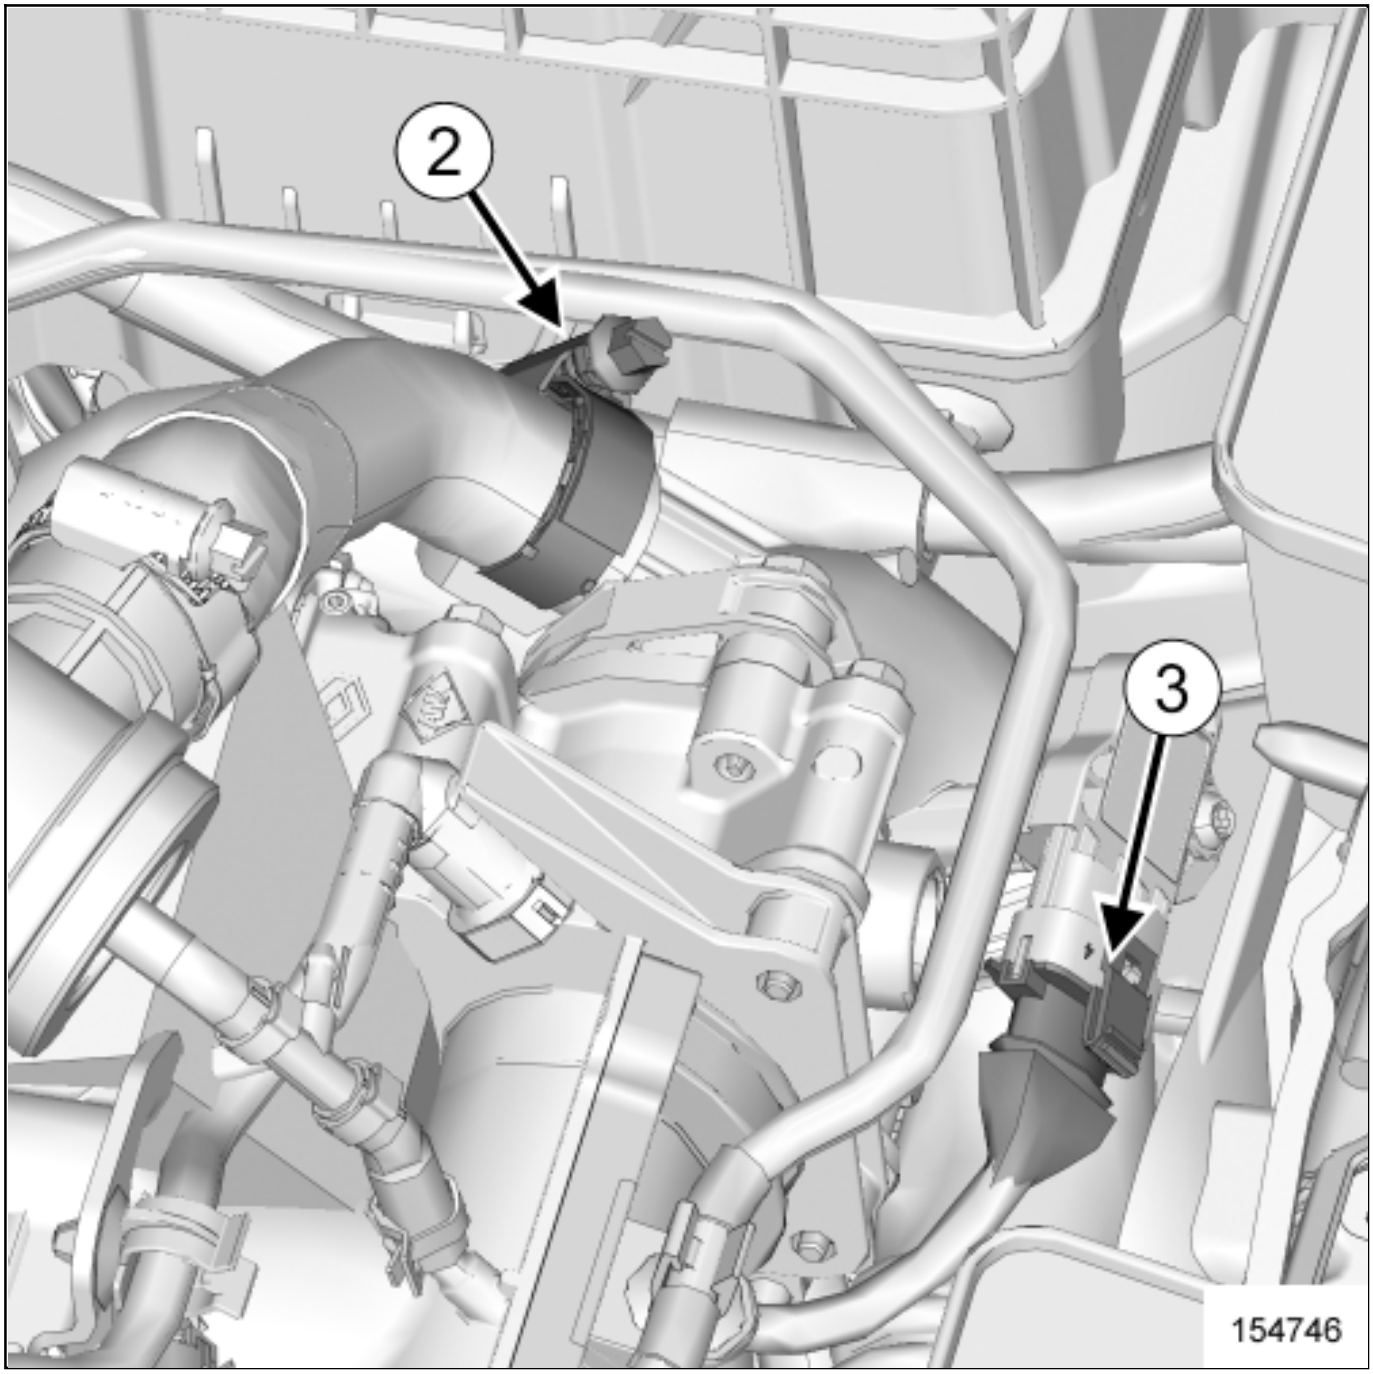


Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the engine undertray.
- Unclip the air filter unit air inlet pipe:
  - from the front end panel,
  - from the air filter unit.
- Remove the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .



2. REMOVAL OPERATION

Move the clip(1) on the intercooler air outlet pipe aside by pulling on both ends of the clip.

Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :

- the intercooler air outlet pipe support bolt from the engine cooling fan assembly,
- the intercooler air outlet pipe support bolt from the throttle valve.

Loosen the clip(2) from the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

Disconnect:

- the air duct link between the intercooler air outlet pipe and the high pressure discharge valve,
- the air temperature and pressure sensor connector(3) .

Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :

- the intercooler air outlet pipe bolts from the throttle valve,
- the intercooler air outlet pipe.

REFITTING

1. REFITTING PREPARATION OPERATION

> Note:
>
> In case of damage to the intercooler air outlet pipe seal, replace the seal.

2. REFITTING OPERATION

Refit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :

- the intercooler air outlet pipe,
- the intercooler air outlet pipe bolts on the throttle valve.

Torque tighten the intercooler air outlet pipe bolts on the throttle valve(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Connect:

- the air temperature and pressure sensor connector,
- the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

Tighten the clip on the air duct link between the intercooler air outlet pipe and the high pressure discharge valve.

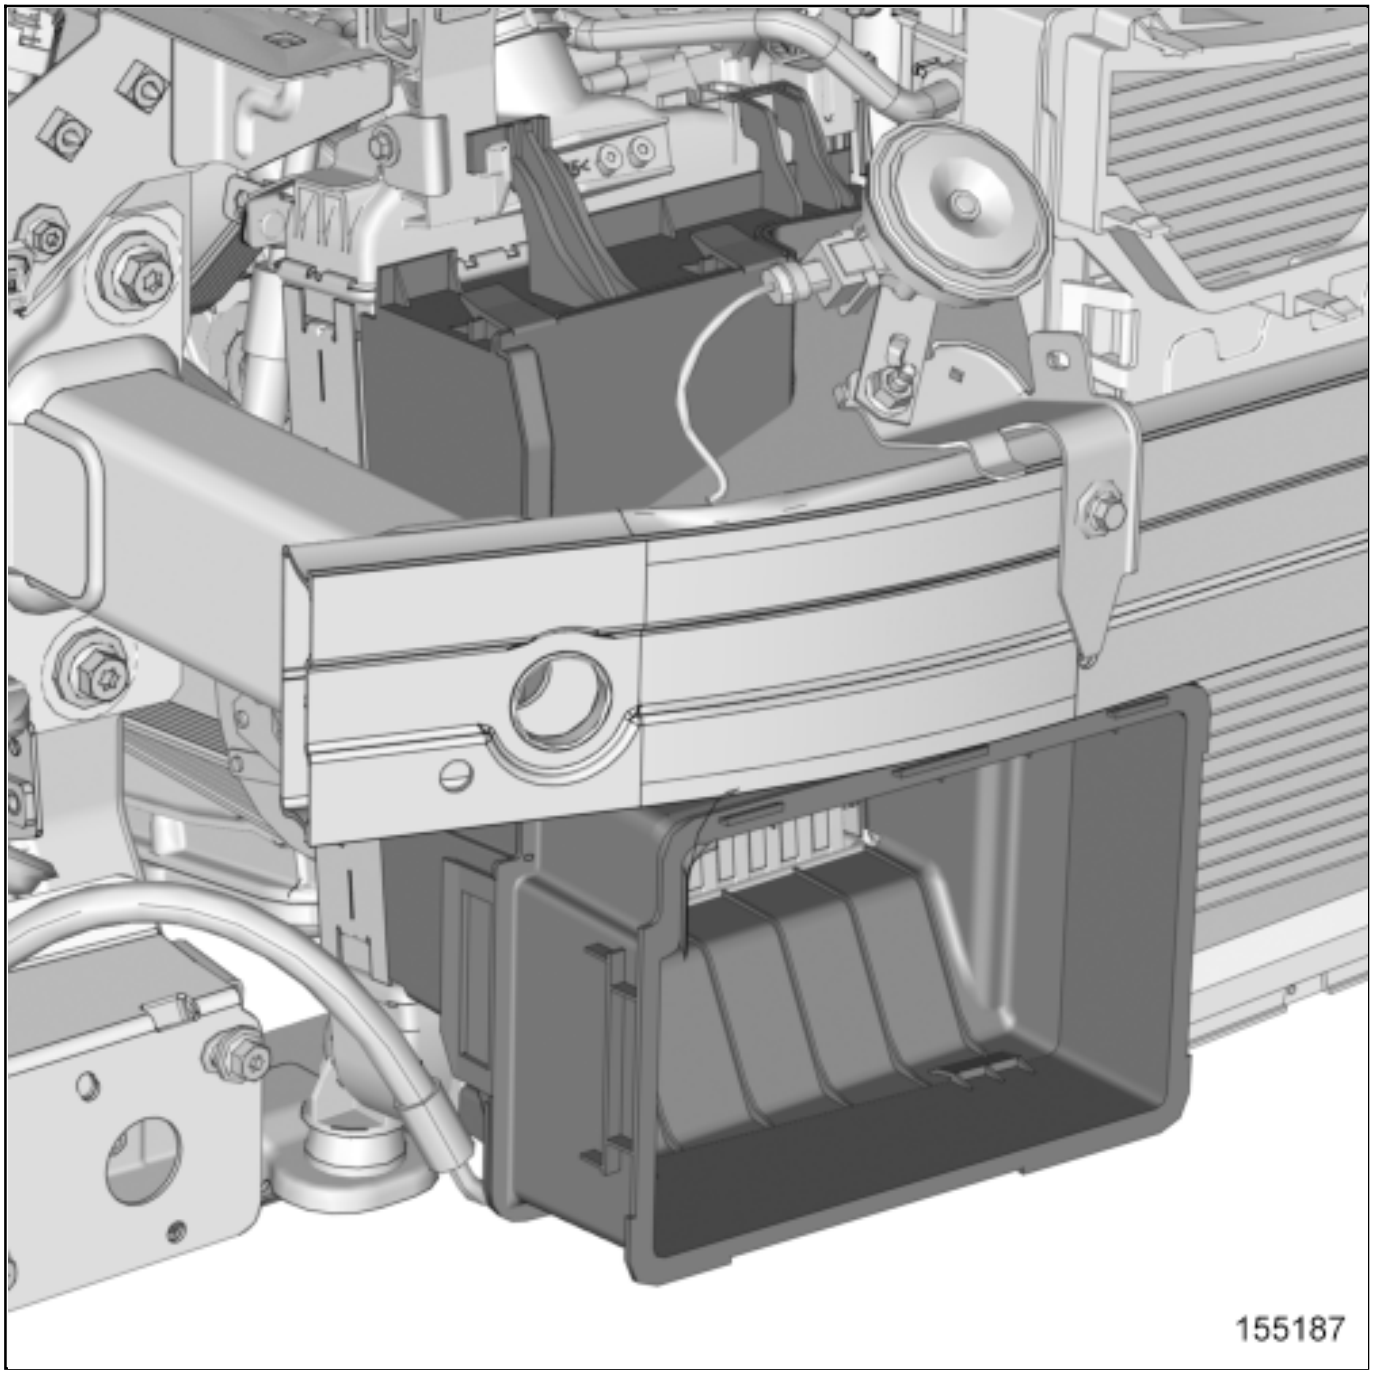
Refit **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** :

- the intercooler air outlet pipe support bolt on the throttle valve,
- the intercooler air outlet pipe support bolt on the engine cooling fan assembly.

Torque tighten **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** :

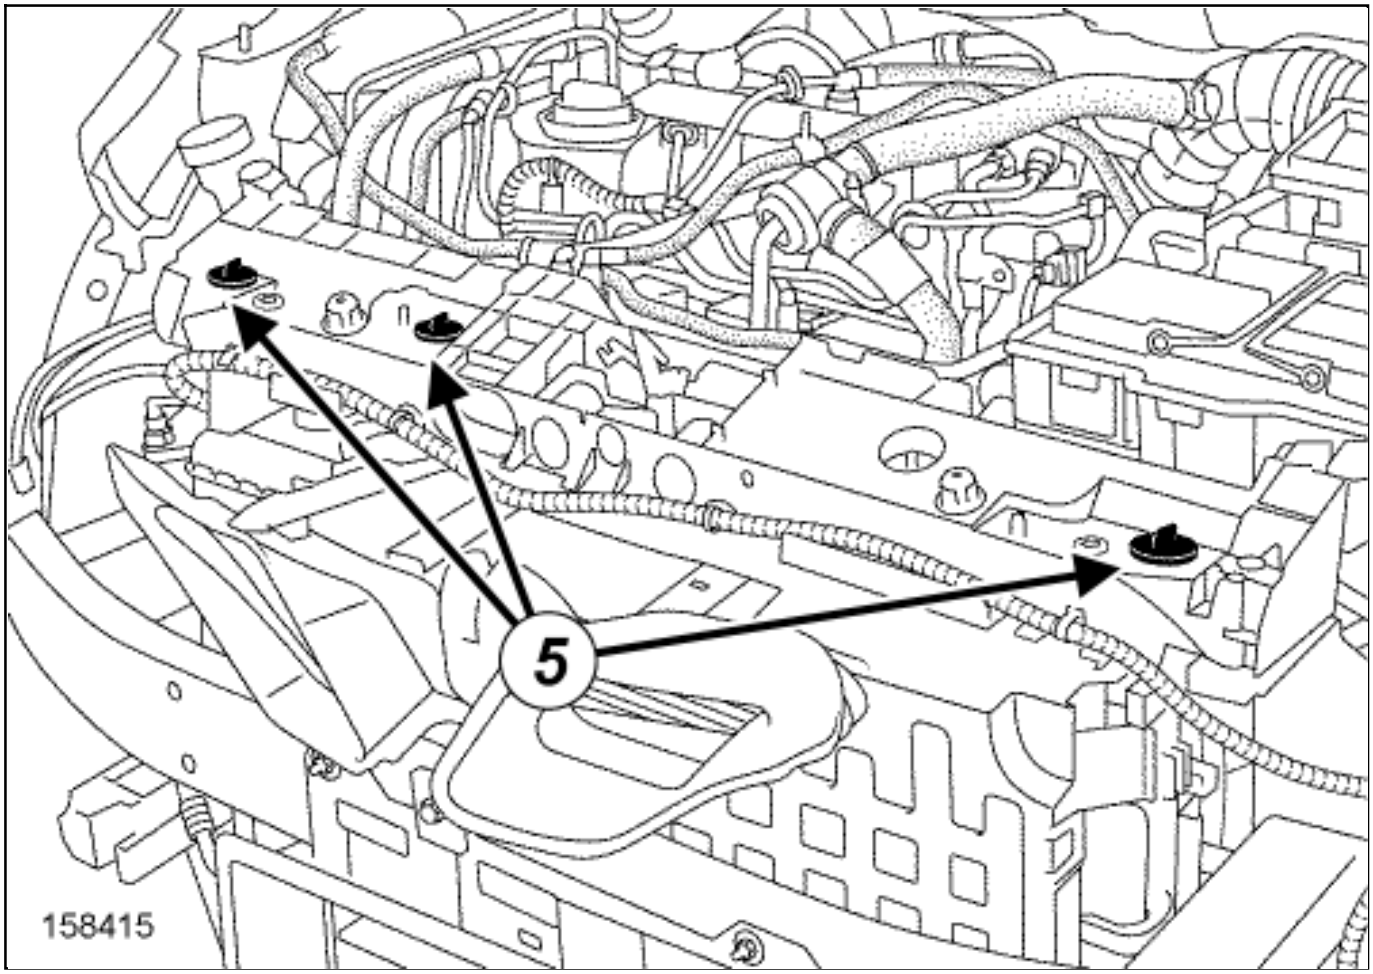
- the intercooler air outlet pipe support bolt on the throttle valve,
- the intercooler air outlet pipe support bolt on the engine cooling fan assembly.

Proceed in the reverse order to removal.



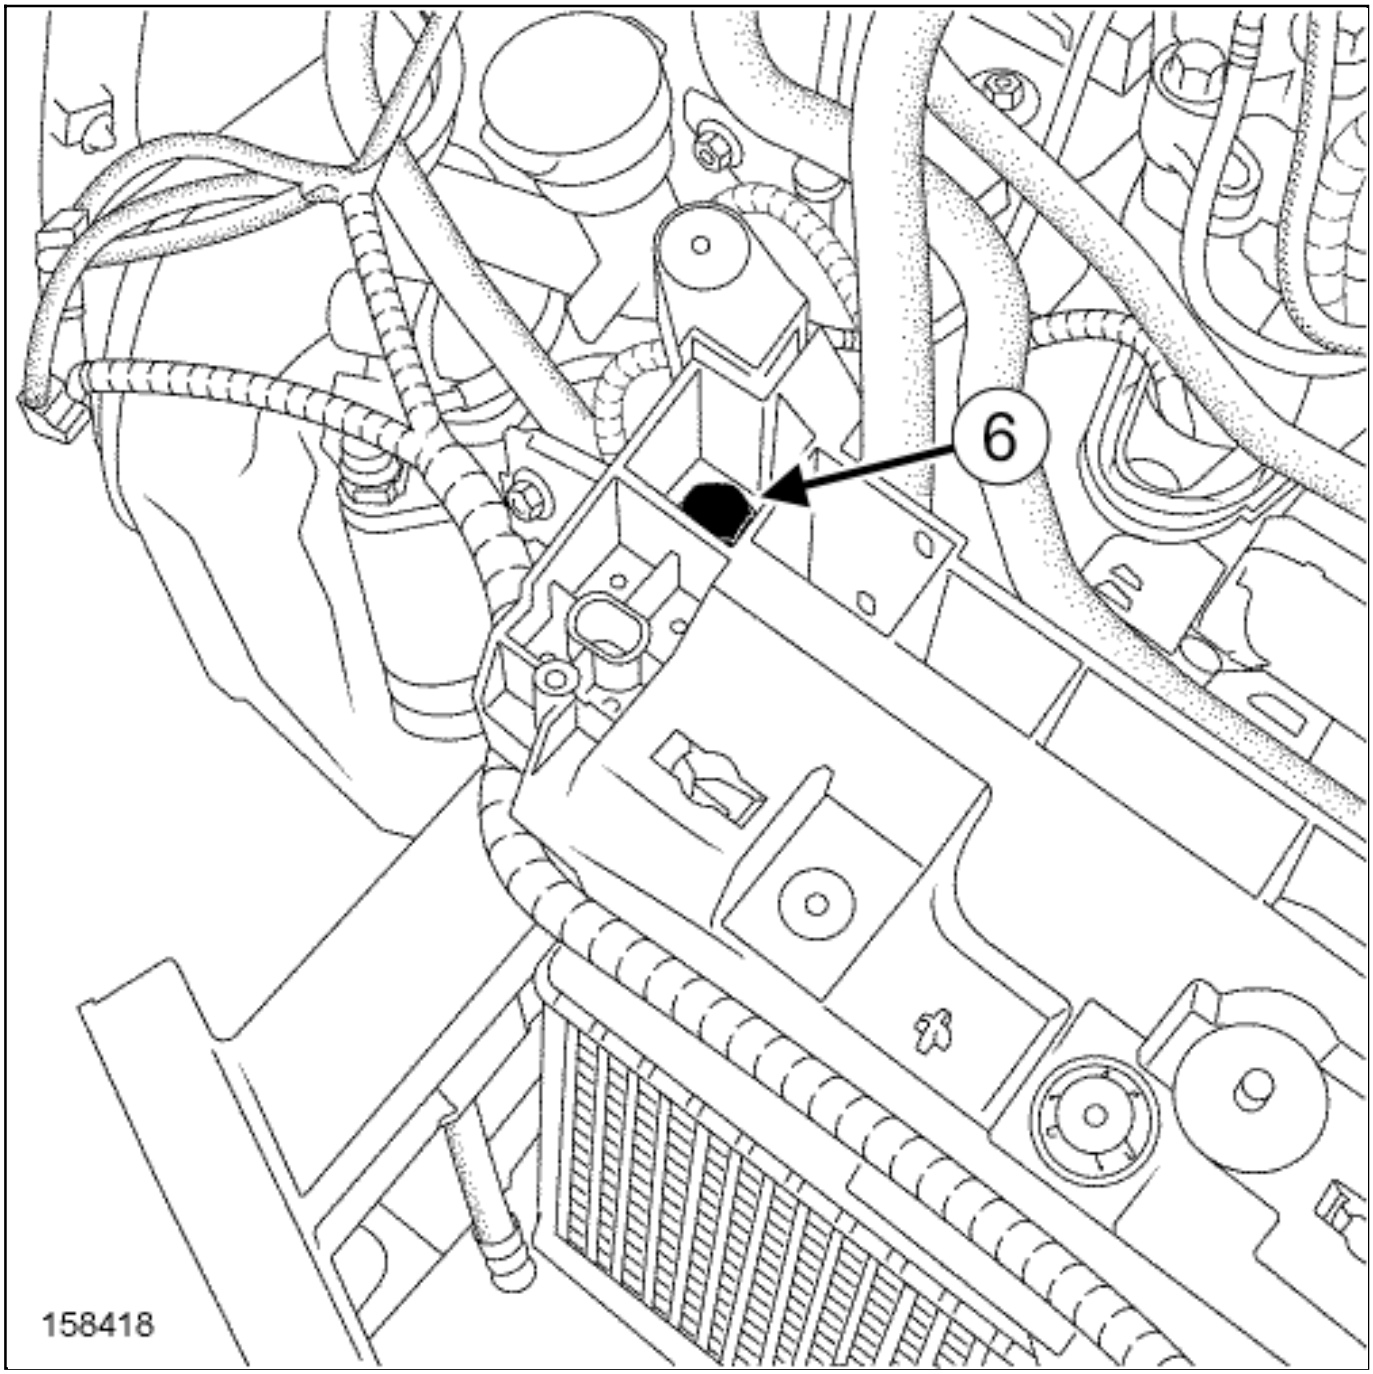
INTERCOOLER: REMOVAL - REFITTING

parts always to be replaced:
turbocharger air cooler air inlet pipe seal
turbocharger air cooler air outlet pipe seal



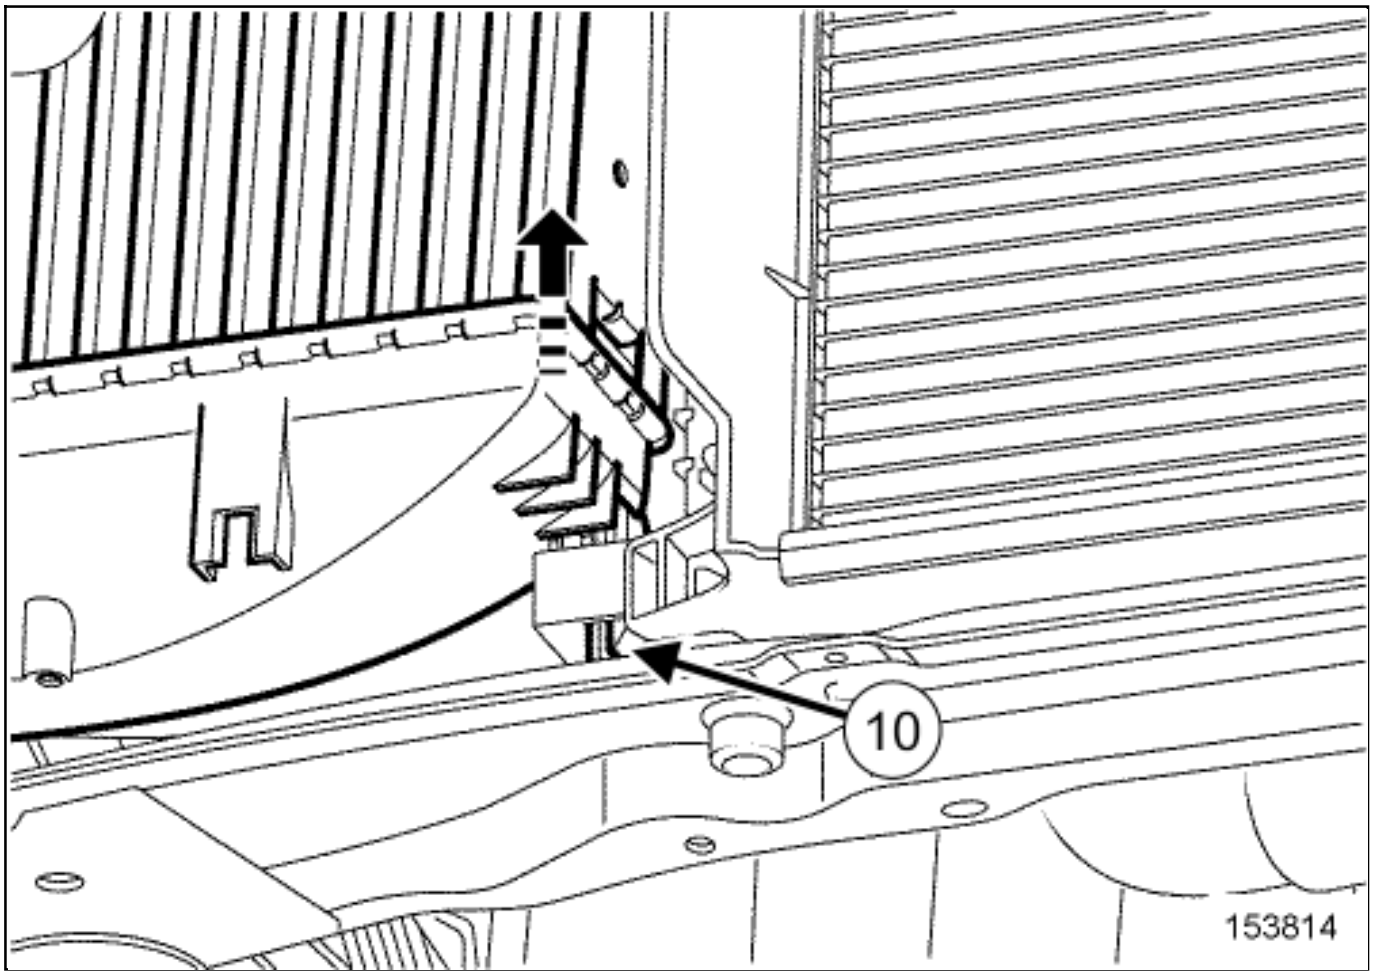
REMOVAL

1. REMOVAL PREPARATION OPERATION

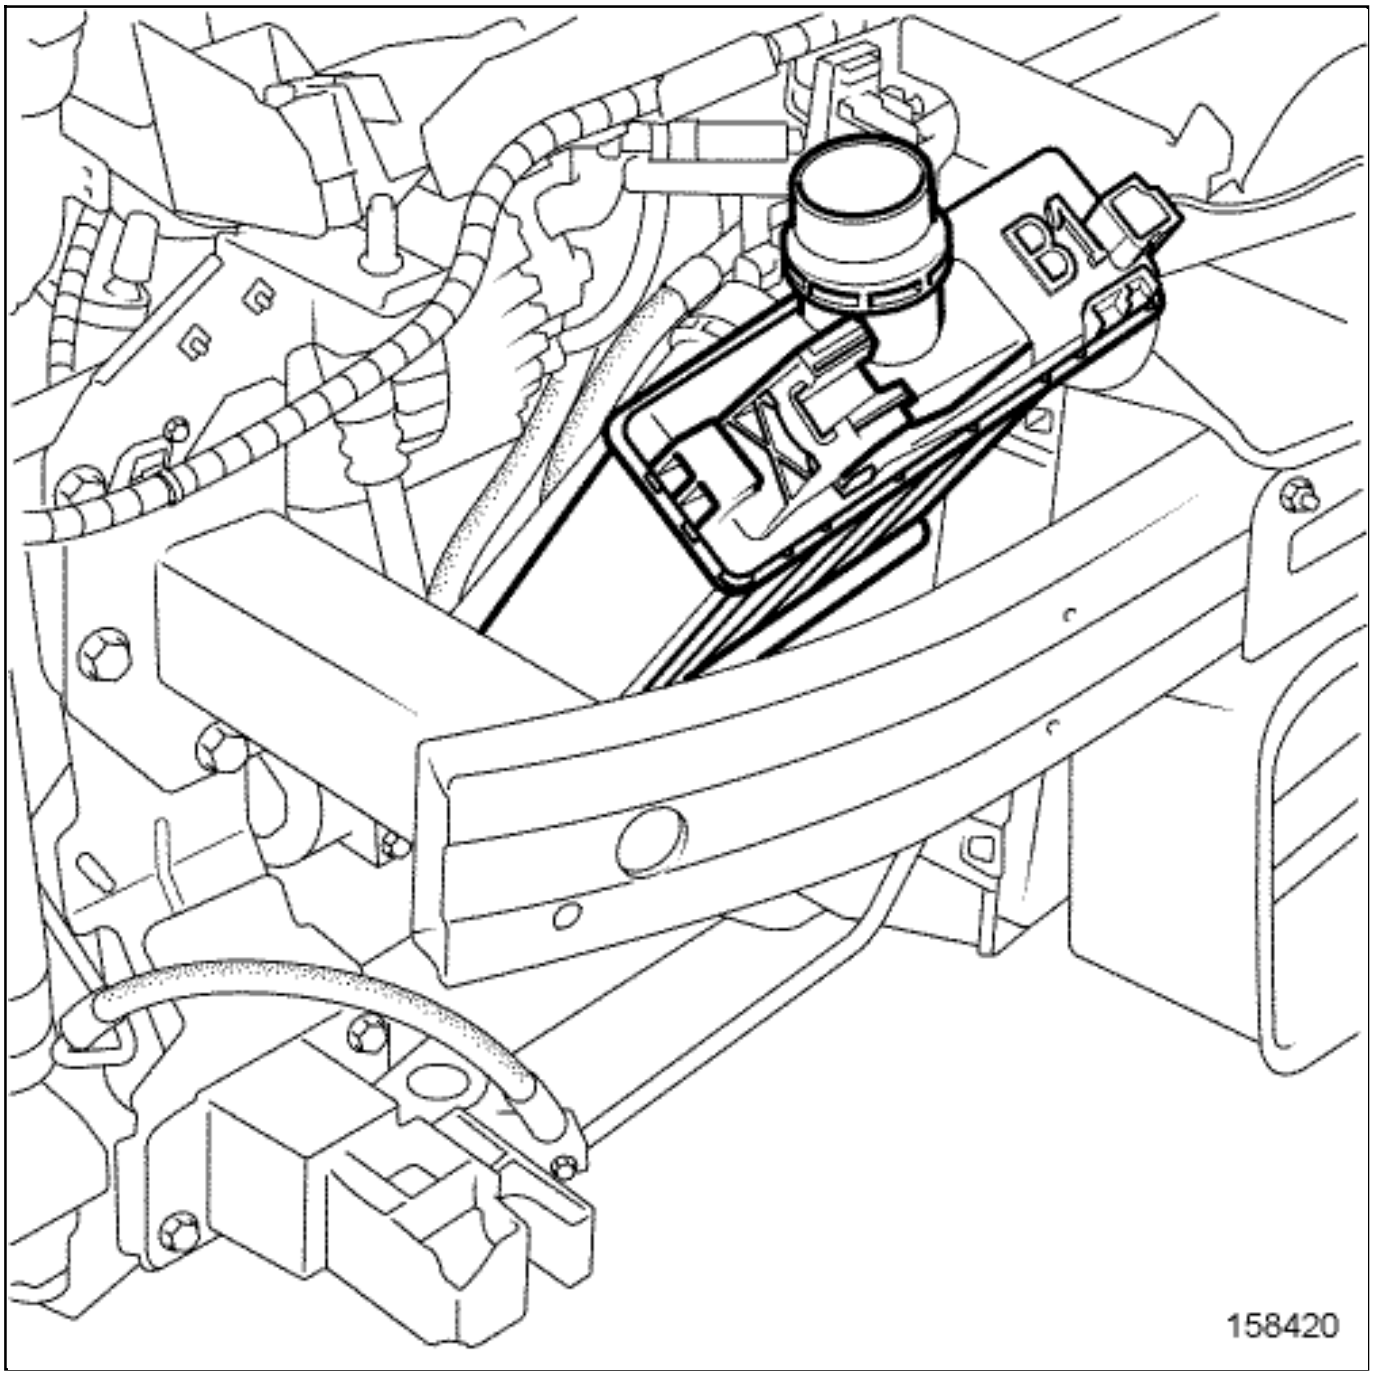


- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Remove:
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liner Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view .
- Remove the right-hand headlight Front signals - lighting assembly: Exploded view .
- Disconnect and move aside:
  - the intercooler air inlet pipe,
  - the intercooler air outlet pipe.

Remove the intercooler air deflector.



Remove the centring pins(5) by turning it anticlockwise.



- Remove the bolts(6) .

- Move aside the front upper cross member.

Press the clips(10) and lift the intercooler in the direction indicated.

Remove the intercooler.

REFITTING

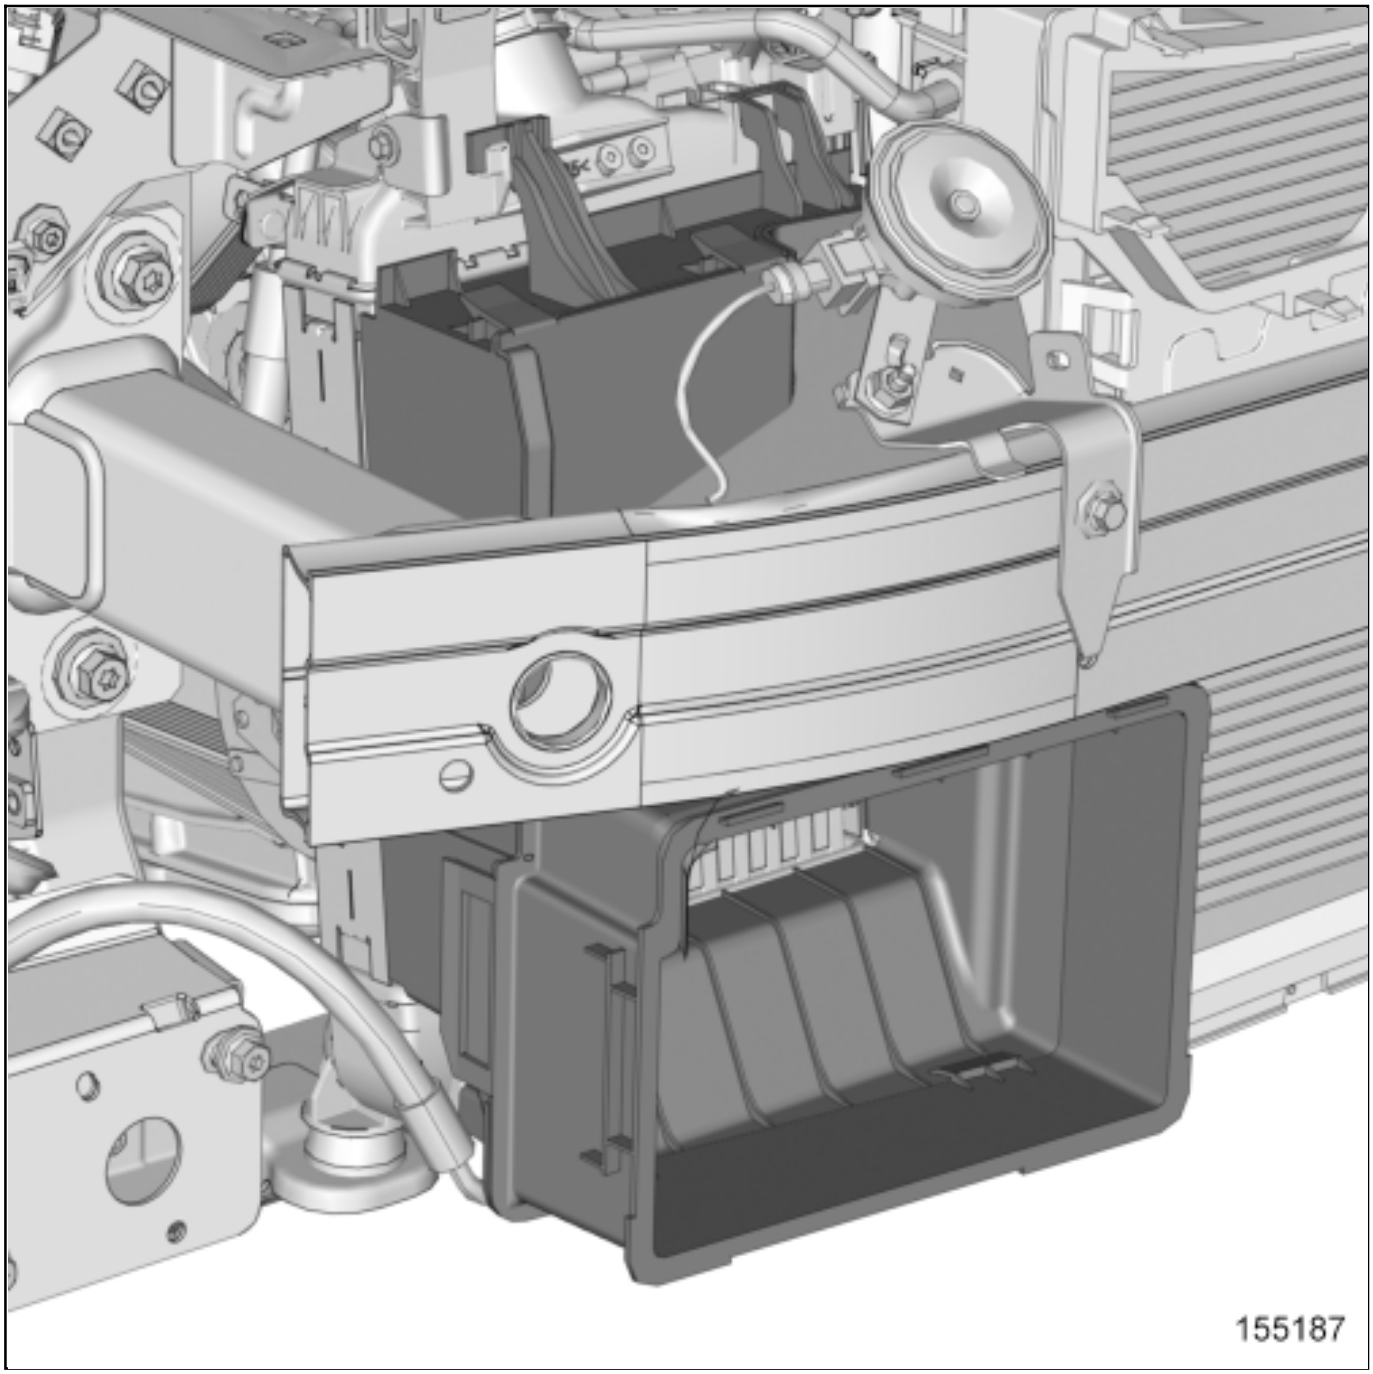
1. REFITTING OPERATION PREPARATION

parts always to be replaced: turbocharger air cooler air inlet pipe seal .

parts always to be replaced: turbocharger air cooler air outlet pipe seal .

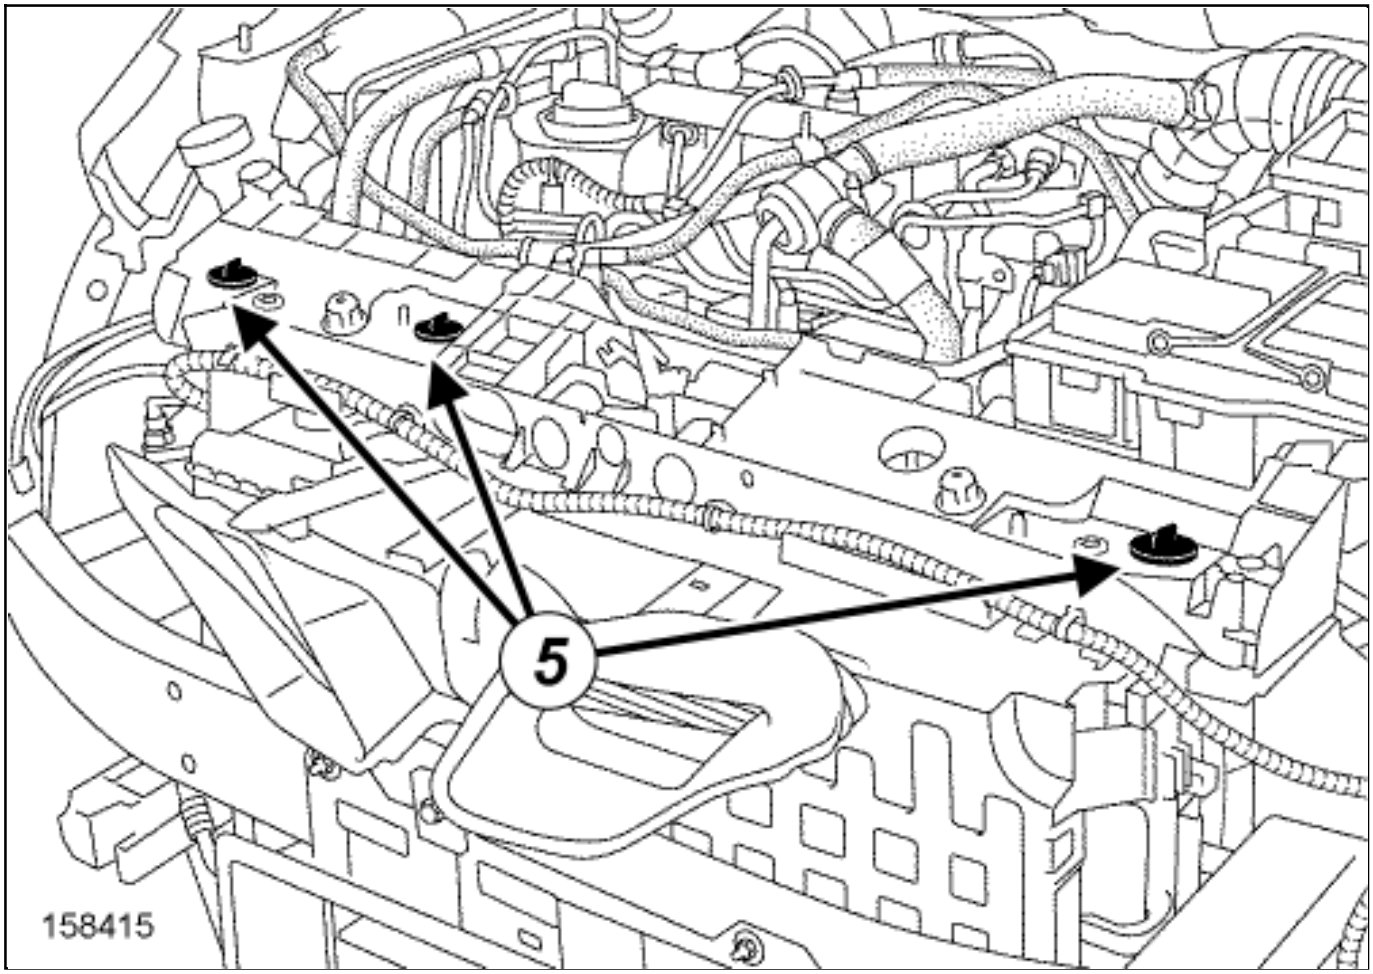
2. REFITTING OPERATION

Proceed in the reverse order to removal.



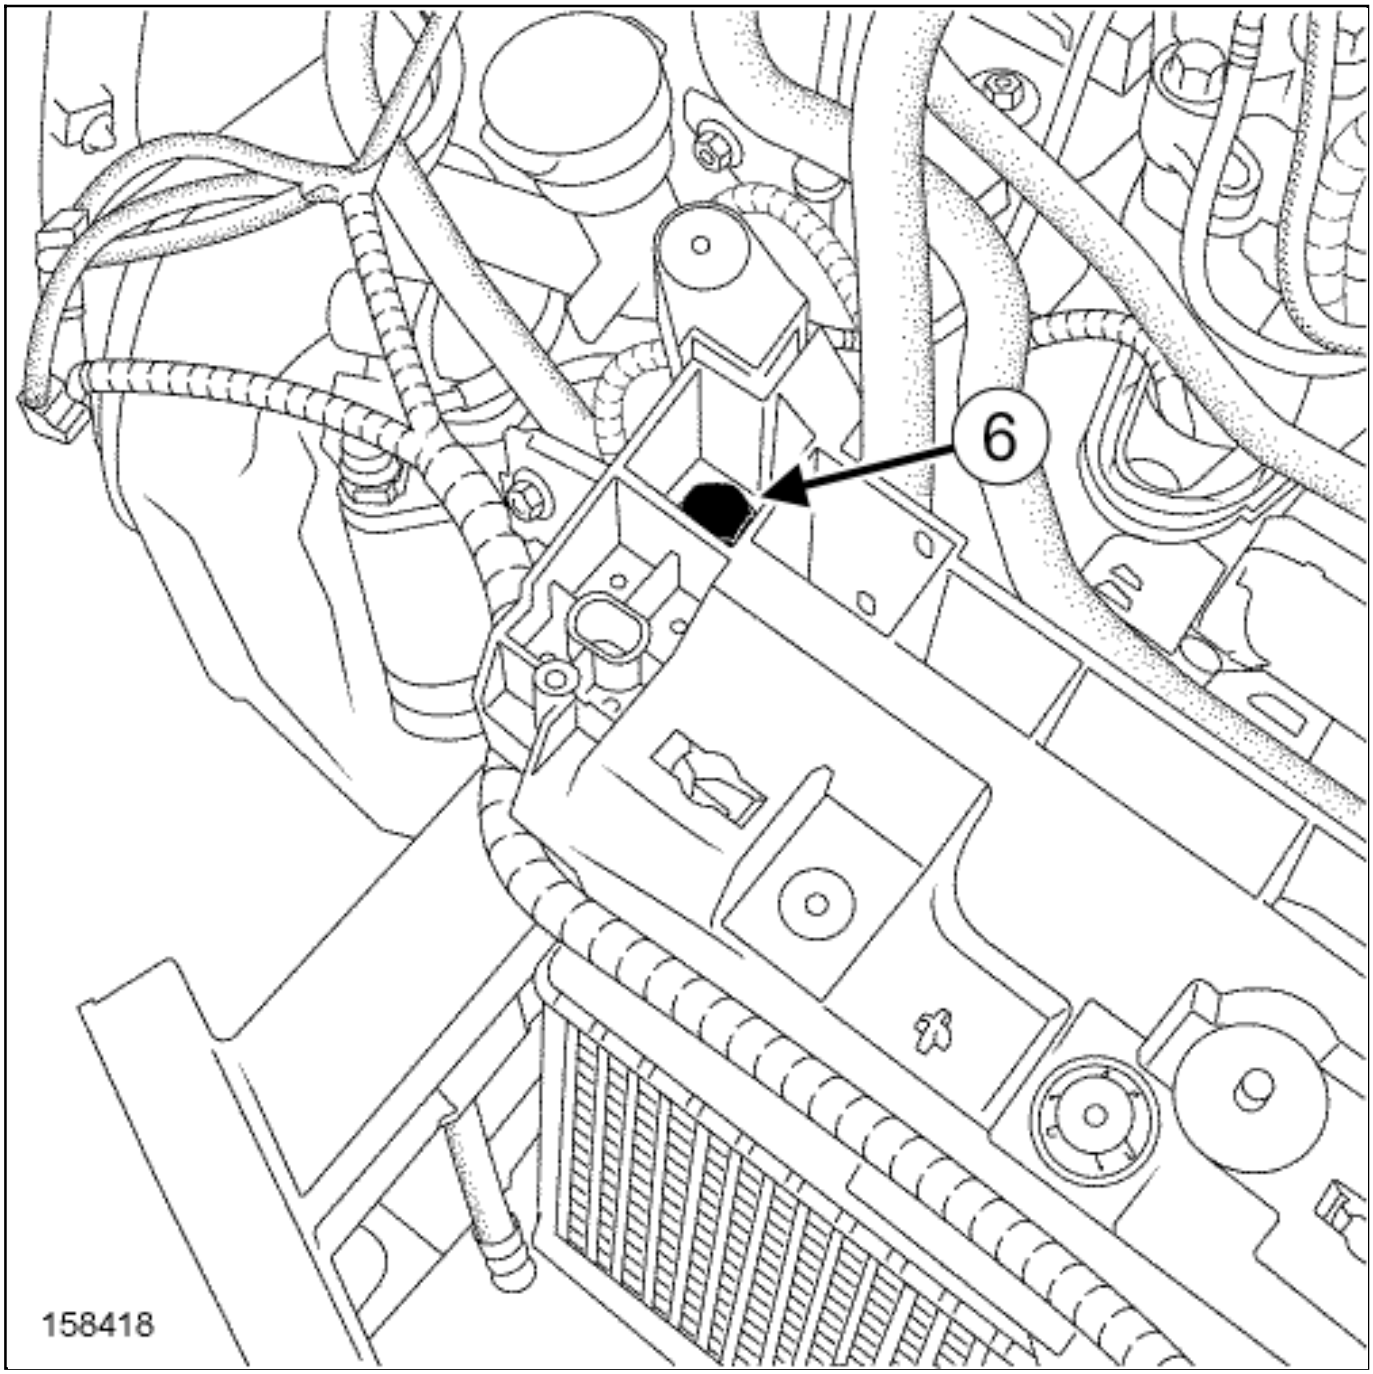
INTERCOOLER : REMOVAL - REFITTING

parts always to be replaced:
turbocharger air cooler air inlet pipe seal
turbocharger air cooler air outlet pipe seal



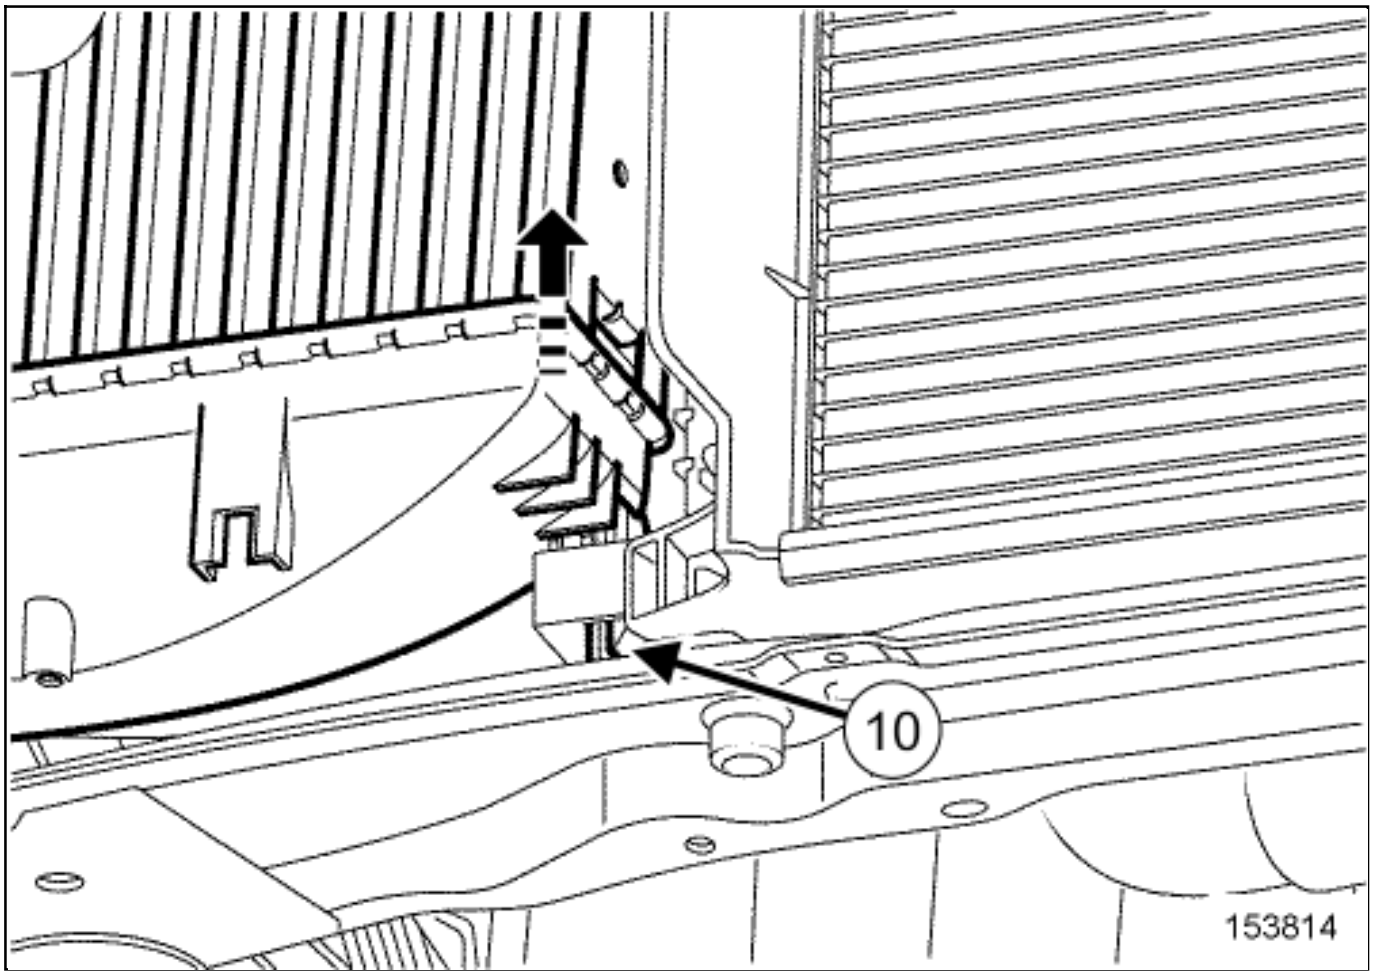
REMOVAL

1. REMOVAL PREPARATION OPERATION

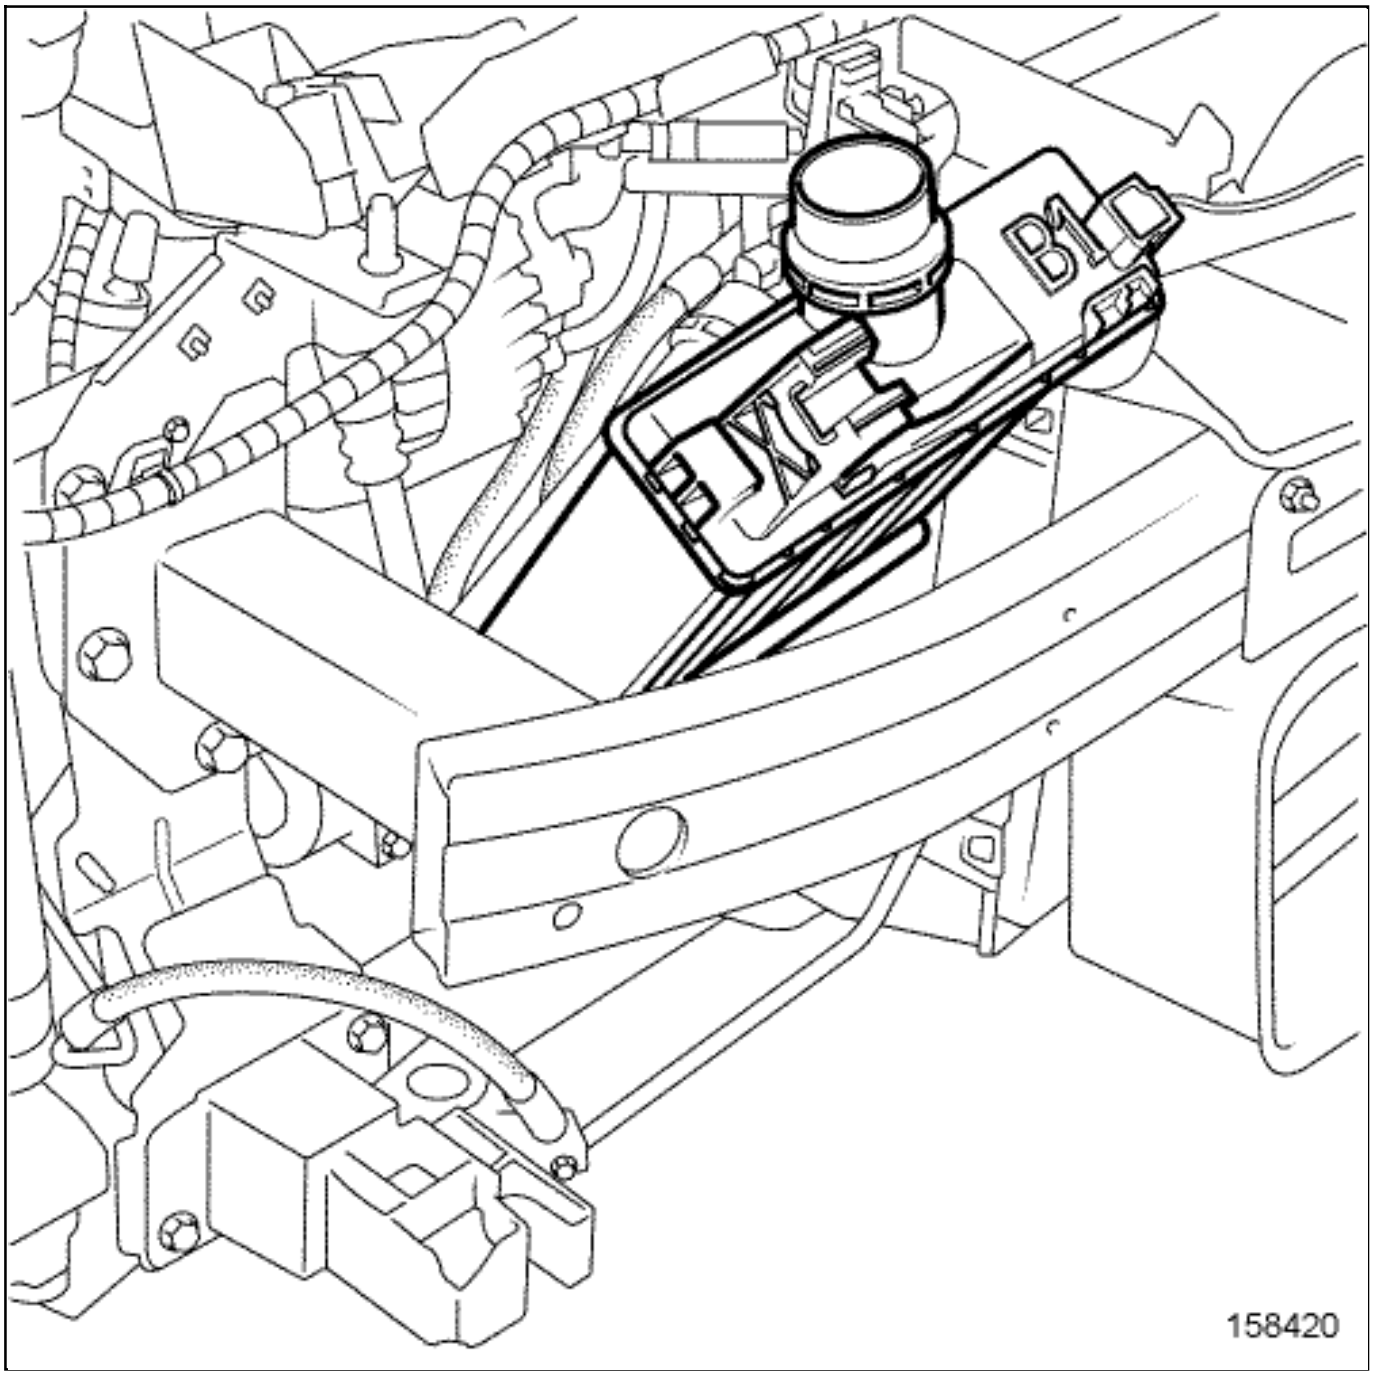


- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Remove:
  - the front wheels Front hub carrier assembly: Exploded view ,
  - the front section of the front wheel arch liner Exterior body front trim assembly: Exploded view ,
  - the front bumper Front bumper assembly: Exploded view .
- Remove the right-hand headlight Front signals - lighting assembly: Exploded view .
- Disconnect and move aside:
  - the intercooler air inlet pipe,
  - the intercooler air outlet pipe.

Remove the intercooler air deflector.



Remove the centring pins(5) by turning it anticlockwise.



- Remove the bolts(6) .

- Move aside the front upper cross member.

Press the clips(10) and lift the intercooler in the direction indicated.

Remove the intercooler.

REFITTING

1. REFITTING OPERATION PREPARATION

parts always to be replaced: turbocharger air cooler air inlet pipe seal .

parts always to be replaced: turbocharger air cooler air outlet pipe seal .

2. REFITTING OPERATION

Proceed in the reverse order to removal.

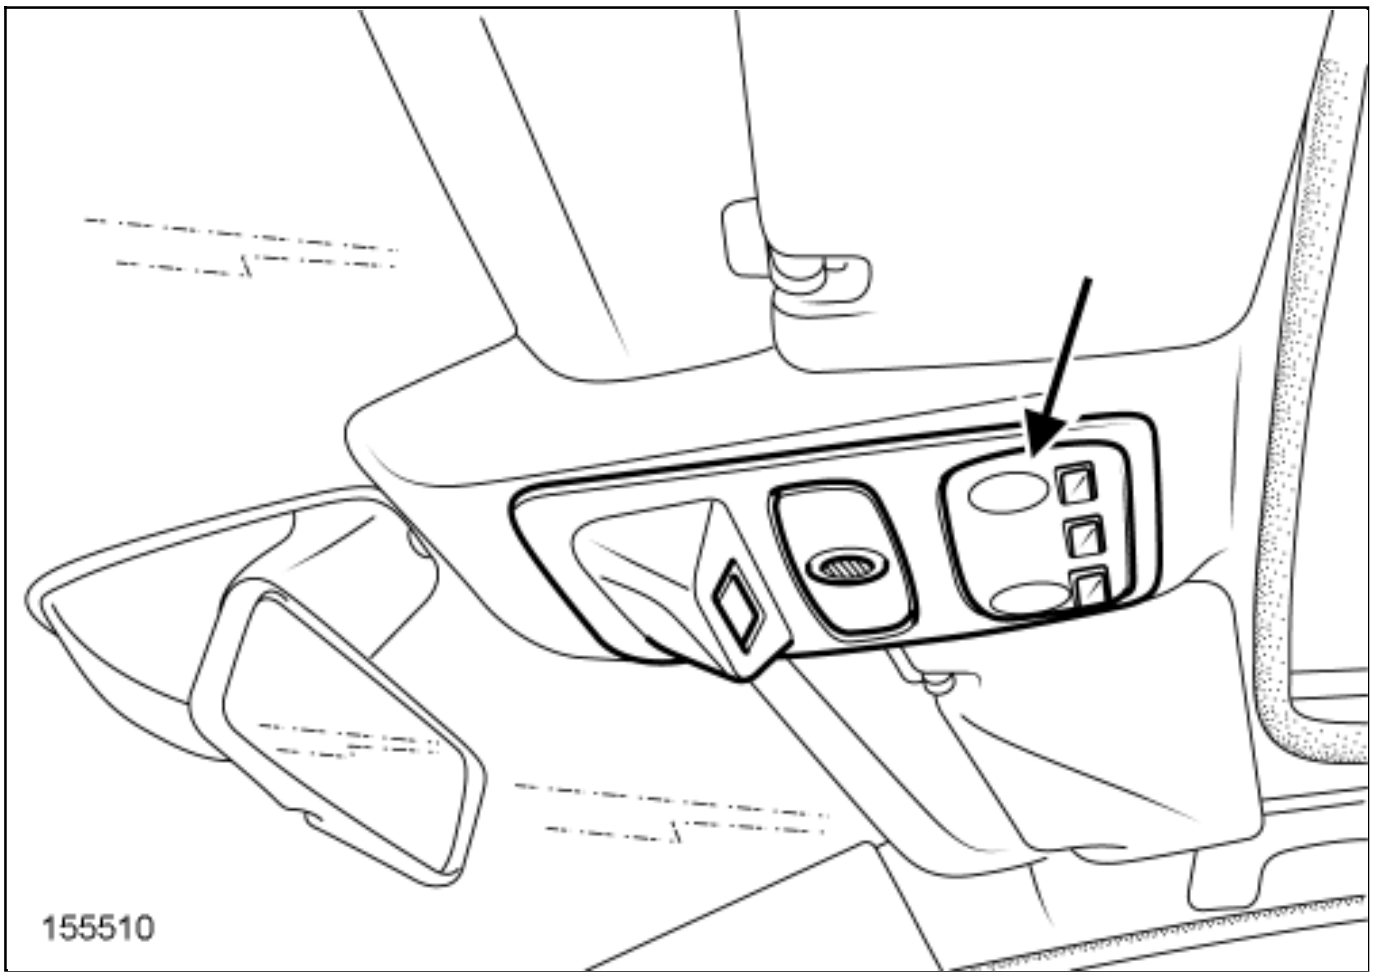
INTERIOR LIGHTING: LIST AND LOCATION OF COMPONENTS

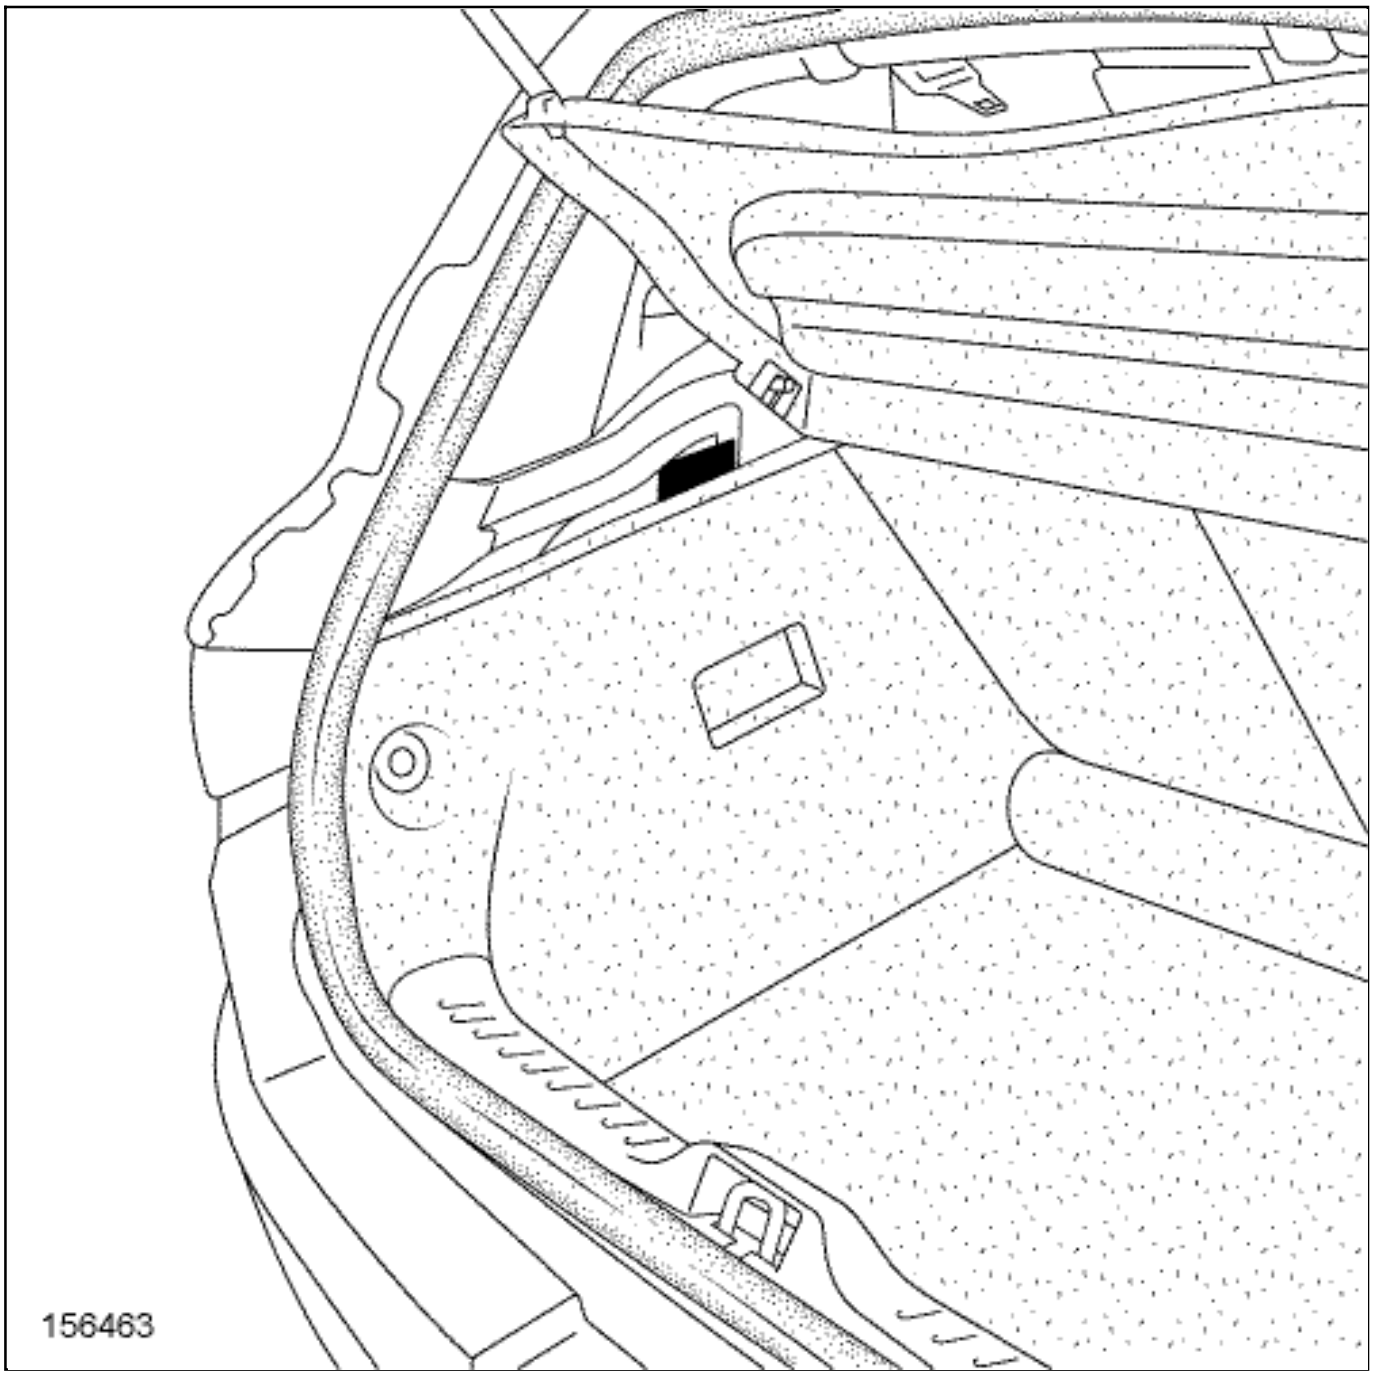
Special tooling required	
Set of trim removal levers.	Car. 1363

1. LIST OF COMPONENTS



1- THE INTERIOR LIGHTING CONSISTS OF:

- courtesy lights,
- a luggage compartment light.



2. LOCATION OF COMPONENTS

Use the toolSet of trim removal levers.(Car. 1363) to remove-refit any interior lighting components.

FRONT COURTESY LIGHT

LUGGAGE COMPARTMENT LIGHT

156463

LOWER COVER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Removes housing with silicone seals.	Mot. 1716

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

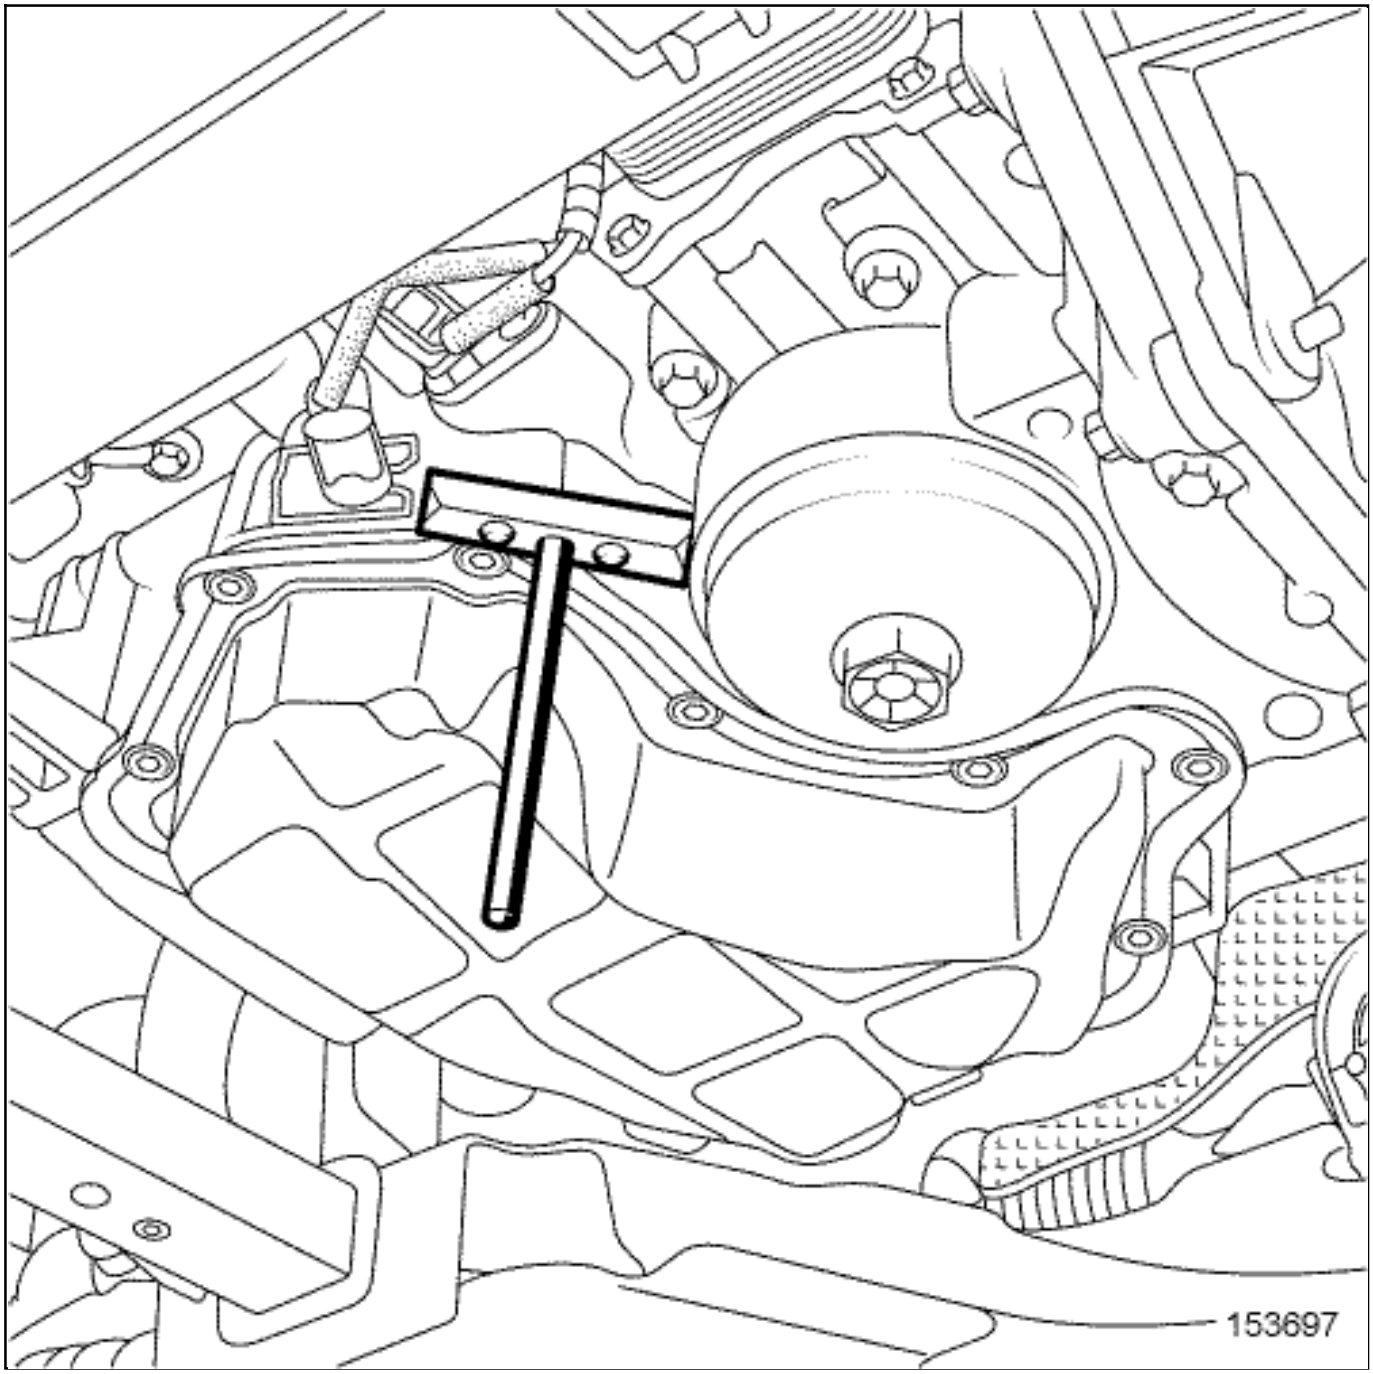
Locations and specifications (tightening torques, parts always to be replaced, etc.) (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:



- the engine undertray bolts,

- the engine undertray.

Drain the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

2. REMOVAL OPERATION

Remove the lower cover bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Detach the lower cover using the toolRemoves housing with silicone seals.(Mot. 1716)

Note:

Gradually detach the sump with small alternating movements to prevent damaging the sump.

Remove the lower cover(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly:

Exploded view)

Note:

Note the quantity of oil in the sump.

REFITTING

1. REFITTING PREPARATION OPERATION

- Apply super cleaning agent for joint faces Vehicle: Parts and consumables for the repair to the parts to be cleaned.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

- Wait approximately 10 min.
- Remove the residue using a wooden spatula.
- Finish cleaning the parts using a grey abrasive pad Vehicle: Parts and consumables for the repair .
- Degrease and clean the joint faces using surface cleaner Vehicle: Parts and consumables for the repair .

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

Check that the sump is not:

- scratched,
- deformed.

If this is the case, replace the sump.

Ensure that the base plate is not scratched.

Apply a bead of silicone adhesive sealant Vehicle: Parts and consumables for the repair with an approximate diameter of 5 mmat a distance of approximately 8 mmfrom the inner edge of the sump to ensure correct sealing.

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

2. REFITTING OPERATION

Fit the lower cover.

Tighten to torque and in order the lower cover bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Top up the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

LOWER COVER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Removes housing with silicone seals.	Mot. 1716

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

Apply a bead of silicone adhesive sealant Vehicle: Parts and consumables for the repair with an approximate diameter of 5 mmat a distance of approximately 8 mmfrom the inner edge of the sump to ensure correct sealing.

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

2. REFITTING OPERATION

Fit the lower cover.

Tighten to torque and in order the lower cover bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Top up the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

LPG INJECTION: PRECAUTIONS FOR THE REPAIR

Note:

It is essential that you respect the following safety advice before carrying out any operation on a vehicle equipped with the LPG system.

1. AUTHORISED WORKSHOP

Repairs to the LPG system must only be carried out in workshops that meet the requirements for this type of operation.

The workshop must be equipped with a BC type approved extinguisher.

The operational area must be well ventilated.

Only workshops equipped with an LPG flare for draining the system may carry out work on the LPG tanks.

2. AUTHORISED STAFF

Only qualified personnel who have received training regarding the LPG system may carry out operations on the system.

3. GENERAL SAFETY ADVICE

LPG is heavier than air in its gaseous form; do not work in a basement garage.

When carrying out any type of work on the LPG system, do not wear clothes containing acrylic or any other material which could generate static electricity.

Keep naked flames and all ignition sources (sparks, cigarettes, mobile phones, etc.) away from the work area.

During any operation on the LPG circuit, place a sign on the driver's seat position: “GAS WORKS IN PROGRESS, DO NOT MOVE”, place signs in the working area: “GAS WORKS IN PROGRESS, DO NOT SMOKE”.

If LPG comes into contact with the skin, it can cause frostbite due to the cold. It is advisable to wear

protective gloves and goggles.

Before the operation, visually inspect that the LPG components are in good condition.

Carry out all of the operations with the battery disconnected.

When carrying out any operations on the LPG system, it is necessary to connect the vehicle to earth.

Before using the flare, it is essential to read the replacement frequencies and authorised frequency of use for the components of the flare provided by the supplier.

Never retighten a union under pressure.

Never plug a leaking union with filling product such as teflon sheath, sealing paste etc.

Never reseal a union by adding filling product. If the leak is still present after torque tightening, always replace the pipe.

Do not repair any of the LPG system faulty parts; they must always be replaced.

Never attempt to remove the tank without having first drained it and rendered it inert with nitrogen (risk of explosion).

Do not replace components fixed onto the LPG tank (LPG tank polyvalve, LPG tank solenoid valve casing, overpressure valve), replace the entire tank assembly.

When an LPG component is removed, it must immediately be replaced or refitted.

Do not wash the engine compartment with a pressurised system or using detergents. These can cause the expansion valve membranes to deteriorate.

After carrying out any operations on the LPG system, check the sealing on the entire gas supply system using the leak detector**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Storing a tank which has not been drained and not rendered inert with nitrogen is prohibited. All tanks replaced during a repair operation should be stored outside and away from any combustive material.

4. IF THERE IS A LEAK OR SMELL OF GAS

In the event of a significant gas leak, it is important to move the vehicle outside, away from any residential areas by pushing it, if necessary.

The emergency services may be required to intervene if the situation cannot be controlled.

5. INSTRUCTIONS TO BE FOLLOWED IF OPERATING ON THE HEAT SOURCE

LPG is stored in pressurised tanks. It is therefore advisable to avoid overheating.

Do not carry out any welding operations and do not use a heat source close to the LPG tank and pipes, otherwise it will be necessary to drain the LPG tank and pipes**(see 17C, LPG injection, LPG tank: Draining)** .

When the vehicle goes into a spray booth, see the Precautions for repair for painting**Paint: Precautions for the repair** .

LPG INJECTION: PRECAUTIONS FOR THE REPAIR

Note:

It is essential that you respect the following safety advice before carrying out any operation on a vehicle equipped with the LPG system.

1. AUTHORISED WORKSHOP

Repairs to the LPG system must only be carried out in workshops that meet the requirements for this type of operation.

The workshop must be equipped with a BC type approved extinguisher.

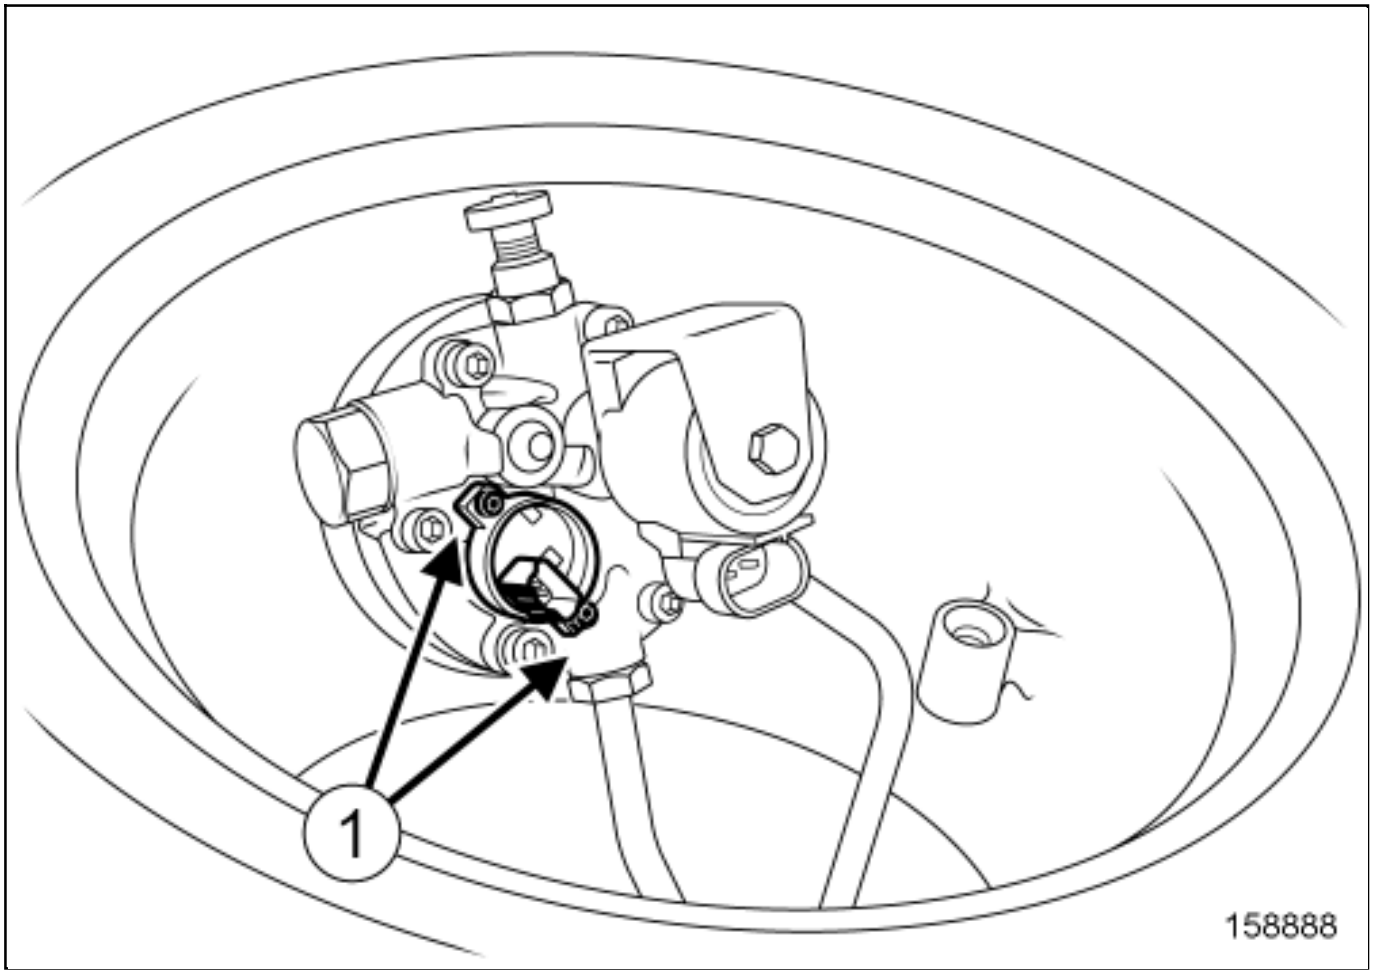
LPG LEVEL SENSOR : REMOVAL - REFITTING

REMOVAL

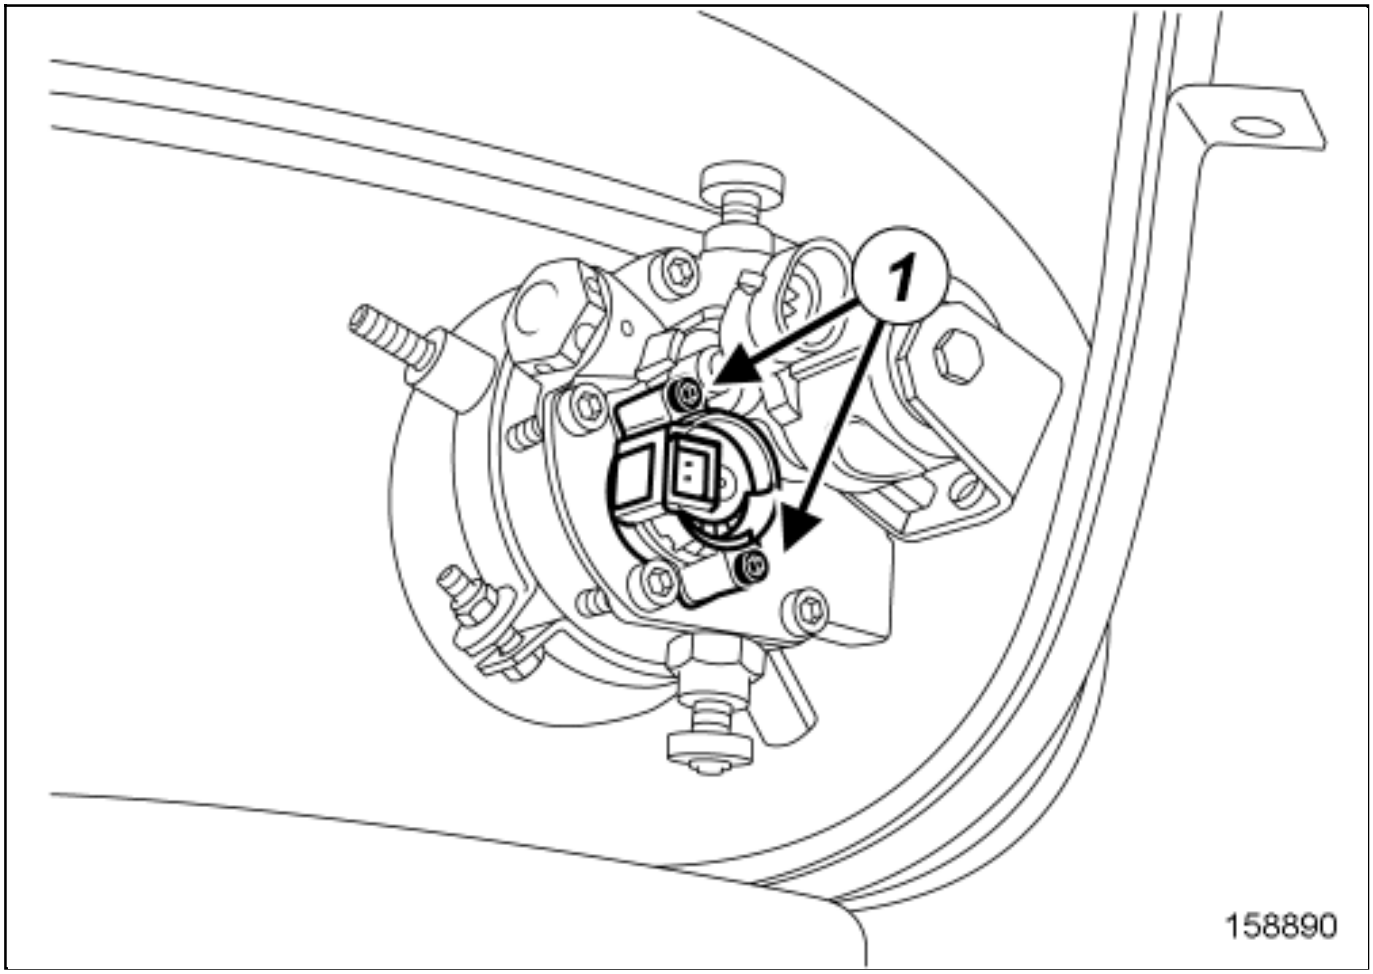
1. REMOVAL PREPARATION OPERATION

- It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .
- Disconnect the batteryBattery: Removal - Refitting (80A, Battery).
- Cut the retaining clip of the multifunction valve protection(if the vehicle is equipped).
- Remove the protection of the multifunction valve.

2. REMOVAL OPERATION



- Disconnect the connector of the LPG level sensor.



Note:

Note down the fitting position of the LPG level sensor.

LPG TANK IN THE LUGGAGE COMPARTMENT

LPG TANK UNDER THE VEHICLE

Remove the bolts(1) of the LPG level sensor.

Remove the LPG level sensor.

REFITTING

Note:

Refit the LPG level sensor in the position marked during removal

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

LPG TANK - NECK PIPE: REMOVAL - REFITTING

REMOVAL

- It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .
- Park the vehicle outside.
- Disconnect the batteryBattery: Removal - Refitting (80A, Battery).
- Remove the rear right-hand wheelWheel: Removal - Refitting (35A, Wheels and tyres).
- Cut the retaining clip of the multifunction valve protection (if the vehicle is equipped).
- Remove the protection of the multifunction valve.
- Disconnect the connector of the LPG tank solenoid valve.
- Drain the neck - LPG tank pipe:
  - gradually undo the nut of the neck - LPG tank pipe on the LPG tank multifunction valve and allow all of the gas to escape.
- Refit the rear right-hand wheelWheel: Removal - Refitting (35A, Wheels and tyres).
- Take the vehicle back inside.
- Position the vehicle on a two-post liftVehicle: Towing and lifting (02A, Lifting equipment).

Remove the rear right-hand wheel Wheel: Removal - Refitting (35A, Wheels and tyres).

Drill out the mounting rivets of the neck - LPG tank pipe.

Loosen the mounting nut of the neck - LPG tank pipe on the filler end piece.

Remove the neck - LPG tank pipe.

REFITTING

Proceed in the reverse order to removal.

Torque tighten:

- the nut of the neck - LPG tank pipe on the filler end piece 14 N.m,
- the nut of the neck - LPG tank pipe on the LPG multifunction valve 14 N.m.

Check the sealing with leak detection product Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

LPG TANK: DRAINING

Note, one or more warnings are present in this procedure

Special tooling required	
Magnet for manually opening the LPG/CNG tank solenoid valve	

Equipment required
pneumatic or electric wrench

DRAINING

1. DRAINING PREPARATION OPERATION

It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .

Note:

Refer to the instructions for use of the AEM LPG igniter in addition to the installation instructions below.

Park the vehicle outside.

Cut the retaining clip of the multifunction valve protection.

Remove the protection of the multifunction valve.

Close the stop cock on the multifunction valve.

Drain the LPG multifunction valve - LPG expansion valve unit pipe:

- start the vehicle in LPG position,
- let the engine run until it automatically switches to petrol mode.

Disconnect the batteryBattery: Removal - Refitting (80A, Battery).

Loosen the nut of the LPG multifunction valve - LPG expansion valve unit pipe

2. DRAINING OPERATION

Disconnect the connector of the LPG tank solenoid valve.

Remove the bolt from the LPG tank solenoid valve.

Remove the LPG tank solenoid valve.

For flaring, use the pneumatic or electric wrench.

Position the flare in a stable position in the flare area.

Position the "TWINY" bottle further than 5 metresaway from the flare.

Position the tank to be emptied further than 10 metresaway from the flare.

Note:

The "TWINY" propane bottle and the nitrogen bottle are not supplied with the flare.

Ensure that all valves of all circuits are closed.

To connect the pilot flame hose between the flare and the "TWINY" bottle:

- Connect the quick-release union to the flare pilot flame end piece.
- Clip the expansion valve to the bottle. The valve must be closed.

For the connection between the tank and the flare:

- Connect the self-sealing union on the end of the hose to the flare connection end piece, with the valve closed.
- Fit the special pipe in place of the LPG multifunction valve - LPG expansion valve unit pipe.
- Connect the self-sealing joint at the end of the hose to the connection socket of the special pipes.

To connect the nitrogen circuit:

- Position the nitrogen bottle near the LPG tank.
- Attach the expansion valve onto the nitrogen bottle and tighten the expansion valve union.
- Fit the adapter on the filler end piece,
- Connect the special nitrogen pad to the LPG tank filler orifice and tighten manually. (make sure there is a seal).

After a check of all the seals to ensure there are no leaks, the system is ready for use.

To light the pilot flame (operator correctly attired):

- Open the "TWINY" bottle expansion valve switch.
- Introduce a flame into the opening provided in the flare cylinder to light the pilot flame.
- Check that the pilot flame is properly lit.

To light the igniter:

- The operator must be at least 10 metresaway from the flare and must ensure that this precaution is respected by everyone.
- Control the tank solenoid valve by putting the toolMagnet for manually opening the LPG/CNG tank solenoid valve in place of the LPG tank solenoid valve.
- Open the stop cock of the multifunction valve,
- Open the progressive flow valve to position 1 (the maximum position is 5).
- The igniter lights.
- Check the passage of the liquid gas through the circulation indicator.
- Adjust the opening of the progressive flow control valve, increasing its opening to position 2 or 3 until the flow lines equalise through the circulation indicator.
- Try to open the progressive flow control valve slowly so as to not trigger the tank flow limiter. If the limiter is triggered, close the flow valve and start the operation again.
- After the flow has equalised, open the nitrogen bottle and adjust the expansion valve to a pressure 1 bar greater than the tank pressure (but not greater than 7 bar).

After the main flame has gone out, let the nitrogen flame sweep at 3 bars with the flow valve completely open for 1 minuteper 10 litrescapacity (e.g: for a 60 litrestank: sweeping = 6 min).

Close the tank solenoid valve and remove theMagnet for manually opening the LPG/CNG tank solenoid valve .

Close the nitrogen circuit by resetting the expansion valve and closing the tap on the nitrogen bottle.

Shut off the pilot flame by closing the expansion valve switch on the "TWINY" gas bottle.

Close the progressive flow valve.

CAUTION

The flare should be left in place until it has cooled completely. Move the flare using the two side handles.

Disconnect all of the unions.

Wind up the hoses.

Put away the equipment.

Refit the LPG tank solenoid valve.

Connect the connector of the LPG tank solenoid valve.

3. REFITTING OPERATION AFTER DRAINING

Pretighten by hand the nut of the LPG multifunction valve - LPG expansion valve unit pipe.

Torque tighten the nut of the LPG multifunction valve - LPG expansion valve unit pipe11 N.m.

Check the sealing of the union between the LPG multifunction valve - LPG expansion valve unit pipe and the LPG multifunction valve with leak detection product**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- fill the tank with several litres of LPG,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the union,
- wait for 5 minutes,
- check that there are no leaks on the union,
- fill up the tank,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the union,
- wait for 5 minutes,
- check that there are no leaks on the union.

Refit the protection of the LPG multifunction valve.

Position a retaining clip between the multifunction valve protection and the LPG tank protection.

LPG TANK: DRAINING

Note, one or more warnings are present in this procedure

Special tooling required	
Magnet for manually opening the LPG/CNG tank solenoid valve	Ms. 1826

Equipment required
pneumatic or electric wrench

DRAINING

1. DRAINING PREPARATION OPERATION

It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .

Note:

Refer to the instructions for use of the AEM LPG igniter in addition to the installation instructions below.

Park the vehicle outside.

Cut the retaining clip of the multifunction valve protection (if the vehicle is equipped).

Remove the protection of the multifunction valve.

Close the stop cock on the multifunction valve.

Drain the LPG multifunction valve - LPG expansion valve unit pipe:

- start the vehicle in LPG position,
- let the engine run until it automatically switches to petrol mode.

Disconnect the batteryBattery: Removal - Refitting (80A, Battery).

Loosen the nut of the LPG multifunction valve - LPG expansion valve unit pipe

2. DRAINING OPERATION

Disconnect the connector of the LPG tank solenoid valve.

Remove the bolt from the LPG tank solenoid valve.

Remove the LPG tank solenoid valve.

For flaring, use the pneumatic or electric wrench.

Position the flare in a stable position in the flare area.

Position the "TWINY" bottle further than 5 metresaway from the flare.

Position the tank to be emptied further than 10 metresaway from the flare.

Note:

The "TWINY" propane bottle and the nitrogen bottle are not supplied with the flare.

Ensure that all valves of all circuits are closed.

To connect the pilot flame hose between the flare and the "TWINY" bottle:

- Connect the quick-release union to the flare pilot flame end piece.
- Clip the expansion valve to the bottle. The valve must be closed.

For the connection between the tank and the flare:

- Connect the self-sealing union on the end of the hose to the flare connection end piece, with the valve closed.
- Fit the special pipe in place of the LPG multifunction valve - LPG expansion valve unit pipe.
- Connect the self-sealing joint at the end of the hose to the connection socket of the special pipes.

To connect the nitrogen circuit:

- Position the nitrogen bottle near the LPG tank.
- Attach the expansion valve onto the nitrogen bottle and tighten the expansion valve union.
- Fit the adapter on the filler end piece,
- Connect the special nitrogen pad to the LPG tank filler orifice and tighten manually. (make sure there is a seal).
- After a check of all the seals to ensure there are no leaks, the system is ready for use.

To light the pilot flame (operator correctly attired):

- Open the "TWINY" bottle expansion valve switch.

- Introduce a flame into the opening provided in the flare cylinder to light the pilot flame.
- Check that the pilot flame is properly lit.

To light the igniter:

- The operator must be at least 10 metres away from the flare and must ensure that this precaution is respected by everyone.
- Control the tank solenoid valve by putting the toolMagnet for manually opening the LPG/CNG tank solenoid valve (**Ms. 1826**) in place of the LPG tank solenoid valve.
- Open the stop cock of the multifunction valve,
- Open the progressive flow valve to position 1 (the maximum position is 5).
- The igniter lights.
- Check the passage of the liquid gas through the circulation indicator.
- Adjust the opening of the progressive flow control valve, increasing its opening to position 2 or 3 until the flow lines equalise through the circulation indicator.
- Try to open the progressive flow control valve slowly so as to not trigger the tank flow limiter. If the limiter is triggered, close the flow valve and start the operation again.
- After the flow has equalised, open the nitrogen bottle and adjust the expansion valve to a pressure 1 bar greater than the tank pressure (but not greater than 7 bar).

After the main flame has gone out, let the nitrogen flame sweep at 3 bars with the flow valve completely open for 1 minuteper 10 litrescapacity (e.g: for a 60 litrestank: sweeping = 6 min).

Close the tank solenoid valve and remove theMagnet for manually opening the LPG/CNG tank solenoid valve(**Ms. 1826**) .

Close the nitrogen circuit by resetting the expansion valve and closing the tap on the nitrogen bottle.

- Shut off the pilot flame by closing the expansion valve switch on the "TWINY" gas bottle.
- Close the progressive flow valve.

CAUTION

The flare should be left in place until it has cooled completely. Move the flare using the two side handles.

- Disconnect all of the unions.
- Wind up the hoses.
- Put away the equipment.
- Refit the LPG tank solenoid valve.
- Connect the connector of the LPG tank solenoid valve.

3. REFITTING OPERATION AFTER DRAINING

- Pretighten by hand the nut of the LPG multifunction valve - LPG expansion valve unit pipe.
- Torque tighten the nut of the LPG multifunction valve - LPG expansion valve unit pipe11 N.m.
- Check the sealing of the union between the LPG multifunction valve - LPG expansion valve unit pipe and the LPG

multifunction valve with leak detection product[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products):

- fill the tank with several litres of LPG,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the union,
- wait for 5 minutes,
- check that there are no leaks on the union,
- fill up the tank,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the union,
- wait for 5 minutes,
- check that there are no leaks on the union.

Refit the protection of the LPG multifunction valve.

Position a retaining clip between the multifunction valve protection and the LPG tank protection (if the vehicle is equipped).

LPG TANK: DRAINING

Note, one or more warnings are present in this procedure

Special tooling required	
Magnet for manually opening the LPG/CNG tank solenoid valve	Ms. 1826

Equipment required
pneumatic or electric wrench

DRAINING

1. DRAINING PREPARATION OPERATION

It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .

Note:

Refer to the instructions for use of the AEM LPG igniter in addition to the installation instructions below.

Park the vehicle outside.

Cut the retaining clip of the multifunction valve protection (if the vehicle is equipped).

Remove the protection of the multifunction valve.

Close the stop cock on the multifunction valve.

Drain the LPG multifunction valve - LPG expansion valve unit pipe:

- start the vehicle in LPG position,
- let the engine run until it automatically switches to petrol mode.

Disconnect the batteryBattery: Removal - Refitting (80A, Battery).

Loosen the nut of the LPG multifunction valve - LPG expansion valve unit pipe

2. DRAINING OPERATION

Disconnect the connector of the LPG tank solenoid valve.

Remove the bolt from the LPG tank solenoid valve.

Remove the LPG tank solenoid valve.

For flaring, use the pneumatic or electric wrench.

Position the flare in a stable position in the flare area.

Position the "TWINY" bottle further than 5 metresaway from the flare.

Position the tank to be emptied further than 10 metresaway from the flare.

Note:

The "TWINY" propane bottle and the nitrogen bottle are not supplied with the flare.

Ensure that all valves of all circuits are closed.

To connect the pilot flame hose between the flare and the "TWINY" bottle:

- Connect the quick-release union to the flare pilot flame end piece.
- Clip the expansion valve to the bottle. The valve must be closed.

For the connection between the tank and the flare:

- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the union,
- wait for 5 minutes,
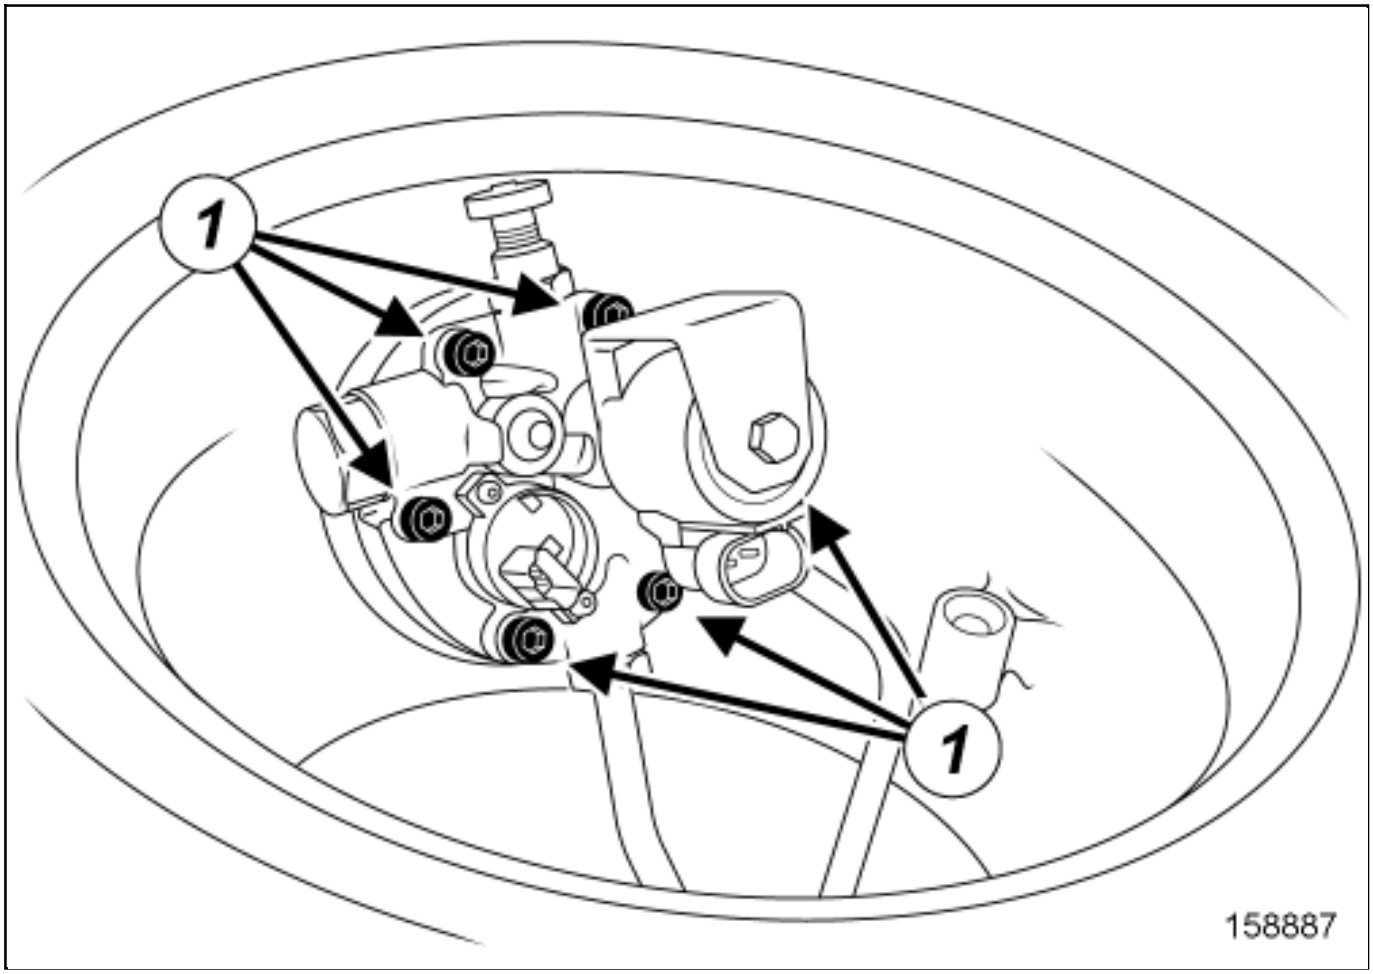
- check that there are no leaks on the union.

Refit the protection of the LPG multifunction valve.

Position a retaining clip between the multifunction valve protection and the LPG tank protection (if the vehicle is equipped).

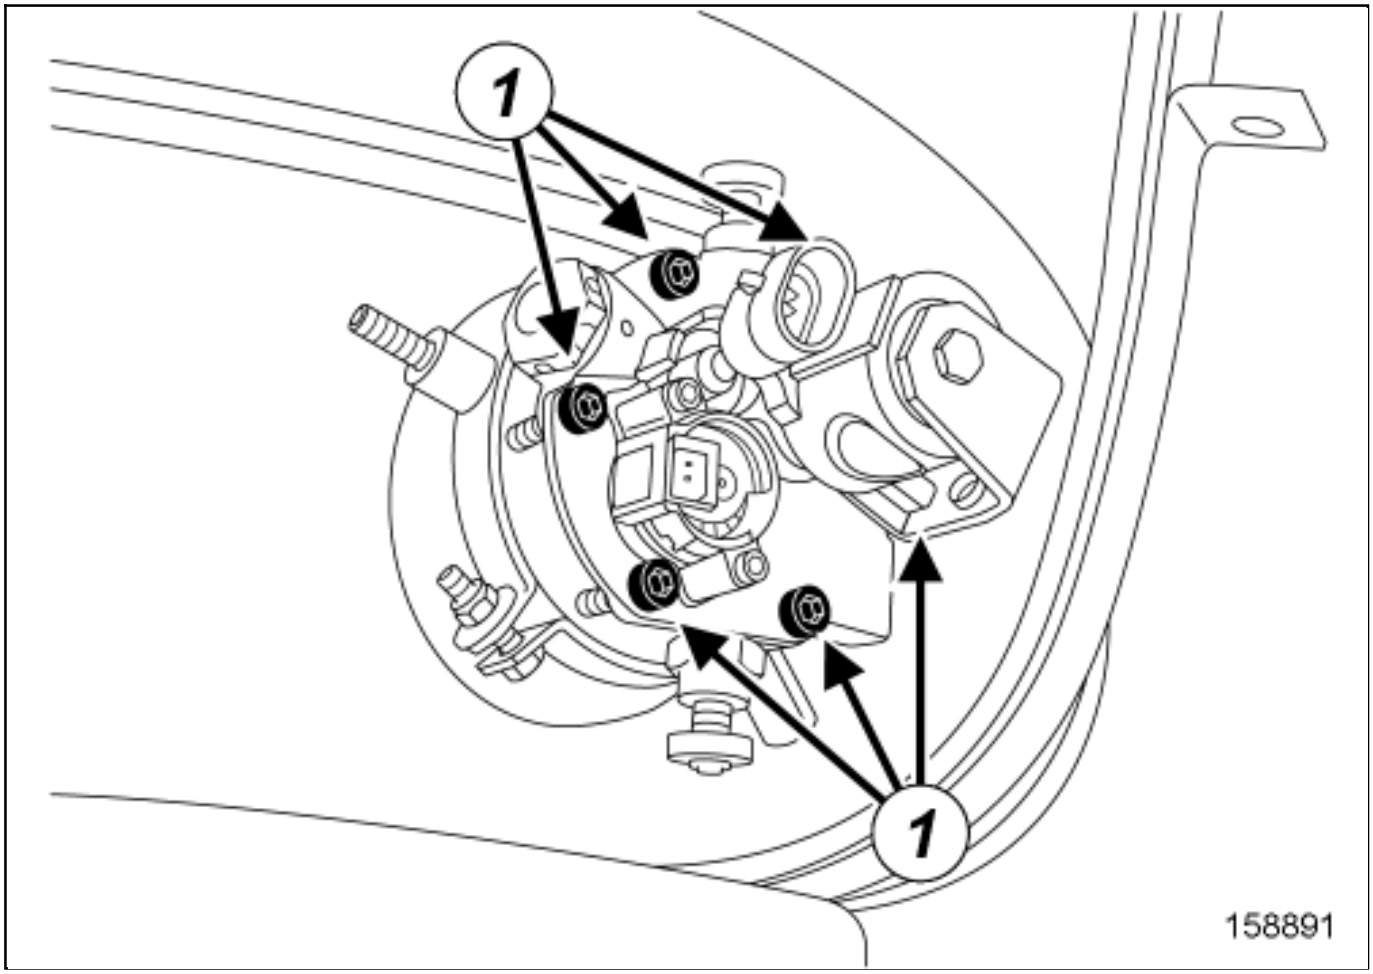
LPG TANK MODULE : REMOVAL - REFITTING

REMOVAL



1. REMOVAL PREPARATION OPERATION

- It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .
- Park the vehicle outside.
- Disconnect the batteryBattery: Removal - Refitting (80A, Battery).
- Partially remove the neck - LPG tank pipe on the LPG multifunction valve side(see 17C, LPG injection, LPG tank - neck pipe: Removal - Refitting) .
- Drain the LPG tank(see 17C, LPG injection, LPG tank: Draining) .
- Take the vehicle back inside.
- Position the vehicle on a two-post liftVehicle: Towing and lifting (02A, Lifting equipment).



2. REMOVAL OPERATION

- Disconnect the connector of the LPG level sensor.

LPG TANK IN THE LUGGAGE COMPARTMENT

LPG TANK UNDER THE VEHICLE

- Loosen the LPG tank module bolts(1) .

- Detach the LPG tank module.

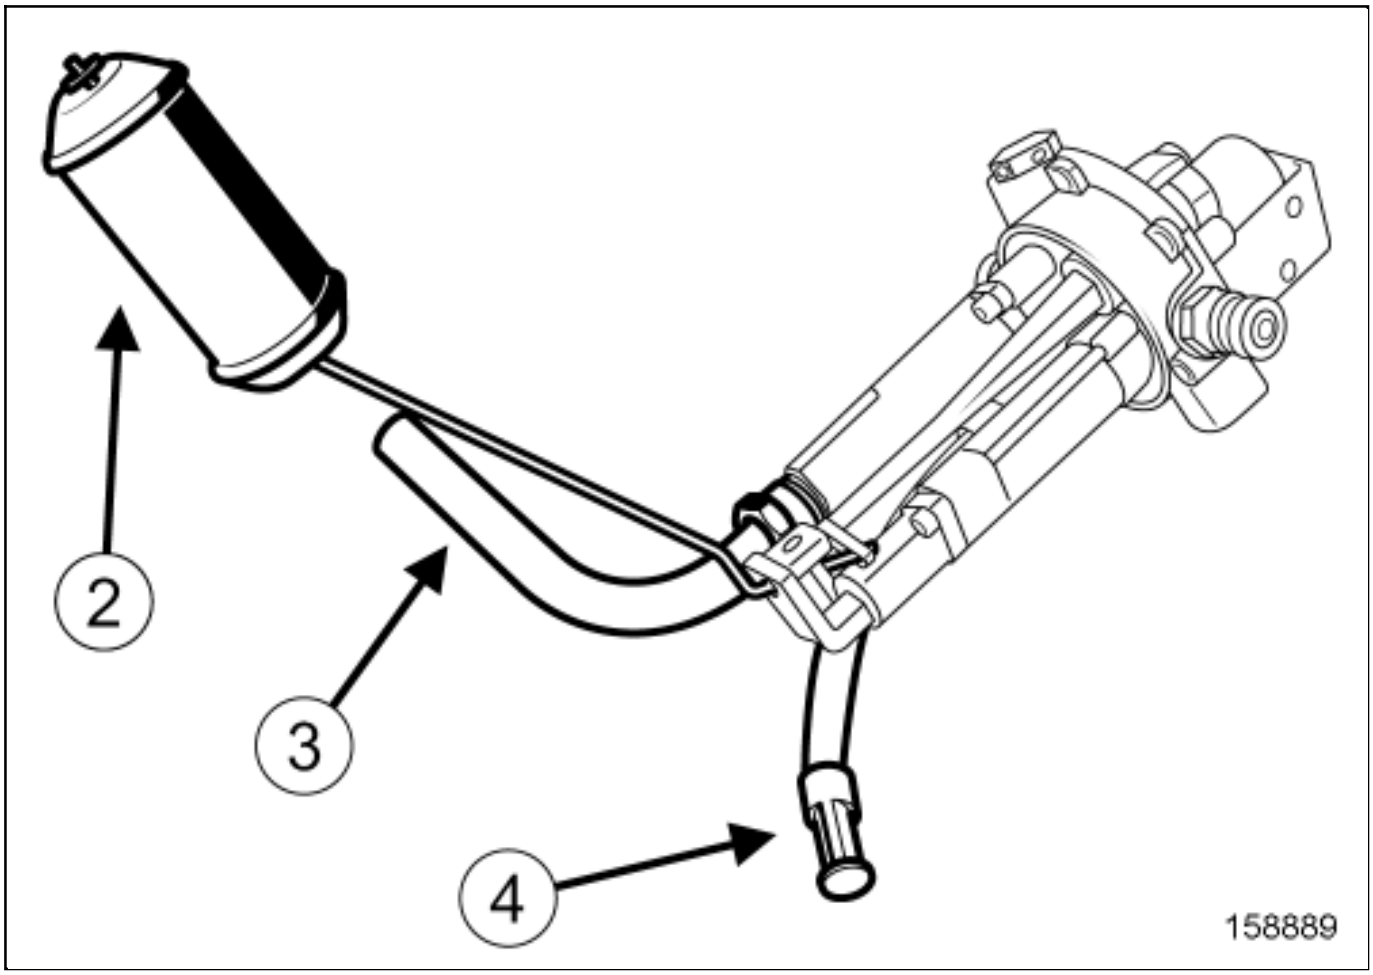
- Remove the LPG tank module bolts.

Note:

Do not force the float, the overpressure pipe or the plunger when removing

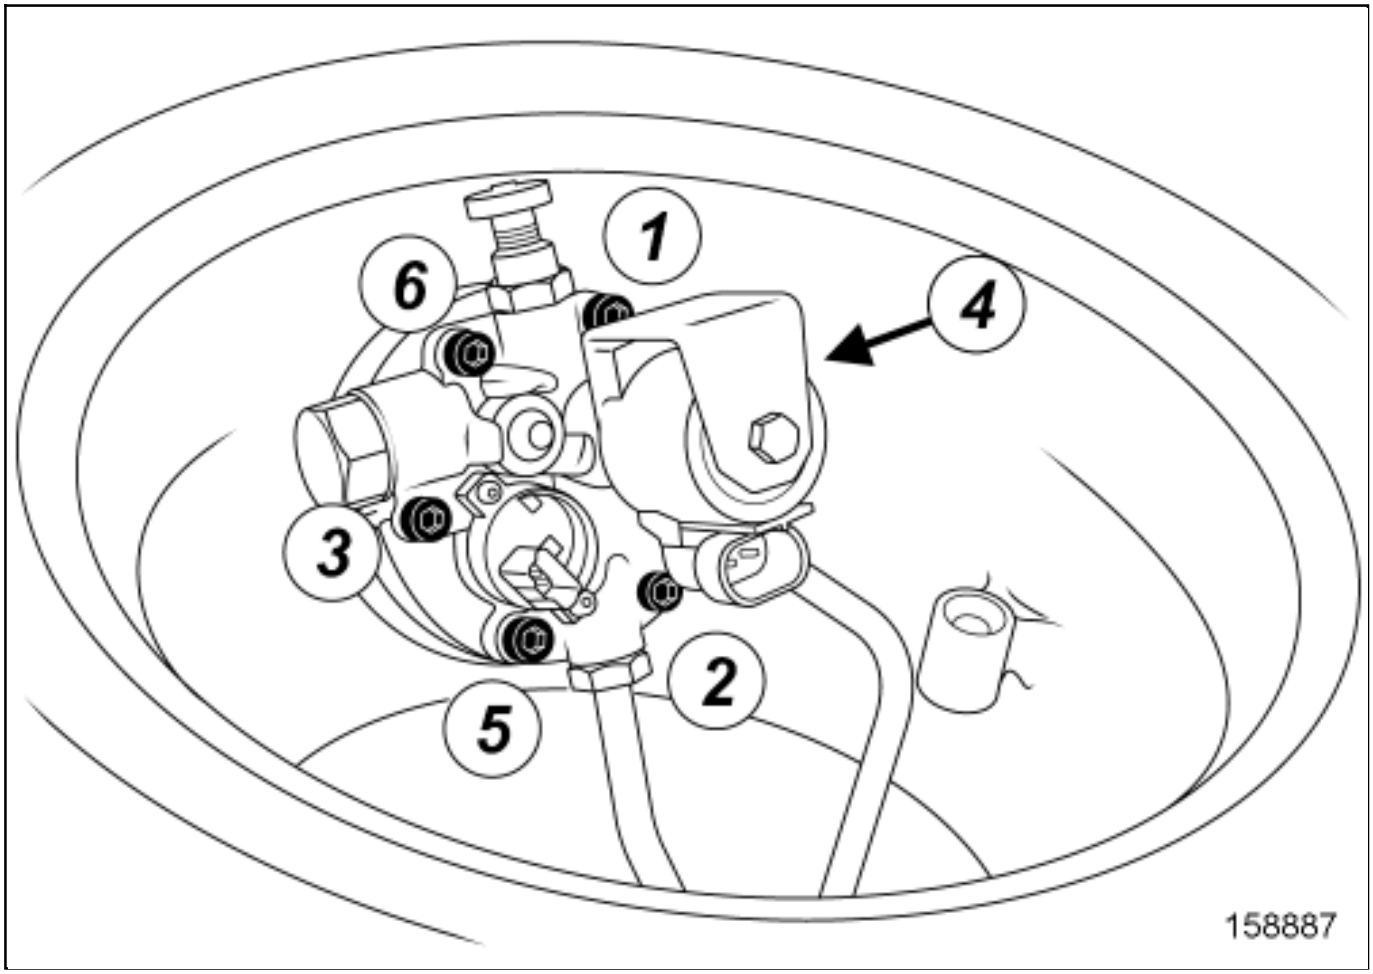
- Remove the LPG tank module.

REFITTING



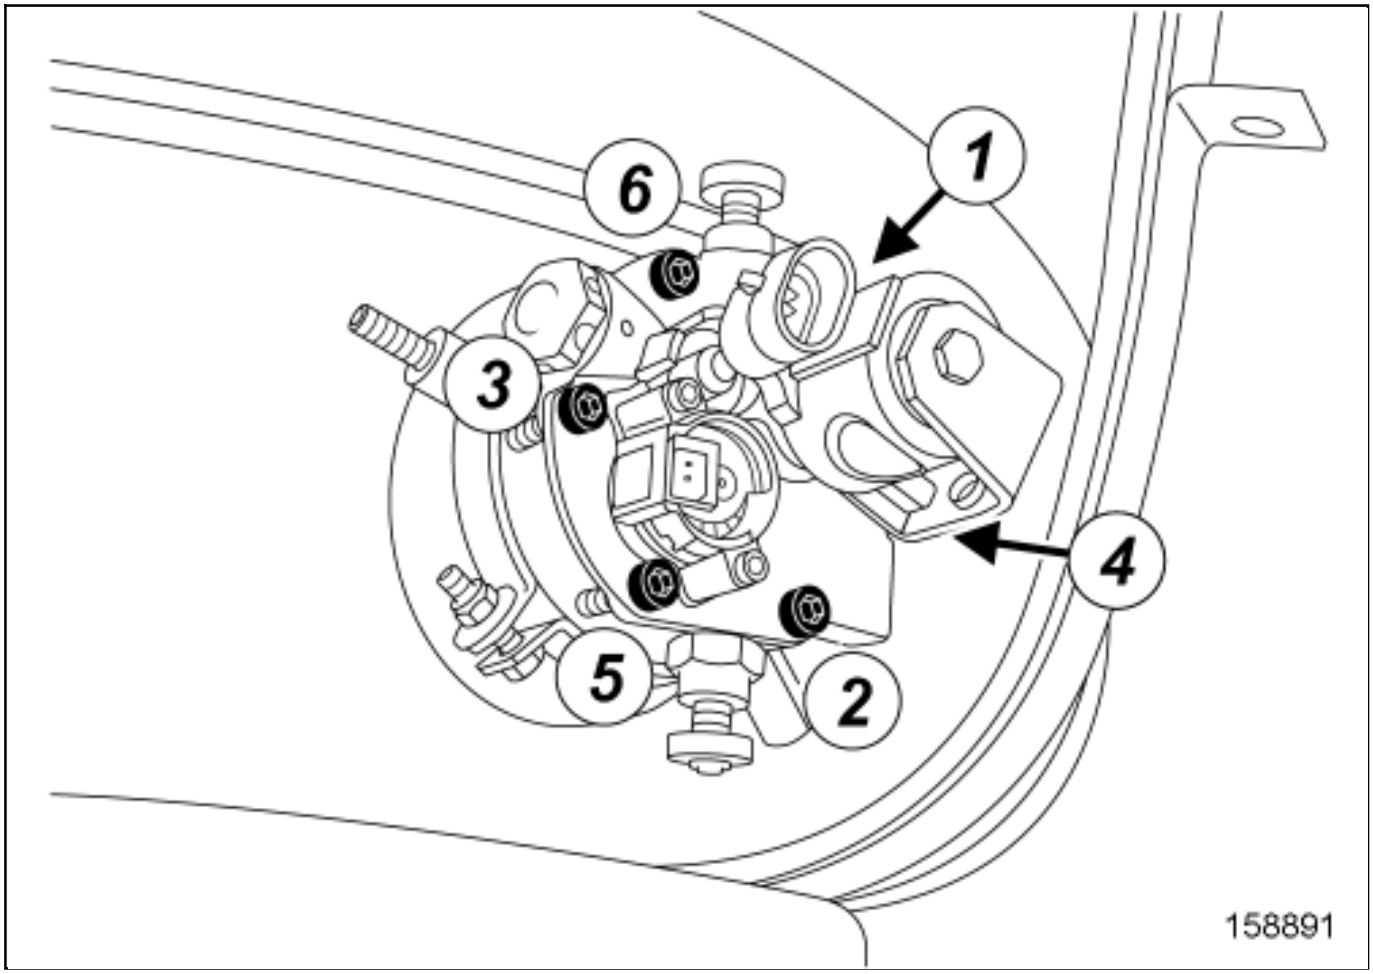
1. REFITTING PREPARATION OPERATION

Check that the LPG tank module seal are the position correct.



2. REFITTING OPERATION

Note:



Do not force the float, the overpressure pipe or the plunger when refitting

LPG TANK IN THE LUGGAGE COMPARTMENT

LPG TANK UNDER THE VEHICLE

Position the LPG tank module.

Insert one after another into the LPG tank hole:

- the float(2) ,
- the overpressure pipe(3) ,
- the plunger(4) .

Tighten to torque and in order the LPG tank module bolts5 N.m.

3. FINAL OPERATION

Proceed in the reverse order to removal.

Torque tighten:

- the nut of the neck - LPG tank pipe on the LPG tank multifunction valve 14 N.m (see 17C, LPG injection, LPG tank - neck pipe: Removal - Refitting) ,
- the nut of the LPG multifunction valve - LPG expansion valve unit pipe 11 N.m (see 17C, LPG injection, LPG tank: Draining) .

Check the sealing of the unions on the LPG multifunction valve with leak detection product Vehicle: Parts and consumables for the repair (04B, Consumables - Products):

- fill the tank with several litres of LPG,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the unions,
- wait for 5 minutes,
- check that there are no leaks,
- fill up the tank,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the unions,
- wait for 5 minutes,
- check that there are no leaks on the union.

Refit the protection of the LPG multifunction valve.

XSL version : 3.02 du 22/07/11

LPG TANK: REMOVAL - REFITTING

Equipment required
component jack

REMOVAL

- It is essential to read the repair precautions(see 17C, LPG injection, LPG injection: Precautions for the repair) .
- Park the vehicle outside.
- Disconnect the batteryBattery: Removal - Refitting (80A, Battery).
- Partially remove the neck - LPG tank pipe on the LPG multifunction valve side(see 17C, LPG injection, LPG tank - neck pipe: Removal - Refitting) .
- Drain the LPG tank(see 17C, LPG injection, LPG tank: Draining) .
- Take the vehicle back inside.
- Position the vehicle on a two-post liftVehicle: Towing and lifting (02A, Lifting equipment).
- Remove:
  - the protection of the LPG tank,
  - the central mounting nut from the LPG tank frame support.
- Fit the component jackunder the LPG tank frame support.
- Remove:

- 2 rear mounting nuts from the LPG tank frame support,
- 2 front mounting nuts from the LPG tank frame support,
- the frame support with the LPG tank.

1. ONLY IN CASE OF REPLACEMENT

For making inert the old LPG tank, outside the building and in the open air perform the following operations :

- remove the LPG tank multifonction valve,
- fill the LPG tank with water,
- empty the water from the LPG tank.

The old LPG tank is now portable and recyclable as an ordinary part.

REFITTING

Proceed in the reverse order to removal.

Torque tighten:

- the front mounting nuts of the LPG tank frame support45 N.m,
- the rear mounting nuts of the LPG tank frame support45 N.m,
- the central mounting nut of the LPG tank frame support28 N.m,

the mounting nut of the LPG tank protection11 N.m.

Torque tighten the nut of the neck - LPG tank pipe on the LPG tank multifunction valve14 N.m **(see 17C, LPG injection, LPG tank - neck pipe: Removal - Refitting)** .

Torque tighten the nut of the LPG multifunction valve - LPG expansion valve unit pipe11 N.m**(see 17C, LPG injection, LPG tank: Draining)** .

Check the sealing of the unions on the LPG multifunction valve with leak detection product**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- fill the tank with several litres of LPG,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the unions,
- wait for 5 minutes,
- check that there are no leaks,
- fill up the tank,
- start the engine, and operate it in "gas" mode,
- apply leak detector and check that there are no leaks on the unions,
- wait for 5 minutes,
- check that there are no leaks on the union.

XSL version : 3.02 du 22/07/11

LPG TANK SOLENOID VALVE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- It is essential to read the repair precautions (see 17C, LPG injection, LPG injection: Precautions for the repair) .
- Disconnect the battery Battery: Removal - Refitting (80A, Battery).
- Cut the retaining clip of the multifunction valve protection(if the vehicle is equipped).
- Remove the protection of the multifunction valve.

2. REMOVAL OPERATION

- Disconnect the connector of the LPG tank solenoid valve.
- Remove:
  - the bolt from the LPG tank solenoid valve,
  - the LPG tank solenoid valve.

REFITTING

Proceed in the reverse order to removal.

Repair-11x06x01x16-01x37-1-1-1.xml

XSL version : 3.02 du 22/07/11

MAINTENANCEOPERATIONALINSTRUCTIONS :SERVICE

 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool
Electronic check tool

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repairVehicle: Precautions for the repair

The Renault maintenance programme includes all checks, top-ups, adjustments, and part replacements necessary for vehicle maintenance. For information on the specific service intervals for the vehicle, refer to the maintenance booklet or to ICM.

1. CONTENT OF THE DIFFERENT TYPES OF SERVICES AND THE ANNUAL INTERMEDIATE VISIT:

1-SERVICES:

The types of service (Maintenance Service, General Service, Renault Service) and the operations to be performed may vary depending on the vehicle and the date of manufacture. To find out which specific checks and operations should be performed on the vehicle, refer to the vehicle maintenance booklet.

1- ANNUAL INTERMEDIATE VISIT:

For vehicles for which the oil change is to be performed no later than every 2 years, a non-obligatory visit including the following operations is advised:

- check the engine oil level,
- check the level, condition, and sealing of the brake fluid circuit,
- check the coolant level,
- check the level, condition, and sealing of the power-assisted steering circuit,
- check the washer fluid level,
- electronic fault finding of the battery with the test tool,
- electronic fault finding of the computers,
- condition of the windscreen and rear view mirrors,

- wear of the windscreen wiper and rear wiper blades,
- check the exterior lighting and signals,
- condition and pressure of the tyres (including emergency spare wheel or tyre repair aerosol),
- condition of gaiters, rubber mounting bushes, and ball joints,
- exhaust system check,
- sealing of the front and rear shock absorbers,
- wear of the front and rear brake pads and brake discs.

NOTE: the content of the intermediate visit, as well as its commercial name, may vary from one country to another. Thus additional checks and / or operations could be added to this list. For more information, please contact the manufacturer's technical teams in your country

2. SPECIAL CONDITIONS OF CUSTOMER USE AND MAINTENANCE MANAGEMENT FOR VEHICLES EQUIPPED WITH THE OCS (OIL CONTROL SYSTEM) FOR GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, ISRAEL:

Definitions:

What does it mean that a vehicle is operated under normal conditions of customer use?

A vehicle is operated under normal conditions of customer use if it is not operated under the special conditions of customer use (see below). In this case, observe the standard maintenance programme provided in the maintenance booklet or ICM (Shared World Information).

What does it mean that a vehicle is operated under special conditions of customer use?

A special condition of customer use affects the replacement frequency of one or several parts of the maintenance programme (service, air filter replacement, fuel filter replacement, etc.). The vehicle is said to operate under special conditions of customer use if:

– The instrument panel displays that a service is required (change engine oil and oil filter), only for vehicles equipped with the OCS (Oil Control System) oil quality control device. See "List of vehicles equipped with OCS or information in ICM (Shared World Information)",

– At least 50% of the vehicle operating time is with the engine idling (example: constant door-to-door driving without stopping the engine),

– At least 50% of trips are at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),

– At least 30% of the miles driven involve towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),

- Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),

- Extended use (+ than 3000 miles (5000 km)/year) at temperatures continuously below -15˚C.

What is the OCS (Oil Control System) and what does it detect?

The OCS is a device that evaluates oil degradation by calculations, taking into account the severe engine operating conditions that affect the oil. Thus, under certain driving conditions, the instrument panel indicates to the customer that a service is required.

Which vehicles are equipped with the OCS device?

THE MODELS EQUIPPED WITH THE OCS ARE FOR THE COUNTRIES OF GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, AND ISRAEL:

Note :

For the Dacia vehicles consult the ICM for the vehicles manufactured starting from 14/06/2011, before consulting the table.

For the Renault vehicles consult the ICM for the vehicles manufactured starting from 01/01/2010, before consulting the table.

1- FOR TURKEY, ROMANIA AND BULGARIA :

For the vehicles sold starting from 01/01/2011, consult the ICM.

1- MANAGEMENT OF VEHICLE MAINTENANCE IN CASE OF DRIVING UNDER SPECIAL CONDITIONS OF CUSTOMER USE:

It is ESSENTIAL to read the instructions:

Depending on whether the vehicle is fitted with OCS or not, refer to the corresponding table below.

The tables below contain X's or notes to specify the maintenance operations to be performed depending on the special conditions of customer use.

For the other maintenance programme parts that need not be replaced early, the maintenance interval is the same as recommended for normal conditions of customer use (see the maintenance booklet or ICM). If this interval will be reached before the next customer visit, replace this part ahead of schedule.

If the vehicle is operated under several of these special conditions of customer use, apply the most stringent recommendation for replacement specified for the special conditions of use concerned.

FOR MODELS WITHOUT OCS:

	Divide by 2 the engine oil and oil filter service interval for normal conditions of use		Divide by 2 the air filter replacement interval for normal conditions of use (1)		Divide by 2 the diesel filter replacement interval for normal conditions of use (1)		Replace the belts and rollers 18,000 miles (30,000 km) sooner than for normal use conditions (1)(2)	Replace the cabin filter during every service for normal conditions of use (1)
	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time		
At least 50% of the vehicle operating time with the engine idling (e.g. constant door-to-door driving without stopping the engine)	X	X	X	X	X	X	X	
At least 50% of trips at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),	X		X		X		X	X

At least 30% of the miles driven while towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),	X				X		X	
Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),	X		X		X		X	X
Extended use (+ than 3000 miles (5000 km) /year) at temperatures continuously below -15˚C.	X							

(1) If the recommended interval will be reached before the next customer visit, replace the part concerned ahead of schedule.

(2) Certain pulleys of certain engines must be replaced when replacing the accessories belt. See the "Supplementary operations" section.

FOR MODELS WITH OCS (SEE THE TABLE OF MODELS EQUIPPED WITH THE

OCS AND THE COUNTRIES CONCERNED):

	Divide by 2 the engine oil and oil filter service interval for normal conditions of use (1)		Divide by 2 the air filter replacement interval for normal conditions of use (1)		Divide by 2 the diesel filter replacement interval for normal conditions of use (1)		Replace the belts and rollers 18,000 miles (30,000 km) sooner than for normal use conditions (1)(2)	Replace the cabin filter during every service for normal conditions of use (1)
	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time		
Instrument panel display that a service is required (engine oil and oil filter service) due to the OCS (Oil Control System).	Observe the message on the vehicle instrument panel and perform the service (engine oil and oil filter service) when it is requested(1).							
At least 50% of the vehicle operating time with the engine idling (e.g. constant door-to-door driving without stopping the engine)			X	X	X	X	X	

At least 50% of trips at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),			X		X		X	X
At least 30% of the miles driven while towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),					X		X	
Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),	X		X		X		X	X

Extended use (+ than 3000 miles (5000 km) /year) at temperatures continuously below -15˚C.	X							

(1) If the recommended interval will be reached before the next customer visit, replace the part concerned ahead of schedule.

(2) Certain pulleys of certain engines must be replaced when replacing the accessories belt. See the "Supplementary operations" section.

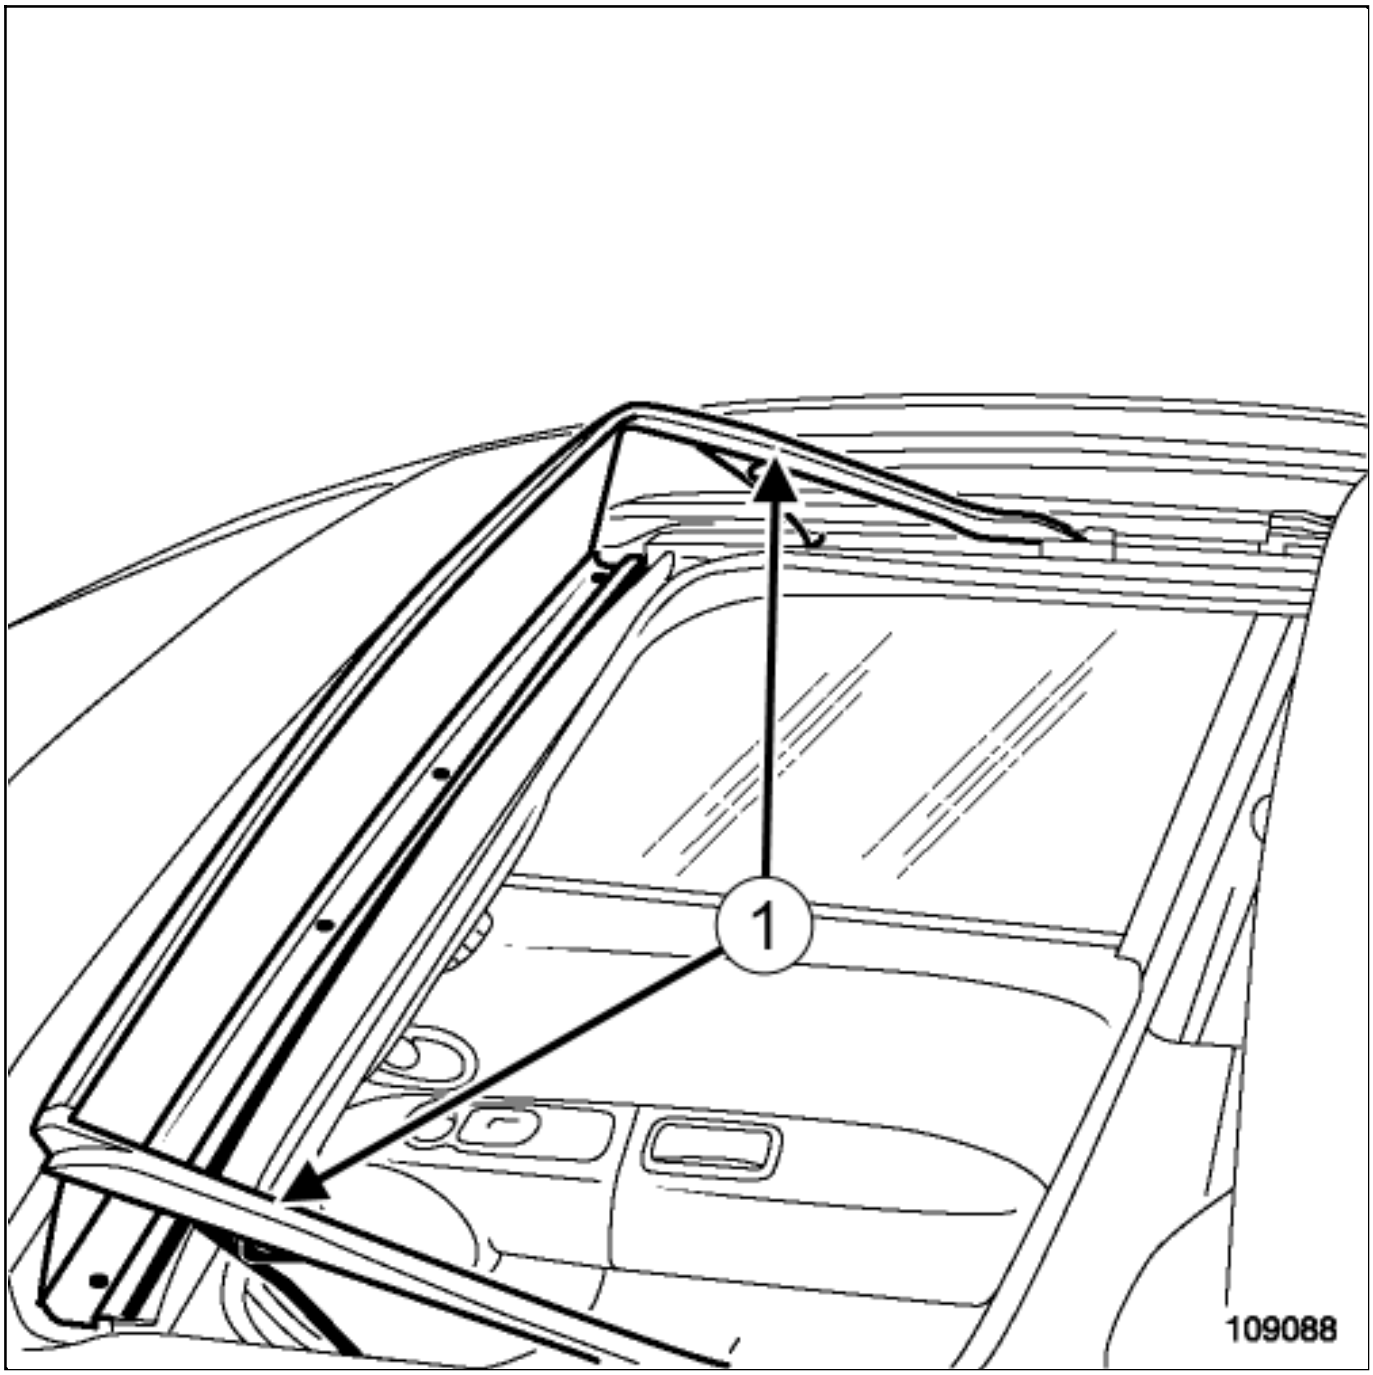
3. SPECIAL CONDITIONS OF CUSTOMER USE (OIL CONTROL SYSTEM) FOR THE COUNTRIES NOT MENTIONED ABOVE:

See the vehicle's maintenance booklet.

4. PROCEDURES FOR PERFORMING OPERATIONS AND CHECKS DURING THE MAINTENANCE OR SERVICE:

The customer must be warned if a check reveals a fault.

Checks marked with an asterisk depend on the vehicle or the country.

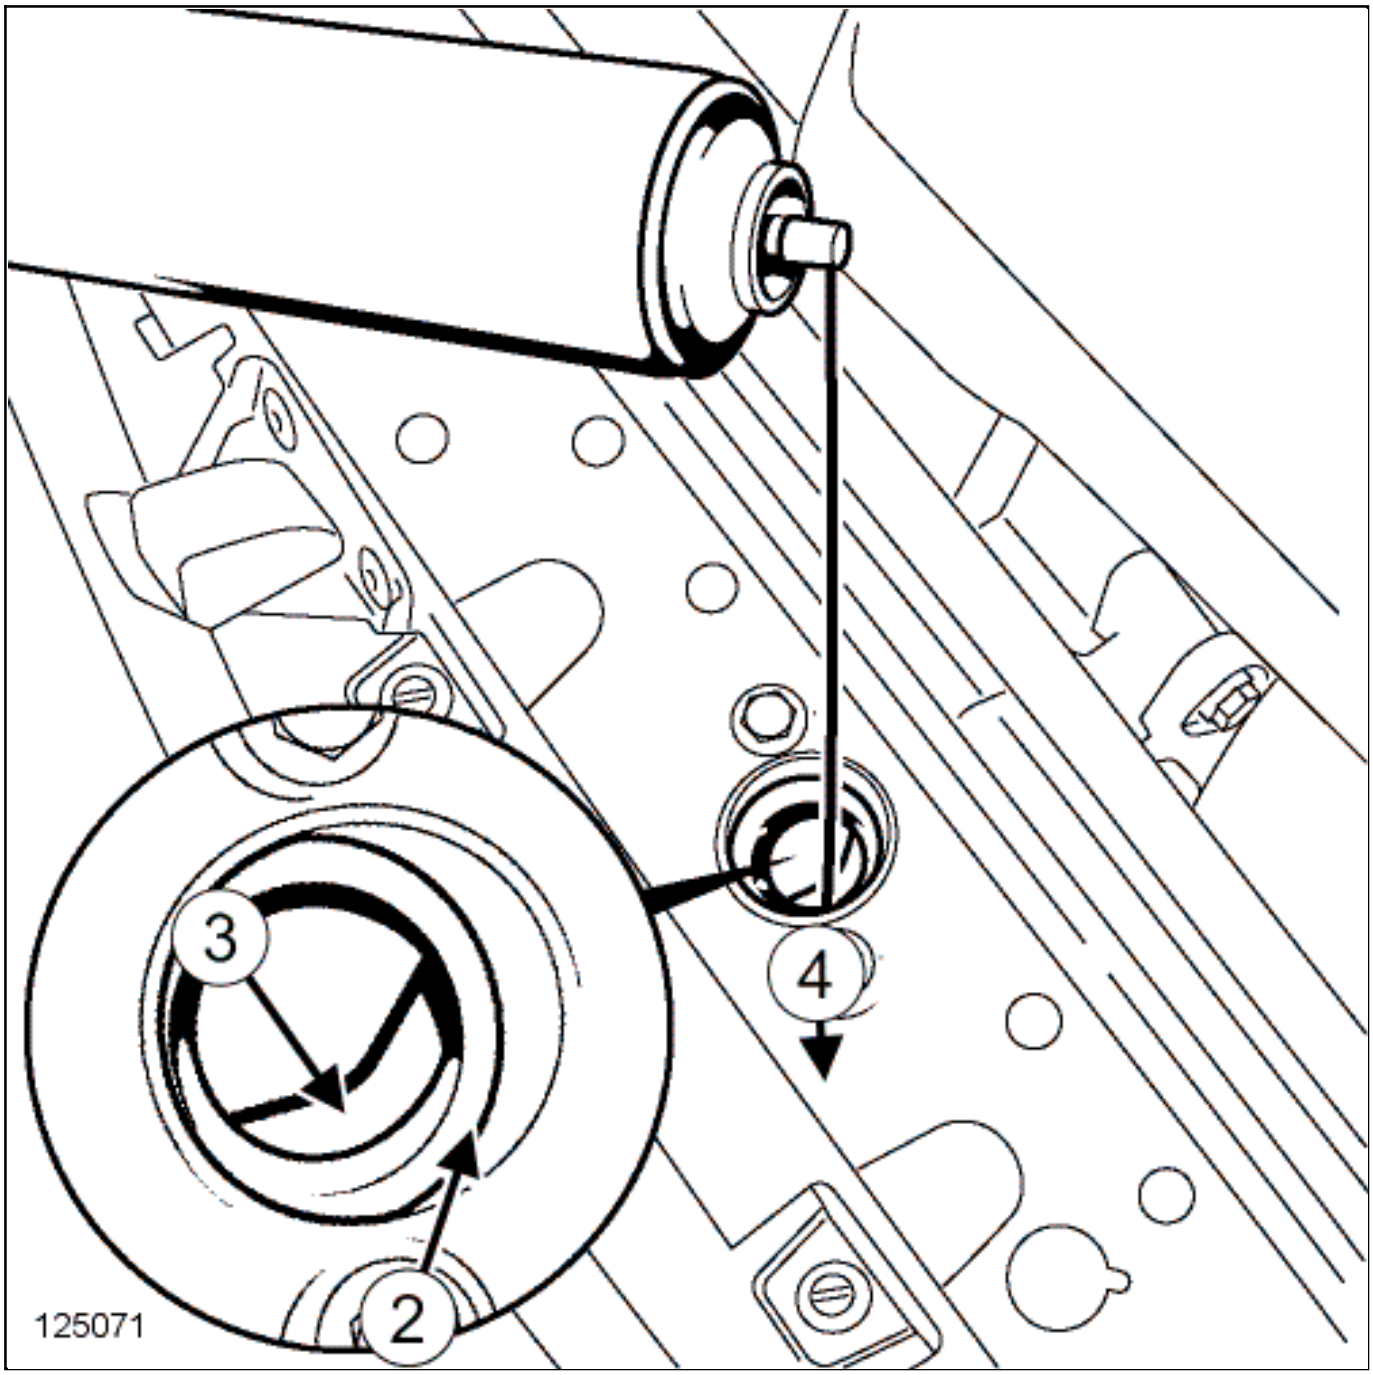


1- BODYWORK: ANTICORROSION CHECK

☐ Visually inspect the condition of the:
- vehicle,
- underside of the vehicle,
- wheel arches.

Indicate any damage to the underbody protection, and all cuts, ruptures, scratches or corrosion anywhere on the vehicle.

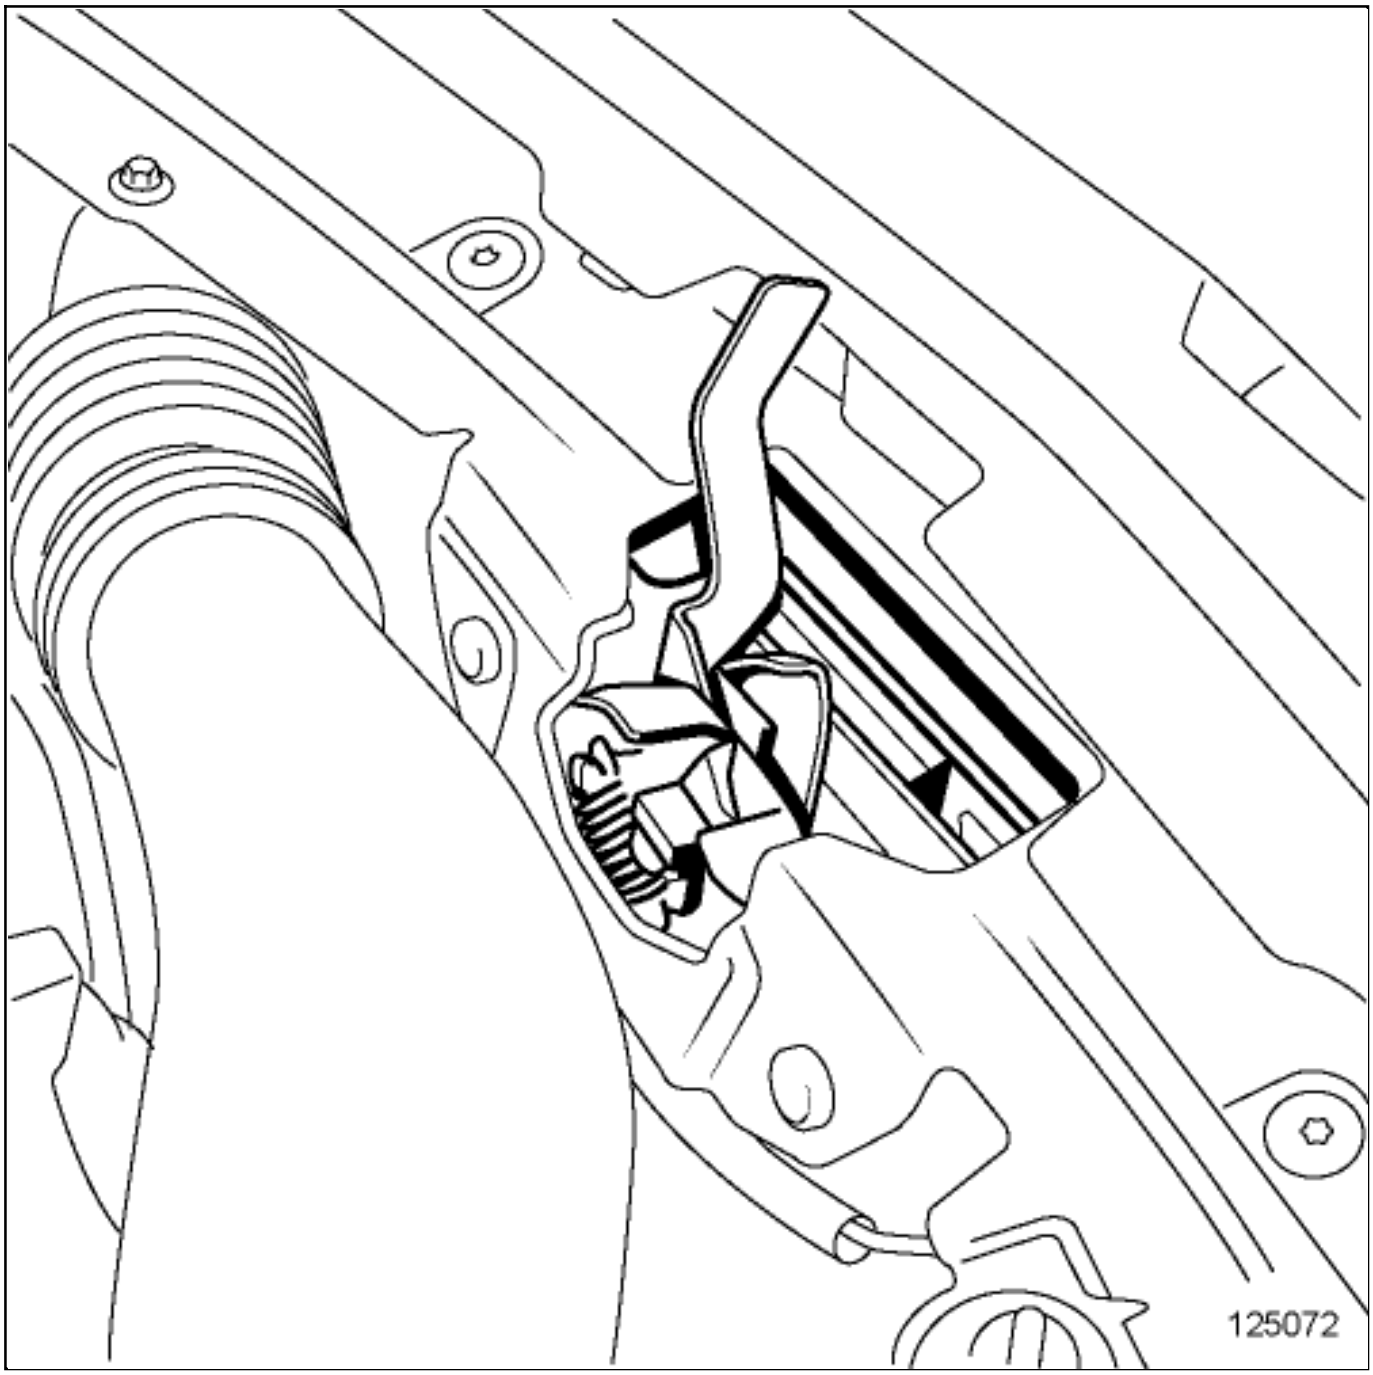
This inspection contributes to the validity of the anticorrosion warranty. It is therefore necessary to complete the maintenance sheets in the maintenance booklet.



2- BODYWORK: CLEANING THE DEFLECTOR ARMS AND PANORAMIC SUNROOF MOBILE PANEL

Use a dry, lint-free cloth to clean the sunroof deflector arms (1) and the section of the mobile panel with which they come into contact.

3- BODYWORK: CHECKING THE BONNET LOCK LUBRICATION AND OPERATION



1)GUILLOTINE TYPE LOCK

As specified in the photo above, apply silicone-free lubricant Vehicle: Parts and consumables for the repair (04B, Consumables - Products), placing it between the body of the lock (2) and the lock blade (3) in the direction of the lock blade hinge shaft (4).

Let it set for1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

2)OTHER TYPES OF LOCK

Apply silicone-free lubricant[Vehicle: Parts and consumables for the repair](04B, Consumables - Products) to the catch assembly.

Let it set for1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

4- GREASING OF THE REAR DOOR HINGES AND THE UPPER STRIKER PANEL HOOK OF THE SLIDING SIDE DOOR(MASTER II PHASE 3)

Apply opening element greaseto the rear door hinges and the upper striker panel hook of the sliding side door (see **Vehicle: Parts and consumables for the repair**)

5- ENGINE: DRAINING THE ENGINE OIL

The oil grade is essential for maintaining the service life of the engine. Carefully follow the manufacturer's recommendations specified in the Technical Note**Engine oil: Specifications** (Technical Note 6013A, 04A, Lubricants).

Use the correct quantity of oil and the correct sump plug sealing washer**Engine oil: Draining - Refilling** (10A, Engine and peripherals).

After topping up, let the oil run for approximately 10 minutes before checking the level. The oil level maximum mark on the dipstick must never be exceeded (risk of damage to the engine).

6- ENGINE: REPLACING THE OIL FILTER

Replace the engine oil filter after each oil service**Oil filter: Removal - Refitting** (10A, Engine and peripherals).

7- ENGINE: CHECKING THE EXHAUST SYSTEM

☐ Visually inspect:

- that there is no corrosion, piercing or impact to the silencer, expansion chamber, catalytic converter and particle filter*,
- that the rubber mounting bushes are not torn or cracked,
- that the exhaust pipe is not in contact with the underside of the vehicle.

8- ENGINE: BLEEDING WATER FROM THE FUEL FILTER* (IF THE PART HAS NOT REACHED ITS REPLACEMENT INTERVAL)

Bleed the water from the fuel filter by unscrewing the water bleed cap and letting the water run into a suitable container.

9- ENGINE: CHECKING THE CLUTCH PLAY* FOR LOGAN-SANDERO (EXCEPT FOR AUTOMATIC COMPENSATION)

(Logan and Sandero only) Use the recommended checking procedure**Clutch control: Adjustment** (37A, Mechanical component controls).

10- CHECKING THE LEVELS, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC POWER-ASSISTED STEERING*

Check the hydraulic steering fluid level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

11- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: COOLING

Check the coolant level: it should be between the minimum and maximum level on the reservoir.

Visually check the circuit sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

12- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC BRAKE/CLUTCH*

Visually check the circuit sealing, checking the condition and that there are no leaks around the engine compartment, under the vehicle or at the unions.

- Check the brake fluid level:
  - If the level is between the minimum and maximum, do not add brake fluid as wear on the discs, pads, drums and linings leads to a progressive drop in the brake fluid level in the tank which will usually be rectified once these components are replaced. However, the brake fluid level should never drop below the minimum mark.
  - If there is an abnormal loss of fluid, the cause of which cannot be found with this check, advise the customer.

13- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC UNIT*

Check the hydraulic unit oil level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

14- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC CLUTCH*

Check the hydraulic clutch fluid level, it should be at the middle level of the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

15- CHECKING THE CHASSIS: CONDITION OF THE GAITERS, RUBBER MOUNTING BUSHES AND BALL JOINTS

Check the condition of the driveshaft and steering rubber gaiters, all ball joints and the rubber mounting bushes. There must not be any signs of tearing or cracks.

16- CHECKING THE CHASSIS: TYRE CONDITION AND PRESSURE (INCLUDING EMERGENCY SPARE WHEEL OR PRESENCE OF TYRE-REPAIR AEROSOL)

Check that the tread depth of the tyres has not reached the wear warning strips, explain the degree of tyre wear to the customer.

Check that there is no abnormal tyre wear, and no bulges, blisters, tears or foreign objects (sharp object, screw, etc.).

Check and readjust the tyre inflation pressure when cold according to the type of driving.

Check the pressure and condition of the emergency spare wheel, or if not supplied with the vehicle, check that there is a tyre repair aerosol in the vehicle.

Respect the recommended pressure shown on the label on the door (if the vehicle does not have one, refer to the Driver's Handbook or.

17- CHECKING THE CHASSIS: PRESENCE OF THE WHEEL VALVE CAPS

Check that each valve cap is present.

18- CHECKING THE CHASSIS: SEALING OF THE FRONT AND REAR SHOCK ABSORBERS

Visually check that there is no oil leaking along the length of the shock absorbers.

19- CHECKING THE CHASSIS: WEAR OF THE FRONT AND REAR BRAKE PADS AND BRAKE DISCS*, AND SWAPPING THE FRONT AND REAR WHEELS

In order to perform a quality check, always remove the wheels (an electric impact wrench or a pneumatic wrench can be used to loosen the wheel bolts and nuts).

Check the thickness of the brake pads and compare to the minimum authorised value. In case of partial wear, advise the customer of the degree of wear to the brake pads.

Check the thickness of the front brake discs and the thickness of the rear brake discs and compare to the minimum authorised value. In case of partial wear, advise the customer of the degree of wear to the brake discs.

Refit the wheels. For Duster 4X4, swap the front and rear wheels.

When refitting the wheels, an electric impact wrench set at low speed can be used to fit the wheel bolts and nuts until contact, then torque tighten them.

20- CHECKING VISIBILITY: EXTERIOR LIGHTING AND SIGNALS

Check the side lights, dipped headlights, main beam headlights, front and rear fog lights, the direction

indicators and side mounted indicators, the reversing lights, the hazard warning lights, the brake lights, the registration plate lighting and the additional cornering lights*.

21- CHECKING VISIBILITY: INTERIOR LIGHTING

Checking door lighting, interior lights and sun visors, glovebox and luggage compartment lights.

22- CHECKING VISIBILITY: CONDITION OF THE WINDSCREEN AND DOOR MIRRORS

Check that there are no cracks or chips.

23- CHECKING VISIBILITY: WEAR ON THE FRONT AND REAR WINDSCREEN WIPER BLADES

Check the quality of the wiping function and check that the wiper blades are not torn or cracked.

24- CHECKING VISIBILITY: FRONT AND REAR WINDSCREEN WASHER FLUID LEVEL

Check that there is windscreen washer fluid present.

Top up, if necessary.

25- LABELS: CHECKING THE AIRBAG SAFETY AND ENGINE COMPARTMENT LABELS ARE PRESENT AND CORRECTLY POSITIONED

☐ Check that the vehicle has the following original safety labels:

- airbag, located on the windscreen, sun visor and passenger side of the dashboard,
- battery, oil, cooling system, heating and air conditioning system, engine cooling fan located in the engine compartment.

26- ELECTRONIC CHECK: BATTERY

Check the condition of the battery with the tool "Midtronics R330".

27- ELECTRONIC CHECK: COMPUTERS

Note:

Always check the condition of the battery before checking the computers as insufficient voltage can affect the computers.

The purpose of this procedure is to see if any of the computers are faulty.

The following tools are essential for carrying out fault finding on these systems:

- an approved Renault Electronic check tool(QUEST) with the latest update,
- an approved Renault Diagnostic tool(CLIP) with the latest update,
- a CAN probe.

Running fault finding on the computers highlights possible faults not displayed by the system self-test procedure, and allows them to be analysed and deleted

28- CHECKING CHARGING CORD (ONLY TWIZY):

Visually check the charging cord without removing.

29- CHECKING ELECTRIC VEHICLE (ONLY KANGOO AND FLUENCE):

Electronic check :

Select the symptome in MCS (Modulate Targeting Symptome): R201, integrate it into the order of repair.

Make a electronic check of computers, see "Electronic check : computers".

Make the checks of symptome R201: "Maintenance Range".

NB :

Do not control the system Quick Dropbecause it is canceled.

30- ELECTRONIC FAULT FINDING: OPERATION OF THE INSTRUMENT PANEL WARNING LIGHTS

Check that the following warning lights come on when the ignition is switched on:

- STOP warning light,
- SERVICE warning light.

31- REINITIALISATION: MAINTENANCE/OIL SERVICE DISPLAY*

Reset the maintenance/oil service interval display (see Driver's Handbook).

32- SERVICE SHEETS: AFFIXING THE SERVICE LABEL IN THE ENGINE COMPARTMENT*

Fill in the maintenance label and affix it in the engine compartment.

5. SUPPLEMENTARY OPERATIONS:

The removal and refitting procedures and some of the checks to be carried out during maintenance are set out in the repair manuals or the technical notes. The information and repair methods given below are specific to the maintenance programme.

For an exhaustive description of the operations to be carried out during the maintenance operation, refer to the vehicle maintenance booklet.

1- REPLACEMENT OF THE ACCESSORIES BELT, ROLLERS, AND PULLEYS (PULLEY TO BE REPLACED DEPENDING ON THE VEHICLE)

When replacing the belt, it is essential to replace the tensioning rollers and fixed rollers across the whole range. It is also necessary to replace the damper pulley (also known as the crankshaft accessories pulley) or the alternator pulley on certain engines, see below.

Table of pulleys to be replaced during maintenance only according to the accessories belt replacement frequency. The vehicles concerned are those for which the maintenance booklets mention a replacement for certain engines. The detail of the vehicle variants concerned is given below (vehicles manufactured after June 2006):

1)FOR GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, ISRAEL:

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley during maintenance operations
F4R	714, 715, 720, 760, 761, 762, 763, 764, 765, 766, 767, 770, 771, 774, 776, 784, 786, 787, 792, 794, 795, 796, 797, 800, 811, 820, 830, 867, 870, 886, 887, 896, 897.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
M9R	610, 700, 720, 721, 722, 740, 760, 761, 780, 812.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	
V9X	All	

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	802, 813.	To be replaced each time the accessories belt and its rollers are scheduled for replacement

2)OTHER COUNTRIES:

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley
K4J equipped with air conditioning	730, 732, 740, 770, 780.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
K4M equipped with air conditioning	604, 606, 680, 690, 694, 696, 697, 698, 716, 744, 745, 760, 761, 762, 764, 766, 768, 770, 780, 782, 788, 790, 791, 794, 800, 801, 804, 812, 813, 814, 824, 830, 831, 834, 835, 844, 854, 856, 862, 866.	
K4M equipped with air conditioning	838, 839, 848, 858	To be replaced every other time the accessories belt and its rollers are scheduled for replacement
K9K	782	

F4R	714, 715, 720, 760, 761, 762, 763, 764, 765, 766, 767, 770, 771, 774, 776, 784, 786, 787, 792, 794, 795, 796, 797, 800, 811, 820, 830, 867, 870, 886, 887, 896, 897.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
K9K	278, 282, 288, 292, 732, 734, 764, 772, 780, 804, 806, 832, 836.	
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 794, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	
M9R	610, 700, 720, 721, 722, 740, 742, 760, 761, 780, 812.	
V9X	All	
M9R	802, 803, 805, 809, 816, 830, 832, 833.	To be replaced every other time the accessories belt and its rollers are scheduled for replacement
M9T	All	To be replaced every other time the accessories belt and its rollers are scheduled for replacement

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	802, 813	To be replaced each time the accessories belt and its rollers are scheduled for replacement

2- REPLACING THE TIMING BELT AND ROLLERS

When replacing the belt, it is essential to replace the tensioning and fixed rollers across the whole range. Certain vehicle/engine specifications require associated parts to be replaced, therefore it is necessary to consult the repair procedure for the vehicle and engine for further details.

3- CHECKING THE REAR BRAKE LININGS FOR VEHICLES FITTED WITH DRUMS

Check the wheel cylinders for any possible leaks.

Remove any dust from the brake linings using a brake cleaning product.

Check the thickness of the drum linings and compare it to the minimum authorised thickness..

4- CLEANING THE AIR CONDITIONING SYSTEM

The air conditioning system is cleaned by cleaning the evaporator.

6. STANDARD OF PROFESSIONAL ACTIVITY

The Standard of Professional Activity is a tool which describes the operation to perform in an optimised order favouring time and quality. This way of working allows for the elimination and reduction of unnecessary actions, the grouping together of operations by operation area and a reduction in down time.

Order of performance	Principal steps	Key points
Preparing the vehicle:		
1	Consult the repair order and ICM editions to find out:- The works to be performed and additional operations- The presence of OTS	
2	Check that the driver's protections are in place (front seat, steering wheel, floor carpet, gear lever)	
3	Check for the maintenance booklet and the wheel anti-theft key (if equipped) on the passenger seat	
4	Check the instrument panel warning lights with the ignition on	Warning light (STOP and SERVICE)
5	Start the vehicle and check that all the warning lights go out	No warning light lit
6	Move the vehicle to the workstation, leave the engine running	
Passenger compartment checks:		
7	Step out of the vehicle and connect the exhaust gas extraction system	

8	❑ Check the exterior signals and lights: ■ Side lights, ■ Dipped headlights, ■ Main beam headlights, ■ Front and rear fog lights, ■ direction indicators and side mounted indicators, ■ Front and rear hazard warning lights, ■ Brake lights, ■ number plate lighting, ■ Reversing lights, ■ Additional cornering lights,	Use a mirror If not done whilst walking around the vehicle
9	❑ Check the interior lighting: ■ Courtesy lights, ■ Sun visors, ■ Glovebox.	
10	Release the bonnet, and remove the diagnostic socket cover	
11	Reset the distance before oil change/maintenance display	
12	Switch off the engine and switch on the ignition again	
13	Step out of the vehicle, take the wheel anti-theft key	
Front visibility check:		
14	Check the condition of the windscreen wiper blades	
15	Check the condition of the windscreen	
Engine compartment checks:		
16	Open the bonnet	

17	Run fault finding on the battery with the "MIDTRONICS R330" tool.	
18	Grease the bonnet catch using silicone-free lubricant	
19	Go back into the passenger compartment, switch on the ignition and connect the Diagnostic tool "Clip" or Electronic check tool "Quest" and run the computer scan	
20	Release the bonnet 10 times using the control in the driver's position	
21	Check the levels and sealing of the hydraulic circuits in the engine compartment: ■ the coolant circuit, ■ of the hydraulic power-assisted steering circuit (depending on the version), ■ of the brake fluid and clutch circuit (depending on the version), ■ hydraulic unit of the sequential gearbox (depending on the version).	Do not top up the brake fluid level
22	Check the washer fluid level.	
23	Remove the oil filler cap	
24	Loosen the oil filter if accessible from above.	
25	Check the clutch clearance (Logan version)	
26	Bleed the water from the fuel filter (if accessible)	Bleed the fuel filter if it has not reached its replacement interval

27	Check for the presence of the "Manufacturer's Recommendations" label located in the engine compartment	The "manufacturer's recommendations" labels include: oil, battery, cooling circuit, fan, air conditioning.
Check the condition of the bodywork on the driver's side:		
28	Check the lighting of the front door sill	
29	Read and retain the tyre pressure	
30	Check the condition of the rear view mirror	
31	Visually inspect the condition of the bodywork	
32	Check the lighting of the rear door sill (if equipped)	
33	Position the arms or pads of the lift (depending on the type of lift)	
34	Take the pressure gauge (if it is not present in the kit)	
Rear vehicle checks:		
35	Check the lighting of the luggage compartment	
36	Check the level of wear of the emergency spare wheel (if accessible through the luggage compartment)	
37	Check the pressure and the presence of the valve cap	

38	Check the condition of the rear screen wiper blade	
Check the condition of the bodywork on the passenger's side:		
39	Visually inspect the condition of the bodywork	
40	Check the lighting of the rear door sill	
41	Check the lighting of the front door sill	
42	Check the presence of the airbag label on the passenger's side	
43	Check the condition of the rear view mirror	
44	Position the arms or pads of the lift (depending on the type of lift)	
Computer checks		
45	Record the scan results of Diagnostic tool "Clip" or Electronic check tool"Quest"	
46	Disconnect the Diagnostic tool"Clip" or Electronic check tool "quest"	
Panoramic sunroof check		
47	Clean the arms of the sunroof deflector and the section of the mobile panel which comes into contact with them (if equipped)	
48	Raise the vehicle to chest height	

Check on driver's side front wheel		
49	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
50	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
51	Check the level of brake pad wear	Note the degree of wear on the test certificate
52	Check the brake disc wear	
53	Check the condition of the brake hose	
54	Check the condition of the rubber mounting bushes and suspension arm ball joint	
55	Check the sealing of the shock absorber	
56	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
57	Check the condition of the driveshaft gaiters and steering gaiters	
58	Check the level of power-assisted steering fluid (Laguna 3)	
Check on driver's side rear wheel:		
59	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	

60	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
61	Check the level of wear of the brake pads, depending on the version	Note the degree of wear on the test certificate
62	Check the brake disc wear (if equipped)	
63	Check the condition of the brake hose	
64	Check the sealing of the shock absorber.	
65	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
Check on passenger's side rear wheel:		
66	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
67	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
68	Check the level of wear of the brake pads, depending on the version	Note the degree of wear on the test certificate
69	Check the brake disc wear (if equipped)	
70	Check the condition of the brake hose	
71	Check the sealing of the shock absorber.	

72	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
Check on passenger's side front wheel		
73	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
74	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
75	Check the level of brake pad wear	Note the degree of wear on the test certificate
76	Check the brake disc wear	
77	Check the condition of the brake hose	
78	Check the condition of the rubber mounting bushes and suspension arm ball joint	
79	Check the sealing of the shock absorbers.	
80	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
81	Check the condition of the driveshaft gaiters and steering gaiters	
82	Bleed the water in the fuel filter (if accessible through wheel arch) according to the maintenance programme)	

83	Raise the vehicle to the upper position	
Underbody operations		
84	Remove the protection plate underneath the engine and position the oil collector	
85	Remove the drain plug	Let the oil flow for 10 minutes
86	Remove the oil filter (version accessed from underneath)	
87	Check the exhaust system: Corrosion, contact with body and condition of the rubber mounting bushes	
88	Check the condition of the catalytic converter	
89	Check the condition of the spring, shock absorber cups and shock absorber on the right-hand and left-hand sides (if accessible from underneath)	
90	Check the condition of the underbody brake pipes	
91	Check the condition and pressure of the emergency spare wheel (if accessible from underneath)	
92	☐ Check the engine components using a lamp: ■ Cooling system hoses, ■ Coolant pump, ■ Engine block, ■ Turbocharger	

93	Parts are supplied using Dialogys and the physical values should be noted (tightening torque, oil grade and quantity)	
94	Refit the new oil filter (if accessible)	Lubricate the seal, tighten to torque depending on the model
95	Refit the drain plug	With new seal and according to recommended part number, for copper seals, the lips should be on the plug side (panel cover) Torque tighten depending on the model
96	Clean the oil residues	
97	Drain the oil collector.	
	Supplementary operation: replacement of fuel filter	See ICM/Maintenance booklet
98	Refit the protection plate underneath the engine	
99	Read the tyre pressure on the label on the driver's side door (if equipped)	Pressure to be applied depends on customer's driving type
100	Lower the vehicle to chest height	
Operations on driver's side front wheel		
101	Refit the wheel	**Wheel: Removal - Refitting** (35A, Wheels and tyres)

102	Check the tyre pressure and the presence of the valve cap	
Operations on driver's side rear wheel		
	Supplementary operation: remove dust and check the drum brake (if equipped)	See ICM/Maintenance booklet
103	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
104	Check the tyre pressures and the presence of the valve cap	
Operations on passenger's side rear wheel		
	Supplementary operation: remove dust and check the drum brake (if equipped)	See ICM/Maintenance booklet
105	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
106	Check the tyre pressures and the presence of the valve cap	
Operations on passenger's side front wheel		
	Remove - refit diesel filter (depending on the version)	See ICM/Maintenance booklet
107	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)

108	Check the tyre pressures and the presence of the valve cap	
109	Lower the vehicle to the low position	
Operations in the engine compartment		
110	Refit the new oil filter (if accessible)	Lubricate the seal, tighten by hand or to torque depending on the model
111	Fill the engine oil	Respect the grade and quantity of engine oil.
112	Replace the oil filler cap	
	Supplementary operation: replacement of diesel filter (depending on the version)	See ICM/Maintenance booklet
	Supplementary operation: replacement of fuel filter (depending on the version)	See ICM/Maintenance booklet
	Supplementary operation: replacement of air filter	See ICM/Maintenance booklet
	Supplementary operation: replacement of spark plugs	See ICM/Maintenance booklet
	Supplementary operation: replacement of brake fluid	See ICM/Maintenance booklet
	Supplementary operation: replacement of coolant	See ICM/Maintenance booklet
	Supplementary operation: replacement of accessories belt and rollers	See ICM/Maintenance booklet

	Supplementary operation: replacement of damper pulley/alternator pulley (depending on the version)	See Technical Note 6018/Maintenance booklet
	Supplementary operation: replacement of timing belt and rollers	See ICM/Maintenance booklet
	Supplementary operation: check and clean air conditioning system	See ICM/Maintenance booklet
	Supplementary operation: replacement of cabin filter (depending on the version)	See ICM/Maintenance booklet
Internal vehicle operation		
113	Start the vehicle	
114	Switch off the ignition	
	Supplementary operation: replacement of cabin filter (depending on the version)	See ICM/Maintenance booklet
Wheel torque tightening		
115	Consult the tightening torque in the technical documentation	
116	Torque tighten the front wheel on the driver's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
117	Torque tighten the rear wheel on the driver's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
118	Torque tighten the rear wheel on the passenger's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.

119	Torque tighten the front wheel on the passenger's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
Administrative operations		
120	Fill in the test certificate	
121	Indicate, according to the degree of importance, the next works to be performed in order to ensure vehicle conformity.	
Final inspection in the engine compartment:		
122	Fill in and position the maintenance label	
123	After waiting at least 10 minutes after the last top-up or starting the engine, check the oil level using the dipstick	
124	Top up if necessary	
125	Clean the engine cover and the battery cover	

MAINTENANCEOPERATIONALINSTRUCTIONS :SERVICE

 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool
Electronic check tool

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repairVehicle: Precautions for the repair

The Renault maintenance programme includes all checks, top-ups, adjustments, and part replacements necessary for vehicle maintenance. For information on the specific service intervals for the vehicle, refer to the maintenance booklet or to ICM.

1. CONTENT OF THE DIFFERENT TYPES OF SERVICES AND THE ANNUAL INTERMEDIATE VISIT:

1-SERVICES:

The types of service (Maintenance Service, General Service, Renault Service) and the operations to be performed may vary depending on the vehicle and the date of manufacture. To find out which specific checks and operations should be performed on the vehicle, refer to the vehicle maintenance booklet.

1- ANNUAL INTERMEDIATE VISIT:

For vehicles for which the oil change is to be performed no later than every 2 years, a non-obligatory visit including the following operations is advised:

- check the engine oil level,
- check the level, condition, and sealing of the brake fluid circuit,
- check the coolant level,
- check the level, condition, and sealing of the power-assisted steering circuit,
- check the washer fluid level,
- electronic fault finding of the battery with the test tool,
- electronic fault finding of the computers,
- condition of the windscreen and rear view mirrors,

- wear of the windscreen wiper and rear wiper blades,
- check the exterior lighting and signals,
- condition and pressure of the tyres (including emergency spare wheel or tyre repair aerosol),
- condition of gaiters, rubber mounting bushes, and ball joints,
- exhaust system check,
- sealing of the front and rear shock absorbers,
- wear of the front and rear brake pads and brake discs.

NOTE: the content of the intermediate visit, as well as its commercial name, may vary from one country to another. Thus additional checks and / or operations could be added to this list. For more information, please contact the manufacturer's technical teams in your country

2. SPECIAL CONDITIONS OF CUSTOMER USE AND MAINTENANCE MANAGEMENT FOR VEHICLES EQUIPPED WITH THE OCS (OIL CONTROL SYSTEM) FOR GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, ISRAEL:

Definitions:

What does it mean that a vehicle is operated under normal conditions of customer use?

A vehicle is operated under normal conditions of customer use if it is not operated under the special conditions of customer use (see below). In this case, observe the standard maintenance programme provided in the maintenance booklet or ICM (Shared World Information).

What does it mean that a vehicle is operated under special conditions of customer use?

A special condition of customer use affects the replacement frequency of one or several parts of the maintenance programme (service, air filter replacement, fuel filter replacement, etc.). The vehicle is said to operate under special conditions of customer use if:

– The instrument panel displays that a service is required (change engine oil and oil filter), only for vehicles equipped with the OCS (Oil Control System) oil quality control device. See "List of vehicles equipped with OCS or information in ICM (Shared World Information)",

– At least 50% of the vehicle operating time is with the engine idling (example: constant door-to-door driving without stopping the engine),

– At least 50% of trips are at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),

– At least 30% of the miles driven involve towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),

- Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),

- Extended use (+ than 3000 miles (5000 km)/year) at temperatures continuously below -15˚C.

What is the OCS (Oil Control System) and what does it detect?

The OCS is a device that evaluates oil degradation by calculations, taking into account the severe engine operating conditions that affect the oil. Thus, under certain driving conditions, the instrument panel indicates to the customer that a service is required.

Which vehicles are equipped with the OCS device?

THE MODELS EQUIPPED WITH THE OCS ARE FOR THE COUNTRIES OF GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, AND ISRAEL:

Note :

For the Dacia vehicles consult the ICM for the vehicles manufactured starting from 14/06/2011, before consulting the table.

For the Renault vehicles consult the ICM for the vehicles manufactured starting from 01/01/2010, before consulting the table.

1- FOR TURKEY, ROMANIA AND BULGARIA :

For the vehicles sold starting from 01/01/2011, consult the ICM.

1- MANAGEMENT OF VEHICLE MAINTENANCE IN CASE OF DRIVING UNDER SPECIAL CONDITIONS OF CUSTOMER USE:

It is ESSENTIAL to read the instructions:

Depending on whether the vehicle is fitted with OCS or not, refer to the corresponding table below.

The tables below contain X's or notes to specify the maintenance operations to be performed depending on the special conditions of customer use.

For the other maintenance programme parts that need not be replaced early, the maintenance interval is the same as recommended for normal conditions of customer use (see the maintenance booklet or ICM). If this interval will be reached before the next customer visit, replace this part ahead of schedule.

If the vehicle is operated under several of these special conditions of customer use, apply the most stringent recommendation for replacement specified for the special conditions of use concerned.

FOR MODELS WITHOUT OCS:

	Divide by 2 the engine oil and oil filter service interval for normal conditions of use		Divide by 2 the air filter replacement interval for normal conditions of use (1)		Divide by 2 the diesel filter replacement interval for normal conditions of use (1)		Replace the belts and rollers 18,000 miles (30,000 km) sooner than for normal use conditions (1)(2)	Replace the cabin filter during every service for normal conditions of use (1)
	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time		
At least 50% of the vehicle operating time with the engine idling (e.g. constant door-to-door driving without stopping the engine)	X	X	X	X	X	X	X	
At least 50% of trips at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),	X		X		X		X	X

At least 30% of the miles driven while towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),	X				X		X	
Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),	X		X		X		X	X
Extended use (+ than 3000 miles (5000 km) /year) at temperatures continuously below -15˚C.	X							

(1) If the recommended interval will be reached before the next customer visit, replace the part concerned ahead of schedule.

(2) Certain pulleys of certain engines must be replaced when replacing the accessories belt. See the "Supplementary operations" section.

FOR MODELS WITH OCS (SEE THE TABLE OF MODELS EQUIPPED WITH THE

OCS AND THE COUNTRIES CONCERNED):

	Divide by 2 the engine oil and oil filter service interval for normal conditions of use (1)		Divide by 2 the air filter replacement interval for normal conditions of use (1)		Divide by 2 the diesel filter replacement interval for normal conditions of use (1)		Replace the belts and rollers 18,000 miles (30,000 km) sooner than for normal use conditions (1)(2)	Replace the cabin filter during every service for normal conditions of use (1)
	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time	Distance (kilometres or miles)	Time		
Instrument panel display that a service is required (engine oil and oil filter service) due to the OCS (Oil Control System).	Observe the message on the vehicle instrument panel and perform the service (engine oil and oil filter service) when it is requested(1).							
At least 50% of the vehicle operating time with the engine idling (e.g. constant door-to-door driving without stopping the engine)			X	X	X	X	X	

At least 50% of trips at an average speed of less than 18 mph (30 km/h) (primarily urban use, taxi, etc.),			X		X		X	X
At least 30% of the miles driven while towing a trailer, caravan, etc. weighing more than 500 kg (condition only for passenger vehicles),					X		X	
Use in a dusty environment (work-site, + than 600 miles (1000 km)/year on unpaved roads, etc.),	X		X		X		X	X

Extended use (+ than 3000 miles (5000 km) /year) at temperatures continuously below -15˚C.	X							

(1) If the recommended interval will be reached before the next customer visit, replace the part concerned ahead of schedule.

(2) Certain pulleys of certain engines must be replaced when replacing the accessories belt. See the "Supplementary operations" section.

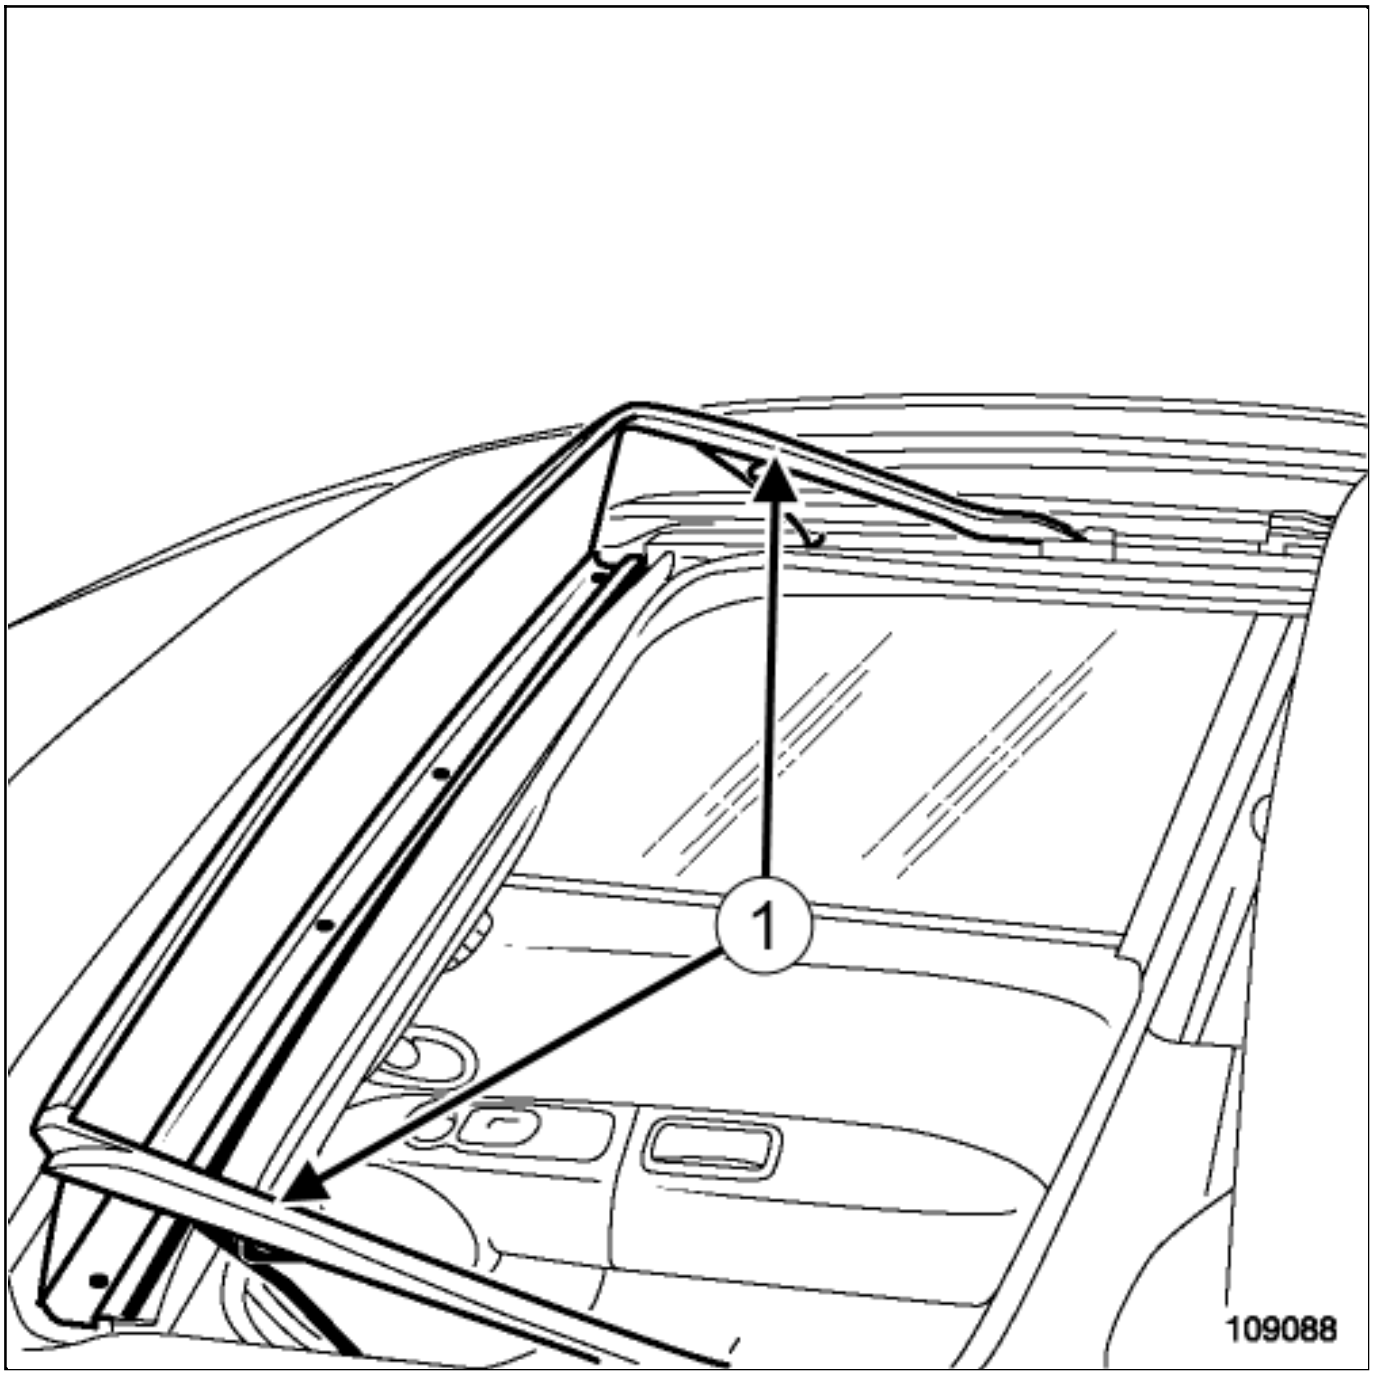
3. SPECIAL CONDITIONS OF CUSTOMER USE (OIL CONTROL SYSTEM) FOR THE COUNTRIES NOT MENTIONED ABOVE:

See the vehicle's maintenance booklet.

4. PROCEDURES FOR PERFORMING OPERATIONS AND CHECKS DURING THE MAINTENANCE OR SERVICE:

The customer must be warned if a check reveals a fault.

Checks marked with an asterisk depend on the vehicle or the country.

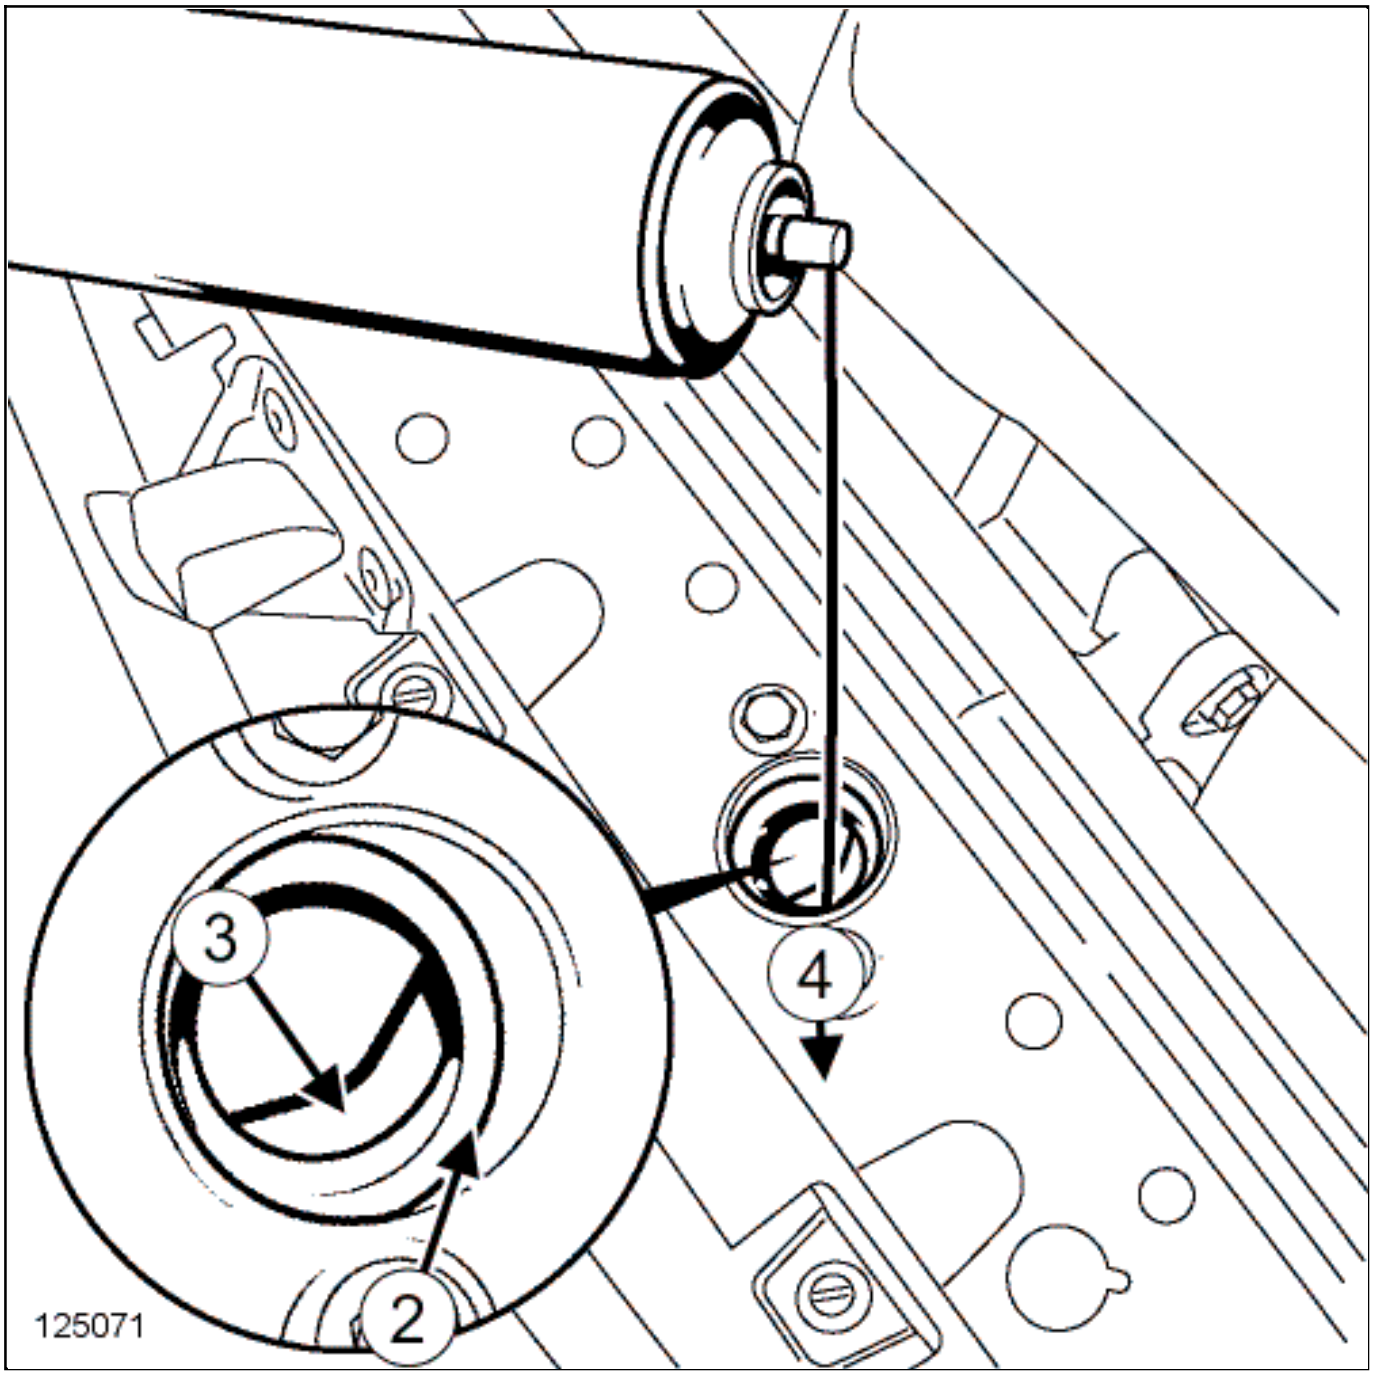


1- BODYWORK: ANTICORROSION CHECK

☐ Visually inspect the condition of the:
- vehicle,
- underside of the vehicle,
- wheel arches.

Indicate any damage to the underbody protection, and all cuts, ruptures, scratches or corrosion anywhere on the vehicle.

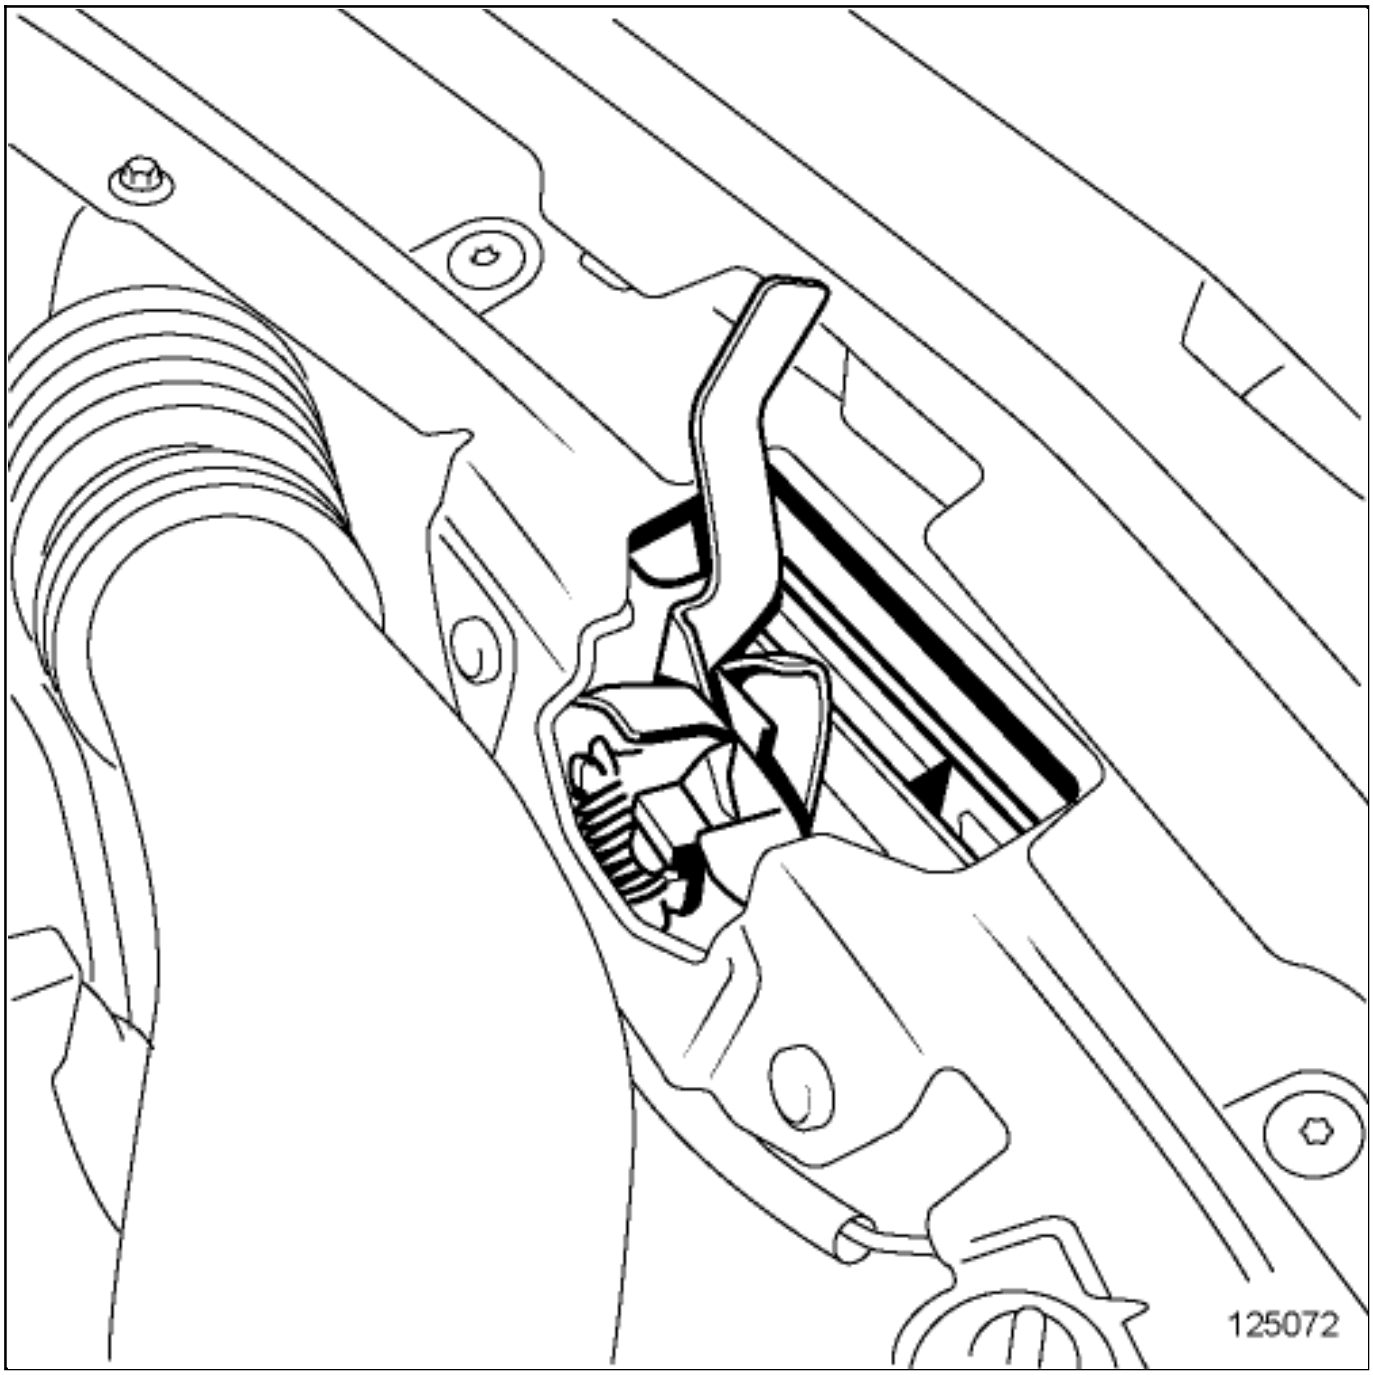
This inspection contributes to the validity of the anticorrosion warranty. It is therefore necessary to complete the maintenance sheets in the maintenance booklet.



2- BODYWORK: CLEANING THE DEFLECTOR ARMS AND PANORAMIC SUNROOF MOBILE PANEL

Use a dry, lint-free cloth to clean the sunroof deflector arms (1) and the section of the mobile panel with which they come into contact.

3- BODYWORK: CHECKING THE BONNET LOCK LUBRICATION AND OPERATION



1)GUILLOTINE TYPE LOCK

As specified in the photo above, apply silicone-free lubricant Vehicle: Parts and consumables for the repair (04B, Consumables - Products), placing it between the body of the lock (2) and the lock blade (3) in the direction of the lock blade hinge shaft (4).

Let it set for1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

2)OTHER TYPES OF LOCK

Apply silicone-free lubricant[Vehicle: Parts and consumables for the repair](04B, Consumables - Products) to the catch assembly.

Let it set for1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

4- GREASING OF THE REAR DOOR HINGES AND THE UPPER STRIKER PANEL HOOK OF THE SLIDING SIDE DOOR(MASTER II PHASE 3)

Apply opening element greaseto the rear door hinges and the upper striker panel hook of the sliding side door (see **Vehicle: Parts and consumables for the repair**)

5- ENGINE: DRAINING THE ENGINE OIL

The oil grade is essential for maintaining the service life of the engine. Carefully follow the manufacturer's recommendations specified in the Technical Note**Engine oil: Specifications** (Technical Note 6013A, 04A, Lubricants).

Use the correct quantity of oil and the correct sump plug sealing washer**Engine oil: Draining - Refilling** (10A, Engine and peripherals).

After topping up, let the oil run for approximately 10 minutes before checking the level. The oil level maximum mark on the dipstick must never be exceeded (risk of damage to the engine).

6- ENGINE: REPLACING THE OIL FILTER

Replace the engine oil filter after each oil service**Oil filter: Removal - Refitting** (10A, Engine and peripherals).

7- ENGINE: CHECKING THE EXHAUST SYSTEM

☐ Visually inspect:

- that there is no corrosion, piercing or impact to the silencer, expansion chamber, catalytic converter and particle filter*,
- that the rubber mounting bushes are not torn or cracked,
- that the exhaust pipe is not in contact with the underside of the vehicle.

8- ENGINE: BLEEDING WATER FROM THE FUEL FILTER* (IF THE PART HAS NOT REACHED ITS REPLACEMENT INTERVAL)

Bleed the water from the fuel filter by unscrewing the water bleed cap and letting the water run into a suitable container.

9- ENGINE: CHECKING THE CLUTCH PLAY* FOR LOGAN-SANDERO (EXCEPT FOR AUTOMATIC COMPENSATION)

(Logan and Sandero only) Use the recommended checking procedure**Clutch control: Adjustment** (37A, Mechanical component controls).

10- CHECKING THE LEVELS, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC POWER-ASSISTED STEERING*

Check the hydraulic steering fluid level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

11- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: COOLING

Check the coolant level: it should be between the minimum and maximum level on the reservoir.

Visually check the circuit sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

12- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC BRAKE/CLUTCH*

Visually check the circuit sealing, checking the condition and that there are no leaks around the engine compartment, under the vehicle or at the unions.

- Check the brake fluid level:
  - If the level is between the minimum and maximum, do not add brake fluid as wear on the discs, pads, drums and linings leads to a progressive drop in the brake fluid level in the tank which will usually be rectified once these components are replaced. However, the brake fluid level should never drop below the minimum mark.
  - If there is an abnormal loss of fluid, the cause of which cannot be found with this check, advise the customer.

13- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC UNIT*

Check the hydraulic unit oil level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

14- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC CLUTCH*

Check the hydraulic clutch fluid level, it should be at the middle level of the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

15- CHECKING THE CHASSIS: CONDITION OF THE GAITERS, RUBBER MOUNTING BUSHES AND BALL JOINTS

Check the condition of the driveshaft and steering rubber gaiters, all ball joints and the rubber mounting bushes. There must not be any signs of tearing or cracks.

16- CHECKING THE CHASSIS: TYRE CONDITION AND PRESSURE (INCLUDING EMERGENCY SPARE WHEEL OR PRESENCE OF TYRE-REPAIR AEROSOL)

Check that the tread depth of the tyres has not reached the wear warning strips, explain the degree of tyre wear to the customer.

Check that there is no abnormal tyre wear, and no bulges, blisters, tears or foreign objects (sharp object, screw, etc.).

Check and readjust the tyre inflation pressure when cold according to the type of driving.

Check the pressure and condition of the emergency spare wheel, or if not supplied with the vehicle, check that there is a tyre repair aerosol in the vehicle.

Respect the recommended pressure shown on the label on the door (if the vehicle does not have one, refer to the Driver's Handbook or.

17- CHECKING THE CHASSIS: PRESENCE OF THE WHEEL VALVE CAPS

Check that each valve cap is present.

18- CHECKING THE CHASSIS: SEALING OF THE FRONT AND REAR SHOCK ABSORBERS

Visually check that there is no oil leaking along the length of the shock absorbers.

19- CHECKING THE CHASSIS: WEAR OF THE FRONT AND REAR BRAKE PADS AND BRAKE DISCS*, AND SWAPPING THE FRONT AND REAR WHEELS

In order to perform a quality check, always remove the wheels (an electric impact wrench or a pneumatic wrench can be used to loosen the wheel bolts and nuts).

Check the thickness of the brake pads and compare to the minimum authorised value. In case of partial wear, advise the customer of the degree of wear to the brake pads.

Check the thickness of the front brake discs and the thickness of the rear brake discs and compare to the minimum authorised value. In case of partial wear, advise the customer of the degree of wear to the brake discs.

Refit the wheels. For Duster 4X4, swap the front and rear wheels.

When refitting the wheels, an electric impact wrench set at low speed can be used to fit the wheel bolts and nuts until contact, then torque tighten them.

20- CHECKING VISIBILITY: EXTERIOR LIGHTING AND SIGNALS

Check the side lights, dipped headlights, main beam headlights, front and rear fog lights, the direction

indicators and side mounted indicators, the reversing lights, the hazard warning lights, the brake lights, the registration plate lighting and the additional cornering lights*.

21- CHECKING VISIBILITY: INTERIOR LIGHTING

Checking door lighting, interior lights and sun visors, glovebox and luggage compartment lights.

22- CHECKING VISIBILITY: CONDITION OF THE WINDSCREEN AND DOOR MIRRORS

Check that there are no cracks or chips.

23- CHECKING VISIBILITY: WEAR ON THE FRONT AND REAR WINDSCREEN WIPER BLADES

Check the quality of the wiping function and check that the wiper blades are not torn or cracked.

24- CHECKING VISIBILITY: FRONT AND REAR WINDSCREEN WASHER FLUID LEVEL

Check that there is windscreen washer fluid present.

Top up, if necessary.

25- LABELS: CHECKING THE AIRBAG SAFETY AND ENGINE COMPARTMENT LABELS ARE PRESENT AND CORRECTLY POSITIONED

☐ Check that the vehicle has the following original safety labels:

- airbag, located on the windscreen, sun visor and passenger side of the dashboard,
- battery, oil, cooling system, heating and air conditioning system, engine cooling fan located in the engine compartment.

26- ELECTRONIC CHECK: BATTERY

Check the condition of the battery with the tool "Midtronics R330".

27- ELECTRONIC CHECK: COMPUTERS

Note:

Always check the condition of the battery before checking the computers as insufficient voltage can affect the computers.

The purpose of this procedure is to see if any of the computers are faulty.

The following tools are essential for carrying out fault finding on these systems:

- an approved Renault Electronic check tool(QUEST) with the latest update,
- an approved Renault Diagnostic tool(CLIP) with the latest update,
- a CAN probe.

Running fault finding on the computers highlights possible faults not displayed by the system self-test procedure, and allows them to be analysed and deleted

28- CHECKING CHARGING CORD (ONLY TWIZY):

Visually check the charging cord without removing.

29- CHECKING ELECTRIC VEHICLE (ONLY KANGOO AND FLUENCE):

Electronic check :

Select the symptome in MCS (Modulate Targeting Symptome): R201, integrate it into the order of repair.

Make a electronic check of computers, see "Electronic check : computers".

Make the checks of symptome R201: "Maintenance Range".

NB :

Do not control the system Quick Dropbecause it is canceled.

30- ELECTRONIC FAULT FINDING: OPERATION OF THE INSTRUMENT PANEL WARNING LIGHTS

Check that the following warning lights come on when the ignition is switched on:

- STOP warning light,
- SERVICE warning light.

31- REINITIALISATION: MAINTENANCE/OIL SERVICE DISPLAY*

Reset the maintenance/oil service interval display (see Driver's Handbook).

32- SERVICE SHEETS: AFFIXING THE SERVICE LABEL IN THE ENGINE COMPARTMENT*

Fill in the maintenance label and affix it in the engine compartment.

5. SUPPLEMENTARY OPERATIONS:

The removal and refitting procedures and some of the checks to be carried out during maintenance are set out in the repair manuals or the technical notes. The information and repair methods given below are specific to the maintenance programme.

For an exhaustive description of the operations to be carried out during the maintenance operation, refer to the vehicle maintenance booklet.

1- REPLACEMENT OF THE ACCESSORIES BELT, ROLLERS, AND PULLEYS (PULLEY TO BE REPLACED DEPENDING ON THE VEHICLE)

When replacing the belt, it is essential to replace the tensioning rollers and fixed rollers across the whole range. It is also necessary to replace the damper pulley (also known as the crankshaft accessories pulley) or the alternator pulley on certain engines, see below.

Table of pulleys to be replaced during maintenance only according to the accessories belt replacement frequency. The vehicles concerned are those for which the maintenance booklets mention a replacement for certain engines. The detail of the vehicle variants concerned is given below (vehicles manufactured after June 2006):

1)FOR GERMANY, ANDORRA, AUSTRIA, BELGIUM, DENMARK, SPAIN, ESTONIA, FINLAND, FRANCE, GREAT BRITAIN, GREECE, HUNGARY, IRELAND, ICELAND, ITALY, LATVIA, LIECHTENSTEIN, LITHUANIA, LUXEMBOURG, NORWAY, NETHERLANDS, POLAND, PORTUGAL, CZECH REPUBLIC, SLOVAKIA, SLOVENIA, SWEDEN, SWITZERLAND, CROATIA, ISRAEL:

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley during maintenance operations
F4R	714, 715, 720, 760, 761, 762, 763, 764, 765, 766, 767, 770, 771, 774, 776, 784, 786, 787, 792, 794, 795, 796, 797, 800, 811, 820, 830, 867, 870, 886, 887, 896, 897.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
M9R	610, 700, 720, 721, 722, 740, 760, 761, 780, 812.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	
V9X	All	

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	802, 813.	To be replaced each time the accessories belt and its rollers are scheduled for replacement

2)OTHER COUNTRIES:

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley
K4J equipped with air conditioning	730, 732, 740, 770, 780.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
K4M equipped with air conditioning	604, 606, 680, 690, 694, 696, 697, 698, 716, 744, 745, 760, 761, 762, 764, 766, 768, 770, 780, 782, 788, 790, 791, 794, 800, 801, 804, 812, 813, 814, 824, 830, 831, 834, 835, 844, 854, 856, 862, 866.	
K4M equipped with air conditioning	838, 839, 848, 858	To be replaced every other time the accessories belt and its rollers are scheduled for replacement
K9K	782	

F4R	714, 715, 720, 760, 761, 762, 763, 764, 765, 766, 767, 770, 771, 774, 776, 784, 786, 787, 792, 794, 795, 796, 797, 800, 811, 820, 830, 867, 870, 886, 887, 896, 897.	To be replaced each time the accessories belt and its rollers are scheduled for replacement
K9K	278, 282, 288, 292, 732, 734, 764, 772, 780, 804, 806, 832, 836.	
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 794, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	
M9R	610, 700, 720, 721, 722, 740, 742, 760, 761, 780, 812.	
V9X	All	
M9R	802, 803, 805, 809, 816, 830, 832, 833.	To be replaced every other time the accessories belt and its rollers are scheduled for replacement
M9T	All	To be replaced every other time the accessories belt and its rollers are scheduled for replacement

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	802, 813	To be replaced each time the accessories belt and its rollers are scheduled for replacement

2- REPLACING THE TIMING BELT AND ROLLERS

When replacing the belt, it is essential to replace the tensioning and fixed rollers across the whole range. Certain vehicle/engine specifications require associated parts to be replaced, therefore it is necessary to consult the repair procedure for the vehicle and engine for further details.

3- CHECKING THE REAR BRAKE LININGS FOR VEHICLES FITTED WITH DRUMS

Check the wheel cylinders for any possible leaks.

Remove any dust from the brake linings using a brake cleaning product.

Check the thickness of the drum linings and compare it to the minimum authorised thickness..

4- CLEANING THE AIR CONDITIONING SYSTEM

The air conditioning system is cleaned by cleaning the evaporator.

6. STANDARD OF PROFESSIONAL ACTIVITY

The Standard of Professional Activity is a tool which describes the operation to perform in an optimised order favouring time and quality. This way of working allows for the elimination and reduction of unnecessary actions, the grouping together of operations by operation area and a reduction in down time.

Order of performance	Principal steps	Key points
Preparing the vehicle:		
1	Consult the repair order and ICM editions to find out:- The works to be performed and additional operations- The presence of OTS	
2	Check that the driver's protections are in place (front seat, steering wheel, floor carpet, gear lever)	
3	Check for the maintenance booklet and the wheel anti-theft key (if equipped) on the passenger seat	
4	Check the instrument panel warning lights with the ignition on	Warning light (STOP and SERVICE)
5	Start the vehicle and check that all the warning lights go out	No warning light lit
6	Move the vehicle to the workstation, leave the engine running	
Passenger compartment checks:		
7	Step out of the vehicle and connect the exhaust gas extraction system	

8	❑ Check the exterior signals and lights: ■ Side lights, ■ Dipped headlights, ■ Main beam headlights, ■ Front and rear fog lights, ■ direction indicators and side mounted indicators, ■ Front and rear hazard warning lights, ■ Brake lights, ■ number plate lighting, ■ Reversing lights, ■ Additional cornering lights,	Use a mirror If not done whilst walking around the vehicle
9	❑ Check the interior lighting: ■ Courtesy lights, ■ Sun visors, ■ Glovebox.	
10	Release the bonnet, and remove the diagnostic socket cover	
11	Reset the distance before oil change/maintenance display	
12	Switch off the engine and switch on the ignition again	
13	Step out of the vehicle, take the wheel anti-theft key	
Front visibility check:		
14	Check the condition of the windscreen wiper blades	
15	Check the condition of the windscreen	
Engine compartment checks:		
16	Open the bonnet	

17	Run fault finding on the battery with the "MIDTRONICS R330" tool.	
18	Grease the bonnet catch using silicone-free lubricant	
19	Go back into the passenger compartment, switch on the ignition and connect the Diagnostic tool "Clip" or Electronic check tool "Quest" and run the computer scan	
20	Release the bonnet 10 times using the control in the driver's position	
21	Check the levels and sealing of the hydraulic circuits in the engine compartment: ■ the coolant circuit, ■ of the hydraulic power-assisted steering circuit (depending on the version), ■ of the brake fluid and clutch circuit (depending on the version), ■ hydraulic unit of the sequential gearbox (depending on the version).	Do not top up the brake fluid level
22	Check the washer fluid level.	
23	Remove the oil filler cap	
24	Loosen the oil filter if accessible from above.	
25	Check the clutch clearance (Logan version)	
26	Bleed the water from the fuel filter (if accessible)	Bleed the fuel filter if it has not reached its replacement interval

27	Check for the presence of the "Manufacturer's Recommendations" label located in the engine compartment	The "manufacturer's recommendations" labels include: oil, battery, cooling circuit, fan, air conditioning.
Check the condition of the bodywork on the driver's side:		
28	Check the lighting of the front door sill	
29	Read and retain the tyre pressure	
30	Check the condition of the rear view mirror	
31	Visually inspect the condition of the bodywork	
32	Check the lighting of the rear door sill (if equipped)	
33	Position the arms or pads of the lift (depending on the type of lift)	
34	Take the pressure gauge (if it is not present in the kit)	
Rear vehicle checks:		
35	Check the lighting of the luggage compartment	
36	Check the level of wear of the emergency spare wheel (if accessible through the luggage compartment)	
37	Check the pressure and the presence of the valve cap	

38	Check the condition of the rear screen wiper blade	
Check the condition of the bodywork on the passenger's side:		
39	Visually inspect the condition of the bodywork	
40	Check the lighting of the rear door sill	
41	Check the lighting of the front door sill	
42	Check the presence of the airbag label on the passenger's side	
43	Check the condition of the rear view mirror	
44	Position the arms or pads of the lift (depending on the type of lift)	
Computer checks		
45	Record the scan results of Diagnostic tool "Clip" or Electronic check tool"Quest"	
46	Disconnect the Diagnostic tool"Clip" or Electronic check tool "quest"	
Panoramic sunroof check		
47	Clean the arms of the sunroof deflector and the section of the mobile panel which comes into contact with them (if equipped)	
48	Raise the vehicle to chest height	

Check on driver's side front wheel		
49	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
50	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
51	Check the level of brake pad wear	Note the degree of wear on the test certificate
52	Check the brake disc wear	
53	Check the condition of the brake hose	
54	Check the condition of the rubber mounting bushes and suspension arm ball joint	
55	Check the sealing of the shock absorber	
56	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
57	Check the condition of the driveshaft gaiters and steering gaiters	
58	Check the level of power-assisted steering fluid (Laguna 3)	
Check on driver's side rear wheel:		
59	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	

60	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
61	Check the level of wear of the brake pads, depending on the version	Note the degree of wear on the test certificate
62	Check the brake disc wear (if equipped)	
63	Check the condition of the brake hose	
64	Check the sealing of the shock absorber.	
65	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
Check on passenger's side rear wheel:		
66	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
67	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
68	Check the level of wear of the brake pads, depending on the version	Note the degree of wear on the test certificate
69	Check the brake disc wear (if equipped)	
70	Check the condition of the brake hose	
71	Check the sealing of the shock absorber.	

72	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
Check on passenger's side front wheel		
73	Check the level of wear of the tyre + presence of foreign bodies (blisters, tears, foreign objects)	
74	Remove the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
75	Check the level of brake pad wear	Note the degree of wear on the test certificate
76	Check the brake disc wear	
77	Check the condition of the brake hose	
78	Check the condition of the rubber mounting bushes and suspension arm ball joint	
79	Check the sealing of the shock absorbers.	
80	Check for corrosion on wheel arch, the condition of the spring, shock absorber cups and shock absorber	
81	Check the condition of the driveshaft gaiters and steering gaiters	
82	Bleed the water in the fuel filter (if accessible through wheel arch) according to the maintenance programme)	

83	Raise the vehicle to the upper position	
Underbody operations		
84	Remove the protection plate underneath the engine and position the oil collector	
85	Remove the drain plug	Let the oil flow for 10 minutes
86	Remove the oil filter (version accessed from underneath)	
87	Check the exhaust system: Corrosion, contact with body and condition of the rubber mounting bushes	
88	Check the condition of the catalytic converter	
89	Check the condition of the spring, shock absorber cups and shock absorber on the right-hand and left-hand sides (if accessible from underneath)	
90	Check the condition of the underbody brake pipes	
91	Check the condition and pressure of the emergency spare wheel (if accessible from underneath)	
92	☐ Check the engine components using a lamp: ■ Cooling system hoses, ■ Coolant pump, ■ Engine block, ■ Turbocharger	

93	Parts are supplied using Dialogys and the physical values should be noted (tightening torque, oil grade and quantity)	
94	Refit the new oil filter (if accessible)	Lubricate the seal, tighten to torque depending on the model
95	Refit the drain plug	With new seal and according to recommended part number, for copper seals, the lips should be on the plug side (panel cover) Torque tighten depending on the model
96	Clean the oil residues	
97	Drain the oil collector.	
	Supplementary operation: replacement of fuel filter	See ICM/Maintenance booklet
98	Refit the protection plate underneath the engine	
99	Read the tyre pressure on the label on the driver's side door (if equipped)	Pressure to be applied depends on customer's driving type
100	Lower the vehicle to chest height	
Operations on driver's side front wheel		
101	Refit the wheel	**Wheel: Removal - Refitting** (35A, Wheels and tyres)

102	Check the tyre pressure and the presence of the valve cap	
Operations on driver's side rear wheel		
	Supplementary operation: remove dust and check the drum brake (if equipped)	See ICM/Maintenance booklet
103	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
104	Check the tyre pressures and the presence of the valve cap	
Operations on passenger's side rear wheel		
	Supplementary operation: remove dust and check the drum brake (if equipped)	See ICM/Maintenance booklet
105	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)
106	Check the tyre pressures and the presence of the valve cap	
Operations on passenger's side front wheel		
	Remove - refit diesel filter (depending on the version)	See ICM/Maintenance booklet
107	Refit the wheel	Wheel: Removal - Refitting (35A, Wheels and tyres)

108	Check the tyre pressures and the presence of the valve cap	
109	Lower the vehicle to the low position	
Operations in the engine compartment		
110	Refit the new oil filter (if accessible)	Lubricate the seal, tighten by hand or to torque depending on the model
111	Fill the engine oil	Respect the grade and quantity of engine oil.
112	Replace the oil filler cap	
	Supplementary operation: replacement of diesel filter (depending on the version)	See ICM/Maintenance booklet
	Supplementary operation: replacement of fuel filter (depending on the version)	See ICM/Maintenance booklet
	Supplementary operation: replacement of air filter	See ICM/Maintenance booklet
	Supplementary operation: replacement of spark plugs	See ICM/Maintenance booklet
	Supplementary operation: replacement of brake fluid	See ICM/Maintenance booklet
	Supplementary operation: replacement of coolant	See ICM/Maintenance booklet
	Supplementary operation: replacement of accessories belt and rollers	See ICM/Maintenance booklet

	Supplementary operation: replacement of damper pulley/alternator pulley (depending on the version)	See Technical Note 6018/Maintenance booklet
	Supplementary operation: replacement of timing belt and rollers	See ICM/Maintenance booklet
	Supplementary operation: check and clean air conditioning system	See ICM/Maintenance booklet
	Supplementary operation: replacement of cabin filter (depending on the version)	See ICM/Maintenance booklet
Internal vehicle operation		
113	Start the vehicle	
114	Switch off the ignition	
	Supplementary operation: replacement of cabin filter (depending on the version)	See ICM/Maintenance booklet
Wheel torque tightening		
115	Consult the tightening torque in the technical documentation	
116	Torque tighten the front wheel on the driver's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
117	Torque tighten the rear wheel on the driver's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
118	Torque tighten the rear wheel on the passenger's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.

119	Torque tighten the front wheel on the passenger's side and refit the trim (if equipped)	Refitting the trim confirms the tightening operation.
Administrative operations		
120	Fill in the test certificate	
121	Indicate, according to the degree of importance, the next works to be performed in order to ensure vehicle conformity.	
Final inspection in the engine compartment:		
122	Fill in and position the maintenance label	
123	After waiting at least 10 minutes after the last top-up or starting the engine, check the oil level using the dipstick	
124	Top up if necessary	
125	Clean the engine cover and the battery cover	

MAINTENANCEVALUES:DESCRIPTION

Special tooling required	
Brake calliper piston return tool.	Fre. 1190-01
14 mm Plug spanner.	Ele. 1382-01
8 mm square engine drain plug spanner.	Mot. 1018
Torque wrench for spark plugs	Ele. 1933

1. ENGINE MAINTENANCE SUMMARY

Note:

(*) The engine oil grade and viscosity only applies to the following countries:

Germany, Andorra, Austria, Belgium, Denmark, Spain, Estonia, Finland, France, Great Britain, Greece, Hungary, Ireland, Iceland, Italy, Latvia, Liechtenstein, Lithuania, Luxembourg, Norway, Netherlands, Poland, Portugal, Czech Republic, Slovakia, Slovenia, Sweden, Switzerland, Croatia, Israel.

Important: for vehicles in countries which are not listed above, please refer to Technical Note 6013AEngine oil: Specifications .

OIL	Engine oil grade (*)	RN0720
	Oil viscosity (*) depending on external temperature	t > -20˚C 5W30 or 5W40 t > -25˚C 5W30 or 5W40 t > -30˚C 0W30 or 0W40
	Engine oil capacity with oil filter replacement	4.7 litres

DRAIN PLUG	Tool	8 mm square engine drain plug spanner.(Mot. 1018)
	Tightening torque	50 N.m
OIL FILTER	Tool	27 mm spanner
	Other tightening	25 N.m

PLUG	Tool	14 mm Plug spanner.(Ele. 1382-01) Torque wrench for spark plugs(Ele. 1933)
	Tightening torque	24 N.m
	Electrode gap	0.7 + 0 / - 0.1 mm Not adjustable
COIL	Tightening torque	10 N.m

2. CHASSIS MAINTENANCE SUMMARY

WHEELS	Tightening torque	105 N.m

BRAKE FLUID	Brake fluid grade	DOT 4, ISO CLASS 6, RENAULT Standard: 03-50-006

FRONT BRAKES

Tools	Tool	Brake calliper piston return tool.(Fre. 1190-01)
Tightening torques	Front disc bolts	20 N.m
	Front guide pin bolts	27 N.m
	Front calliper support bolts	105 N.m

Measurement	Front disc diameter	258 mm
	Minimum front brake disc thickness	19.8 mm
	Minimum front brake pad thickness	10 mm

REAR BRAKES

Tightening torque	Rear drum nut	175 N.m
Measurement	Rear drum diameter	203.2 mm
	Maximum rear drum diameter	204.4 mm
	Minimum rear lining thickness	2.4 mm

MANUALGEARBOXOIL:SPECIFICATIONS

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions**Vehicle: Precautions for the repair** .

1. GEARBOX TYPE/OIL TYPE CORRELATIONS:

GEARBOX TYPE	TYPE OF OIL FOR GEARBOX
JBX JCX JEX JRX JHX JSX NDX TLX	TRANSELF TRJ 75W80 or TRANSELF NFJ 75W80
PKX PFX VMX NEX NGX N0X UNX	TRANSELF TRX 75W80 or TRANSELF NFP 75W80
ZFX	TRANSELF LD 75W80

Component identification:

The third character Xcorresponds to the figure written on the identification plate and therefore covers the entire manual gearbox range.

2. STANDARDS AND PART NUMBERS OF THE VARIOUS RECOMMENDED OILS:

DESIGNATION	STANDARD	PART NUMBER
TRANSELF TRX 75W80 or TRANSELF NFP 75W80	APIGL4, MIL-L-2105 C or D	7711573523 (5 litres)
TRANSELF TRJ 75W80 or TRANSELF NFJ 75W80	APIGL4, MIL-L-2105 C or D	7711226421 (1 litre)
TRANSELF LD 75W80	APIGL4, MIL-L-2105	May be ordered from ELF

3. IDENTIFICATION OF OIL FOR STANDARD EXCHANGE PK1 GEARBOXES:

Note:

For standard exchange PK1 gearboxes, the oil type (TRZ or TRP) is shown on a label.

These two oils are replaced by TRX 75W80 or NFP 75W80.

MANUAL GEARBOX: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

1. SAFETY

1- GENERAL INFORMATION

This method provides information which will allow you to:

- acquire good knowledge of the component on which you will be working,
- benefit from the best repair conditions,
- obtain optimum component operation and meet customer requirements,
- optimise component repair time.

It is worth taking the time to read this method as you will gain time later on during the repairs.

1)GENERAL RECOMMENDATIONS

Observe basic principles of vehicle repair.

The quality of repair depends first and foremost on the care exercised by the person in carrying it out.

Carry out the operation on the component on a clean working area.

To ensure good repair:

- use the recommended consumables Vehicle: Parts and consumables for the repair ,

- use the recommended tools,
- observe the tightening torques,
- observe the recommendations for parts that should always be replaced after removal, refitting or replacement operations,
- clean and degrease the sections to be bonded, to ensure they bond correctly.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

Use professional products and apply them with care, for example do not apply too much sealing paste to the sealing surface to prevent damaging the component.

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid may cause damage to some components.

Observe the chronological order of the steps:

- remove the component,
- clean the component before repairing,
- remove the part(s) concerned

- check the part(s) removed,
- replace faulty part(s) with new part(s),
- perform the necessary adjustments and/or settings so that the component operates correctly,

observe the tightening torques.

Note:

To prevent any pollution and to ensure the quality of the repair, it is strictly forbidden to reuse the drained gearbox oil.

Note:

Ensure sure that the parts removed match up and ensure that they are refitted in the correct order.

2)SPECIAL TOOLING

Use suitable tools which are in good condition (use of "multi-purpose" tools, such as adjustable pliers, etc., should be avoided wherever possible).

For good quality repairs and for working in safe conditions, use only special tooling.

3)SAFETY

Equipment risks:

- The "Note" heading used in the description of the method indicates that particular care should be taken for the operation described.
- The "Important" heading used in the description of the method indicates that there is a risk of damage to the component.

Working safely:

- The "Warning" heading used in the description of the method indicates that particular care should be taken for the operation described and that there is a human risk,
- use supports and adopt a correct posture when performing heavy work or raising loads,
- check that the working area is clean and tidy during the operation,
- use personal protection (gloves, goggles, work shoes, masks, skin protection, etc.),
- do not use harmful products in unventilated rooms,
- do not ingest any chemicals (brake fluid, coolant, etc.).

Respecting the environment:

- sort waste according to its particular qualities,
- do not burn discarded products (tyres, etc.).

4)CONCLUSION

Respecting the recommended methods will guarantee the best performance and reliability of the component.

MASKING : DESCRIPTION

Note:

The vehicle must be clean and degreased with surface cleaner before masking Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

- Procedure 1 : masking for painting an opening element,
- Procedure 2 : masking for painting an opening element and a rear wing panel,
- Procedure 3 : masking for painting a roof,
- Procedure 4 : masking the windows.

Note:

The interior of the components to be painted must be masked to prevent paint fog and dust from the spray gun pressure being deposited on them.

1. PROCEDURE 1: MASKING FOR PAINTING AN OPENING ELEMENT

Put the opening element in the open position.

Apply half of the 50 mm(1) masking tape, inside the component perimeter, leaving the other half sticking out.

Block the holes accessible from the interior with 25 mm masking tape (for example, windscreen jets, protective moulding and badges).

Close the opening element.

Fix the part of masking tape(2) that sticks out on the adjacent component with 19 mm masking tape.

Mask the whole vehicle with a cover (disposable or reusable plastic).

Continue with the masking of the vehicle. Use the most suitable dimensions for the components to be protected (paper, plastic).

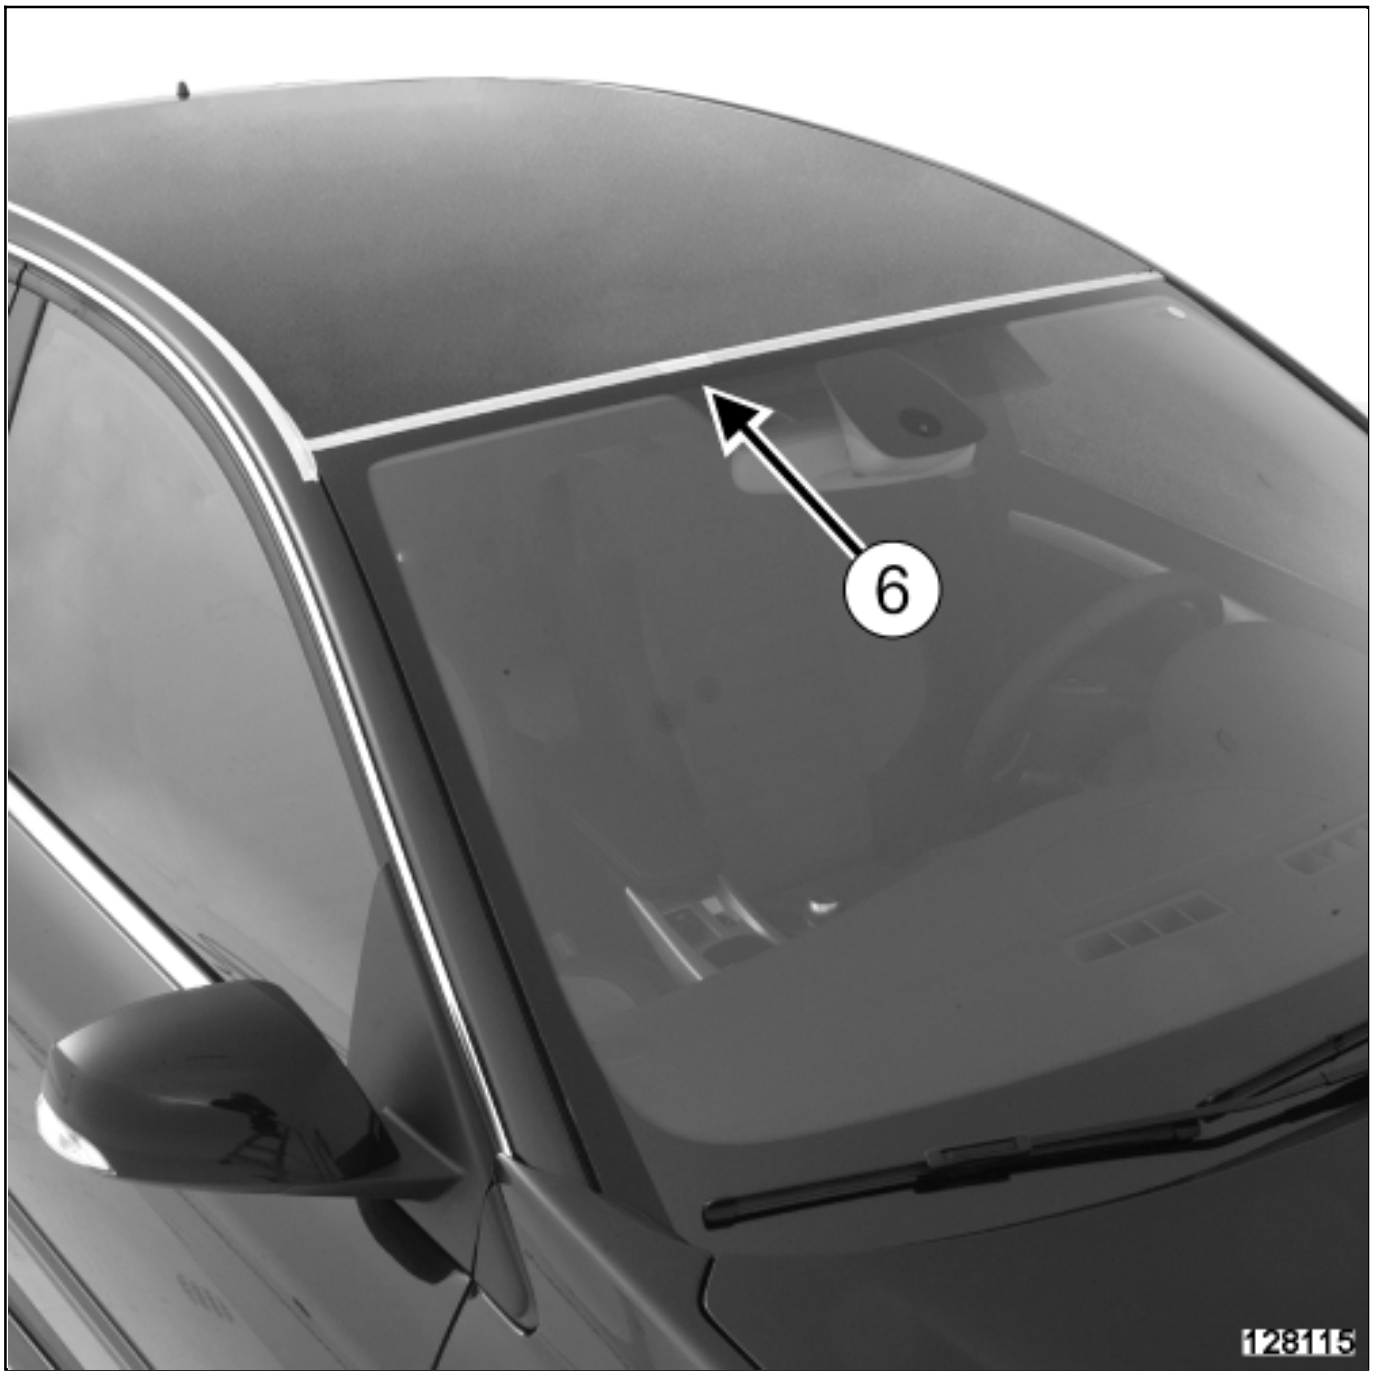
2. PROCEDURE 2: MASKING FOR PAINTING A DOOR AND A REAR WING

Open the side door.

Apply the 19 mm foam tape(3) , inside the rear wing.

Close the door while checking that the foam seals completely.

Put 50 mm masking tape(4) , on the wing inside the wheel arch.

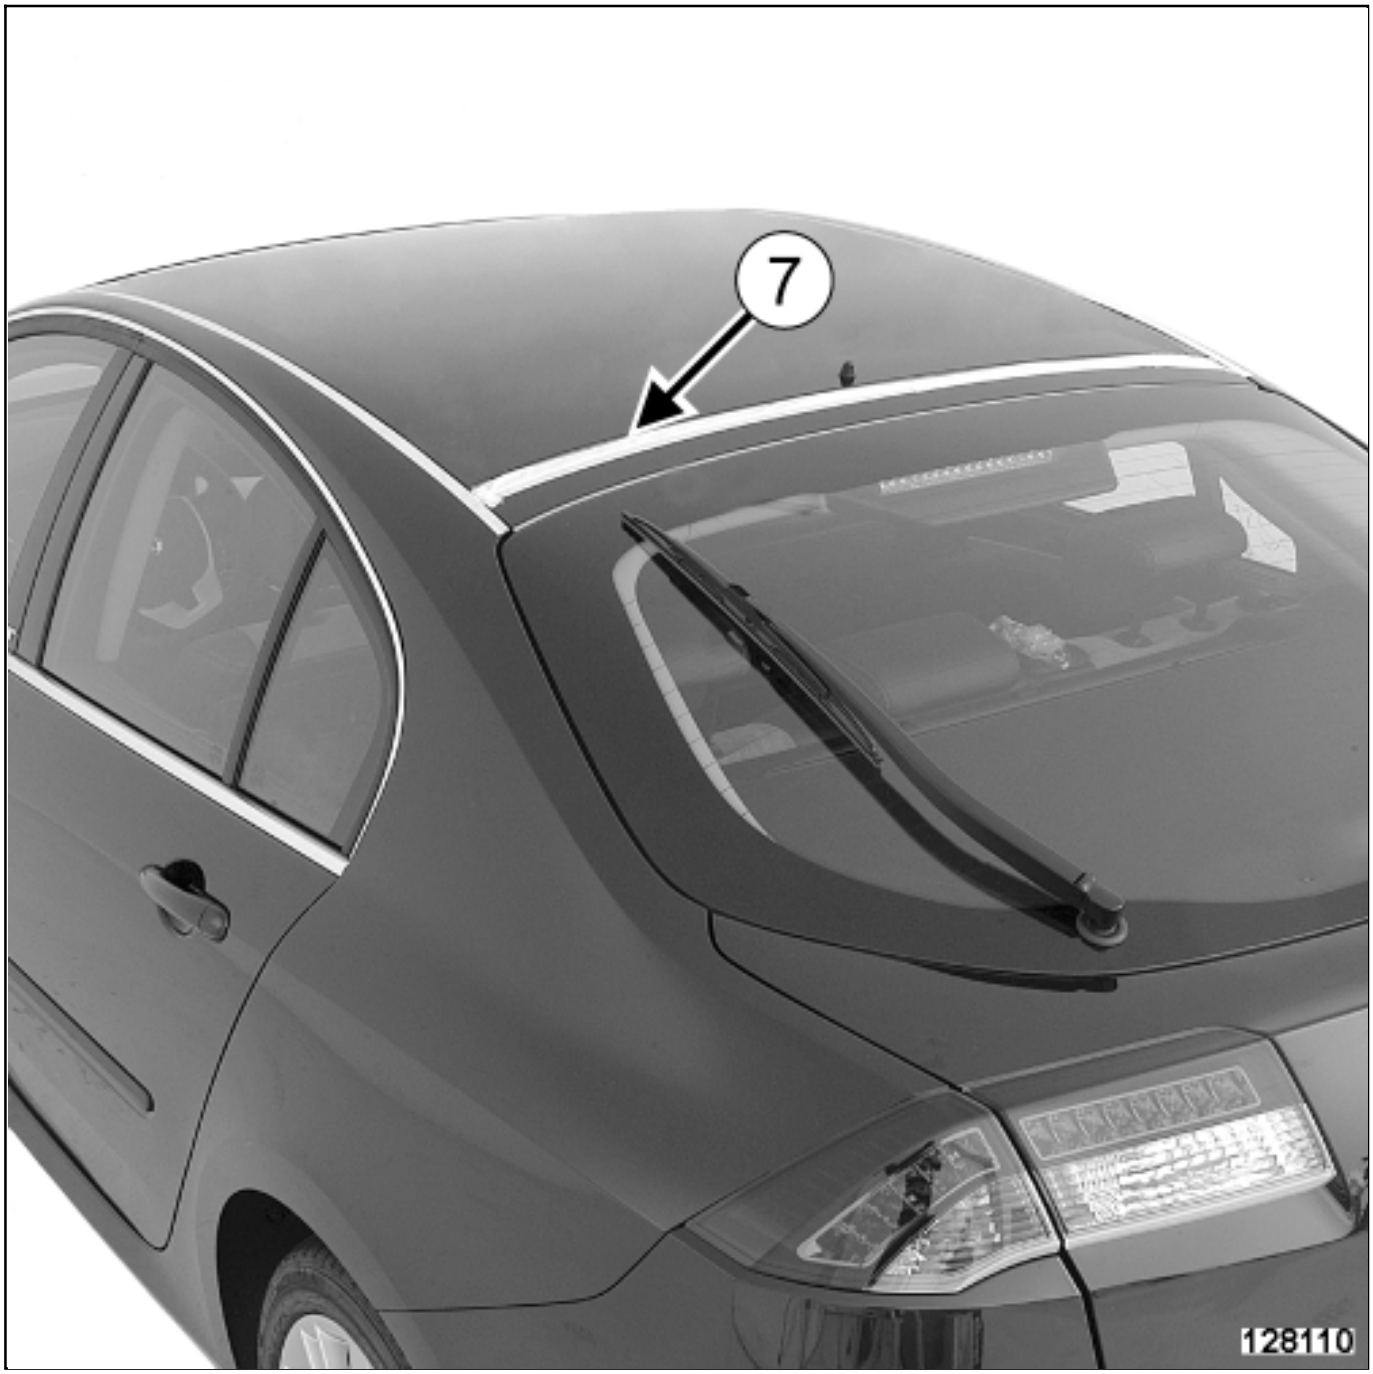


Continue protecting the wheel with paper(5) fixed to the part of the masking tape that sticks out.

Mask the whole vehicle with a cover (disposable or reusable plastic).

Continue with the masking of the vehicle. Use the most suitable dimensions for the components to be protected (paper, plastic).

3. PROCEDURE 3: MASKING FOR PAINTING A ROOF

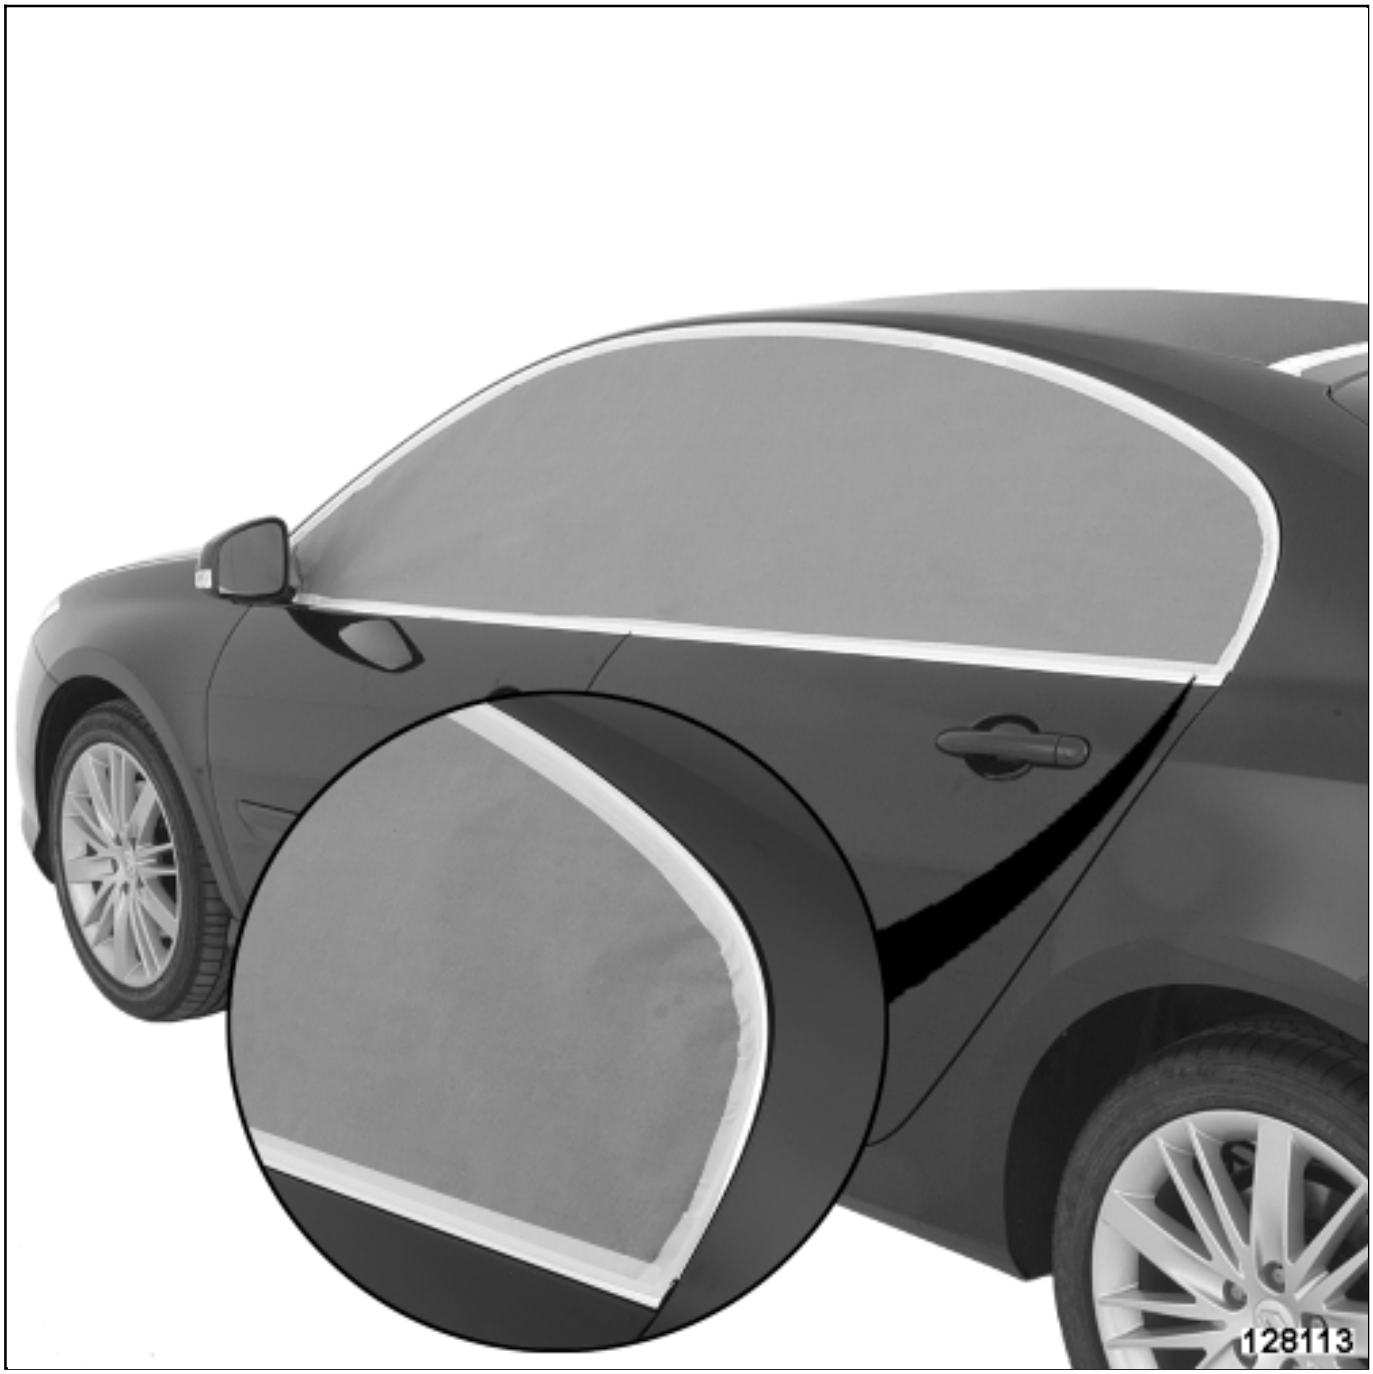


Apply the special tape(6) , by sliding the rigid part of the tape inside the windscreen seal beforehand.

Vehicle: Parts and consumables for the repair (04B, Consumables - Products)

Note:

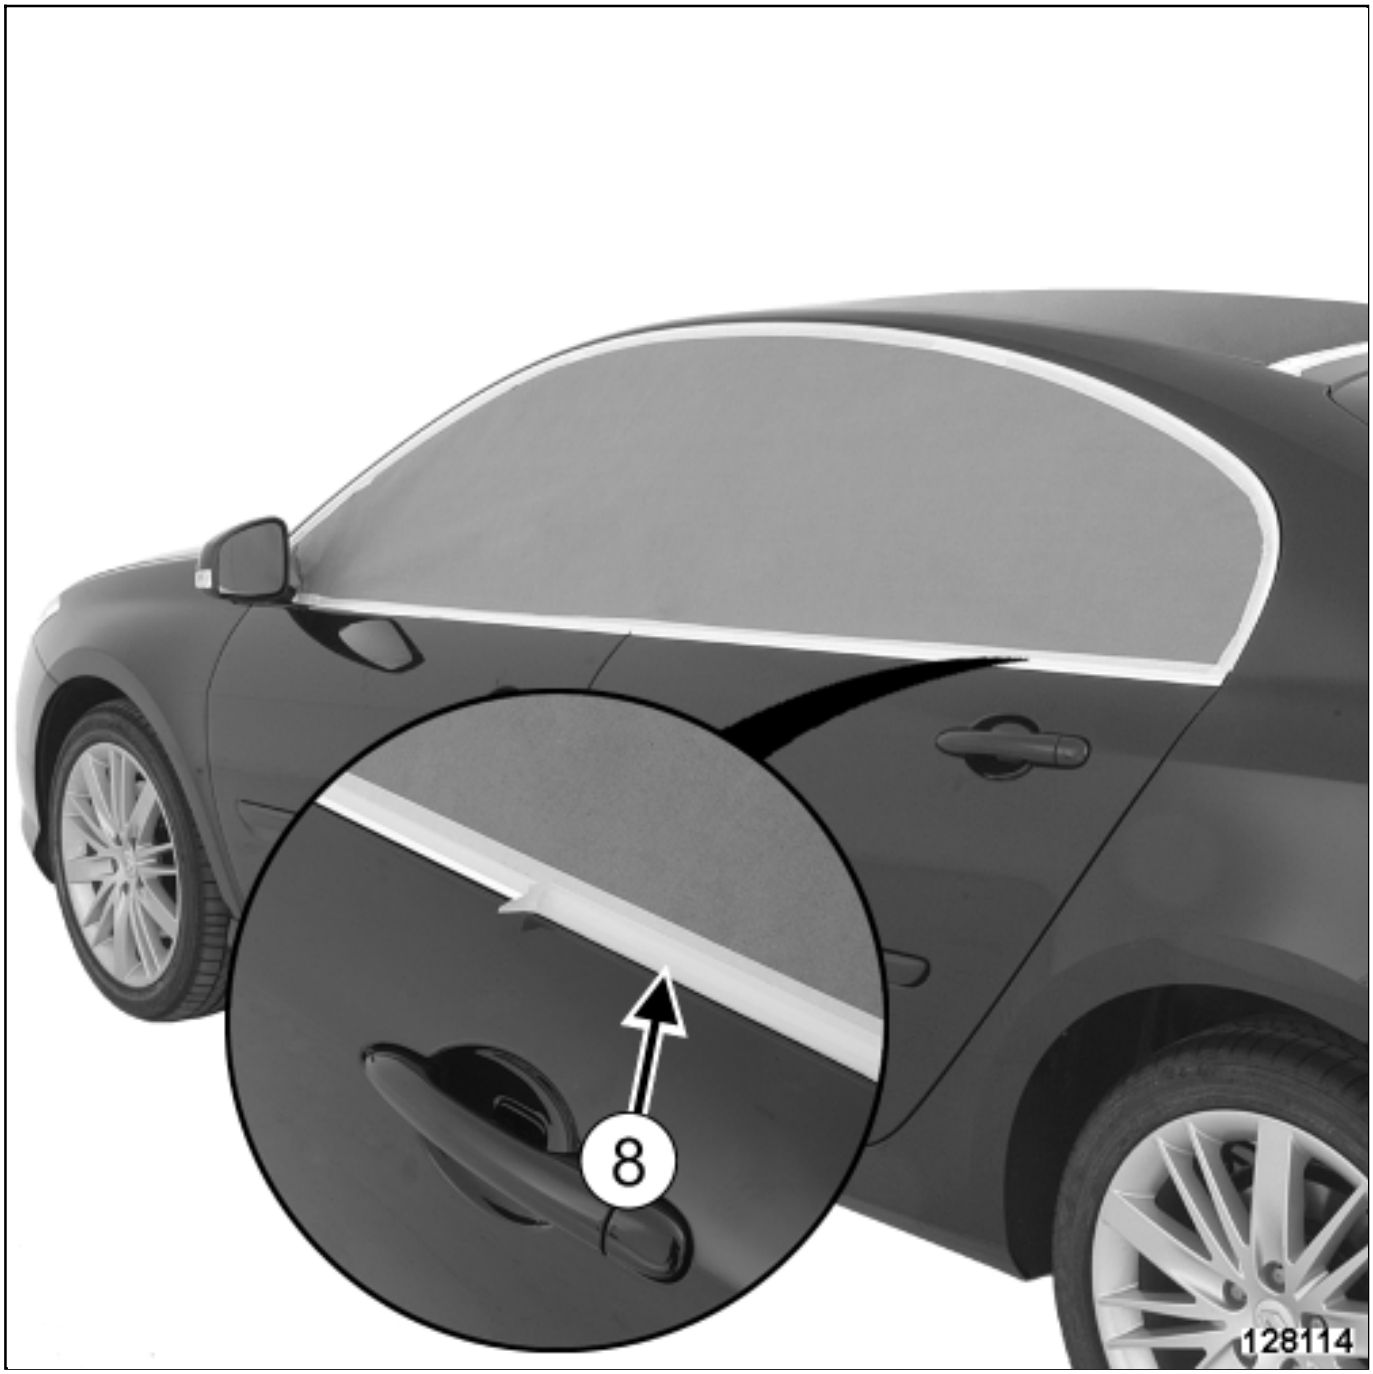
Apply 19 mm foam tape inside the upper side door pillars of the doors for the vehicles concerned.



Apply masking tape(7) in the rear section of the roof letting it stick out over the tailgate.

Fix the adhesive tape(7) with 19 mm masking tape.

Continue with the masking of the vehicle. Use the most suitable dimensions for the components to be protected (paper, plastic).



4. PROCEDURE 4: MASKING THE WINDOWS

128112

Fit the paper suitable for the component.

Cut the paper and fix it with 19 mm masking tape at 0.5 cm from the edge.

Last, place 19mm finishing masking tape(8) on the whole perimeter of the window (remove it as soon as the painting is finished and before drying).

MECHANISM HOUSING BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Adjustable support for fitting bearings.	Bvi. 1418
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306
Gearbox Supporter	RSM. 9308

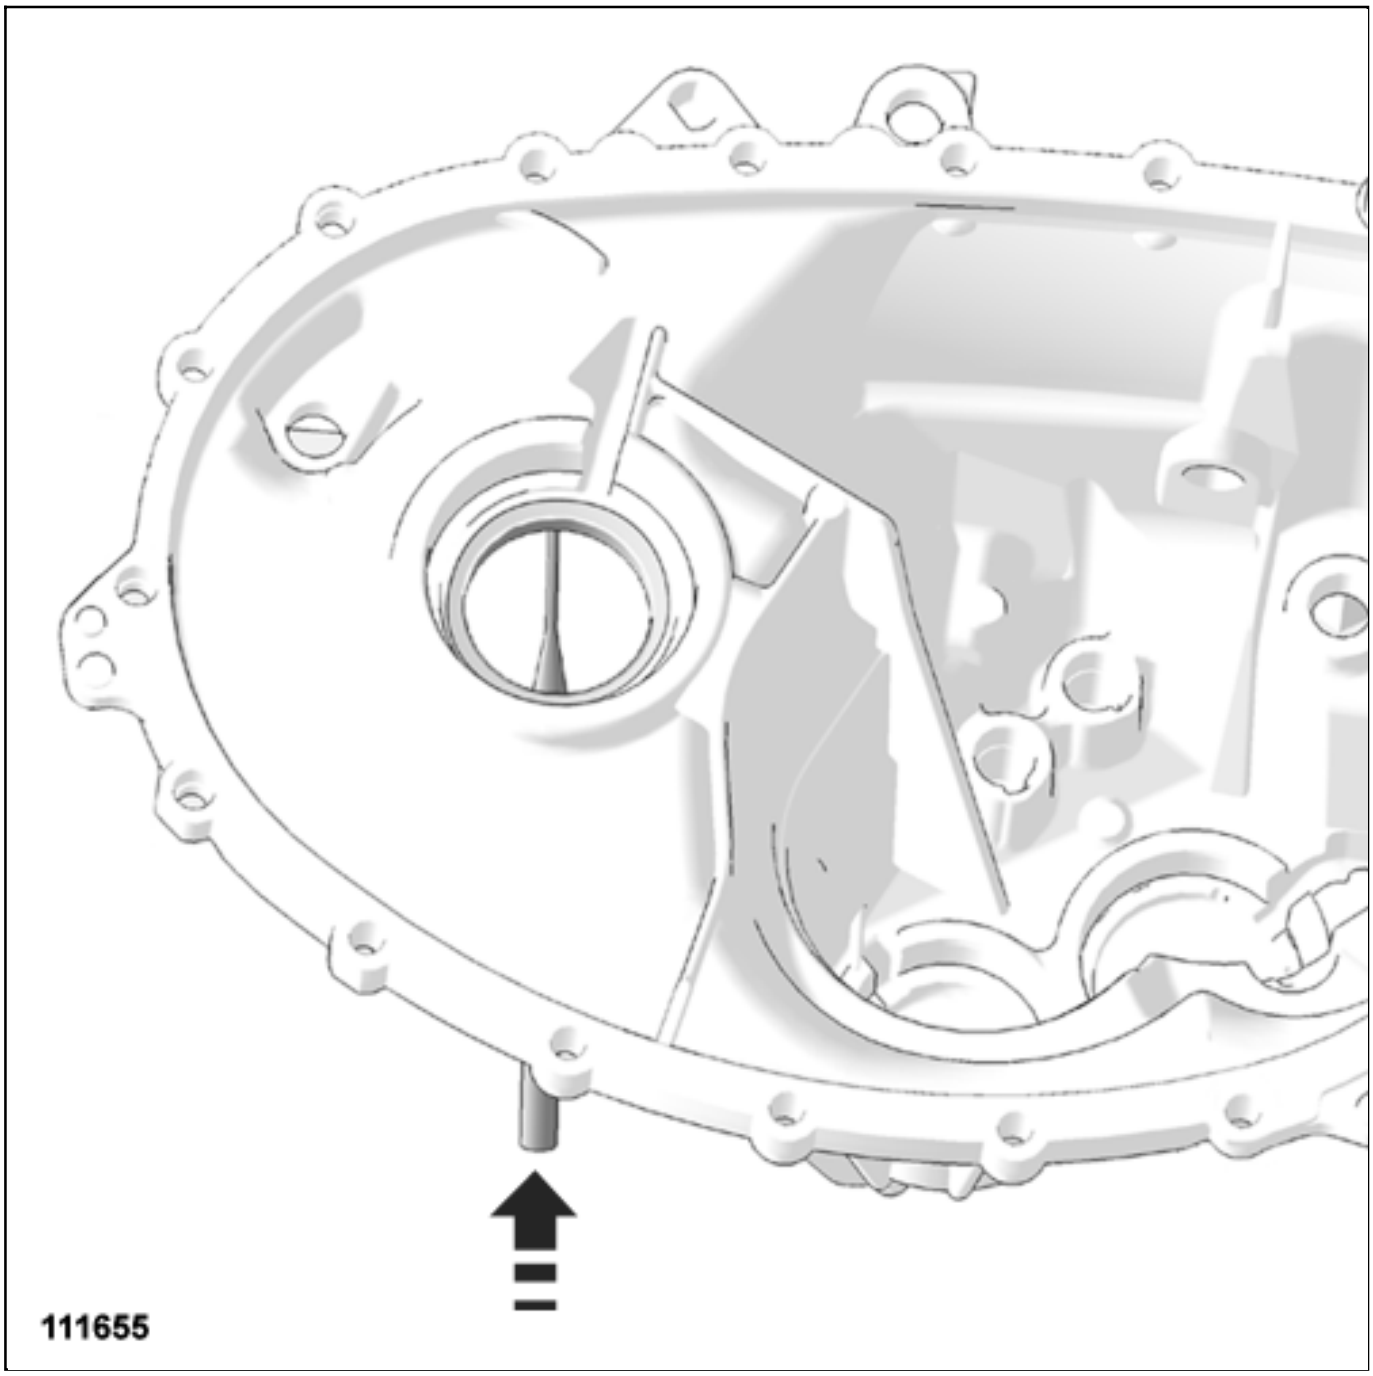
Equipment required
roll pin punch

parts always to be replaced:
Mechanism housing bearing

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).



REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:

- the automatic gearbox **Automatic gearbox: Removal - Refitting** ,
- the automatic gearbox wiring **Automatic gearbox wiring: Removal - Refitting** ,
- the speed sensors **Speed sensor: Removal - Refitting** ,
- the gear engaged sensor **Gear engaged sensor: Removal - Refitting** ,
- the automatic transmission computer **Automatic gearbox computer : Removal - Refitting** ,
- the mechanism housing **(see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting)** .

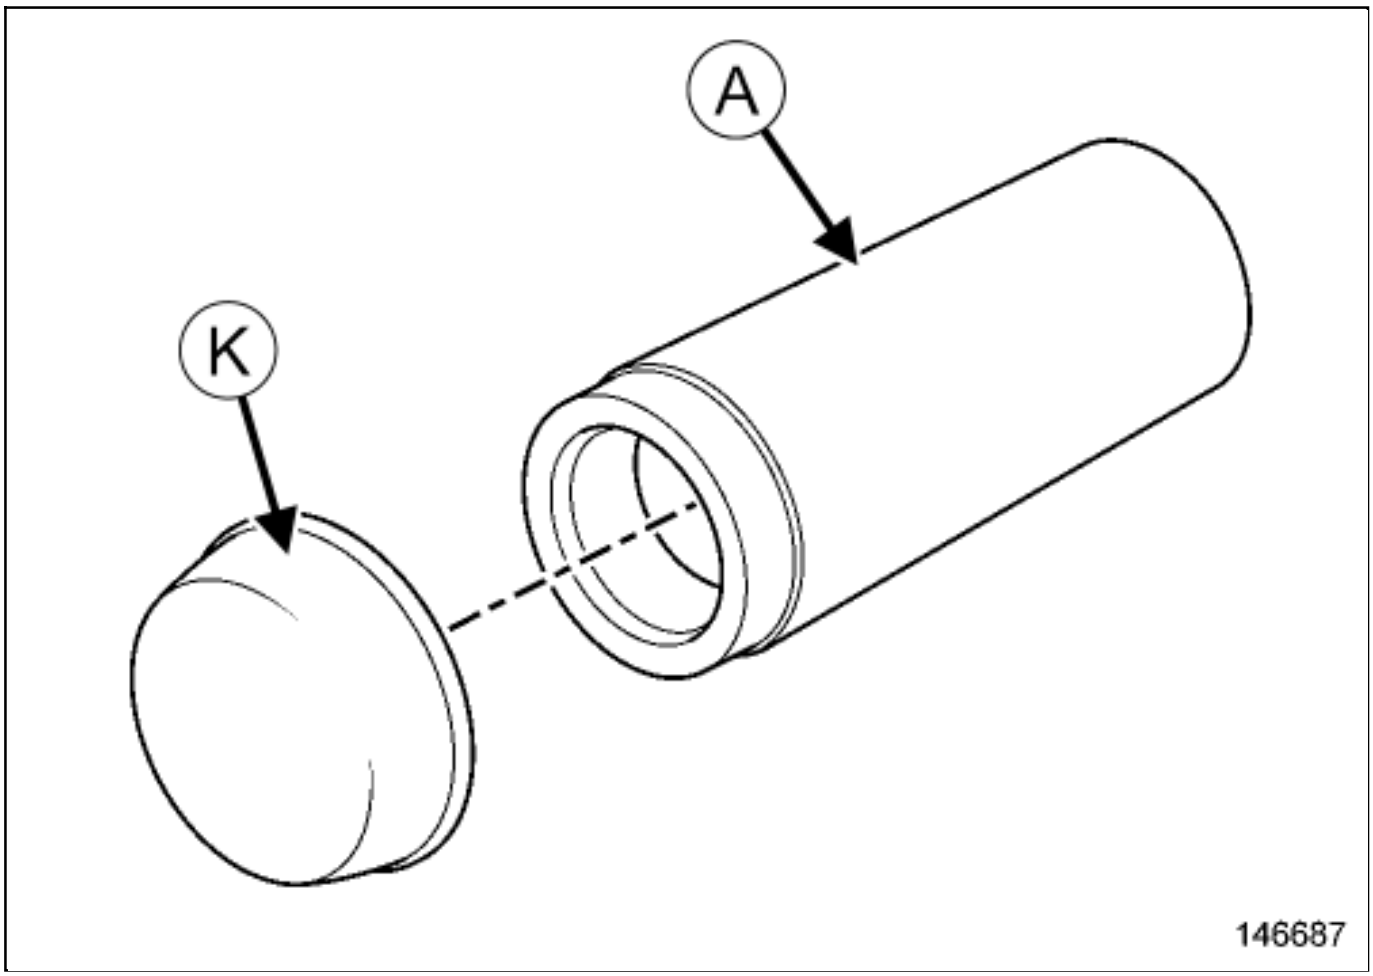
2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the differential bearing using a roll pin punch.

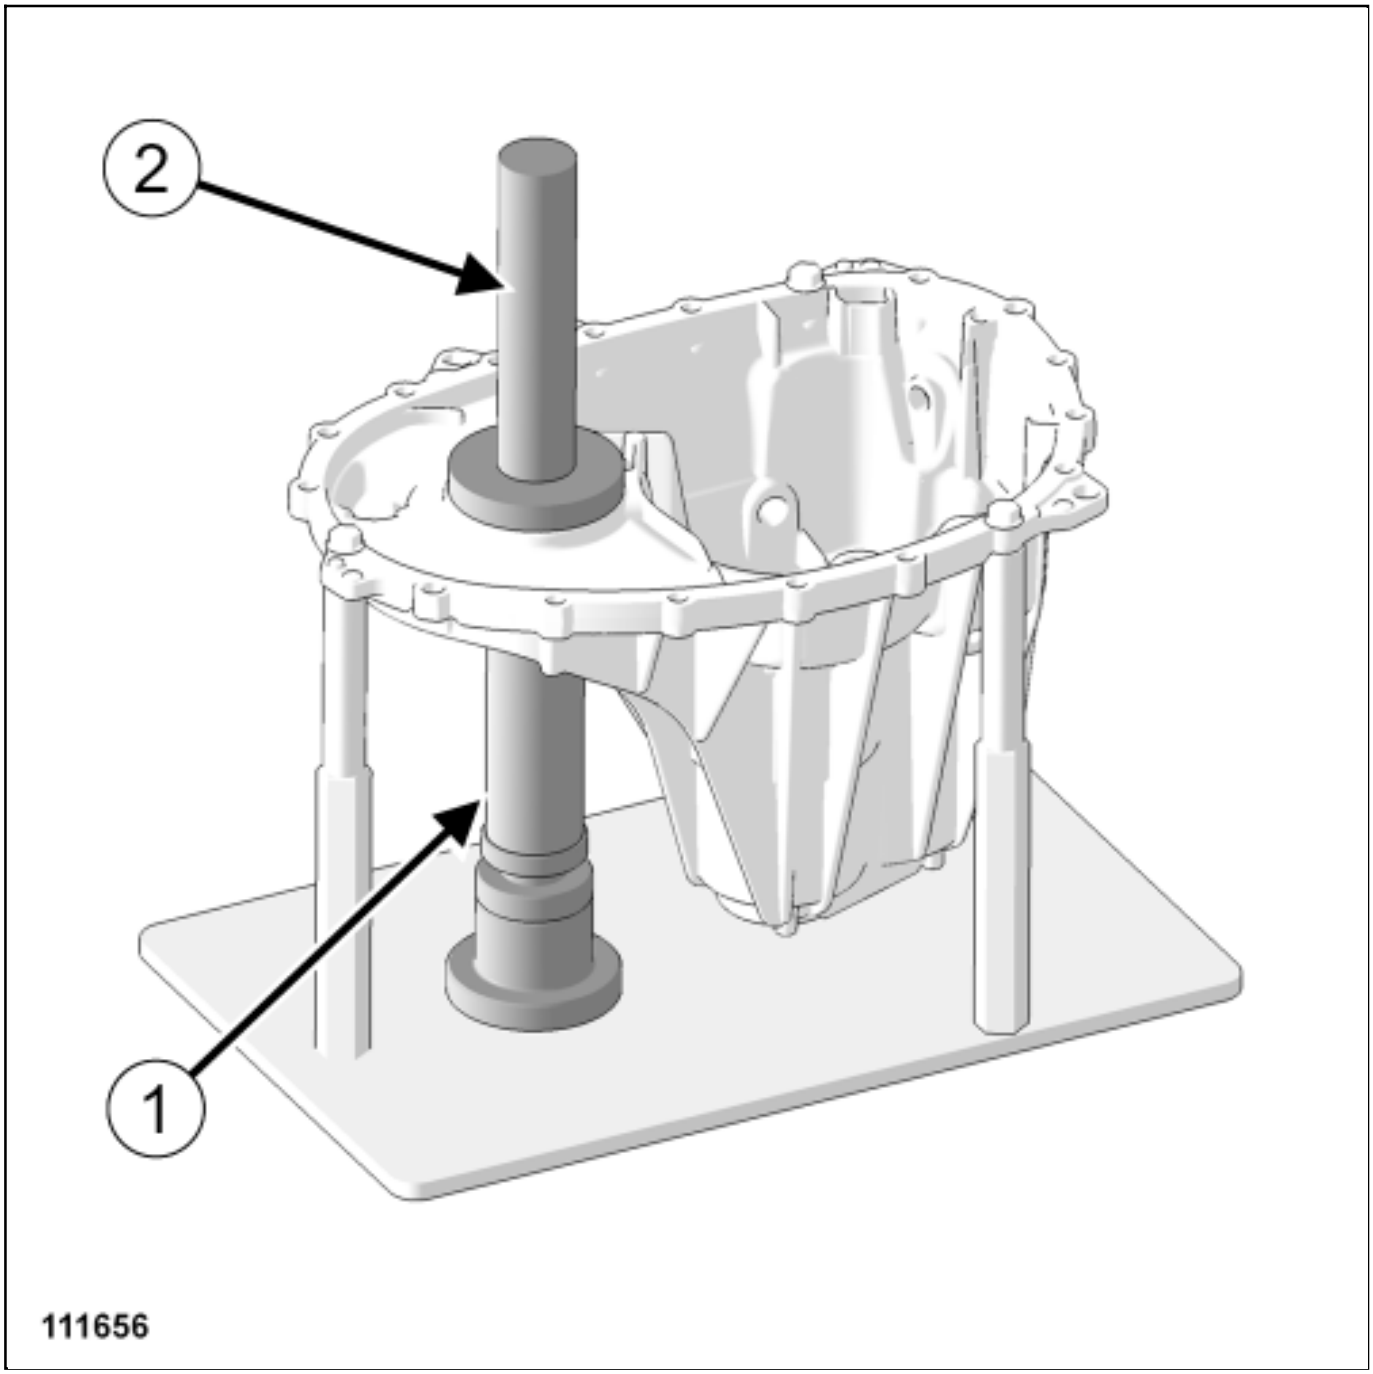
REFITTING

1. REFITTING PREPARATION OPERATION

Clean all the removed parts[Vehicle: Parts and consumables for the repair](#) (04B, Consumables -



Products).



parts always to be replaced: Mechanism housing bearing .

2. REFITTING OPERATION FOR PART CONCERNED

CAUTION

Failure to observe the following procedure could cause irreparable damage to the automatic gearbox casings.

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

MECHANISM HOUSING: REMOVAL - REFITTING

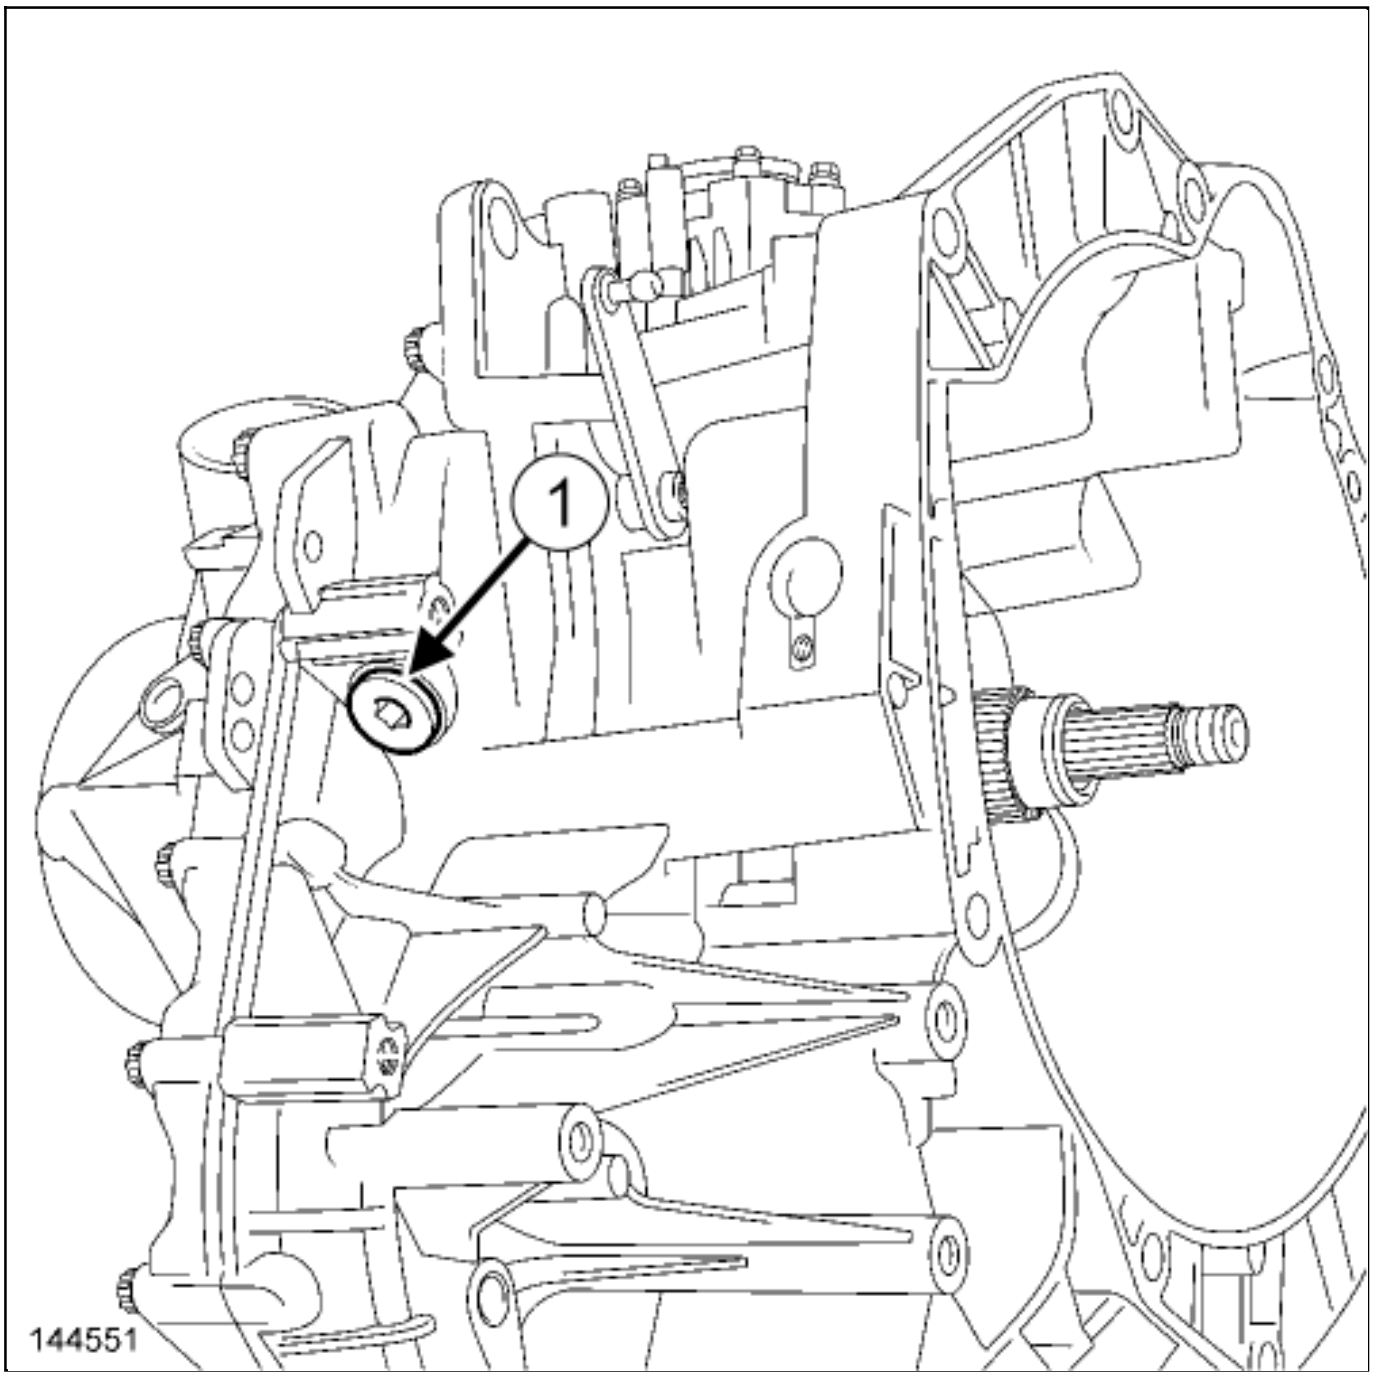
 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Inertia seal extractor	Bvi. 1948
Extractor	RSM. 9303

WARNING

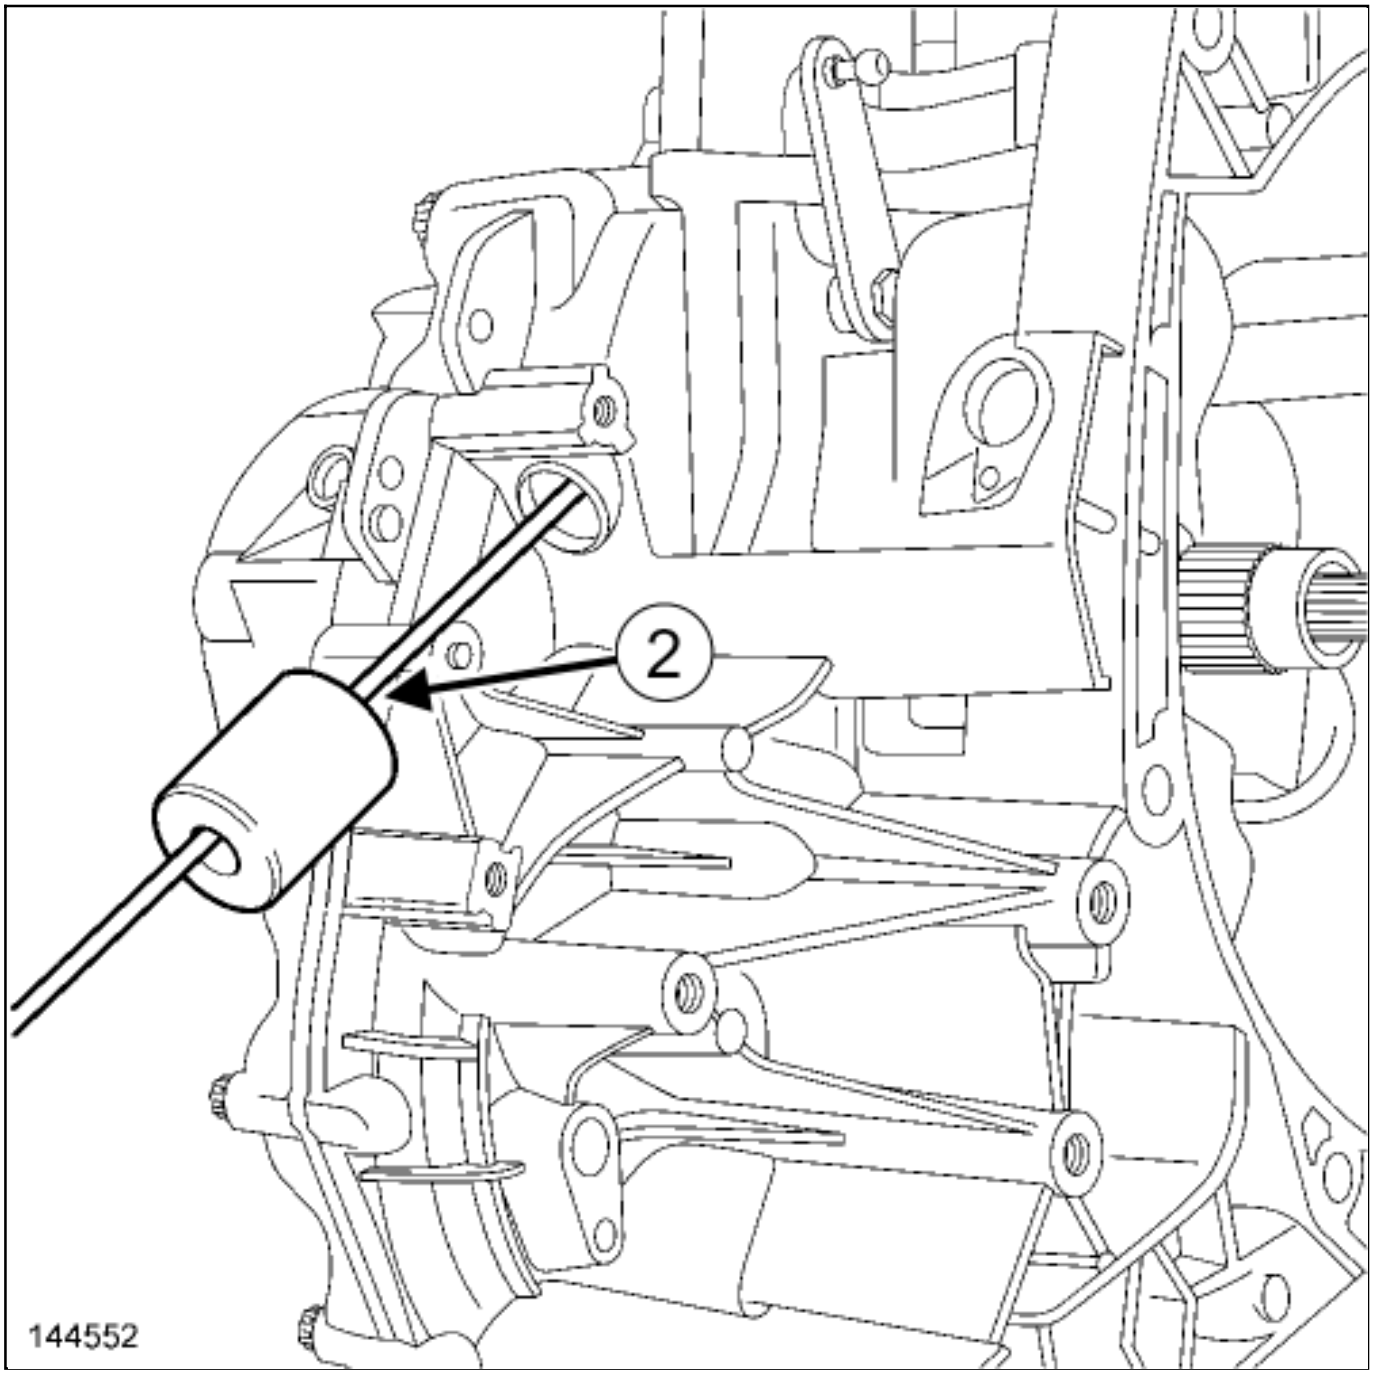
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).



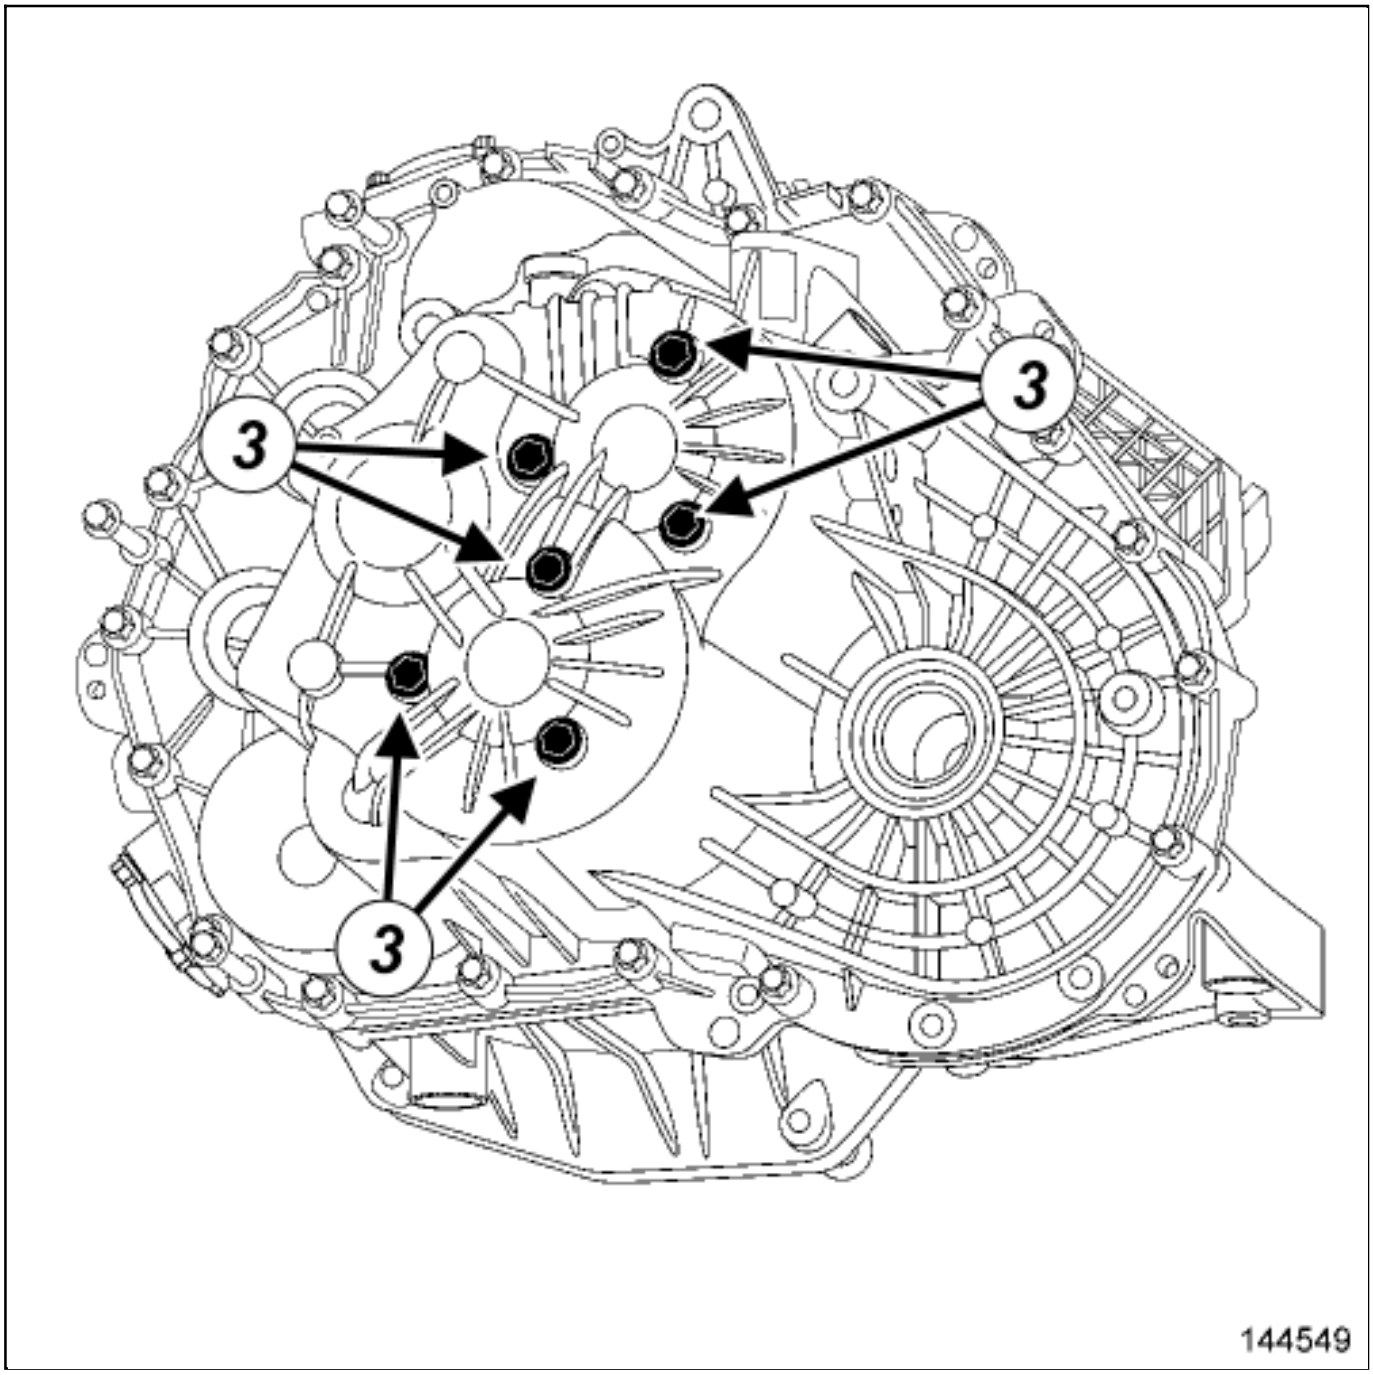
REMOVAL

1. REMOVAL PREPARATION OPERATION

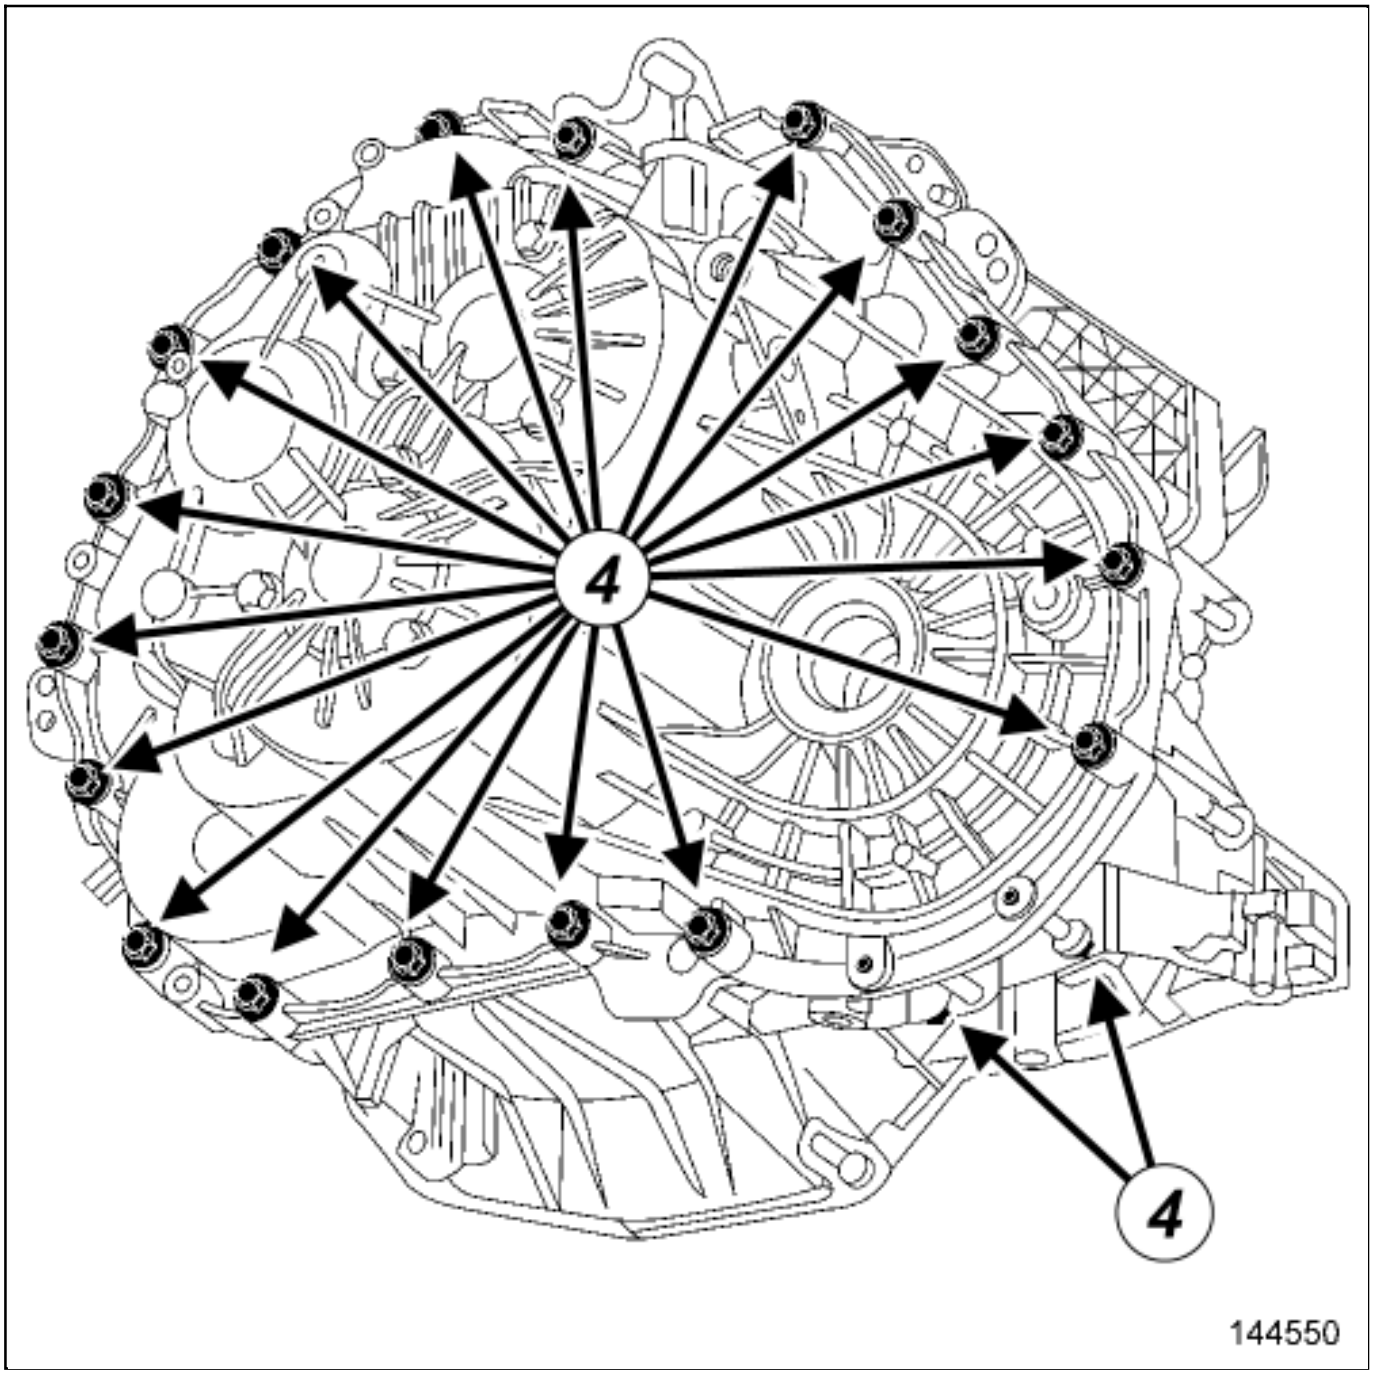


Remove:

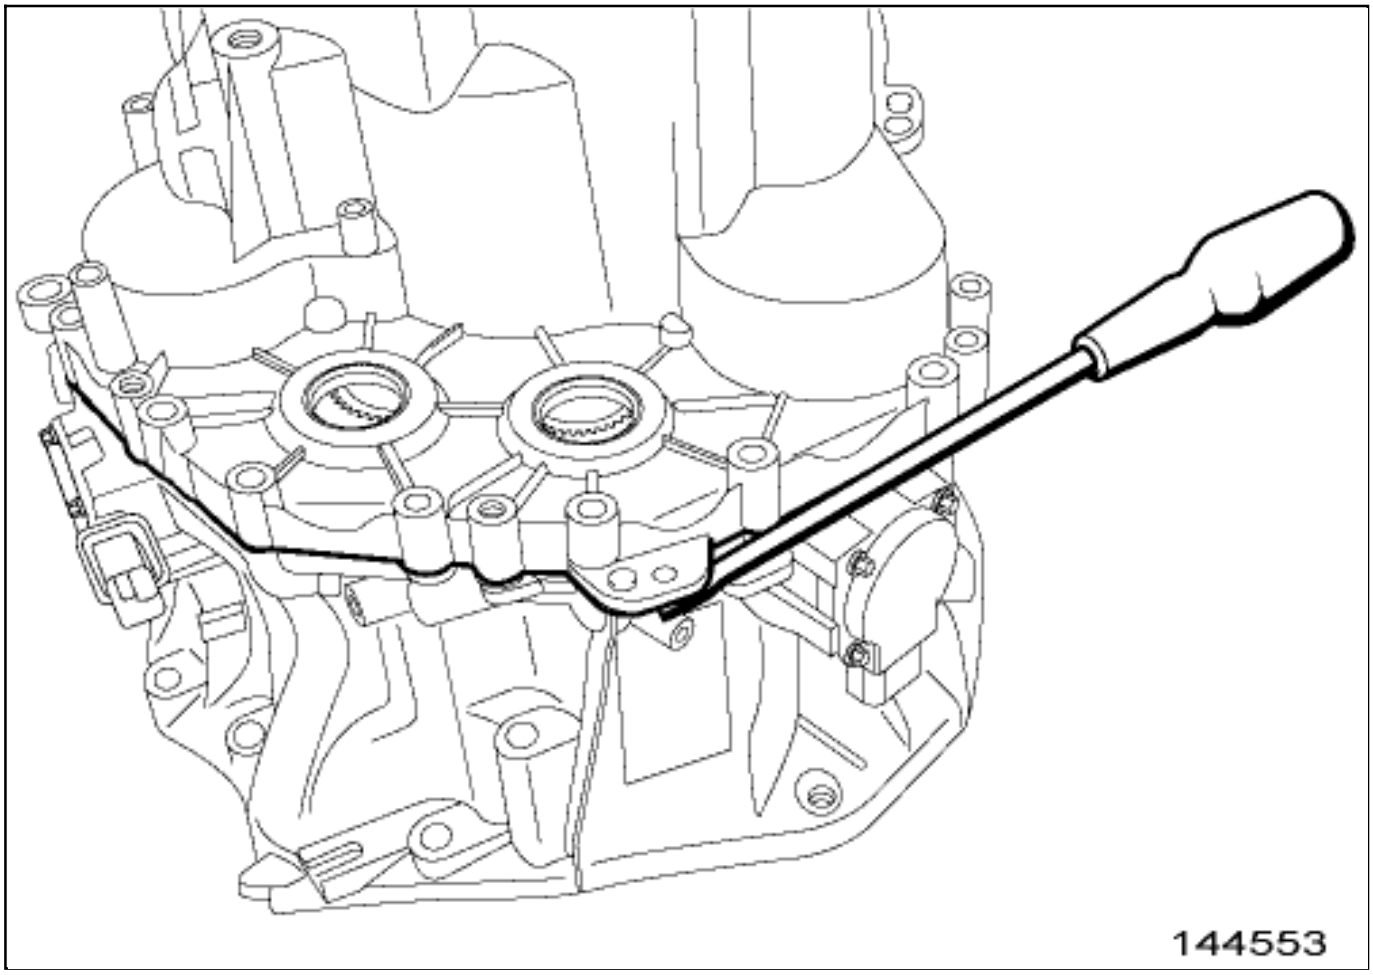
- the automatic gearbox Automatic gearbox: Removal - Refitting ,
- the automatic gearbox wiring Automatic gearbox wiring: Removal - Refitting ,
- the speed sensors Speed sensor: Removal - Refitting ,
- the gear engaged sensor Gear engaged sensor: Removal - Refitting ,
- the automatic transmission computer Automatic gearbox computer : Removal - Refitting .



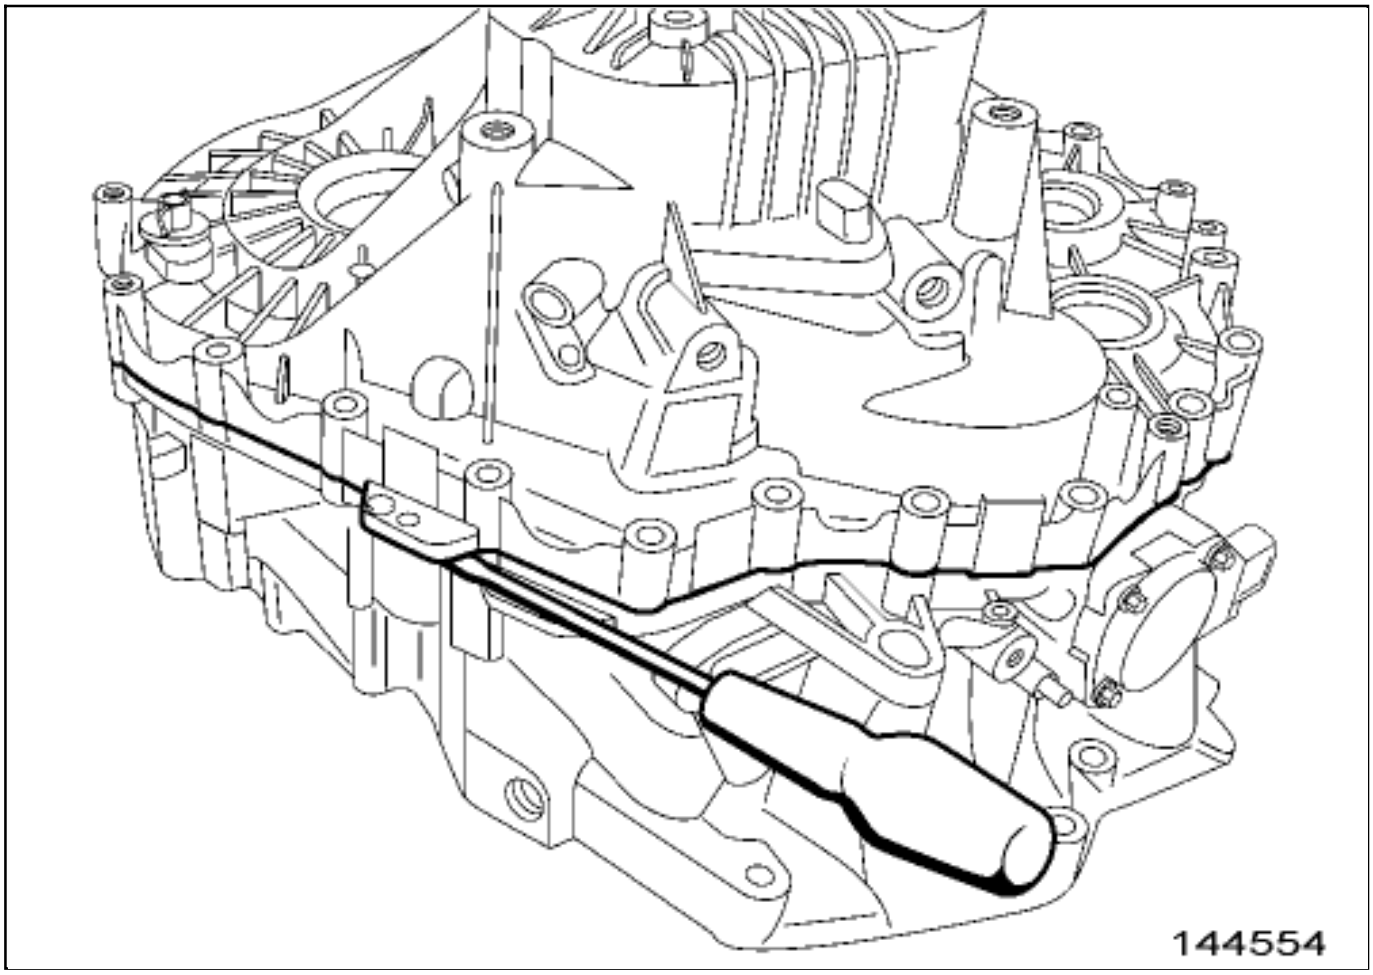
2. OPERATION FOR REMOVAL OF PART CONCERNED



Remove the plug from the locating ball cartridge(1) of the parking shaft.



Remove the locating ball cartridge using the toolInertia seal extractor(Bvi. 1948) (2) .



Remove the bolts from the automatic gearbox shafts(3) .

Remove the bolts from the mechanism housing(4) .

144553

Note:

To remove the mechanism housing, use the two ears of the housing as a lever so as not to damage the joint face.

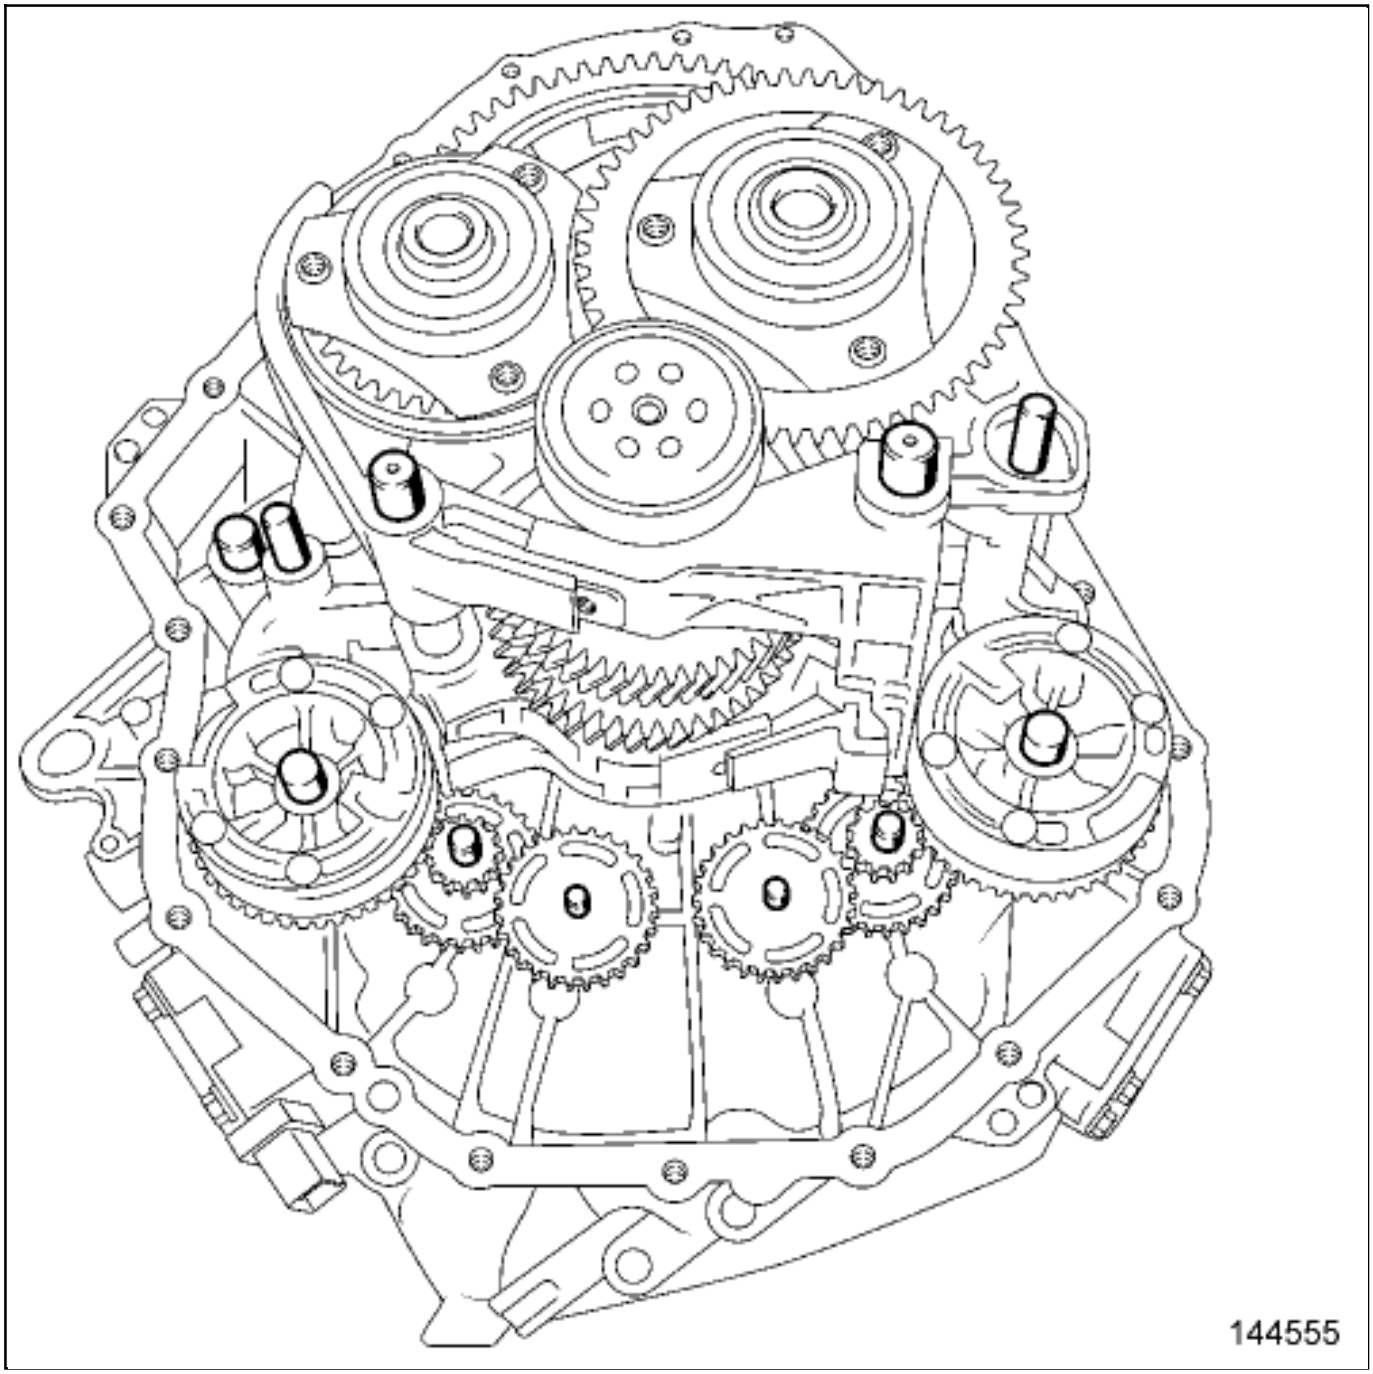
Remove the mechanism housing.

REFITTING

1. REFITTING PREPARATION OPERATION

Clean:

- 7 -

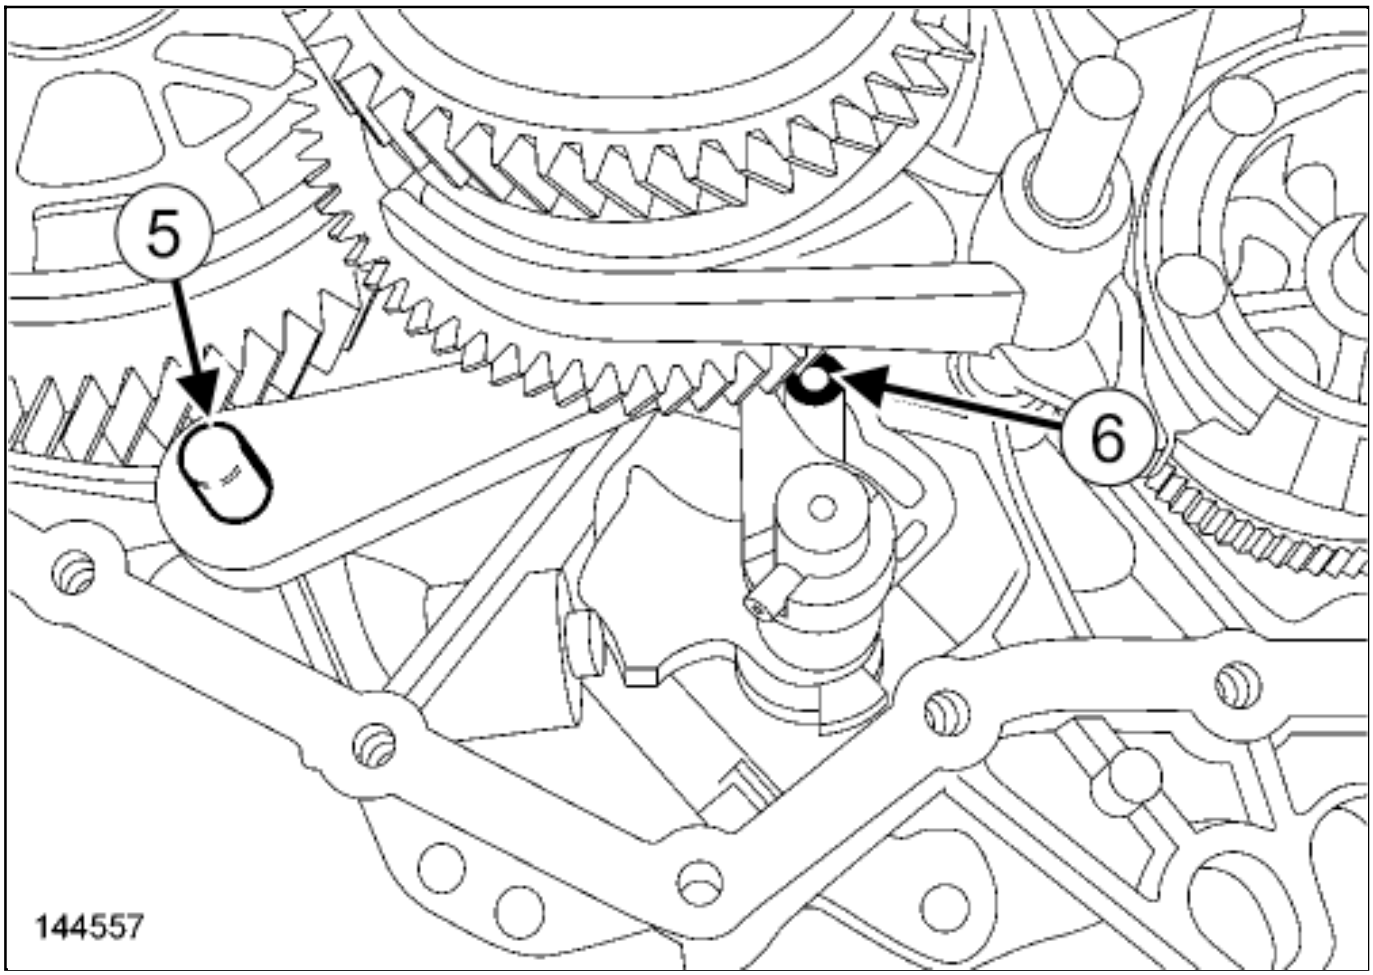


- all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products),
- the joint face of the automatic gearbox casings Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

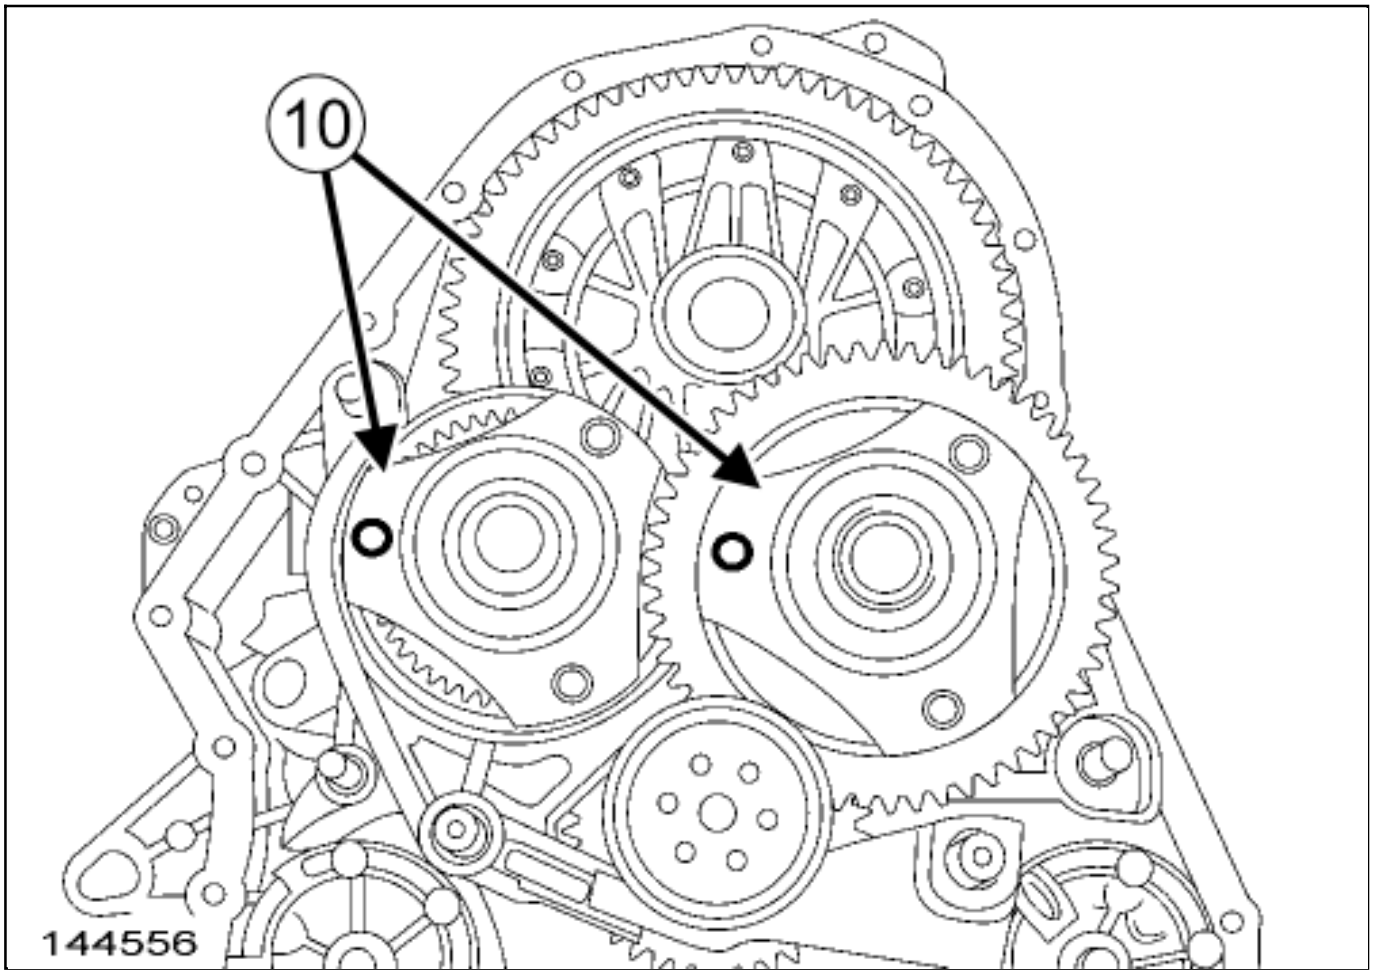
Always replace the seal of the gearbox casings.

CAUTION

Failure to observe the following procedure could cause irreparable damage to the automatic gearbox casings.



Check:



- the presence and correct position of all the control shafts on the clutch housing and the gear shift drums,
- the presence of the mechanism housing centring dowels.

CAUTION

Failure to observe the following procedure could damage the parking mechanism.

Check the presence and correct position of the parking finger shaft(5) as well as the parking finger pin which must be in the opening of the parking lever shaft(6) .

Position the retaining plates(10) correctly so that they correspond with the holes in the mechanism housing during refitting.

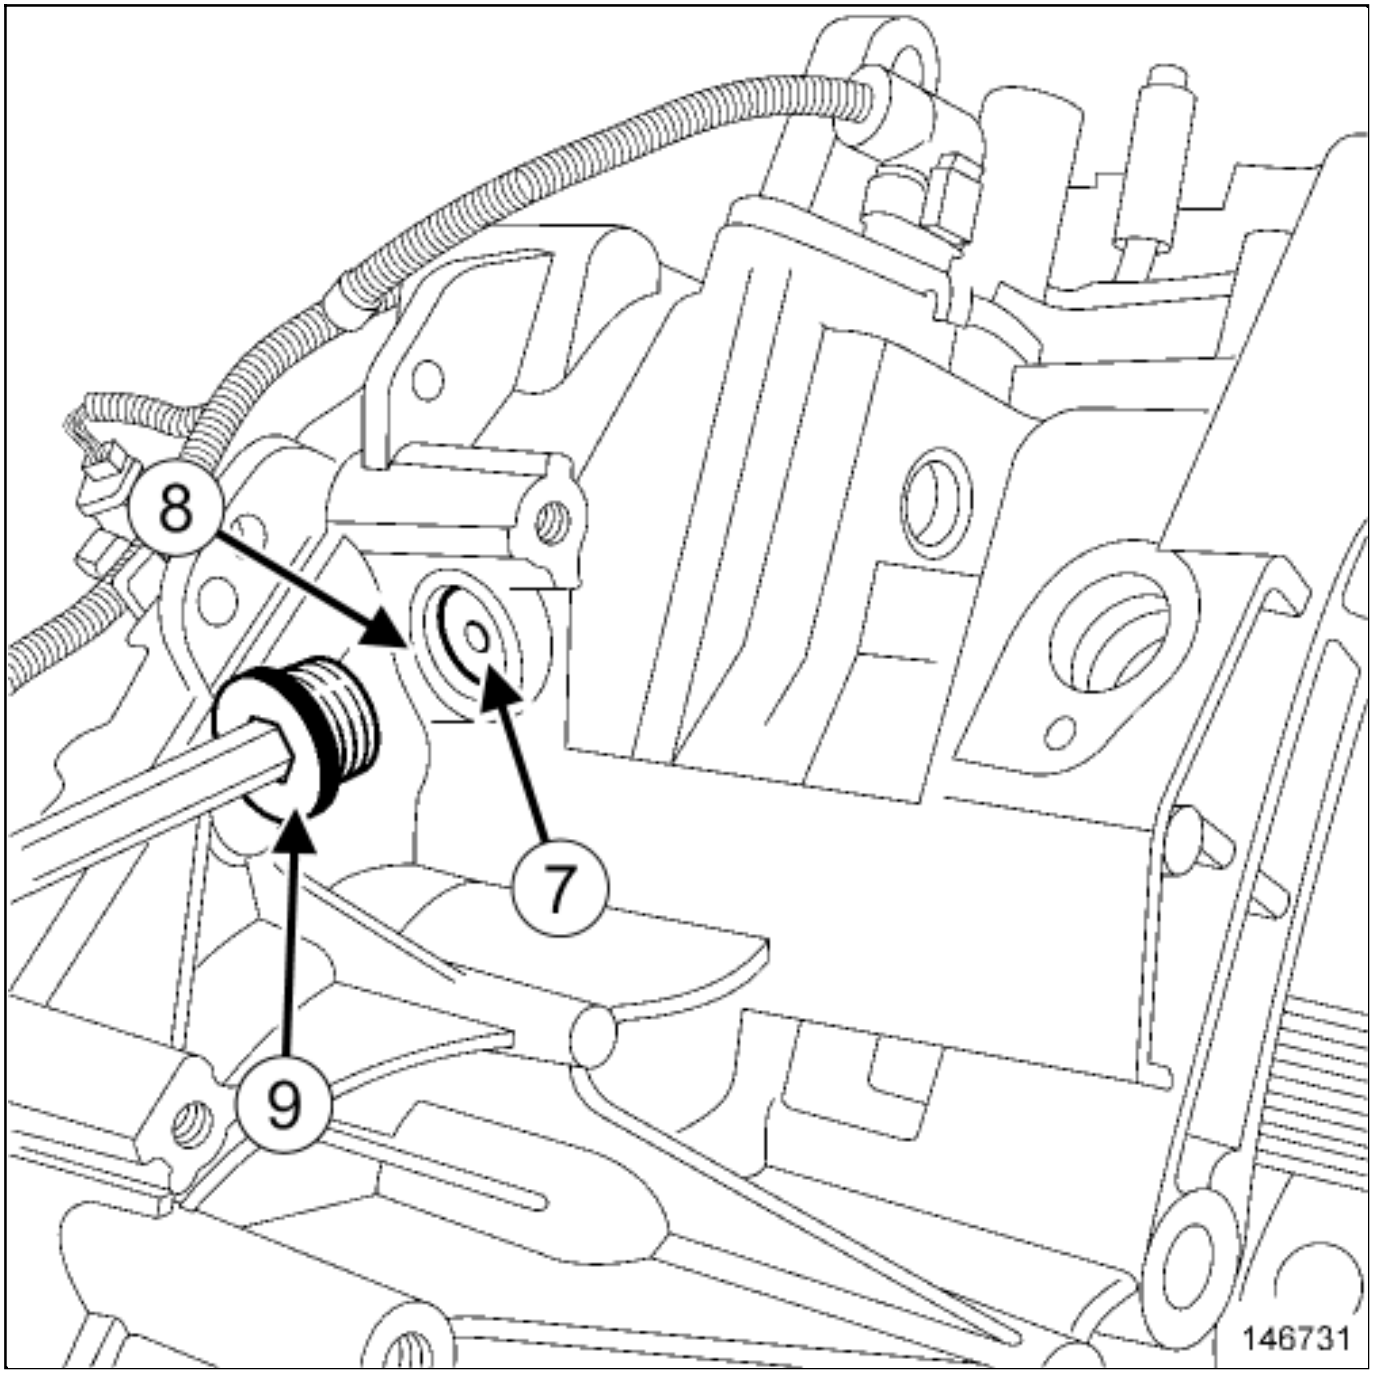
2. REFITTING OPERATION FOR PART CONCERNED

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Apply a bead of Sealing resin Vehicle: Parts and consumables for the repair (04B, Consumables - Products) to the joint face of the mechanism housing.

Refit the mechanism housing.



Guide the retaining plates(10) using a screwdriver.

Refit:

- the automatic gearbox shaft bolts,
- the mechanism housing bolts.

Torque tighten:

- the mechanism housing bolts27 N.m,
- the automatic gearbox shaft bolts33 N.m.

Fit the parking shaft locating ball cartridge(7) until 4 threadsare showing in the threaded plug hole on the clutch housing(8) .

Refit the plug of the parking shaft locating ball cartridge(9) .

Note:

The tightening of the parking shaft locating ball cartridge plug allows the correct positioning of the parking shaft locating ball cartridge in its housing.

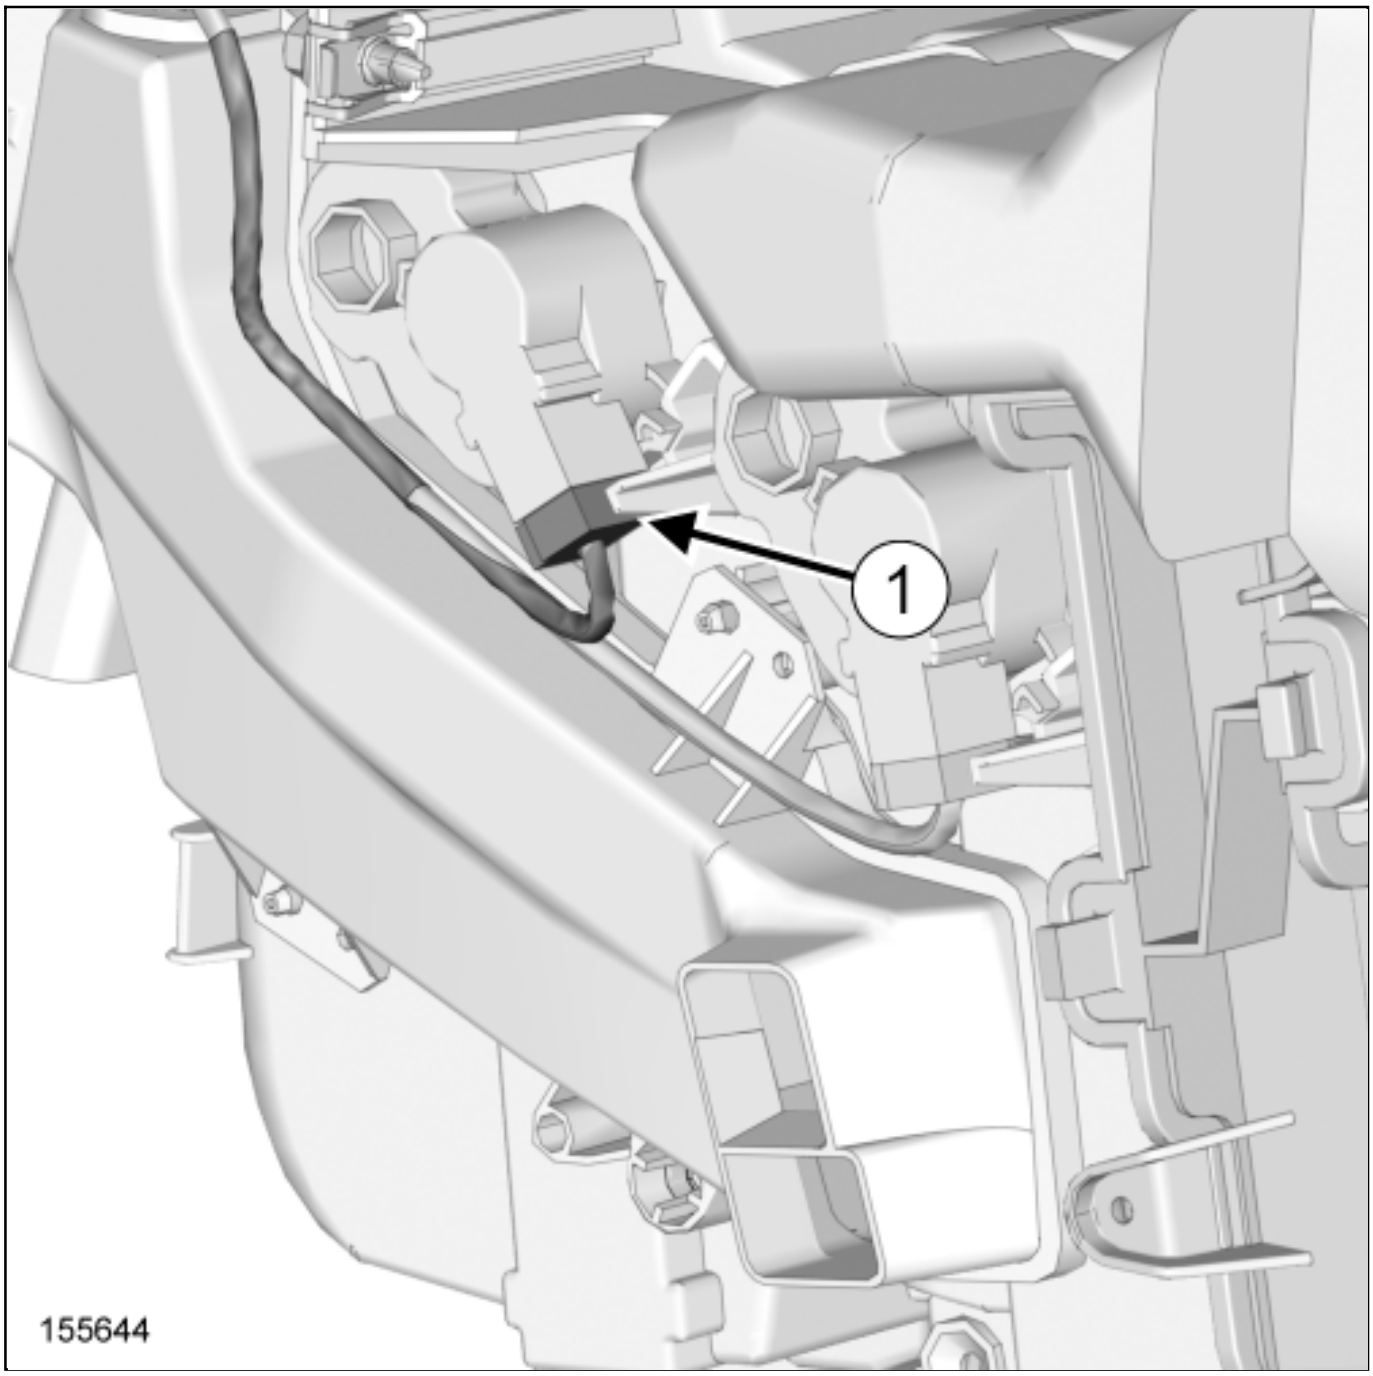
Torque tighten the parking shaft locating ball cartridge plug46 N.m.

3. FINAL OPERATION

Proceed in the reverse order to removal.

MIXING MOTOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool



Locations and specifications (tightening torques, parts to always be replaced, etc.).(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove the gloveboxDashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Disconnect the mixing motor connector(1) .

- Unclip the mixing motor from the distribution unit(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REFITTING

1. REFITTING OPERATION

-

Position the mixing motor in relation to the flat surface of the mixing motor recess.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

"Air conditioning computer" ,

-Component affected by the After repair procedure:

"Front air mixing flap motor" .

MODULATE VARIATION OF SPEED OF FAN ASSEMBLY FOR PASSENGER COMPARTMENT :REMOVAL-REFITTING

Special tooling required	
Set of trim removal levers.	Car. 1363

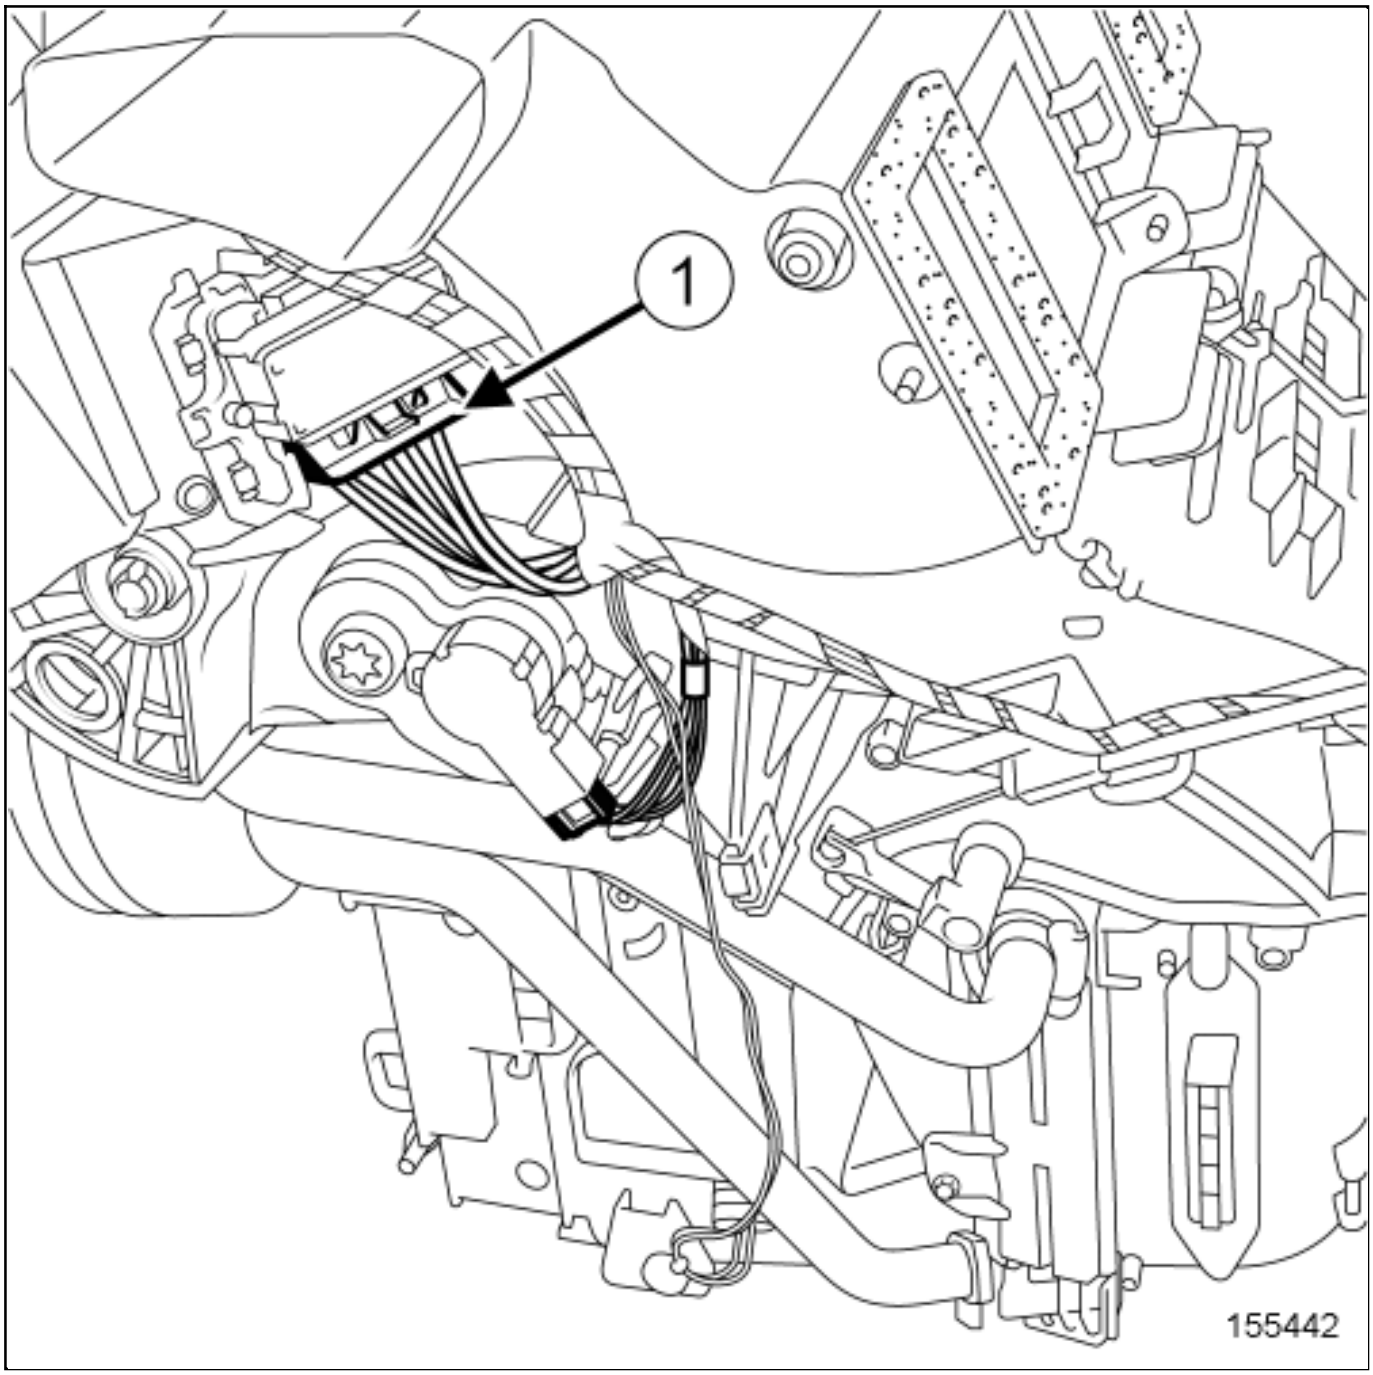
Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Note:

There are two types of fitting for the distribution unit: Valéo and Denso.

REMOVAL

1. REMOVAL PREPARATION OPERATION

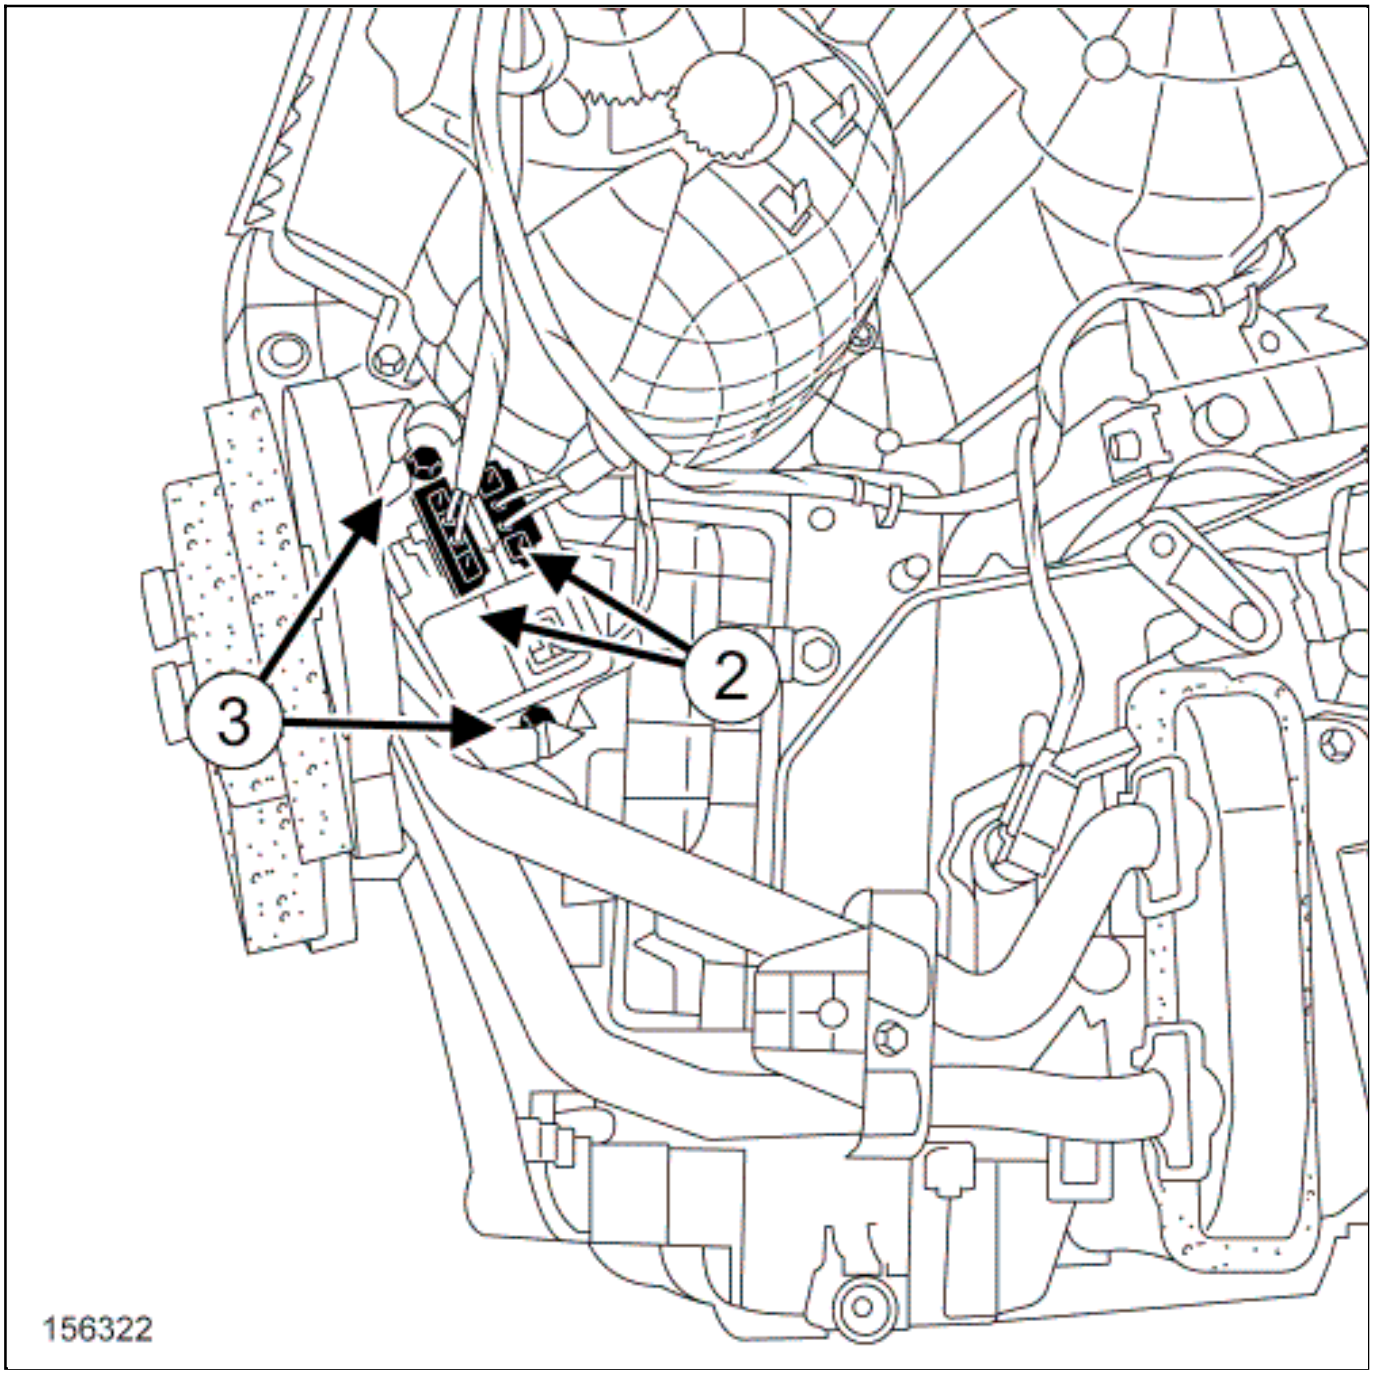


- Remove the dashboard lower trimDashboard assembly: Exploded view .

1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT

- Remove the pedal assemblyPedal assembly: Exploded view .

2. REMOVAL OPERATION



1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A VALÉO DISTRIBUTION UNIT

Disconnect the connector(1) from the modulate variation of fan assembly for passenger compartment.

Unclip the modulate variation of fan assembly for passenger compartment using the toolSet of trim removal levers.(Car. 1363) **(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view)** .

2- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT

Disconnect the connectors(2) from the modulate variation of fan assembly for passenger compartment.

Remove:

- the bolts(3) from modulate variation of speed of fan assembly for passenger compartment,
- the modulate variation of speed of fan assembly for passenger compartment.

REFITTING

Proceed in the reverse order to removal.

Repair-30x02x01x52-01x37-1-3-1.xml

XSL version : 3.02 du 22/07/11

MULTIFUNCTIONSUPPORT:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.) (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Disconnect the 12V battery Battery: Removal - Refitting .

Remove:

- the engine undertray bolts,
- the engine undertray.

Remove:

- the front right-hand wheel Front hub carrier assembly: Exploded view ,
- the front section of the front right-hand wheel arch liner Exterior body front trim assembly: Exploded view .

Remove the front bumper Front bumper assembly: Exploded view .

Remove:

- the air deflector,
- the intercooler (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove:

- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the alternator (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Remove the air conditionning compressor nut (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Loosen the air conditioning compressor bolts (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Remove the air conditioning compressor studs (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Move aside the air conditioning compressor.

Remove the engine oil dipstick guide bolt (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

2. REMOVAL OPERATION

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the multifonction support bolts,
- the multifonction support.

REFITTING

1. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the multifonction support,
- the multifonction support bolts.

Refit the air conditioning compressor studs.

Torque tighten(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the air conditioning compressor studs,
- the multifonction support bolts.

2. FINAL OPERATION

Refit the engine oil dipstick guide bolt(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Torque tighten the engine oil dipstick guide bolt(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Refit (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the air conditioning compressor bolts,
- the air conditioning compressor nut.

Torque tighten (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the air conditioning compressor bolts,
- the air conditioning compressor nut.

Proceed in the reverse order to removal.

MULTIFUNCTIONSUPPORT:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.) Engine accessories assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the 12V battery Battery: Removal - Refitting .
- Remove:
  - the engine undertray bolts,
  - the engine undertray.
- Remove:
  - the front right-hand wheel Front hub carrier assembly: Exploded view ,
  - the front section of the front right-hand wheel arch liner Exterior body front trim assembly: Exploded view .

Remove the front bumper Front bumper assembly: Exploded view .

Remove:

NEW VEHICLE FINISH: DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

1. NEW VEHICLE OPERATIONAL INSTRUCTIONS FOR FINISHING

1- INTRODUCTION

1)ADMINISTRATIVE:

[] The operations described in finishing must be carried just before the handover of the vehicle. If the preparation has been done in the dealership, ensure that Flash AVES was made on receipt of the vehicle in the dealership.

[] If the commercial secretary has not done 24 hours before the finishing, check that the vehicle is not affected by OTS (Special Technical Operations), based in ICM (Shared Information World) or other information available (eg VIN list for which one or more OTS apply).

2)ACCESSORIES (TO BE FITTED BY THE WORKSHOP):

[] Have accessories fitted. The vehicle will need to be transferred to the workshop (towbar, professional features, sports kit, etc.).

3)SERVICES ACTIVATION:

[] Check on the New Vehicle Delivery Quality sheet if all the subscribed services were activated within five previous days. If not, contact the commercial secretary.

[] Perform 2 starts vehicle in area covered by telephone operators.

[] Check the level of fuel, if necessary, add fuel.

2- VEHICLES ACCESSORIES:

[] Check the presence of the duplicate keys and cards.

[] Check the conformity of the vehicle documentations (model , language, exhaustivity).

1- CLEANING:

[] If necessary, wash the vehicle bodywork and vacuuming the interior of vehicle and the boot.

- [] Clean:
  - the dashboard,
  - the windows (inside and outside).

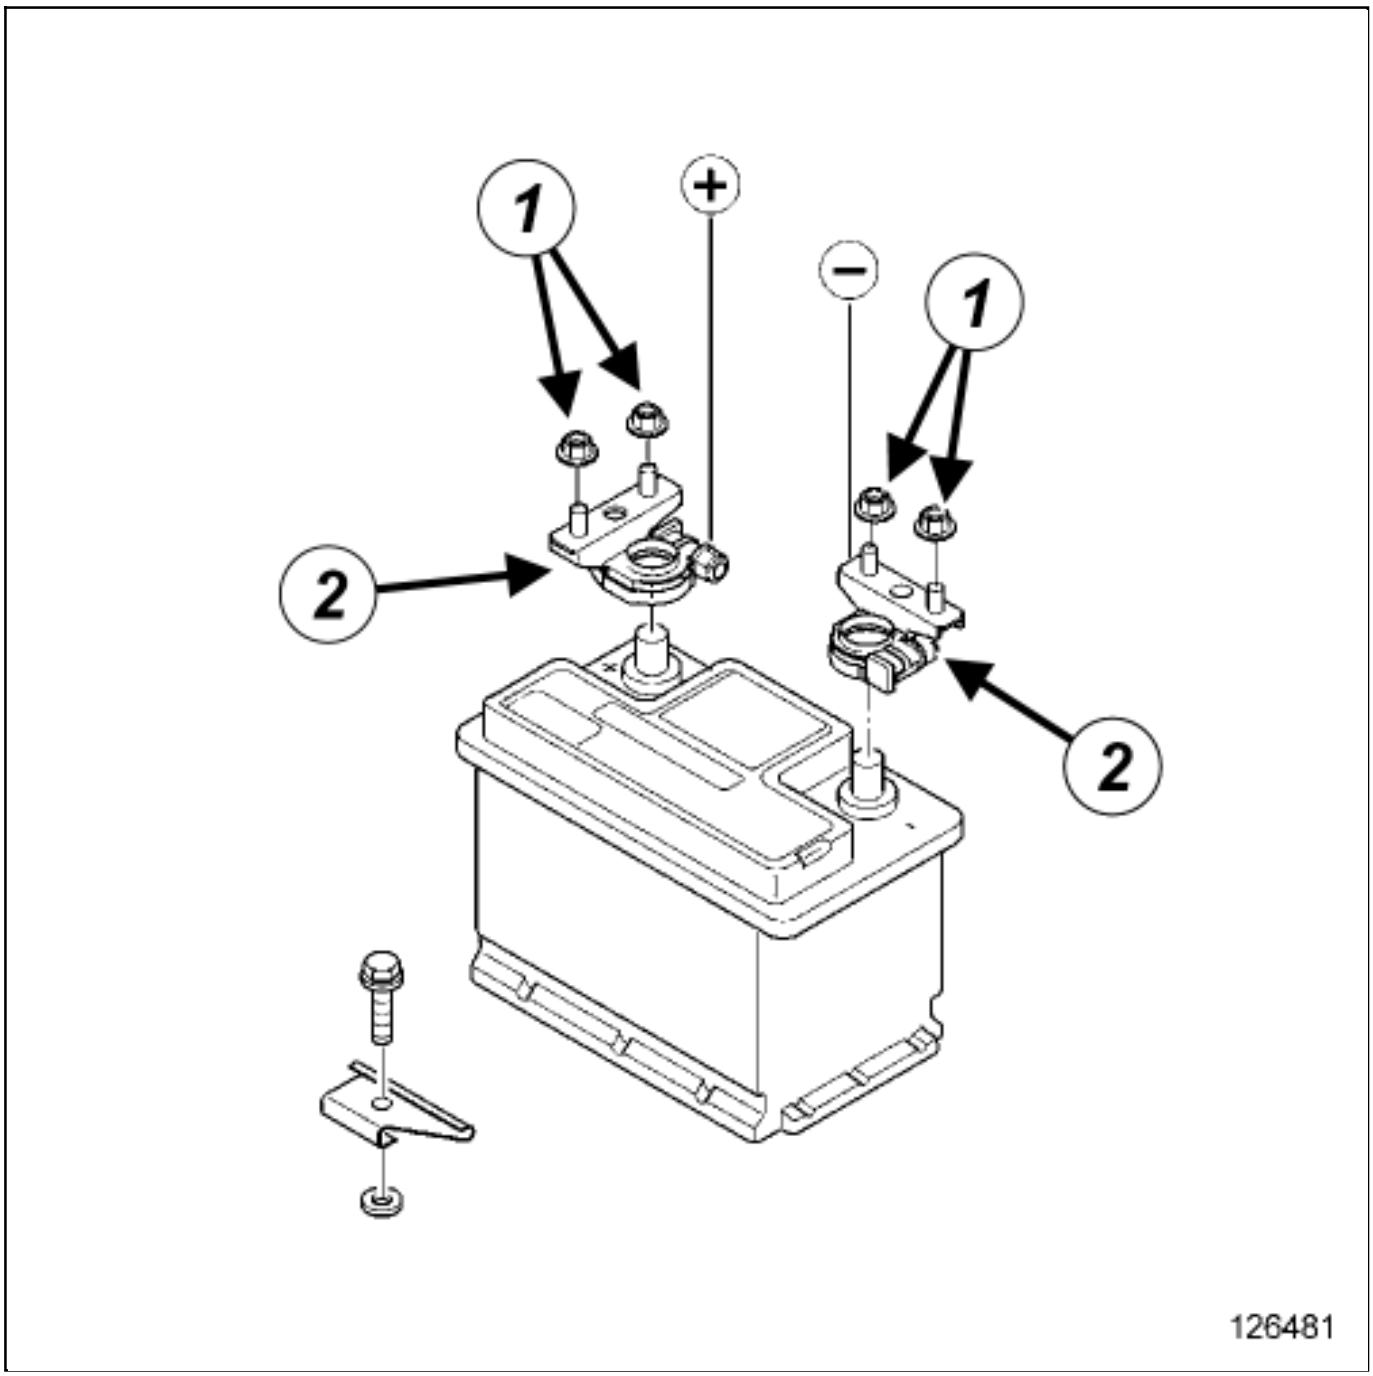
2- ENGINE COMPARTMENT:

1)CHECKING THE BATTERY:

Note:

Transfer the vehicle to the workshop if you reply << YES >> to one of the following 4 questions.

[] 1) Did the vehicle not start on its own?



[] 2) Is the battery's magic eye not green or is there a specific message on the instrument panel?

Note:

Specific message on the instrument panel, 2 possibilities:

1 - Written message: "Recharge battery" or "Battery low, start the engine".

2 - Battery charge warning light flashes.

[] 3) Are the stud nuts(1) loose (turn the cables from right to left)?

[] 4) Are the battery stud terminal(2) nuts loose (turn the terminals from right to left)?

3- VEHICLE INTERIOR: PASSENGER COMPARTMENT CONTROLS

1)ACTIVATE AND INITIALISE:

[] The navigation system, store the customer's address (see the user manual for the navigation system).

[] The trip computer display (see Driver's Handbook, Trip computer).

[] Remove the vehicle's interior protection (except from the driver's seat).

[] The oil service interval display on the trip computer (see Driver's Handbook, Trip computer).

[] If a warning light comes on or an error message is displayed on the instrument panel, the vehicle will need to be transferred to the workshop.

4- ACCESSORIES (TO BE FITTED BY THE TECHNICIAN PREPARING THE NEW VEHICLE):

[] Fit the accessories not requiring the vehicle to be transferred to the workshop (mats etc.).

[] Fit the antenna (depending on the vehicle).

[] Fit the wheel trims.

[] Fit the registration plates.

[] Fit the wheel plugs.

[] Fit the phone support.

5- APPEARANCE:

[] Treat non-compliance can be supported by the preparation (small scratches can be removed by the polish, stains, ...).

[] For matt paintings, all alterations must be made in the workshop. prohibiting the use of abrasives, polish typ.

XSL version : 3.02 du 22/07/11

NEW VEHICLE FINISH: DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

1. NEW VEHICLE OPERATIONAL INSTRUCTIONS FOR FINISHING

1- INTRODUCTION

1)ADMINISTRATIVE:

[] The operations described in finishing must be carried just before the handover of the vehicle. If the preparation has been done in the dealership, ensure that Flash AVES was made on receipt of the vehicle in the dealership.

[] If the commercial secretary has not done 24 hours before the finishing, check that the vehicle is not affected by OTS (Special Technical Operations), based in ICM (Shared Information World) or other information available (eg VIN list for which one or more OTS apply).

2)ACCESSORIES (TO BE FITTED BY THE WORKSHOP):

[] Have accessories fitted. The vehicle will need to be transferred to the workshop (towbar, professional features, sports kit, etc.).

3)SERVICES ACTIVATION:

[] Check on the New Vehicle Delivery Quality sheet if all the subscribed services were activated within five previous days. If not, contact the commercial secretary.

[] Perform 2 starts vehicle in area covered by telephone operators.

[] Check the level of fuel, if necessary, add fuel.

2- VEHICLES ACCESSORIES:

[] Check the presence of the duplicate keys and cards.

[] Check the conformity of the vehicle documentations (model , language, exhaustivity).

1- CLEANING:

[] If necessary, wash the vehicle bodywork and vacuuming the interior of vehicle and the boot.

- [] Clean:
  - the dashboard,
  - the windows (inside and outside).

2- ENGINE COMPARTMENT:

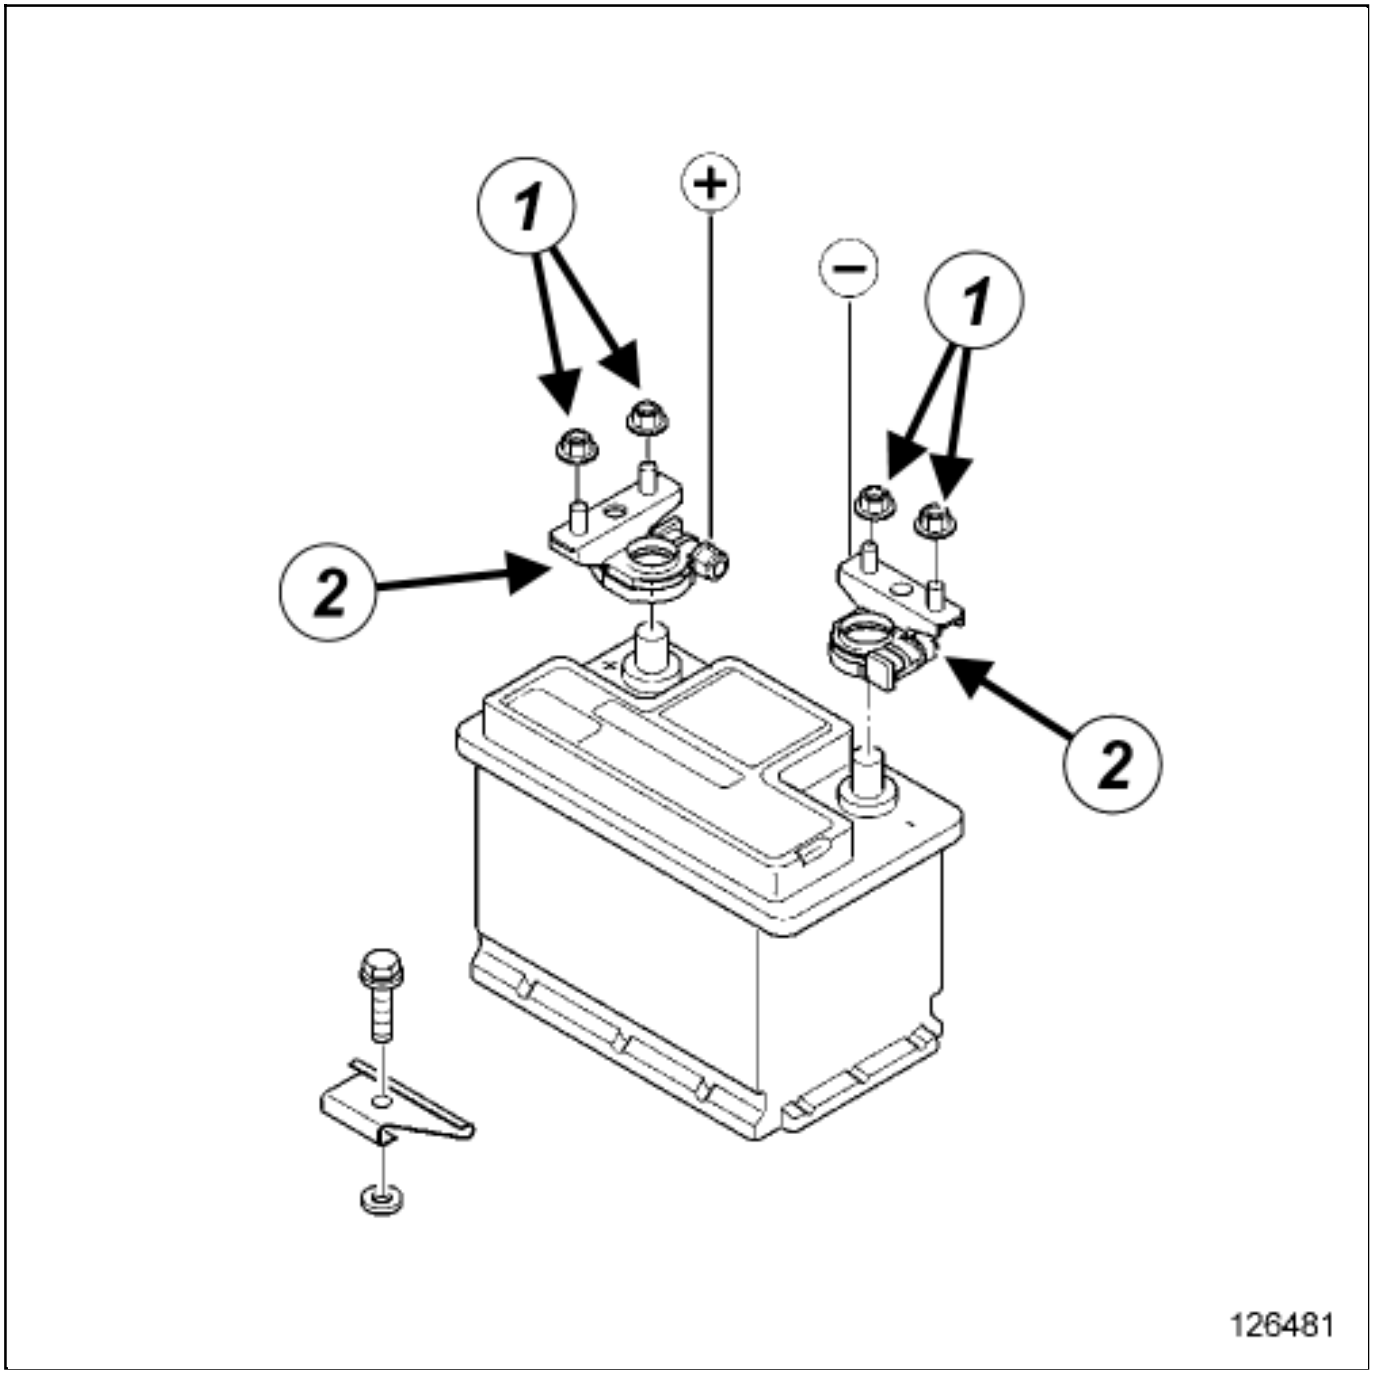
1)CHECKING THE BATTERY:

Note:

Transfer the vehicle to the workshop if you reply << YES >> to one of the following 4 questions.

[] 1) Did the vehicle not start on its own?

[] 2) Is the battery's magic eye not green or is there a specific message on the instrument panel?



Note:

Specific message on the instrument panel, 2 possibilities:

1 - Written message: "Recharge battery" or "Battery low, start the engine".

2 - Battery charge warning light flashes.

[] 3) Are the stud nuts(1) loose (turn the cables from right to left)?

[] 4) Are the battery stud terminal(2) nuts loose (turn the terminals from right to left)?

3- VEHICLE INTERIOR: PASSENGER COMPARTMENT CONTROLS

1)ACTIVATE AND INITIALISE:

[] The navigation system, store the customer's address (see the user manual for the navigation system).

[] The trip computer display (see Driver's Handbook, Trip computer).

[] Remove the vehicle's interior protection (except from the driver's seat).

[] The oil service interval display on the trip computer (see Driver's Handbook, Trip computer).

[] If a warning light comes on or an error message is displayed on the instrument panel, the vehicle will need to be transferred to the workshop.

4- ACCESSORIES (TO BE FITTED BY THE TECHNICIAN PREPARING THE NEW VEHICLE):

[] Fit the accessories not requiring the vehicle to be transferred to the workshop (mats etc.).

[] Fit the antenna (depending on the vehicle).

[] Fit the wheel trims.

[] Fit the registration plates.

[] Fit the wheel plugs.

[] Fit the phone support.

5- APPEARANCE:

[] Treat non-compliance can be supported by the preparation (small scratches can be removed by the polish, stains, ...).

[] For matt paintings, all alterations must be made in the workshop. prohibiting the use of abrasives, polish typ.

NEW VEHICLE: GENERAL INFORMATION

INFORMATION

You will find 2 types of operational instructions in this Technical Note 3598A:

I . New vehicle operational instructions for preparation: The first part is applicable to vehicles that have not undergone new vehicle preparation. It describes all of the operations to be carried out before handing the vehicle over to the customer (see 01D, Mechanical introduction, New vehicle preparation: Description) .

II . New vehicle operational instructions for finishing: The second part is applicable to vehicles that have undergone new vehicle preparation outside the dealership (e.g. local subcontractor or centralised preparation such as in the United Kingdom, Belgium, Luxembourg and the Netherlands). It describes the final operations to be carried out before handing the vehicle over to the customer (see 01D, Mechanical introduction, New vehicle finish: Description) .

Edition number	Period	Addition
Edition 14	from 01/03/2008 to 30/06/2008	battery check procedure
Edition 15	from 01/07/2008 to 31/10/2008	special notes on X61, X35 and X45
Edition 16	from 01/11/2008 to 31/01/2009	special notes on X95
Edition 17	from 01/02/2009 to 31/05/2009	Navigation preparation: Description procedure
Edition 18	from 01/06/2009 to 31/09/2009	- special notes on X62 - Voice selection table in the Navigation preparation: Description procedure
Edition 19	from 01/10/2009 to 31/04/2010	- special notes on X38
Edition 20	from 01/05/2010 to 31/09/2010	special notes on X33
Edition 21	from 01/10/2010 to 31/12/2010	special notes on X43 additional information on the date of the battery check
Edition 22	from 01/01/2011 to 31/05/2011	commercial names of the new vehicles
Edition 23	from 01/06/2011 to 30/11/2011	special notes on electrical vehicles (X38 and X61

Edition 24	from 01/12/2011 to 31/01/2012	special notes on X09
Edition 25	from 01/02/2012 to 31/03/2012	special notes on X92
Edition 26	from 01/04/2012 to 30/11/2012	special notes on X10, X67 and X98
Edition 27	from 01/12/2012 to 20/05/2014	special notes on X52 and X87
Edition 28	from 20/05/2014 to __/__/____	special notes on X07 and X82

Code	Vehicle
X06	Twingo
X44	Twingo II
X76	Kangoo
X61	Kangoo II

NEW VEHICLE PREPARATION: DESCRIPTION

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

1. NEW VEHICLE OPERATIONAL INSTRUCTIONS FOR PREPARATION

This first part is applicable to vehicles that have not undergone new vehicle preparation. It describes all of the operations to be carried out before finishing which must be done .

1- ACCESS TO THE PREPARATION STATION

Note:

If the vehicle does not start, transfer it to the workshop.

Check the operation of the windscreen wiper.

Check the operation of the windscreen and headlight washer jets.

Check the operation of the rear screen wiper.

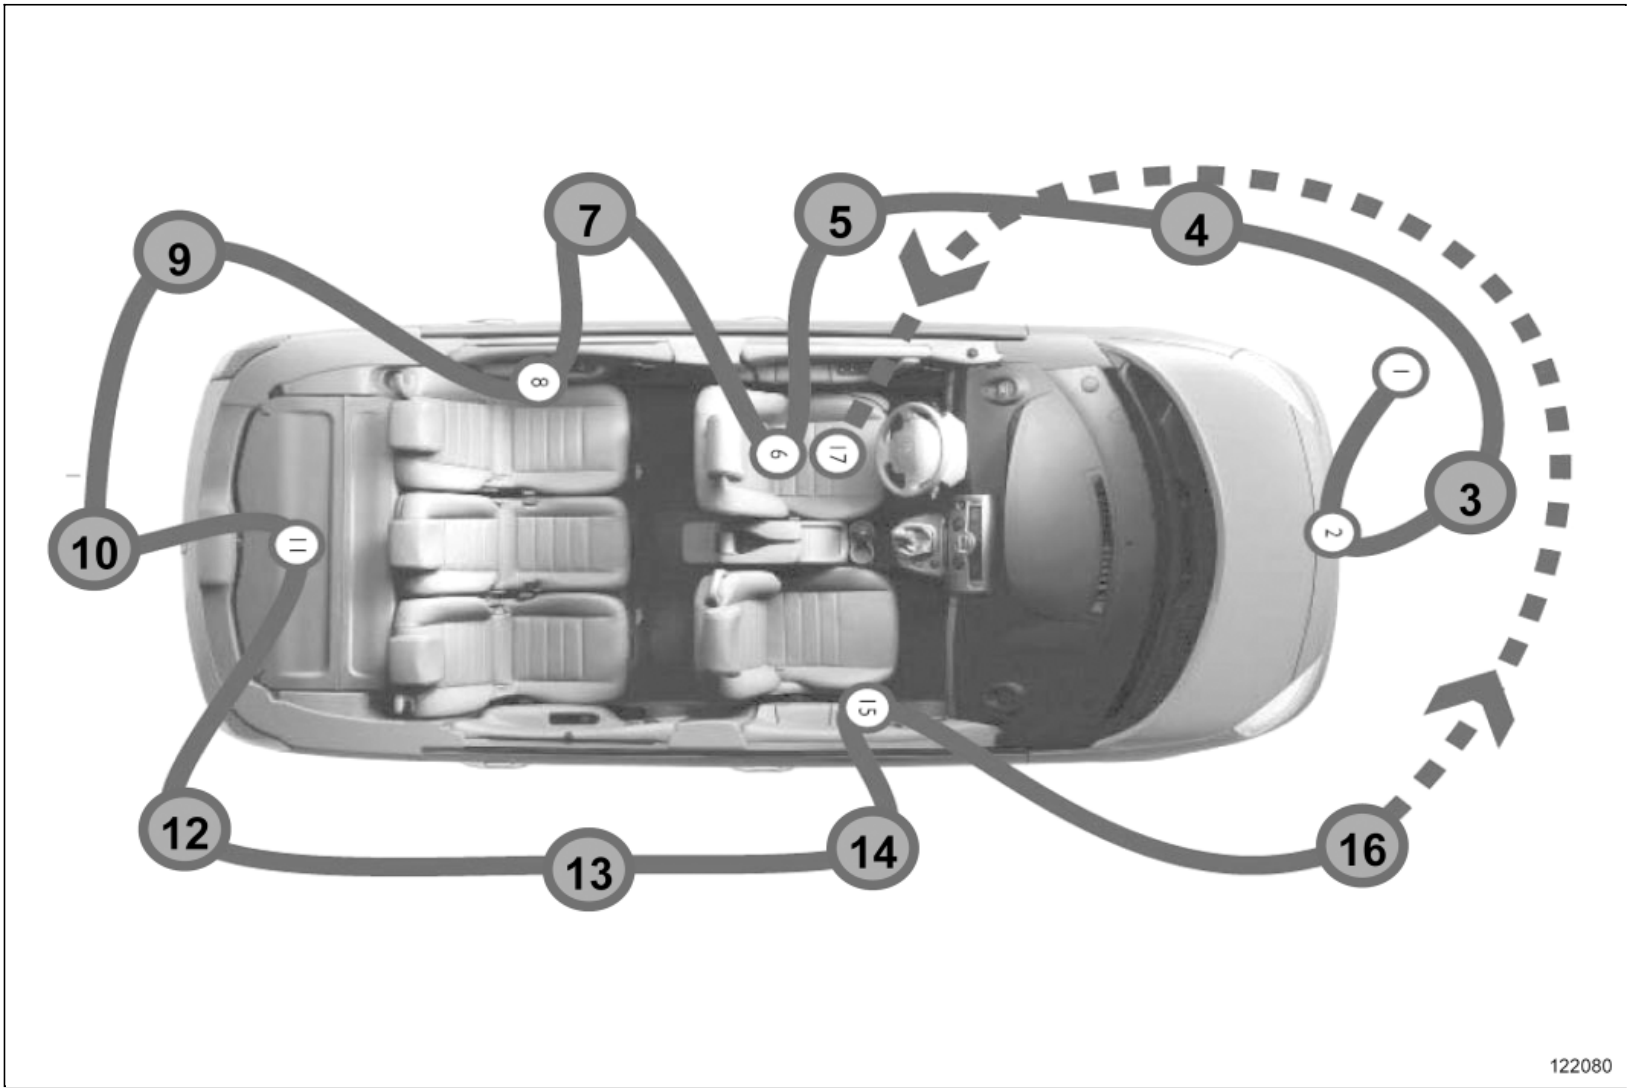
Check the ventilation in all positions with the air vents open (including manual or automatic air conditioning mode). Do not close the air vents after the check.

2- REMOVING THE PROTECTION AND CHECKING THE APPEARANCE OF THE VEHICLE

1)REMOVING THE VEHICLE PROTECTION

Remove the wiper blade shims.

Remove the rubber and adhesive protection (rear screen, rear windows, etc.).



Remove the protective shims on the rear lights.

For vehicles that are protected by film(packaging code 2): remove the vehicle protection(see 01C, Vehicle bodywork specifications, Removing the vehicle protection: Description)

For vehicles that are protected by copolymer(packaging code 4): Remove the vehicle protection(see 01C, Vehicle bodywork specifications, Removing the vehicle protection: Description)

Watch the bodywork.

1)CHECKING THE APPEARANCE OF THE VEHICLE

Open the bonnet from the carrier.

Area to check	Check
3 - Front end panel	
Bonnet	Operation and noise when opening and closing the bonnet Damage to appearance (panelwork, paintwork) Damage to headlights, fog lights Leaks under the vehicle and underbody protruding components
Roof	
Windscreen	
Headlights	
Radiator grille	
Front bumper	
4 - Left-hand side panel and roof / front left-hand wing panel	
Left-hand side panel and roof	Damage to appearance (panelwork, paintwork)
Front left-hand wing	
5 - Front left-hand door	
Front left-hand door Front left mirror	Operation and noise when opening and closing the front left-hand door Damage to appearance (panelwork, paintwork) Window cracks
7 - Rear left-hand door	
Rear left-hand door	Operation and noise when opening and closing the rear left-hand door Damage to appearance (panelwork, paintwork)
9 - Rear left-hand wing / left-hand side panel	
Rear left-hand wing	Damage to appearance (panelwork, paintwork)
Left-hand side panel, quarter panel and roof	Damage to appearance (panelwork, paintwork)
10 - Rear panel	
Rear panel: tailgate, luggage compartment lid, rear screen, rear bumper, lights, etc.	Operation and noise when opening and closing the luggage compartment lid or tailgate Damage to appearance (panelwork, paintwork) Parts protruding under the vehicle
12 - Rear right-hand wing	
Rear right-hand wing	Damage to appearance (panelwork, paintwork)
13 - Rear right-hand door	
Rear right-hand door	Operation and noise when opening and closing the rear right-hand door Damage to appearance (panelwork, paintwork)
14 - Front right-hand door	

Front right-hand door Front right mirror	Operation and noise when opening and closing the front right-hand door Damage to appearance (panelwork, paintwork) Window cracks
16 - Front right-hand wing / right-hand side panel and roof	
Front right-hand wing	Damage to appearance (panelwork, paintwork)
Right-hand side panel and roof	Damage to appearance (panelwork, paintwork)

1- ENGINE COMPARTMENT

1)CHECKING THE BATTERY

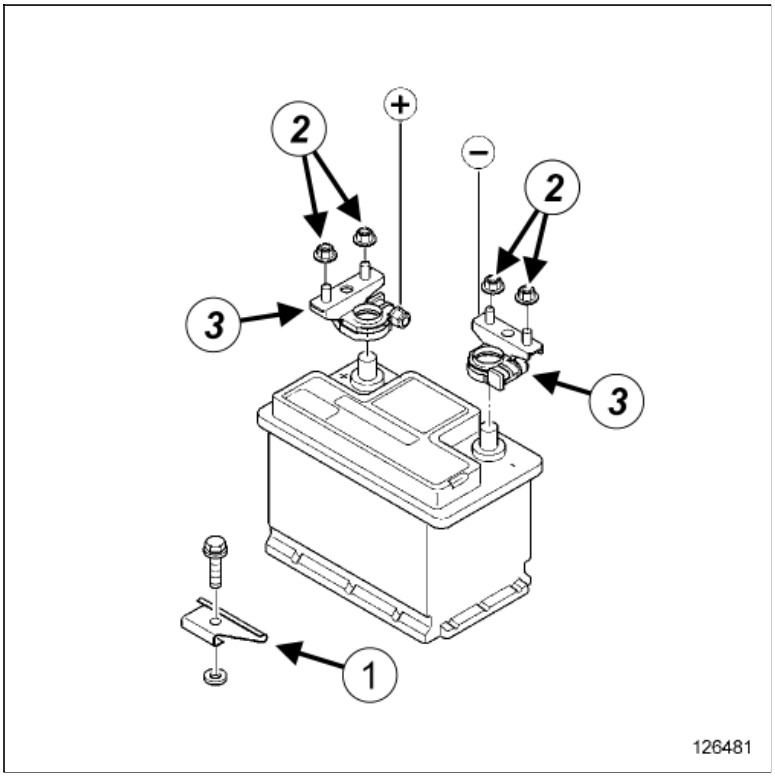
Note:

Transfer the vehicle to the workshop if one of following failure occurs.

Did the vehicle not start on its own?

Is the battery more than 12 months old?

Does the battery show traces of acid and/or sulphation and/or impact?



Is the battery's magic eye not green or is there a specific message on the instrument panel?

Note:

Specific message on the instrument panel, 2 possibilities:

1 - Written message: "Recharge battery" or "Battery low, start the engine".

2 - Battery charge warning light flashes.

Is the battery bracket(1) loose (turn the battery from right to left)?

Are the stud nuts(2) loose (turn to the cables from right to left)?

Are the battery stud terminal nuts(3) loose (turn the terminals from right to left)?

Position the battery cover ready in the luggage compartment Battery: Removal - Refitting (MR for the vehicle, 80A, Battery).

Fit the cover onto the diagnostic socket.

2)CHECKING AND TOPPING UP THE FLUIDS (IF NECESSARY) (ENGINE OFF AND COLD)

Note:

All vehicle levels following the new vehicle preparation process must comply with the acceptance criteria described below.

Topping up the fluid is often required because of a leak in the circuit.

CAUTION

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

Wipe away any oil run-off.

	Minimum value	Maximum value	Type of gauge
[]Windscreen washer fluid	Maximum	Maximum	
[]Power-assisted steering fluid (depending on model and engine)	Medium between minimum and maximum	Maximum	On the reservoir
[]Brake fluid (two possible procedures depending on the vehicle)	Medium between minimum and maximum or instrument panel warning light	Maximum or instrument panel warning light	On the reservoir
	Check that the brake fluid level warning light goes out on the instrument panel (see Driver's Handbook)		
[]Coolant	Minimum + 10 mm	Maximum	On the reservoir
[]Engine oil	Maximum - 5 mm	Maximum	Mechanical on the engine

2- WHEELS AND TYRES

Check if the tyres are damaged (tyres with notches, scratched, etc.).

Check that the valve caps are present, including the emergency spare wheel.

Check and inflate the tyres, including the emergency spare wheel (see Driver's handbook, Tyre pressure).

3- BOOT

Check that the tyre repair aerosol is present (depending on the vehicle).

Check that the luggage compartment light is operating correctly.

Check that the tool kit is present (jack, hubcap tool, tow eye, wheel wrench).

4- VEHICLE EXTERIOR: PASSENGER COMPARTMENT CONTROLS

1)CHECK THAT THE FOLLOWING ARE OPERATIONAL

Locks and keys or cards (including duplicates).

Unlock and lock from the inside

Side lights.

Dipped headlights.

Cornering dipped headlights.

Main beam headlights.

Fixed cornering lights.

Direction indicators.

Fog lights.

Brake lights.

Reverse gear lights.

Hazard warning lights.

Number plate lights.

Fit the consumer cut-out fuse.

5- VEHICLE INTERIOR: PASSENGER COMPARTMENT CONTROLS

1)CHECK THAT THE FOLLOWING ARE OPERATIONAL

Note:

Transfer the vehicle to the workshop in the event of a fault.

Front and rear interior lights and map reading light.

Glove box light,

Courtesy lights.

Storage compartment lights.

Instrument panel lighting (Instrument panel: Removal - Refitting).

Lights-on reminder buzzer (with a door open).

Seats (including access to the rear seats).

Steering wheel adjsutment

Rear door safety catch.

Rear view mirrors.

2)ACTIVATE AND INITIALIZE

The radio: enter the anti-theft code (see Radio user manual).

The daytime running lights (see Driver's handbook, Exterior lighting and signage).

The anti-intruder device (see Driver's Handbook, Anti-intruder device).

The Carminat TomTom Navigation system and R-link ,put the SD card and store the customer's address(see 01D, Mechanical introduction, Navigation preparation: Description) .

The time (see Driver's handbook, Clock).

The trip computer display (see Driver's Handbook, Trip computer).

The oil service interval display on the trip computer (see Driver's Handbook, Trip computer).

3)CHECKER

If a warning light comes on or an error message is displayed on the instrument panel, the vehicle will need to be transferred to the workshop.

Repair-00x01x01x20-02x21-1-2-1.xml

XSL version : 3.02 du 22/07/11

NEW VEHICLE PREPARATION: DESCRIPTION

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

1. NEW VEHICLE OPERATIONAL INSTRUCTIONS FOR PREPARATION

This first part is applicable to vehicles that have not undergone new vehicle preparation. It describes all of the operations to be carried out before finishing which must be done .

1- ACCESS TO THE PREPARATION STATION

Note:

If the vehicle does not start, transfer it to the workshop.

Check the operation of the windscreen wiper.

Check the operation of the windscreen and headlight washer jets.

Check the operation of the rear screen wiper.

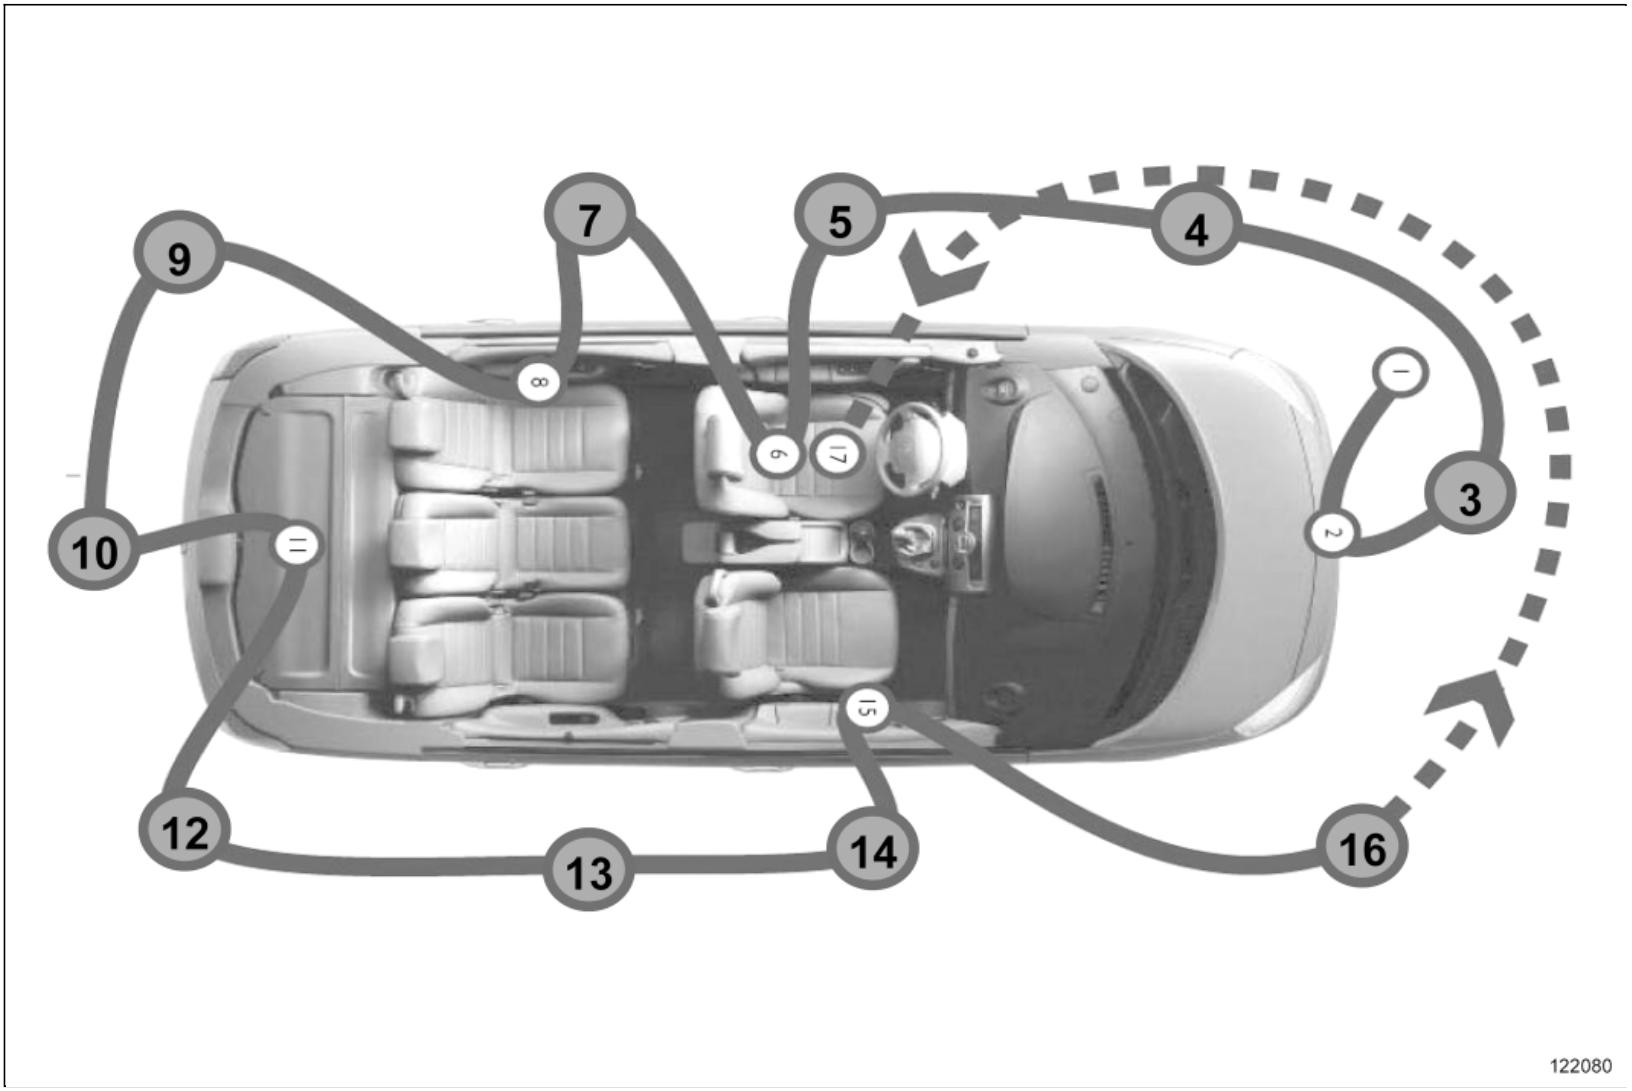
Check the ventilation in all positions with the air vents open (including manual or automatic air conditioning mode). Do not close the air vents after the check.

2- REMOVING THE PROTECTION AND CHECKING THE APPEARANCE OF THE VEHICLE

1)REMOVING THE VEHICLE PROTECTION

Remove the wiper blade shims.

Remove the rubber and adhesive protection (rear screen, rear windows, etc.).



Remove the protective shims on the rear lights.

For vehicles that are protected by film(packaging code 2): remove the vehicle protection(see 01C, Vehicle bodywork specifications, Removing the vehicle protection: Description)

For vehicles that are protected by copolymer(packaging code 4): Remove the vehicle protection(see 01C, Vehicle bodywork specifications, Removing the vehicle protection: Description)

Watch the bodywork.

1)CHECKING THE APPEARANCE OF THE VEHICLE

Open the bonnet from the carrier.

Area to check	Check

14 - Front right-hand door	

Front right-hand door Front right mirror	Operation and noise when opening and closing the front right-hand door Damage to appearance (panelwork, paintwork) Window cracks
16 - Front right-hand wing / right-hand side panel and roof	
Front right-hand wing	Damage to appearance (panelwork, paintwork)
Right-hand side panel and roof	Damage to appearance (panelwork, paintwork)

1- ENGINE COMPARTMENT

1)CHECKING THE BATTERY

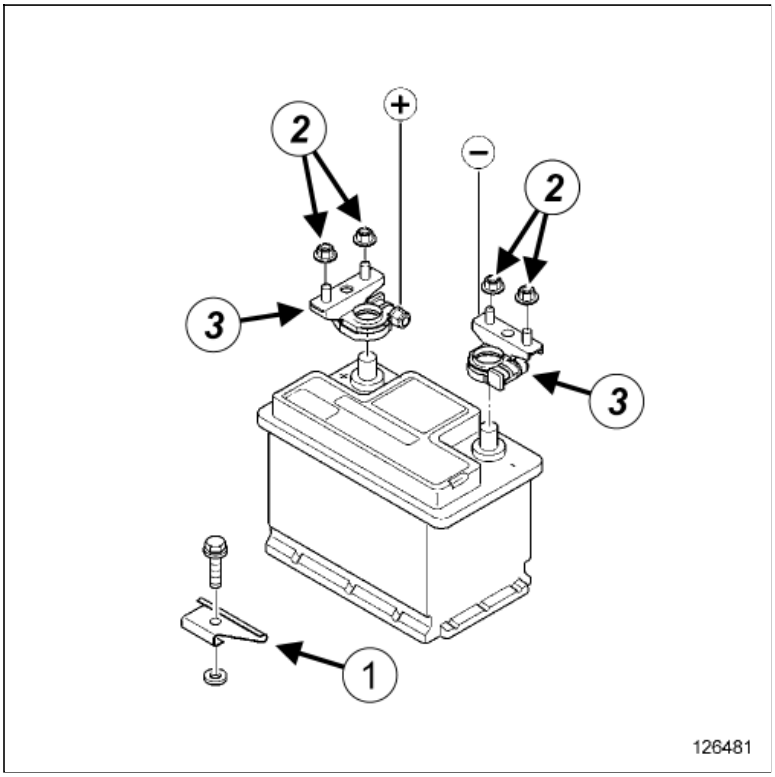
Note:

Transfer the vehicle to the workshop if one of following failure occurs.

Did the vehicle not start on its own?

Is the battery more than 12 months old?

Does the battery show traces of acid and/or sulphation and/or impact?



Is the battery's magic eye not green or is there a specific message on the instrument panel?

Note:

Specific message on the instrument panel, 2 possibilities:

1 - Written message: "Recharge battery" or "Battery low, start the engine".

2 - Battery charge warning light flashes.

Is the battery bracket(1) loose (turn the battery from right to left)?

Are the stud nuts(2) loose (turn to the cables from right to left)?

Are the battery stud terminal nuts(3) loose (turn the terminals from right to left)?

Position the battery cover ready in the luggage compartment Battery: Removal - Refitting (MR for the vehicle, 80A, Battery).

Fit the cover onto the diagnostic socket.

2)CHECKING AND TOPPING UP THE FLUIDS (IF NECESSARY) (ENGINE OFF AND COLD)

Note:

All vehicle levels following the new vehicle preparation process must comply with the acceptance criteria described below.

Topping up the fluid is often required because of a leak in the circuit.

CAUTION

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

Wipe away any oil run-off.

	Minimum value	Maximum value	Type of gauge
[]Windscreen washer fluid	Maximum	Maximum	
[]Power-assisted steering fluid (depending on model and engine)	Medium between minimum and maximum	Maximum	On the reservoir
[]Brake fluid (two possible procedures depending on the vehicle)	Medium between minimum and maximum or instrument panel warning light	Maximum or instrument panel warning light	On the reservoir
	Check that the brake fluid level warning light goes out on the instrument panel (see Driver's Handbook)		
[]Coolant	Minimum + 10 mm	Maximum	On the reservoir
[]Engine oil	Maximum - 5 mm	Maximum	Mechanical on the engine

2- WHEELS AND TYRES

Check if the tyres are damaged (tyres with notches, scratched, etc.).

Check that the valve caps are present, including the emergency spare wheel.

Check and inflate the tyres, including the emergency spare wheel (see Driver's handbook, Tyre pressure).

3- BOOT

Check that the tyre repair aerosol is present (depending on the vehicle).

Check that the luggage compartment light is operating correctly.

Check that the tool kit is present (jack, hubcap tool, tow eye, wheel wrench).

4- VEHICLE EXTERIOR: PASSENGER COMPARTMENT CONTROLS

1)CHECK THAT THE FOLLOWING ARE OPERATIONAL

Locks and keys or cards (including duplicates).

Unlock and lock from the inside

Side lights.

Dipped headlights.

Cornering dipped headlights.

Main beam headlights.

Fixed cornering lights.

Direction indicators.

Fog lights.

Brake lights.

Reverse gear lights.

Hazard warning lights.

Number plate lights.

Fit the consumer cut-out fuse.

5- VEHICLE INTERIOR: PASSENGER COMPARTMENT CONTROLS

1)CHECK THAT THE FOLLOWING ARE OPERATIONAL

Note:

Transfer the vehicle to the workshop in the event of a fault.

Front and rear interior lights and map reading light.

Glove box light,

Courtesy lights.

Storage compartment lights.

Instrument panel lighting (Instrument panel: Removal - Refitting).

Lights-on reminder buzzer (with a door open).

Seats (including access to the rear seats).

Steering wheel adjsutment

Rear door safety catch.

Rear view mirrors.

2)ACTIVATE AND INITIALIZE

The radio: enter the anti-theft code (see Radio user manual).

The daytime running lights (see Driver's handbook, Exterior lighting and signage).

The anti-intruder device (see Driver's Handbook, Anti-intruder device).

The Carminat TomTom Navigation system and R-link ,put the SD card and store the customer's address(see 01D, Mechanical introduction, Navigation preparation: Description) .

The time (see Driver's handbook, Clock).

The trip computer display (see Driver's Handbook, Trip computer).

The oil service interval display on the trip computer (see Driver's Handbook, Trip computer).

3)CHECKER

If a warning light comes on or an error message is displayed on the instrument panel, the vehicle will need to be transferred to the workshop.

Repair-00x01x01x20-02x21-1-2-1.xml

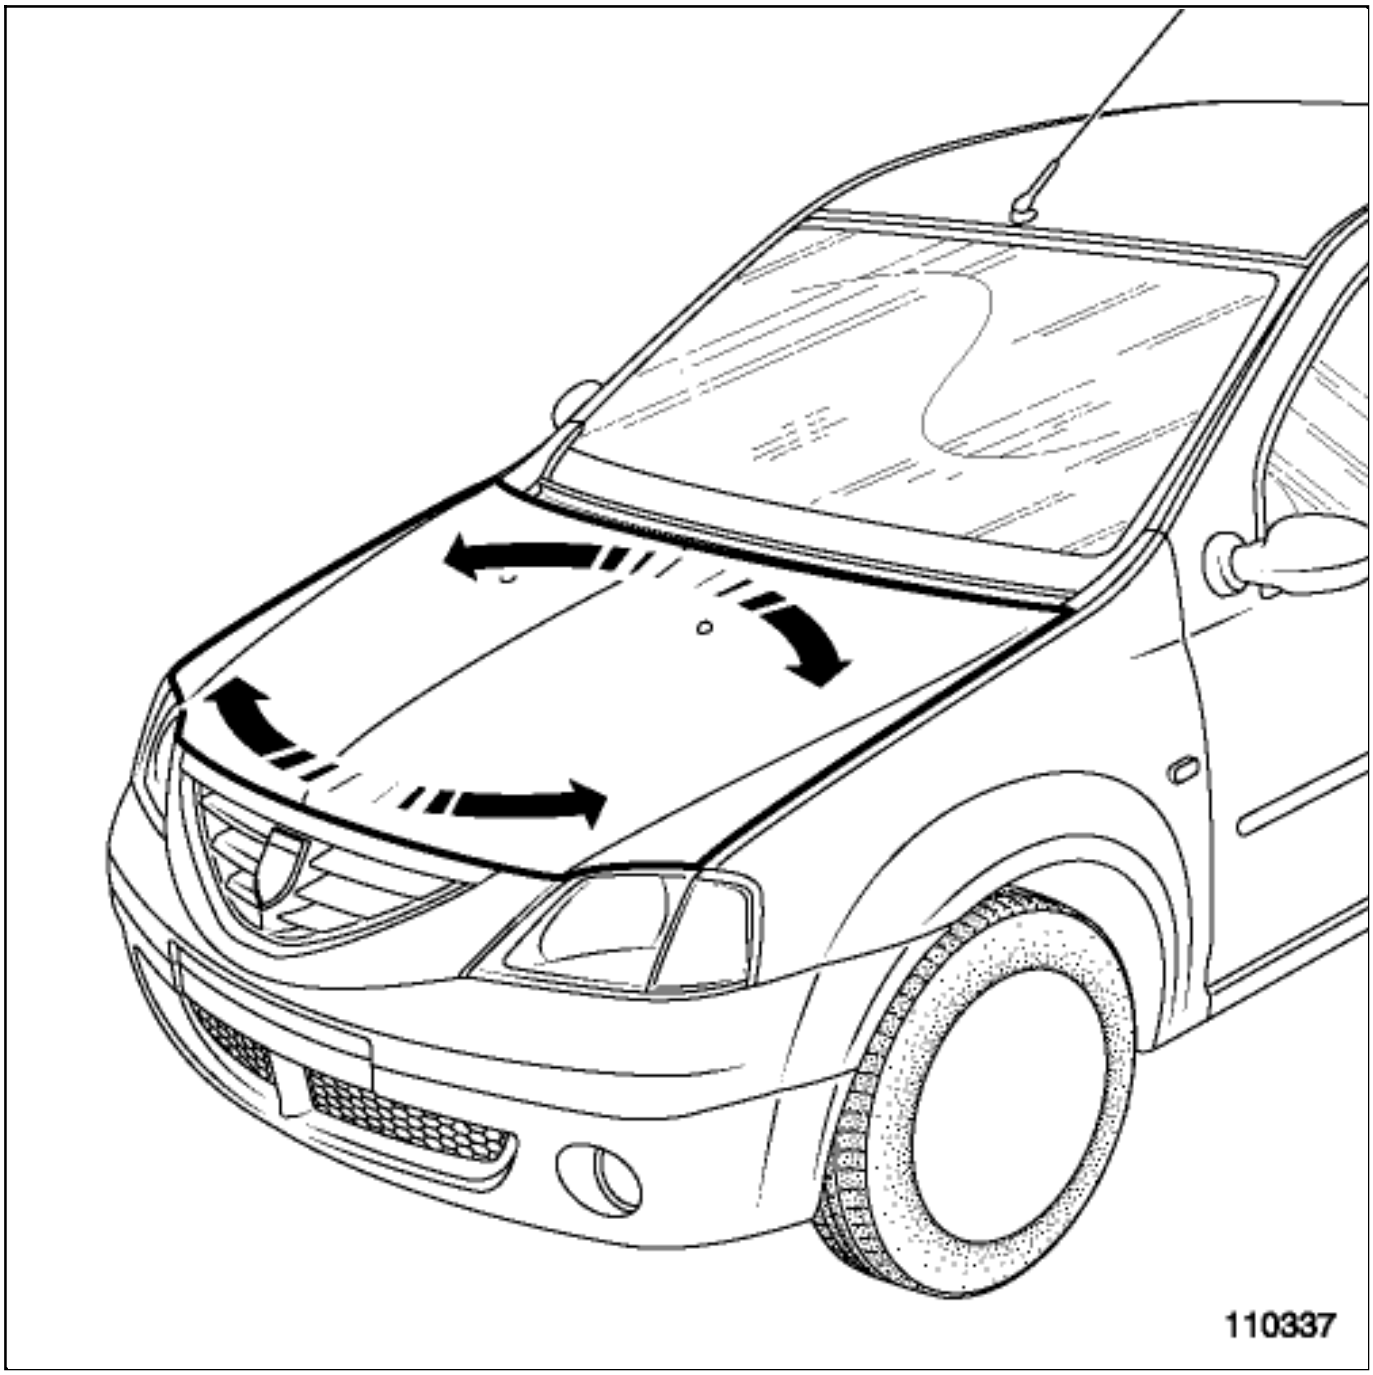
XSL version : 3.02 du 22/07/11

NON-SIDEOPENINGELEMENTS:ADJUSTMENT

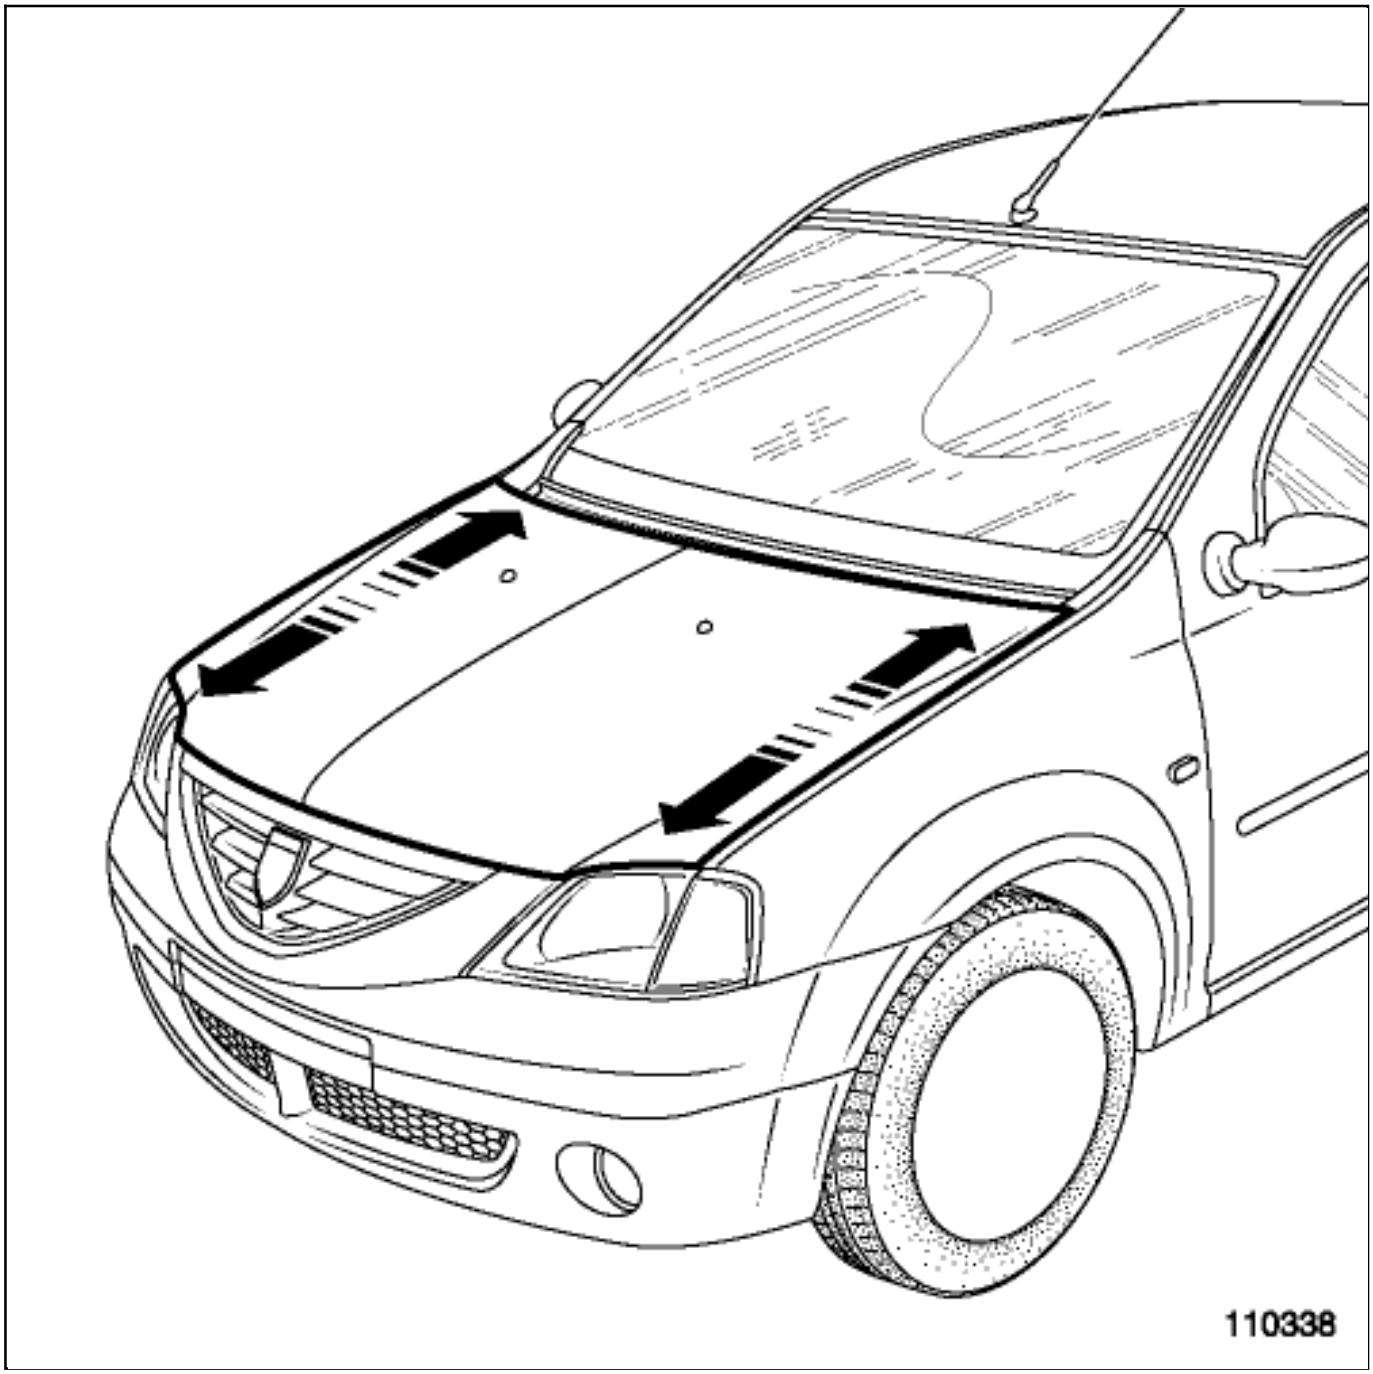
1. BONNET

Check that the peripheral components are adjusted correctly.

The lock and/or the retaining hook of the bonnet must be removed or loosened in order not to create any obstruction when in the closed position.

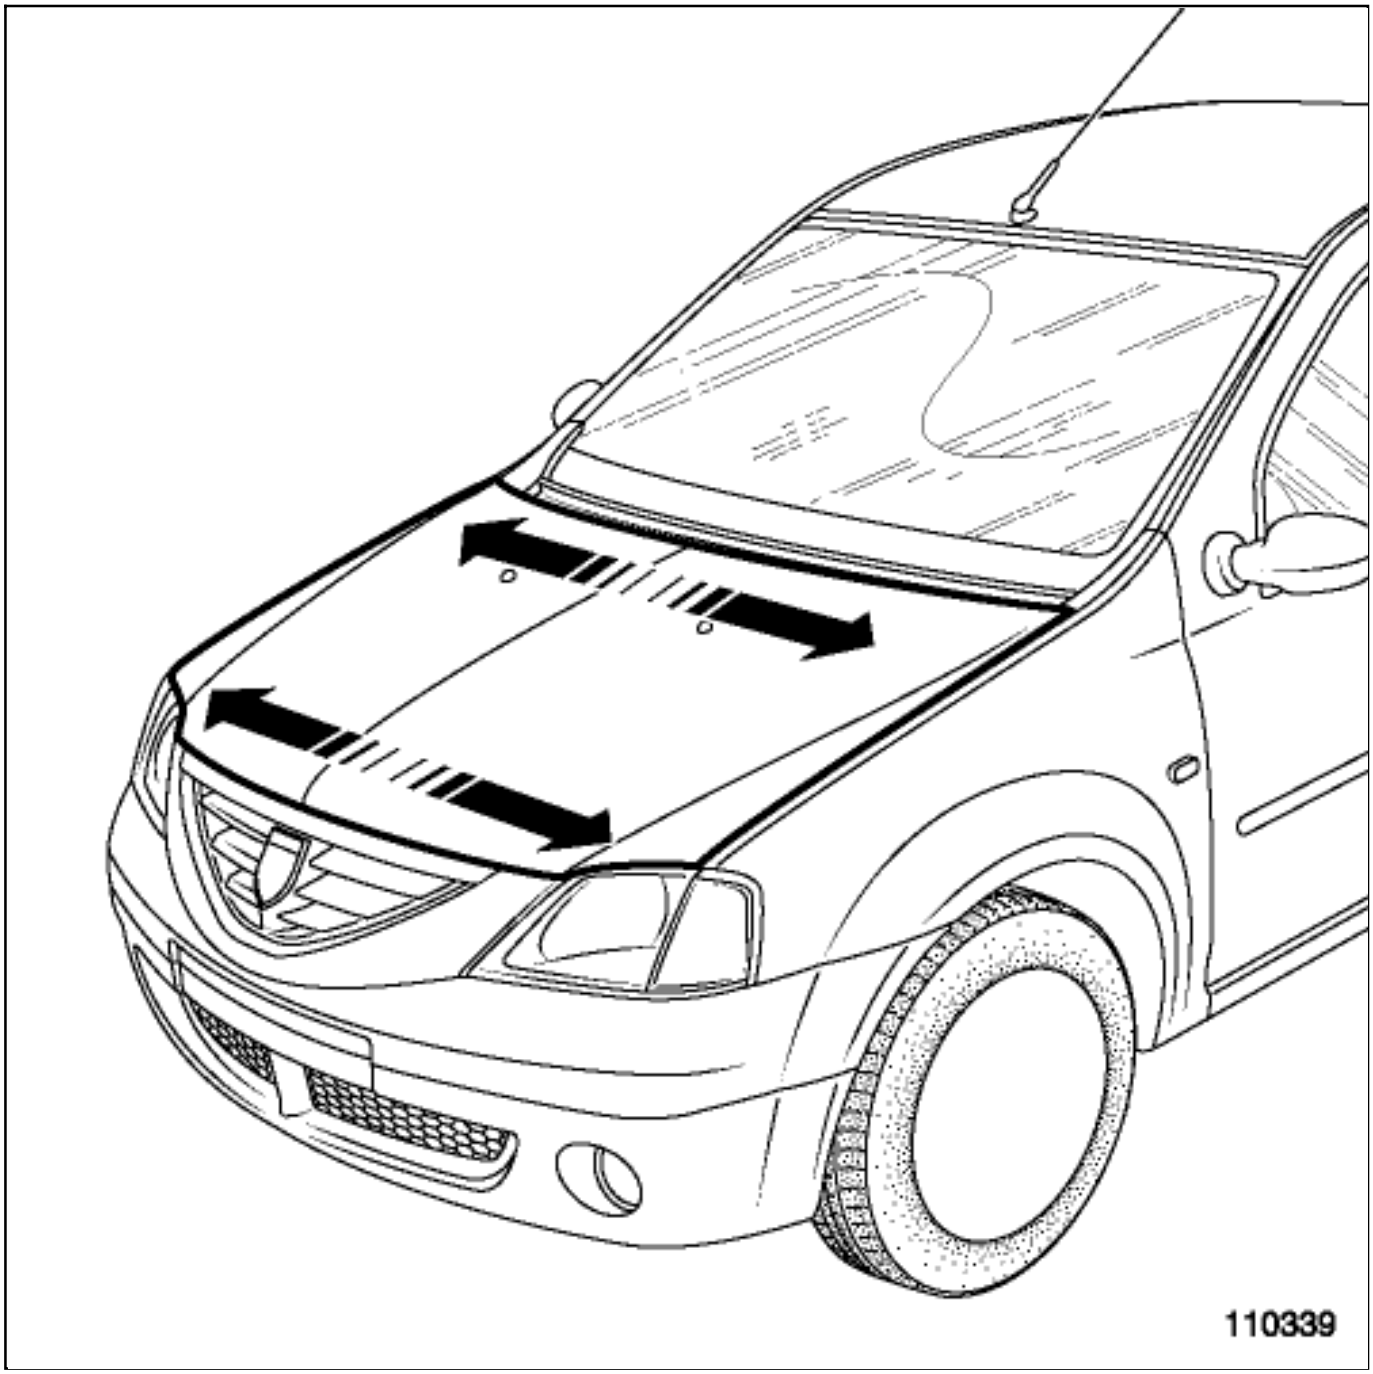


Fit the bonnet, pre-tightening in the middle of the adjustment.

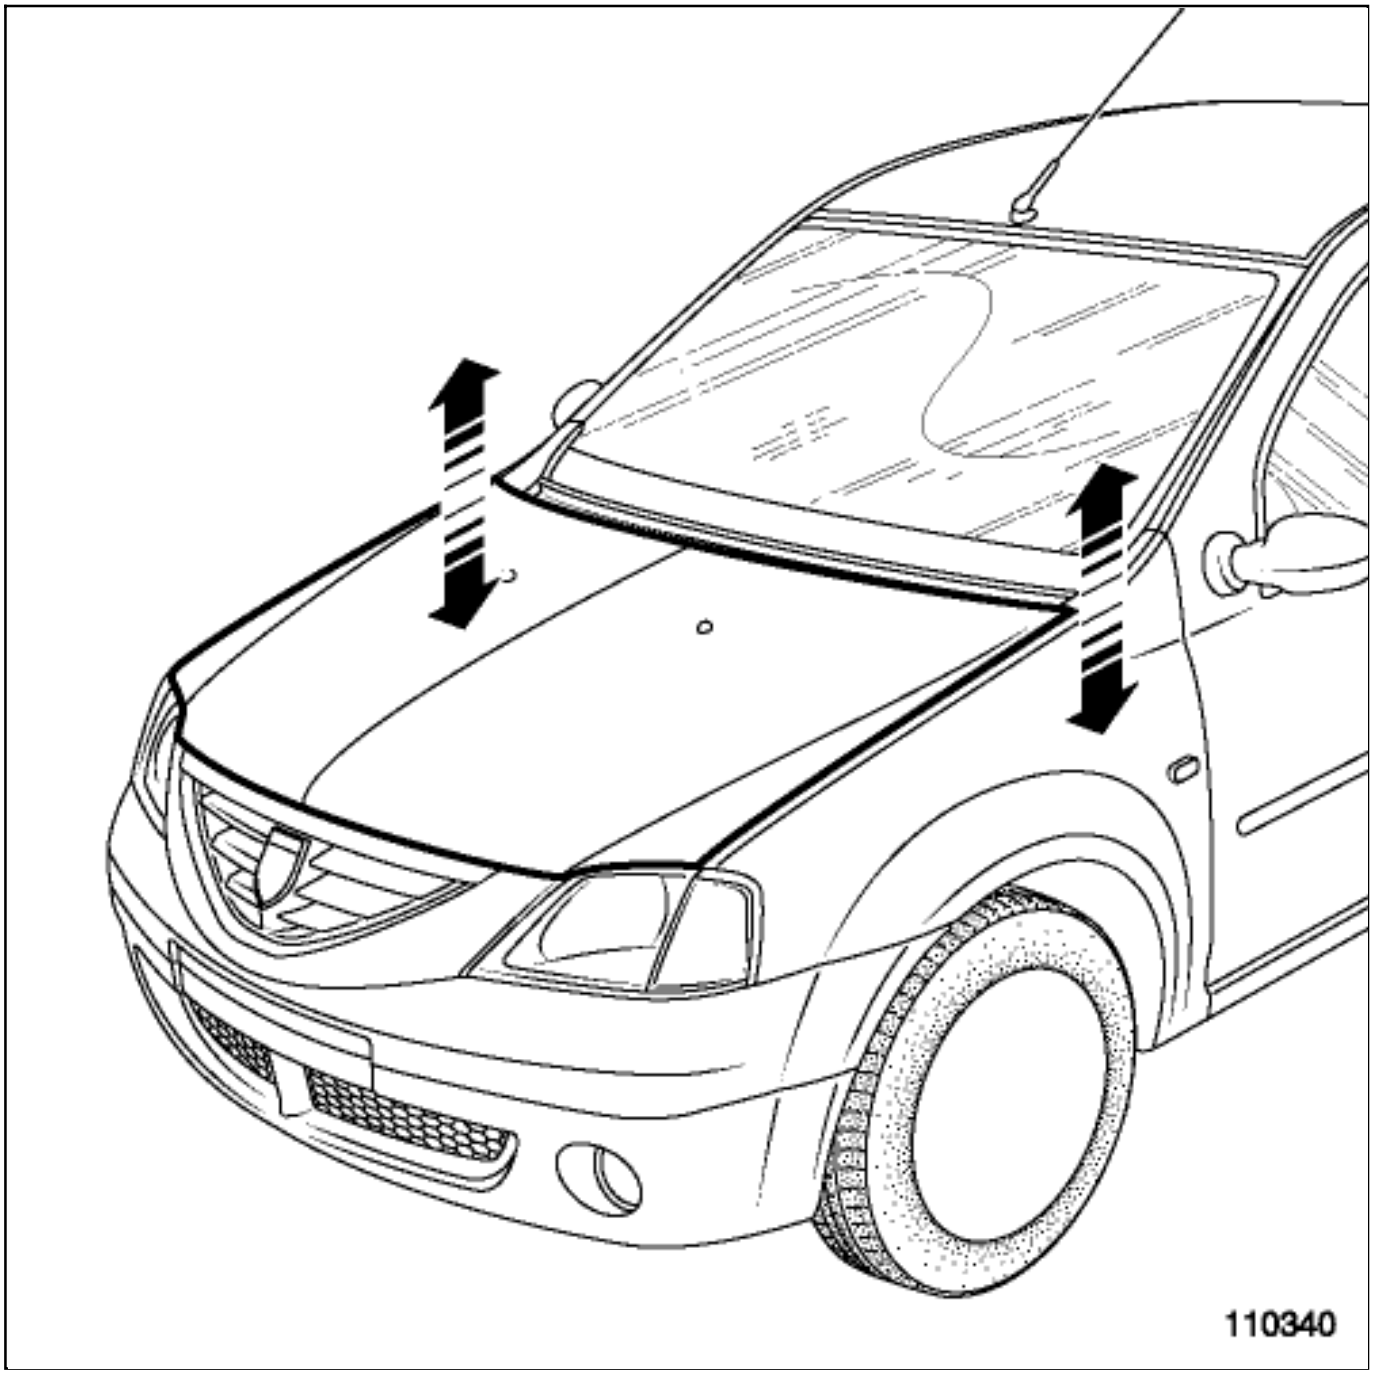


Note:

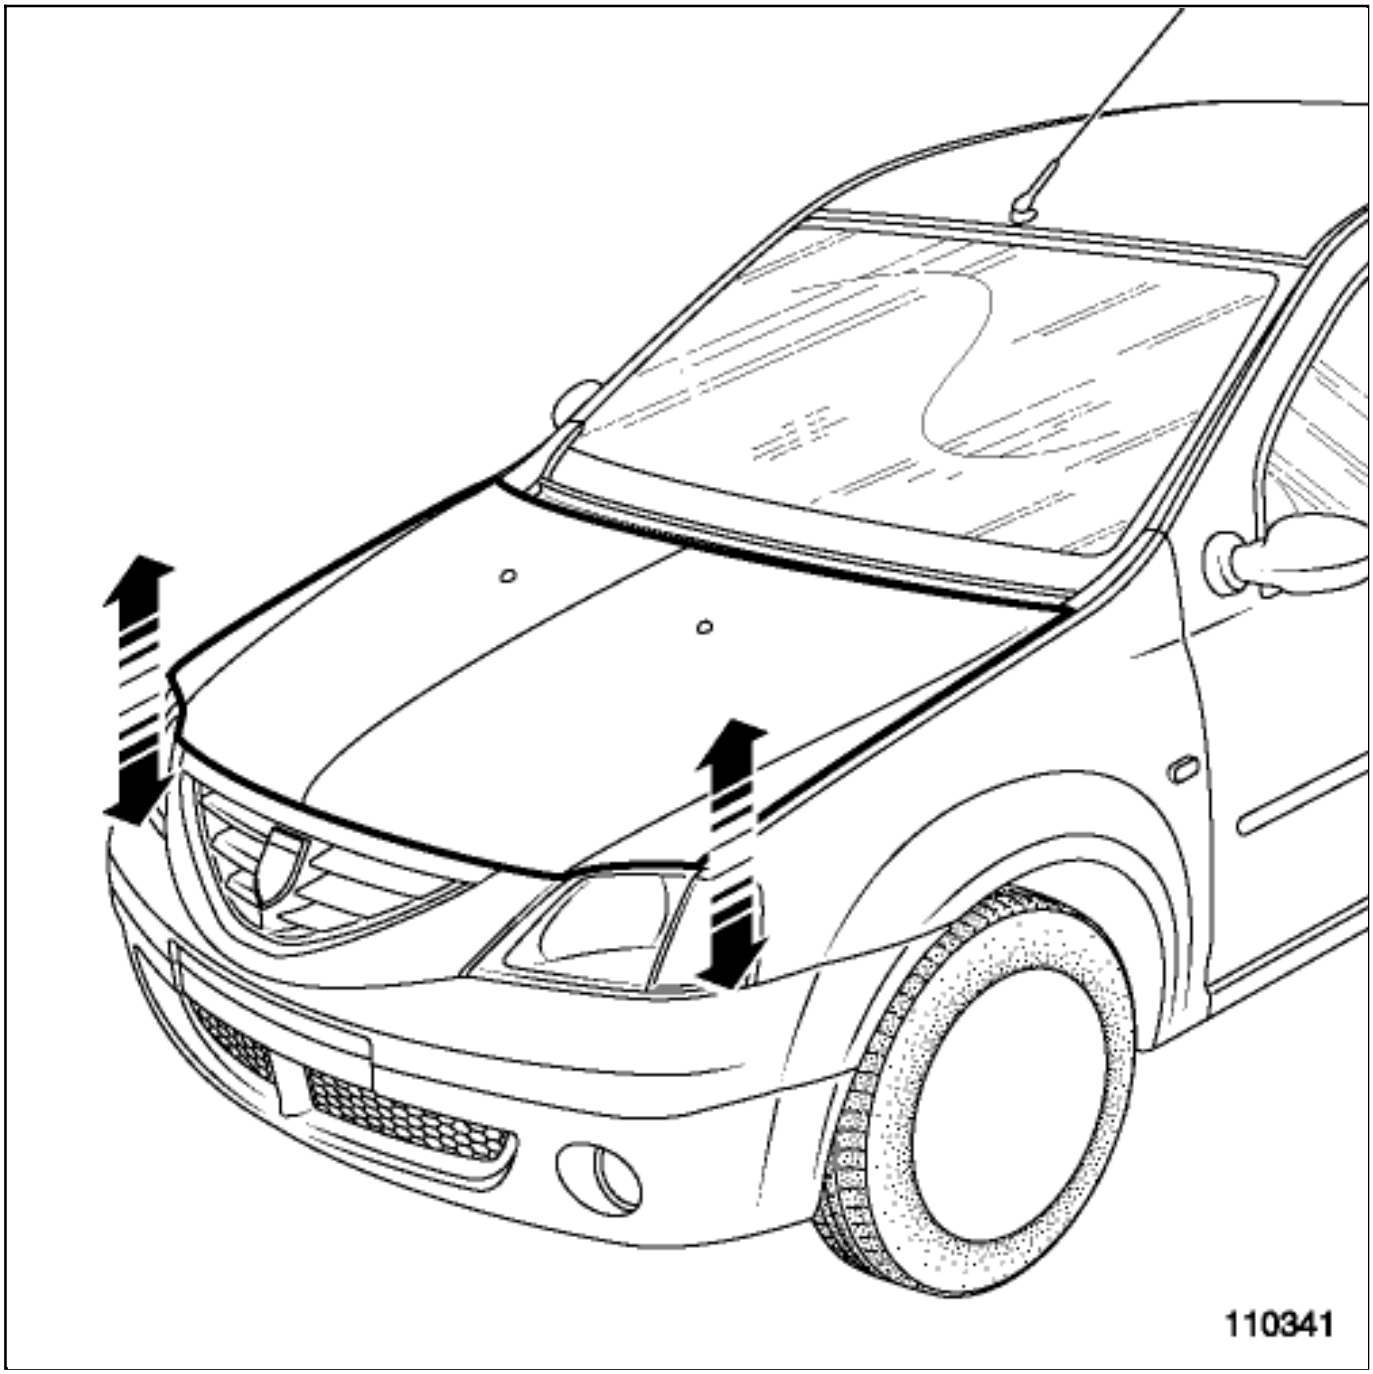
For information about the adjustment zones, refer to the MR for the vehicle concerned.



1- ADJUSTMENT CHRONOLOGY



- Adjust the centring of the bonnet (angle).



Adjust the longitudinal alignment; the bonnet/windscreen pillar and bonnet/headlight alignment.

Adjust the side alignment of the bonnet/wings; this must be identical on each side, and there must be the possibility of clearance on the wing adjustments.

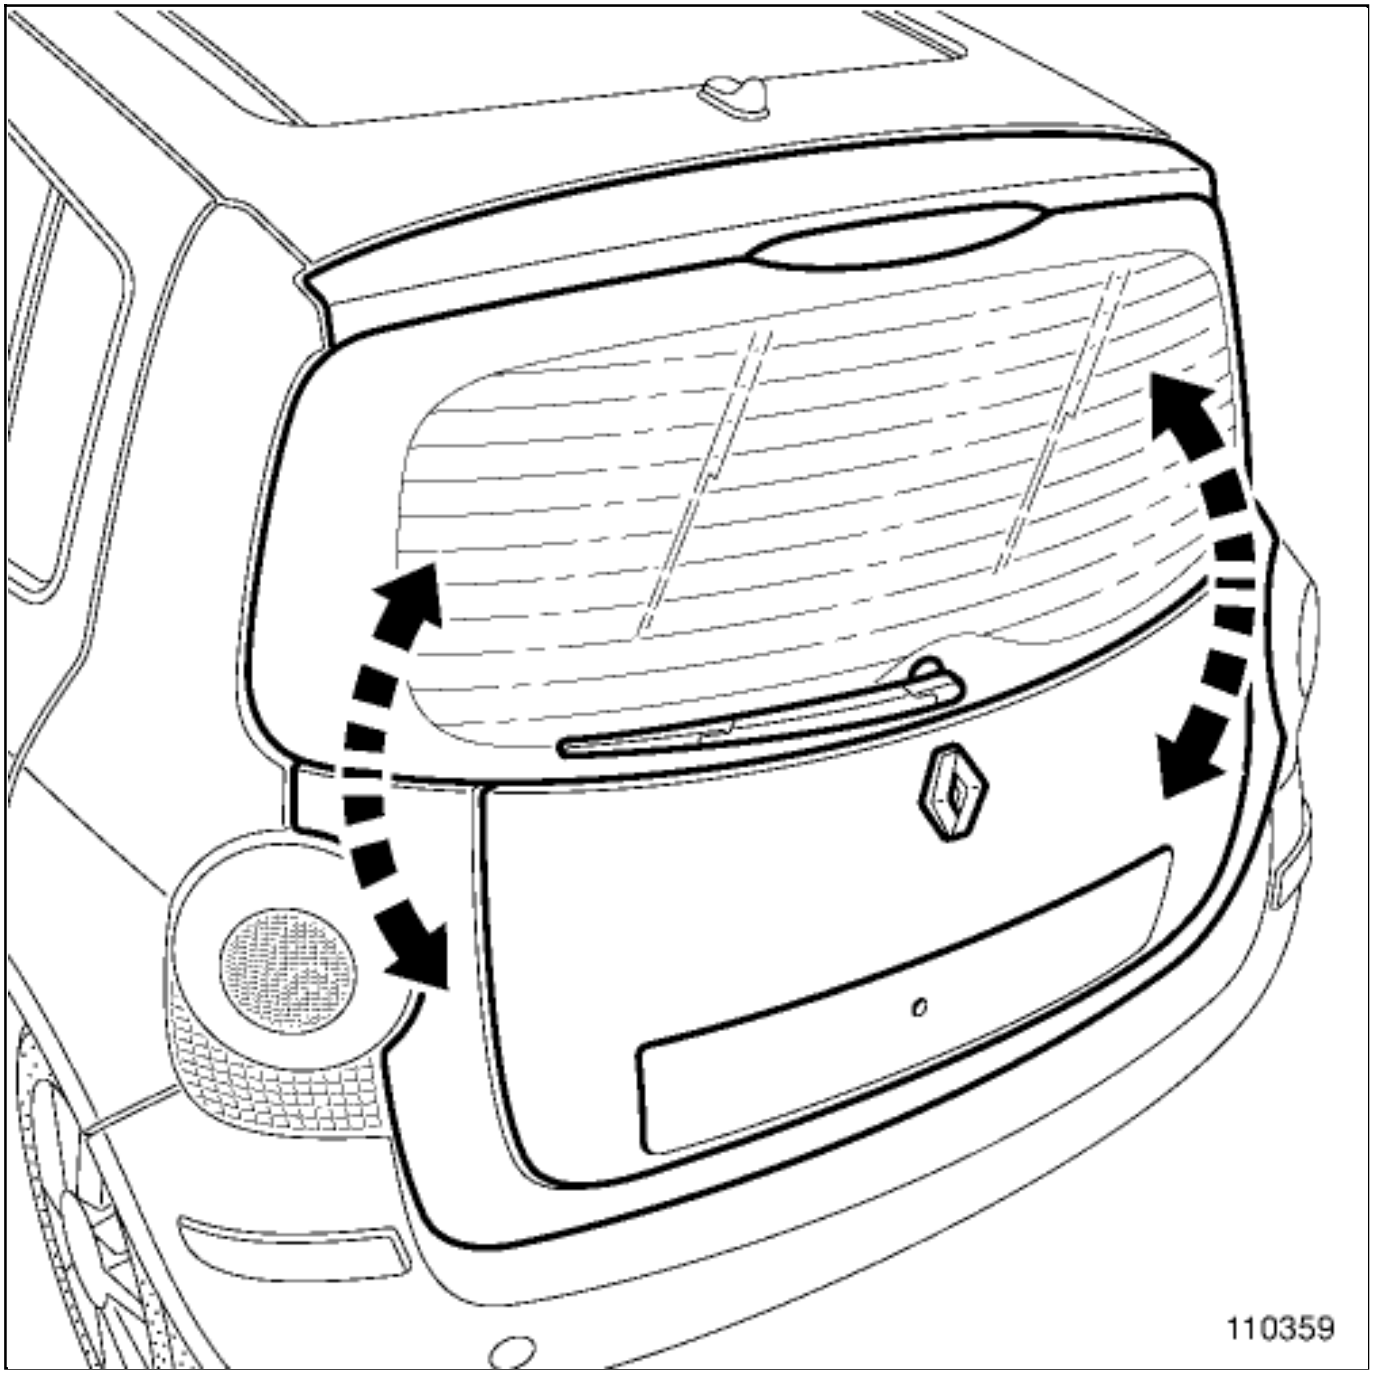
Adjust the bonnet rear flush fitting.

Adjust the bonnet front flush fitting.

Check the adjustment and the correct operation then tighten into position.

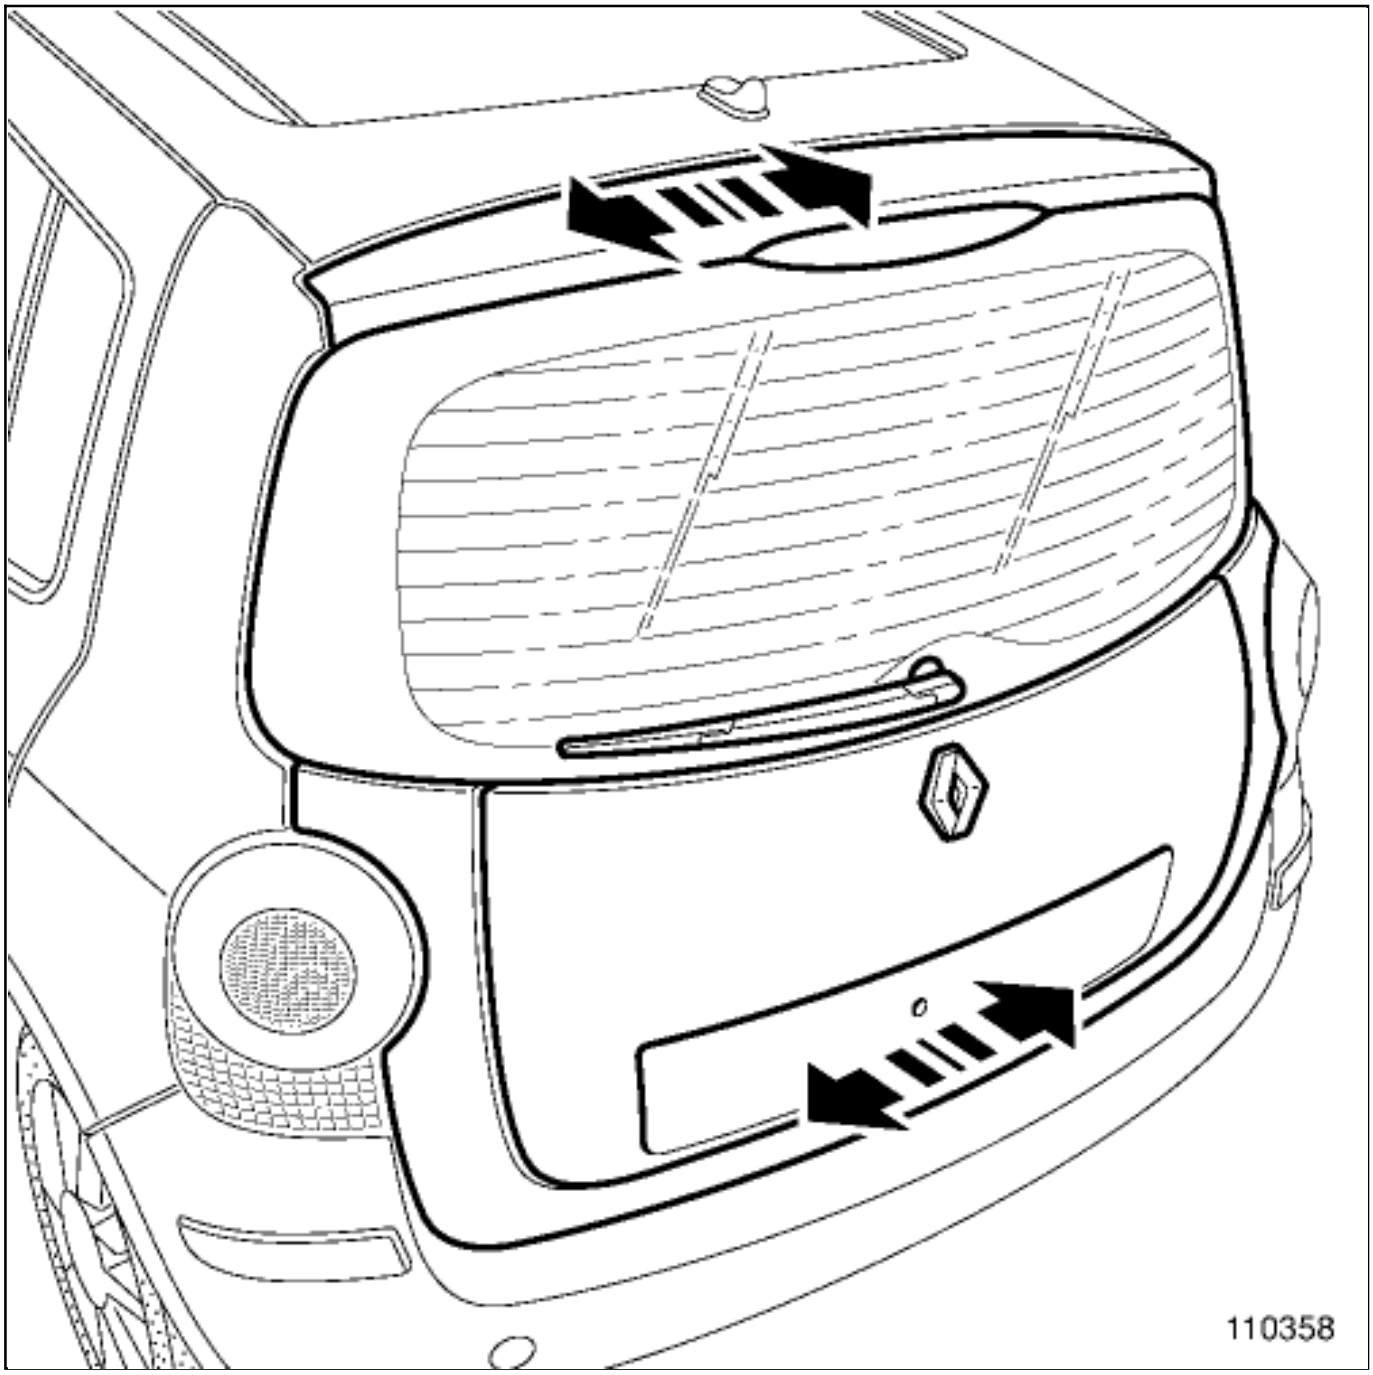
2. TAILGATE

Check that the peripheral components are adjusted correctly.



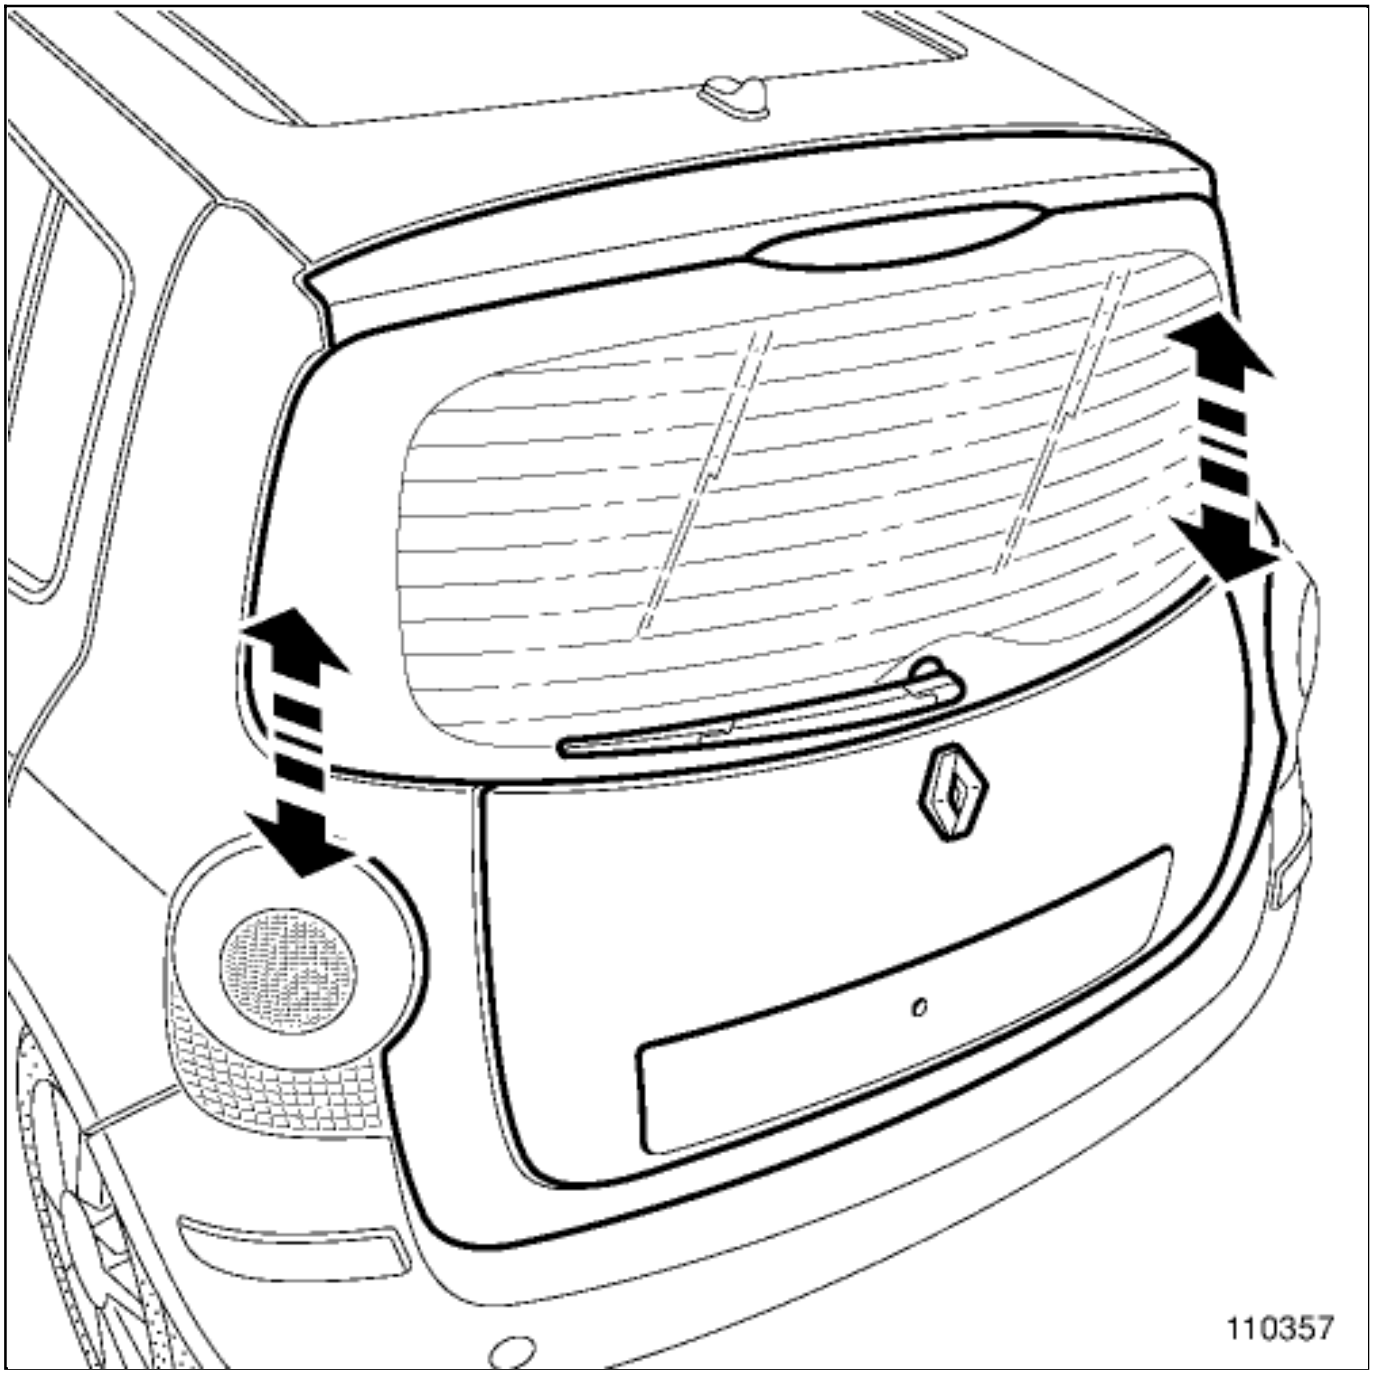
Refit all of the heavy fittings of the tailgate.

Release the striker panel and fit the tailgate, pre-tightening in the middle of the adjustments.

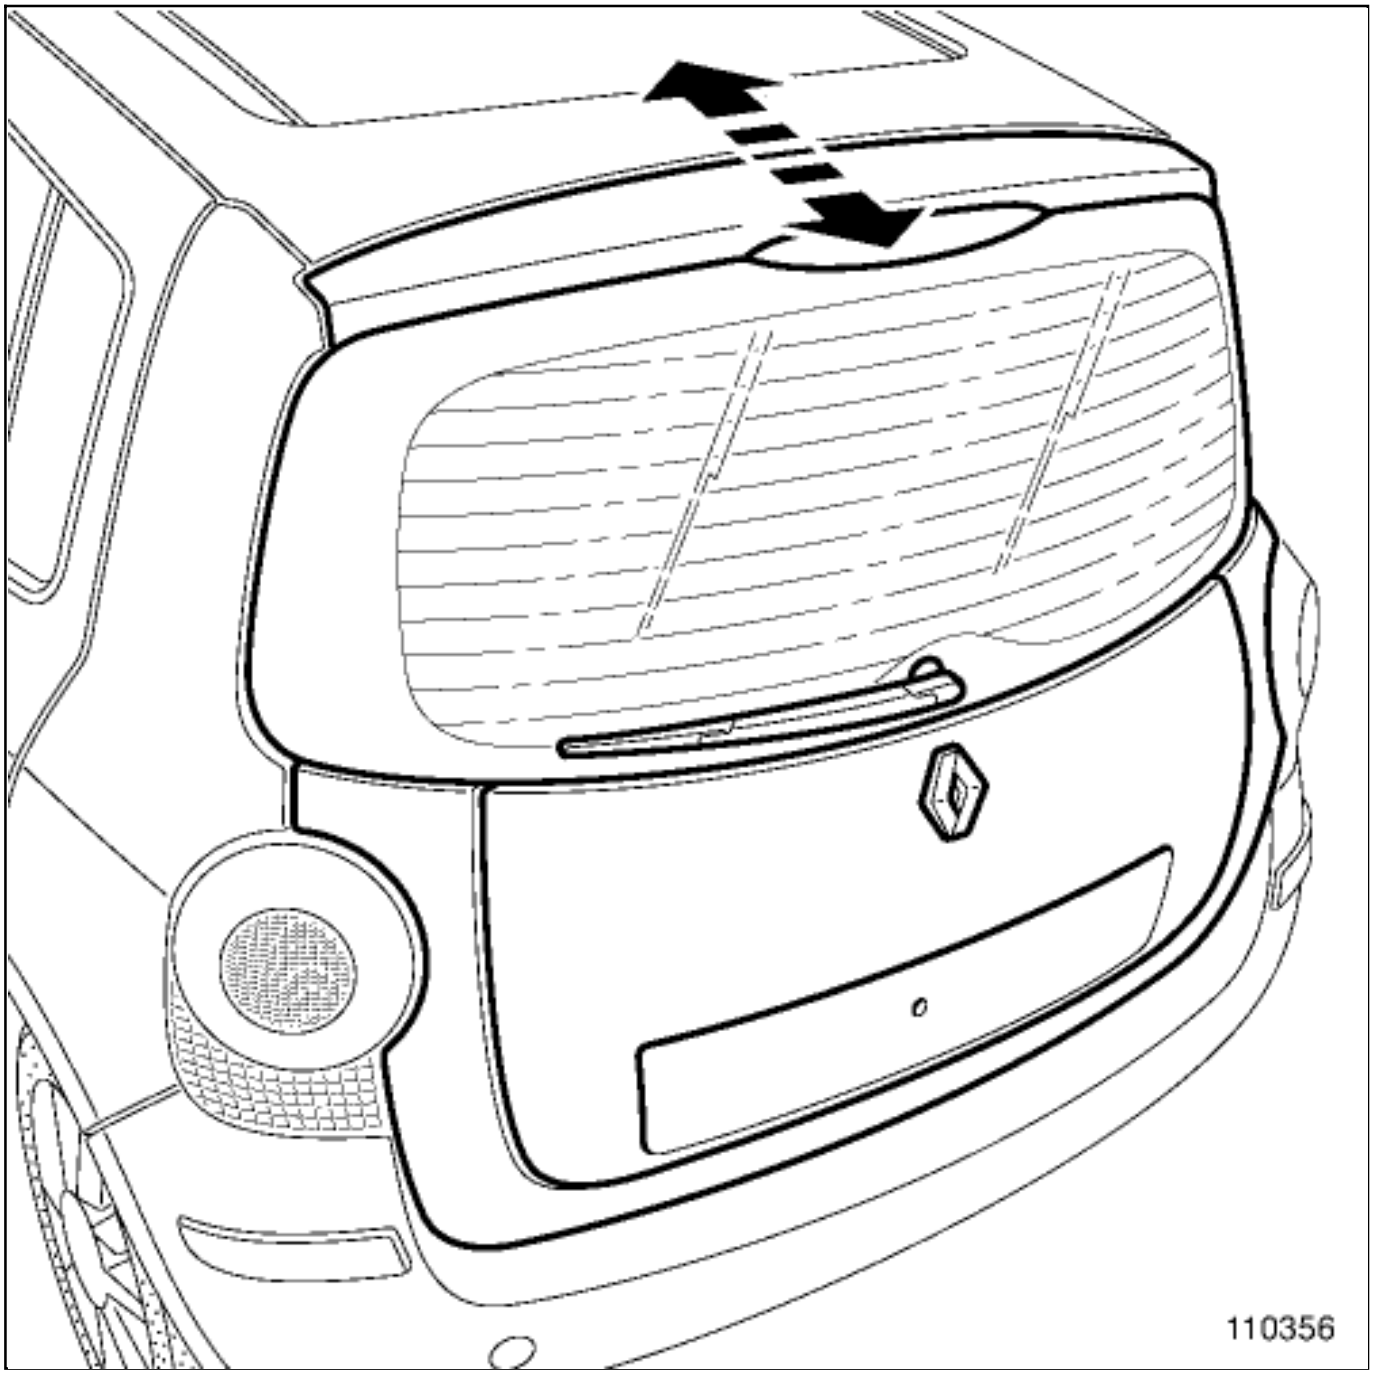


Note:

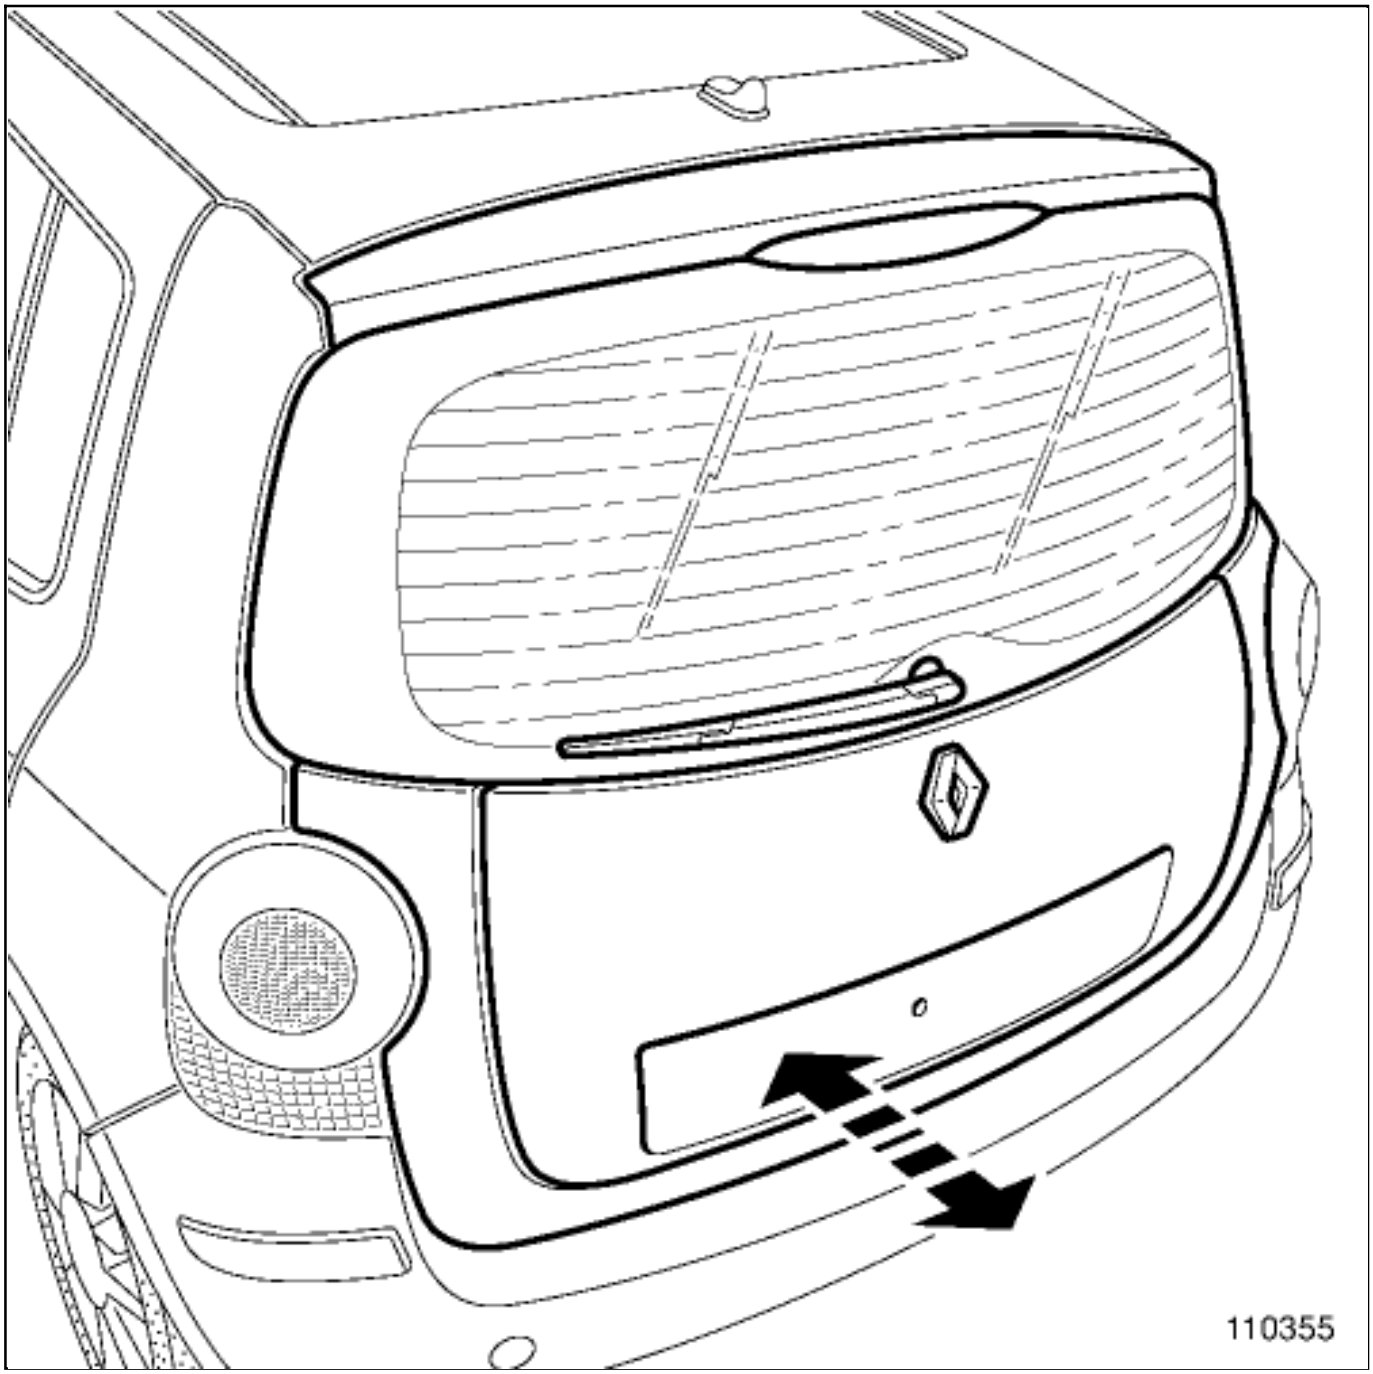
For information about the adjustment zones, refer to the MR for the vehicle concerned.



1- ADJUSTMENT CHRONOLOGY



Centre the tailgate.



Adjust the side alignment of the tailgate.

Adjust the height alignment of the tailgate.

Adjust the top flush fitting between the tailgate and roof.

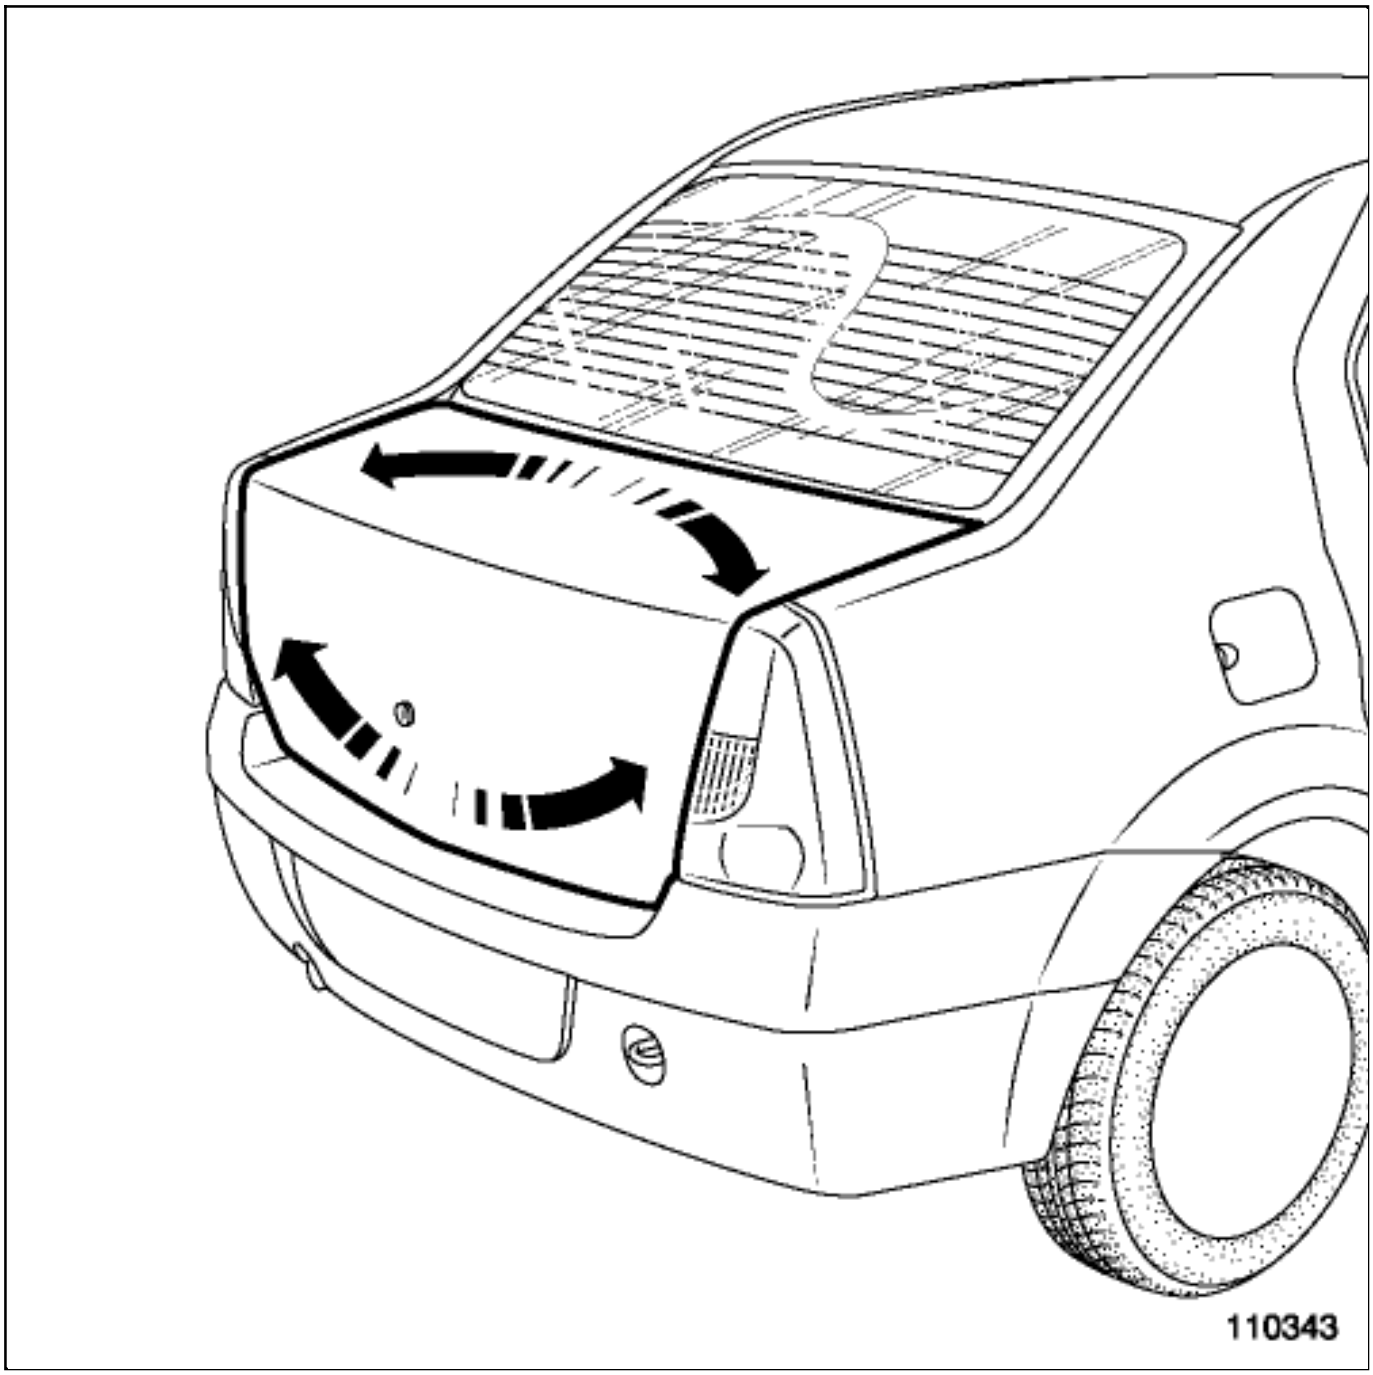
Adjust the flush fitting of the bottom of the tailgate, as well as the contact and the closure firmness.

Check the adjustment and the correct operation then tighten into position.

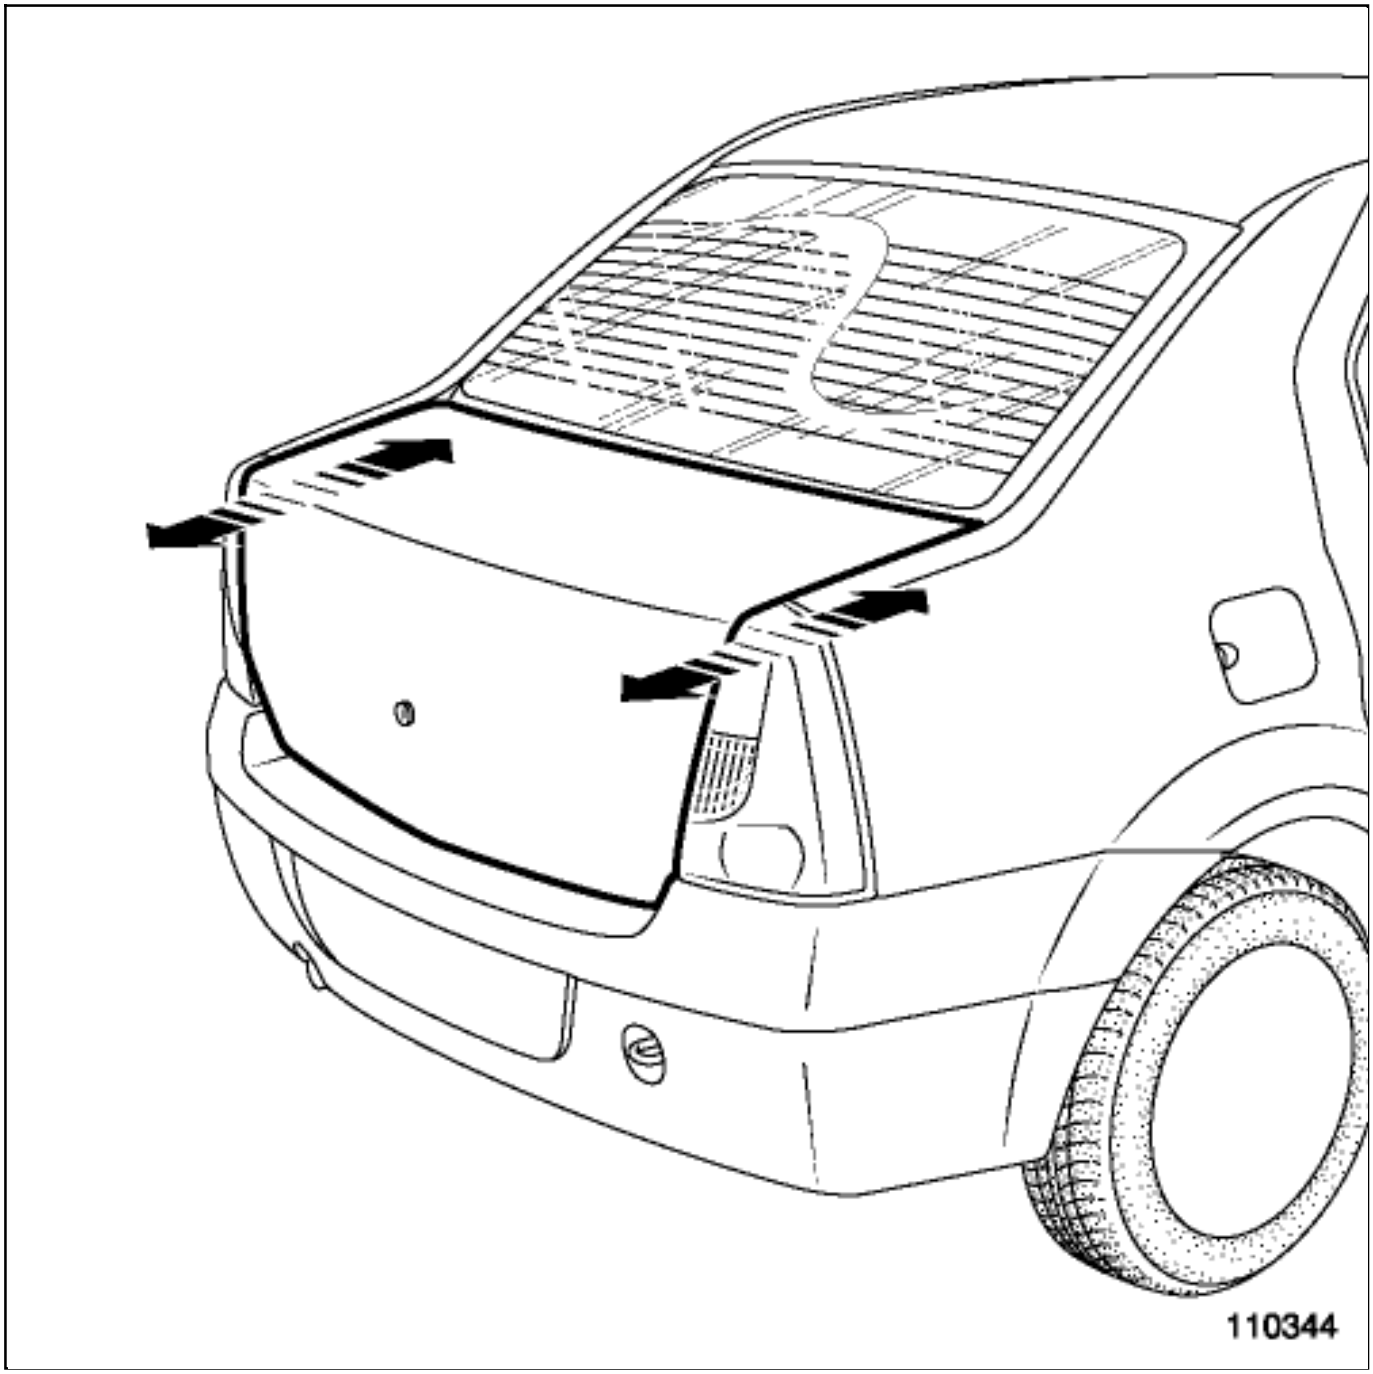
3. BOOT LID

Check that the peripheral components are adjusted correctly.

Refit all of the heavy fittings of the tailgate.

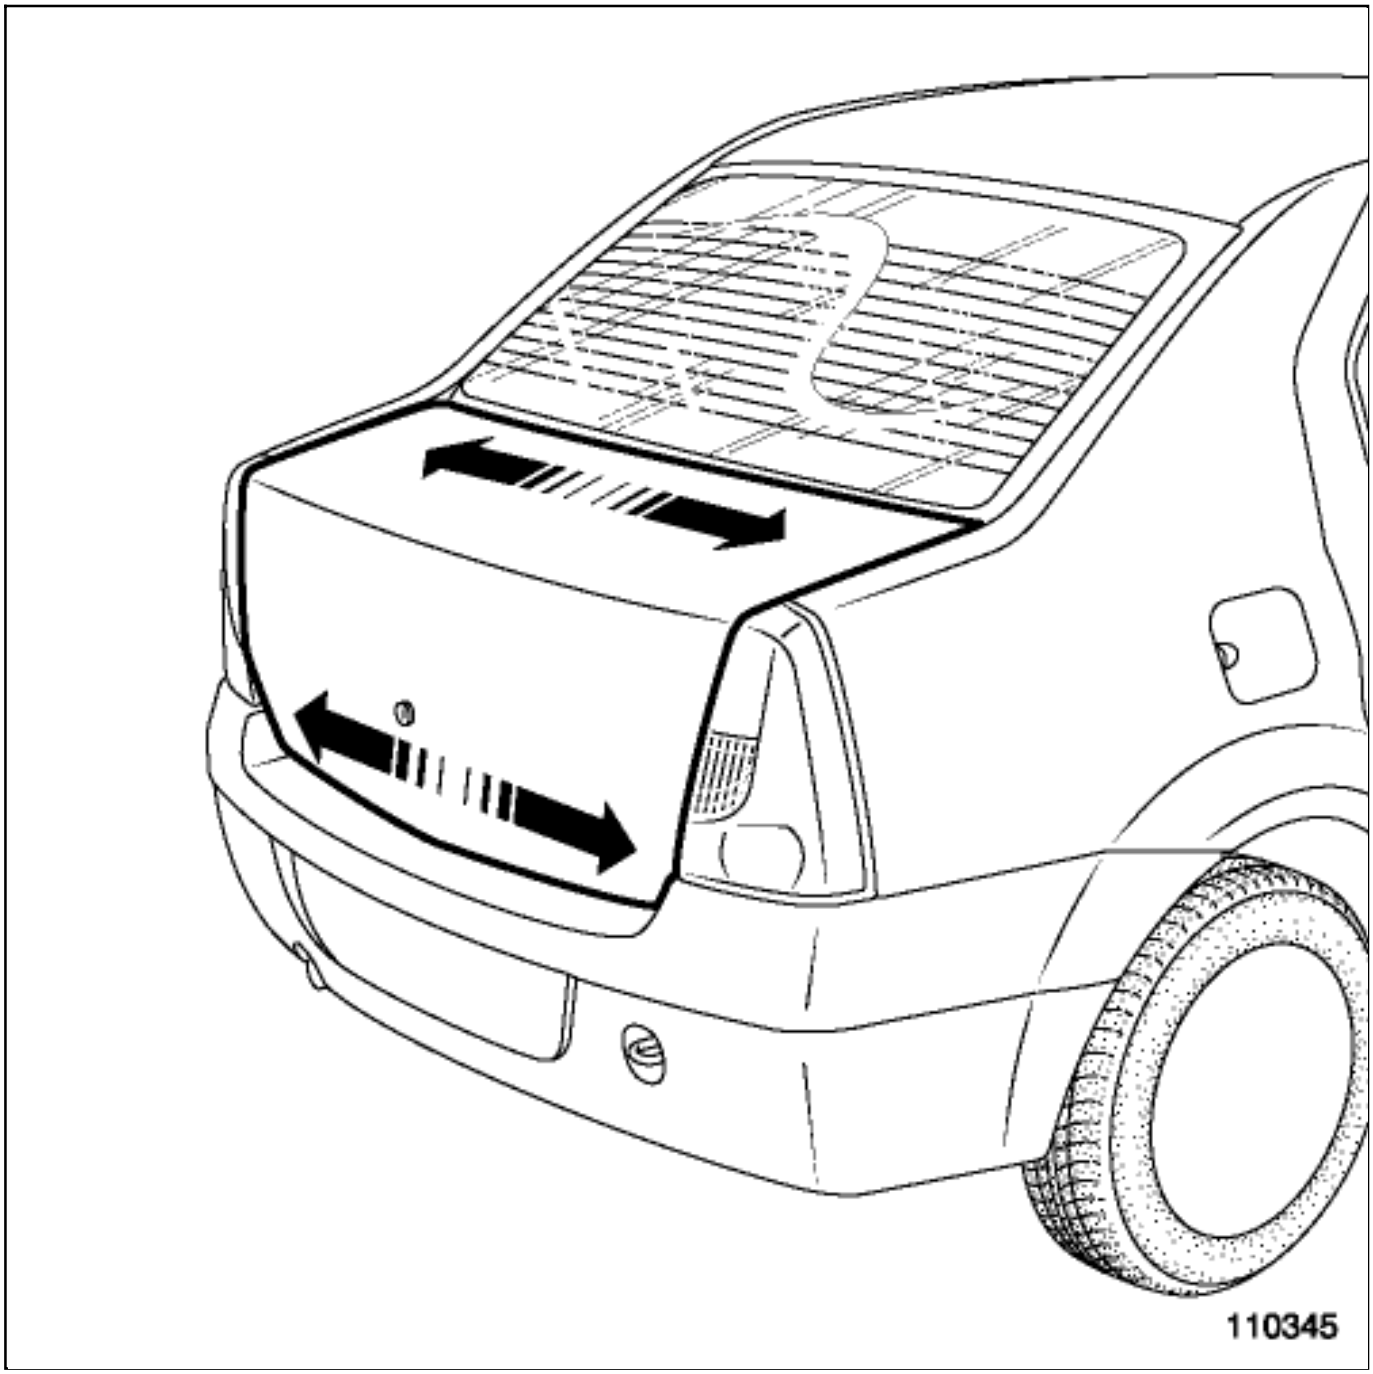


Release the striker panel and fit the tailgate, pre-tightening in the middle of the adjustments.

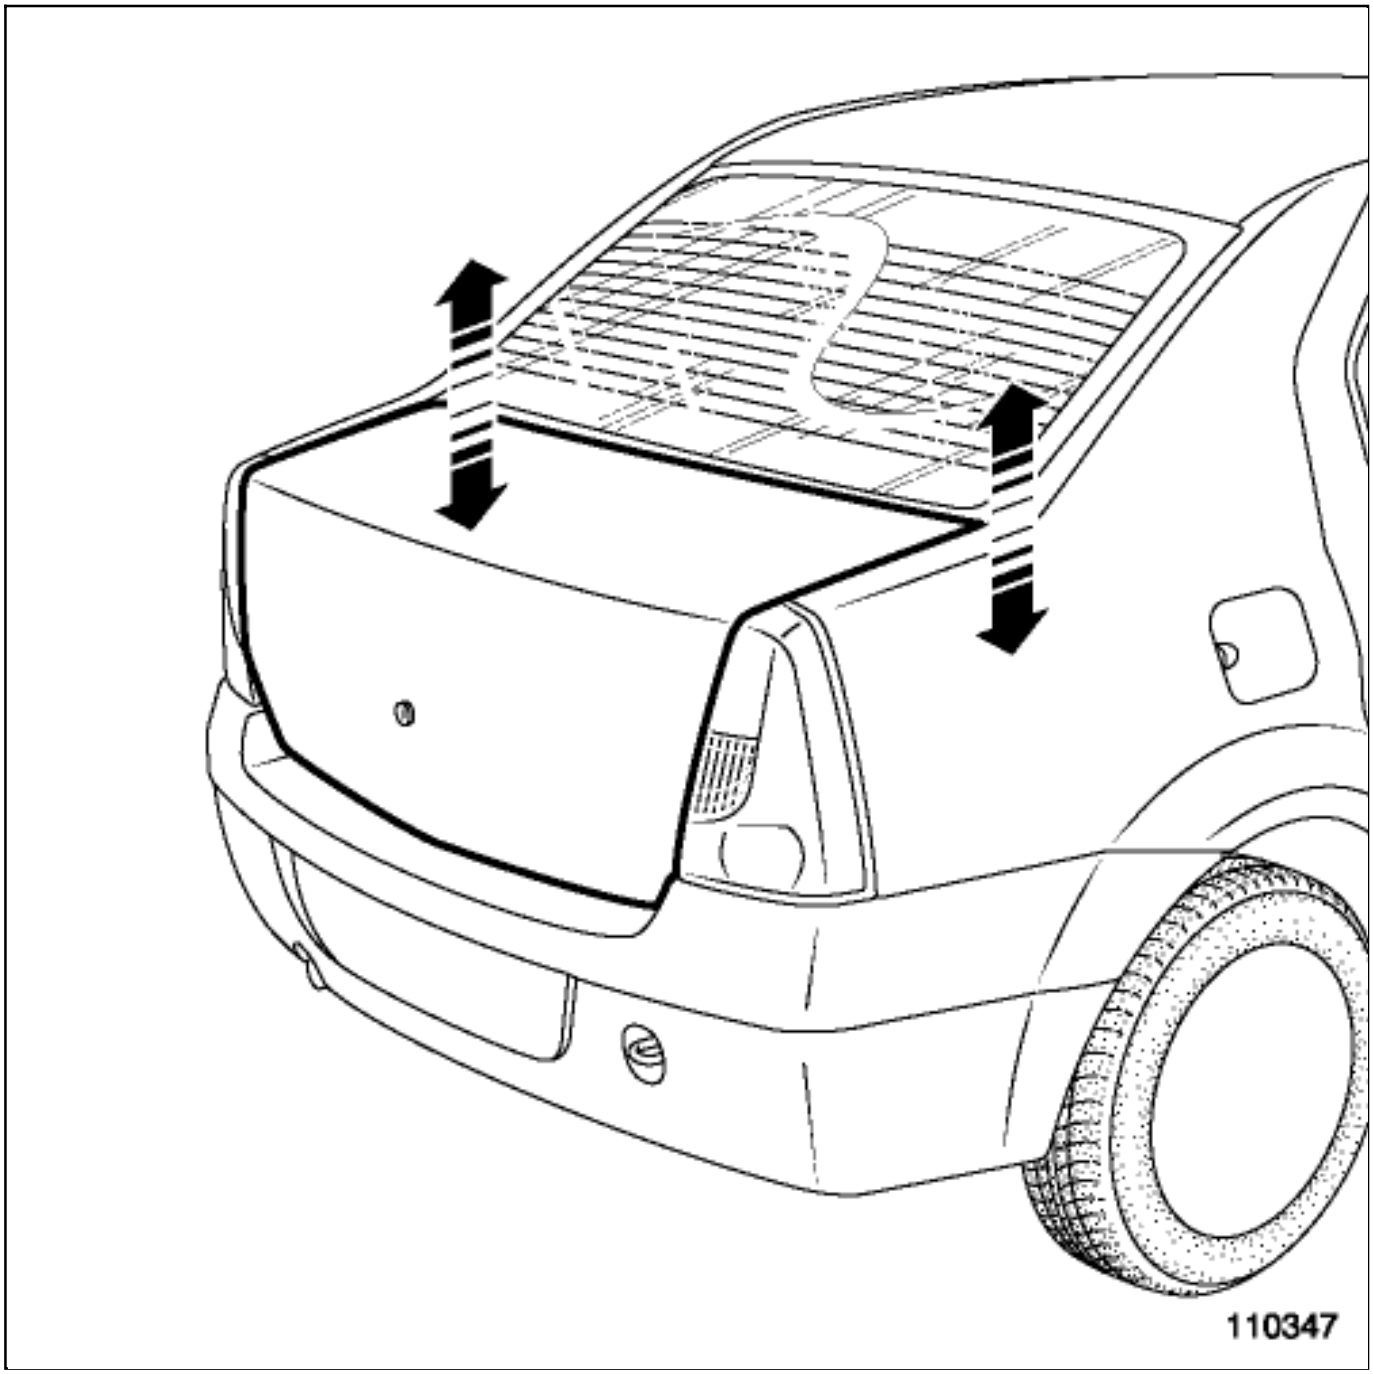


Note:

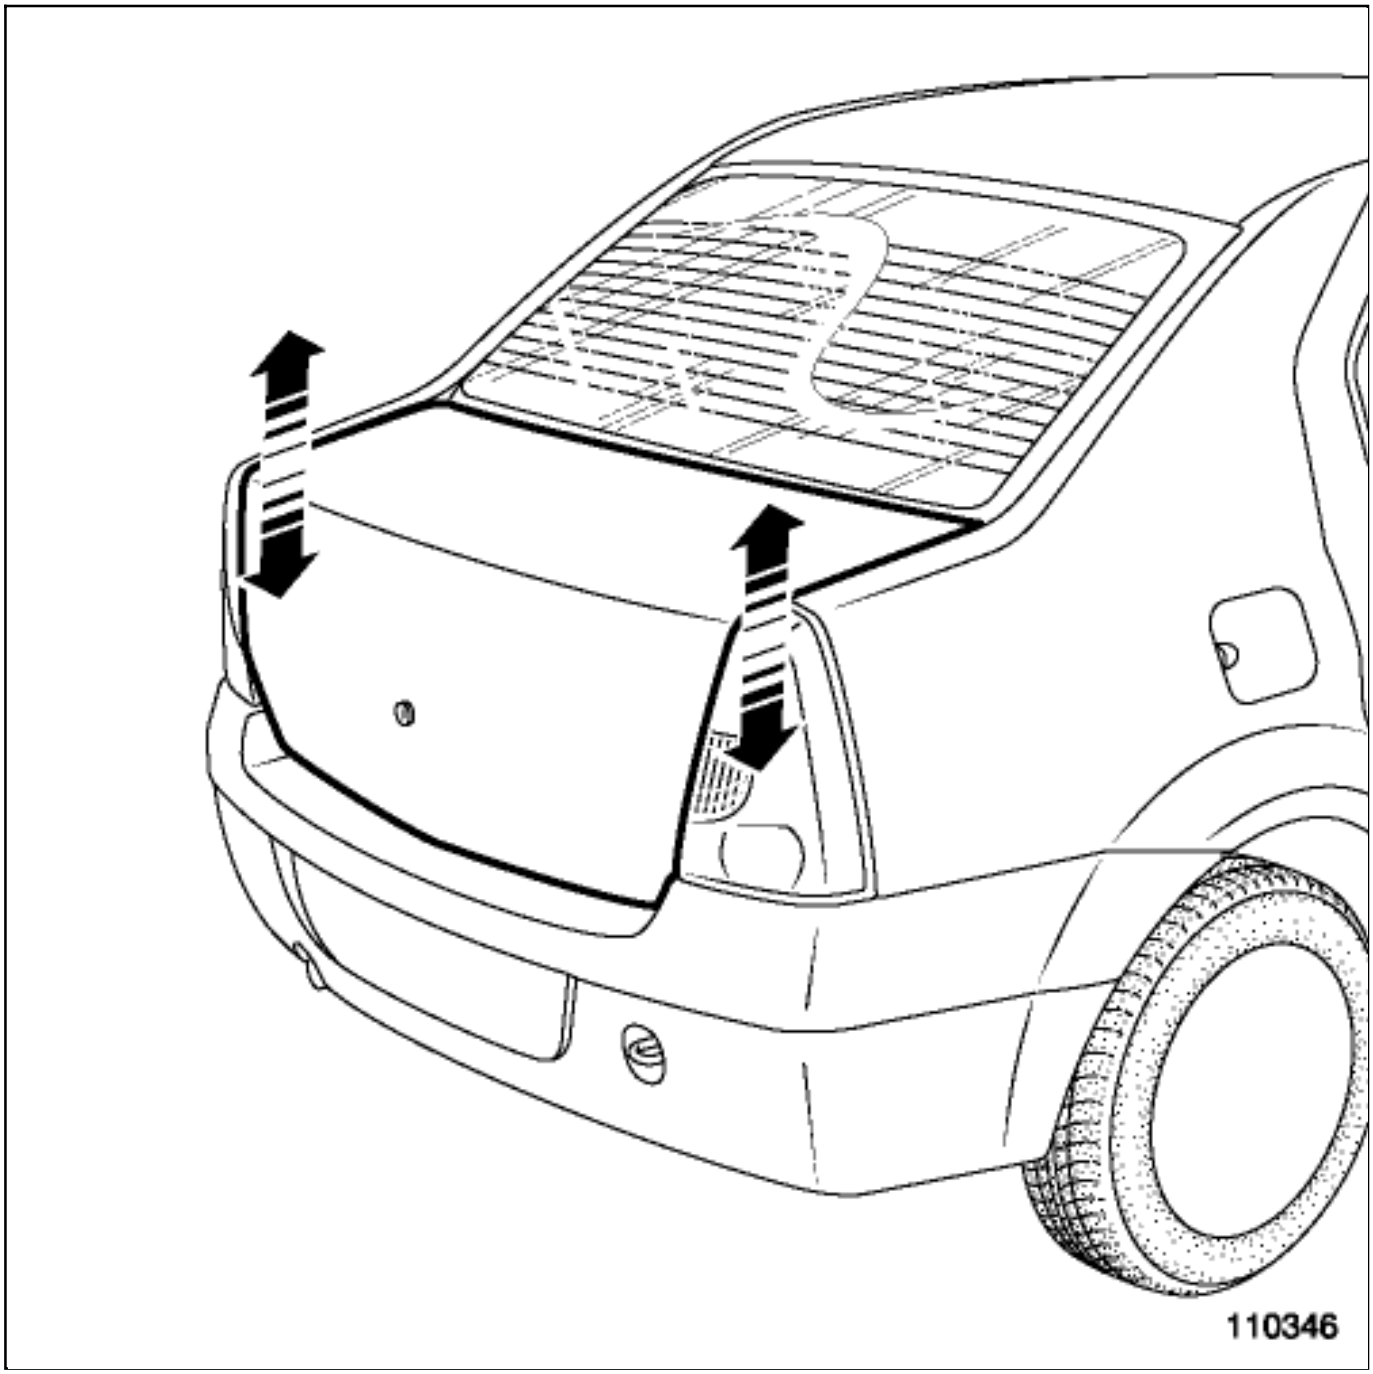
For information about the adjustment zones, refer to the MR for the vehicle concerned.



1- ADJUSTMENT CHRONOLOGY



Centre the boot lid.



Adjust the longitudinal alignment of the boot lid.

Adjust the side alignment of the boot lid.

Adjust the rear flush fitting of the boot lid.

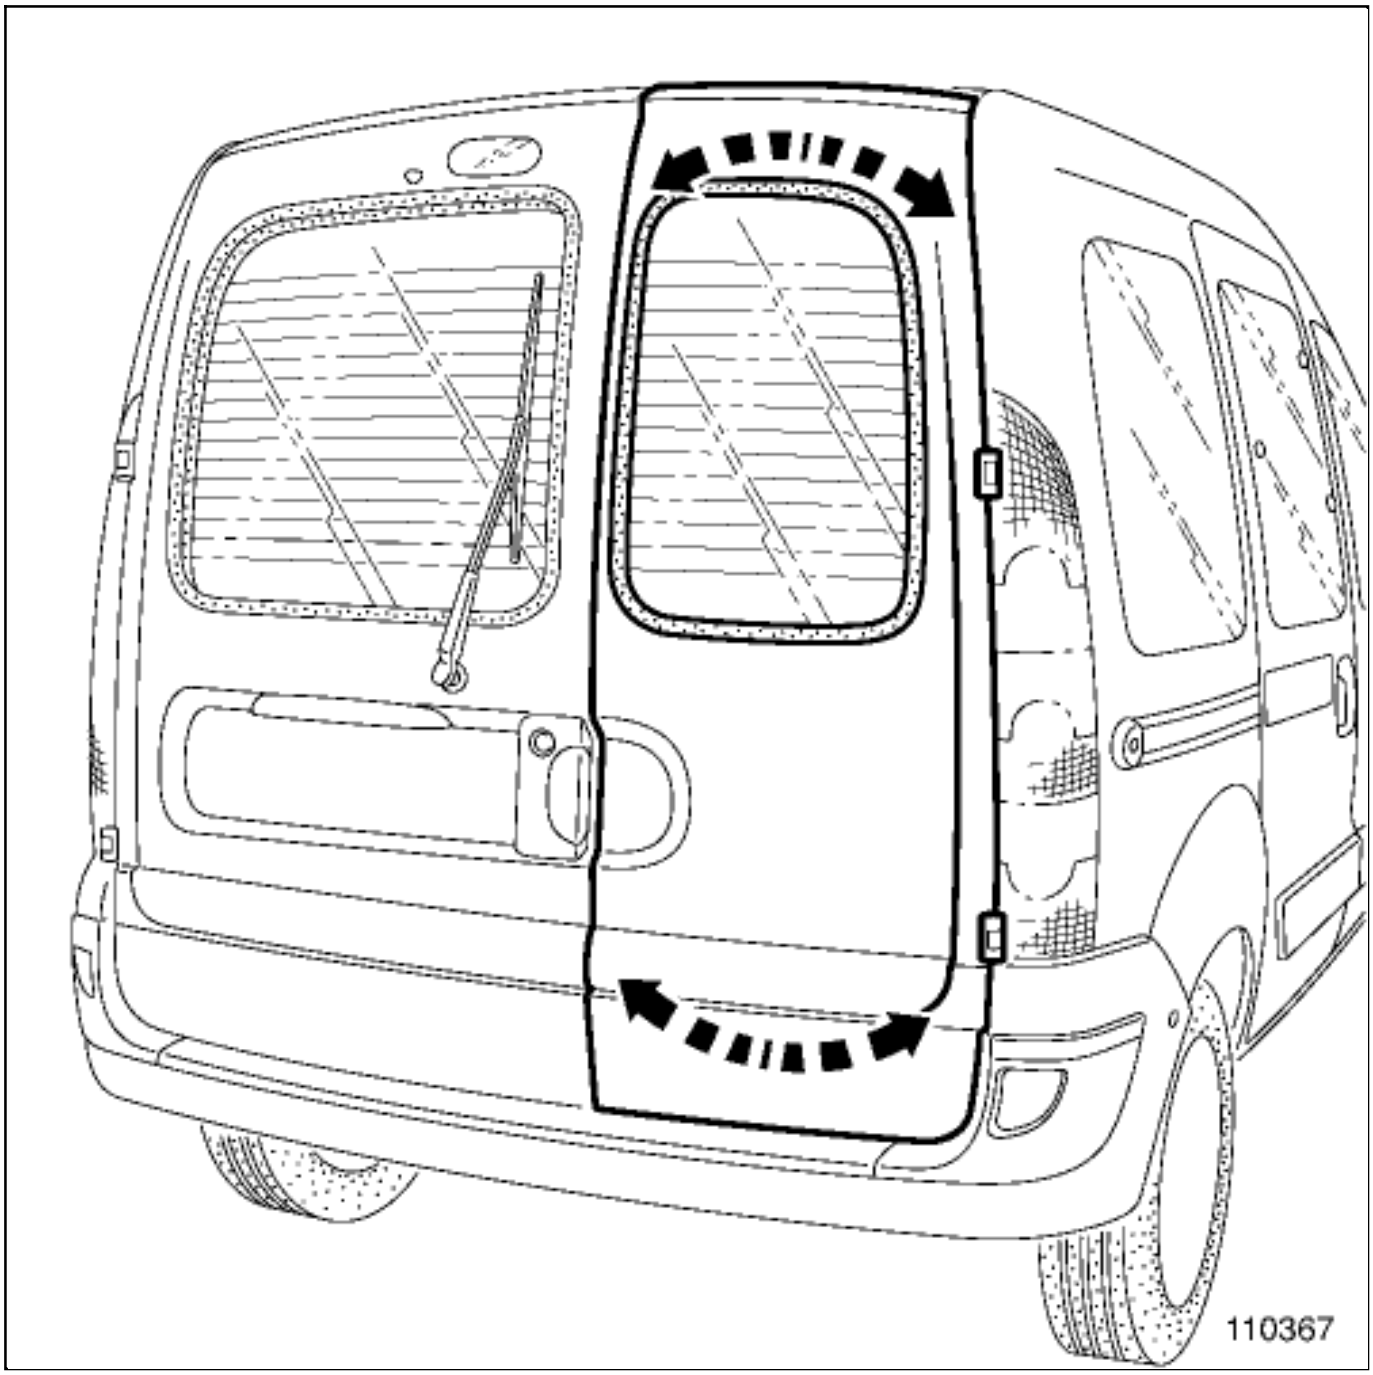
- Adjust the rear flush fitting of the boot lid, as well as the contact and the closure firmness.
- Check the adjustment and the correct operation then tighten into position.

4. REAR LOADING DOOR

Check that the peripheral components are adjusted correctly.

the adjustment can be carried out on both doors simultaneously, if the vehicle is equipped with two doors.

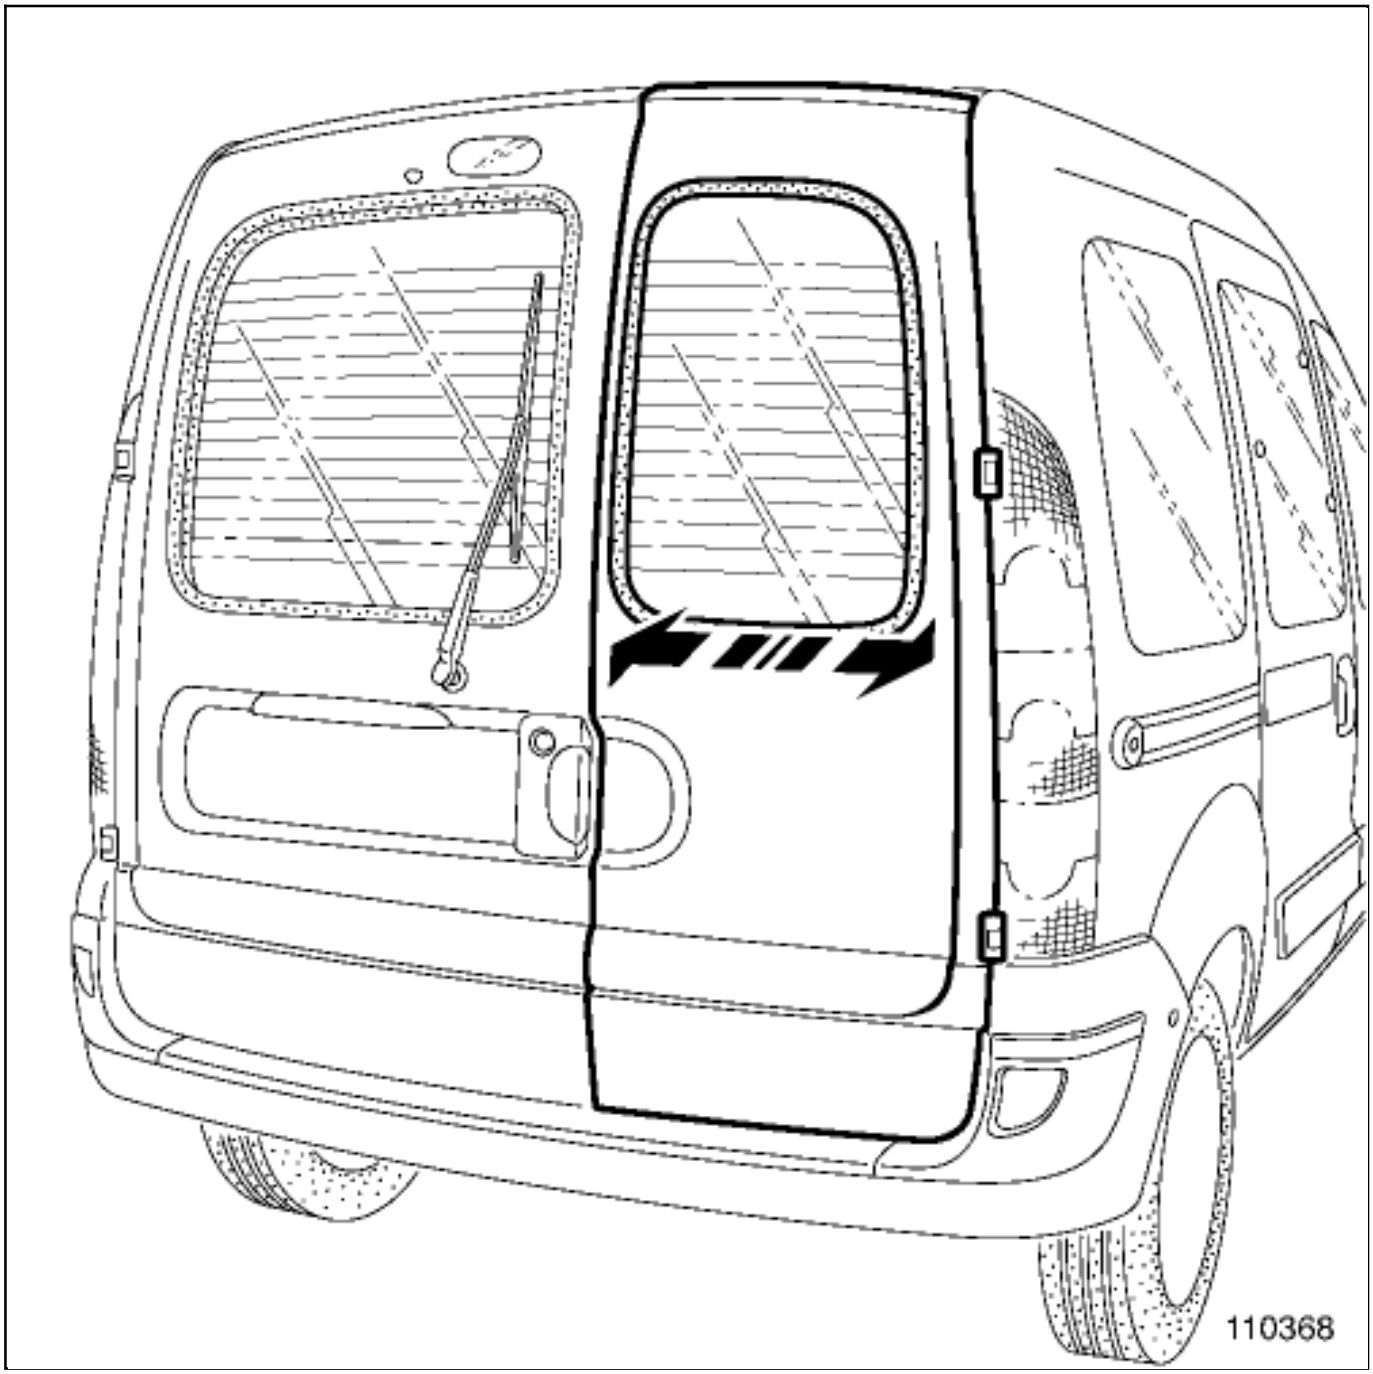
Refit all of the heavy door fittings.



Before carrying out the adjustments, release the striker panel and fit the door, pretightening in the middle of the adjustment.

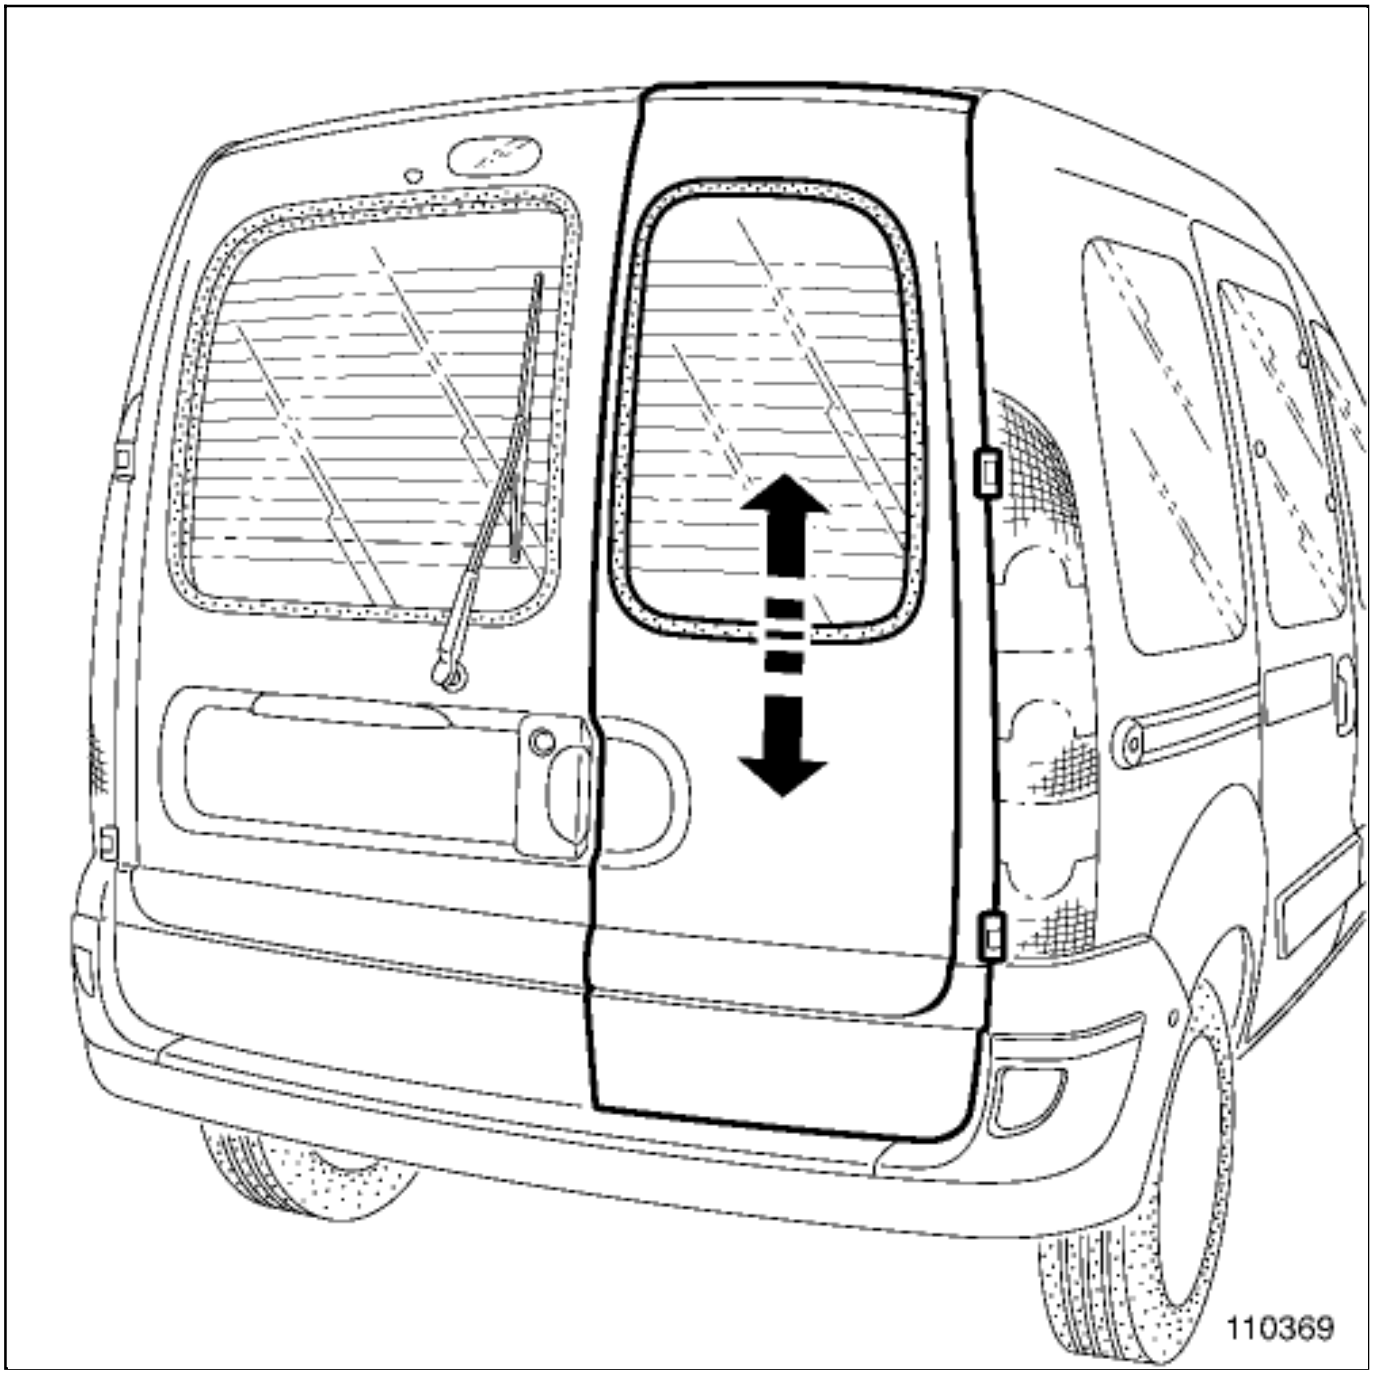
Note:

For information about the adjustment zones, refer to the MR for the vehicle concerned.

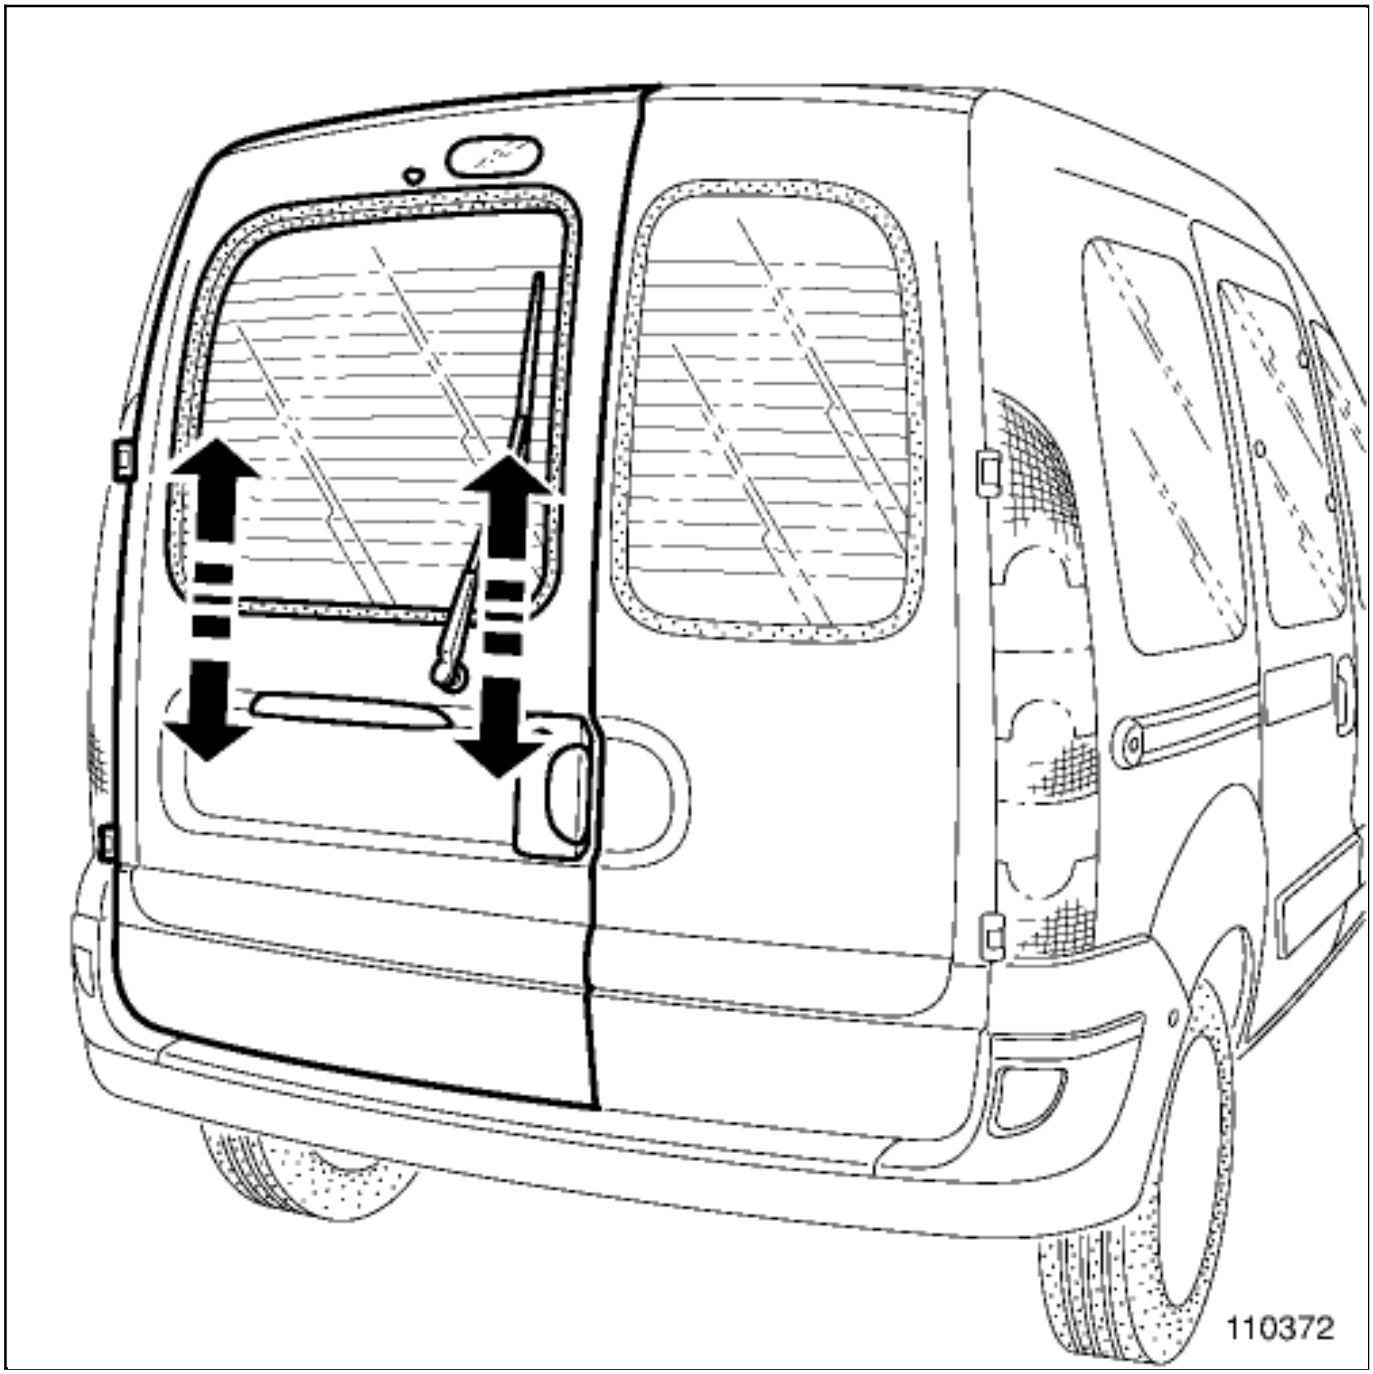


1- ADJUSTMENT CHRONOLOGY

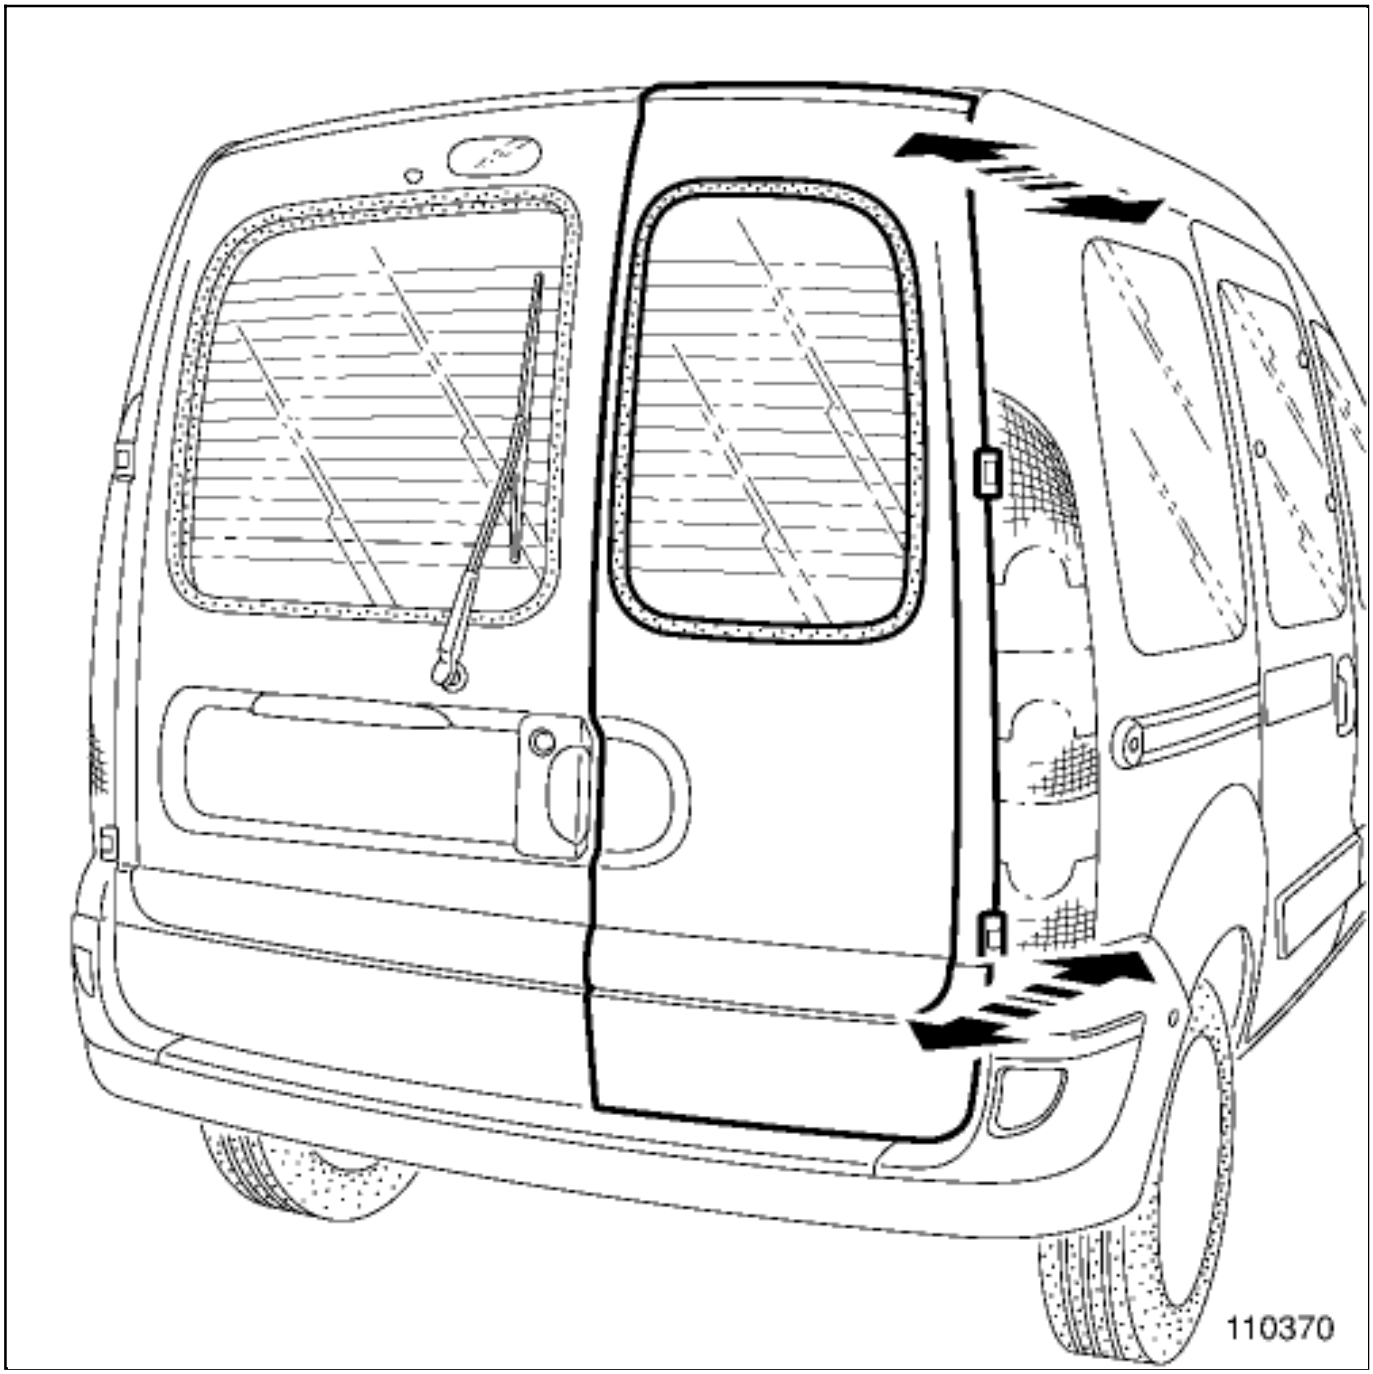
Adjust the centring of the door with the lock on the floor.



Adjust the centring of the door without the lock on the floor.

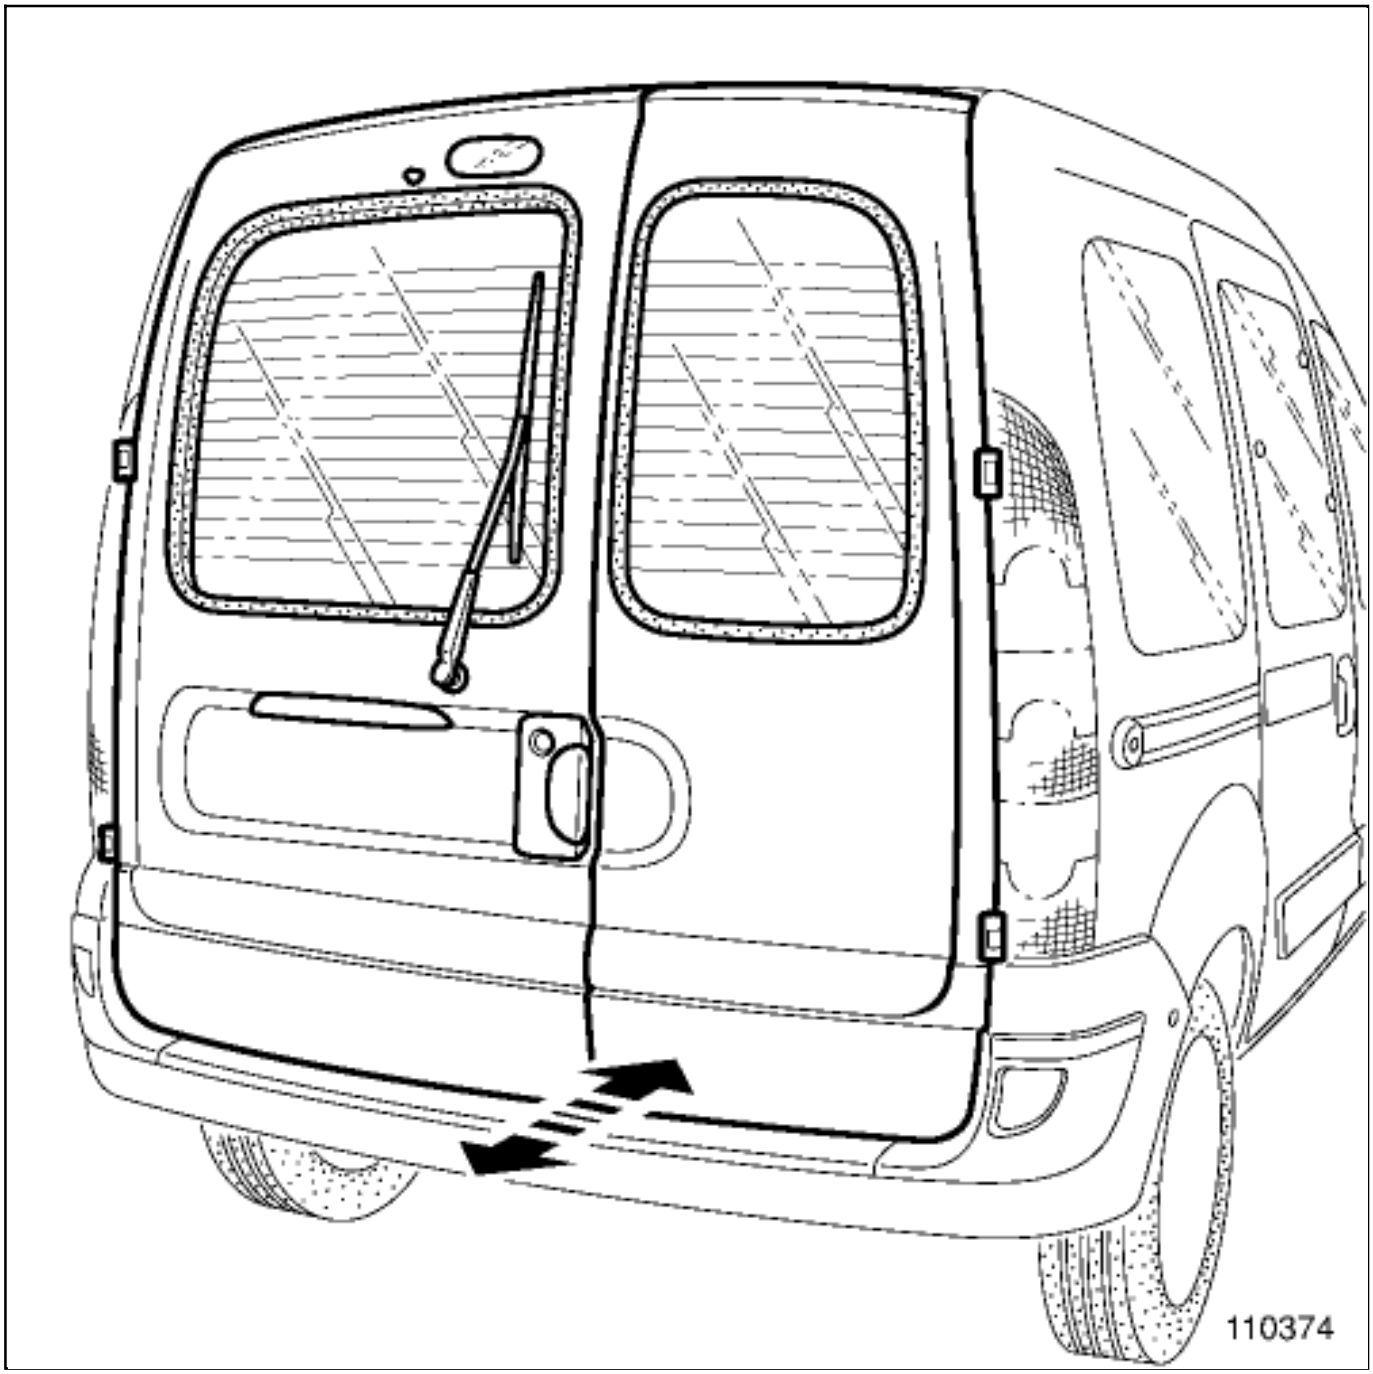


Adjust the side alignment of the door with the lock on the floor.



Adjust the side alignment of the door without the lock on the floor.

Adjust the vertical alignment of the door with the lock on the floor.



Adjust the vertical alignment of the door without the lock on the floor.

Adjust the flush fitting of the external section of the door with the lock on the floor.

Adjust the flush fitting of the external section of the door without the lock on the floor.

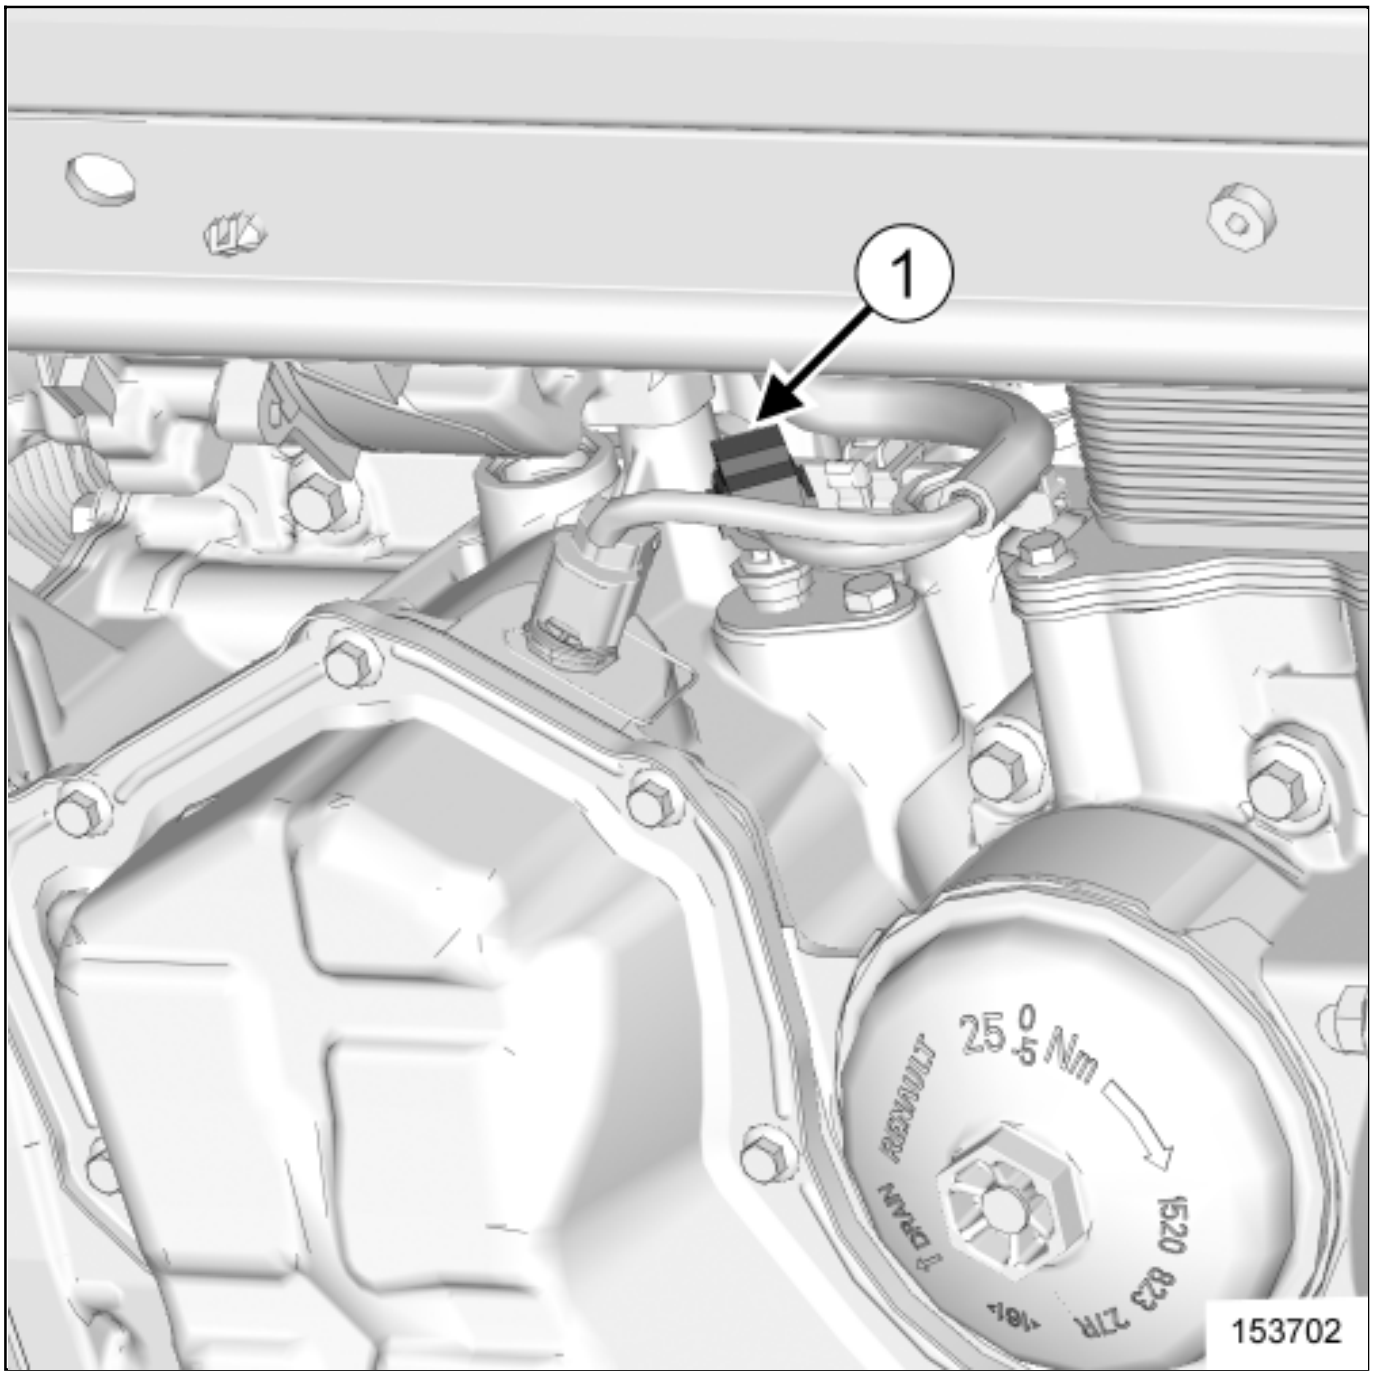
Adjust the flush fitting of the bottom central section of both doors.

- Adjust the flush fitting of the top central section of both doors.

- Check the adjustment and the correct operation then tighten into position.

OIL LEVEL SENSOR: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced etc.)(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove:
  - the engine undertray bolts,
  - the engine undertray.

2. REMOVAL OPERATION

Disconnect the oil level sensor connector(1) .

Remove (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil level sensor bolt,
- the oil level sensor.

REFITTING

1. REFITTING PREPARATION OPERATION

Lubricate the O-ring with engine oil.

2. REFITTING OPERATION

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil level sensor,
- the oil level sensor bolt.

Torque tighten the oil level sensor bolt(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

OIL PRESSURE: CHECK

Note, one or more warnings are present in this procedure

Special tooling required	
22 mm socket for removal - refitting of oxygen sensors.	Mot. 1495-01
Oil pressure gauge kit.	Mot. 836-05

Equipment required
1/2" long socket (12.7 mm square drive)
multimeter
roll pin punch

CAUTION

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When topping up the engine oil, always leave at least 10 minutesbefore checking the level with a dipstick.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Engine and transmission assembly sensors) .

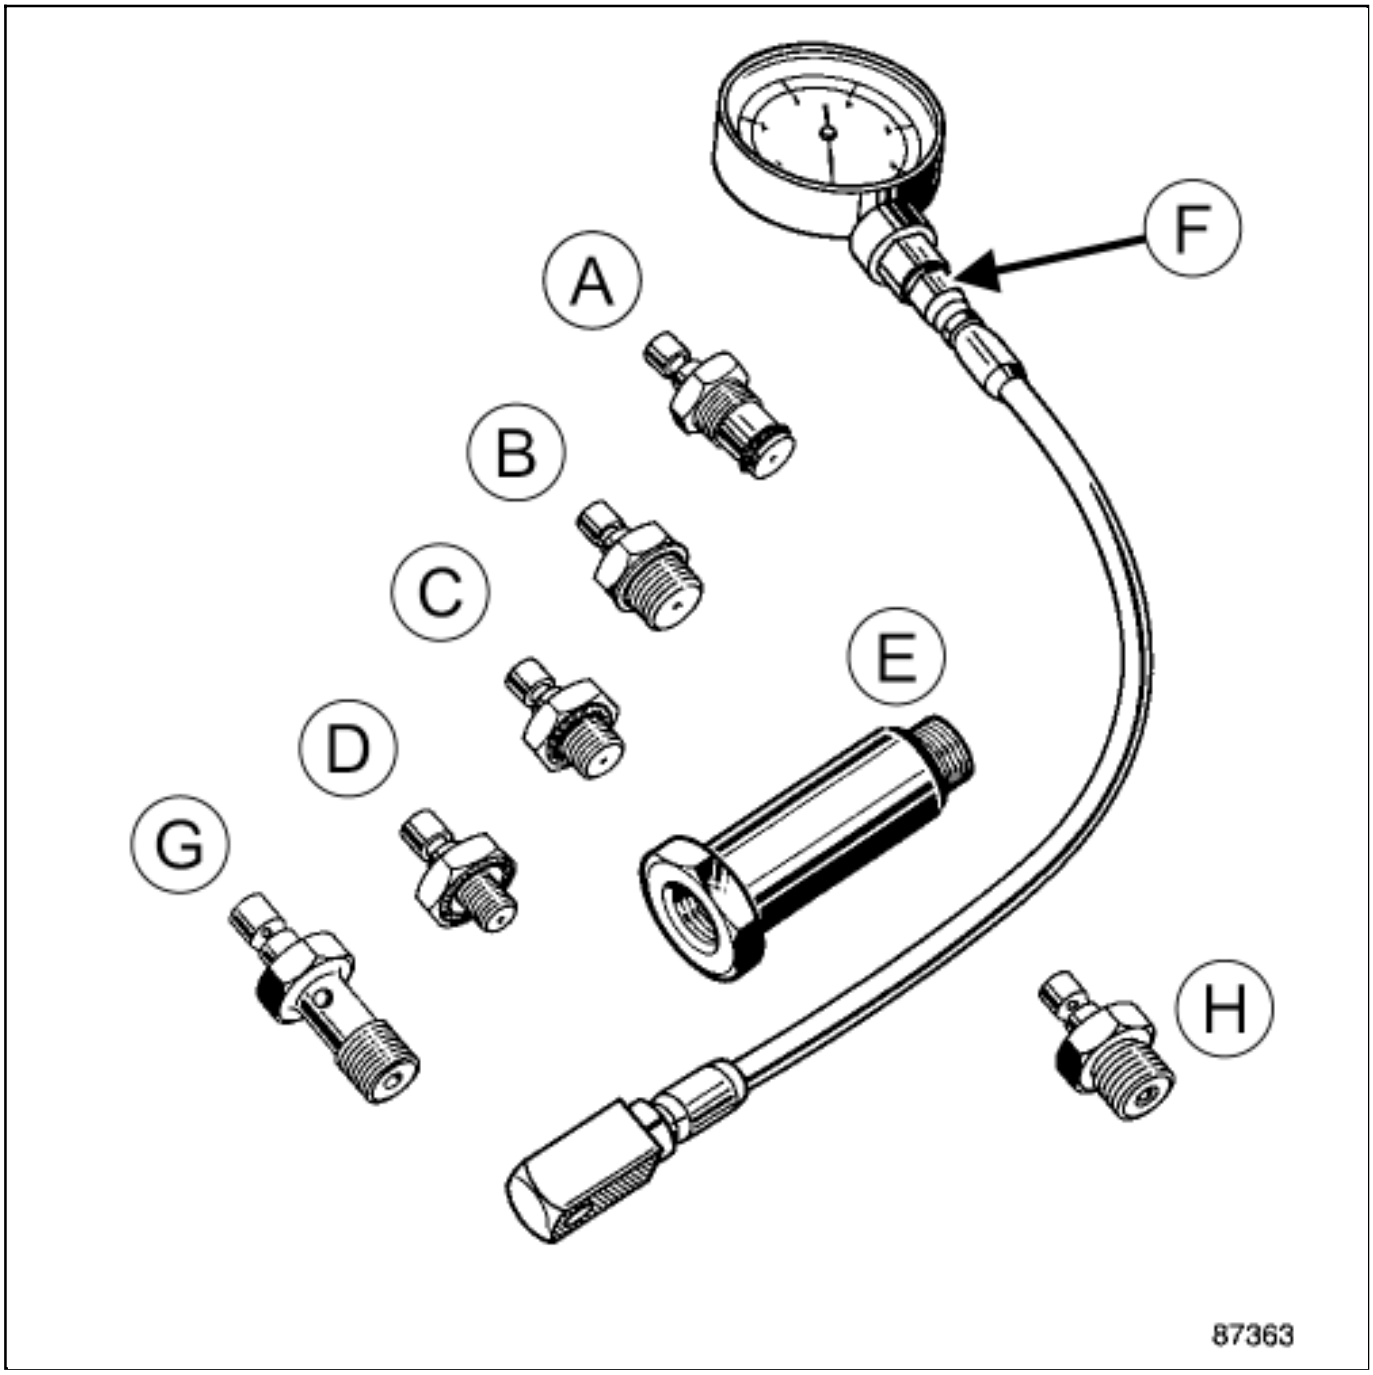
CHECK

1. PREPARATION OPERATION FOR CHECK

Position the vehicle on a two-post lift **Vehicle: Towing and lifting** .

Disconnect the battery **Battery: Removal - Refitting** .

Remove the engine undertray.



Remove:

- the intercooler air outlet pipe **Air inlet assembly: Exploded view** ,
- the oil-water heat exchanger **(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view)** .

Remove the oil pressure sensor **(see 10A, Engine and cylinder block assembly, Oil pressure sensor: Removal - Refitting)** .

2. CHECK

Check the correct operation of the oil pressure sensor valve using the roll pin punch with a diameter of 2 mm and the multimeter.

Position the engine oil pressure sensor toolOil pressure gauge kit.(Mot. 836-05) fitted with suitable end pieces using the tool22 mm socket for removal - refitting of oxygen sensors.(Mot. 1495-01) or a 1/2" long socket (12.7 mm square drive).

End pieces:

- D4F engine:

end piece C+ F

- K9K engine:

- end piece E+ C+ F

- H4B/H5F engine:

- end piece D+ F

- H4D engine:

- end piece D+ F

Refit the oil-water heat exchanger(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Start the vehicle.

Monitor the engine oil pressure as the engine oil temperature increases (approximately 80°C or the first time the engine cooling fan is triggered)which must not be lower than the pressure at idle speed.

If the oil pressure is lower at idle speed, check that:

- the oil filter is not clogged,
- there is no dirt or swarf in the engine oil,
- the oil pump is in good condition and being correctly driven.

Drive the engine speed at 3000 rpm.

Check the oil pressure values:

- idling < X < 4000 rpm: 1.7 bar < X < 2.5 bar

- 4000 rpm < X < MAX rpm: 3.5 bar < X < 4.5 bar
- 3000 rpm: 1.5 to 2.8 bar
- disconnect the oil pump connector.

  3000 rpm: 3.2 to 4.5 bar

Switch off the engine.

Remove the oil-water heat exchanger(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Remove the toolOil pressure gauge kit.(Mot. 836-05) with the end pieces.

3. FINAL OPERATION

Proceed in the reverse order to the preparation operation for the check.

Wipe away any oil run-off with a cloth.

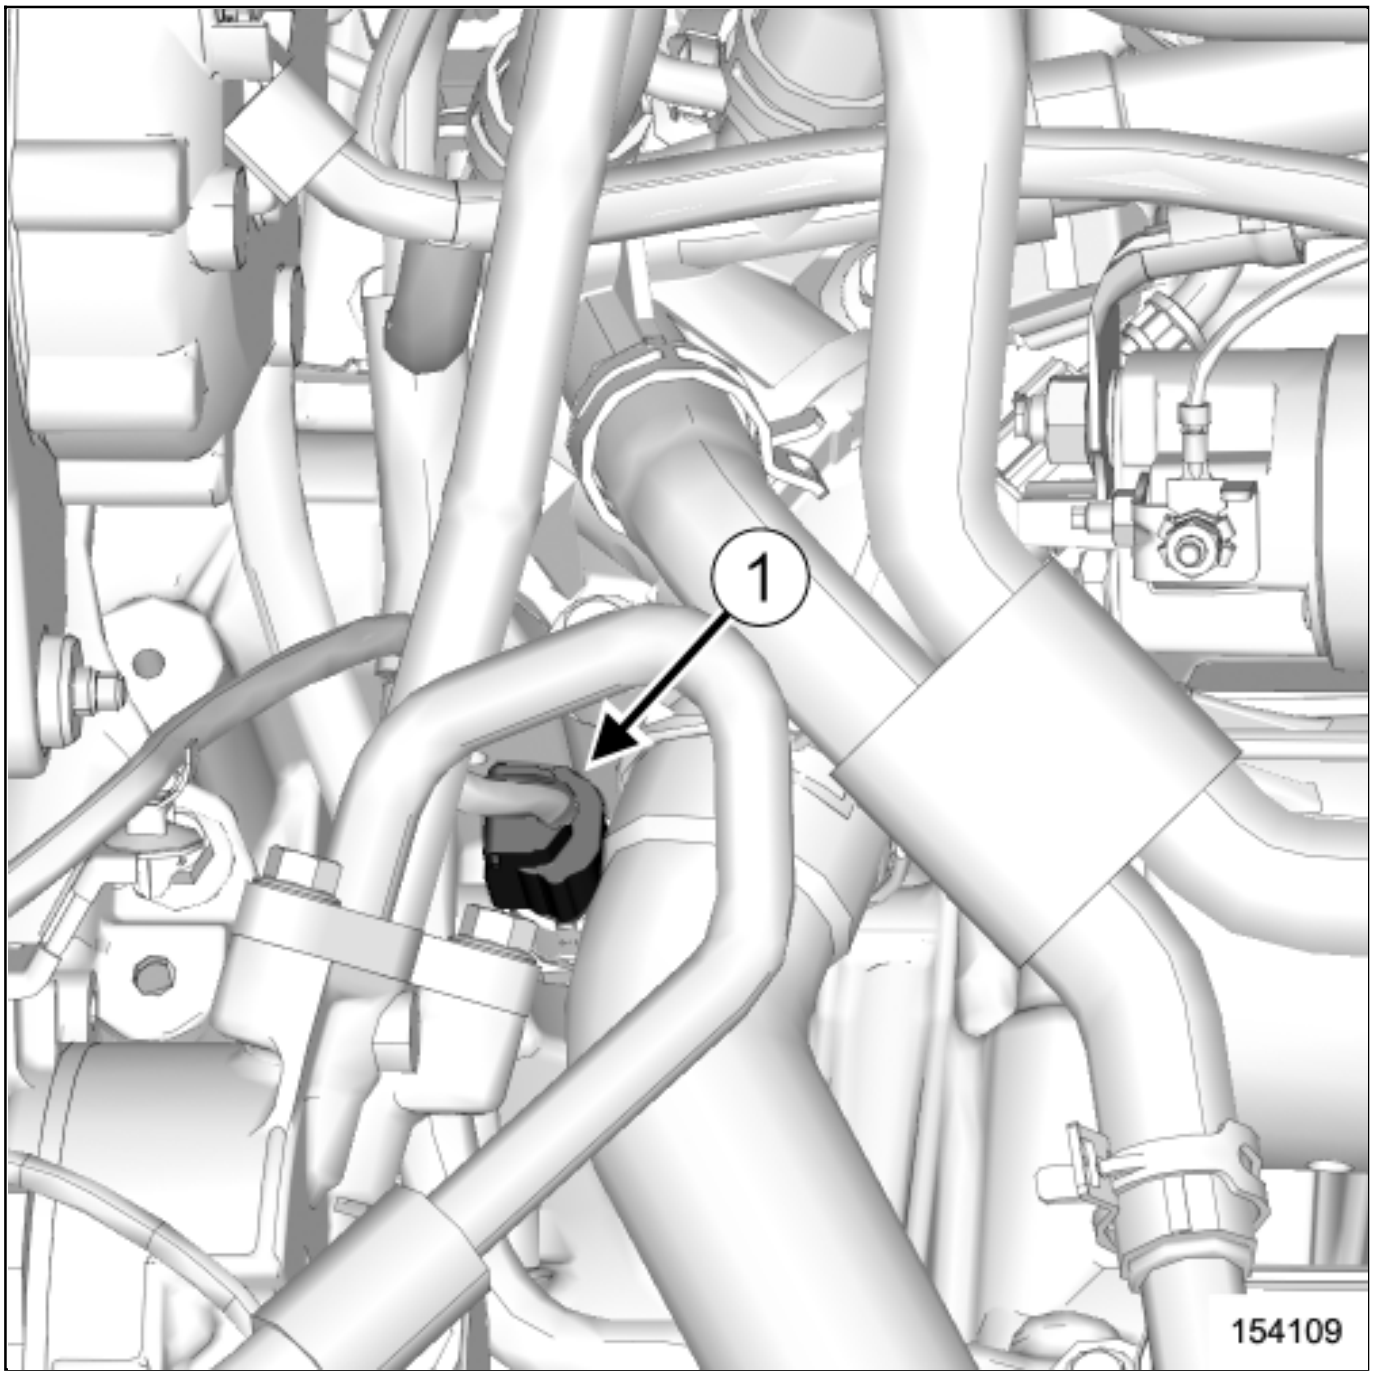
Wait at least 10 minutes.

Check the oil level using the dipstick.

Top up the oil level if necessaryEngine oil: Specifications .

Start the vehicle and check that there are no oil leaks from the oil pressure sensor.

OIL PRESSURE SENSOR: REMOVAL - REFITTING



Locations and specifications (tightening torques, parts always to be replaced, etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .
- Disconnect the battery(see **Battery: Removal - Refitting**) .
- Remove:
  - the engine undertray bolts
  - the engine undertray,
  - the intercooler air outlet pipe**(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** ,

2. REMOVAL OPERATION

Disconnect the connector(1) from the oil pressure sensor.

Remove the oil pressure sensor using a 22 mmlong socket.

REFITTING

1. REFITTING PREPARATION OPERATION

Coat the threading of the oil pressure sensor with silicone adhesive sealant**Vehicle: Parts and consumables for the repair** to ensure correct sealing.

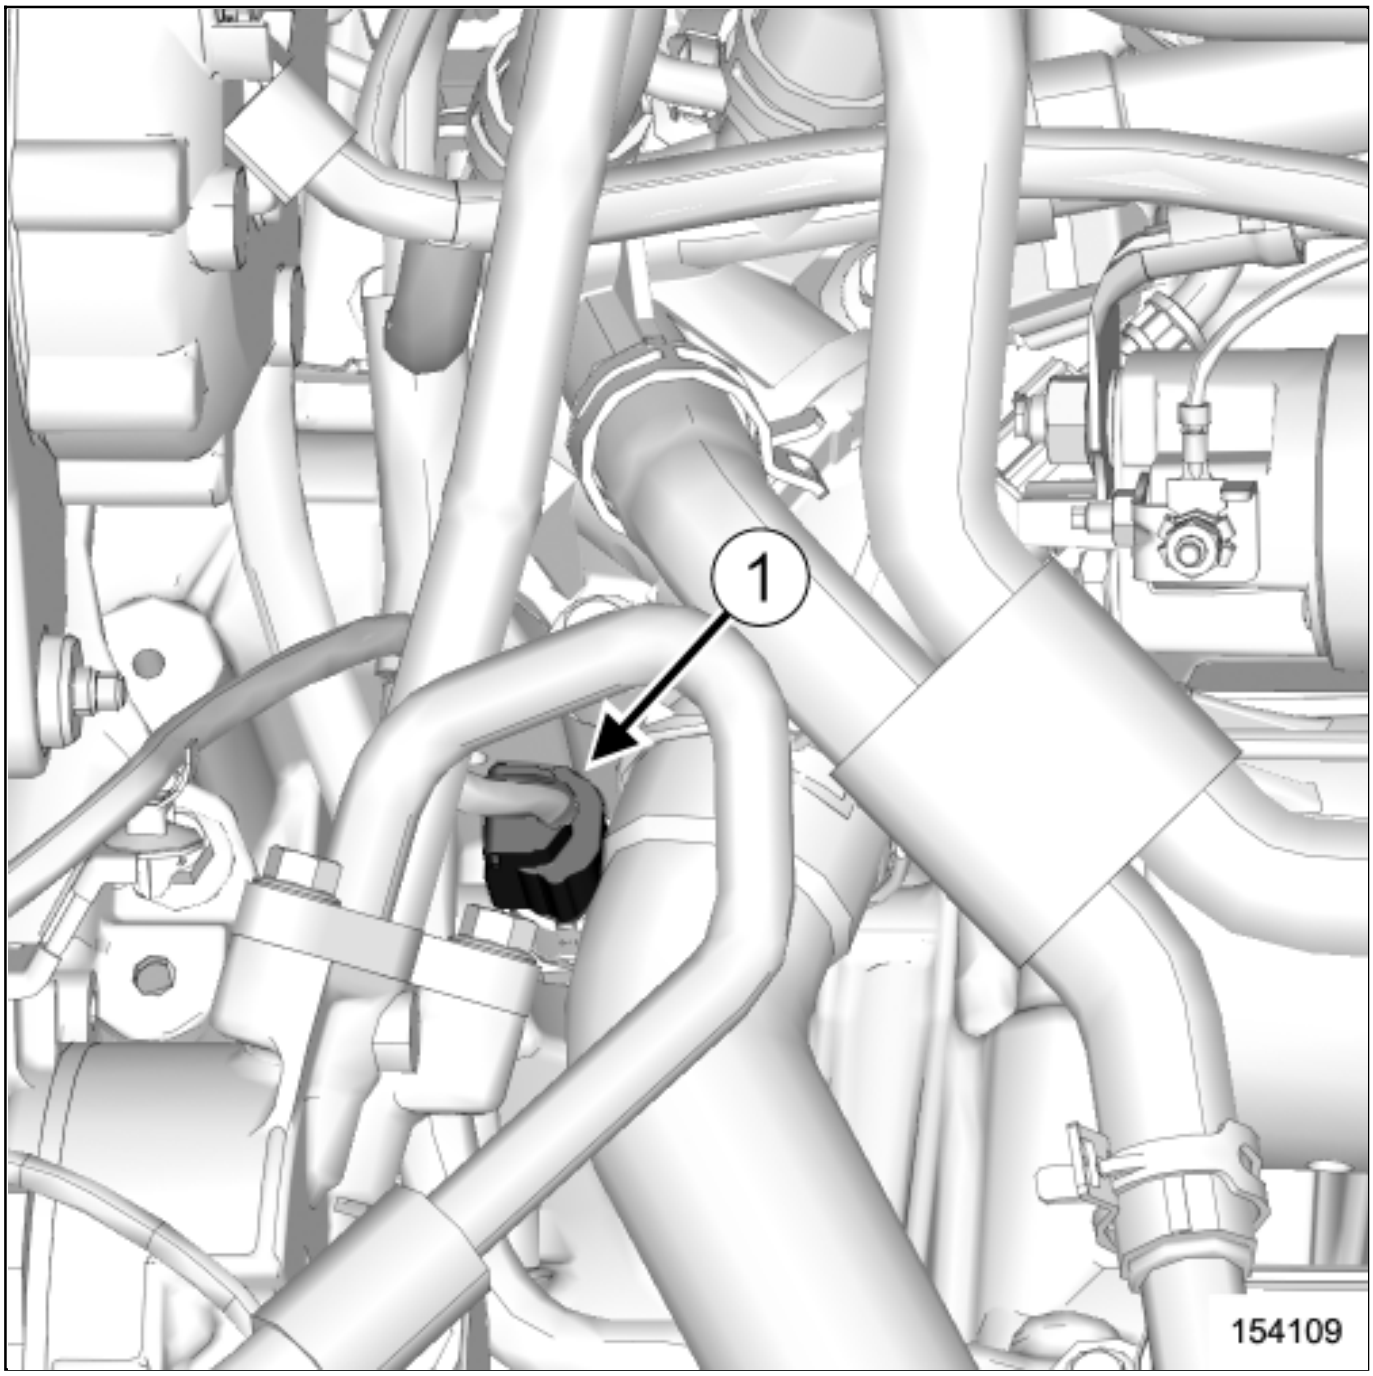
2. REFITTING OPERATION

Refit the oil pressure sensor(see **Engine and transmission assembly sensors: List and location of components**) .

Torque tighten the oil pressure sensor(see **Engine and transmission assembly sensors: List and location of components**) .

Proceed in the reverse order to removal.

OIL PRESSURE SENSOR: REMOVAL - REFITTING



Locations and specifications (tightening torques, parts always to be replaced, etc.)(see **10A**, **Engine and cylinder block assembly**, **Engine and transmission assembly sensors: List and location of components**, page) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .
- Disconnect the battery(see **Battery: Removal - Refitting**) .
- Remove:
  - the engine undertray bolts
  - the engine undertray,
  - the intercooler air outlet pipe**Air inlet assembly: Exploded view** ,

2. REMOVAL OPERATION

Disconnect the connector(1) from the oil pressure sensor.

Remove the oil pressure sensor using a 22 mmlong socket.

REFITTING

1. REFITTING PREPARATION OPERATION

Coat the threading of the oil pressure sensor with silicone adhesive sealant[Vehicle: Parts and consumables for the repair] to ensure correct sealing.

2. REFITTING OPERATION

Refit the oil pressure sensor(see **10A**, **Engine and cylinder block assembly**, **Engine and transmission assembly sensors: List and location of components**, page) **.**

Torque tighten the oil pressure sensor(see **10A**, **Engine and cylinder block assembly**, **Engine and transmission assembly sensors: List and location of components**, page) **.**

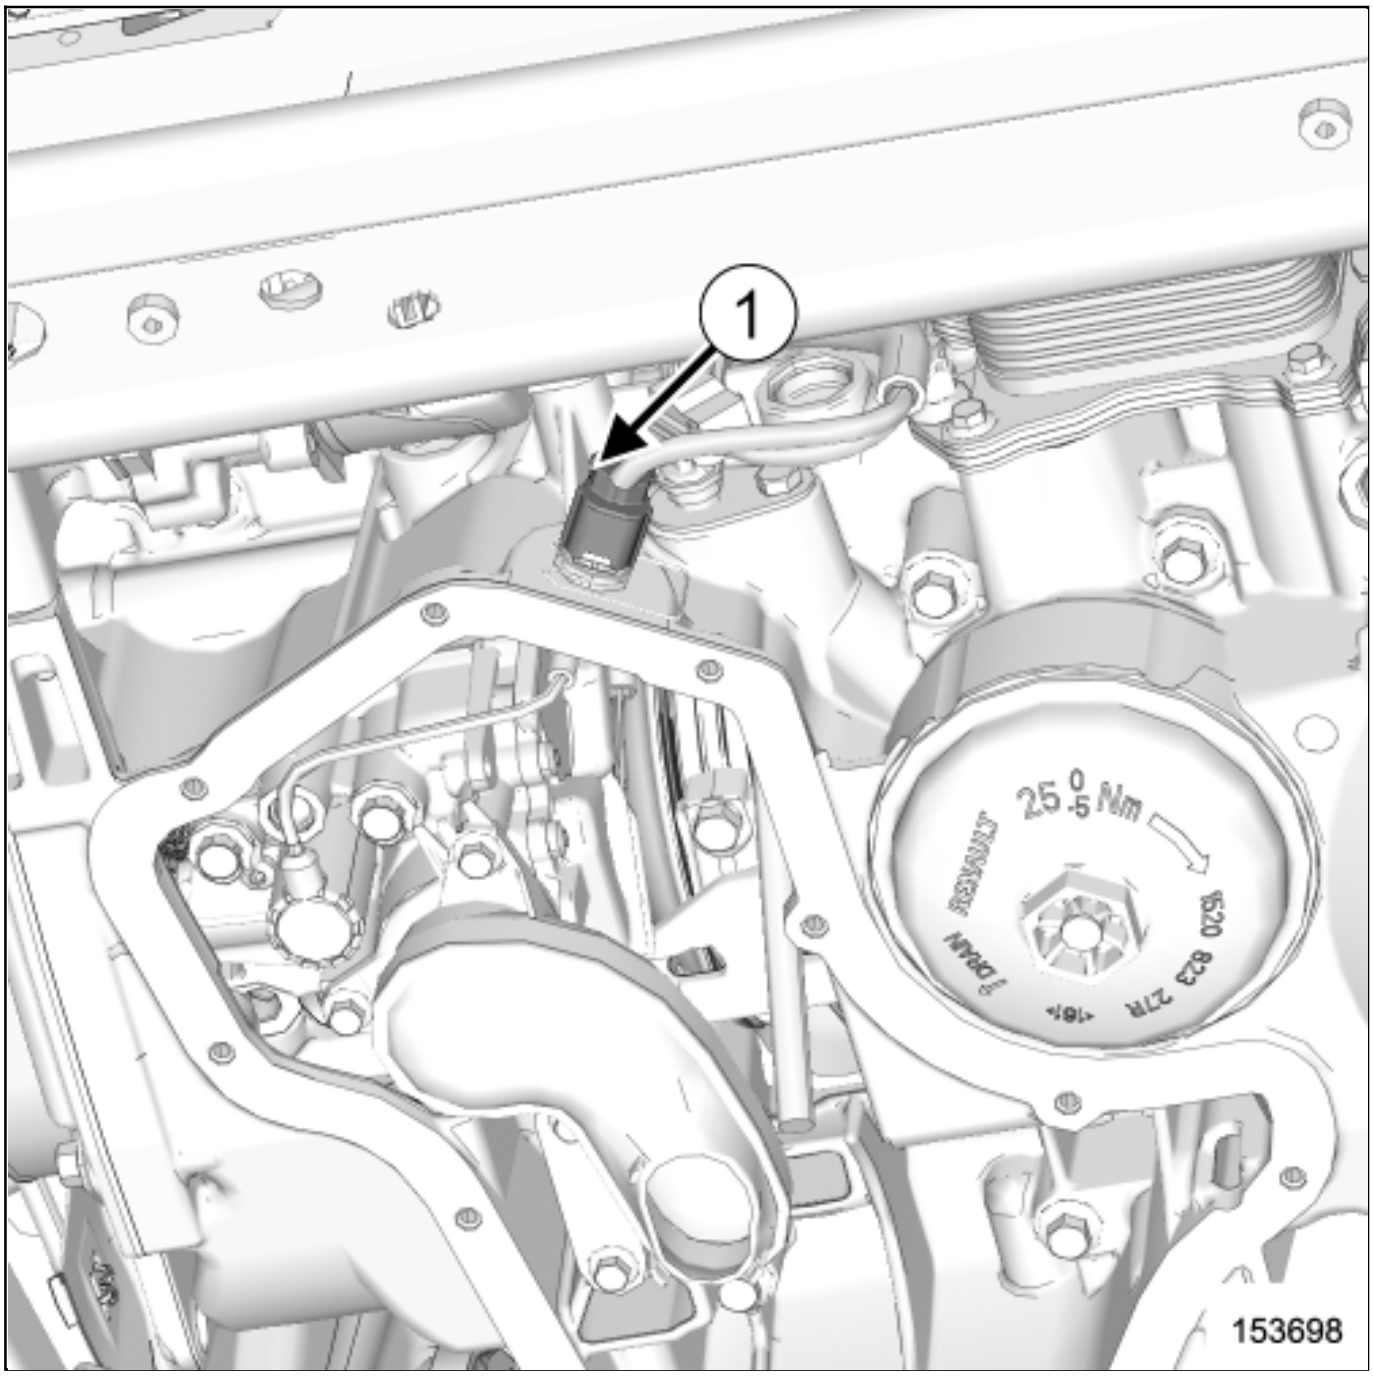
Proceed in the reverse order to removal.

OIL PUMP: REMOVAL - REFITTING

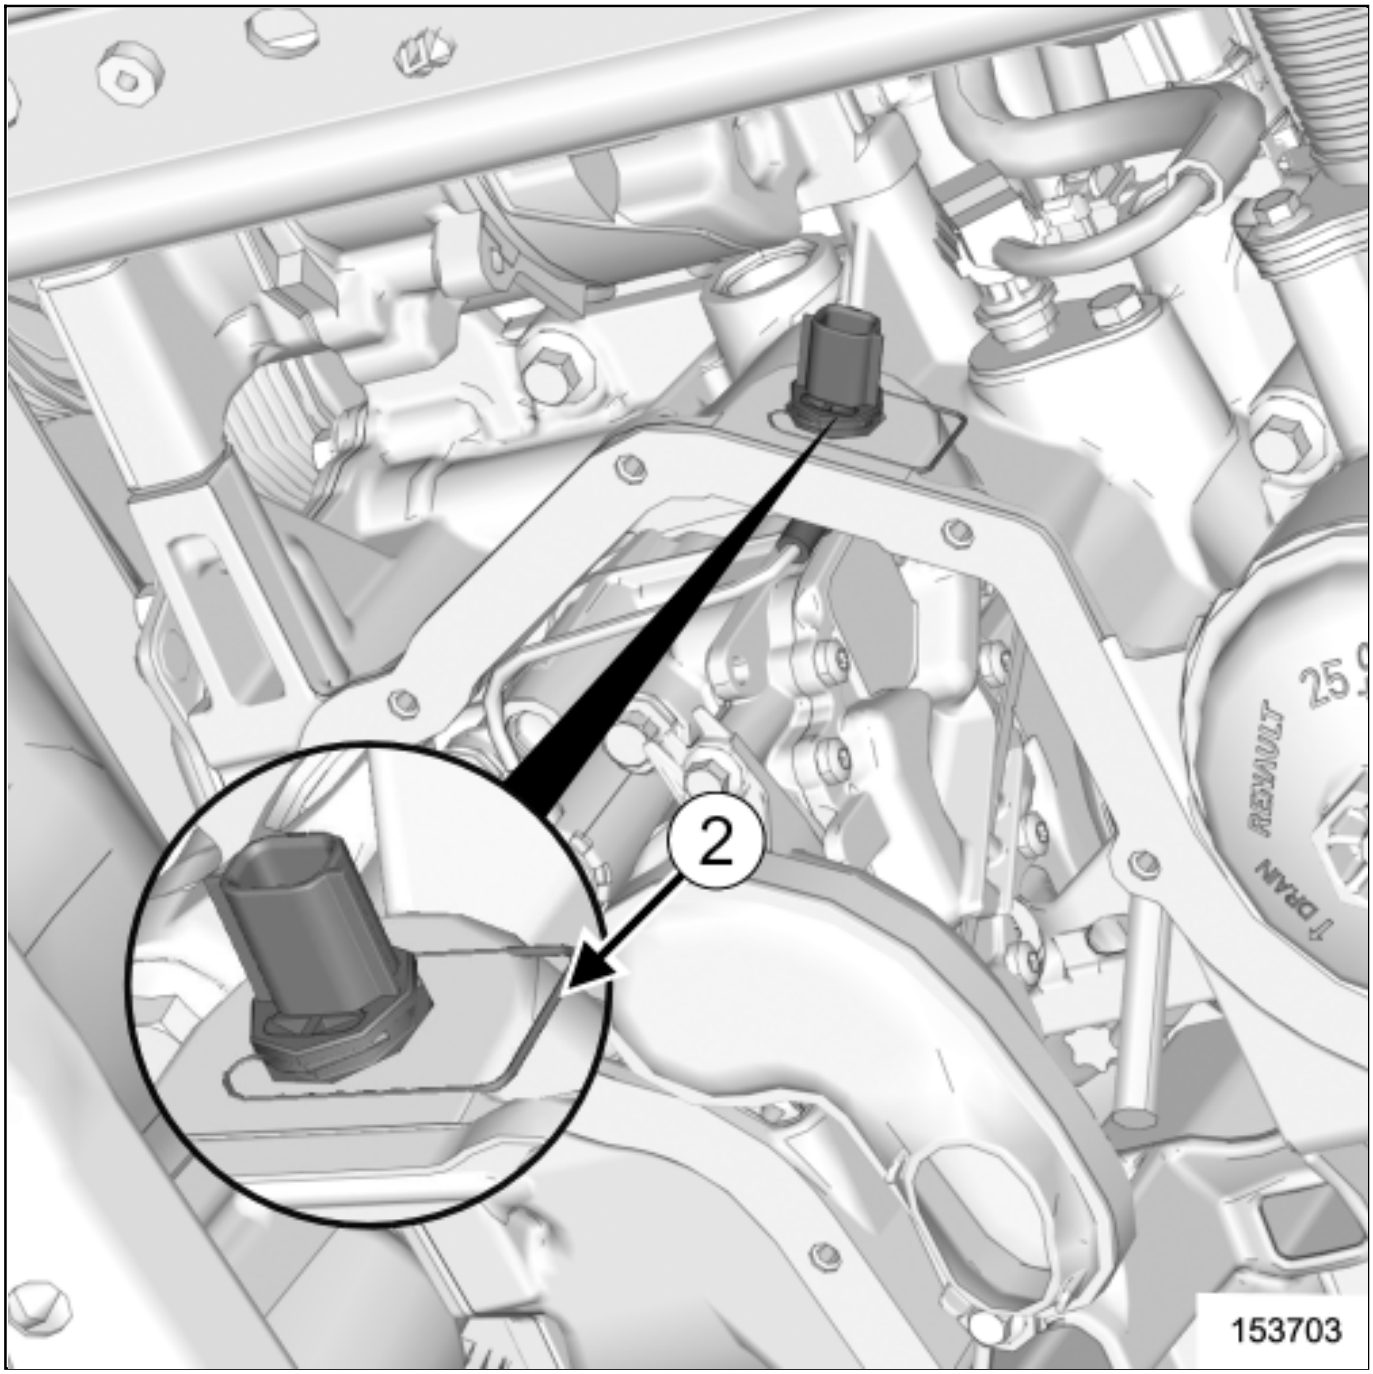
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the engine undertray.
- Drain the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .
- Remove the lower cover(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .



Note:

The solenoid oil pump can be changed without removing the oil pump (remove the bolt from the oil pump and the clip of the connector).

2. REMOVAL OPERATION

Disconnect the oil pump connector(1) .

Remove the clip(2) .

Unclip the oil pump connector.

Remove (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump strainer bolts,

- the oil pump strainer,
- the oil pump strainer seal,
- the oil pump bracket bolts,
- the oil pump bracket,
- the oil pump bolts,
- the oil pump pinion from the oil pump chain,
- the oil pump.

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replace:

- the oil pump strainer seal.

2. REFITTING OPERATION

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump,
- the oil pump pinion on the oil pump chain.

Note:

If necessary, use a locally produced hook to fit the oil pump chain to the oil pump pinion.

Refit the oil pump bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Torque tighten the oil pump bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump bracket,
- the oil pump bracket bolts.

Torque tighten the oil pump bracket bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- a new oil pump strainer seal,
- the oil pump strainer,
- the oil pump strainer bolts.

Torque tighten the oil pump strainer bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Top up the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

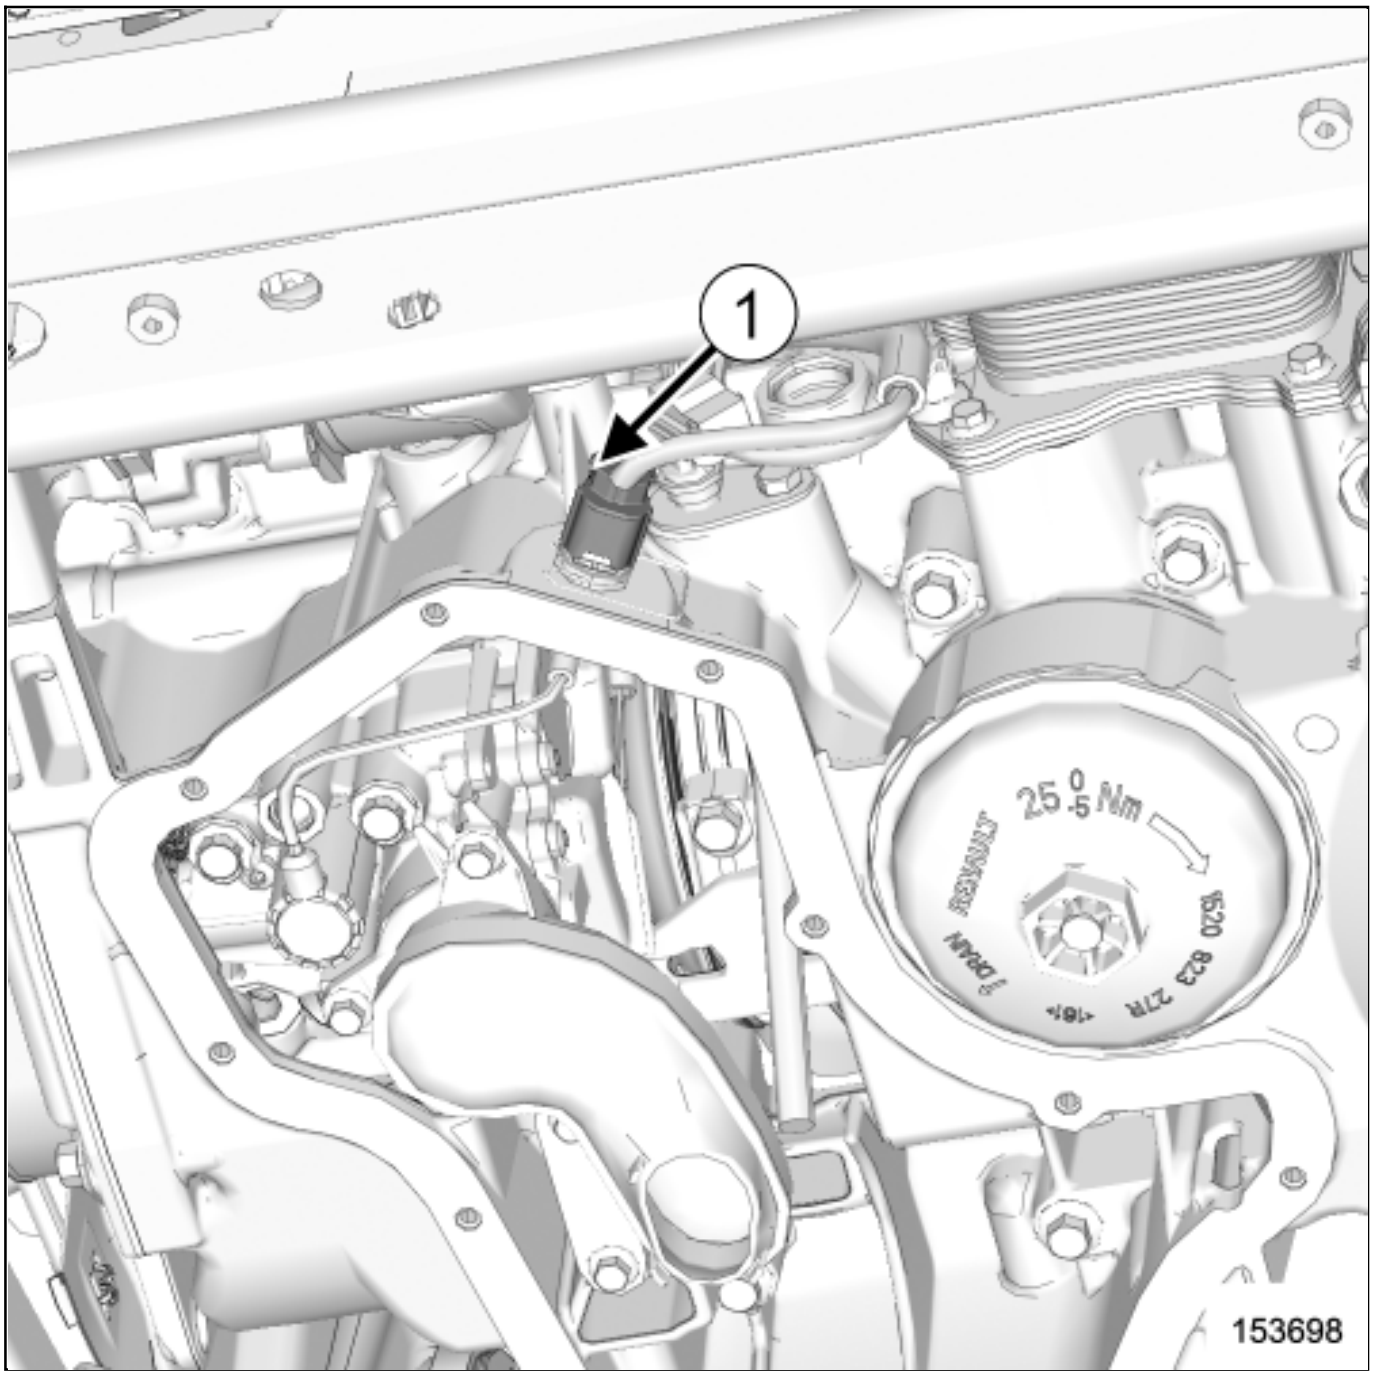
XSL version : 3.02 du 22/07/11

OIL PUMP: REMOVAL - REFITTING

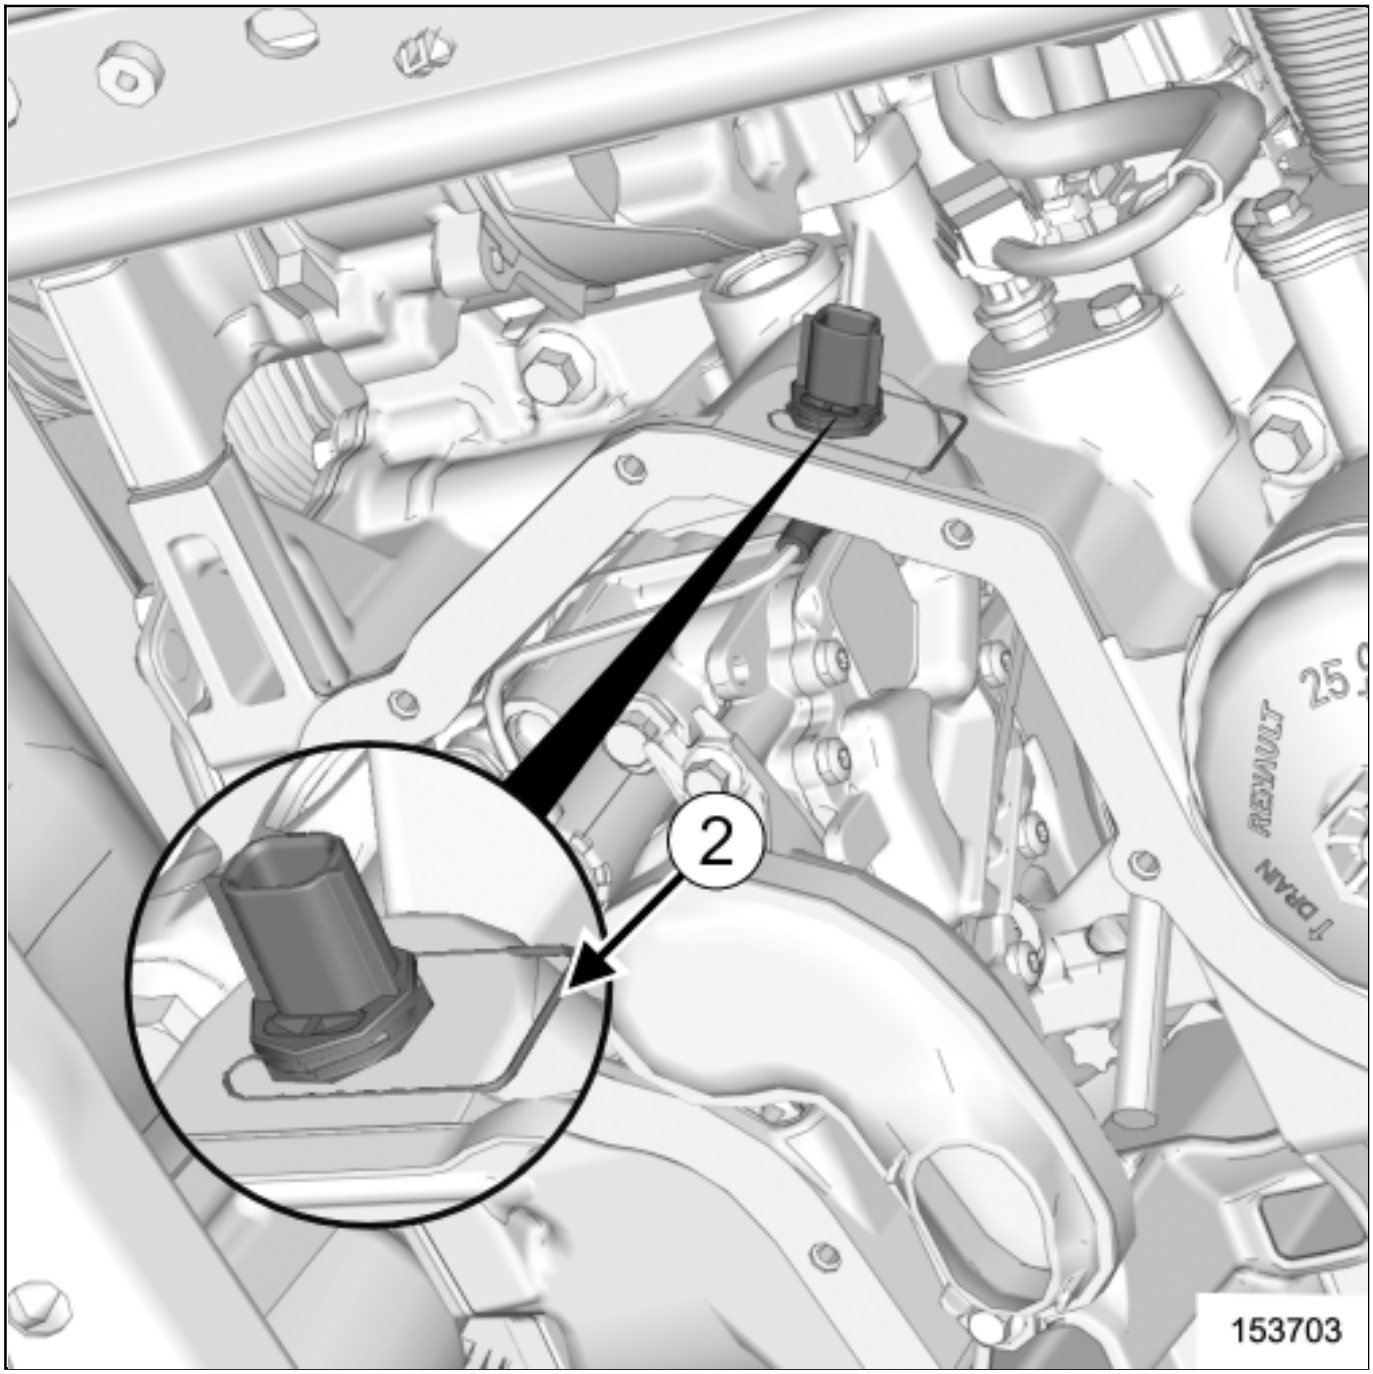
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the engine undertray.
- Drain the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .
- Remove the lower cover(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .



Note:

The solenoid oil pump can be changed without removing the oil pump (remove the bolt from the oil pump and the clip of the connector).

2. REMOVAL OPERATION

Disconnect the oil pump connector(1) .

Remove the clip(2) .

Unclip the oil pump connector.

Remove (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump strainer bolts,

- the oil pump strainer,
- the oil pump strainer seal,
- the oil pump bracket bolts,
- the oil pump bracket,
- the oil pump bolts,
- the oil pump pinion from the oil pump chain,
- the oil pump.

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replace:

- the oil pump strainer seal.

2. REFITTING OPERATION

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump,
- the oil pump pinion on the oil pump chain.

Note:

If necessary, use a locally produced hook to fit the oil pump chain to the oil pump pinion.

Refit the oil pump bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Torque tighten the oil pump bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil pump bracket,
- the oil pump bracket bolts.

Torque tighten the oil pump bracket bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- a new oil pump strainer seal,
- the oil pump strainer,
- the oil pump strainer bolts.

Torque tighten the oil pump strainer bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Top up the engine oil(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

XSL version : 3.02 du 22/07/11

OIL-COOLANT HEAT EXCHANGER: REMOVAL - REFITTING

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583

parts always to be replaced:

coolant-engine oil heat exchanger seal on the cylinder block

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two post liftVehicle: Towing and lifting .

Remove:

- the engine undertray bolts,
- the engine undertray.

2. REMOVAL OPERATION

Fit the toolPipe clamps.(Ms. 583) on to the pipes of the oil-coolant heat exchanger(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Move aside with the toolRemote operation pliers for hose clips.(Mot. 1448) the coolant pipe clips of the oil-coolant heat exchanger(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the pipes of the oil-coolant heat exchanger(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Remove (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the oil-coolant heat exchanger bolts,
- the oil-coolant heat exchanger,
- the oil-coolant heat exchanger seals.

REFITTING

1. REFFITING PREPARATION OPERATION

parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block .

Clean and degrease the bearing faces of the oil coolant heat exchanger and the cylinder block with SURFACE CLEANERVehicle: Parts and consumables for the repair .

2. REFFITING OPERATION

Refit (see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) :

- the new seal on the oil-coolant heat exchanger,
- the oil-coolant heat exchanger.

Torque tighten the oil-coolant heat exchanger bolts(see 10A, Engine and cylinder block assembly, Engine oil circuit assembly: Exploded view) .

Proceed in the reverse order to removal.

Perform the following operations:

- top up the engine oil with oil recommended by the manufacturer(see **Petrol engine oils: Specifications**) ,
- top up the cooling system,
- bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

OIL-COOLANT HEAT EXCHANGER: REMOVAL - REFITTING

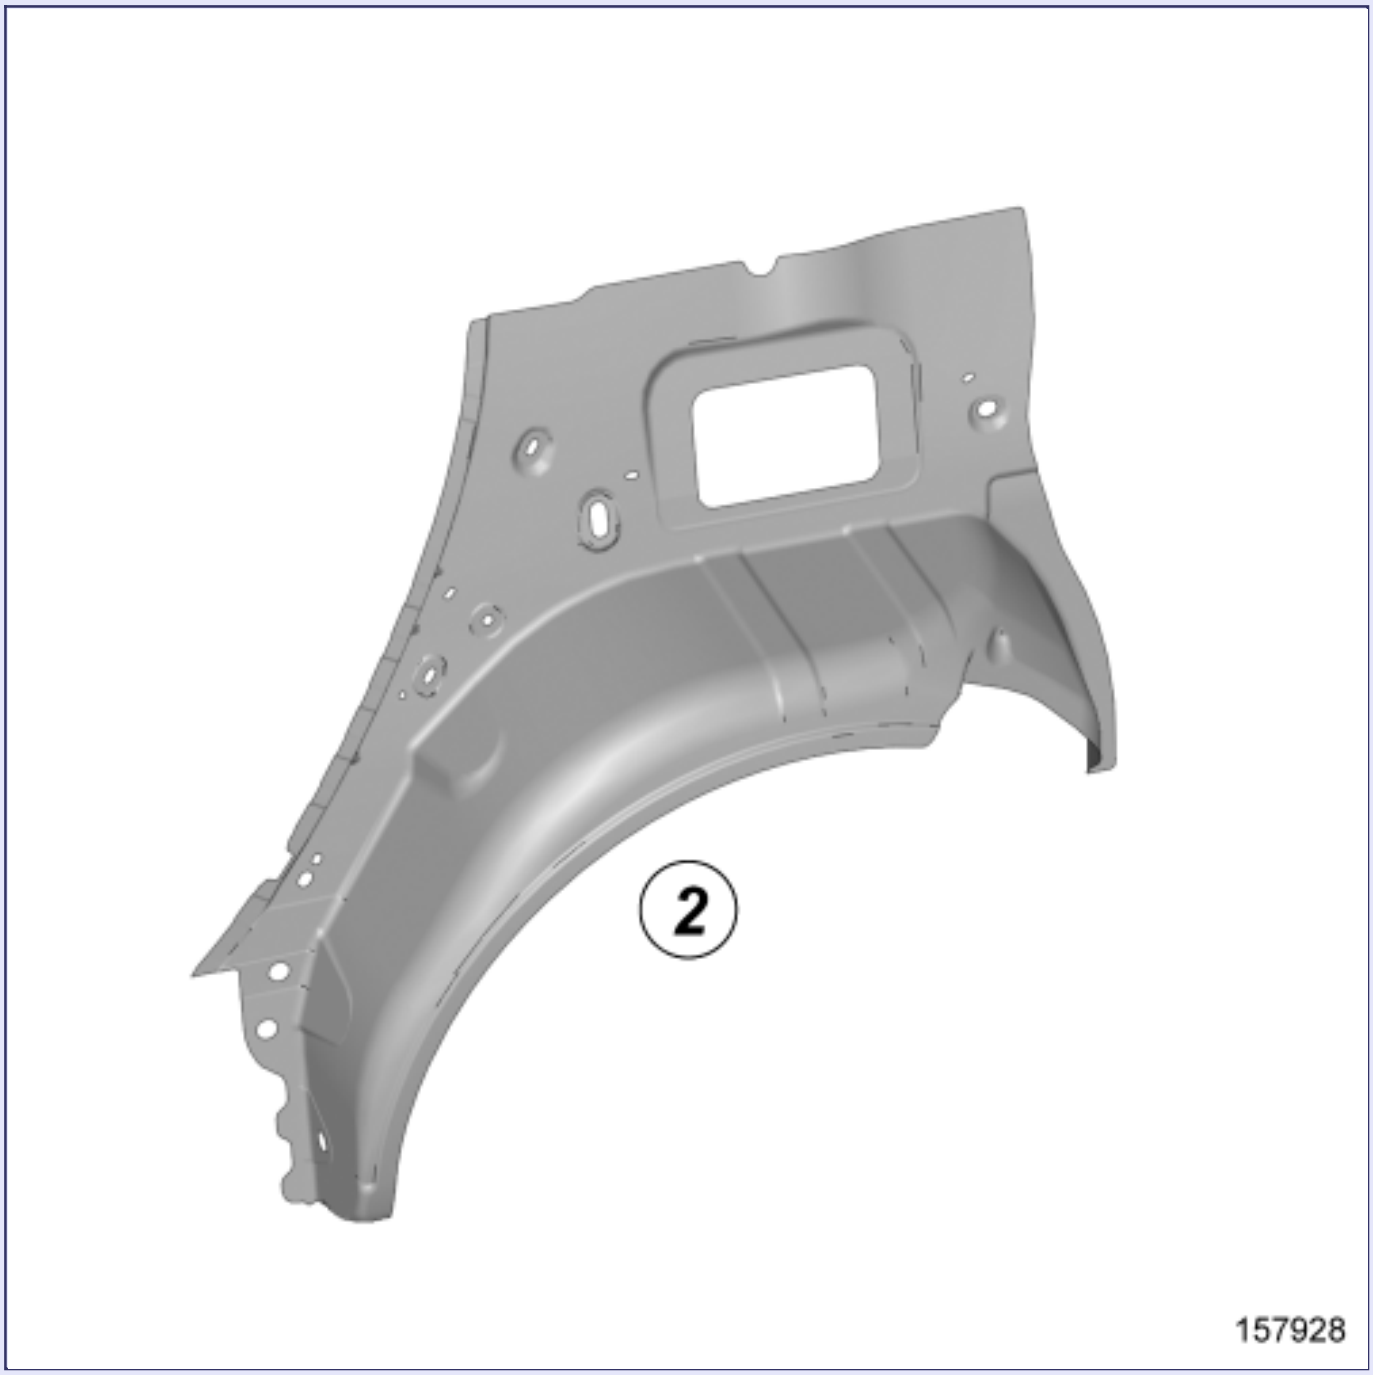
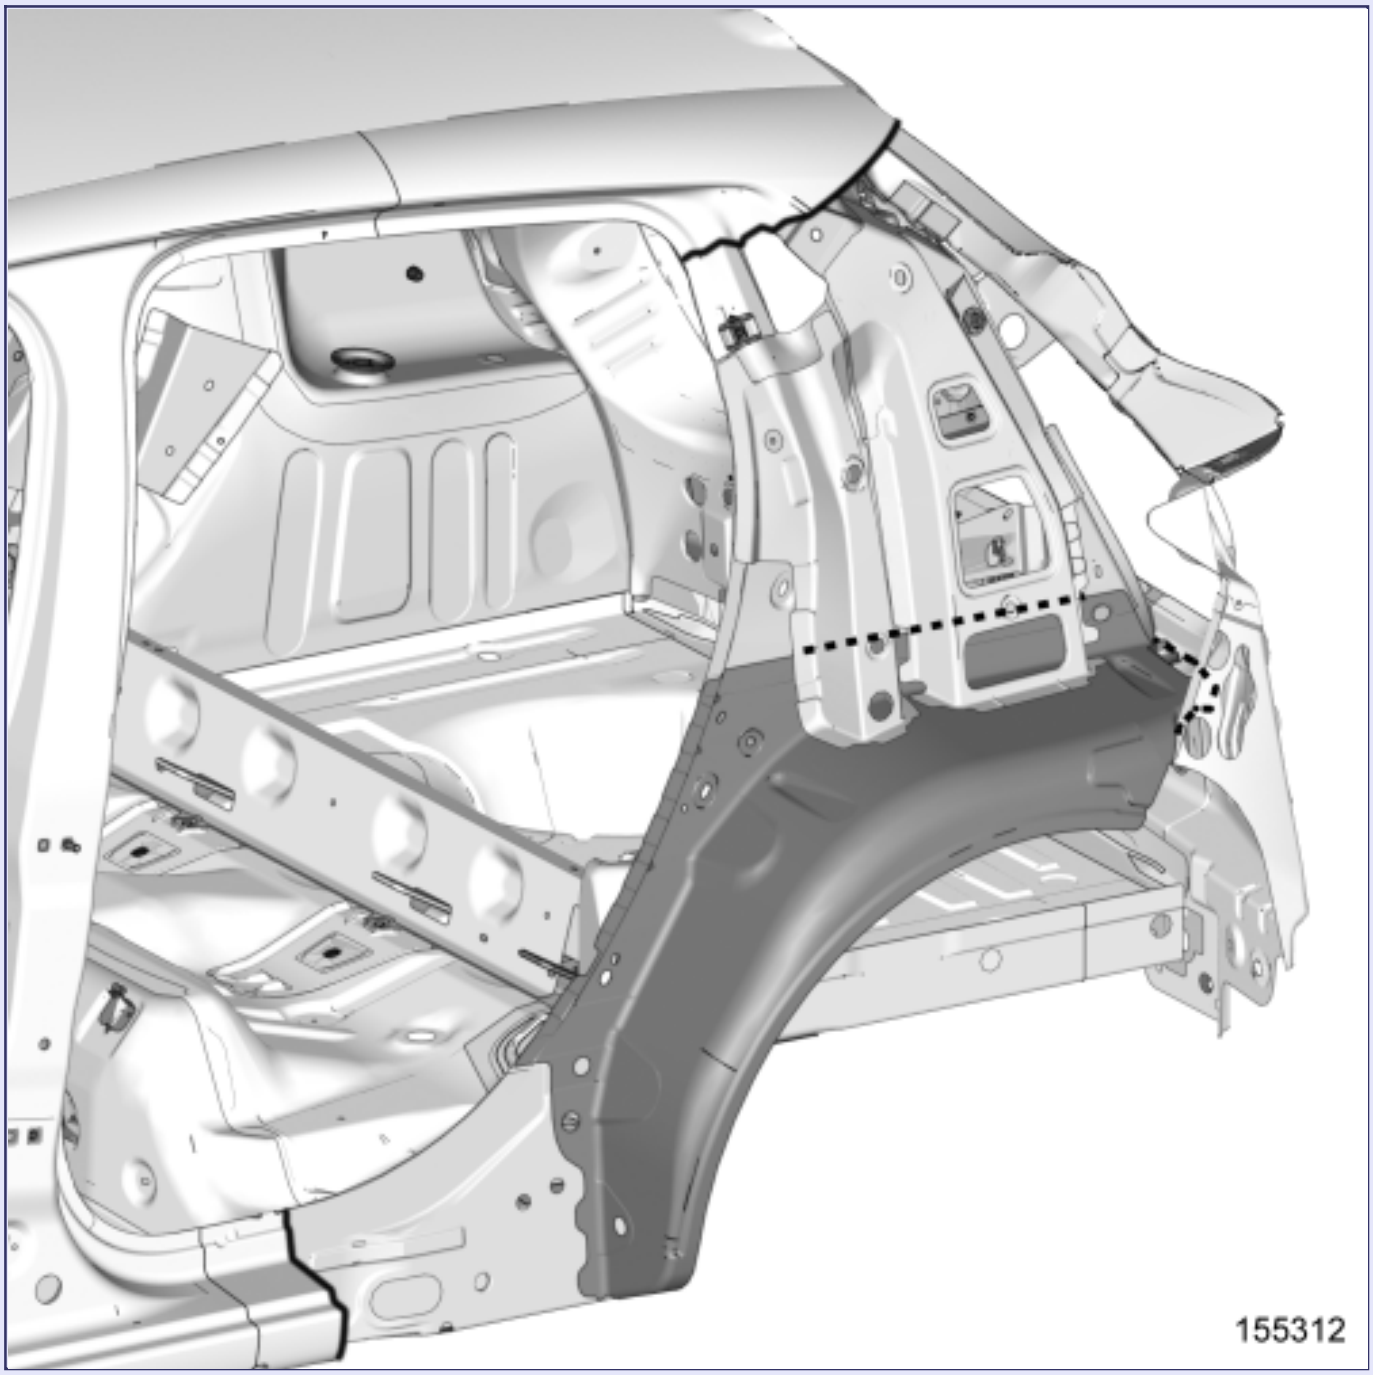
OUTER REAR WHEEL ARCH: REPLACEMENT



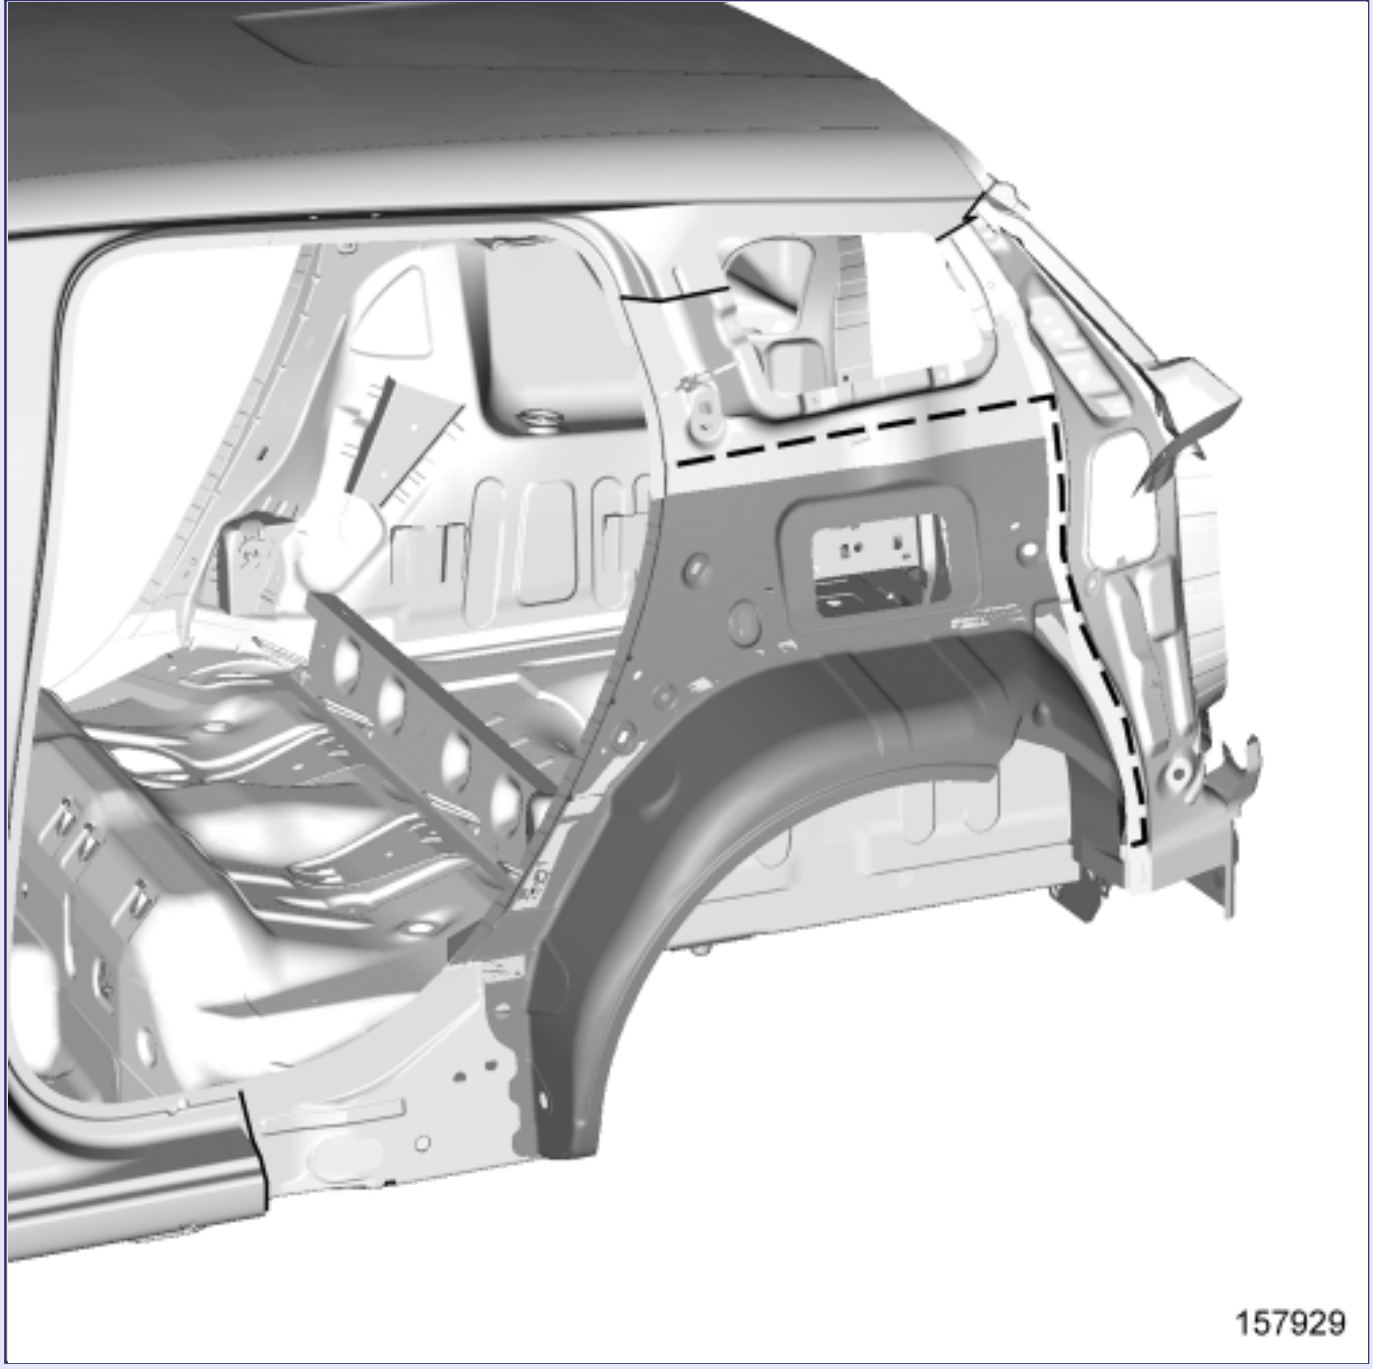
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Quarter panel lining	Mild steel	0.6



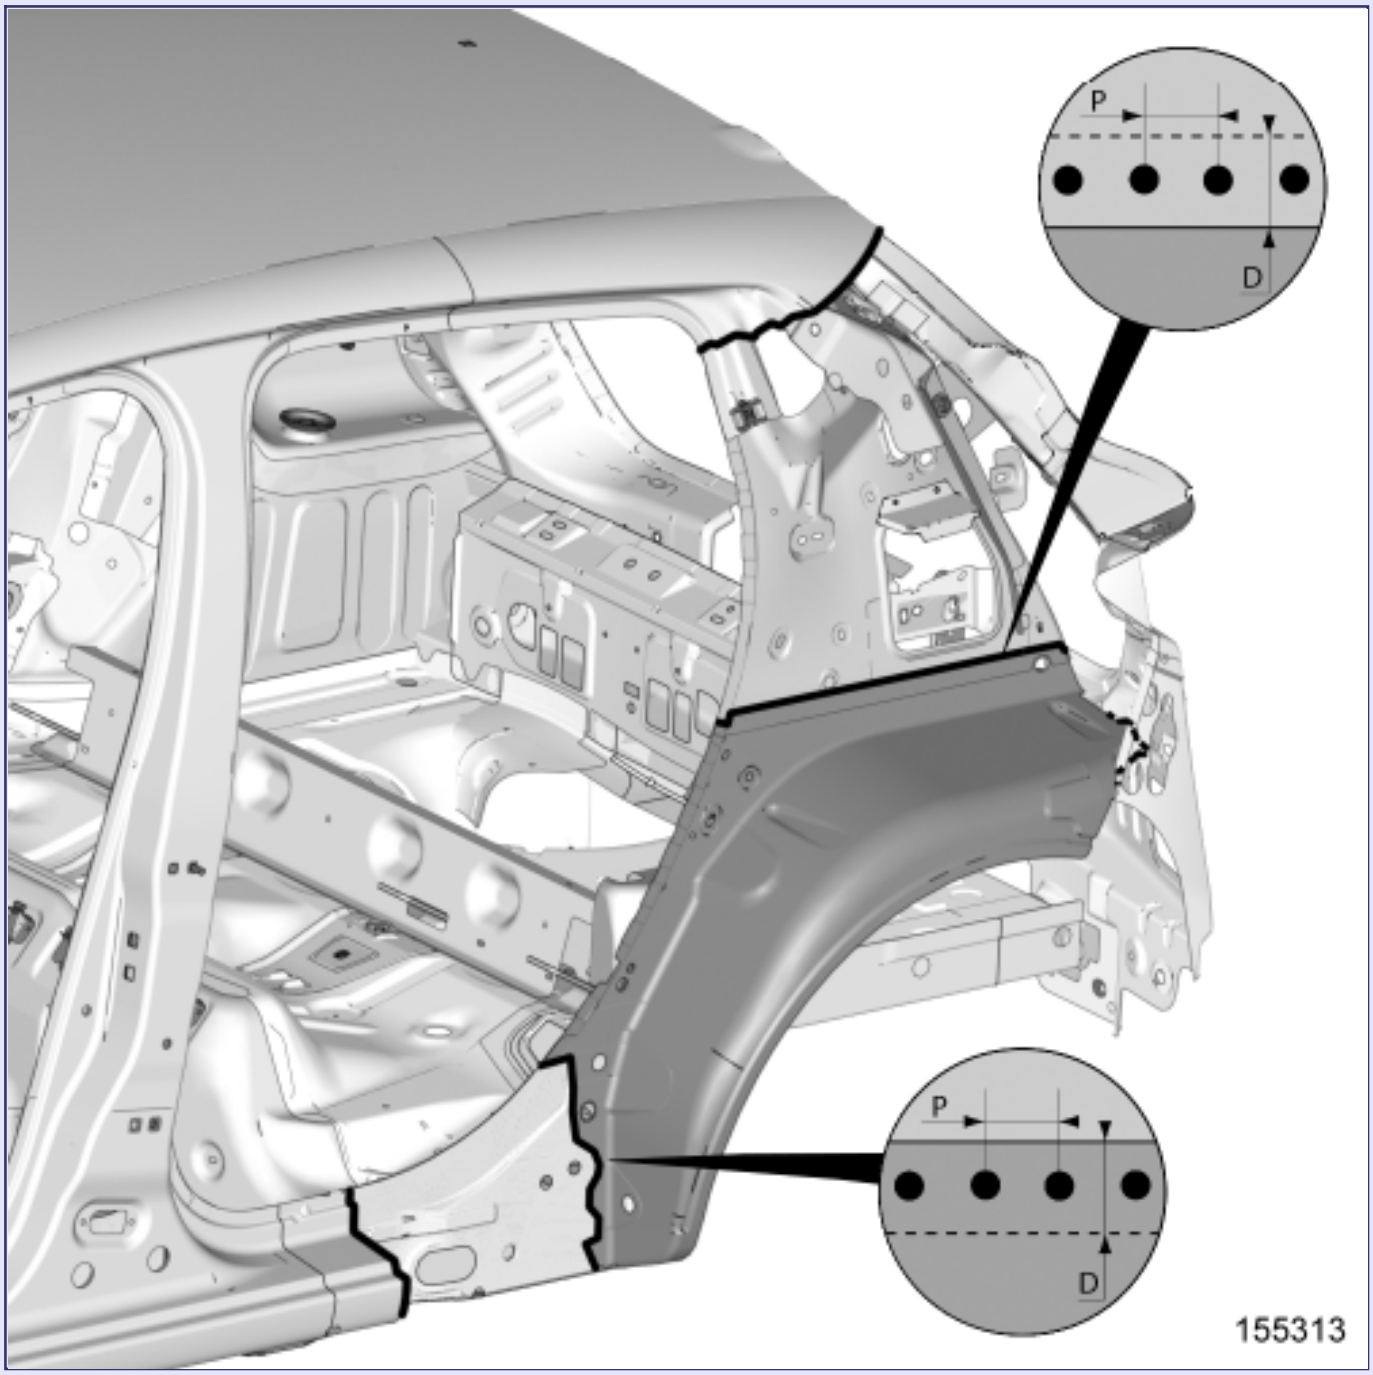
No.	Description	Type	Thickness (mm)
(2)	Quarter panel lining	Mild steel	0.6



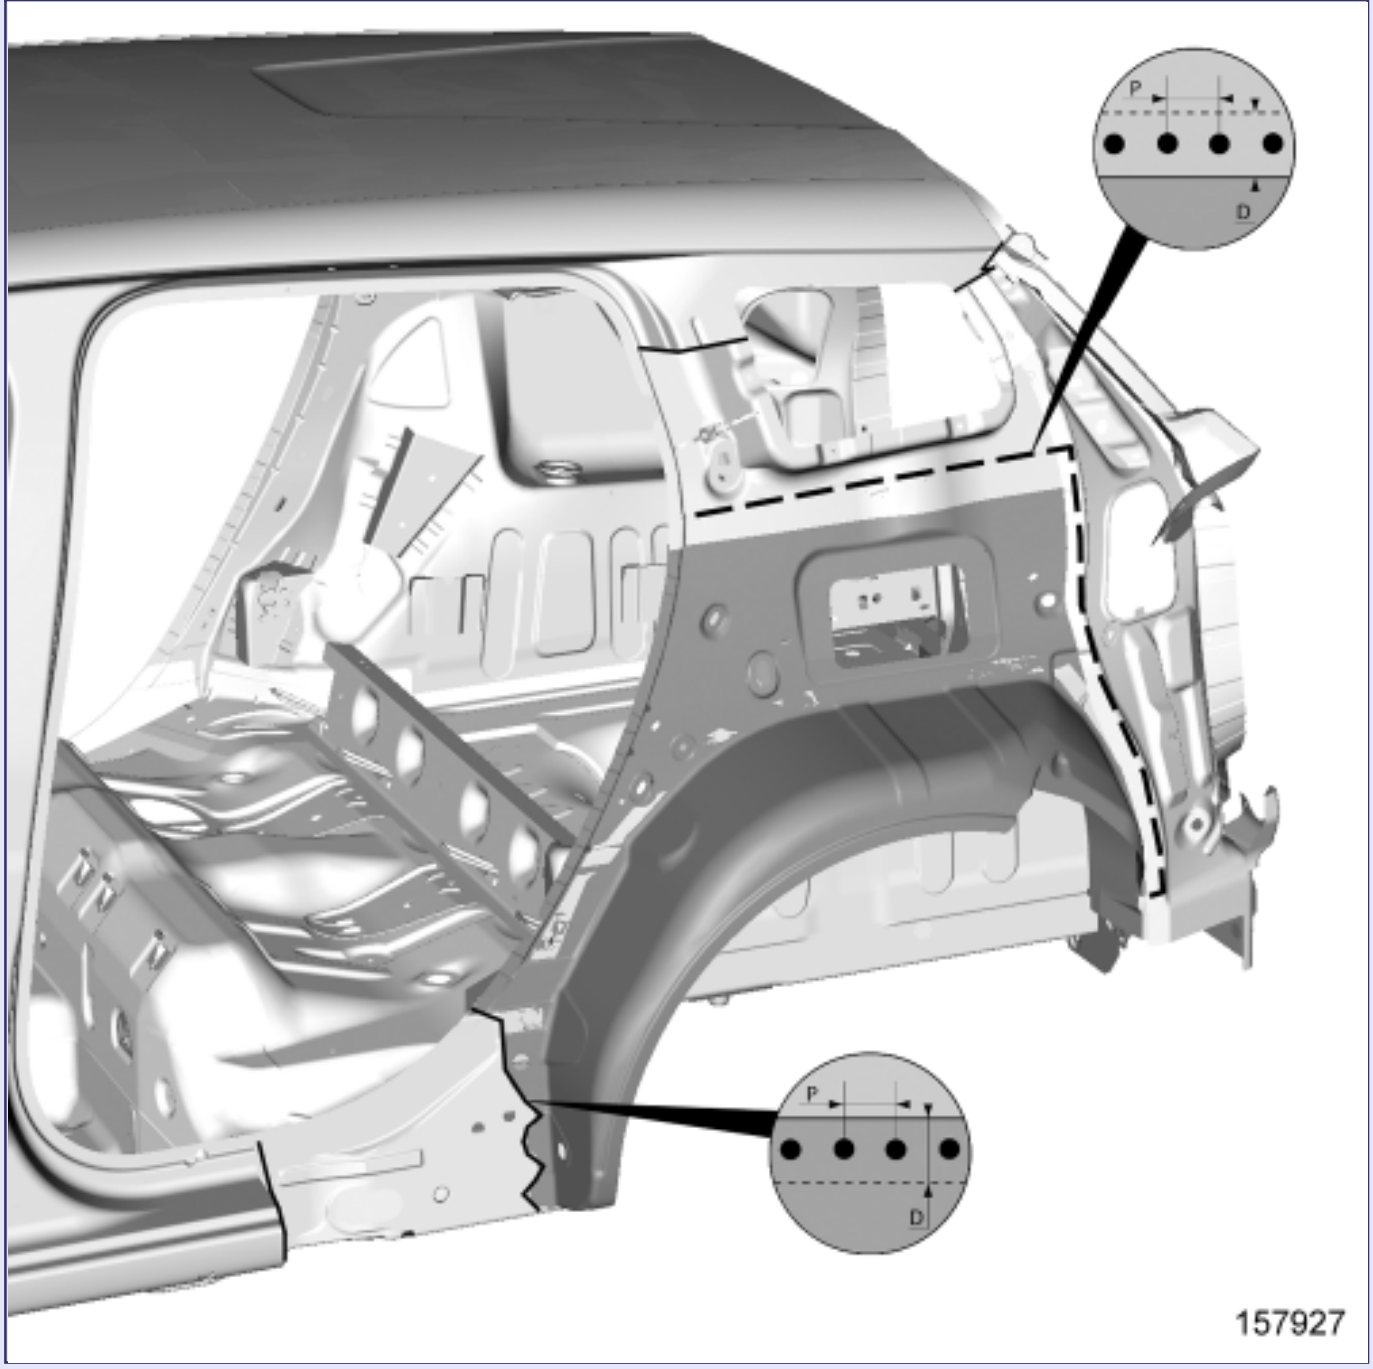
2. IN THE EVENT OF REPLACEMENT

- There is only one way of replacing this part:
  - complete replacement.

B98(B98)



K98(K98)



1- COMPLETE REPLACEMENT

1)PART IN POSITION

B98(B98)

K98(K98)

P (Pitch) = 25 mm

D = 30 mm

Make a superimposed connection[Partial replacement connections by overlapping: Description](#) (MR 400, 40E, Partial replacement connections).

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

OUTPUT SHAFT: STRIPPING - REBUILDING

Note, one or more warnings are present in this procedure

Special tooling required	
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306

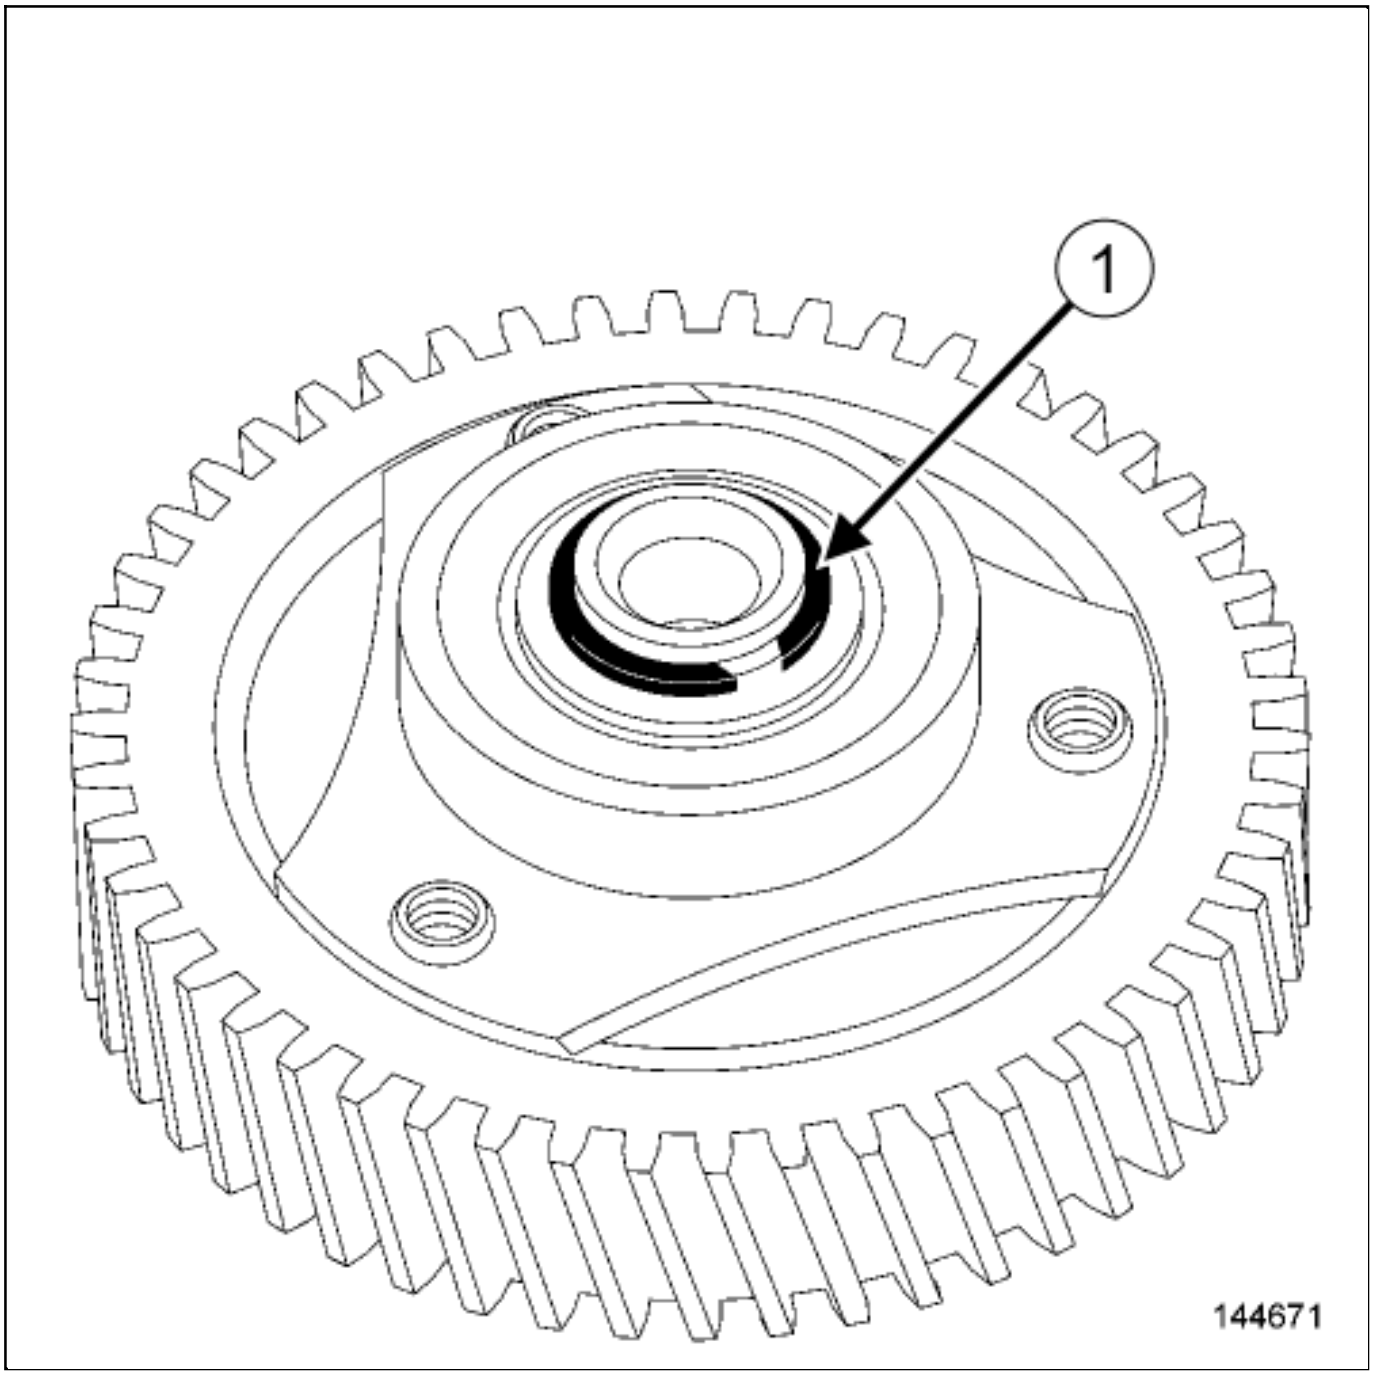
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

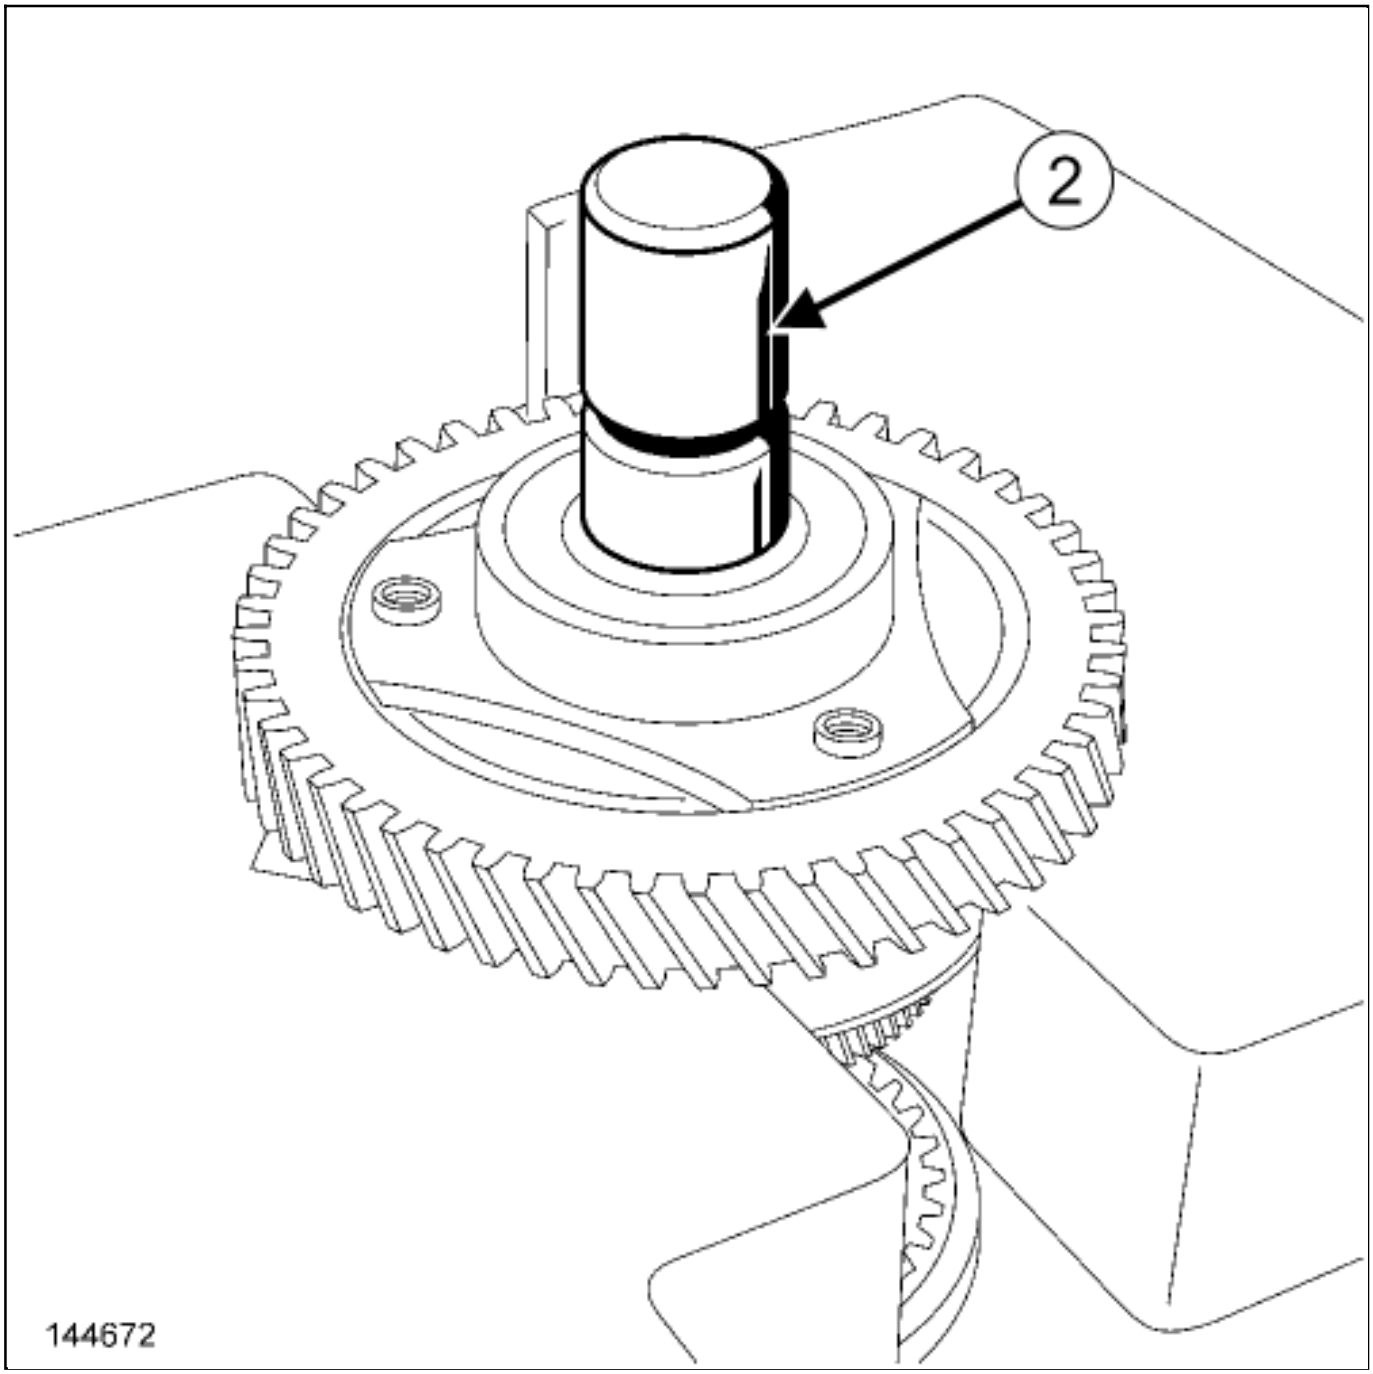
STRIPPING

1. STRIPPING PREPARATION OPERATION



Remove:

- the automatic gearbox Automatic gearbox: Removal - Refitting ,
- the automatic gearbox wiring Automatic gearbox wiring: Removal - Refitting ,
- the speed sensors Speed sensor: Removal - Refitting ,
- the gear engaged sensor Gear engaged sensor: Removal - Refitting ,
- the automatic transmission computer Automatic gearbox computer : Removal - Refitting ,

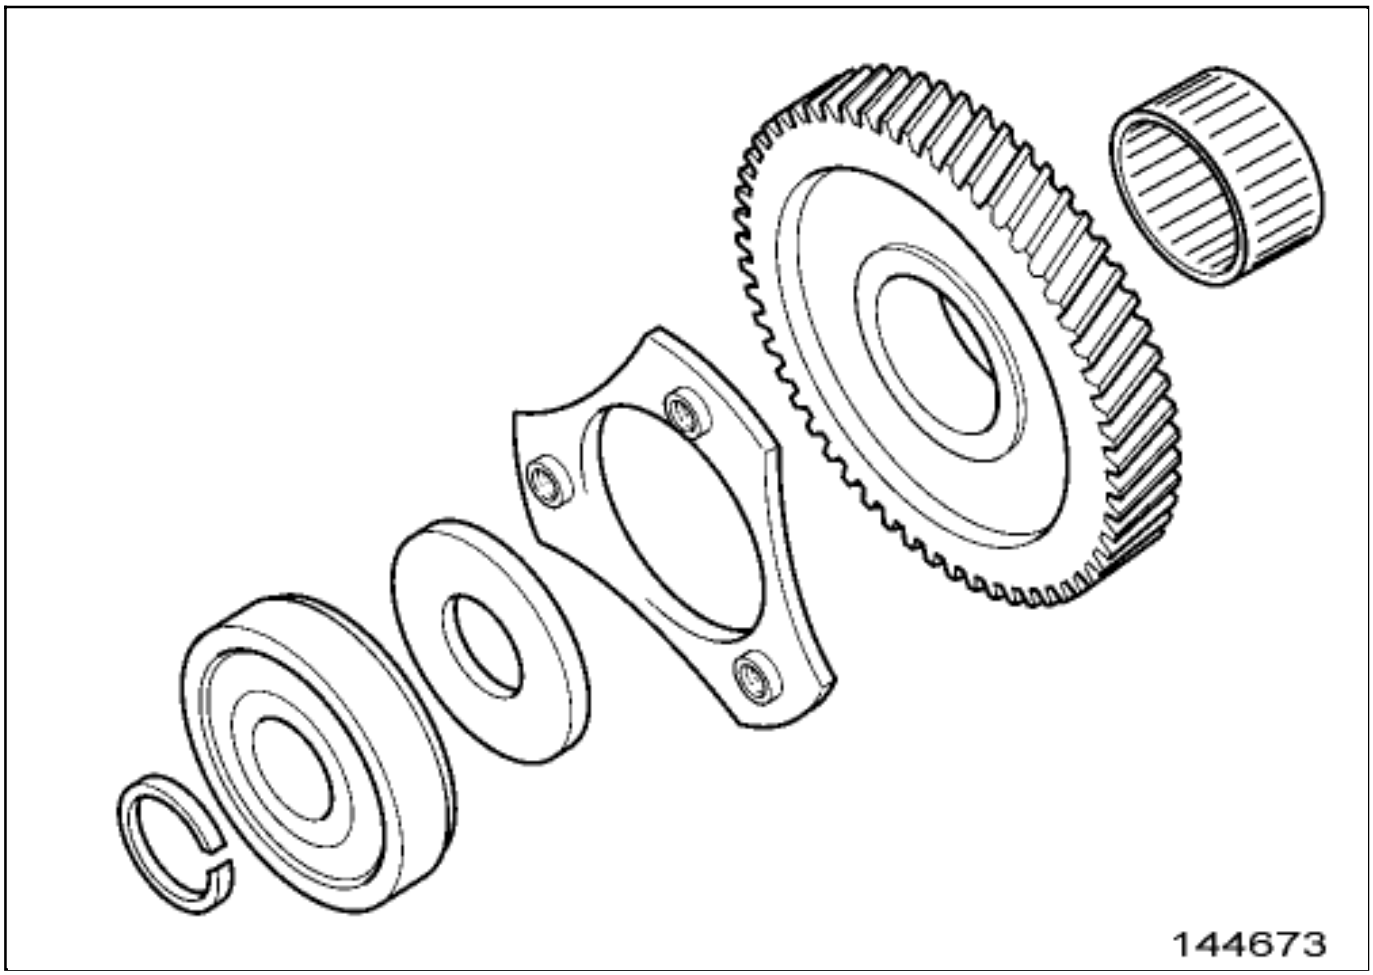


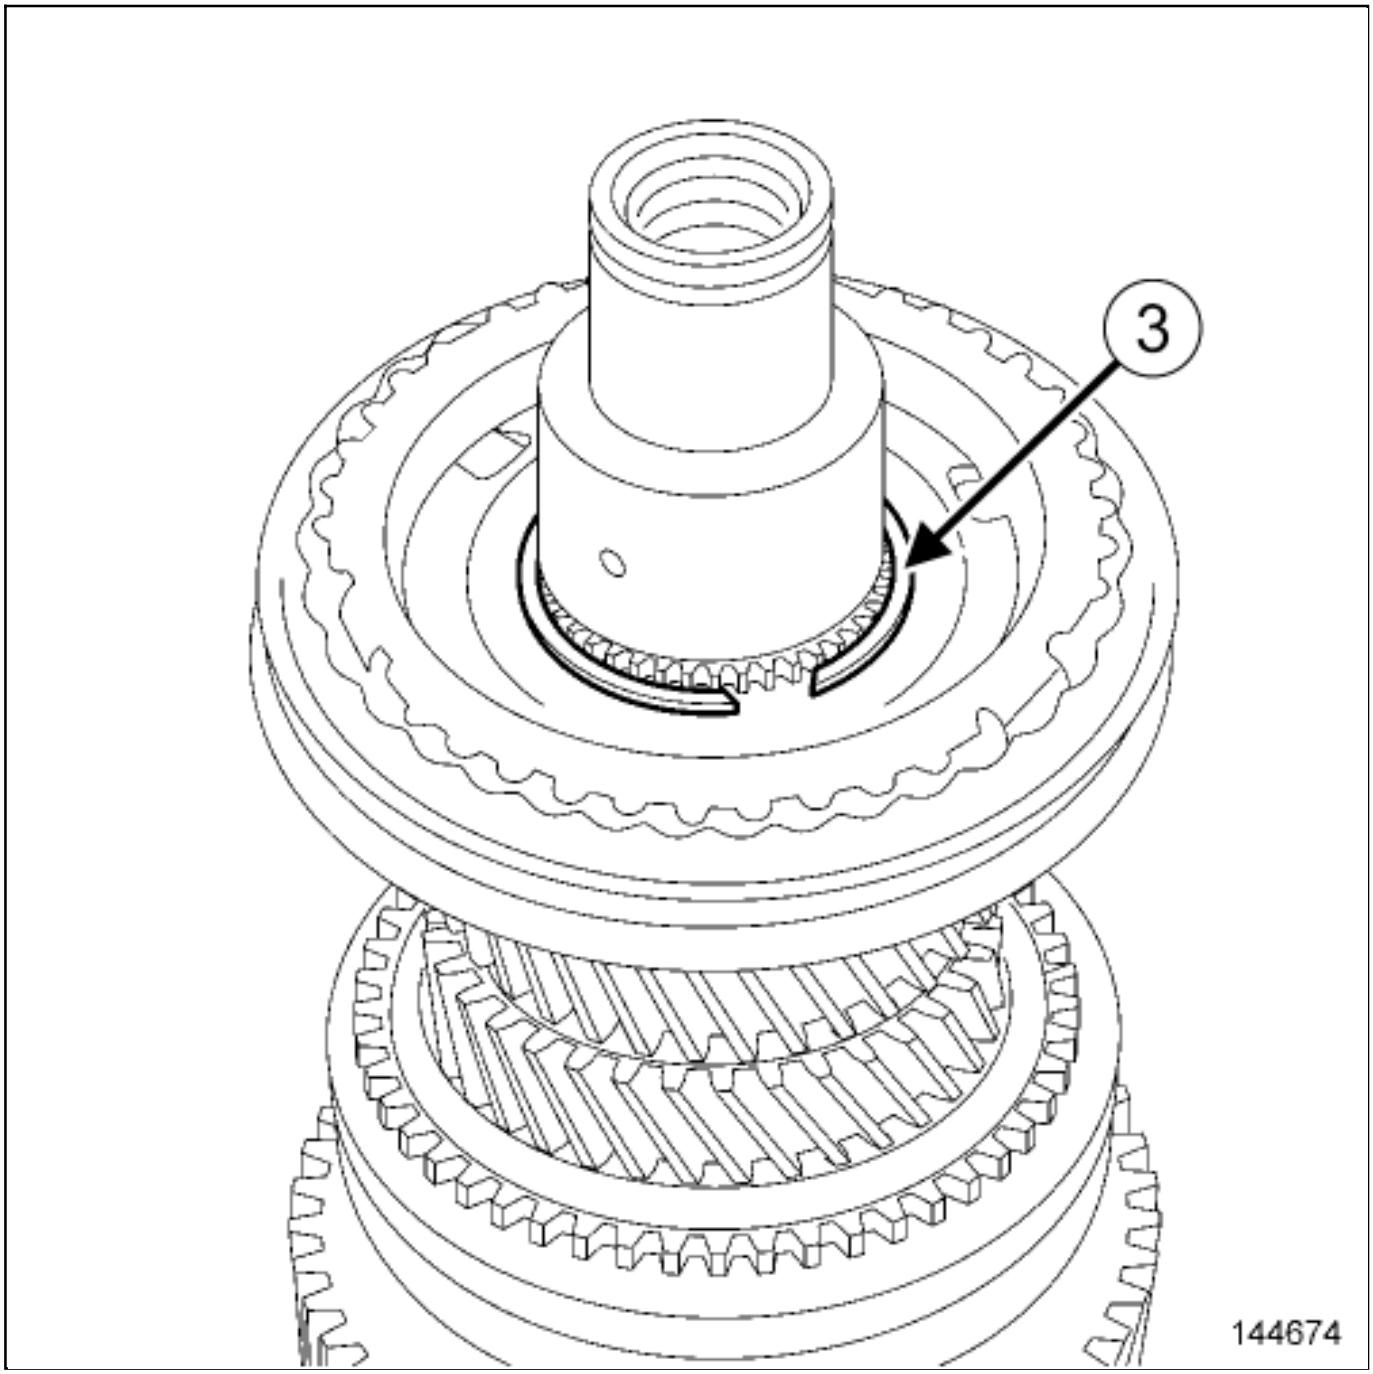
- the clutch pressure plate **Clutch: Removal - Refitting** ,
- the clutch actuator motors **Clutch actuator motor: Removal - Refitting** ,
- the clutch thrust bearing **Clutch thrust bearing: Removal - Refitting** ,
- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** ,
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** ,
- the input shaft bearing on the clutch housing **(see 23A, Automatic gearbox , Clutch housing bearing: Removal - Refitting)** ,
- the gearbox shafts **(see 23A, Automatic gearbox , Gearbox shaft: Removal - Refitting)** .

2. STRIPPING OPERATION FOR PART CONCERNED

1- STRIPPING THE 1ST, 5TH, 6THAND 2NDGEARS FROM THE SHAFT:

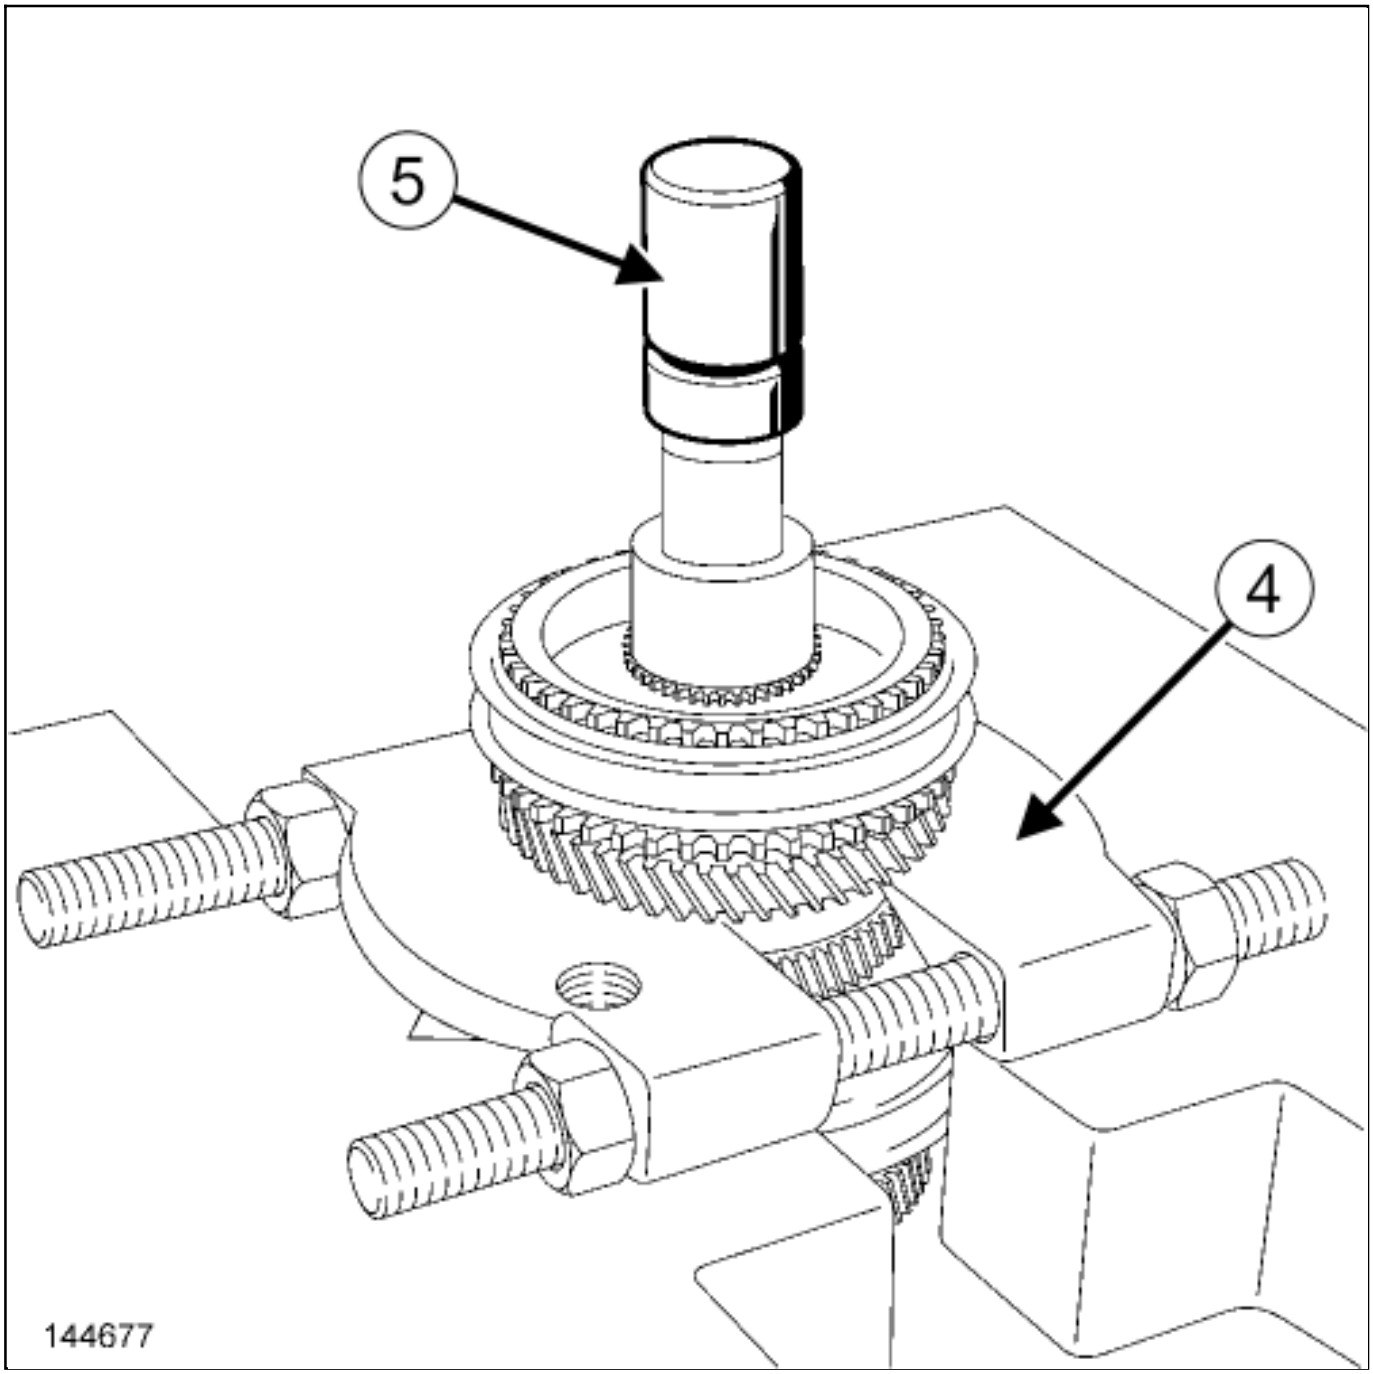
Remove the clip(1) using snap ring pliers.





Fit the gearbox shaft on a press using the 1st gear pinion as support.

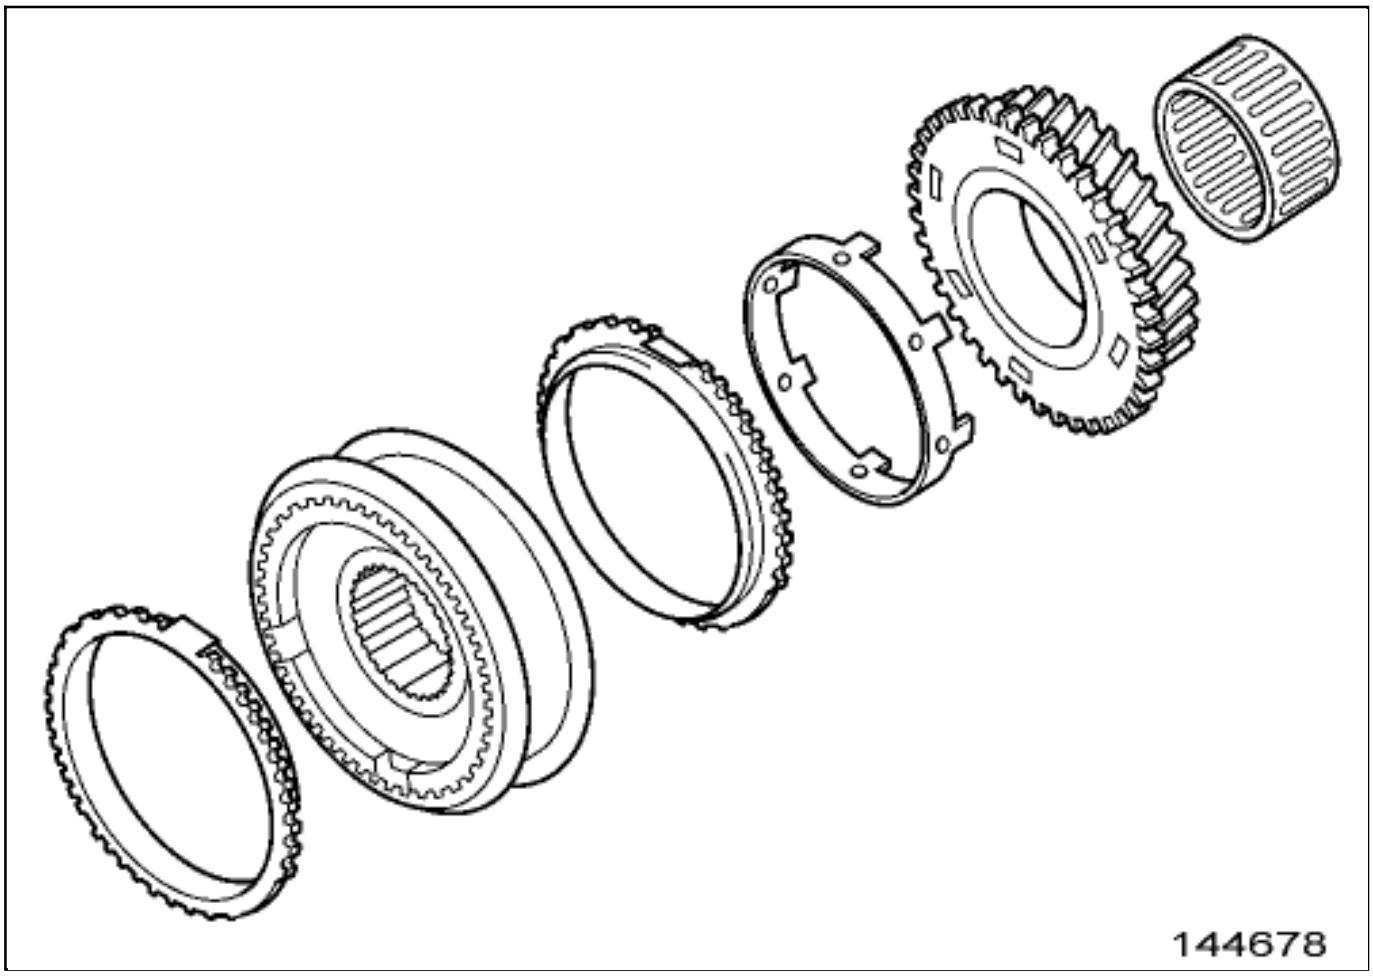
Press the gearbox shaft pin using the toolDC4 gearbox internal renovation kit(Bvi. 1956) E (2) .

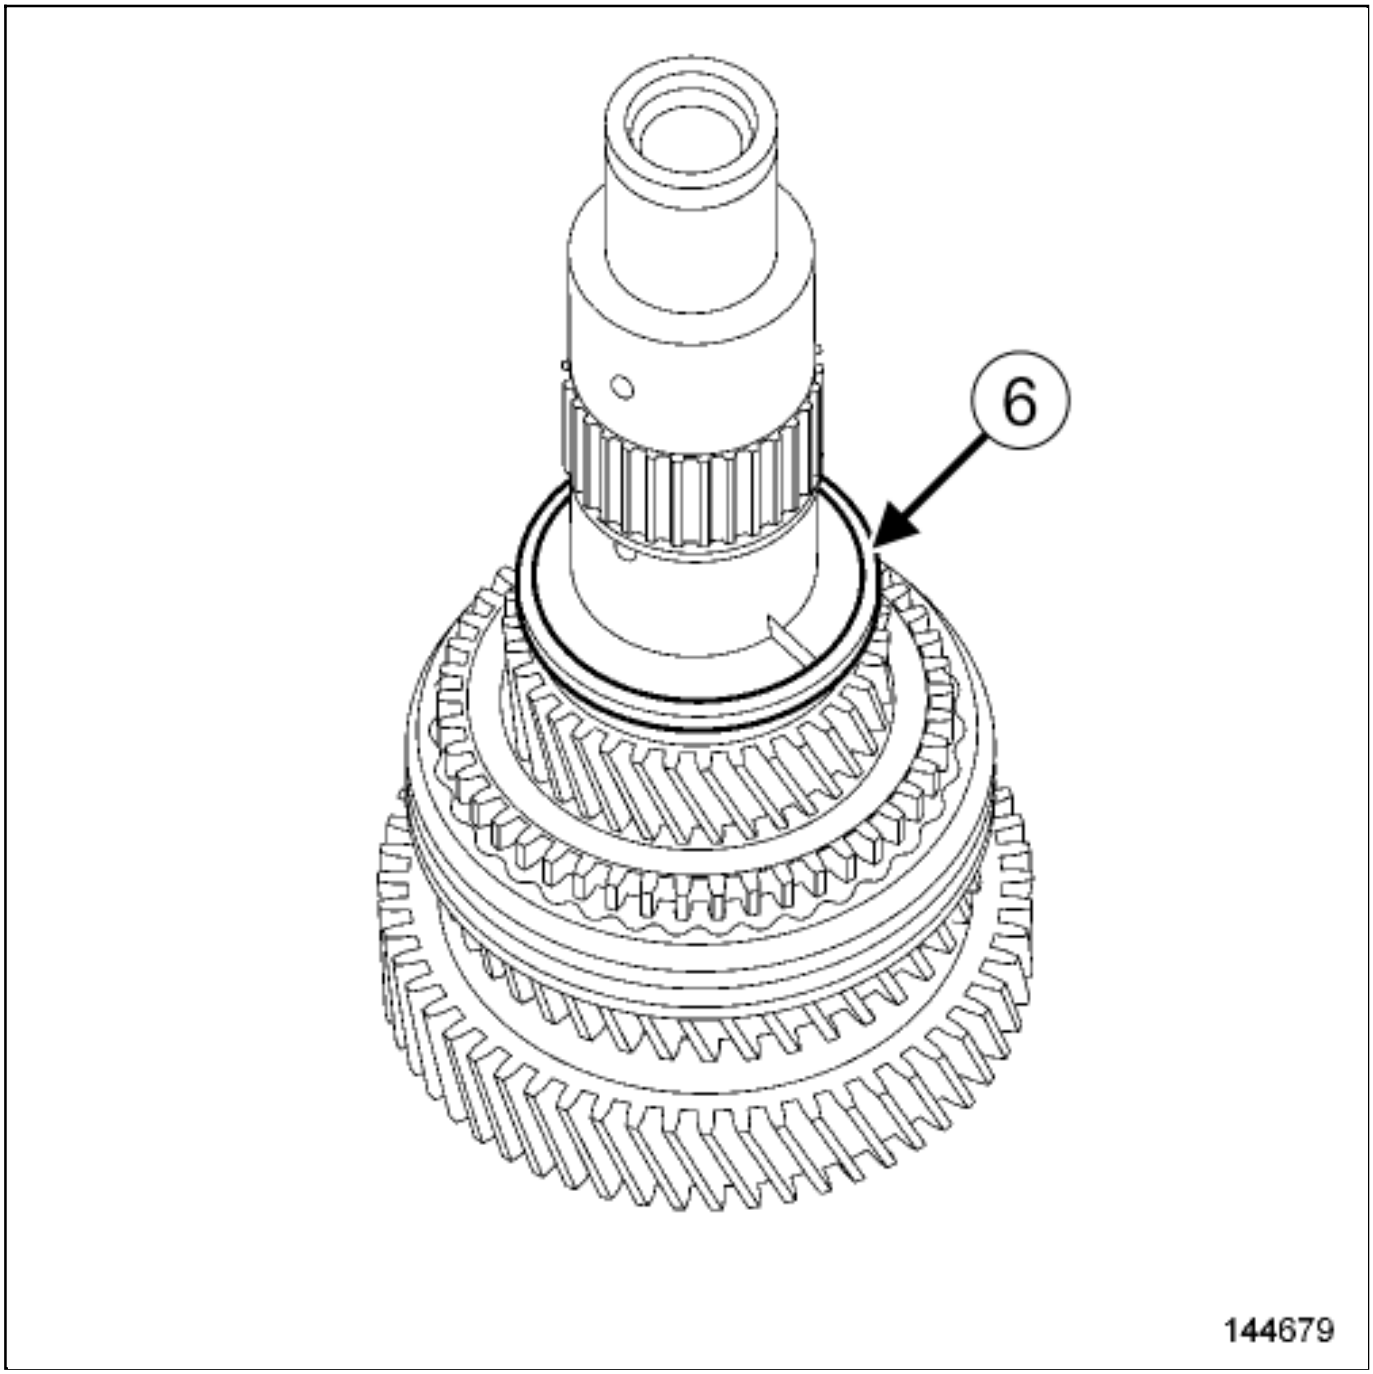


Remove the 1st gear pinion.

STACK AFTER REMOVAL OF THE1ST GEAR PINION

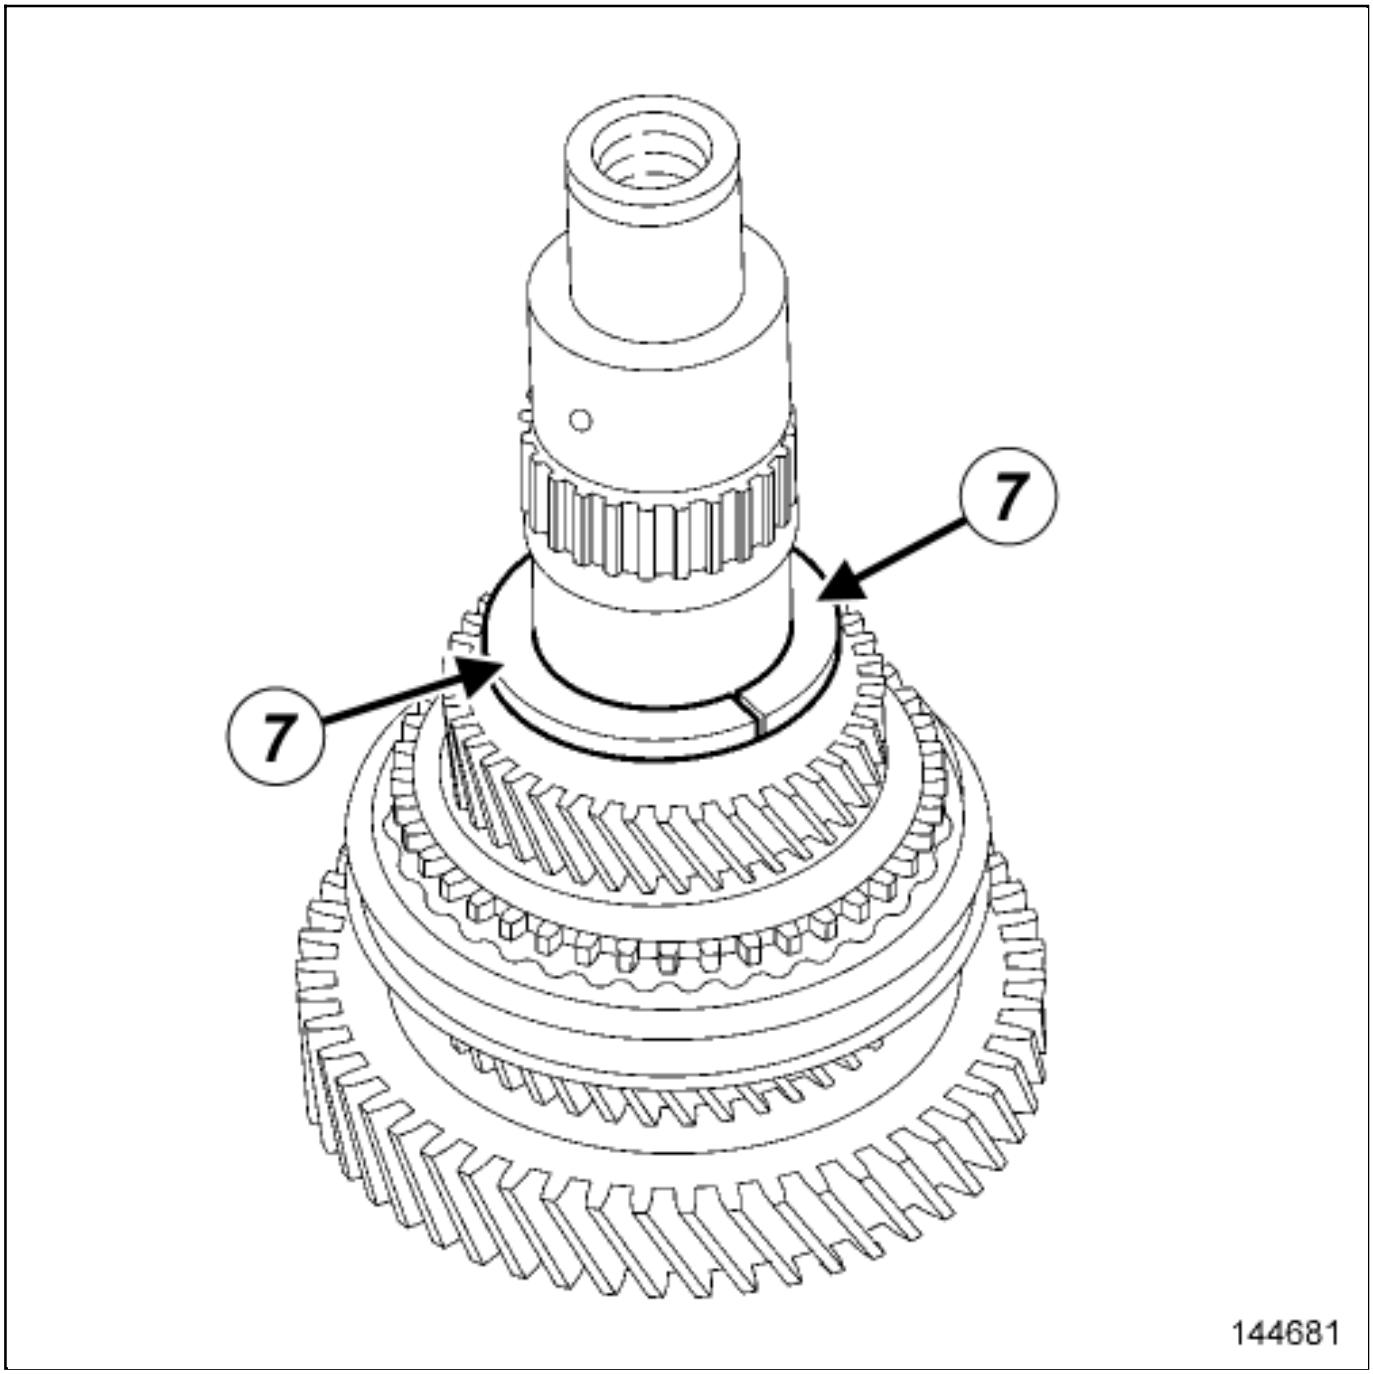
Remove the clip(3) using snap ring pliers.





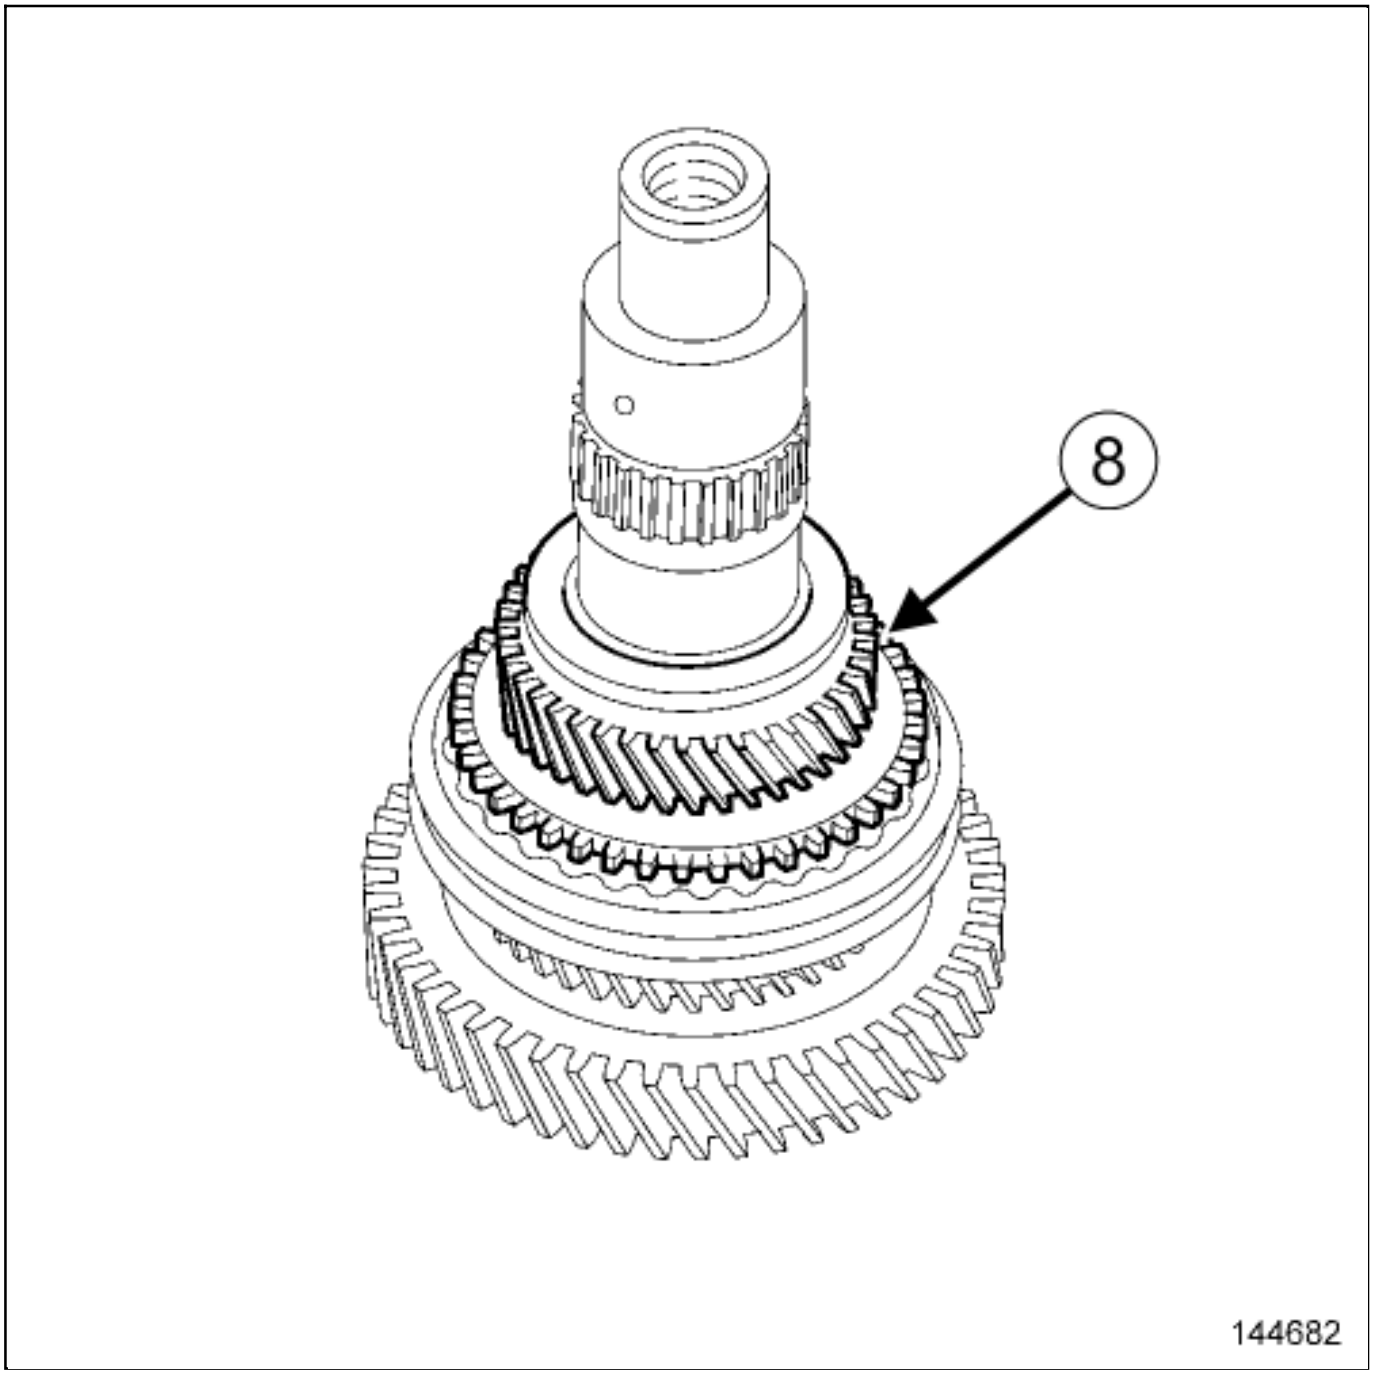
Fit a separator(4) under the 5th gear pinion and above the locking washer of the 6th gear pinion.

Press the gearbox shaft pin using the toolDC4 gearbox internal renovation kit(Bvi. 1956) E (5) .

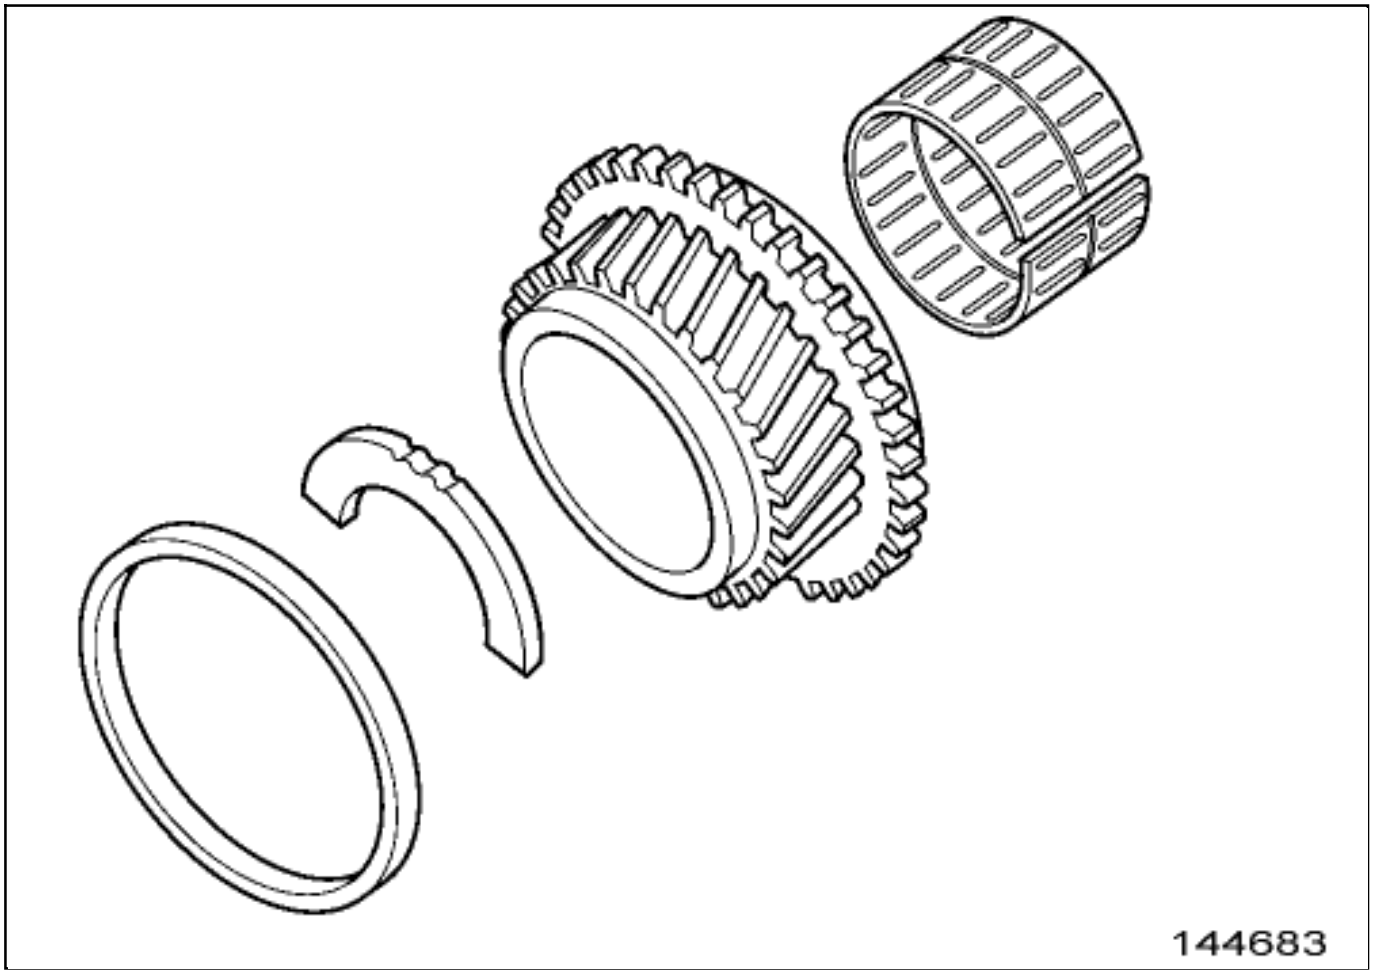


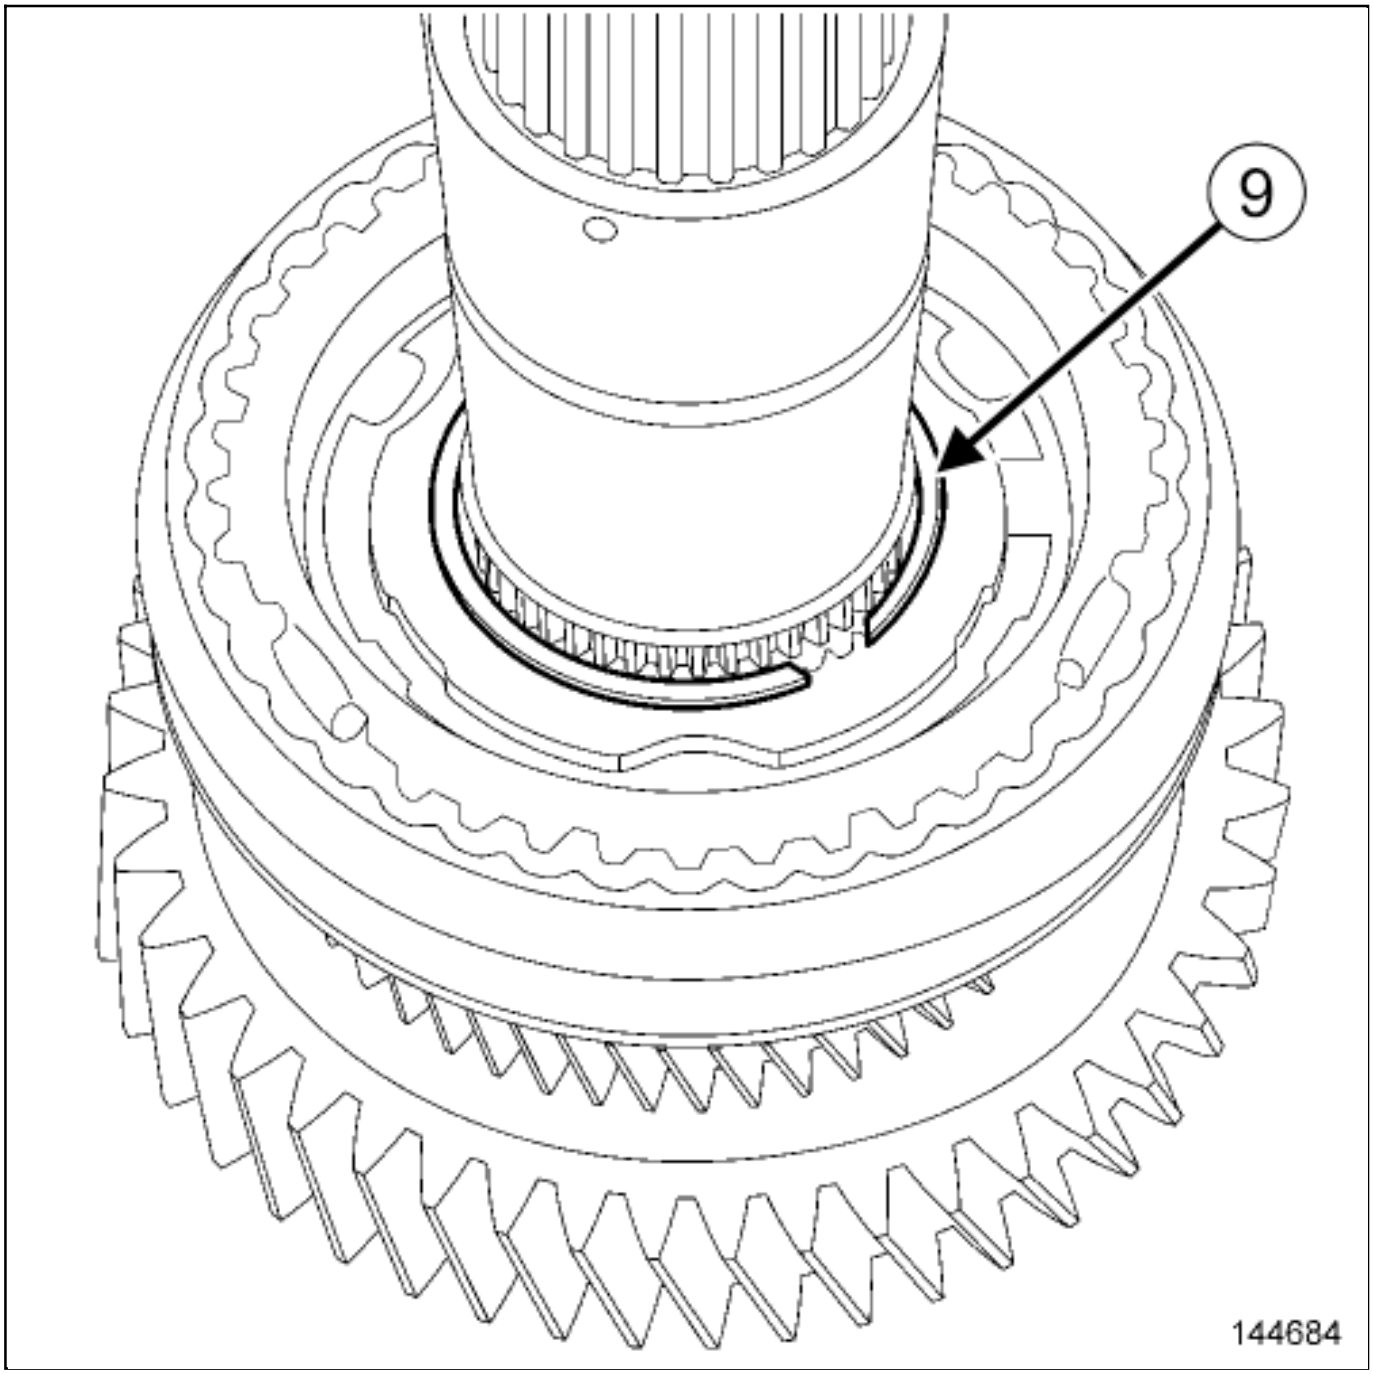
Remove the 5th gear pinion.

STACK AFTER REMOVAL OF THE 5TH GEAR PINION

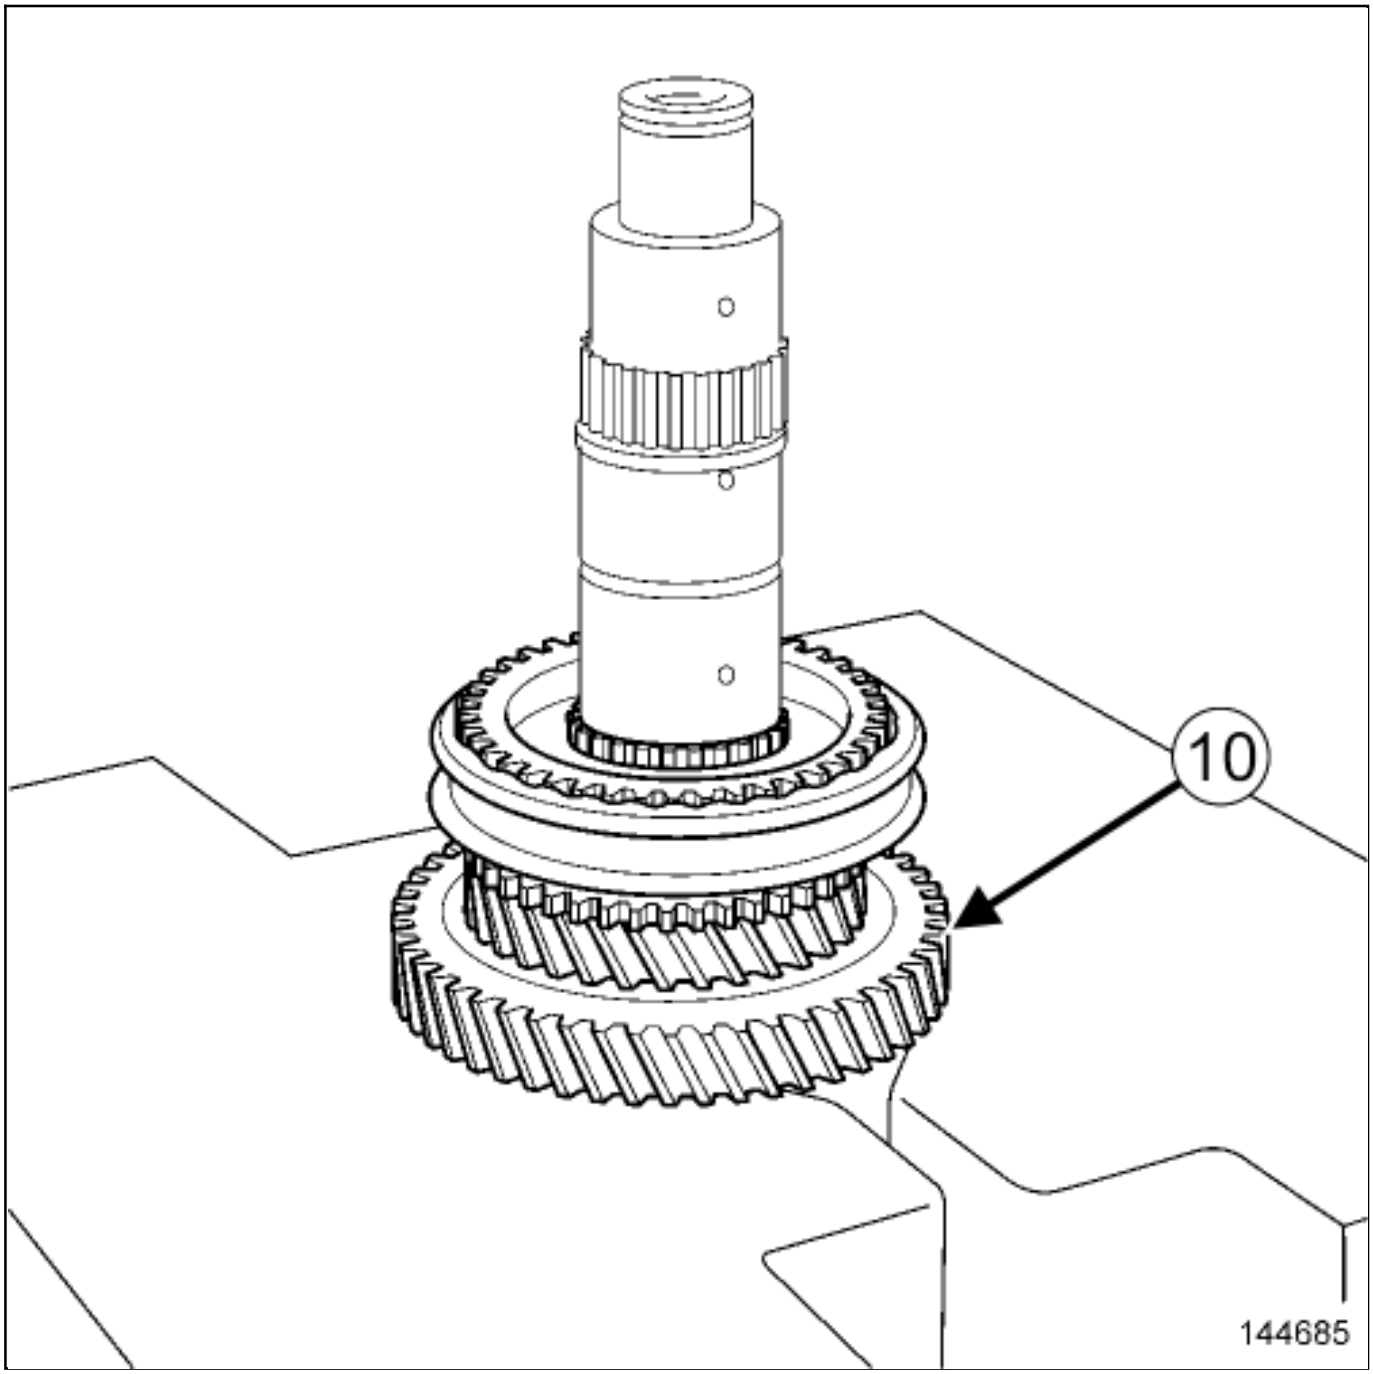


Remove the locking washer(6) from the 6th gear pinion.





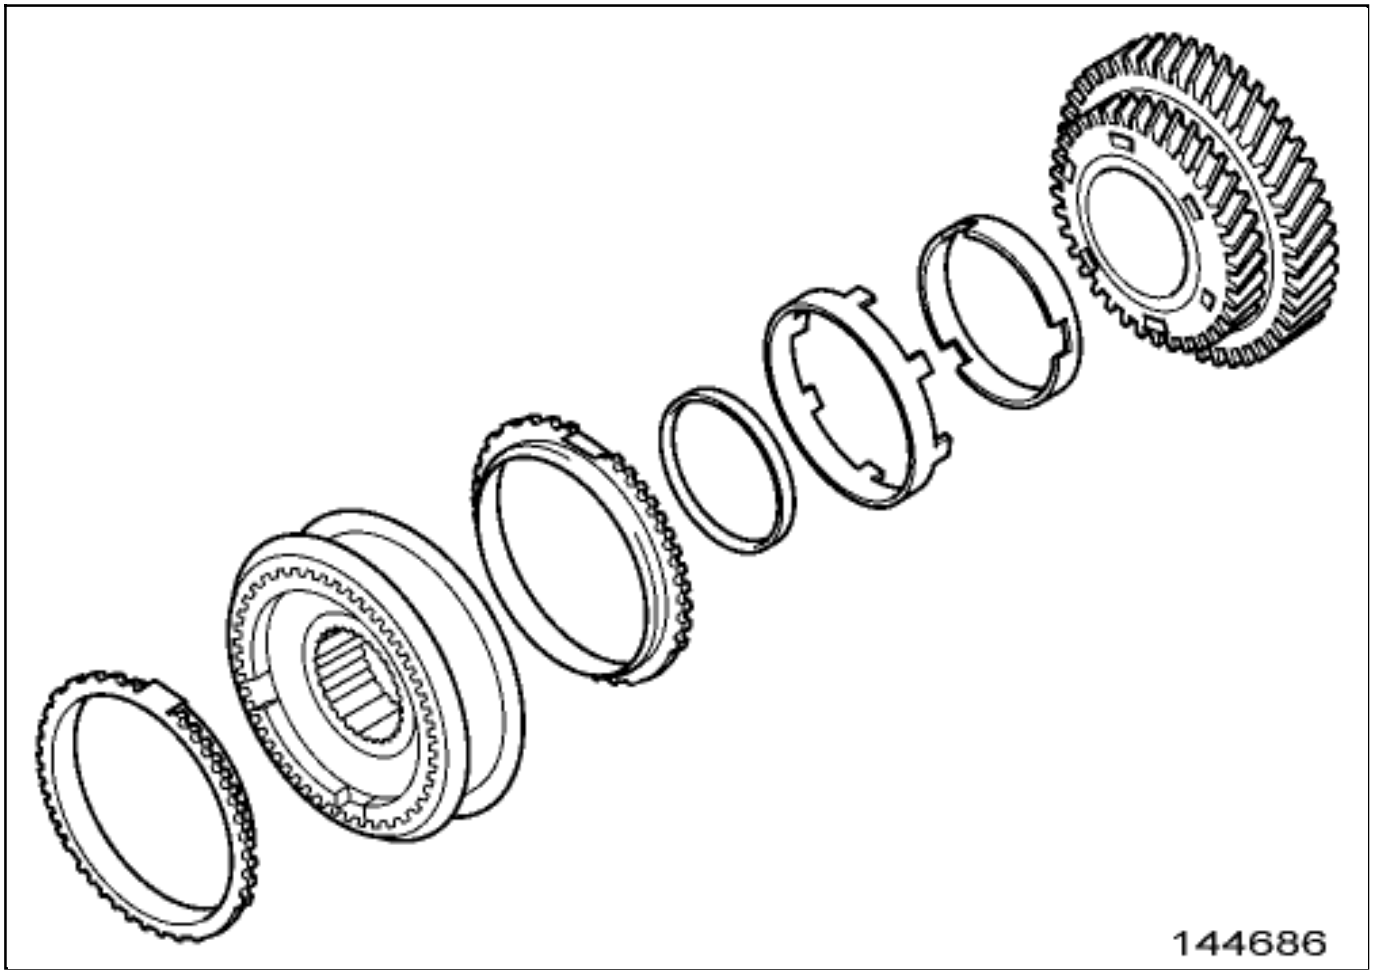
Remove the half-shells(7) from the 6th gear pinion.

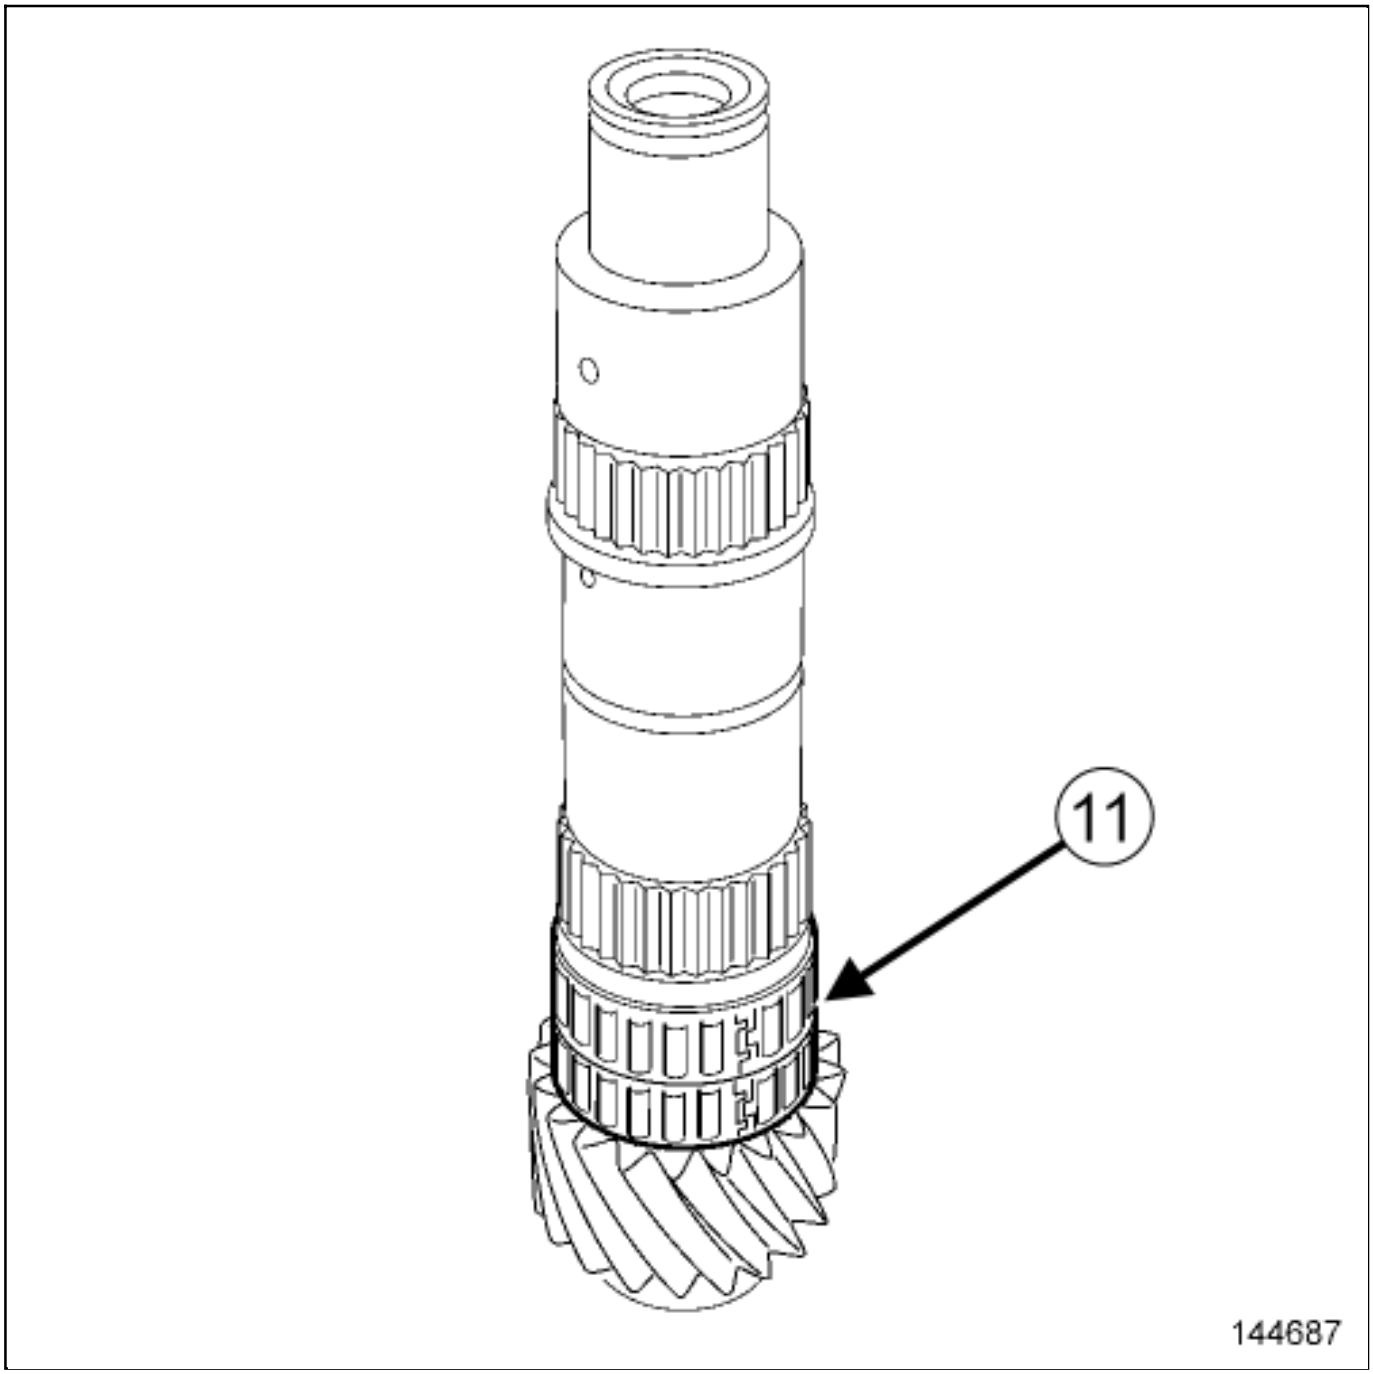


Remove the 6th gear pinion(8) .

STACK AFTER REMOVAL OF THE 6TH GEAR PINION

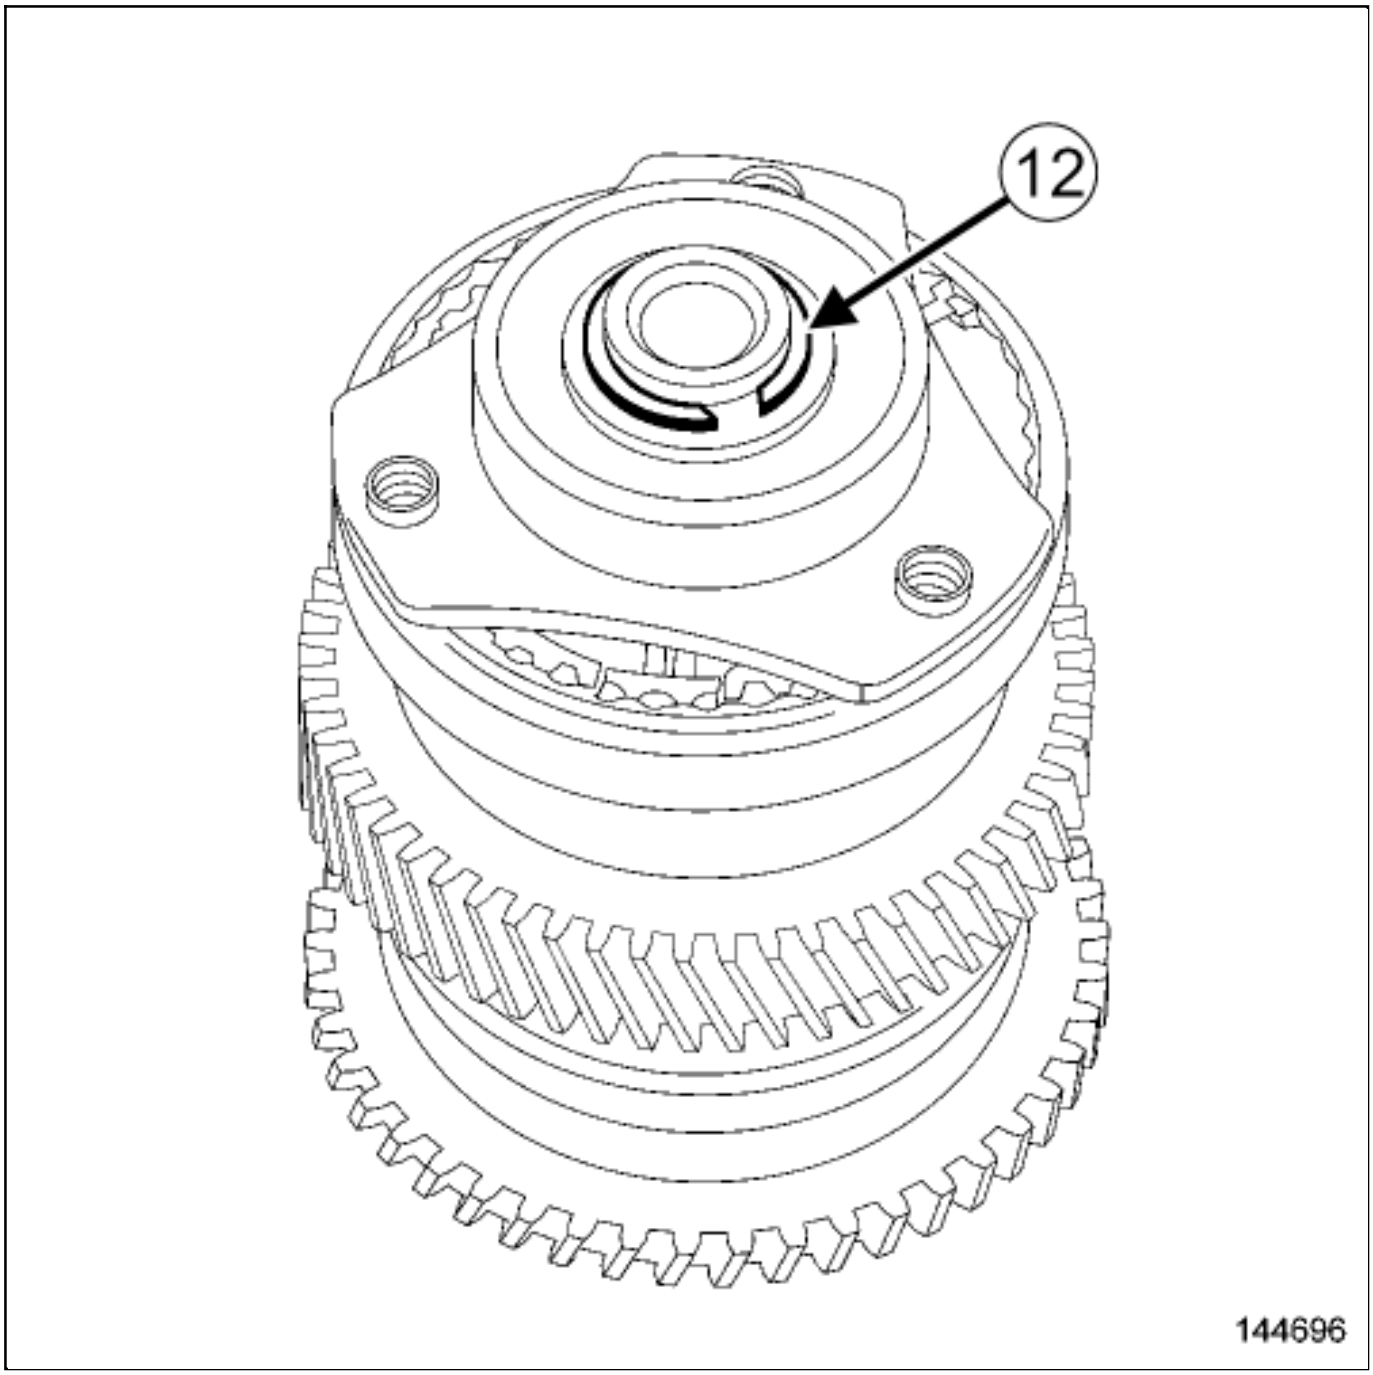
144683





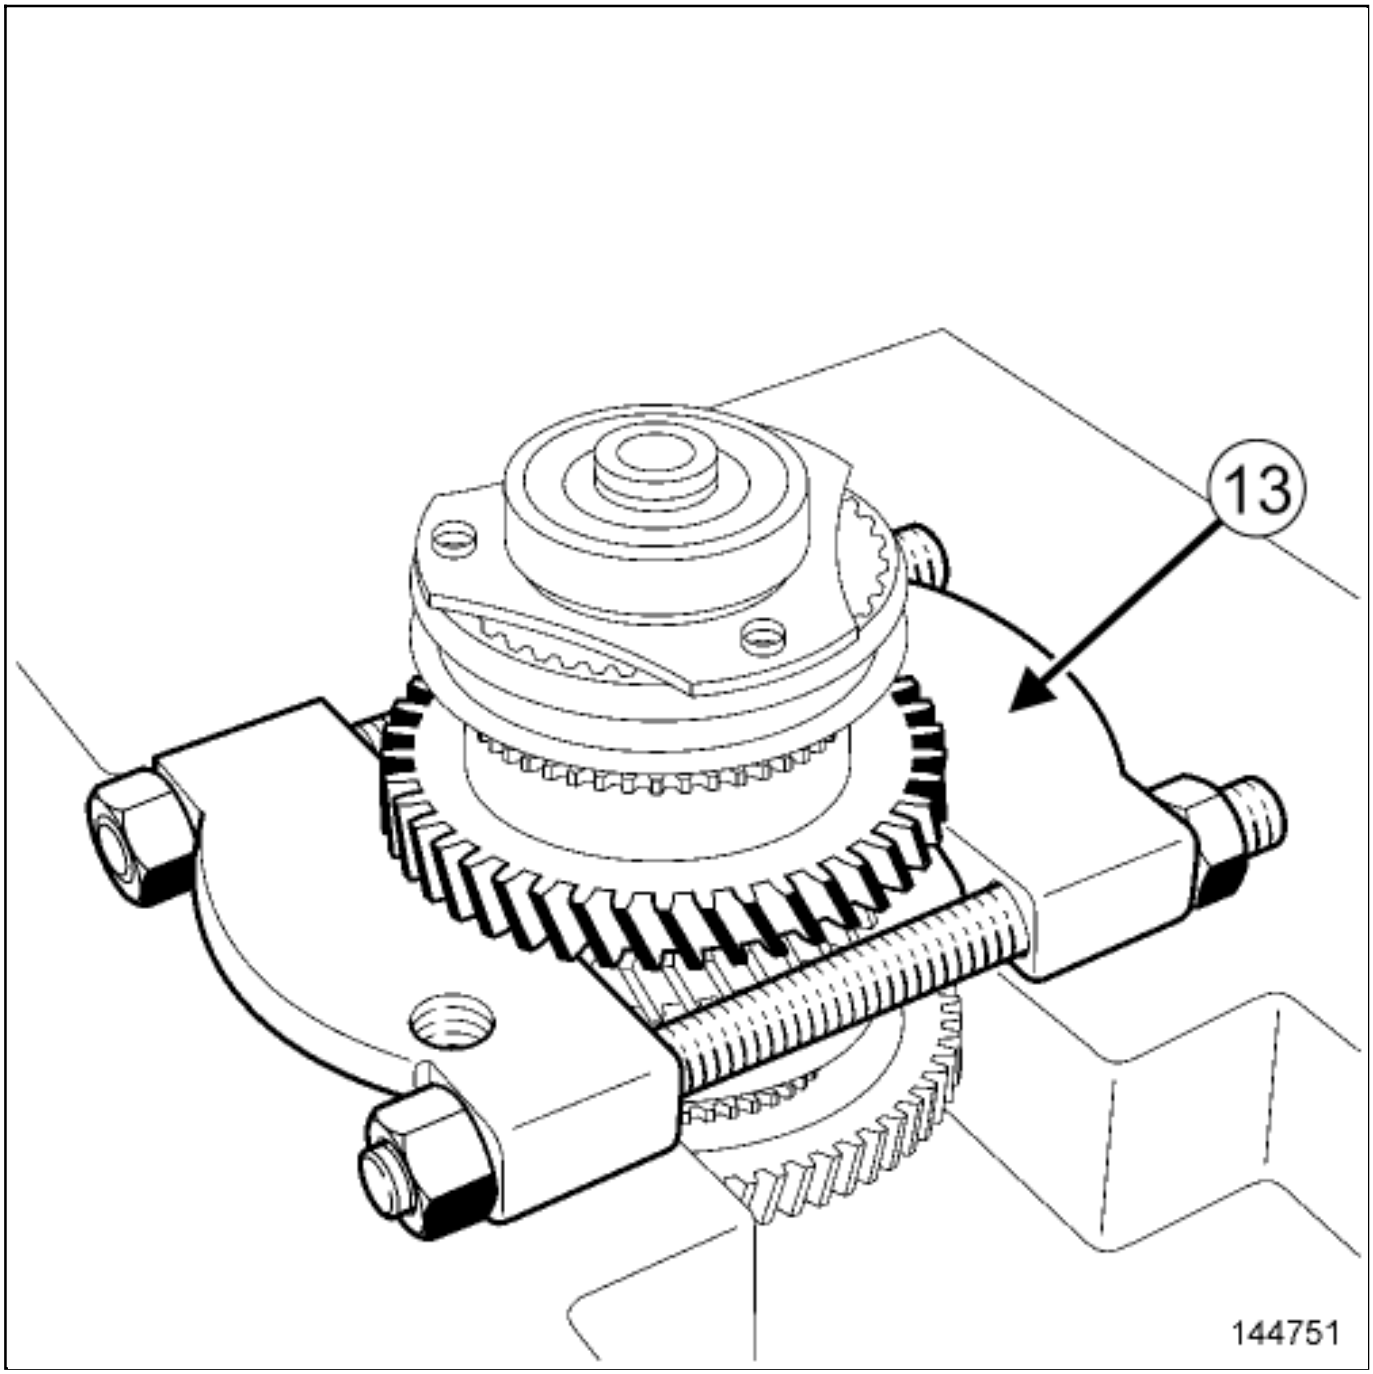
Remove the clip(9) using snap ring pliers.

- Fit the gearbox shaft on a press using the 2nd gear pinion for support(10) .
- Press the gearbox shaft pin.
- Remove the 2nd gear pinion.

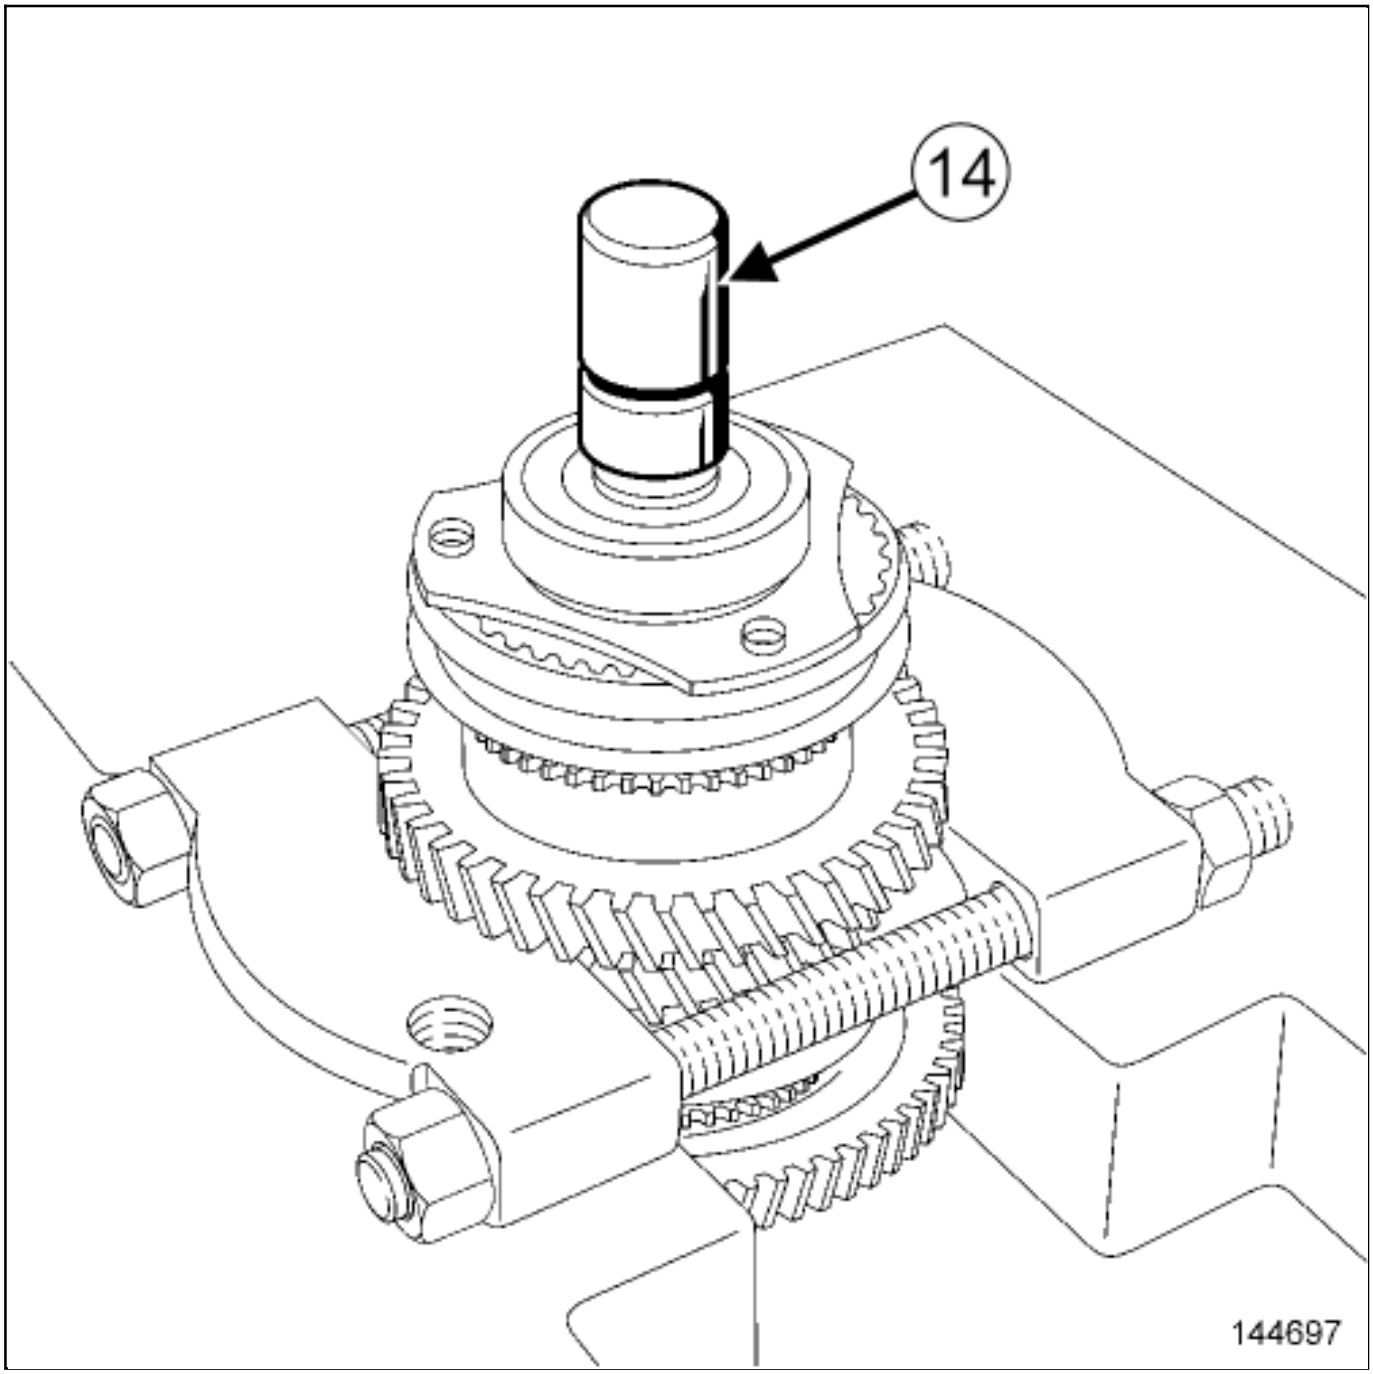


STACK AFTER REMOVAL OF THE 2ND GEAR PINION

144686

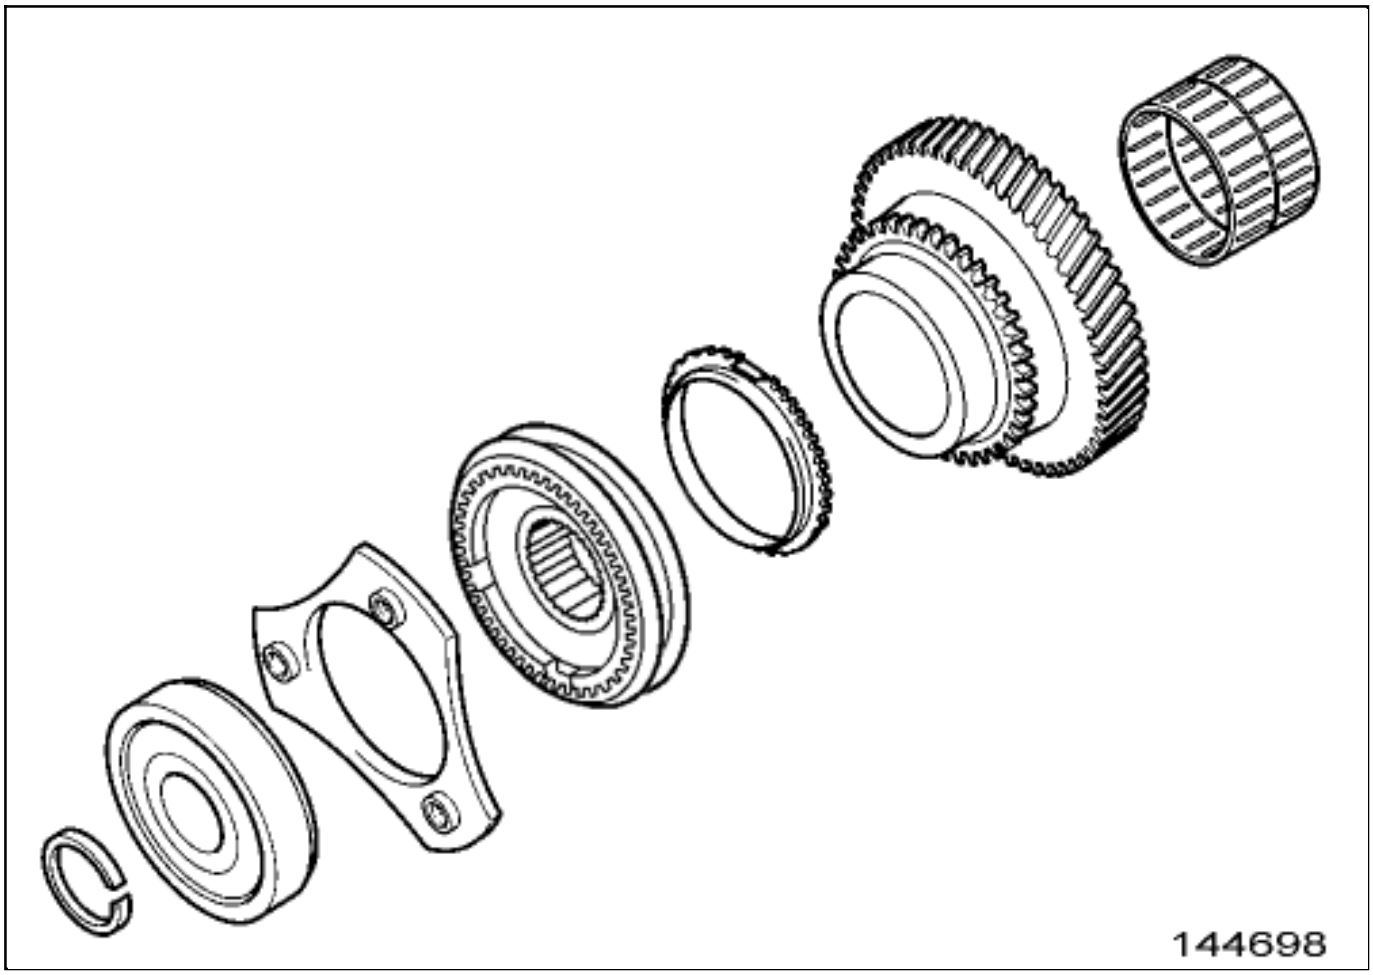


Remove the 2nd gear pinion bearing from the gearbox shaft.

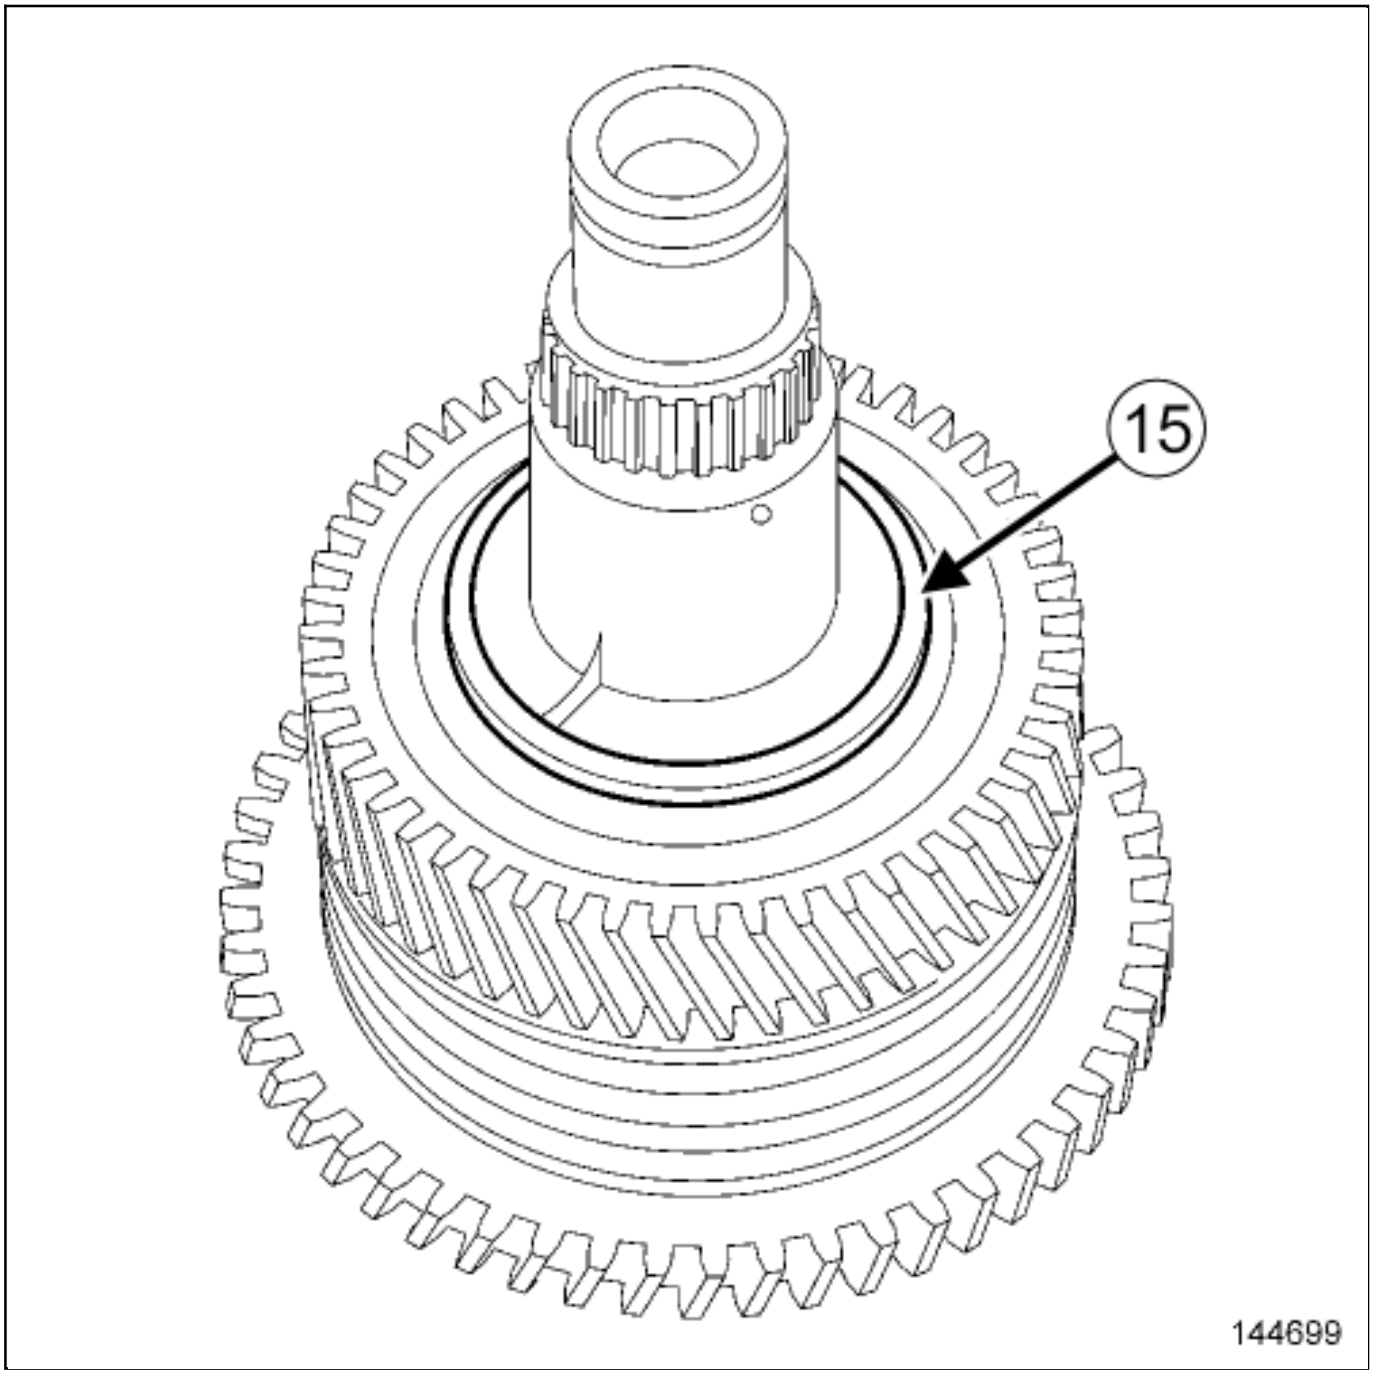


2- STRIPPING THE 3RDGEAR, 4THGEAR AND REVERSE GEAR FROM THE SHAFT:

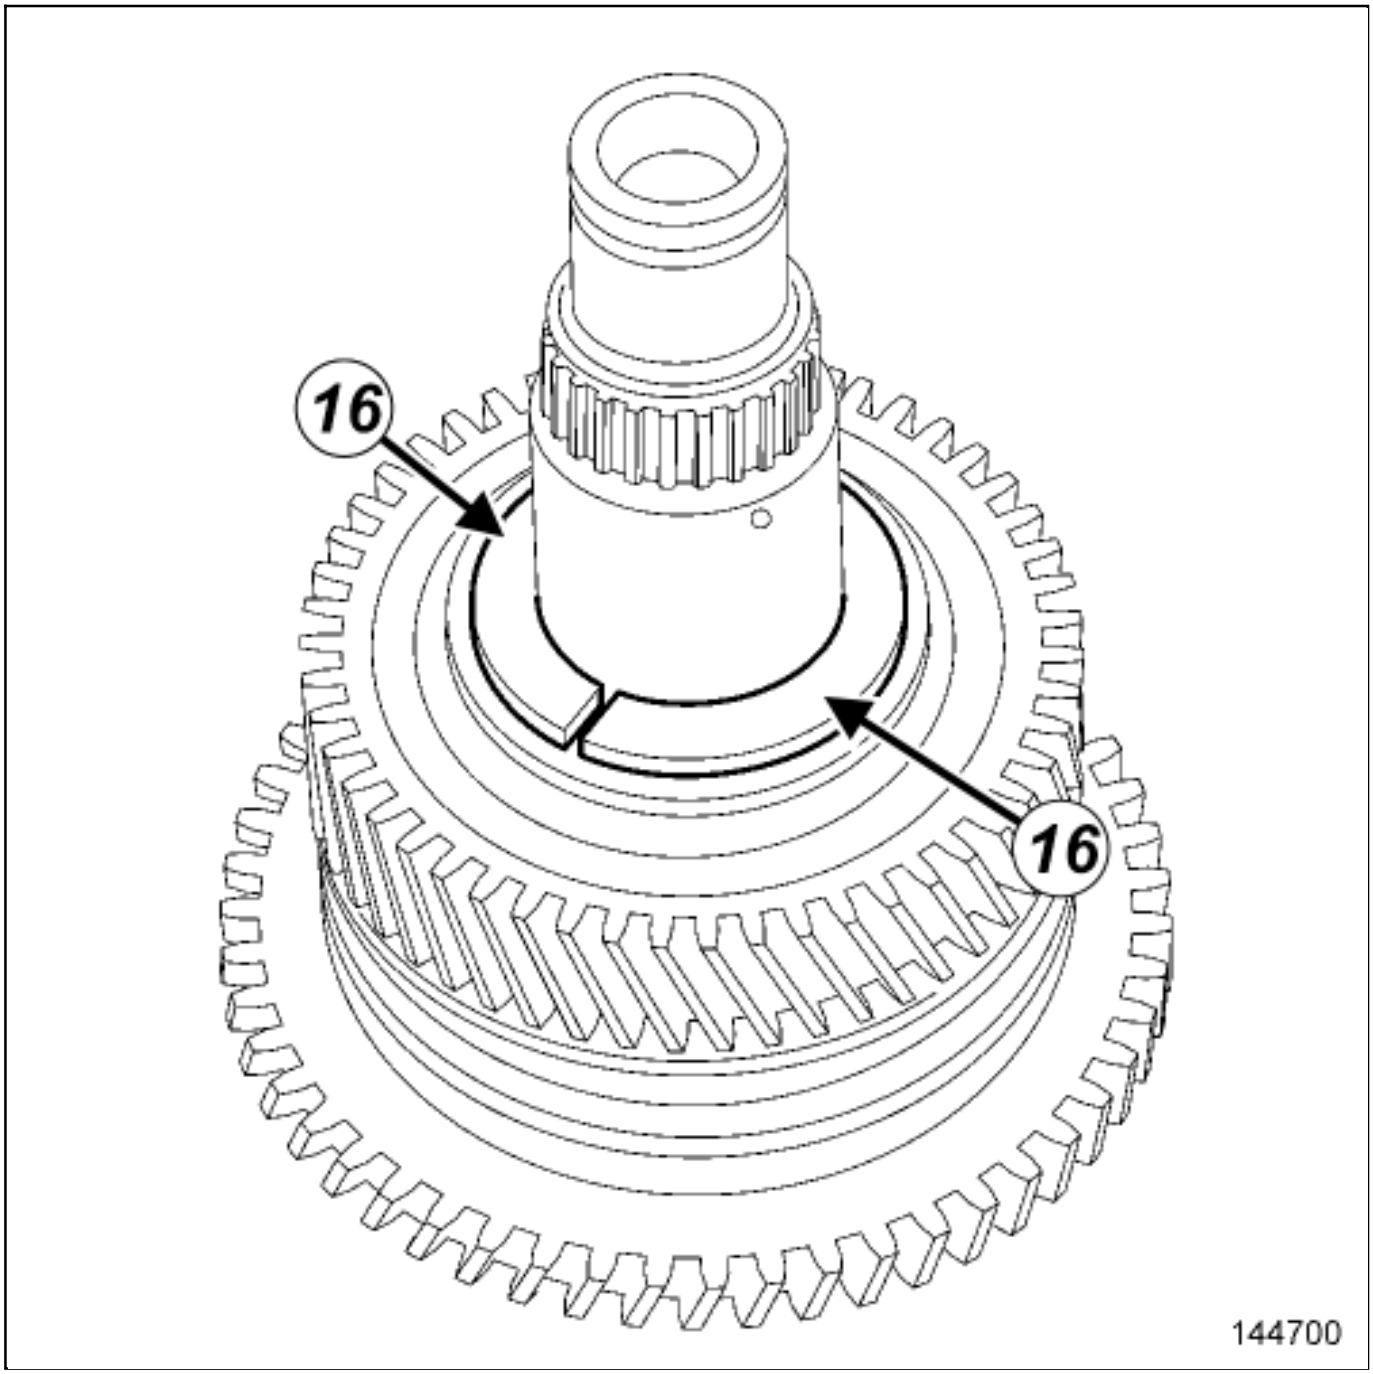
Remove the clip(12) using snap ring pliers.



Fit a separator(13) under the 3rd gear pinion.



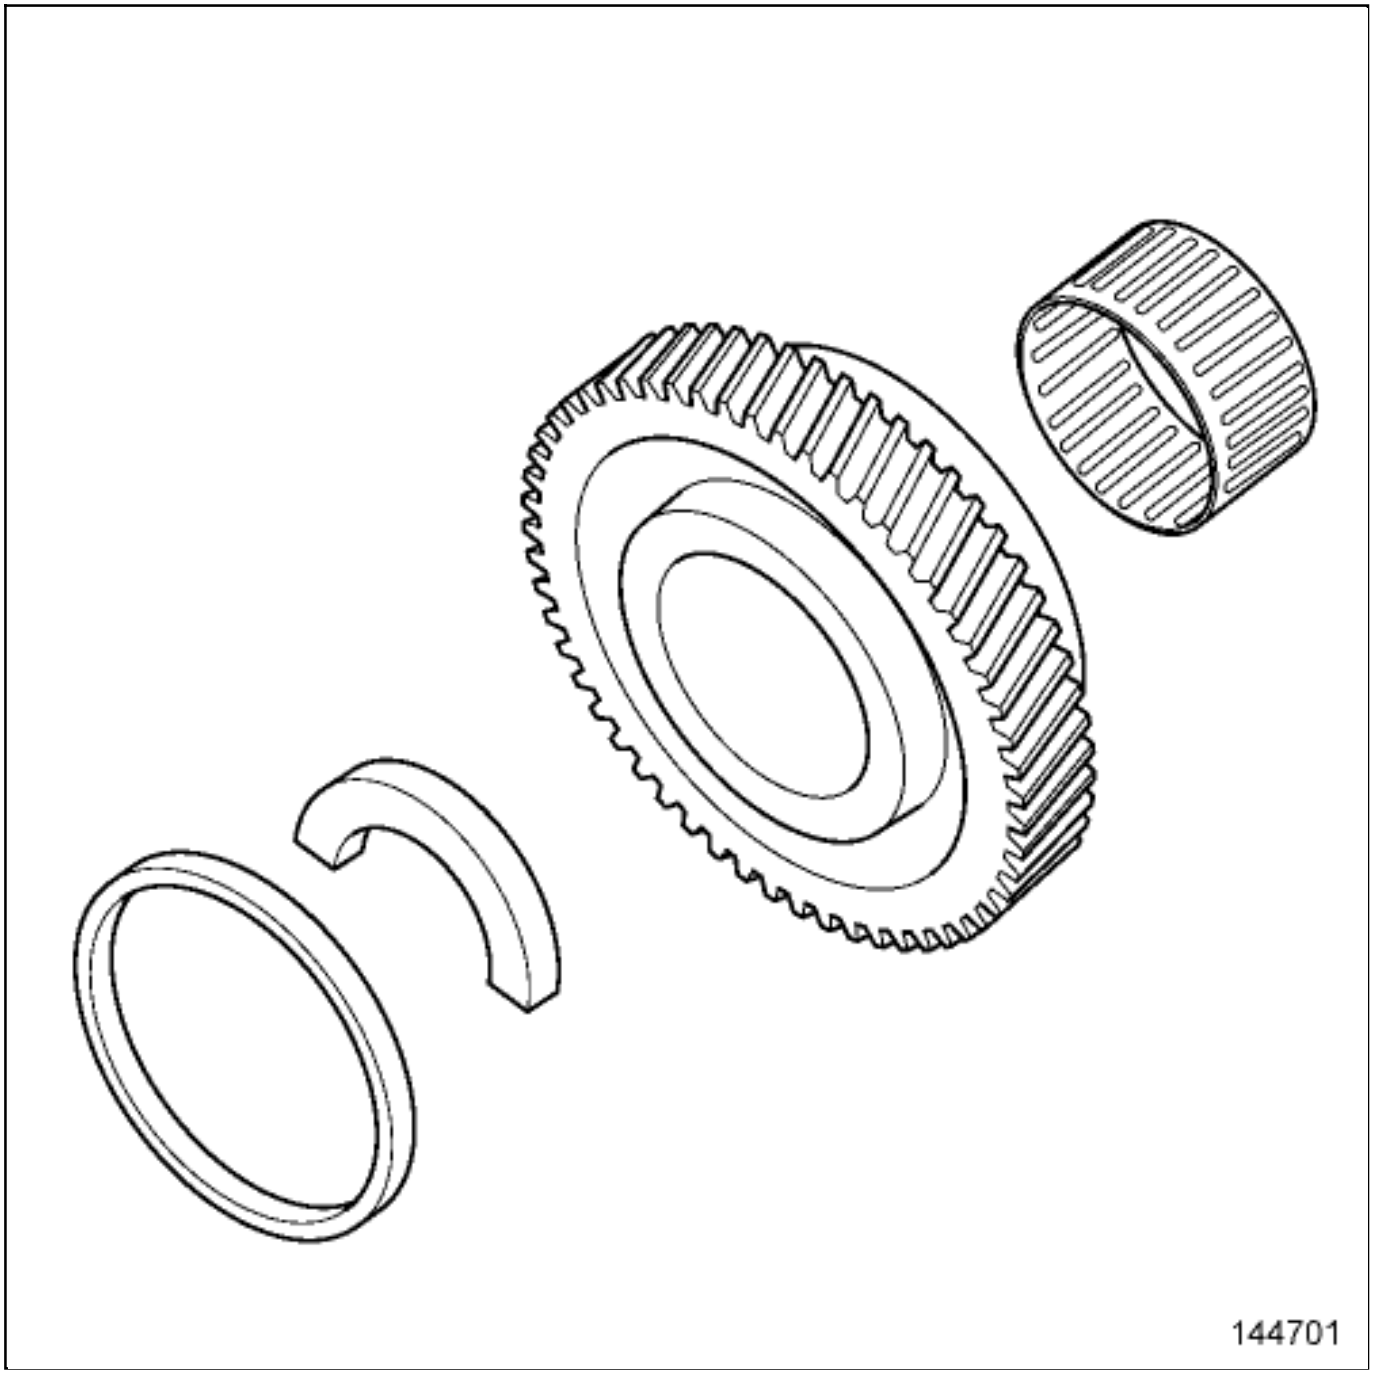
- Press the gearbox shaft pin using the toolDC4 gearbox internal renovation kit(Bvi. 1956) E (14) .



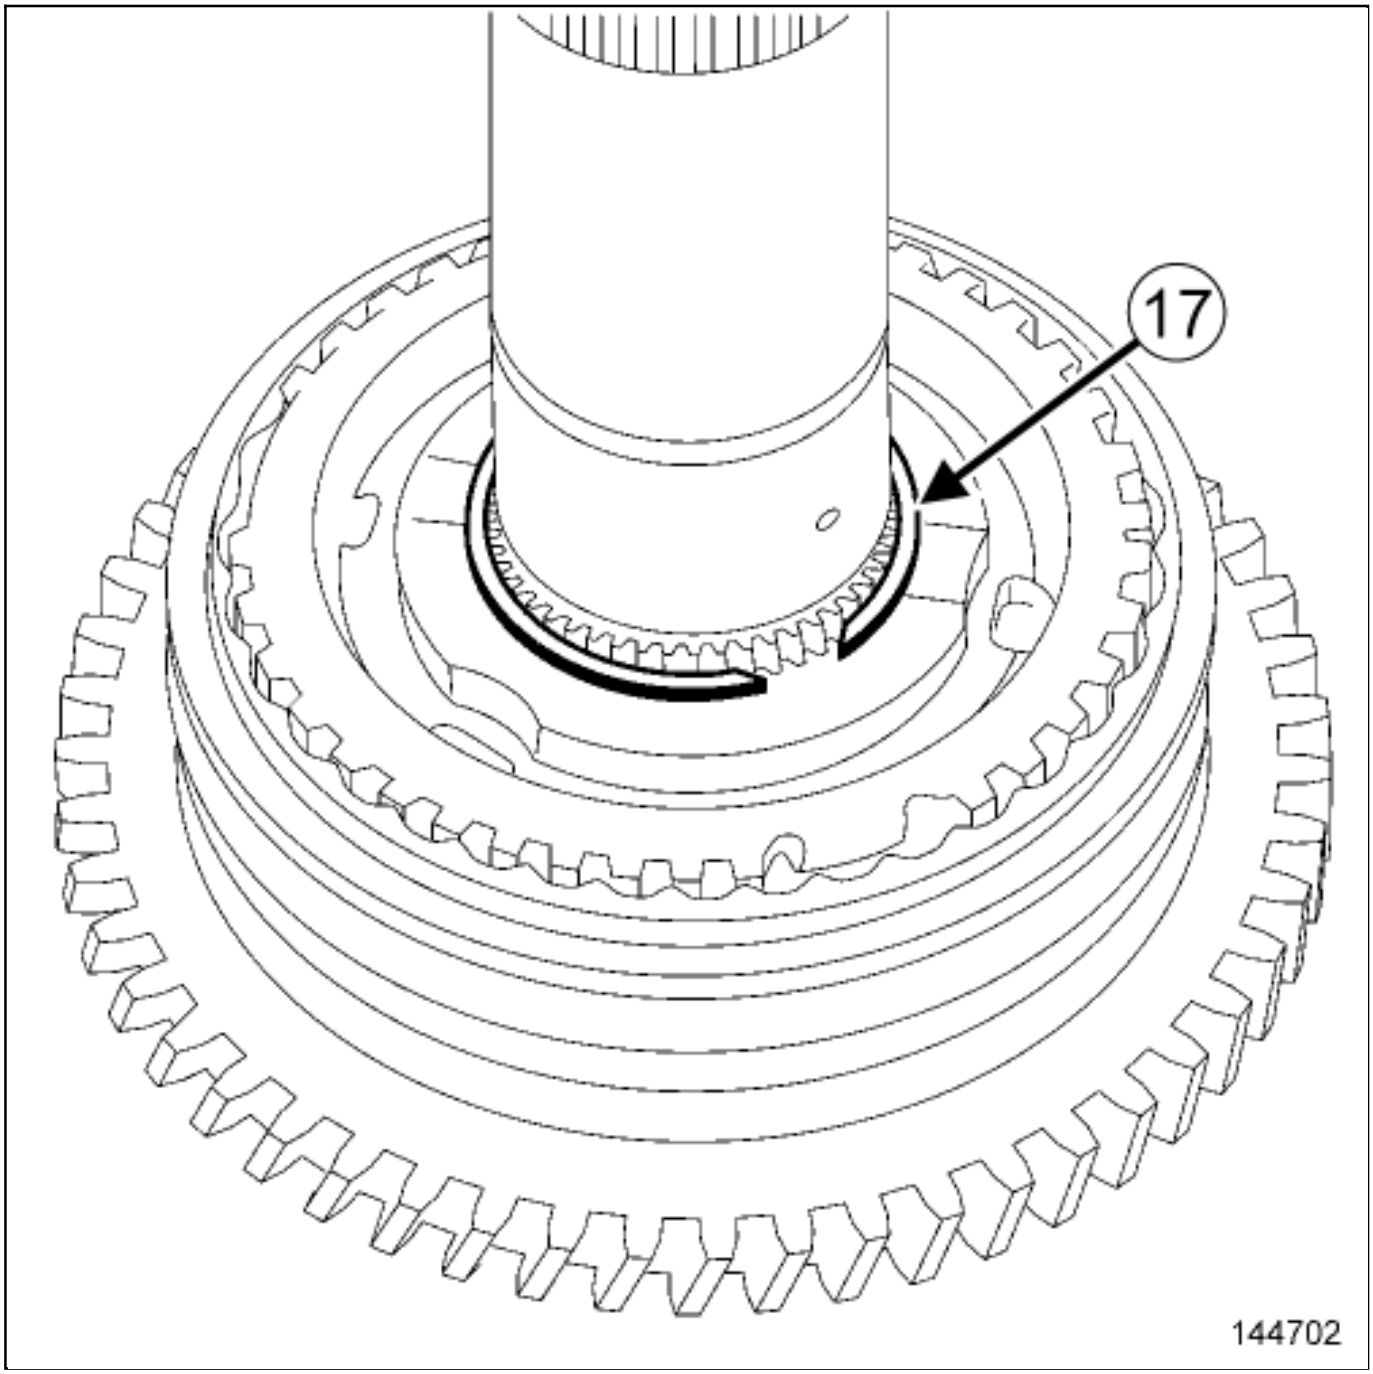
- Remove the 3rd gear pinion.

STACK AFTER REMOVING THE 3RD GEAR PINION

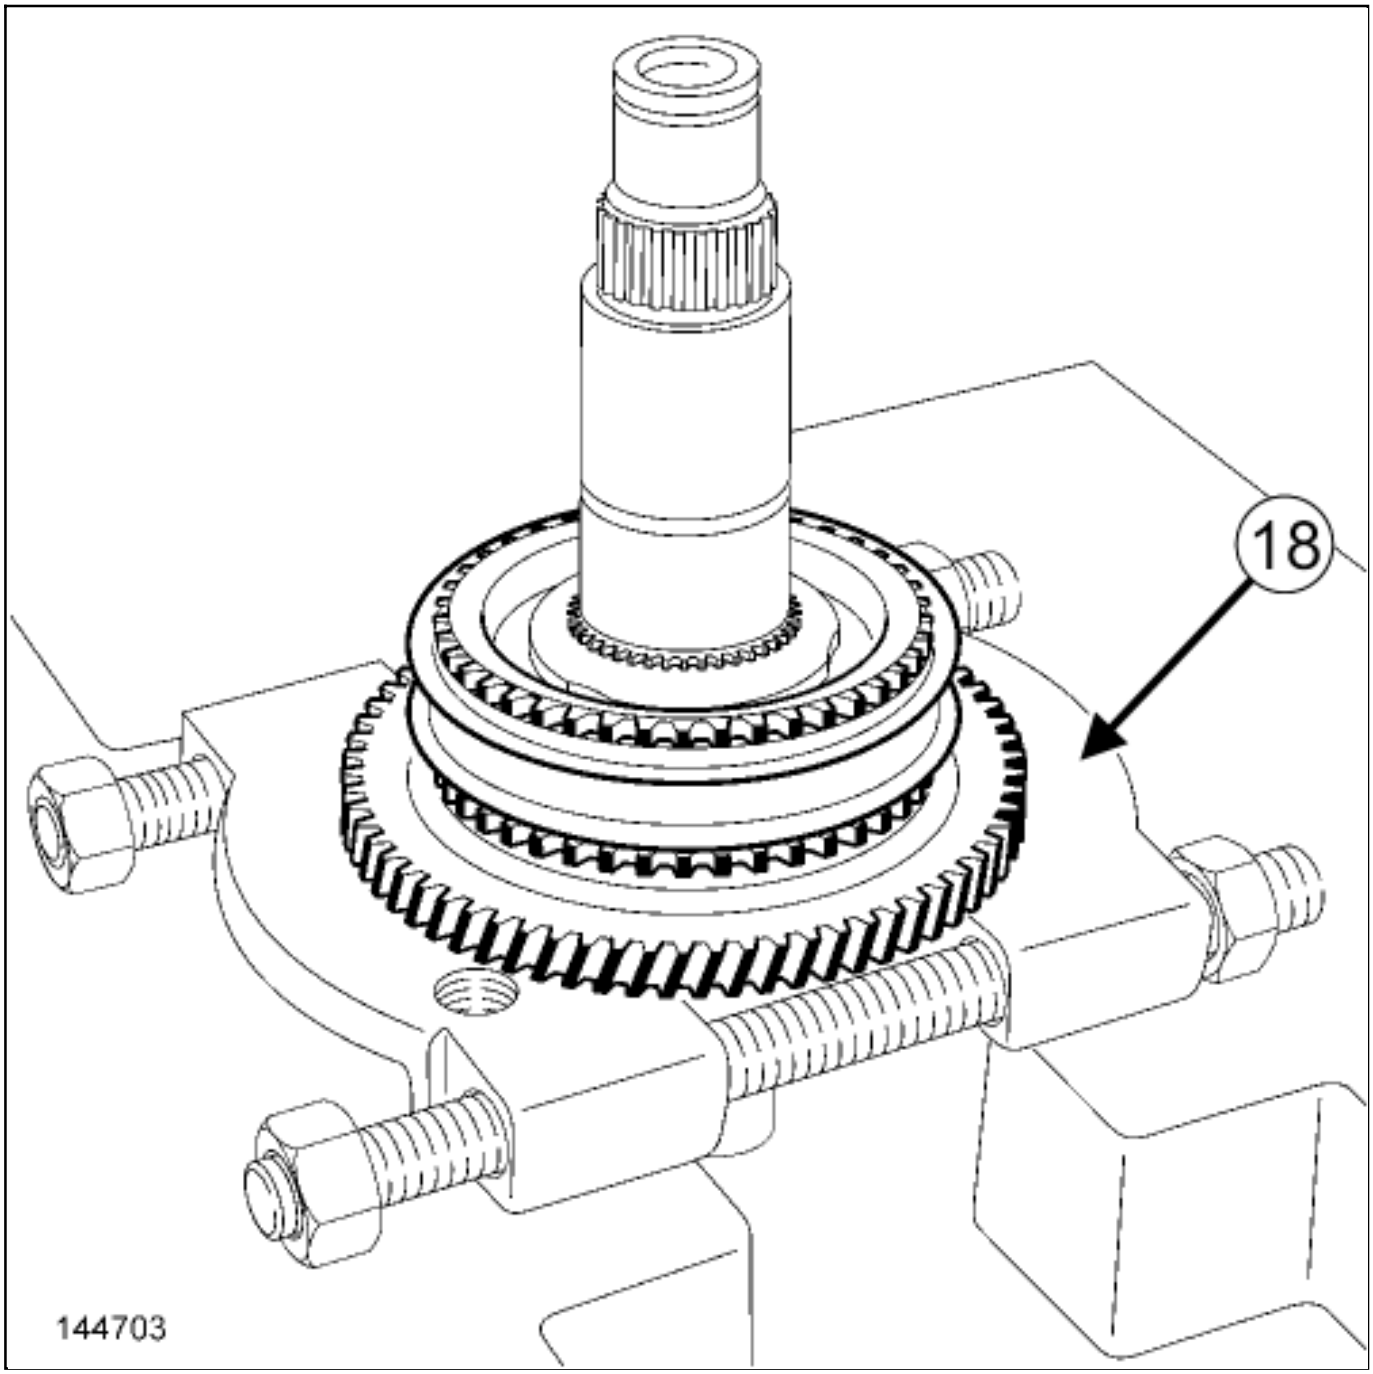
144698



Remove the locking washer(15) from the 4th gear pinion.



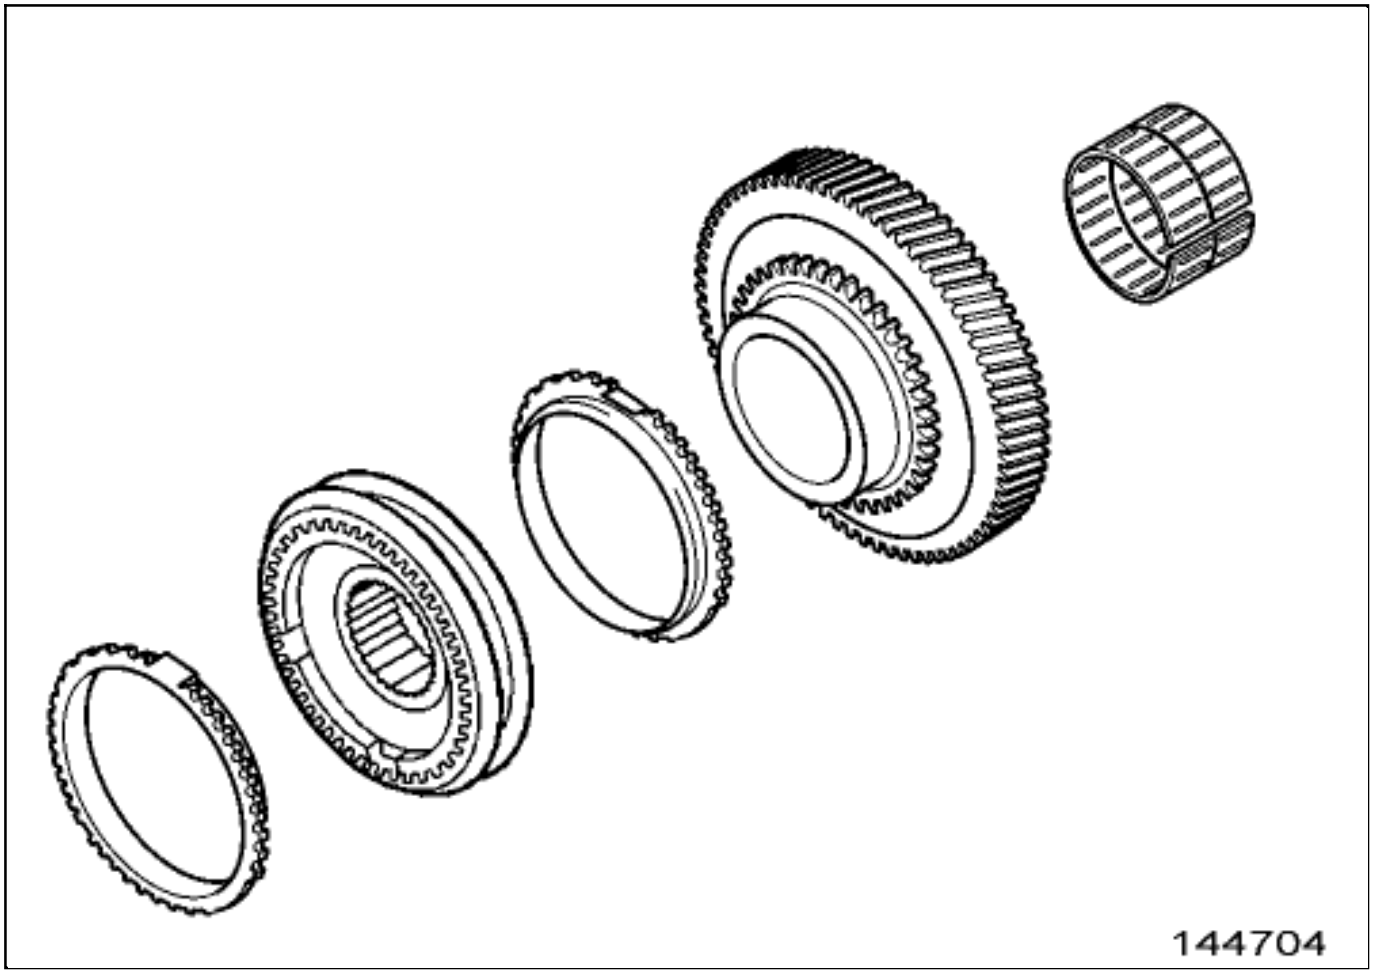
Remove:

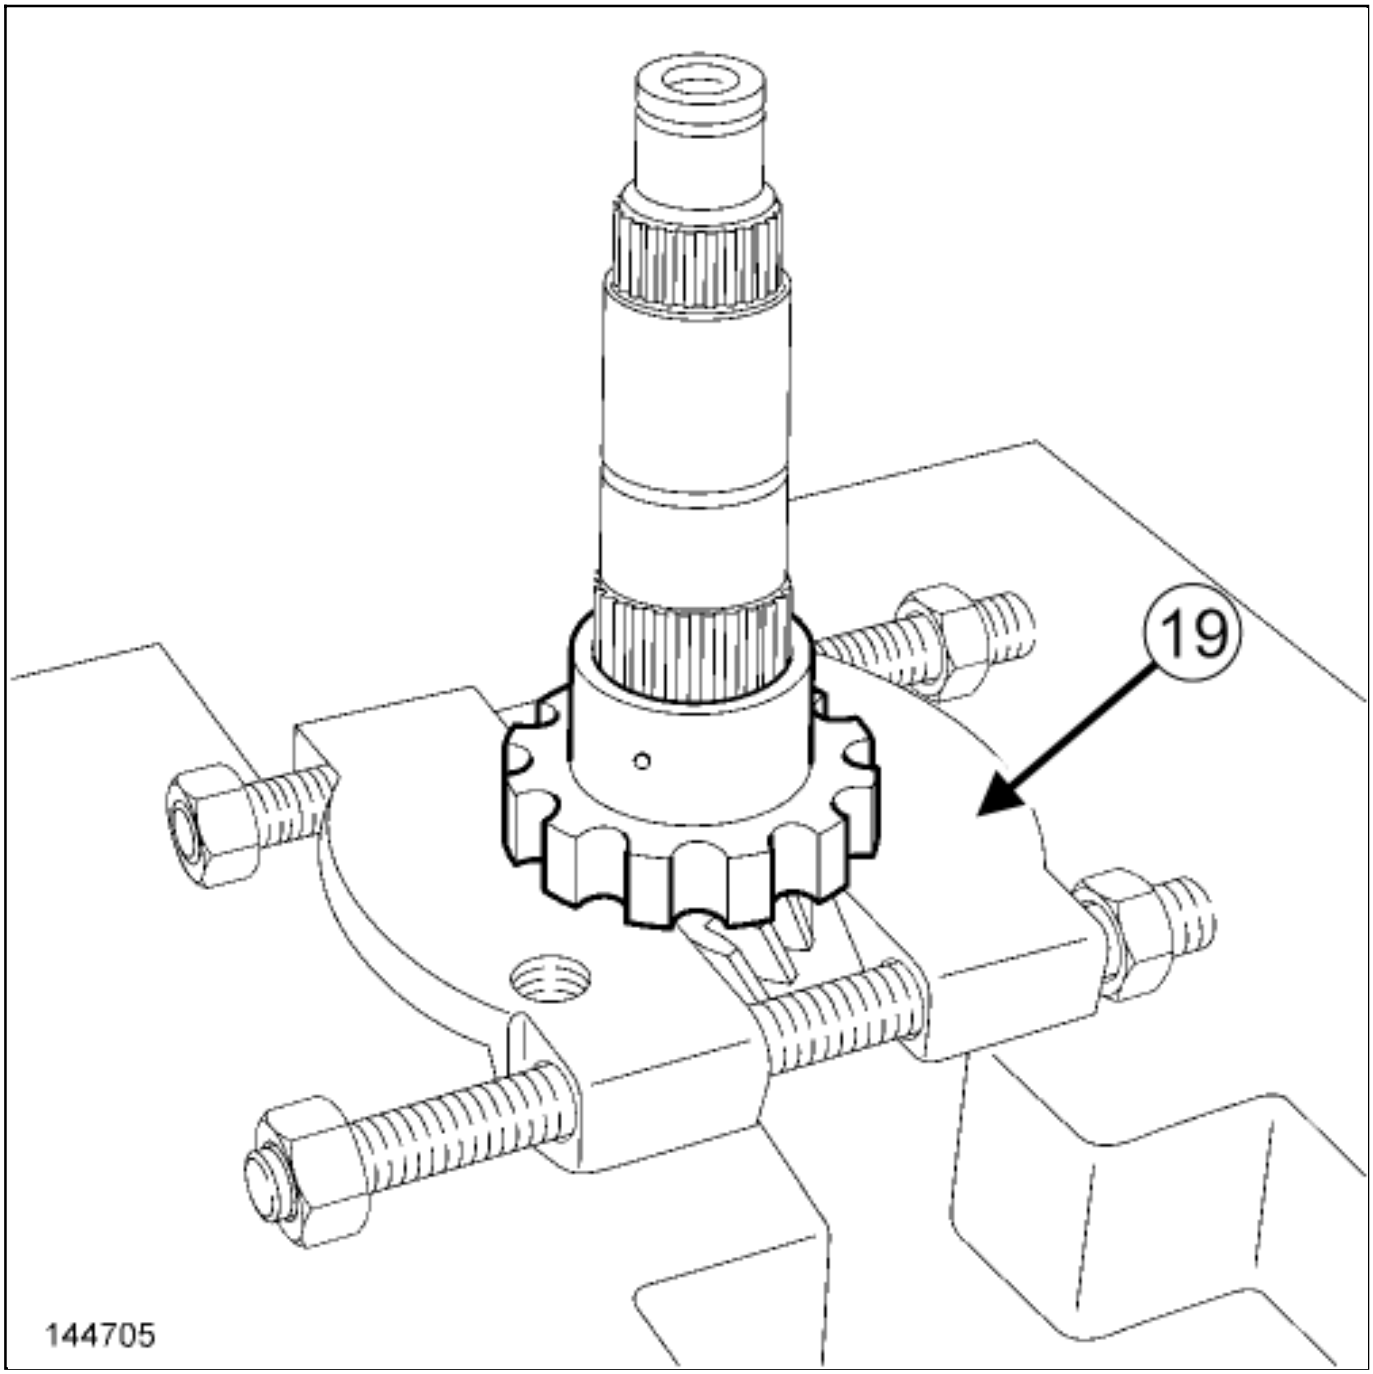


- the half-shells(16) of the 4th gear pinion,
- the 4th gear pinion.

STACK AFTER REMOVAL OF THE 4TH GEAR PINION

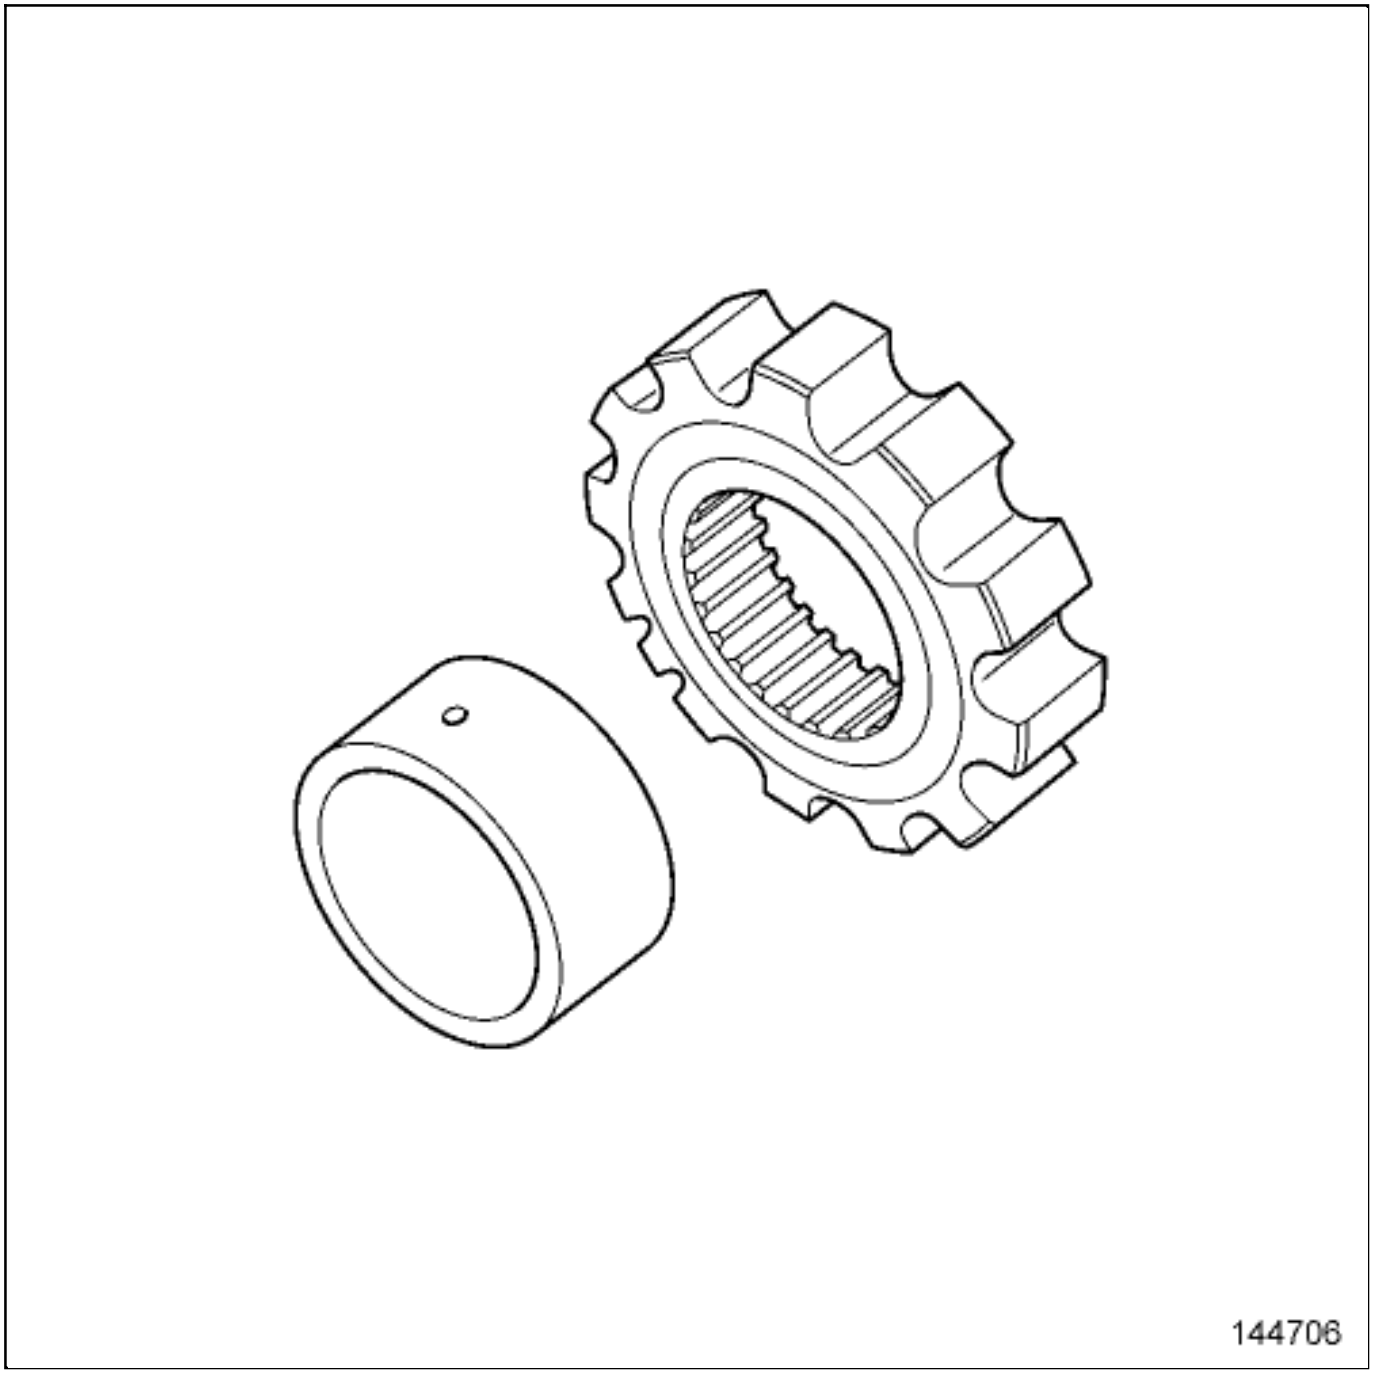
144701





Remove the clip(17) using snap ring pliers.

- Fit a separator(18) under the reverse gear pinion.
- Press the gearbox shaft pin.
- Remove the reverse gear pinion.



STACK AFTER REMOVING THE REVERSE GEAR PINION

144704

- Fit a separator(19) under the parking gear wheel.
- Press the gearbox shaft pin.
- Remove the parking gear wheel.

STACK AFTER REMOVING THE PARKING GEAR WHEEL

REBUILDING

1. REBUILDING PREPARATION OPERATION

-

Clean all the removed parts[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

-

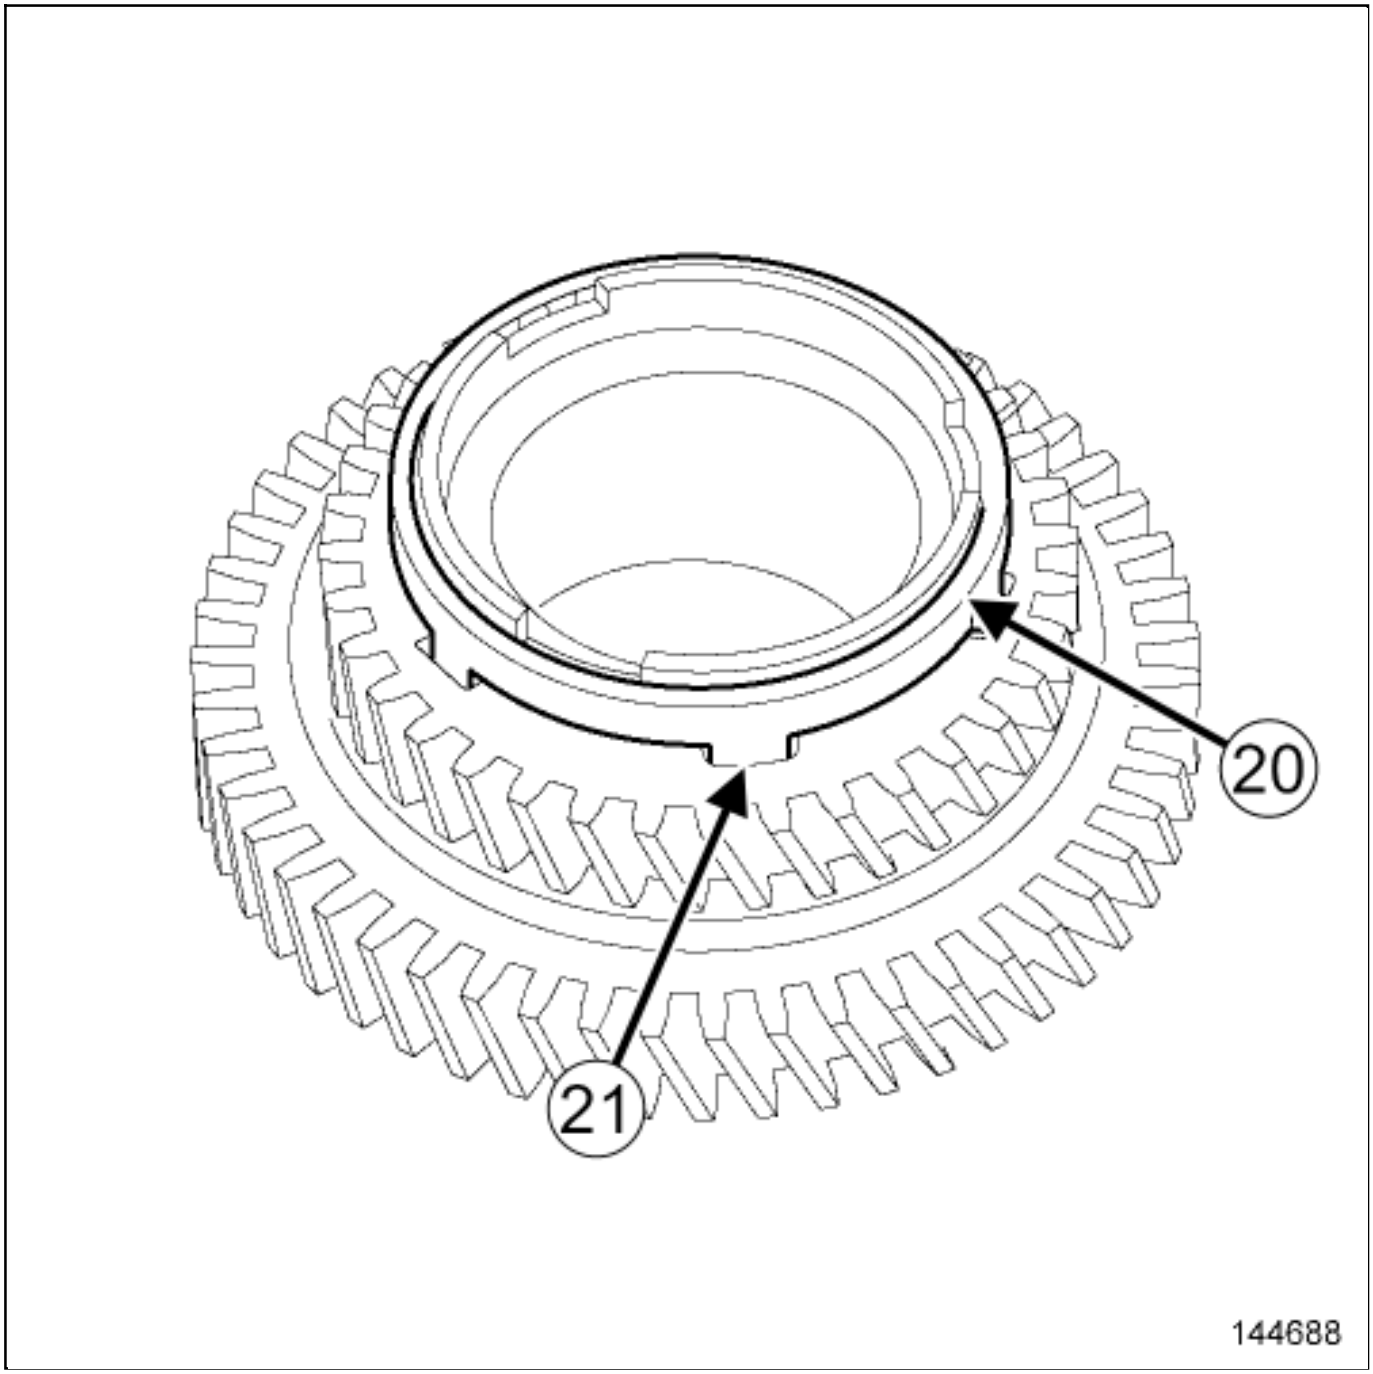
Always replace:

- the bearings,
- the stop clips,
- the damaged parts.

2. REBUILDING OPERATION FOR PART CONCERNED

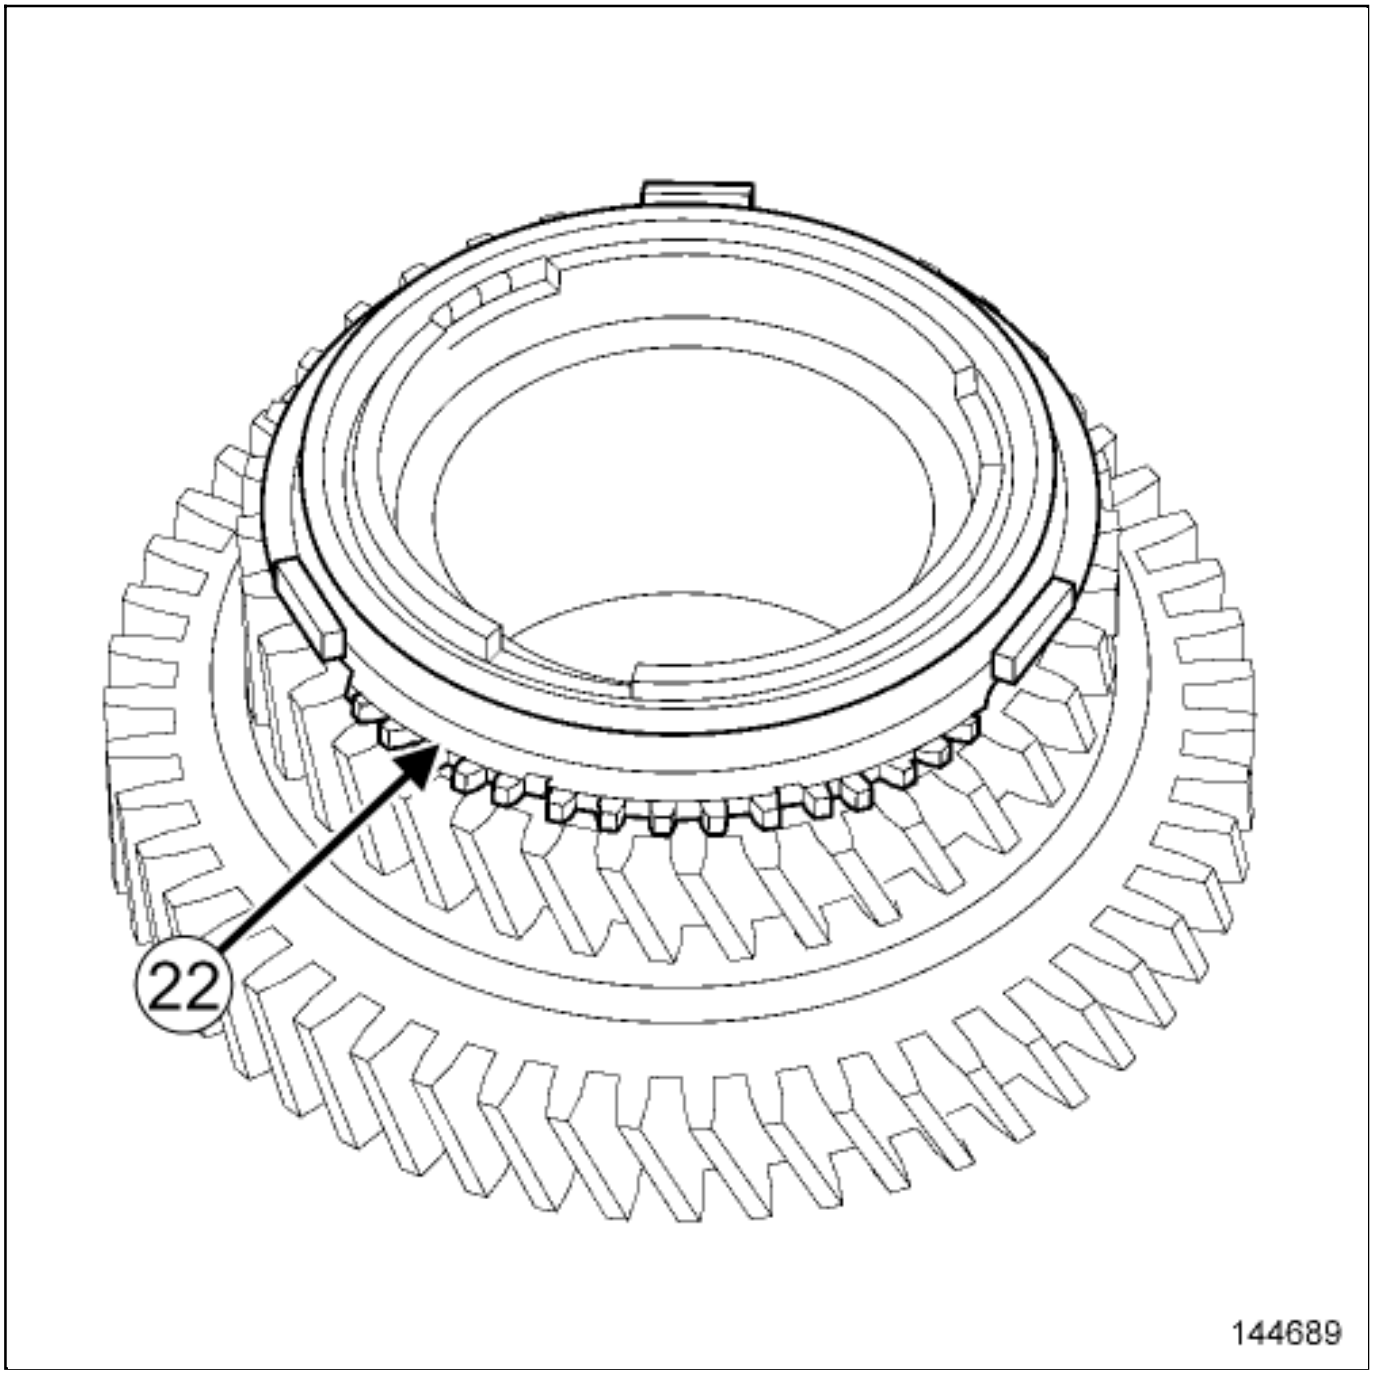
CAUTION

Failure to adhere to the following procedure may damage the gearbox.



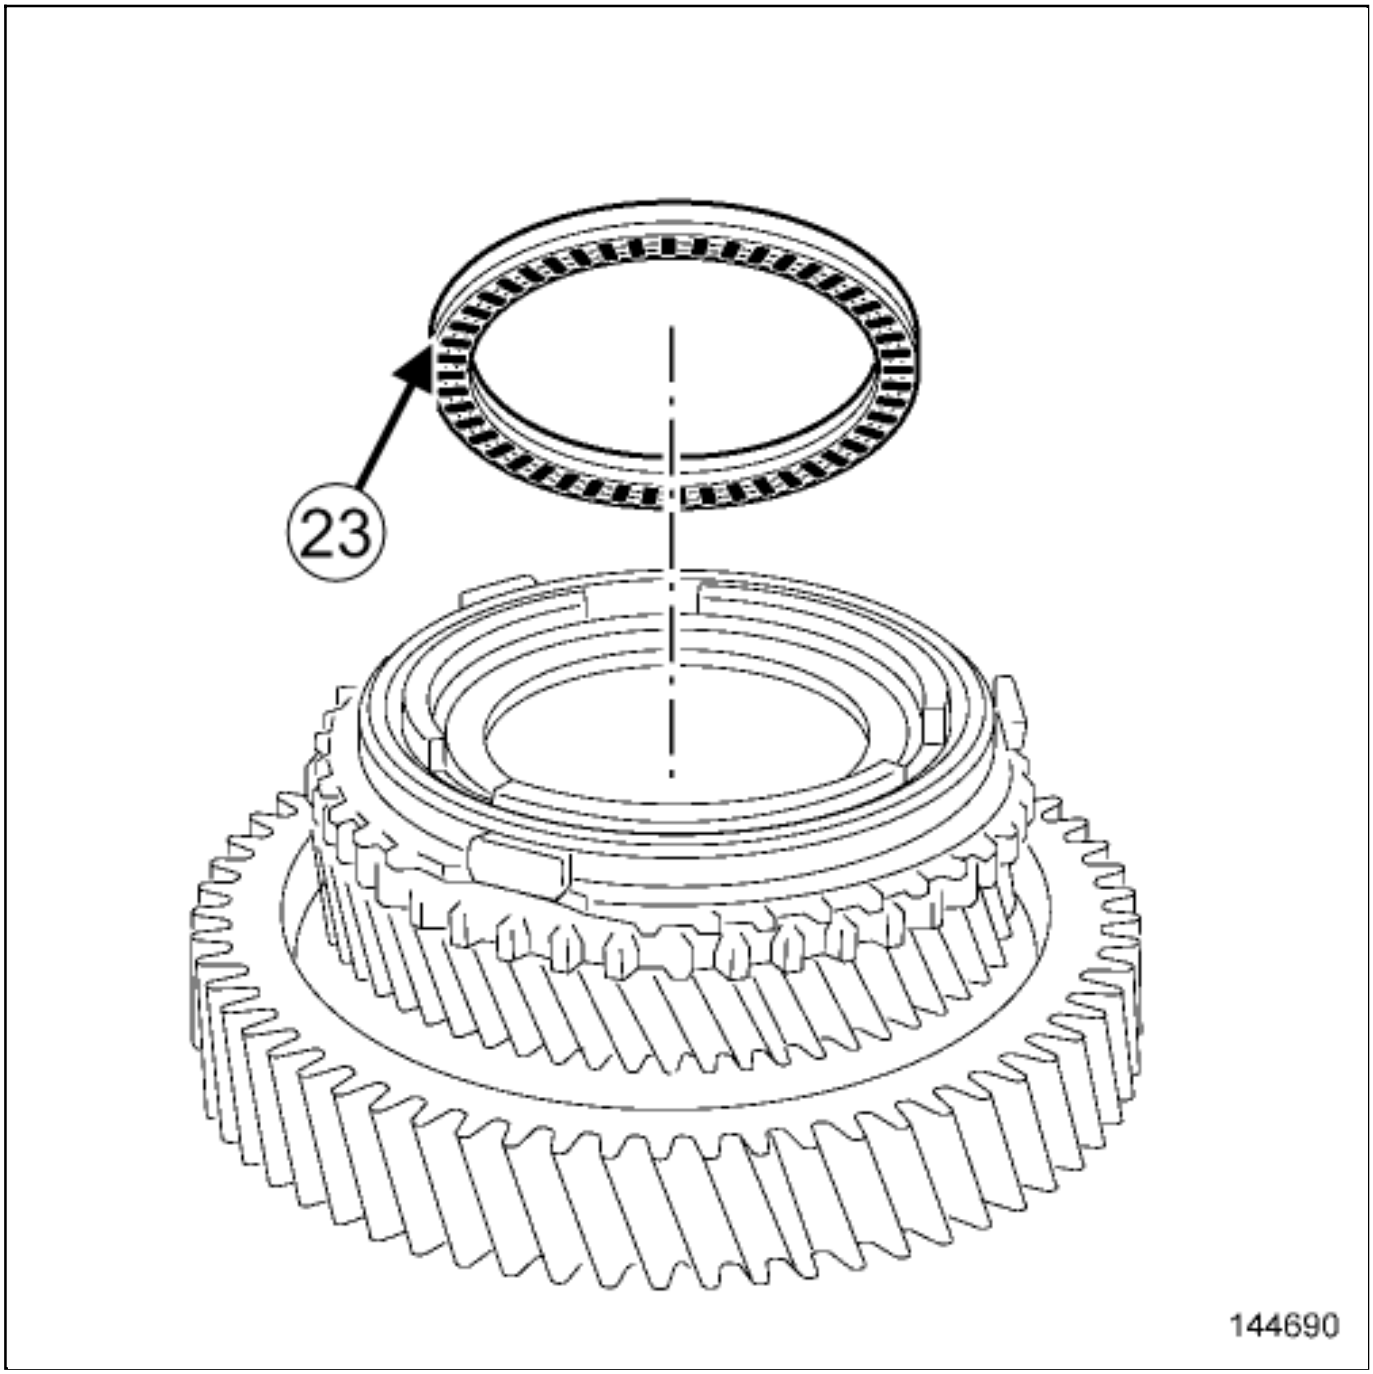
Note:

Particular attention must be paid when refitting shafts.



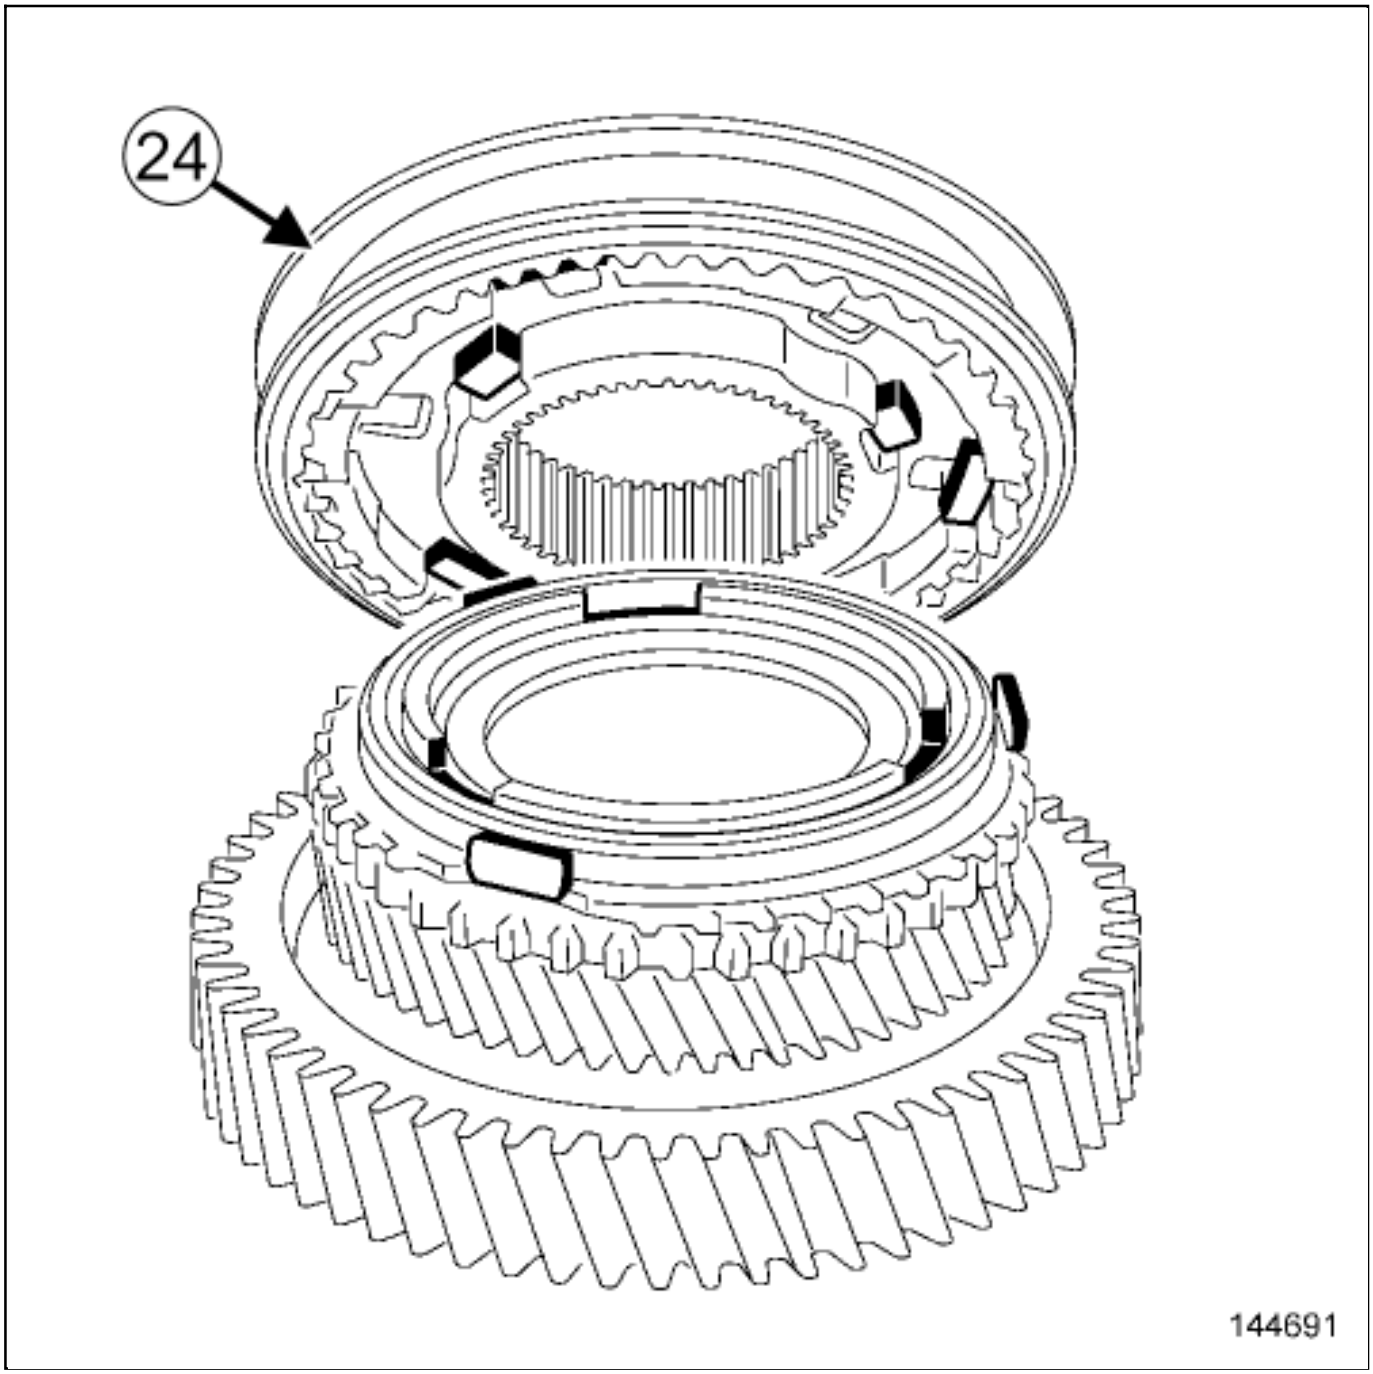
Stacking and pressing may require the presence of two operators in order to hold the part and press it at the same time so that it is inserted in the shaft in the optimum manner.

1- REBUILDING 1ST, 5TH, 6THAND 2NDGEARS ON THE SHAFT:



Refit a new 2nd gear pinion bearing on the gearbox shaft.

Refit the synchroniser rings(20) on the 2nd gear pinion and ensure that they are properly inserted in the lugs(21) .

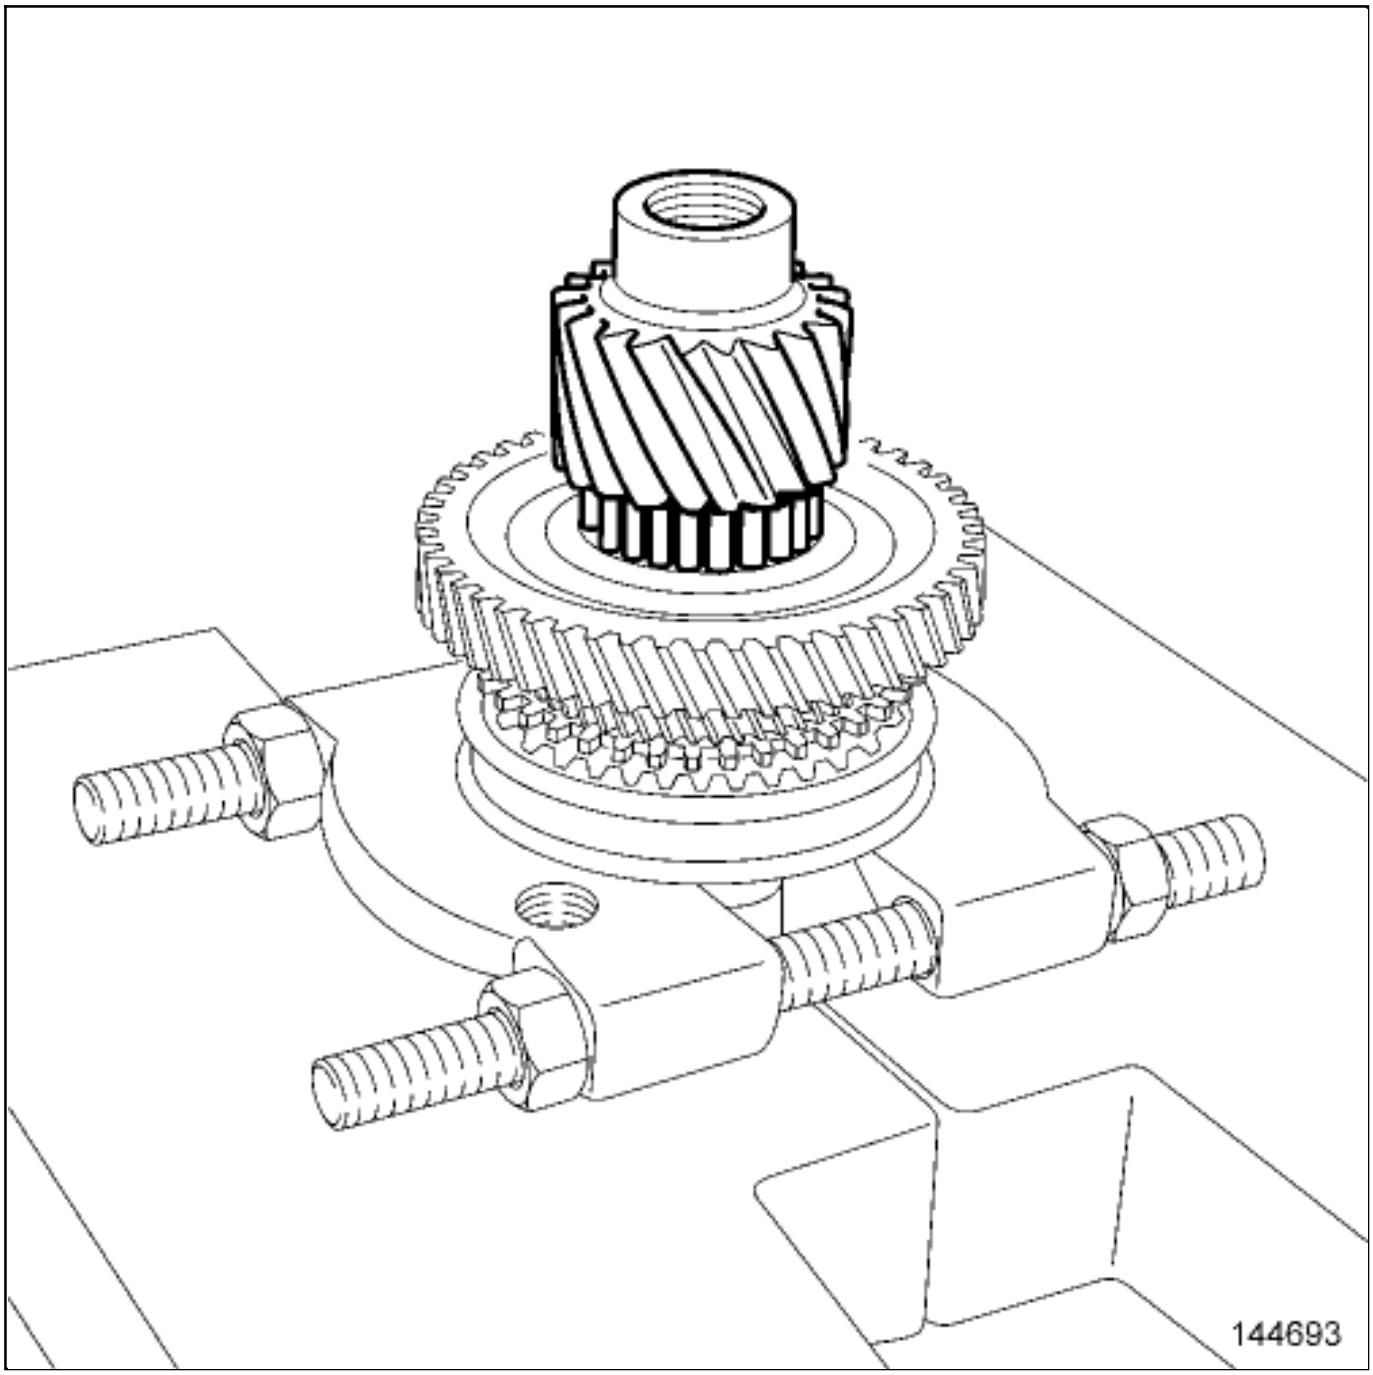


Refit the synchroniser ring(22) on the 2nd gear pinion.

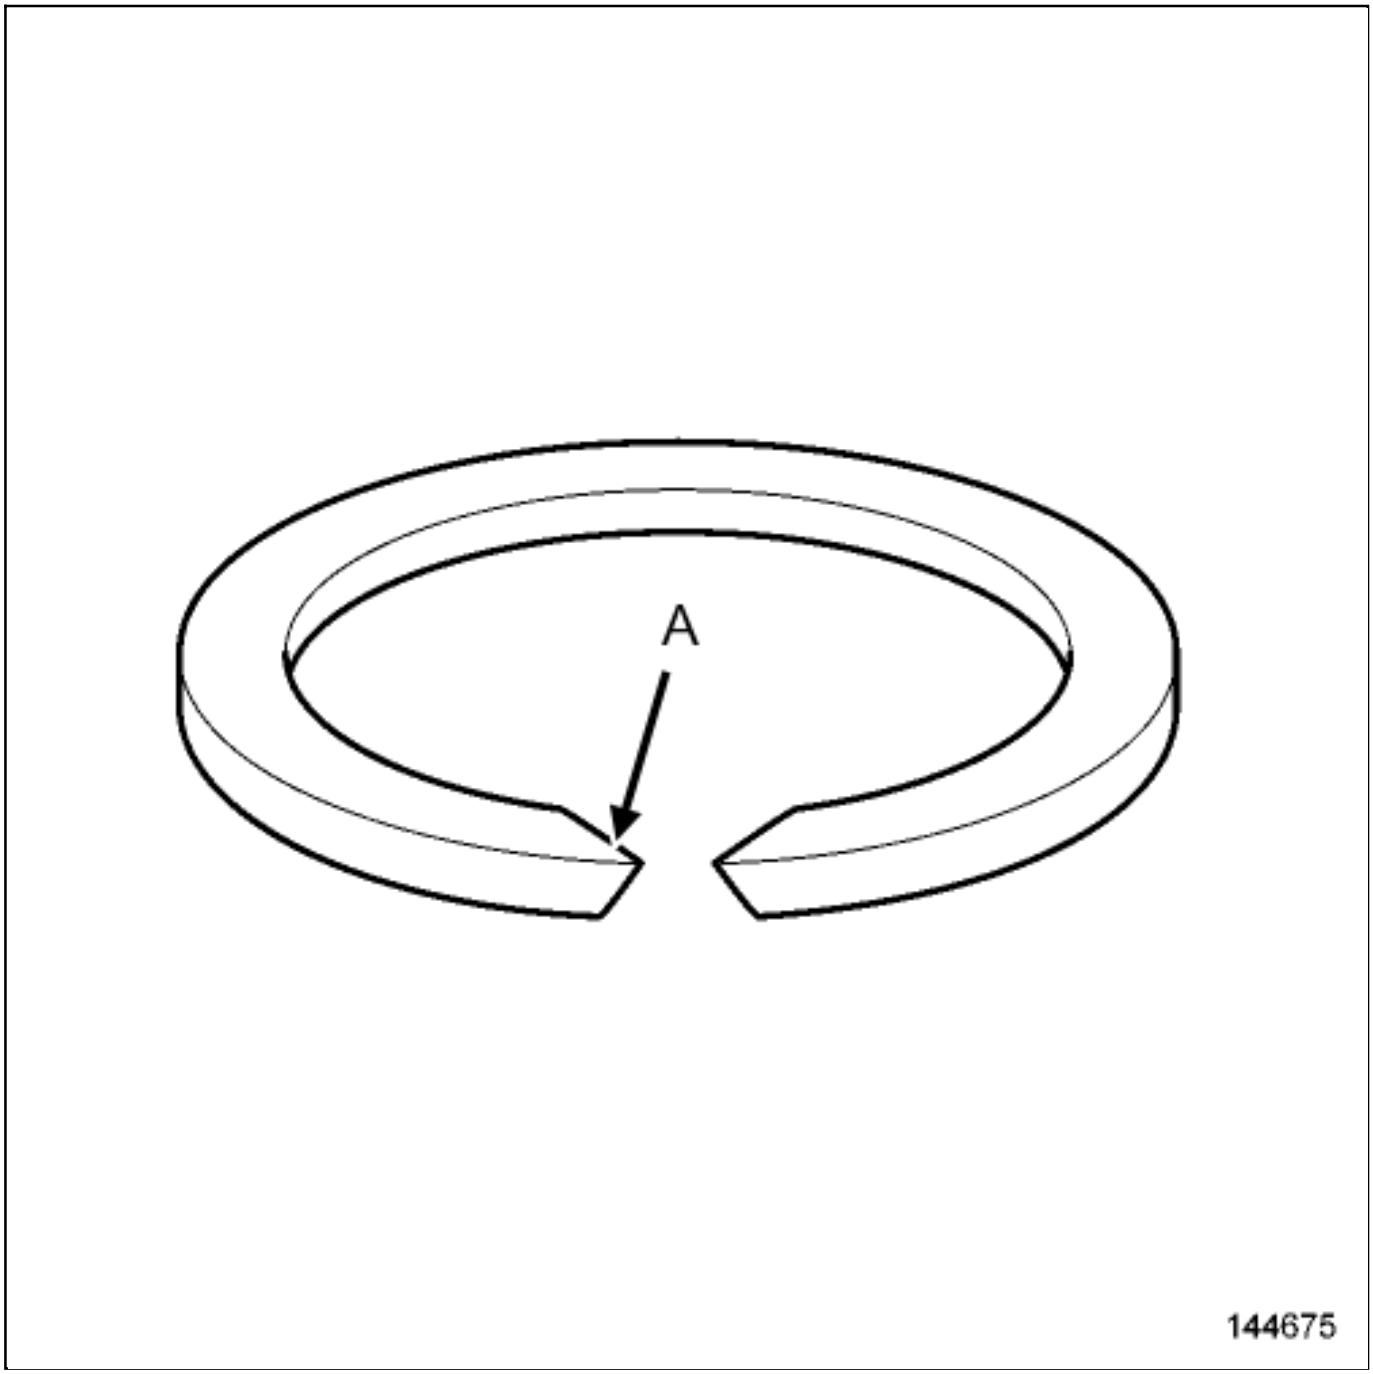
Refit the needle bearing(23) .

Note:

The needles must be on the mating face of the 2nd gear pinion.



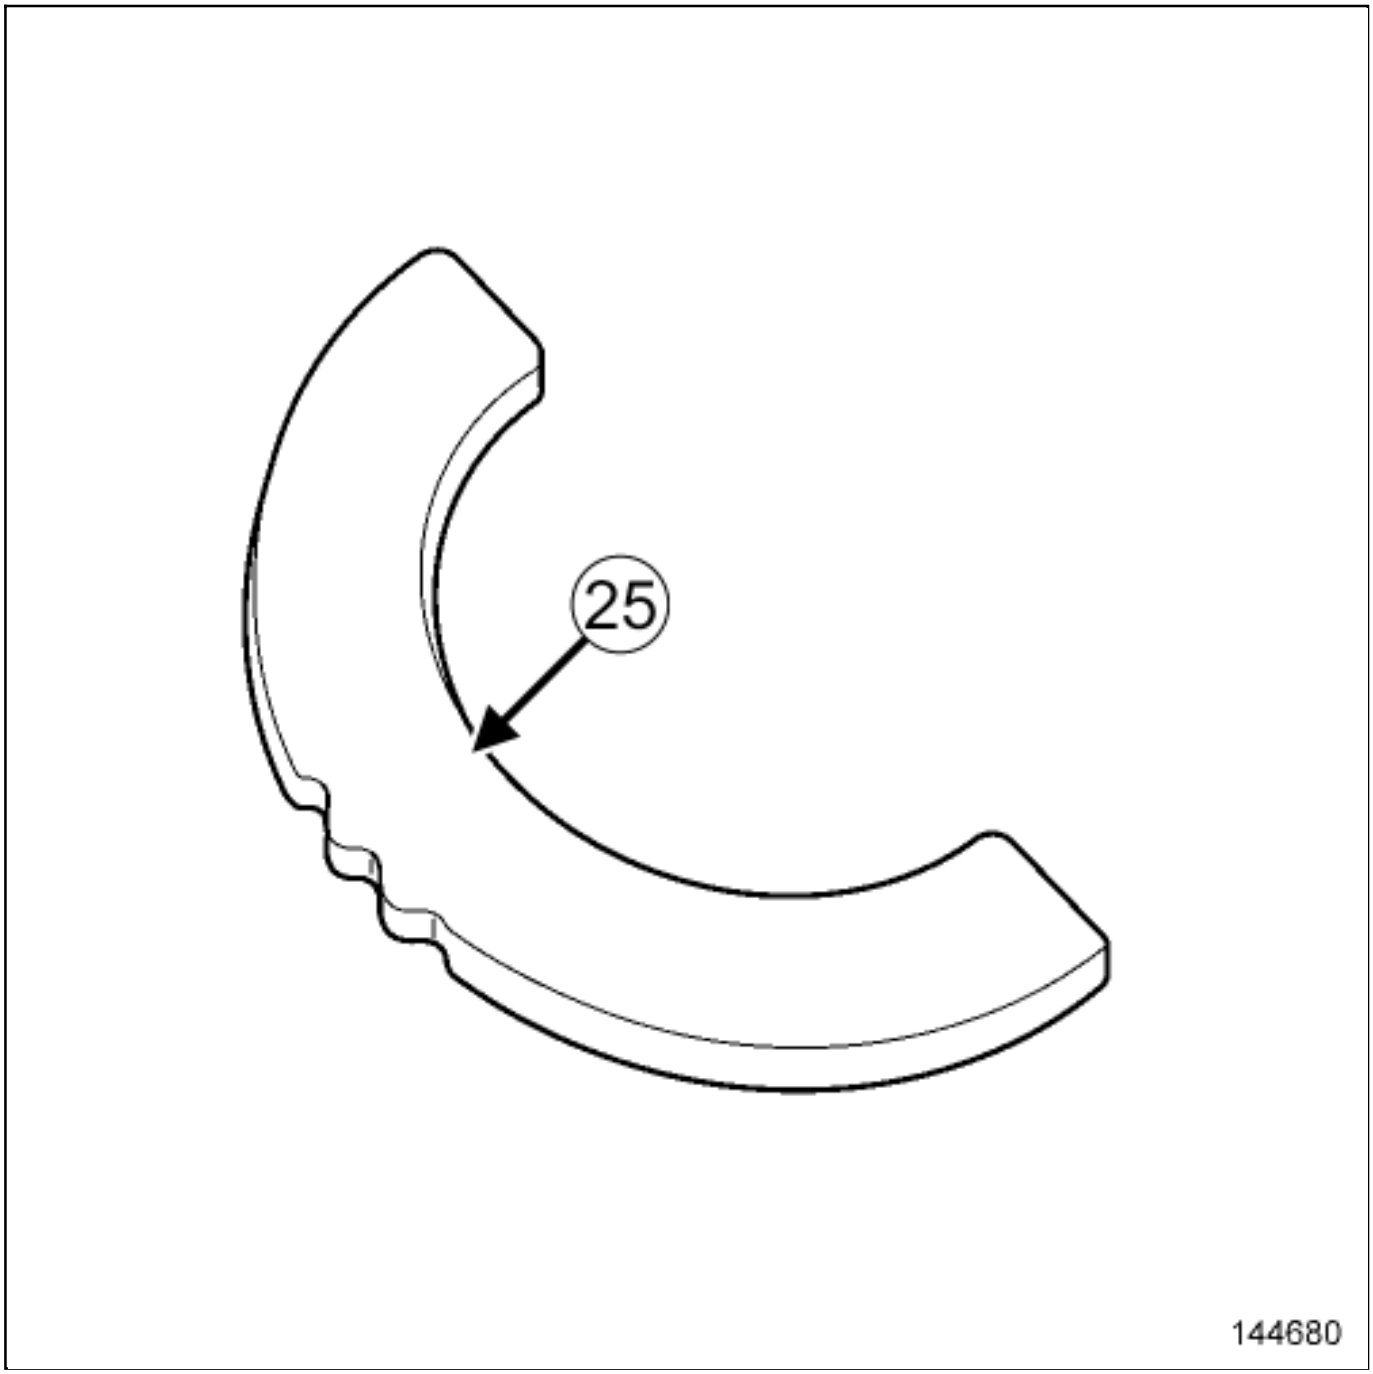
Refit the synchroniser hub(24) .



Note:

Rotate the synchroniser hub so that all the lugs are inserted correctly.

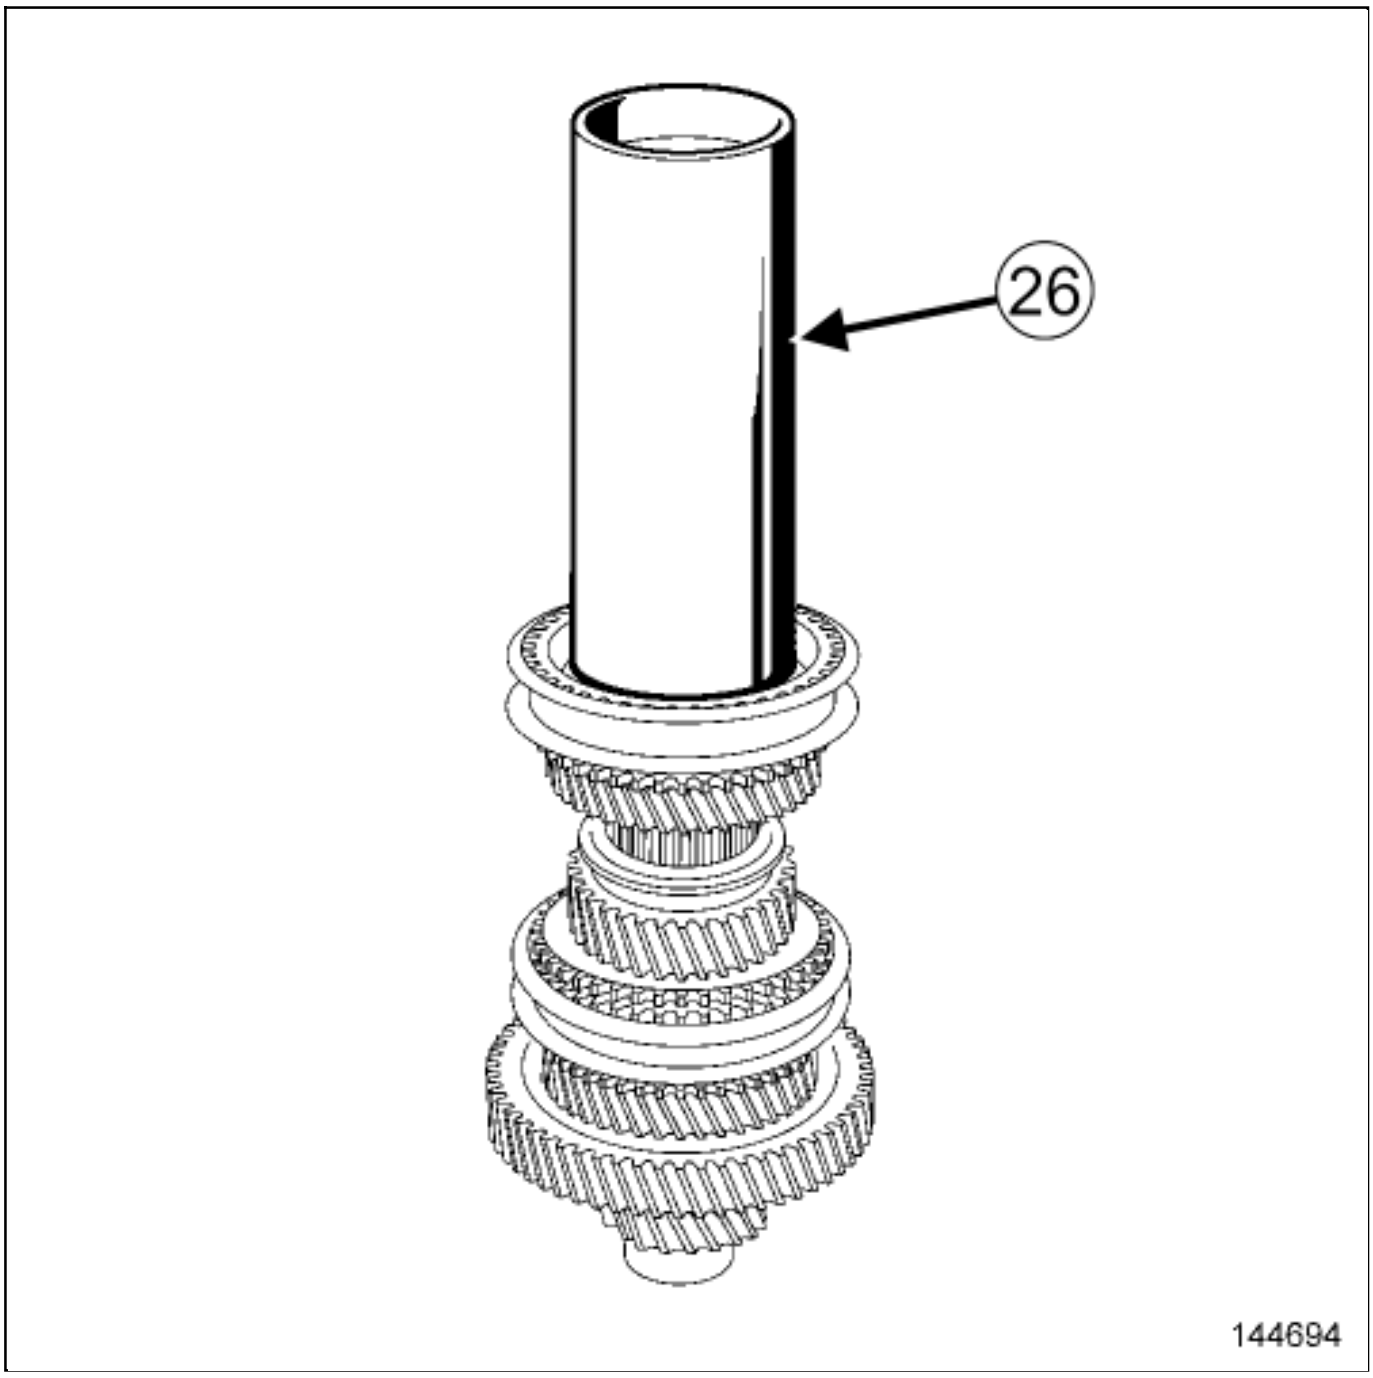
Fit the 2nd gear pinion assembly on the gearbox shaft.



Press the gearbox shaft.

Refit:

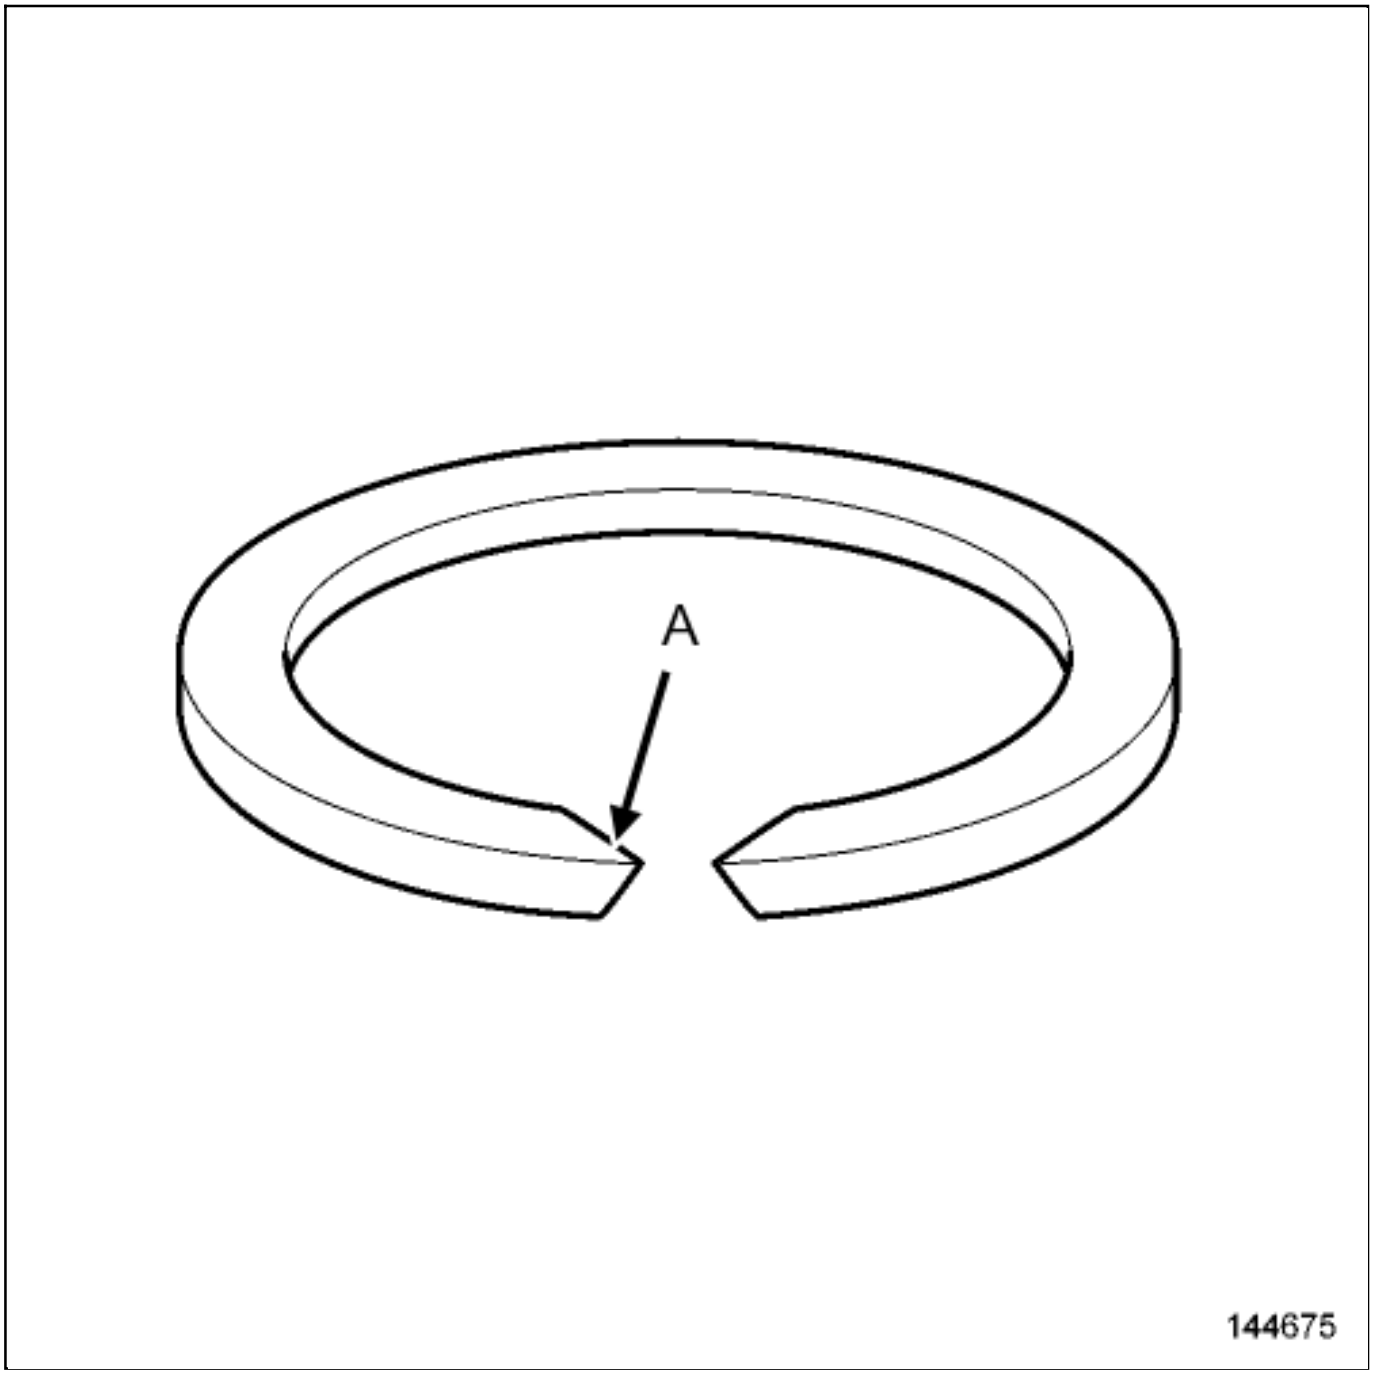
- a new clip using snap ring pliers, ensuring that the pointed section of the clip(**A**) faces upwards,
- a new 6th gear pinion bearing,
- the 6th gear pinion.



Refit:

- the half-shells of the 6th gear pinion(**25**) ,
- the locking washer of the 6th gear pinion.

Refit a 5th gear pinion bearing on the 5th gear pinion.

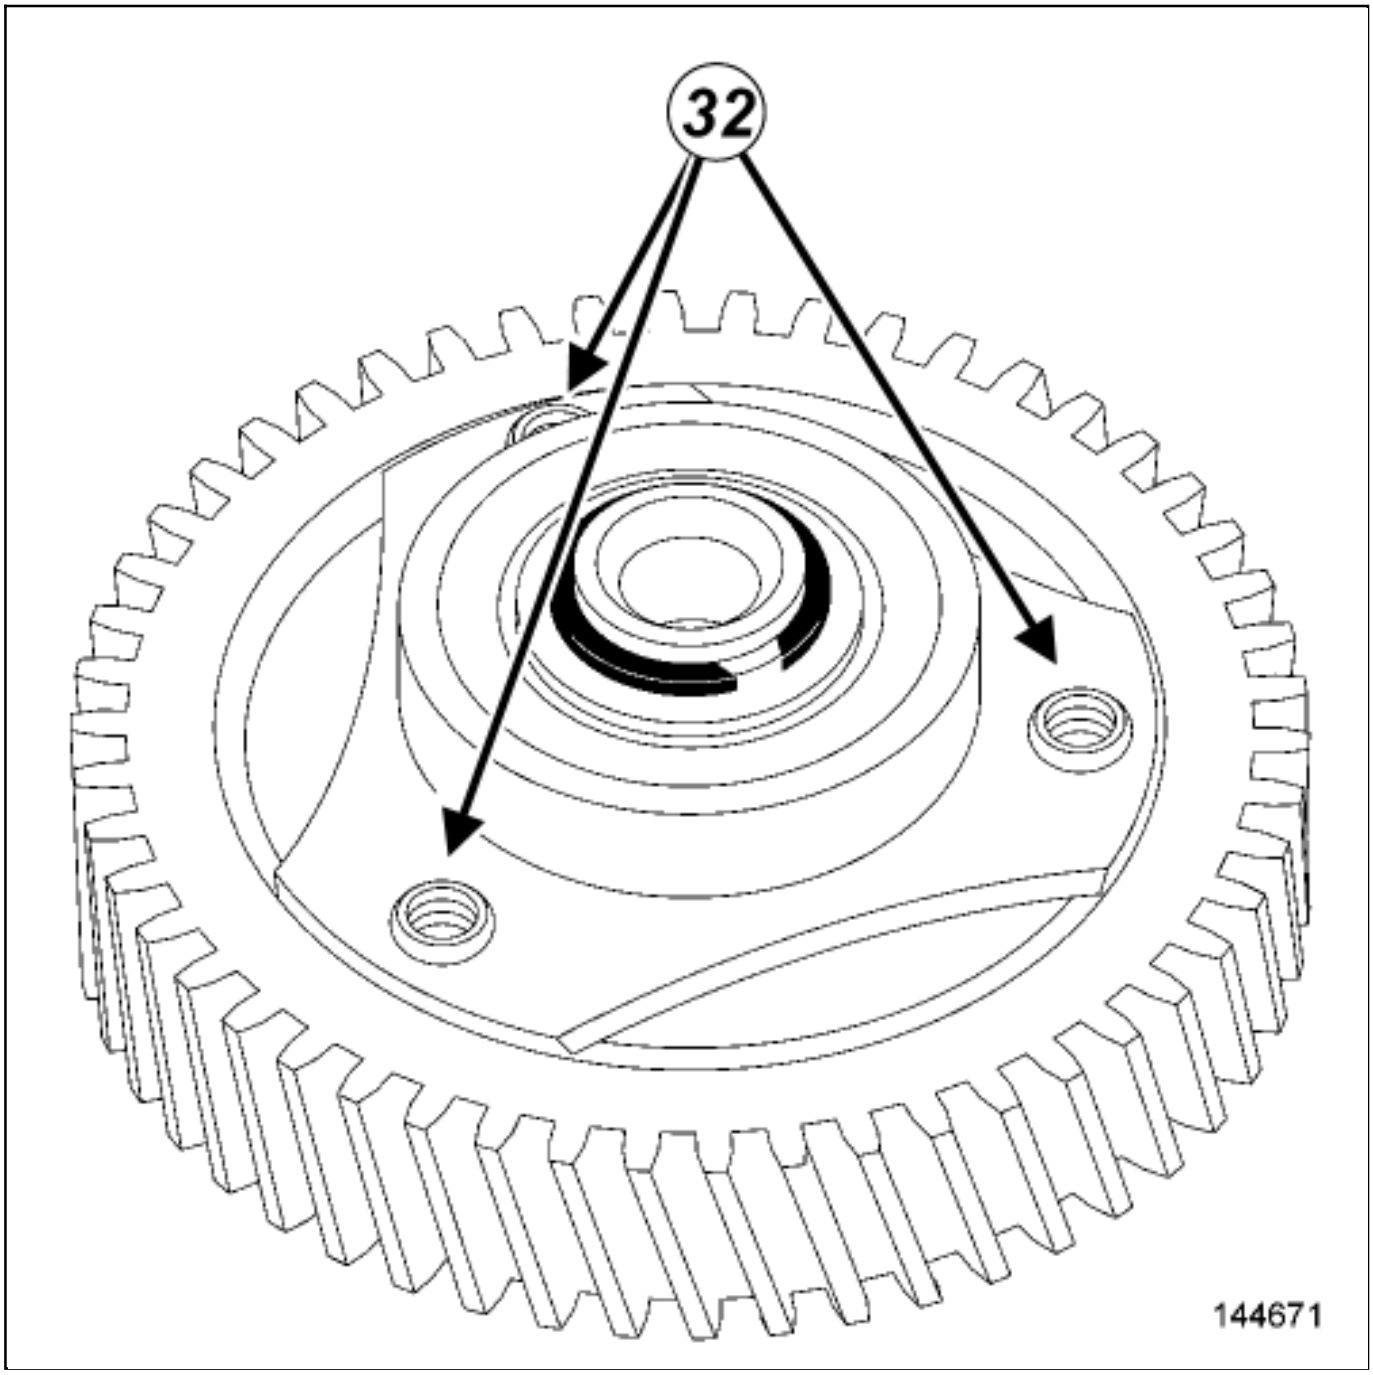


Fit the 5th gear pinion and the synchroniser hub on the gearbox shaft, paying attention to the lugs.

Note:

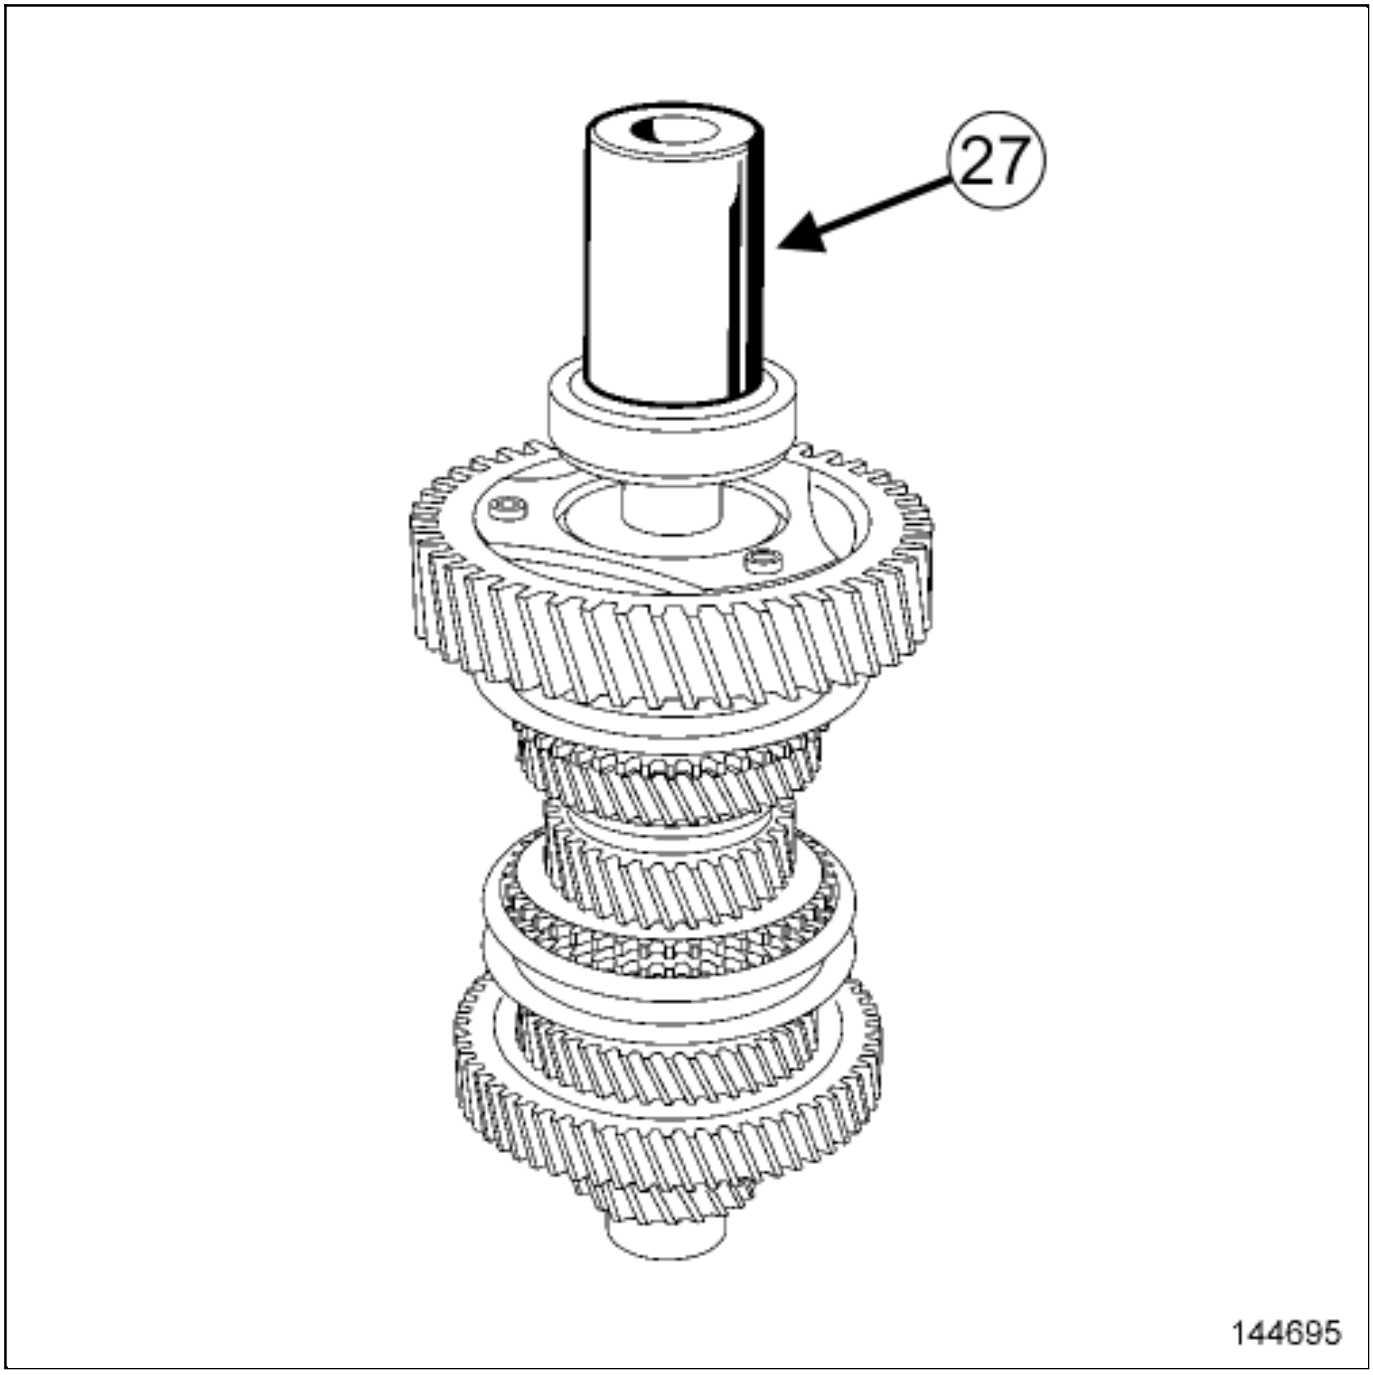
Keep the "5th gear pinion - synchroniser hub" assembly facing upwards when pressing.

Refit the 5th gear pinion using a press and the toolDC4 gearbox internal renovation kit(Bvi. 1956) A (26) .



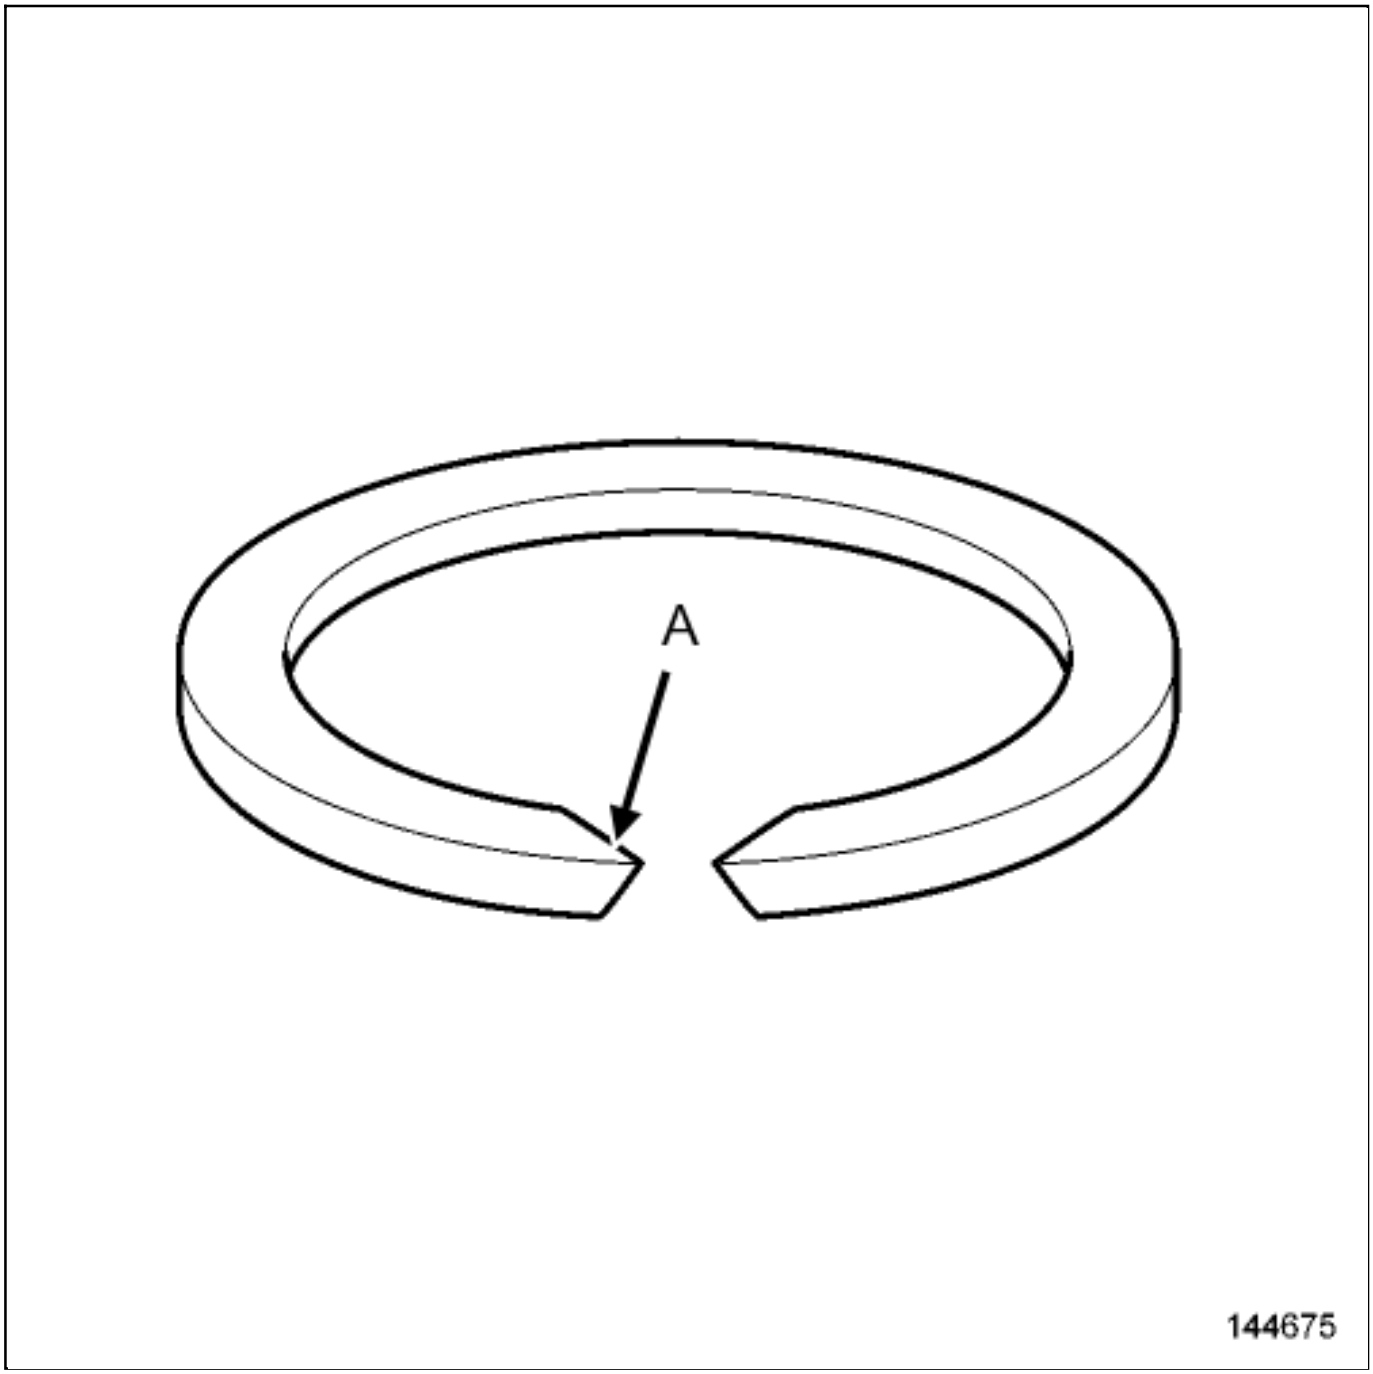
Refit:

- a new clip using snap ring pliers, ensuring that the pointed section of the clip(A) faces upwards,
- a new 1st gear pinion bearing on the 1st gear pinion,



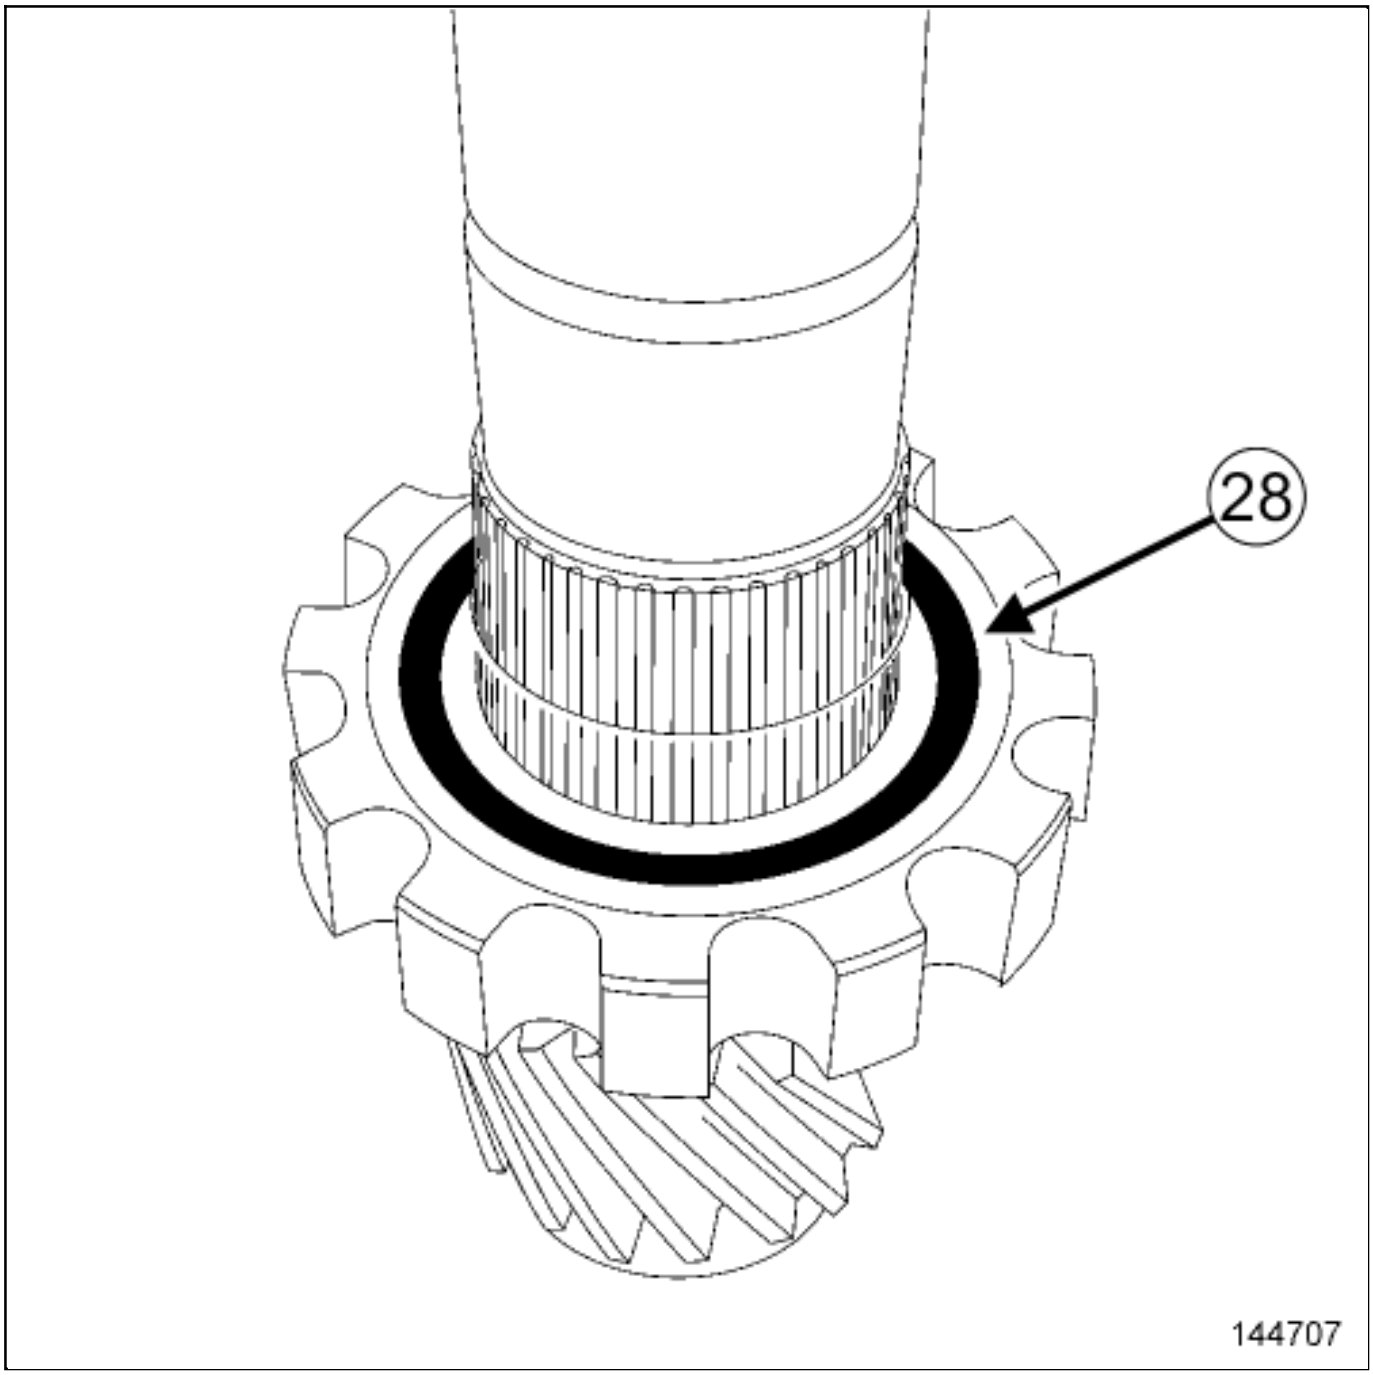
- the 1st gear pinion,
- the calibration washer.

Note:

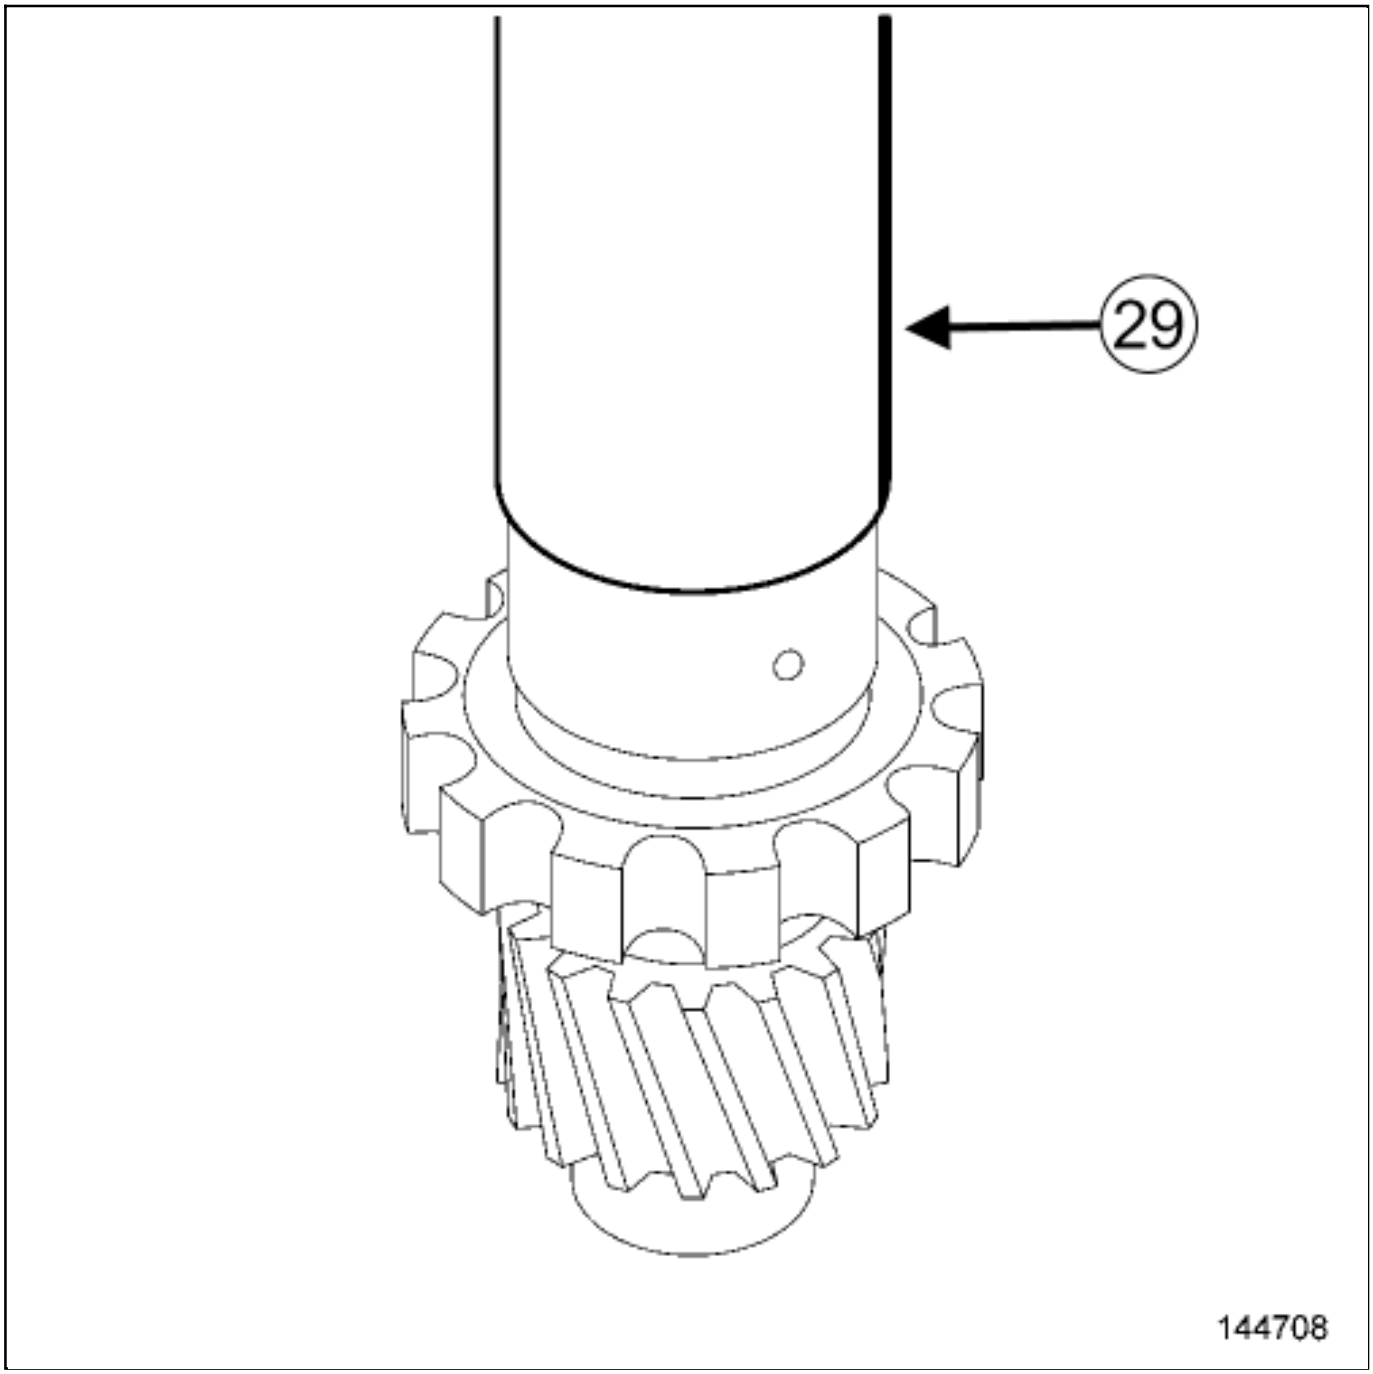


Pay attention to the direction of fitting of the retaining plate.

Refit the retaining plate with the convex part of the three threads opposite the 1st gear pinion.

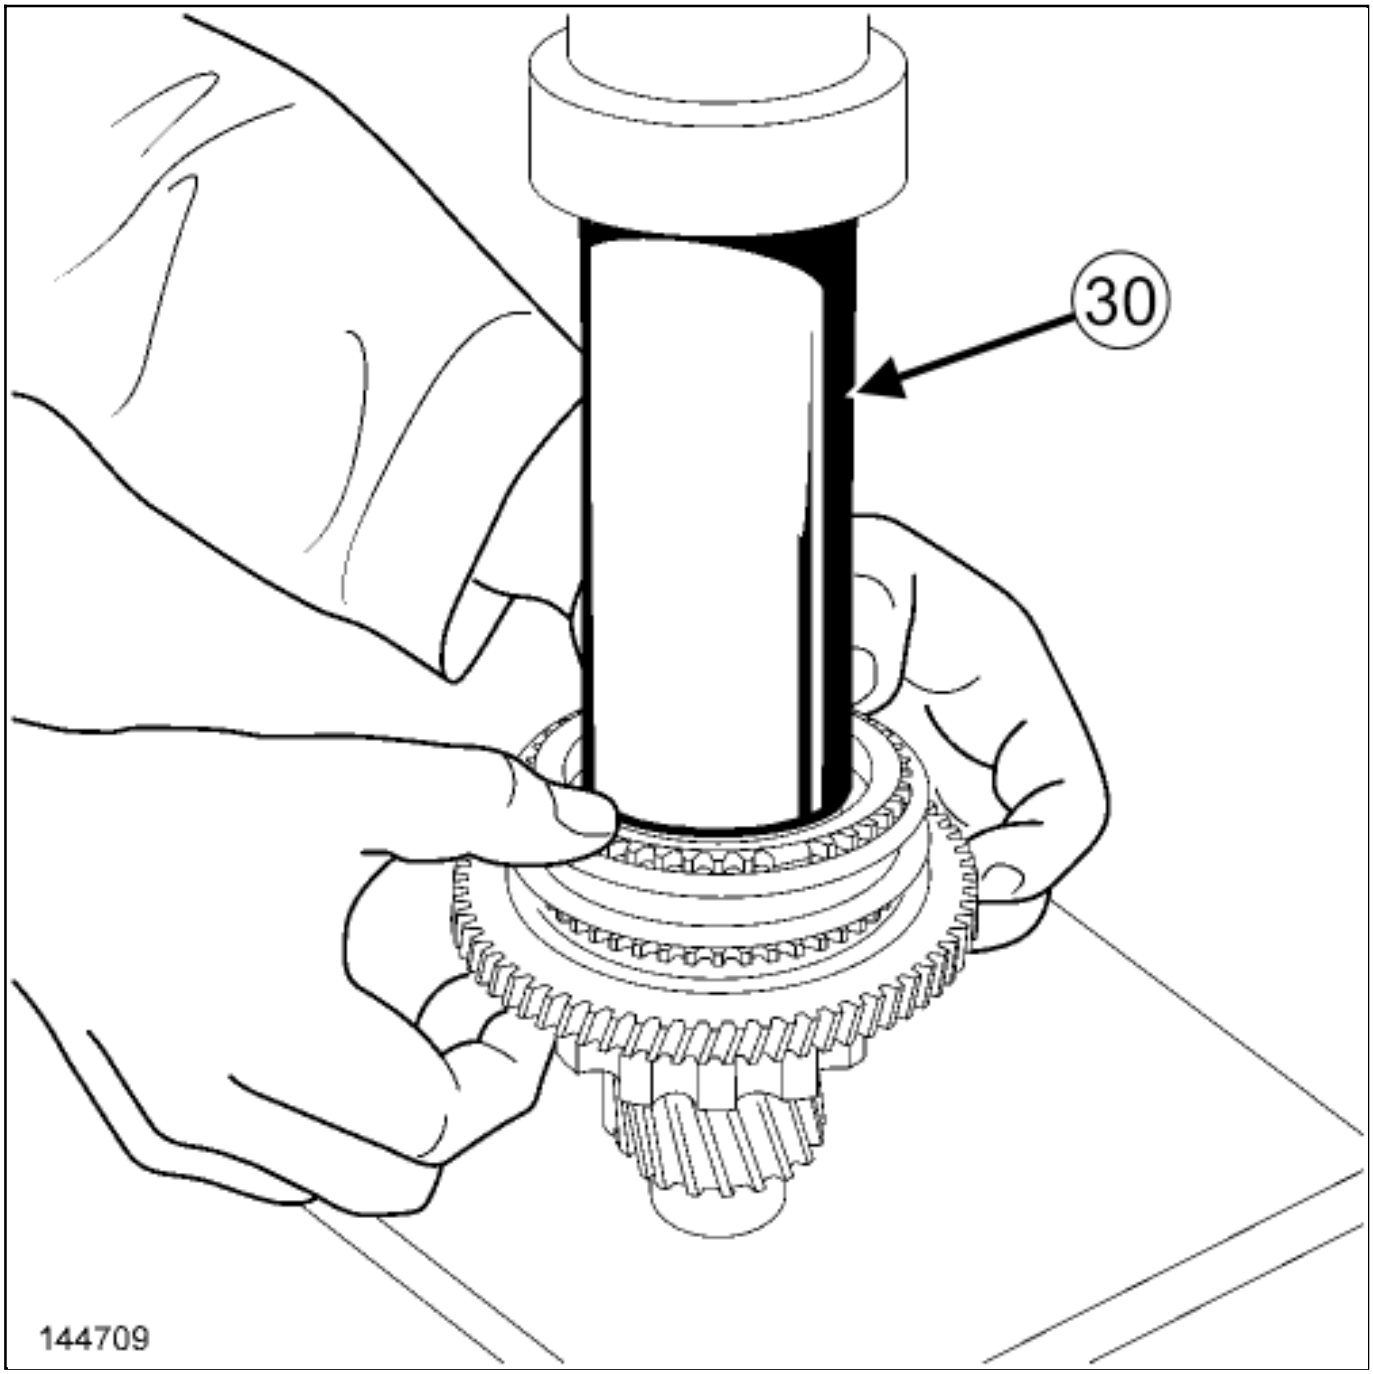


Refit a new gearbox shaft bearing using a press and the toolDC4 gearbox internal renovation kit (Bvi. 1956) D (27) .



Refit a new clip using snap ring pliers ensuring that the pointed section of the clip(A) faces upwards.

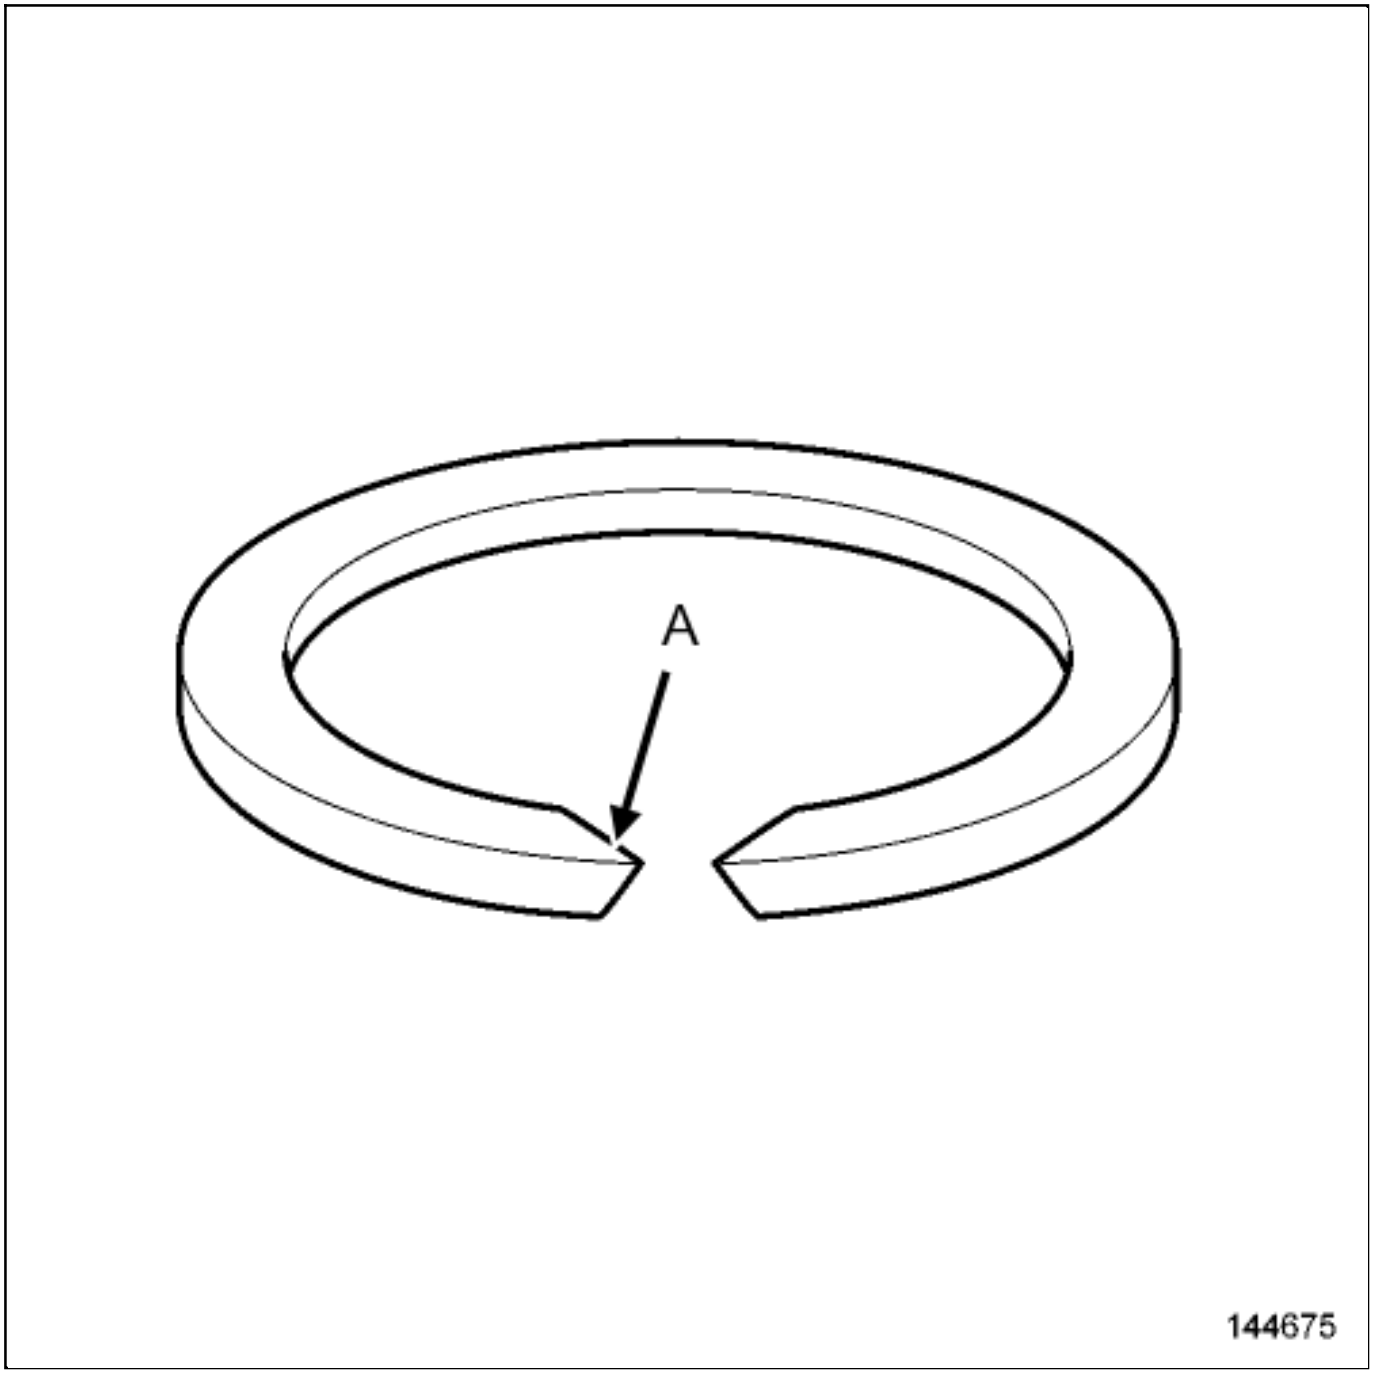
2- REBUILDING THE SHAFT WITH 3RD, 4THAND REVERSE GEARS:



Fit the parking gear wheel on the gearbox shaft, positioning the neck(28) upwards.

Refit the needle bearing ring of the reverse gear pinion using a press and the toolDC4 gearbox internal renovation kit(Bvi. 1956) A (29) .

Refit a new reverse gear pinion bearing on the reverse gear pinion.

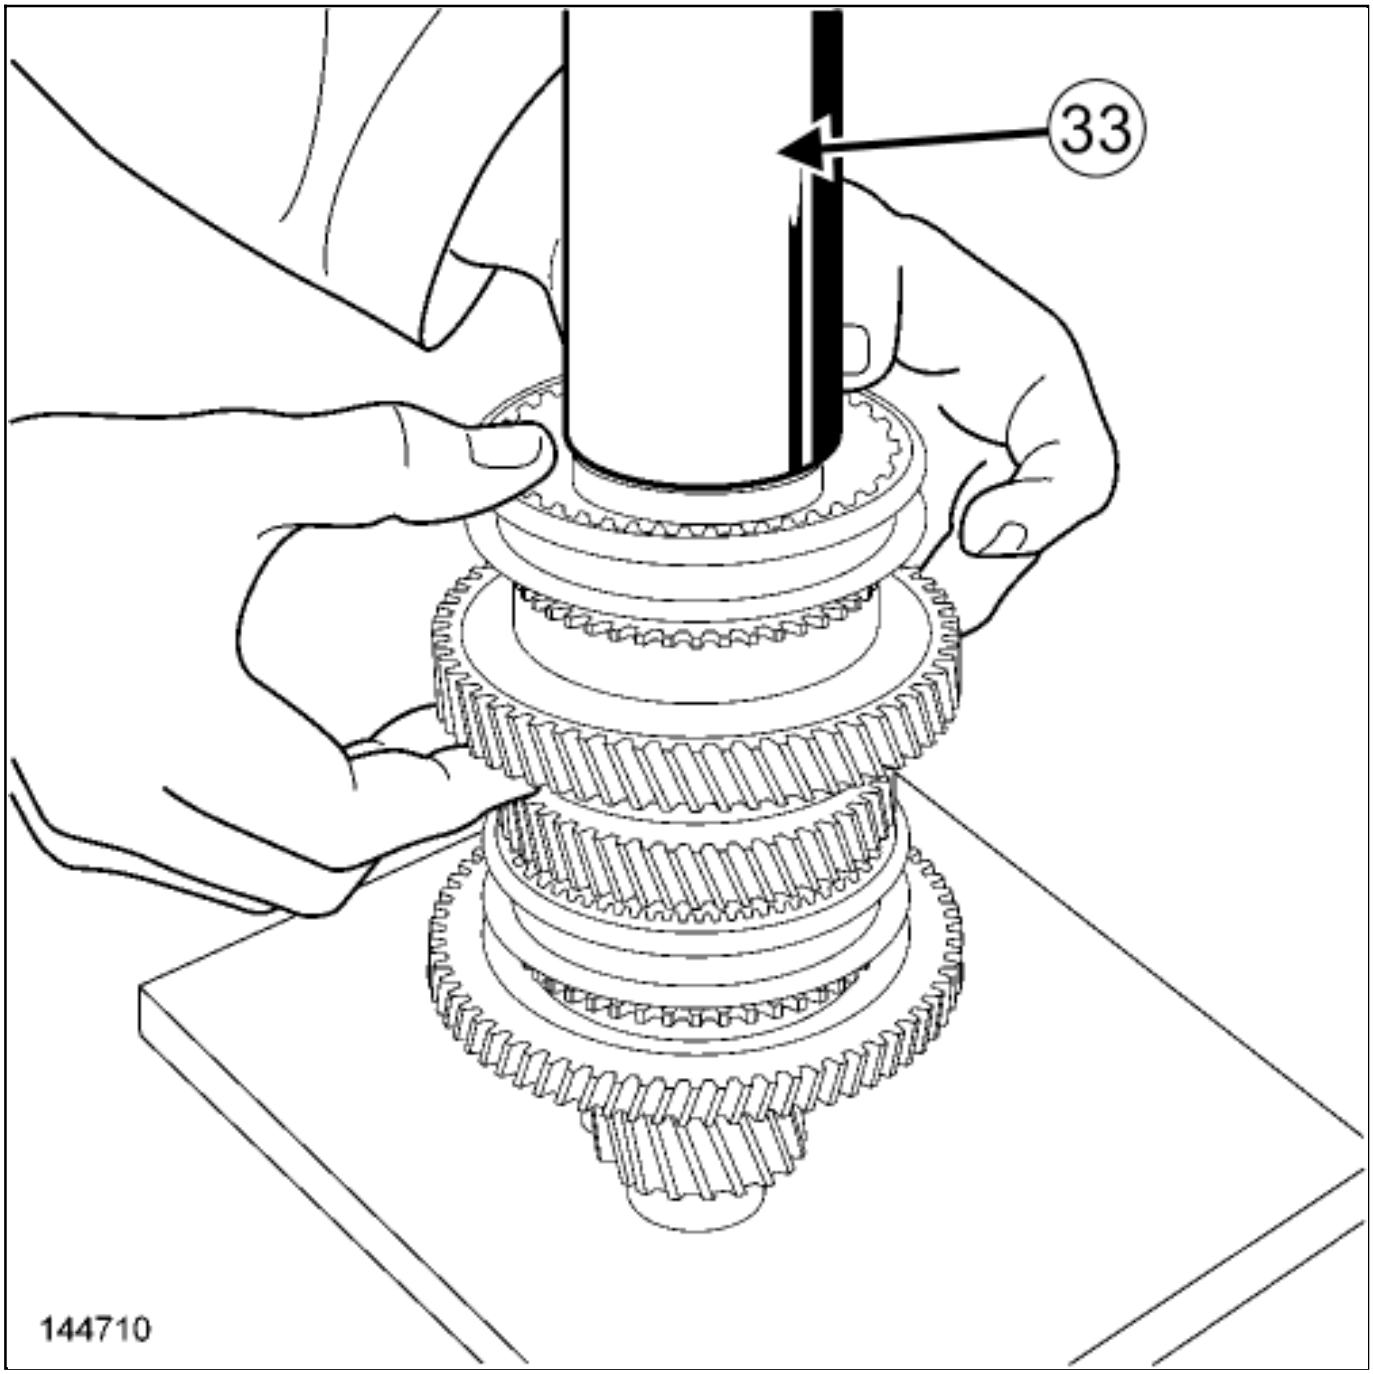


Fit the reverse gear pinion and the synchroniser hub on the gearbox shaft, paying attention to the lugs.

Note:

Keep the "reverse gear pinion - synchroniser hub" assembly facing upwards during pressing.

Refit the reverse gear pinion using a press and the toolDC4 gearbox internal renovation kit(Bvi. 1956) A (30) .

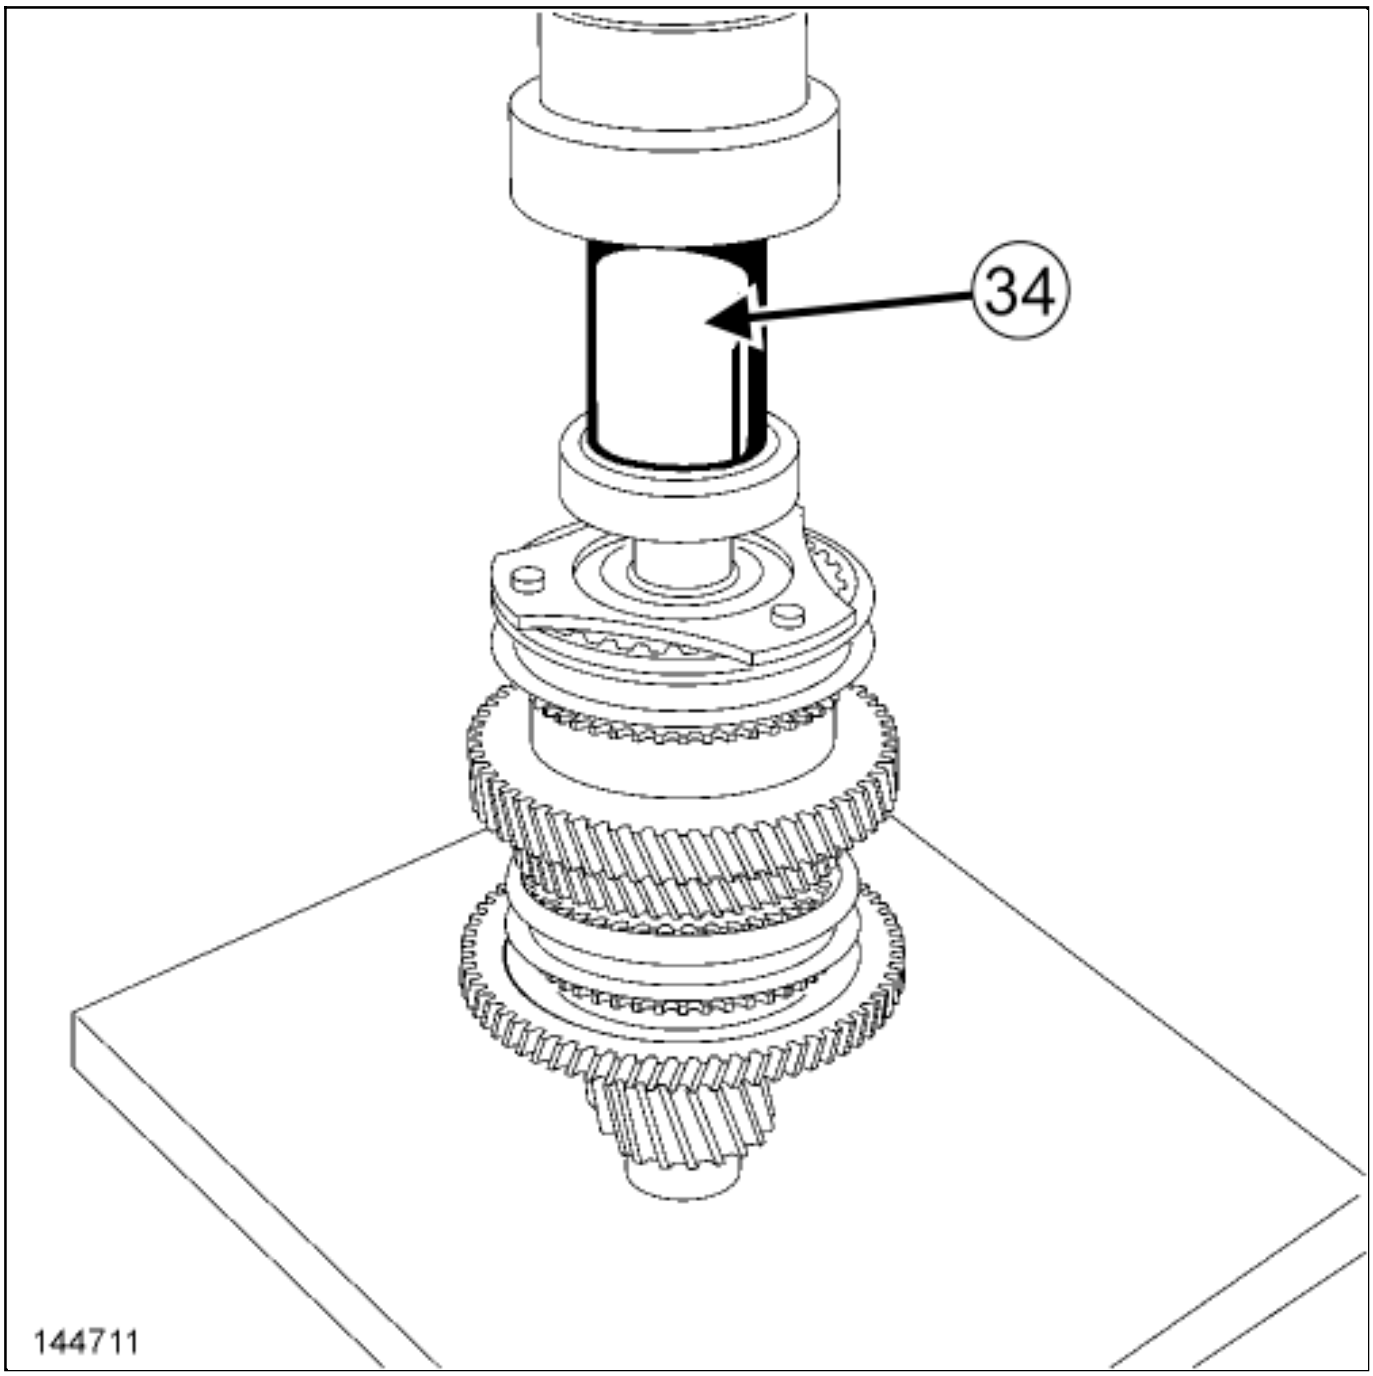


Refit a new clip using snap ring pliers ensuring that the pointed section of the clip(A) faces upwards.

Refit:

- a new 4th gear pinion bearing on the 4th gear pinion,
- the 4th gear pinion,
- the half-shells of the 4th gear pinion,
- the locking washer of the 4th gear pinion,
- a new 3rd gear pinion bearing on the 3rd gear pinion,
- the 3rd gear pinion.

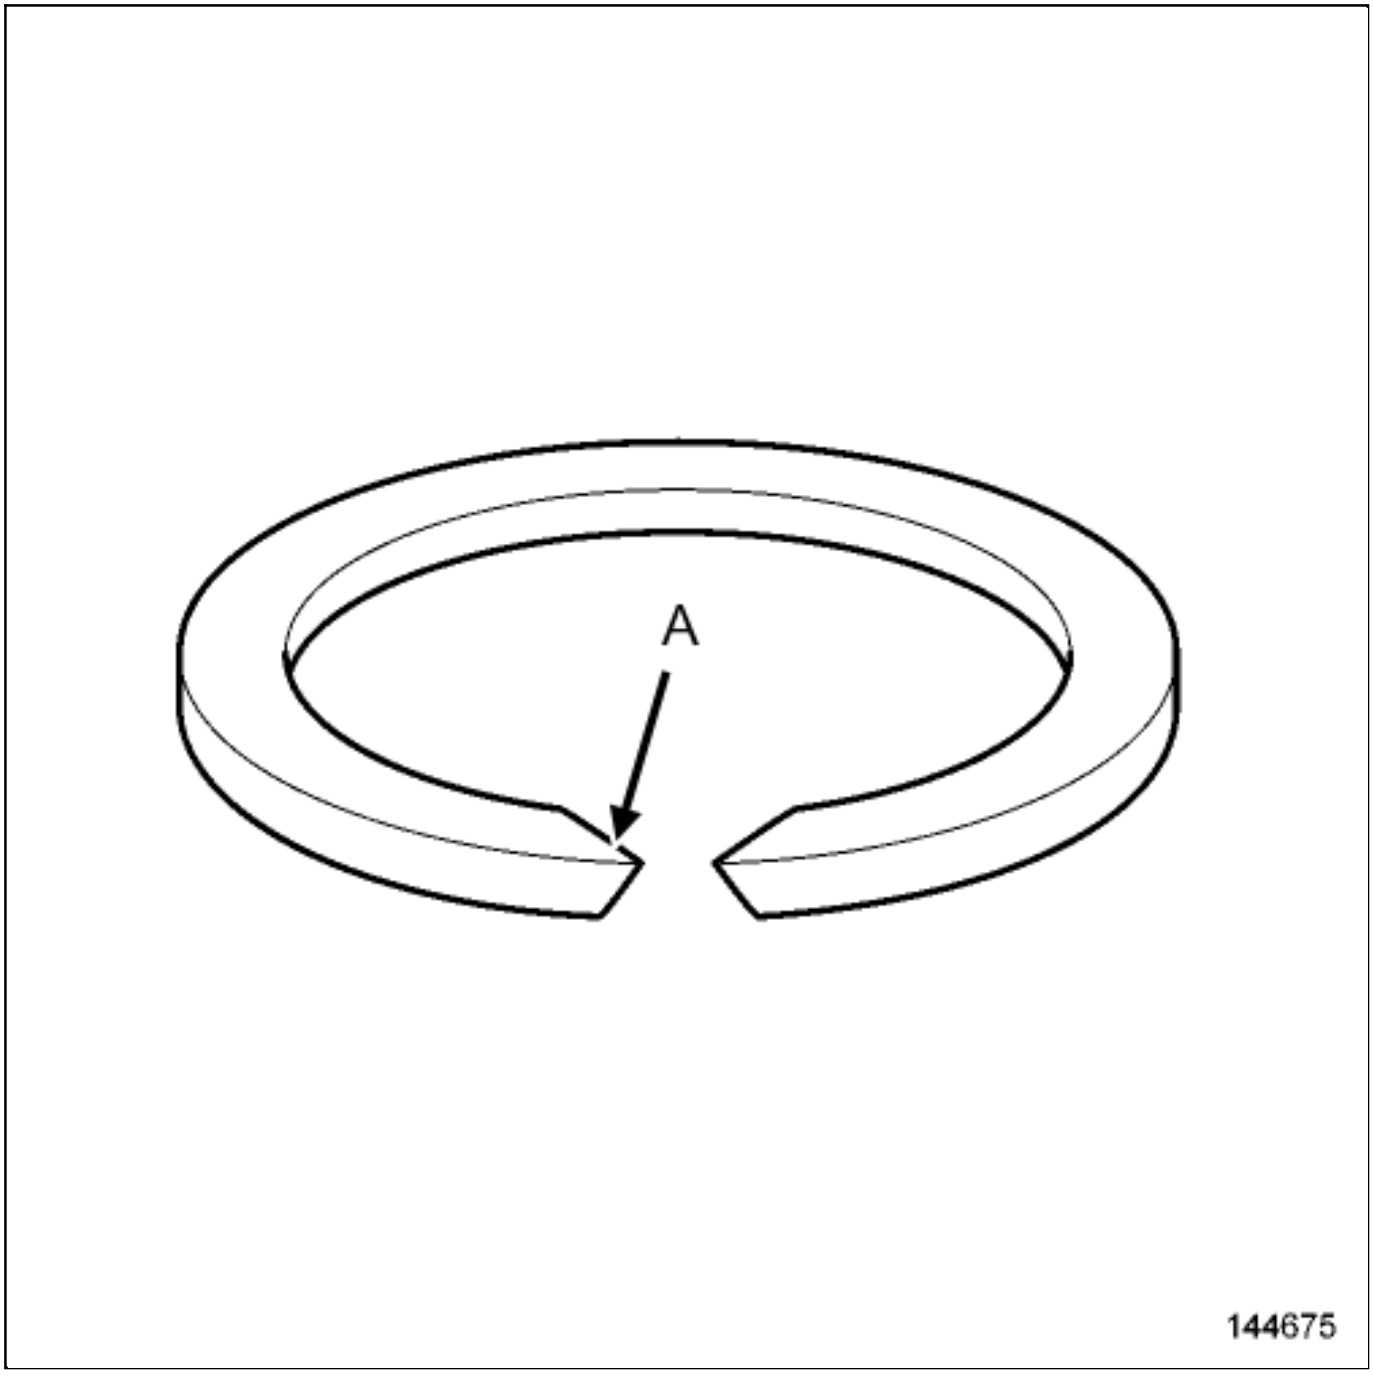
Fit the 3rd gear pinion and the synchroniser hub on the gearbox shaft, paying attention to the lugs.



Note:

Keep the "3rd gear pinion - synchroniser hub" assembly facing upwards when pressing.

Refit the 3rd gear pinion and the synchroniser hub using a press and the toolDC4 gearbox internal renovation kit(Bvi. 1956) A (33) .



- Refit the retaining plate with the convex part of the three threads opposite the 3rd gear pinion.

- Fit the new gearbox shaft bearing.

Refit the new gearbox shaft bearing using a press and the toolDC4 gearbox internal renovation kit (Bvi. 1956) D (34) .

Refit the new gearbox shaft bearing using a press and the toolDC4 gearbox internal renovation (RSM. 9306) D (34) .

Refit a new clip using snap ring pliers ensuring that the pointed section of the clip(A) faces upwards.

3. FINAL OPERATION

Proceed in the reverse order to removal.

OXYGEN SENSORS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.	Mot. 1495

CAUTION

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

CAUTION

If the connections are corroded, repair the wiring (see Wiring: Precautions for repair) (Technical Note 6015A, 88A, Wiring).

Note:

This procedure is for removal - refitting of the upstream oxygen sensor and the downstream oxygen sensor.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

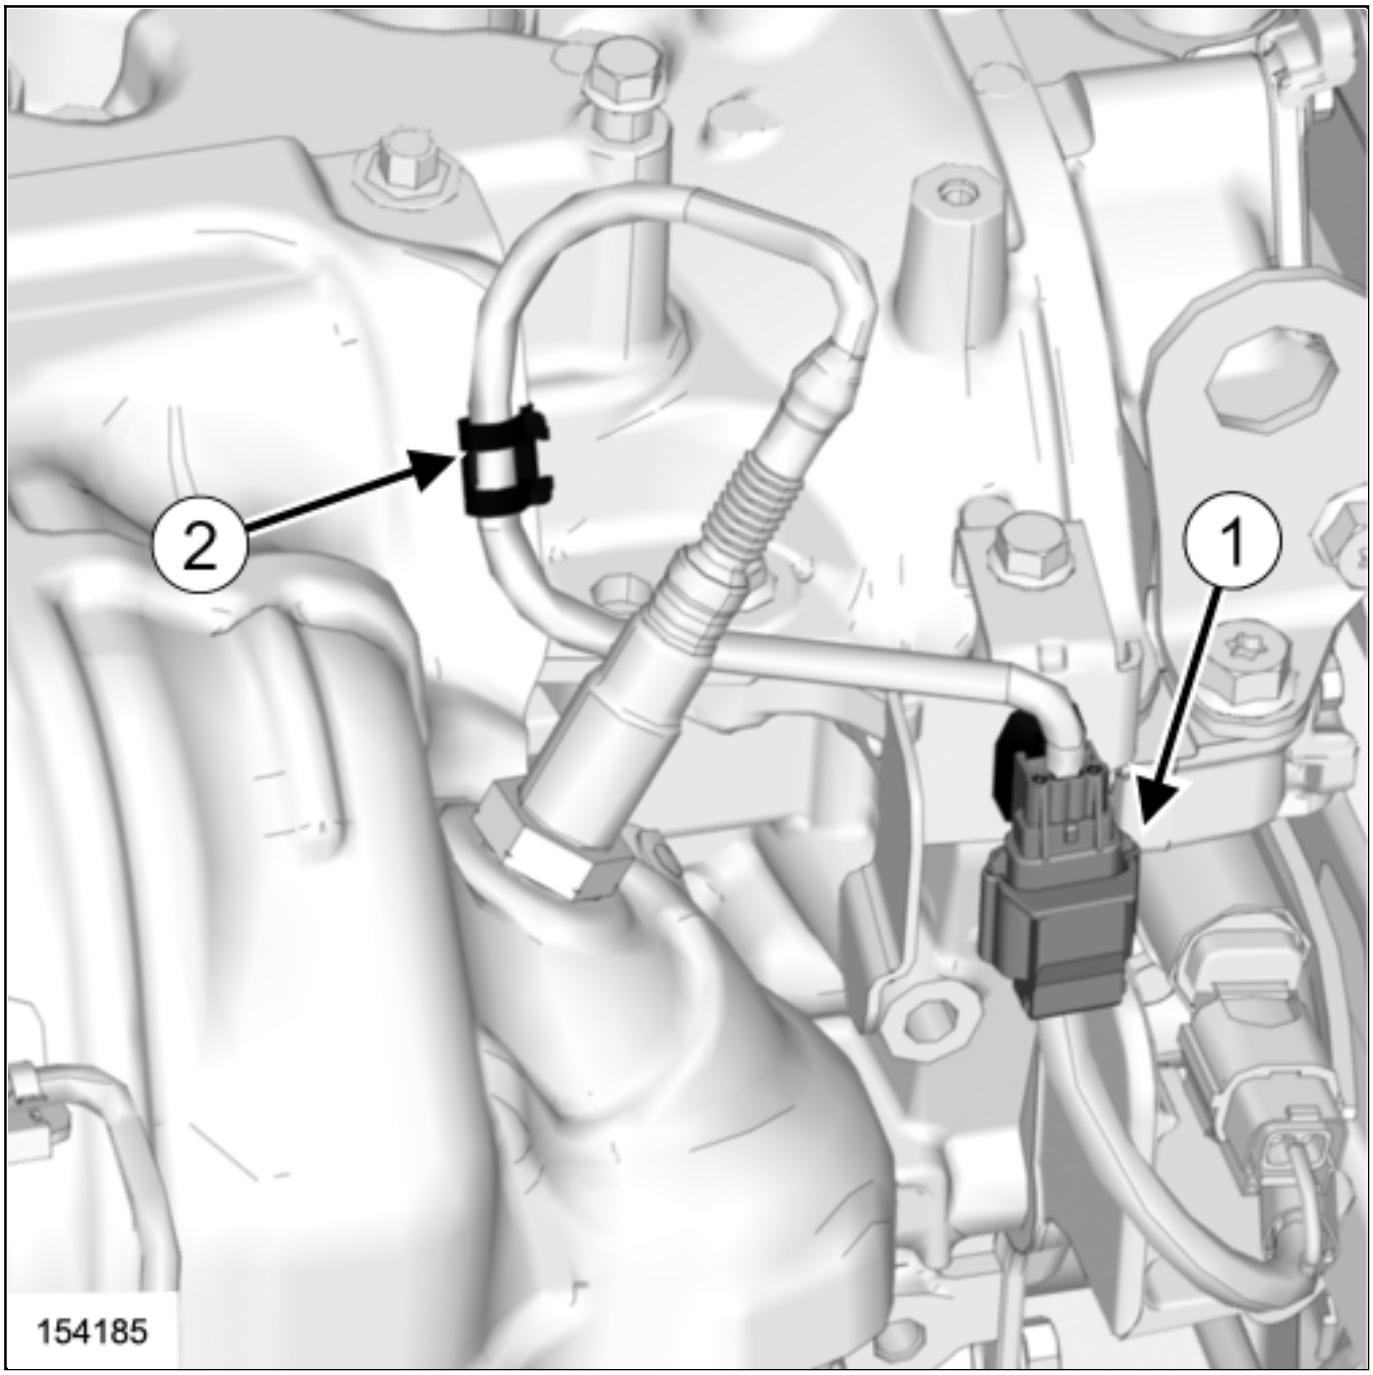
REMOVAL

1. REMOVAL PREPARATION OPERATION

1- REMOVING THE DOWNSTREAM OXYGEN SENSOR

Move the clip of the high pressure discharge duct from the turbo-manifold air inlet pipe**Air inlet assembly: Exploded view** .

Disconnect:



- the high pressure discharge duct from the turbo-manifold air inlet pipe**Air inlet assembly: Exploded view** ,
- the air inlet pressure sensor from the turbo-manifold air inlet pipe(see **Engine and transmission assembly sensors: List and location of components**) ,
- the petrol vapour rebreather pipe from the turbo-manifold air inlet pipe.

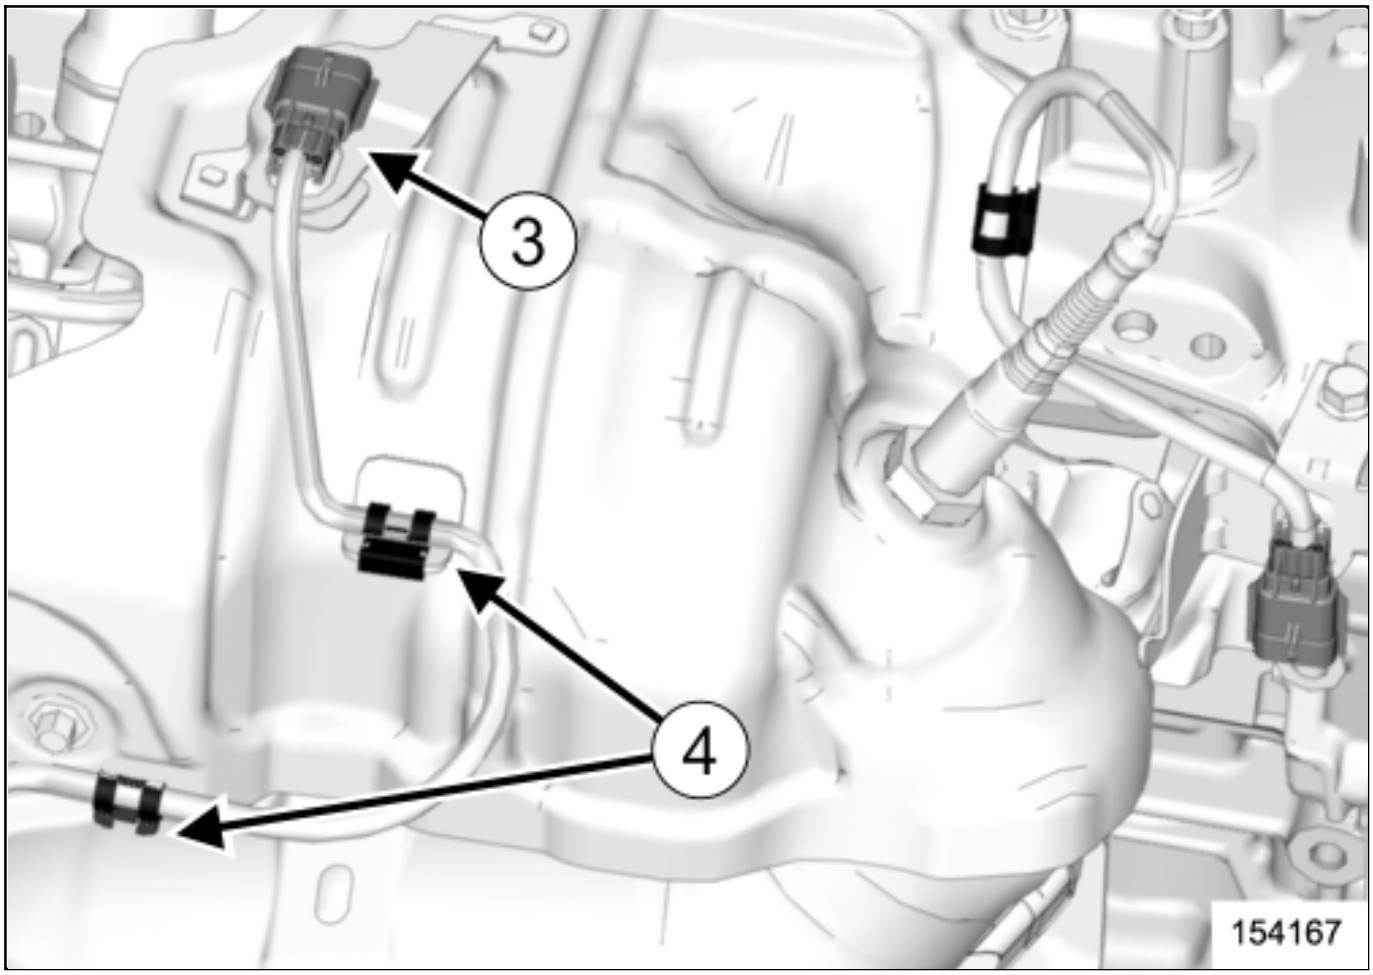
Loosen the clips from the turbo-manifold air inlet pipe**Air inlet assembly: Exploded view** .

Remove the turbo-manifold air inlet pipe**Air inlet assembly: Exploded view** .

2. REMOVAL OPERATION

1- REMOVING THE UPSTREAM OXYGEN SENSOR

Disconnect the upstream oxygen sensor connector(1) .



Unclip:

- the upstream oxygen sensor connector,
- the upstream oxygen sensor wiring from the upper turbo-manifold heat shield(2) .

Remove the upstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

2- REMOVING THE DOWNSTREAM OXYGEN SENSOR

Disconnect the downstream oxygen sensor connector.

Unclip:

- the downstream oxygen sensor connector(3) ,
- the downstream oxygen sensor wiring(4) from the upper turbo-manifold heat shield.

Remove the downstream oxygen sensor using the tool22 mm socket for removal - refitting of

oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) connected to a universal joint (see **Engine and transmission assembly sensors: List and location of components**) .

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the threading of the upstream and downstream oxygen sensor using a wire brush.

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the thread hole of the upstream and downstream oxygen sensor on the catalytic pre-converter,
- the threading of the upstream and downdtream oxygen sensor if it is to be reused.

2. REMOVAL OPERATION

Refit the upstream and downstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

Torque tighten the upstream and downstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

Proceed in the reverse order to removal.

OXYGEN SENSORS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.	Mot. 1495

CAUTION

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

CAUTION

If the connections are corroded, repair the wiring (see Wiring: Precautions for repair) (Technical Note 6015A, 88A, Wiring).

Note:

This procedure is for removal - refitting of the upstream oxygen sensor and the downstream oxygen sensor.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

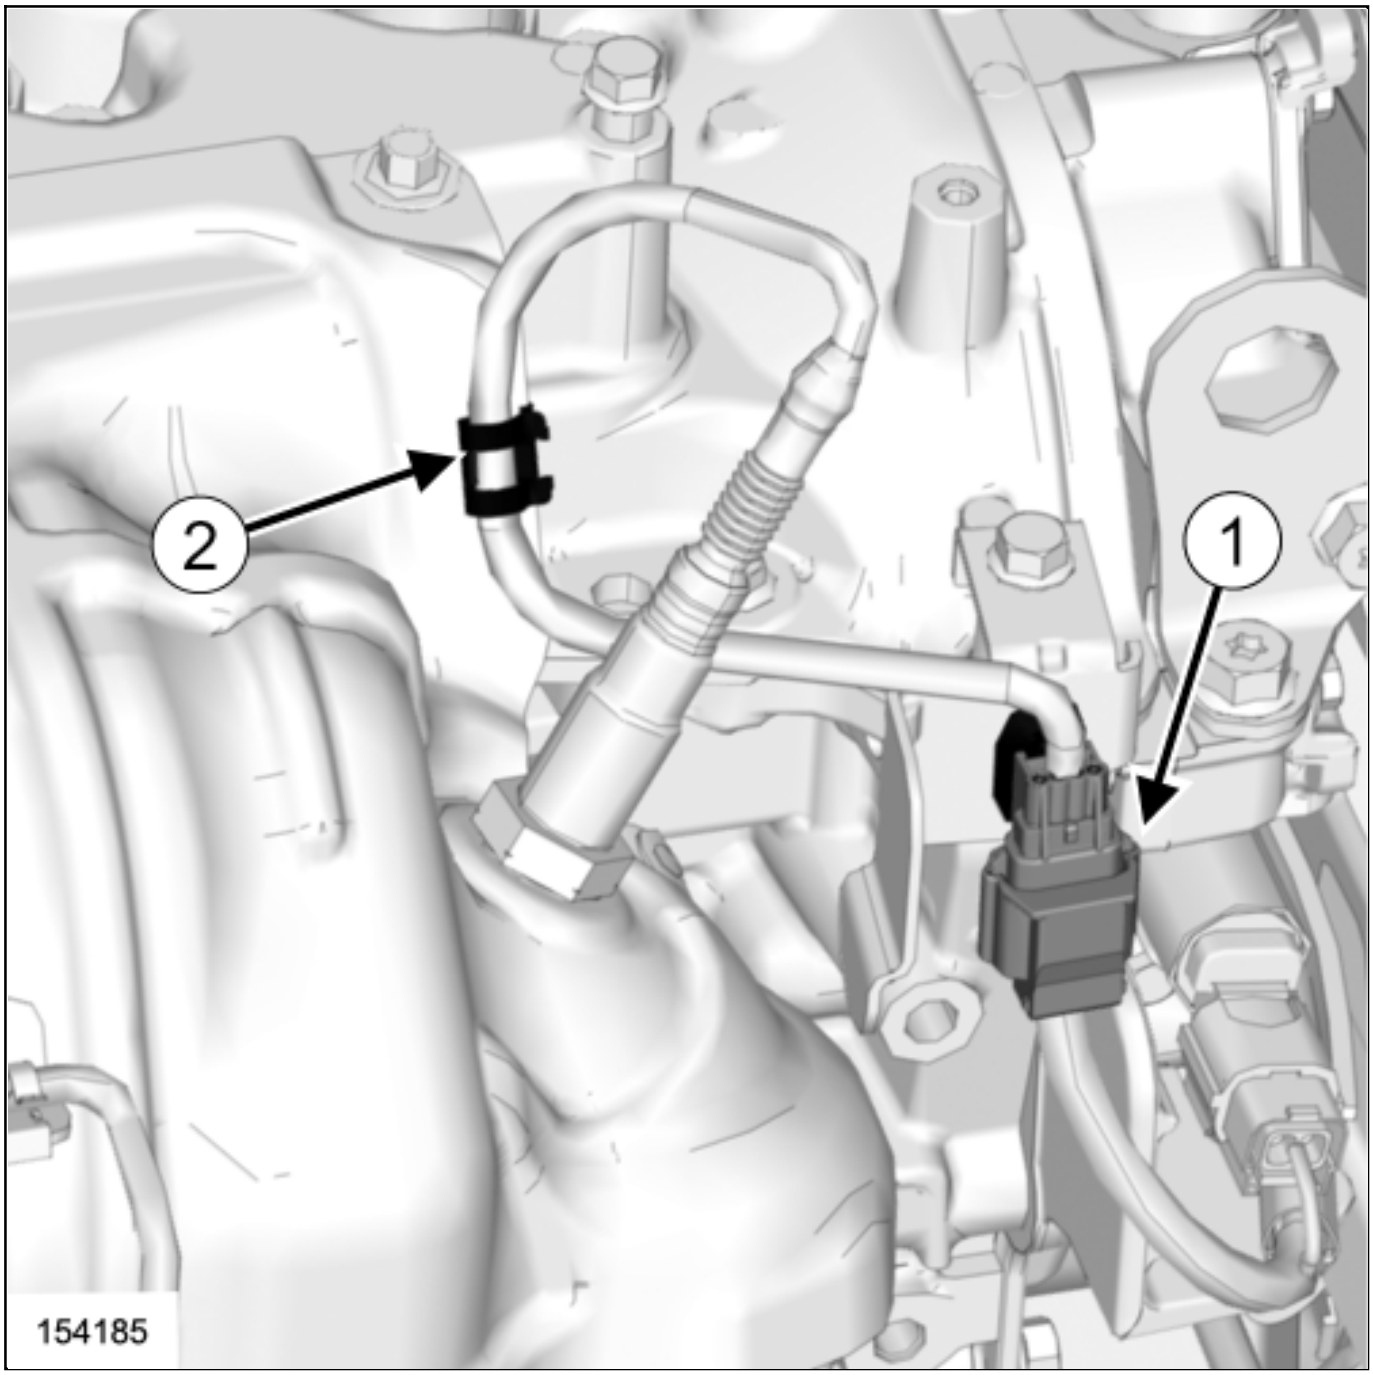
REMOVAL

1. REMOVAL PREPARATION OPERATION

1- REMOVING THE DOWNSTREAM OXYGEN SENSOR

Move the clip of the high pressure discharge duct from the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Disconnect:



- the high pressure discharge duct from the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the air inlet pressure sensor from the turbo-manifold air inlet pipe(see **Engine and transmission assembly sensors: List and location of components**) ,
- the petrol vapour rebreather pipe from the turbo-manifold air inlet pipe.

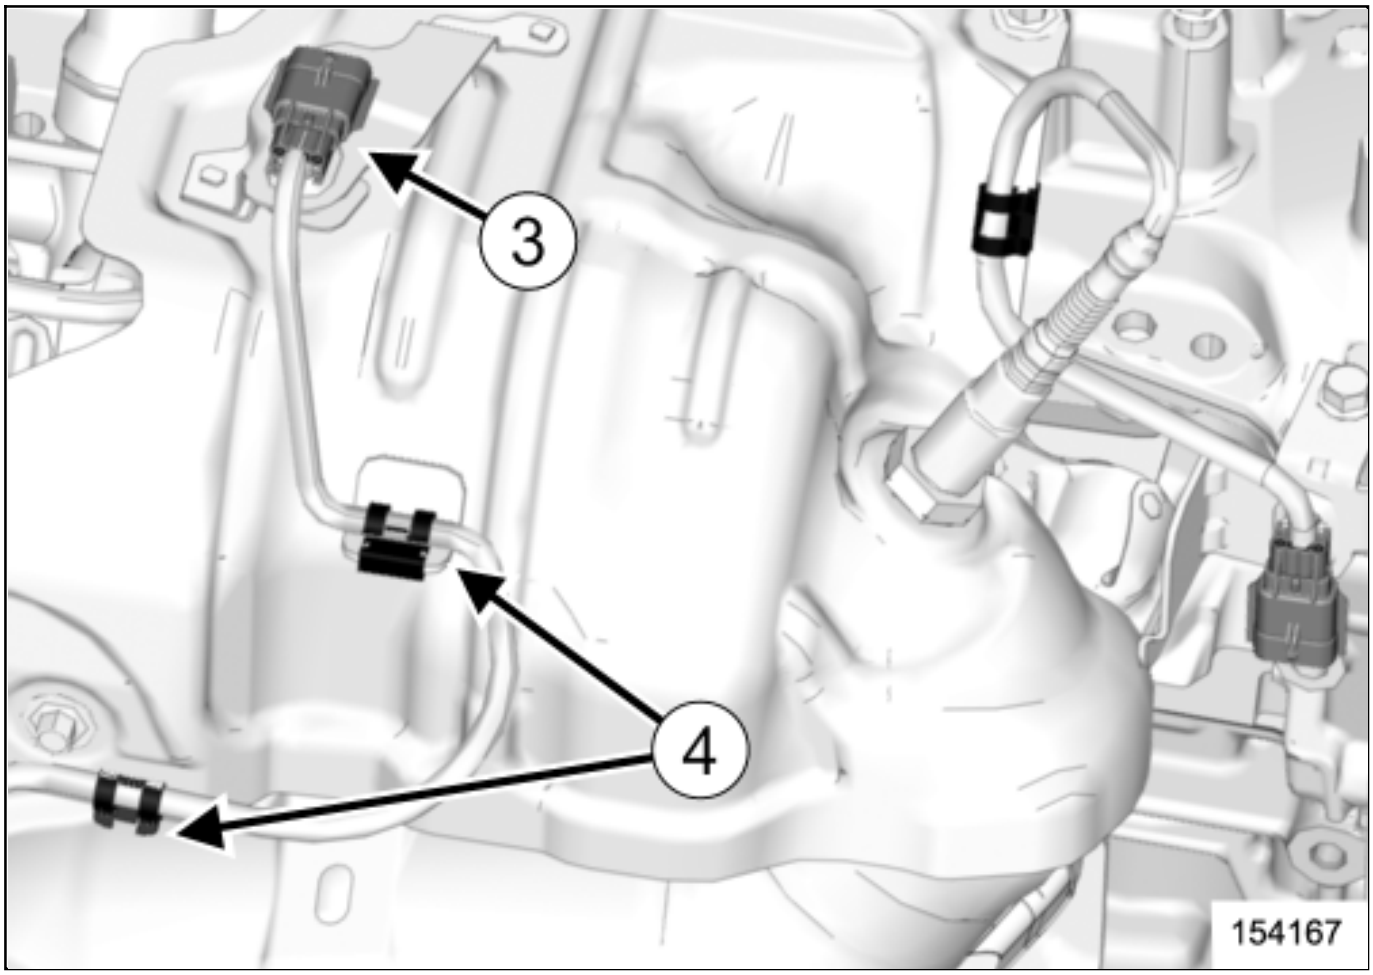
Loosen the clips from the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REMOVAL OPERATION

1- REMOVING THE UPSTREAM OXYGEN SENSOR

Disconnect the upstream oxygen sensor connector(1) .



Unclip:

- the upstream oxygen sensor connector,
- the upstream oxygen sensor wiring from the upper turbo-manifold heat shield(2) .

Remove the upstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

2- REMOVING THE DOWNSTREAM OXYGEN SENSOR

Disconnect the downstream oxygen sensor connector.

Unclip:

- the downstream oxygen sensor connector(3) ,
- the downstream oxygen sensor wiring(4) from the upper turbo-manifold heat shield.

Remove the downstream oxygen sensor using the tool22 mm socket for removal - refitting of

oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) connected to a universal joint (see **Engine and transmission assembly sensors: List and location of components**) .

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the threading of the upstream and downstream oxygen sensor using a wire brush.

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the thread hole of the upstream and downstream oxygen sensor on the catalytic pre-converter,
- the threading of the upstream and downdtream oxygen sensor if it is to be reused.

2. REMOVAL OPERATION

Refit the upstream and downstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

Torque tighten the upstream and downstream oxygen sensor using the tool22 mm socket for removal - refitting of oxygen sensors - 1/2 square drive and 24 mm hexagonal ext.(Mot. 1495) (see **Engine and transmission assembly sensors: List and location of components**) .

Proceed in the reverse order to removal.

PAINT BLEND: PREPARATION AND PAINT RANGE

Note, one or more warnings are present in this procedure

Note:

The blending in method should be used on adjacent components when replacing a surface component.

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Use extra ventilation source.

1. BLENDING IN METHODS

water dilutable or solvent basecoats and clearcoats.

- Procedure 1 : Water dilutable basecoat union,
- Procedure 2 : Solvent basecoat union,
- Procedure 3 : LS - MS - HS clearcoat union.

1- WATER DILUTABLE BASECOAT UNION

1)PROCEDURE 1

Standard method:

Steps	Description	Special notes
1	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
2	Wipe / blow	
3	Sand	P400 - P500on the repaired zones / Grey dampened abrasive finishing pad or P1000at the edge
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Prepare the water dilutable basecoat	According to the PRODUCT TECHNICAL SHEET
7	Apply the water dilutable basecoat	a haze and one or two coats (covering) plus a fine fitting coat while overlapping towards the exterior of the repair zone Wide graduation with spray gun
8	Remove solvent / dry	Complete Masking (with or without forced ventilation)

Droplet method:

Steps	Description	Special notes
1	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
2	Wipe / blow	
3	Sand	P400 - P500on the repaired zones / Grey dampened abrasive finishing pad or P1000at the edge
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Prepare the water dilutable basecoat	According to the PRODUCT TECHNICAL SHEET
7	Apply the water dilutable basecoat	a haze and one or two coats (covering) plus a fine fitting coat while overlapping towards the exterior of the repair zone Wide graduation with spray gun
8	Dry / remove solvent	Complete Masking (with or without forced ventilation)
9	Prepare the union	Use the same mixture, reduce the air pressure so as to obtain fine spray droplets
10	Apply	a thin coat while redoing the whole graduation zone from the exterior towards the interior (the droplet appearance disappears during drying)
11	Remove solvent / dry	Complete Masking (with or without forced ventilation)

Basic stabilising additive:

Steps	Description	Special notes
1	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
2	Wipe / blow	
3	Sand	P400 - P500on the repaired zones / Grey dampened abrasive finishing pad or P1000at the edge
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Prepare the water dilutable stabilising basecoat	According to the PRODUCT TECHNICAL SHEET
7	Prepare the water dilutable basecoat	According to the PRODUCT TECHNICAL SHEET
8	Apply the water dilutable stabilising basecoat	a thin coat of stabilising basecoat on the whole component
9	Apply the coloured water dilutable basecoat	On the repaired zone in one or two coats (covering), plus a fitting coat by overlapping towards the exterior of the repaired zone
10	Remove solvent / dry	Complete Masking (with or without forced ventilation)

2- SOLVENT BASECOAT UNION

1)PROCEDURE 2

Standard method:

Steps	Description	Special notes
1	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
2	Wipe / blow	
3	Sand	P400 - P500on the repaired zones / Grey dampened abrasive finishing pad or P1000at the edge
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleaner H_20 Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Prepare the solvent basecoat	Dilute the basecoat according to the PRODUCT TECHNICAL SHEET
7	Apply the solvent basecoat	Apply two or three coats of this mixture to obtain the cover while slightly overlapping towards the exterior of the repaired zone
8	Remove solvent / dry	Masking between each coat, leave for 15 minutes before applying the clearcoat

3- LS - MS - HS CLEARCOAT UNION

Note:

Polish the zones to be connected

1)PROCEDURE 3

Standard method:

Steps	Description	Special notes
1	Prepare the clearcoat	Catalyze and dilute according to the LS - MS - HS PRODUCT TECHNICAL SHEET
2	Apply the clearcoat	According to the type of clearcoat (3, 2 or one coat) Cover the basecoat painted zone Overlap slightly towards the exterior of the repaired zone
3	Apply the union thinner	Apply thin coats
4	Dry	According to the PRODUCT TECHNICAL SHEET

PAINTFAULT:DESCRIPTION

Types of paint faults
I GRAIN
II RUNS
III MONO or BI COMPONENT PRIMER POWDERING
IV BASECOAT POWDERING
V POROSITY in the MASTIC POLYESTER COATING
VI DAPPLING
VII ORANGE PEEL SKIN
VIII MARBLING
IX CURLS - CURLING
X VISIBILITY of REVARNISHED BICOAT BASECOAT MELTED UNIONS
XI VISIBILITY of MELTED UNIONS on DIRECT SHINY TOPCOAT
XII FOG FALLOUT
XIII REAPPEARANCE OF SANDING SCRATCHES
XIV FILM CREASING at REASSEMBLY
XV MARKS in the PRIMER COAT
XV MARKS and MICROBUBBLES in the CLEARCOAT and TOPCOAT

XVII LOSS of SHINE in the CLEARCOAT and TOPCOAT
XVIII POOR HARDENING of the CLEARCOAT and TOPCOAT
XIX POOR DRYING of the MONO or BI COMPONENT PRIMER
XX FORMATION of STAINS
XXI BURYING
XXII POLYESTER MASTIC TRIMMING
XXIII BI COMPONENT PRIMER TRIMMING
XXIV REJECTION (silicone)
XXV WEAKNESSES / CRACKS
XXVI DETACHMENT on PLASTIC MATERIALS
XXVII DETACHMENT of the UNDERCOAT
XXVIII DETACHMENT of the CLEARCOAT and TOPCOAT
XXIX DETACHMENT of the POLYESTER MASTIC
XXX BLISTERING

1. GRAINS

Description: Particles of various shapes and sizes, this fault can be seen on the film surface. It is important to find out on which coating thickness the fault appears so that the procedure to be carried out can be identified.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Incorrect maintenance of the booth	Clean the floor with a vacuum cleaner and repaint the booth walls Protection of the walls with a film or static product
The inlet and extraction air filters are clogged, thus causing turbulences	Replace the inlet and extraction filters Observe replacement frequencies: ■ ceiling 1000 hours, ■ floor 90 hours, ■ pre-filter 500 hours.
Booth depressurised	Adjust the ventilation to slight overpressure
Application gun dirty	Clean the gun straight away after use Never immerse it totally in thinner (clogging of the air circuit) Use a specific Base coat, Top coat or Clear coat gun
Dusty, dirty clothing or clothing that leaves fibres	Wear a clean anti-static overall, exclusively for the application
Non filtered products or dirty or pierced paint filters	Filter all the products after mixing Use cone filters or clean, non-pierced plastic filters
Contamination of the sprayed air	Bleed your compressor and use a submicronic purifier, check the cleanliness of the cartridges

CAUSES	REMEDIES
Deposits in the basecoat colours Usage limit date is exceeded	Use clean and non-pierced paint filters Take basecoat colours from a new batch
The caps and covers have not been closed correctly on the cans and boxes allowing impurities to get in.	Close the cans and boxes after use

3- METHODS

CAUSES	REMEDIES
The vehicle operating, washing, cleaning, blowing, degreasing methods are insufficient. The internal and external surfaces of the vehicle have not been cleaned with compressed air	Do not wipe with fluffy cloths or paper Wash and clean the internal surfaces of the vehicle: ■ clean with compressed air at a pressure greater than the one used for the application of the product (+ 1 bar), ■ wipe the vehicle and masking with a clean pad.
Masking paper on the support not suitable (newspaper type) Non-masked interiors: engine, wheel arches, etc	Use masking paper Cover the interior of the engine compartment (shiny side of the paper towards the outside)
Unsticking of the basecoat fog during clearcoat application	Fix the residual basecoat fog on the masking with a slight clearcoat haze by lowering the pressure
Lack of equipment maintenance and cleanliness in the whole workshop	Draw up a maintenance plan for the equipment
The bodywork surface is statically loaded which attracts dust	Install an Antistatic air pipe (see workshop equipment) In the booth: ■ connect the components to be painted to earth, ■ use an antistatic cleaner (composite material components)

2. RUNS

Description: This fault can be seen when there is too much product or a very localised excessive thickness on a vertical or tilted surface. This excess flows along the support, forming runs.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Incorrect adjustment of the gun	Correct the nozzle adjustments, flow, pressure and width of the spray according to the component to be painted
Gun dirty or faulty	Clean the cap, the nozzle, the point
Air Pressure incorrect	Adapt the application pressure according to the gun type
Lack of lighting	Check the operation of the neon lights in your booth
Ambient temperature too low (< 18˚C)	Increase the application temperature 18to 23˚C

2- PRODUCTS

CAUSES	REMEDIES
Thinner and hardener unsuitable	Use the hardener and thinner which correspond to the application temperature
Temperature of the product too low Viscosity does not comply with the Technical Sheet	Get the products to the correct temperature before application Adjust viscosity (see PRODUCT TECHNICAL SHEET)
Time for evaporation insufficient between coats	Make sure there is enough time for solvent evaporation between each coat

3- METHODS

CAUSES	REMEDIES
Support temperature too low	Increase the temperature of the support, (23°C) and the same for product
Support incorrectly degreased Dirty surface	Clean the support with a solvent surface cleaner
Supports poorly sanded	Check the methods for sanding the supports
Irregular nozzle Distance of application not complied with	Review the gun method

3. POWDERING OF THE MONO OR BI COMPONENT PRIMERS

Description: Dry spraying, usually granular texture without any shine and porous.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Very fast air speed	Improve booth ventilation (air speed): max 0.4 m/s
Dirty gun Incorrect spraying	Check the cleanliness of the gun
Air pressure too high	Check the application air pressure on the gun
Incorrect adjustment of the gun Nozzle unsuitable or too small	Correct the adjustment of your gun Choice of nozzle (see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
Viscosity does not comply with instructions	Adjust product viscosity
Thinner and hardener not appropriate for the application temperature Usage limit date is exceeded	Use a stronger evaporating thinner and in case of high temperatures add 5to 10%thinner Check the storage dates of the hardeners

3- METHODS

CAUSES	REMEDIES
Incorrect application of partial primings	Apply the undercoat in a pyramid shape: a very wide first coat on the repair and reducing for the following coats
Gun too far from the support	Observe the application distance for the correct product wetness

4. POWDERING OF THE BASECOATS

Description: Dry spraying, usually granular texture without any shine and porous. May cause a loss in the whole coating adherence.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Booth application temperature too high	Add a retarder (e.g. :D40)
Very fast air speed	Improve booth ventilation (air speed) max 0.4 m/s
Dirty gun Incorrect spraying	Check the cleanliness of the gun
Air pressure too high	Check the application air pressure on the gun
Incorrect adjustment of the gun Nozzle unsuitable or too small	Correct the adjustment of your gun Choice of nozzle (see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
Viscosity does not comply with instructions	Adjust product viscosity
Thinner and hardener not appropriate for the application temperature Usage limit date is exceeded	Use a stronger evaporating thinner Check the storage dates of the hardeners

3- METHODS

CAUSES	REMEDIES
Support too hot	Reduce the temperature of the support, if possible to the temperature of the product
Gun too far from the support	Observe the application distance for the correct product wetness

5. POROSITY IN THE POLYESTER MASTIC COAT

Description: Characterised by a group of small holes in the mastic coat. Can be seen during mastic application or after sanding.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Storage of the boxes of polyester mastic in a place which is too humid or which has a lot of temperature fluctuations	Store the boxes of polyester mastic at a temperature of between 18°Cand 23°Cand in a dry place
Use of knives in poor condition	Check the cleanliness of your mastic knives

2- PRODUCTS

CAUSES	REMEDIES
Quality of the polyester mastic	Use a standard polyester mastic then a finishing mastic to plug the porosities or, instead, use a finishing mastic which plugs and finishes directly Take into consideration the quality of the surface to be repaired (aluminium, zinc, etc)
The boxes of polyester mastic are incorrectly closed after use, causing the mastic to dry and allowing impurities get in.	Close the boxes of polyester mastic correctly, the solvent used for its manufacture contributes to the ease of application and to the final quality

3- METHODS

CAUSES	REMEDIES
On highly damaged supports mastic has been applied in a very thick layer	Apply polyester mastic twice
Porosity on the surface of the polyester mastic	Apply a very thin coat for finishing

6. DAPPLING

Description: Coloured area with darker sheen (clouded effect) with pearlescent or metallic colours due to migration of aluminium particles or of pearl particles forming small greyish clouds.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The temperature of your booth is too low	Regulate the temperature of your booth to between 18°Cand 23°Cin order to facilitate the evaporation of the solvents
The atomisation of your gun is not to standard	Make sure your gun is kept clean Check the tightening of the nozzle and air cap Modify the adjustment of your gun Carry out a test on paper
The air pressure is not correct	Check the pressure of your gun (see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
Viscosity does not comply with the Technical Sheet	Adjust viscosity (see PRODUCT TECHNICAL SHEET)
The thinner used for the solvent paints is not suitable for the surface or the temperature	Reconsider the choice of thinner, for large surface area or high temperature, slow thinner, avoid fast range

3- METHODS

CAUSES	REMEDIES
The support to be painted is too cold	Increase the temperature of the support and product to 23˚C
Your gun is too near or too far from the support The speed is irregular	Check the spray method, distance and speed depending on the gun The aluminium is placed on the last coat before the total evaporation of the solvents
The evaporation time between coats is insufficient	Allow enough time for evaporation between the basecoats and between the application of the basecoat and clearcoat (see PRODUCT TECHNICAL SHEET)

7. ORANGE PEEL

Description: Paint defect where spreading properties and imperfect drying conditions lead to a film with a flecked surface.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The application temperature is too high so the solvents evaporate too quickly	Adjust the temperature of your booth between 18°Cand 23°C and check the ventilation (air speed)
The air pressure is insufficient	Correct the air pressure. A pressure which is too low will not give a correct atomisation and will not disperse the product
The nozzle of your gun is unsuitable	Check the choice of your gun nozzle. If the nozzle is too strong, the flow will also be too strong (see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
The thinner and hardener are inappropriate for the application temperature	Adapt the thinner and hardener to the application temperature, for higher than 25°Cuse a slower thinner
The viscosity does not comply with the instructions	Adjust the viscosity of the top coat The product temperature must be between 18°Cand 23°C, reheat the product in the booth if necessary

3- METHODS

CAUSES	REMEDIES
Old surfaces that already have orange peel skins	Sand the surface to remove the existing orange peel skin Use a suction sander P320or P400dry
The spray method is incorrect The application speed is irregular	Correct the spray gun procedure Uniform gun spray

8. MARBLING

Description: Appearance fault in the grade of a metallic paint which leaves each gun spray pass visible. The aluminium flakes or the pearl particles are applied irregularly, which causes dark and light straight bands.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The temperature of your booth is too low	Adjust the product, support and booth temperature to between 18°Cand 23°C
The centre or the ends of the projection of your gun are loaded too much	Correct the adjustment of the gun Test on a sheet of paper (shape of the spray and product distribution)
The air pressure is not correct	Check the air pressure (see PRODUCT TECHNICAL SHEET)
Gun dirty, incorrect atomisation	Check the cleanliness of your gun

2- PRODUCTS

CAUSES	REMEDIES
The viscosity does not comply with the instructions	Adjust viscosity (see PRODUCT TECHNICAL SHEET)
The thinner used is inadequate	Choose a solvent that dries more quickly in colder or more humid conditions

3- METHODS

CAUSES	REMEDIES
The support to be painted is too cold	Increase the temperature of the support and product (see PRODUCT TECHNICAL SHEET)
Profusion of static electricity	Connect the vehicle to the booth earth
The overlapping of passes is irregular The gun is not perpendicular to the supports	Review the spray gun method. If the fault is only visible after the application of the clearcoat, dry, sand and apply a new basecoat and clearcoat.
The evaporation times between the coats are insufficient	Allow sufficient evaporation times between coats (see PRODUCT TECHNICAL SHEET)
The number of coats is excessive	Comply with the recommended number of coats (see PRODUCT TECHNICAL SHEET)

9. CURLING - CURLS

Description: Deterioration of the paint surface characterised by crinkling (at various depths), the film rising during the hardening process.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The application temperature is too low No evaporation of solvents	Increase the temperature of the support and the product to 23˚C

2- PRODUCTS

CAUSES	REMEDIES
The thinner used is too aggressive	Choose a lighter and less aggressive thinner
The viscosity is not correct	(see PRODUCT TECHNICAL SHEET)

3- METHODS

CAUSES	REMEDIES
No solvent compatibility test	Check surface sensitivity Solvent test (surface hardness)
Painting on not fully hardened top coat	Sand the surfaces fully and carry out the procedure again Insulate with a bi component primer or strip completely and carry out the procedure again
Hole on a vehicle with clearcoat sanded to the bi coat basecoat	Insulate with a bi component primer, applying thin coats to prevent soaking
The application is too wet from the first coat which causes the surface to be soaked	Apply a first very fine layer in order to insulate the surface
No evaporation of solvents	Allow sufficient evaporation time between coats

10. VISIBILITY OF THE MELTED UNIONS ON BI LAYER BASECOAT RE PAINTED WITH CLEARCOAT

Description: The outlines or edges of the union can be seen.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Application temperature too high	Decrease the application temperature (ideally between 18°Cand 23°C)
Lack of lighting Poor visibility	Check the cleanliness and the operation of the booth neons (see maintenance plan)
Application pressure too high	Check the application pressure
Incorrect gun adjustment (spray width, product flow)	Correct the gun adjustment according to the surfaces (flow) and according to your application: open to the maximum for a whole component, reduced for a small surface

2- PRODUCTS

CAUSES	REMEDIES
Inappropriate thinner, too light Incorrect positioning of the particles	Thinner intended for this use (see PRODUCT TECHNICAL USE)
Viscosity of the bi-layer basecoat not in compliance with the instructions	Adjust the viscosity according to PRODUCT TECHNICAL SHEET recommendations Take high temperature conditions into account (possible over-diluting)
Too much difference in colour	Check the colour before application on a test plate
Time for evaporation insufficient between coats	Allow sufficient evaporation time between coats (see PRODUCT TECHNICAL SHEET)

3- METHODS

CAUSES	REMEDIES
Poor preparation of the surface to be connected	Roughen the area to be faded out Use a grey abrasive pad or P1000and degrease the complete component Wipe and blow the component
Fog too dry or too much (dark areas)	Widen the layers by graduating uniformly to melt the union area Reapply clearcoat to the whole component (see Powdering the components)

11. VISIBILITY OF THE MELTED UNIONS ON THE DIRECT SHINY TOPCOAT

Description: The outlines or edges of the union can be seen.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Lack of lighting Poor visibility	Check the cleanliness and the operation of the booth neons (see maintenance plan)
Too much fluctuation in the application temperature	Adjust the application temperature to between 18°Cand 23°C
Application pressure too high	Check the application pressure
Incorrect gun adjustment (spray width, product flow)	Correct the gun adjustment according to the surfaces (flow) and according to your application: open to the maximum for a whole component, reduced for a small surface

2- PRODUCTS

CAUSES	REMEDIES
Inappropriate thinner Viscosity of the topcoat not in compliance with the instructions	Adjust viscosity (see PRODUCT TECHNICAL SHEET)
Too much difference in colour	Check the colour before application
Time for evaporation insufficient between coats	Allow sufficient evaporation time between coats

3- METHODS

CAUSES	REMEDIES
Poor preparation of the surfaces to be connected	Prepare the area to be faded out according to the method Buff the component surface (shiny part) Degrease, blow and wipe the component
Fog too dry and matt area too large	Widen while graduating the topcoats with light and wet coats. Over dilute with paint thinner and flood the fog area Finish with union thinner

12. FOG FALL OUT

Description: Small particles of paint spray fall on the vehicle during the first drying phase which causes lots of bubbles forming on the surface. Do not confuse with microbubbles, the appearance is practically identical, the causes are different.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Too high concentration of fog in the booth Clogged up filter	Replace the air extraction and inlet filters
The air extraction is insufficient Air circulation deficient	Get the air speed checked Adjust the opening valves of the air extraction and inlets on the chimneys Create a light overpressure
The air pressure is not correct (too powerful)	Check the air pressure at application (see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
The level of dilution is too high	Observe the level of dilution recommended by the paint manufacturer (see PRODUCT TECHNICAL SHEET)

3- METHODS

CAUSES	REMEDIES
Gun spray too far from the support	Review the gun method
Paint fog is already present on the vehicle	Remove the existing fog by polishing
Masking the vehicle carelessly	Completely mask the interior and exterior of the vehicle before painting Use of a disposable or reusable cover

13. REAPPEARANCE OF SANDING SCRATCHES

Description: When repairs are finished, sanding marks can be seen in the coating thickness. The parts concerned may also have no shine.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Buffing with an abrasive disc too rough before polyester application	Sand the transition areas Bevelling of the old paintwork with block sand papers P80 / P100.
Mastic and undercoat drying temperatures not complied with	Comply with the recommended temperature Use an Infrared dryer if possible

2- PRODUCTS

CAUSES	REMEDIES
Undercoat not suitable for the finish	Choose a protective bi component type undercoat for repair of 60 to 300µand an undercoat type 1K, for the new components max 30µ(see PRODUCT TECHNICAL SHEET)
Aggressive thinner (slowevaporation)	Use a lighter and less aggressive thinner
Sandpaper too rough	Sanding (see PRODUCT TECHNICAL SHEET): Sand the old paint surfaces (dry P500 to P600/ dry P400 to P800) Do not exceed more than three sizes of grain between every operation (example: the P240does not remove P80scratches, for this it is necessary to use P150or P180.

3- METHODS

CAUSES	REMEDIES
Original finishing Old surfaces sensitive to solvent	Identify the surfaces using a clean cloth soaked in solvent On damaged surfaces, sand down to the panel and insulate with a bi-component undercoat
Incorrect polyester finishing	Sand the polyester mastic dry They must be insulated with a pre-treatment primer
Hardening of the undercoat not sufficient (drying time)	Sand the polyester mastic dry They must be insulated with a pre-treatment primer
Undercoat not thick enough	Apply the undercoat in a pyramid shape on the whole surface while overlapping well on the mastic repair areas Apply a black matt sanding guide

14. FILM CREASING AT ASSEMBLY

Description: Paint film not fully hardened, remaining supple and deforming during accessory, aerial and door handle assembly, after tightening. The panel forms creases around the assembled parts.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The nozzle chosen for the gun is not suitable (diameter too large)	Check the choice of nozzle for your gun

2- PRODUCTS

CAUSES	REMEDIES
Product viscosity is not correct The product is too thick	Adjust product viscosity
The thinner used is not suitable, too heavy Poor evaporation	Check the thinner choice

3- METHODS

CAUSES	REMEDIES
Old paint has not hardened sufficiently	Heat the poorly hardened paint surfaces for 30 min at 60°C
Clearcoat or topcoat applied too thickly	Apply thinner coats (see PRODUCT TECHNICAL SHEET)
The number of coats is excessive	Comply with the advised number of coats
the drying is incorrect	Carry out the drying for the time and at the temperature recommended by the paint manufacturer Make sure there is total cooling before reassembly

15. MARKS IN THE PRIMER COAT

Description: Imperfection of a paint film characterised by the presence of small holes which look like needle holes.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The drying of the undercoat is not correct Incorrect usage of Infrared dryer	Heat (see PRODUCT TECHNICAL SHEET) using an Infrared dryer Observe the distances between the support and the Infrared dryer 60to 70 cm Observe the desolvation phase
The nozzle used on the gun is unsuitable or too large	Reconsider the choice of gun nozzle (see PRODUCT TECHNICAL SHEET)
Presence of impurities in the compressor, the purifier or the air pipes	Improve the compressor, sensor and air pipe cleanliness
The gun adjustment is inadequate	Correct the adjustment of the gun flow according to the application
The air pressure is not correct	Check the air pressure

CAUSES	REMEDIES
Viscosity does not comply with the recommendations (preparation without thinner) The thinner used is unsuitable	Check viscosity Observe the Technical Sheet recommendations Use a thinner which evaporates more slowly
Undercoat unsuitable for the load (example: 1K primer)	Apply a protective bi-component primer
Usage limit date is exceeded Hardeners that have absorbed humidity	Check the use limit date of the products

CAUSES	REMEDIES
Fault still present, after a previous repair not carried out following best practises	Check there are no marks on the support. If there are, sand until a homogenous surface, and then apply bi-component primer
The support to prime is too hot	Do not apply primer to a support that is too hot
Porosity of the polyester mastics	Cover the porosities with an extra fine polyester mastic before priming
Sanding residues Support sanded with water is not dry enough (humidity condensation)	Check the cleanliness of the support to be primed
Thick layer of primer coat applied	Apply thinner coats (see PRODUCT TECHNICAL SHEET)
The evaporation time between coats is insufficient	Allow sufficient evaporation time between coats (total mating)
The number of coats is excessive	Comply with the recommended number of coats (see PRODUCT TECHNICAL SHEET)

16. HOLES / MICROBUBBLES IN THE TOPCOAT OR CLEARCOAT

Description:

HOLES: Imperfection of a paint film characterised by the presence of small holes which look like needle holes.

MICROBUBBLES: Very small bubbles that can hardly be seen appear in the thickness of the film.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Temperature increases too quickly during drying phase	Adjust the booth with a desolvation stage of 5to 10 min before drying and an increase of 60˚Cin 7˚C/ min stages
Ventilation is too strong	Adjust the air speed to 0.40 m/s Add a retarder thinner temporarily
The temperature is high too for the application	Decrease the application temperature to between 18and 23˚C Avoid thermal shocks
The nozzle of the gun is not suitable, the flow is too strong	Check the nozzle choice for your gun
Presence of impurities in your compressor, purifier and air pipes.	Optimise the compressor, sensor and air pipe cleanliness
The adjustment of your gun is inadequate The air pressure is not correct	Correct the adjustment of your gun (paint flow / application speed) Check the air pressure

CAUSES	REMEDIES
Hardener is not suitable for the application temperature	Hardener must be chosen according to the application temperature (see PRODUCT TECHNICAL SHEET)
The thinner used is not suitable, too slow or too fast, it gets trapped in the successive coats	Use the solvent suitable for the temperature. A thinner which dries too quickly at a high temperature does not allow the solvents in the topcoats and clearcoats to evaporate in the correct way from 25°C
The viscosity does not comply with the recommendations and application conditions	Adjust the viscosity of your product (see PRODUCT TECHNICAL SHEET)
Usage limit date is exceeded	Observe the service life of the products

3- METHODS

CAUSES	REMEDIES
Bicoat basecoat too thick, or not dry enough	Observe the thicknesses of the bicoat basecoat and the number of coats Observe the recovery time between the basecoat and the clearcoat
The support to be painted is too hot	Check the temperature of the supports and products in order to avoid a thermal shock
Clearcoat applied in a thick coat	Apply thinner coats. Comply with the recommended number of coats (see PRODUCT TECHNICAL SHEET)
The evaporation time between coats is insufficient	Allow sufficient evaporation times between coats, which may vary depending on the products and temperatures After application wait for 5to 10 minbefore the drying stage at 60°C
Thermal shock after drying	Allow the booth to cool down before getting the vehicle out

17. LOSS OF SHINE IN THE CLEARCOAT AND TOPCOAT

Description: This fault is characterised by less luminosity in the paint film and by a lack of shine and reflection. It can be localised or generalised on the whole of the repair area.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The booth temperature is irregular Strong humidity in the booth	Regulate the application temperature between 18and 23°C Do not spray the walls and the floor (stagnant water in the booth)
Too high concentration of fog	Replace the air extraction and inlet filters
Extraction fault (weak extraction) incorrect extraction of the solvents	Adjust the air speed in the cab 0.4 m/s It should be overpressurised
Impurity in the purifiers	Check the cleanliness of the purifiers
The nozzle of your gun is unsuitable	Correct the choice of gun nozzle Observe the recommendations
The adjustment of your gun is inadequate	Check the adjustment of your nozzle (product flow / application speed)
The drying is incorrect	Check that the booth performs a complete drying cycle: duration and temperature If the vehicle is not sufficiently dried, the polymerisation continues in the cold, outside and the hardener may absorb humidity

CAUSES	REMEDIES
The thinner or hardener used is inappropriate	Modify the choice of thinner or hardener
Viscosity is not in accordance with recommendations	Adjust product viscosity, an over dilution decreases the richness of the resin
Usage limit date is exceeded	Observe the service life of the products

3- METHODS

CAUSES	REMEDIES
Undercoat wet / wet too thick	Apply an undercoat max 20µ
Clearcoat or top coat applied either too thickly or too thinly	Observe the number of layers, thicknesses and evaporation time between coats (see PRODUCT TECHNICAL SHEET)
The evaporation times between Clearcoats and Topcoats are not complied with	Allow sufficient evaporation times between topcoats. Observe the evaporation time between the bicoat base and the clearcoat

18. INCORRECT HARDENING OF THE CLEARCOAT OR TOPCOAT

Description: This fault is perceptible with a slight finger touch, the surface is sticky or soft. The paint film may have light microbubbles, a loss of shine or a high sensitiveness to scratches.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Insufficient application temperature The atmosphere is too humid	Adjust the temperature of the support, products and booth to between 18and 23°C. Temperature lower than 5°Cstops polymerisation
The drying is incorrect, duration shortened Drying temperature not sufficient	Observe the recommended drying time and temperature The recommended time does not take into account the time for the temperature to increase
The air circulation in your booth is defective Incorrect discharge of solvents Not enough fresh air	Check the booth air speed at spraying 0.40 m/s During drying the air must be recycled 85to 90%to evacuate solvents and maintain the required oxygen rate
The choice of nozzle is unsuitable (diameter is too large)	Adapt the nozzle according to the product used (see PRODUCT TECHNICAL SHEET)
The adjustment of your gun is not appropriate	Correct the adjustment of your gun

2- PRODUCTS

CAUSES	REMEDIES
The clearcoat and hardener mixture ratio is not correct	Observe the recommended proportioning, (see PRODUCT TECHNICAL SHEET) More hardener does not dry faster
Excess of retarder or antisilicone thinner	Observe the operating instructions and recommended proportions
Hardener which has been subjected to humidity Incorrect choice of hardener	Put the caps back on the cans after use Check the cleanliness and the quality of your hardener Check the storage dates of the products

3- METHODS

CAUSES	REMEDIES
Basecoat too thick	Observe the thickness of the bi coat basecoat (see PRODUCT TECHNICAL SHEET)
The support to be painted is too cold	Increase the temperature of the support and product (23°C)
Topcoats and clearcoats applied very thickly	Apply thinner coats Take care not to overcharge flat surfaces
The evaporation time between coats is insufficient Solvent blocking	Allow sufficient evaporation times between coats
The number of coats is excessive	Comply with the recommended number of coats (see PRODUCT TECHNICAL SHEET)

19. INCORRECT DRYING OF THE MONO OR BI COMPONENT PRIMER

Description: Can be felt when touching slightly. The film is not hard. During sanding it can be noticed because the paper gets clogged. Can generate sanding scratches and loss of shine on all the finishes.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Application temperature not suitable The atmosphere is too cold or too humid	Increase the temperature of the support and product (23°C)
No drying of the undercoat	(see PRODUCT TECHNICAL SHEET) Dry the undercoat
The choice of nozzle is unsuitable (diameter is too large)	Choose the correct nozzle (nozzle diameter)
The adjustment of your nozzle is not appropriate (too much flow)	Readjust your gun: paint flow / application speed Check the air pressure

2- PRODUCTS

CAUSES	REMEDIES
The primer and hardener mixture ratio is not right	Observe the recommended proportions, too much hardener does not mean faster hardening
Hardener not suitable for loaded primers	Use recommended hardeners (see PRODUCT TECHNICAL SHEET)
Hardener which has been subjected to humidity	Put the caps back on the cans after use Check the cleanliness and the quality of your hardener

3- METHODS

CAUSES	REMEDIES
The support to apply primer to is too cold	Increase the temperature of the support and product (23°C)
Primer coat applied very thickly The number of coats is excessive	Apply thinner coats. Observe the PRODUCT TECHNICAL SHEET
The evaporation time between coats is insufficient, the solvents are blocked in the product thickness	Allow sufficient solvent evaporation time, increase the drying time in case of overloading

20. FORMATION OF STAINS

Description: This is characterised by a physical attack or a decolouration of the painted surface.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The nozzle is not cleaned correctly, particles from a previous application pollute the product to be applied	Check the cleanliness of your gun, do not immerse the gun during cleaning Clogging of the air circuit
Dirty cleaning solvents	Replace the cleaning solvents often

2- PRODUCTS

CAUSES	REMEDIES
Increase in peroxide, too much polyester mastic hardener has been used	Observe the correct proportions of peroxide hardener (see PRODUCT TECHNICAL SHEET- use scales) In case of excess, strip and start the mastic operation again

CAUSES	REMEDIES
Tree sap	Wash in soapy water for pollution less than 24 hours, after this time, clean with turpentine fluid
Guano	Wash with detergent and water ■ fine sanding, polishing, ■ sanding until all defects have disappeared. Reapply the primer and finishing coat
Stains without soaking, migration of an exterior agent: rubber support gallery, self-adhesive	Buff if the stains are superficial, otherwise sand then insulate with a bi-component primer and finish
Acid rains Bleached stains in the upper coat pigments	Wash with detergent and water ■ fine sanding, polishing, ■ sanding until all defects have disappeared. Reapply the primer and finishing coat
Cement stains	Wash in water and detergent for fresh projections Then Water + Acetic acid 10%
Reaction between the original finishing coat pigments and the solvents of the coat applied underneath. Poor pigment quality	Test the old finishing coat by applying a coloured coat on a small area.
Colour pigment appear of original or repair products that are sensitive to solvents (example: white on red = pinkish white)	Insulate the pigmentation with a bi component undercoat or a coat of black paint

21. BURYING

Description: Is characterised by a contracted appearance and a loss of shine. Along with the reappearance of sanding scratches.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The nozzle of your gun is unsuitable	Choose the correct nozzle (nozzle diameter)
The adjustment of your nozzle is not suitable, its flow is too strong	Readjust your nozzle: paint flow / application speed
Lack of equipment for drying the undercoats	Equip the workshop with an infrared type dryer To be used throughout the repair cycle

2- PRODUCTS

CAUSES	REMEDIES
Hardener and thinner inappropriate, procedure too fast	Check the choice of hardener and thinner (see PRODUCT TECHNICAL SHEET)
Incorrect hardener rate	Observe the hardener rate (see PRODUCT TECHNICAL SHEET)
The viscosity is not in compliance with the instructions	Adjust the viscosity of your products

3- METHODS

CAUSES	REMEDIES
Original topcoat sensitive to the solvents	Insulate with a bi-component primer, using thin coats
The bi coat basecoat is too thick	Comply with the number of recommended coats
Non-compliance with the technical sheets	Consult regularly and COMPLY with the technical sheets
The drying temperature has not been complied with for all the products used during painting	Observe the recommended drying time and temperature (see PRODUCT TECHNICAL SHEET) After drying and cooling, open the doors of your booth

22. POLYESTER MASTIC TRIMMING

Description: Reappearance of the edge of the repair area after undercoat drying. It leaves a lack of shine near the mastic and sanding scratches on the whole of the repair area.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Drying temperature of the polyester mastic not complied with	Observe the recommended drying times and temperature For complete drying, optimise the usage of infrared dryers
Insufficiently long and wide sanding blocks for the mastic surface.	Use a manual sander block adapted to the surface or a vibrating suction sander with a hard plate

2- PRODUCTS

CAUSES	REMEDIES
Polyester mastic insufficiently hard, incorrect proportion of peroxide hardener	Observe the proportion of peroxide hardener (see PRODUCT TECHNICAL SHEET) Use scales to visualise the proportions
Polyester mastic sanded with paper that is not suitable	Do not sand polyester mastic with grain that is: ■ too fine P240P320 : poor trimming, ■ too large P40P60 : scratches too deep, impossible to smooth scratches. Sand the polyester mastics with papers of grain P100 / P150PRODUCT TECHNICAL SHEET

3- METHODS

CAUSES	REMEDIES
Application of the polyester mastic on unknown surfaces	Identify the surfaces using a clean cloth soaked in solvent. Application of polyester mastic only on bare panels. Then insulate with a protective bi component undercoat or a polyester sprayable primer (see PRODUCT TECHNICAL SHEET)
Your buffing after straightening is too rough, poorly softened	After component straightening, dry sand with an orbital sander P80 or a block P100(hard plate) Smooth the old surfaces, repair areas should be perfect with no thicknesses
Mastic application insufficiently lengthened Mastic sanding incorrectly faded out	Apply mastic with knives suitable for repairing the surface by widening to the maximum
Mastic sanding with trimming on the edges	Begin the sanding at the centre of the mastic
Mastic sanding without block (or not suitable) to recover the flatness of the area on which the mastic has been applied	Apply a sanding guide Sand the polyester mastic with a block suitable for the surface For P150 P220Sand using crossed lines according to PRODUCT TECHNICAL SHEET

23. TRIMMING OF BI COMPONENT PRIMER

Description: This fault can be observed with partial primer application by sinking of the topcoat, structure contracted to around 5 mmwide on the edge of the primer after paint drying.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Drying temperature not complied with	Adjust the booth or the infra-red dryer to the recommended temperature and time Observe the recommended temperature (see PRODUCT TECHNICAL SHEET)
Sanding block not suitable Manual sanding	Sand with a suction orbital sander P320 P400 Use supple plates (sanding will be finer) For repairing large surfaces sand with a large block

2- PRODUCTS

CAUSES	REMEDIES
Incorrect dilution	Avoid diluting too much. Use the recommended thinner
Time for drying insufficient	Observe the number of coats and the recommended drying time Recommend the use of an infrared

3- METHODS

CAUSES	REMEDIES
Polyester mastic saturated with humidity	Always sand the polyester mastics dry, cover them quickly with pre-treatment primer and a bi-component primer
Non-adherence of the primer to shiny parts, lack of sanding	Sand correctly the mastic areas
Lack of sanding on the edge of the primer	Bevel with the sander the edge of the primer with fine sand paper P320 P400dry, finishing with P500 P600
Insufficient application of primer on the edge of the repaired areas Significant fog on the edge of partial primer	Apply the undercoat in a pyramid shape: a very wide first coat on the repair and reducing for the following coats

24. REFUSAL (SILICONE)

Description: Craters appear during or after the application, on surfaces of supports that have been polluted during or after the gun spray.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The booth ventilation is done in the workshop	Use exterior ventilation (see workshop equipment)

2- PRODUCTS

CAUSES	REMEDIES
The caps and covers have not been closed correctly on the cans and boxes allowing impurities to get in.	Close the cans and boxes after each use. The anti-silicone products to be mixed with the topcoat are only palliative products

3- METHODS

CAUSES	REMEDIES
The support has been cleaned carelessly Silicone, grease, oil residues etc.	Wash the vehicle with a solution composed of 20% vinegar or an alkaline solution with 10% ammonia in a bucket of hot water. Then rinse in clean water and dry
Greasy surface. Sweat stain. Soap, oil, exhaust smoke etc.	Carefully degrease small surfaces of the surfaces to be painted and wipe before evaporation
Use of silicone-based aerosols and buffing products in the workshop	Do not use silicone-based products. Silicone is very volatile, it can pollute a workshop very quickly
The vehicles are introduced in the booth with the engine running thus releasing their exhaust gases	Observe the cleanliness rules, push the vehicle manually into the booth with the engine switched off

25. WEAKNESSES / CRACKS

Description: Superficial cracks on paint type coating, characterised by small mosaic shaped cracks on the whole painted support.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The choice of the gun nozzle is inappropriate	(see PRODUCT TECHNICAL SHEET)

2- PRODUCTS

CAUSES	REMEDIES
Use of a very thick thermoplastic undercoat	Choose a bi-component undercoat
Application of a non-catalysed top coat (confusion with bi coat basecoat)	Observe the hardener and thinner proportions Sand down to stable surface then work upwards according to the product procedure

3- METHODS

CAUSES	REMEDIES
The wet undercoat and the top coat are too thick	Apply thinner coats Allow sufficient evaporation time for solvents between product coats
Application of a two component product on non hardened surfaces	Eliminate completely the areas concerned and if necessary start from the panel before proceeding with a complete application process
The weakening of the upper coat is caused by expansion due to the elasticity of the surface. Non stabilised surface, not hardened	Remove all sanding faults, then insulate with a bi-component undercoat

26. DETACHMENT ON PLASTIC MATERIALS

Description: Deterioration characterised by a loss of adherence which can be seen by the lifting of the film on the support or by the separation of coats.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The atmosphere is too humid, see humidity rate during application	Maintain the temperature of the support, booth and product between 18°Cand 23°C
Large quantities of various sorts of pollution in the compressor, purifier and air pipes (oil, humidity, dust, etc.)	Check the cleanliness of your compressor, purifier, filters and air pipes

2- PRODUCTS

CAUSES	REMEDIES
Adhesive primer inappropriate for the plastic support	Use an adhesive primer for plastic material
The proportion ratio of adhesive primer is not in compliance	Observe the proportion ratios (see PRODUCT TECHNICAL SHEET)

3- METHODS

CAUSES	REMEDIES
No support cleaning	Completely clean twice the surface to be painted with an Antistatic degreaser
The sanding is insufficient	Sand the components to be painted correctly, original primer or thermohardening
The adhesive primer coats are applied very thickly	Apply thinner coats. Comply with the number of recommended coats
The number of coats is excessive The recovery time is too long or too short	Observe the recovery time (chemical reaction) between the primary and the primer or the topcoat
Parts in drained supple polyurethane foam Composite materials (Plastic) soaked in mould removing agent	Proceed with drying for 1/2 hour at 60°C, to degrease again

27. DETACHMENT OF THE UNDERCOAT

Description: Deterioration characterised by a loss of adherence between the undercoat and the mastic or the original cataphoretic coating, which can be seen by lifts in the film on the support or by the separation of the coats.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The support to be painted is too hot	Maintain the temperature of the support, booth and product between 18°Cand 23°C
The atmosphere is too humid, see humidity rate	Maintain the temperature of the support, booth and product between 18°Cand 23°C
Incorrect usage of Infrared dryer	Observe the support/infrared and desolvation distance

2- PRODUCTS

CAUSES	REMEDIES
Hardener taken humidity, DLUoverlapped	Put the caps back on cans after use. Check the cleanliness and quality of your hardener, check the storage dates of the products
Hardener rate inappropriate Choice of thinner or hardenerinappropriate	Check the hardener rate Use the recommended thinner or hardener

3- METHODS

CAUSES	REMEDIES
No support cleaning	Clean the component to be painted completely with a surface cleaner
Sanding the old paint is not sufficient	Degrease and sand the surfaces to be primed with care, a matt appearance is essential Sand according to PRODUCT TECHNICAL SHEET
The support has either not received a filler or has received an unsuitable filler	Apply suitable filler on the bare supports (metal sheets, composite material) (see PRODUCT TECHNICAL SHEET)

28. DETACHMENT OF THE CLEARCOAT AND TOPCOAT

Description: Deterioration characterised by a loss of adherence which can be seen by the lifting of the film on the support or by the separation of coats.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Basecoat powdering	Avoid applications that are too dry Use the bicoat thinner, suitable for a temperature of 25°Cuse a slow thinner. (example: retarder thinner)

2- PRODUCTS

CAUSES	REMEDIES
Hardener which has been subjected to humidity	Put the caps back on cans after use. Check the cleanliness and quality of your hardener, check the storage dates of the products
Use of anti silicone in the basecoat to be recoated with clearcoat	Cleaning the support with an ammoniac product or applying thin coats of basecoat in order to block the silicone is not permitted
Hardener rate inappropriate Choice of thinner or hardener inappropriate	Check the hardener rate Use the recommended thinner or hardener

3- METHODS

CAUSES	REMEDIES
The sanding and cleaning of the old paint is insufficient	Degrease and sand the surfaces to be painted with care, there should be a matt finish before painting. The same applies with a polishing pad for a union
The bicoat basecoats are applied too thickly	Apply thinner bicoat basecoats 20 microns (see PRODUCT TECHNICAL SHEET)
The evaporation time between the bicoat basecoat and the clearcoat is too long	Observe the evaporation time between the bicoat base and the clearcoat

29. DETACHMENT OF THE POLYESTER MASTIC

Description: Characterised by the separation of the mastic from the panel or other types of support,

(electro, galva, alu).

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
The mastic has been burnt with the use of an infrared device	Observe a distance of 60to 70 cmfrom the support when using an infrared device
The atmosphere is too humid. The temperature is too low during mastic application	See humidity rate Maintain the temperature during mastic application between 18°Cand 23°C

2- PRODUCTS

CAUSES	REMEDIES
Mastic inappropriate	Use mastic appropriate for the supports

3- METHODS

CAUSES	REMEDIES
No support cleaning	Completely clean the surface to be applied with mastic with a surface cleaner
Support too cold for mastic application	Increase the temperature of the support (the same as the product temperature) to avoid thermal shocks

30. BLISTERING

Description: Phenomenon characterised by the appearance of more or less voluminous damage under a coat of paint or under coats of complex coating. Small bubbles form in the film thickness.

1- MATERIAL / ENVIRONMENT

CAUSES	REMEDIES
Poor ventilation in the booth, high air humidity See humidity rate, exterior of site favouring humidity (water sources)	Regulate the workshop temperature between 18°Cand 23°Cas well as in the booth. Adjust the air speed 0.40 m/s Your booth must be overpressurised
Lifting due to too fast a temperature increase with an infrared dryer	Observe the desolvation phase and the distance between the support and infrared
Significant impurities and water in your compressor, purifier and air pipes	Clean your compressor. Check the cleanliness of the purifier filters and air pipes used in the paint workshop and the booth

2- PRODUCTS

CAUSES	REMEDIES
Thinner too aggressive, may cause the surface coats to deform or inflate.	Choose a thinner which is suitable for the finishing coat and the conditions in the workshop
Hardener which has been subjected to humidity	Check the cleanliness and the quality of your hardener Put the caps back on the cans after use
Polyester mastic sanded with water	Only sand the polyester products dry, cover them quickly with a pre-treatment primer and a bi-component primer

CAUSES	REMEDIES
Poor cleaning. Support contaminated by humidity. Sanding residues with grease, oil	Make sure the supports are cleaned. Wiping, blowing, degreasing
Support too cold	Heat the support. It must be at ambient temperature before paint application Avoid thermal shocks
The surface deforms or curls during application or drying	Remove the finishing coat of the areas concerned and reapply the paint. If required, remove all the paint and completely reapply on the bare metal

PAINT: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

All painting operations must be carried out in a location designed for these operations (e.g. booths).

The spray booths must comply with the standards currently in force (air speed at 0.40 m/sor above, no measurement below 0.30 m/s).

Periodic maintenance and checking of these facilities ensures their safety and quality.

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

When drying with an infrared device, it is important to respect:

- the distance, time and temperature specified on the product technical sheet. Use a distance thermometer part number: 77 11 237 210.
- the user and safety advice given by the manufacturer of the infrared device.

In the same way as for paintwork, the safety equipment (masks, filter cartridges, gloves, safety goggles, overalls, etc.) for this equipment can be acquired from your local IXELL supplier.

1. BODYWORK ON CNG / NGV VEHICLES

1- BOOTH TEMPERATURE (T):

- if (T) lower or equal to 65˚C: the CNGvehicle is permitted without emptying the fuel tank,
- if (T) between 65˚Cand 80˚C: the vehicle is permitted in the booth only if the fuel tank is emptied,
- if (T) greater than 80˚C: the CNGvehicle is not permitted in the booth unless the tank has been emptied and removed.

2. BODYWORK ON THE LPG VEHICLES

1- USING A SPRAY BOOTH

■

When a vehicle enters a spray booth, remove the tank as a precaution or carry out flaring and degassing with a flare, then make it inert with a nitrogen flush.

■

If equipment (infrared lamp, etc.) needs to be used for drying mastic, primer or paint, near to the LPG tank, such as during a retouching procedure, it is essential to carry out flaring and degassing of the LPG tank and then to make it inert with a nitrogen flush.

Note:

If working at under 50˚C, it will be possible to leave the tank in place, on condition that it is filled to less than 70% of its capacity.

3. HIGH DURABILITY VARNISH

1- RECOMMENDATION

■

When the vehicle comes with original high durability varnish, it is strongly recommended that IXELL IXALIS type anti-scratch varnish is used during the repair.

■

Using this type of varnish guarantees the original function of the high durability varnish.

4. ANTI-CORROSION PROTECTION AFTER DRILLING

❑

Each time a panel is stripped in the workshop when drilling, degrease and wipe the area and then use a fine paintbrush to apply the following:

■

A pre-treatment primer,

■

A bi-component primer

Paint in the vehicle body colour

5. FLEXIBLE PRODUCT

1- RECOMMENDATION

When painting a component which has been hit by gravel, it is advisable to add a flexible additive to the bi-component primer and to the varnish or topcoat.

6. TRICOAT PAINT OR TINTED CLEARCOAT

1- RECOMMENDATION

When the vehicle is equipped with a tricoat paint or a tinted clearcoat for each operation it must be assigned a labour time << additional to paint >> at the bicoat paint labour time for the operation of the concerned element.

PAINT TOUCH UP: PREPARATION AND PAINT RANGE

Note:

The paint touch-ups on the matt paints are impossible, it is necessary to repaint the element.

Touch up for faults:

- Procedure 1 : Grains,
- Procedure 2 : Drips,
- Procedure 3 : Orange peel,
- Procedure 4 : Superficial scratches,
- Procedures 5 : Polishing method.

1. THE PRODUCTS

- Polishing liquid Vehicle: Parts and consumables for the repair (04B, Consumables - Products),
- Finishing liquid Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

2. PROCEDURE DESCRIPTIONS

1- PROCEDURE: GRAINS

Steps	Description	Special notes
1	Sand using the orbital sander or manual sanding block by graduating the sanding	P1500 to P2000
2	Finish with sanding finishing	(see 5 - PROCEDURE: POLISHING)

2- PROCEDURE: DRIPS

Steps	Description	Special notes
1	Sand using the orbital sander or manual sanding block by graduating the sanding	P1500 to P2000
2	Finish with sanding finishing	(see 5 - PROCEDURE: POLISHING)

3- PROCEDURE: ORANGE PEEL

Steps	Description	Special notes
1	Sand using the orbital sander or manual sanding block by graduating the sanding	P1500 to P2000
2	Finish with sanding finishing	(see 5 - PROCEDURE: POLISHING)

4- PROCEDURE: SUPERFICIAL SCRATCHES

Steps	Description	Special notes
1	Pass an indelible pen or paint across the scratch to use as a guide for sanding	White or black according to the colour of the support
2	Start by sanding to reduce the scratch without removing the sanding guide completely	P1500
3	Then, sand until the guide has totally disappeared by graduating the sanding	P2000
4	Finish with sanding finishing	(see 5 - PROCEDURE: POLISHING)

5- PROCEDURE: POLISHING

Note:

The temperature of plastic materials increase very quickly during the glazing process and the paint softens.

Steps	Description	Special notes
1	Use a little polishing liquid on the felt disc or on the foam plate	Polishing liquid
2	Repaint the sanded zone and the whole component	P2000
3	Polish until the product has disappeared	The abrasion will decrease progressively during polishing
4	Use a little polishing liquid on the felt disc or on the foam plate	Polishing liquid
5	Wipe with a sheepskin finishing cloth	Sheepskin

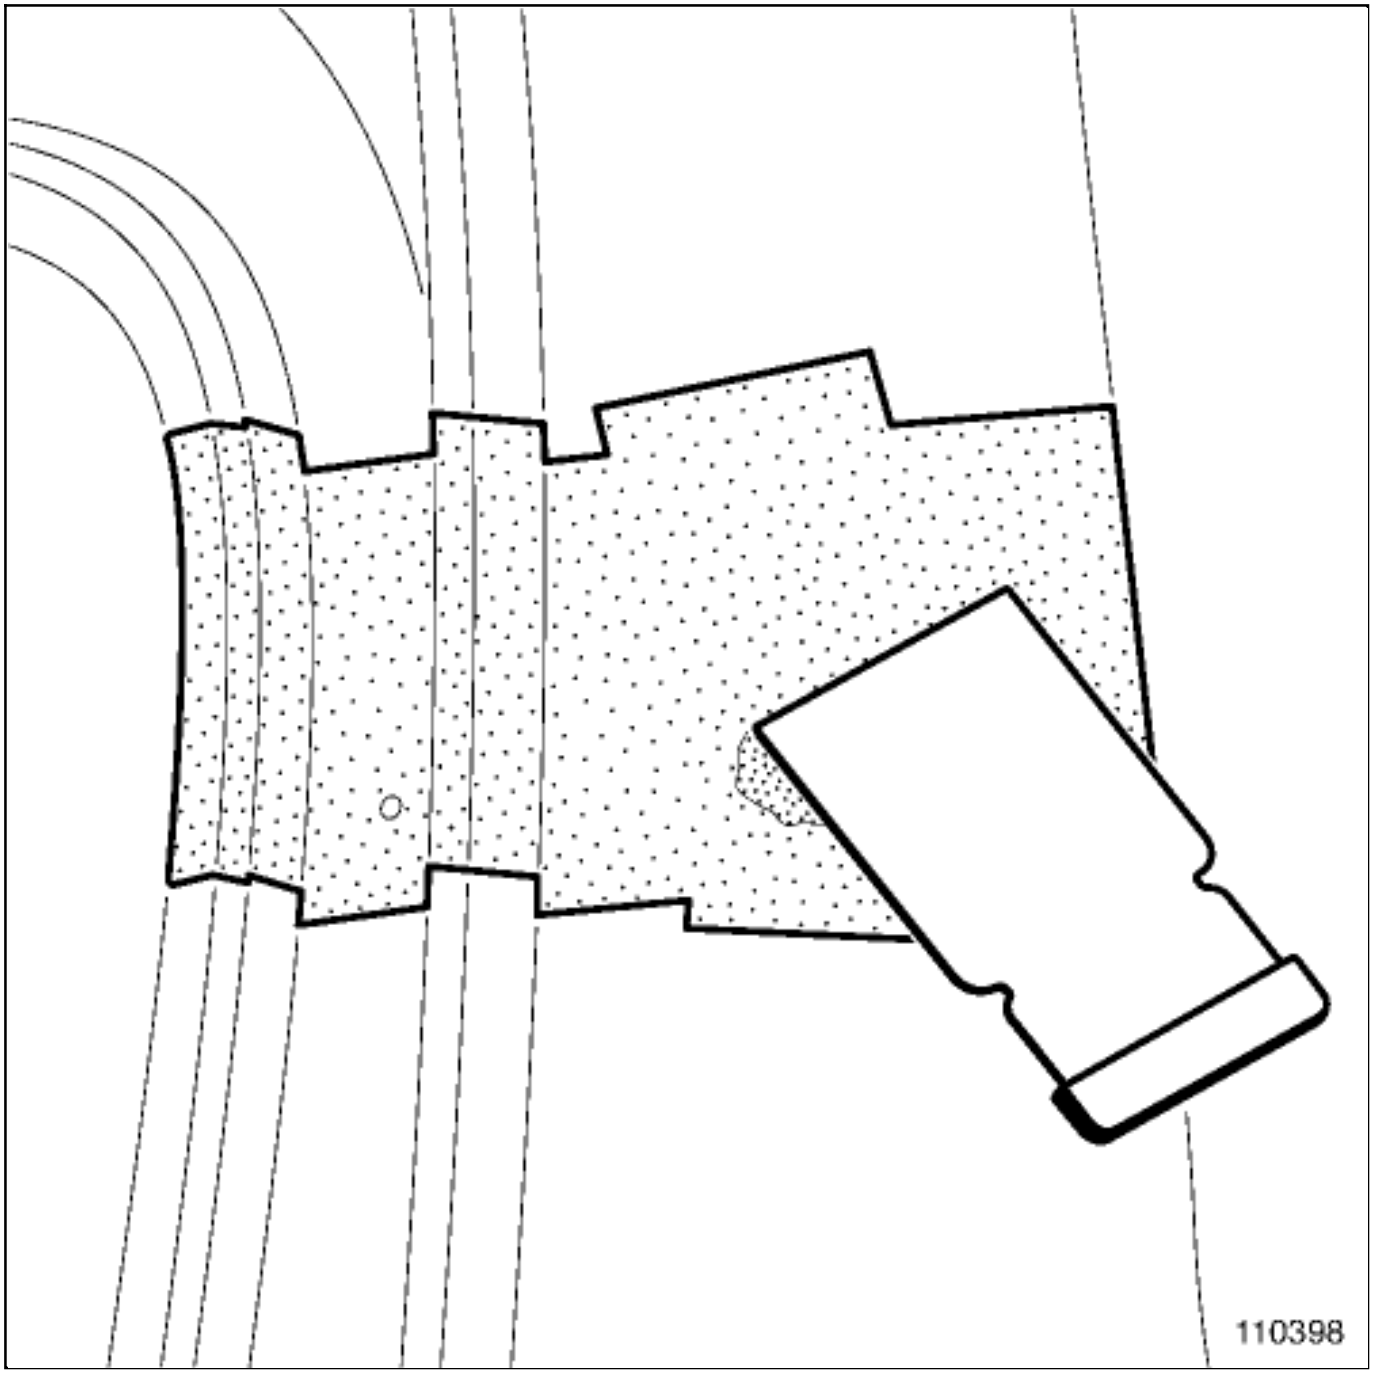
PANELWORKFINISHINGPRODUCTS

Note:

In compliance with the new European directive on recycling automobiles, vehicles manufactured after 1st July 2003 must no longer contain lead-based products.

Precisely, for bodywork repairs, these vehicles must no longer be repaired with tin solder, which contains a major proportion of lead.

The replacement solution for this type of operation is the use of aluminium loaded polyester mastic.



1. POLYESTER MASTIC

Use of bi-component polyester mastic for curves. The choice of the mastic polyester is made according to the nature of the support following the instructions in the Product technical datasheet.

This product is used only for surface finishing, and can never be used to remedy a lack of sheet thickness or be used as reinforcement to fill in a fold on a structure component.

Types of repair operations where surface finishing mastic is used:

- finishing after filing down chain bead welds,
- finishing the curve of a straightening job by "pull nail" type inertia,
- surface finishing of straightened zones,
- finishing of a scratch caused by hail or other causes.

Advantages:

- Easy to implement.
- Rapid drying.
- Easy to sand.

Disadvantage:

- No adhesion on surfaces applied with pre-treatment primer or non sanded surfaces.

Operator protection:

- obligatory respiratory protection,
- use extra ventilation source,
- obligatory hand protection.

2. PREPARATION

> Note:
>
> Observe the legislation in force in the country for all product usage.

Sand the repaired zones with P80 to P120.

Sand the edges of the zones to be repaired. Overlap the surface by approximately 60 to 70 mm for better adhesion of the mastic. Sand with P150 to P180.

(see 05B, Equipment and Tools, Tools for sanding a structural component: Use)

Dust the zones to be repaired by suction or with a cloth.

Blow and degrease with surface cleaner the zones to be repaired.

Vehicle: Parts and consumables for the repair

> Note:
>
> An excess of hardener in the mastic causes rings (modification of the pigmentation) that will be visible when the vehicle is painted**Paint fault: Description** (Technical Note 592A, 90A, General information).

Prepare the mastic, respecting the proportions of the hardener in accordance with the Product technical datasheet .

Comply with the drying times in accordance with the Product technical datasheet. It is recommended to use an infrared drying device to accelerate drying and facilitate sanding.

Method for sanding the mastic:

- Sand from the centre towards the exterior without touching the edge of the mastic.
- Remove the scratches created previously by the sanding by starting to level the edges.
- Sand the whole area to be repaired, overlapping by 150 to 200 mm with P240 to P280in order to apply undercoat.

Dust the zones to be repaired by suction or with a cloth.

Blow and degrease with surface cleaner the zones to be repaired.

Note:

Wet sanding of mastics is forbidden.

3. APPLICATION

1- SMALL SURFACES

Apply the mastic in a single coat, on the whole of the repaired surface creating a dome shape in the centre.

Comply with the drying times in accordance with the Product technical datasheet. It is recommended to use an infrared drying device to accelerate drying and facilitate sanding.

2- LARGE SURFACES

Fill in the faults remaining after panelwork operations by combing over with mastic.

Apply a second thick layer covering the entire zone to be repaired,three or four minutes (without prior sanding) after application of the first mastic layer.

Comply with the drying times in accordance with the Product technical datasheet. It is recommended to use an infrared drying device to accelerate drying and facilitate sanding.

4. FINISHING

Use a suitable grain in accordance with the Product technical datasheet.

Method for sanding the mastic:

- Sand from the centre towards the exterior without touching the edge of the mastic.
- Remove the scratches created previously by the sanding by starting to level the edges.
- Sand the whole area to be repaired, overlapping by 150 to 200 mm with P240 to P280in order to apply undercoat.

Apply the preparation procedure before painting

Steel bodywork component: Preparation and paint range (Technical Note 592A, 94A, Paint application procedure for panels).

PARKING BRAKE ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Brake mechanism: Precautions for the repair ,
- Vehicle: Precautions for the repair .

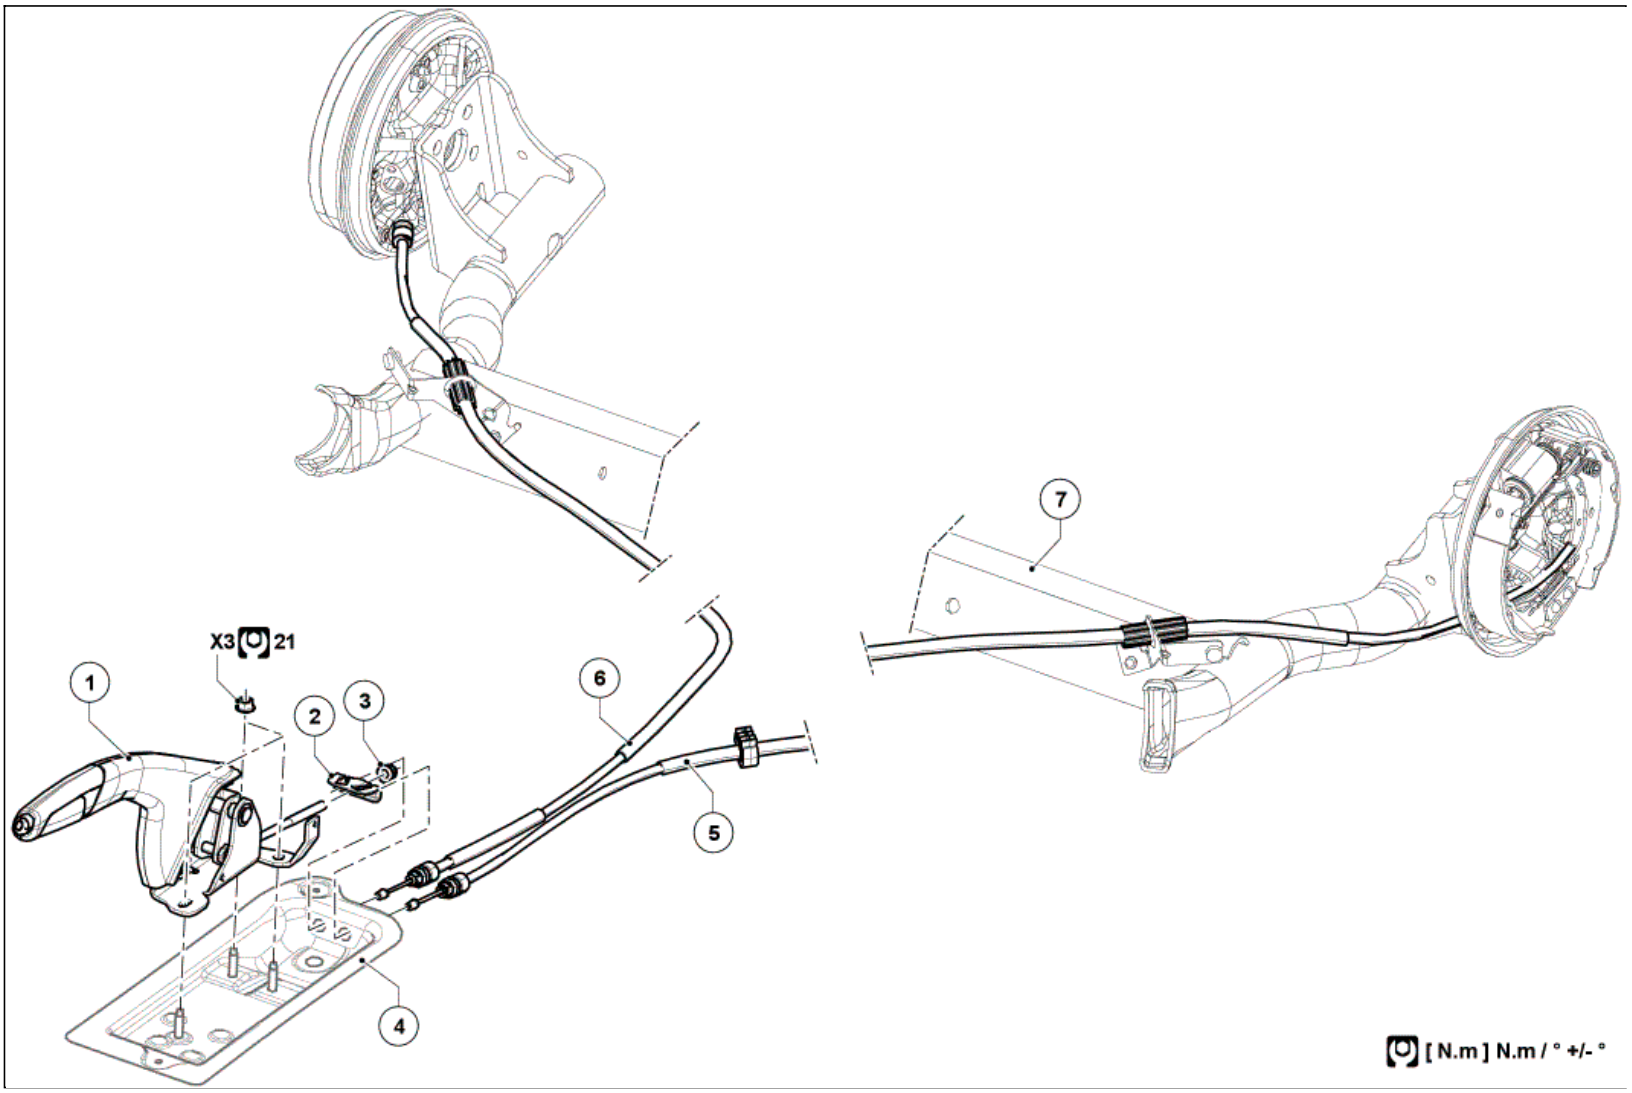


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

PARTICLEFILTER:CLEANING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
twin exhaust pipe kit
particle filter kit

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

Note:

Forced regeneration should only be carried out after the "SERVICE" warning light has come on accompanied by the "REGENERATE PARTICLE FILTER" message or the orange "CHECK EMISSIONS" warning light (see Driver's Handbook for vehicle concerned).

1. INSTRUCTIONS FOR CARRYING OUT A FORCED REGENERATION OF THE PARTICLE FILTER

1- PRECAUTIONS TO BE TAKEN DURING FORCED REGENERATION OF THE PARTICLE FILTER

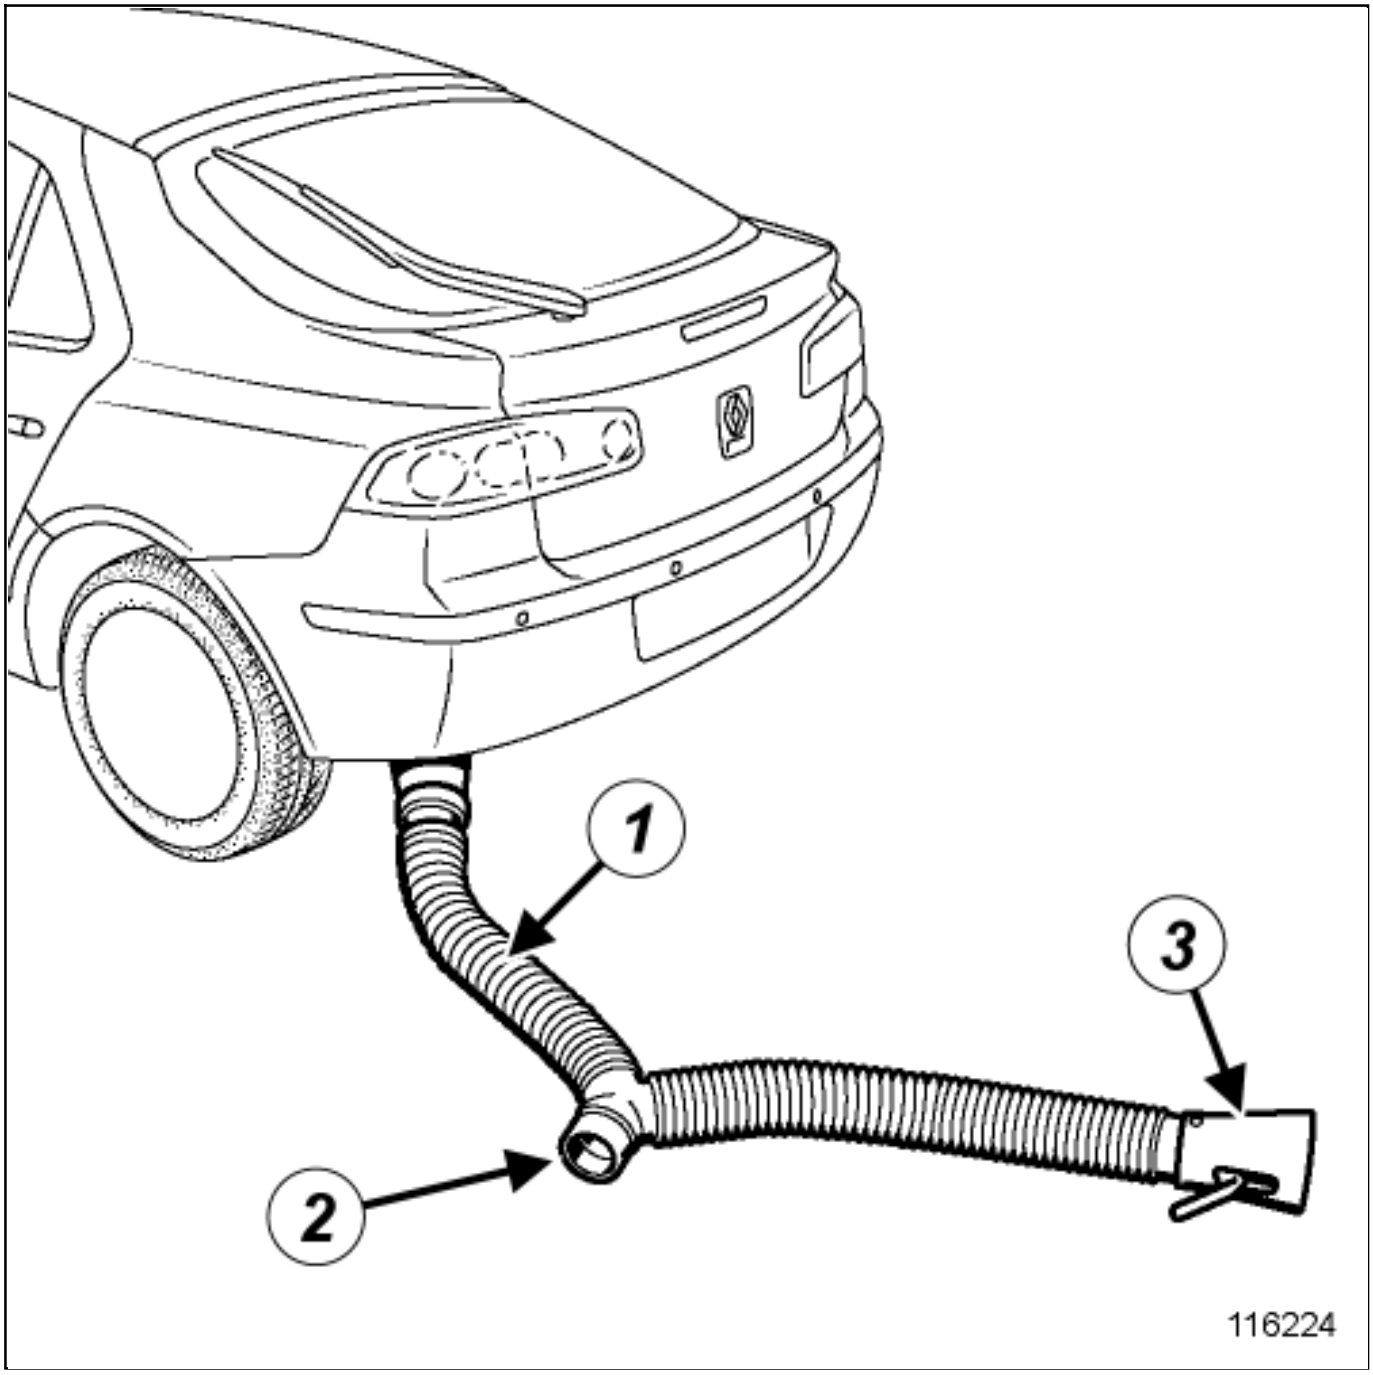
There are currently two additional kits for extracting exhaust gas in the workshop (see garage equipment catalogue), both of which are approved for use at the high temperatures produced during forced regeneration of the particle filter.

The two kits approved for particle filter regeneration are:

- the particle filter kitfor use with vehicles fitted with a single exit silencer,

the twin exhaust pipe kitfor use with vehicles equipped with a twin exhaust pipe on the silencer.

WARNING



During forced regeneration of the particle filter, the temperature of the exhaust pipe rises significantly.

Always use one of the two kits approved for the high temperatures reached during forced regeneration, whether the operation is carried out in the workshop using an exhaust gas extractor, or outside the workshop.

Ensure that when in use, the kit is not touching the rear bumper when carrying out forced regeneration of the particle filter.

TWIN EXHAUST PIPE KIT SPECIAL FEATURES

Note:

When using a twin exhaust pipe kit(1) on a single exhaust pipe:

- that an exhaust gas extractor is fitted to openings(2) and (3) if forced regeneration is being carried out in the workshop,
- that openings(2) and (3) are positioned to direct the hot exhaust gases away from another vehicle or a person, if the operation is being carried out outside the workshop.

2. PROCEDURE FOR FORCED REGENERATION OF THE PARTICLE FILTER USING THE CLIP DIAGNOSTIC TOOL

- Open the bonnet before running the forced regeneration command.

CAUTION

To prevent engine racing, check the engine oil level using the dipstick before running the forced regeneration command.

The engine oil level must be between the "MIN" and "MAX" marks on the dipstick.

- If necessary, adjust the engine oil level.

- Connect the Diagnostic tool to the vehicle.

- Carry out forced regeneration of the particle filter (see Fault finding - Interpretation of commands) (13B, Diesel injection).

Note:

If required, the forced regeneration procedure may be stopped by pressing the engine Start button twice in succession.

Note:

Strong odours and thick smoke may be released during forced regeneration of the particle filter.

-

When forced regeneration of the particle filter has finished, and using the Diagnostic tool:

- deal with the present faults,
- clear the stored faults.

WARNING

Wear heat protective gloves during the operation.

Remove the kit for extracting the high temperature exhaust gas.

CAUTION

Check the engine oil level using the dipstick to avoid any risk of the engine racing.

The engine oil level must be between the "MIN" and "MAX" marks on the dipstick.

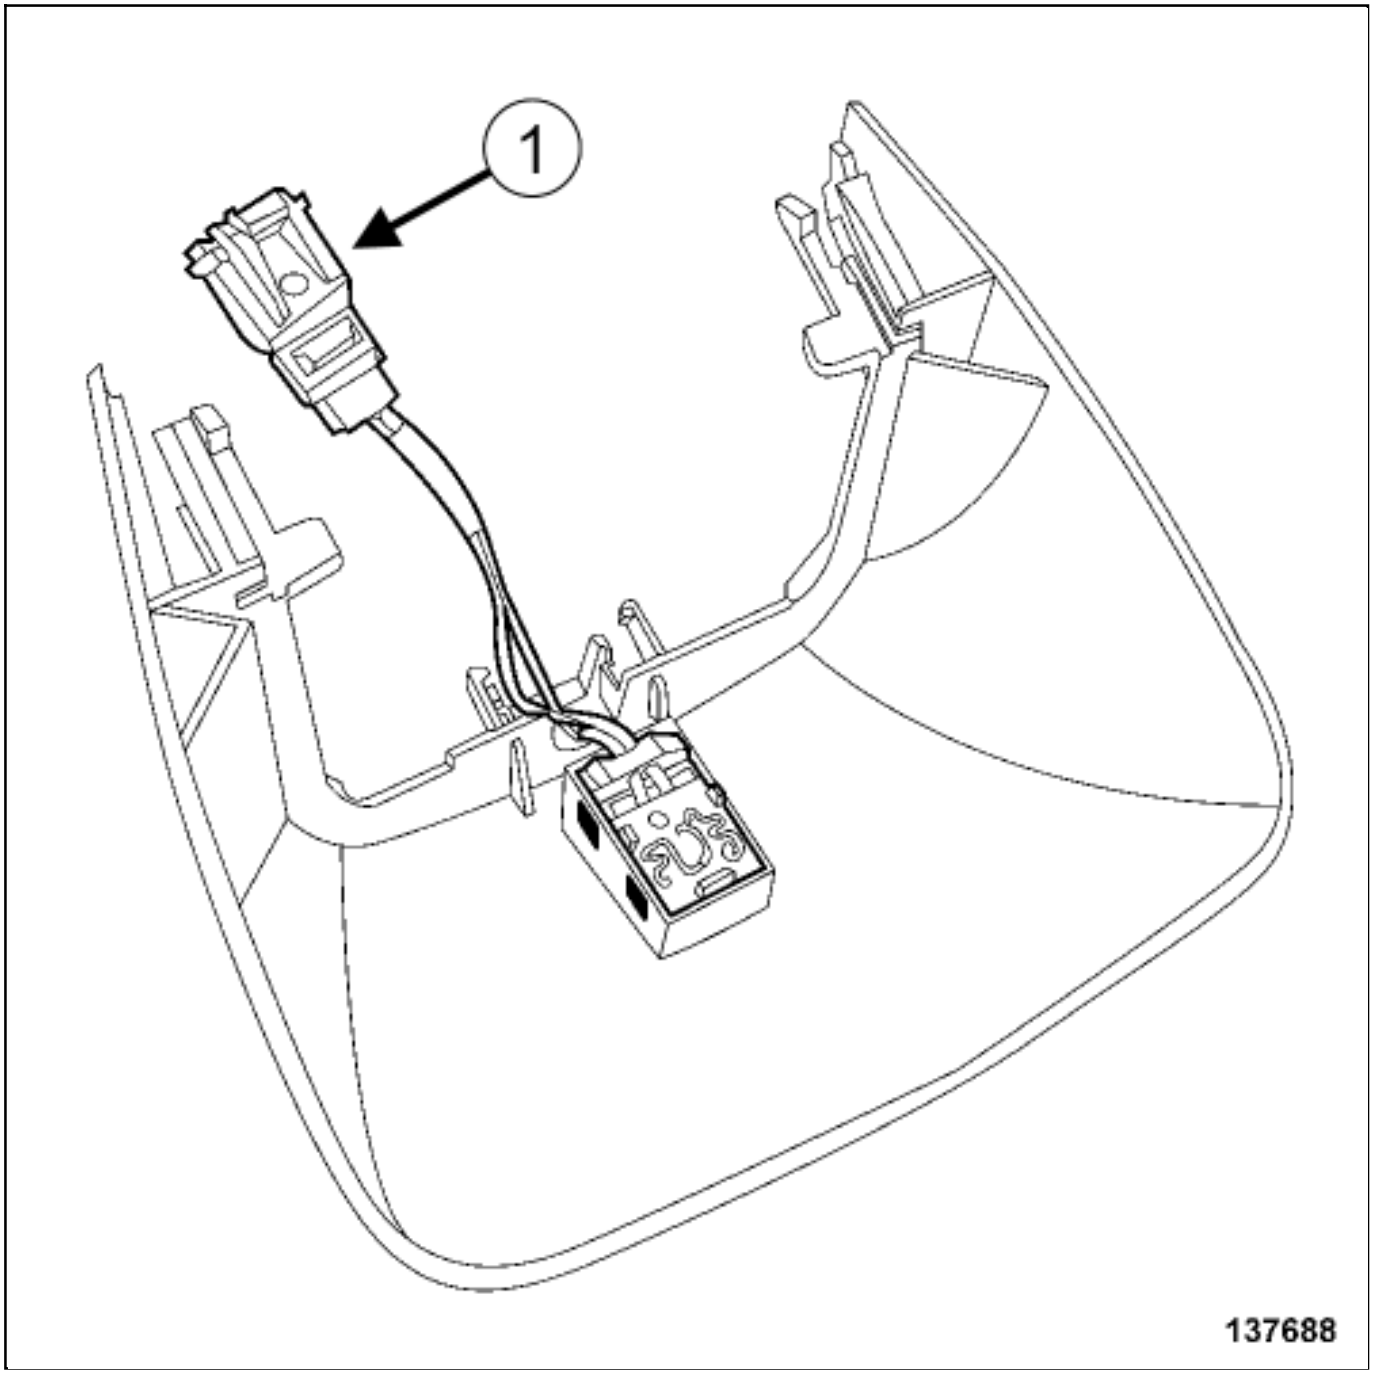
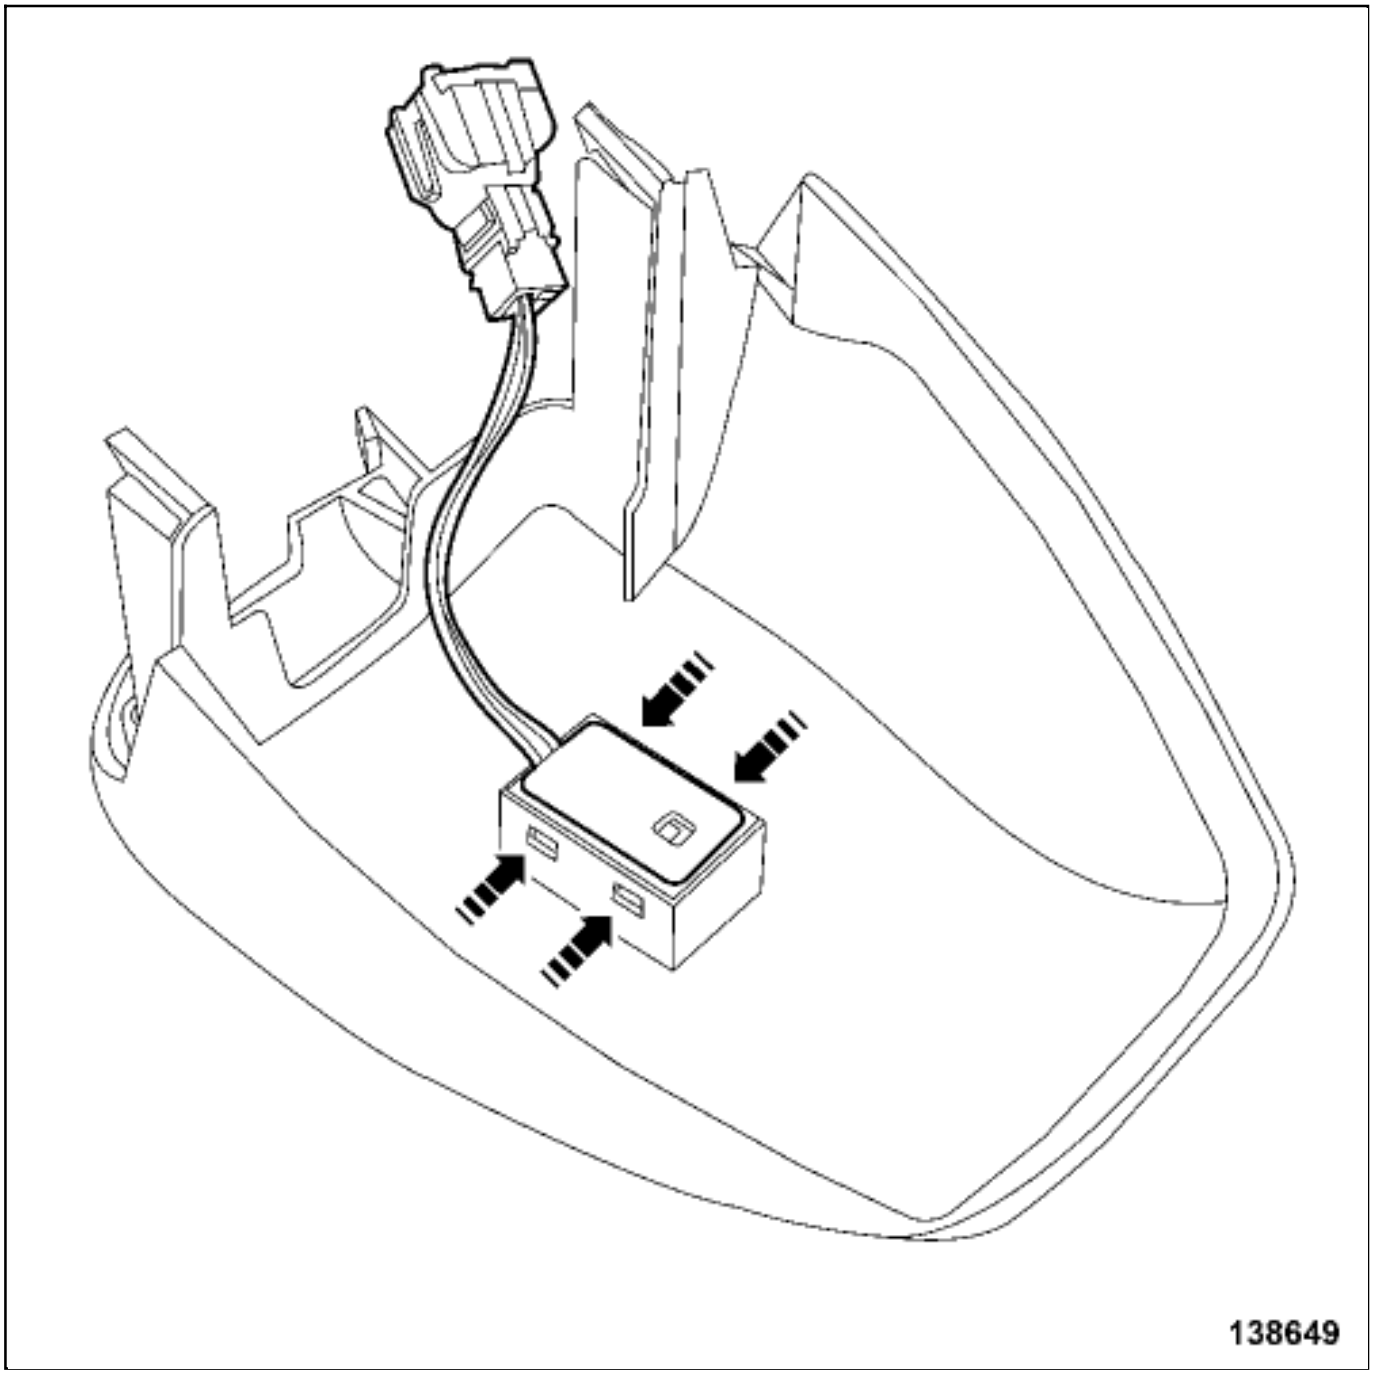
PASSENGER COMPARTMENT TEMPERATURE SENSOR: REMOVAL - REFITTING



REMOVAL

1. REMOVAL OPERATION



Remove the interior rear view mirror trims.

Disconnect the passenger compartment temperature sensor connector(1) .

Unclip the passenger compartment temperature sensor from the interior rear view mirror trim.

REFITTING

1. REFITTING OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

PASSENGER'S FRONTAL AIRBAG: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:
Passenger's frontal airbag mounting on dashboard
Passenger's frontal airbag mounting on dashboard cross member

Locations and specifications (tightening torques, parts to always be replaced, etc.)Dashboard assembly: Exploded view .

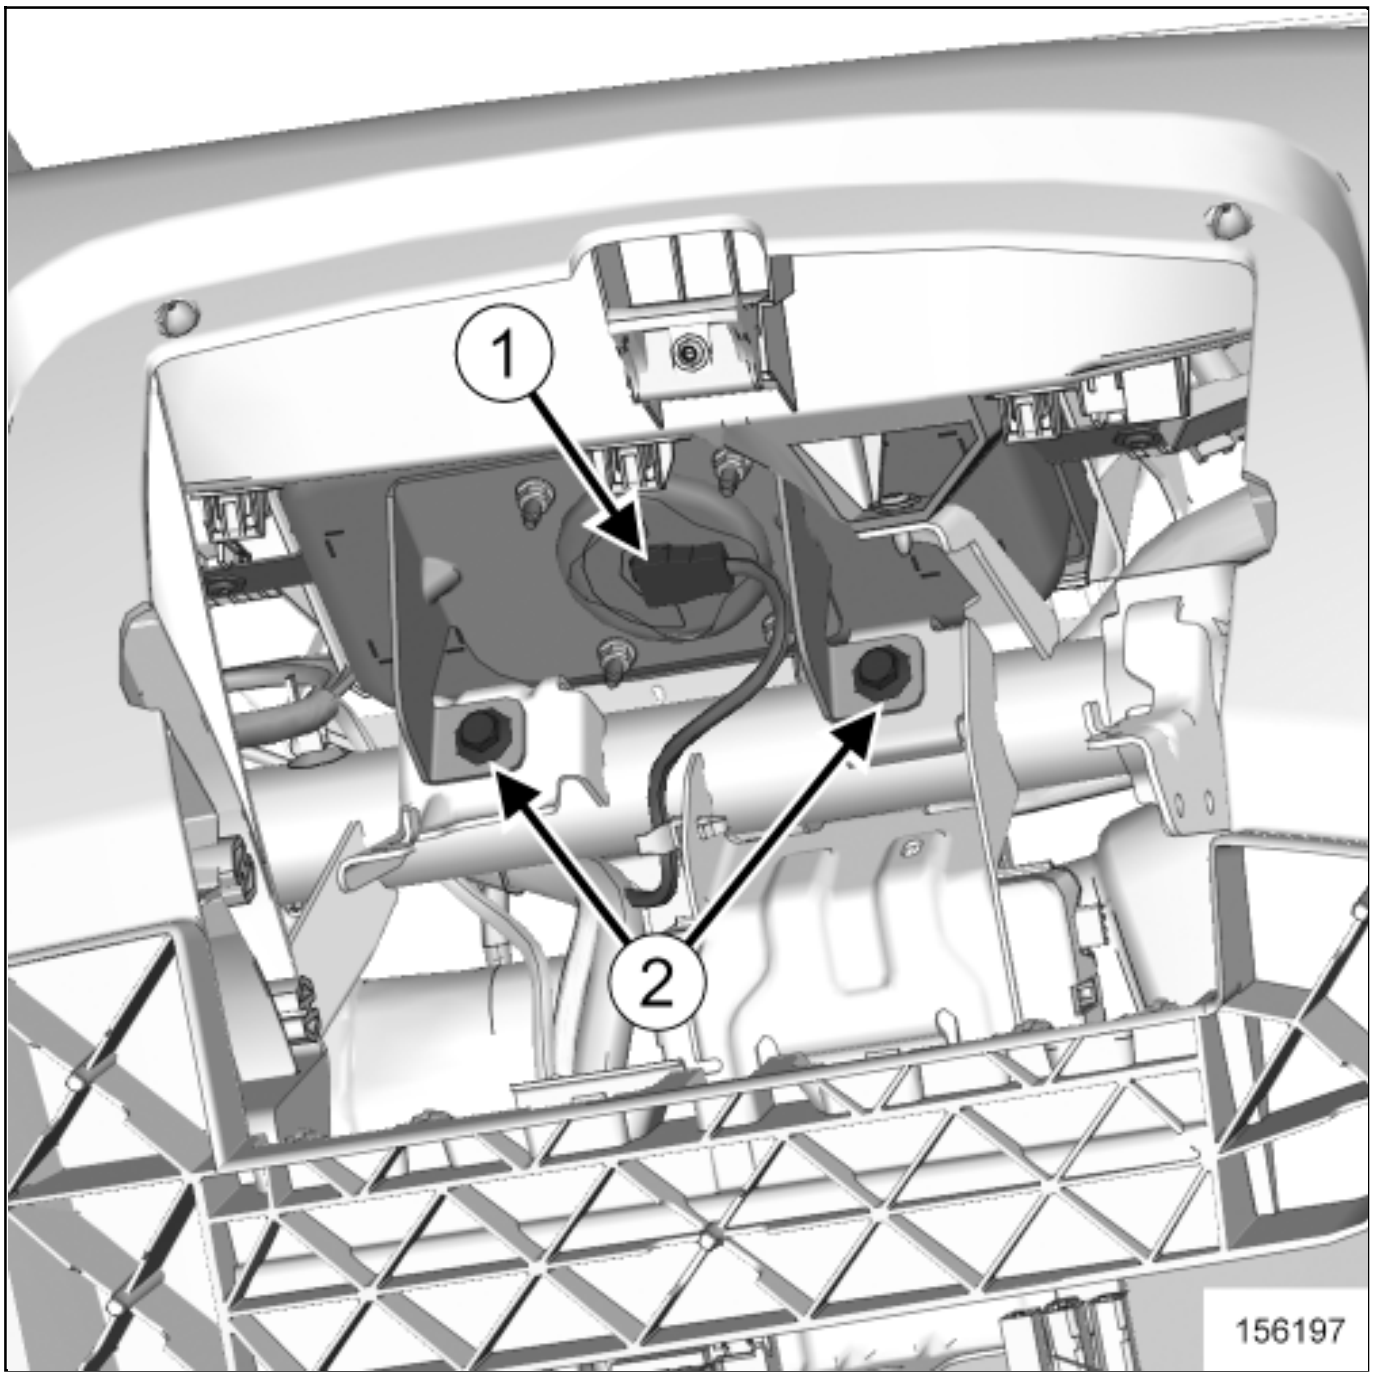
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

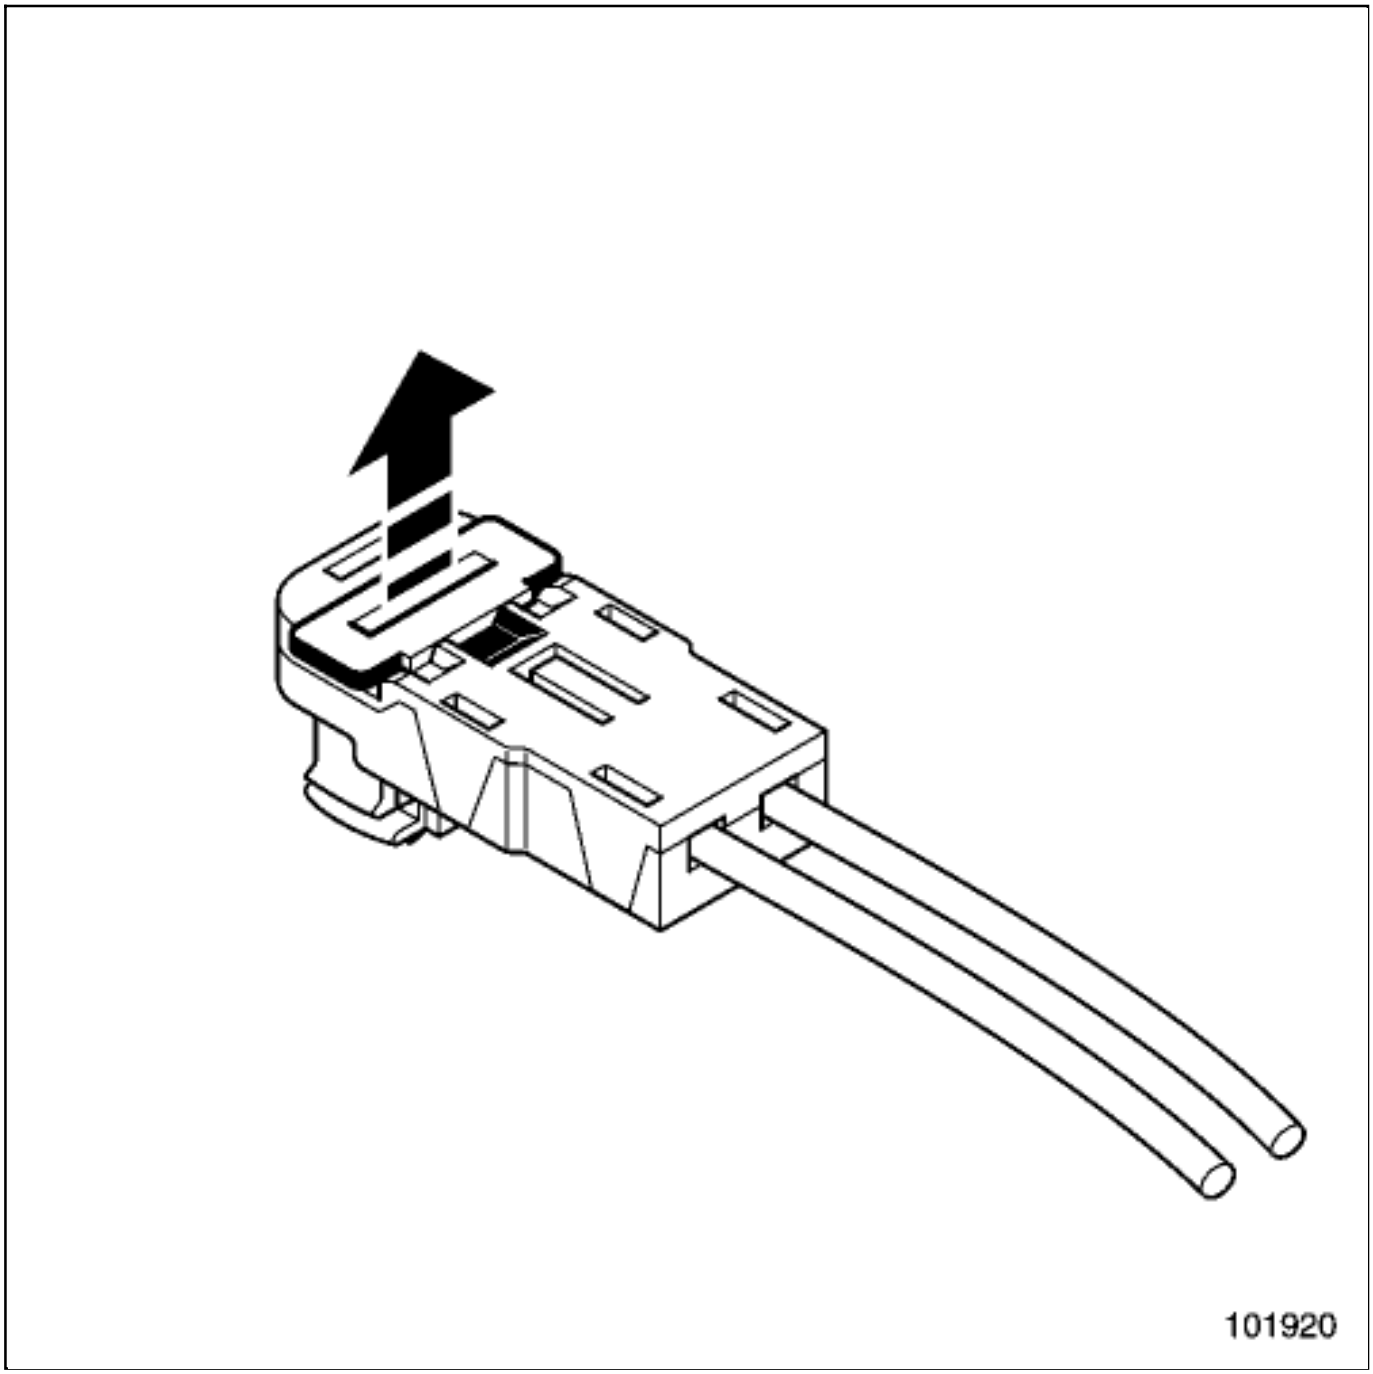
(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) ,

Vehicle: Precautions for the repair .

WARNING

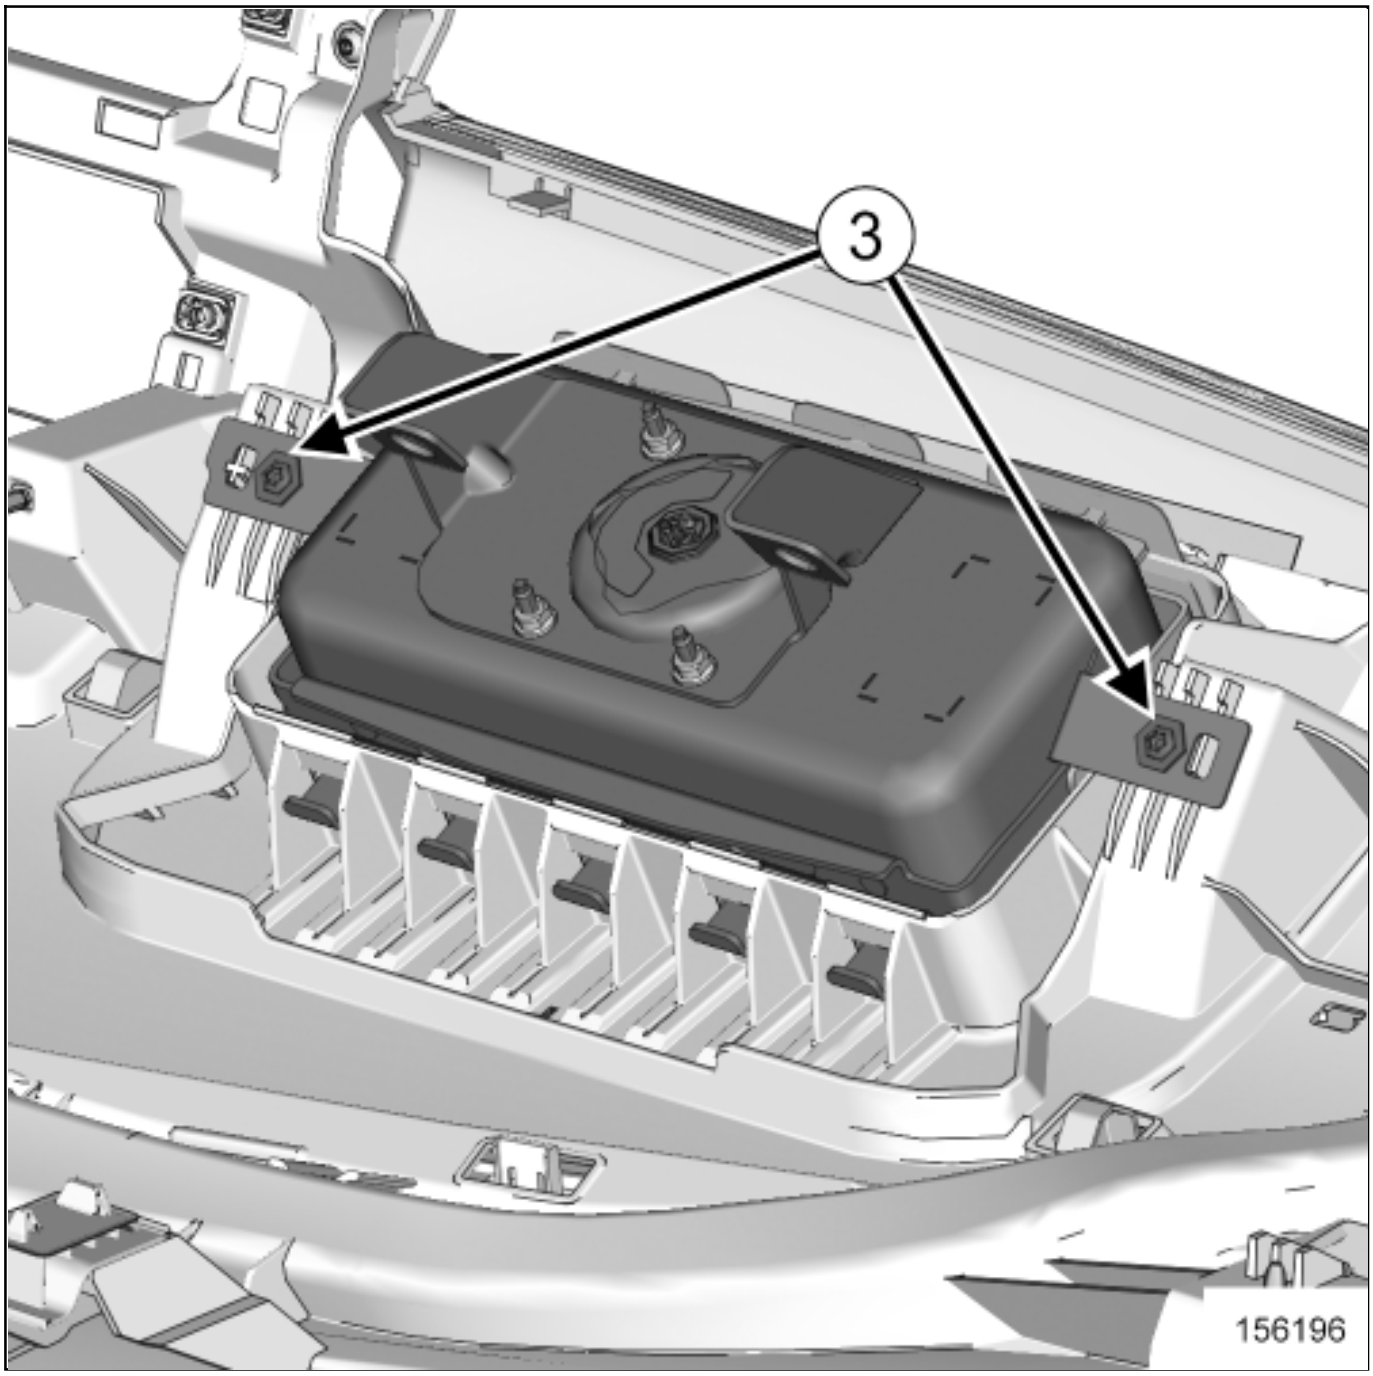


Never handle the pyrotechnic systems (pretensioners or airbags) near to a source of heat or naked flame - they may be triggered.



REMOVAL

1. REMOVAL PREPARATION OPERATION



Disconnect the batteryBattery: Removal - Refitting .

Remove the glovebox[Dashboard assembly: Exploded view] .

- Disconnect the airbag module connector(1) by unclipping the safety device.
- Remove the bolts(2) attaching the airbag module to the dashboard cross member.
- Remove the dashboard Dashboard assembly: Exploded view .

- Remove the screws(3) attaching the airbag module to the support.
- Move the airbag module support to detach clips.
- Remove the passenger's frontal airbag.

WARNING

To prevent the any component from being thrown upwards, store the airbag with the inflatable cushion facing upwards.

REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: Passenger's frontal airbag mounting on dashboard .
- parts always to be replaced: Passenger's frontal airbag mounting on dashboard cross member .

2. REFITTING OPERATION

- Proceed in the reverse order to removal.
- Torque tighten the passenger front airbag screws on the dashboard2 N.m.

3. FINAL OPERATION

- Proceed in the reverse order to removal.
-

Torque tighten the passenger front airbag bolts on the dashboard cross member12 N.m.

WARNING

To eliminate the risk of any accident, do not reuse pyrotechnic components.

It is essential to destroy pretensioners or airbags before scrapping a vehicle or a part only (see 88C, Airbags and pretensioners, Airbags and pretensioners: Recycling - Destruction) .

4. CHECKING AFTER REPAIR

- Switch on the ignition.
- Check that there are no faults on the instrument panel.

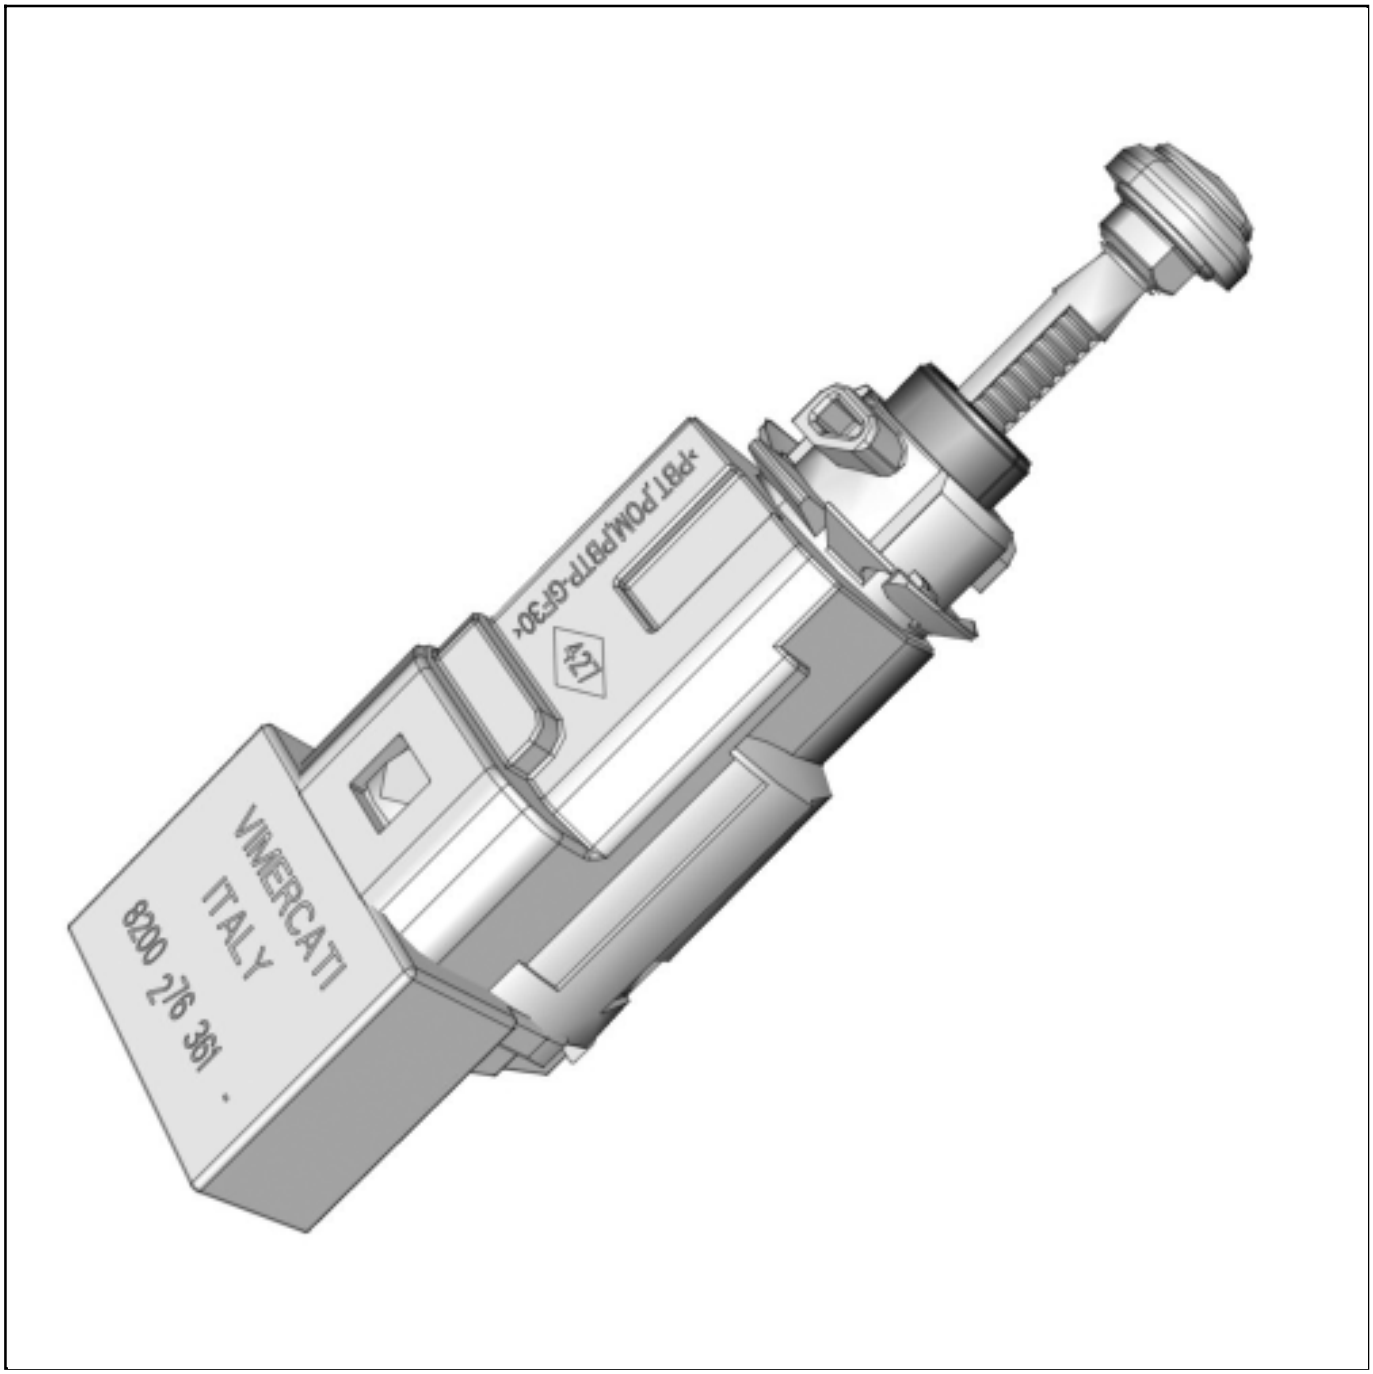
PEDAL ASSEMBLY MECHANISM: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. BRAKE PEDAL

WARNING

To avoid breaking the connection between the brake servo pushrod and the brake pedal, check that the safety clevis pin is locked onto the brake servo pushrod by tilting it from the top downwards.

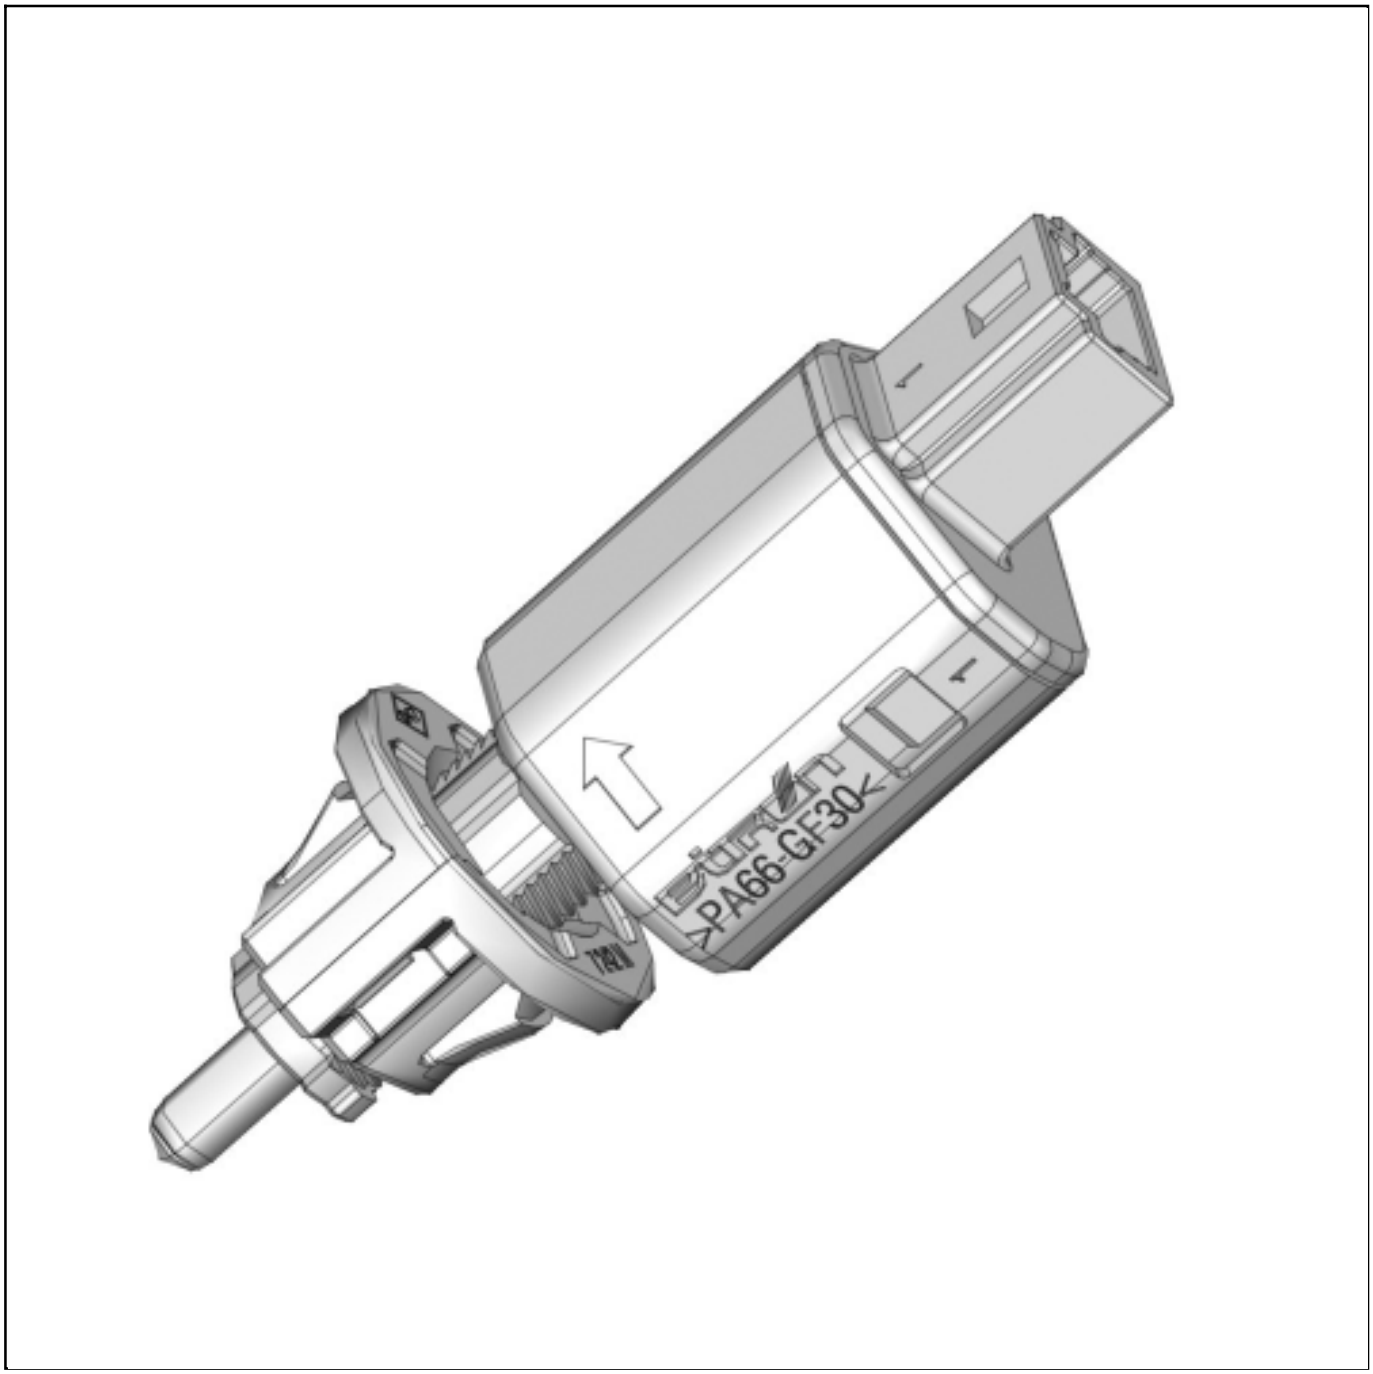


2. PEDAL SWITCHES

CAUTION

Incorrect adjustment of the pedal switches may cause premature wear of the brakes or clutch, or a malfunction of the injection system.

VIMERCATI AND BITRON SWITCHES (GENERATION 1)

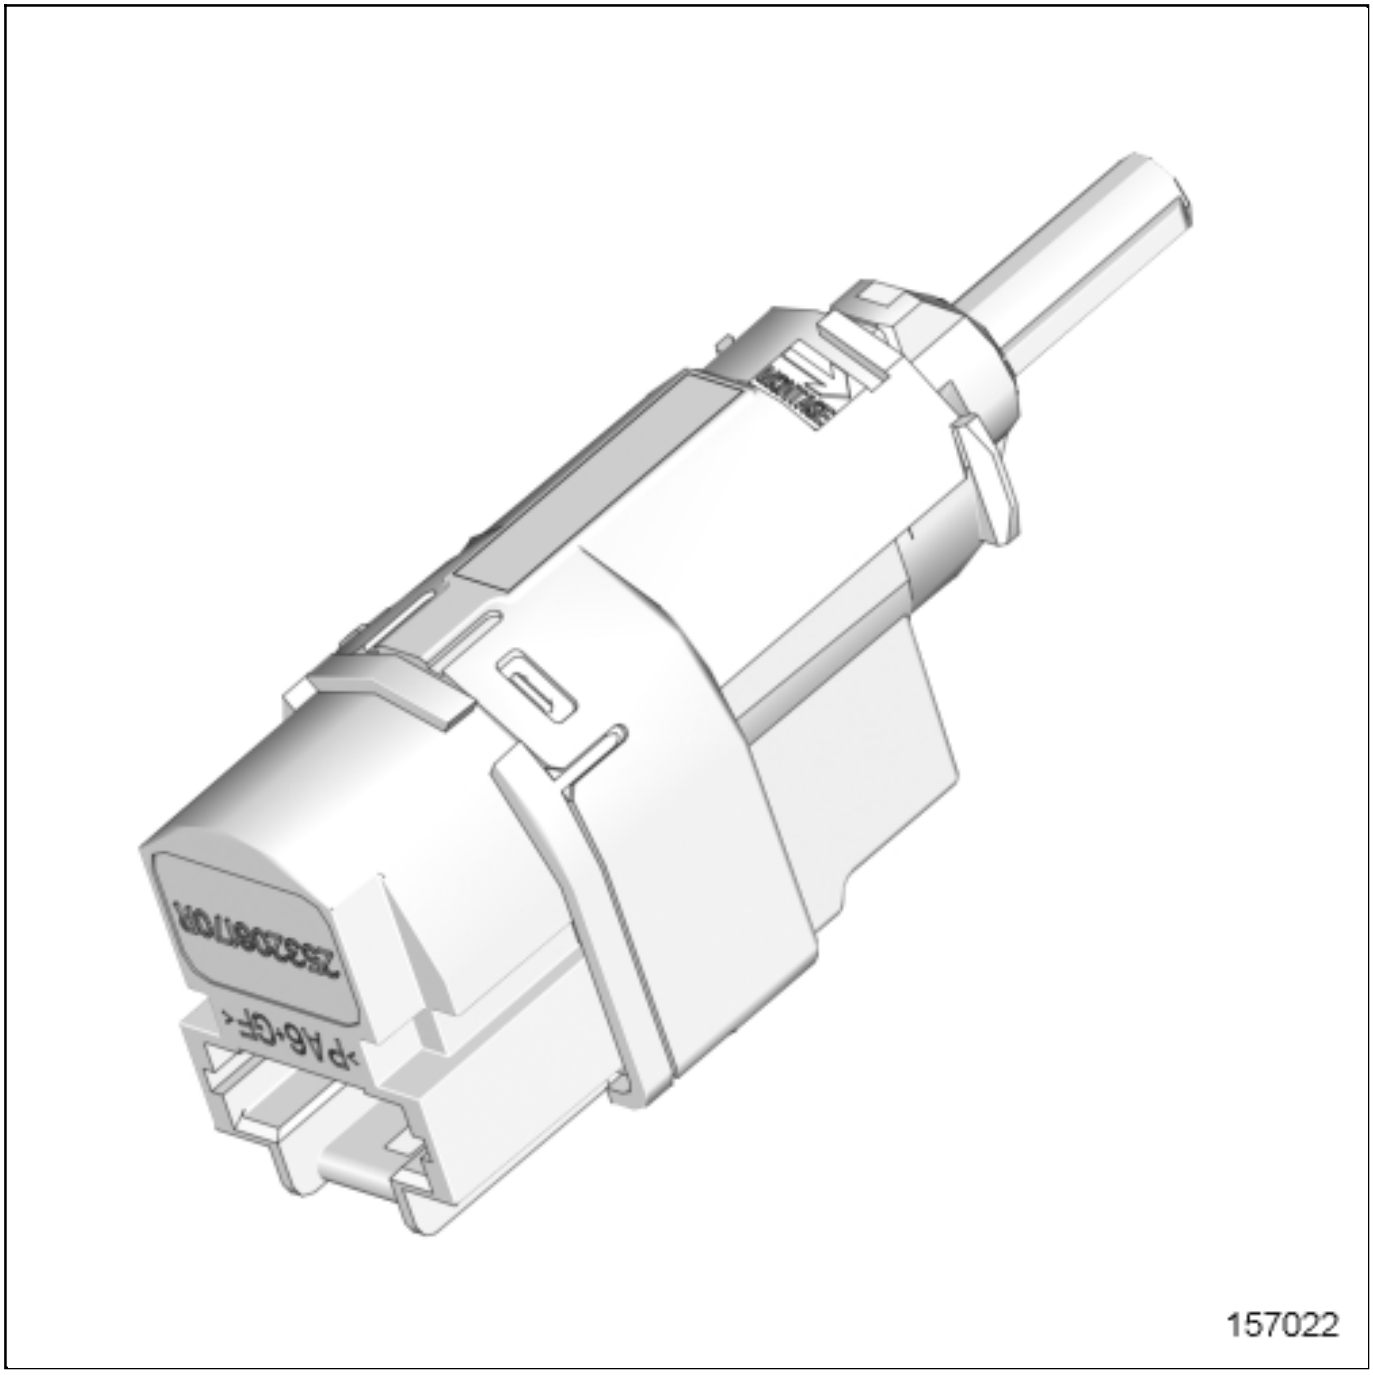


CAUTION

To ensure the correct operation of the switch, the notched rod must not be separated from the switch casing. Whenever the notched rod is completely removed, the switch must be replaced.

CAUTION

To avoid a possible loss of adjustment, replace the switch after 3 consecutive adjustments of the notched rod.



BITRON SWITCHES (GENERATION 2)

CAUTION

To avoid any malfunction (cruise control - speed limiter, starting function, braking function), the pedal switches must be replaced whenever they are removed.

METHODE ELECTRONICS (GENERATION 4)

CAUTION

To ensure the correct operation of the switch, the notched rod must not be separated from the switch casing. Whenever the notched rod is completely removed, the switch must be replaced.

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the brake pedal switch if the brake pedal is not connected to the brake servo pushrod.

Note:

Do not remove or fit the clutch pedal switch if the clutch pedal is not connected to the clutch master cylinder.

PEDAL ASSEMBLY MECHANISM: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure**

Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the brake pedal switch if the brake pedal is not connected to the brake servo pushrod.

Note:

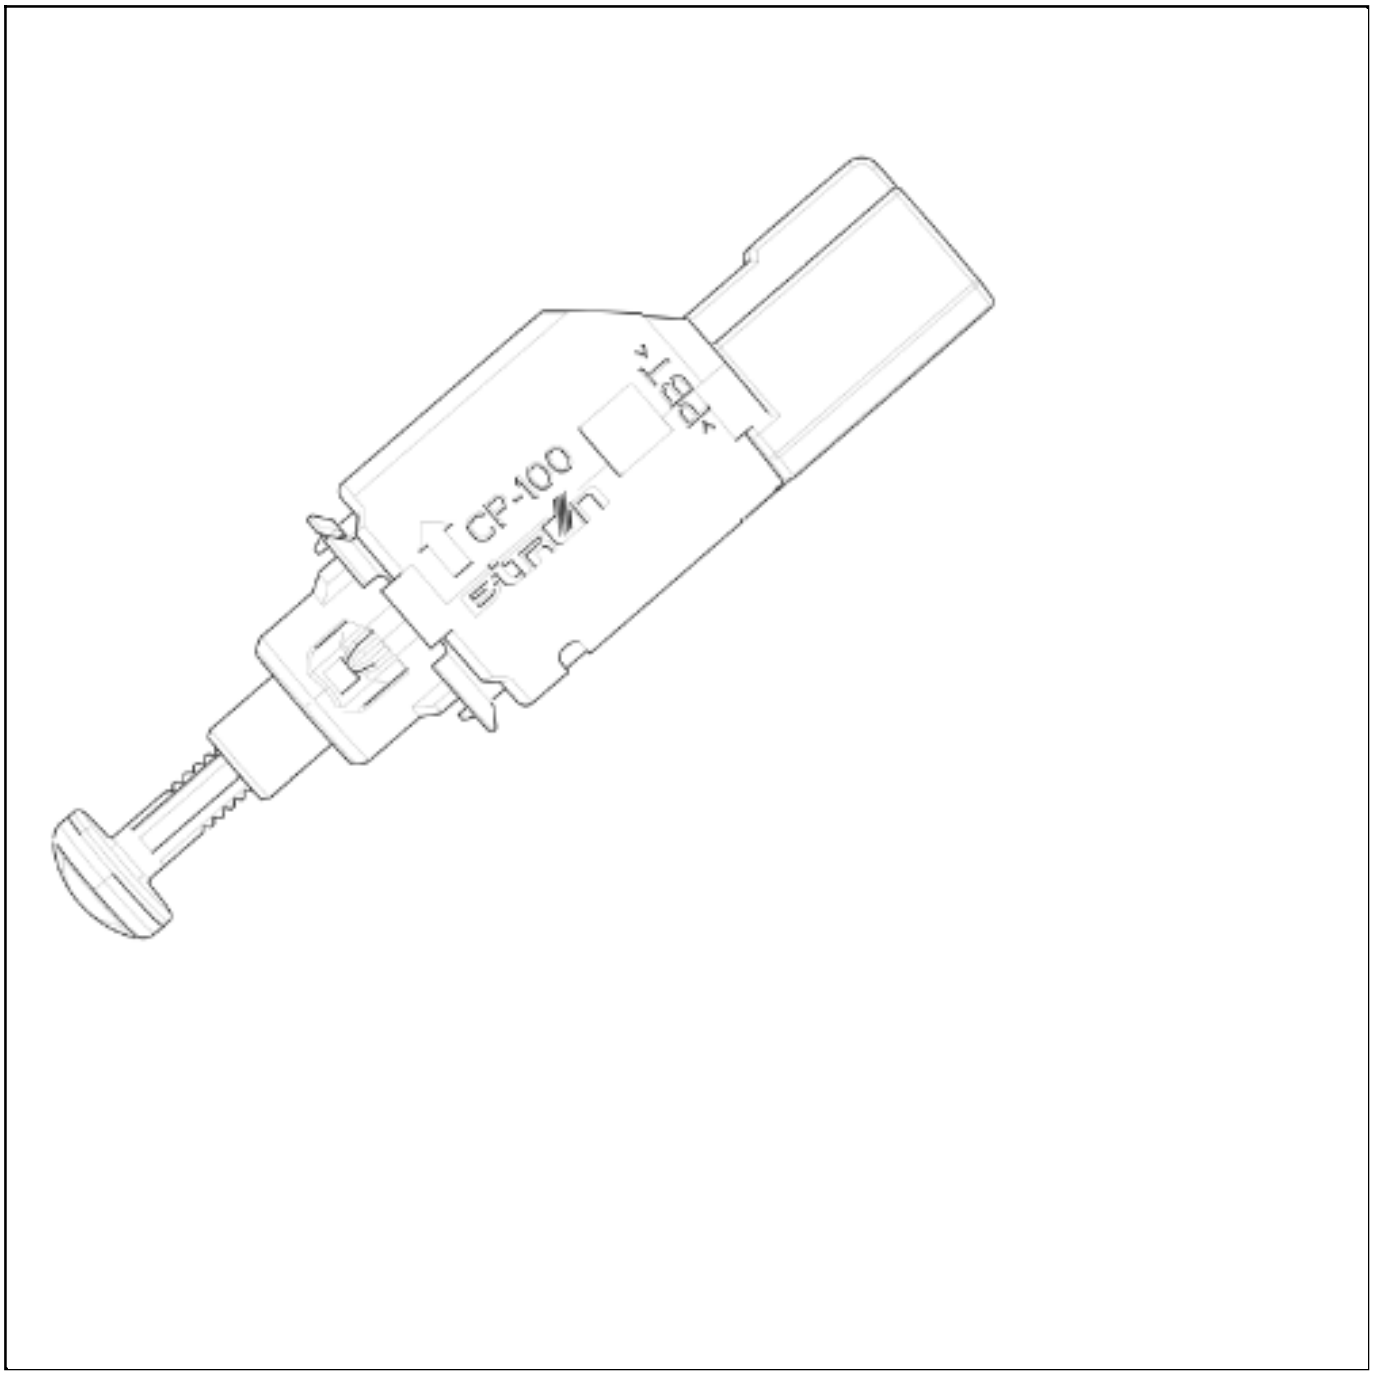
Do not remove or fit the clutch pedal switch if the clutch pedal is not connected to the clutch master cylinder.

PEDALSWITCHES:ADJUSTMENT

 **Note, one or more warnings are present in this procedure** 

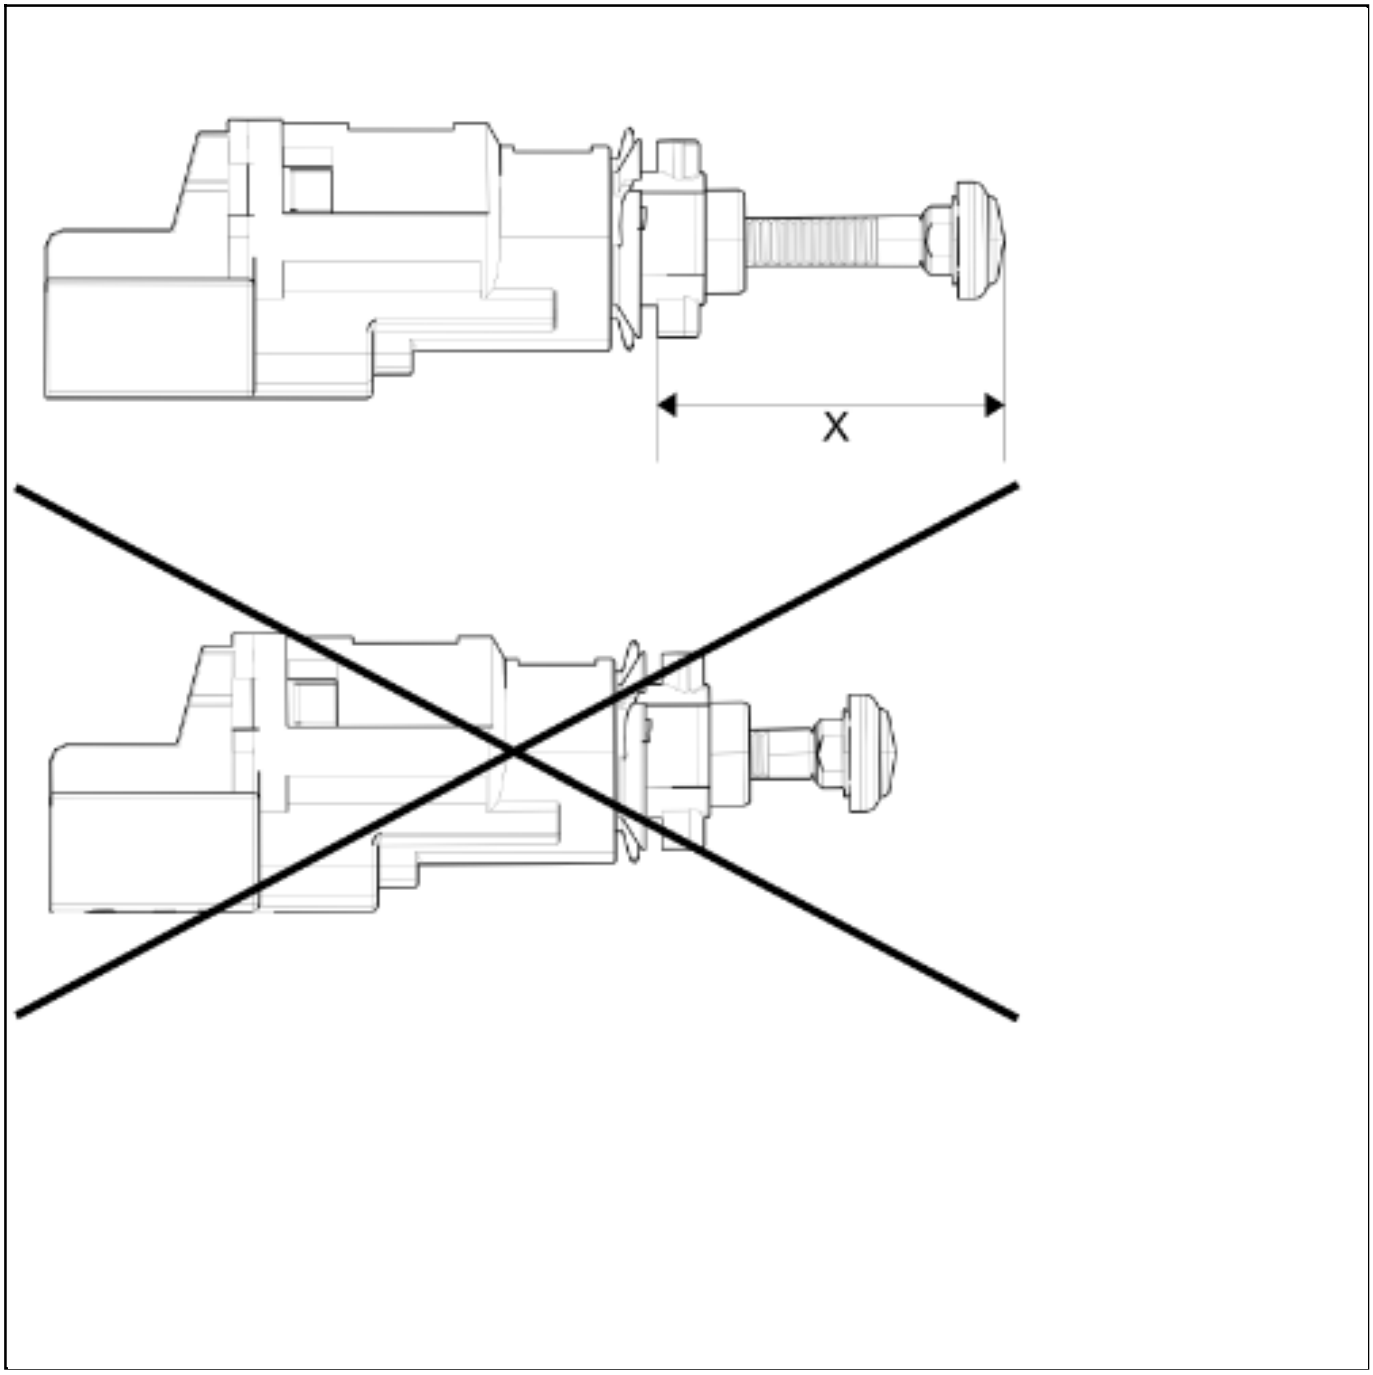
Equipment required
Diagnostic tool
set of feeler gauges

parts always to be replaced:
Brake pedal switch ring
Brake pedal switch
Clutch pedal switch ring
Clutch pedal switch



WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



(see 37A, Mechanical component controls, Pedal assembly mechanism: Precautions for the repair) ,

Vehicle: Precautions for the repair .

1. VIMERCATI AND BITRON SWITCH (GENERATION 1)

SWITCH BEFORE FITTING

If adjusting the brake pedal switch, check that the brake servo pushrod is connected to the brake pedal.

Depress the pedal by hand.

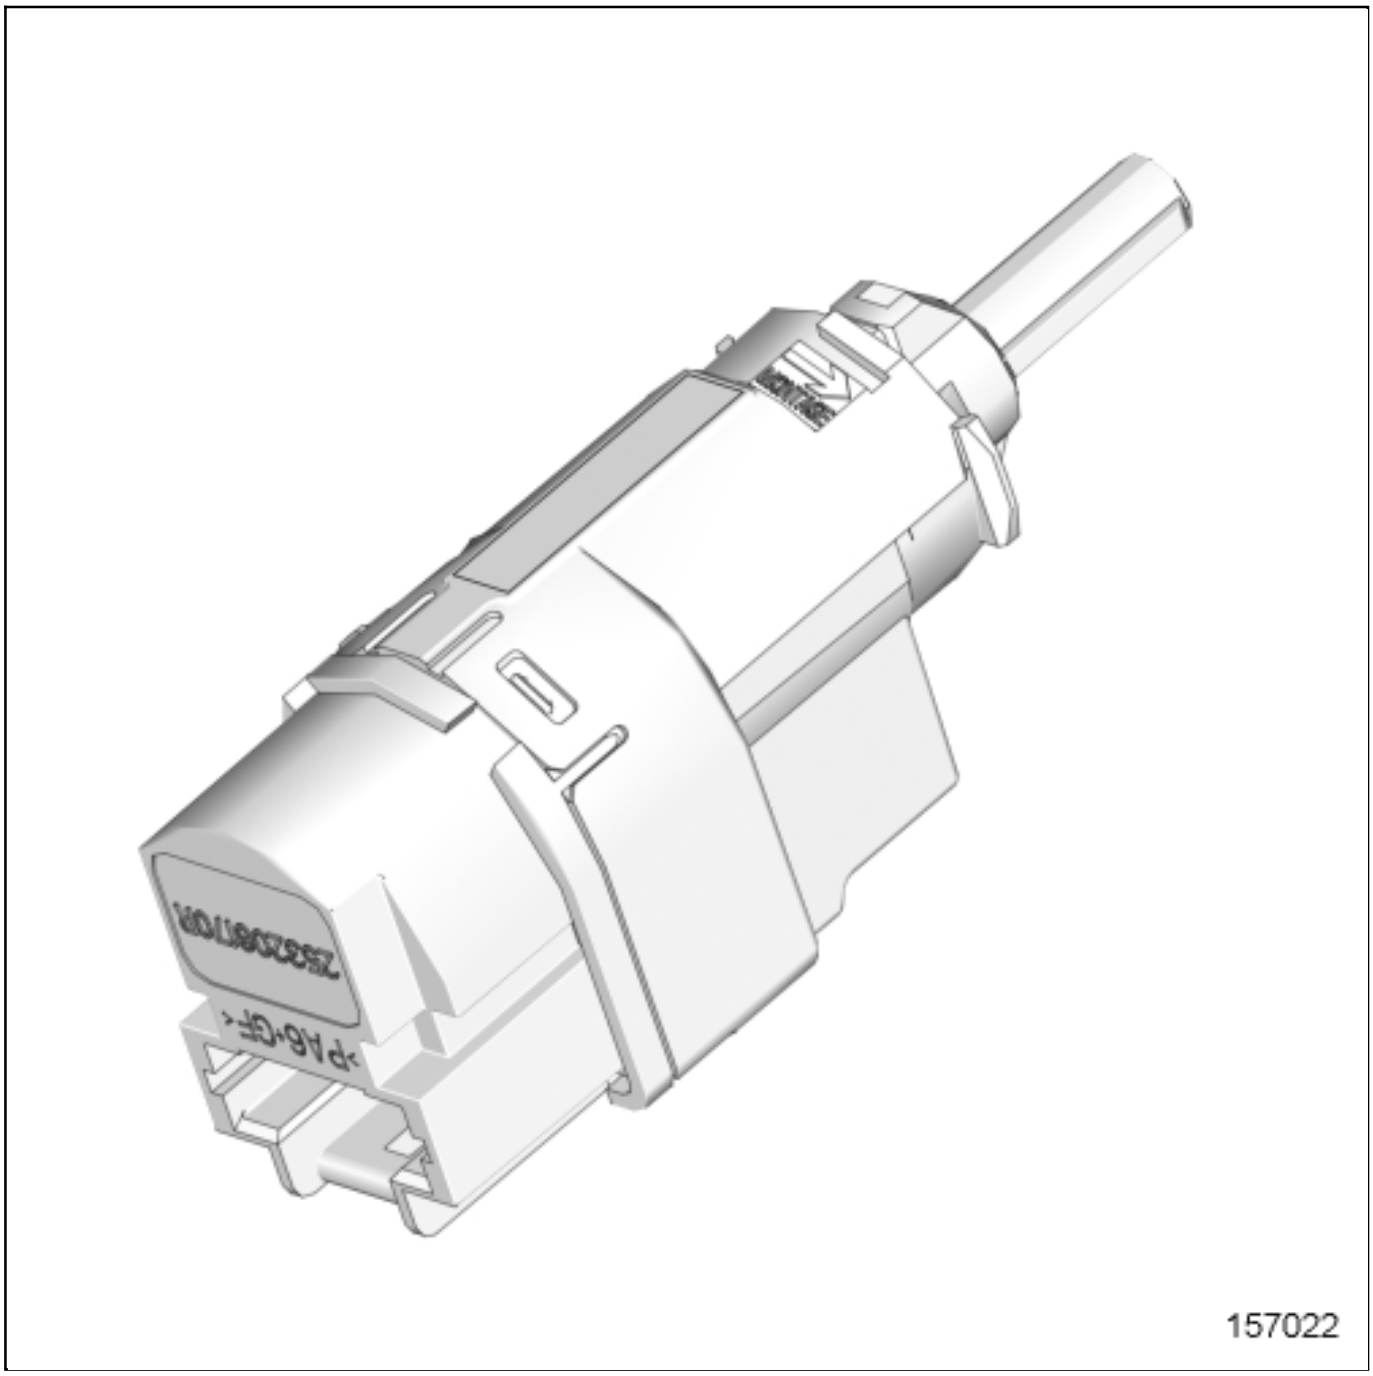
Refit the switch

Lock the switch by turning it a quarter of a turn clockwise.

At the same time, carefully return the pedal.

Note:

The switch is automatically adjusted by fully depressing the pedal.



The automatic adjustment makes a clicking noise when in operation.

Connect the switch connector.

2. BITRON SWITCH (GENERATION 2)

3. METHODE ELECTRONICS (GENERATION 4)

1- CLUTCH PEDAL SWITCH

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

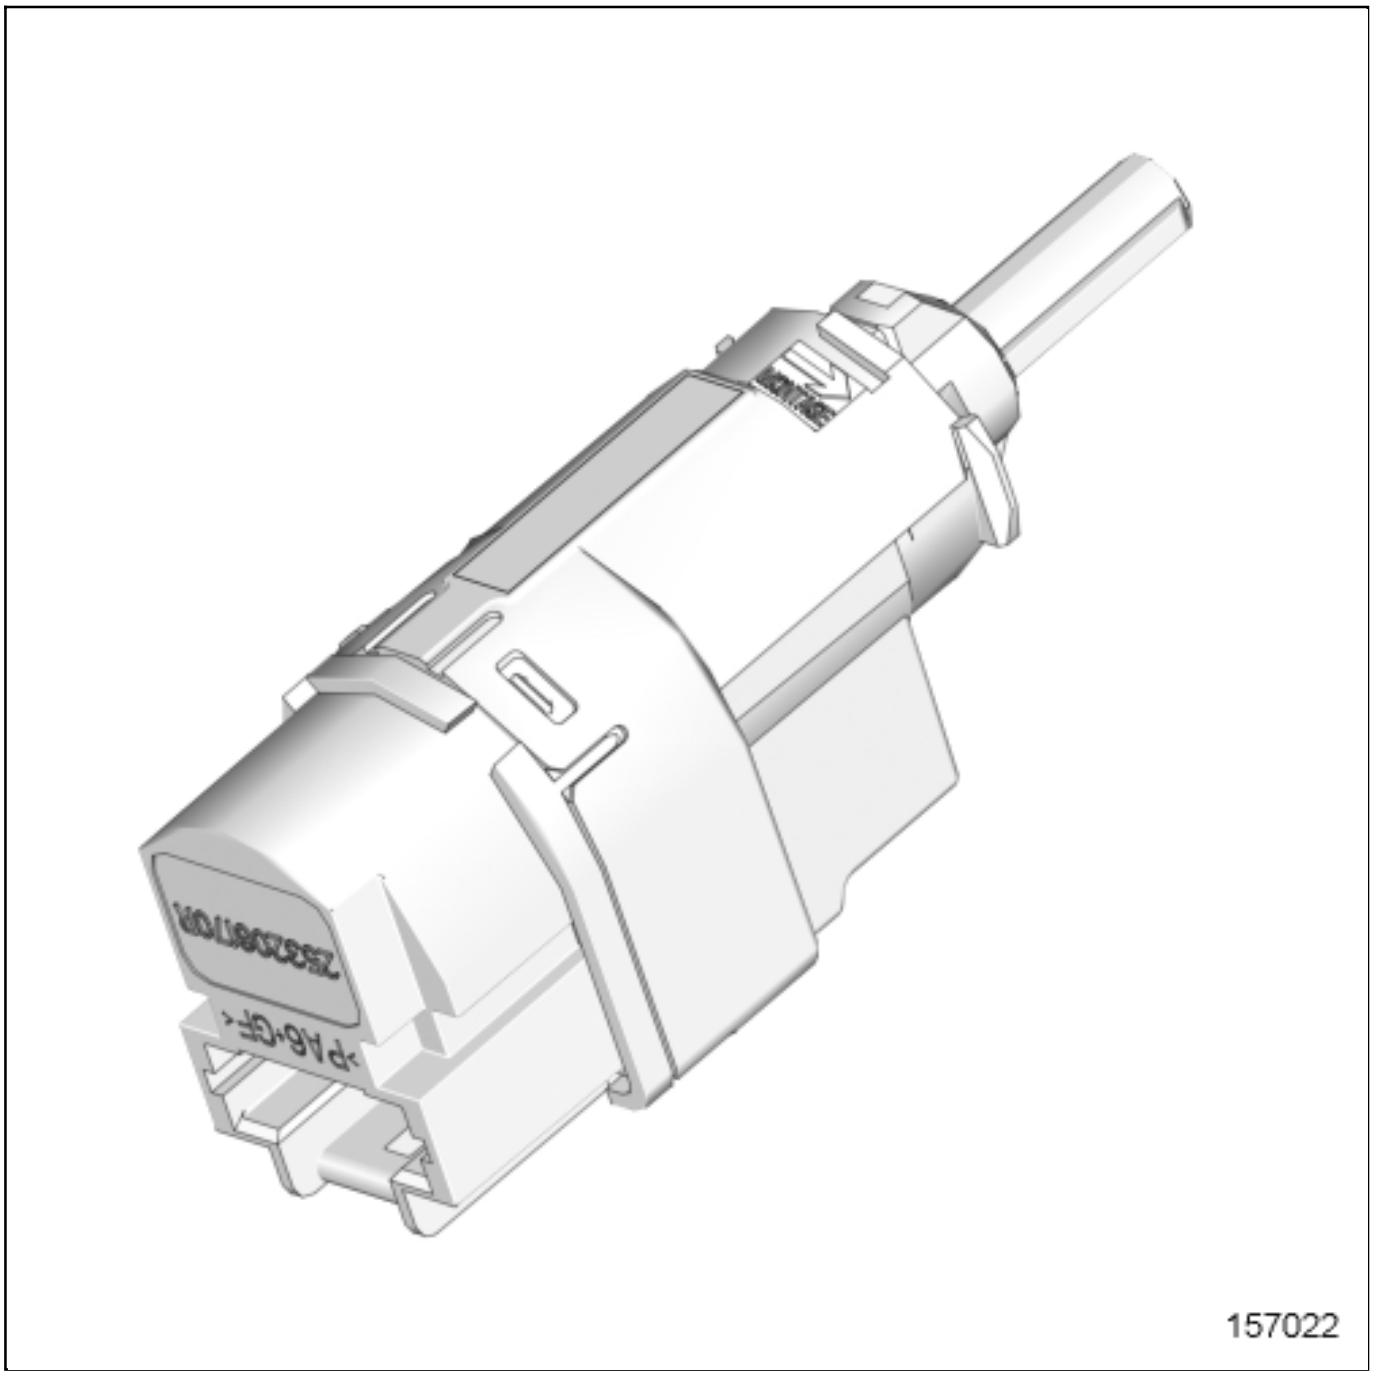
Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the clutch pedal switch if the clutch pedal is not connected to the clutch master cylinder.

Note:

Hold the switch against the bracket.



- Remove the clutch pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the clutch pedal switch by turning it a quarter of a turn clockwise.

Note:

There is no adjustment operation for this type of clutch pedal switch.

2- BRAKE PEDAL SWITCH

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the brake pedal switch if the brake pedal is not connected to the brake servo pushrod.

Note:

Hold the switch against the bracket.

- Remove the brake pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the brake pedal switch by turning it a quarter of a turn clockwise.

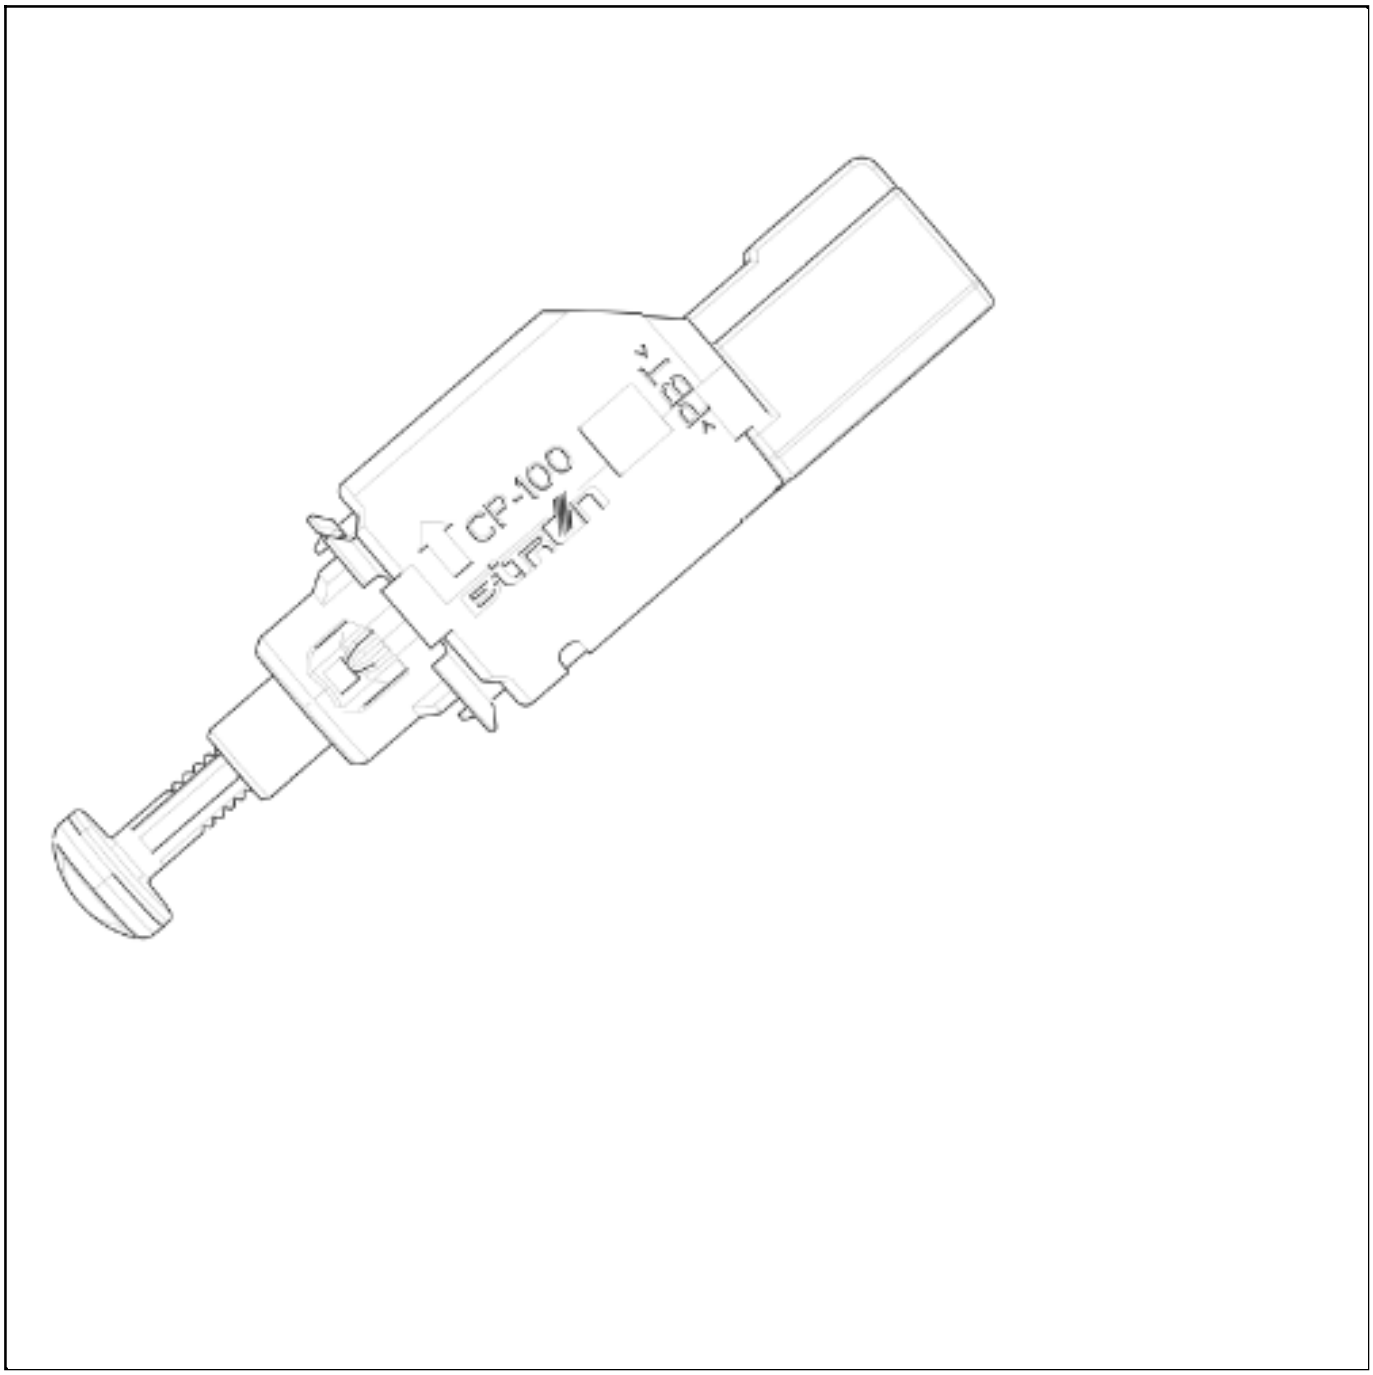
Note:

There is no adjustment operation for this type of brake pedal switch.

PEDALSWITCHES:ADJUSTMENT

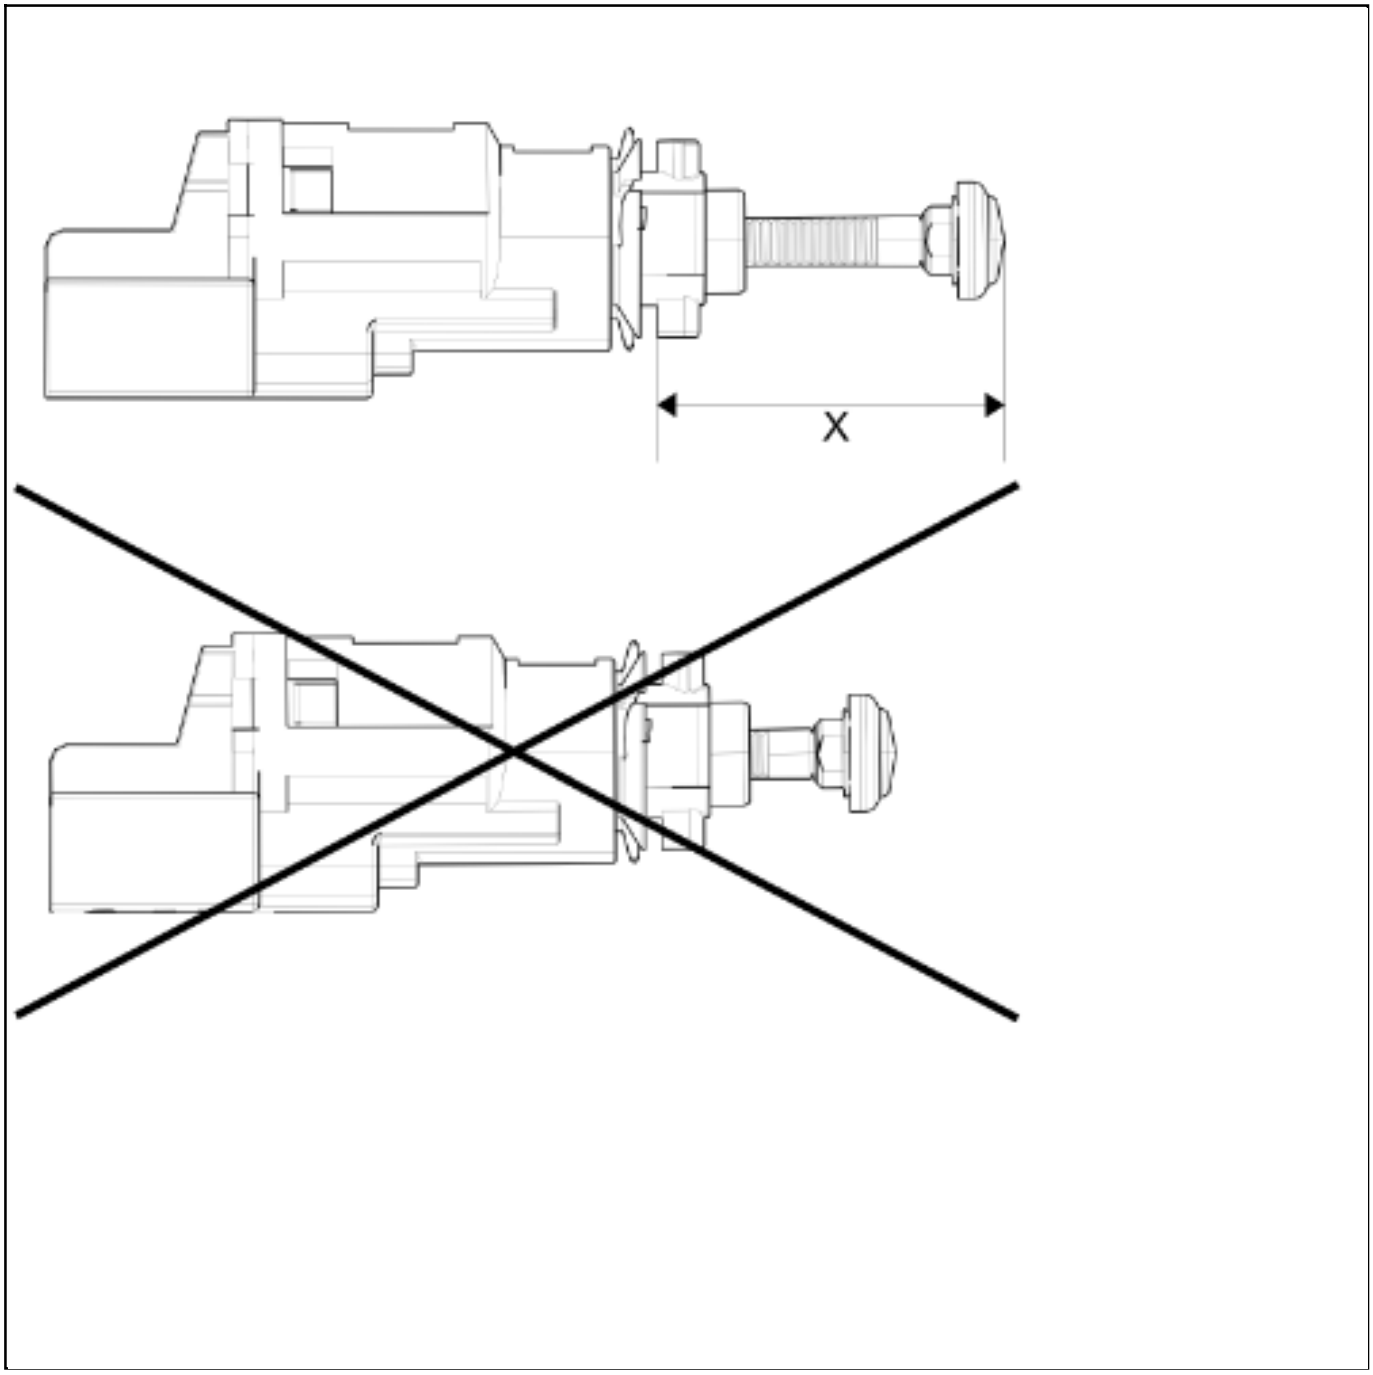
Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
set of feeler gauges



parts always to be replaced:
Brake pedal switch ring
Brake pedal switch
Clutch pedal switch ring
Clutch pedal switch

WARNING



To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 37A, Mechanical component controls, Pedal assembly mechanism: Precautions for the repair) ,

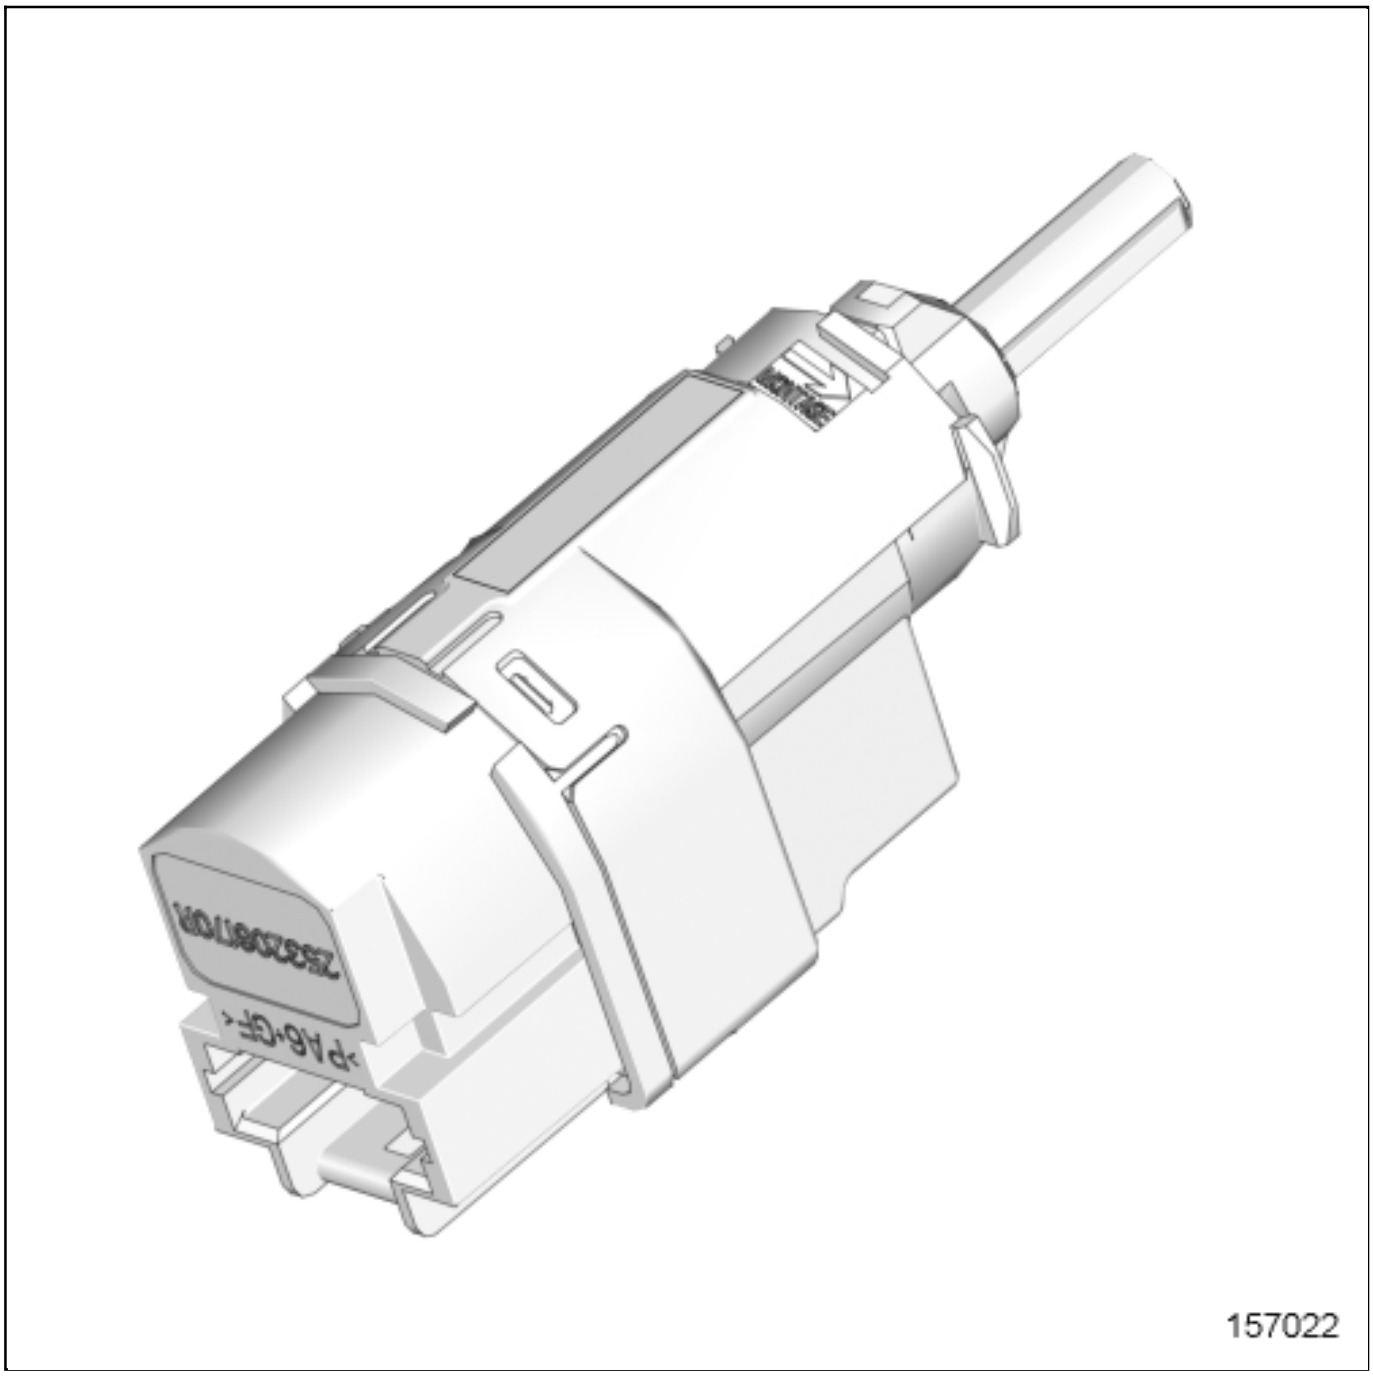
- Refit the switch

- Lock the switch by turning it a quarter of a turn clockwise.

At the same time, carefully return the pedal.

Note:

The switch is automatically adjusted by fully depressing the pedal.



The automatic adjustment makes a clicking noise when in operation.

Connect the switch connector.

2. BITRON SWITCH (GENERATION 2)

3. METHODE ELECTRONICS (GENERATION 4)

1- CLUTCH PEDAL SWITCH

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

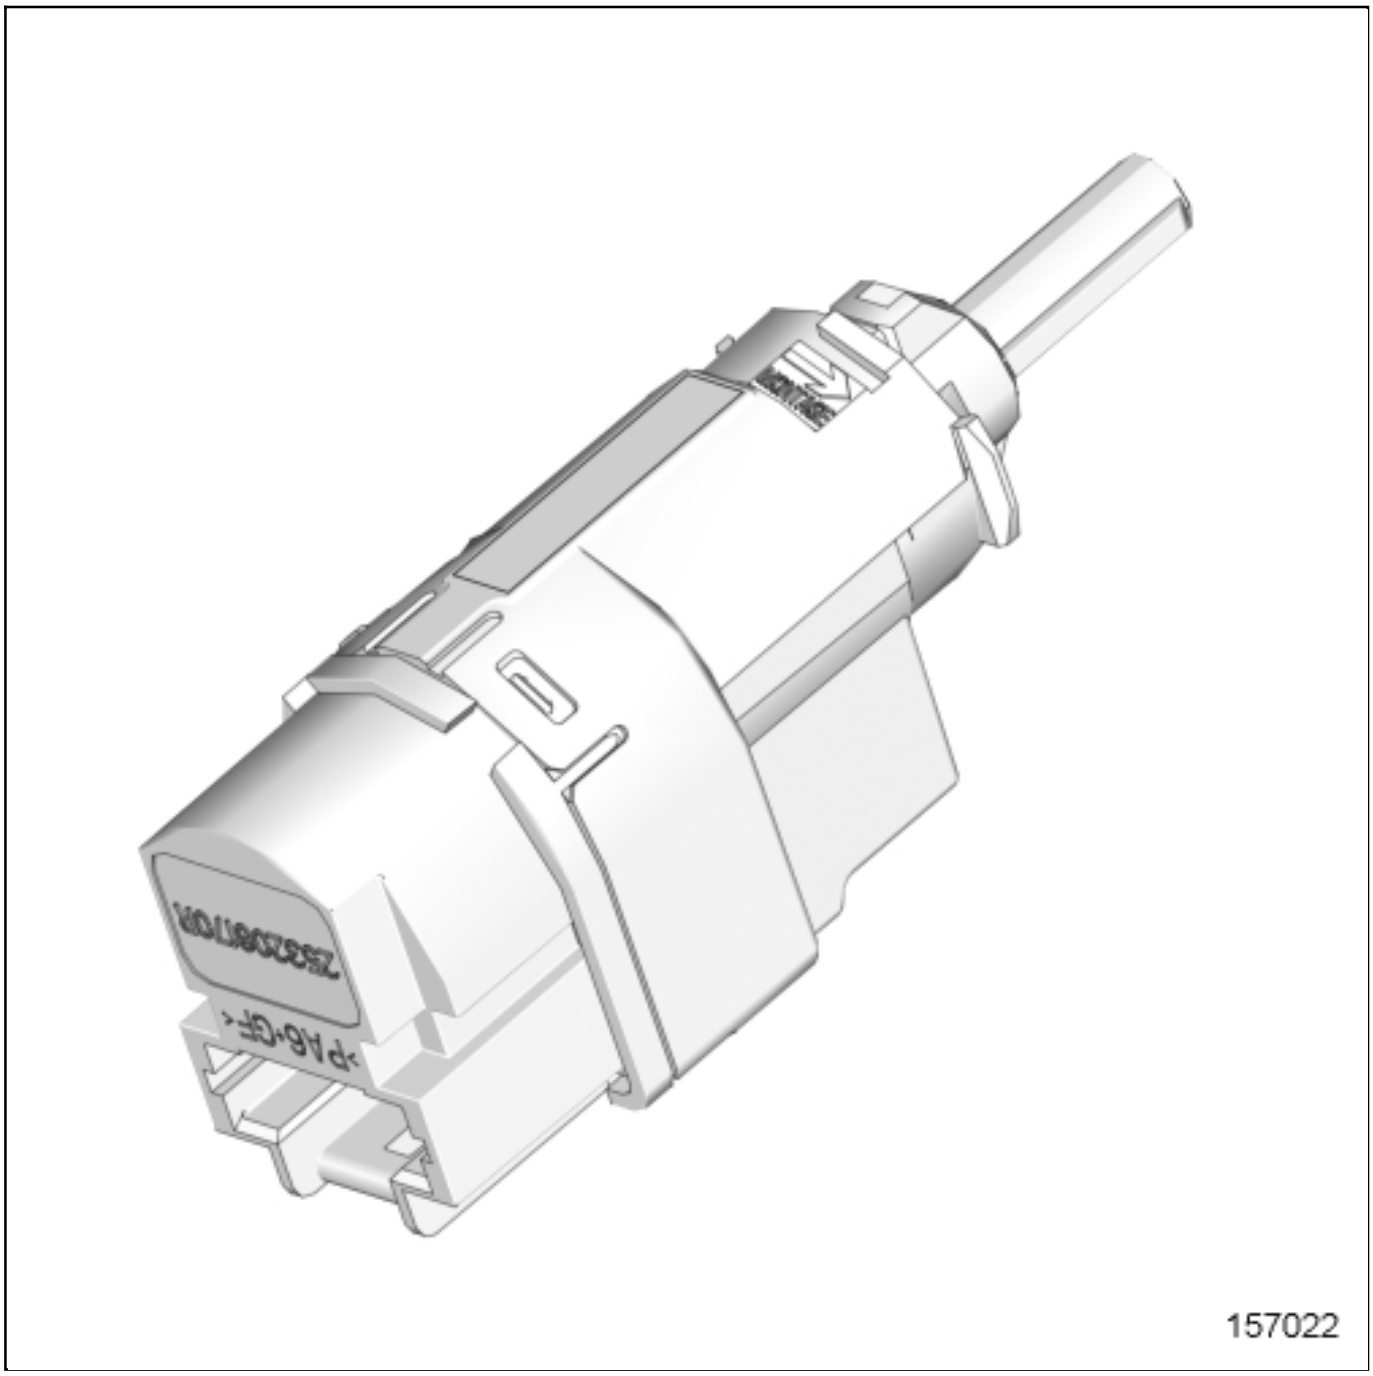
Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the clutch pedal switch if the clutch pedal is not connected to the clutch master cylinder.

Note:

Hold the switch against the bracket.



- Remove the clutch pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the clutch pedal switch by turning it a quarter of a turn clockwise.

Note:

There is no adjustment operation for this type of clutch pedal switch.

2- BRAKE PEDAL SWITCH

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the brake pedal switch if the brake pedal is not connected to the brake servo pushrod.

Note:

Hold the switch against the bracket.

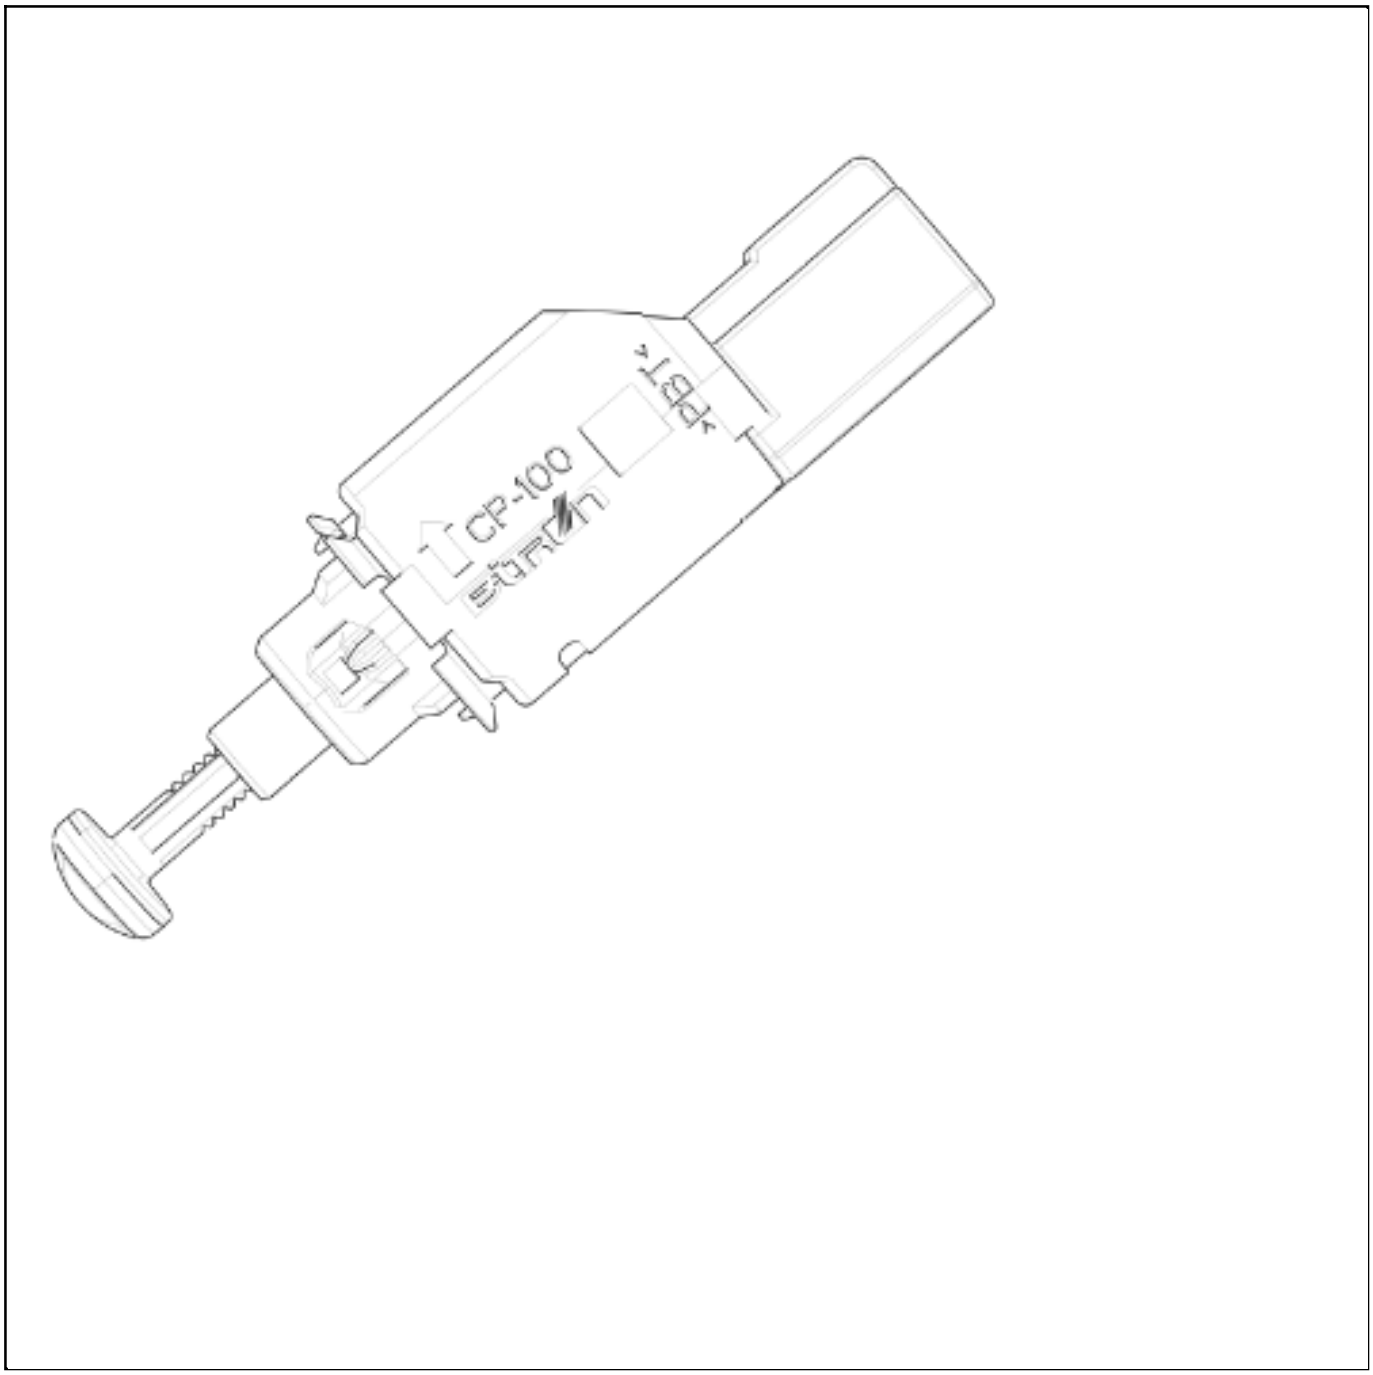
- Remove the brake pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the brake pedal switch by turning it a quarter of a turn clockwise.

Note:

There is no adjustment operation for this type of brake pedal switch.

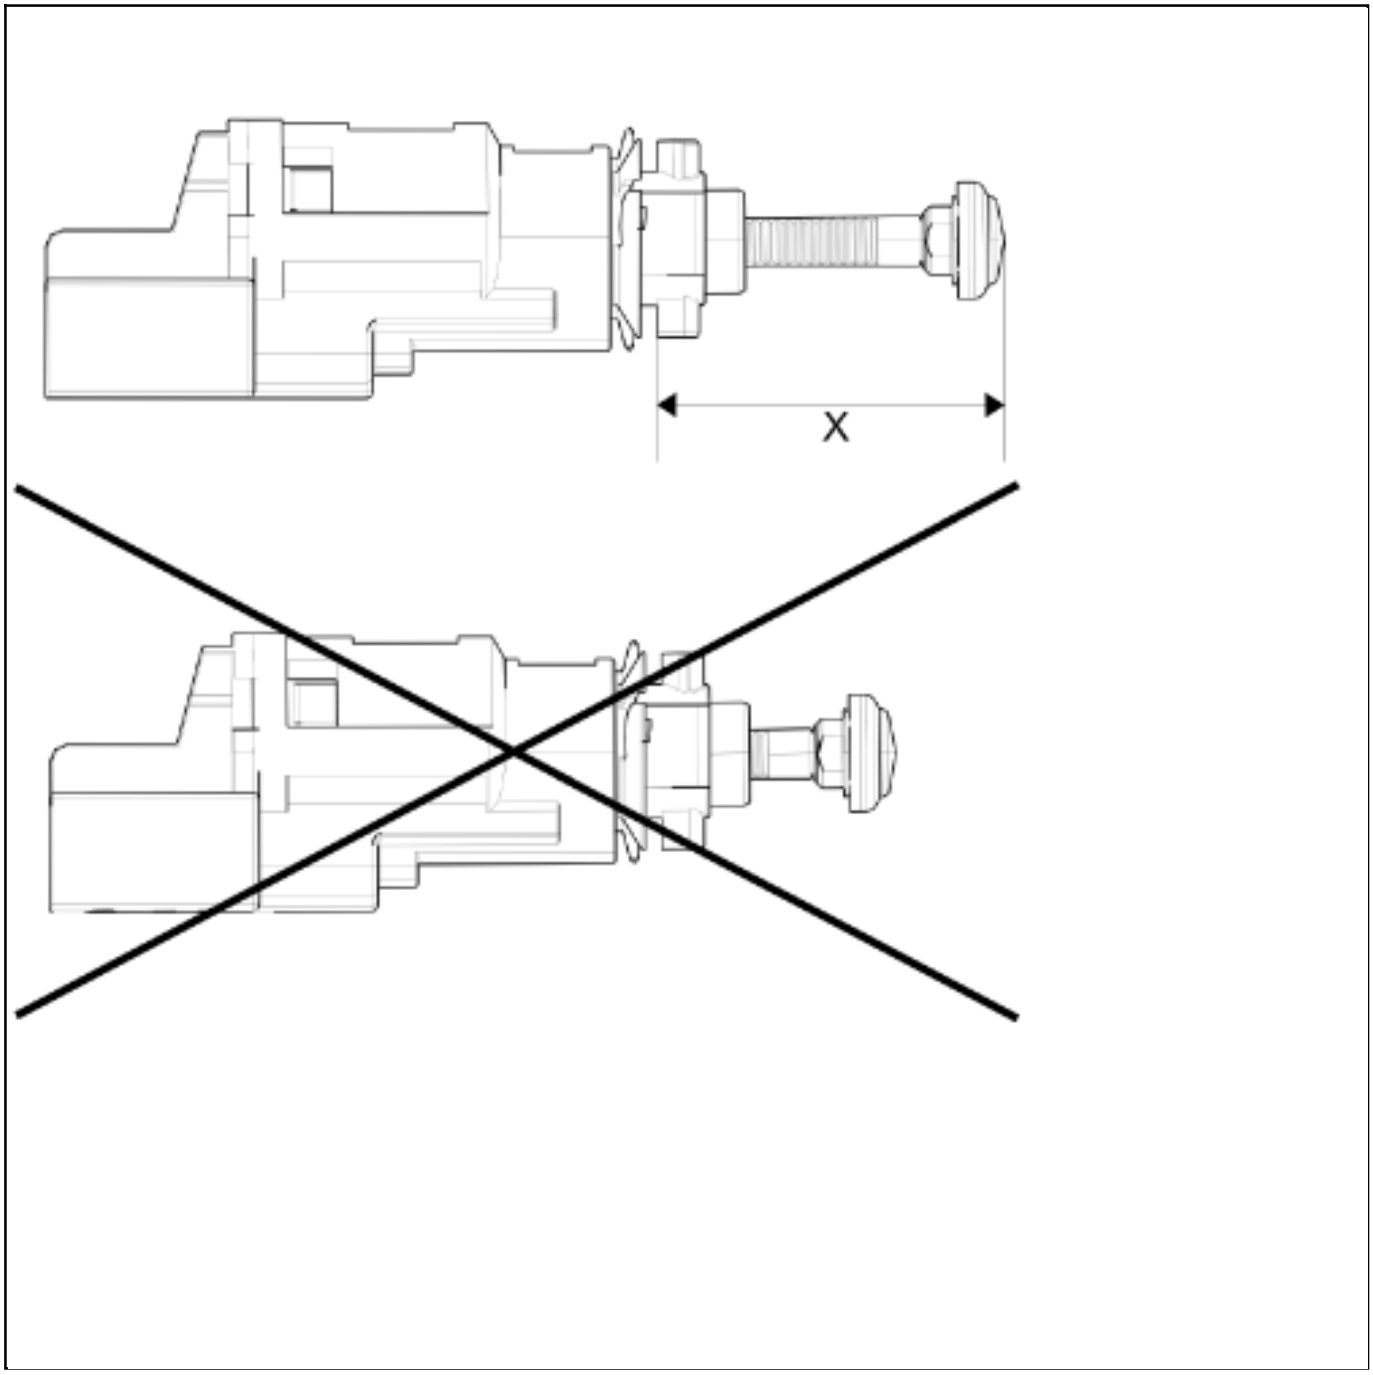
PEDALSWITCHES:ADJUSTMENT

Note, one or more warnings are present in this procedure



WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



- (see 37A, Mechanical component controls, Pedal assembly mechanism: Precautions for the repair) ,
-

Vehicle: Precautions for the repair .

1. VIMERCATI AND BITRON SWITCH (GENERATION 1)

SWITCH BEFORE FITTING

If adjusting the brake pedal switch, check that the brake servo pushrod is connected to the brake pedal.

Depress the pedal by hand.

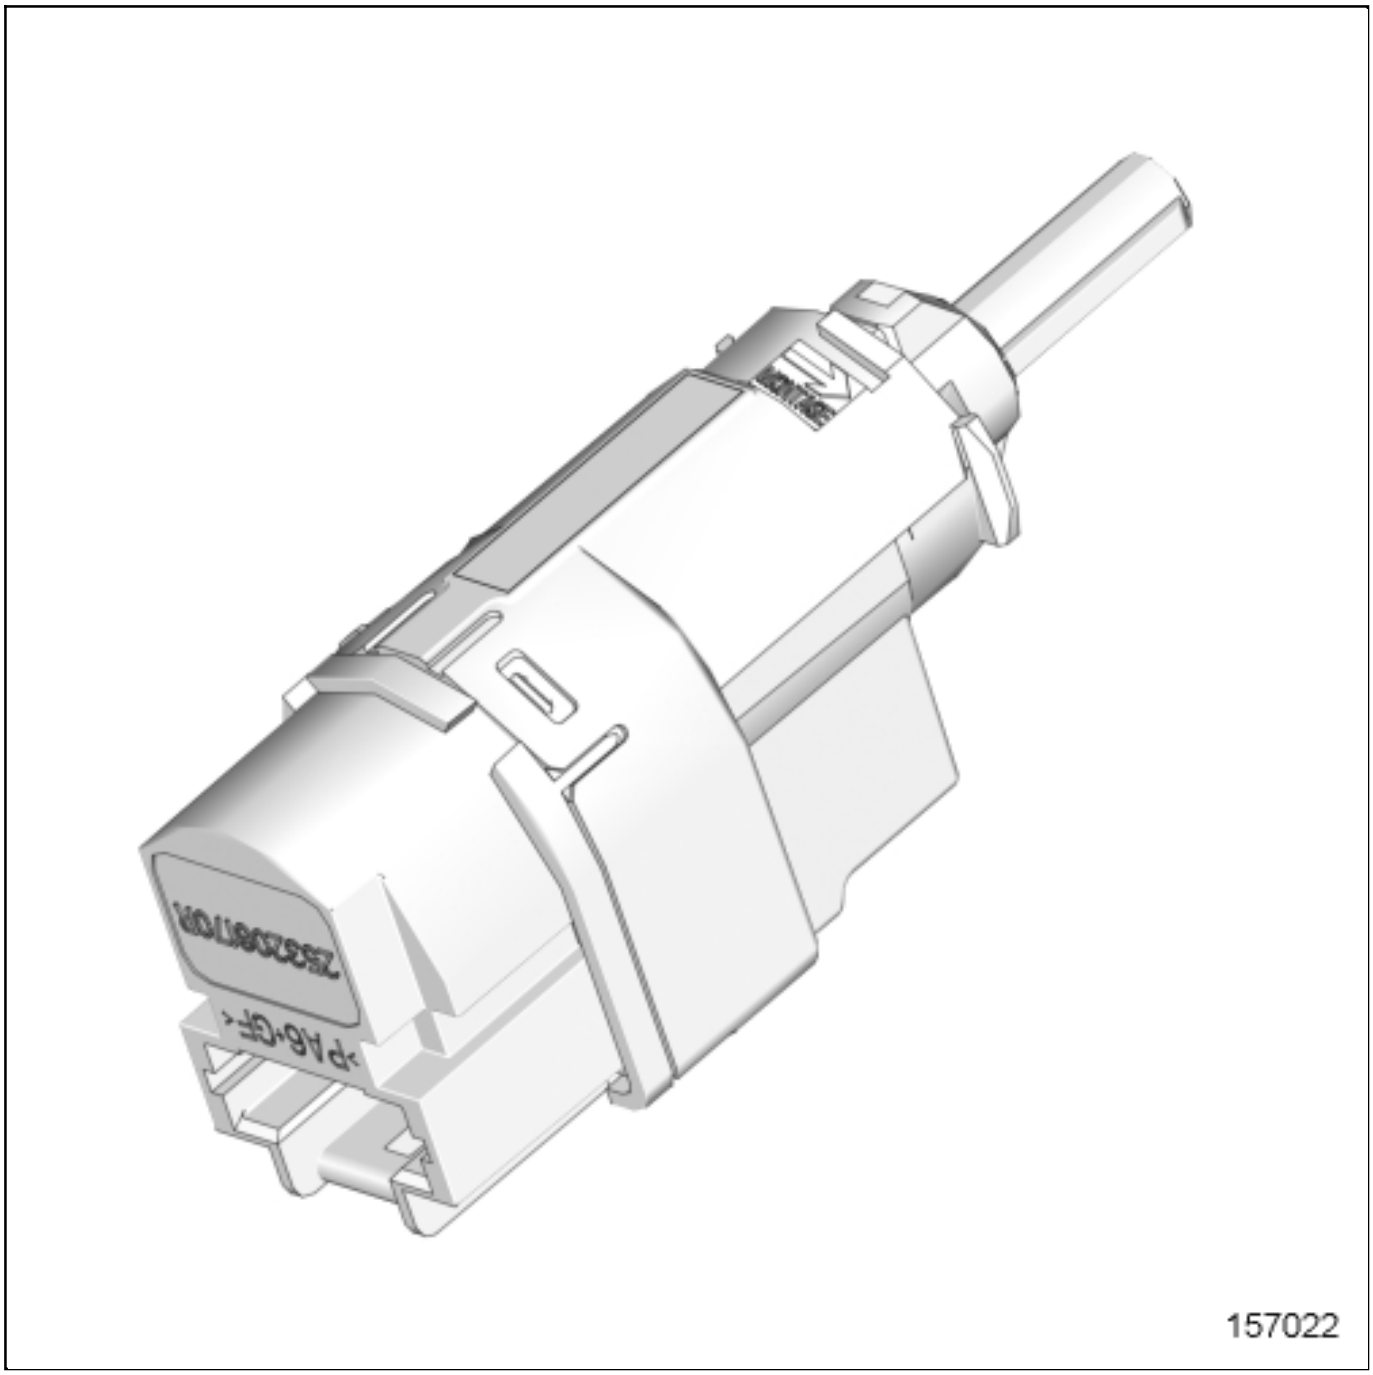
Refit the switch

Lock the switch by turning it a quarter of a turn clockwise.

At the same time, carefully return the pedal.

Note:

The switch is automatically adjusted by fully depressing the pedal.



The automatic adjustment makes a clicking noise when in operation.

Connect the switch connector.

2. BITRON SWITCH (GENERATION 2)

3. METHODE ELECTRONICS (GENERATION 4)

1- CLUTCH PEDAL SWITCH

157022

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

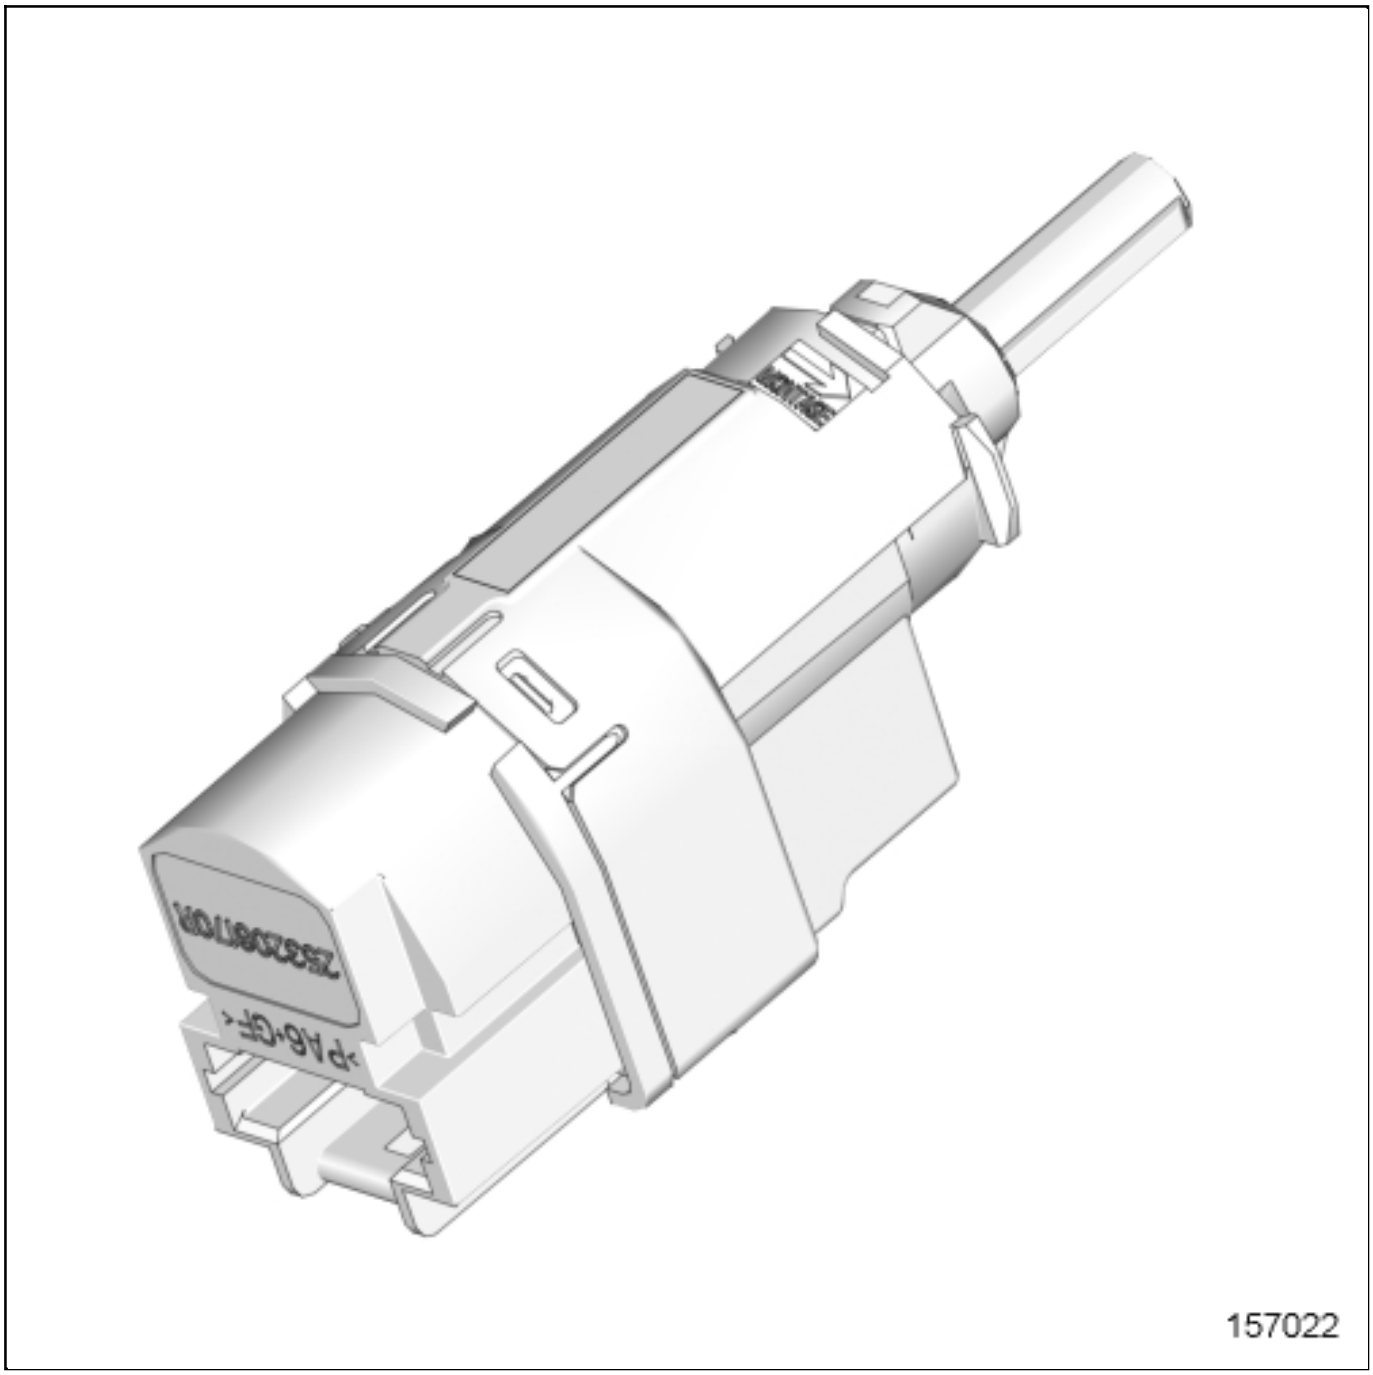
Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the clutch pedal switch if the clutch pedal is not connected to the clutch master cylinder.

Note:



Hold the switch against the bracket.

- Remove the clutch pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the clutch pedal switch by turning it a quarter of a turn clockwise.

Note:

There is no adjustment operation for this type of clutch pedal switch.

2- BRAKE PEDAL SWITCH

157022

Note:

Do not press or move the pedal during installation in order to avoid incorrect adjustment of the switch.

Note:

Do not press or move the pedal during disassembly in order to avoid damaging the switch.

Note:

Do not remove or fit the brake pedal switch if the brake pedal is not connected to the brake servo pushrod.

Note:

Hold the switch against the bracket.

- Remove the brake pedal switch by turning it a quarter of a turn anti-clockwise.
- Press the switch against the bracket and hold it perpendicular to the pedal aperture.
- Refit the brake pedal switch by turning it a quarter of a turn clockwise.

Note:

There is no adjustment operation for this type of brake pedal switch.

PETROL INJECTION : EXPLODED VIEW

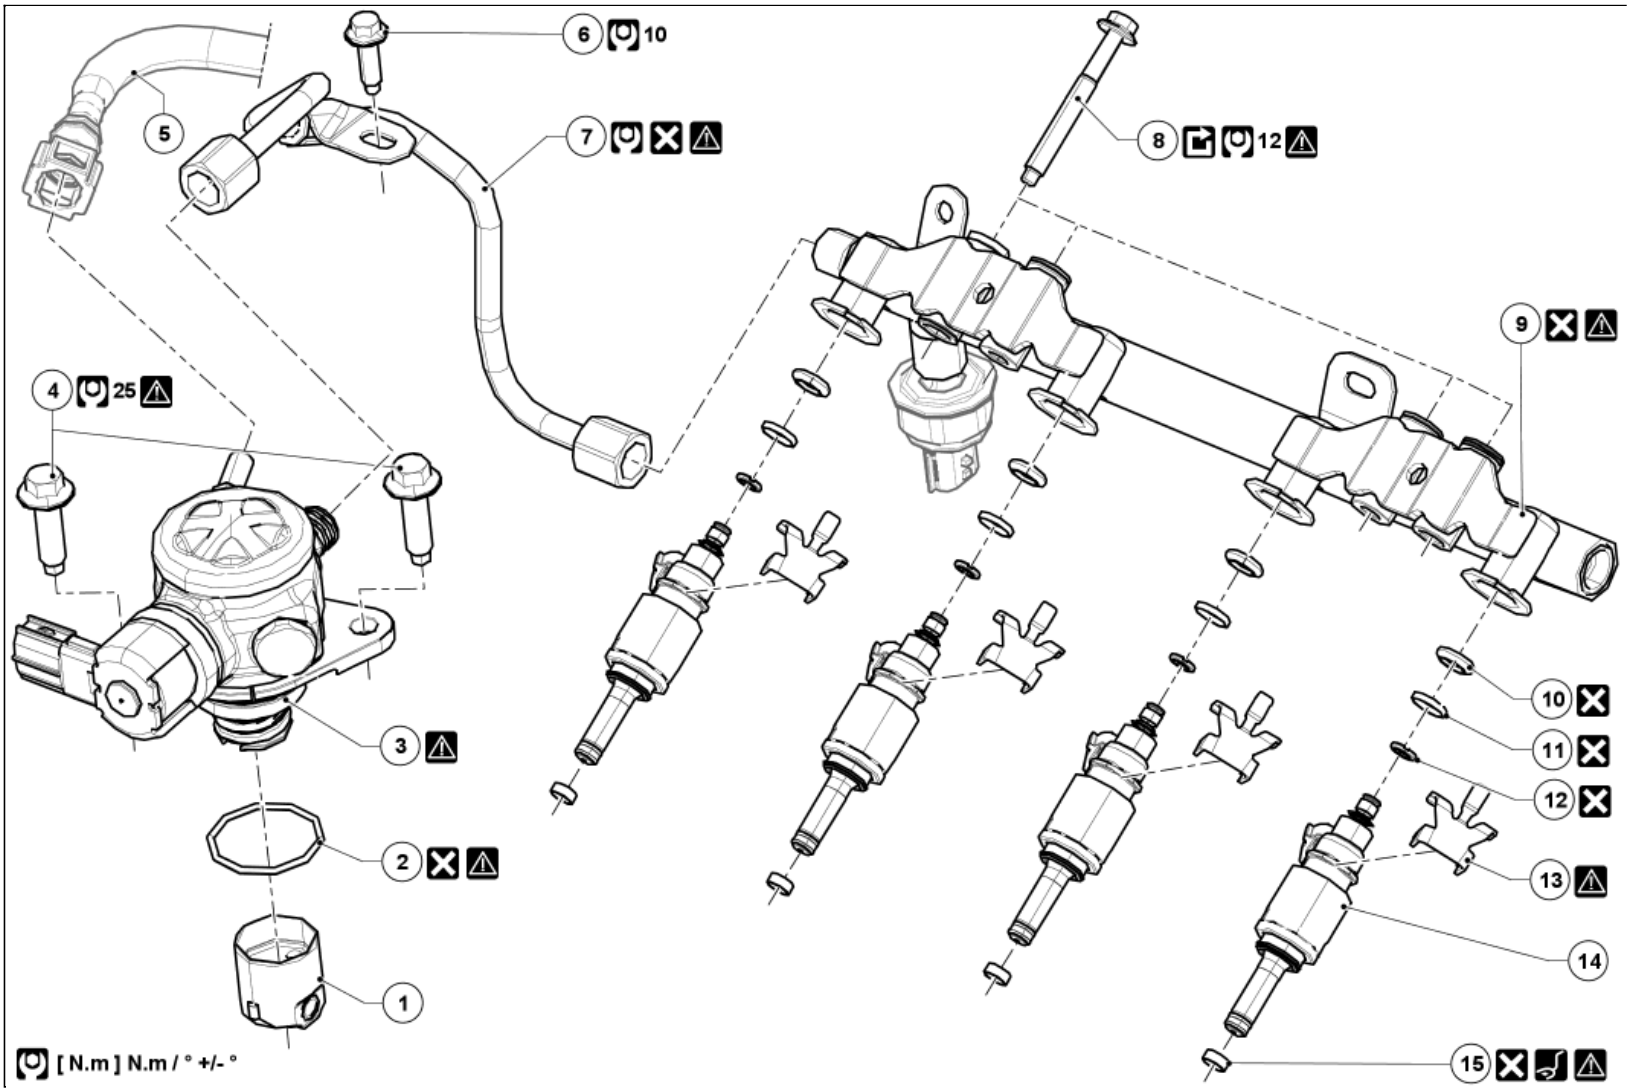


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Gasoline high pressure pump lifter	
2	Gasoline high pressure pump seal	Lightly oil the new seal
3	Gasoline high pressure pump	(see **High pressure pump: Removal - Refitting**) Tightening and replacement(see 17B, Petrol injection, Injector rail - Injectors: Removal - Refitting) Risk of damaging the pipe or the gaseline rail
4	Gasoline high pressure pump bolts	25 N.m +/-4 Place the drive cam on the camshaft at bottom dead center, then tightening bolts gradual and alternately
5	Low pressure gasoline supply hose	
6	Gasoline inlet high pressure pipe to high pressure rail bolt	10 N.m +/-2
7	Gasoline inlet high pressure pipe to high pressure rail	Tightening and replacement(see 17B, Petrol injection, Injector rail - Injectors: Removal - Refitting) Risk of damaging the pipe or the gaseline rail
8	Injector rail - injectors assembly bolts	12 N.m +/-1 Tightening spiral from the outside, timing end
9	Injector rail - injectors	(see 17B, Petrol injection, Injector rail - Injectors: Removal - Refitting) Tightening spiral from the outside Tightening and replacement(see 17B, Petrol injection, Injector rail - Injectors: Removal - Refitting) Risk of damaging the pipe or the gaseline rail
10	O-ring seal	
11	O-ring lower seal	
12	Ring stopper	
13	Injector damper clip	Warning: the injector is not held on the rail by the clip
14	Gasoline direct injection injector	(see 17B, Petrol injection, Injector rail - Injectors: Removal - Refitting) Warning: the injector is held neither on the rail or on the cylinder head. Do not shock the injector
15	Injector nozzle teflon ring seal	Respect the fitting instructions (Mot.1533)

PINKING SENSOR: REMOVAL - REFITTING

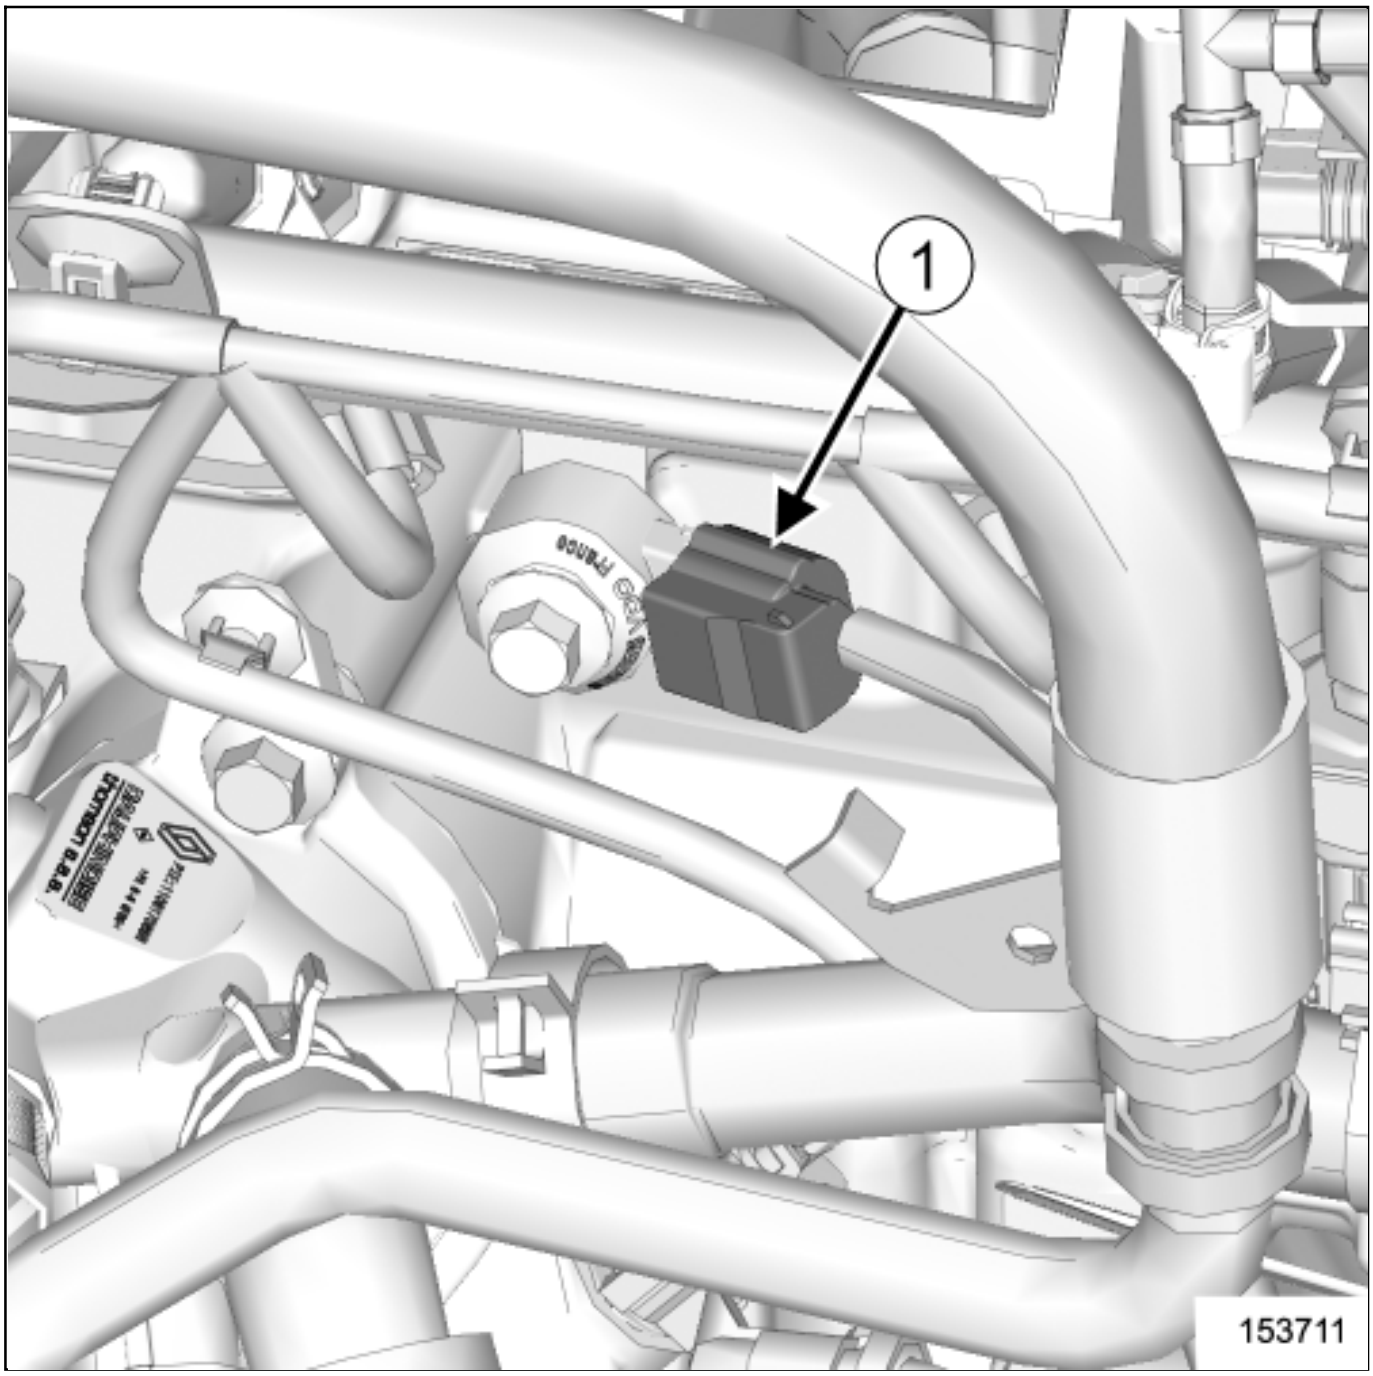
Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts always be replaced, etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .



Remove:

- the engine undertray bolts,
- the engine undertray.

Remove **Air inlet assembly: Exploded view** :

- the intercooler air inlet pipe,
- the air inlet pipe,
- the throttle valve,
- the inlet distributor.

2. REMOVAL OPERATION

Note:

Mark the positioning of the sensor before removing.

Disconnect the pinking sensor connector(1) .

Remove (see **Engine and transmission assembly sensors: List and location of components**) :

- the pinking sensor bolt,
- the pinking sensor.

REFITTING

1. REFITTING OPERATION

- Refit in its initial position(see **Engine and transmission assembly sensors: List and location of components**) :
  - the pinking sensor,
  - the pinking sensor bolt.
- Torque tighten the pinking sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) **.**
- Connect the pinking sensor connector.

2. FINAL OPERATION

- Proceed in the reverse order to removal.
- Apply the After repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component controlled by this computer concerned by the After repair procedure:

- "Pinking sensor" .

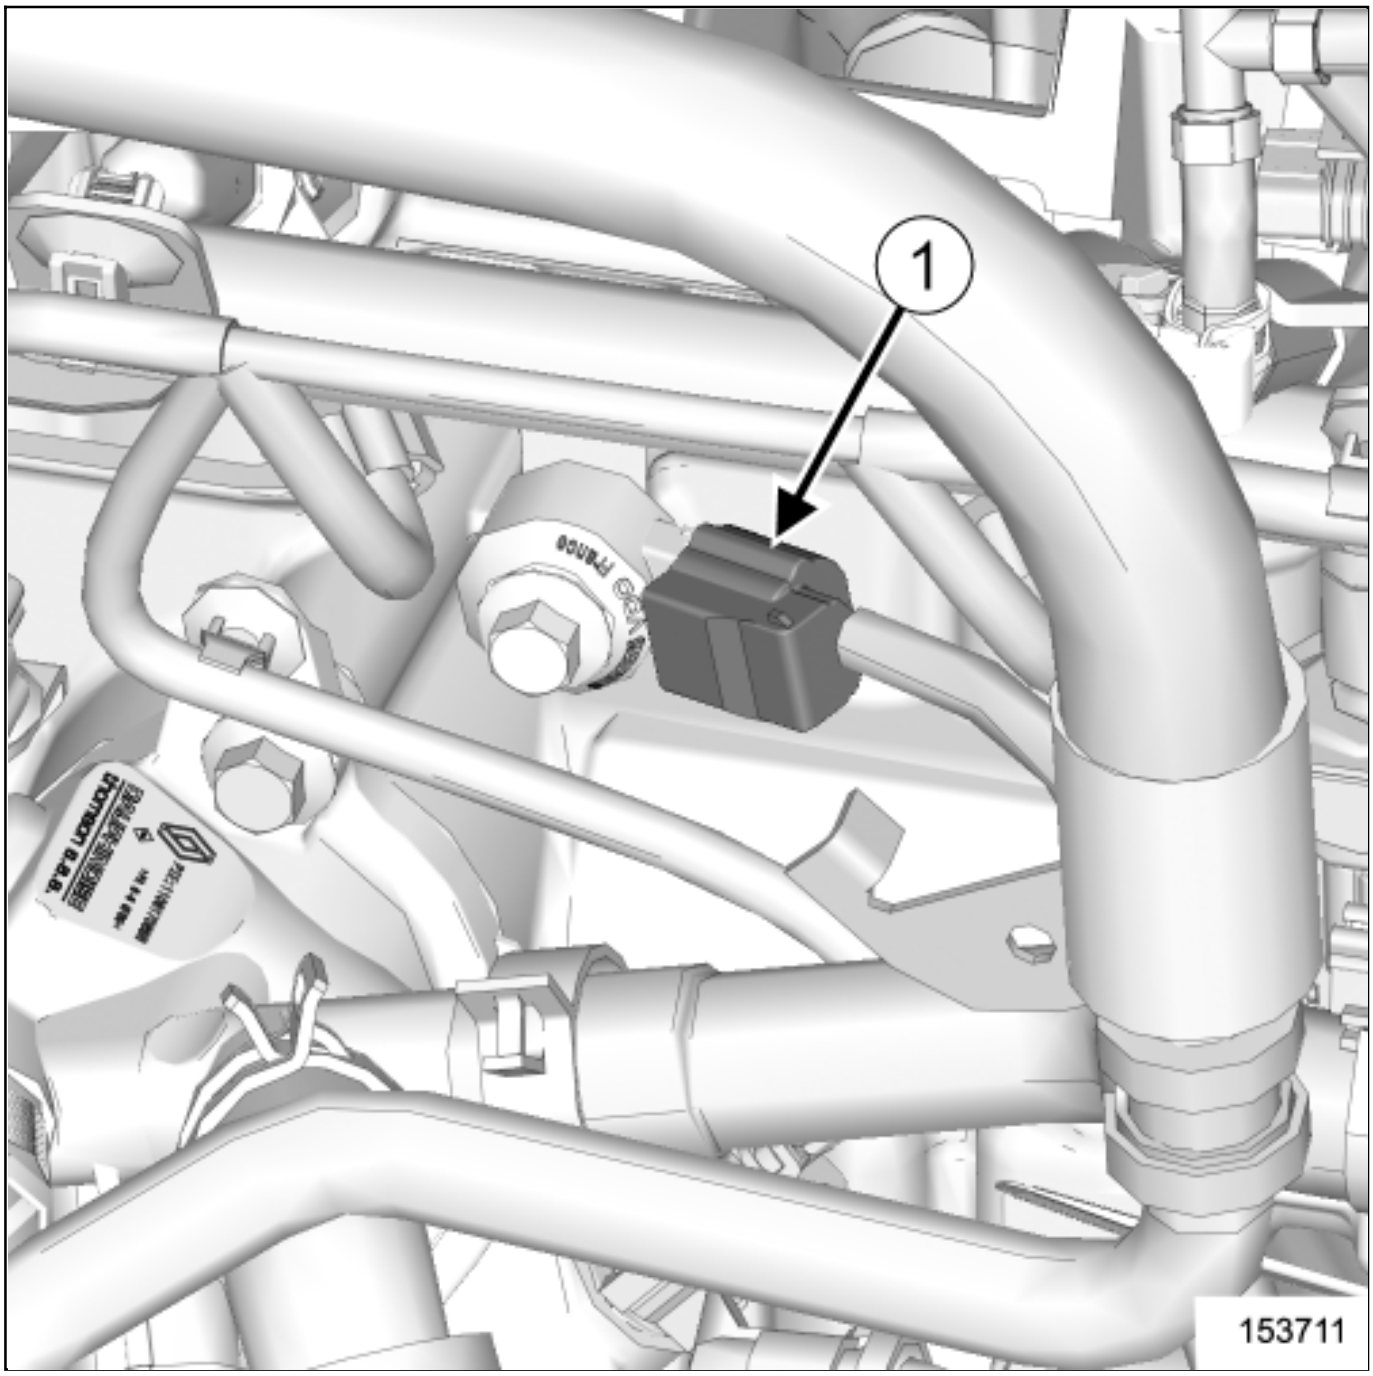
XSL version : 3.02 du 22/07/11

PINKING SENSOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts always be replaced, etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .

- Remove:
  - the engine undertray bolts,
  - the engine undertray.

- Remove **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** :
  - the intercooler air inlet pipe,
  - the air inlet pipe,
  - the throttle valve,
  - the inlet distributor.

2. REMOVAL OPERATION

Note:

Mark the positioning of the sensor before removing.

Disconnect the pinking sensor connector(1) .

Remove (see **Engine and transmission assembly sensors: List and location of components**) :

- the pinking sensor bolt,
- the pinking sensor.

REFITTING

1. REFITTING OPERATION

- Refit in its initial position(see **Engine and transmission assembly sensors: List and location of components**) :
  - the pinking sensor,
  - the pinking sensor bolt.
- Torque tighten the pinking sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) **.**
- Connect the pinking sensor connector.

2. FINAL OPERATION

- Proceed in the reverse order to removal.
- Apply the After repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component controlled by this computer concerned by the After repair procedure:

- "Pinking sensor" .

XSL version : 3.02 du 22/07/11

PLASTICMATERIALBODYWORKCOMPONENT:DESCRIPTION

1.INTRODUCTION

Plastic forms an integral part of:

- the vehicle's interior trim,
- the vehicle's exterior trim,
- possibly the entire bodywork,
- electronic equipment,
- certain mechanical parts.

The recommended repair product has been tested in the RENAULTlaboratories according to very precise specifications.

To ensure optimum safety and product quality, carefully observe:

- the safety instructions,
- use recommended products,
- the repair procedures.

Note:

Always refer to the product's technical sheet in addition to this Technical Note.

2. CLASSIFICATION OF PLASTICS

1- THERMOPLASTICS:

Thermoplastics are materials which, when exposed to heat, become malleable and soft. The advantage of this malleability is that they can be shaped. After cooling, they become hardened and keep their new shape.

If they are exposed to heat again, the above phenomenon reoccurs every time this operation is repeated.

1)THE MAIN THERMOPLASTICS:

Chemical description	ISO CODE 1043
Acrylonitrile, butadiene, styrene	A.B.S
Acrylate, Styrene, Acrylonitrile	A.S.A
Ethylene, propylene, diene, methylene	EPDM
Polycarbonate	PC
Polyamide	PA
Polypropylene	PP
Polyethylene	PE
Polyvinyl chloride	PVC
Polystyrene / Polyester	SB / PPO
Polyamide / Polyester	PA / PPO

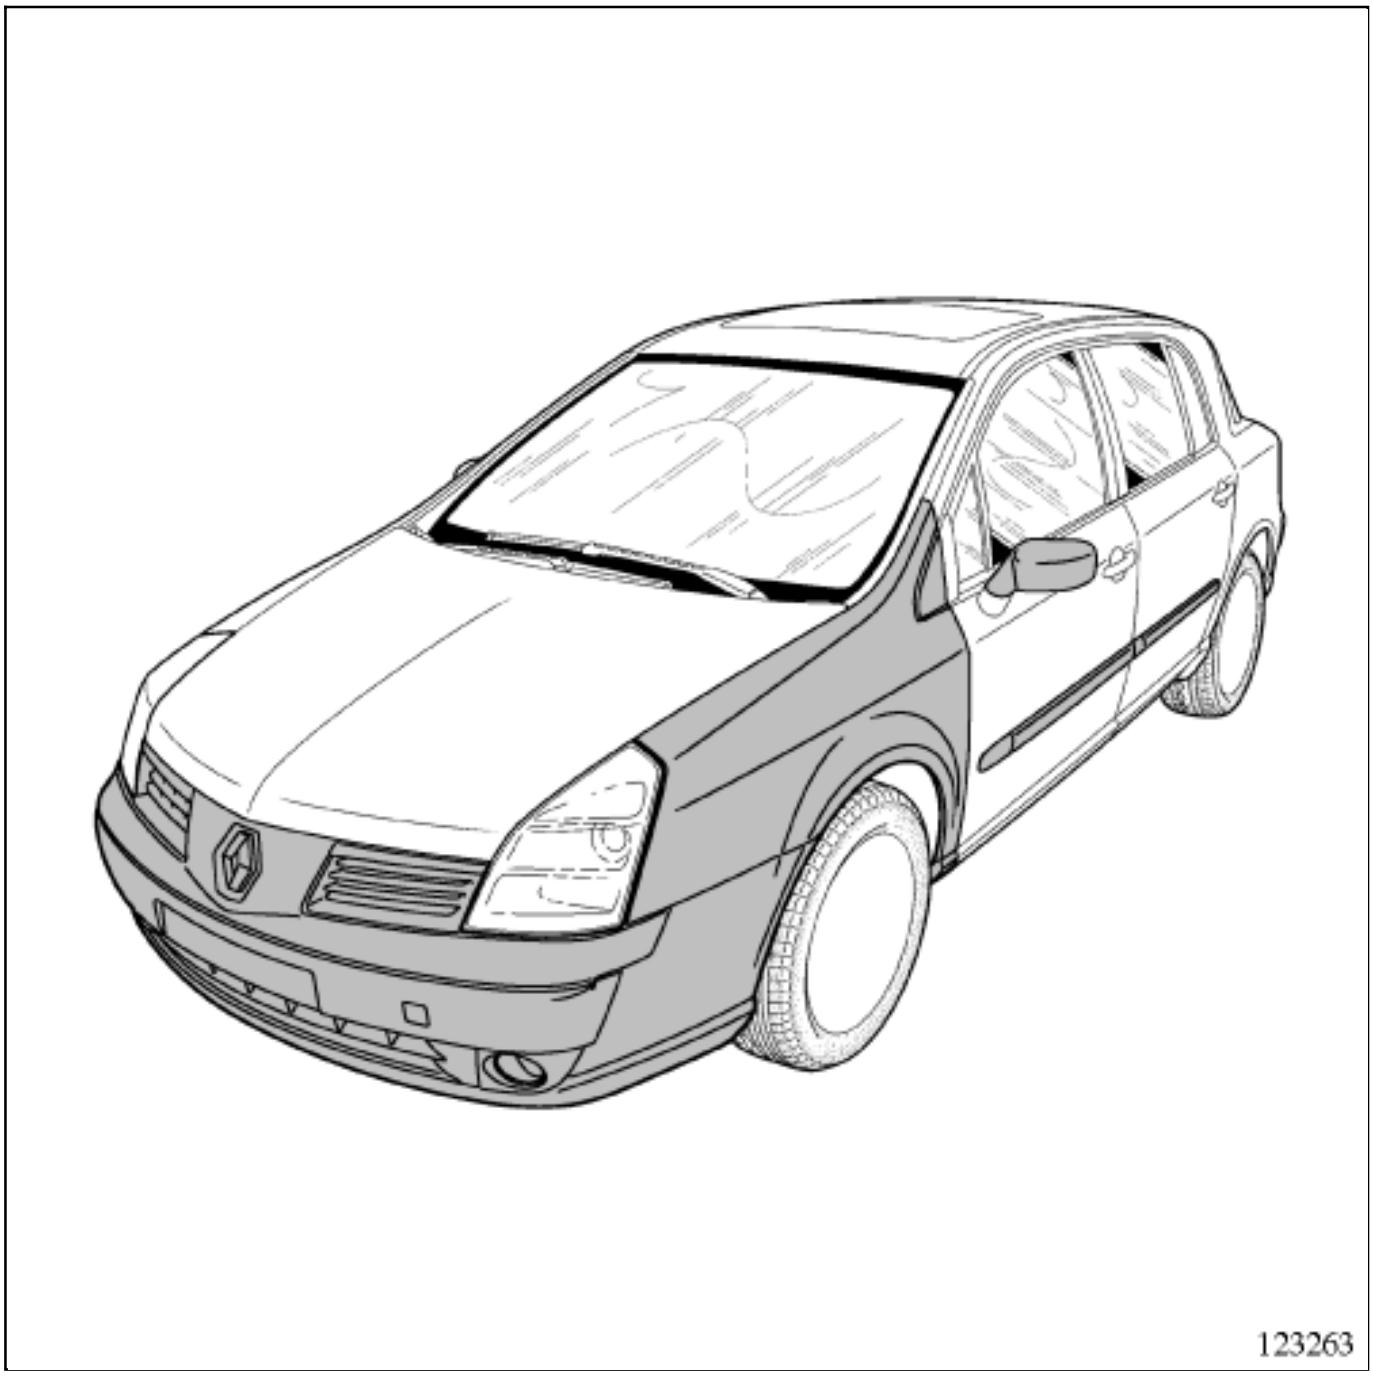
2- THERMOSETTING PLASTICS

Thermosetting plastics are those which harden when exposed to heat and will burn under excessive heat.

1)THE MAIN THERMOSETTING PLASTICS:

Chemical description	ISO CODE 1043
Unsaturated Polyester	UP
Epoxy Resin	EP
Polyurethane Resin	PUR
Sheet Molding Compound	SMC
Resine Transfert Molding	RTM

Note:



All plastics are categorised as either thermoplastics or thermosetting plastics.

Note:

Read the ISO code displayed inside the plastic part.

3. USING PLASTICS IN THE AUTOMOTIVE PRODUCTION INDUSTRY

According to the area of use, parts are manufactured either:

as thermoplastics:

-
- passenger compartment trim,
- dashboard,
- bumpers,

- wings,
- protective mouldings.

or as thermosetting plastics:

-
- wings,
- bonnet,
- doors,
- tailgate,
- leaf spring,
- driveshafts.

PLASTIC MATERIAL BODYWORK COMPONENT: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

1. PROTECTIVE GEAR

WARNING

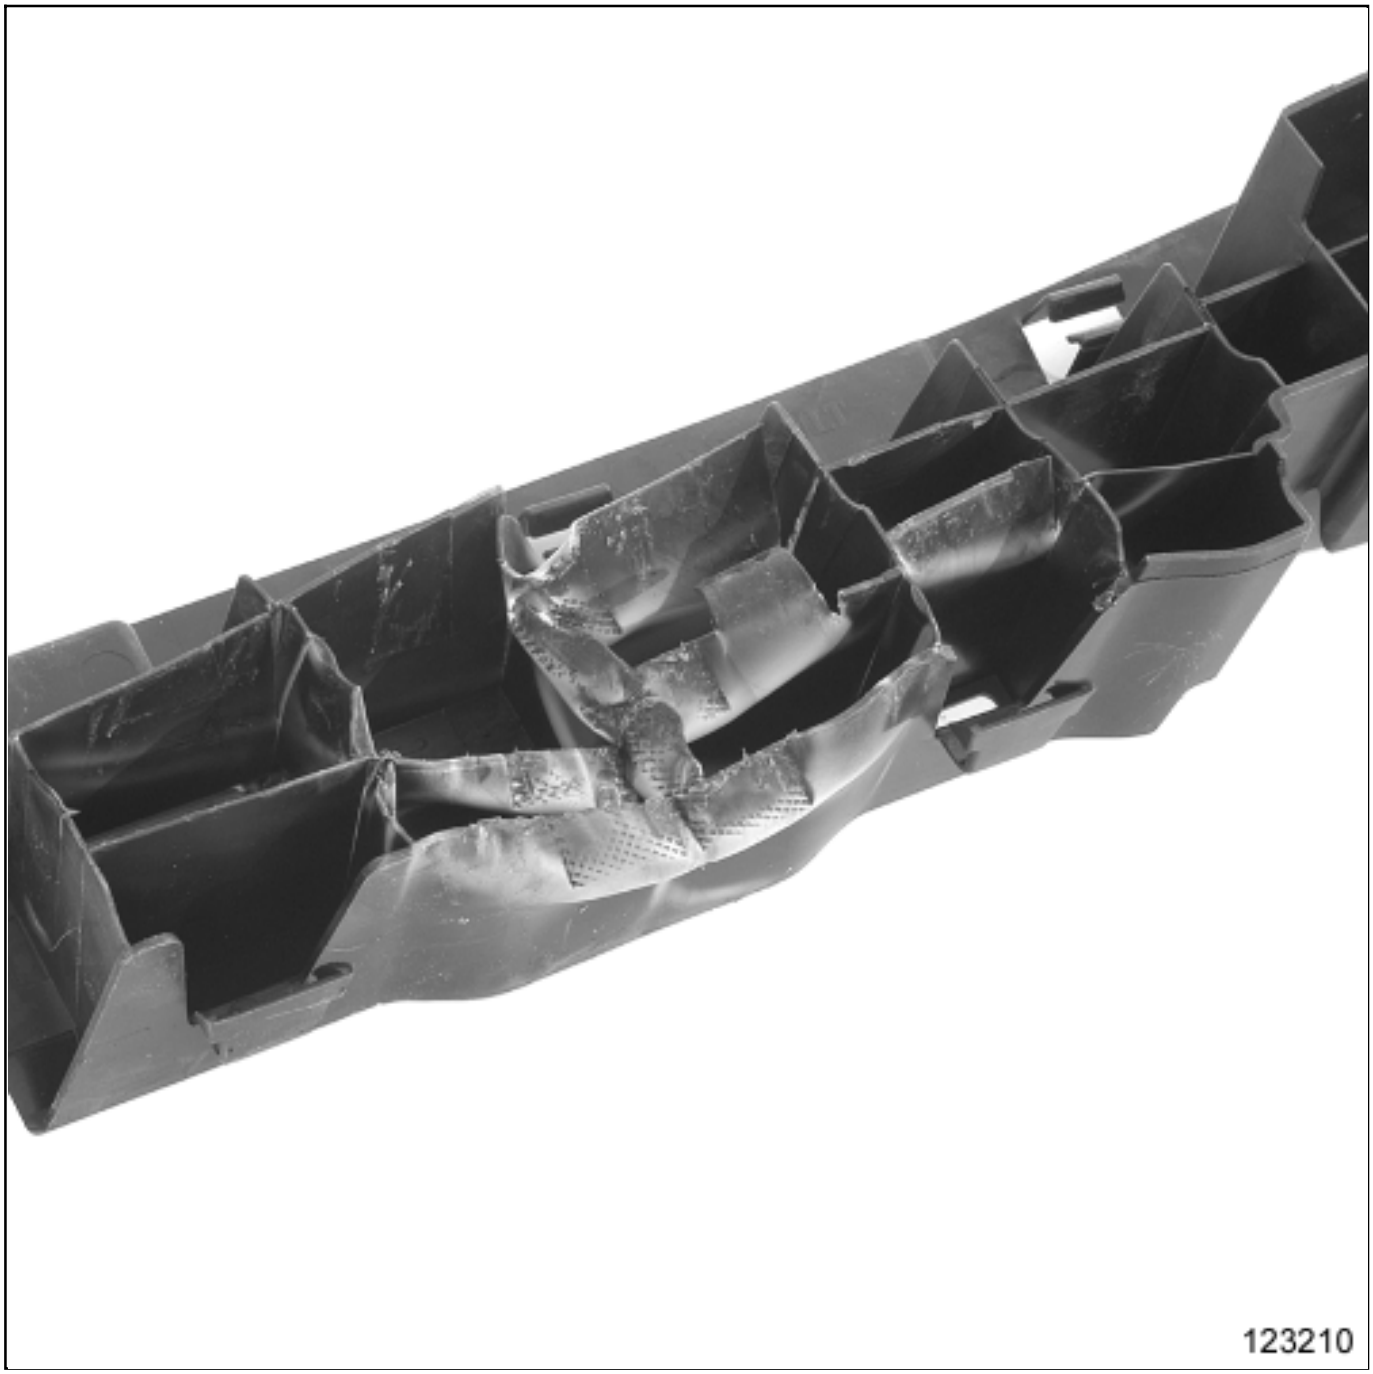
Always wear protective gear (gloves, goggles and breathing masks).

Use extra ventilation source.

Use a supplied air mask if the area is not ventilated.

Note:

When repairing SMC type composite material, it is advisable to wear an antistatic suit.



2. RECOMMENDATION

Note:

It is necessary to remove the part to be repaired, in order to check that the components located around the edge are not damaged.

Note:

It is recommended to limit the rotation speed when sanding with the orbital sander in order to prevent plastic material from overheating and the formation of dirt.

It is forbidden to carry out any repairs to safety components or areas such as absorbers, diffusers and any components which are listed in the vehicle's repair manual as components which cannot be repaired.

Fractures and tears must not exceed 100 mmin length and must be located outside the bumper absorber areas and away from the safety components.

The holes must not exceed 50 mmin diameter and must be located outside the bumper absorber areas and away from the safety components.

In all cases, the surface to be repaired should not exceed 20 cm^2 .

1- FOR BONDING:

If the primer is too thick, this will always cause loss of adherence when the product attaches.

Do not accelerate the primer drying time using infra-red light. Respect the primer drying time (refer to the manufacturer's instructions).

Apply the resin in the form of a dome in order to avoid damaging the support.

Note:

It is forbidden to repair Noryl. The composition of the material is likely to contain recycled products which are incompatible with the bi-component repair mastic.

2- FOR THE WELD:

Note:

The weld repair is carried out with the component removed.

The repair procedures differ depending on the type of plastic used.

For ABS, ASAand Polycarbonatematerials, only fractures can be repaired. The composition of the filler rod does not adhere to these materials.

For Norylmaterials, it is only possible to repair holes.

Welding is not possible on composite materials.

Never melt a piece of recovered plastic to perform a repair.

Do not use any other mesh than the one contained in the kit due to a risk of oxidation.

It is necessary to preheat and melt the rod by half its thickness, before contact with the support. This step activates the bonding agents contained in the rod.

3- FOR EPOXY RESIN

Use only for RTM thermosetting plastics

Repair-40x01x45x10-02x60-1-1-1.xml

XSL version : 3.02 du 22/07/11

PLASTICMATERIALBODYWORKCOMPONENT:REPAIR

Note, one or more warnings are present in this procedure

1. PROCEDURES FOR REPAIRING PLASTICS

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Use extra ventilation source.

Use a supplied air mask if the area is not ventilated.

1- SPECIAL NOTES FOR REPAIRING PLASTICS

Procedure 1 : repairing a deep scratchon a plastic chassis element.

Procedure 2 : repairing a crackon a plastic chassis element.

Procedure 3 : repairing a holeon a plastic chassis element.

Procedure 4 : repairing a mounting bracketon a plastic chassis element.

Procedure 5 : partial replacementof an element by cuting.

Procedure 6 : partial replacementof an element by cuting with patcht drilling.

2. PROCEDURE 1

Repairing a deep scratch on a plastic chassis element

1- BONDING METHOD

Note:

Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

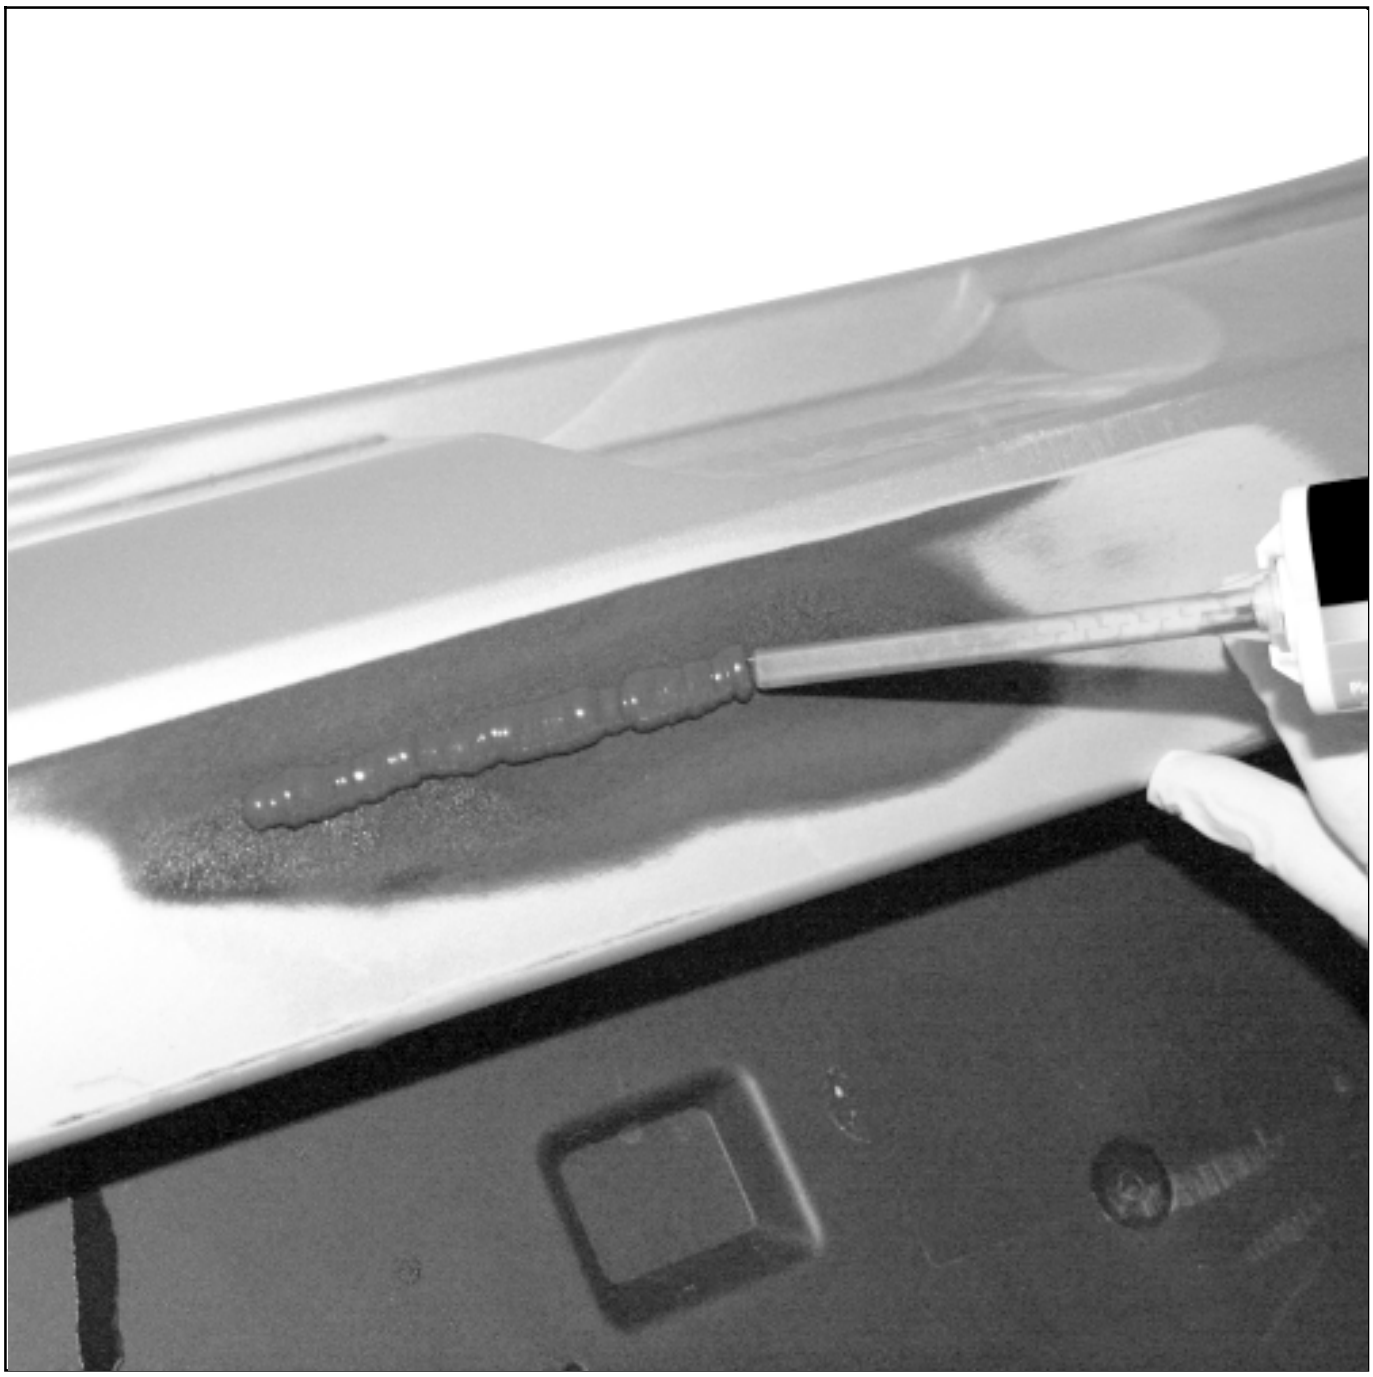
(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

- Wash the component in soapy water and rinse in clean water.

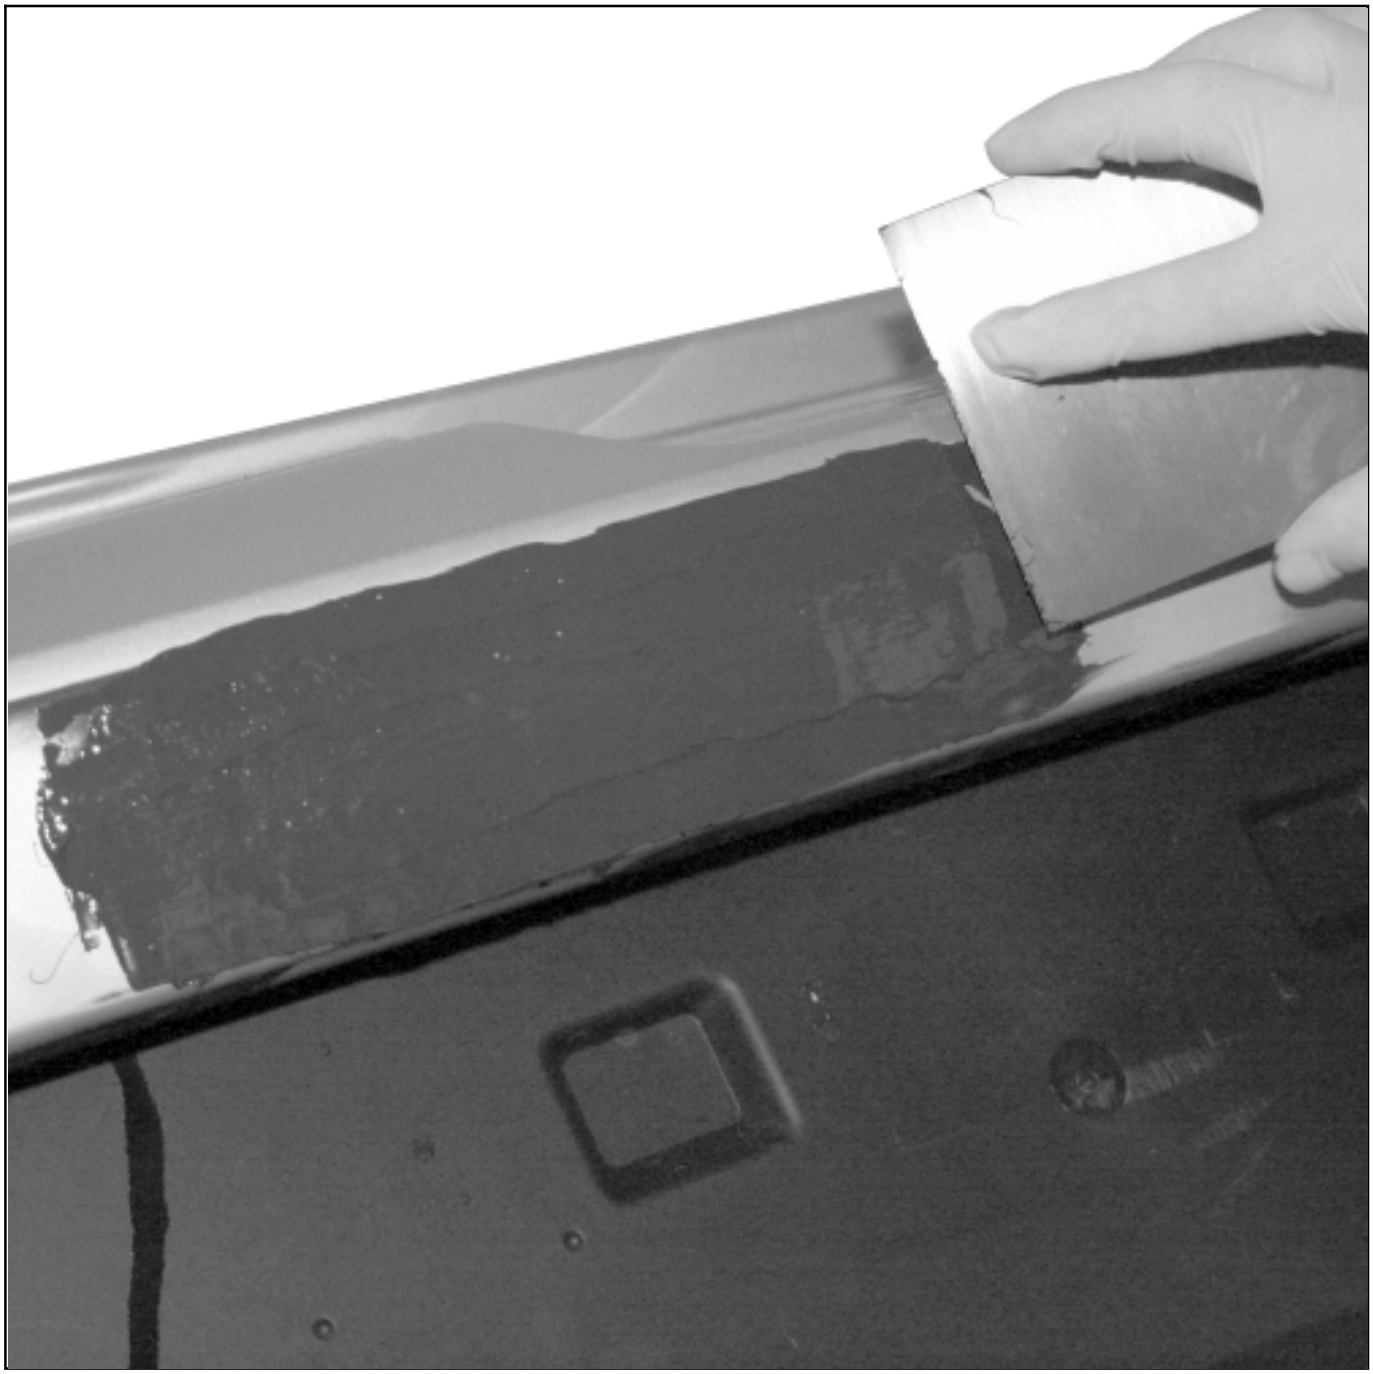
- Clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNERVehicle: Parts and consumables for the repair (04B, Consumables - Products).

- Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

Surface the scratch using the orbital sander with a P 150.



- Blow the component and clean the area to be repaired with the cleaner included in the Plastic repair kit .



- Apply the adhesive primerincluded in the Plastic repair kitto the damaged area.

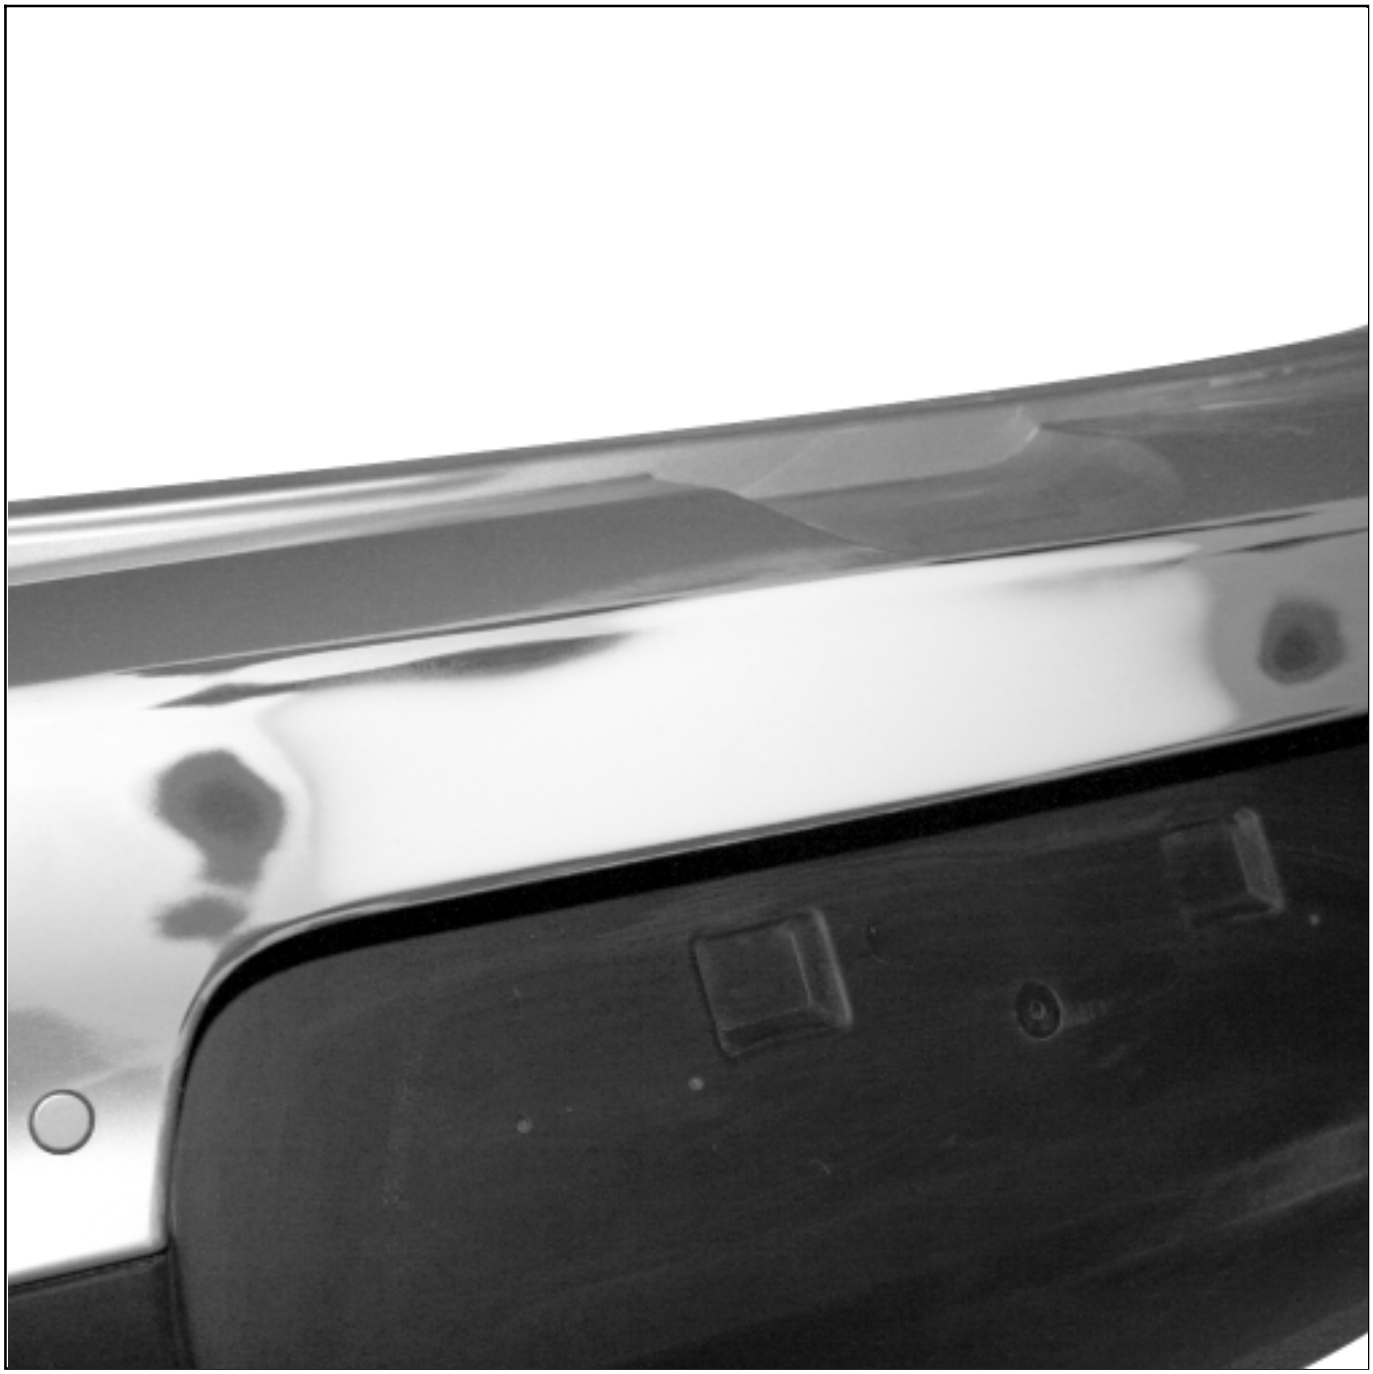
- Leave the adhesive primerto dry (see product technical sheet).

Prepare the bi-component repair mastic(see 50A, General information, Products for plastic material bodywork components: Description) .

Apply the bi-component repair masticto the component.

- Smooth using a mastic block creating a dome shape.

- Leave the bi-component repair masticto dry (see product technical sheet).



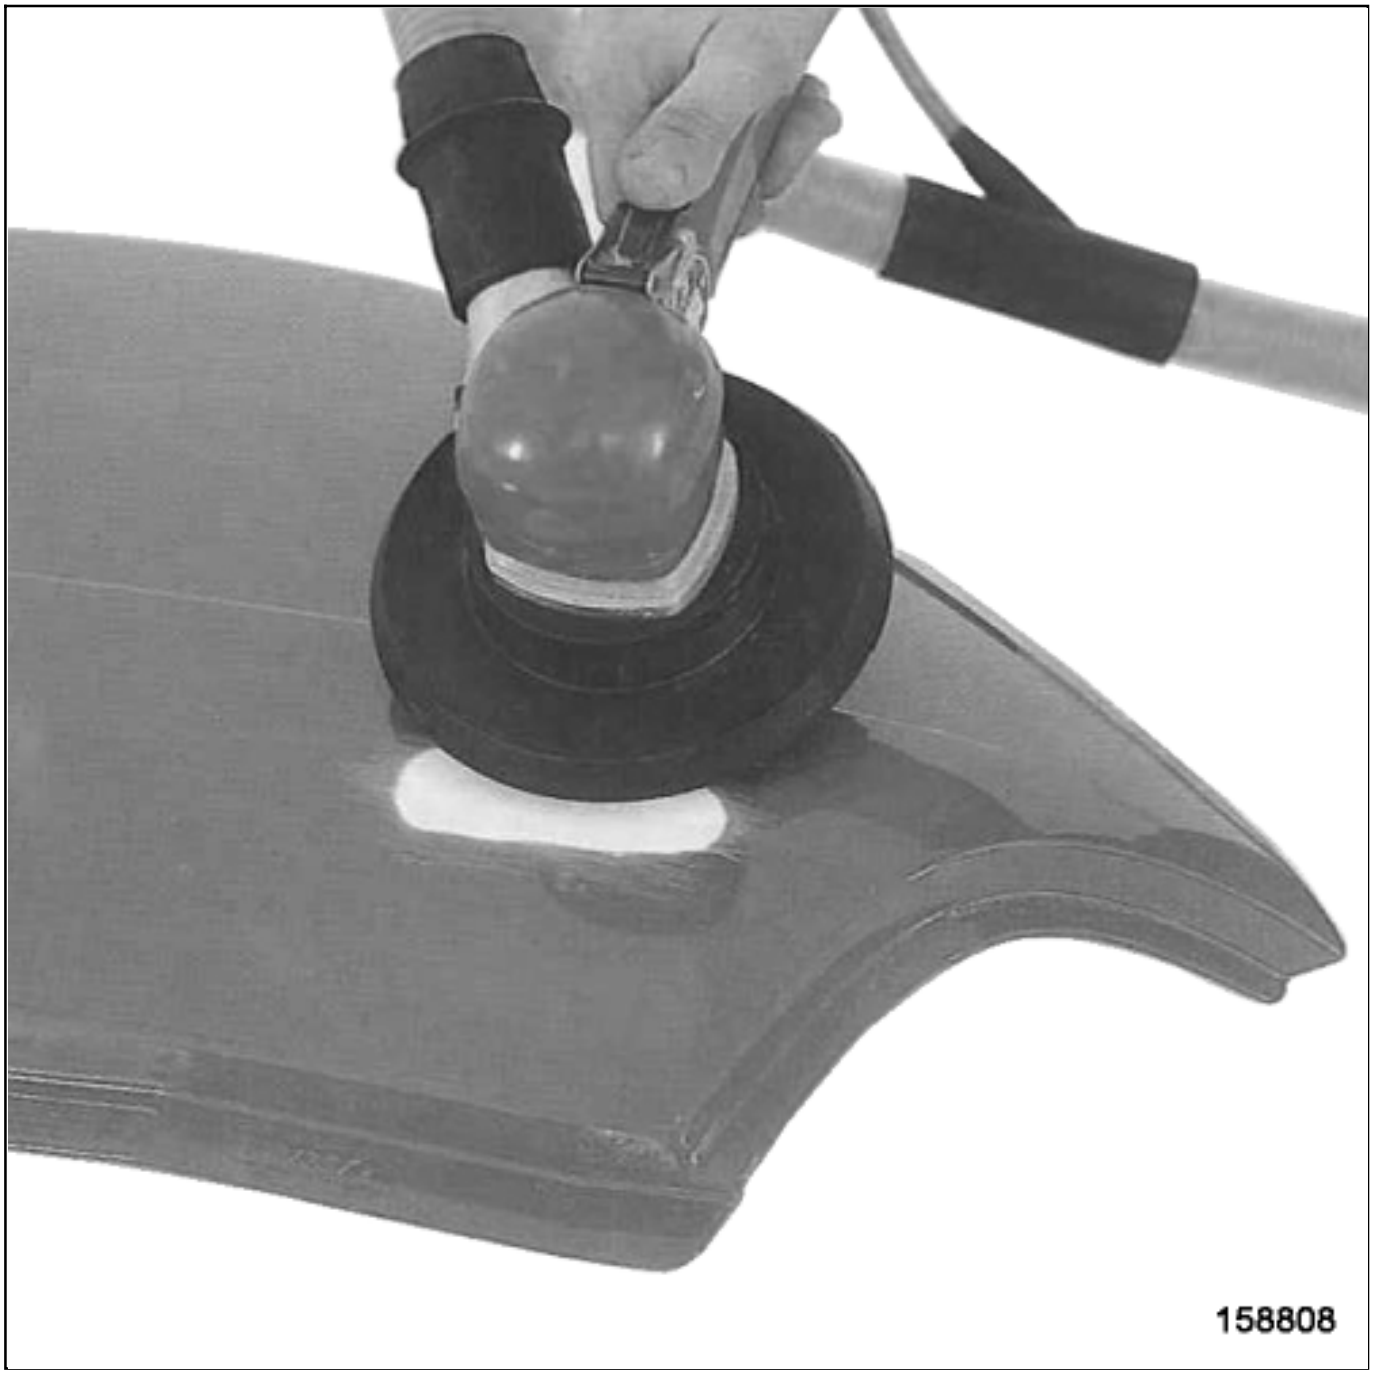
- Surface with a P 150then finish with a P 240.

- Blow the component and clean the area to be repaired with the cleaner included in the Plastic repair kit .

If necessary, apply a finishing mastic(see product technical sheet) **Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Sand the finishing masticwith a P 150then finish with a P 240.

Follow the paint application procedure according to the material concerned:



- SMC bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Polypropylene / polyethylene bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Noryl bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),

ABS bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic).

2- RESIN EPOXY METHOD

Note:

Method apply only on RTM component.

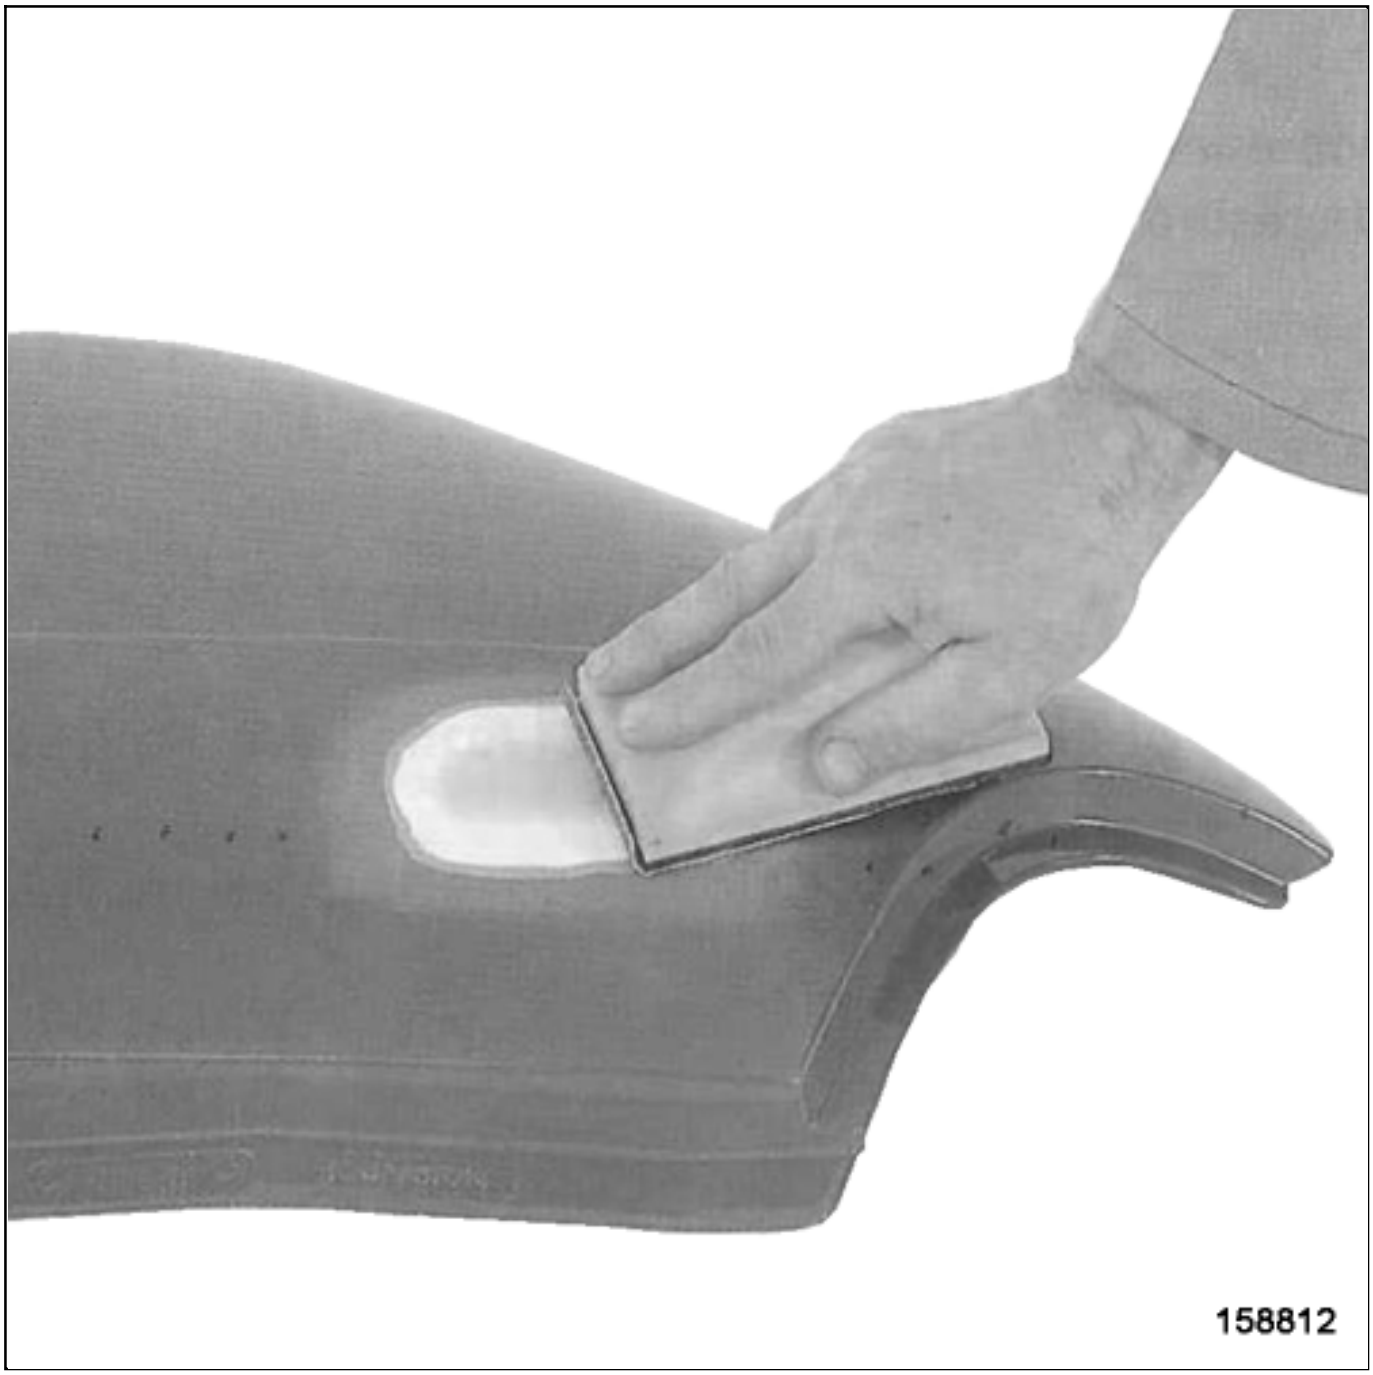
Chamfering 20 to 30mm around the crack using the orbital sander with a P 150.

Sand the paint around the zone to be repaired using the orbital sander with a P 150

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

Wet the chamfer using à brush soaked with Epoxy resin.



Add short fibres with resin(50 % maxi.).

Apply the mixture using a spatula.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

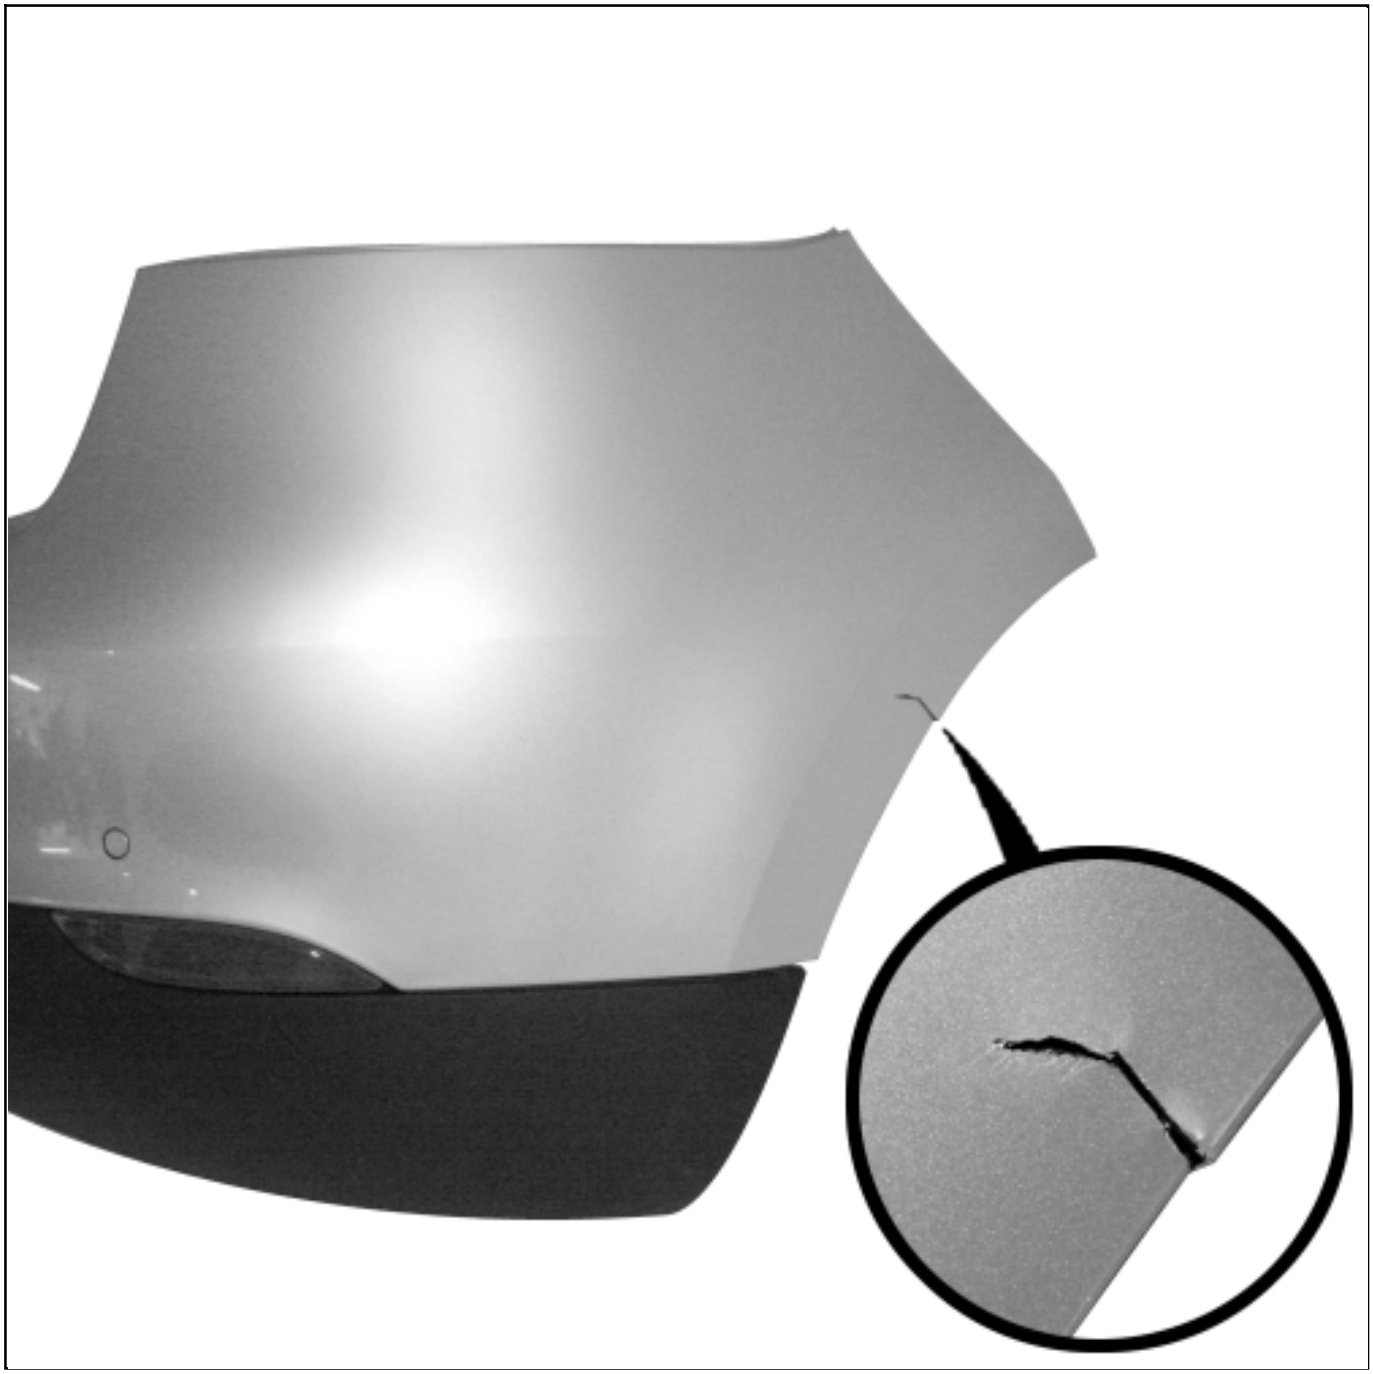
Sand using the orbital sander with a P 80then with a P180and P240.

Apply if necessary a finishing mastic(see product technical sheet). (see **Vehicle: Parts and consumables for the repair**)

Sand the finishing masticusing a P 150then finish using a P240.

3. PROCEDURE 2

Repairing cracks on a plastic chassis element.



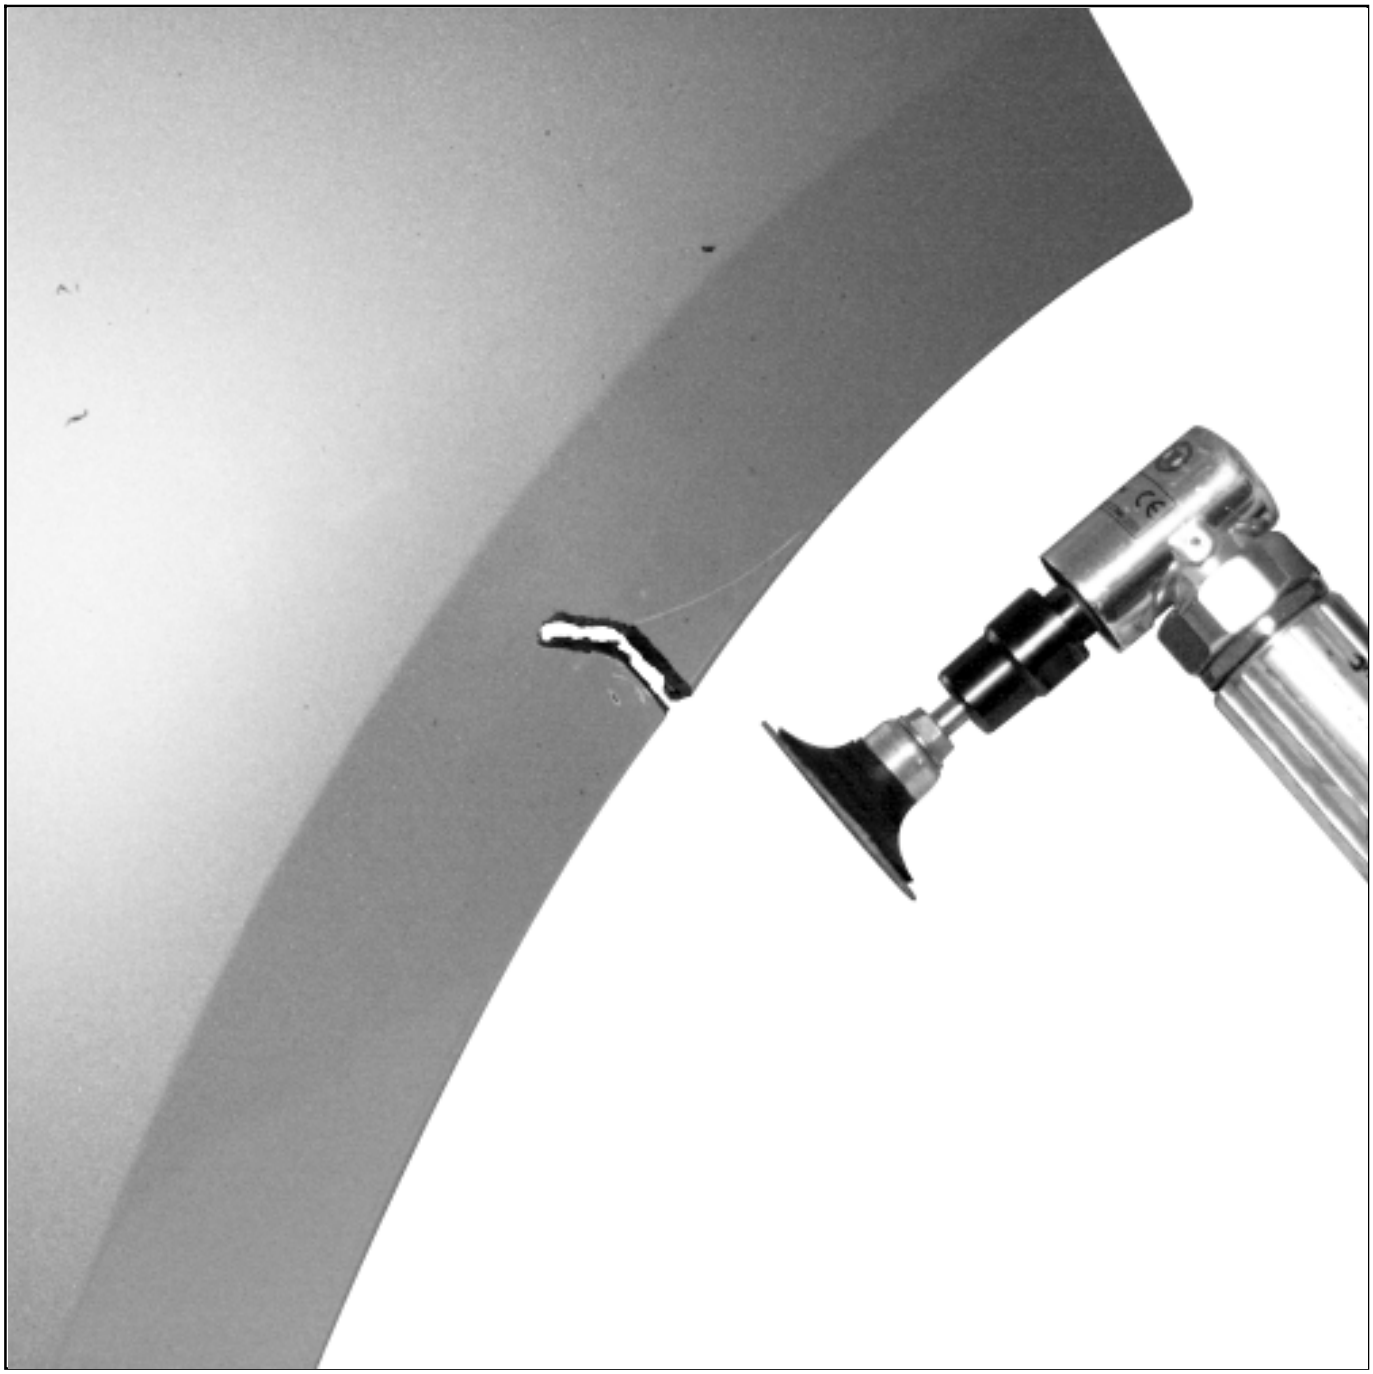
1- BONDING METHOD

Note:

Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

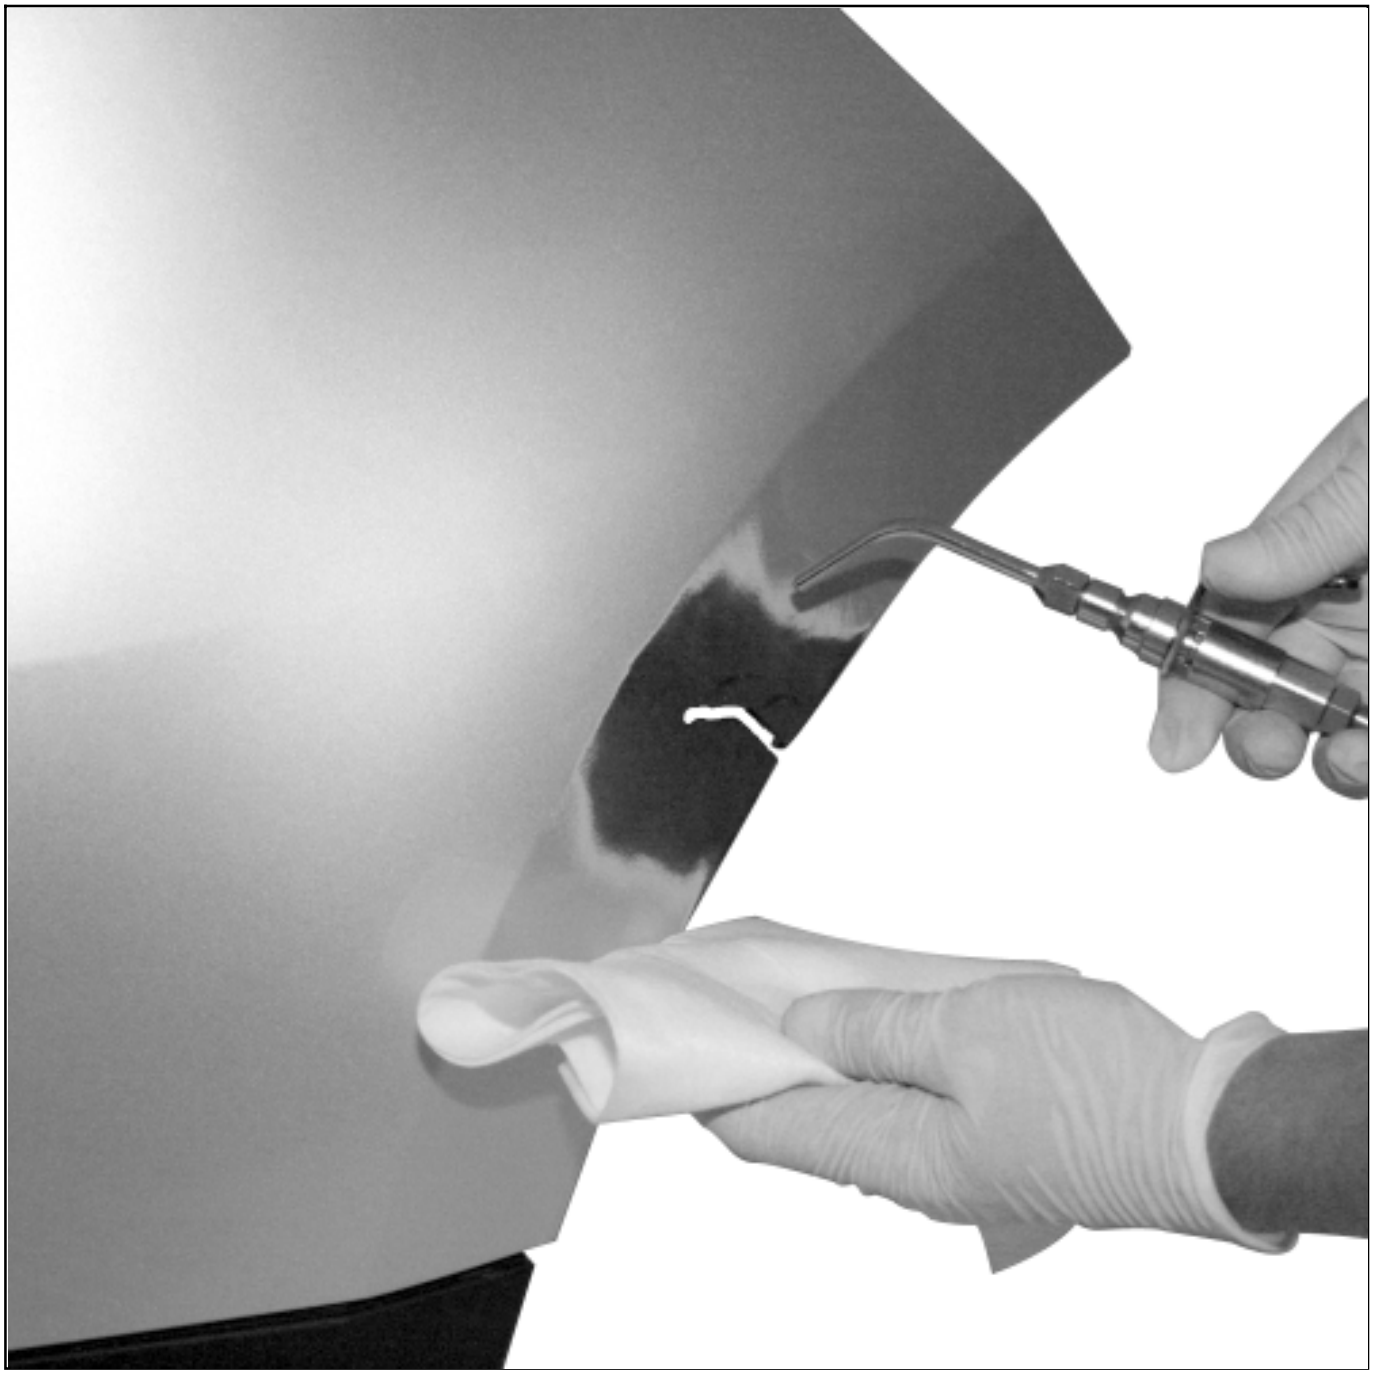


Wash the component in soapy water and rinse in clean water.

Clean the area with a clean, dry LINT-FREE CLOTH**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

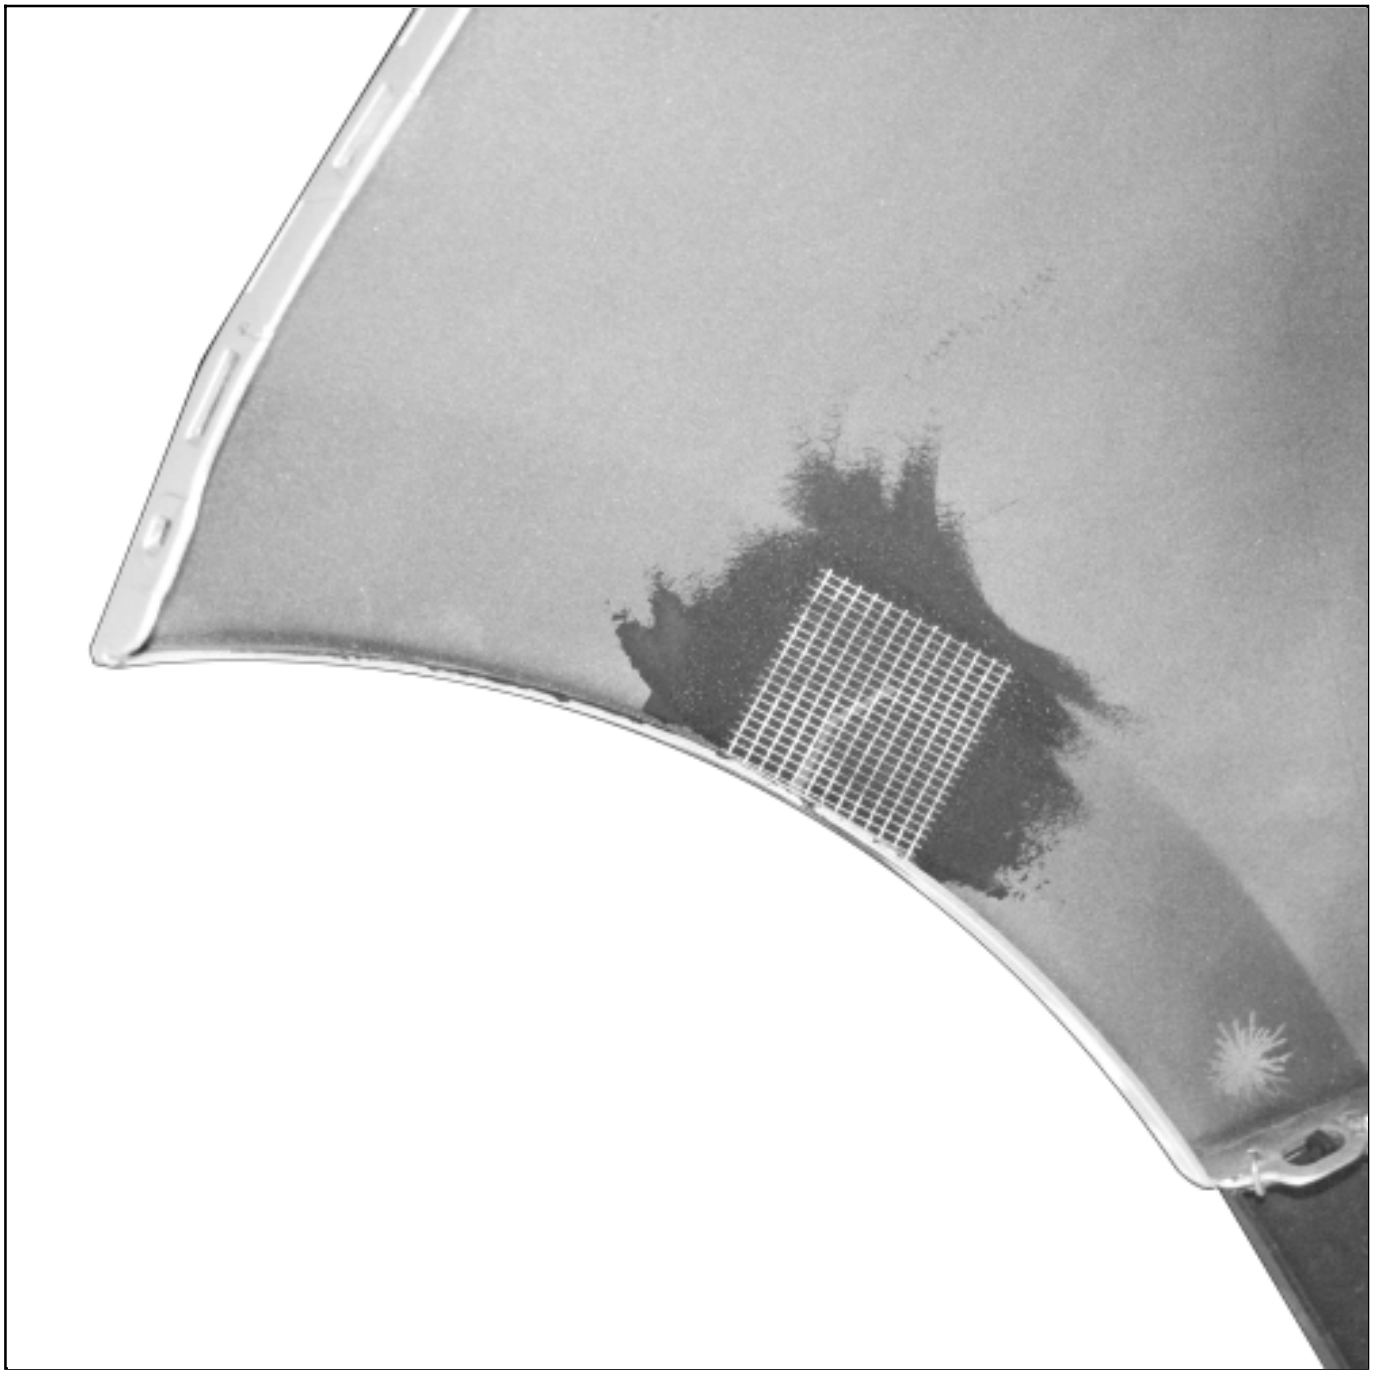
Wipe the area with a clean, dry LINT-FREE CLOTH**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Drill the end of the crack using a 4 mmdrill bit to stop it spreading.



Extend the length of the crack by 2 mmusing an angle grinderor a sharp tool.

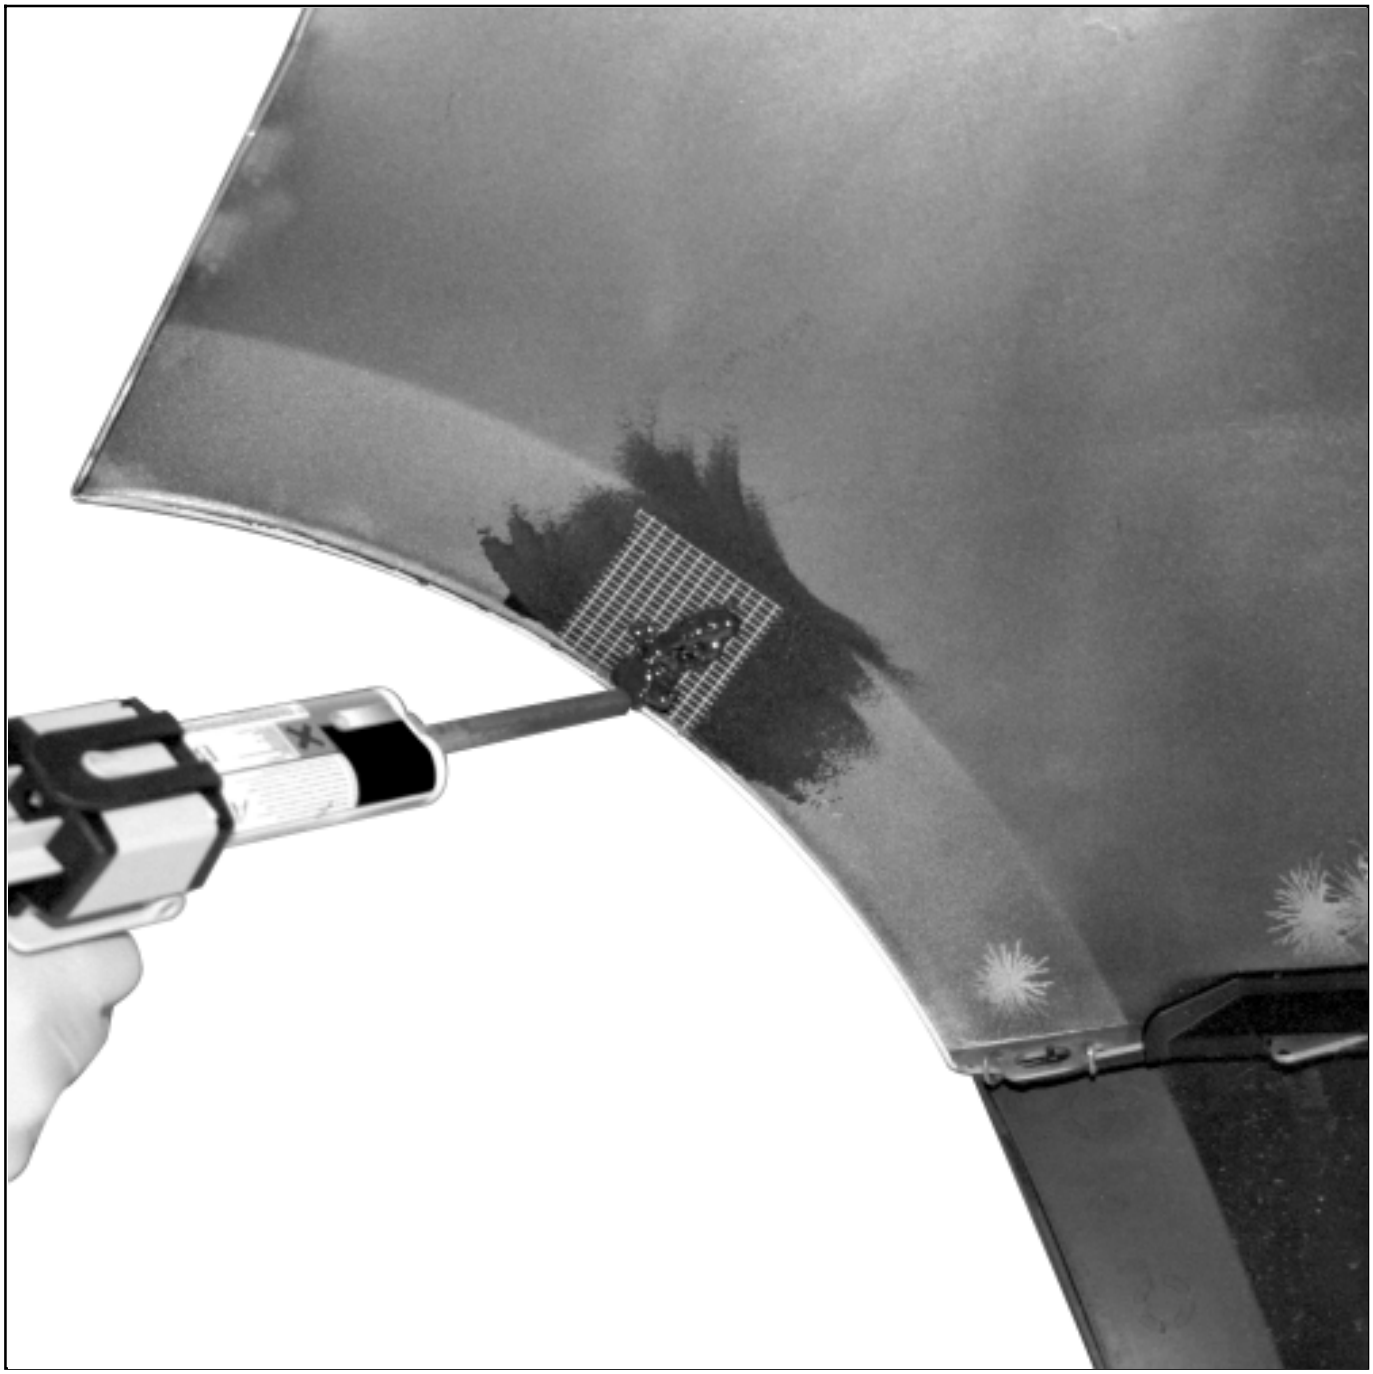
Chamfer the crack on the exterior side using an angle grinderor a belt sanderequipped with a P 120 abrasive pad.



Surface the interior and exterior areas to be repaired with a P 150.

Blow the component and clean the area to be repaired with the cleaner included in the plastic repair kit box.

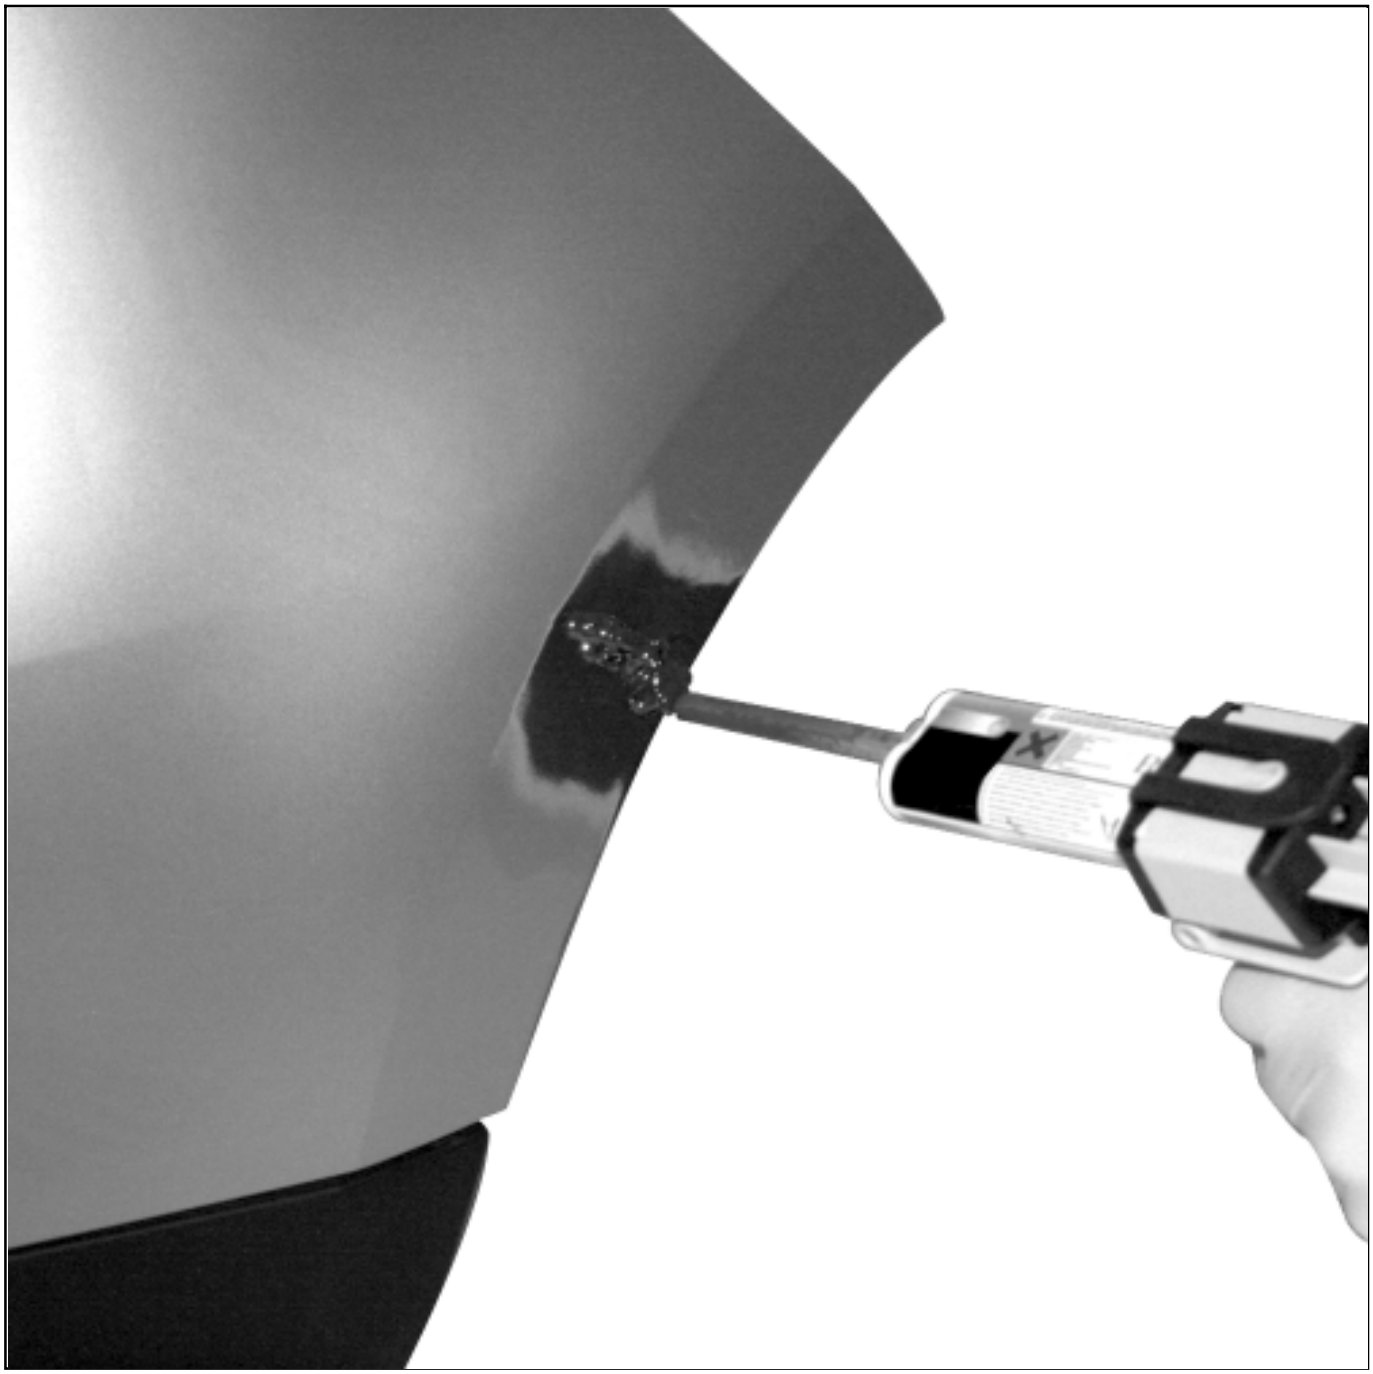
Apply the adhesive primerincluded in the plastic repair kitto the interior and exterior areas.



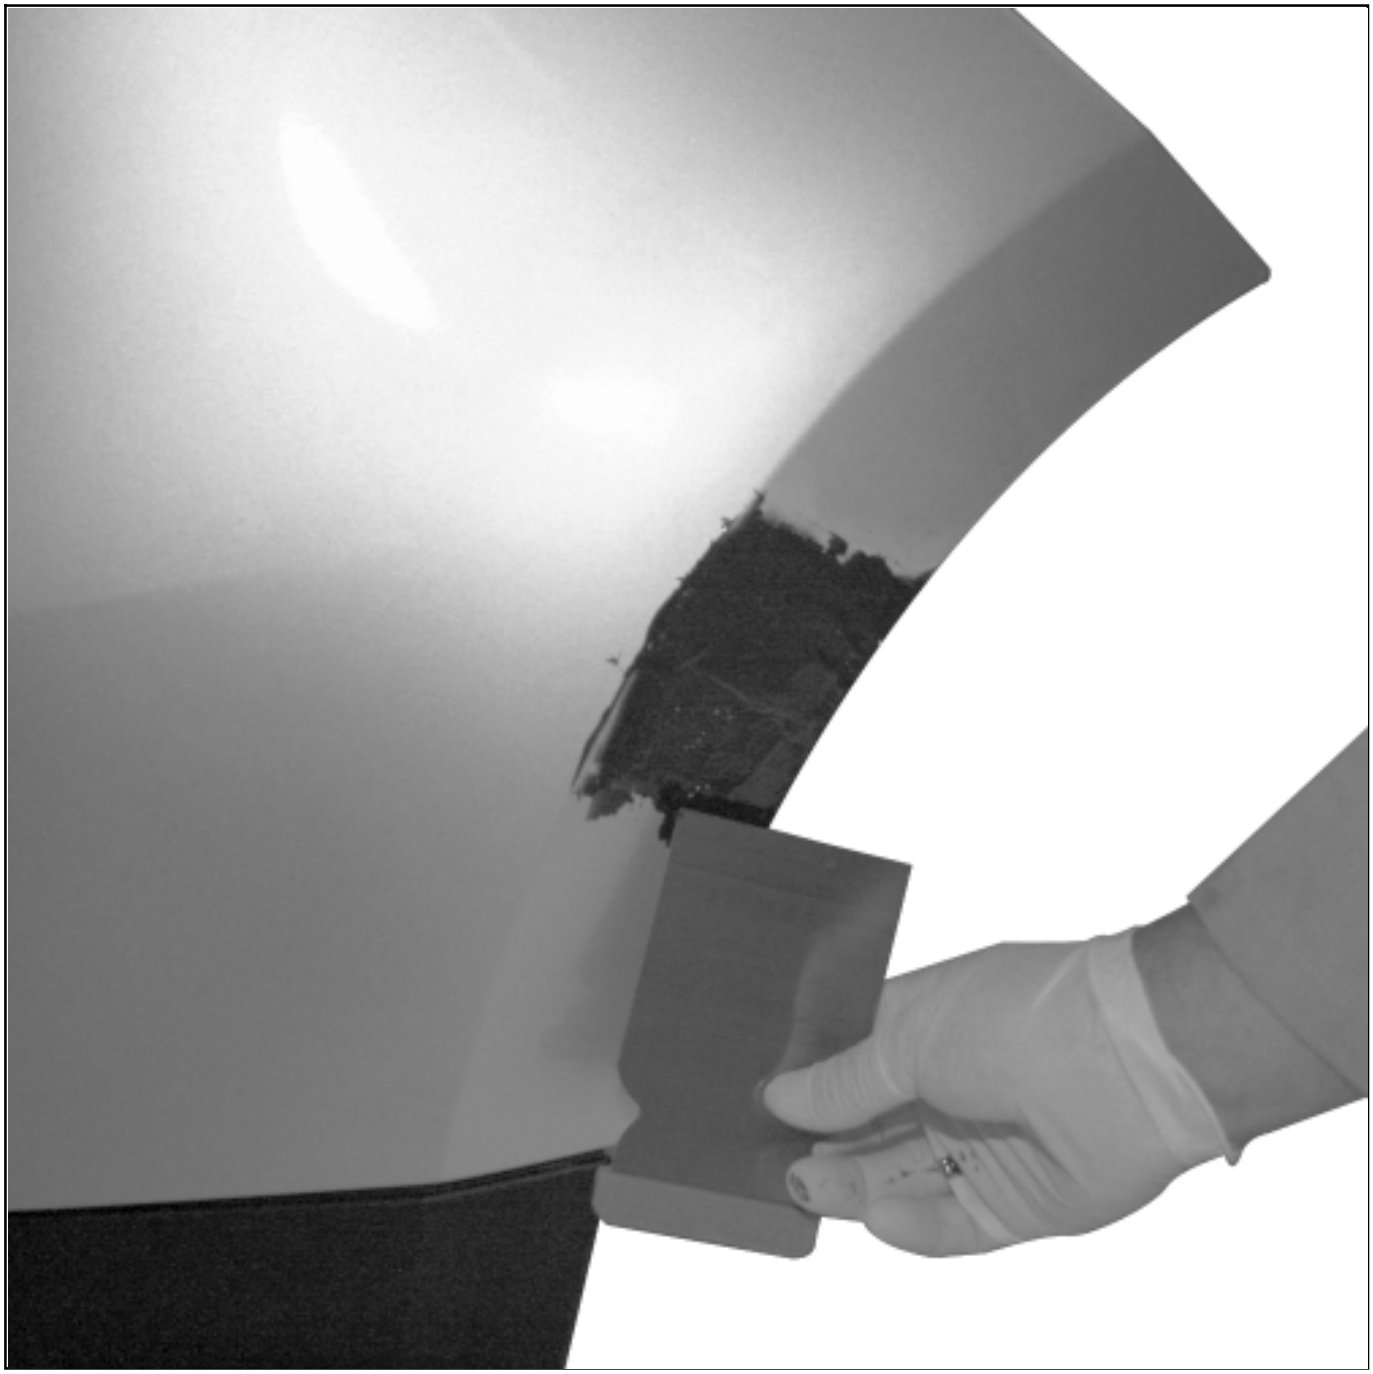
Leave the adhesive primerto dry (see product technical sheet).

Adjust a piece of reinforcing film (cloth)suitable for repairing the inside of the component.

Prepare the bi-component repair mastic(see 50A, General information, Products for plastic material bodywork components: Description) .



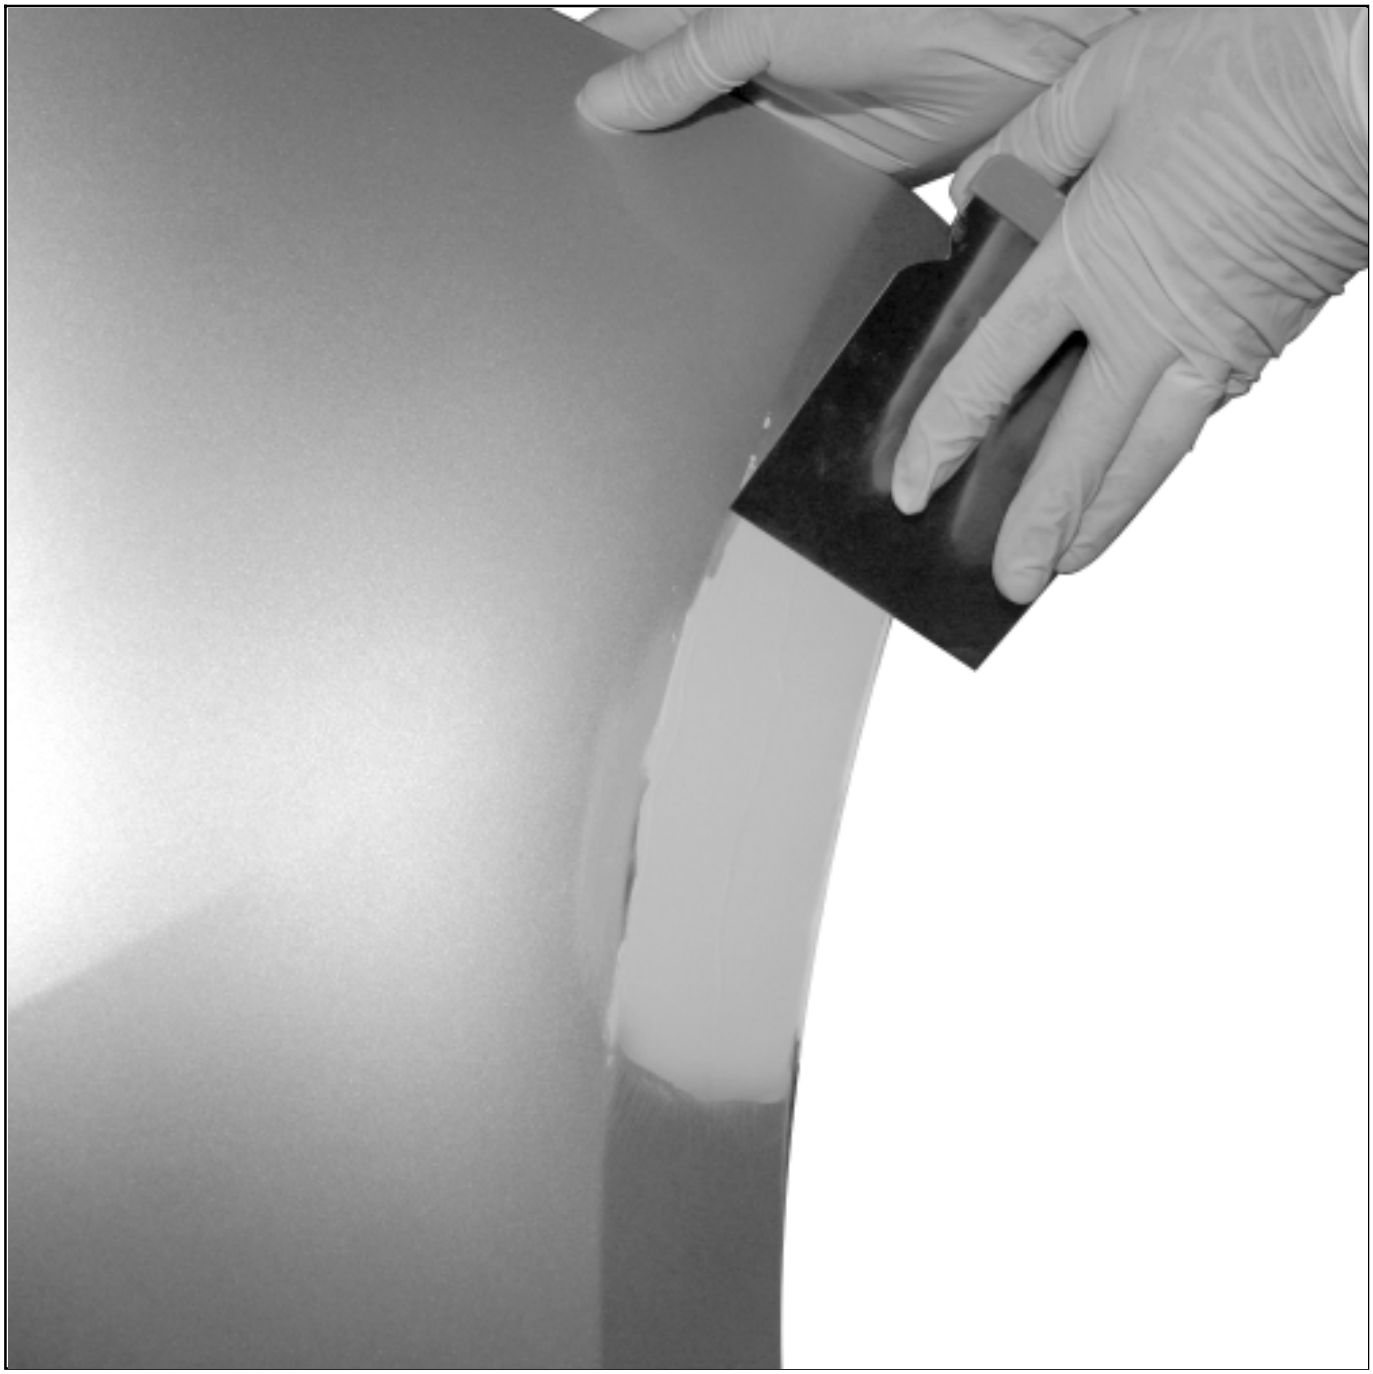
Extrude a narrow bead around the area to be repaired on the inside of the component and apply reinforcing film (cloth).



Extrude a thick bead on the reinforcing film at the crack.

Smooth using a spatula.

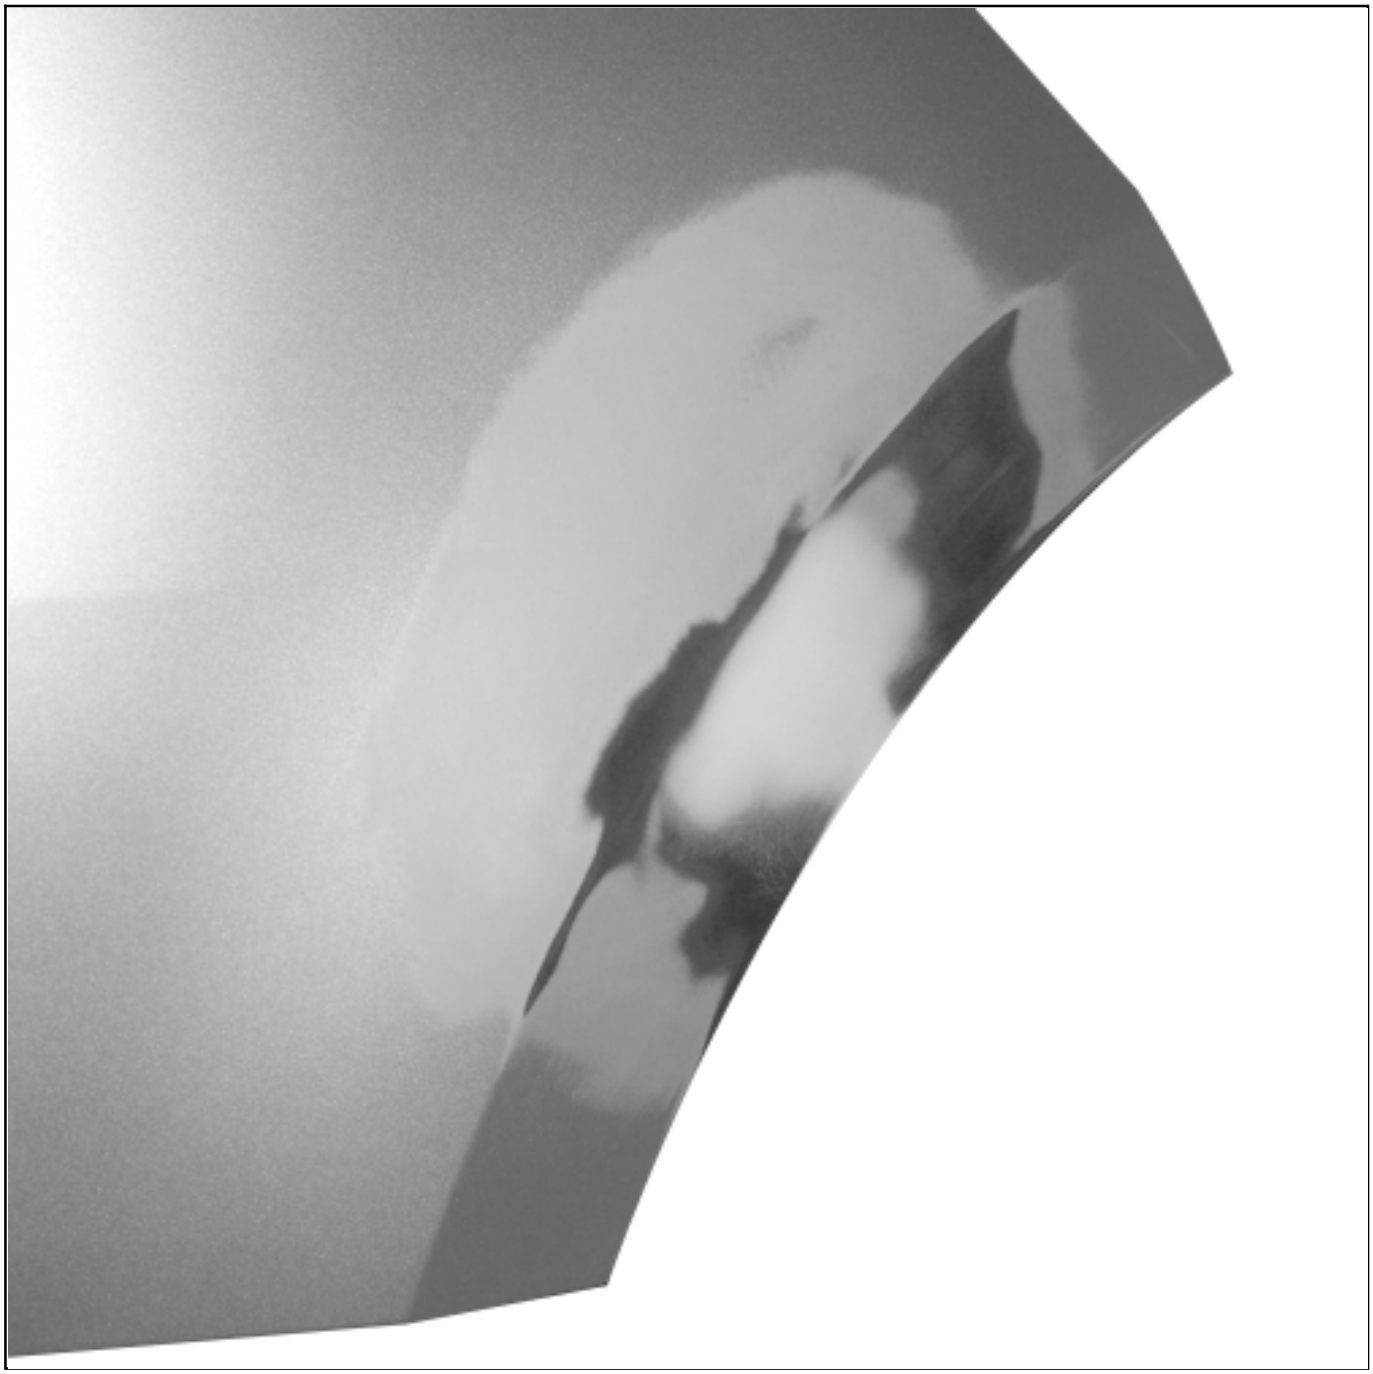
Extrude a thick bead in the chamfer on the exterior side.



Smooth using a spatula.

Leave the bi-component repair masticto dry (see product technical sheet).

Surface on the exterior side with a P 150then finish with a P 240.



Blow the component and clean the area to be repaired with the cleaner included in the Plastic repair

kit .

If necessary, apply a finishing mastic(see product technical sheet) Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Sand the finishing masticwith a P 150then finish with a P 240.

Follow the paint application procedure according to the material concerned:

- SMC bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Polypropylene / polyethylene bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Noryl bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),

ABS bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic).

2- WELDING METHOD

Note:

Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

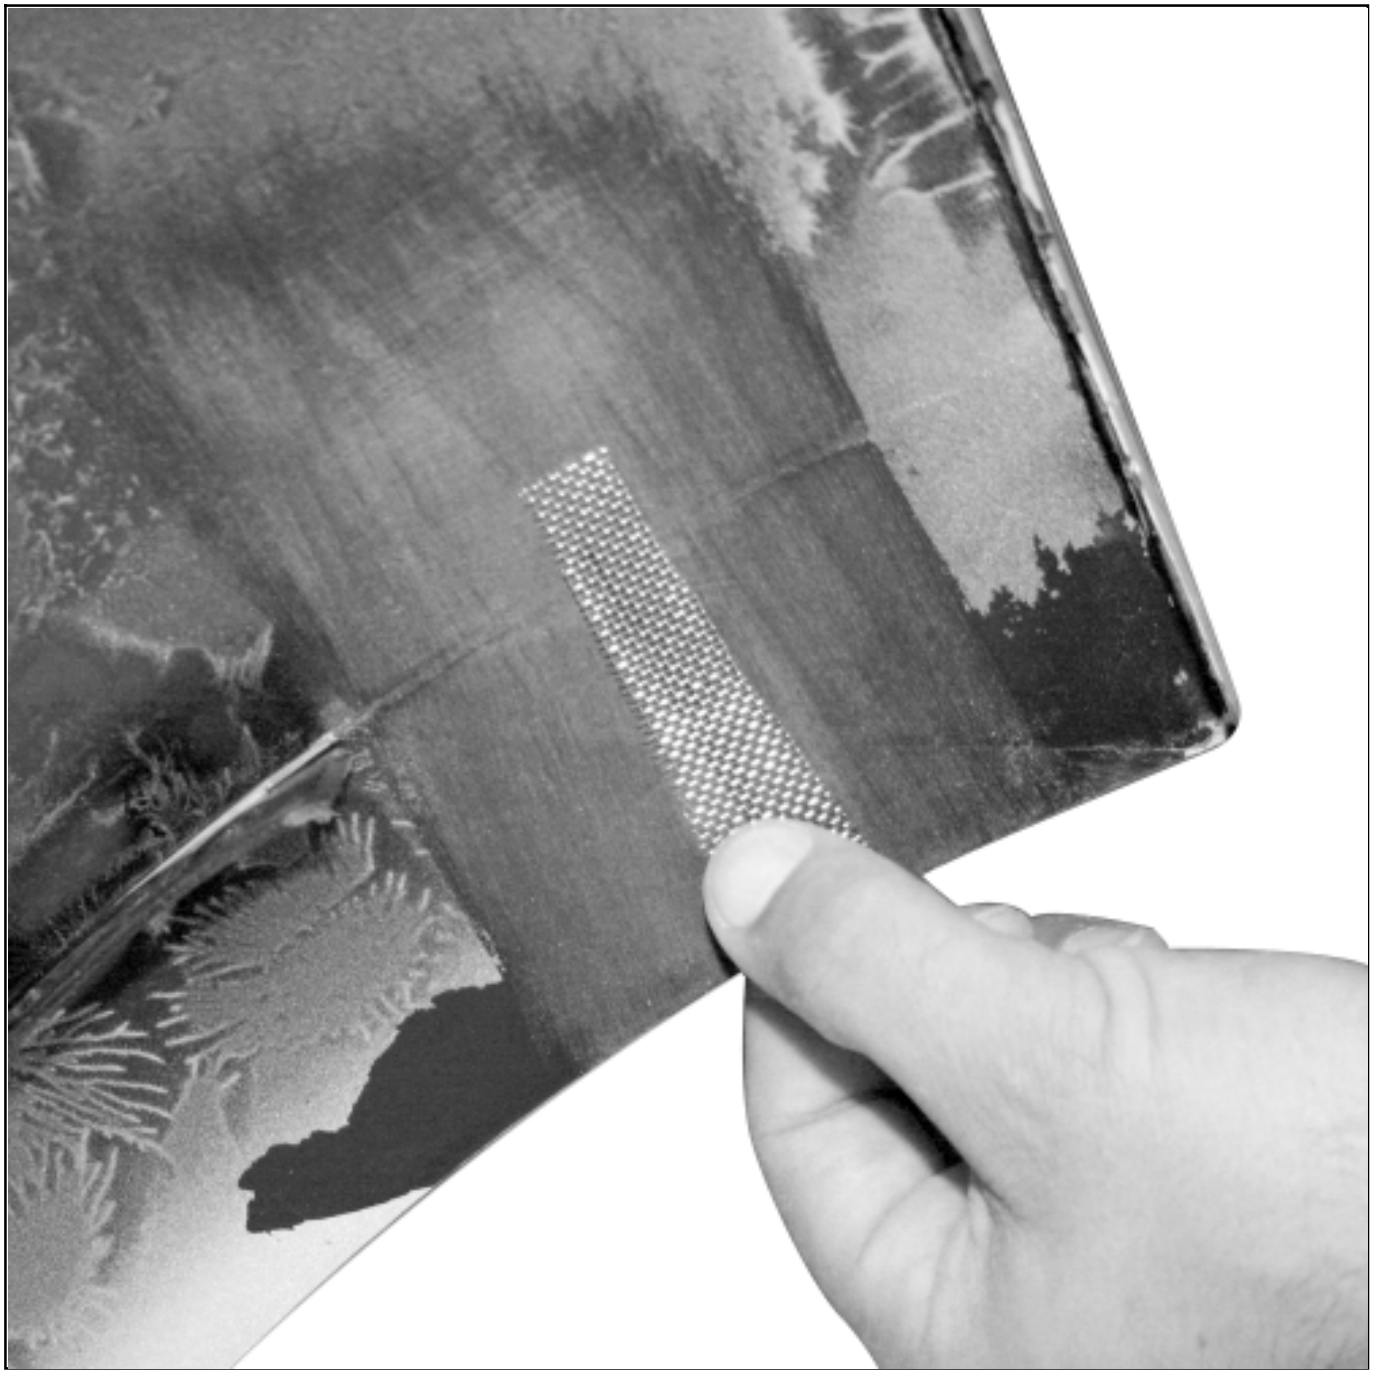
(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

Wash the component in soapy water and rinse in clean water.

Clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNERVehicle: Parts and consumables for the repair (04B, Consumables - Products).

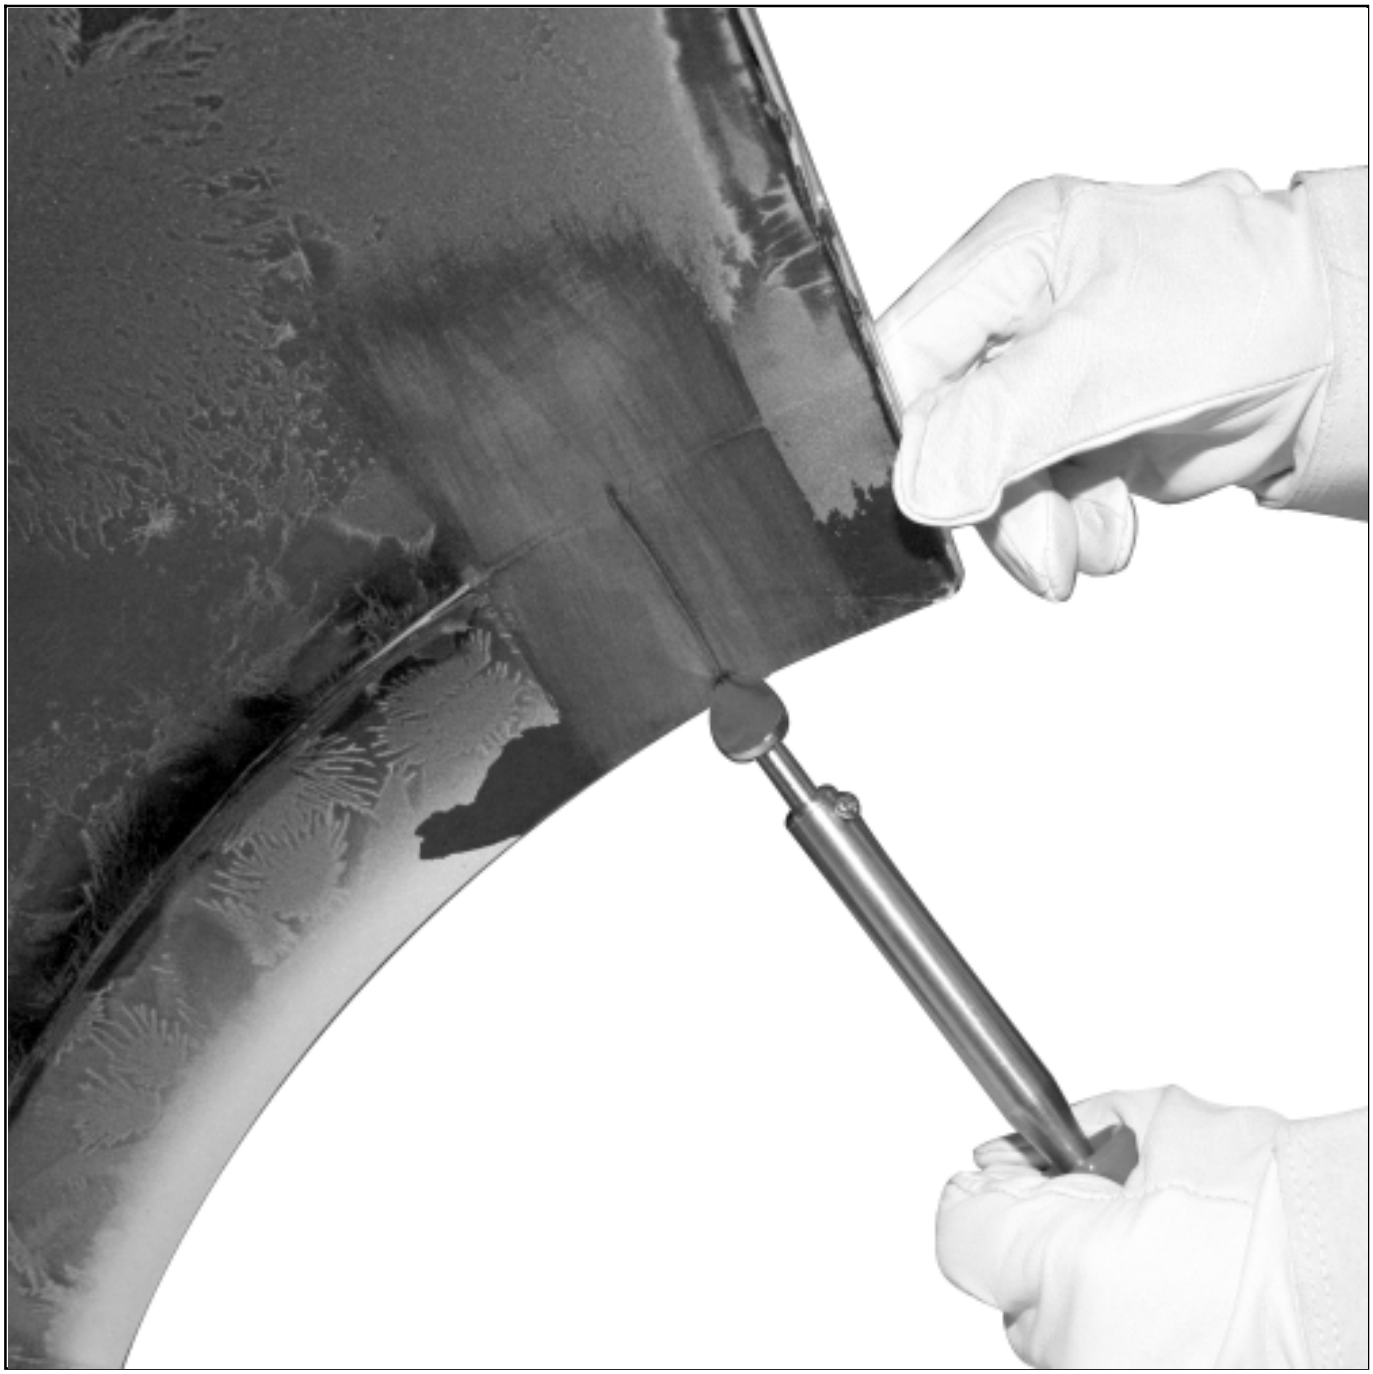
Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

Strip the paint with a P 150over a width of 50 mm.



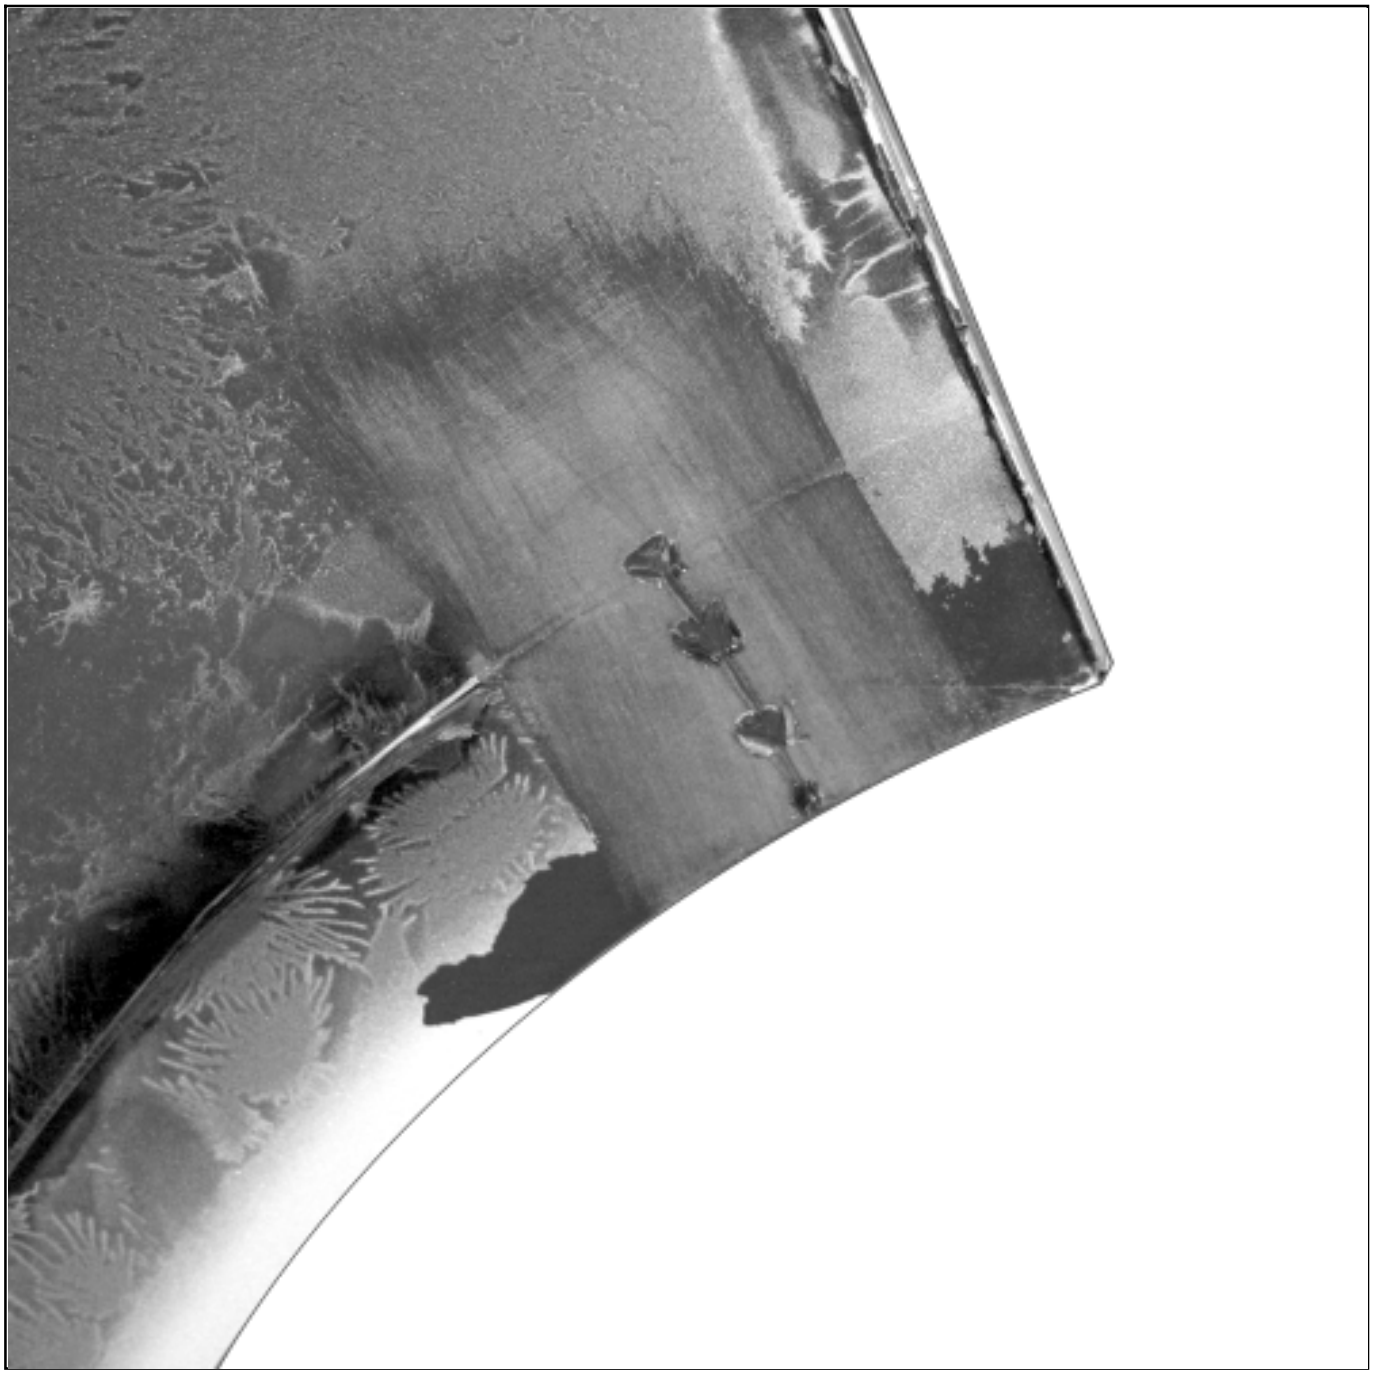
- Blow the component and clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

- Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).



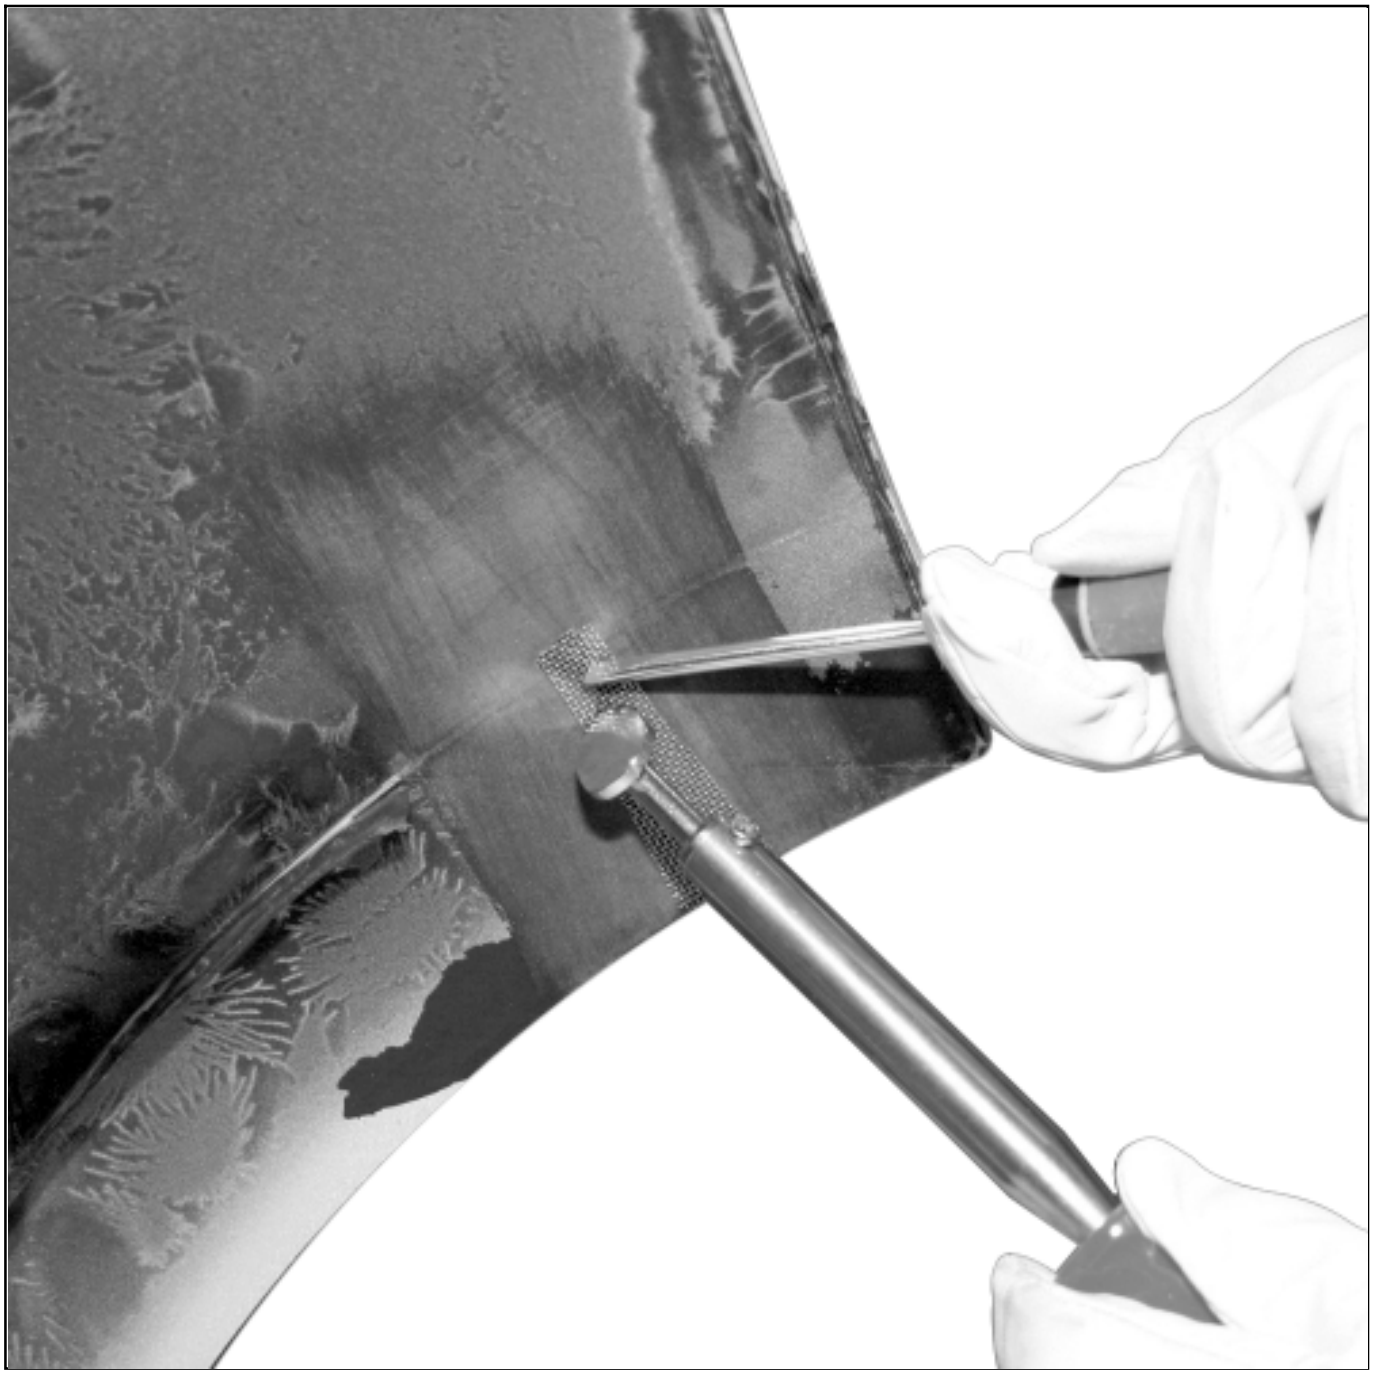
- Preheat the soldering iron.

Cut the stainless steel mesh wider at the start of the crack.

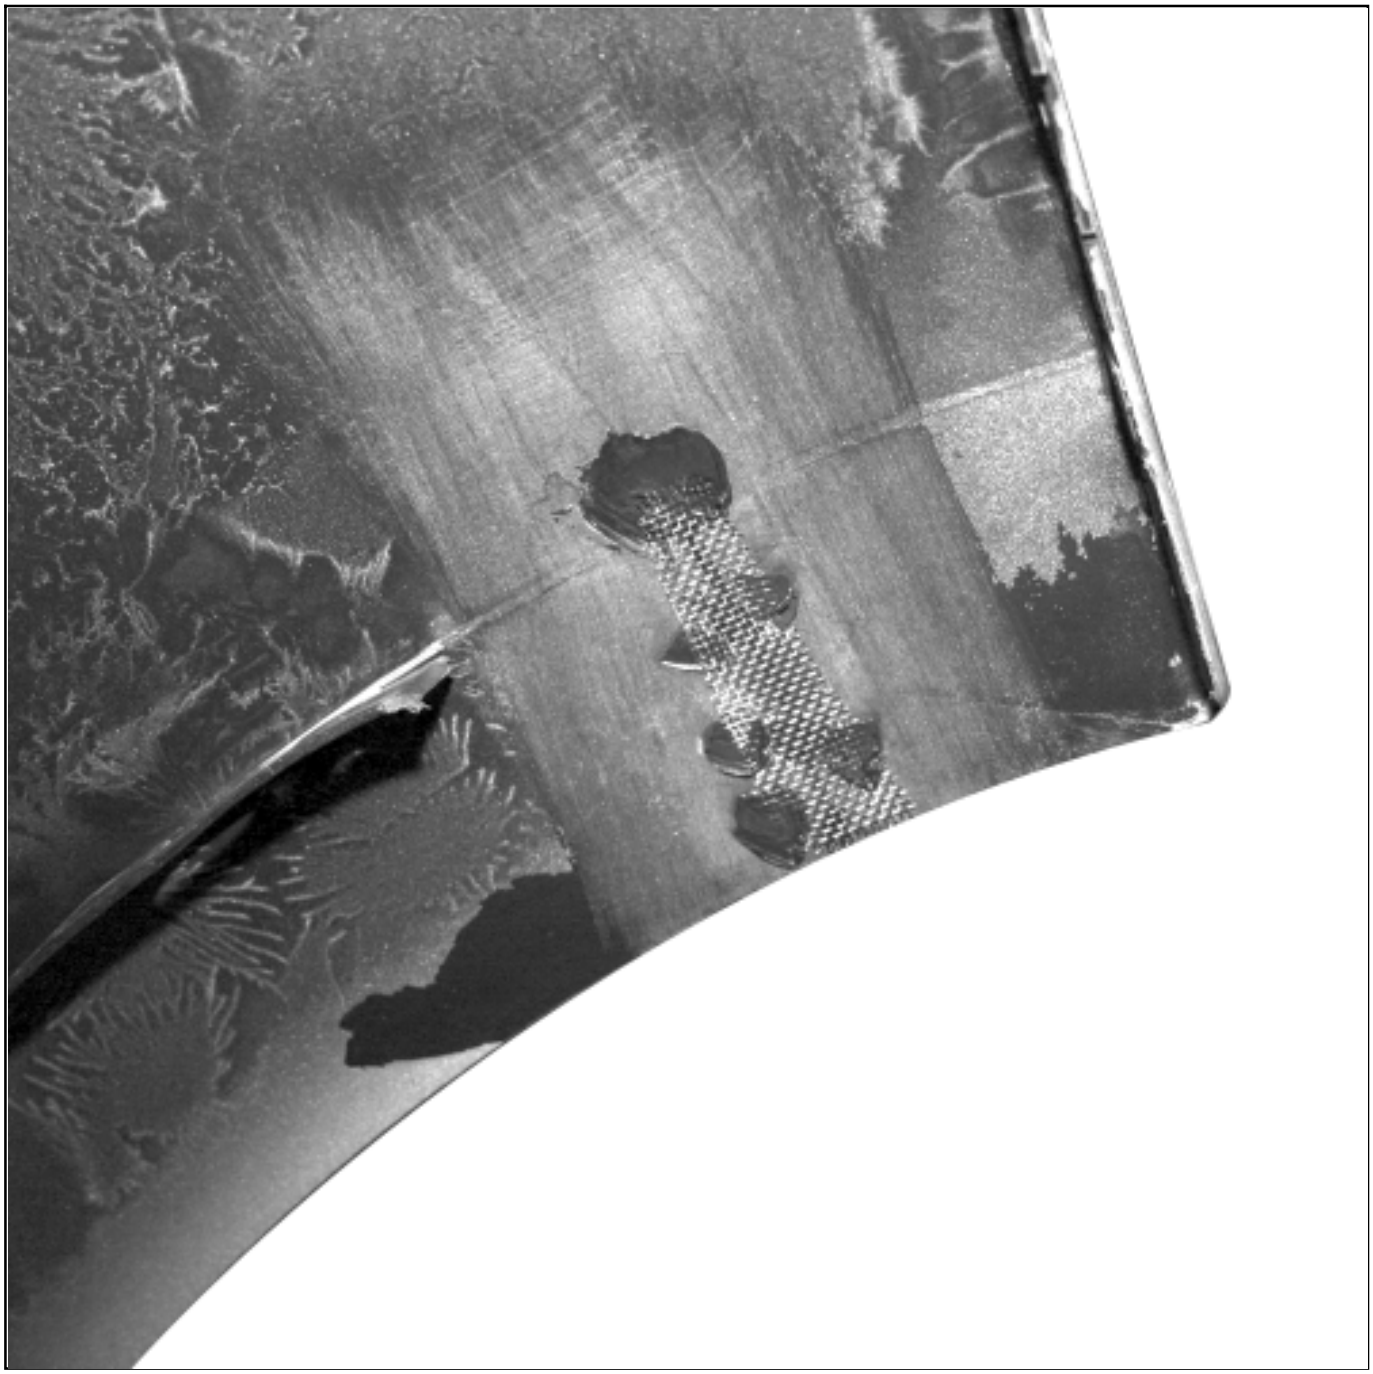


Adjust the stainless steel mesh according to the shape of the support.

Spot-weld the start of the crack with the tip of the soldering iron in order to maintain the shape.

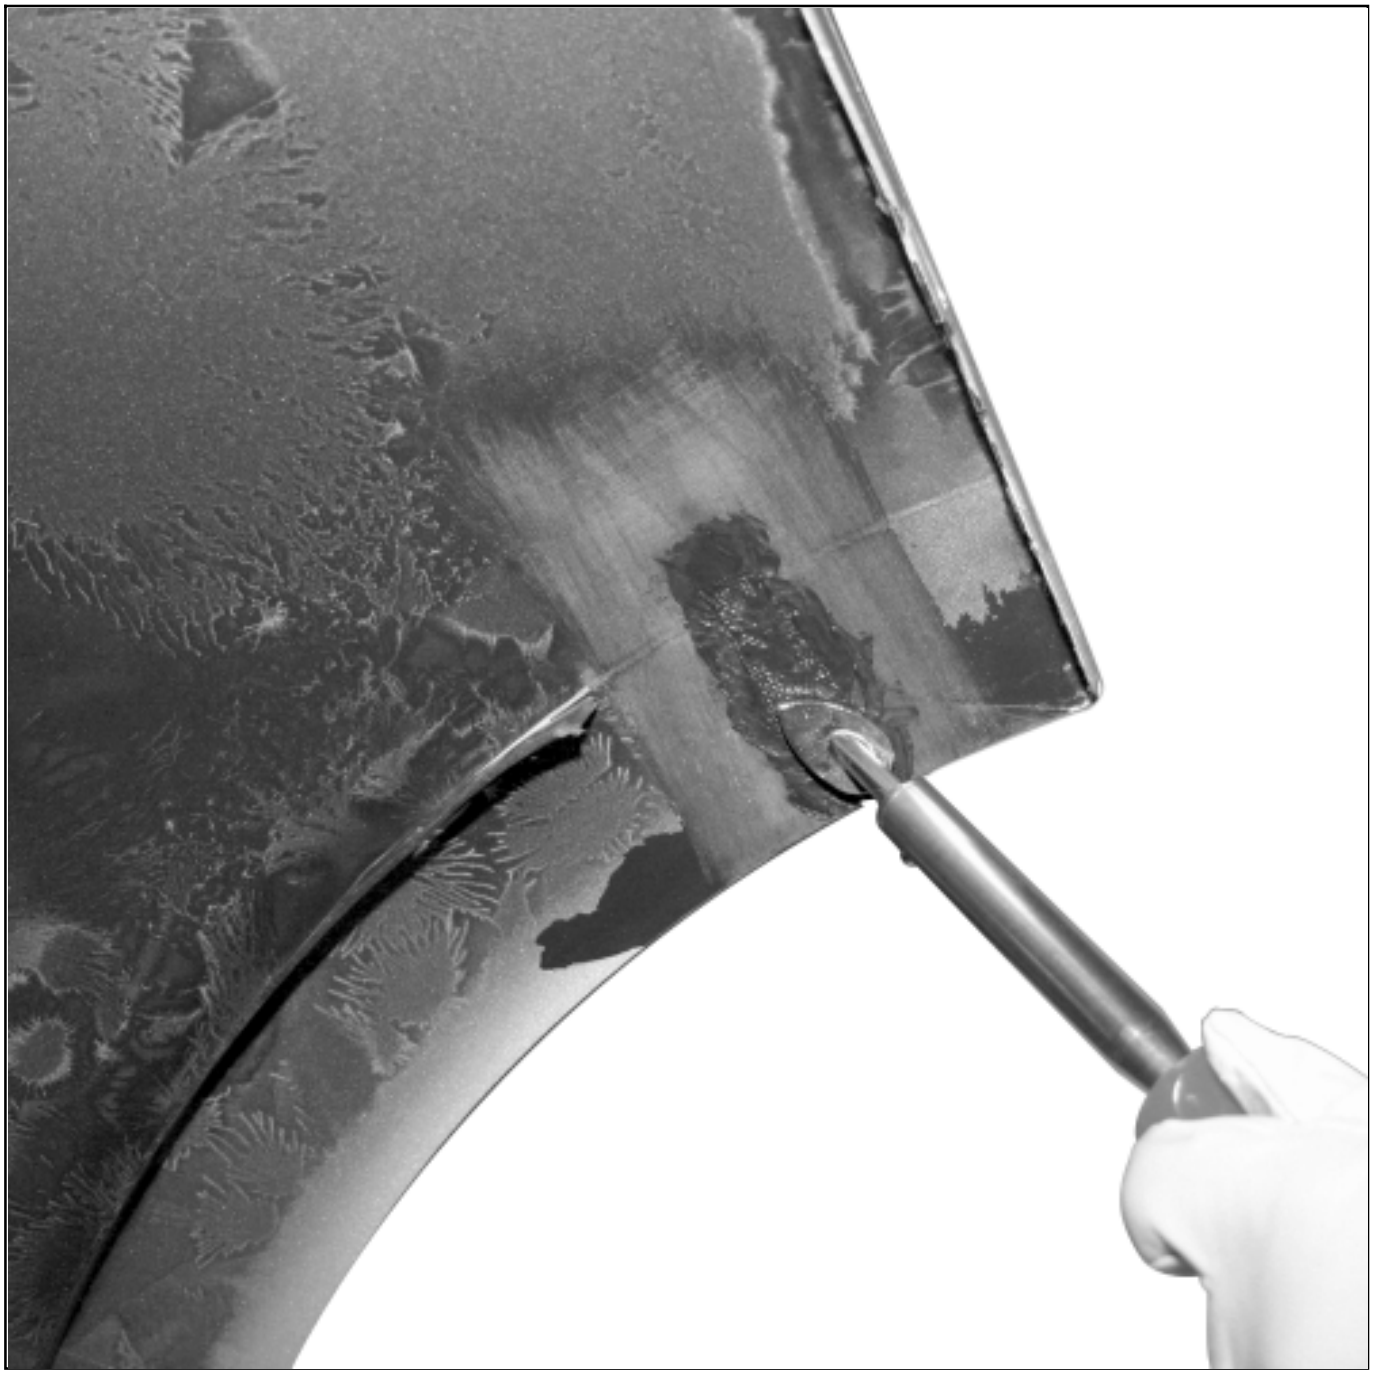


Cool the spot weld, for two seconds, vigorously with the cooler[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

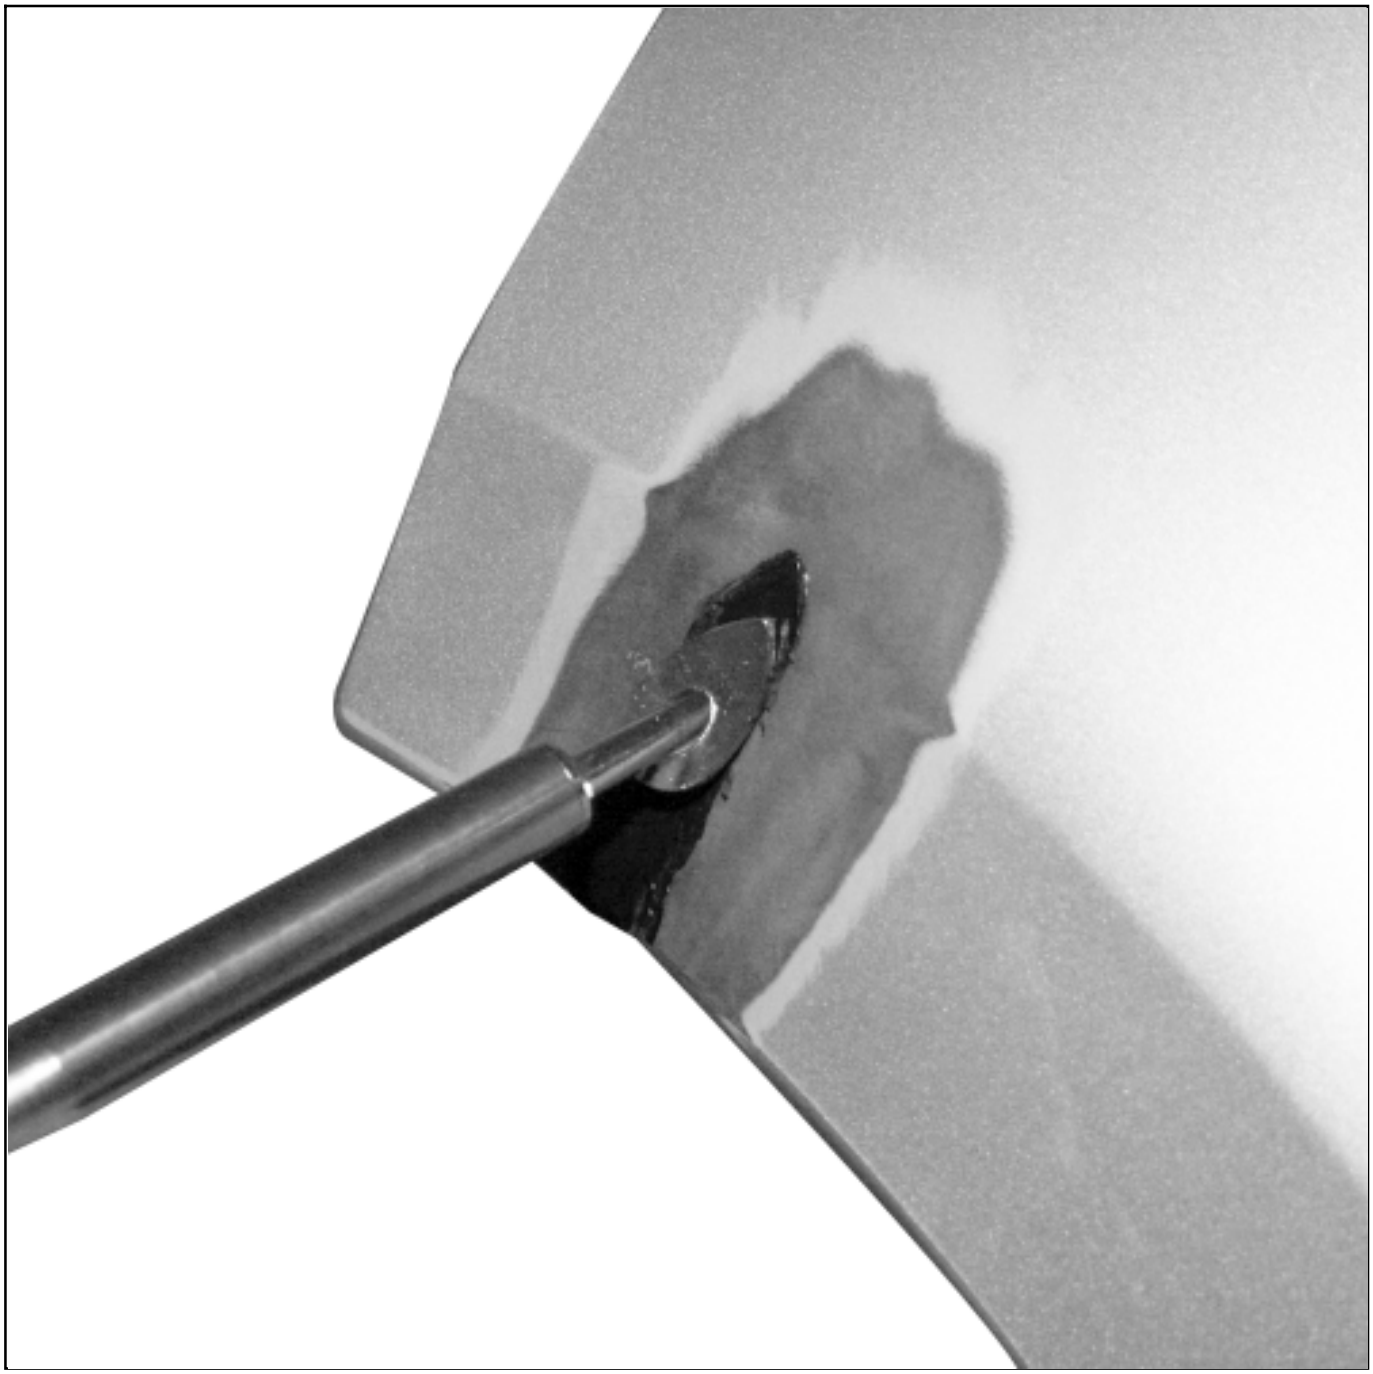


Repeat this operation along the length of the crack.

Cool each spot weld, for two seconds, vigorously with the cooler[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

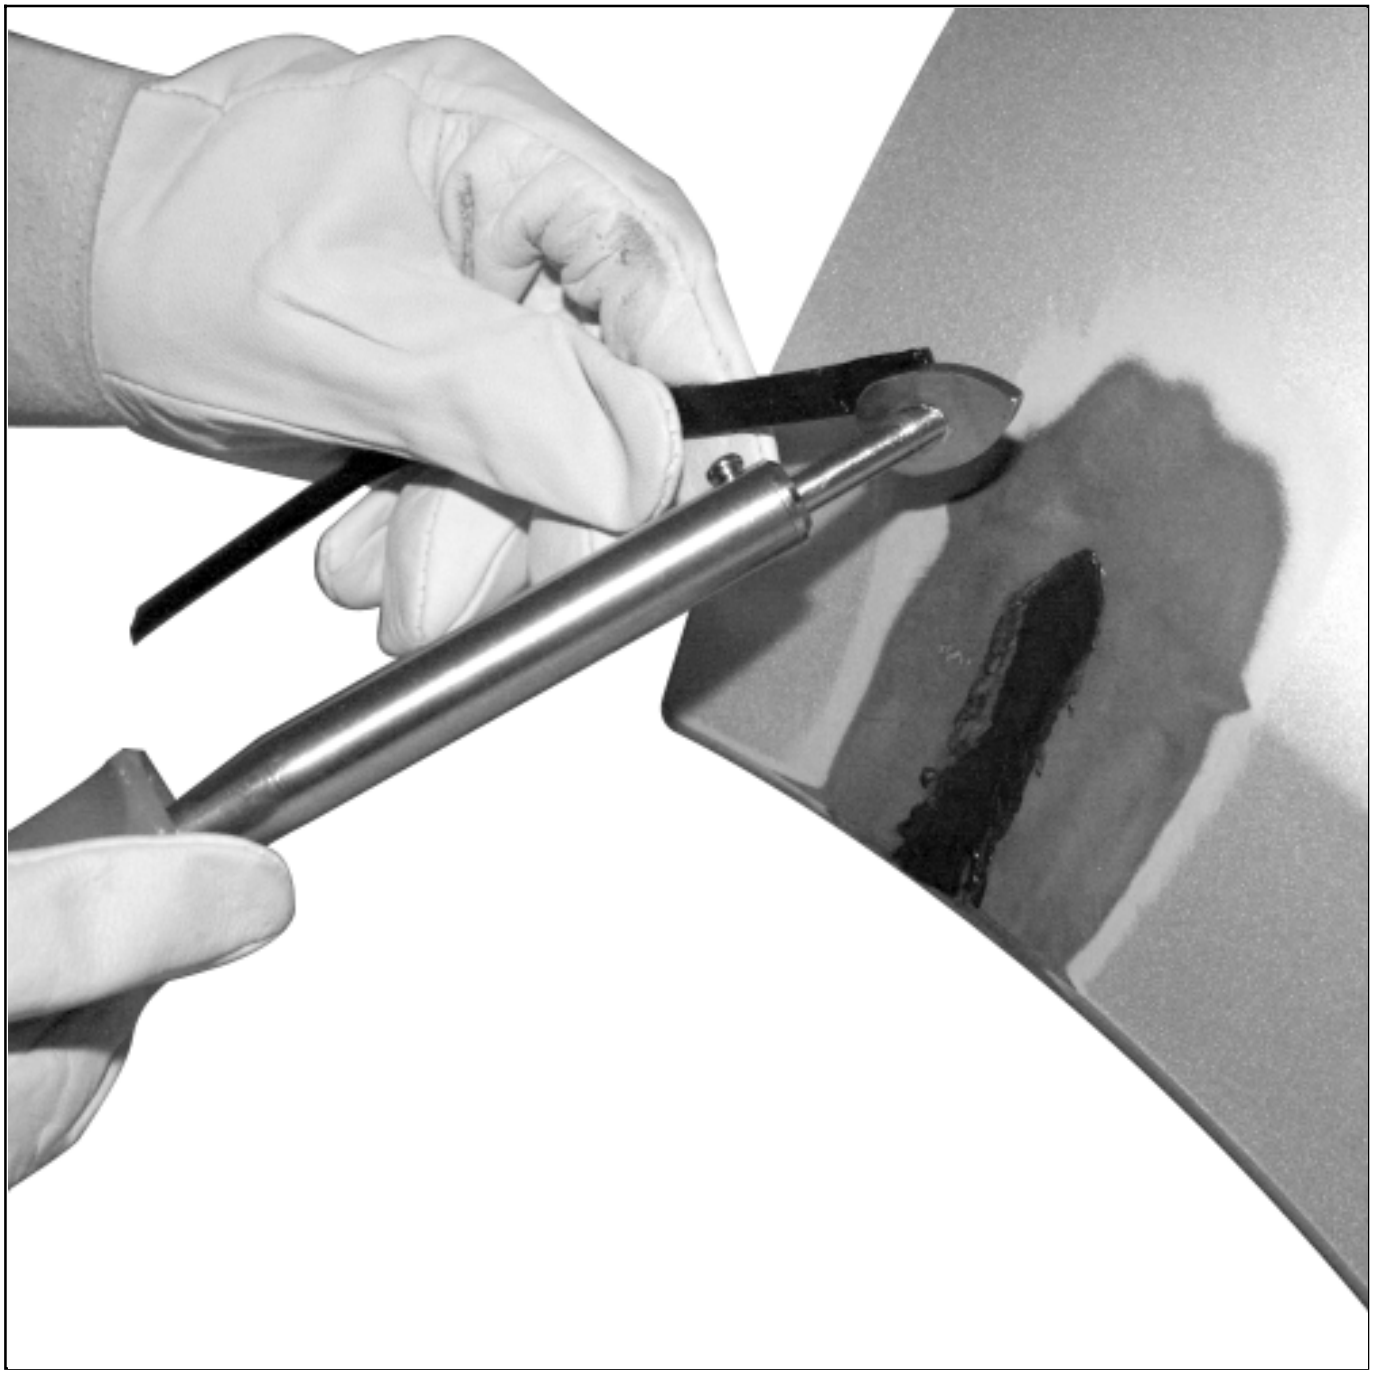


Position the stainless steel mesh and hold it using a dedicated tool.



- Spot-weld the stainless steel mesh.

- Cool each spot weld, for two seconds, vigorously with the cooler**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).



Enclose the stainless steel mesh in the plastic material along the length of the crack.

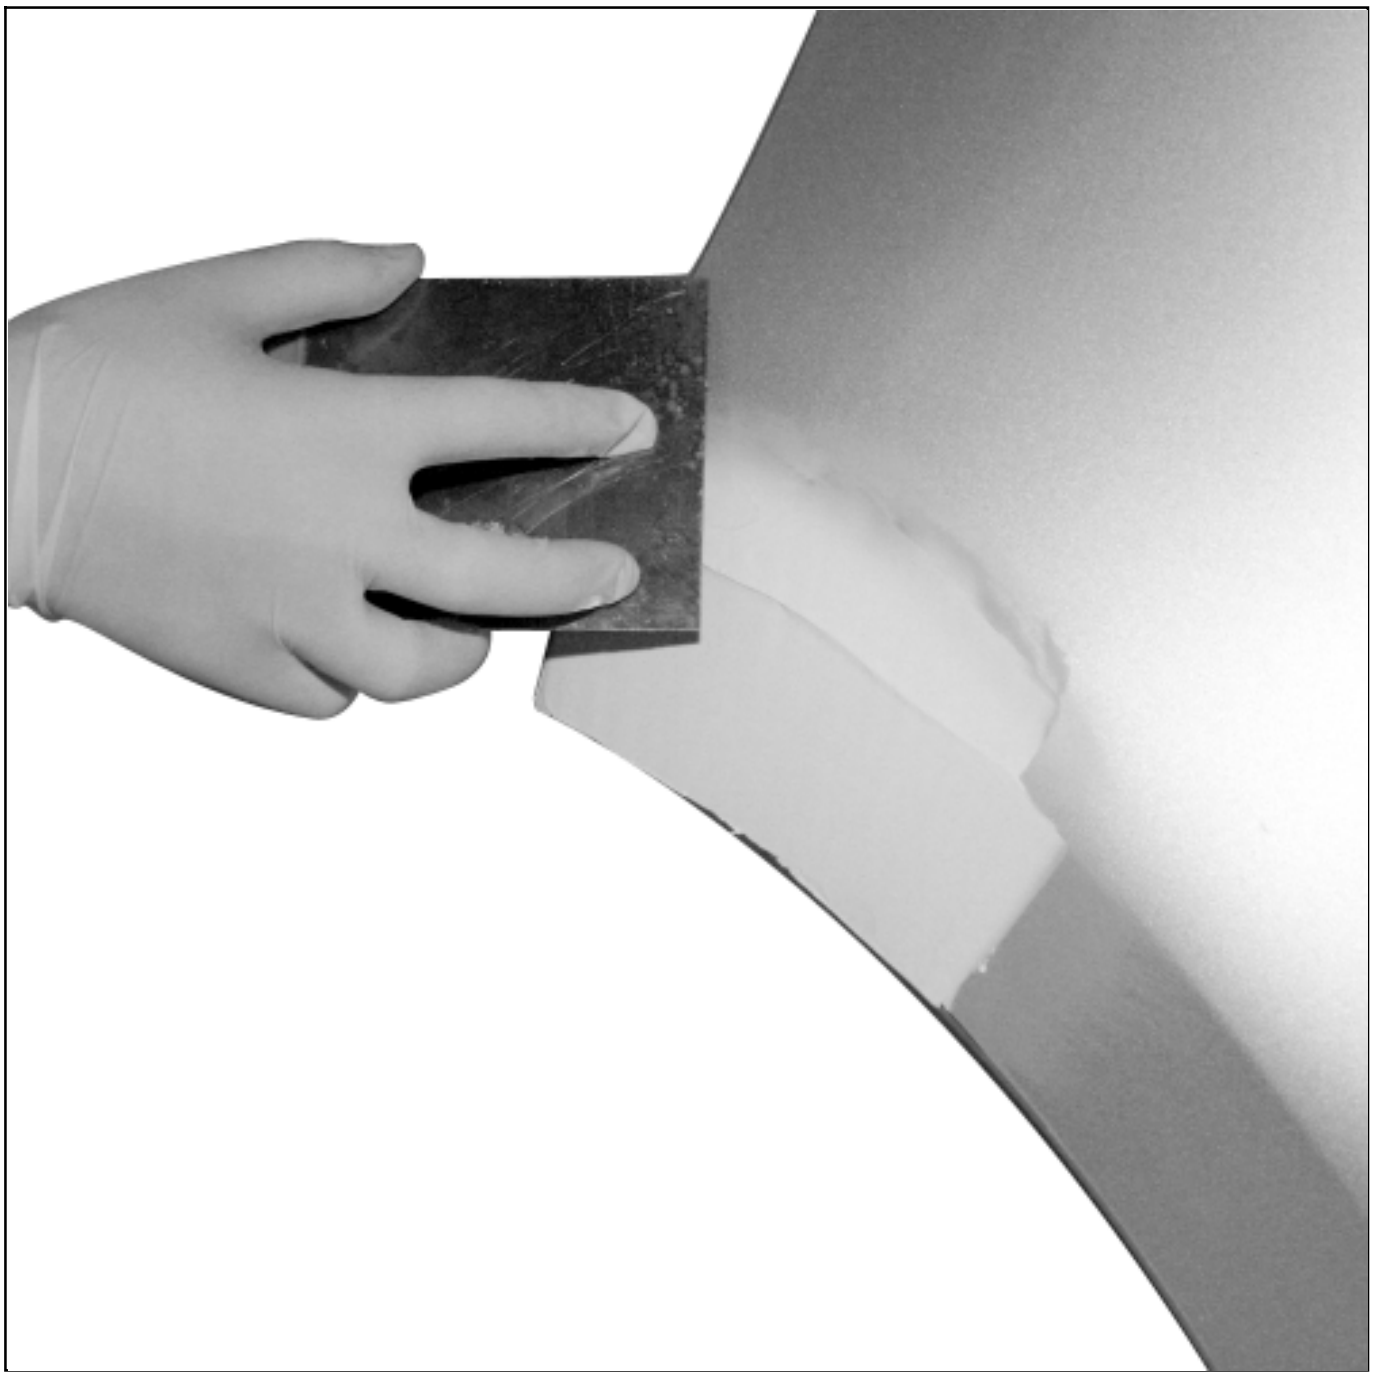
Cool the whole of the repaired area for two seconds, vigorously with the cooler Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Weld the exterior part of the bumper.

Add material by preheating the welding rod with the tip of the soldering iron (except for ABS, ASA and Polycarbonatetype materials).

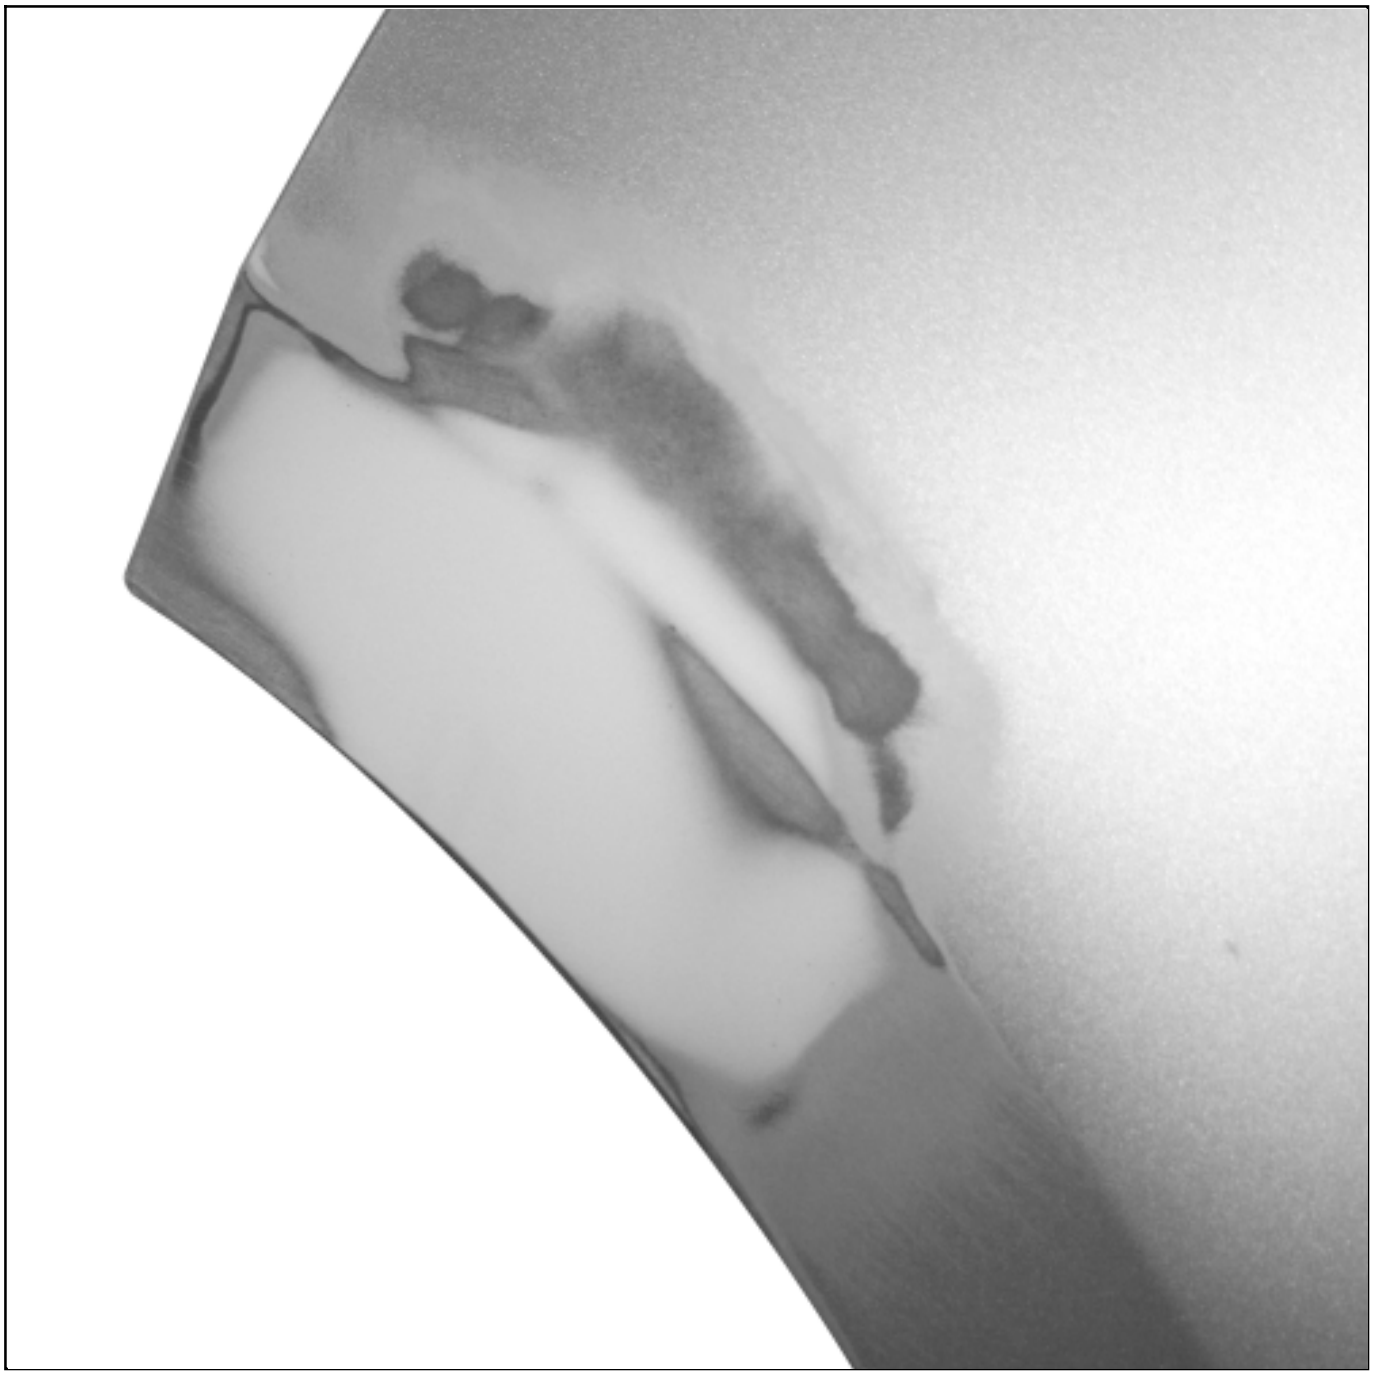
Note:

For ABS, ASAand Polycarbonate, fill the crack with the surrounding material



Cool the whole of the repaired area for two seconds, vigorously with the cooler Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Surface with a P 80 to P 150 then finish with a P 240.



Blow the component and clean the area to be repaired with a LINT-FREE CLOTH soaked in ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

If necessary, apply a finishing mastic(see product technical sheet) Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Sand the finishing masticwith a P 150then finish with a P 240.

Follow the paint application procedure according to the material concerned:

- **Polypropylene / polyethylene bodywork component: Preparation and paint range** (Technical Note 592A, 95A, Paint application procedure on plastic),
- **ABS bodywork component: Preparation and paint range** (Technical Note 592A, 95A, Paint application procedure on plastic).

3- EPOXY RESINE METHOD

Note:

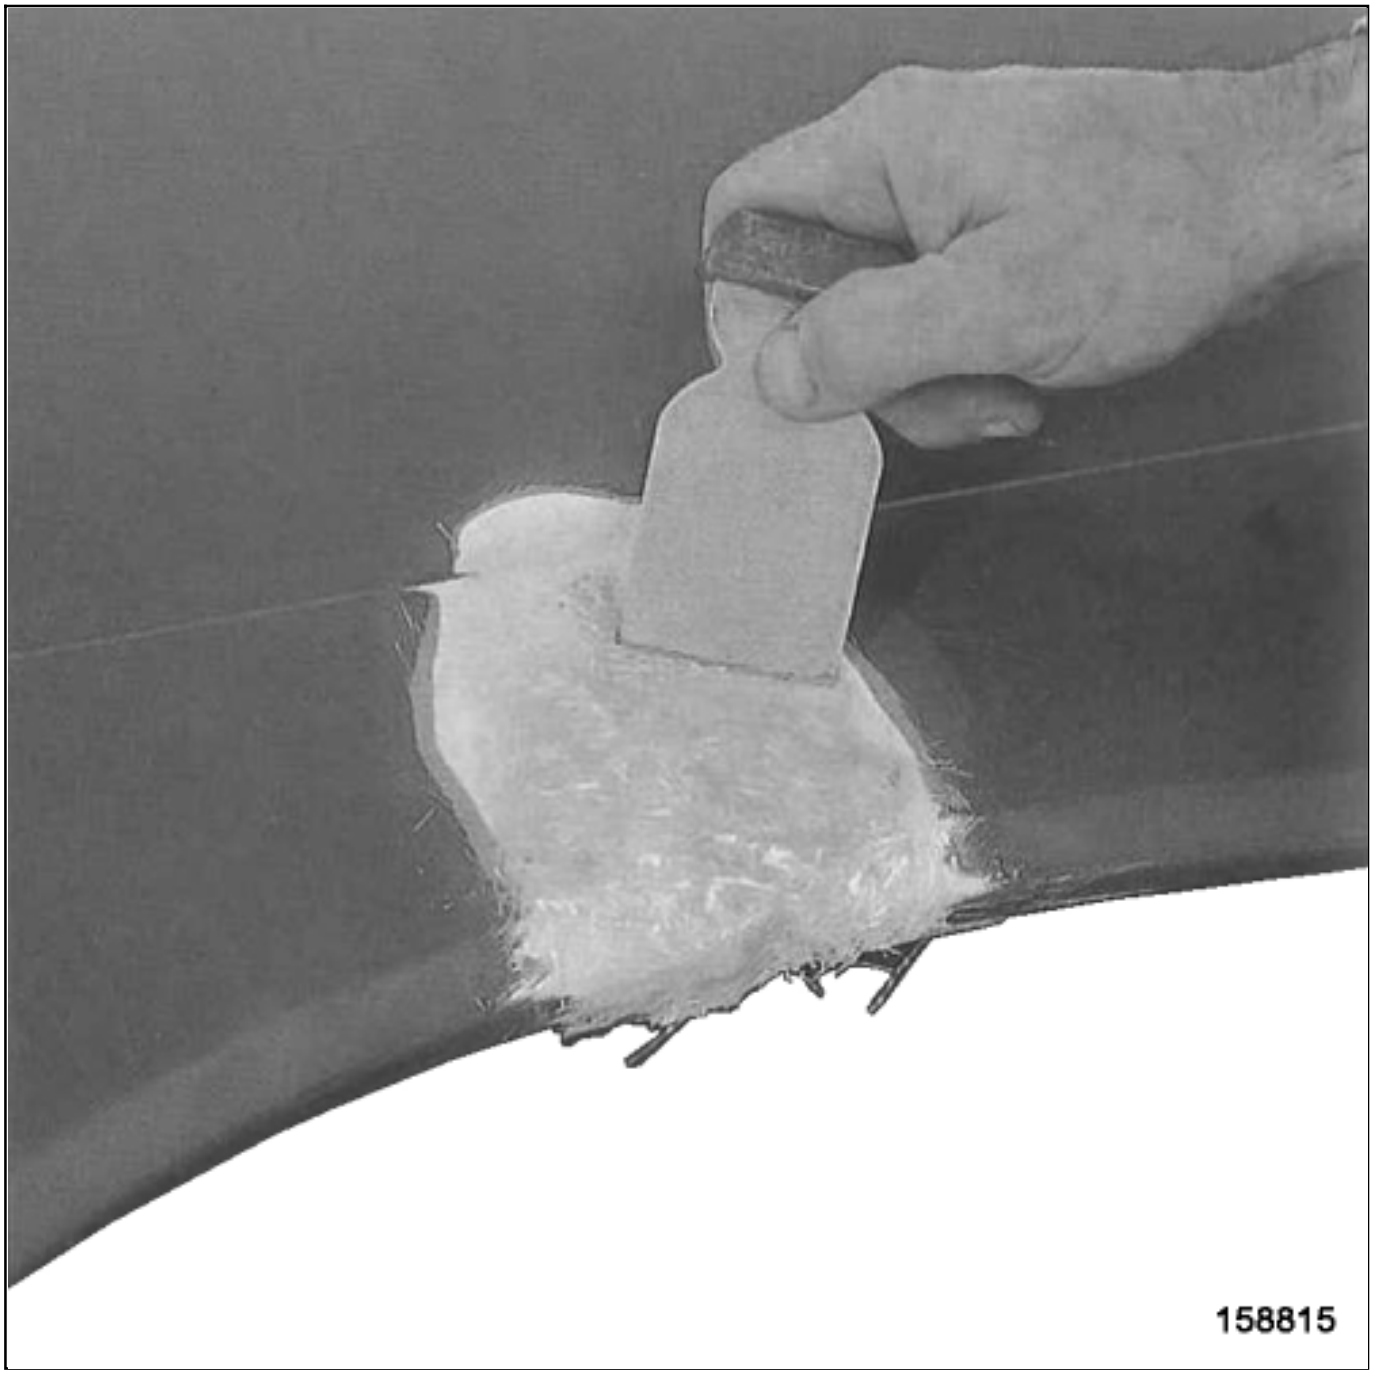
Method apply only on RTM component.

Open the crack to let a hole of 10 mmwide.

Chamfering between 30to 40 mmaround the crack using the orbital sander with a P80.

Sand the paint around the zone to be repaired using the orbital sander with a P 150

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).



Align the borders of the component using a plate pad(local manufactured)and fix them with plate screws.

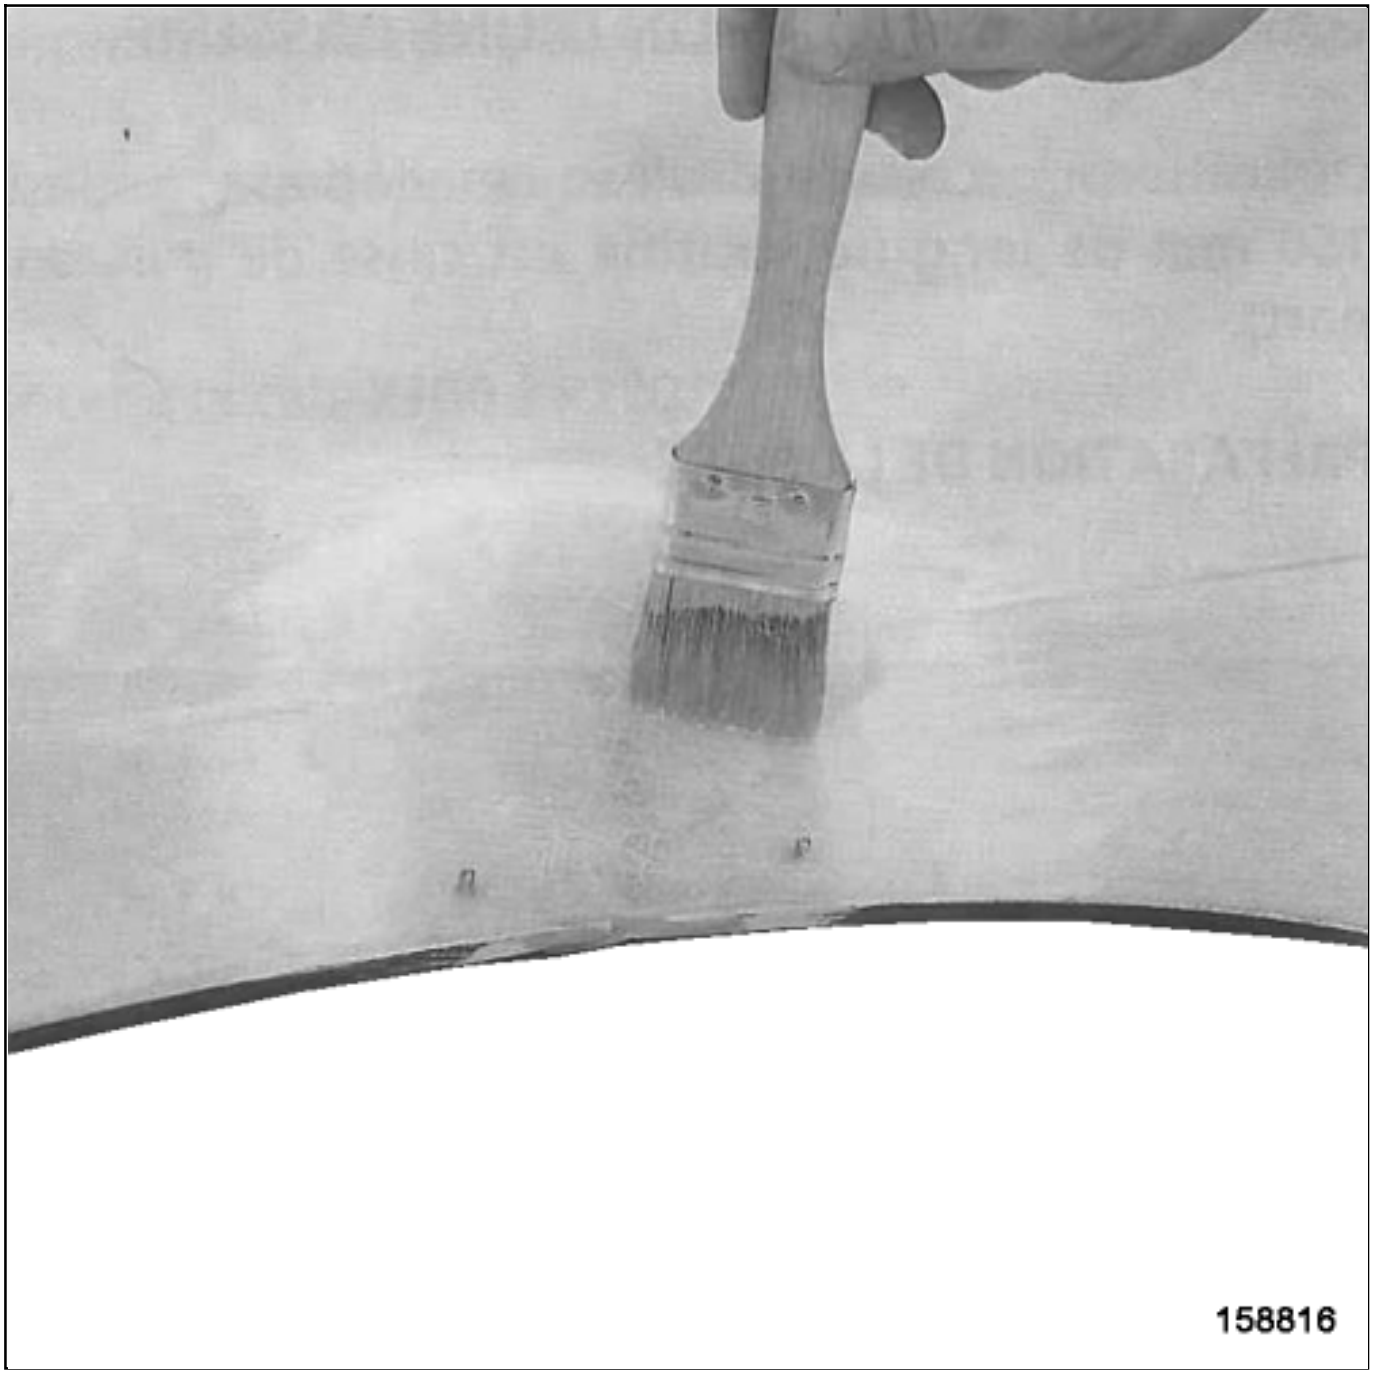
Cut 2 strips of materialwith repair length, first of 50mmwide and second of 100 mmwide.

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

Fit the strip of materiel.

Soaked the component interior with Epoxy resin.



Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

Remove the plate pads.

Cut a stripcovering the chamfer.

- Chamfering the screws holes.

- Fit the strip soaking with resin.

Note:

Pay particular attention at output screw area and at strips junction reinforcement to prevent the air bubbles form.

Add short fibres with resin(50 % maxi.).

Apply the mixture using a spatula.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

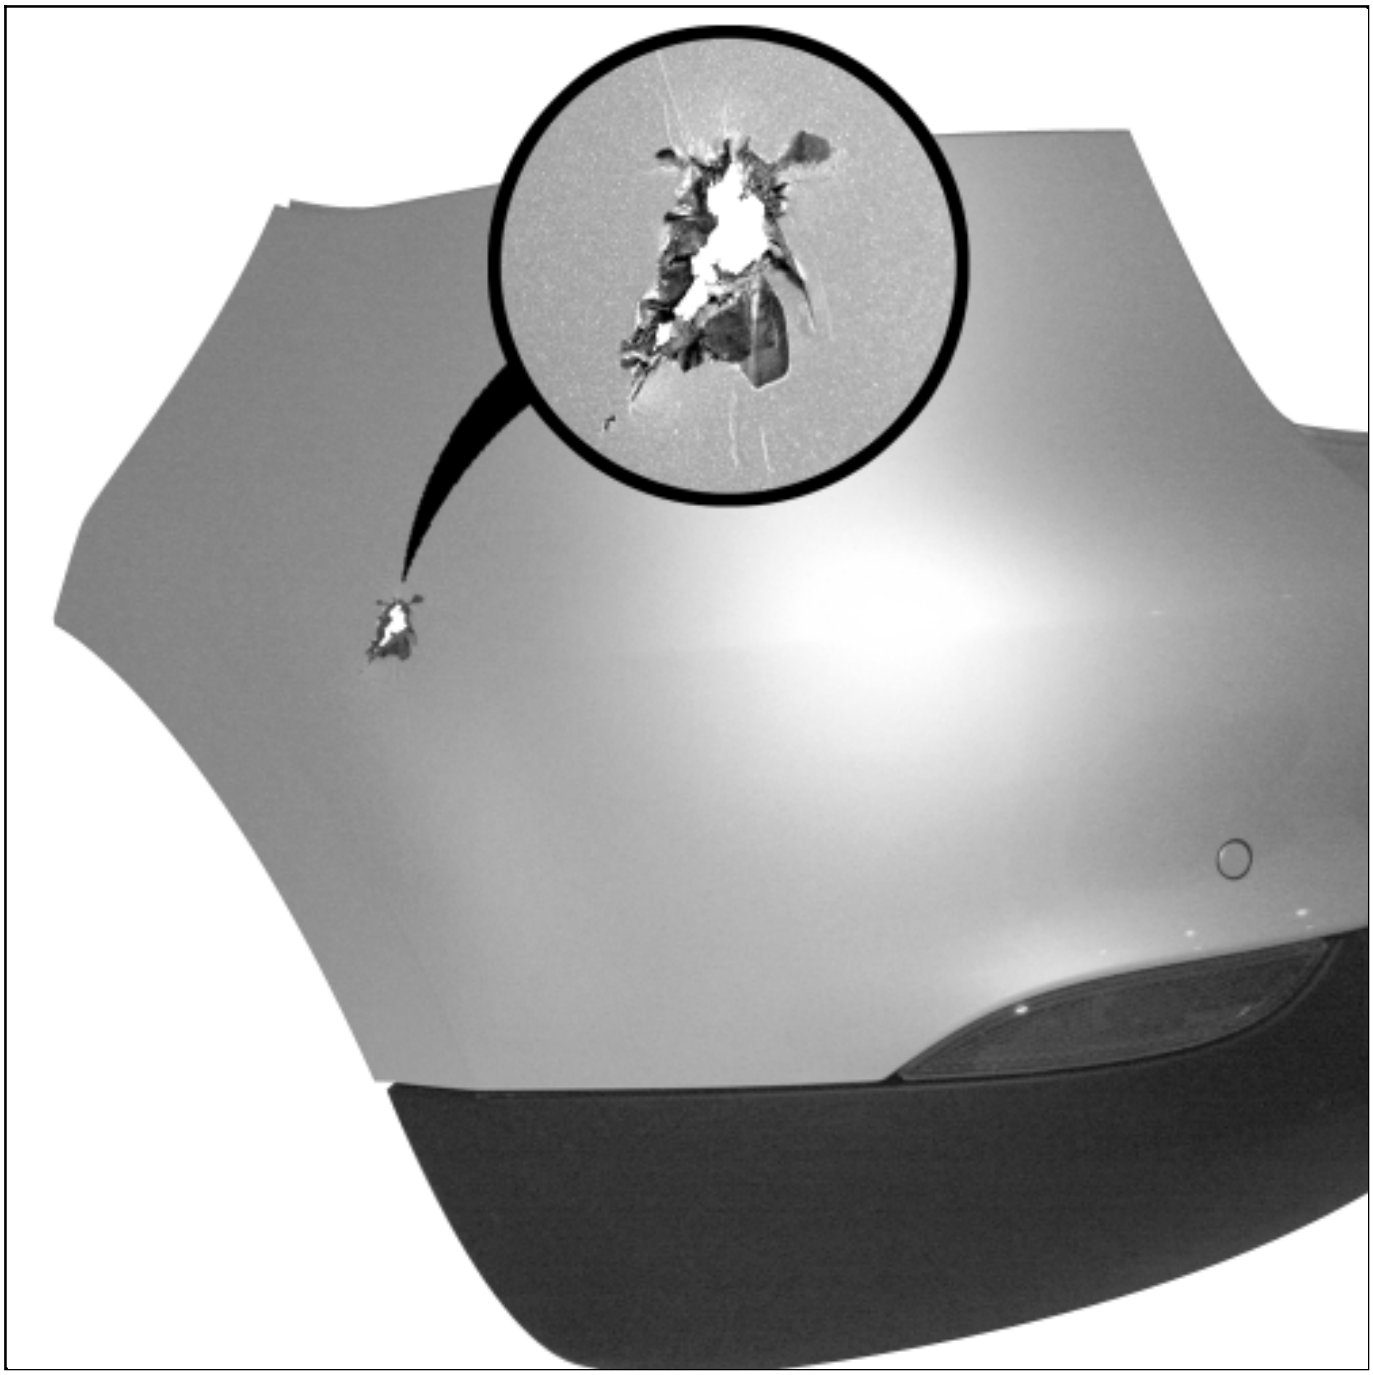
Sand using the orbital sander with a P 80then with a P180and P240.

Apply if necessary a finishing mastic(see product technical sheet). (see **Vehicle: Parts and consumables for the repair**)

Sand the finishing masticusing a P 150then finish using a P240.

4. PROCEDURE 3

Repairing a hole on a plastic chassis element.



1- BONDING METHOD

Note:

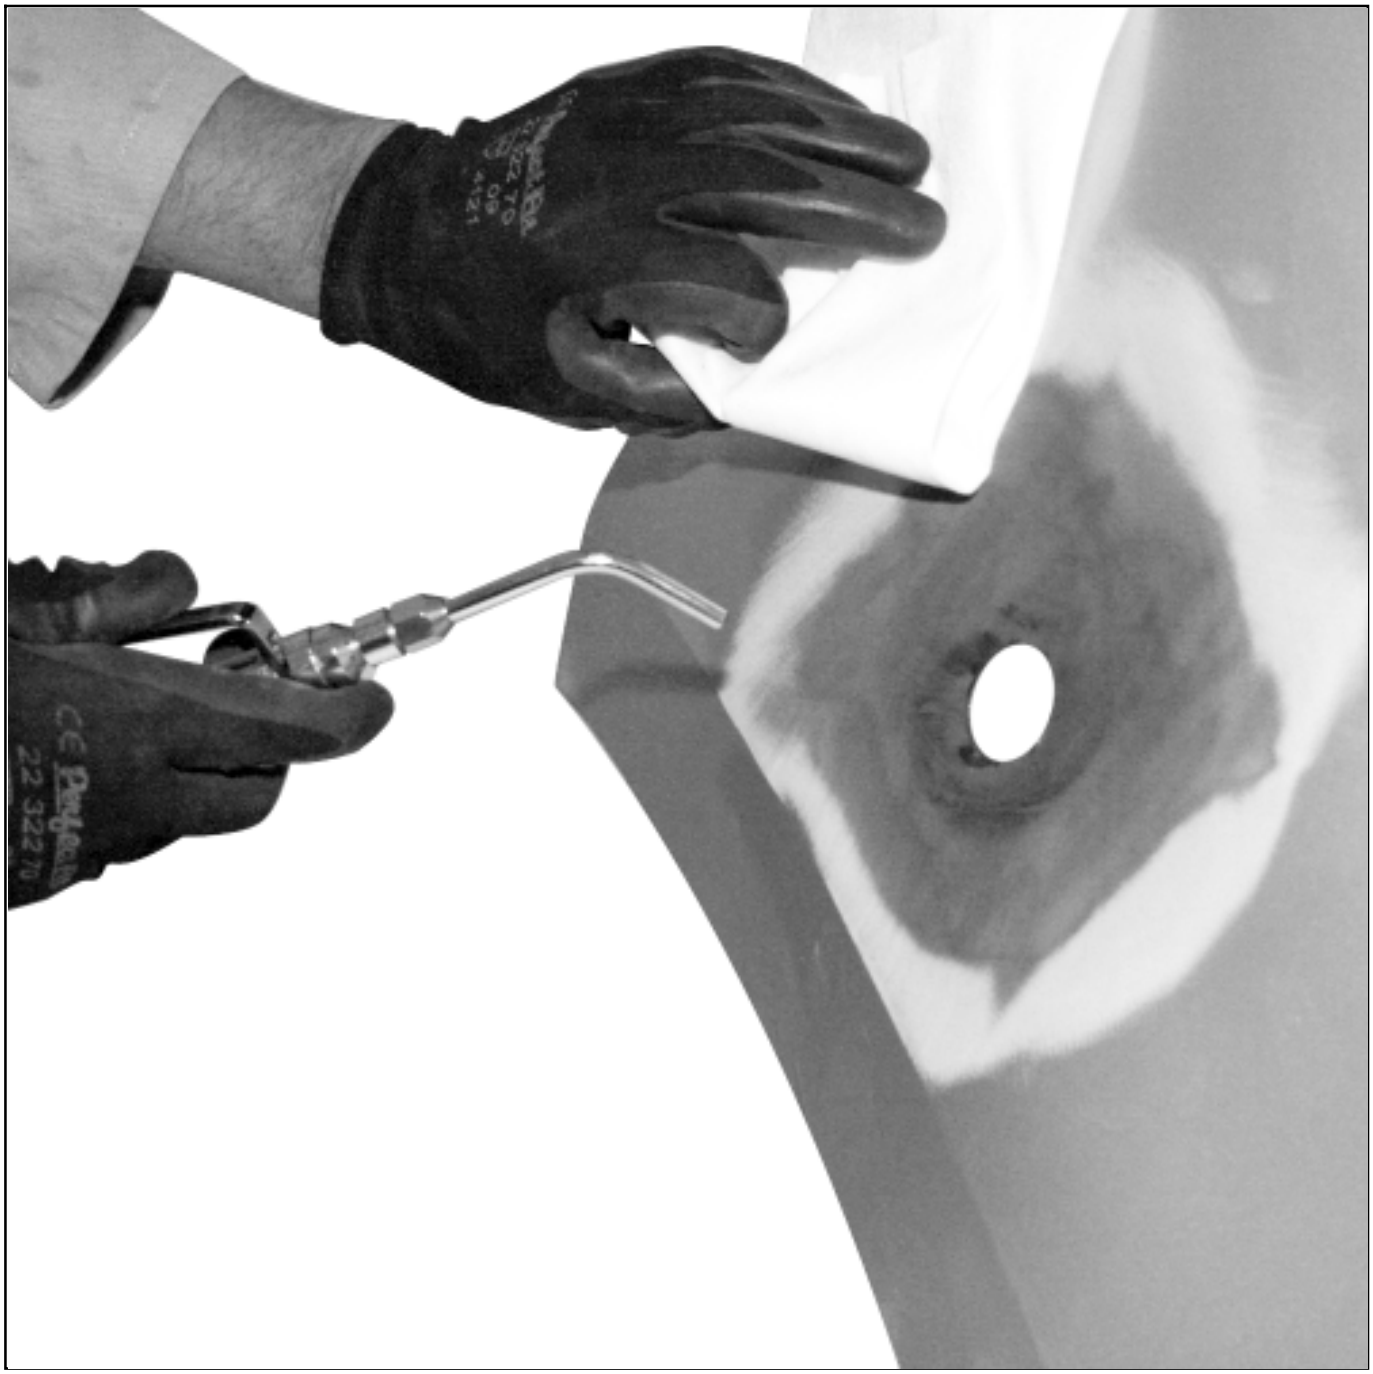
Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

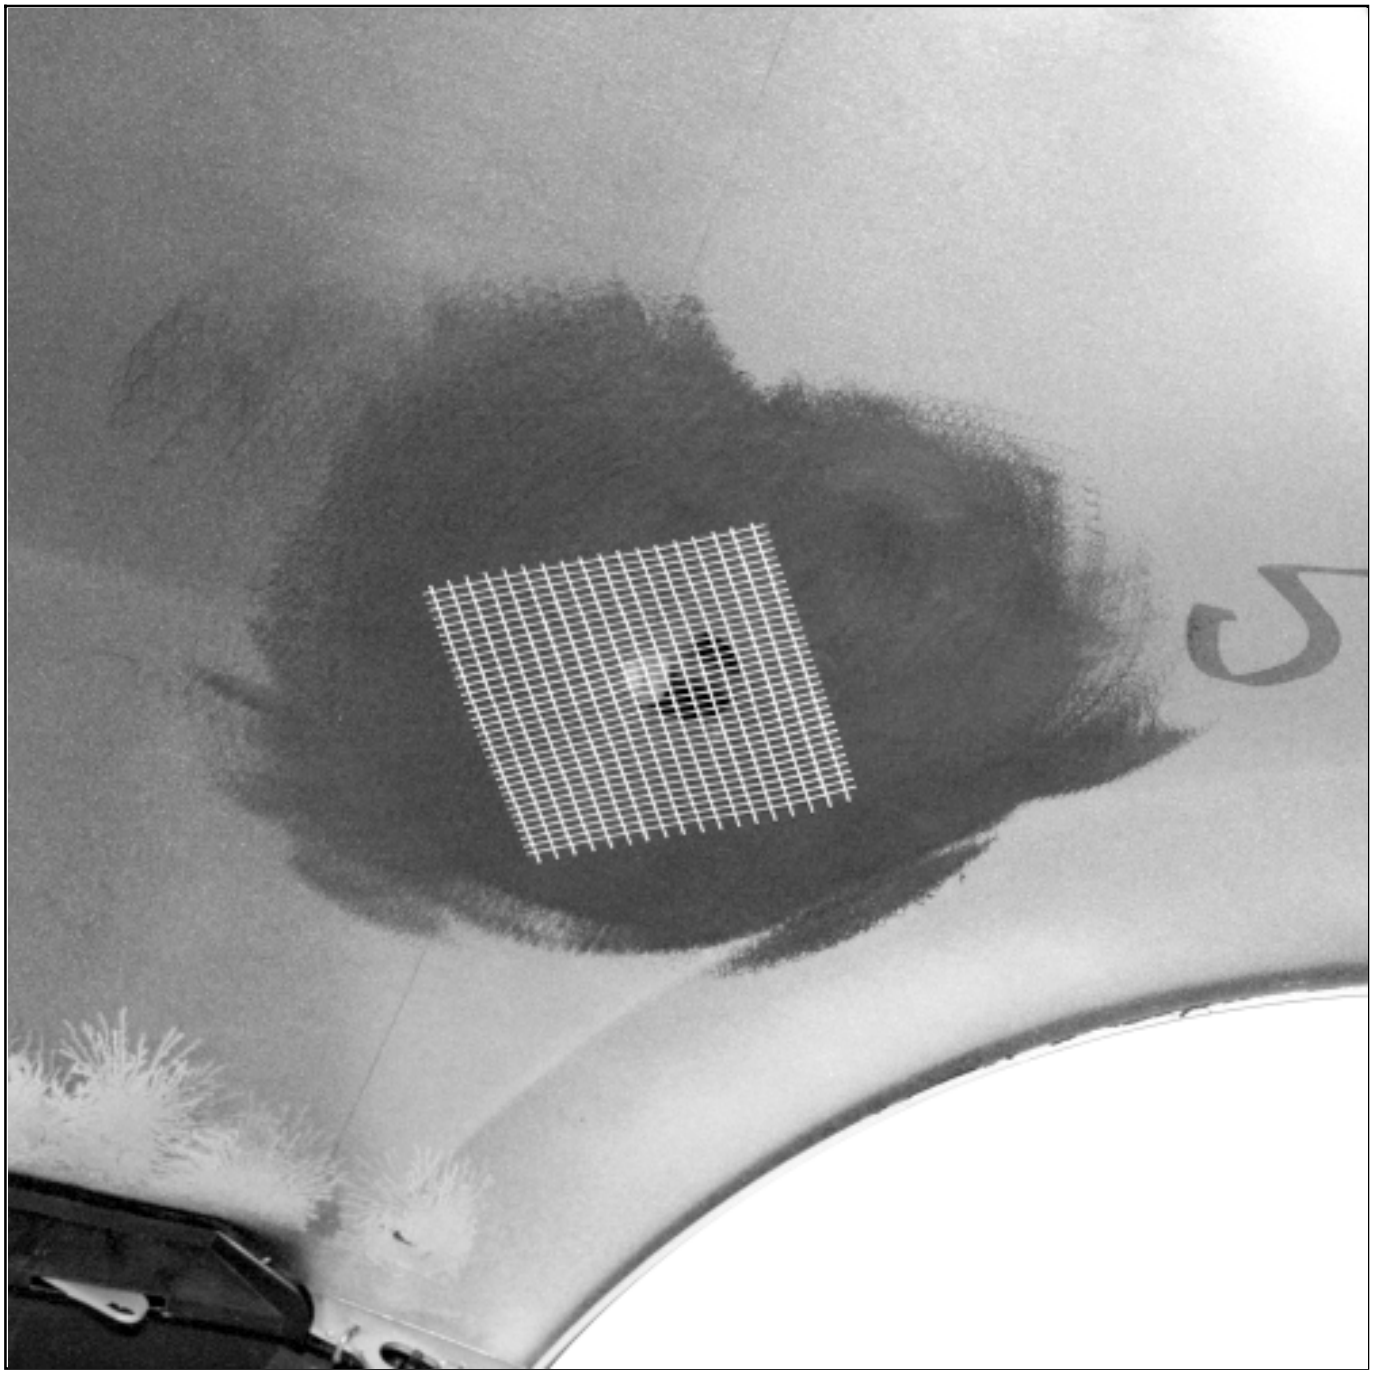
Wash the component in soapy water and rinse in clean water.

Clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNERVehicle: Parts and consumables for the repair (04B, Consumables - Products).



Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

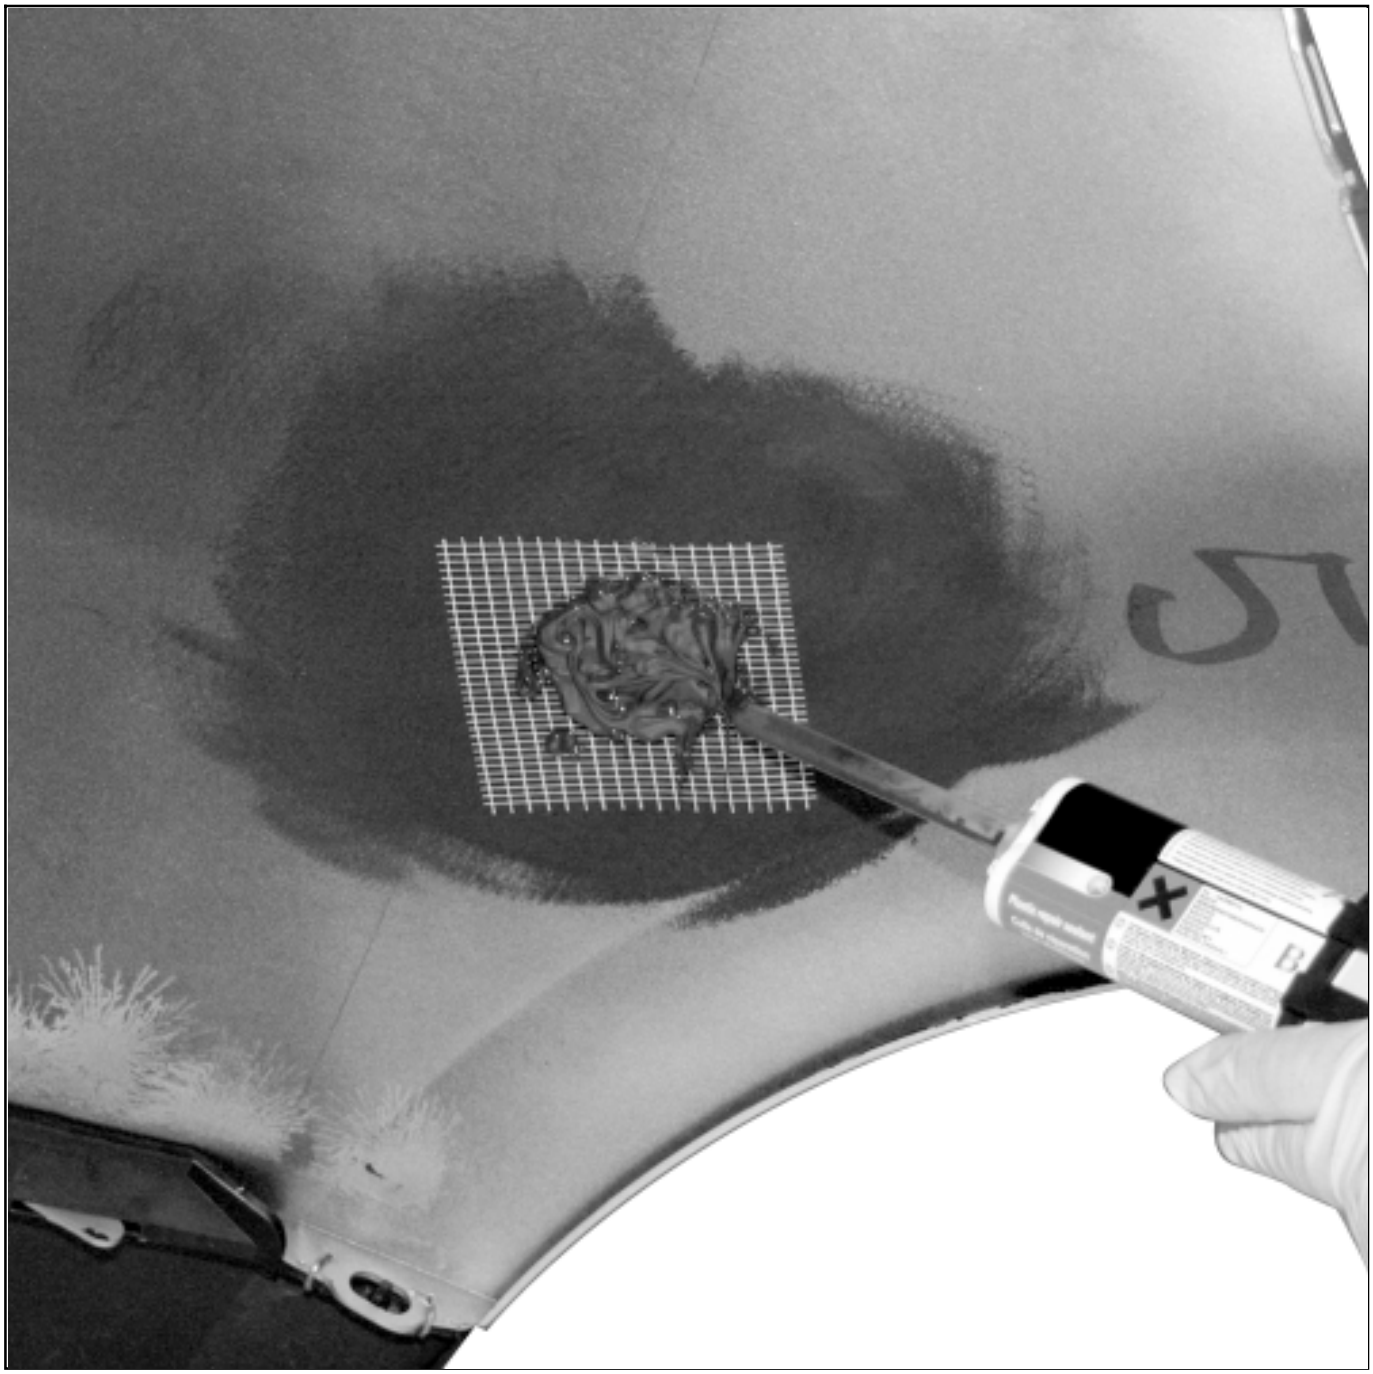
Chamfer on the exterior side using an angle grinderor a belt sanderequipped with a P 120abrasive pad.



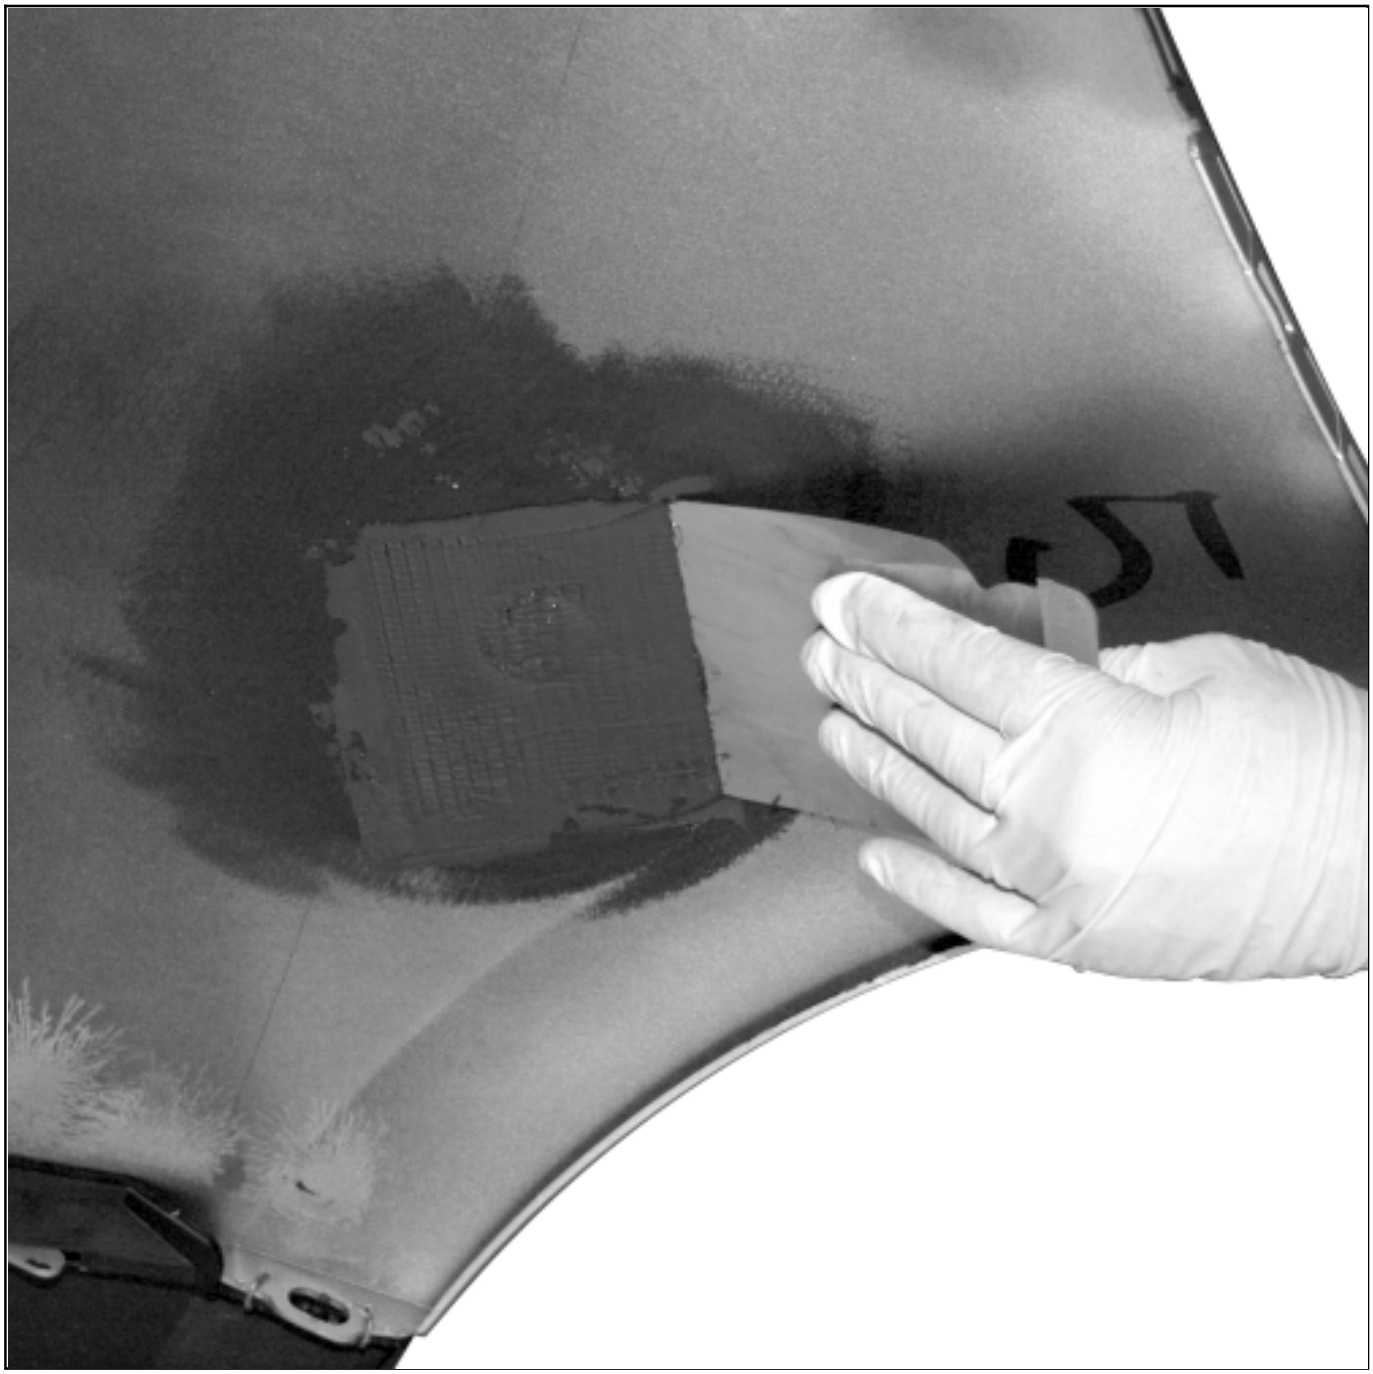
Surface the interior and exterior areas with the orbital sander using a P 150.

Blow the component and clean the area to be repaired with the cleaner included in the plastic repair kit box.

Apply the adhesive primerincluded in the plastic repair kitto the interior and exterior areas.

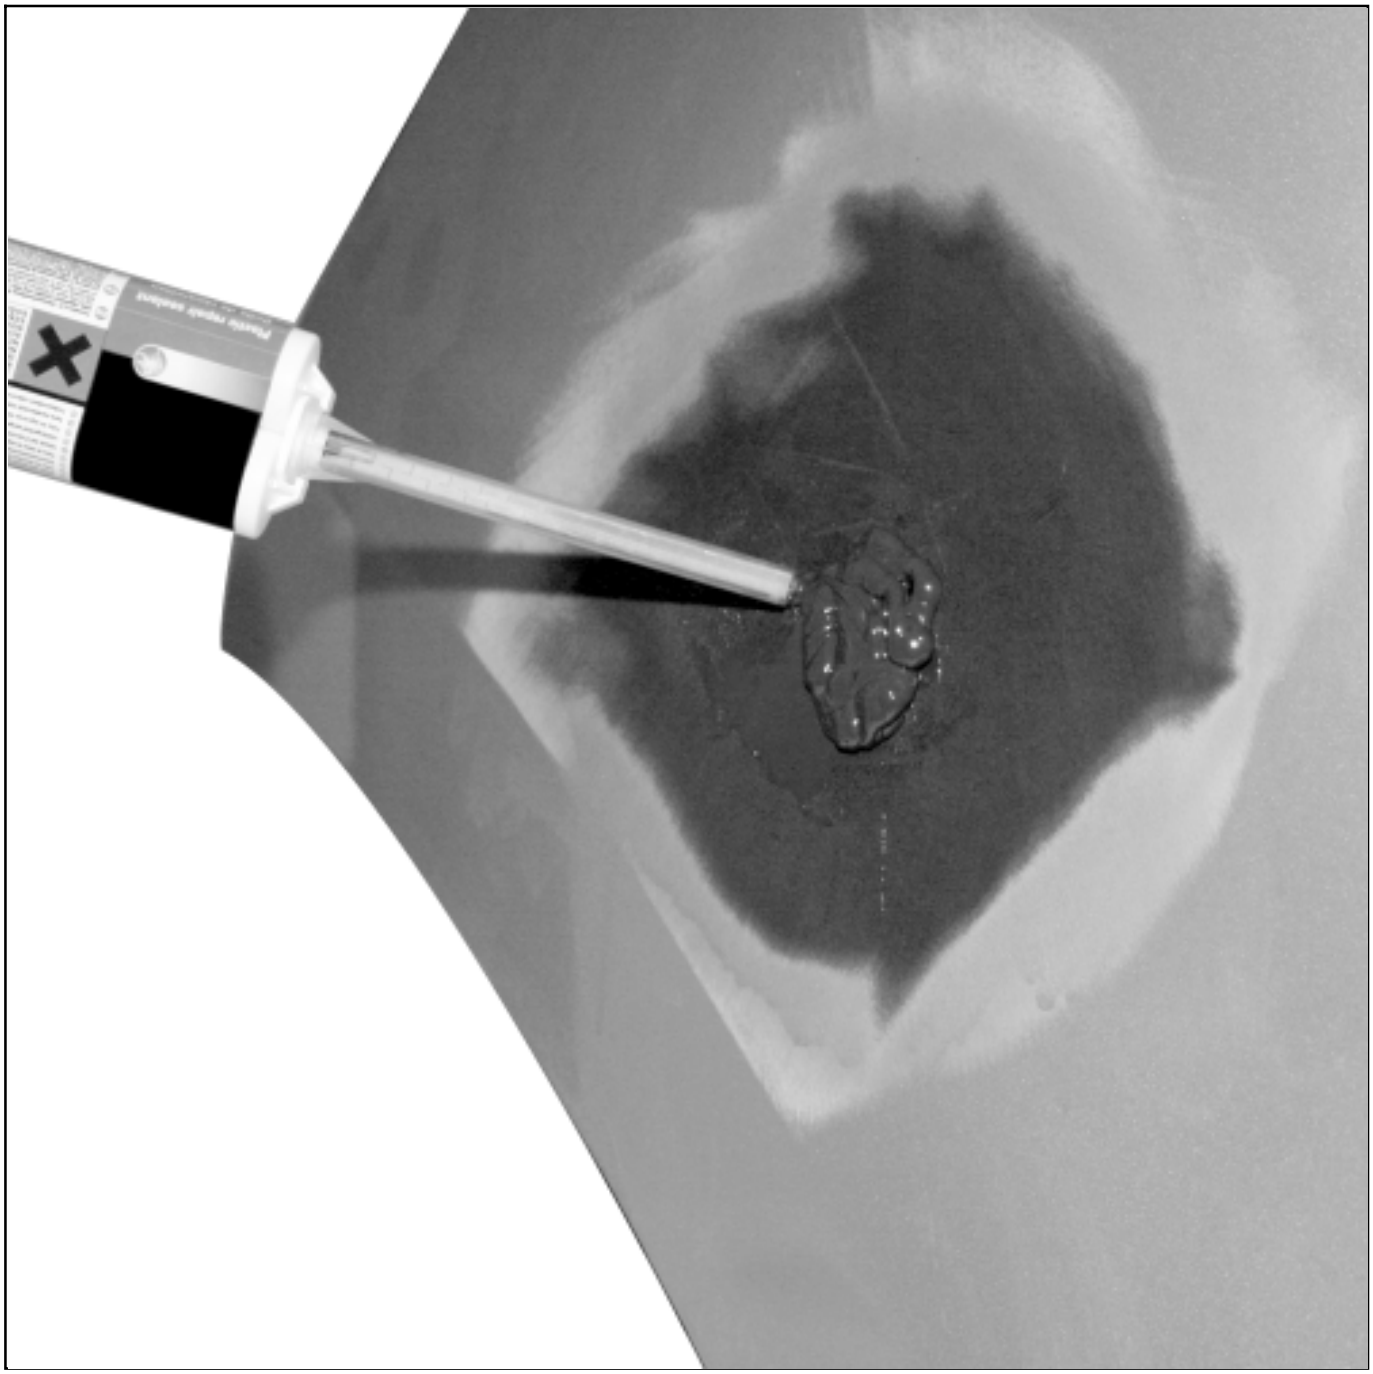


Leave the adhesive primerto dry (see product technical sheet).

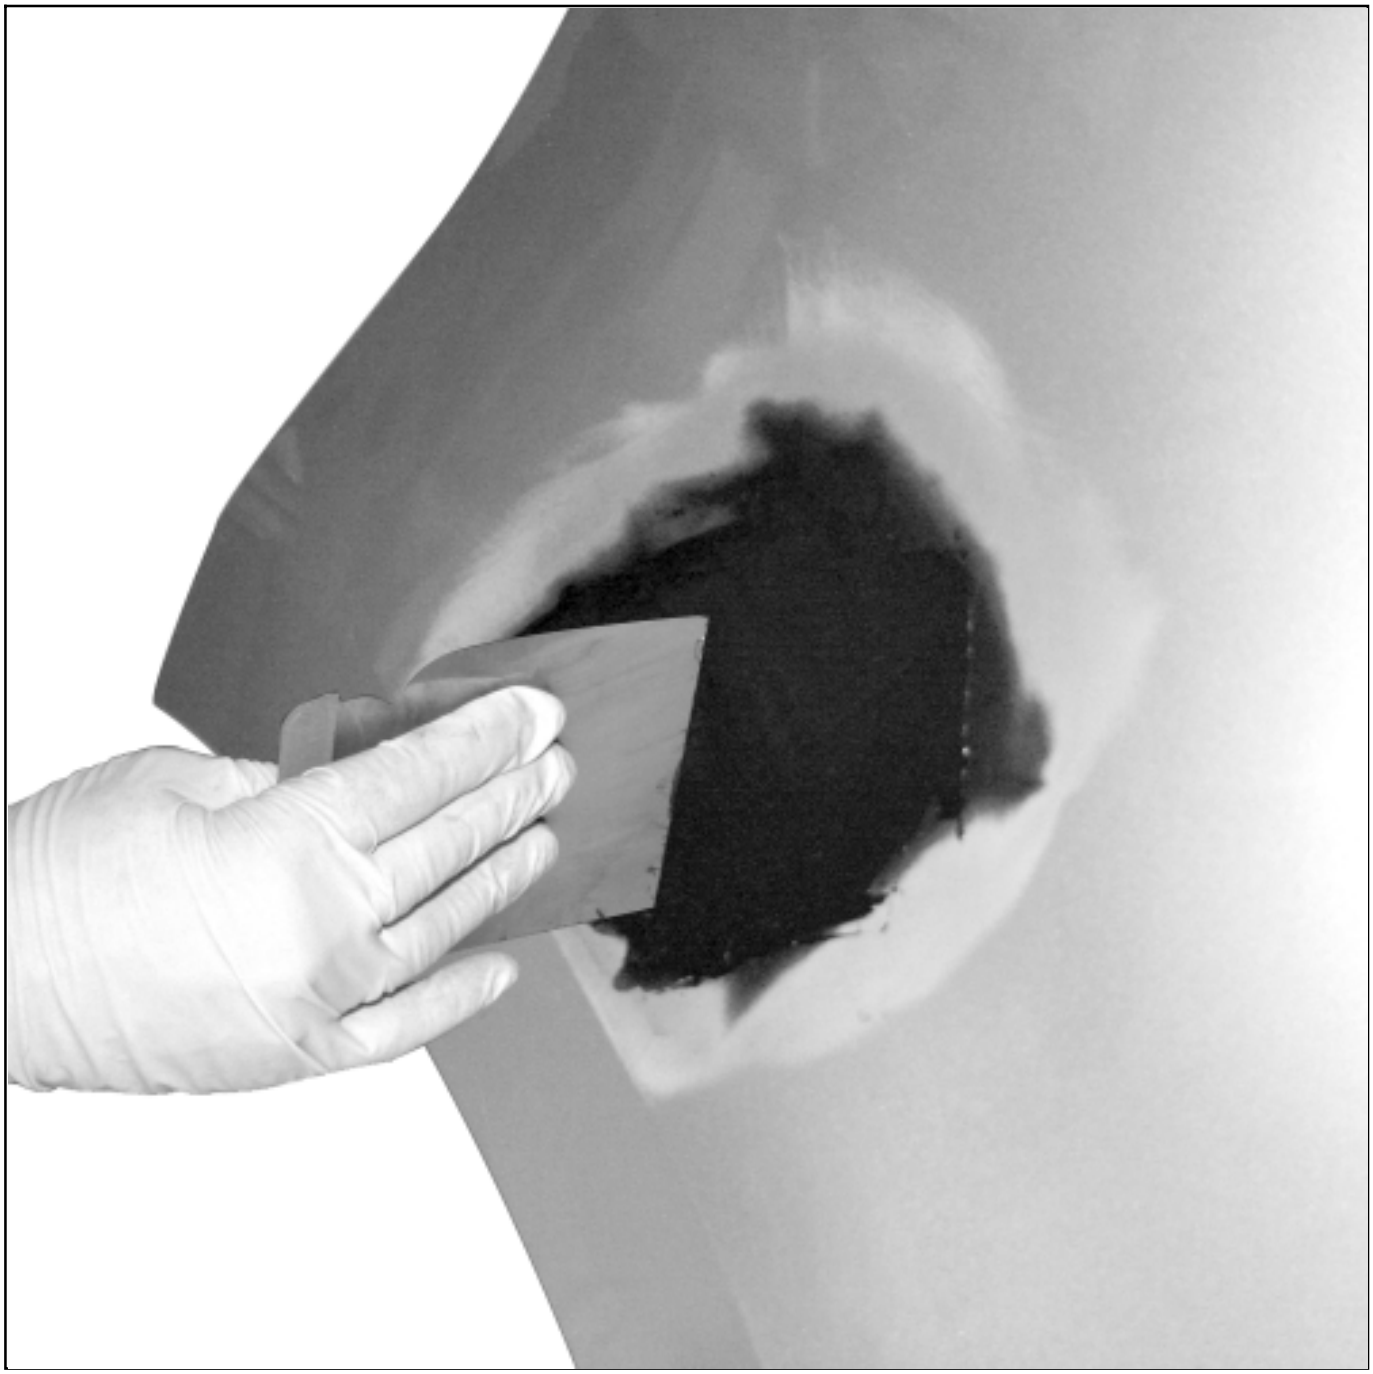


Adjust a piece of reinforcing film (cloth)suitable for repairing the inside of the component.

Prepare the bi-component repair mastic(see 50A, General information, Products for plastic material bodywork components: Description) .

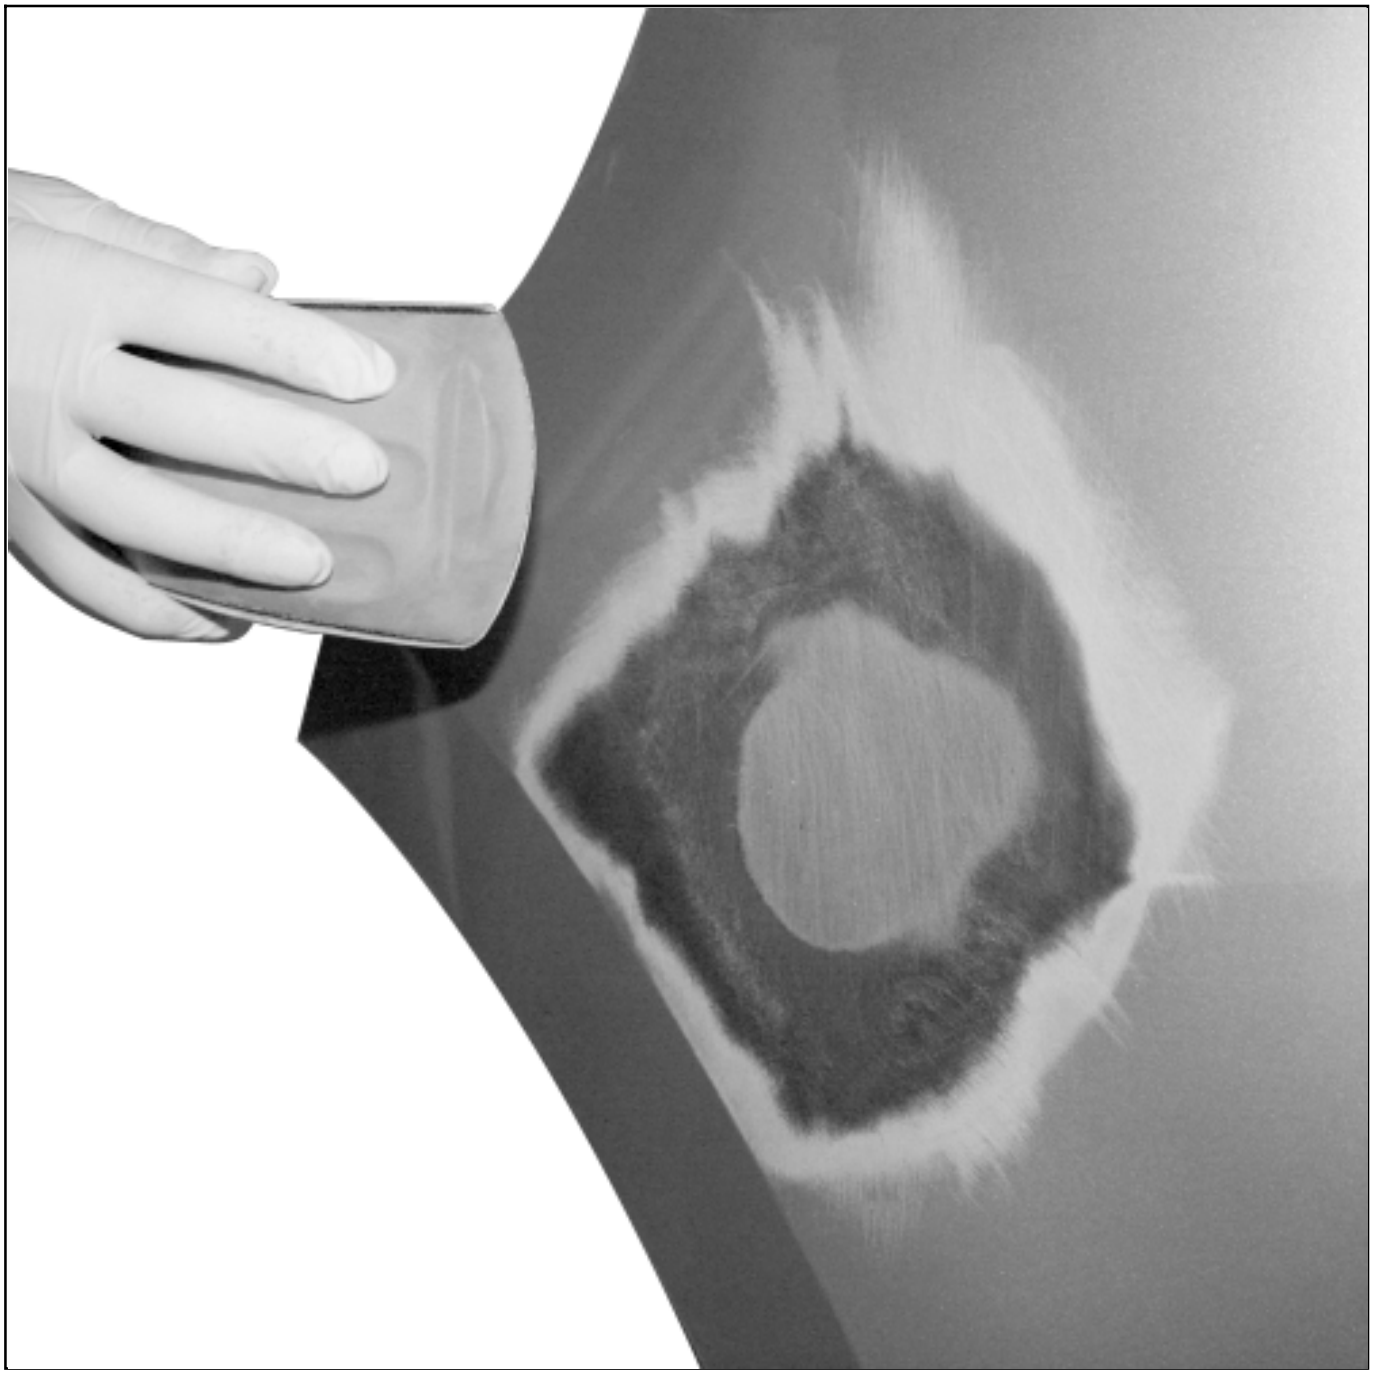


Extrude a narrow bead around the areas to be repaired on the inside of the component and apply reinforcing film (cloth).

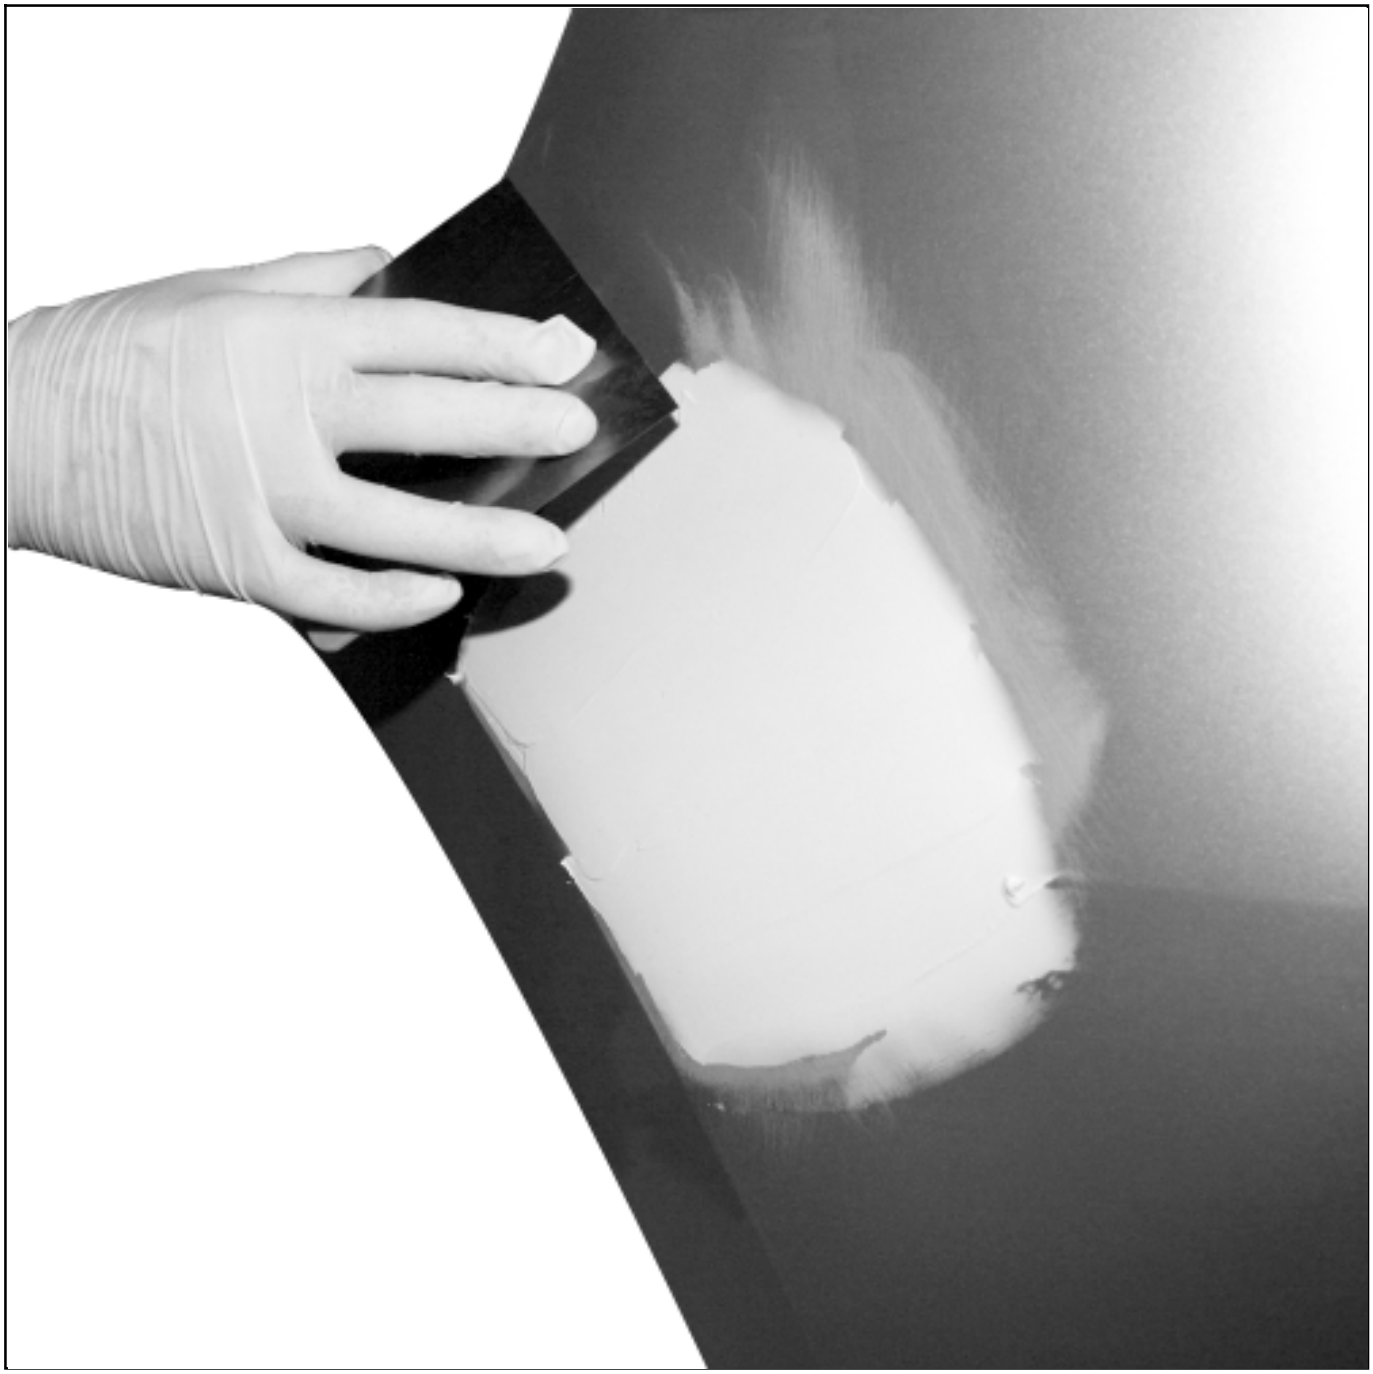


Extrude a thick bead on the reinforcing film (cloth)at the hole.

Smooth using a spatula.

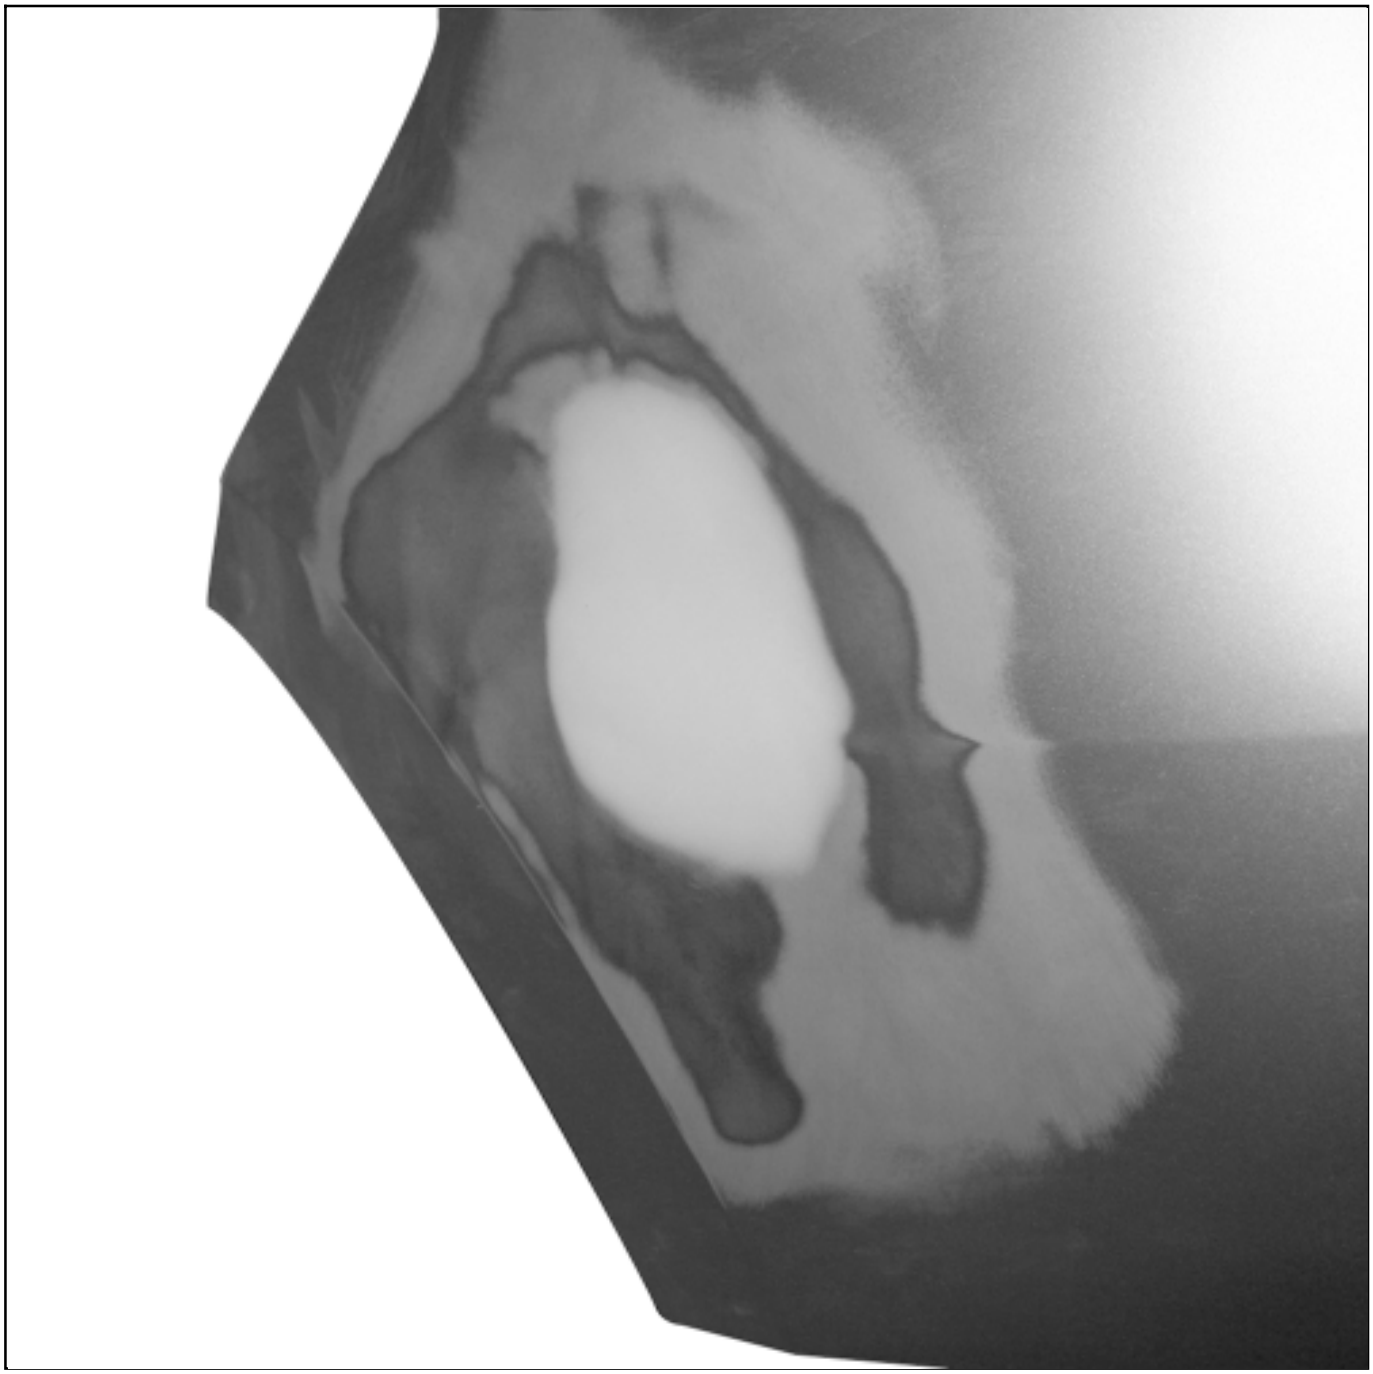


Extrude a thick bead on the reinforcing film (cloth)at the hole on the exterior.



Smooth using a spatula.

Leave the bi-component repair masticto dry (see product technical sheet).



Surface on the exterior side with a P 150then finish with a P 240.

If necessary, apply a finishing mastic(see product technical sheet) Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Sand the finishing masticwith a P 150then finish with a P 240.

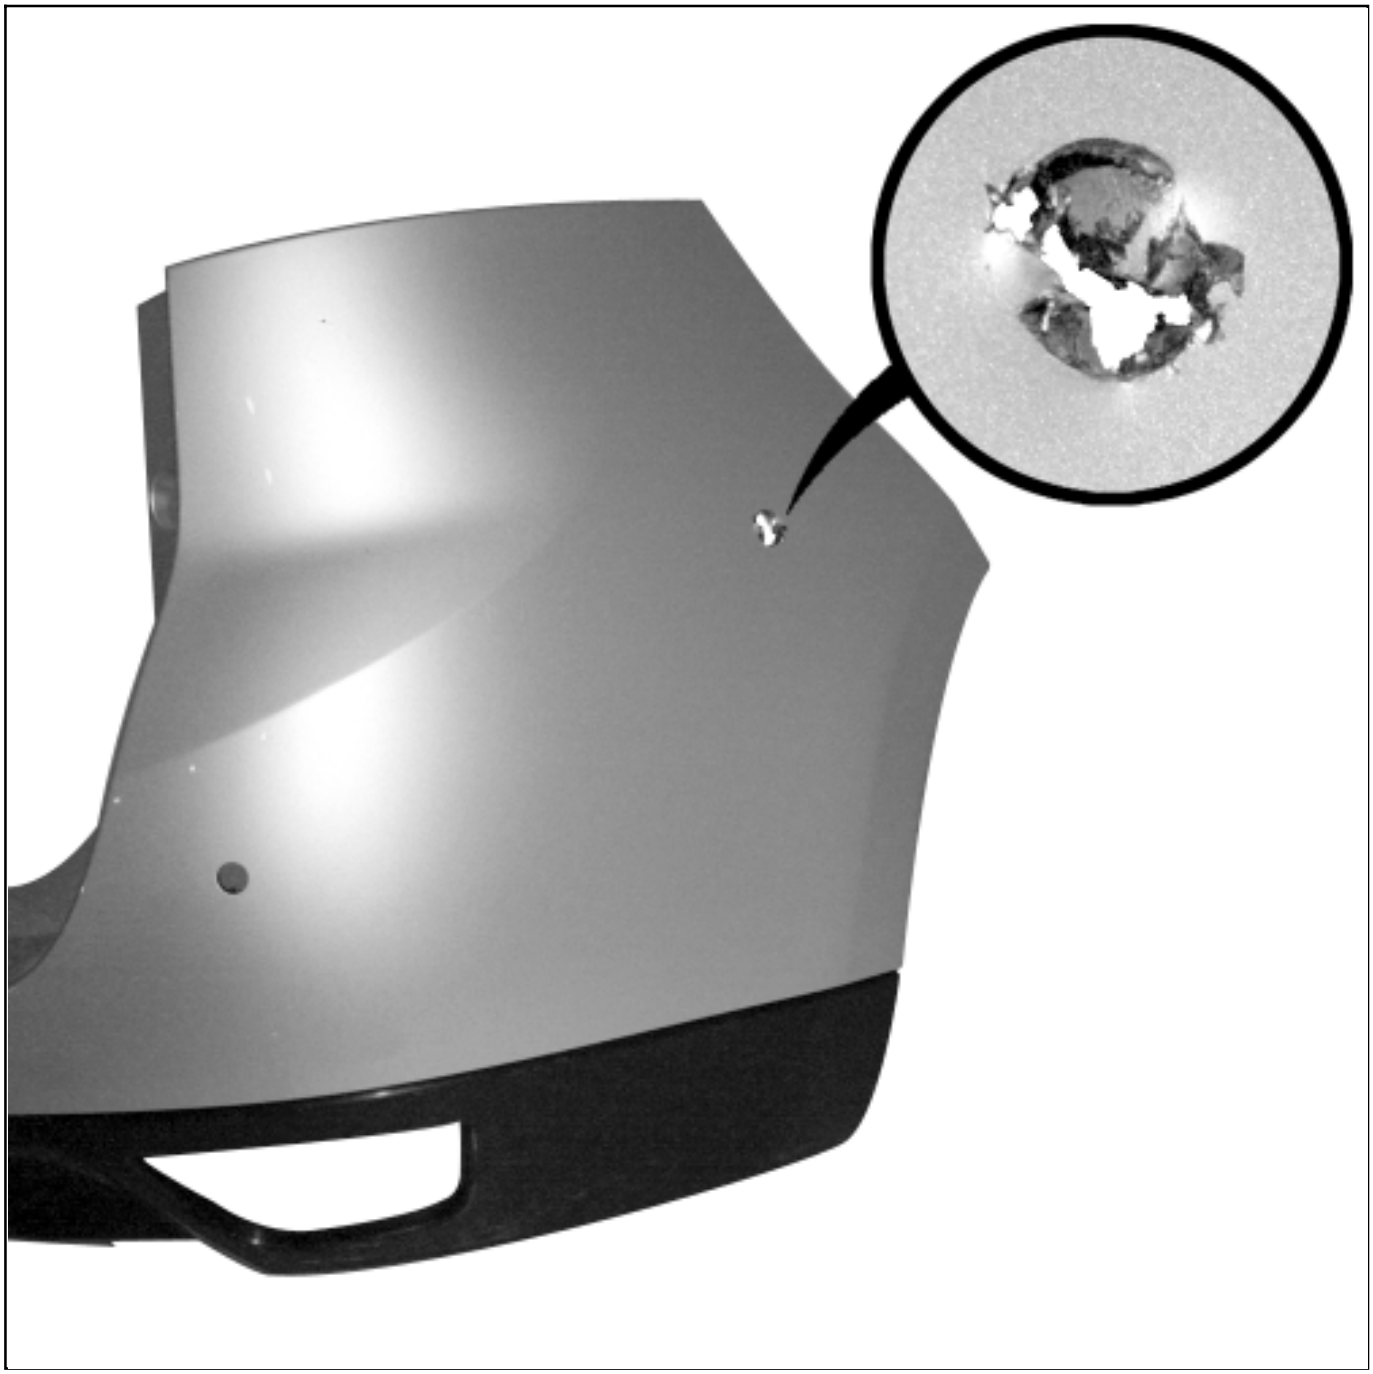
Follow the paint application procedure according to the material concerned:

- SMC bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Polypropylene / polyethylene bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- ABS bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),

Noryl bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic).

2- WELD METHOD

Note:



Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

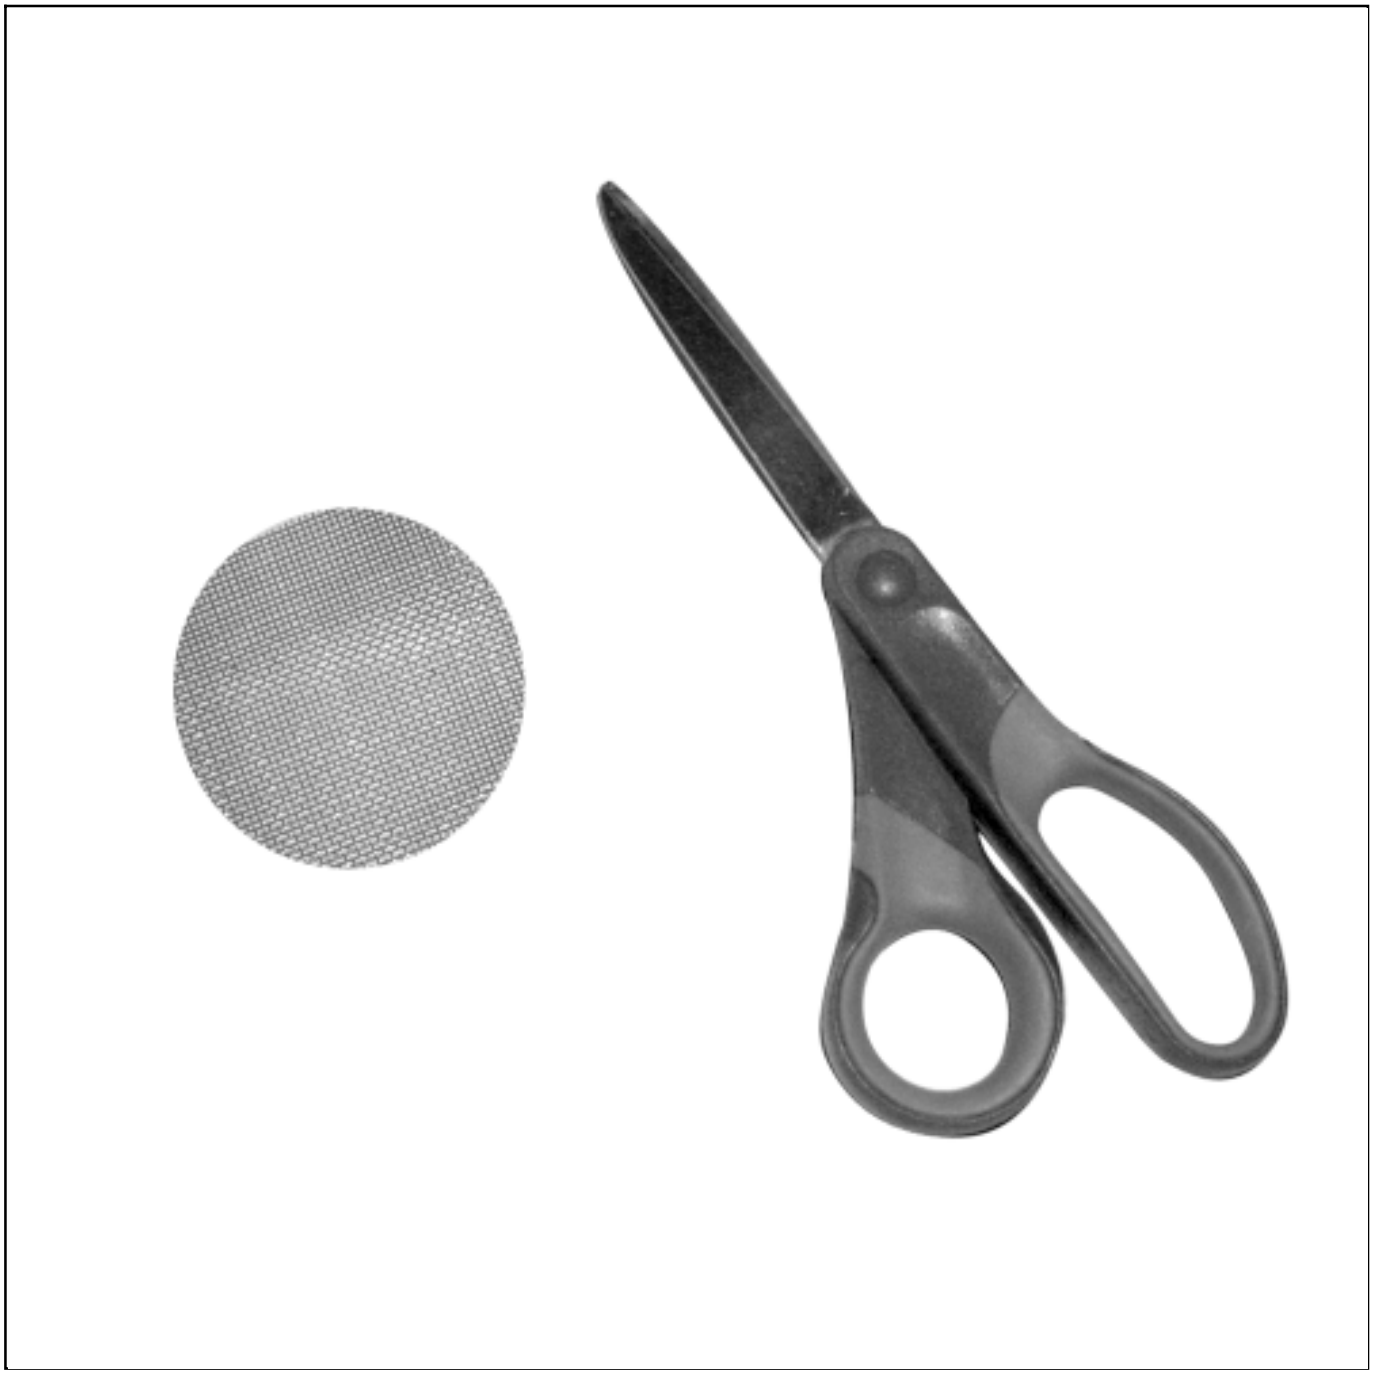
Note:

This repair cannot be carried out on ABS, ASAand Polycarbonateplastics.

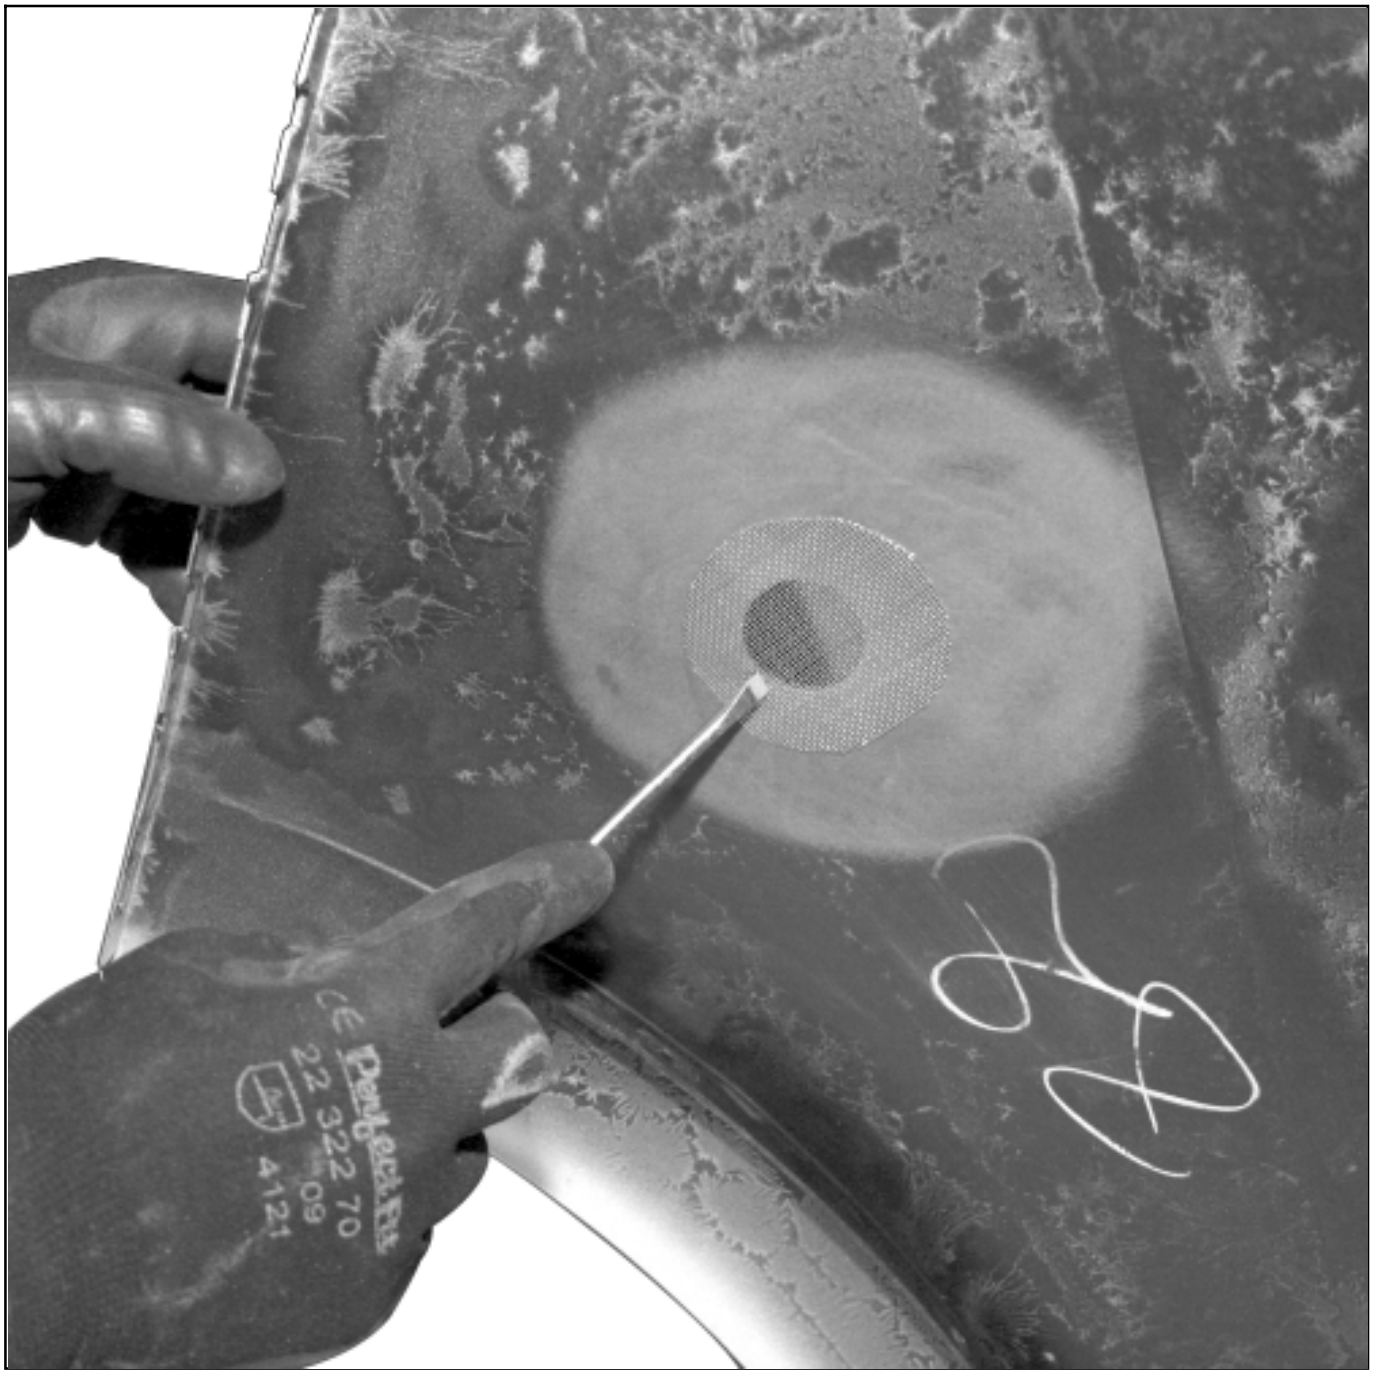
- Wash the component in soapy water and rinse in clean water.

- Clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNERVehicle: Parts and consumables for the repair (04B, Consumables - Products).

- Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).



Strip the paint with a P 150 over a radius of 100 mm.



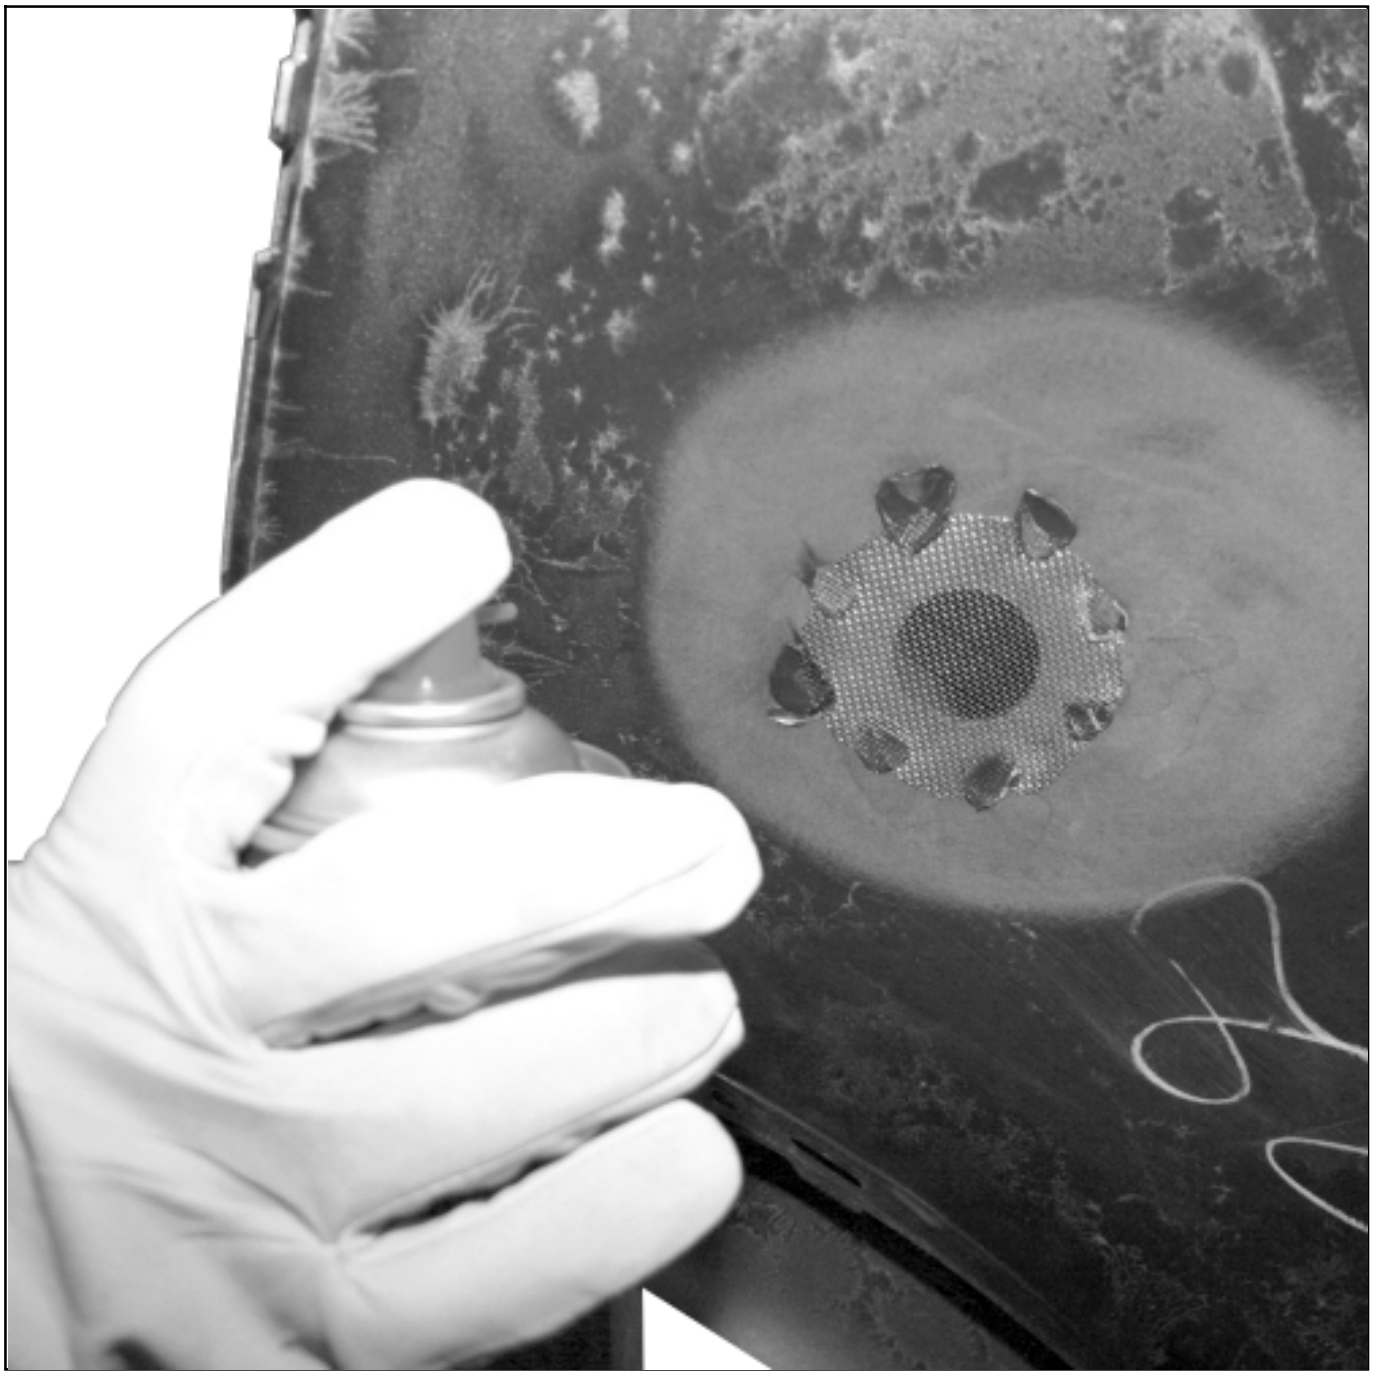
Blow the component and clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

Preheat the soldering iron.

Cut the stainless steel mesh suitable for the repair.

Adjust the stainless steel mesh and hold it using a dedicated tool.



Spot weld around the edge of the stainless steel mesh frame with the tip of the soldering iron.

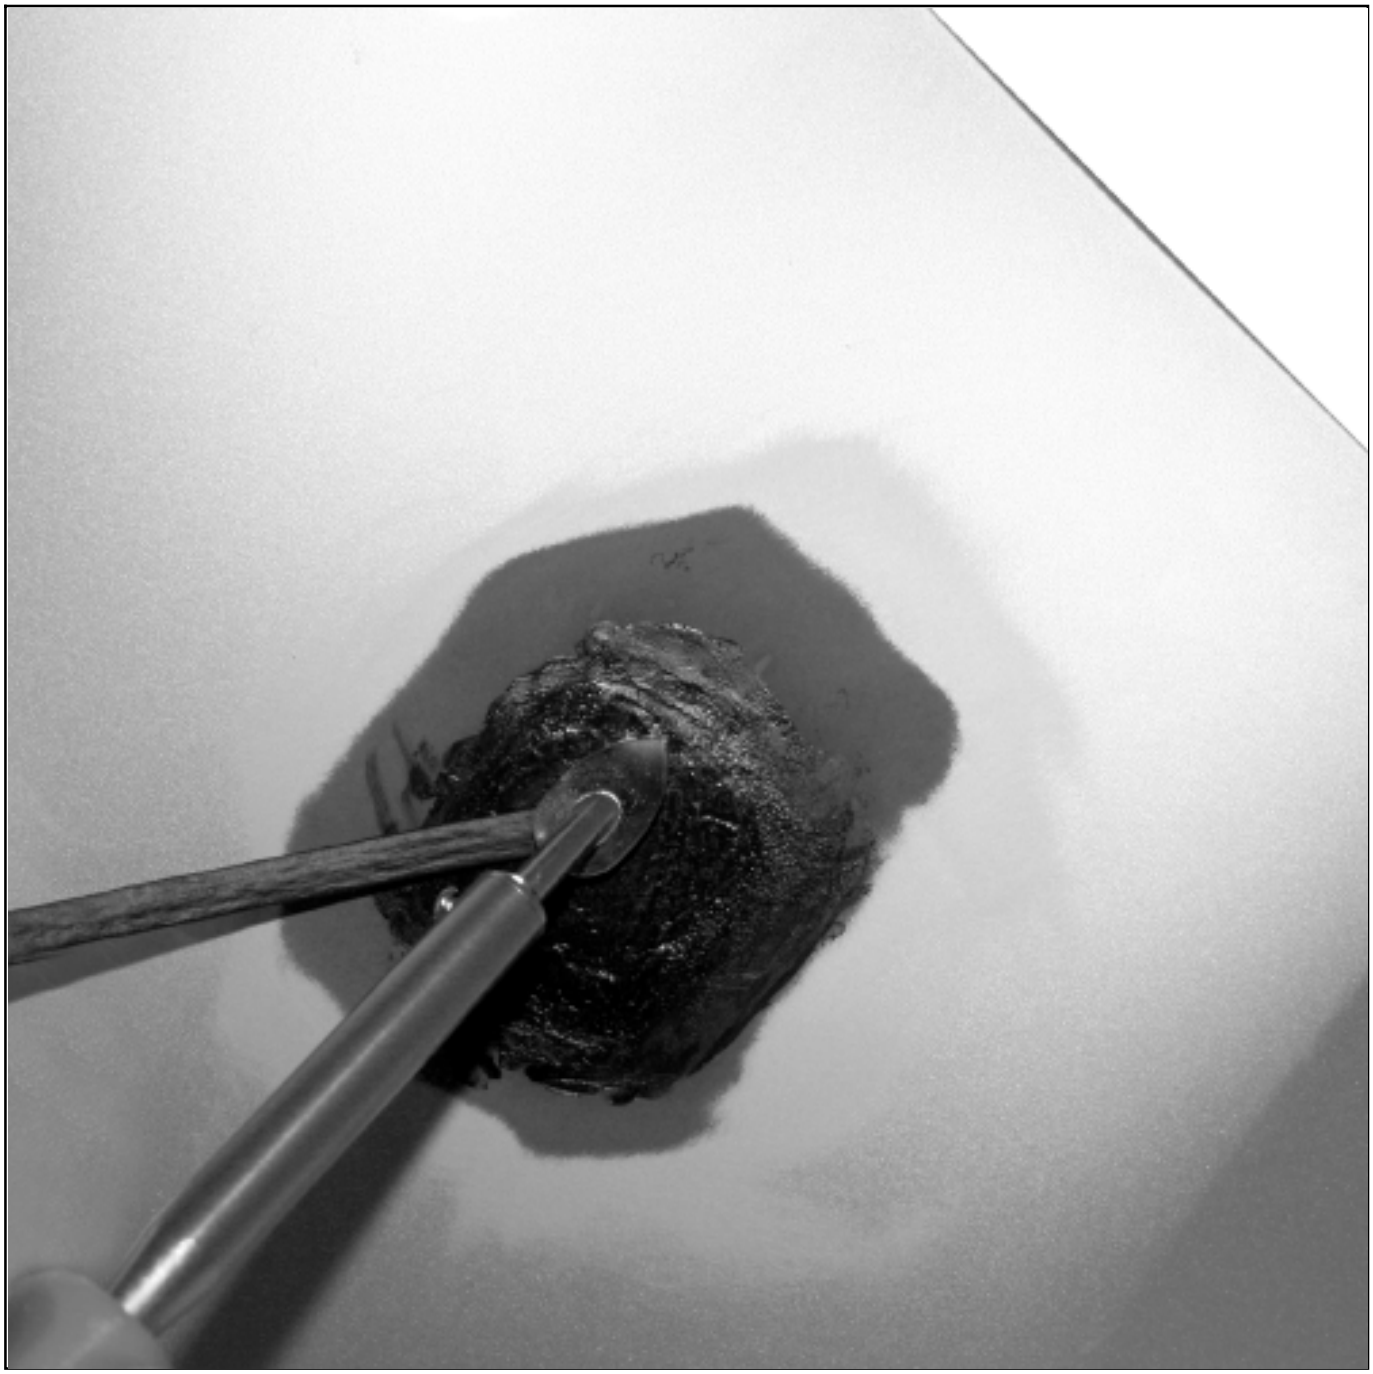
Note:

For noryl:

Add material around the edge of the hole by preheating the welding rod with the tip of the soldering iron.

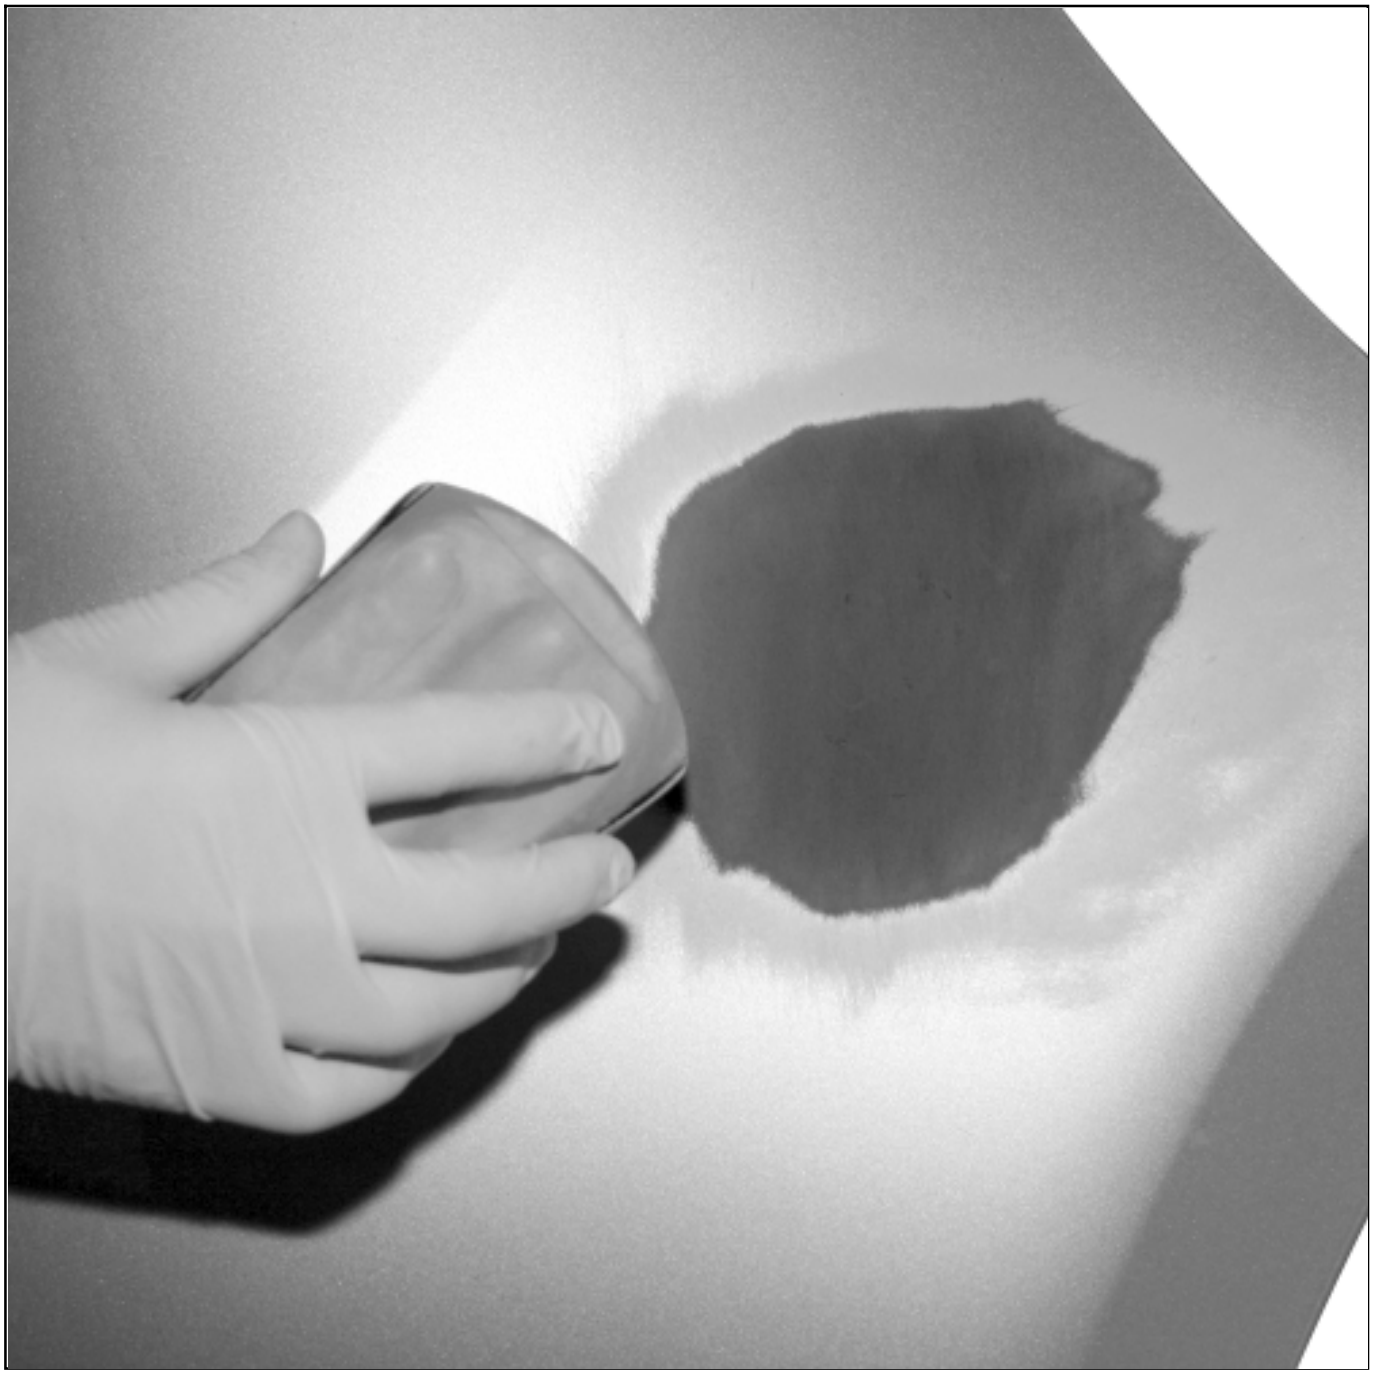
Enclose the stainless steel mesh in the additional material.

Cool each spot weld, for two seconds, vigorously with the cooler Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

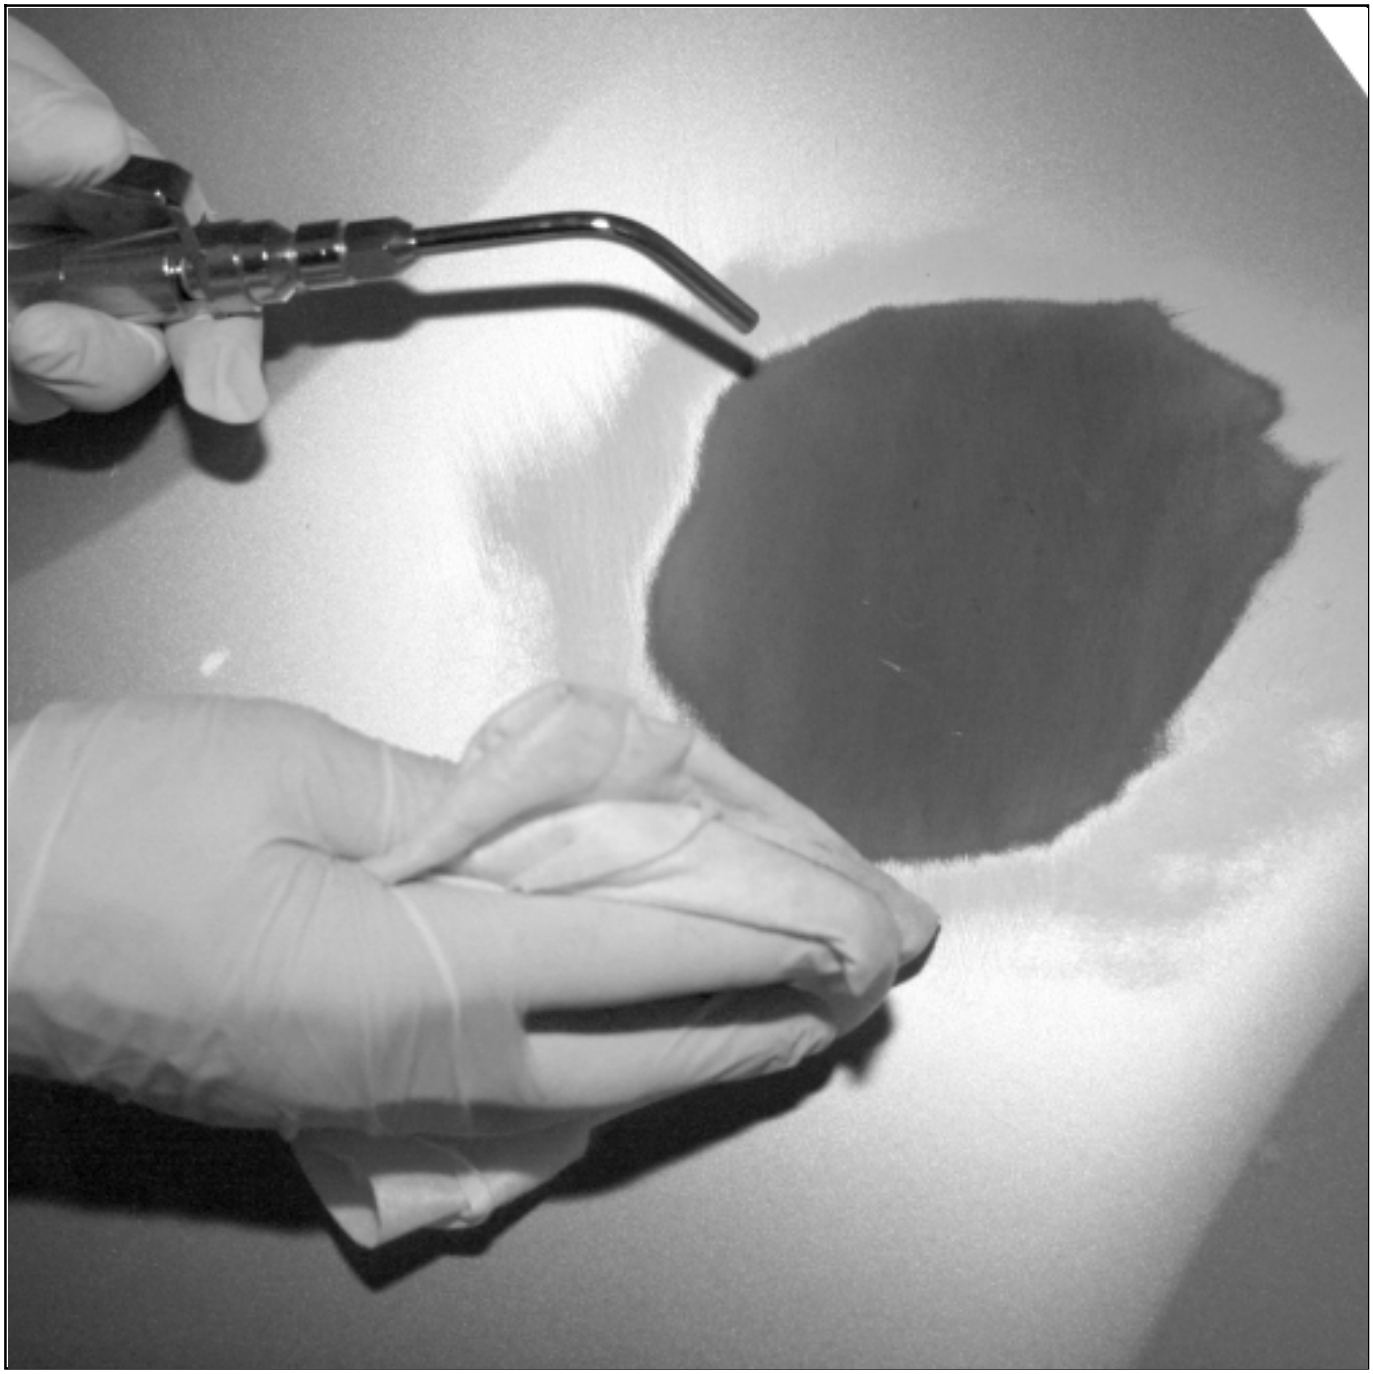


Enclose the stainless steel frame in the plastic material.

Cool the whole of the repaired area for two seconds, vigorously with the cooler Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

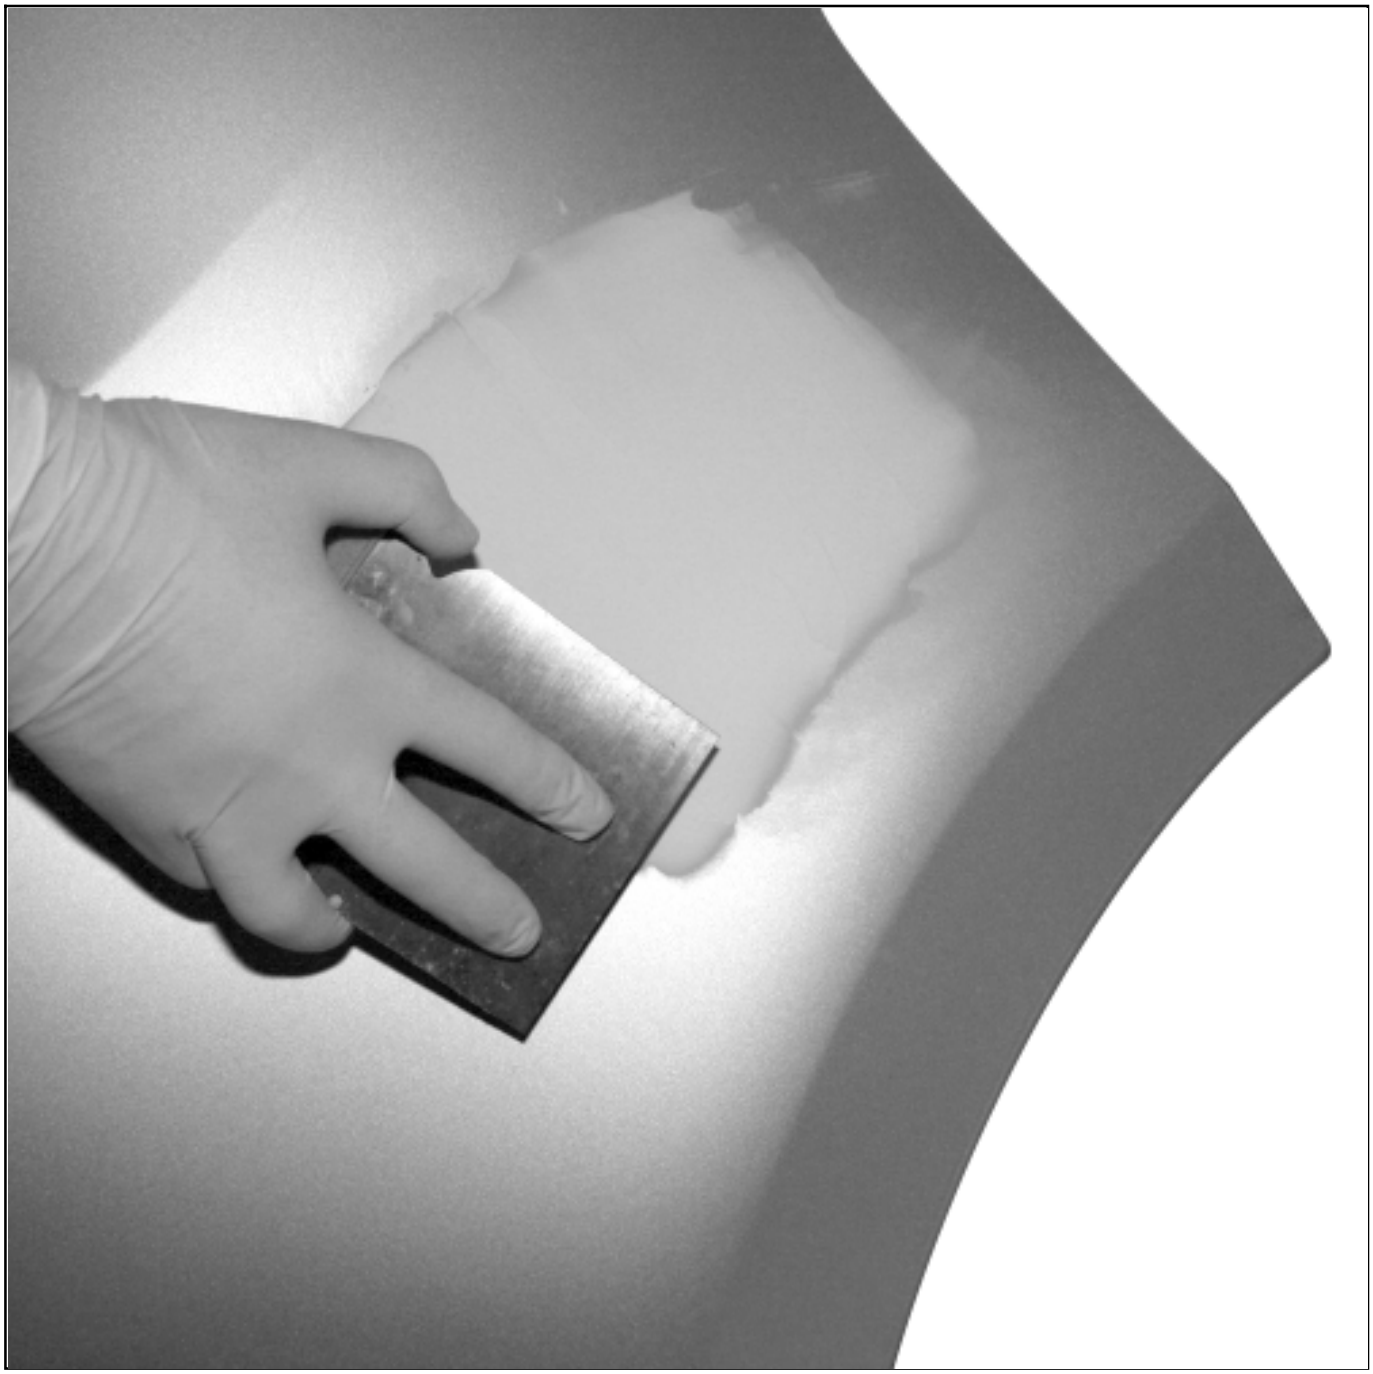


- Add material by preheating the welding rod with the tip of the soldering iron.
- Cool the whole of the repaired area for two seconds, vigorously with the cooler[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

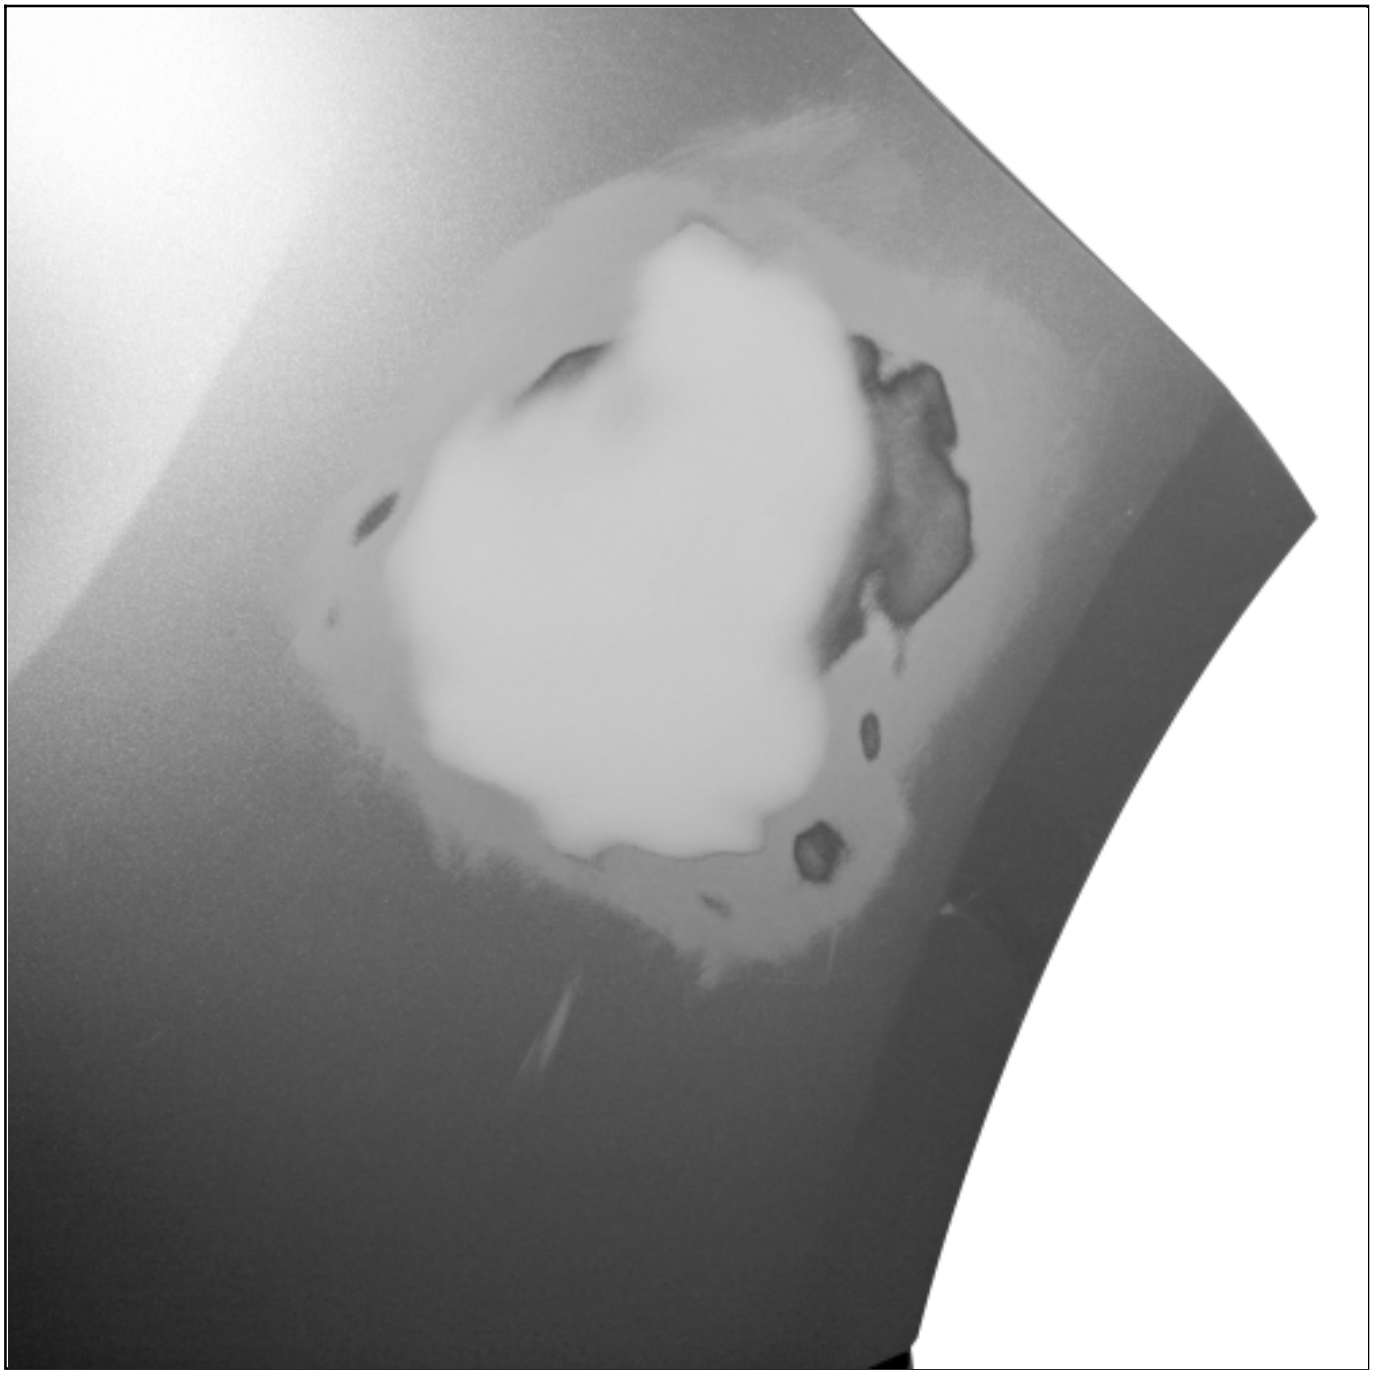


- Add material to the exterior by preheating the welding rod with the tip of the soldering iron.

- Cool the whole of the repaired area for two seconds, vigorously with the cooler Vehicle: Parts and consumables for the repair (04B, Consumables - Products).



Surface with a P 80to P 150then finish with a P 240.

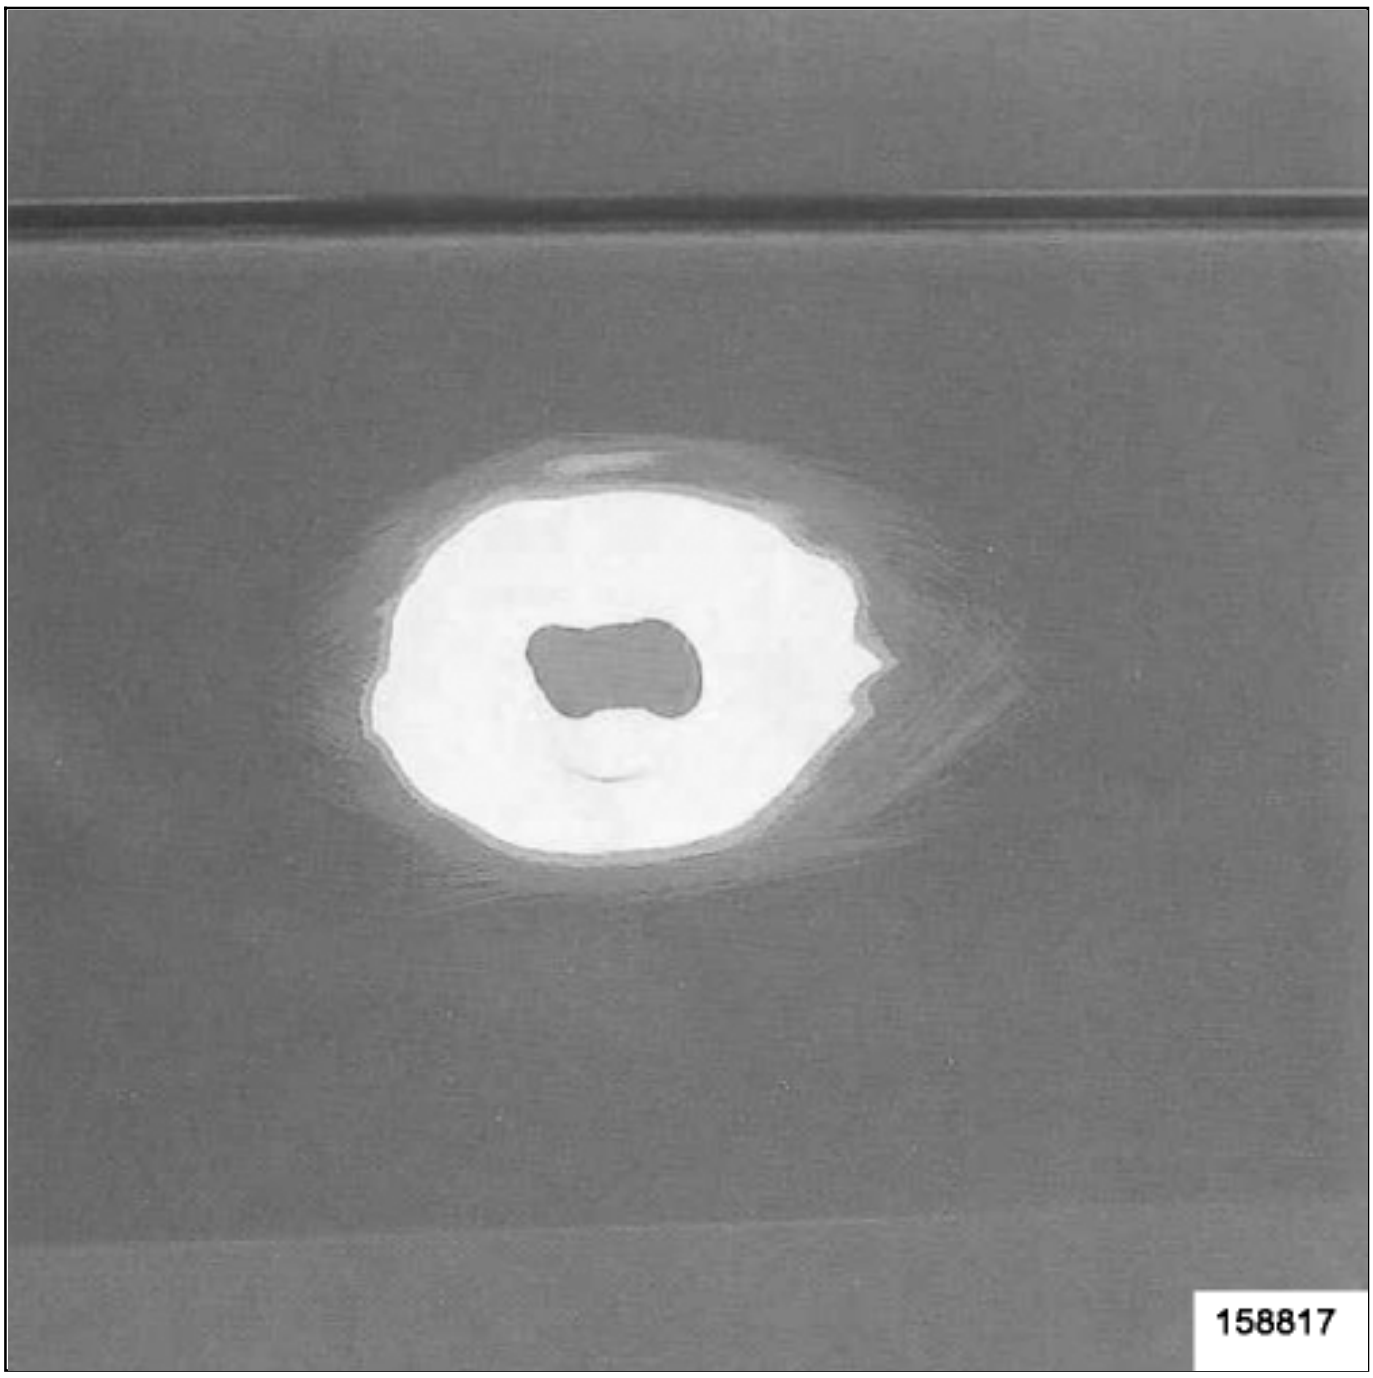


Blow the component and clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).

If necessary, apply a finishing mastic(see product technical sheet) **Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Sand the finishing masticwith a P 150then finish with a P 240.

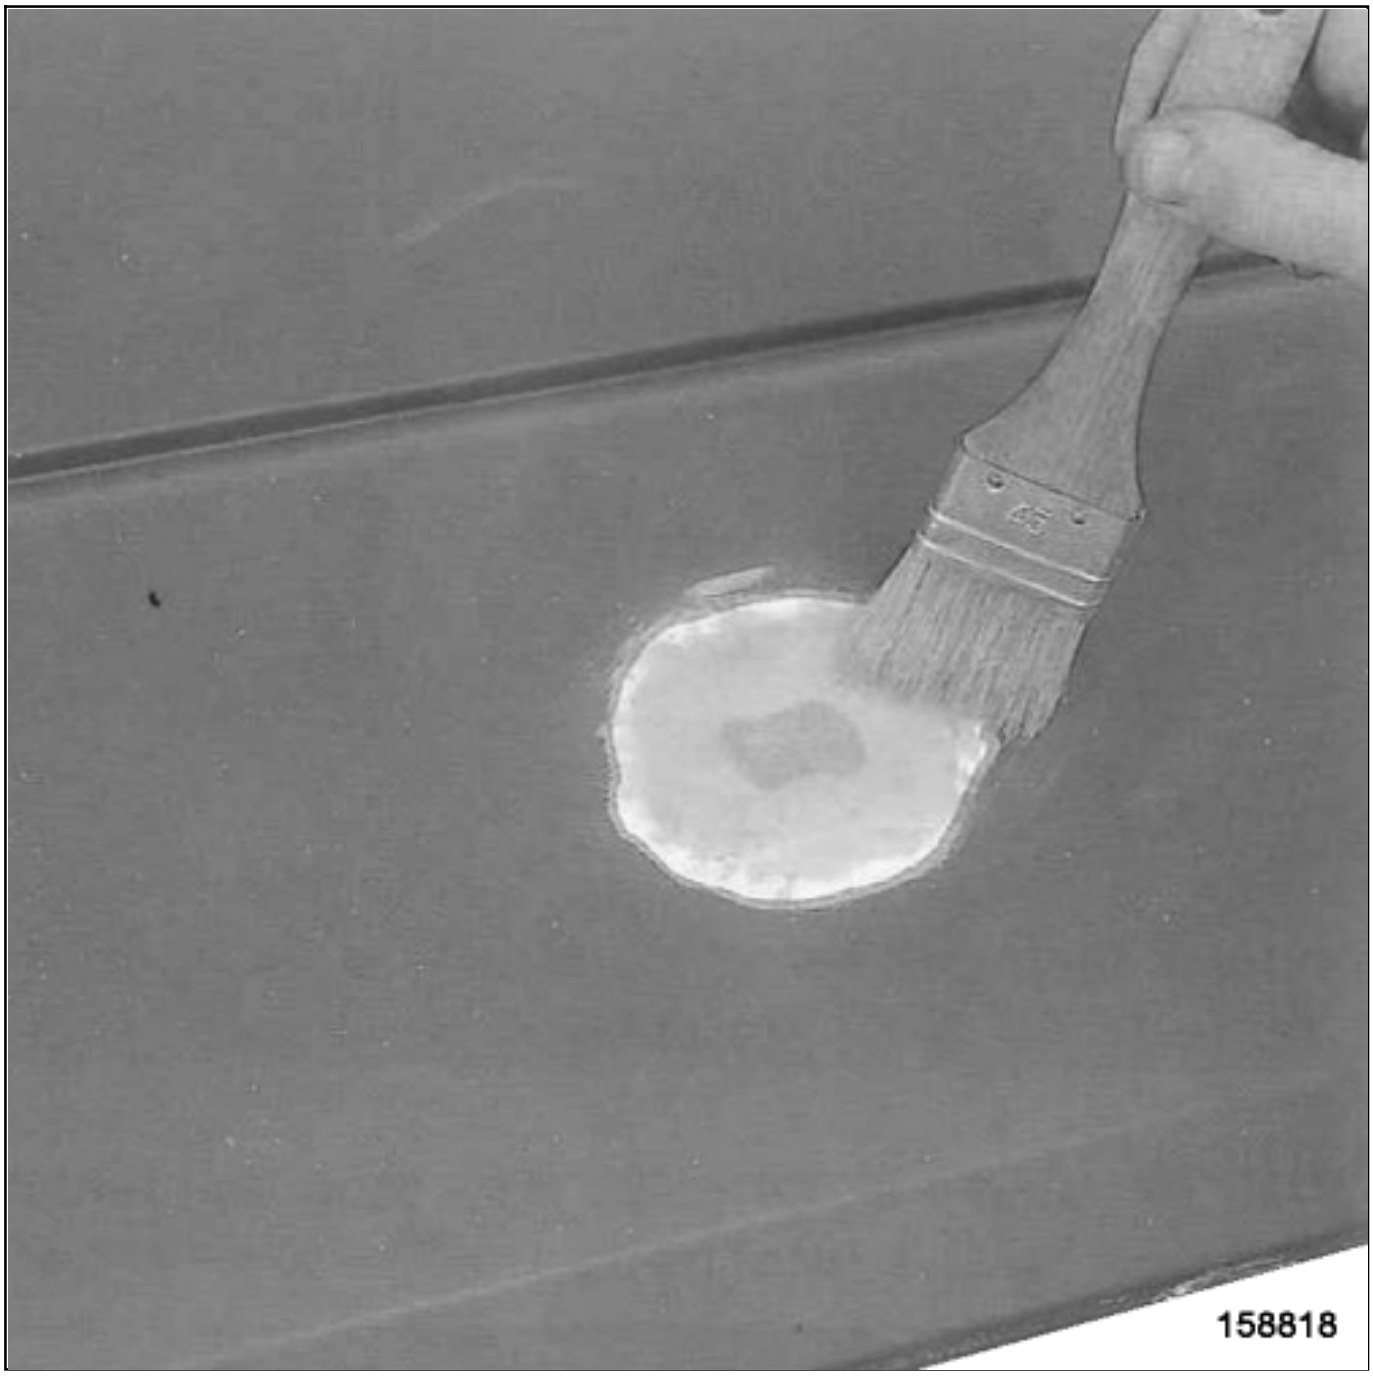


Follow the paint application procedure according to the material concerned:

- Polypropylene / polyethylene bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic),
- Noryl bodywork component: Preparation and paint range (Technical Note 592A, 95A, Paint application procedure on plastic).

Note:

Method apply only on RTM component.



Chamfering around a radius between 30to 40 mmusing the orbital sander with a P80.

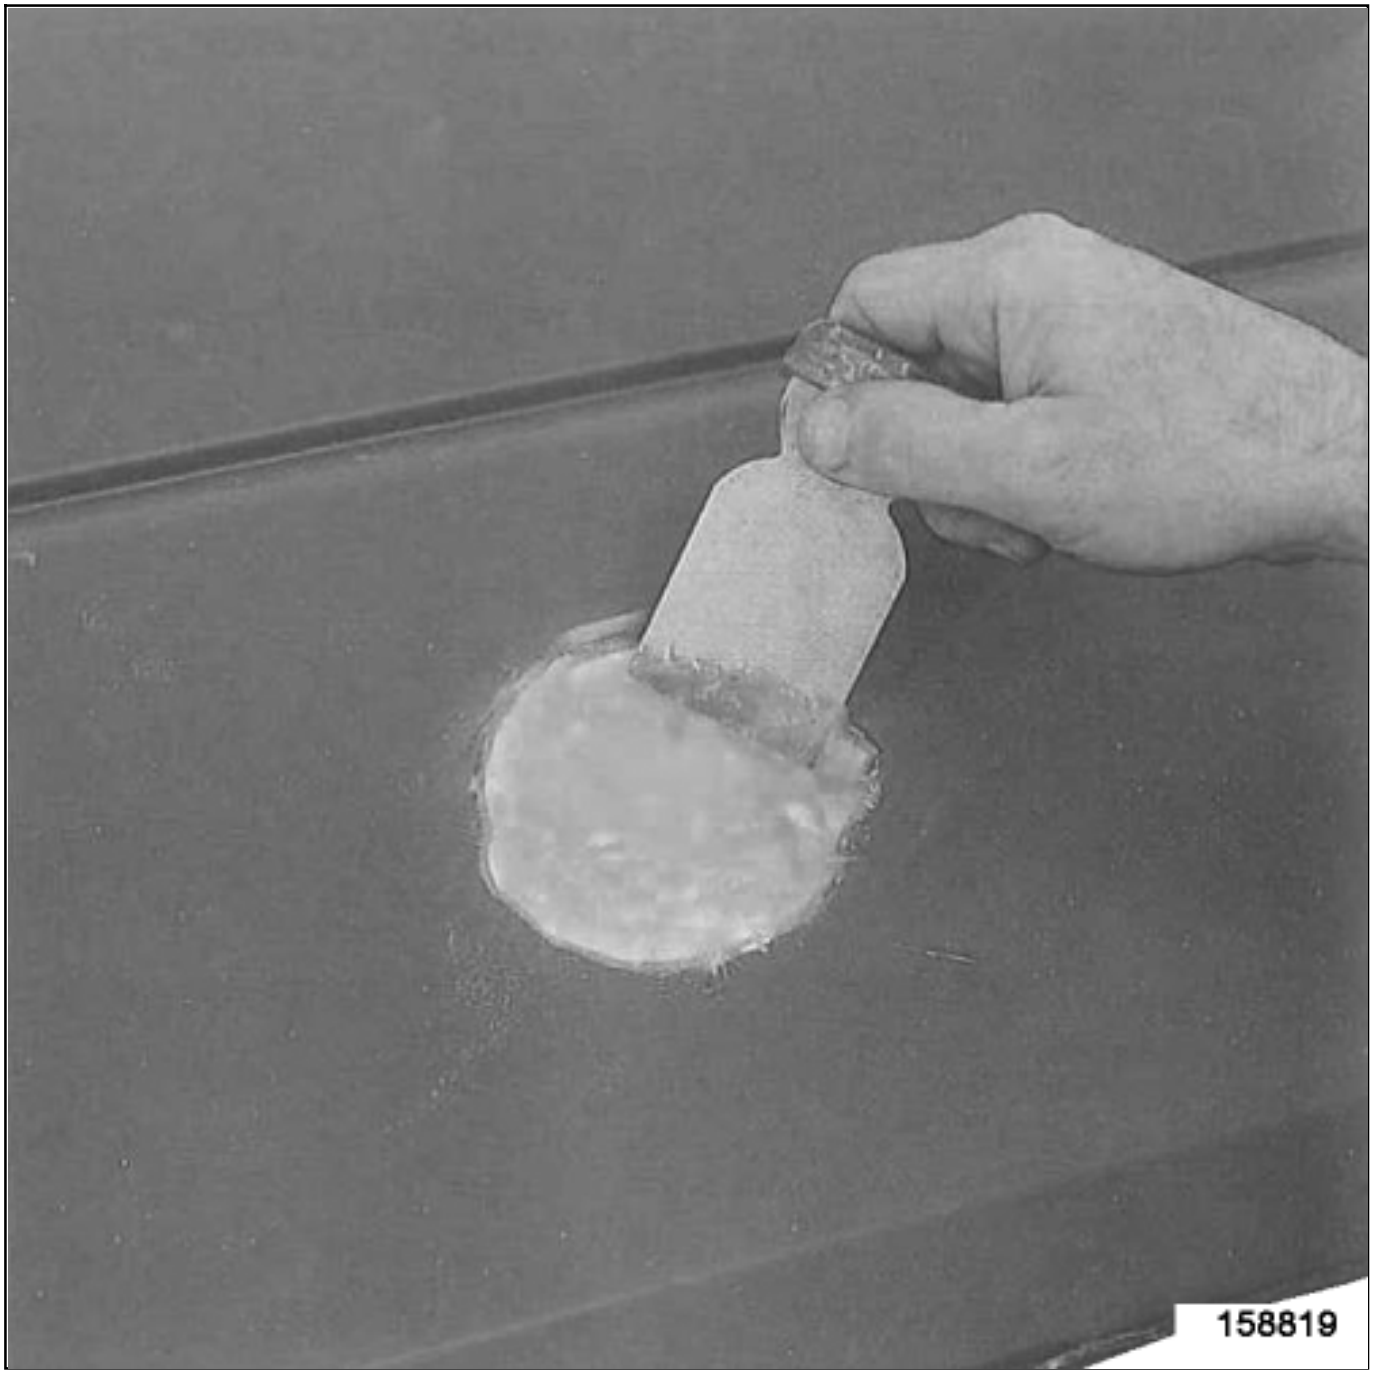
Sand the paint around the zone to be repaired using the orbital sander with a P 150

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Cut a piece of materielrecovering the chamfering.

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

- Wet the chamfer with Epoxy resin.



- Position the reinforcement a poket.

- Soak the reinforcement with Epoxy resin.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

- Prepare the Epoxy resin (see 50A, General information, Products for plastic material bodywork components: Description) .

- Add short fibres with resin and well mix.

- Fill the pocket with mixture.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

Sand using the orbital sander with a P 80then with a P180and P240.

Apply if necessary a finishing mastic(see product technical sheet). (see **Vehicle: Parts and consumables for the repair**)

Sand the finishing masticusing a P 150then finish using a P240.

5. PROCEDURE 4

Repairing a mounting bracket on a plastic chassis element

1- BONDING METHOD

Note:

Before any repairs, check the reparability of components made from plastic materials.

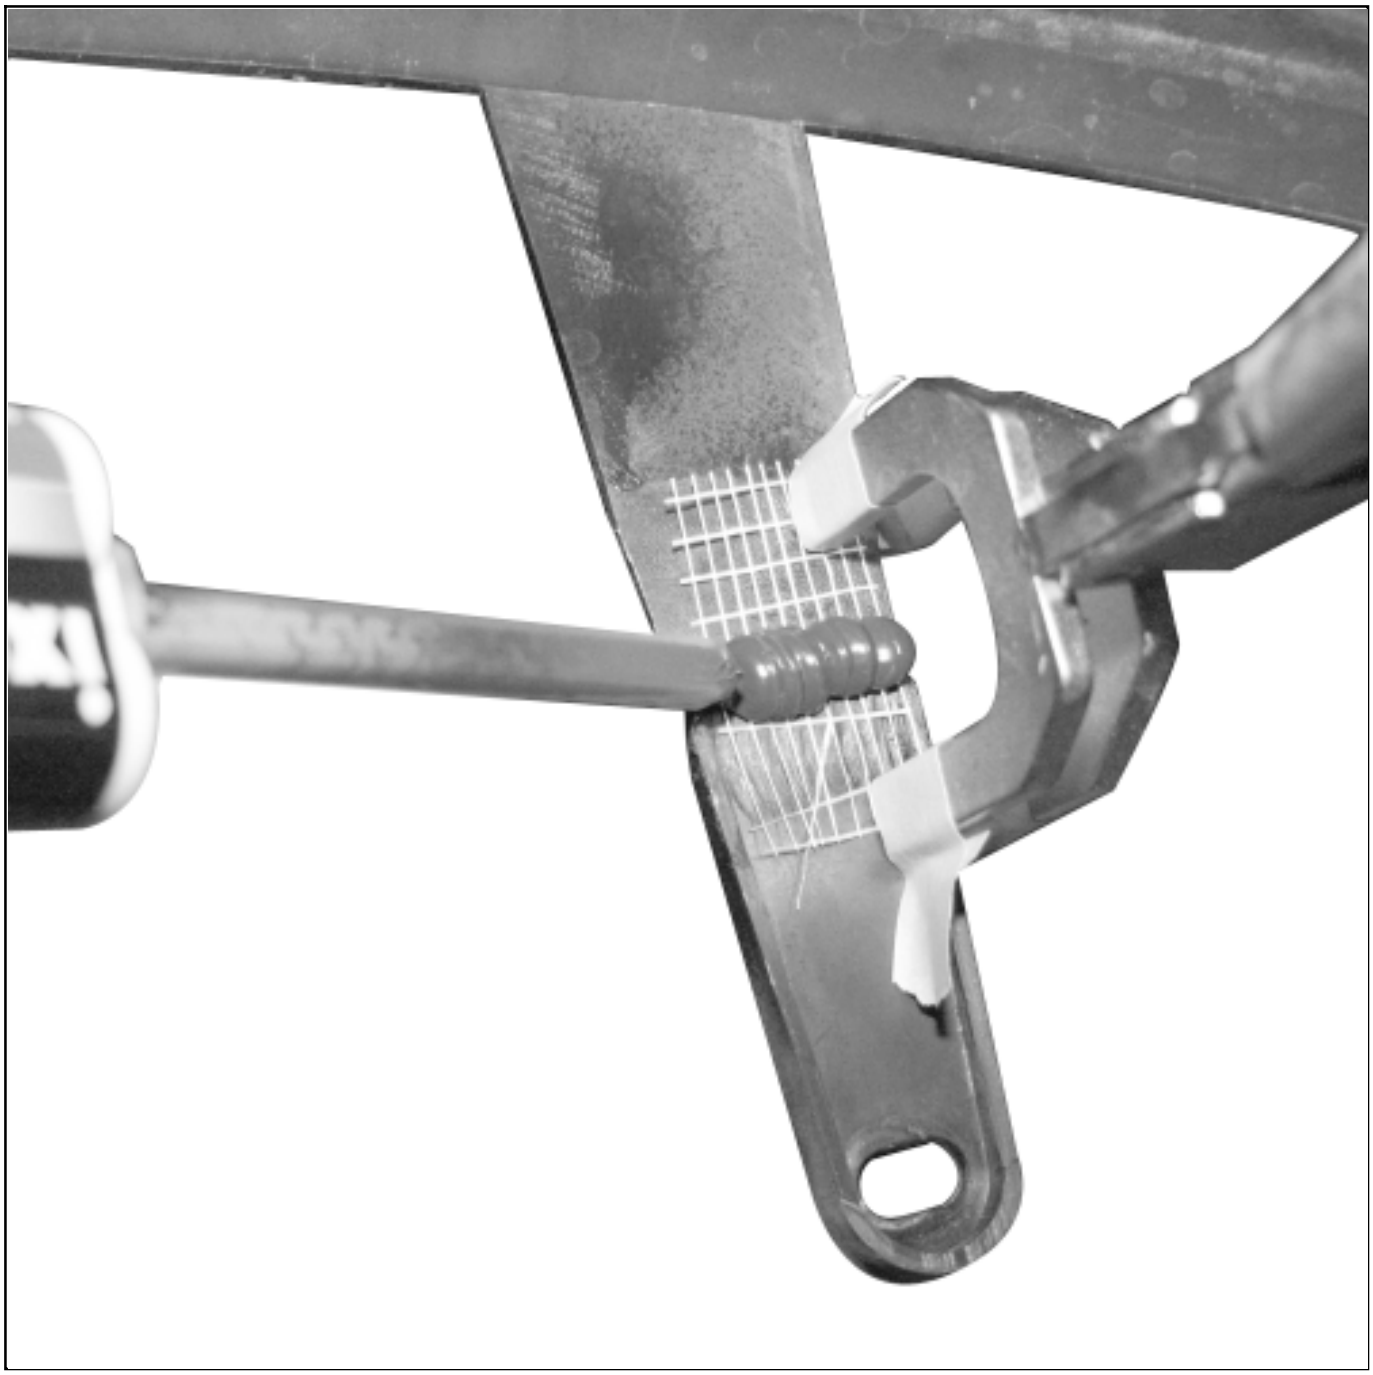
(see 50A, General information, Products for plastic material bodywork components: Description) .

(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

Chamfer the two sections of the mounting bracket on both sides using a grinder with an angular member .

Blast and clean the inside and outside of the component with the cleanerincluded in the Plastic repair kit box.

Apply the adhesive primerincluded in the Plastic repair kitbox to the inside and outside of the component.



Leave the adhesive primer to dry (see product technical sheet).

Adjust a piece of reinforcing film (cloth) adapted to repairing the internal and external faces.

Prepare the bi-component repair mastic **(see 50A, General information, Products for plastic material bodywork components: Description)** .

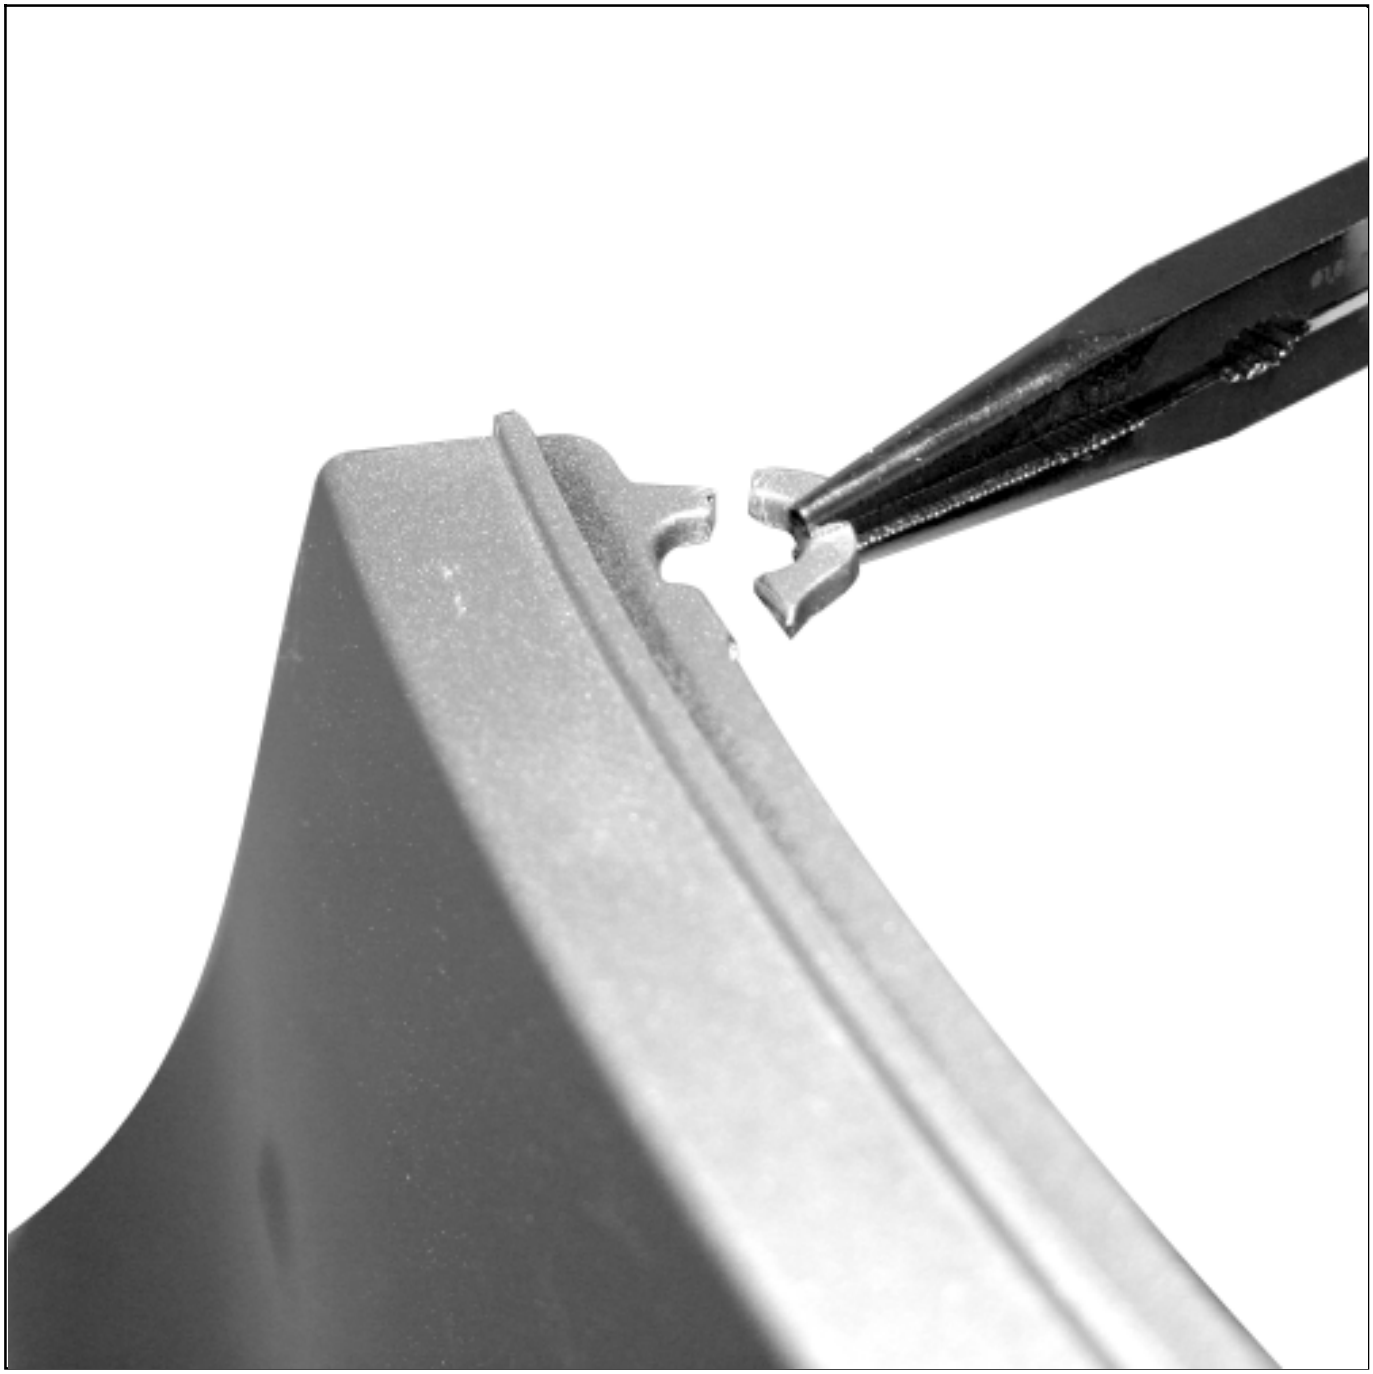
Maintain pressure on the two parts with pliers.

- Extrude bi-component repair masticbetween the two parts.
- Smooth the bi-component repair masticon the internal and external faces.
- Leave the bi-component repair masticto dry (see product technical sheet).

- Surface the exterior side with a P 150then finish with a P 240.
- Retouch the paintwork if necessary.

2- WELDING METHOD

Note:

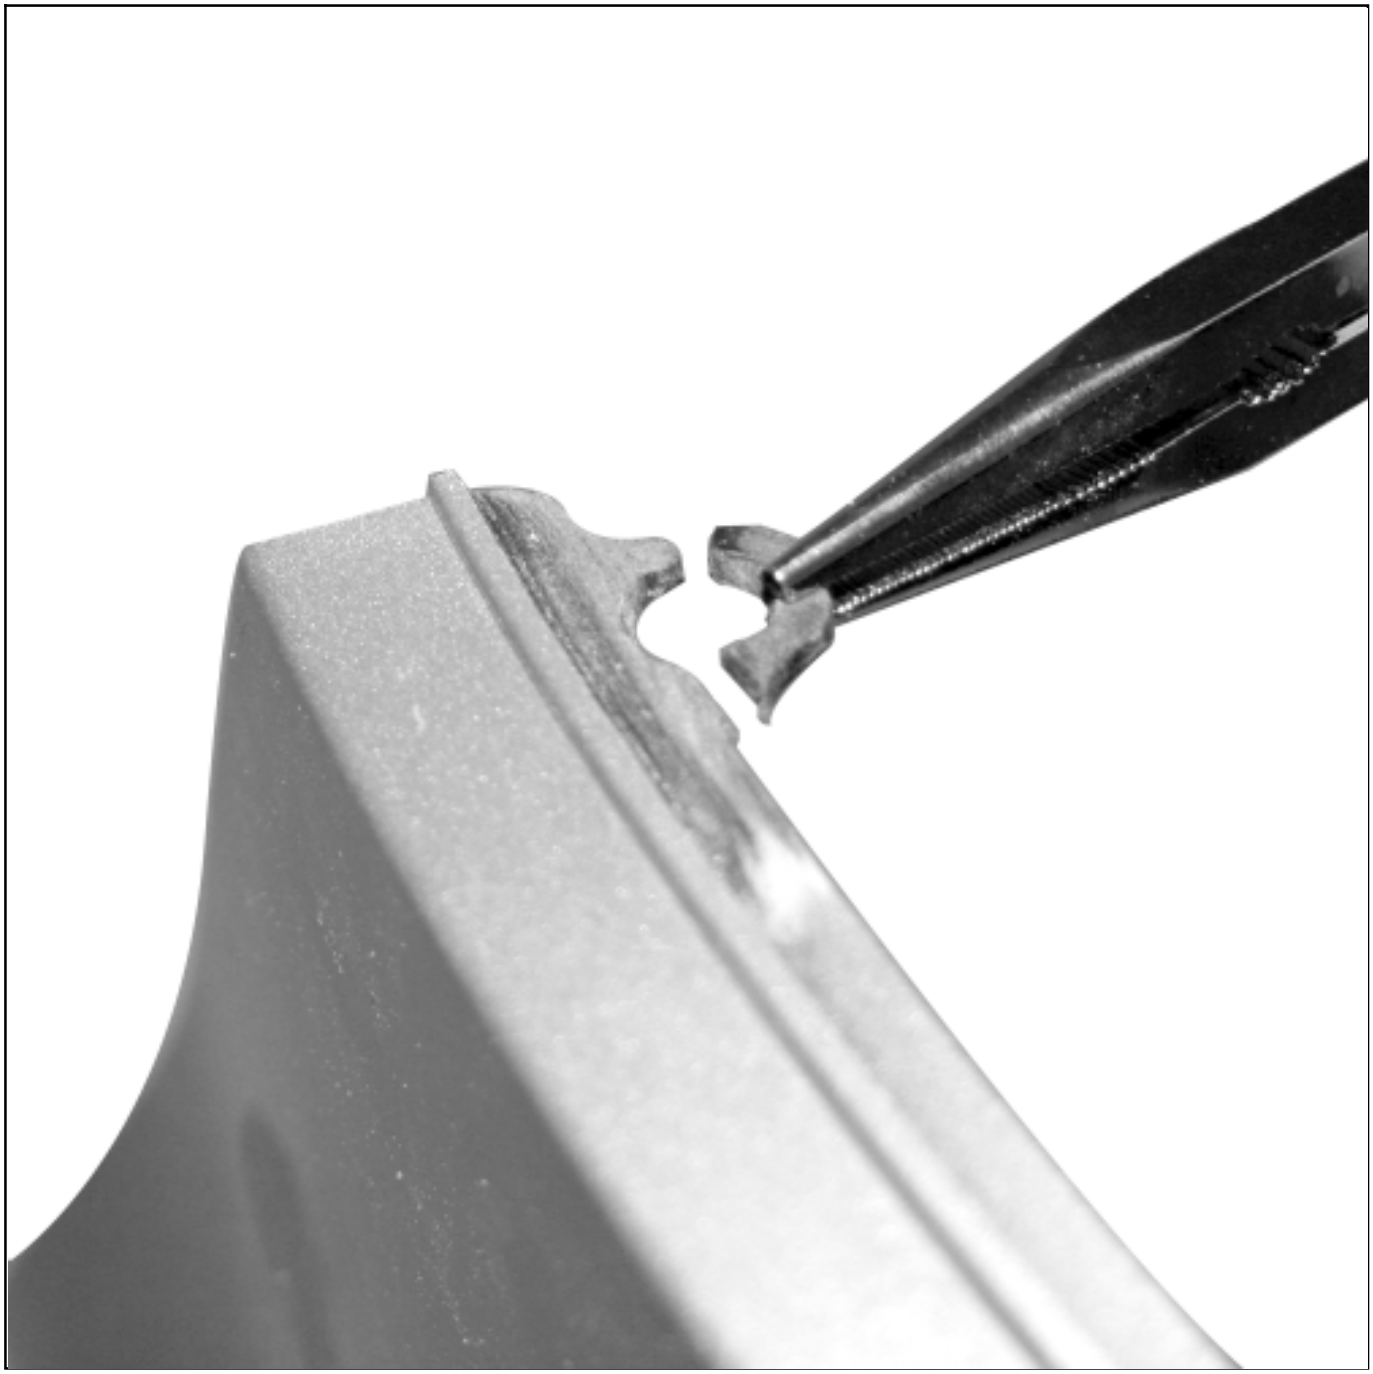


Before any repairs, check the reparability of components made from plastic materials.

(see 50A, General information, Products for plastic material bodywork components: Description) .

(see 50A, General information, Plastic material bodywork component: Precautions for the repair) .

Note:

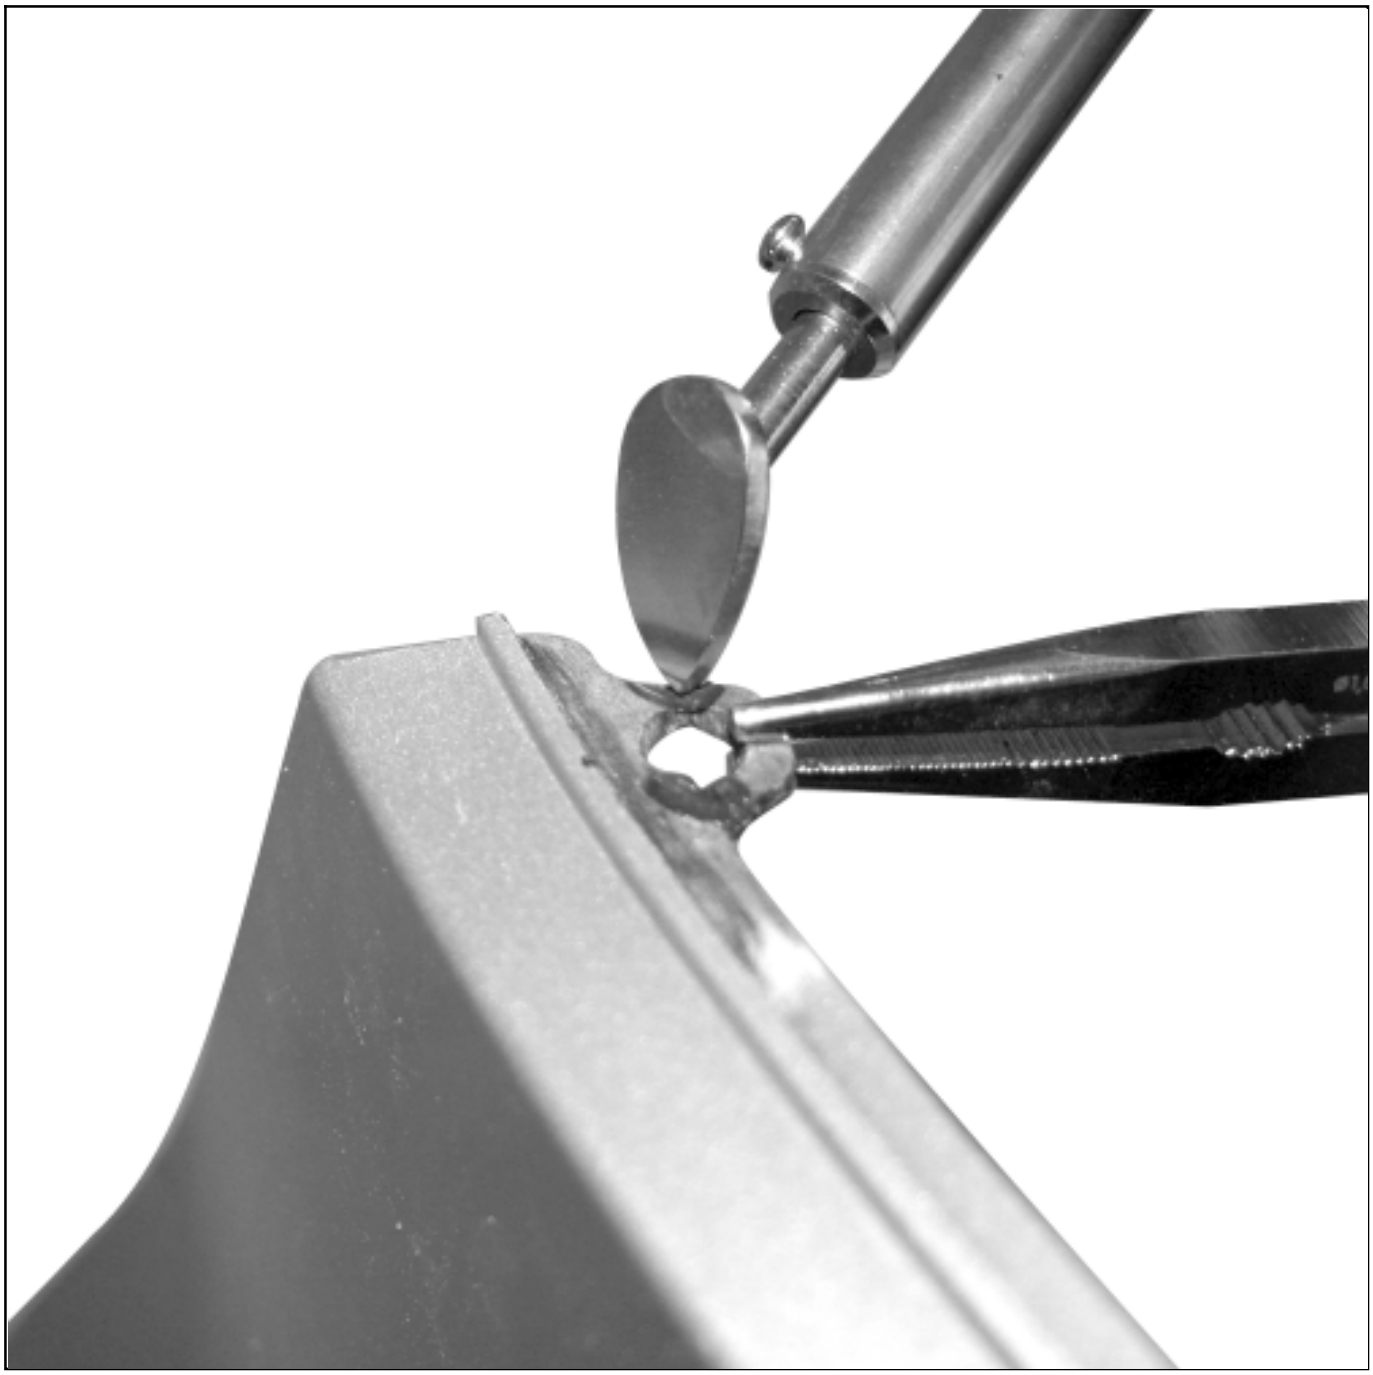


This repair cannot be carried out on ABS, ASAand Polycarbonateplastics.

- Wash the component in soapy water and rinse in clean water.

- Clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNERVehicle: Parts and consumables for the repair (04B, Consumables - Products).

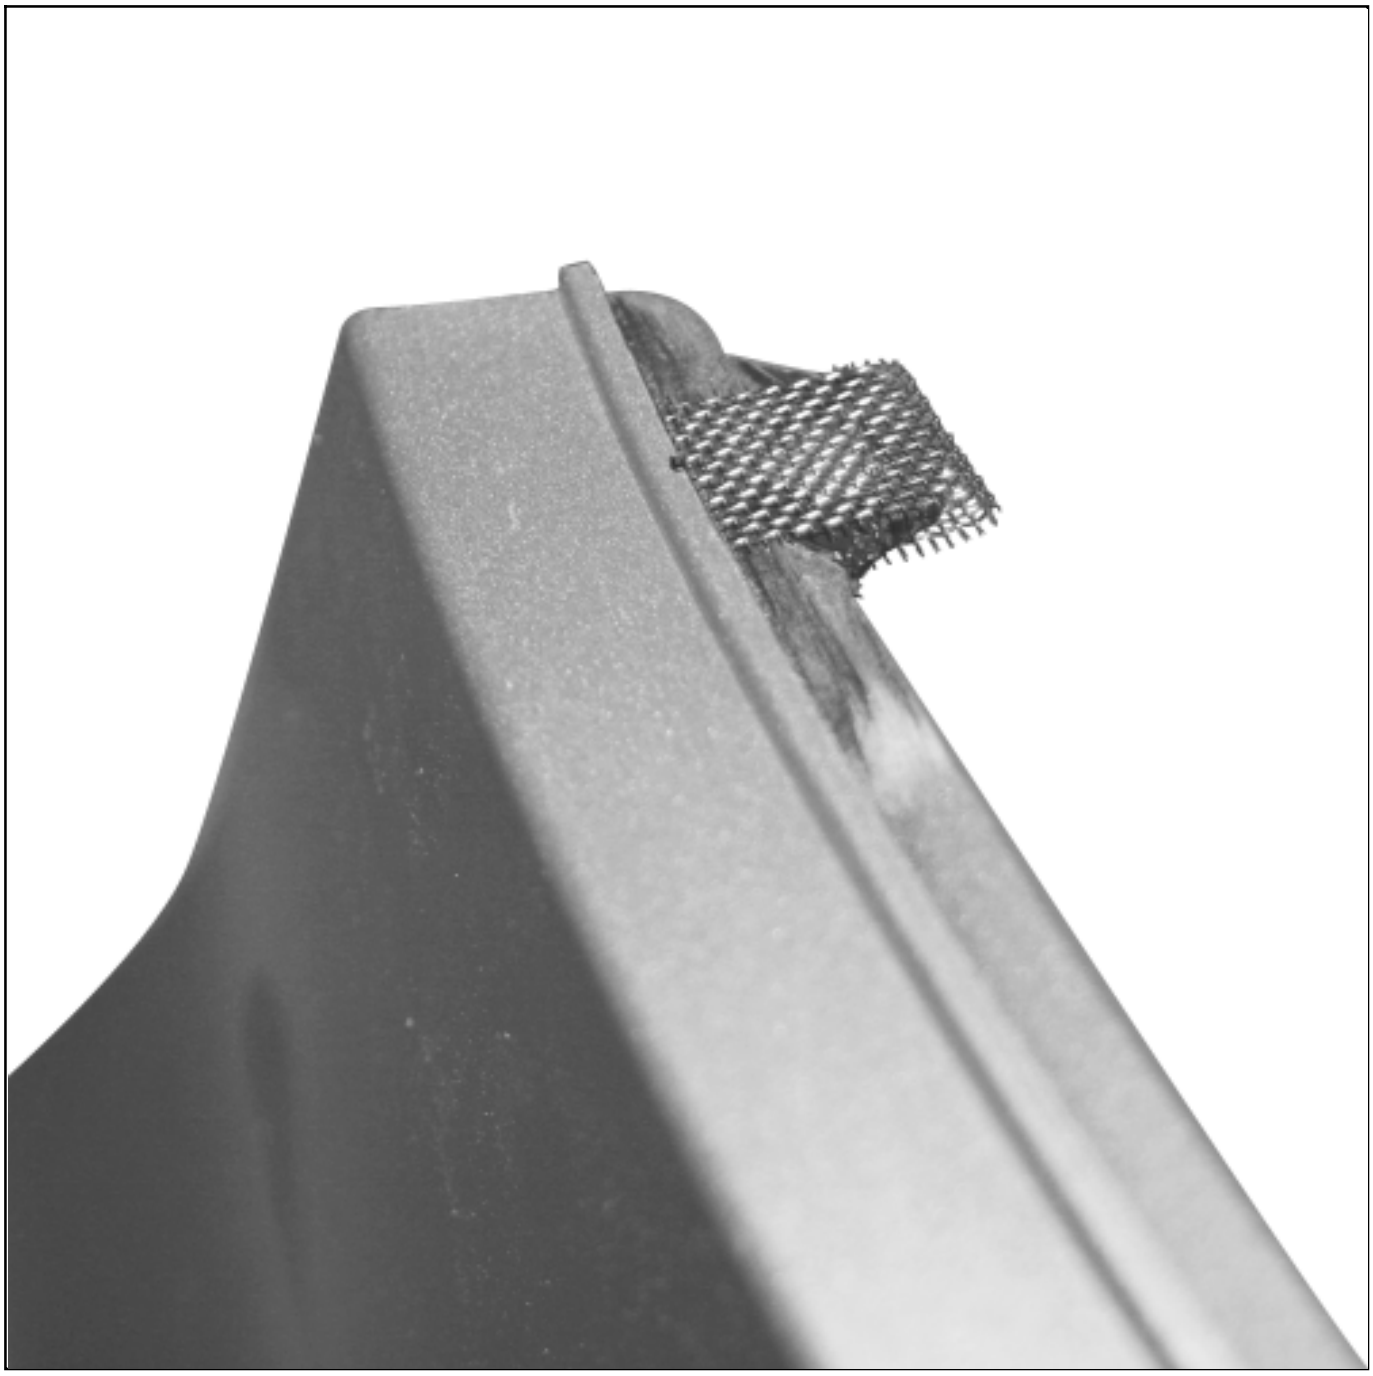
- Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).



Strip the paint with P 150on the repair area.

Blow the component and clean the area to be repaired with a LINT-FREE CLOTHsoaked in ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the area with a clean, dry LINT-FREE CLOTHVehicle: Parts and consumables for the repair (04B, Consumables - Products).



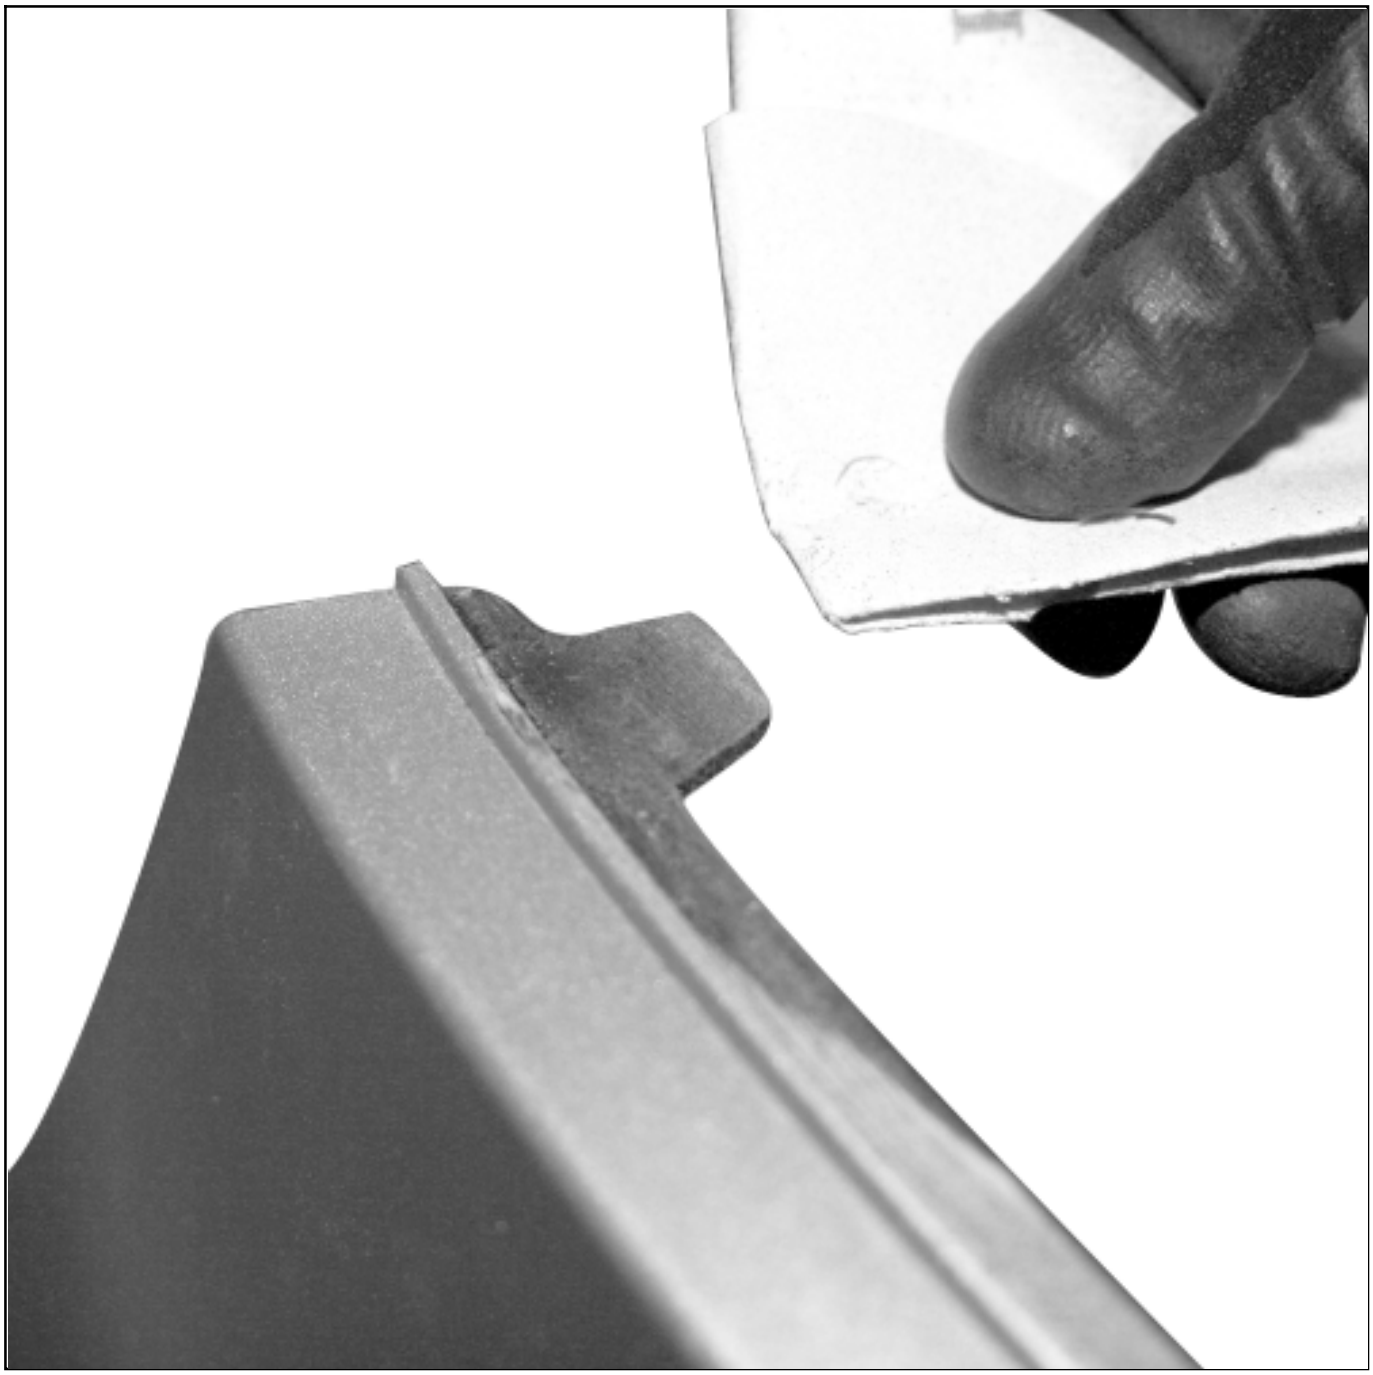
Preheat the soldering iron.

Cut the stainless steel mesh according to the shape of the support.

Spot-weld with the tip of the soldering iron on the ends in order to hold the mounting bracket.

Cool each spot weld, for two seconds, vigorously with the cooler[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

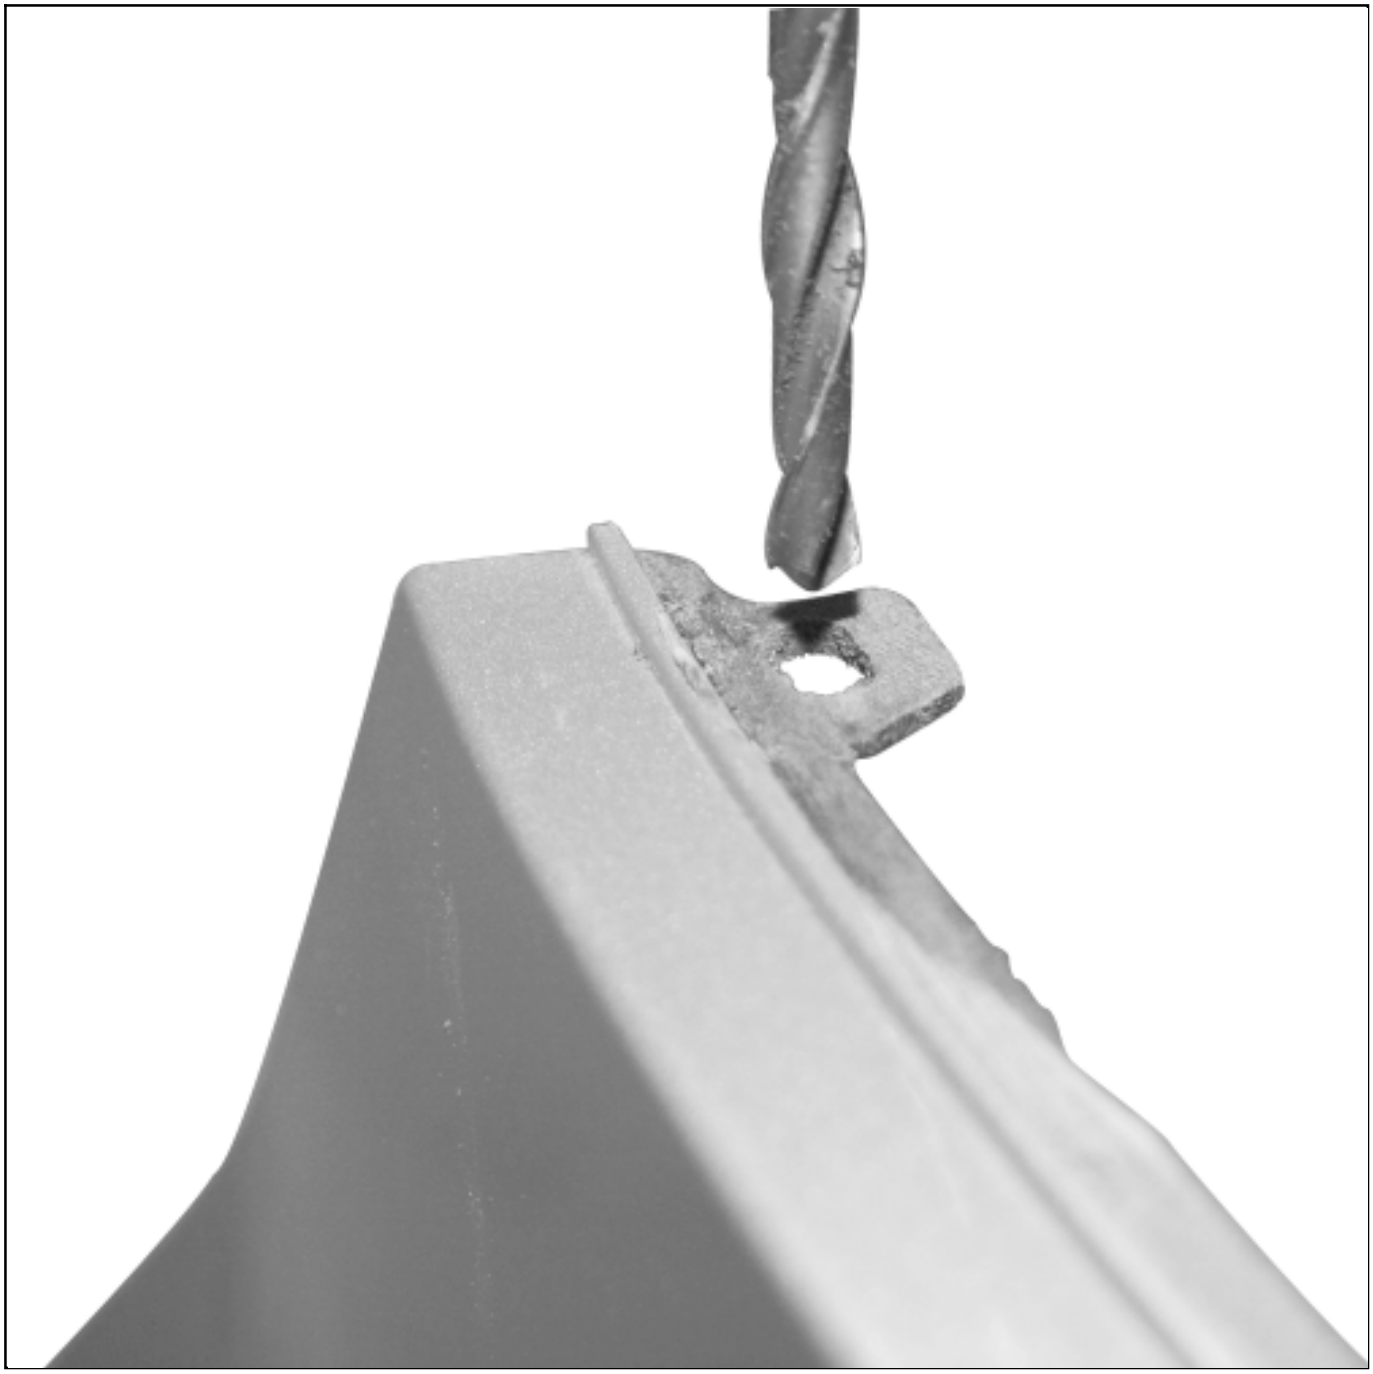
Position the stainless steel mesh and hold it using a dedicated tool.



Enclose the stainless steel frame in the plastic material.

Cool the whole of the repaired area for two seconds, vigorously with the cooler[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

Add material by preheating the welding rod with the tip of the soldering iron.



Cool the whole of the repaired area for two seconds, vigorously with the cooler**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Surface with a P 80to P 150then finish with a P 240.

Blow the component and clean the area to be repaired with a LINT-FREE CLOTHsoaked in

ANTISTATIC THINNER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Adjust the shape of the part to return it to its original appearance.

Retouch the paintwork if necessary.

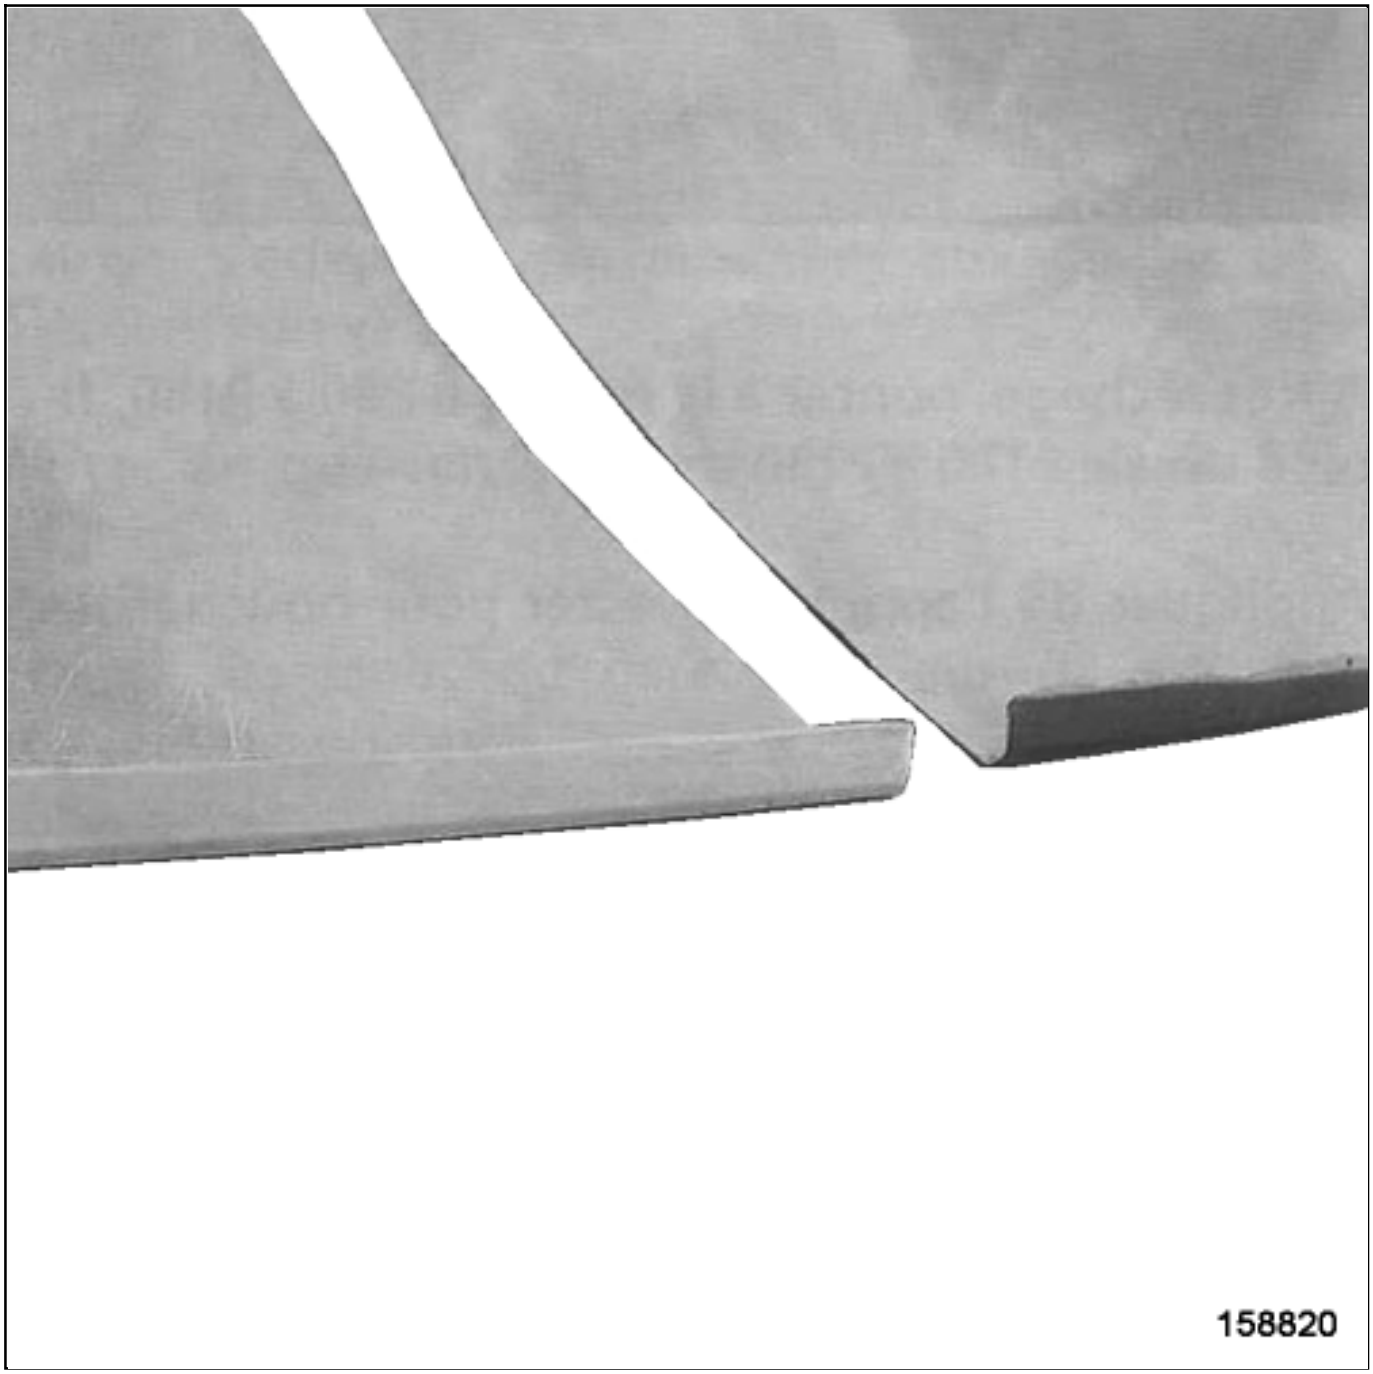
6. PROCEDURE 5

Partial replacement of an element by cuting.

Note:

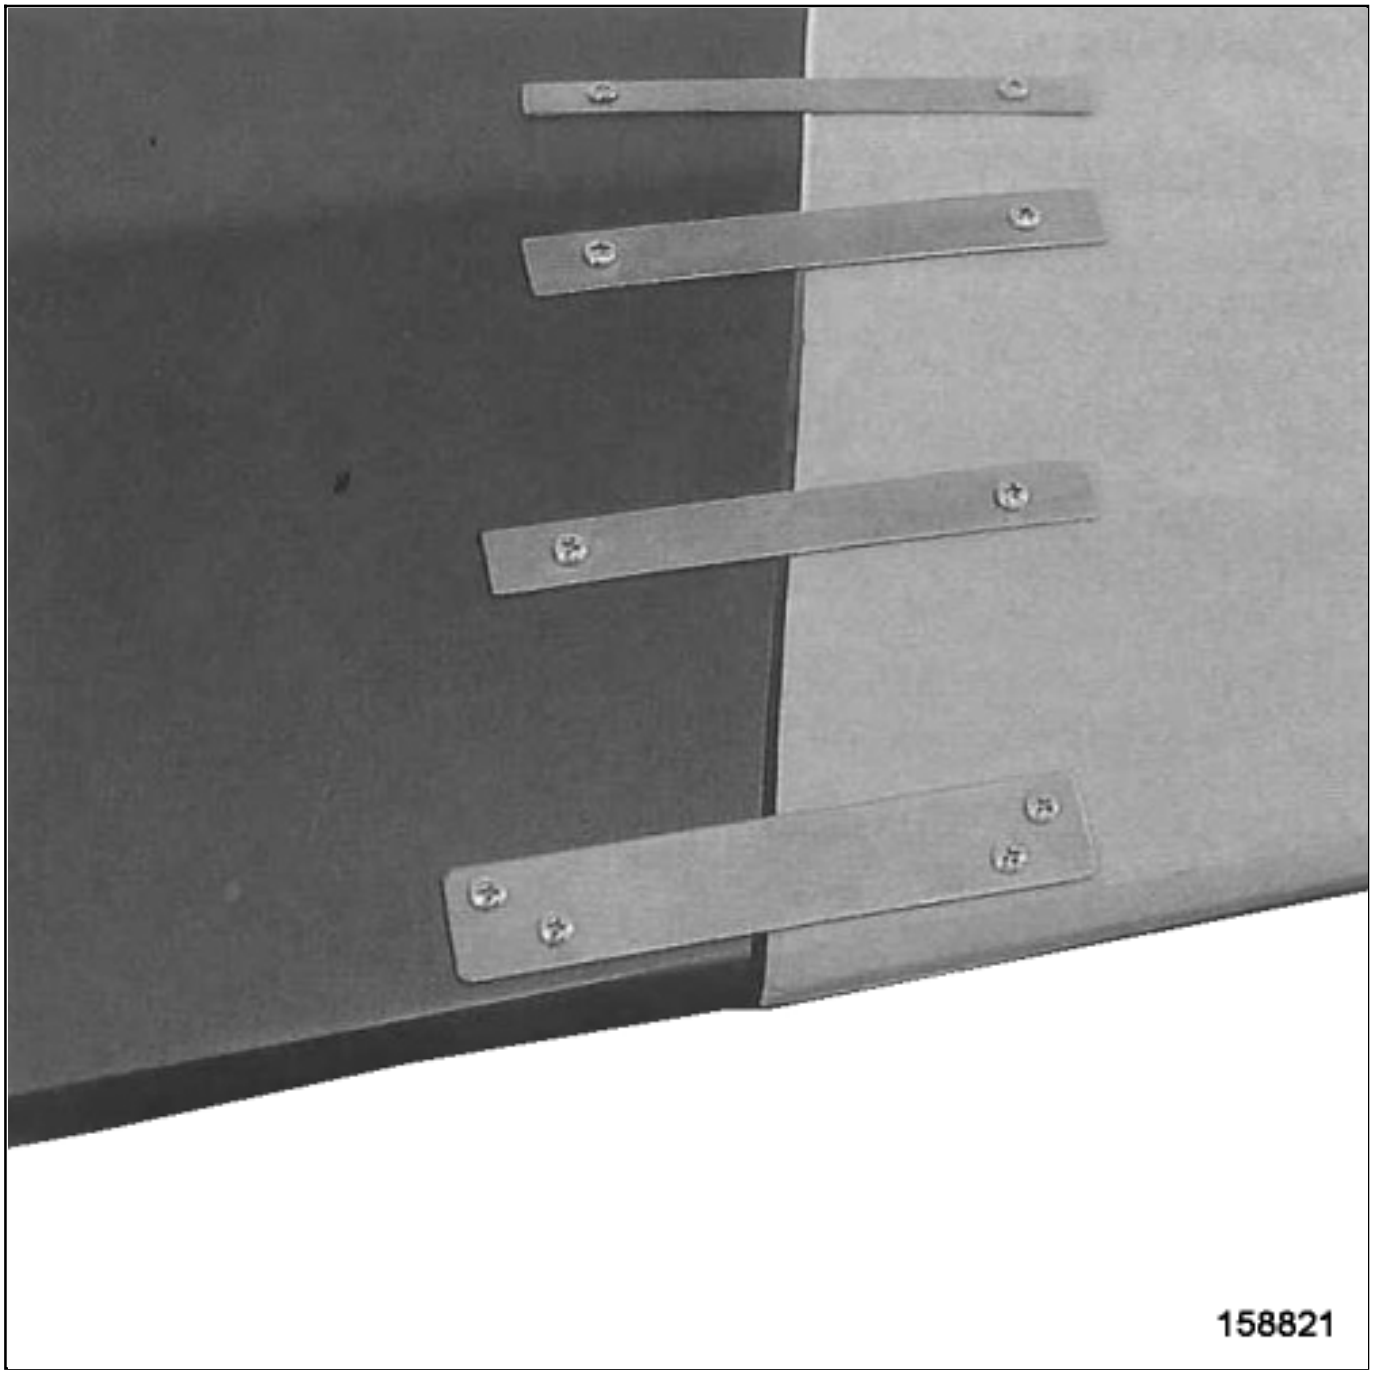
Method apply only on RTM component.

Note:



The components are manufactured by the method referred to as "contact" .

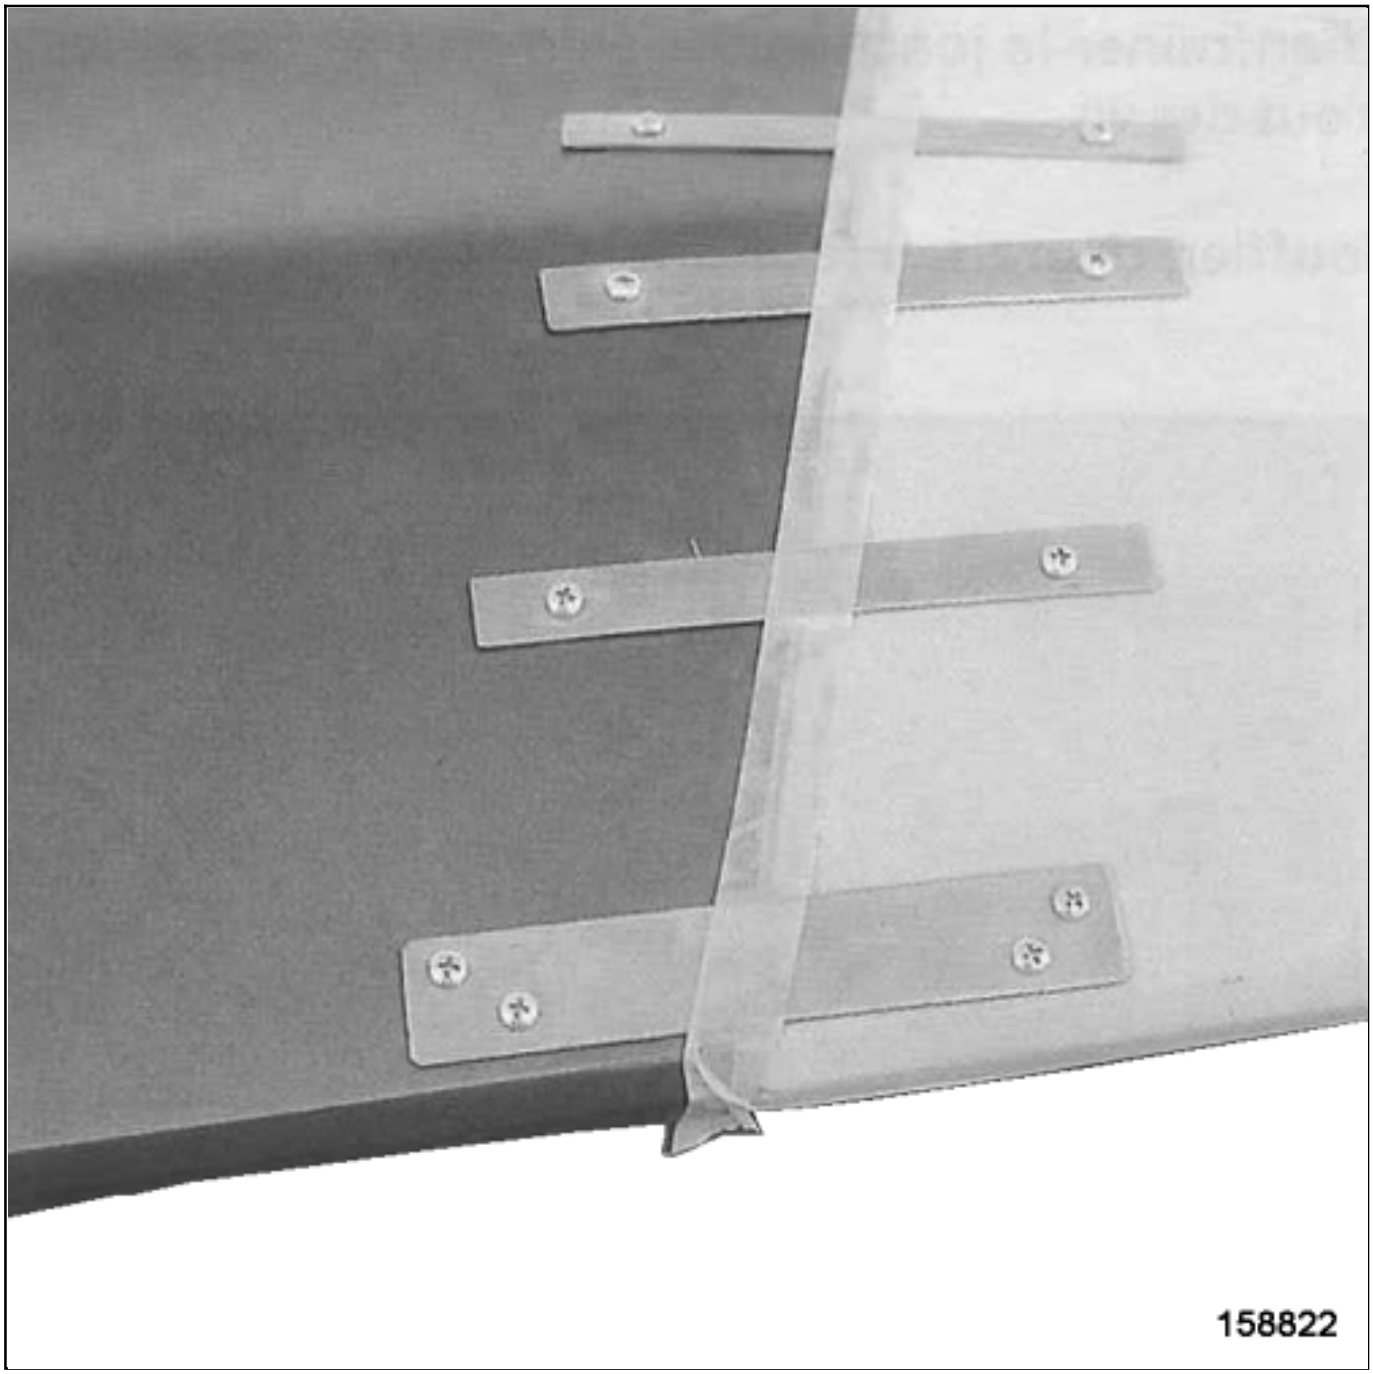
The reparation is performed by the interne face of the component.



Cut the damaged component beyond the cracks.

Cut and adjust the new component.

Prepare a space from 5to 10mm between the two components.



Chamfering the interne face of components on 100 mmwide.

- Position the new component.

- Hold the new component by the externe face using a plate pad(local manufactured)and fix them with plate screws.

- Check the clearance and the flush fitting.

Bond a masking tape on externe face on all reparation length.

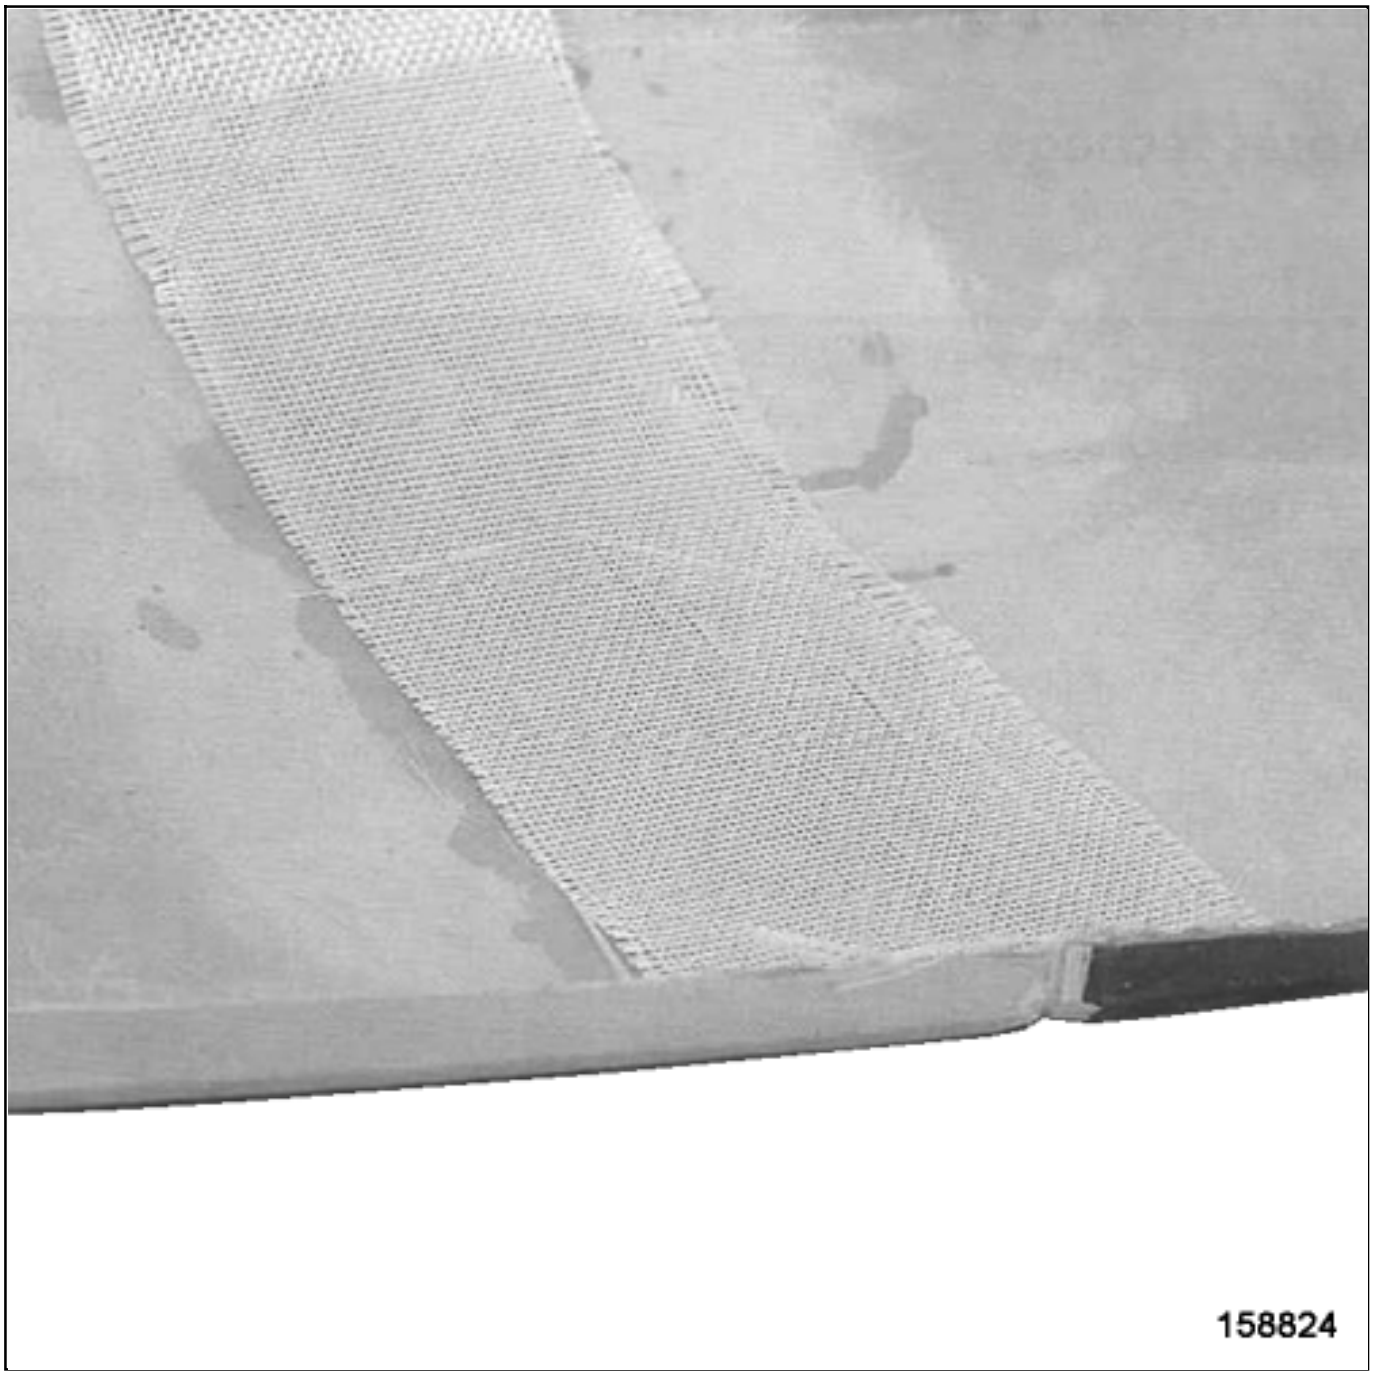
Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Cut a piece of materielrecovering the reparation assembly.

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components:

Description) .

Put the material strip by soaking with resin.



Note:

Pay particular attention at output screw area and at strips junction reinforcement to prevent the air bubbles form.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

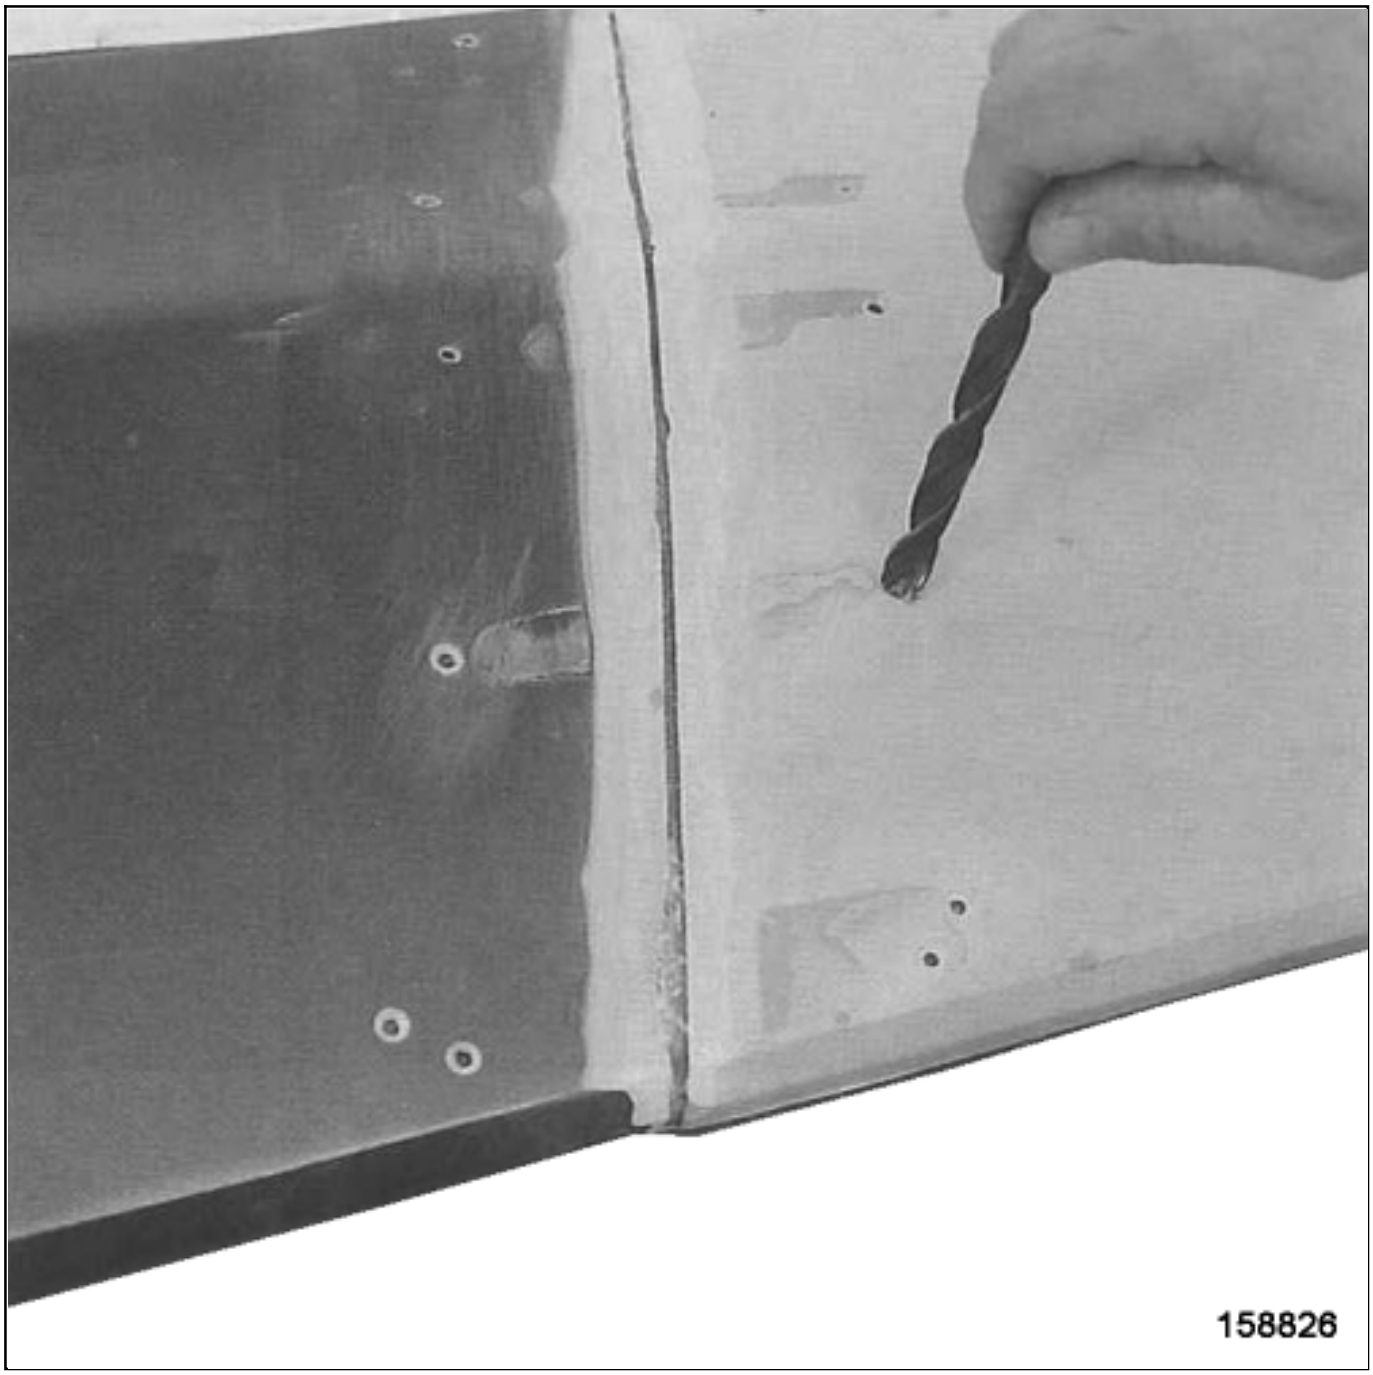
Remove the pads.

Prepare the reinforcement strips(material, cloth)by cuting then in a growing order 10 to 15 mm

Note:

According with the component width, the reinforcement strips number is variable, the purpose is to conserve the characteristic similar to the original.

- Sand the zone to be repaired using the orbital sander with a P 40
- Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).
- Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

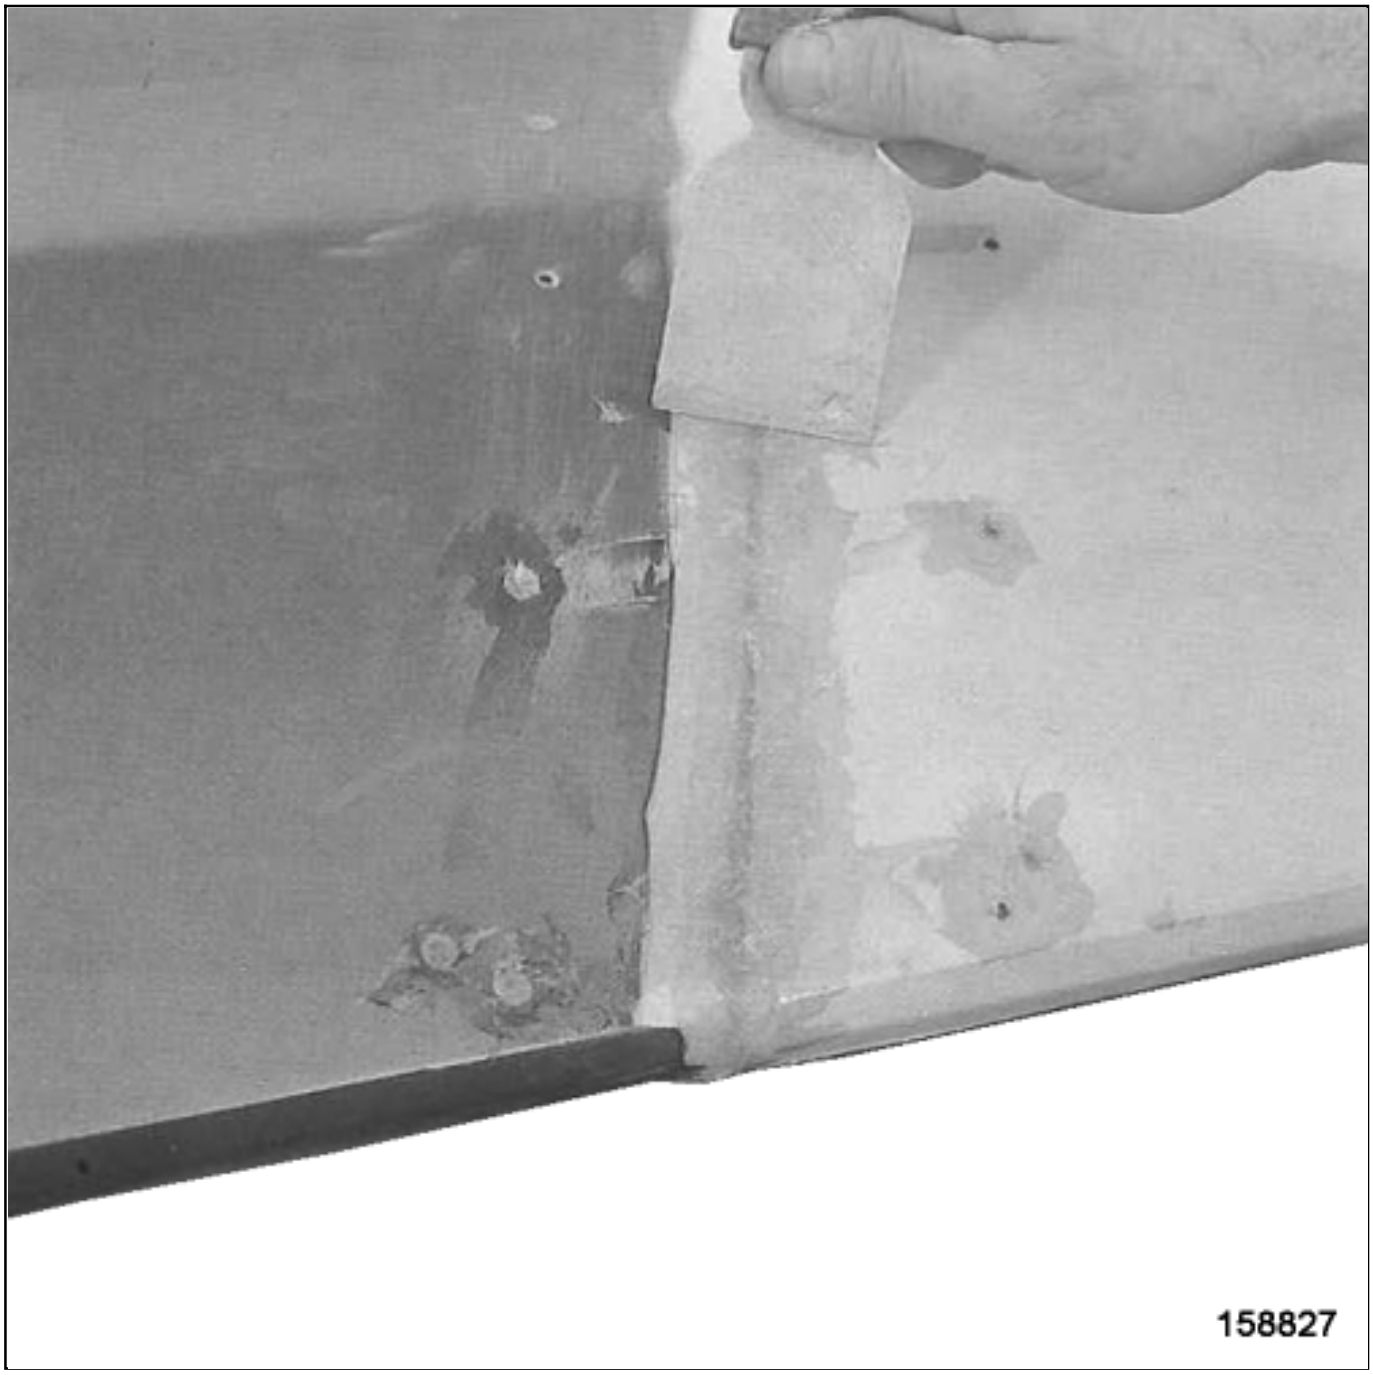


Put the material strip by soaking with resin.

Pass the spiked roller.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).



Chamfering the components junction.

Countersink the screws holes.

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

Add short fibres with resin and well mix.

- Fill the chamfer and the holes using a spatula.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

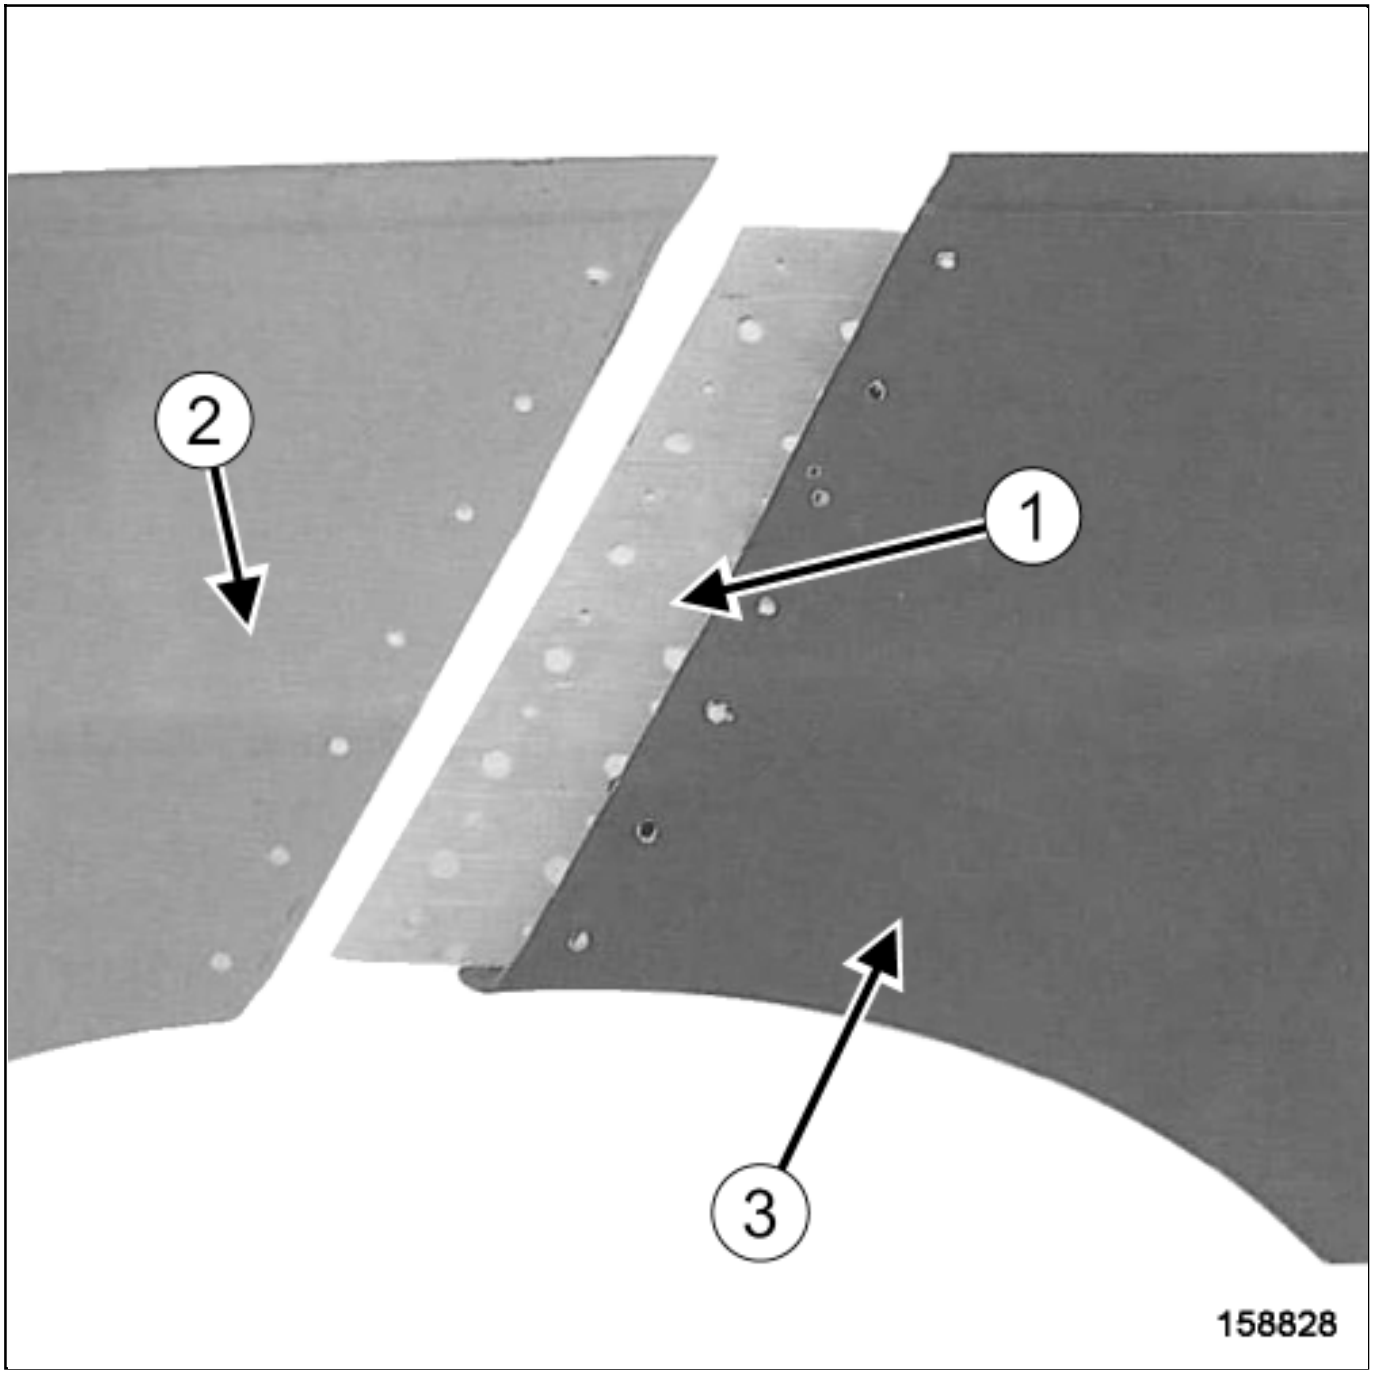
- Apply if necessary a finishing mastic(see product technical sheet). (see **Vehicle: Parts and consumables for the repair**)

- Sand the finishing masticusing a P 150then finish using a P240.

7. PROCEDURE 6

- Partial replacement of an element by cuting with patcht drilling.

Note:



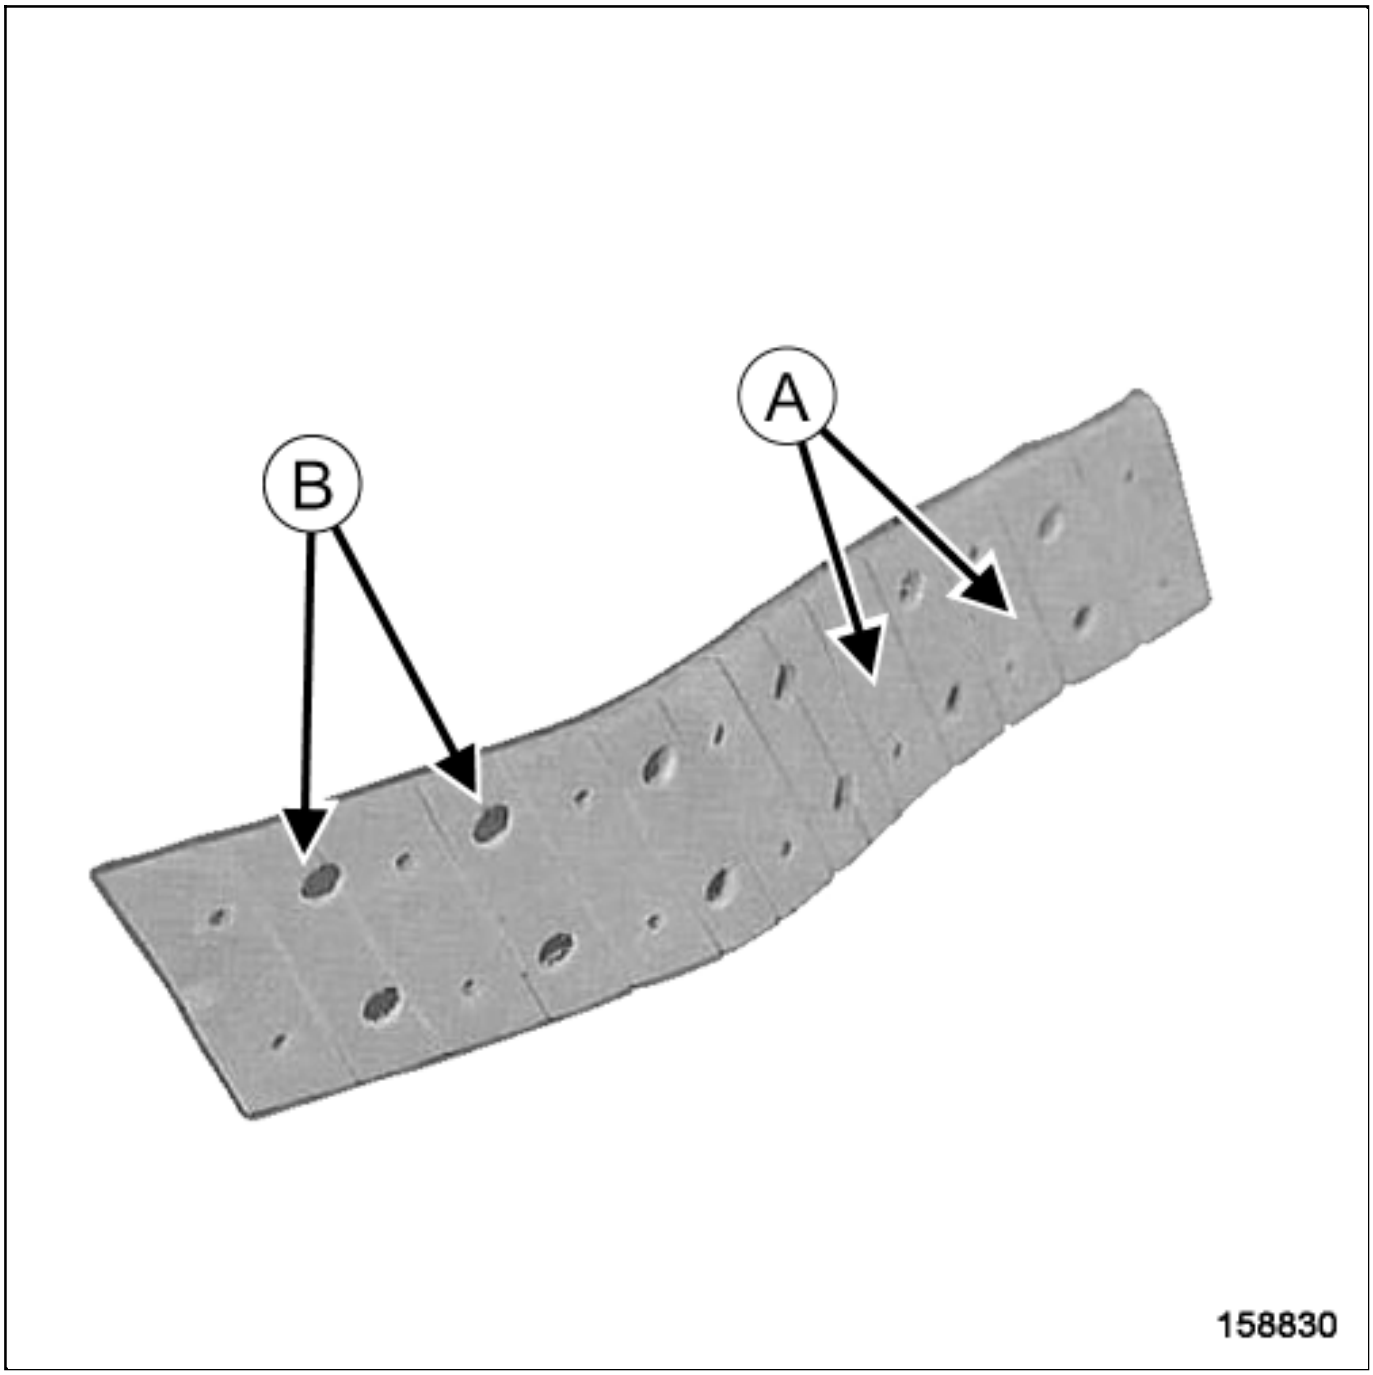
Method apply only on RTM component.

Note:

The components are manufactured by the method referred to as "contact" .

The reparation is performed by the interne face of the component.

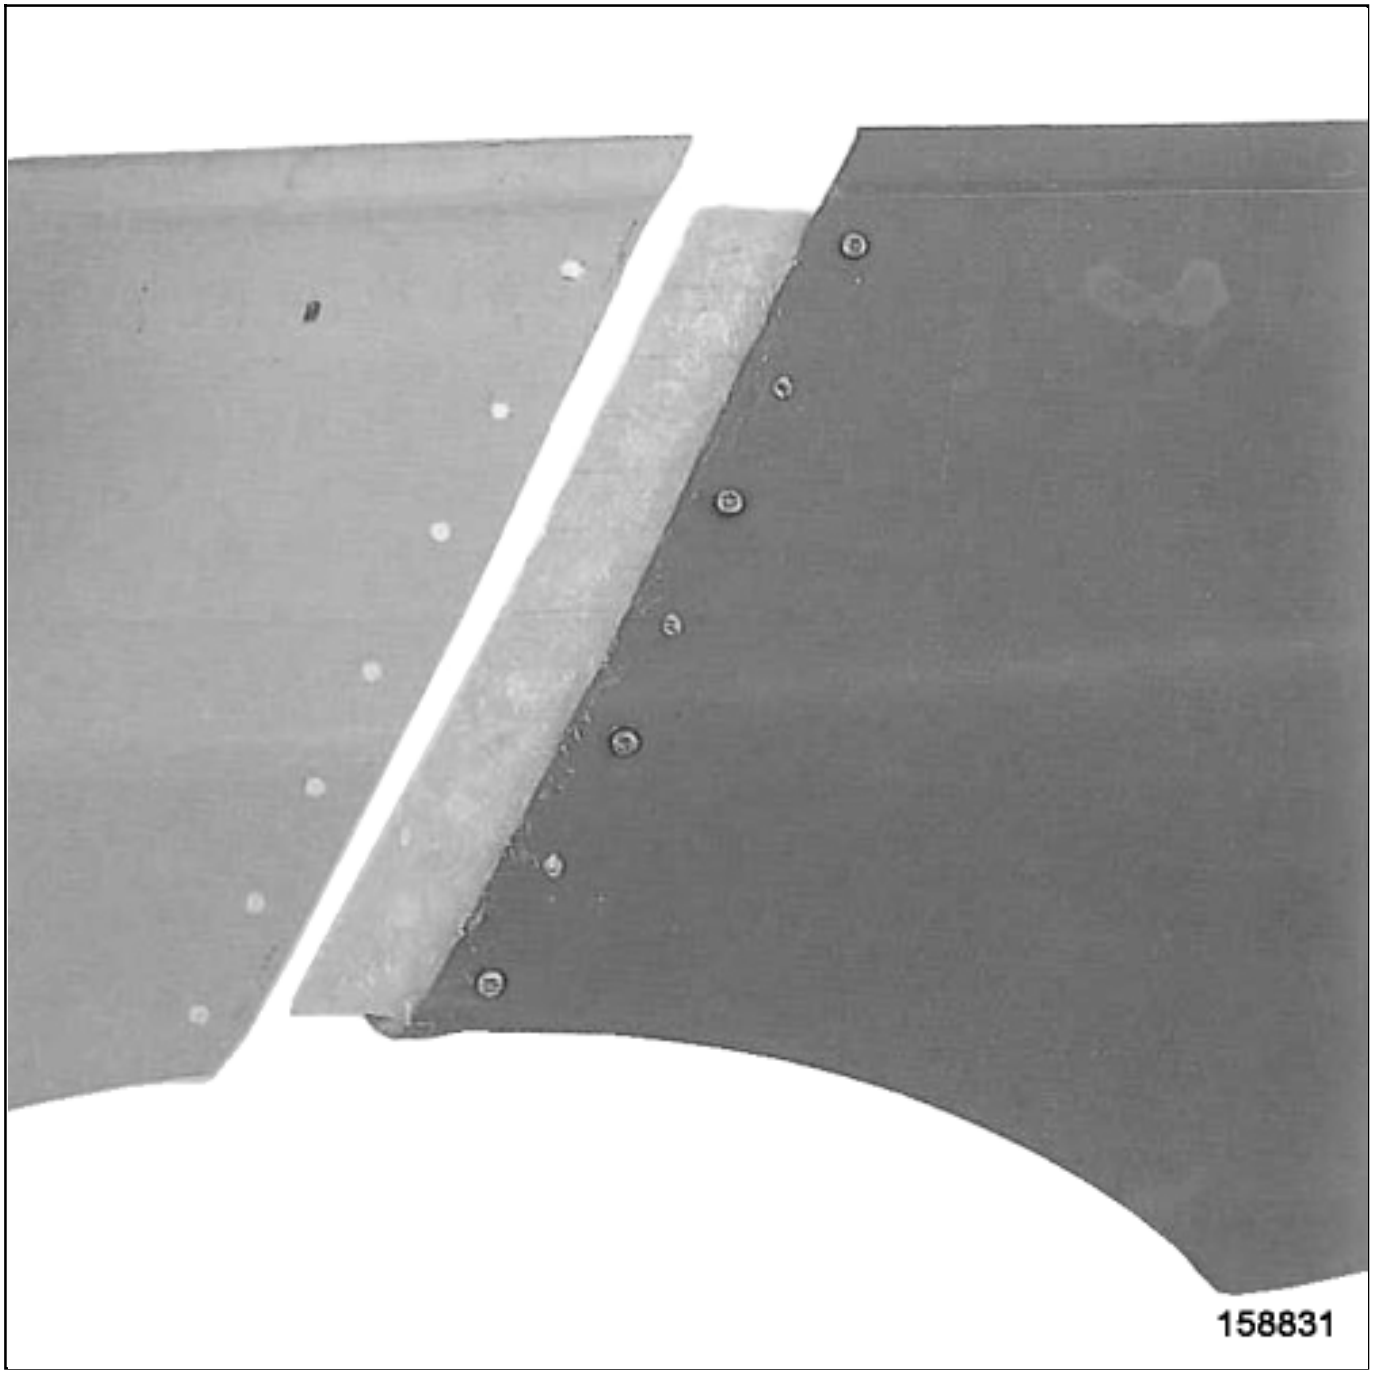
- Cut the damaged component for facilitate the patcht drilling.
- Cut and adjust the new component.



- Drill the component on the vehicle.
- Temporary fit on the vehicle the patch drilling with plate screws.
- Position the new comonent on the vehicle.

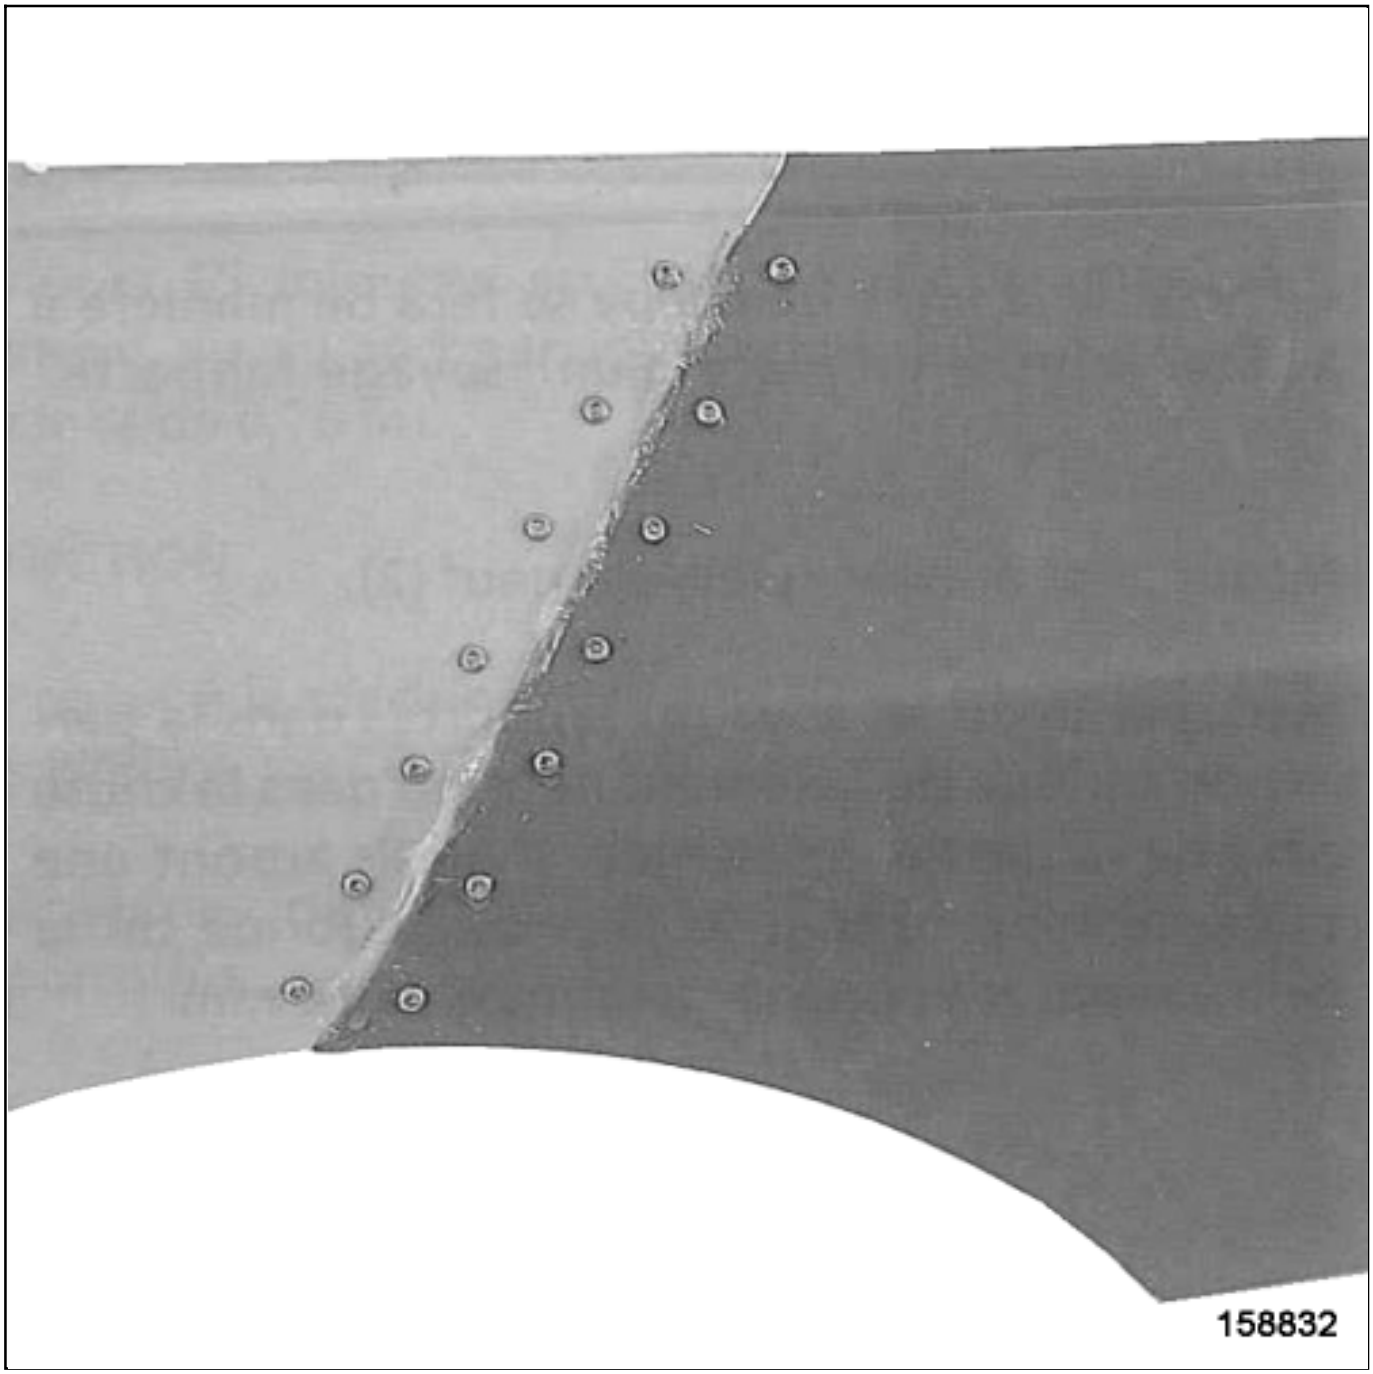
Fit on the vehicle the patch drilling with plate screws.

If necessary hold the new components with locking pliers.



Check the new component position.

Remove all components.



Do the grooves(A) , in the intern al side of patch drilling for adjust to the curve of component on the vehicle.

- Drill the holes(B) with a 8 mmdiameter.
- Countersink the holes fron external side.
- Sand the zone to be repaired using the orbital sander with a P 40
- Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).
- Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .

Band the half way of patcht drillingand fit on the component on the vehicle using plate screws.

Band the second half way of patcht drilling.

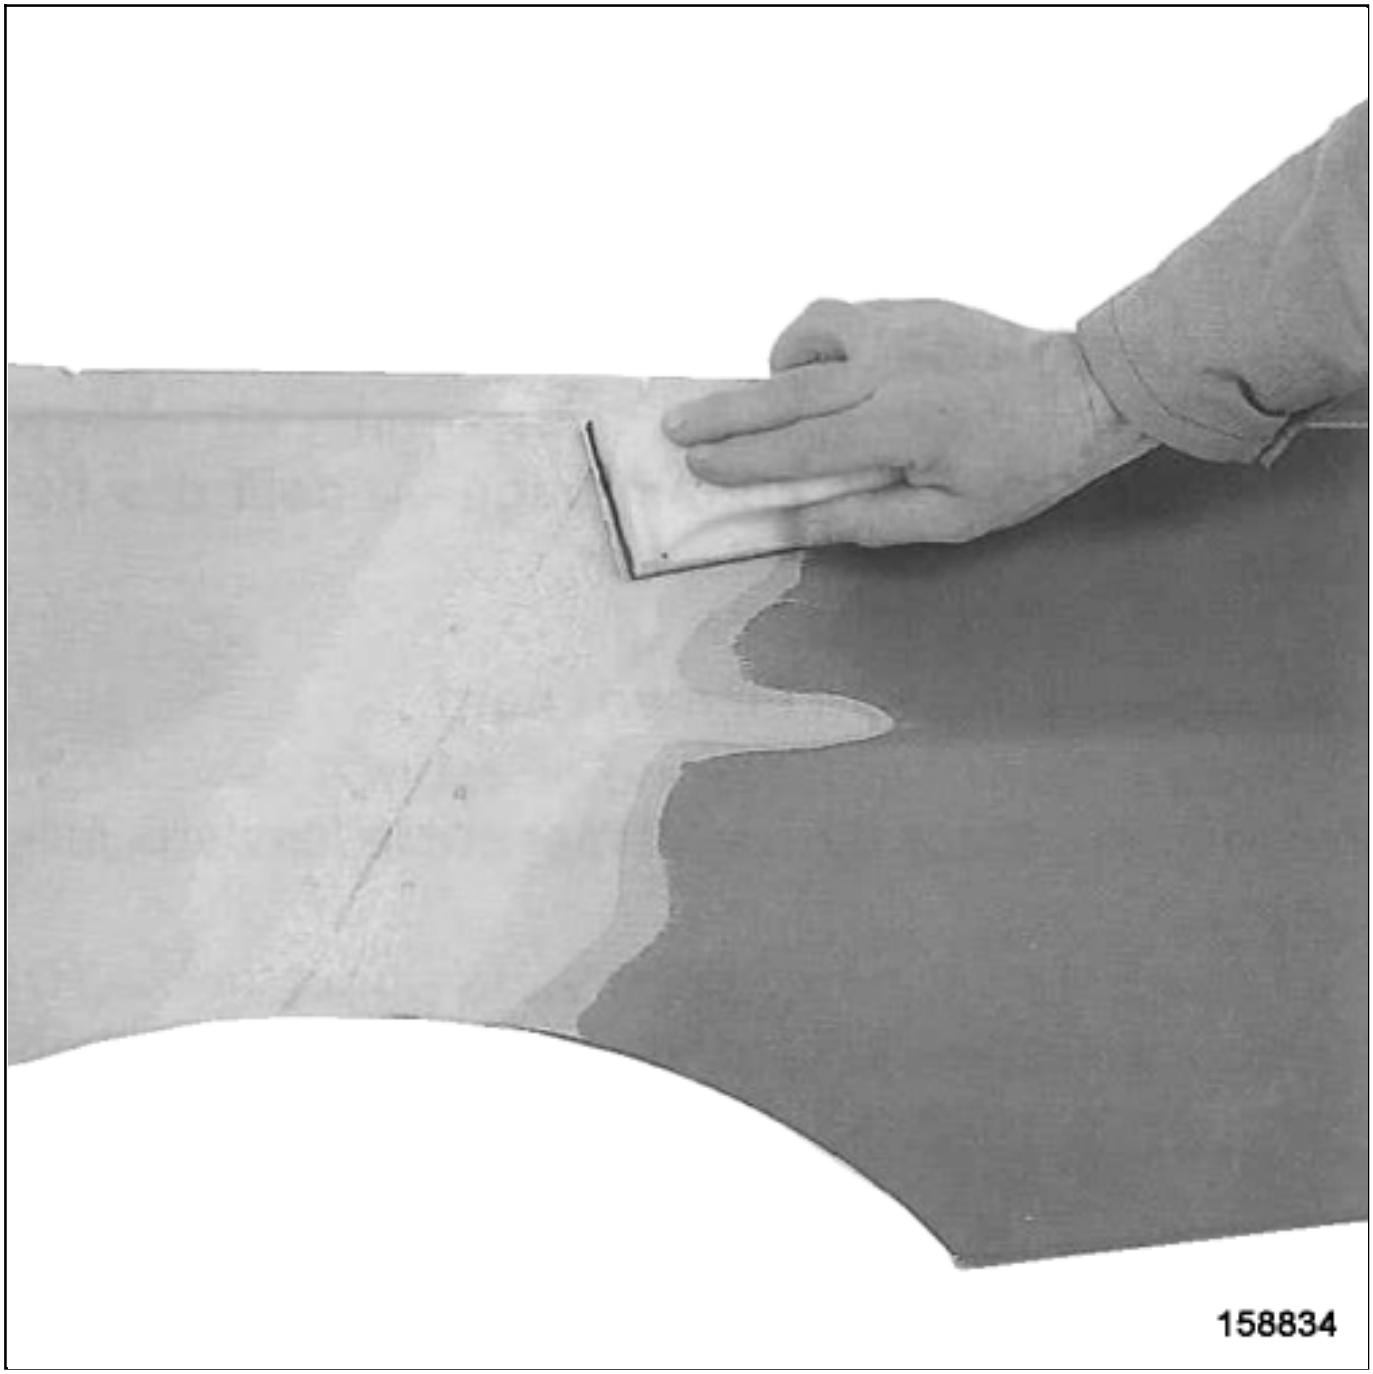
Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

Remove the plate screws.

Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).

Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .



Apply the reinforcement by soaking of resin.

Note:

After 15 minutes,accelerate the hardening in drying oven or in infrared drying device(60° C maxi at a distance of 70 cm).

- Sand the zone to be repaired using the orbital sander with a P 40
- Blow the component and clean the area to be repaired with the Acetone(see product techincal sheet).
- Prepare the Epoxy resin(see 50A, General information, Products for plastic material bodywork components: Description) .
- Add short fibres with resin and well mix.
- Apply the mixture on reparation zone.

Sand using the orbital sander with a P 80then with a P180and P240.

Apply if necessary a finishing mastic(see product technical sheet). (see **Vehicle: Parts and consumables for the repair**)

Sand the finishing masticusing a P 150then finish using a P240.

XSL version : 3.02 du 22/07/11

PLUGS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
14 mm Plug spanner.	Ele. 1382-01
Torque wrench for spark plugs	Ele. 1933

Equipment required
set of feeler gauges

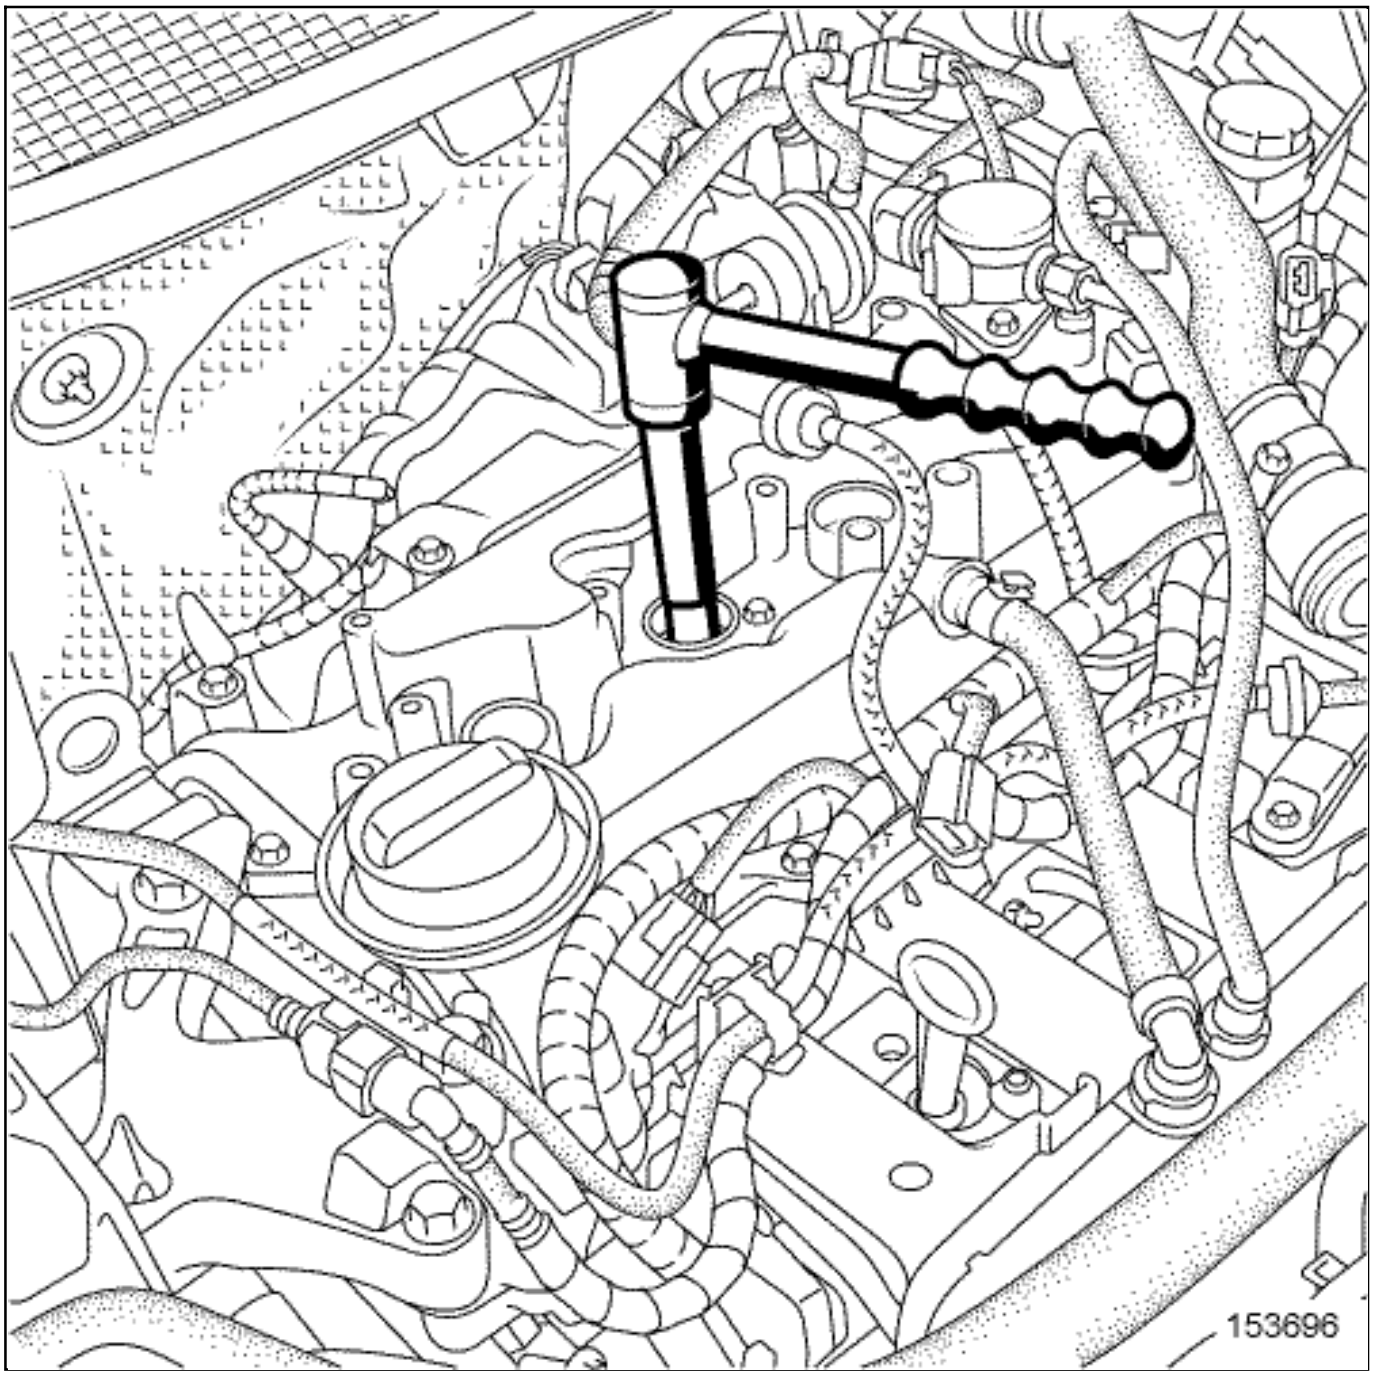
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts always to be replaced, etc.). Cylinder head assembly: Exploded view

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Move the intercooler air inlet pipe Air inlet assembly: Exploded view .
- Disconnect the petrol vapour rebreathing pipe from:
  - the rocker cover,
  - the turbo-manifold air inlet pipe.
- Move the petrol vapour rebreathing pipe.

Remove Cylinder head assembly: Exploded view :

- the design cover bolts,
- the design cover.

Remove the ignition coilCylinder head assembly: Exploded view .

2. REMOVAL OPERATION

Remove the spark plugs using the tool14 mm Plug spanner.(Ele. 1382-01) equipped with the tool Torque wrench for spark plugs(Ele. 1933) Cylinder head assembly: Exploded view .

REFITTING

1. REFFITING PREPARATION OPERATION

Check the spark plug electrode gaps using a set of feeler gauges.

2. REFFITING OPERATION

Refit the spark plugs**Cylinder head assembly: Exploded view** .

Torque tighten the spark plugs using the tool14 mm Plug spanner.(**Ele. 1382-01**) equipped with the tool Torque wrench for spark plugs(**Ele. 1933**) **Cylinder head assembly: Exploded view** .

Proceed in the reverse order to removal.

PLUGS: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
14 mm Plug spanner.	Ele. 1382-01
Torque wrench for spark plugs	Ele. 1933

Equipment required
set of feeler gauges

WARNING

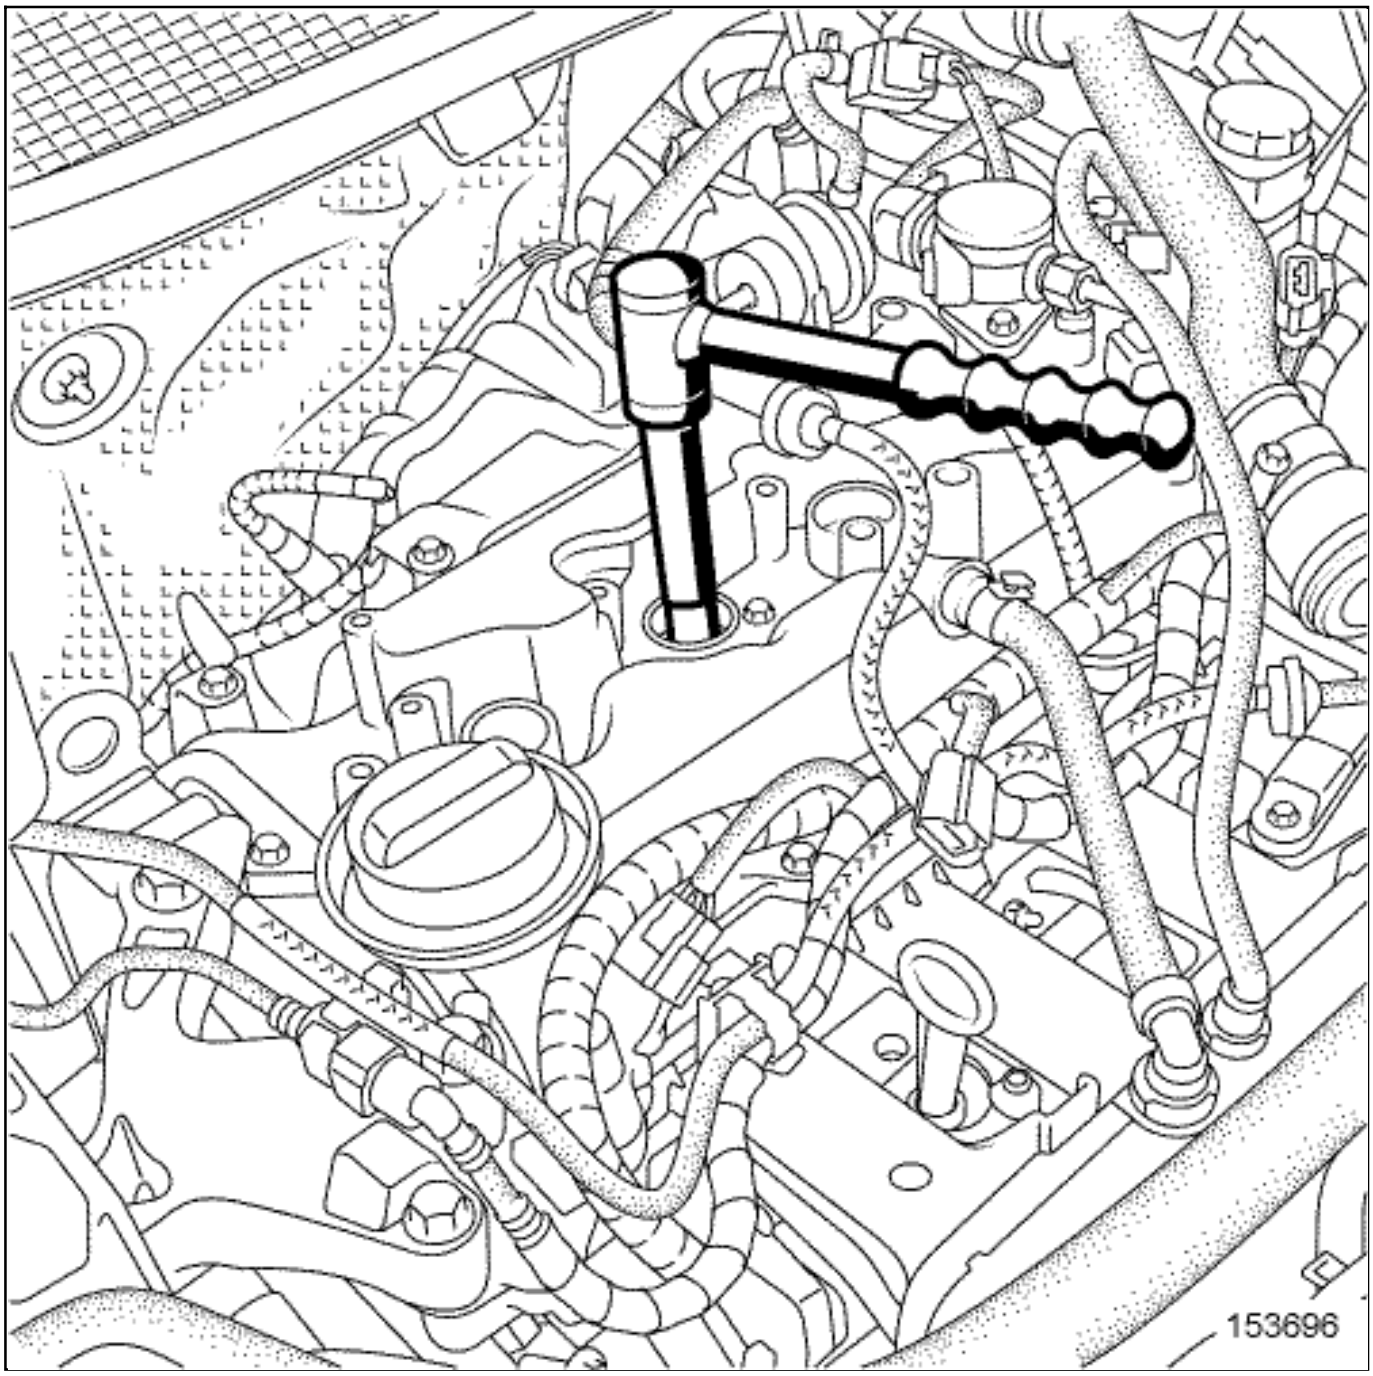
Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts always to be replaced, etc.). (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Move aside the intercooler air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Disconnect the petrol vapour rebreathing pipe from:
  - the rocker cover,
  - the turbo-manifold air inlet pipe.



Move aside the petrol vapour rebreathing pipe.

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the design cover bolts,
- the design cover.

Remove the ignition coil(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

2. REMOVAL OPERATION

Remove the spark plugs using the tool14 mm Plug spanner.(Ele. 1382-01) equipped with the tool Torque wrench for spark plugs(Ele. 1933) (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REFITTING

1. REFFITING PREPARATION OPERATION

Check the spark plug electrode gaps using a set of feeler gauges.

2. REFFITING OPERATION

- Refit the spark plugs **(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)** .

- Torque tighten the spark plugs using the tool14 mm Plug spanner.(**Ele. 1382-01**) equipped with the tool Torque wrench for spark plugs(**Ele. 1933**) **(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)** .

- Proceed in the reverse order to removal.

POLYCARBONATE BODYWORK COMPONENT : PAINT PREPARATION AND RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Note:

Before using the products, consult the manufacturer's technical sheet.

Note:

Never apply pre-treatment primer or primer filler on this type of material.

Steps	Description	Special notes
1	Sand using the orbital sander until the clearcoat disapeared	P180
2	Rub the sanding guide on the repair area	Black colour
3	Sand using the orbital sander the repair area until the guide disapeared	P240
4	Rub the sanding guide on the repair area	Black colour
5	Sand using the orbital sander the repair area until the guide disapeared	P320
6	Rub the sanding guide on the repair area	Black colour
7	Sand using the orbital sander the repair area until the guide disapeared	P400
8	Rub the sanding guide on the repair area	Black colour
9	Sand using the orbital sander the repair area until the guide disapeared	P500
10	Rub the sanding guide on the repair area	Black colour
11	Sand using the orbital sander the repair area until the guide disapeared	P800

12	Rub the sanding guide on the repair area	Black colour
13	Sand using the orbital sander the repair area until the guide disapeared	P1000
14	Rub the sanding guide on the repair area	Black colour
15	Sand using the orbital sander the repair area until the guide disapeared	P2000
16	Rub the sanding guide on the repair area	Black colour
17	Sand using the orbital sander the repair area until the guide disapeared	P 4000
18	Degrease	Lint-free cloth soaked in antistatic thinner**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).
19	Use a little polishing liquid on the foam plate	Polishing liquid
20	Polish until the product has disappeared	
21	Degrease	Lint-free cloth soaked in antistatic thinner**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).
22	Apply adhesive primer	See FT product
23	Remove solvent/dry	
24	Apply anti-scratch varnish	See FT product

POLYPROPYLENE/POLYETHYLENE BODYWORK COMPONENT: PREPARATION AND PAINT RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Note:

Before using the products, consult the manufacturer's technical sheet.

Note:

Never apply pre-treatment primer or primer filler on this type of material.

1. PRE PRIMED PARTS

Note:

The bumpers for Mégane III are supplied by the Parts Department with paint colour 676 (Pearl Black).

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Smooth	Grey adhesive pad soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Rub with an adhesive pad	
7	Apply the paint finishing	

2. NON PRE-PRIMED PARTS

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
3	Dry	30 minutes at 60˚C
4	Smooth	Grey adhesive pad soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
5	Wipe / blow	
6	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
7	Apply an adherence promoter	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
8	Remove solvent	
9	Apply a bi-component primer (according to the PRODUCT TECHNICAL SHEET for the adhesion promoter)	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Remove solvent / dry	
11	Sand	P400-P500 dry / P400-P500 with water
12	Wipe / blow	

13	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
14	Rub with an adhesive pad	
15	Apply the finishing paint	

3. REPAIRED COMPONENTS

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
3	Sand the defect	P240 / orbital sander (mid-speed)
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
6	Apply and sand polyester mastic if necessary	Plastic material bodywork component: Repair (Technical Note 662A, 50A, General information)
7	Wipe / blow	
8	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).
9	Apply an adherence promoter	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Remove solvent	
11	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
12	Remove solvent / dry	
13	Sand	P400-P500 dry / P400-P500 with water
14	Wipe / blow	

15	Degrease	Lint-free cloth soaked in antistatic thinner**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).
16	Rub with an adhesive pad	
17	Apply the finishing paint	

PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions**(see 01D, Mechanical introduction, Vehicle: Precautions for the repair)**

1. GENERAL INFORMATION

All information contained in these manuals is intended exclusively for automotive industry professionals.

The documentation is intended to cover all vehicles in theRENAULTrange throughout the world, but may not cover equipment designed for use in specific countries.

The procedures and fault finding procedures recommended and described in this manual have been designed by automotive industry repair professionals.

1- GENERAL RECOMMENDATIONS

Observe basic principles of vehicle repair.

The quality of repair depends first and foremost on the care exercised by the person in carrying it out.

To ensure good repair:

- protect the sensitive areas of the vehicle (seats, steering wheel, wings, etc.),
- unless otherwise indicated, all repairs must be done with the ignition off,
- when welding on the vehicle, it is advisable to remove or disconnect components near the repair area that could be affected by the heat,
- use recommended professional products and original parts,

- observe the tightening torques,
- replace roll pins, self-locking or bonded nuts or bolts every time they are removed,
- take care with electrical and electronic components which cannot withstand excess voltage and improper handling; replace any electrical and electronic components which have experienced a voltage drop,
- make sure that the connectors are correctly clipped,
- do not pull on the wiring,

WITH STOP AND START (STOSTA)

Disable the Stop & Start system for all operations requiring the opening of the bonnet by the command located in the cockpit.

To ensure good repair:

- check for the sealing plugs on the connectors,
- do not just replace parts one after the other, carry out detailed fault finding beforehand,
- carry out a final check before returning the vehicle to the customer (set the clock, check the alarm operation, check the lights and indicators etc.),
- clean and degrease the sections to be bonded (threads, stub axle splines) to ensure proper adherence.
- Desactivate the start and stop mode for all interventions requiring the bonnet opening.

Protect the accessories and timing belts, the electrical accessories (starter, blanking cover, electric power assisted steering pump) and the mating face to prevent diesel fuel spilling onto the clutch friction plate.

The design quality of our vehicles demands that nothing is left to chance in making a good repair, and it is essential to refit parts or components exactly as they were originally (for instance: heat shields, wiring routing, pipe routing, particularly in the area of the orange high-voltage wirings).

Do not blow away dust (brakes, etc.), vacuum them up or clean the component with a cleaning agent (such as a brake cleaning product).

Use professional products and apply them with care, for example do not apply too much sealing paste to the sealing surface.

Exhaust gases (petrol and diesel) are pollutants. Operate engines or self-contained heaters with care and always use exhaust gas extractors.

Ensure that there is no risk of a short circuit occurring when the electrical connections are reconnected (e.g. charger, converter, traction battery and 12V battery, etc.). Some points need greasing, others do not, therefore particular attention should be paid during refitting operations to ensure that they work properly under all conditions.

2- SPECIAL TOOLING - EASE OF USE

The repair procedures have been designed using special tools; they must therefore be carried out using these tools to ensure a high degree of working safety and quality of repair.

The equipment we have approved has undergone careful research and testing, and must be used and maintained with care.

3- RELIABILITY - UPDATING

New repair procedures are constantly being developed in the interests of repair quality, either with new products (emission control, injection, electronics, etc.), or in fault finding. Be sure to consult the Workshop Repair Manuals or Technical Notes or fault finding summaries before any servicing operation.

Since vehicle specifications are subject to change during their commercial life, it is essential to check whether there are any updated Technical Notes when seeking information.

4- SAFETY

Operations on certain equipment and certain parts (for instance: spring-shock absorber assembly, electric traction reduction gearing, brake system, ABS, airbag, etc.) require particular attention to be paid to safety, cleanliness and care.

The safety symbol used in this manual indicates that special attention must be paid to the procedure or the tightening torque values.

Working safely:

- use suitable tools which are in good condition (use of "multi-purpose" tools, such as adjustable pliers, etc., should be avoided wherever possible),
- use supports and adopt a correct posture when performing heavy work or raising loads,
- make sure that the procedure used is not dangerous,
- do not wear any jewellery or other small objects during an operation,
- use personal protection (gloves, safety glasses, work shoes, masks, skin barrier creams, etc.),
- always follow the safety instructions associated with the operation to be performed,
- do not smoke when working on vehicles,
- use smoke extractors (welding, exhaust gases, etc.),
- do not use harmful products in unventilated rooms,
- do not overstrain yourself or attempt inappropriate work operations,
- use axle stands when working under a vehicle raised on a jack,
- do not ingest any chemicals (brake fluid, coolant, etc.),
- do not open the cooling circuit when it is hot and pressurised,
- take care with components that are liable to start up suddenly (engine cooling fan, etc.).

Respecting the environment:

- do not allow waste refrigerants to escape into the atmosphere,
- do not dispose of waste vehicle fluids (oil, brake fluid, etc.) in drains,
- do not burn discarded products (tyres, etc.).

5- CONCLUSION

The procedures contained in this document merit your attention. Please read them carefully in order to reduce the risk of injury, and avoid using incorrect procedures that could damage the vehicle or make it dangerous in use.

Following the recommended procedures will help you to provide a quality of service which will ensure the vehicles achieve the highest levels of performance and reliability.

Maintenance and repair operations must be carried out under the proper conditions to ensure that our vehicles run safely and reliably.

Repair-00x01x01-02x60-2-9-1.xml

XSL version : 3.02 du 22/07/11

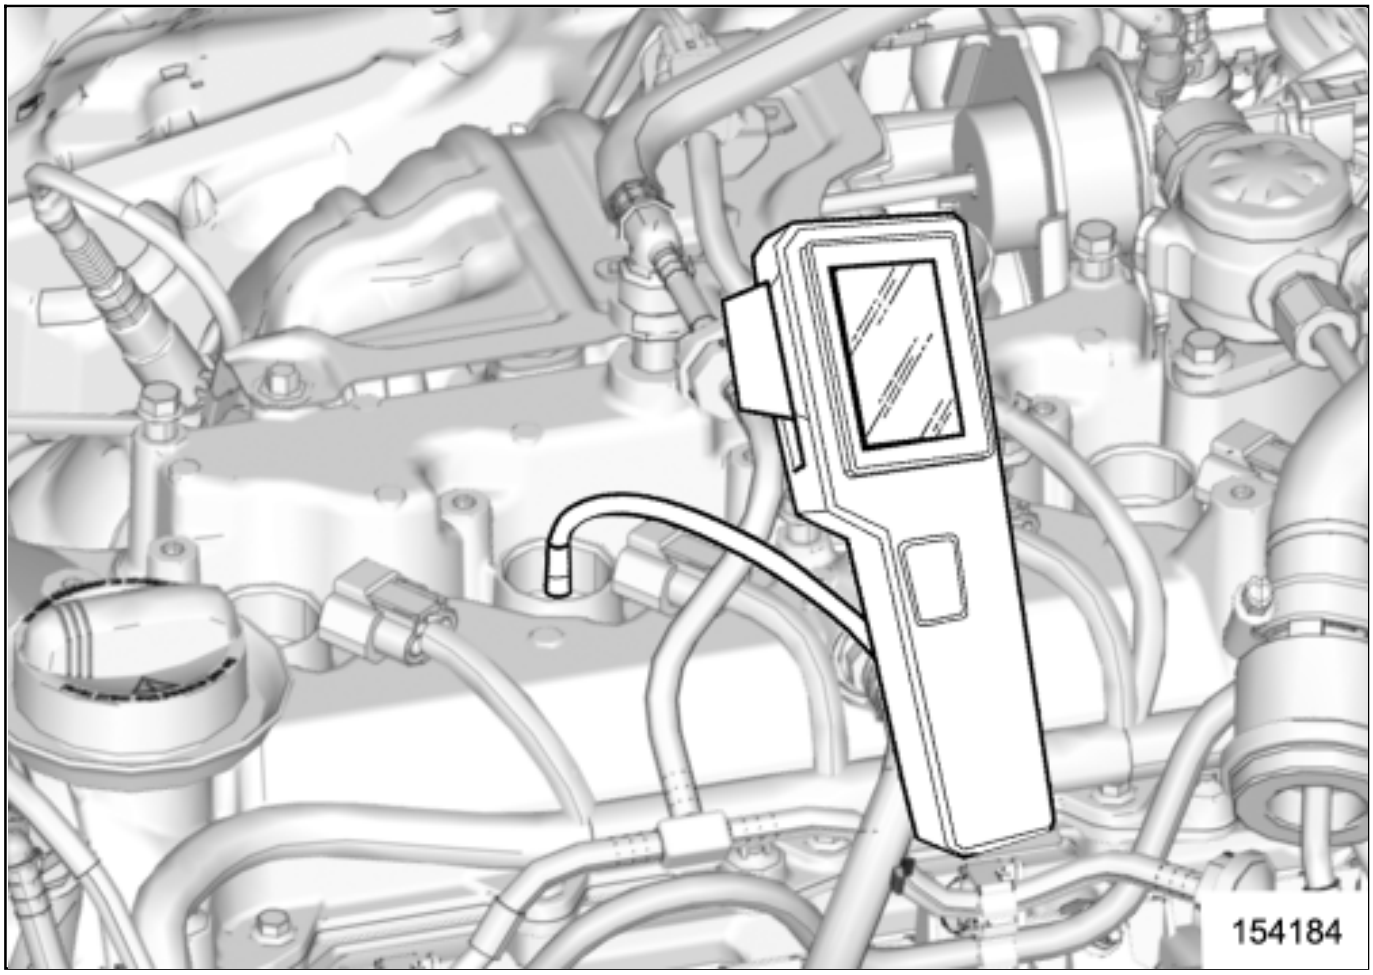
PRESSURE AT END OF COMPRESSION: CHECK

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
petrol compression gauge

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .



CHECK

1. PREPARATION OPERATION FOR CHECK

Remove the turbocharger air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove:

- the coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the spark plugs (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

Connect a petrol compression gauge.

Run command with Diagnostic tool:

- RZ003 : "ENGINE ADAPTIVES",
- VP036 : "FUEL SUPPLY INHIBITION".

Put the vehicle under starting conditions:

- gear lever in neutral position for a manual gearbox,
- "P" (park) position for an automatic gearbox,

brake pedal depressed.

2. TEST OPERATION

- Press the vehicle start button to trigger the engine starting phase.

> Note:
>
> The engine will be driven for 20 swithout starting.

- Check the compression of cylinder no. 1.
- Fully depress the accelerator pedal in order to open the throttle valve during the compression measurements.

> Note:
>
> Put the vehicle back in forced + after ignition feed as soon as the starter has stopped (in order to maintain the inhibition of the engine starting and to be able to measure the compression of the other cylinders).

> Note:
>
> It is necessary to wait for at least 10 secondsbefore starting the engine each time (the starter will not run due to its thermal protection).

- Measure the compression of the other cylinders.

3. FINAL OPERATION

Disconnect the petrol compression gauge.

Refit:

- the spark plugs (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view).

Refit the turbocharger air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view).

Remove the card from the reader to interrupt the + after ignition feed and wait for the loss of communication message to appear on the Diagnostic tool.

Note:

If the message does not appear, wait 9 minutes.

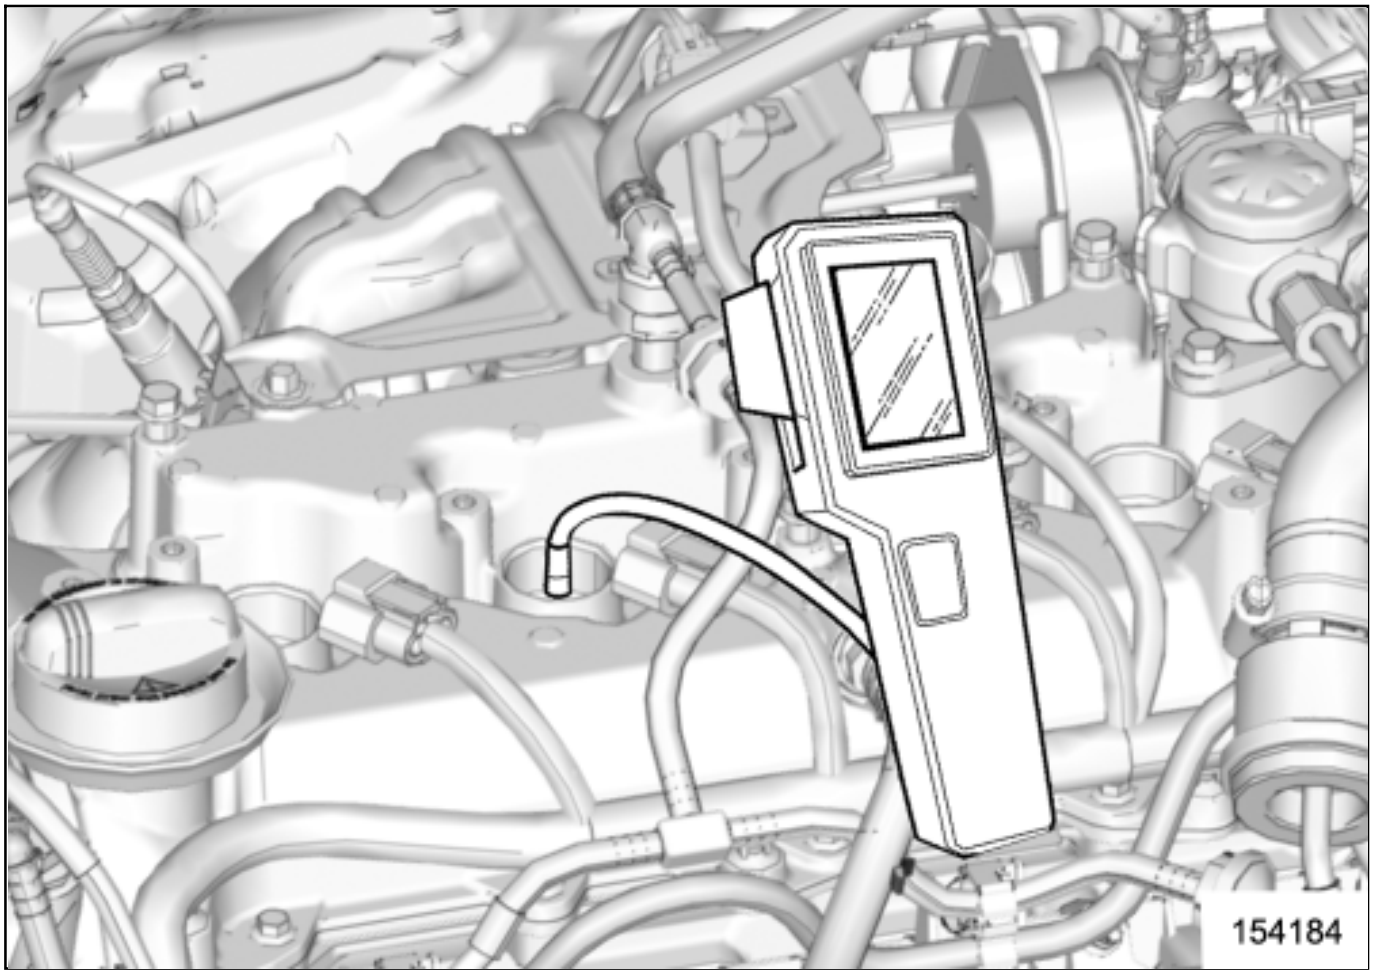
When the loss of communication message appears or after waiting 9 minutes, force the vehicle's + after ignition feed.

PRESSURE AT END OF COMPRESSION: CHECK

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
petrol compression gauge

WARNING



Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

CHECK

1. PREPARATION OPERATION FOR CHECK

- Remove the turbocharger air outlet pipe Air inlet assembly: Exploded view .

- Remove:
  - the coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
  - the spark plugs (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

Connect a petrol compression gauge.

Run command with Diagnostic tool:

- RZ003 : "ENGINE ADAPTIVES",
- VP036 : "FUEL SUPPLY INHIBITION".

Put the vehicle under starting conditions:

- gear lever in neutral position for a manual gearbox,
- "P" (park) position for an automatic gearbox,

brake pedal depressed.

2. TEST OPERATION

- Press the vehicle start button to trigger the engine starting phase.

> Note:
>
> The engine will be driven for 20 swithout starting.

- Check the compression of cylinder no. 1.

- Fully depress the accelerator pedal in order to open the throttle valve during the compression measurements.

> Note:
>
> Put the vehicle back in forced + after ignition feed as soon as the starter has stopped (in order to maintain the inhibition of the engine starting and to be able to measure the compression of the other cylinders).

> Note:
>
> It is necessary to wait for at least 10 secondsbefore starting the engine each time (the starter will not run due to its thermal protection).

- Measure the compression of the other cylinders.

3. FINAL OPERATION

-

Disconnect the petrol compression gauge.

Refit:

- the spark plugs (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view).

Refit the turbocharger air outlet pipe Air inlet assembly: Exploded view.

Remove the card from the reader to interrupt the + after ignition feed and wait for the loss of communication message to appear on the Diagnostic tool.

Note:

If the message does not appear, wait 9 minutes.

When the loss of communication message appears or after waiting 9 minutes, force the vehicle's + after ignition feed.

PRESSURE SENSOR: REMOVAL - REFITTING

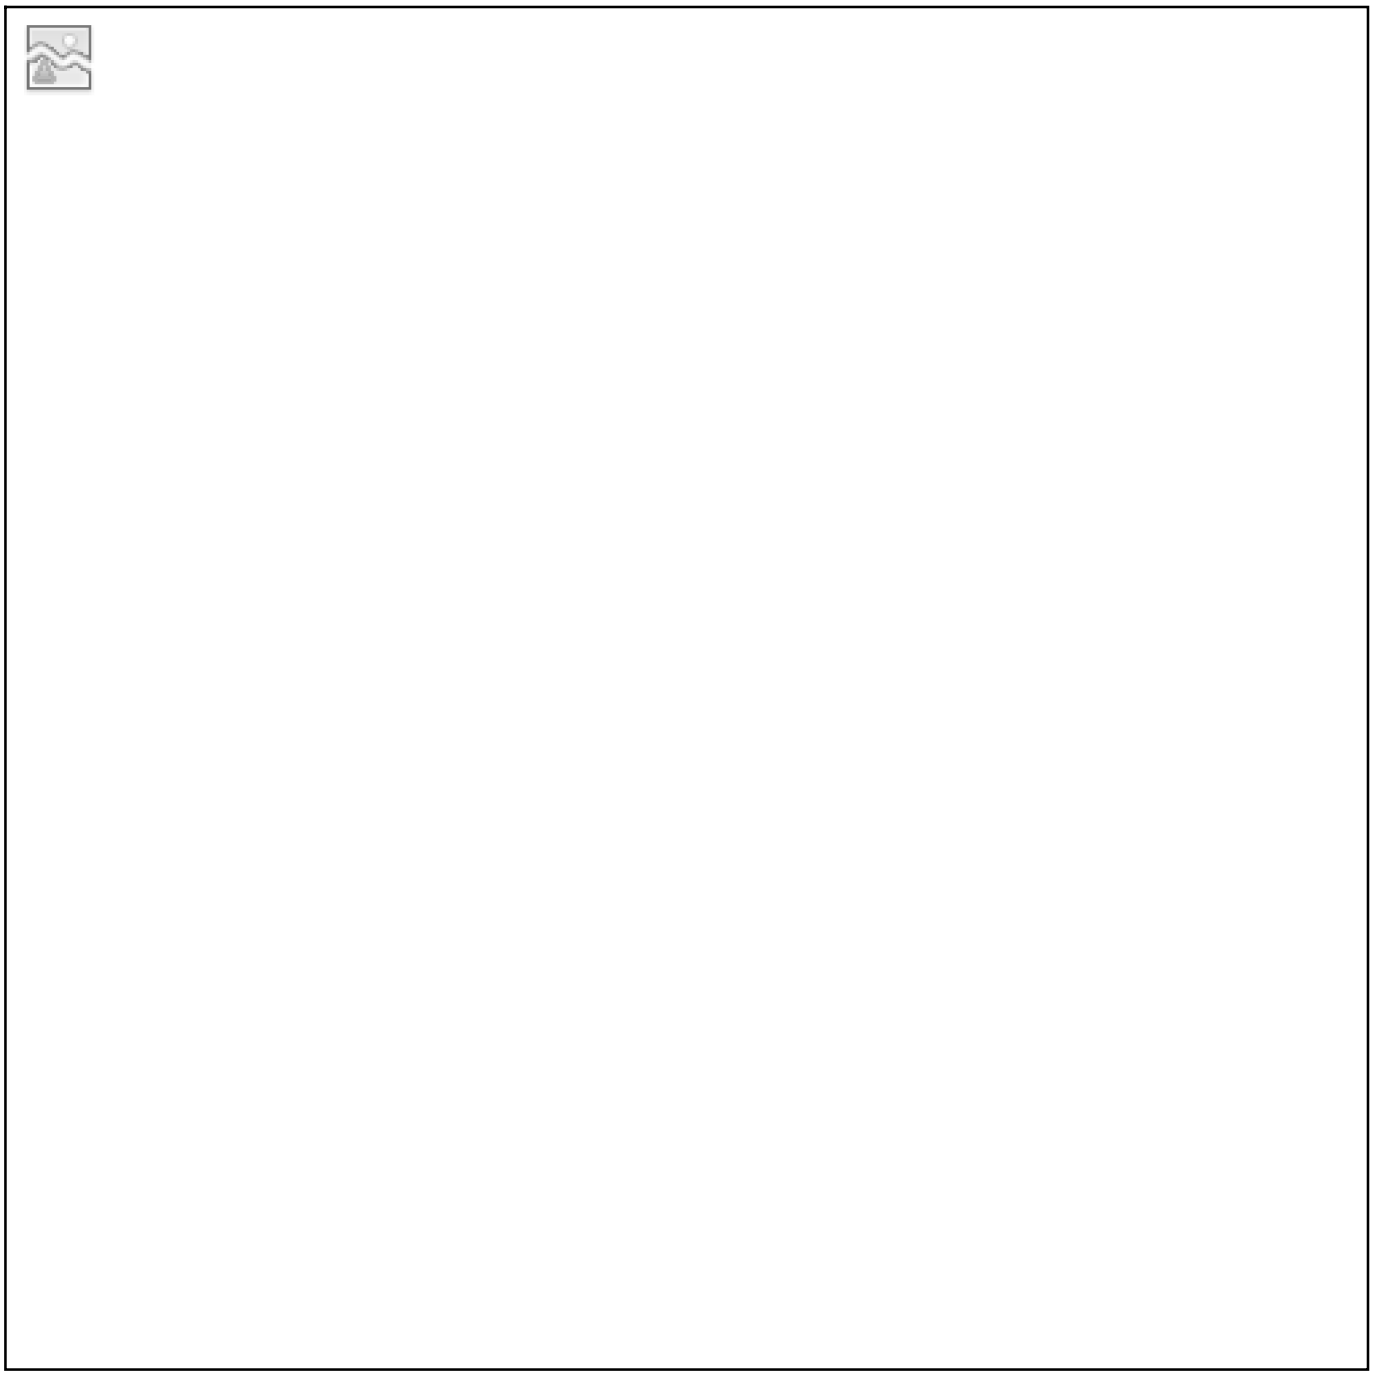
Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

parts always to be replaced:
Pressure sensor

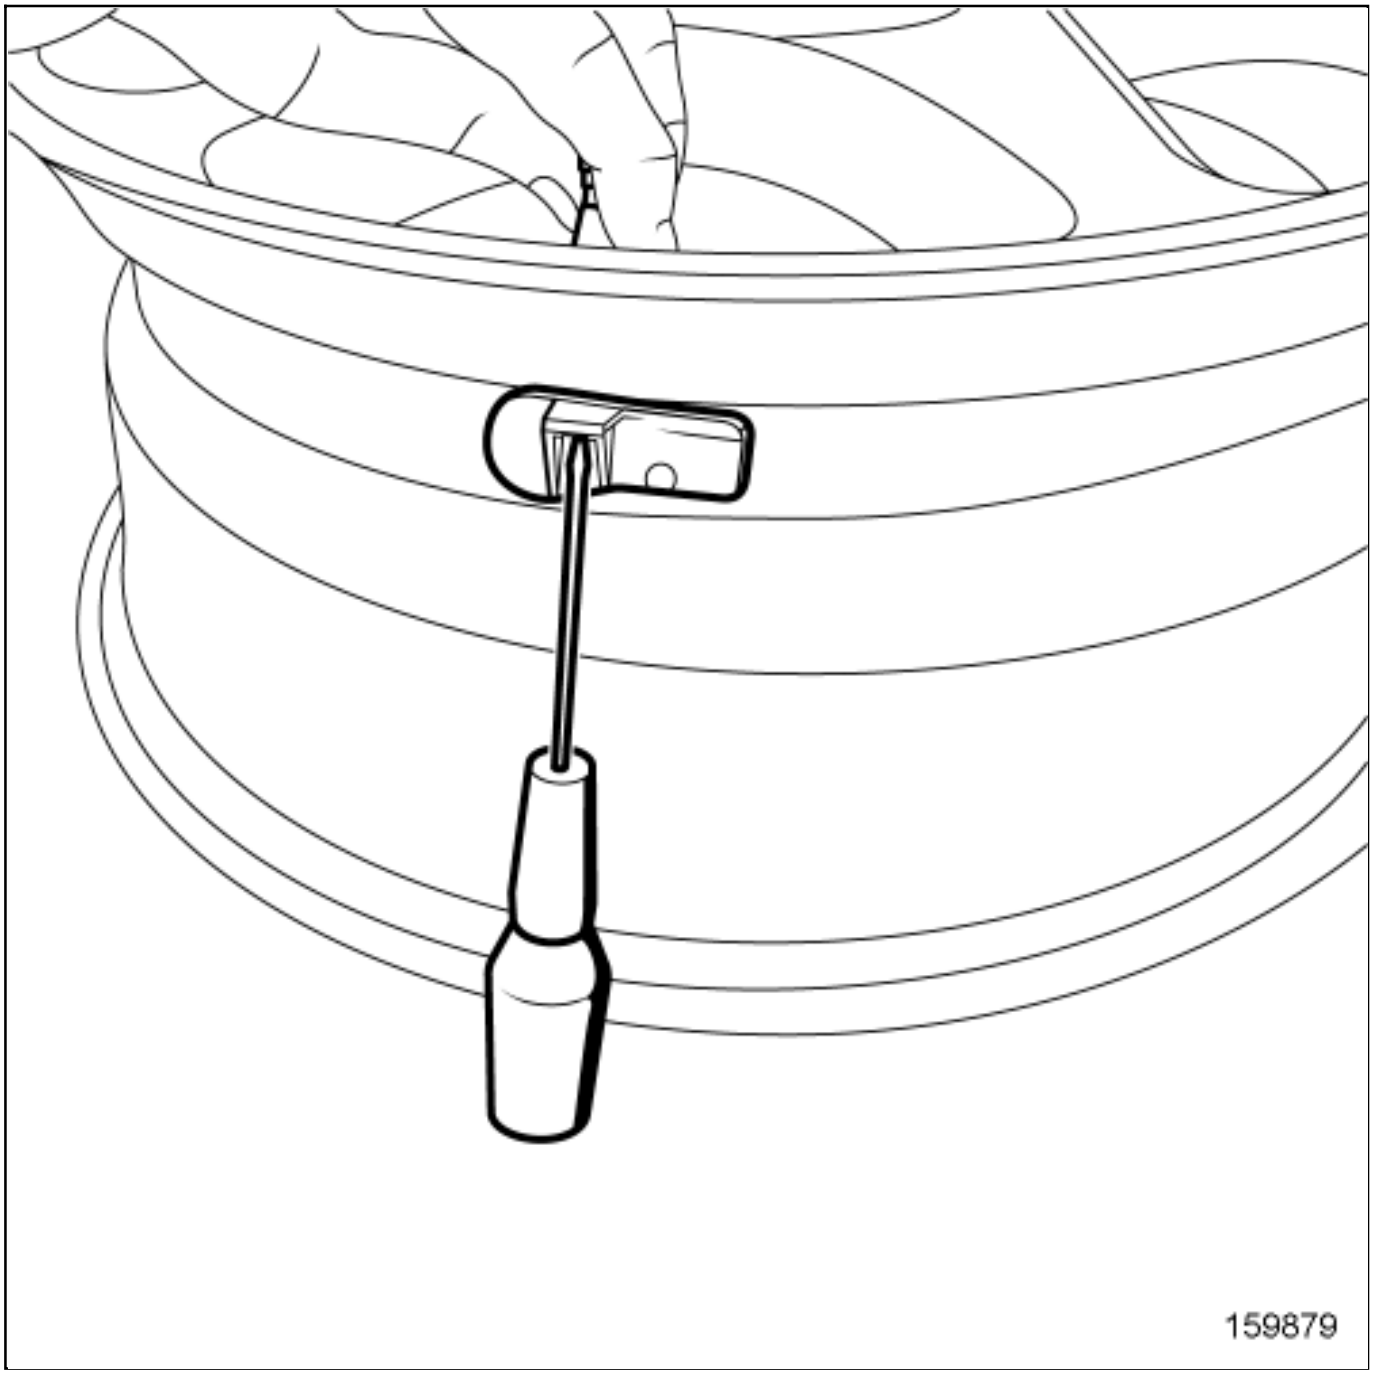
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair(see **Tyre pressure monitor: Precautions for the repair**) .



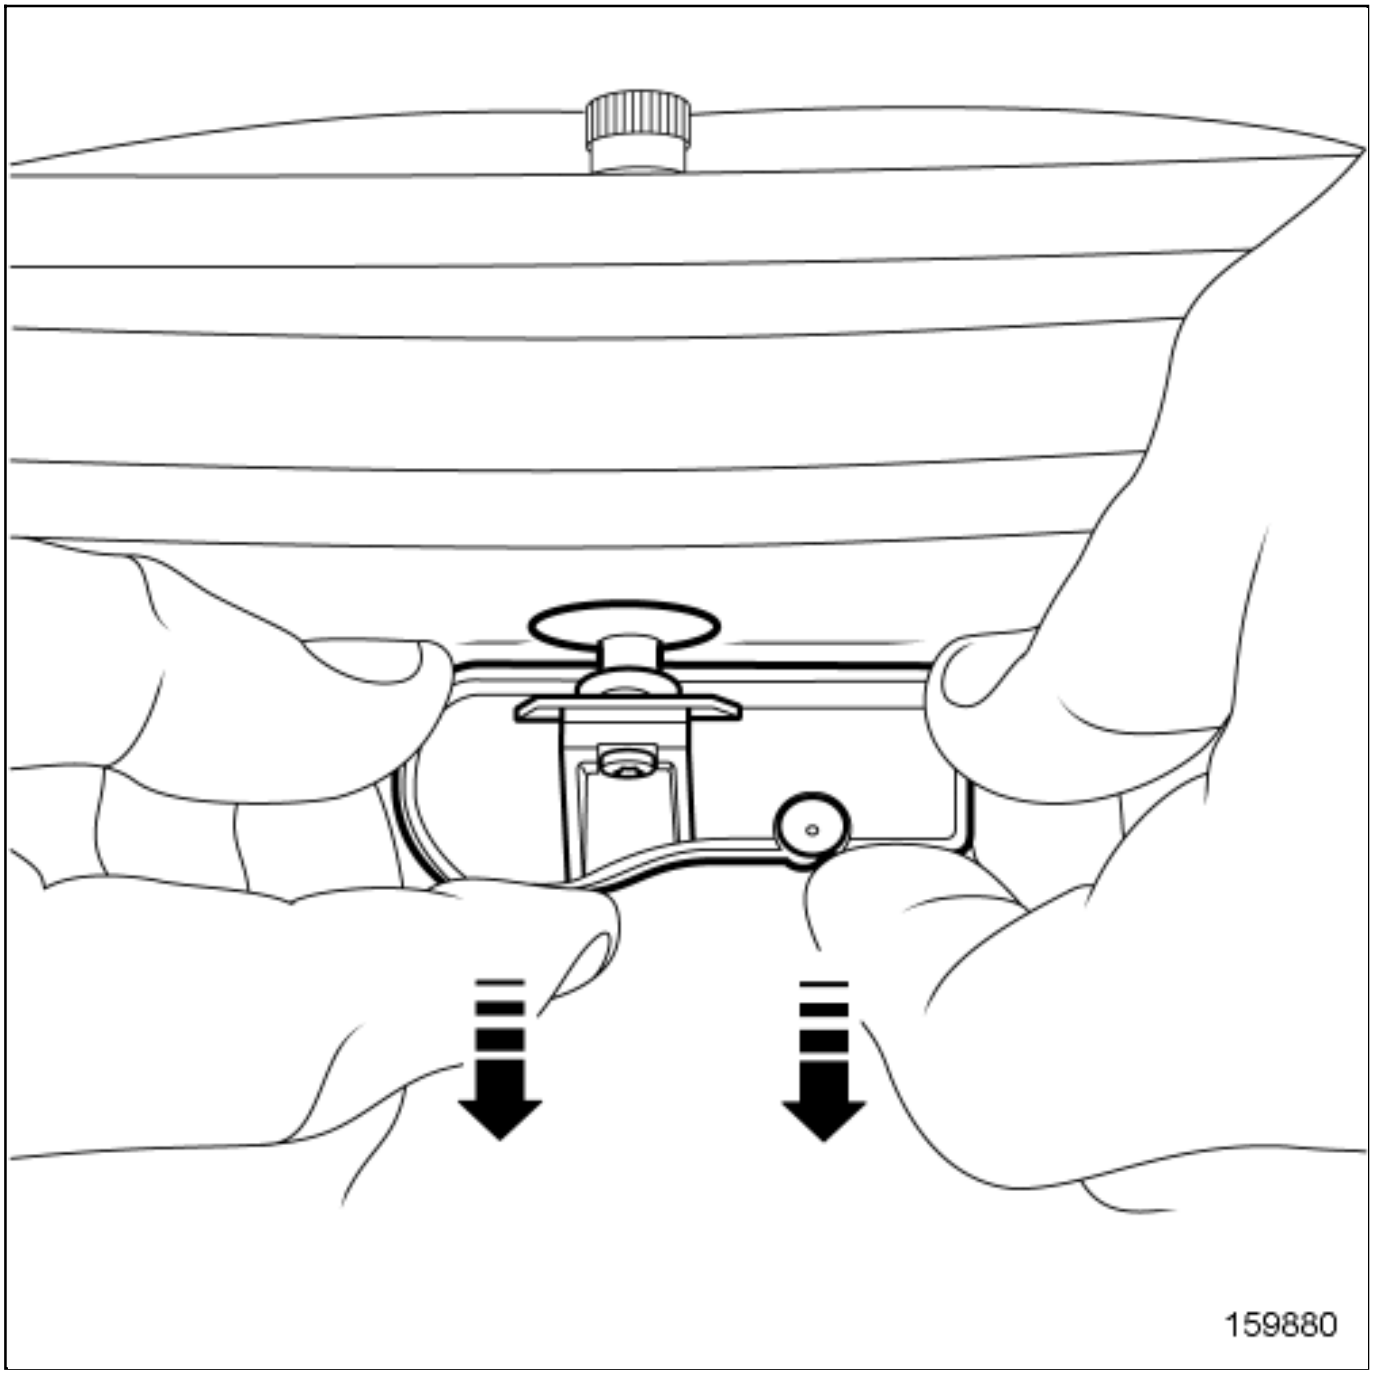
No.	Description
1	pressure sensor
2	pressure sensor bolt
3	valve
4	type valve cap

REMOVAL



1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift **Vehicle: Towing and lifting** .
- Remove:
  - the wheels **Wheel: Removal - Refitting** ,
  - the tyres **Tyres: Removal - Refitting** .



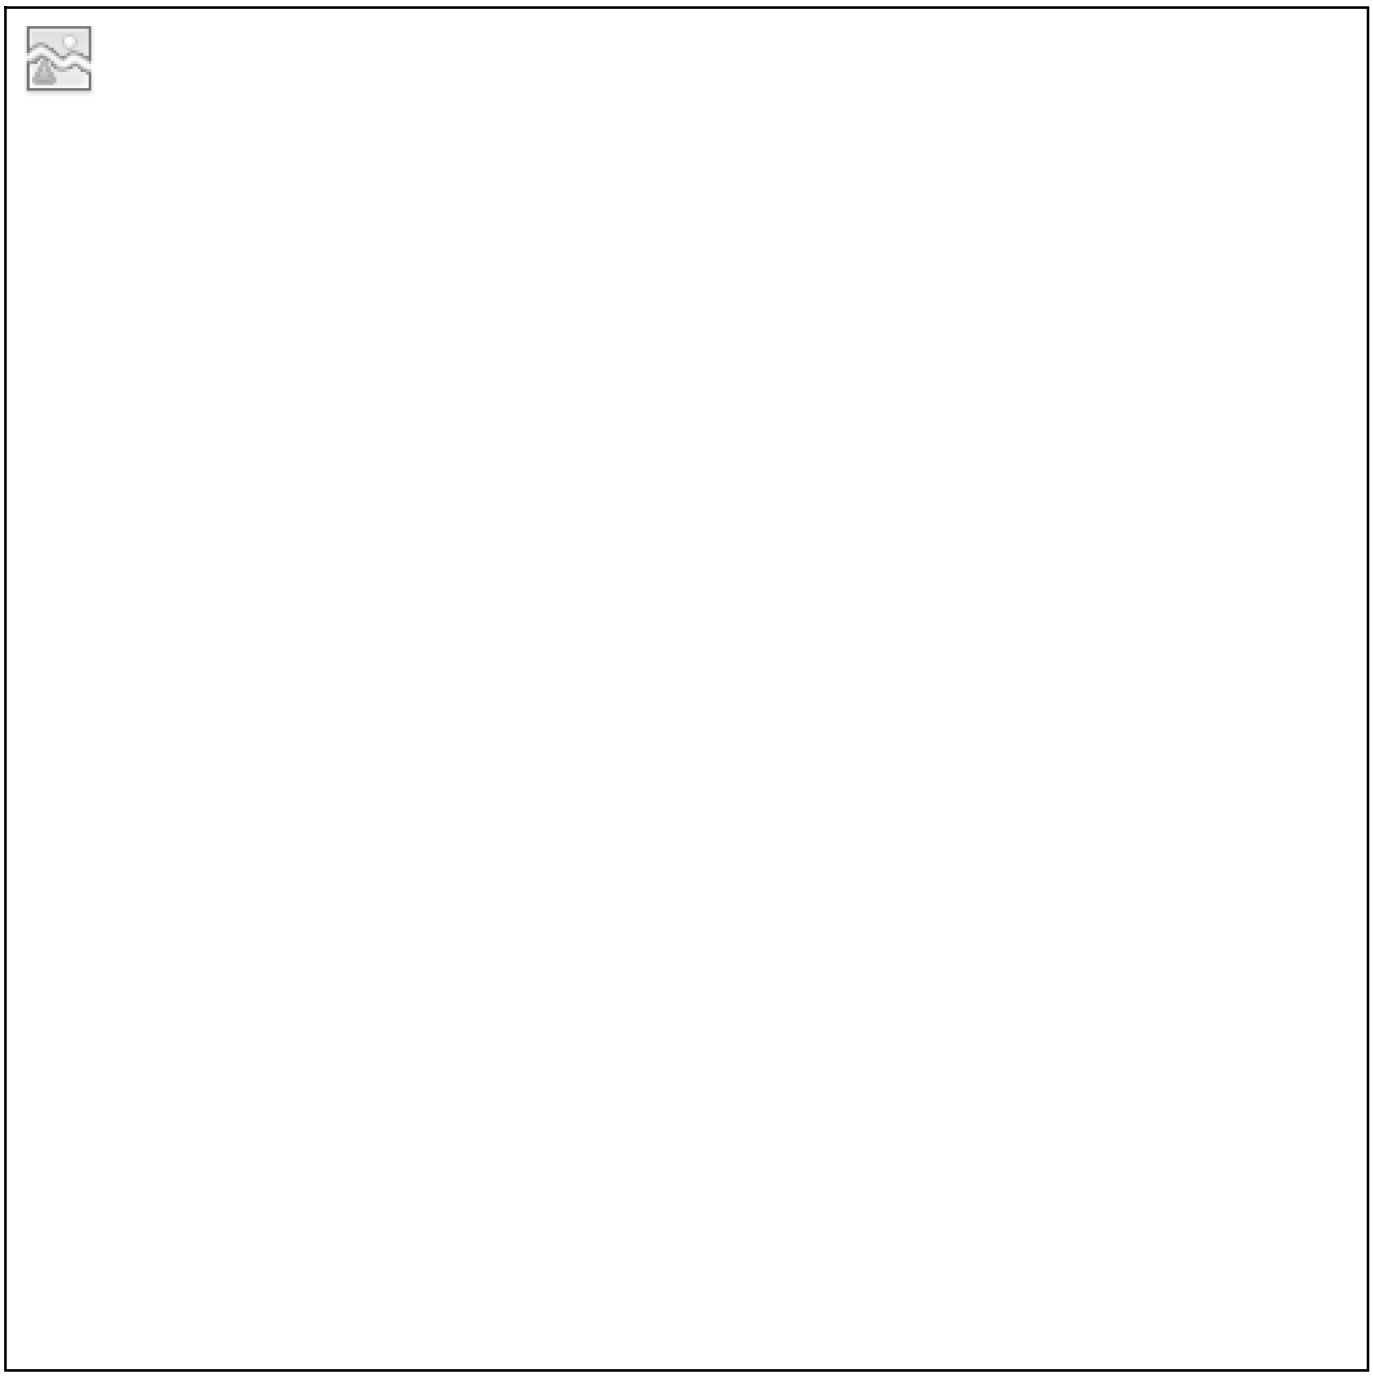
2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the type valve cap(5) whilst holding the pressure sensor on the wheel rim.

Remove the pressure sensor mounting bolt using a screwdriver as shown in the picture.

Carefully remove by pulling the pressure sensor as shown in the picture.

Remove the valve.



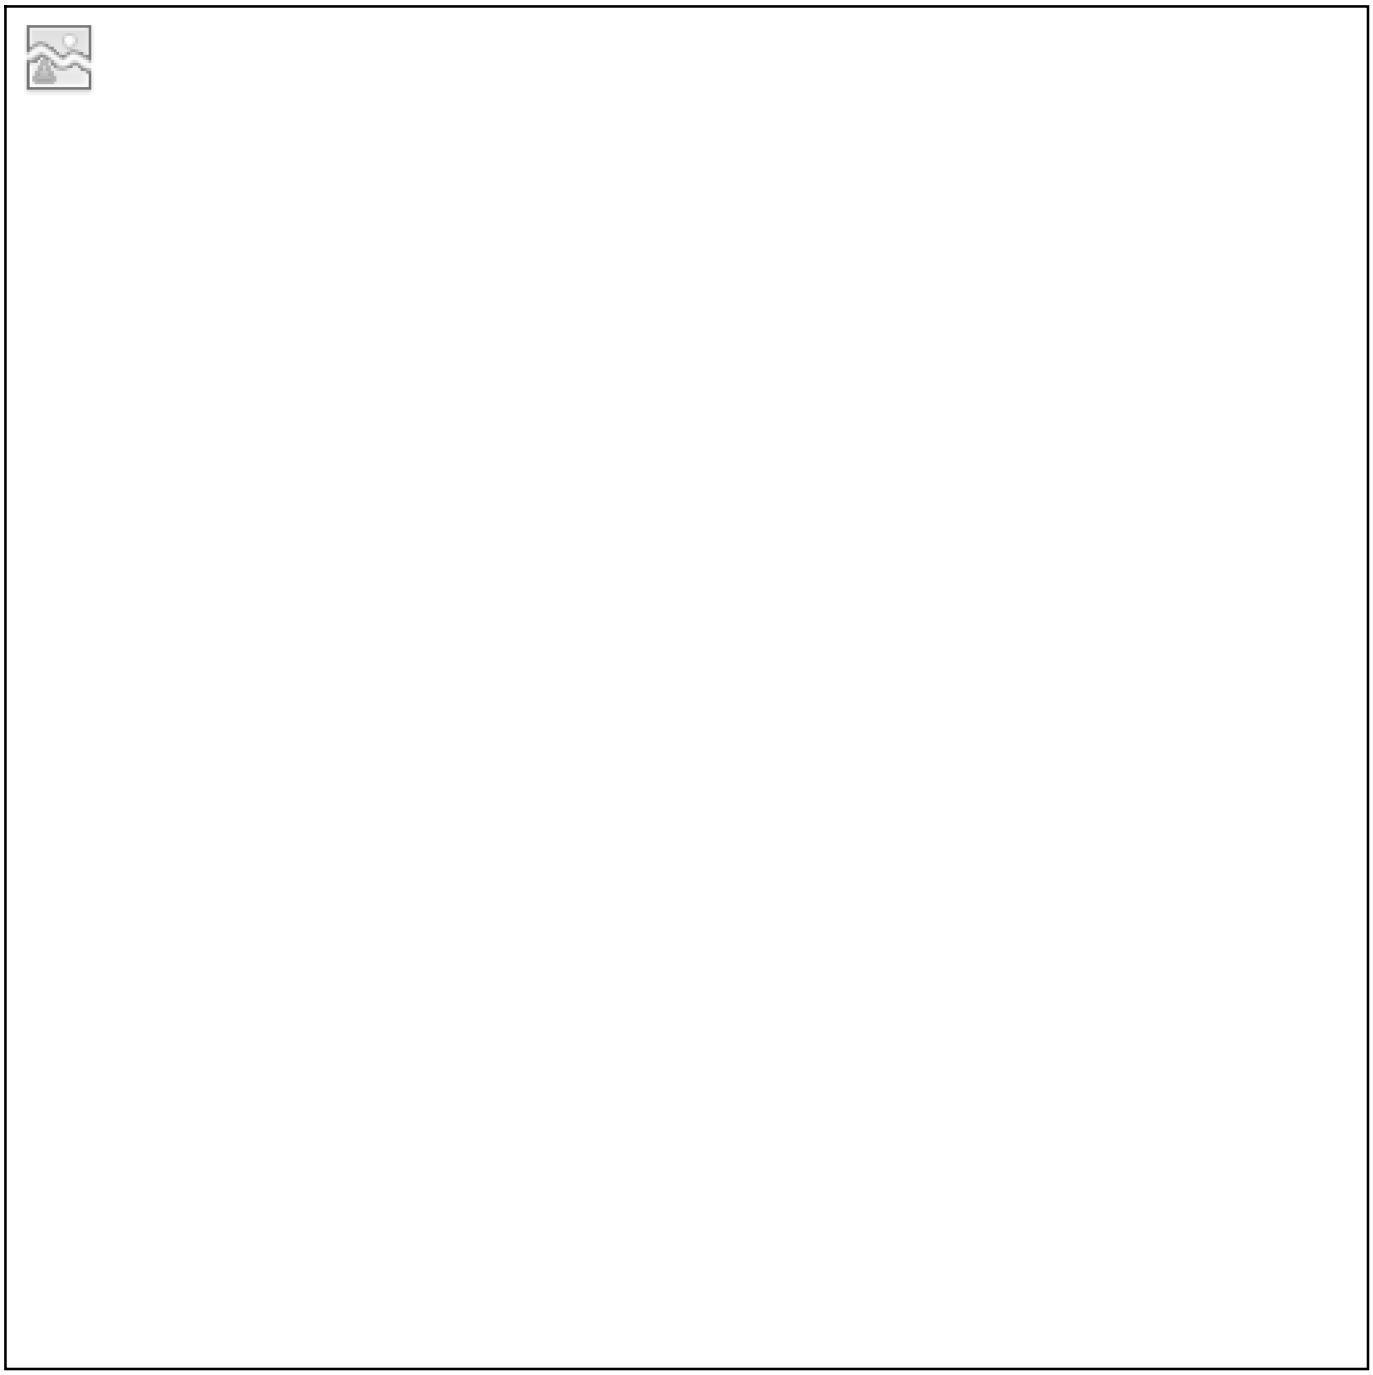
REFITTING

1. REFITTING PREPARATION OPERATION

Note: Always replace the pressure sensor bolt.

1- WHEN REPLACING THE VALVE ONLY

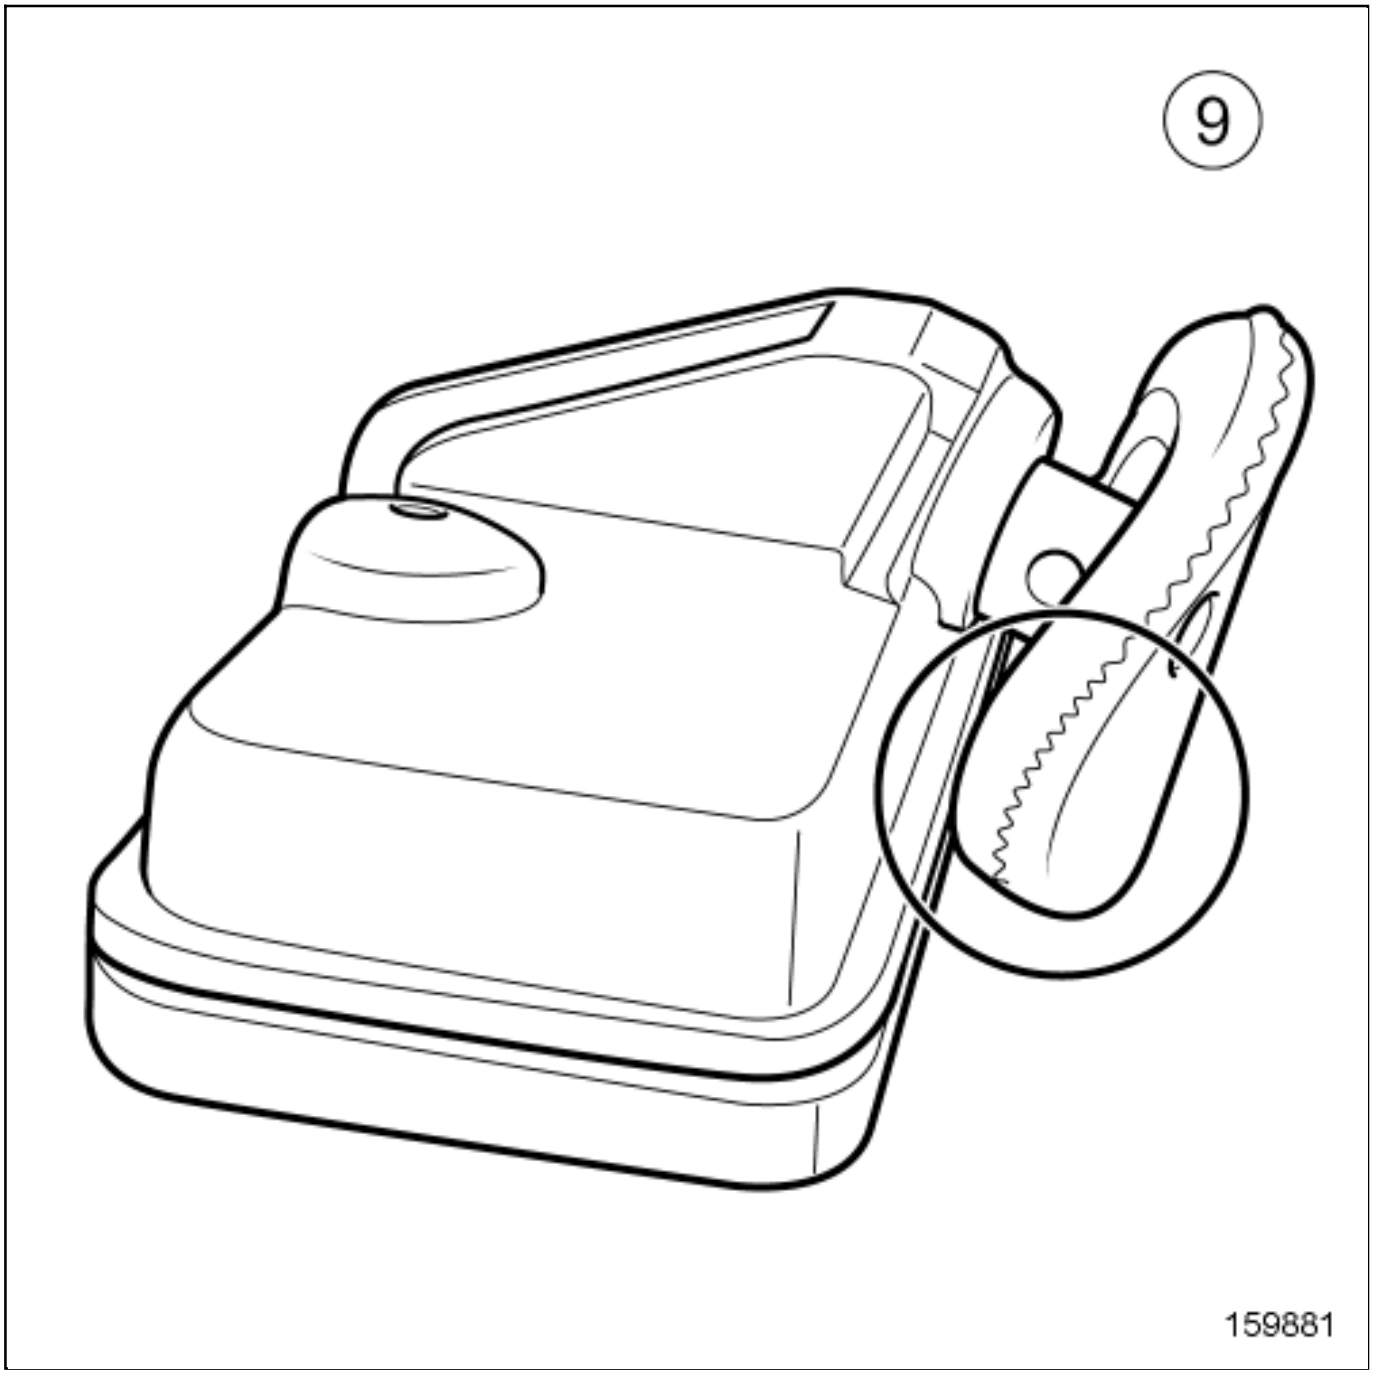
Note: Always replace the pressure sensor valve.



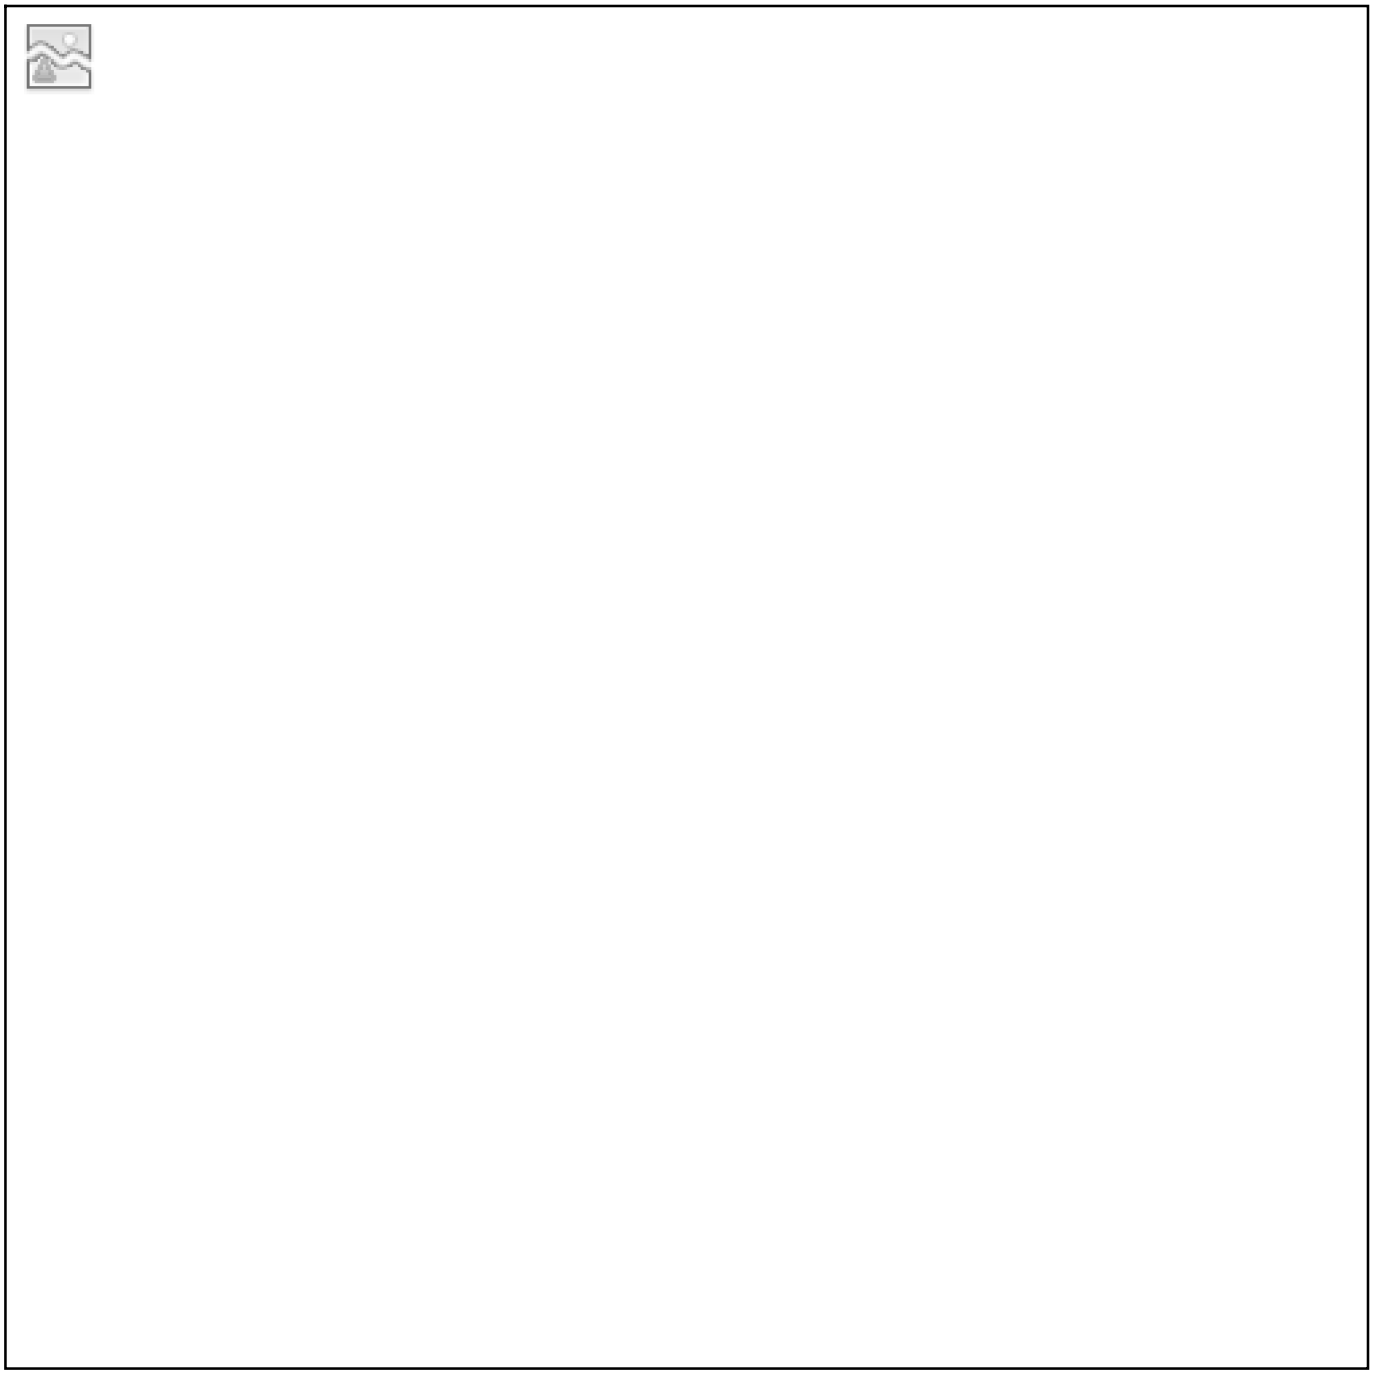
Remove the valve(6) from the pressure sensor according to the order of the arrows.

2- WHEN REPLACING THE PRESSURE SENSOR

parts always to be replaced: Pressure sensor .



2. REFITTING OPERATION FOR PART CONCERNED



1- REFITTING THE PRESSURE SENSOR

Refit:

- the valve on the pressure sensor, ensuring that the bevel of the valve is facing towards the bottom of the wheel,
- the pressure sensor on the wheel rim(**9**) .

9
159881

Make sure that the sensor is correctly positioned on the wheel rim:

- incorrectly fitted(7) ,
- correctly fitted(8) .

Check that the cup is completely pressed around the wheel hole.

Pretighten the nut of the pressure sensor while keeping the sensor in contact on the bottom of the wheel rim.

Torque tighten the pressure sensor bolt1.4 N.m .

3. FINAL OPERATION

Proceed in the reverse order to removal

1- SPECIAL NOTES ON THE FIRST FITTING

Note:

If replacing the pressure sensor, carry out the necessary operations using the Diagnostic tool .

Apply the after repair procedure using the Diagnostic tool:

- connect Diagnostic tool,
- select "UCH" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Tyre pressure monitor valve" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

XSL version : 3.02 du 22/07/11

XSL version : 3.02 du 22/07/11

PRODUCTS AND EQUIPMENT FOR BOLTED ASSEMBLY

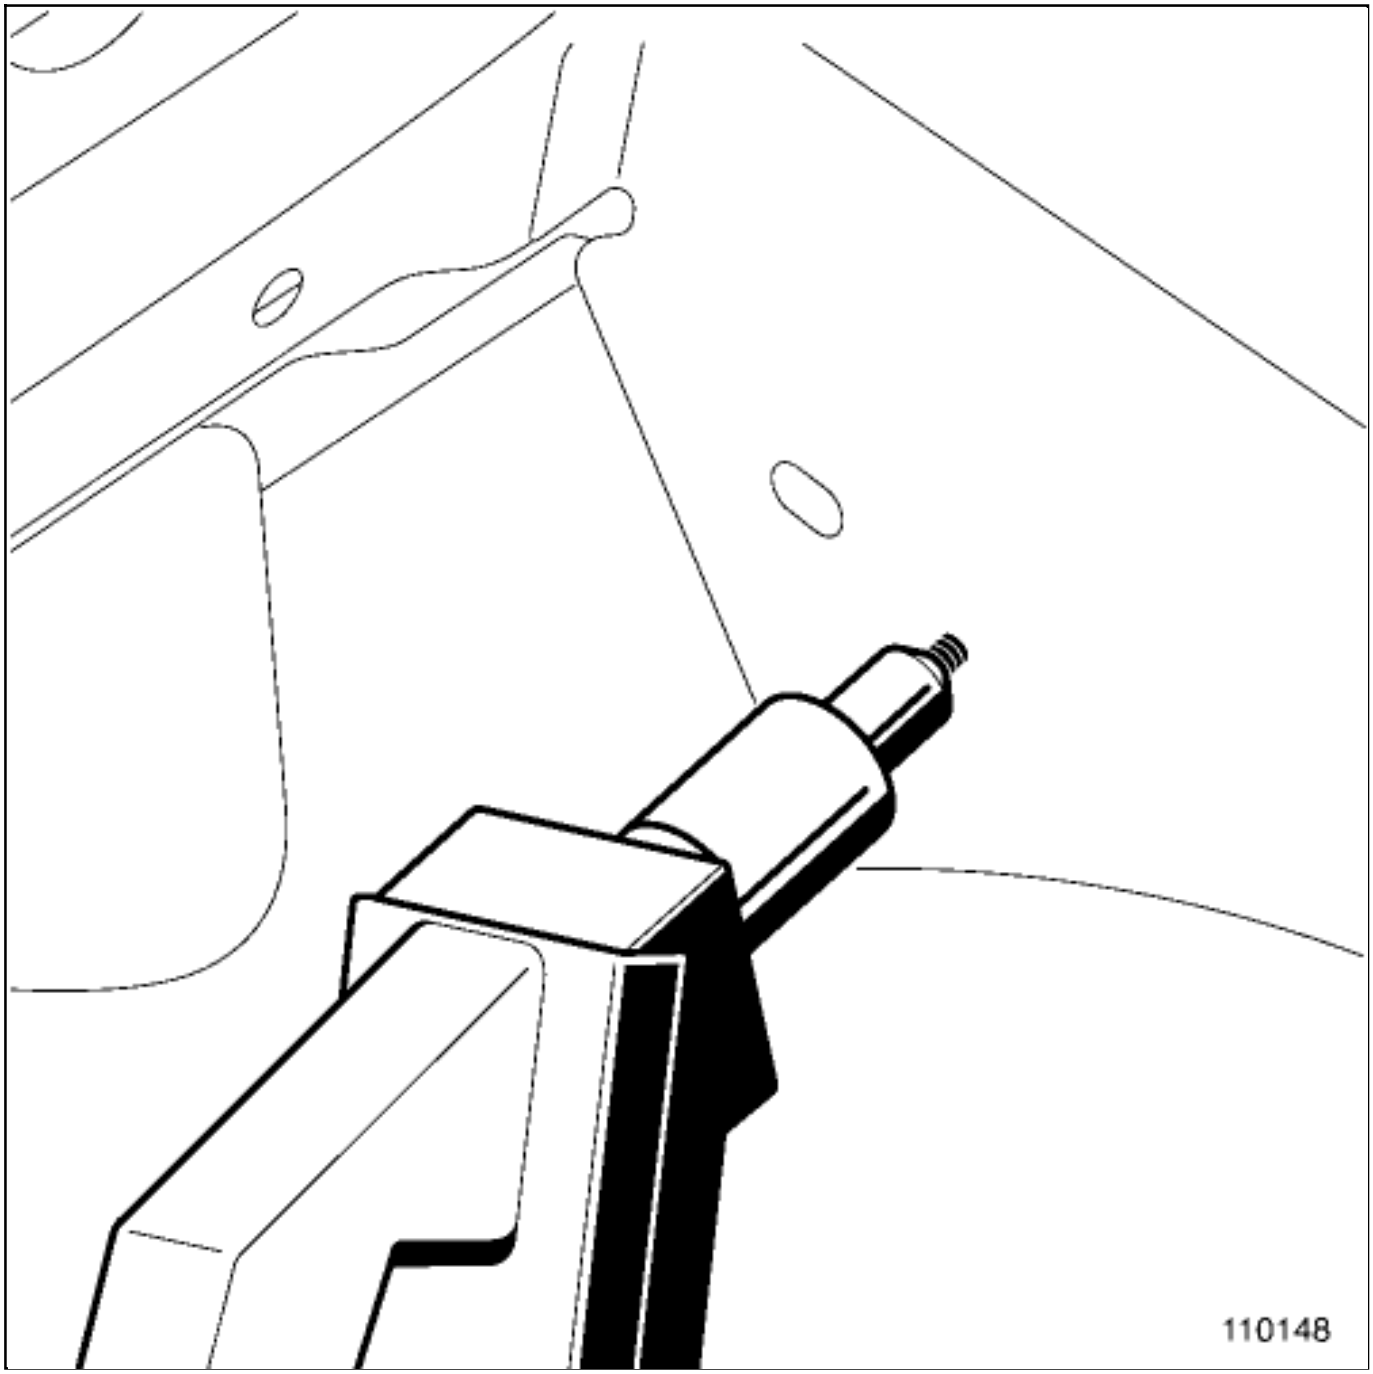
1. NUTS AND STUDS TO BE CRIMPED

Use when a thread on a bodywork component is damaged or when fitted on a new part.

Advantages:

- Fitting before or after painting.

Disadvantages:



- The support has to be drilled.
- For nuts, M10 thread maximum.

Operator protection:

- obligatory hand protection,
- obligatory eye protection.

2. NUTS AND STUDS TO BE WELDED

Use for welding studs on new components or the vehicle structure.

Advantages:

- Allows fitting on all steel panel supports.

Disadvantages:

- The support has to be stripped.

Operation to be carried out before painting.

Operator protection:

- obligatory hand protection,
- obligatory eye protection.

3. STUDS FOR RIVETING

Use when a thread on a bodywork component is damaged or when fitted on a new part.

Advantages:

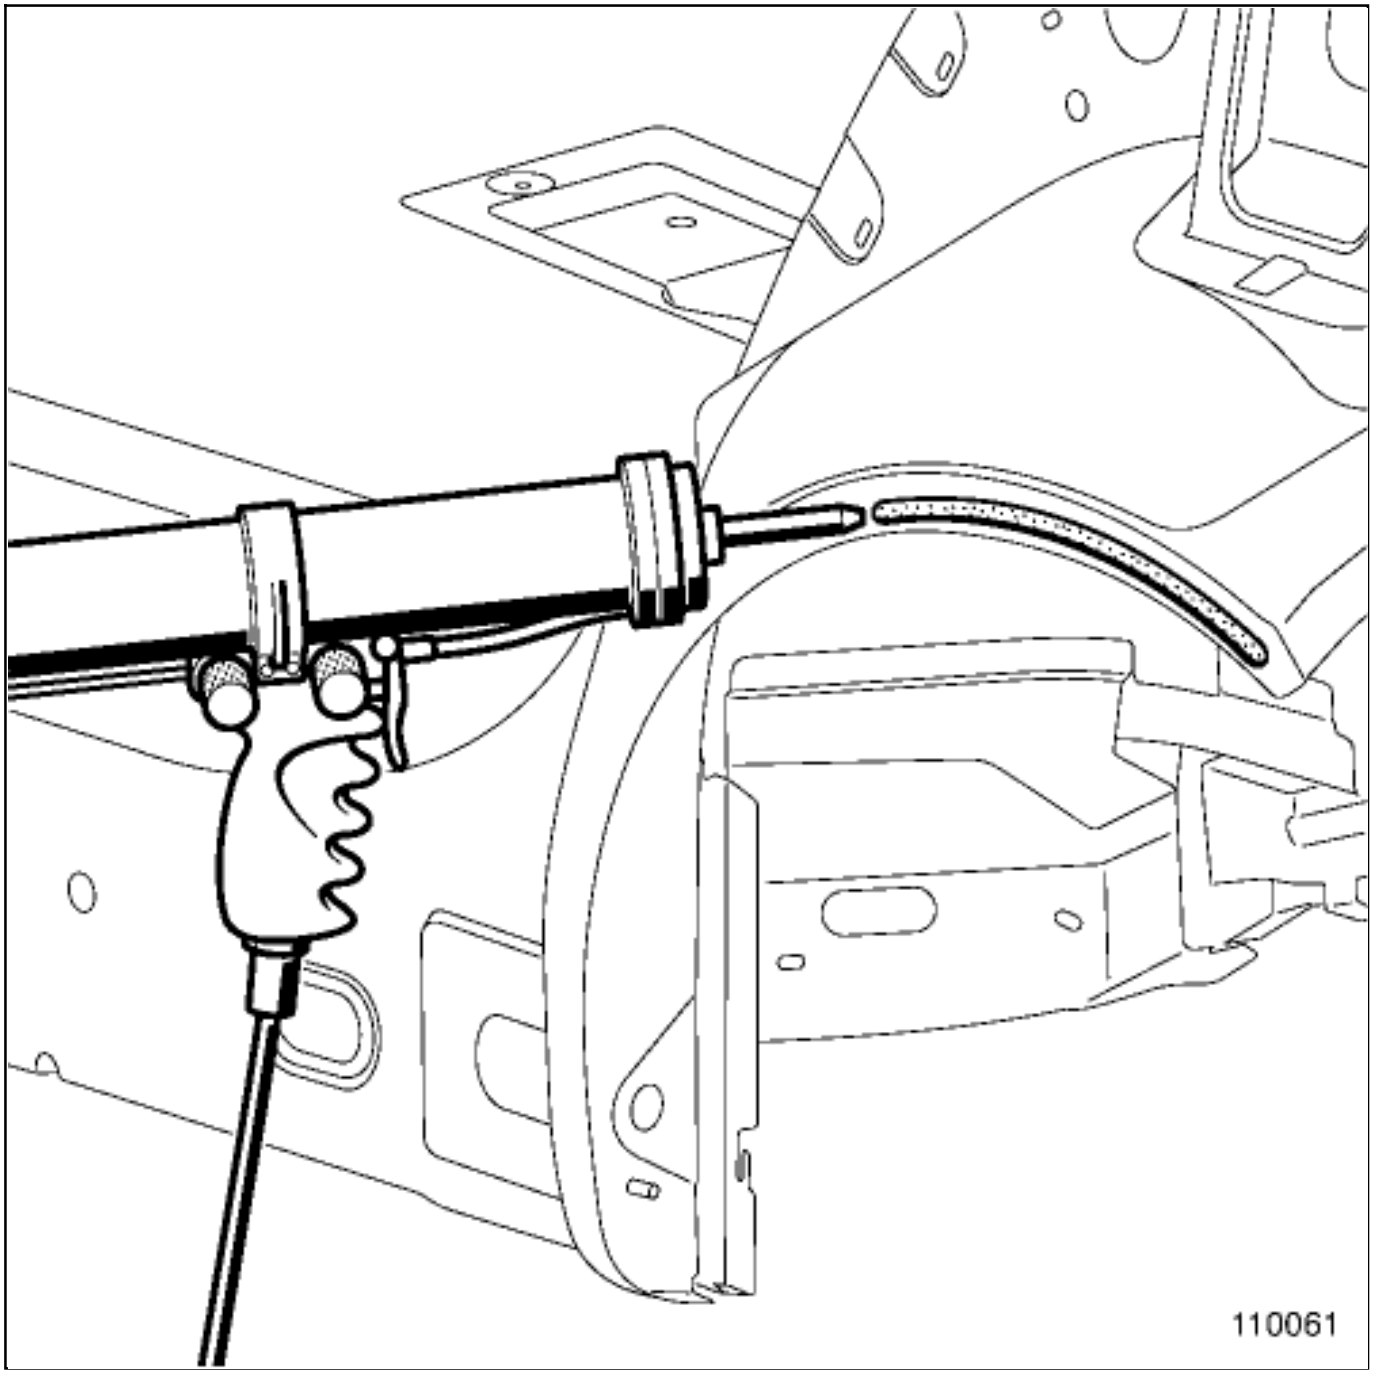
- Fitting before or after painting.

Disadvantages:

- The support has to be drilled.
- Only for non-coated threads.

Operator protection:

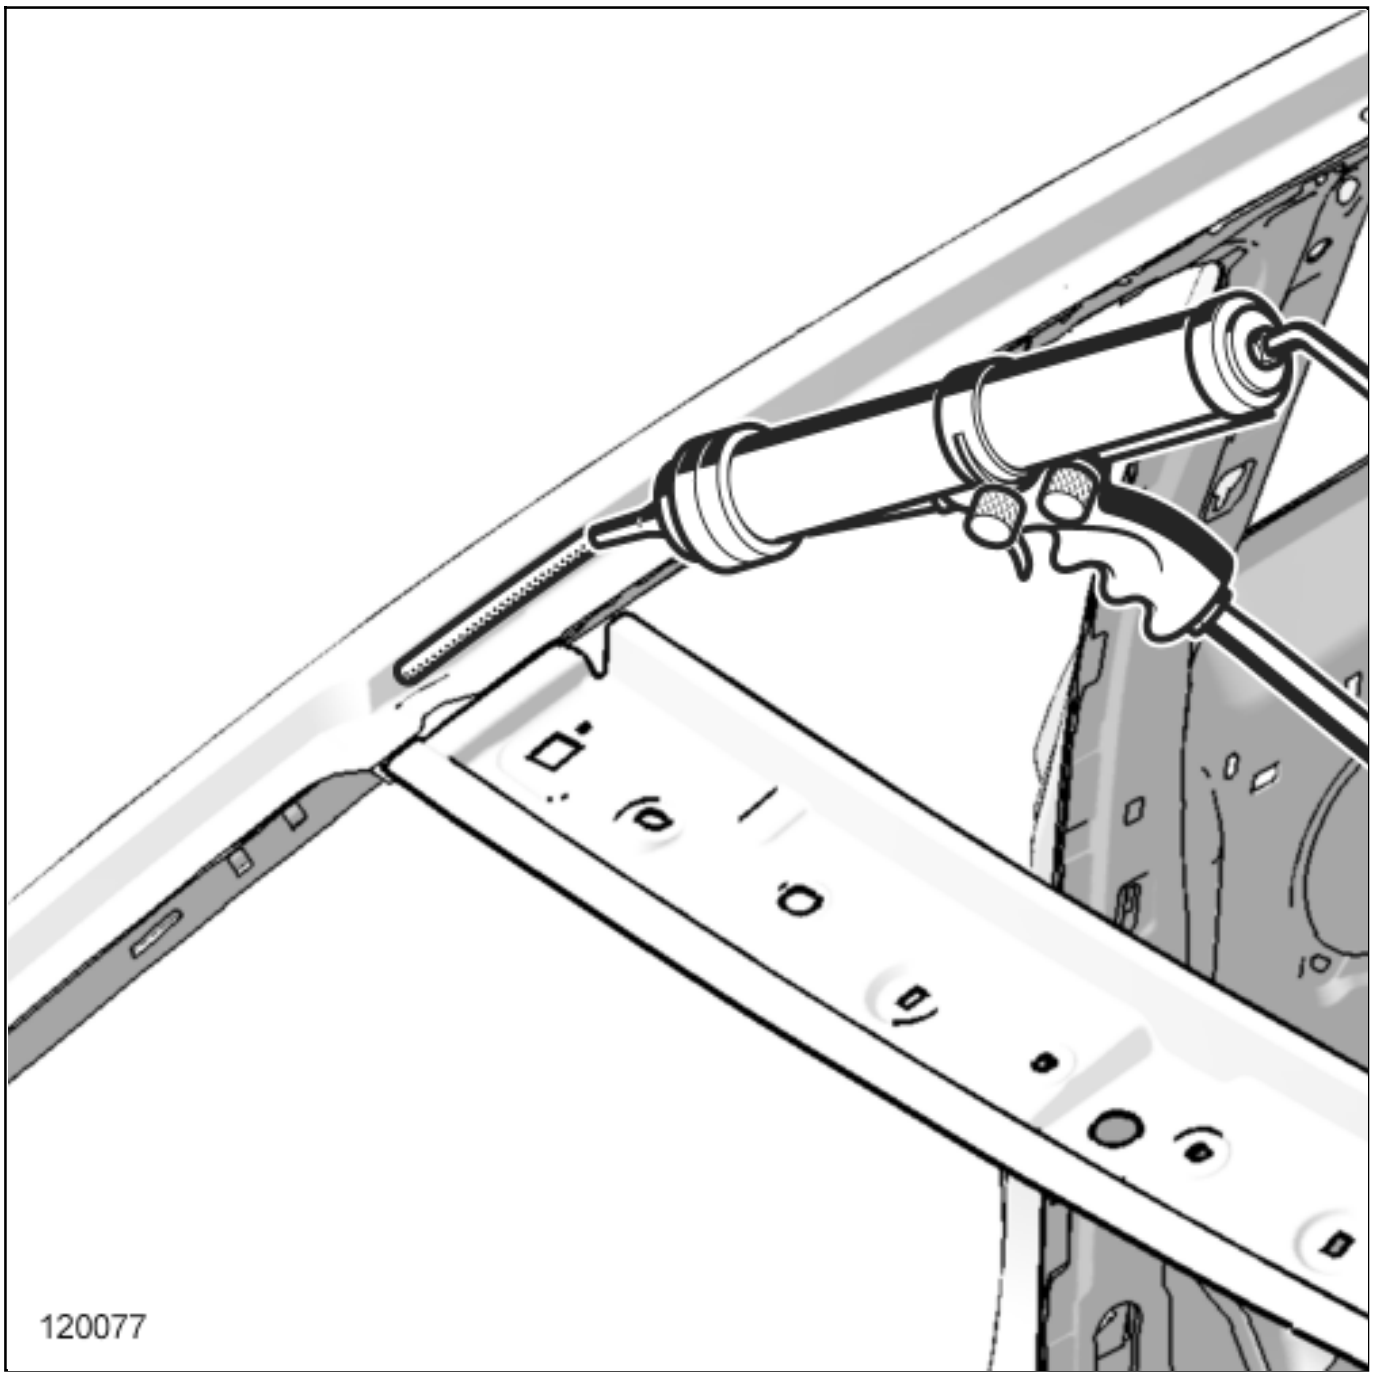
- obligatory hand protection,
- obligatory eye protection.



PRODUCTS AND EQUIPMENT FOR BONDED ASSEMBLY

1. RIGID GLUING

1- STANDARD RIGID ADHESIVE



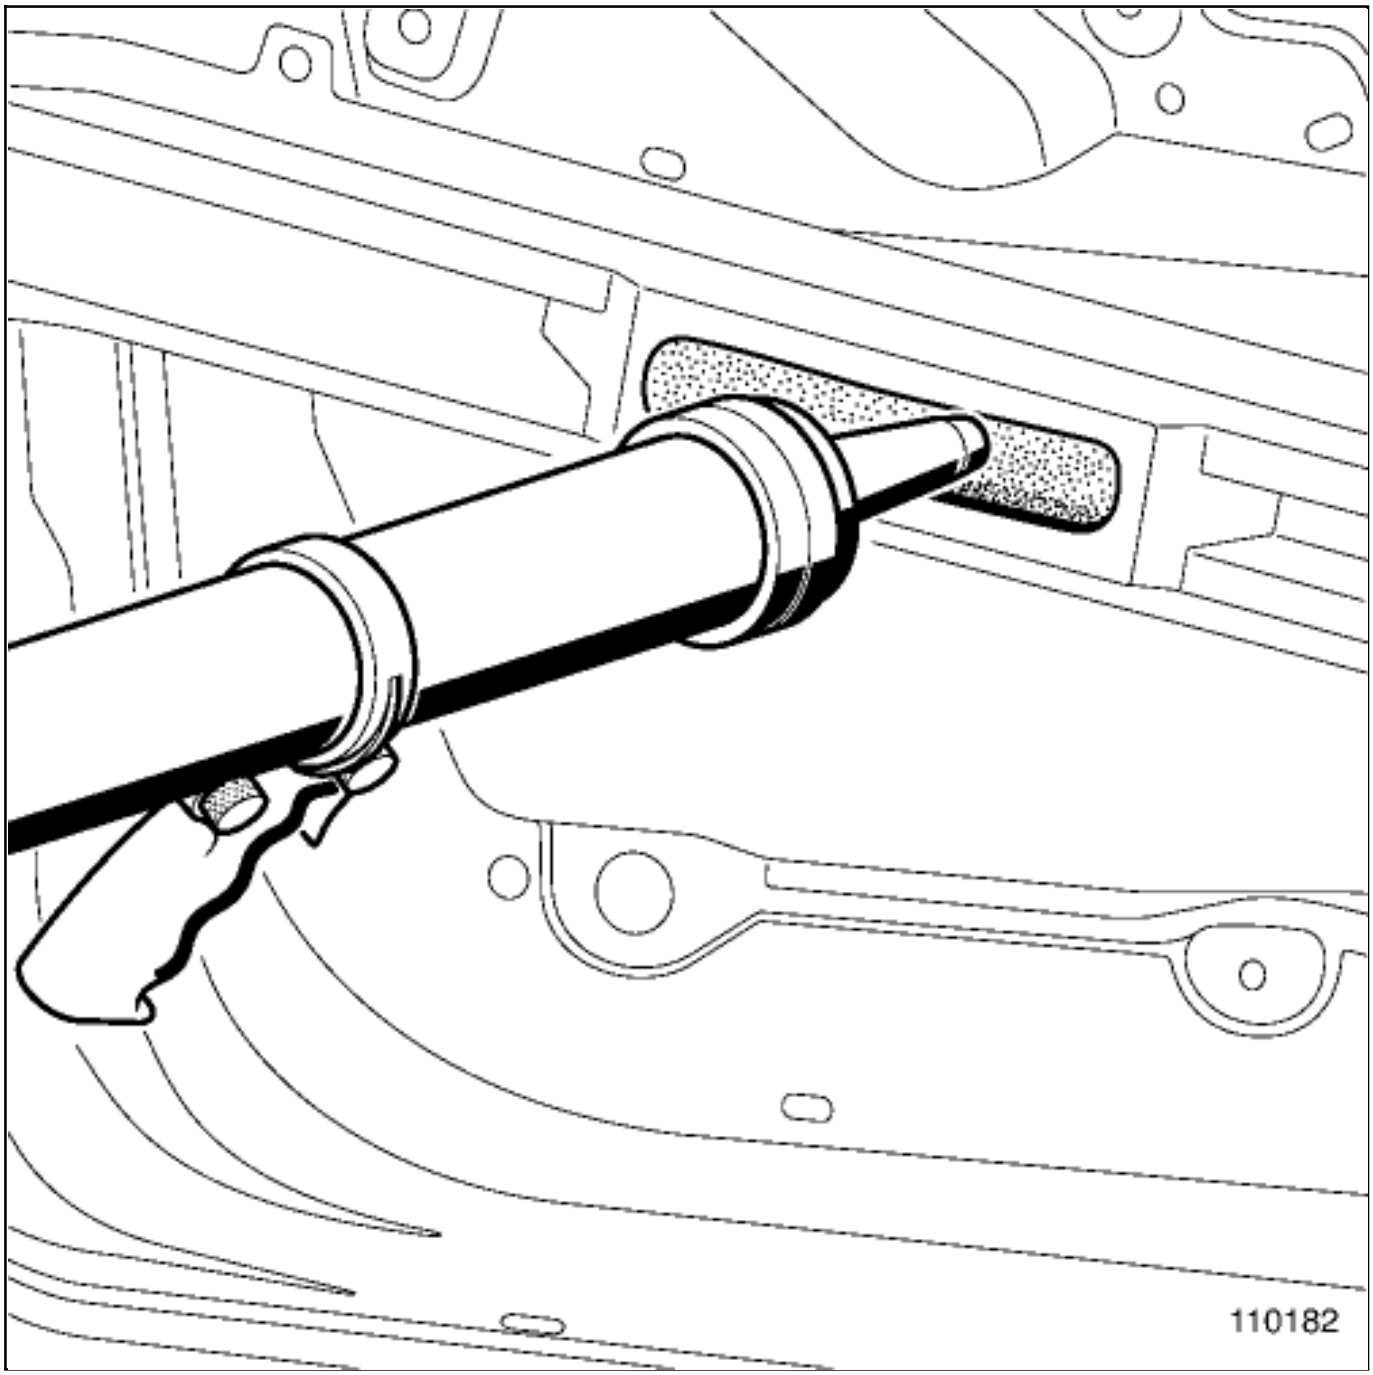
Used to bond components to the structure.

Use also for crimping a door panel or wing.

2- HIGH PERFORMANCE RIGID ADHESIVE

Used for bonding a roof in place of the laser weld.

Advantages:



- Rigid assembly and good sealing.
- Rapid drying.
- Can be applied on an untreated sheet.

Disadvantage:

- The mating surface must be clean, or it will become unstuck in time.

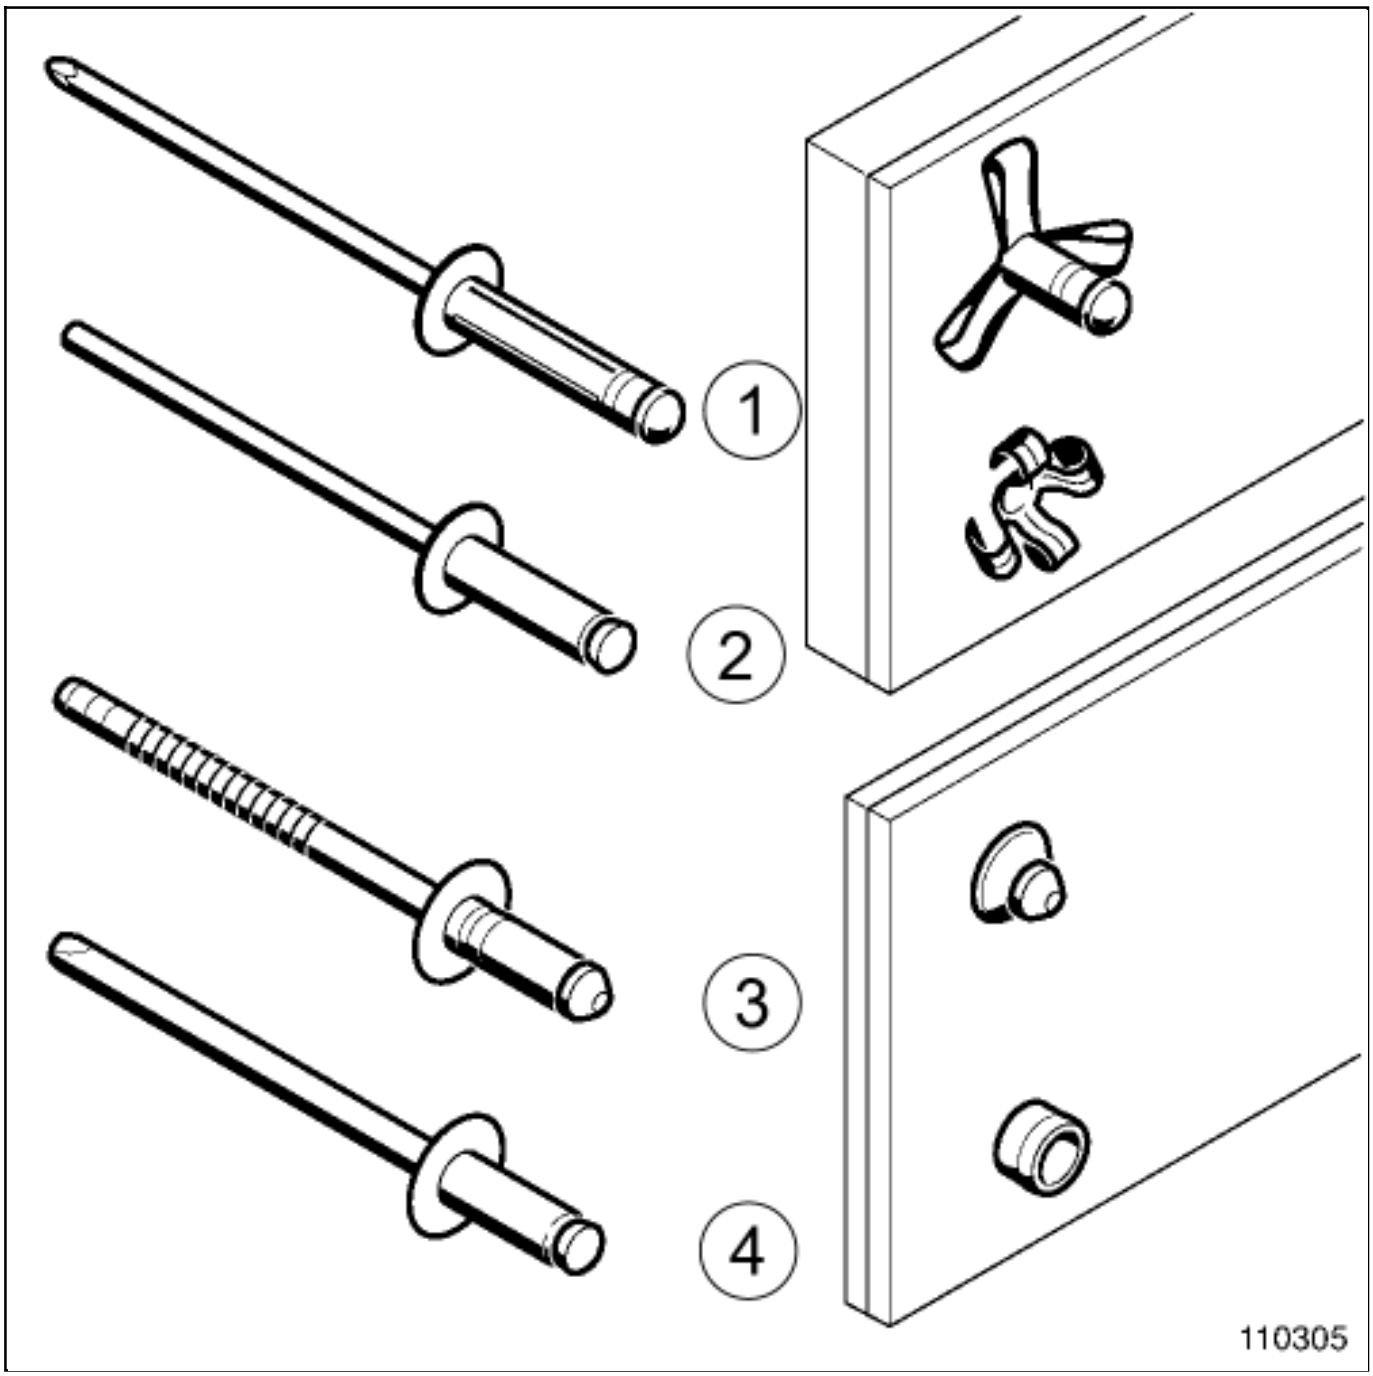
2. FLEXIBLE ADHESIVE

Use for positioning a part in place in relation to the structure, the adhesive serves as a shock absorber.

Advantages:

- Flexible assembly and good sealing.
- Rapid drying.

Disadvantage:



- The mating surface must be prepared, or it will become unstuck in time.

PRODUCTS AND EQUIPMENT FOR RIVETED ASSEMBLY

1. VARIOUS RIVETS USED FOR REPAIRS

1- CHOICE OF TYPE OF RIVET

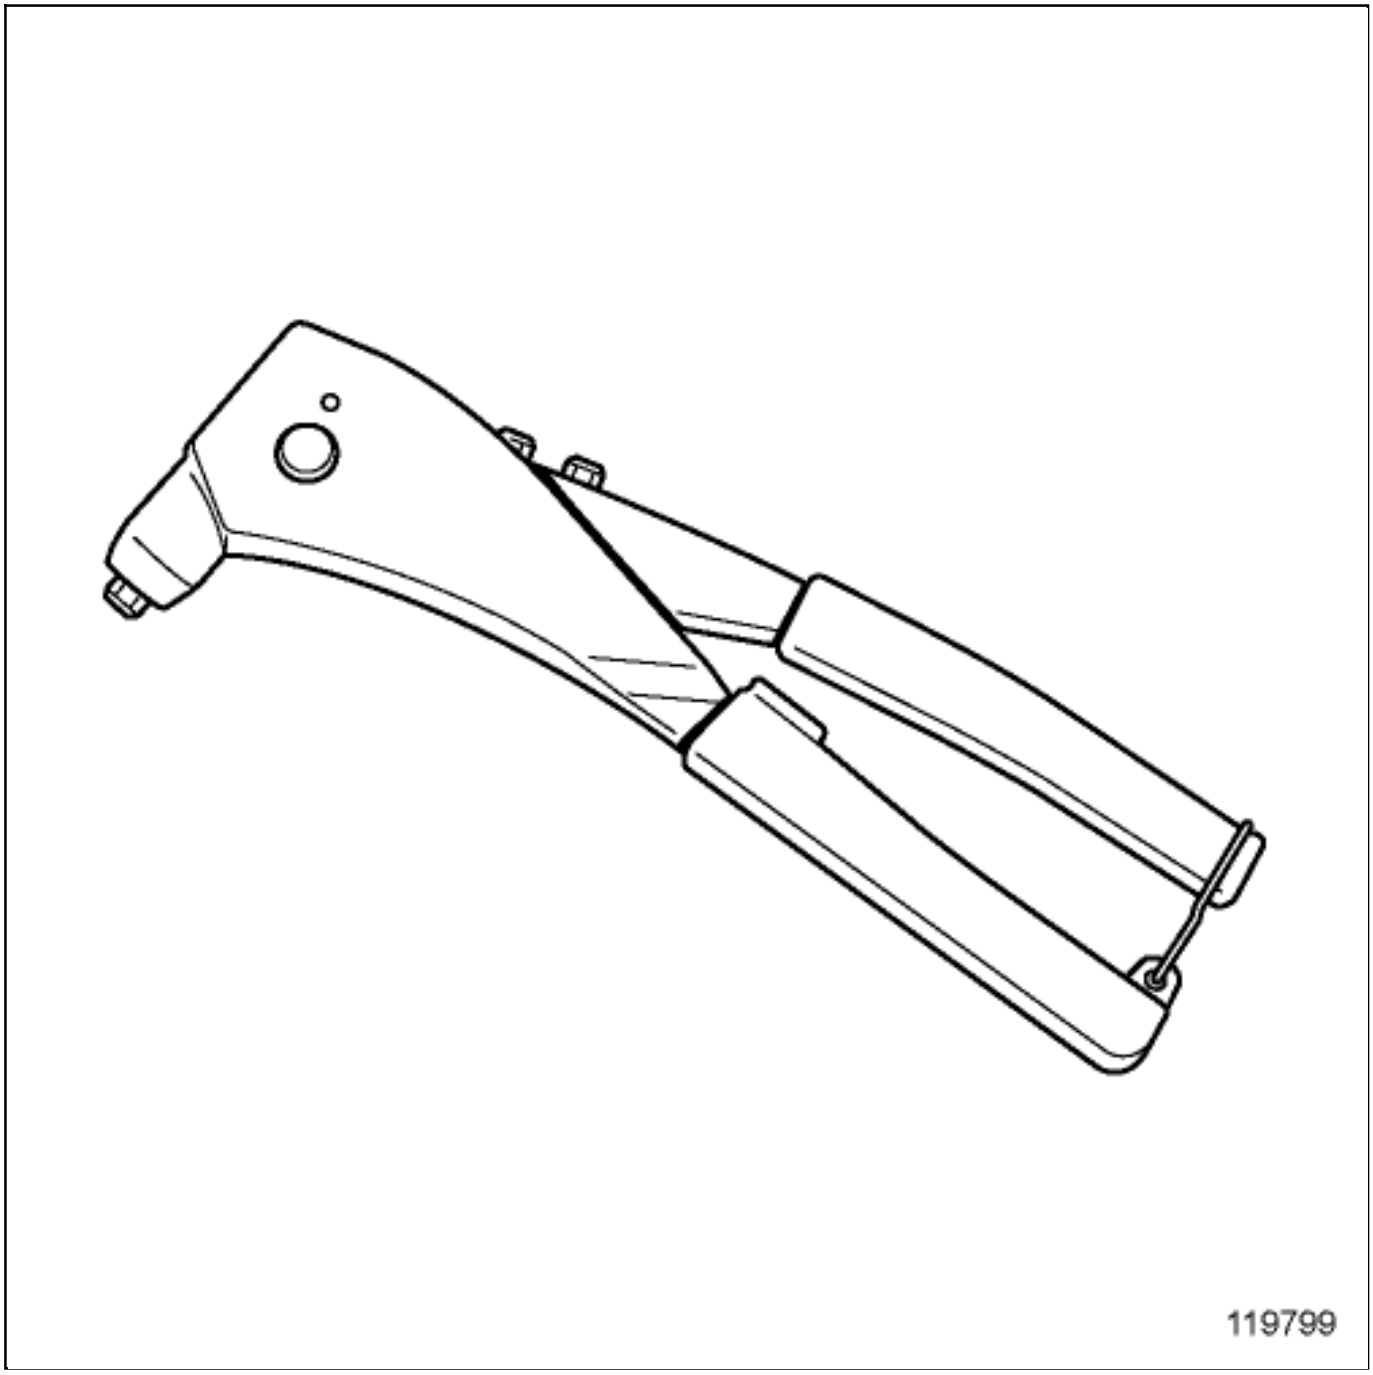
The choice of the type of rivet depends on the material and the thickness of components to be assembled, and the mechanical properties desired for the assembly.

(1) This aluminium expansion rivet of ∅ 4 mmis used for fixing fragile components such as plastics or plastic panels; it is fitted with a standard riveting gun.

(2) This flanged rivet of ∅ 4 mmis used for fixing fragile components such as plastics or plastic sheets; it is fitted with a standard riveting gun.

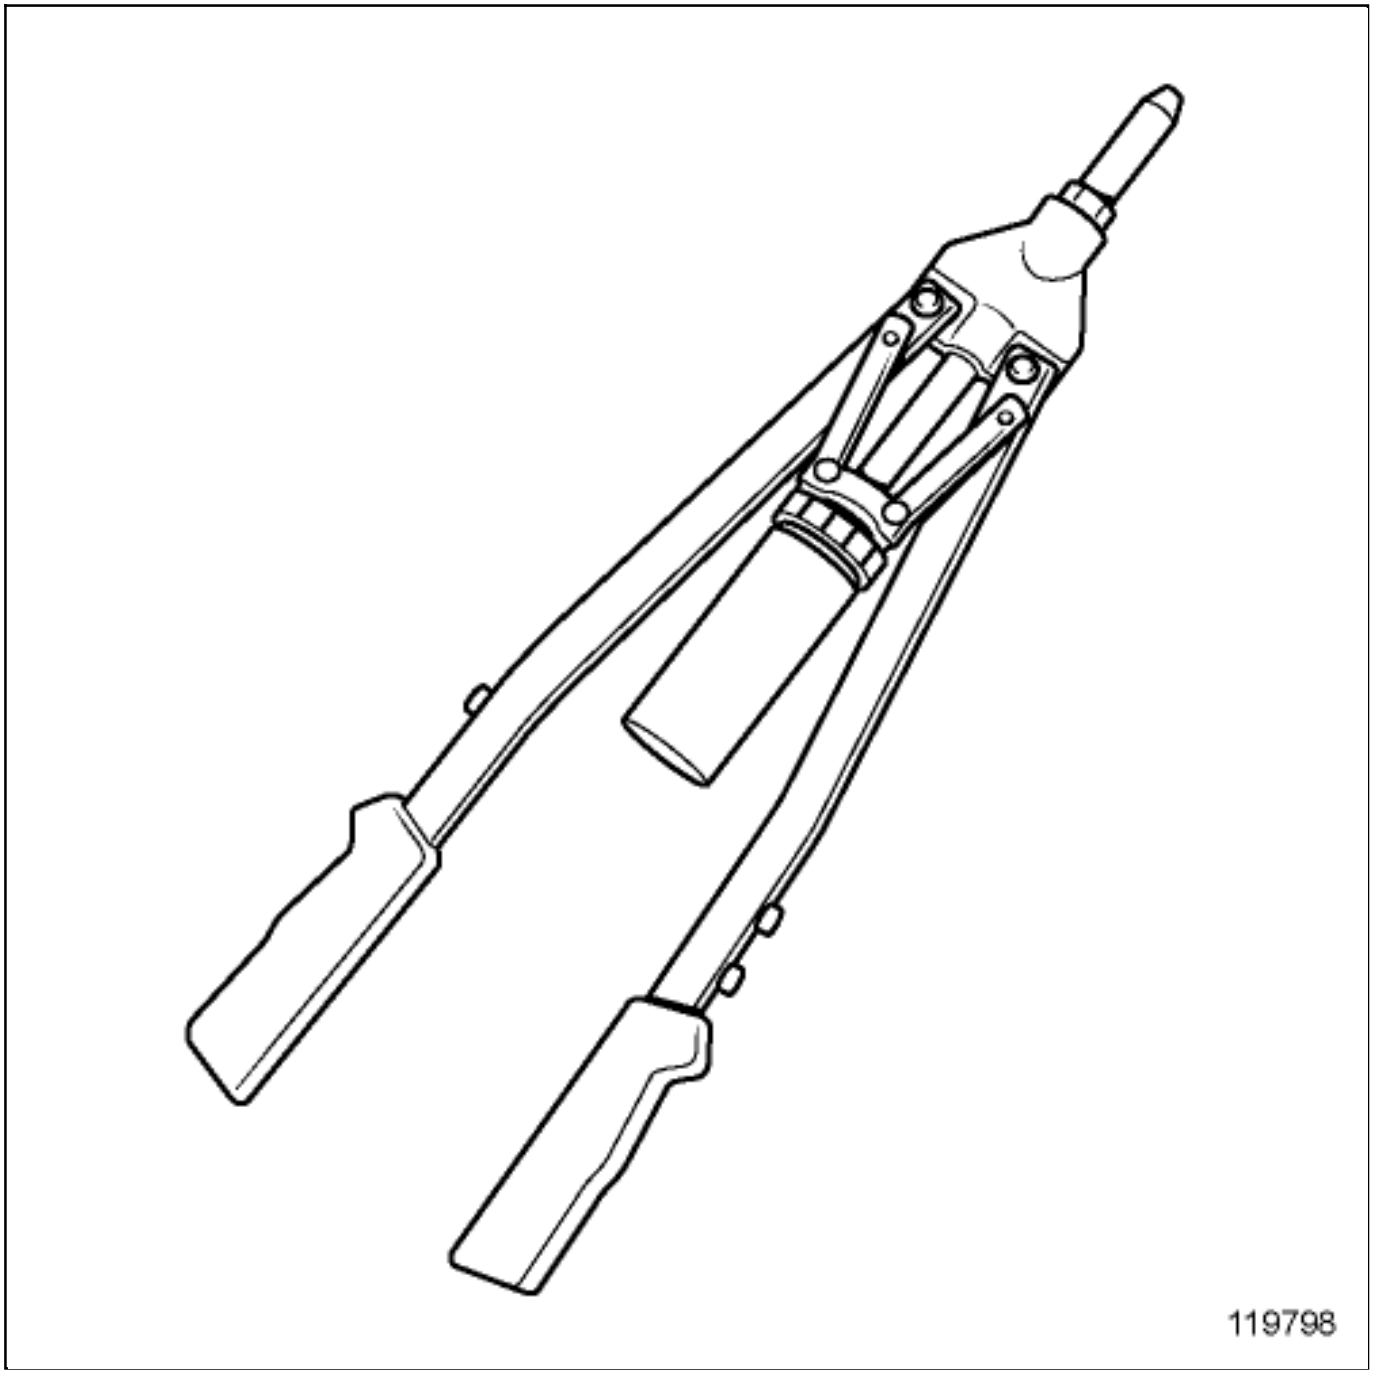
(3) This watertight rivet of ∅ 4.8 mmor ∅ 6.4 mmis used for assembling components, and is equivalent to a weld (only for a panel width of < 1 mm); it is fitted using a pneumatic riveting gun or a "two-handed" riveting gun.

(4) This aluminium rivet/steel rod of ∅ 4.8 mmor ∅ 6.4 mmis used for assembling aluminium components, and is fitted with a pneumatic riveting gun or a "2-handed" riveting gun.



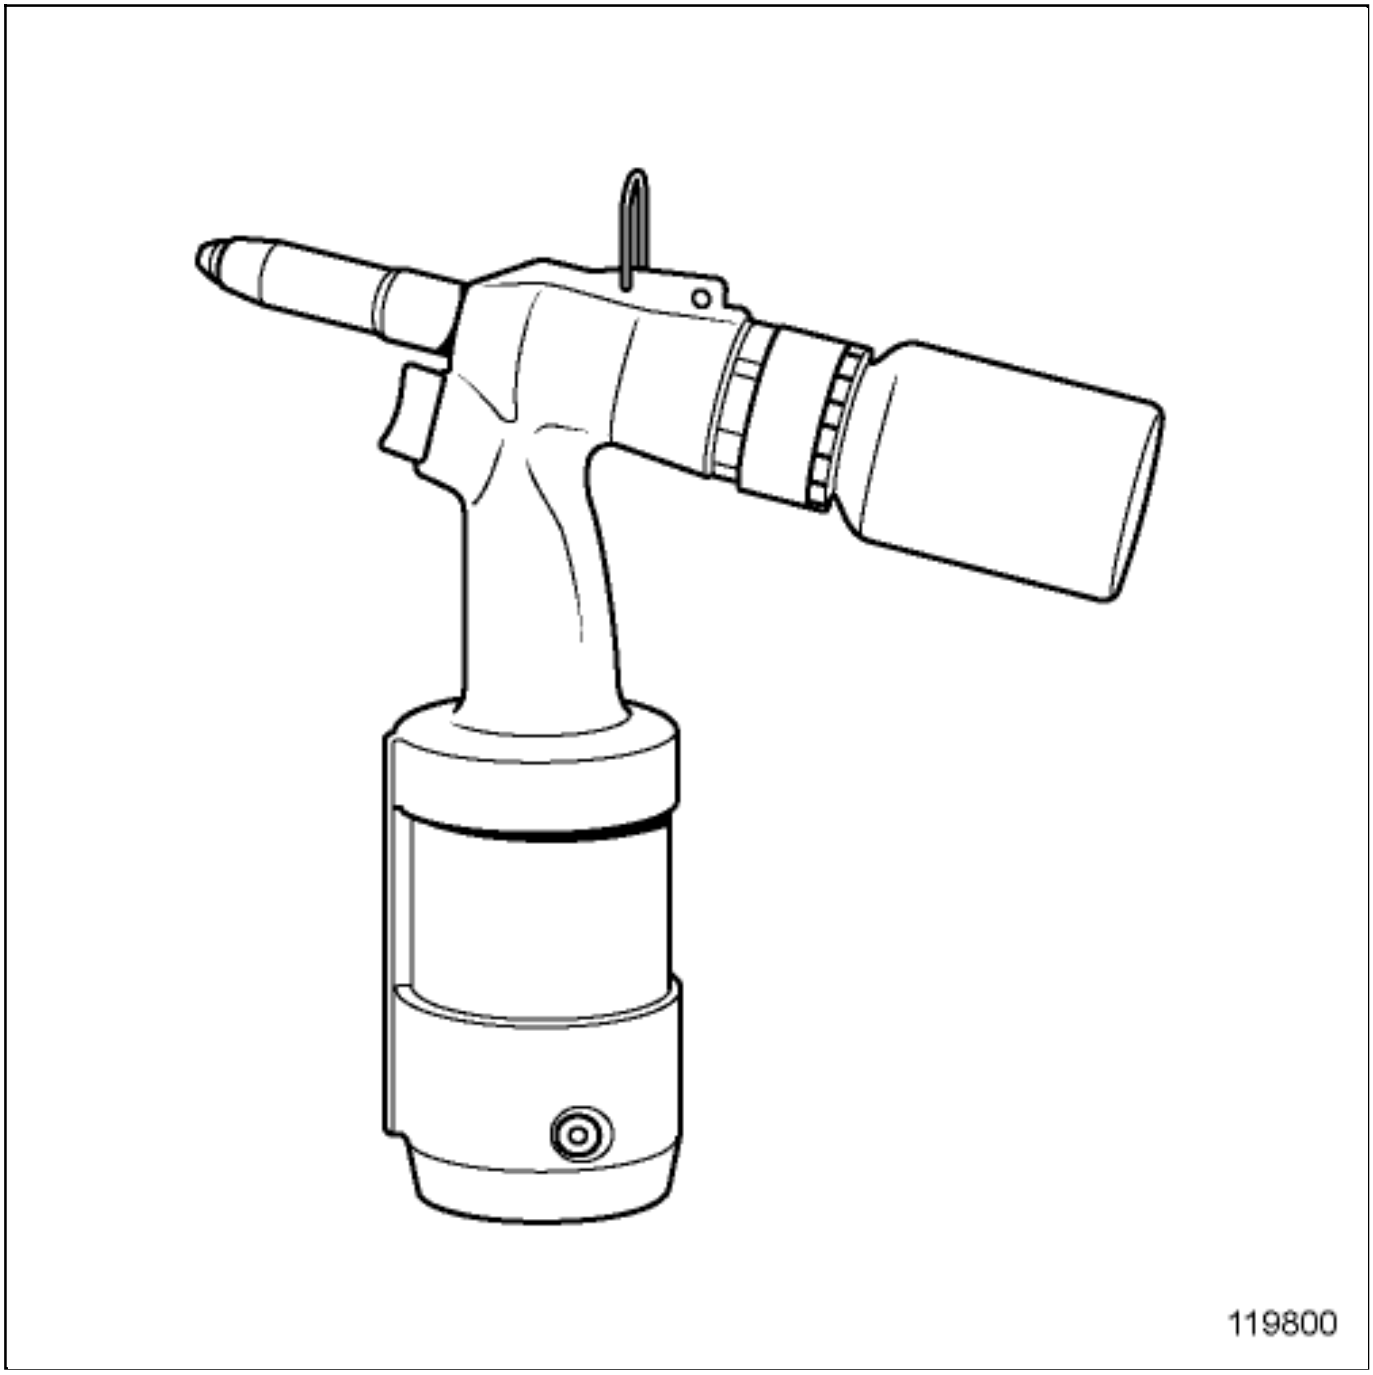
2- DRILLING HOLE DIAMETER

For rivet types(3) and (4) refer to the table below.



∅ rivet (mm)	Thickness when crimped (mm)	Shaft length (mm)	∅ drilling hole
4 (standard riveting gun)	0.5 - 3.0	6	4.1 to 4.5
	2.0 - 5.0	8	
	4.0 - 6.5	10	
	6.5 - 8.5	12	
4.8 ("2-handed" riveting gun)	0.5 - 2.5	6	4.9 to 5.1
	1.0 - 4.5	8	
	3.0 - 6.0	10	
	4.5 - 8.0	12	
6.4 (pneumatic riveting gun)	0.5 - 6.0	12	6.6 to 7.7
	6.0 - 13.0	20	

3- TYPE OF RIVETING GUN



STANDARD RIVETING GUN

"2-HANDED" RIVETING GUN

PNEUMATIC RIVETING GUN

119800

PRODUCTS FOR PLASTIC MATERIAL BODYWORK COMPONENTS: DESCRIPTION

1. REPAIRING BY BONDING

Used to repair deep scratches, fractures, holes and mounting brackets.

- Use on thermoplasticand thermosettingmaterials:
  - Polypropylene (PP) ,
  - Polypropylene/polyethylene (PP / PE) ,
  - Polypropylene / EPDM (PP / EPDM),
  - POLYCARBONATE ,
  - ABS ,
  - ASA ,
  - Composite materials .

1- COMPOSITION OF THE PLASTIC ADHESIVE KIT:

- Plastic repair kit**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):
  - Cleaner,
  - Bi-component repair mastic,
  - Bonding primer,
  - Primer rubber application pad,
  - Self-mixing nozzles,
  - Reinforcing film.

2- PREPARING THE KIT:

Place the cartridges in the nozzle.

Extrude 20 mmof bead in order to obtain a homogenous mixture of the product before application.

3- GUN:

Plastic repair gun**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

2. WELDING REPAIR

Used to repair fractures, holes and mounting brackets.

Suited to repairing complex geometry areas.

Use on thermoplasticmaterials:

- Polypropylene (PP) ,
- Polypropylene / Polyethylene (PP / PE),
- Polypropylene / EPDM (PP / EPDM),
- POLYCARBONATE ,
- ABS ,
- ASA ,
- Noryl .

1- COMPOSITION OF THE PLASTIC WELD KIT:

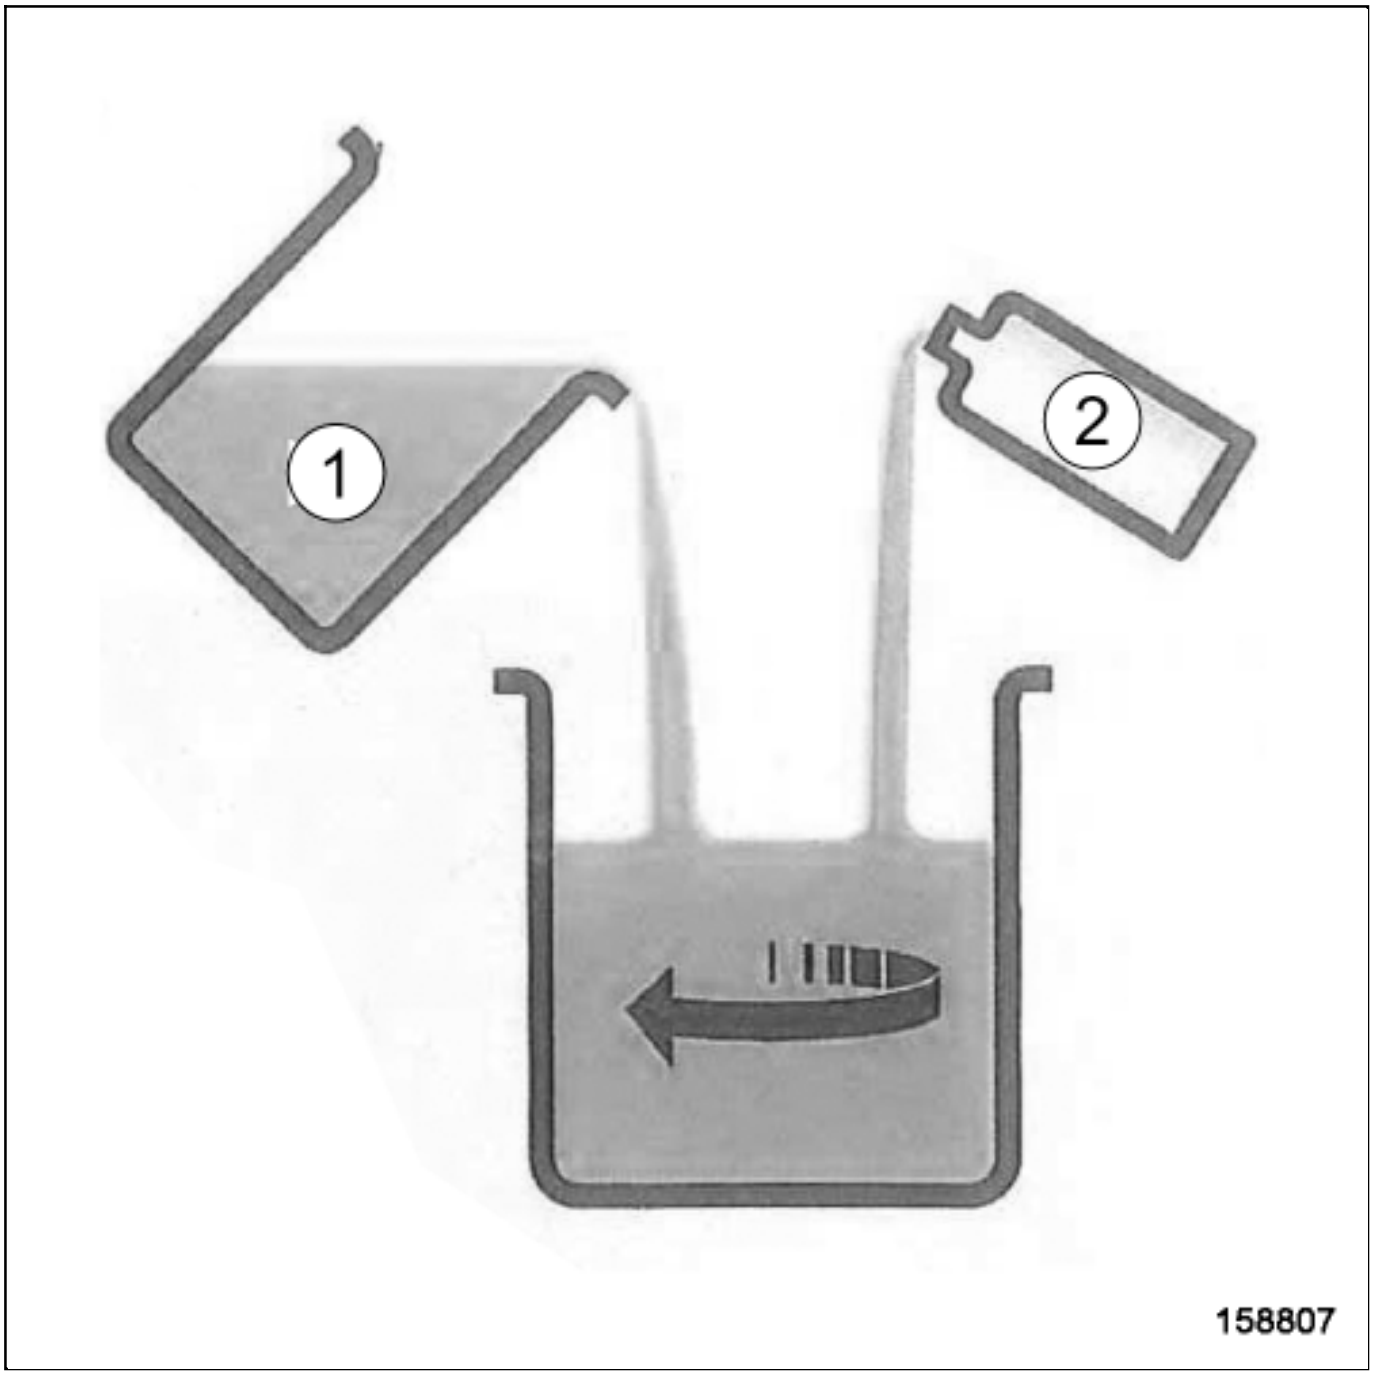
Welding repair kit**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- Soldering iron,
- rod,
- 18/10 stainless steel mesh,
- soldering iron support,
- cooling,
- brush (wooden handle).

3. EPOXY RESIN REPAIR

Used to repair scratches, cracks, openings and to do remplacement partiel of element

Used on thermosettingmaterials



Transfert Molding Resine(RTM)

1- CONTENT OF RESIN EPOXY KIT

Resin epoxy kitVehicle: Precautions for the repair :

- Resin
- Hardnener
- Glass cloth
- Glass mat
- Short fibres

2- KIT PREPARATION

A resin pot(1) (166g) for 1 bottle of hardner.

If necessary add shots fibres (50% maxi).

The mixture has a 15 to 20 minat 20° C.

Don't use under 20° C.

4. FINISHING MASTIC

Used to repair slight scratches and to ensure the finish of bonding/weld repairs**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- Polypropylene (PP) ,
- Polypropylene/polyethylene (PP / PE) ,
- Polypropylene / EPDM (PP / EPDM),
- POLYCARBONATE ,
- ABS ,
- ASA ,
- Noryl ,
- Composite materials .

XSL version : 3.02 du 22/07/11

PRODUCTS FOR PREPARING AND BONDING WINDOWS: DESCRIPTION

Note, one or more warnings are present in this procedure

Note:

Never mix the products when carrying out any adhesive bonding process.

You must only use products contained in the selected bonding kit.

The expiry date on the packaging of the bonding kit must be respected.

1. BONDING KIT

1- BASICPAC

ADHESIVE KIT(high modulus adhesive, Non-conducting**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- an additional cartridge + nozzle**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products),
- a 310 mlcartridge,
- a sachet of glass cleaner or activator including two wipes: one of which is wet and the other dry,
- a tube of primer,
- a pair of gloves,
- a preparation nozzle for the cartridge,
- an application nozzle for the cement bead.

2- S-P KIT

S-P KIT ADHESIVE KIT(high modulus adhesive, non-conducting**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- an additional cartridge of S-P KIT + nozzle**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products),
- a 310 mlcartridge,
- a sachet of glass cleaner or activator including two wipes: one of which is wet and the other dry,
- a 10 mltube of primer,
- a pair of gloves,
- a preparation nozzle for the cartridge,
- an application nozzle for the cement bead.

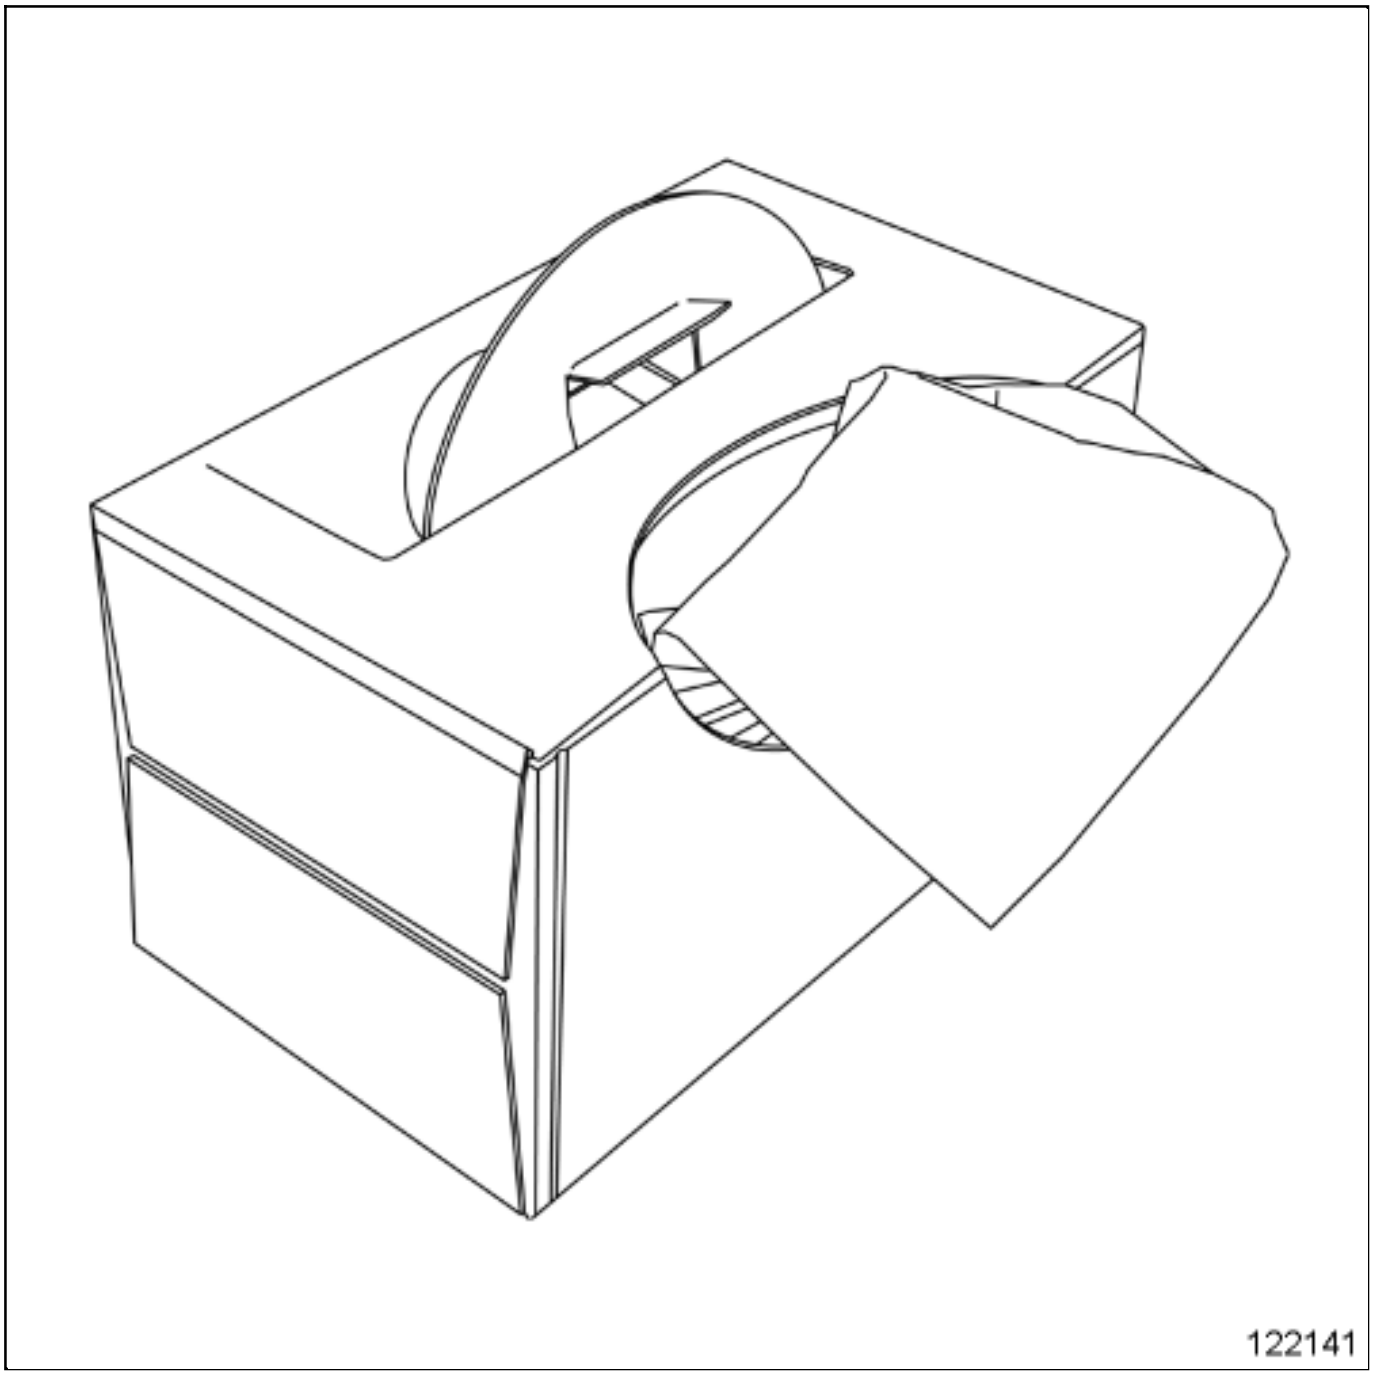
3- BIPAC EVOLUTION

BIPAC EVOLUTION ADHESIVE KIT(high modulus adhesive, non-conducting**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products):

- two 225 mlcartridges: adhesive and accelerator,
- a mixer,
- a sachet of glass cleaner or activator including two wipes: one of which is wet and the other dry,
- a 10 mltube of primer (green and red marking),
- a pair of gloves,
- an application nozzle for the cement bead.

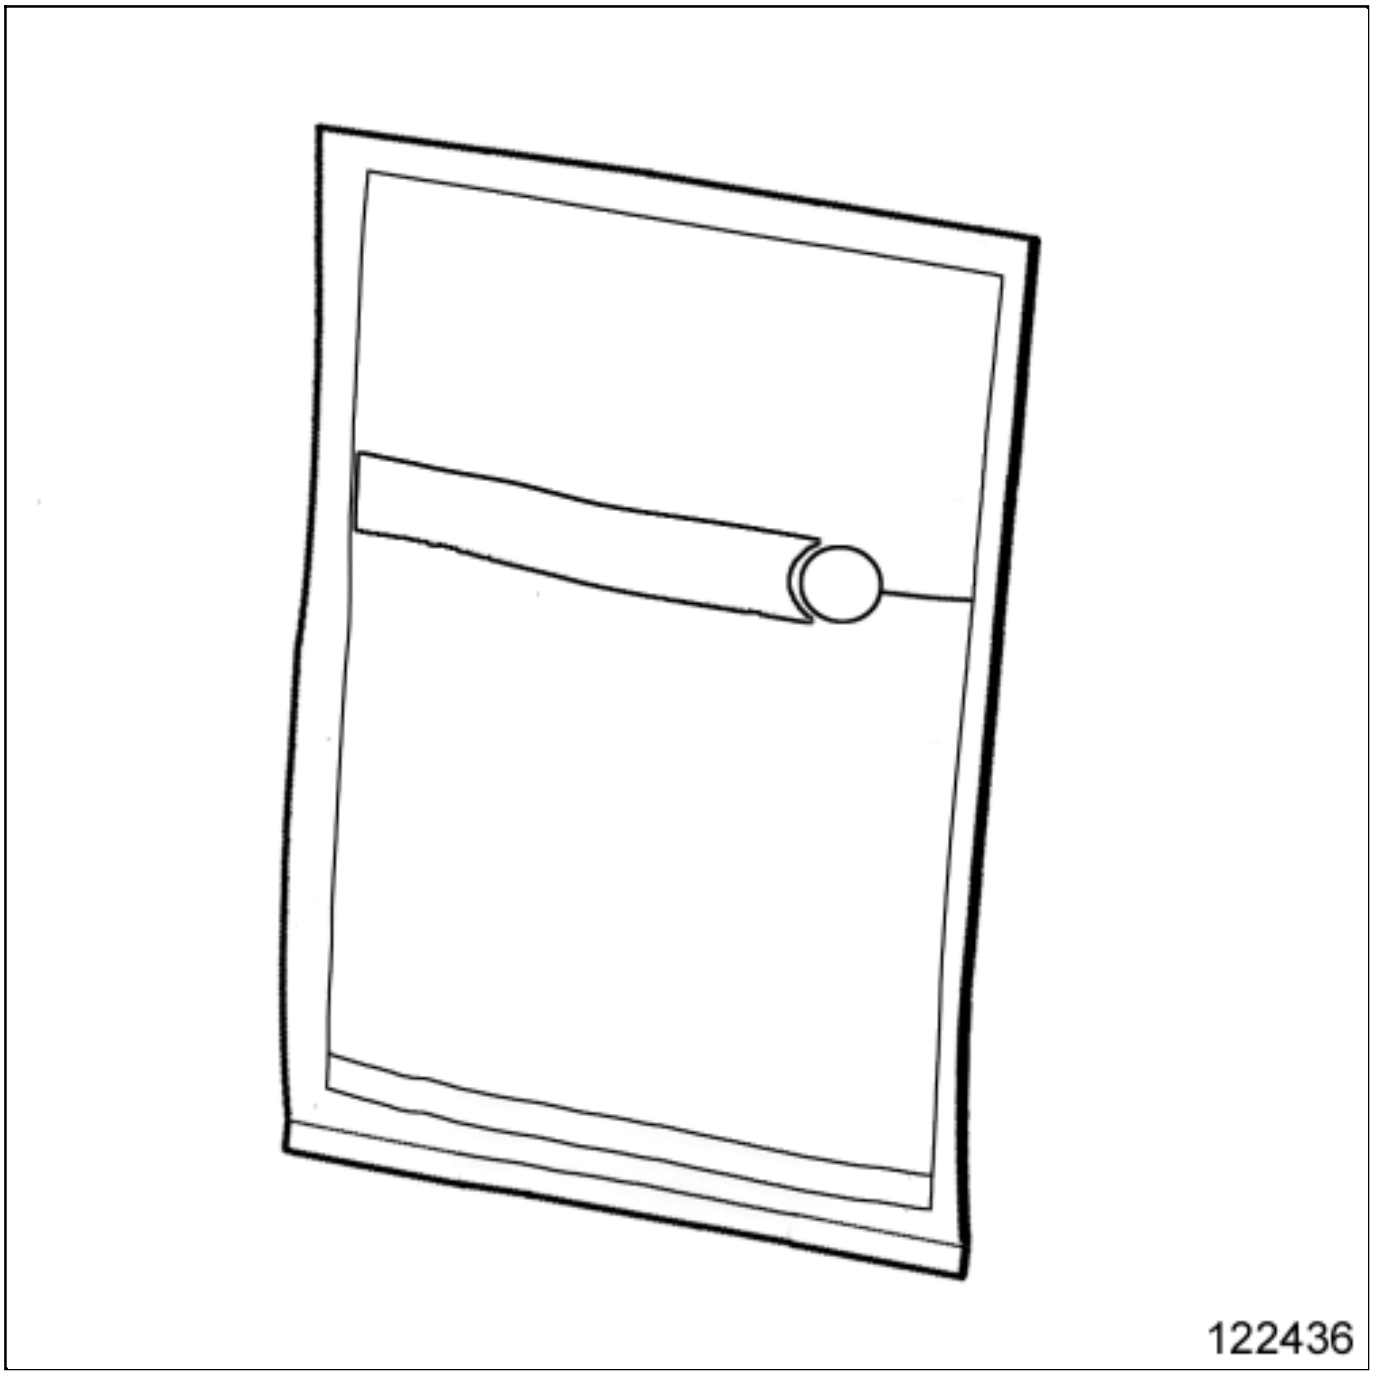
2. CLEANER

1- HEPTANE



Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Heptane is a very volatile solvent and allows optimal cleaning of the area surrounding the bond.



It evaporates quickly.

2- LINT-FREE CLOTH

Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

3- GLASS CLEANER OR ACTIVATOR

Most new windows from the Parts Department have already been primed when they are supplied.

This primed area shows the bonding path.

The glass cleaner or activator reactivates this primer and promotes adhesion.

Note:

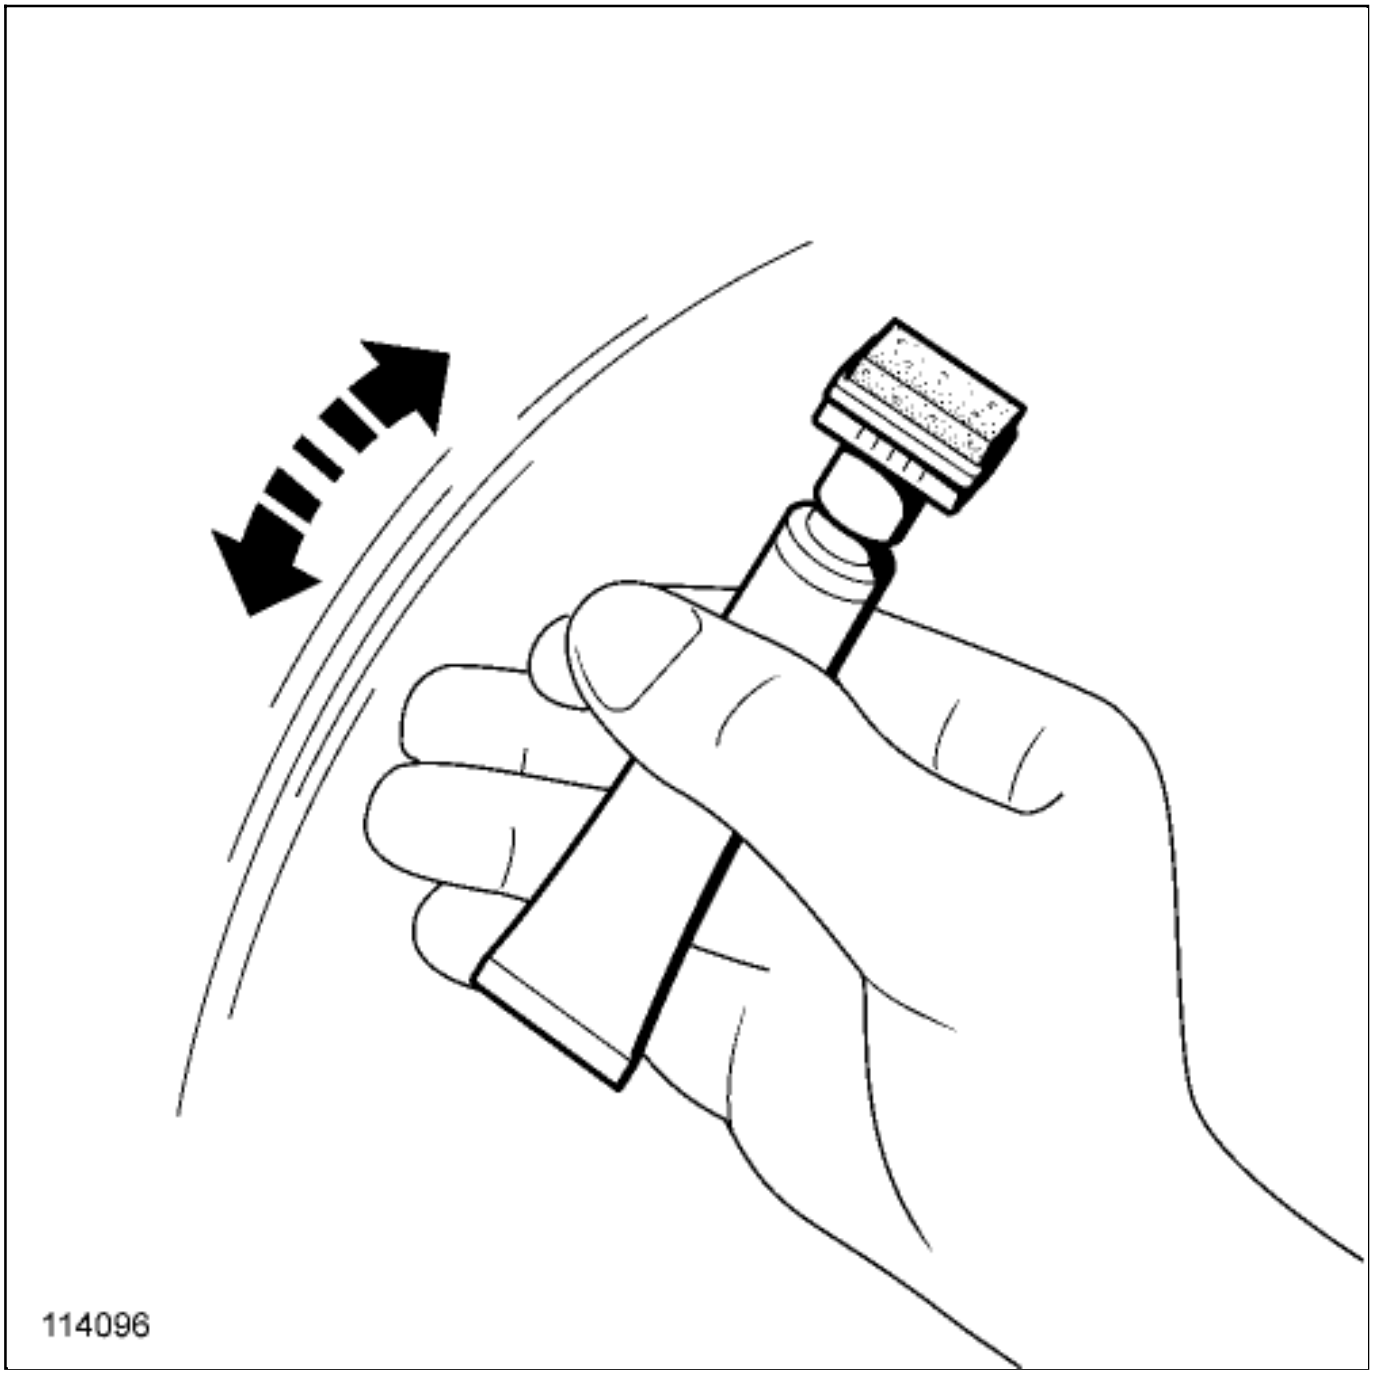
It is essential to clean this product containing active ingredients with a dry wipe before applying the primer (green and red marking) contained in the bonding kit.

3. PRIMER

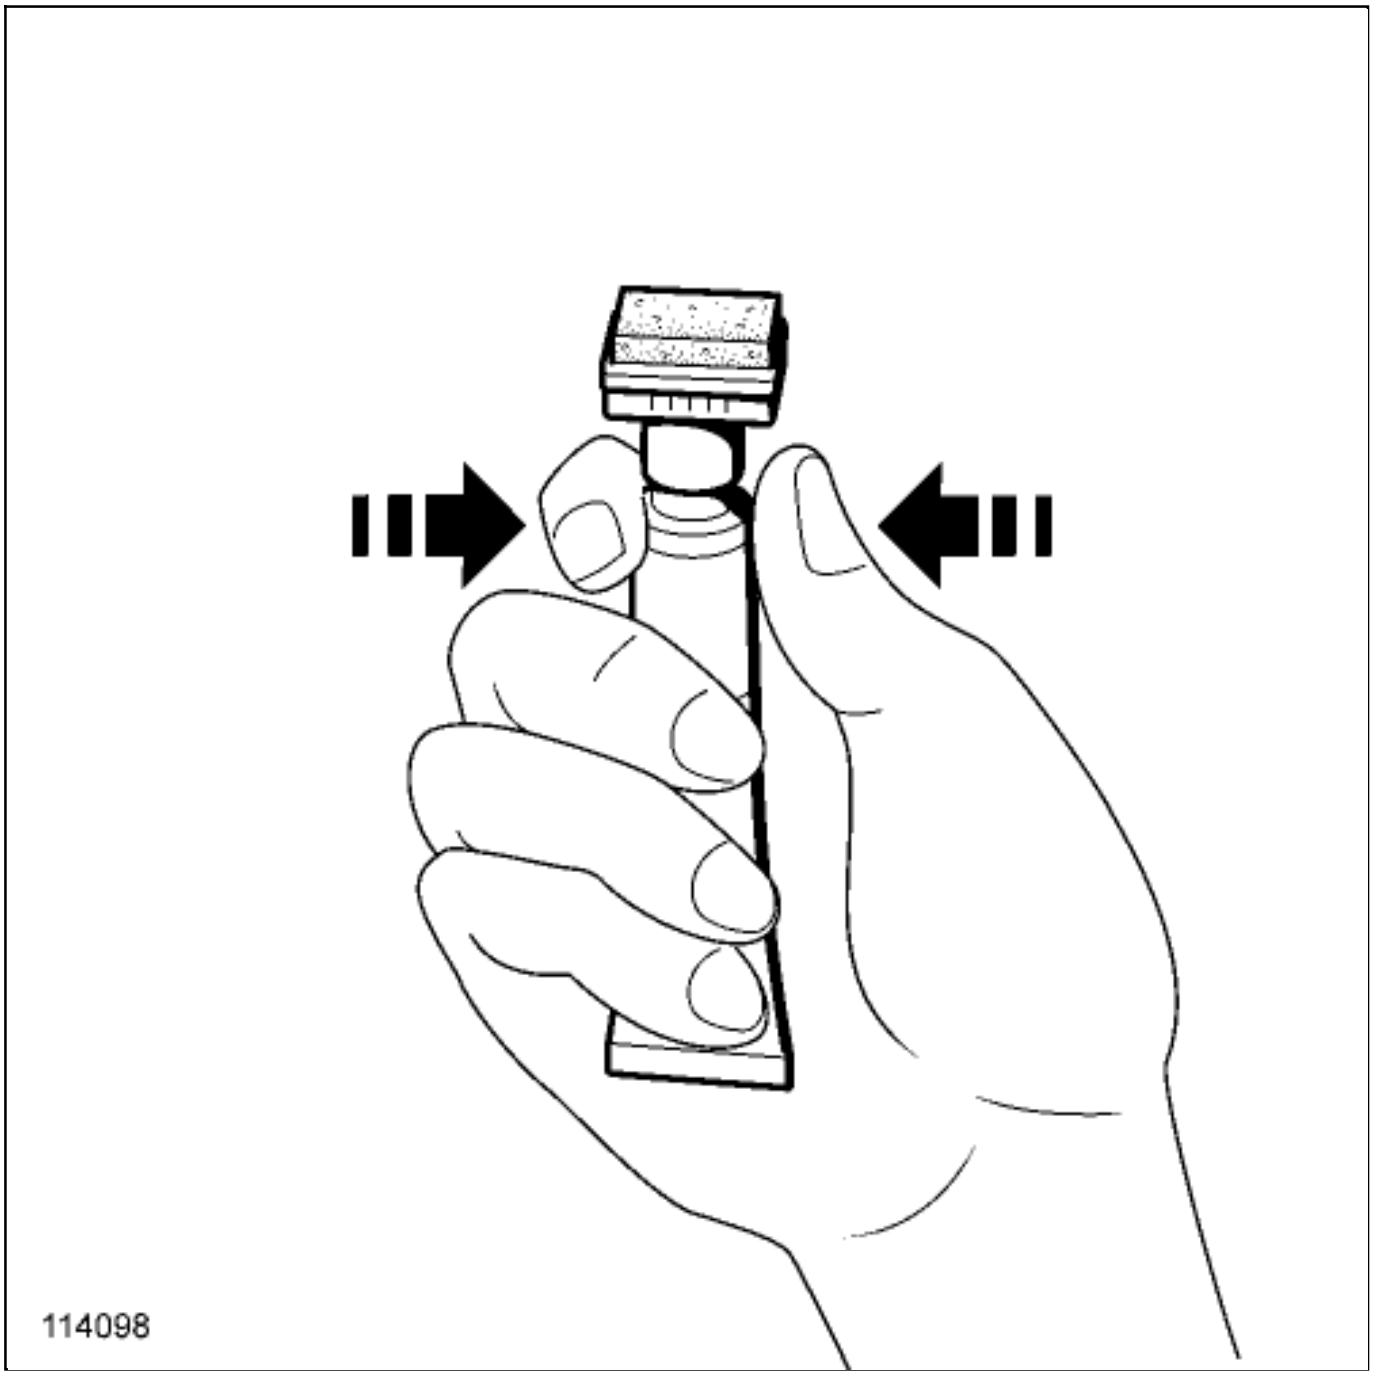
1- PRIMER (EXCEPT POLYCARBONATE)

It ensures that the cement bead adheres to different mountings.

It also protects the cement bead from ultraviolet rays which can damage the molecular structure of the cement bead and reduce its resistance.

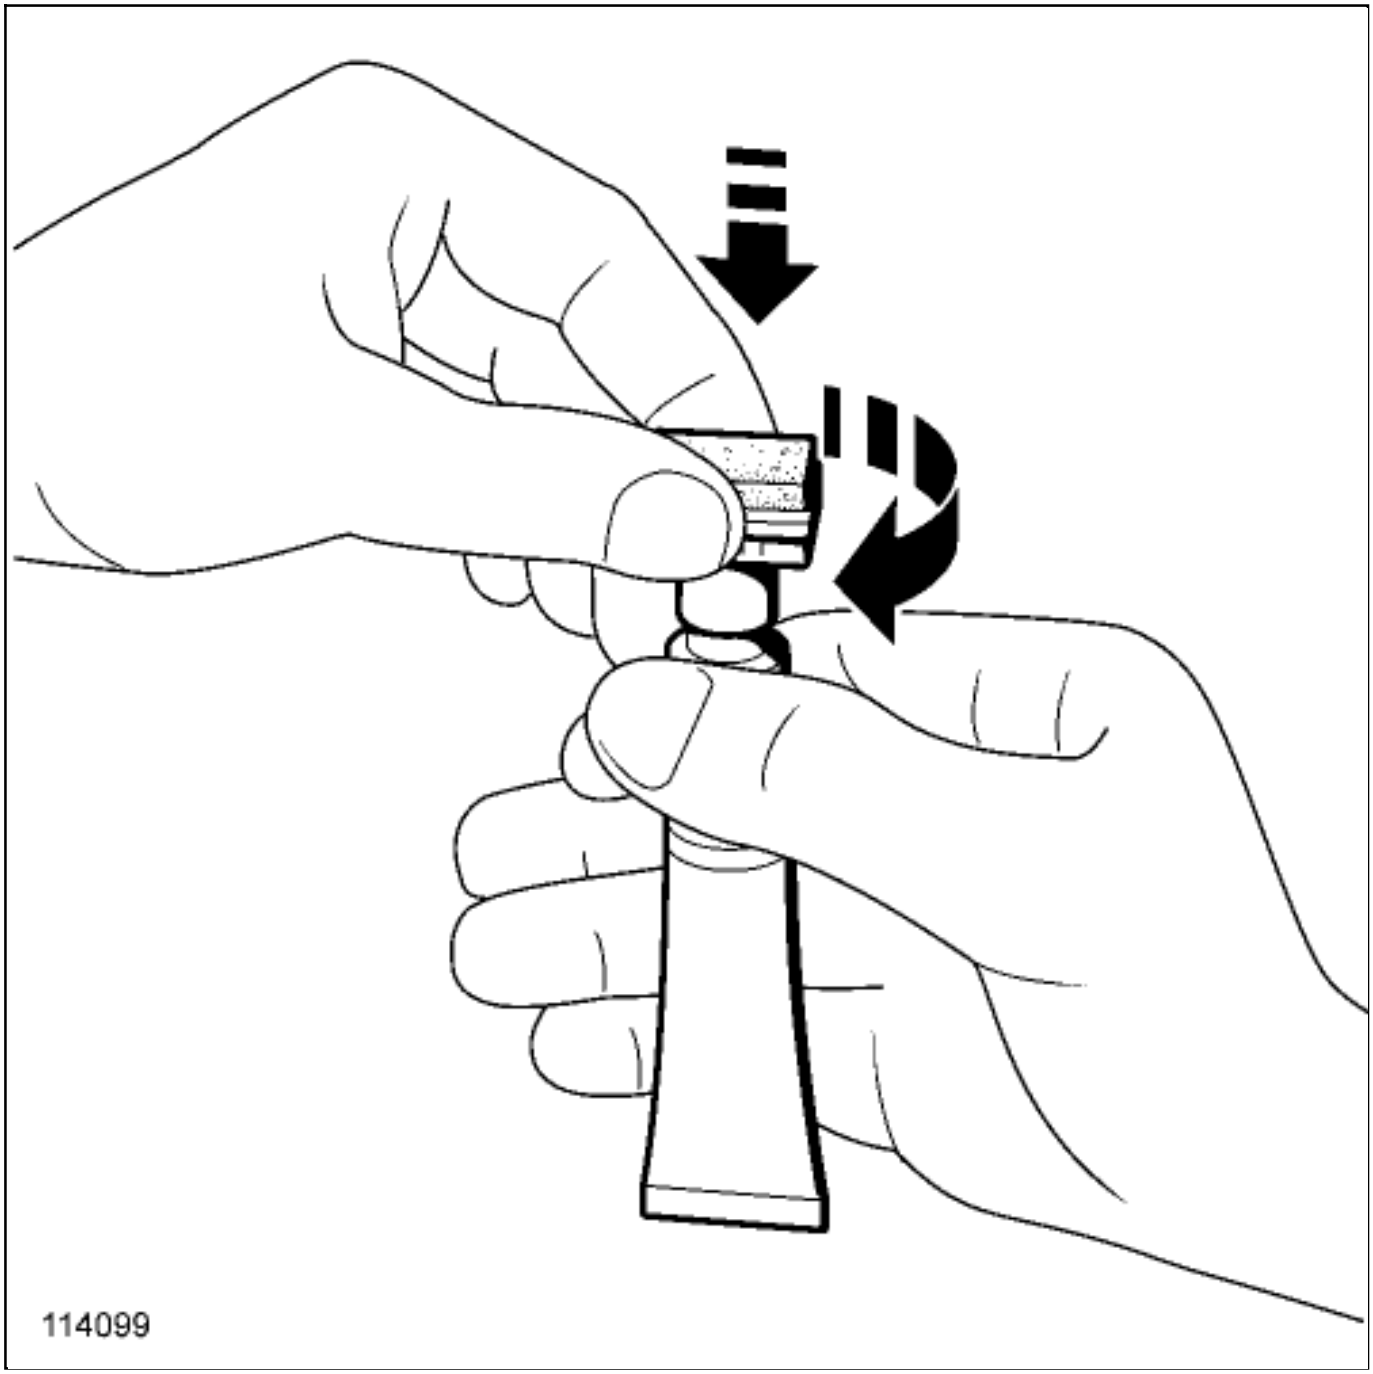


PRIMER (GREEN AND RED)



CAUTION

In order not to stain the windows, immediately clean any product which has spilt onto the area outside the bonding area.



4. USING THE TUBE OF PRIMER

Shake the tube for approximately 1 minuteso that the product is uniform.

Hold the neck of the tube with the applicator pad facing upwards.

Screw the applicator pad on properly so that the tube is well sealed.

Soak the applicator pad before application.

CAUTION

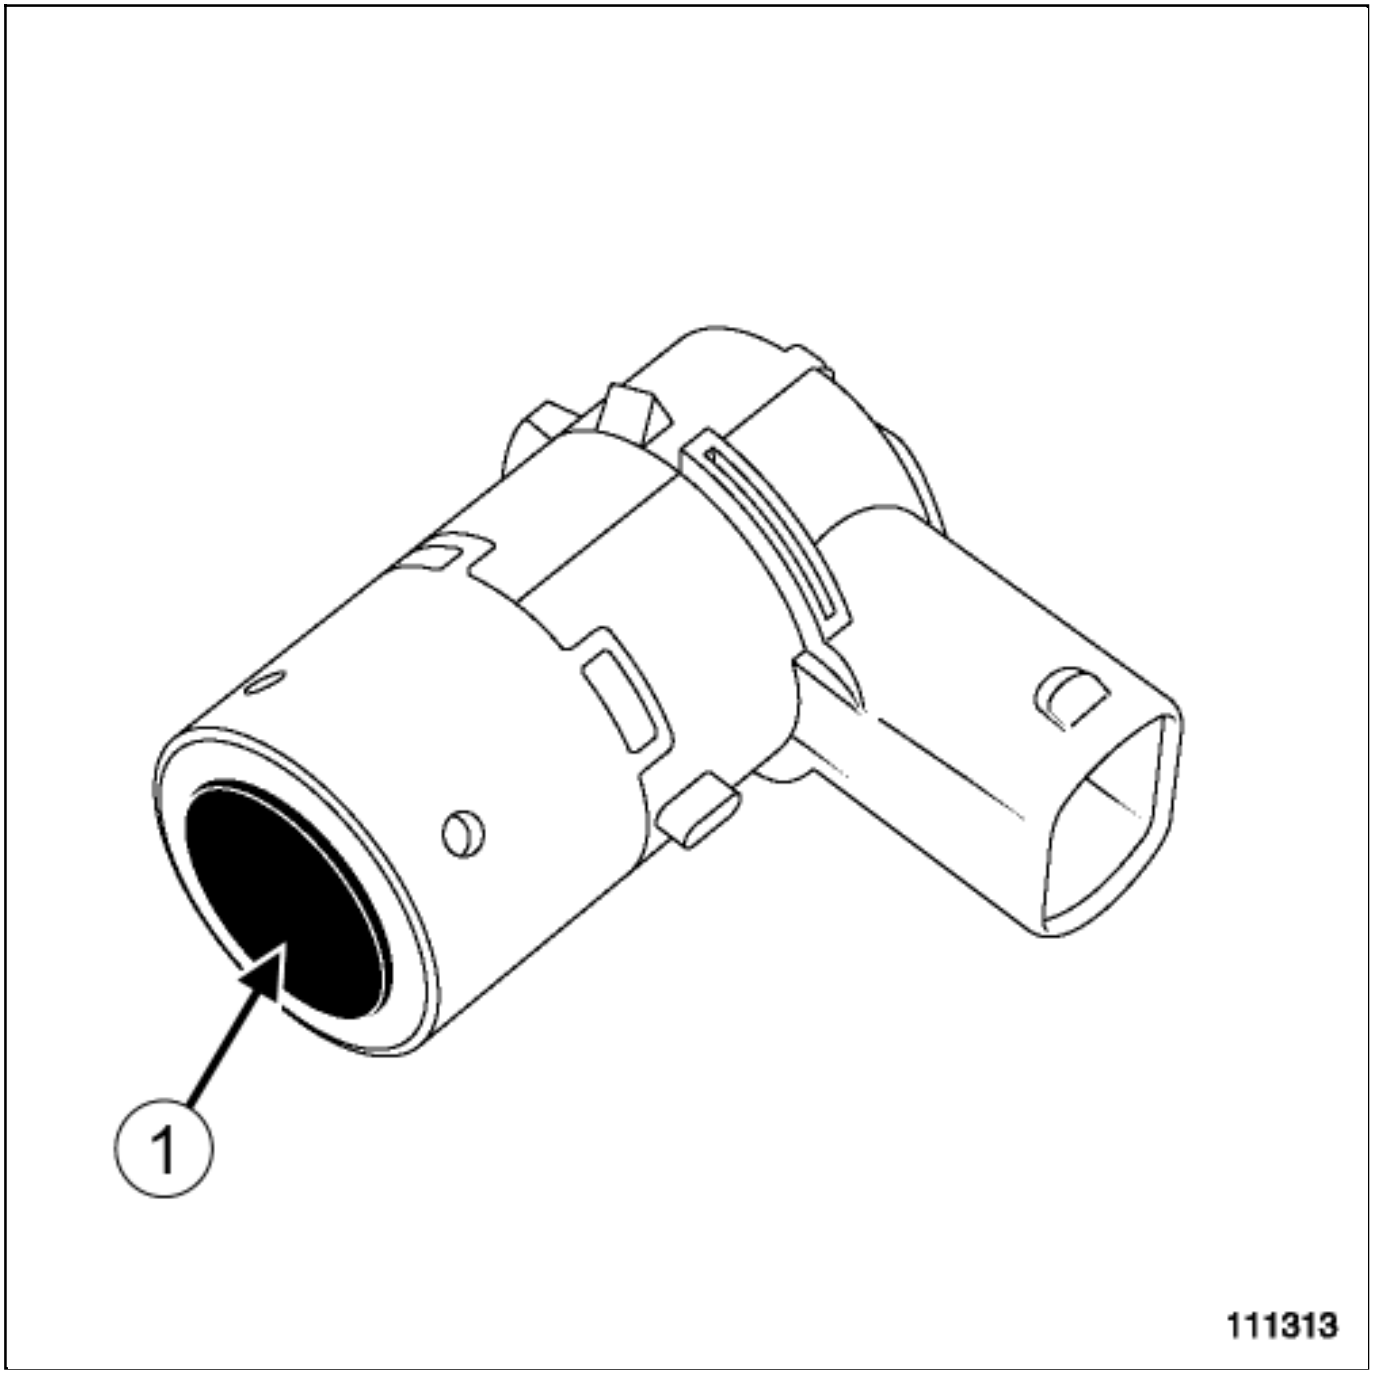
In order not to stain the windows, immediately clean any product which has spilt onto the area outside the bonding area.

Never apply the cement bead onto wet primer.

XSL version : 3.02 du 22/07/11

PROXIMITY SENSOR: PREPARATION AND PAINT RANGE

Note, one or more warnings are present in this procedure



CAUTION

The proximity sensors are fragile. Handle with care as the external part cannot withstand impacts.

When drying the bumper and/or proximity radars, the temperature must not exceed 60˚C .

The radar detects using a highly sensitive membrane(1) .

The sensitivity of the membrane may be affected by an unsuitable coating.

The radar will then detect false information or nothing at all.

1. PAINTING

Only proximity radars sold and prepared in the Parts Departmentcan be painted.

Paint the proximity radars and the bumper separately.

Put masking tape on the part of the proximity radar which must not be painted.

For proximity radars which are supplied unassembled, paint the proximity radar only and assemble the unit after drying.

Apply the product range for painting on polypropylene(see 95A, Paint application range for plastic, Polypropylene / polyethylene bodywork component: Preparation and paint range) .

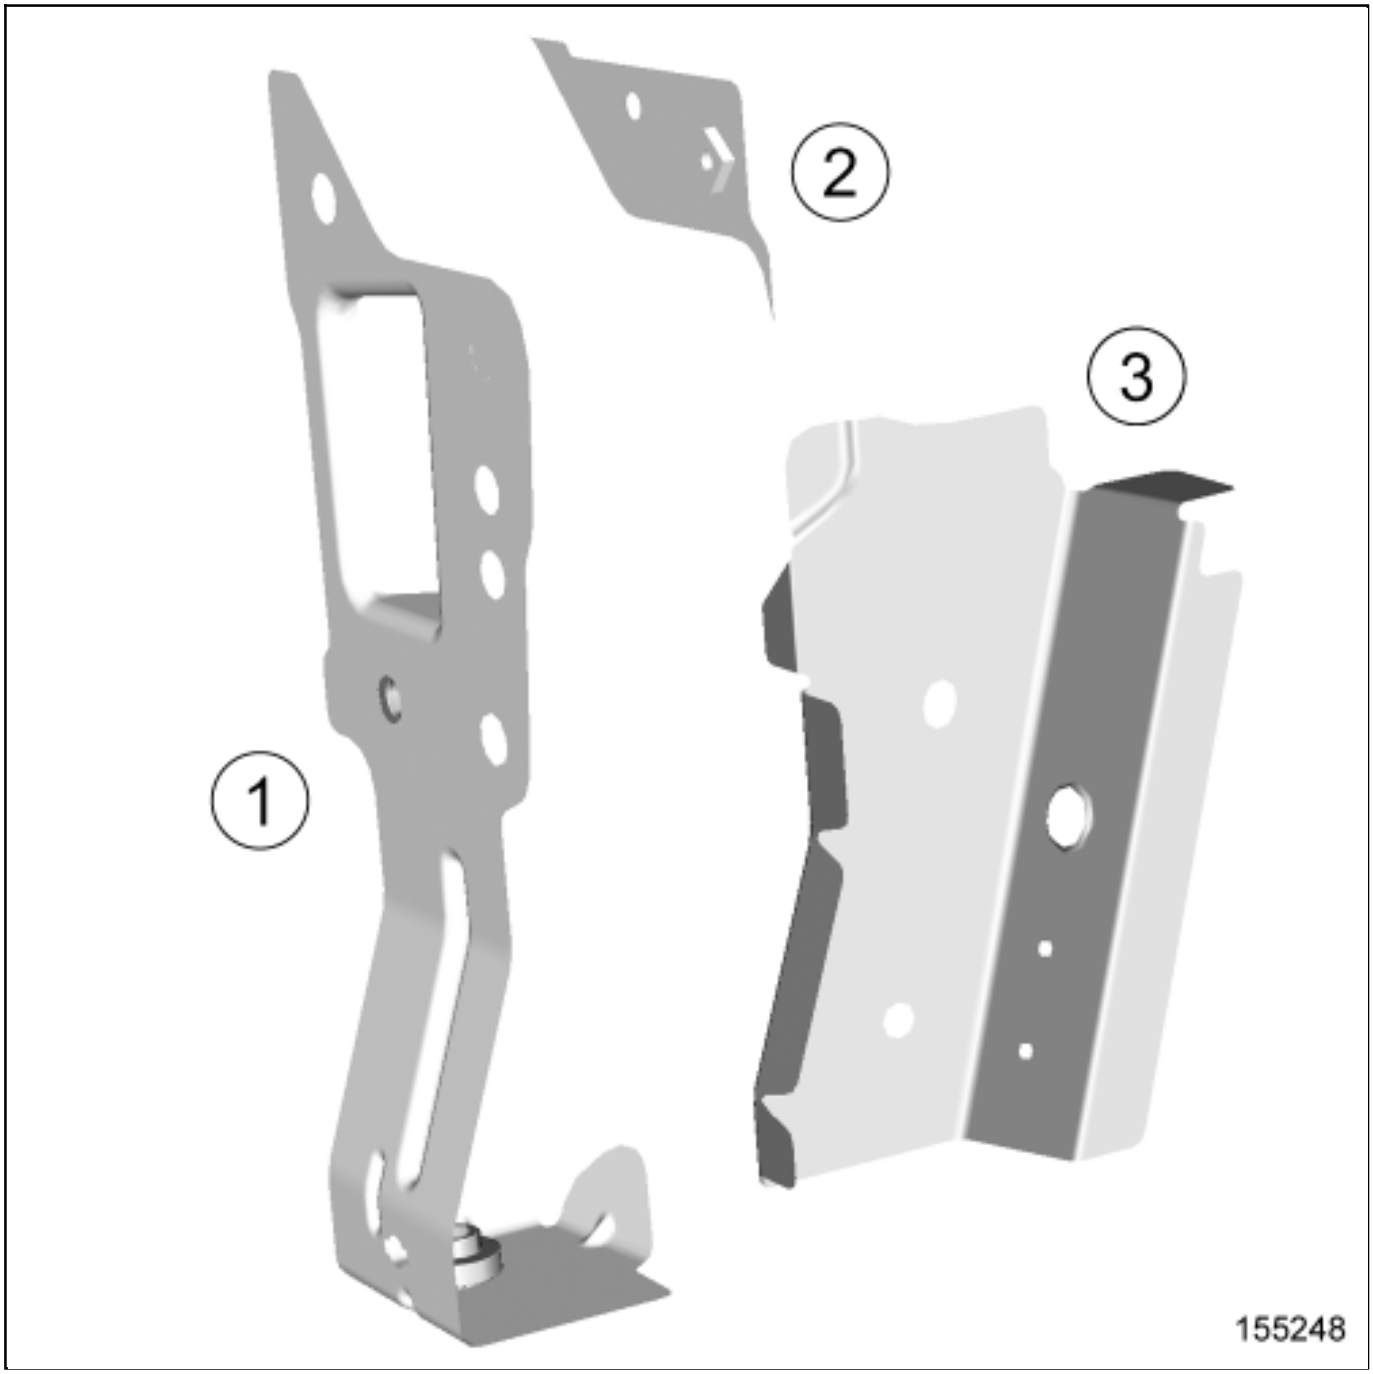
If retouching the paintwork on the bumper, mask or remove the proximity radars.

The proximity radars must not be painted several times.

2. MALFUNCTION

Faults leading to proximity radar malfunctioning:

- excessive run or paint thickness on the membrane,
- run in the peripheral section of the membrane's neck,
- damage to the membrane,
- deformed bumper changing the alignment of the proximity radars.



RADIATORCROSSMEMBERMOUNTING:REPLACEMENT

Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

Note:

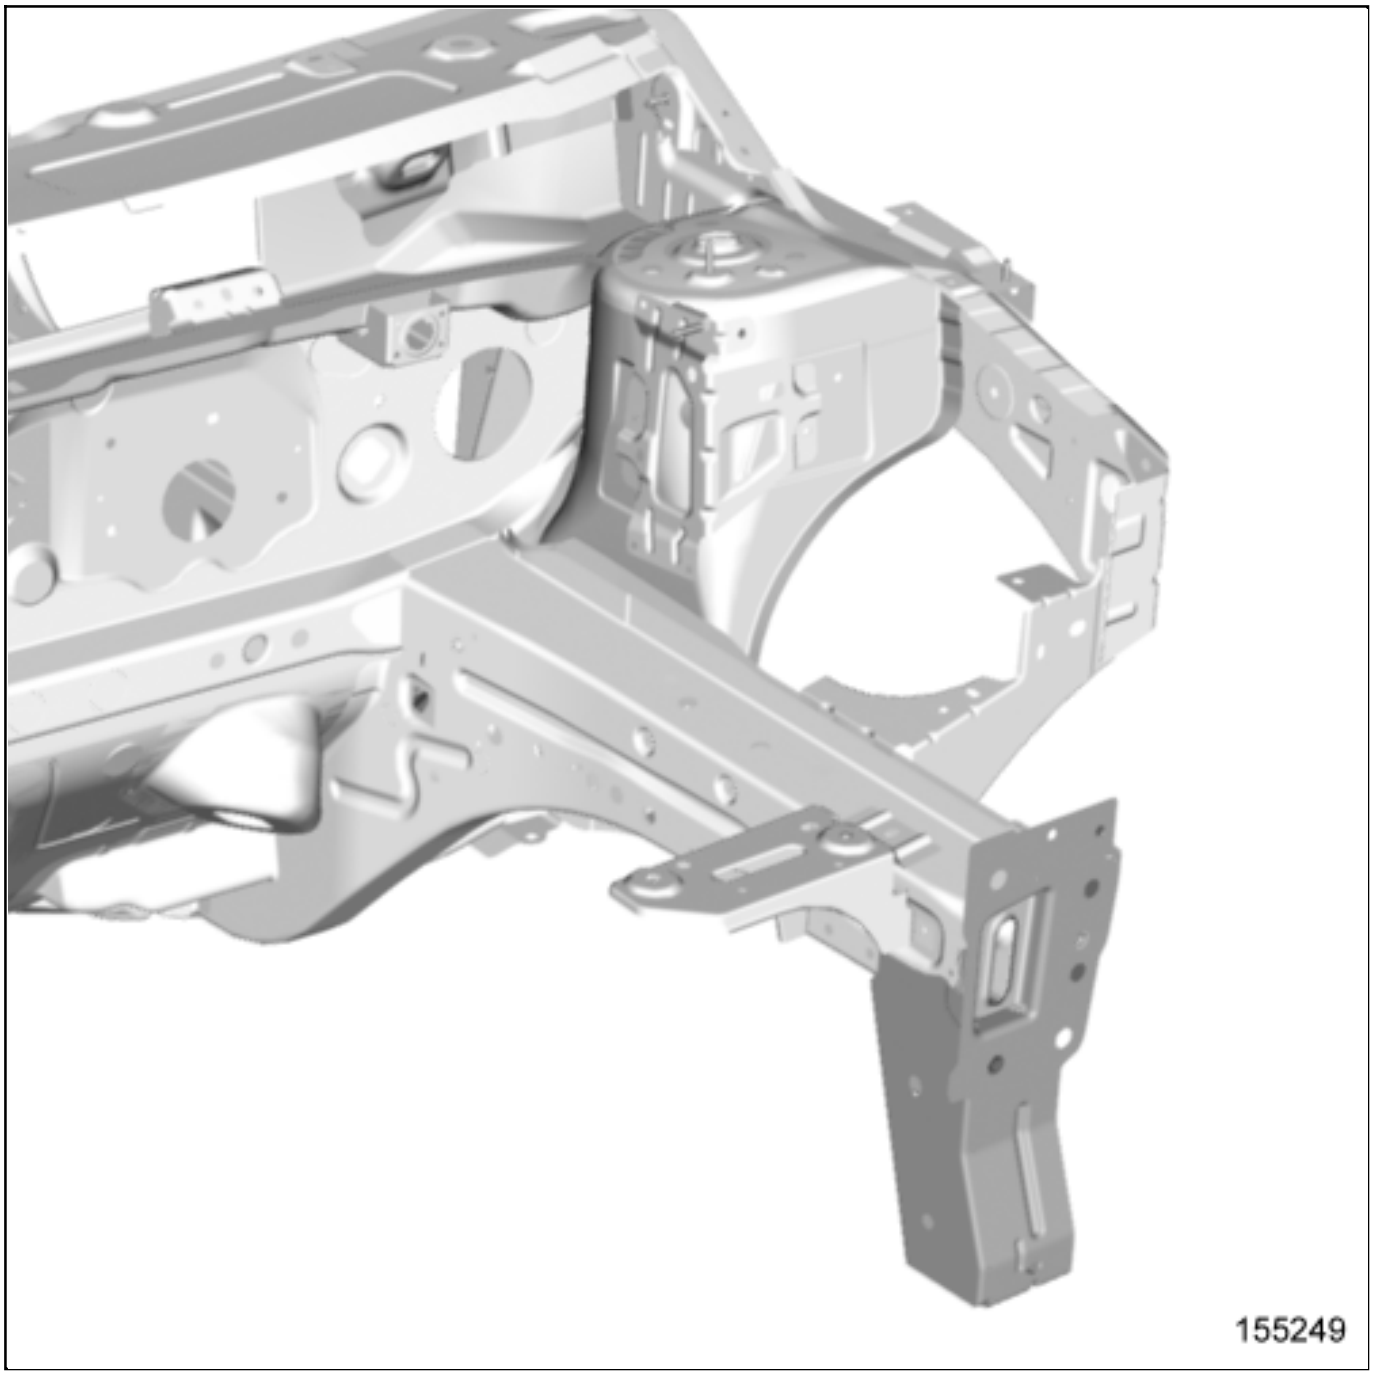
This part has the same following characteristics at each side.

No.	Description	Type	Thickness (mm)
(1)	Additional mounting front unit	HLE	1.2
(2)	Additional subframe mounting front right-hand bracket	HLE	2.5
(3)	Front right-hand side member connection plate	THLE	2.5

2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

complete replacement.



WARNING

Use a repair bench to ensure the positioning of the points and the geometry of the axle assemblies.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

RADIO: LIST AND LOCATION OF COMPONENTS

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

1. LIST OF COMPONENTS

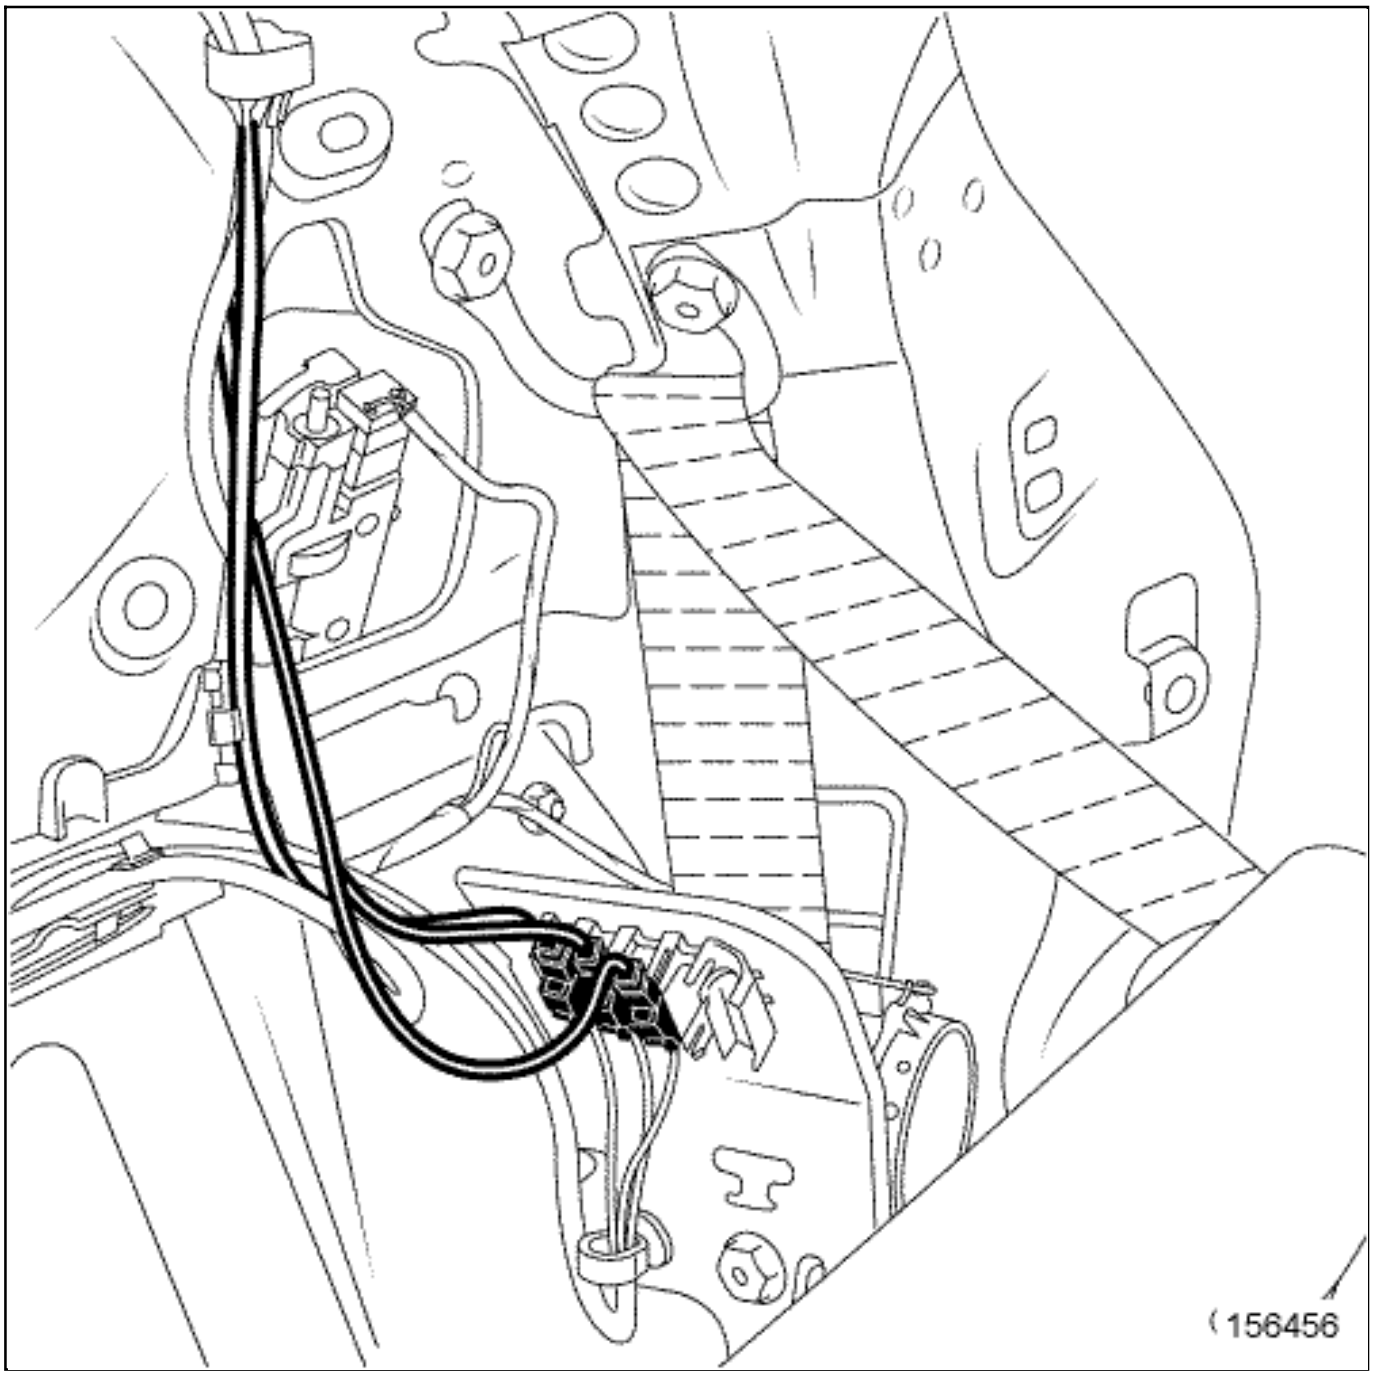
1- THE RADIO SYSTEM COMPRISES:

- a radio aerial
- front speakers Front side opening element assembly on the passenger compartment side: Exploded view
- rear speakers Rear side opening element assembly on the passenger compartment side: Exploded view
- tweeters in the dashboard Dashboard assembly: Exploded view
- a radio control satellite
- a radio
- an offset multimedia socket
- an "hands-free" microphone

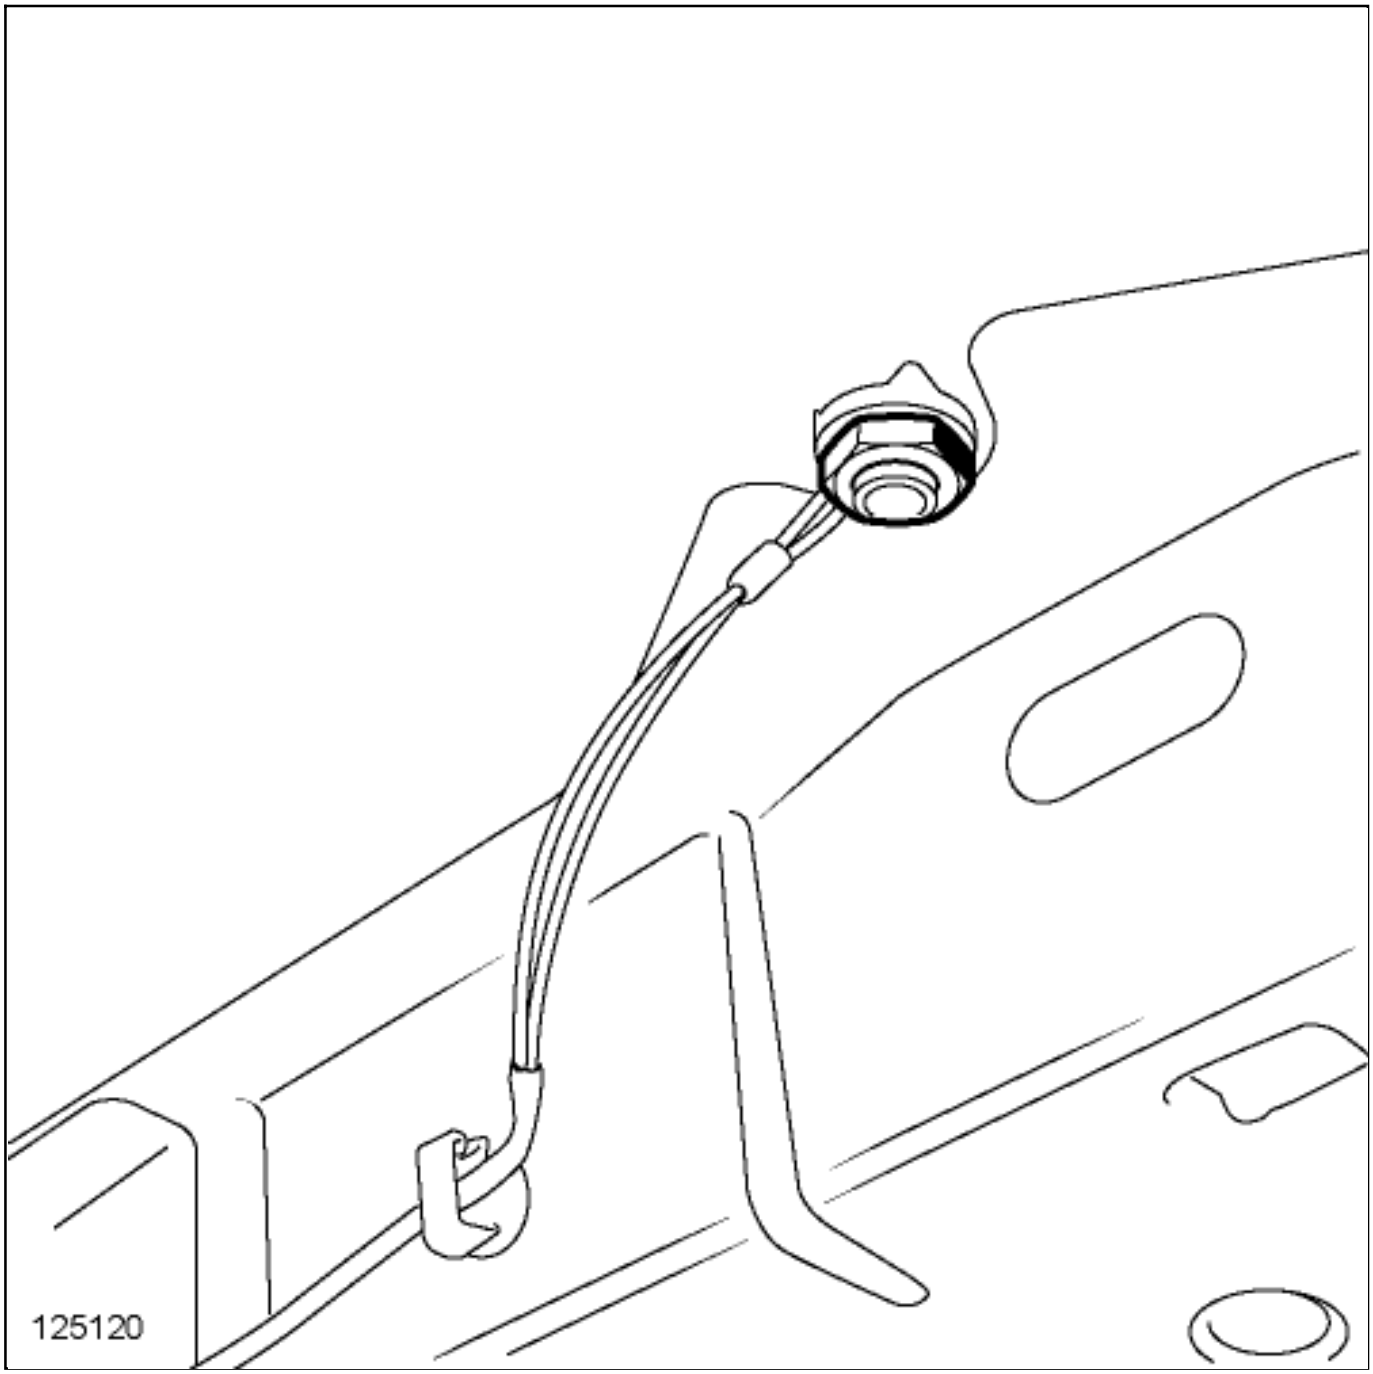
2. LOCATION OF COMPONENTS

CAUTION

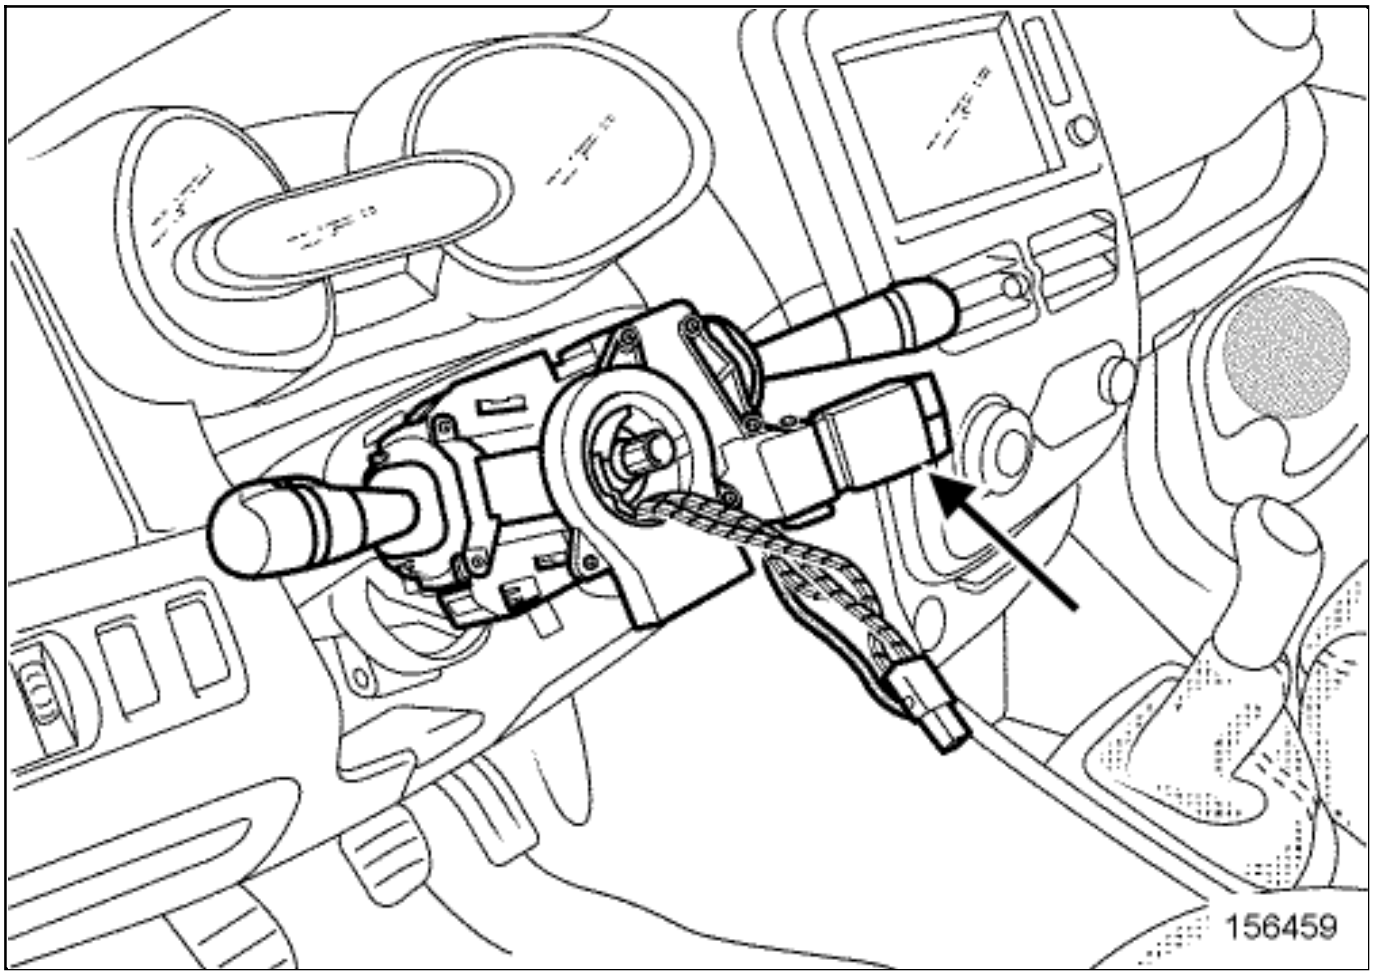
To prevent damaging the navigation system, wait 1 minuteafter switching off the + after ignition feed.



CAUTION



To ensure correct operation:



- do not pinch the aerial cable,
- do not bend the aerial cable,
- do not force the aerial cable when refitting.

XSL version : 3.02 du 22/07/11

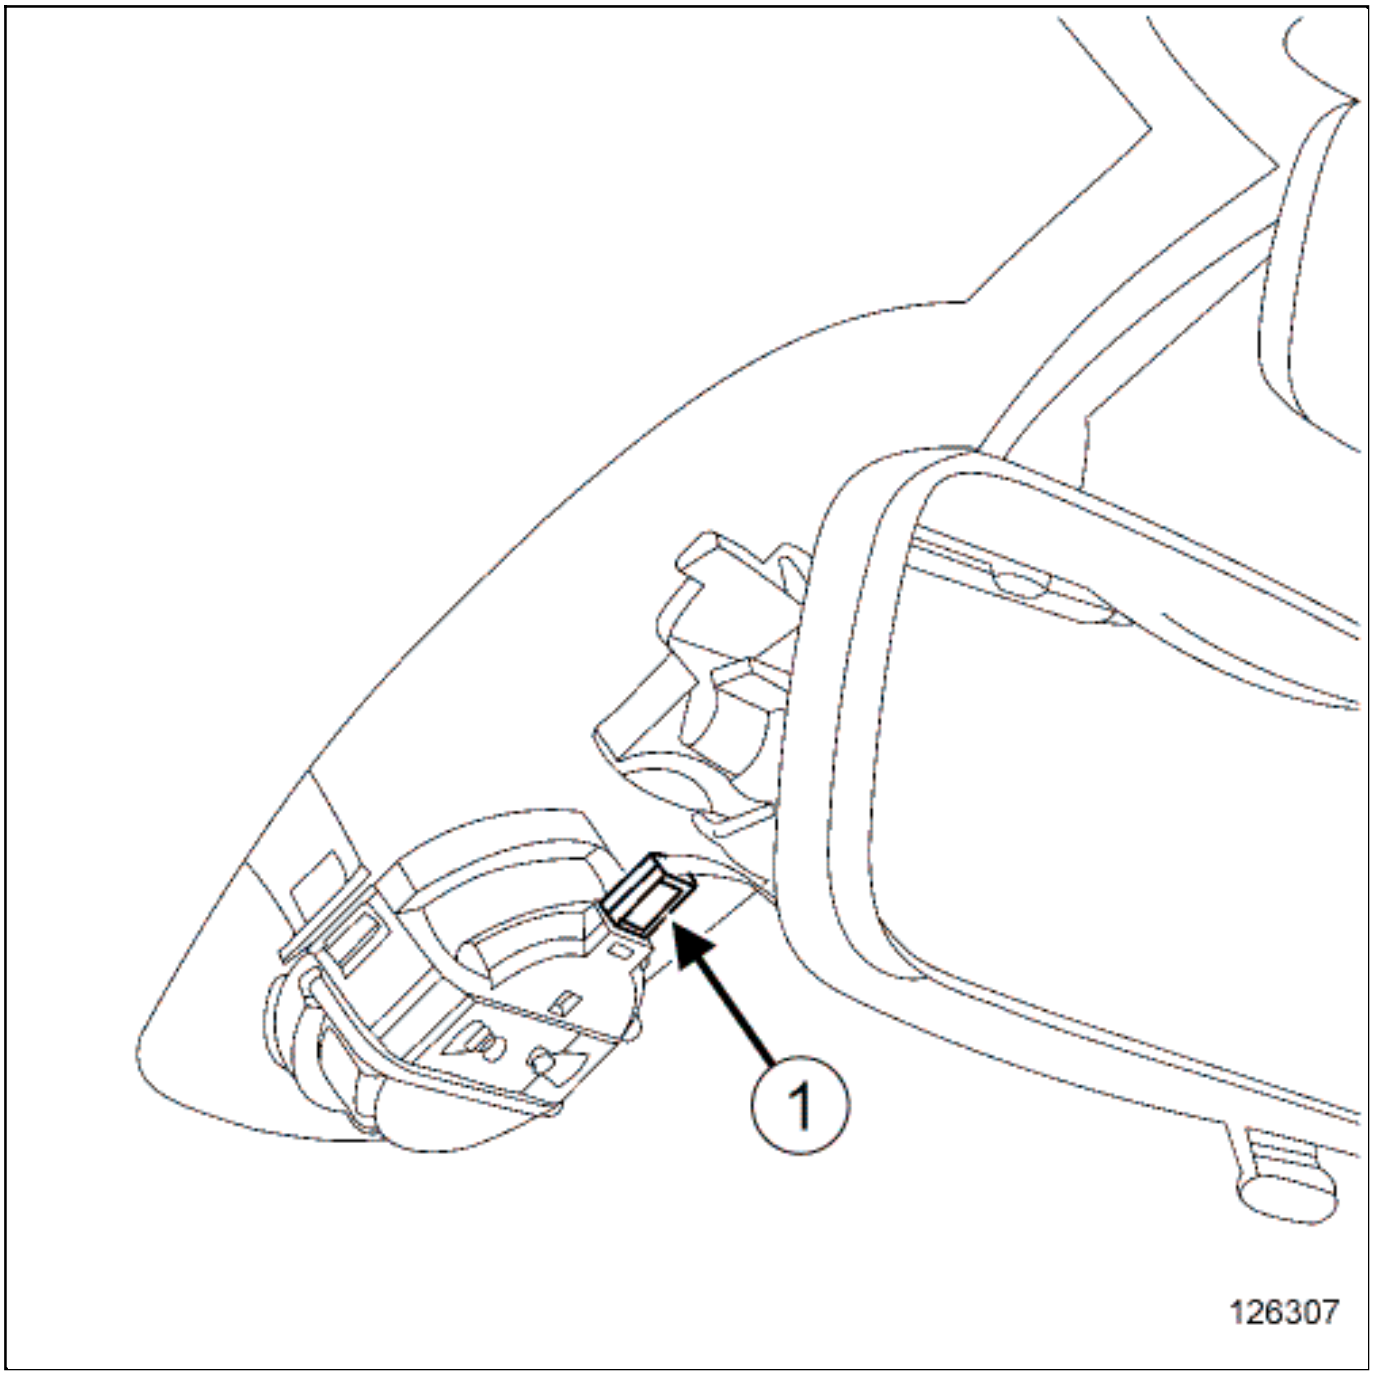
RAIN AND LIGHT SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Set of trim removal levers.	Car. 1363

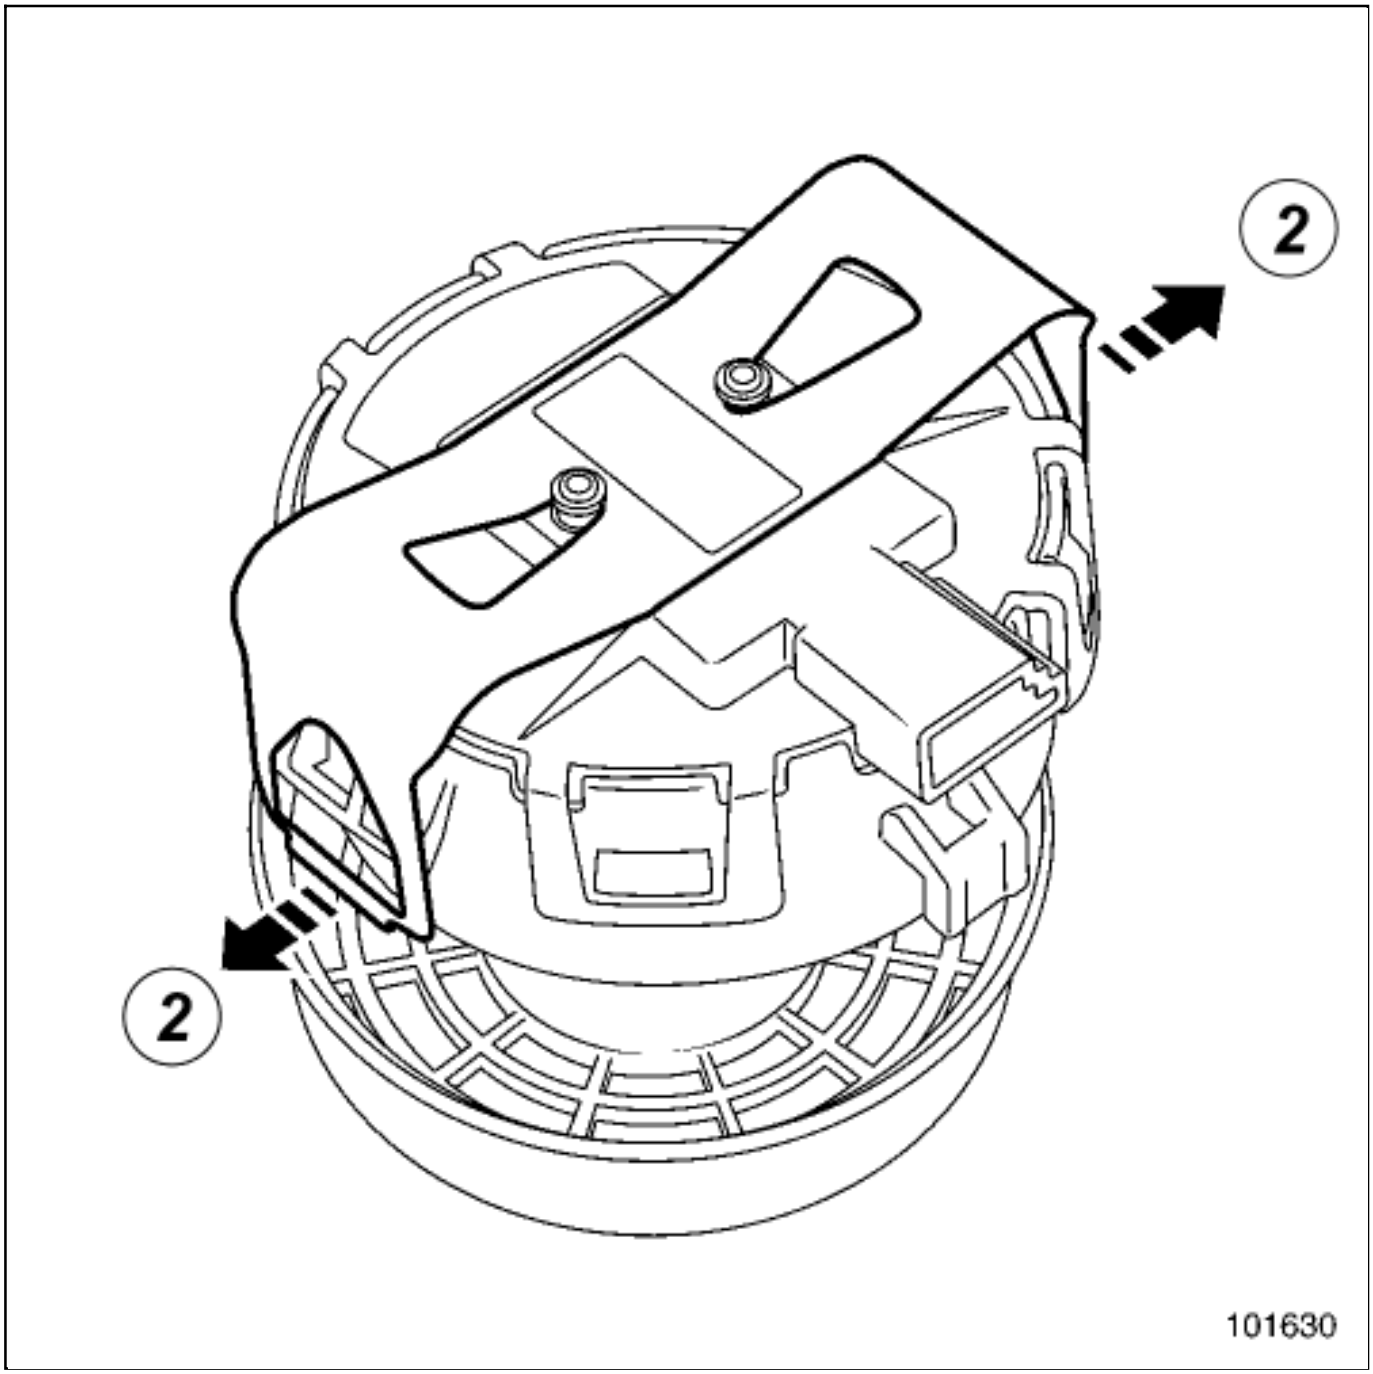
Note:

The rain and light sensor also controls the solar radiation function depending on the vehicle equipment level.



REMOVAL

1. REMOVAL PREPARATION OPERATION



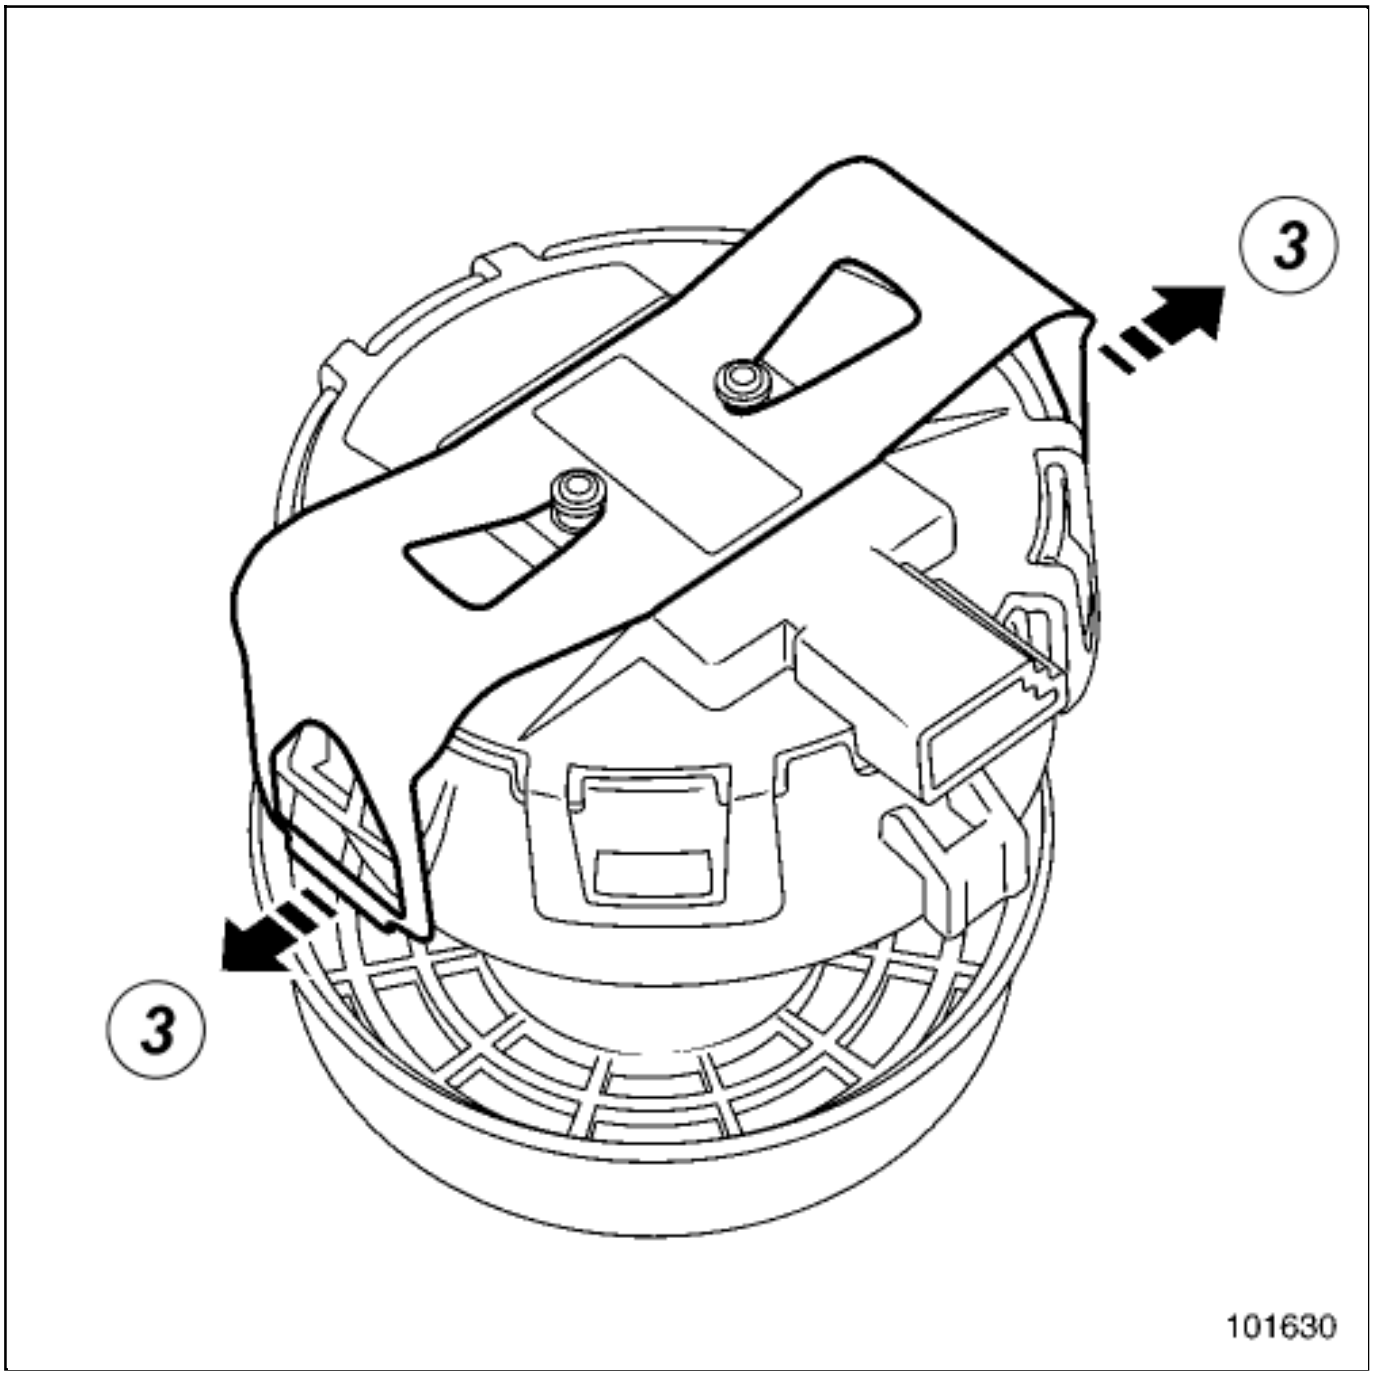
- Switch off the ignition.
- Unclip the covers under the door mirror using theSet of trim removal levers.(Car. 1363) .
- Disconnect the connectors.

2. REMOVAL OPERATION

1- REPLACING THE RAIN AND LIGHT SENSOR

Disconnect the rain and light sensor connector.

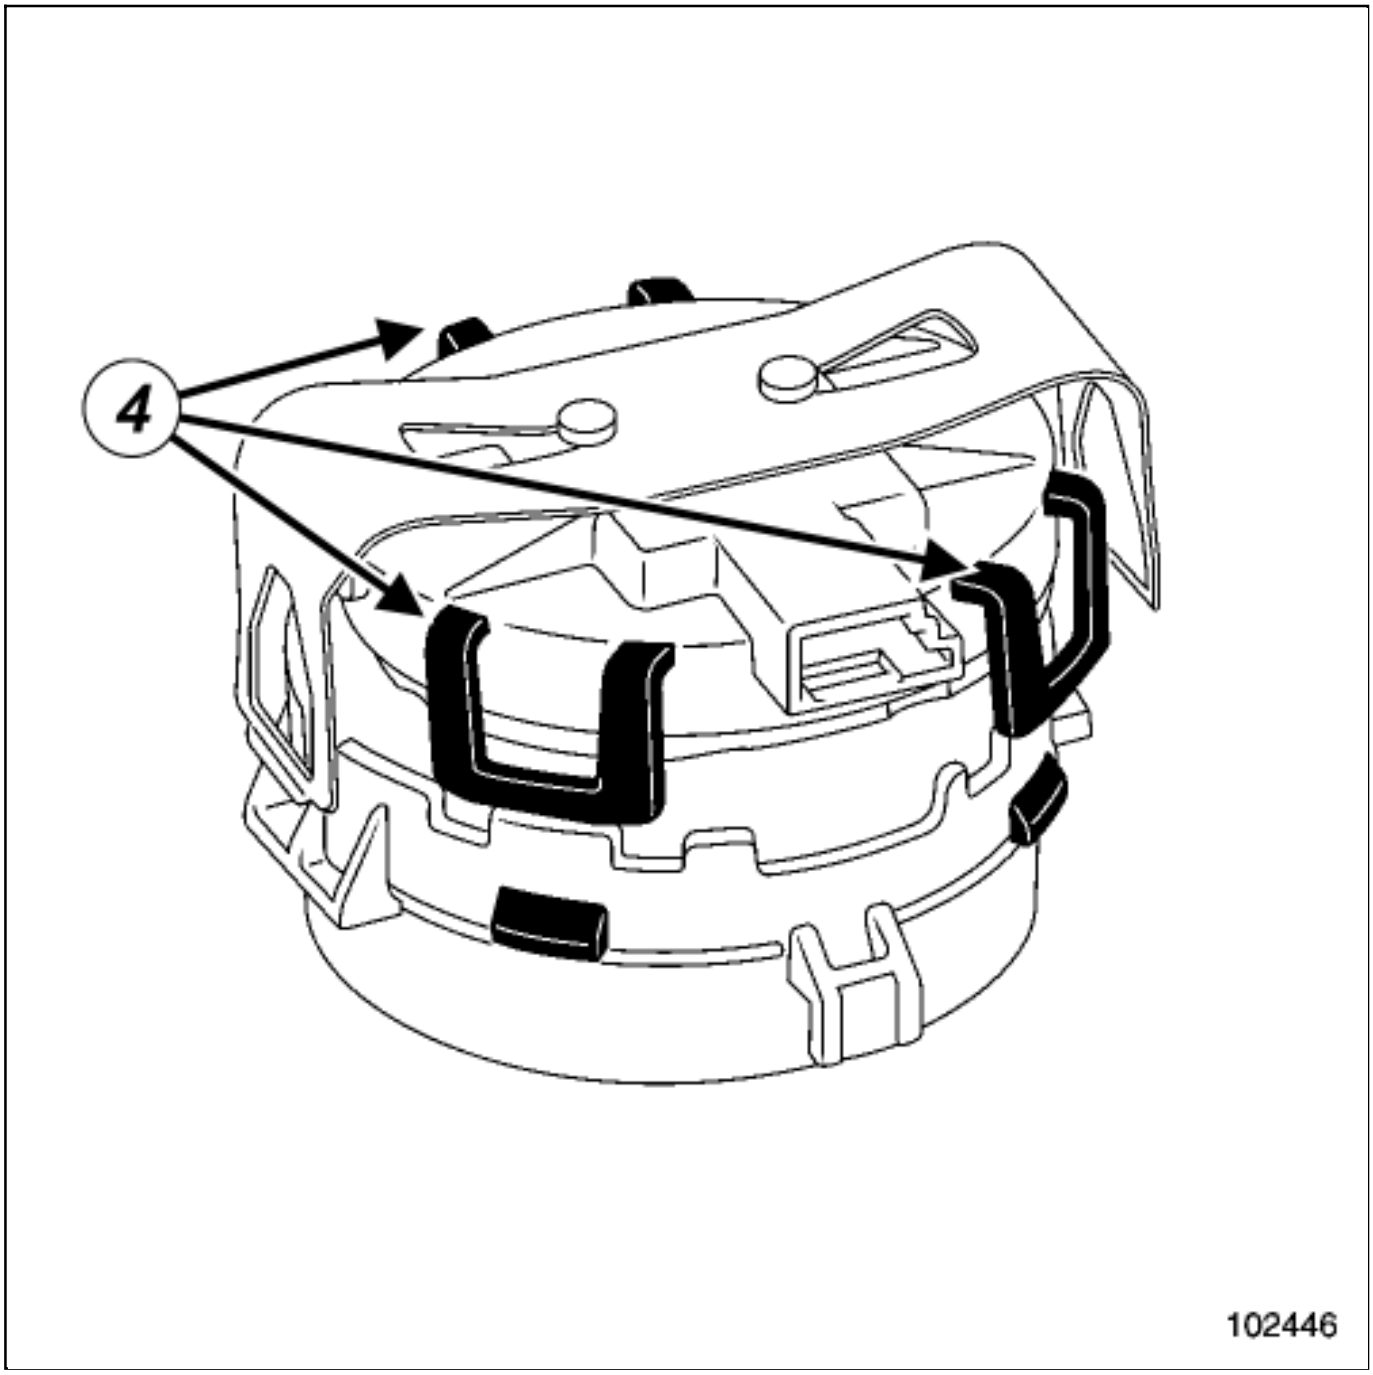
Unclip the two side clips(2) from the rain and light sensor using theSet of trim removal levers. (Car. 1363) ,



Remove the rain and light sensor.

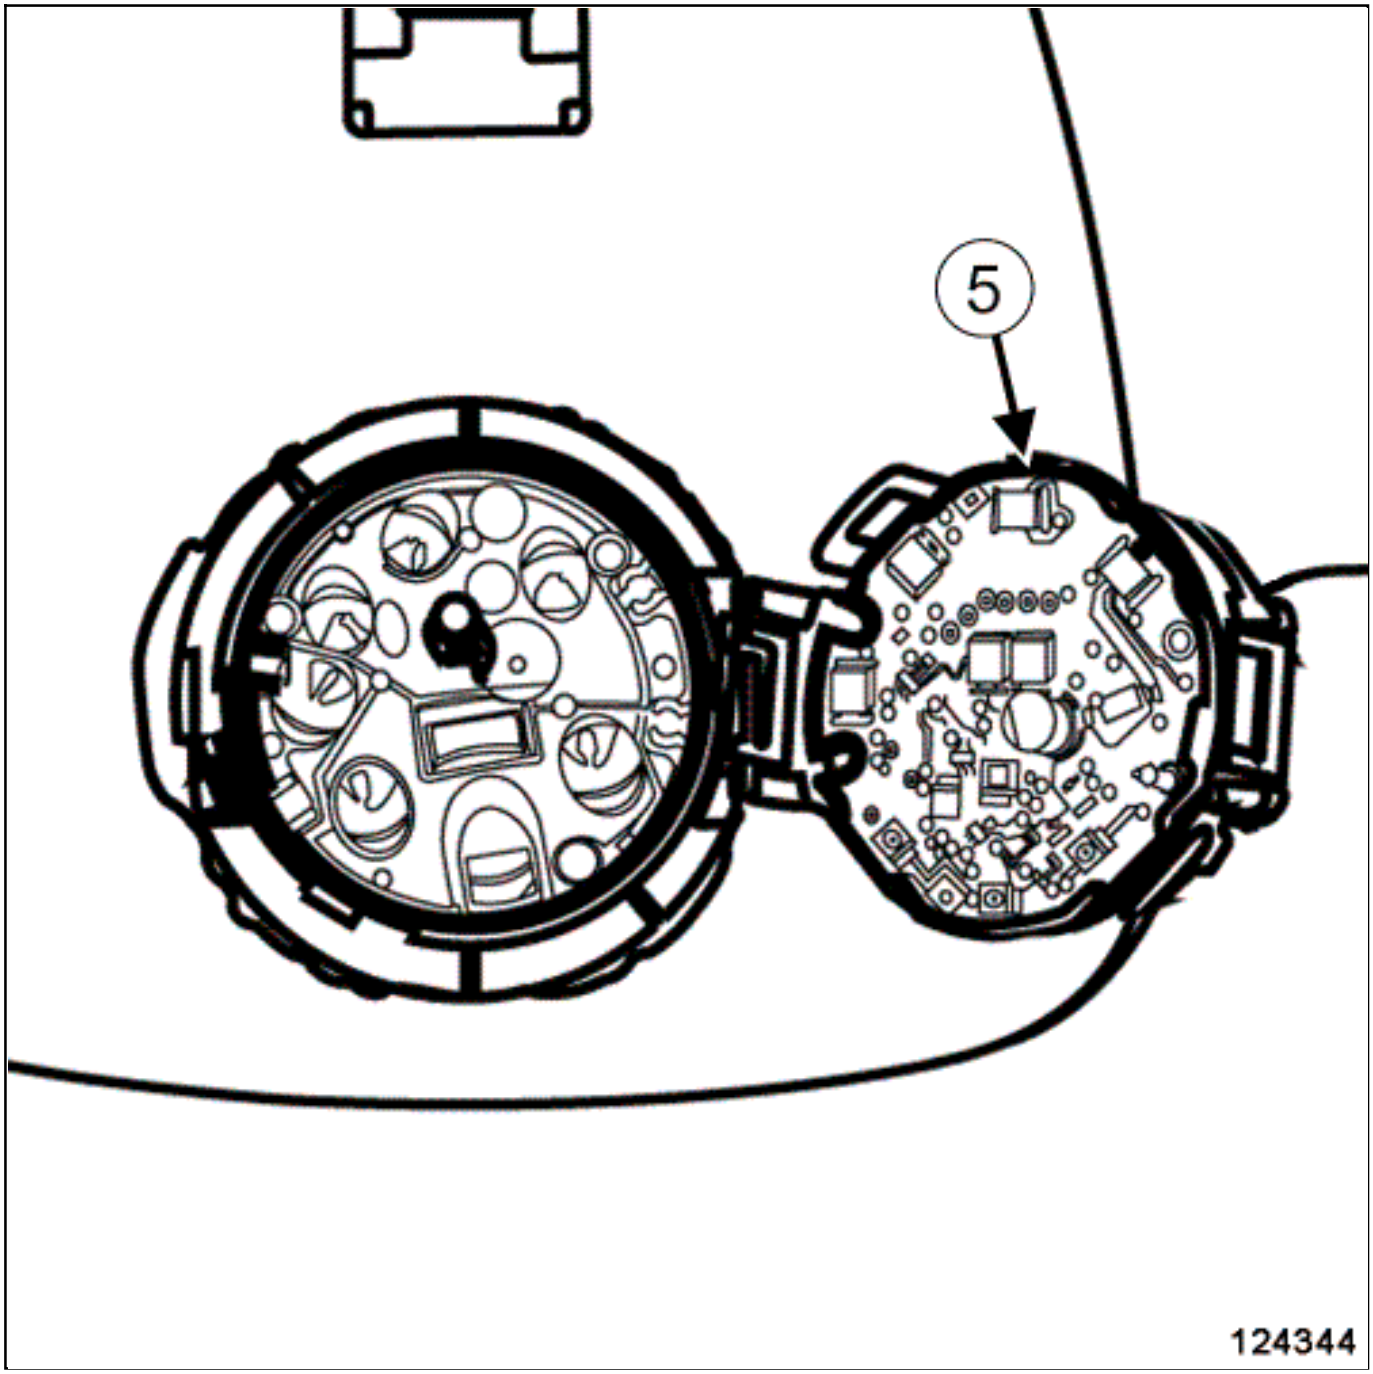
2- REPLACE THE WINDSCREEN

Note:



After the rain and light sensor has been removed, do not reuse the old adhesive base. Use a new adhesive base.

Disconnect the rain and light sensor connector.



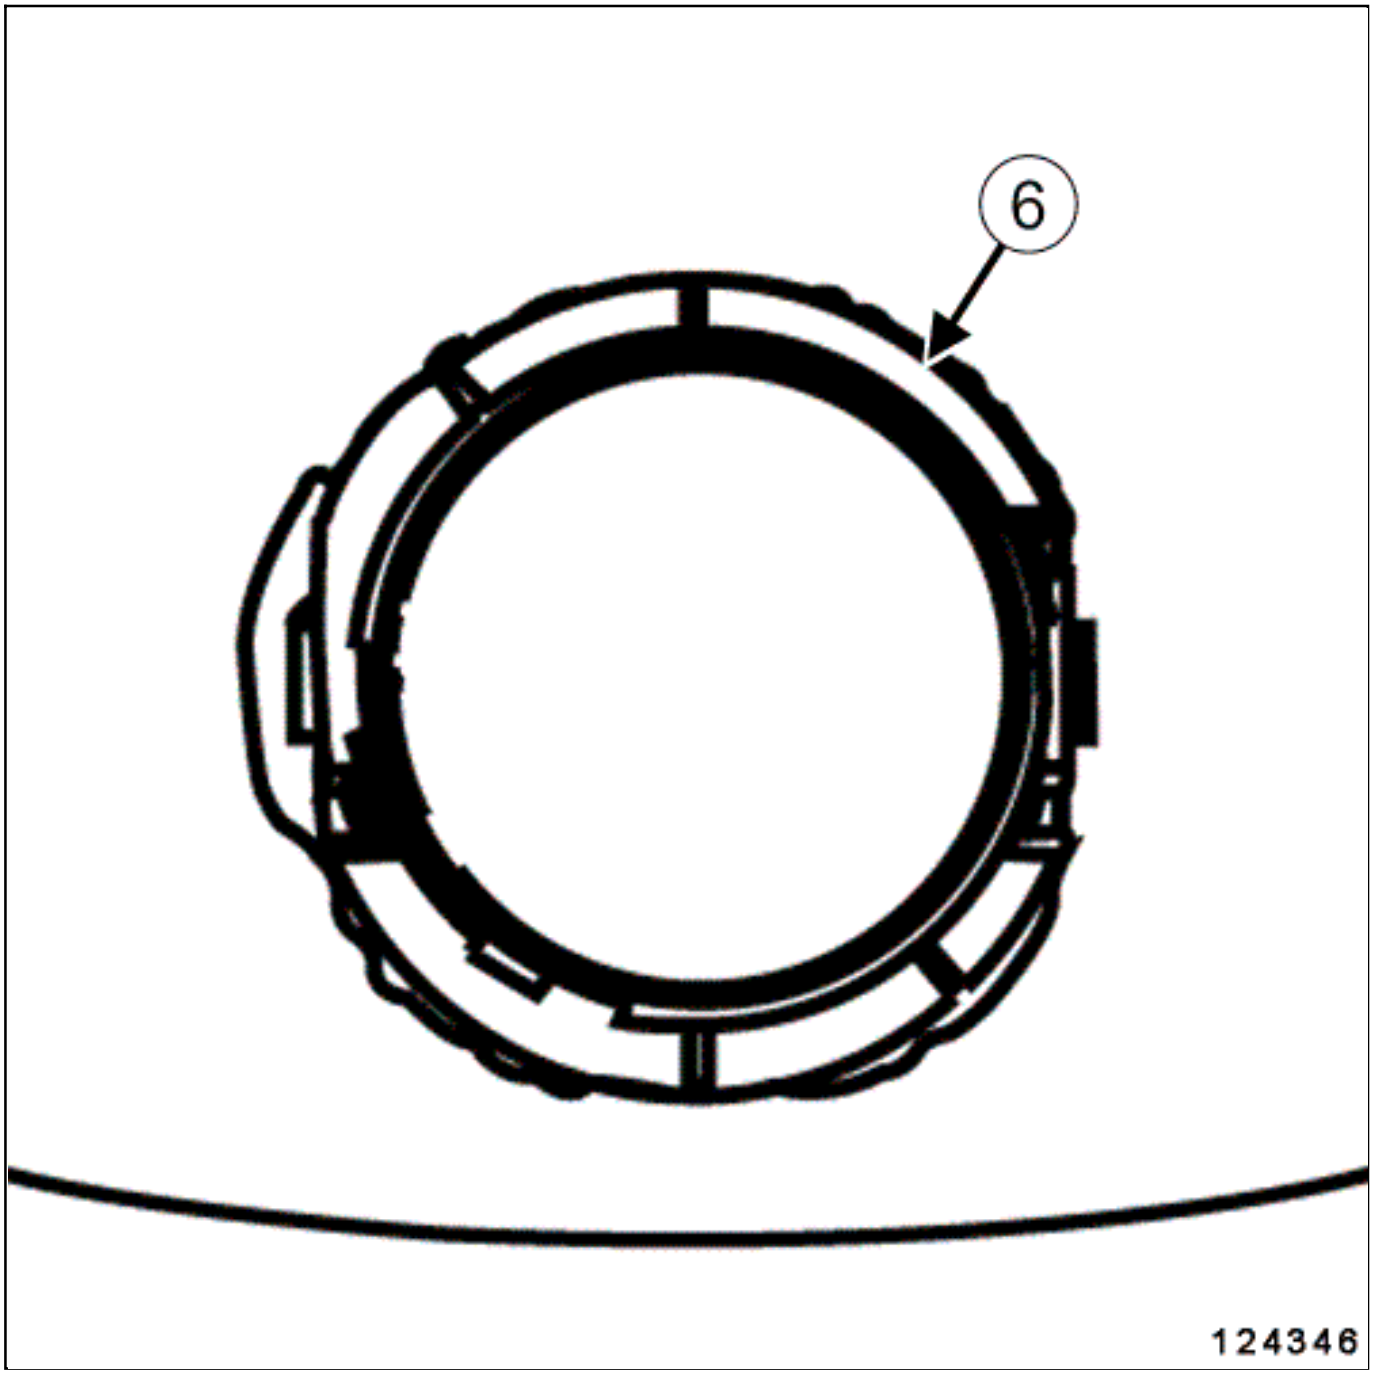
Unclip the side clipsof the rain and light sensor from the base of the windscreen, using the tool

Set of trim removal levers.(Car. 1363) .

Unclip the rain and light sensor's printed circuit unit by pressing on the clips(4) using a small flat-blade screwdriver.

Remove the rain and light sensor's printed circuit unit.

REFITTING



1. REFITTING PREPARATION OPERATION

CAUTION

The rain sensor should be removed and refitted in totally clean conditions: any dust or cloth residue could cause a malfunction.

Do not touch the electronic part of the sensor. Fit the sensor to the vehicle immediately after removing it from its packaging.

1- REPLACING THE RAIN AND LIGHT SENSOR

On the inside of the windscreen, clean the sensor mounting ring(5) using the Set of trim removal levers. (Car. 1363) .

Clean the outside of the windscreen in the area covered by the rain and light sensor.

2. REFITTING OPERATION

Note:

The audible locking of the side clips fixing the rain and light sensor into its mounting ring on the windscreen confirm that it is correctly held and positioned.

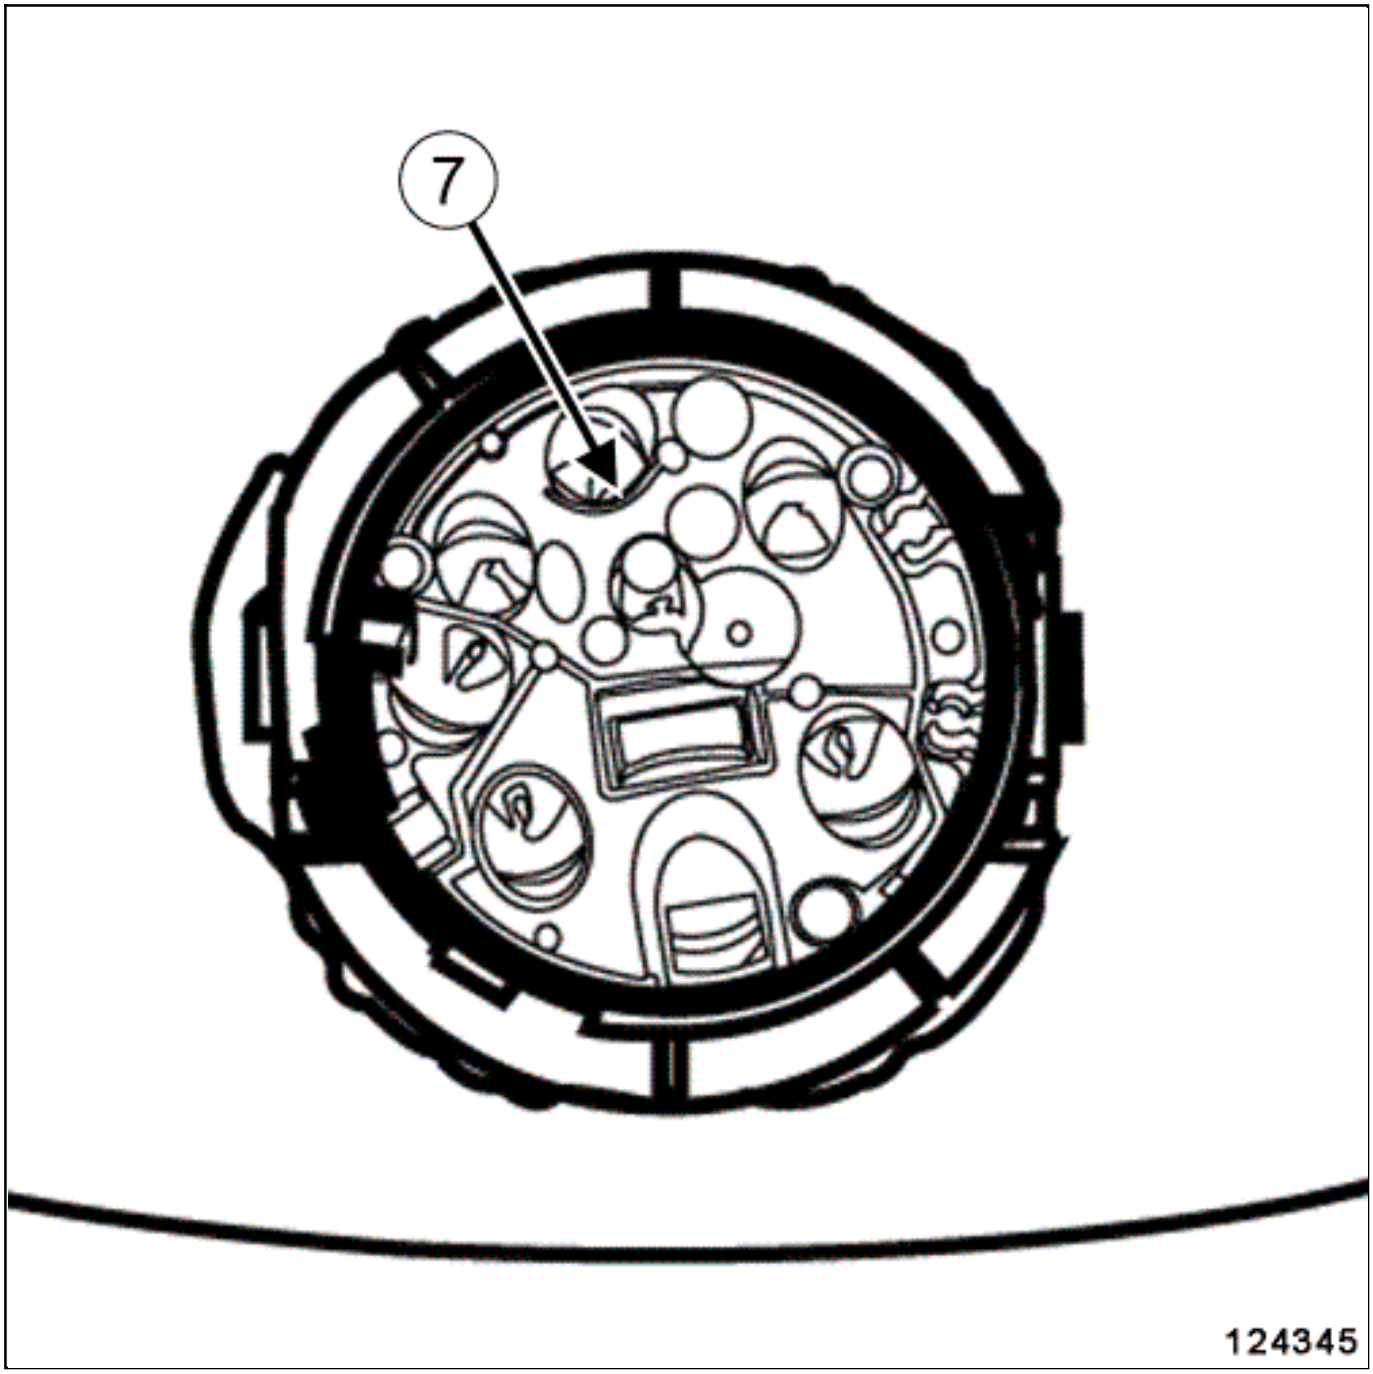
Note:

To avoid damaging the adhesive base, do not turn the rain and light sensor once it is positioned on the windscreen.

Note:

Wait 5 minutes before connecting the rain and light sensor to allow air bubbles between the adhesive base and the windscreen to disperse.

1- REPLACING THE RAIN AND LIGHT SENSOR



Fit the rain and light sensor.

Clip on the side clips of the rain and light sensor.

Wait 5 minutes before connecting the rain and light sensor.

Connect the rain and light sensor connector.

2- REPLACE THE WINDSCREEN

Position the new adhesive base with the transparent light guide(6) towards the bottom.

Position the rain and light sensor's printed circuit unit with the connector at the top.

Clip the rain and light sensor's printed circuit unit onto the new adhesive base.

Clip the rain and light sensor onto the windscreen mounting base using the side clips.

Wait 5 minutes before connecting the rain and light sensor.

Connect the rain and light sensor connector.

3. FINAL OPERATION

Proceed in the reverse order to removal

REAR AXLE ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 33A, Rear axle components, Rear axle components: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

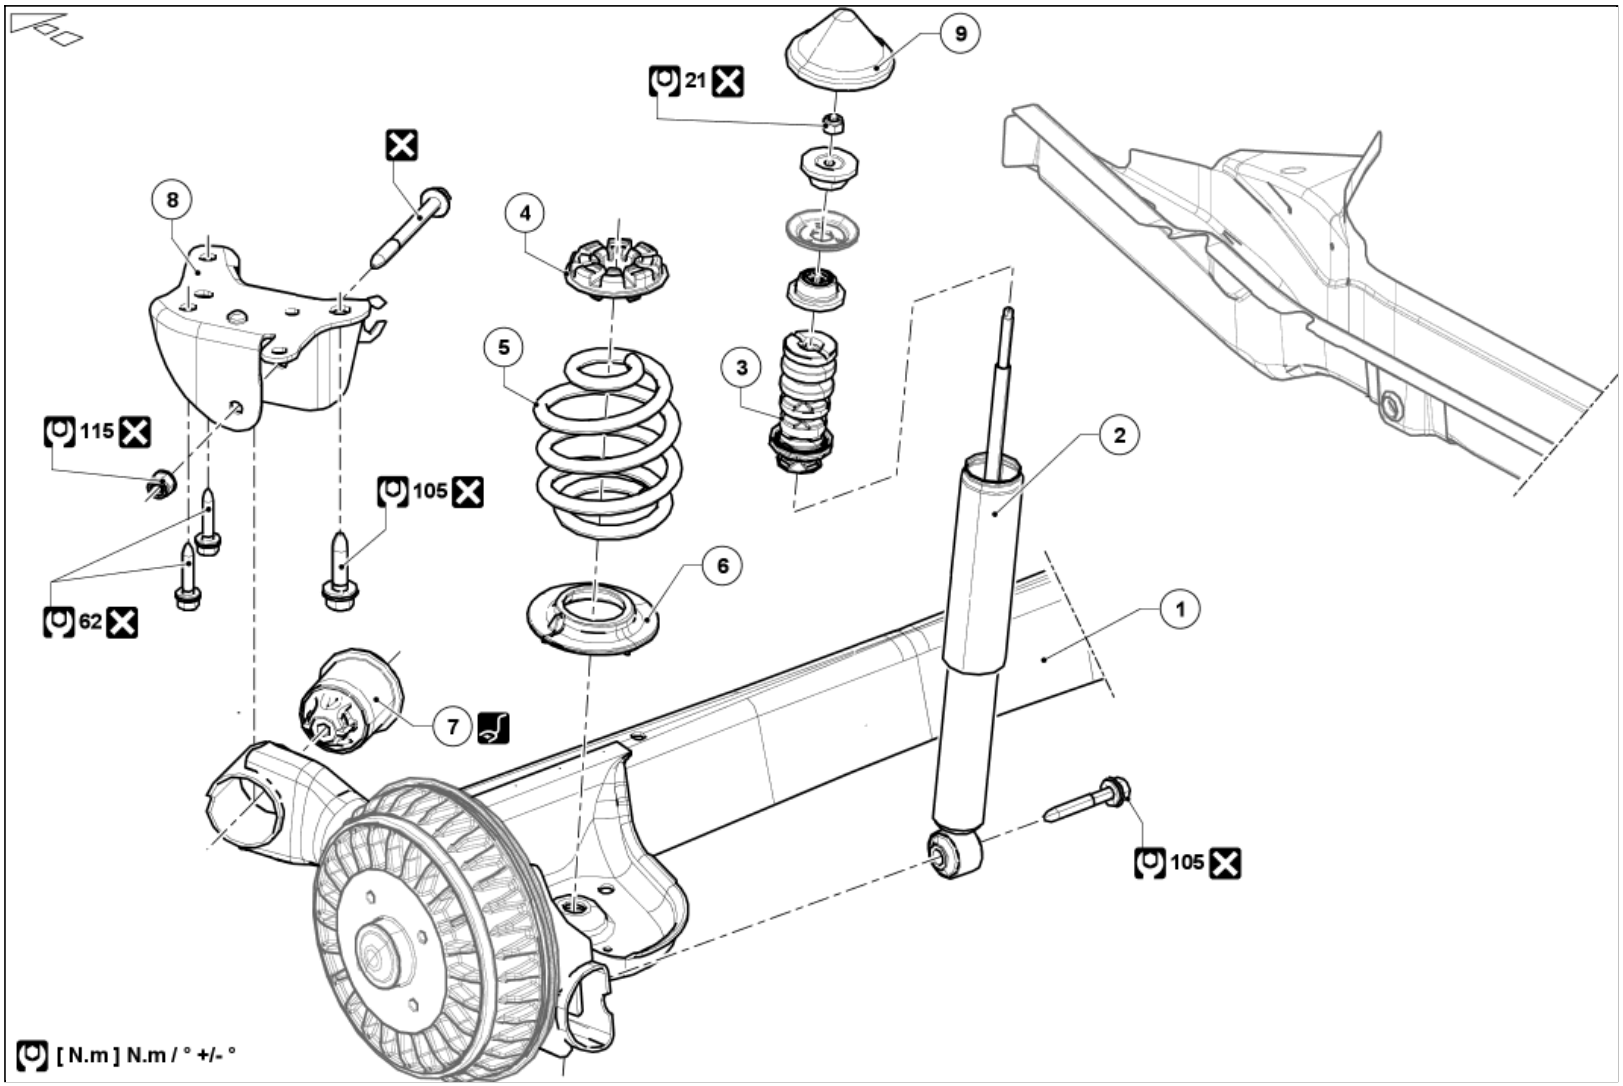


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Rear axle	
2	Rear shock absorber	(see 33A, Rear axle components, Shock absorber: Removal - Refitting)
3	Rear axle stop	
4	Spring upper support	
5	Spring	
6	Spring lower support	
7	Rear axle rubber bearing	(see 33A, Rear axle components, Rear axle rubber bearing: Removal - Refitting) (Tar. 1838)
8	Rear axle bearing	
9	Shock absorber cap	

REAR AXLE COMPONENTS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Do not press on the brake pedal during work on the brake system.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

Brake fluid is highly corrosive. Ensure any brake fluid spilt on parts of the vehicle is cleaned off.

In case of incorrect handling, the brake fluid can cause serious injury and damage. Follow the manufacturer's instructions for brake fluid.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Clean around the braking system with brake cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

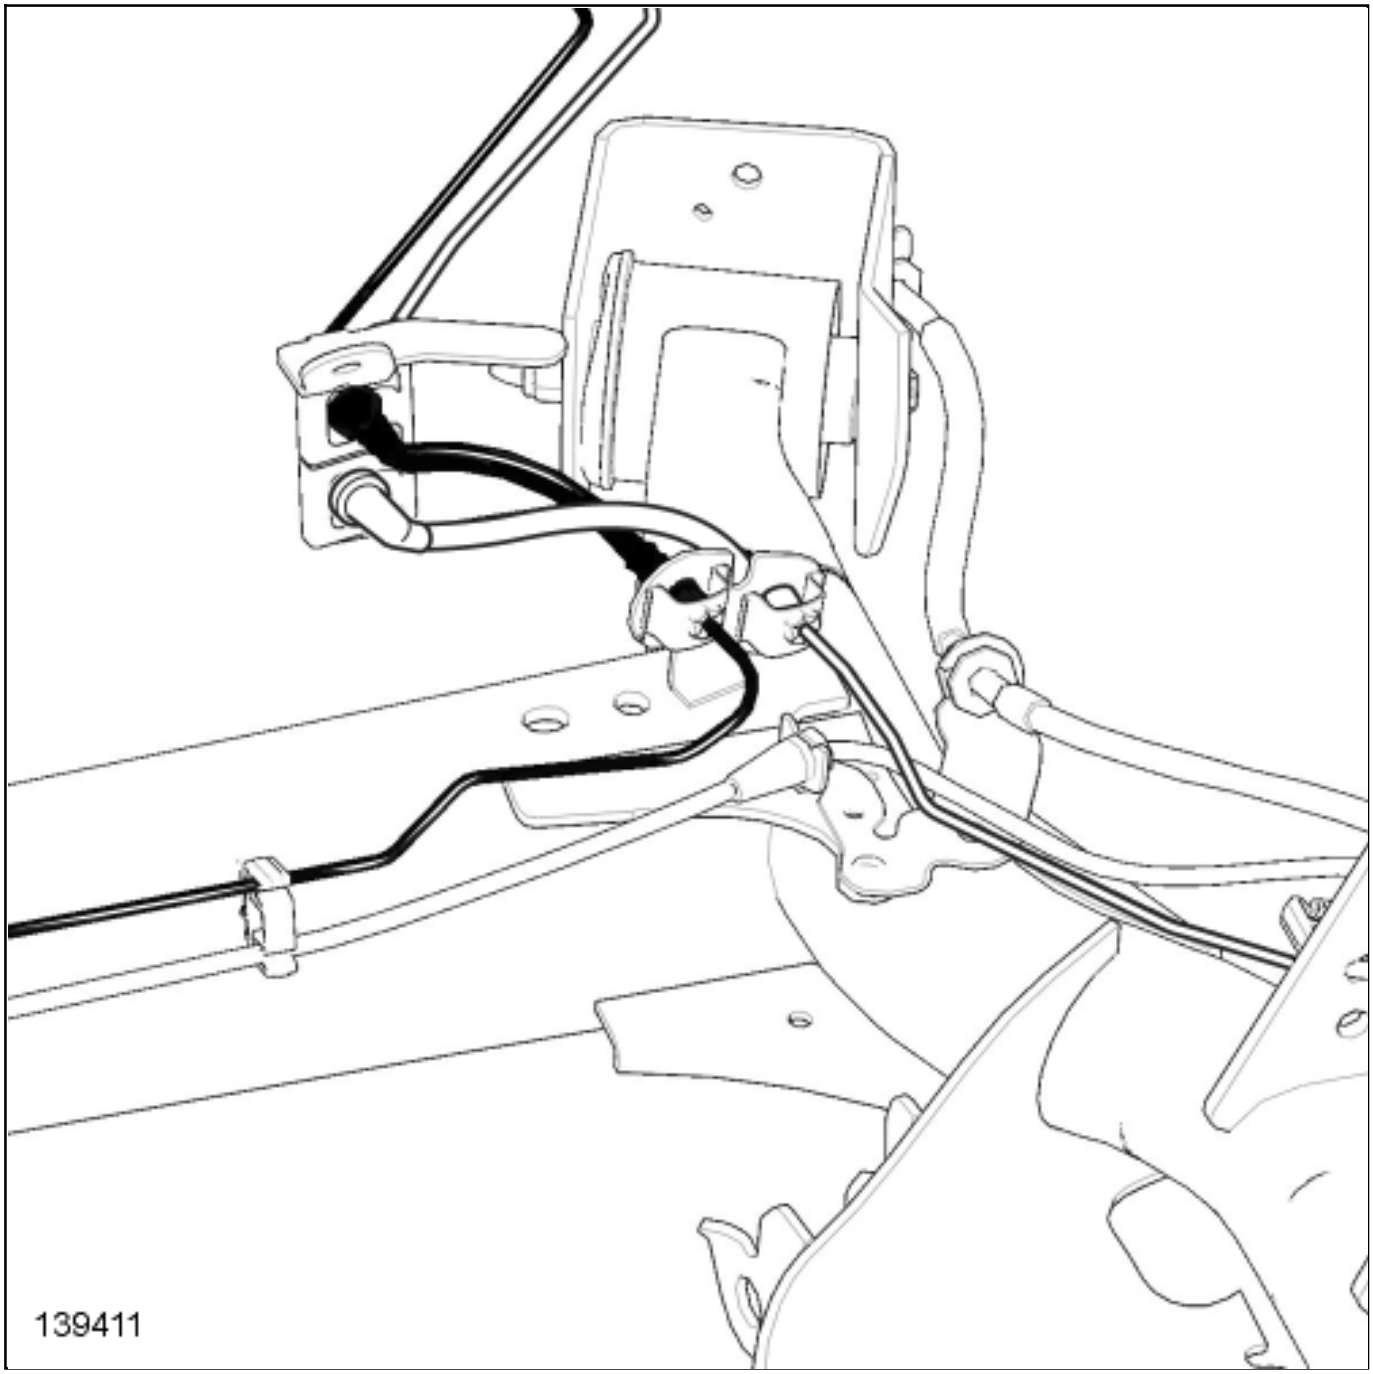
Prepare for the flow of fluid, and protect the surrounding components.

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

3. GENERAL RECOMMENDATIONS

1- BRAKING

When replacing brake pads, be sure to replace the pads on the opposite side.



When replacing a disc, always replace the disc on the opposite side.

When replacing brake discs, you must replace the brake pads.

CAUTION

To avoid damaging the parking brake cable protectors and causing premature wear of the system, do not handle the cables with a tool.

WARNING

To ensure that the ABS and ESP systems operate correctly, check that the underbody brake pipes are clipped in place and are not crossed.

WARNING

In order not to disrupt the ESP system and cause an accident, do not swap the connection of the brake pipes and hoses.

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

It is essential to replace the rigid brake pipe clips.

WARNING

To avoid brake imbalance, both drums must be of the same diameter. Regrinding one drum necessitates regrinding of the opposite drum.

2- BEARING, STUB AXLE CARRIER

It is essential to check the condition of the bearing surface and the stub-axle carrier before refitting the bearing.

CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target on the bearing.

Use surface cleaner[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products) to clean:

- the inner surface of the new bearing, in contact with the rear stub-axle,
- the rear stub-axle surface in contact with the new bearing.

3-SUSPENSION SPRING

When replacing the spring, make sure it is positioned the right way round.

When replacing a spring, always replace the spring on the opposite side.

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks and tightening or positioning clamps should be equipped with rubber or plastic in order to avoid damage on the springs.

It is recommended to replace springs if:

- the paint is damaged,
- there are dents on the spring.

CAUTION

To prevent the suspension spring from prematurely breaking, do not damage the anti-corrosion protection.

4- REAR AXLE

CAUTION

To prevent any damage, do not use the rear axle as support for the lifting system.

CAUTION

To prevent the components of the rear axle from deteriorating (rubber bushes, brake hoses, etc.) do not remove the two shock absorbers at the same time. Proceed one side at a time.

REAR AXLE COMPONENTS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Do not press on the brake pedal during work on the brake system.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

Brake fluid is highly corrosive. Ensure any brake fluid spilt on parts of the vehicle is cleaned off.

In case of incorrect handling, the brake fluid can cause serious injury and damage. Follow the manufacturer's instructions for brake fluid.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Clean around the braking system with brake cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

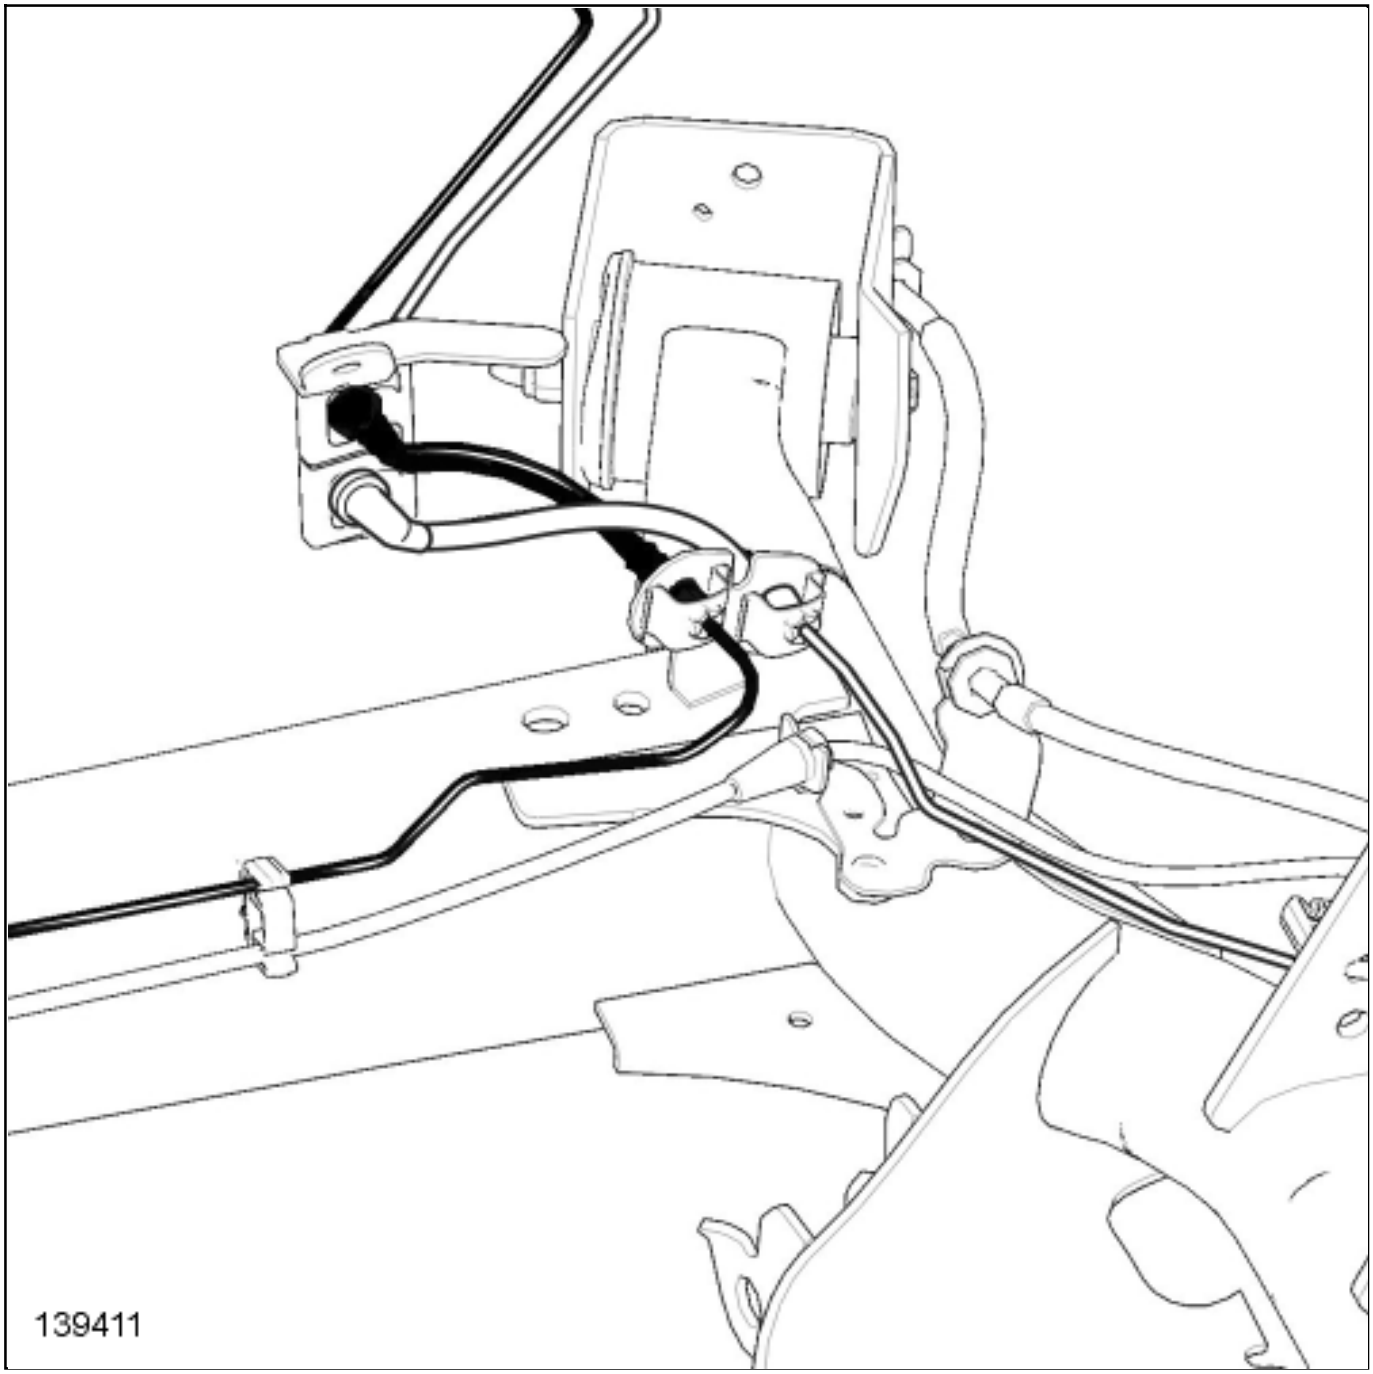
Prepare for the flow of fluid, and protect the surrounding components.

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

3. GENERAL RECOMMENDATIONS

1- BRAKING

When replacing brake pads, be sure to replace the pads on the opposite side.



When replacing a disc, always replace the disc on the opposite side.

When replacing brake discs, you must replace the brake pads.

CAUTION

To avoid damaging the parking brake cable protectors and causing premature wear of the system, do not handle the cables with a tool.

WARNING

To ensure that the ABS and ESP systems operate correctly, check that the underbody brake pipes are clipped in place and are not crossed.

WARNING

In order not to disrupt the ESP system and cause an accident, do not swap the connection of the brake pipes and hoses.

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

It is essential to replace the rigid brake pipe clips.

WARNING

To avoid brake imbalance, both drums must be of the same diameter. Regrinding one drum necessitates regrinding of the opposite drum.

2- BEARING, STUB AXLE CARRIER

It is essential to check the condition of the bearing surface and the stub-axle carrier before refitting the bearing.

CAUTION

To ensure that the wheel speed sensor works properly, do not mark the sensor target on the bearing.

Use surface cleaner[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products) to clean:

- the inner surface of the new bearing, in contact with the rear stub-axle,
- the rear stub-axle surface in contact with the new bearing.

3-SUSPENSION SPRING

When replacing the spring, make sure it is positioned the right way round.

When replacing a spring, always replace the spring on the opposite side.

During assembly and removing operations, the surface and the protection paint must not be damaged.

There must be no impacts during operations. Any handling hooks and tightening or positioning clamps should be equipped with rubber or plastic in order to avoid damage on the springs.

It is recommended to replace springs if:

- the paint is damaged,
- there are dents on the spring.

CAUTION

To prevent the suspension spring from prematurely breaking, do not damage the anti-corrosion protection.

4- REAR AXLE

CAUTION

To prevent any damage, do not use the rear axle as support for the lifting system.

CAUTION

To prevent the components of the rear axle from deteriorating (rubber bushes, brake hoses, etc.) do not remove the two shock absorbers at the same time. Proceed one side at a time.

REAR AXLE RUBBER BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for removing and refitting rear axle rubber bushes	

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

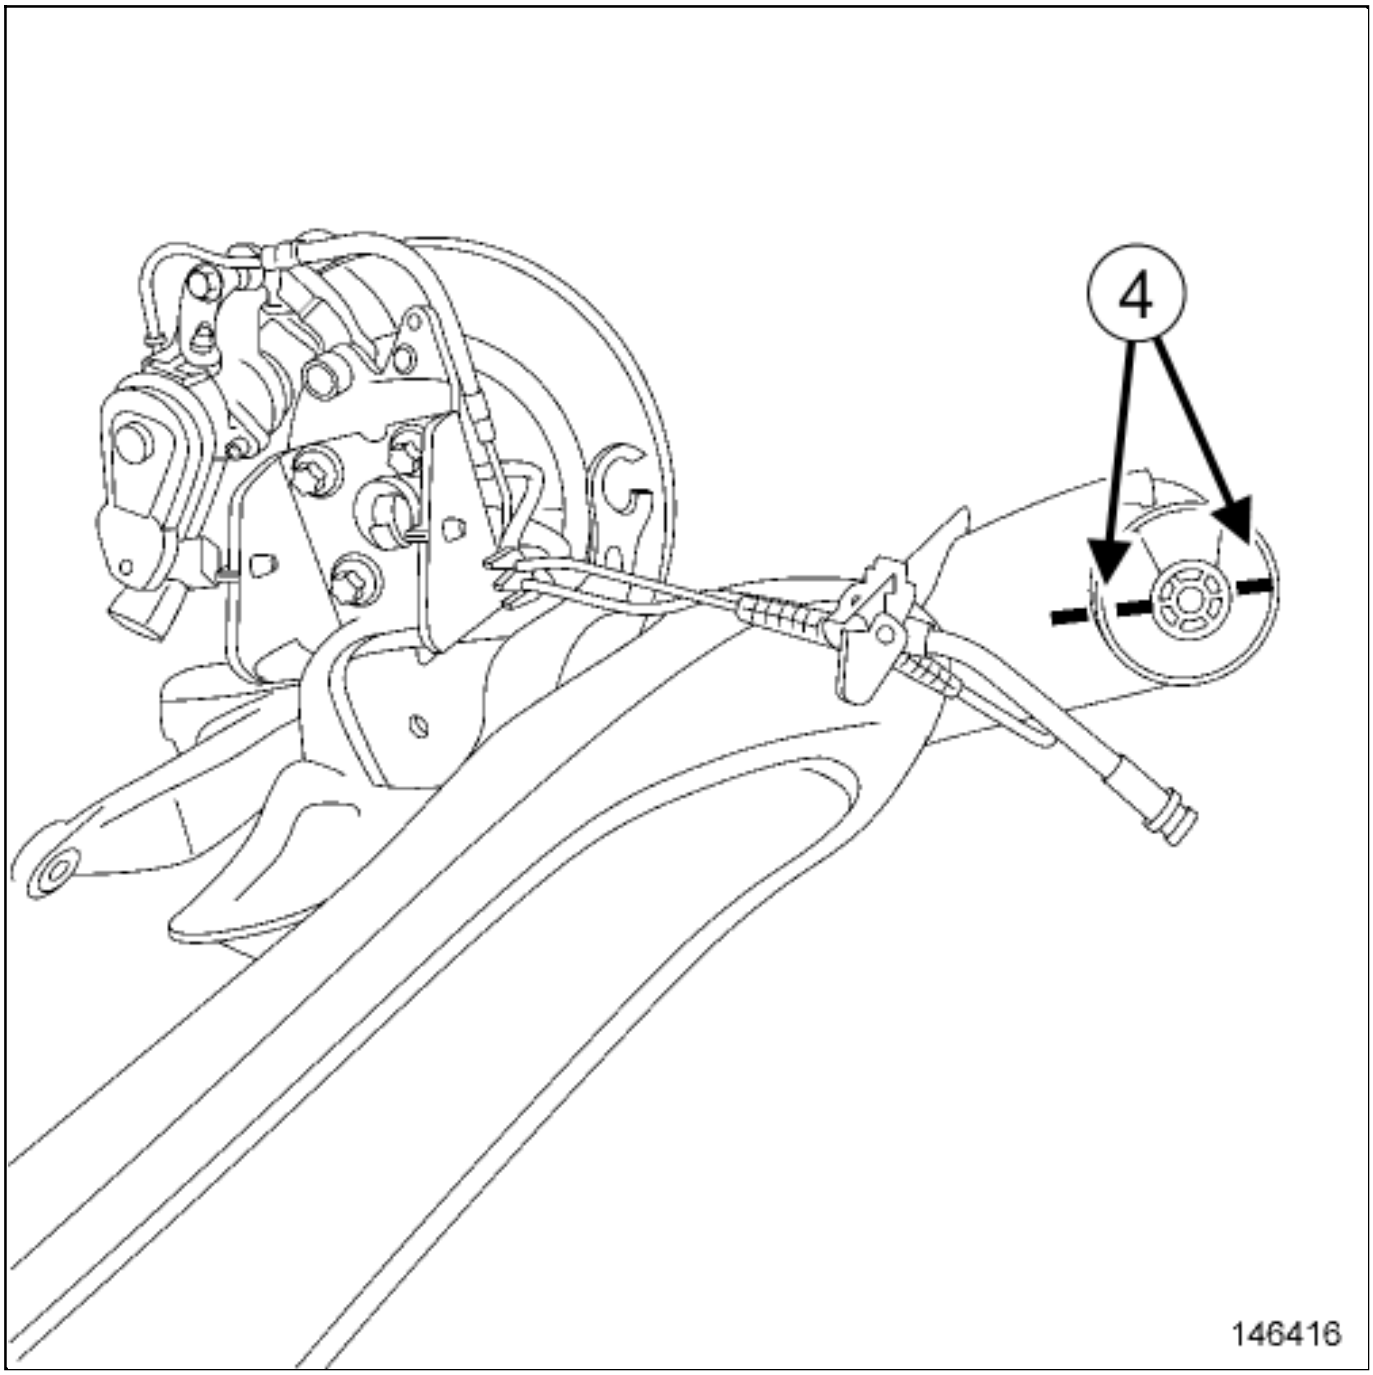
(see 33A, Rear axle components, Rear axle components: Precautions for the repair) ,

Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 33A, Rear axle components, Rear axle assembly: Exploded view) .

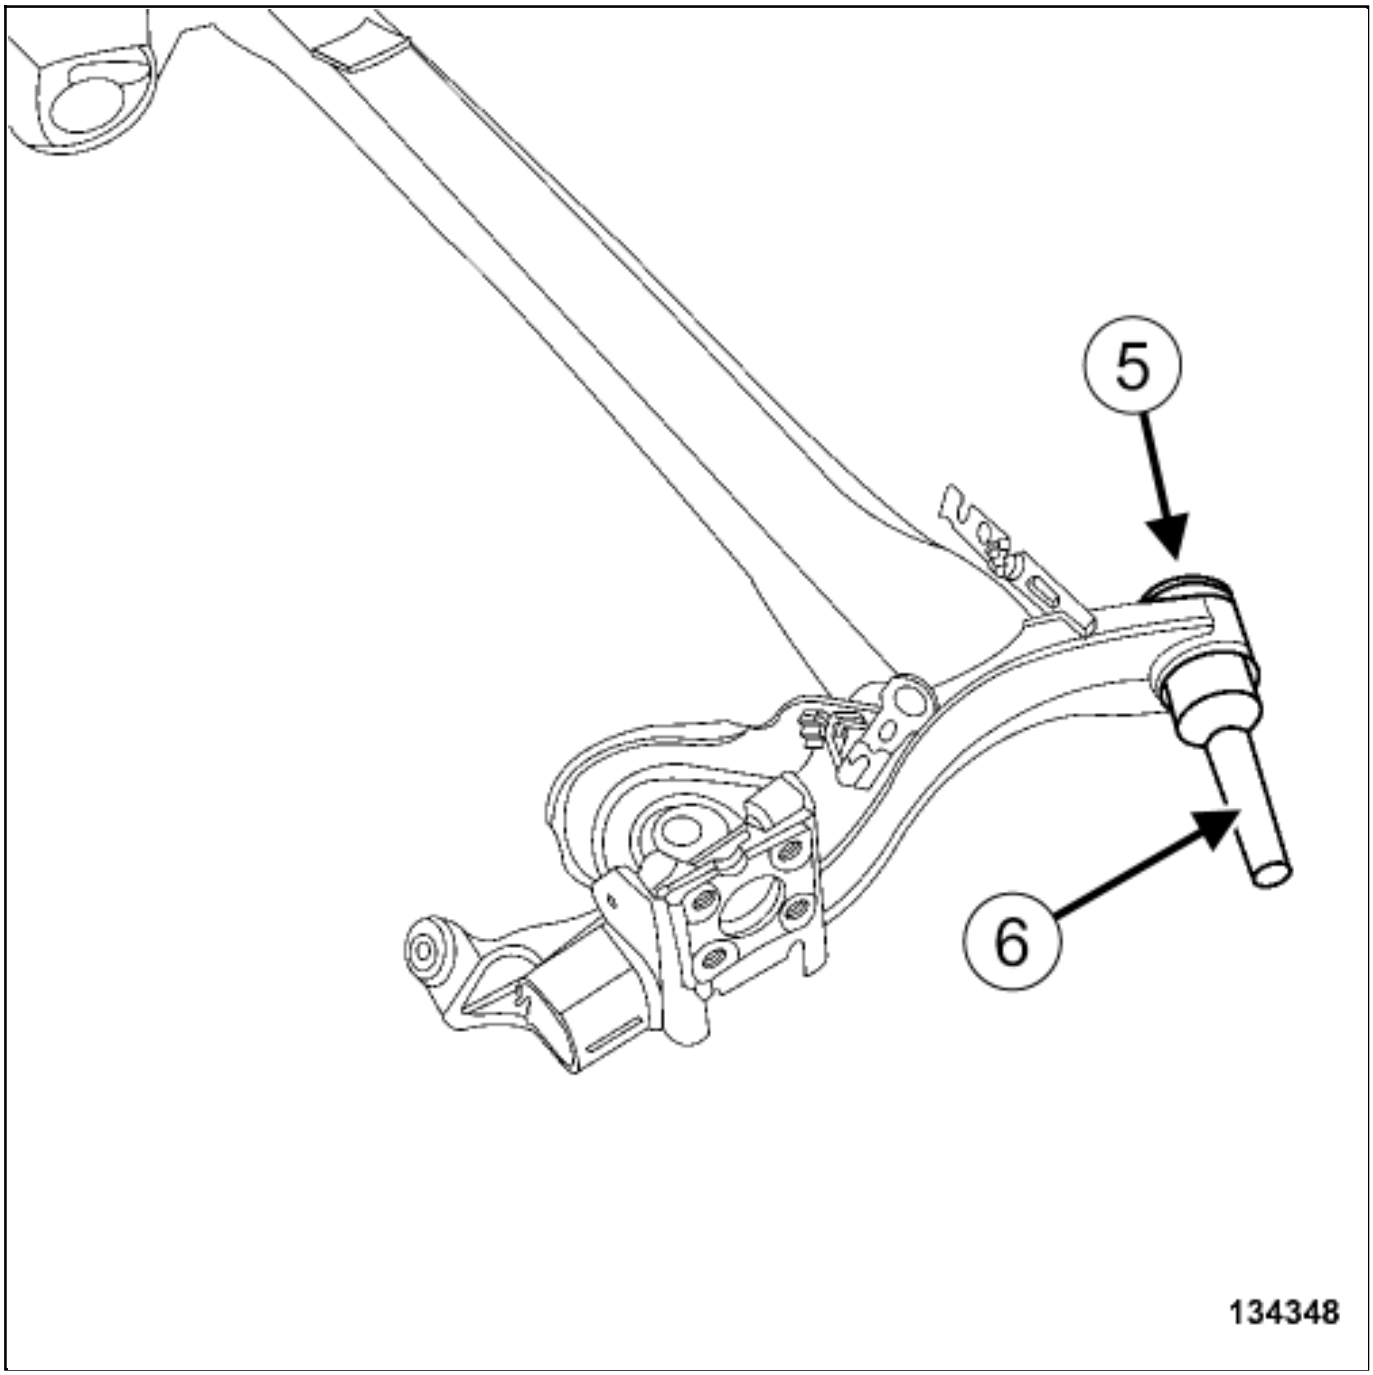
REMOVAL

1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove the rear wheelsWheel: Removal - Refitting .

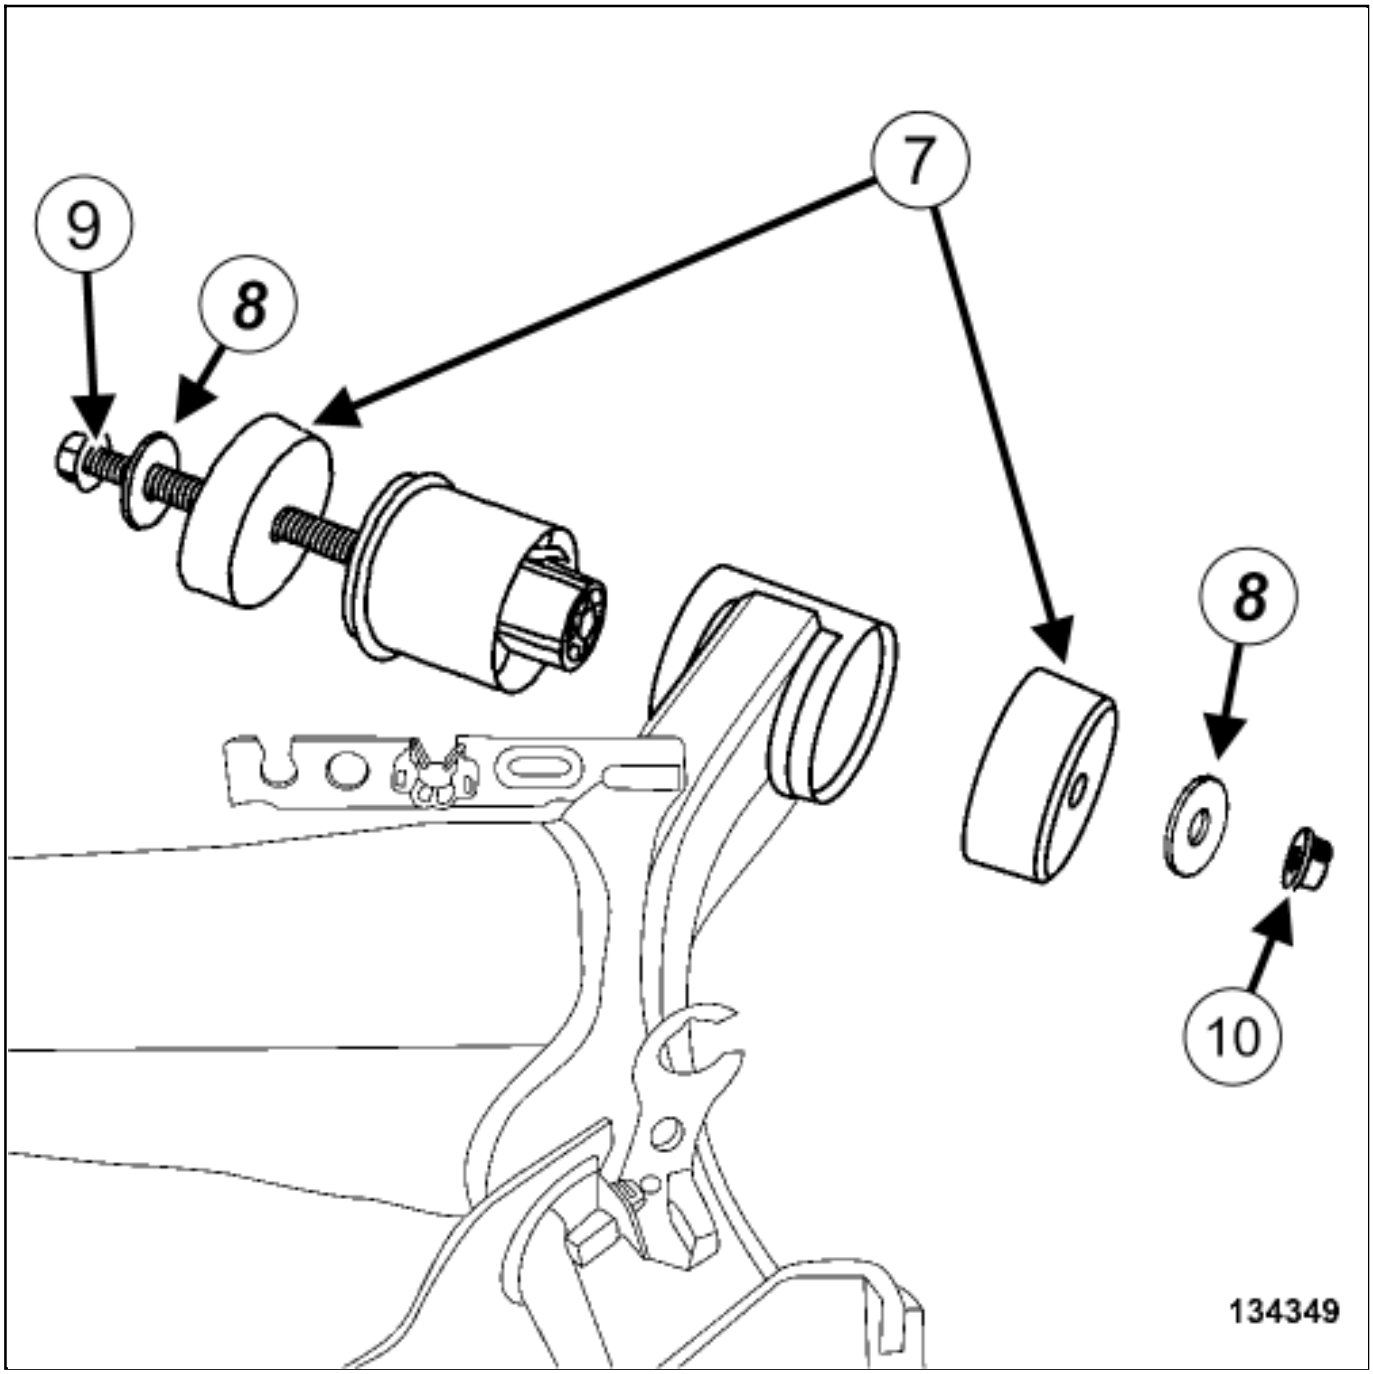


Remove the rear wheel arch liners.

Remove the rear axle(see 33A, Rear axle components, Rear axle assembly: Exploded view) .

2. REMOVAL OPERATION

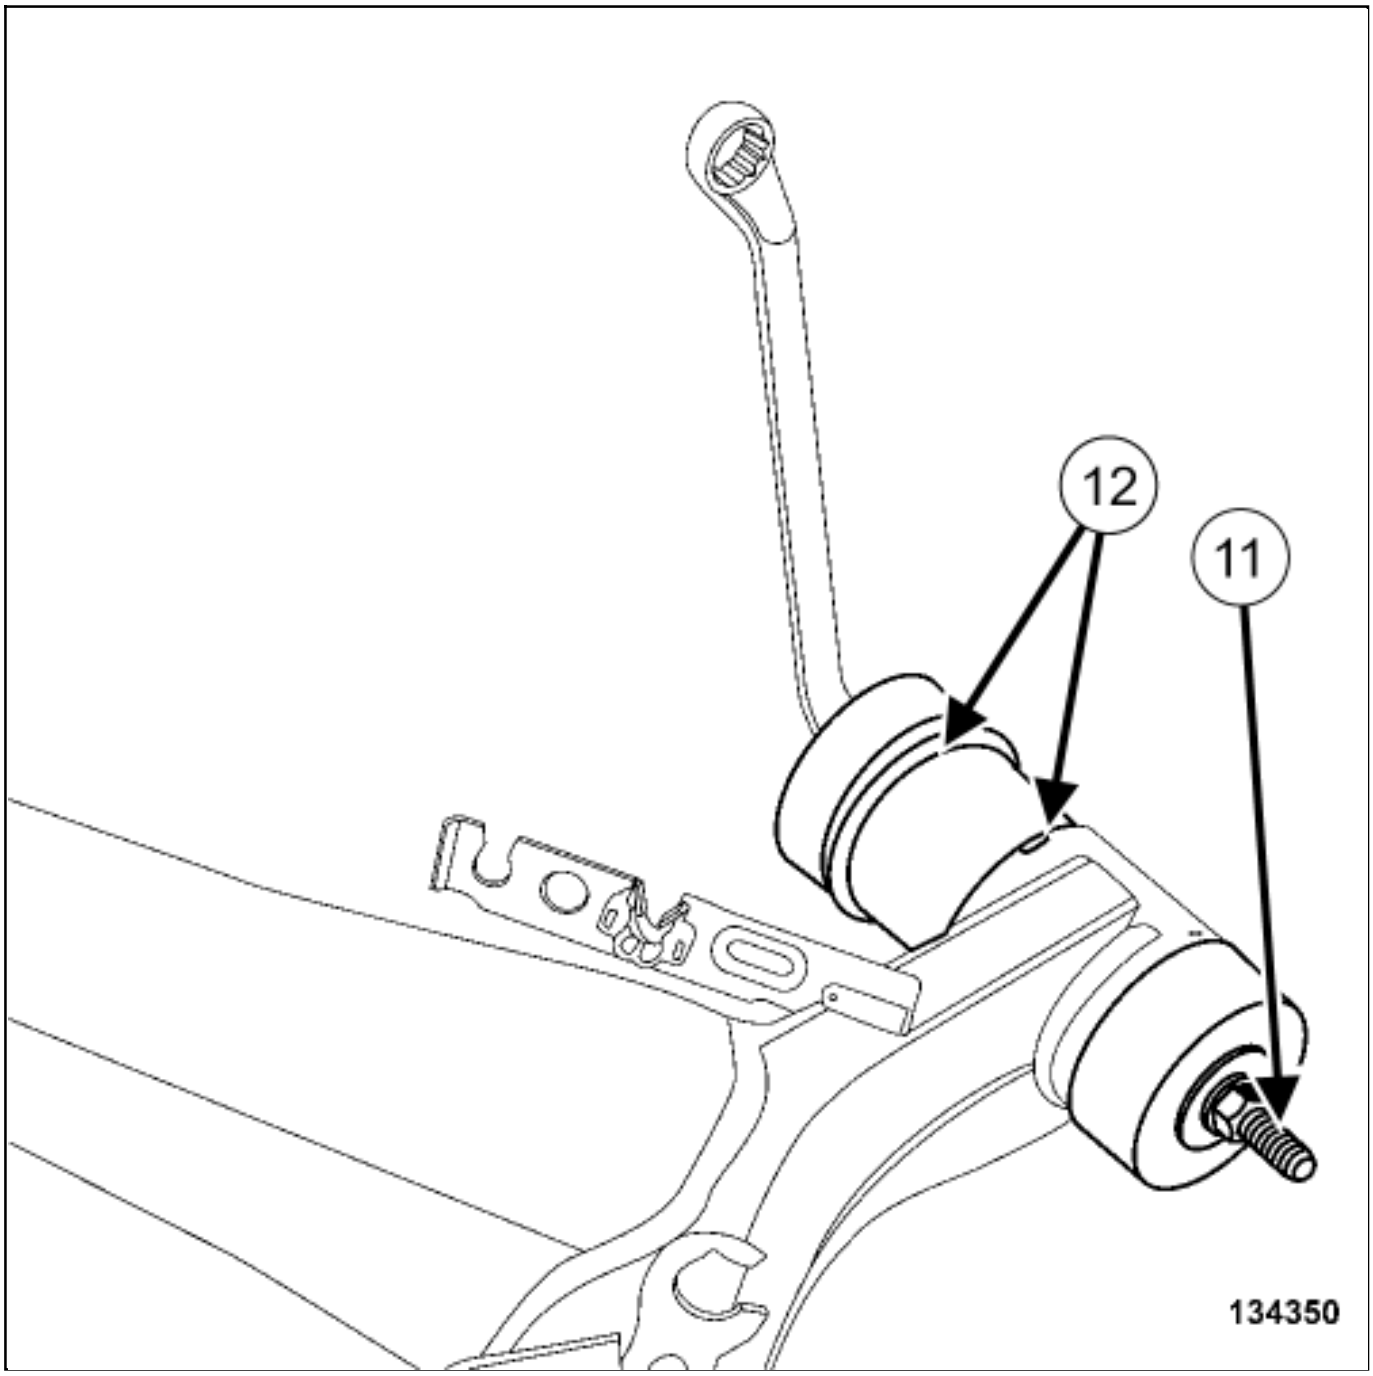
Make a mark(4) on the rear axle for positioning the rubber bearing.



Remove the rubber bushes(5) by hitting them with a hammer and the bush castor of the toolTool for removing and refitting rear axle rubber bushes(6) .

REFITTING

1. REFITTING OPERATION



Position the rubber bush so as to align the paint marks of the new rubber bush and the mark made previously on the rear axle.

Fit:

- the covers of the toolTool for removing and refitting rear axle rubber bushes(7) ,
- the threaded rod of the toolTool for removing and refitting rear axle rubber bushes(9) ,
- the washer of the toolTool for removing and refitting rear axle rubber bushes(8) ,

the nut of the toolTool for removing and refitting rear axle rubber bushes(10) .

Tighten the rod (11) of the toolTool for removing and refitting rear axle rubber bushes until the cover comes into contact with the rear axle.

Check that the marks are still aligned at(12) .

Torque tighten the cover nut16 N.m.

Remove the toolTool for removing and refitting rear axle rubber bushes .

2. FINAL OPERATION

Proceed in the reverse order to removal.

REAR AXLE

REAR BRAKE LINING: REMOVAL - REFITTING

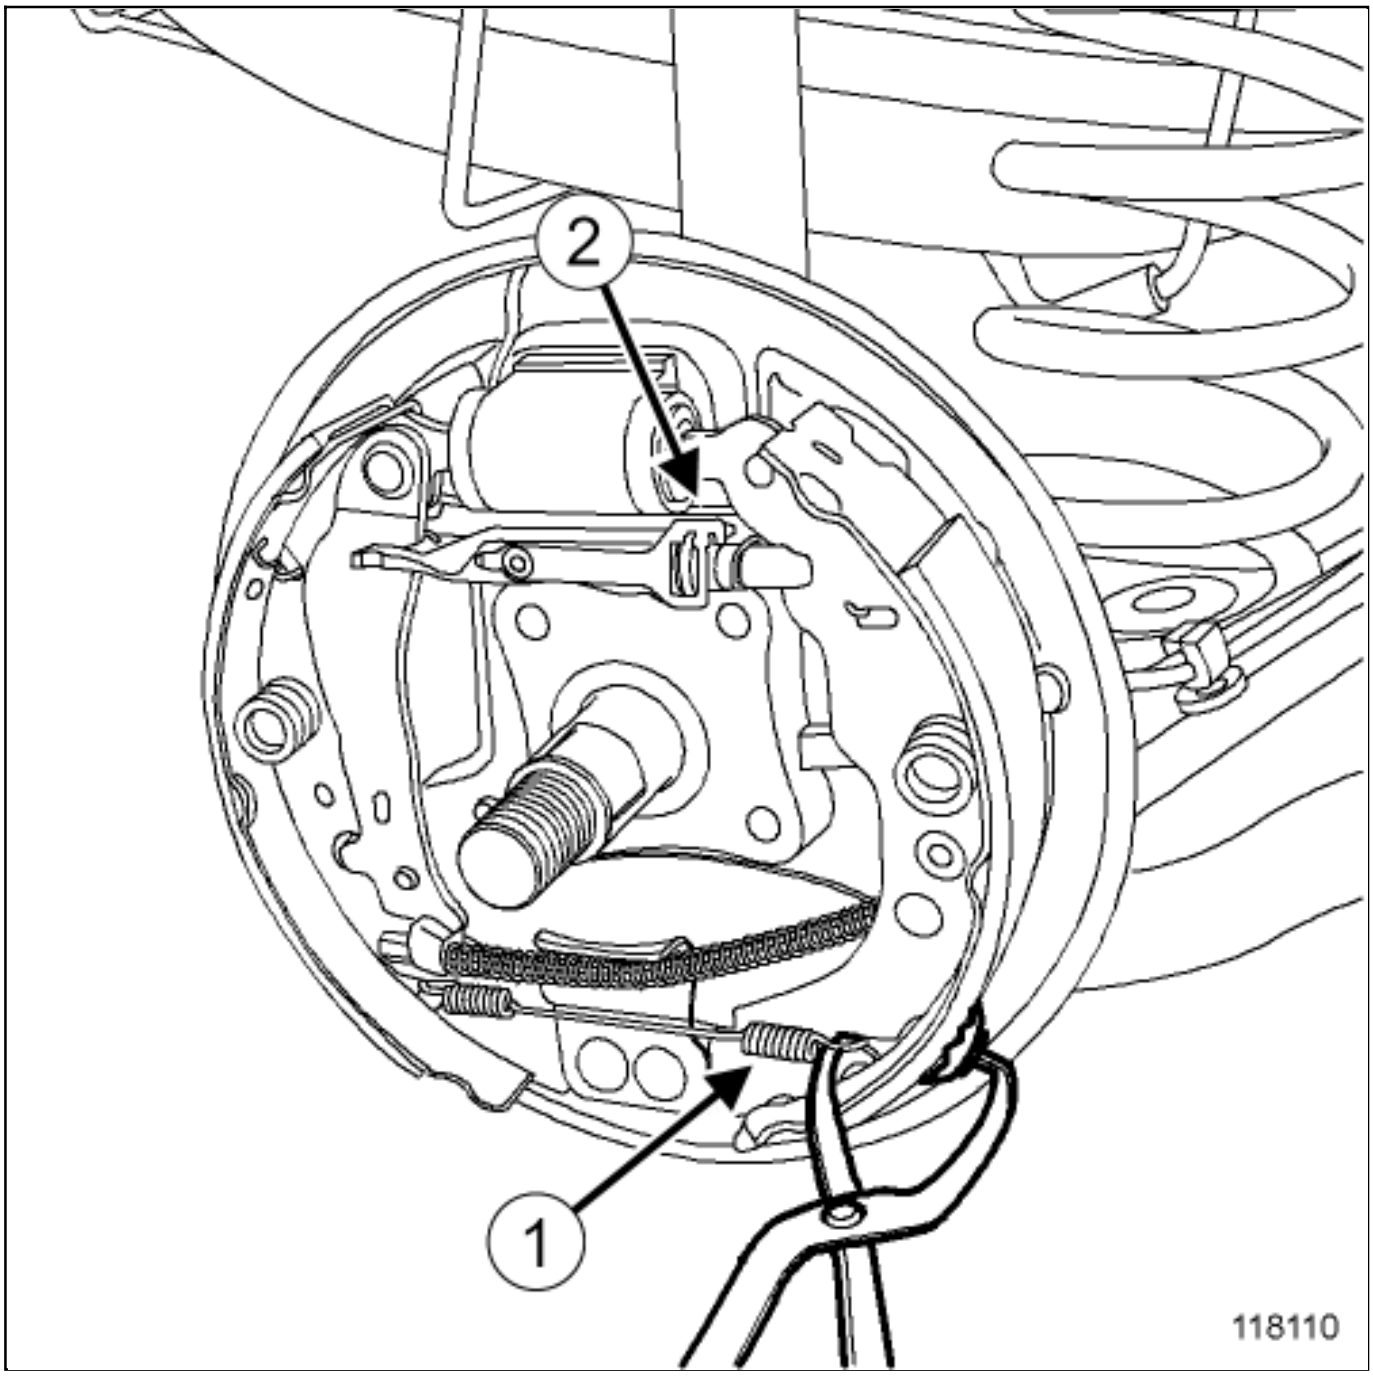
Note, one or more warnings are present in this procedure

WARNING

- To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair.
  - Brake circuit: Precautions for the repair ,
  - Vehicle: Precautions for the repair (01D, Mechanical introduction).

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 33A, Rear axle components, Rear drum brake assembly : Exploded view) .

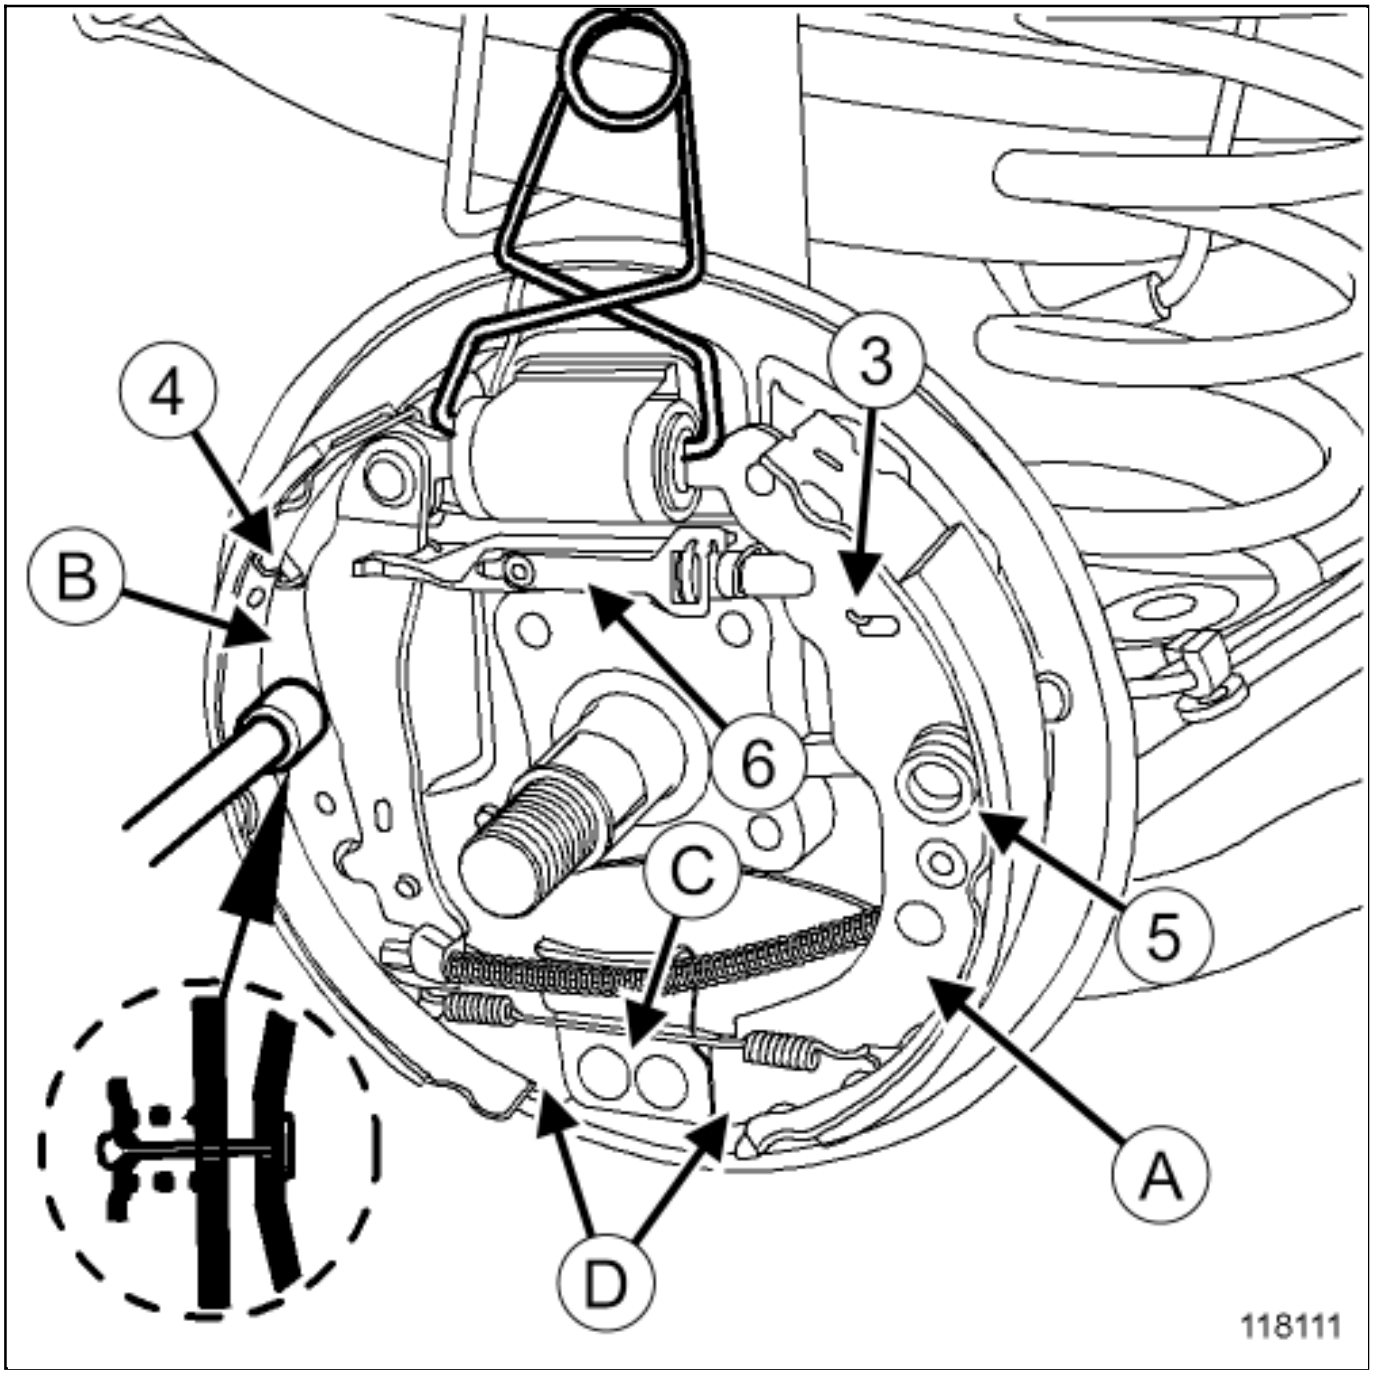
Note:



Replace all of the brake pads on one axle at the same time. Never mix brake pads of different brands or quality.

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Release the parking brake.
- Remove:
  - the rear wheelWheel: Removal - Refitting ,
  - the brake drum(see 33A, Rear axle components, Rear drum brake assembly : Exploded view) .

2. REMOVAL OPERATION

Remove:

- the lower spring(1) ,
- the upper spring(2) .

Place pliers on the slave cylinder pistons.

Remove:

- the spring(3) on the incremented automatic compensation system,
- the retaining spring(4) from the trailing shoe linkage,

- the side retaining springs(5) while holding the connecting rod in contact with the brake back-plate,
- the linkage(6) .

Alternately remove each shoe base(D) from the fixed bridge piece(C) .

Remove:

- the leading shoe(A) ,
- the trailing shoe(B) .

Uncouple the parking brake cable from the parking brake lever.

REFITTING

1. REFITTING PREPARATION OPERATION

Remove any dust from the brake drums and back-plates using Brake cleaner Vehicle: Parts and consumables for the repair .

Lightly grease the support linkage thread.

Note:

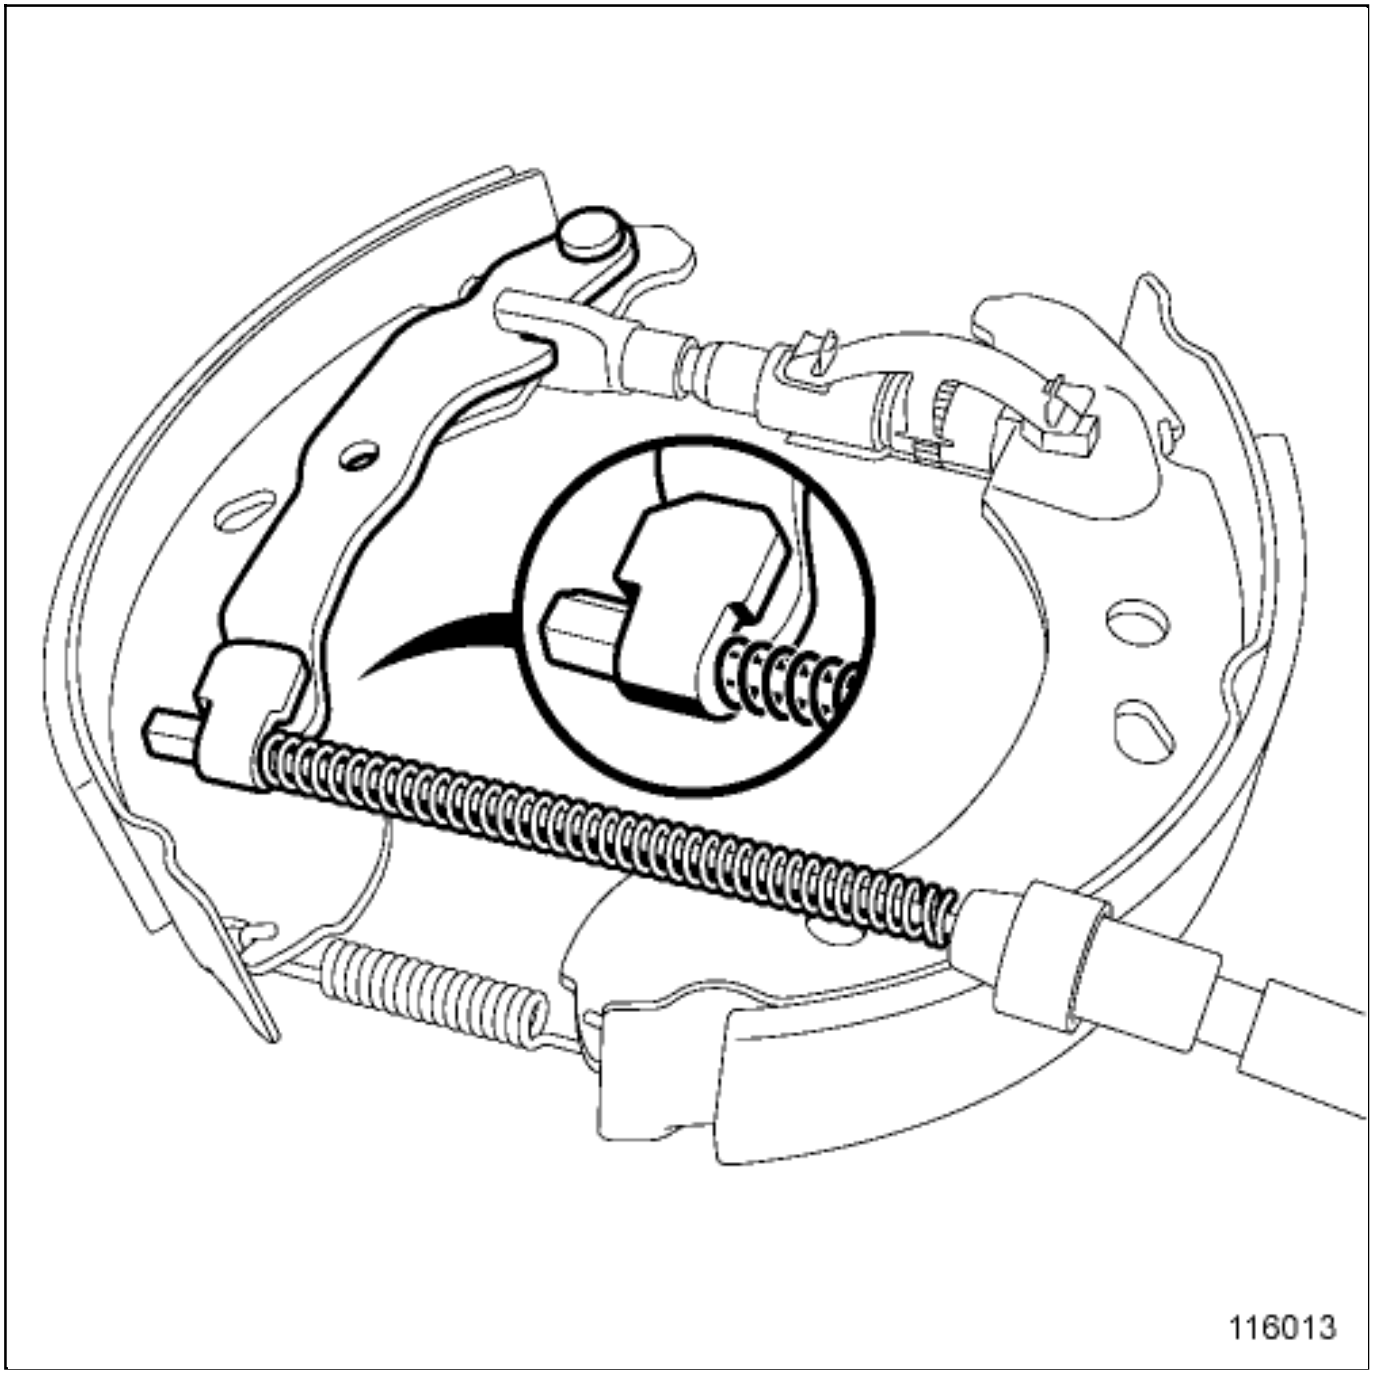
The brake mechanism components are different on the left and right-hand sides, so it is important not to confuse them.

On the left-hand brake: the bolt has a right-hand thread.

On the right-hand brake: the bolt has a left-hand thread.

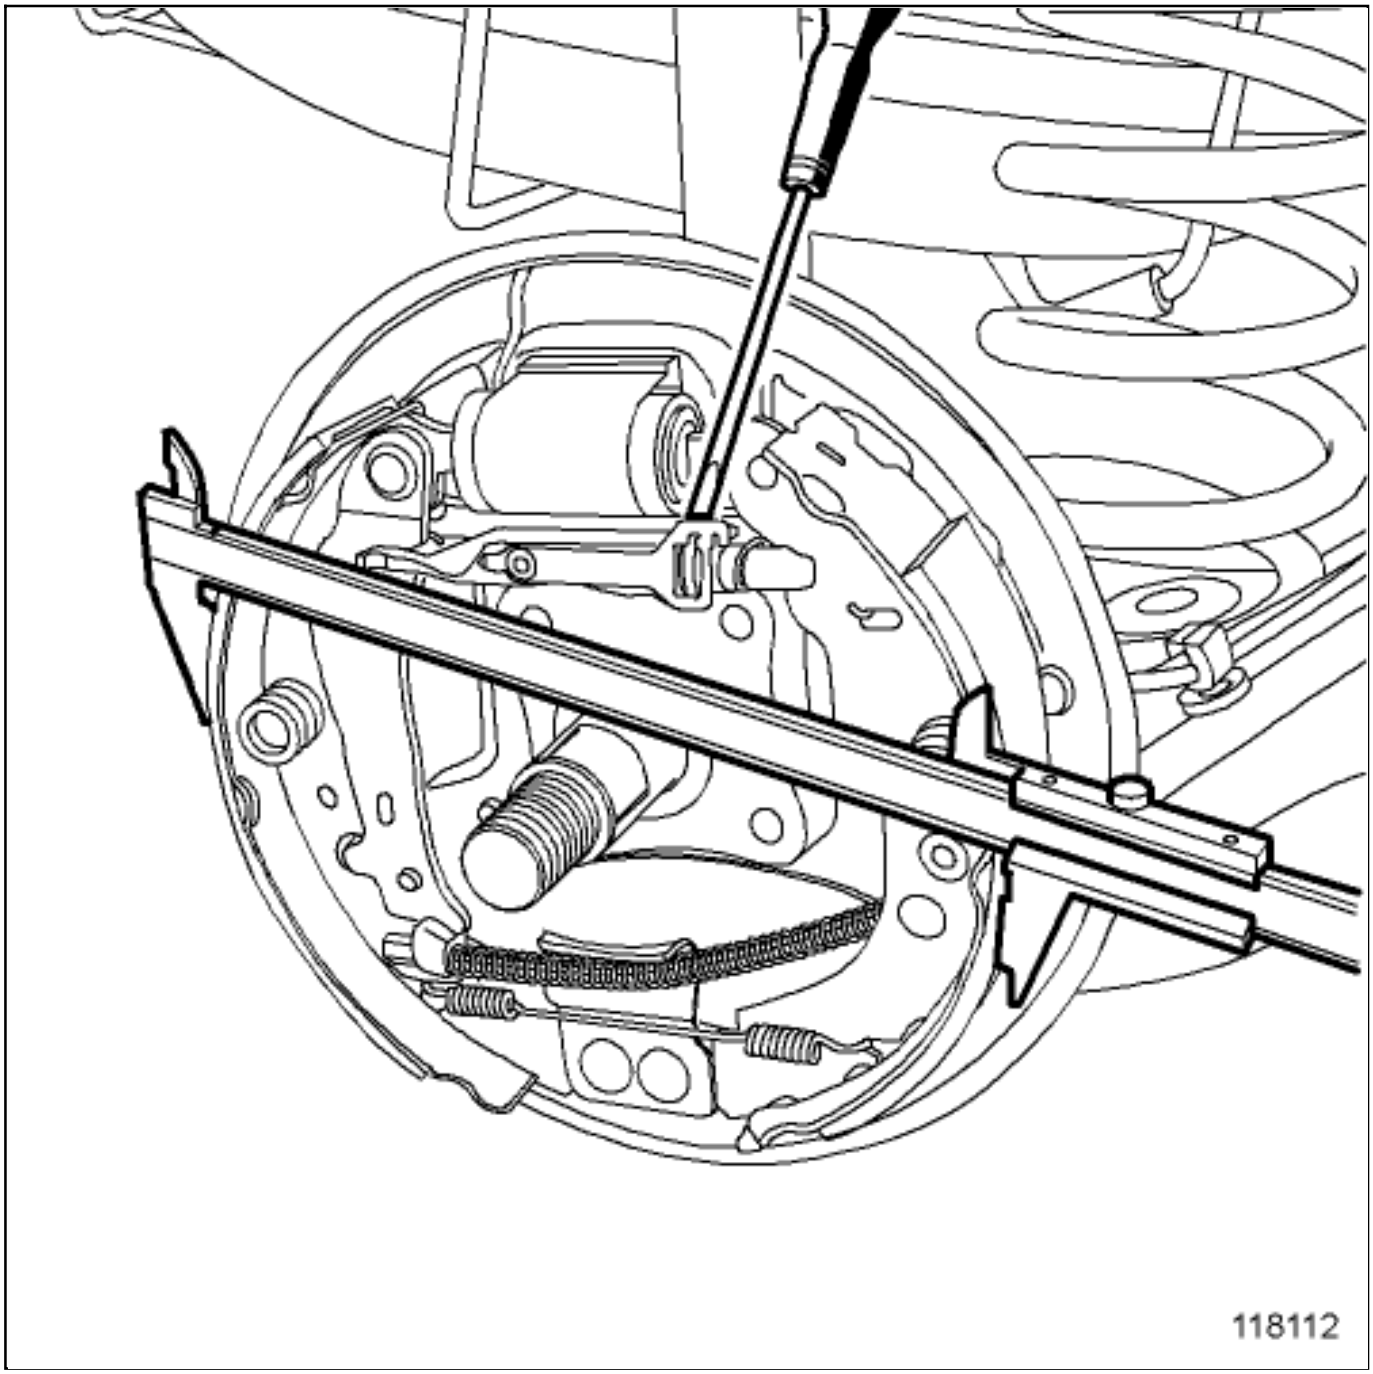
2. REFITTING OPERATION

Refit:



- the linkage to the trailing shoe while holding it together with its spring,
- the incremented automatic compensation system spring to the linkage,
- the parking brake cable to the parking brake lever,
- the leading shoe,
- the incremented automatic compensation system spring to the leading shoe.

Fit the leading shoe/trailing shoe assembly to the back-plate.



Refit:

- the upper spring,
- the lower spring,
- the side retaining springs while holding the connecting rod in contact with the brake back-plate.

Remove the pliers from the slave cylinder pistons.

Check that the parking brake cable is correctly positioned on the parking brake lever.

Using a screwdriver, adjust the diameter of the shoes with the linkage to obtain a diameter of 202.5 mm ± 0.1.

Carry out the same adjustment on the other side.

Adjust the handbrake if the lever stops between the first and second positions of the parking brake lever's travel **Parking brake lever: Adjustment** .

3. FINAL OPERATION

Refit:

- the brake drum (see 33A, Rear axle components, Rear drum brake assembly : Exploded view) ,
- the rear wheel Wheel: Removal - Refitting .

Adjust the brake linings by depressing the brake pedal repeatedly.

Check that the incremented compensation system is working properly (characteristic "click" from the drums when the brake pedal is repeatedly depressed).

Proceed in the reverse order to removal.

REAR BUMPER ASSEMBLY: EXPLODED VIEW

K98(K98)

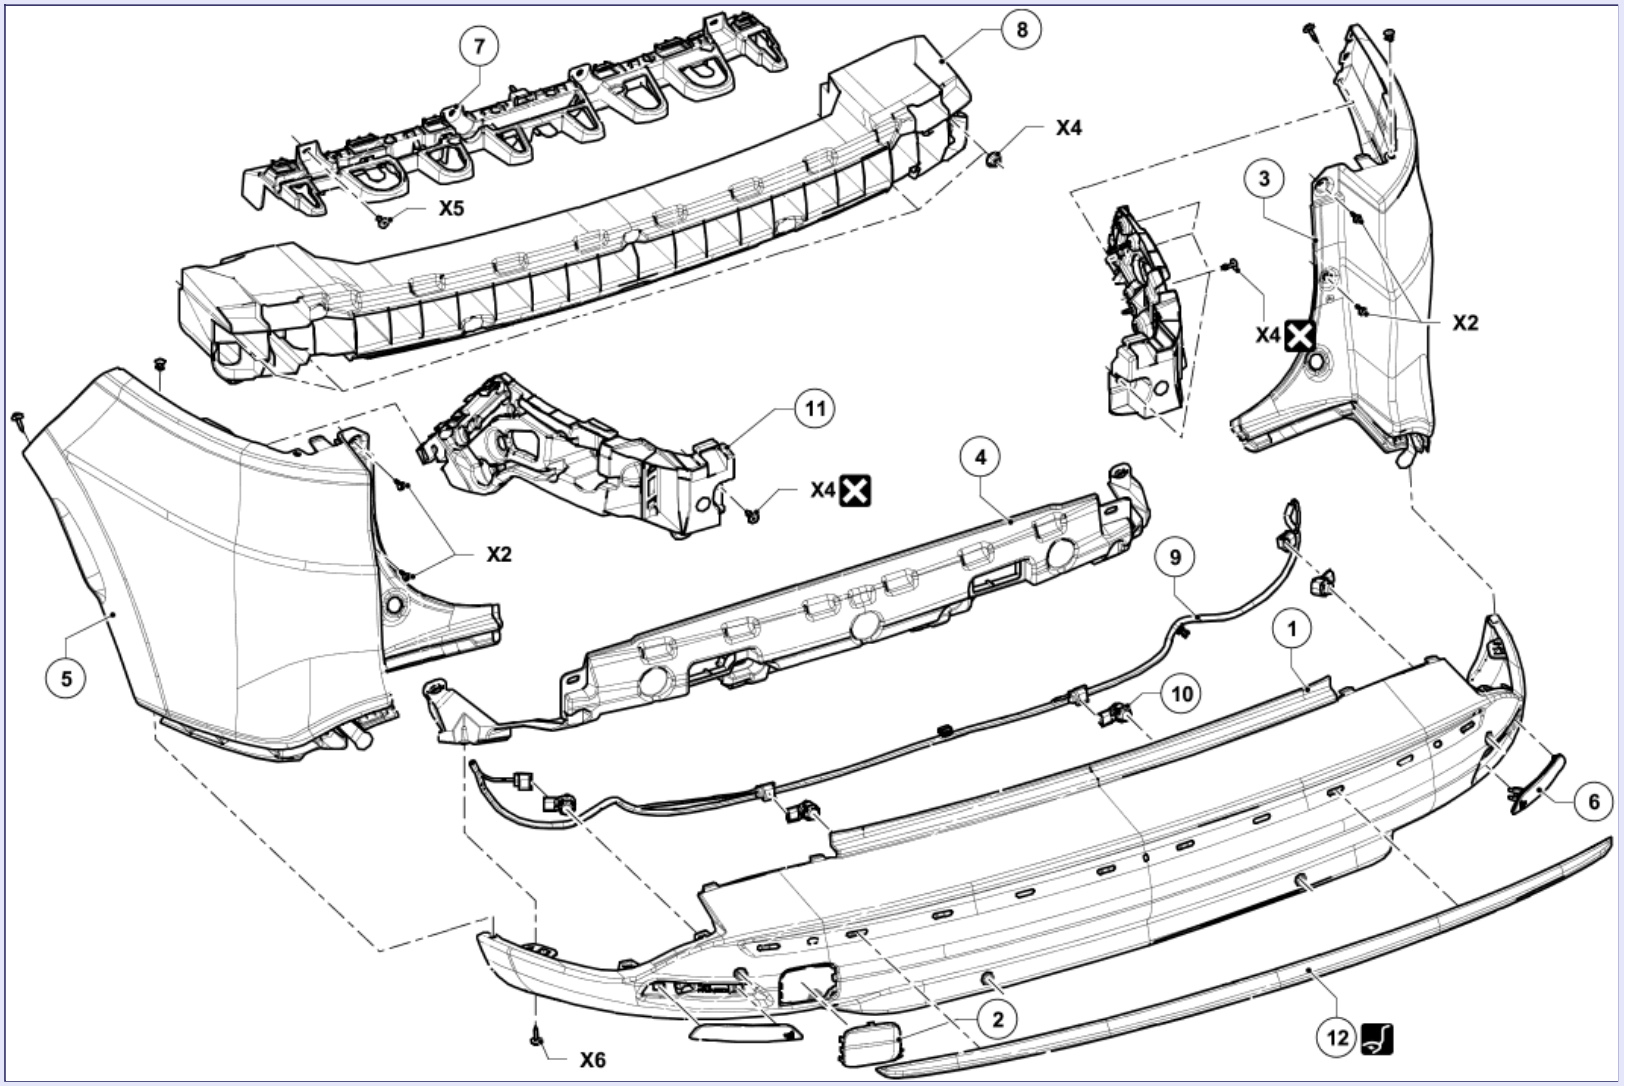


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard Torques Tightening torques: General information .

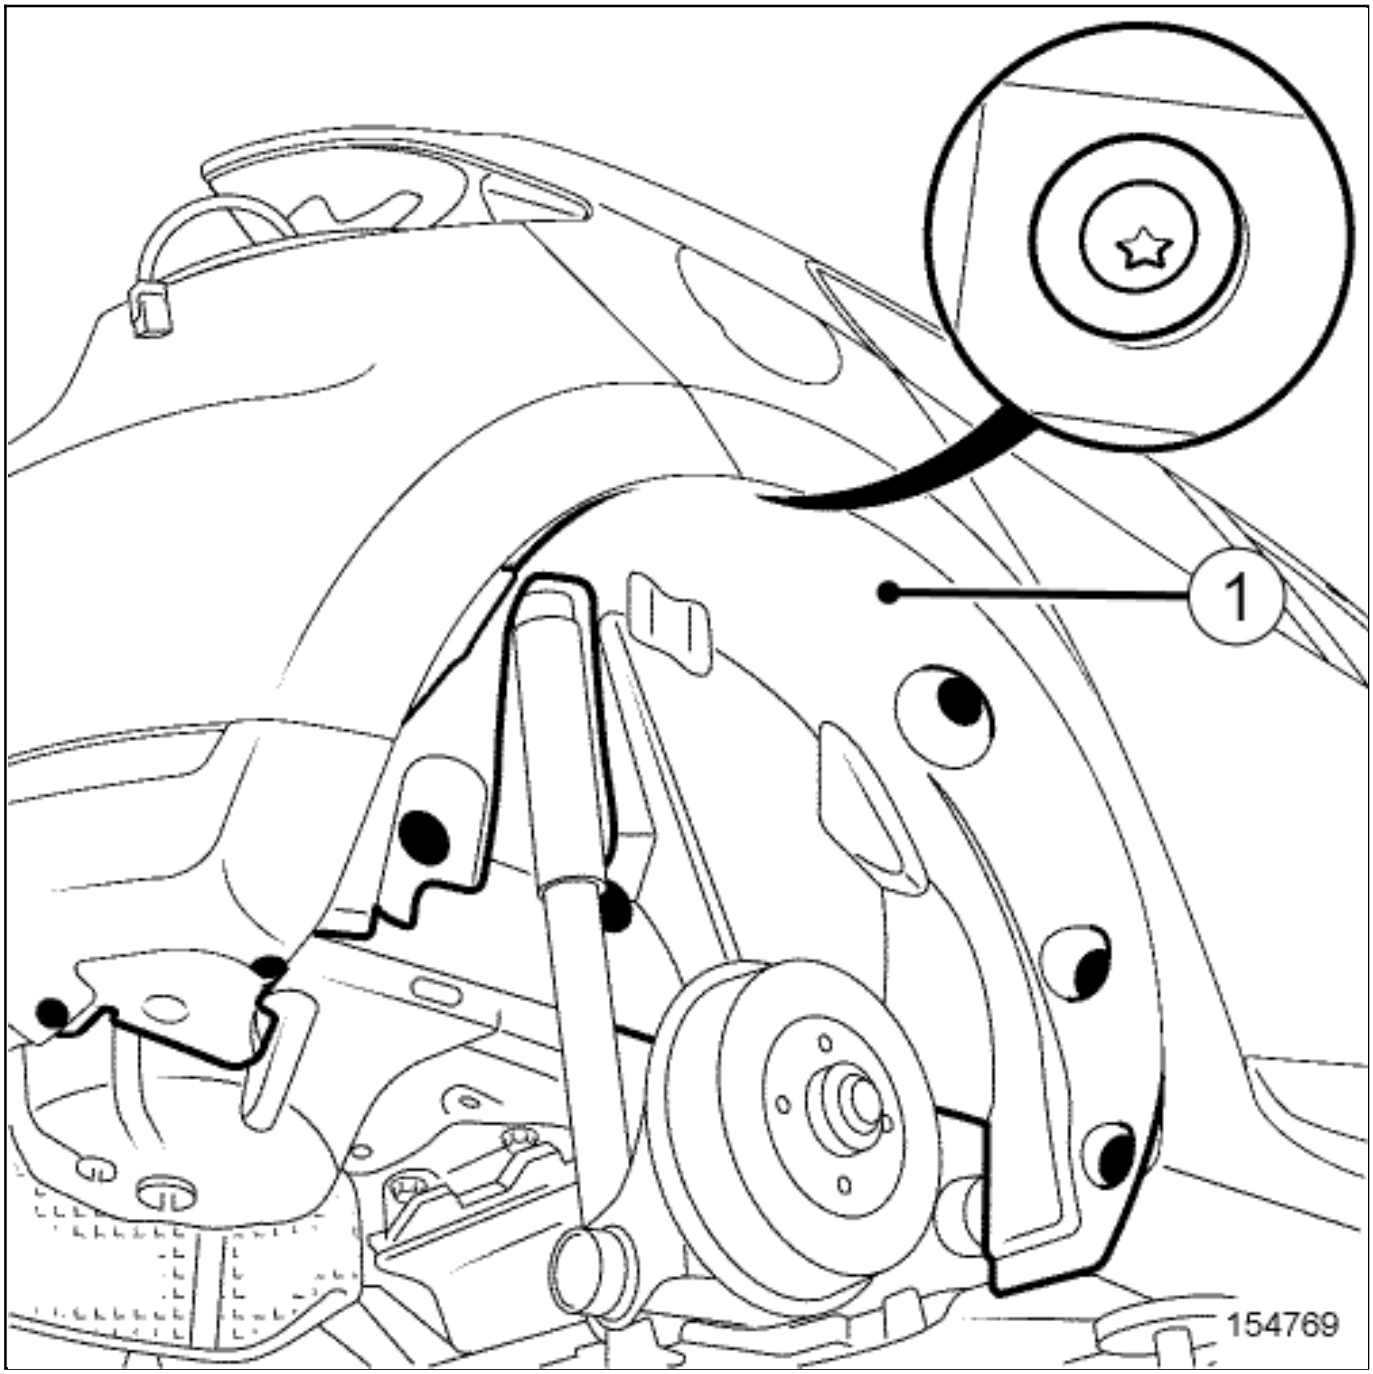
REAR BUMPER: REMOVAL - REFITTING

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the rear wheelsRear hub carrier assembly: Exploded view .

- Move aside the luggage compartment seal.
-

Remove:

- rear side bumper trims (see 55A, Exterior protection, Rear bumper assembly: Exploded view) ,
- the rear lights on wing Rear signals - lighting assembly: Exploded view .

Remove the rear wheel arch liners(1) .

2. REMOVAL OPERATION

Remove the rear bumper screws(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .

Unclip the rear bumper.

Partially remove the rear bumper (this operation requires two people).

Disconnect the rear bumper wiring connector(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .

Remove the rear bumper(see 55A, Exterior protection, Rear bumper assembly: Exploded view) (this operation requires two people).

REFITTING

Proceed in the reverse order to removal.

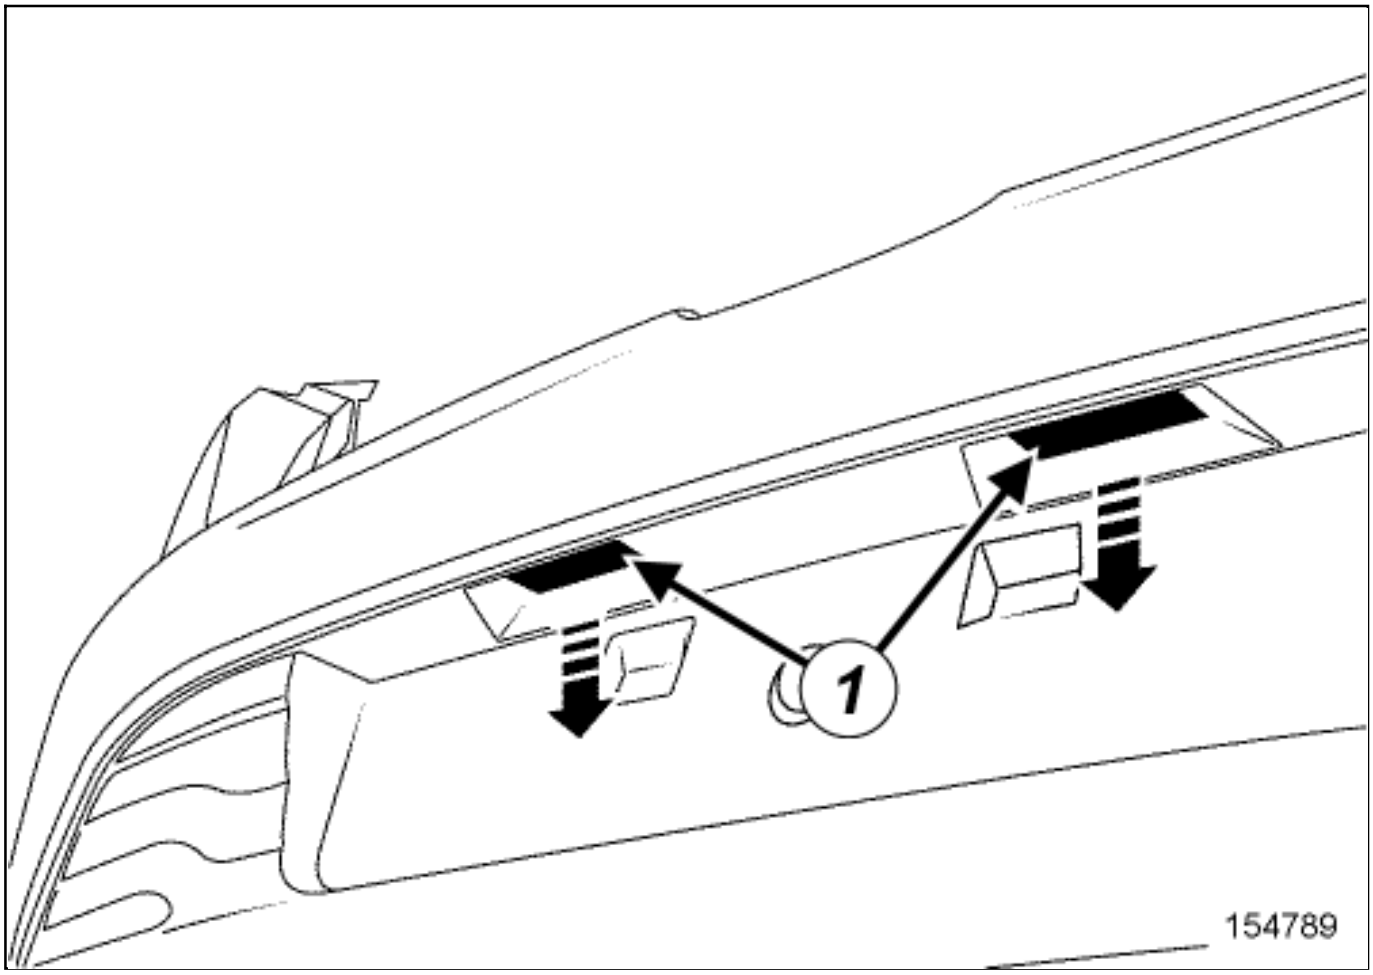
Carry out a fonction test.

REAR BUMPER: STRIPPING - REBUILDING

Special tooling required	
Set of trim removal levers.	Car. 1363

parts always to be replaced:
rear bumper rivet

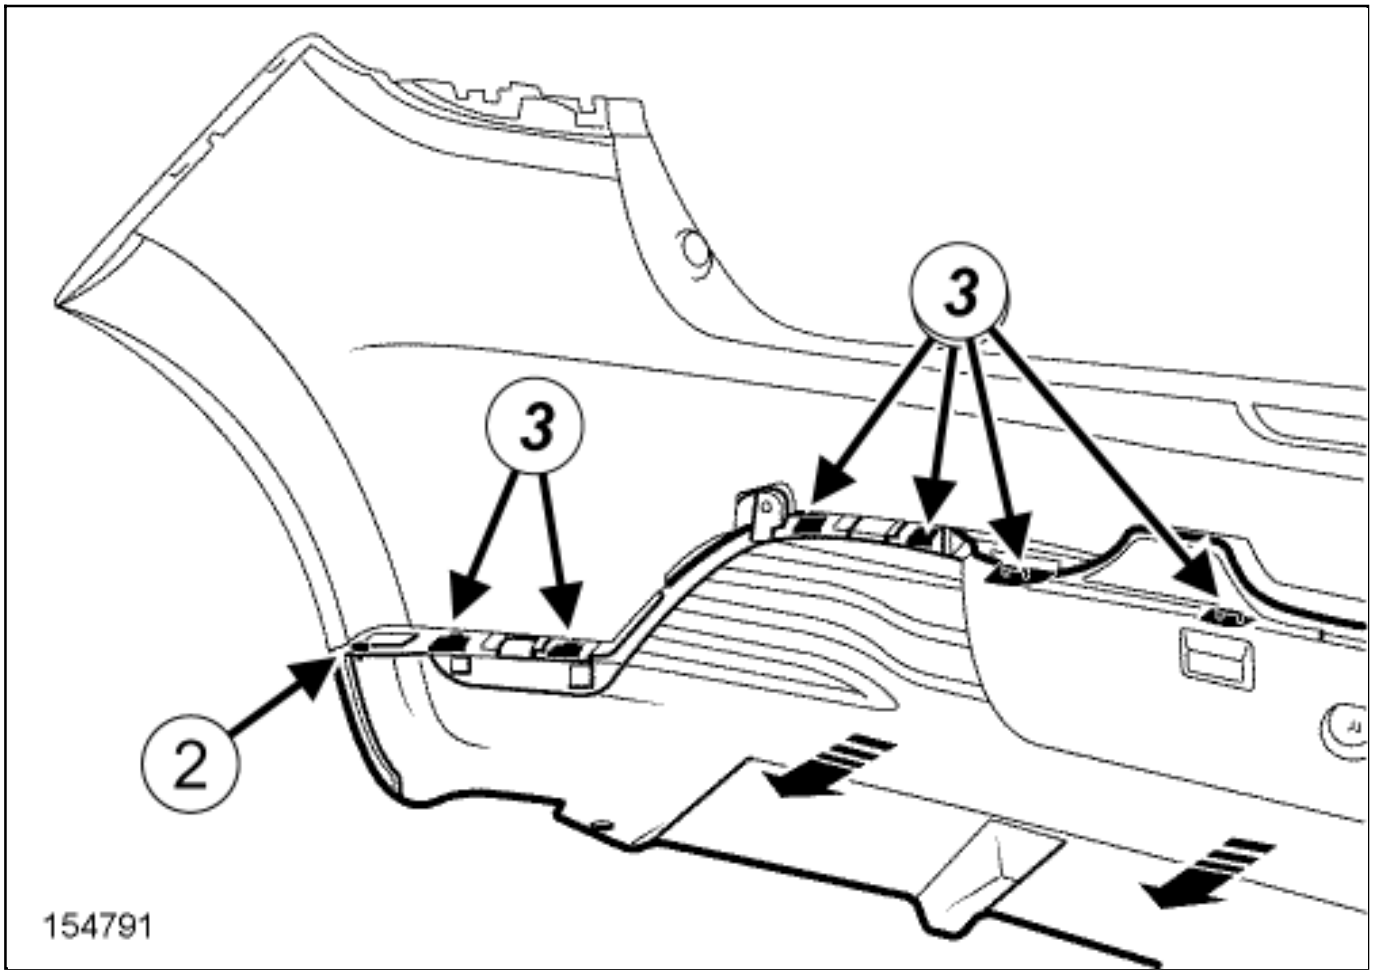
Location and specifications (tightening torques, parts always to be replaced, etc.)(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .



STRIPPING

1. STRIPPING PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove:
  - the rear wheelsRear hub carrier assembly: Exploded view ,
  - the rear wheel arch liners,
  - the rear lights on wingRear signals - lighting assembly: Exploded view ,
  - the rear bumper(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .



2. STRIPPING OPERATION

- Remove the rear bumper wiring(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .

Remove the number plate lights(1) using the toolSet of trim removal levers.(Car. 1363) .

Remove the reflectors(see 55A, Exterior protection, Rear bumper assembly: Exploded view) .

- Drill out the rivets on each side(2) .
- Unclip the rear bumper end panel at(3) .

REBUILDING

1. REBUILDING PREPARATION OPERATION

- parts always to be replaced: **rear bumper rivet** .

2. REBUILDING OPERATION

Proceed in the reverse order to removal.

Repair-50x05x04-01x31-1-32-1.xml

XSL version : 3.02 du 22/07/11

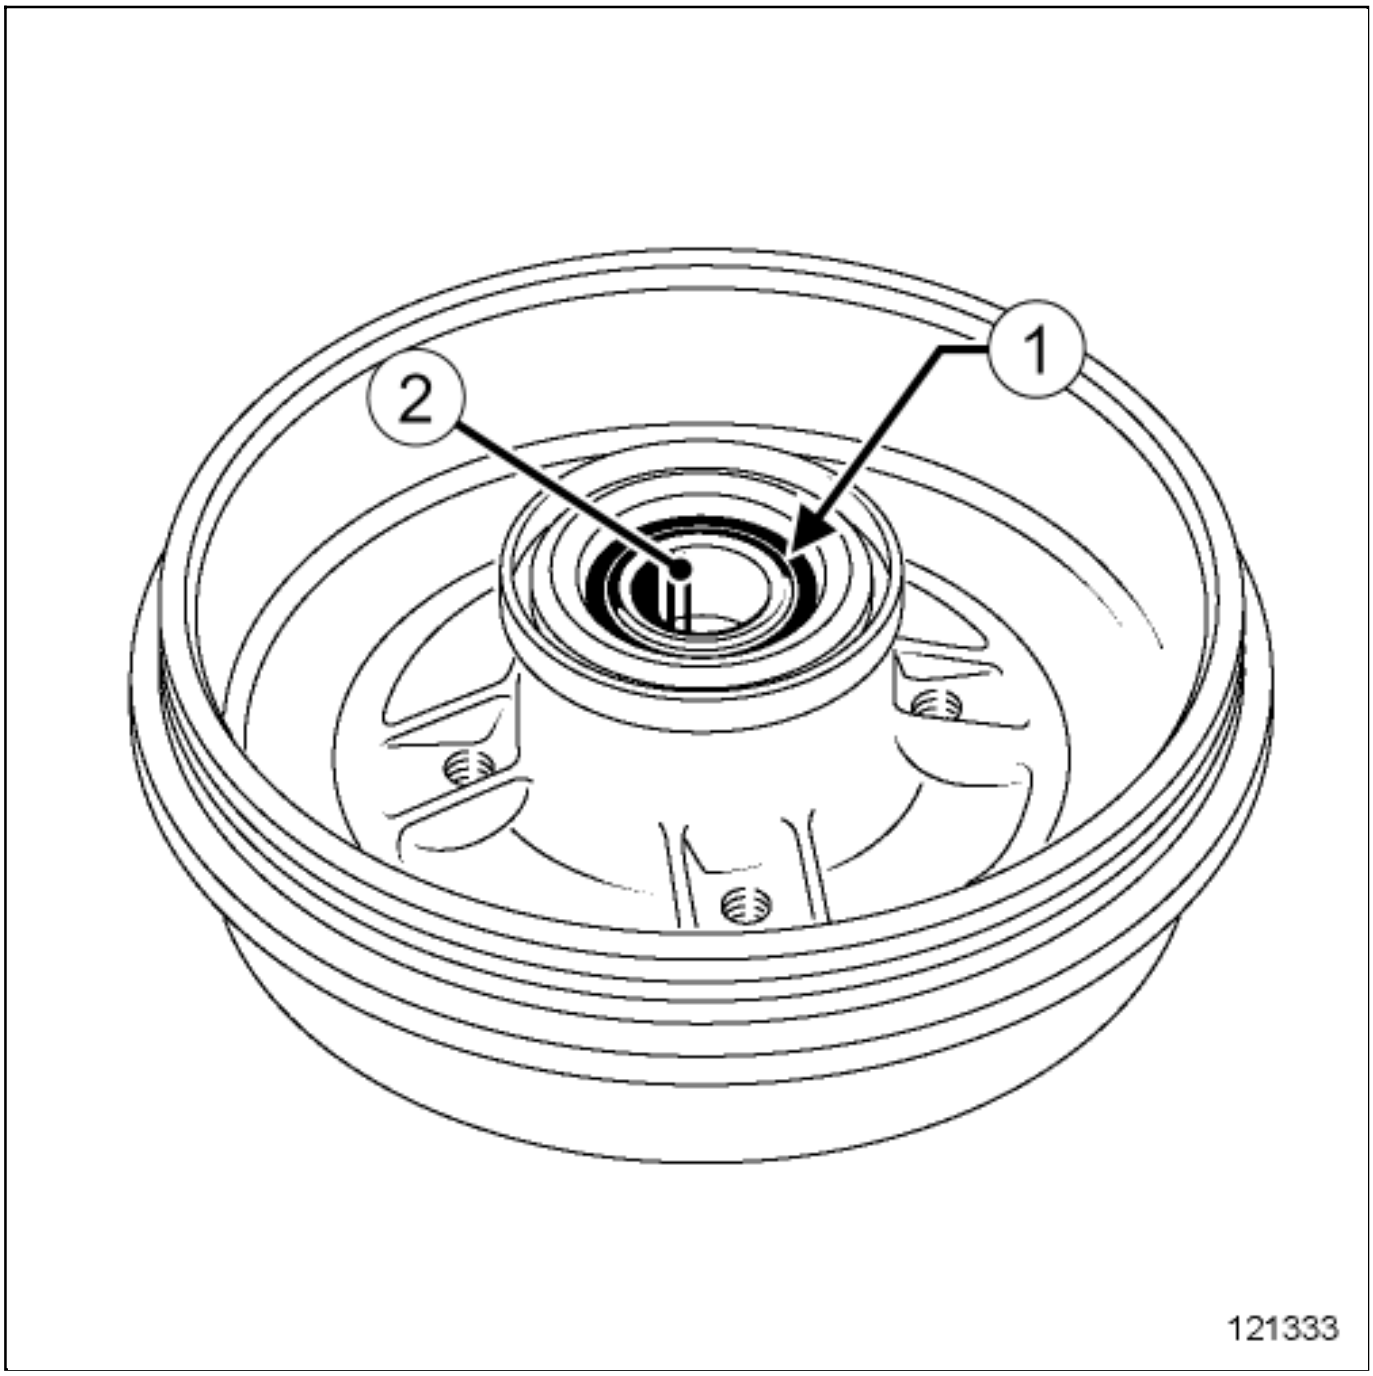
REAR DRUM BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

- To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:
  - (see 33A, Rear axle components, Rear axle components: Precautions for the repair) ,
  - Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 33A, Rear axle components, Rear hub carrier assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .

- Remove:
  - the rear wheel(see 33A, Rear axle components, Rear hub carrier assembly: Exploded view) ,
  - the rear brake drum(see 33A, Rear axle components, Rear hub carrier assembly: Exploded view) .

2. REMOVAL OPERATION

From the drum, remove:

- the bearing circlip(1) ,
- the bearing(2) using a tube with an external diameter of 49 mm.

REFITTING

1. REFITTING PREPARATION OPERATION

Use surface cleanerto cleanVehicle: Parts and consumables for the repair :

- the internal and external surfaces of the bearing in contact with the drum and the stub axle,

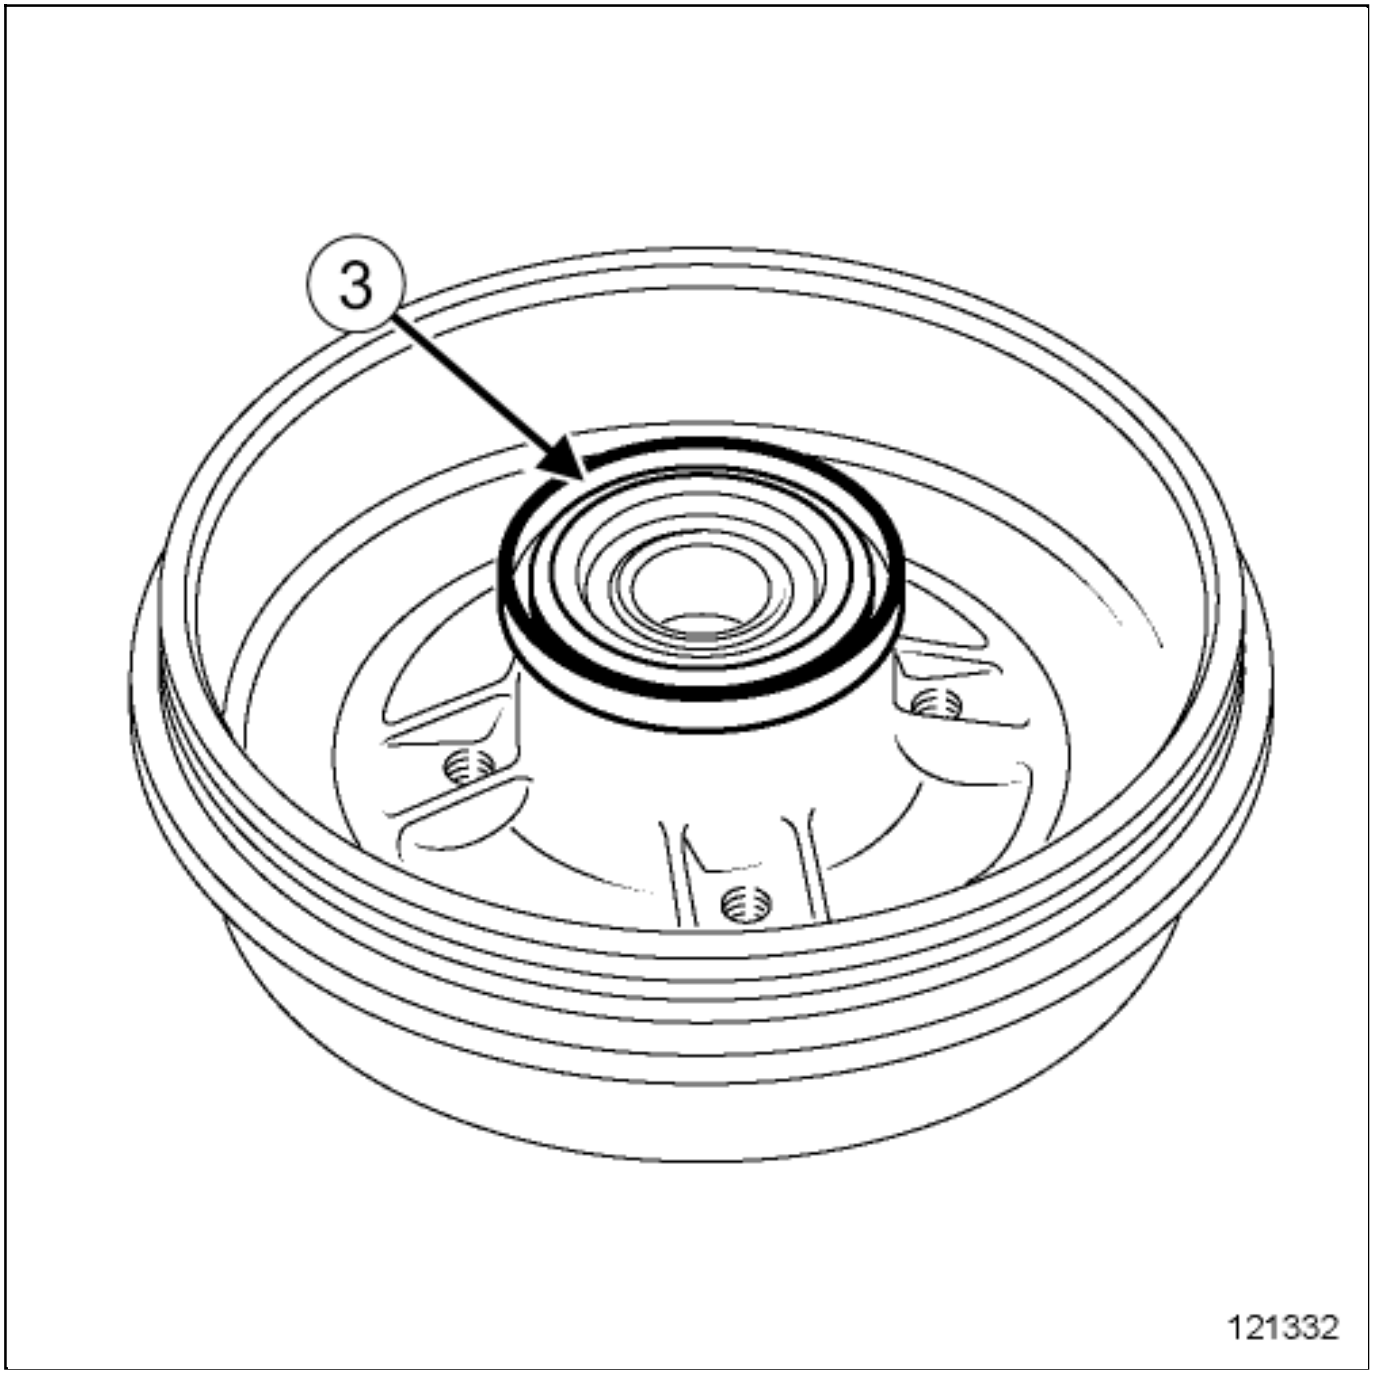
- the drum surfaces in contact with the bearing,
- the stub-axle surfaces in contact with the bearing.

Always check the surface condition of the following components:

- bore of the drum in contact with the bearing,
-

the stub-axle.

Replace the faulty components.



CAUTION

Do not press the bearing's internal bush so as to avoid damaging the bearing (very high shrink-fitting force).

Note:

Check that the tube is pressing against the outer bush of the bearing.

Note:

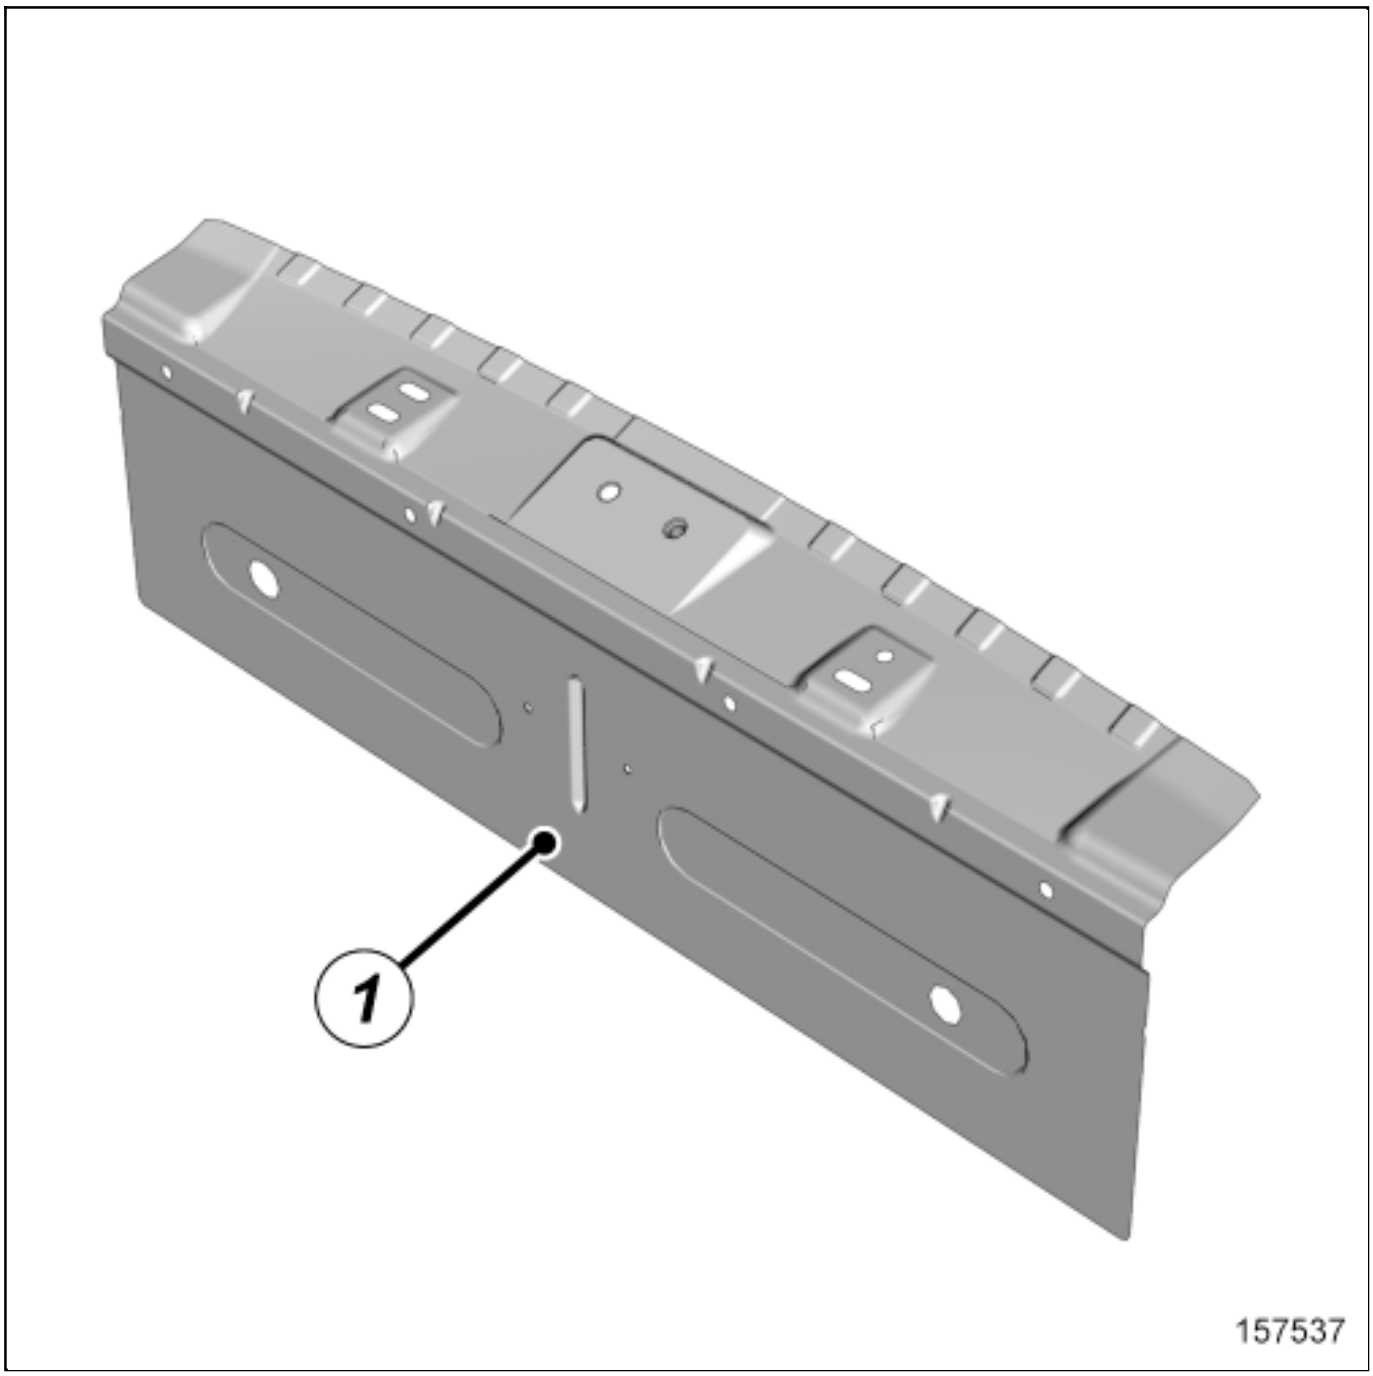
Take care not to press the ABS target(3) when refitting the bearing.

2. REFITTING OPERATION

Fit the bearing until it presses the shoulder using a tube with a diameter of 53 mmusing a

hydraulic press.

Refit the bearing circlip.



3. FINAL OPERATION

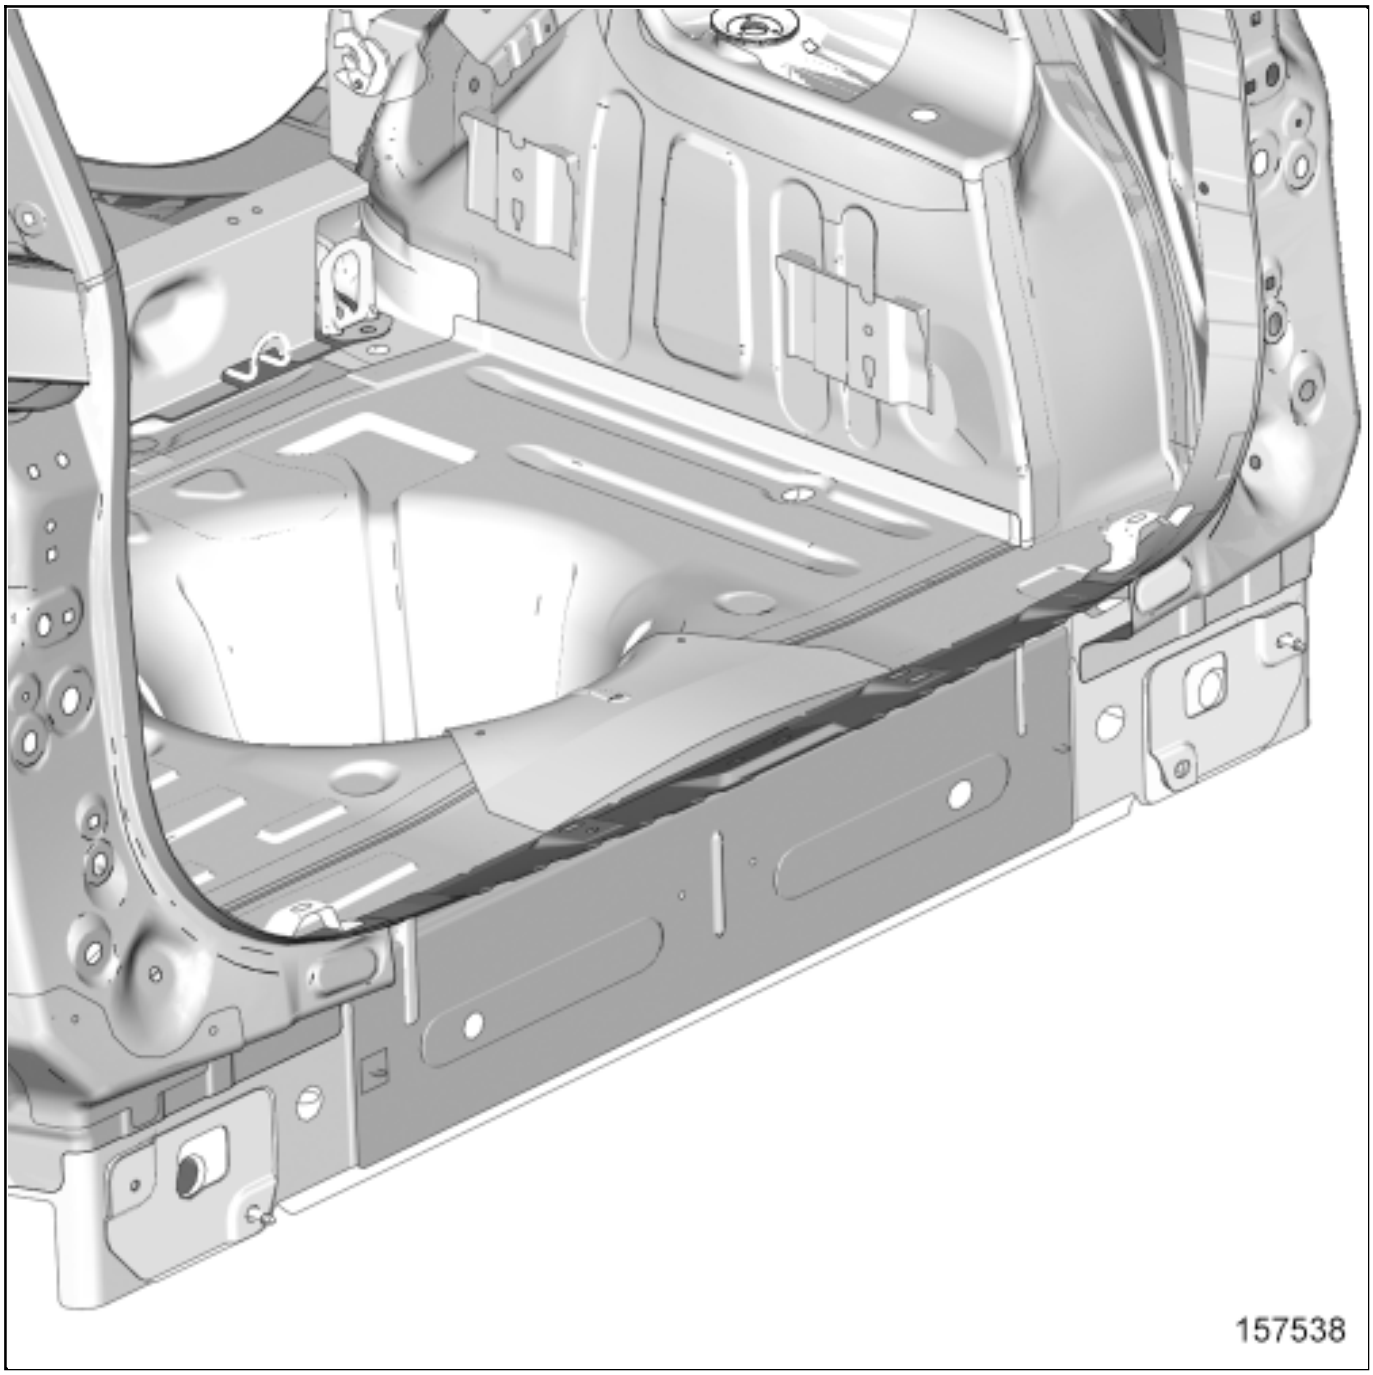
Proceed in the reverse order to removal.

REAR END PANEL LINING: REPLACEMENT

Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Rear end panel lining, centre section	Mild steel	0.65



2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

complete replacement.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

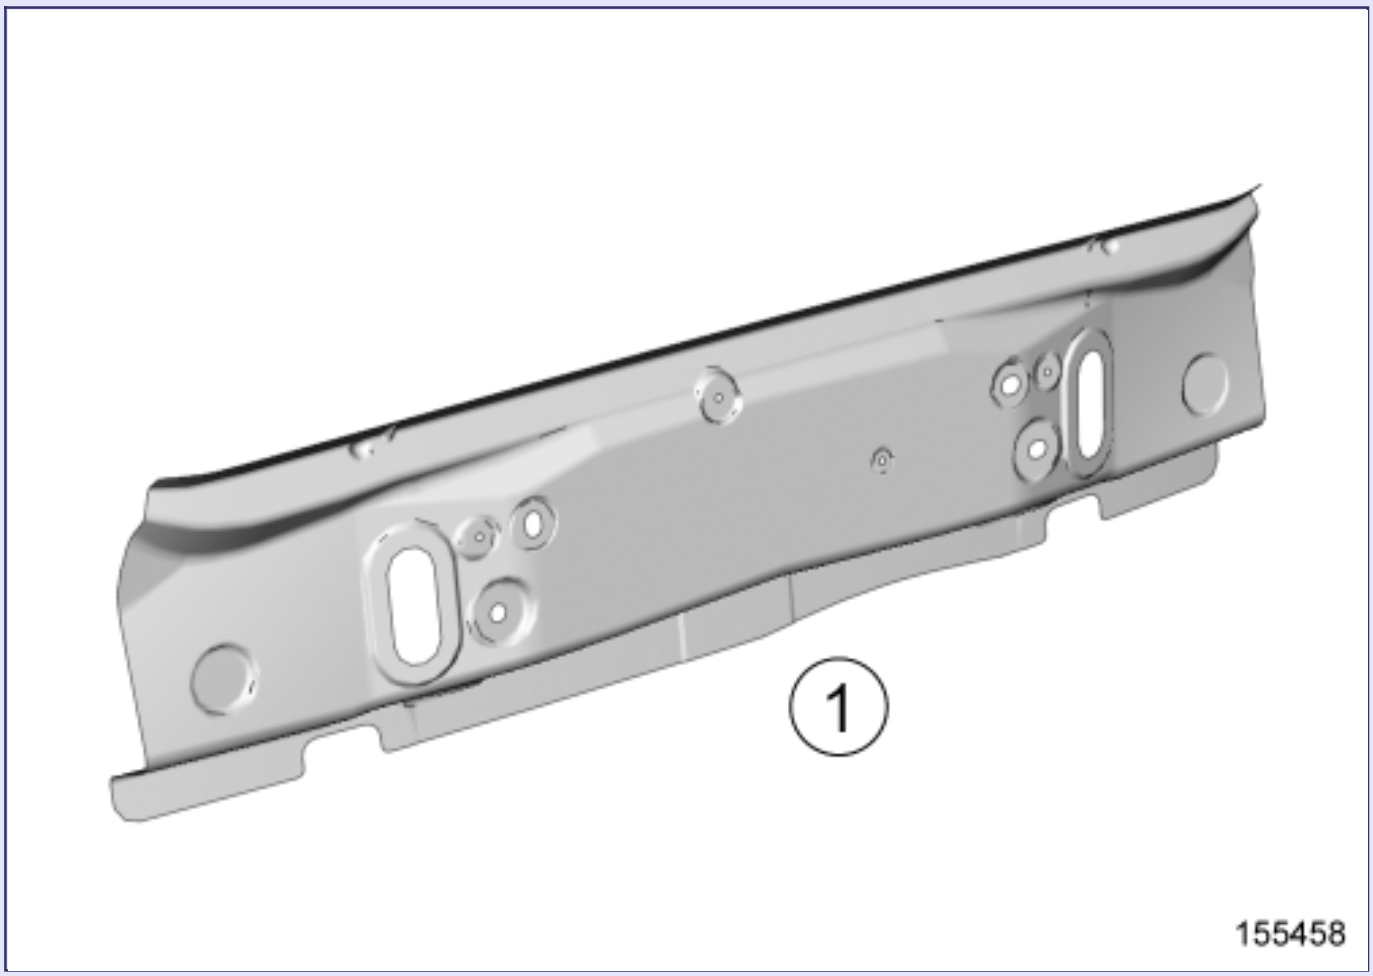
To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

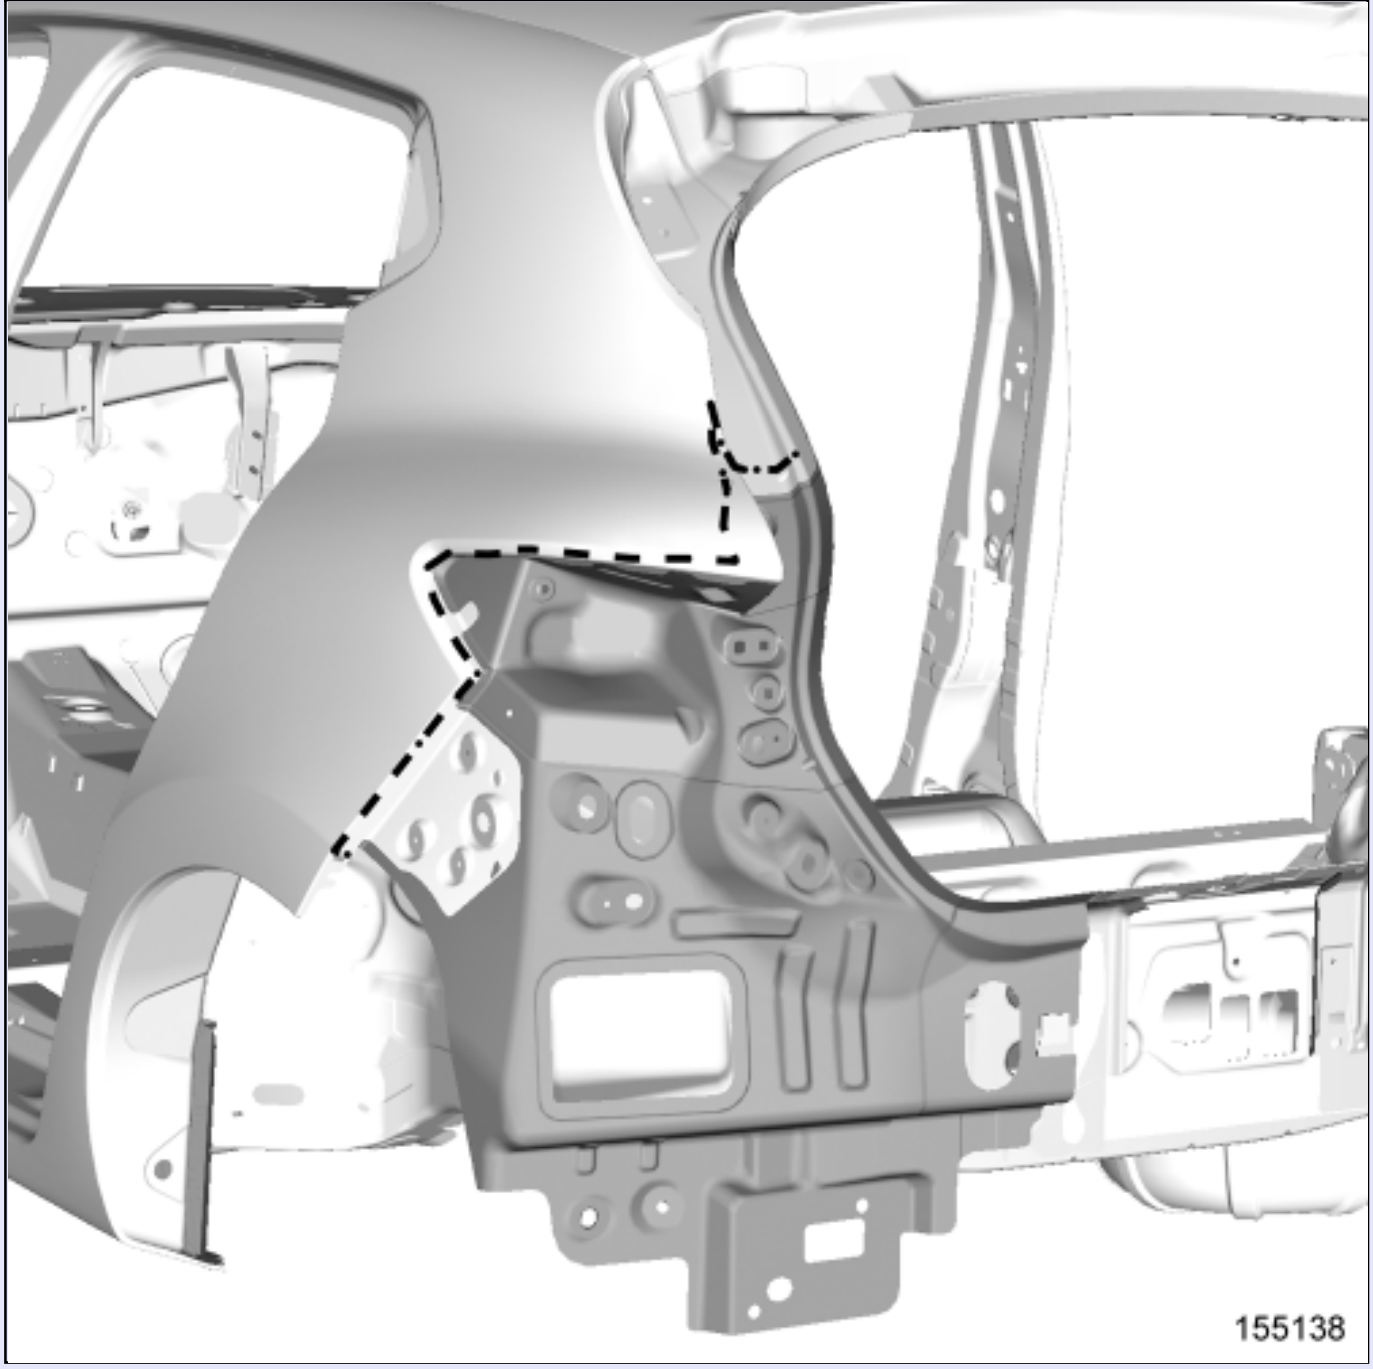
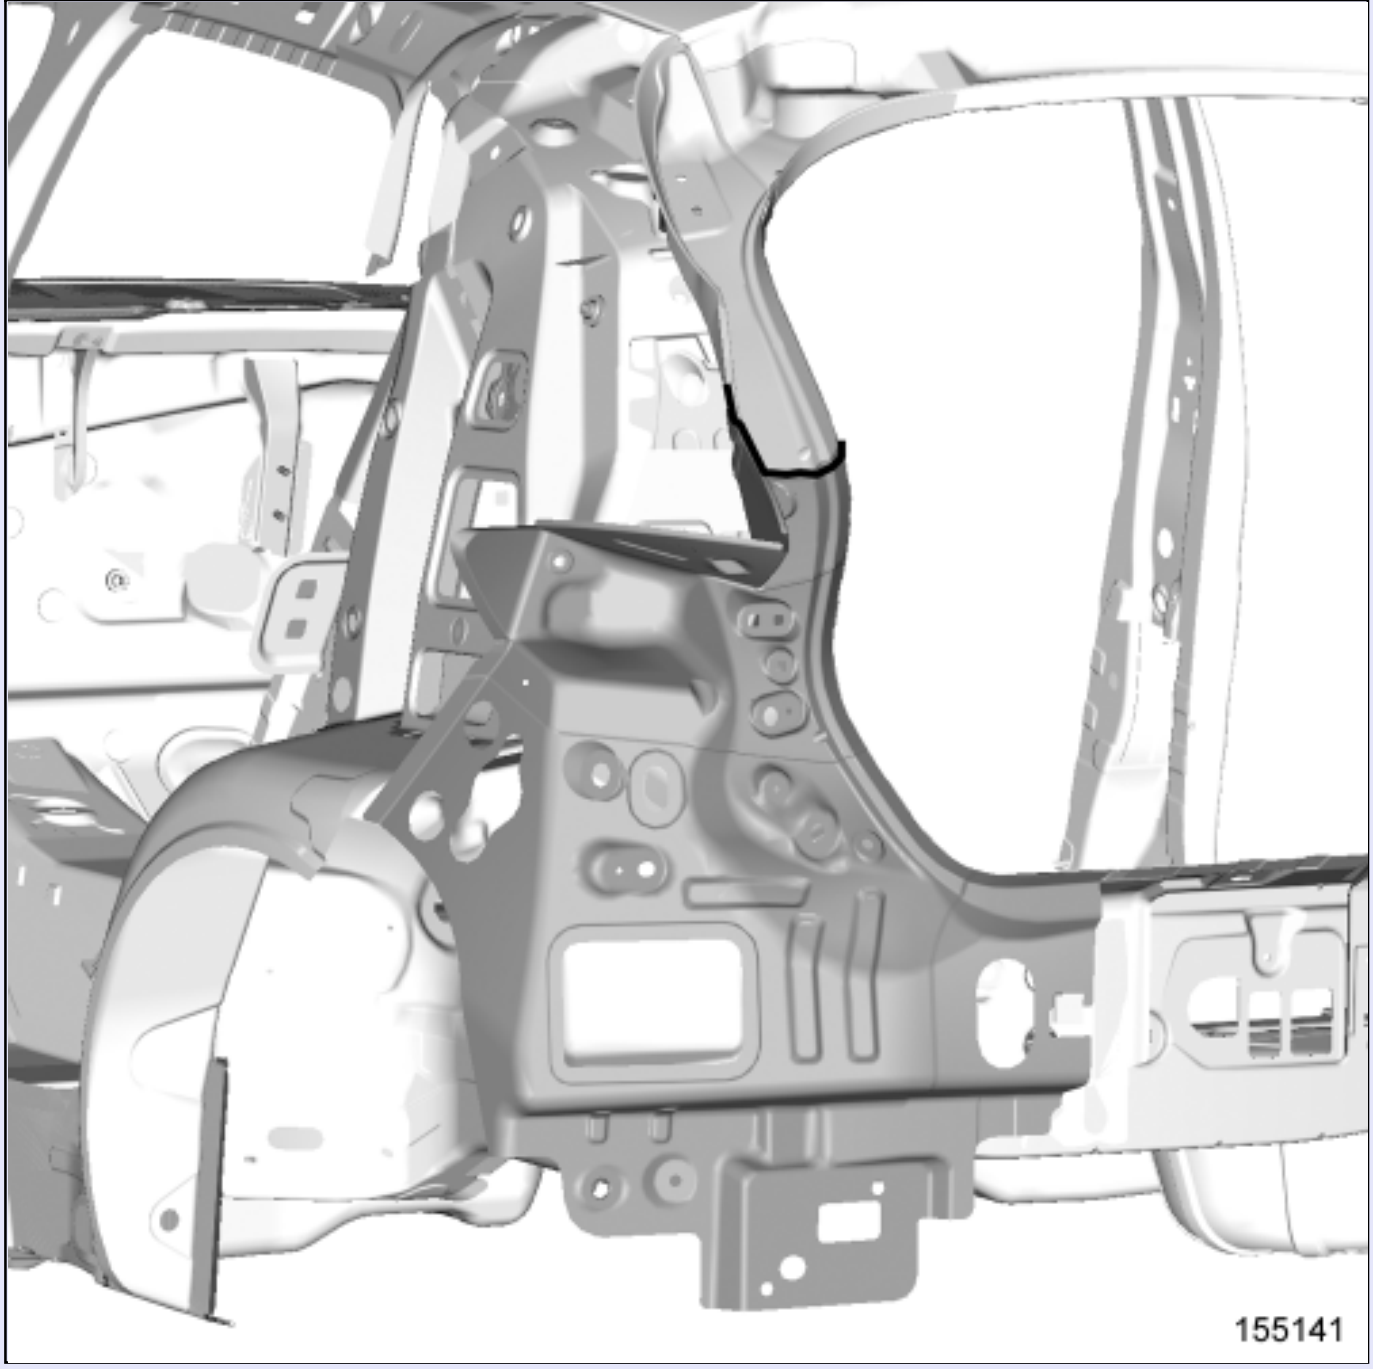
2- PARTIAL REPLACEMENT A-B

1)PART IN POSITION



DETAILED VIEW

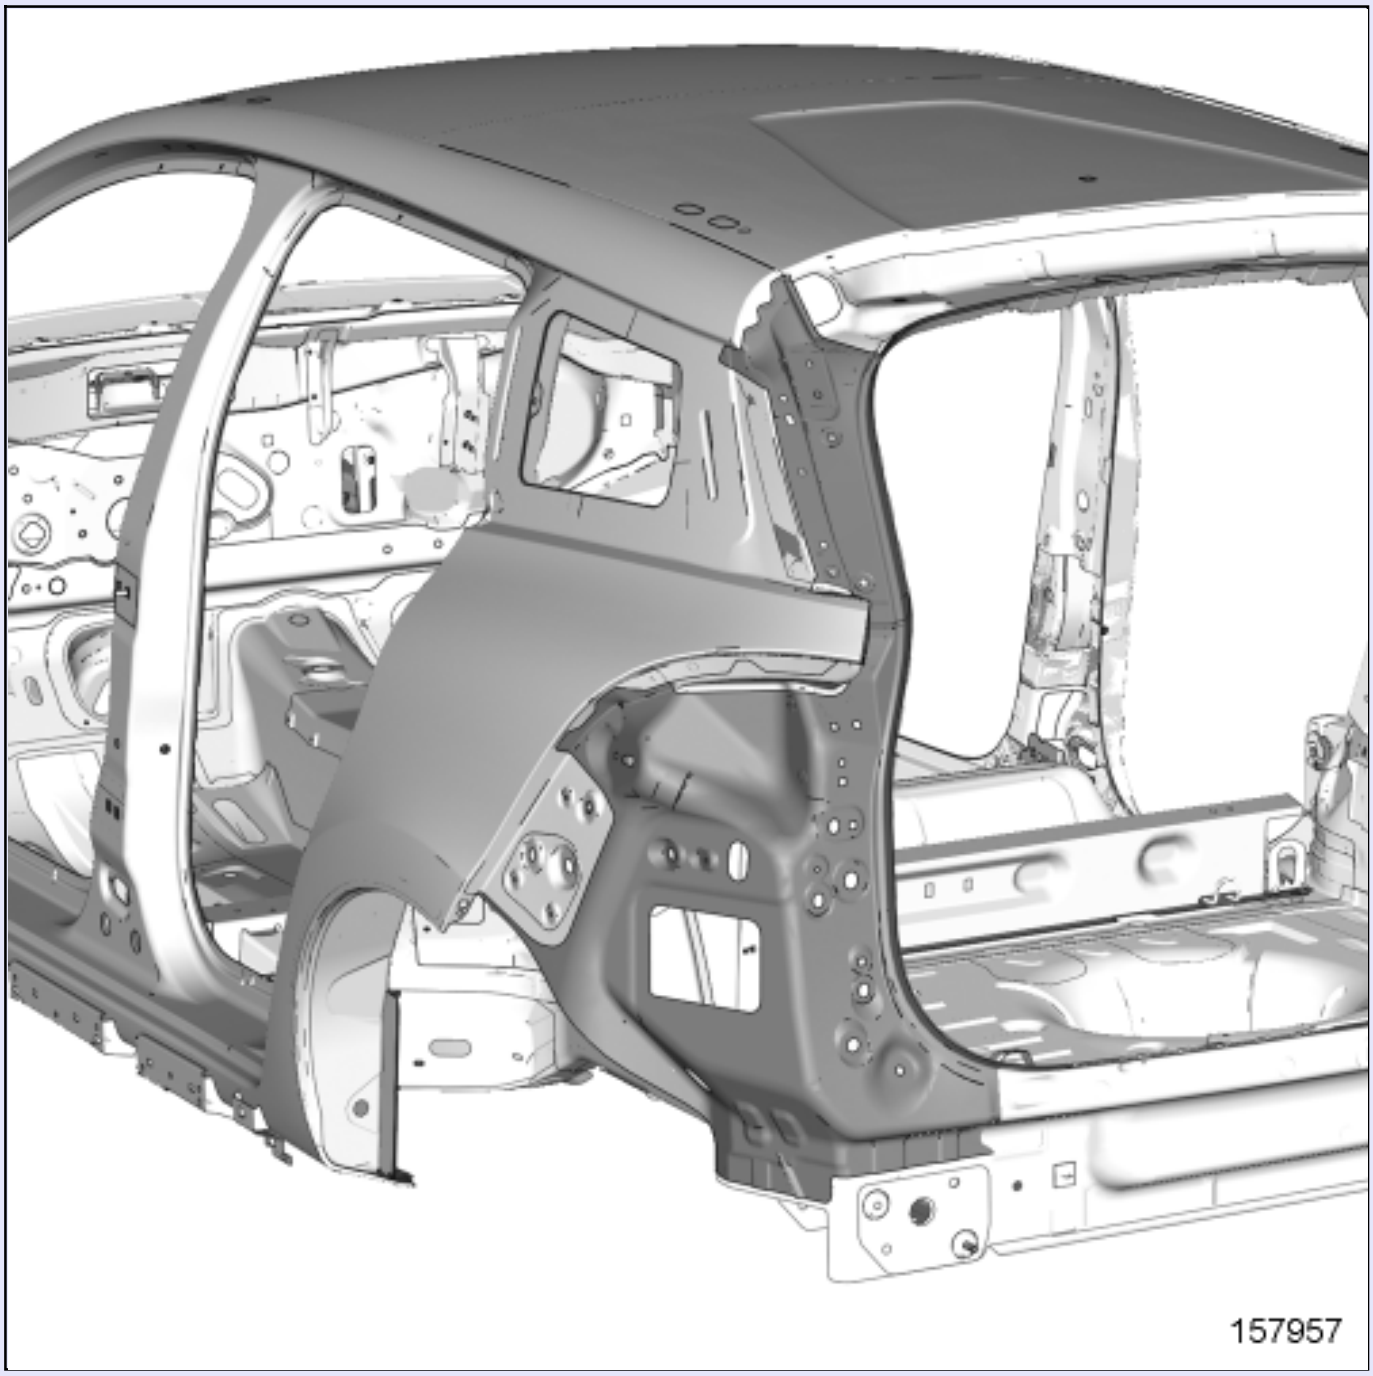


Make a superimposed connection[Partial replacement connections by overlapping: Description](MR 400, 40E, Partial replacement connections).

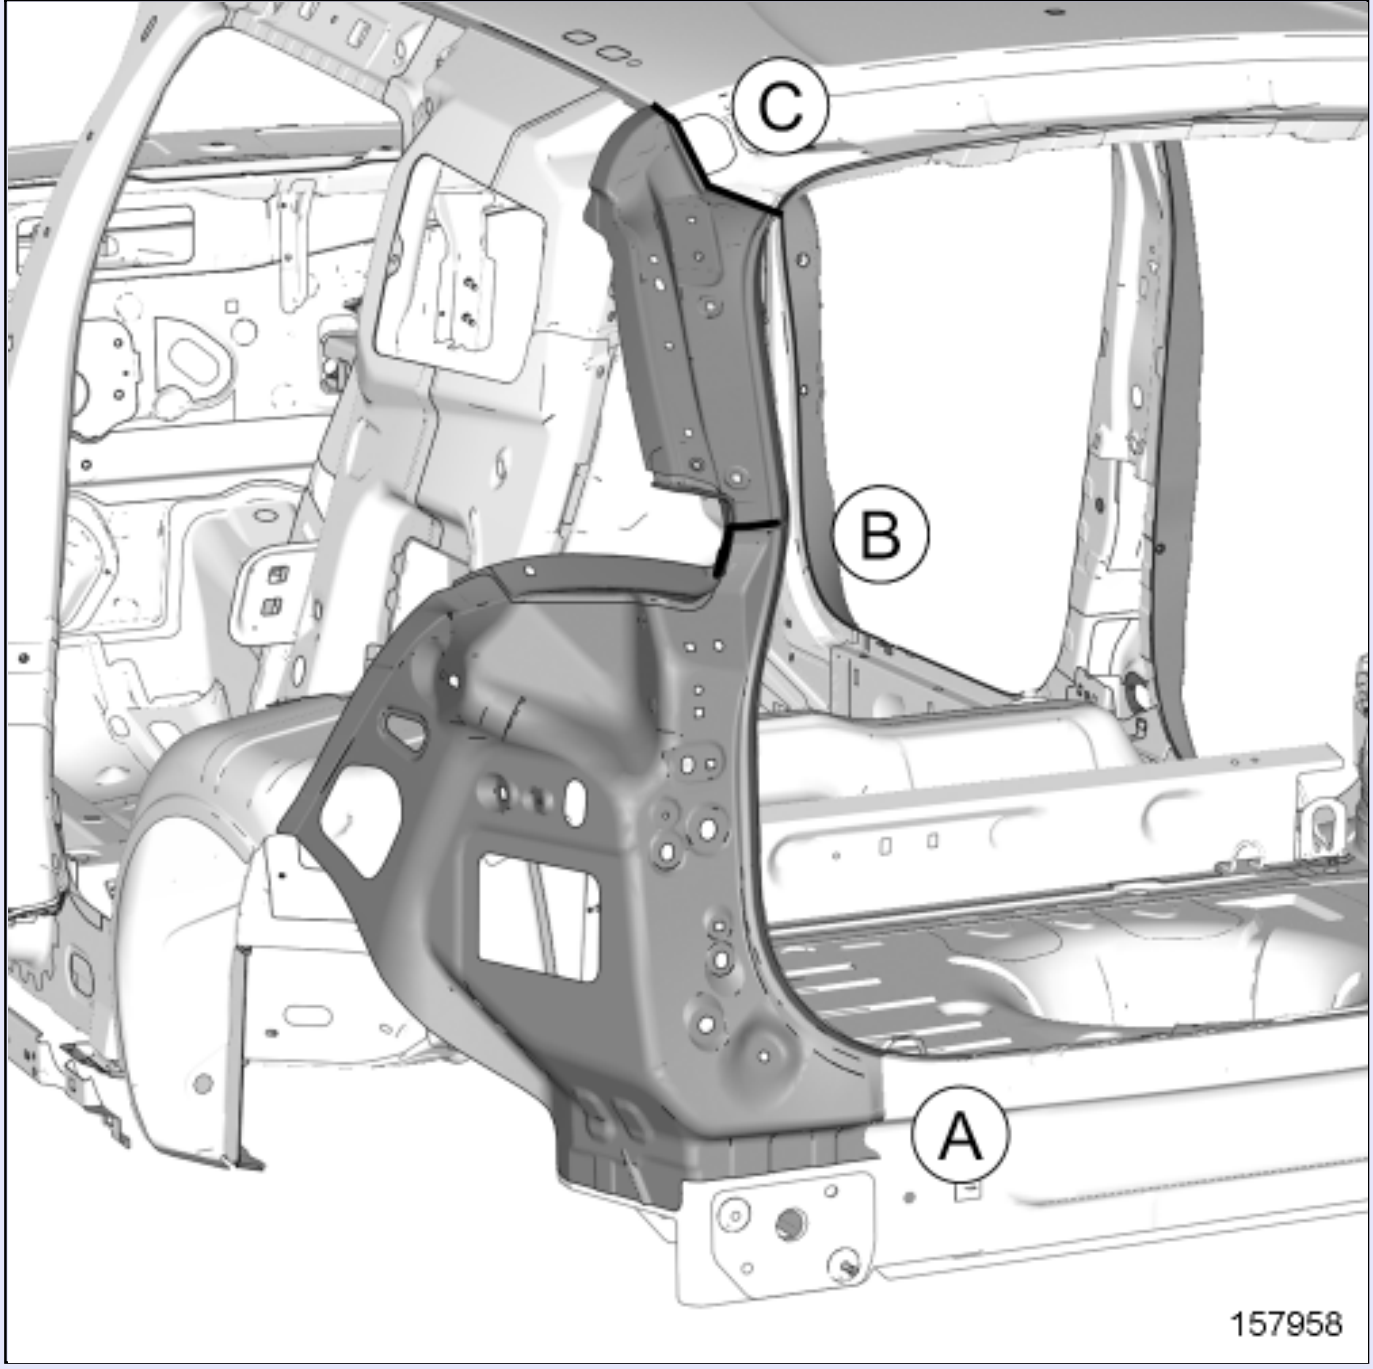
3- PARTIAL REPLACEMENT A-C

1)PART IN POSITION

DETAILED VIEW



Make a superimposed connection[Partial replacement connections by overlapping: Description](#) (MR 400, 40E, Partial replacement connections).

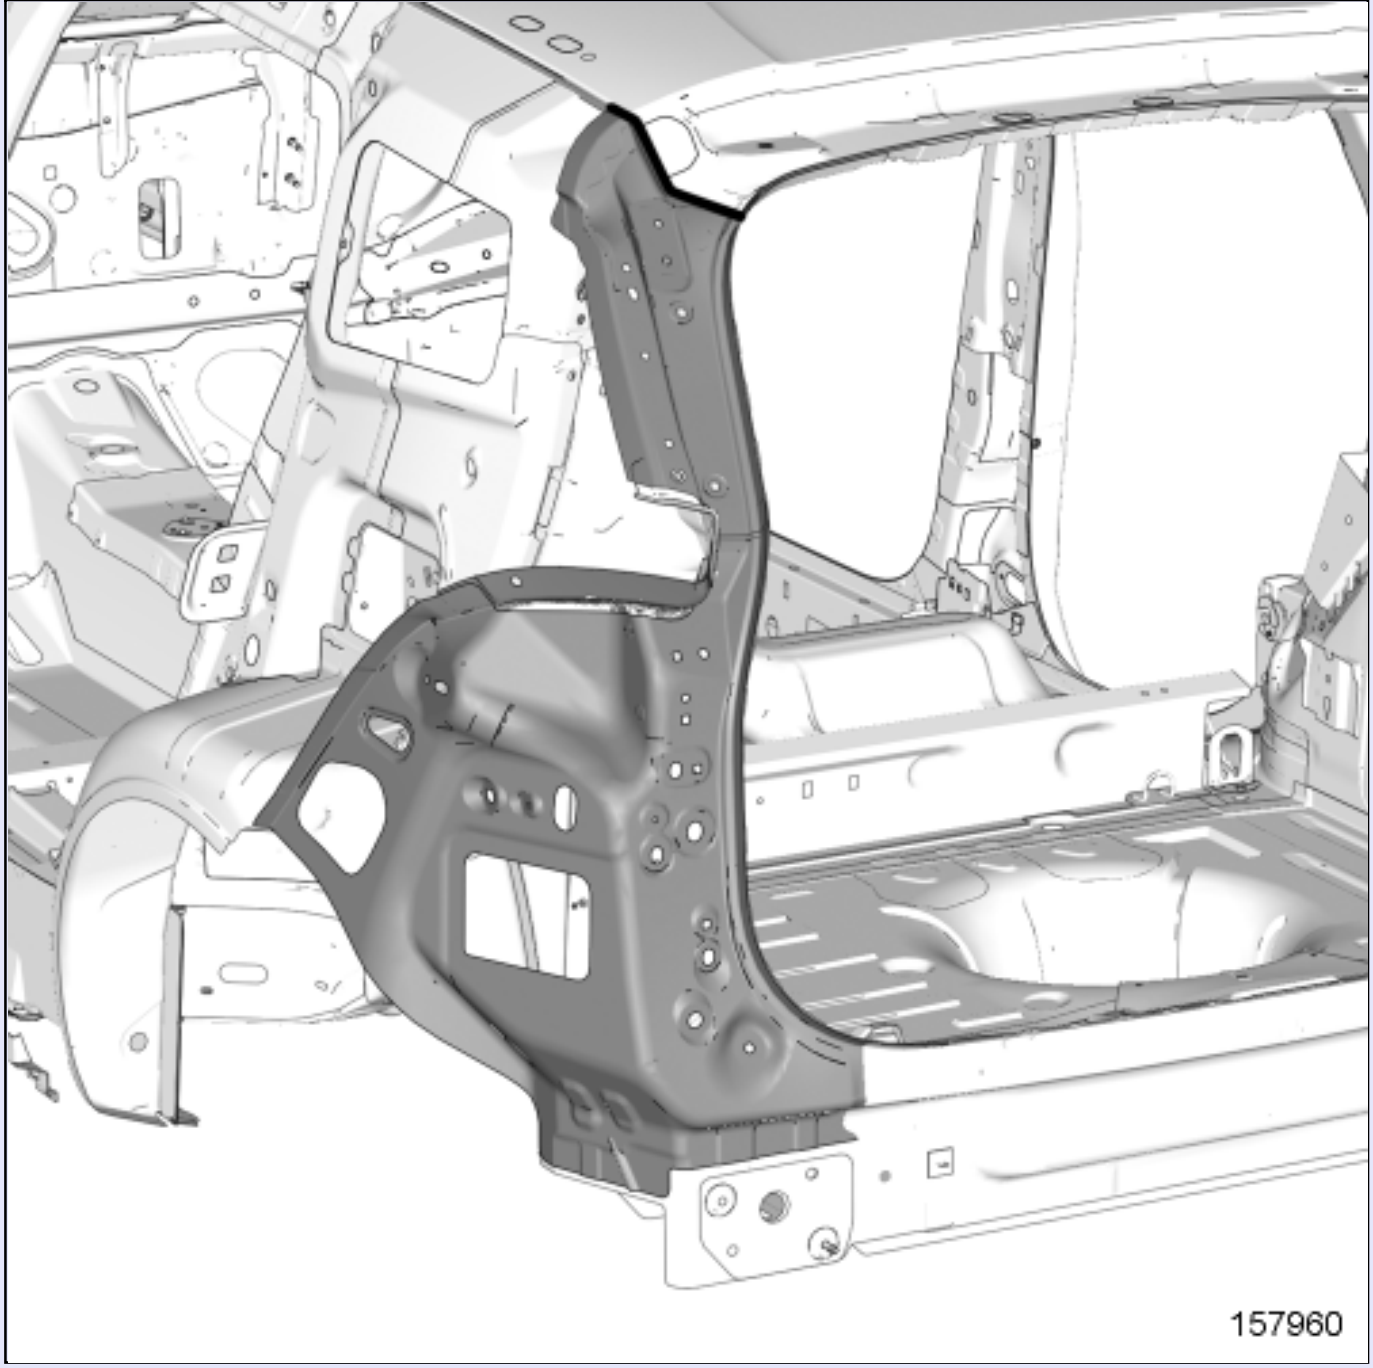


K98(K98)

The options for replacing this part are as follows:

- complete replacement A-C,

partial replacement A-B.



1- COMPLETE REPLACEMENT A-C

1)PART IN POSITION

DETAILED VIEW

2)POSITION OF ELECTRIC EARTHS

CAUTION

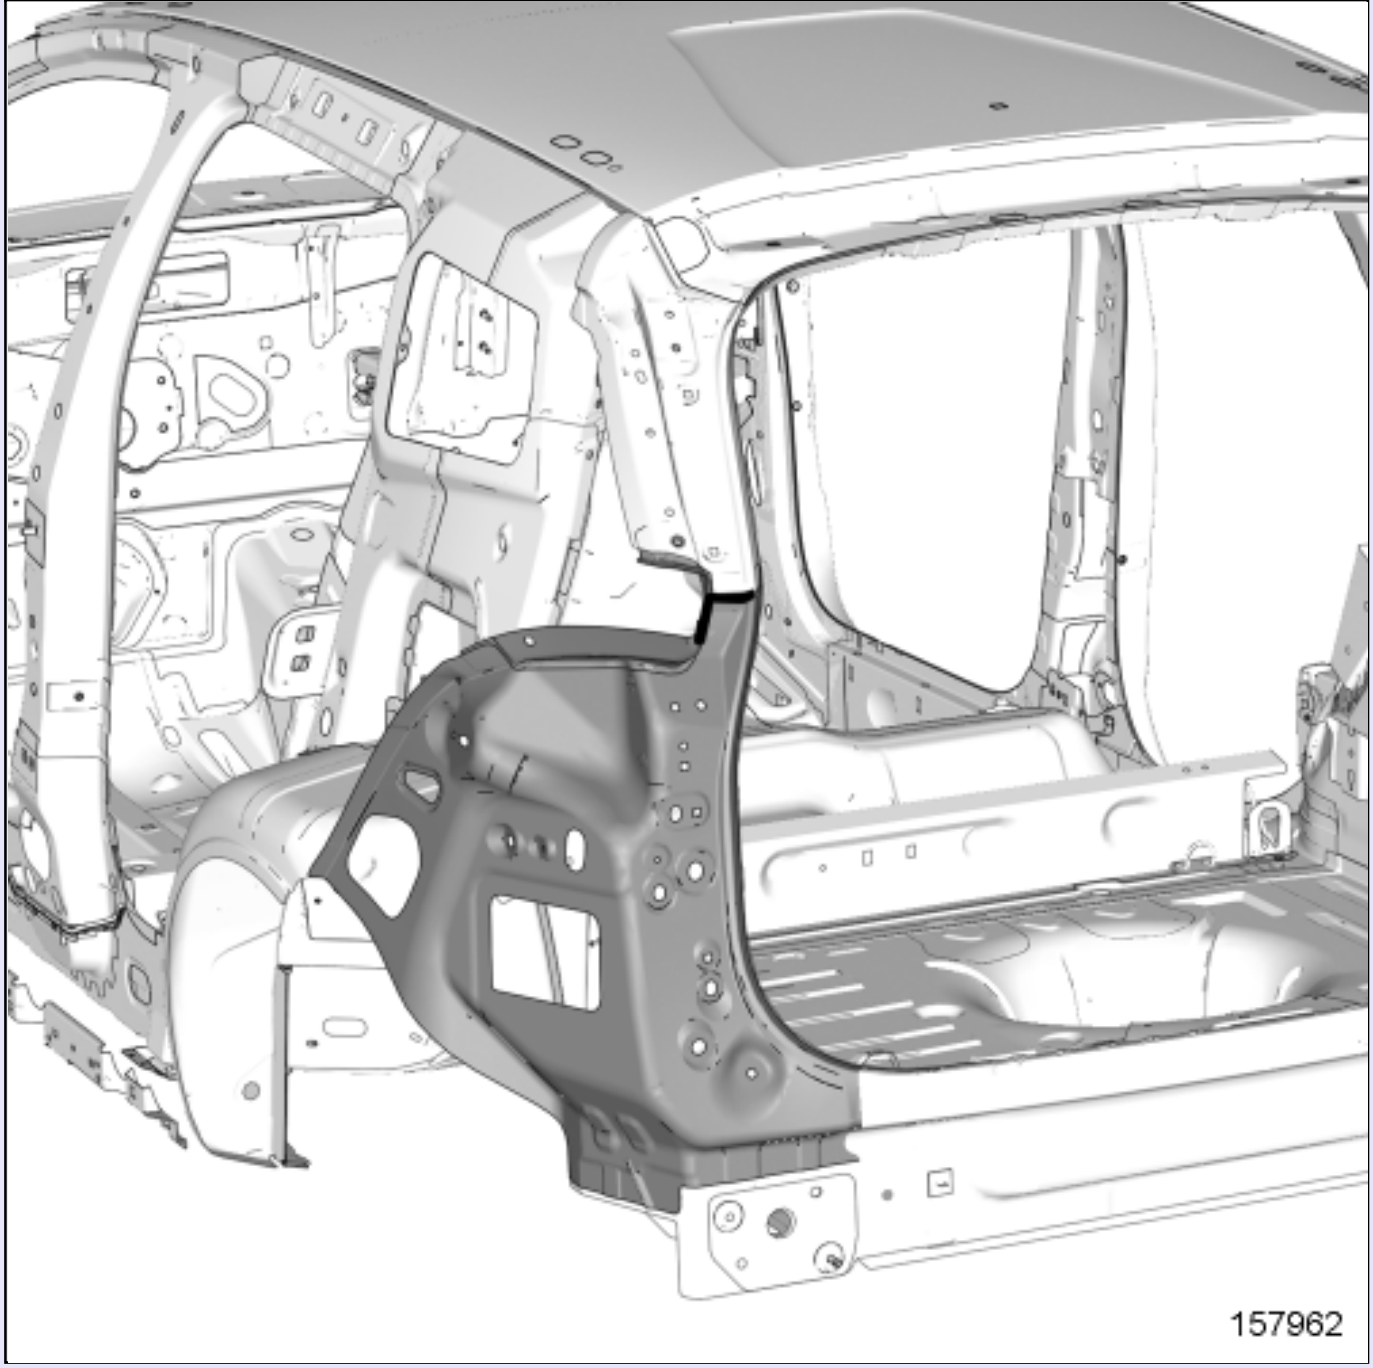
To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earths on body: List and location of components (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT A-B

1)PART IN POSITION

DETAILED VIEW

Make a superimposed connection[Partial replacement connections by overlapping: Description](#) [Partial replacement connections by overlapping: Description](#) (MR 400, 40E, Partial replacement connections).

Repair-40x09x02x10-02x49-1-8-1.xml

XSL version : 3.02 du 22/07/11

REAR LIGHTING: LIST AND LOCATION OF COMPONENTS

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 81A, Rear lighting, Rear signals - lighting assembly: Exploded view) .

1. LIST OF COMPONENTS

1- THE "REAR LIGHTING" EQUIPMENT CONSISTS OF:

- rear lights on wing,
- rear opening element lights,
- rear light bulbs,
- an high level brake light.

2. LOCATION OF COMPONENTS

1- REAR LIGHT ON WING

Open the tailgate.

Remove the rear bumper side trimRear bumper assembly: Exploded view .

Remove (see 81A, Rear lighting, Rear signals - lighting assembly: Exploded view) :

- the rear light on wing screws,
- the rear light on wing nut,
- the rear light on wing.

Disconnect the rear light on wing connector.

2- REAR OPENING ELEMENT LIGHT

Open the tailgate.

Remove the rear opening element trimRear opening element trim: Removal - Refitting .

Remove (see 81A, Rear lighting, Rear signals - lighting assembly: Exploded view) :

- the rear opening element light nuts,
- the rear opening element light.

Unclip the bulb holder.

3- REAR LIGHT BULBS

The rear opening element light bulbs can be replaced without removing the rear light (accessible by the rear opening element trim flap).

The rear light on wing bulbs are to be replaced by removing the rear light and unclipping the bulbs support plate.

To replace any bulbs(see 81A, Rear lighting, Rear signals - lighting assembly: Exploded view) .

4- HIGH LEVEL BRAKE LIGHT

Remove Exterior rear opening element assembly: Exploded view :

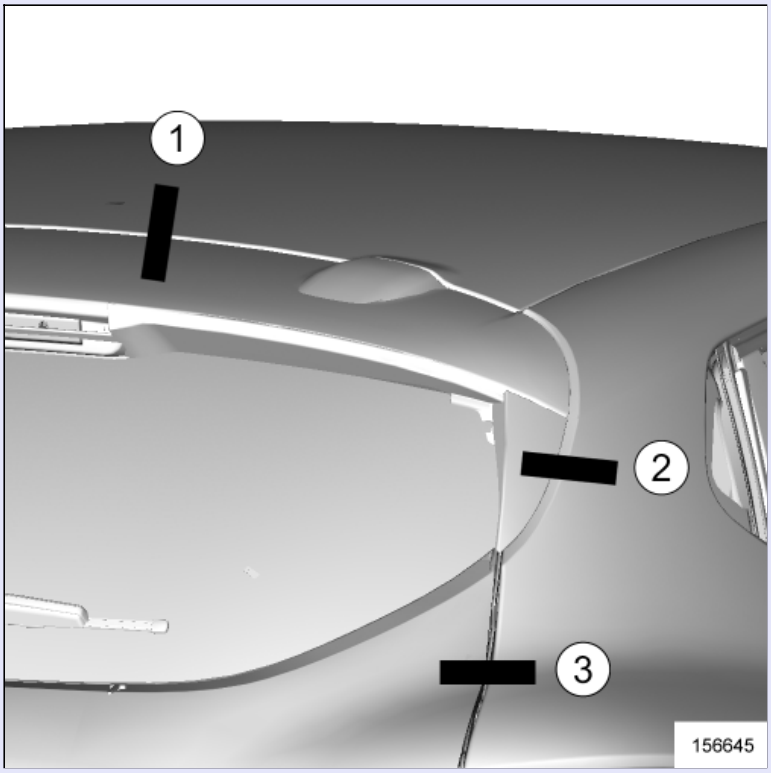
- the rear screen side trims,
- the rear opening element spoiler.

Disconnect the high level brake light connector.

Remove (see 81A, Rear lighting, Rear signals - lighting assembly: Exploded view) :

- the high level brake light screws,
- the high level brake light.

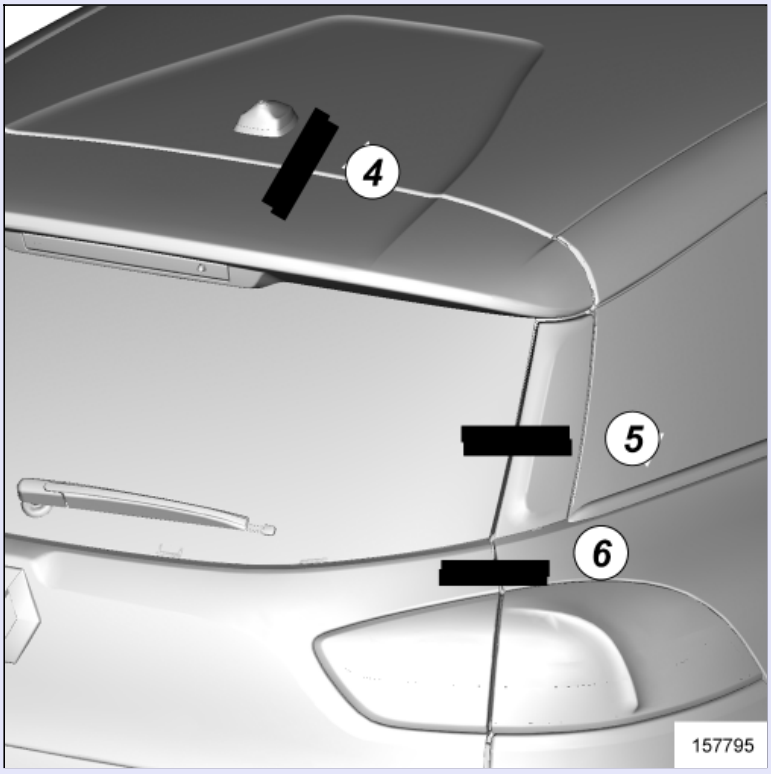
XSL version : 3.02 du 22/07/11



REAR OPENING ELEMENT: ADJUSTMENT

Location and specifications (tightening torques, parts always to be replaced, etc.)Rear opening element mechanism assembly: Exploded view .

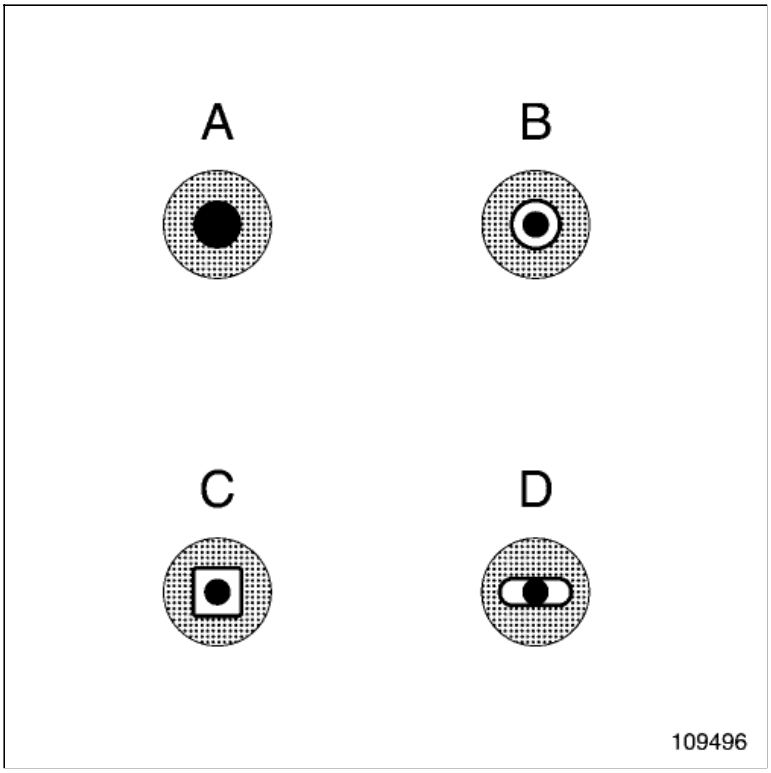
ADJUSTMENT VALUES



- For all information about tailgate adjustment valuesVehicle panel gaps: Adjustment value .

B98(B98)

- Observe the adjustment sequence(1) , (2) , (3) .



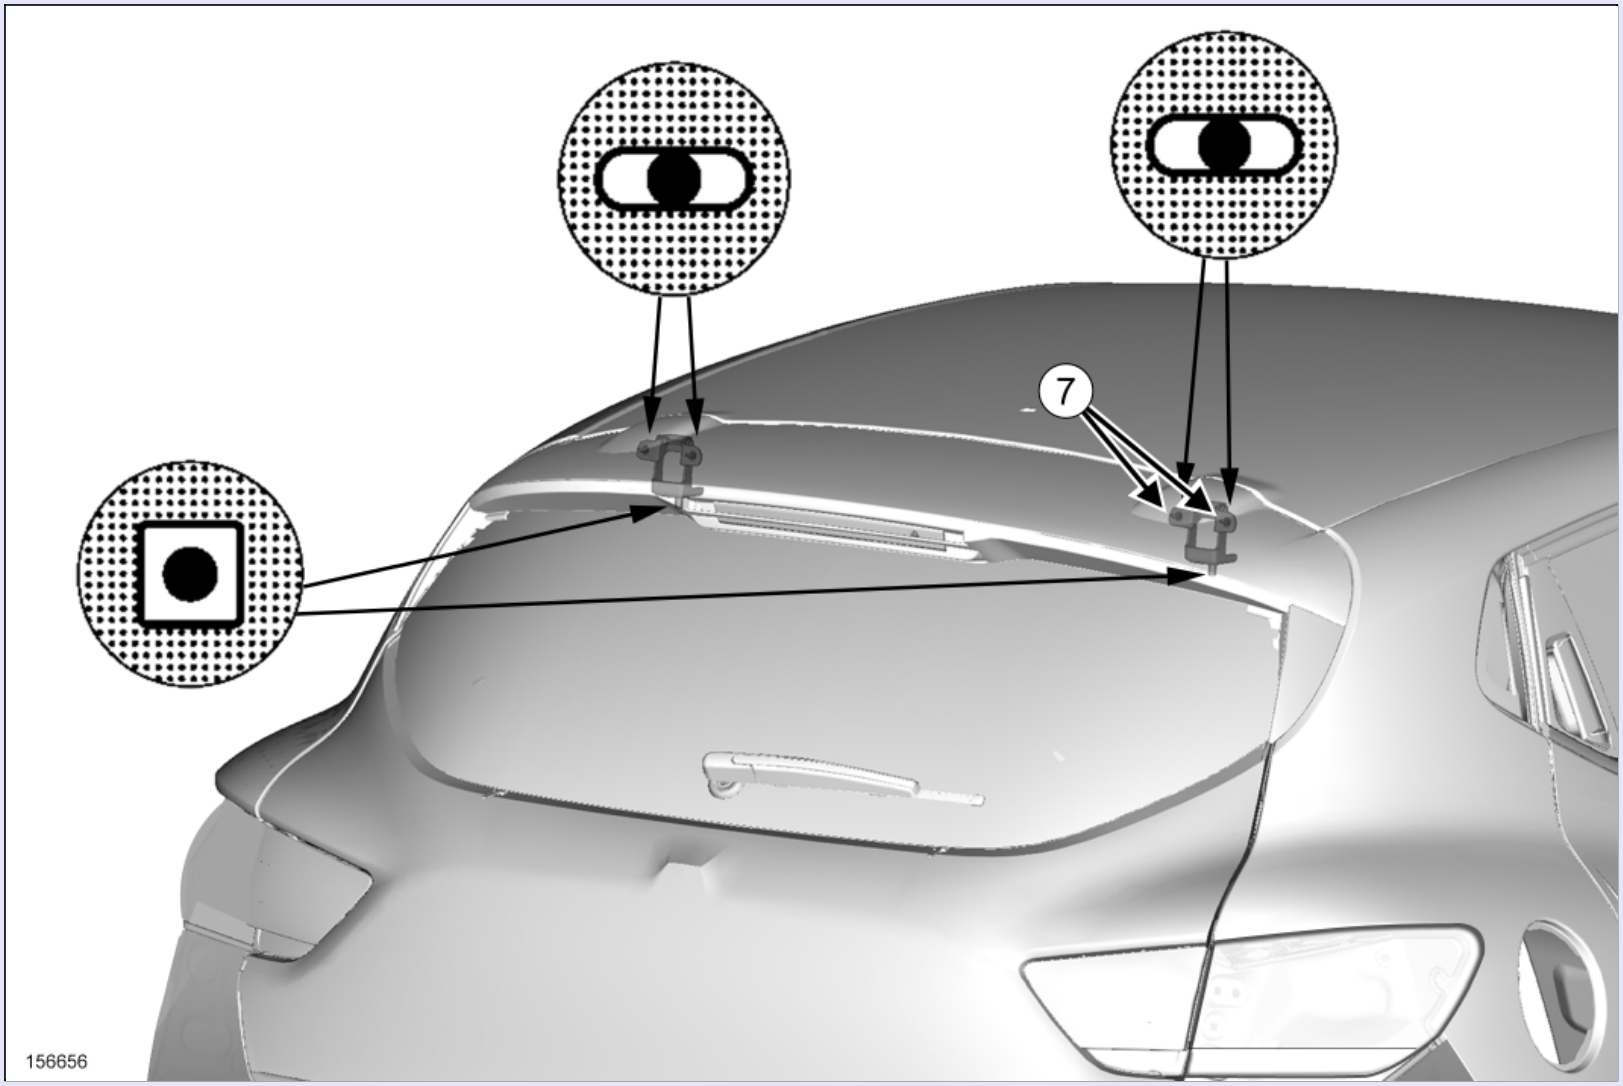
K98(K98)

- Observe the adjustment sequence(4) , (5) , (6) .

ADJUSTMENT

- There are three options for adjusting the tailgate:
  - using the tailgate bolts,
  - using the tailgate hinge nuts,
  - using the rear end panel striker plate.

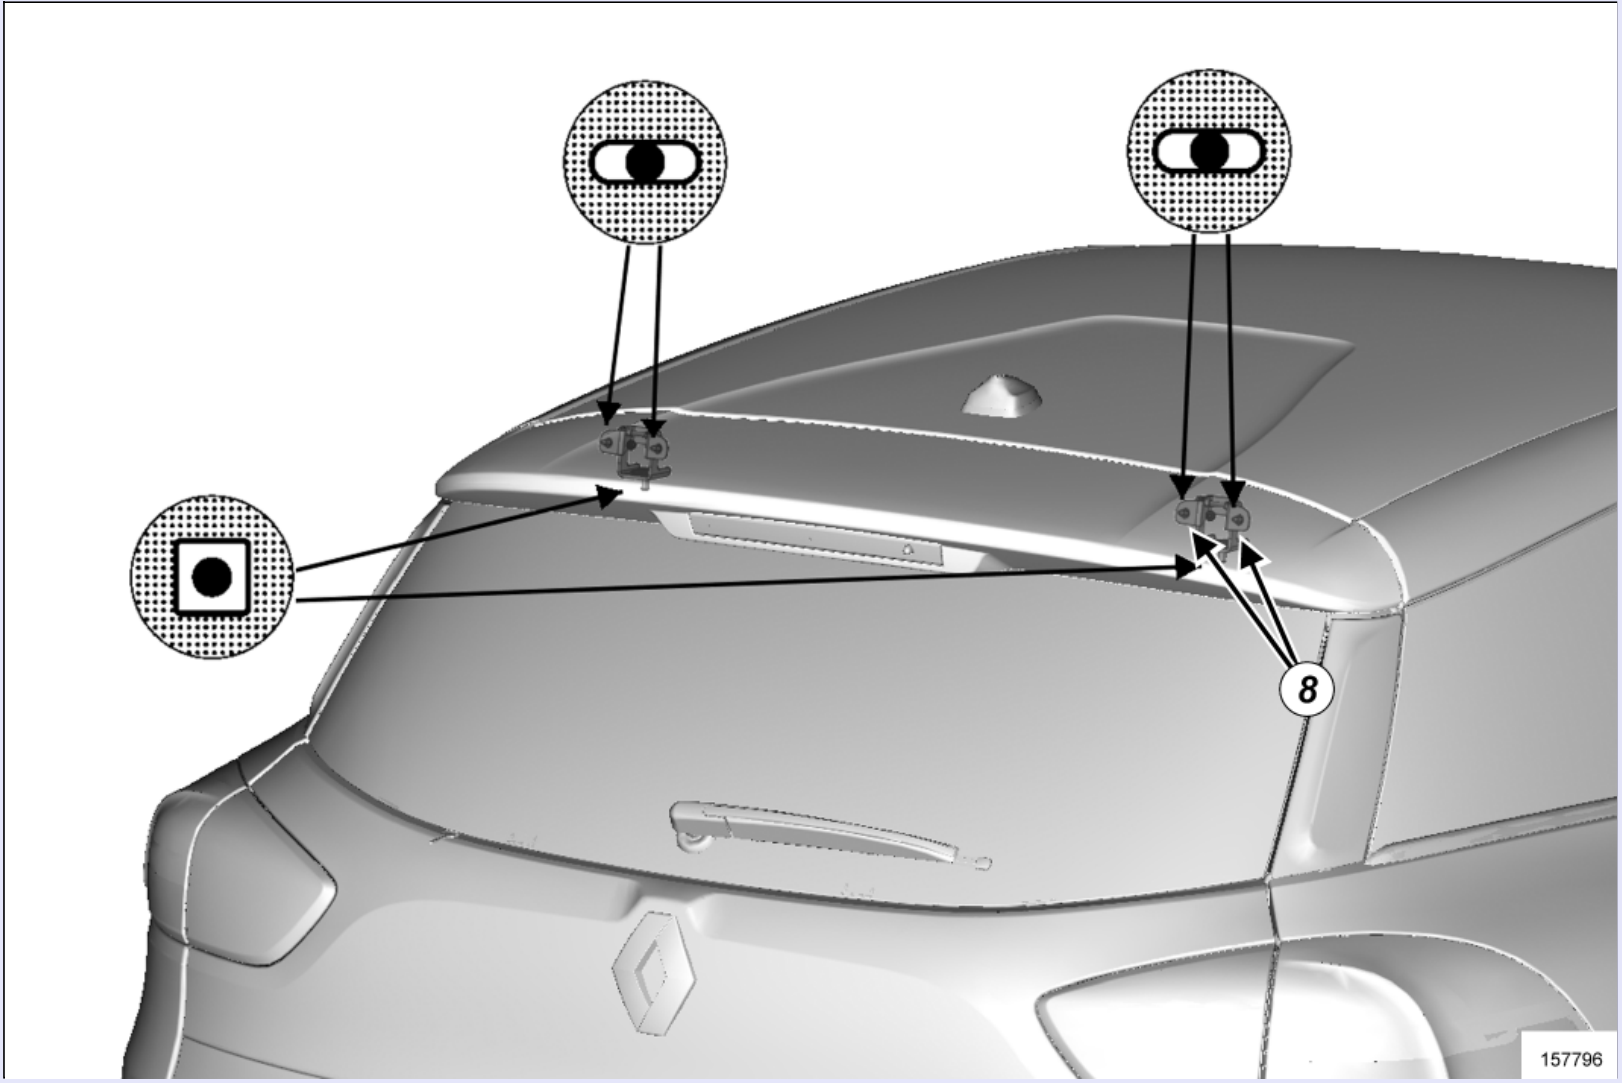
- Symbols A, B, C and D show the adjustment options.



The black dot in the centre represents the body of the bolt.

The grey section represents the component to be adjusted.

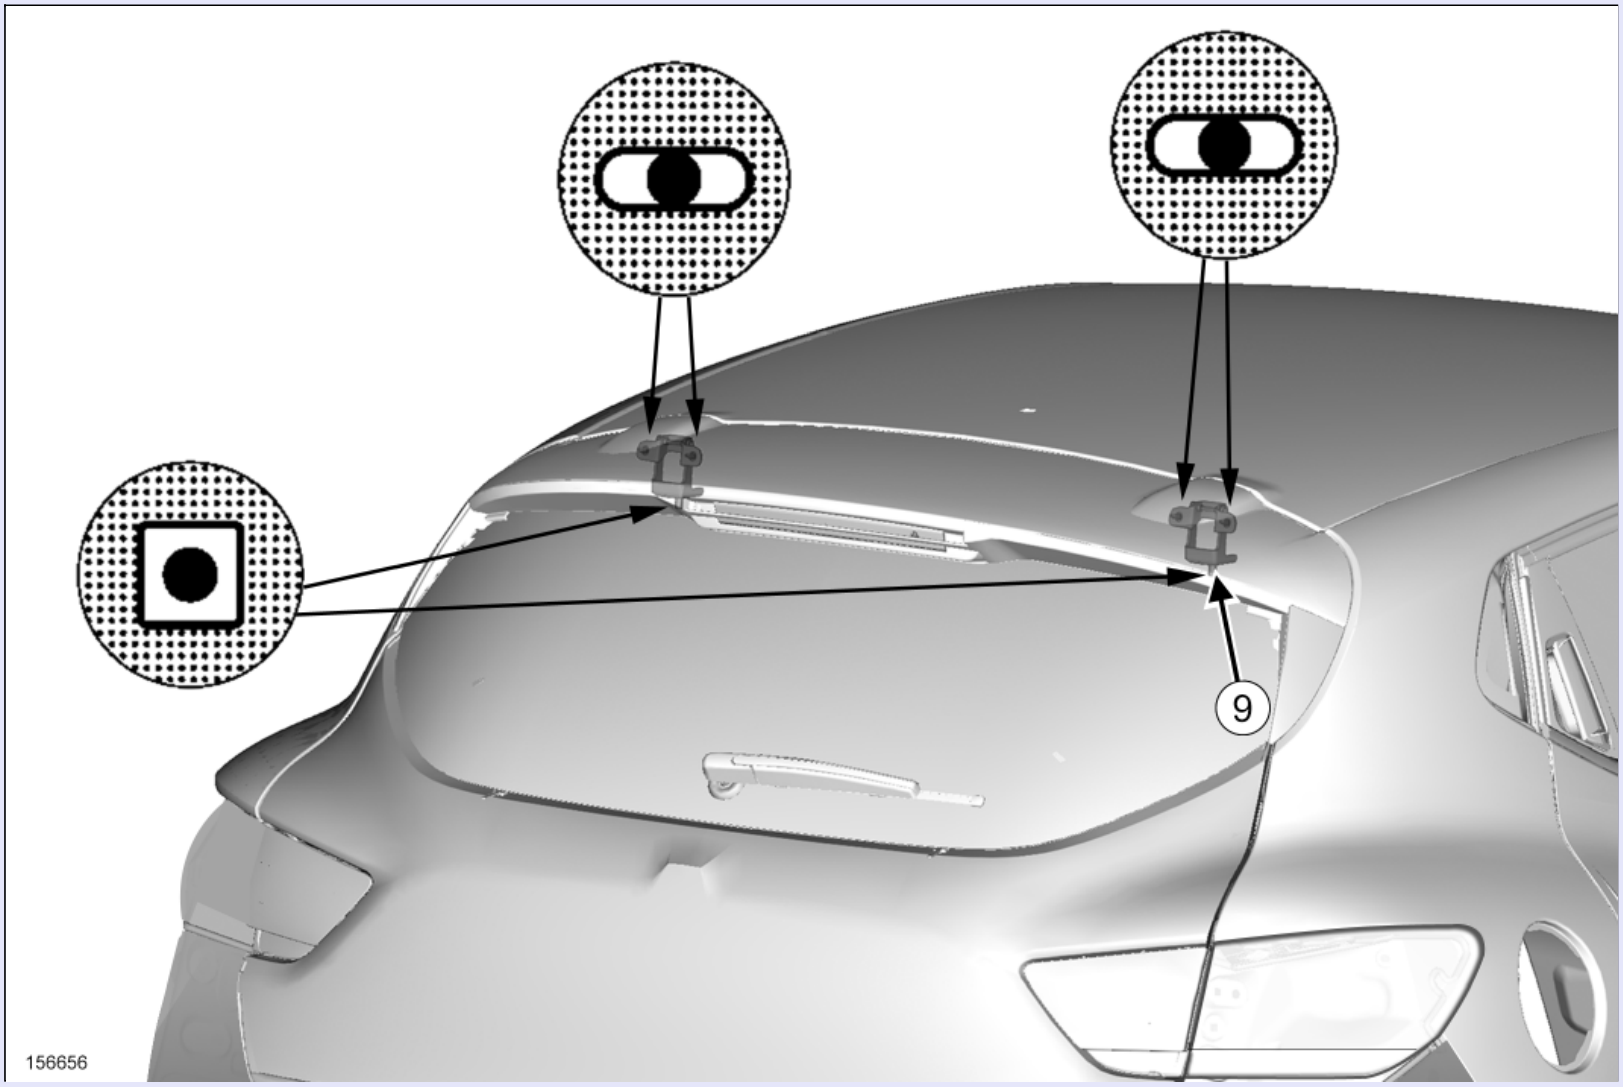
The white section represents the adjustment area.



1. ADJUSTMENT USING THE TAILGATE BOLTS

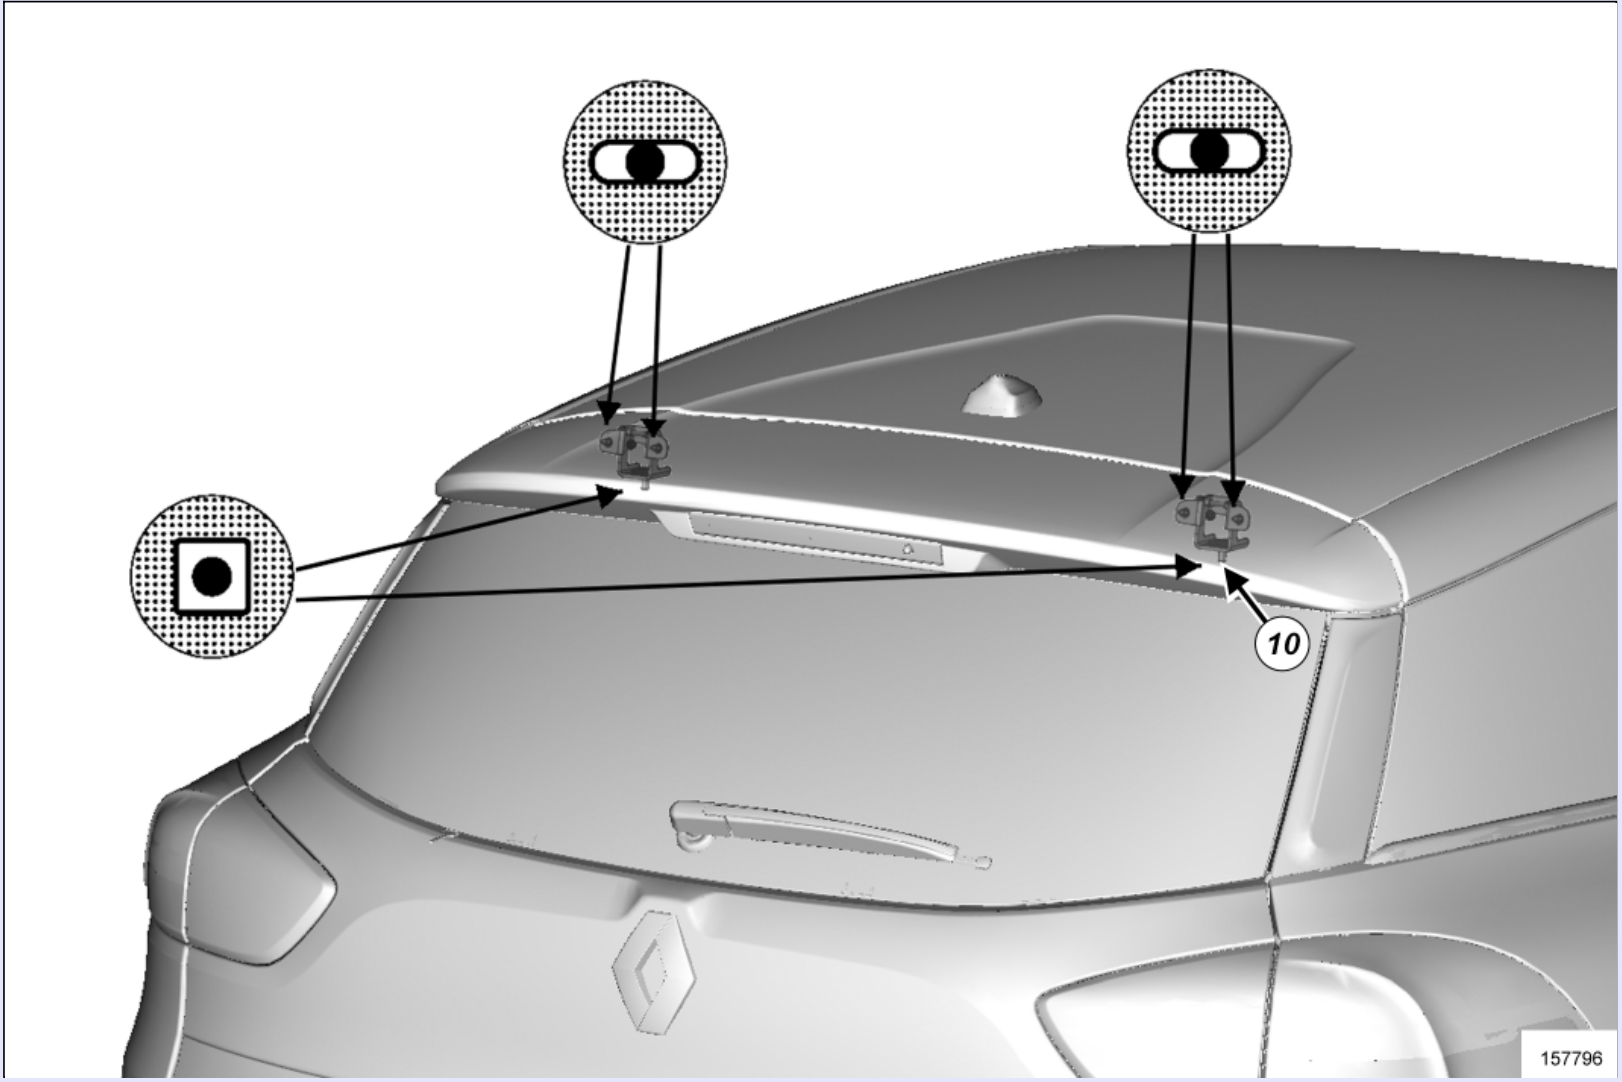
B98(B98)

- Undo the tailgate bolts(7) on each side of the vehicle.
- Adjust the tailgate panel gaps.
- Torque tighten the tailgate boltsRear opening element mechanism assembly: Exploded view .



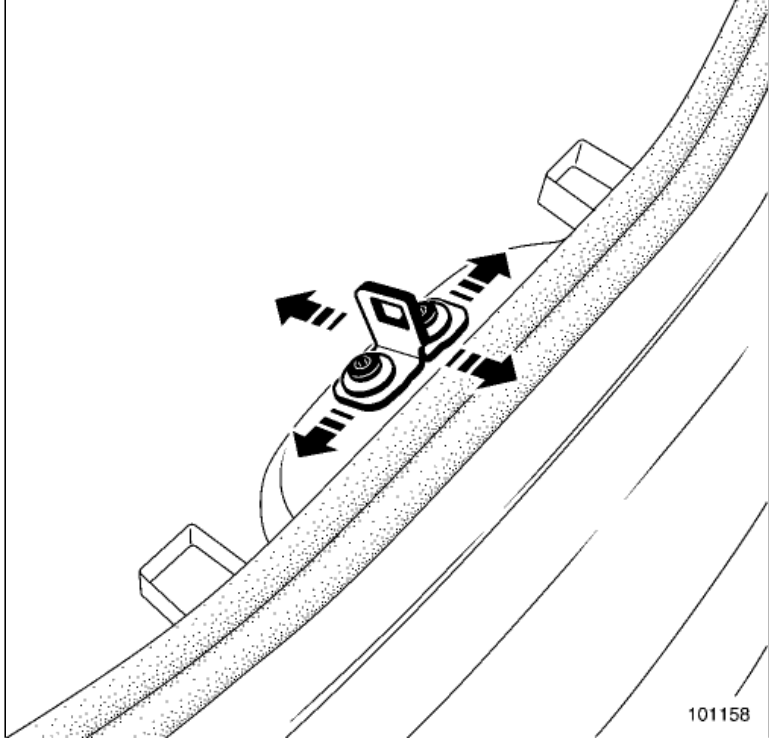
K98(K98)

- Undo the tailgate bolts(8) on each side of the vehicle.
- Adjust the tailgate panel gaps.
- Torque tighten the tailgate bolts Rear opening element mechanism assembly: Exploded view .



2. ADJUSTMENT USING THE HINGE NUTS

B98(B98)



- Undo the hinge nut(9) on each side of the vehicle.
- Adjust the tailgate panel gaps.
- Tighten the hinge nuts.

K98(K98)

- Undo the hinge nut(10) on each side of the vehicle.
- Adjust the tailgate panel gaps.
- Tighten the hinge nuts.

3. REAR END PANEL STRIKER PLATE ADJUSTMENT

- Loosen the striker plate bolts on the rear end panel.
- Adjust the tailgate panel gaps.
- Tighten the striker plate bolts.

REAR OPENING ELEMENT MECHANISM ASSEMBLY: EXPLODED VIEW

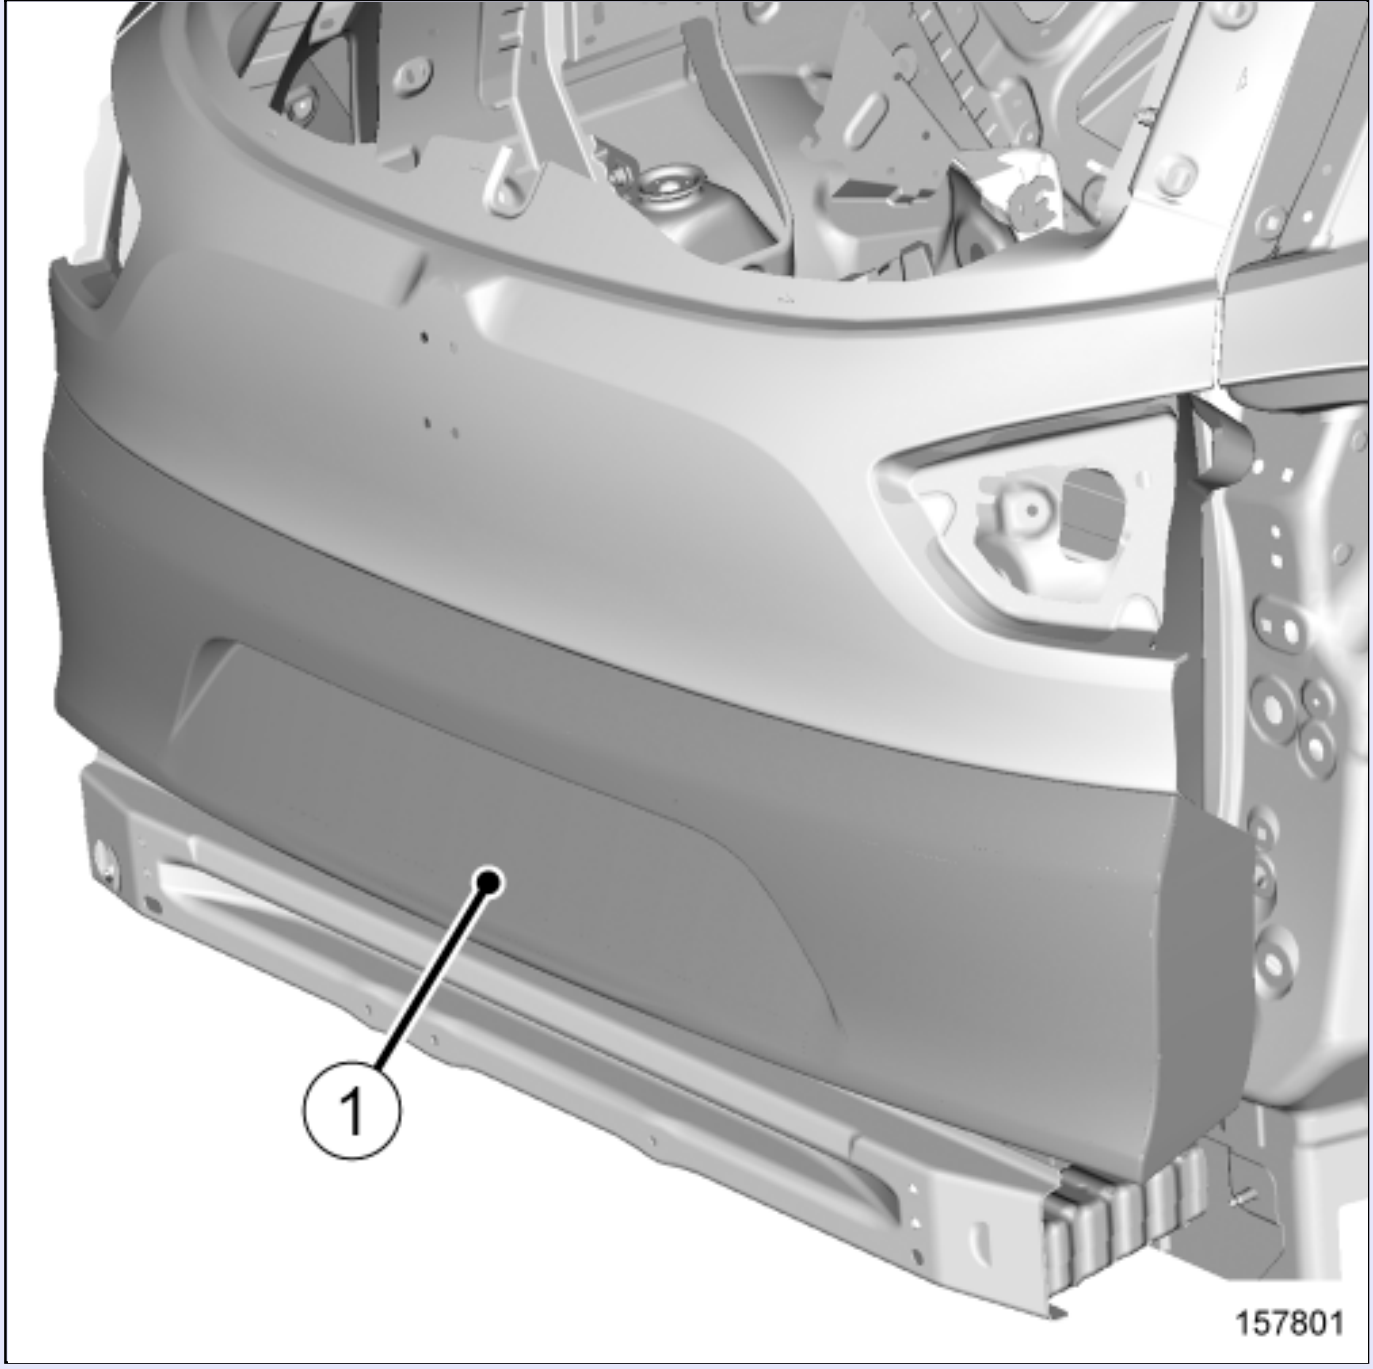
REAR OPENING ELEMENT: REMOVAL - REFITTING

Location and specifications (tightening torques, parts always to be replaced, etc.)Rear opening element mechanism assembly: Exploded view .

1. REMOVAL WITHOUT THE HINGES

1- REMOVAL PREPARATION OPERATION



B98(B98)

- Remove:
  - the rear opening element trim Rear opening element trim: Removal - Refitting ,
  - the rear screen side trims Exterior rear opening element assembly: Exploded view ,
  - the rear opening element spoiler blanking covers Exterior rear opening element assembly: Exploded view ,
  - the rear opening element spoiler Exterior rear opening element assembly: Exploded view .

- Disconnect the following connectors of:
  - the rear screen wiper motor,
  - the high level brake light,
  - the tailgate lock,
  - the heated rear screen,

- Remove from the tailgate:
  - the tailgate wiring,
  - the tailgate washer jet tube,
  - the tailgate gas struts Rear opening element mechanism assembly: Exploded view .

K98(K98)

Remove:

- the rear opening element trim Rear opening element trim: Removal - Refitting ,
- the rear opening element spoiler blanking covers Exterior rear opening element assembly: Exploded view ,
- the rear opening element spoiler Exterior rear opening element assembly: Exploded view ,
- the rear opening element strip(1) Exterior rear opening element assembly: Exploded view .

Disconnect the following connectors of:

- the rear screen wiper motor,
- the high level brake light,
- the tailgate lock,
- the heated rear screen,

Remove from the tailgate:

- the tailgate wiring,
- the tailgate washer jet tube,
- the tailgate gas struts Rear opening element mechanism assembly: Exploded view .

2- REMOVAL OPERATION

Remove Rear opening element mechanism assembly: Exploded view :

- the tailgate bolts on each side of the vehicle,
- the tailgate (this operation requires two people).

2. REFITTING WITHOUT HINGES

Proceed in the reverse order to removal.

Adjust the gaps and flush fittings of the tailgate (see 48A, Non-side opening elements, Rear opening

element: Adjustment) .

3. REMOVAL WITH HINGES

1- REMOVAL PREPARATION OPERATION

B98(B98)

Remove the headlining partially**Headlining: Removal - Refitting** .

Remove:

- the rear opening element trim**Rear opening element trim: Removal - Refitting** ,
- the rear screen side trims**Exterior rear opening element assembly: Exploded view** ,
- the rear opening element spoiler blanking covers**Exterior rear opening element assembly: Exploded view** ,
- the rear opening element spoiler**Exterior rear opening element assembly: Exploded view** .

Disconnect the following connectors of:

- the rear screen wiper motor,
- the high level brake light,
- the tailgate lock,
- the heated rear screen.

Remove from the tailgate:

- the tailgate wiring,
- the tailgate washer jet tube,
- the tailgate gas struts**Rear opening element mechanism assembly: Exploded view** .

K98(K98)

Remove the headlining partially**Headlining: Removal - Refitting** .

Remove:

- the rear opening element trim Rear opening element trim: Removal - Refitting ,
- the rear opening element spoiler blanking covers Exterior rear opening element assembly: Exploded view ,
- the rear opening element spoiler Exterior rear opening element assembly: Exploded view ,
- the rear opening element strip(1) Exterior rear opening element assembly: Exploded view .

Disconnect the following connectors of:

- the rear screen wiper motor,
- the high level brake light,
- the tailgate lock,
- the heated rear screen.

Remove from the tailgate:

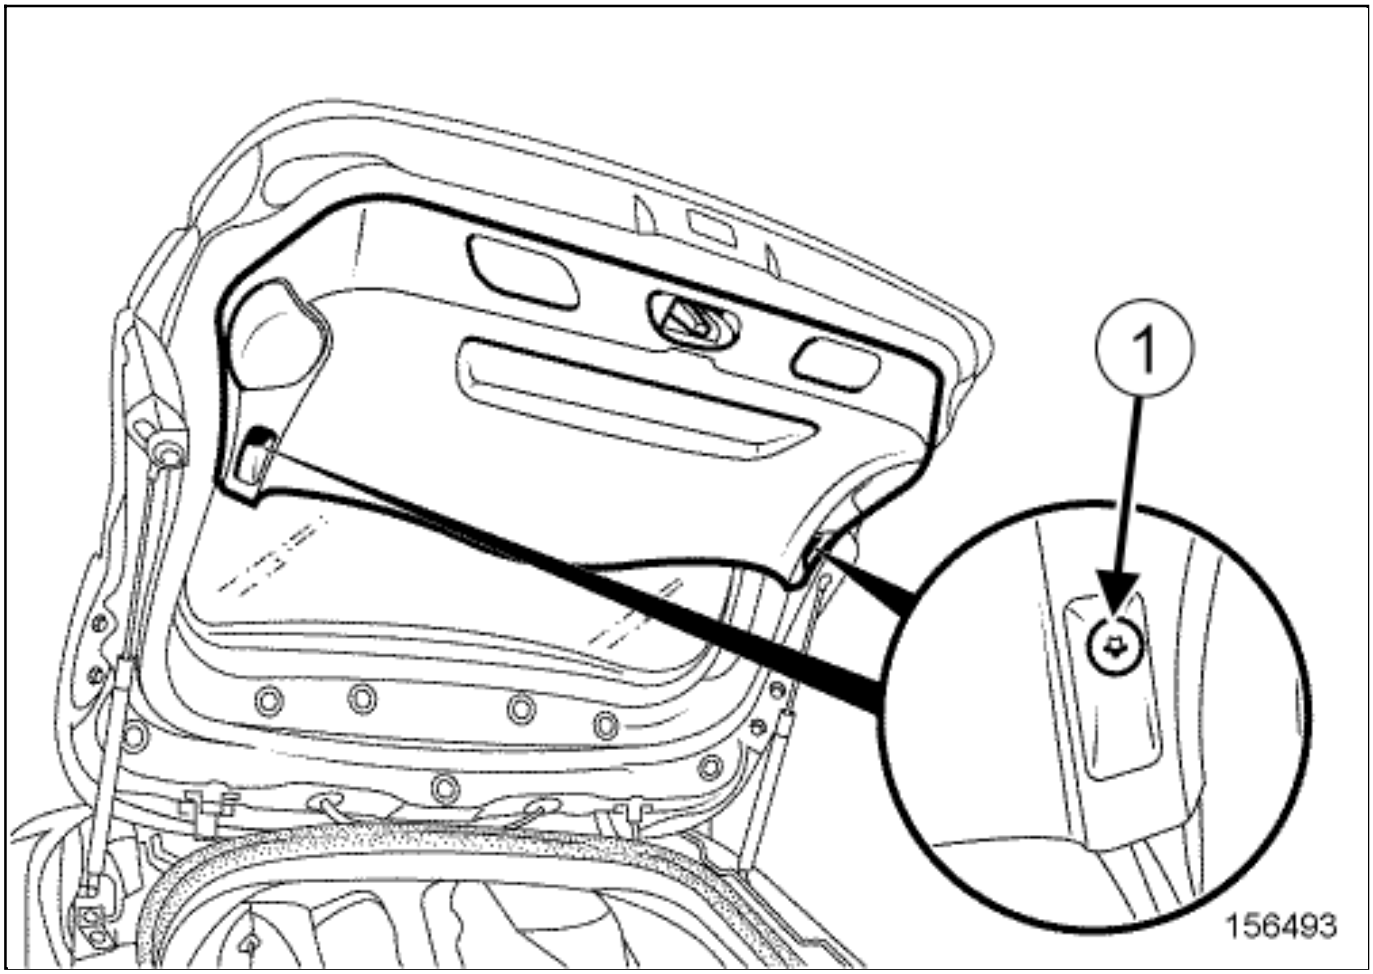
- the tailgate wiring,
- the tailgate washer jet tube,
- the tailgate gas struts Rear opening element mechanism assembly: Exploded view .

2- REMOVAL OPERATION

Remove Rear opening element mechanism assembly: Exploded view :

- the tailgate hinge nut on each side of the vehicle,
- the tailgate (this operation requires two people).

4. REFITTING WITH HINGES



Proceed in the reverse order to removal.

Adjust the tailgate panel gaps(see 48A, Non-side opening elements, Rear opening element: Removal - Refitting) .

REAR OPENING ELEMENT TRIM: REMOVAL - REFITTING

REMOVAL

1. REMOVAL OPERATION

- Remove:
  - the screws(1) ,
  - the rear opening element trim using a pair of unclipping pliers.

REFITTING

1. REFITTING PREPARATION OPERATION

- Check the clips and replace them if necessary.

2. REFITTING OPERATION

- Proceed in the reverse order to removal.

Repair-70x04x02x01-01x37-1-4-1.xml

XSL version : 3.02 du 22/07/11

REAR QUARTER PANEL WINDOW: REMOVAL - REFITTING

Note:

The seal of the rear quarter panel window is moulded onto the rear quarter panel window. If the seal has deteriorated, always replace the rear quarter panel window.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove Interior body side trim assembly: Exploded view :
  - the rear inner sill upper trim,
  - the rear parcel shelf side trim,
  - the rear quarter panel trim.

- Protect the area around the rear quarter panel window with masking tape.

2. REMOVAL OPERATION

- Cut the cement bead Window bonding tool: Use and Window detachment: Description .

- Remove the rear quarter panel window.

REFITTING

1. REFITTING PREPARATION OPERATION

- For preparation and bonding Products for preparing and bonding windows: Description .

2. REFITTING OPERATION

- Bond the rear quarter panel window**Window bonding: Description** .
- Equal out the clearances and shut lines.
- Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

REAR SCREEN: REMOVAL - REFITTING

parts always to be replaced:

Rear screen adjusting shim

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:

- the tailgate trim Rear opening element trim: Removal - Refitting ,
- the rear screen wiper arm Wiping and washing: List and location of components ,
- the rear screen wiper motor Wiping and washing: List and location of components ,
- the rear screen side trims Exterior rear opening element assembly: Exploded view ,
- the rear opening element spoiler Exterior rear opening element assembly: Exploded view .

Disconnect:

- the rear screen de-icer connectors,
- the aerial amplifier connectors.

2. REMOVAL OPERATION

Protect the edges of the rear screen using masking tape.

Cut the cement bead Window bonding tool: Use and Window detachment: Description .

Remove the rear screen (this operation requires two people).

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Rear screen adjusting shim .

For preparation and bonding Products for preparing and bonding windows: Description .

2. REFITTING OPERATION

Bond the rear screen Window bonding: Description .

Note:

This operation requires two operators.

Equal out the clearances and shut lines.

Remove the tabs from the stops once the adhesive has dried.

3. FINAL OPERATION

Proceed in the reverse order to removal.

Carry out a function test.

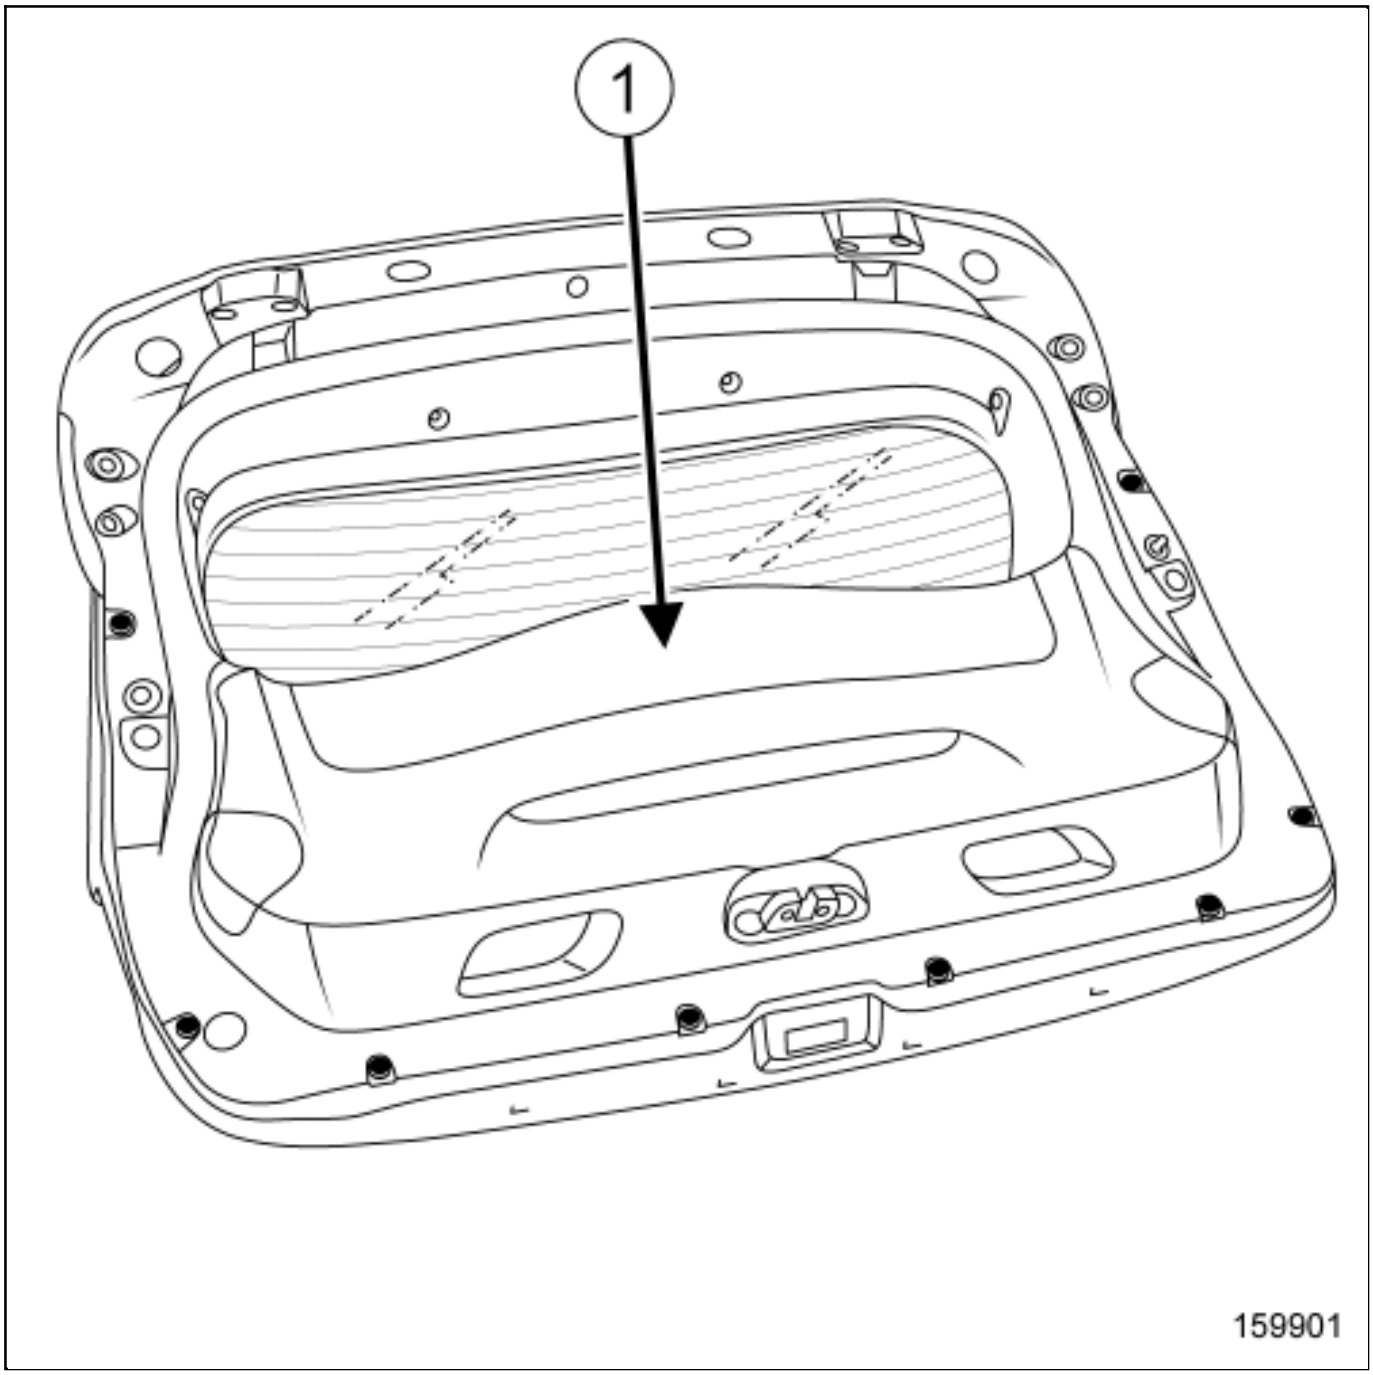
REAR SCREEN WIPER MOTOR: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

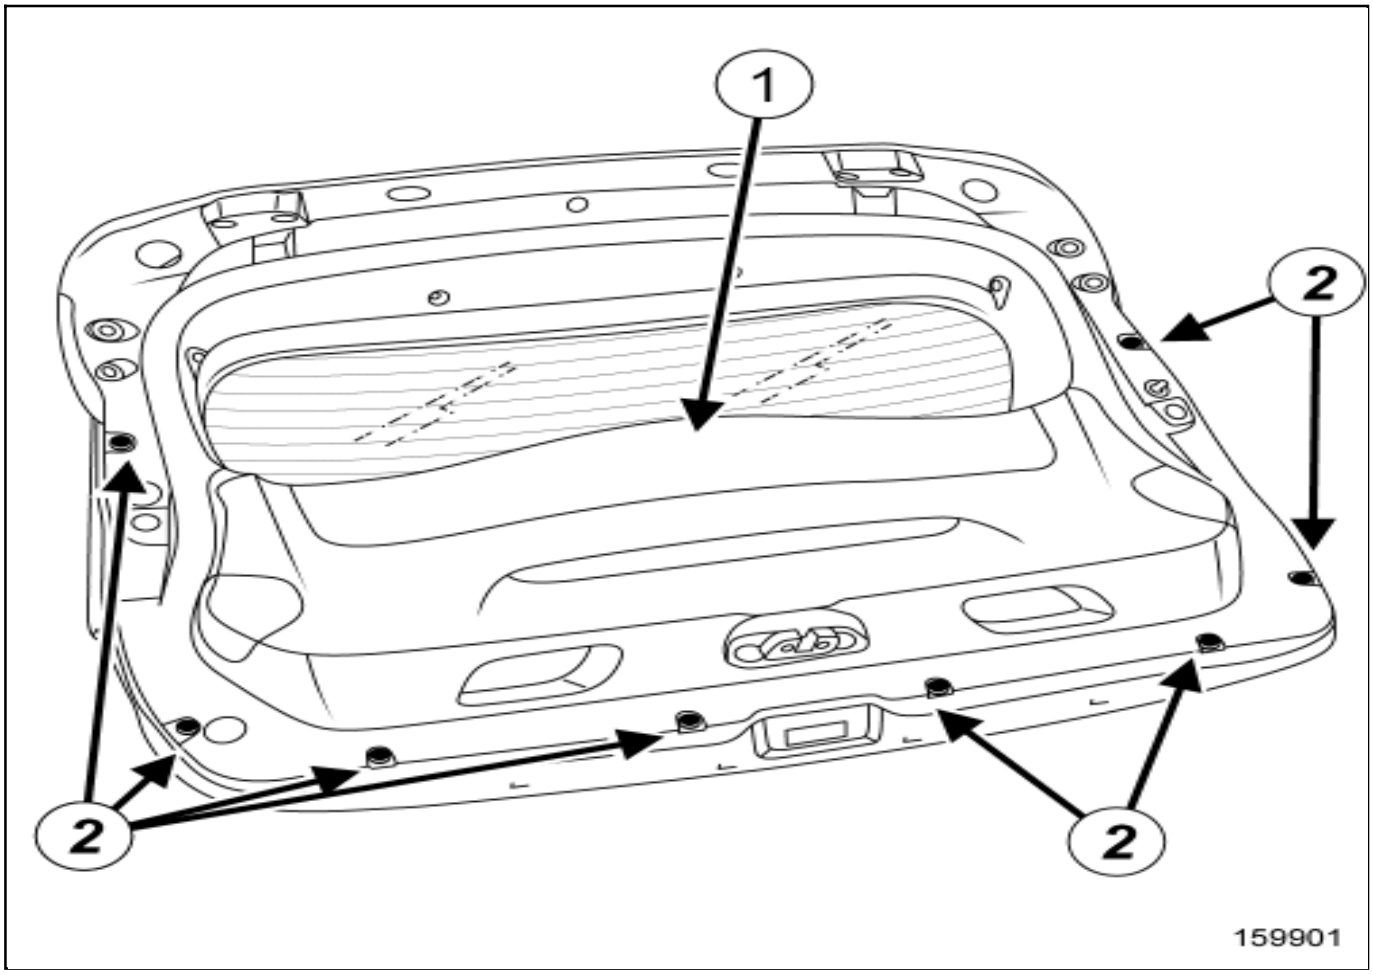
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

REMOVAL



1. REMOVAL PREPARATION OPERATION



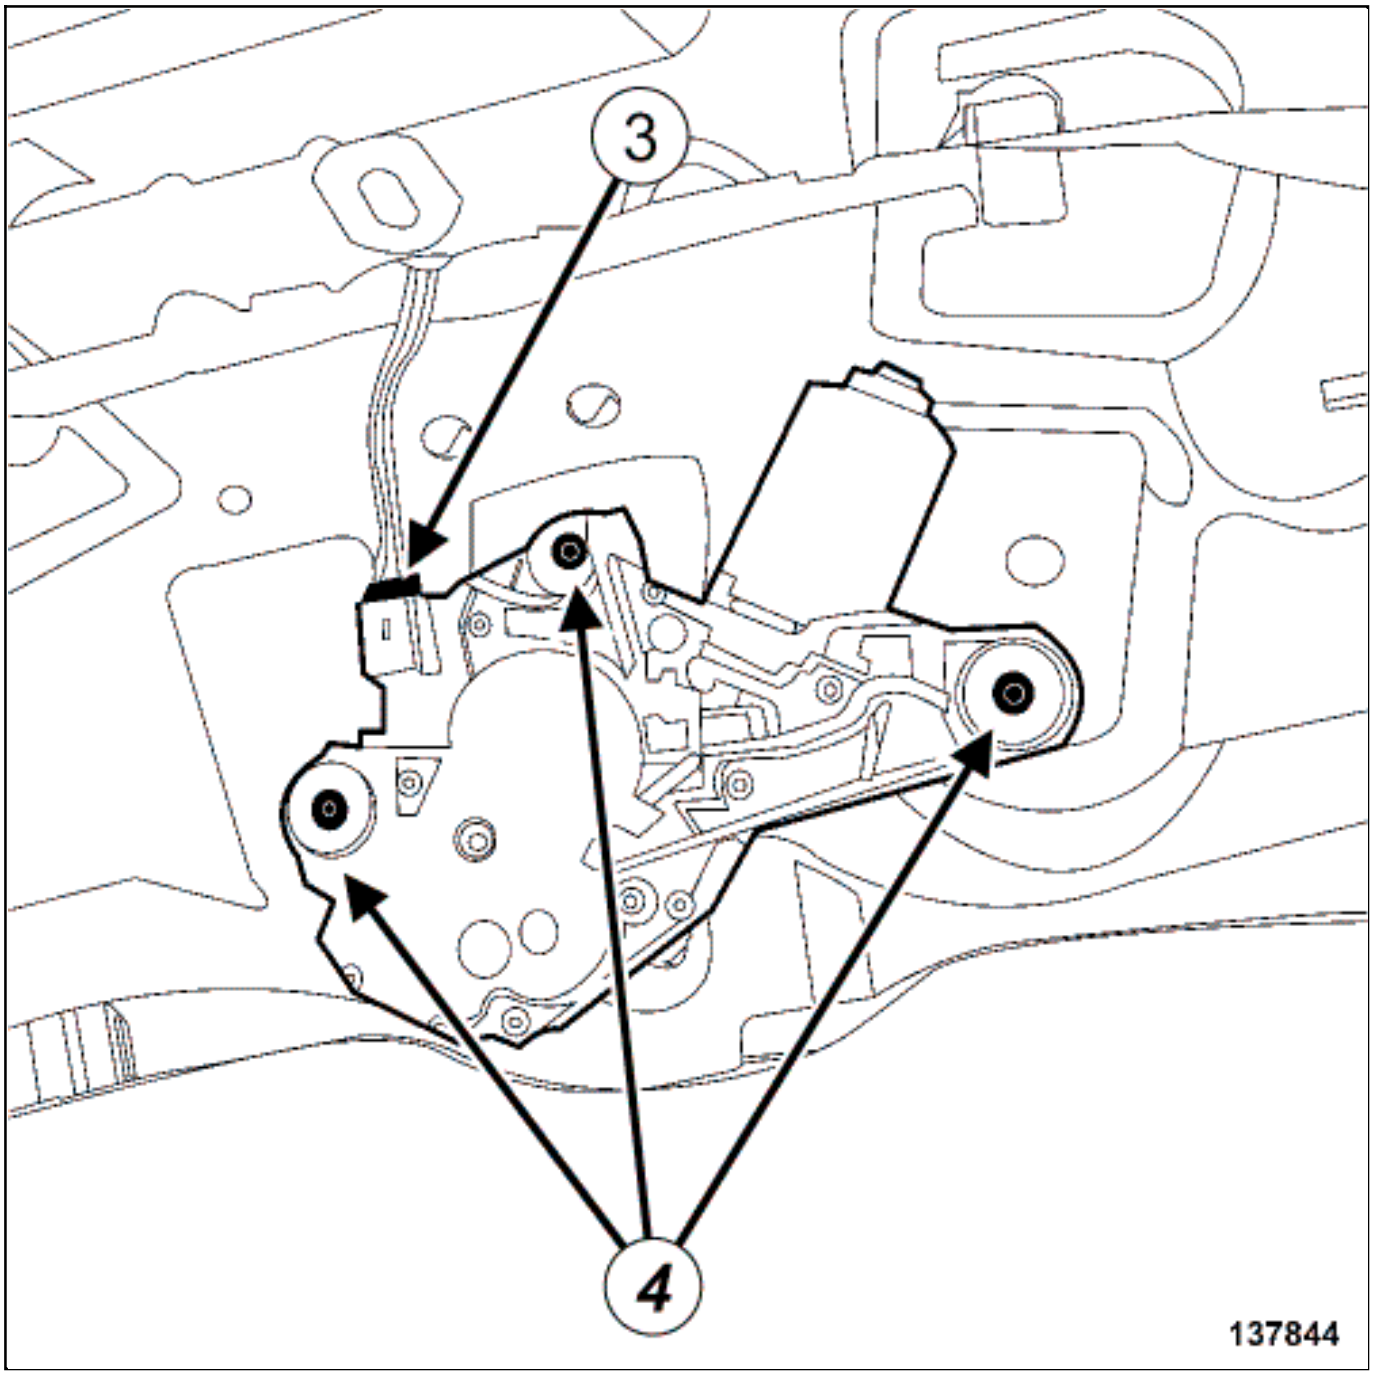
- Remove the lift the wiper arm Wiping and washing: List and location of components .

1- STEEL TAILGATE

- Remove the rear opening element trim Rear opening element trim: Removal - Refitting .

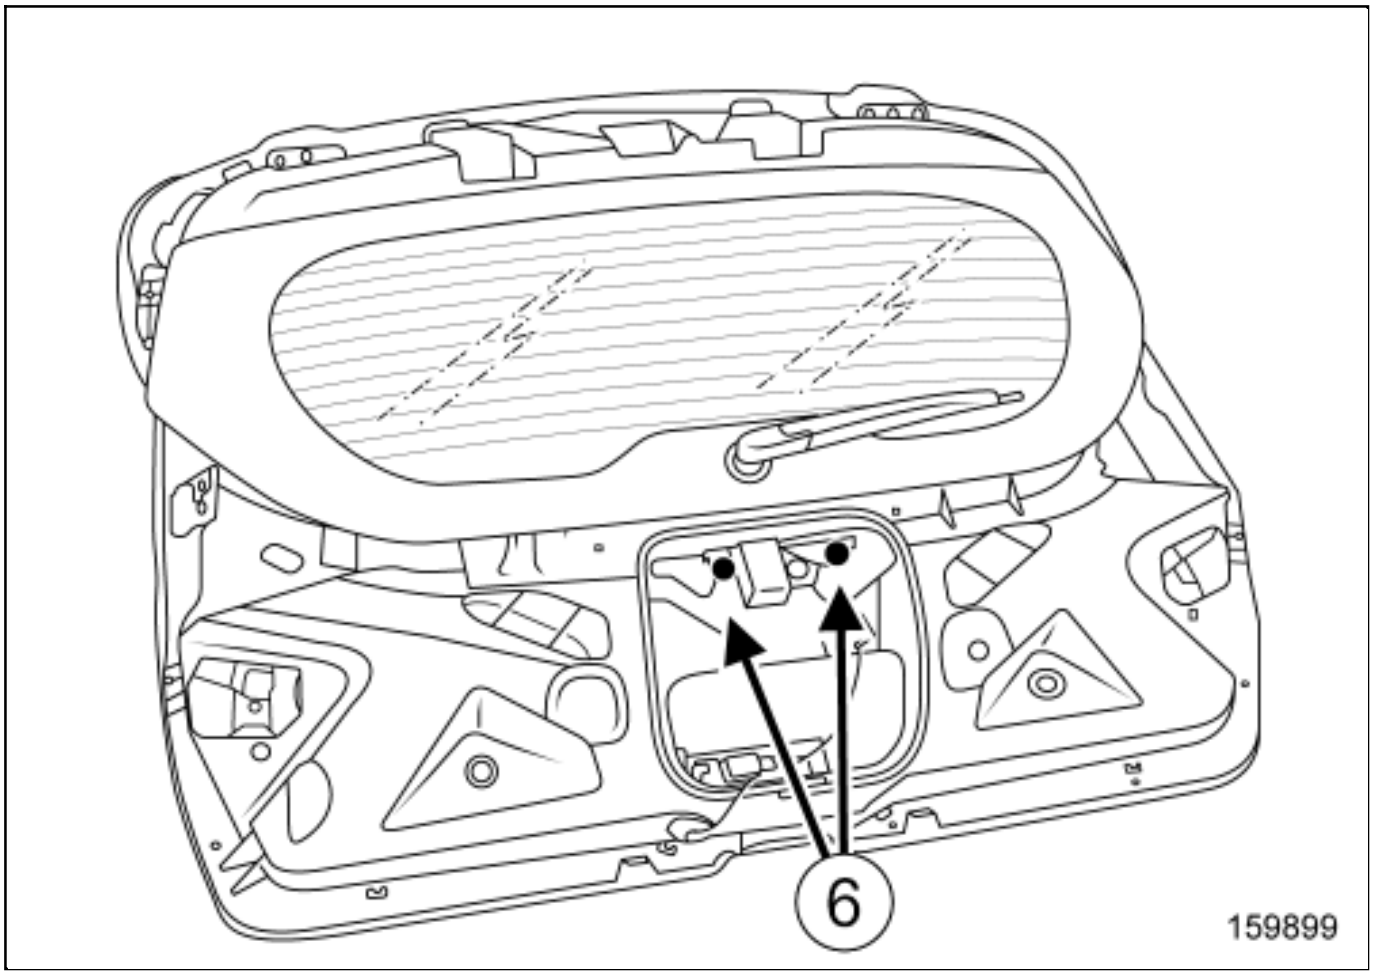
2- PLASTIC TAILGATE

1
159901

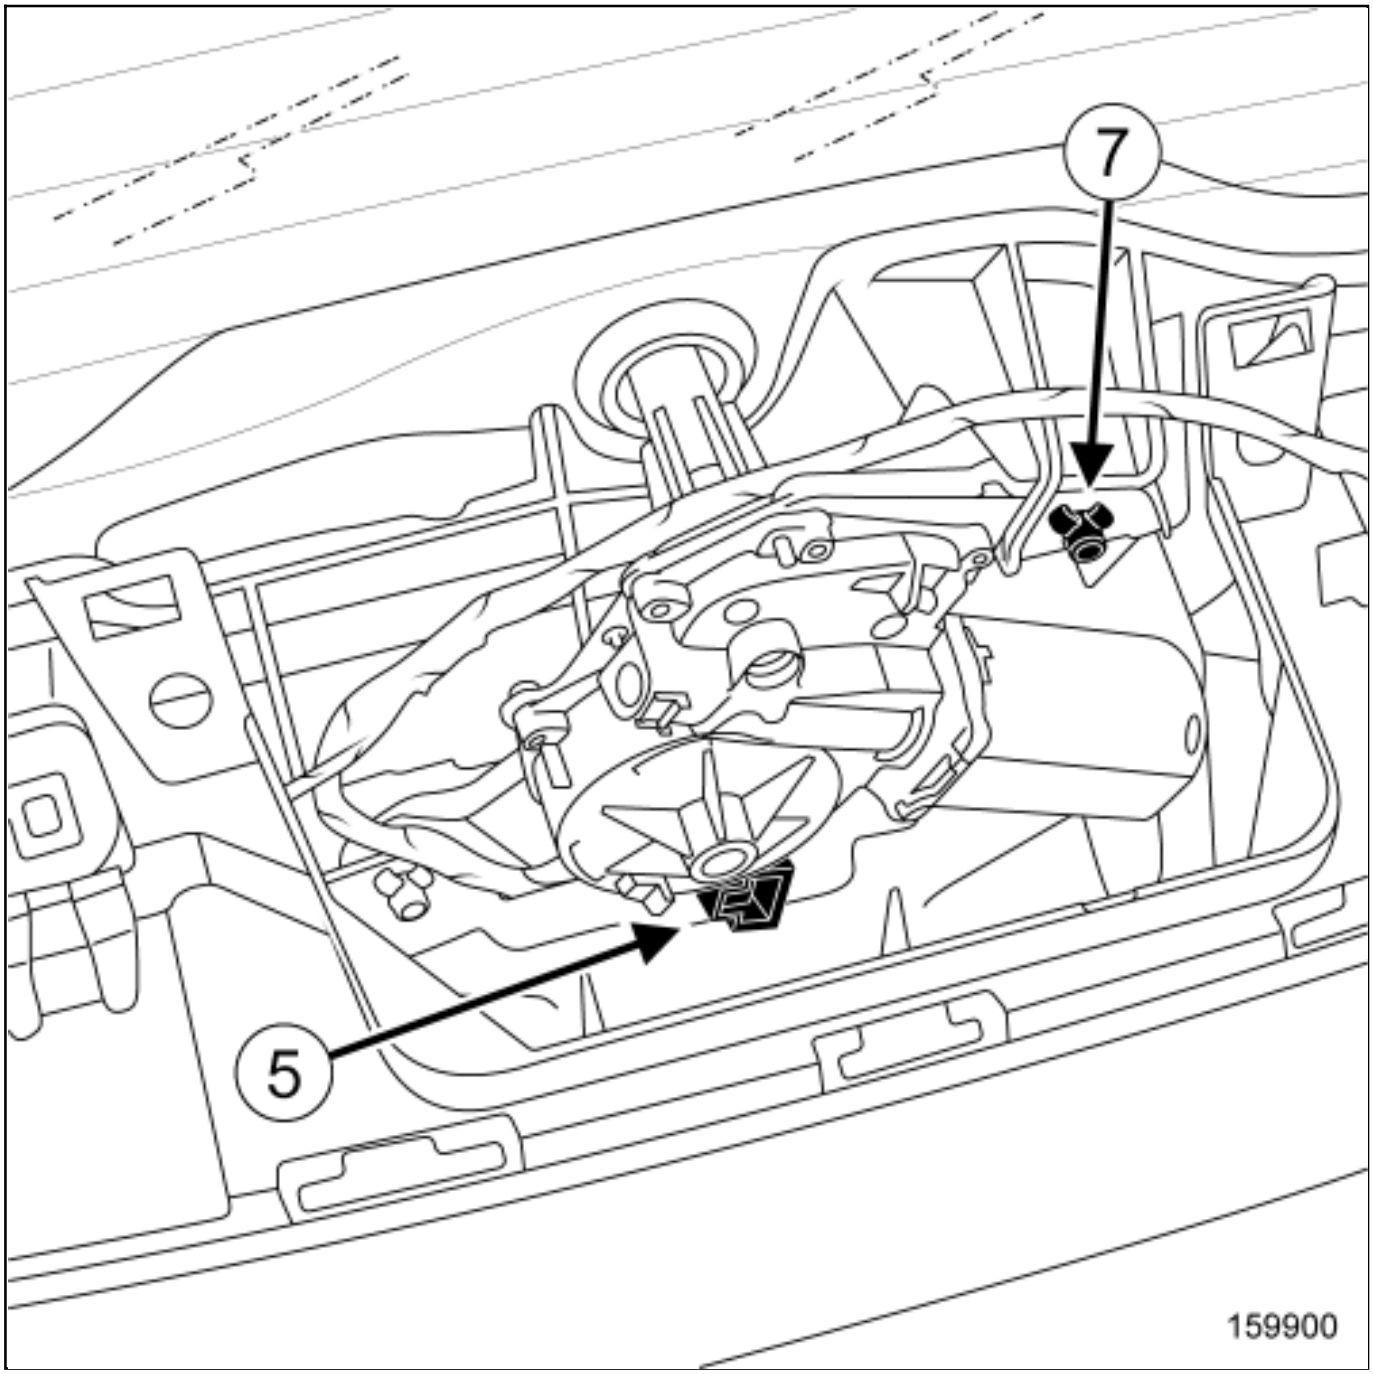


- Unclip the tailgate trim inside(1) .

- Remove:
  - the tailgate trim exterior bolt,
  - the tailgate trim exterior(2) .



2. REMOVAL OPERATION



1- STEEL TAILGATE

- Disconnect the rear screen wiper motor connector(3) .
- Remove the rivets(4) from the rear screen wiper motor.

2- PLASTIC TAILGATE

6
159899

- Disconnect the rear screen wiper motor connector(5) .
- Remove the rivets(6) from the rear screen wiper motor
- Cut the rivet(7) using a cutting tool.

REFITTING

1. REFITTING OPERATION FOR PART CONCERNED

Refit:

- the rear screen wiper motor,
- new rivets to the rear screen wiper motor (see MR 400).

Connect the rear screen wiper motor connector.

2. FINAL OPERATION

Proceed in the reverse order to removal.

REAR SECTION OF THE VEHICLE: SEALING CHECK

Note:

Before any operation, check the water outlet openings. Clean any residue which has accumulated (for example: dead leaves, twigs, etc.) and check that water flows out correctly.

Note:

To check the sealing of the rear opening element windows(see 60A, General information, Windows: Sealing check) .

Note:

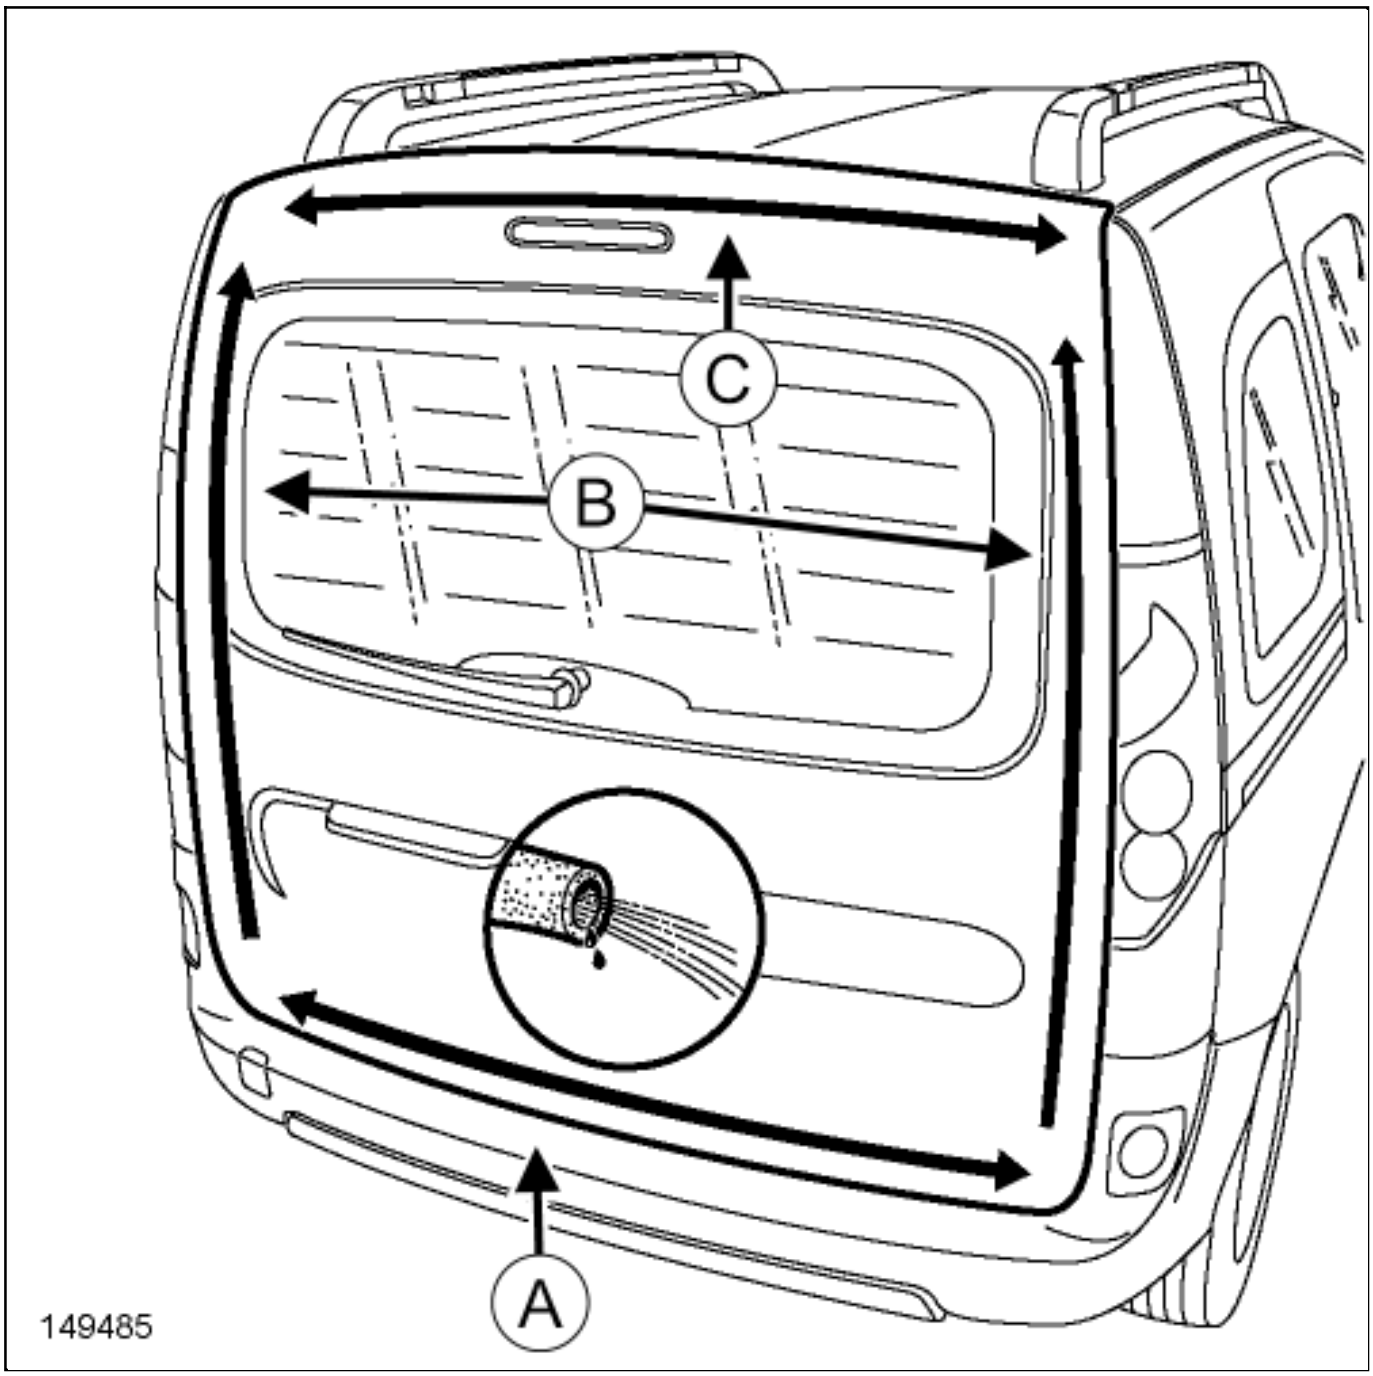
When checking the sealing of the rear section of the vehicle, the interior or exterior trims must be partially removed to facilitate the sealing check (see MR for the vehicle concerned).

Note:

The list of the joint areas dealt with here is general. Additional zones may exist depending on the layout of each vehicle (see MR for the vehicle concerned).

1. PREPARATION OPERATION FOR CHECKING THE SEALING

1- CONDITIONS TO RESPECT BEFORE CHECKING THE SEALING



- Position the vehicle on a level washing area(see 60A, General information, Vehicle sealing: General information) .
- Check that all the opening elements are closed(see 60A, General information, Vehicle sealing: General information) .
- Prepare the equipment to perform the operation(see 60A, General information, Sealing tools: Use) ,(see

60A, General information, Sealing tools: Description) and(see 60A, General information, Vehicle sealing: General information) .

- Adjust the flow of the water jet(see 60A, General information, Sealing tools: Use) .

2. OPERATION FOR CHECKING THE SEALING

1- REAR OPENING ELEMENT SEAL

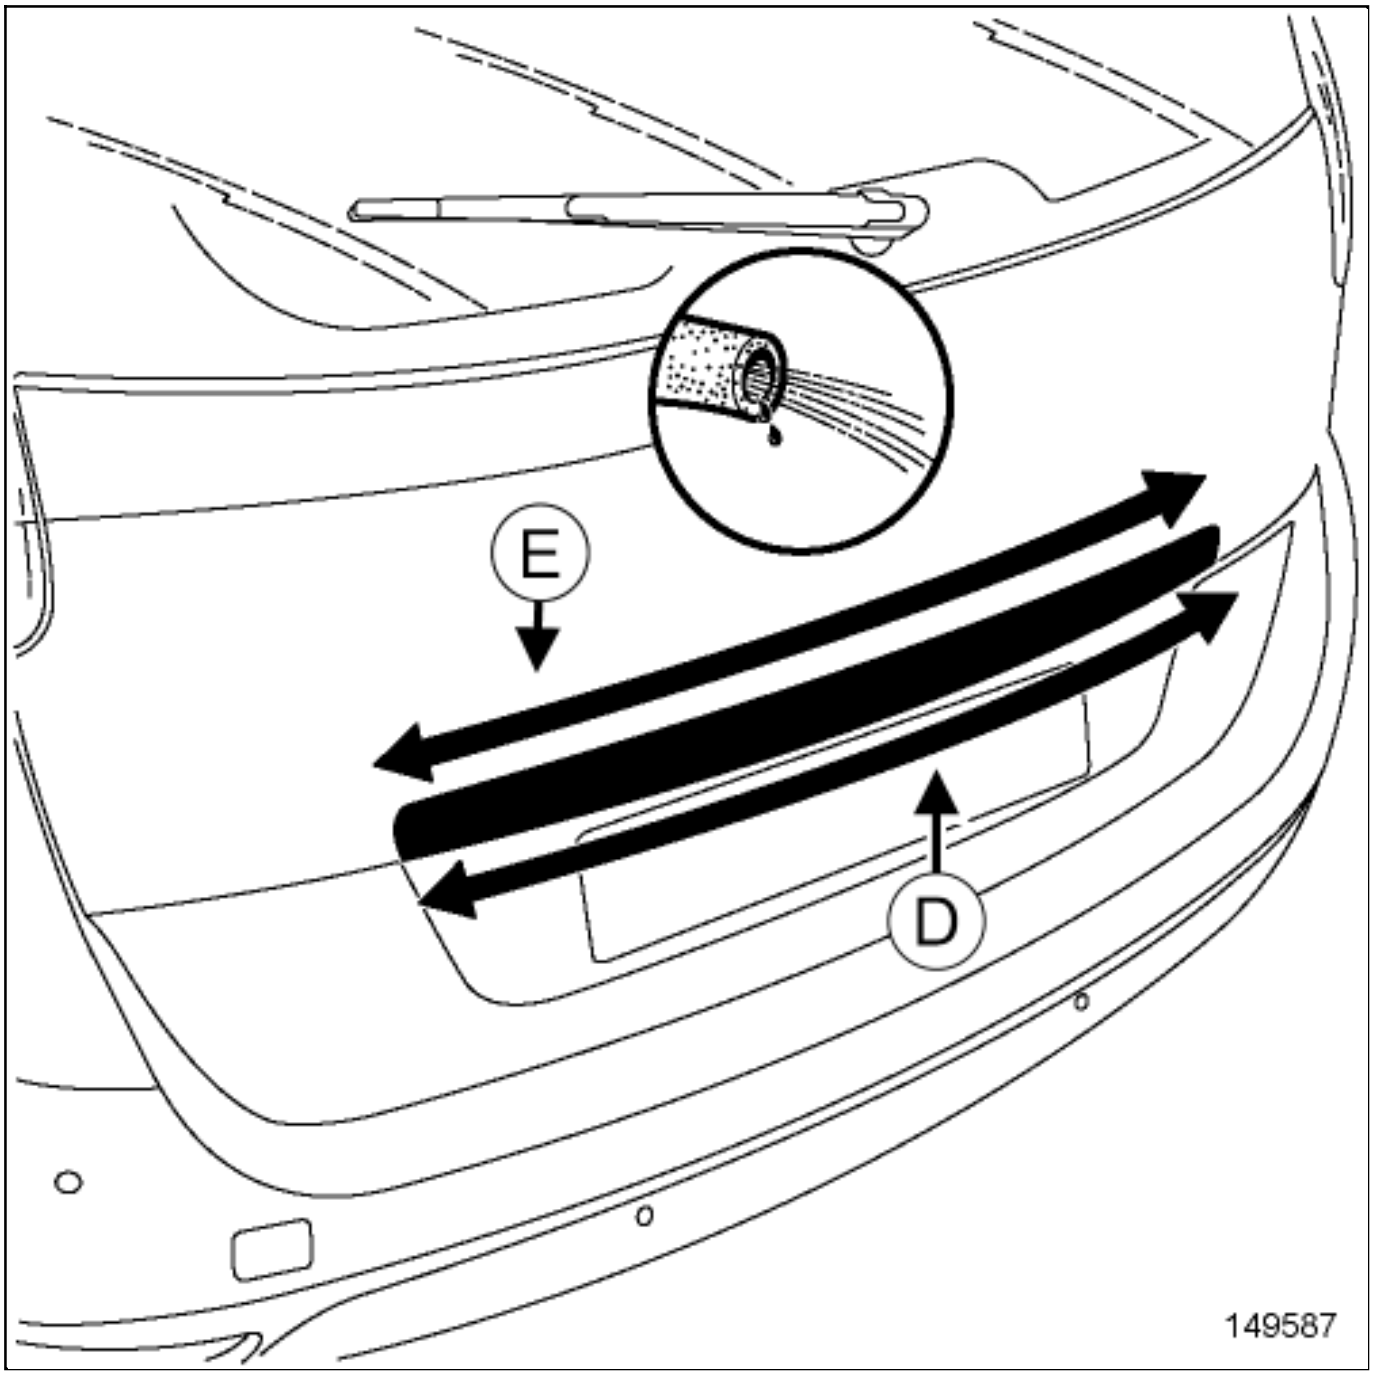
- Spray the lower section(A) of the opening element by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

- Spray the vertical sections(B) of the rear opening element gradually from the bottom upwards to the upper section.

-

  Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .



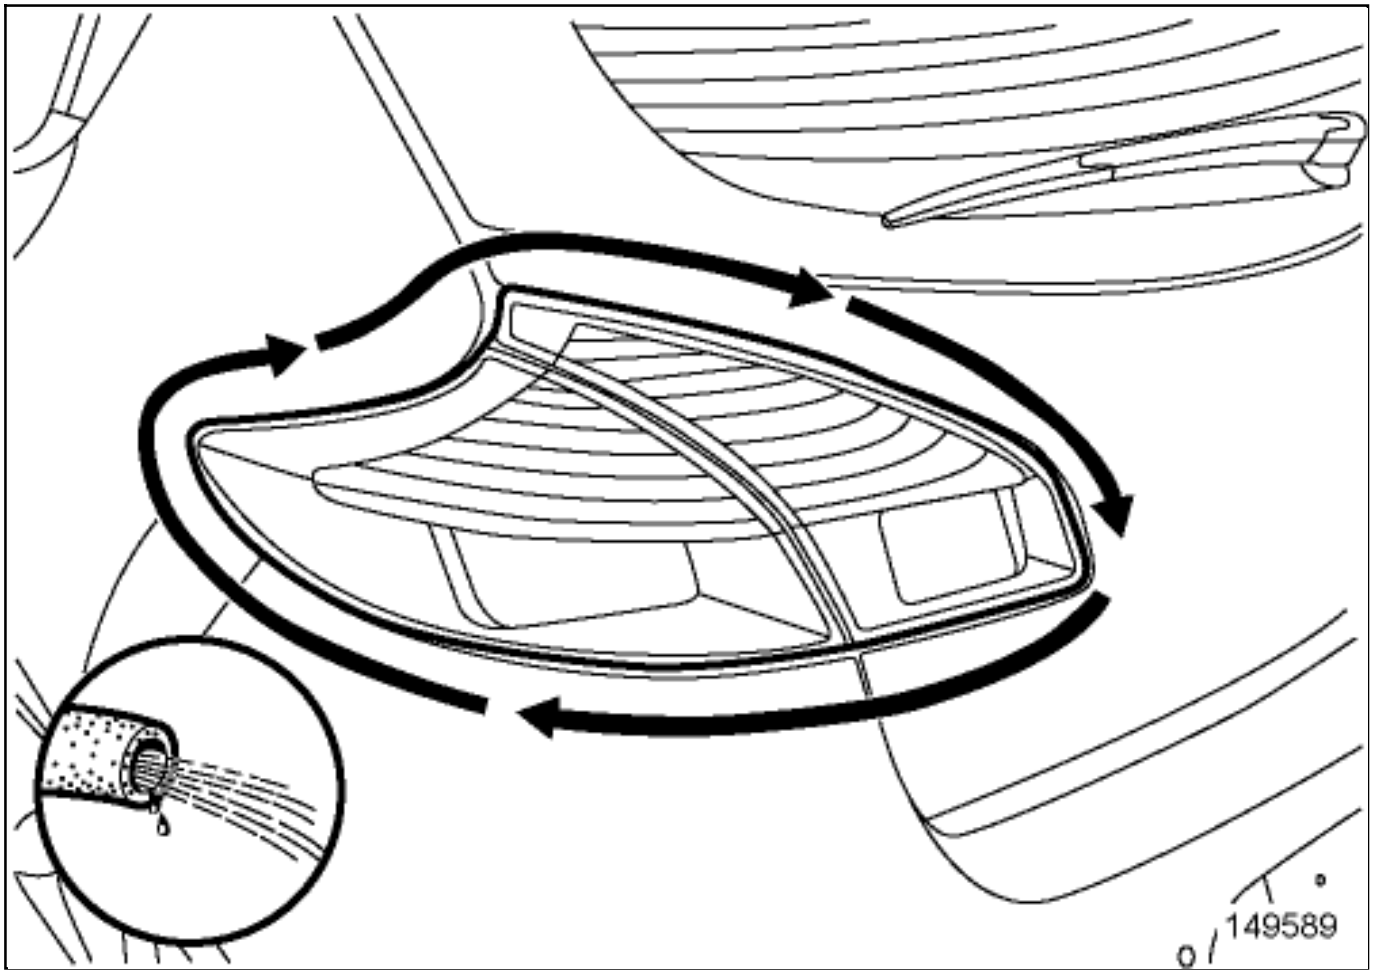
-

  Spray the upper section(C) of the rear opening element by sweeping the zone from right to left.

-

  Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

2- REAR OPENING ELEMENT STRIP



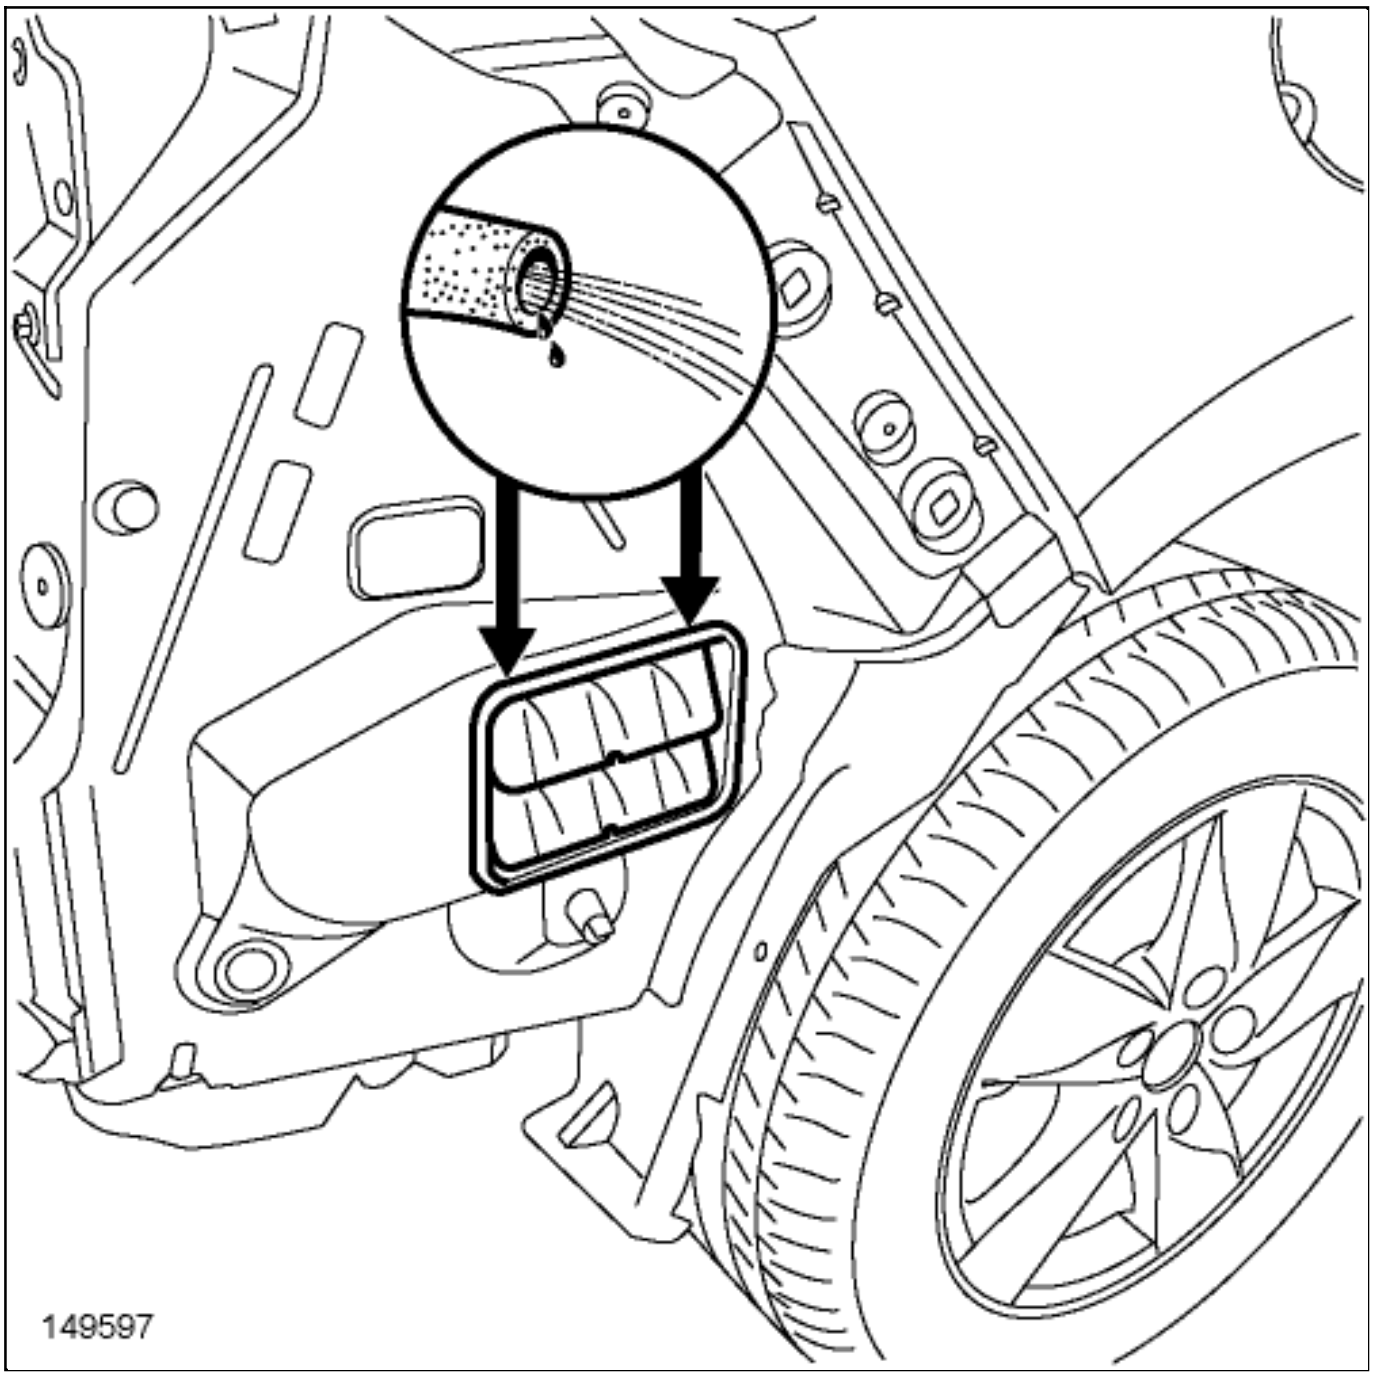
- Spray the lower section(D) of the rear opening element strip by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

- Spray the upper section(E) of the rear opening element strip by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

3- REAR LIGHTS ON THE WING, ON THE REAR OPENING ELEMENT AND THE 3RD BRAKE LIGHT

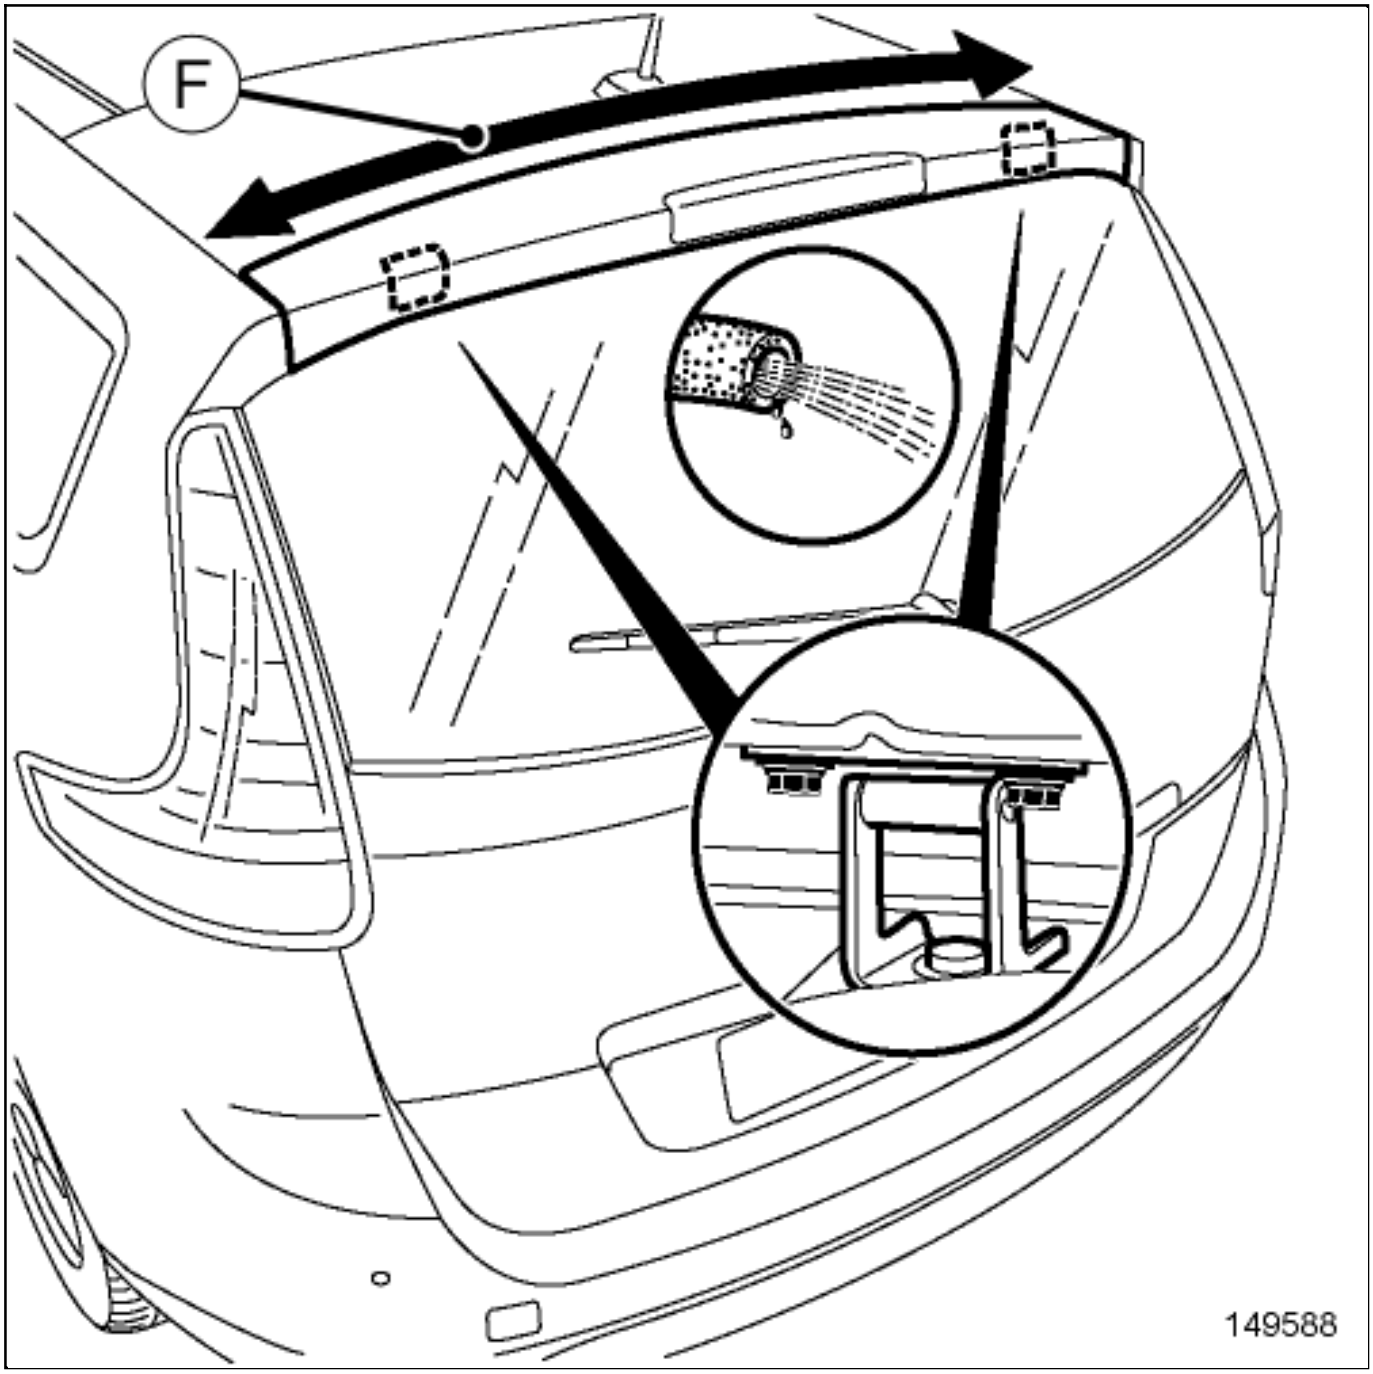


Spray the rear lights gradually from the bottom upwards by sweeping the zone in a circular manner.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

4- REAR AIR EXTRACTORS

Note:



When spraying the rear air extractor, do not spray the central section directly as the flexible membranes may become deformed under the pressure of the water.

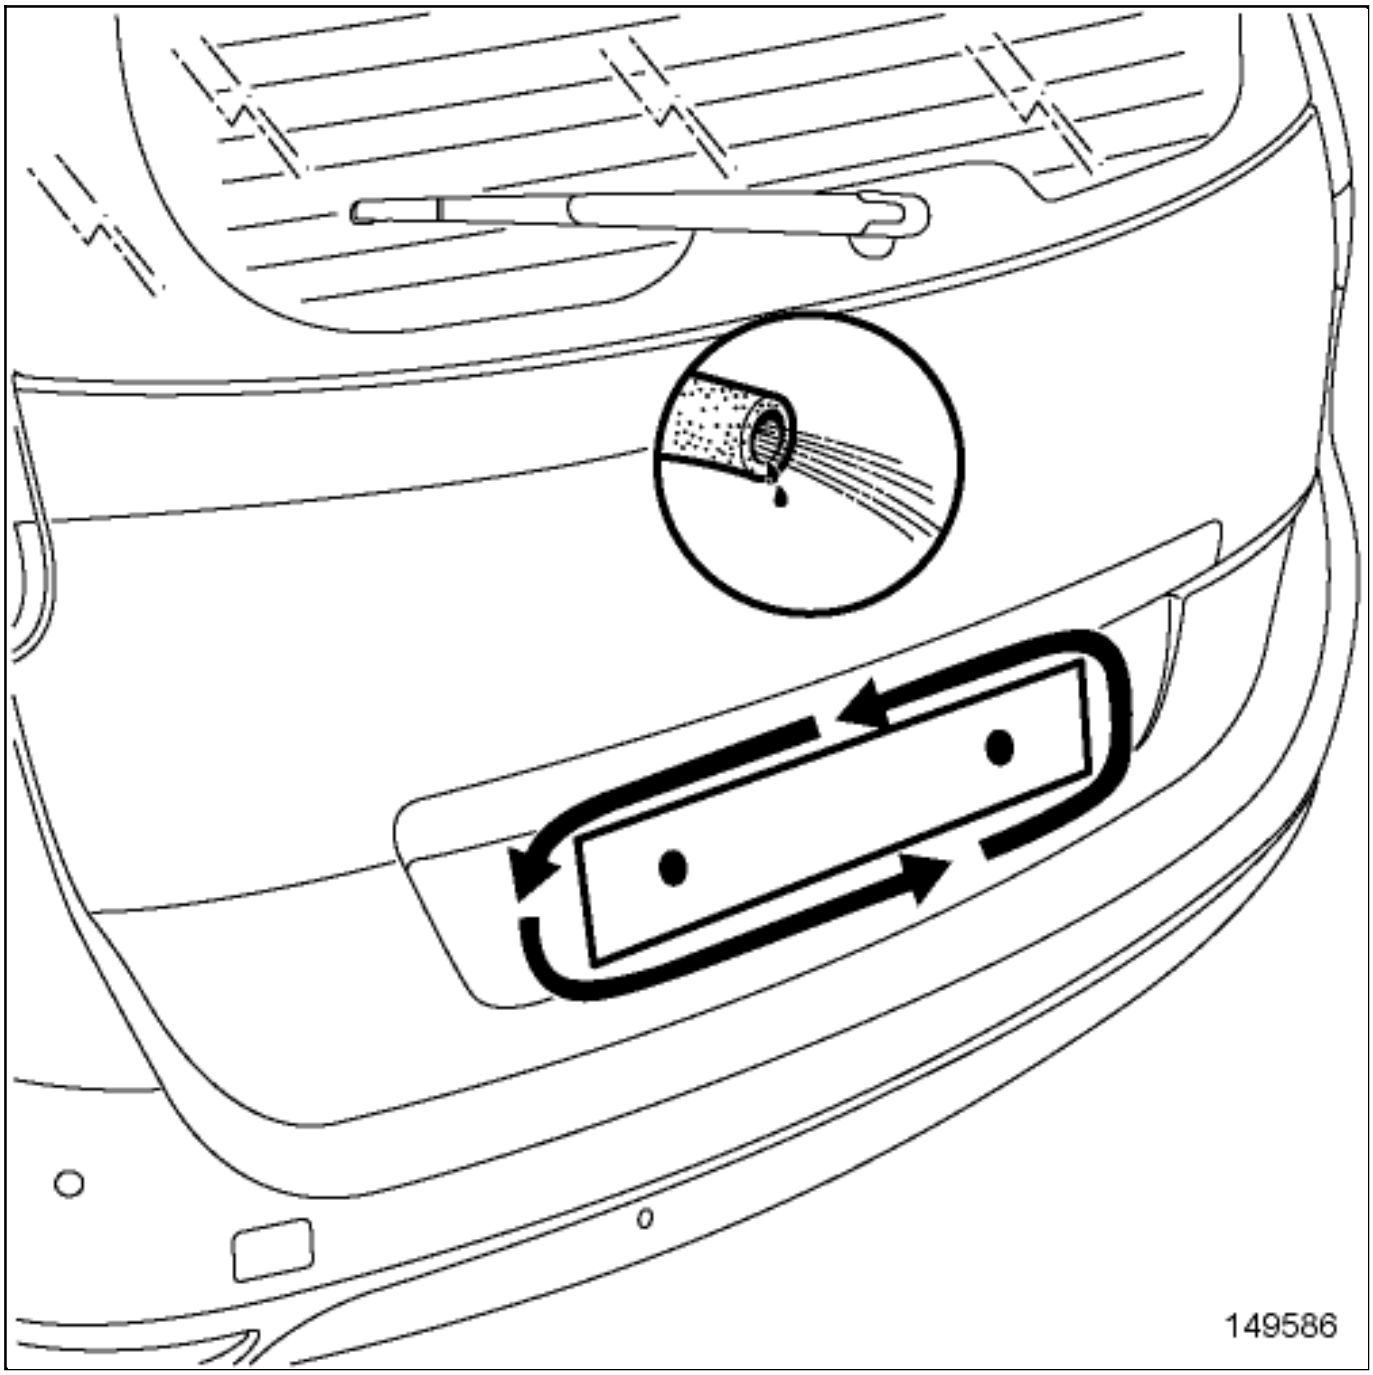
Spray the edge of the rear air extractor by sweeping the zone from the top downwards.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

5- REAR OPENING ELEMENT HINGES

First procedure:

- Spray the upper section(F) of the rear opening element by sweeping the zone from right to left.

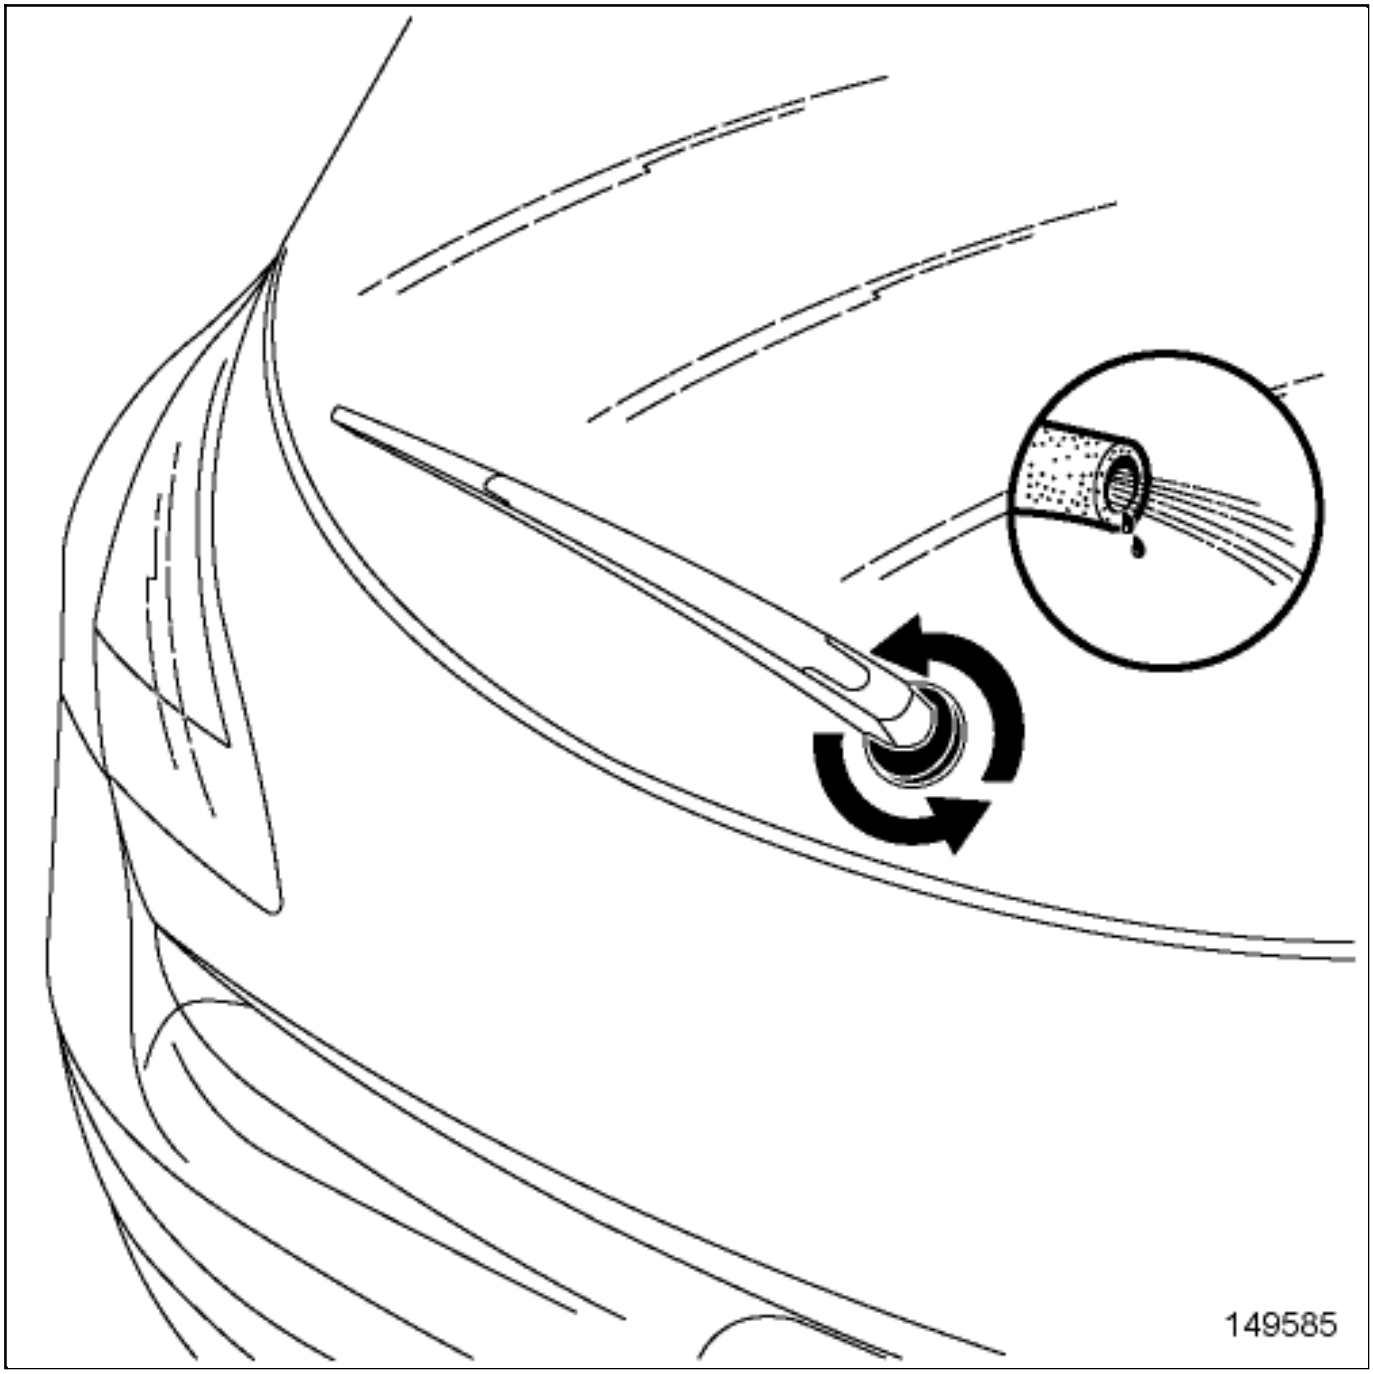


Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Second procedure:

Spray the joint area of the rear opening element hinges locally using the hand pressure sprayer(see 60A, General information, Sealing tools: Description) ,(see 60A, General information, Sealing tools: Use) .

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

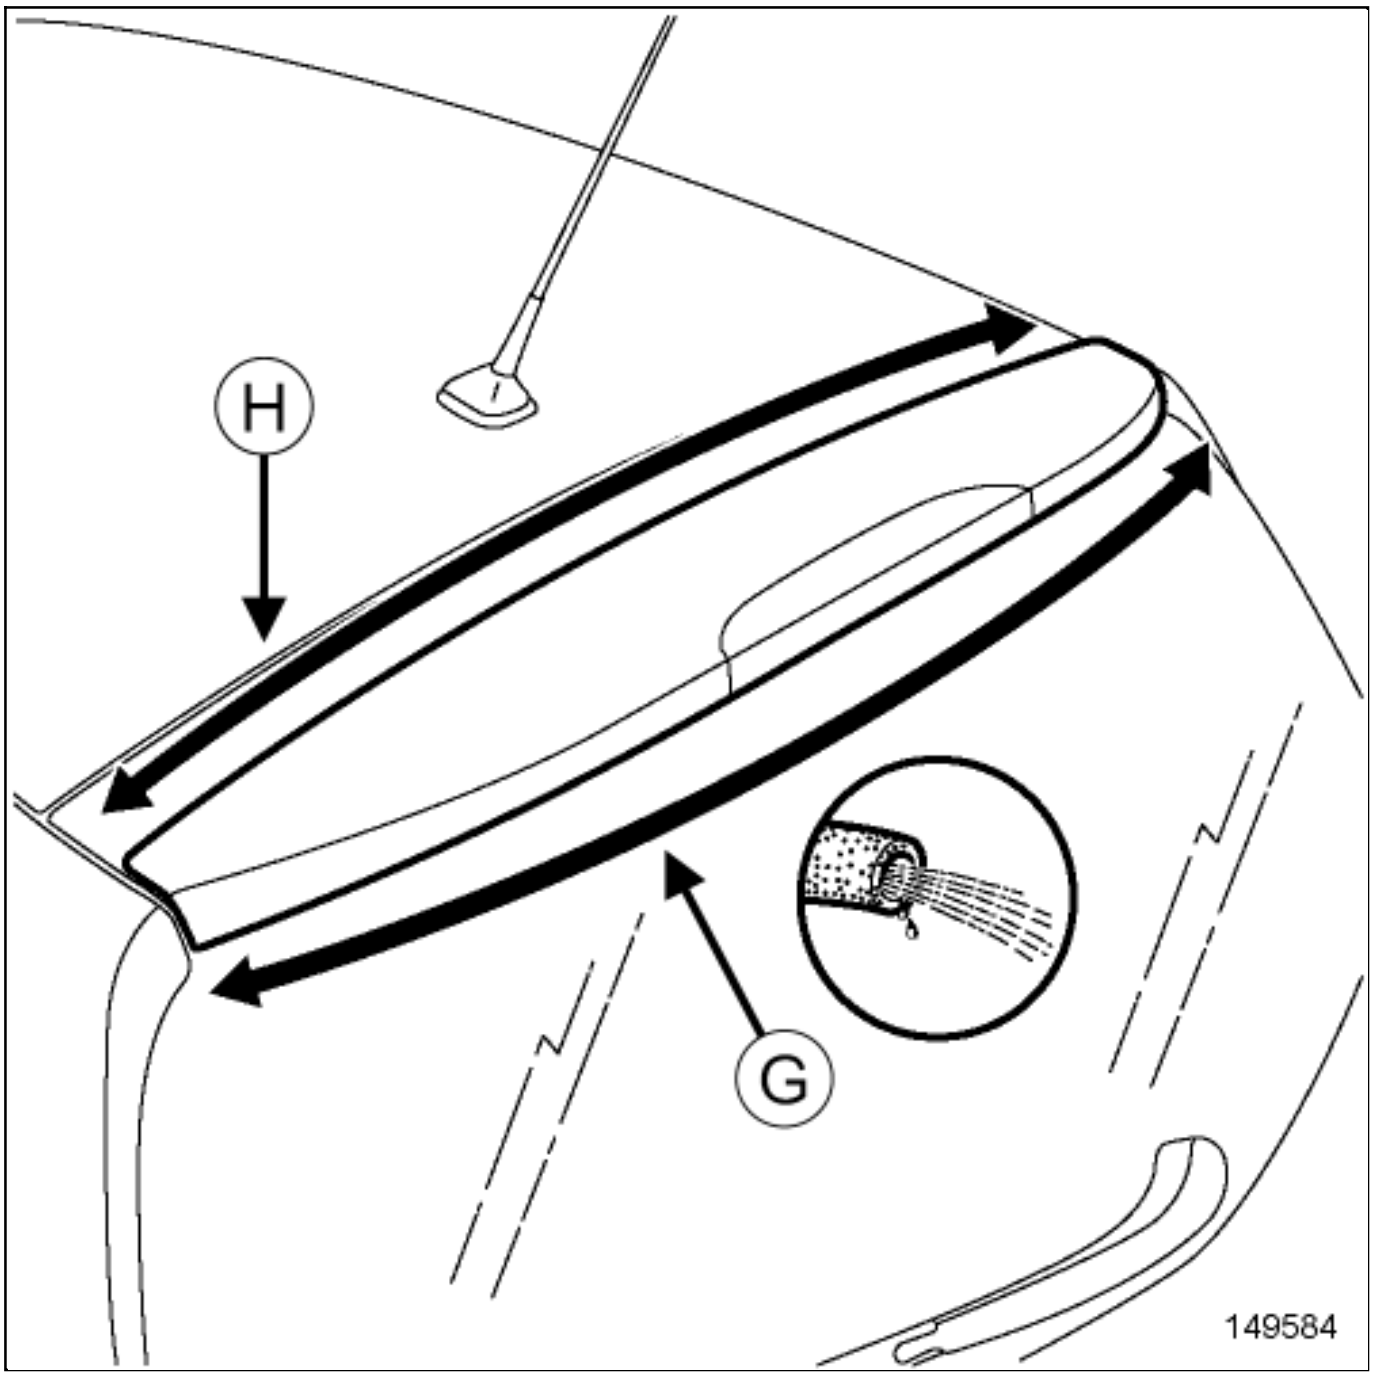


6- NUMBER PLATE RIVETS ON REAR OPENING ELEMENT

- Spray the edge of the number plate by sweeping the zone in a circular manner.
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Spray the rivets of the number plate without moving.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

7- REAR WIPER MOTOR SEAL



Spray the edge of the rear wiper motor seal by sweeping the zone in a circular manner.

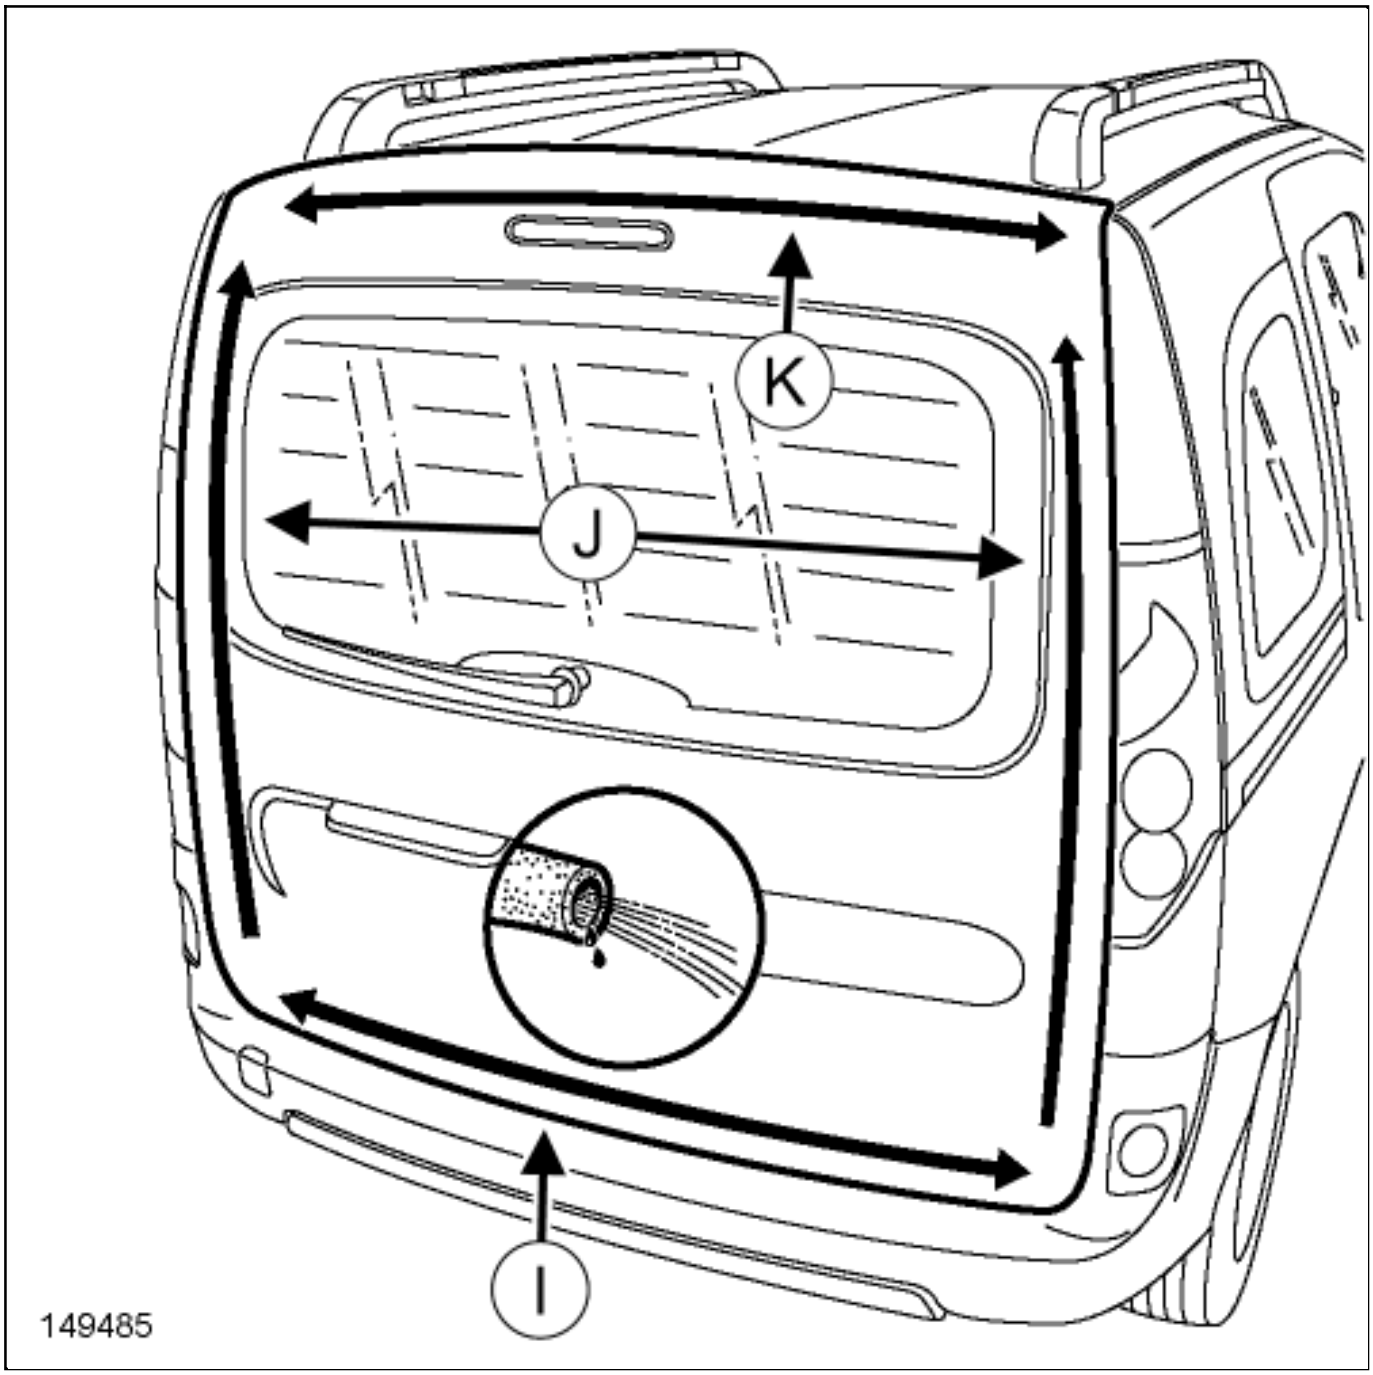
Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle

sealing: General information) .

8- REAR AERODYNAMIC COMPONENT

Spray the lower section(G) of the rear aerodynamic component by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle



sealing: General information) .

Spray the upper section(H) of the rear aerodynamic component by sweeping the zone from right to left.

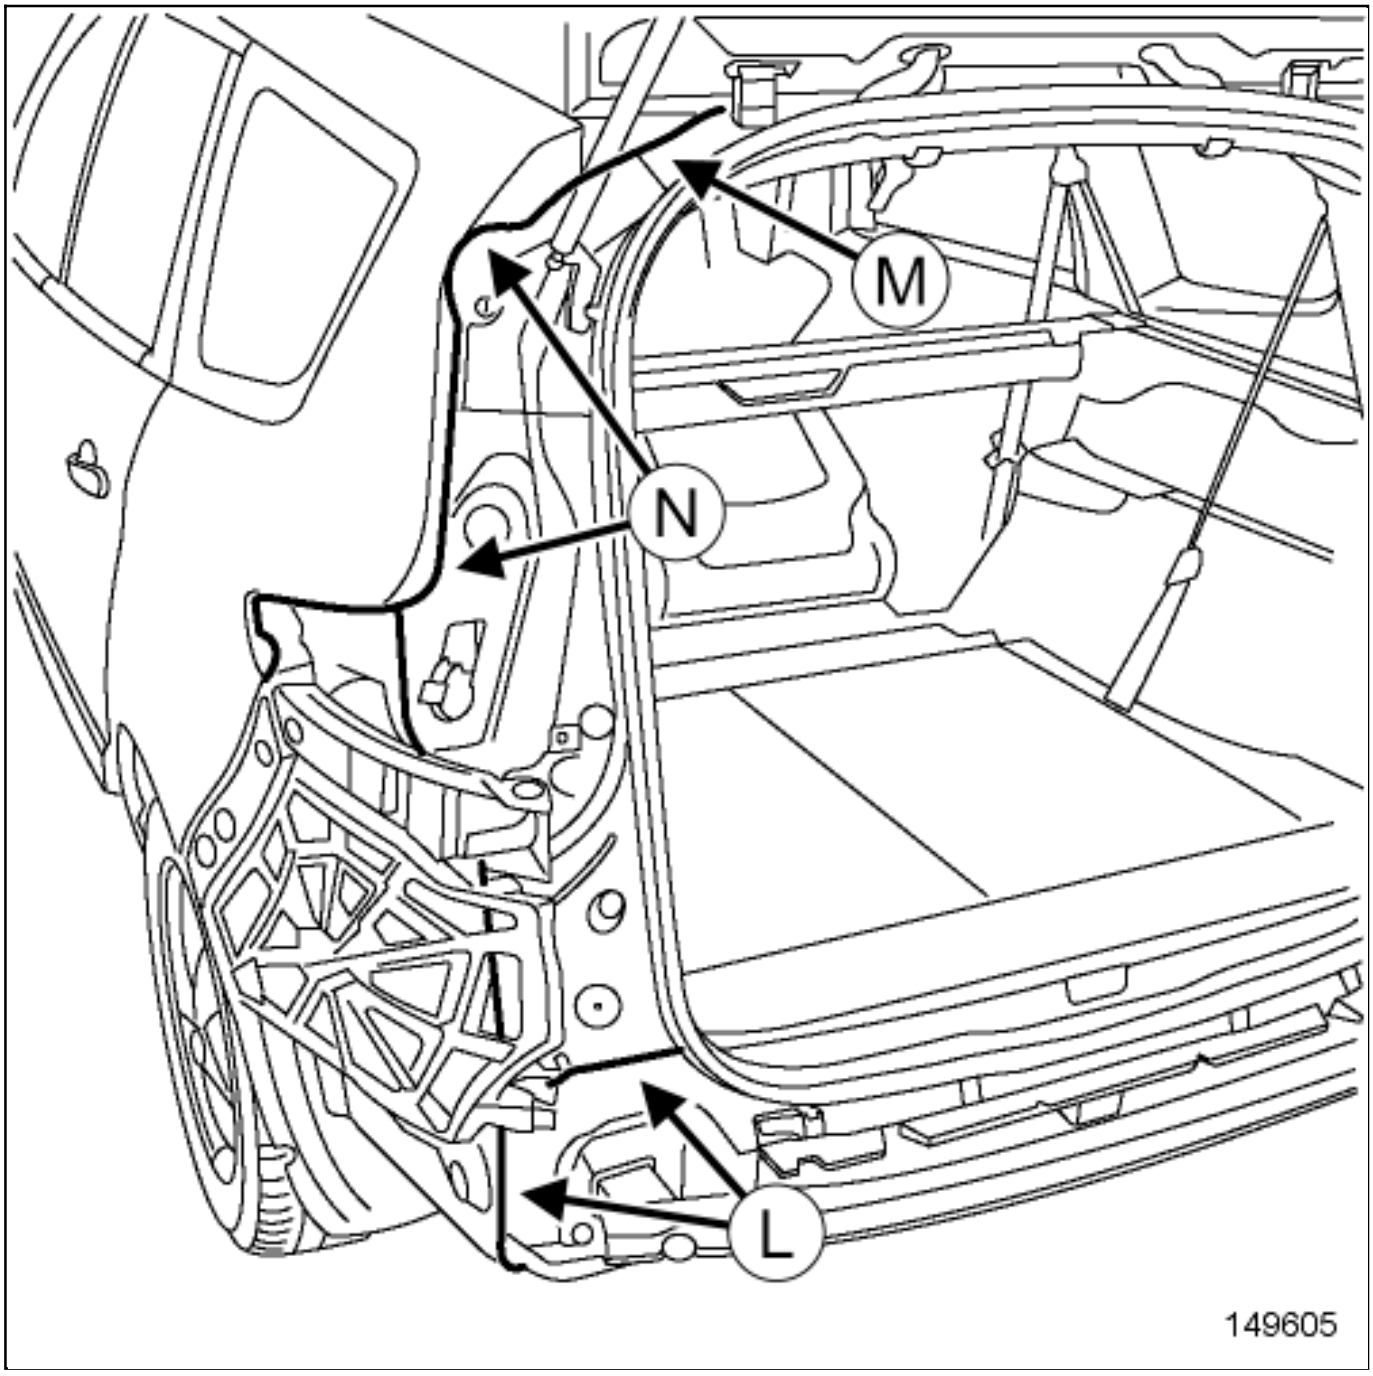
Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

9- MASTIC FILLING OF THE REAR WING PANEL / REAR WING PANEL RAIN CHANNEL / REAR LIGHT MOUNTING / REAR END PANEL AND REAR WING PANEL RAIN CHANNEL / ROOF

1)FIRST PROCEDURE: REAR OPENING ELEMENT CLOSED

- Spray the lower section(I) of the rear opening element by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .



- Spray the vertical sections(J) of the rear opening element gradually from the bottom upwards to the upper section.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the upper section(K) of the rear opening element by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

2)SECOND PROCEDURE: REAR OPENING ELEMENT OPEN

Spray the joint area(L) of the rear end panel / rear light mounting locally using the hand pressure sprayer from the bottom upwards(see 60A, General information, Sealing tools: Description) ,(see 60A, General information, Sealing tools: Use) .

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the joint area(M) of the rear wing panel / rear wing panel rain channel / rear light mounting locally using the hand pressure sprayer from the bottom upwards(see 60A, General information, Sealing tools: Description) ,(see 60A, General information, Sealing tools: Use) .

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the joint area(N) of the rear wing panel rain channel / roof locally using the hand pressure sprayer from the bottom upwards(see 60A, General information, Sealing tools: Description) ,(see 60A, General information, Sealing tools: Use) .

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

10- CHECKING THE SEALING WITH THE TRIM REMOVED

If the customer complaint could not be reproduced in accordance with the procedure, remove the interior trims (see Body internal trim in the vehicle's repair manual) then repeat the sealing check from step 1; extend the sealing check to the surrounding areas(see 60A, General information, Vehicle sealing: General information) .

XSL version : 3.02 du 22/07/11

REAR SECTION OF THE VEHICLE: SEALING REPAIR

Note:

Before repairing the sealing, check the sealing of the zone concerned(see 60A, General information, Vehicle: Sealing check) .

1. PREPARATION OPERATION FOR REPAIRING THE SEALING

1- CHECK THE POSITION AND ADJUST IF NECESSARY:

- the clearances and flush fitting of the rear opening elementVehicle panel gaps: Adjustment value (01C, Vehicle bodywork specifications),
- rear opening element seals,
- rear opening element stripRear opening element strip: Removal - Refitting (55A, Exterior protections),
- rear lights,
- rear air extractors,
- rear opening element hinges,
- number plate rivets,
- rear wiper motor seal.

Note:

If the seals are dirty, clean them in soapy water(see 60A, General information, Vehicle sealing: General information) .

2- WAS ANY ACTION PERFORMED?

- NO: move on to the next step.
- YES: check the sealing of the zone(see 60A, General information, Rear section of the vehicle: Sealing

repair) .

Was water present in the passenger compartment of the vehicle?

YES: move on to the next step.

NO: fault resolved.

2. SEALING REPAIR OPERATION

1- REPAIRING THE SEALING OF THE REAR OPENING ELEMENT SEAL

Is water present in the passenger compartment after the rear opening element sealing has been checked?

NO: move on to the next step.

YES:

a) if the rear opening element seal is deformed, replace the rear opening element seal,

b) if the rear opening element seal shows signs of wear, cuts or cracks, replace the rear opening element seal.

Check the sealing of the rear opening element seal(see 60A, General information, Rear section of the vehicle: Sealing check) .

2- REPAIRING THE SEALING OF THE REAR OPENING ELEMENT STRIP

Is water present in the passenger compartment after the rear opening element sealing has been checked?

NO: move on to the next step.

YES:

a) if the rear opening element strip is deformed or cracked, replace the rear opening element stripRear opening element strip: Removal - Refitting (55A, Exterior protections),

b) if the sealing foam of the rear opening element strip is incorrectly positioned, detached or deformed, replace the rear opening element strip sealing foamRear opening element strip: Removal - Refitting (55A, Exterior protections).

Check the sealing of the rear opening element strip(see 60A, General information, Rear section of the vehicle: Sealing check) .

3- REPAIRING THE SEALING OF THE REAR LIGHTS ON THE WING, ON THE REAR OPENING ELEMENT AND THE 3RD BRAKE LIGHT

Is water present in the passenger compartment after the sealing of the rear lights on the wing, on the rear opening element and the 3rd brake light have been checked?

NO: move on to the next step.

YES:

a) if the lights: on the rear wing, rear opening element or 3rd brake light are deformed or cracked, replace the light on the rear wing, on the rear opening element or the 3rd brake lightRear wing light: Removal - Refitting (81A, Rear lighting) orRear opening element light: Removal - Refitting (81A, Rear lighting) or3rd brake light: Removal - Refitting (81A, Rear lighting),

b) if the seals of the lights: on the rear wing, rear opening element or 3rd brake light are incorrectly positioned or deformed, replace the light on the rear wing, on the rear opening element or the 3rd brake lightRear wing light: Removal - Refitting (81A, Rear lighting) orRear opening element light: Removal - Refitting (81A, Rear lighting) or 3rd brake light: Removal - Refitting (81A, Rear lighting),

c) the panelwork is deformed in the contact zone of the lights: on the rear wing, on the rear opening element or the 3rd brake light, flatten the panelwork in the contact zone of the seal for the light on the rear wing, on the rear opening element or the 3rd brake light.

Check the sealing of the rear lights on the wing, on the rear opening element and the 3rd brake light (see 60A, General information, Rear section of the vehicle: Sealing check) .

4- REPAIRING THE SEALING OF THE REAR AIR EXTRACTOR

Is water present in the passenger compartment after the sealing of the rear air extractor has been checked?

NO: move on to the next step.

YES:

a) if the rear air extractor is deformed, replace the rear air extractor,

b) if the rear air extractor is incorrectly positioned, reposition the rear air extractor,

c) if the panelwork is deformed in the contact zone of the seal of the rear air extractor, flatten the panelwork in the contact zone of the rear air extractor seal.

Check the sealing of the rear air extractor(see 60A, General information, Rear section of the vehicle: Sealing check) .

5- REPAIRING THE SEALING OF THE REAR OPENING ELEMENT HINGES

Is water present in the passenger compartment after the sealing of the rear opening element hinges has been checked?

NO: move on to the next step.

YES:

a) if the panelwork is deformed in the contact zone of the rear opening element hinge, flatten the contact zone of the rear opening element hinge, then apply filler masticAnti-corrosion protection products after assembly: Use (04F, Bodywork products and mountings),

b) if the sealing mastic is faulty or cracked, apply filler masticAnti-corrosion protection products after assembly: Use (04F, Bodywork products and mountings).

Check the sealing of the rear opening element hinges(see 60A, General information, Rear section of the vehicle: Sealing check) .

6- REPAIRING THE SEALING OF THE NUMBER PLATE RIVETS ON AN OPENING ELEMENT

Is water present in the passenger compartment after the sealing of the number plate rivets on the rear opening element has been checked?

- NO: move on to the next step.
- YES:

a) if the rivets of the number plate are deformed or poorly crimped, replace the number plate rivets **Products and equipment for riveted assembly: Use** (04F, Bodywork products and mountings).

Check the sealing of the number plate rivets**(see 60A, General information, Rear section of the vehicle: Sealing check)** .

7- REPAIRING THE SEALING OF THE REAR WIPER MOTOR SEAL

Is water present in the passenger compartment after the rear wiper motor seal has been checked?

- NO: move on to the next step.
- YES:

a) if the rear wiper motor seal is incorrectly positioned, reposition the rear wiper motor seal**Rear screen wiper motor: Removal - Refitting** (85A, Wiping - Washing),

b) if the rear wiper motor seal is deformed or shows signs of wear, cuts or cracks, replace the rear wiper motor seal **Rear screen wiper motor: Removal - Refitting** (85A, Wiping - Washing).

Check the sealing of the rear wiper motor seal**(see 60A, General information, Rear section of the vehicle: Sealing check)** .

8- REPAIRING THE SEALING OF THE REAR AERODYNAMIC COMPONENT

Is water present in the passenger compartment after the sealing of the rear aerodynamic component has been checked?

NO: move on to the next step.

YES:

a) if the rear aerodynamic component is deformed or cracked, replace the rear aerodynamic component (see **Luggage compartment lid spoiler: Removal - Refitting**) (56A, Exterior equipment) or**Tailgate spoiler: Removal - Refitting** (56A, Exterior equipment),

b) if the sealing foam of the rear aerodynamic component is deformed, torn or detached, replace the sealing foam of the rear aerodynamic component(see **Luggage compartment lid spoiler: Removal - Refitting**) (56A, Exterior equipment) or**Tailgate spoiler: Removal - Refitting** (56A, Exterior equipment).

Check the sealing of the rear aerodynamic component**(see 60A, General information, Rear section of the vehicle: Sealing check)** .

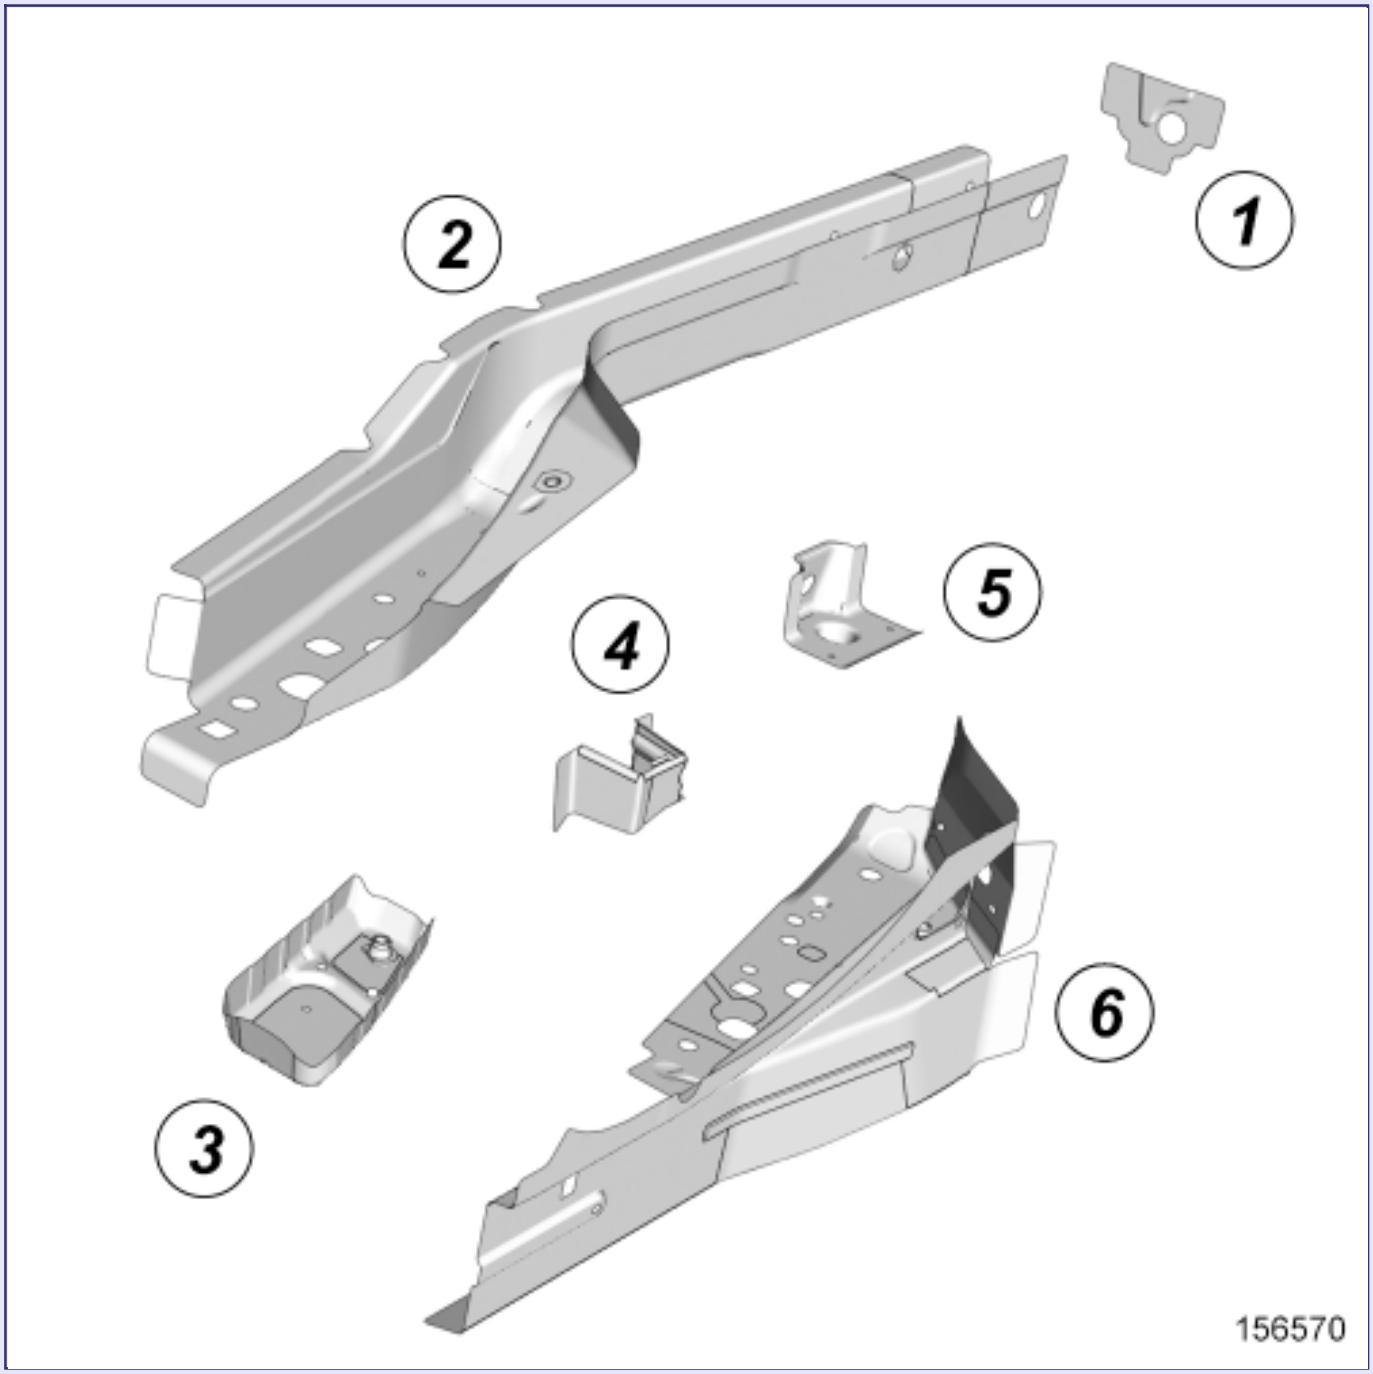
9- REPAIRING THE SEALING OF THE MASTIC FILLING OF THE REAR WING PANEL / REAR WING PANEL RAIN CHANNEL / REAR LIGHT MOUNTING / REAR END PANEL AND REAR WING PANEL RAIN CHANNEL / ROOF

Is water present in the passenger compartment after the sealing of the mastic filling of the rear wing panel / rear wing panel rain channel / rear light mounting / rear end panel and rear wing panel rain channel / roof has been checked?

NO: fault resolved.

YES:

a) if the mastic is faulty or incorrectly positioned on the panelwork connections, apply extruded mastic to the panelwork connections**Anti-corrosion protection products after assembly: Use** (04F, Bodywork products and mountings).



Check the sealing of the mastic filling of the rear wing panel / rear wing panel rain channel / rear light mounting / rear end panel and rear wing panel rain channel / roof**(see 60A, General information, Rear section of the vehicle: Sealing check)** .

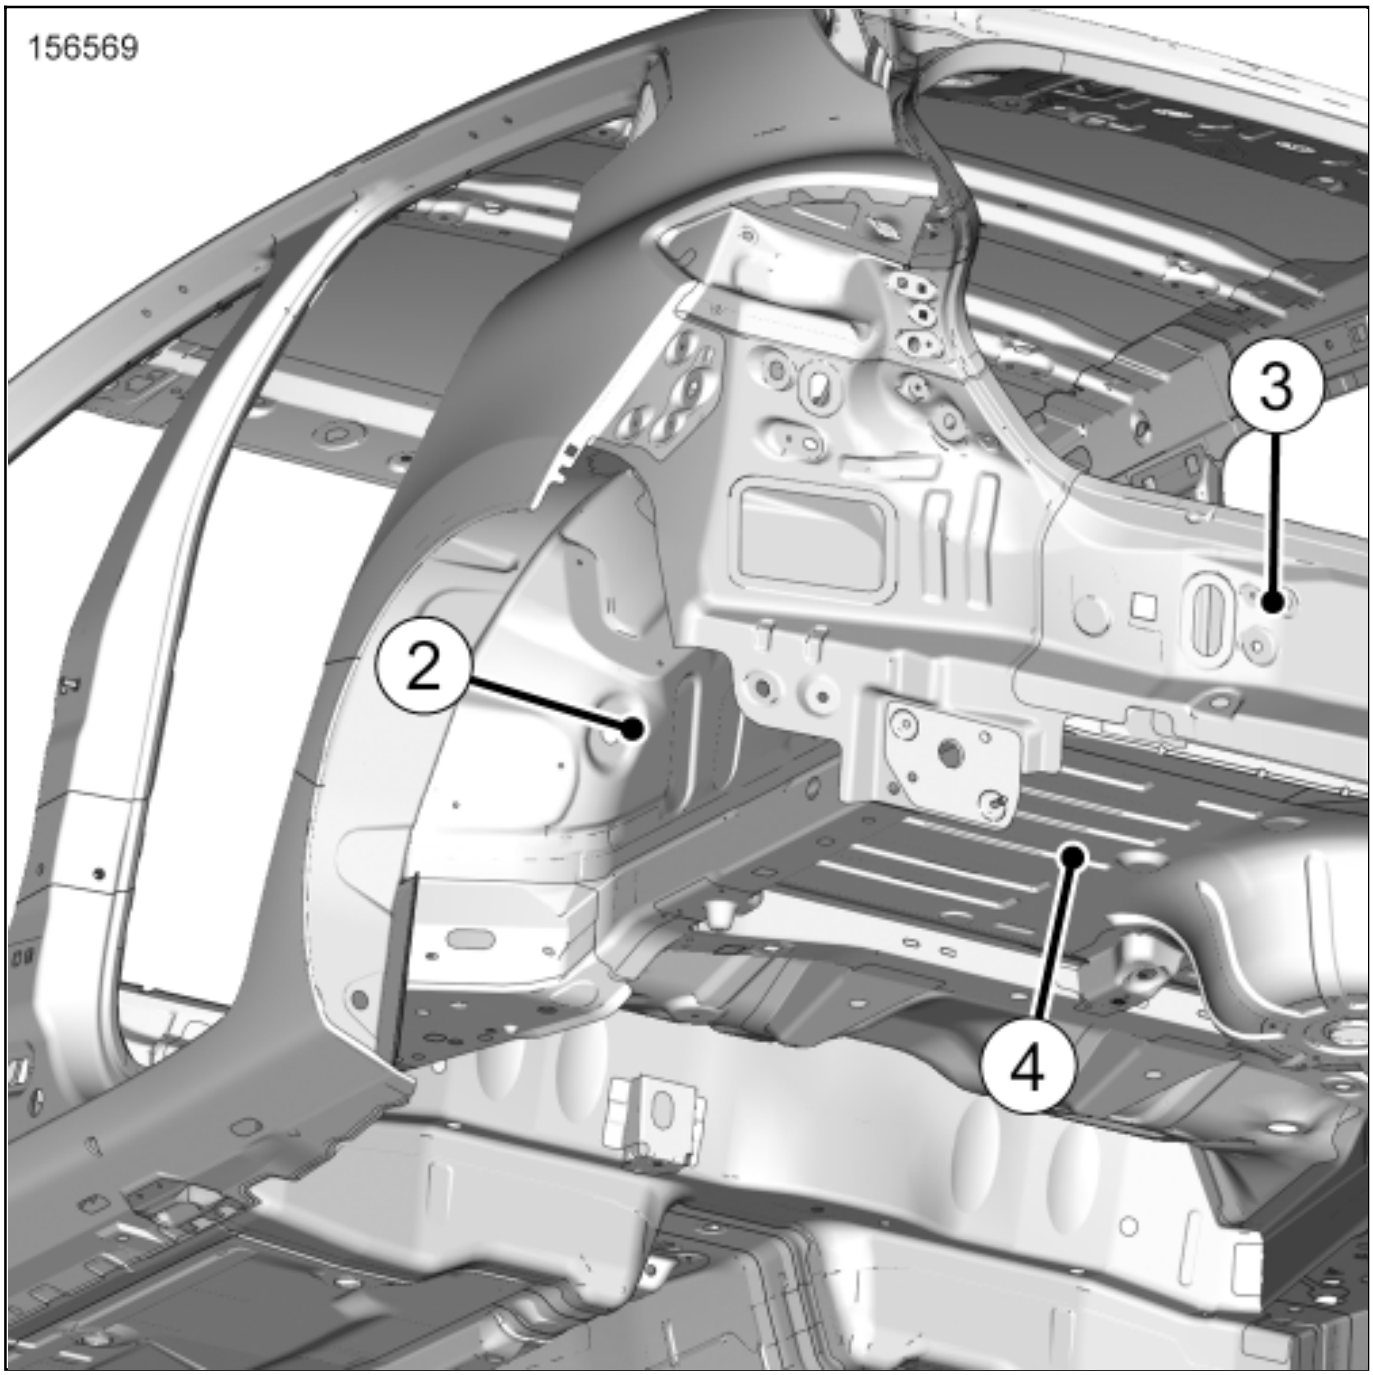
2)POSITION OF ELECTRICAL EARTHS



CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)BODYWORK COMPONENTS THAT CANNOT BE REMOVED - STRUCTURES TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

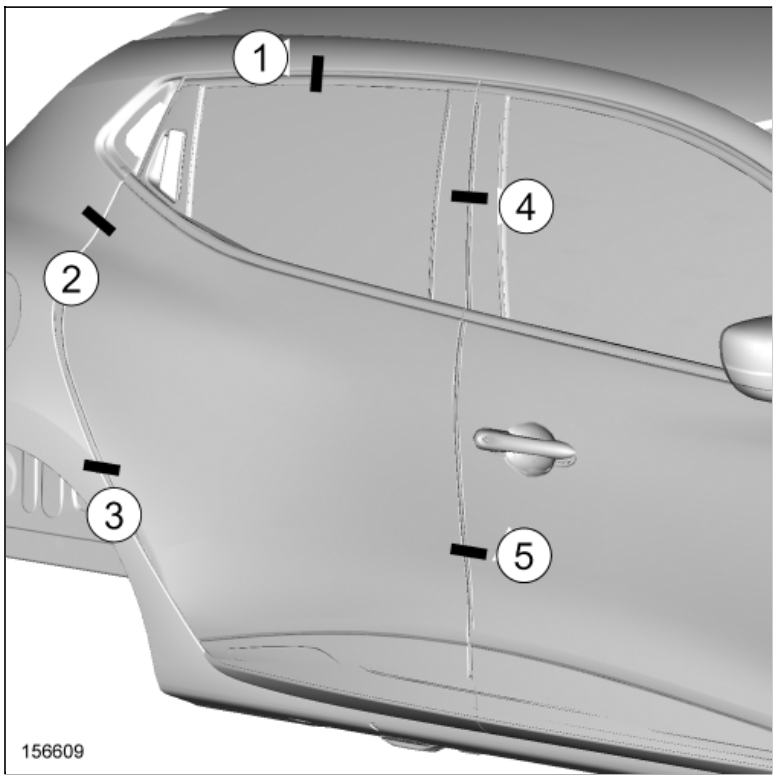
Remove:

- the rear bumper assembly Rear bumper assembly: Exploded view ,
- the rear lights support Rear light mounting: Replacement ,
- the inner rear wheel arch(2) ,
- the rear end panel(3) ,
- the sill panel Sill panel: Replacement ,
- the rear section of rear floor(4) .

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

REAR SIDE OPENING ELEMENT: ADJUSTMENT



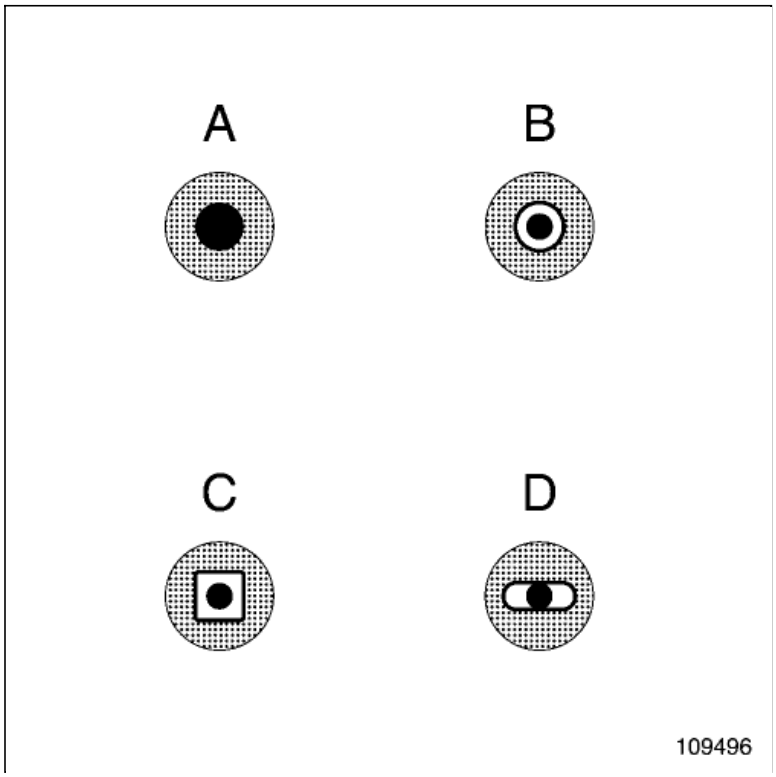
Location and specifications (tightening torques, parts always to be replaced, etc.)Opening mechanism assembly of rear side opening element: Exploded view .

ADJUSTMENT VALUES

- For information on the side opening element adjustment valuesVehicle panel gaps: Adjustment value .

ADJUSTMENT

- There are two options for adjusting the rear side door:
  - using the rear side door mountings,
  - using the rear side door striker plates.

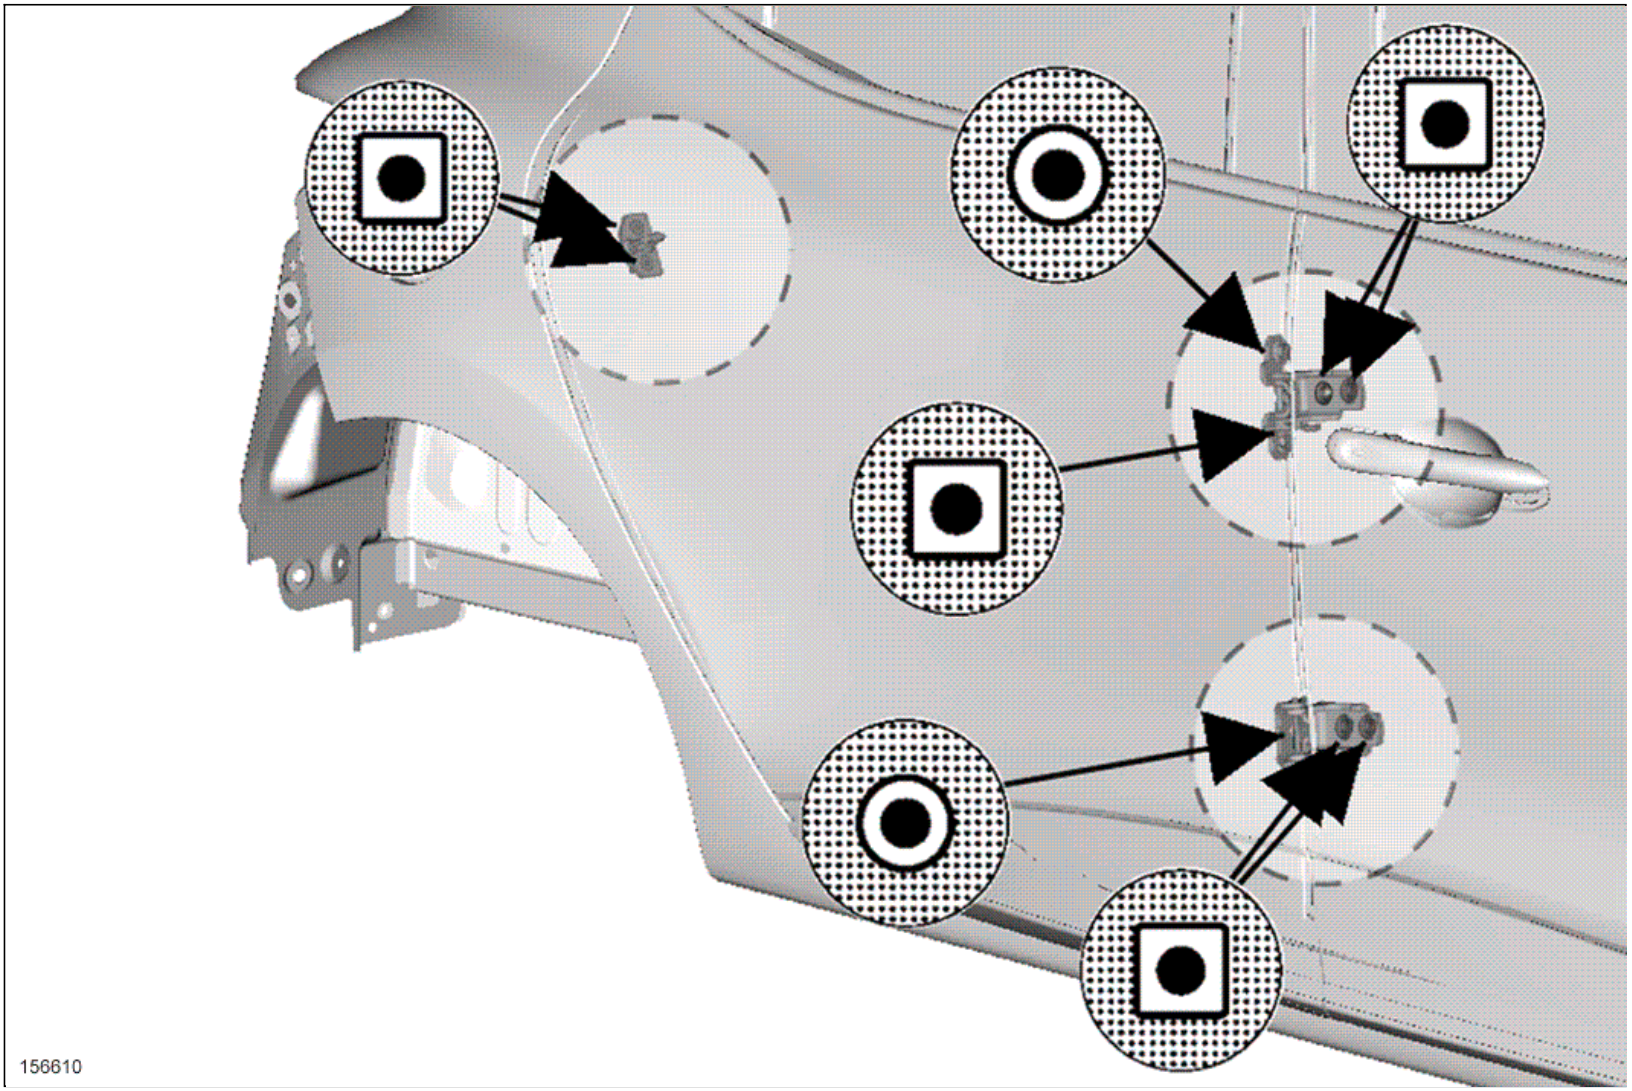


-

Respect the adjustment order of zones(1) , (2) , (3) , (4) and (5) .

Note:

Adjustment of zones (4) and (5) is only valid if the front door is correctly adjusted.



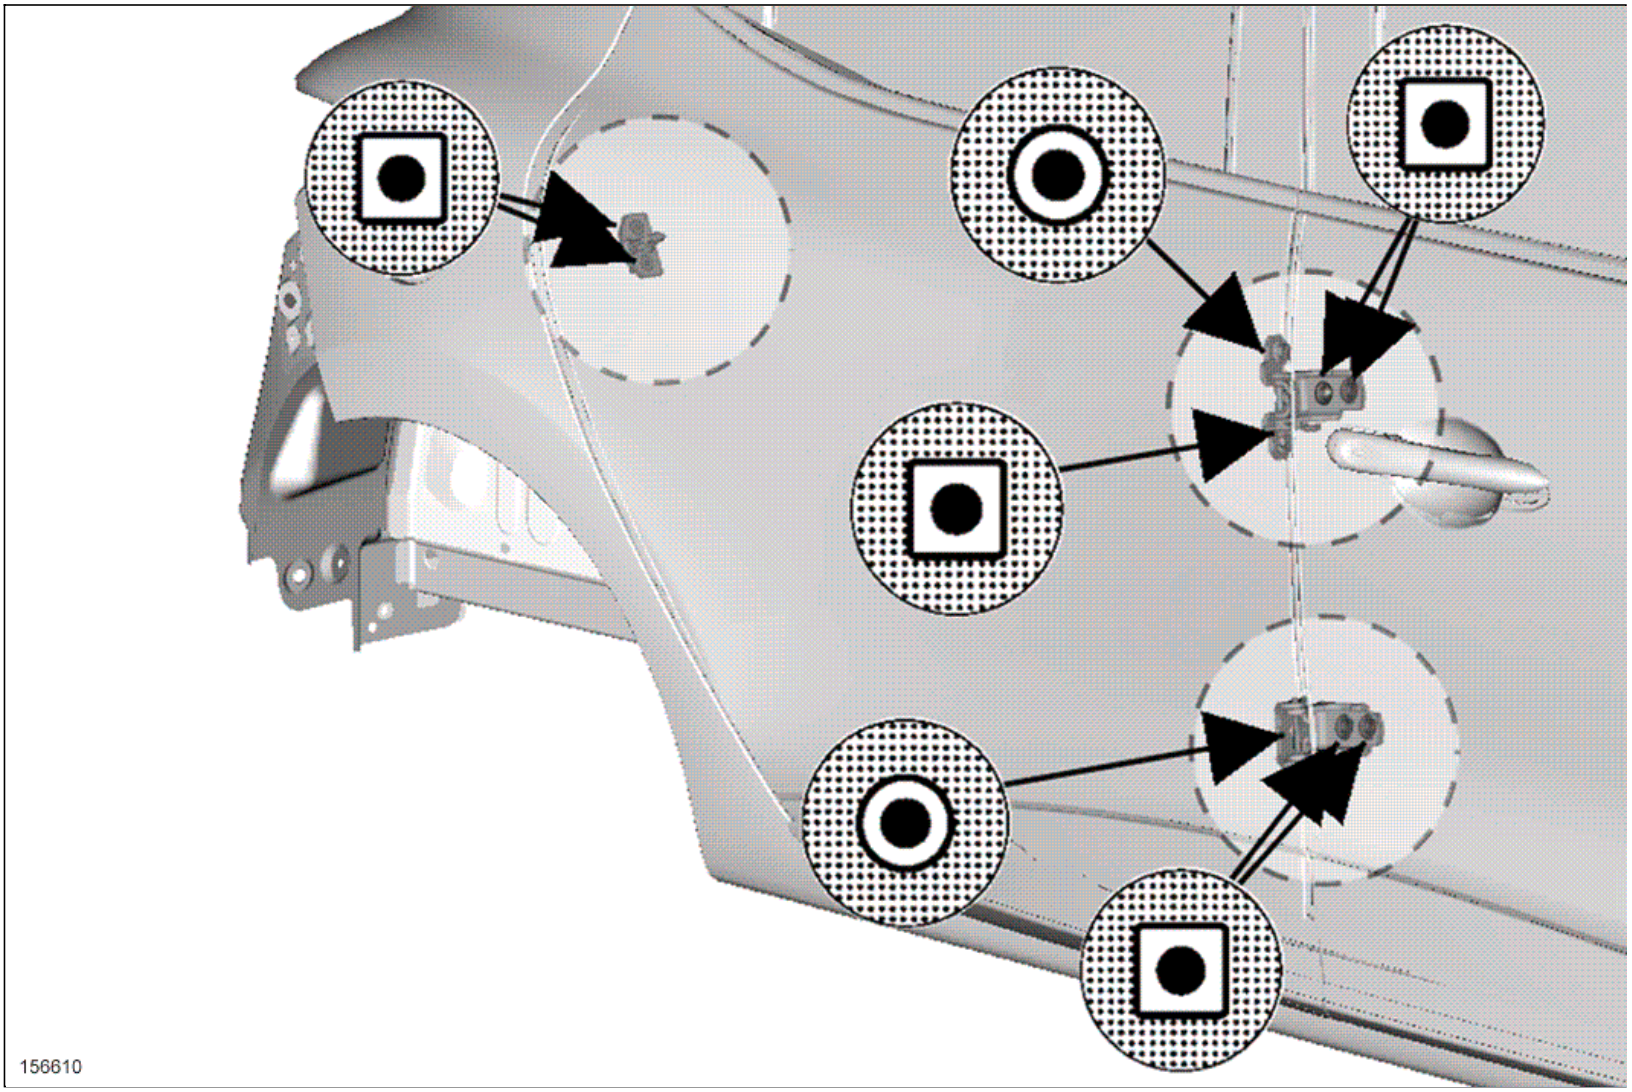
Symbols A, B, C and D show the adjustment options.

The black dot in the centre represents the body of the bolt.

The grey section represents the component to be adjusted.

The white section represents the adjustment area.

1. HEIGHT AND LENGTH ADJUSTMENT



Note:

Adjustment of zones (4) and (5) is dependent on the adjustment of the front side opening element(see 47A, Side opening elements, Front side opening element: Adjustment) .

Adjust in the following order:

- the height of zones(1) and (2) ,
- the length of zones(3) , (4) and (5) .

2. DEPTH ADJUSTMENT

Note:

Adjustment of zones (4) and (5) is dependent on the adjustment of the front side opening element(see 47A, Side opening elements, Front side opening element: Adjustment) .

Note:

The original hinge mounting plates are bonded to the door box section.

To carry out the adjustment, it is necessary to remove the plate using a wooden block and a hammer.

Adhere to the following adjustment sequence:

- adjust the depth of zones(1) , (4) and (5) ,
- adjust the height of the striker panel in relation to the lock to prevent them touching,
- adjust the depth of zones(2) and (3) .

Note:

The striker plate is spot-welded to the rear wing reinforcement.

To carry out adjustments, deform the fuse brackets of the plate.

REAR SIDE OPENING ELEMENT ASSEMBLY ON THE PASSENGER COMPARTMENT SIDE: EXPLODED VIEW

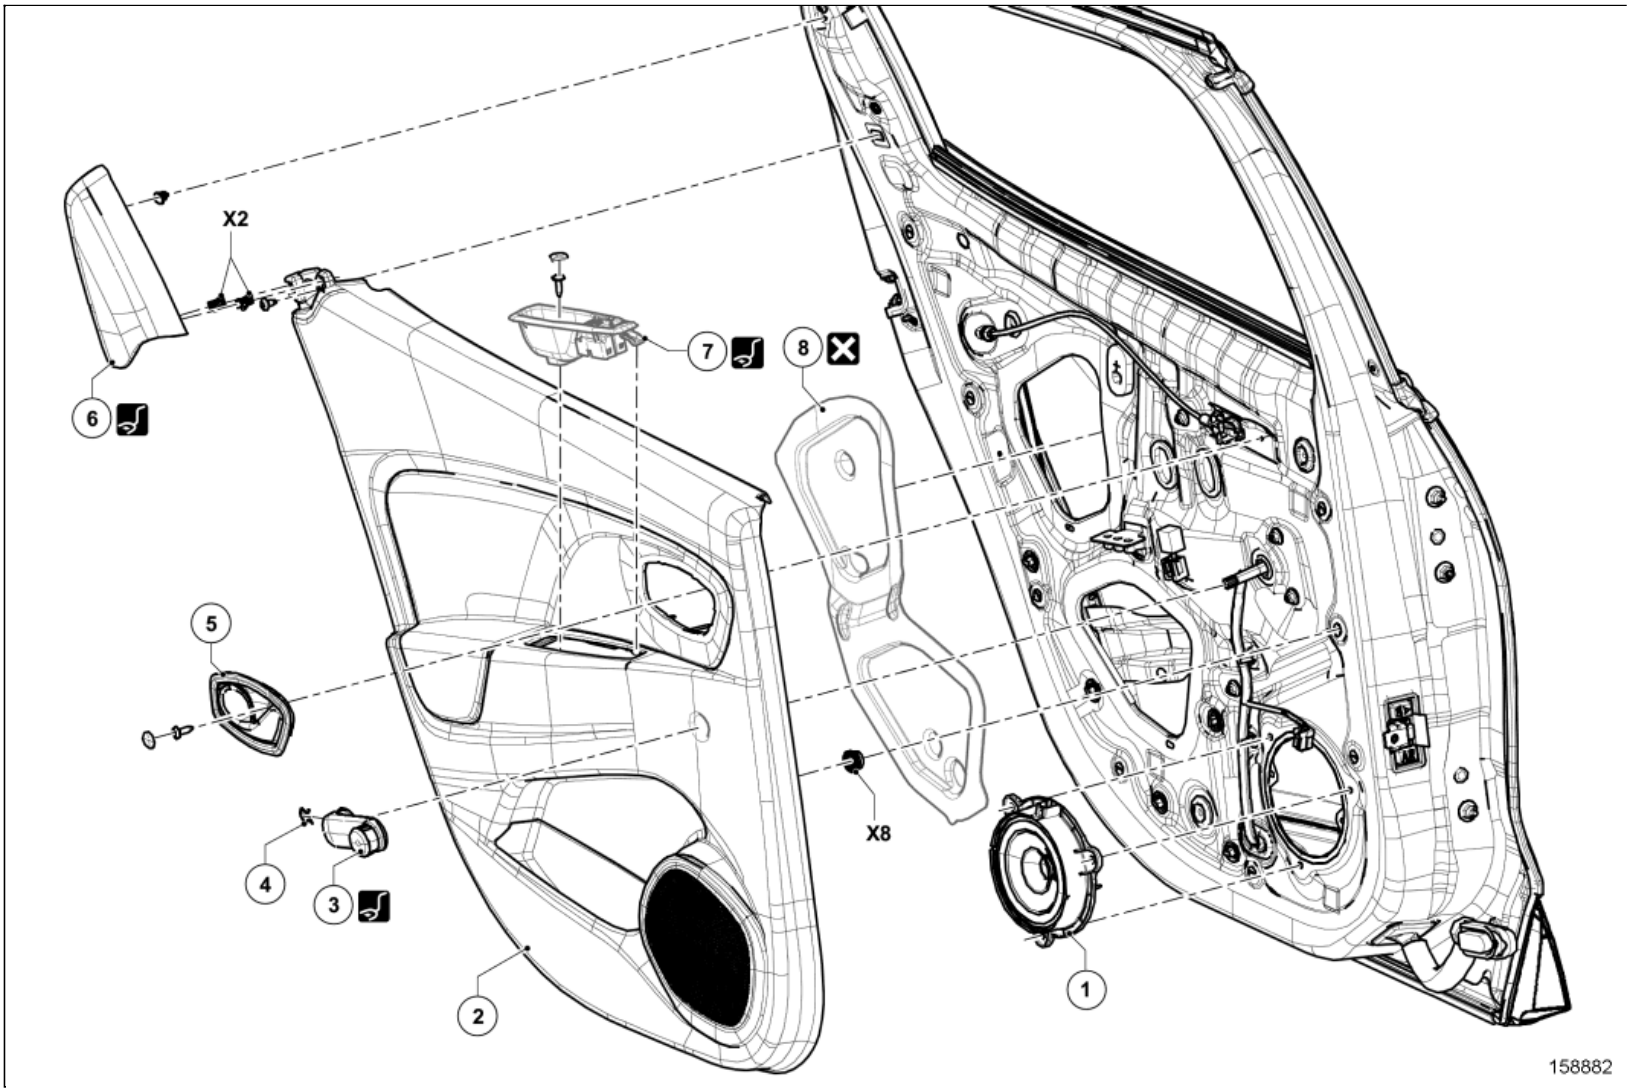


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations

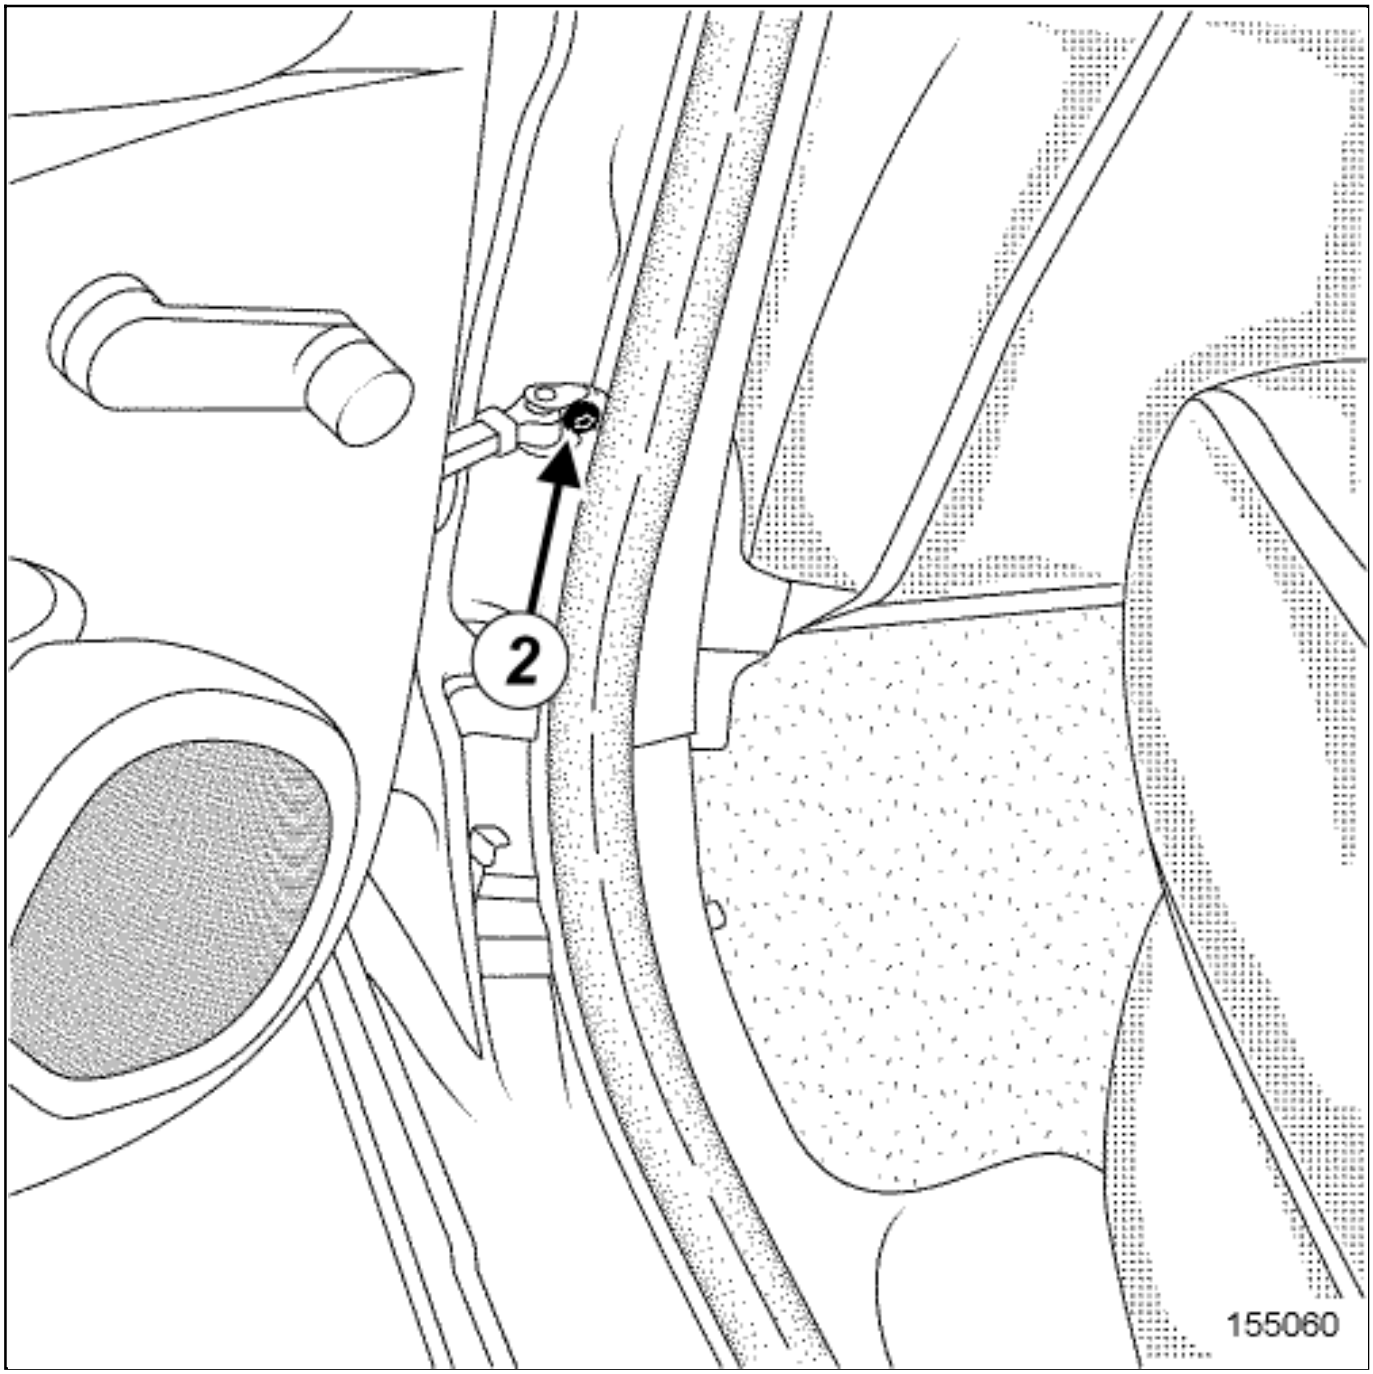
REAR SIDE OPENING ELEMENT: REMOVAL - REFITTING

Location and specifications (tightening torques, parts always to be replaced, etc.)**Opening mechanism assembly of rear side opening element: Exploded view** .

This operation can be carried out in two ways:

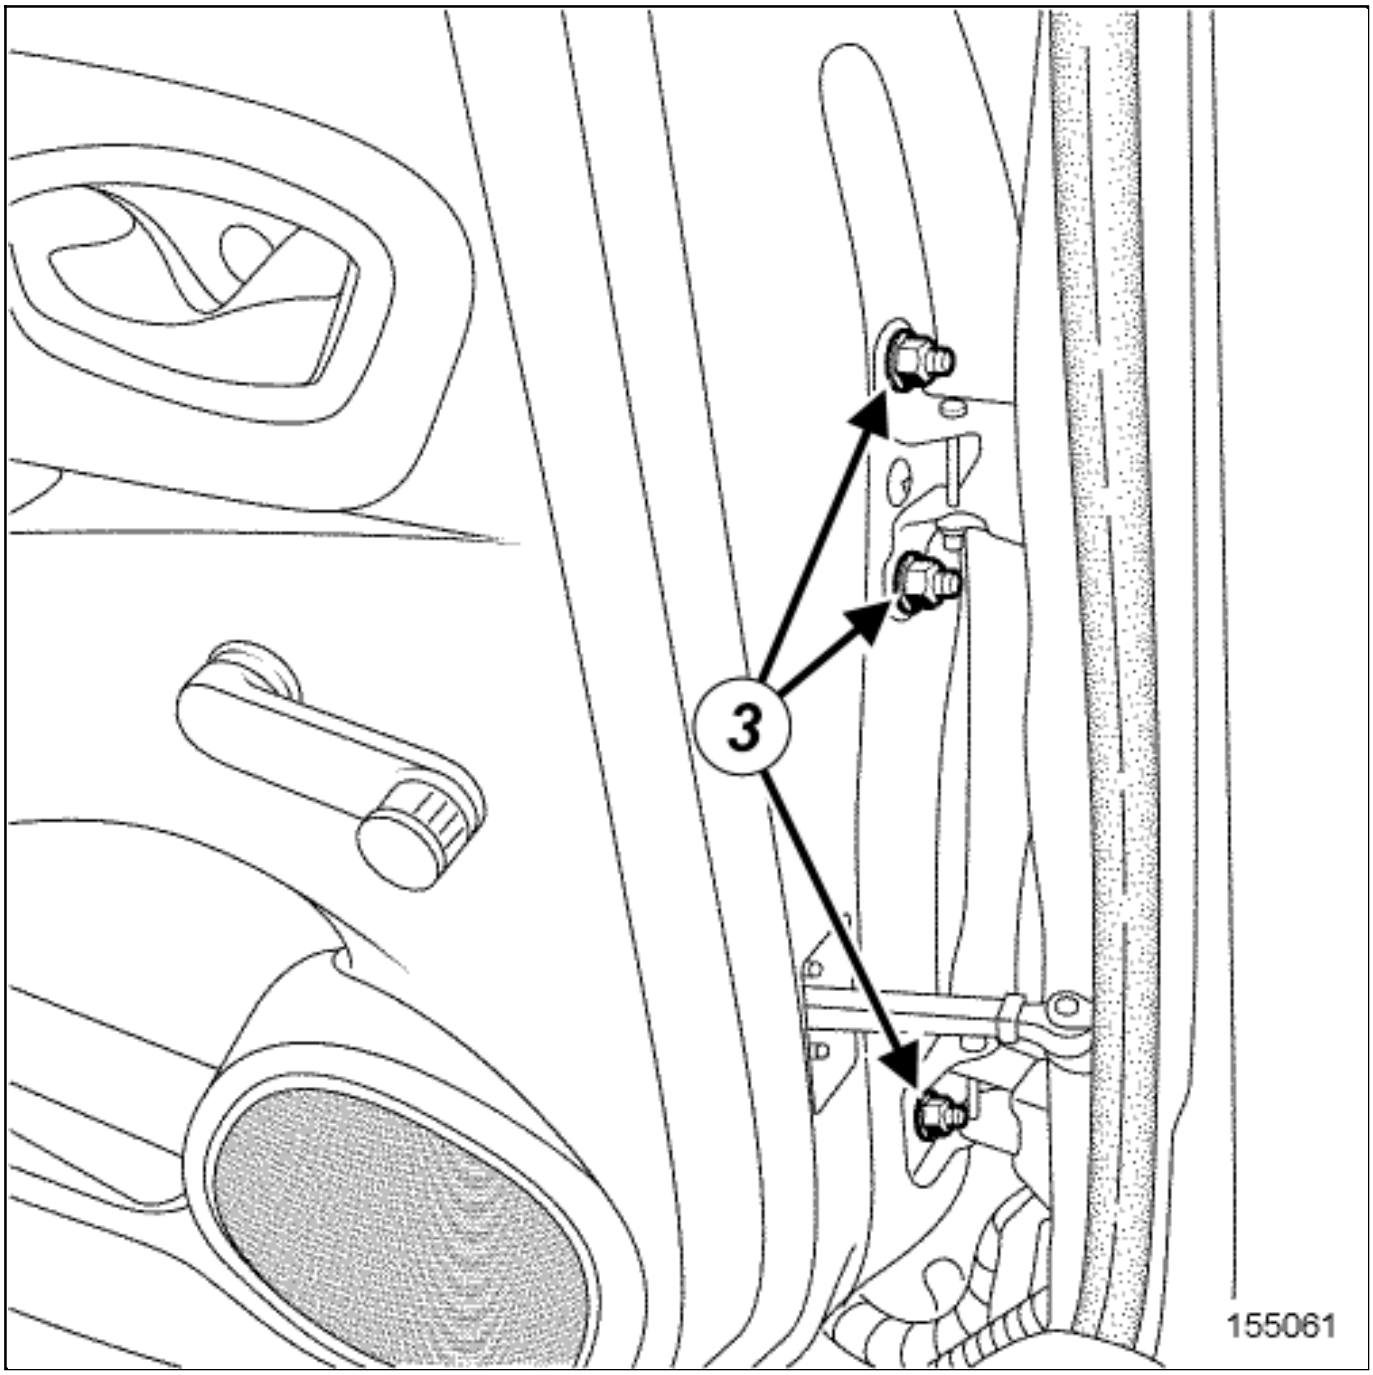


- removal without hinges: used when replacing the door.
- removal with hinges: allows the initial adjustments to be kept.

REMOVAL

1. REMOVAL PREPARATION OPERATION

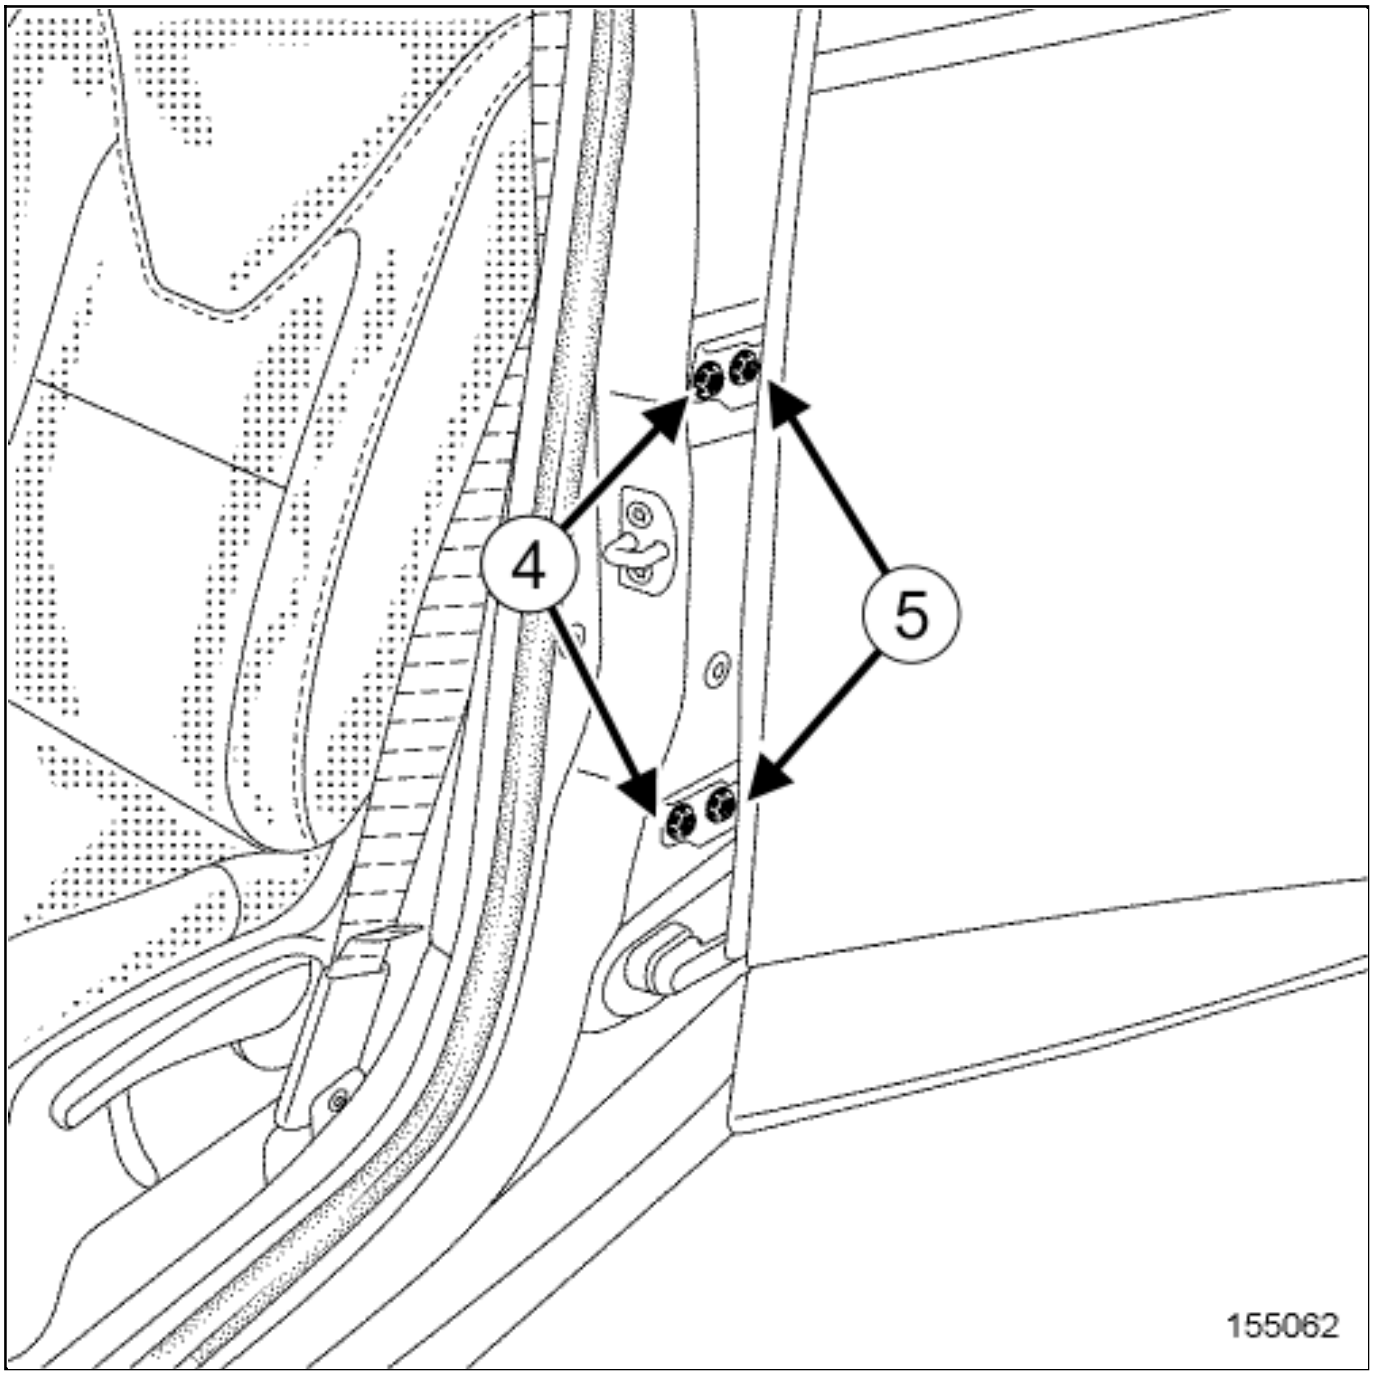
Disconnect the connector(1) of the rear side door wiring.



Remove the bolt(2) from the rear side door check strap.

Move aside the rear side door check strap.

2. REMOVAL OPERATION



1- REMOVAL WITHOUT HINGES

Remove:

- the rear side door nuts(3) ,
- the rear side door (this operation requires two people).

2- REMOVAL WITH HINGES

Remove:

- the rear side door nuts(**4**) ,
- the rear side door bolts(**5**) ,
- the rear side door (this operation requires two people).

REFITTING

1. REFITTING OPERATION

1- REFITTING WITHOUT HINGES

- Proceed in the reverse order to removal.
- Adjust the rear side door clearances and flush fittings(see 47A, Side opening elements, Rear side opening element: Adjustment) .
- Carry out a function test on all functions.

2- REFITTING WITH HINGES

Note:

Apply a bead of sealing masticVehicle: Parts and consumables for the repair to the door hinges Anti-corrosion protection product before assembly: Use .

- Proceed in the reverse order to removal.
- Adjust the rear side door clearances and flush fittings(see 47A, Side opening elements, Rear side opening element: Adjustment) .
- Carry out a function test on all functions.

RECIRCULATIONMOTOR:REMOVAL-REFITTING

Equipment required
Diagnostic tool

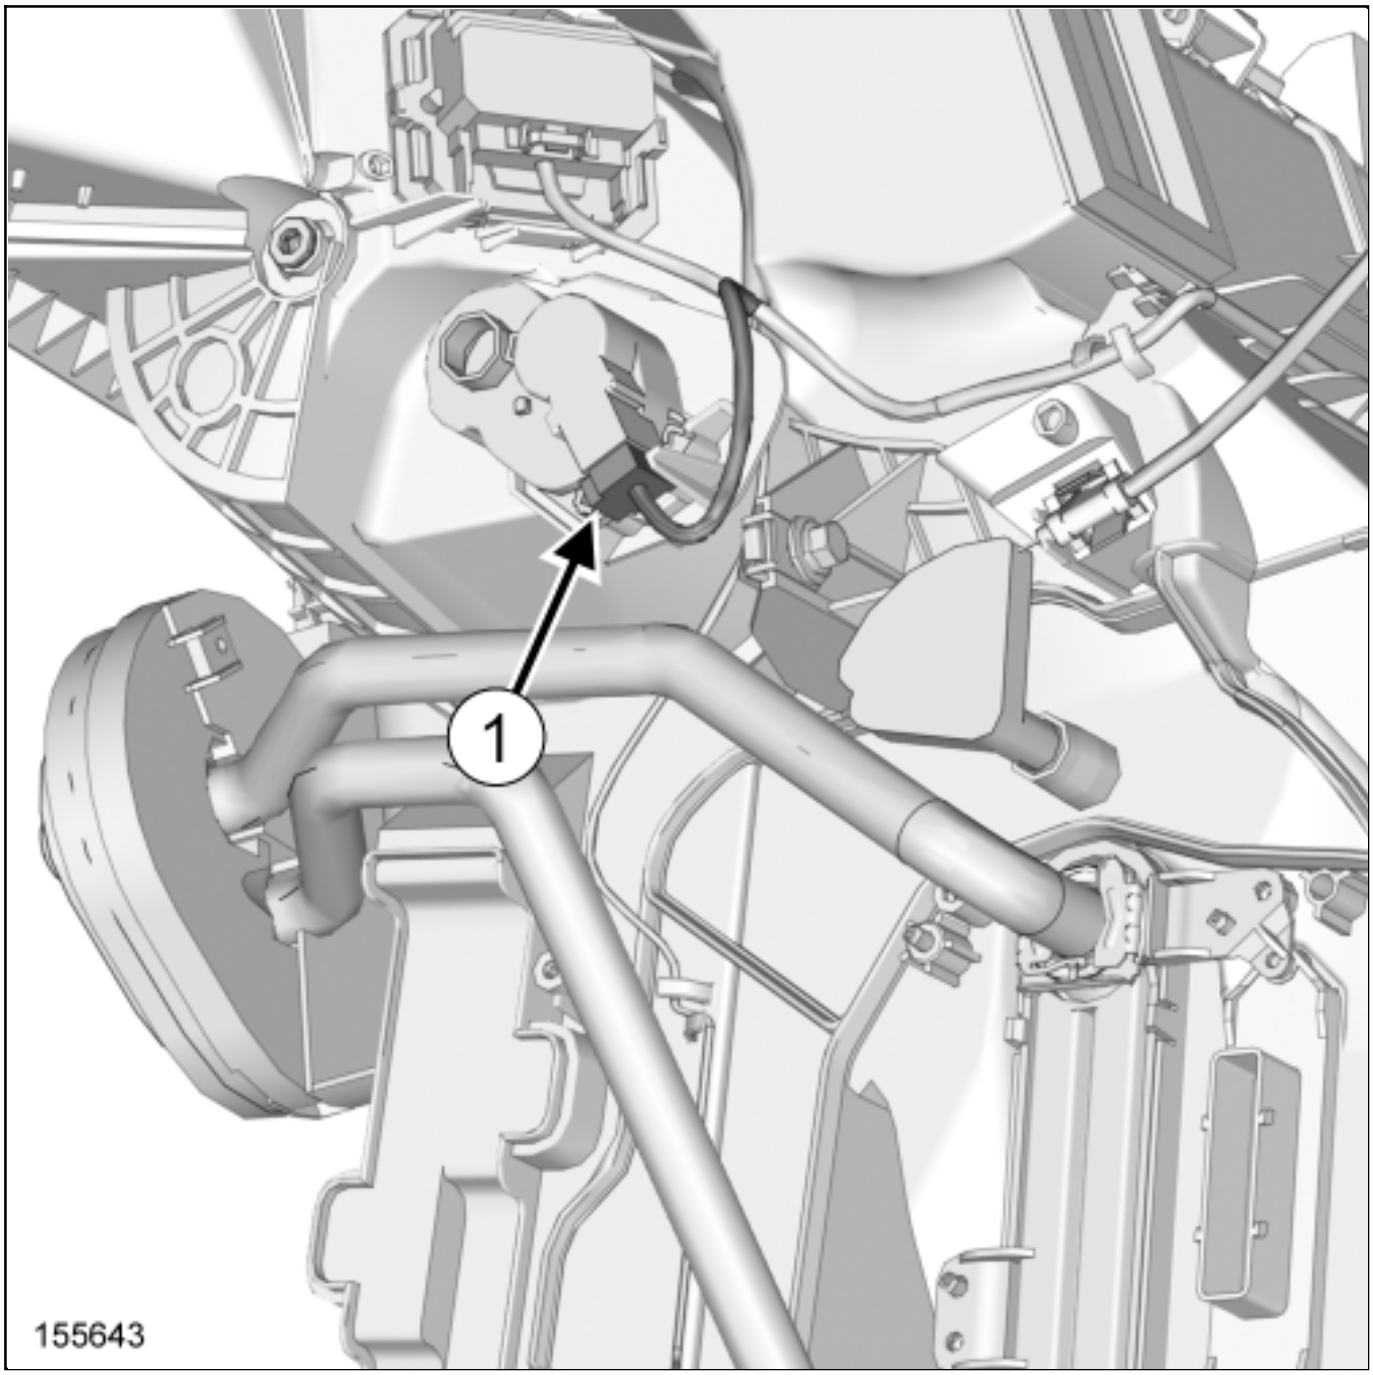
Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Note:

There are two types of fitting for the distribution unit: Valéo and Denso.

REMOVAL

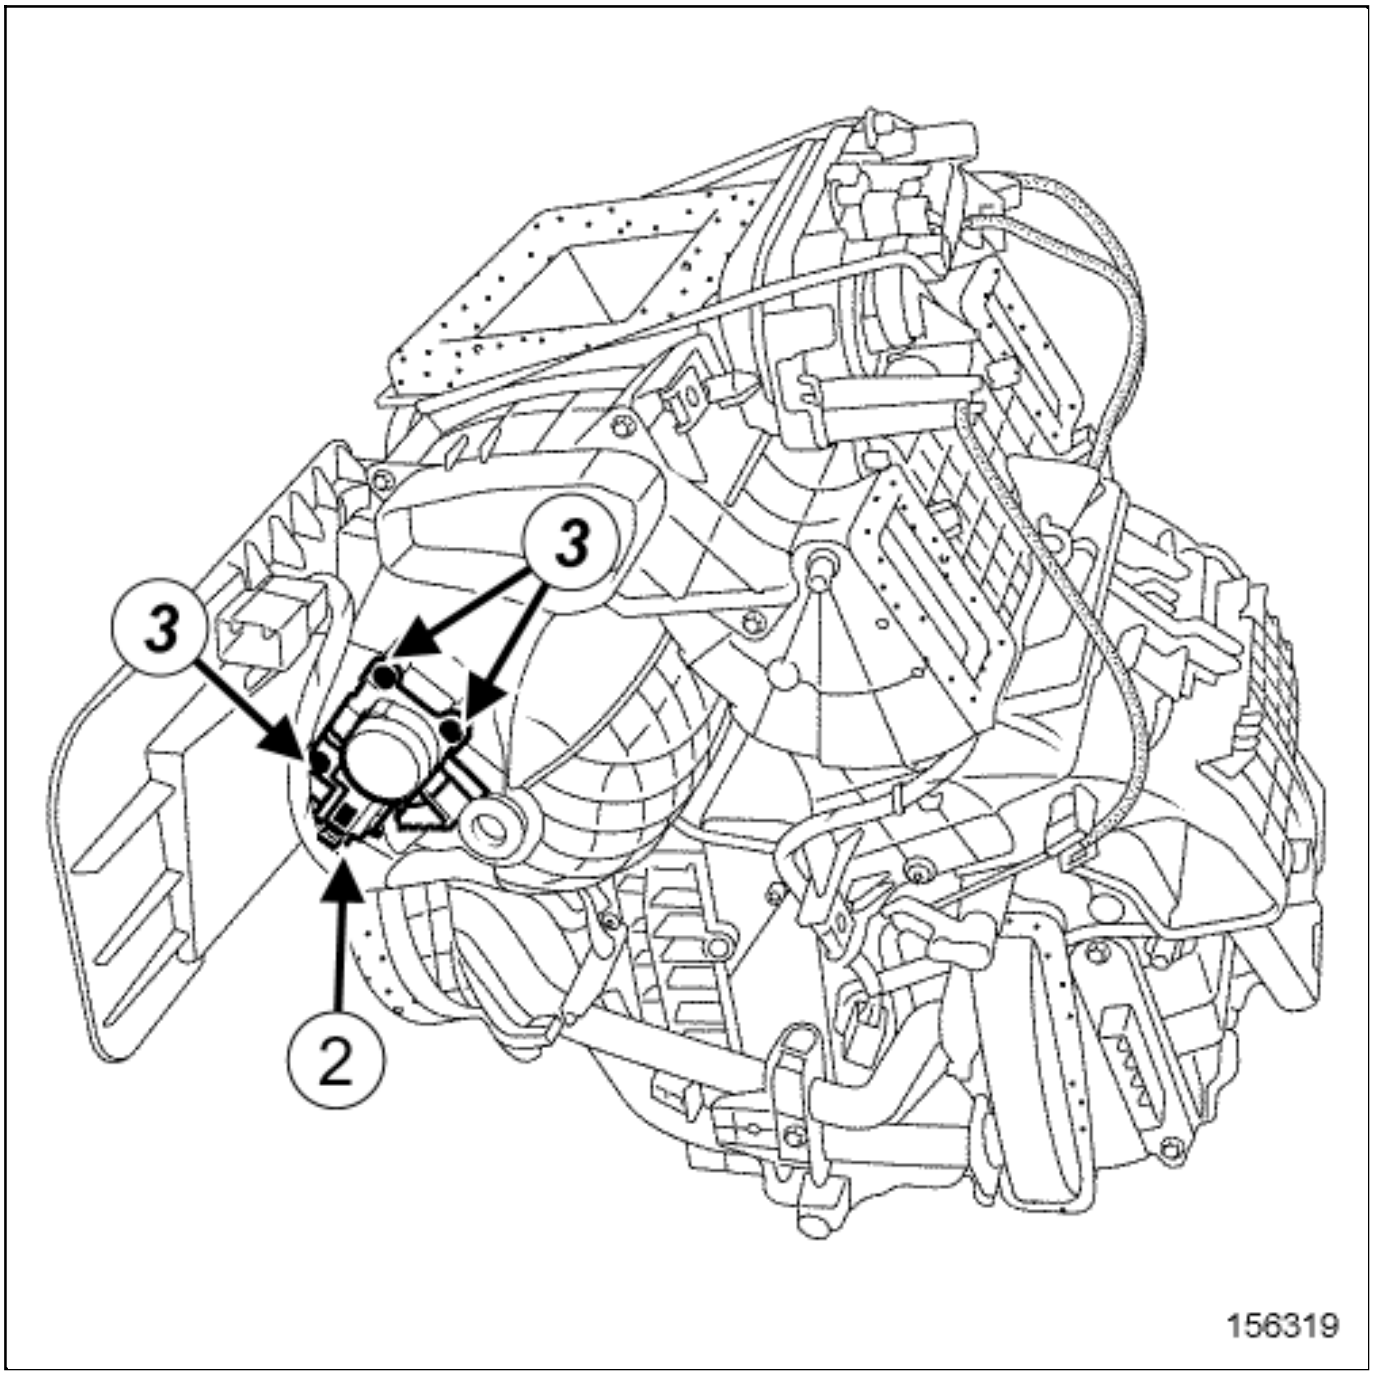
1. REMOVAL PREPARATION OPERATION



- Remove the dashboard lower trimDashboard assembly: Exploded view .

1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT

- Remove the dashboardDashboard assembly: Exploded view .

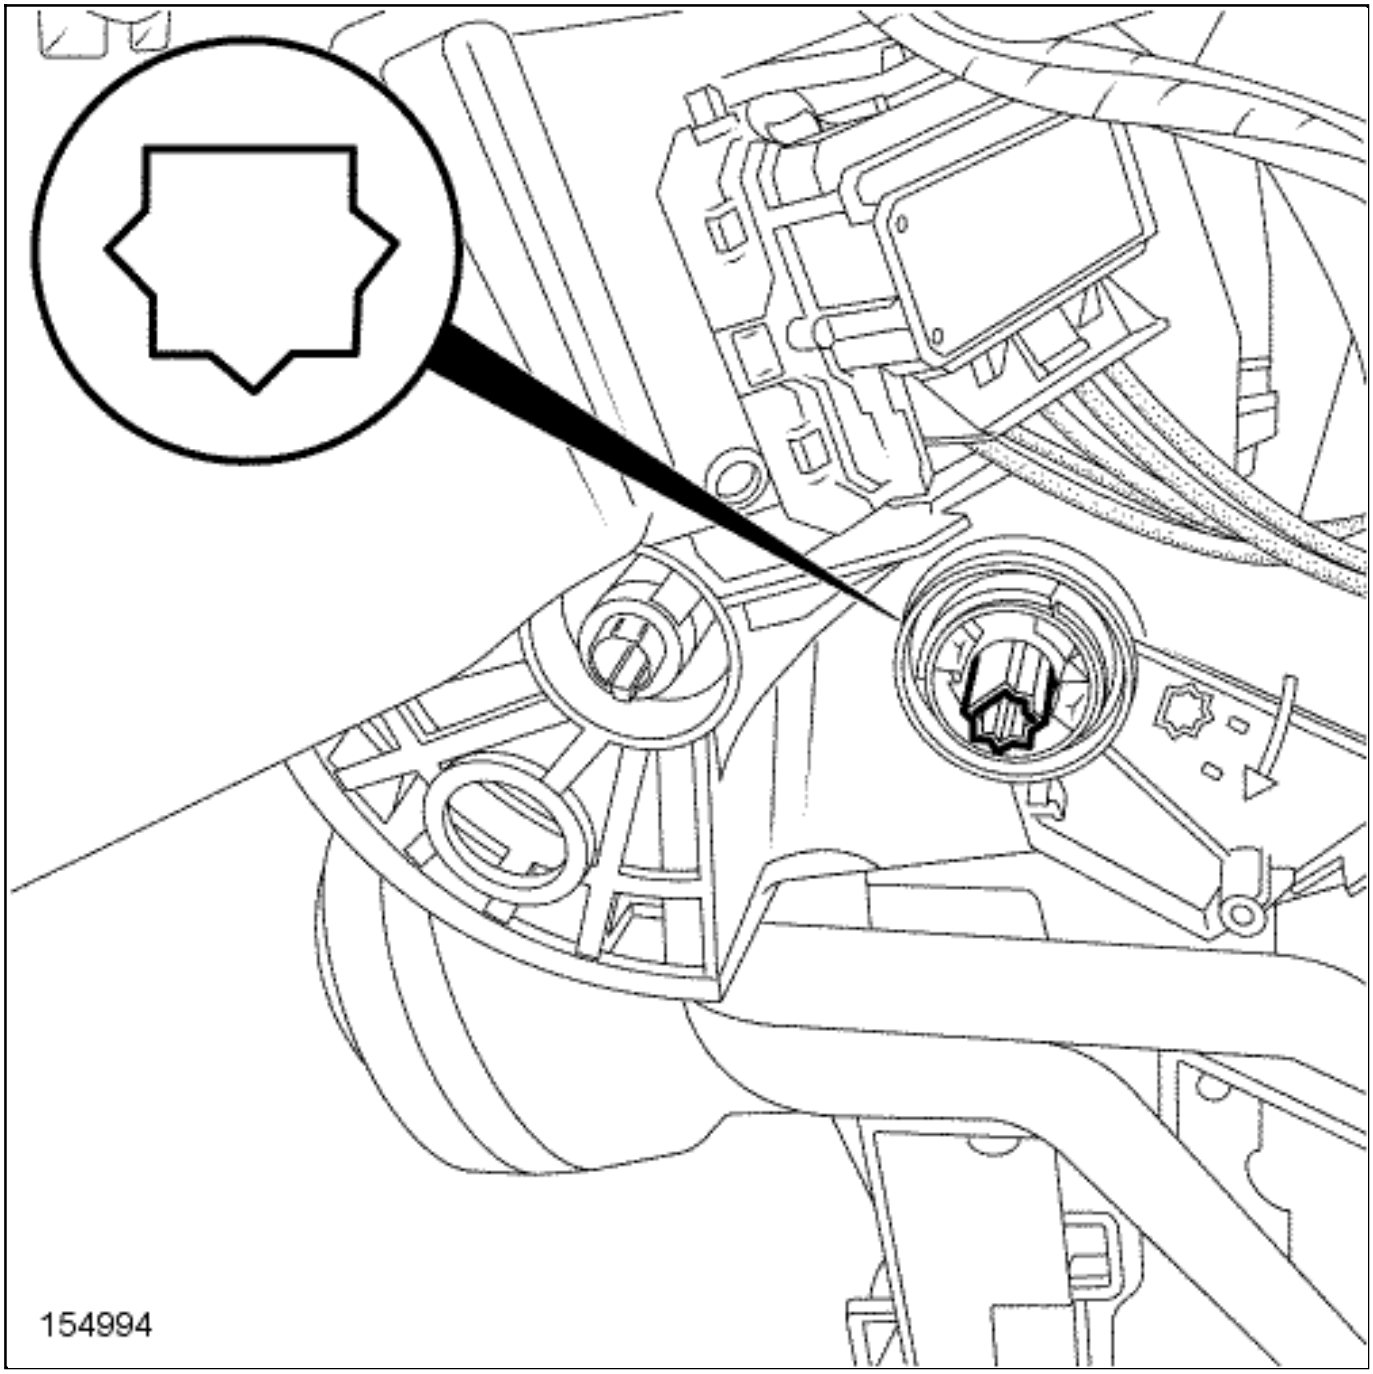


2. REMOVAL OPERATION

1- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A VALÉO DISTRIBUTION UNIT

- Disconnect the recirculation motor connector(1) .
- Unclip the recirculation motor from the distribution unit.

2- THIS PROCEDURE APPLIES TO VEHICLES EQUIPPED WITH A DENSO DISTRIBUTION UNIT



Disconnect the recirculation motor connector(2) .

Remove:

- the bolts(3) from the recirculation motor,
- the recirculation motor.

REFITTING

1. REFITTING OPERATION

Position the air recirculation motor in relation to the flat surface of the air recirculation motor recess.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

- "Air conditioning computer" ,

-Component affected by the After repair procedure:

- "Air recirculation flap motor" .

Repair-30x02x04x07-01x37-1-35-1.xml

XSL version : 3.02 du 22/07/11

REFRIGERANTCIRCUIT:CHECK

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 62A, Air conditioning, Air conditioning: Precautions for the repair) ,

Vehicle: Precautions for the repair (01D, Mechanical introduction).

Note:

After any work on air conditioning circuit leaks on the Laguna II, Vel Satis and Espace IV, check that filling fault DF033 Refrigerantis not present, using the Diagnostic tool. If it is present, clear it. The compressor cannot operate until the fault is cleared.

There are several types of detector:

electronic detectors,

trace detectors.

Note:

To carry out an after repair check, use the procedure for the electronic detector (1). To carry out a more thorough check for leaks, use a trace detector (2).

Check that the air conditioning system is operating correctly(see 62A, Air conditioning, Air conditioning: Check) .

1. REFRIGERANT CIRCUIT SEALING CHECKING OPERATION

1- ELECTRONIC DETECTORS

CAUTION
Consult the device's operating manual to avoid incorrect use.

- Switch on the electronic detector.
- Start the engine.
- Let the air conditioning system run for 15 minutes.
- Switch off the engine.
- Check the sealing of the refrigerant circuit using the electronic trace detector (follow the trace of the circuit as closely as possible, to limit variations due to other gases).

Note:

If replacing a defective part (see 62A, Air conditioning).

1- TRACE DETECTORS

CAUTION

Consult the device's operating manual to avoid incorrect use.

CAUTION

To avoid damaging the cold loop components (corrosions, etc.), do not use dye if the traces reveal that some product has already been injected.

- Check for dye on the cold loop components with the ultraviolet light.
- Inject the dye.
- Start the engine.
- Let the air conditioning system run for 15 minutes.
- Switch off the engine.
- Check the refrigerant circuit sealing by scanning the circuit with the ultraviolet light.

Note:

If replacing a defective part (see 62A, Air conditioning).

-

Affix a label (supplied with the dye capsule), to indicate that dye has been used (as close as possible to the filler valves).

REFRIGERANTCIRCUIT:CHECK

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

XSL version : 3.02 du 22/07/11

REFRIGERANT CIRCUIT: DRAINING - FILLING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
refrigerant charging station

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

WARNING

Consult the safety and cleanliness advice and operation recommendations before carrying out any repair(see 62A, Air conditioning, Air conditioning: Precautions for the repair) .

CAUTION

Consult the device's operating manual to avoid incorrect use.

CAUTION

To avoid damaging the cold loop components (corrosions, etc.), do not use dye if the traces reveal that some product has already been injected.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine type (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

1. RECOVERING REFRIGERANT FLUID

Note:

If the air conditioning circuit is fitted with a single filler valve, some filling equipment only requires the use of the high pressure pipe (refer to the filling station instructions).

Depending on the situation, run the system for a few minutes before recovering the coolant to improve drainage.

Note:

It is essential to follow these procedures to prevent:

- gas escaping when the circuit is opened,

- pollution of the environment through the release of gas into the atmosphere when the circuit is opened or when a vacuum is created.

When draining or checking the refrigerant fill load, three scenarios are to be taken into account:

- the engine is running and the air conditioning is in operation (A),
- the engine is running but the air conditioning is not in operation (B),
- the engine is not running nor is the air conditioning in operation (C).

Scenario A:

- Operate the air conditioning until the cooling fan assembly is triggered twice,
- Switch off the engine,
- drain for the first time (note down the original value),
- wait 15 minutes,
- check that the relative pressure is no more than 0 bar,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

Scenario B:

- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the first time (note down the value),
- wait 15 minutes,
- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the second time (note down the value),
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

Scenario C:

- drain for the first time (note down the value),
- wait 2 hours,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

2. CREATING A VACUUM

It is essential to carry out vacuum extraction correctly before loading, otherwise the air conditioning will not work properly.

There are two scenarios to consider:

- vacuum created immediately after discharge (scenario A),
- vacuum created after an interval of several hours or days (scenario B).

Scenario A:

- creation of a vacuum takes 20 minutes.

Scenario B:

- creation of a vacuum takes 45 minutes to eliminate any trace of moisture.

Test the seal once the vacuum has been created (some stations do this automatically).

3. FILLING

Fill up the refrigerant circuit using the refrigerant charging station.

Top up the oil with the recommended type and volume of oil and refrigerant, depending on the work carried out(see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Check there are no leaks using the electronic detector(see 62A, Air conditioning, Refrigerant circuit: Check) .

CAUTION

After injecting dye into the refrigerant, be sure to indicate this on a label (supplied with the dye capsule), and the date of the operation.

Position the label so it is visible near to the cold loop filler valve.

Check that the air conditioning system is operating correctly(see 62A, Air conditioning, Air conditioning: Check) .

REFRIGERANT CIRCUIT: DRAINING - FILLING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
refrigerant charging station

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

WARNING

Consult the safety and cleanliness advice and operation recommendations before carrying out any repair(see 62A, Air conditioning, Air conditioning: Precautions for the repair) .

CAUTION

Consult the device's operating manual to avoid incorrect use.

CAUTION

To avoid damaging the cold loop components (corrosions, etc.), do not use dye if the traces reveal that some product has already been injected.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine type (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

1. RECOVERING REFRIGERANT FLUID

Note:

If the air conditioning circuit is fitted with a single filler valve, some filling equipment only requires the use of the high pressure pipe (refer to the filling station instructions).

Depending on the situation, run the system for a few minutes before recovering the coolant to improve drainage.

Note:

It is essential to follow these procedures to prevent:

- gas escaping when the circuit is opened,

- pollution of the environment through the release of gas into the atmosphere when the circuit is opened or when a vacuum is created.

When draining or checking the refrigerant fill load, three scenarios are to be taken into account:

- the engine is running and the air conditioning is in operation (A),
- the engine is running but the air conditioning is not in operation (B),
- the engine is not running nor is the air conditioning in operation (C).

Scenario A:

- Operate the air conditioning until the cooling fan assembly is triggered twice,
- Switch off the engine,
- drain for the first time (note down the original value),
- wait 15 minutes,
- check that the relative pressure is no more than 0 bar,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

Scenario B:

- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the first time (note down the value),
- wait 15 minutes,
- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the second time (note down the value),
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

Scenario C:

- drain for the first time (note down the value),
- wait 2 hours,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

2. CREATING A VACUUM

It is essential to carry out vacuum extraction correctly before loading, otherwise the air conditioning will not work properly.

There are two scenarios to consider:

- vacuum created immediately after discharge (scenario A),
- vacuum created after an interval of several hours or days (scenario B).

Scenario A:

- creation of a vacuum takes 20 minutes.

Scenario B:

- creation of a vacuum takes 45 minutes to eliminate any trace of moisture.

Test the seal once the vacuum has been created (some stations do this automatically).

3. FILLING

Fill up the refrigerant circuit using the refrigerant charging station.

Top up the oil with the recommended type and volume of oil and refrigerant, depending on the work carried out(see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Check there are no leaks using the electronic detector(see 62A, Air conditioning, Refrigerant circuit: Check) .

CAUTION

After injecting dye into the refrigerant, be sure to indicate this on a label (supplied with the dye capsule), and the date of the operation.

Position the label so it is visible near to the cold loop filler valve.

Check that the air conditioning system is operating correctly(see 62A, Air conditioning, Air conditioning: Check) .

REFRIGERANT CIRCUIT: DRAINING - FILLING

Note, one or more warnings are present in this procedure

Equipment required
refrigerant charging station

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

WARNING

Consult the safety and cleanliness advice and operation recommendations before carrying out any repair(see 62A, Air conditioning, Air conditioning: Precautions for the repair) .

CAUTION

Consult the device's operating manual to avoid incorrect use.

CAUTION

To avoid damaging the cold loop components (corrosions, etc.), do not use dye if the traces reveal that some product has already been injected.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine type (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

1. RECOVERING REFRIGERANT FLUID

Note:

If the air conditioning circuit is fitted with a single filler valve, some filling equipment only requires the use of the high pressure pipe (refer to the filling station instructions).

Depending on the situation, run the system for a few minutes before recovering the coolant to improve drainage.

Note:

It is essential to follow these procedures to prevent:

- gas escaping when the circuit is opened,

- pollution of the environment through the release of gas into the atmosphere when the circuit is opened or when a vacuum is created.

When draining or checking the refrigerant fill load, three scenarios are to be taken into account:

- the engine is running and the air conditioning is in operation (A),
- the engine is running but the air conditioning is not in operation (B),
- the engine is not running nor is the air conditioning in operation (C).

Scenario A:

- Operate the air conditioning until the cooling fan assembly is triggered twice,
- Switch off the engine,

- drain for the first time (note down the original value),
- wait 15 minutes,
- check that the relative pressure is no more than 0 bar,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35gor -100g.

Scenario B:

- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the first time (note down the value),
- wait 15 minutes,
- run the engine until the cooling fan is triggered twice,
- Switch off the engine,
- drain for the second time (note down the value),
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35gor -100g.

Scenario C:

- drain for the first time (note down the value),

- wait 2 hours,
- repeat the cycles until the relative pressure is equal to or less than 0 bar,
- add together the values of the various draining operations; the fill is confirmed as being correct if the volume of refrigerant fluid is the specified fill +35g or -100g.

2. CREATING A VACUUM

It is essential to carry out vacuum extraction correctly before loading, otherwise the air conditioning will not work properly.

There are two scenarios to consider:

- vacuum created immediately after discharge (scenario A),
- vacuum created after an interval of several hours or days (scenario B).

Scenario A:

- creation of a vacuum takes 20 minutes.

Scenario B:

- creation of a vacuum takes 45 minutes to eliminate any trace of moisture.

Test the seal once the vacuum has been created (some stations do this automatically).

3. FILLING

Fill up the refrigerant circuit using the refrigerant charging station.

Top up the oil with the recommended type and volume of oil and refrigerant, depending on the work carried out(see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Check there are no leaks using the electronic detector(see 62A, Air conditioning, Refrigerant circuit: Check) .

CAUTION

After injecting dye into the refrigerant, be sure to indicate this on a label (supplied with the dye capsule), and the date of the operation.

Position the label so it is visible near to the cold loop filler valve.

Check that the air conditioning system is operating correctly(see 62A, Air conditioning, Air conditioning: Check) .

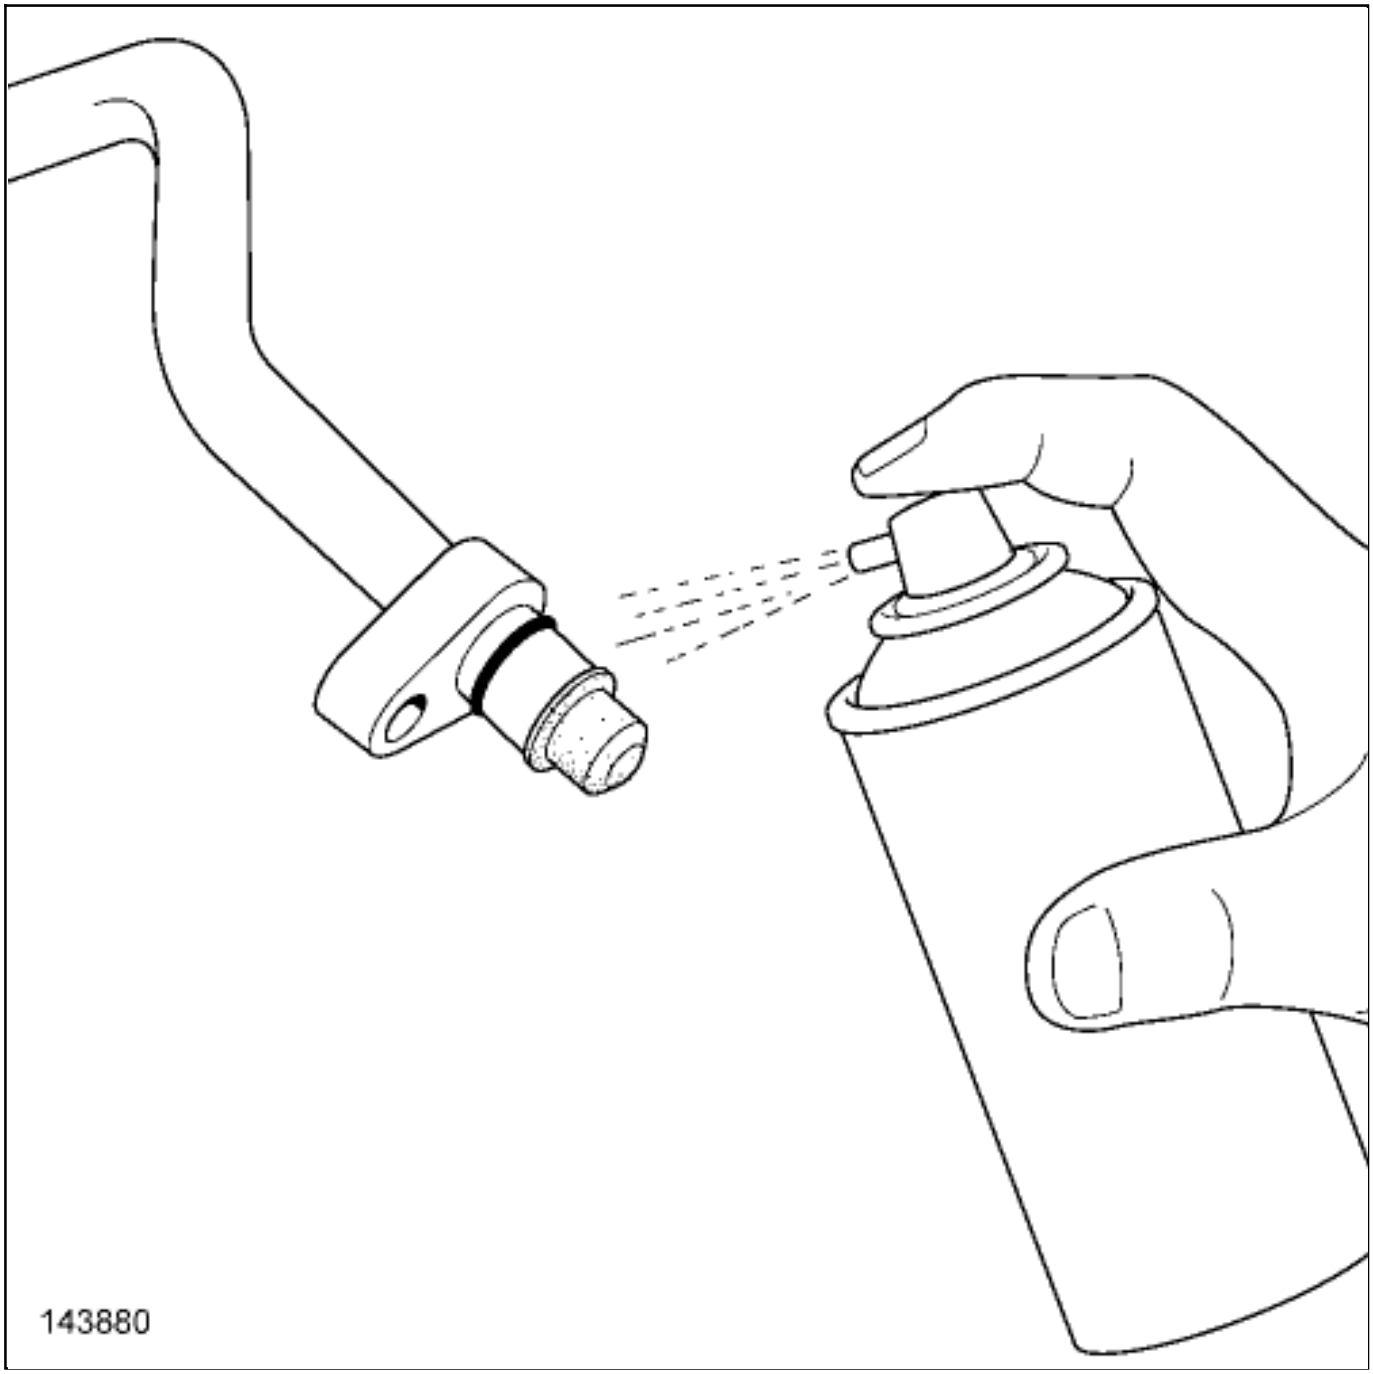
REFRIGERANT CIRCUIT PIPE SEAL: CLEANING

Note, one or more warnings are present in this procedure

Equipment required
compressed air nozzle

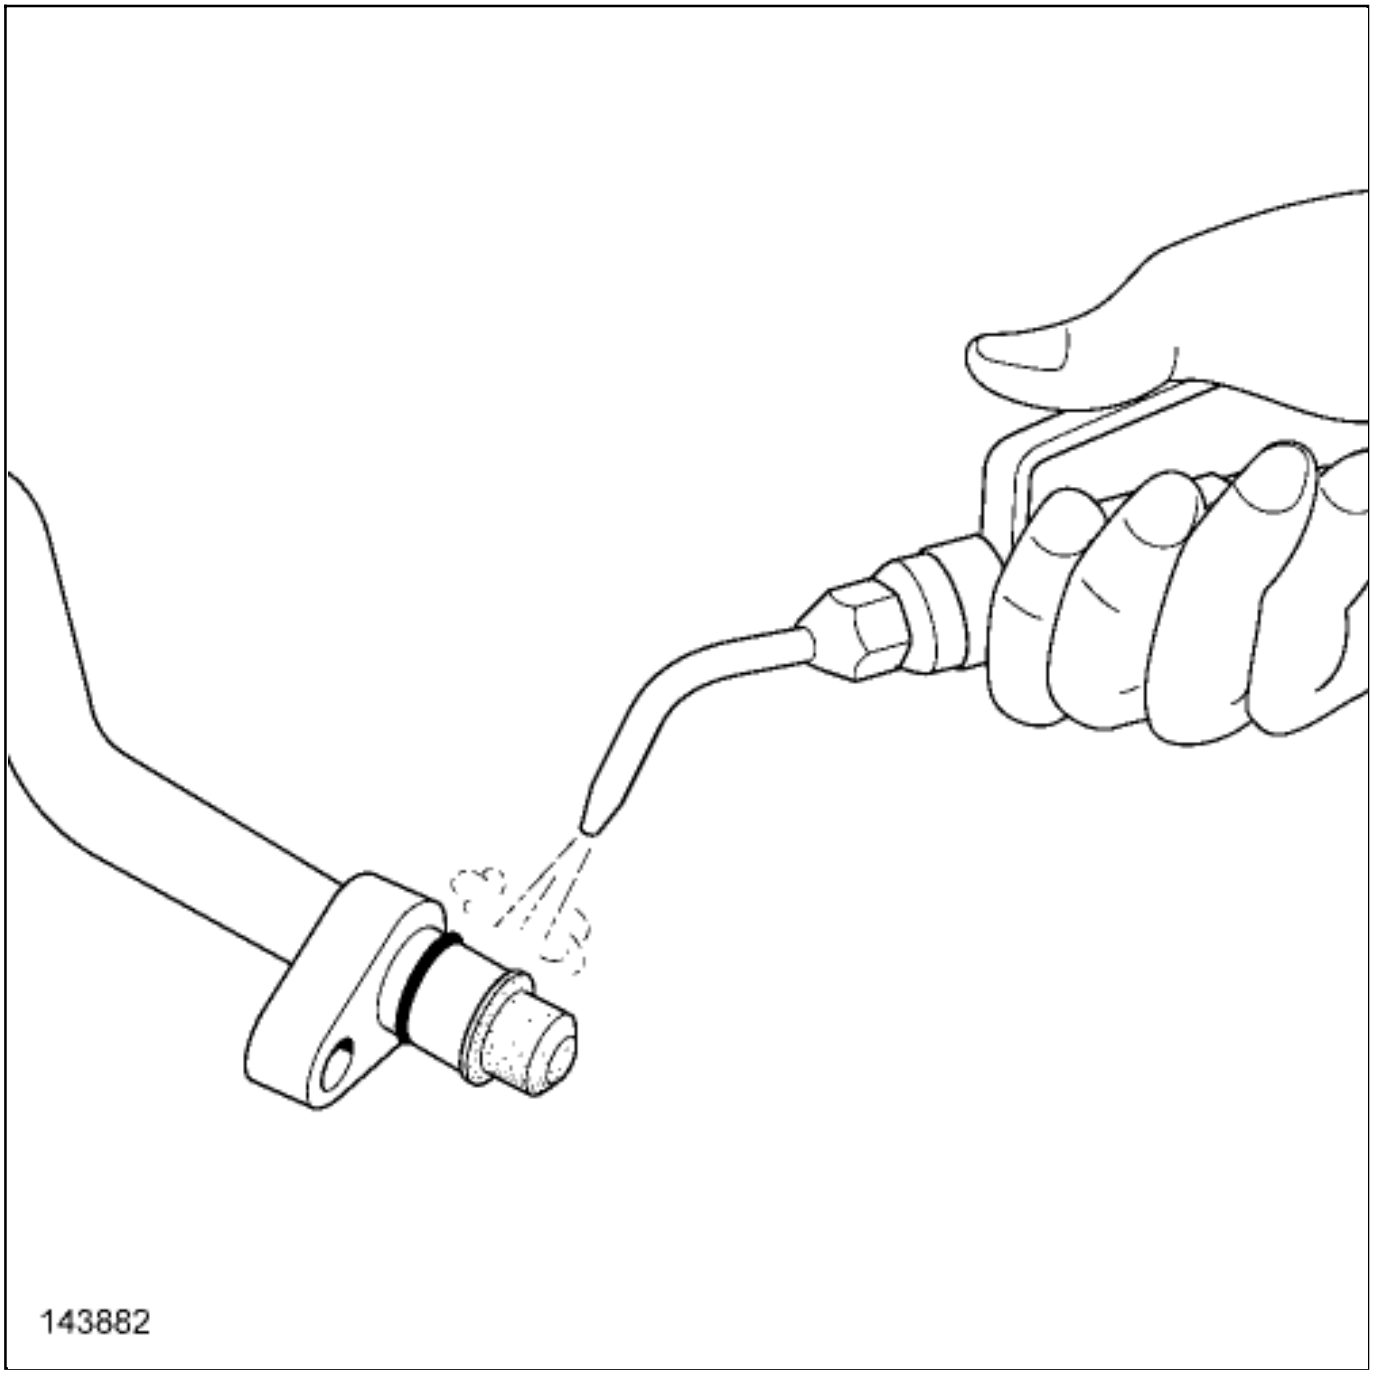
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair



WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



- (see 62A, Air conditioning, Air conditioning: Precautions for the repair)
- Vehicle: Precautions for the repair

CLEANING

Insert the blanking plugs.

Clean the surface and the seals of the connecting pipes using ENGINE CLEANER Vehicle: Parts and consumables for the repair .

- Blow using a compressed air nozzle on the surface and the seals of the connecting pipes.

- Lubricate the surface and the seals of the connecting pipes with air conditioning oil (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

- Remove the blanking plugs.

XSL version : 3.02 du 22/07/11

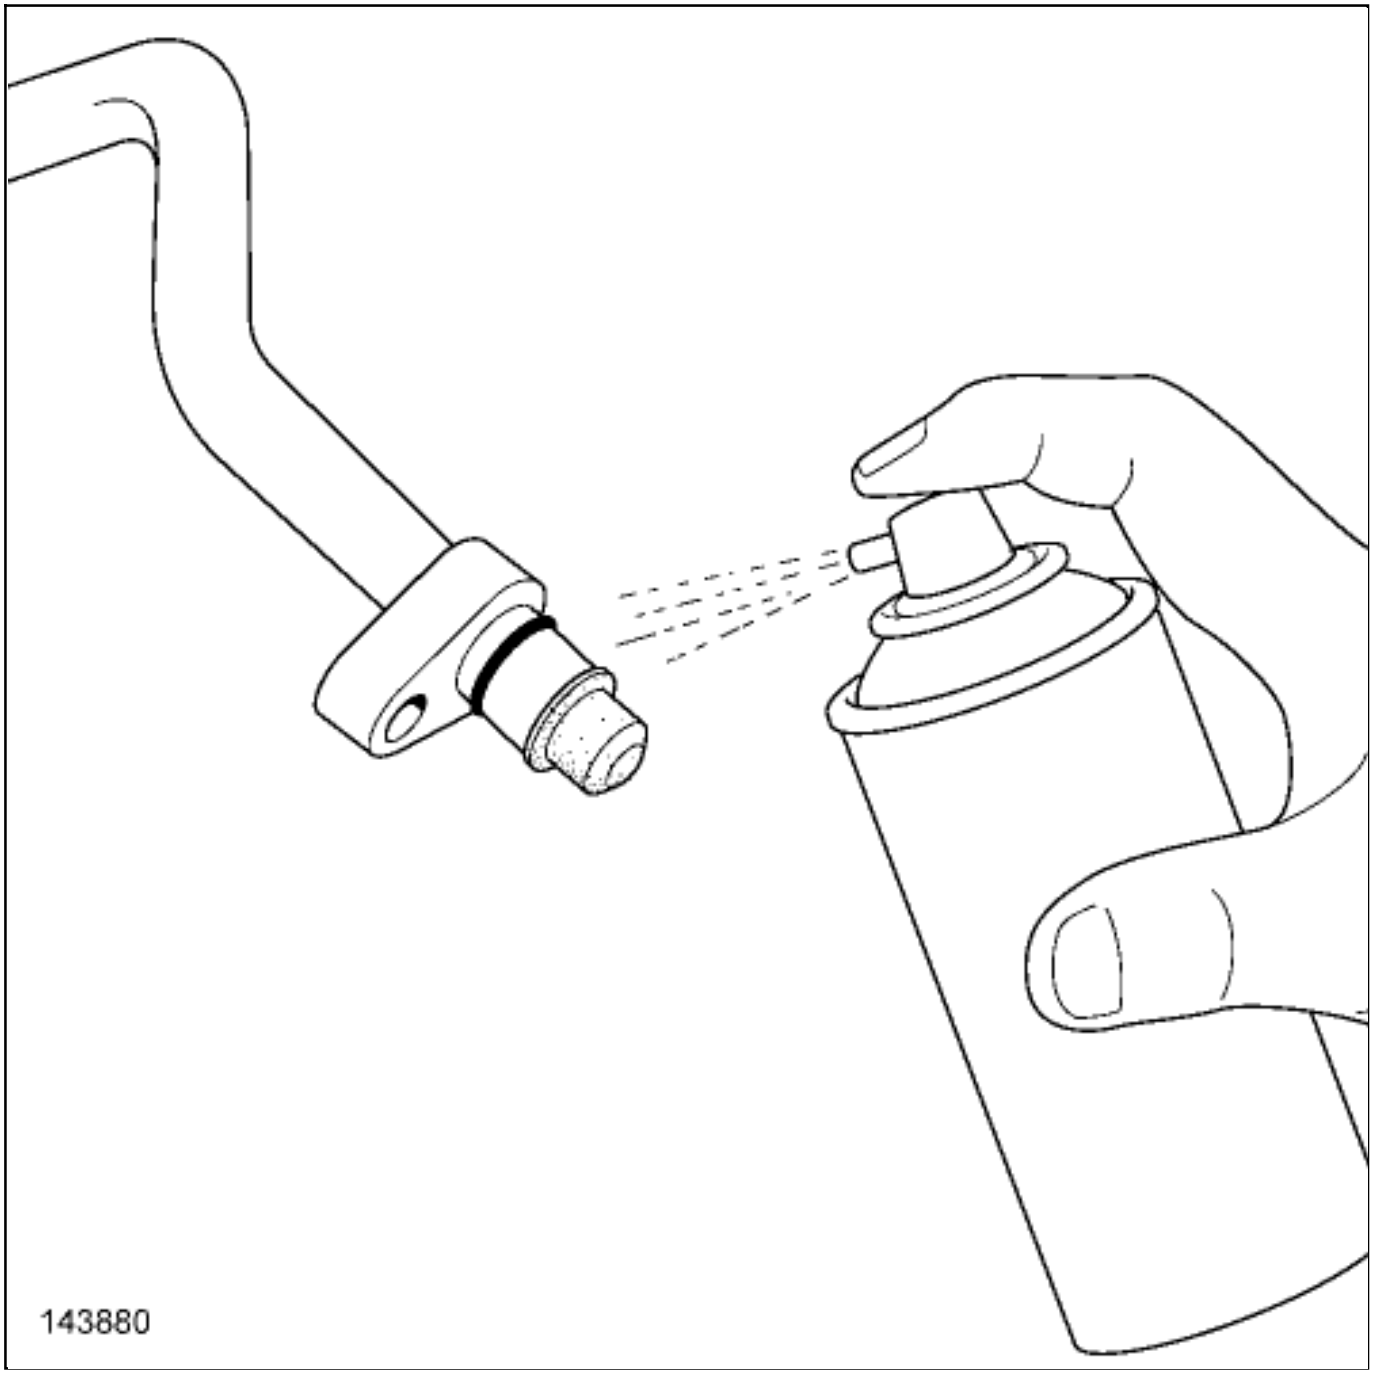
REFRIGERANT CIRCUIT PIPE SEAL: CLEANING

Note, one or more warnings are present in this procedure

Equipment required
compressed air nozzle

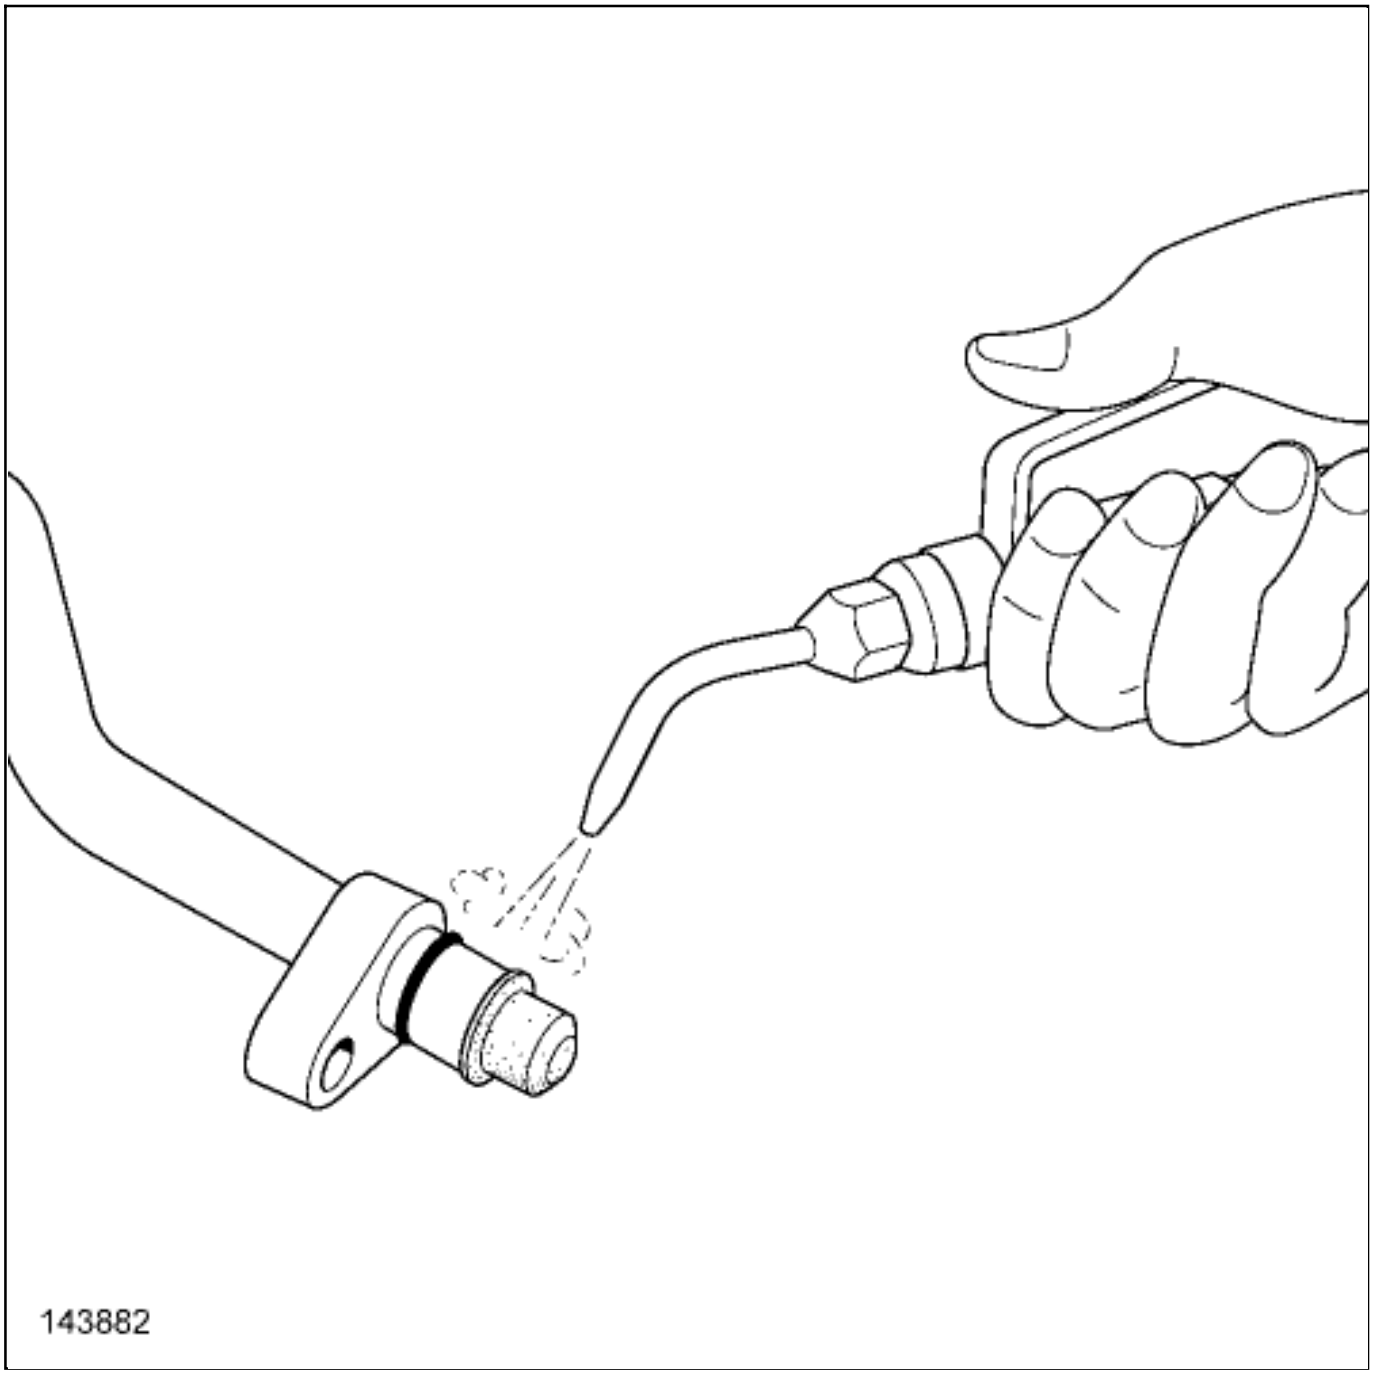
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair



WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



- (see 62A, Air conditioning, Air conditioning: Precautions for the repair)
- Vehicle: Precautions for the repair

CLEANING

Insert the blanking plugs.

Clean the surface and the seals of the connecting pipes using ENGINE CLEANER Vehicle: Parts and consumables for the repair .

- Blow using a compressed air nozzle on the surface and the seals of the connecting pipes.

- Lubricate the surface and the seals of the connecting pipes with air conditioning oil (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

- Remove the blanking plugs.

REFRIGERANT PIPE SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Set of trim removal levers.	Car. 1363

Equipment required
refrigerant charging station

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

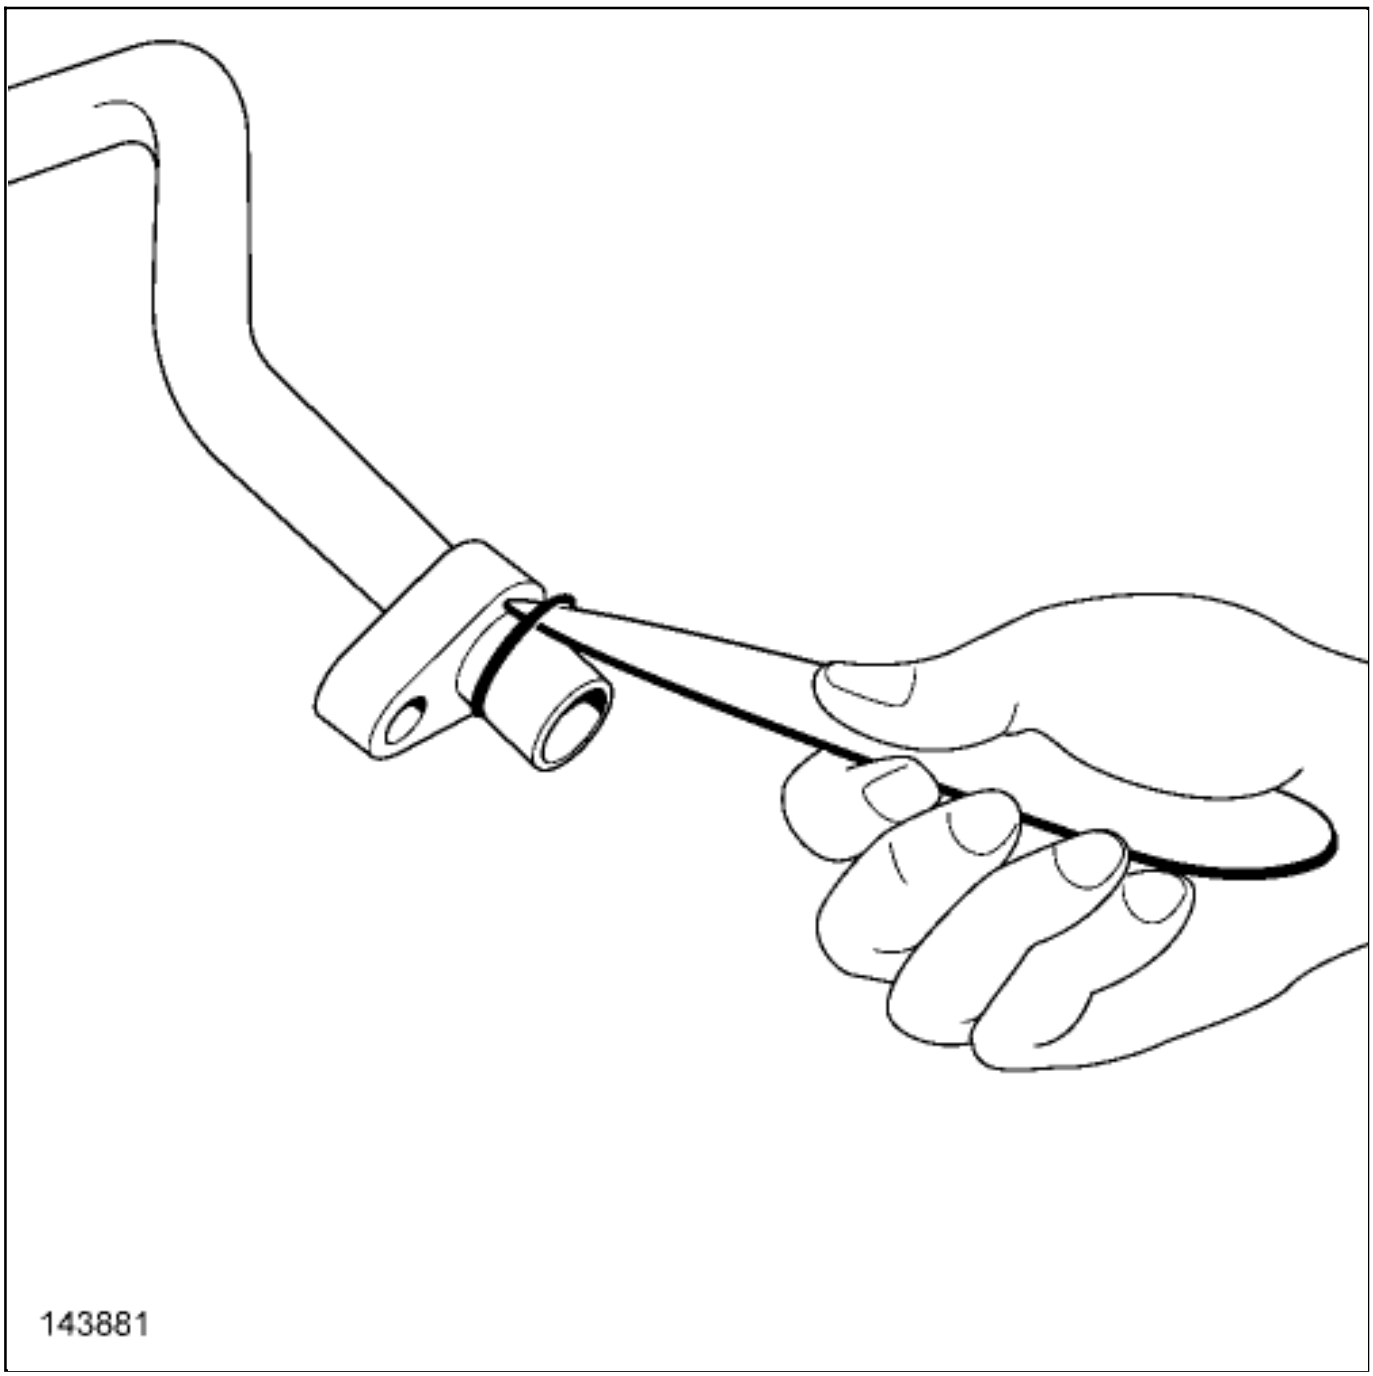
- (see 62A, Air conditioning, Air conditioning: Precautions for the repair)
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Drain the refrigerant circuit using the refrigerant charging station (see 62A, Air conditioning, Refrigerant circuit: Draining - Filling) .

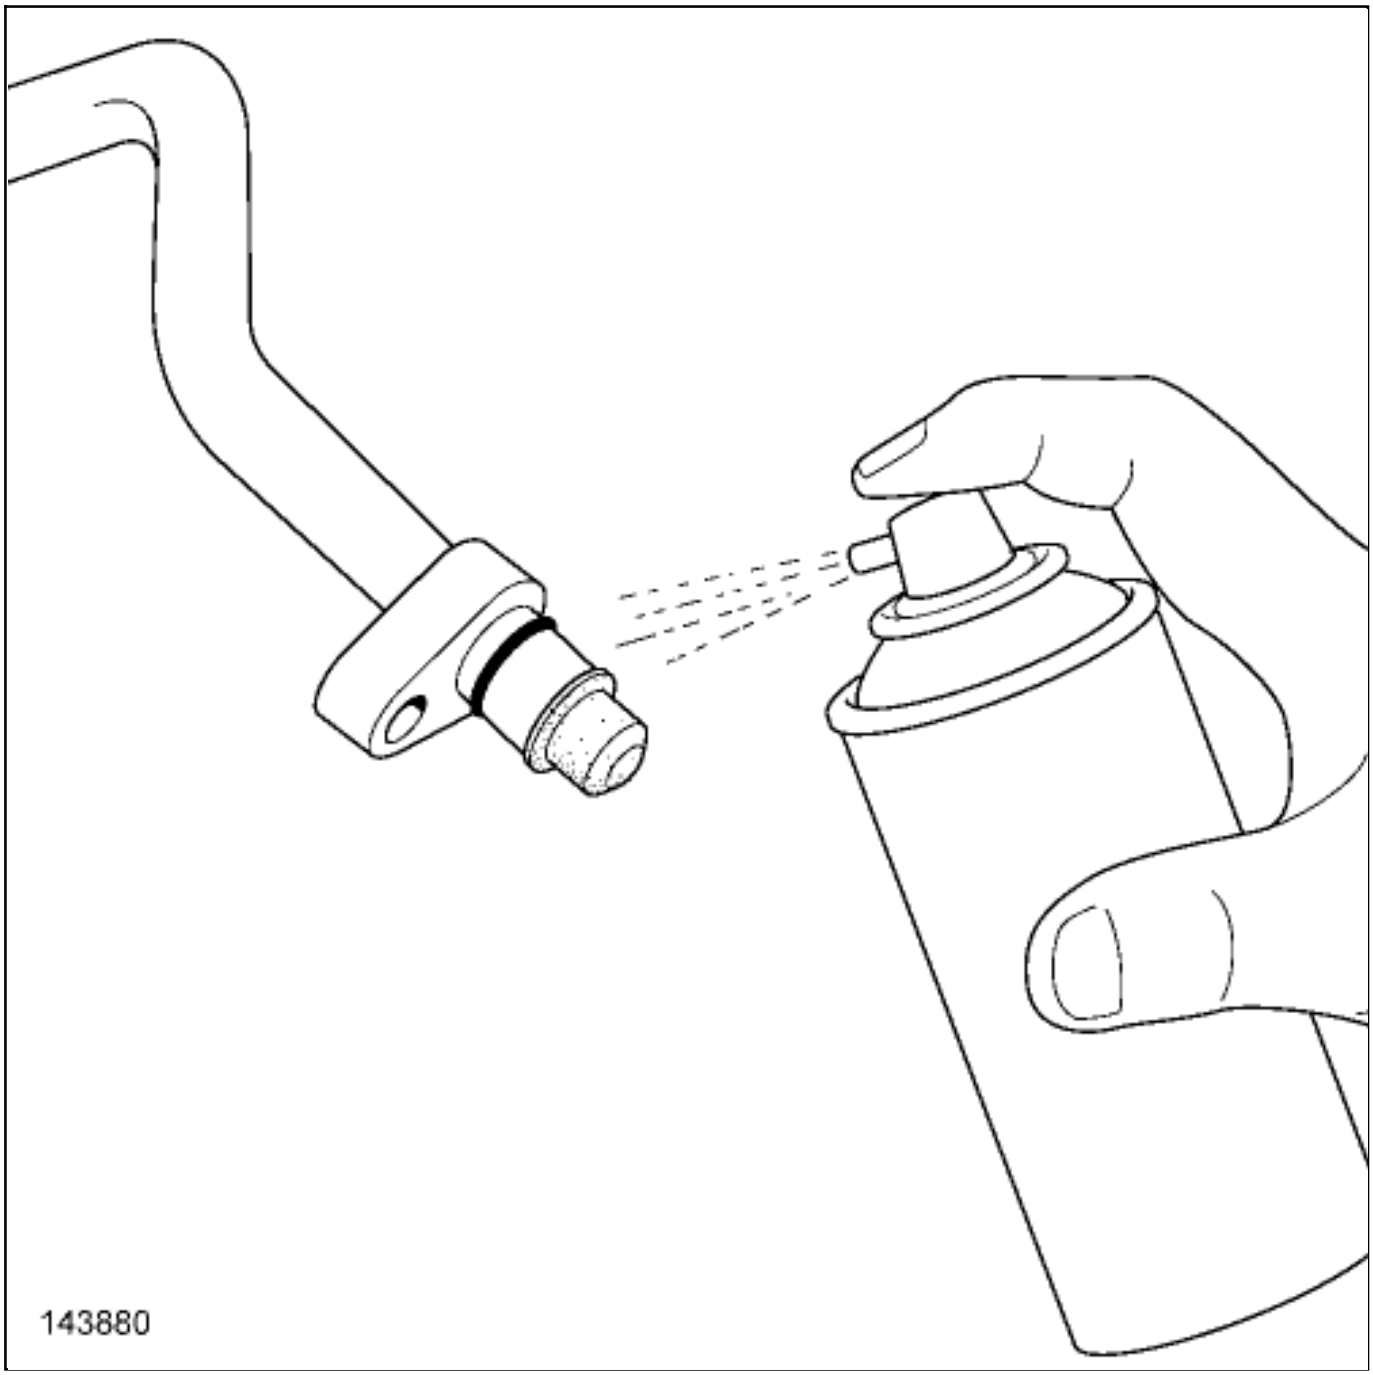
Disconnect the battery Battery: Removal - Refitting .



Remove the connecting pipe concerned:

- Condenser - evaporator connecting pipe: Removal - Refitting
- Condenser - expansion valve connecting pipe: Removal - Refitting
- Rear condenser - front condenser connecting pipe: Removal - Refitting
- Evaporator - dehydrator reservoir connecting pipe: Removal - Refitting
- Compressor - rear condenser connecting pipe: Removal - Refitting
- Condenser - evaporator connecting pipe: Removal - Refitting
- Compressor - dehydrator reservoir connecting pipe: Removal - Refitting
- Dehydrator reservoir - rear expansion valve connecting pipe: Removal - Refitting
- (see **Main expansion valve - additional expansion valve pipe: Removal - Refitting**)
- Expansion valve - intermediate pipe connecting pipe at the expansion valve outlet: Removal - Refitting
- Dehydrator reservoir - expansion valve connecting pipe: Removal - Refitting
- Daqui em diante Condenser - dehydrator reservoir connecting pipe: Removal - Refitting
- Expansion valve - compressor connecting pipe: Removal - Refitting
- Expansion valve - rear expansion valve connecting pipe: Removal - Refitting
- Rear expansion valve - compressor connecting pipe: Removal - Refitting

- Compressor - condenser connecting pipe: Removal - Refitting



- Compressor - intermediate pipe connecting pipe: Removal - Refitting

2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the seal from the connecting pipe using the toolSet of trim removal levers.(Car. 1363) .

Fit blanking plugs.

Clean the surface of the pipe(see 62A, Air conditioning, Refrigerant circuit pipe seal: Cleaning) .

REFITTING

1. REFITTING OPERATION FOR PART CONCERNED

Refit the seal on the connecting pipe.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine types (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Connect the battery Battery: Removal - Refitting .

Perform the following operations:

- refill the refrigerant circuit using the refrigerant charging station (see 62A, Air conditioning, Refrigerant circuit: Draining - Filling) ,
- check for leaks (see 62A, Air conditioning, Refrigerant circuit: Check) .

Check that the air conditioning system is operating correctly (see 62A, Air conditioning, Air conditioning: Check) .

REFRIGERANT PIPE SEAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Set of trim removal levers.	Car. 1363

refrigerant charging station

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

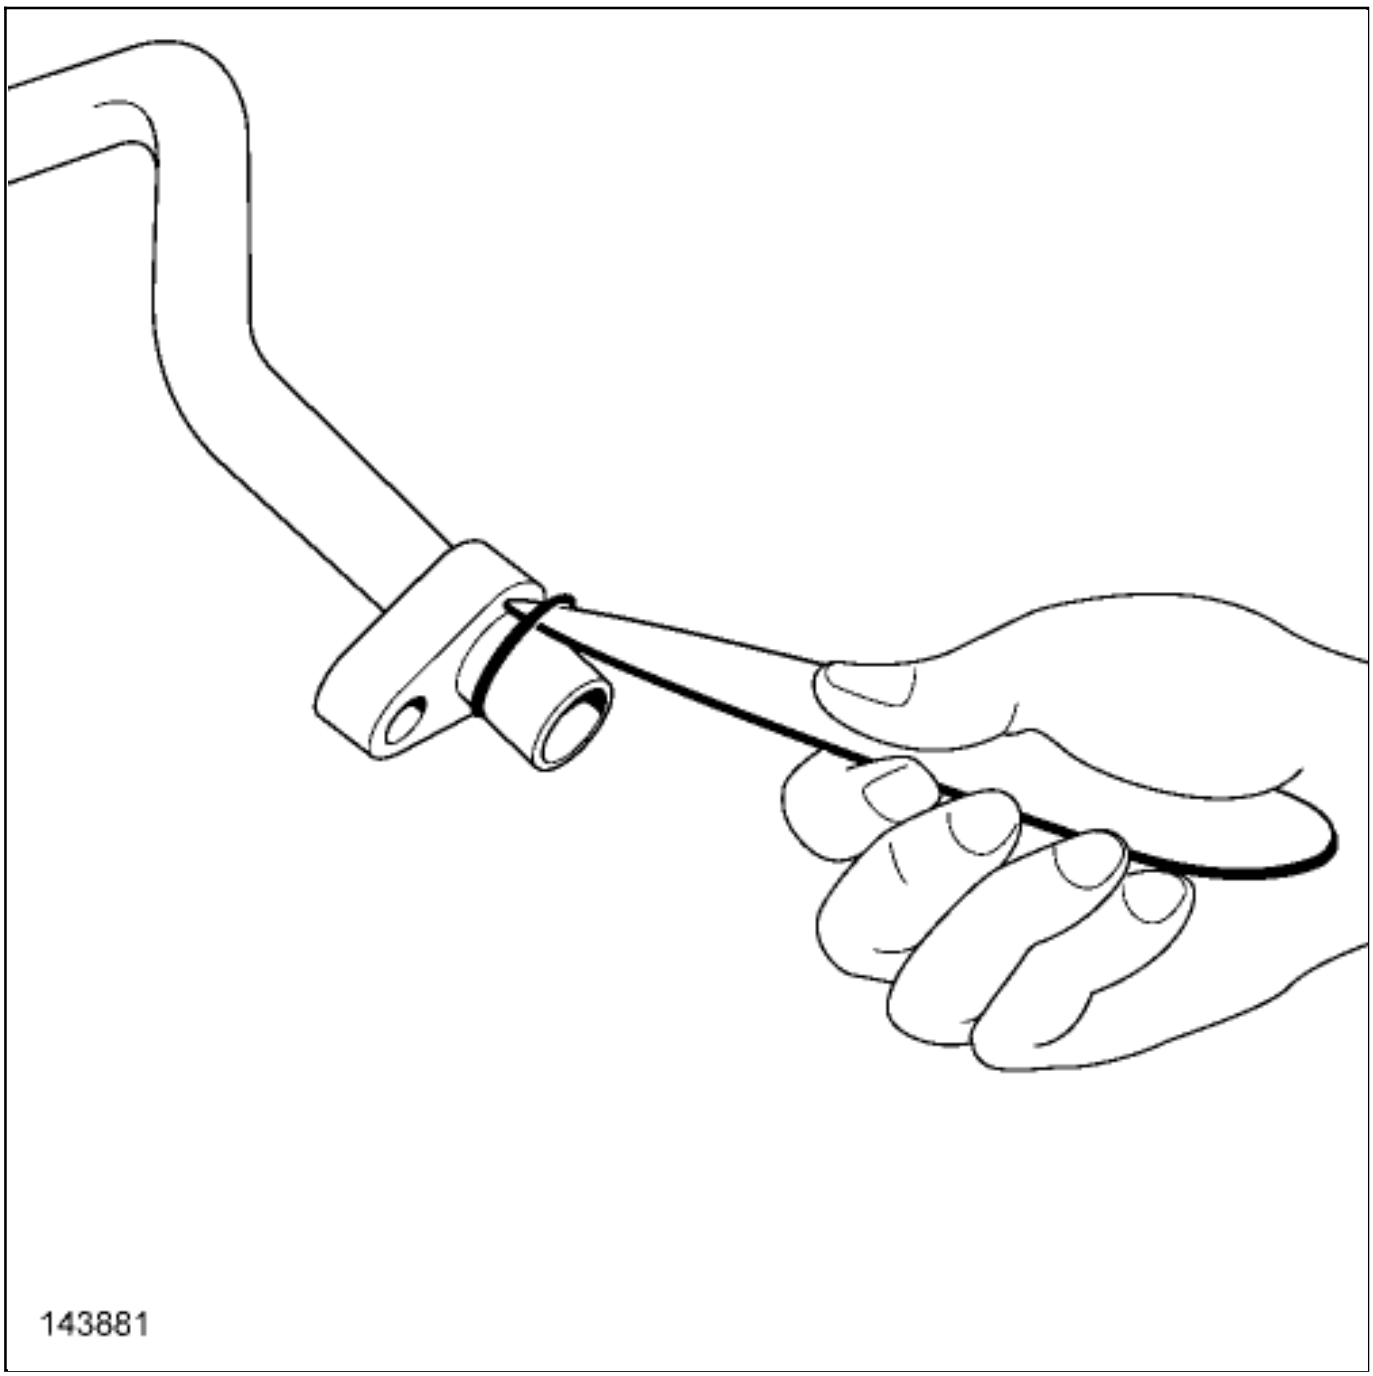
- (see 62A, Air conditioning, Air conditioning: Precautions for the repair)
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Drain the refrigerant circuit using the refrigerant charging station (see 62A, Air conditioning, Refrigerant circuit: Draining - Filling) .

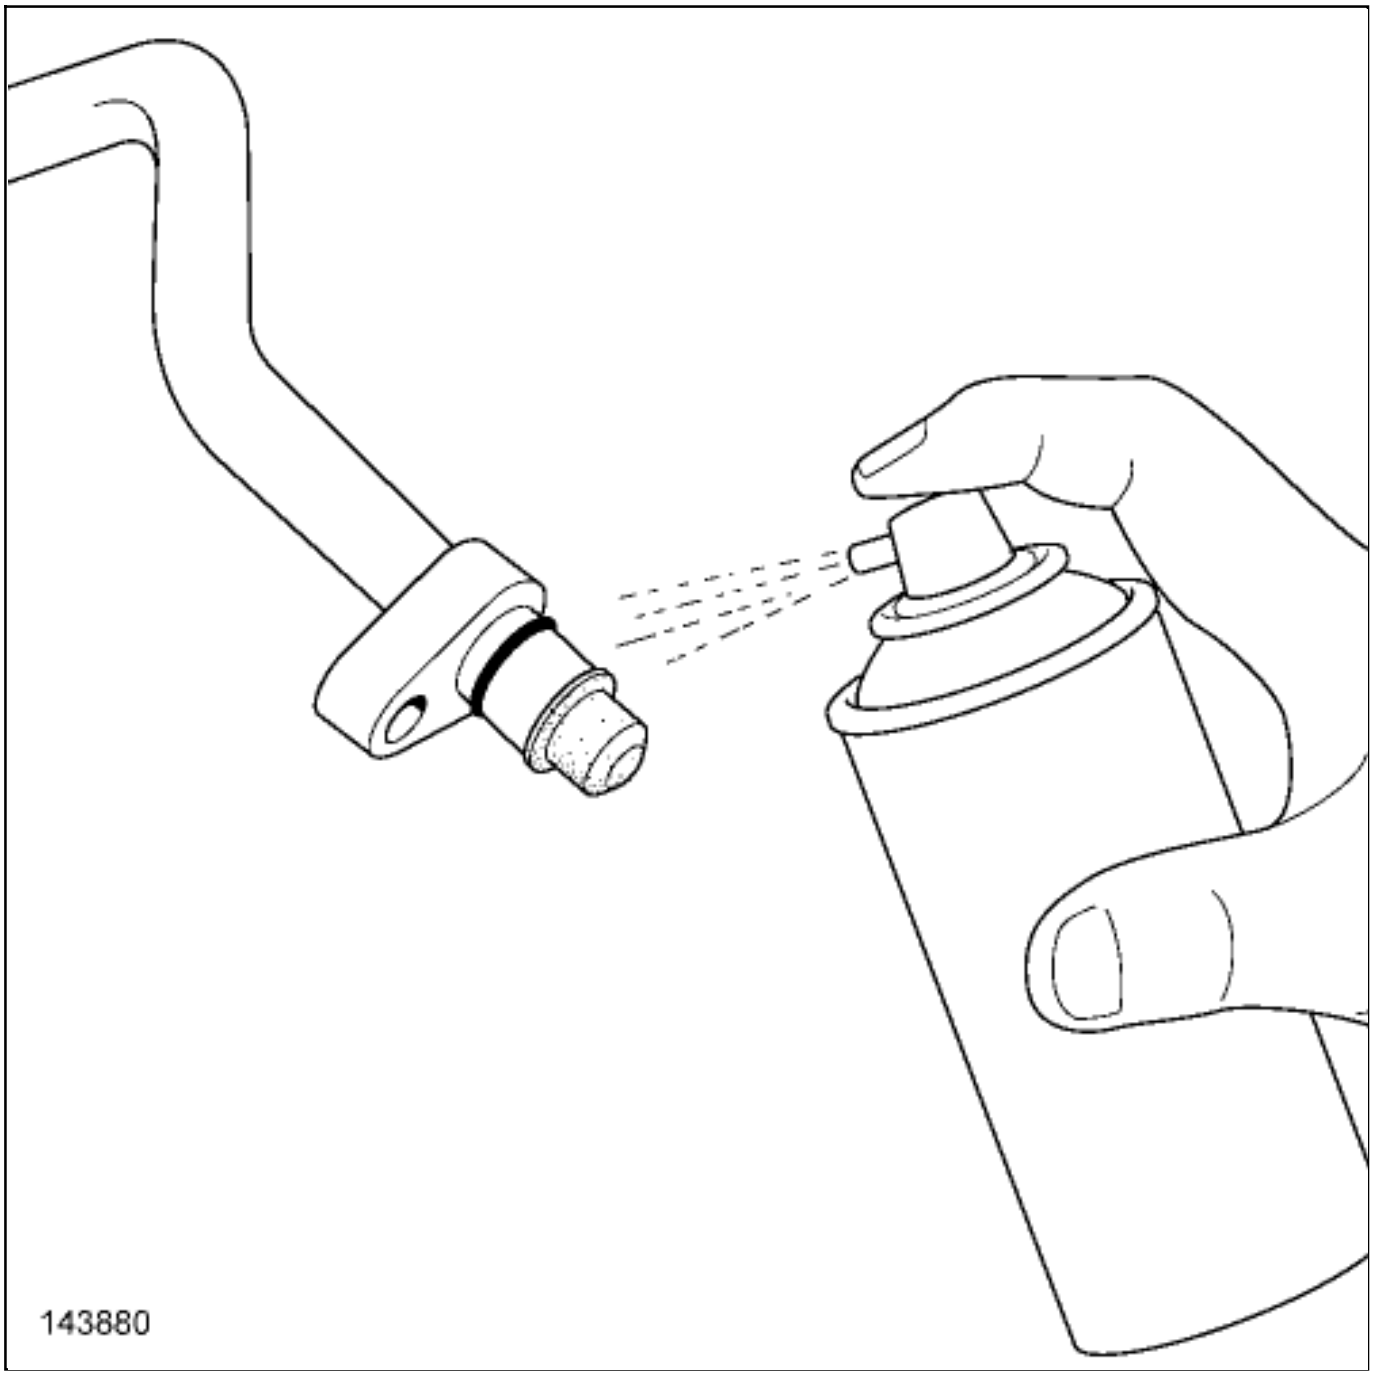
Disconnect the battery Battery: Removal - Refitting .



Remove the connecting pipe concerned:

- Condenser - evaporator connecting pipe: Removal - Refitting
- Condenser - expansion valve connecting pipe: Removal - Refitting
- Rear condenser - front condenser connecting pipe: Removal - Refitting
- Evaporator - dehydrator reservoir connecting pipe: Removal - Refitting
- Compressor - rear condenser connecting pipe: Removal - Refitting
- Condenser - evaporator connecting pipe: Removal - Refitting
- Compressor - dehydrator reservoir connecting pipe: Removal - Refitting
- Dehydrator reservoir - rear expansion valve connecting pipe: Removal - Refitting
- (see **Main expansion valve - additional expansion valve pipe: Removal - Refitting**)
- Expansion valve - intermediate pipe connecting pipe at the expansion valve outlet: Removal - Refitting
- Dehydrator reservoir - expansion valve connecting pipe: Removal - Refitting
- Daqui em diante Condenser - dehydrator reservoir connecting pipe: Removal - Refitting
- Expansion valve - compressor connecting pipe: Removal - Refitting
- Expansion valve - rear expansion valve connecting pipe: Removal - Refitting
- Rear expansion valve - compressor connecting pipe: Removal - Refitting

- Compressor - condenser connecting pipe: Removal - Refitting



- Compressor - intermediate pipe connecting pipe: Removal - Refitting

2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the seal from the connecting pipe using the toolSet of trim removal levers.(Car. 1363) .

Fit blanking plugs.

Clean the surface of the pipe(see 62A, Air conditioning, Refrigerant circuit pipe seal: Cleaning) .

REFITTING

1. REFITTING OPERATION FOR PART CONCERNED

Refit the seal on the connecting pipe.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine types (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Connect the battery Battery: Removal - Refitting .

Perform the following operations:

- refill the refrigerant circuit using the refrigerant charging station (see 62A, Air conditioning, Refrigerant circuit: Draining - Filling) ,
- check for leaks (see 62A, Air conditioning, Refrigerant circuit: Check) .

Check that the air conditioning system is operating correctly (see 62A, Air conditioning, Air conditioning: Check) .

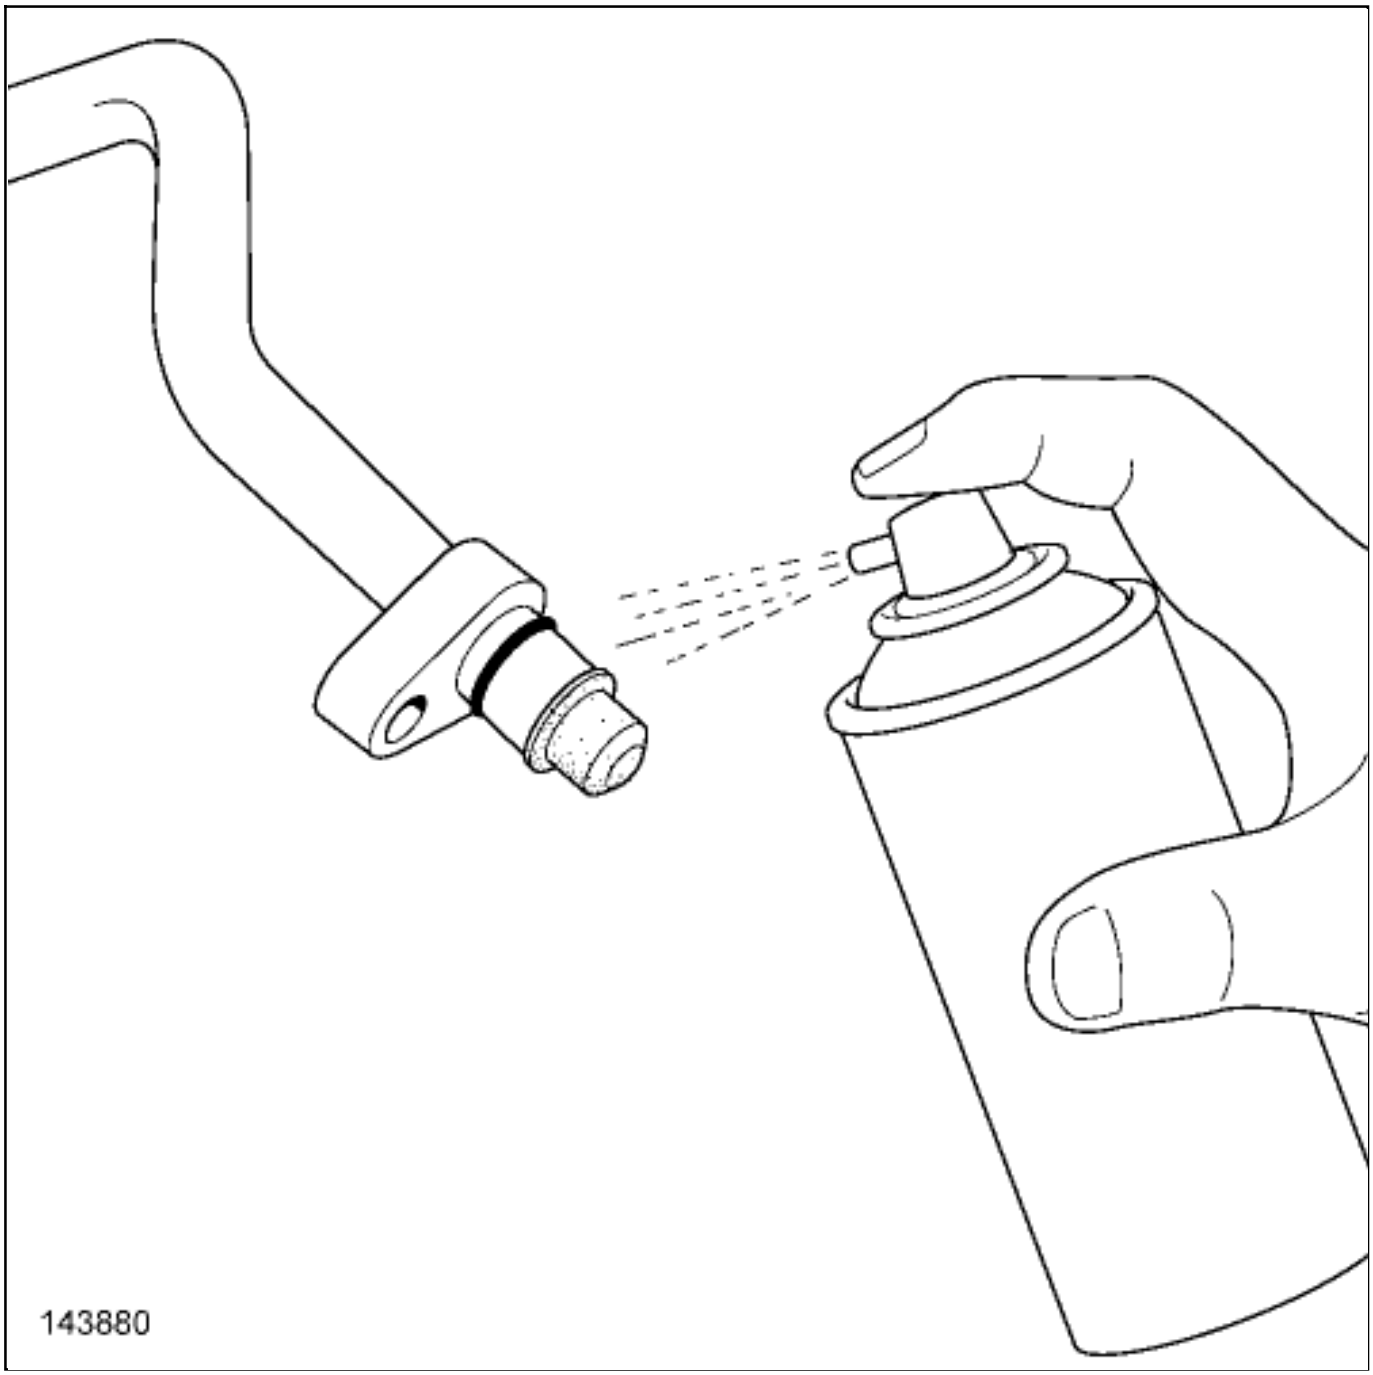
- Expansion valve - intermediate pipe connecting pipe at the expansion valve outlet: Removal - Refitting
- Dehydrator reservoir - expansion valve connecting pipe: Removal - Refitting
- Daqui em diante Condenser - dehydrator reservoir connecting pipe: Removal - Refitting
- Expansion valve - compressor connecting pipe: Removal - Refitting
- Expansion valve - rear expansion valve connecting pipe: Removal - Refitting
- Rear expansion valve - compressor connecting pipe: Removal - Refitting

- Compressor - condenser connecting pipe: Removal - Refitting



- Compressor - intermediate pipe connecting pipe: Removal - Refitting

2. OPERATION FOR REMOVAL OF PART CONCERNED

Remove the seal from the connecting pipe using the toolSet of trim removal levers.(Car. 1363) .

Fit blanking plugs.

Clean the surface of the pipe(see 62A, Air conditioning, Refrigerant circuit pipe seal: Cleaning) .

REFITTING

1. REFITTING OPERATION FOR PART CONCERNED

Refit the seal on the connecting pipe.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Note:

A summary table gives the quantities of refrigerant in the system according to the engine types (see 62A, Air conditioning, Air conditioning: Parts and consumables for the repair) .

Connect the battery Battery: Removal - Refitting .

Perform the following operations:

- refill the refrigerant circuit using the refrigerant charging station (see 62A, Air conditioning, Refrigerant circuit: Draining - Filling) ,
- check for leaks (see 62A, Air conditioning, Refrigerant circuit: Check) .

Check that the air conditioning system is operating correctly (see 62A, Air conditioning, Air conditioning: Check) .

REMOVING THE VEHICLE PROTECTION: DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

1. PROTECTIVE GEAR

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

2. EQUIPMENT, PRODUCTS AND TOOLS NECESSARY FOR REMOVING THE PROTECTION FROM A VEHICLE PROTECTED BY COPOLYMER

Description	Part numbers
Step ladder for roof (very high vehicle)	77 11 221 082
Protection remover N6	77 11 230 195
Cleaning glove or sponge	77 11 419 556
Pressure spray	77 11 221 515
Drying accelerator AS29	77 11 228 949
High pressure cleaner	

3. PROCEDURE FOR REMOVING COPOLYMER PROTECTION

Note:

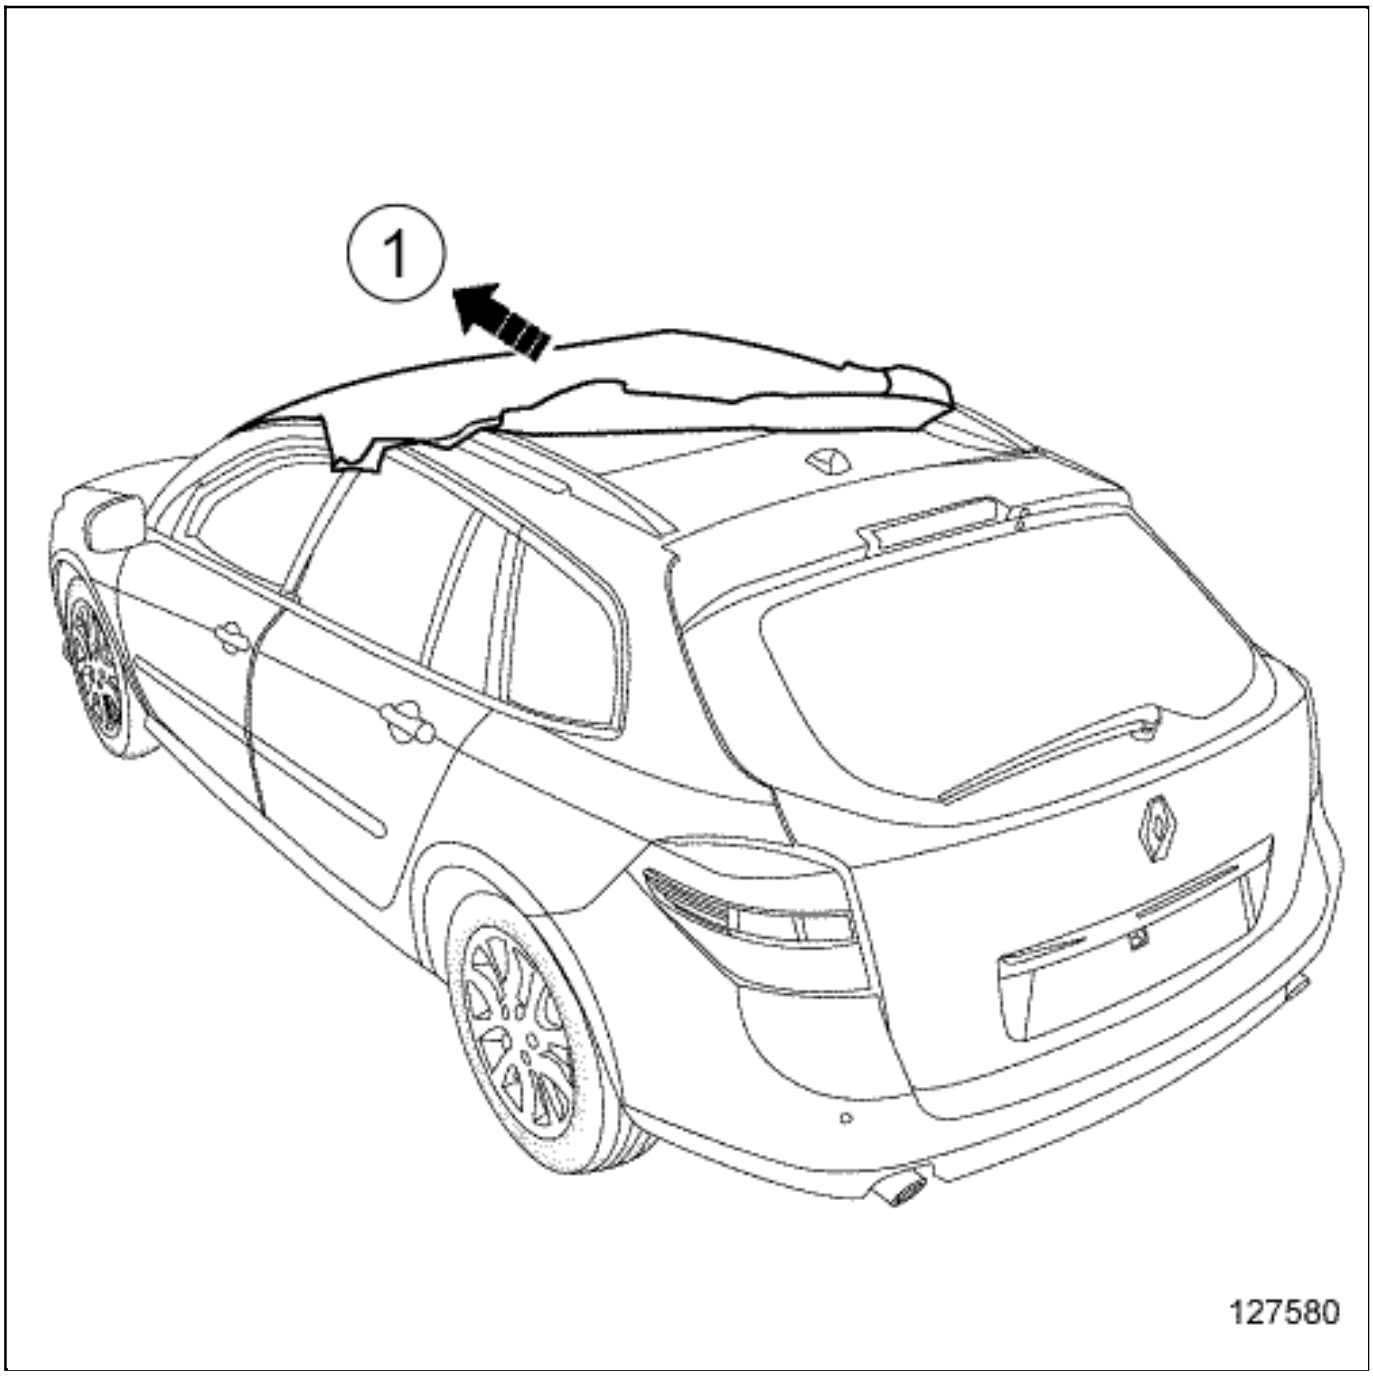
Carry out the operation for removing the vehicle protection in a well-ventilated washing area.

Note:

Before using the products, consult the manufacturer's technical sheet.

Dilute the vehicle protection remover N6by 15%with water.

Spray the product on the whole surface of the vehicle.



Leave the product to work (15 minutes maximum) without letting it dry.

Spray the product on the whole surface of the vehicle a second time and then wash with a sponge.

Rinse the vehicle well with clean water.

Finish by a finishing rinse with the drying accelerator AS29.

4. PROCEDURE FOR REMOVING THE PROTECTIVE FILM

Spray the film beforehand if the temperature of the bodywork is greater than 40˚C.

Lift the protective film at(1) and roll it on itself.

Clean the dust residues with soapy water.

Expose the component to an infrared type heat source at 60˚C for 10 minutes if there are any traces under the film. Perform this operation in a paint workshop.

5. PROCEDURE FOR REMOVING THE PROTECTIVE FOAM

Detach the protective foam starting with one corner, and remove the adhesive tape and the foam.

Clean any traces of residual adhesive using a lint-free cloth soaked in heptane.

REPLACINGANON-REMOVABLECOMPONENT:DESCRIPTION

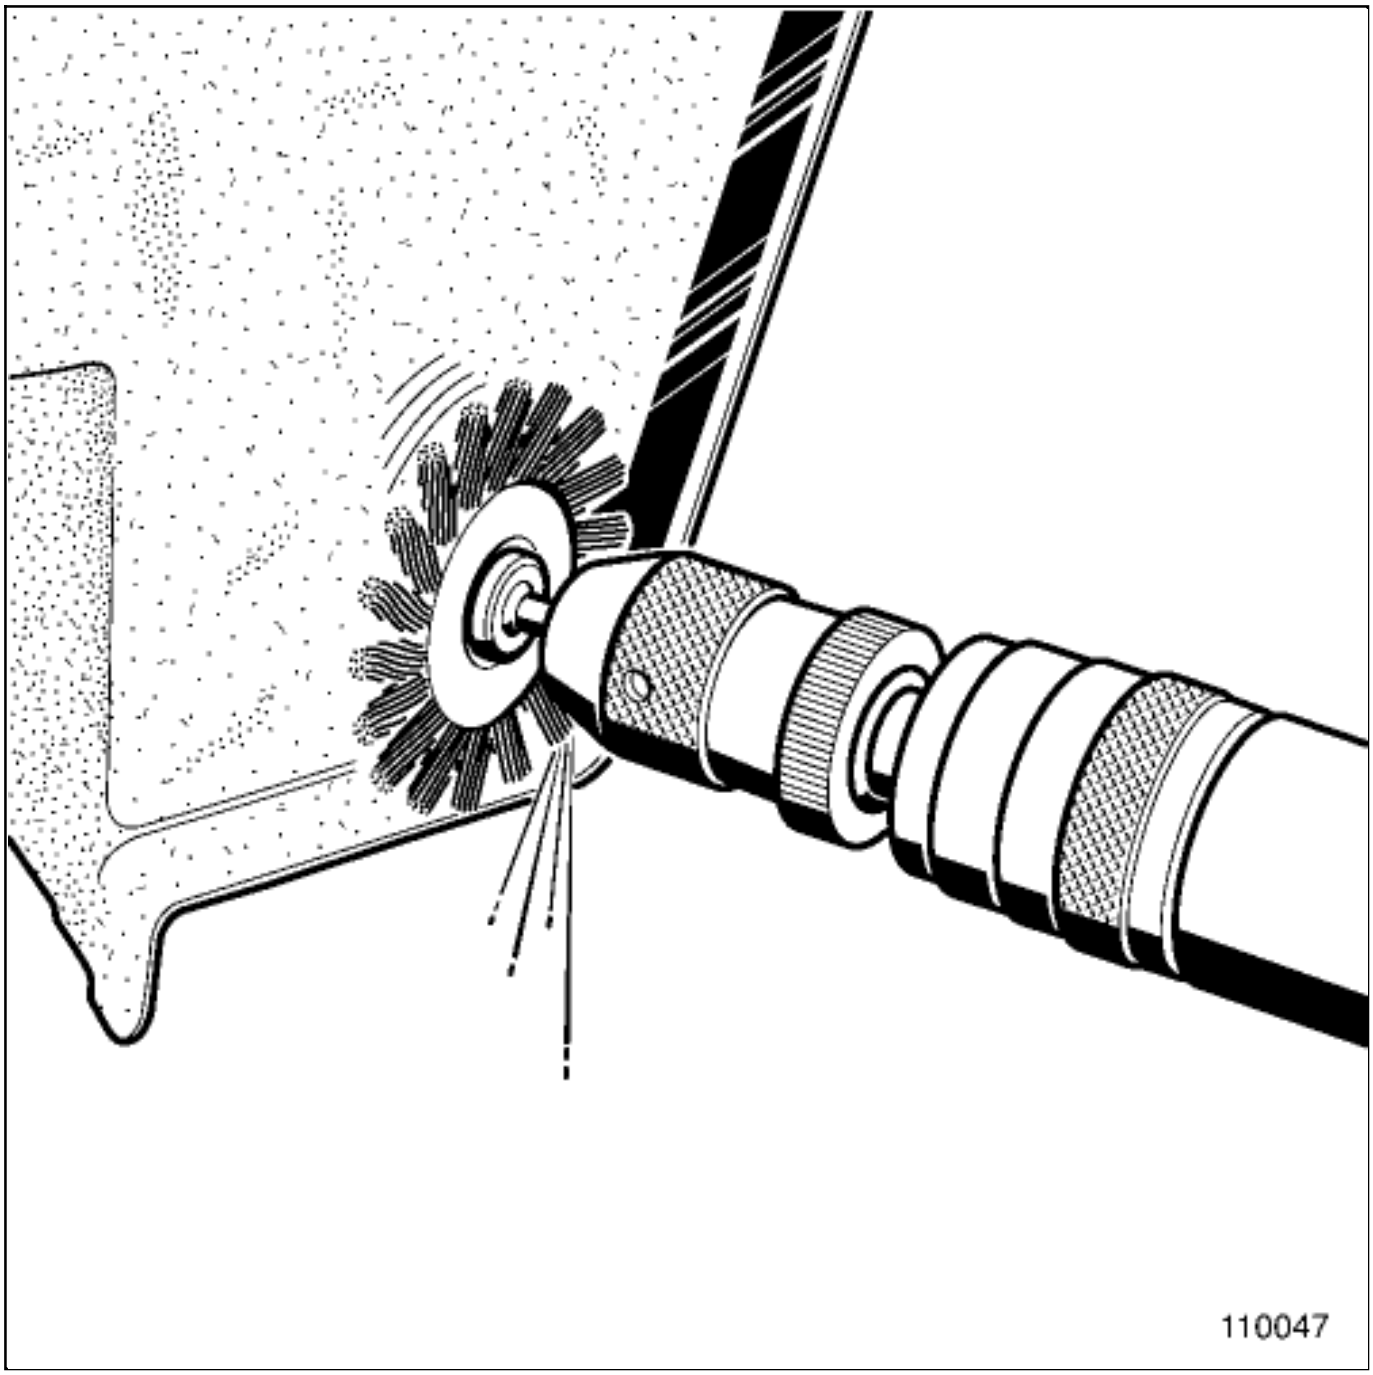
1. INTRODUCTION

All the procedures described in this document ensure the quality of repairs, including the mechanical functioning of joints which are different to the originals.

Time calculations for the repairs are based on the use of these tools and procedures.

1- REPLACEMENTS REQUIRING PARTIAL CUTTING

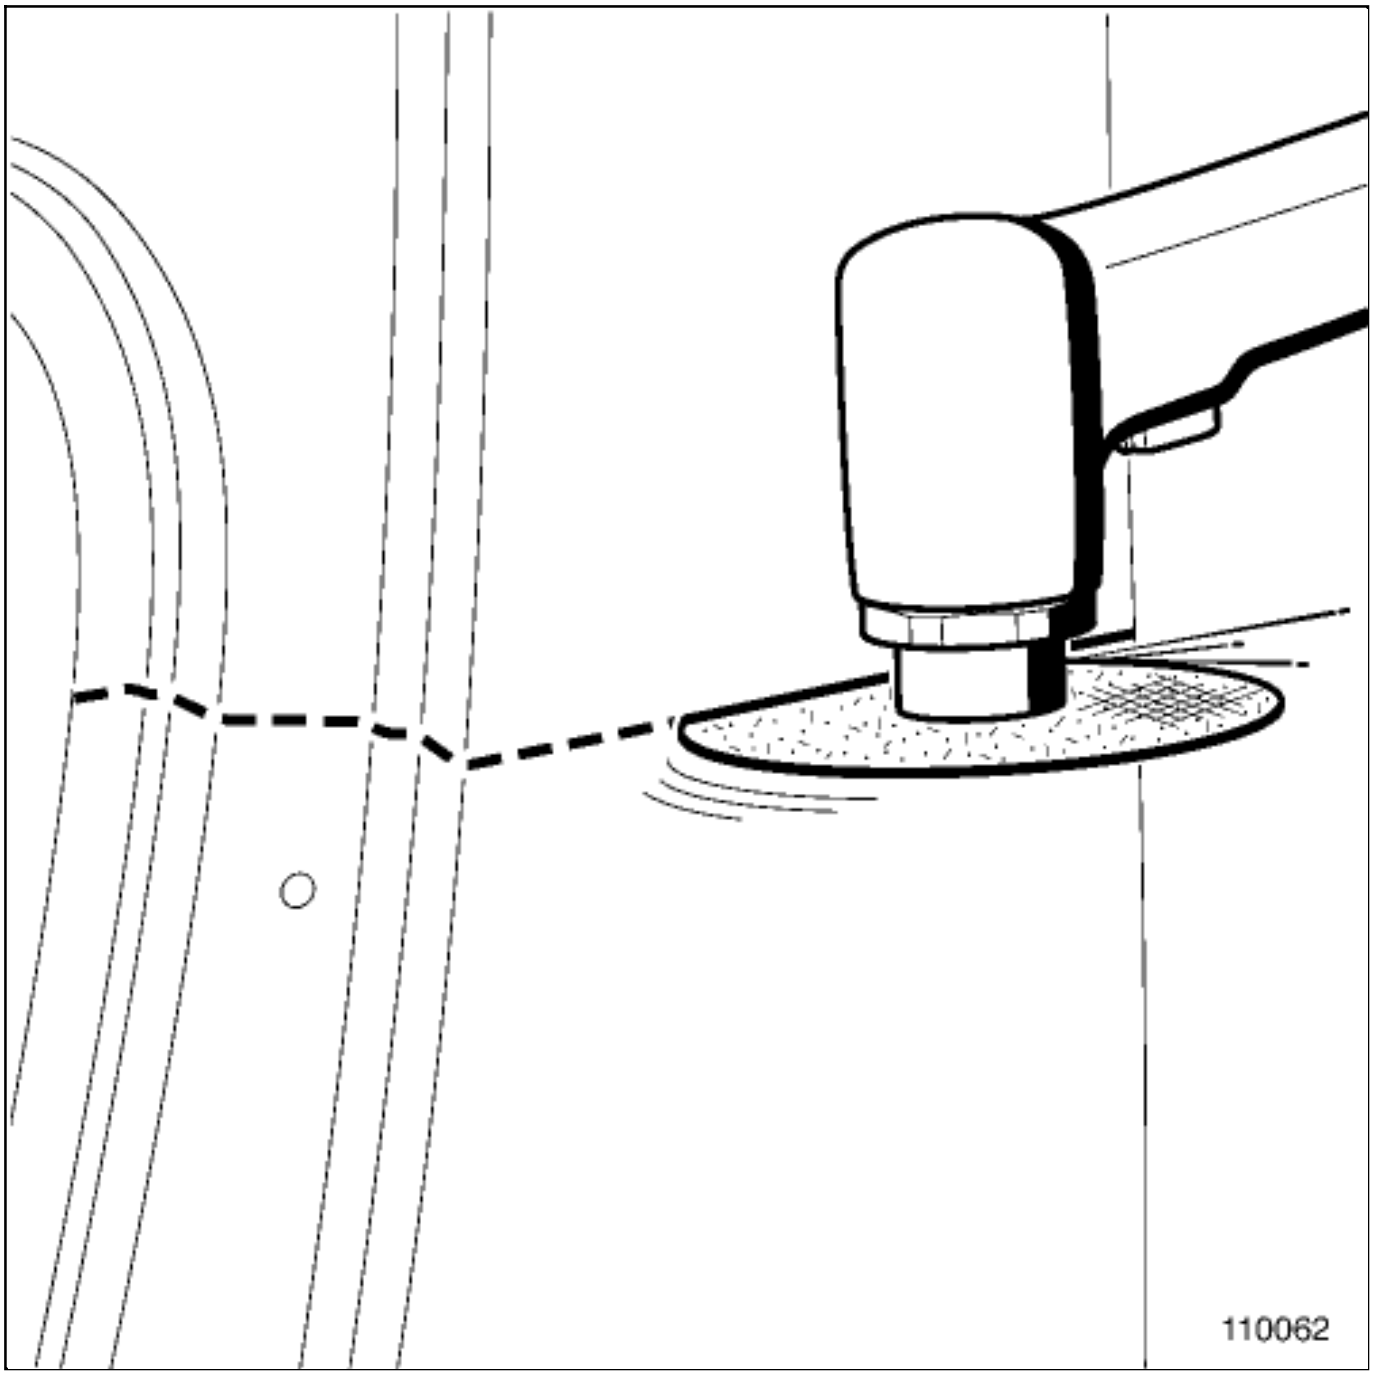
For safety reasons, it is not recommended to:



- cut and re-weld in close proximity to a reinforcement or a fatigued area (e.g.: engine and transmission assembly mounting, shock absorber mounting, seat belt mounting point),
- cut and re-weld edge to edge a structural component and its linings using the same line. Offset the cut lines by a few centimetres to distribute the weld stresses and the crumple zones,
- braze the side members, cross members or any other part of the structure.

Cutting positions indicated in the procedures which do not have any special features are given for information only. They may be adjusted according to deformities caused by impacts, unless there is a specific indication given in the vehicle's MR.

The operation times are calculated in relation to the position of these cuts and it is advisable to follow them. If the operator opts for a different cutting area, the time stated for the operation may vary.

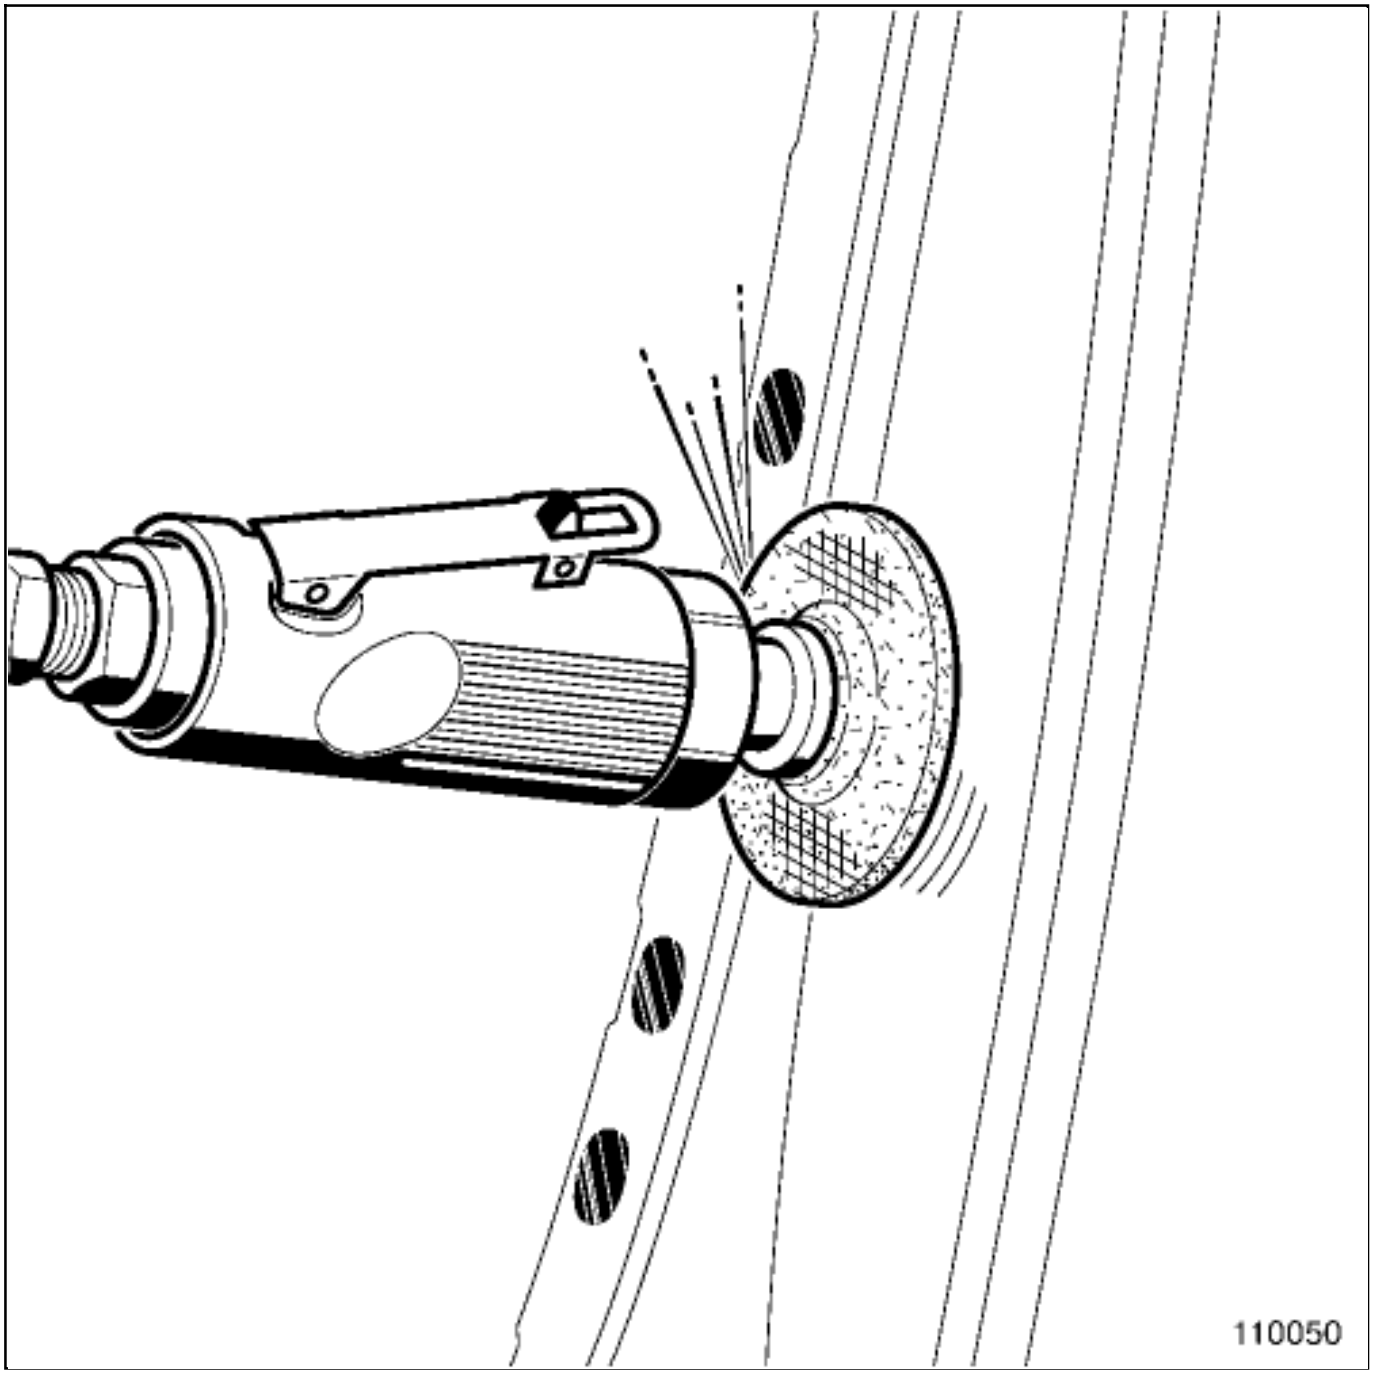


2. DISASSEMBLY

1- SCOURING

Clean the joint lines to reveal the spot welds, if covered by anti-grit mastic or paint sealing mastic(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use) .

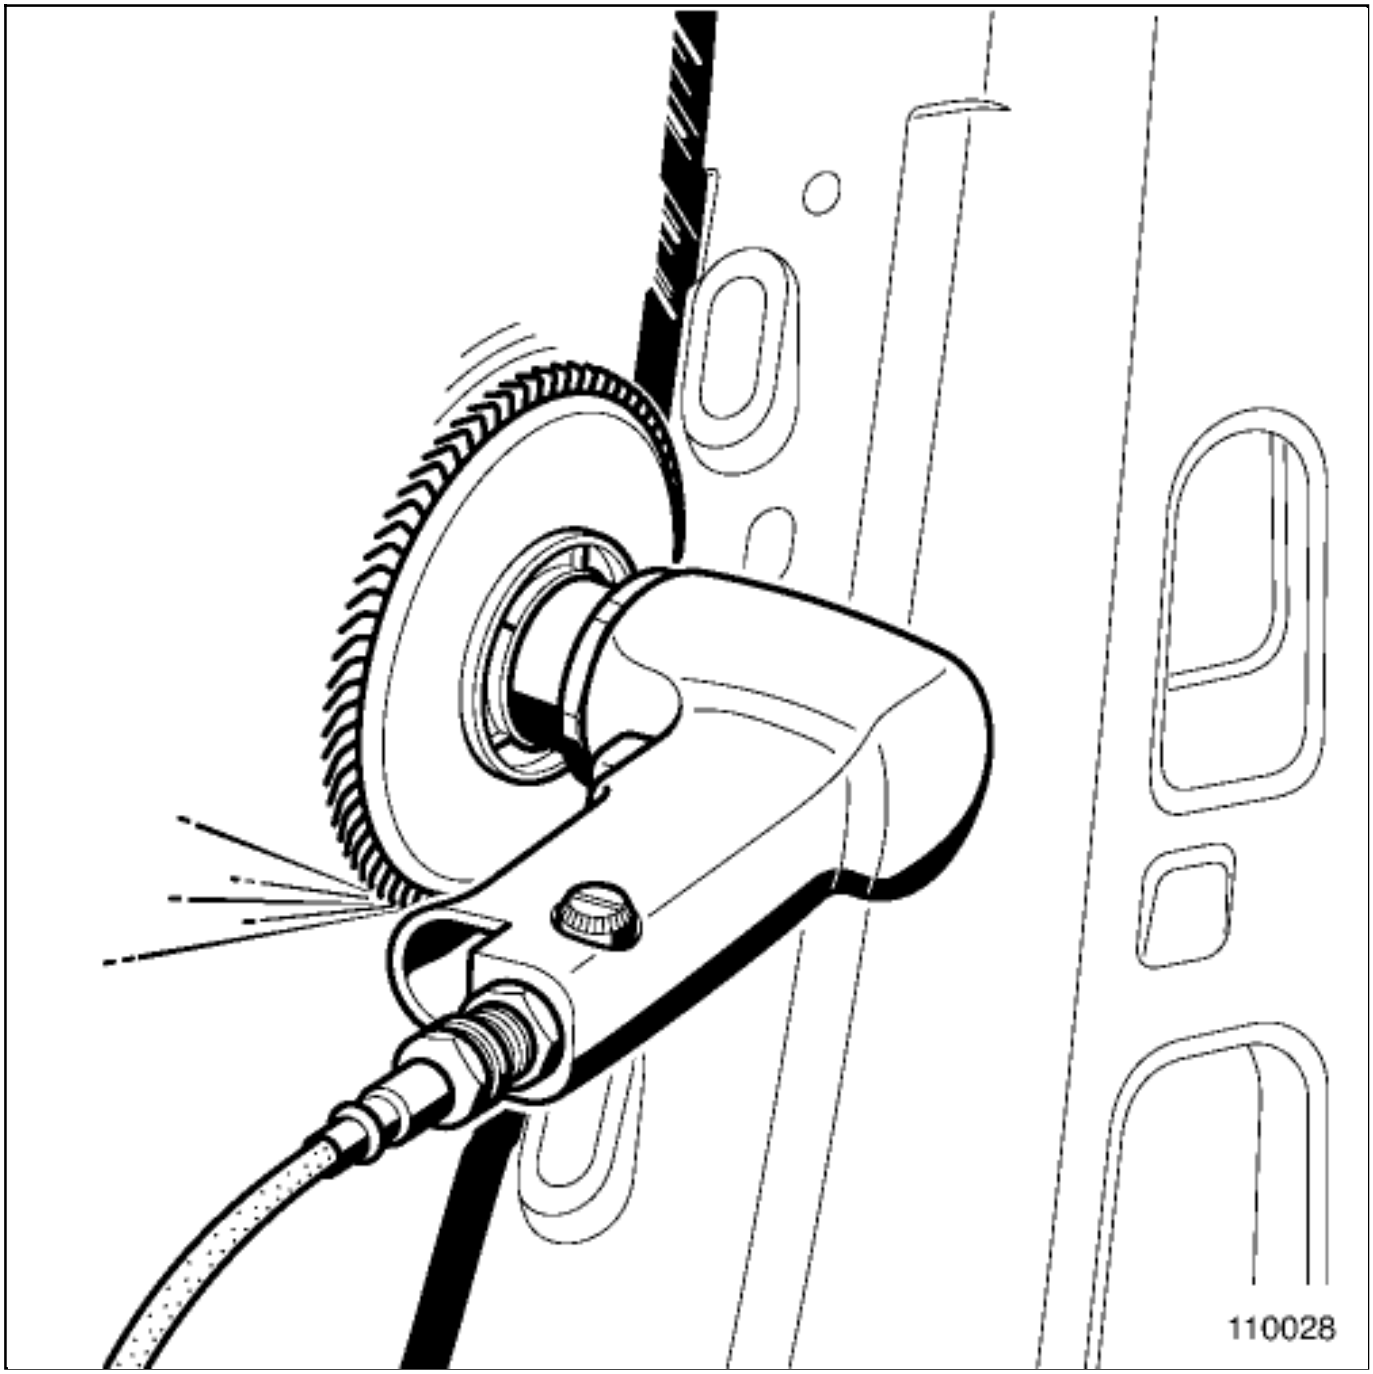
2- CUTTING



For partial replacements, the position of the cut lines on the damaged part is chosen with the following requirements in mind:

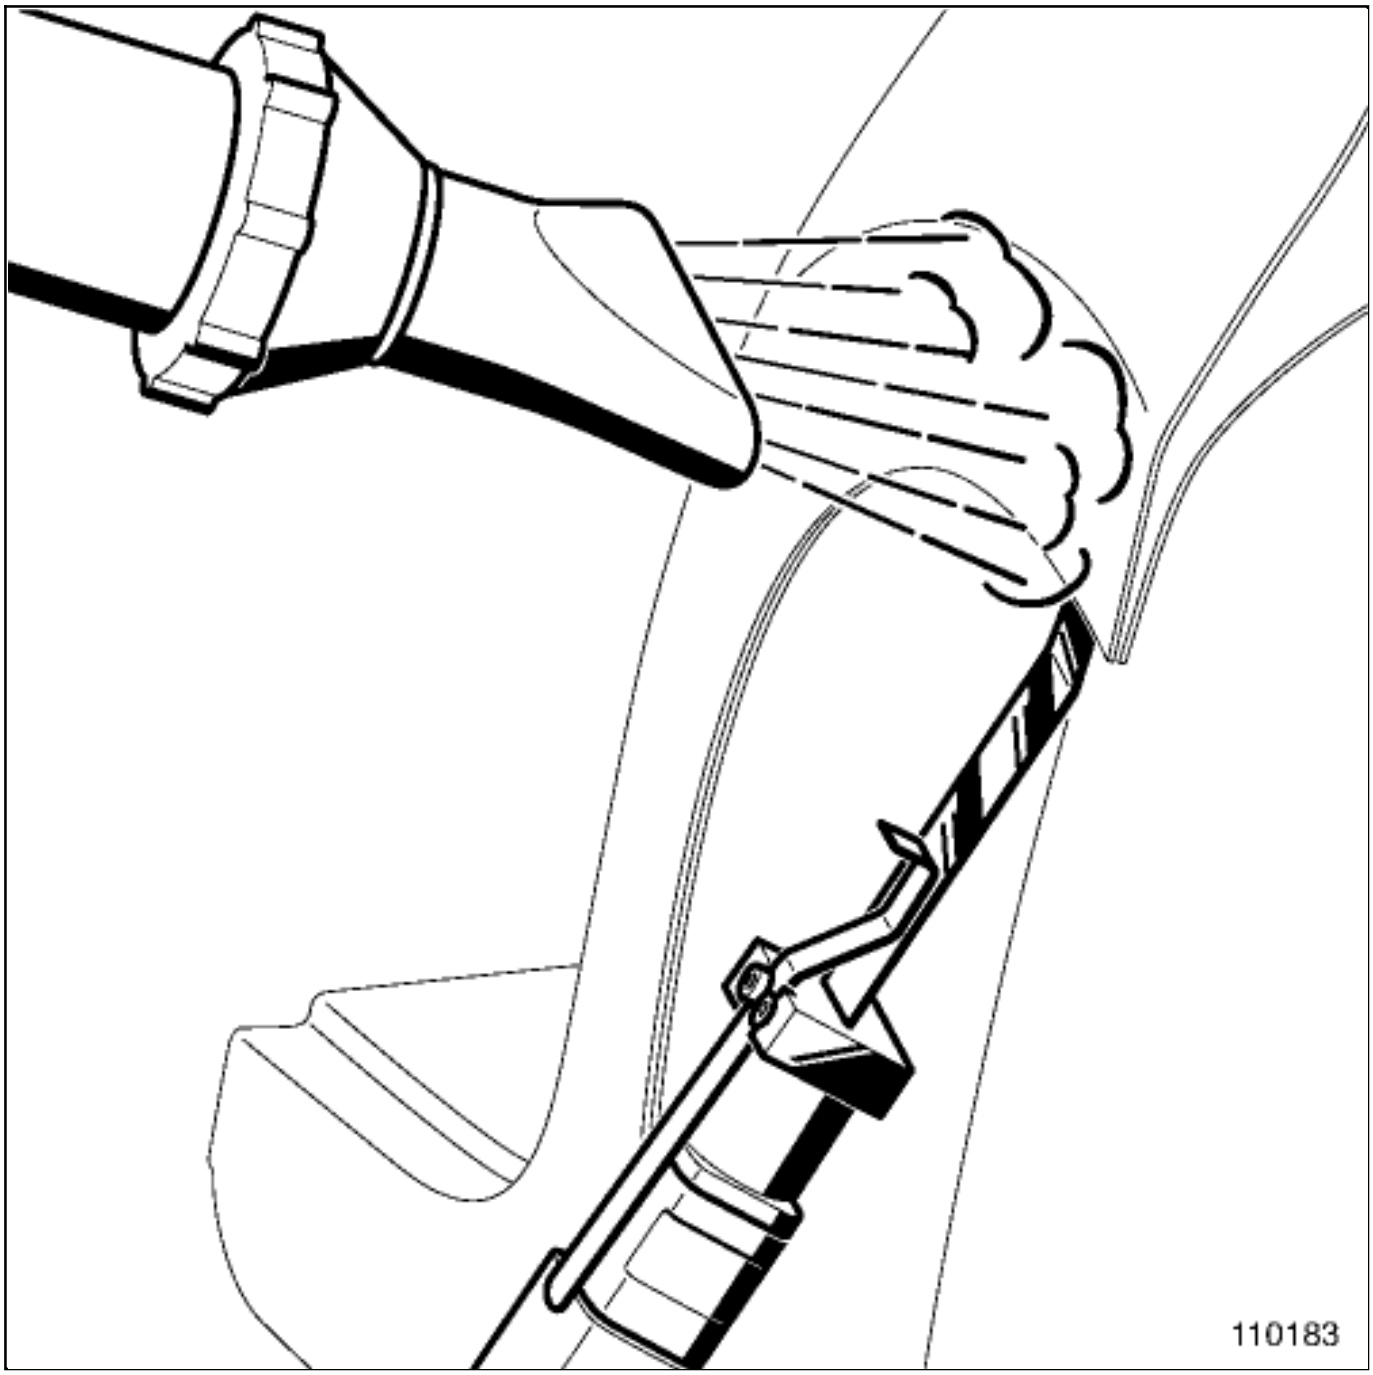
- obtain a non-deformed area with sufficient space to ensure coverage of 50 mm by the new part,
- avoid areas where there is a significant risk of deformation when butt welding,
- choose straight, shaped or ribbed parts,
- choose a place where the internal face is accessible for anti-corrosion protection of the hollow section,

find an area with sufficient space to allow overlapping cuts.



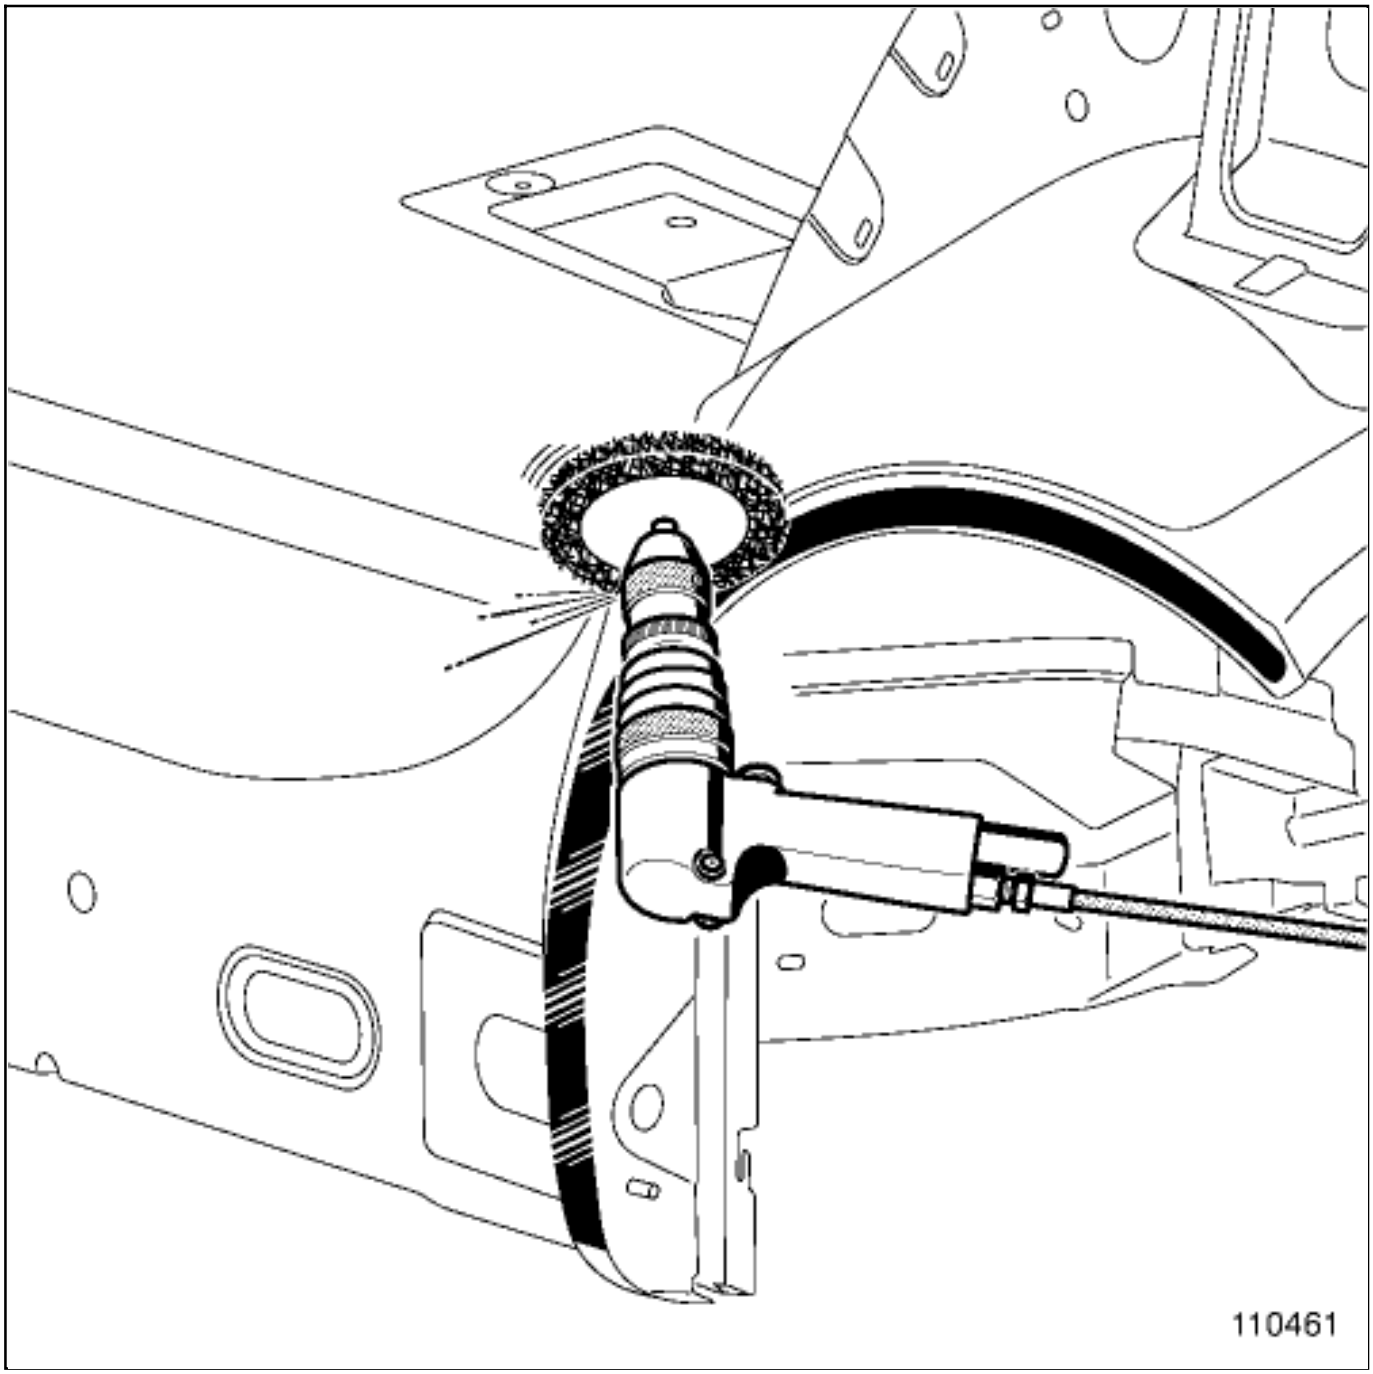
(see 05B, Equipment and Tools, Tools for cutting a structural component: Use) .

3- UNPICKING



Unpick the spots using the most suitable tool according to the access, taking care to avoid damaging the retained support panel(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use) .

4- GRINDING



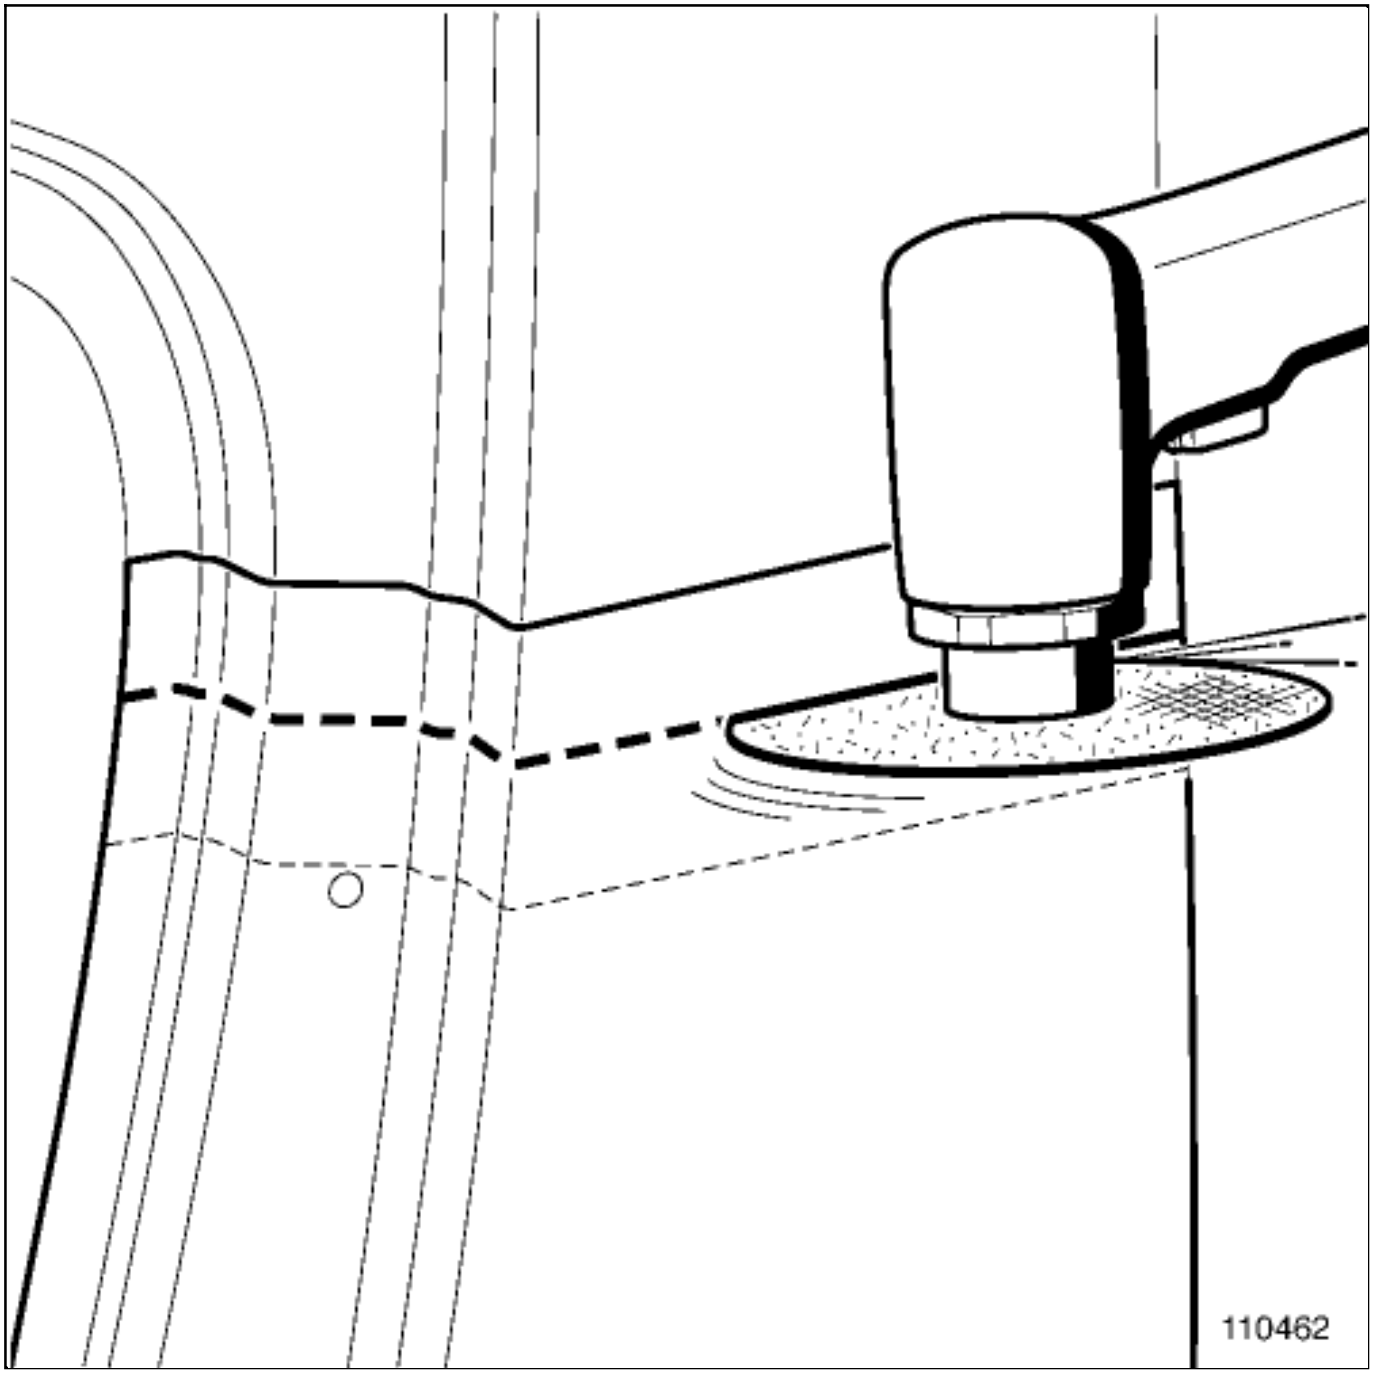
After removing damaged parts, grind the welding residue on the remaining support panels. Scour the weld joint interfaces(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use) .

1)SPECIAL FEATURE OF BONDED ASSEMBLIES

Heat the joint face using a paint burner, sliding a metal blade into the joint until it detaches.

Scour the cement bead residue left on the retained support panels(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use) .

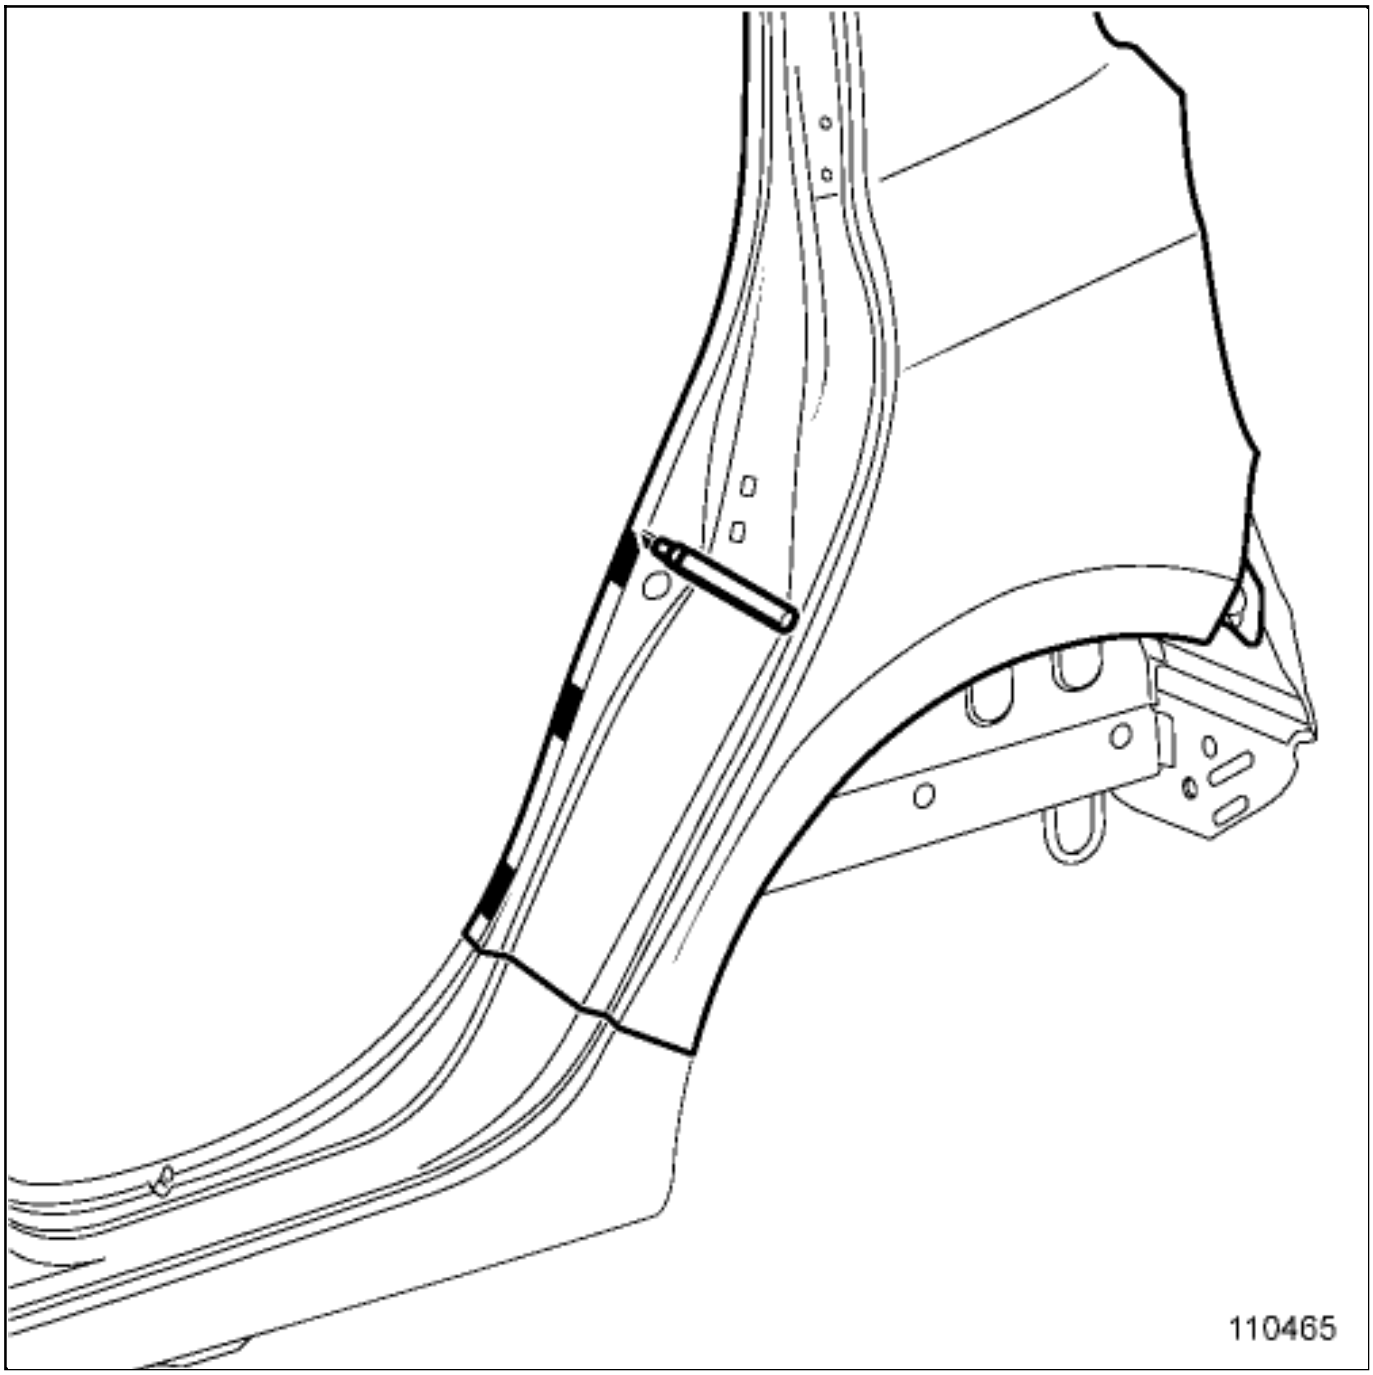
3. PREPARATION BEFORE ASSEMBLY



According to the different joint types, carry out the following operations in order, if necessary:

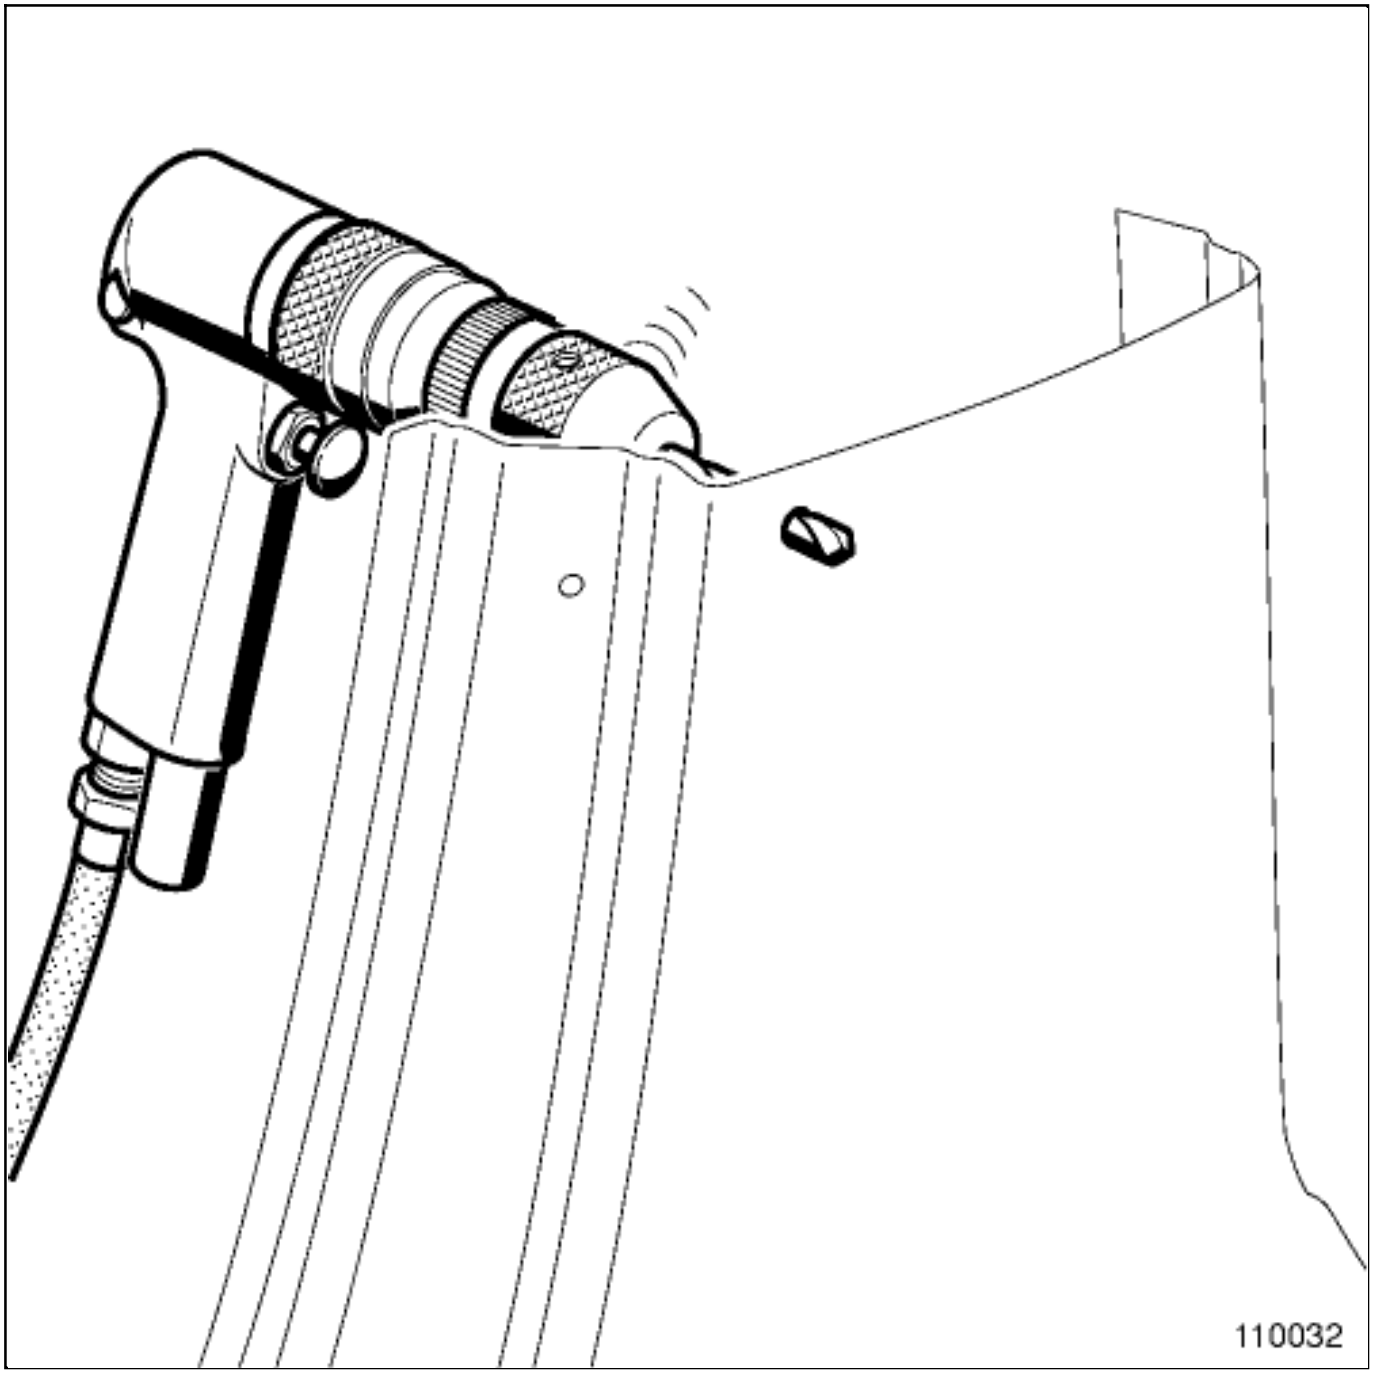
1- ADJUSTING

Position and adjust the new part on the vehicle.



Fix the new part using locking pliers.(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use) .

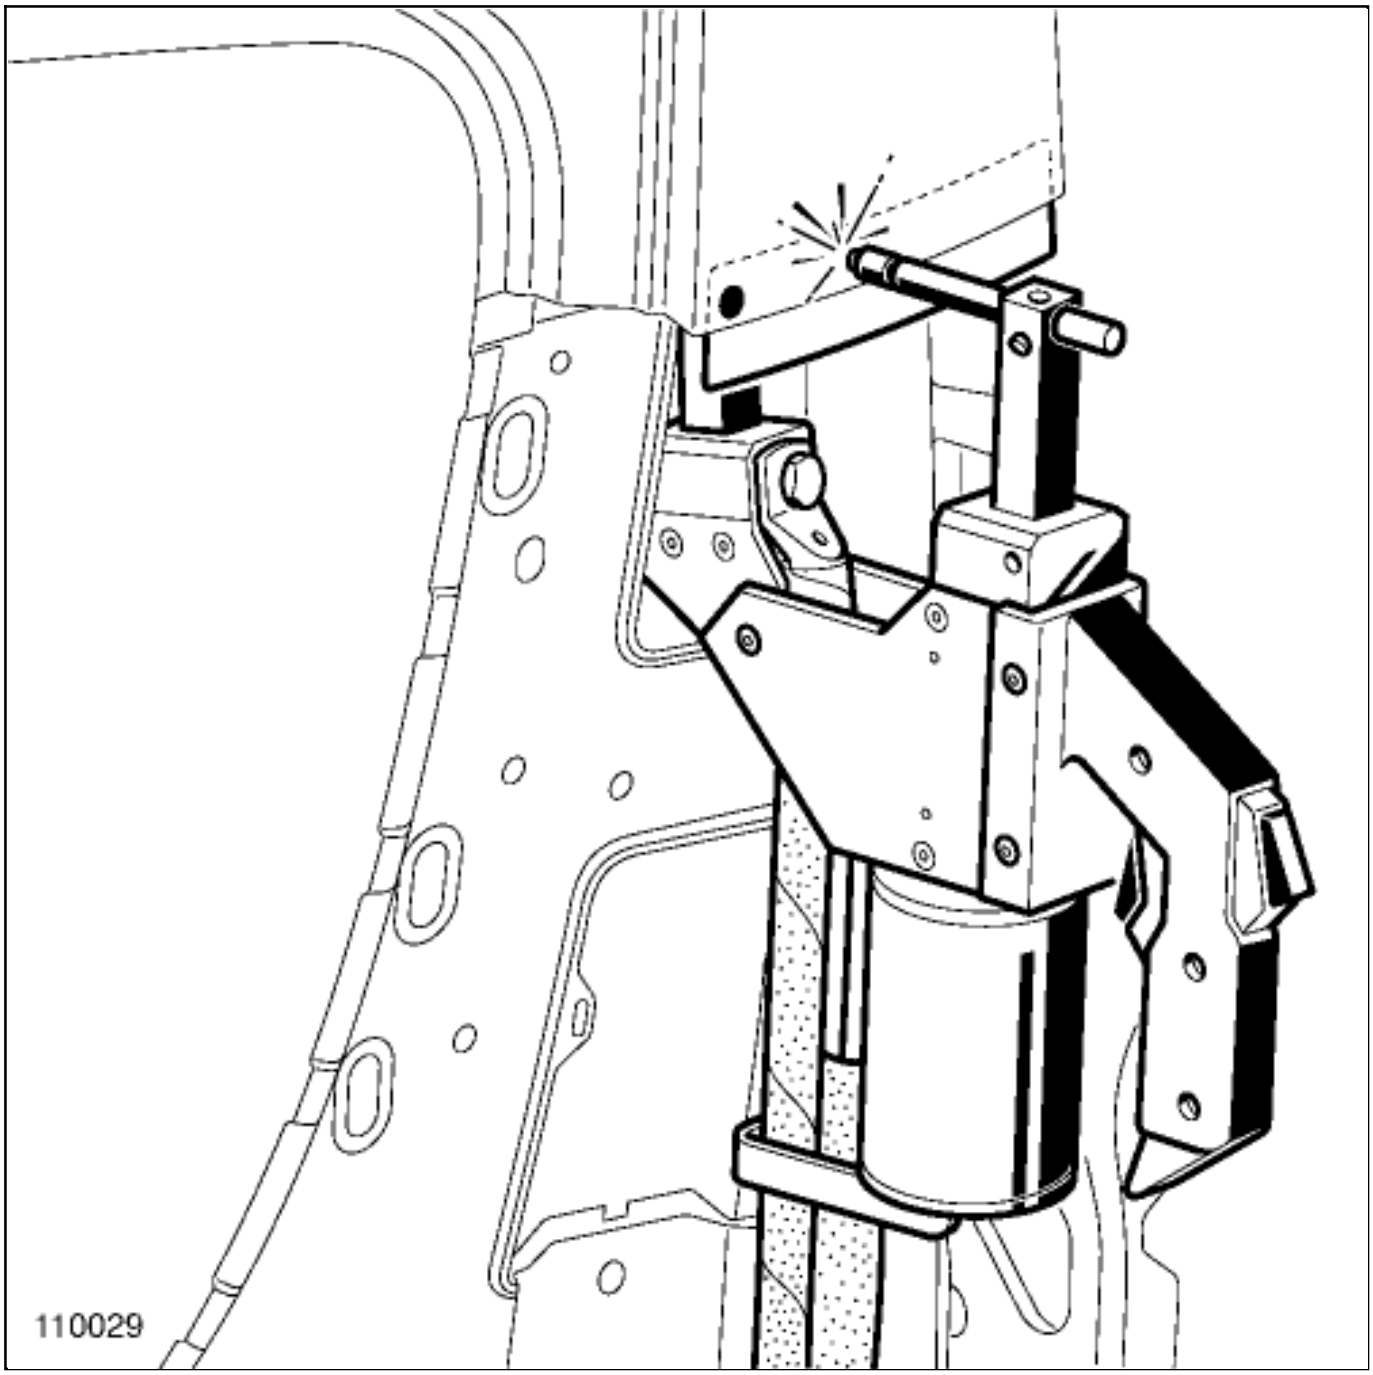
For partial replacements, use the new part to cover the part on the vehicle by 50 mm.



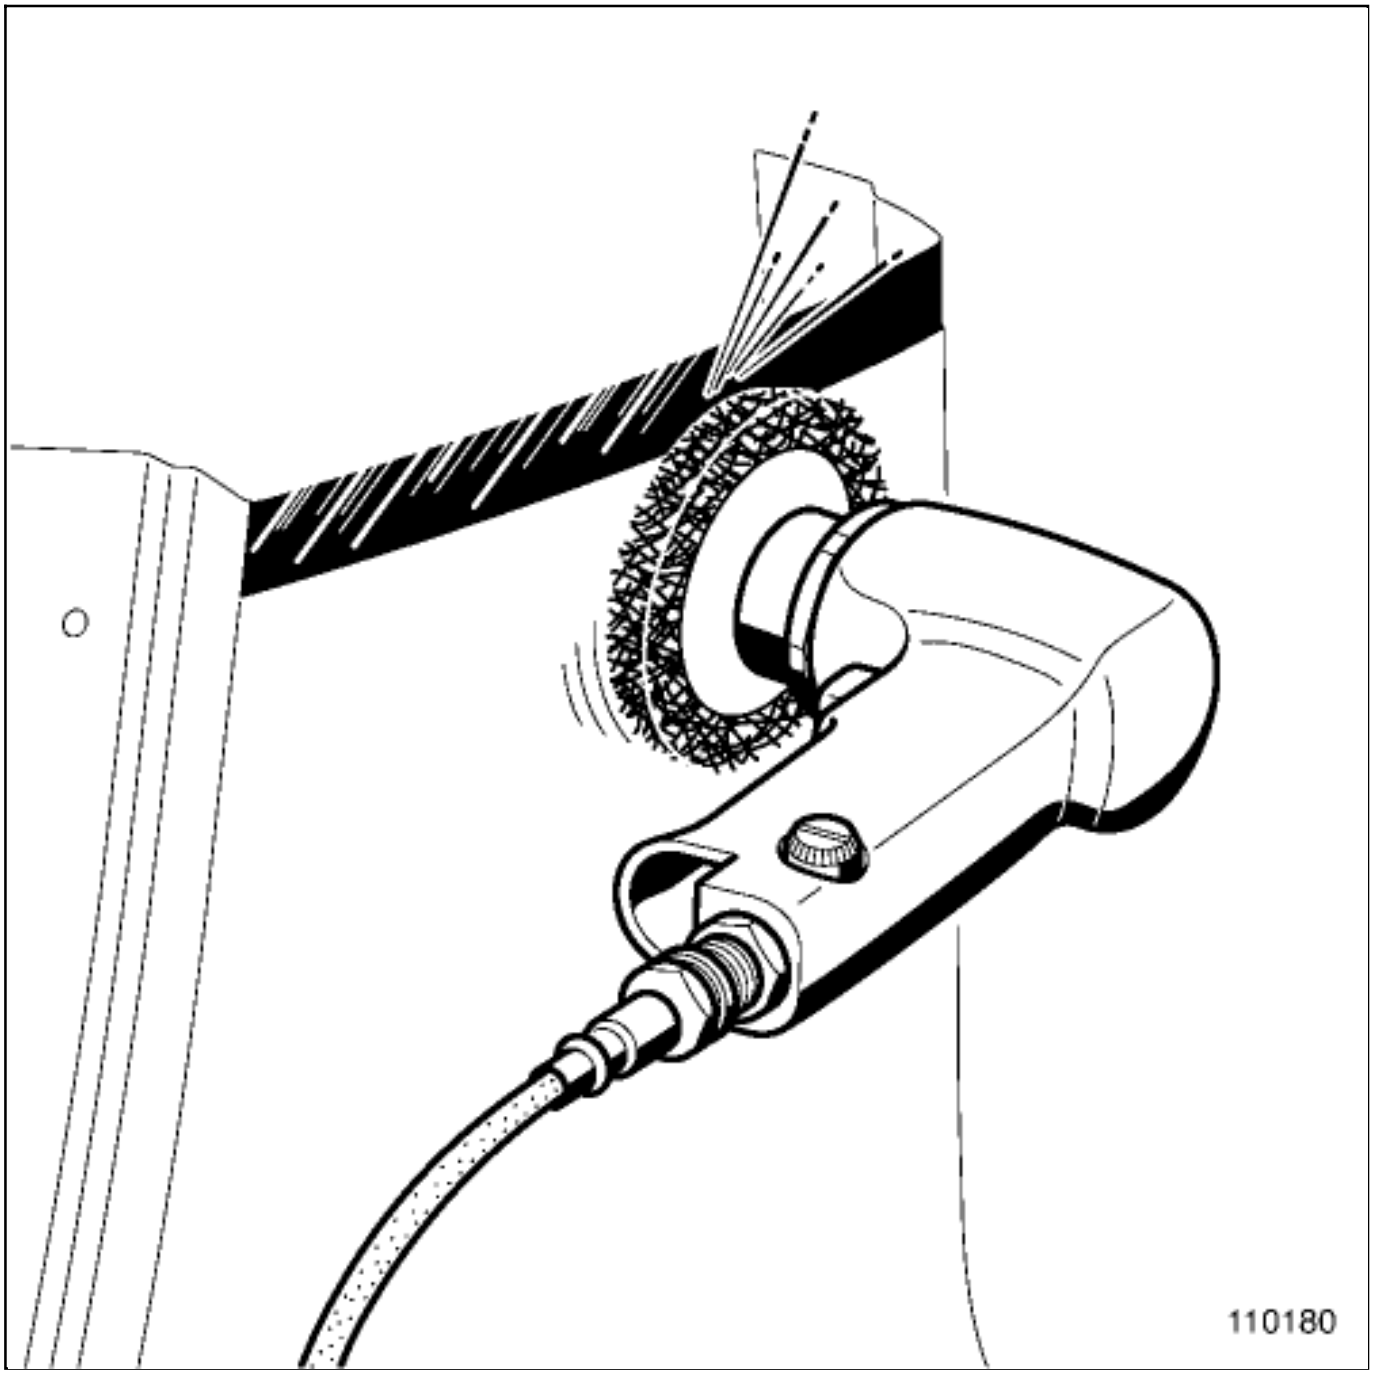
Cut the two overlapping parts simultaneously.

Remove the new part then take off the residual section of panel left on the vehicle.

Using an indelible marker pen, mark the internal face:

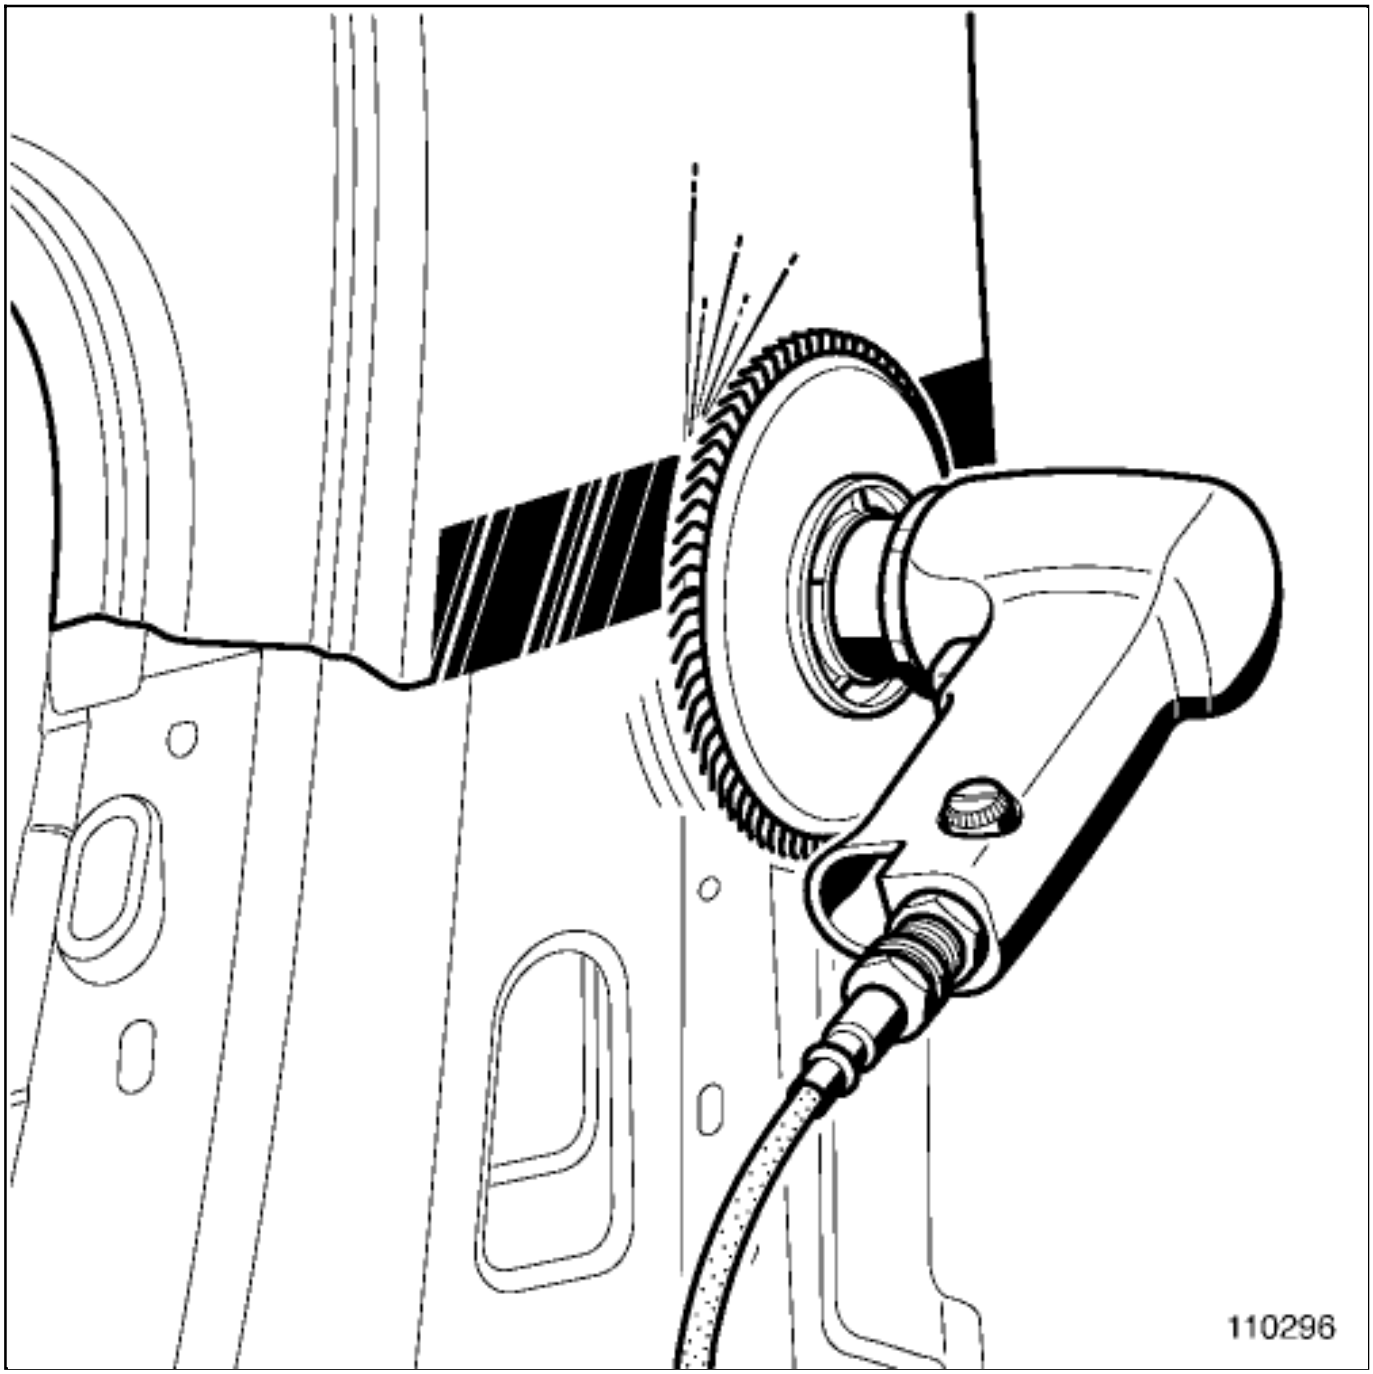


- of the plug weld points weld joint areas.
- the bonding areas.

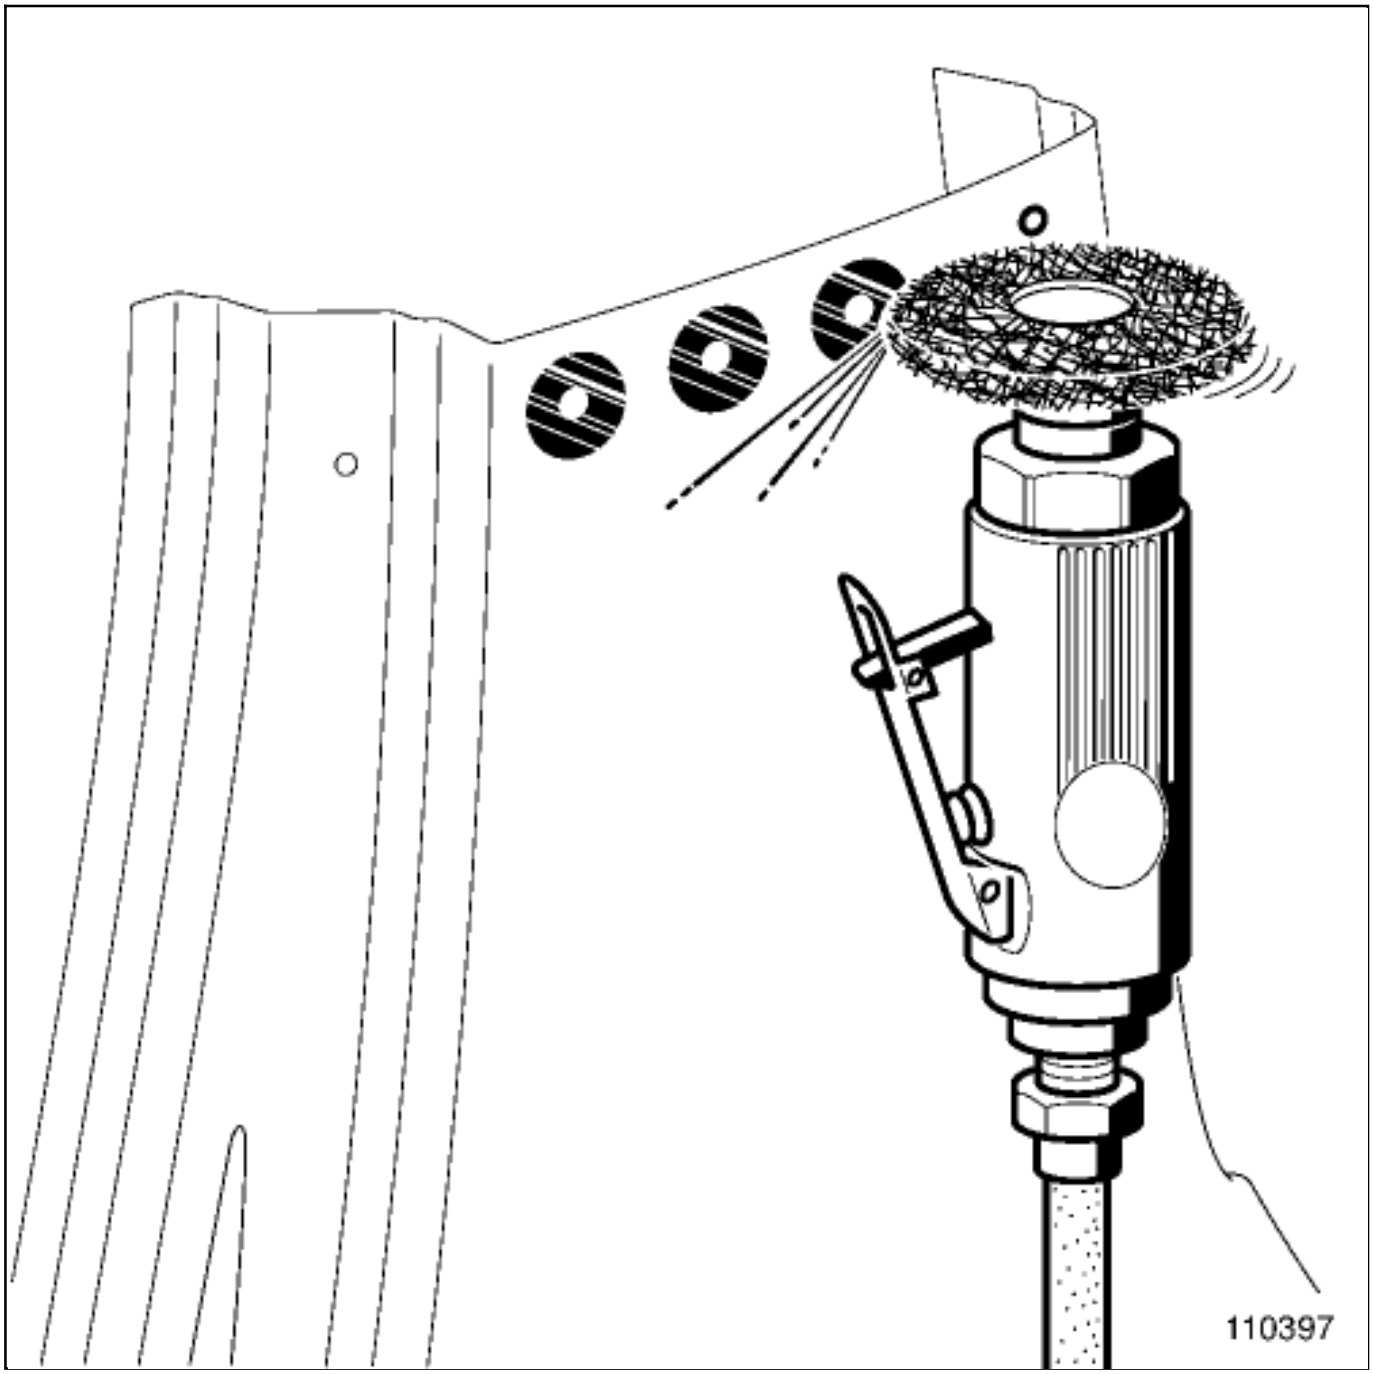


From the part's internal face:

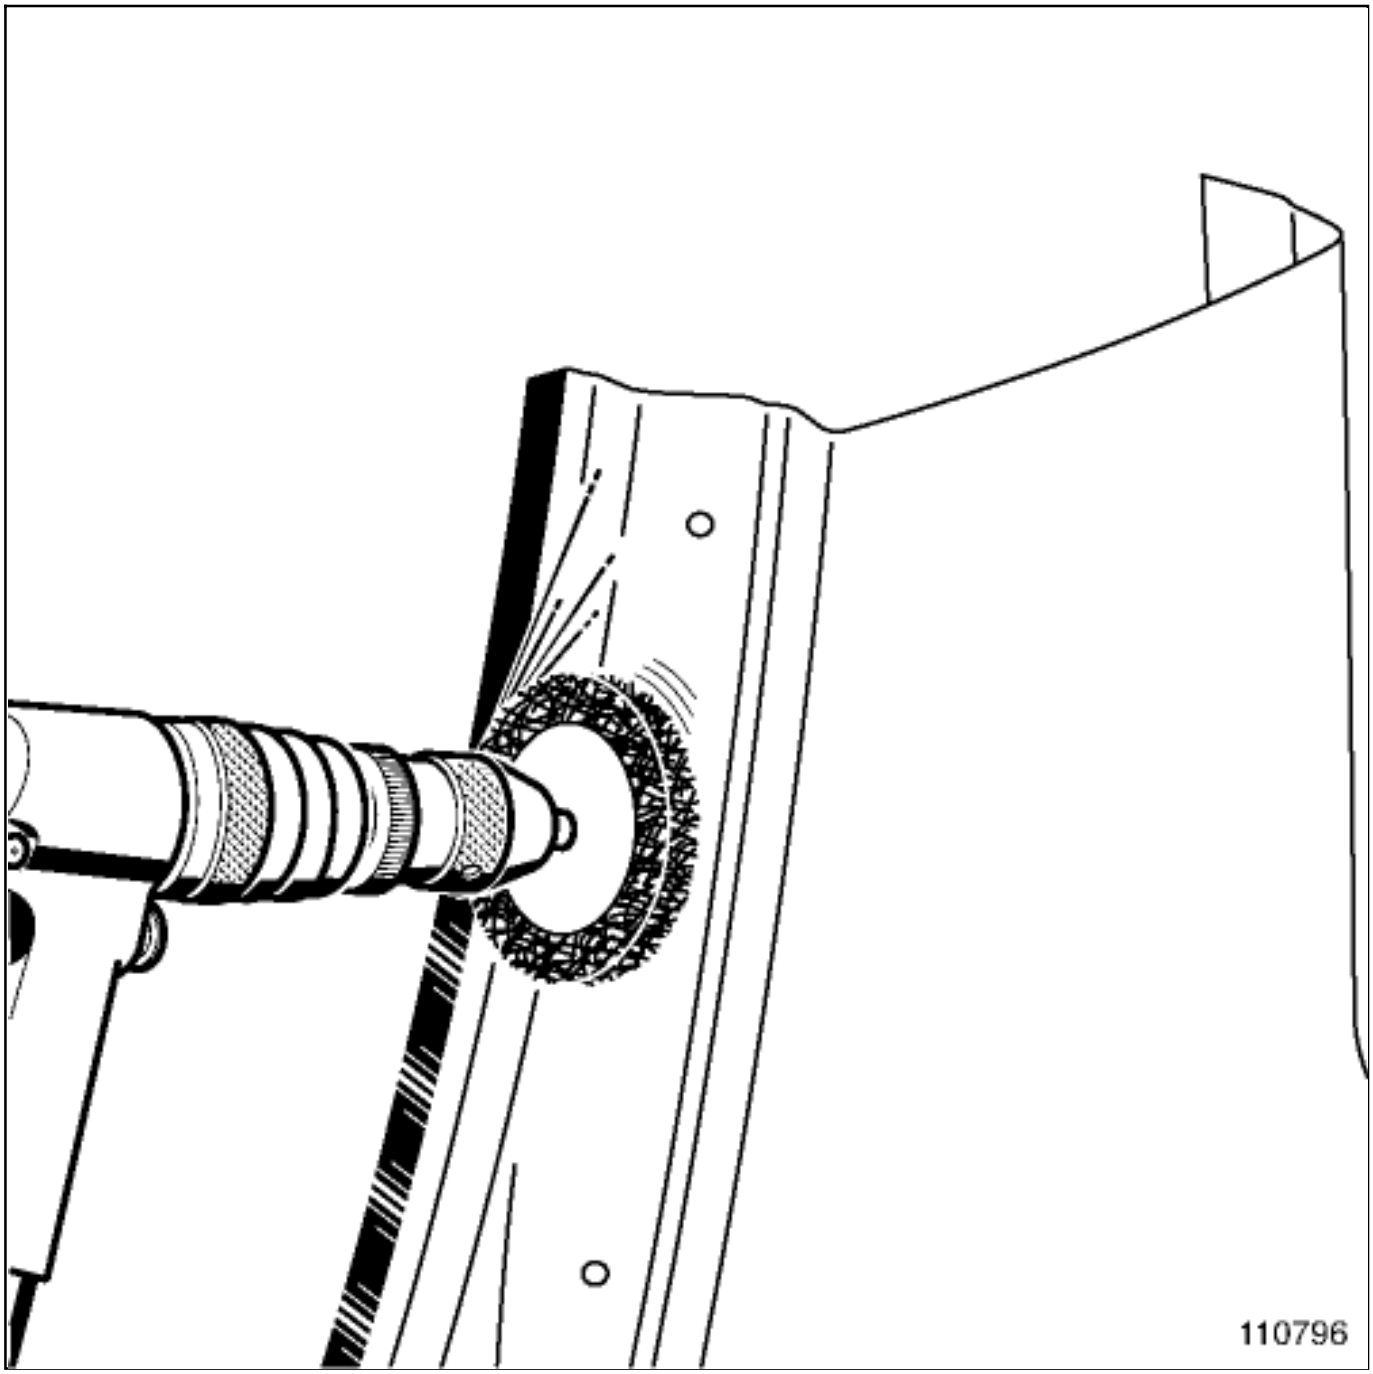
- carry out the drilling operation for the plug welds and the riveting,
- clean the bonding zones without scouring.
- scour the electrical resistance welded connections.



From the replacement part cut off, recover a metal strip measuring approximately 40 mmin width with a length which is adapted to the patched drilling area.

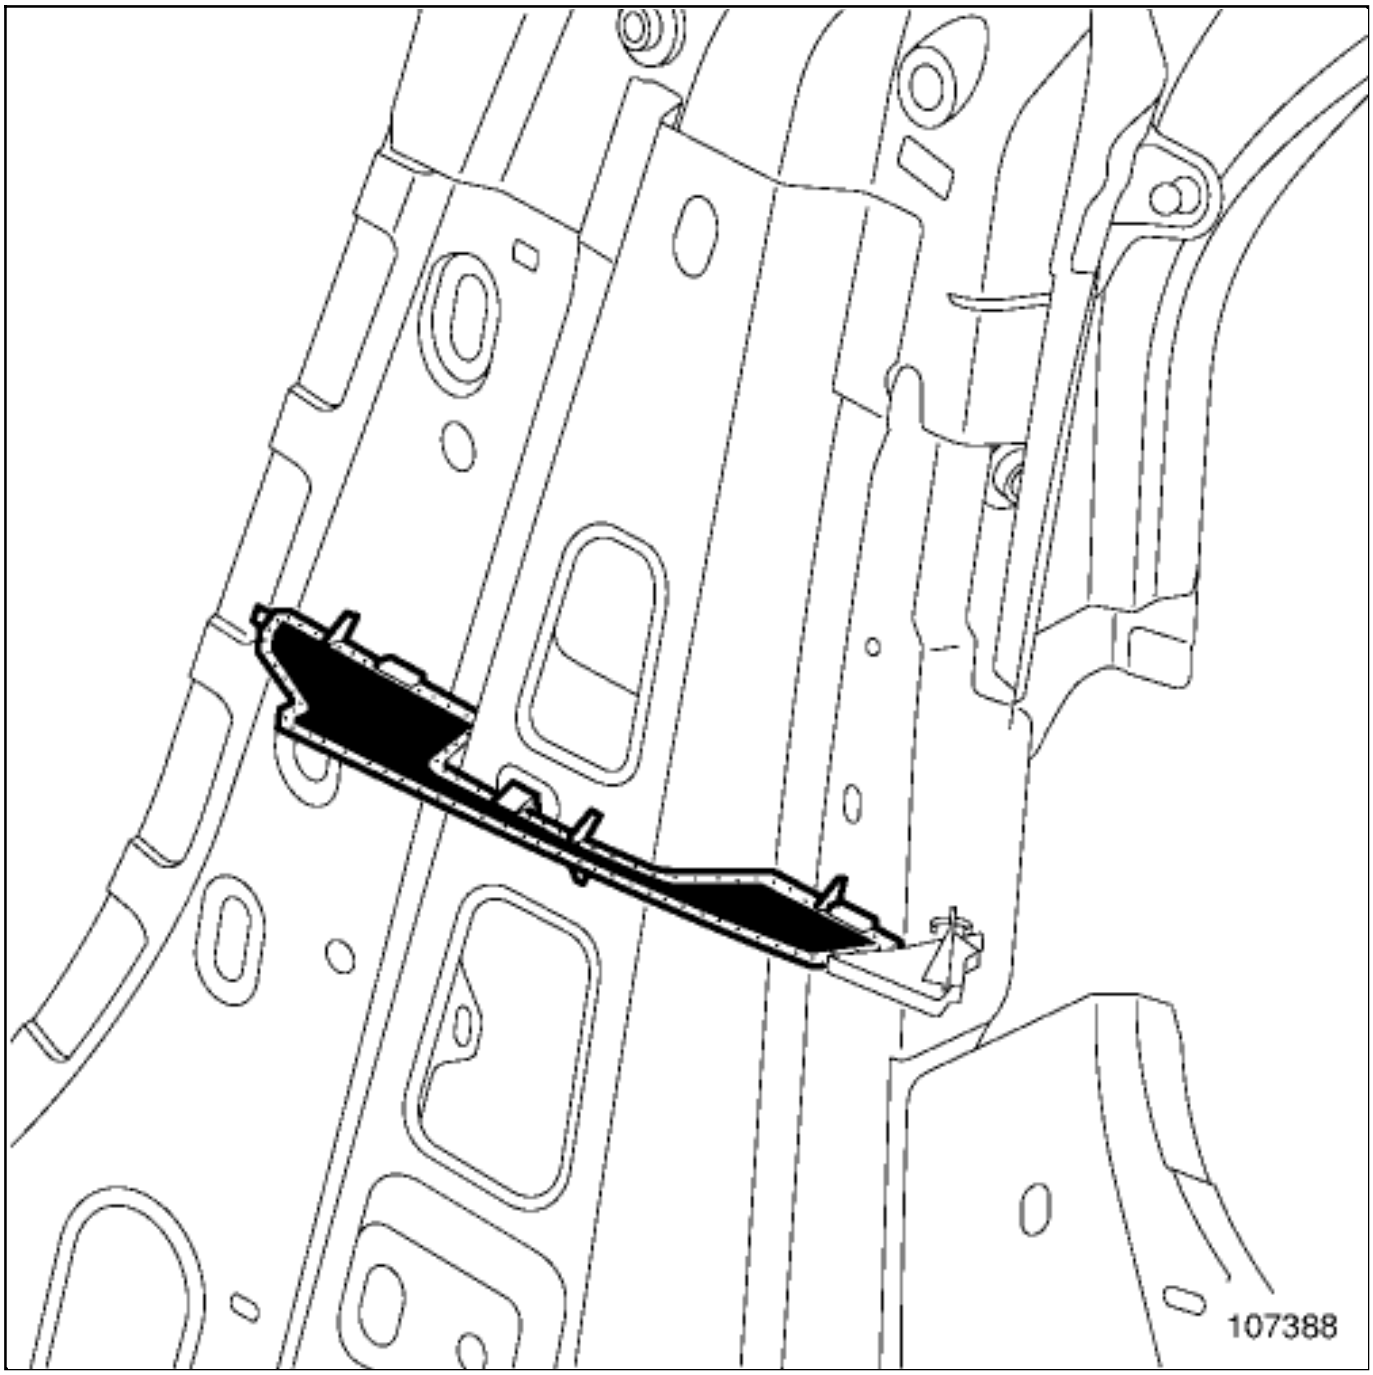


Weld this metal strip to the vehicle to carry out the patched drilling.



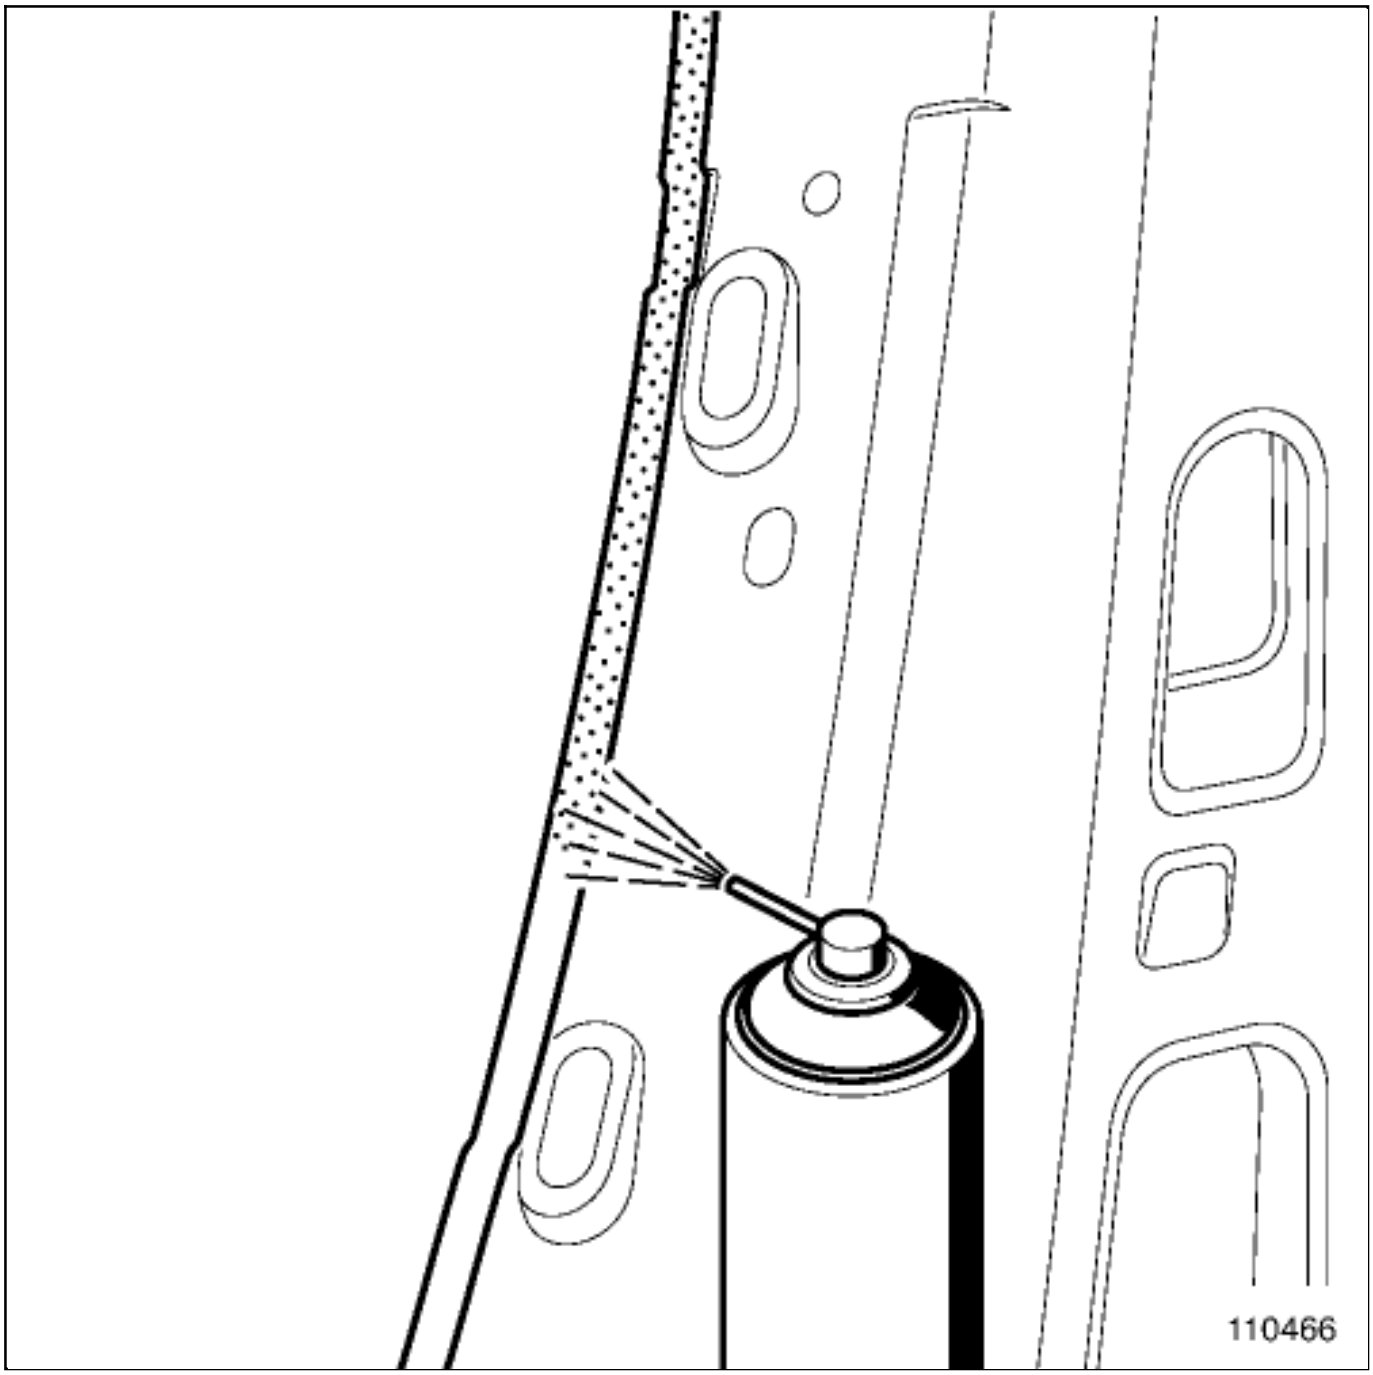
Scour the external joint faces depending on the type of weld.

Scour the weld edges of the partial cuts.



Deburr the edge of the plug weld holes.

Scour the faces of the resistance welded joints.



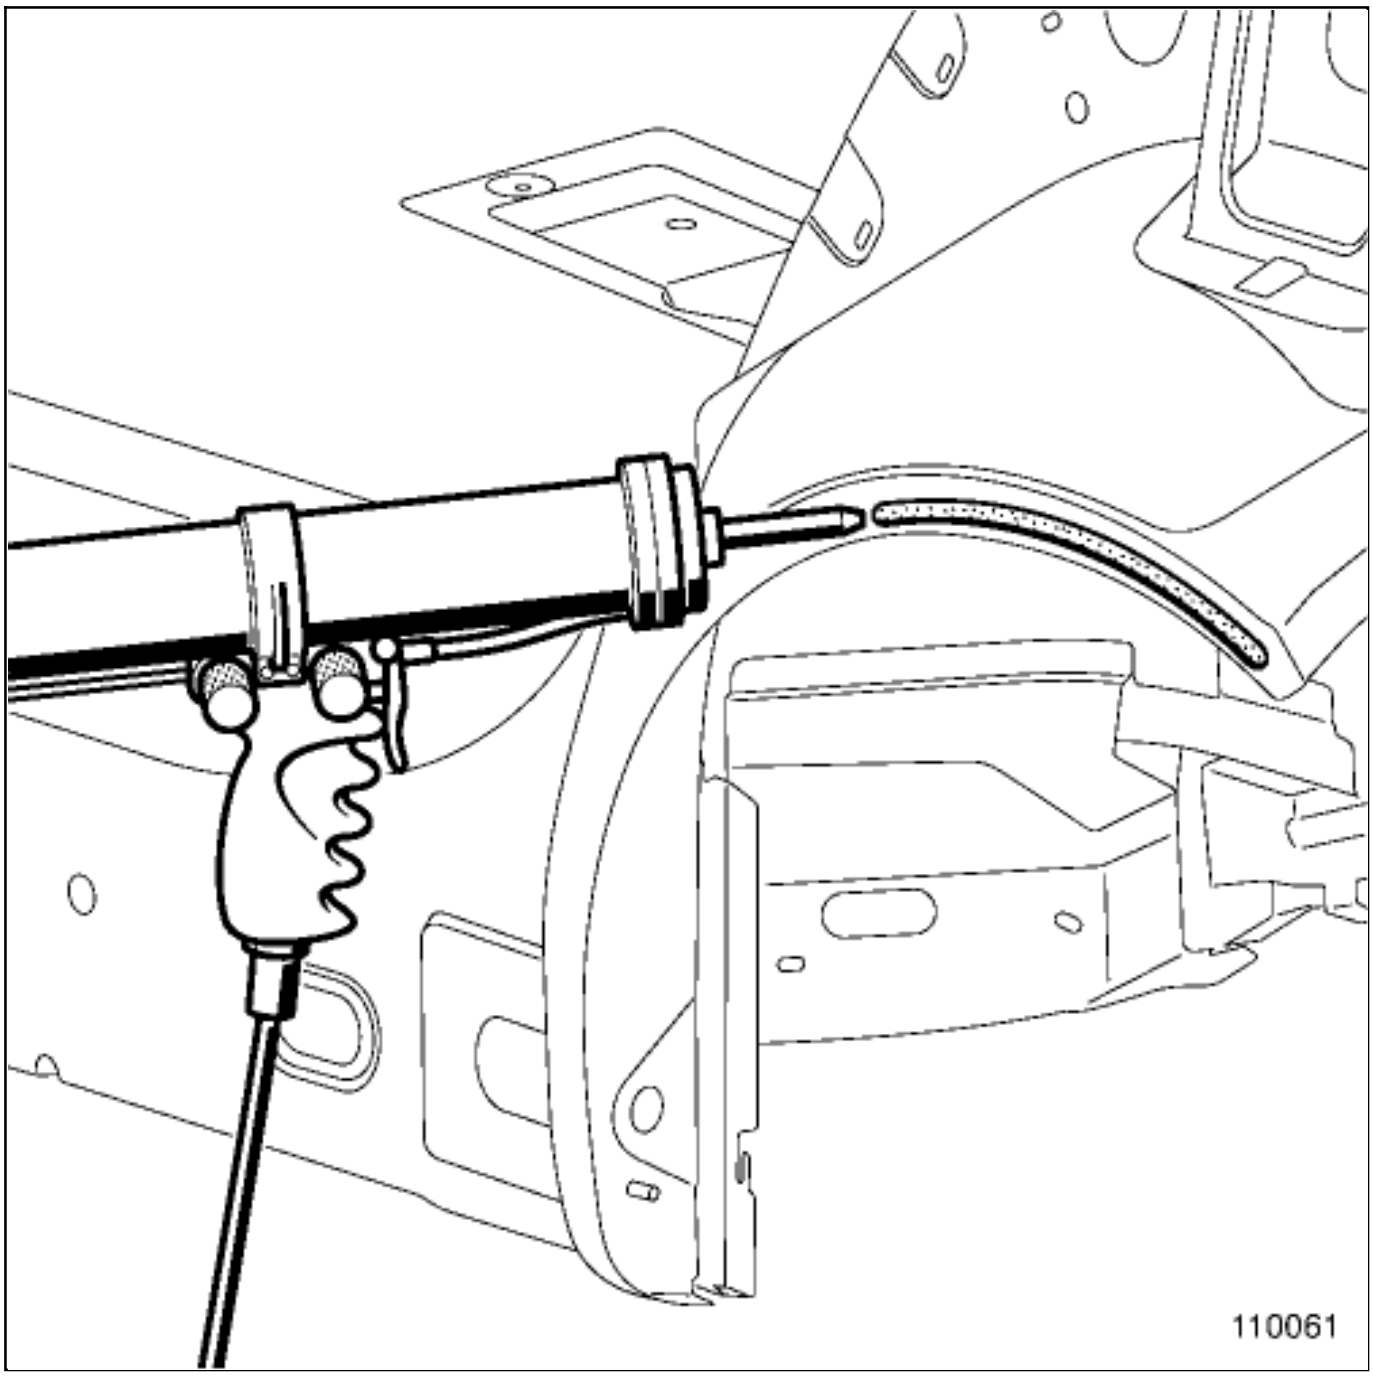
Scour the faces of the butt welded joints(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use) .

4- FITTING ACOUSTIC PROTECTION BEFORE ASSEMBLY

Fit the acoustic inserts(see 40J, Protective devices , Structural acoustic protection: Description) .

5- APPLYING THE ANTICORROSION PROTECTION BEFORE ASSEMBLY

Concerns only joint interfaces (on the vehicle and on the new part).

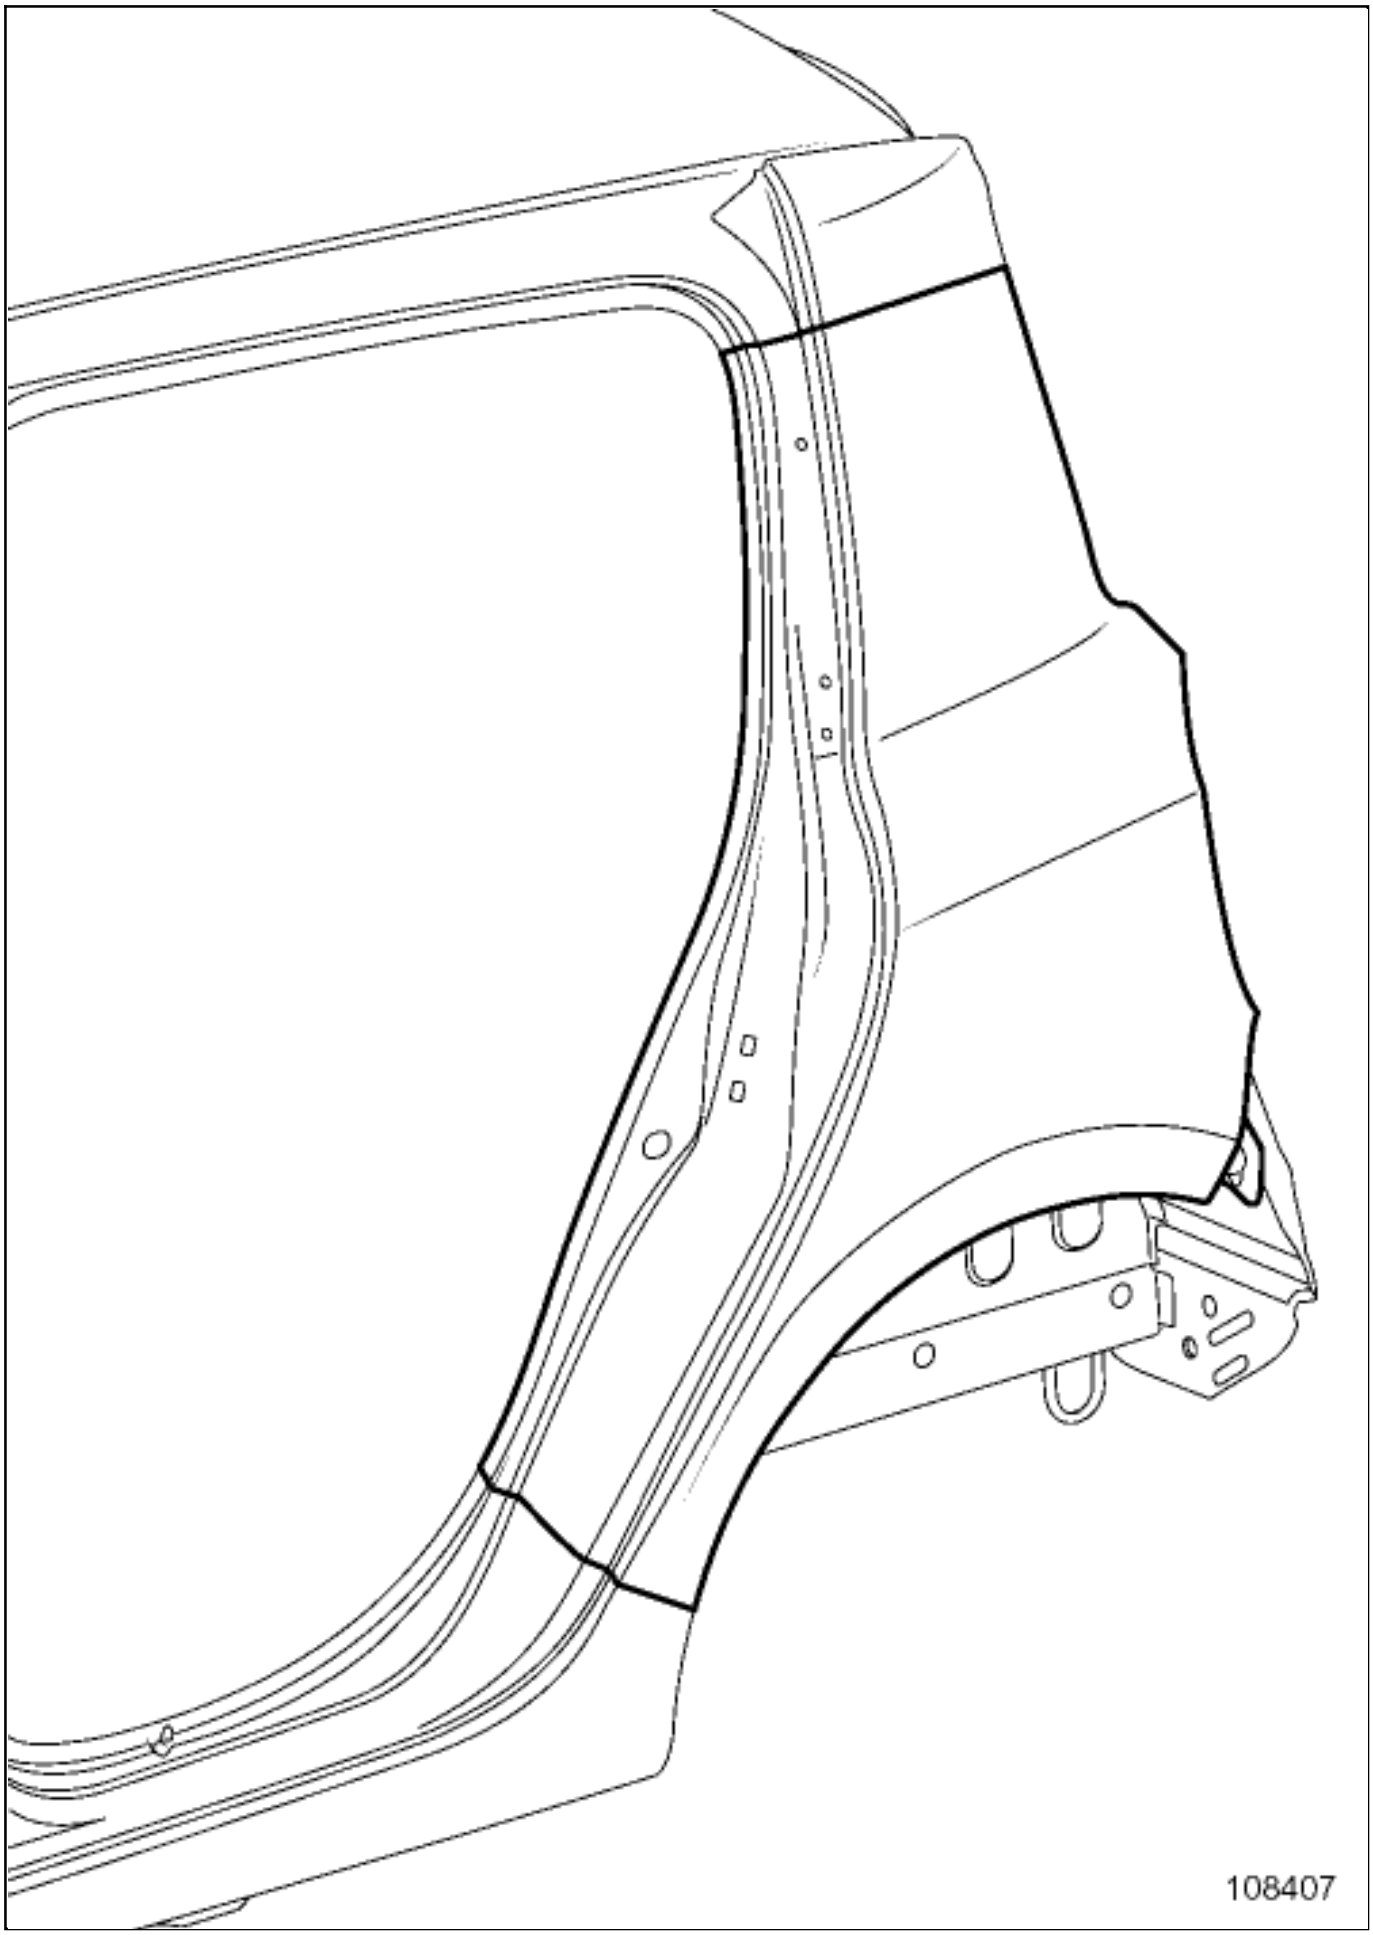


Depending on the locations, apply in order:

- spray products,
- pad or brush products,
- extruded products.

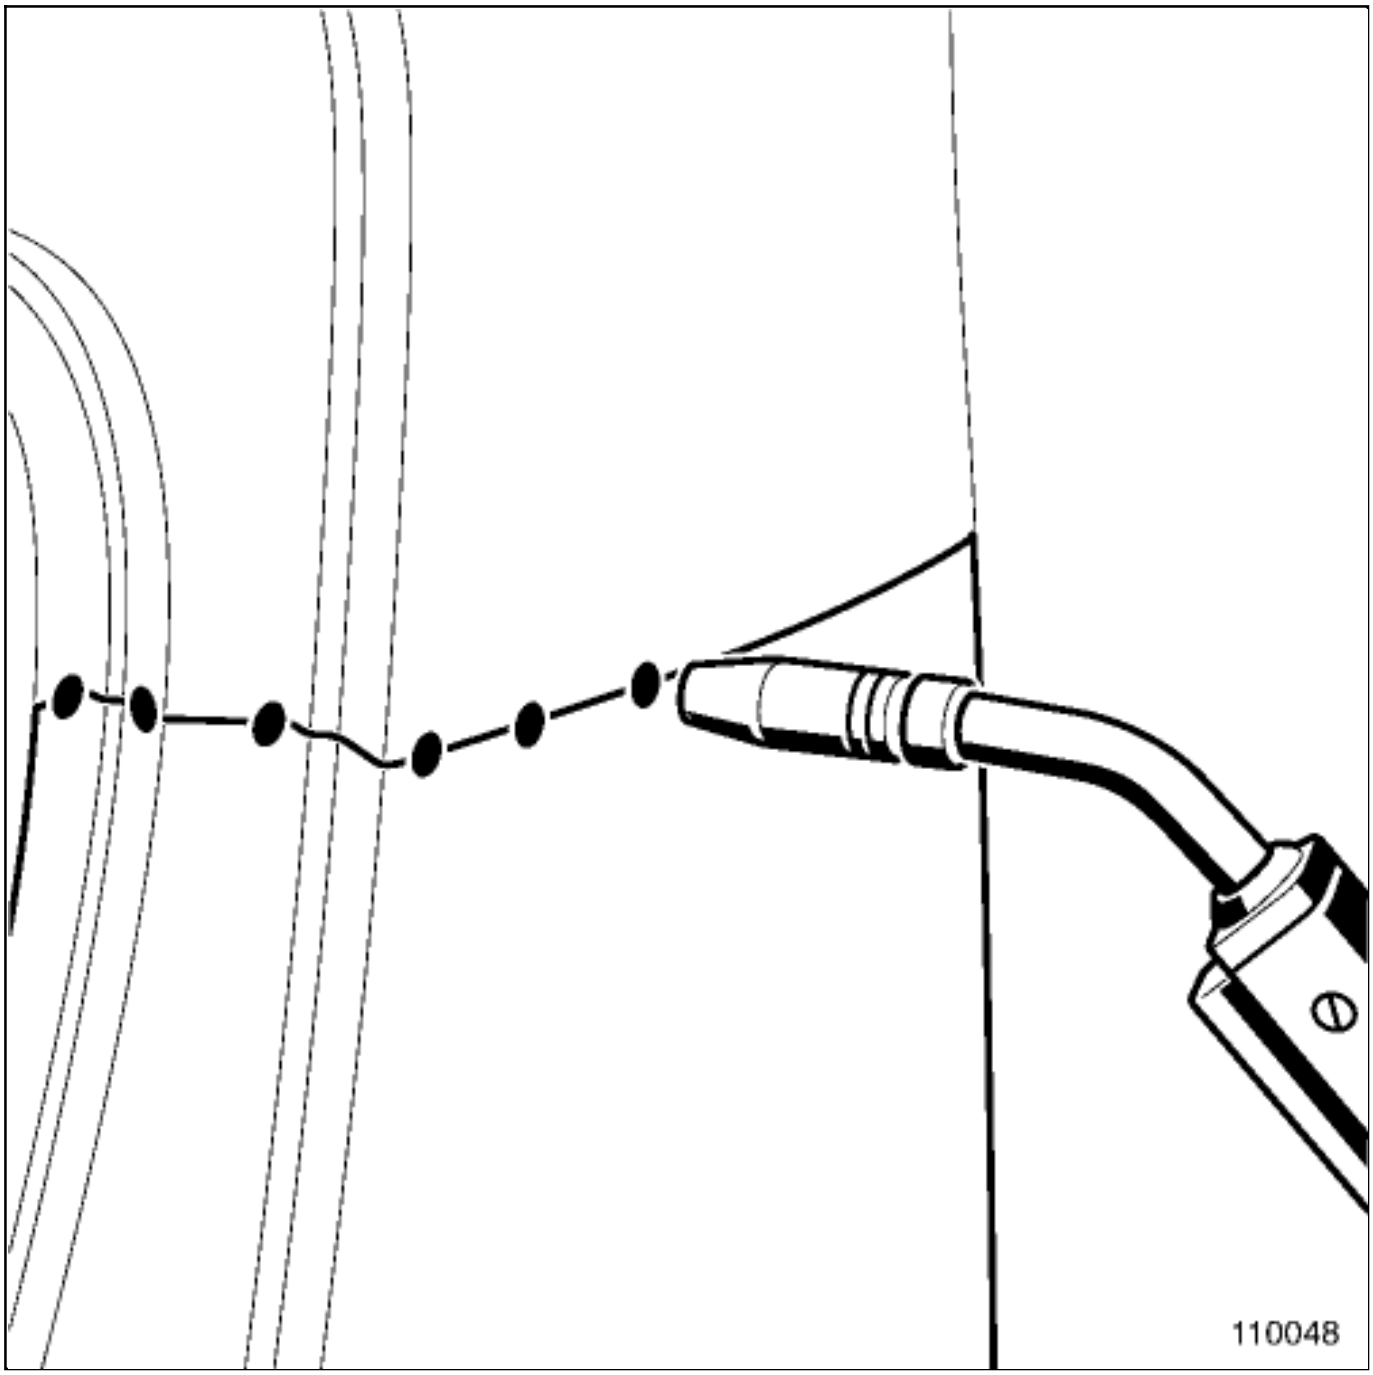
(see 40J, Protective devices , Anti-corrosion protection of joints before welding: Description) .

4. ASSEMBLY



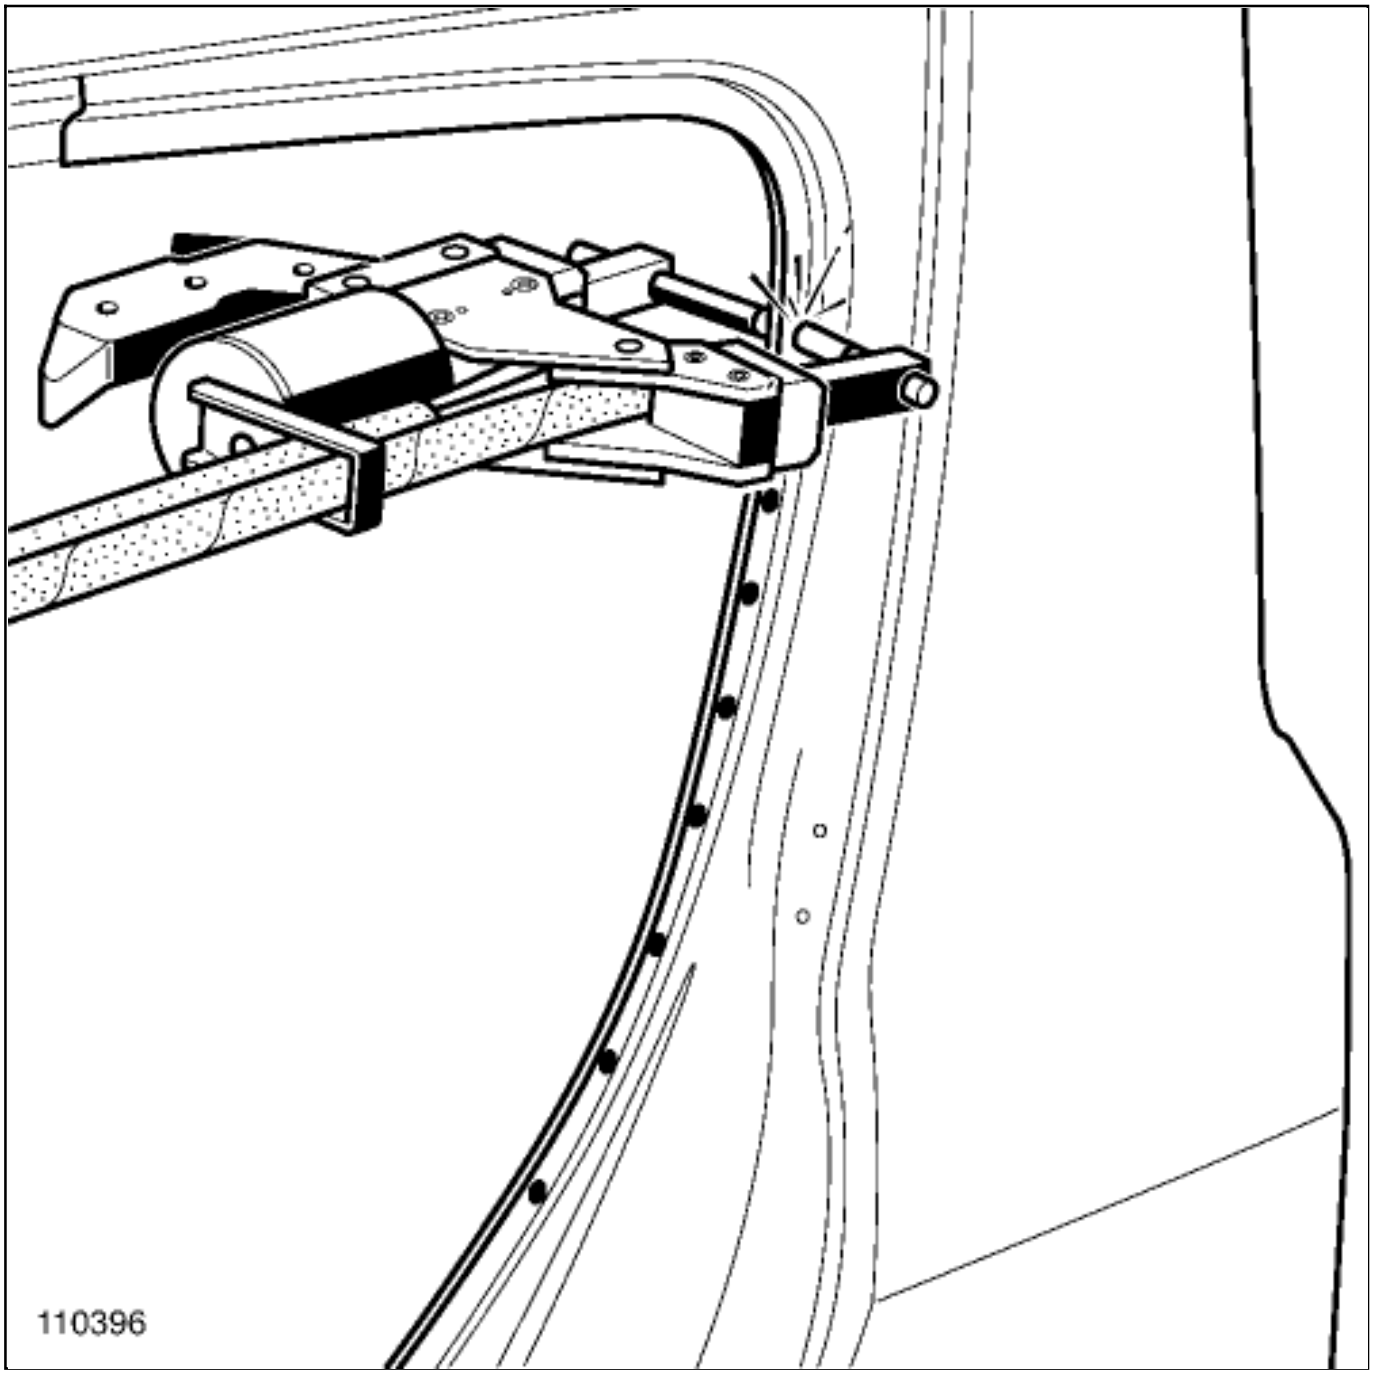
1- APPLICATION OF THE BONDING PRODUCTS

(see 40F, Bonded connections, Connections by rigid bonding: Description) .



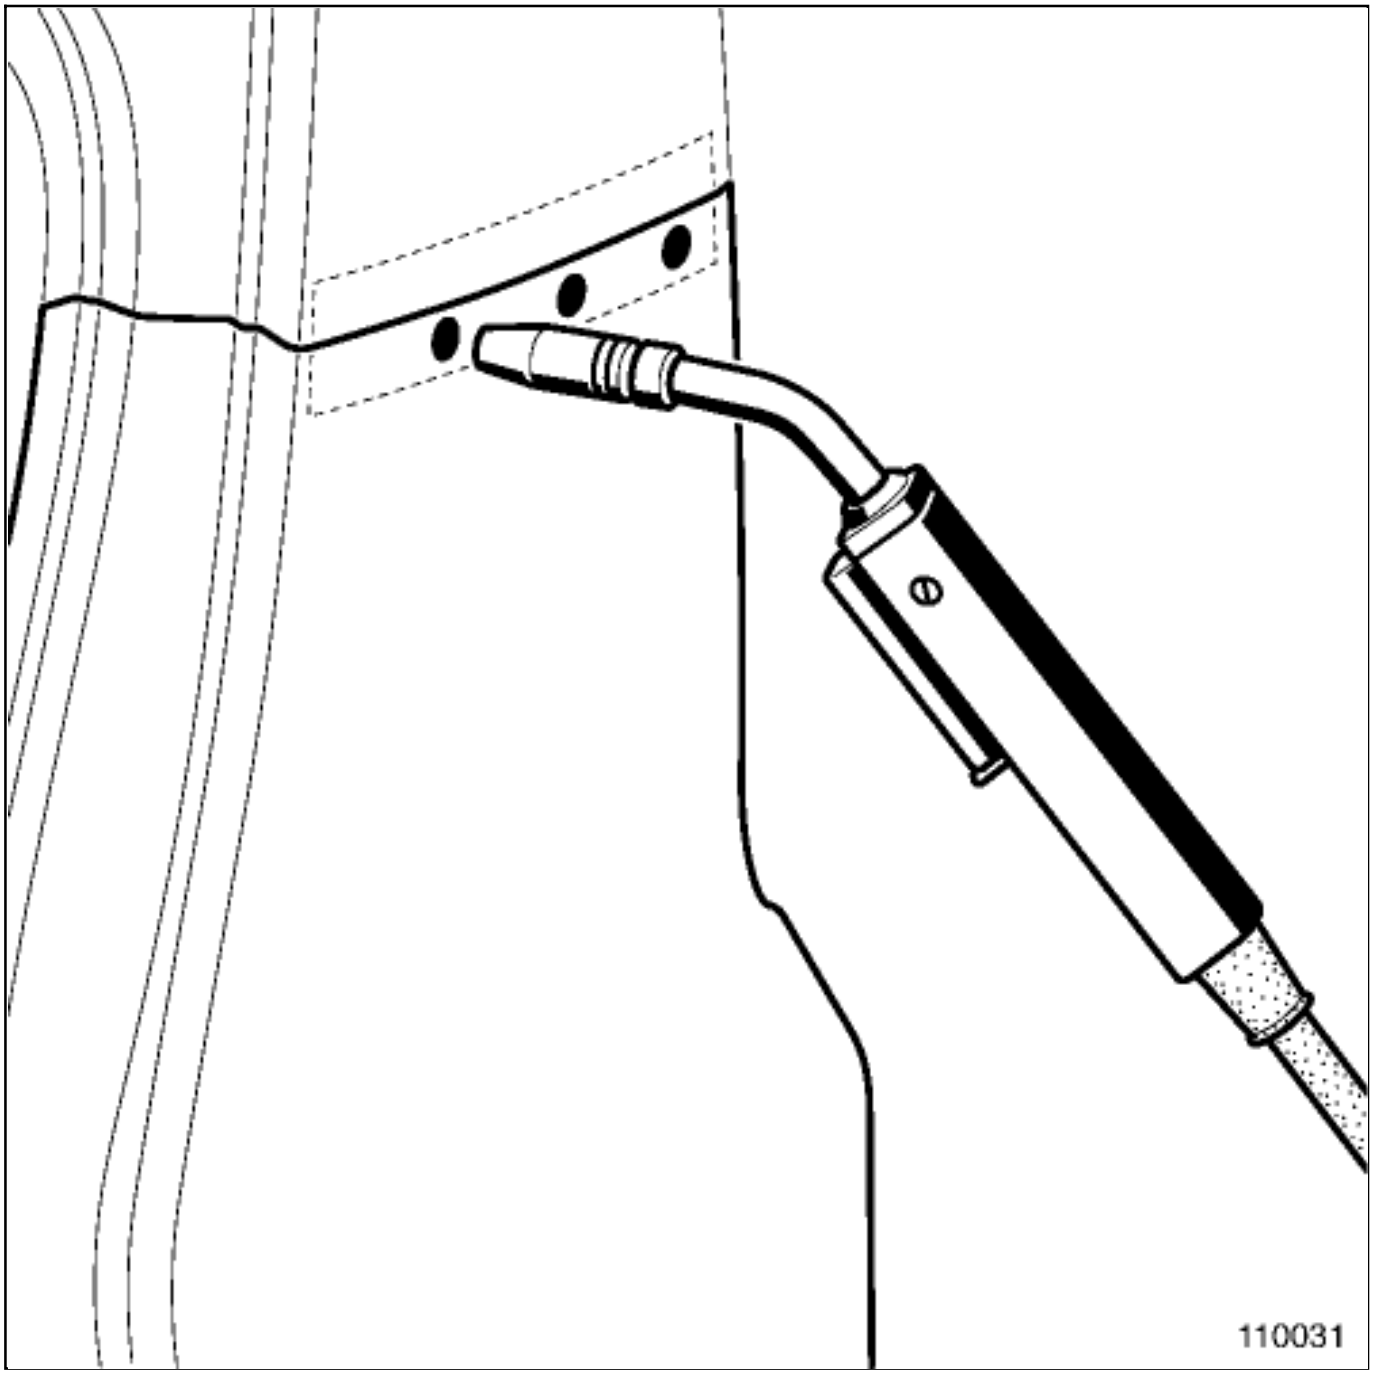
(see 40F, Bonded connections, Connections by soft bonding: Description) .

2- FITTING AND ADJUSTING THE REPLACED PARTS

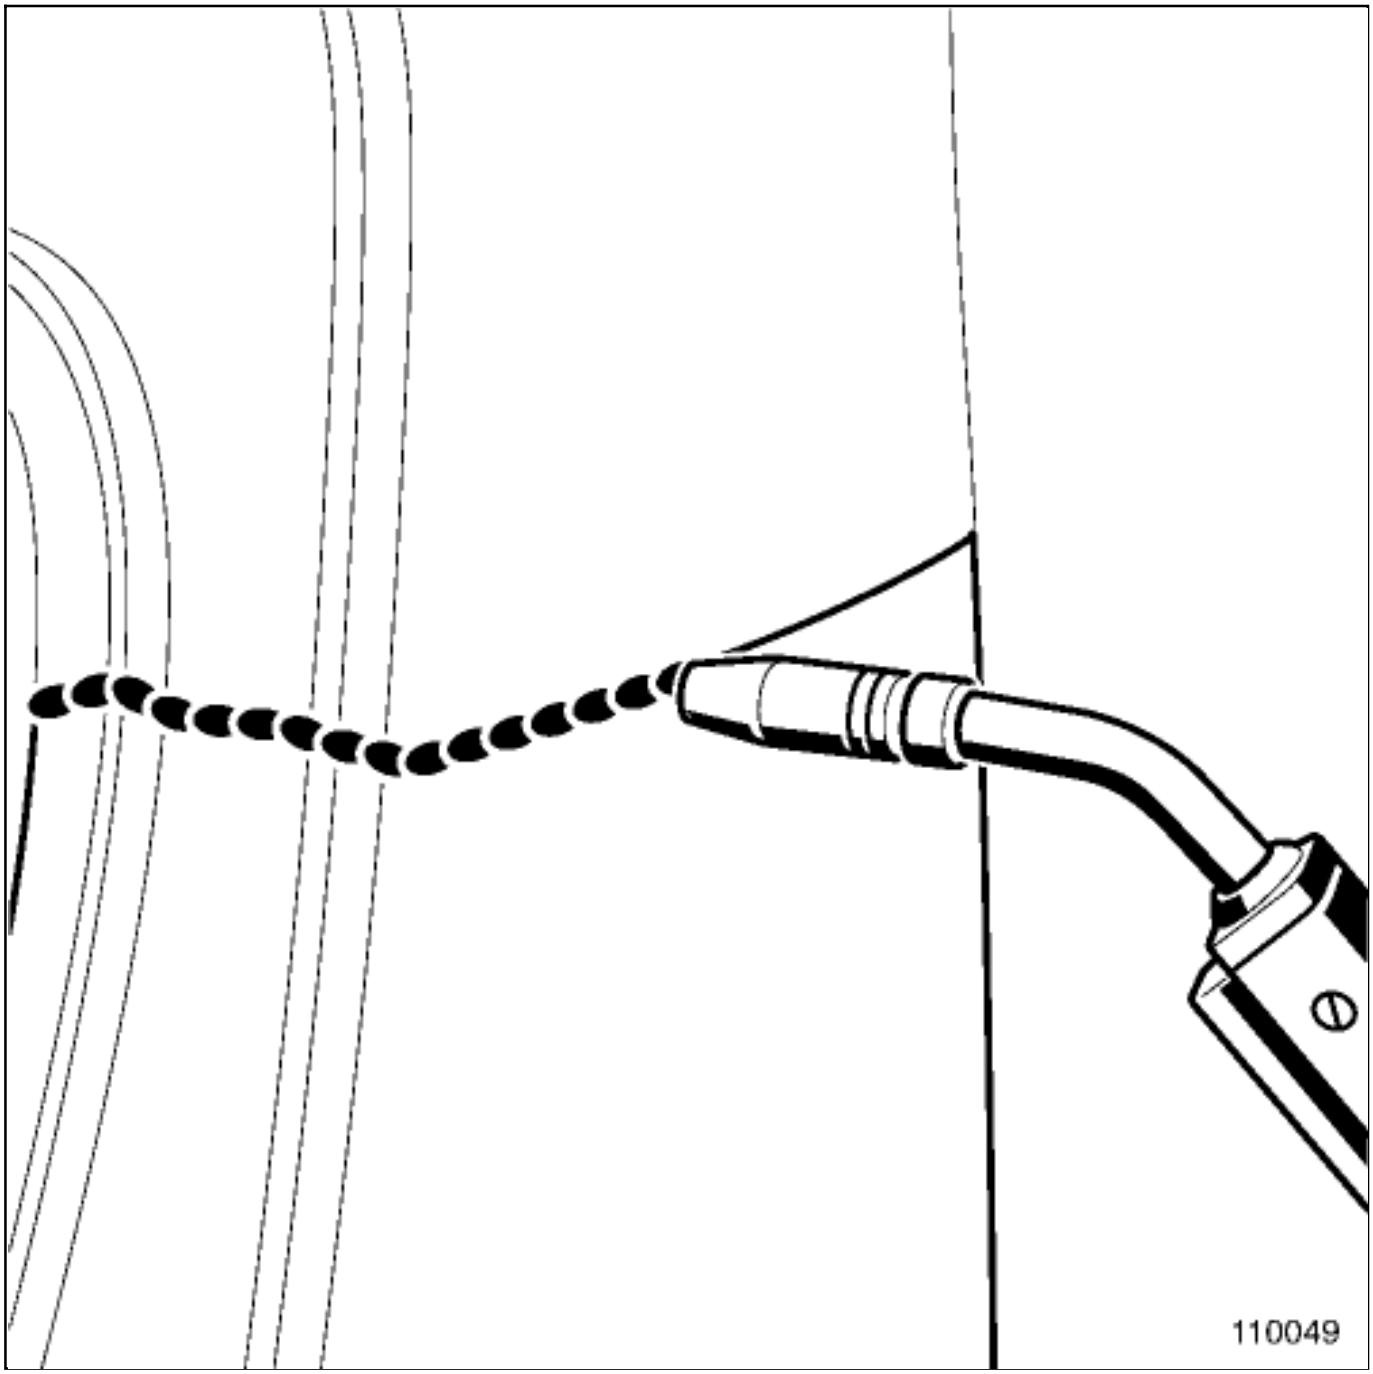


108407

Position and adjust the new part on the vehicle. Fix using locking pliers.(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use) .

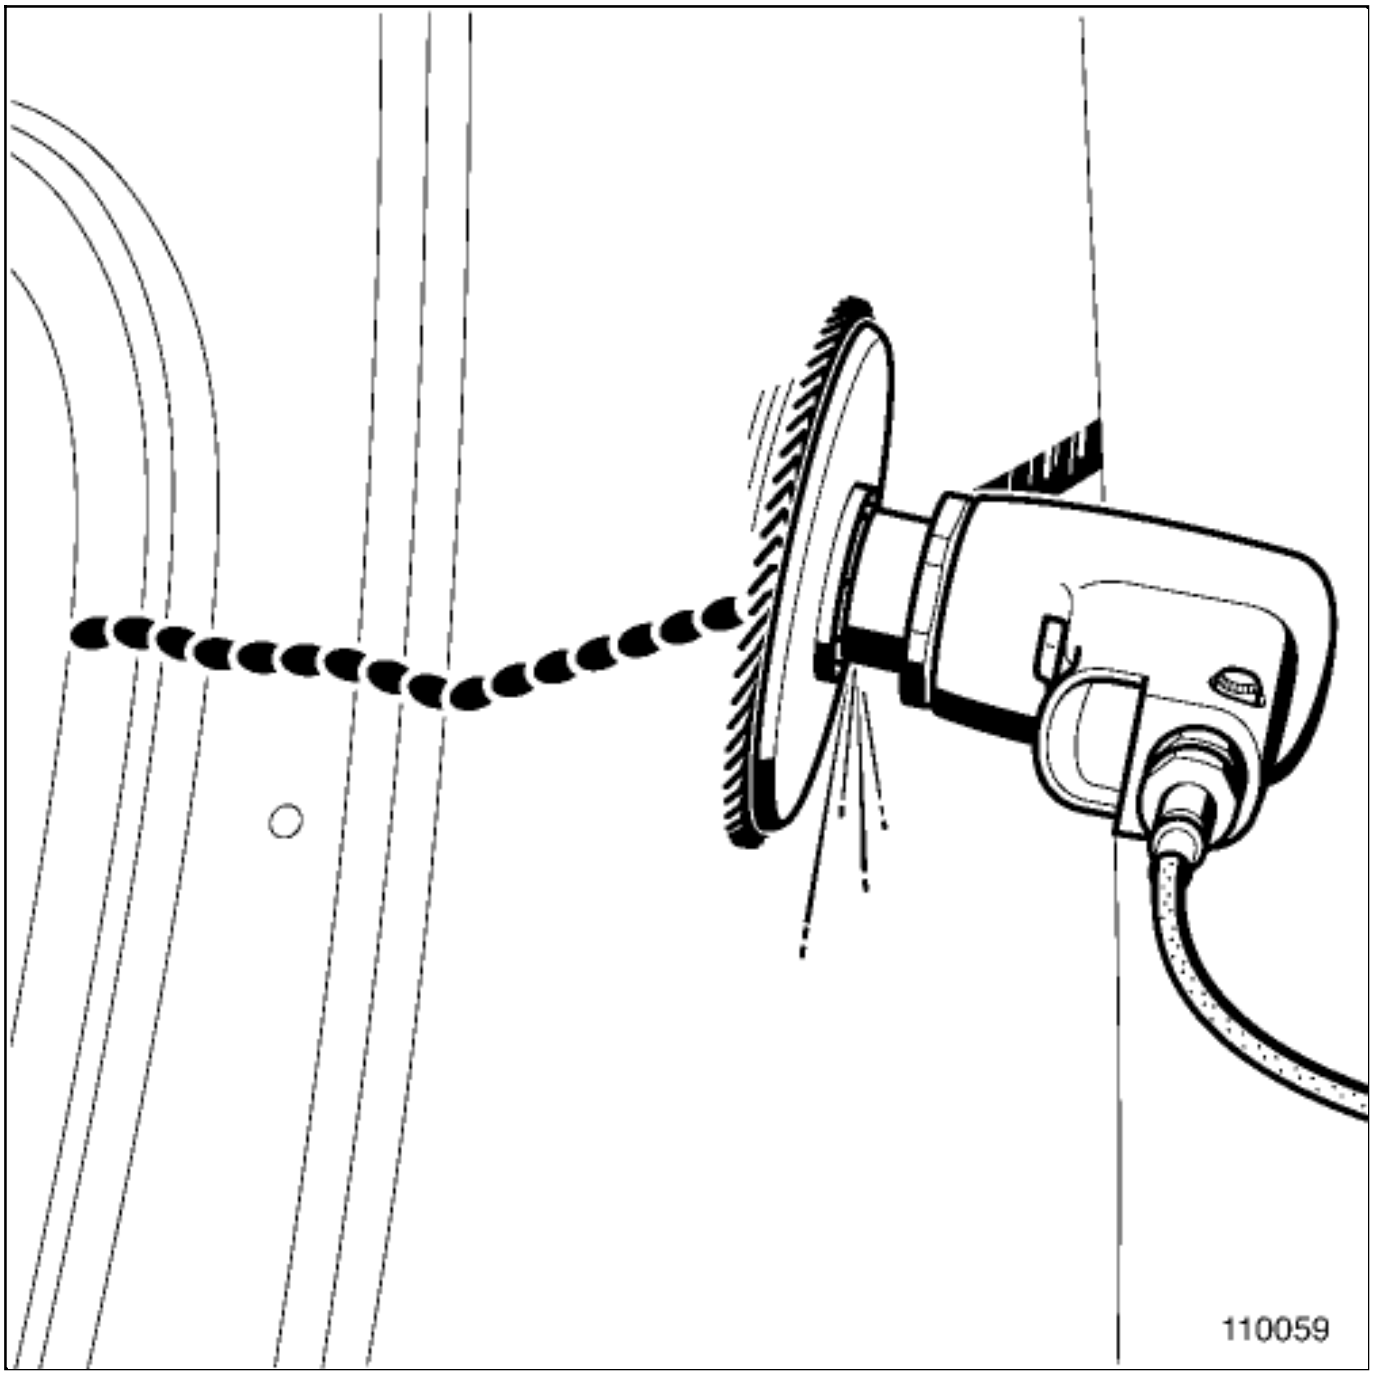


3- CARRYING OUT THE WELDING

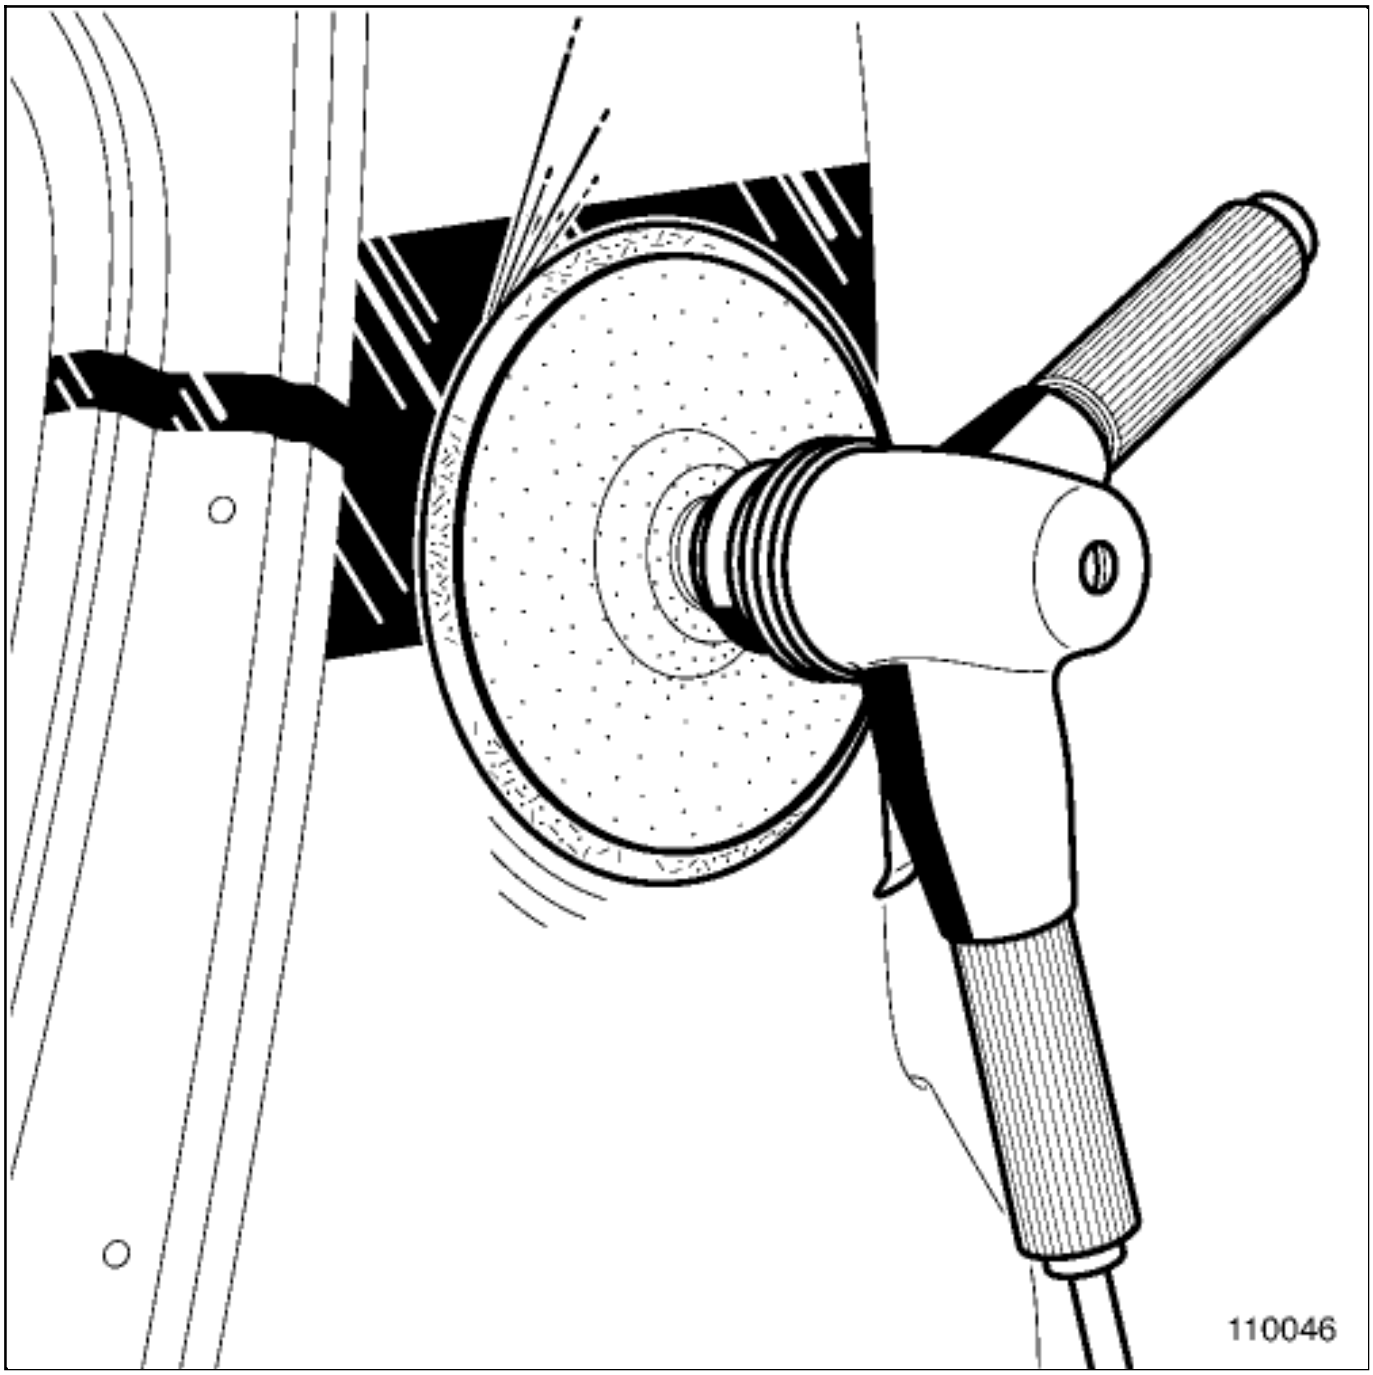


Carry out the securing points on the butt welding lines.

Do the SER points.

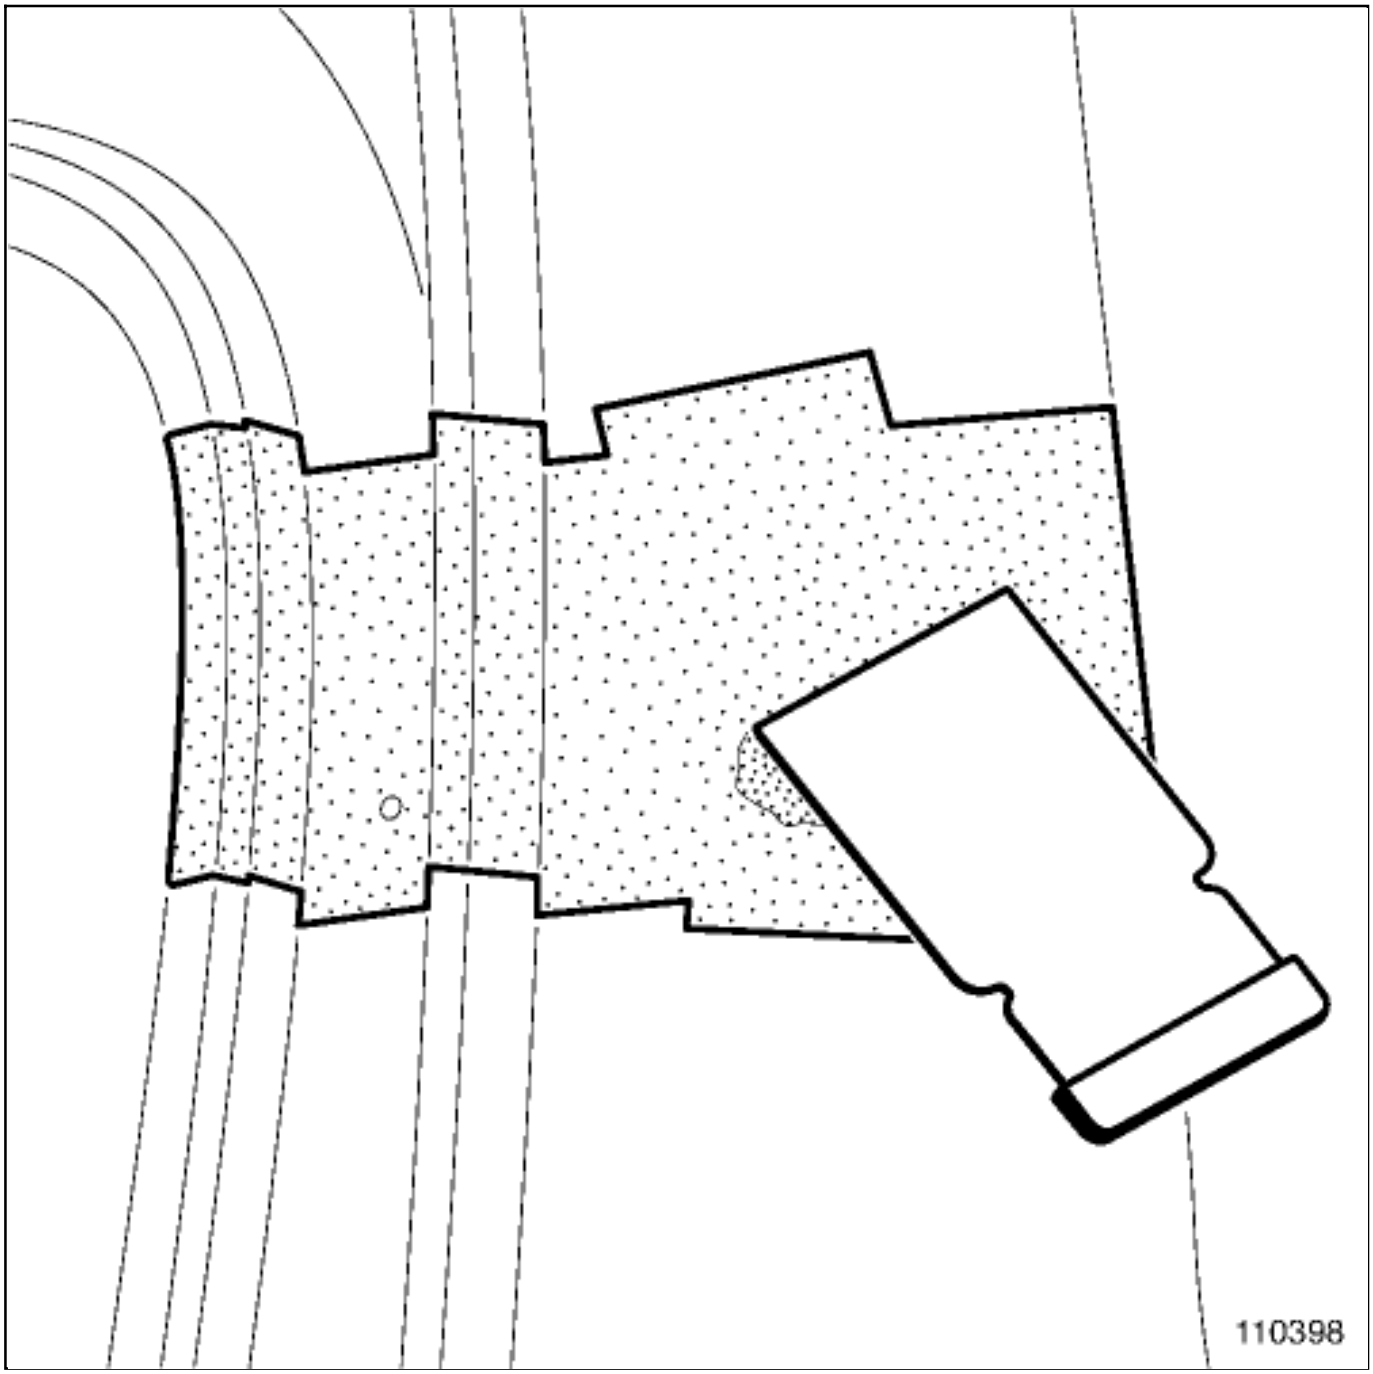


Do the plug welds.



Carry out the butt welding using a bead of chain weld.

4- GRINDING THE WELDS



Level off the weld beads and the plug welds(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use) .

5- SHAPE FINISHING

Scour the areas which will receive sealant to provide adherence.

On the visible parts, finish with a coat of sealant on both sides.

Surface finish using a sander fitted with a P120(see 04F, Bodywork products and mountings, Panelwork finishing products: Use) dry disc.

RIM POLYURETHANE BODYWORK COMPONENT: PREPARATION AND PAINT RANGE

Note, one or more warnings are present in this procedure

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Note:

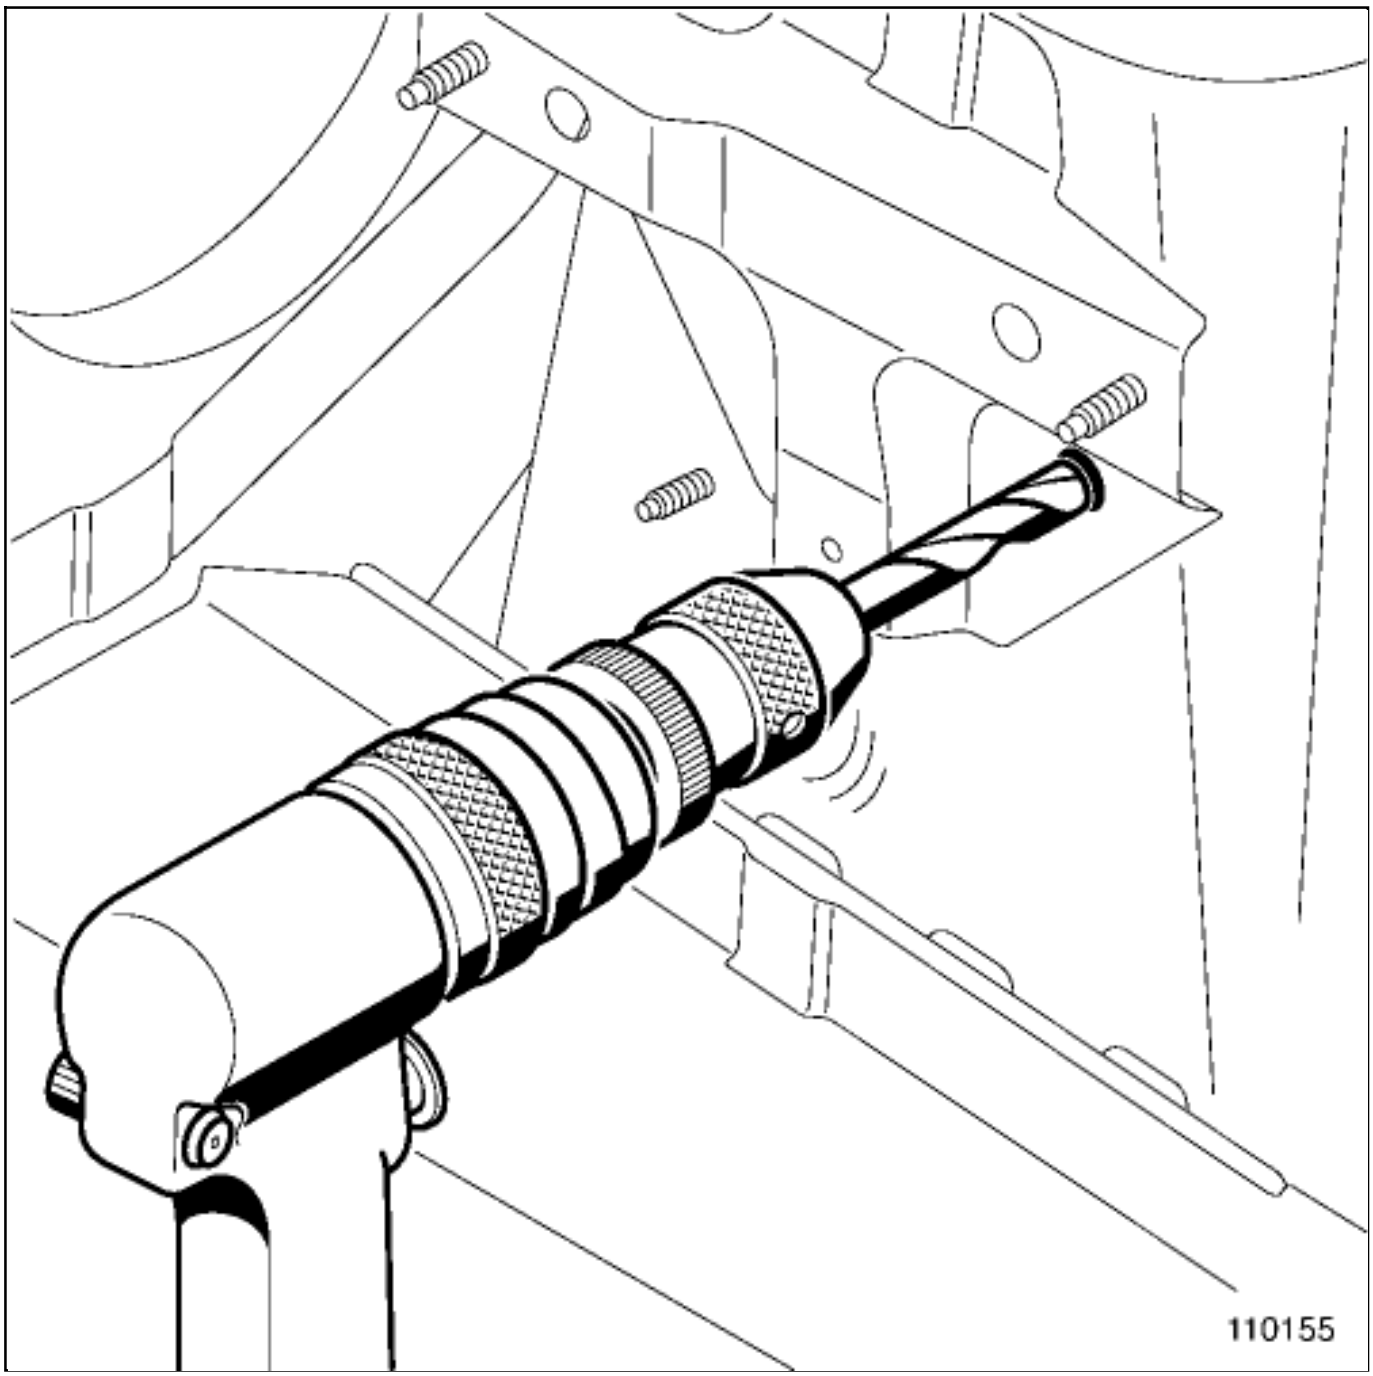
Before using the products, consult the manufacturer's technical sheet.

Note:

Never apply pre-treatment primer or primer filler on this type of material.

1. PRE PRIMED PARTS

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products). Wipe with a dry lint-free cloth.
3	Smooth	Grey pad soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products). Wipe with a dry lint-free cloth.
6	Rub with an adhesive pad	
7	Apply the paint finishing	
8	Dry	60 minat 45˚C(in order to avoid deforming the parts).



2. NON PRE-PRIMED PART

Steps	Description	Special notes
1	Internal and external washing with soapy water	Internal and external with soapy water. Rinsing in clean water.
2	Wipe / blow	
3	Degrease	Lint-free cloth soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products). Wipe with a dry lint-free cloth.
4	Smooth	Red rubber pad soaked in soapy water. Rinsing in clean water.
5	Wipe / blow	
6	Degrease	Lint-free cloth soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
7	Apply a bi-component primer	Apply wet on wetFortiaprimer or a flexibleLeviaprimer(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
8	Remove solvent / dry	20 minat 45˚C.
9	Sand	Rub down with the P800 abrasive sponge.
10	Degrease	Lint-free cloth soaked in antistatic thinner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
11	Eliminating porosities	If porosities, apply a finishing mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and repeat steps 6, 7, 8 and 9.
12	Apply the finishing paint	

13	Dry	60 minat 45˚C(in order to avoid deforming the parts).

RIVETEDCONNECTIONS

1. DISASSEMBLY

Remove the nail from the rivet head if still present.

Drill the rivet head using a drill bit which is slightly bigger than the diameter of the rivet body.

Remove the rivet body to separate the two components.

Remove the component to be replaced.

2. PREPARATION BEFORE ASSEMBLY

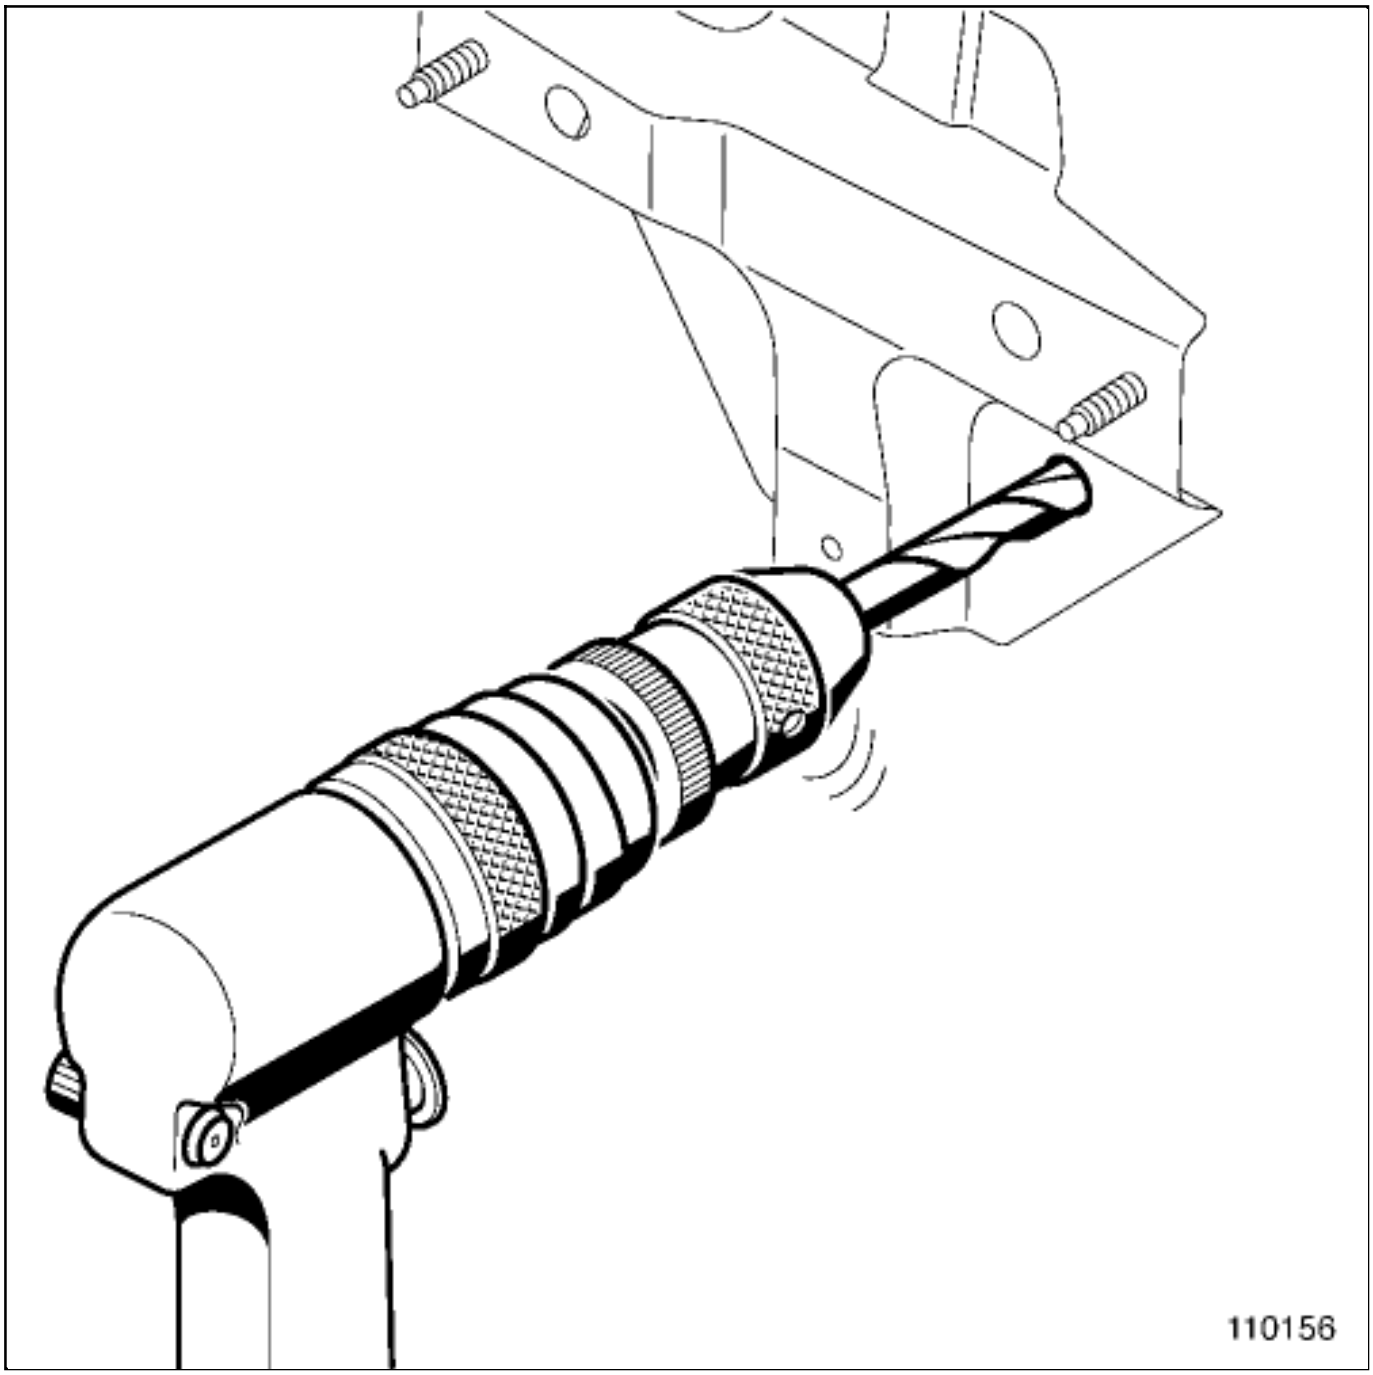
1- ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Note:



If a spot weld must be replaced with a rivet, simultaneously drill the spare part and the part on the vehicle depending on the diameter of the rivet used (see table below).

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the part.

3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Drill or pierce the locations marked previously, in accordance with the table below:

∅ rivet (mm)	4	4.8	6.4
∅ drilling hole (mm)	4.1 to 4.5	4.9 to 5.1	6.6 to 7

4- APPLY THE PROTECTION BEFORE ASSEMBLY

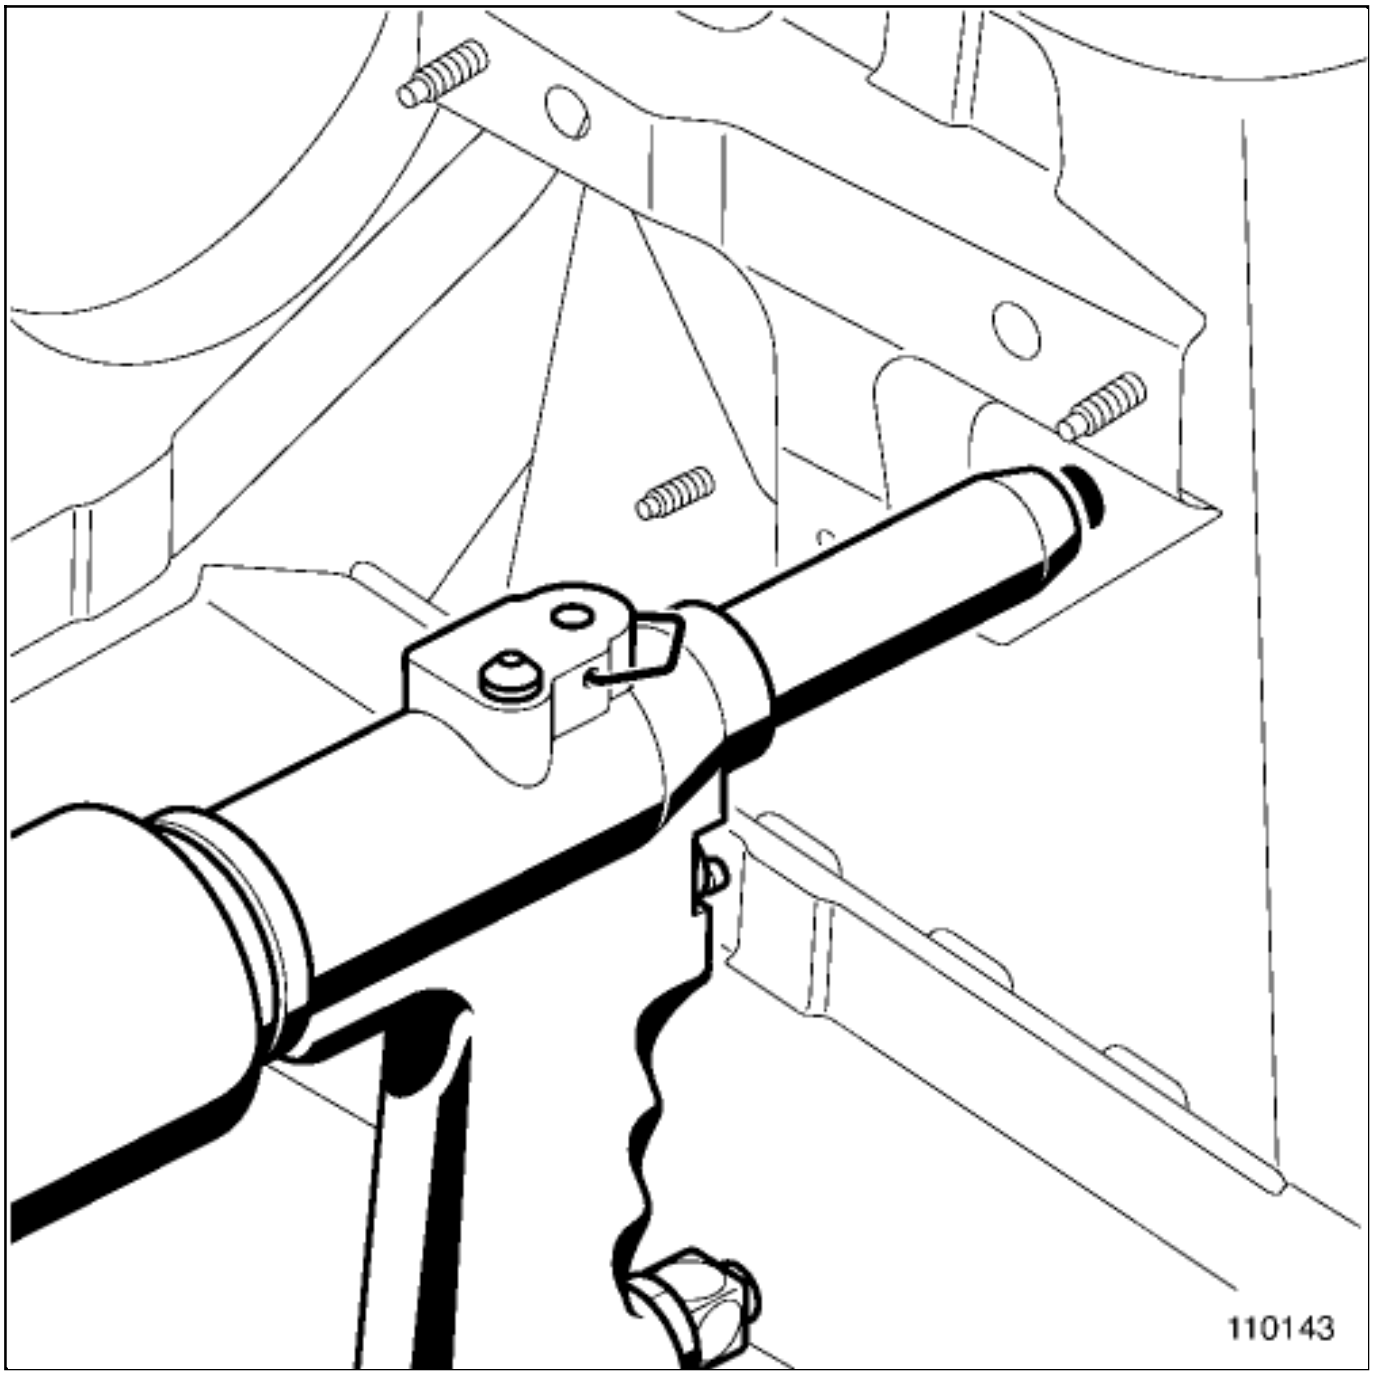
Fit the sound insulation inserts into the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection.

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3. ASSEMBLY



1- FITTING AND ADJUSTING THE REPLACED PARTS

Reassemble the part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- RIVETING

Fit the rivet.

Note:

In all cases, hold the pliers firmly when breaking the nail to avoid damaging the component.

Note:

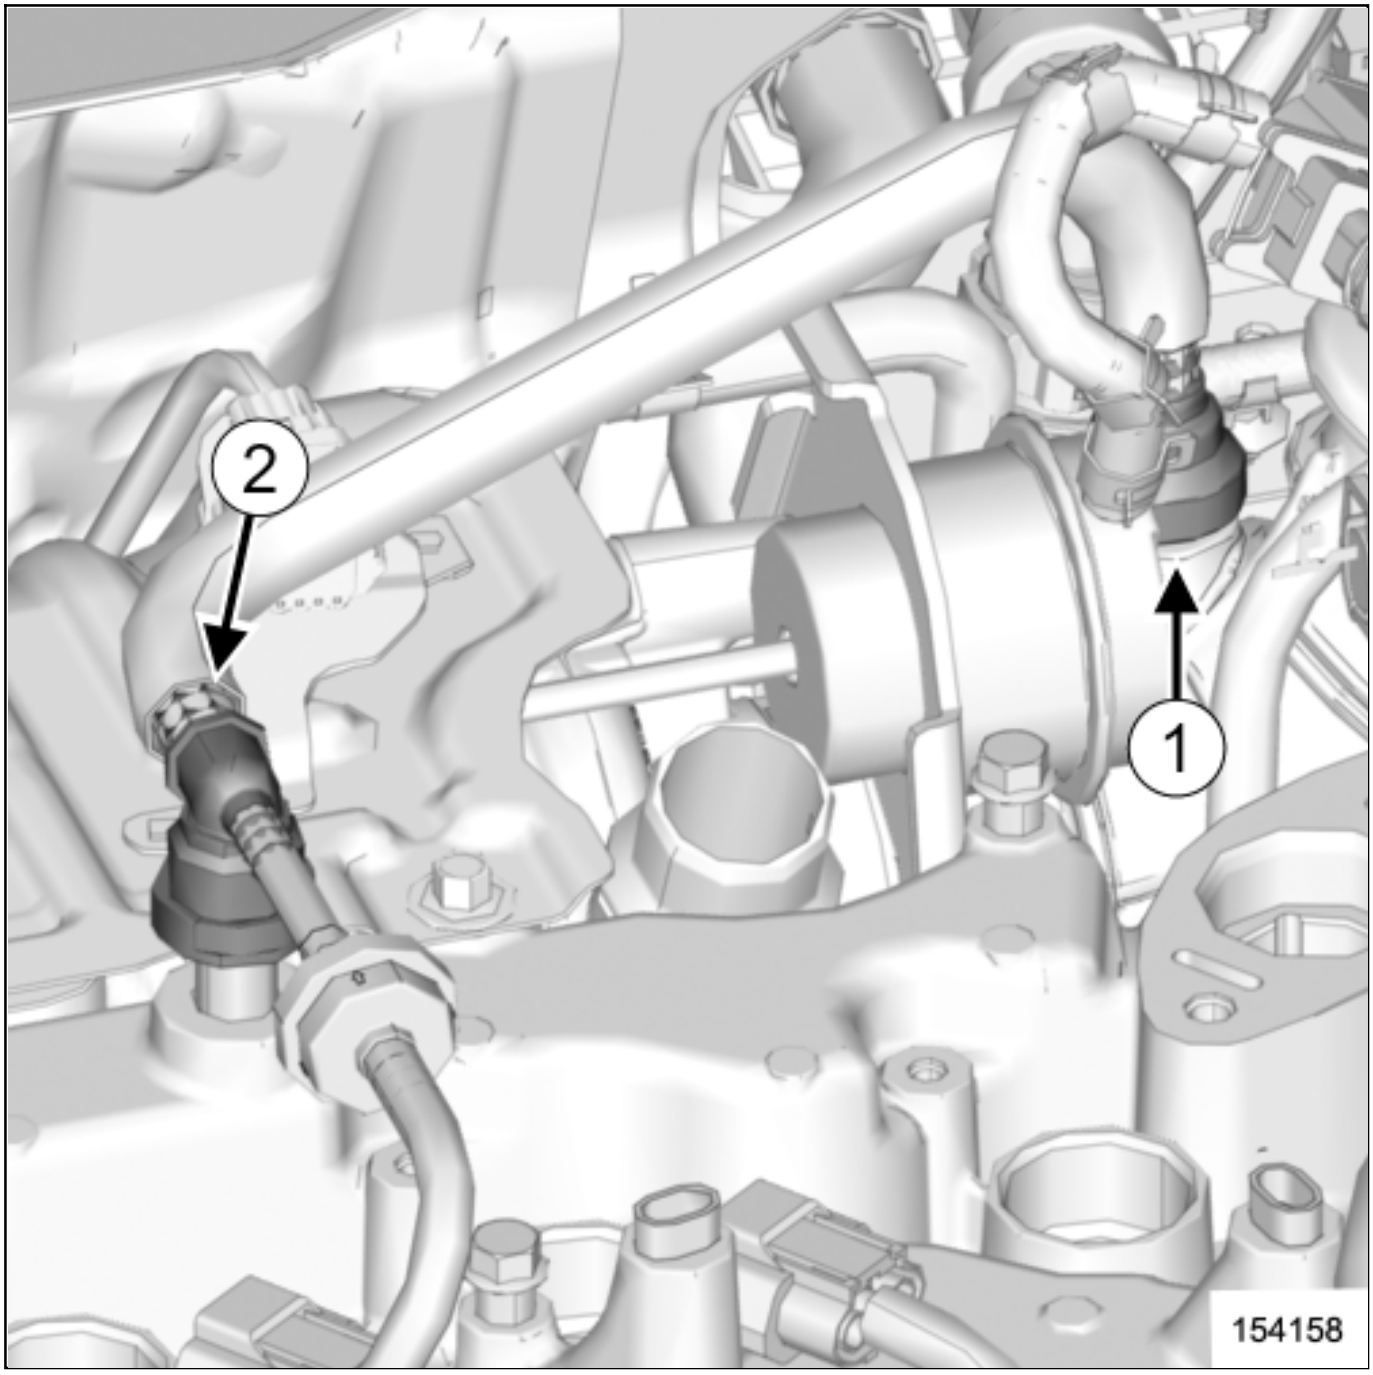
For riveting three thickness types, check that the components are correctly secured together and that the length of the rivet body is sufficient to ensure they are held.

XSL version : 3.02 du 22/07/11

ROCKER COVER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:



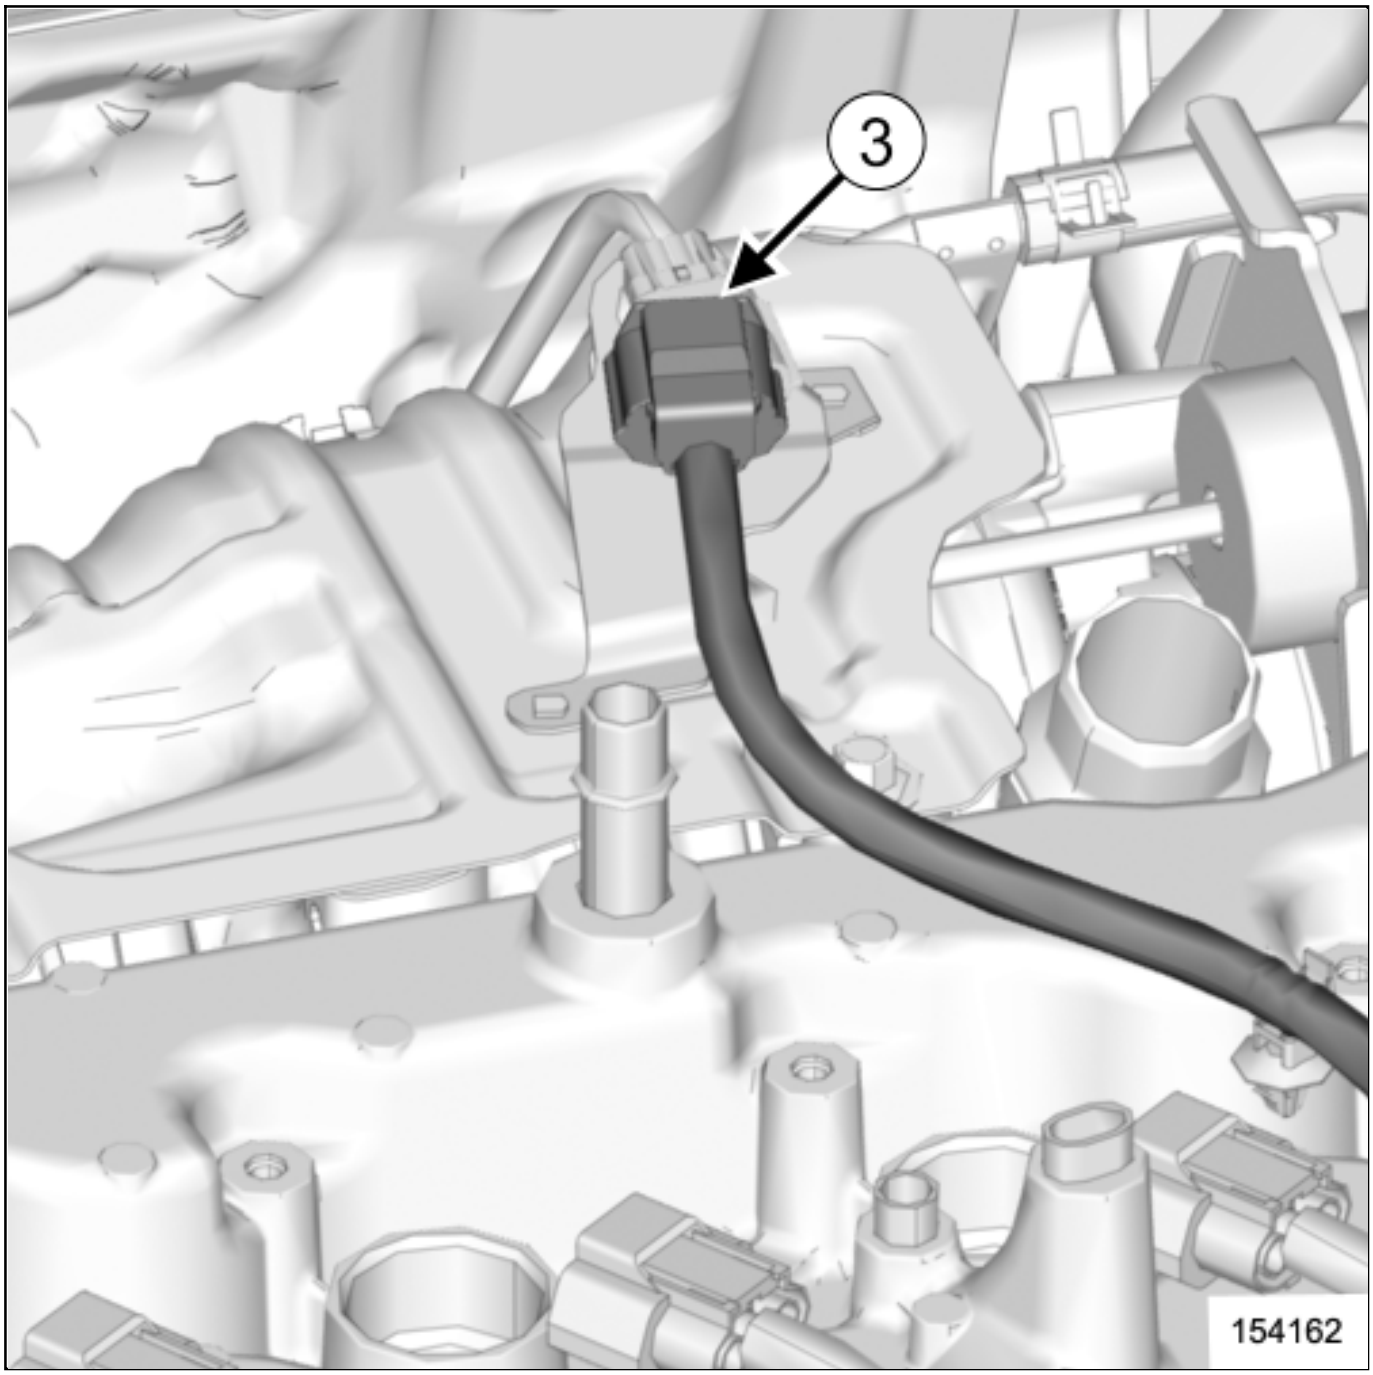
- rocker cover seal

Locations ans specifications (tightening torques, parts always to be replaced, etc...)(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the intercooler air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the throttle valve (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the high pressure pump (see **Petrol injection: List and location of components**) .

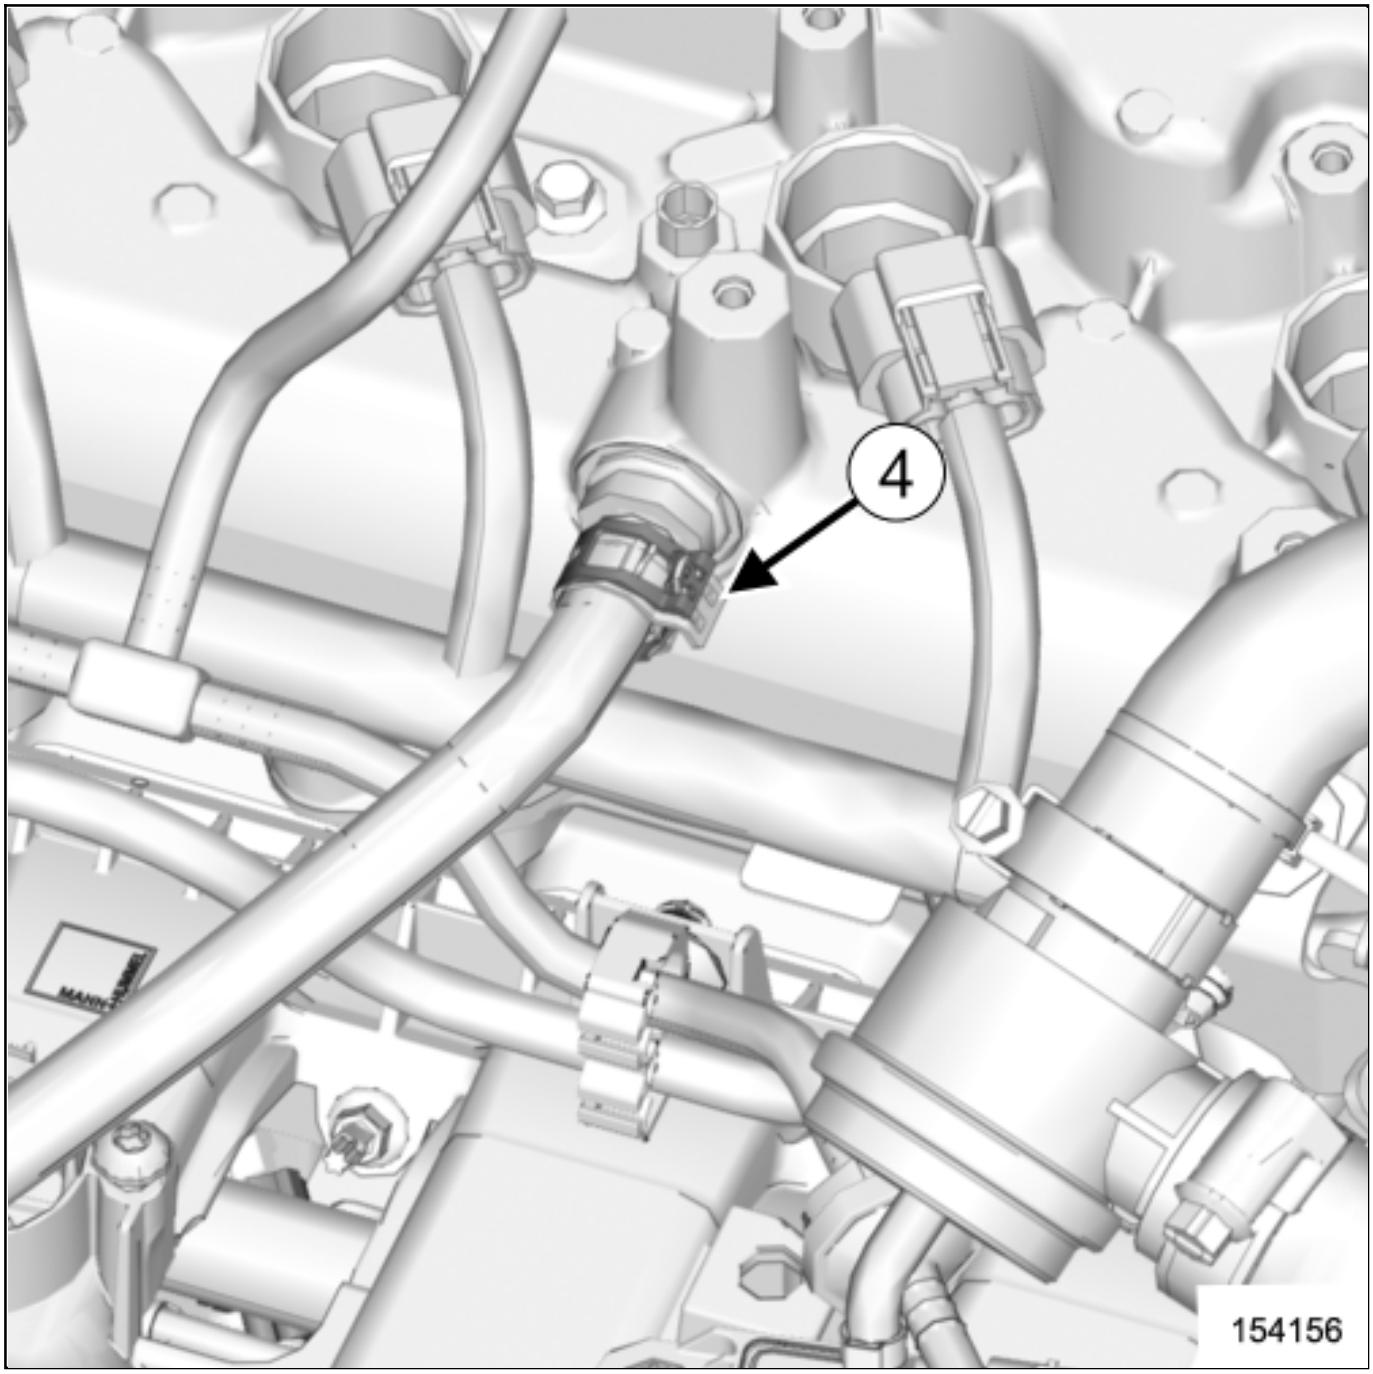


Disconnect:

- the petrol vapour rebreathing pipe from the turbo-manifold air inlet pipe(1) ,
- the petrol vapour rebreathing pipe from the rocker cover(2) .

Move the petrol vapour rebreathing pipe.

Remove:



- the ignition coil (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the camshaft position sensors (see **Engine and transmission assembly sensors: List and location of components**).

Disconnect the downstream oxygen sensor connector(3).

Unclip the downstream oxygen sensor connector.

Move the downstream oxygen sensor wiring.

Move the clip from oil vapour rebreathing pipe(4) .

Disconnect the oil vapour rebreathing pipe from the rocker cover.

Remove the upstream oxygen sensor (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upstream oxygen sensor connector bracket bolts,
- the upstream oxygen sensor connector bracket.

Unclip the downstream oxygen sensor wiring from the upper turbo-manifold heat shield.

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upper turbo-manifold heat shield bolts,
- the upper turbo-manifold heat shield.

Unclip:

- the clips from the engine wiring,
- the clip from the exhaust camshaft position sensor wiring.

2. REMOVAL OPERATION

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the rocker cover bolts,
- the rocker cover,

the rocker cover seal.

Note:

The rocker cover bolts are not the same length mark their positions.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: rocker cover seal .

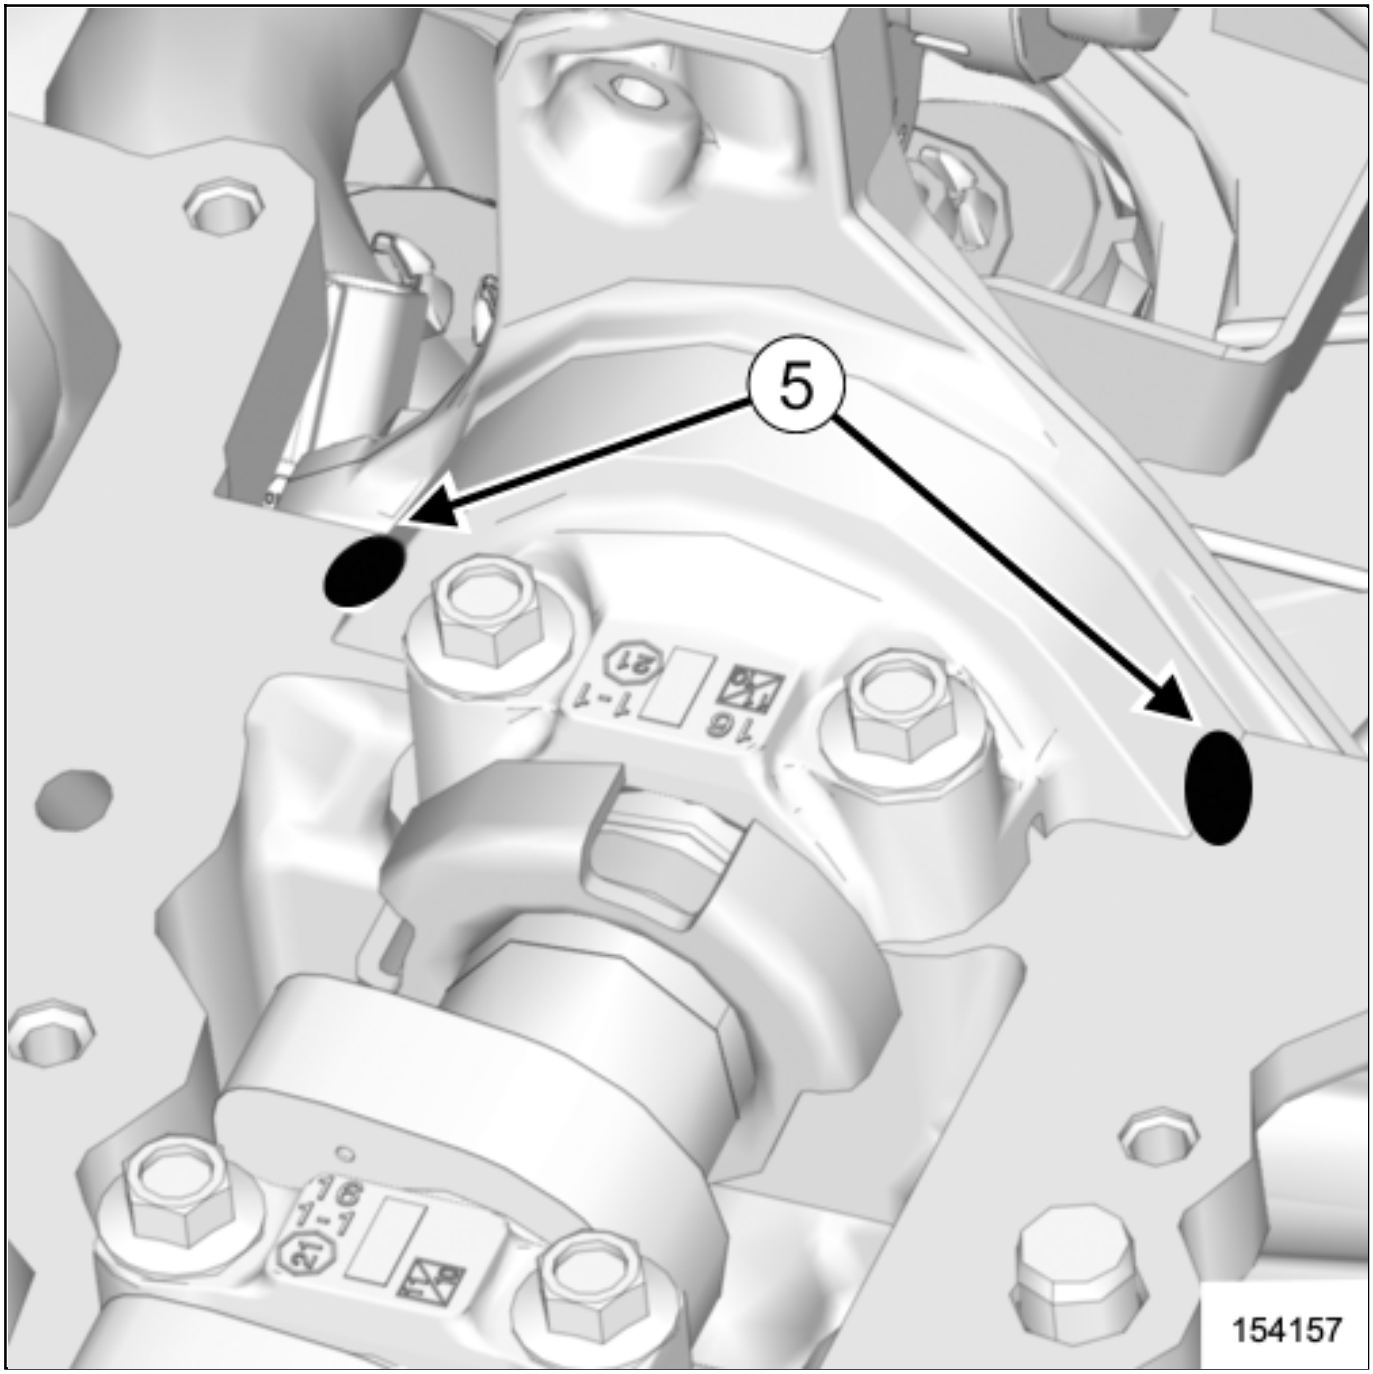
CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION



Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

Clean and degrease the joint faces using surface cleanerVehicle: Parts and consumables for the repair .

Apply dots (5) of silicone adhesive sealant Vehicle: Parts and consumables for the repair to the cylinder head.

2. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the new rocker cover seal,

- the rocker cover,
- the rocker cover bolts.

Torque tighten in the order the rocker cover bolts(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

3. FINAL OPERATION

Clip:

- the engine wiring clips,
- the exhaust camshaft position sensor wiring clip.

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upper turbo-manifold heat shield,
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield bolts(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upstream oxygen sensor connector bracket,
- the upstream oxygen sensor connector bracket bolts.

Torque tighten the upstream oxygen sensor connector bracket bolts(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

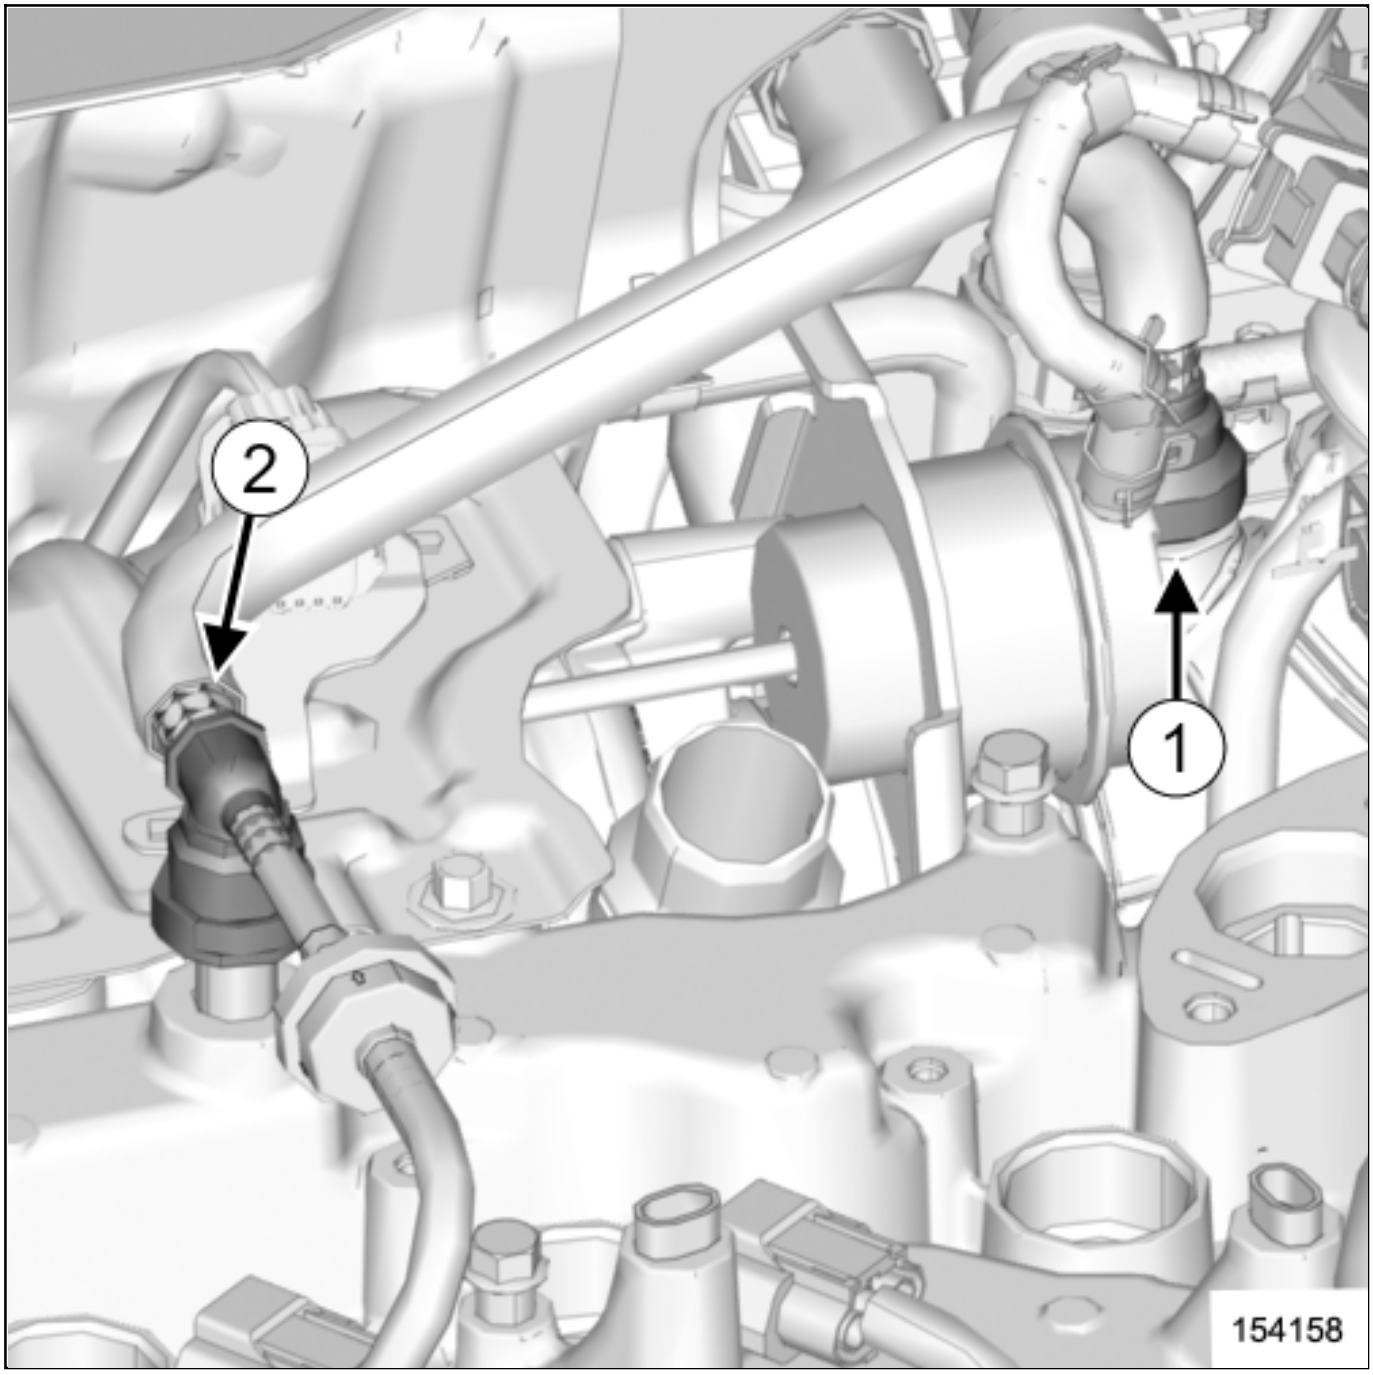
Proceed in the reverse order to removal.

Top up with engine oil recommended by the manufacturer(see 10A, Engine and cylinder block assembly , Engine oil - Oil filter : Draining - Filling) .

ROCKER COVER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:



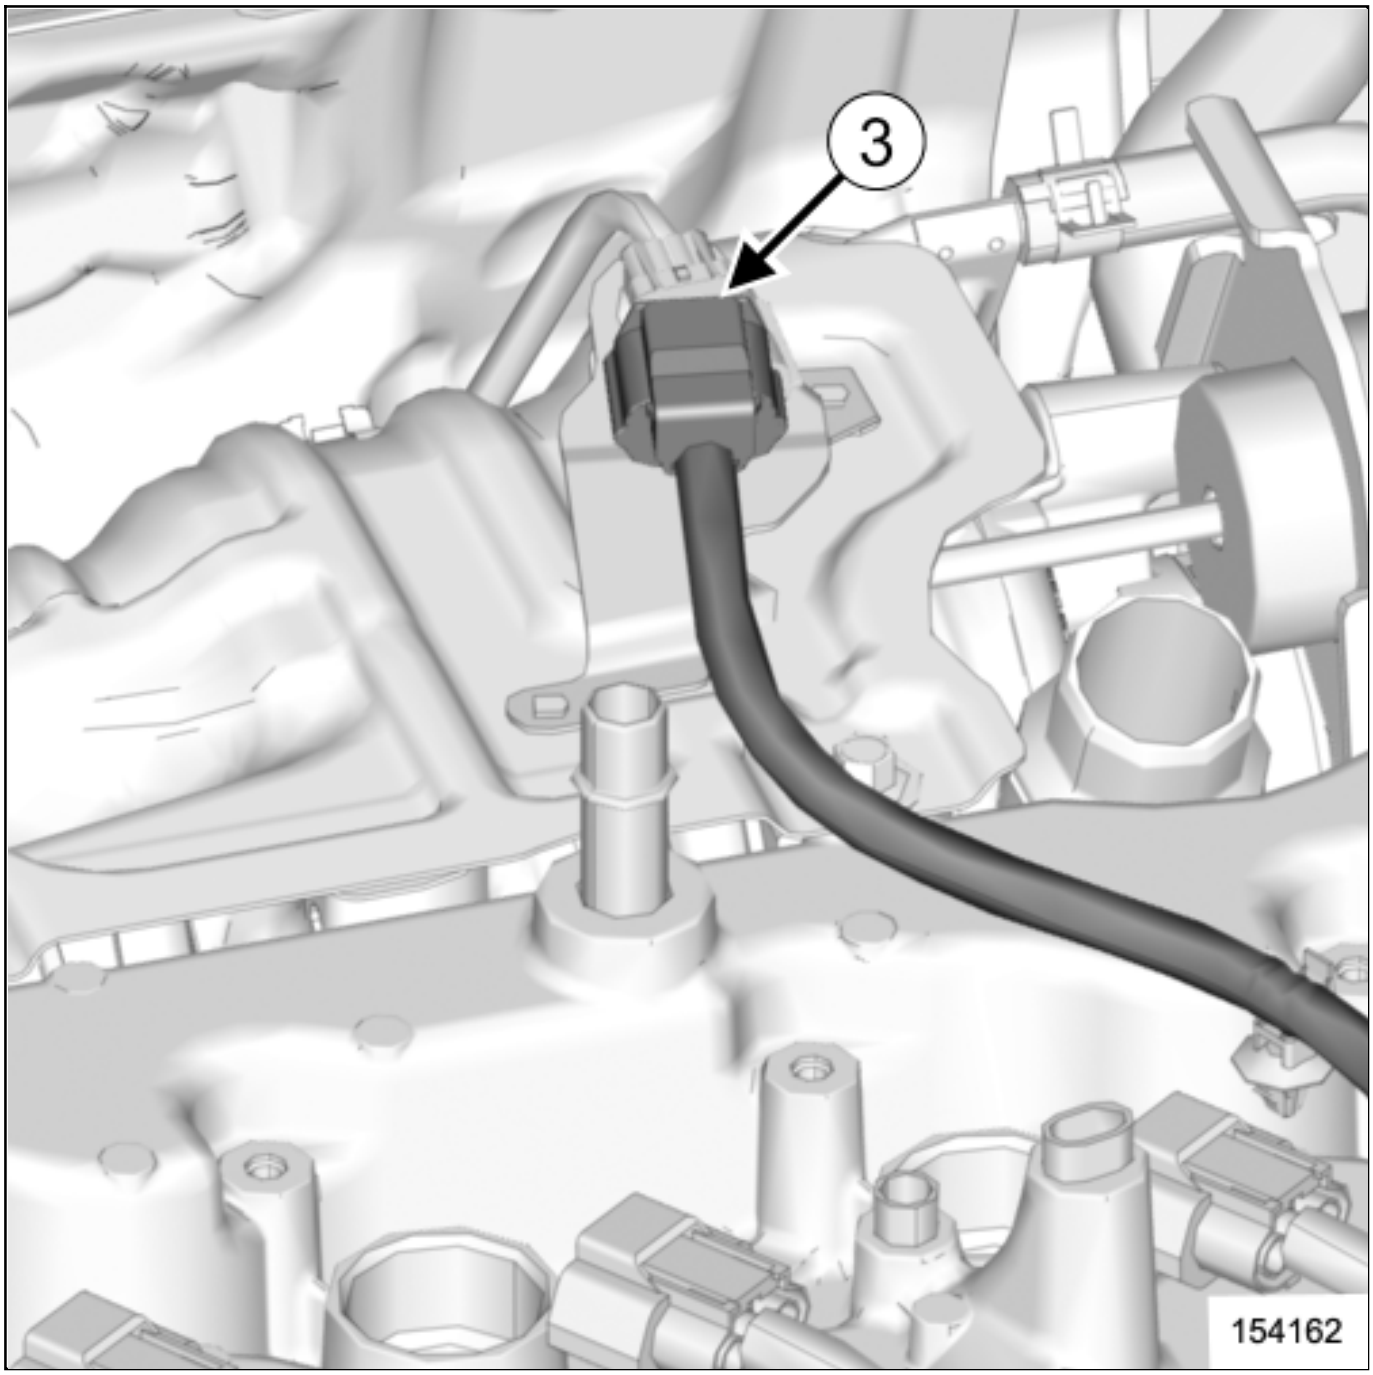
- rocker cover seal

Locations ans specifications (tightening torques, parts always to be replaced, etc...)(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the intercooler air inlet pipeAir inlet assembly: Exploded view ,
  - the throttle valveAir inlet assembly: Exploded view ,
  - the high pressure pump(see **Petrol injection: List and location of components**) .

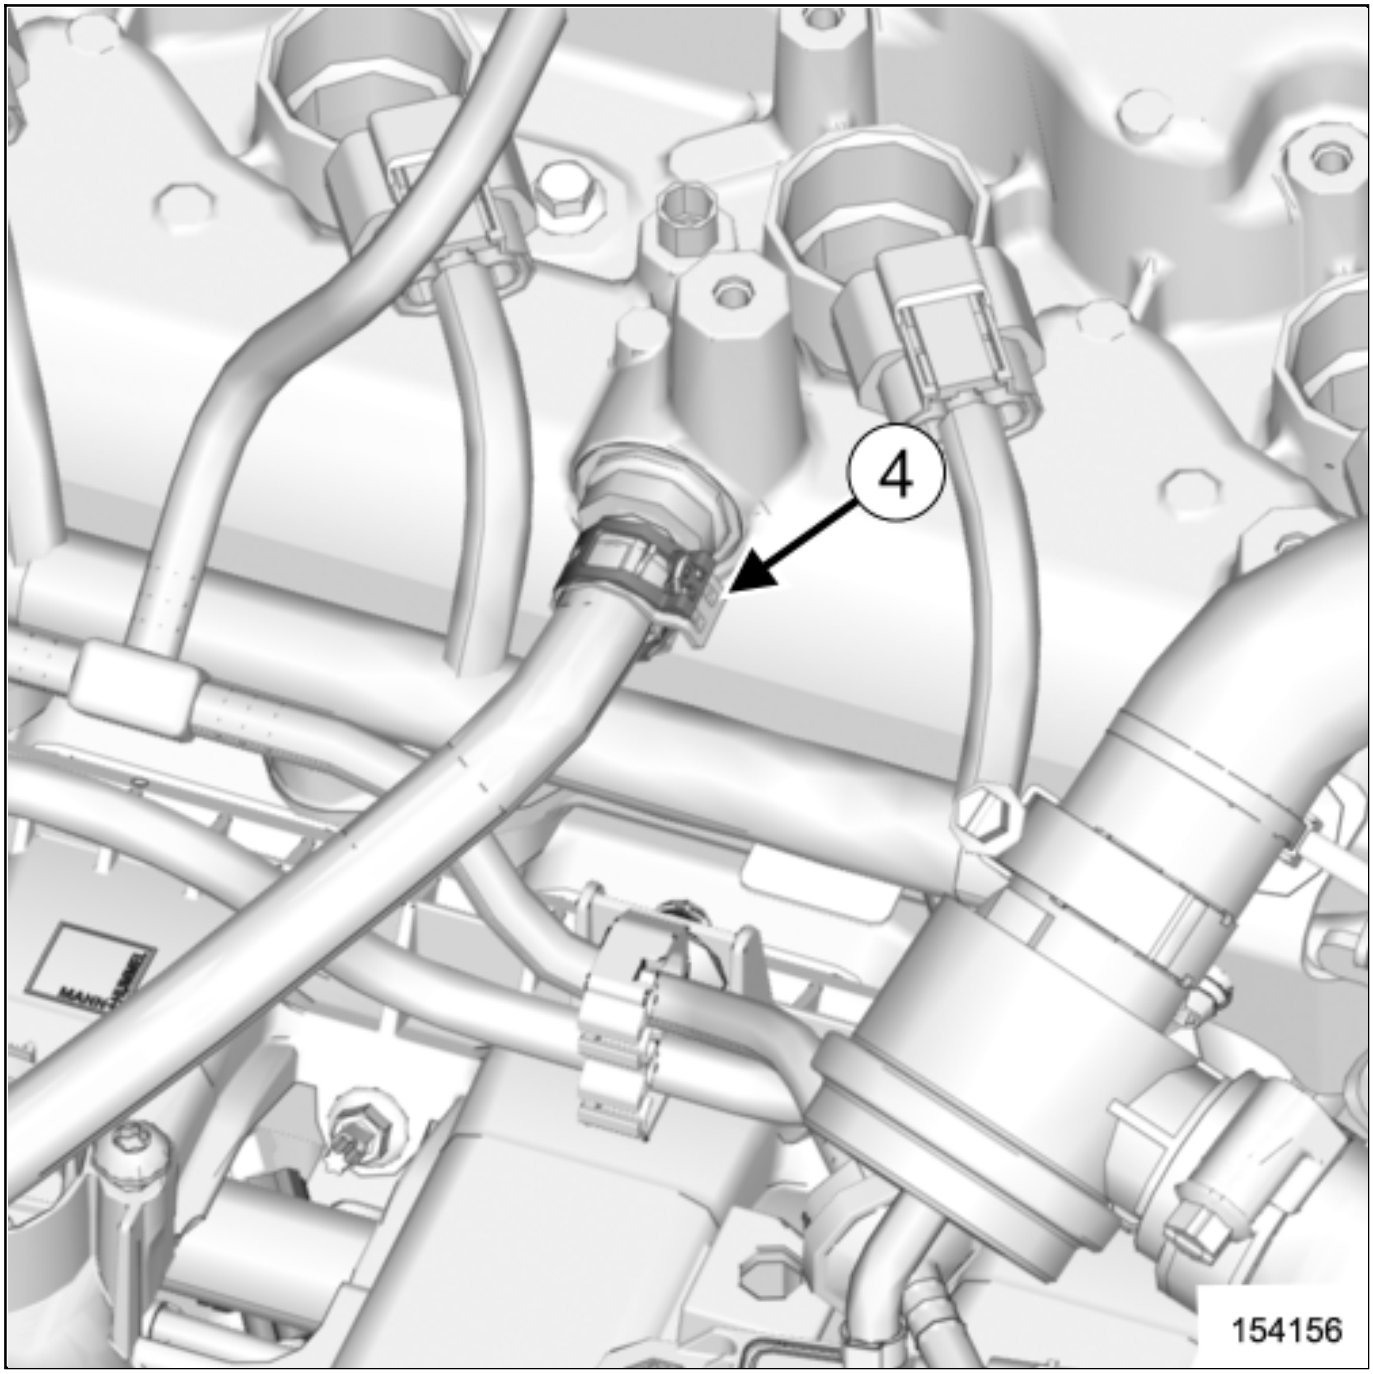


Disconnect:

- the petrol vapour rebreathing pipe from the turbo-manifold air inlet pipe(1) ,
- the petrol vapour rebreathing pipe from the rocker cover(2) .

Move the petrol vapour rebreathing pipe.

Remove:



- the ignition coil (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the camshaft position sensors (see **Engine and transmission assembly sensors: List and location of components**).

Disconnect the downstream oxygen sensor connector(3).

Unclip the downstream oxygen sensor connector.

Move the downstream oxygen sensor wiring.

Move the clip from oil vapour rebreathing pipe(4) .

Disconnect the oil vapour rebreathing pipe from the rocker cover.

Remove the upstream oxygen sensor **Exhaust assembly in engine compartment: Exploded view** .

Remove **Exhaust assembly in engine compartment: Exploded view** :

- the upstream oxygen sensor connector bracket bolts,
- the upstream oxygen sensor connector bracket.

Unclip the downstream oxygen sensor wiring from the upper turbo-manifold heat shield.

Remove **Exhaust assembly in engine compartment: Exploded view** :

- the upper turbo-manifold heat shield bolts,
- the upper turbo-manifold heat shield.

Unclip:

- the clips from the engine wiring,
- the clip from the exhaust camshaft position sensor wiring.

2. REMOVAL OPERATION

Remove **(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)** :

- the rocker cover bolts,
- the rocker cover,

the rocker cover seal.

Note:

The rocker cover bolts are not the same length mark their positions.

REFITTING

1. REFITTING PREPARATION OPERATION

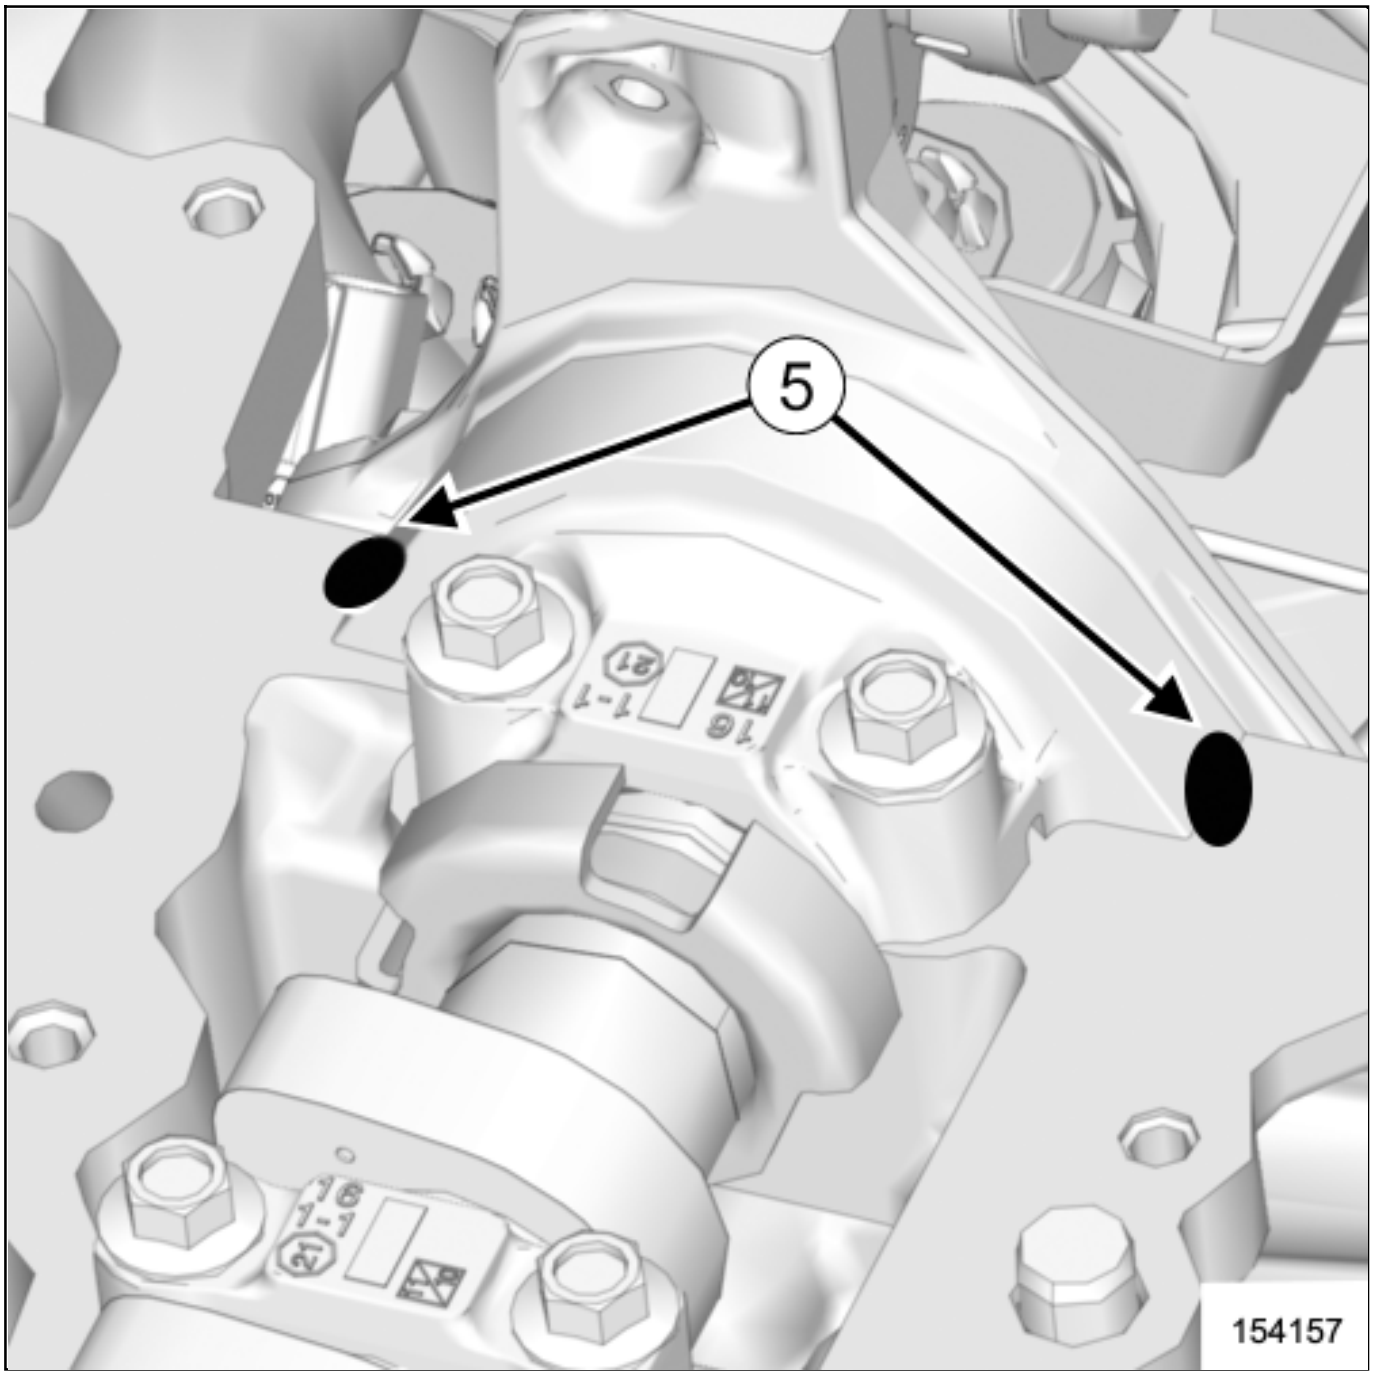
parts always to be replaced: rocker cover seal .

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.



CAUTION

Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

Clean and degrease the joint faces using surface cleaner Vehicle: Parts and consumables for the repair .

Apply dots (5) of silicone adhesive sealant Vehicle: Parts and consumables for the repair to the cylinder head.

2. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the new rocker cover seal,
- the rocker cover,
- the rocker cover bolts.

Torque tighten in the order the rocker cover bolts(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

3. FINAL OPERATION

Clip:

- the engine wiring clips,
- the exhaust camshaft position sensor wiring clip.

Refit Exhaust assembly in engine compartment: Exploded view :

- the upper turbo-manifold heat shield,
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield boltsExhaust assembly in engine compartment: Exploded view .

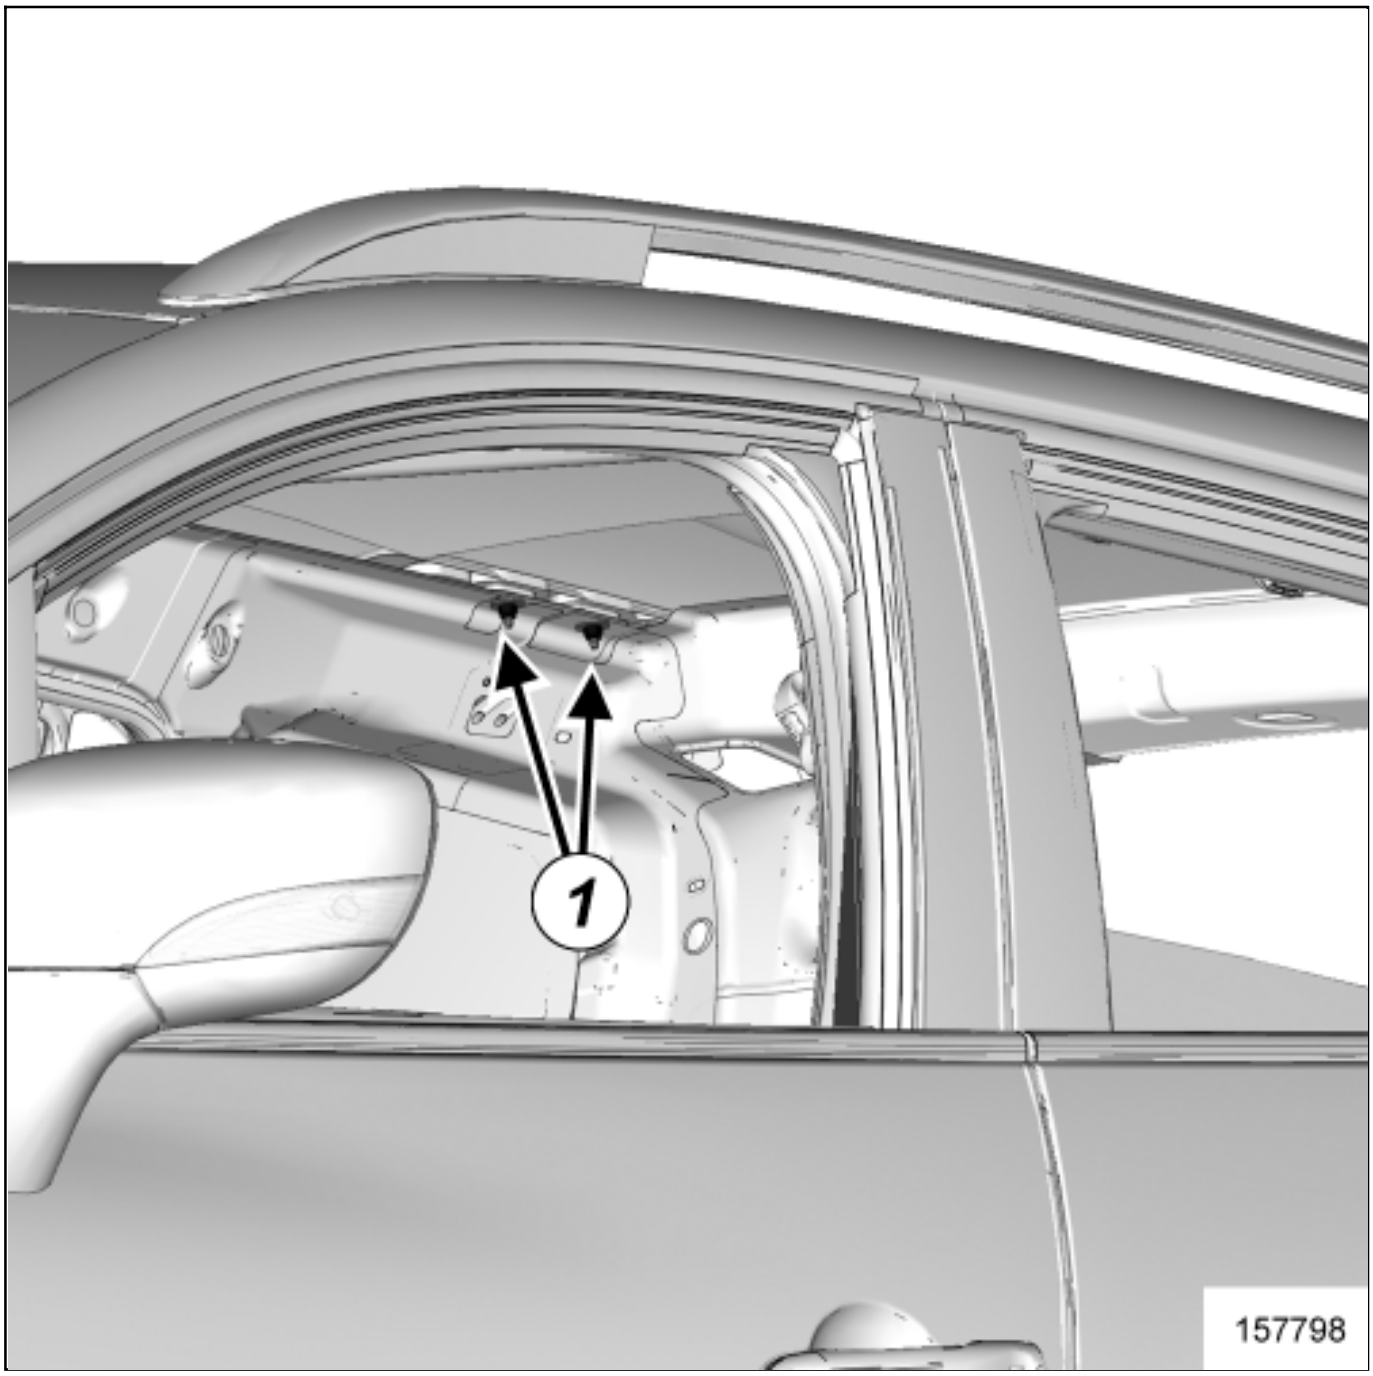
Refit Exhaust assembly in engine compartment: Exploded view :

- the upstream oxygen sensor connector bracket,
- the upstream oxygen sensor connector bracket bolts.

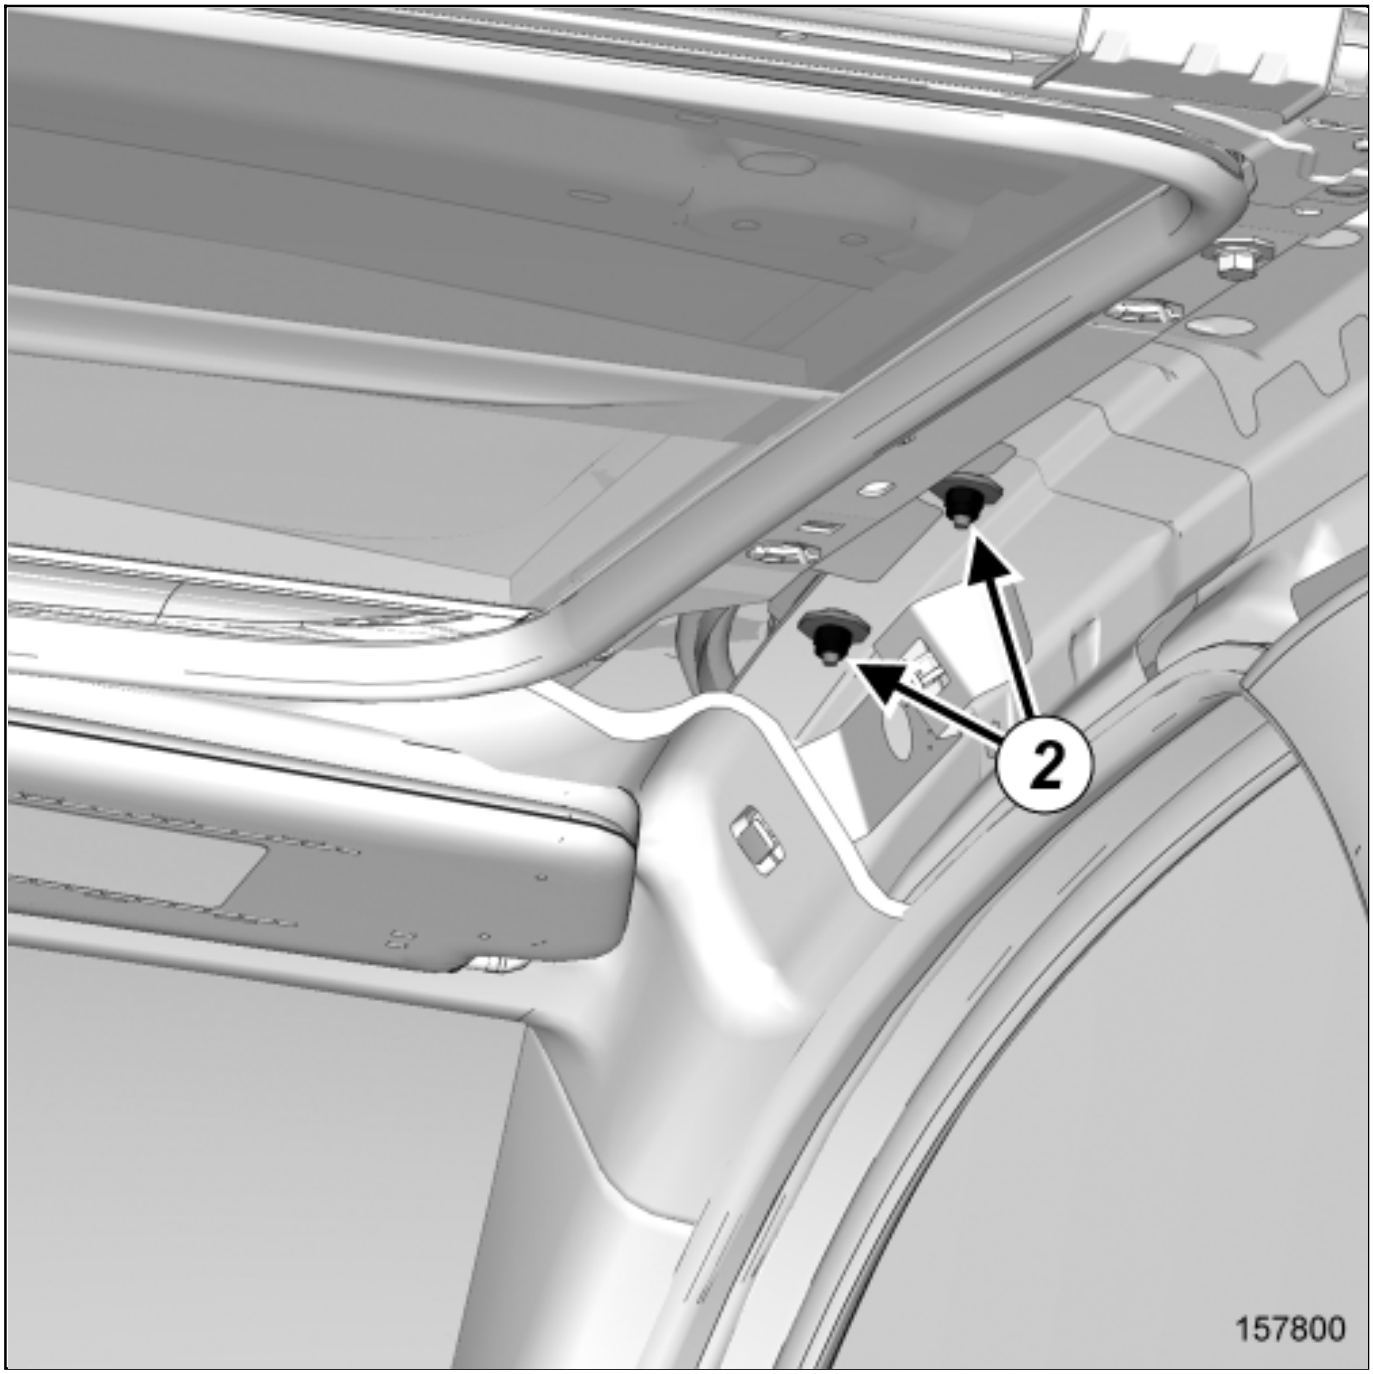
Torque tighten the upstream oxygen sensor connector bracket bolts**Exhaust assembly in engine compartment: Exploded view** .

Proceed in the reverse order to removal.

Top up with engine oil recommended by the manufacturer**Engine oil - Oil filter : Draining - Filling** .



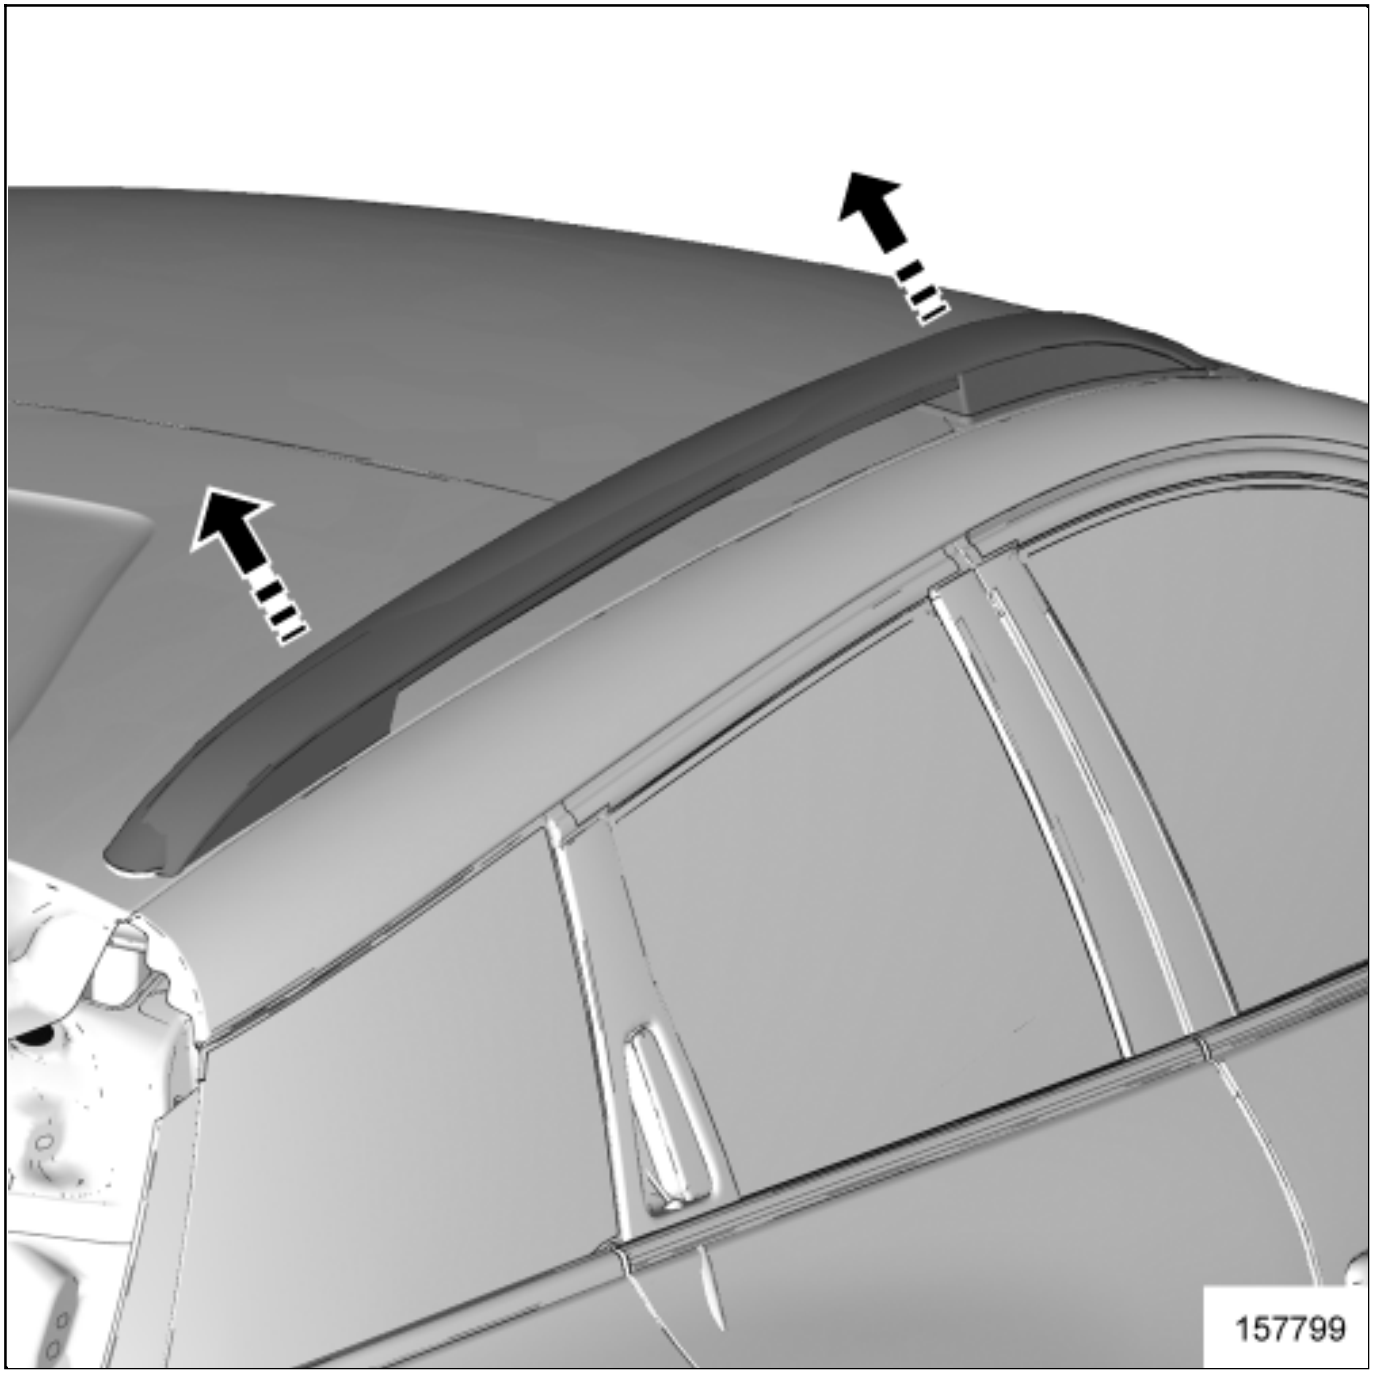
ROOF BAR: REMOVAL - REFITTING



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove Roof trim assembly: Exploded view :
  - the grab handles,
  - the headlining partially.



2. REMOVAL OPERATION

1
157798

Remove:

- the rear roof bar nuts(1) ,
- the front roof bar nuts(2) .

Remove the roof bar following the direction of the arrows.

REFITTING

1. REFITTING PREPARATION OPERATION

Check the condition and cleanliness of:

-
- the roof bar,
- the roof,
-

the roof bar support plates (replace if necessary).

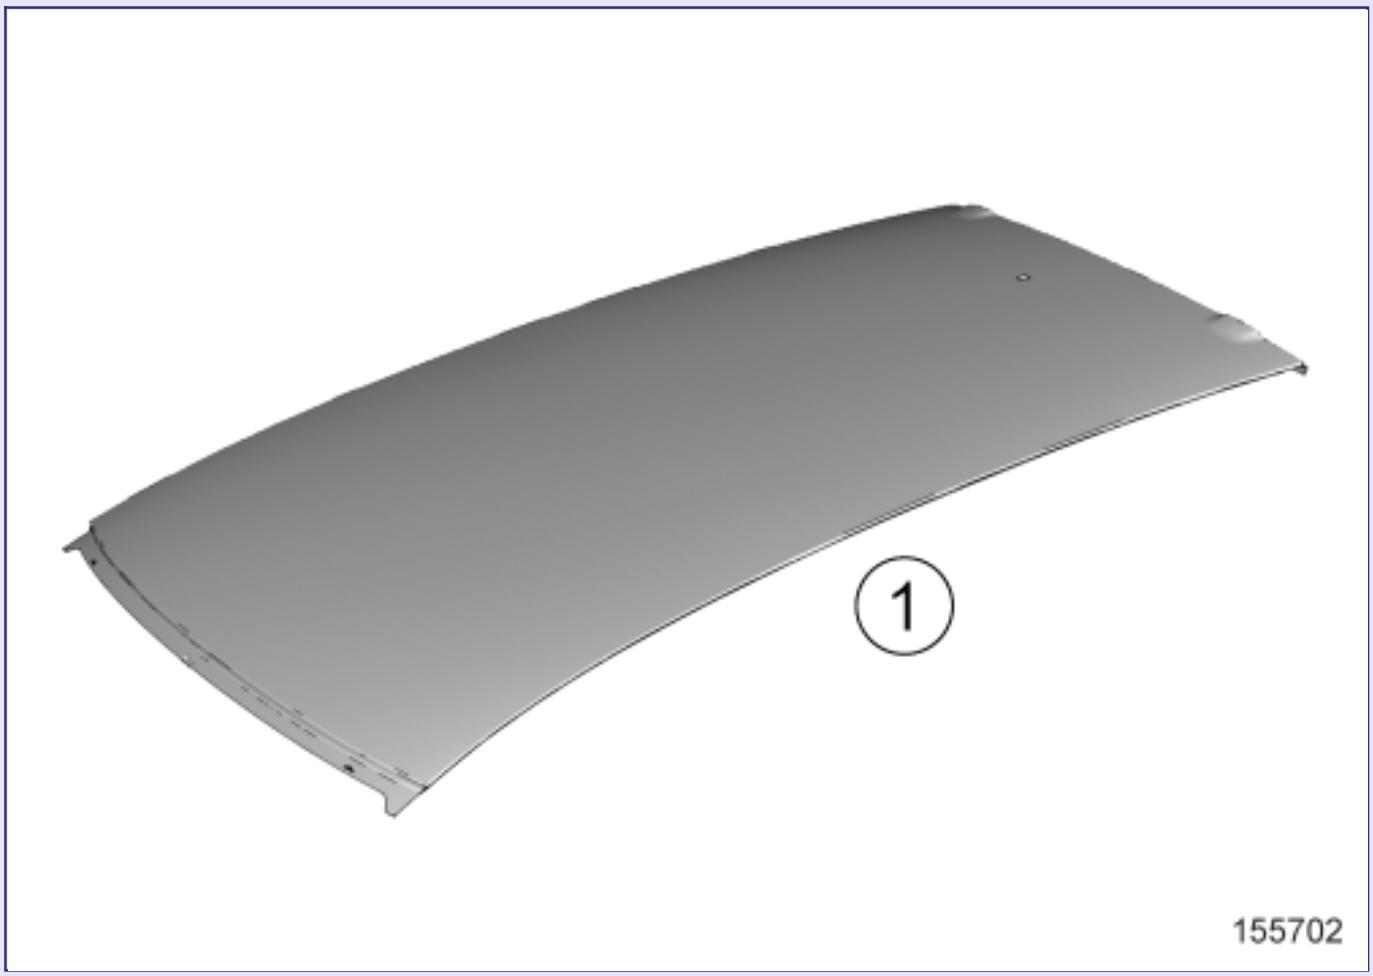
2. REFITTING OPERATION

Refit the roof bar.

Torque tighten the roof bar nuts8 N.m.

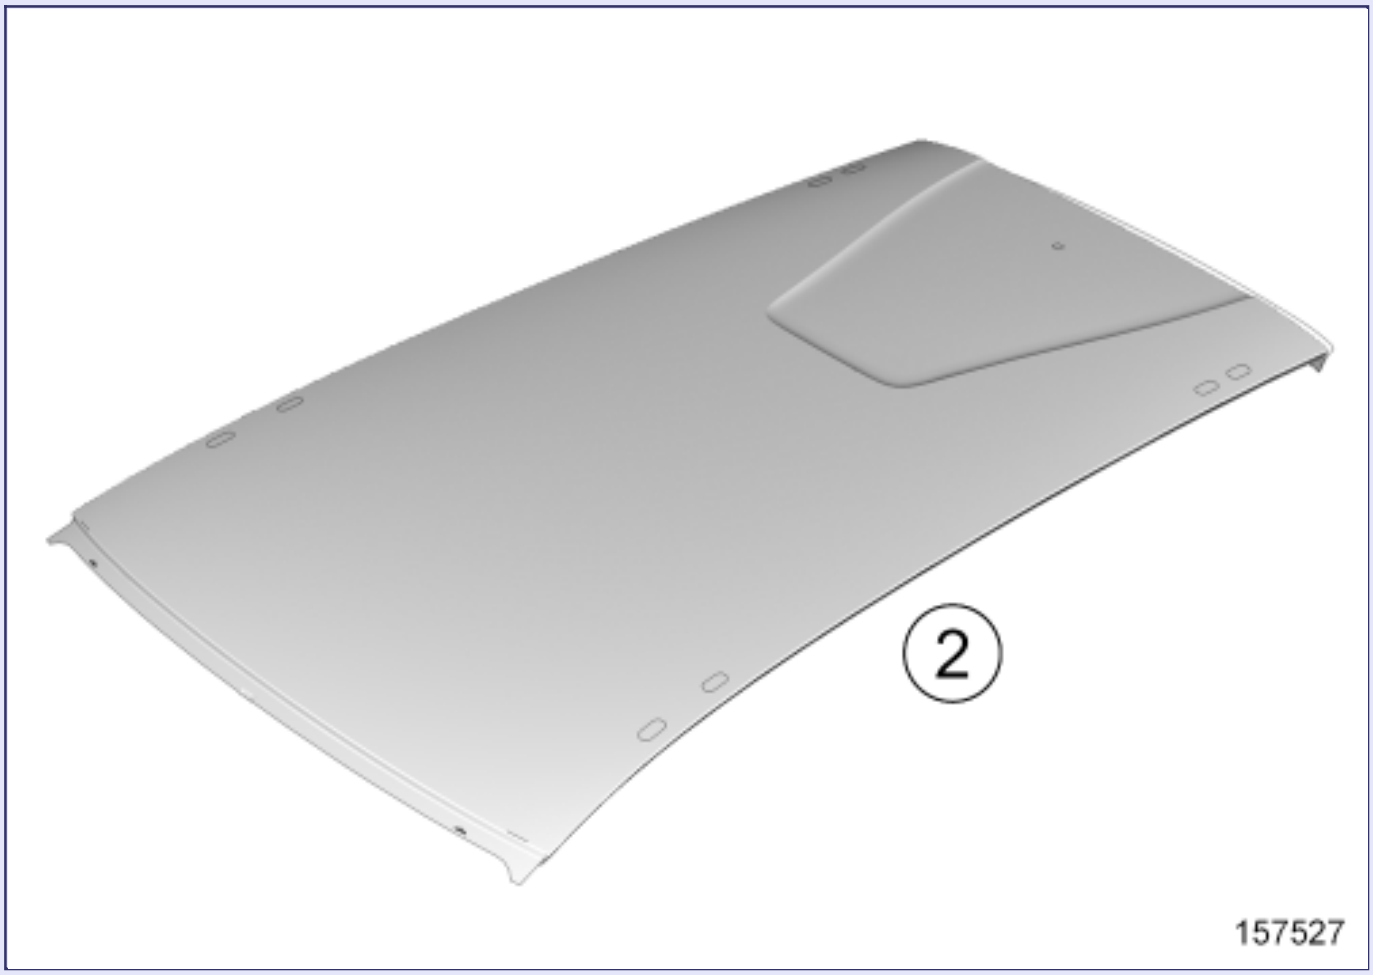
Check the sealing of the roof bars.

3. FINAL OPERATION



Proceed in the reverse order to removal.

ROOF:REPLACEMENT



Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

B98(B98)

No.	Description	Type	Thickness (mm)
(1)	Roof	Mild steel	0.75

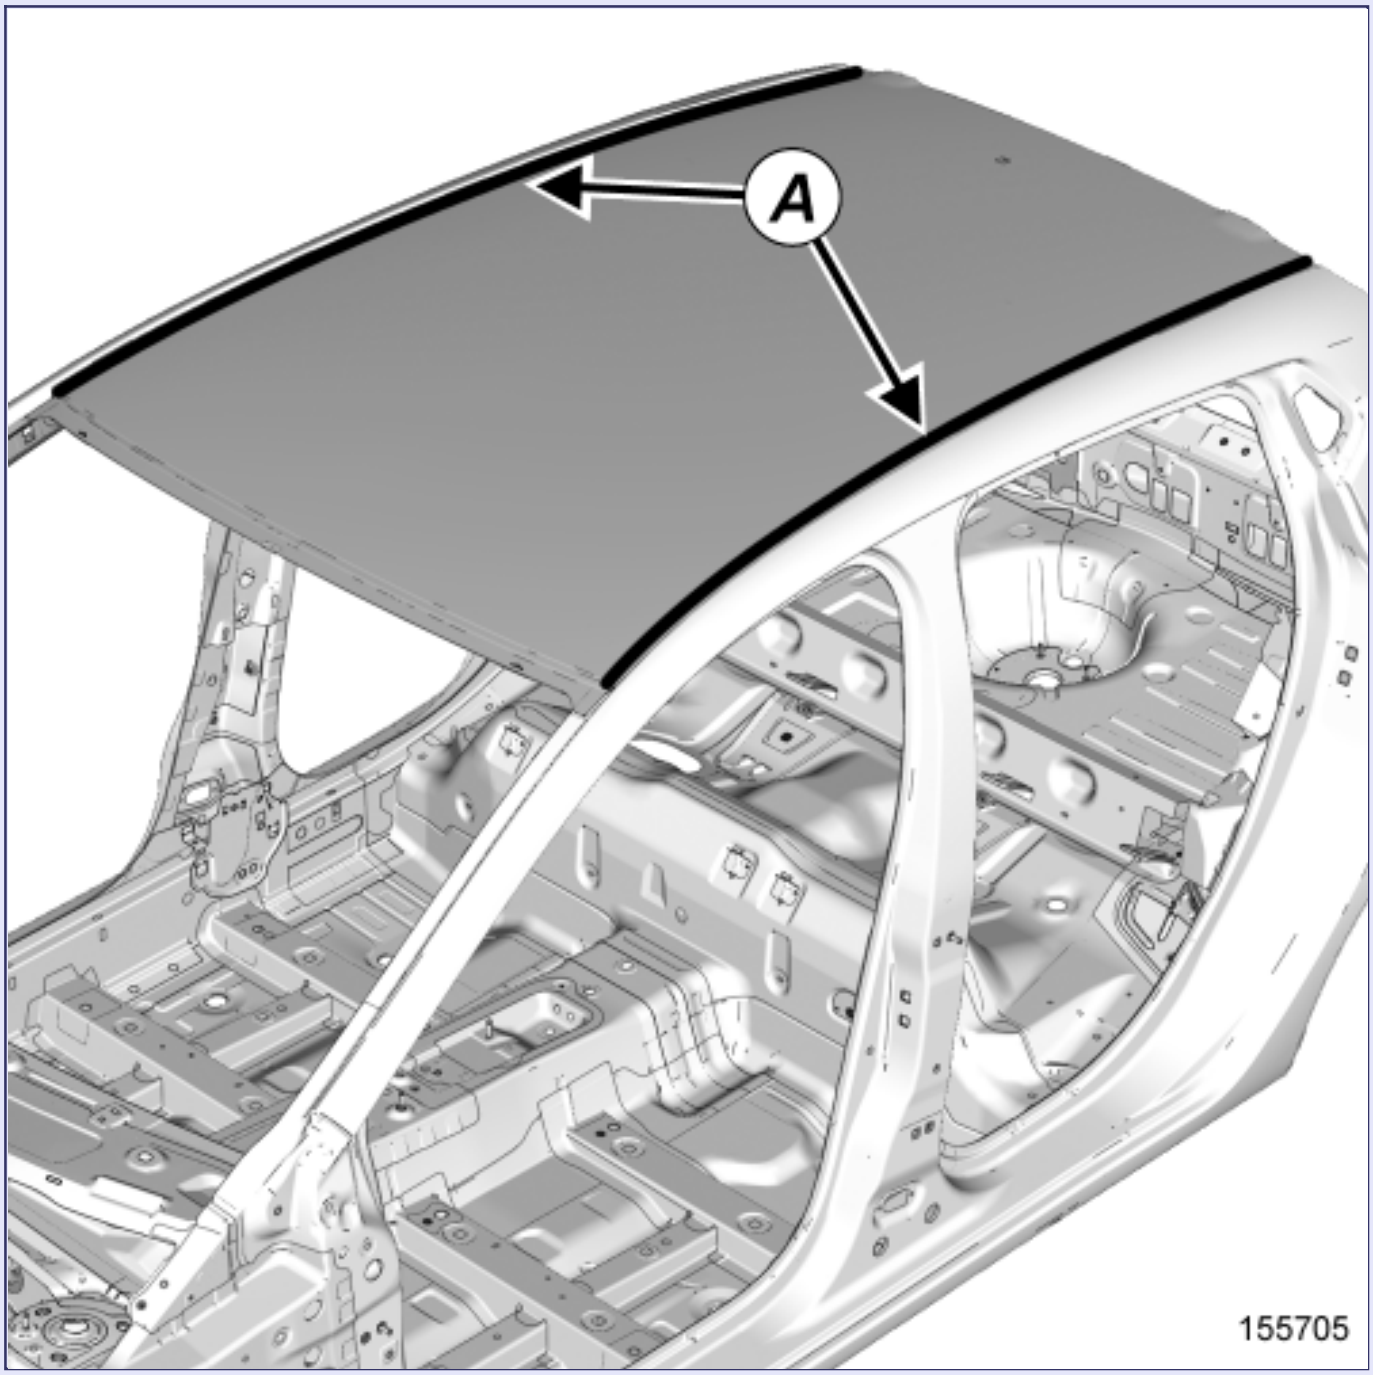
No.	Description	Type	Thickness (mm)
(2)	Roof	Mild steel	0.75

2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

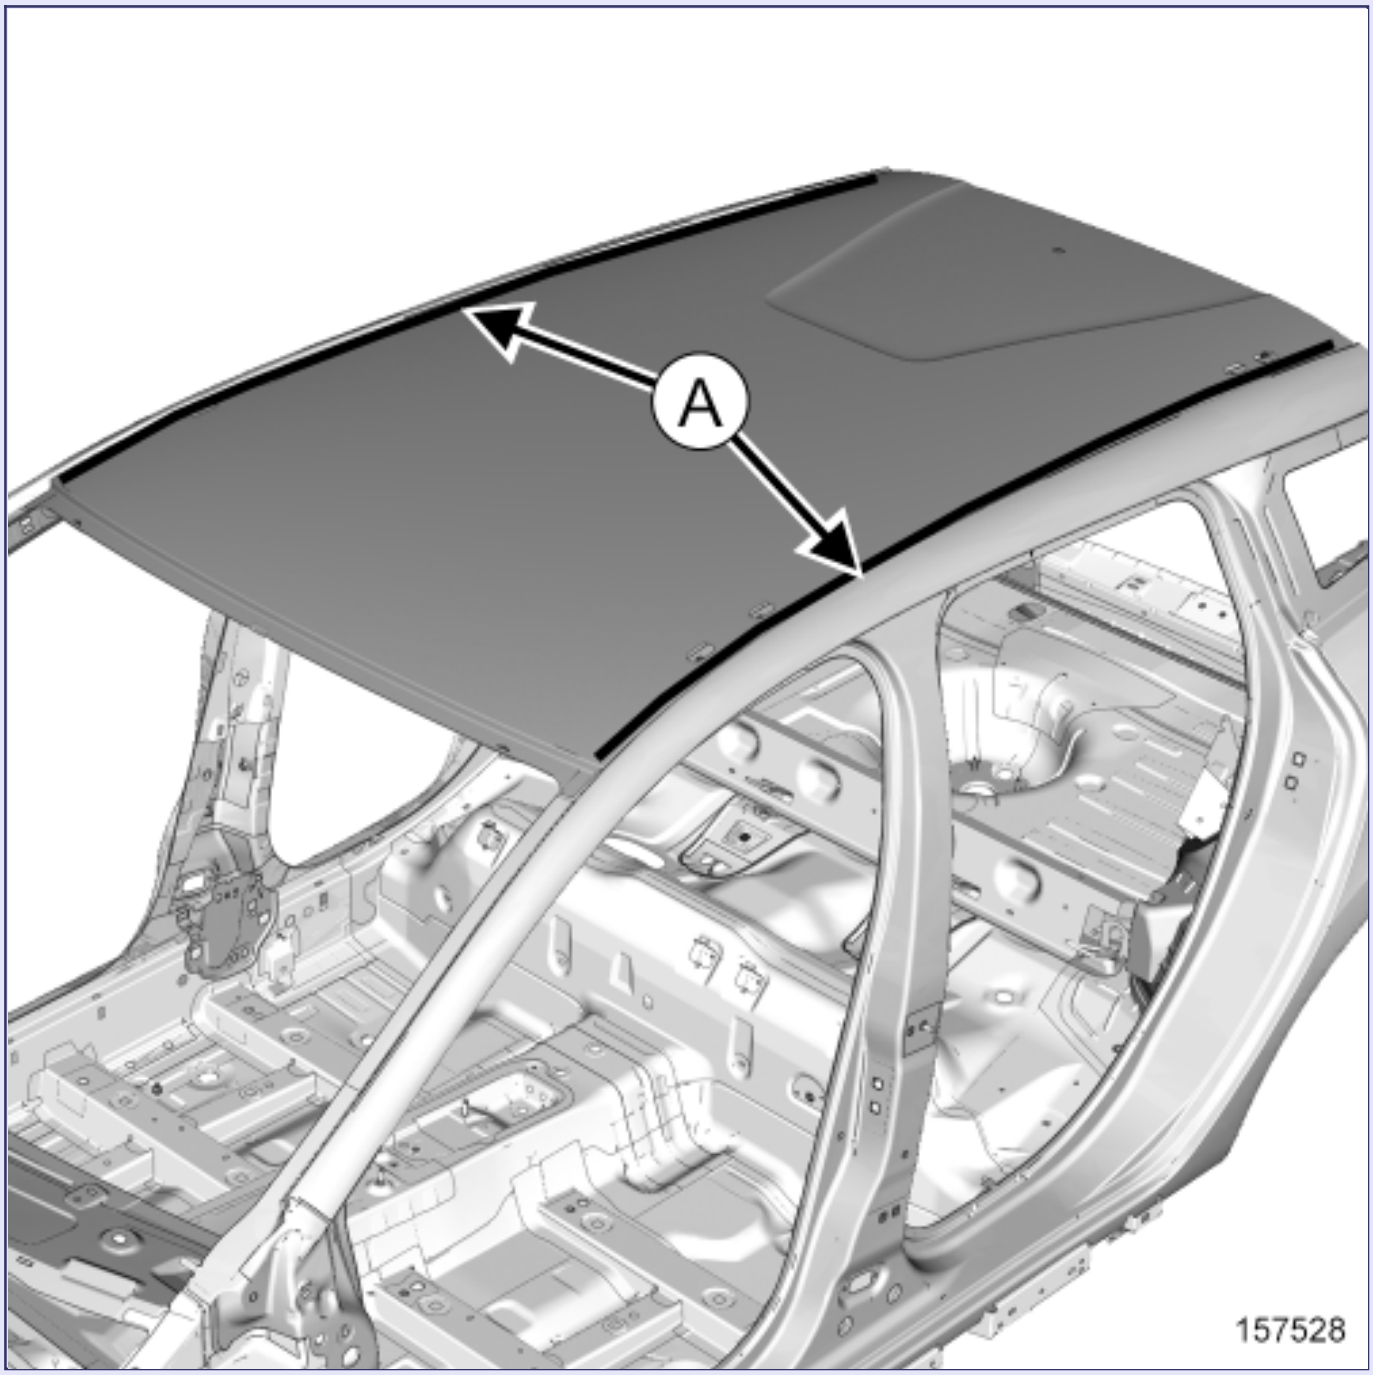
- complete replacement.

CAUTION



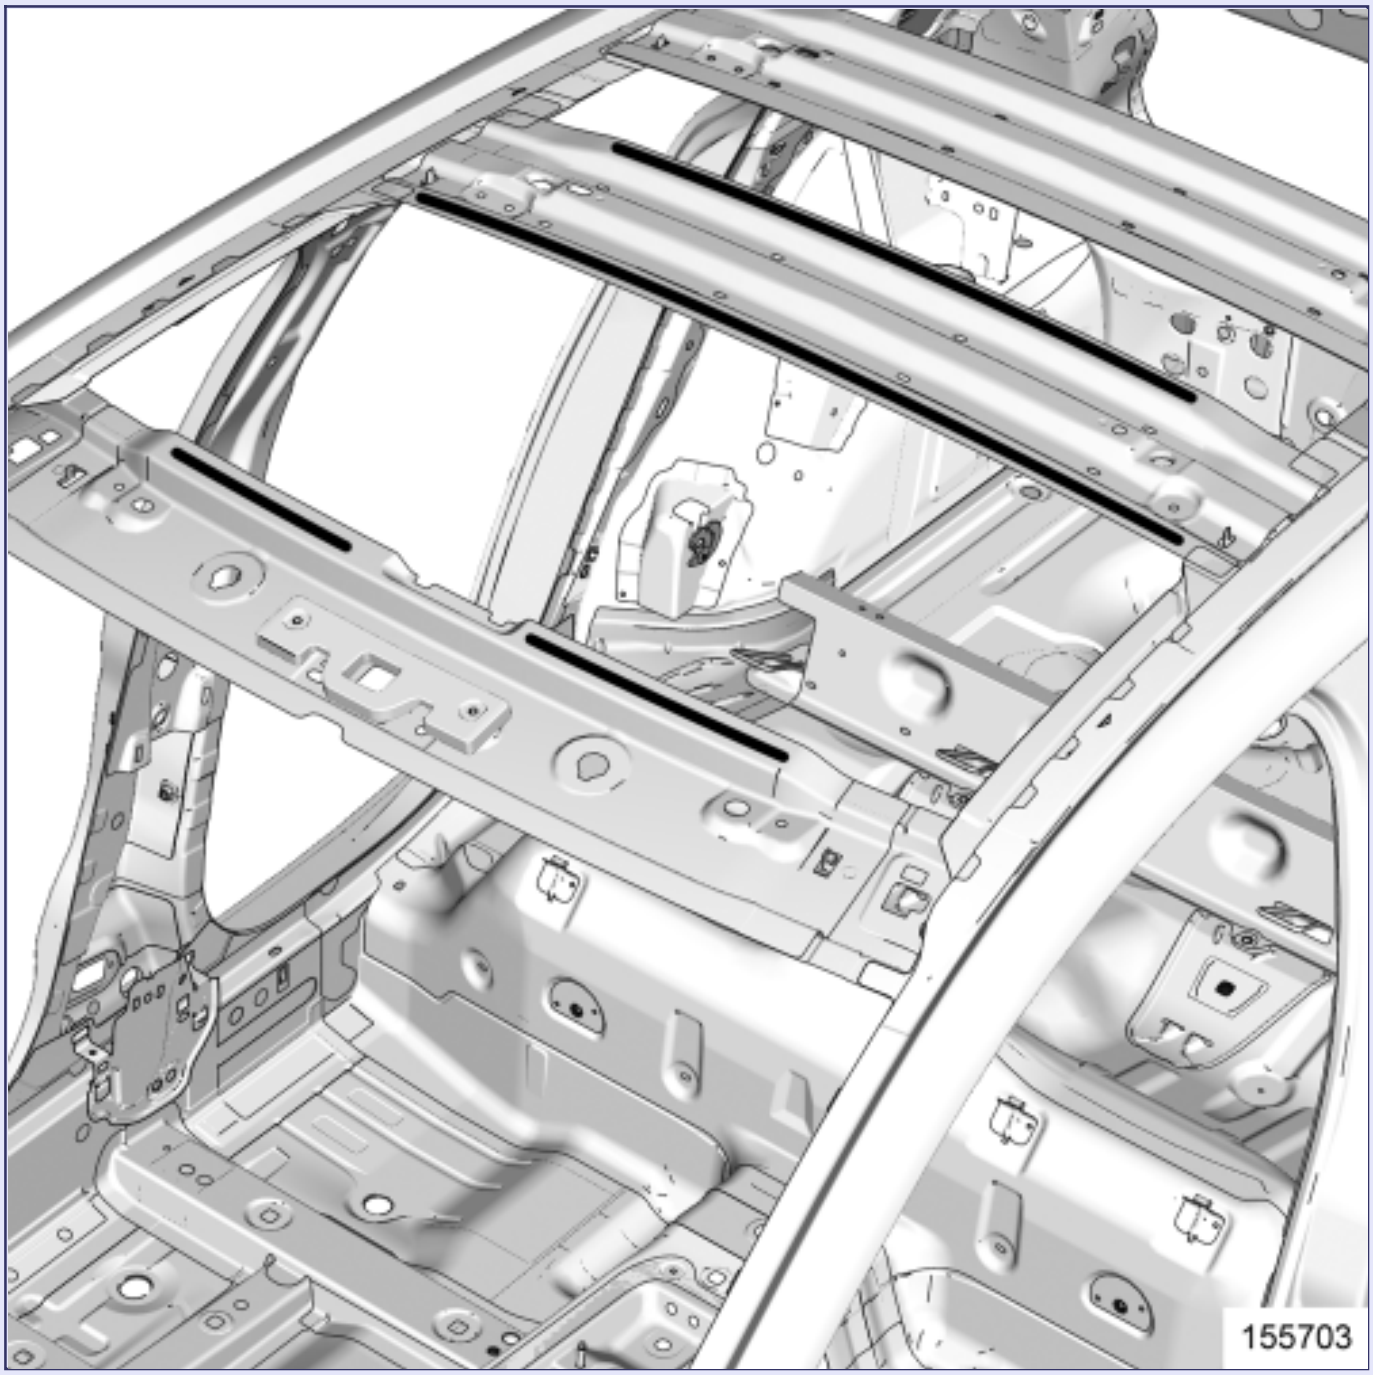
To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).



Locate the earths located near to the weld area**Earths on body: List and location of components** .

1- COMPLETE REPLACEMENT



1)PART IN POSITION

ROTARYSWITCH:ADJUSTMENT

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 84A, Control - Signals, Control - Signals: Precautions for repair) ,
- Vehicle: Precautions for the repair .

This method is used to put the rotary switch in the neutral position.

1. PRELIMINARY CONDITIONS FOR THE ADJUSTMENTS

- The wheels are set straight ahead.
- The rotary switch is refitted on the steering column.
- The steering wheel is removed.

2. ADJUSTMENT

Note:

Certain rotary switch models are equipped with a locking device.

To perform the adjustment, it is essential to unlock the rotary switch when handling.

Turn the movable part of the rotary switch fully to the left.

Turn the movable part of the rotary switch fully to the right, counting the number of turns.

Divide the number of turns counted by 2.

Turn the movable part of the rotary switch to the left by the number of turns calculated.

The rotary switch is now within the turn of its neutral position.

Example:

5 turns were counted between the full left and full right position of the rotary switch.

Turn the movable stop of the switch 2.5 turns to the left to find neutral again.

Continue the rotation until the marks are aligned.

The switch is now in the neutral position.

ROTARYSWITCH:ADJUSTMENT

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

Turn the movable stop of the switch 2.5 turns to the left to find neutral again.

- Continue the rotation until the marks are aligned.
- The switch is now in the neutral position.

RULES FOR USING STRUCTURAL BODYWORK TOOLS: DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

- The operator will choose the right tool depending on:
  - access to the work area : flat; at an angle; in a corner,
  - the environment where the welding overlap is located : sensitive to splashes or not,
  - the position in the sheet stacking for unpicking : primary or secondary,
  - the type of material for working : mastic, adhesive or sheets.

1. STRIPPING TOOLS

By definition, these tools must remove all paint protections from the body panel without damaging the material.

CAUTION

This is only possible on metal parts. For plastic components, you must be careful not to damage the support (see details in the procedures).

-

Functions:

- In the phase of removing welded components, the idea is to locate the spot welds to be able to unpick them. It is not necessary to strip the components completely.
- In the pre-assembly phase, the mating surfaces on the vehicle and new part must be stripped to prepared the surfaces for assembly.

2. MACHINING TOOL

By definition these tools are used to remove particles of a material that constitutes the body component, during unwelding, grinding or cutting operations.

Note:

According to the grit used, some of them can also be used for stripping, but do not lose their ability to remove metal particles.

CAUTION

In this case, as for plastic components, you must be careful not to damage the support (see details in the procedures).

For the correct use of these tools with equipment fitted with speed reduction, it is essential to observe the rotating speeds indicated: either on the label on the "consumable tools" themselves (grinders or discs), or in equipment catalogues for "cutting" tools (burrs or drill bits).

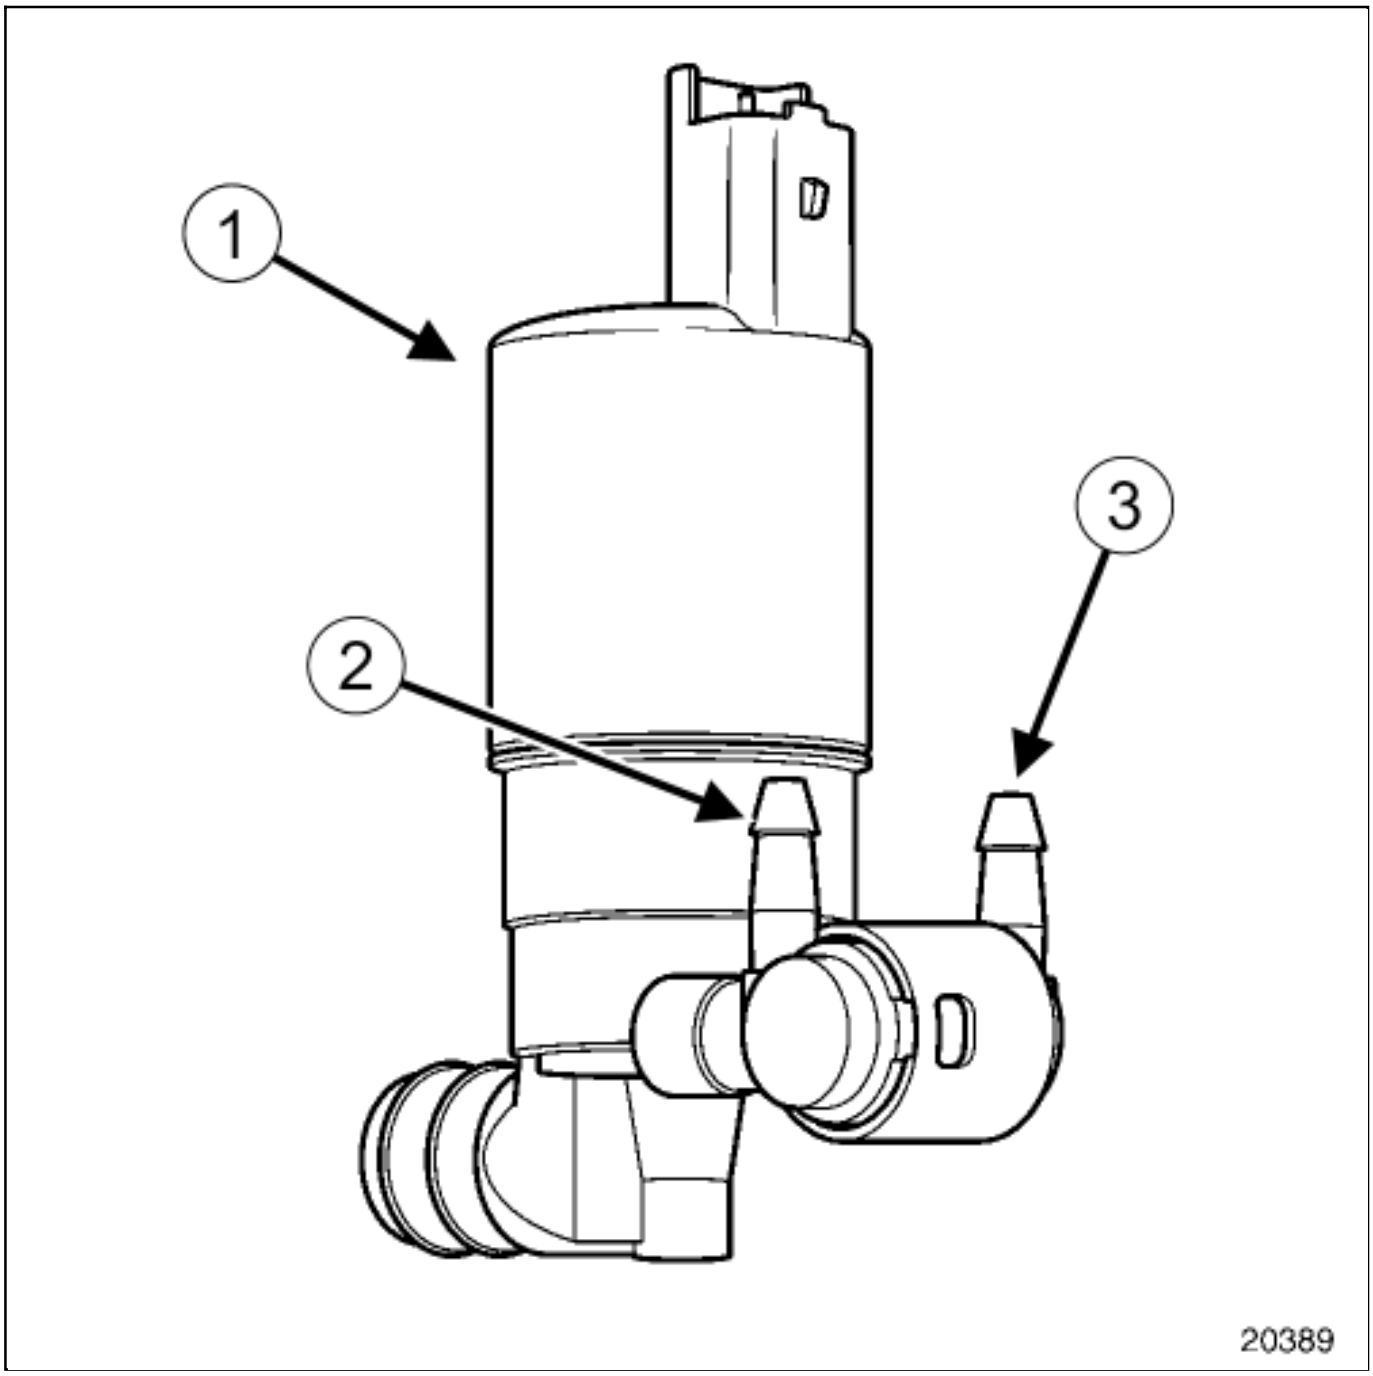
SCREEN WASHER PUMP: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

REMOVAL



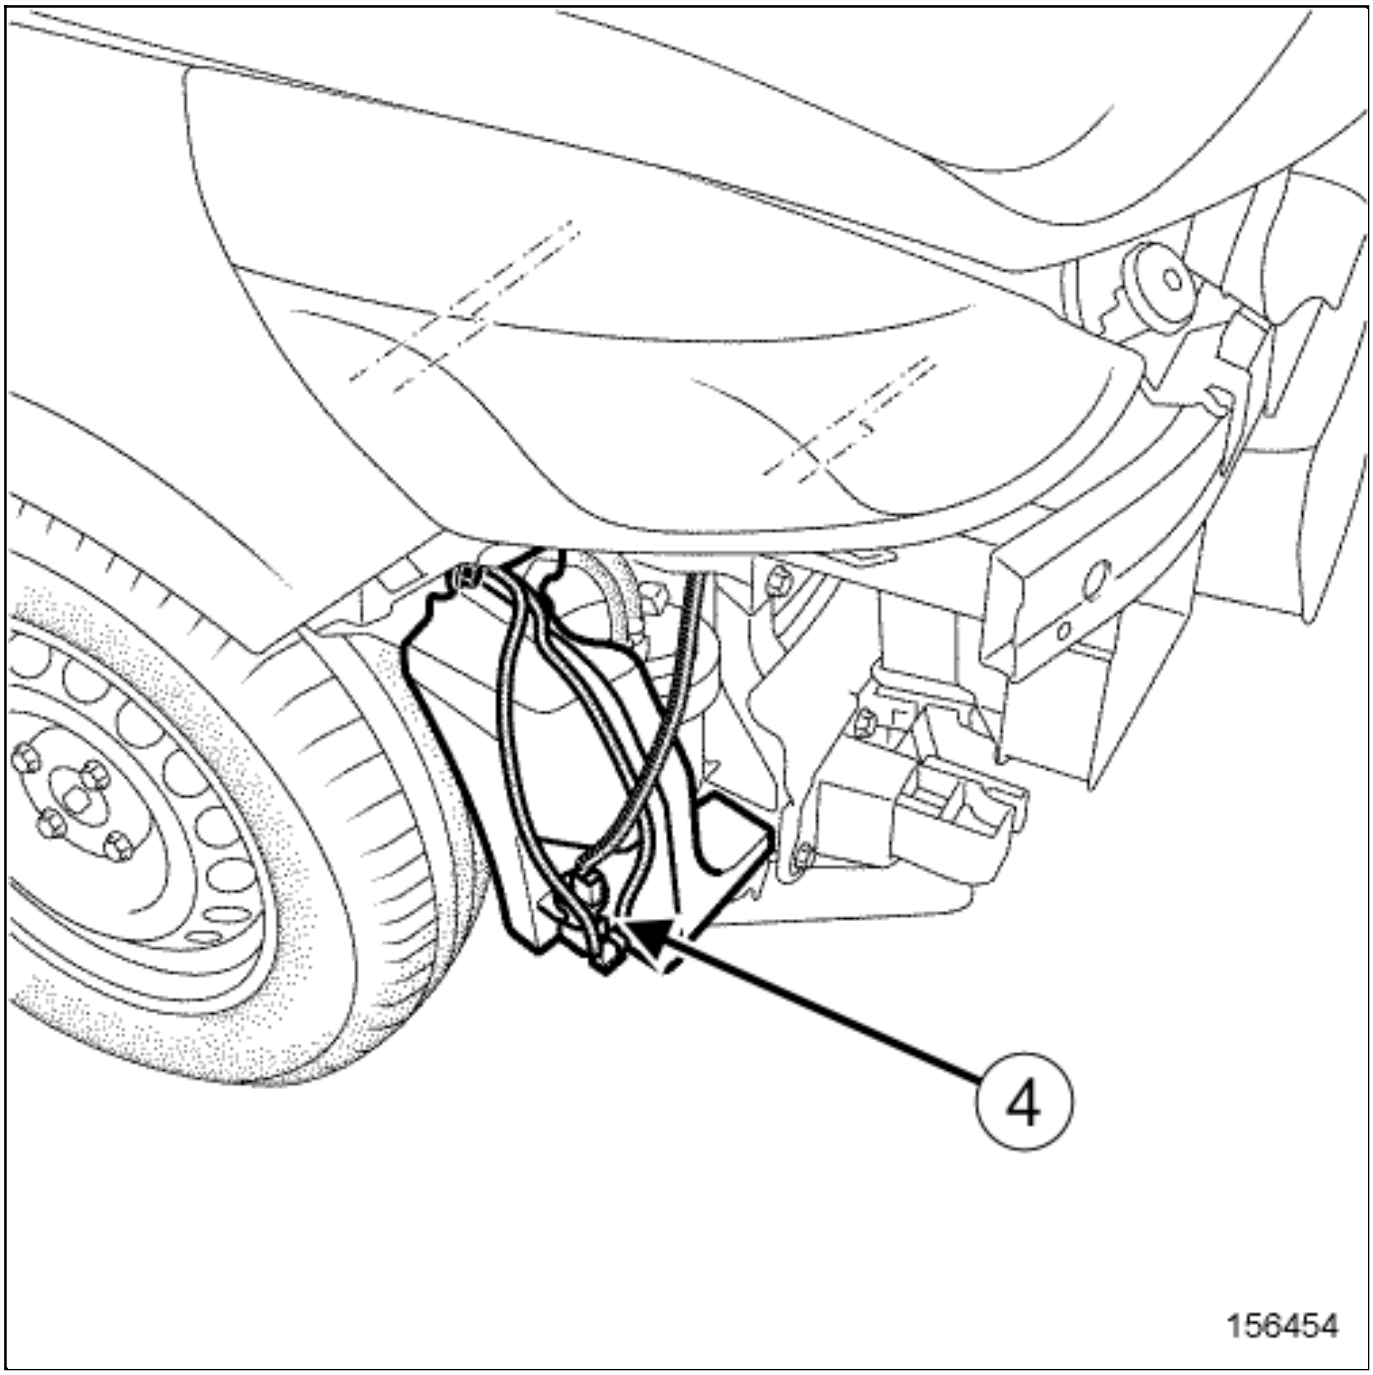
1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
-

Remove:

- the front right-hand wheel Wheel: Removal - Refitting ,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) .

2. REMOVAL OPERATION



Note:

When removing the windscreen washer pump, mark the two pipes before disconnecting them.

Disconnect:

- the connector(1) from the windscreen washer pump,

- the front jet supply pipe(2) ,
- the supply pipe from the rear jet(3) .

Note:

When removing the windscreen washer pump, use a container to collect the windscreen washer fluid which will flow out of the bottle.

Remove the windscreen washer pump(4) .

REFITTING

1. REFITTING OPERATION

Refit the windscreen washer pump to the bottle.

Connect:

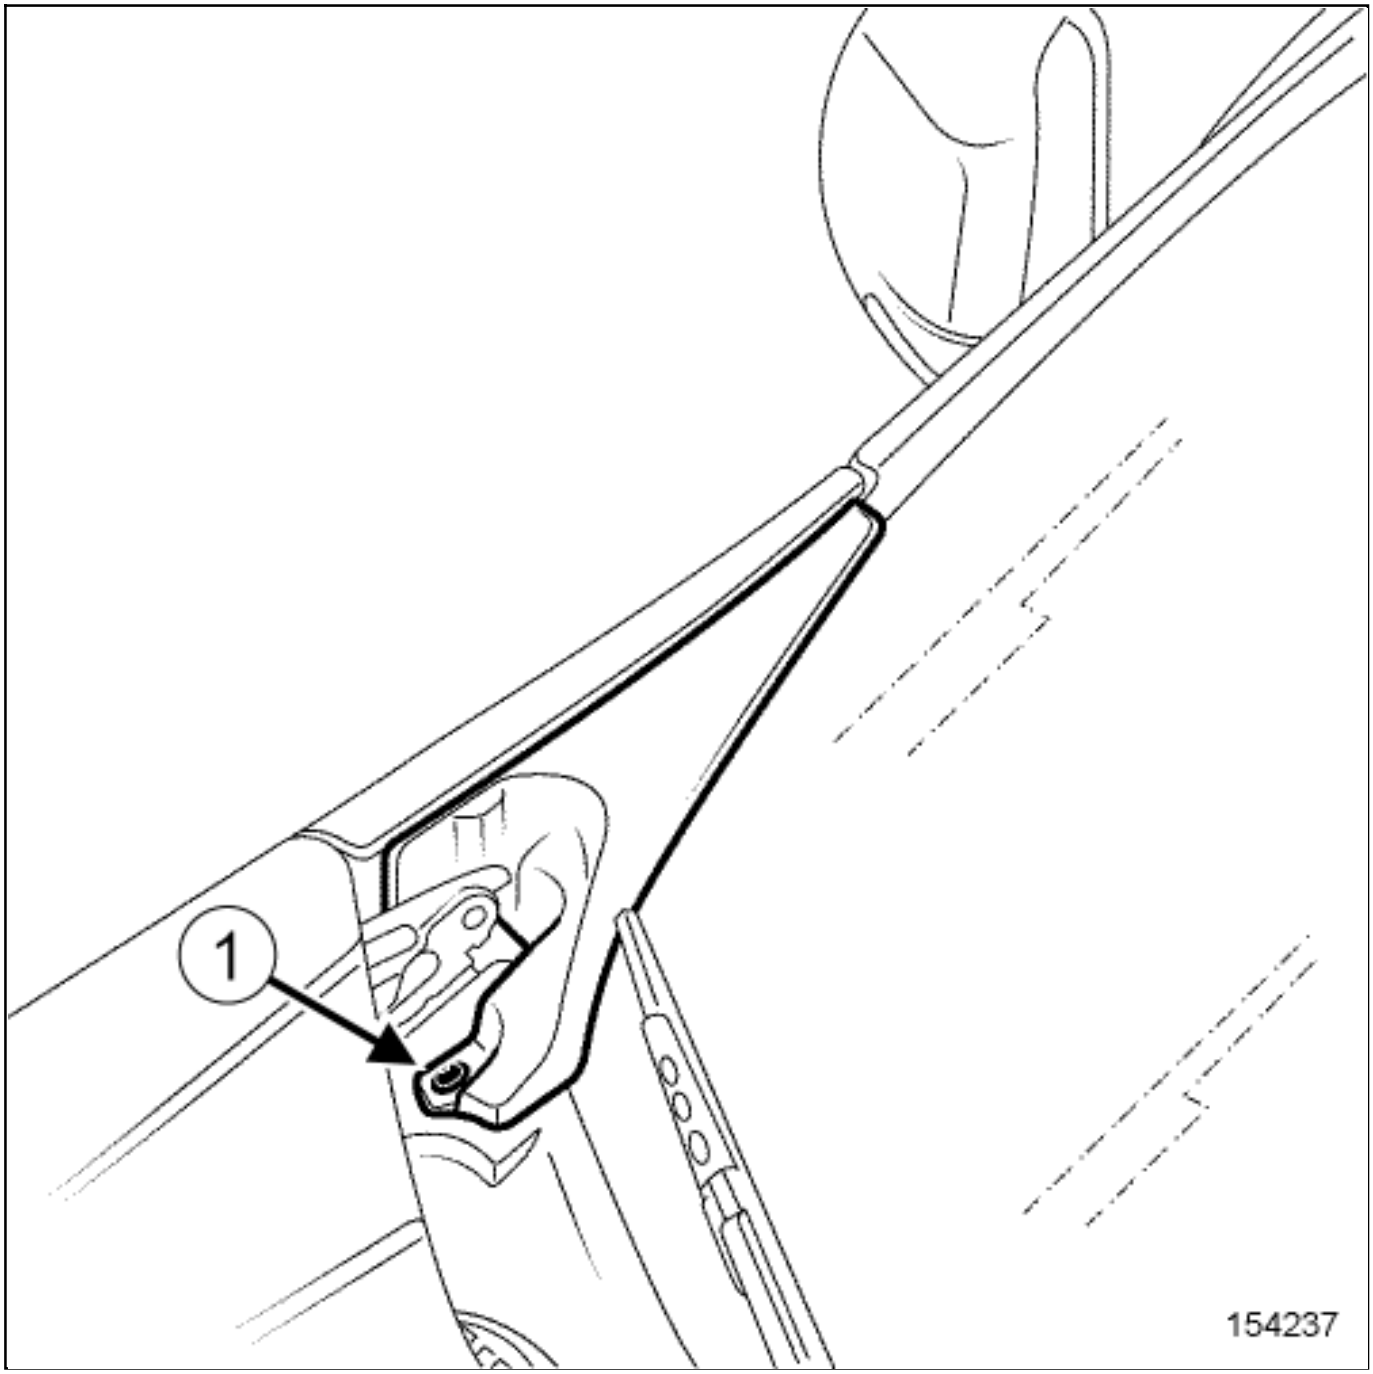
- the rear jet supply pipe,
- the front jet supply pipe,
- the windscreen washer pump connector.

2. FINAL OPERATION

Proceed in the reverse order to removal.

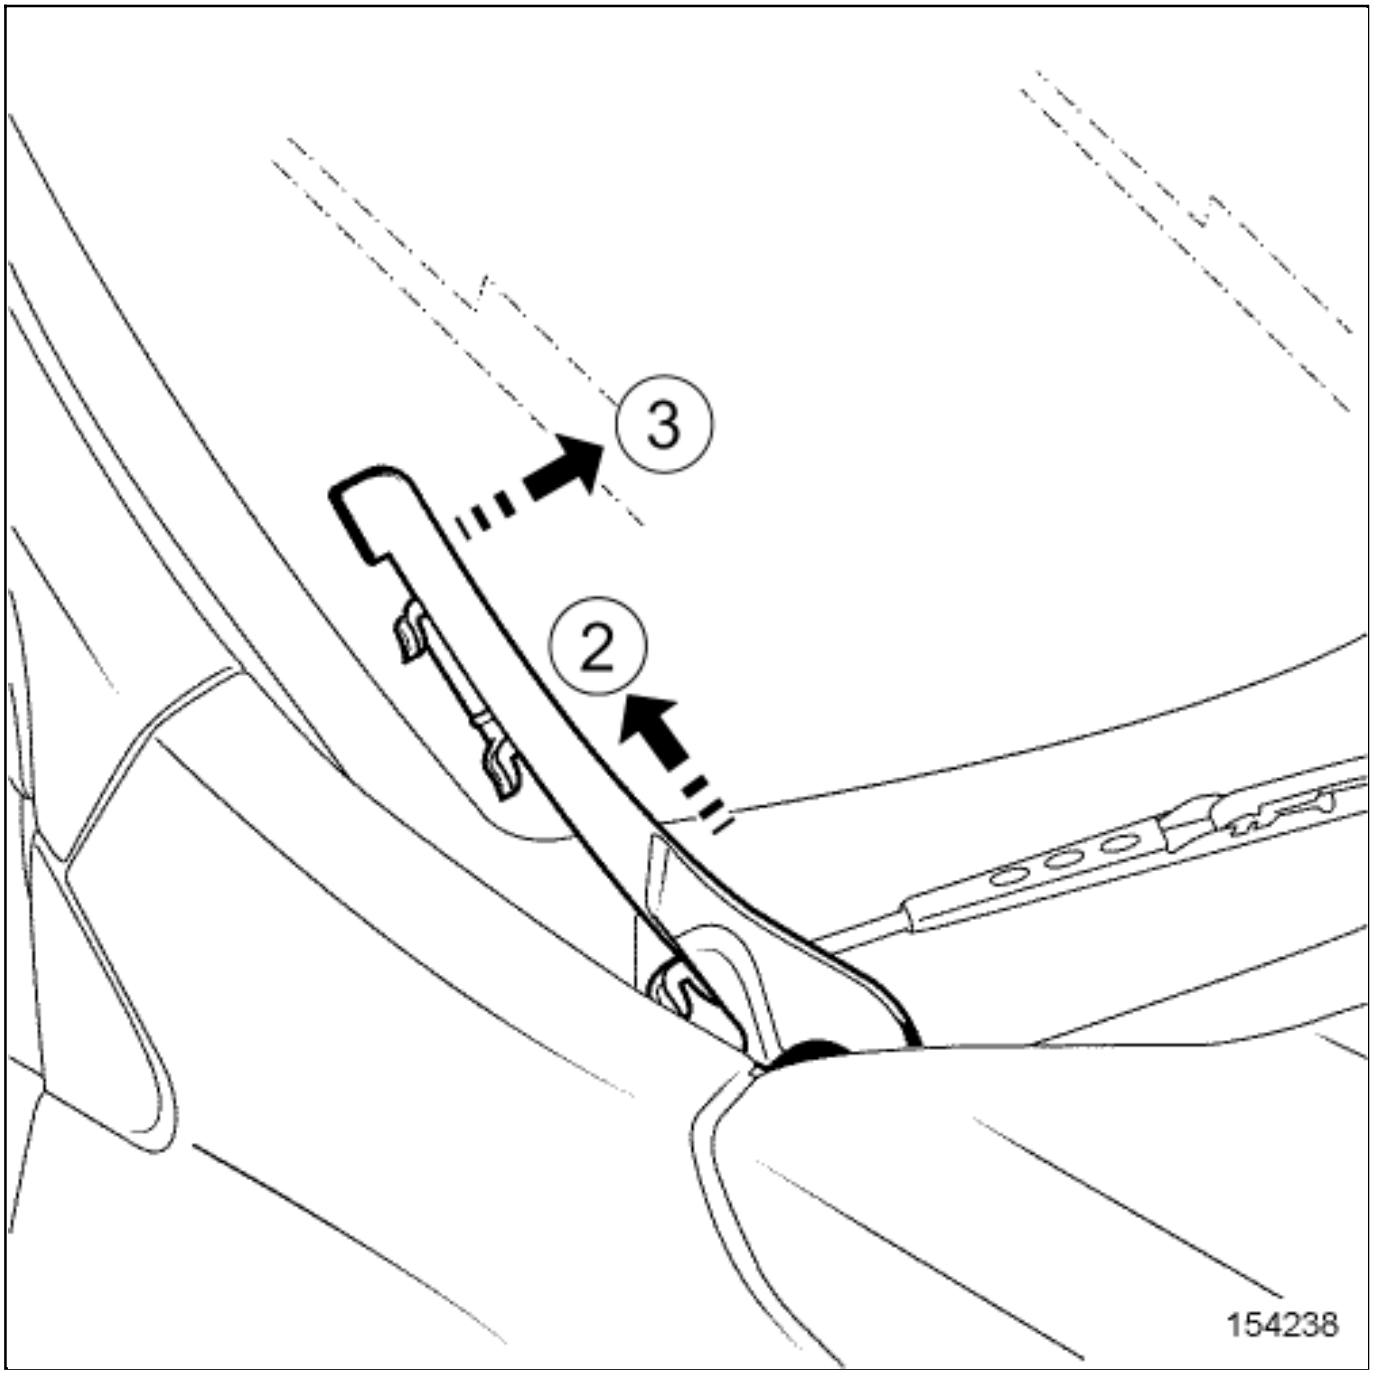
Fill-up the windscreen washer bottle.

SCUTTLE PANEL GRILLE: REMOVAL - REFITTING



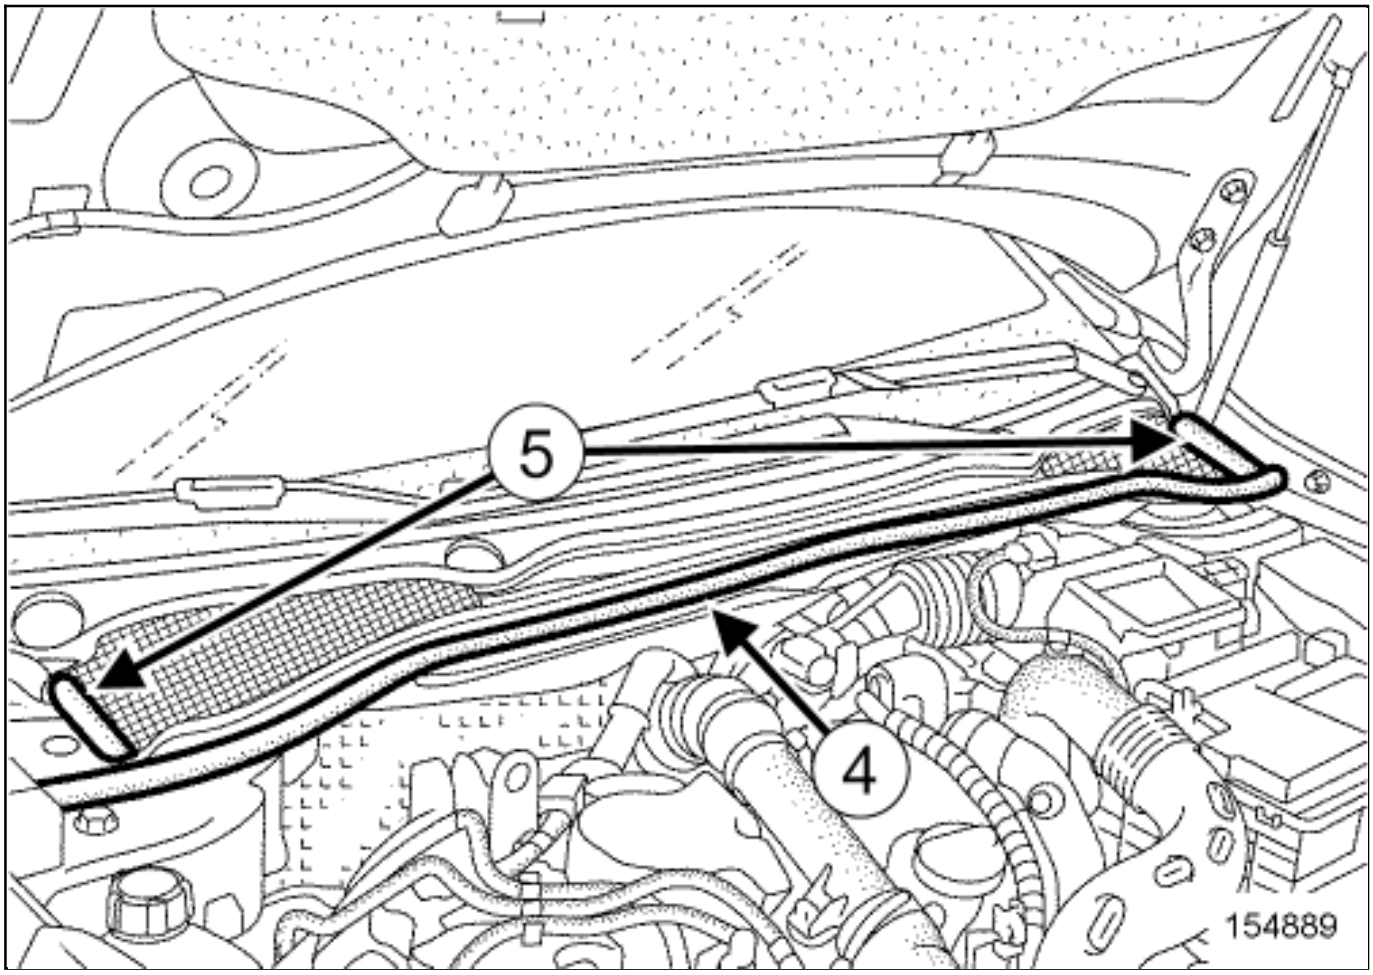
parts always to be replaced:

clip under scuttle panel grille



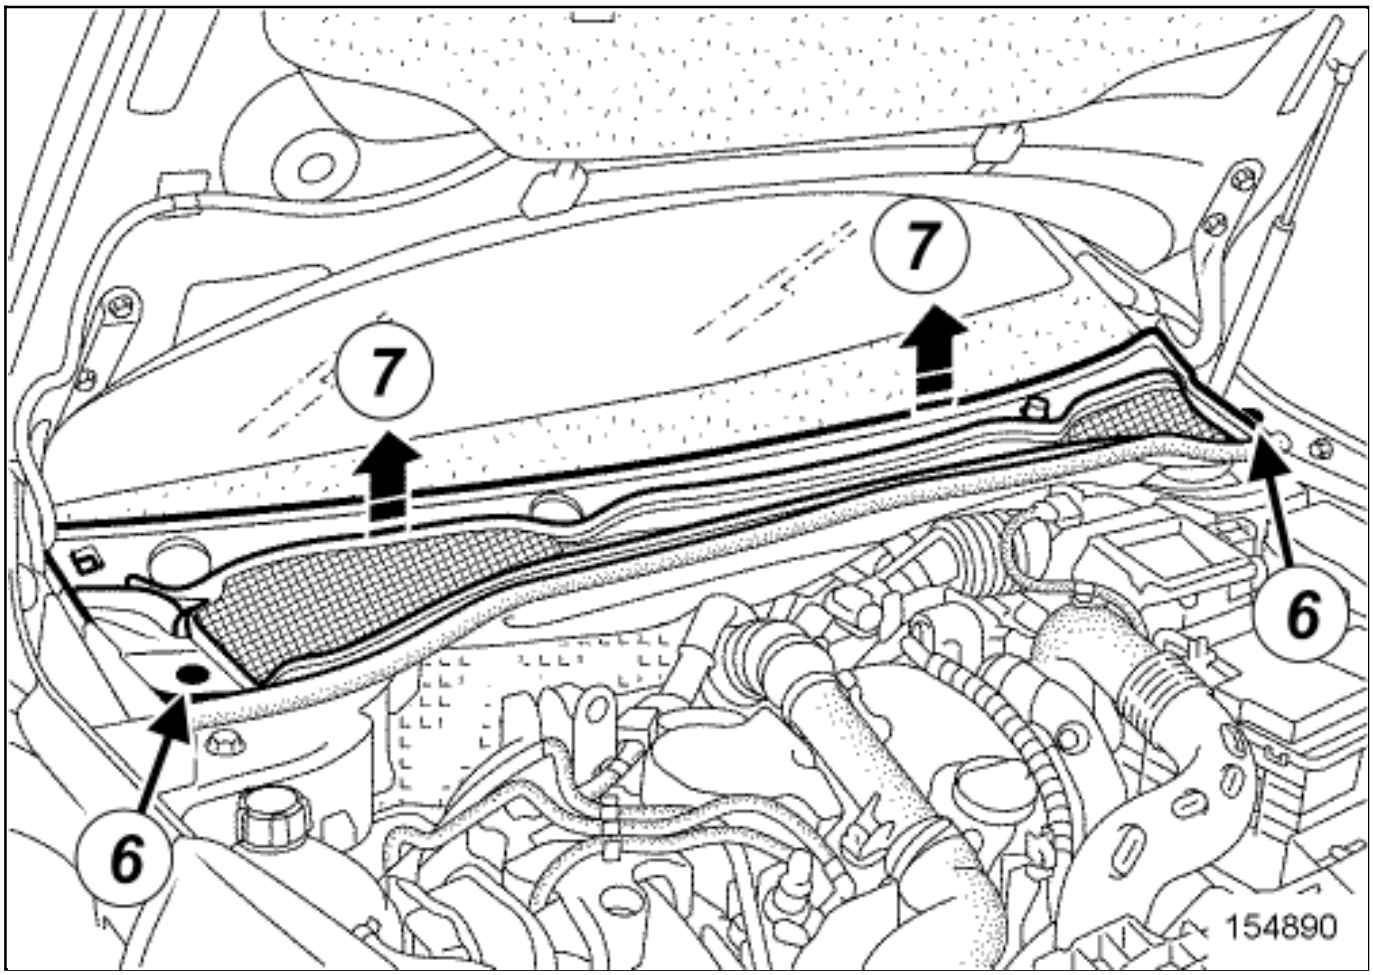
REMOVAL

1. REMOVAL PREPARATION OPERATION



Remove the windscreen wiper arms Wiping and washing: List and location of components .

Remove the windscreen lower side trim screw(1) .



Remove the windscreen lower side trim by sliding at(2) and pulling at(3).

Remove:

- the engine compartment seal(4) ,
- the side sections of the scuttle panel grille(5) .

2. REMOVAL OPERATION

- Remove the clips(6) from the scuttle panel grille.
- Unclip the scuttle panel grille.
- Remove the scuttle panel grille following the direction of the arrow(7) .

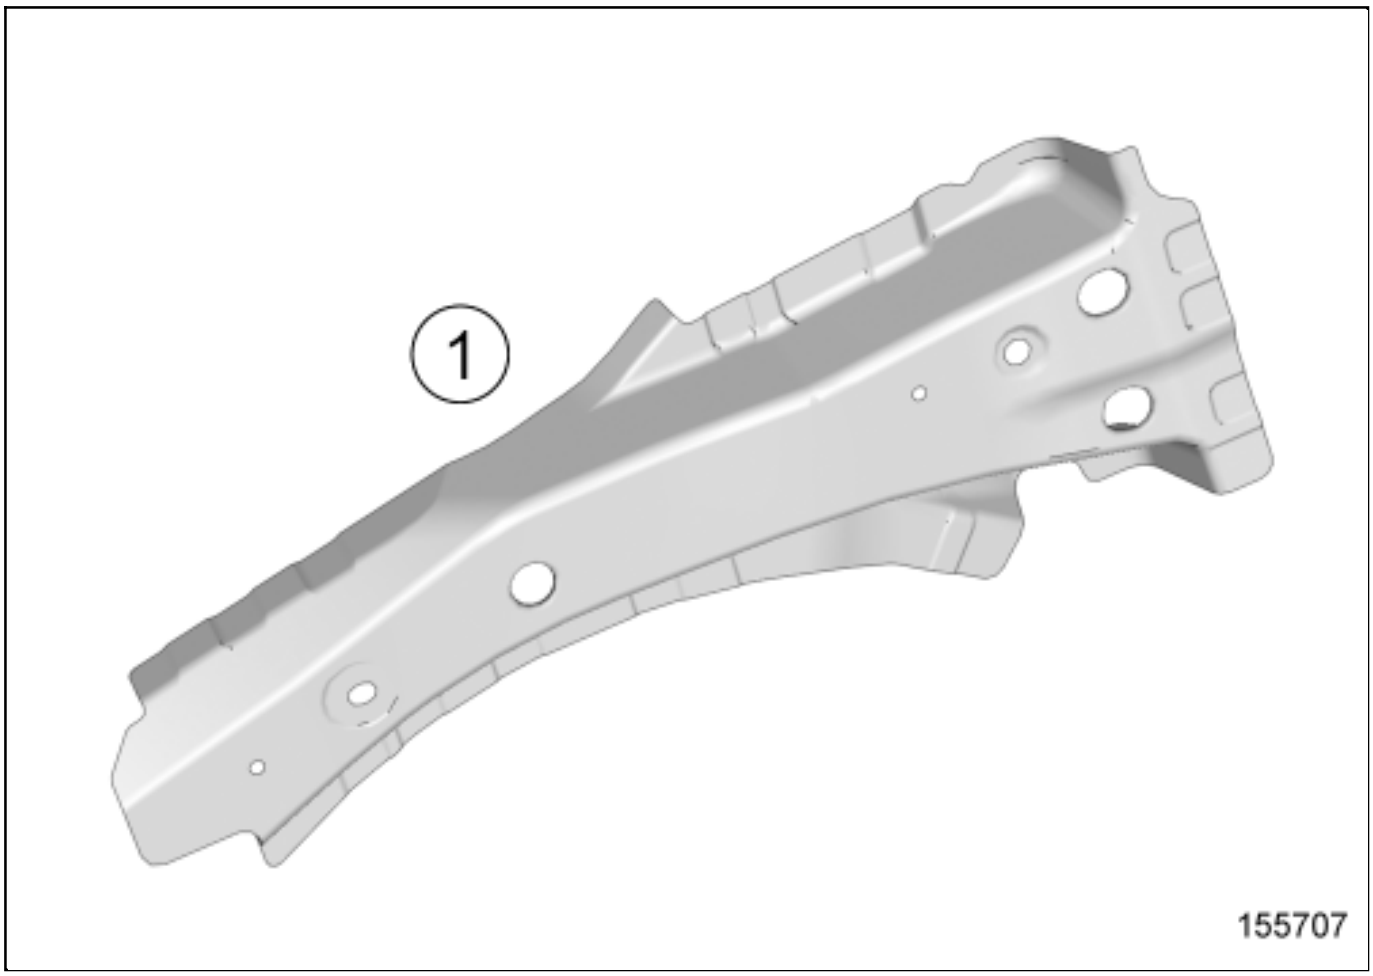
REFITTING

1. REFITTING PREPARATION OPERATION

Note:

Check that the windscreen and the scuttle panel grille are clean before refitting.

parts always to be replaced: clip under scuttle panel grille .



2. REFITTING OPERATION

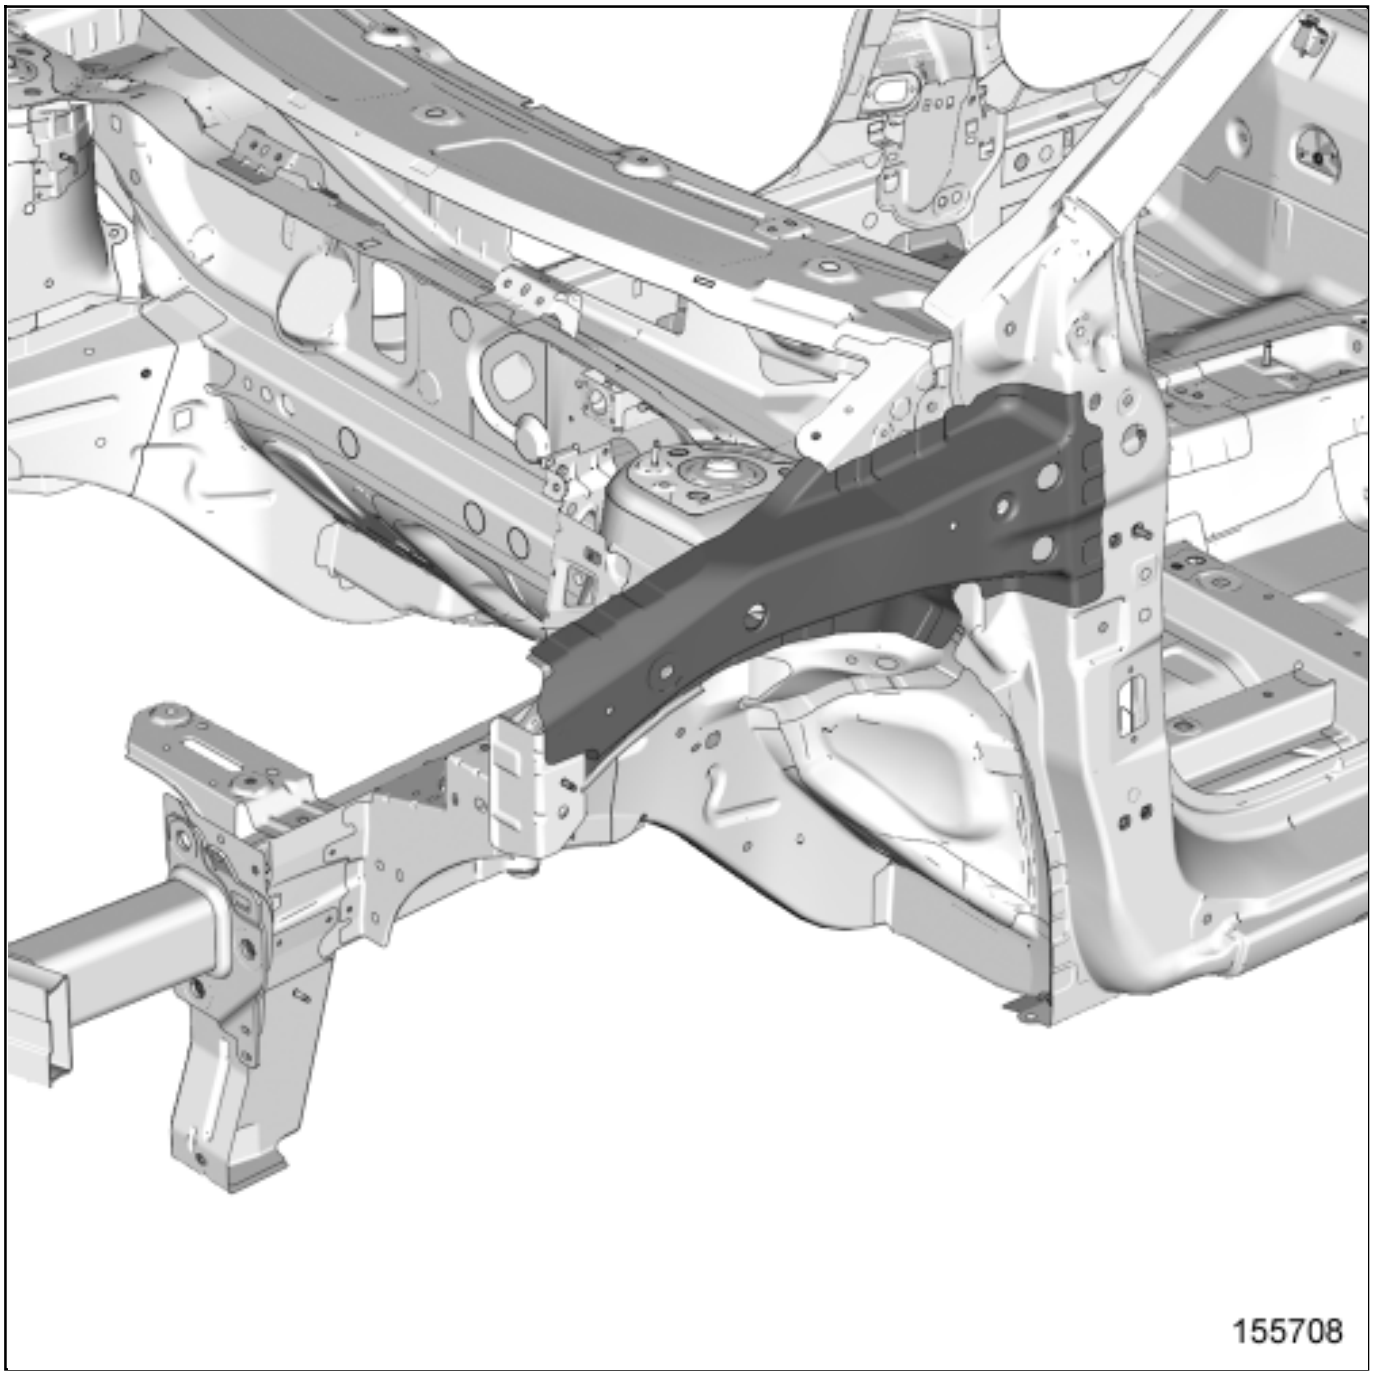
Proceed in the reverse order to removal.

SCUTTLESIDEPANELUPPERREINFORCEMENT:REPLACEMENT

Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Scuttle side panel reinforcement	HLE	1



2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

complete replacement.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

SEALINGPRODUCT:DESCRIPTION

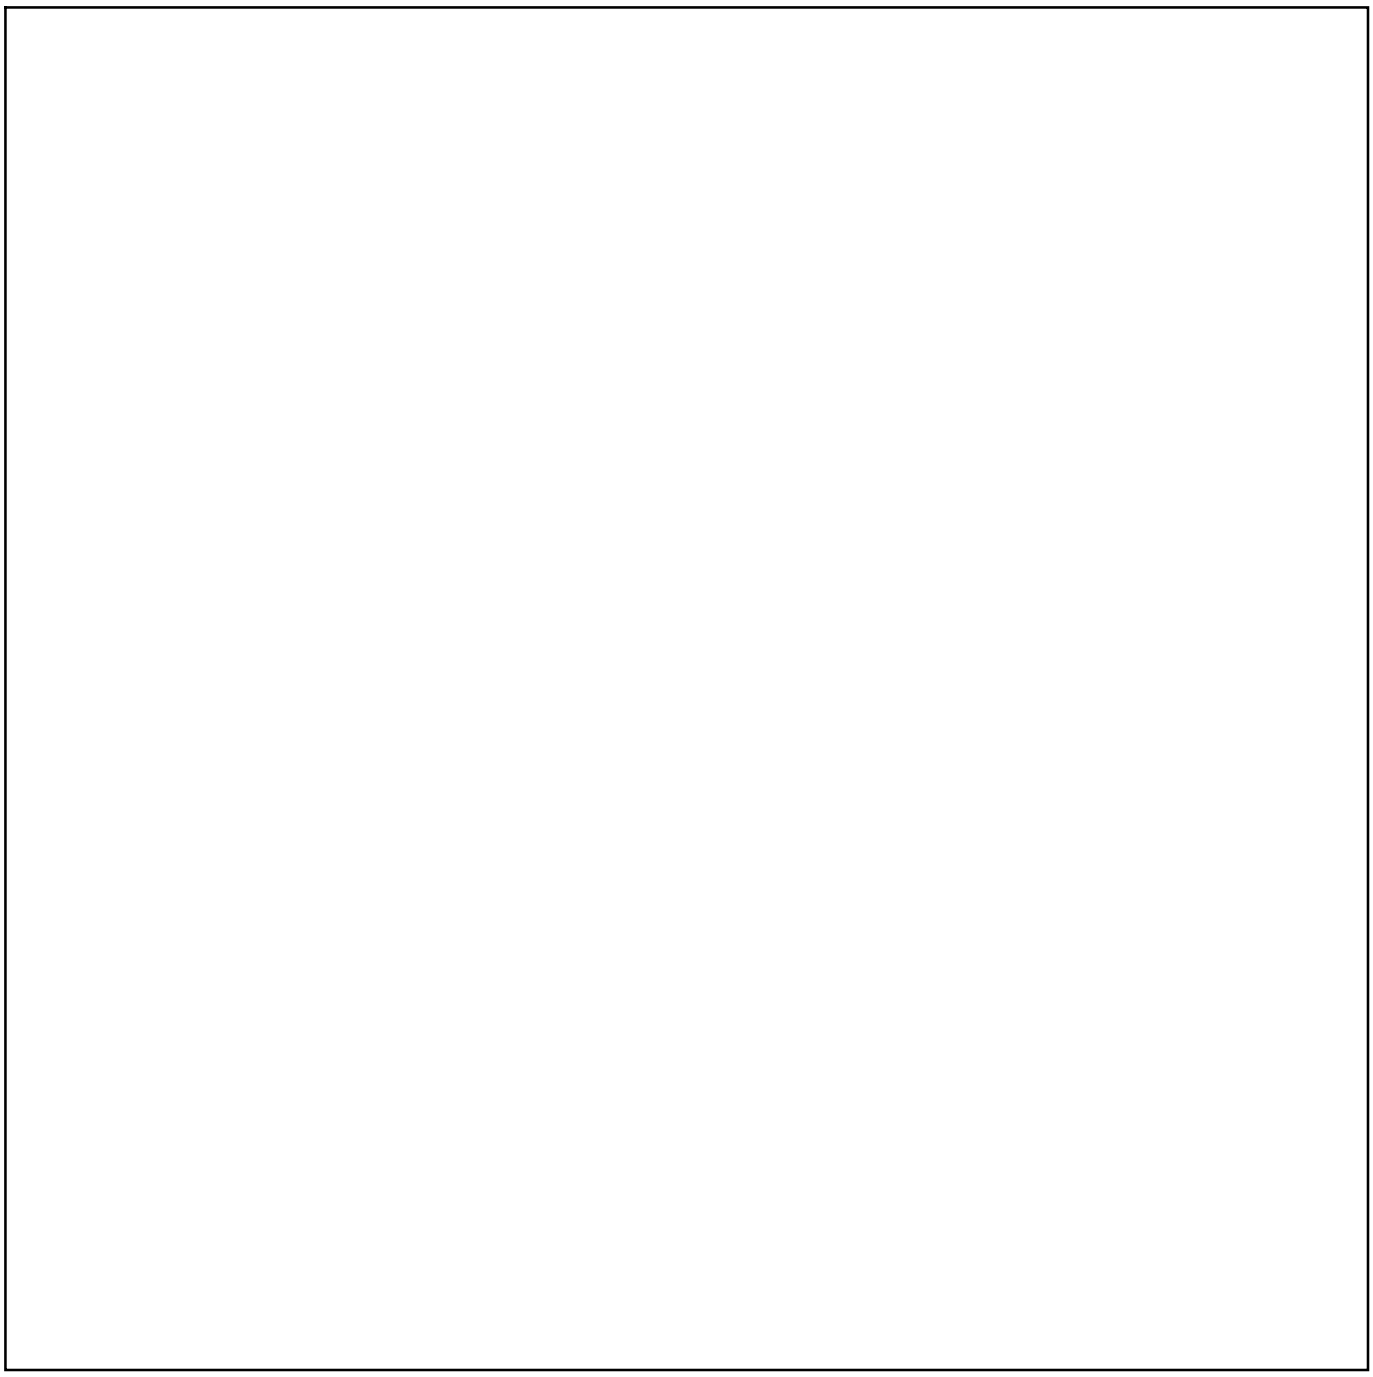
 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Operator protection : use extra ventilation source.

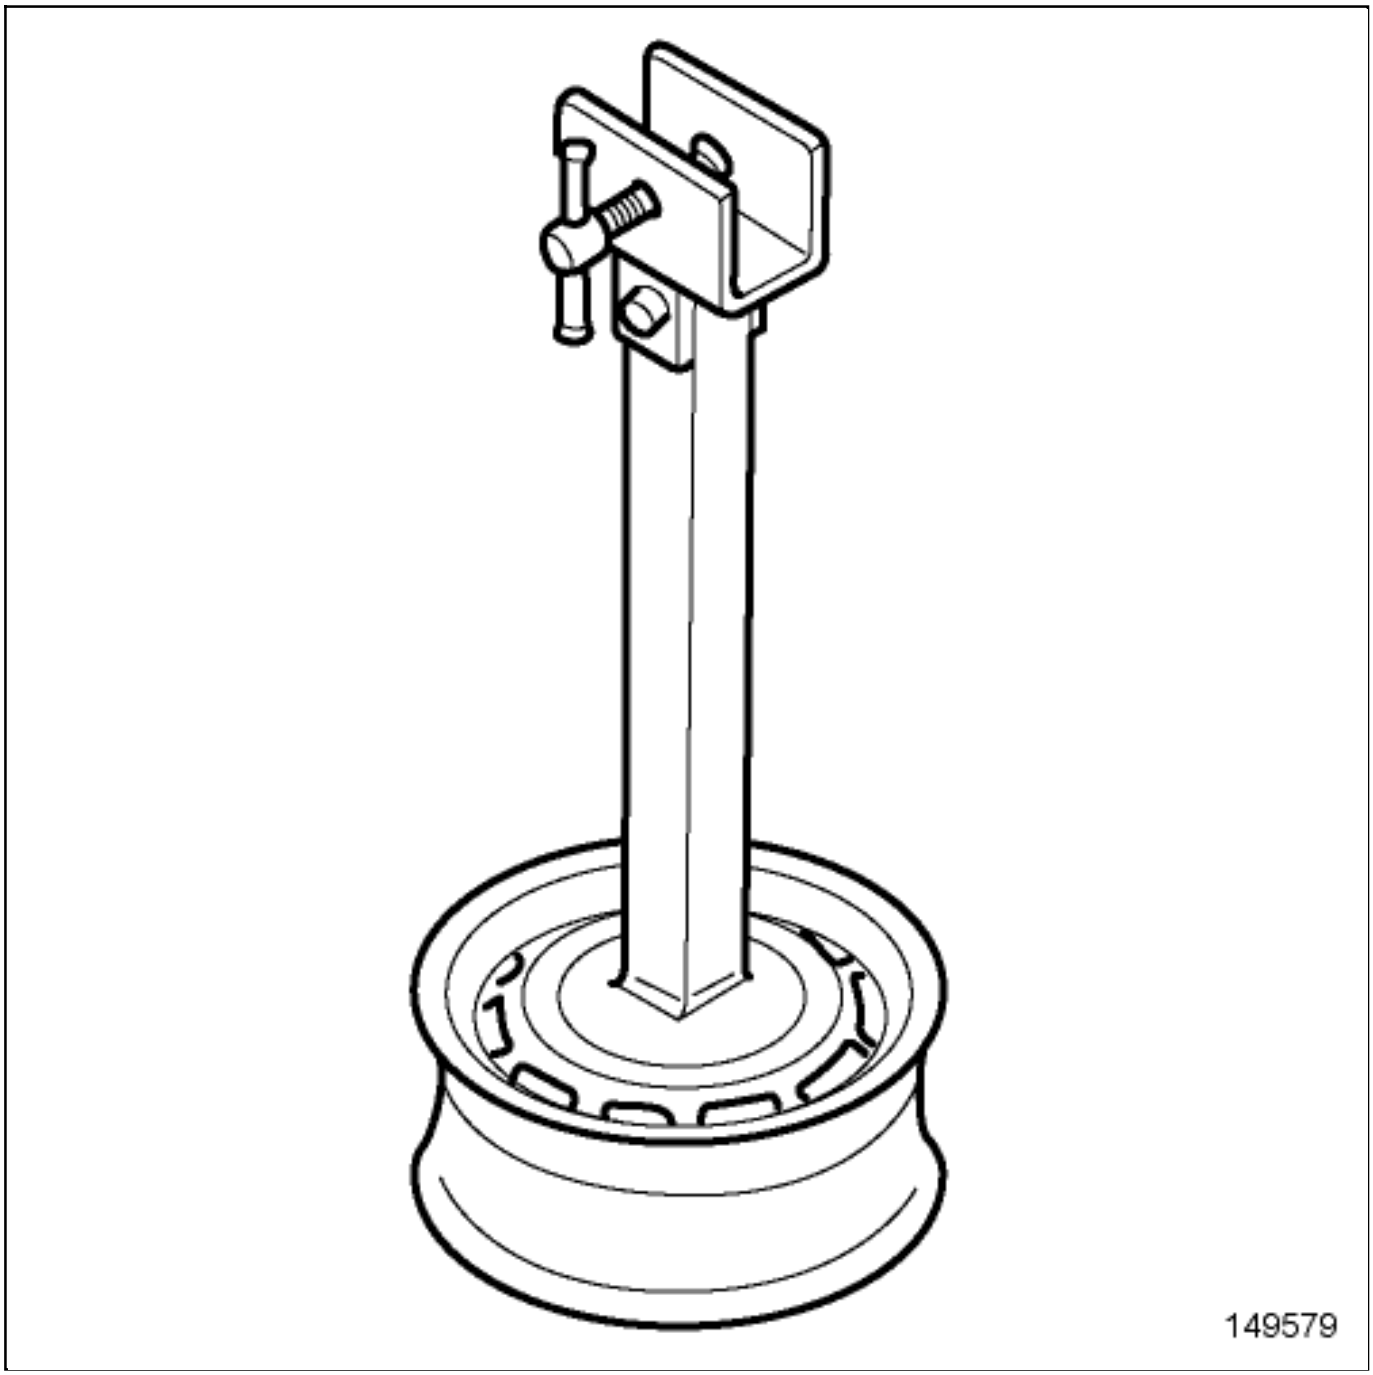
Steps	Description	Special notes
1	Remove the mastic from the areas to be repaired	Tools for stripping very thick soft mastic: Use Tools for scraping rigid adhesives and paint: Use
2	Wipe / blow	
3	Sand	P180 - P240 dry
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	If the panel is bare, use cold electro zinc plating	(see 04E, Paint, Anti-corrosion protection by cold electro zinc plating: Description)
7	Application of a pre-treatment primer on bare areas	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
8	Solvent remover	
9	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
10	Apply a bi-component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
11	Apply a sealing mastic	Anti-corrosion protection products after assembly: Use (04F, Products and bodywork mountings))Vehicle: Parts and consumables for the repair (04B, Consumables - Products)



12	Smooth the seal in the visible areas	Bodywork tool 1786

SEALINGTOOLS:DESCRIPTION

1. EXAMPLES OF TOOLS TO USE



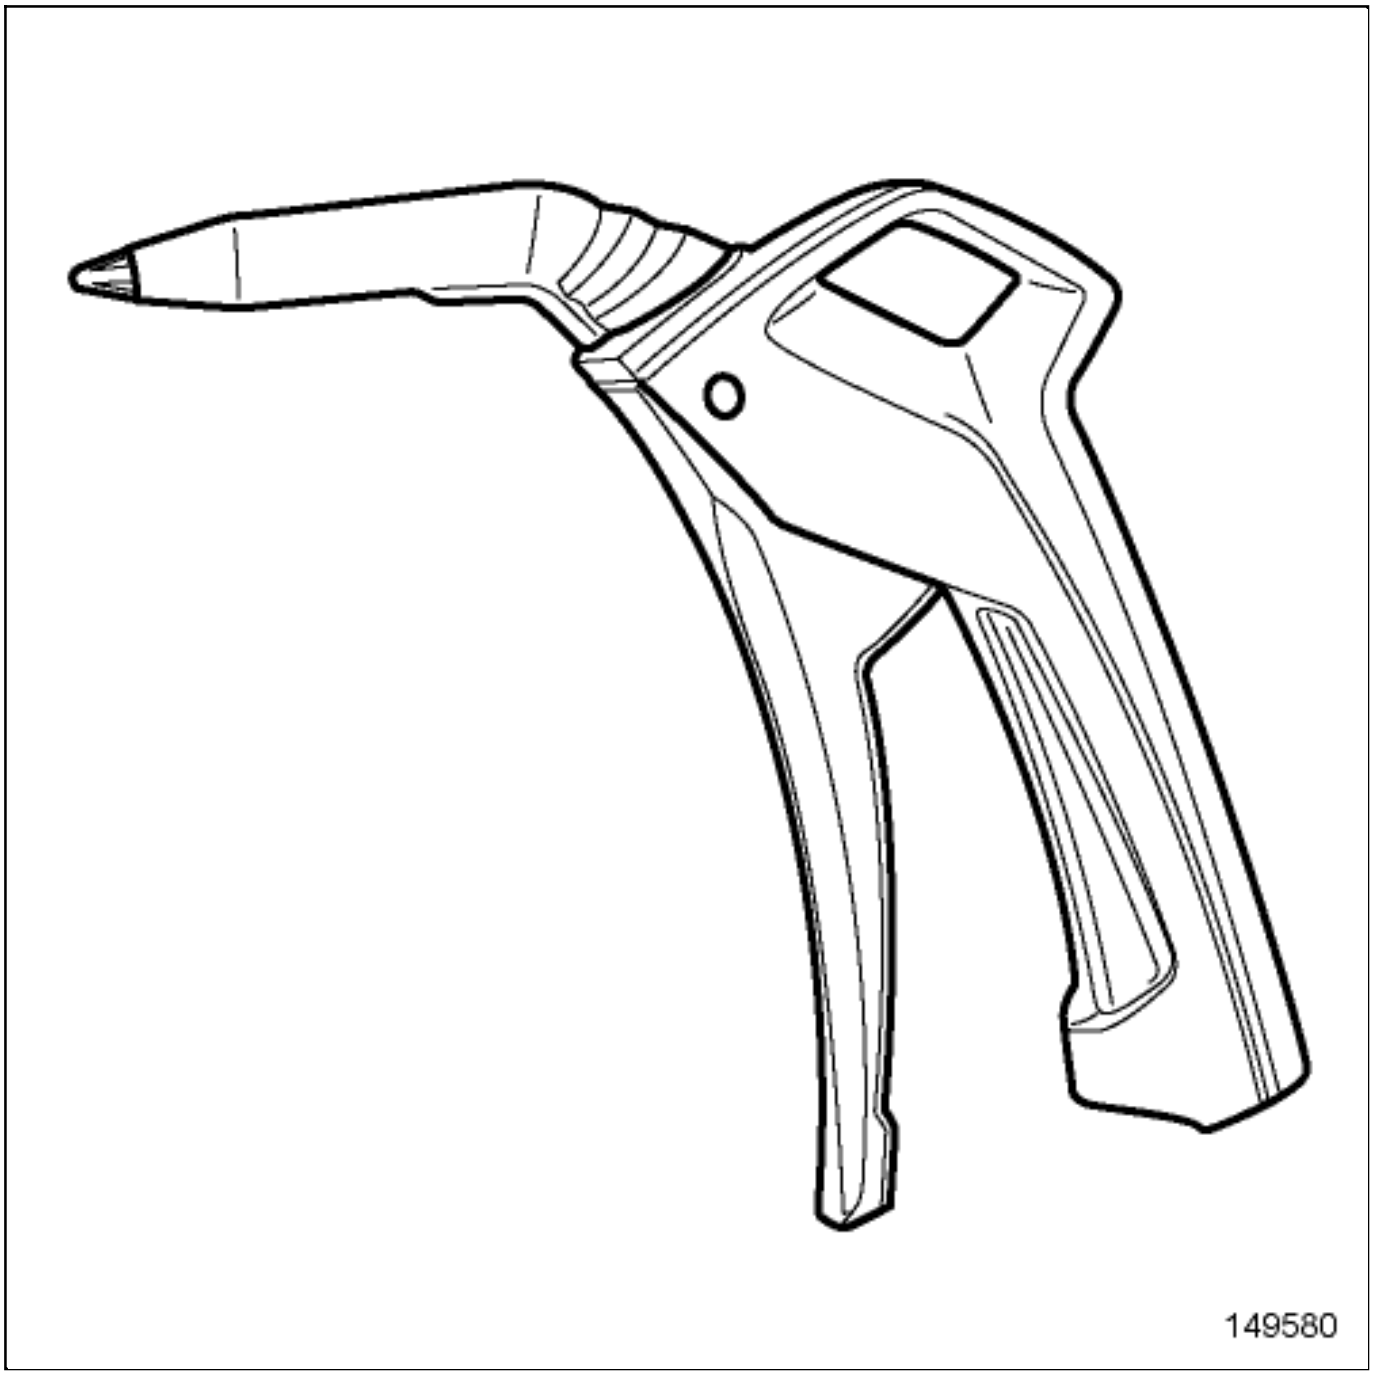
1- SPRAYING TOOLS

1)SPRAY HOSE

The spray hose must have an internal diameter of 14 mm.

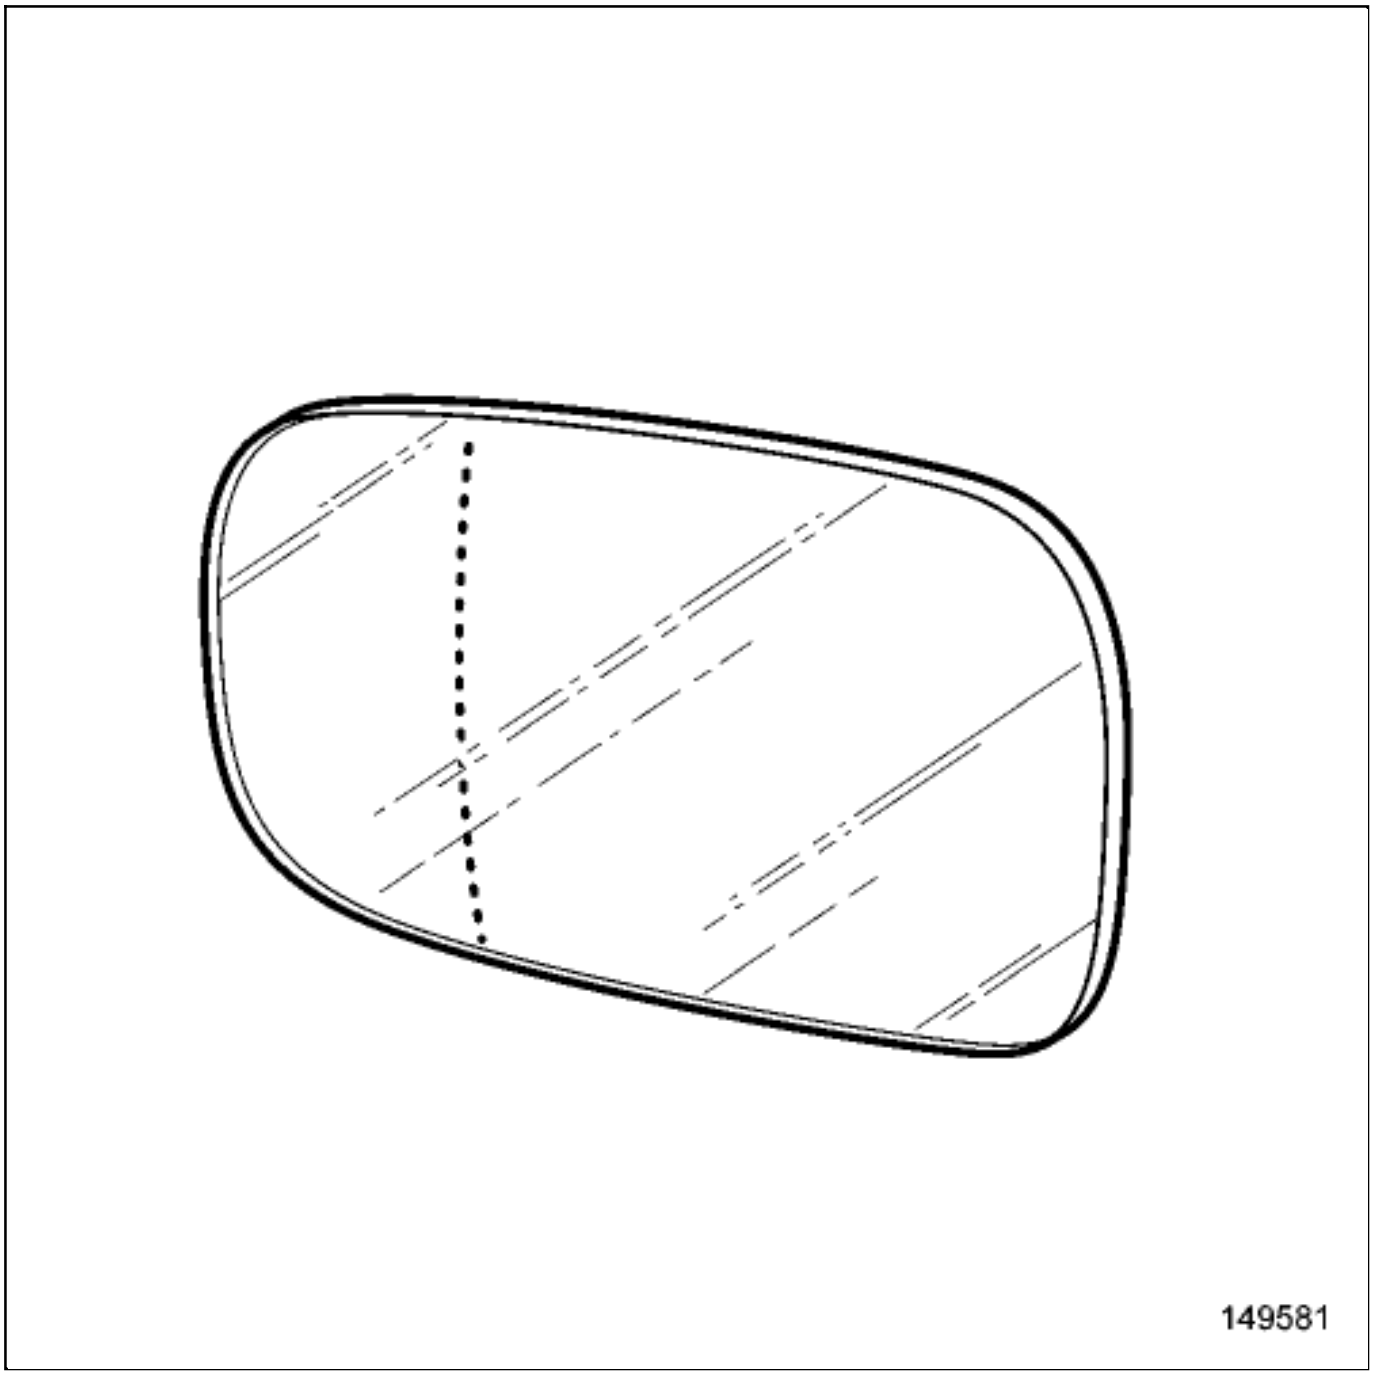
2)LOCALLY MANUFACTURED JET SUPPORT

To be used for long sealing tests.



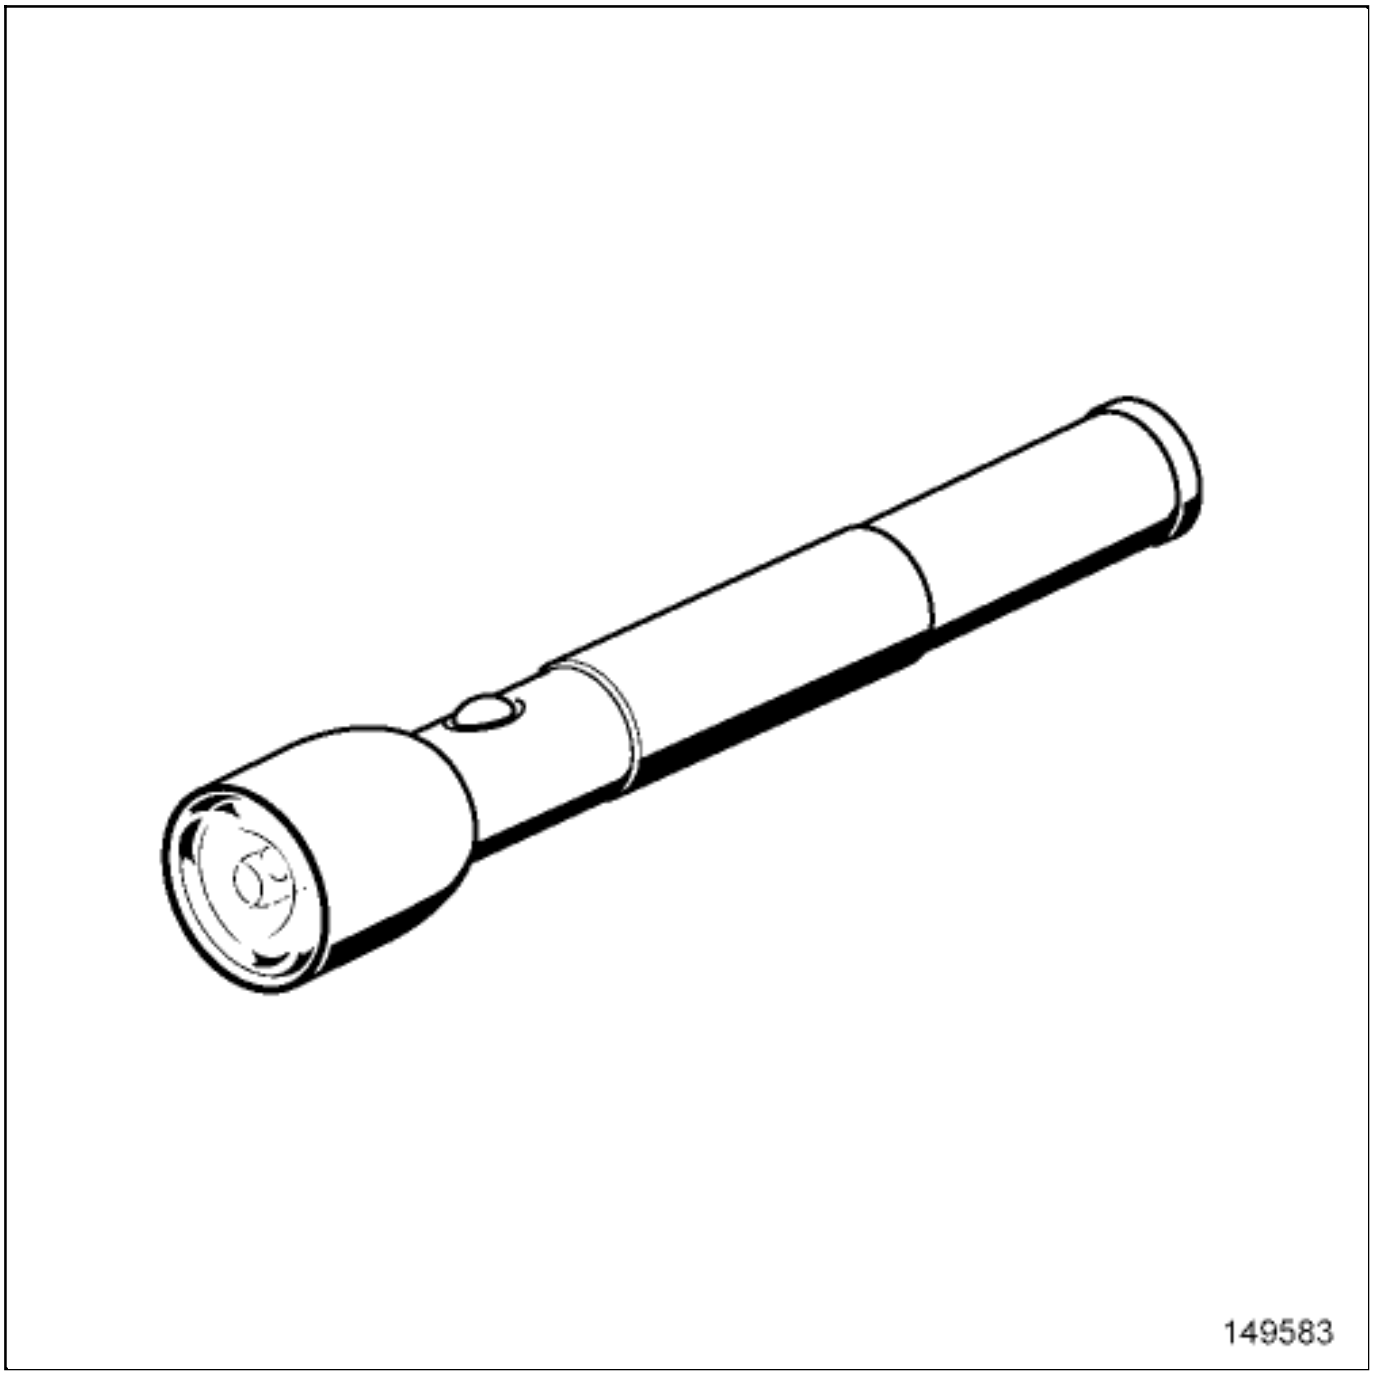
3)HAND PRESSURE SPRAYER

To be used on a particular area or to check a small area after the sealing has been repaired.



2- WATER INGRESS SEARCH TOOLS

1)AIR JET WITH A COMPRESSED AIR GUN



The pressure of the jet must be limited in order not to damage the vehicle component.

2)DOOR MIRROR GLASS

To be used in places which cannot be seen directly.

3)POCKET TORCH OR PEN-SHAPED TORCH

To be used in places with poor light.

3- MASTIC FILLING TOOLS

1)STRIPPING TOOLS

Tools for stripping very thick soft sealantsTools for stripping very thick soft mastic: Use (05B, Equipment and tools).

Tools for stripping rigid adhesives and paintTools for scraping rigid adhesives and paint: Use (05B, Equipment

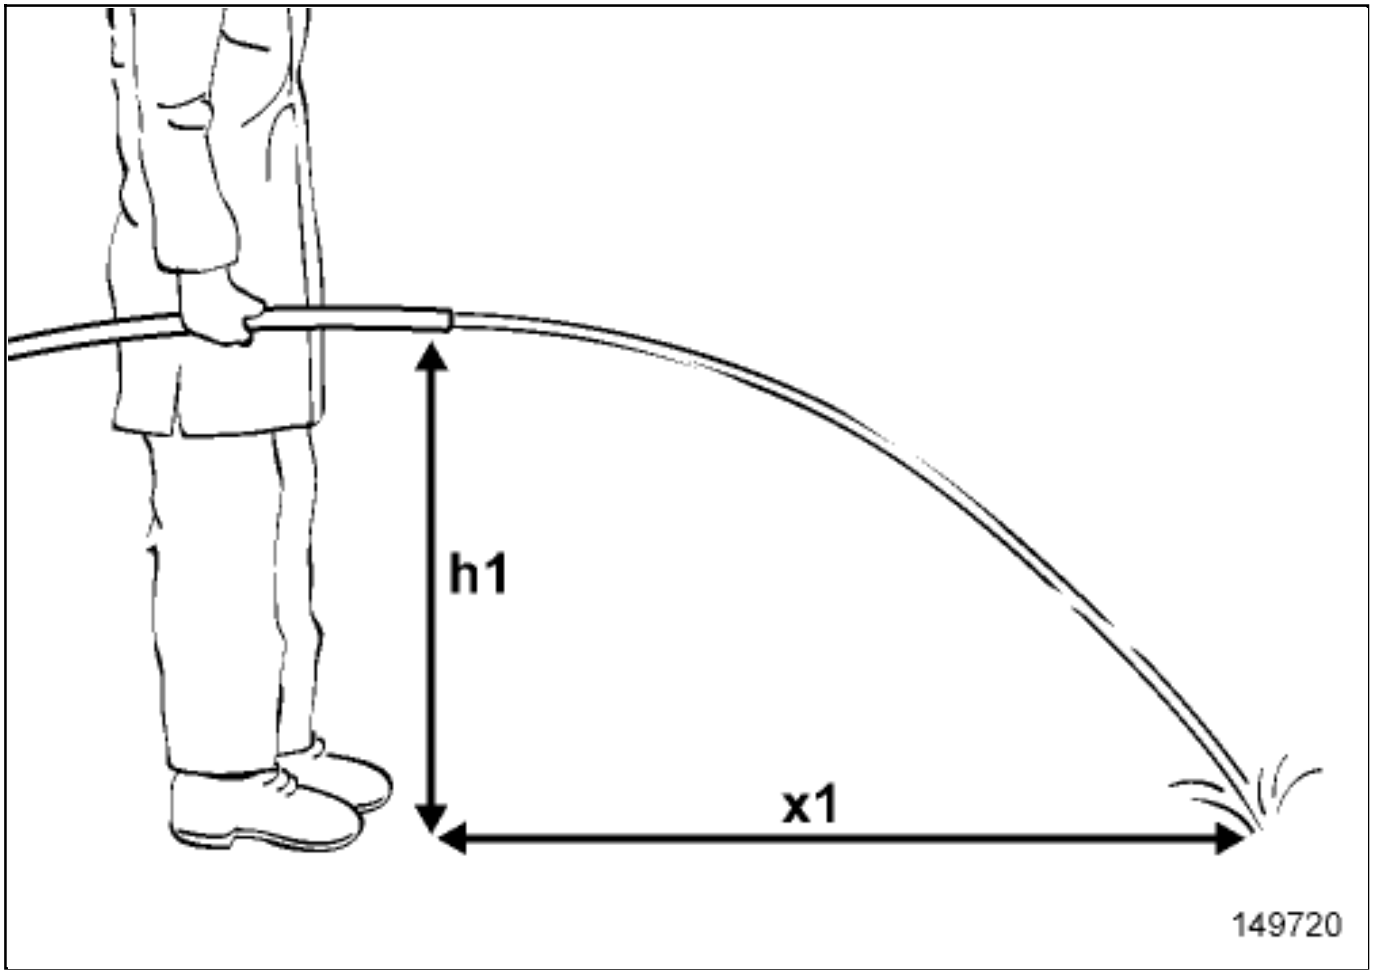
and tools).

To be used to strip mastic-filled zones.

2)EXTRUSION NOZZLE

Anti-corrosion protection of joints after weldingAnti-corrosion protection of joints after welding: Description (40J, Protection).

To be used to fill missing mastic.

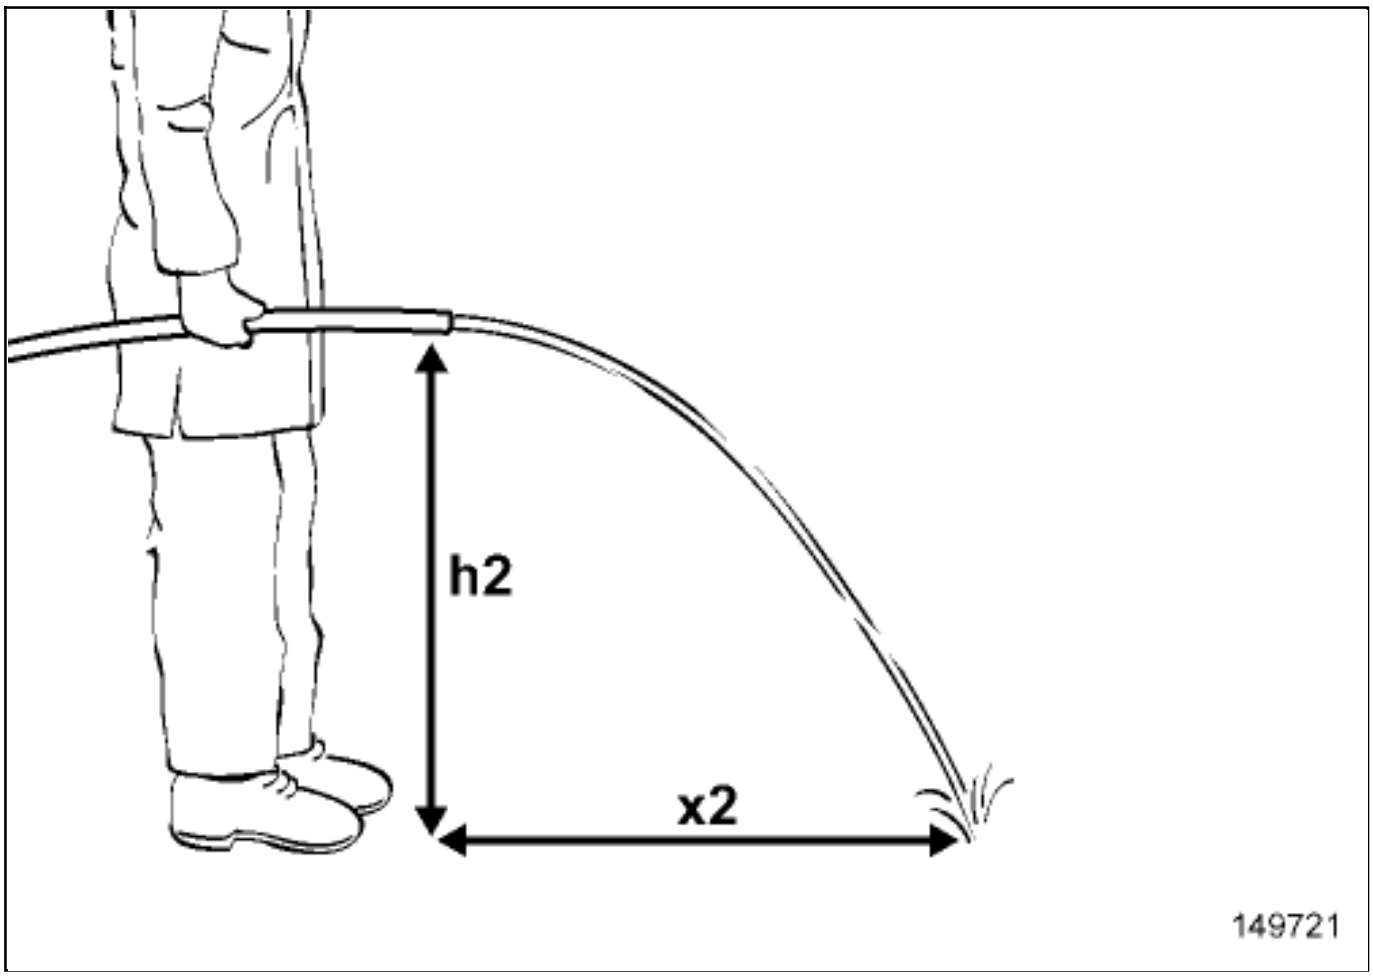


SEALING TOOLS: USE

1. SPRAYING TOOLS

1- ADJUSTING MODE FOR GARDENER TYPE JET

1)VEHICLE WITH STANDARD BODYWORK



Gardener type jet:

- the pipe must be used without an end piece,
- the internal diameter of the pipe should be 14 mm,
- the flow must be equal to 20 l/min, which corresponds to a projection of X1 = 1,20 m from the end of your toes by maintaining the pipe at H1 = 1 m (hip height),

unless otherwise indicated, the spraying distance should be 75 cm ± 5 cm.

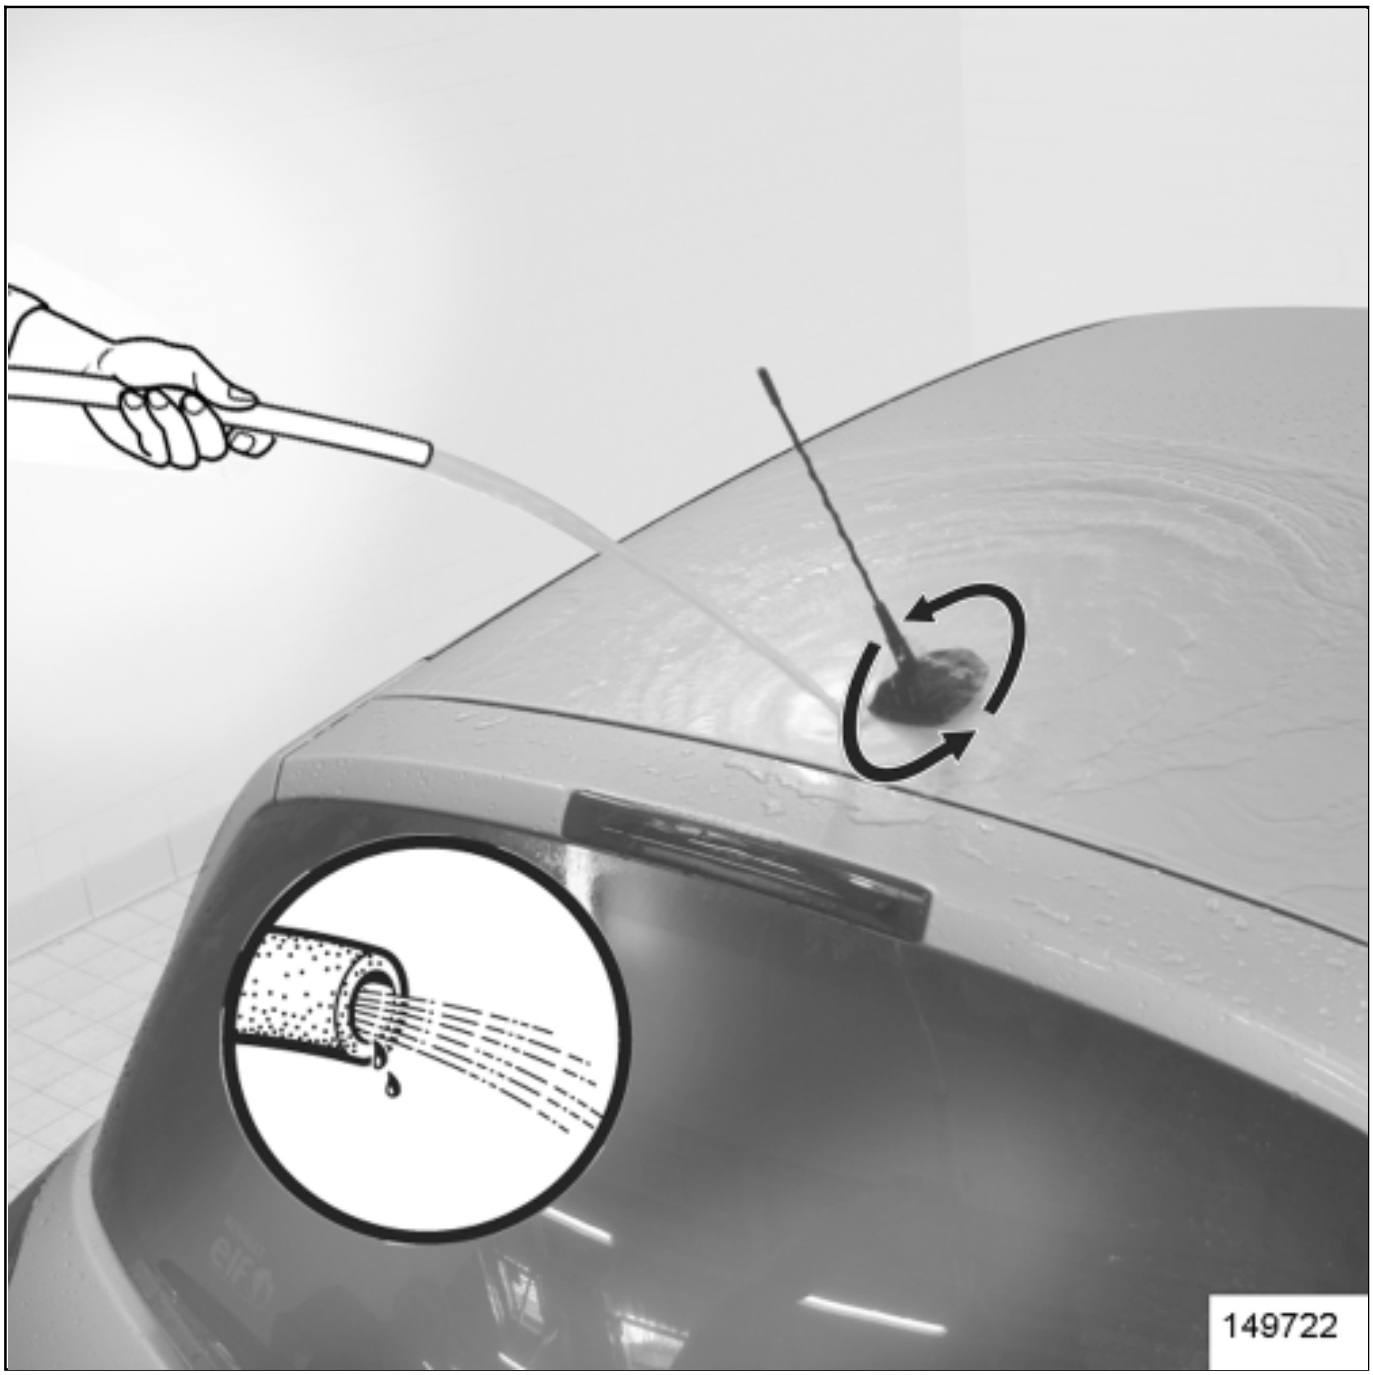
2)VEHICLE WITH COUPÉ CABRIOLET BODY

Note:

Adjustment (B) of the gardener type jet applies to specific zones on coupé cabriolet versions (side windows, retractable roof). For zones common to both coupé cabriolet and standard bodywork versions, the gardener type jet must be adjusted (A).

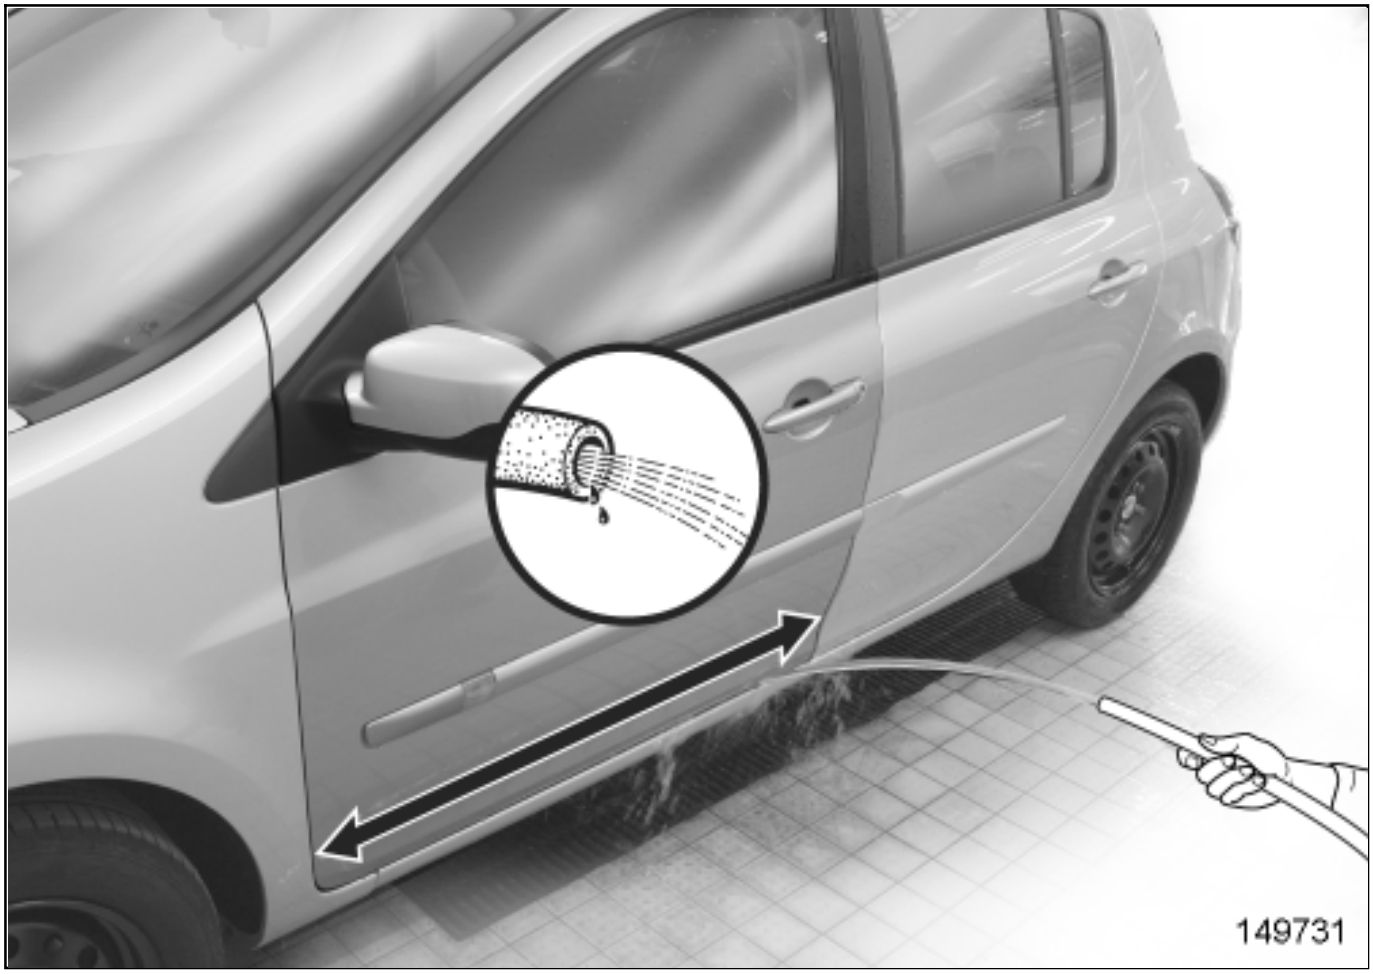
Gardener type jet:

- the pipe must be used without an end piece,
- the internal diameter of the pipe should be 14 mm,



the flow must be equal to 10 l/min, which corresponds to a projection of X2 = 0,80 m from the end of your toes by maintaining the pipe at H2 = 1 m (hip height),

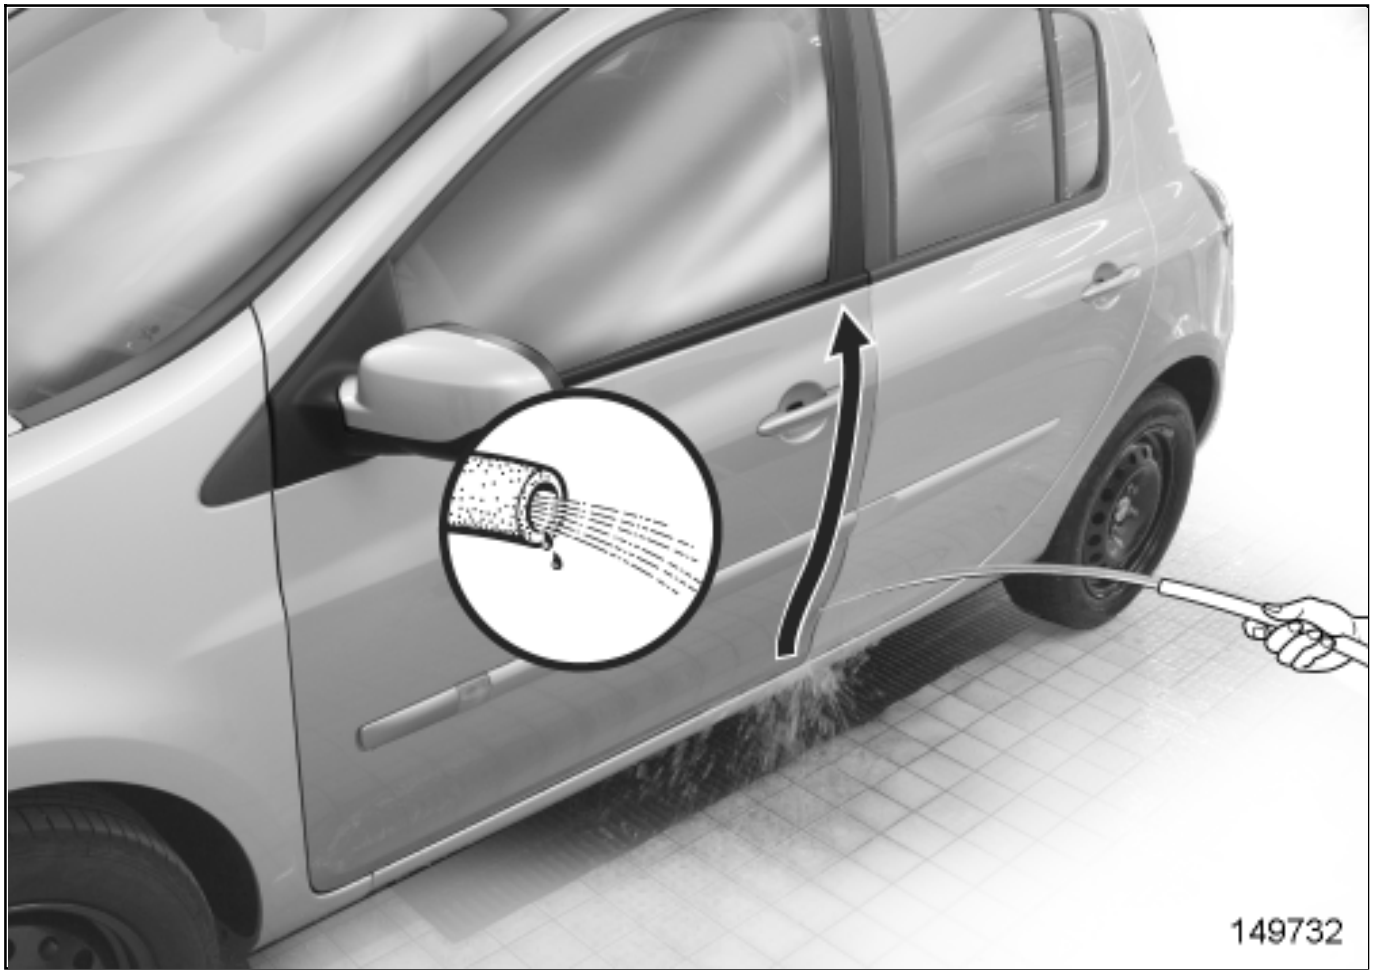
unless otherwise indicated, the spraying distance must be 10 cm.



2- INSTRUCTIONS FOR USING THE GARDENER TYPE JET

1)SPRAYING BY SWEEPING

CIRCULAR SWEEPING



HORIZONTAL SWEEPING

-
- Minimal spraying duration, 3 minutes,
- number of sweeps, at least 3,

  sweeping speed, 10 cm/s.

VERTICAL SPRAYING

Gradually spray the zone from the bottom upwards for at least 3 minutes.

2)STATIC SPRAYING

Minimal spraying duration, 30 seconds, without exceeding 40 seconds.

3- INSTRUCTIONS FOR USING THE PRESSURISED SPRAYER

Note:

the use of a pressurised sprayer enables the sealing to be checked in a particular area without having to spray the entire vehicle and enables a zone to be tested after repair.

- Fill the sprayer to 3/4 of its volume,
- close the sprayer,
- pump at least 4 times to pressurise the sprayer (repeat the operation uniformly during use in order to keep the sprayer under pressure),
- adjust the nozzle to a solid water jet,
- spray at a distance of approximately 20 cm.

2. TOOLS TO AID THE SEARCH

1- INSTRUCTIONS FOR USING THE SPRAYING SUPPORT

Note:

In certain cases, the vehicle may need to be sprayed for a long time. In order to reproduce the infiltration, the use of a spraying support (locally manufactured) prevents the need for the second operator.

- Direct the garden type jet to the sealing check zone,
- immobilise the spray hose on the spraying support,
- leave the jet in the static position on the spraying zone.

2- INSTRUCTIONS FOR USING THE AIR GUN

- Use the air gun to check the sealing in a particular area,
- moderately adjust the pressure of the air jet in order not to damage the internal trim components of the vehicle,

blow inside the passenger compartment.

3- INSTRUCTIONS FOR USING THE DOOR MIRROR GLASS

-
-

The door mirror glass allows zones which are difficult to reach to be visible,

direct the door mirror glass in order to view the zone to be checked.

4- INSTRUCTIONS FOR USING THE LIGHT OR PEN-SHAPED TORCH

-
-

The light and pen-shaped torch enable zones which are difficult to access to be viewed,

when the light or pen-shaped torch can be adjusted, adjust the lighting so that it focuses on one point.

3. TOOLS FOR REPAIR

1- INSTRUCTIONS FOR USING THE STRIPPING TOOLS

-

Stripping tools**Tools for stripping very thick soft mastic: Use** (05B, Equipment and tools) and**Tools for scraping rigid adhesives and paint: Use** (05B, Equipment and tools).

2- INSTRUCTIONS FOR USING THE EXTRUSION NOZZLE

-

Extrusion nozzle**Anti-corrosion protection of joints after welding: Description** (40J, Protections).

SHOCK ABSORBER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component jack

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 33A, Rear axle components, Rear axle components: Precautions for the repair) ,

Vehicle: Precautions for the repair .

CAUTION

To avoid any damage to the axle assemblies, the vehicle must not be raised using the front suspension arms for support or under the rear axle.

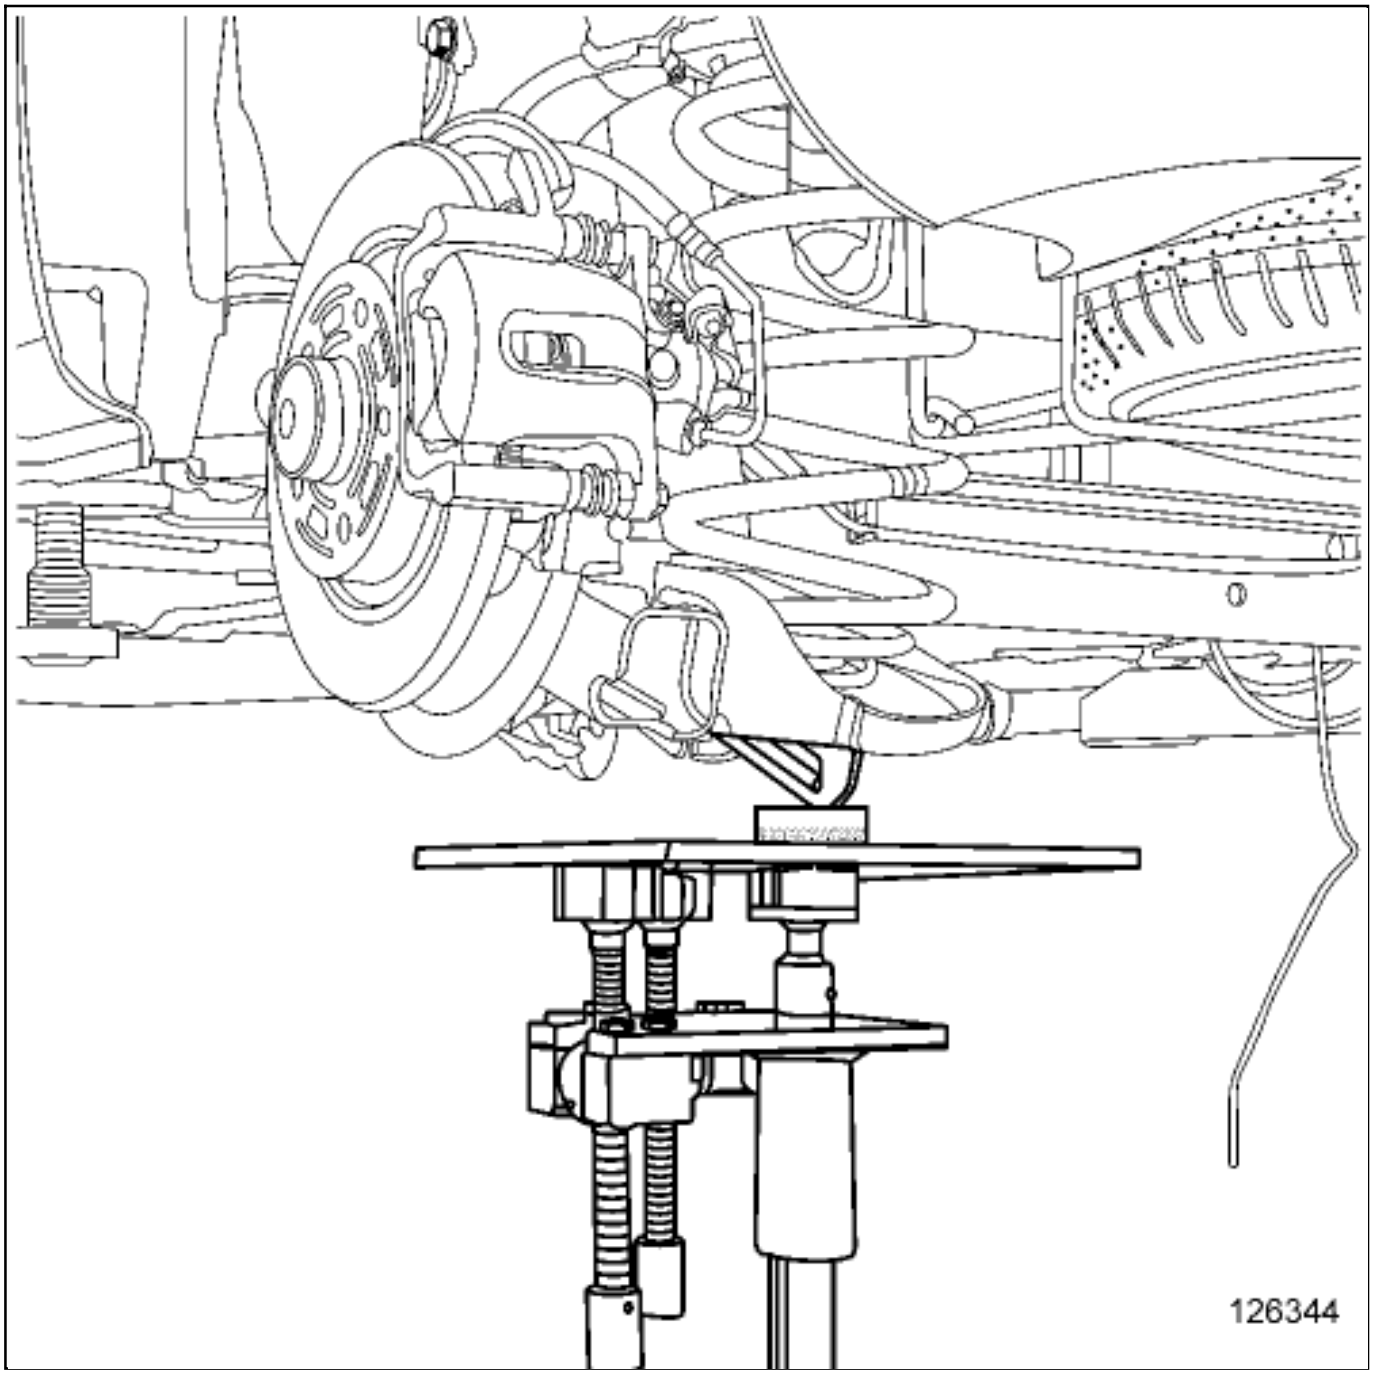
CAUTION

To prevent any suspension asymmetry, replace both of the shock absorbers on the same axle.

CAUTION

To prevent the components of the rear axle from deteriorating (rubber bushes, brake hoses, etc.) do not remove the two shock absorbers at the same time. Proceed one side at a time.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 33A, Rear axle components, Rear axle assembly: Exploded view) .



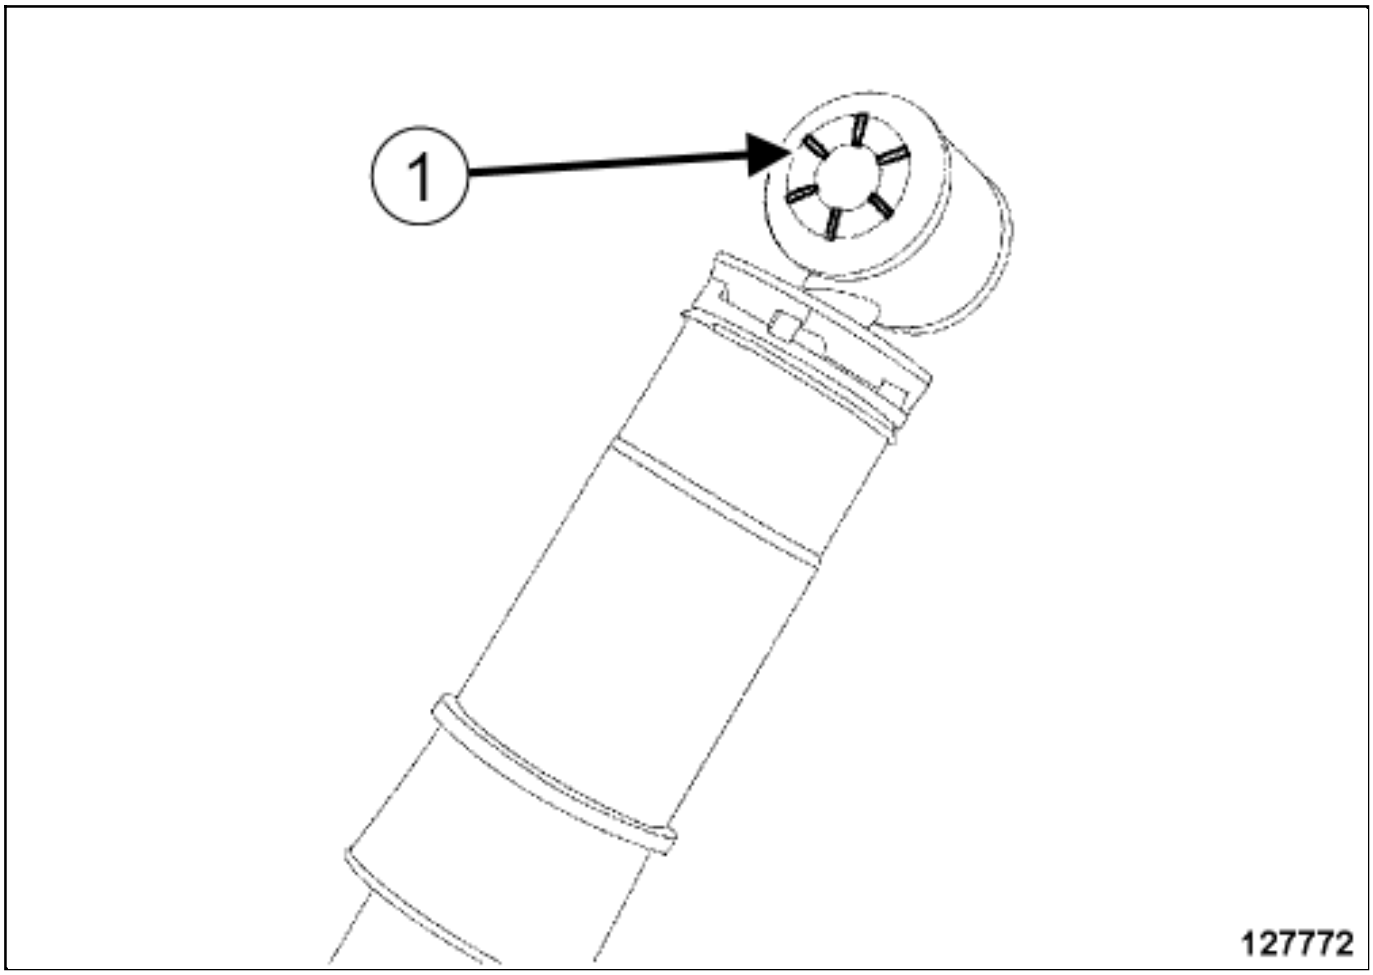
REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Separate the rear wheel arch trimInterior body side trim assembly: Exploded view .
- Remove the rear wheel(see 33A, Rear axle components, Rear hub carrier assembly: Exploded view) .

2. REMOVAL OPERATION

- Remove the cap(see 33A, Rear axle components, Rear axle assembly: Exploded view) .
- Loosen the upper shock absorber nut, whilst holding the bolt head and with the wheels on the ground (see 33A, Rear axle components, Rear axle assembly: Exploded view) .
- Raise the lift.



- Fit a component jack under the lower suspension spring cup.

- Remove the shock absorber (see 33A, Rear axle components, Rear axle assembly: Exploded view) .

REFITTING

1. REFITTING OPERATION

Note:

When refitting the shock absorbers, check that the upper eye of the shock absorber is correctly positioned.

The six male groves(1) facing towards the body, the four female grooves facing the bolt head.

- Refit the shock absorber(see 33A, Rear axle components, Rear axle assembly: Exploded view) .
- Proceed in the reverse order to removal.
- Repeat these operations on the shock absorber on the opposite side.

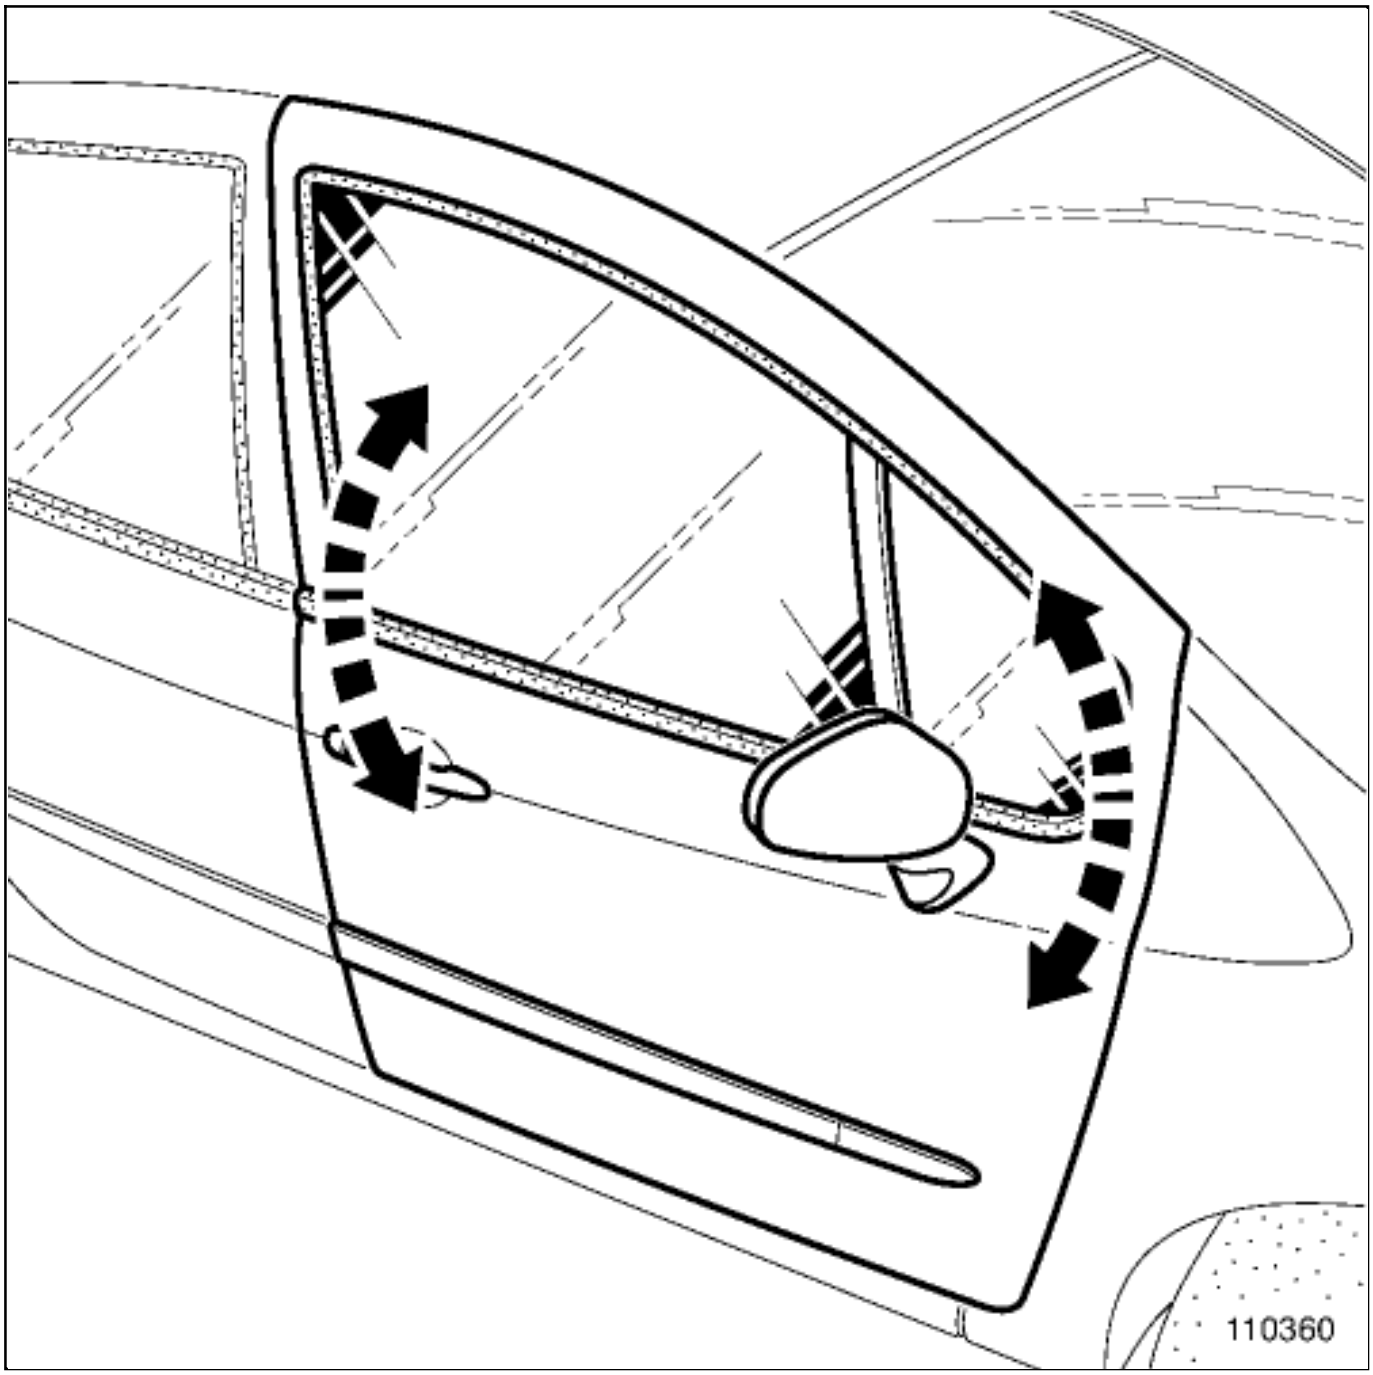
XSL version : 3.02 du 22/07/11

SIDEOPENINGELEMENTS:ADJUSTMENT

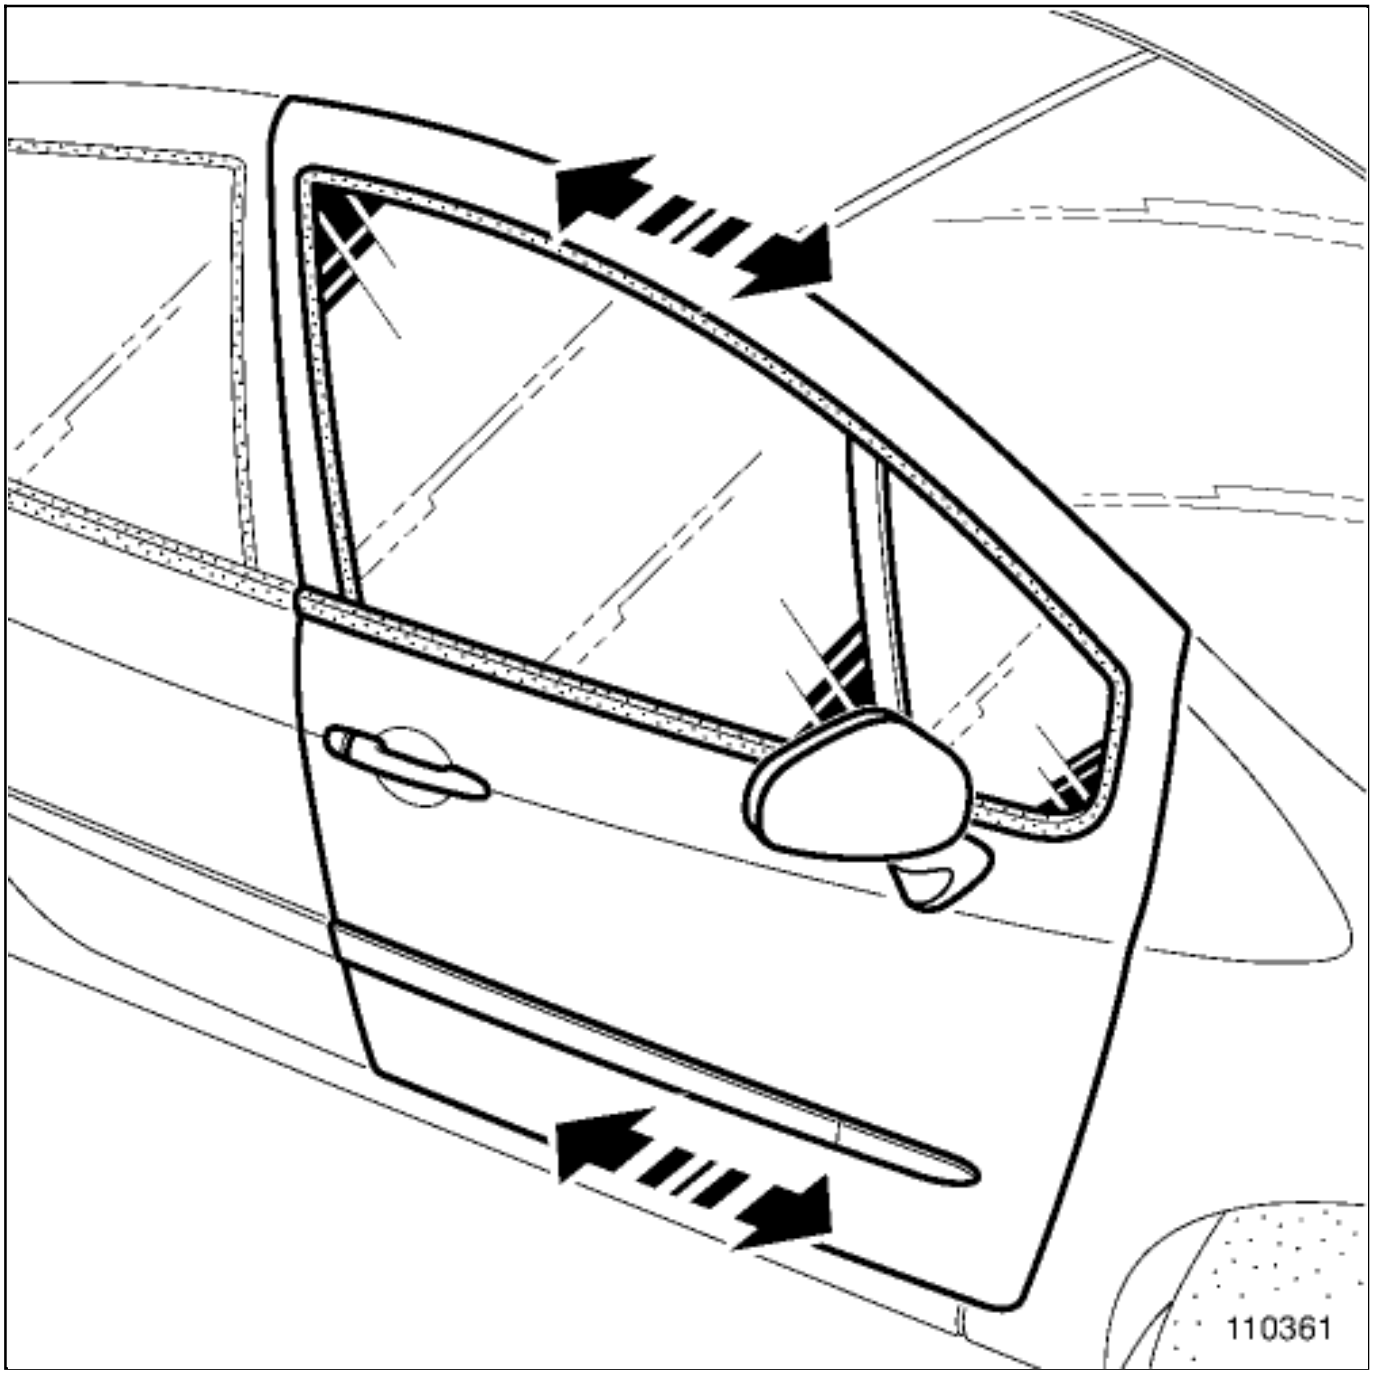
1. HINGED SIDE DOOR

- Check that the peripheral components are adjusted correctly.

Refit the heavy door fittings (closing system, window winder system).

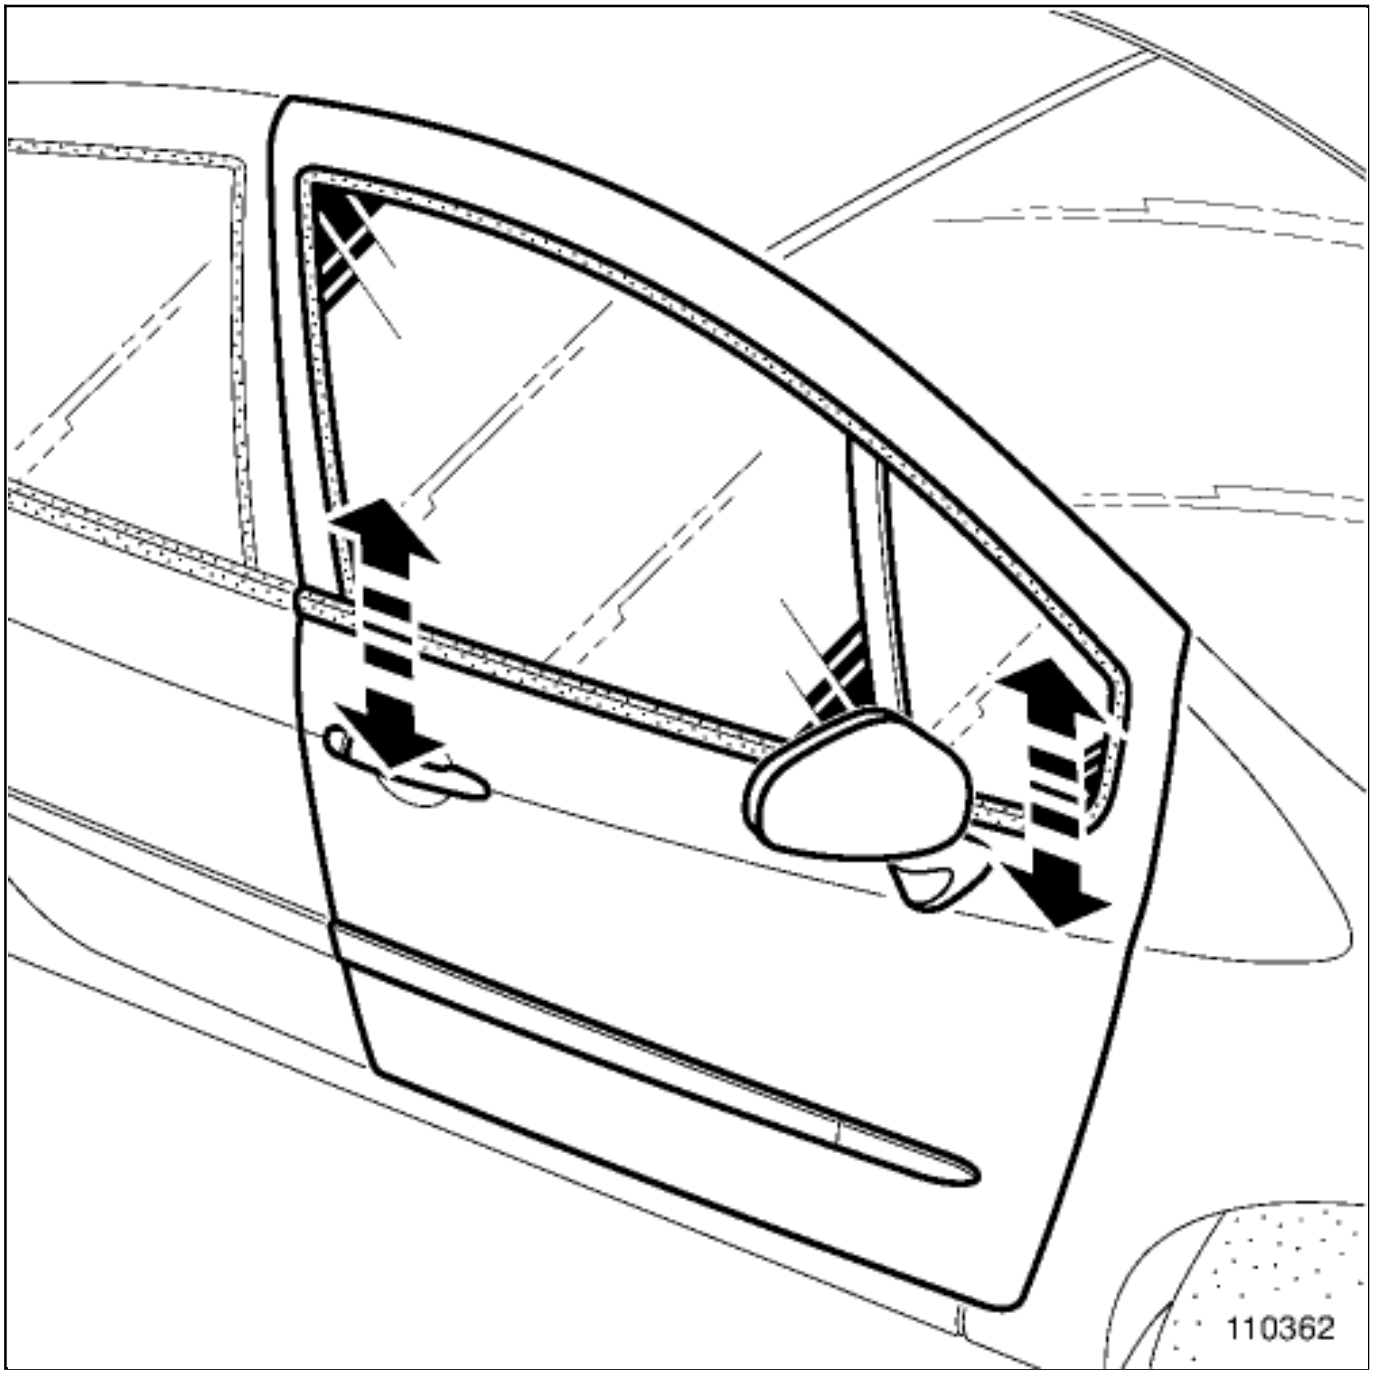


Before carrying out the adjustments, release the striker panel and fit the hinges, pre-tightening in the middle of the adjustment.

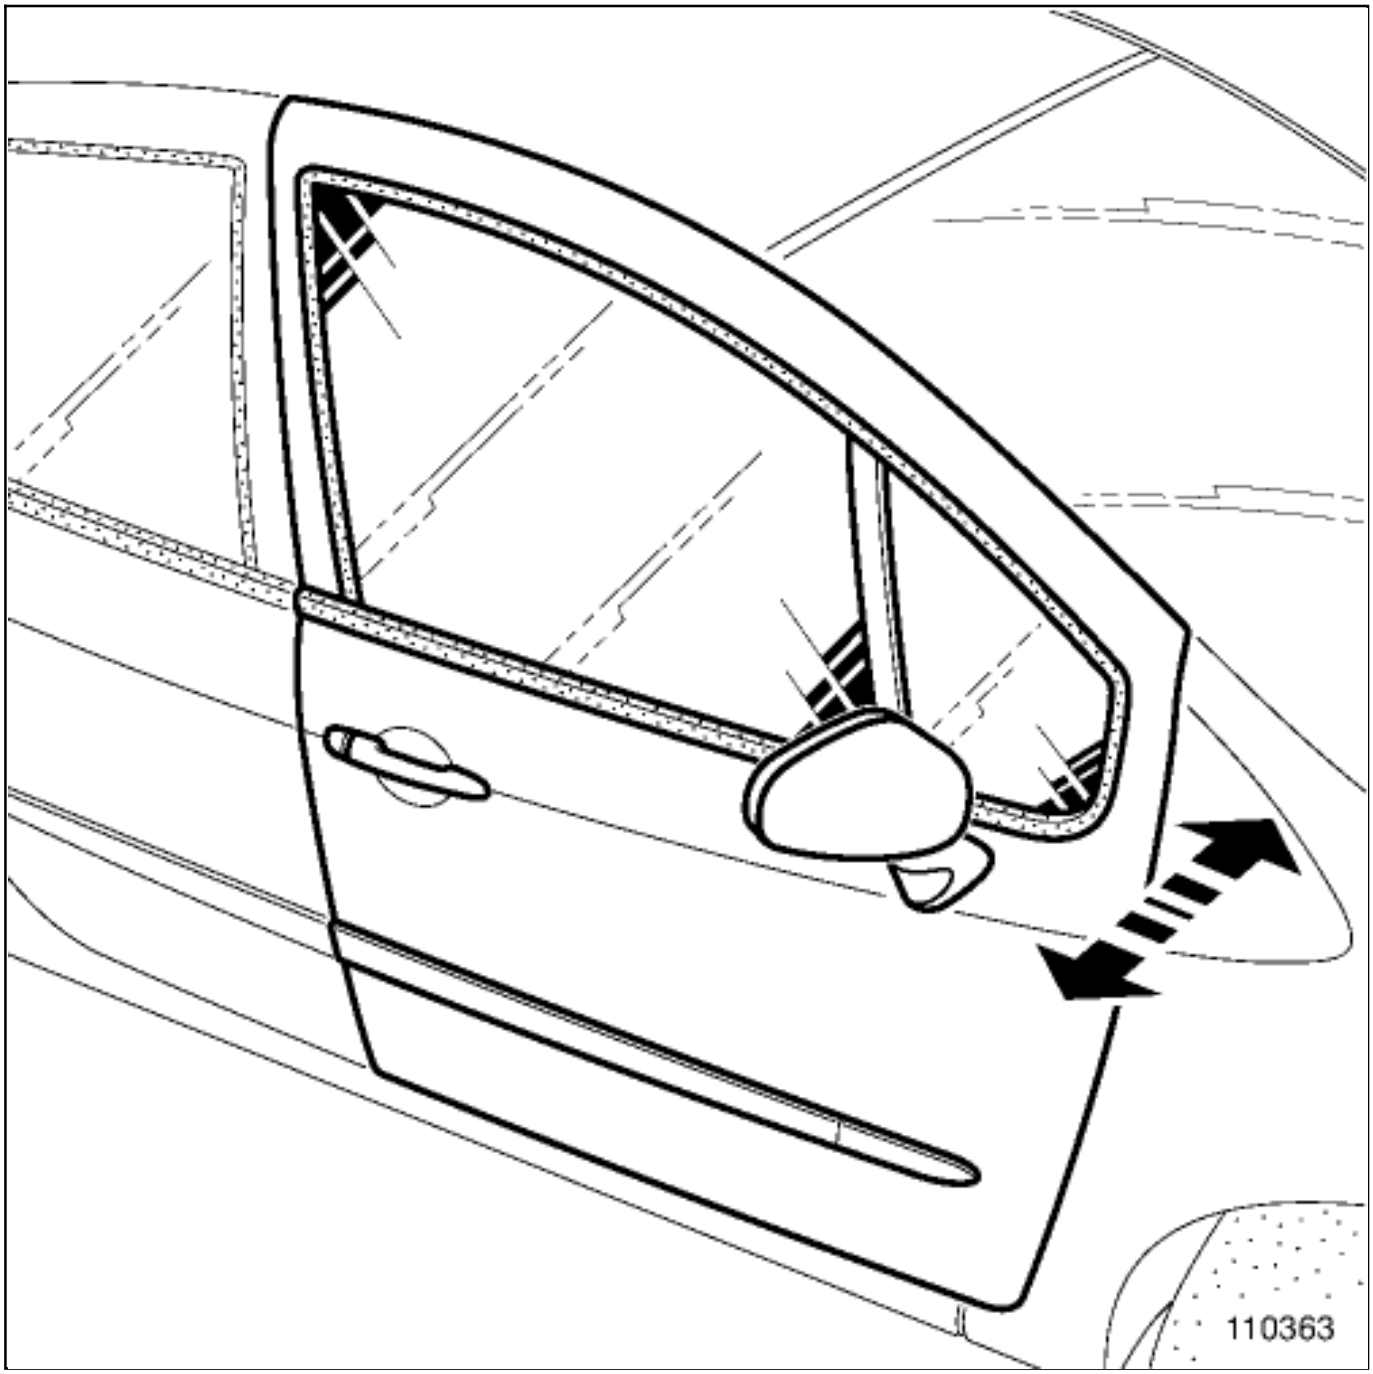


Note:

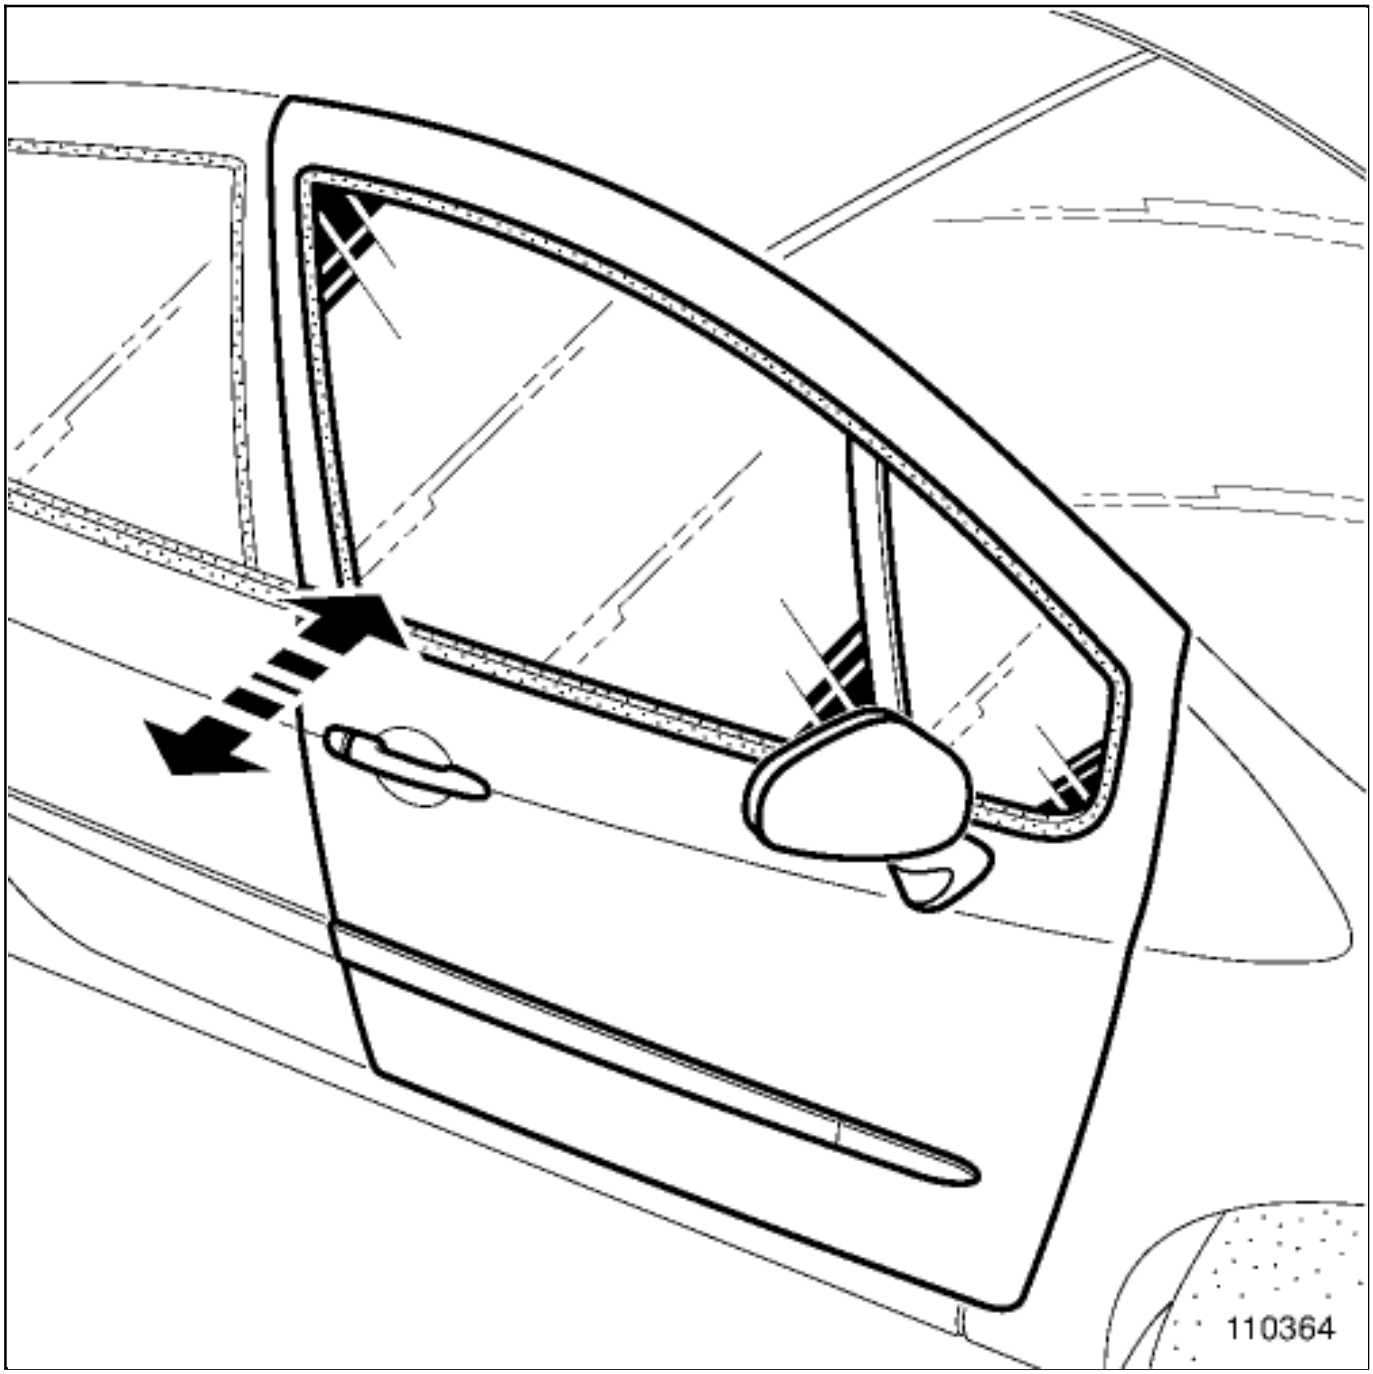
For information about the adjustment zones, refer to the MR for the vehicle concerned.



1- ADJUSTMENT CHRONOLOGY



- Adjust the centring of the door.



Adjust the side alignment of the door.

Adjust the alignment of the door height.

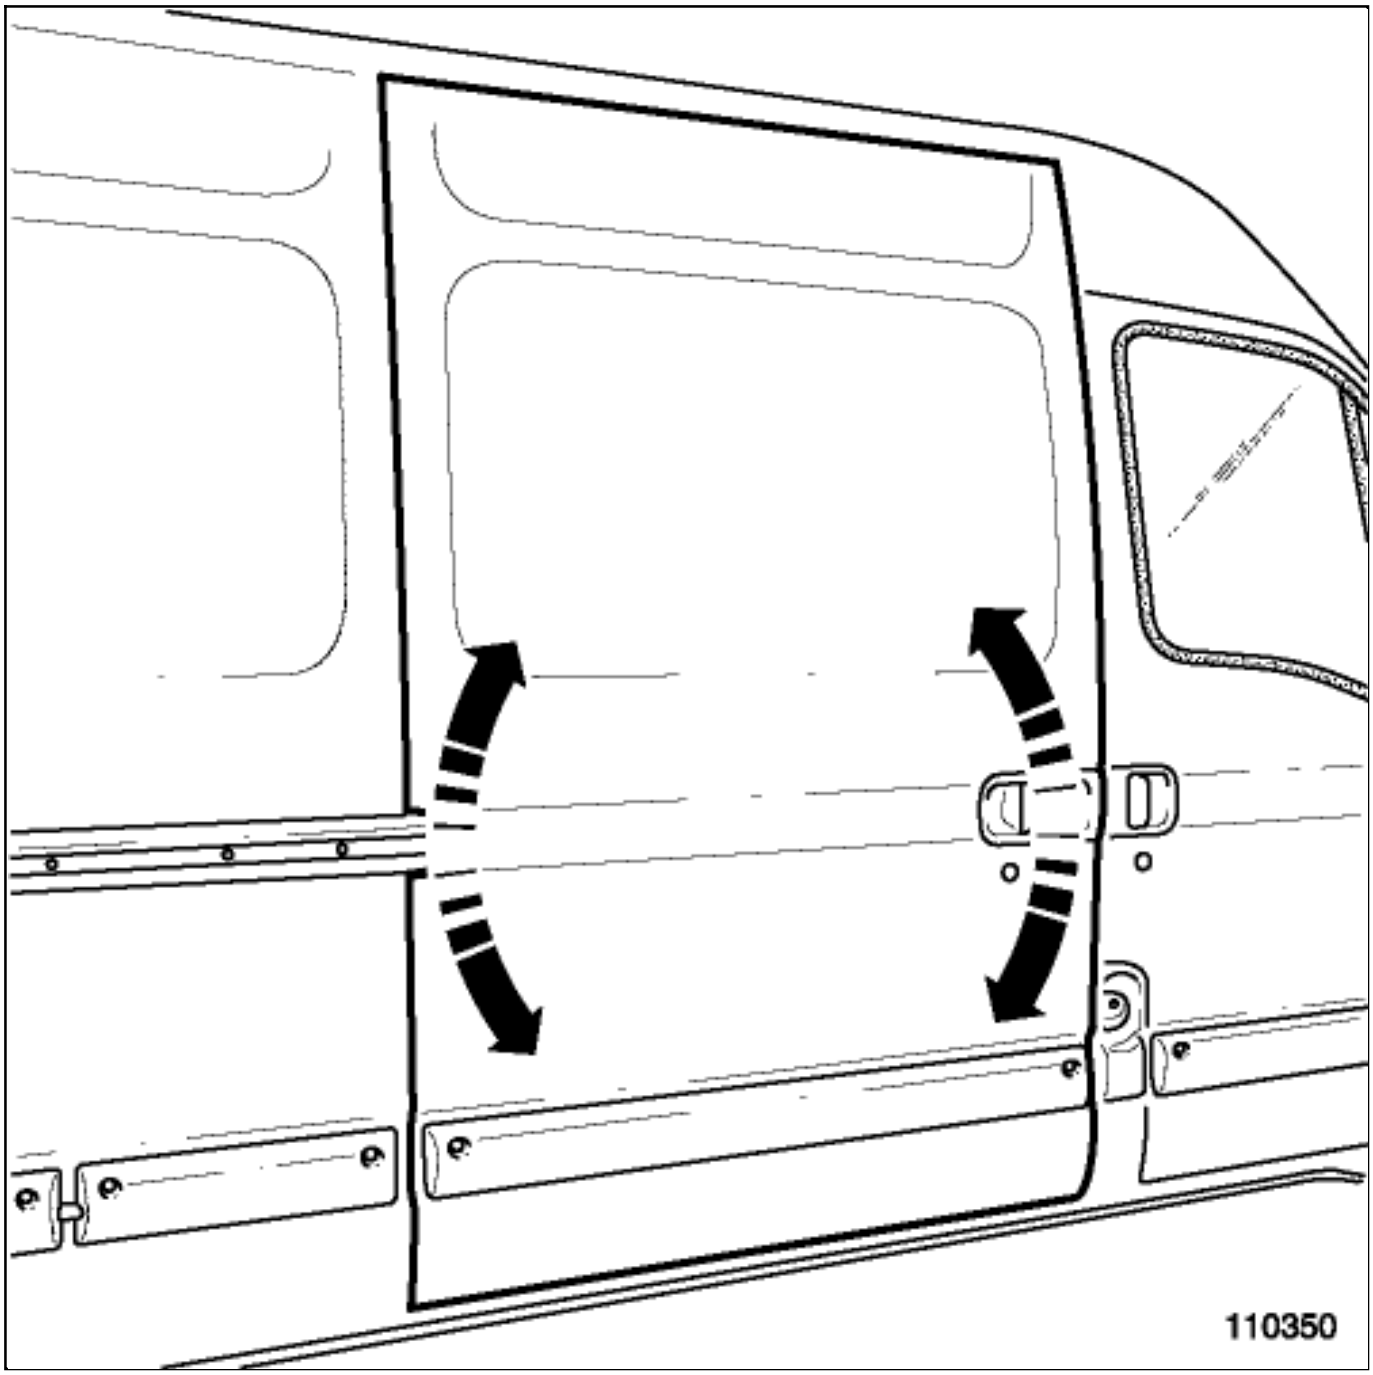
Adjust the front flush fitting of the door.

- Adjust the rear flush fitting of the door, as well as the contact and the closure firmness.
- Check the adjustment and the correct operation then tighten into position.

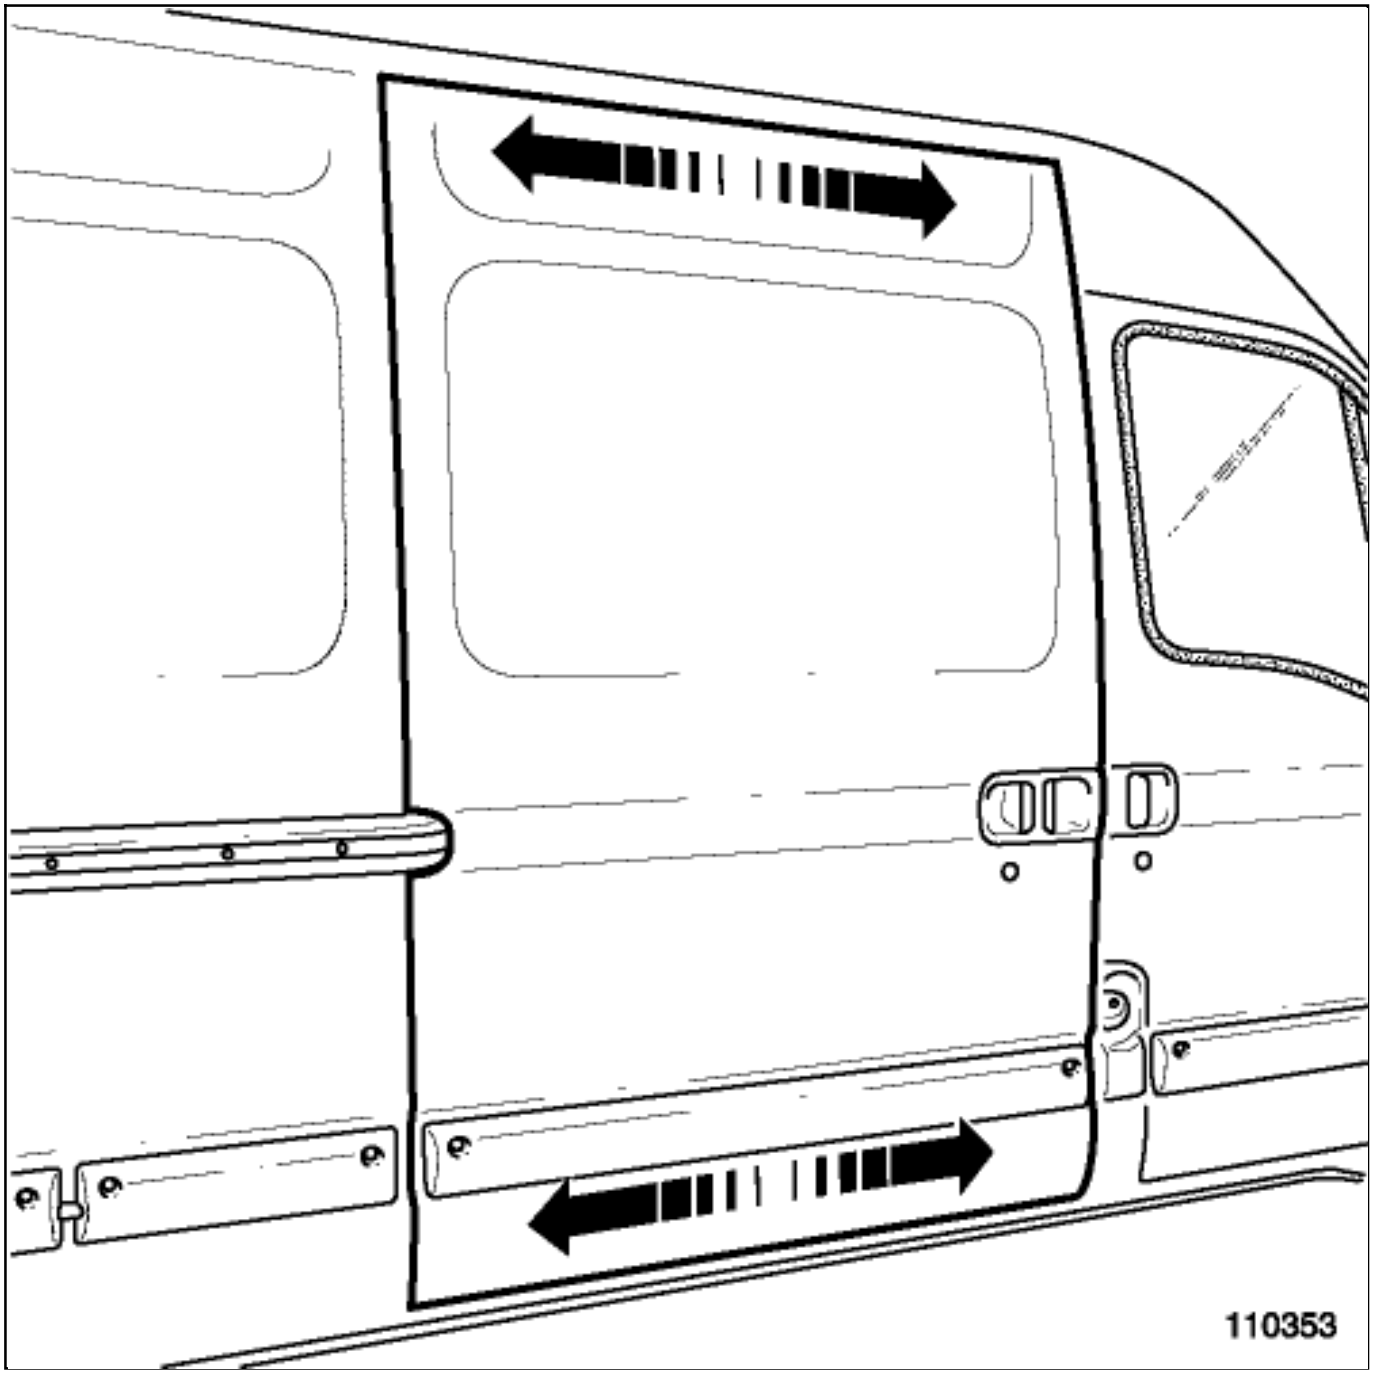
2. SLIDING SIDE DOOR

Check that the peripheral components are adjusted correctly.

Refit the heavy door fittings (closing system, window winder system).

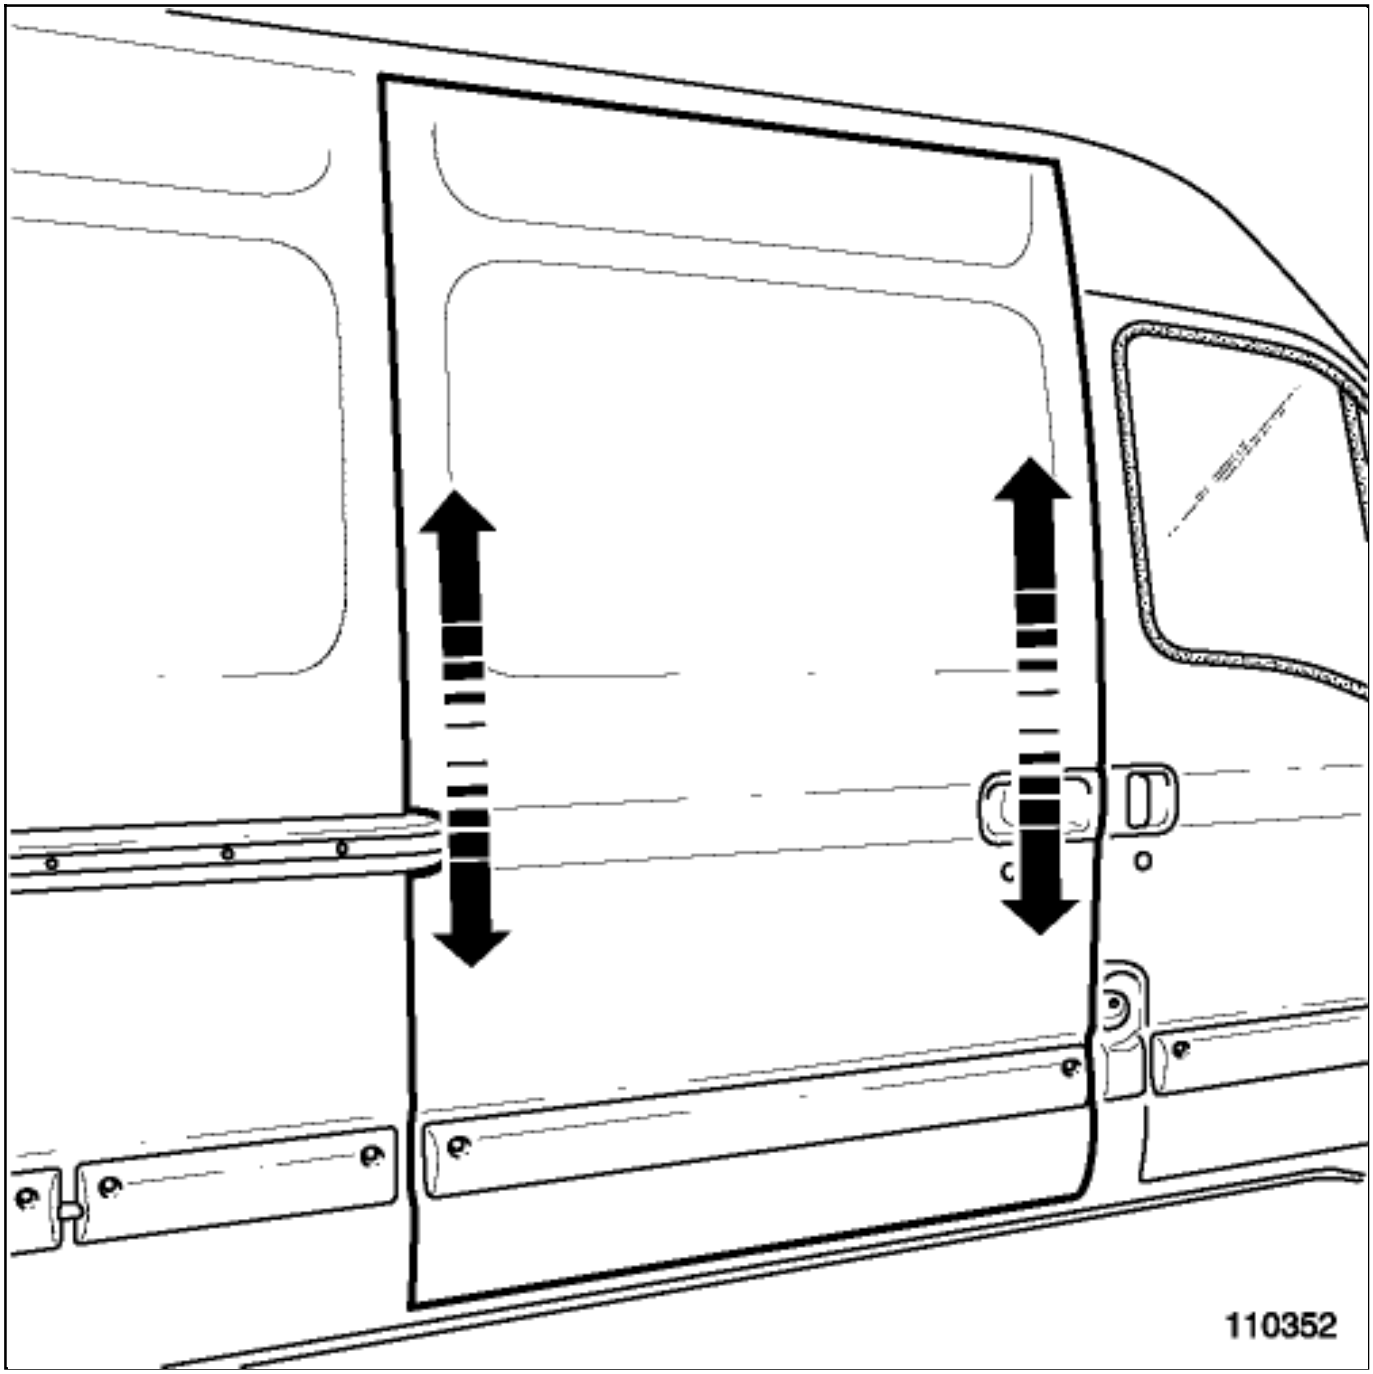


Before carrying out the adjustments, release the striker panel and fit the hinges, pre-tightening in the middle of the adjustment.

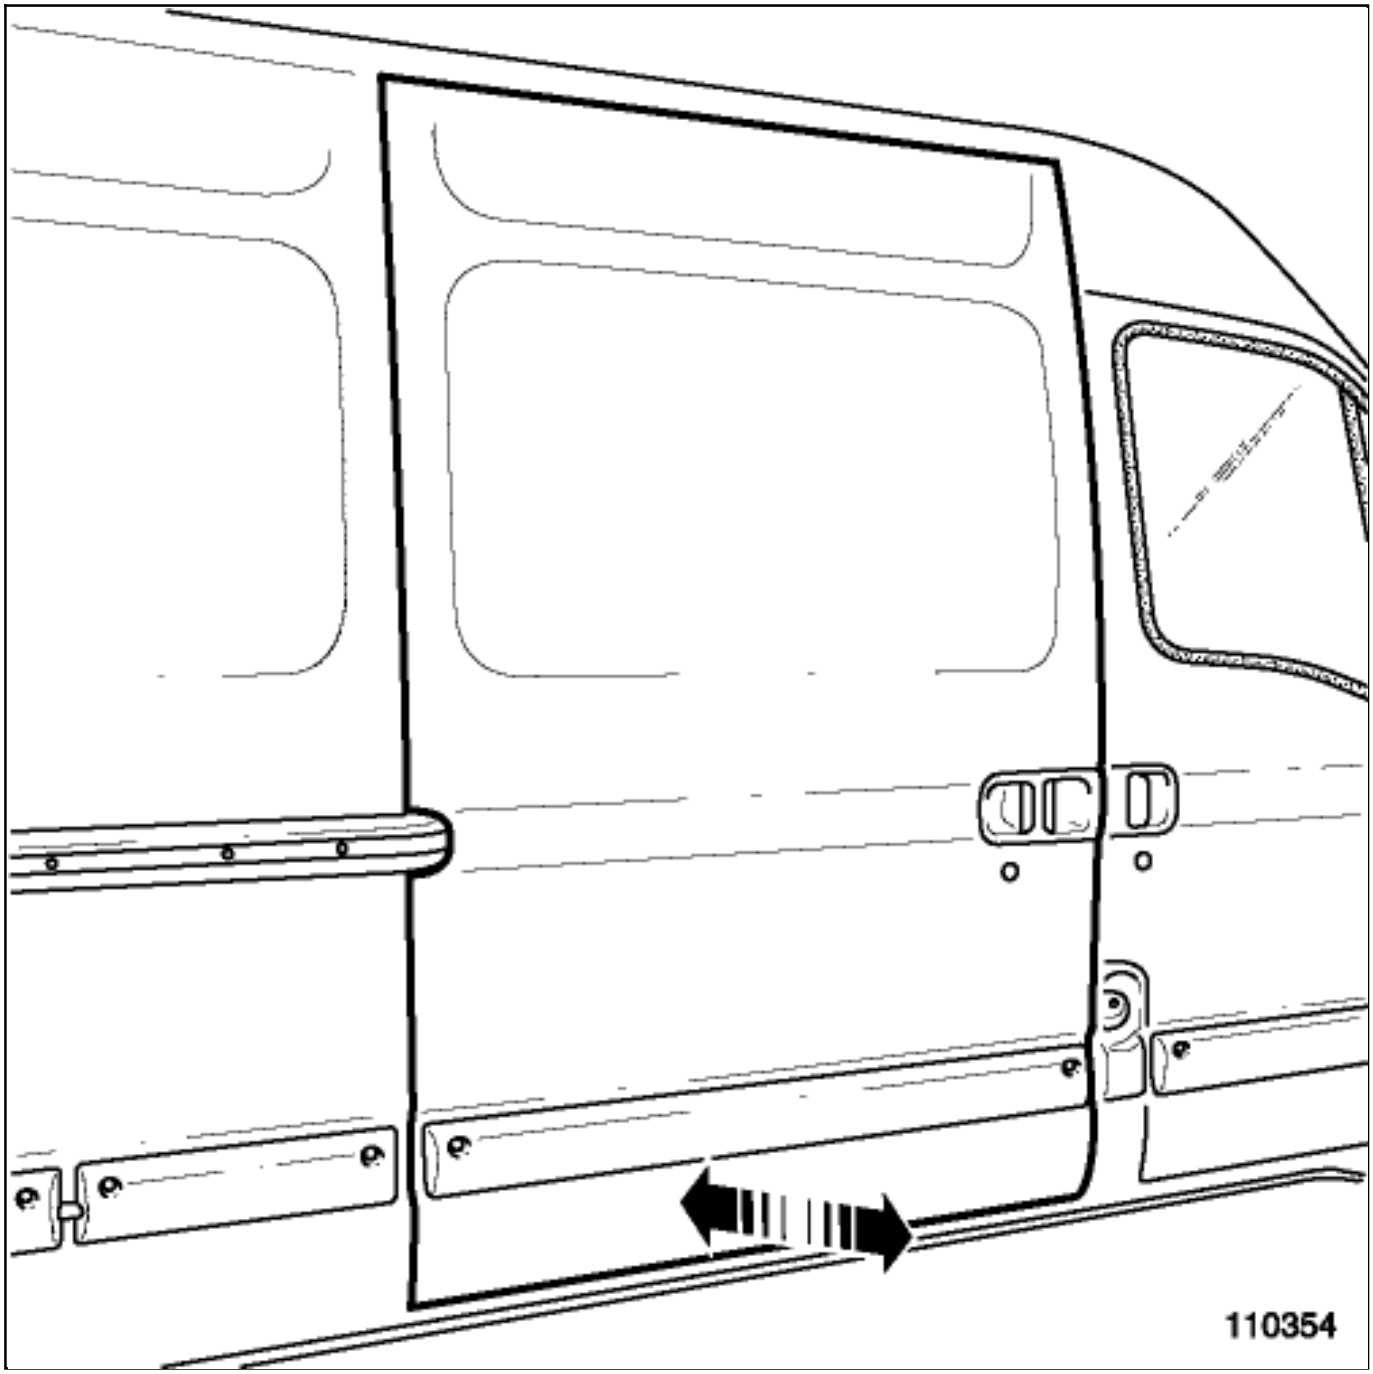


Note:

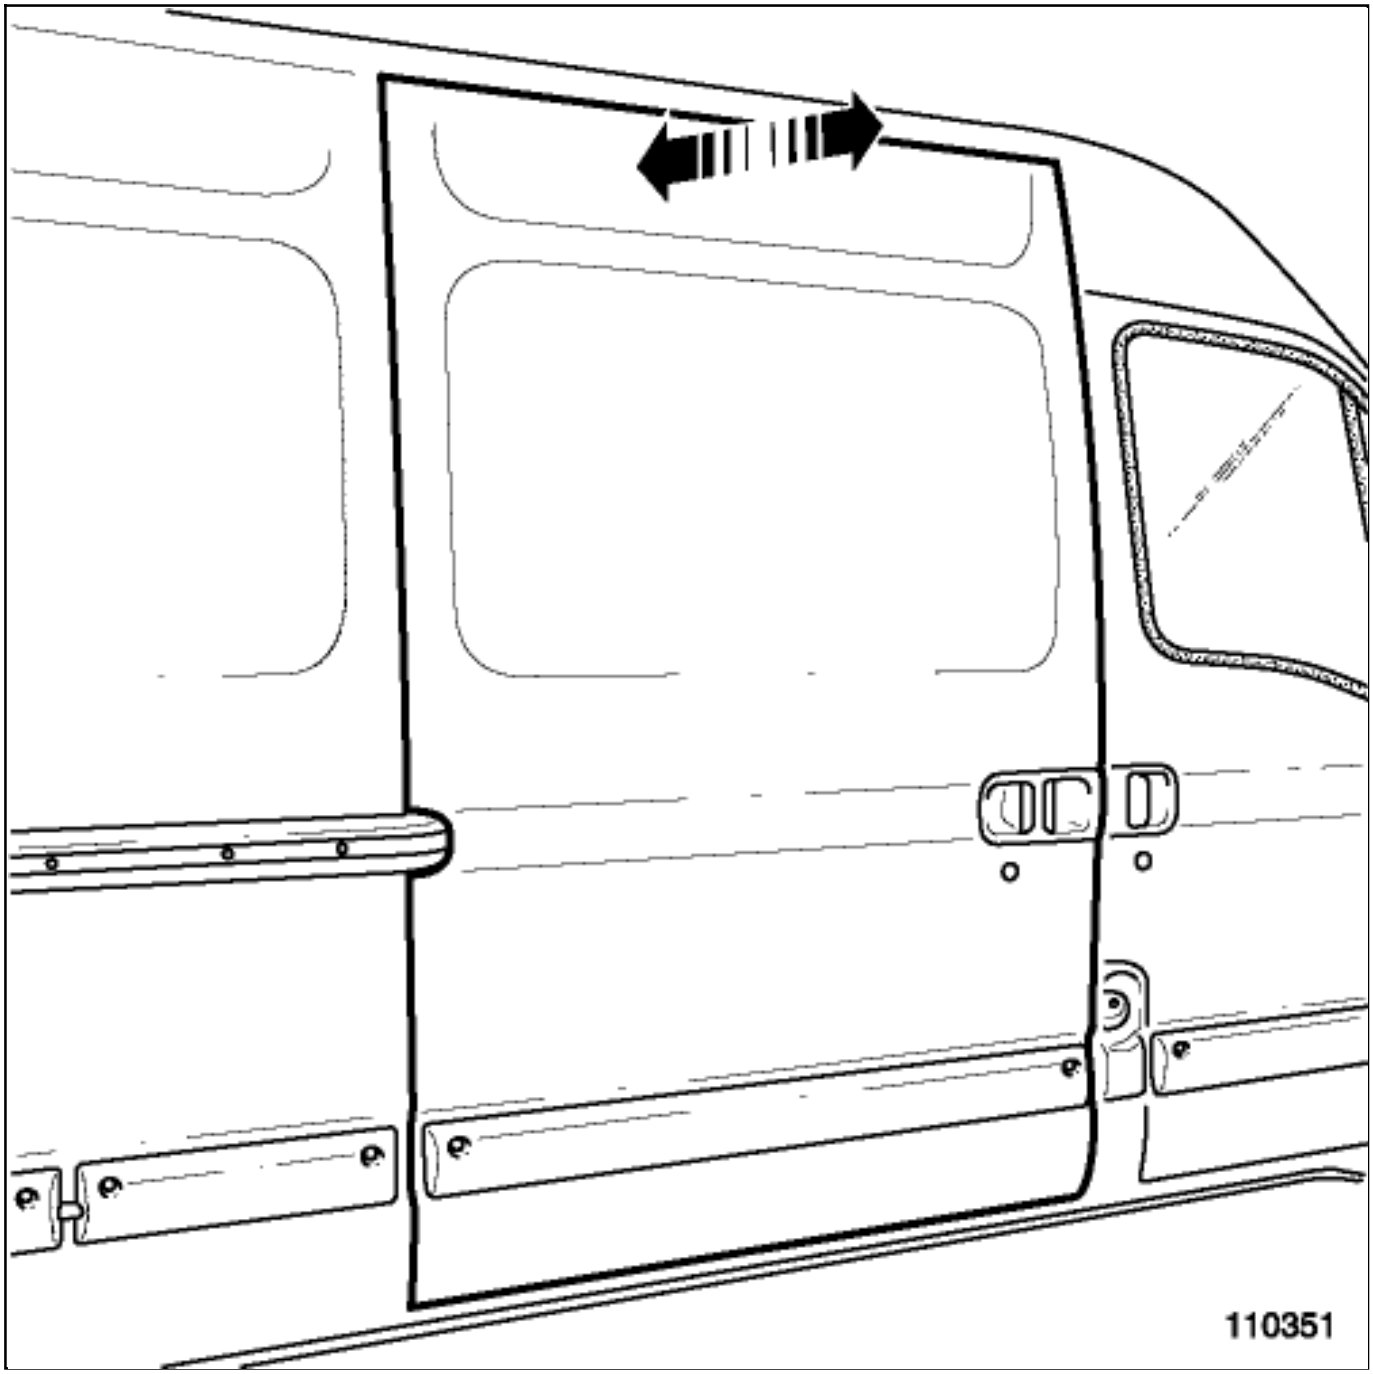
For information about the adjustment zones, refer to the MR for the vehicle concerned.



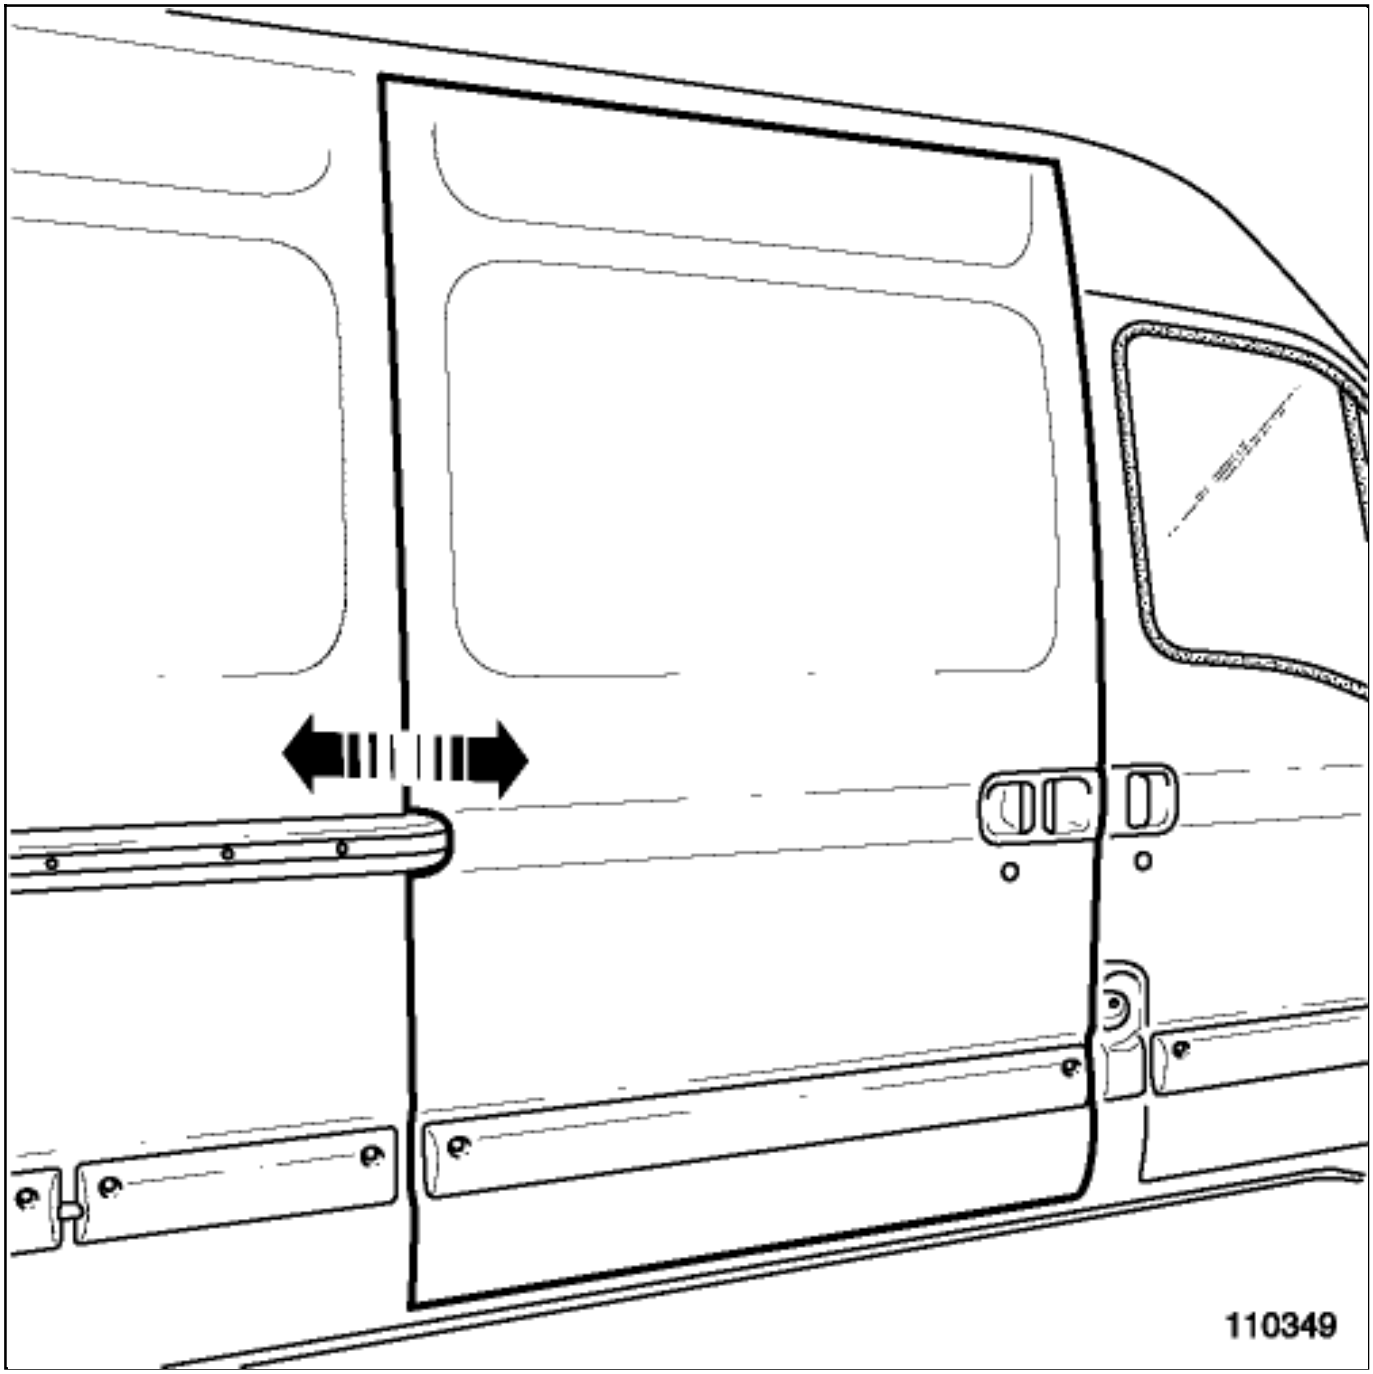
1- ADJUSTMENT CHRONOLOGY



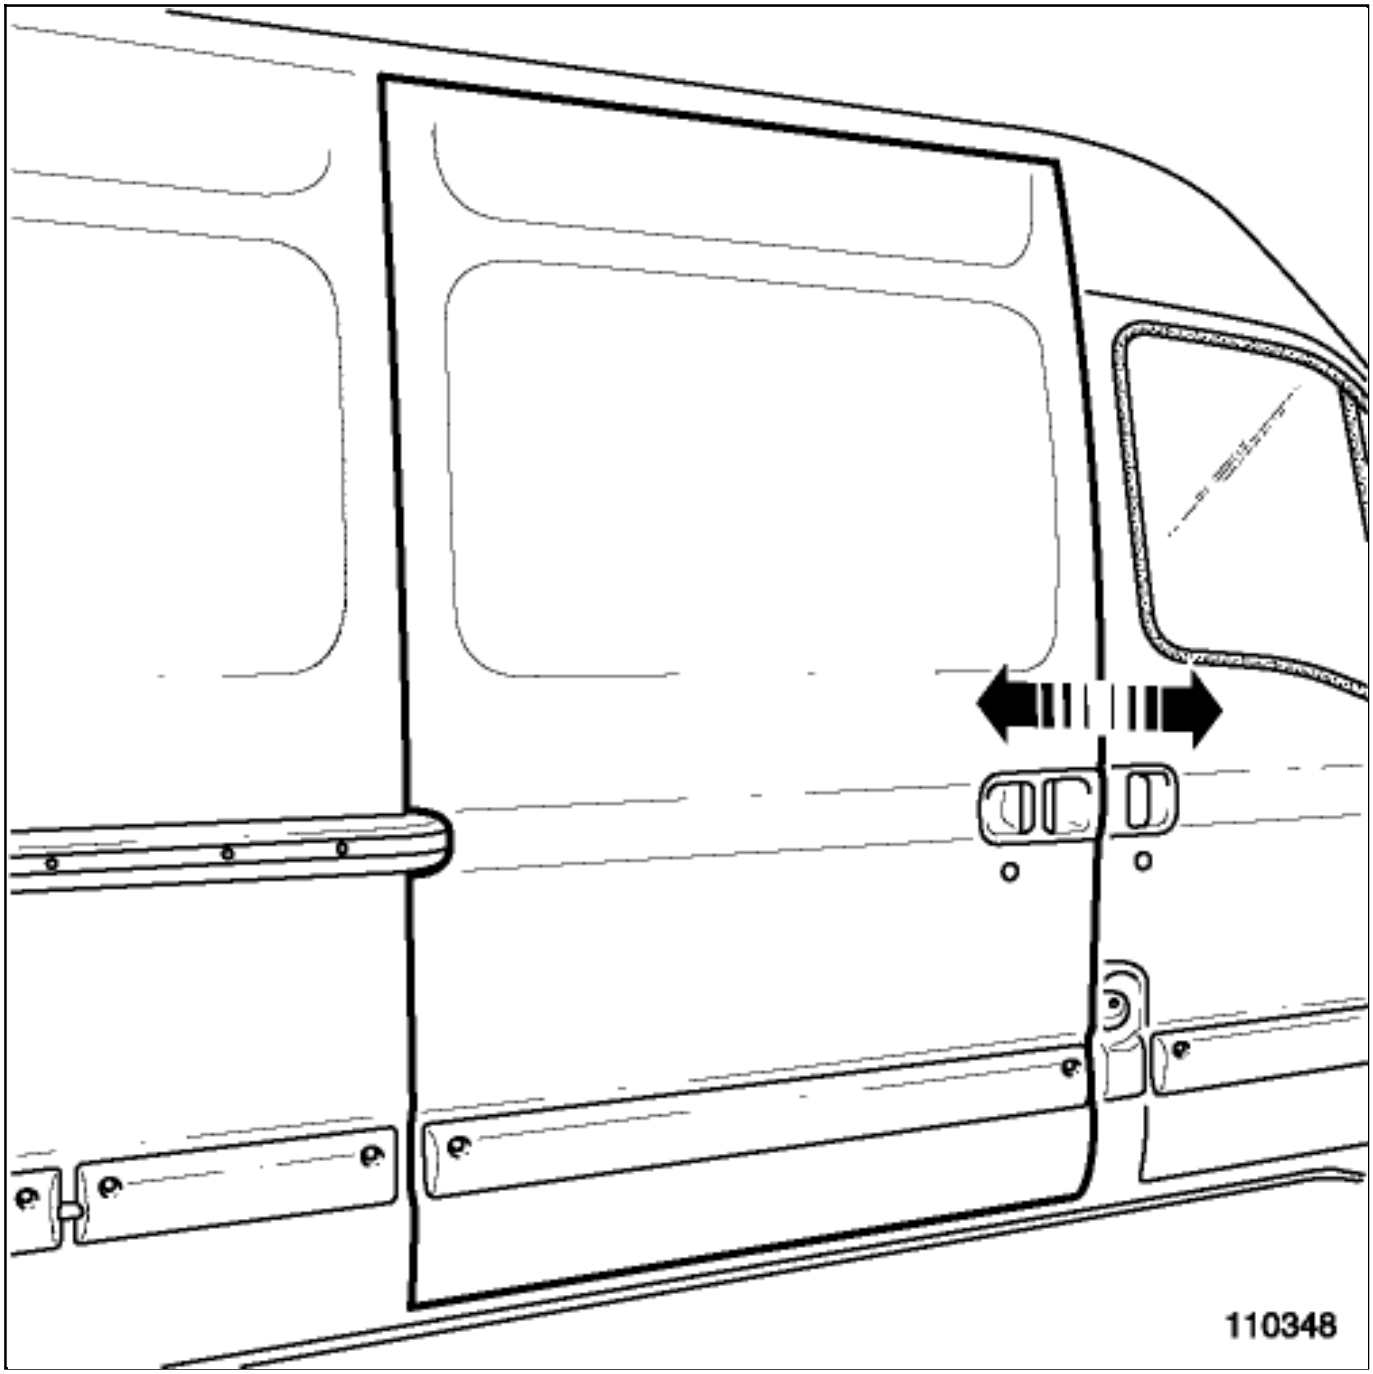
Adjust the centring of the door.



Adjust the side alignment of the door.



Adjust the alignment of the door height.



Adjust the flush fitting of the bottom section of the door.

Adjust the flush fitting of the top section of the door.

Adjust the rear flush fitting of the door.

- Adjust the front flush fitting of the door.

- Check the adjustment and the correct operation then tighten into position.

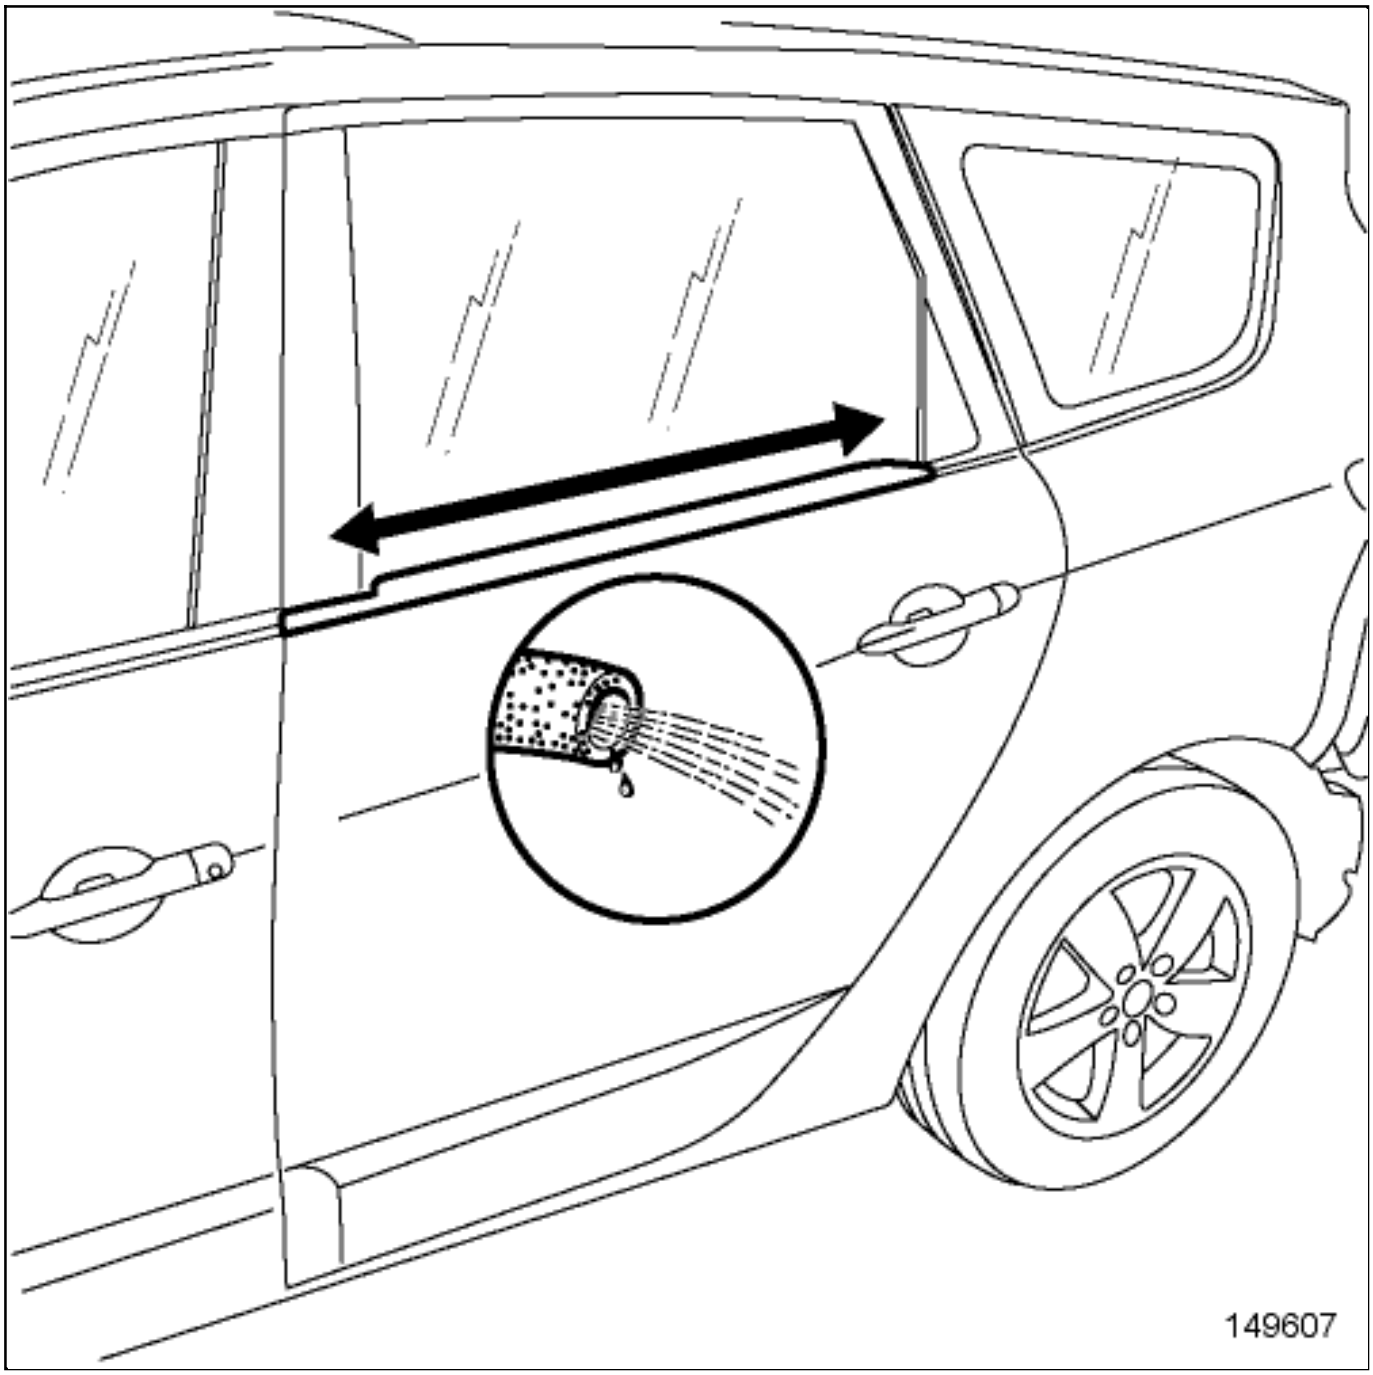
SIDE OPENING ELEMENTS: SEALING CHECK

Note:

Before any operation, check the water outlet openings. Clean any residue which has accumulated (example: dead leaves, twigs, etc.) in order to check that the water flows out correctly.

Note:

To check the sealing of the side opening element windows(see 60A, General information, Windows: Sealing check) .

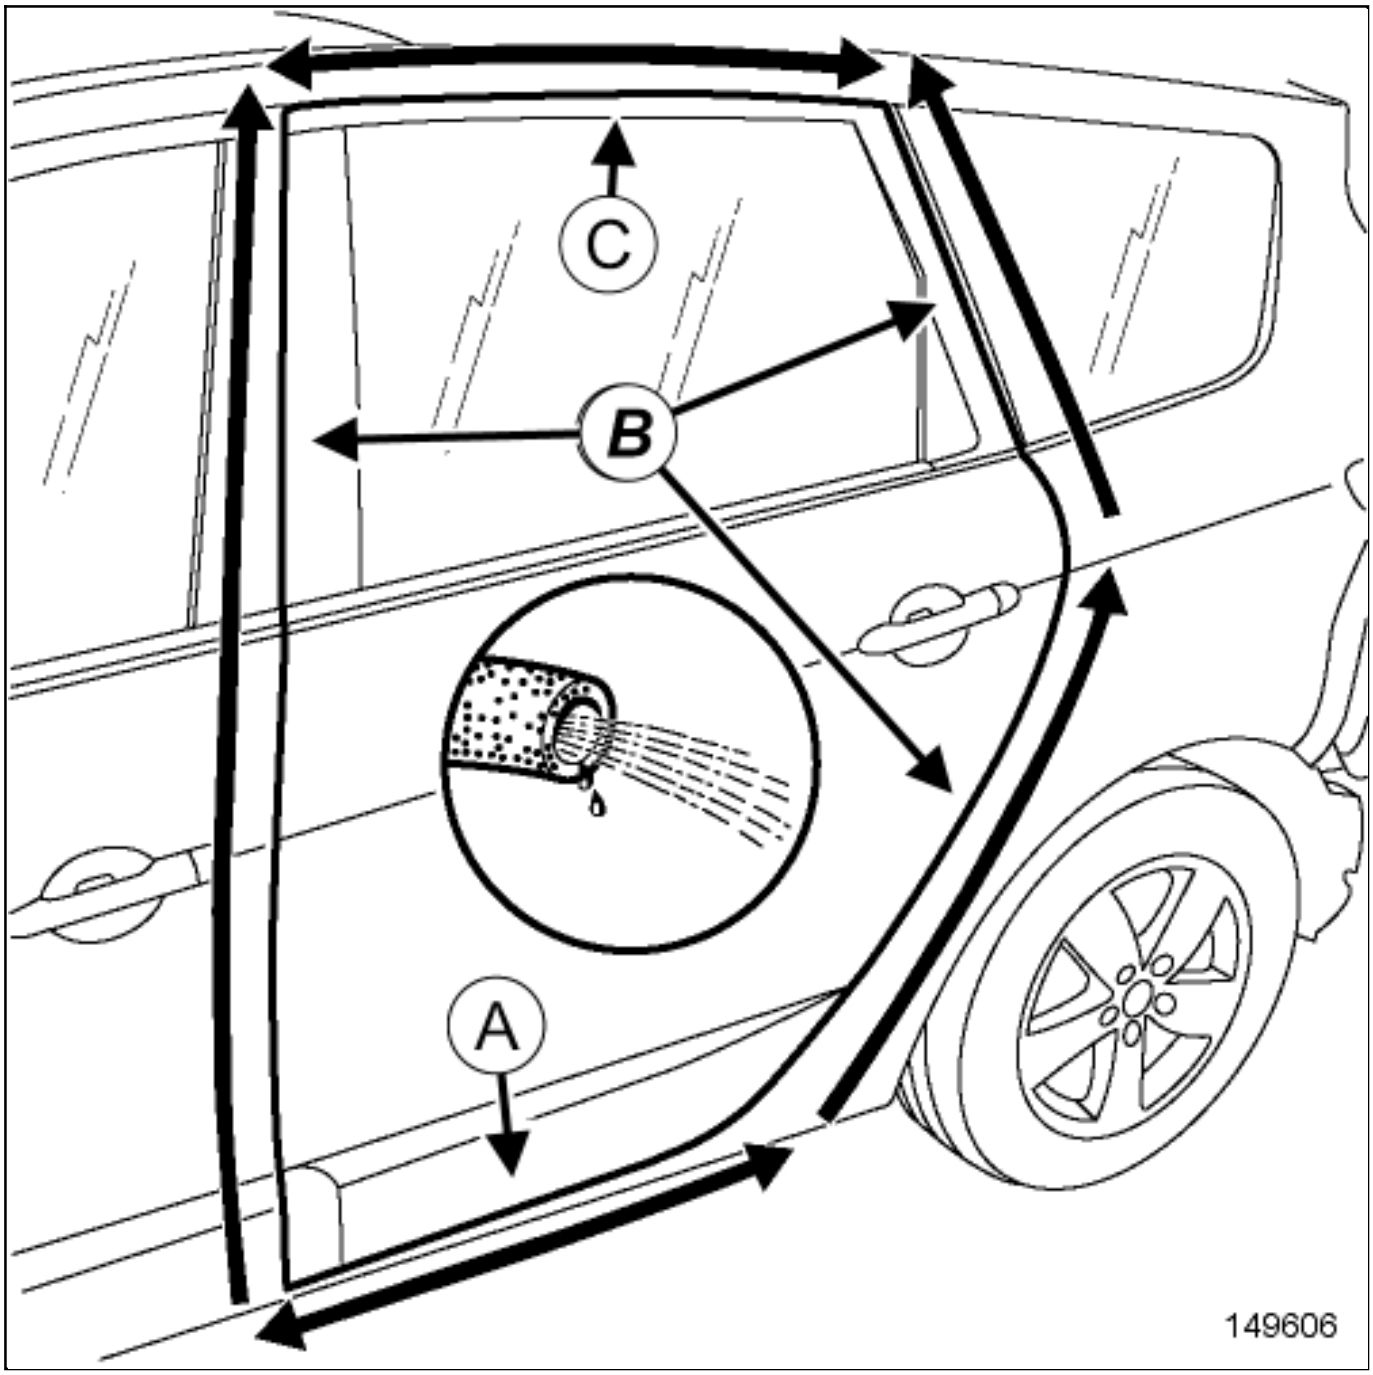


1. PREPARATION OPERATION FOR CHECKING THE SEALING

1- CONDITIONS TO RESPECT BEFORE CHECKING THE SEALING

- Position the vehicle on a level washing area(see 60A, General information, Vehicle sealing: General information) .
- Check that all of the opening elements are closed(see 60A, General information, Vehicle sealing: General information) .
- Prepare the equipment to perform the operation(see 60A, General information, Sealing tools: Use) ,(see 60A, General information, Sealing tools: Description) and(see 60A, General information, Vehicle sealing: General information) .
- Adjust the flow of the water jet(see 60A, General information, Sealing tools: Use) .

2. OPERATION FOR CHECKING THE SEALING



1- SIDE OPENING ELEMENT SEALING FILM OR TRIMS

- Spray the exterior weatherstrip by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

2- SIDE OPENING ELEMENT SEAL

- Spray the low section(A) of the opening element by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

- Gradually spray the vertical sections(B) of the opening element from the bottom upwards to the upper section.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the upper section(C) of the opening element by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

3- CHECKING THE SEALING WITH THE TRIM REMOVED

If the customer complaint could not be reproduced in accordance with the procedure, remove the interior trims (see Body internal trim in the vehicle's repair manual) then repeat the sealing check from step 1, extend the sealing check to the surrounding areas(see 60A, General information, Vehicle: Sealing check) .

SIDE OPENING ELEMENTS: SEALING REPAIR

Note:

Before repairing the sealing, check the sealing of the zone concerned (see 60A, General information, Vehicle: Sealing check) .

1. PREPARATION OPERATION FOR REPAIRING THE SEALING

1- CHECK AND ADJUST IF NECESSARY:

- the clearances and flush fitting Vehicle panel gaps: Adjustment value (01C, Vehicle bodywork specifications),
- the condition and positioning of the exterior weatherstrip Front side door exterior weatherstrip: Removal - Refitting (66A, Window sealing) or Rear side door exterior weatherstrip: Removal - Refitting (66A, Window sealing),
- the condition and positioning of the side opening element seals.

Note:

If the seals are dirty, clean them in soapy water (see 60A, General information, Vehicle sealing: General information) .

2- WAS ANY ACTION PERFORMED?

- NO: move on to the next step.
- YES: check the sealing of the zone (see 60A, General information, Side opening elements: Sealing check) .

Was water present in the passenger compartment of the vehicle?

- YES: move on to the next step.
- NO: fault resolved.

2. SEALING REPAIR OPERATION

1- REPAIRING THE SEALING OF THE SIDE OPENING ELEMENT SEALING FILM OR TRIM

A) Is water present in the passenger compartment after the sealing of the side opening element trim has been checked?

NO: move on to the next step.

YES:

a) if the side opening element trim is deformed or cracked, replace the side opening element trim**Front side door trim: Removal - Refitting** (72A, Side opening elements trim) or**Rear side door trim: Removal - Refitting** (72A, Side opening elements trim) or(see **Sliding side door trim: Removal - Refitting**) (72A, Side opening elements trim),

b) if the sealing mastic of the side opening element trim is incorrectly positioned, replace the sealing mastic **Front side door trim: Removal - Refitting** (72A, Side opening elements trim) or**Rear side door trim: Removal - Refitting** (72A, Side opening elements trim) or(see **Sliding side door trim: Removal - Refitting**) (72A, Side opening elements trim) and**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products),

c) if the clips of the side opening element trim are damaged, replace the clips**Front side door trim: Removal - Refitting** (72A, Side opening elements trim) or**Rear side door trim: Removal - Refitting** (72A, Side opening elements trim) or(see **Sliding side door trim: Removal - Refitting**) (72A, Side opening elements trim).

Check the sealing of the side opening element trim**(see 60A, General information, Side opening elements: Sealing check)** .

B) Is water present in the passenger compartment after the side opening element sealing film has been checked?

NO: move on to the next step.

YES:

a) remove the side opening element trim**Front side door trim: Removal - Refitting** (72A, Side opening elements trim) or **Rear side door trim: Removal - Refitting** (72A, Side opening elements trim) or(see **Sliding side door trim: Removal - Refitting**) (72A, Side opening elements trim),

b) if the sealing film of the side opening element is detached, deformed or torn, replace the sealing film

Door sealing film: Removal - Refitting (65A, Opening element sealing),

c) if the clips of the side opening element trim are damaged, replace the clipsFront side door trim: Removal - Refitting (72A, Side opening elements trim) orRear side door trim: Removal - Refitting (72A, Side opening elements trim) or(see **Sliding side door trim: Removal - Refitting**) (72A, Side opening elements trim),

d) if the sealing foam on the door box section is detached, deformed or torn, replace the foamFront side door electric window mechanism: Removal - Refitting (51A, Side opening element mechanisms) orRear side door electric window mechanism: Removal - Refitting (51A, Side opening element mechanisms) or(see **Front side door manual window winder mechanism: Removal - Refitting**) (51A, Side opening element mechanisms) orRear side door manual window winder mechanism: Removal - Refitting (51A, Side opening element mechanisms),

e) if the blanking covers of the door box section are detached, reposition the blanking covers, if the blanking covers are deformed, replace the blanking coversFront side door electric window mechanism: Removal - Refitting (51A, Side opening element mechanisms) orRear side door electric window mechanism: Removal - Refitting (51A, Side opening element mechanisms) or(see **Front side door manual window winder mechanism: Removal - Refitting**) (51A, Side opening element mechanisms) orRear side door manual window winder mechanism: Removal - Refitting (51A, Side opening element mechanisms).

Check the sealing of the side opening element sealing film(see 60A, General information, Side opening elements: Sealing check) .

2- REPAIRING THE SEALING OF THE SIDE OPENING ELEMENT SEAL

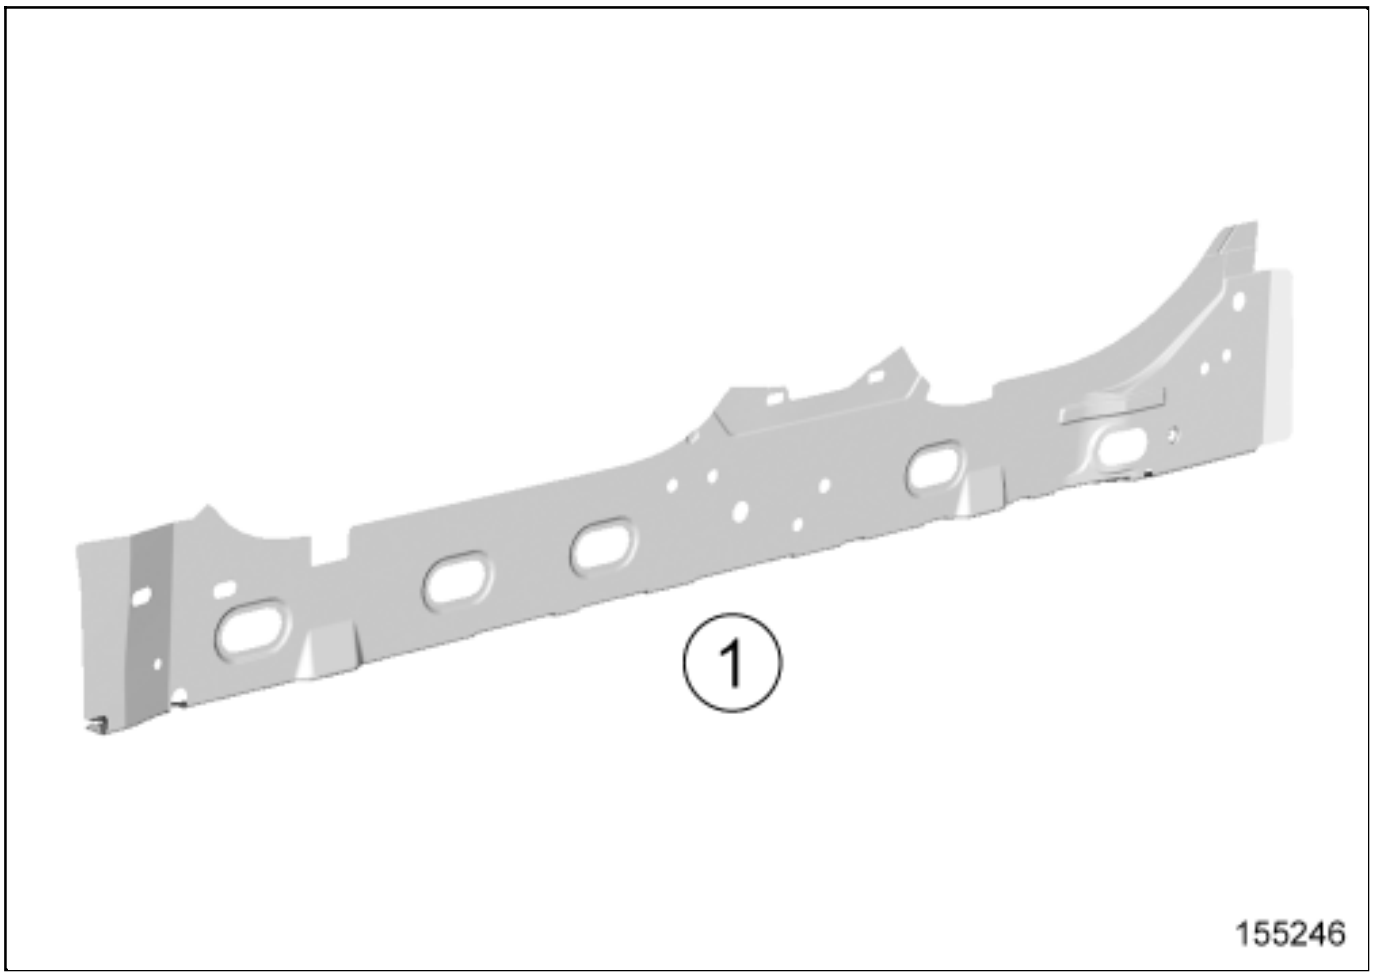
Is water present in the passenger compartment after the side opening element sealing has been checked?

NO: fault resolved.

YES:

a) if the side opening element seal is deformed, replace the side opening element seal,

b) if the side opening element seal shows signs of wear, cuts or cracks, replace the side opening element seal.



Check the sealing of the side opening element seal(see 60A, General information, Side opening elements: Sealing check) .

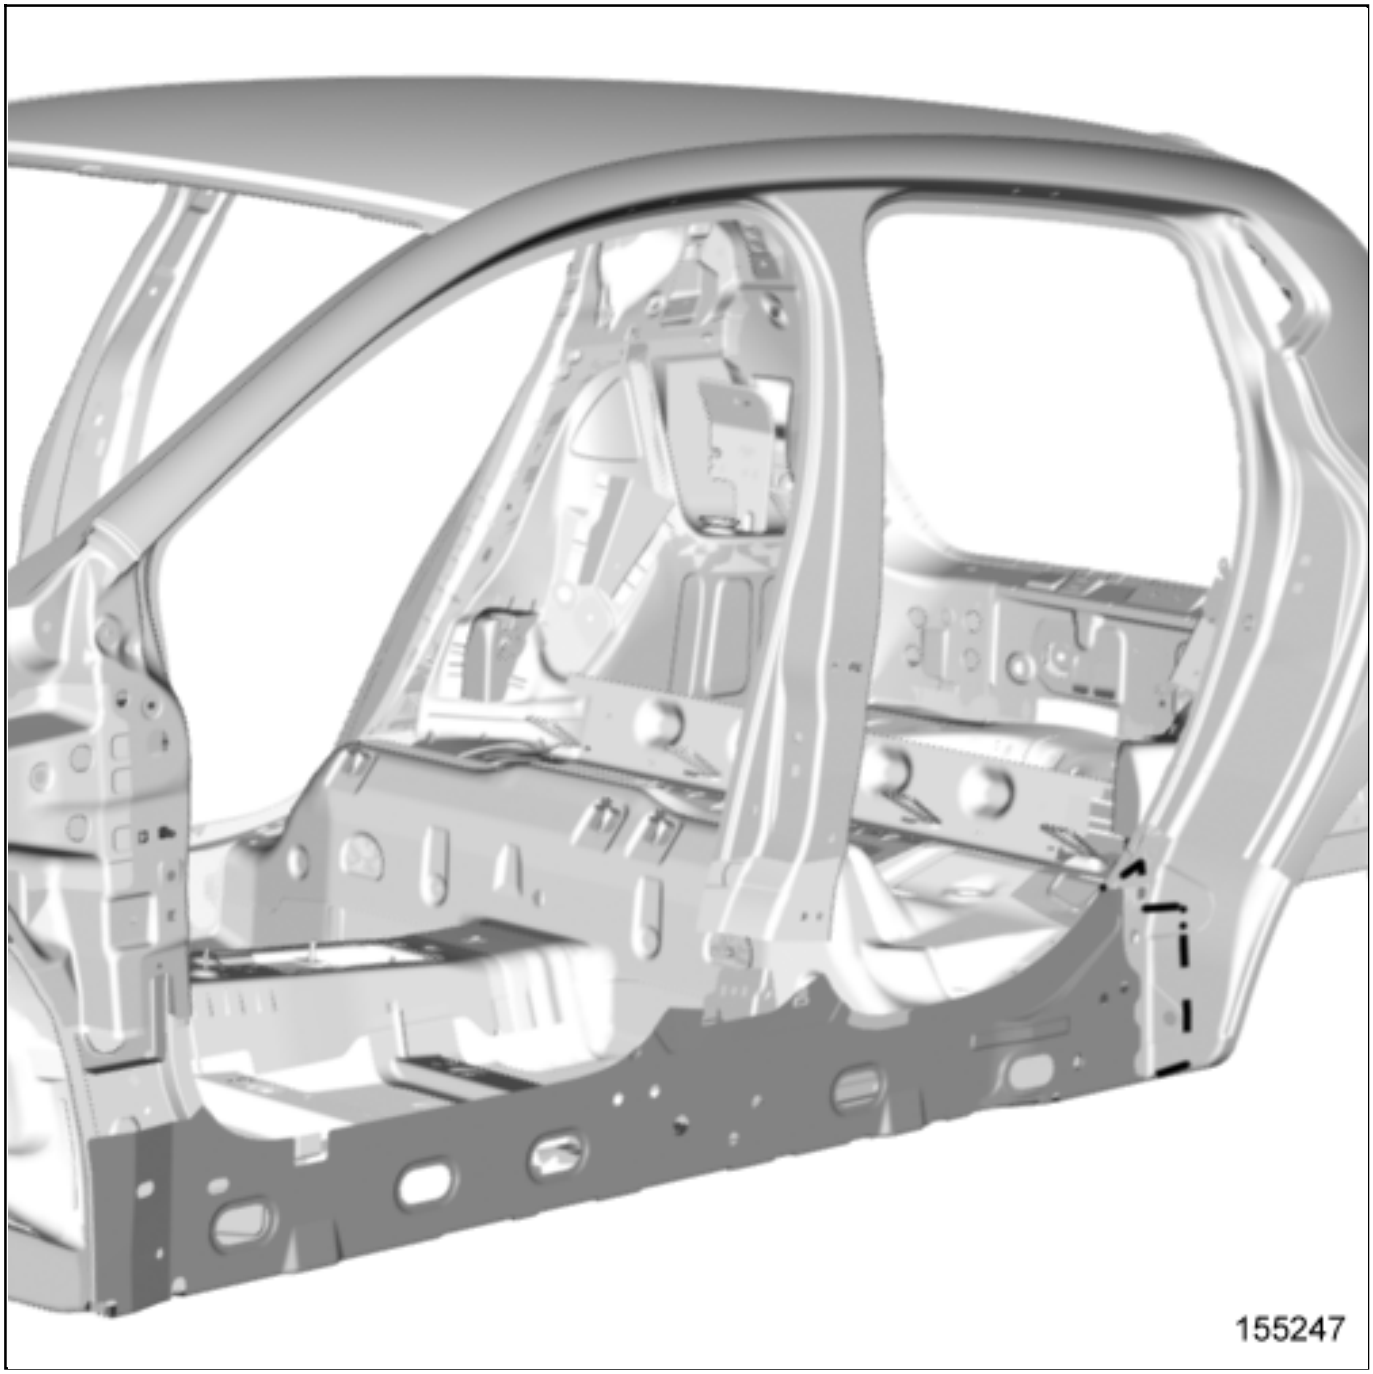
XSL version : 3.02 du 22/07/11

SILL PANEL CLOSURE PANEL: REPLACEMENT

Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Thickness (mm)
(1)	Sill panel closure panel	0.9



2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:

- complete replacement.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

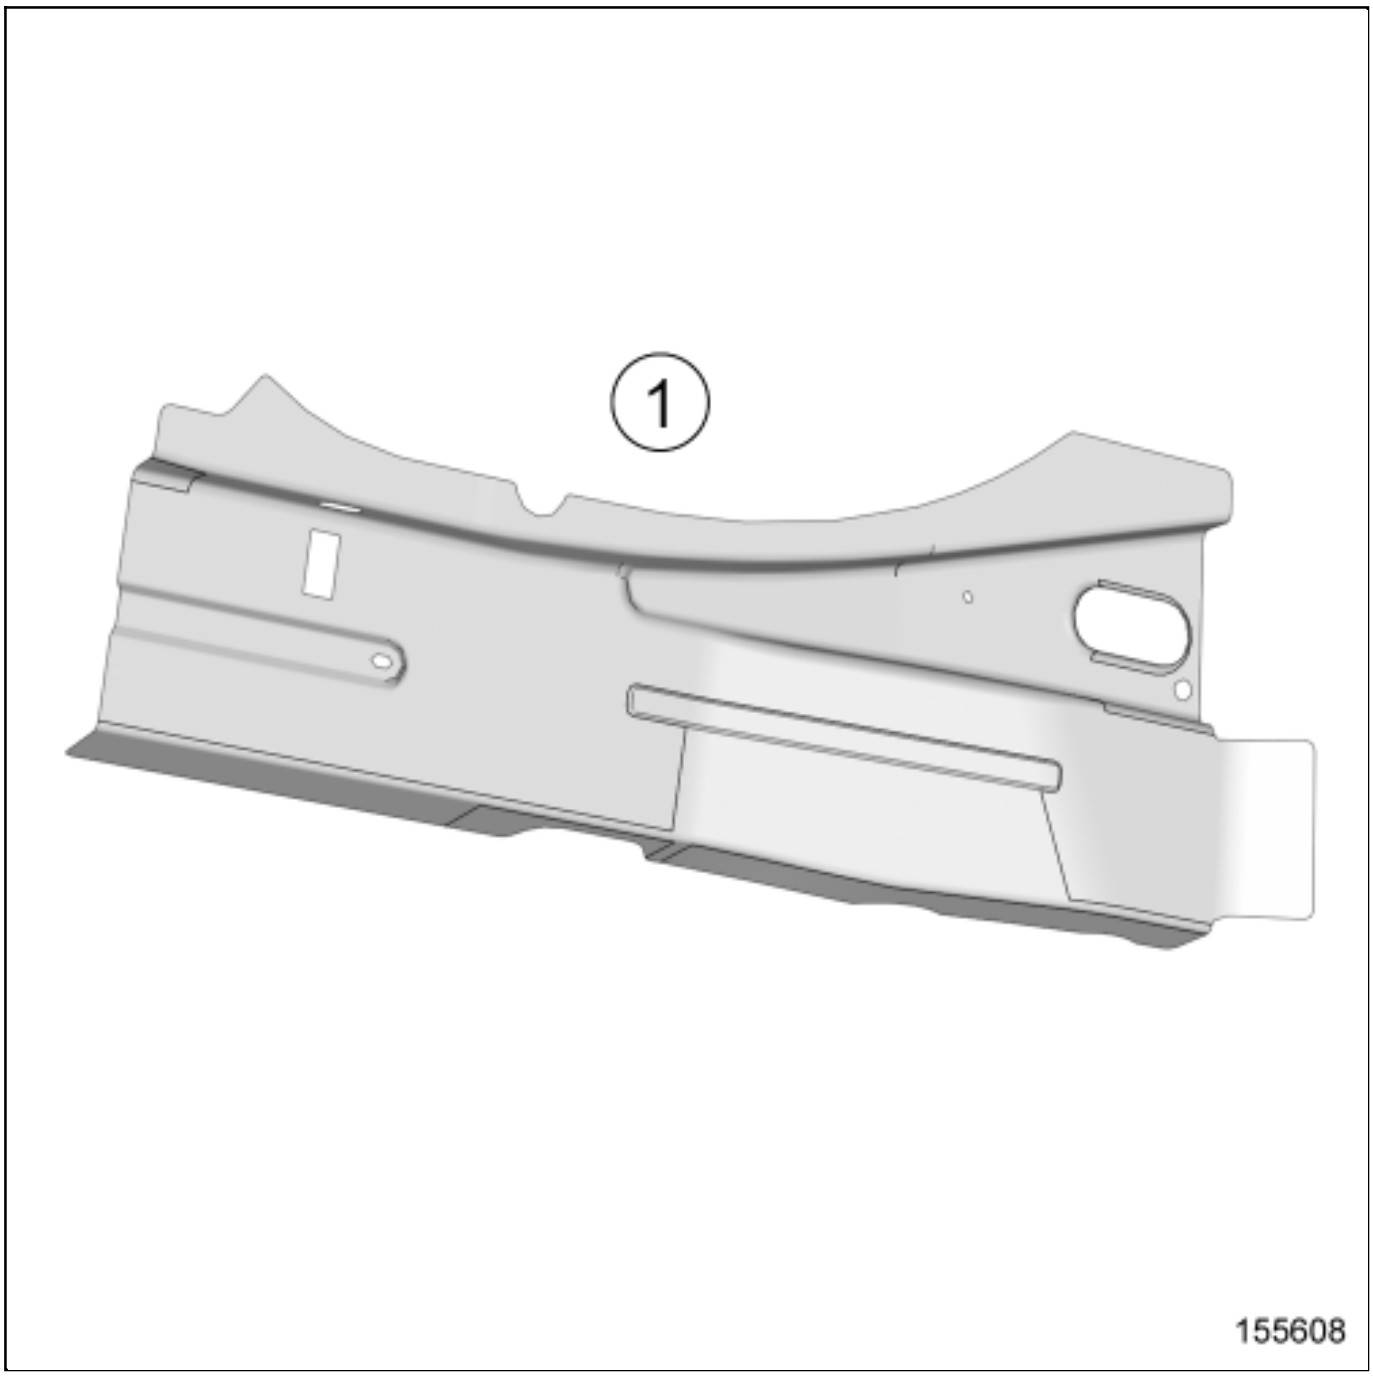
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING



CAUTION

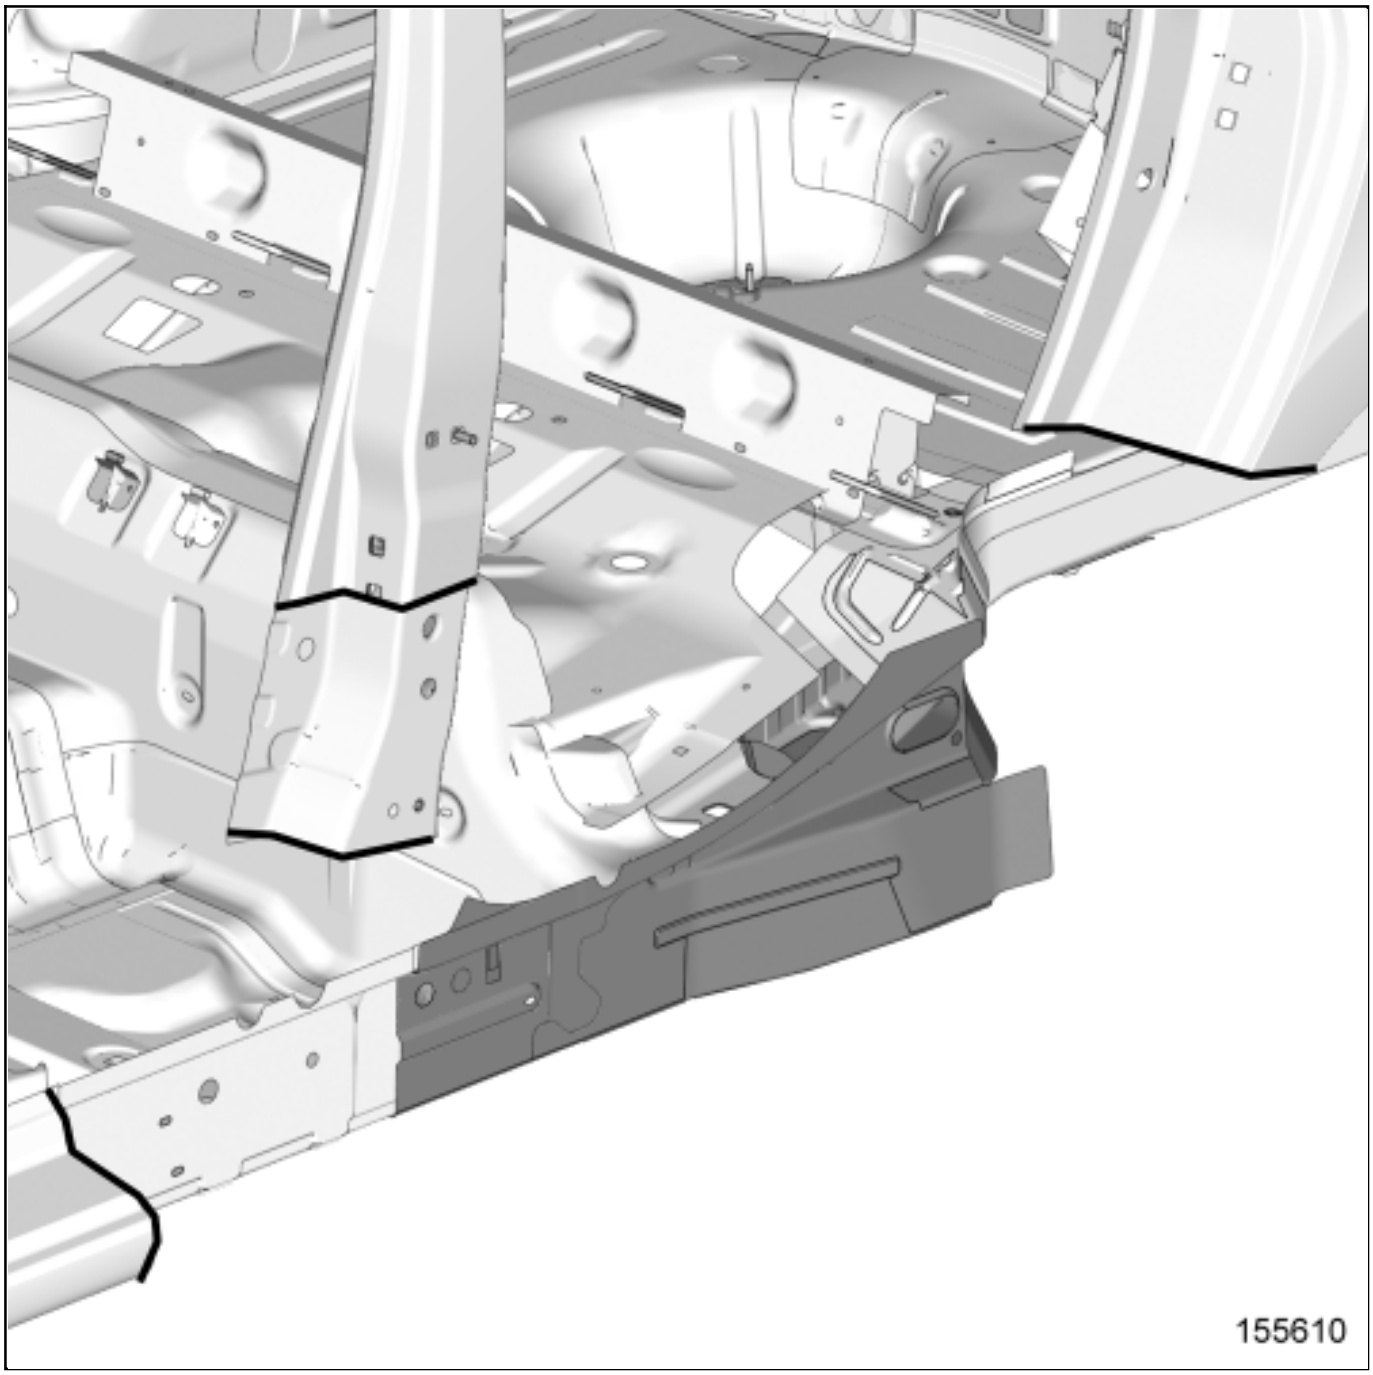
If the mating faces of the parts to be welded are not accessible, make EGW plug welds to replace the original resistance welds (see MR 400).

SILLPANELREARREINFORCEMENT:REPLACEMENT

Note, one or more warnings are present in this procedure

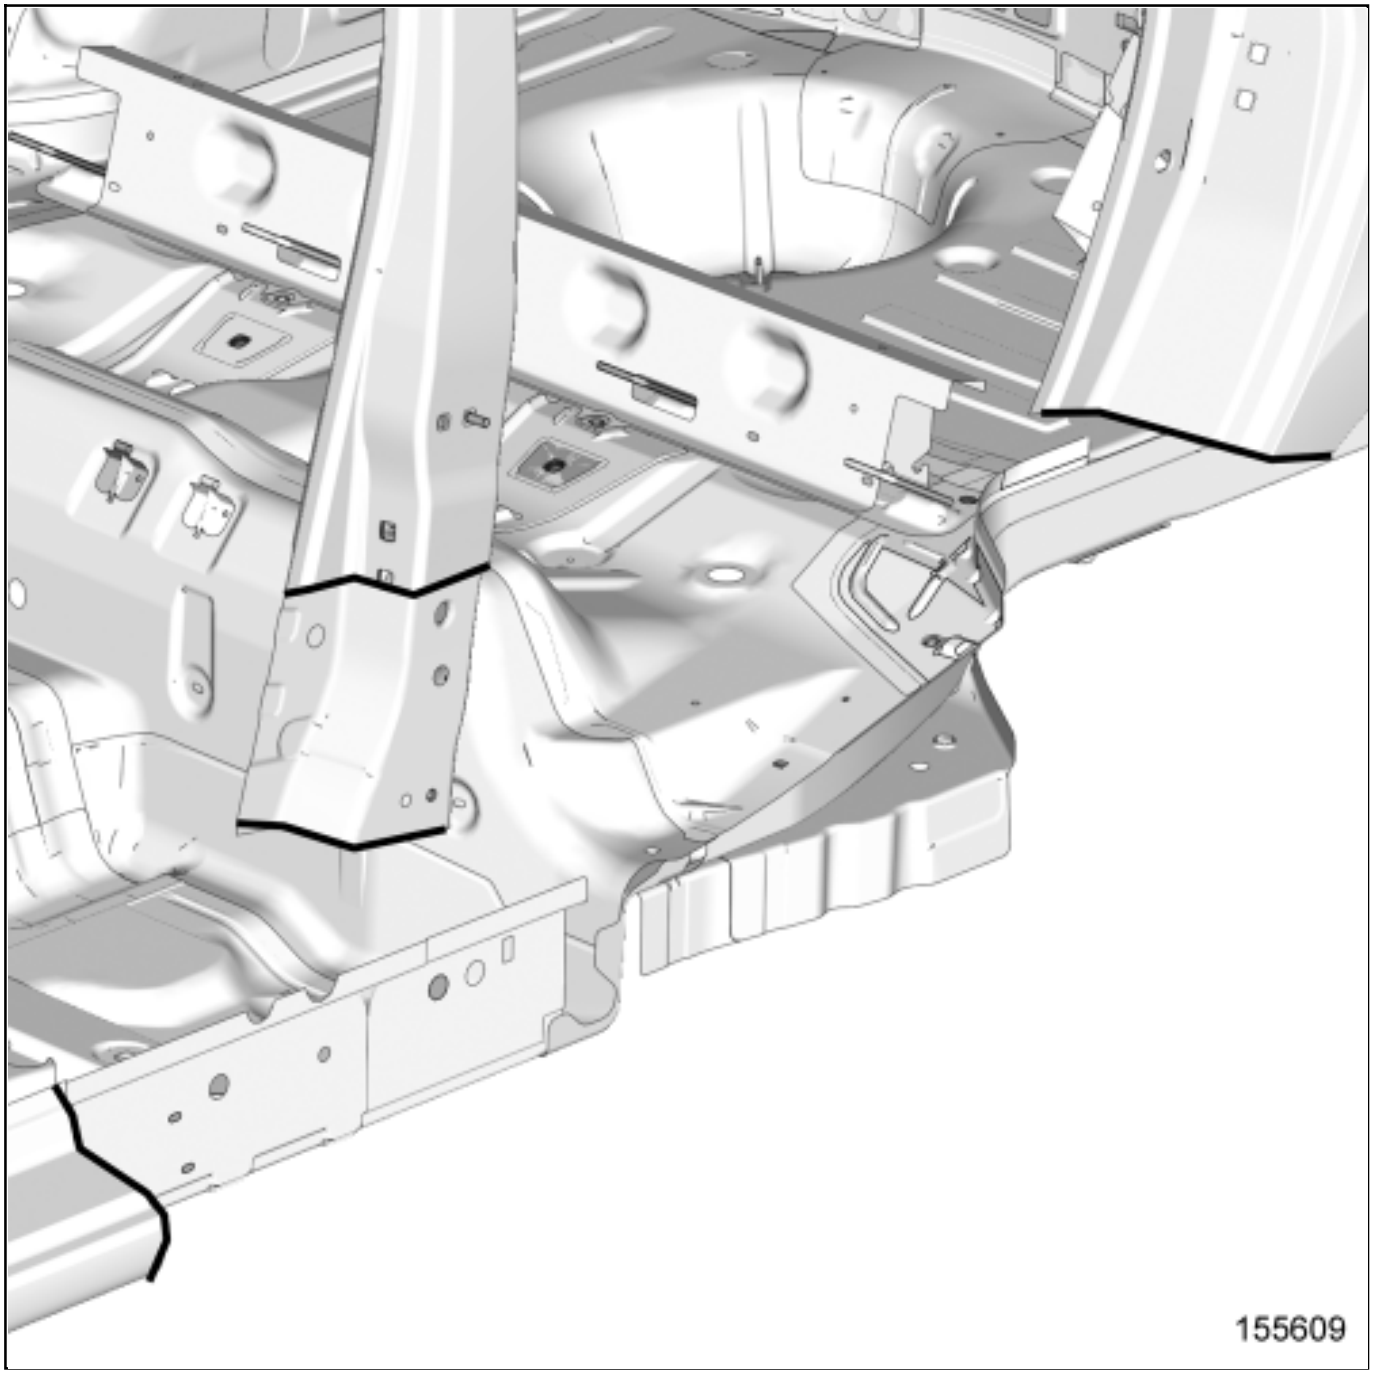
1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Sill panel rear reinforcement	HLE	1.5



2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:



- complete replacement.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

DETAILED VIEW WITHOUT PART

2)POSITION OF ELECTRIC EARTHS

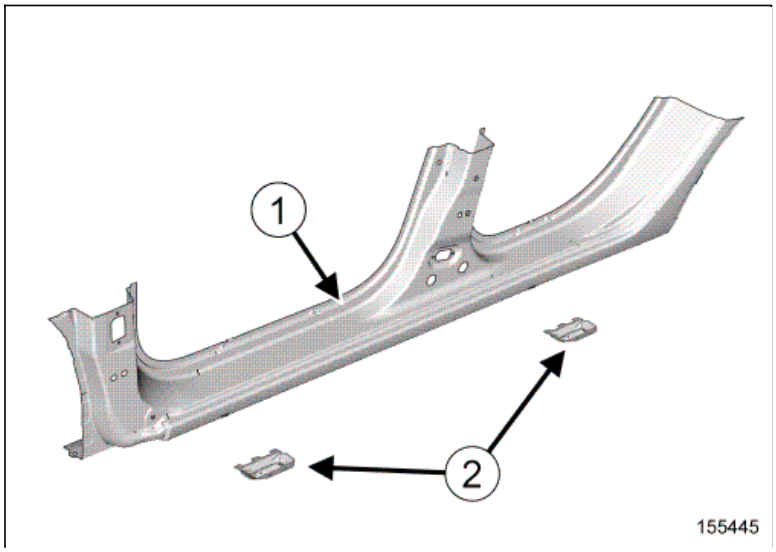
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING



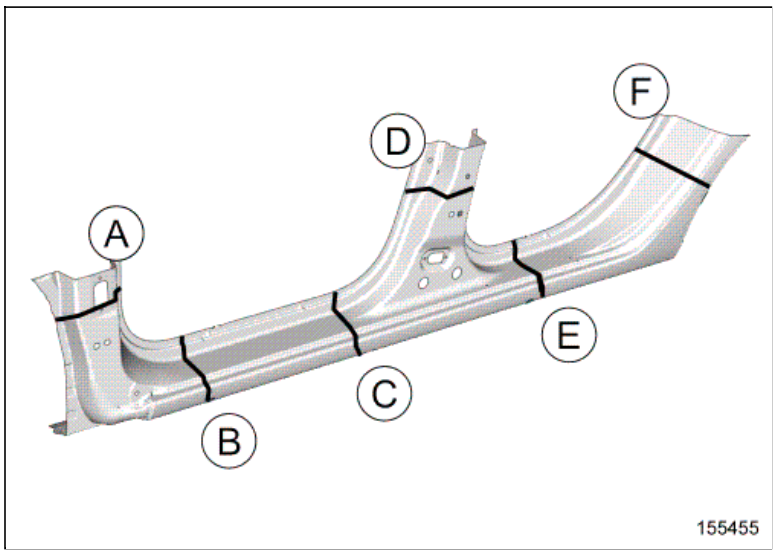
CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

SILLPANEL:REPLACEMENT

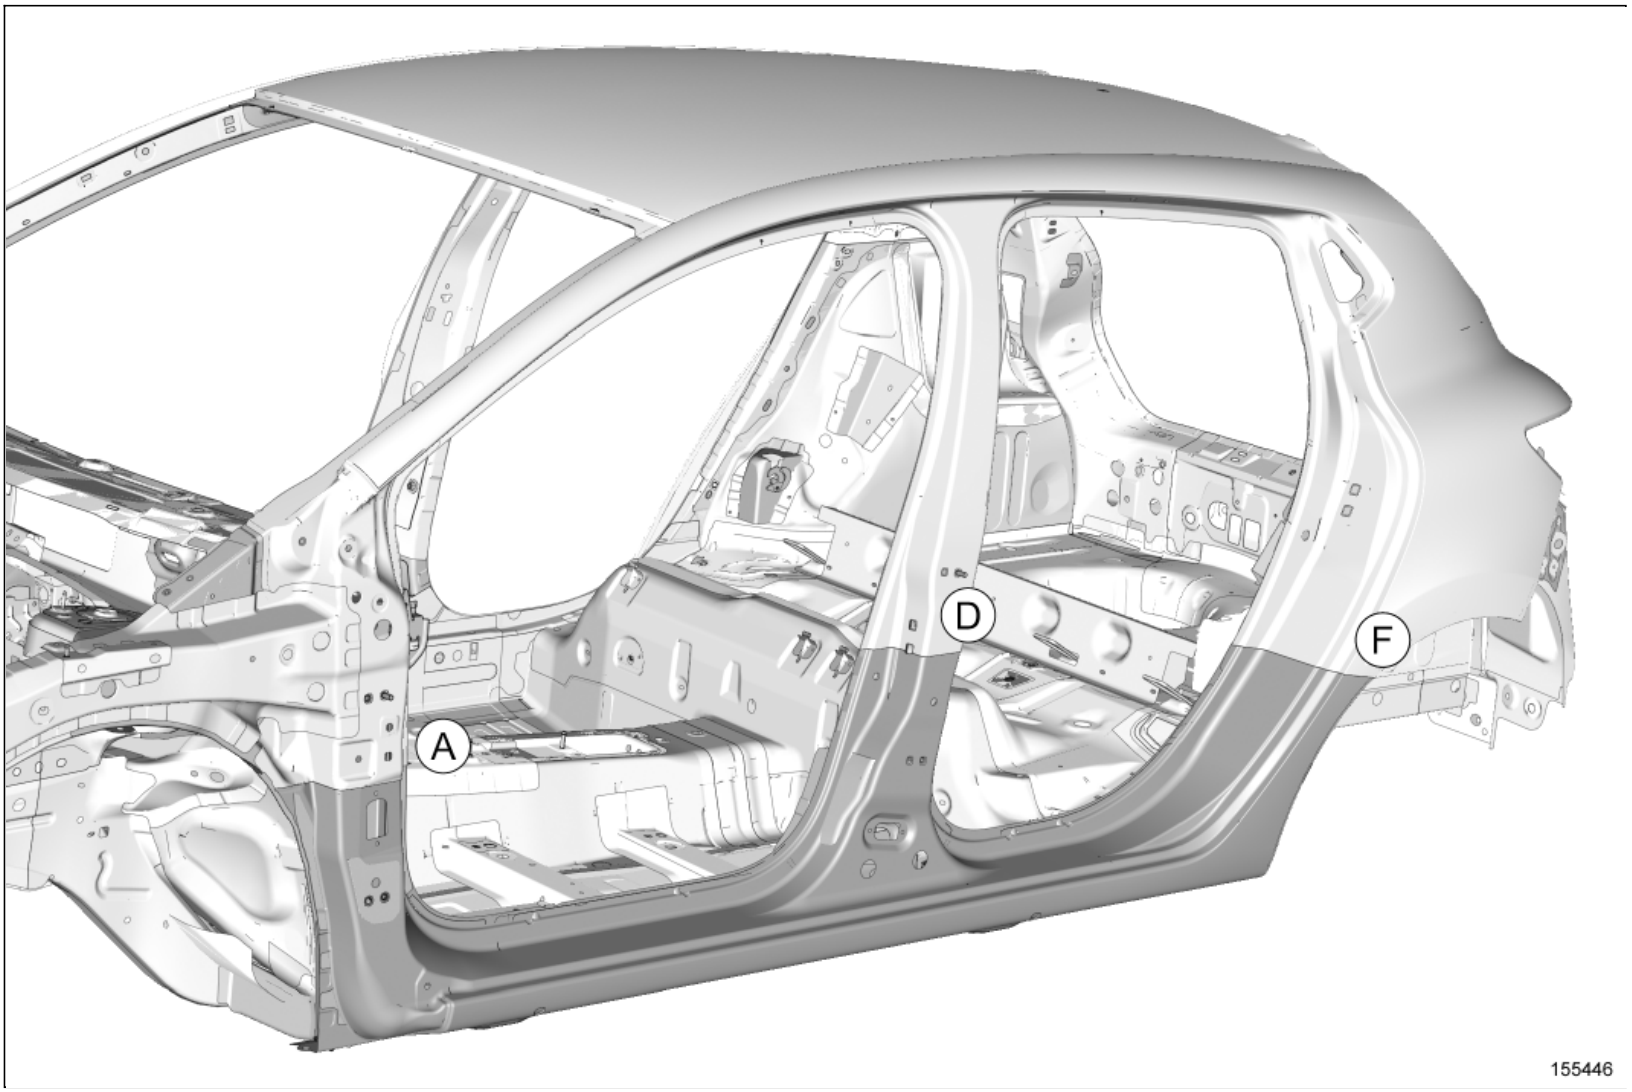
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART



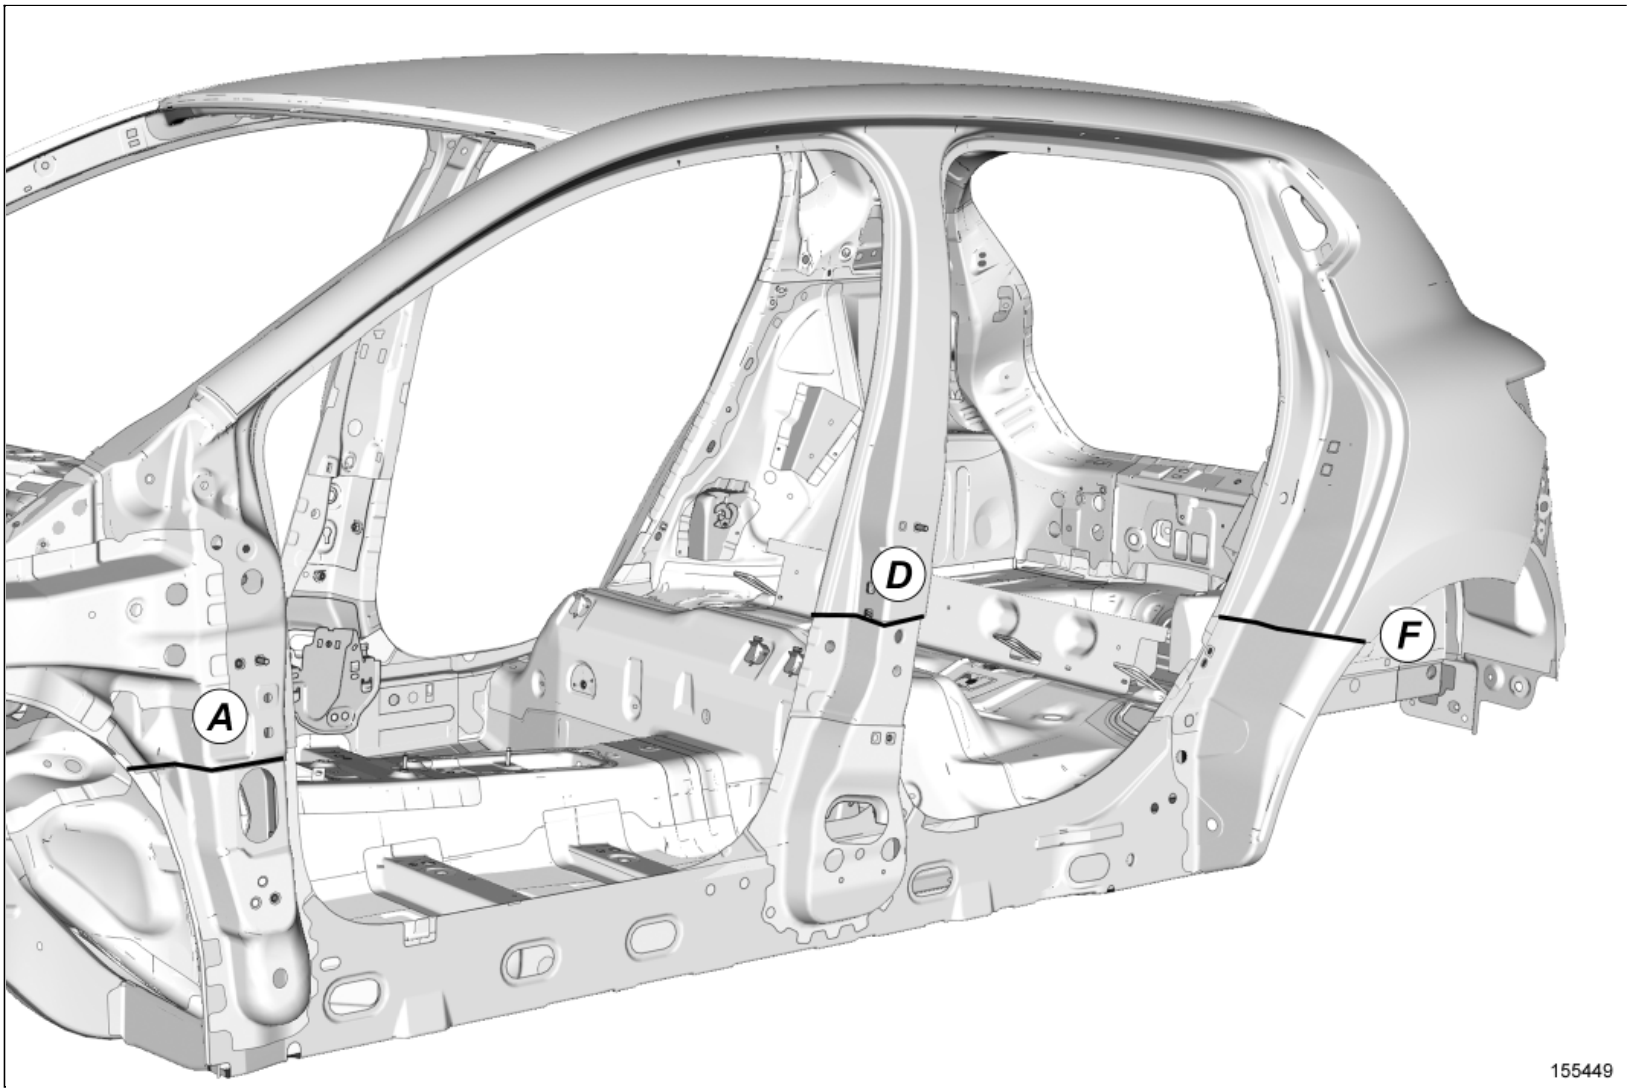
No.	Description	Type	Thickness (mm)
(1)	Sill panel	Mild steel	0.65
(2)	Jack bearing support	THLE	2

2. IN THE EVENT OF REPLACEMENT



The options for replacing this part are as follows:

- complete replacement A-D-F,
- front end partial replacement A-C,
- partial replacement under door B-C,
- rear end section partial replacement E-F.



1- COMPLETE REPLACEMENT A-D-F

1)PART IN POSITION

CUT

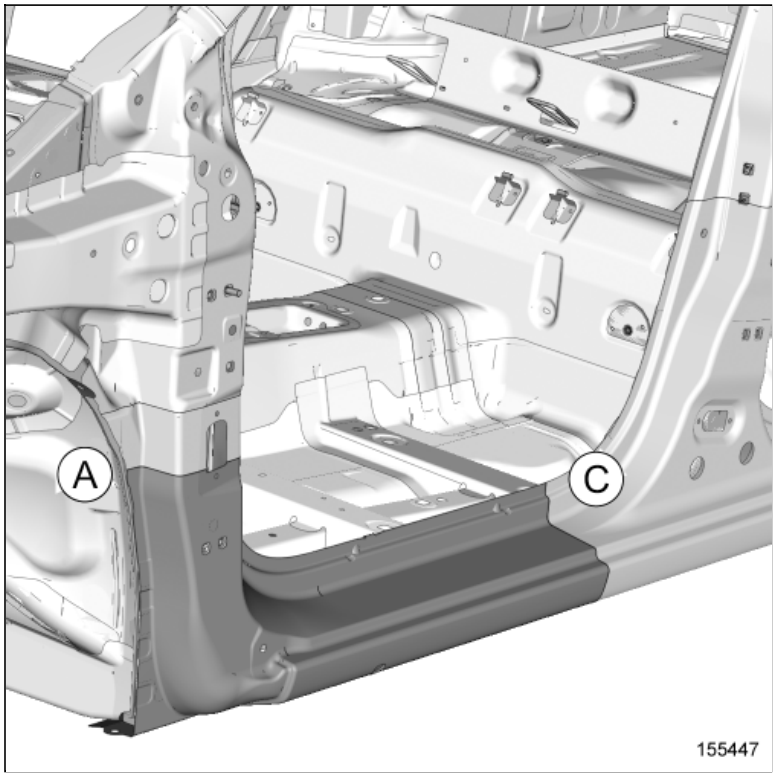
2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

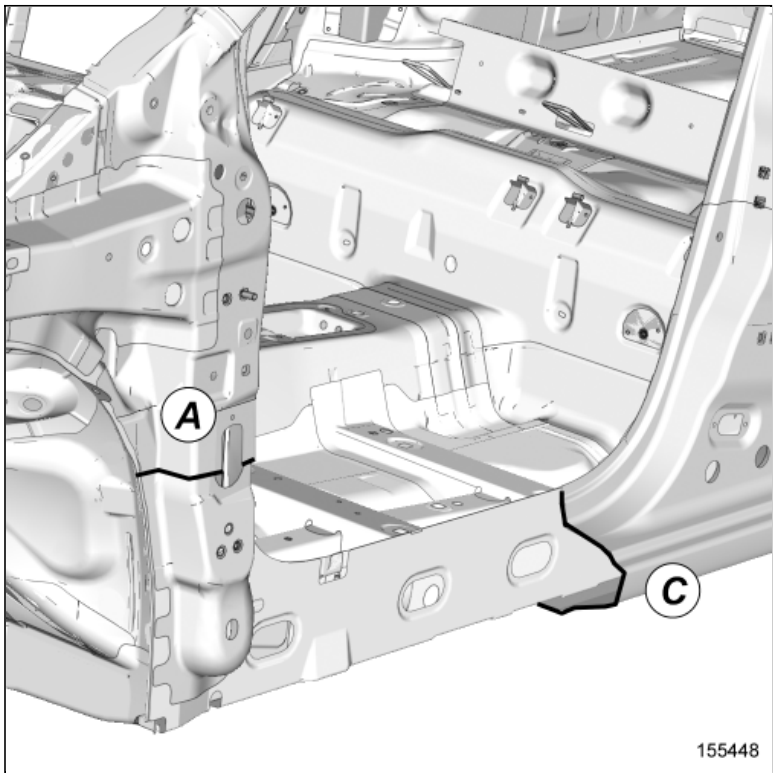
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .



3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- FRONT END PARTIAL REPLACEMENT A-C

1)PART IN POSITION

CUT

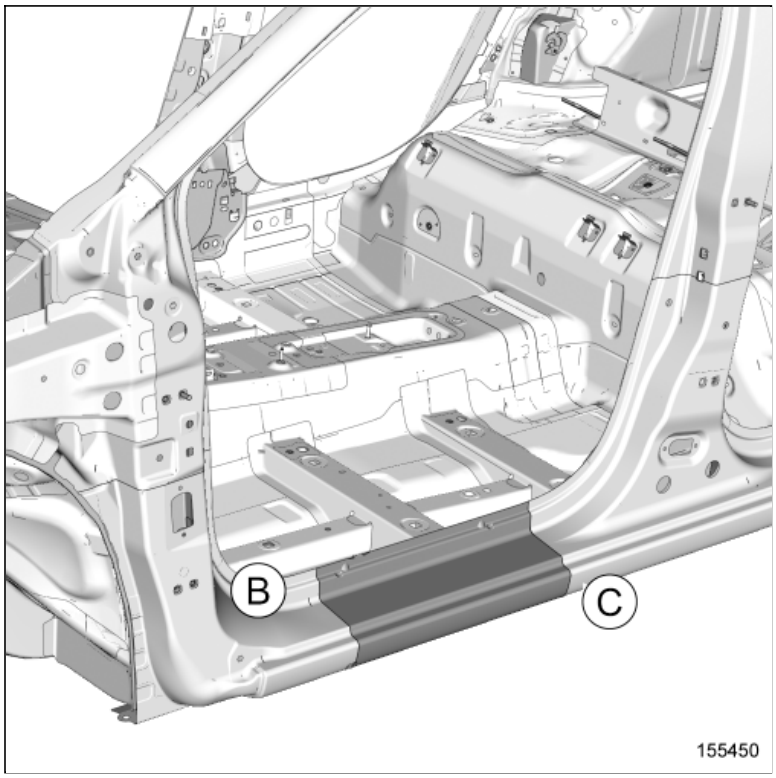
2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

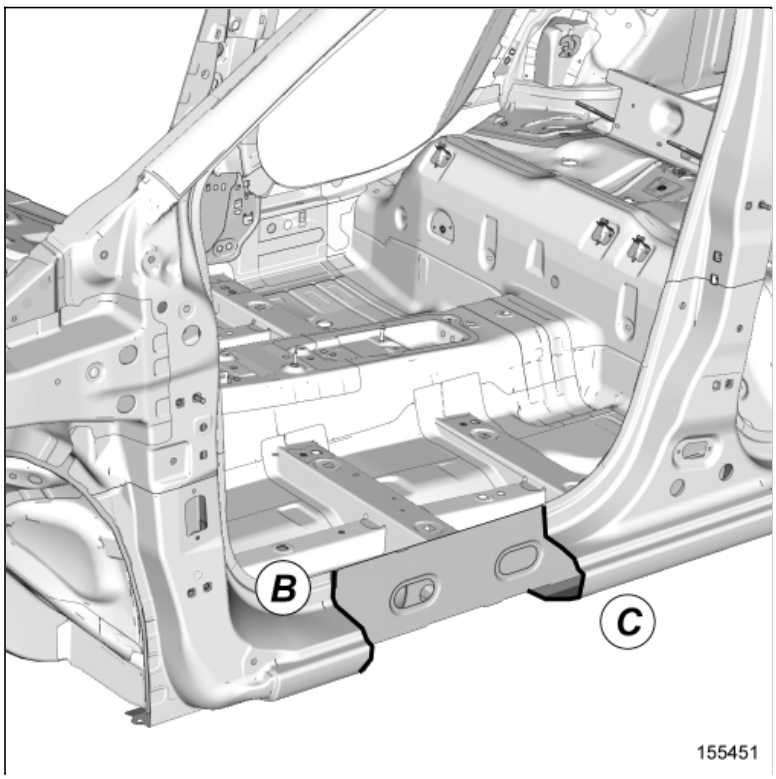
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .



3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

3- PARTIAL REPLACEMENT UNDER DOOR B-C

1)PART IN POSITION

CUT

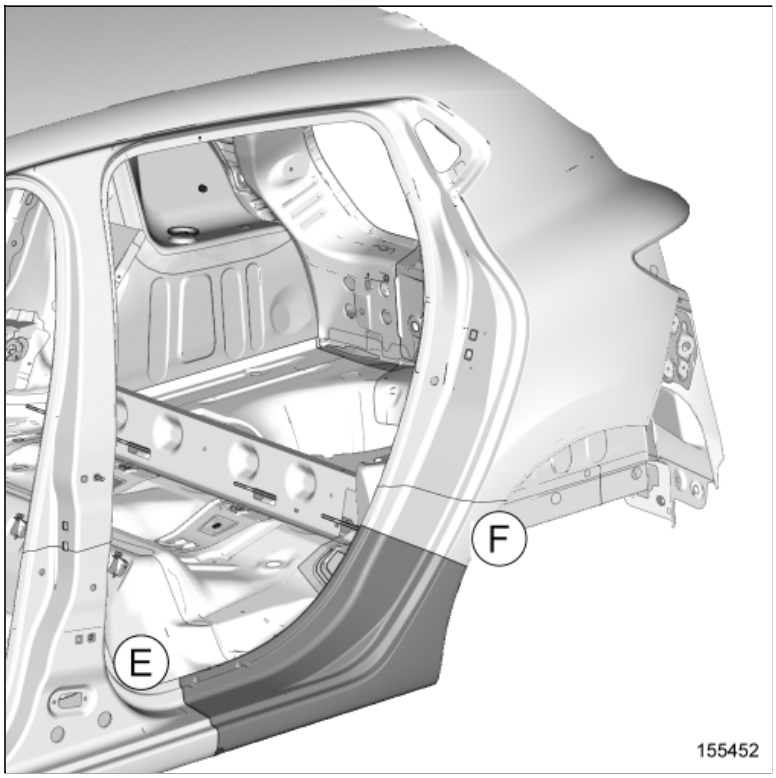
2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

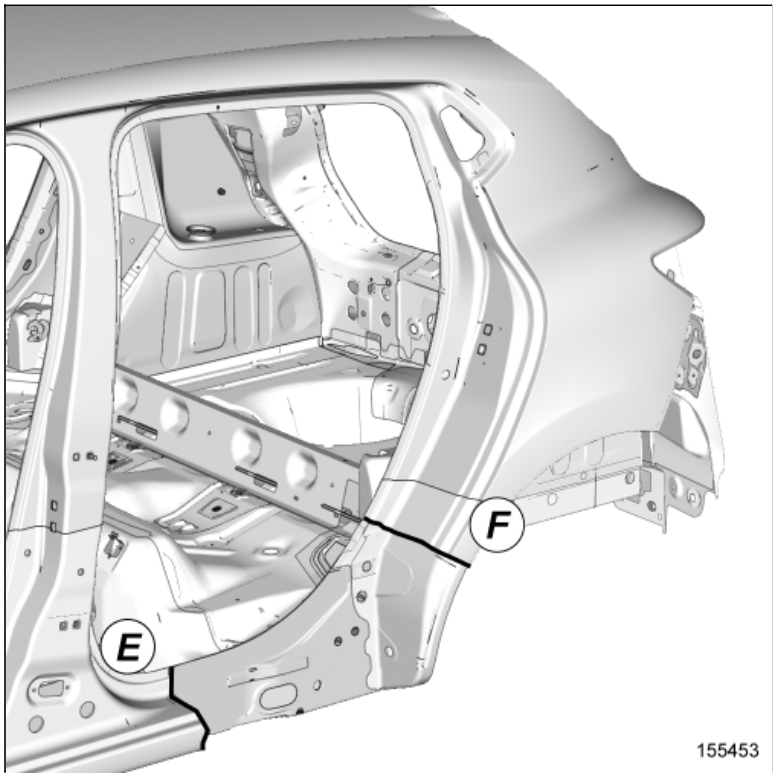
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .



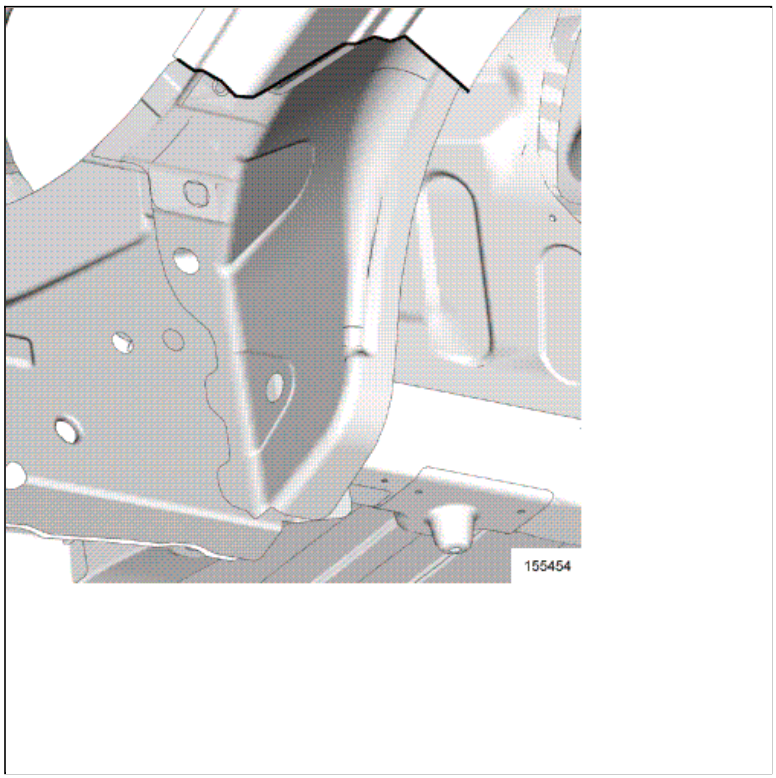
3)SPECIAL NOTES ON MATING

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

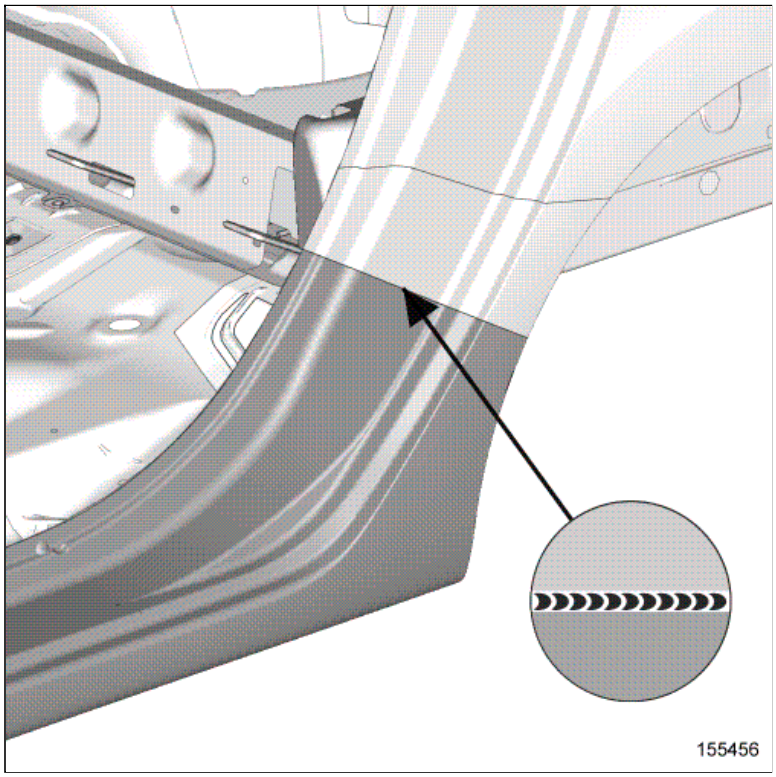
4- REAR END SECTION PARTIAL REPLACEMENT E-F



1)PART IN POSITION

CUT

DETAILED VIEW F



2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

Perform the following operations:

- a butt weld by GMAWchain weld beads in the zone specified by the arrowConnections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections).

SMC BODYWORK COMPONENT: PREPARATION AND PAINT RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Note:

Never apply pre-treatment primer or primer filler on this type of material.

1. PRE PRIMED PARTS

Use extra ventilation source.

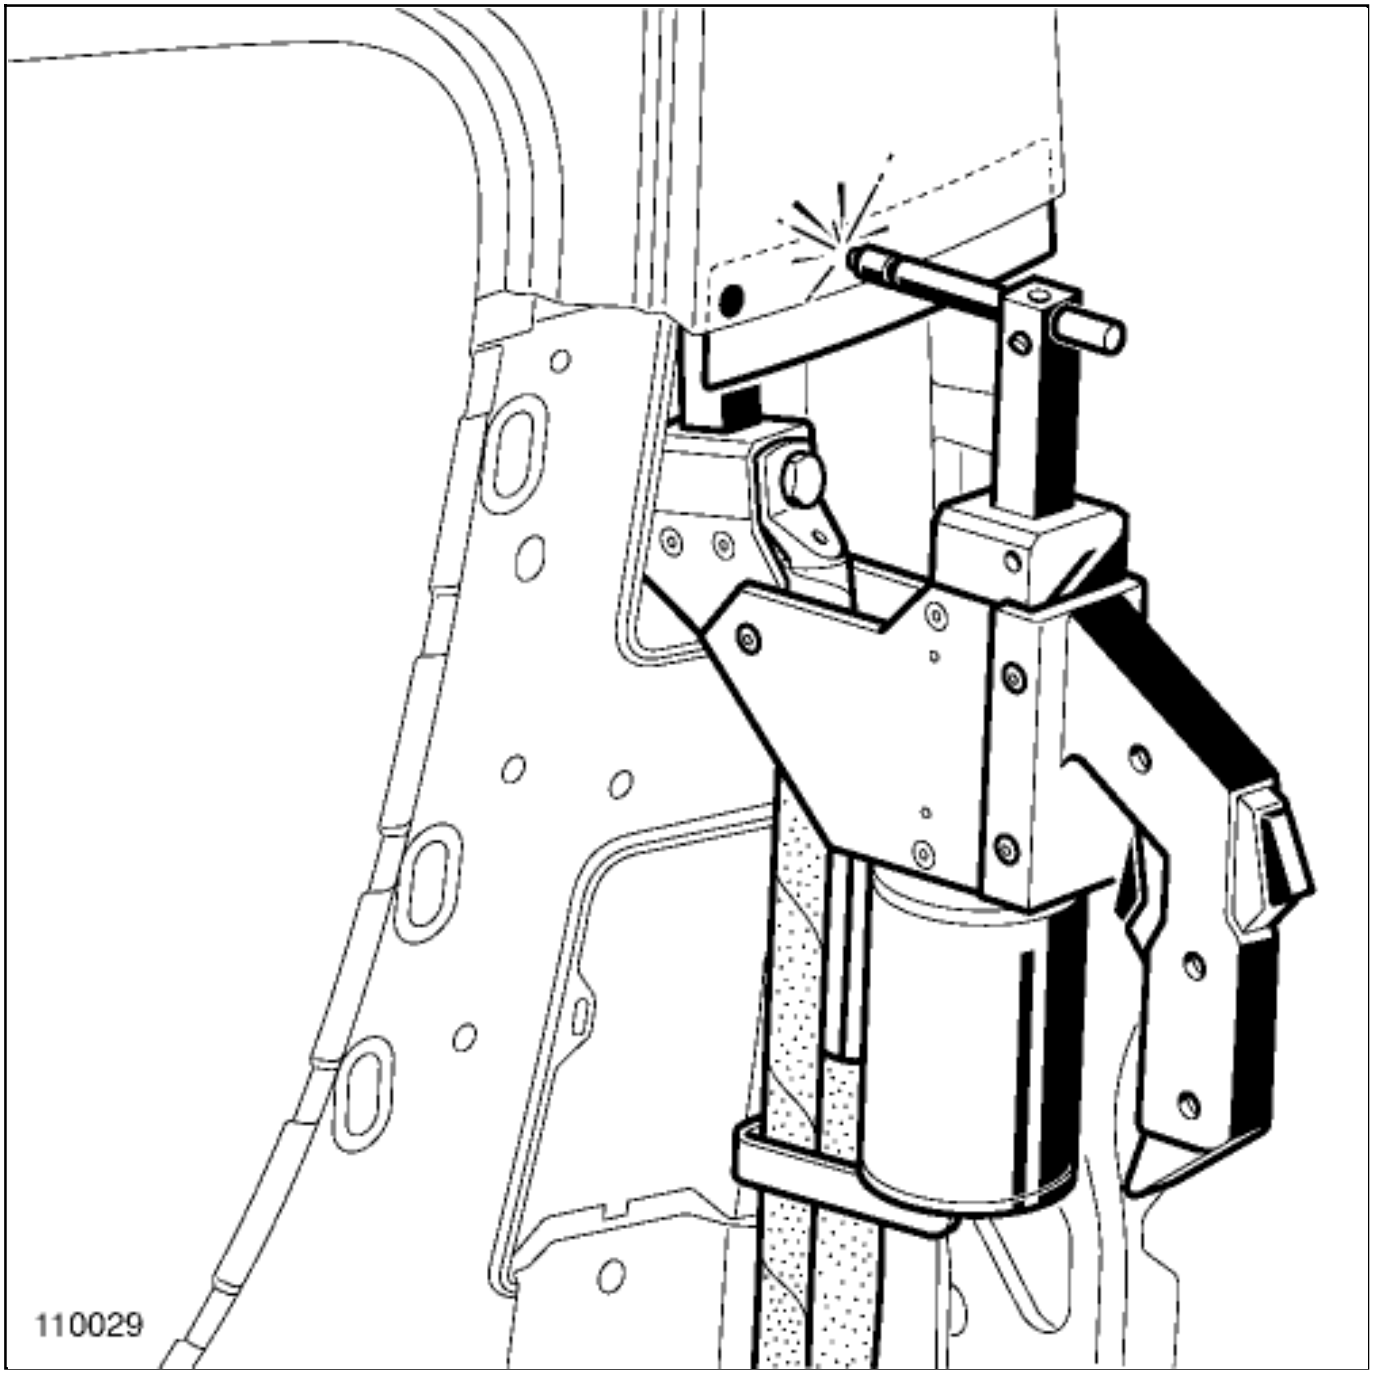
Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Smooth	Grey adhesive pad soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Apply a bi-component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
7	Remove solvent / dry	
8	Sand	P400 - P500 dry / P400 - P800 with water
9	Wipe / blow	
10	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
11	Blow / rub with the abrasive finishing pad	
12	Apply the finishing paint	

2. COMPONENTS TO BE REPAIRED

Plastic material bodywork component: Repair (Technical Note 662A, 50A, General information).

Repair-40x01x45x06-02x65-1-1-1.xml

XSL version : 3.02 du 22/07/11



SOLDEREDASSEMBLYEQUIPMENT:USE

1. ELECTRICAL RESISTANCE SPOT WELDING

Used to weld mating faces where both sides are accessible (e.g.: door entries).

Ordinary welders can weld ordinary steel sheets, and some welders are designed for welding very high or ultra high yield (THLE/UHLE) strength sheets.

The welder used for THLE/UHLE sheets must have an effective minimum welding current of 11500 A. The effective clamp tightening pressure must be a minimum of 450 daN.m. When the appliance is fitted with a manual expansion valve, it is possible to reduce the pressure, but the pressure cannot be measured. Only a peeling test will enable you to check whether the welding bead diameter is enough.

- Advantage:
  - Identical to original welds.

- Disadvantage:
  - Cannot apply welds over 250 mm from the edge the sheet.

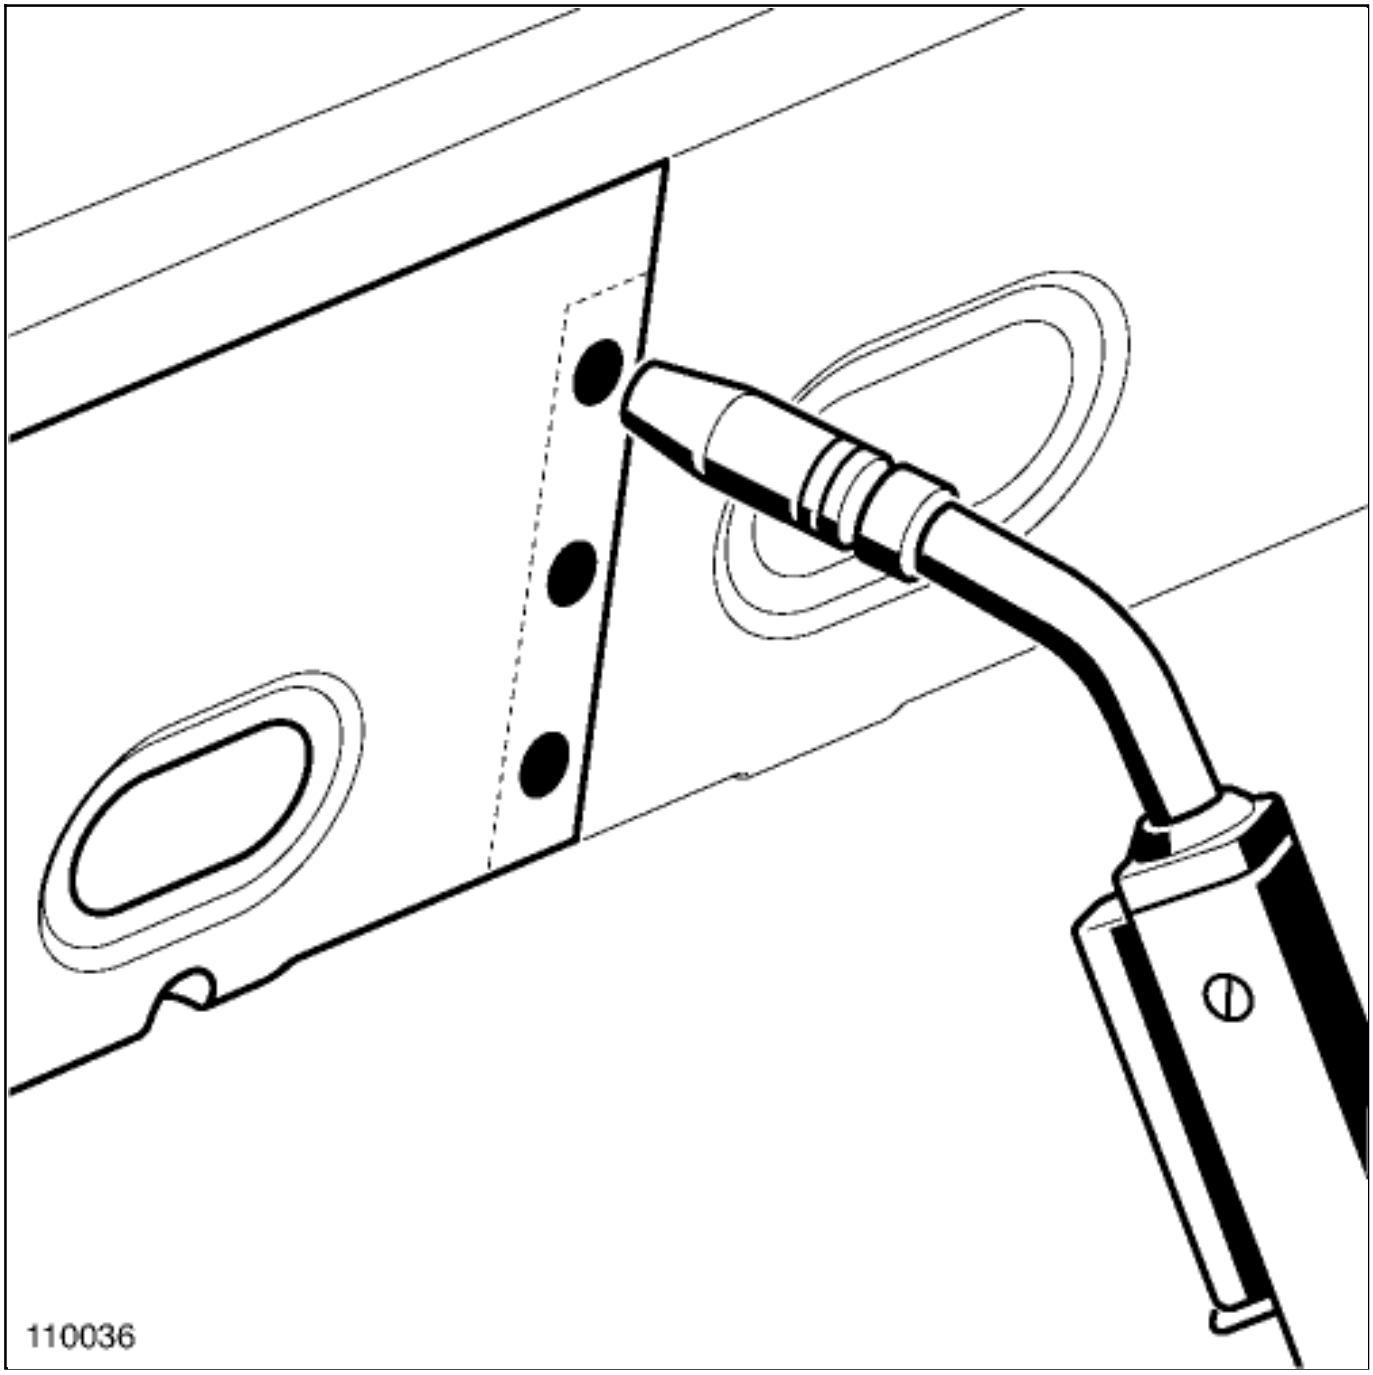
- Operator protection:
  - obligatory eye protection,
  - obligatory hand protection.

- Protection in the work area:
  - external bodywork protection,
  -

- protection of internal and external window faces,
- protection of interior fittings.

2. ARC WELDING UNDER SHIELDING GAS

Used for plug welding sheets, for original weld beads as well as continuous welds on edge-to-edge cuts.



The contact tube and the nozzle must be cleaned regularly so that the gas and the wire are free. To do this, use an anti-splash product.

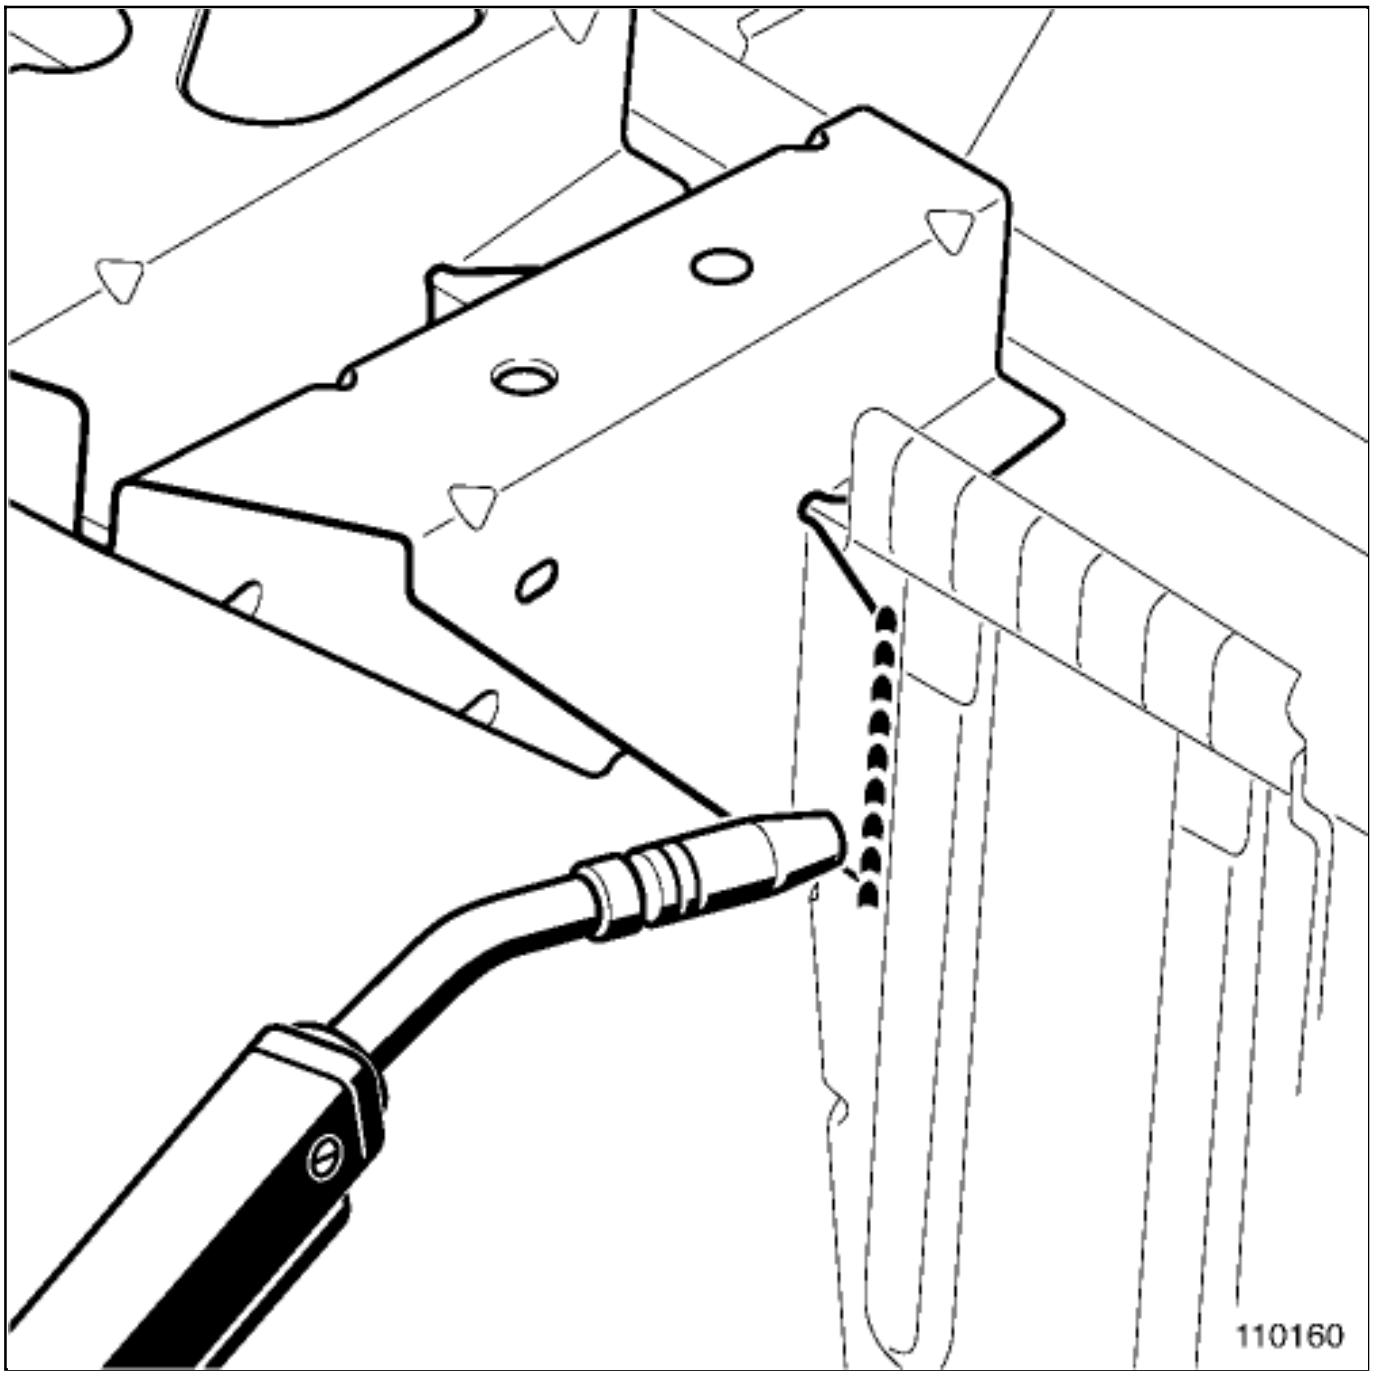
The welder exists in two versions:

- MAG = Metal Active Gas. The gas mixture contains more than 5% CO_2.
- MIG = Metal Inert Gas. The gas mixture contains less than 5% CO_2.

For routine bodywork jobs, the welder can have a minimum welding current of 200 Awith a range of use for welding sheets of 0.6 mm to 4 mm, with a wire ∅ 0.6 to 0.8 mm.

PLUG WELDING POINT

Advantage:



- Allows the making of spot welds throughout the sheet by replacing the original SER points.

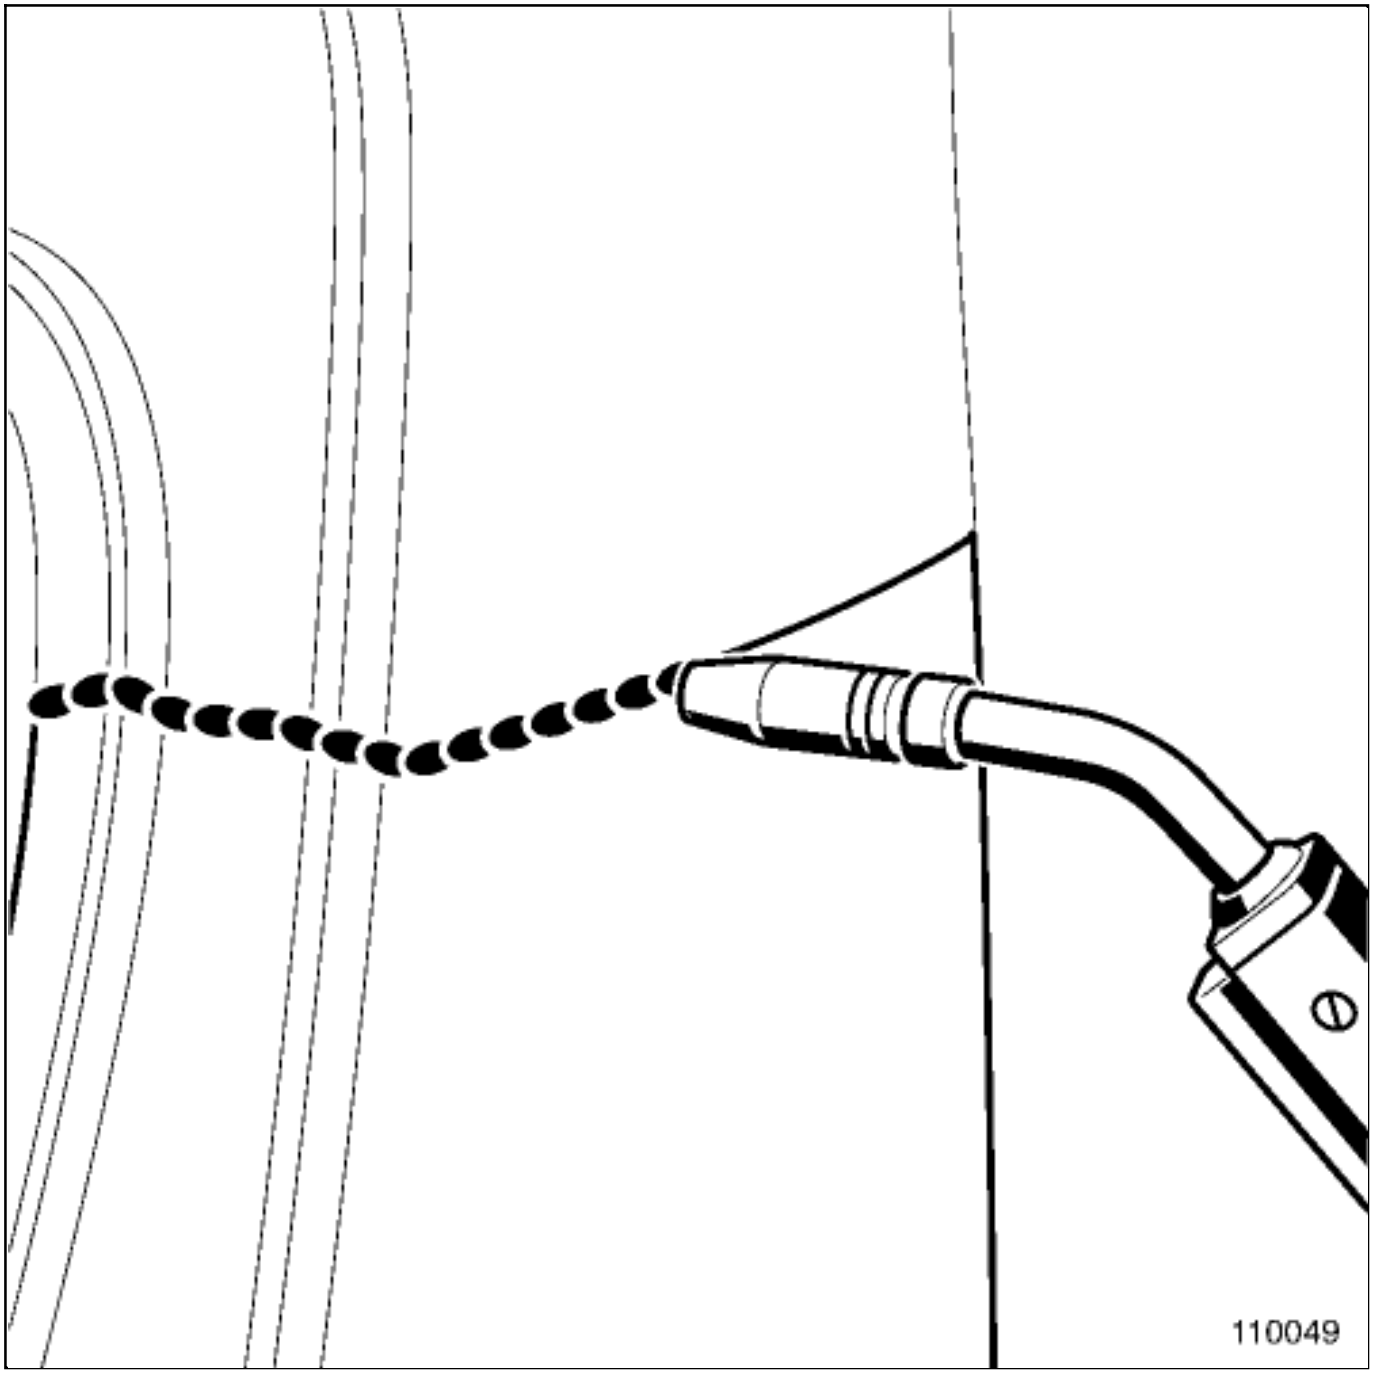
Disadvantages:

- Anticorrosion treatment before assembly is very delicate,
- Impossibility of sealing the mating surfaces before welding,

- Requires perfect mating to obtain correct visible points.

ORIGINAL BEAD

Advantage:



- Identical to original welds.

Disadvantages:

- Anticorrosion treatment before assembly is very delicate,
- Impossibility of sealing the mating surfaces before welding,

  Requires perfect mating to obtain a correct visible bead.

CHAIN BEAD

Advantages:

- Allows edge-to-edge sheet joining.
- Allows the making of spot welds throughout the sheet by replacing the original SER points.

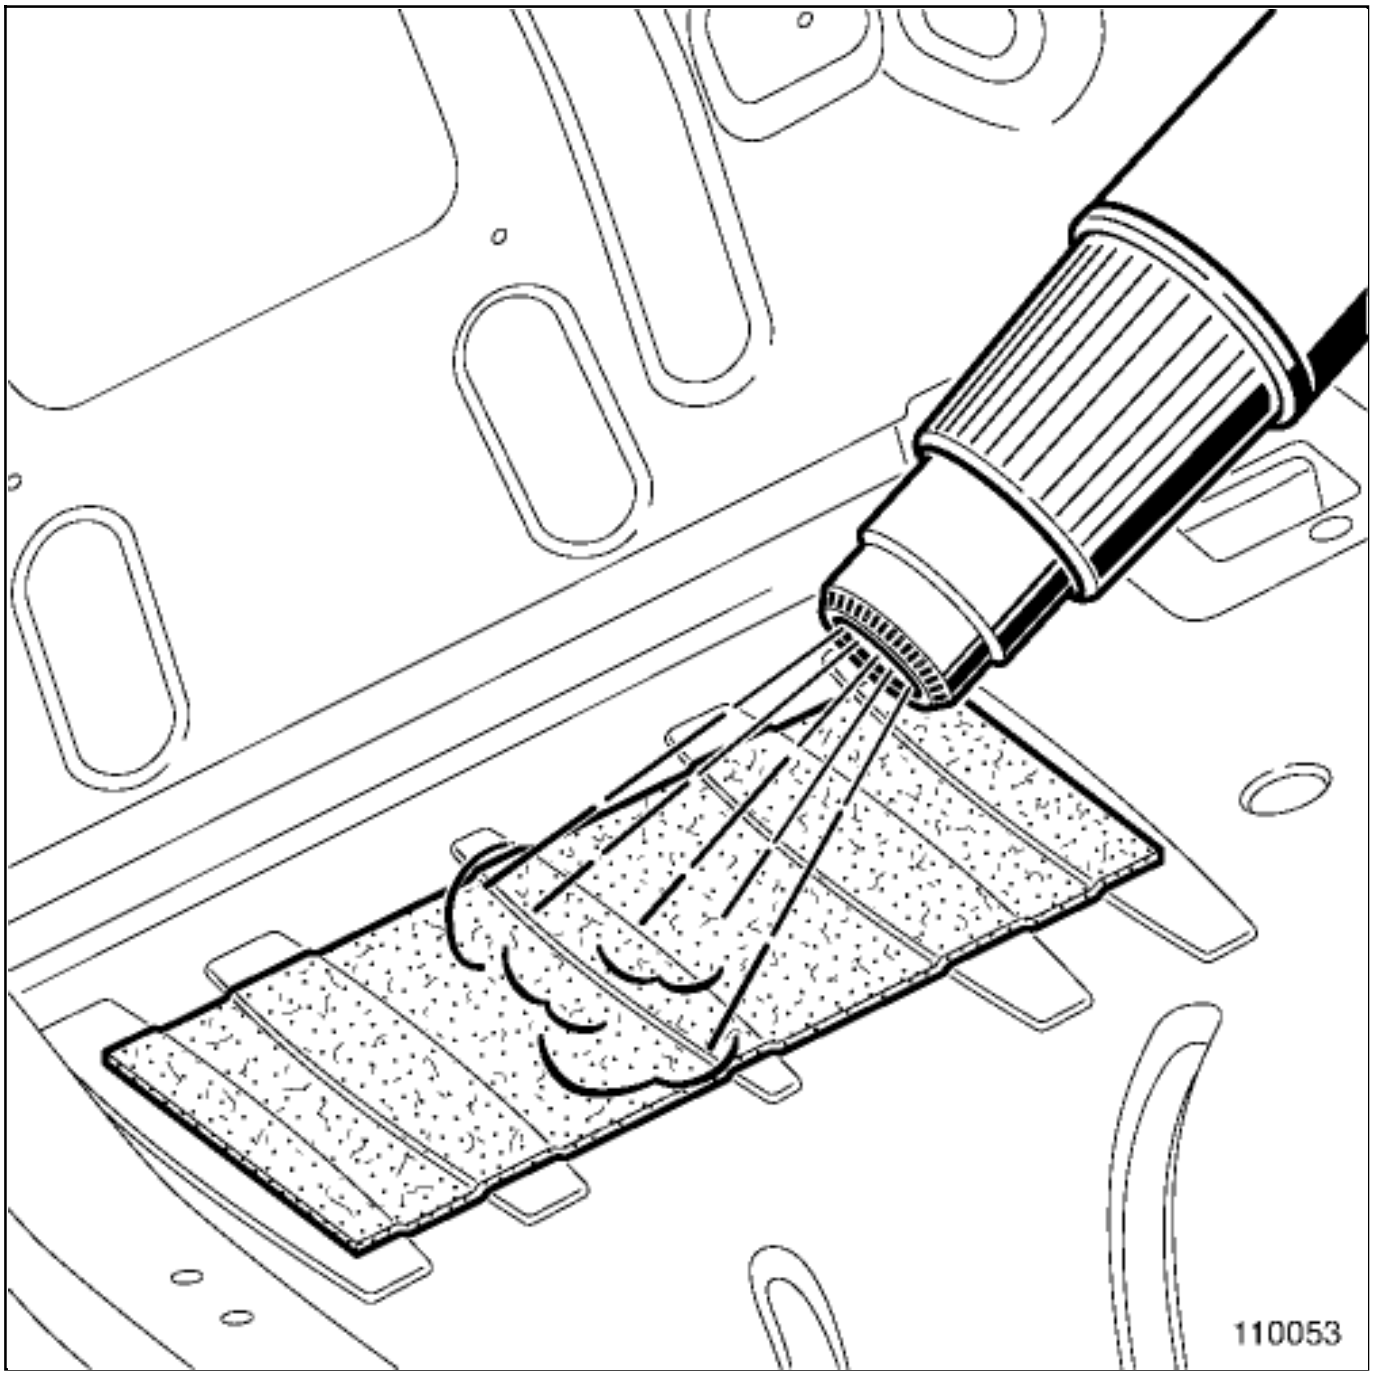
Disadvantages:

- Have to observe the cooling times between each point, otherwise the sheets are liable to become deformed because of the heat,
- Impossibility of anticorrosion treatment before assembly.

Operator protection:

- obligatory eye and face protection,
- obligatory hand protection,
- use extra ventilation source.

Fire risk danger.



Protection in the work area:

- external bodywork protection,
- protection of internal and external window faces,
- protection of interior fittings.

SOUNDPROOFINGPRODUCTSAFTERASSEMBLY

1. SOUNDPROOFING PANEL

Self-adhesive bitumen pads which absorb noise caused by vibrations on large panel surfaces.

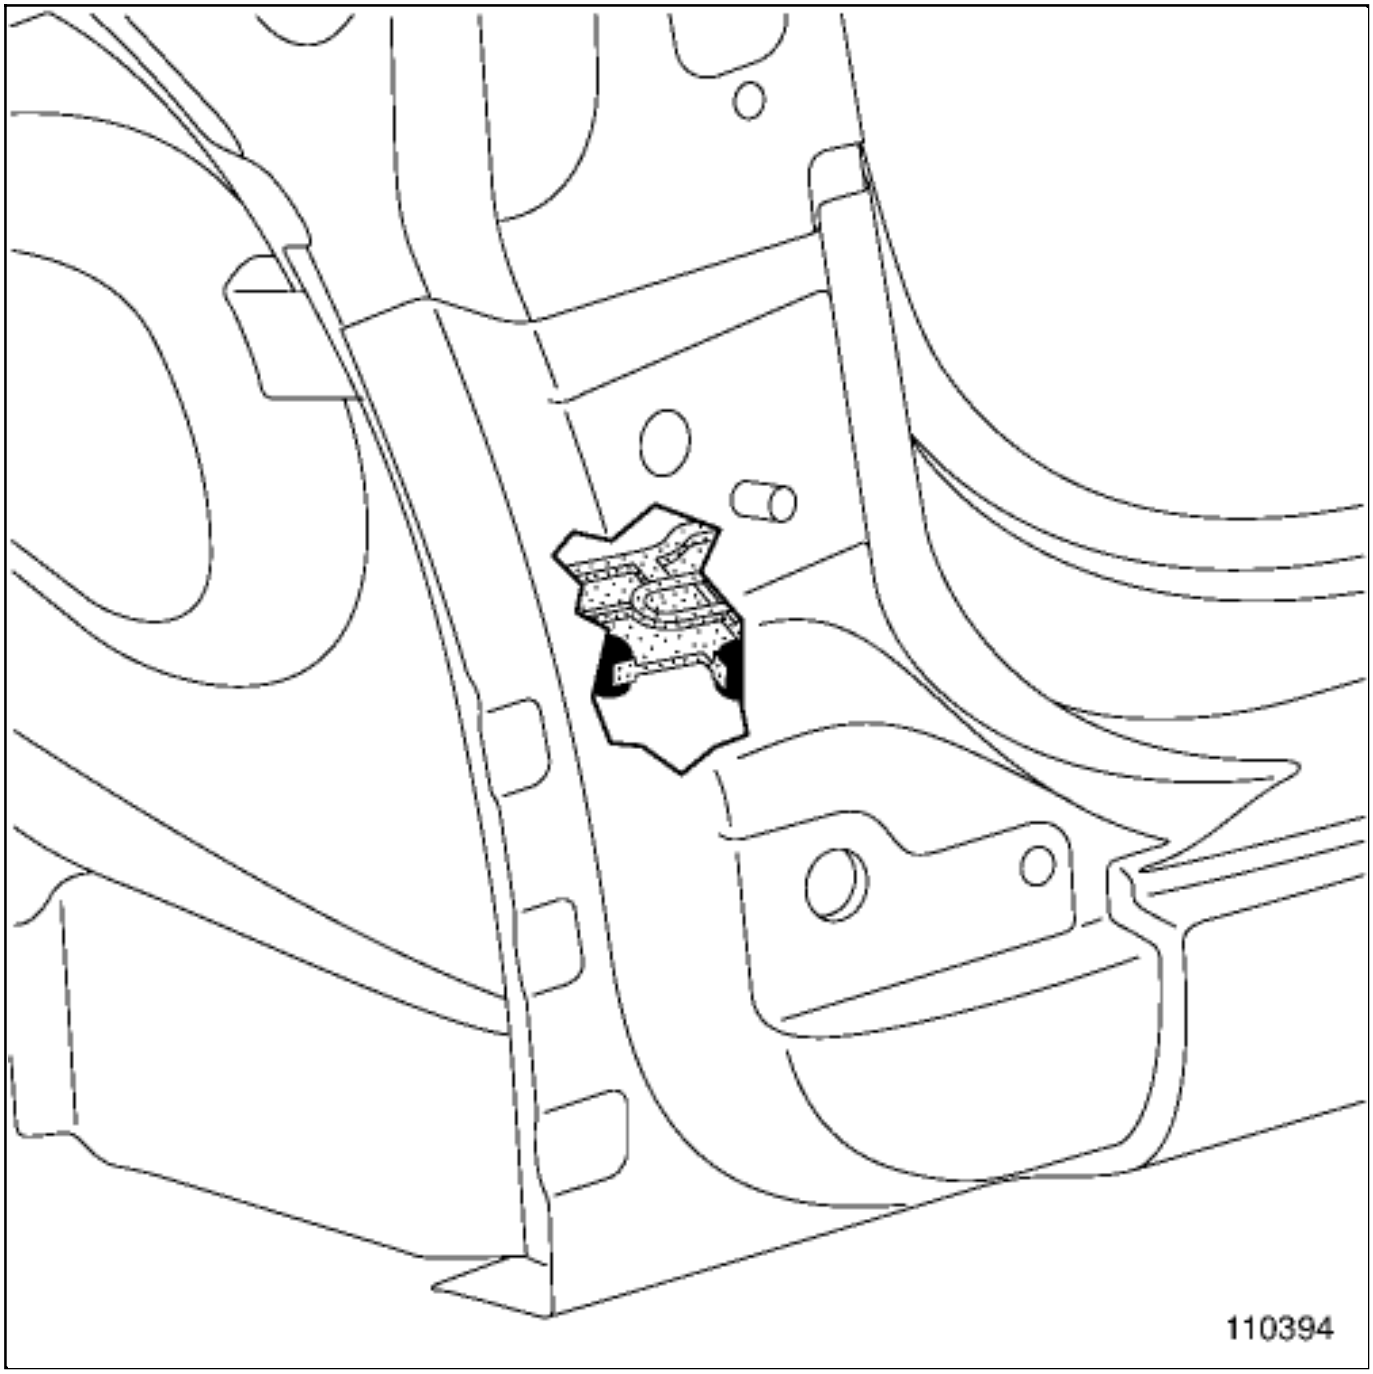
Advantages:

- Conforms with first assembly.
- Highly efficient for soundproofing large surfaces.

Disadvantages:

The obligation of respecting the original position, on pain of amplifying noise.

Repair-00x03x04x18-02x21-2-1-1.xml



XSL version : 3.02 du 22/07/11

SOUNDPROOFINGPRODUCTSBEFOREASSEMBLY

1. HOLLOW BODY PART INSERTS

They ensure the soundproofing the hollow sections of the bodywork structure.

Fitting inserts during repairs requires usage of preformed masticthat is positioned on the edge of the insert before the bodywork components are assembled(see 40J, Protective devices , Structural acoustic protection: Description) .

Advantages:

- Allows the refitting of first assembly components (insert) and ensures protection exactly like the original protection.

Disadvantage:

-

Impossible to retouch after assembly.

Repair-00x03x04x04-02x21-2-1-1.xml

XSL version : 3.02 du 22/07/11

SPEED SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
oil recovery tray

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

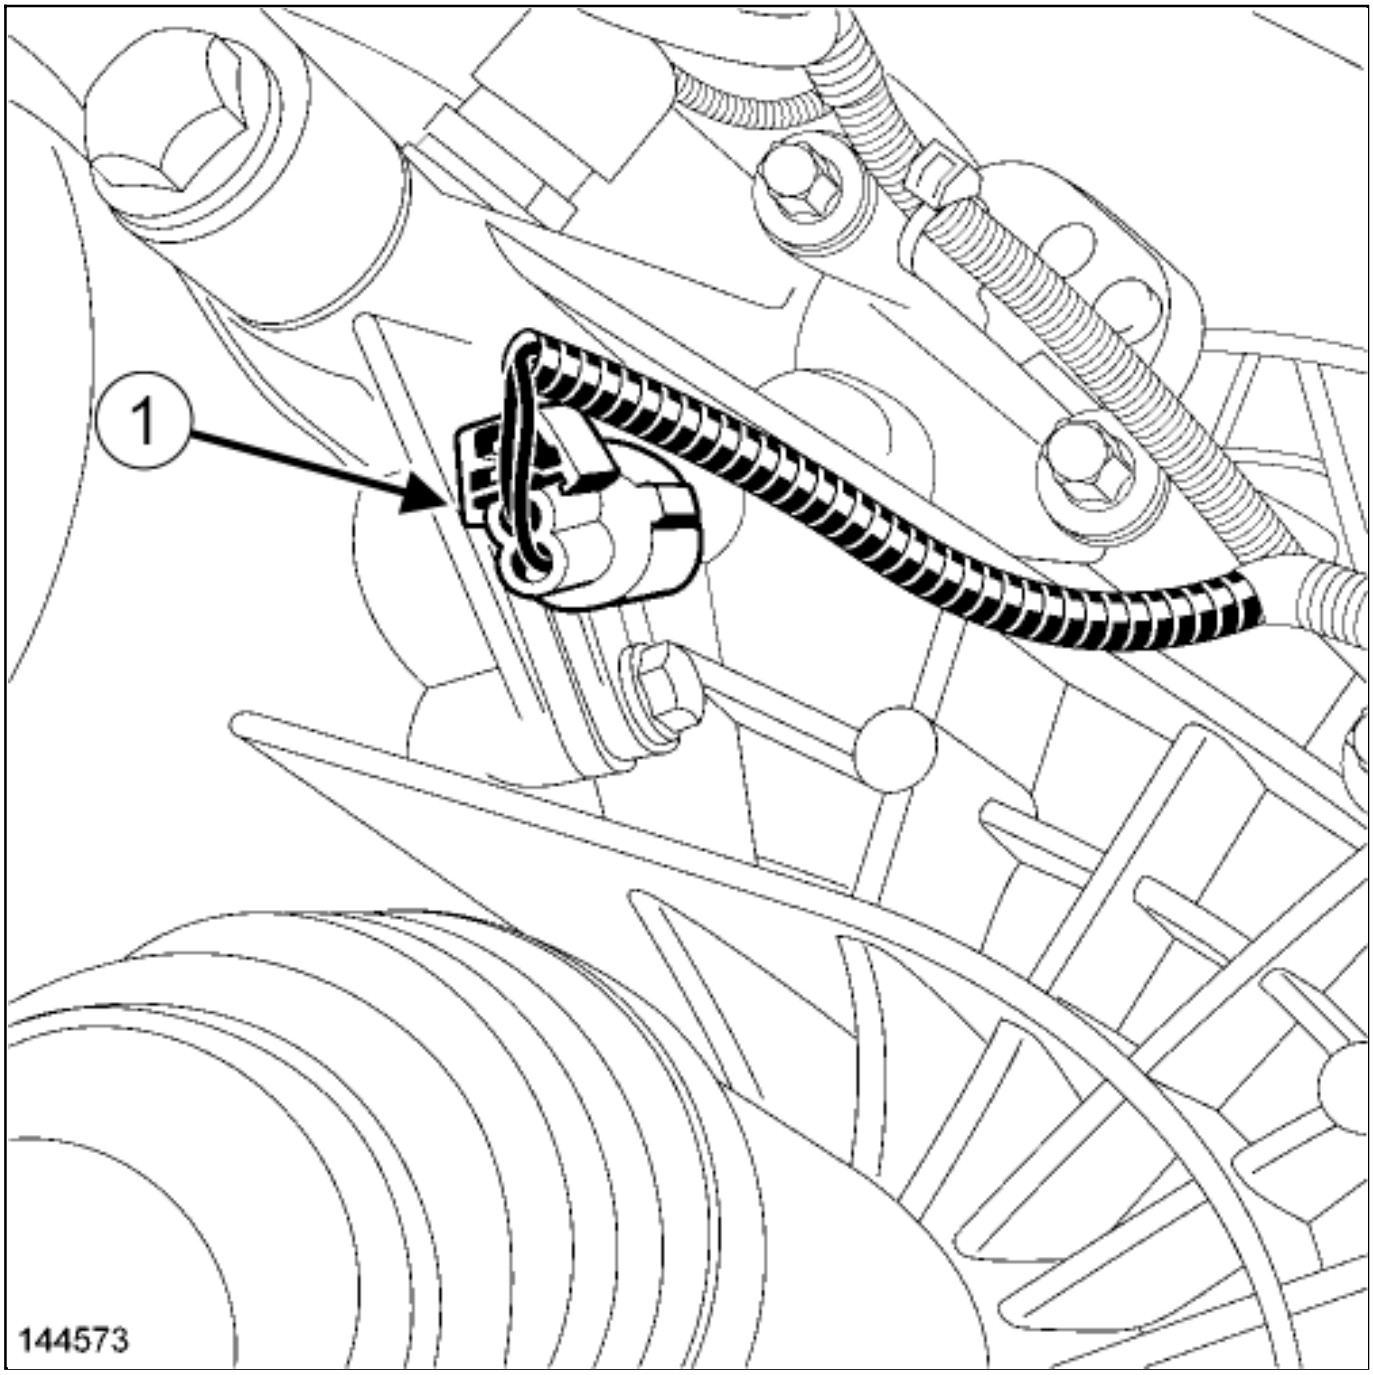
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

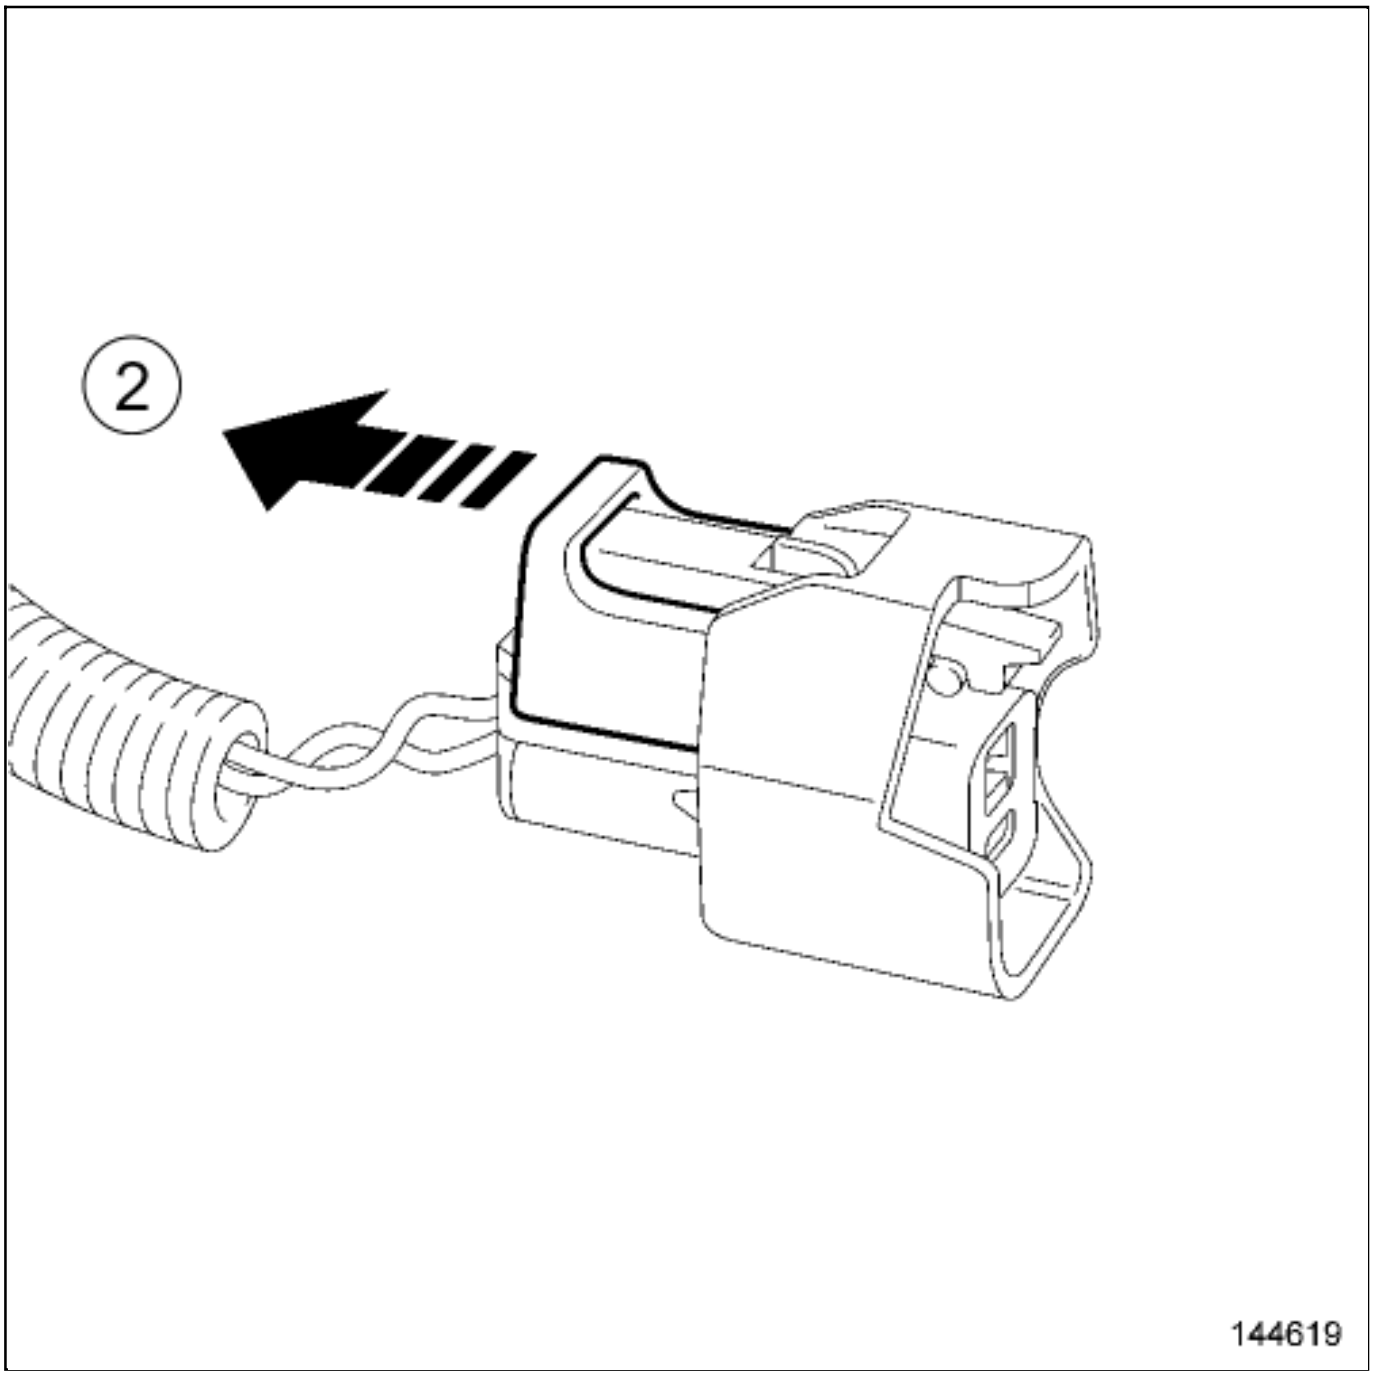
REMOVAL

1. REMOVAL PREPARATION OPERATION

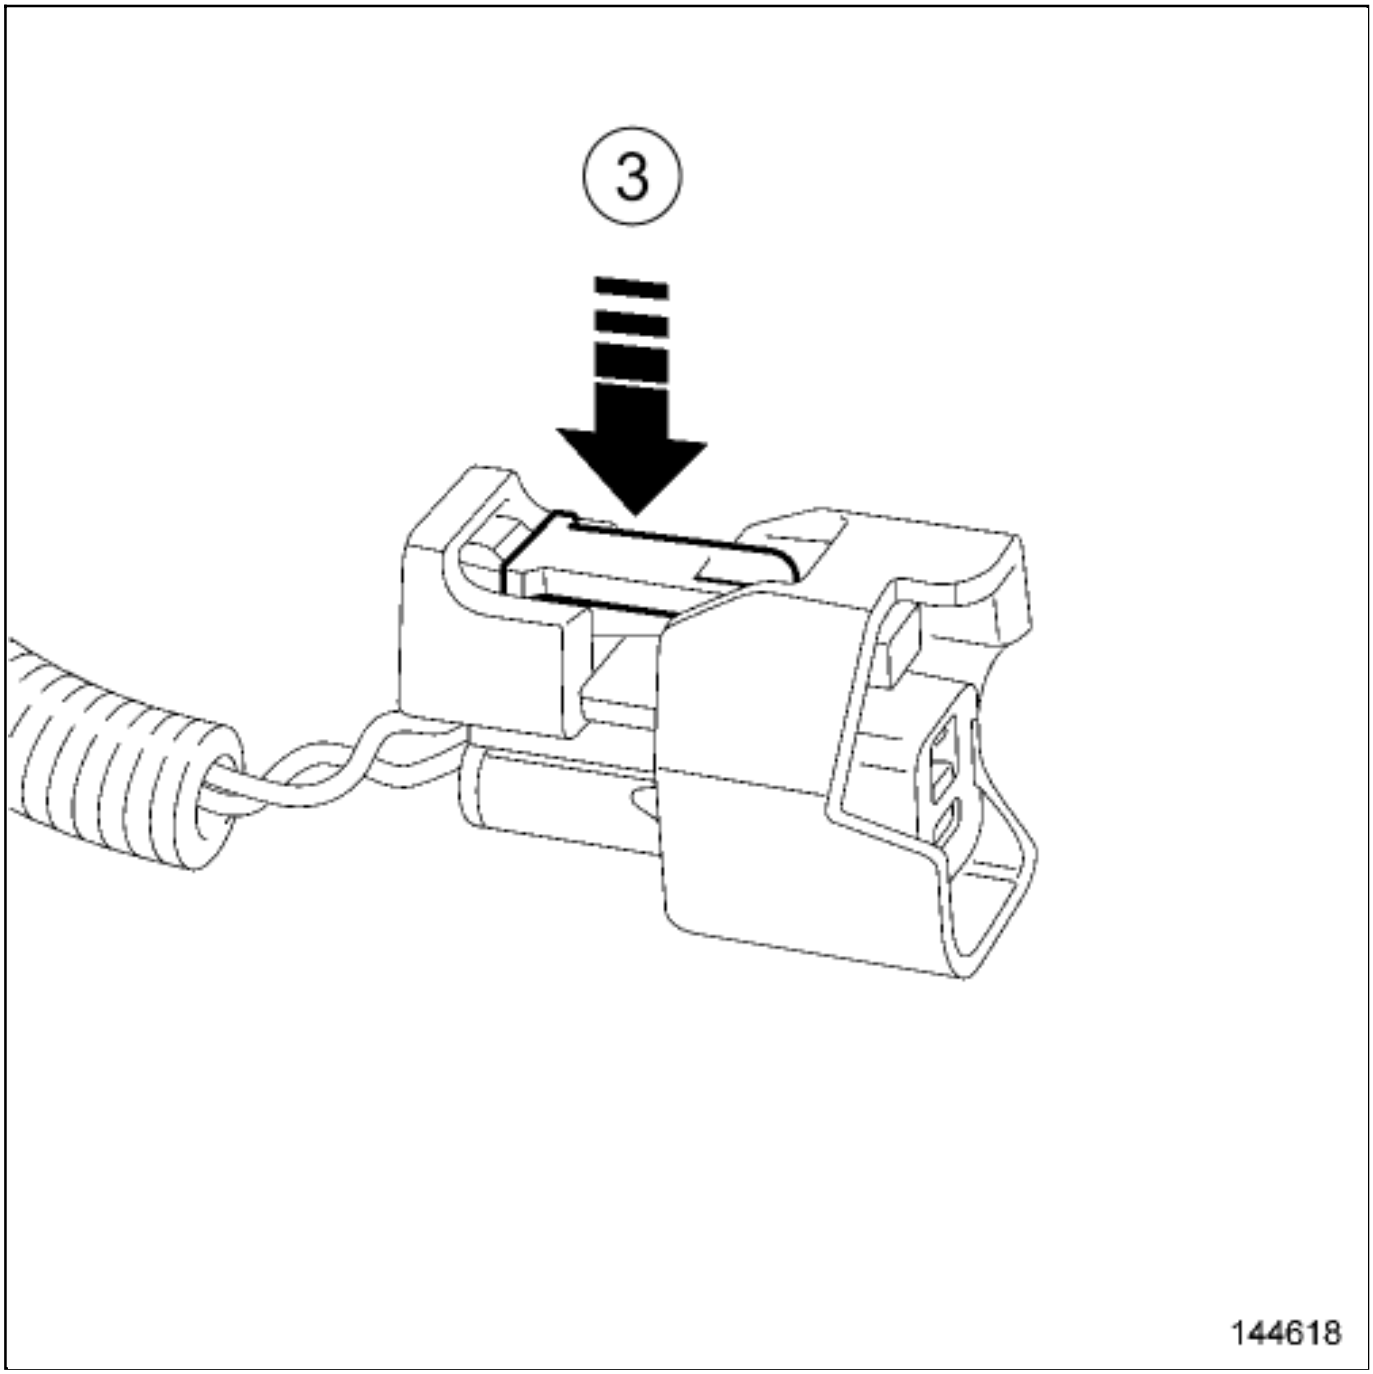
Position the vehicle on a two-post lift Vehicle: Towing and lifting .



Remove the front left-hand wheel Wheel: Removal - Refitting .



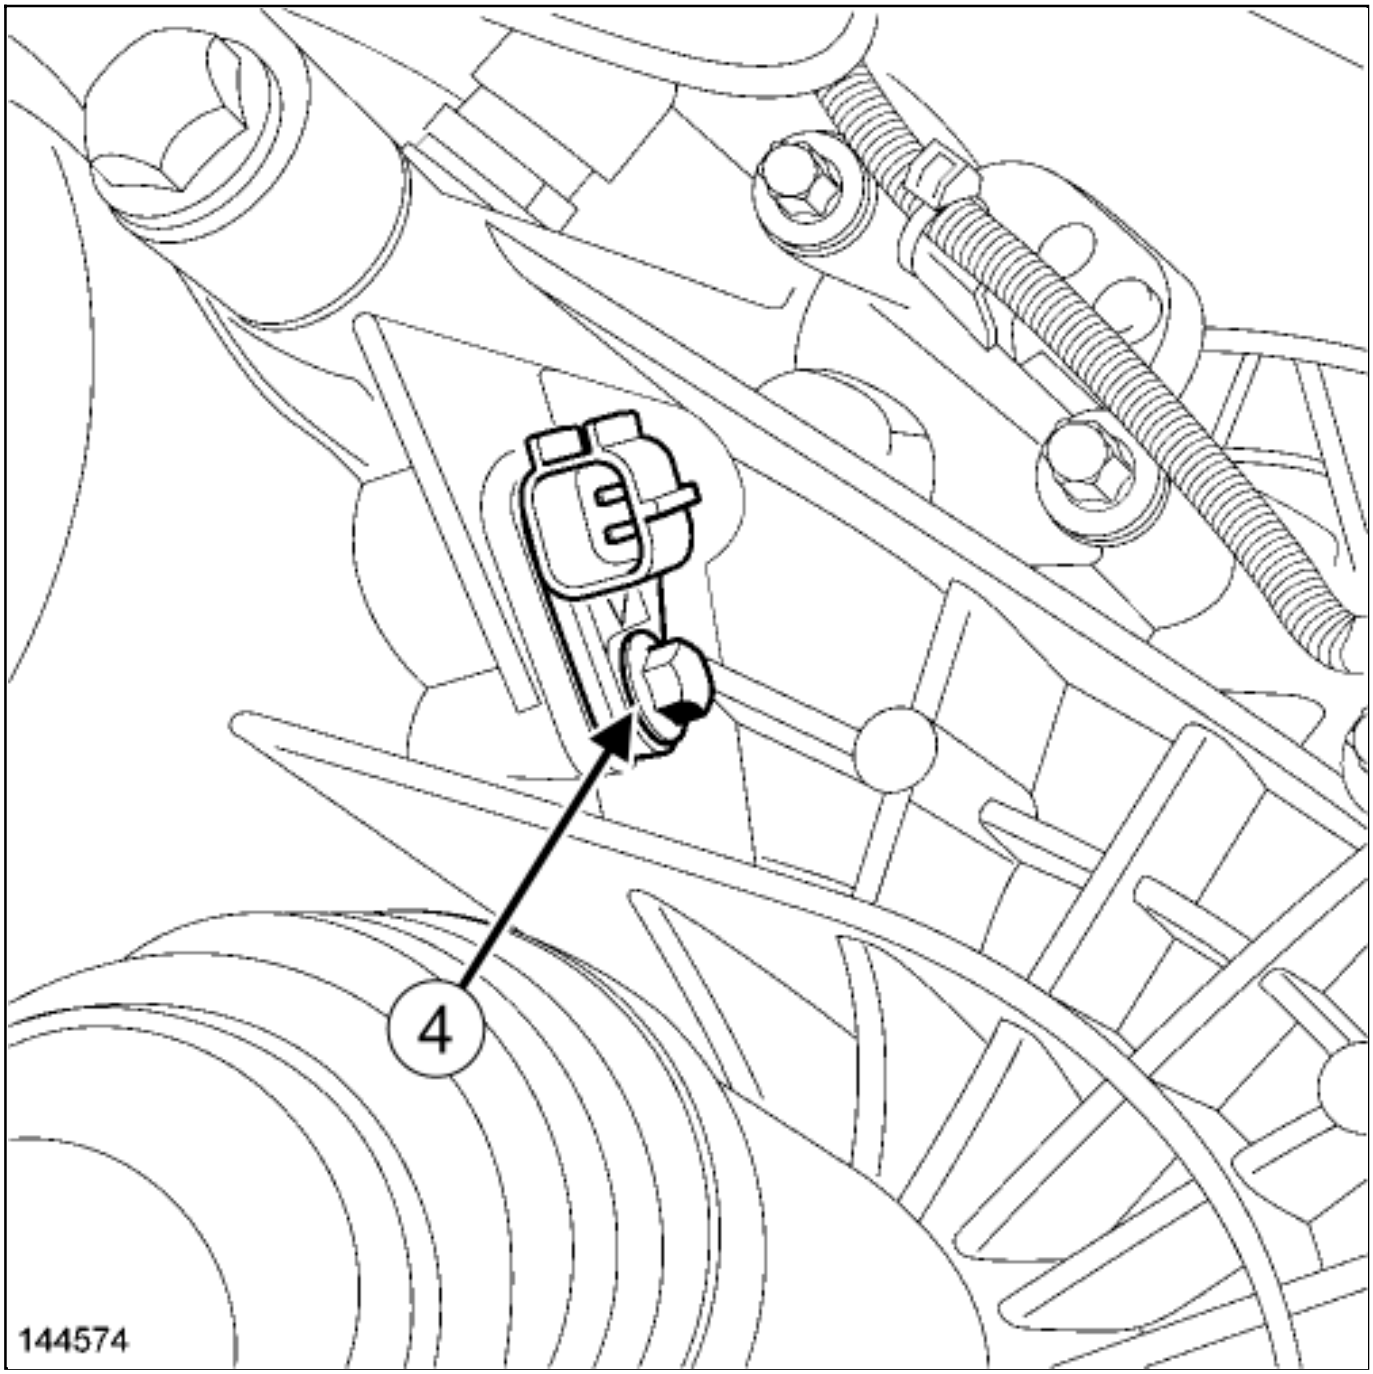
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



2
144619

Disconnect the connector(1) of the automatic gearbox third gear speed sensor by:

- unlocking the connector locking system(2) ,
- pressing the tab(3) and pulling the connector.

Remove:

- the bolt(4) of the automatic gearbox third gear speed sensor,
- the automatic gearbox third gear speed sensor.

Note:

The shaft speed sensor for third gear has a 4 mmthick shim that determines the sensor position in relation to the teeth.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox third gear speed sensor.
- Always replace the seal of the automatic gearbox third gear speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox third gear speed sensor.
- Torque tighten the bolt of the automatic gearbox third gear speed sensor9 N.m.
- Connect the connector of the automatic gearbox third gear speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

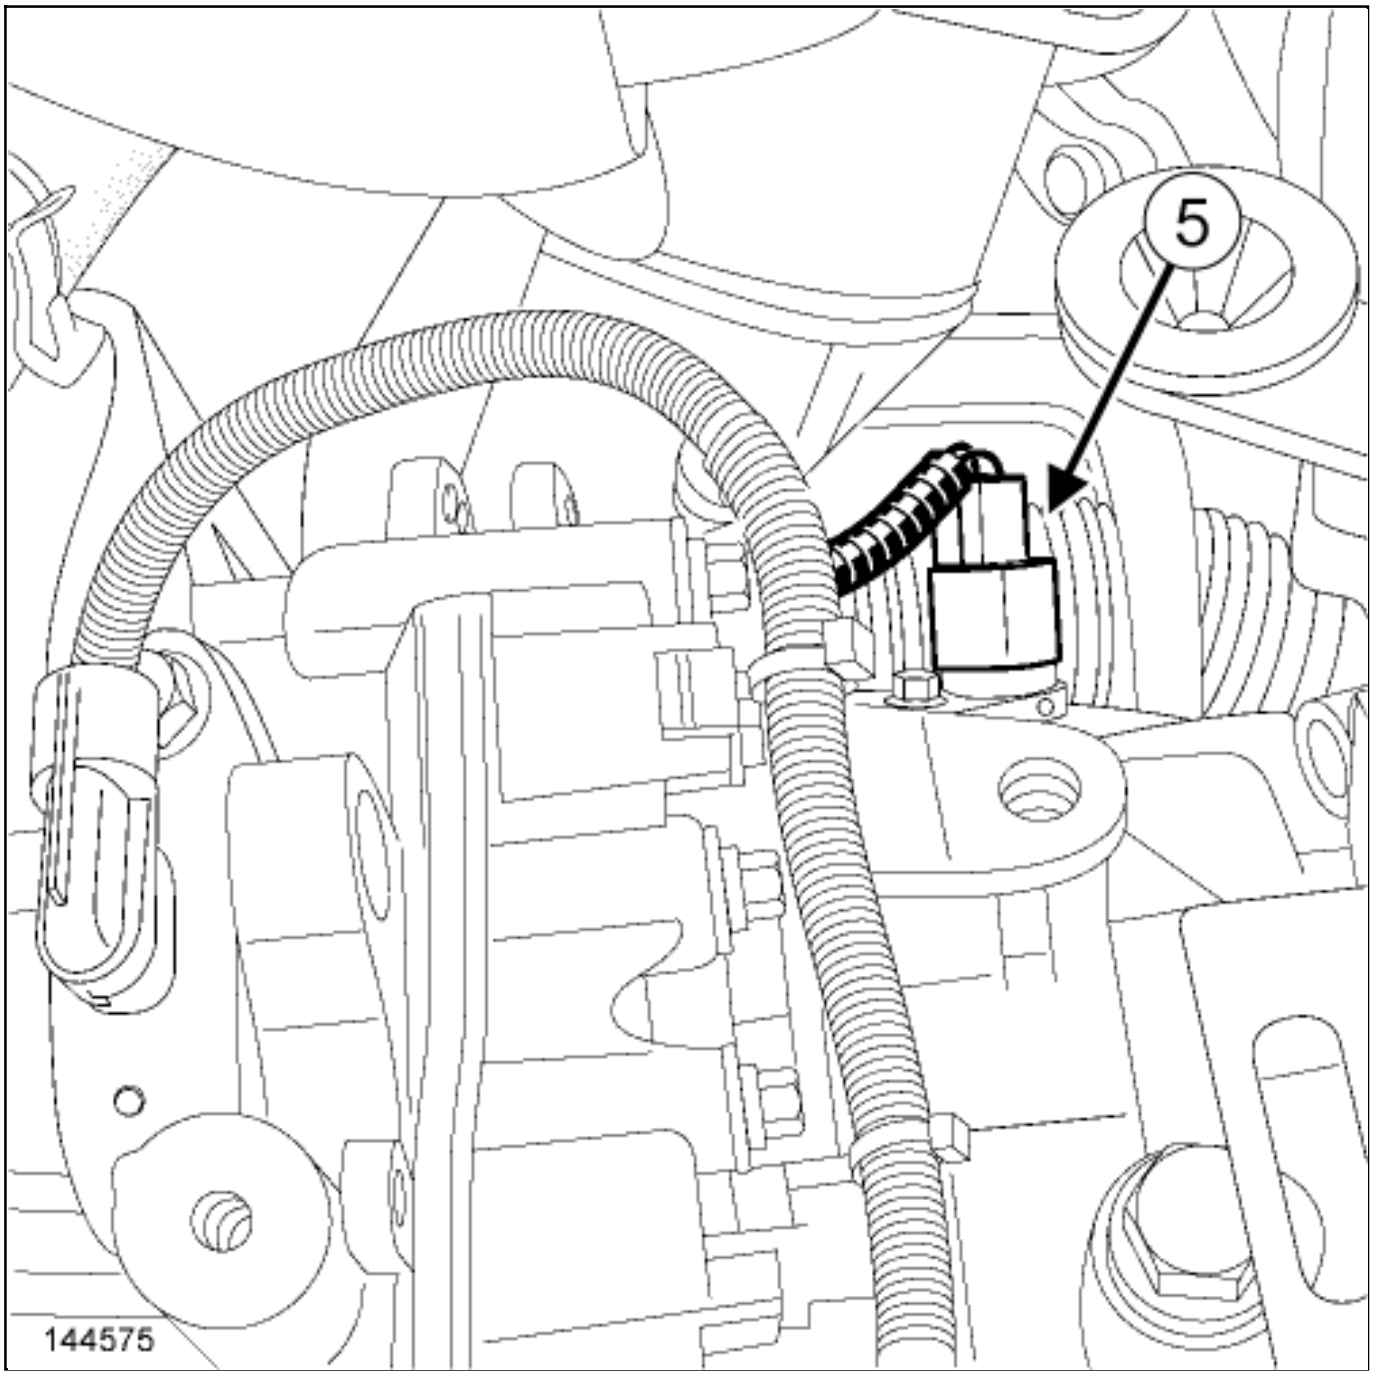
carry out the operations described in the "After repair procedure" section.

REMOVAL

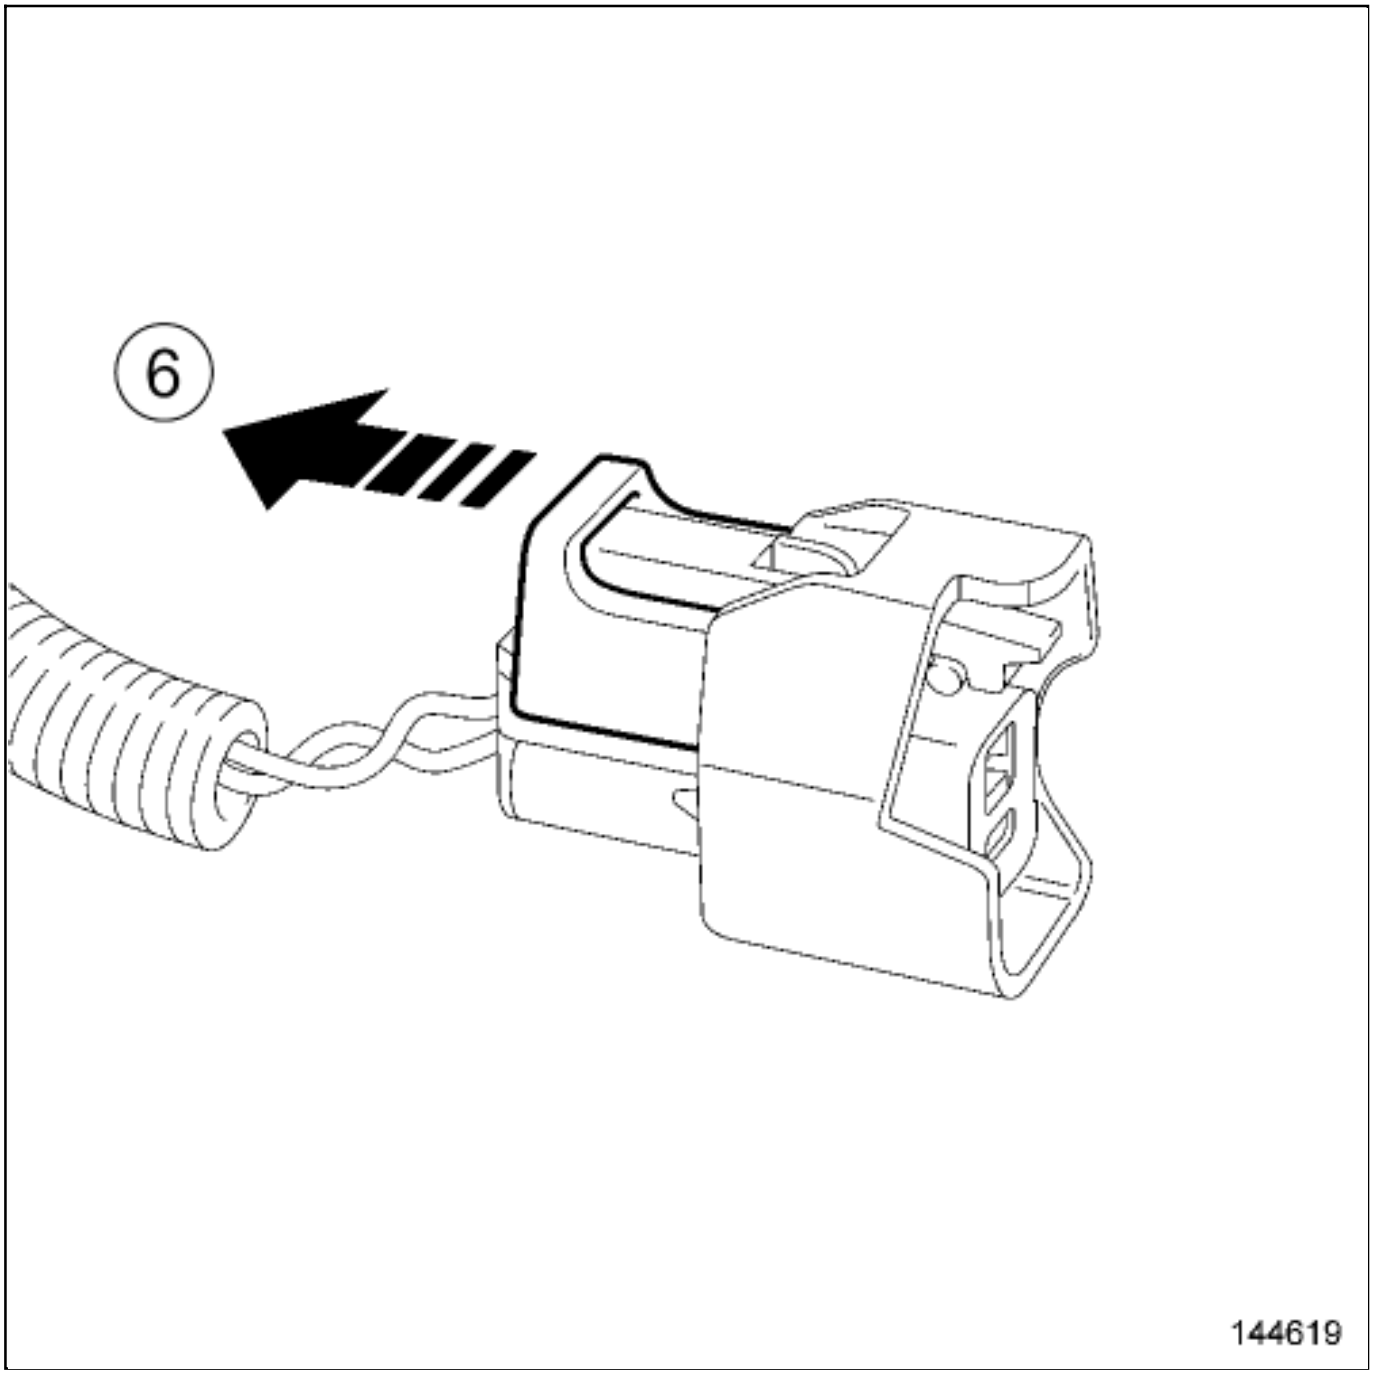
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

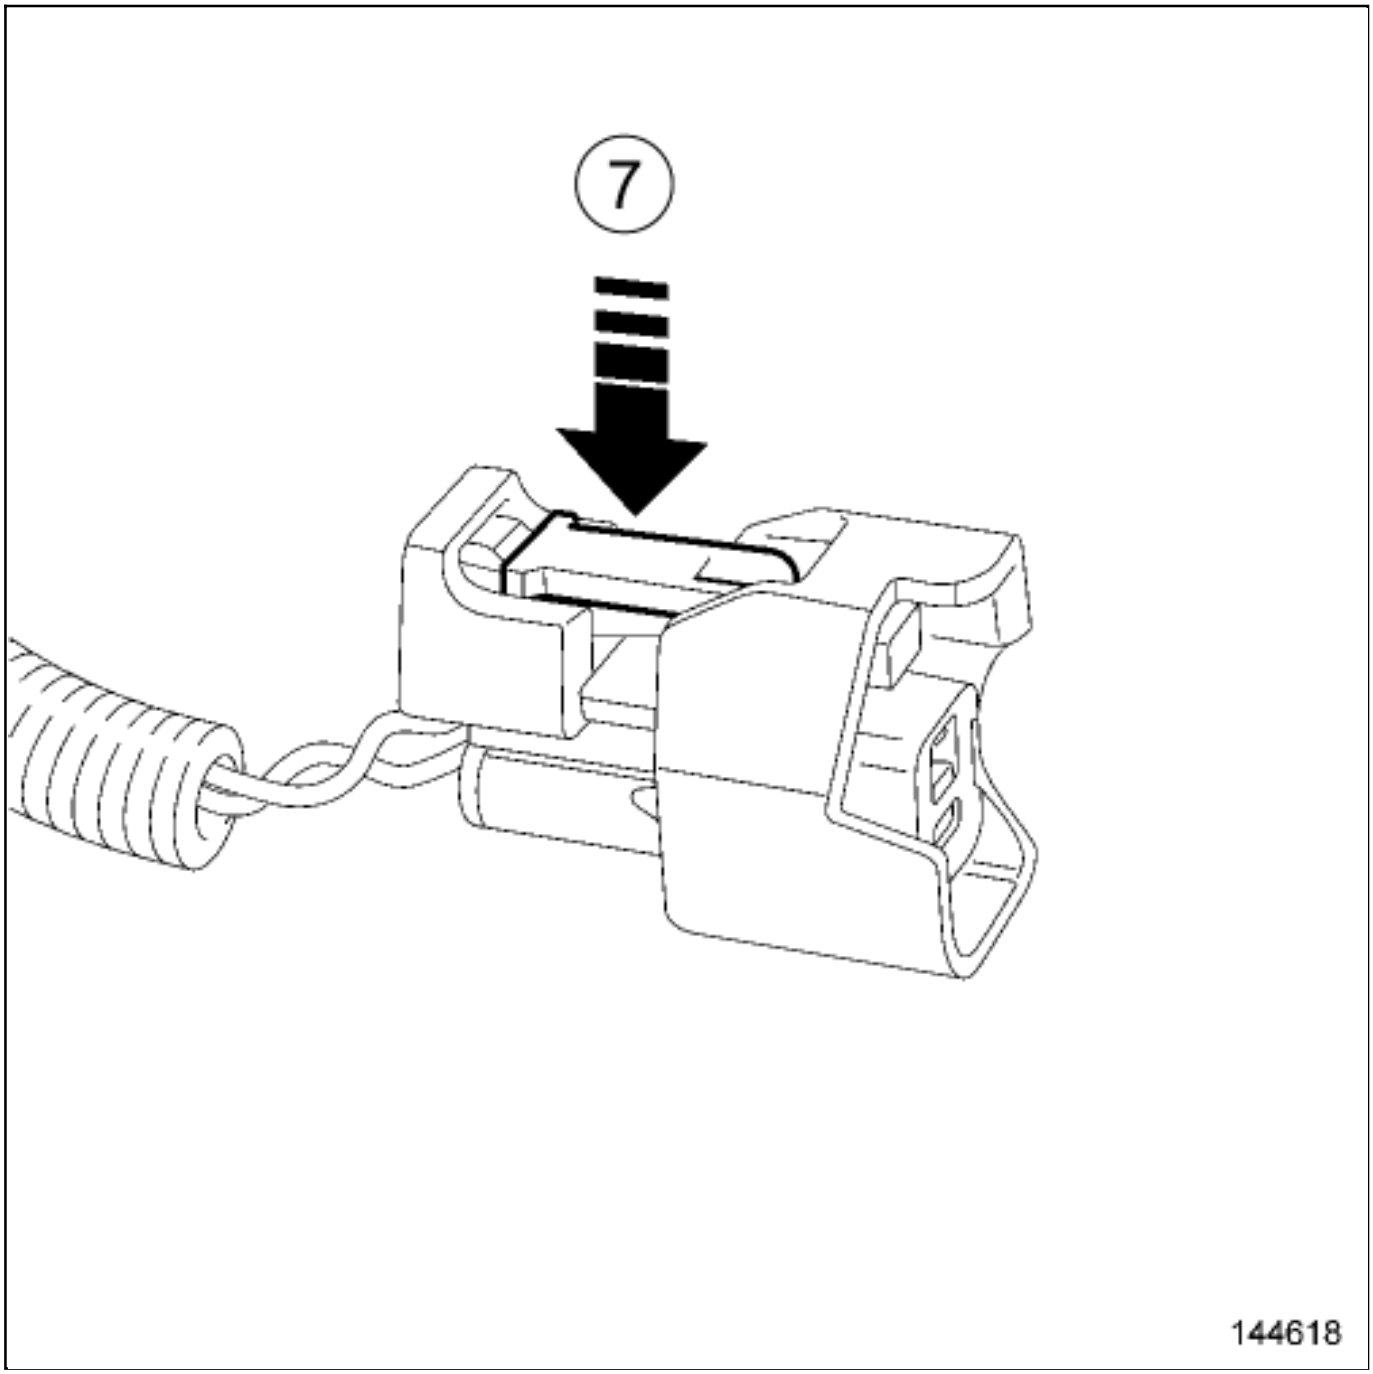
Remove the front left-hand wheelWheel: Removal - Refitting .



2. REMOVAL OPERATION



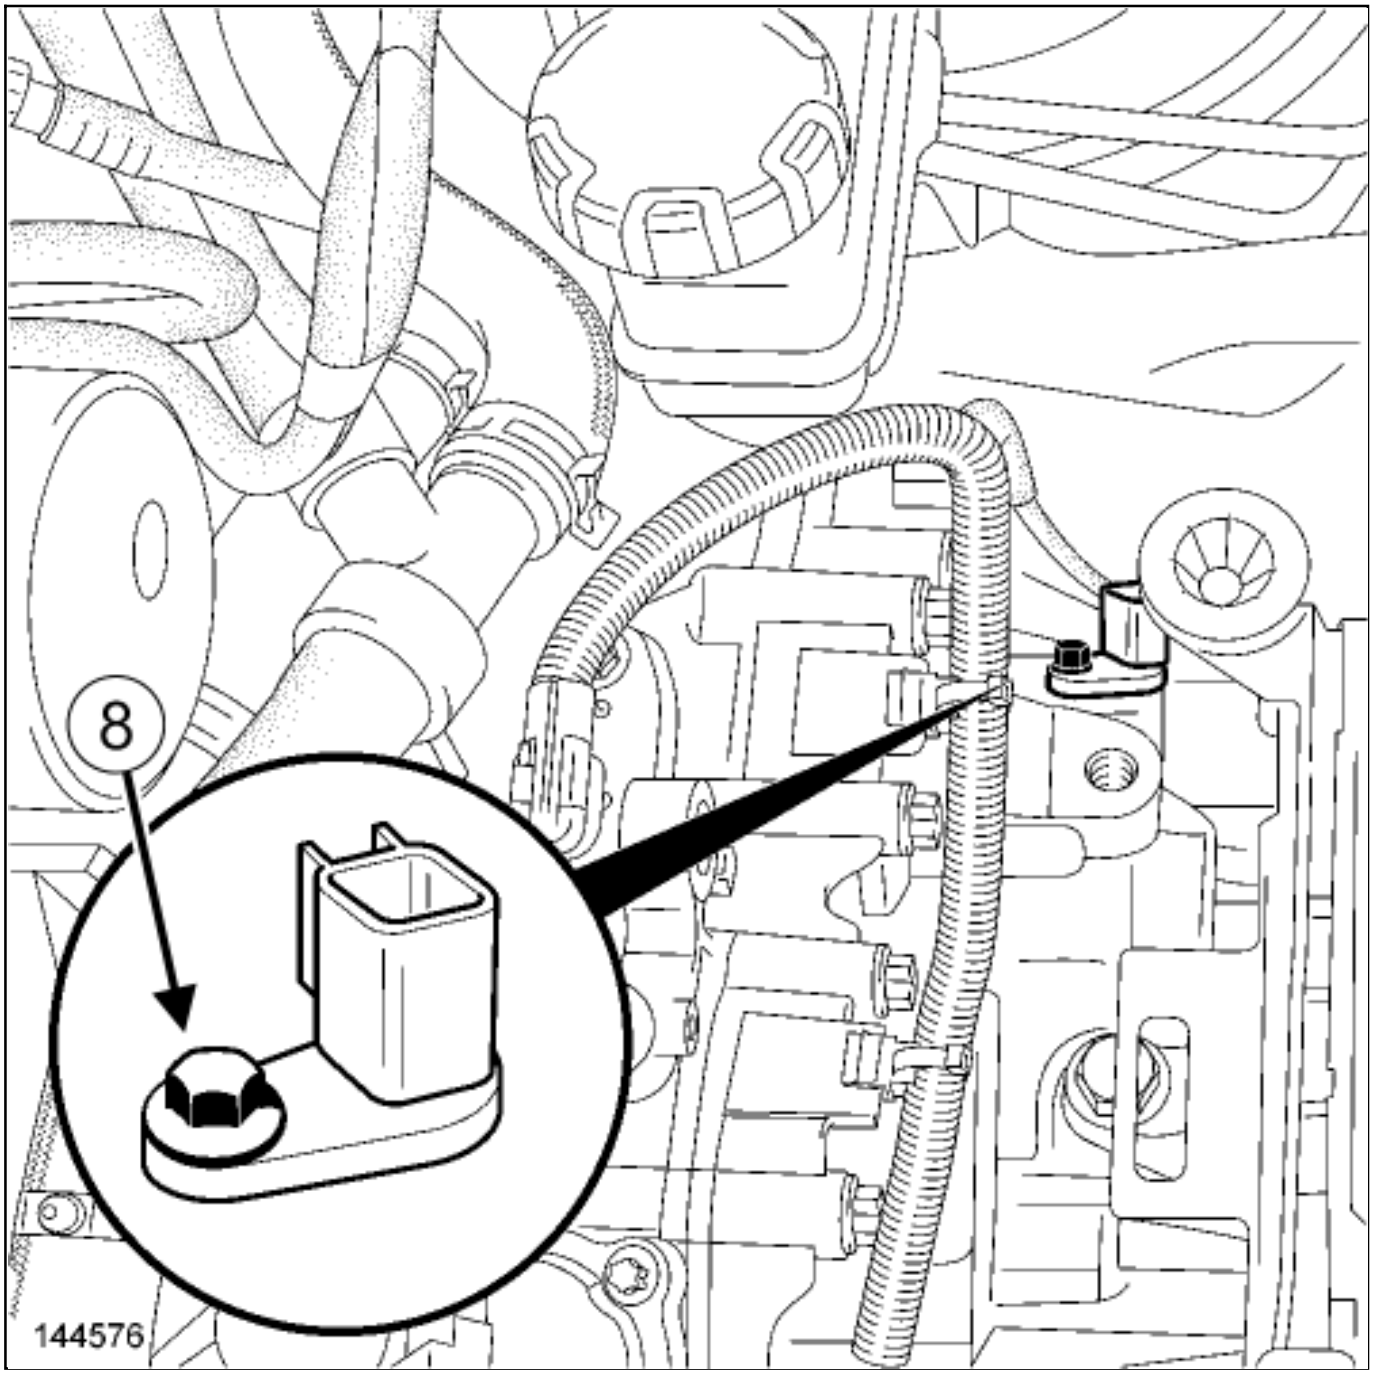
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



6
144619

Disconnect the connector(5) of the automatic gearbox fourth gear speed sensor by:

- unlocking the connector locking system(6) ,
- pressing the tab(7) and pulling the connector.

Remove:

- the bolt(8) of the automatic gearbox fourth gear speed sensor,
- the automatic gearbox fourth gear speed sensor.

Note:

The engine speed sensor for fourth gear has a 2 mmthick shim that determines the sensor position in relation to the teeth.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox fourth gear speed sensor.
- Always replace the seal of the automatic gearbox fourth gear speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox fourth gear speed sensor.
- Torque tighten the bolt of the automatic gearbox fourth gear speed sensor9 N.m.
- Connect the connector of the automatic gearbox fourth gear speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

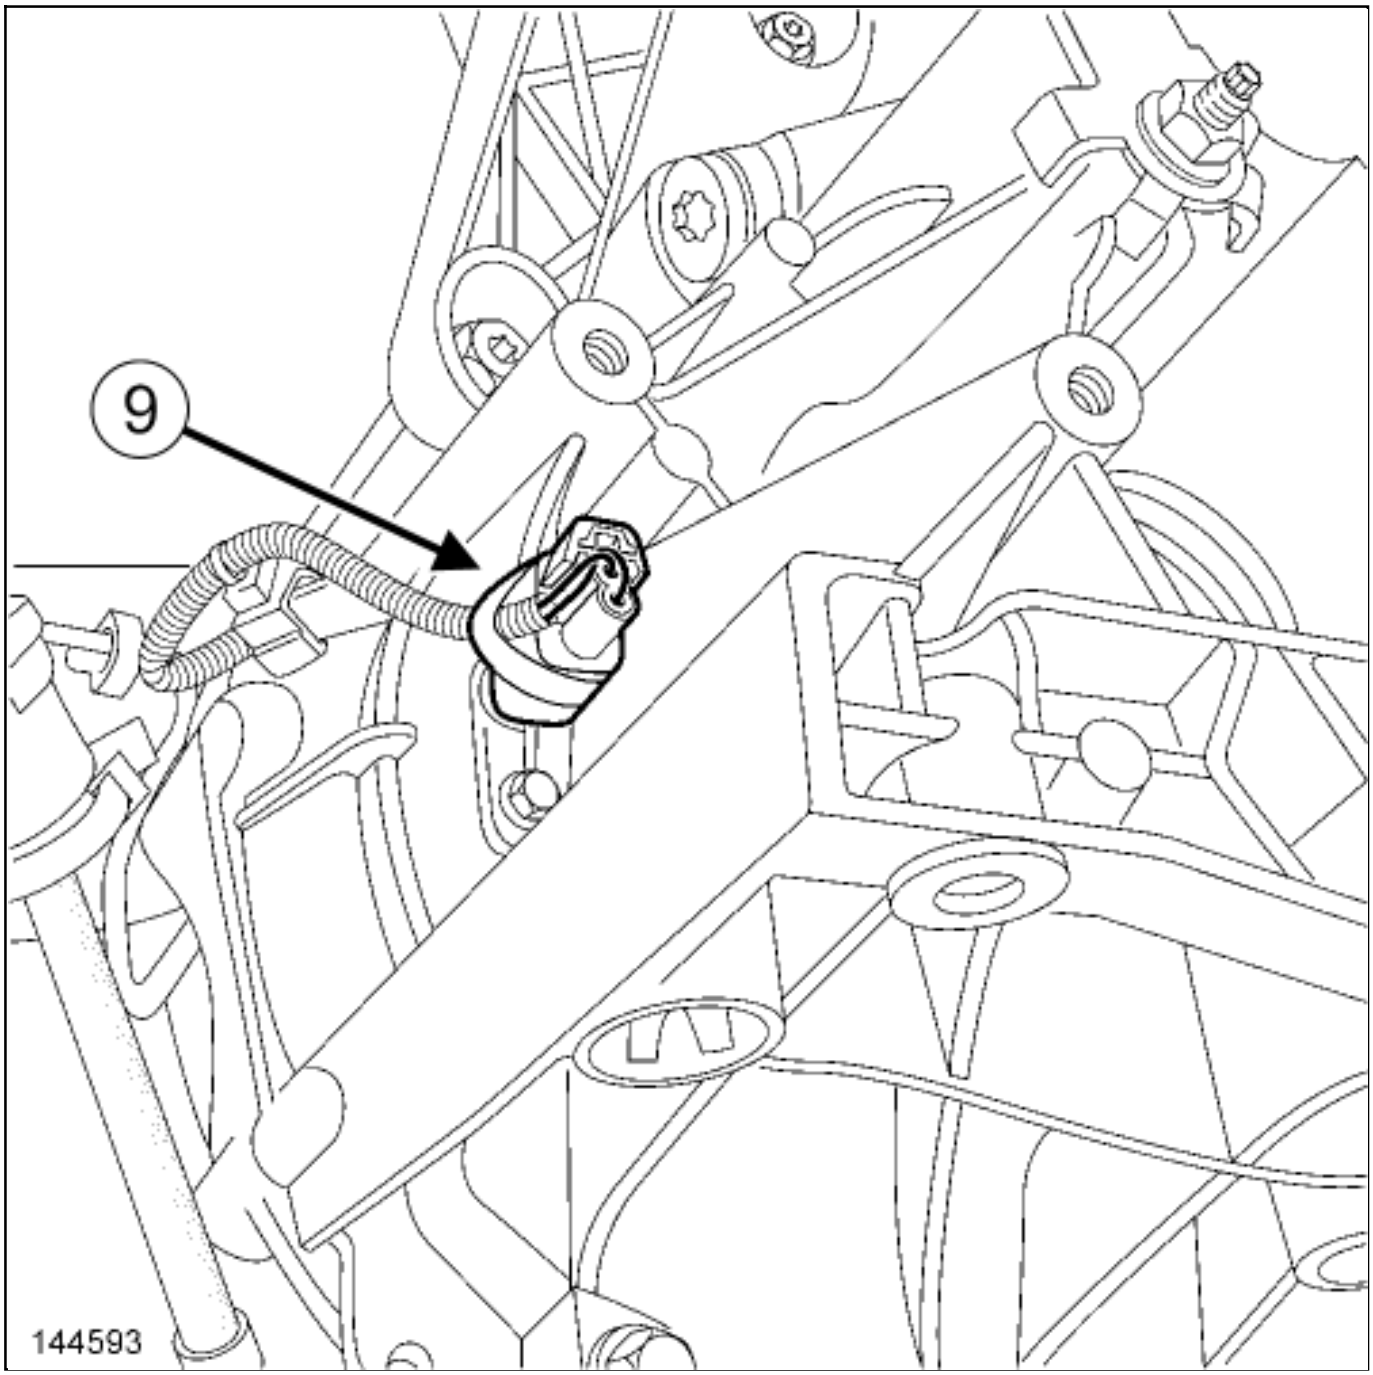
carry out the operations described in the "After repair procedure" section.

REMOVAL

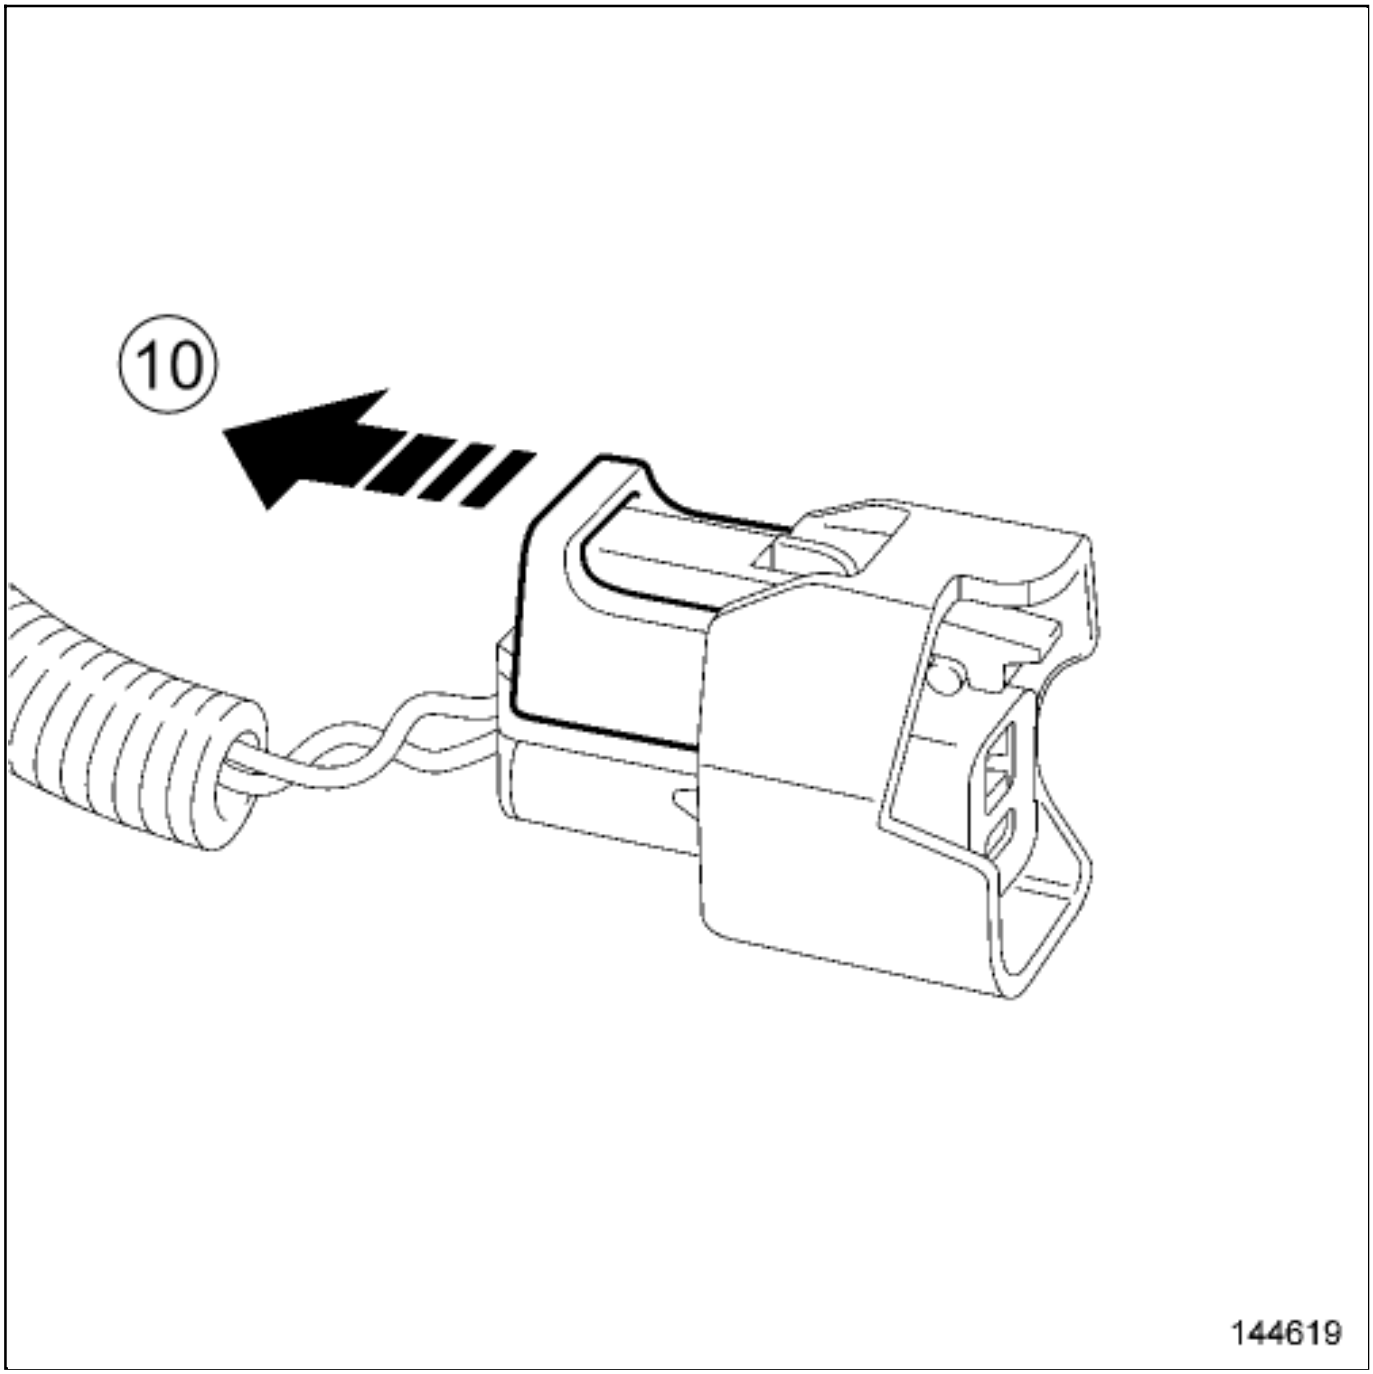
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

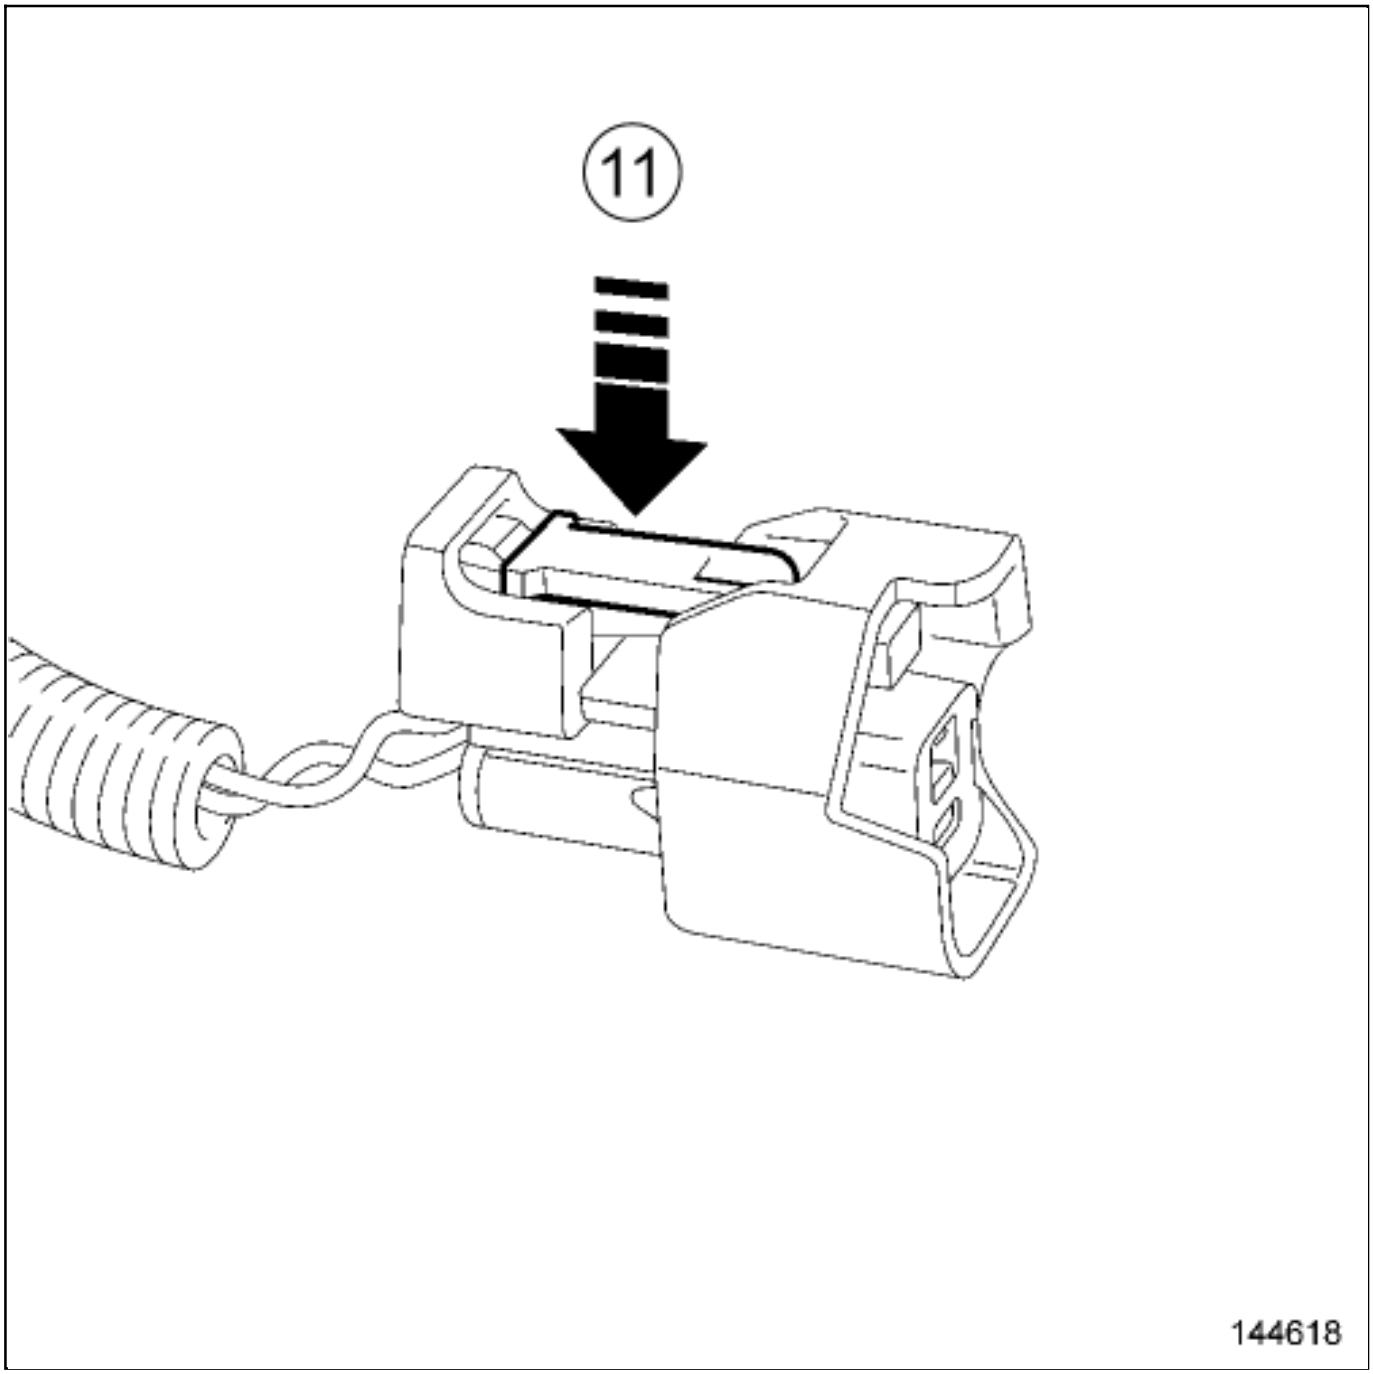
Remove the engine undertray.



2. REMOVAL OPERATION



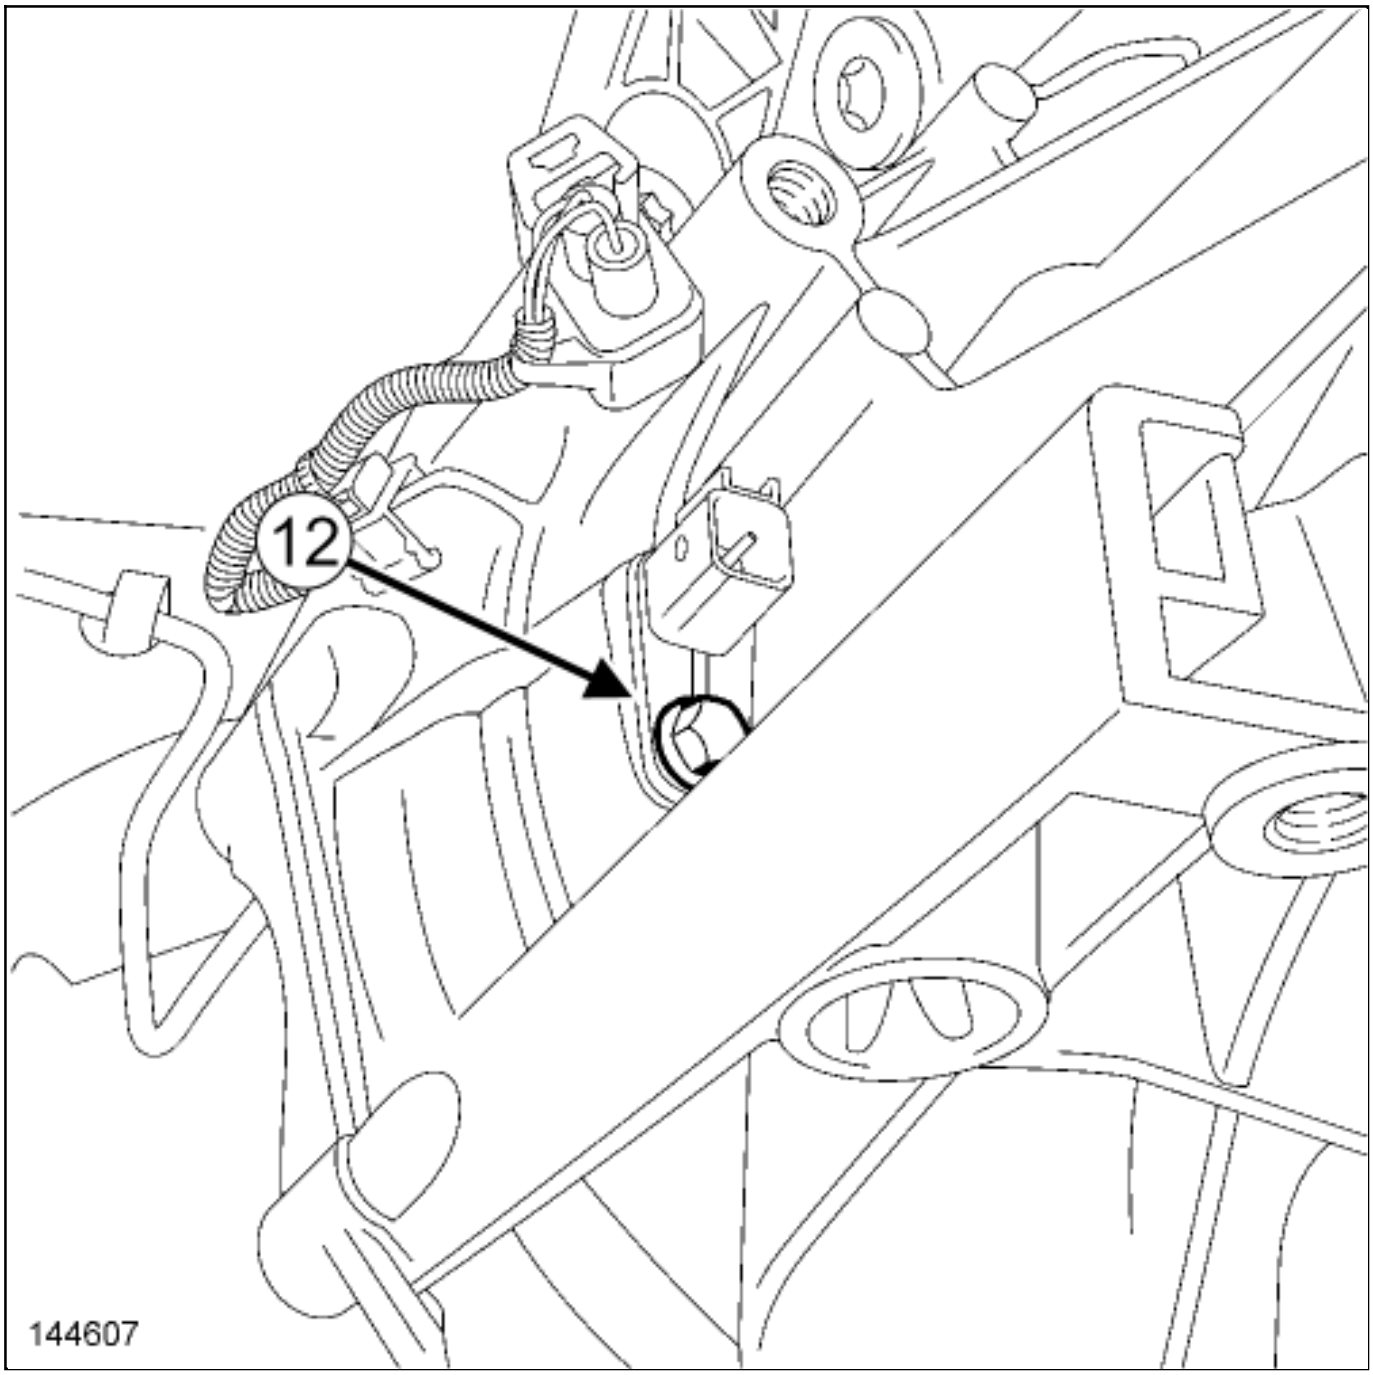
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



10
144619

Disconnect the connector(9) of the automatic gearbox differential speed sensor by:

- unlocking the connector locking system(10) ,
- pressing the tab(11) and pulling the connector.

Fit an oil recovery trayfor the outflow of gearbox oil.

Remove:

- the bolt(12) of the automatic gearbox differential speed sensor,
- the automatic gearbox differential speed sensor.

Note:

There is no shim for the differential speed sensor.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox differential speed sensor.
- Always replace the seal of the automatic gearbox differential speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox differential speed sensor.
- Torque tighten the bolt of the automatic gearbox differential speed sensor9 N.m.
- Connect the connector of the automatic gearbox differential speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

SPEED SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
oil recovery tray

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

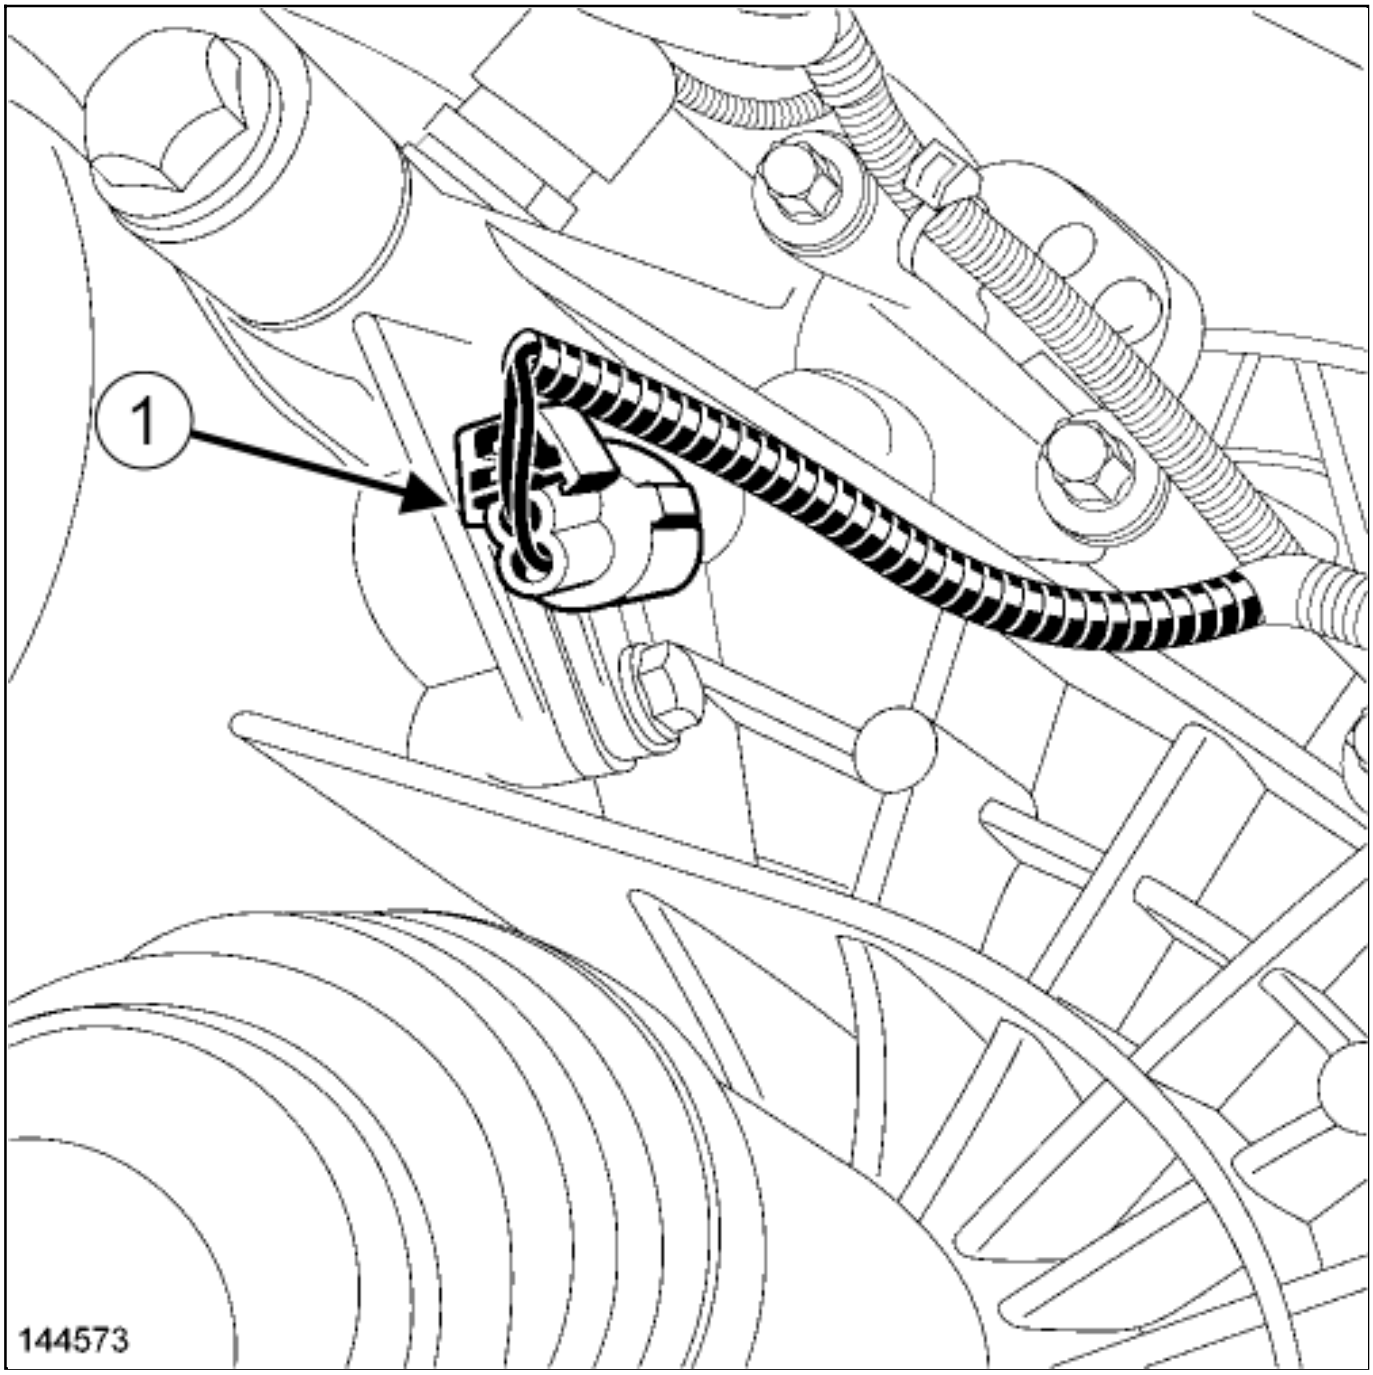
(see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,

Vehicle: Precautions for the repair .

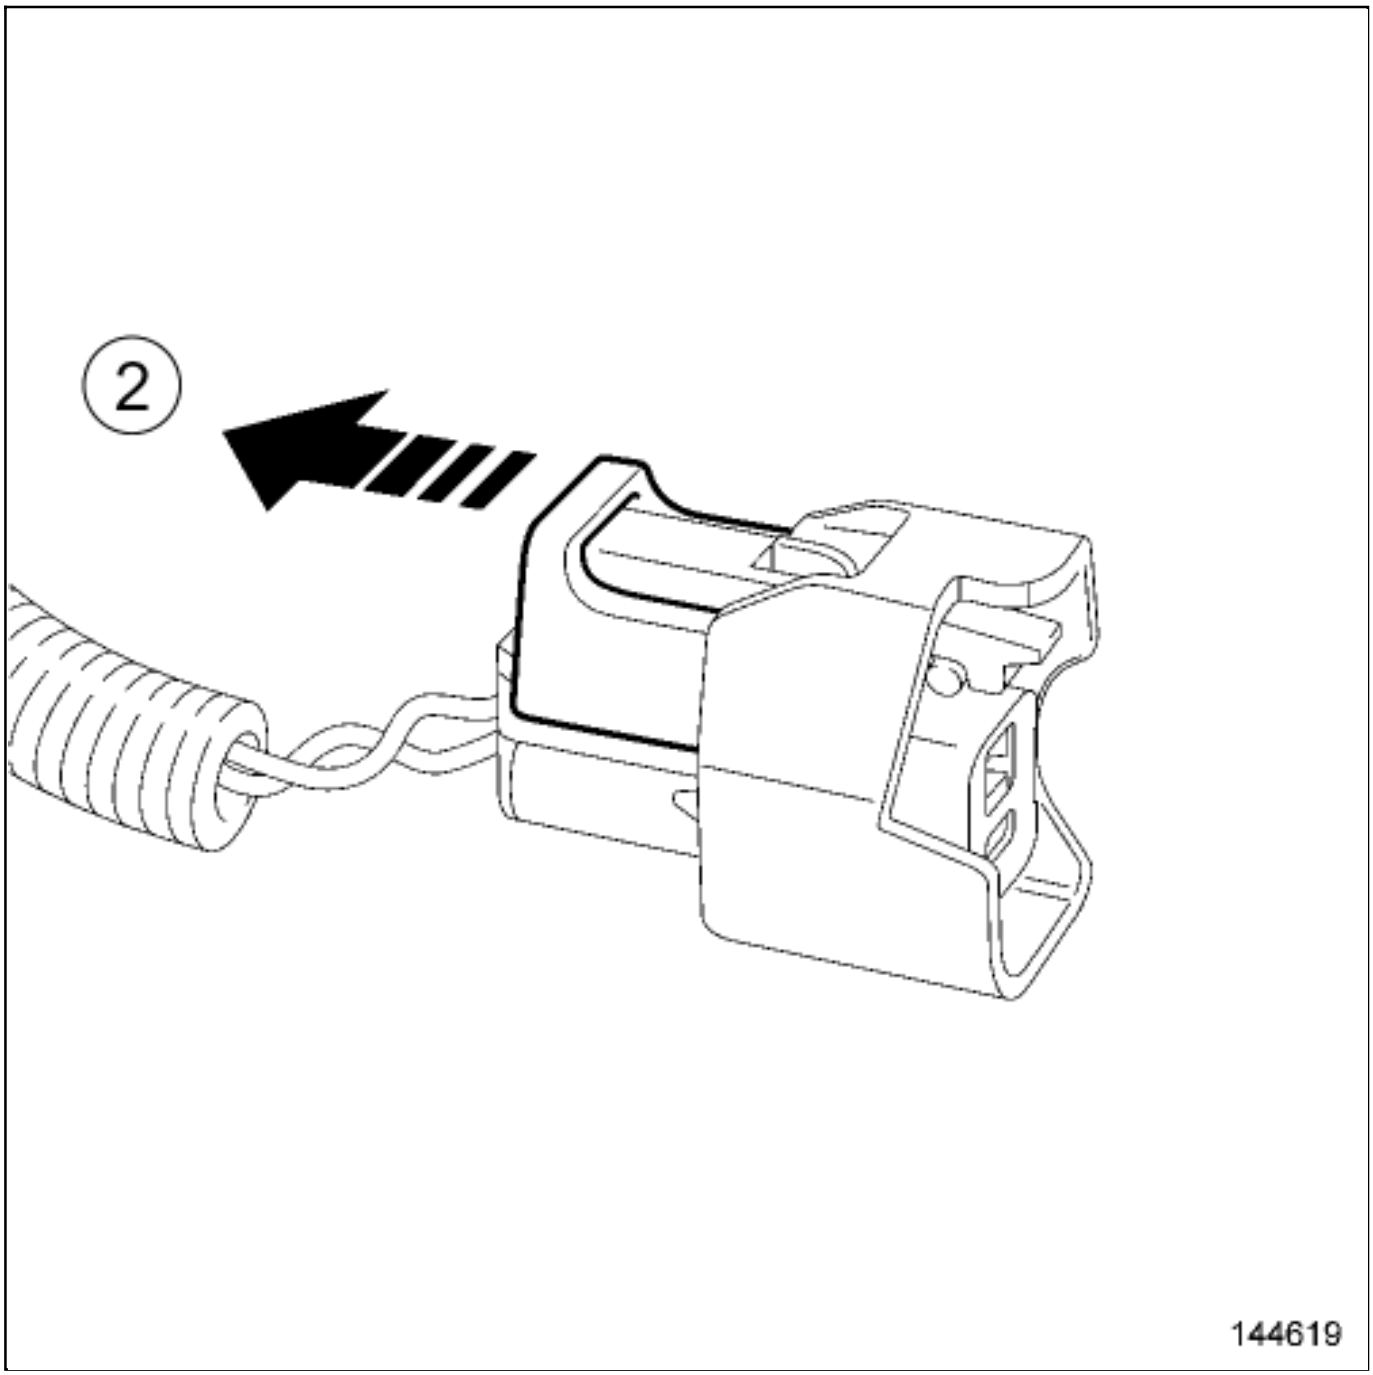
REMOVAL

1. REMOVAL PREPARATION OPERATION

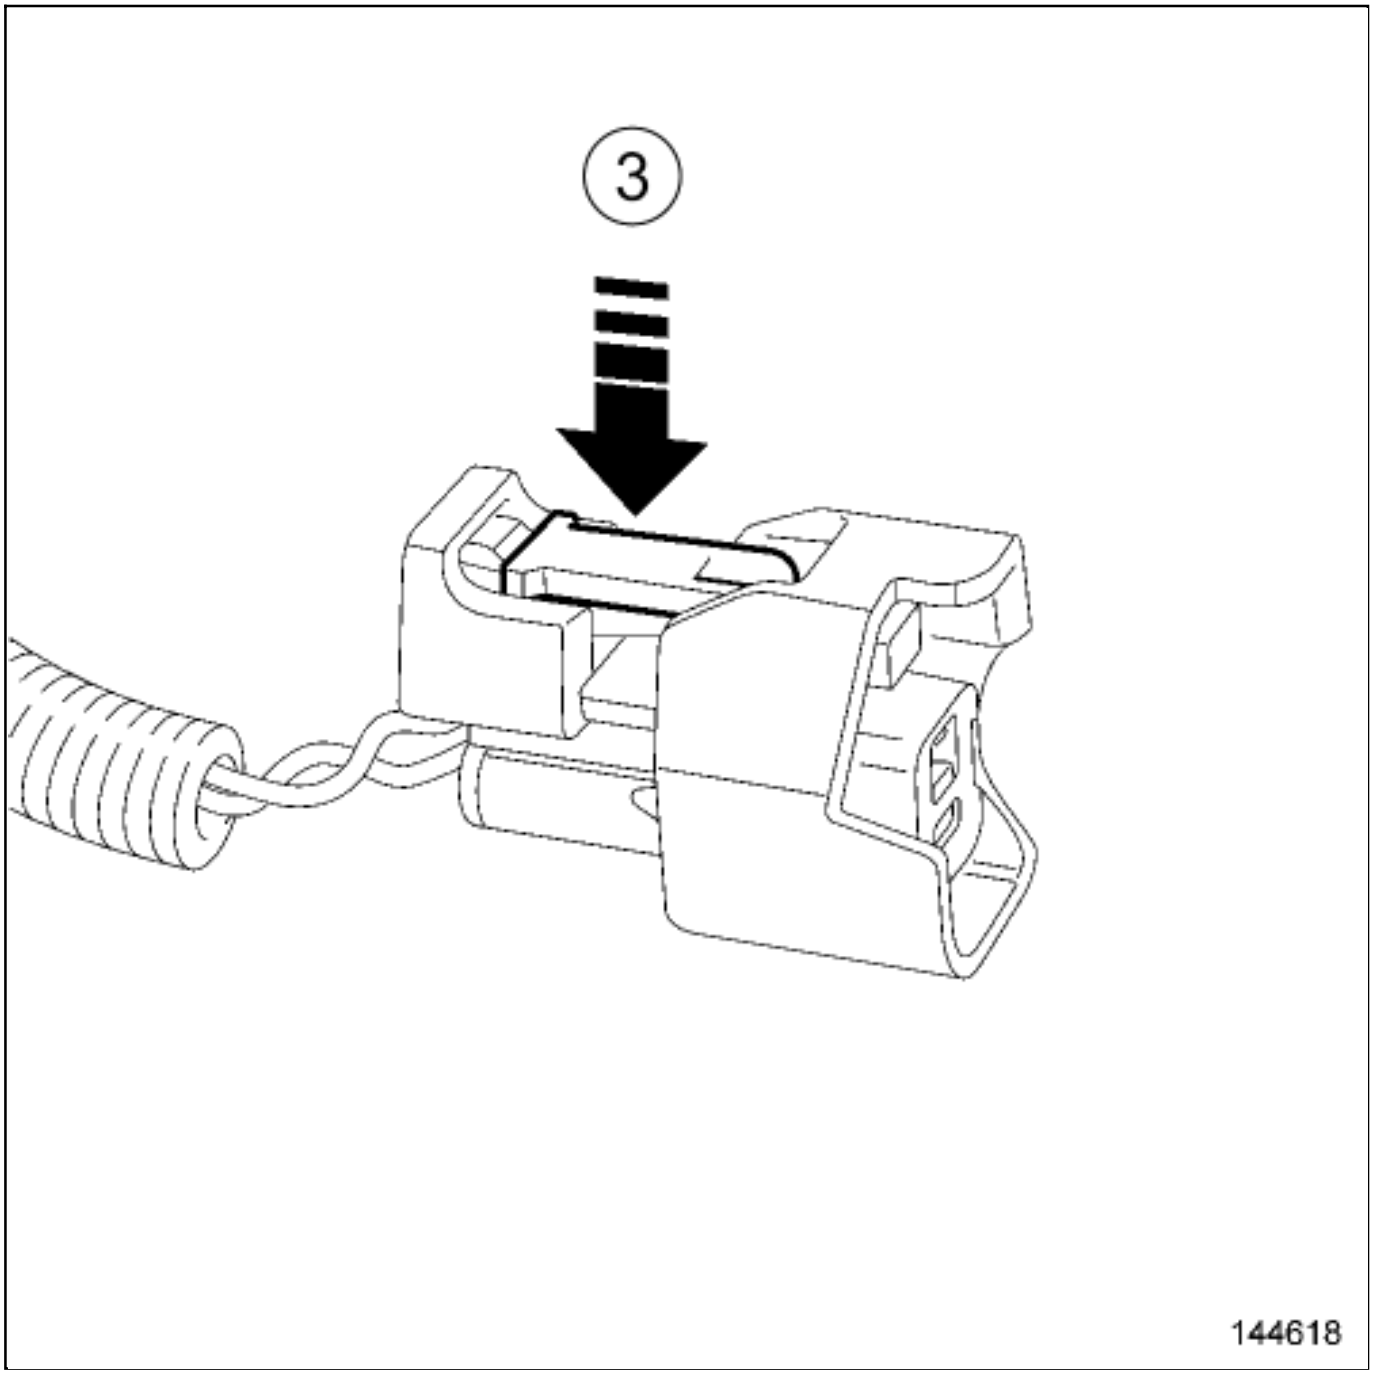
Position the vehicle on a two-post lift Vehicle: Towing and lifting .



Remove the front left-hand wheel Wheel: Removal - Refitting .



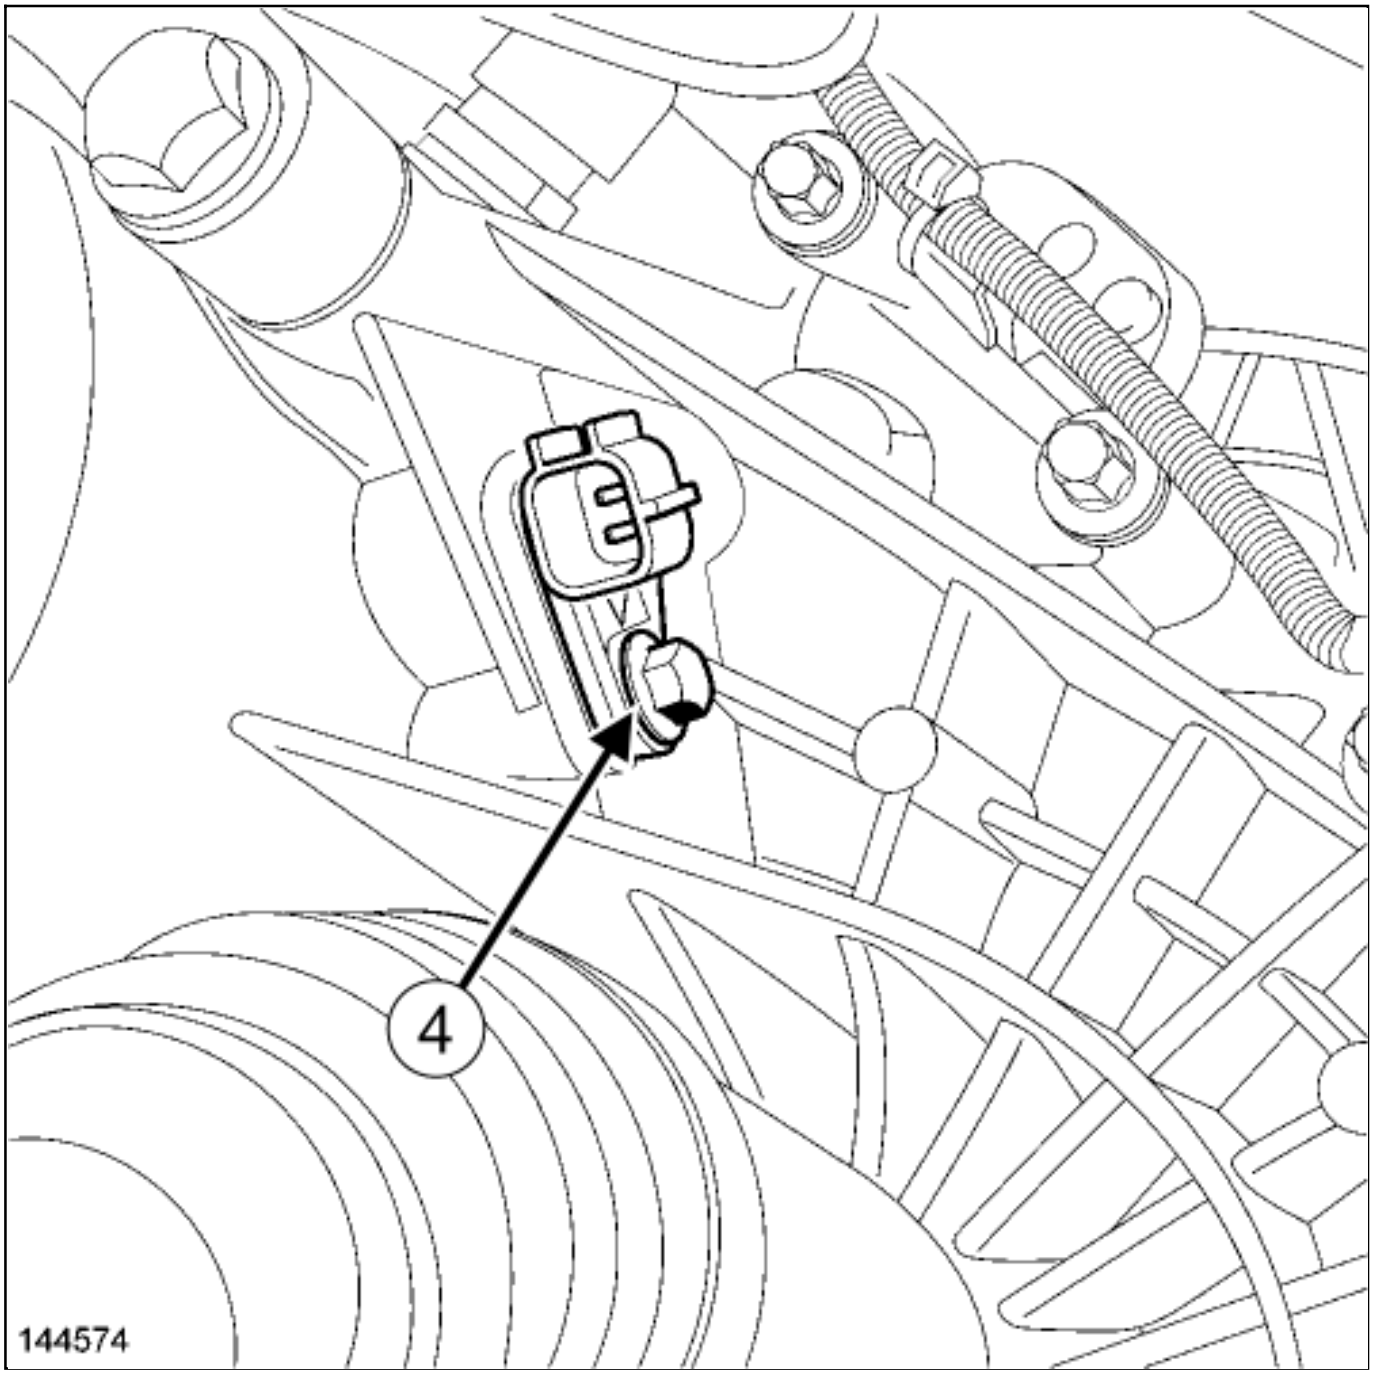
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



2
144619

Disconnect the connector(1) of the automatic gearbox third gear speed sensor by:

- unlocking the connector locking system(2) ,
- pressing the tab(3) and pulling the connector.

Remove:

- the bolt(4) of the automatic gearbox third gear speed sensor,
- the automatic gearbox third gear speed sensor.

Note:

The shaft speed sensor for third gear has a 4 mmthick shim that determines the sensor position in relation to the teeth.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox third gear speed sensor.
- Always replace the seal of the automatic gearbox third gear speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox third gear speed sensor.
- Torque tighten the bolt of the automatic gearbox third gear speed sensor9 N.m.
- Connect the connector of the automatic gearbox third gear speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

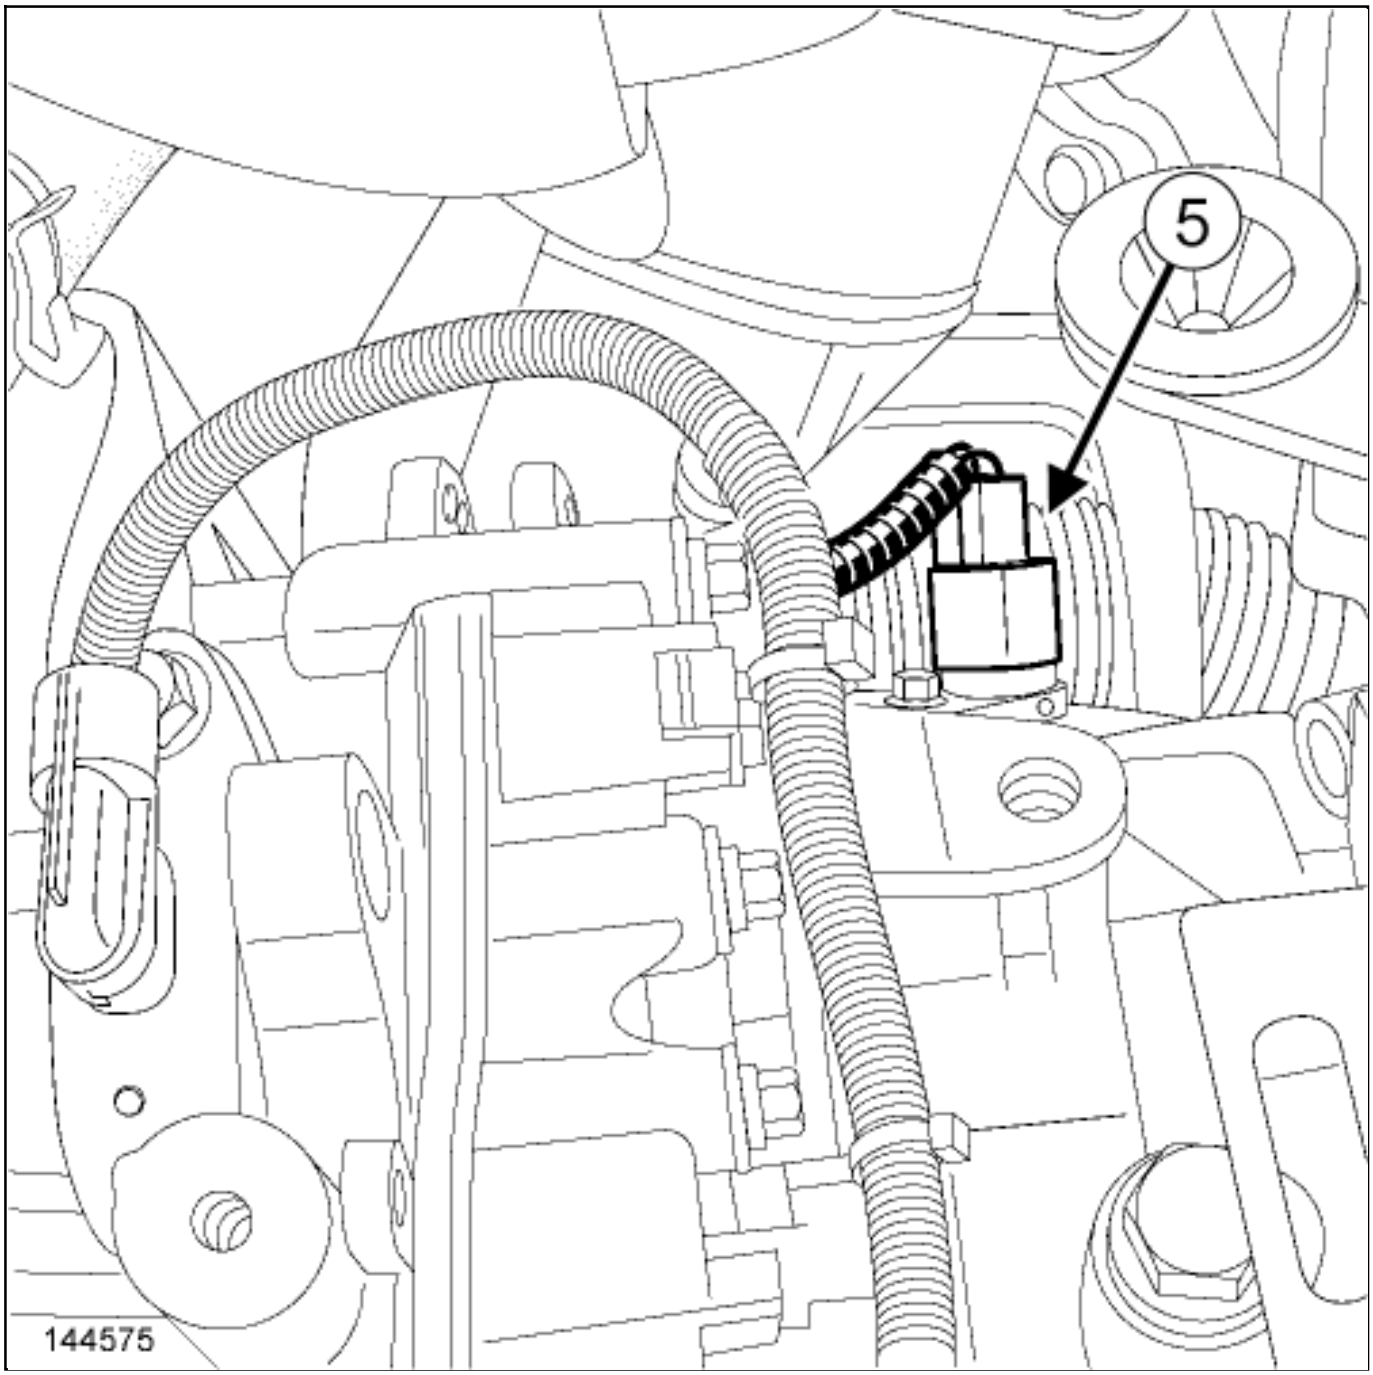
carry out the operations described in the "After repair procedure" section.

REMOVAL

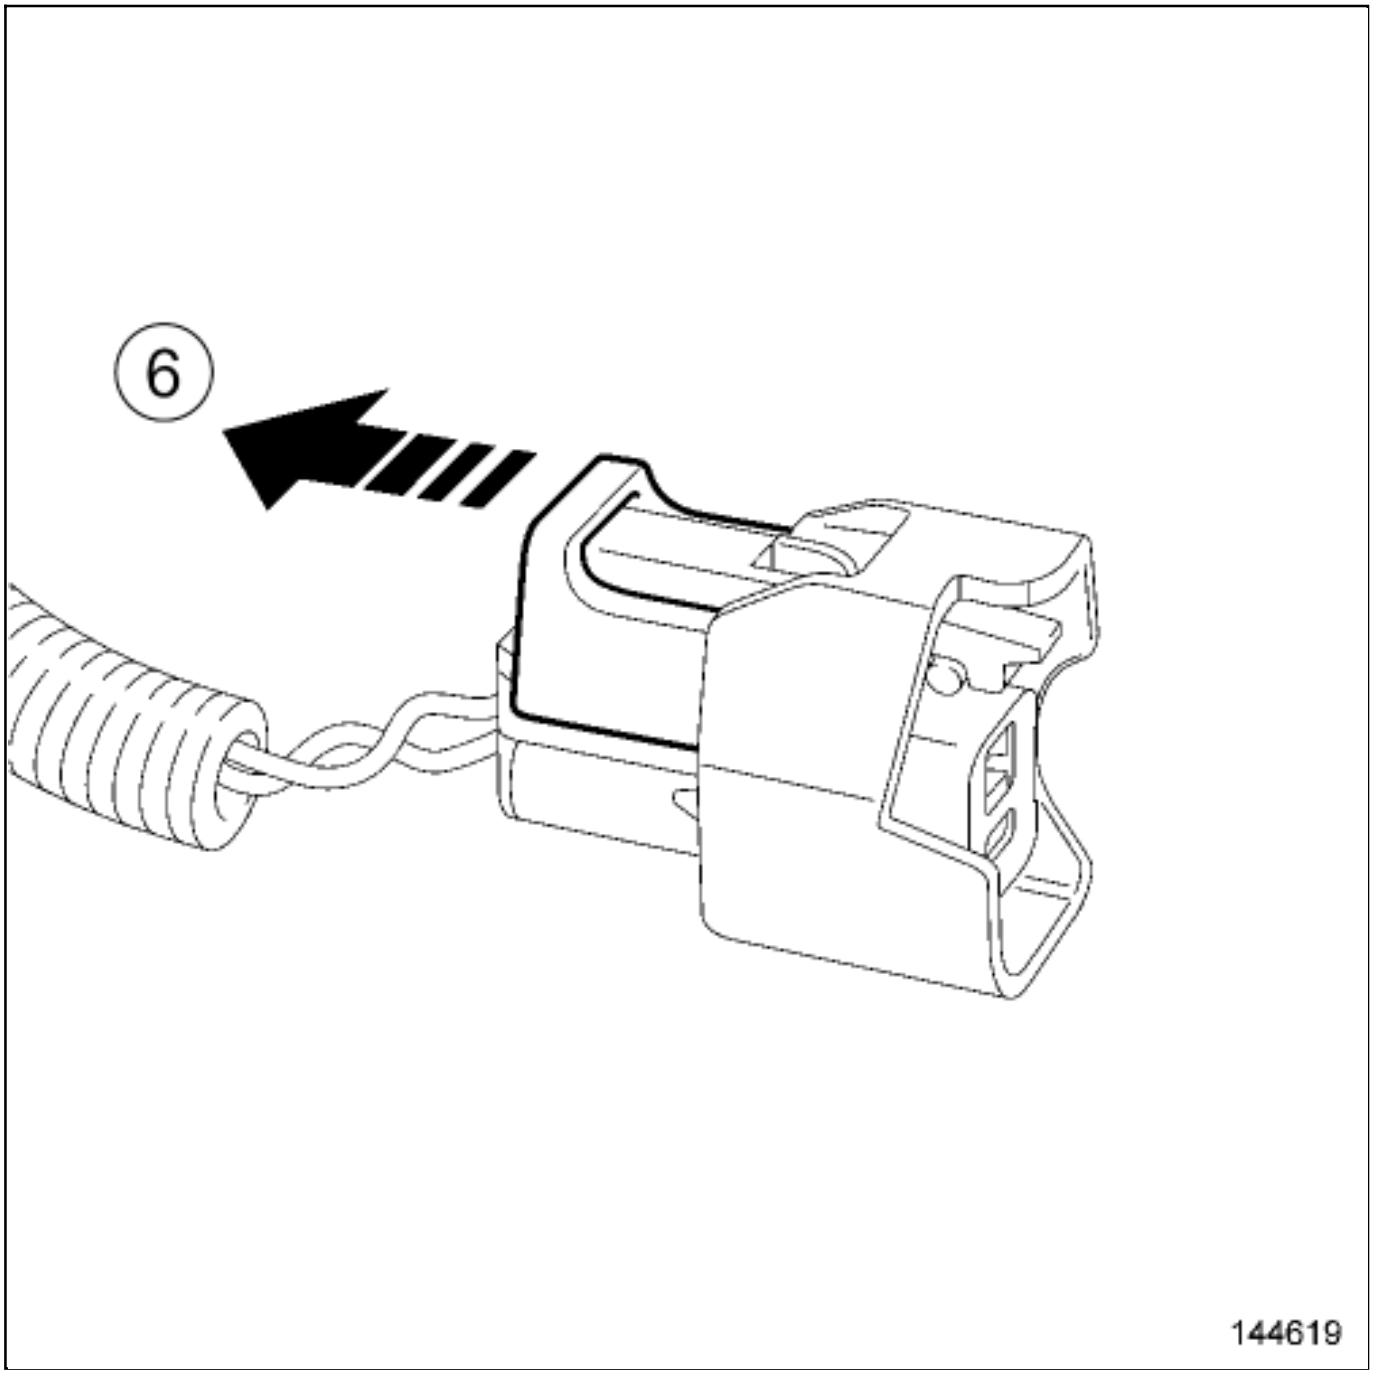
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

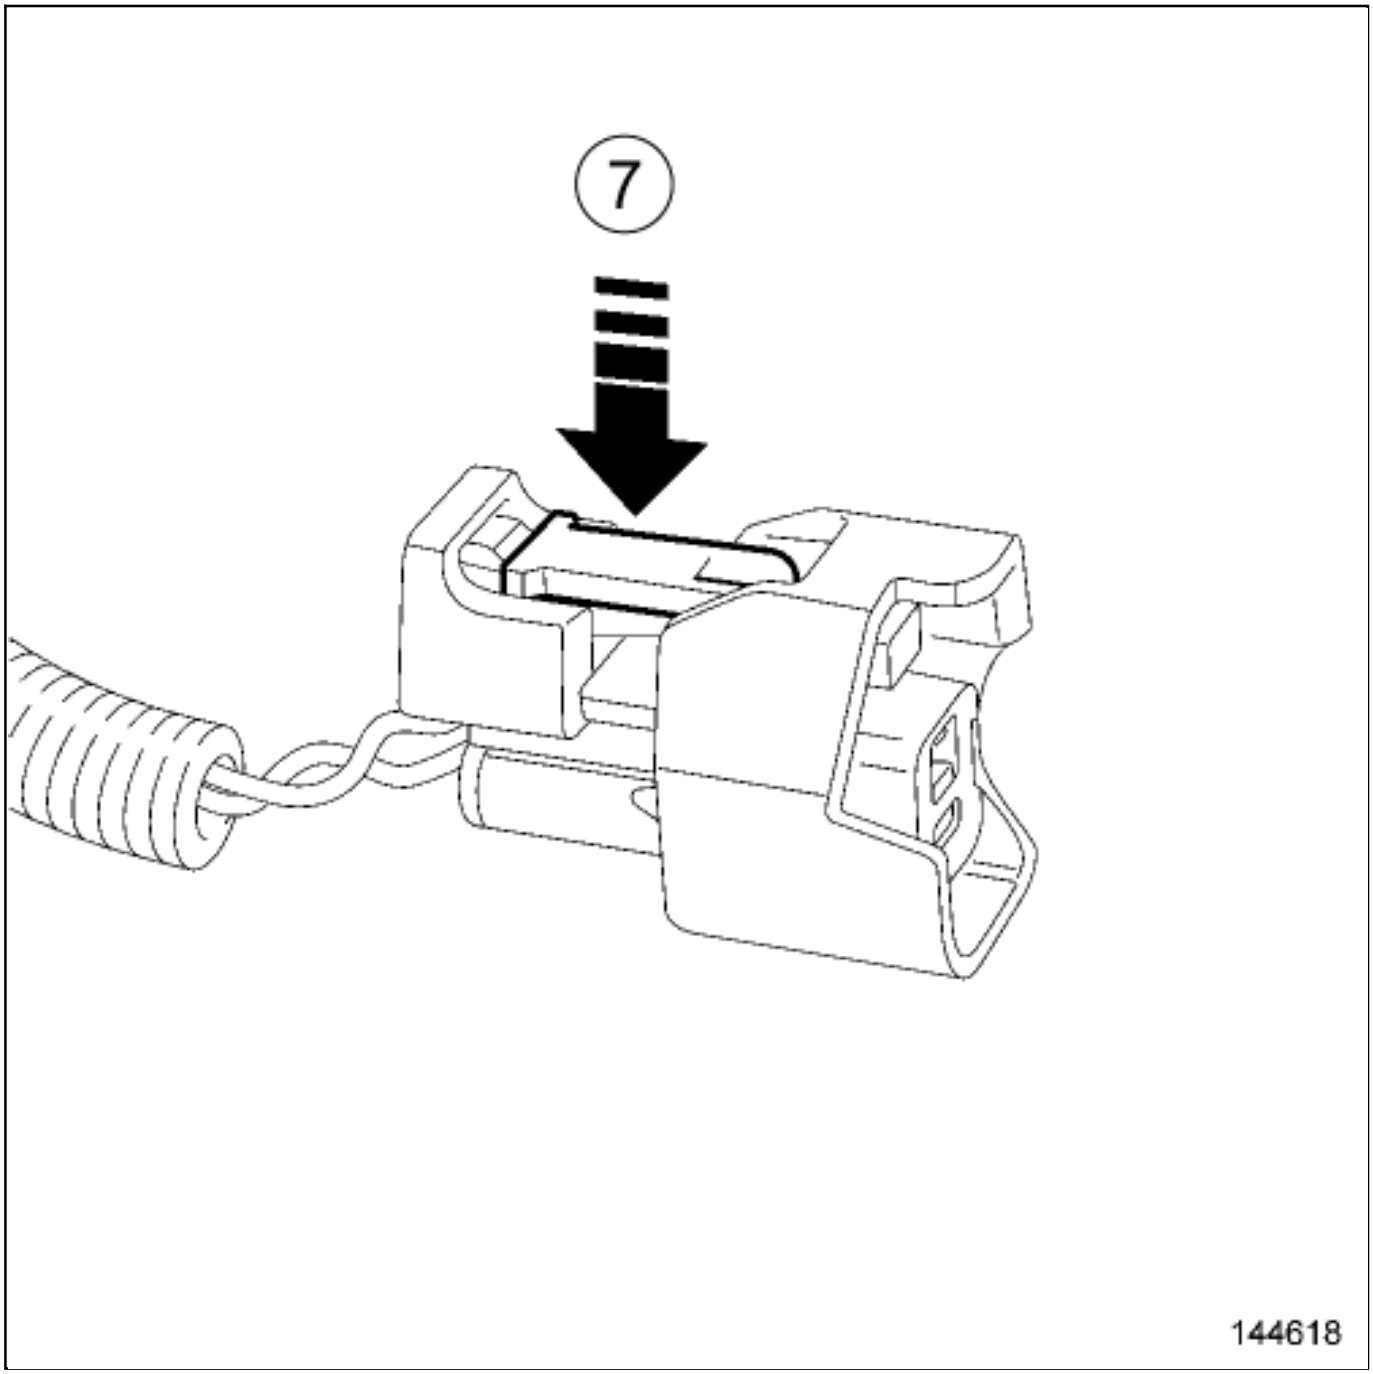
Remove the front left-hand wheelWheel: Removal - Refitting .



2. REMOVAL OPERATION



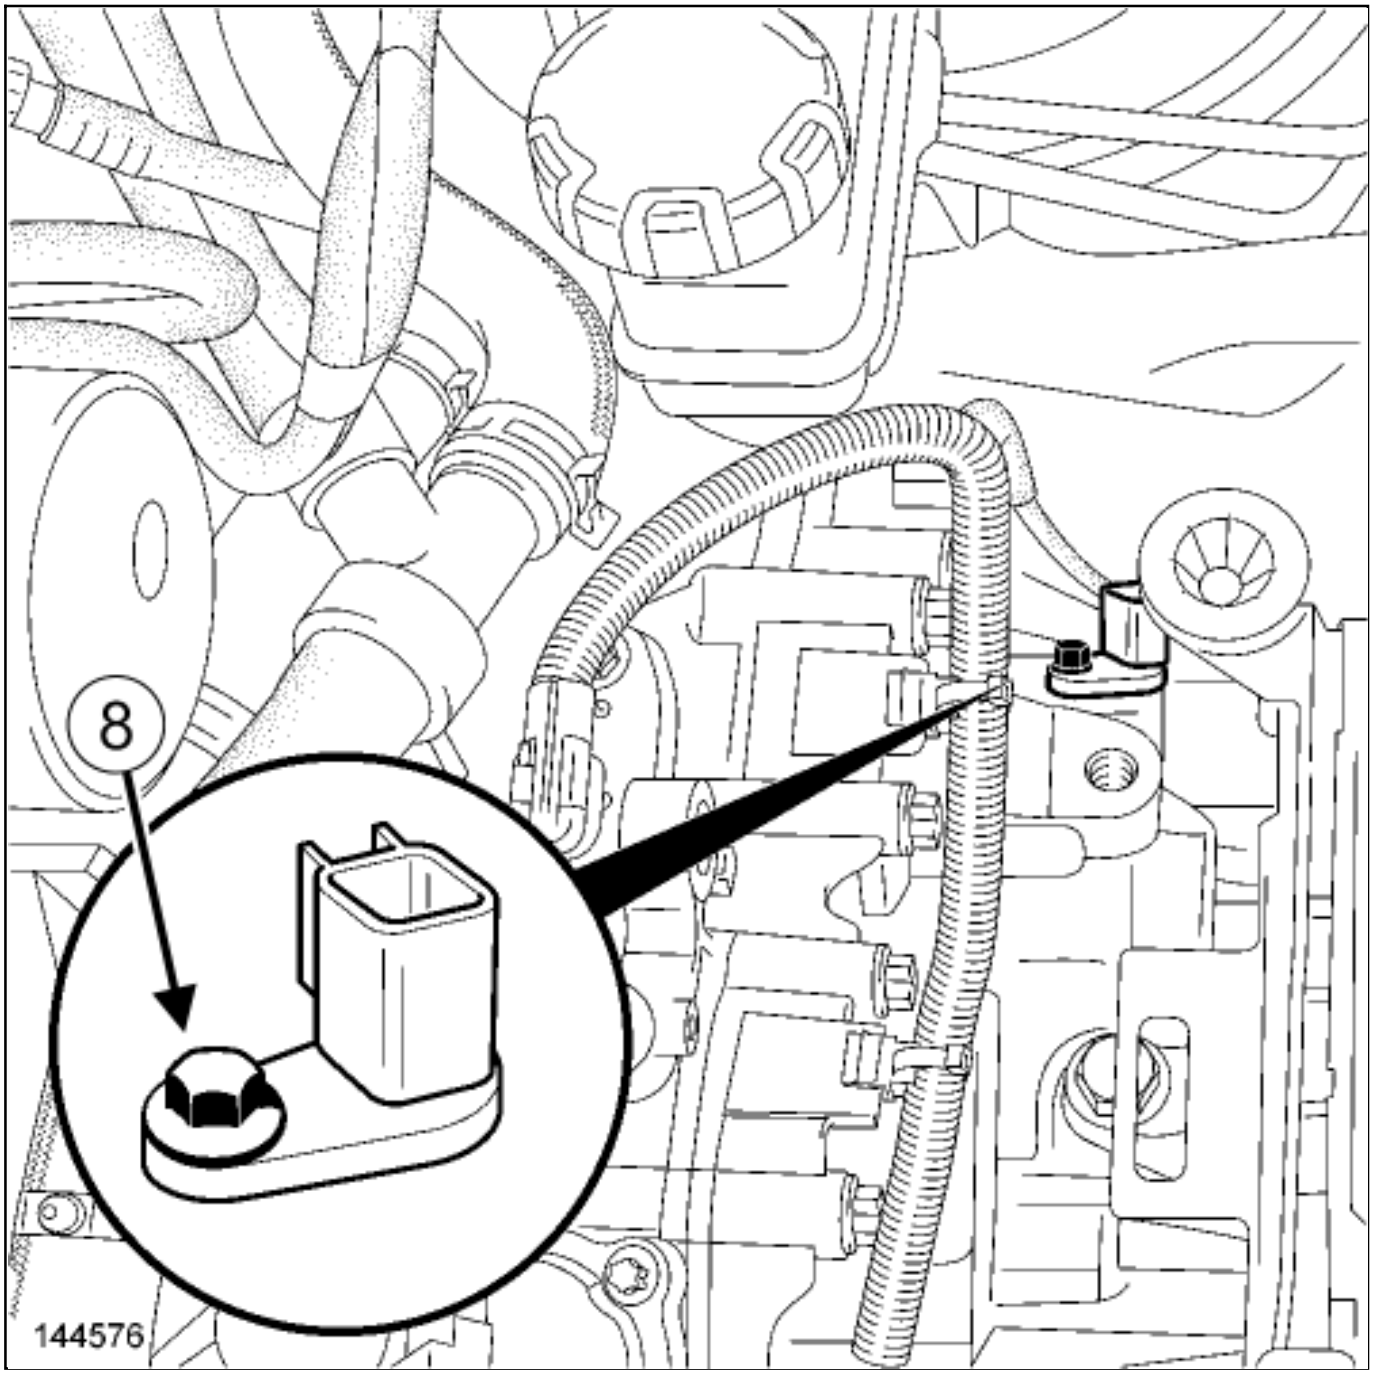
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



6
144619

Disconnect the connector(5) of the automatic gearbox fourth gear speed sensor by:

- unlocking the connector locking system(6) ,
- pressing the tab(7) and pulling the connector.

Remove:

- the bolt(8) of the automatic gearbox fourth gear speed sensor,
- the automatic gearbox fourth gear speed sensor.

Note:

The engine speed sensor for fourth gear has a 2 mmthick shim that determines the sensor position in relation to the teeth.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox fourth gear speed sensor.
- Always replace the seal of the automatic gearbox fourth gear speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox fourth gear speed sensor.
- Torque tighten the bolt of the automatic gearbox fourth gear speed sensor9 N.m.
- Connect the connector of the automatic gearbox fourth gear speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

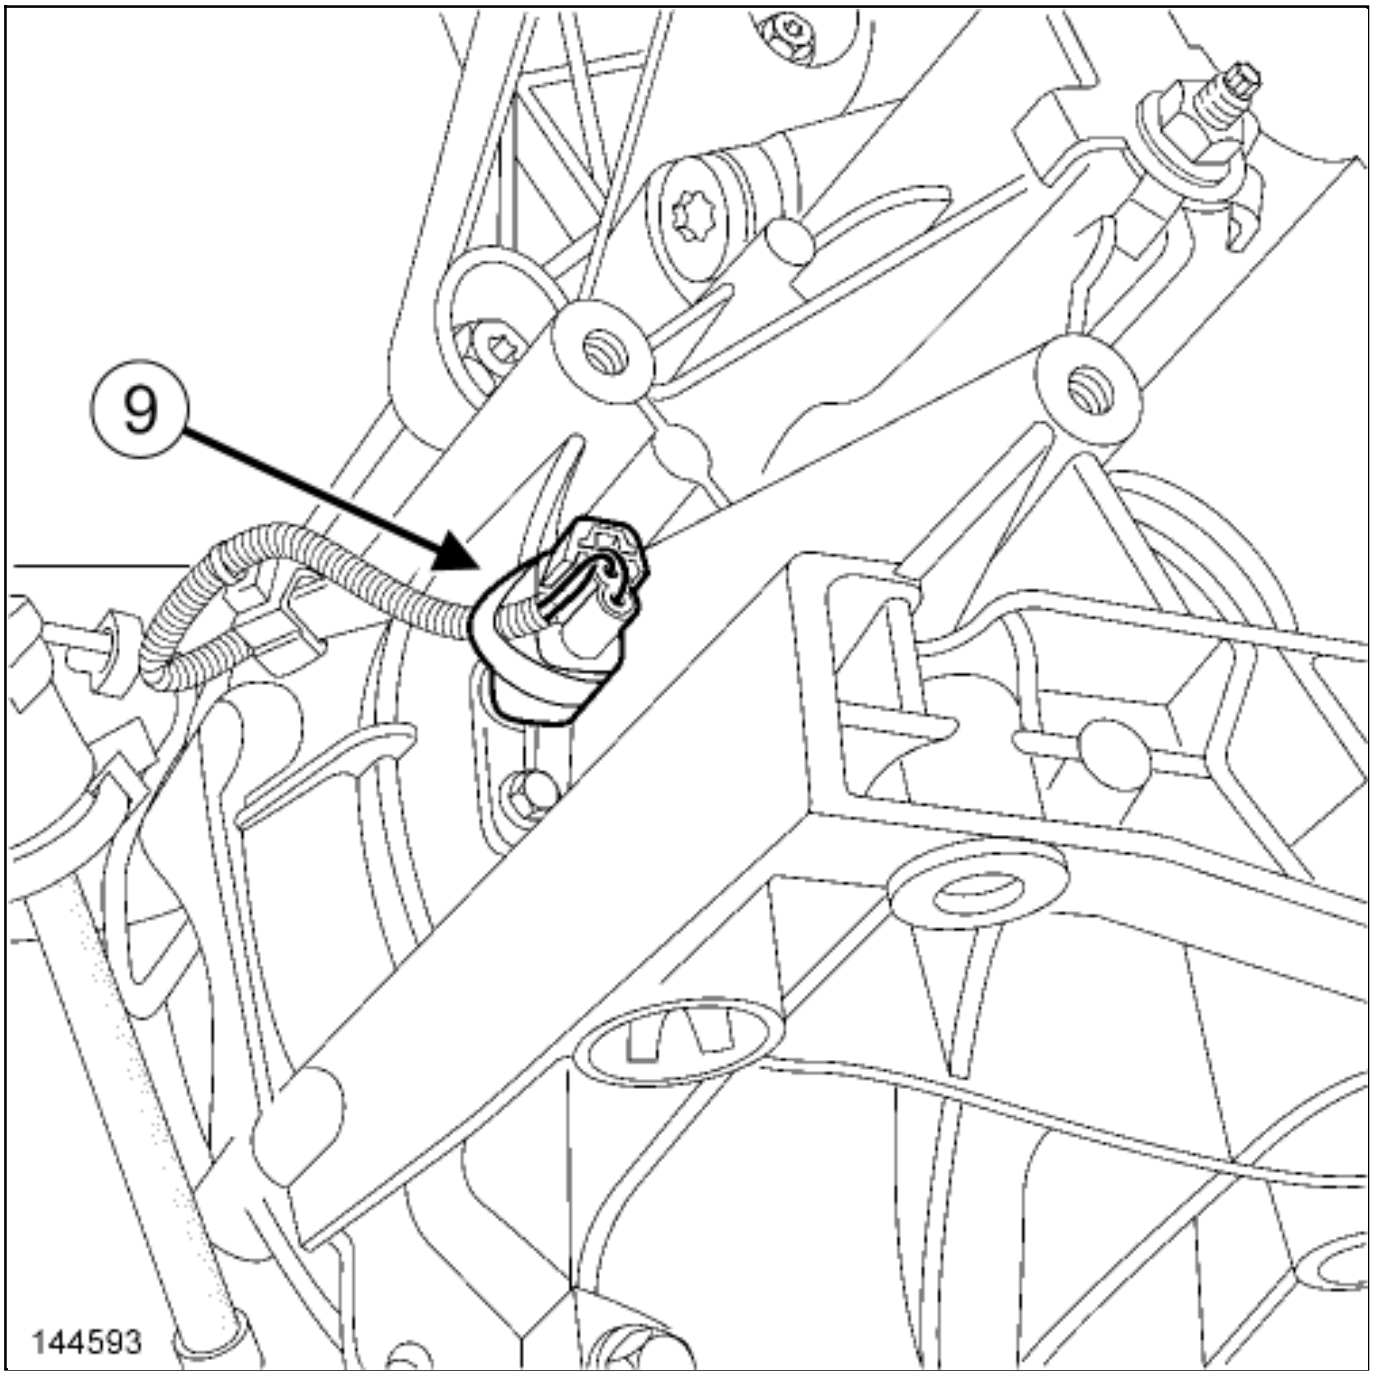
carry out the operations described in the "After repair procedure" section.

REMOVAL

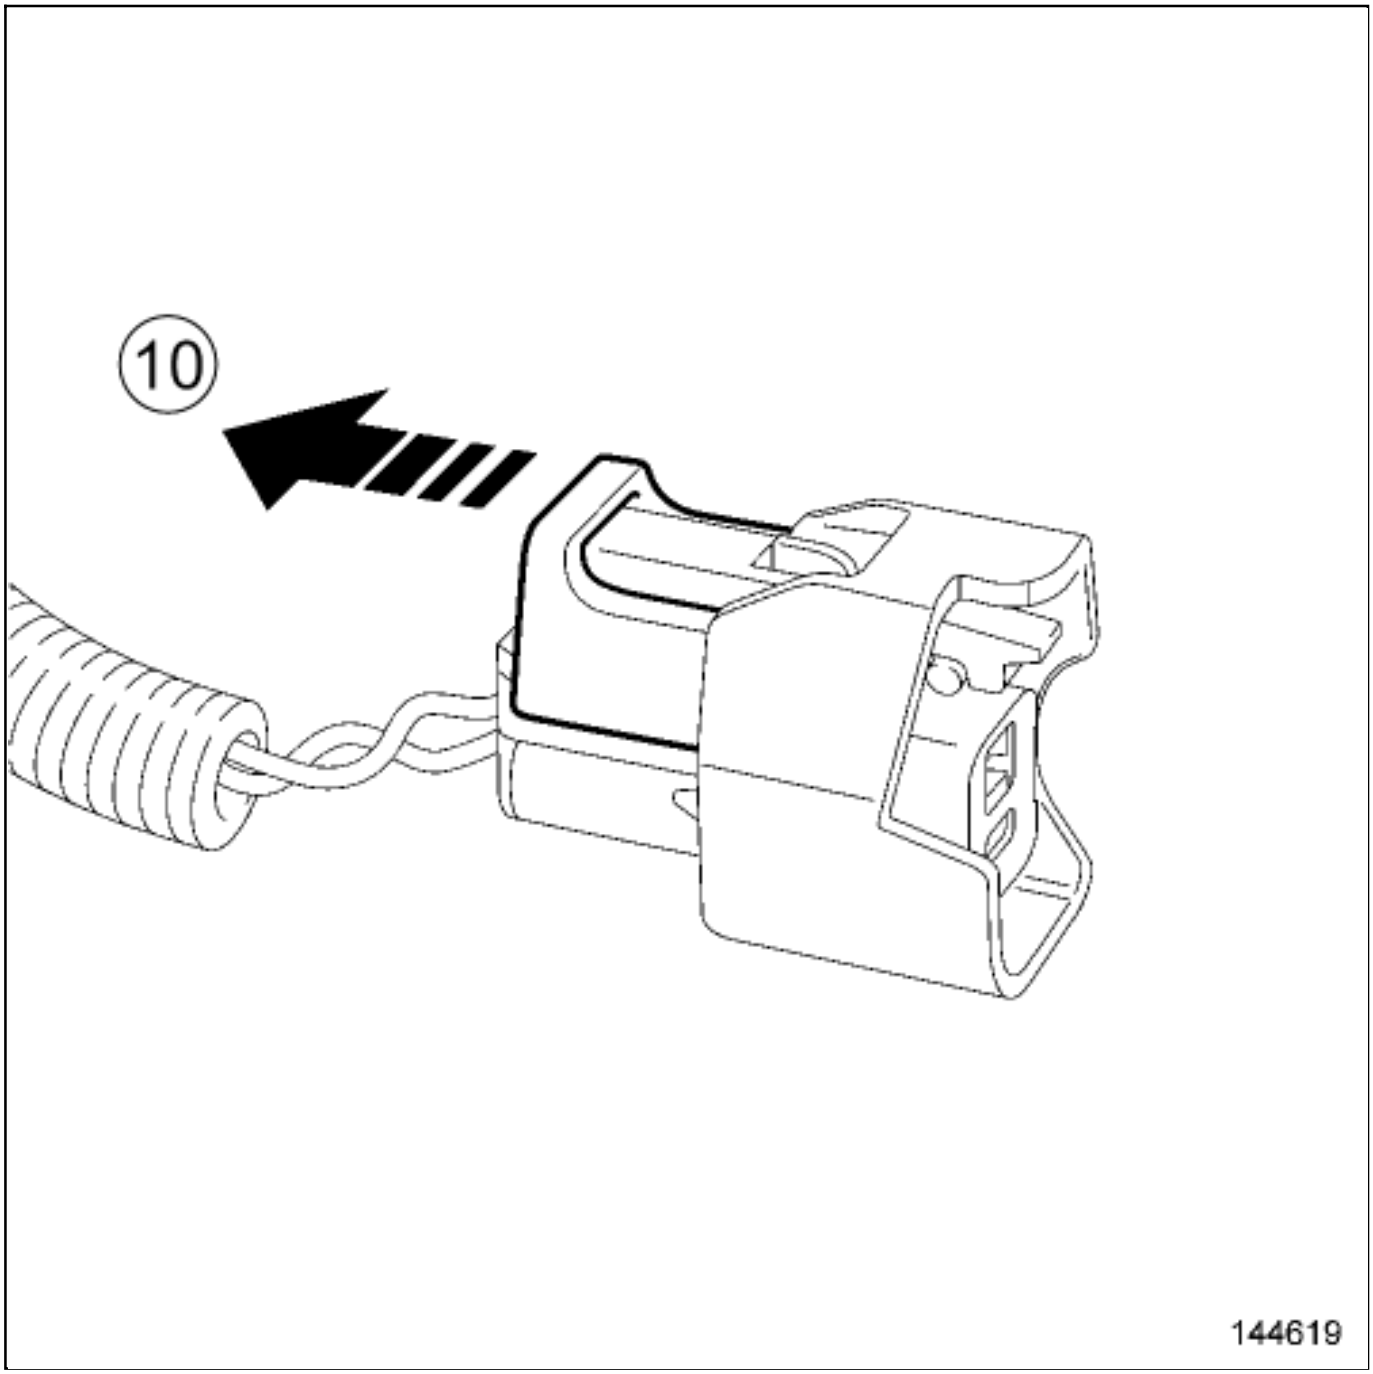
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

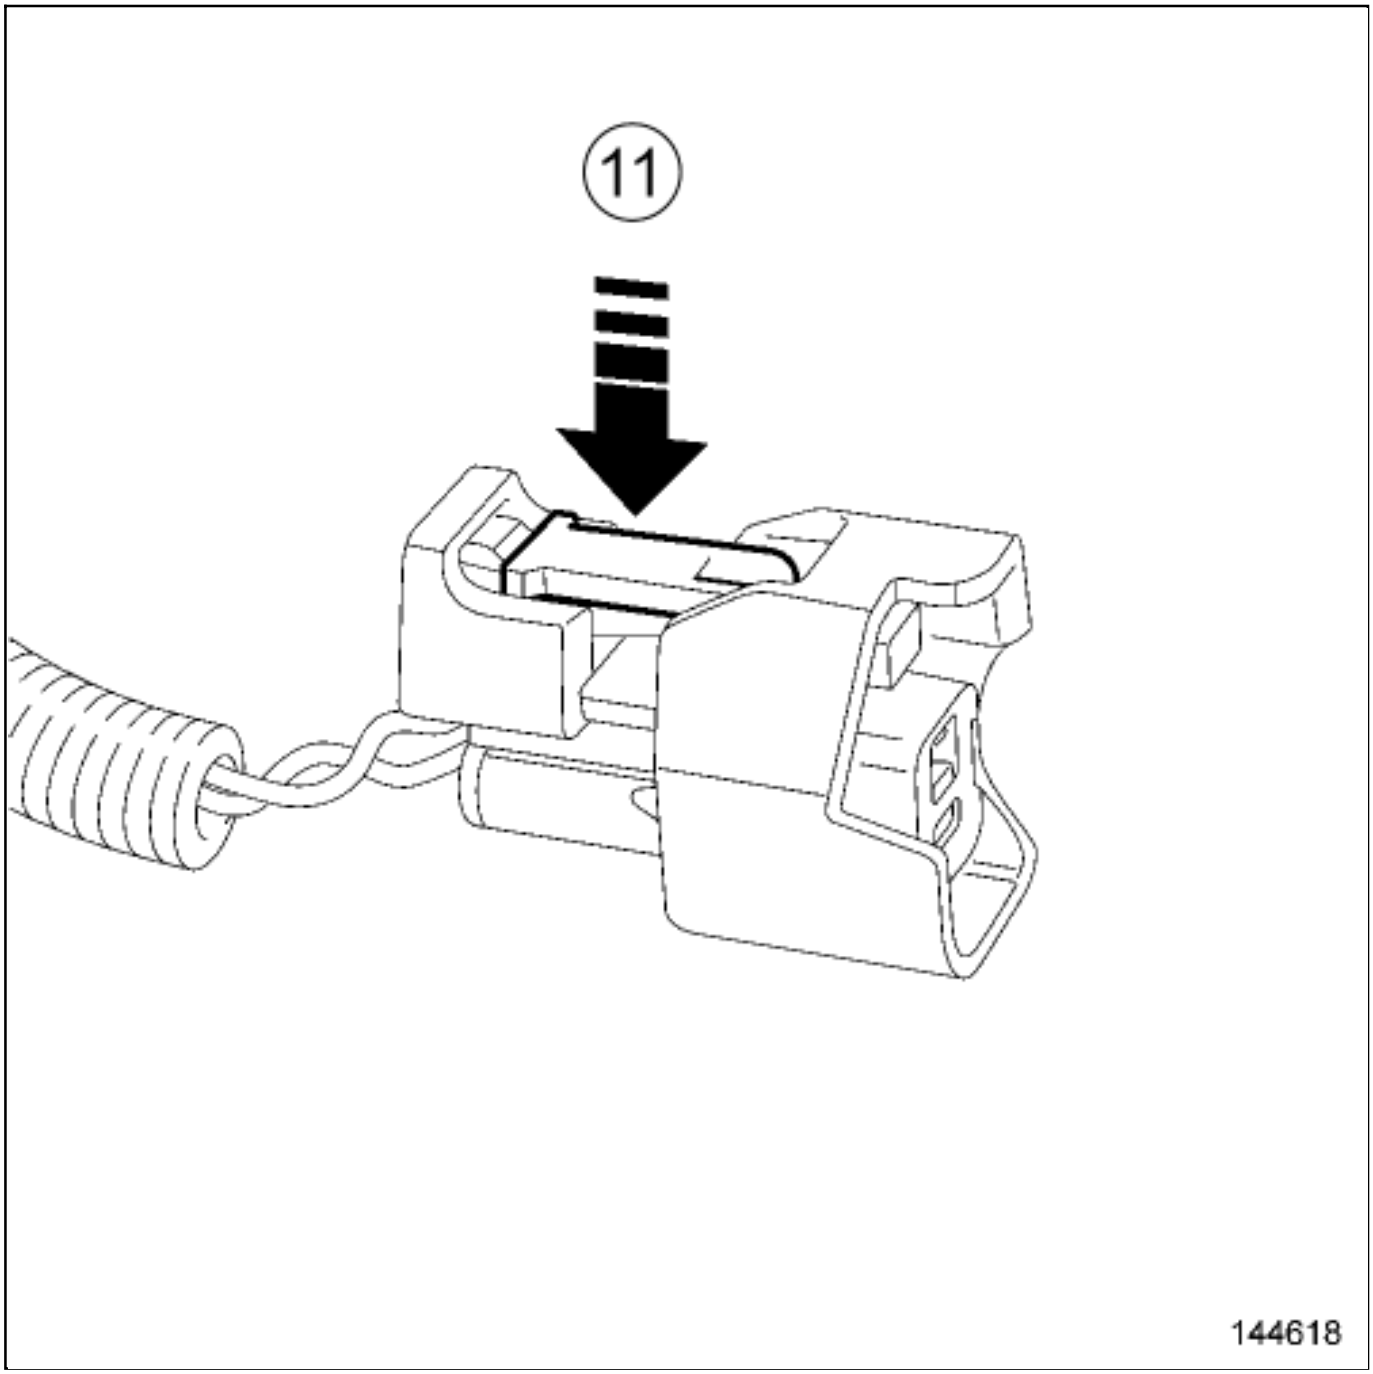
Remove the engine undertray.



2. REMOVAL OPERATION



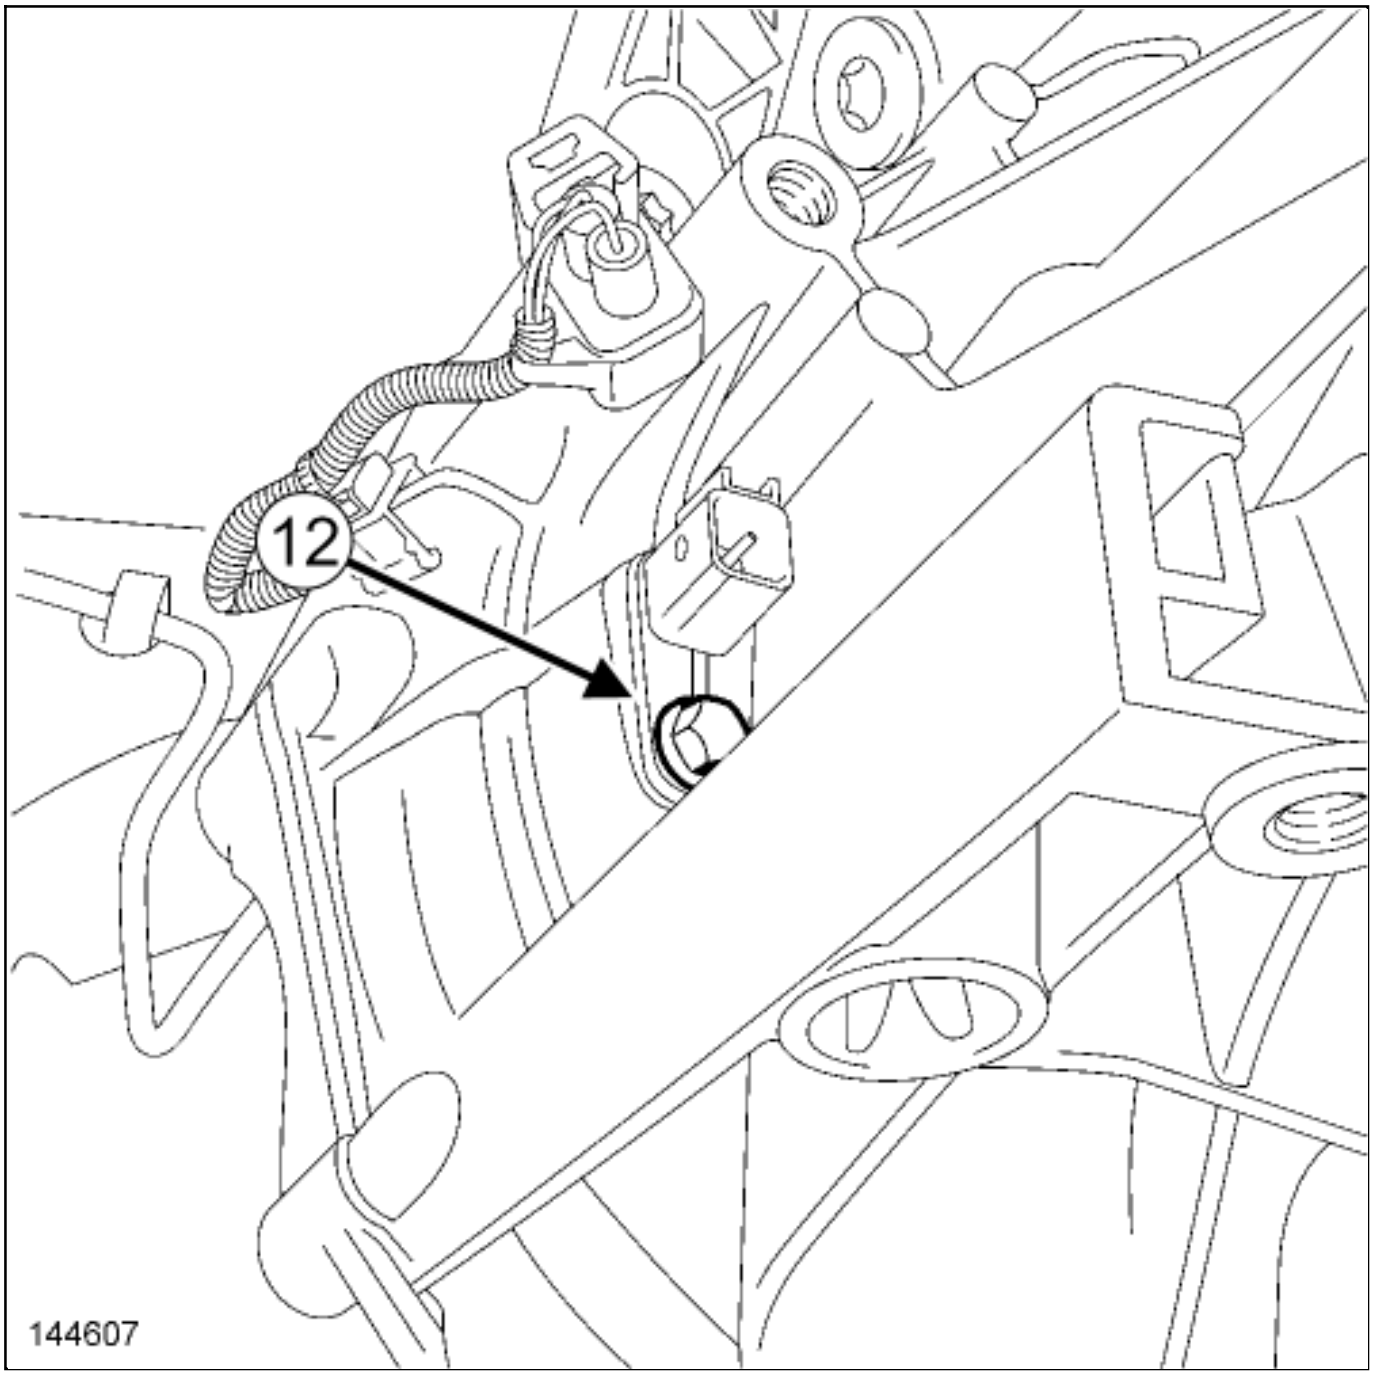
Note:



The connectors have a locking system.

CAUTION

Failure to observe the following procedure could damage the connector.



10
144619

Disconnect the connector(9) of the automatic gearbox differential speed sensor by:

- unlocking the connector locking system(10) ,
- pressing the tab(11) and pulling the connector.

Fit an oil recovery trayfor the outflow of gearbox oil.

Remove:

- the bolt(12) of the automatic gearbox differential speed sensor,
- the automatic gearbox differential speed sensor.

Note:

There is no shim for the differential speed sensor.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint face of:
  - the gearbox casing,
  - the automatic gearbox differential speed sensor.
- Always replace the seal of the automatic gearbox differential speed sensor.

2. REFITTING OPERATION

- Refit the automatic gearbox differential speed sensor.
- Torque tighten the bolt of the automatic gearbox differential speed sensor9 N.m.
- Connect the connector of the automatic gearbox differential speed sensor.
- Reclip the connector lock.
- Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool:

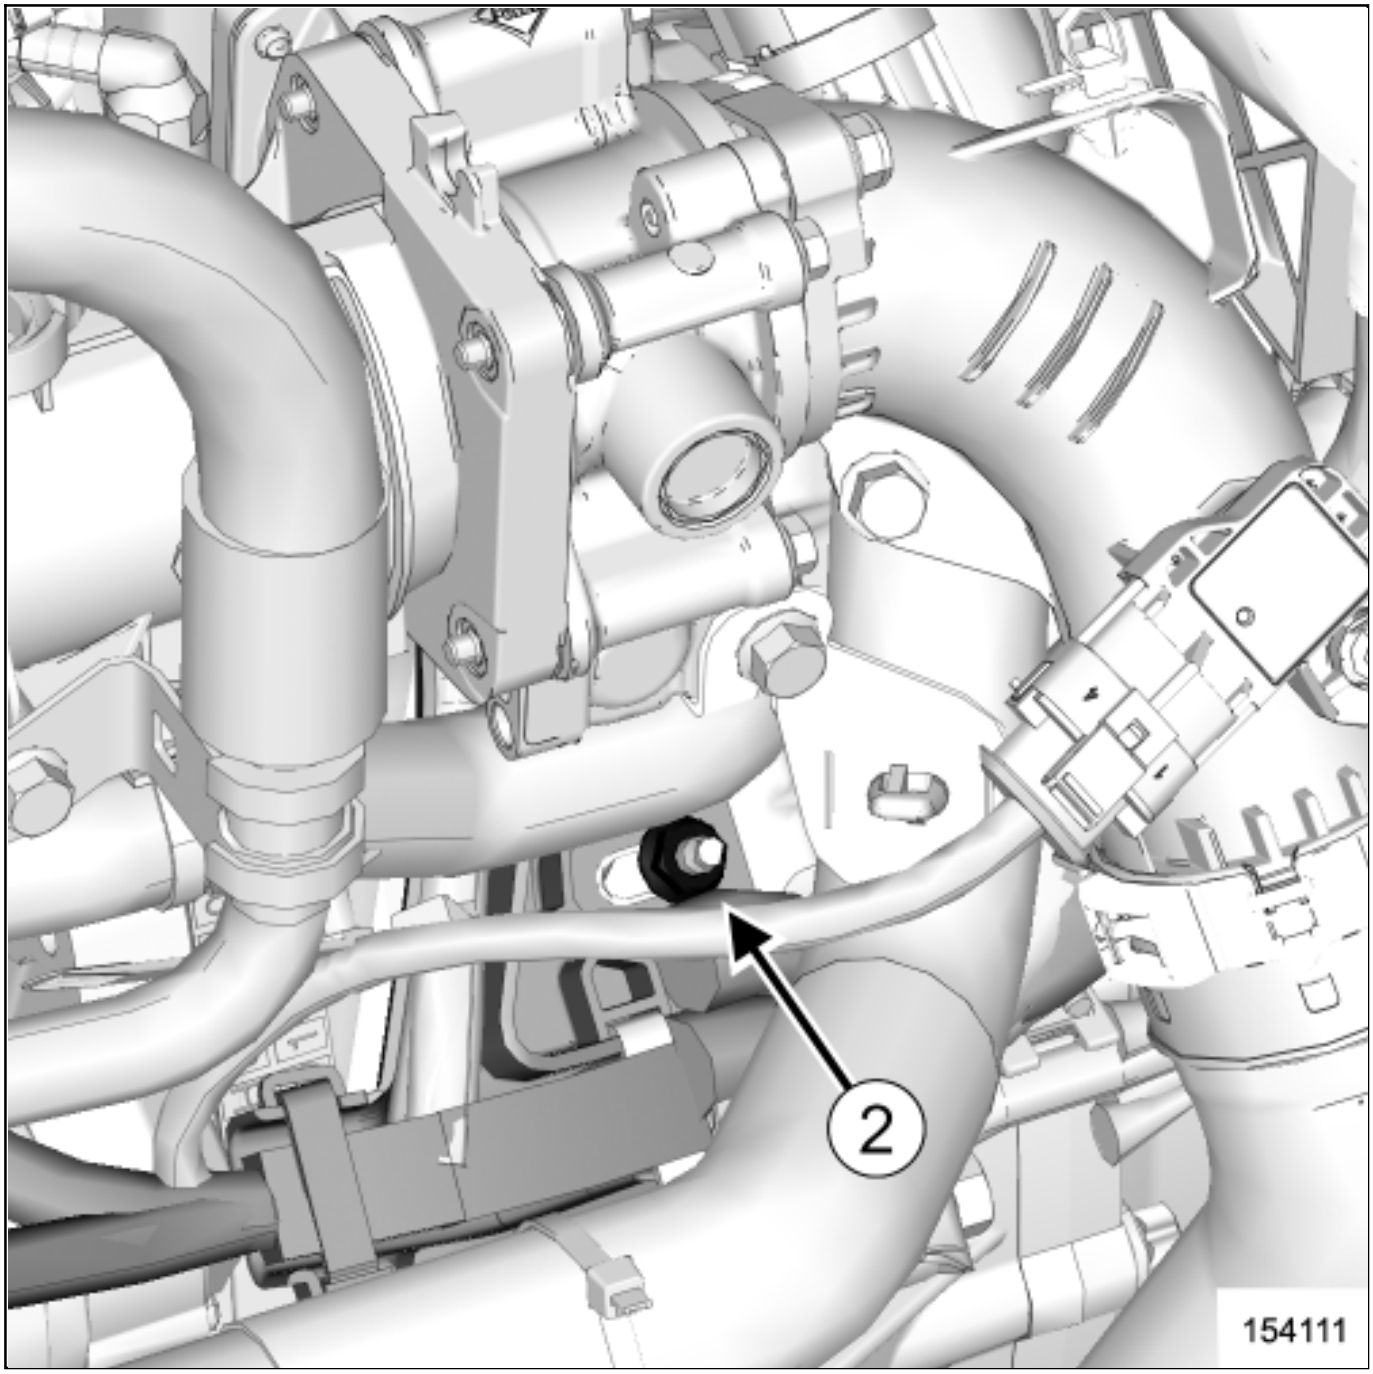
- connect the Diagnostic tool,
- select "Automatic gearbox computer" ,
- go to repair mode,
- display the "before/after repair procedure" for the computer selected,
- select "Gearbox speed sensor" in the "List of components controlled by this computer" section,

carry out the operations described in the "After repair procedure" section.

STARTER: REMOVAL - REFITTING

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583

REMOVAL



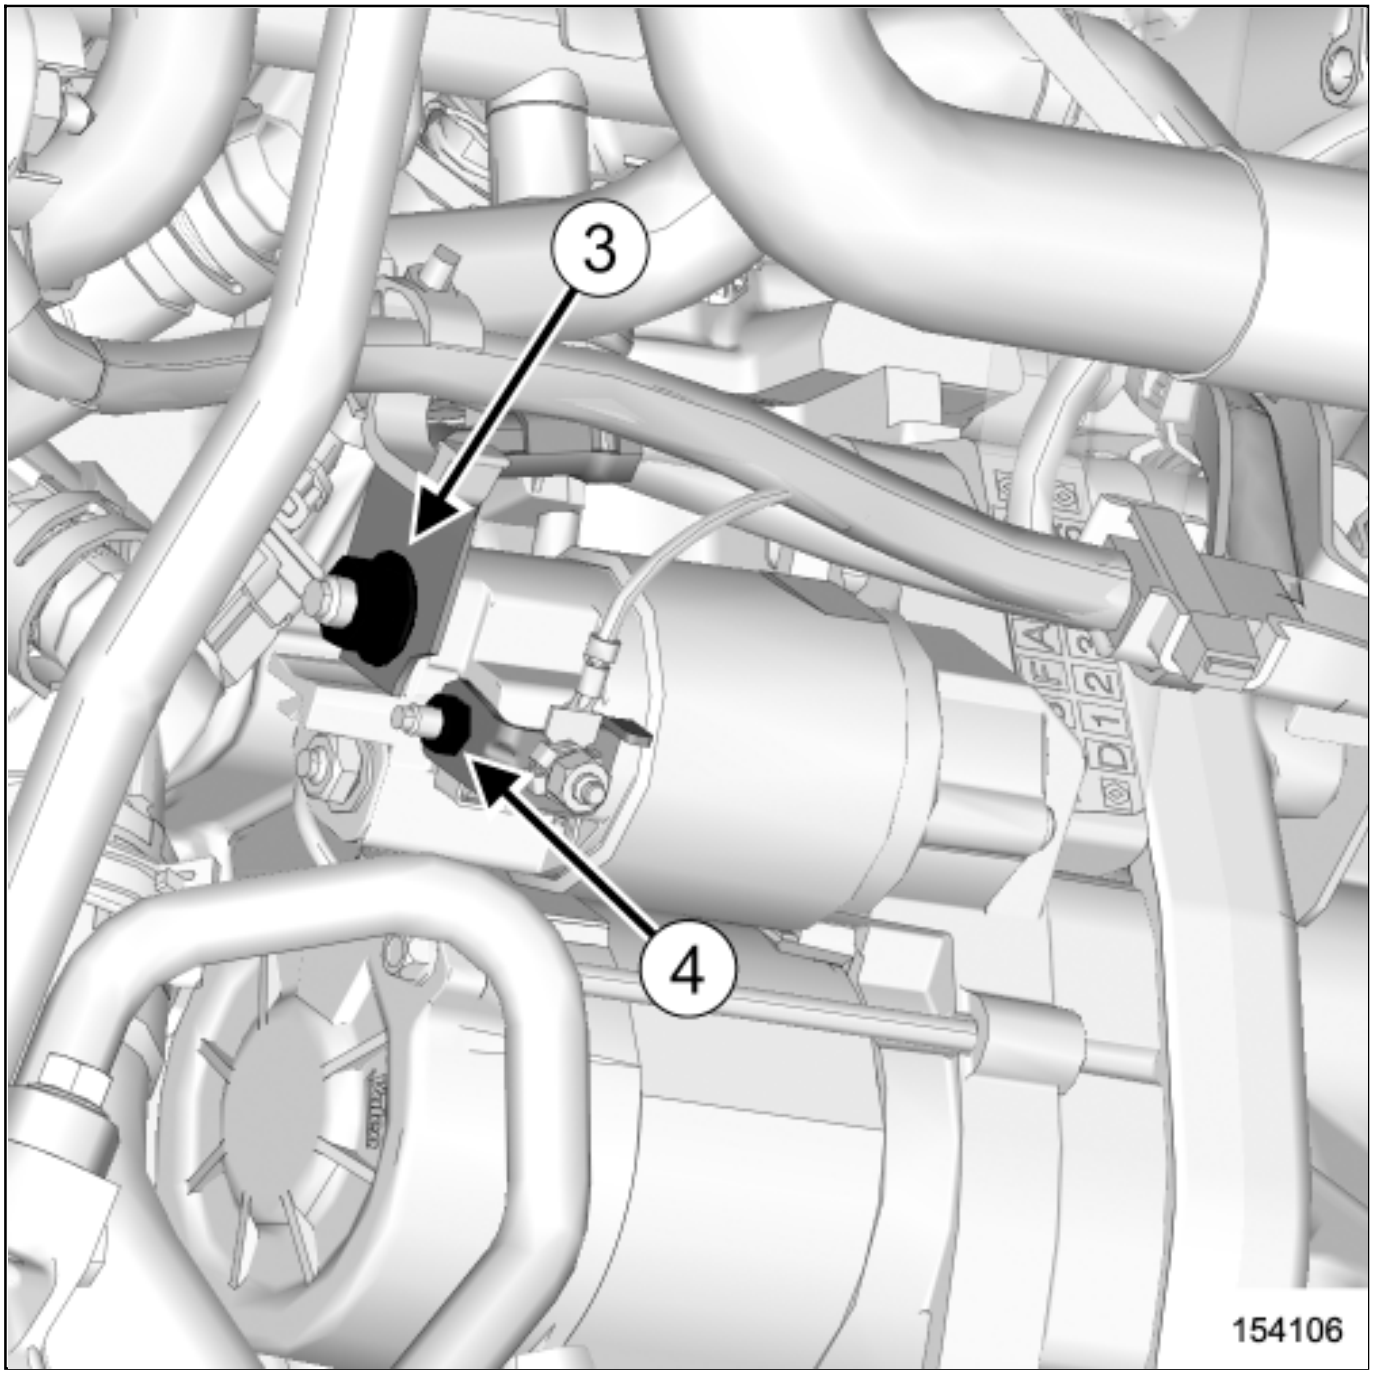
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift **Vehicle: Towing and lifting** .

Disconnect the battery **Battery: Removal - Refitting** .

Remove:

- the intercooler air inlet pipe **Air inlet assembly: Exploded view** ,
- the intercooler air outlet pipe **Air inlet assembly: Exploded view** ,
- the throttle valve **Air inlet assembly: Exploded view** ,
- the inlet distributor **Air inlet assembly: Exploded view** .



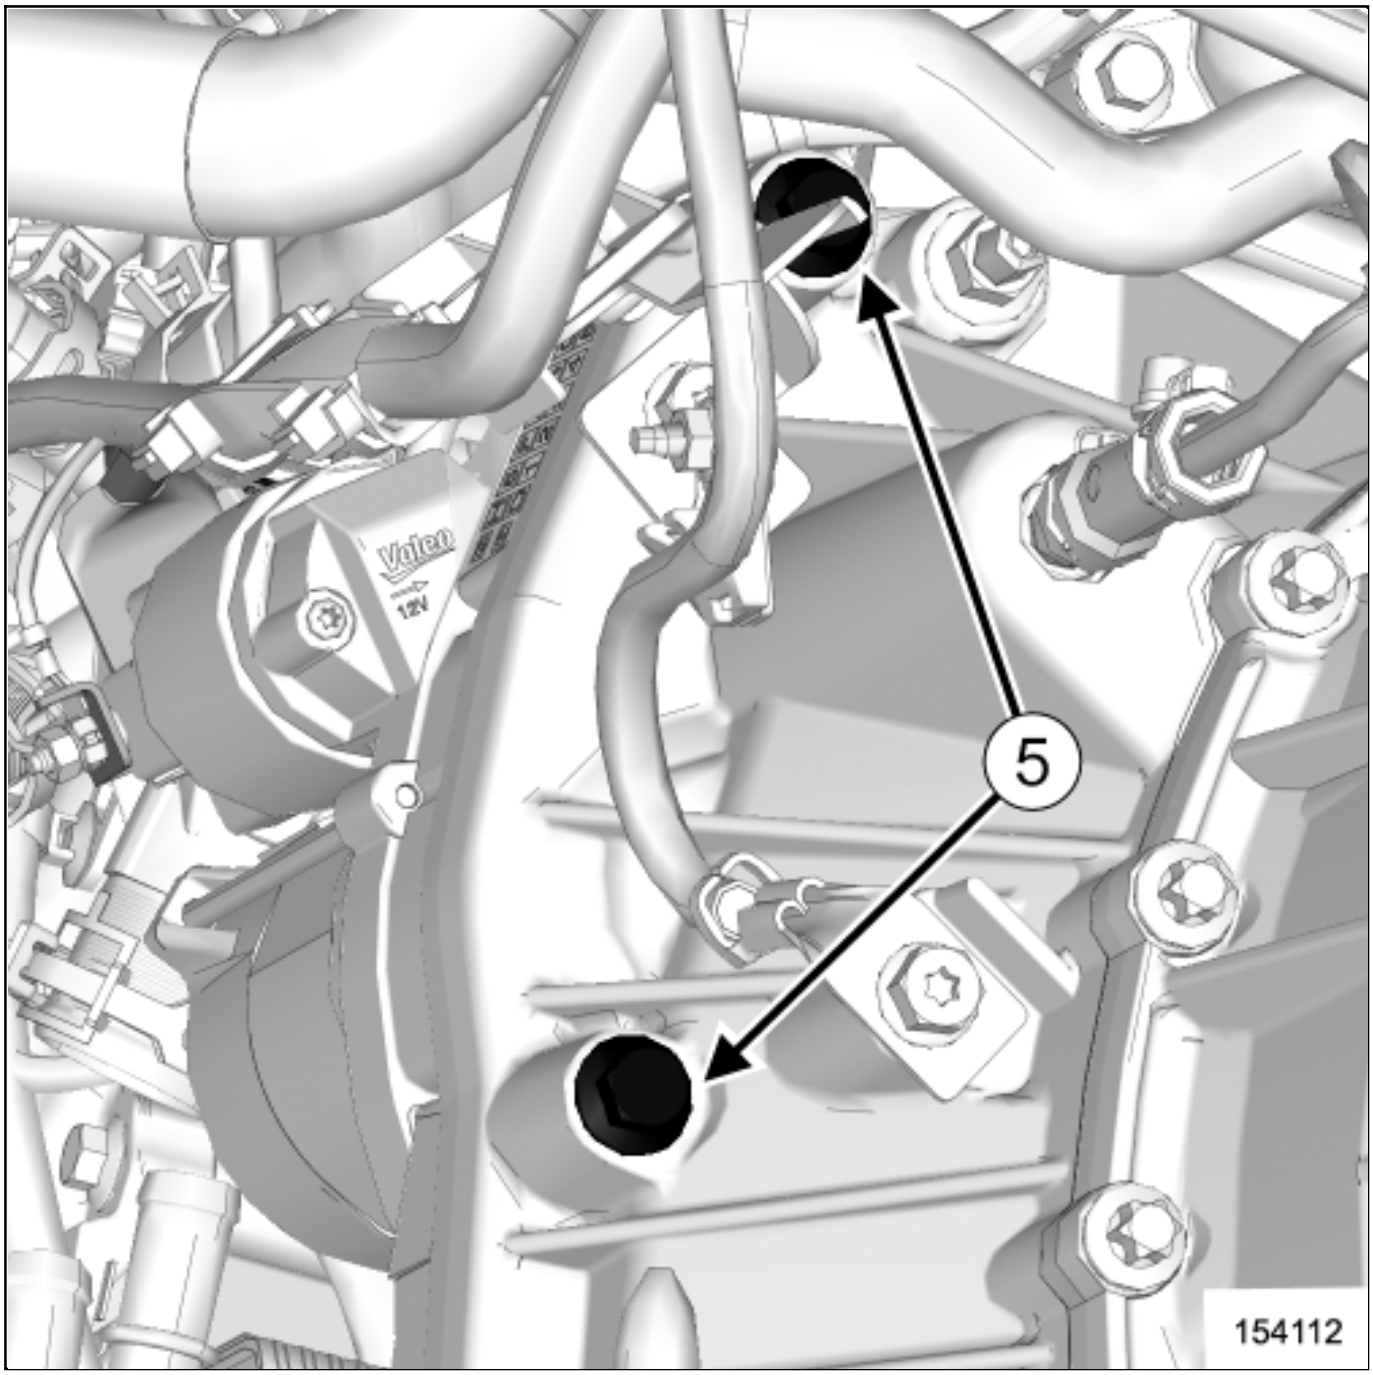
Remove the electrical wiring support nut(1) .

Fit the toolPipe clamps.(Ms. 583) on the coolant pipes of the oil-coolant heat exchanger.

Move aside the clips of the coolant pipes on the oil-coolant heat exchanger using the toolRemote operation pliers for hose clips.(Mot. 1448) .

Disconnect the coolant pipes from the oil-coolant heat exchanger.

2. REMOVAL OPERATION



Remove:

- the nut(2) on the positive terminal of the starter,

the nut(3) of the starter excitation terminal.

Move aside the starter electrical wiring.

Remove:

- the starter bolts(4) ,

the starter.

REFITTING

1. REFFITING PREPARATION OPERATION

Check the presence of the centring dowel on the cylinder block.

2. REFITTING OPERATION

Refit :

- the starter,
- the starter bolts.

Torque tighten the starter bolts44 N.m.

Refit:

- the nut of the starter excitation terminal,
- the nut of the starter positive terminal.

Torque tighten:

- the nut on the positive terminal of the starter8 N.m,
- the nut of the starter excitation terminal5 N.m.

3. FINAL OPERATION

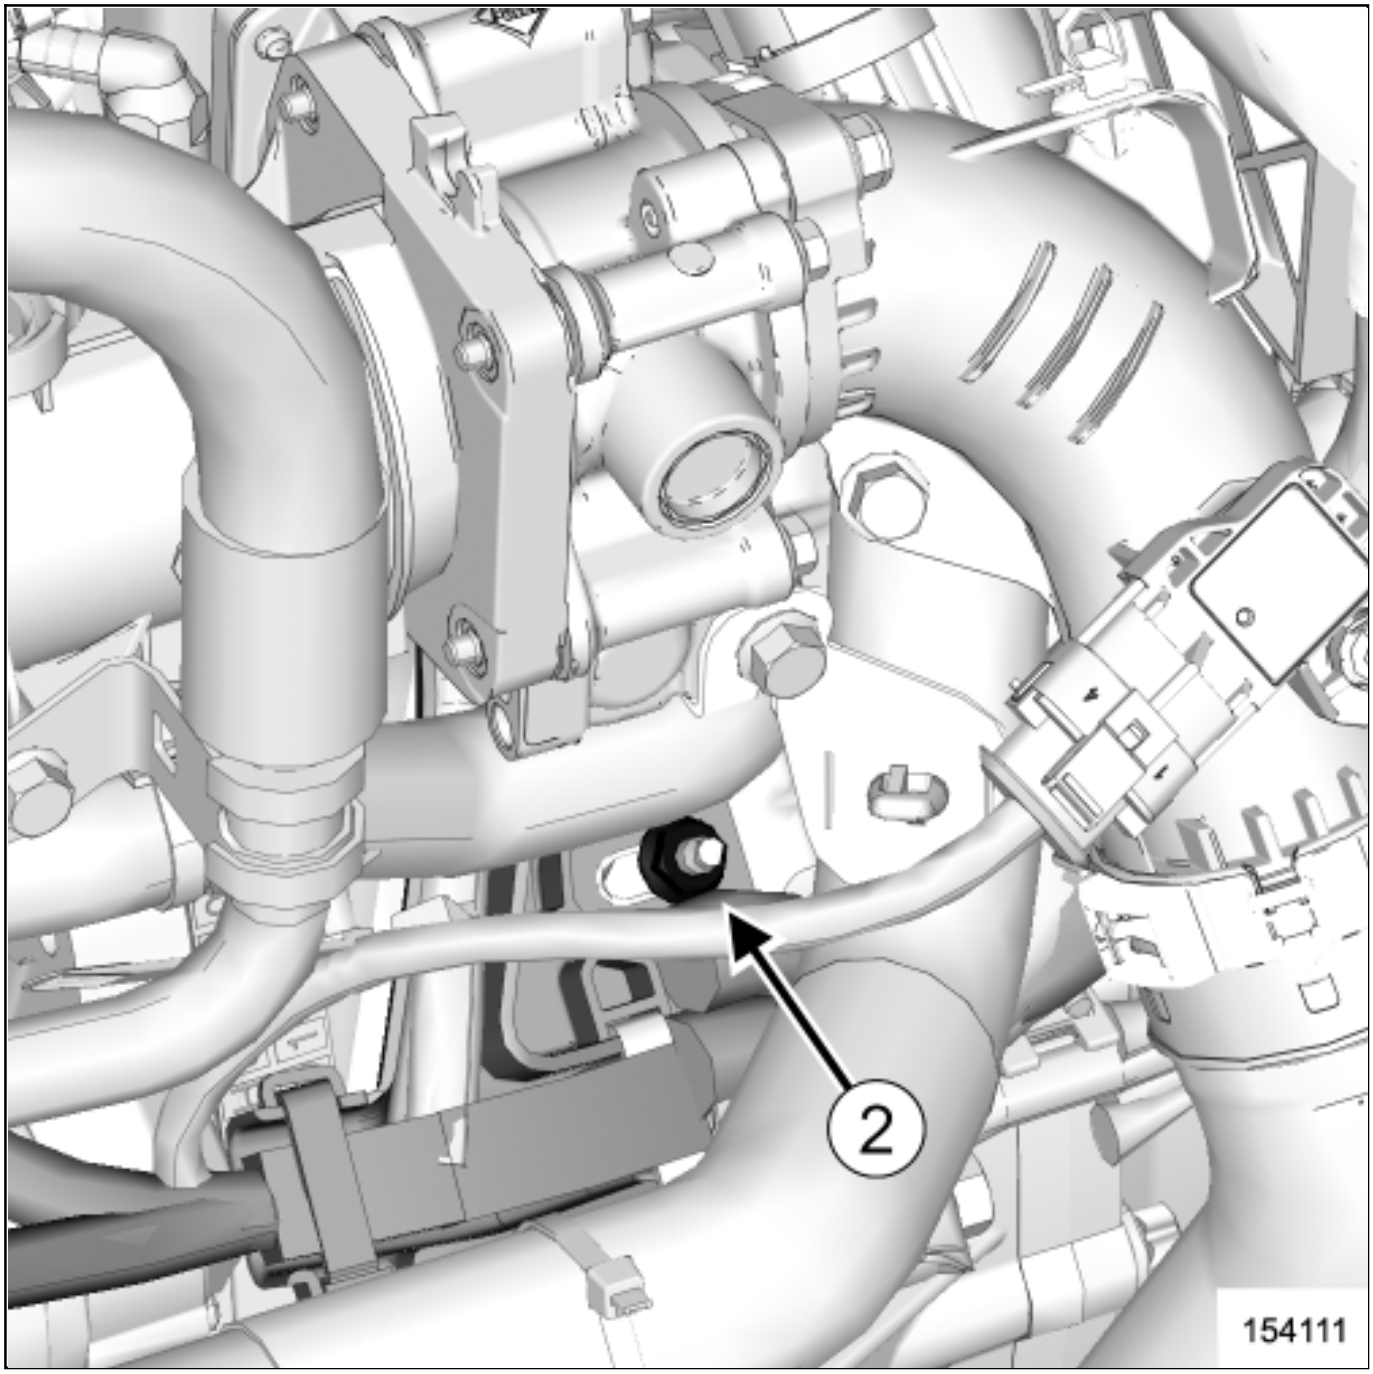
Proceed in the reverse order to removal.

Repair-32x04x01x01-01x37-1-173-1.xml

XSL version : 3.02 du 22/07/11

STARTER: REMOVAL - REFITTING

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583



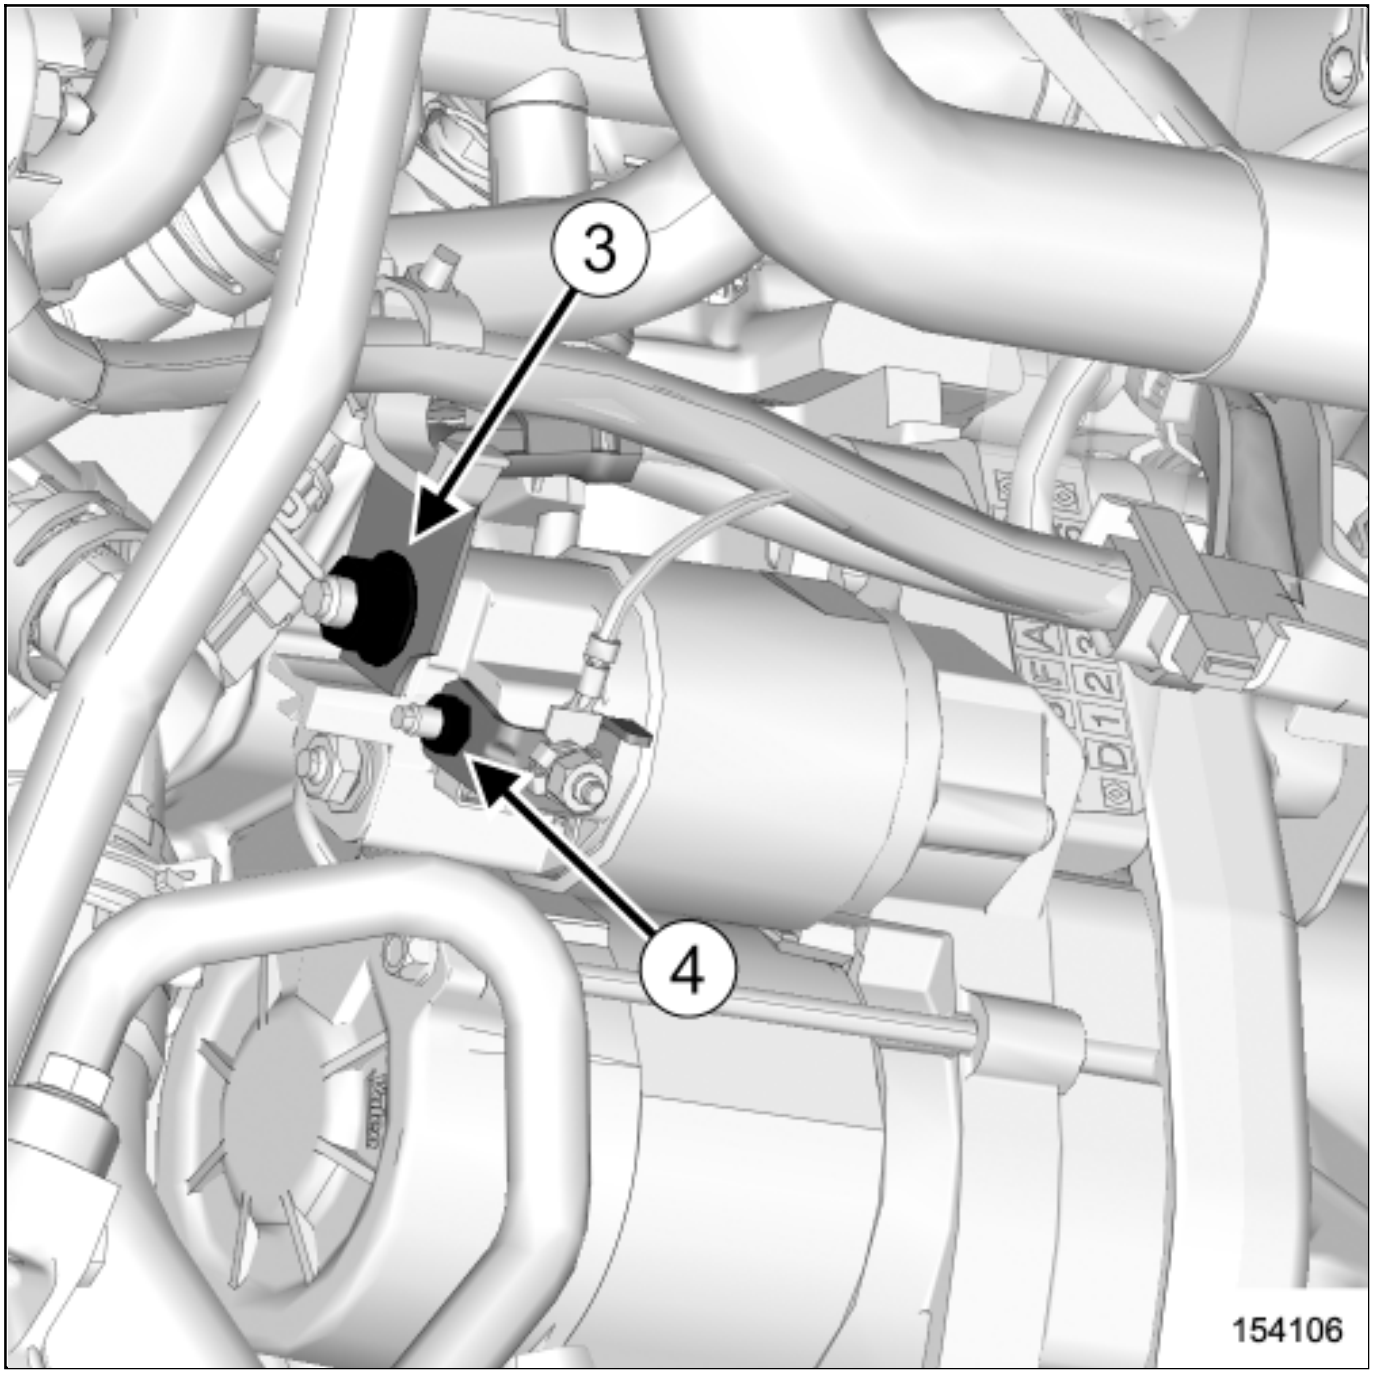
REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift **Vehicle: Towing and lifting** .
- Disconnect the battery **Battery: Removal - Refitting** .
-

Remove:

- the intercooler air inlet pipe **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** ,
- the intercooler air outlet pipe **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** ,
- the throttle valve **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** ,
- the inlet distributor **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** .



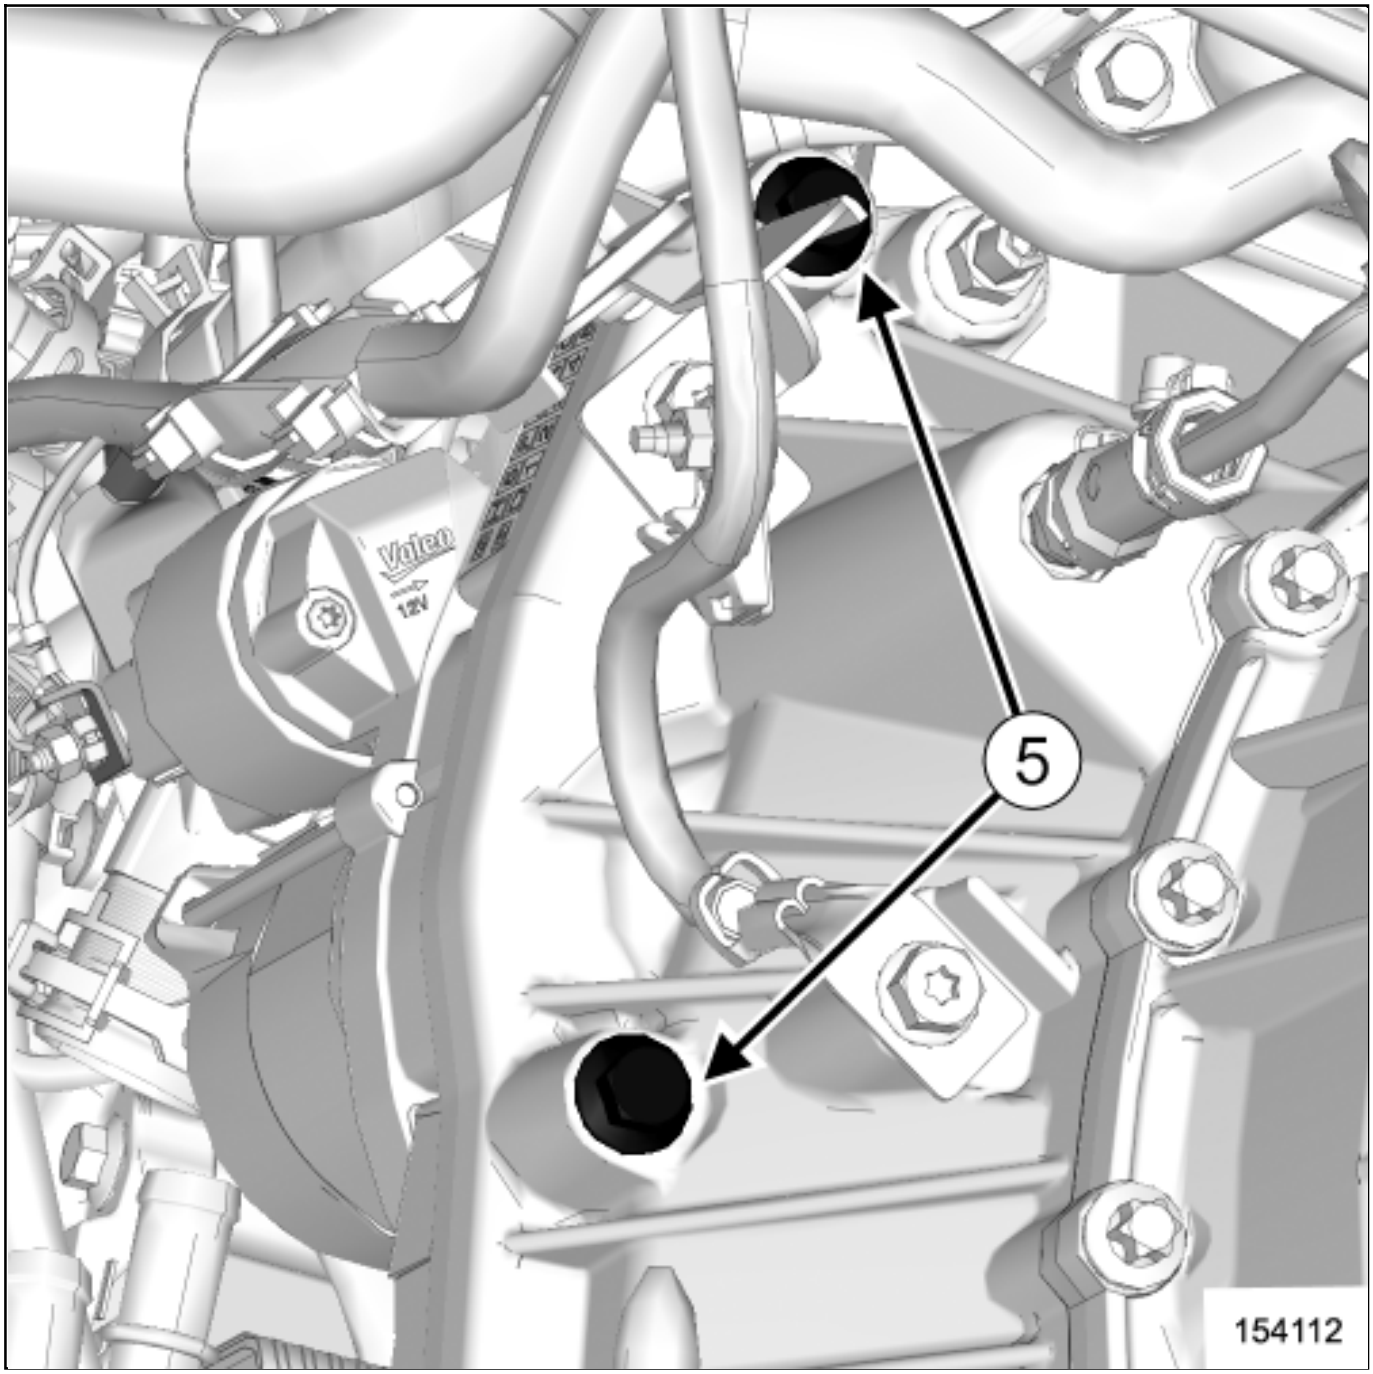
Remove the electrical wiring support nut(2) .

Fit the toolPipe clamps.(Ms. 583) on the coolant pipes of the oil-coolant heat exchanger.

Move aside the clips of the coolant pipes on the oil-coolant heat exchanger using the toolRemote operation pliers for hose clips.(Mot. 1448) .

Disconnect the coolant pipes from the oil-coolant heat exchanger.

2. REMOVAL OPERATION



Remove:

- the nut(3) on the positive terminal of the starter,

the nut(4) of the starter excitation terminal.

Move aside the starter electrical wiring.

Remove:

- the starter bolts(5) ,

the starter.

REFITTING

1. REFFITING PREPARATION OPERATION

Check the presence of the centring dowel on the cylinder block.

2. REFITTING OPERATION

Refit :

- the starter,
- the starter bolts.

Torque tighten the starter bolts44 N.m.

Refit:

- the nut of the starter excitation terminal,
- the nut of the starter positive terminal.

Torque tighten:

- the nut on the positive terminal of the starter8 N.m,
- the nut of the starter excitation terminal5 N.m.

3. FINAL OPERATION

Proceed in the reverse order to removal.

STEEL BODYWORK COMPONENT: PREPARATION AND PAINT RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

1. OXIDISED PANELS

Steps	Description	Special notes
1	Strip the oxidised section	Tools for scraping rigid adhesives and paint: Use (40A, General information)
2	Wipe / blow	
3	Sand the complete repair zone and increase the zone by 150to 200 mm	P180-P240 dry
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Carry out a cold electro zinc plating on the bare panel	(see 04E, Paint, Anti-corrosion protection by cold electro zinc plating: Description) (04E, Painting)
7	Rinse carefully in clean water	
8	Masking	Masking paper
9	Apply a pre-treatment primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Remove solvent	
11	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
12	Remove solvent / dry	

13	Sand the primer	P400 to P500dry / P400 to P800with water
14	Sand the whole component	P500 to P600dry / P800 to P1000with water
15	Wipe / blow	
16	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
17	Masking	(see 99A, Special notes on masking, Masking: Description)
18	Blow / rub with the abrasive finishing pad	
19	Apply the finishing paint	

2. REPAIRED COMPONENTS

1- WITH POLYESTER MASTIC

Steps	Description	Special notes
1	Sand the mastic	Panelwork finishing products: Use (40A, General information)
2	Sand the complete repair zone and increase the zone by 150to 200 mm	P240 to P280dry
3	Wipe / Blow	
4	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
5	Masking	Masking paper
6	Apply a pre-treatment primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
7	Remove solvent	
8	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
9	Remove solvent / dry	
10	Sand the primer	P400 to P500dry / P400 to P800with water
11	Sand the whole component	P500 to P600dry / P800 to P1000with water
12	Wipe / blow	

13	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
14	Masking	(see 99A, Special notes on masking, Masking: Description)
15	Blow / rub with the abrasive finishing pad	
16	Apply the finishing paint	

2- WITHOUT POLYESTER MASTIC

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Sand the complete repair zone and increase the zone by 150 to 200 mm	P240 to P280 dry
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Carry out a cold electro zinc plating on the bare panel	(see 04E, Paint, Anti-corrosion protection by cold electro zinc plating: Description) (04E, Painting)
7	Rinse carefully in clean water	
8	Masking	Masking paper
9	Apply a pre-treatment primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Remove solvent	
11	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
12	Remove solvent/dry	

13	Sand the primer	P400 to P500dry / P400 to P800with water
14	Sand the whole component	P500 to P600dry / P800 to P1000with water
15	Wipe / blow	
16	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
17	Masking	(see 99A, Special notes on masking, Masking: Description)
18	Blow / rub with the abrasive finishing pad	
19	Apply the finishing paint	

3. UNKNOWN SUBSTRATES

Note:

Carry out a lifting test with a solvent thinnerVehicle: Parts and consumables for the repair (04B, Consumables - Products)

1- REACTION TO THE TEST

Steps	Description	Special notes
1	Strip the damaged undercoats	Tools for scraping rigid adhesives and paint: Use (40A, General information)
2	(see repaired components)	

Step	Description	Special notes
1	(see new components)	

4. NEW COMPONENTS

Note:

Do not damage the cataphoretic coating.

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Sand the interior of the component	Red pad
4	Sand the exterior of the component	P240 dry
5	Wipe / Blow	
6	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
7	Masking	Masking paper
8	Apply a pre-treatment primer if there was elimination of the cataphoretic coating during sanding	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
9	Remove solvent	
10	Apply a mono or bi component primer on the whole of the component	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
11	Remove solvent/dry	
12	Sand the primer	According to the PRODUCT TECHNICAL SHEET

13	Wipe / blow	
14	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
15	Apply sealing mastic if necessary	Anti-corrosion protection products after assembly: Use (40A, General information) Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
16	Blow / rub with the abrasive finishing pad	
17	Apply the finishing paint	

STEERINGASSEMBLY :CHECK

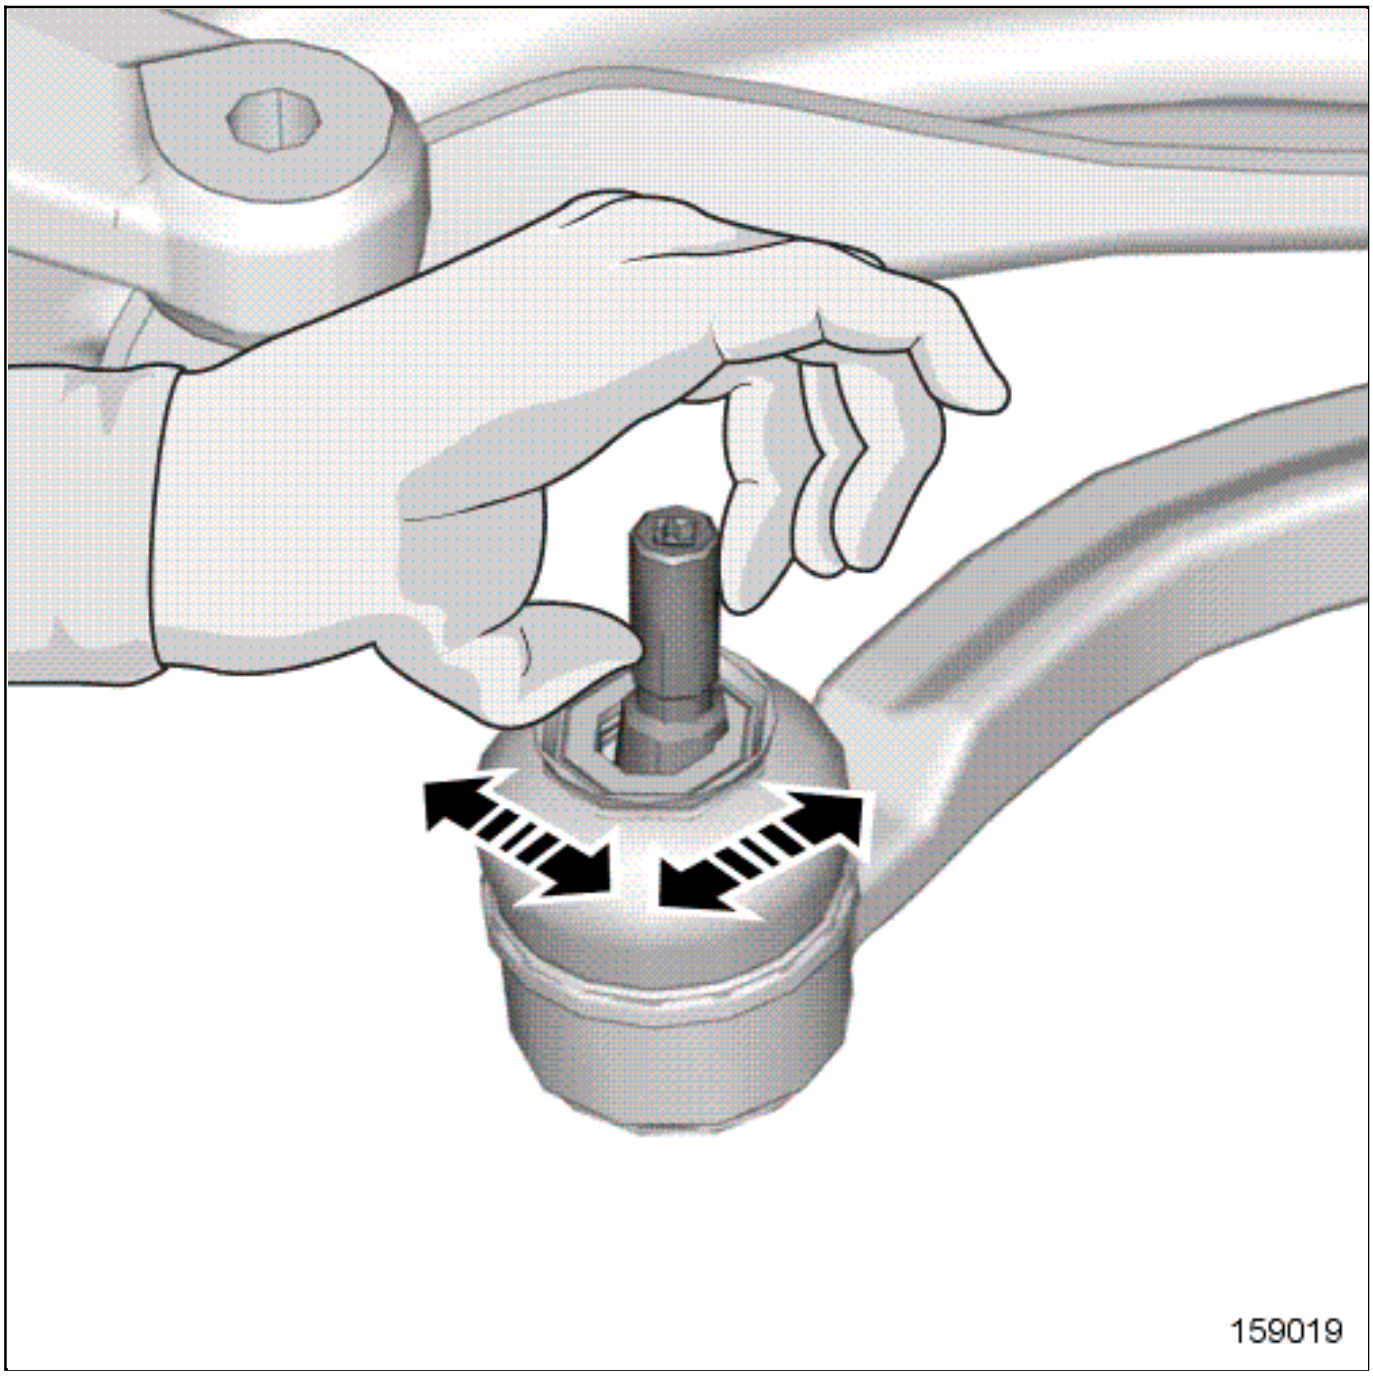
Equipment required
flywheel immobiliser

Note:

This steps are made two sides of the vehicle.

1. STEP NO.1

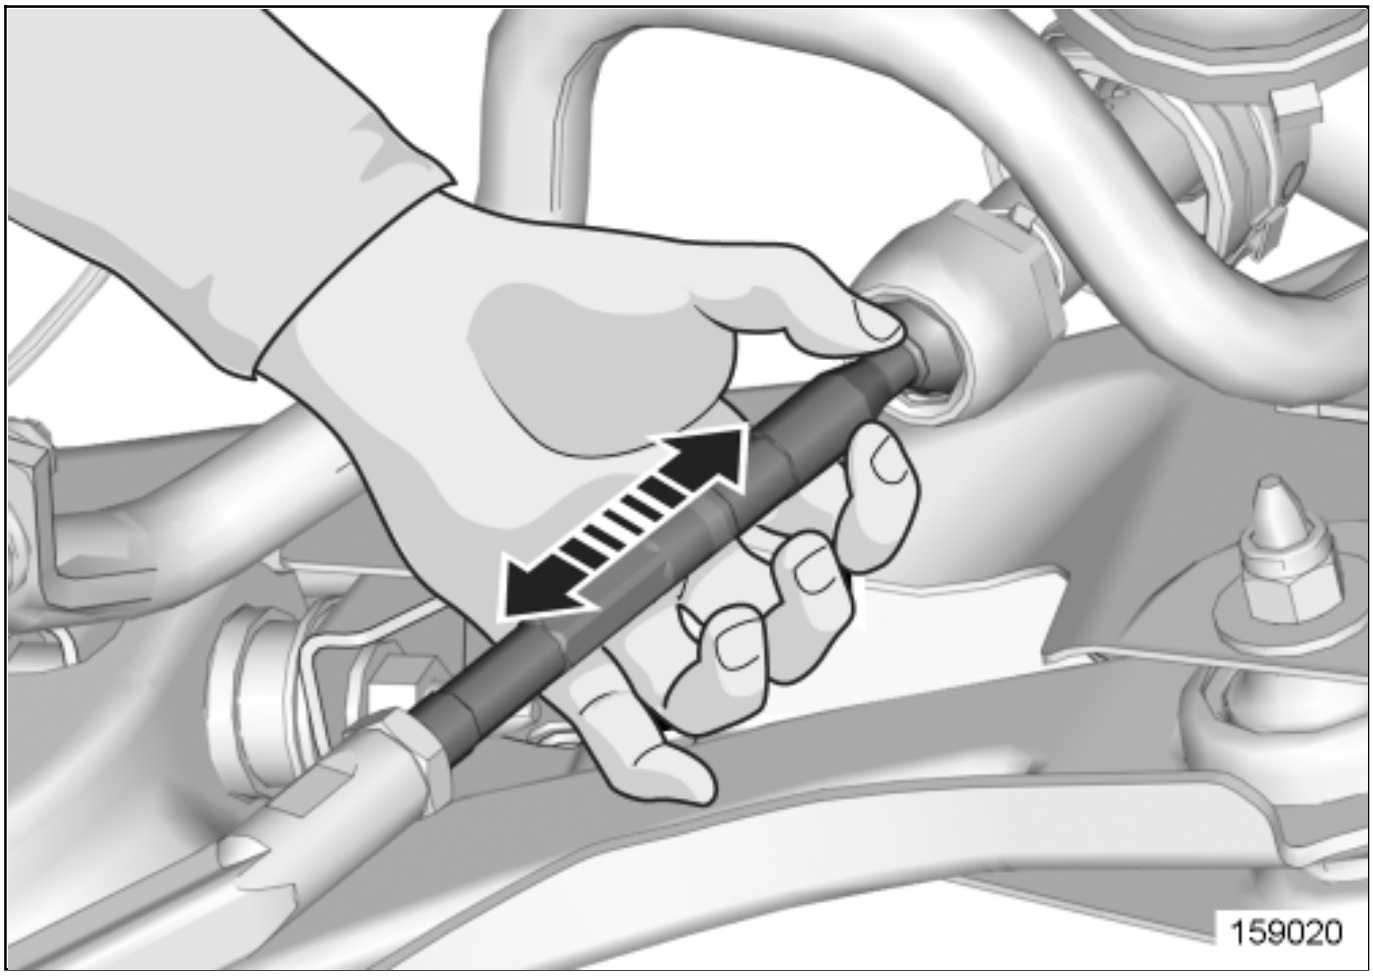
Center the steering wheel and fit the flywheel immobiliser.



Remove the wheel.

Control the clearance of the steering by exerting, on the track rod, translational movements at a high frequency in the direction of the arrow.

If a clearance is detected:



- remove the track rod nut,
- remove the gaiter clips,
- move the track rod gaiter to access at the axial ball joint.

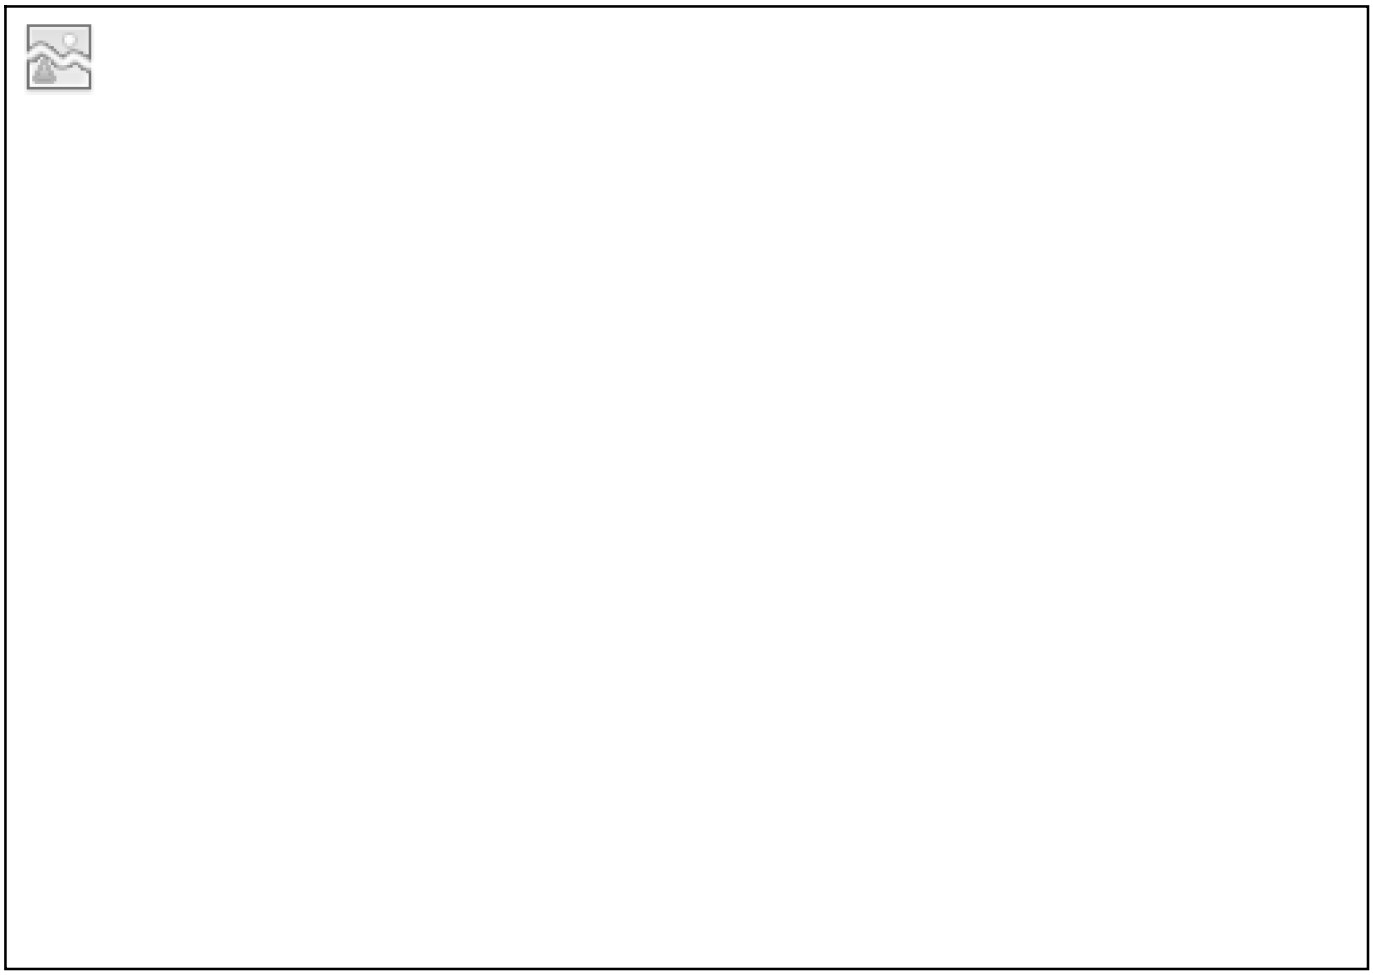
2. STEP NO.2

- Pinch the ball joint.
- Carry out movements in translation along the direction of arrows.
- If a clearance in the ball joint is detected, remove the track rod (see 36A, Steering assembly , Track rod: Removal - Refitting) .

3. STEP NO.3

Check the clearance of the axial ball joint:

- fit the thumb in contact with the ball joint,
- tighten the rod in the hand,
- carry out movements in translation along the direction of arrows.



If nothing clearance are detected:

- refit the gaiter,
- refit new clips.

If a clearance in the ball joint are detected:

- replace the track rod axial ball joint (see 36A, Steering assembly , Axial ball joint linkage: Removal - Refitting) ,
- tighten the wheel alignment adjusting lock nut,
- tighten the track rod nut.

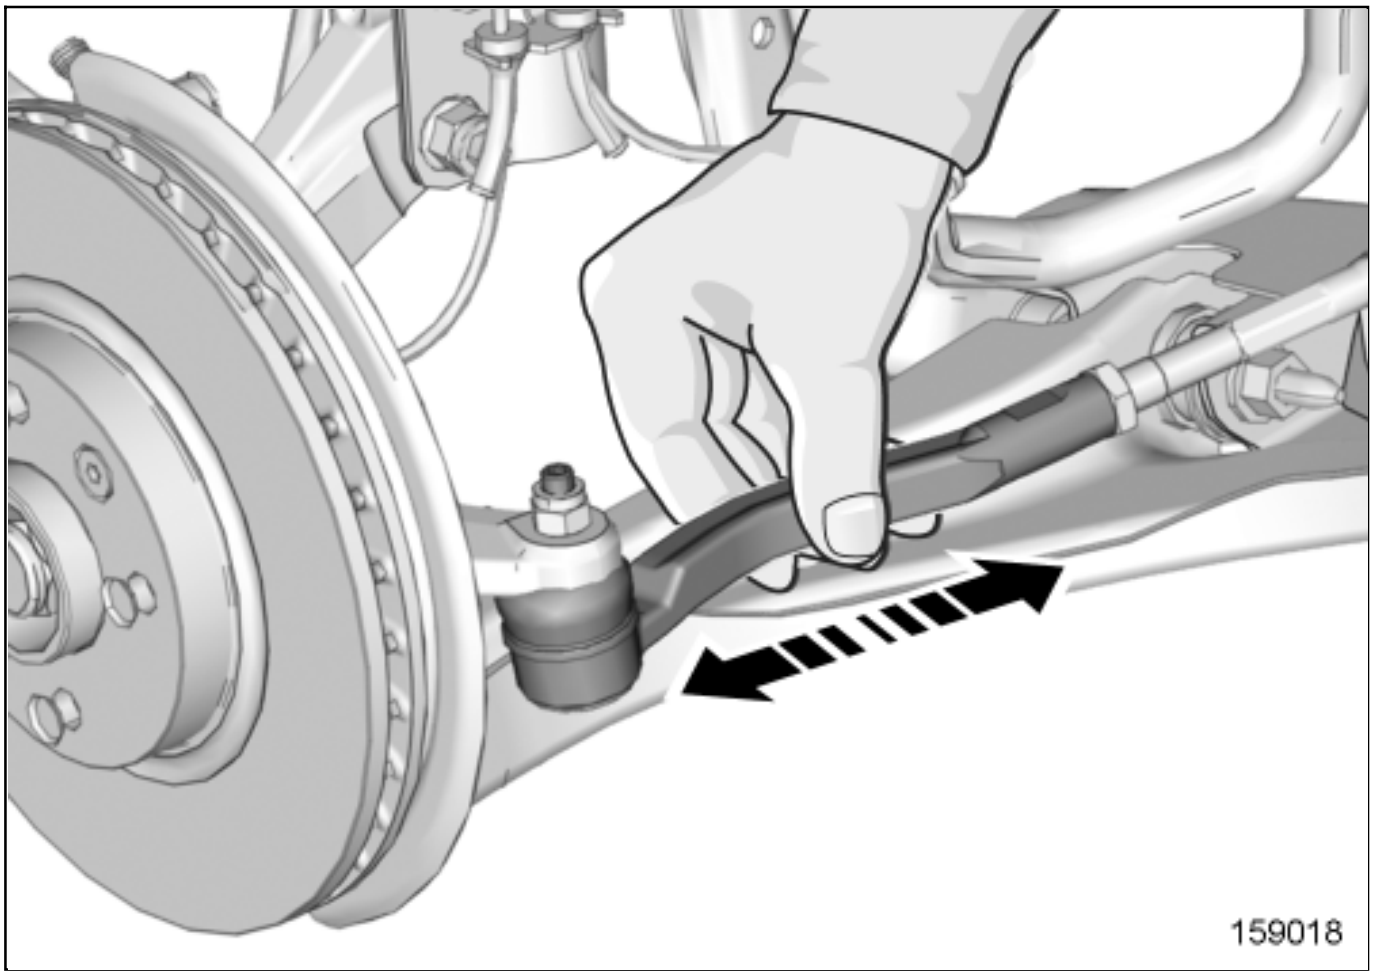
4. STEP NO.4

Control the clearance of the steering by exerting, on the track rod, translational movements at a high frequency in the direction of the arrow.

If a clearance are detected and that the track rod are not replace, replace the track rod.

- Check the axle geometry **Axle assemblies: Check** .

- If necessary, adjust the geometry of the axle assemblies **Front axle system: Adjustment** .



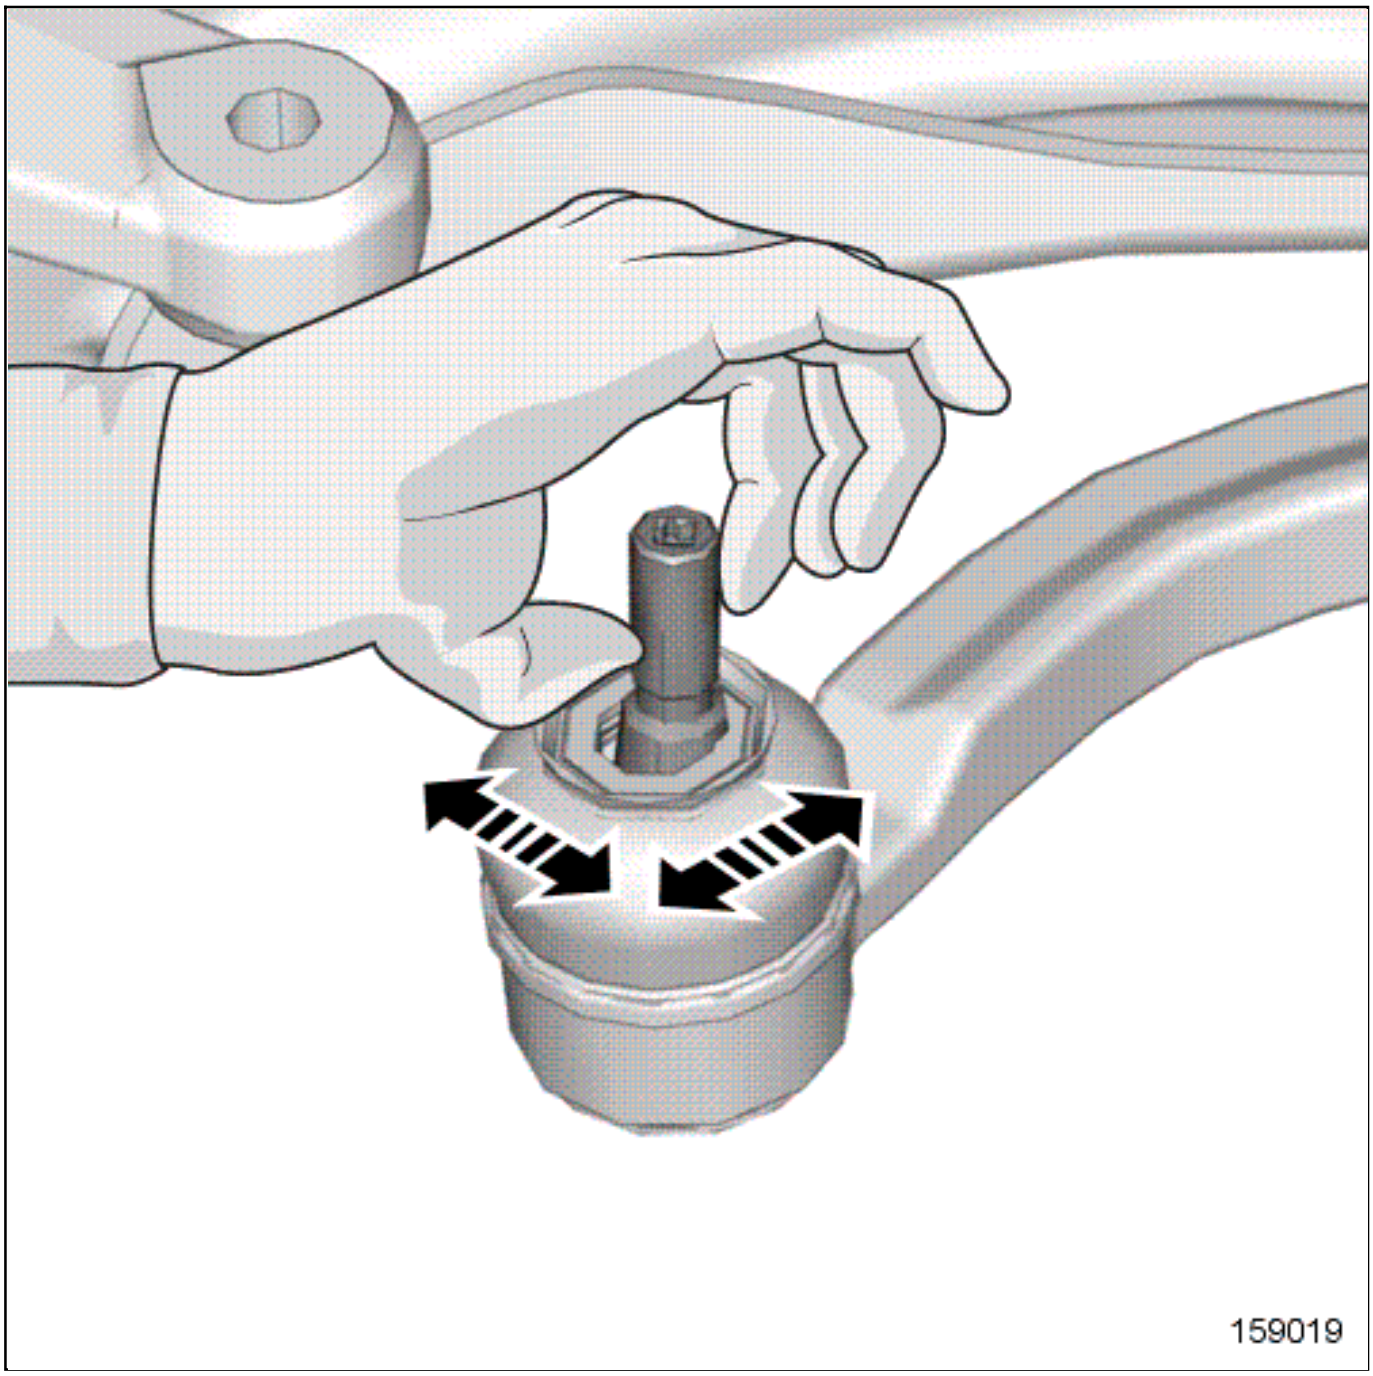
STEERINGASSEMBLY :CHECK

Equipment required
flywheel immobiliser

Note:

This steps are made two sides of the vehicle.

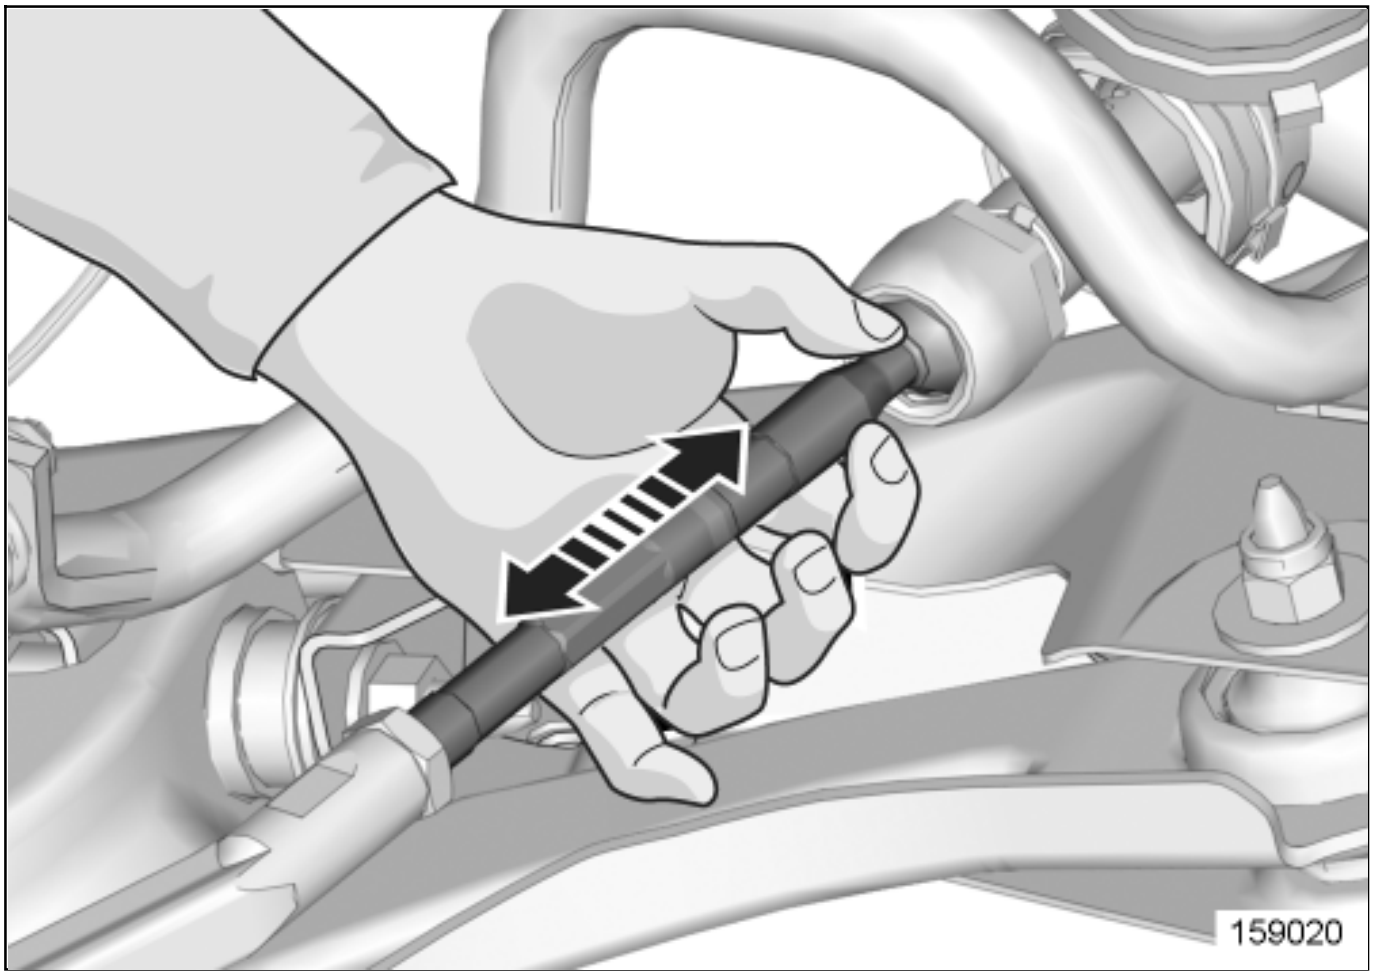
1. STEP NO.1



- Center the steering wheel and fit the flywheel immobiliser.
- Remove the wheel.

Control the clearance of the steering by exerting, on the track rod, translational movements at a high frequency in the direction of the arrow.

If a clearance is detected:



- remove the track rod nut,
- remove the gaiter clips,
- move the track rod gaiter to access at the axial ball joint.

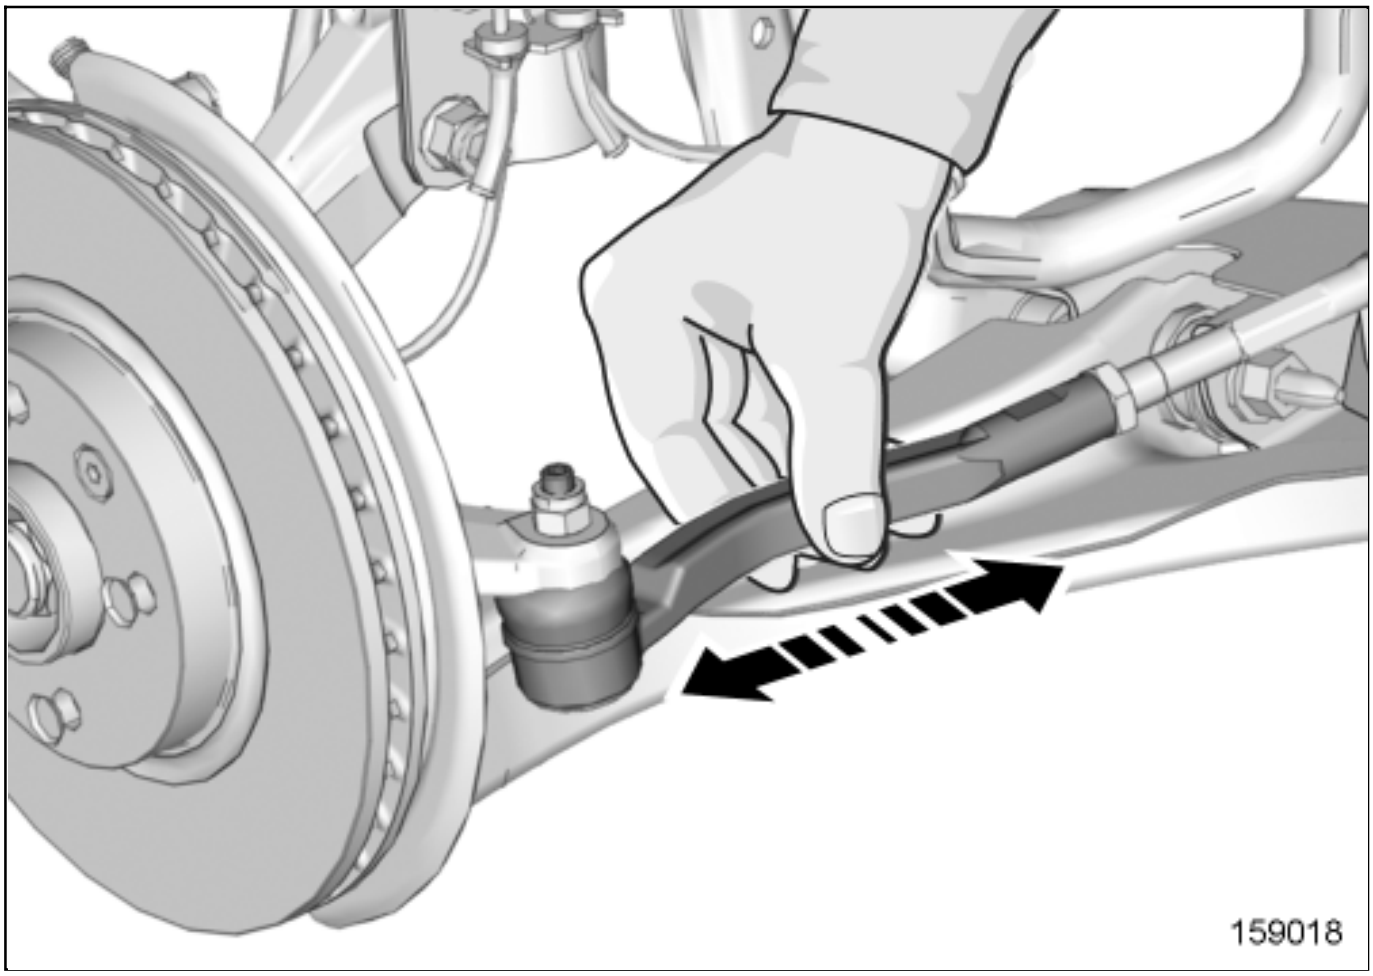
2. STEP NO.2

- Pinch the ball joint.
- Carry out movements in translation along the direction of arrows.
- If a clearance in the ball joint is detected, remove the track rod(see 36A, Steering assembly , Track rod: Removal - Refitting) .

3. STEP NO.3

Check the clearance of the axial ball joint:

- fit the thumb in contact with the ball joint,
- tighten the rod in the hand,
- carry out movements in translation along the direction of arrows.



If no clearance is detected:

- refit the gaiter,
- refit new clips.

If a clearance in the ball joint are detected:

- replace the track rod axial ball joint Axial ball joint linkage: Removal - Refitting ,
- tighten the wheel alignment adjusting lock nut,
- tighten the track rod nut.

4. STEP NO.4

Control the clearance of the steering by exerting, on the track rod, translational movements at a high frequency in the direction of the arrow.

If a clearance are detected and that the track rod are not replace, replace the track rod.

Check the axle geometry**Axle assemblies: Check** .

XSL version : 3.02 du 22/07/11

STEERING ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

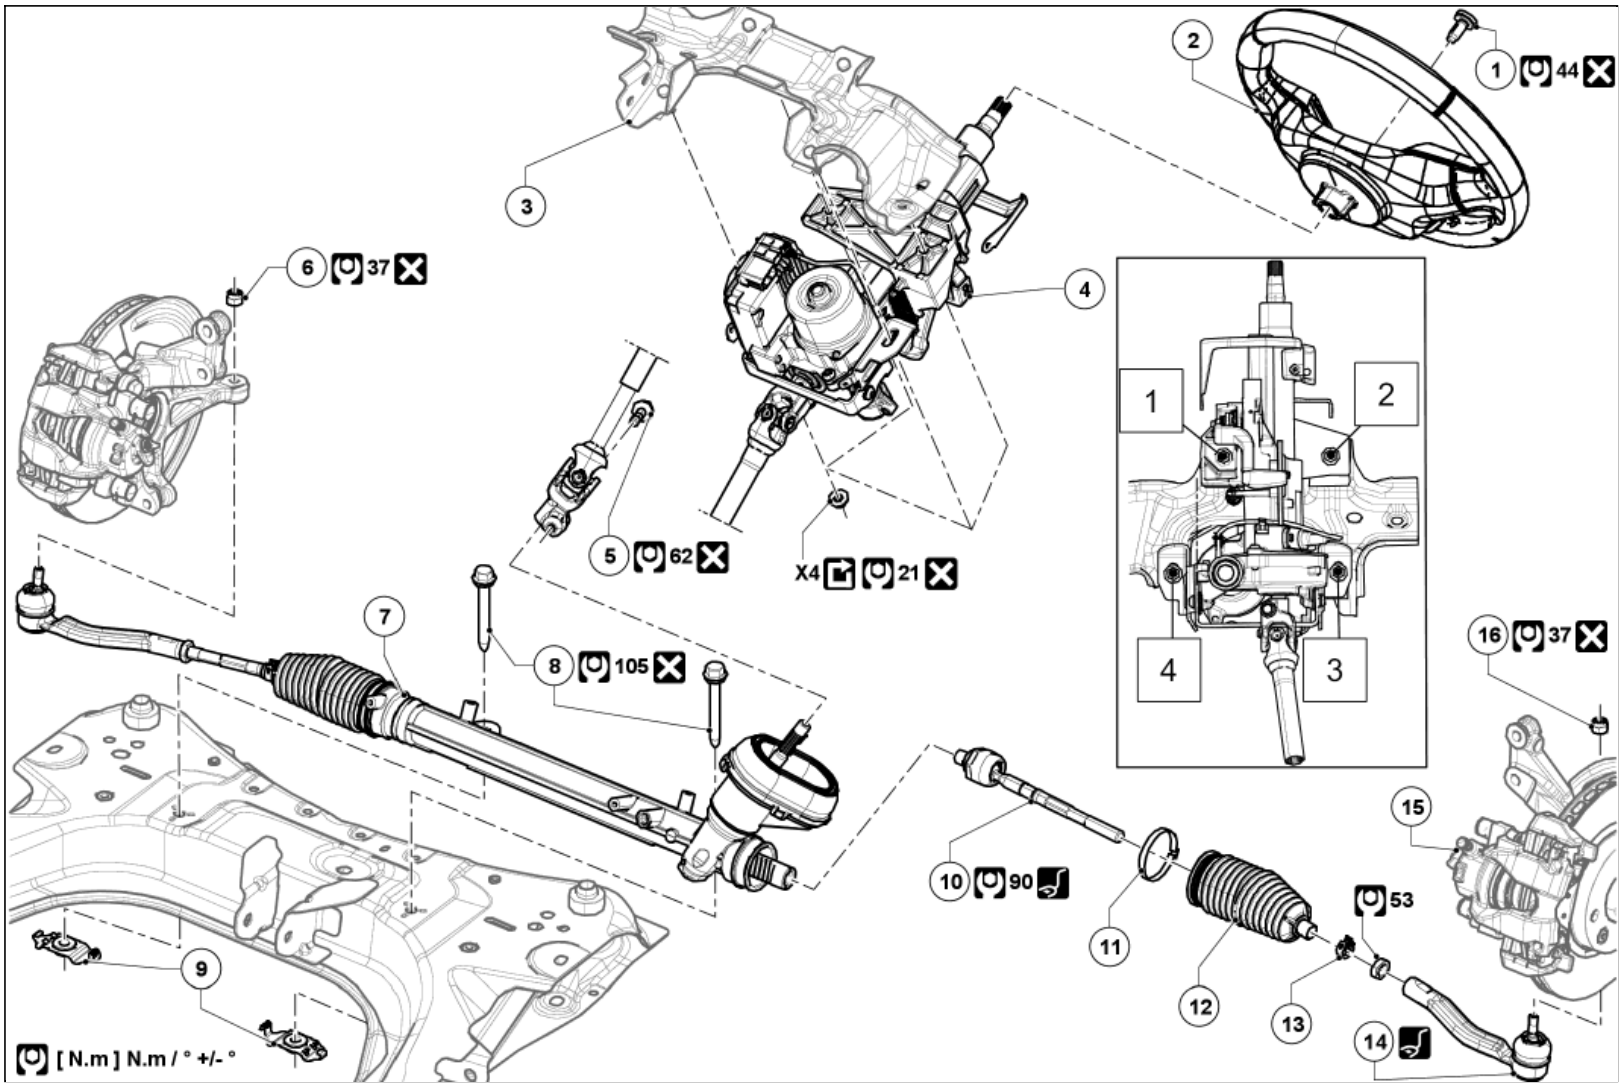

Illustration key: Description .

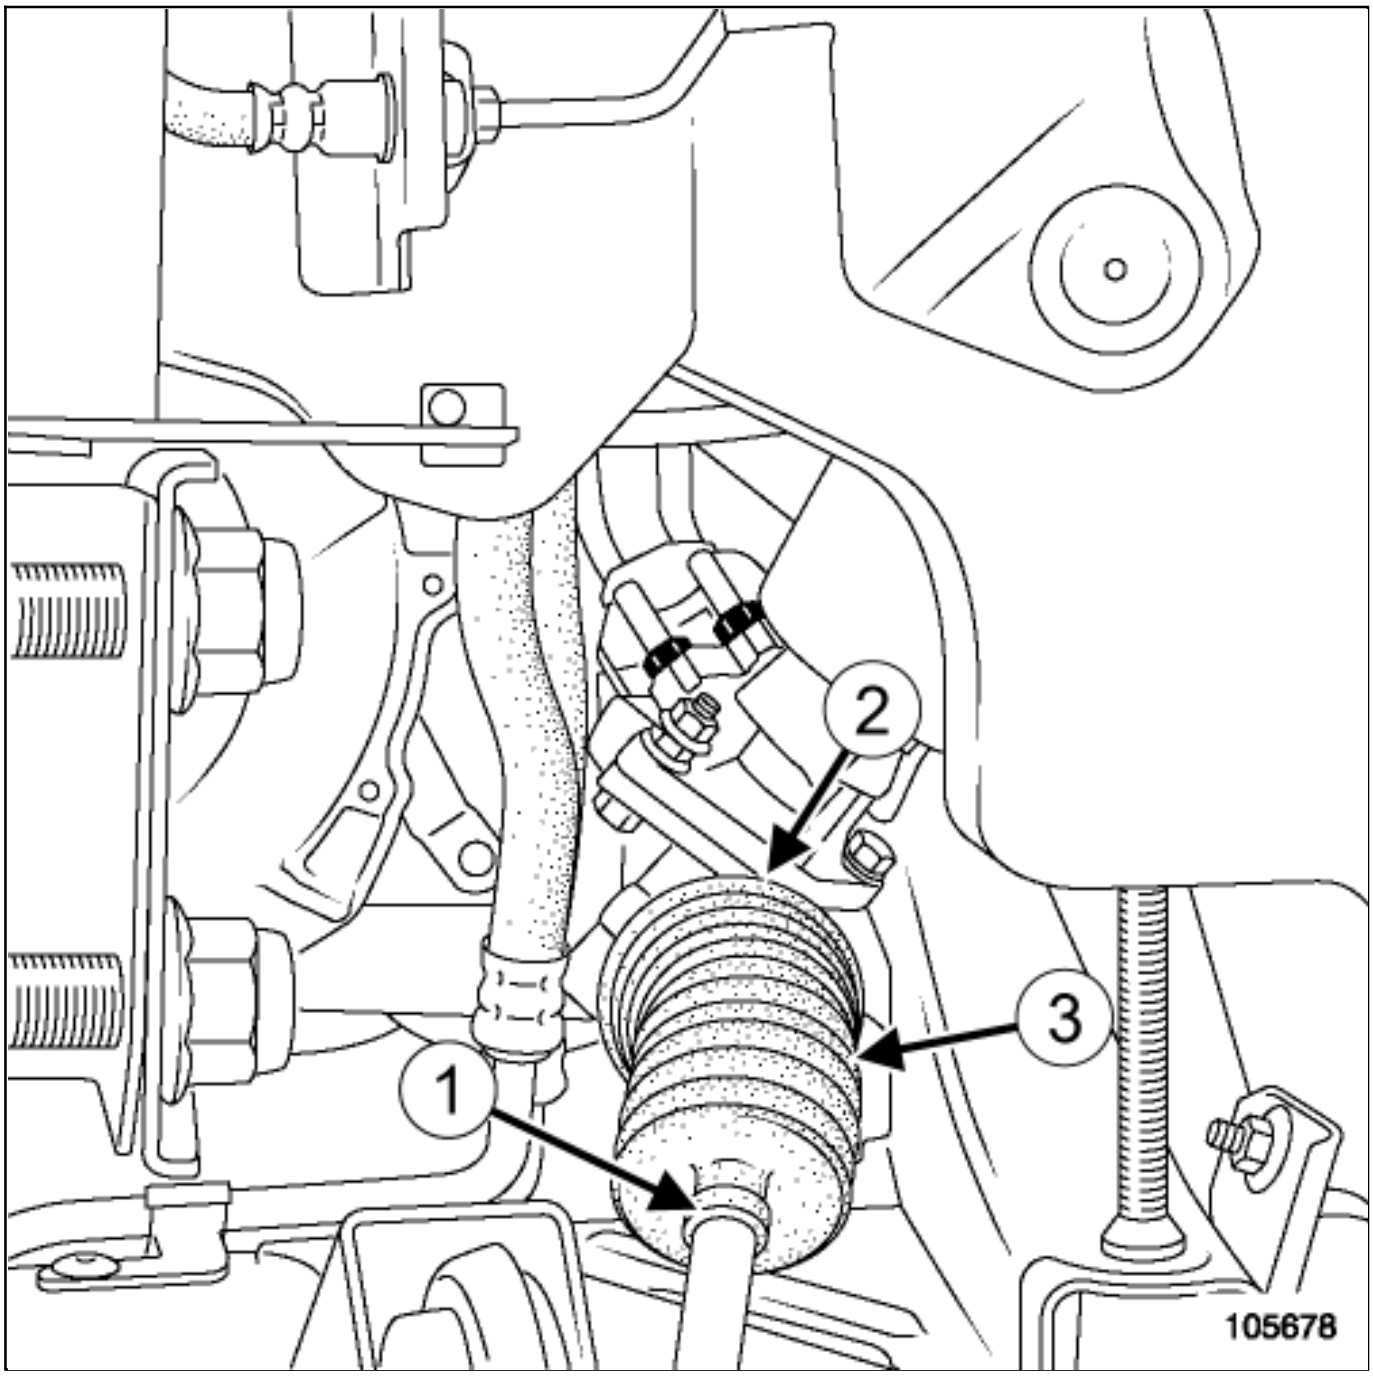
For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

Marks	Designations	Informations
1	Steering wheel bolt	
2	Steering wheel	
3	Dashboard cross member	
4	Steering column	(see 36A, Steering assembly , Steering column: Removal - Refitting)
5	Universal joint bolt	
6	Track rod end nut	
7	Steering box	
8	Steering box bolts	
9	Cage nuts	
10	Axial ball joint linkage	(see 36A, Steering assembly , Axial ball joint linkage: Removal - Refitting) (Dir. 1306-01) (Dir. 1305-01)
11	Steering gaiter clip	
12	Steering box gaiter	
13	Steering gaiter rubber clip	
14	Track rod	(Tav. 476)
15	Front brake calliper	Front brake calliper assembly: Exploded view
16	Track rod end nut	

STEERING BOX GAITER: REMOVAL - REFITTING



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).

- Remove:
  - the front wheel Wheel: Removal - Refitting ,
  - the track rod, (see 36A, Steering assembly , Track rod: Removal - Refitting)
  - the wheel alignment adjusting lock nut.

2. OPERATION FOR REMOVAL OF PART CONCERNED

Note:

When removing the steering gaiter, blast the gaiter surfaces with compressed air to eliminate any impurities that could enter the steering box.

- Remove the gaiter retaining clip(1)
- Cut the gaiter retaining clip(2) .

Remove the gaiter(3) .

REFITTING

1. REFITTING PREPARATION OPERATION

Always replace:

- the steering box gaiter,
- the retaining clips.

Clean the contact surfaces between the steering box and the gaiter using Surface cleaner Vehicle: Parts and consumables for the repair .

Coat the gaiter bearing face on the axial ball joint with silicone lubricant Vehicle: Parts and consumables for the repair to prevent the gaiter from twisting.

Note:

Be sure to centre the steering to ensure the air in the gaiters is equalised.

Note:

Be careful not to damage the gaiters: risk of irreversible damage.

2. REFITTING OPERATION FOR PART CONCERNED

Refit:

- a new steering box gaiter,
- new retaining clips.

3. FINAL OPERATION.

Refit:

- the wheel alignment adjustment lock nut,
- the track rod (see 36A, Steering assembly , Track rod: Removal - Refitting) ,
- the front wheel Wheel: Removal - Refitting .

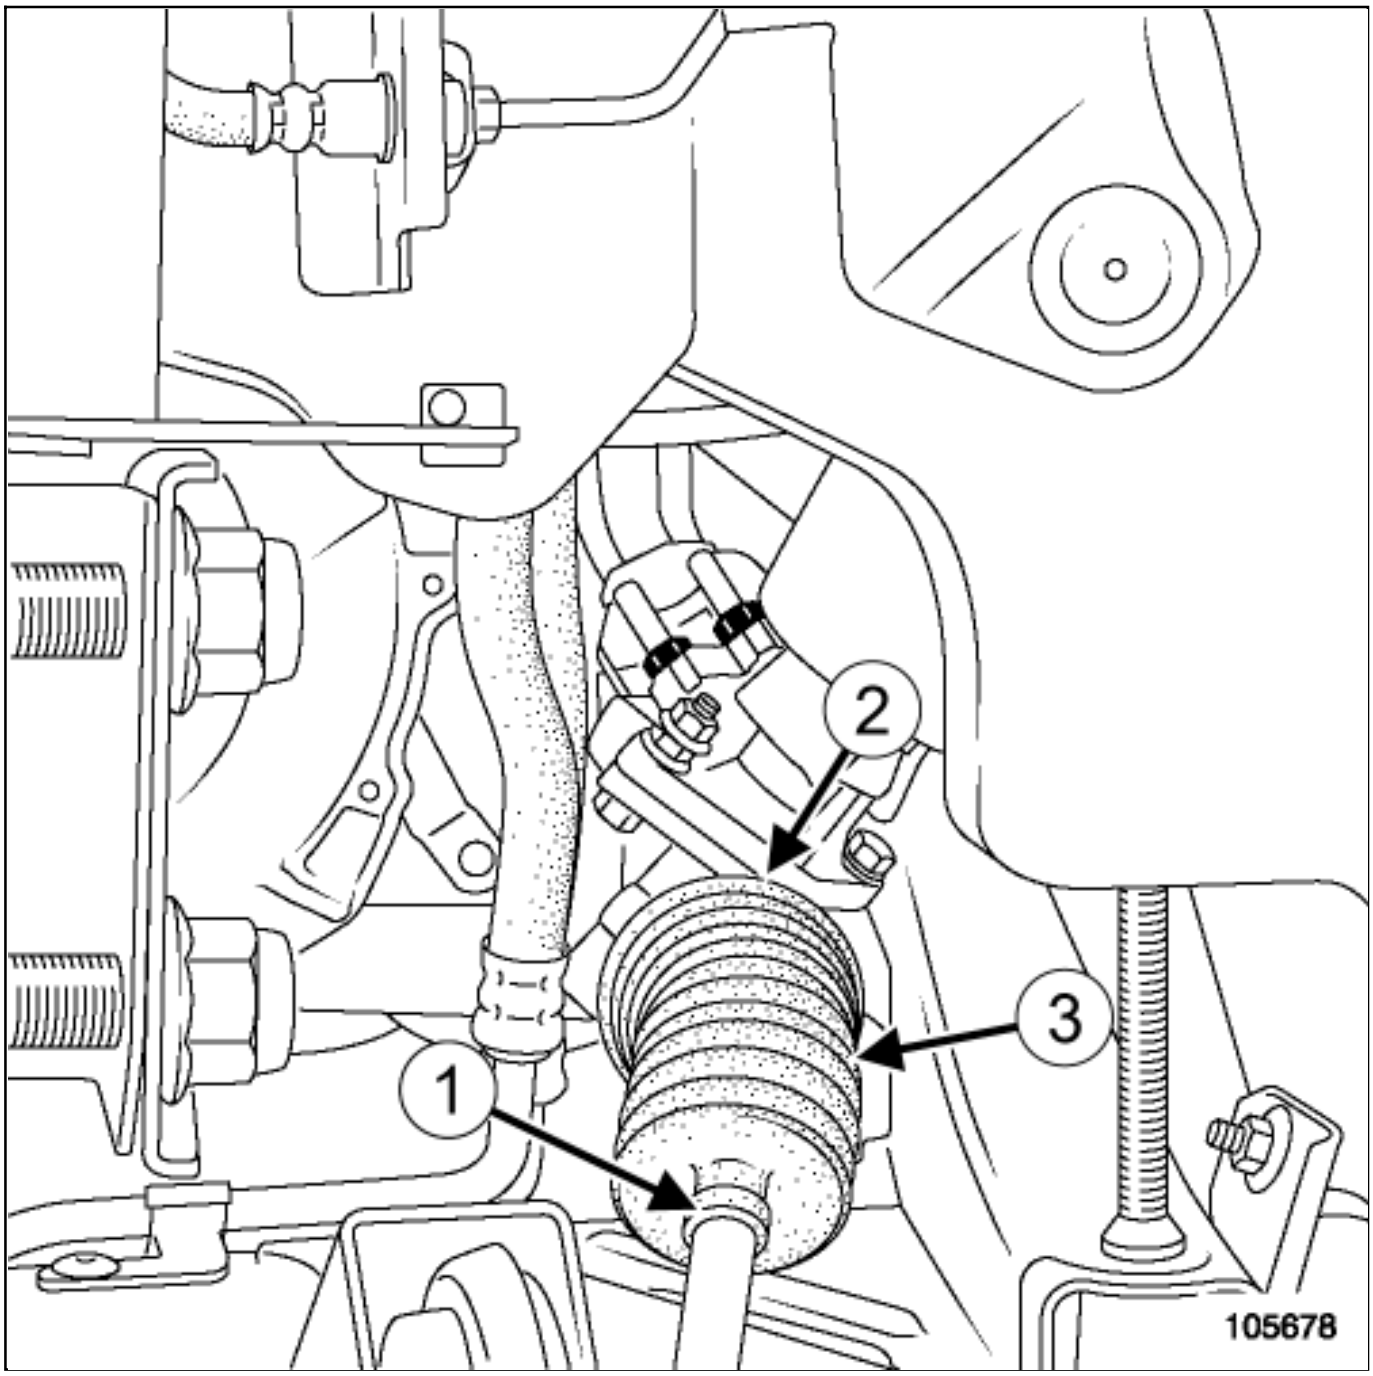
Check the axle geometry Axle assemblies: Check .

If necessary, adjust the geometry of the axle assemblies Front axle system: Adjustment .

STEERING BOX GAITER: REMOVAL - REFITTING

Location and specifications (tightening torques, parts always to be replaced, etc.)Steering assembly: Exploded view .

REMOVAL



1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove:

- the front wheelFront hub carrier assembly: Exploded view ,
- the track rodSteering assembly: Exploded view ,
- the wheel alignment adjusting lock nut.

2. REMOVAL OPERATION

Note:

When removing the steering gaiter, blast the gaiter surfaces with compressed air to eliminate any impurities that could enter the steering box.

- Remove the gaiter retaining clip(1)
- Cut the gaiter retaining clip(2) .

Remove the gaiter(3) .

REFITTING

1. REFITTING PREPARATION OPERATION

Always replace:

- the steering box gaiter,
- the retaining clips.

Clean the contact surfaces between the steering box and the gaiter using Surface cleaner Vehicle: Parts and consumables for the repair .

Coat the gaiter bearing face on the axial ball joint with silicone lubricant Vehicle: Parts and consumables for the repair to prevent the gaiter from twisting.

Note:

Be sure to centre the steering to ensure the air in the gaiters is equalised.

Note:

Be careful not to damage the gaiters: risk of irreversible damage.

2. REFITTING OPERATION

Refit:

- a new steering box gaiter,
- new retaining clips.

3. FINAL OPERATION.

Refit:

- the wheel alignment adjusting lock nut,
- the track rod Steering assembly: Exploded view ,
- the front wheel Front hub carrier assembly: Exploded view .

Check the axle geometry Axle assemblies: Check .

If necessary, adjust the geometry of the axle assemblies Front axle system: Adjustment .

STEERING COLUMN: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 36A, Steering assembly , Steering assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Straighten the wheels.

Lock the airbag computer by applying the before repair procedure using the Diagnostic toolDiagnostic tool : Use :
-Computer concerned by the Before repair procedure:

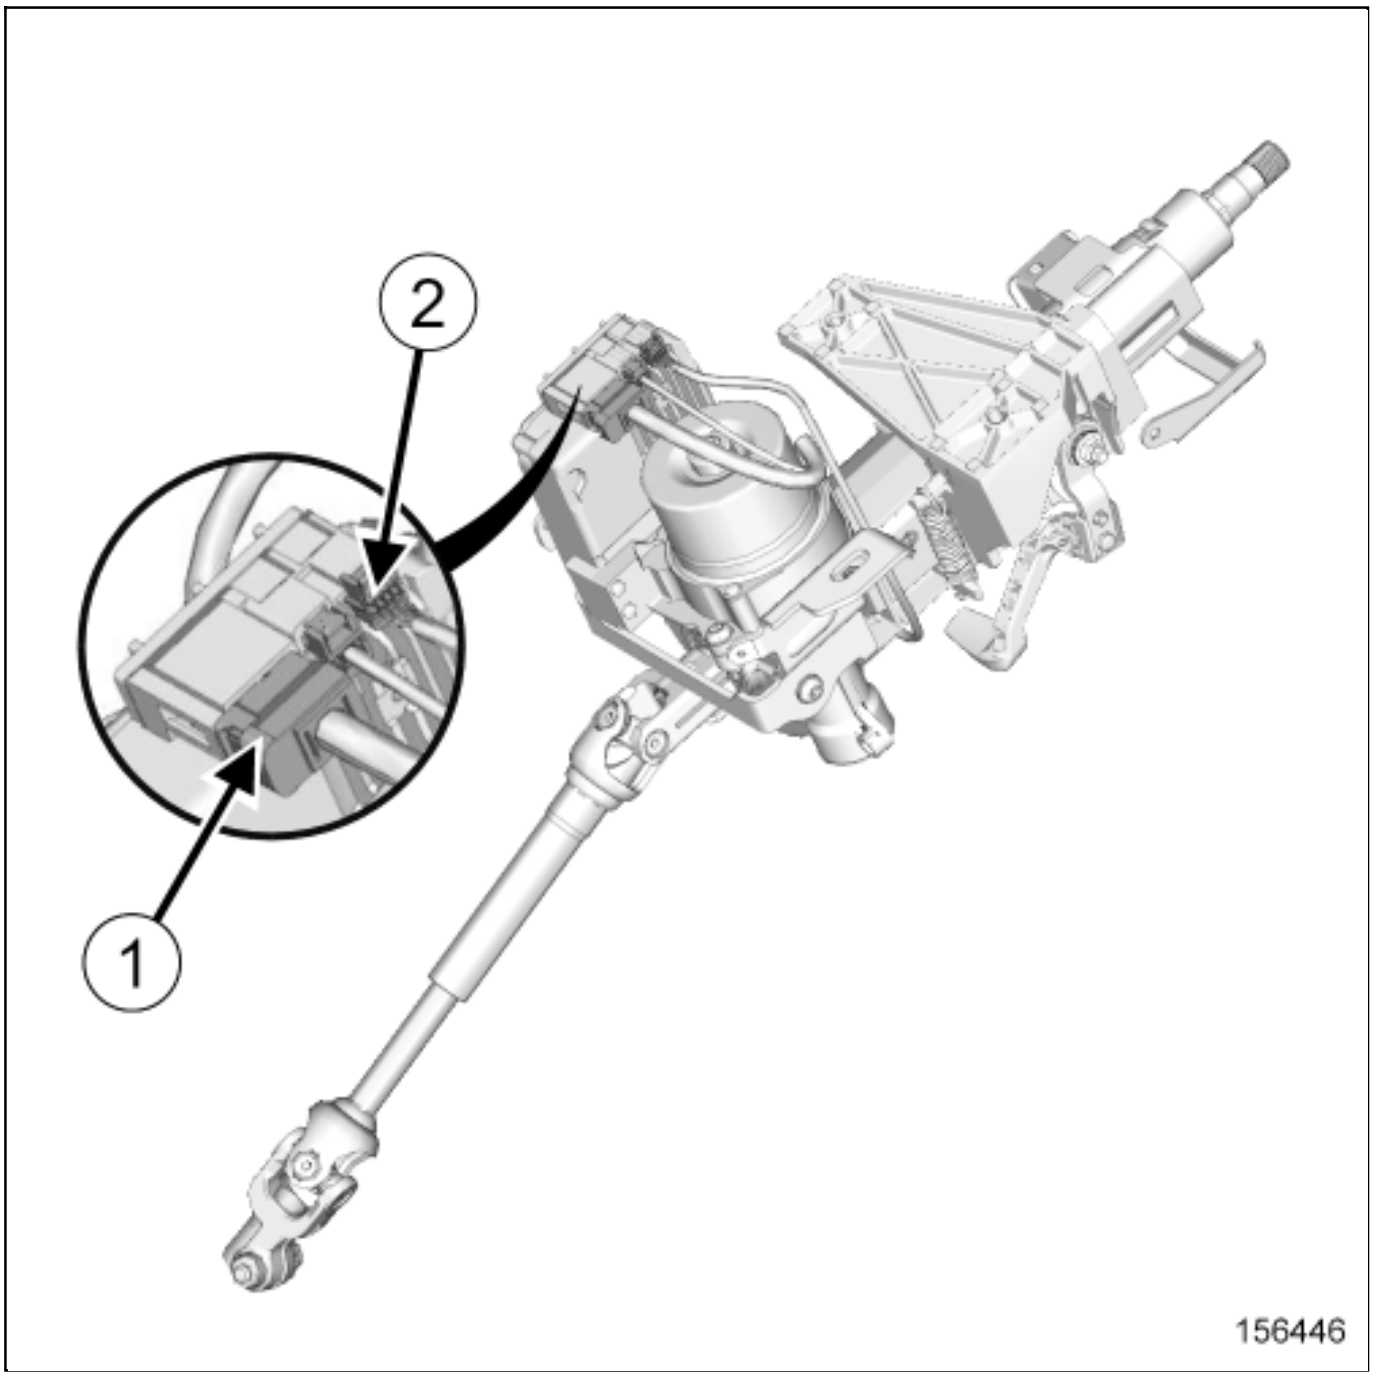
- "Airbag computer" .

Disconnect the batteryBattery: Removal - Refitting .

Remove:

- the driver's front airbagDriver's frontal airbag: Removal - Refitting ,
- the steering wheel(see 36A, Steering assembly , Steering assembly: Exploded view) ,
- the steering column switch assemblyControl - Signals: List and location of components ,
- the dashboard lower trimDashboard assembly: Exploded view .

2. REMOVAL OPERATION



Remove:

- the universal joint bolt(see 36A, Steering assembly , Steering assembly: Exploded view) ,
- the steering column bolts(see 36A, Steering assembly , Steering assembly: Exploded view) .

- Insert a shim under the steering column in order not to damage the connectors.

- Disconnect the steering column lock connector **Immobiliser system: List and location of components** .

- Unclip the steering column wiring.

- Disconnect:
  - the power-assisted steering computer connector(1) ,
  - the electric power-assisted steering computer signal connector(2) .

- Remove the steering column **(see 36A, Steering assembly , Steering assembly: Exploded view)** .

REFITTING

Proceed in the reverse order to removal.

Note:

Check that the secured locking system of the connectors is correctly engaged.

Check that:

- the steering wheel is straight,
- the steering column adjustment mechanism is operating correctly.

Unlock the airbag computer by applying the after repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Airbag computer" .

Apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Assisted steering computer" .

Apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "ABS-ESP computer" ,

-Component controlled by this computer concerned by the After repair procedure:

- "Steering wheel sensor" .

STEERING: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTION TO BE FOLLOWED DURING THE OPERATION

WARNING

Wear cut-resistant gloves during the operation.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Use a cover to protect any chassis elements that may be contaminated with power-assisted steering fluid.

2- INSTRUCTION TO BE FOLLOWED DURING THE OPERATION

Clean around the power-assisted steering system using BRAKE CLEANER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

3. JOB GROUP RECOMMENDATIONS

To ensure correct operation and performance of the system, do not attempt to repair any components other than those supplied in After-Sales.

To ensure the quality of the repair, only use the tooling recommended by the manufacturer.

1- POWER ASSISTED STEERING CIRCUIT:

1)POWER-ASSISTED STEERING FLUID

Only use the fluid recommended by the manufacturer, in order to ensure correct system performance Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

2)BLANKING PLUGS

To prevent impurities from entering the power assisted steering circuit, use blanking plugs on the various dismantled parts.

2- SEALS

To ensure a sound power-assisted steering circuit seal, replace the power-assisted steering pipe seals each time a pipe is removed.

3- STEERING COLUMN

CAUTION

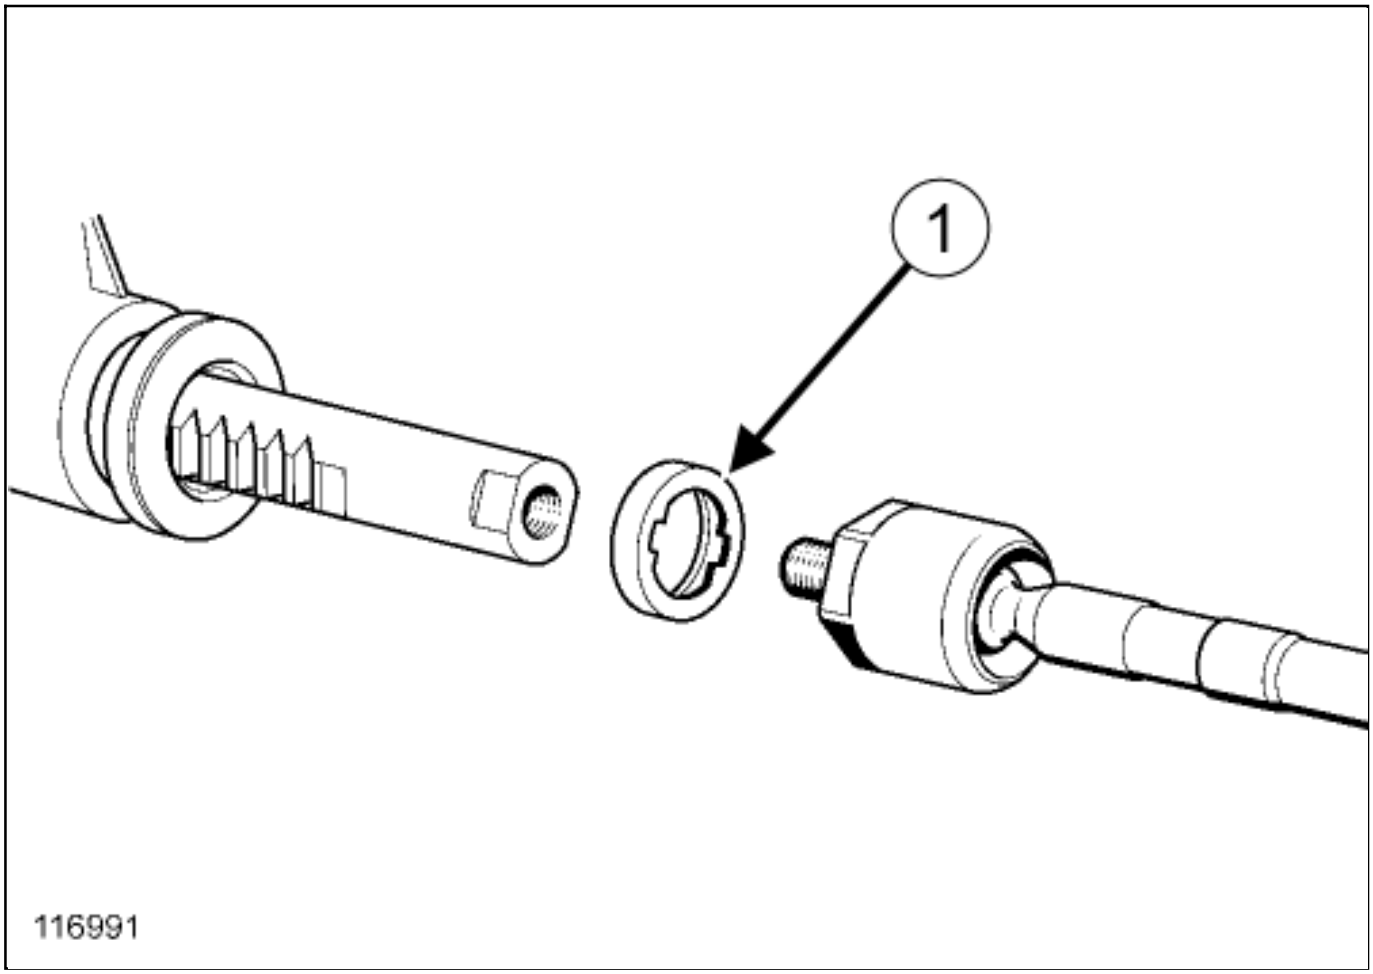
In order not to damage the steering wheel or steering column, the steering wheel-column foolproofing devices must be aligned.

Do not rest the steering column on the adjustment handle.

Do not handle the steering column by the adjustment handle or by the wiring.

Manoeuvre the "steering column - intermediate shaft" assembly by holding each section (one hand on the column and the other on the intermediate shaft). If the steering column is not handled correctly, there is a risk that the steering column or intermediate shaft could fall, which could destroy the system.

Always replace the steering column if it is dropped or in the event of an impact.



4- STEERING BOX

The steering box should not be carried by the gaiters or pipes, as this may damage them.

When the vehicle is positioned with the wheels suspended, the steering rack must not be subjected to violent movements from lock to lock.

Risks: Damage to the teeth of the steering rack and pinion may cause a safety riskrelating to the steering unexpectedly locking.

5- AXIAL BALL JOINT

The axial ball joint limiters(1) are colour coded for foolproofing purposes. When removing or replacing the axial ball joint, check that the limiter with the correct colour code is refitted.

6- POWER-ASSISTED STEERING PUMP

Do not run the engine without steering fluid in the circuit.

7- PUMP ASSEMBLY

Do not run the engine without steering fluid in the circuit.

8- WIRING HARNESSES

Ensure that the electrical wiring is clean and correctly routed.

STEERING: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTION TO BE FOLLOWED DURING THE OPERATION

WARNING

Wear cut-resistant gloves during the operation.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Use a cover to protect any chassis elements that may be contaminated with power-assisted steering fluid.

2- INSTRUCTION TO BE FOLLOWED DURING THE OPERATION

Clean around the power-assisted steering system using BRAKE CLEANER Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

3. JOB GROUP RECOMMENDATIONS

To ensure correct operation and performance of the system, do not attempt to repair any components other than those supplied in After-Sales.

To ensure the quality of the repair, only use the tooling recommended by the manufacturer.

1- POWER ASSISTED STEERING CIRCUIT:

1)POWER-ASSISTED STEERING FLUID

Only use the fluid recommended by the manufacturer, in order to ensure correct system performance Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

2)BLANKING PLUGS

To prevent impurities from entering the power assisted steering circuit, use blanking plugs on the various dismantled parts.

2- SEALS

To ensure a sound power-assisted steering circuit seal, replace the power-assisted steering pipe seals each time a pipe is removed.

3- STEERING COLUMN

CAUTION

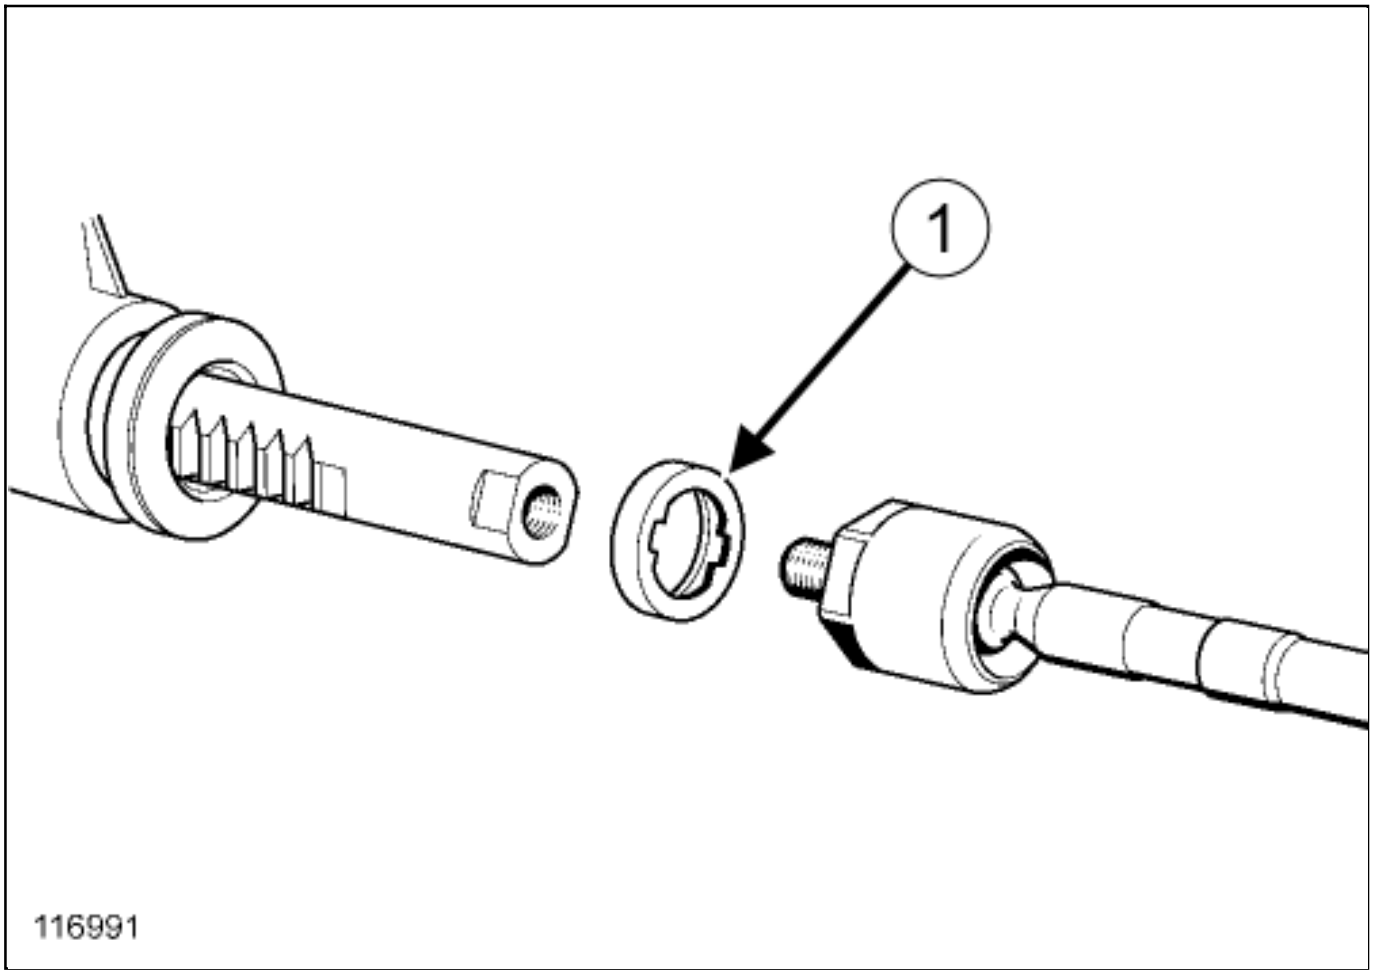
In order not to damage the steering wheel or steering column, the steering wheel-column foolproofing devices must be aligned.

Do not rest the steering column on the adjustment handle.

Do not handle the steering column by the adjustment handle or by the wiring.

Manoeuvre the "steering column - intermediate shaft" assembly by holding each section (one hand on the column and the other on the intermediate shaft). If the steering column is not handled correctly, there is a risk that the steering column or intermediate shaft could fall, which could destroy the system.

Always replace the steering column if it is dropped or in the event of an impact.



4- STEERING BOX

The steering box should not be carried by the gaiters or pipes, as this may damage them.

When the vehicle is positioned with the wheels suspended, the steering rack must not be subjected to violent movements from lock to lock.

Risks: Damage to the teeth of the steering rack and pinion may cause a safety riskrelating to the steering unexpectedly locking.

5- AXIAL BALL JOINT

The axial ball joint limiters(1) are colour coded for foolproofing purposes. When removing or replacing the axial ball joint, check that the limiter with the correct colour code is refitted.

6- POWER-ASSISTED STEERING PUMP

Do not run the engine without steering fluid in the circuit.

7- PUMP ASSEMBLY

Do not run the engine without steering fluid in the circuit.

8- WIRING HARNESSES

Ensure that the electrical wiring is clean and correctly routed.

STEERING WHEEL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

Steering wheel bolt

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Control - Signals: Precautions for repair ,
- Vehicle: Precautions for the repair .

Location and specification (tightening torques, parts always to be replaced, etc.) Steering assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Apply the procedure for deactivating the safety systems Airbag and pretensioners: Precautions for the repair .

- Remove the driver's frontal airbag Driver's frontal airbag: Removal - Refitting .

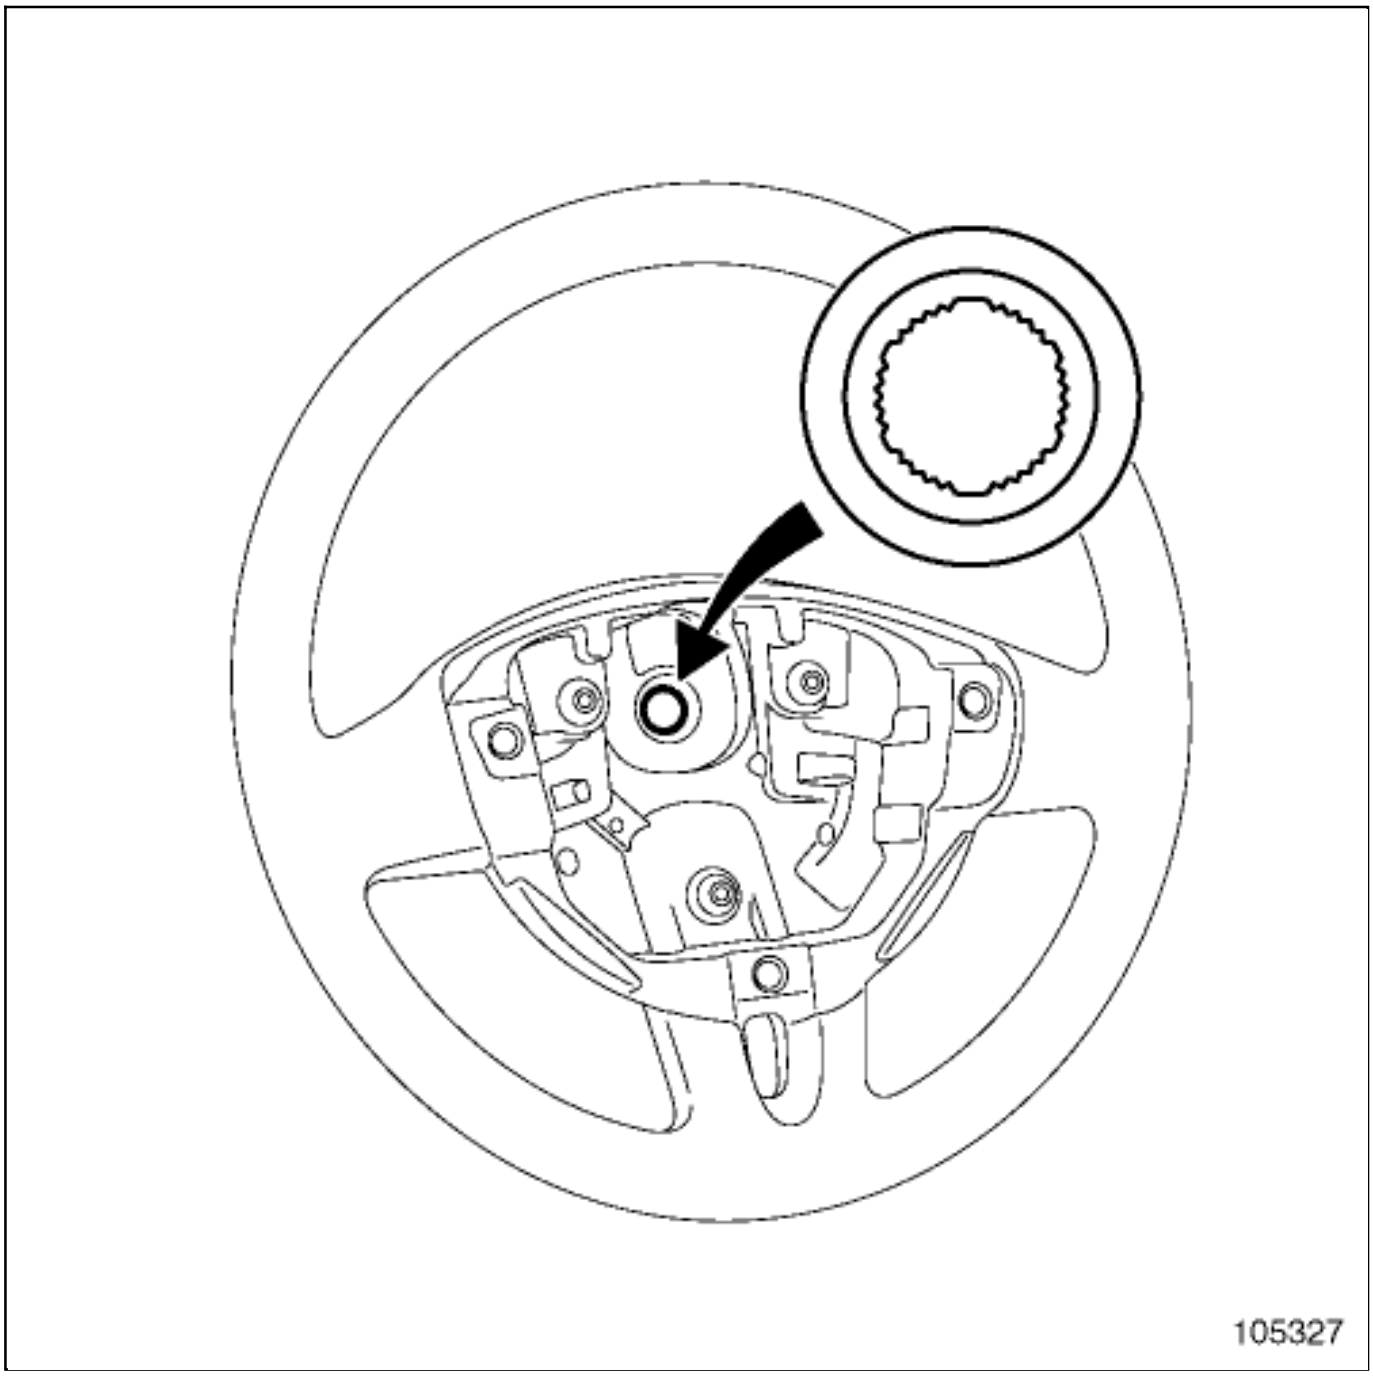
- Set the wheels straight ahead.

- Disconnect the connectors.

2. REMOVAL OPERATION

- Remove the steering wheel bolt.

- Remove the steering wheel.



REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: Steering wheel bolt .

- Check the alignment of the rotary switch Rotary switch: Adjustment .

2. REFITTING OPERATION

CAUTION

In order not to damage the steering wheel or steering column, the steering wheel-column foolproofing devices must be aligned.

Refit the steering wheel.

Connect the connectors.

Refit a new steering wheel bolt.

Torque tighten the steering wheel bolt Steering assembly: Exploded view .

3. FINAL OPERATION

Refit the driver's front airbag Driver's frontal airbag: Removal - Refitting .

Apply the procedure for activating the safety systems Airbag and pretensioners: Precautions for the repair .

4. CHECKING AFTER REPAIR

Switch on the ignition.

Check the operation of the rotary switch:

- turn the steering wheel to the left until it stops,
- turn the steering wheel to the right until it stops,
- check that there are no faults on the instrument panel.

STEERING WHEEL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

Steering wheel bolt

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Control - Signals: Precautions for repair ,
- Vehicle: Precautions for the repair .

Location and specification (tightening torques, parts always to be replaced, etc.)(see 36A, Steering assembly , Steering assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Apply the procedure for deactivating the safety systems Airbag and pretensioners: Precautions for the repair .

Remove the driver's frontal airbag Driver's frontal airbag: Removal - Refitting .

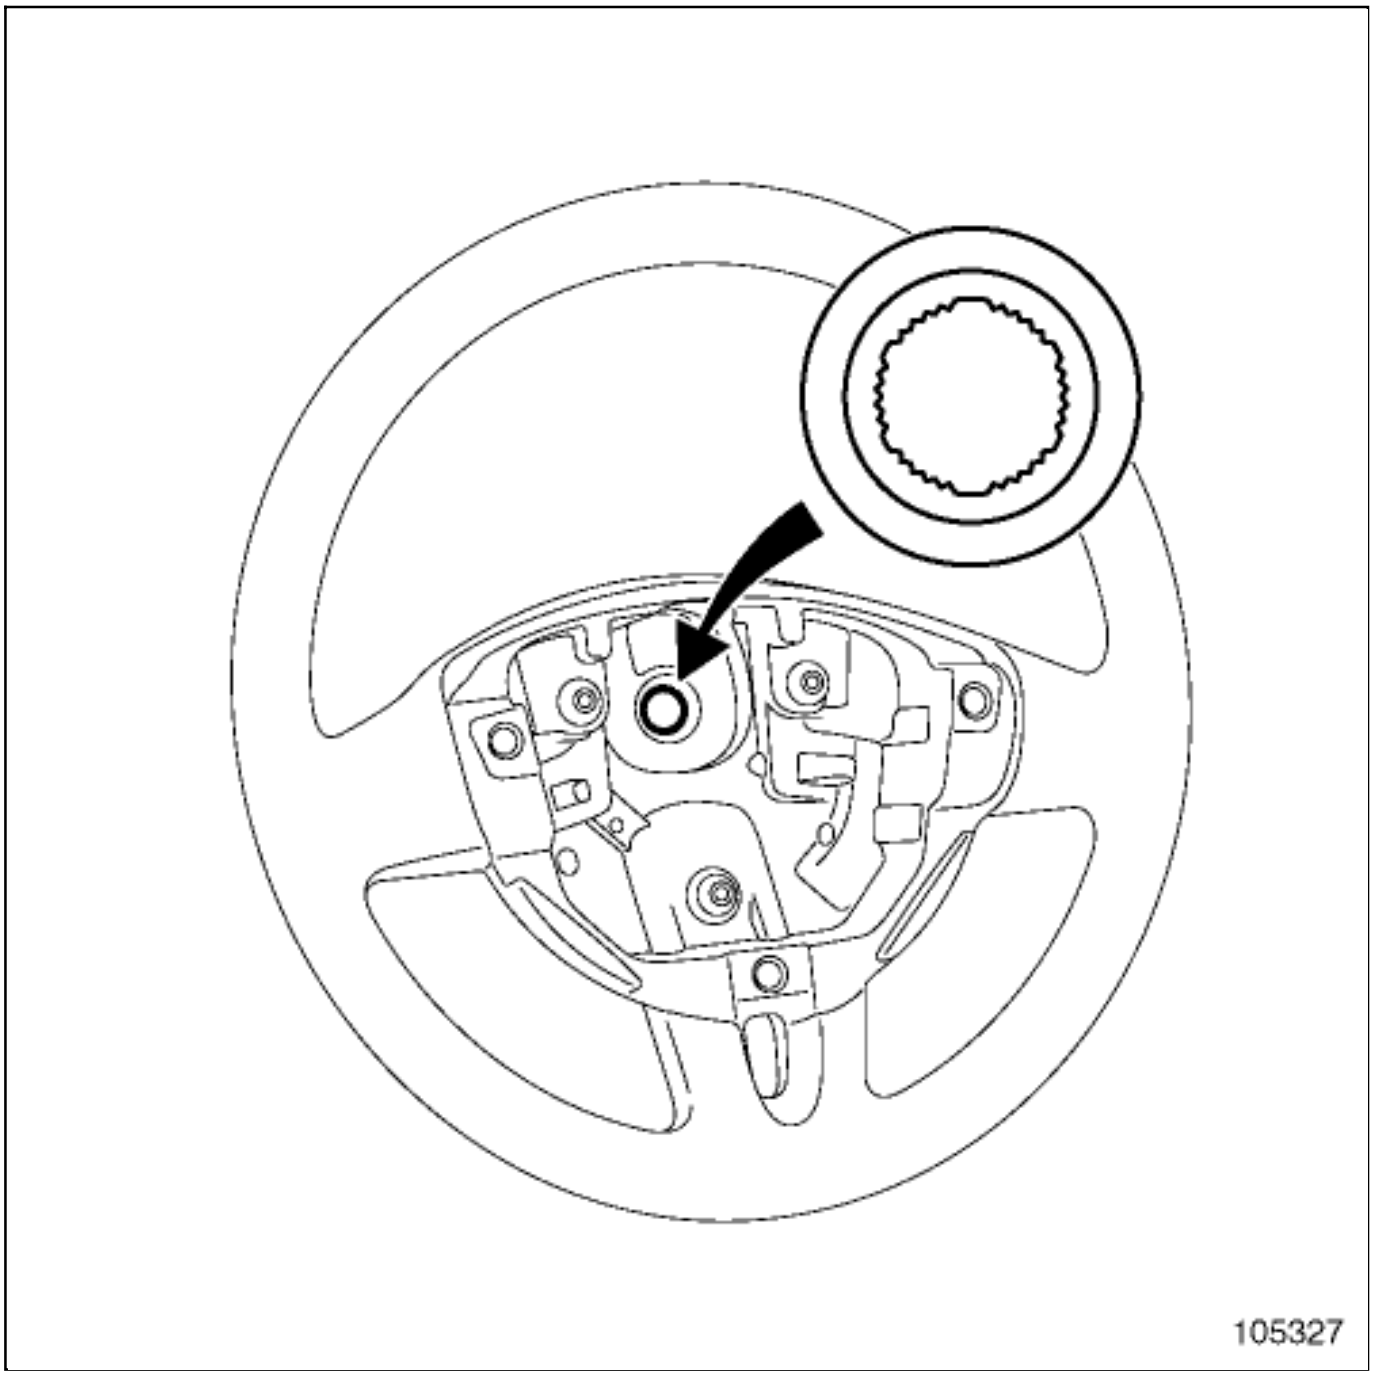
Set the wheels straight ahead.

Disconnect the connectors.

2. REMOVAL OPERATION

Remove the steering wheel bolt.

Remove the steering wheel.



REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Steering wheel bolt .

Check the alignment of the rotary switch Rotary switch: Adjustment .

2. REFITTING OPERATION

CAUTION

In order not to damage the steering wheel or steering column, the steering wheel-column foolproofing devices must be aligned.

Refit the steering wheel.

Connect the connectors.

Refit a new steering wheel bolt.

Torque tighten the steering wheel bolt(see 36A, Steering assembly , Steering assembly: Exploded view) .

3. FINAL OPERATION

Refit the driver's front airbagDriver's frontal airbag: Removal - Refitting .

Apply the procedure for activating the safety systemsAirbag and pretensioners: Precautions for the repair .

4. CHECKING AFTER REPAIR

Switch on the ignition.

Check the operation of the rotary switch:

- turn the steering wheel to the left until it stops,
- turn the steering wheel to the right until it stops,
- check that there are no faults on the instrument panel.

STEERING WHEEL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

Steering wheel bolt

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Control - Signals: Precautions for repair ,
- Vehicle: Precautions for the repair .

Location and specification (tightening torques, parts always to be replaced, etc.) Steering assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Apply the procedure for deactivating the safety systems Airbag and pretensioners: Precautions for the repair .

- Remove the driver's frontal airbag Driver's frontal airbag: Removal - Refitting .

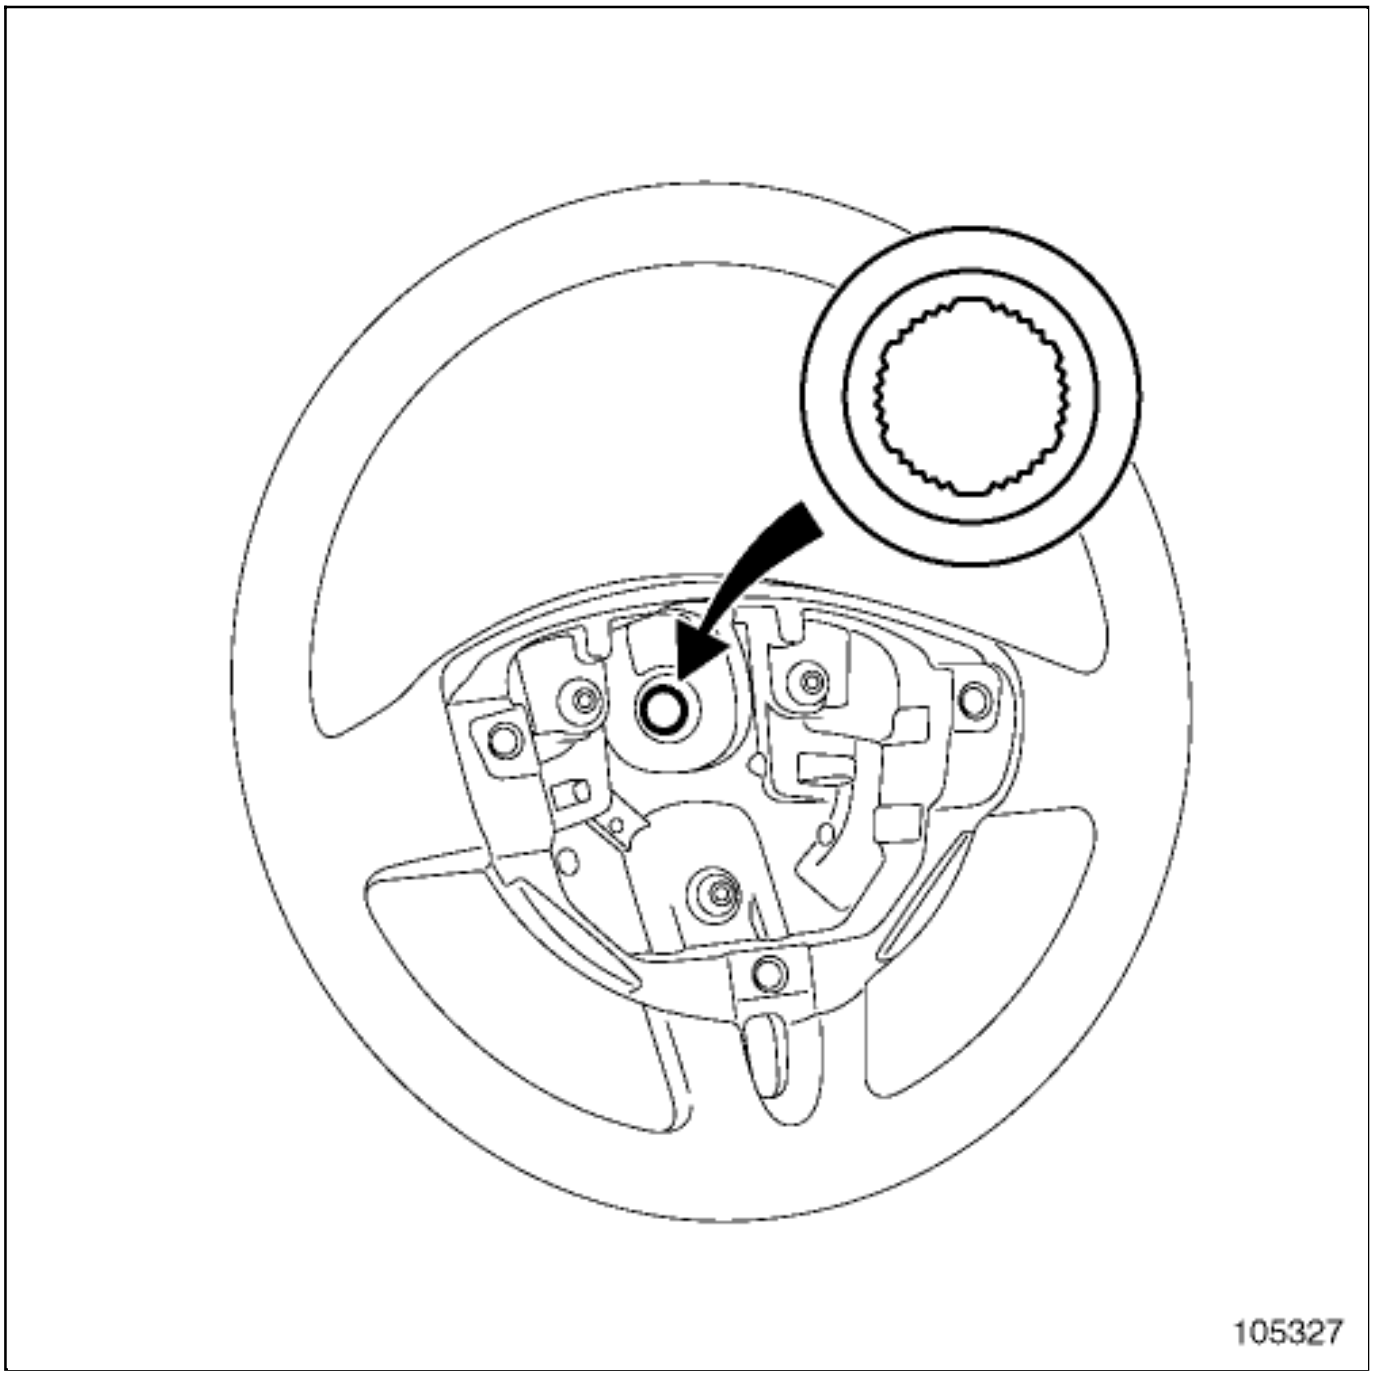
- Set the wheels straight ahead.

- Disconnect the connectors.

2. REMOVAL OPERATION

- Remove the steering wheel bolt.

- Remove the steering wheel.



REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: Steering wheel bolt .

- Check the alignment of the rotary switch Rotary switch: Adjustment .

2. REFITTING OPERATION

CAUTION

In order not to damage the steering wheel or steering column, the steering wheel-column foolproofing devices must be aligned.

Refit the steering wheel.

Connect the connectors.

Refit a new steering wheel bolt.

Torque tighten the steering wheel bolt Steering assembly: Exploded view .

3. FINAL OPERATION

Refit the driver's front airbag Driver's frontal airbag: Removal - Refitting .

Apply the procedure for activating the safety systems Airbag and pretensioners: Precautions for the repair .

4. CHECKING AFTER REPAIR

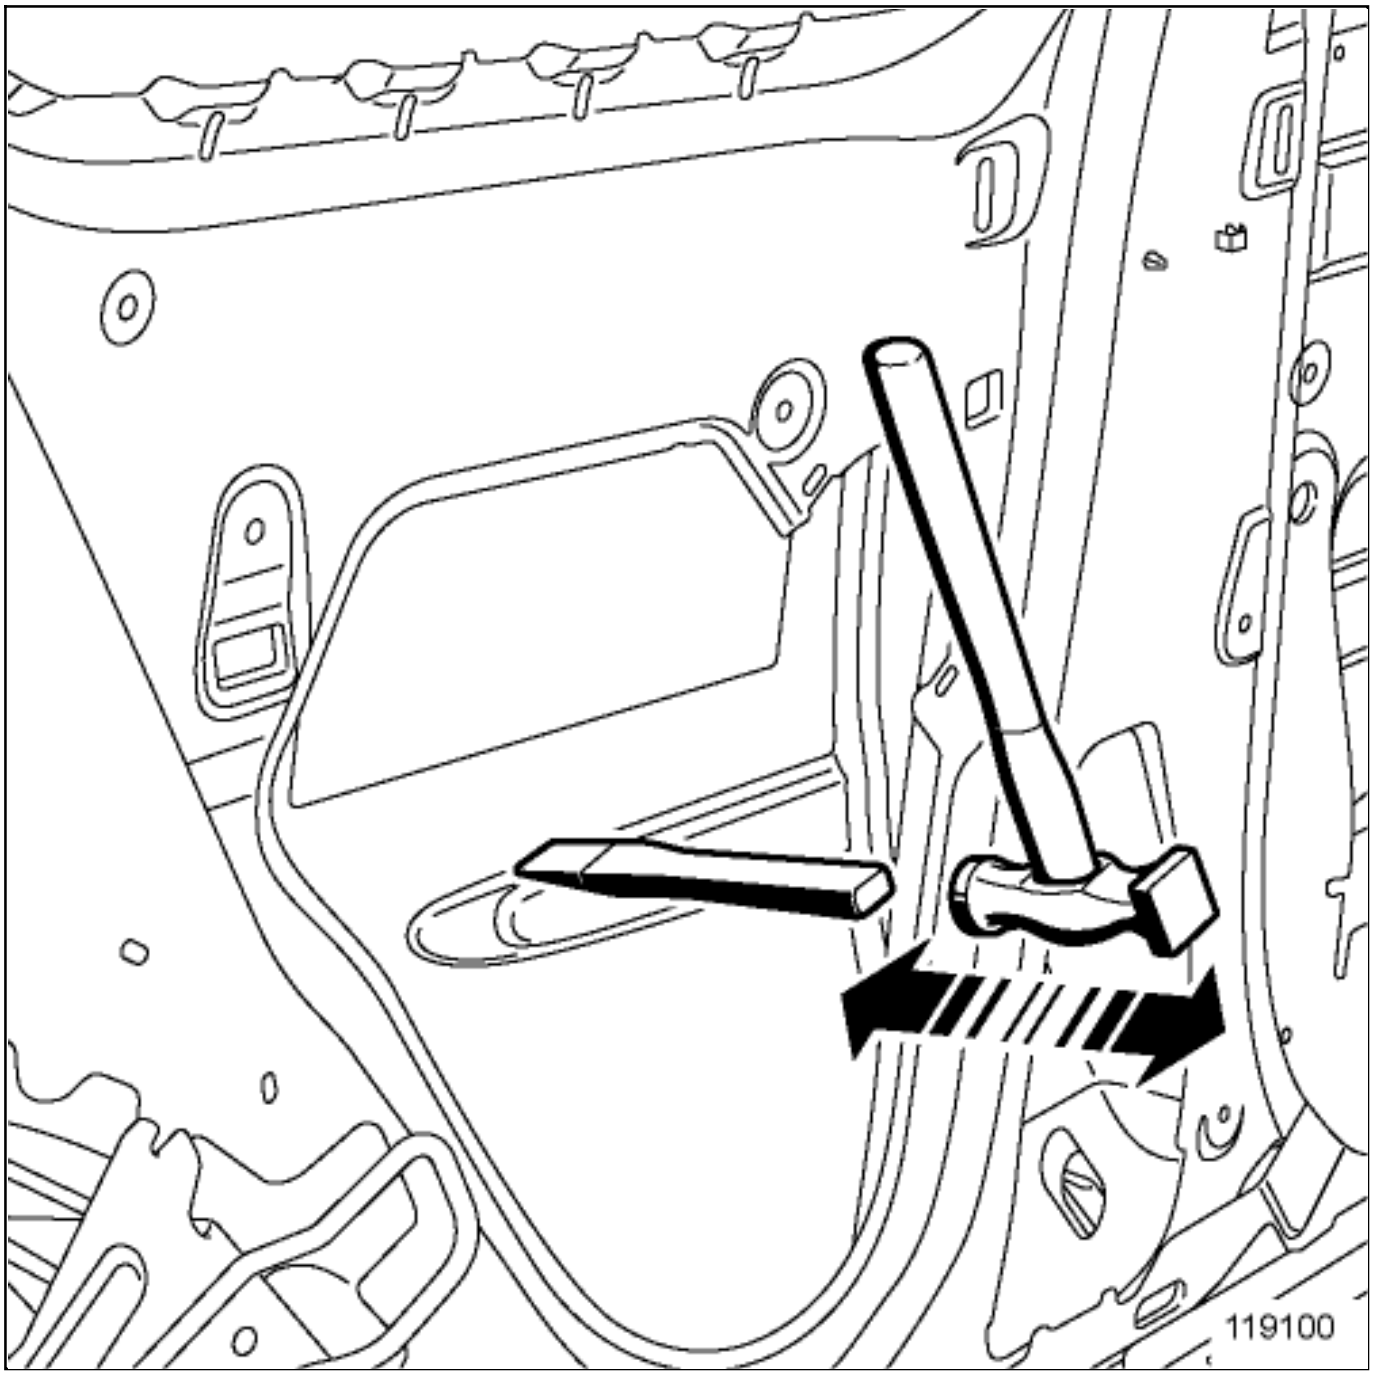
Switch on the ignition.

Check the operation of the rotary switch:

- turn the steering wheel to the left until it stops,
- turn the steering wheel to the right until it stops,
- check that there are no faults on the instrument panel.

STRAIGHTENINGACOMPONENT:DESCRIPTION

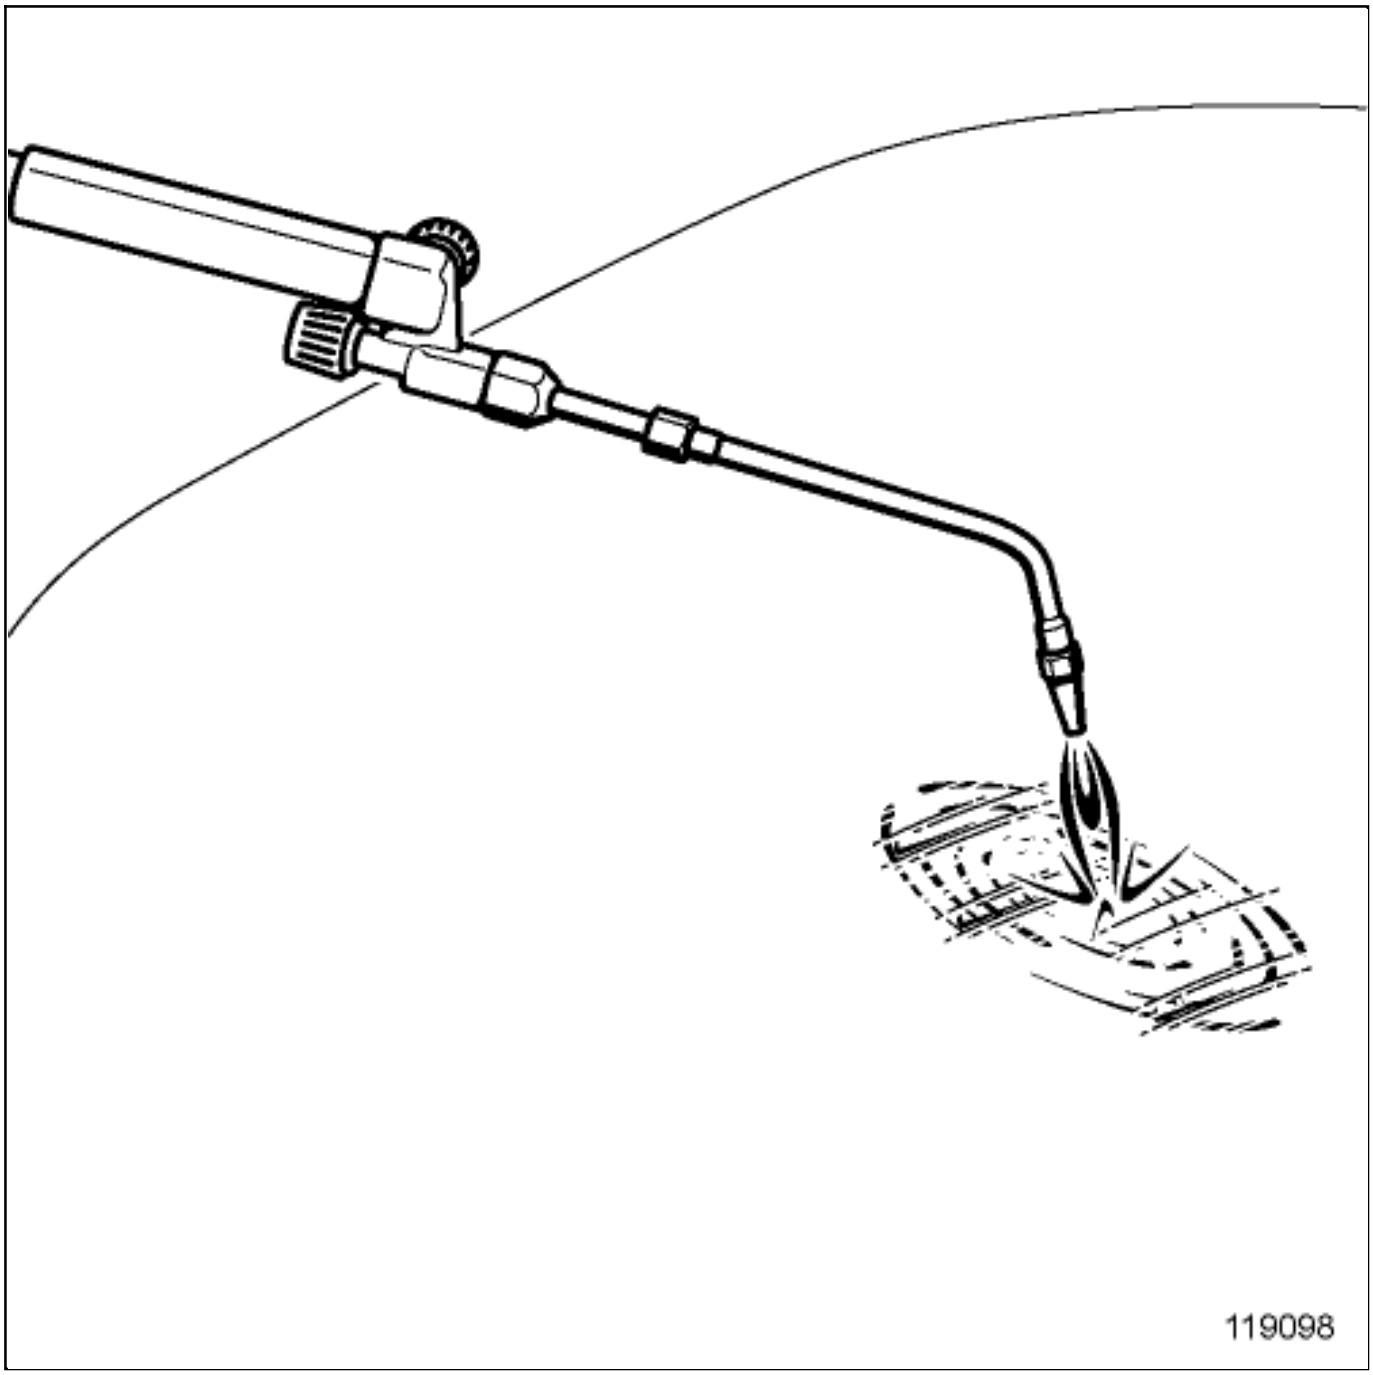
1. REMOVING DENTS FROM STEEL COMPONENTS



- Used only for straightening visible external components:
  - rear wing panels,
  - door panels,
  - side panels,
  - lining components without a primary structural function (e.g.: wheel arches, floor).

It does not require heavy straightening equipment and can be performed anywhere in the bodyshop.

For all dent removal or heating operations, always start at the outside of the deformity and work towards the centre.



1- DENT REMOVAL WITH ACCESS VIA THE INTERNAL FACE

1)STRAIGHTENING

Straighten the internal face using a drift, stake or hammer until as close as possible to the required shape, then use a planishing hammer or mallet and a suitable stake to strike "the opposite way" .

2)HEATING

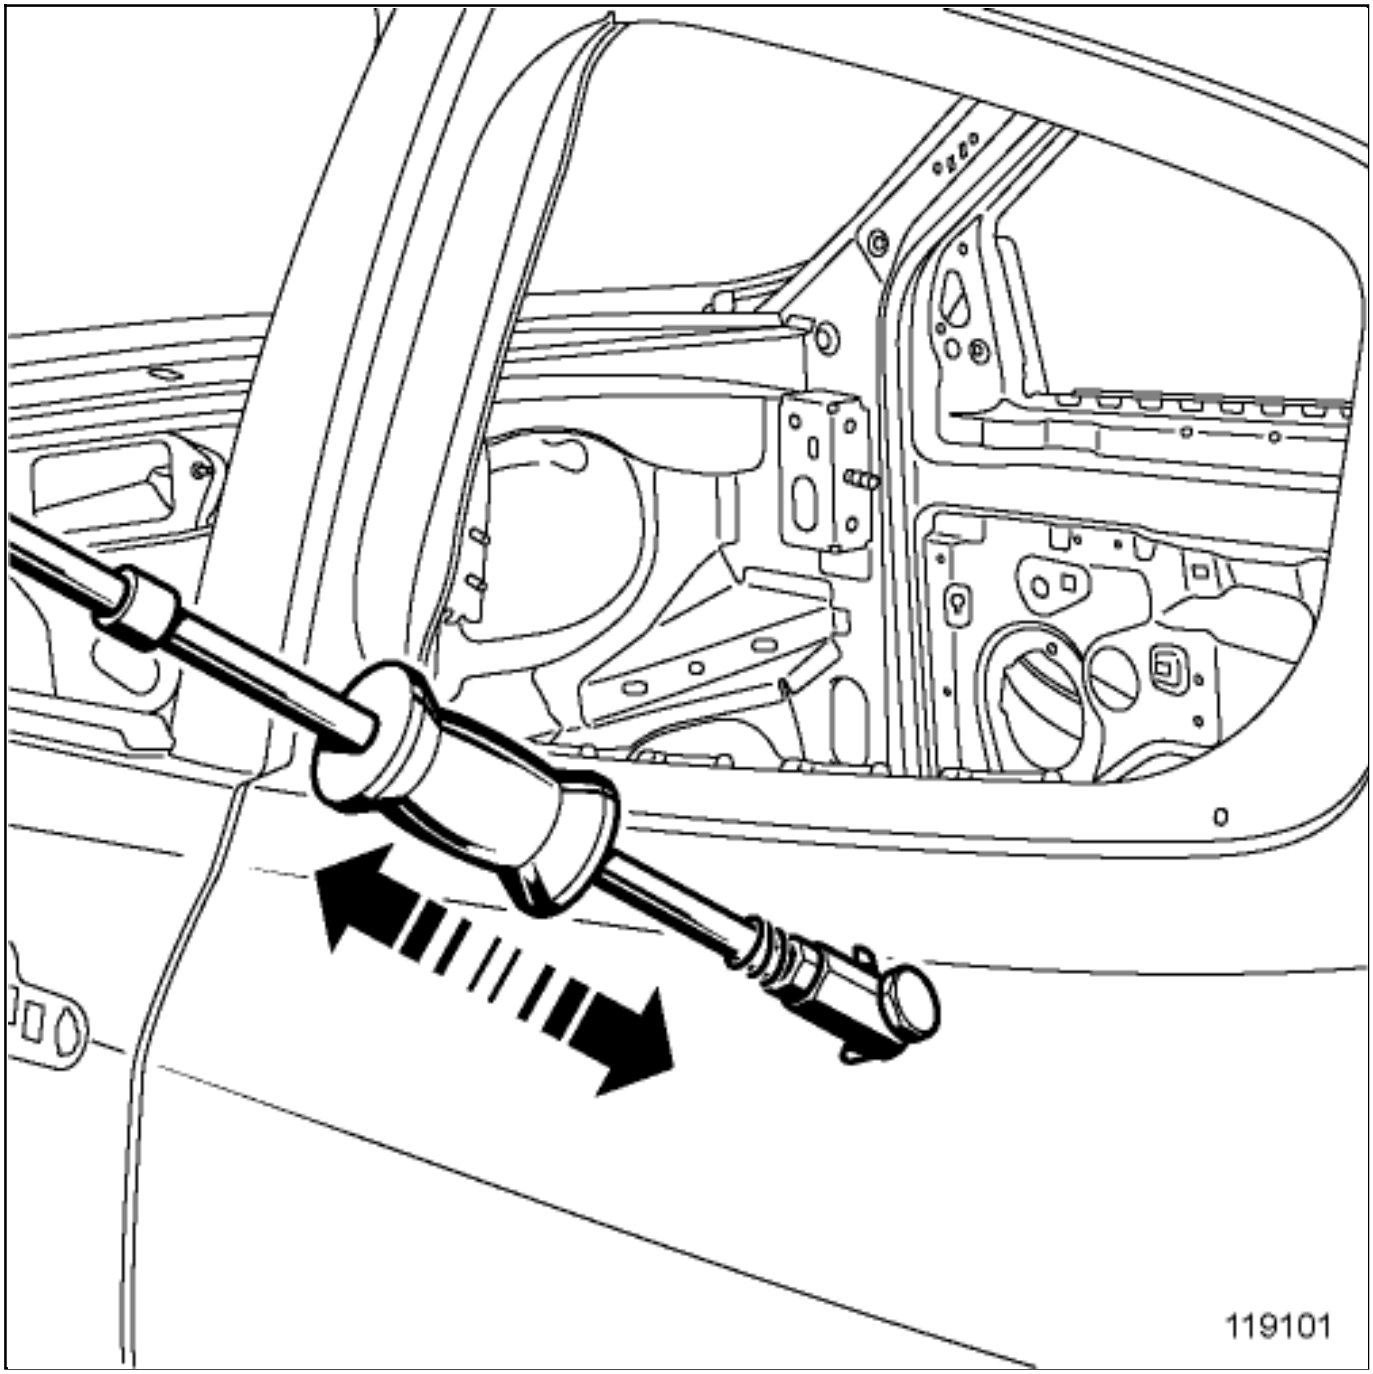
The operation is performed using an oxyacetylene torch, a flat stake and a mallet.

Note:

For steel, this operation destroys all original anti-corrosion protection on the internal and external faces of the heated zones. It is essential to carry out a painting procedure on the internal faces.

By definition, shape finishing on a zone accessible via the internal face must be by "planishing" and heating. Under no circumstances should the component panel be filed or ground, so as not to reduce its thickness.

2- DENT REMOVAL WITHOUT ACCESS VIA INTERNAL FACE

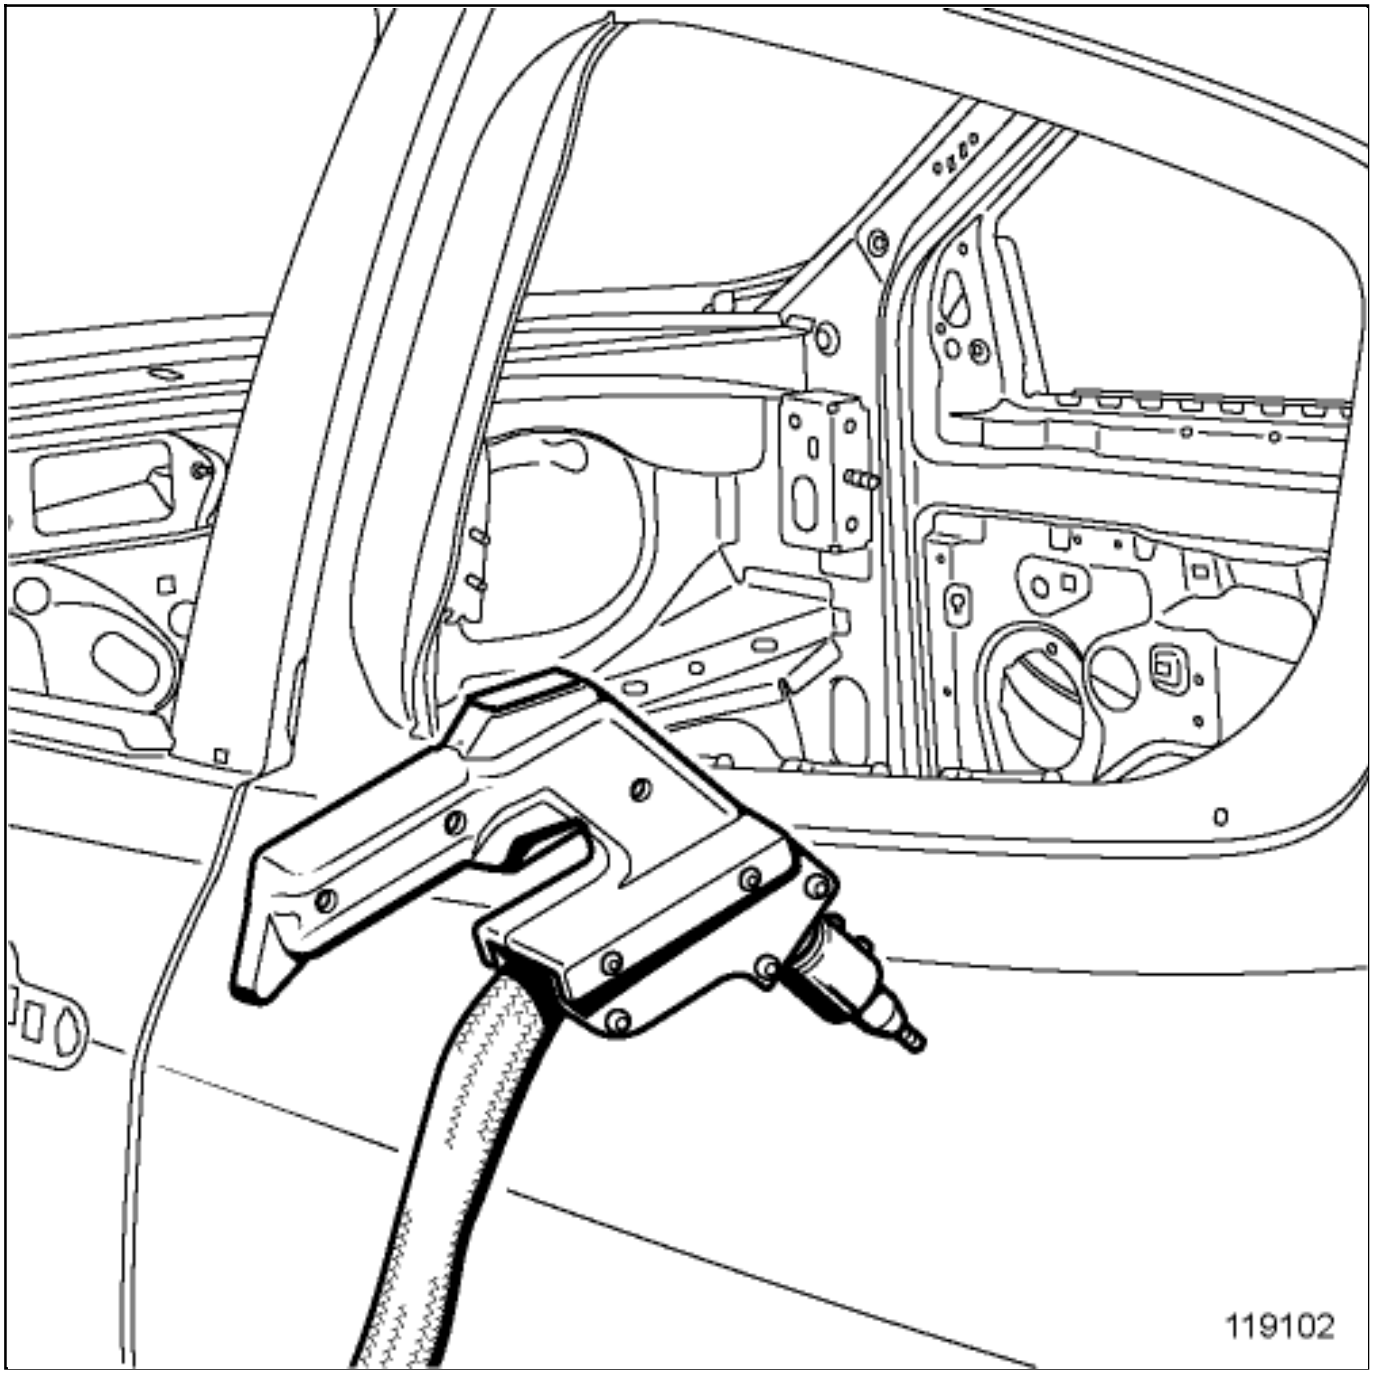


This type of straightening is performed with a "welding/puller" type tool, using two techniques depending on the force to be applied.

1)SINGLE POINT INERTIA STRAIGHTENING

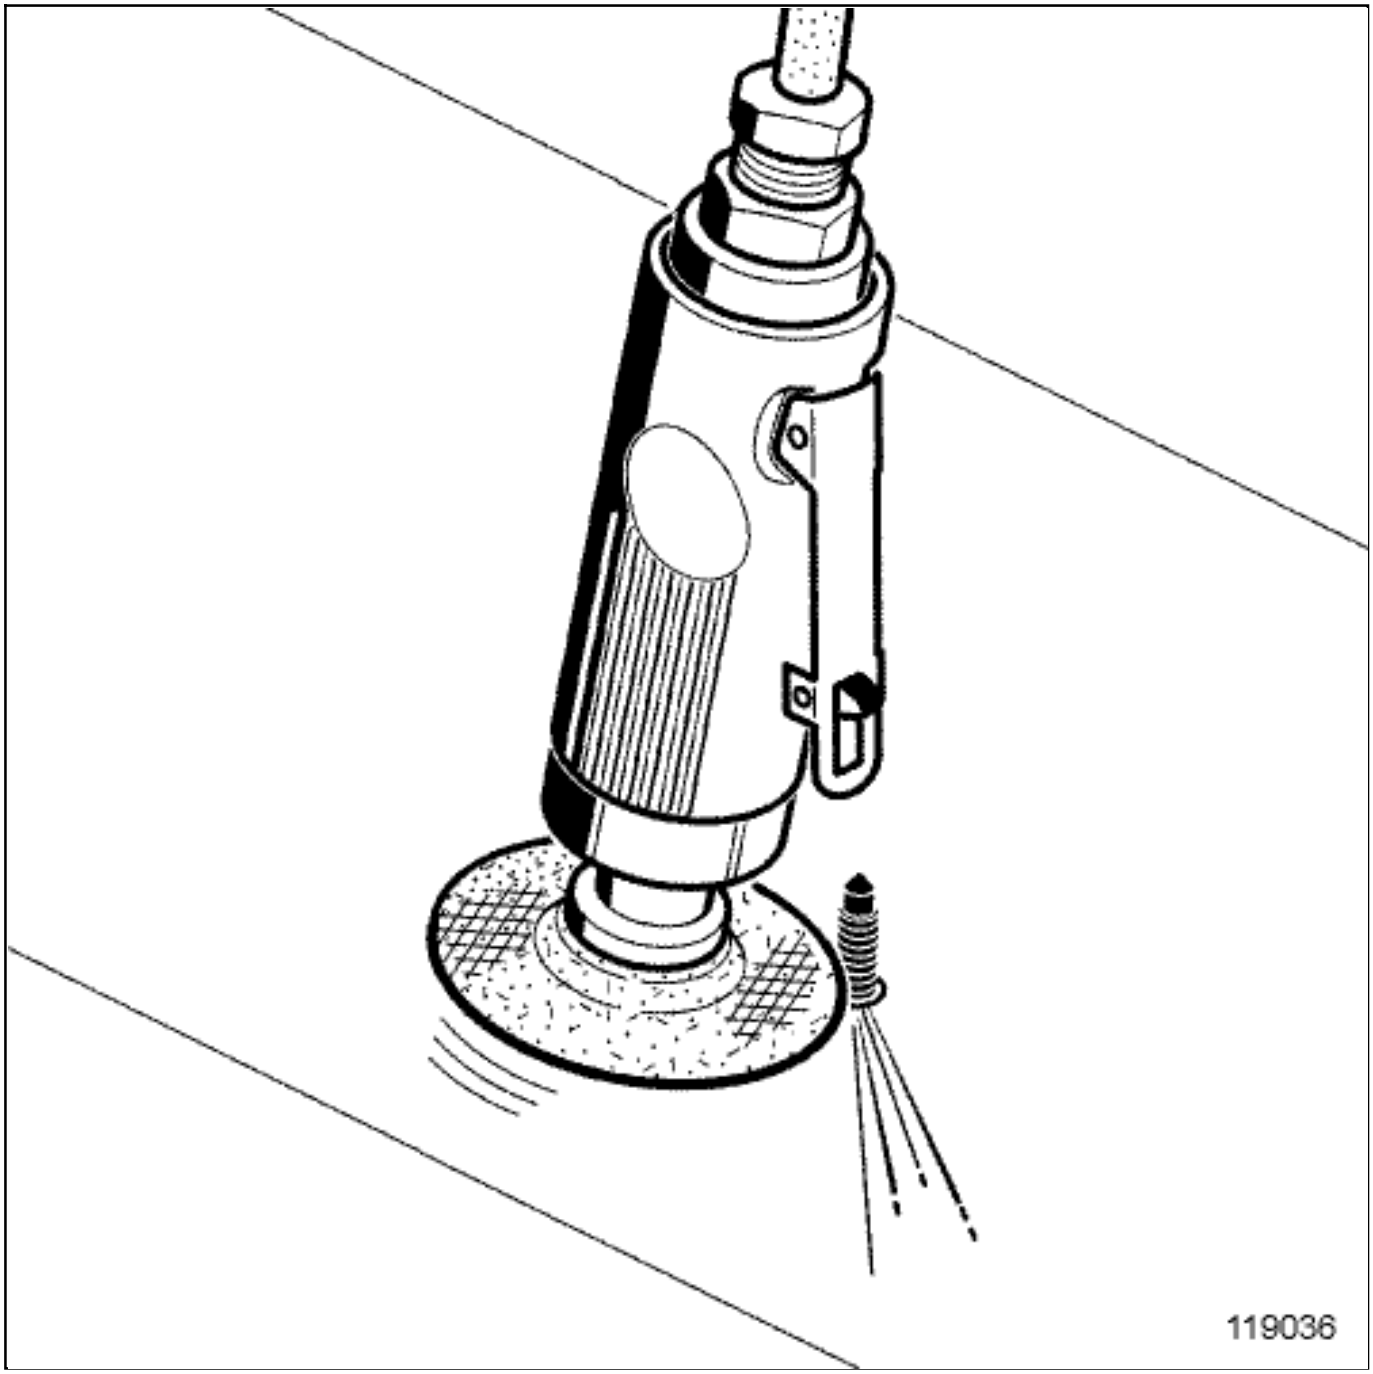
Note:

During an operation of this type on the B-pillar, disconnect the side airbags inertia switch electrical connector.



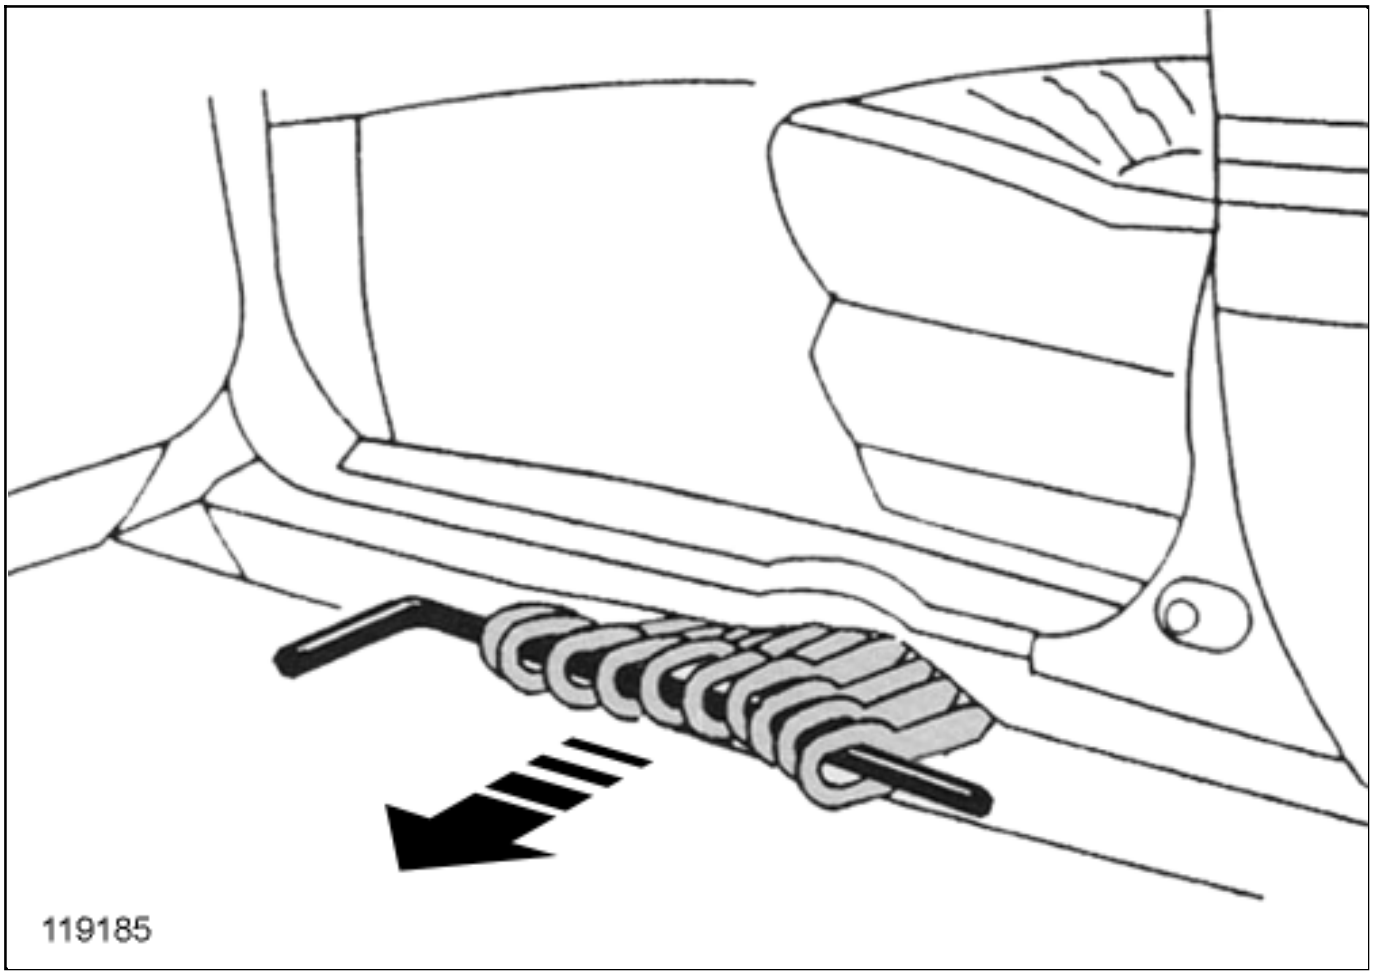
Steel :

■ the operation consists of repeatedly welding a star shape into the recesses of the dent. This is fixed at the end of a rod, along which an inertia weight slides.



Note:

Always start the repair from the outside edge and work inwards, finishing at the centre.



Aluminium :

■ this requires a specific technique and equipment, consisting of welding a threaded stud onto which the pulling device is screwed.

When the operation is complete, the stud is cut then ground. Do not under any circumstances reduce the thickness of the panel, to avoid weakening the component.

2)STRAIGHTENING BY MULTIPOINT PULLING

This technique is used for straightening deep gouge marks; it consists of welding a series of parallel rings in the recess of the deformity, into which a rod is fitted to allow a lever system equipped with a "clamp" to be attached. The advantage is that it can be used to straighten a significant deformation with a single pull.

3)HEATING

Note:

For steel, this operation destroys all original anti-corrosion protection on the internal and external faces of the heated zones. It is essential to inject wax into the hollow sections to protect the internal faces.

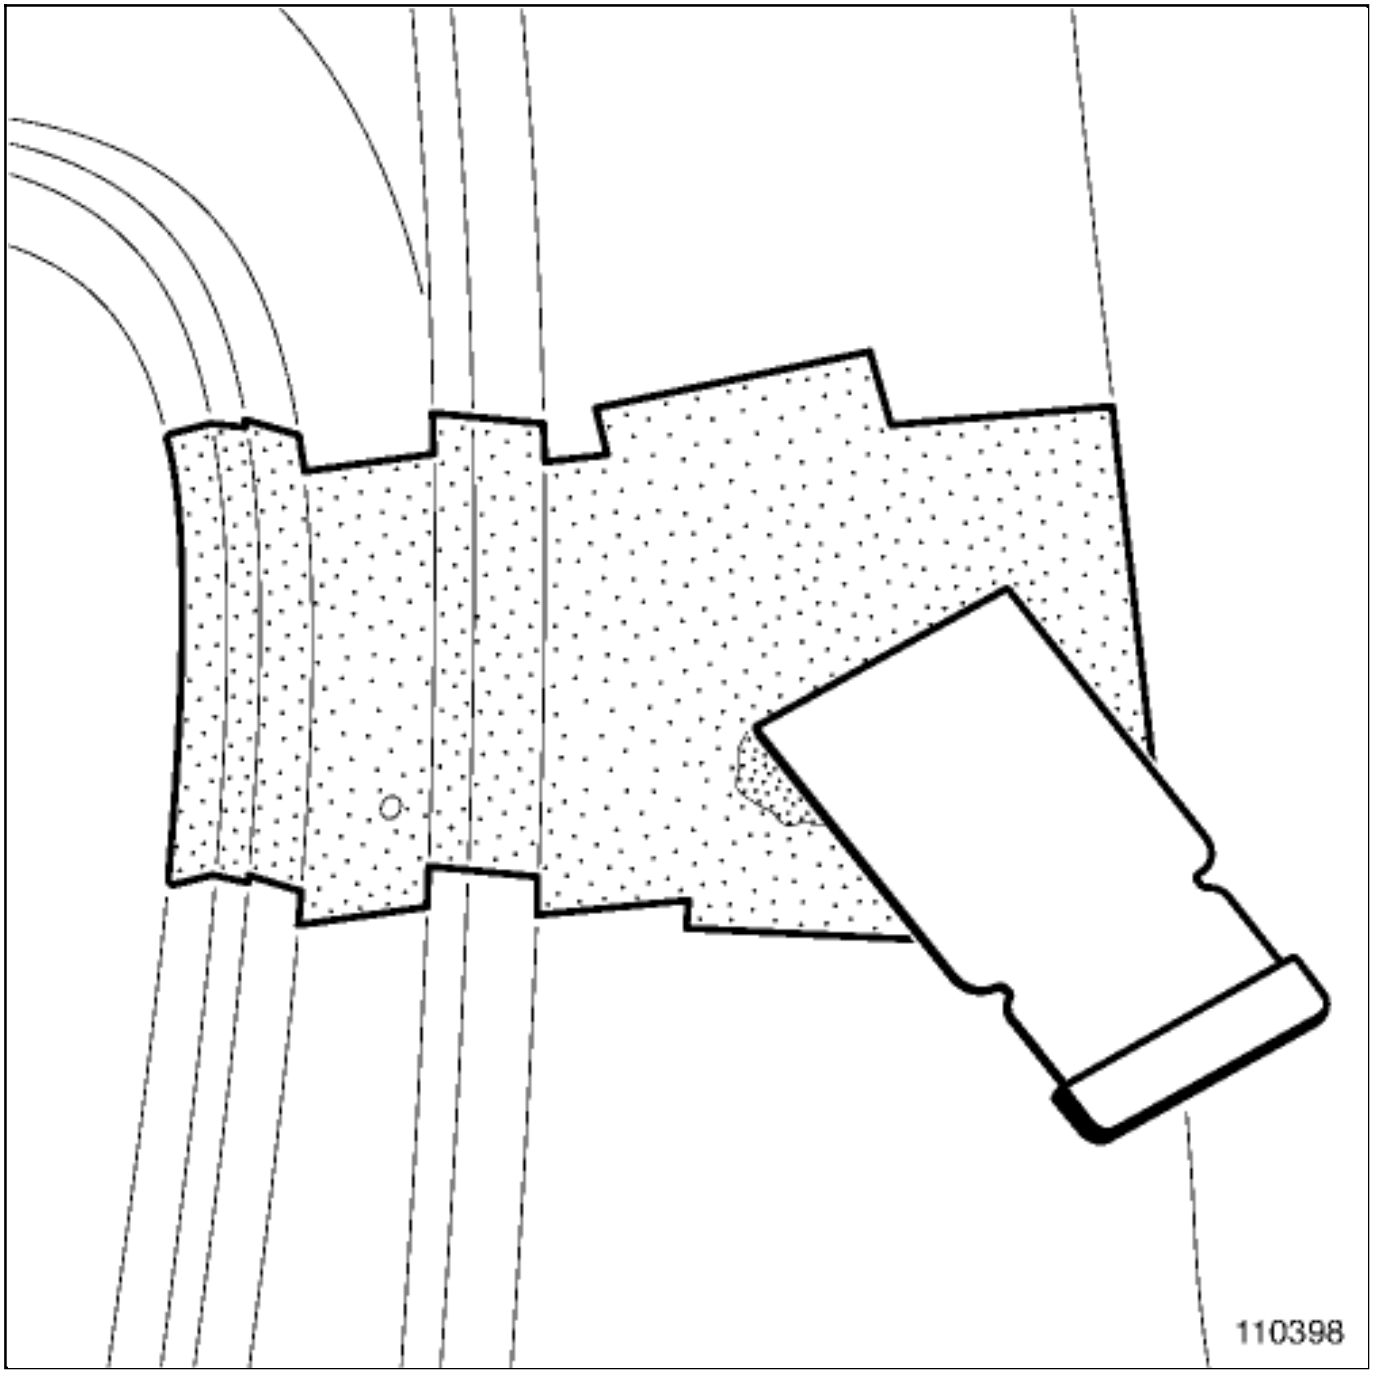
Steel :

an inductor type tool may be used, however in this process the metal is only hardened on the surface to

avoid blistering; lengthening of the panel cannot be reduced.

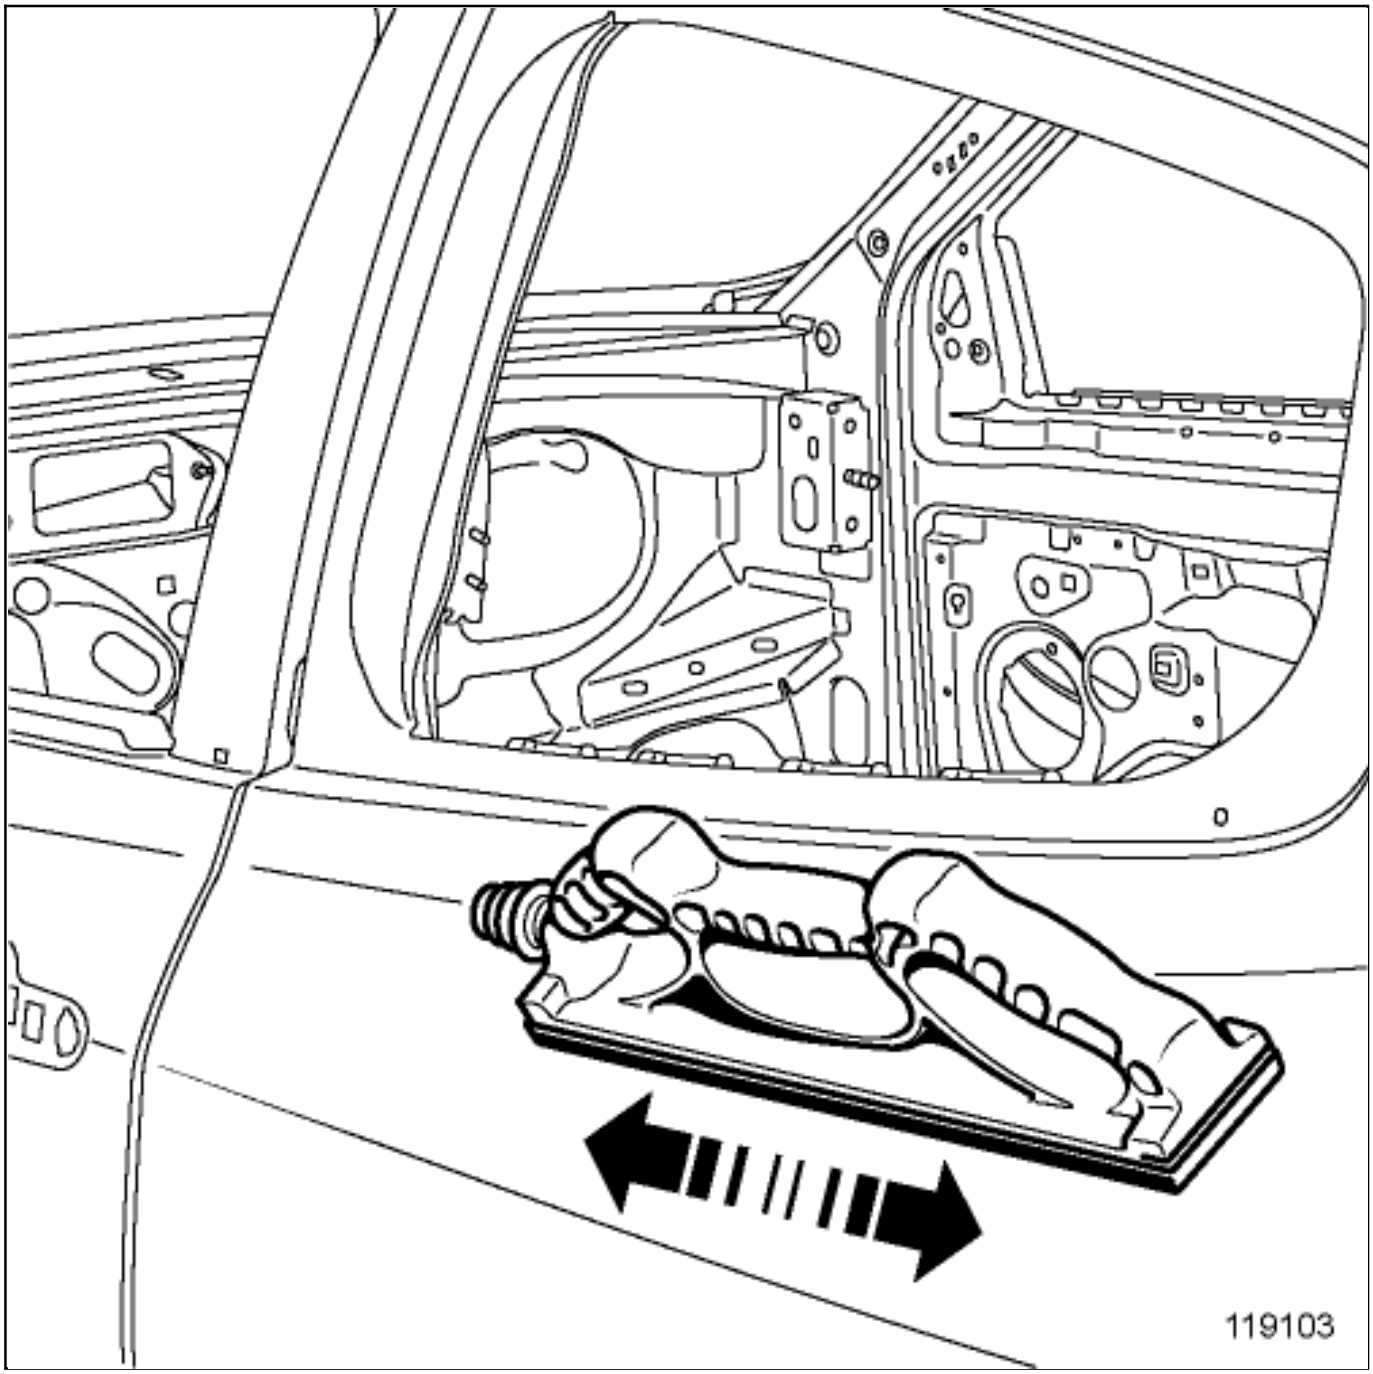
Note:

In the event of excessive lengthening of the panel without access to the internal face, the component must be replaced.



4)SHAPE FINISHING

In accordance with the new European directive on vehicle recycling, vehicles manufactured after the 1st July 2003 should not contain any lead based products.



Furthermore, with regard to bodywork repairs, these vehicles should not be repaired using tin, which contains a large amount of lead.

The replacement solution for this type of operation is to use dual component polyester mastic containing aluminium. Aluminium panels are shape finished using "special aluminium" polyester mastic.

It is important that the thickness of the residual mastic following sanding does not exceed 1 mm.

Polyester mastic is applied using a block or broad knife.

Sanding during shaping should be done using P100dry sand paper with a large "file" type block.

Surface finishing should be via light sanding using P150sand paper.

Never use an "orbital" sander to sand during shape finishing, as the motion of this type of equipment is not suitable for the operation.

2. REMOVING DENTS FROM ALUMINIUM COMPONENTS

1- TOOLS

The basic tools used are the same as for repairing steel panels.

Only use tools and abrasive discs specifically used for repairing aluminium, in order to prevent contamination of the aluminium surface with steel particles, which could result in galvanic corrosion.

Favour the use of mallets, wooden stakes or possibly plastic stakes.

In order to prevent any impact marks and scratches, the metal tools should not have any sharp edges, and their surfaces should be smooth and polished.

Consequently, finishing hammers (grooved face) must not be used.

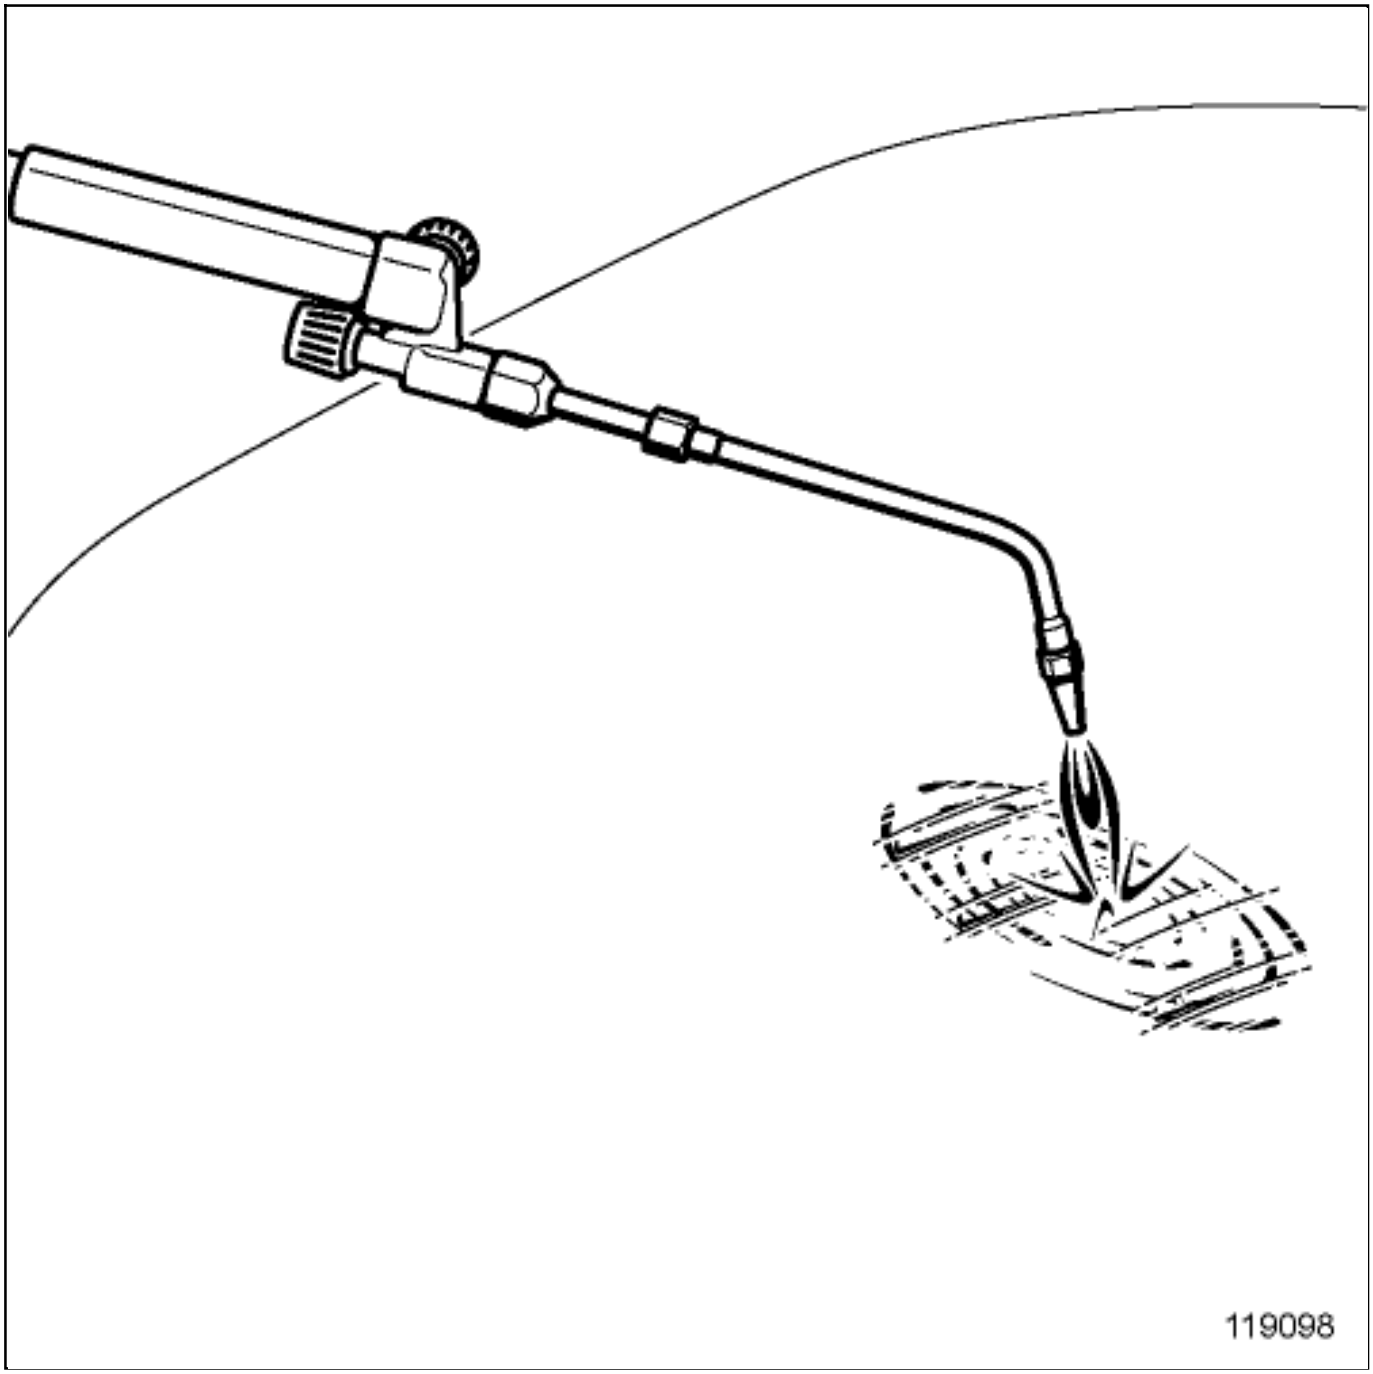
The edges of the files for soft metals should be rounded.

2- DENT REMOVAL

There is a higher risk of lengthening aluminium panels than steel panels; for this reason, the planishing operation should be carried out gently.

Panel lengthening can be eliminated by supplying heat (150˚C) which can be controlled using a temperature indicator.

Note:



Use a 150˚ Heat Markerto control the heating temperature correctly (see IXELL product catalogue).

1)CHECKING THE TEMPERATURE

Before heating, remove any sign of coating (paint, primer, cataphoretic coating), as these can affect the temperature reading.

The flame of the blowtorch should be adjusted so that there is slightly more acetylene in relation to oxygen.

Mark the area using the pencil.

The marks will melt when the temperature is reached.

3- FINISHING

Aluminium bodywork component: Preparation and paint range (94A, Paint application range for panels).

3. JACKING

For reasons of passive safety, all jacking and straightening operations for structural components which have undergone deformation beyond the elastic limit (marked crumpling) must be followed by a planishing operation.

This applies to all structural components, irrespective of the type of panel. They must be replaced if they cannot be straightened cold.

It is very difficult to cold straighten an ultra high elastic limit panel, and you are strongly advised not to heat the material to make it malleable.

For major impacts, it may be necessary to perform preliminary jacking in order to:

- detach the electrical wiring harnesses,
- release the mechanical components to be removed,
- gain access to a joint.

This should not affect the choice of jacking equipment; this is made according to the type of repair to be carried out (see below).

4. LIGHT JACKING

1- JACKING PARTS OF A VEHICLE WHICH DO NOT HAVE A DIRECT INFLUENCE ON STRUCTURAL BEHAVIOUR (E.G.: REAR END PANEL, WHEEL ARCH, FLOOR, LININGS)

All the straightening techniques described above may be used for any parts which are not directly visible and whose primary function is not structural.

2- JACKING AND STRAIGHTENING A STRUCTURAL COMPONENT

For all straightening operations on one of these components, perfectly align the "edges" and blanks by "planishing" with a suitable stake and hammer.

Note:

Never use an inertia type straightening device.

To do this, detach the component's closure panel to gain access to the internal face during straightening.

You are strongly advised not to use shape finishing mastic on a structural component to hide residual crumpling.

1)JACKING WITHOUT SUBFRAME CHECKS

When there is no need for geometry checks (e.g.: rear end panel, scuttle side panel upper reinforcement, front or rear side member ends), repair without parts replacement is carried out on a standard small straightening bench (See: Garage equipment catalogue).

2)JACKING WITH SUBFRAME CHECKS

When geometry checks are necessary (e.g.: assembled side members, front half unit or all parts comprising mechanical mounting points), repair without parts replacement is carried out on a small straightening bench equipped with special raised anchoring clamps to allow a geometry checking system to be positioned underneath the vehicle.

5. HEAVY JACKING AND REBUILDING WITH SUBFRAME CHECKS

The parts concerned by this procedure are identified in each vehicle MR in sub-section 40A**Structural components to be positioned on the repair bench: Description** .

The parts may be partially replaced, except for ultra high elastic limit components, for which complete replacement is compulsory.

When straightening or replacing these parts, it is essential to check the geometry of the components; repairs are carried out on a repair bench (body jig bench) (See: Garage equipment catalogue.

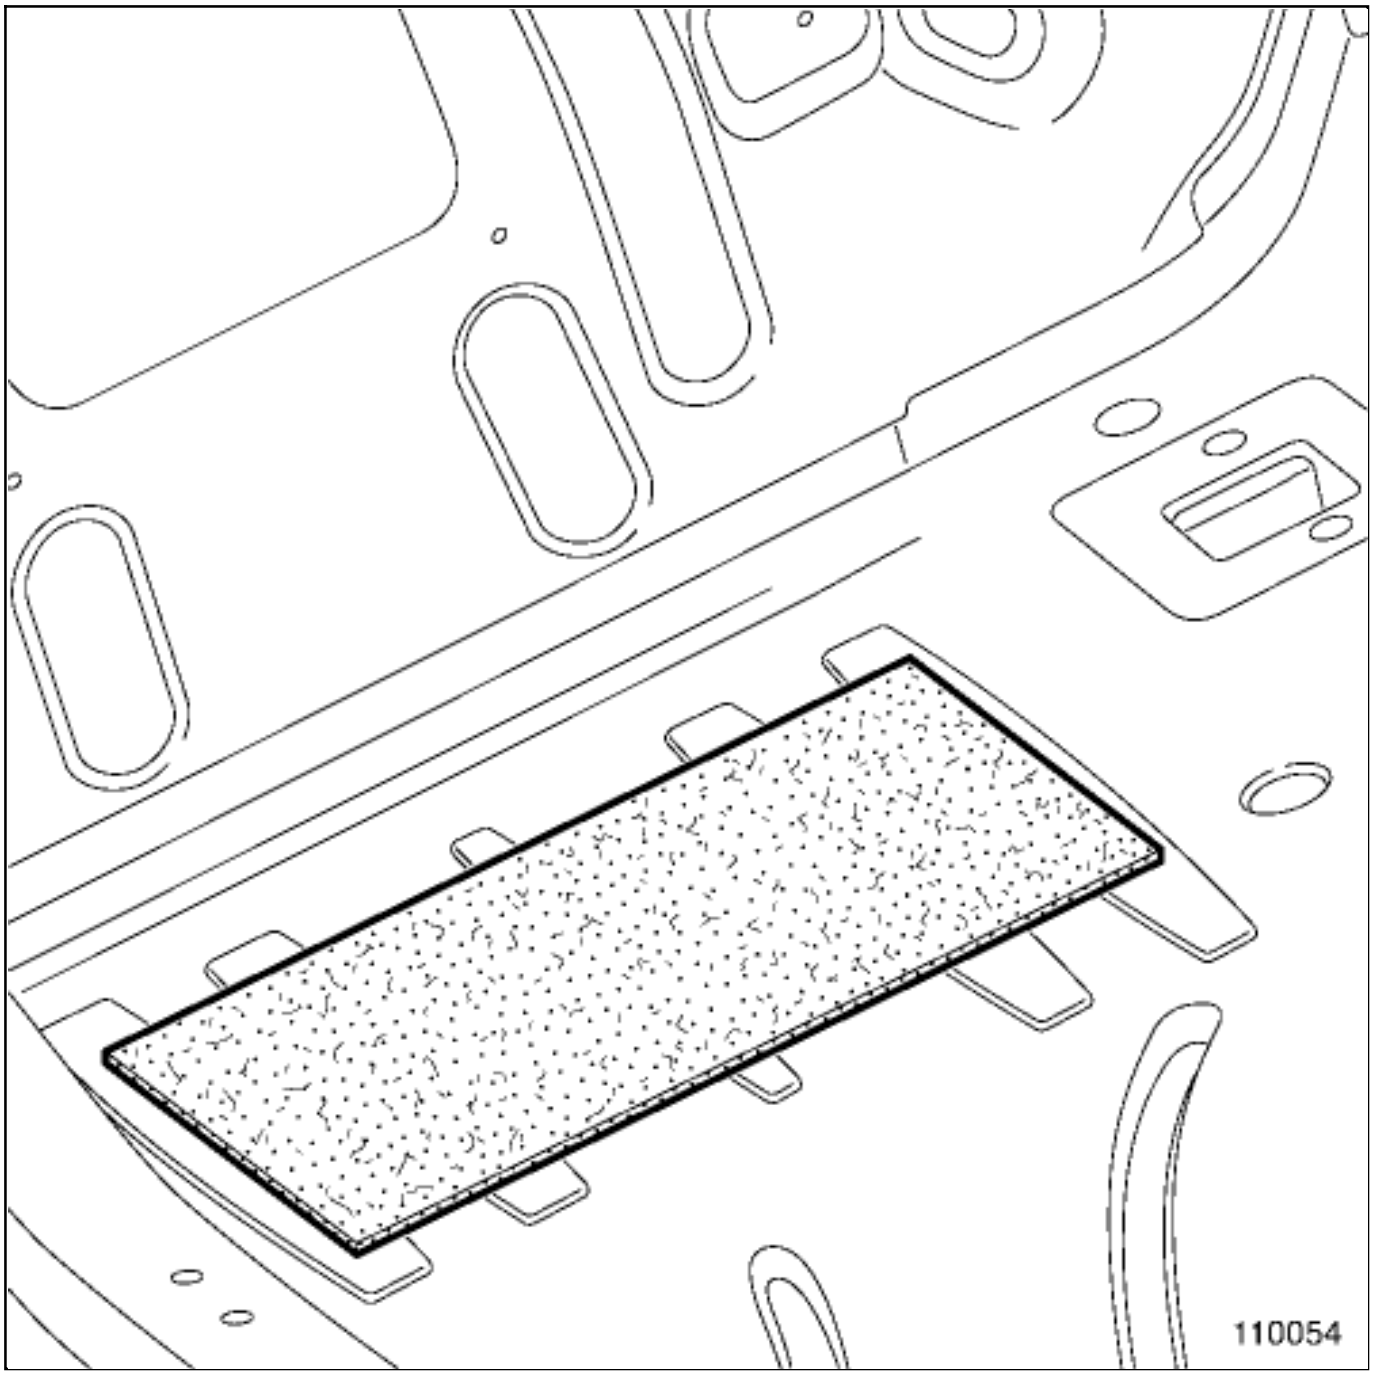
The repair bench consists of several components, each of which fulfils a distinct function:

- The body jig bench: rigid base plate which simultaneously supports and secures the vehicle. This is equipped with an anchoring system comprising four anchoring clamps which may be fitted with additional retaining devices for the three-dimensional checks.
- The jacking system: must comprise at least a 10 tonne bracket, a special “pulling” chain and a gripping device.
- The geometry checking system: this may be either positive, or use three-dimensional measuring. It is used to check and realign important structural points during straightening operations, and the spatial positioning of replaced components in relation to the body.

XSL version : 3.02 du 22/07/11

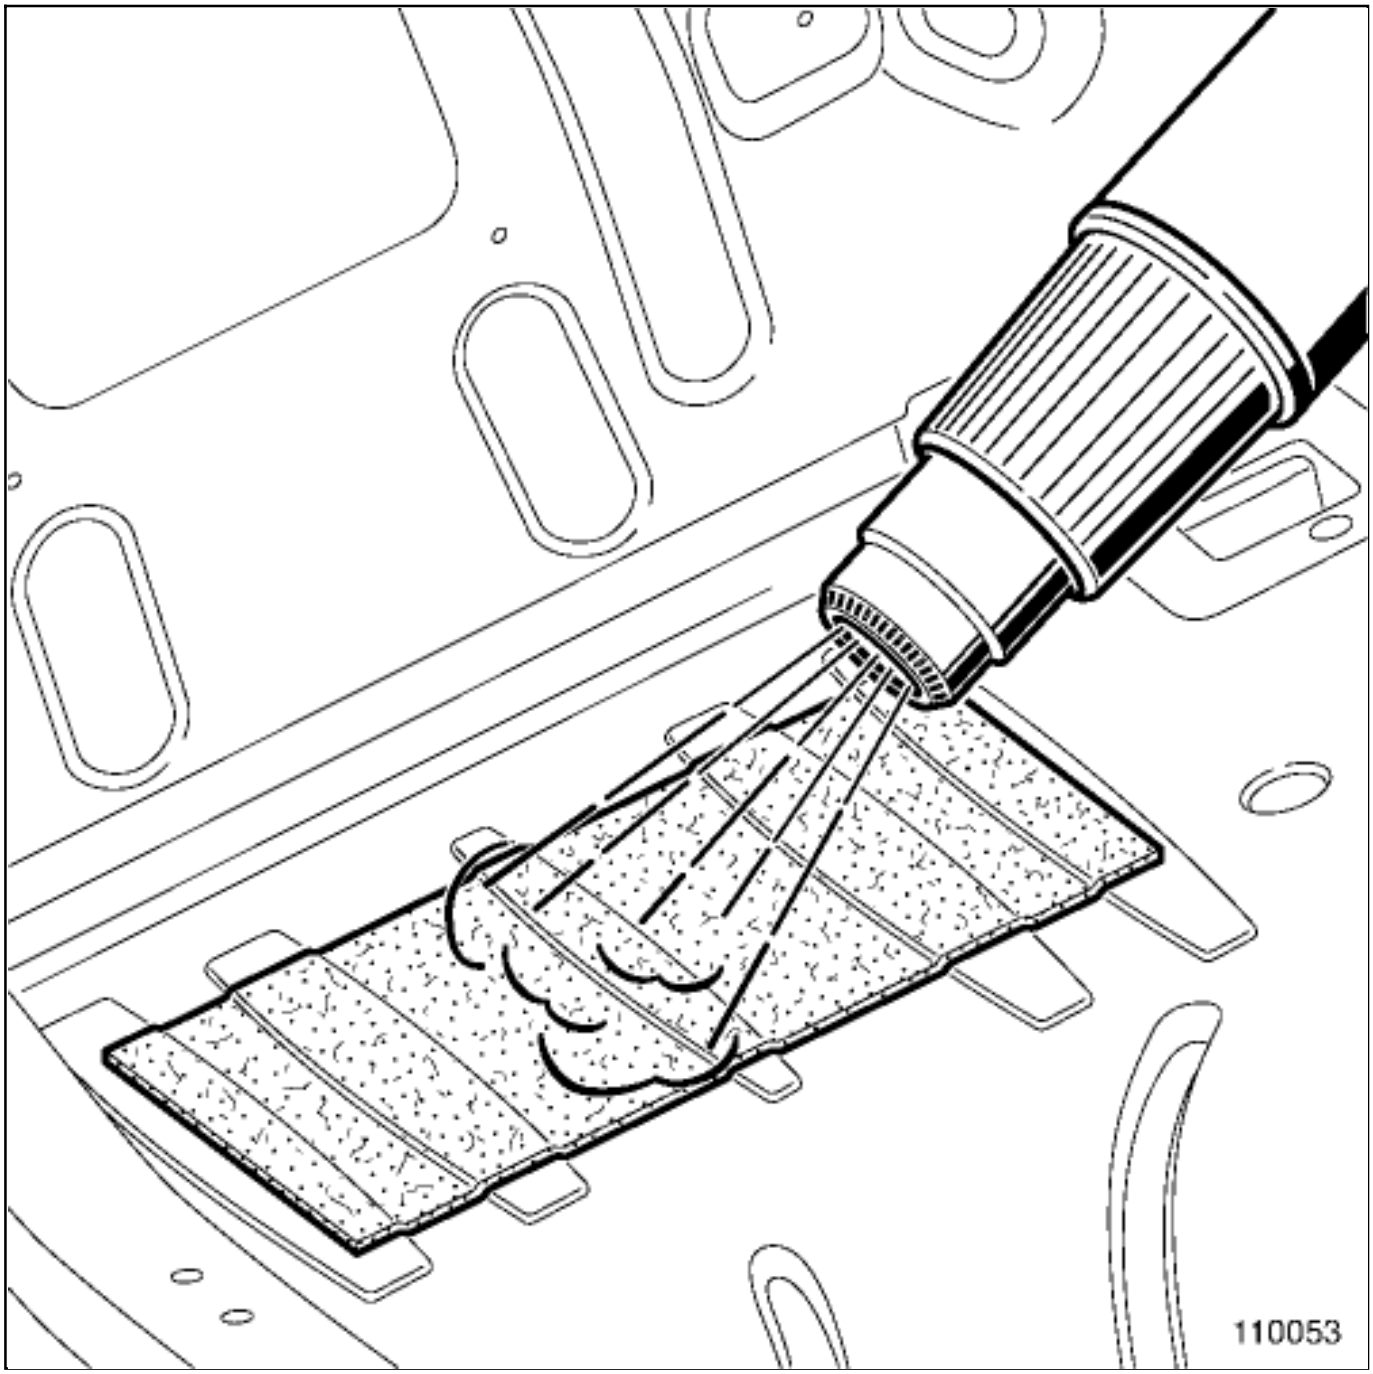
STRUCTURALACOUSTICPROTECTION

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)



1. SHOCK ABSORBING PANELS

1- PREPARATION

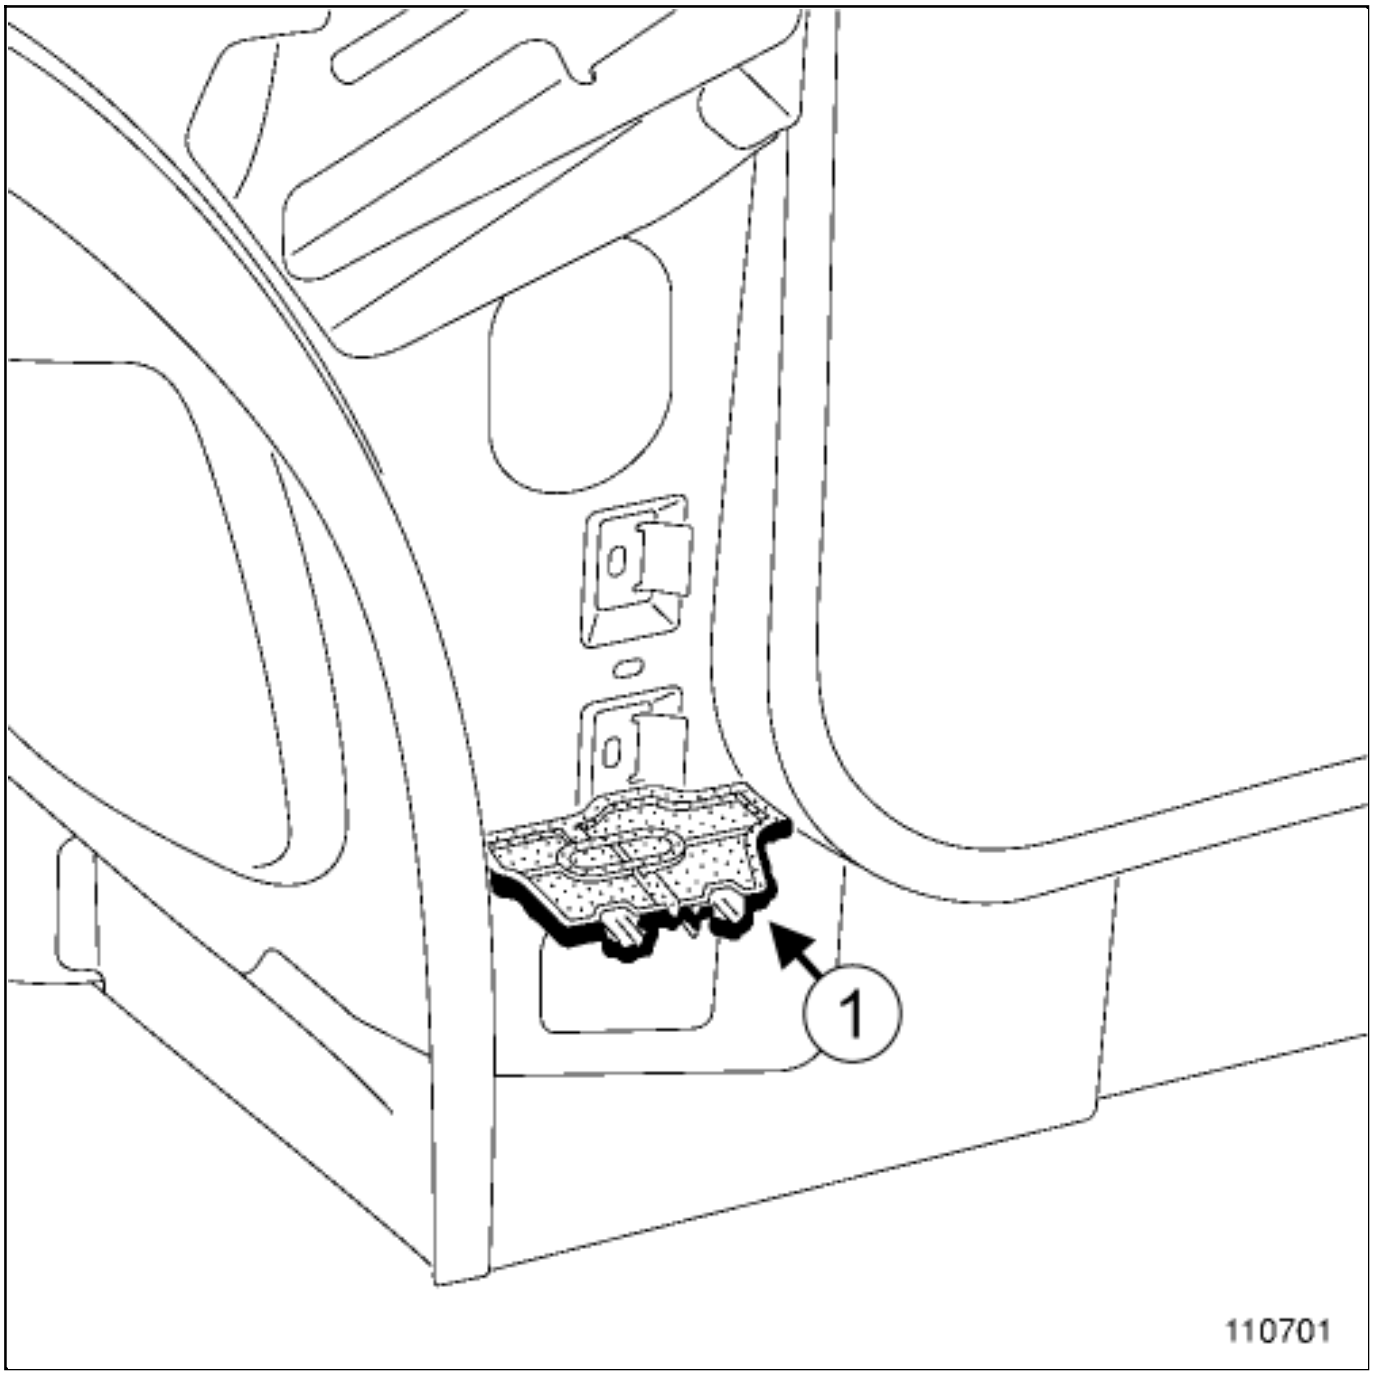


Cut out the panel according to the shape and the dimensions of the original.

Clean the application area on the vehicle.

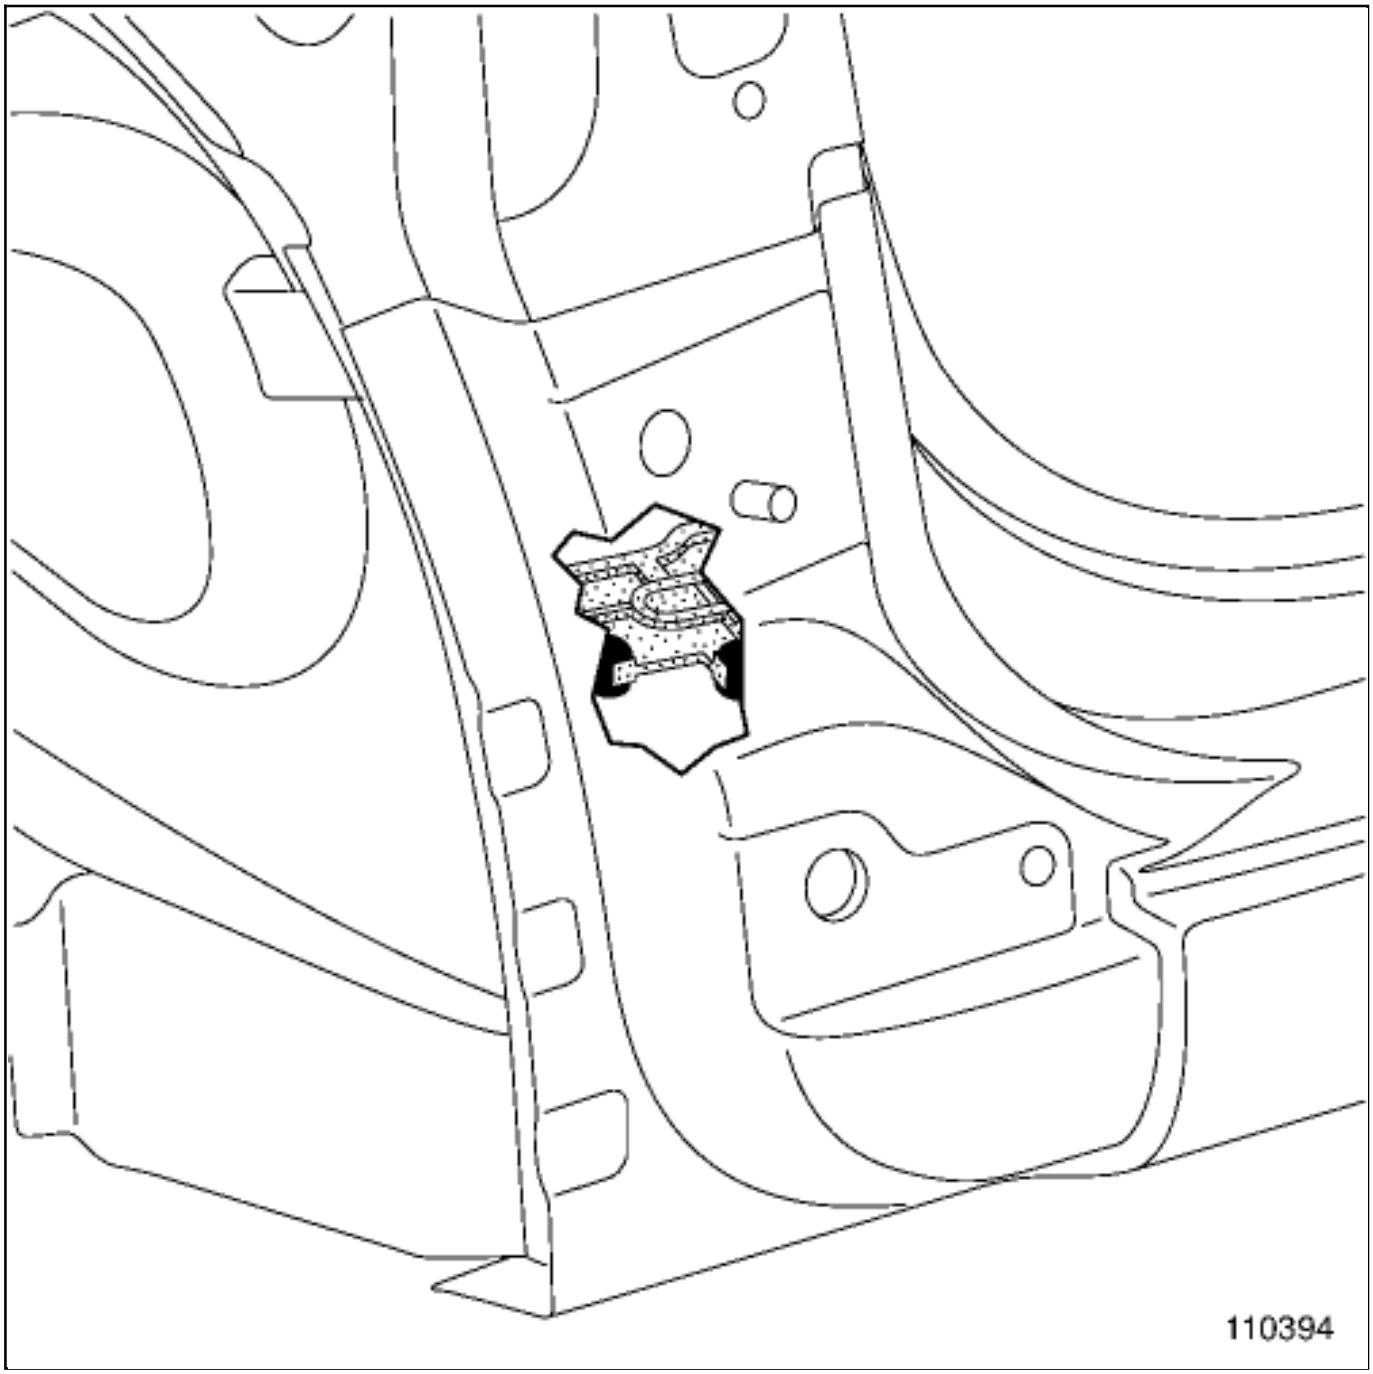
2- BONDING

Apply the panel on the original location.



Remove the protective film on the sticky side of the panel.

Lightly and regularly heat the panel by flattening it with a spatula to optimise the adherence and the shaping of the panel in relation to the support shape.



After cooling, check for the absence of air bubbles; if then appear, the area should be reheated.

2. HOLLOW SECTION INSERT

Clean the insert fitting area on the vehicle and on the new part.

Position the preformed masticbeading (1) on the vehicle in the same position as the original insert.

Assemble the new part by squeezing the bead.

STRUCTURALBODYWORKDOCUMENTATION:DESCRIPTION

1. CLASSIFYING INFORMATION

This information is classified in two complementary documents:

1- VEHICLE STRUCTURE BODYWORK REPAIR PROCEDURES (MR OF THE VEHICLE CONCERNED)

This document comprises two sections:

1)SECTION 0:

This section does not contain repair methods, it only contains description information; it consists of several subsections:

- 01C Vehicle bodywork specifications,
- 02A Lifting equipment,
- 02B Bodywork innovations,
- 03B Collision,
- 04B Consumables - Products,
- 04E Painting,
- 05B Bodywork equipment and tooling.

2)SECTION 4:

This section consists of several subsections:

- 40A General information,
- 41A Lower front structure,
- 41B Lower central structure,
- 41C Lower side structure,

- 41D Lower rear structure,
- 42A Upper front structure,
- 43A Upper side structure,
- 44A Upper rear structure,
- 45A Top of body,
- 47A Side opening elements,
- 48A Non-side opening elements.

These subsections are linked to the Replacement Parts Catalogue and contain two types of information:

- Section 1: General description. This section contains information relating to generic structural spare parts and to their design. This information may be the same for several vehicles.
- Section 2: Description, Removal - Refitting, Stripping - Rebuilding and Adjustment. This section contains information relating to structural spare parts and the special features of the vehicle concerned.

Note:

Always read both parts in order to have all the necessary information to repair the vehicle.

2- FUNDAMENTALS OF THE STRUCTURE BODYWORK REPAIR (MR 400)

This document comprises two sections:

1)SECTION 0:

this section consists of several subsections:

- 04F Bodywork products and mountings
- 05B Bodywork equipment and tooling

2)SECTION 4:

This section contains information on the basic operating ranges which concern the bodyshop technician.

this section consists of several subsections:

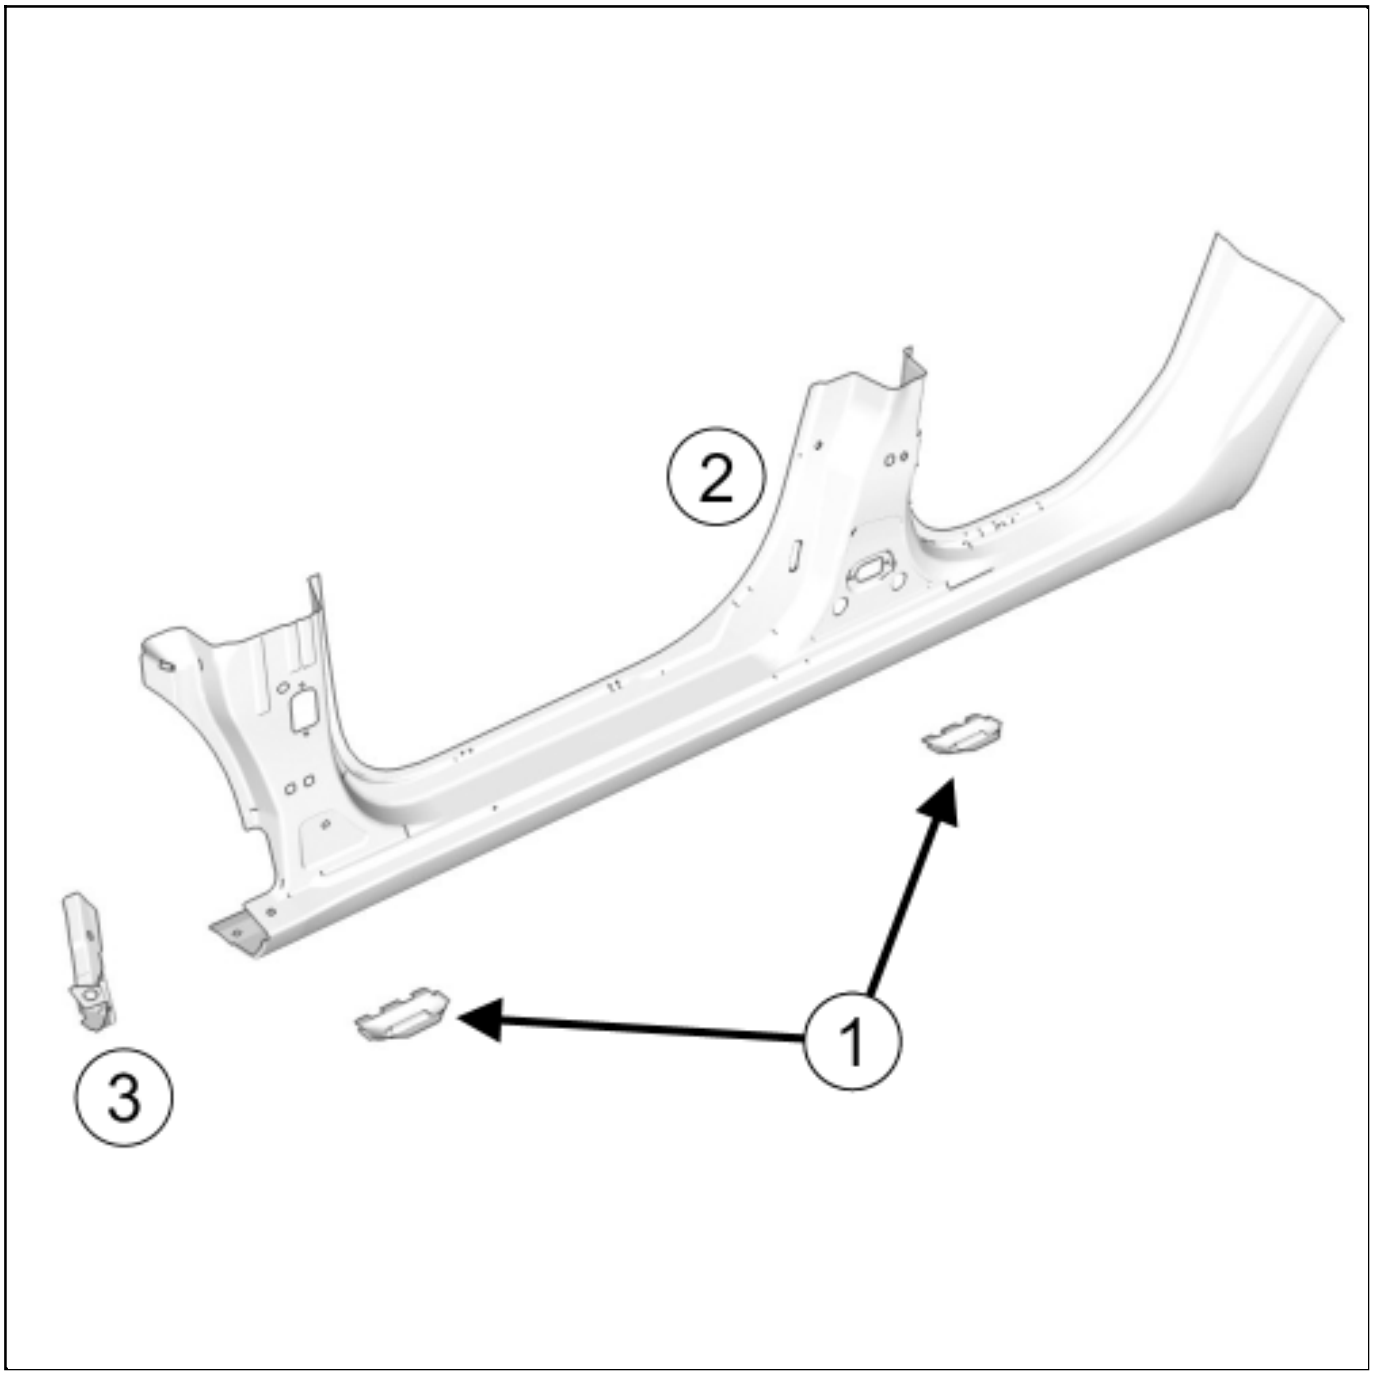
- 40A General information
- 40B Electrical resistance welded connections
- 40C Gas metal arc welded connections (GMAW)
- 40D Laser welded connections
- 40E Partial replacement connections
- 04F Bonded connections
- 40G Riveted connections
- 40H Screw connections
- 40J Protective devices

2. INFORMATION SEARCH

Questions	Answers
Features of specific tools to repair a given vehicle.	Refer firstly to section 0 of the Vehicle MR then refer to the "special tooling catalogue" or the "garage equipment catalogue" .
Features of specific products to repair a given vehicle.	Firstly refer to section 0 of the Vehicle MR then refer to the "IXELL product catalogue" .
Description and part number of a specific tool to repair a given vehicle.	Firstly refer to section 0 of the Vehicle MR.
Using a bodywork tool.	Refer to subsection 40A of the Vehicle MR.
Information concerning the replacement parts of a given vehicle regarding: the possibilities of replacement with the position on vehicle, an adaptation before the assembly, a cutting place with the special notes on this cut, special notes on right-left symmetry. special features of the version or equipment.	Refer to the subsection which corresponds to the part concerned: 41 to 48 of the Vehicle MR.

Information concerning the spare parts of a given vehicle, the composition and the specifications of each part it contains.	Firstly refer to the parts description exploded view in subsection 40 of the Vehicle MR.
	If this is detailed in the document, refer to subsections 41 to 48 of the Vehicle MR which corresponds to the part concerned.
	If this does not appear in the description, refer to subsection 41 to 48 for the part in the next level up.
Information concerning: ■ details of panel overlap on a joint, ■ a procedure and an operational mode relating to a new type of assembly in Renault, ■ a method for using a tool or a new product which is unfamiliar in Renault.	Refer to the subsection which corresponds to the part concerned: 41 to 48 of the Vehicle MR then subsection 40 of Vehicle MR 400.
Towing and raising a vehicle after an accident.	Firstly refer to subsection 02A of the Vehicle MR then the equipment catalogue.
Combination of impacts to repair a given vehicle.	Refer to subsection 03B of the Vehicle MR.
Fault finding on an impact for a given vehicle.	Firstly refer to subsection 03B of the Vehicle MR or MR 400.
Logic of impact fault finding.	See MR 400.

General instructions for: repair, safety, preparing a vehicle, tool classification, precautions for repair.	Refer to section 0 of the Vehicle MR or MR 400.



3. SYMBOLS FOR STRUCTURE REPAIR PROCEDURES

You will find below the detailed explanations of all the symbols used in the structure bodywork methods.

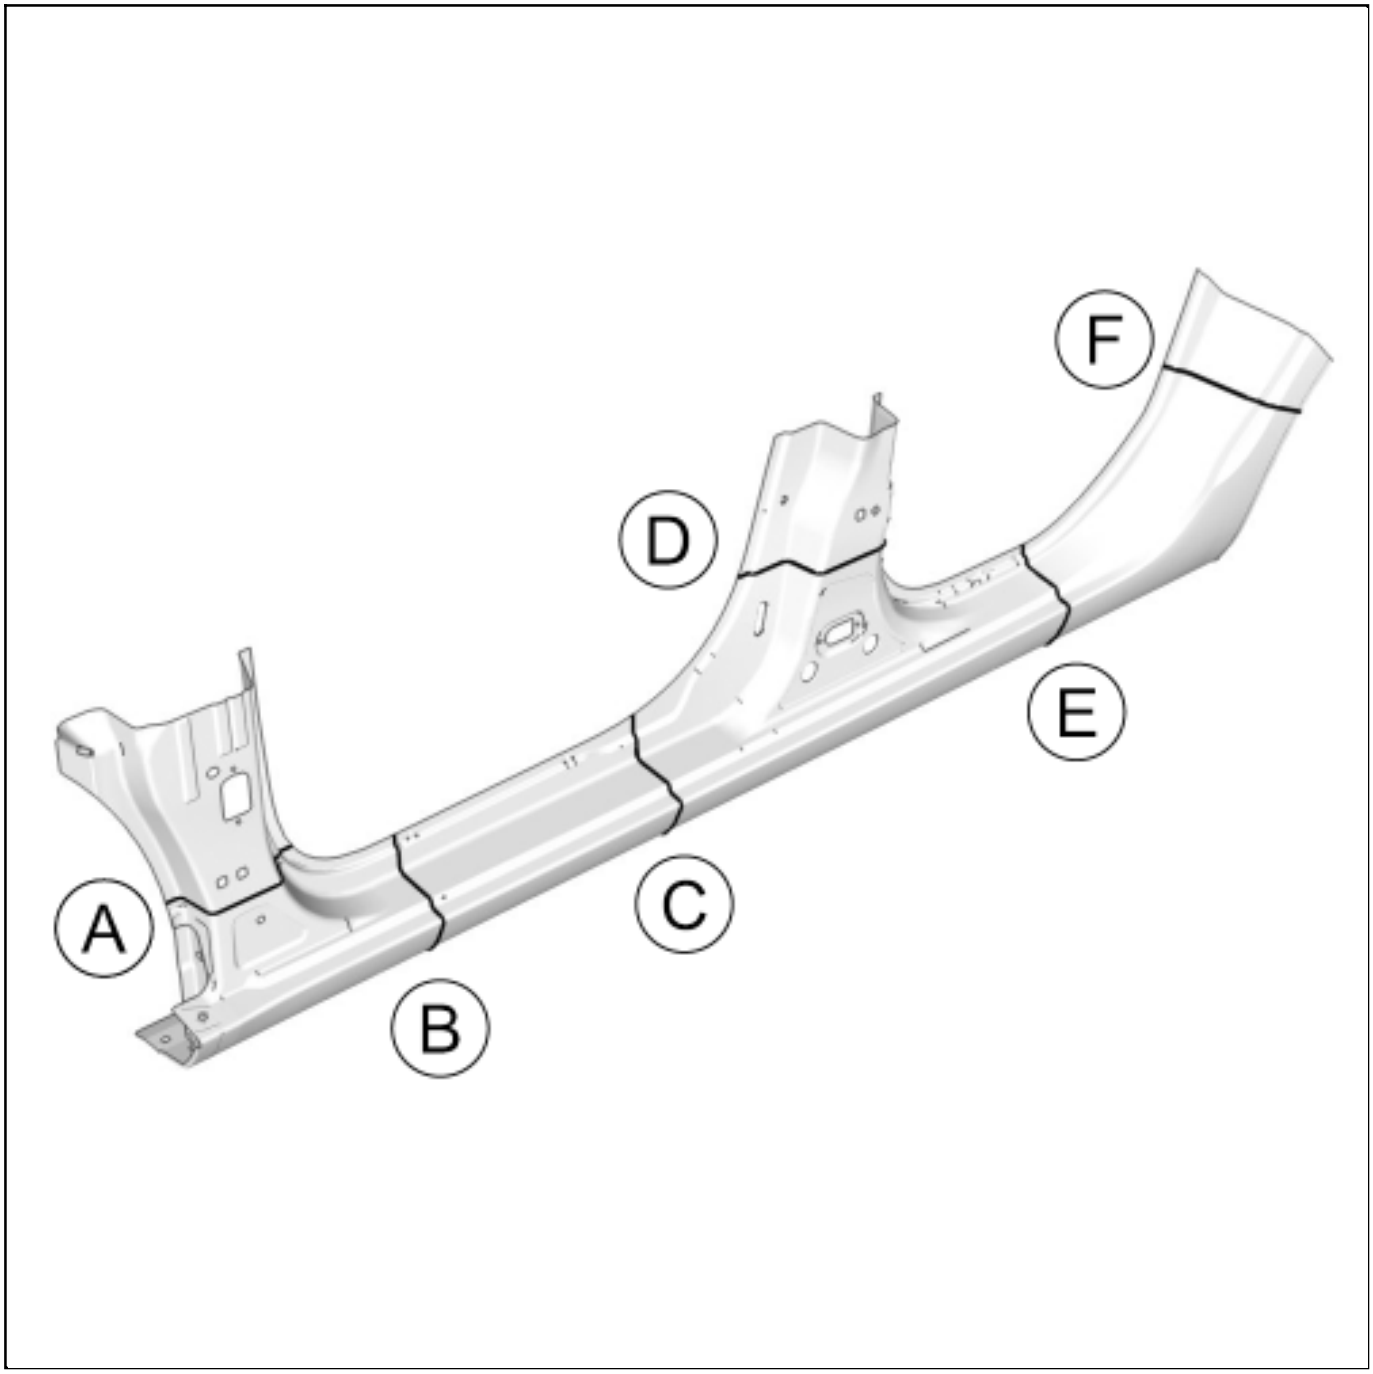
At the top of each DU you will find a reminder of these different components:

- the tightening torques,
- the specific tools.

1- SPECIFICATIONS OF SPARE PARTS

When a spare part consists of several parts, a table indicates the components of the spare part with notes on the illustration.

No.	Description	Type	Thickness (mm)
(1)			
(2)			
(3)			



2- IN THE EVENT OF REPLACEMENT

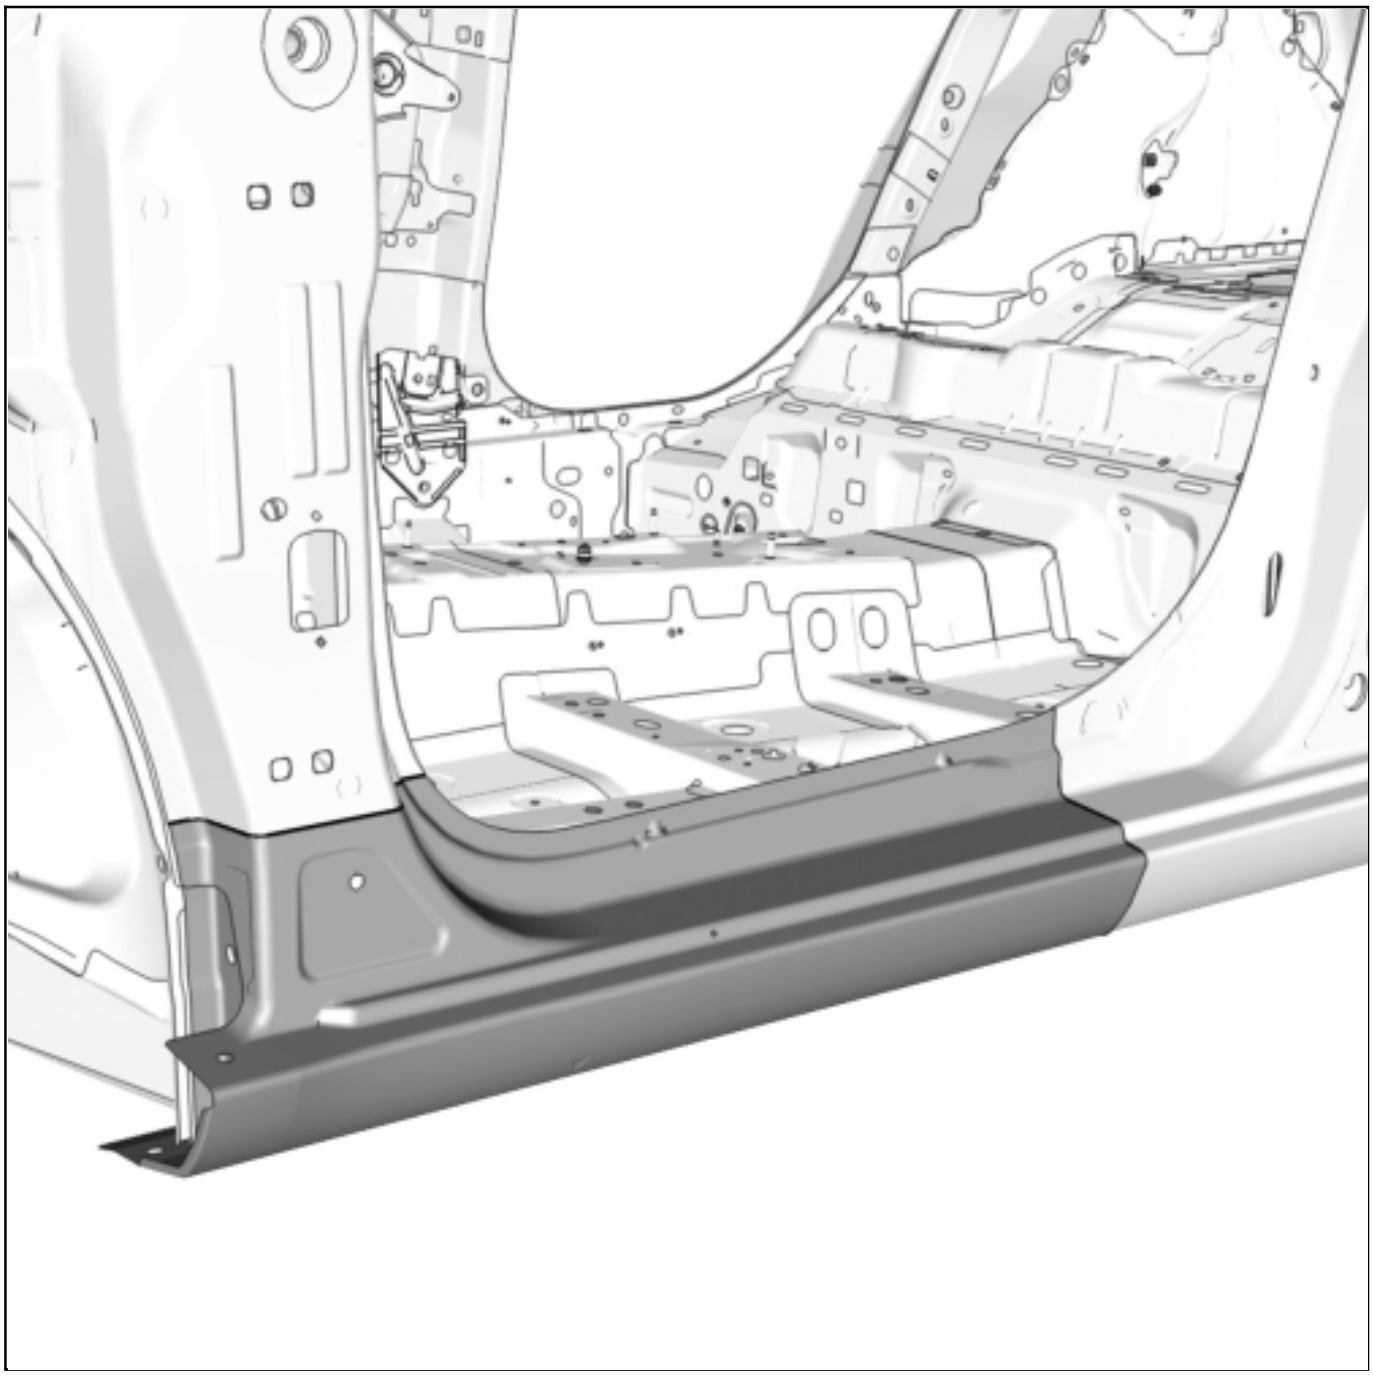
Only on illustrations of replacement parts, the bold lines indicate the possible cuts that can be made in the case of a partial replacement.

A list indicates the name and the marks that delimit the replacement.

The options for replacing this part are as follows:

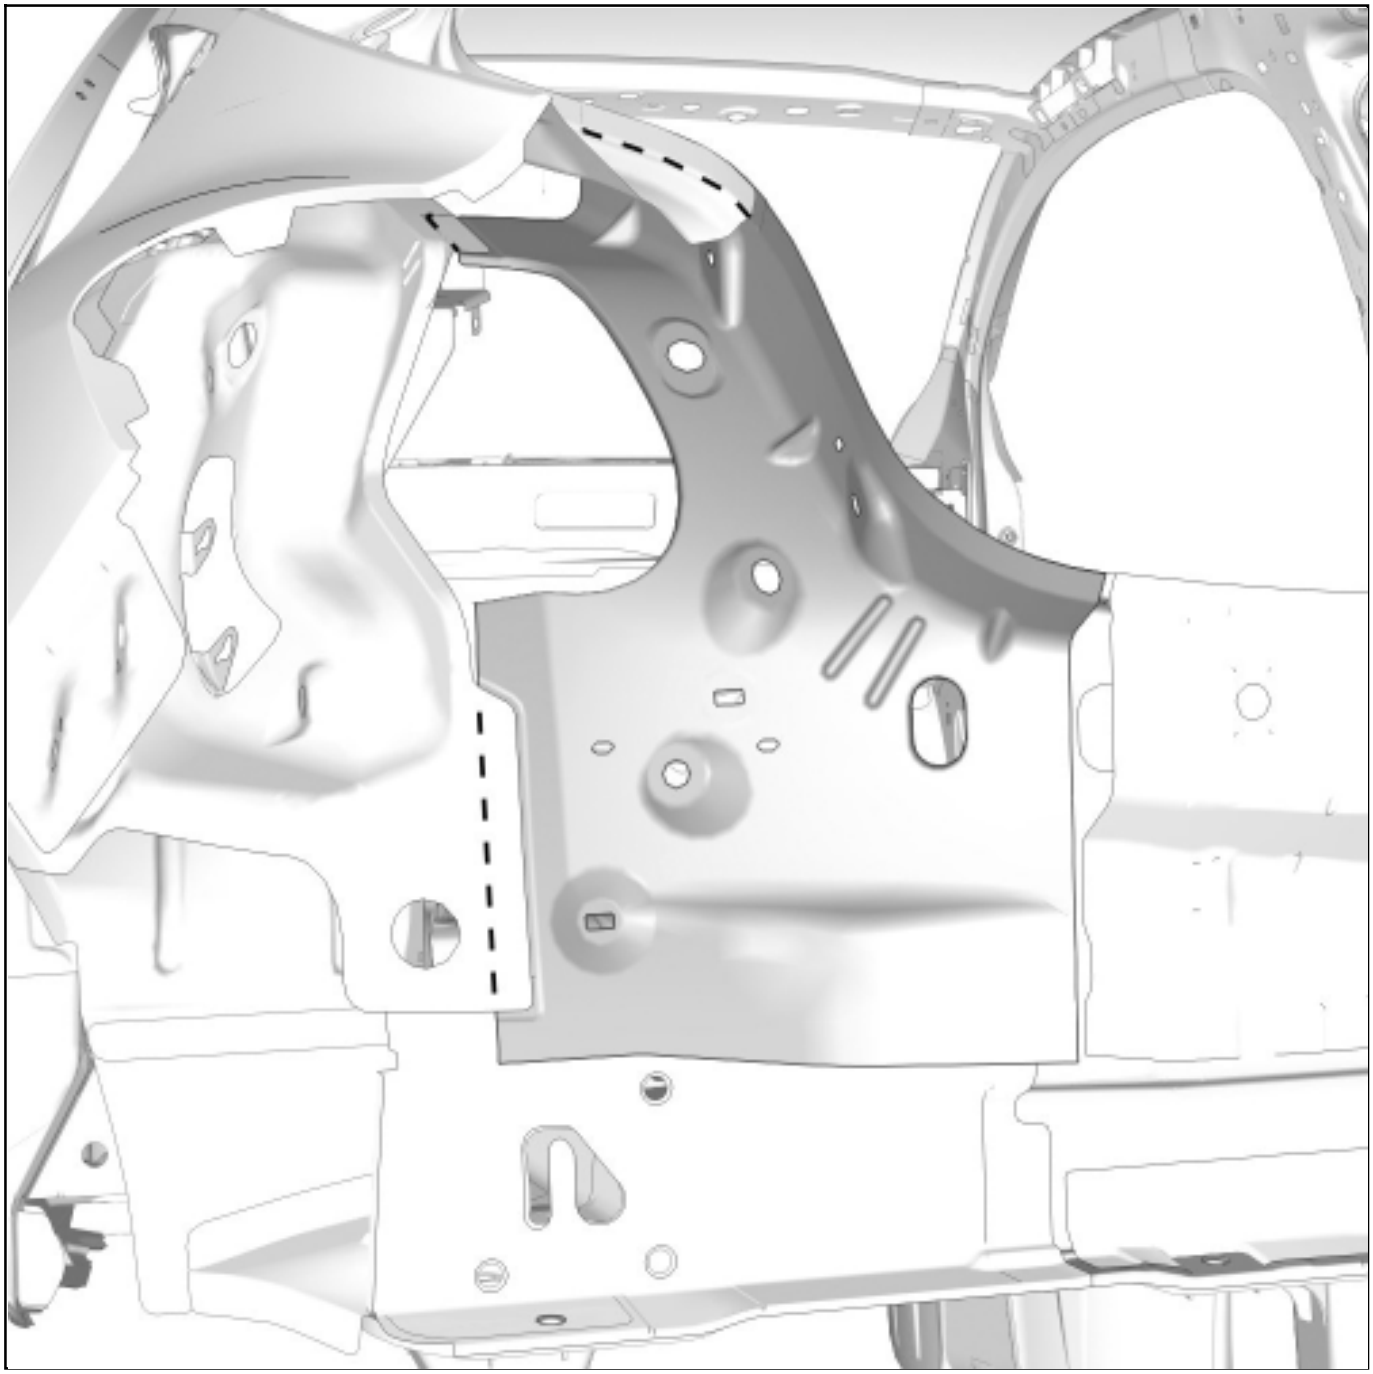
- complete replacement A-D-F,
- front end partial replacement A-C,
- front section partial replacement A-D-E,
- partial replacement under door B-C,
- rear section partial replacement C-D-F,
- rear end section partial replacement E-F.

3- PART IN POSITION ON THE VEHICLE



The spare part is always shaded when shown on the vehicle.

The drawings prioritise the different parts depending on the replacement method.

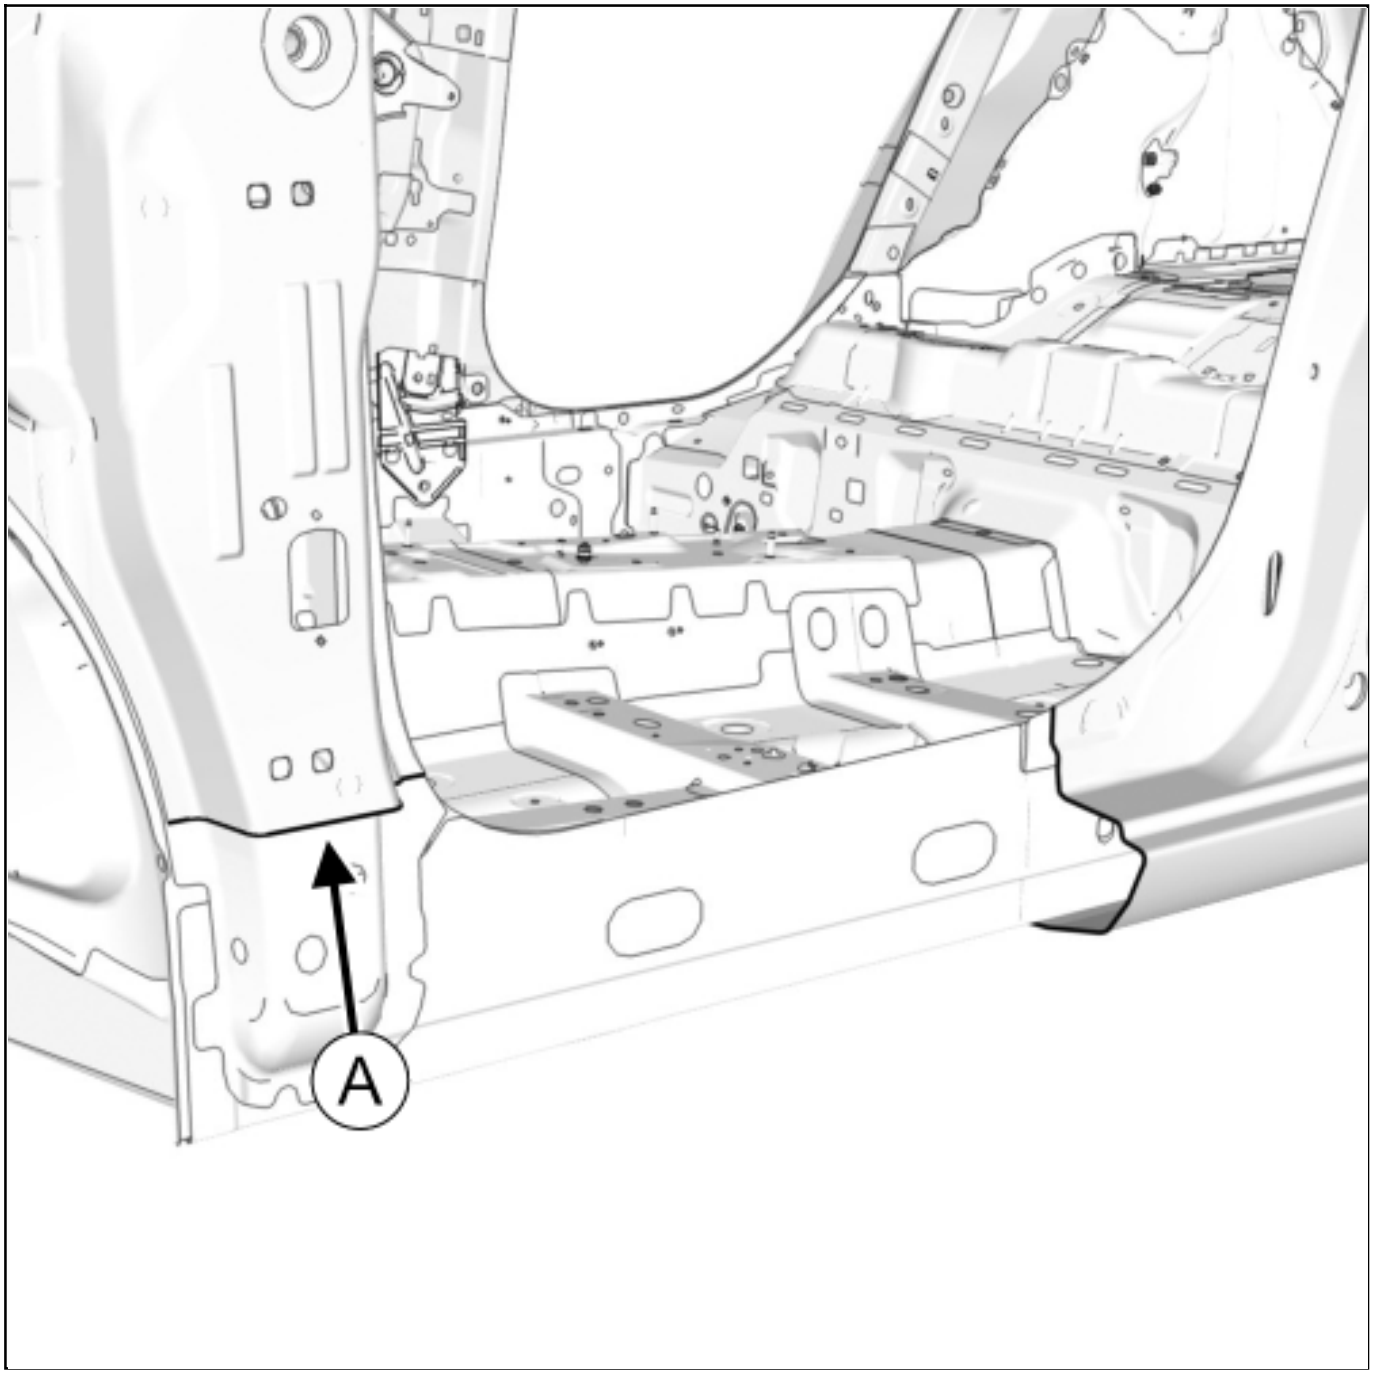


The illustration should show the part to be replaced without the neighbouring components as if they have already been removed.

However, some diagrams may not follow this rule in order to better depict the part in its location.

The structural repair methods are carried out using uncoated steel bodywork panels. The original mastics are not illustrated.

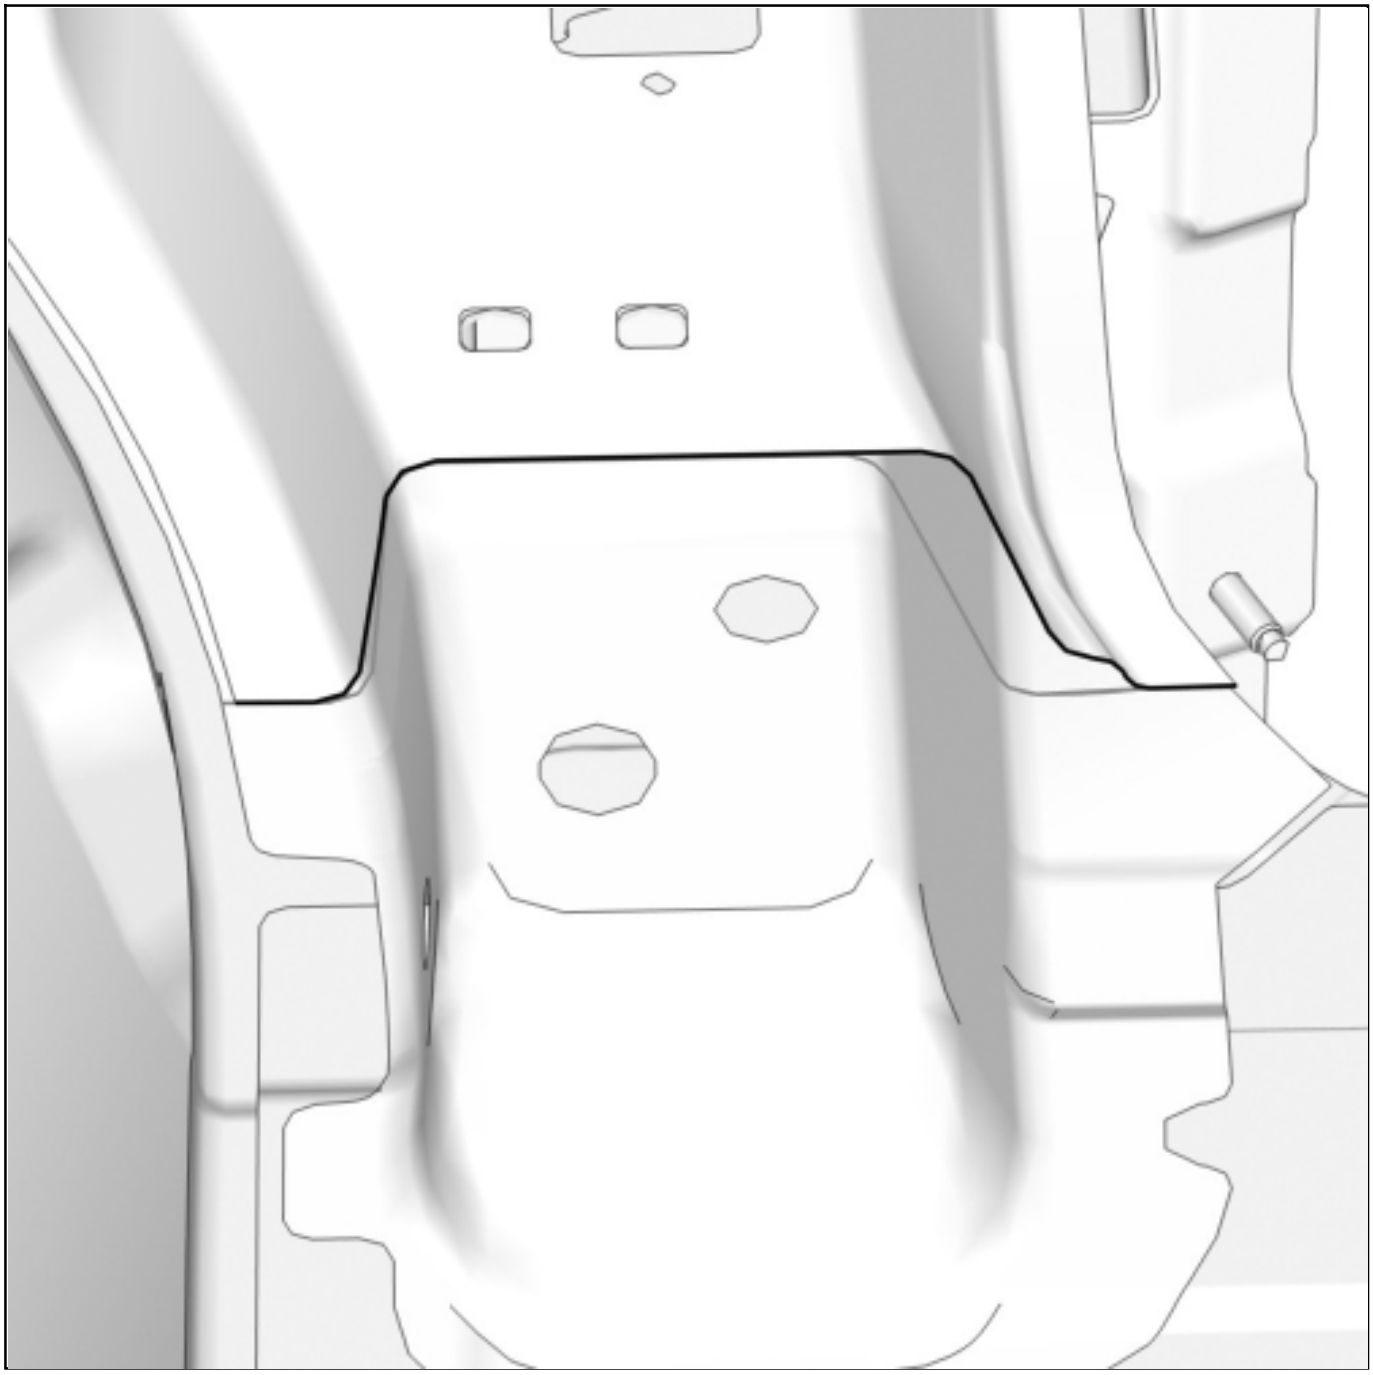
The hidden parts of the spare part are shown with dotted lines.



When a part is symmetrical (identical right and left side), there will only be one side shown in the method (e.g.: partial replacement of rear section rear floor).

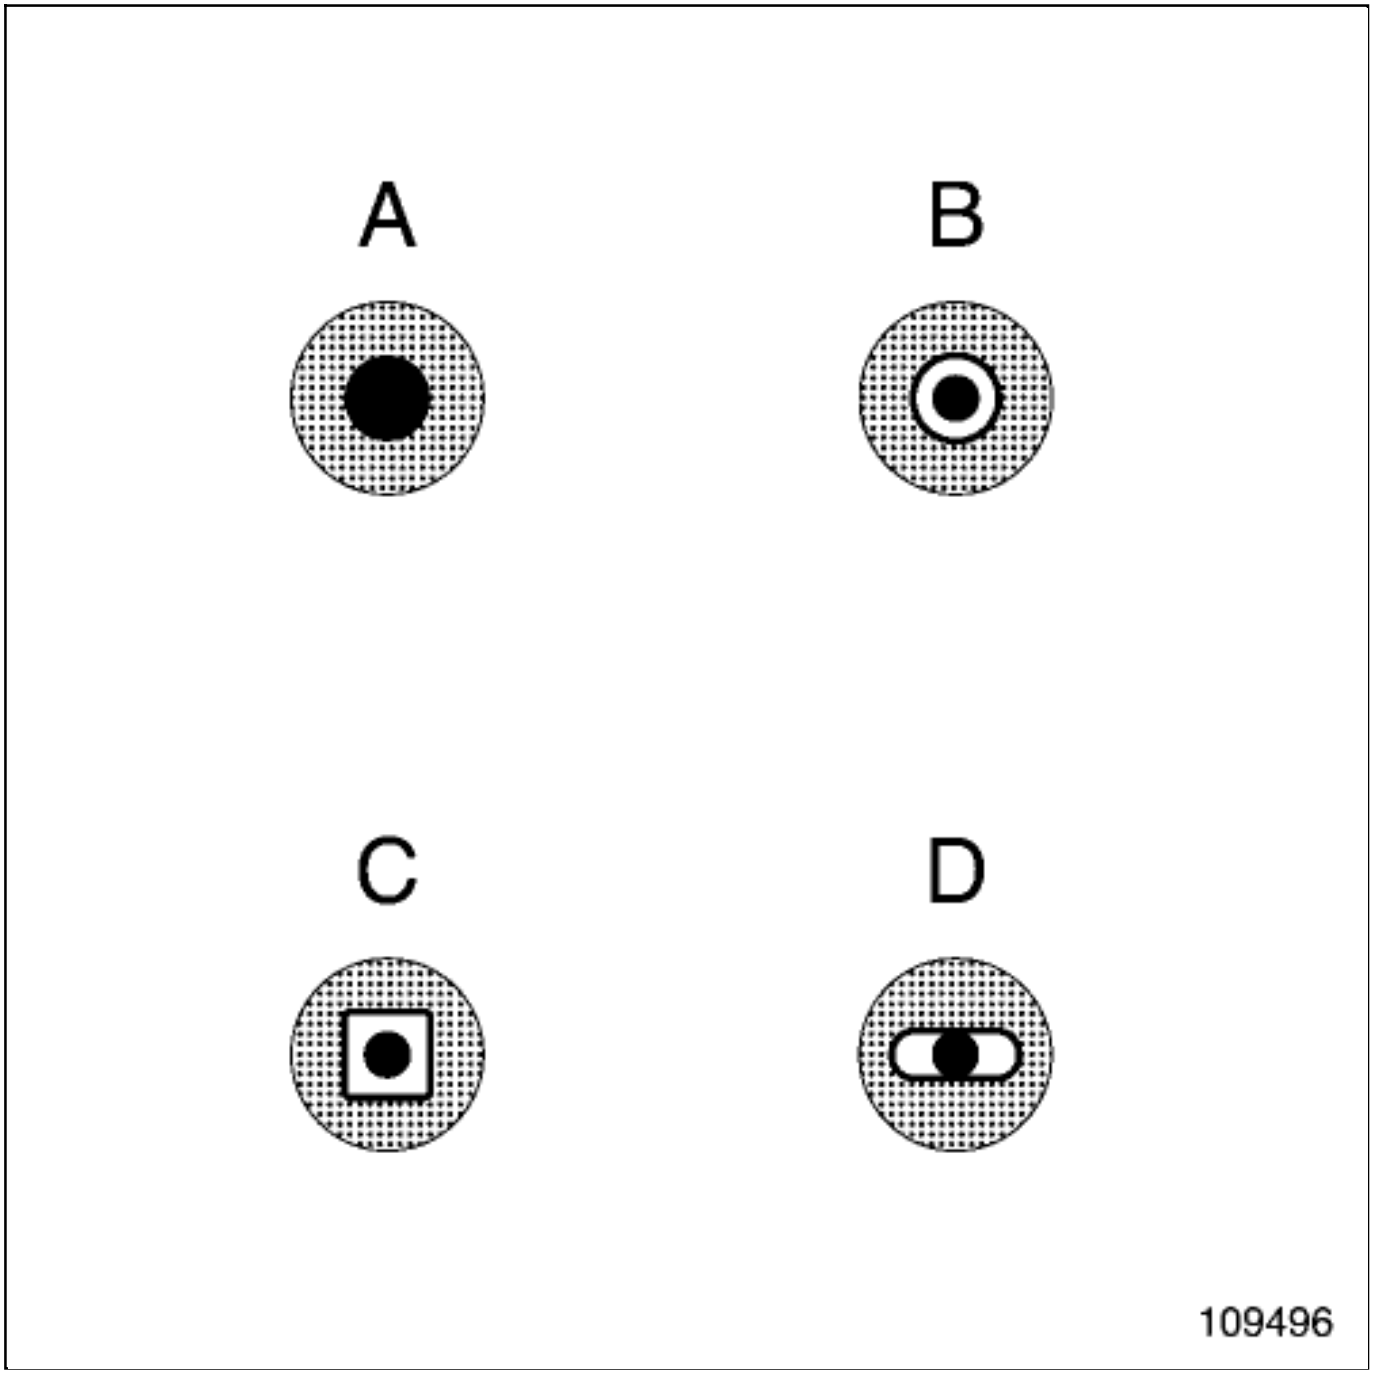
This means that the same operation is to be carried out on the opposite side (number of spot welds, etc.).

If the opposite is the case, specific details are indicated (including cases with right- and left-hand versions).



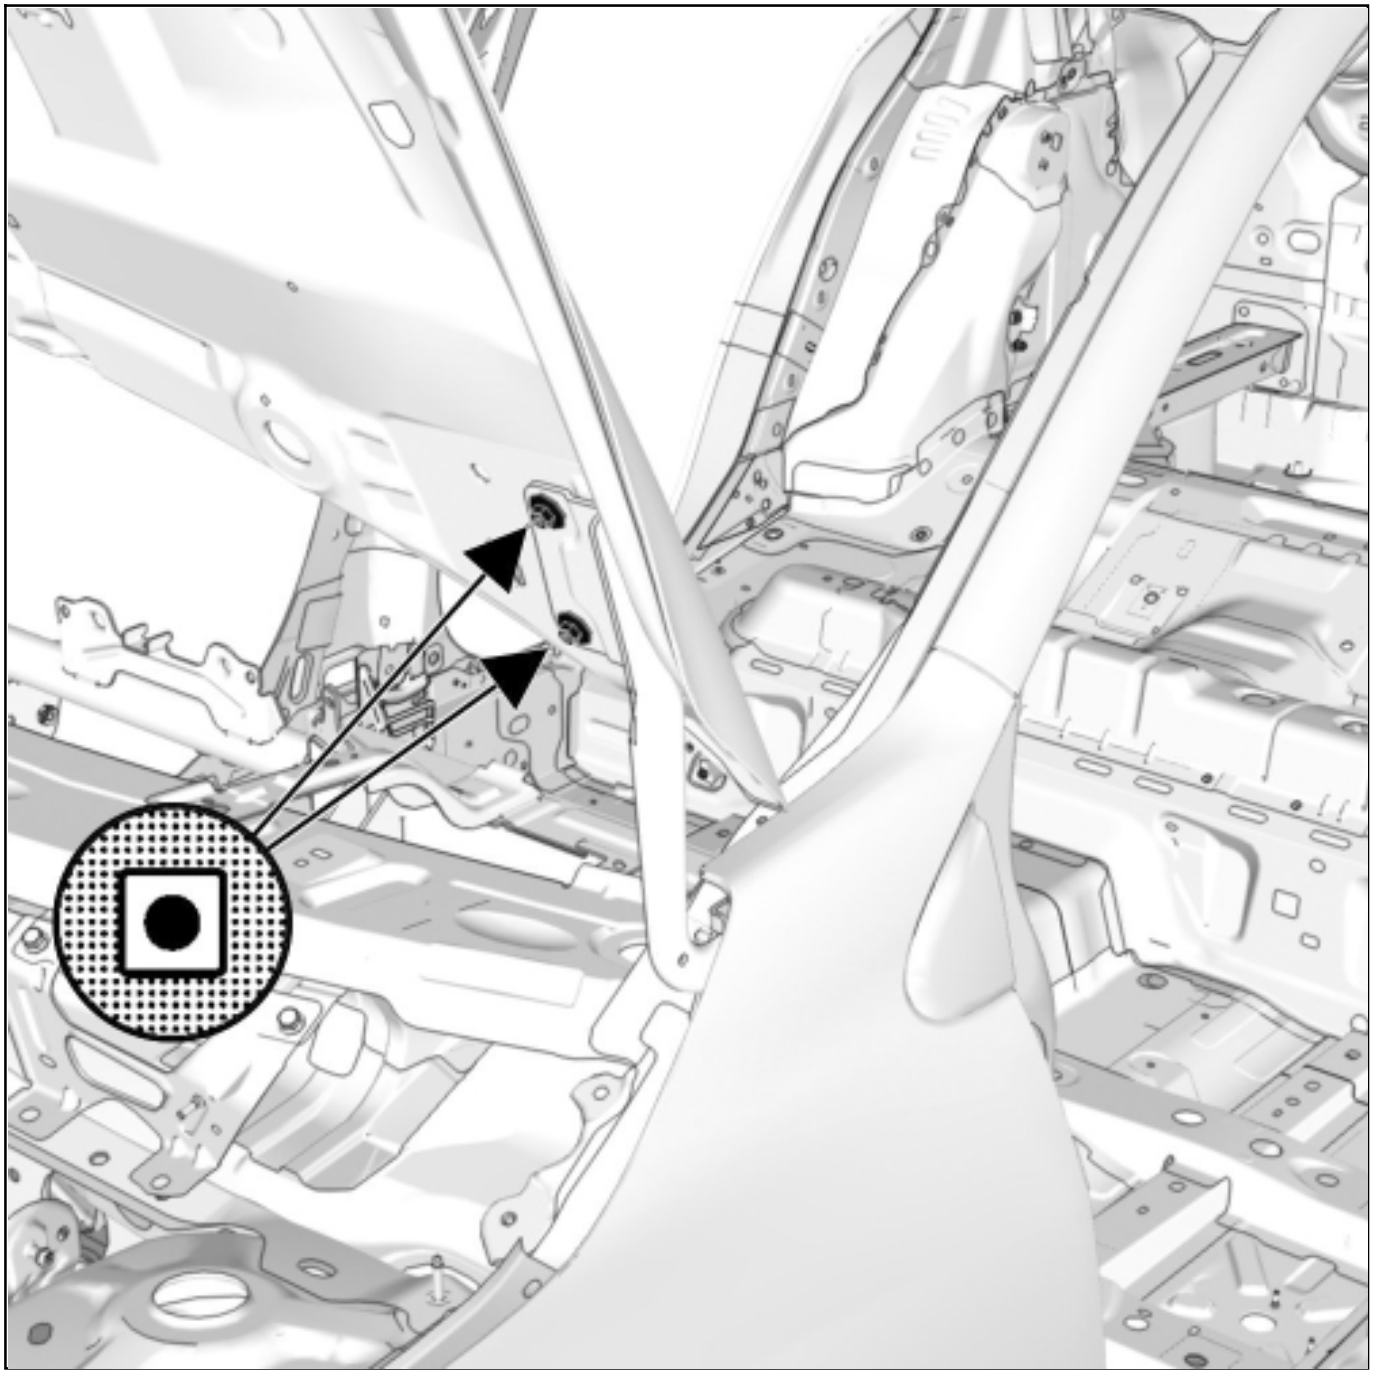
4- SYMBOLS FOR DETAILED VIEWS

The detailed views define the space between the part to replace and the vehicle structure.



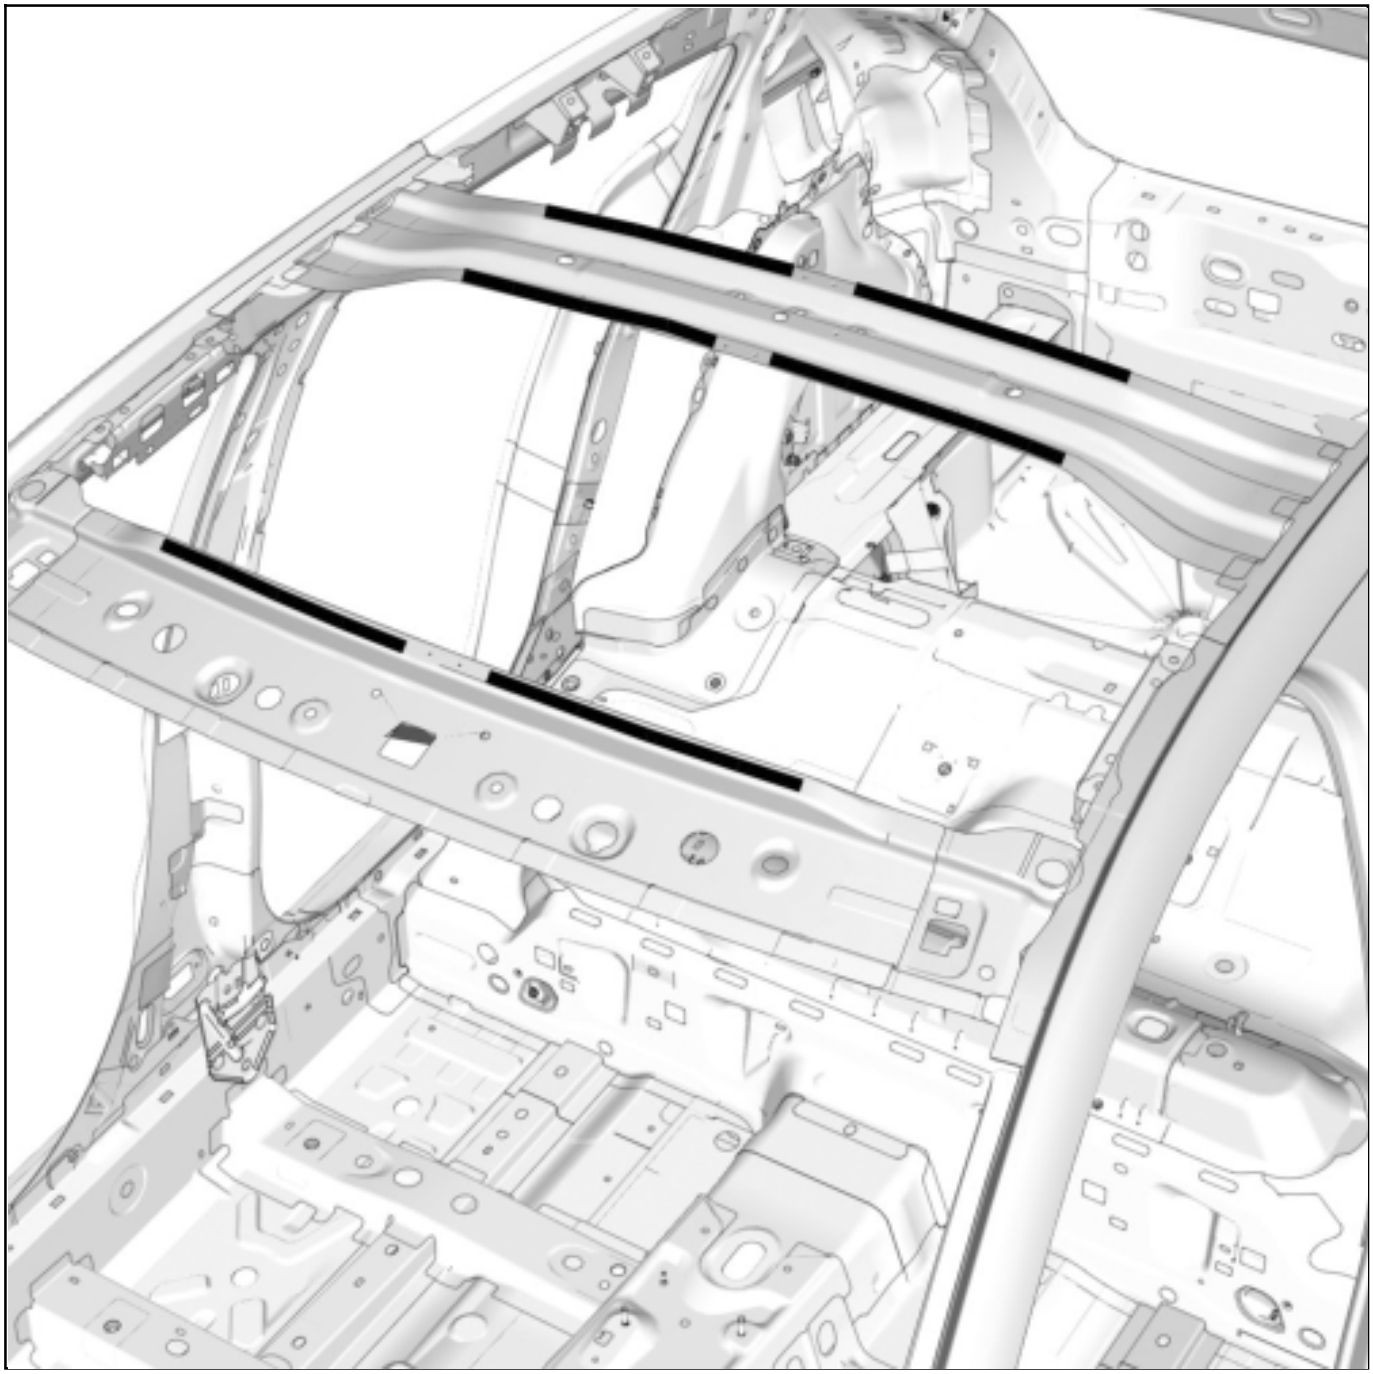
The mark(A) designates the viewing direction of the detailed view for proper orientation of the associated detailed view.

DETAILED VIEW A



5- SYMBOLS FOR OPENING ELEMENT ADJUSTMENTS

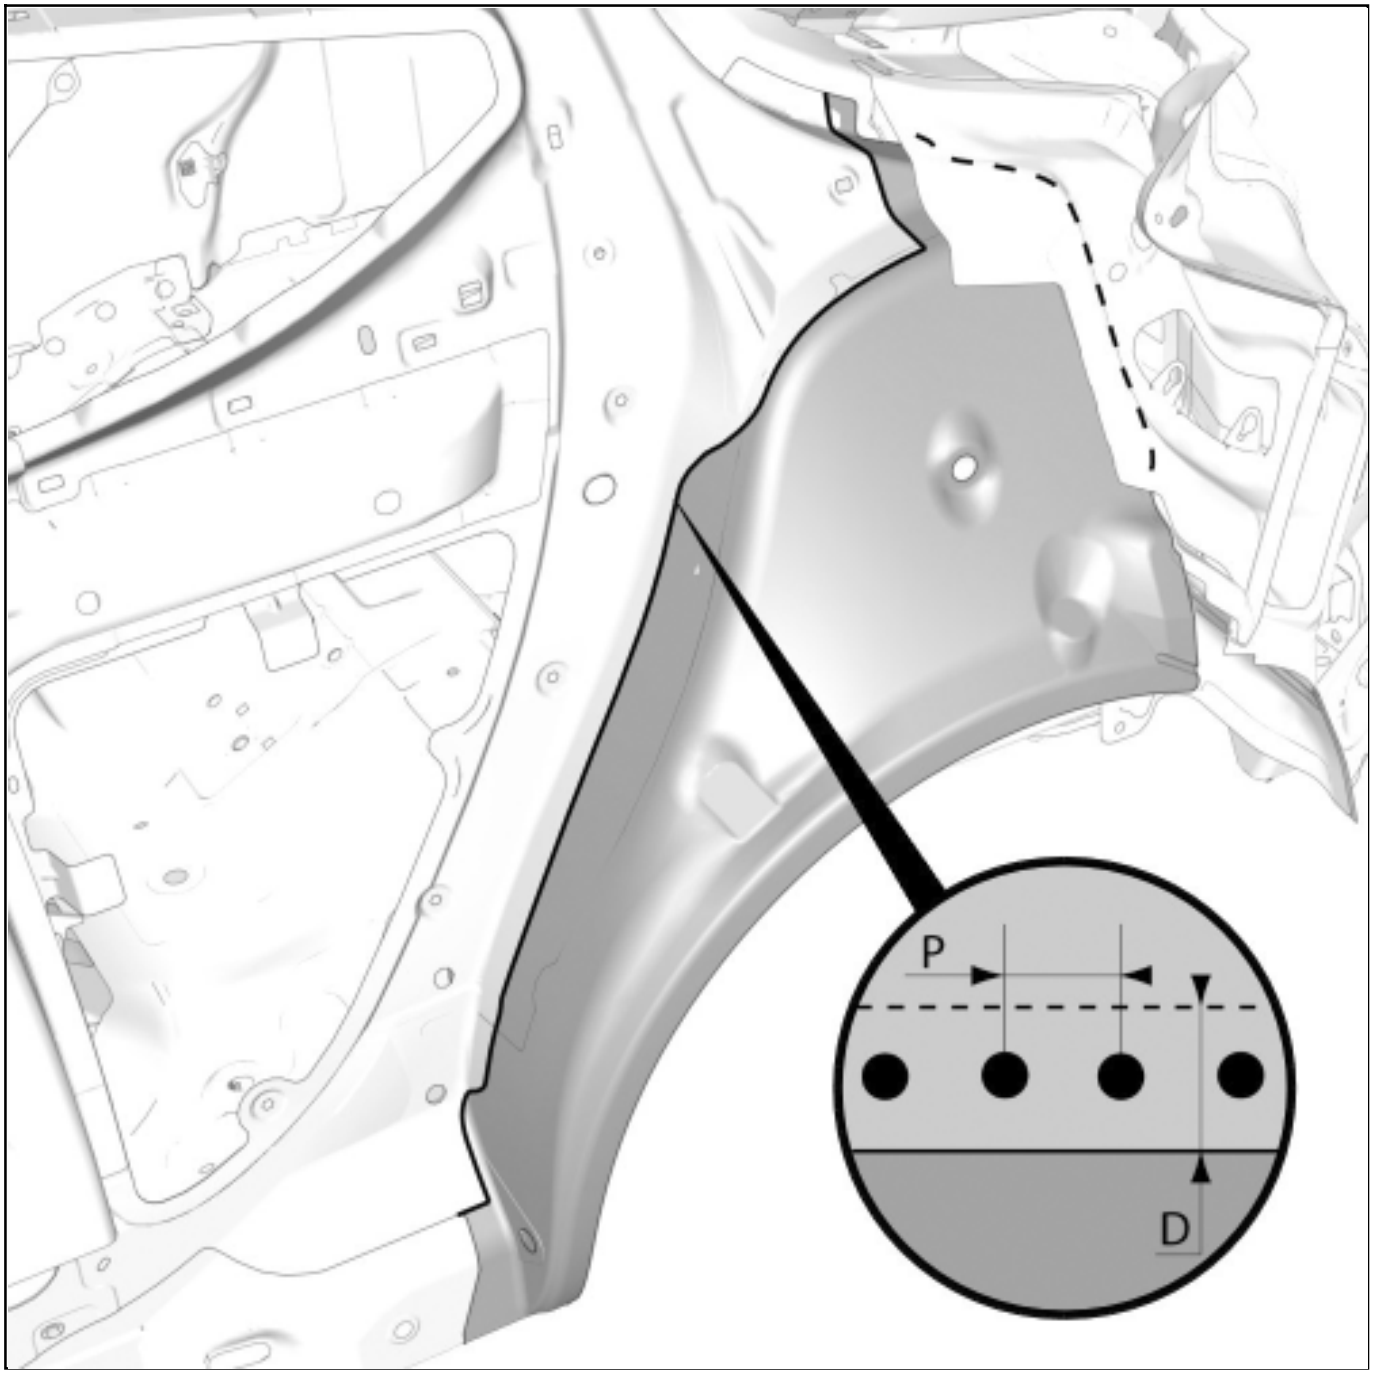
Different symbols indicate the possibilities for adjustment:



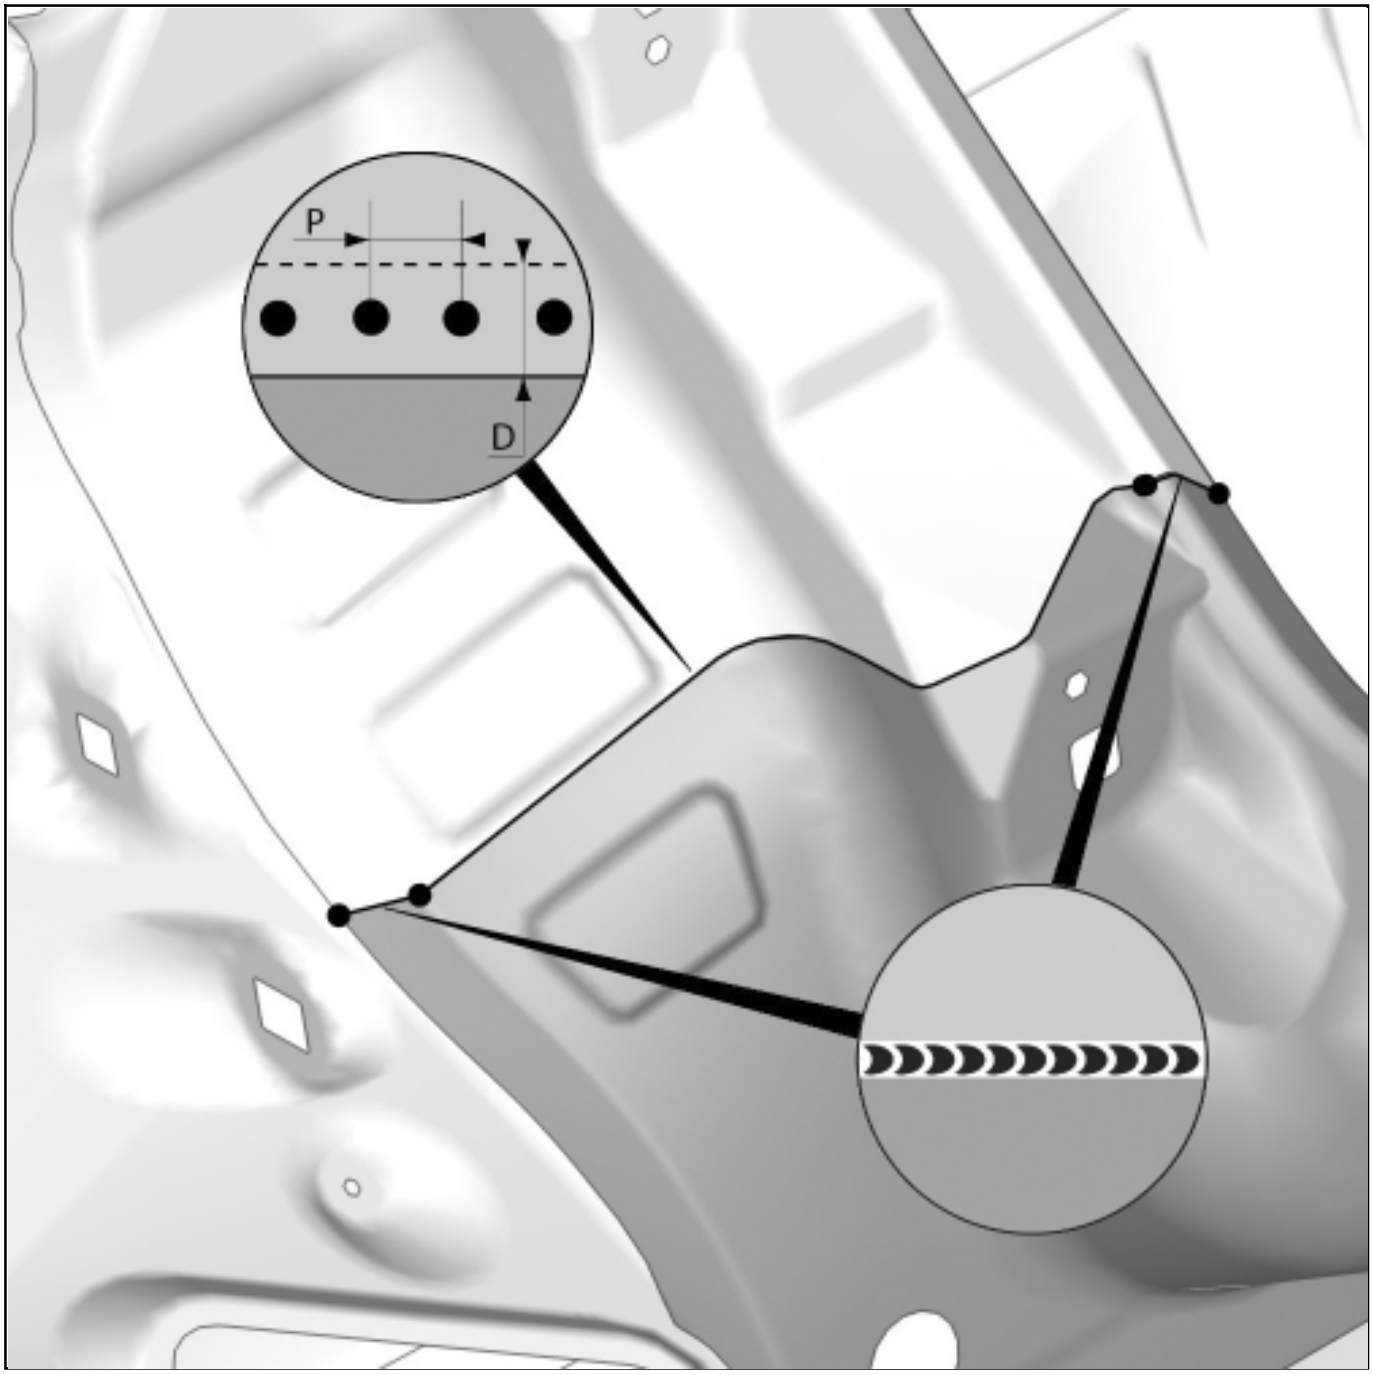
The mountings are shaded.

6- SYMBOLS FOR ADHESIVES AND MASTICS

A shaded band represents the path of a bead of adhesive or mastic.



7- SYMBOLS FOR WELDS

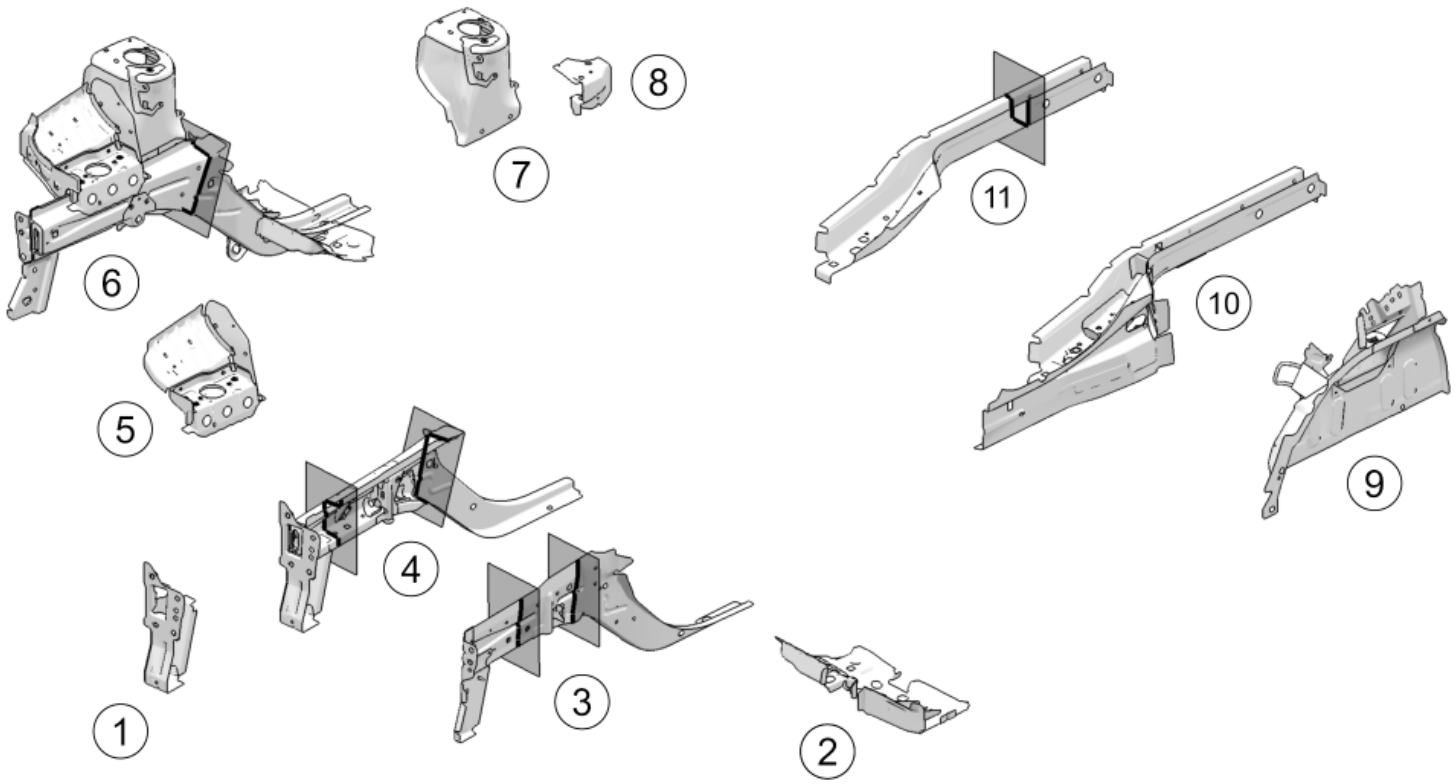


Different symbols represent the type of weld to be made if it is not an original weld.

In case of superimposed or joggle welds, the type of weld to be made is indicated in the text accompanying the illustration.

SUPERIMPOSED WELD

COMBINATION OF TWO TYPES OF WELDS



If two types of welds are used, points delimit the areas.

STRUCTURAL COMPONENTS TO BE POSITIONED ON THE REPAIR BENCH: DESCRIPTION

Note, one or more warnings are present in this procedure

1. PARTS REQUIRING THE USE OF A BODY JIG BENCH

112487

(1) Radiator cross member support

(2) Centre floor front side cross member

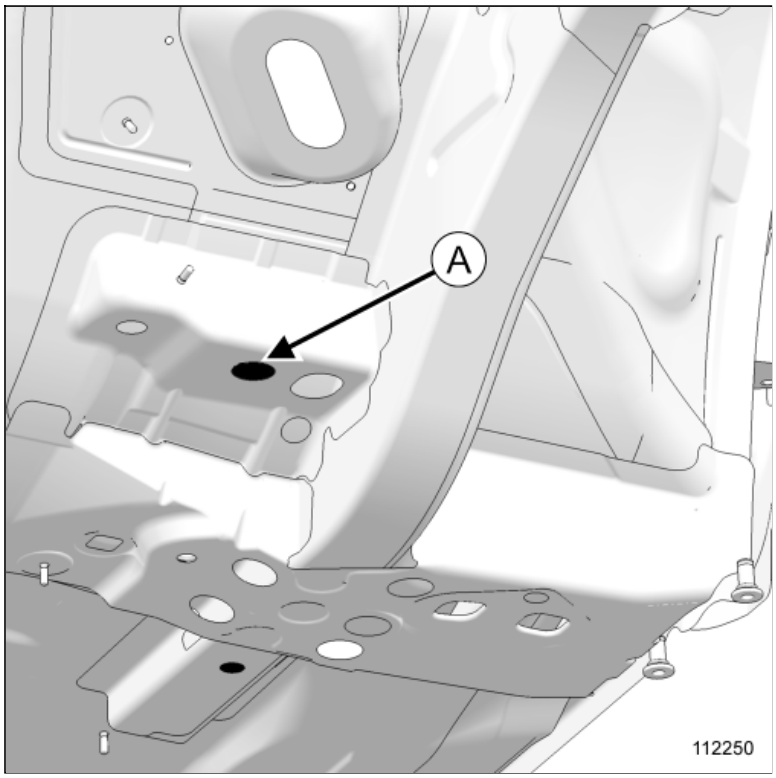
(3) Front side member closure panel

(4) Front side member

(5) Engine stand

(6) Front half-unit

(7) Front wheel arch



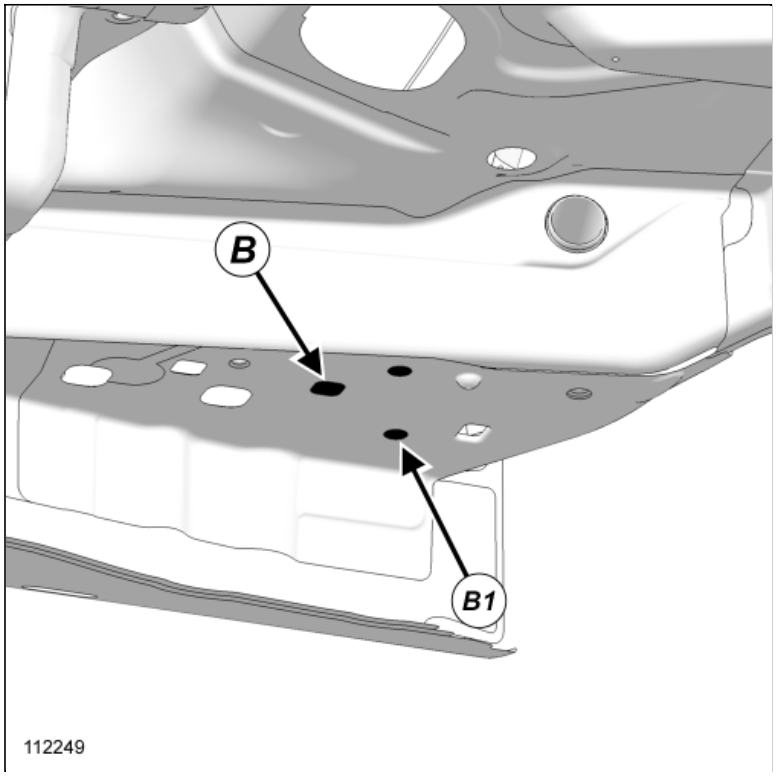
(8) Engine tie-rod attachment

(9) Inner rear wheel arch

(10) Rear side member

(11) Rear side member, rear section

2. FRONT SUBFRAME REAR MOUNTING

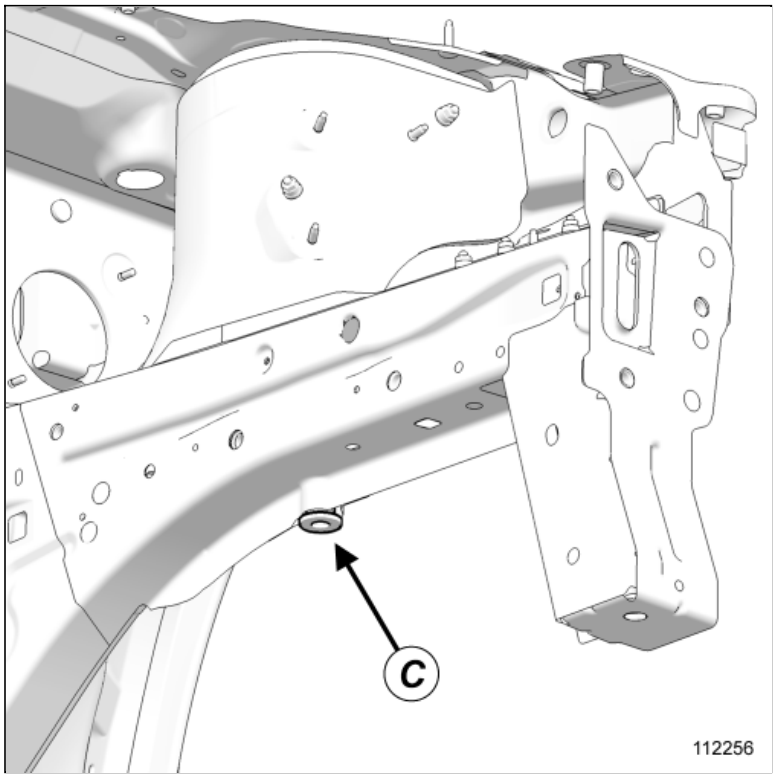


The jig rests under the subframe mounting unit and is centred in the threaded hole(A) .

It is used for replacing a complete front half unit.

WARNING
This/these point(s) help to ensure the correct axle assembly geometry.

3. REAR AXLE ASSEMBLY FRONT MOUNTING

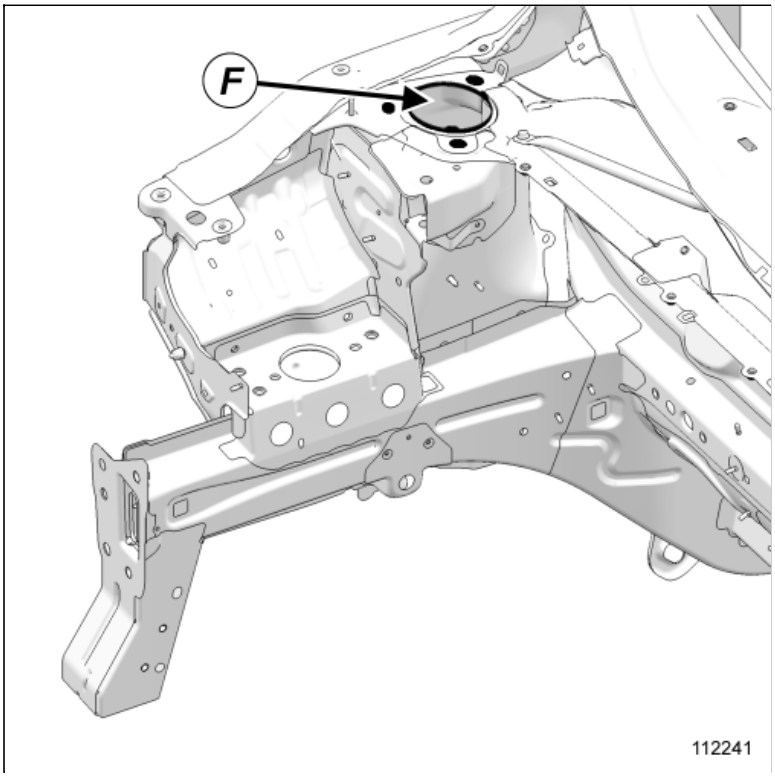


The jig supports the underneath of the rear axle assembly mounting unit and is centred on square hole(B) and fixed on tapped hole(B1) of the rear axle bearing mounting.

It is used for replacing a rear side member assembly.

WARNING
This/these point(s) help to ensure the correct axle assembly geometry.

4. FRONT SUB-FRAME FRONT MOUNTING



The jig supports the underneath of the front sub-frame mounting and is centred on tapped hole(C) .

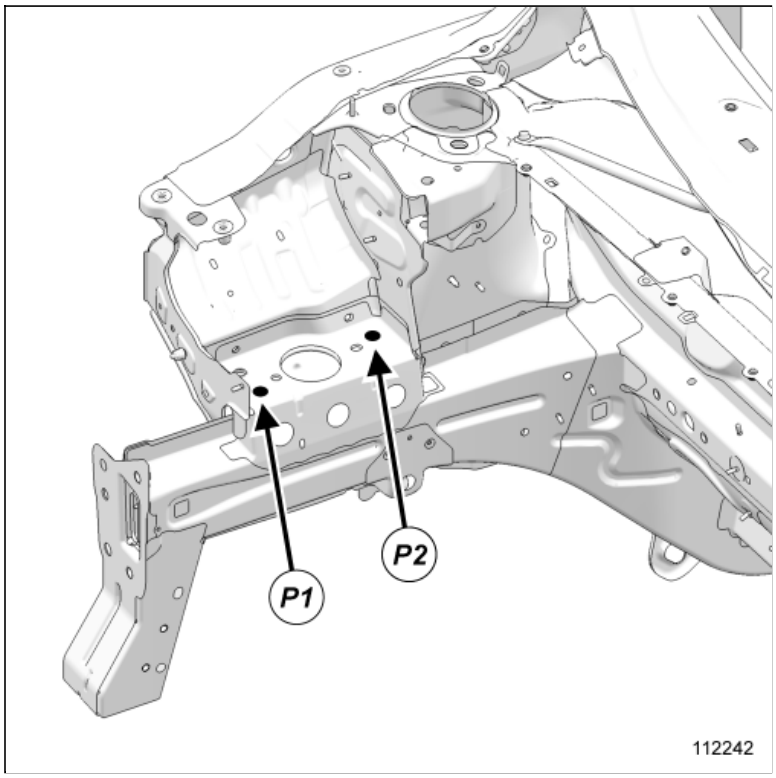
It is used when replacing:

- a complete front side member,
- a front half unit.

WARNING
This/these point(s) help to ensure the correct axle assembly geometry.

5. FRONT SHOCK ABSORBER UPPER MOUNTING

The jig supports the underneath of the shock absorber cup and is centred in the hole(F) of the shock absorber cup.

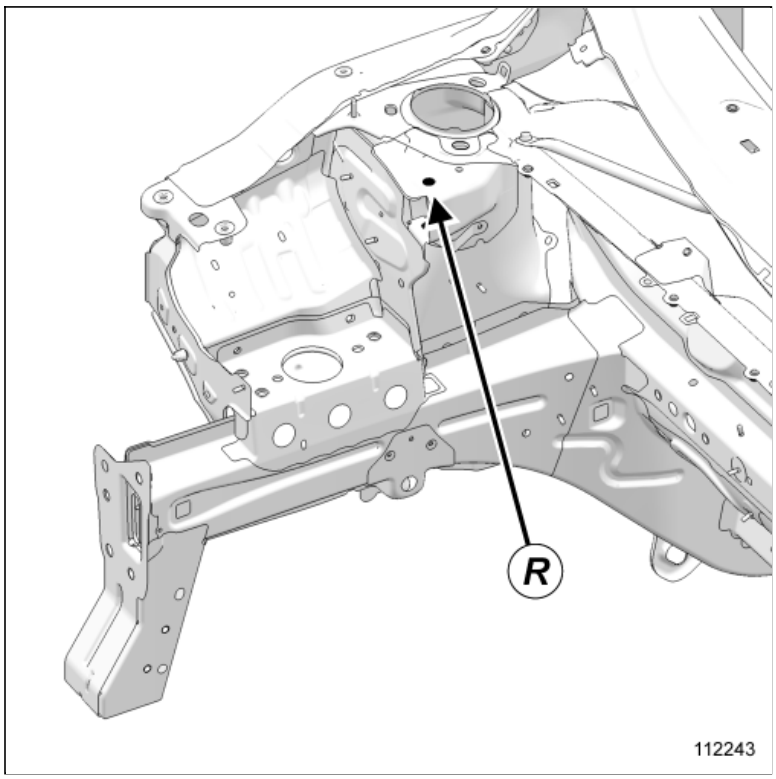


It is used when replacing:

- a wheel arch,
- a front half unit.

It is also used in straightening.

WARNING
This/these point(s) help to ensure the correct axle assembly geometry.

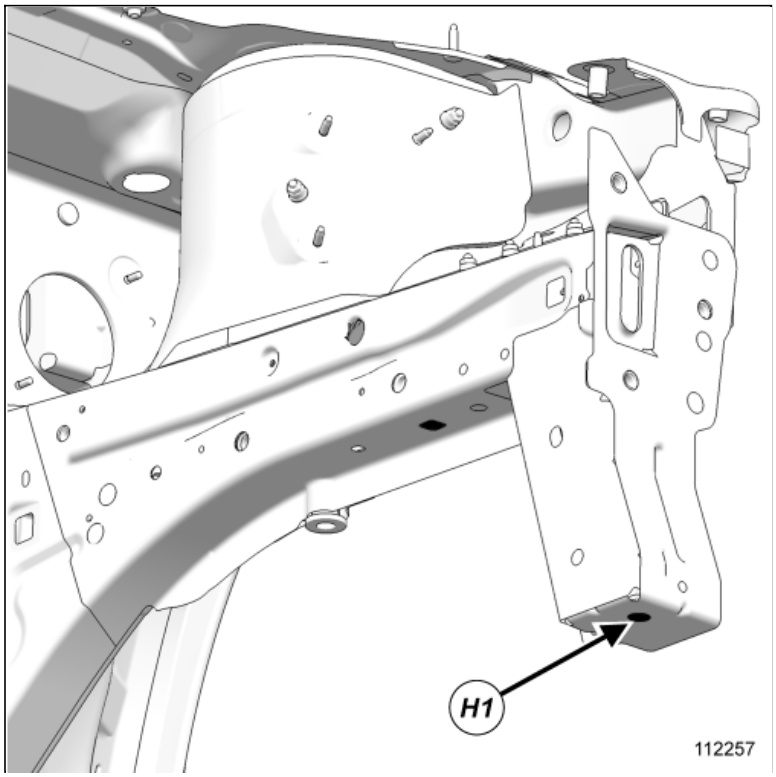


6. ENGINE MOUNTING

The jig rests on the engine mounting and is centred in engine mounting securing holes(P1) and (P2) .

- It is used with the mechanical components removed for the replacement of:
  - a front half unit.
  - the engine mounting.

7. ENGINE TIE-ROD ATTACHMENT

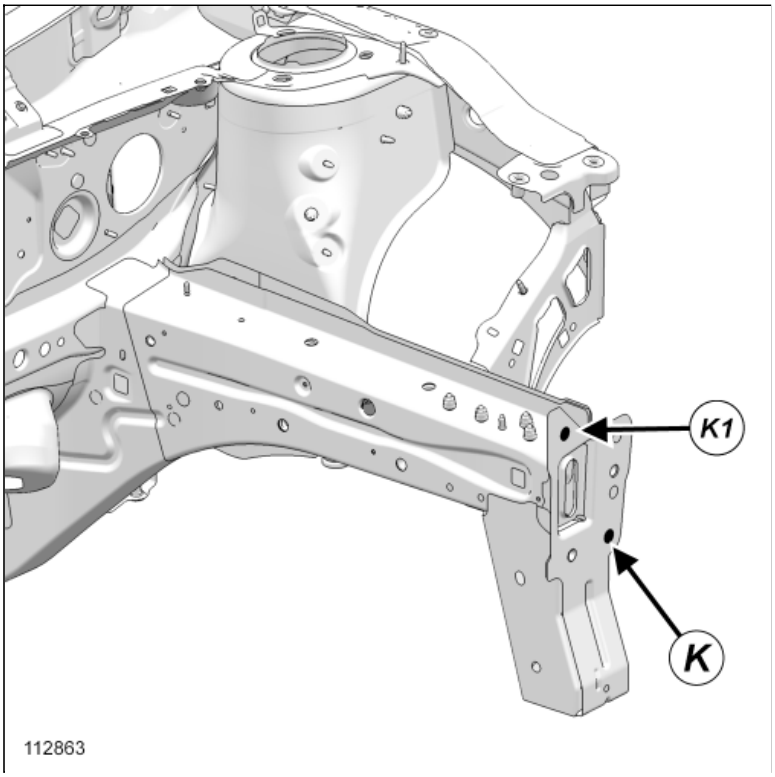


The jig supports the engine tie-rod attachment mounting and is centred in hole(R) .

It is used with the mechanical components removed for the replacement of:

- the engine tie-rod attachment,
- a front half unit.

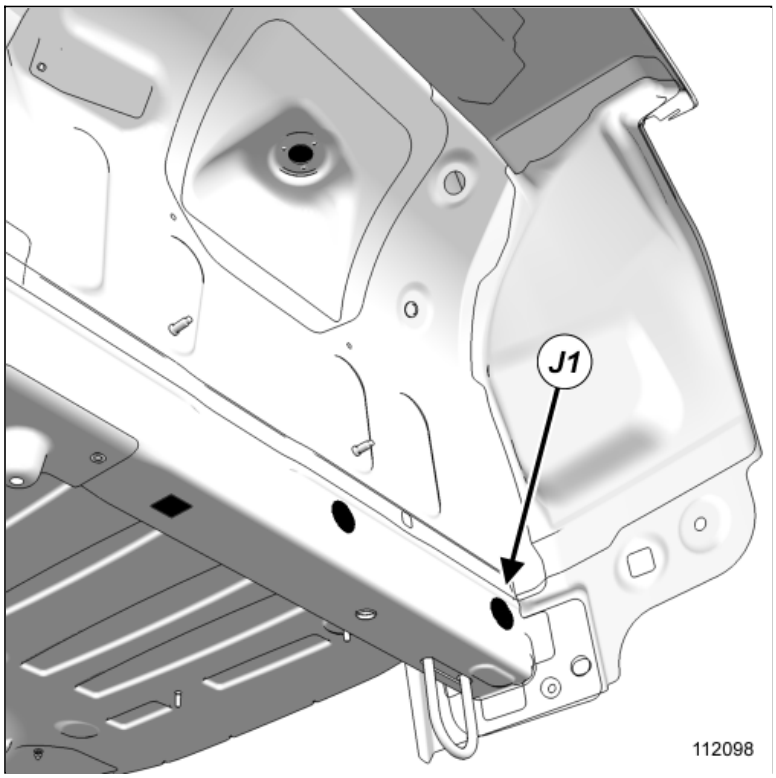
8. RADIATOR MOUNTING CROSS MEMBER MOUNTING



The jig supports the underneath of the radiator cross member and is centred in tapped hole(H1) .

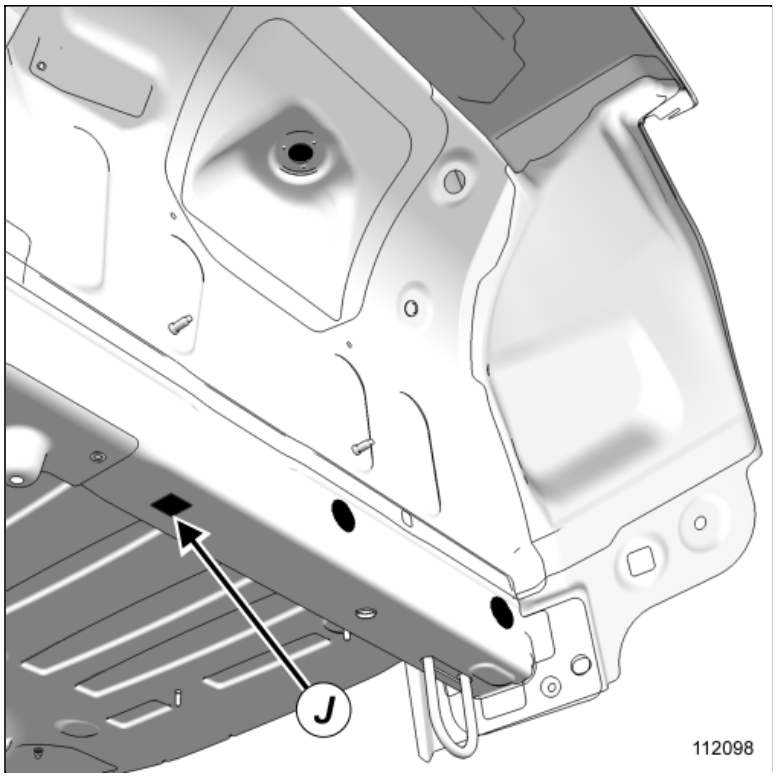
It is used when replacing:

- the radiator cross member mounting,
- the front side member completely or partially,
- a half unit.



9. FRONT IMPACT CROSS MEMBER MOUNTING

The jig rests vertically against the radiator cross member mounting unit and is centred in mounting holes(K) and (K1) .

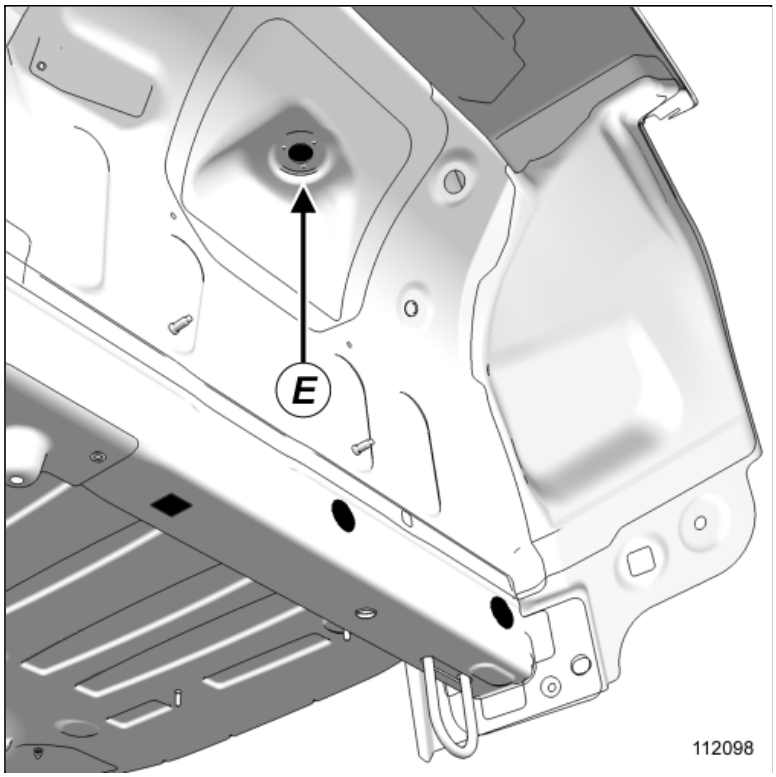


- It is used when replacing:
  - the radiator cross member mounting,
  - the front side member completely or partially,.

10. END OF REAR SIDE MEMBER

The jig rests vertically against the side member and is centred in hole(J1) .

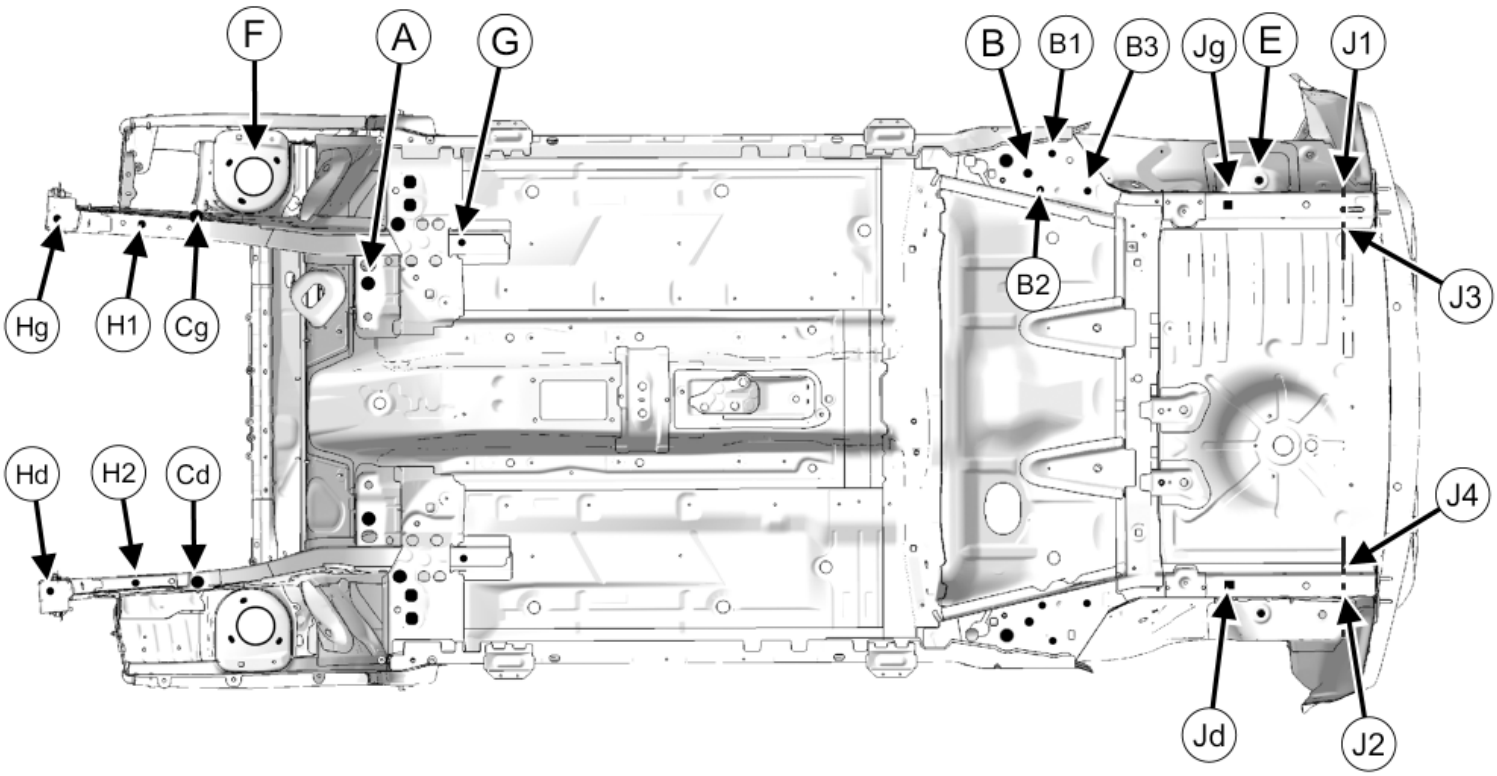
It is used for partially replacing a rear side member.



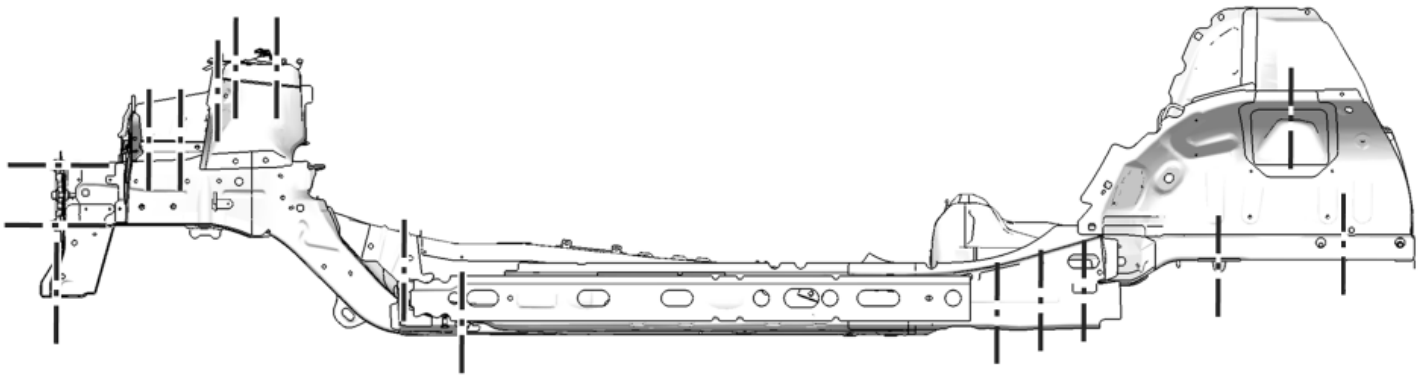
The jig rests under the rear side member and is centred in hole(J) .

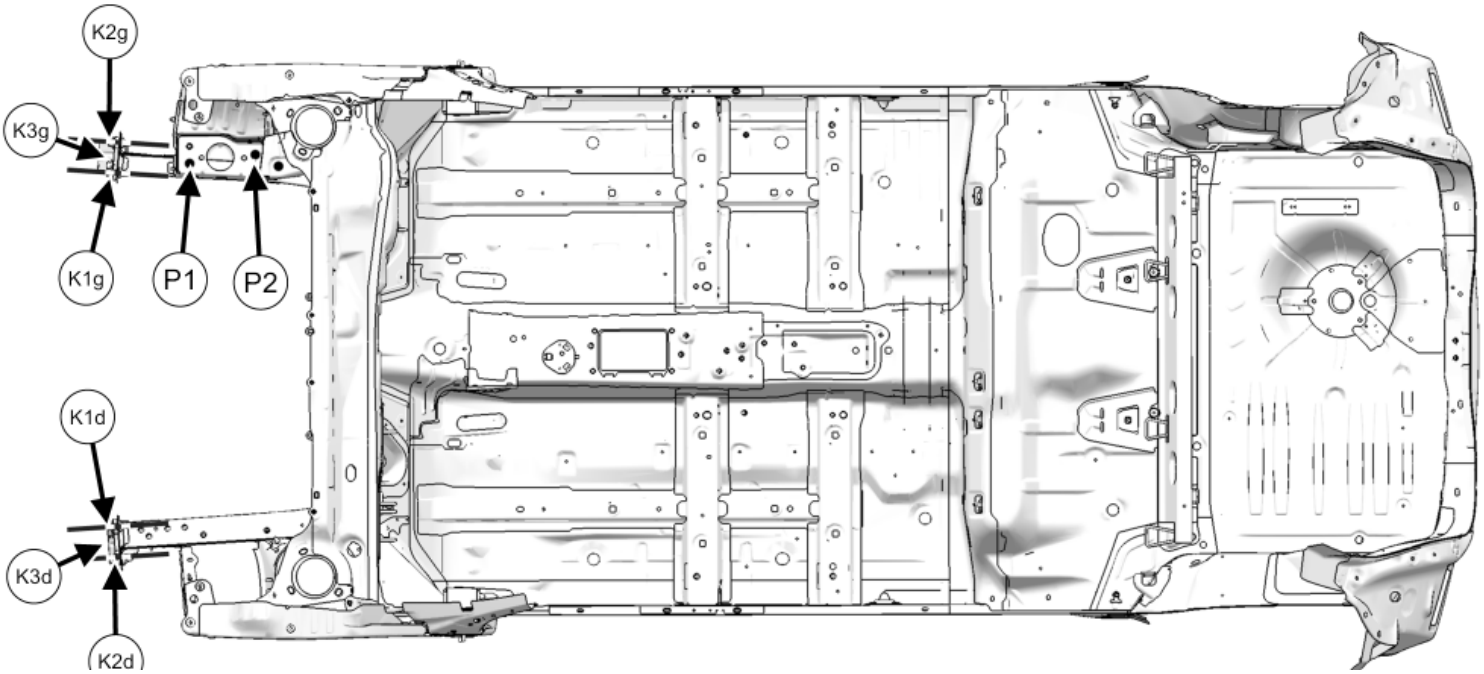
It should be used with the mechanical components in place to realign a rear side member.

It is used with the mechanical components removed, under the same conditions, to replace the complete rear side member.



11. INNER REAR WHEEL ARCH





The jig supports the underneath of the rear shock absorber cup and is centred on hole(E) .

Use it when replacing the rear wheel arch.

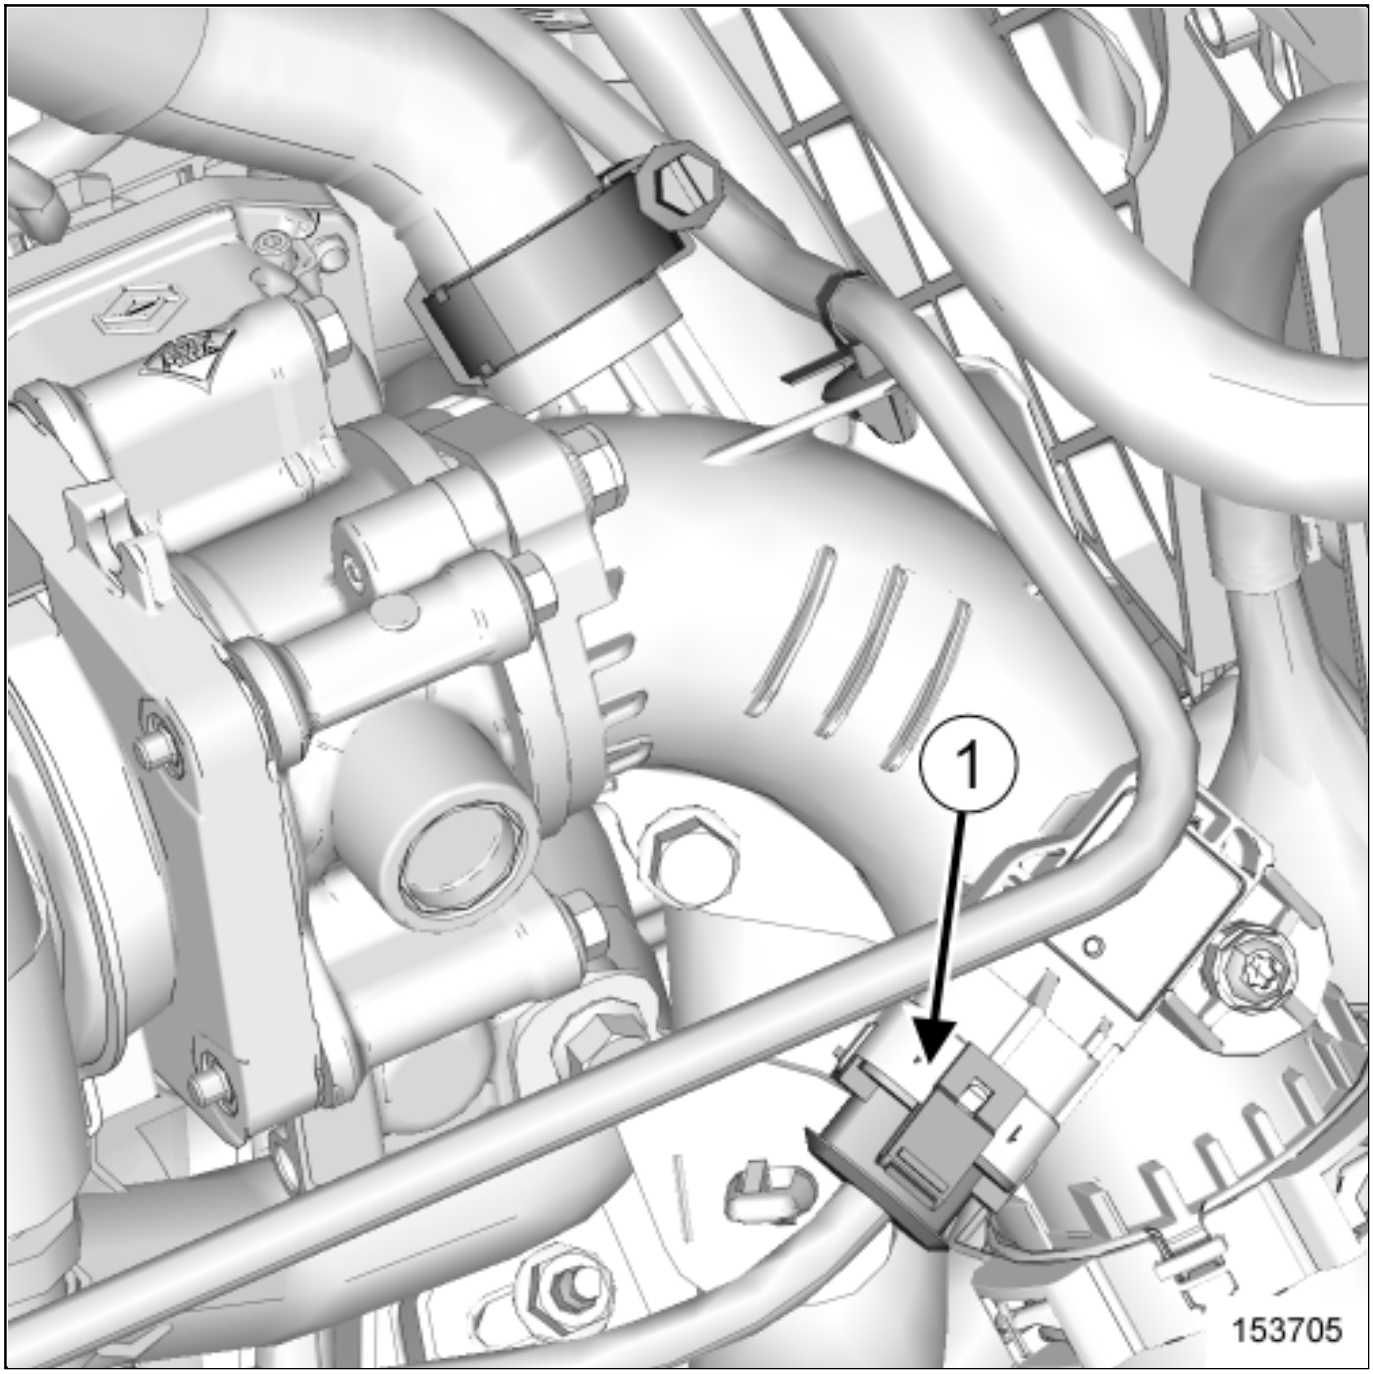
THROTTLE VALVE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

parts always to be replaced:
Throttle valve seal

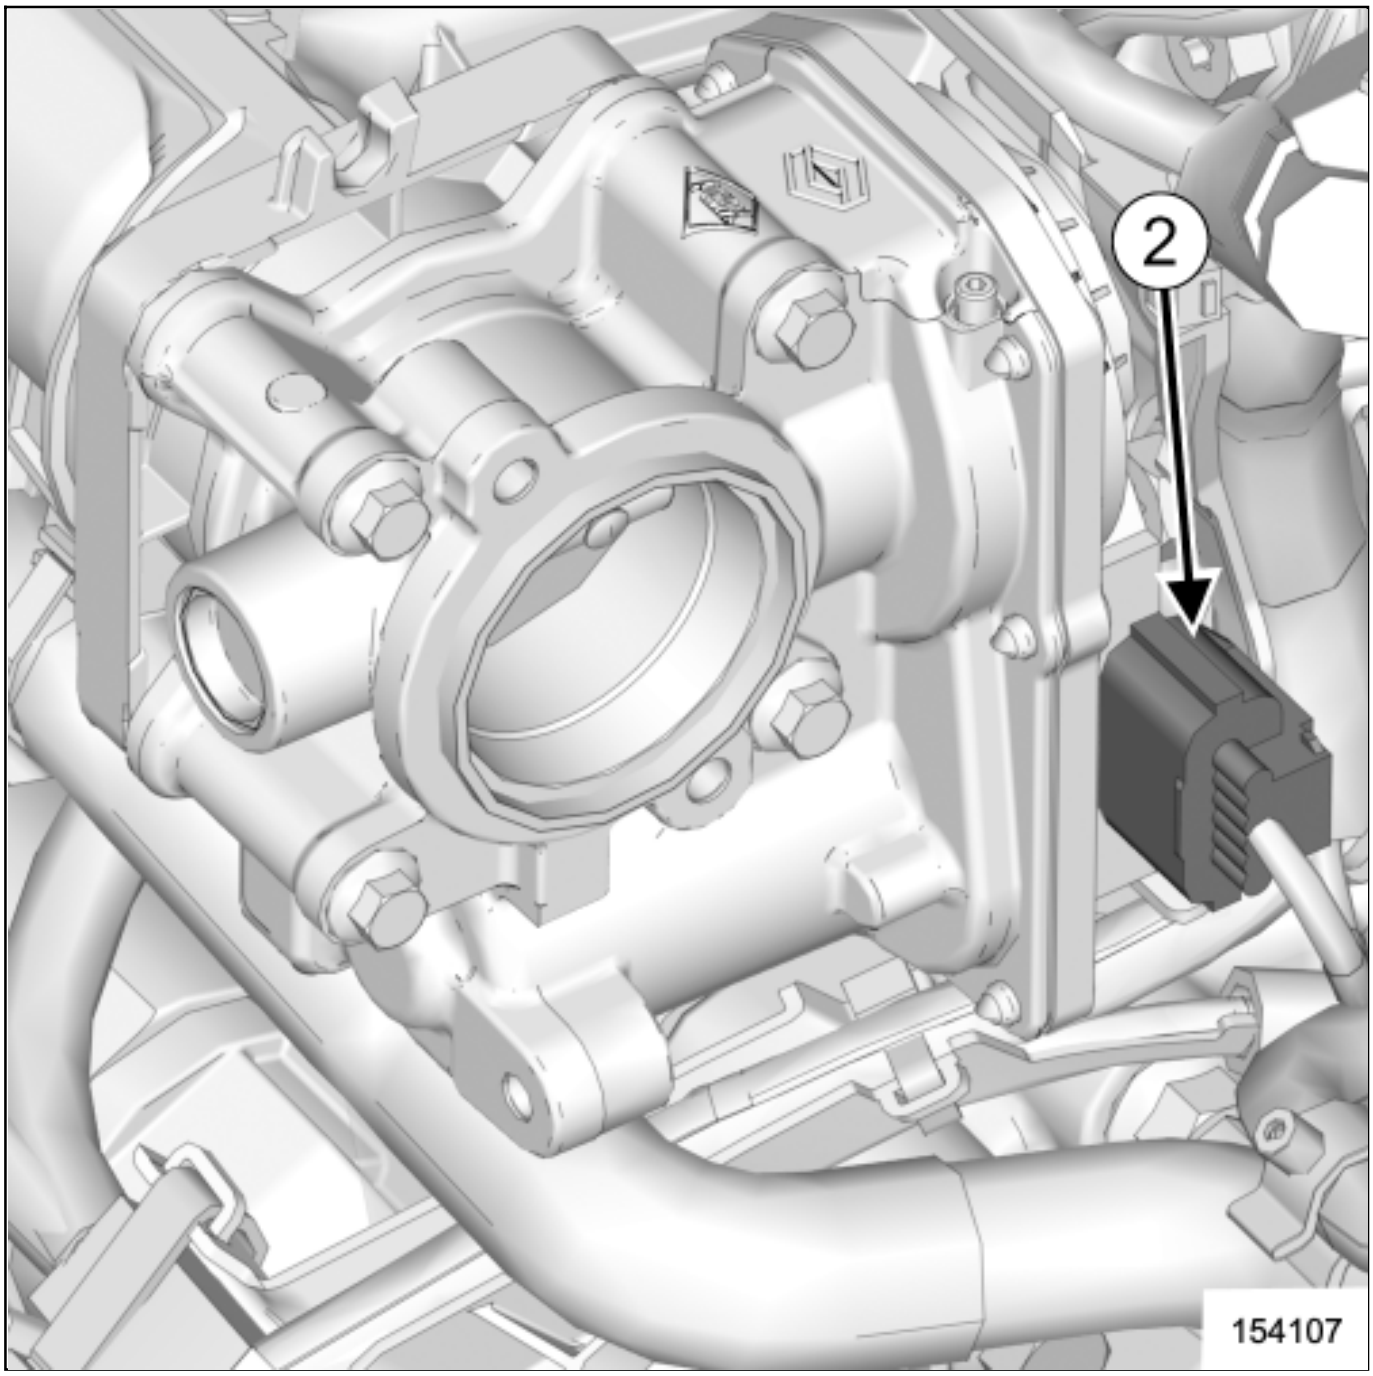


Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :



- the air inlet pipe,
- the air pipe link between intercooler outlet pipe and high pressure discharge valve.

- Disconnect the air temperature and pressure sensor connector(1) .

- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the throttle valve air inlet pipe bolts,
  - the throttle valve air inlet pipe,
  - the throttle valve air inlet pipe seal.

2. REMOVAL OPERATION

- Disconnect the throttle valve connector(2) .

- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the throttle valve bolts,
  - the throttle valve,
  - the throttle valve seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Throttle valve seal.

Part always to be replaced:
- the throttle valve air inlet pipe seal.

Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease:
- the seal housing on the inlet manifold,
- the seal housing on the throttle valve air inlet pipe,
- the seal housing on the throttle valve, if being reused.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

2. REFITTING OPERATION

Refit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
- the new throttle valve seal,
- the throttle valve.

Torque tighten the throttle valve bolts (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Connect the throttle valve connector.

3. FINAL OPERATION

Refit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
- the new throttle valve air inlet pipe seal,
- the throttle valve air inlet pipe.

Torque tighten the throttle valve air inlet pipe bolts (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Connect the air temperature and pressure sensor connector.

Clip the degassing hose onto the throttle valve air inlet pipe.

Proceed in the reverse order to removal.

Apply the After repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

"Injection computer" ,

-Component controlled by this computer concerned by the After repair procedure:

"Throttle valve" .

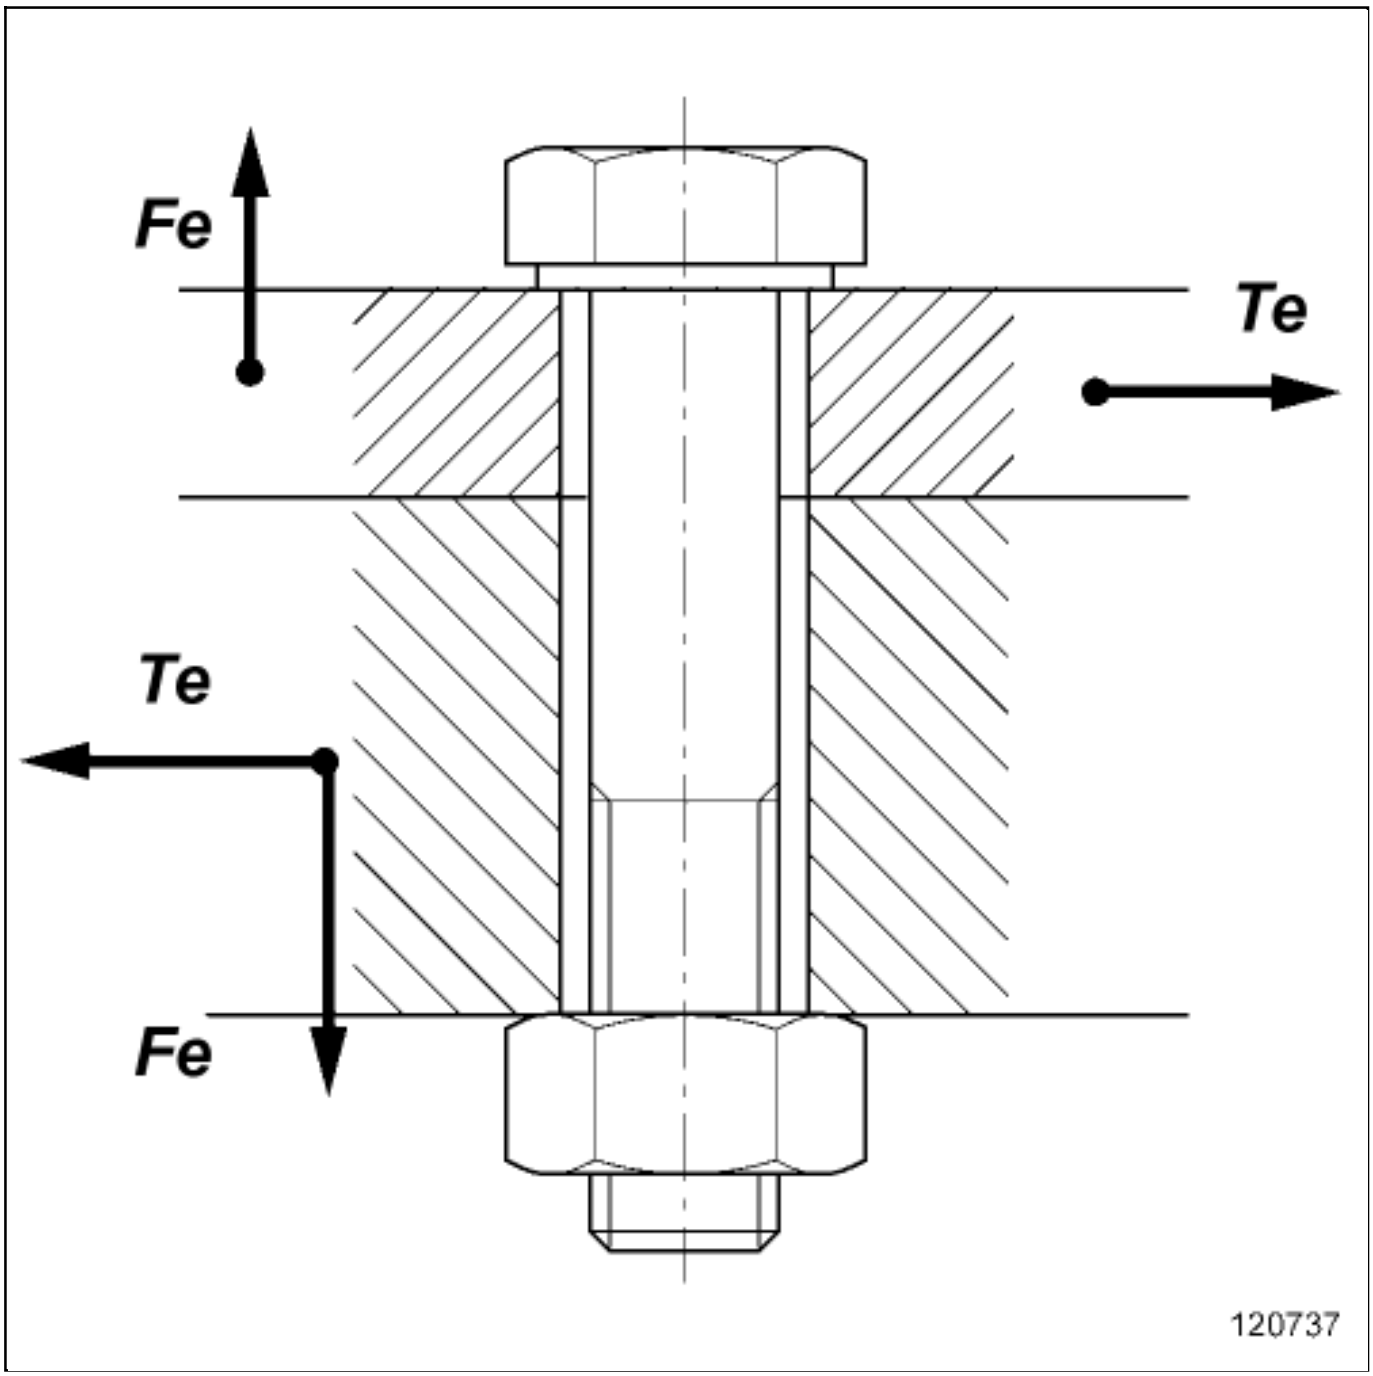
TIGHTENINGTORQUES:GENERALINFORMATION

1. TABLE OF STANDARD TORQUES

Fastenings		Standard tightening torque (N.m)
Diameter	Property class	
M6	8.8	10
M8	8.8	25
M10	8.8	50
M10	10.9	62
M12	10.9	105
M14	10.9	180
M16	10.9	280
M18	10.9	400

SPECIAL NOTES ON ELECTRICAL EARTHS

Fastenings Diameter	Standard tightening torque (N.m)
M6	8
M8	21
M10	44

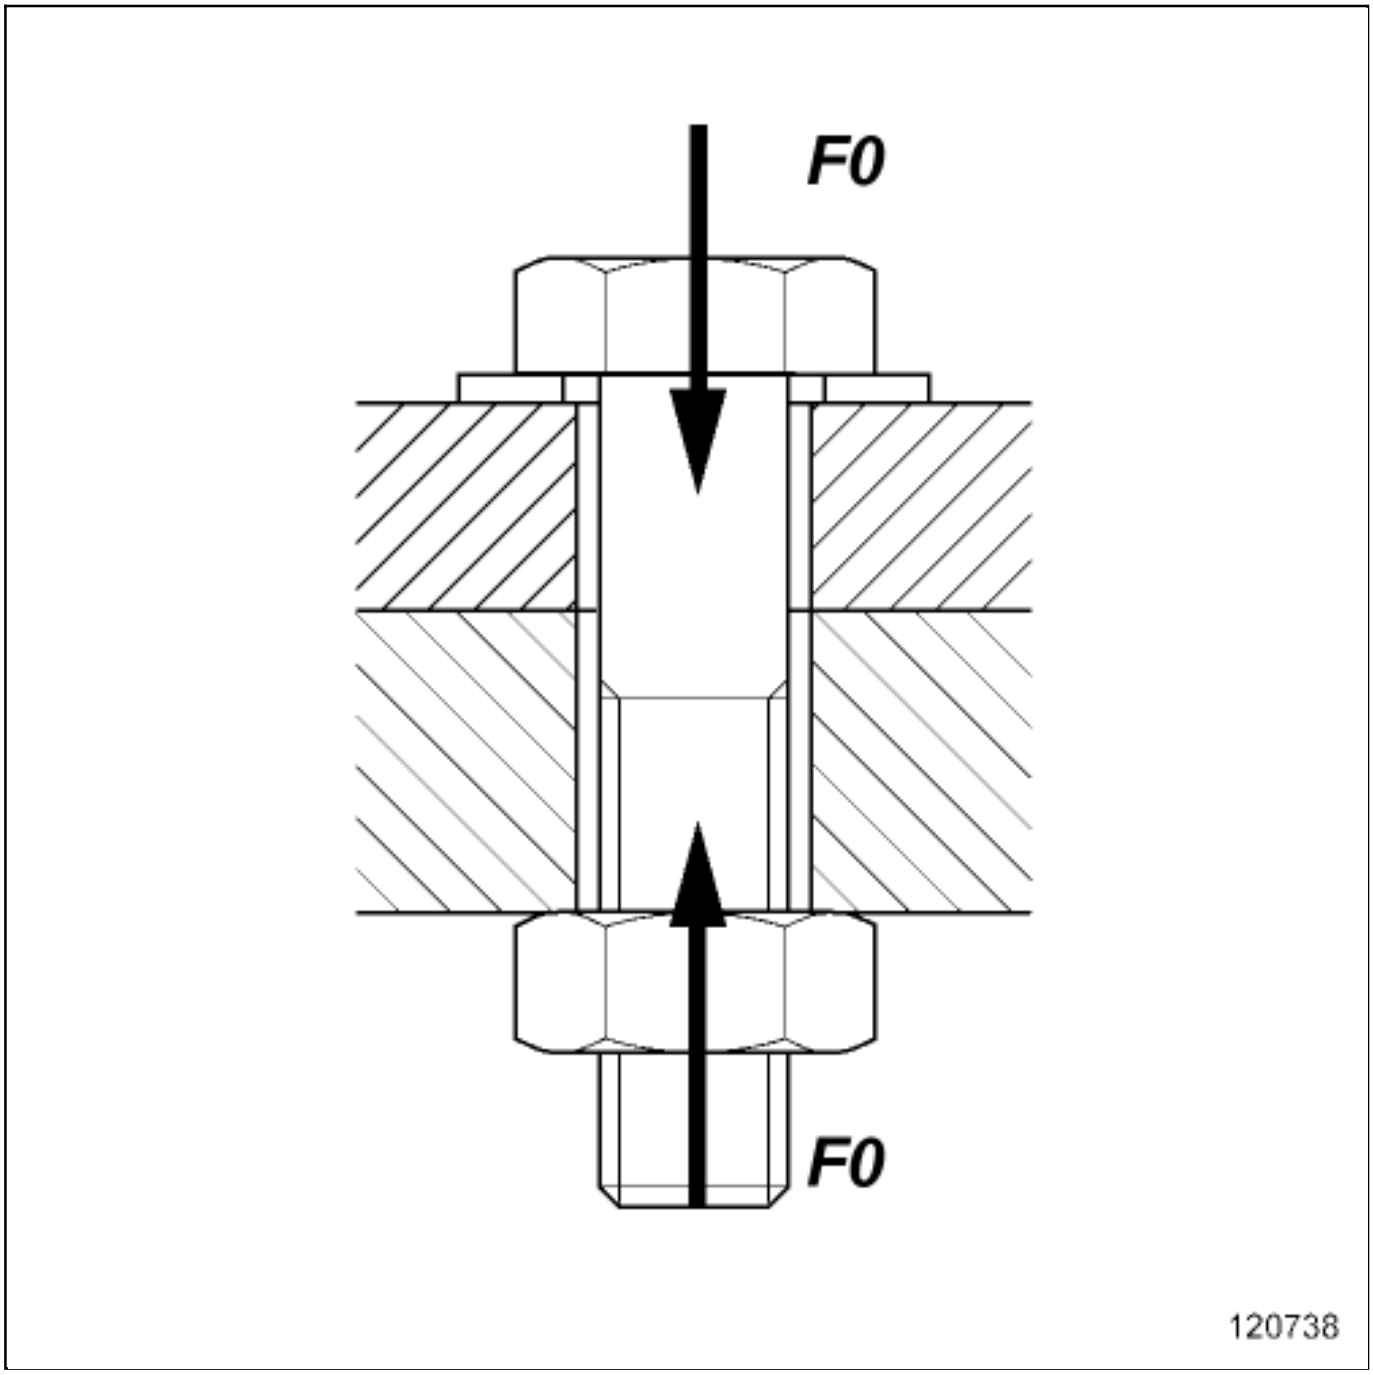


The property class is indicated on the bolt(1) or (2) .

2. FUNCTION OF A BOLTED ASSEMBLY

The bolting system connects parts of an assembly to prevent their separation or sliding when submitted to exterior forces.

EXTERIOR FORCES

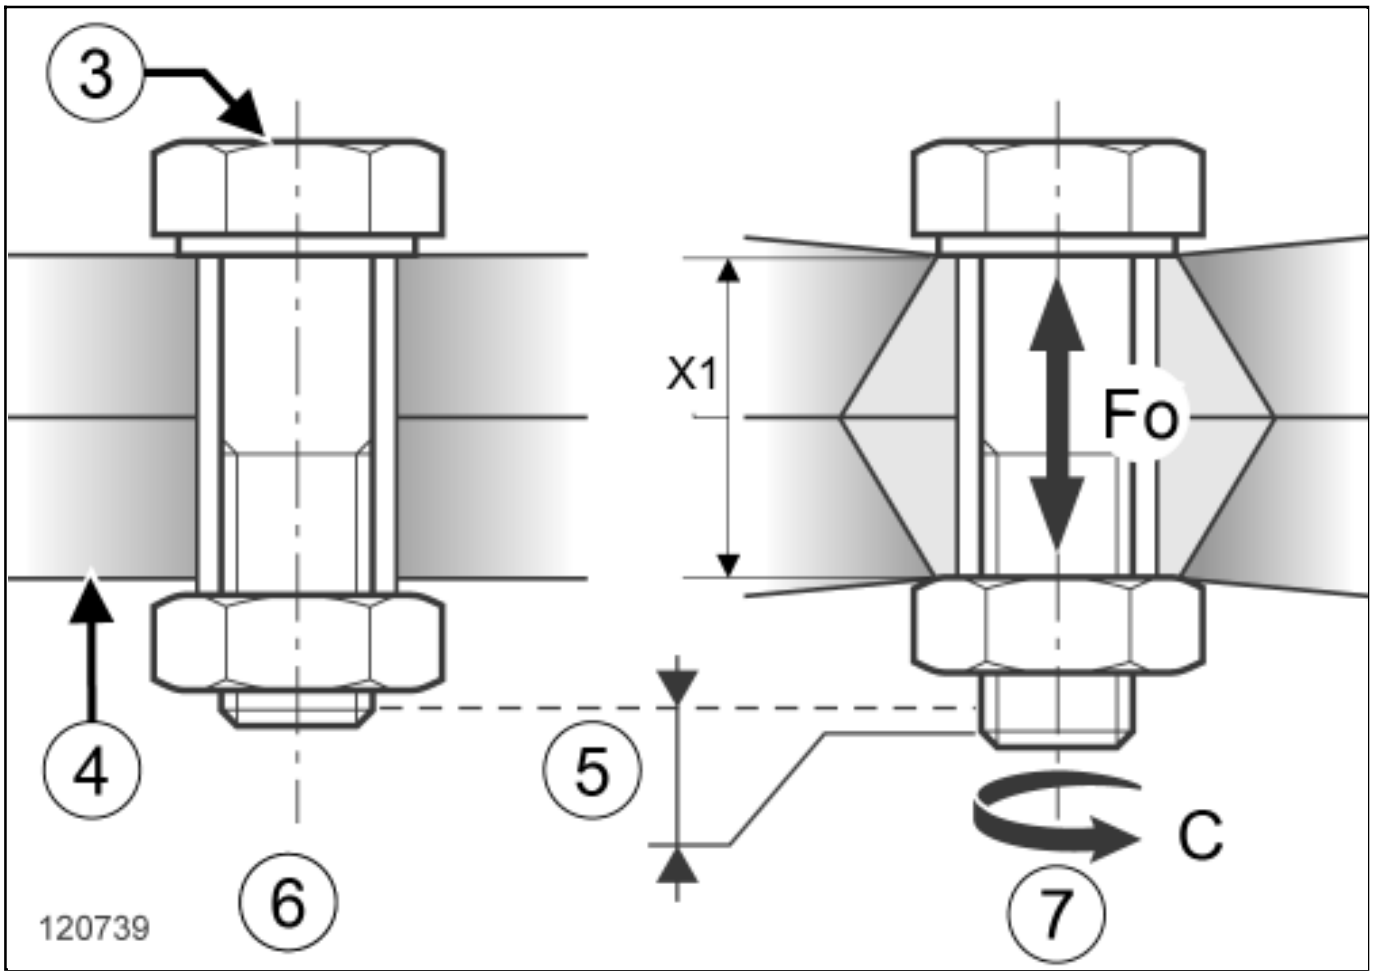


- The assembly is submitted to forces that are:
  - static and / or dynamic,

simple (e.g. simple traction),

multiple (traction + flexion + torsion).

CREATING TENSION (OR PRELOAD) F0



The assembly is held together by the tension created in the bolt when it is tightened.

A reliable assembly is only possible if the correct tension is used:

insufficient tension: risk of loosening,

too much tension: risk of deformation of the parts to be assembled, or shearing of the bolt.

(3) Bolt

(4) Assembled components

(5) Extension of the bolt

(6) Non-tightened assembly

(7) Tightened assembly

(X1) Compression of the assembly

(Fo) Sensor

(C) Tightening torque

Customer complaints resulting from incorrect tightening may be, following assembly, a safety issue (fire, loss of control of the vehicle etc.), an immobilising fault or a noise.

3. TIGHTENING PROCEDURES

The two controlled tightening procedures adapted to automotive repairs because of their low cost and simple operation are torque tightening and angle tightening (also called torque and angle).

1- TORQUE TIGHTENING

This is the most commonly used procedure. Is consists of tightening until a given resisting torque is reached, known as tightening torque.

The tightening torque is distributed in a large part as friction torque (under the head and in the thread) and in a small part as useful torque (to create the tension).

This practise spreads the tension significantly due to the variation in the friction coefficients from one assembly to another and the uncertainty of the tightening procedures and methods.

2- ANGLE TIGHTENING

The principle consists of putting the parts of the assembly in contact using a mating torque (approximately 25 to 30% of the final torque) then to tighten to a determined angle.

This method, which is not dependent on the friction of the tightened assembly, gives more precise results than torque tightening.

4. OBSERVING THE TIGHTENING TORQUES AND ANGLES

Bolted assemblies whose tightening torques and angles are explicitly specified in the removal / refitting procedures must be observed using the appropriate tools (torque wrench, angle measuring disc). Failure to observe this can lead to safety risks, immobilising faults or unwanted noises.

For other bolted assemblies, non-measured tightening (using standard spanners) is acceptable. Nevertheless, the corresponding tightening torque is indicated in the table of standard tightening torques.

5. RECOMMENDED TIGHTENING TOOLS

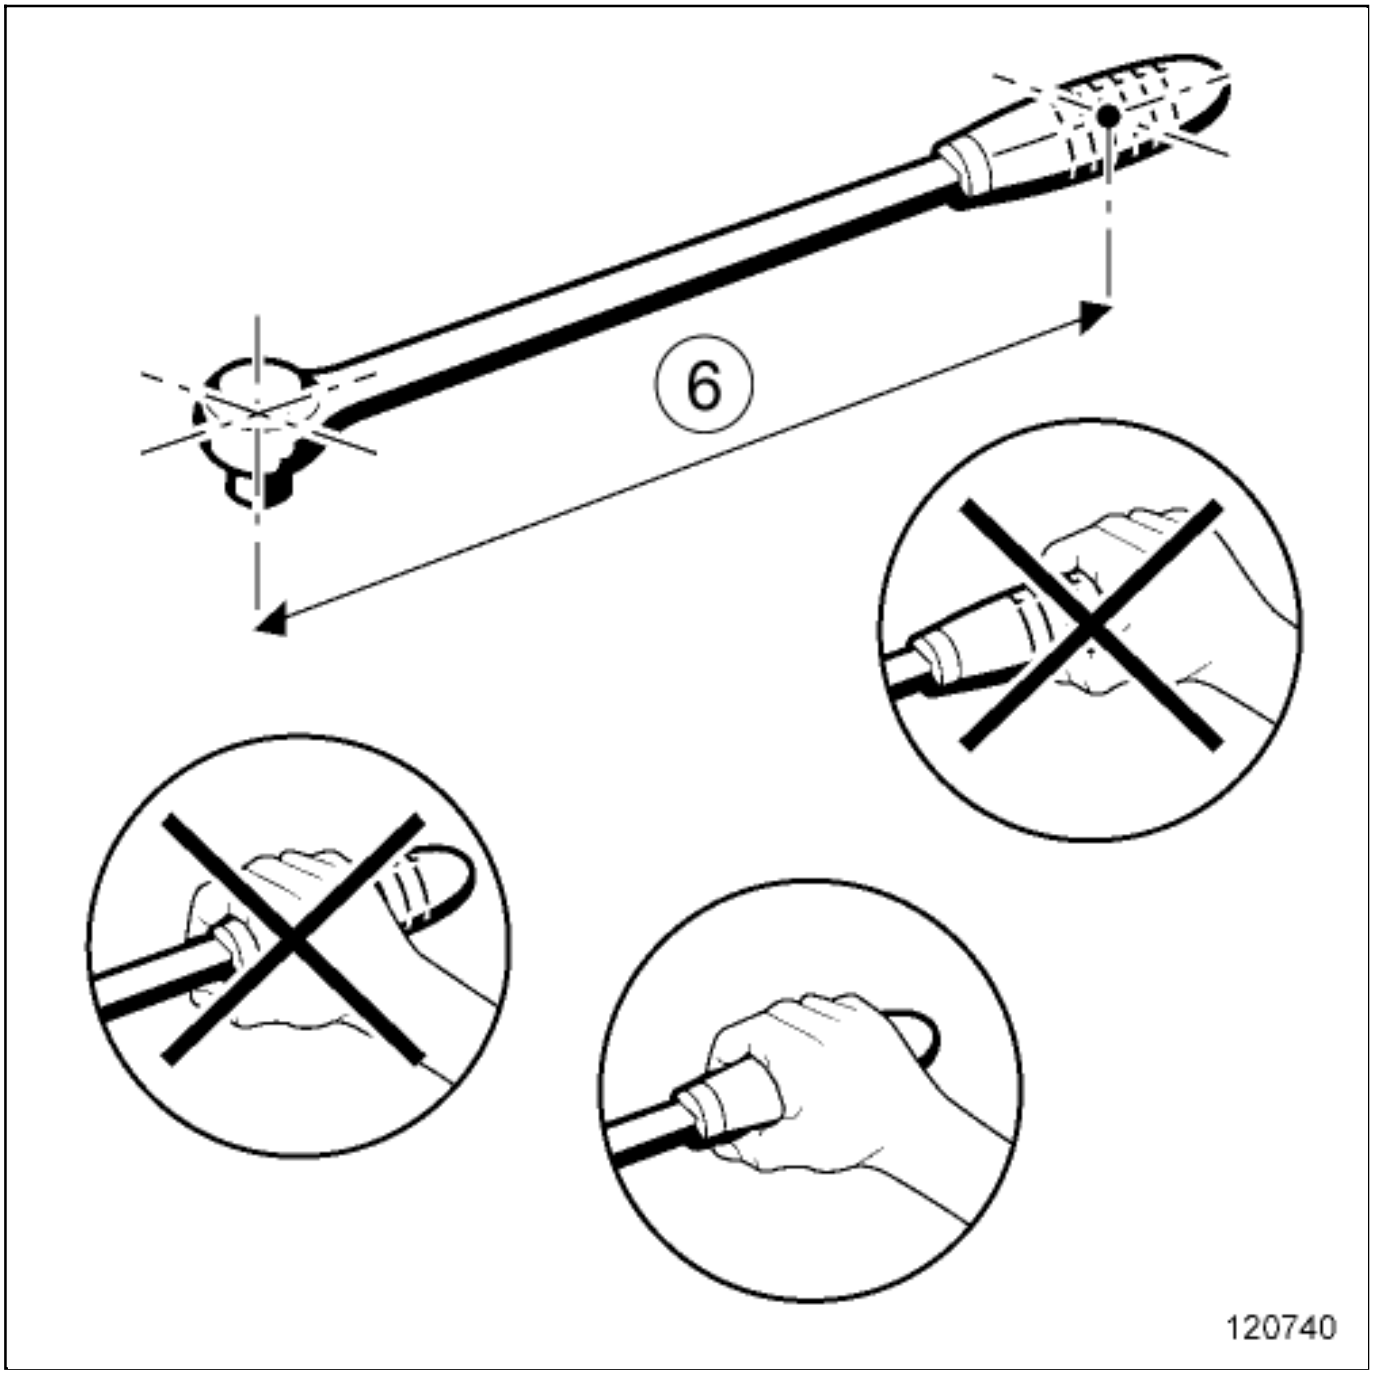
For measured tightening, the repairer must have available torque wrenches to tighten from 4 to 400 N.m as well as an angle measuring disc.

The torque wrenches used may be click type or electronic.

For example:

- 1 torque wrench 4 - 40 N.m,
- 1 torque wrench 20 - 100 N.m,
- 1 torque wrench 80 - 400 N.m,
- 1 angle measurement disc.

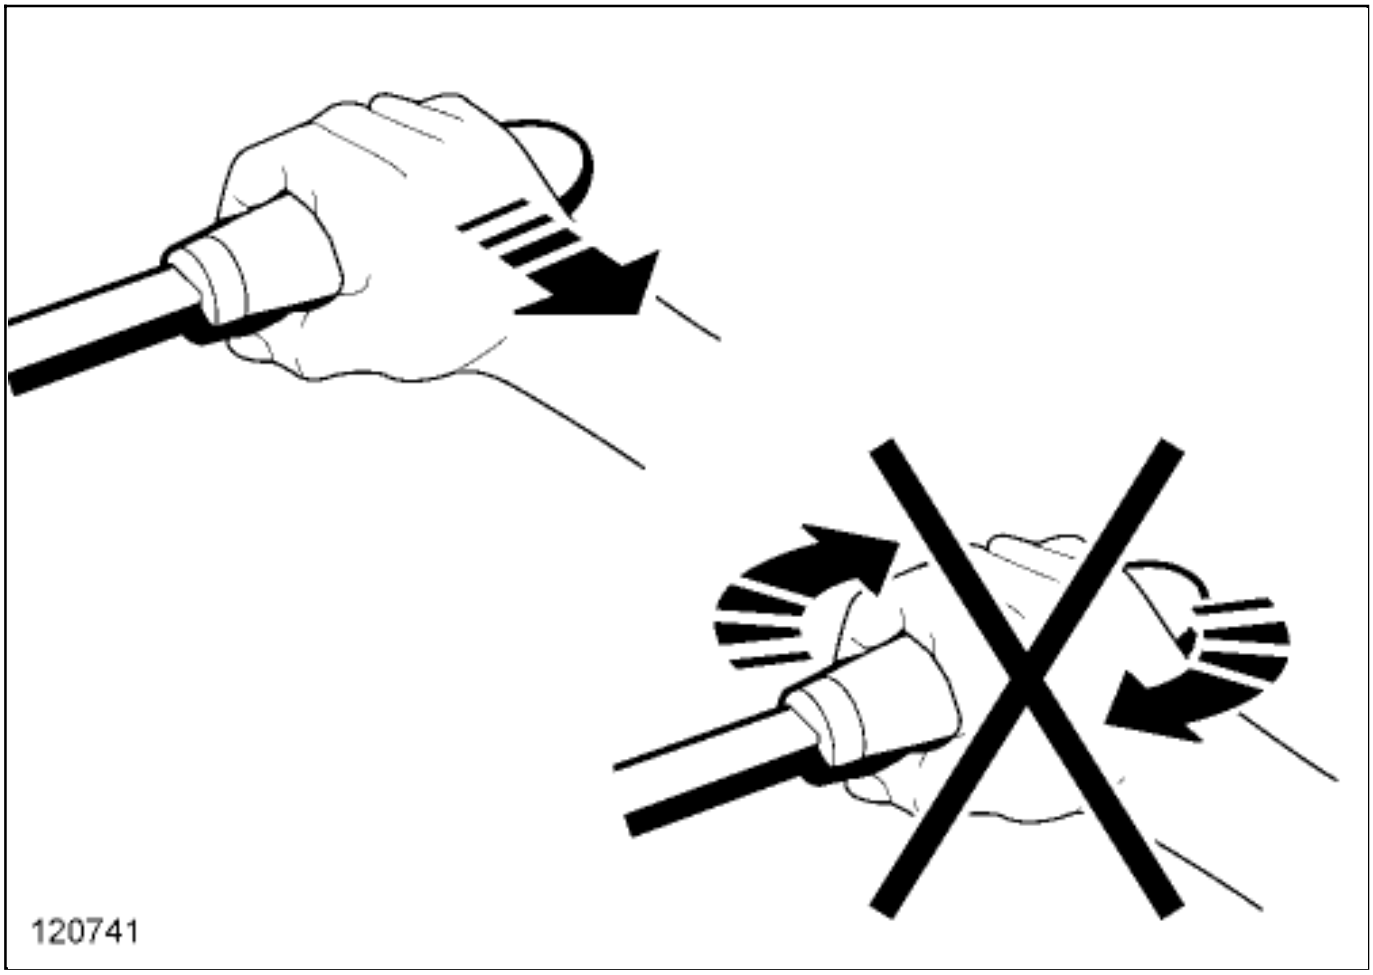
The torque wrenches used must comply with the ISO 6789standard. They must be calibrated regularly following the supplier's recommendations using the appropriate procedures.



6. PRECAUTIONS WHEN USING A CLICK TYPE TORQUE WRENCH

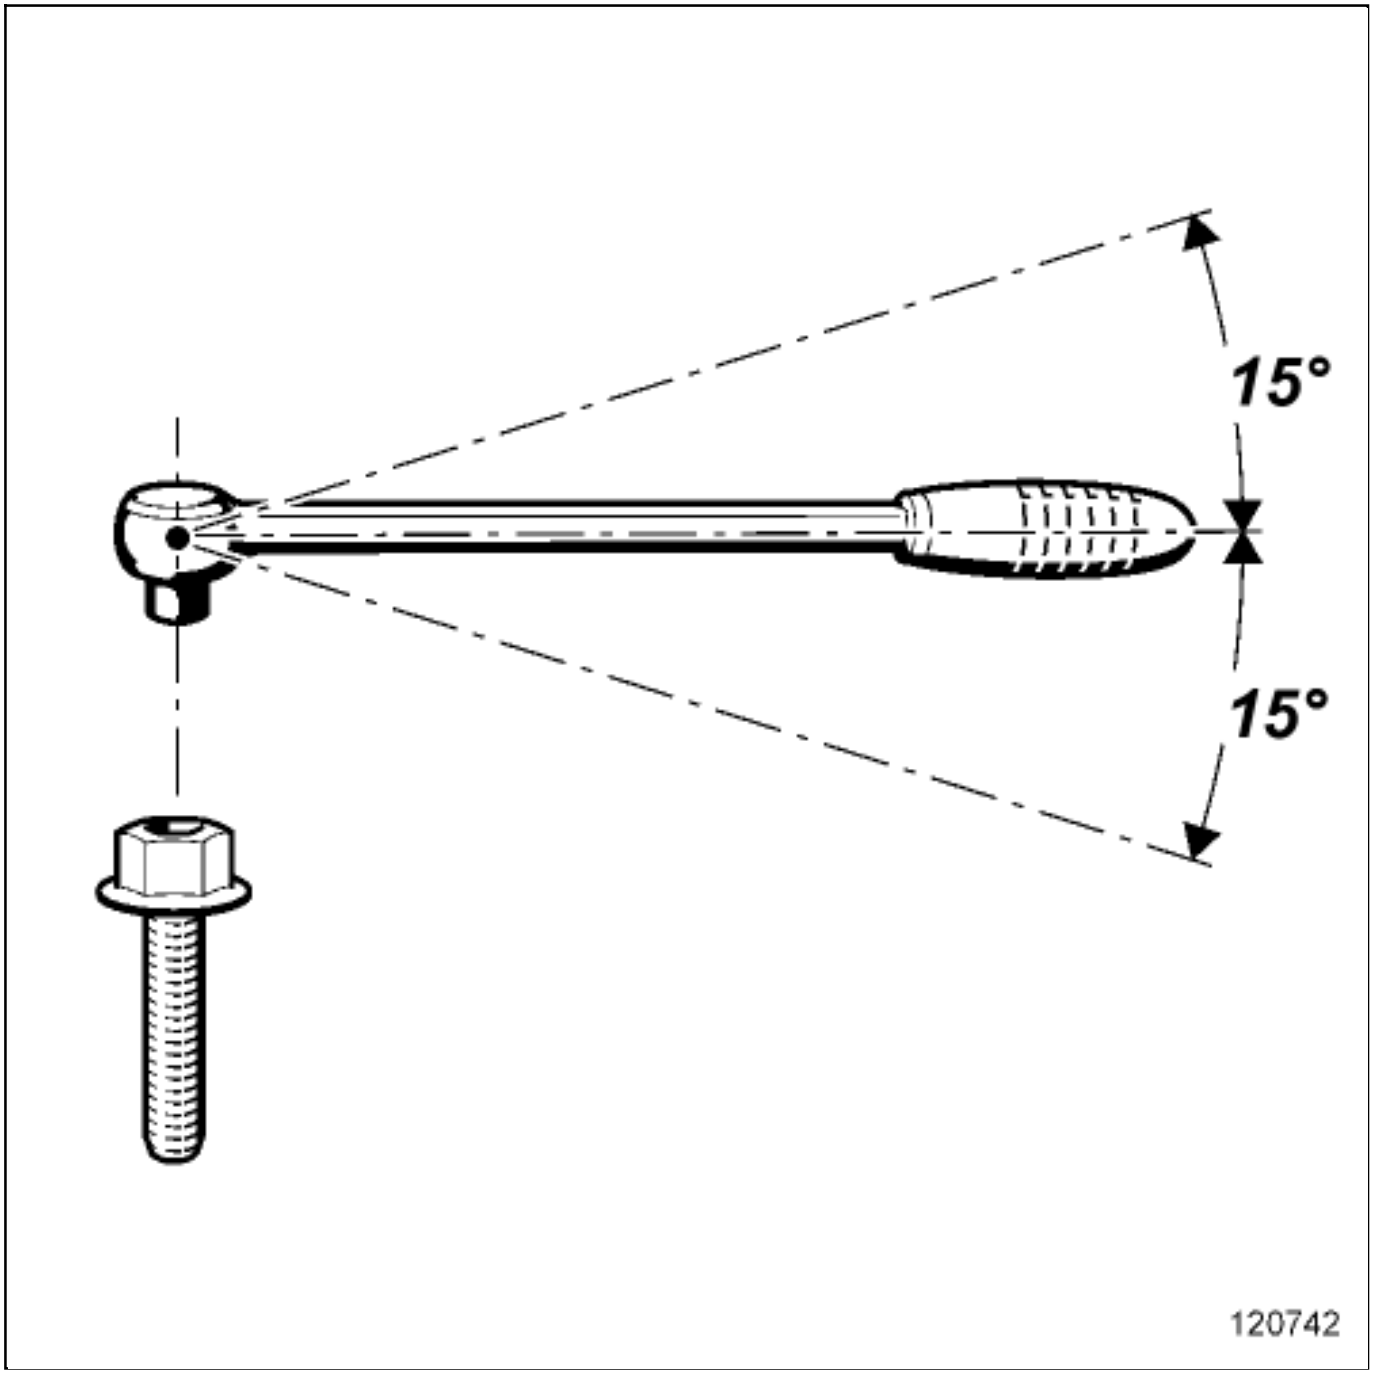
A click type torque wrench is a manual tightening tool. The trigger mechanism causes a break or disengagement of the wrench past a force threshold.

This threshold depends on the setting of the wrench but also depends on the way the wrench is handled.



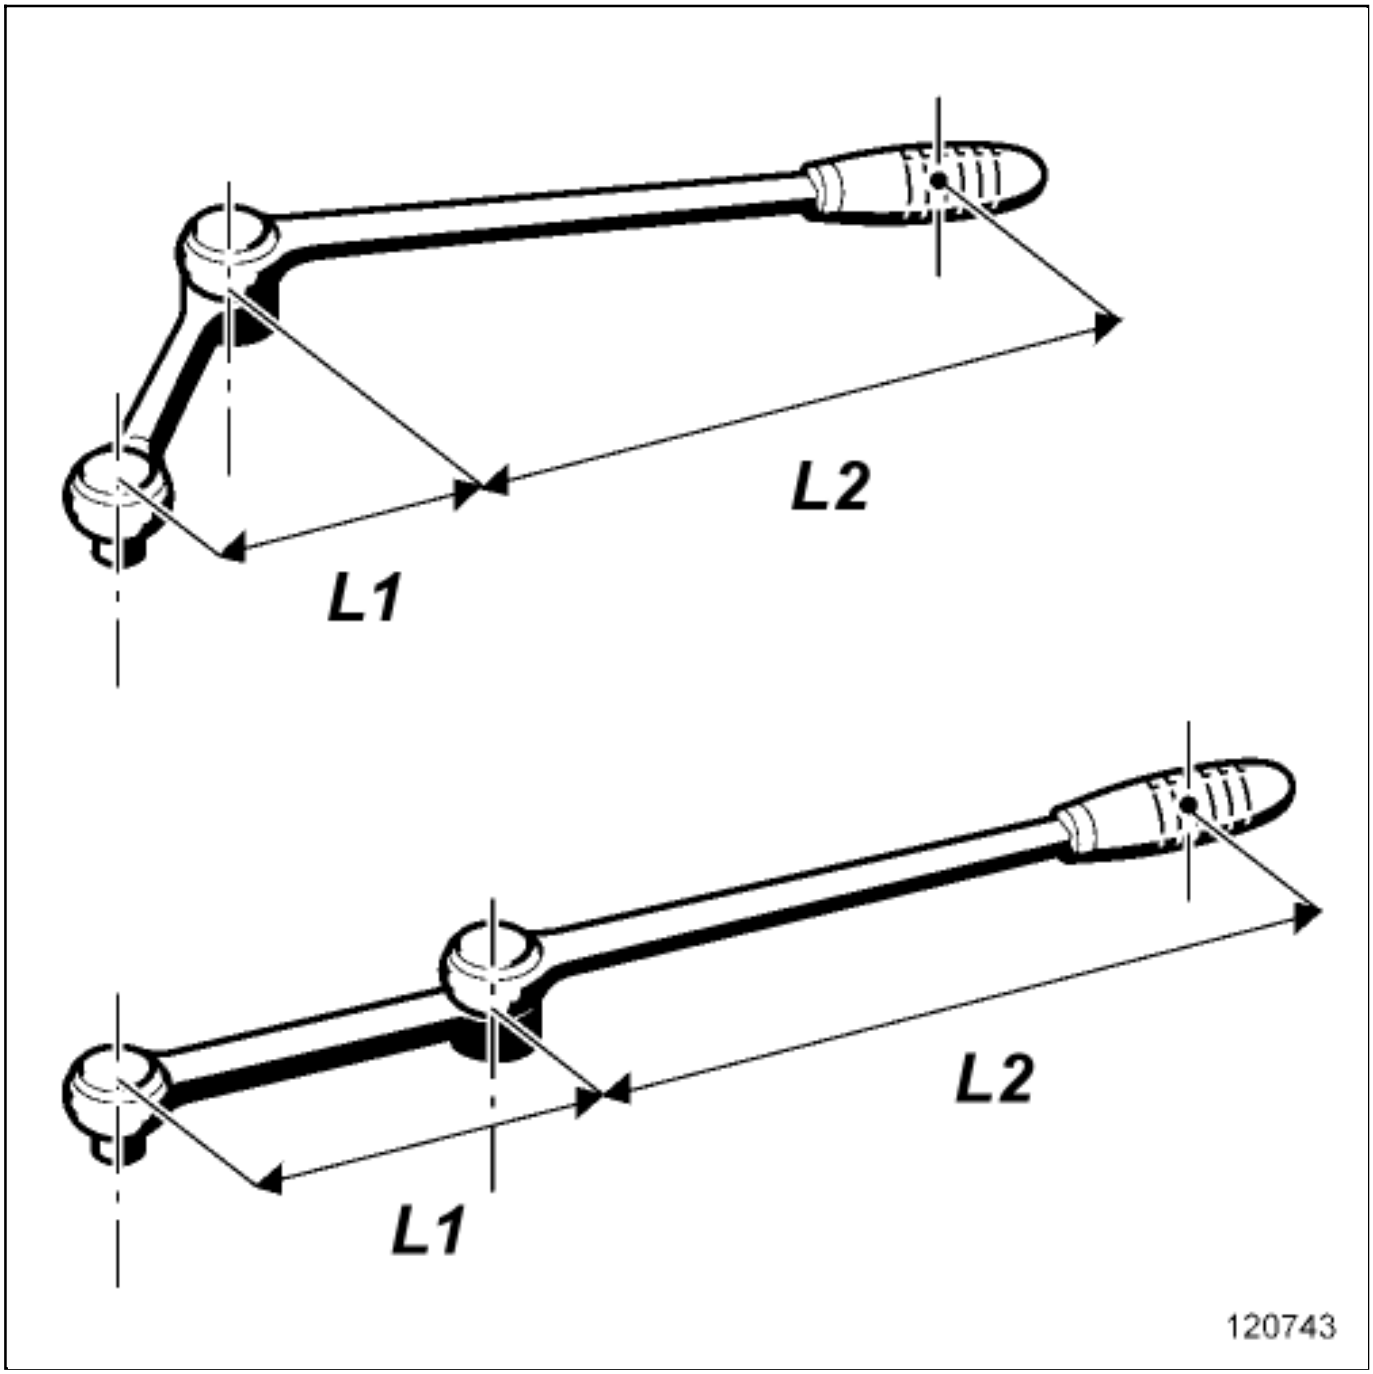
When used following best practises, the accuracy of the tightness when using a click type torque wrench is ± 15%.

The instructions to be observed are:



(6) lever arm

- Place the hand in the centre of the handle. An incorrectly positioned hand on the handle will alter the trigger threshold.



- Pull the wrench gently and steadily, without applying any torsion. Excessive tightening speed as well as jerkiness are major causes of overtightening. Any torsion applied to the wrench will alter the trigger threshold.

- Hold the wrench on the bolt using a minimum of effort. Any effort applied to the wrench head will alter the trigger threshold.

- Apply the tightening effort perpendicular to the mounting observing a tolerance of ± 15˚ relative to the perpendicularity. If the wrench is not perpendicular to the mounting axis, this will result in insufficient tightening.

- Stop tightening as soon as the wrench is triggered. Continued tightening after the wrench is triggered will lead to overtightening.

If the length of the wrench is modified (extending the handle, adapting an end piece) it is essential to recalibrate the wrench to its new configuration.

Modifying the length of the wrench will modify its trigger threshold.

Use the formula: C1 = CO x L2 / (L1+L2)

- CO: torque to apply,
- C1: adjustment torque to be displayed on the wrench,

- L1: length of the extension,
- L2: length of the wrench.

Unless there are special instructions in the repair method, a universal joint (CARDAN joint type) should be used for measured tightening. Using a universal joint will result in a difference between the set torque of the wrench and the actual torque applied.

Before storing the wrench, loosen the adjustment spring completely. A wrench stored with a spring under tension will lose its tightening accuracy.

7. PRECAUTIONS WHEN USING ELECTRONIC TORQUE WRENCHES

An electronic torque wrench is a manual tightening tool. The tightening torque and, depending on the model, the angle is read directly.

When used following best practises, the accuracy of the tightness when using an electronic torque wrench is ± 5%.

Electronic torque wrenches are not affected by the position of the operator's hand.

It is advisable to handle the wrench with care and to stop tightening when the required value is displayed on the wrench.

TIMING ASSEMBLY: EXPLODED VIEW

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

REMOVAL

1. REMOVAL PREPARATION OPERATION

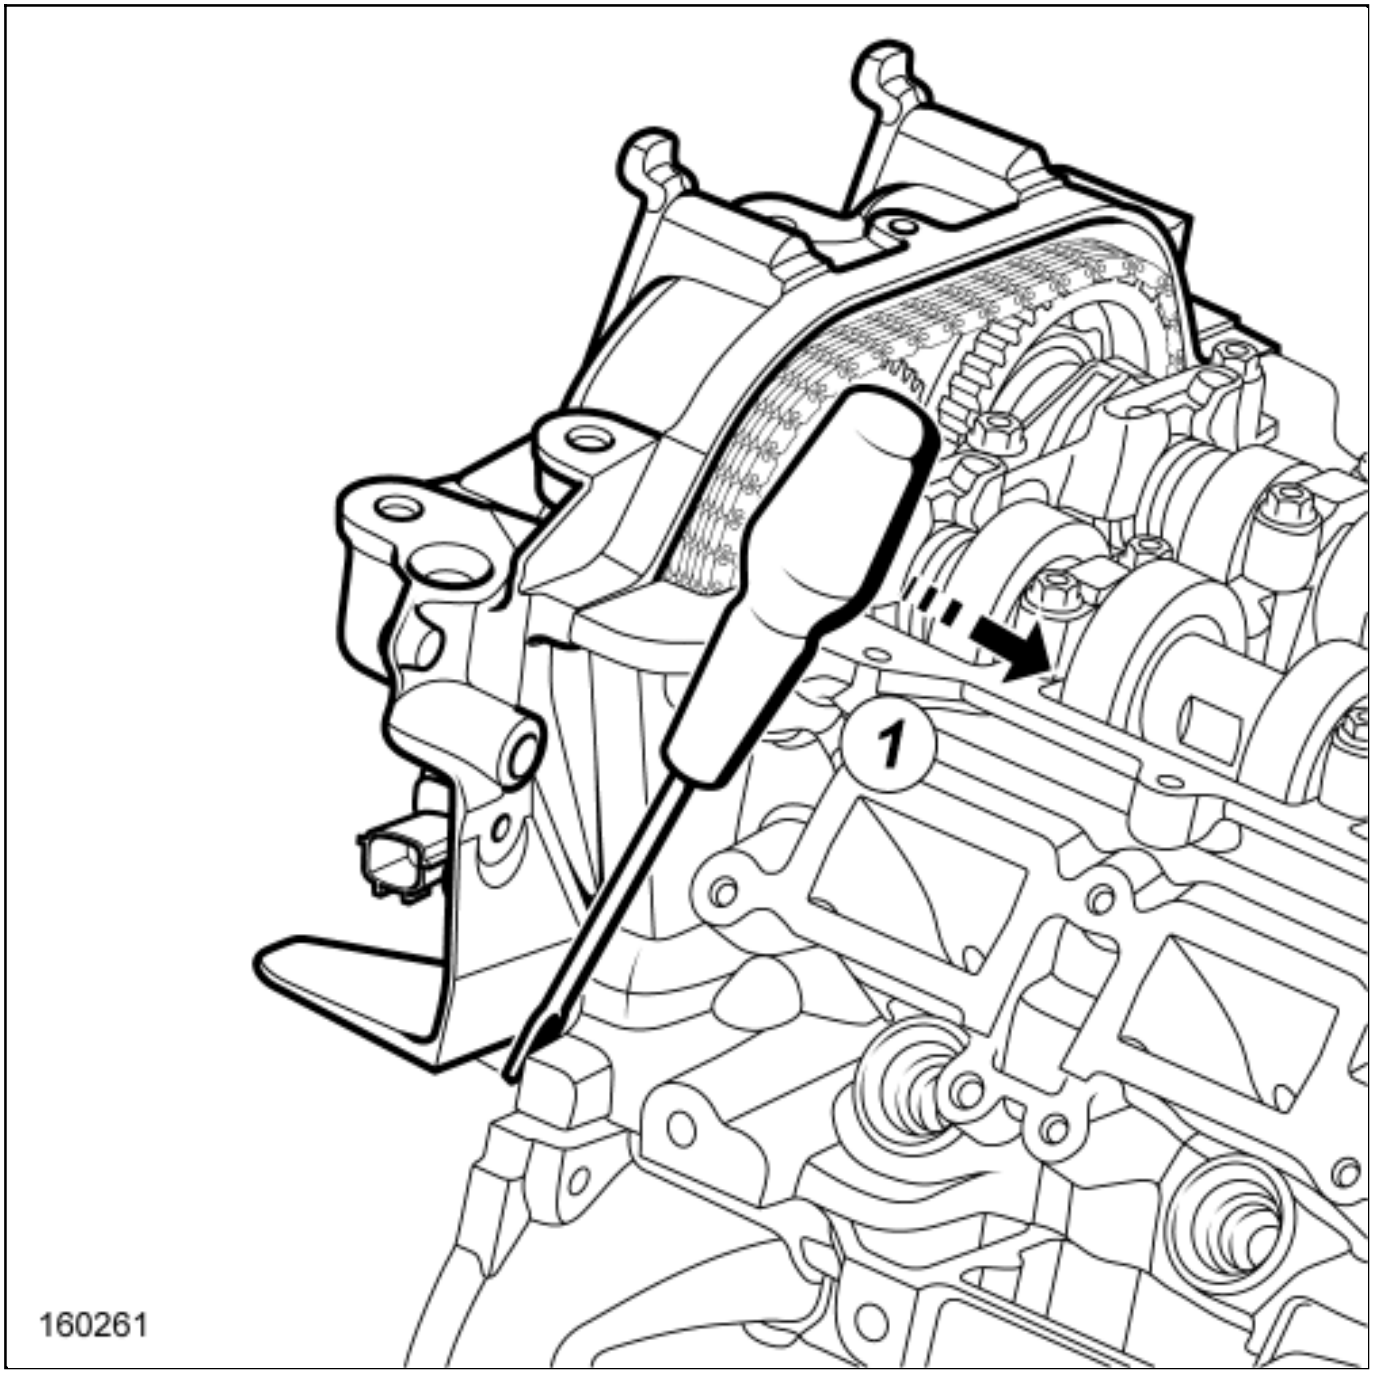
Remove the "engine and gearbox" assembly(see 10A, Engine and cylinder block assembly, Engine - gearbox assembly: Removal - Refitting) .

Separate the manual gearbox from the engine(see **Manual gearbox: Removal - Refitting**) .

Separate the automatic gearbox from the engine(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

Position the engine on the component supportEngine support equipment: Use .

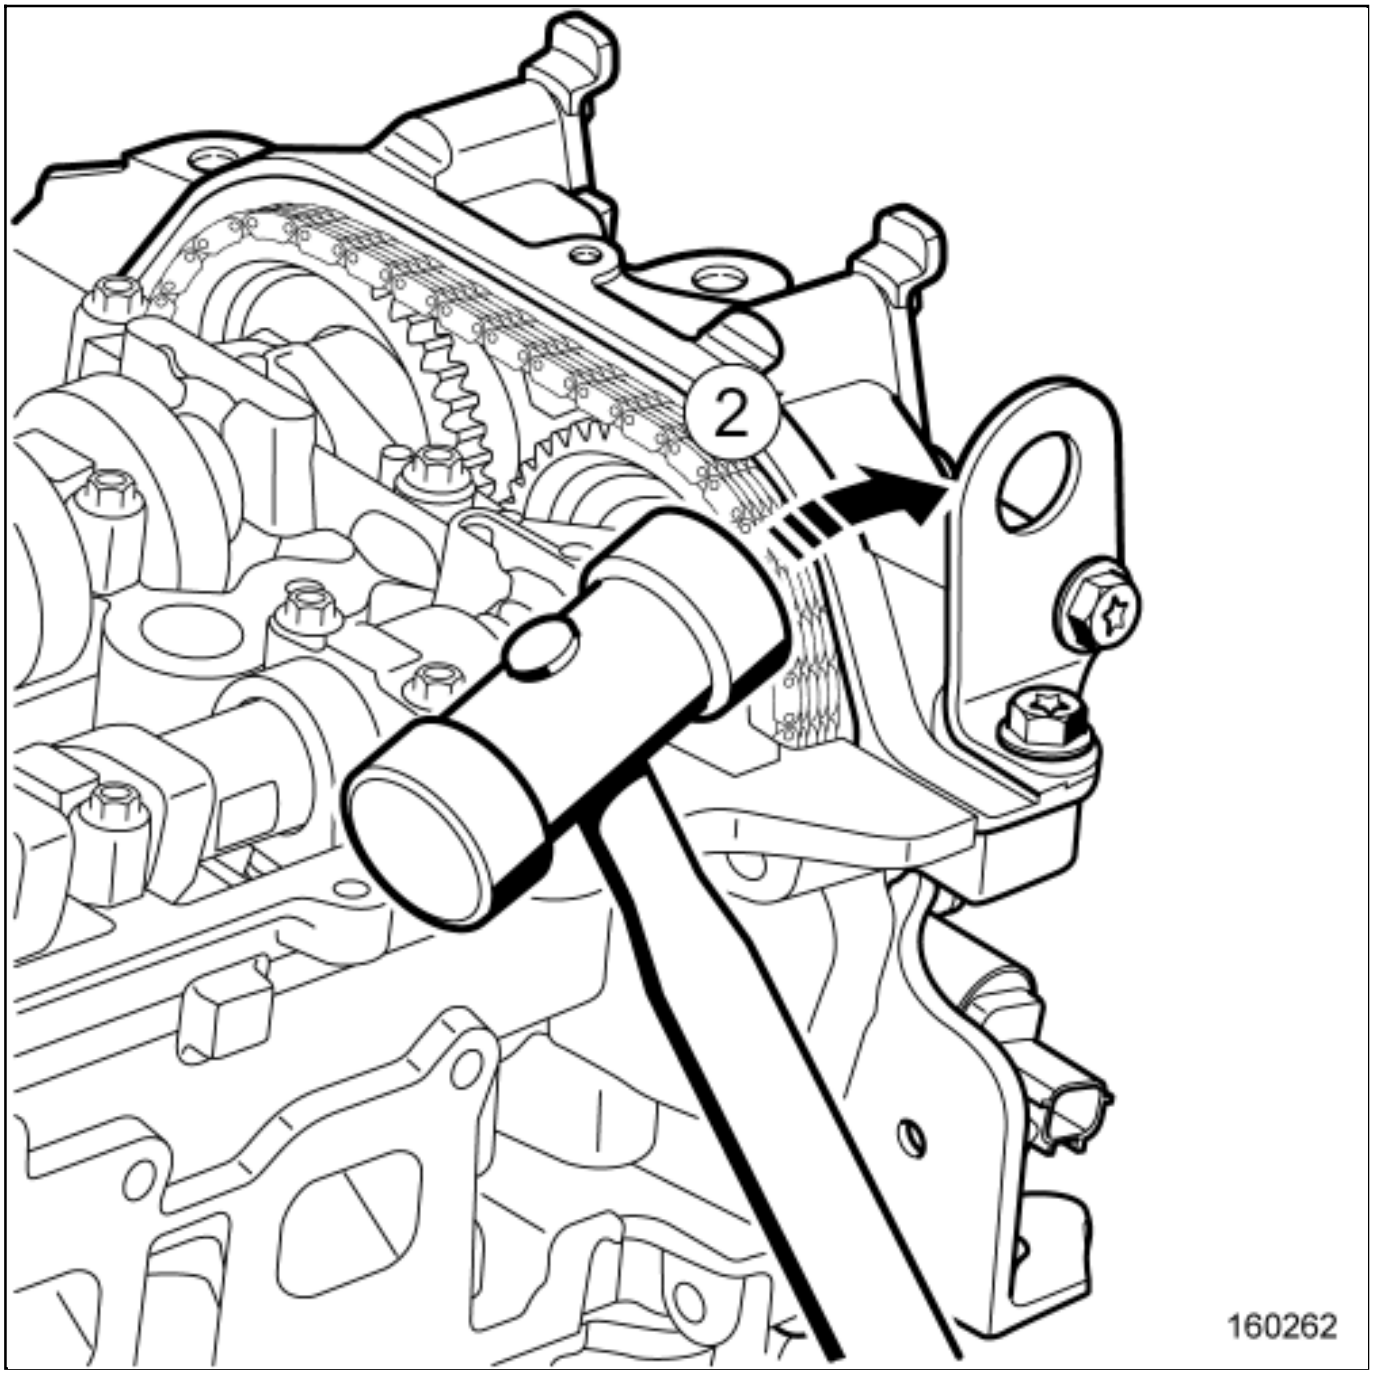
Drain the engine(see **Engine oil: Draining - Refilling**) .



Loosen the bolts of the coolant pump pulley(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Remove:

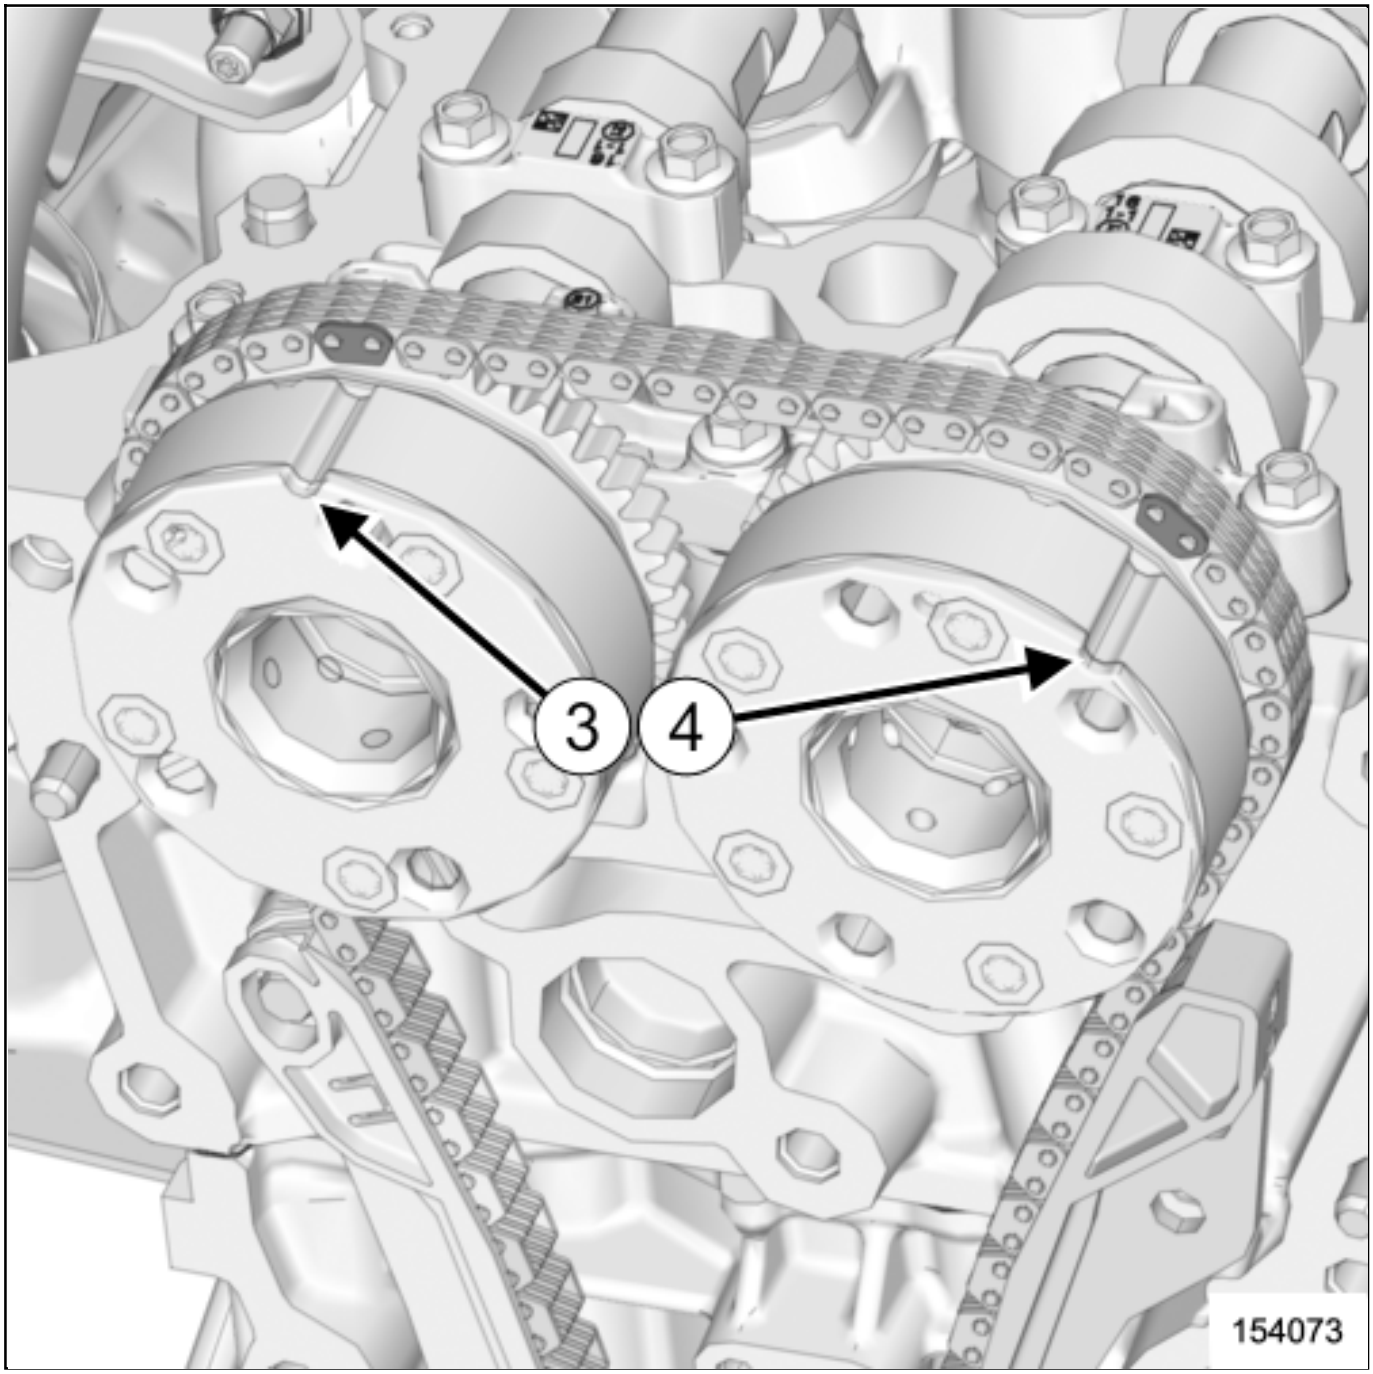
- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view),
- the coolant pump pulley bolts (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view),
- the coolant pump pulley (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view),
- the design cover bolts (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the design cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the ingnition coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the upstream oxygen sensor (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view),
- the upper turbo-manifold heat shield, rear bolt (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view),
- the upper turbo-manifold heat shield, upper bolts (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view),
- the upper turbo-manifold heat shield (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view),
- the gasoline inlet high pressure pipe to high pressure rail bolt (see 17B, Petrol injection, Petrol injection),
- the gasoline inlet high pressure pipe to high pressure rail (see 17B, Petrol injection, Petrol injection),
- the gasoline high pressure pump bolts (see 17B, Petrol injection, Petrol injection),
- the gasoline high pressure pump (see 17B, Petrol injection, Petrol injection),
- the gasoline high pressure pump lifter (see 17B, Petrol injection, Petrol injection),
- the gasoline high pressure pump seal (see 17B, Petrol injection, Petrol injection),
- the inlet camshaft position sensor bolt (see 11A, Top and front of engine, Cylinder head assembly:



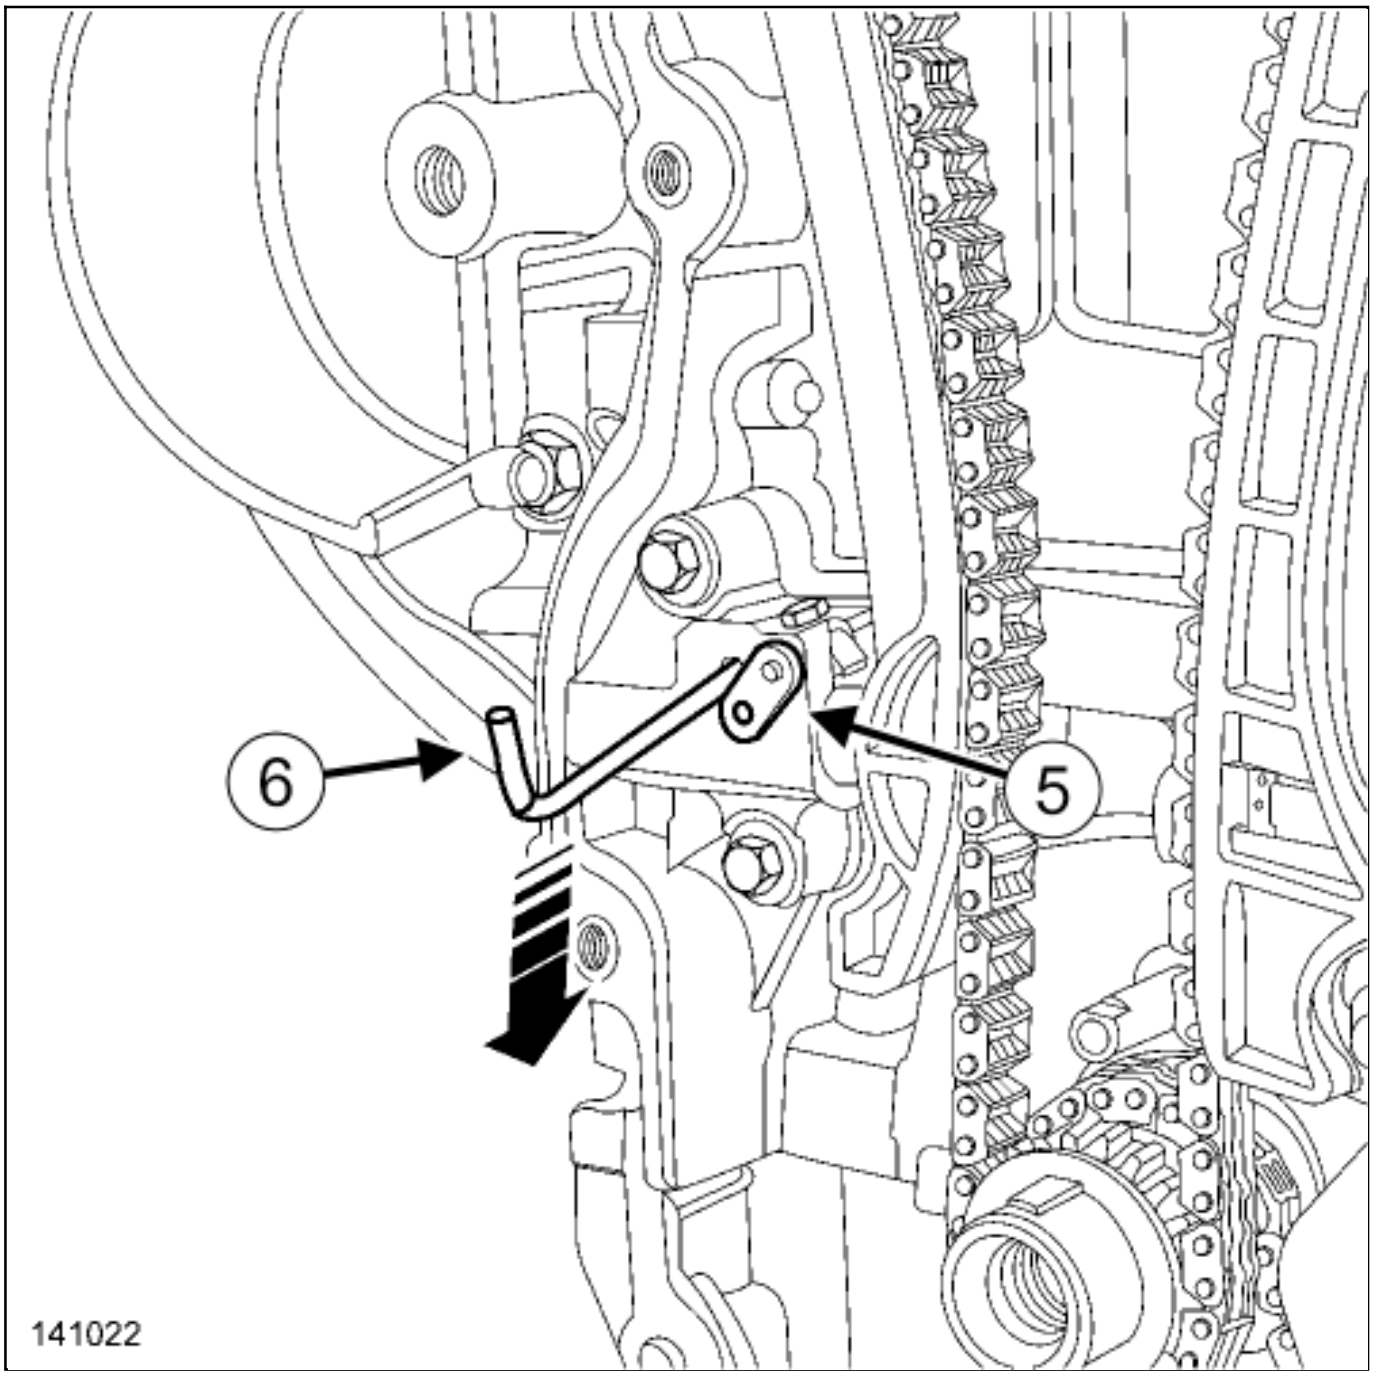
Exploded view) ,

- the inlet camshaft position sensor(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the exhaust position sensor bolt(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the exhaust position sensor(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the crankshaft accessories pulley(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the crankshaft seal on timing end(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the inlet timing dephaser bolt(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the inlet timing dephaser(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the exhaust camshaft dephaser solenoid valve bolt(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the exhaust camshaft dephaser solenoid valve(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the camshaft dephaser oil supply cover bolts(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the camshaft dephaser oil supply cover(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the camshaft dephaser oil supply cover seal(see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the timing cover bolts(see 11A, Top and front of engine, Timing assembly: Exploded view) .

1
160261

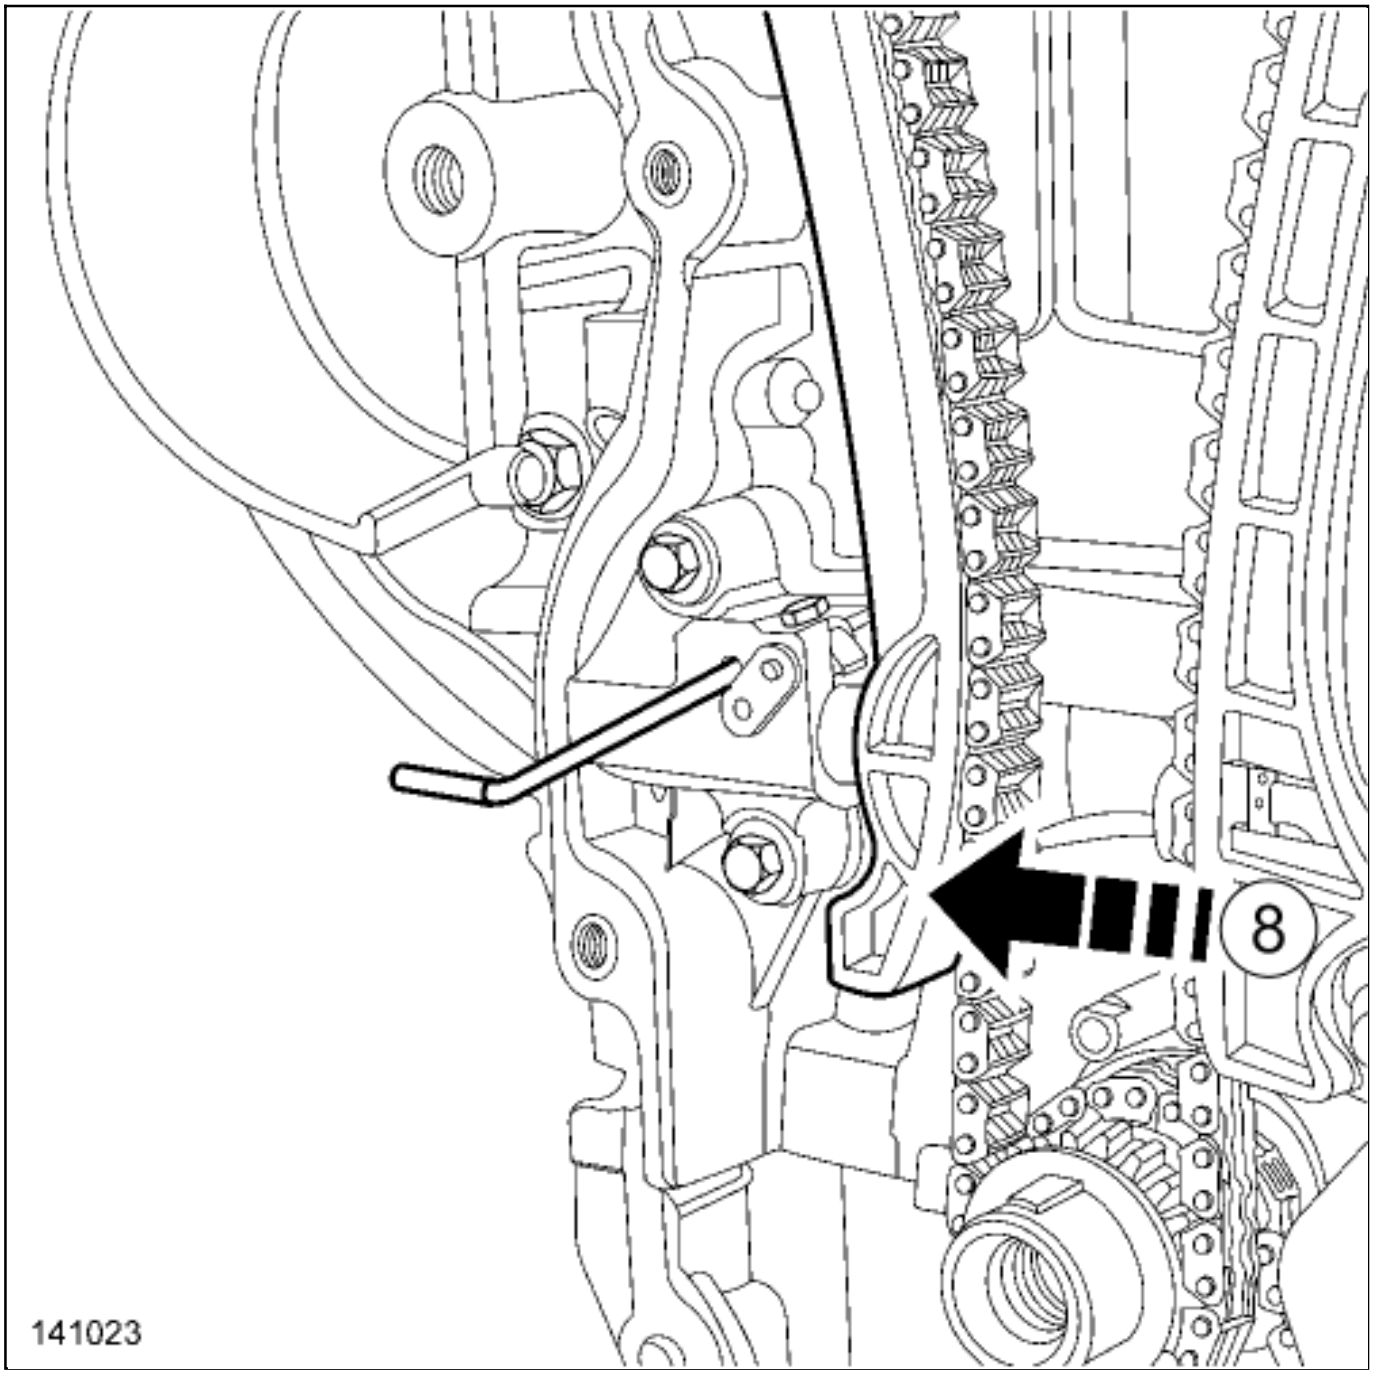


Very carefully separate the timing cover using a flat-blade screwdriver(1)



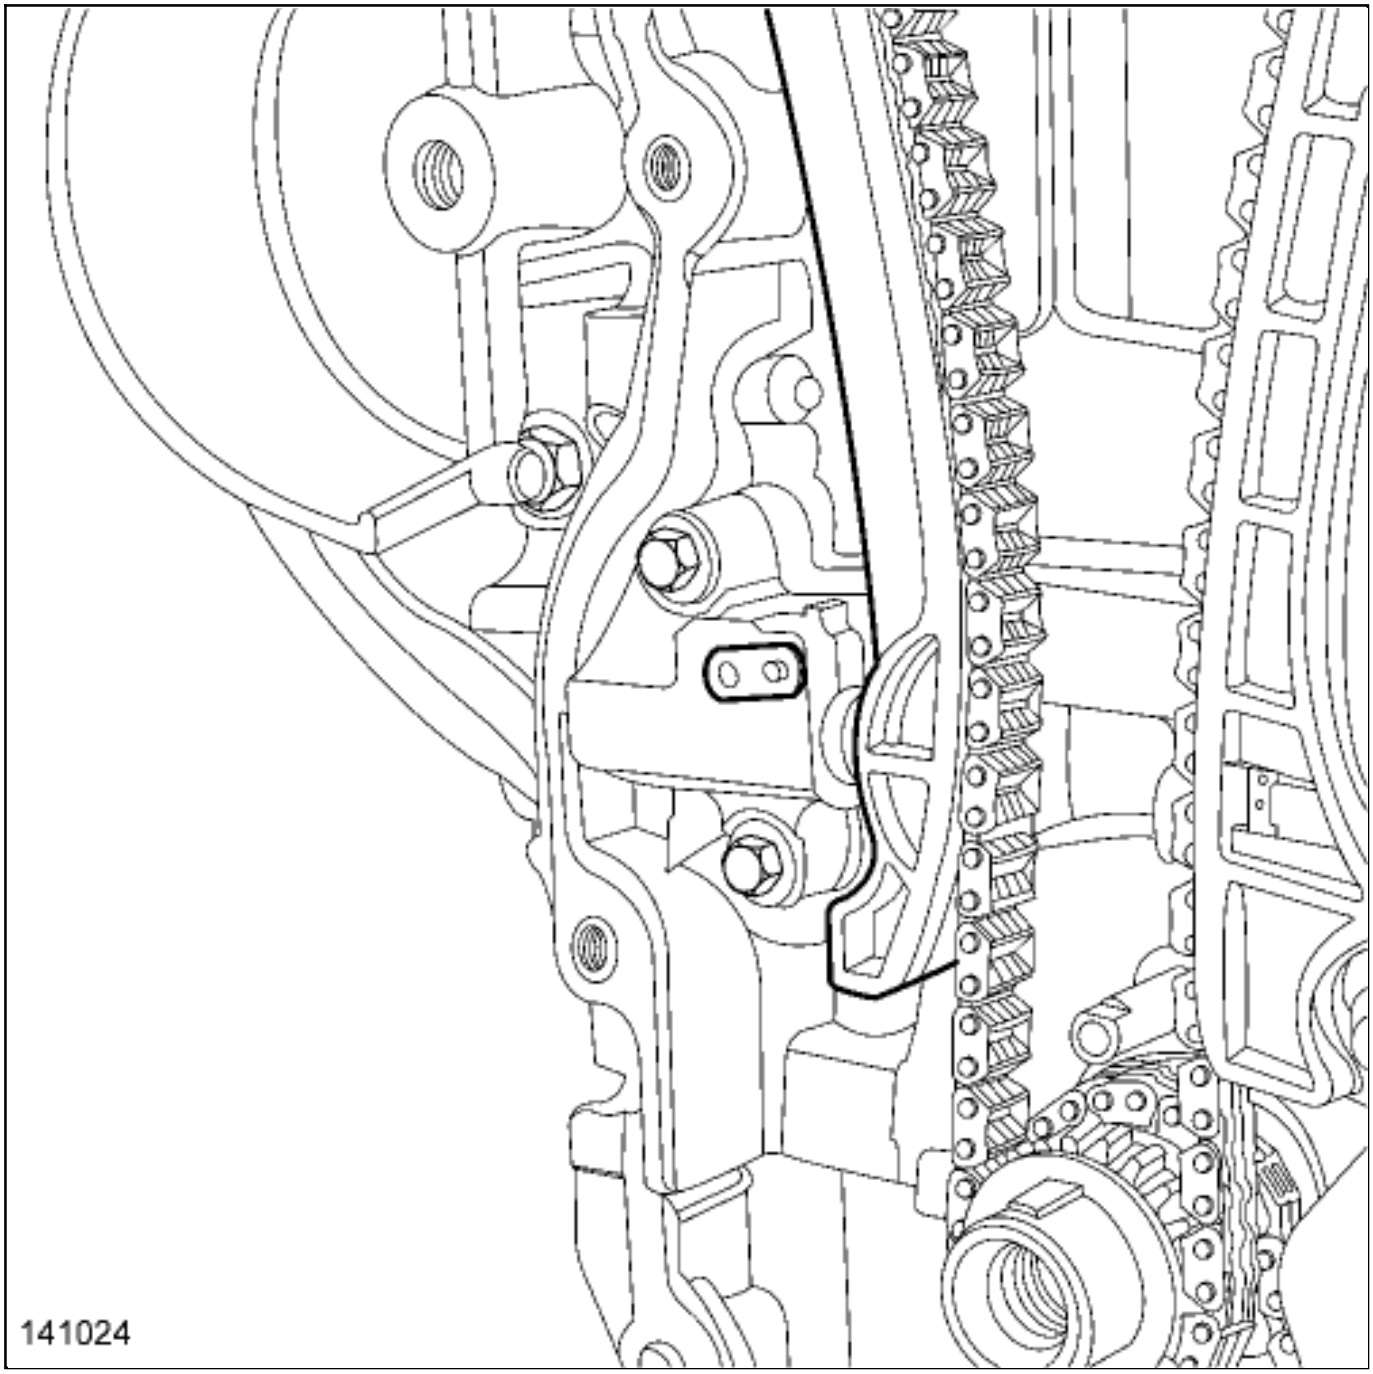
Tap the lifting eye using a mallet(2) to detach the timing cover.

Remove the timing cover(see 11A, Top and front of engine, Timing assembly: Exploded view) .

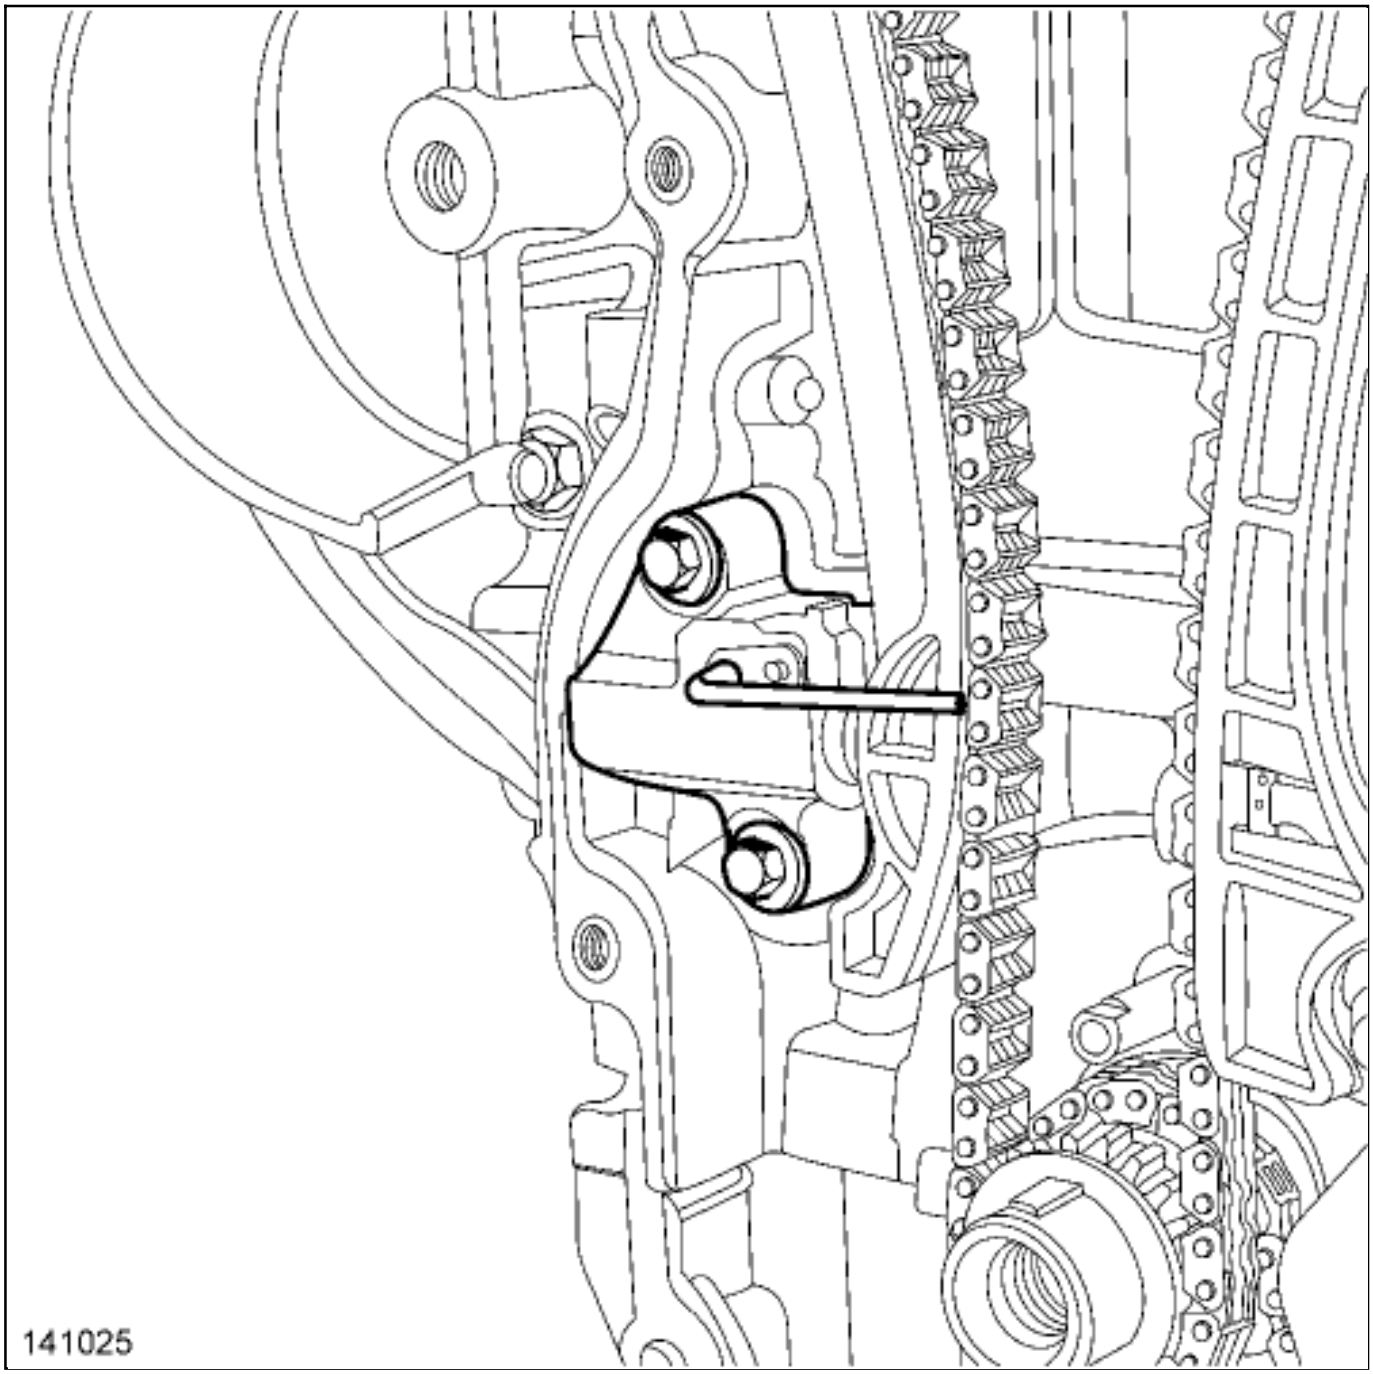


Check that the mark(3) of the exhaust camshaft timing sprocket and the mark(4) of the inlet camshaft timing sprocket are in the same position as shown in the illustration.

2. REMOVAL OPERATION



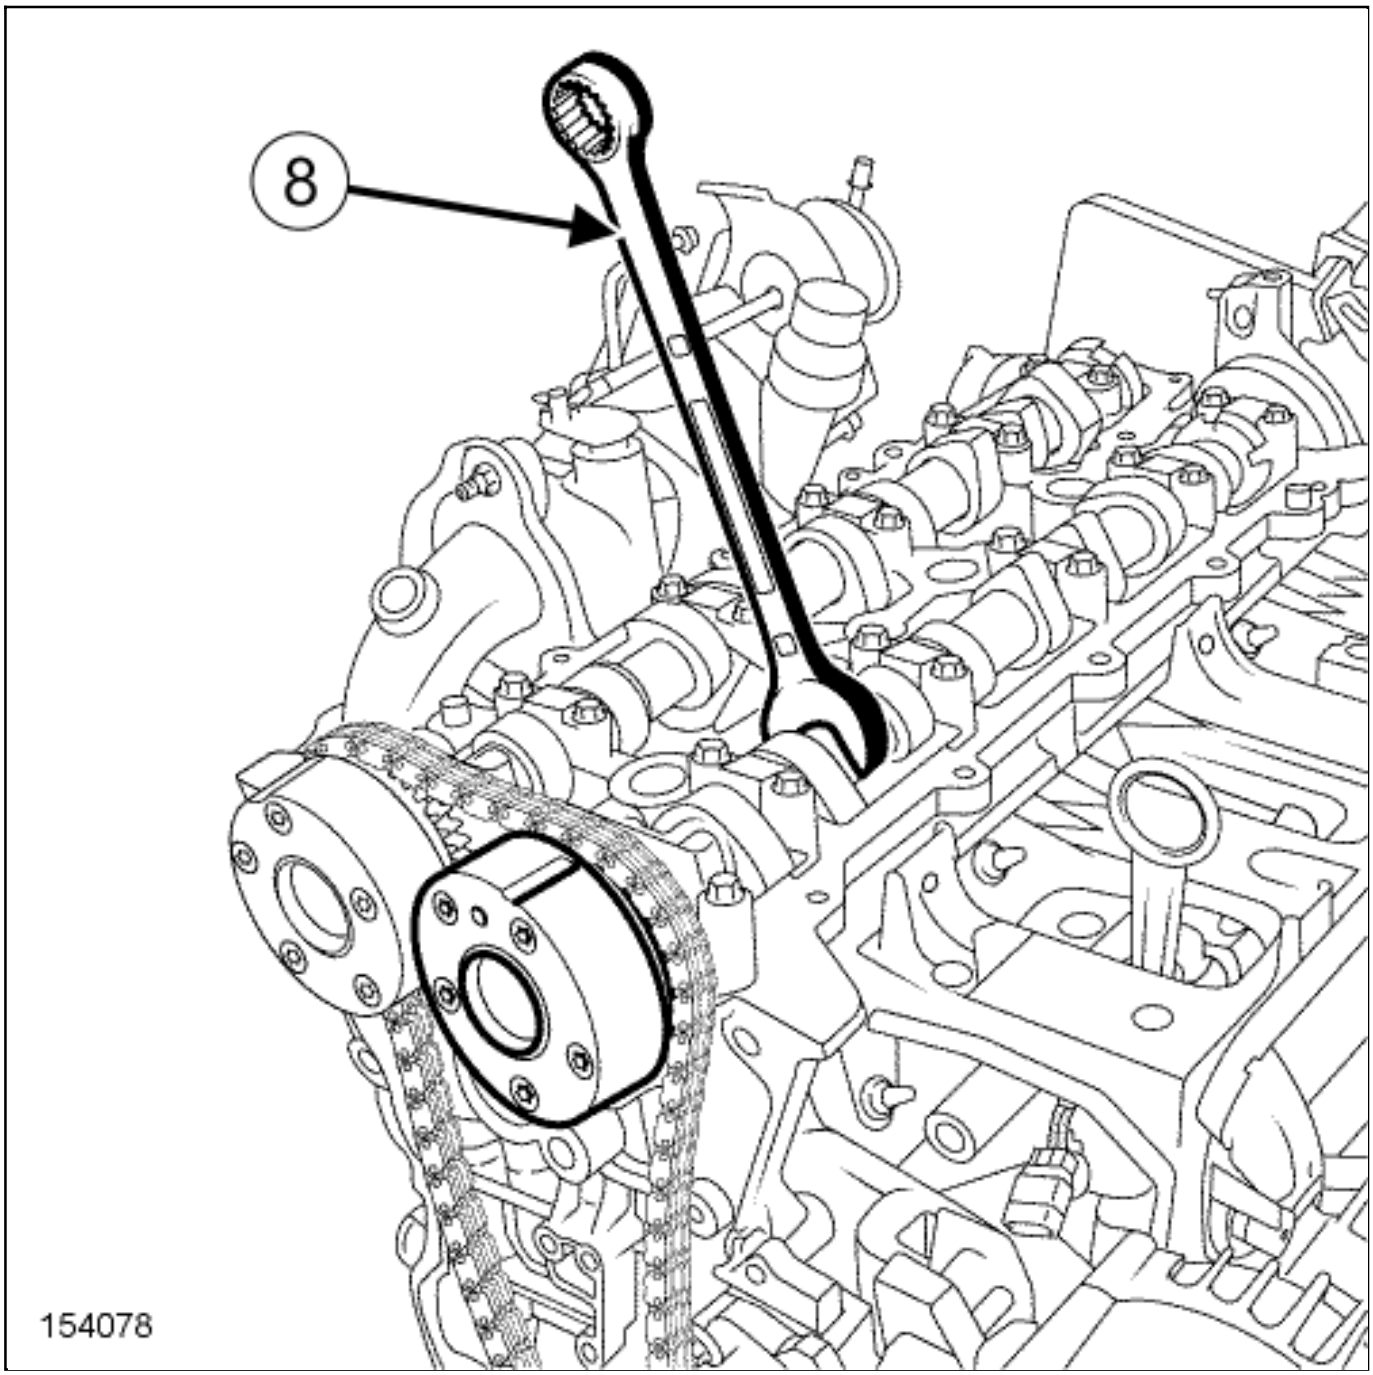
Lower the lever(5) of the timing hydraulic tensioner(see 11A, Top and front of engine, Timing assembly: Exploded view) as far as possible using a 2.5 mm Allen key(6) to release the tensioner piston.

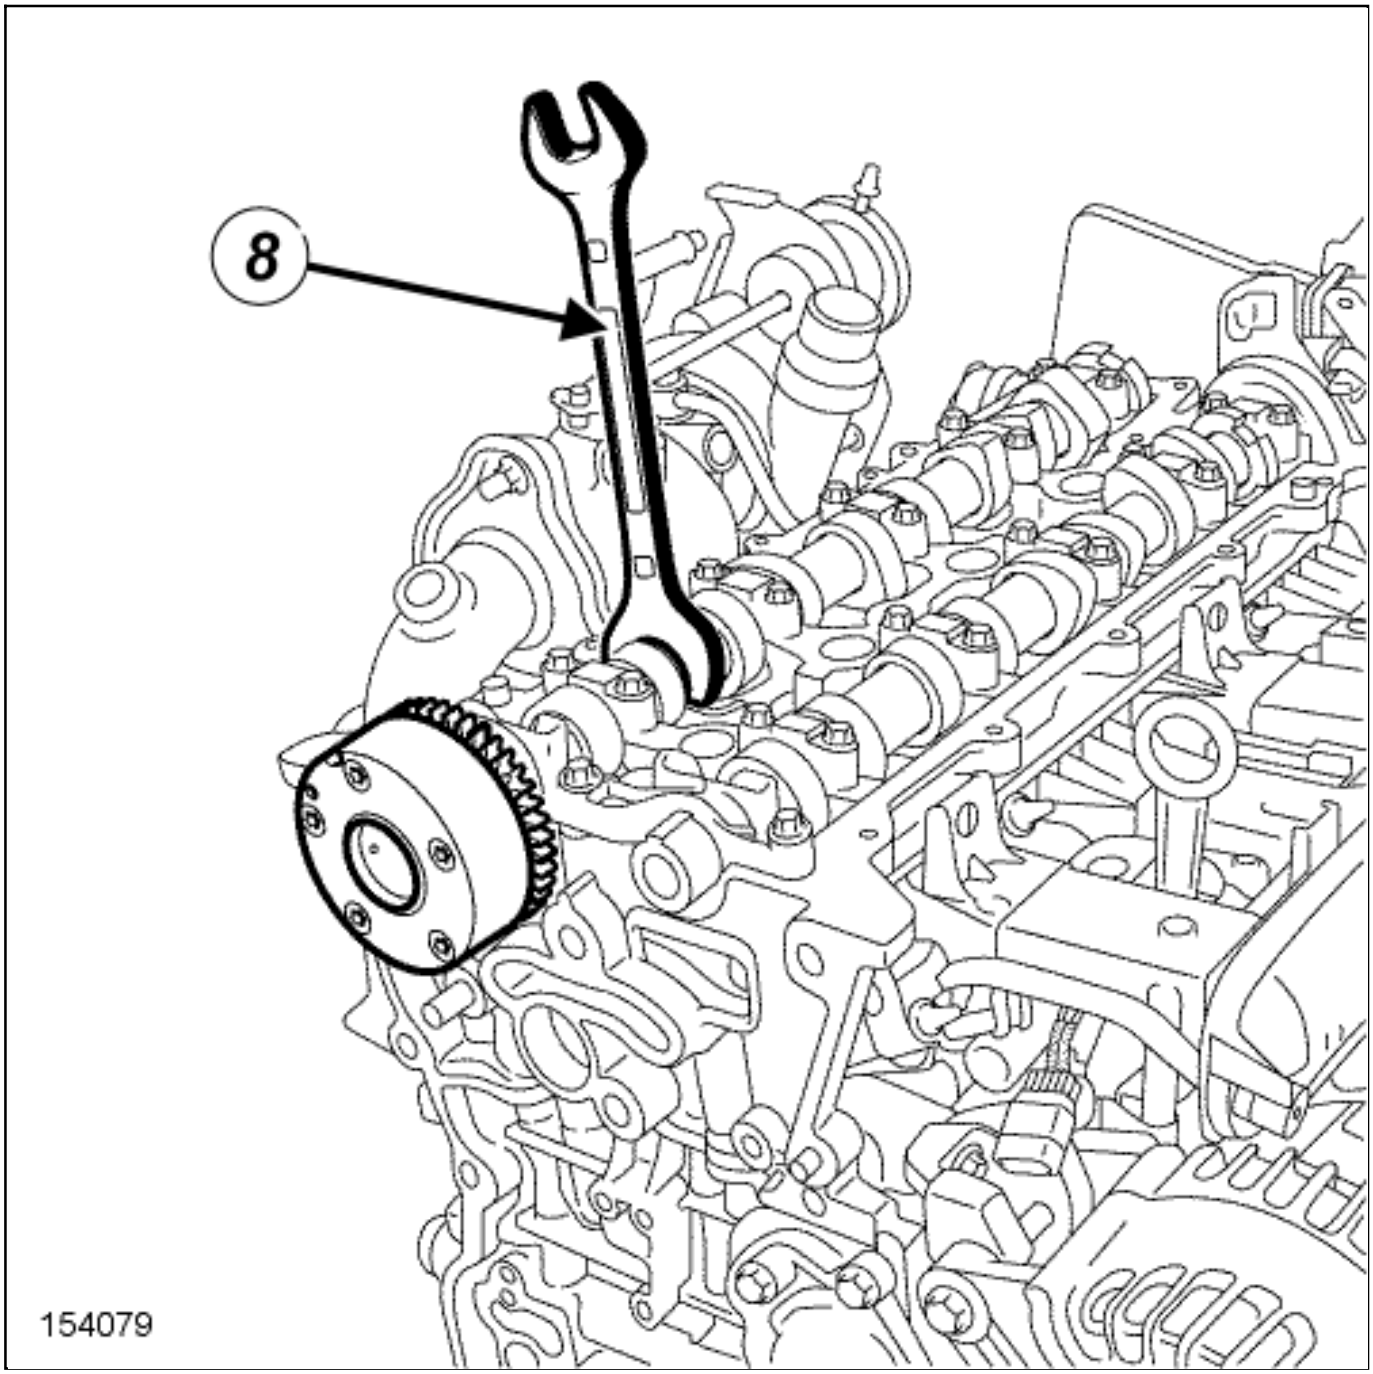


- Push on the timing chain tensioning guide (see 11A, Top and front of engine, Timing assembly: Exploded view) until the timing hydraulic tensioner piston is fully depressed (7) .

- Remove the 2.5 mm Allen key from the timing hydraulic tensioner.

Carefully release the timing chain tensioning guide until the tensioner lever is aligned with the opening on the tensioner casing.





Fit the 2.5 mm Allen keyin the hole on the timing hydraulic tensioner casing to lock the timing chain tensioner lever in the locking position.

Remove: **(see 11A, Top and front of engine, Timing assembly: Exploded view)**

- the timing hydraulic tensioner bolts,
- the timing chain tensioner, taking care not to unlock it,

- the timing chain tensioning guide from its shaft,
- the timing chain guide bolts,
- the timing chain guide.

To loosen the timing sprocket bolts, hold the camshafts using an open-jawed spanner(8) .

Remove : **(see 11A, Top and front of engine, Timing assembly: Exploded view)**

- the timing sprocket bolts,
- the exhaust camshaft timing sprocket,

- the inlet camshaft timing sprocket,
- the timing chain.

REFITTING

1. REFITTING PREPARATION OPERATION

Remove the silicone adhesive sealant residues from the joint faces using a plastic spatula.

CAUTION

Do not scrape the aluminium joint faces, any damage caused to the joint face will result in a risk of leaks.

Note:

The groove pattern ensures proper bonding of the silicone adhesive sealant on the joint faces and must not be altered.

Clean using SUPER CLEANING AGENT FOR JOINT FACES Vehicle: Parts and consumables for the repair the joint faces of:

- the cylinder head,
- the cylinder block,
- the timing cover.

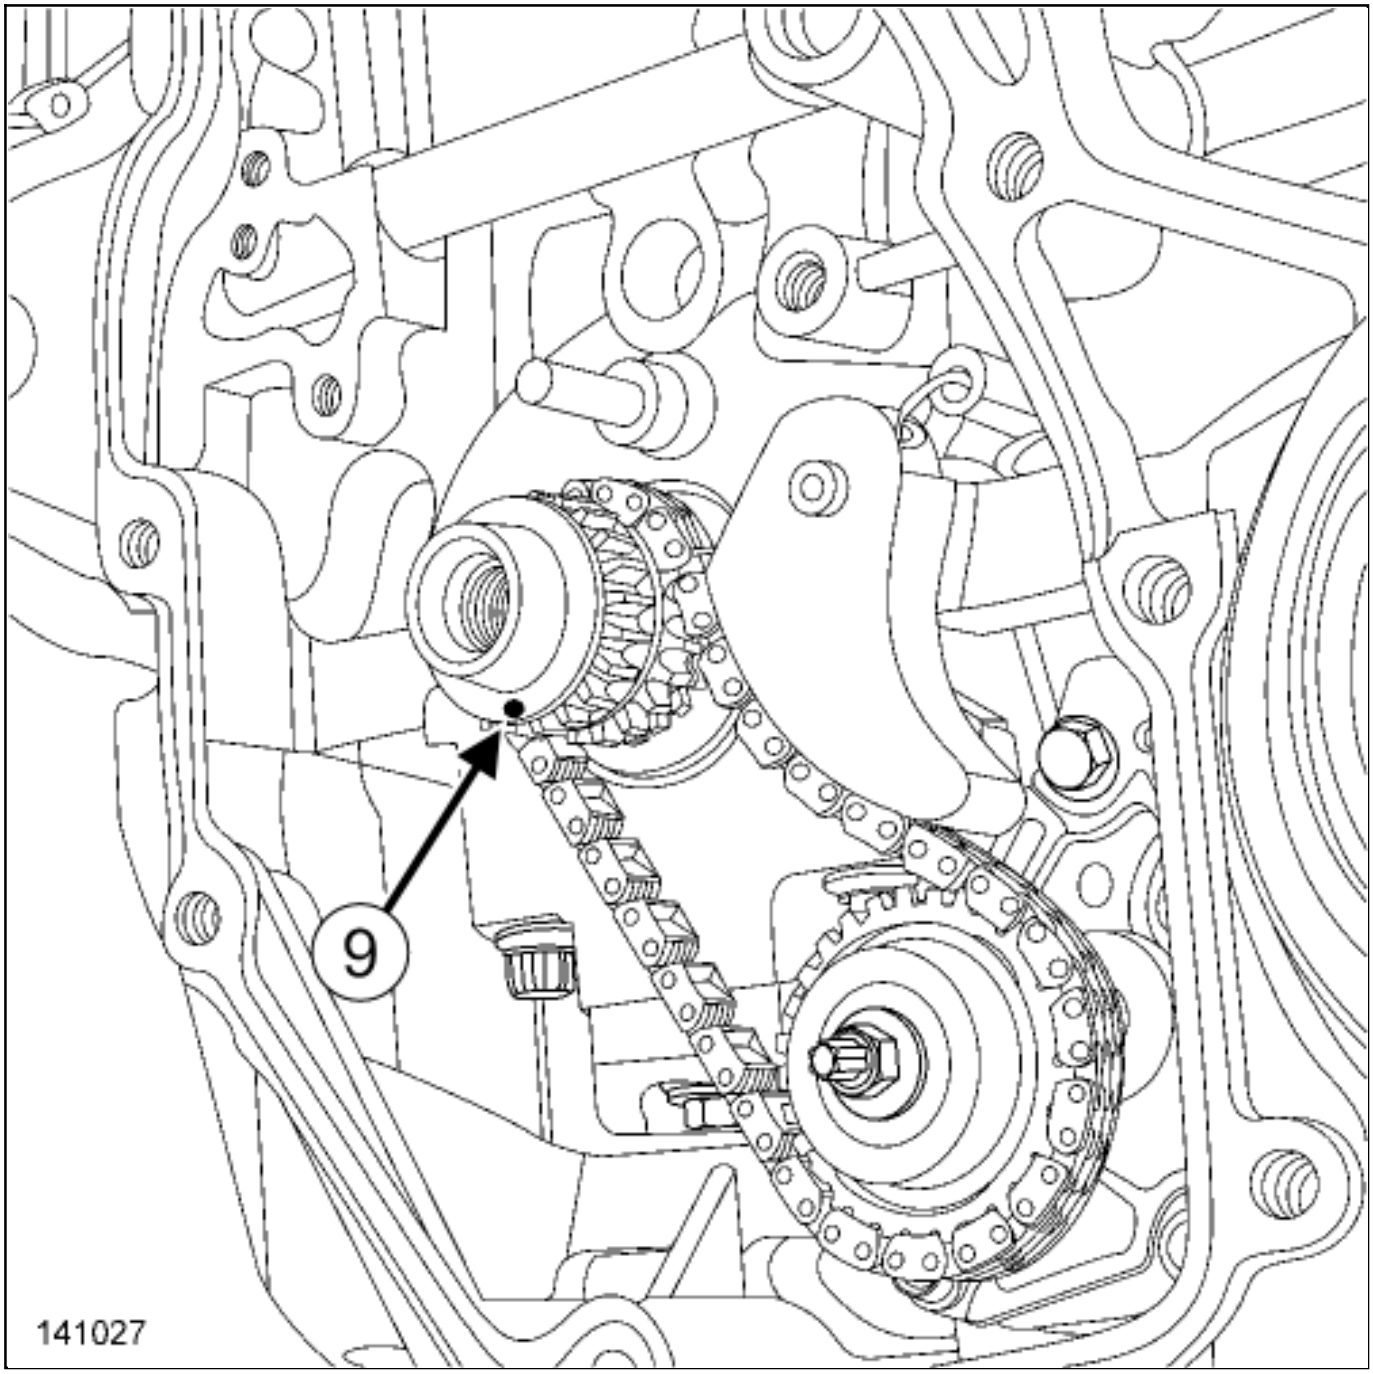
Finish cleaning the joint faces using a GREY ABRASIVE PAD Vehicle: Parts and consumables for the repair .

CAUTION

Do not use any kind of sandpaper.

Degrease using SURFACE CLEANER Vehicle: Parts and consumables for the repair the joint faces of:

- the cylinder head,
- the cylinder block,
- the timing cover.



CAUTION

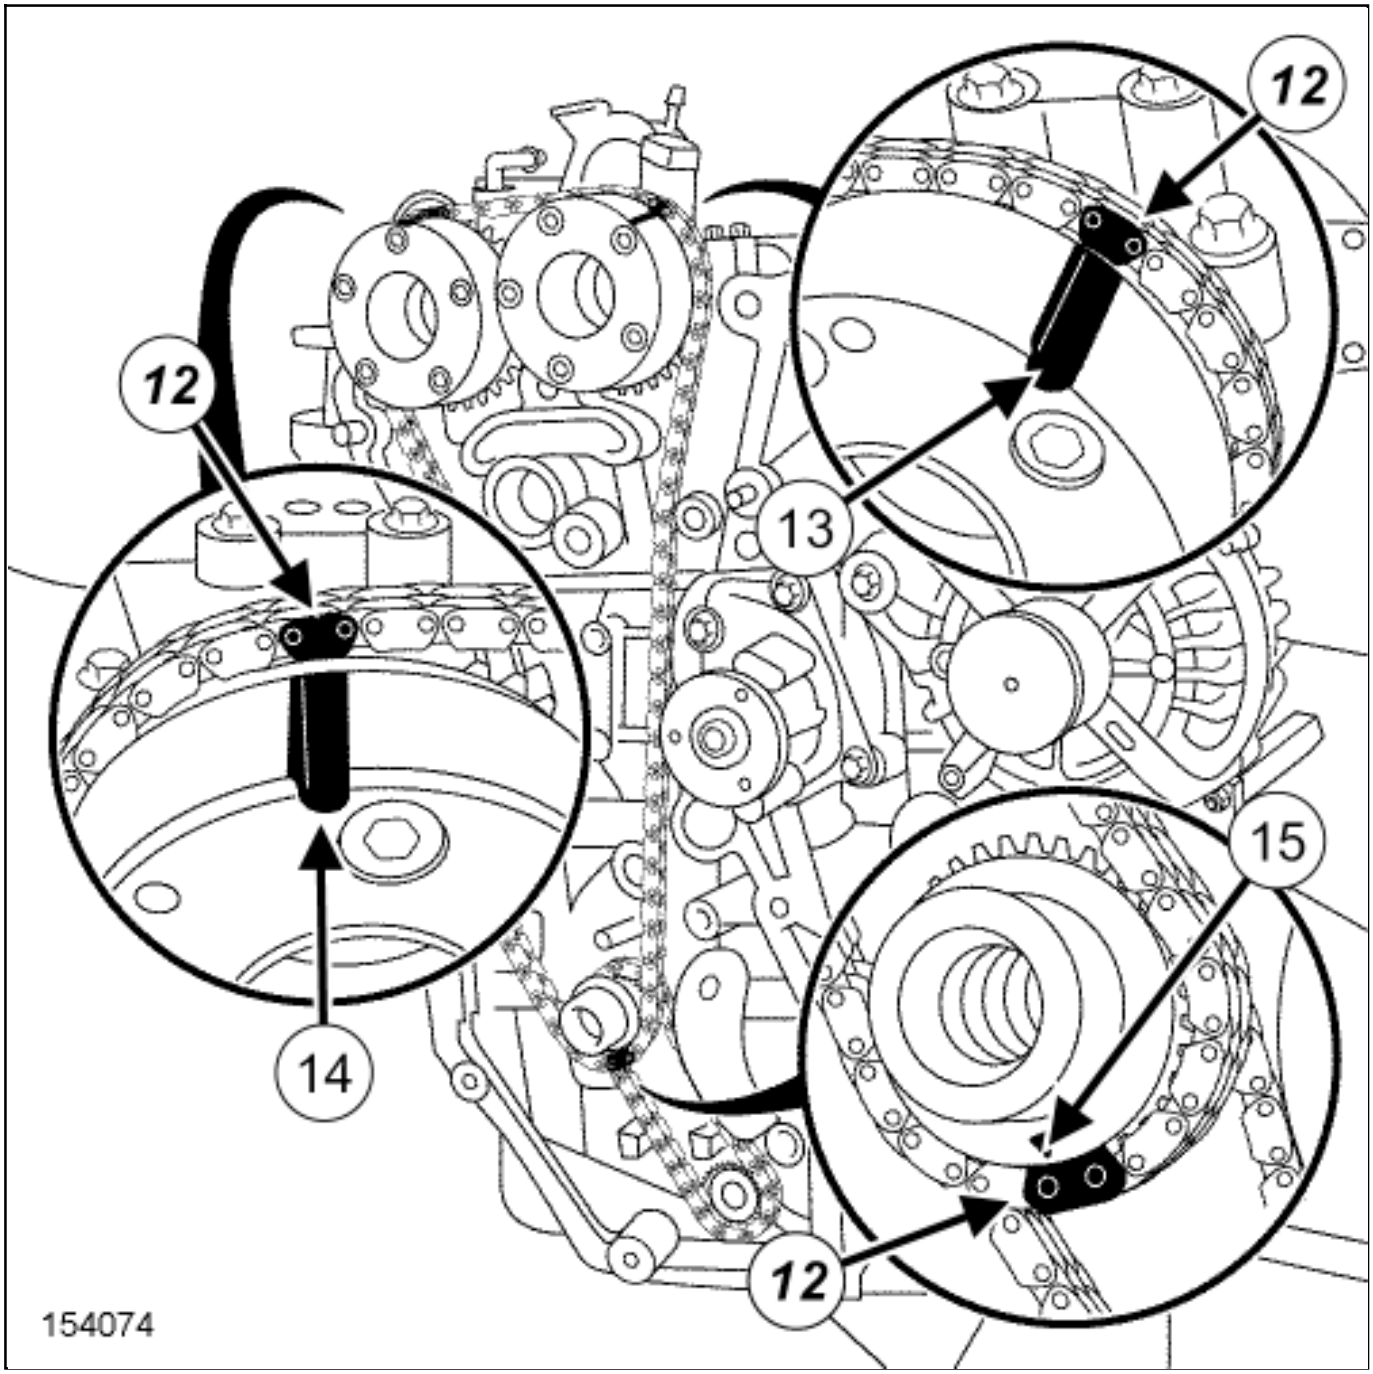
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

parts always to be replaced: Timing chain .

Always replace:

- the timing chain hydraulic tensioner,
- the timing chain tensioning guide,
- the timing chain guide.

Check that the crankshaft mark(9) is positioned vertically pointing downwards.



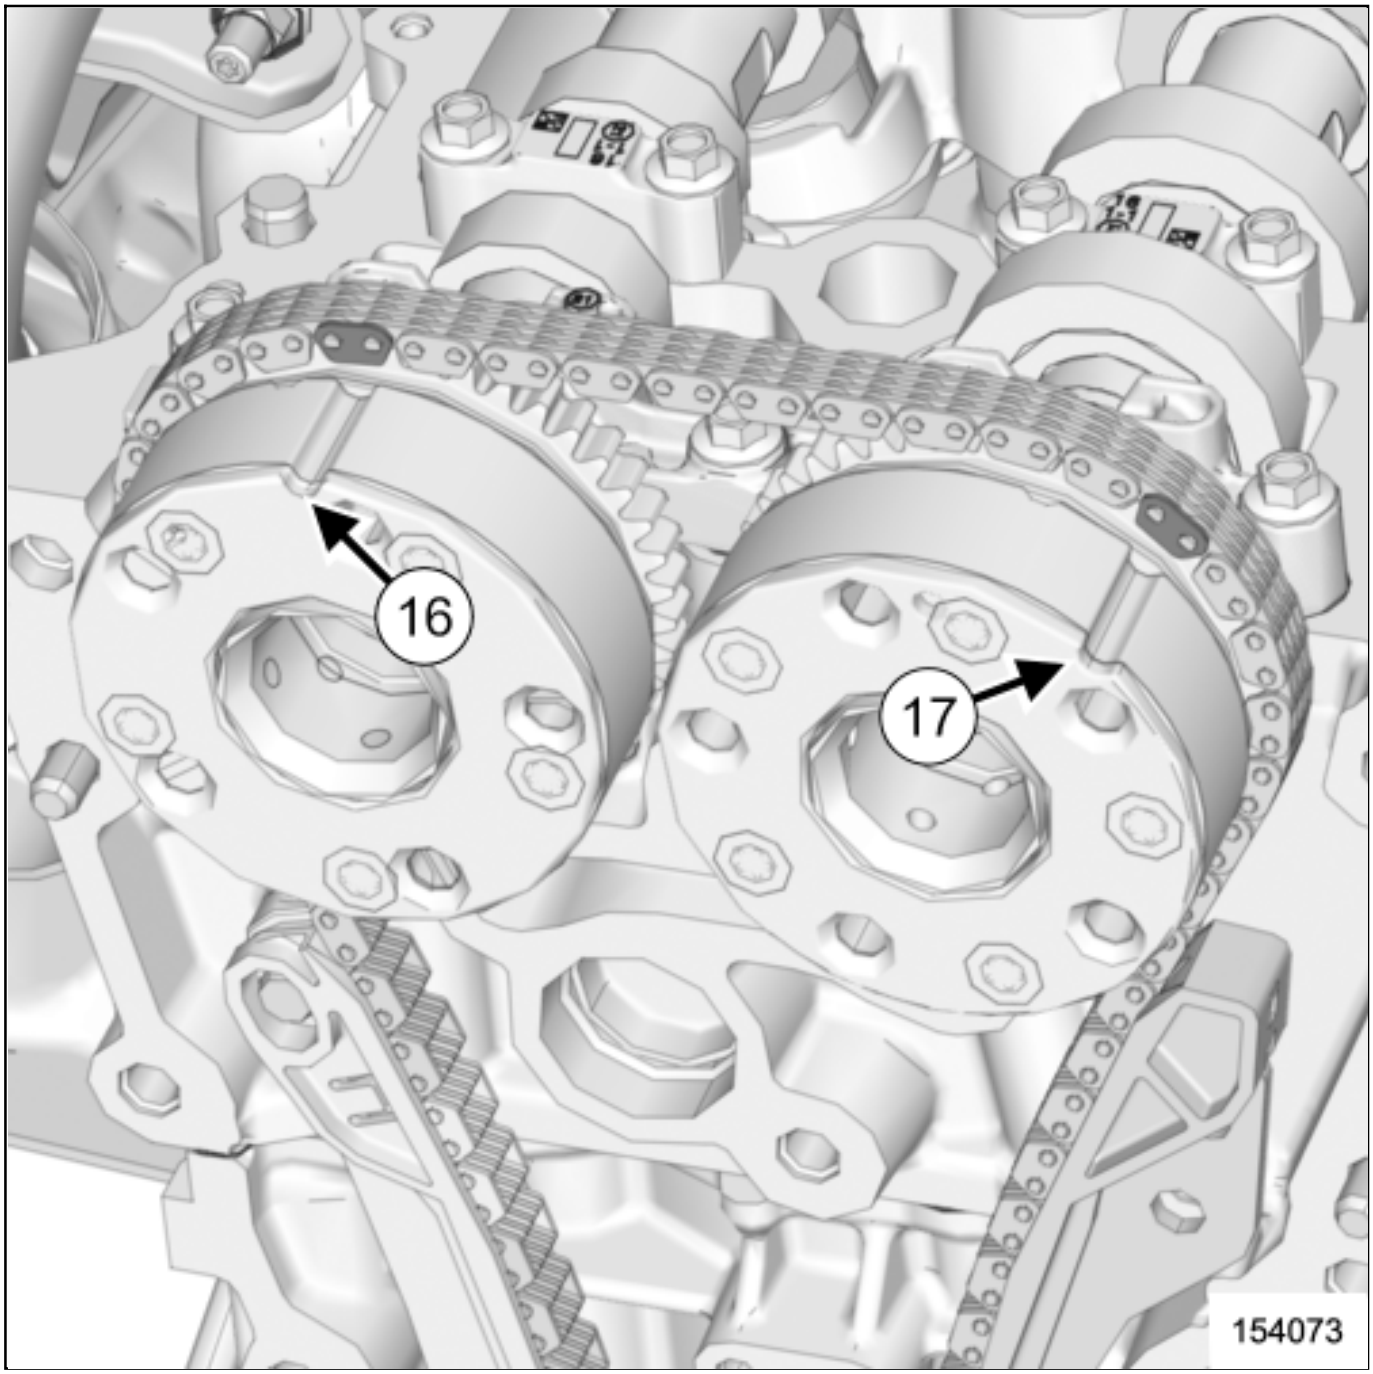
2. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the inlet camshaft timing sprocket,

the exhaust camshaft timing sprocket,

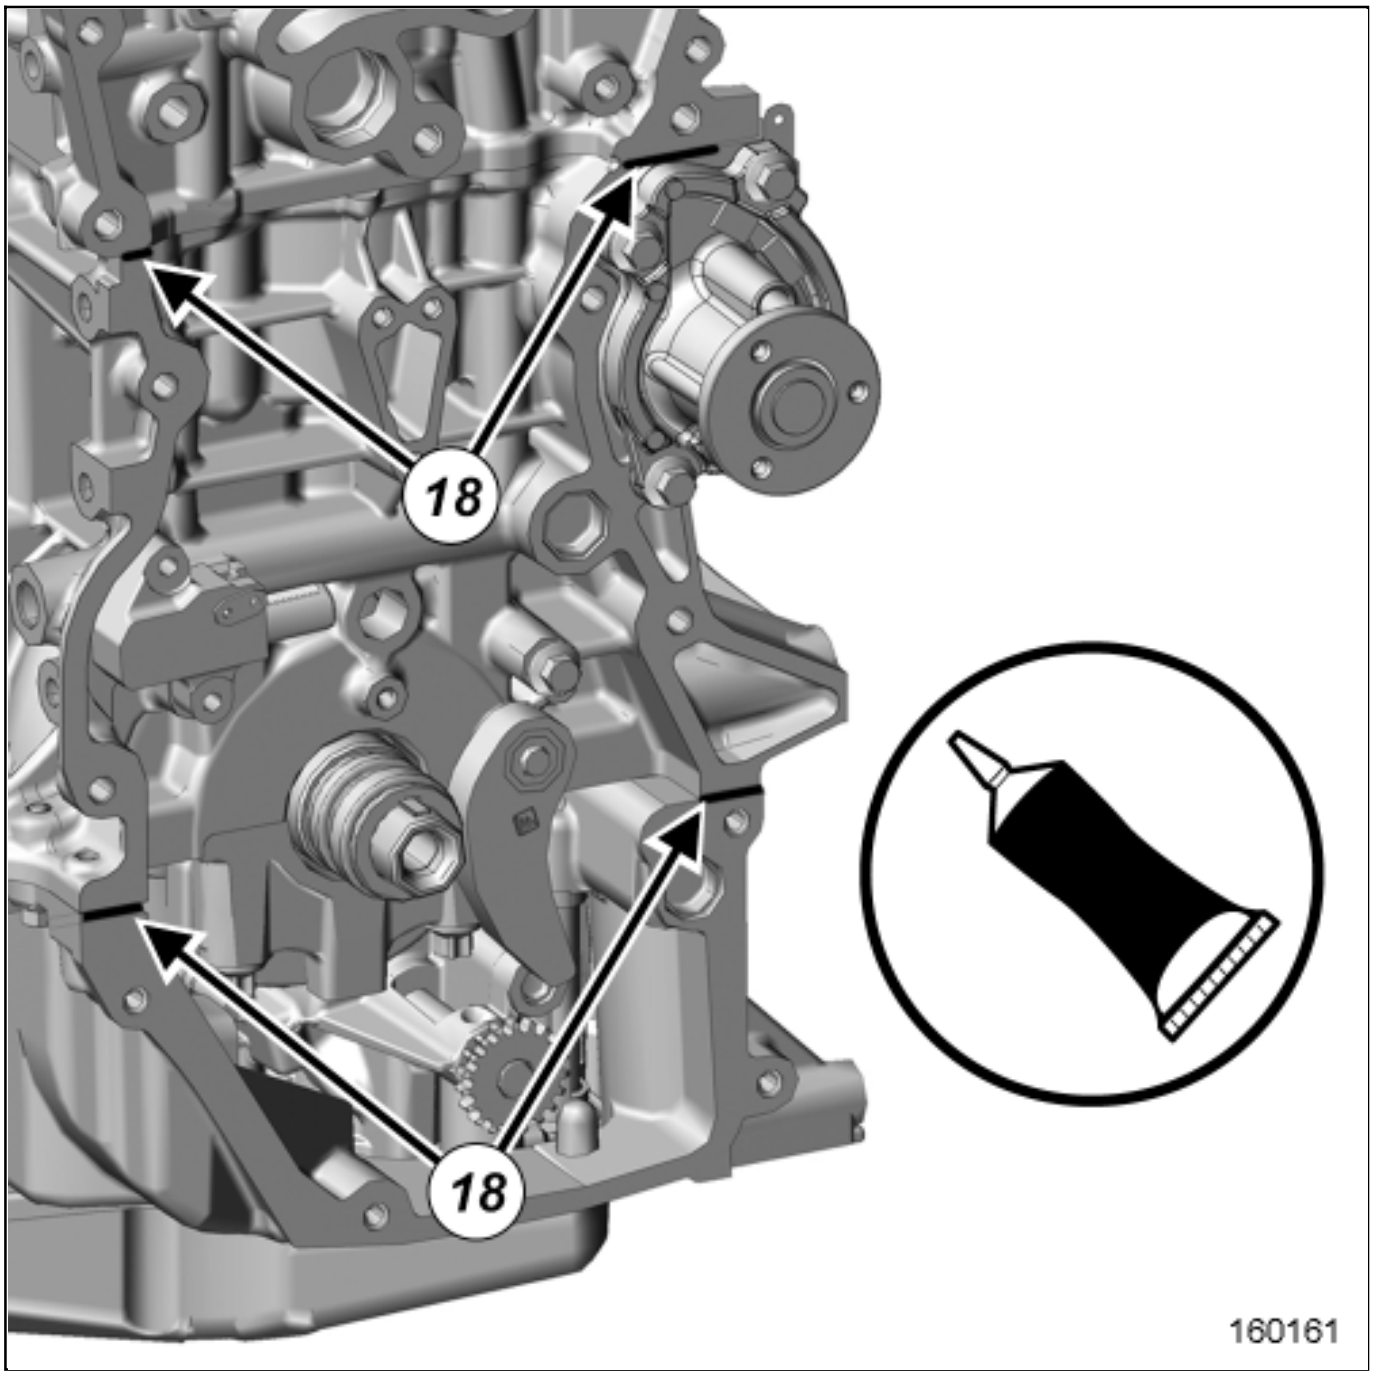
the timing sprocket bolts.



Refit:

a new timing chain, starting with the camshaft dephaser and by aligning the painted links(12) of the timing chain with the marks(13) on the inlet camshaft dephaser,(14) on the exhaust camshaft sprocket and(15) on the crankshaft sprocket,

- the new timing chain guide (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the timing chain guide bolts (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the new timing chain tensioning guide (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the new timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view).



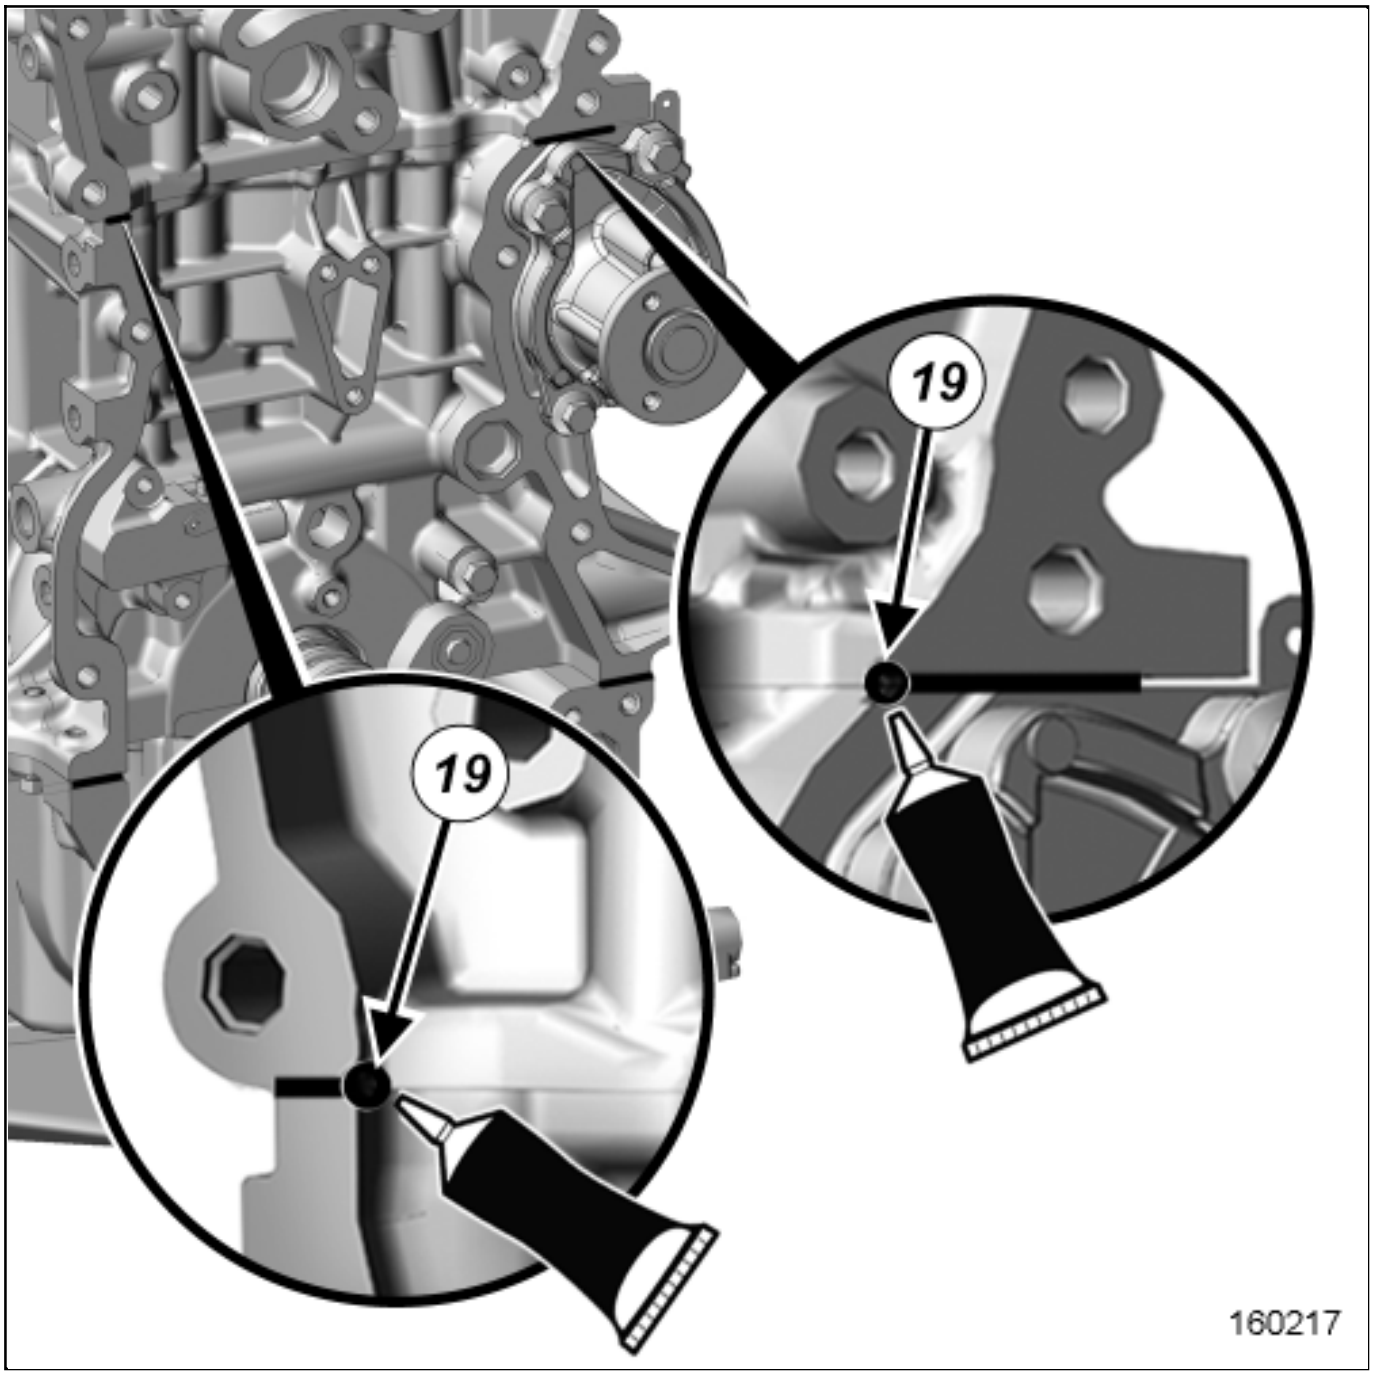
Unlock the timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view).

Rotate the crankshaft clockwise through two revolutions (timing end).

Check that the mark(16) of the exhaust camshaft timing sprocket and the mark(17) of the inlet camshaft timing sprocket are in the same position as shown in the illustration.

3. FINAL OPERATION

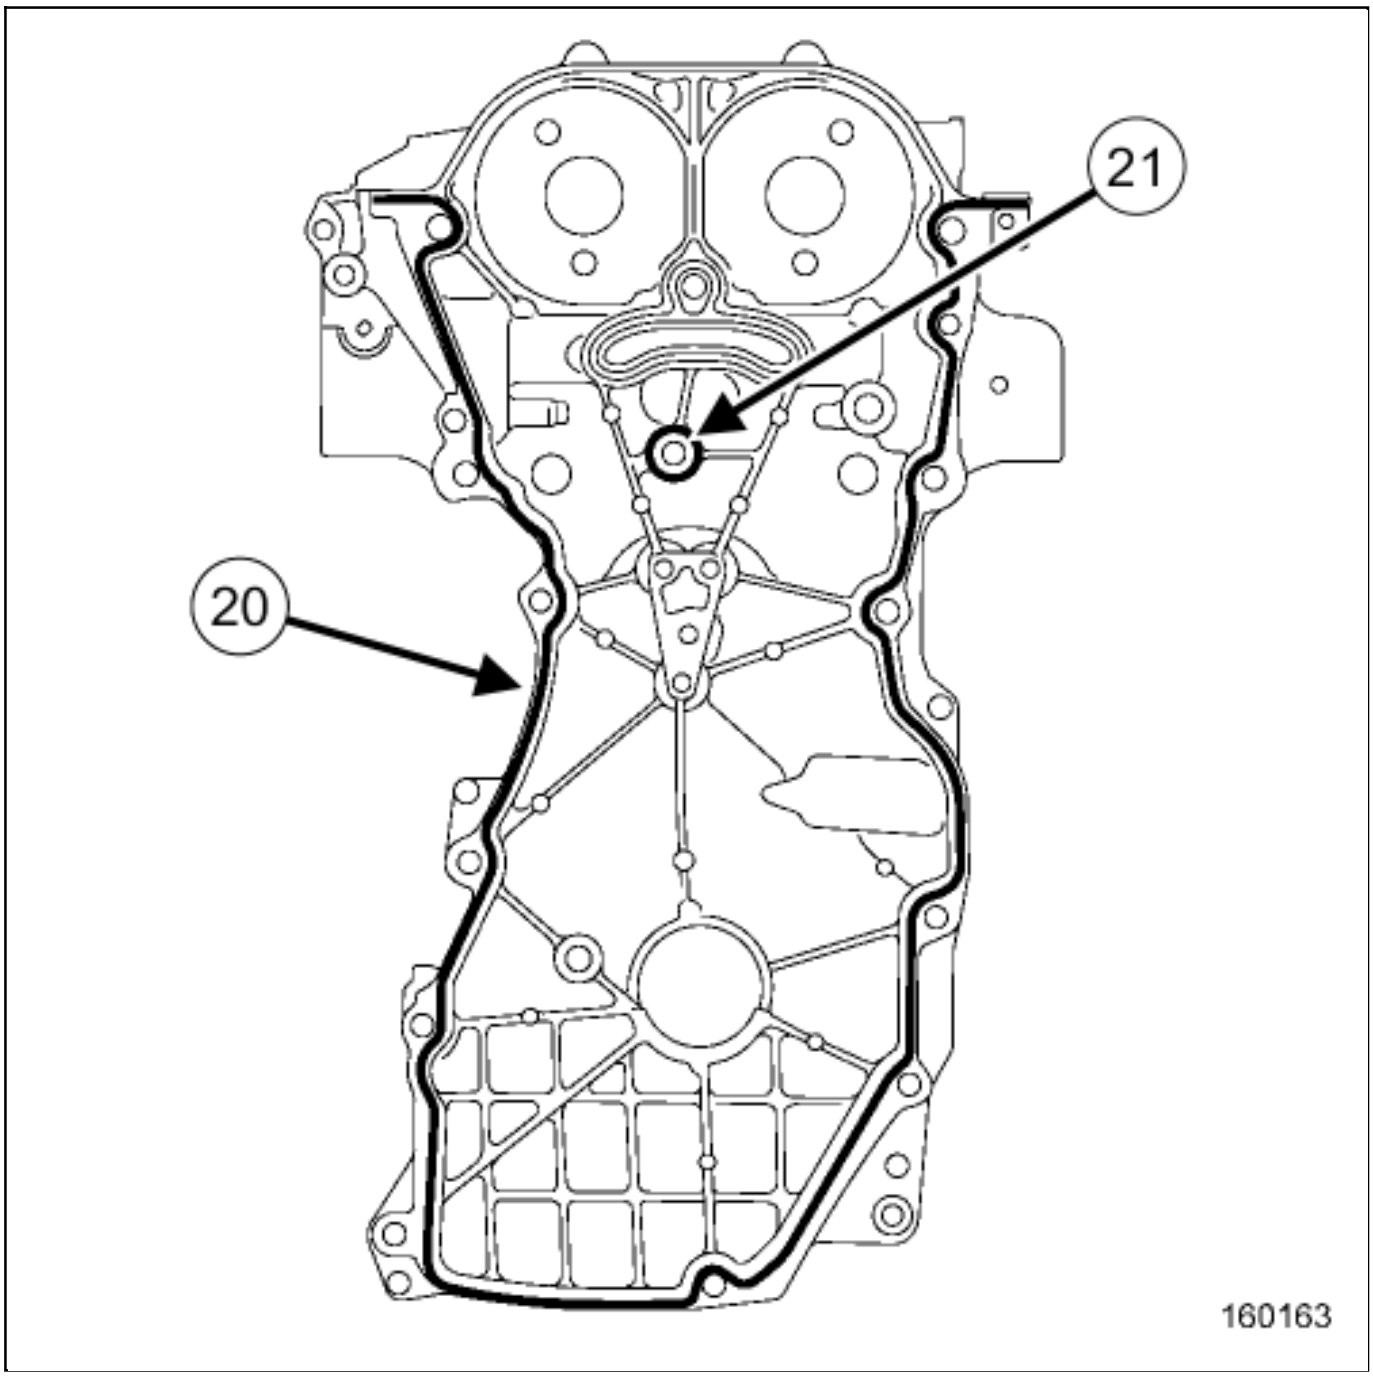
Degrease using SURFACE CLEANER[Vehicle: Parts and consumables for the repair] the joint faces of:



- the cylinder head,
- the cylinder block.

Apply 4 beads of SILICONE ADHESIVE SEALANT[Vehicle: Parts and consumables for the repair] at(18) with a diameter of 3 to 4 mmto fill the gaps between timing cover/cylinder head and timing cover/oil sump.

CAUTION



Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Remove any excess of silicone adhesive sealant using a plastic spatula.

Apply a drop of SILICONE ADHESIVE SEALANT Vehicle: Parts and consumables for the repair with a minimum thickness of 5 mm in the slots (19) to ensure complete sealing of the timing cover / cylinder block / cylinder head.

Degrease the joint faces of the timing cover using SURFACE CLEANER Vehicle: Parts and consumables for the repair

Apply a bead of SILICONE ADHESIVE SEALANTVehicle: Parts and consumables for the repair with a diameter of 3 to 4 mm:

- on the joint face of the timing cover(20) placed at a distance of 1 to 2 mmfrom the inside edge of the timing cover,
- on the center part(21) of the timing cover.

CAUTION

Applying excess sealant could cause it to be squeezed in when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Refit within 5 to 10 min(see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the timing cover,
- the timing cover bolts.

Torque tighten the timing cover bolts(see 11A, Top and front of engine, Timing assembly: Exploded view) .

Wipe off any excess of silicone adhesive sealant from the timing cover edges using a lint-free cloth Vehicle: Parts and consumables for the repair

4. FINAL OPERATION

Proceed in the reverse order to removal.

TIMING CHAIN: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

parts always to be replaced:
Timing chain

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

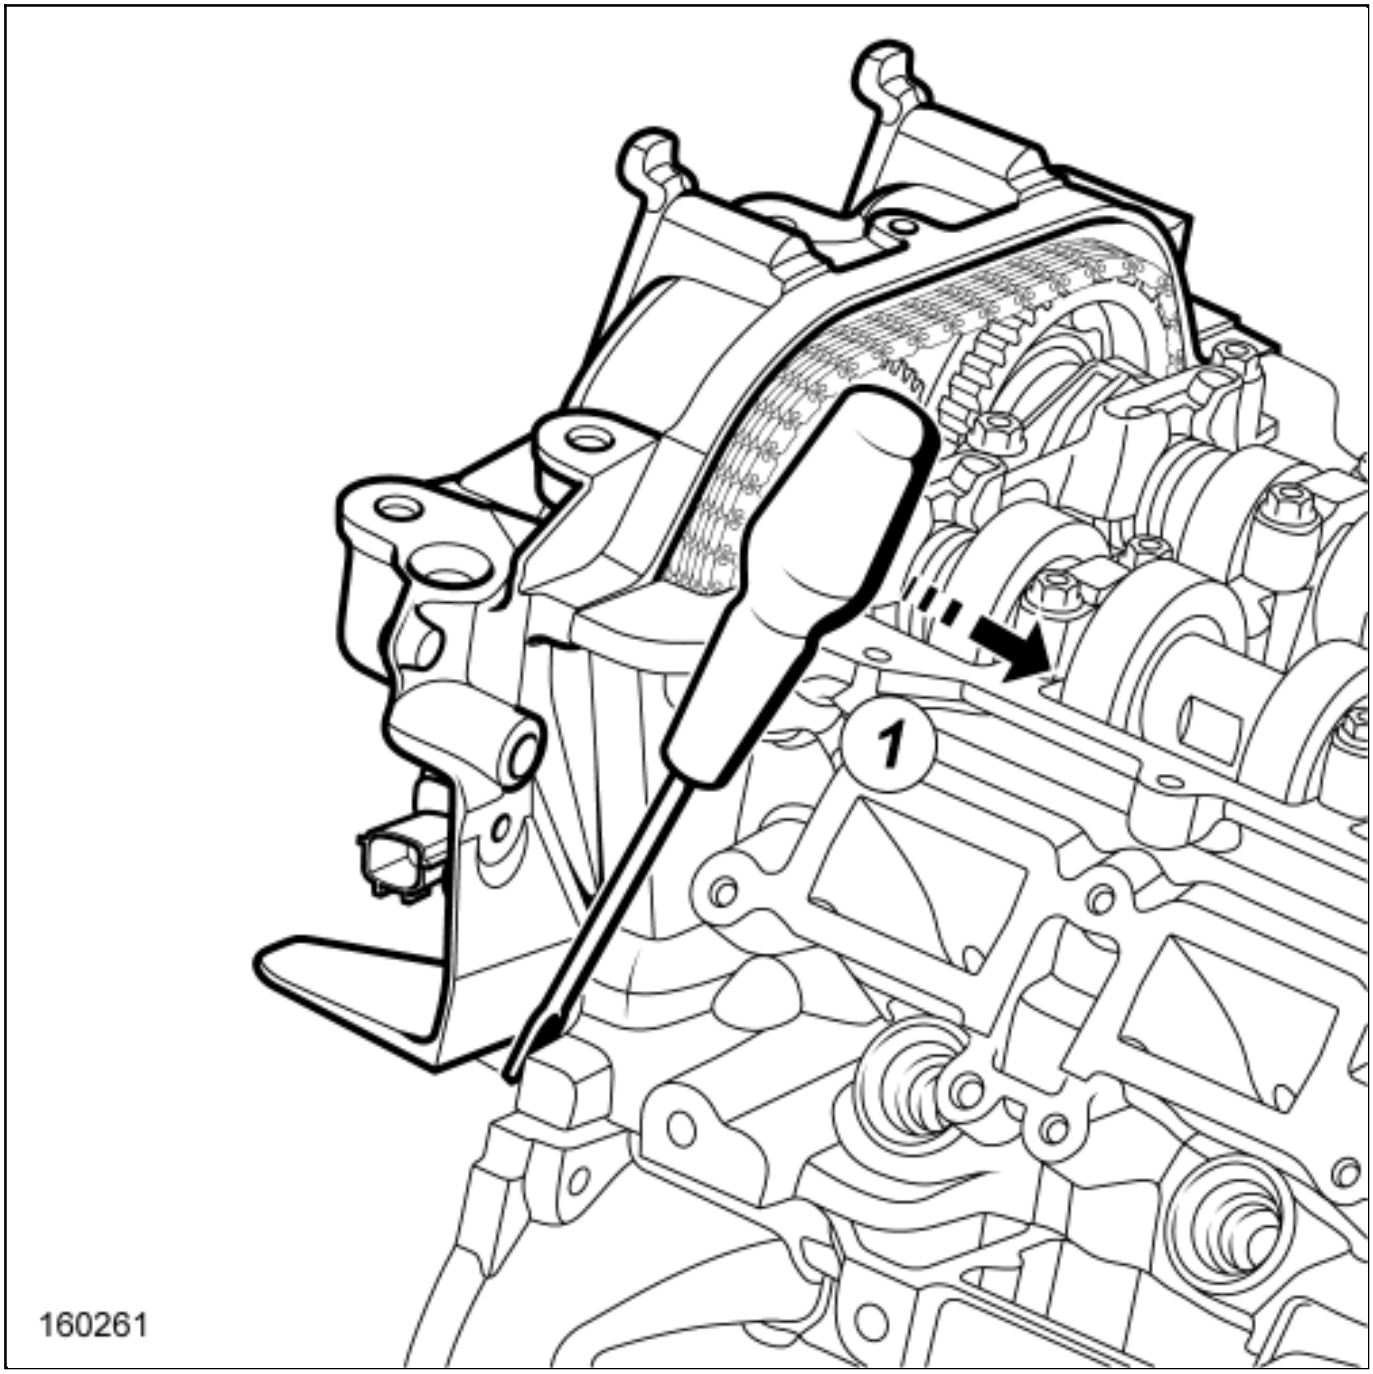
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

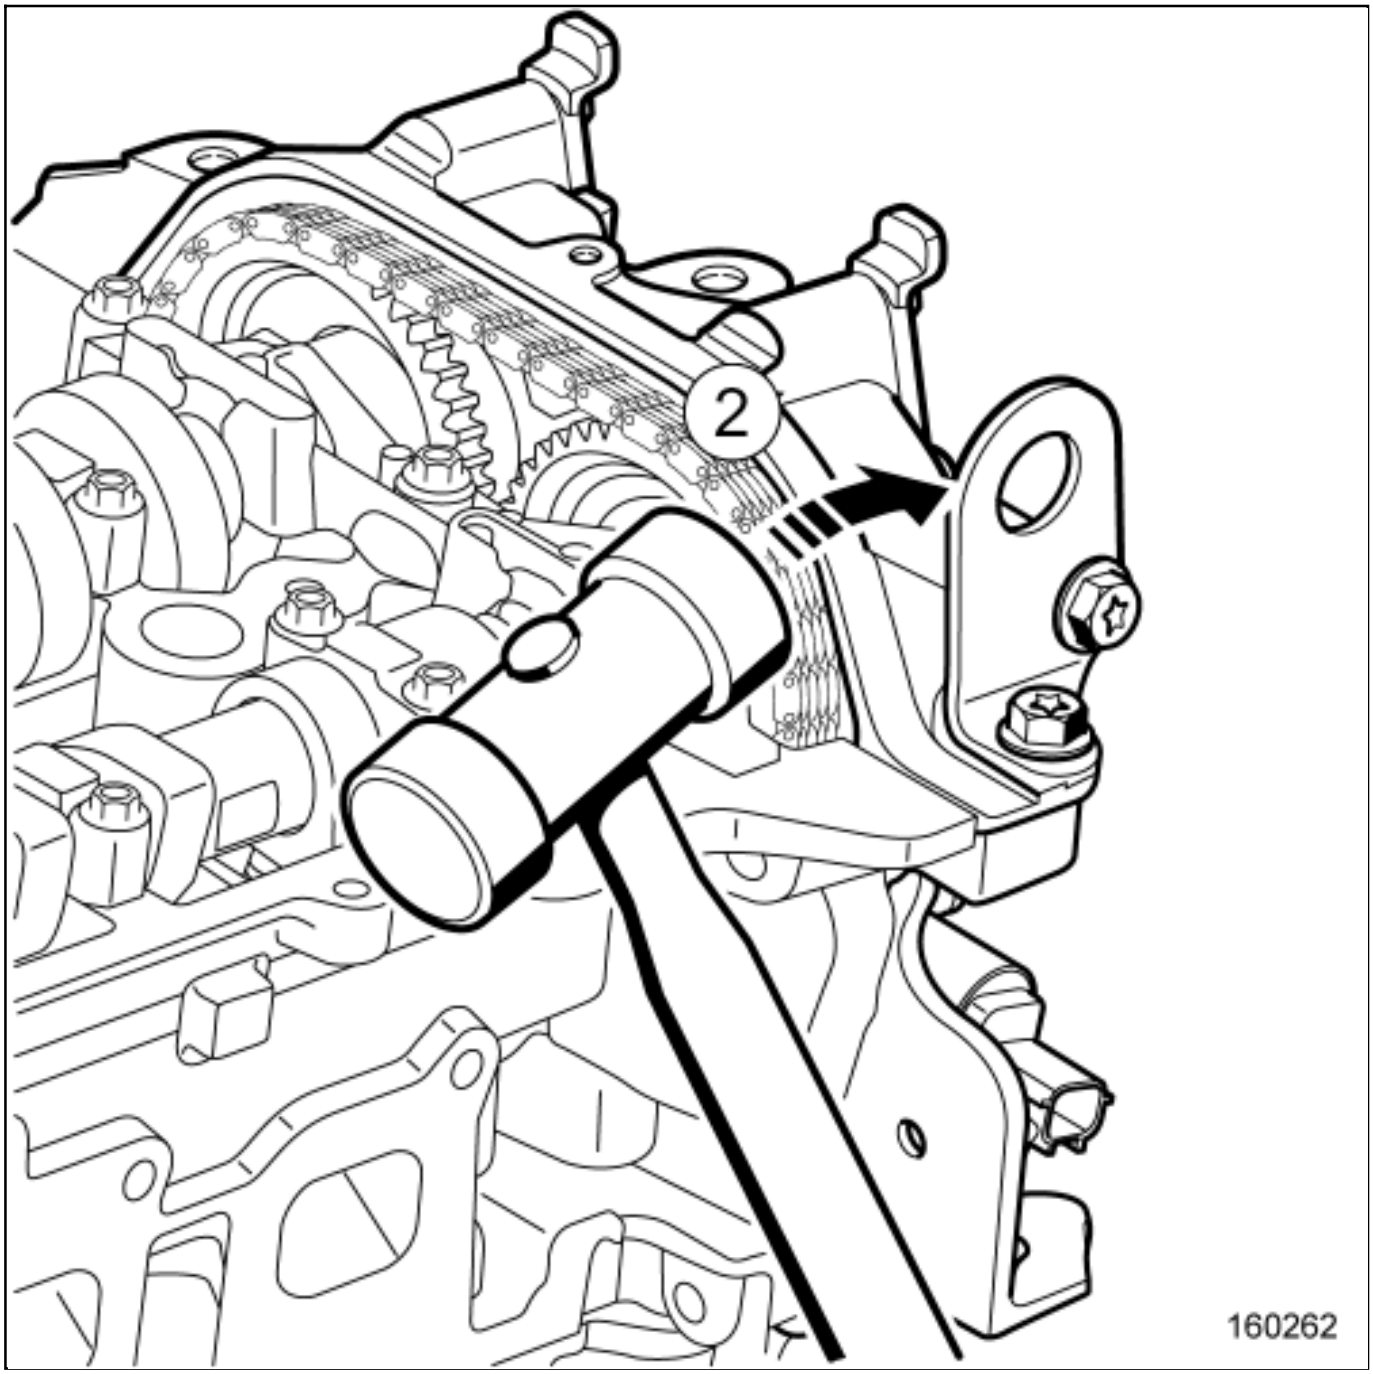
- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.



REMOVAL

1. REMOVAL PREPARATION OPERATION

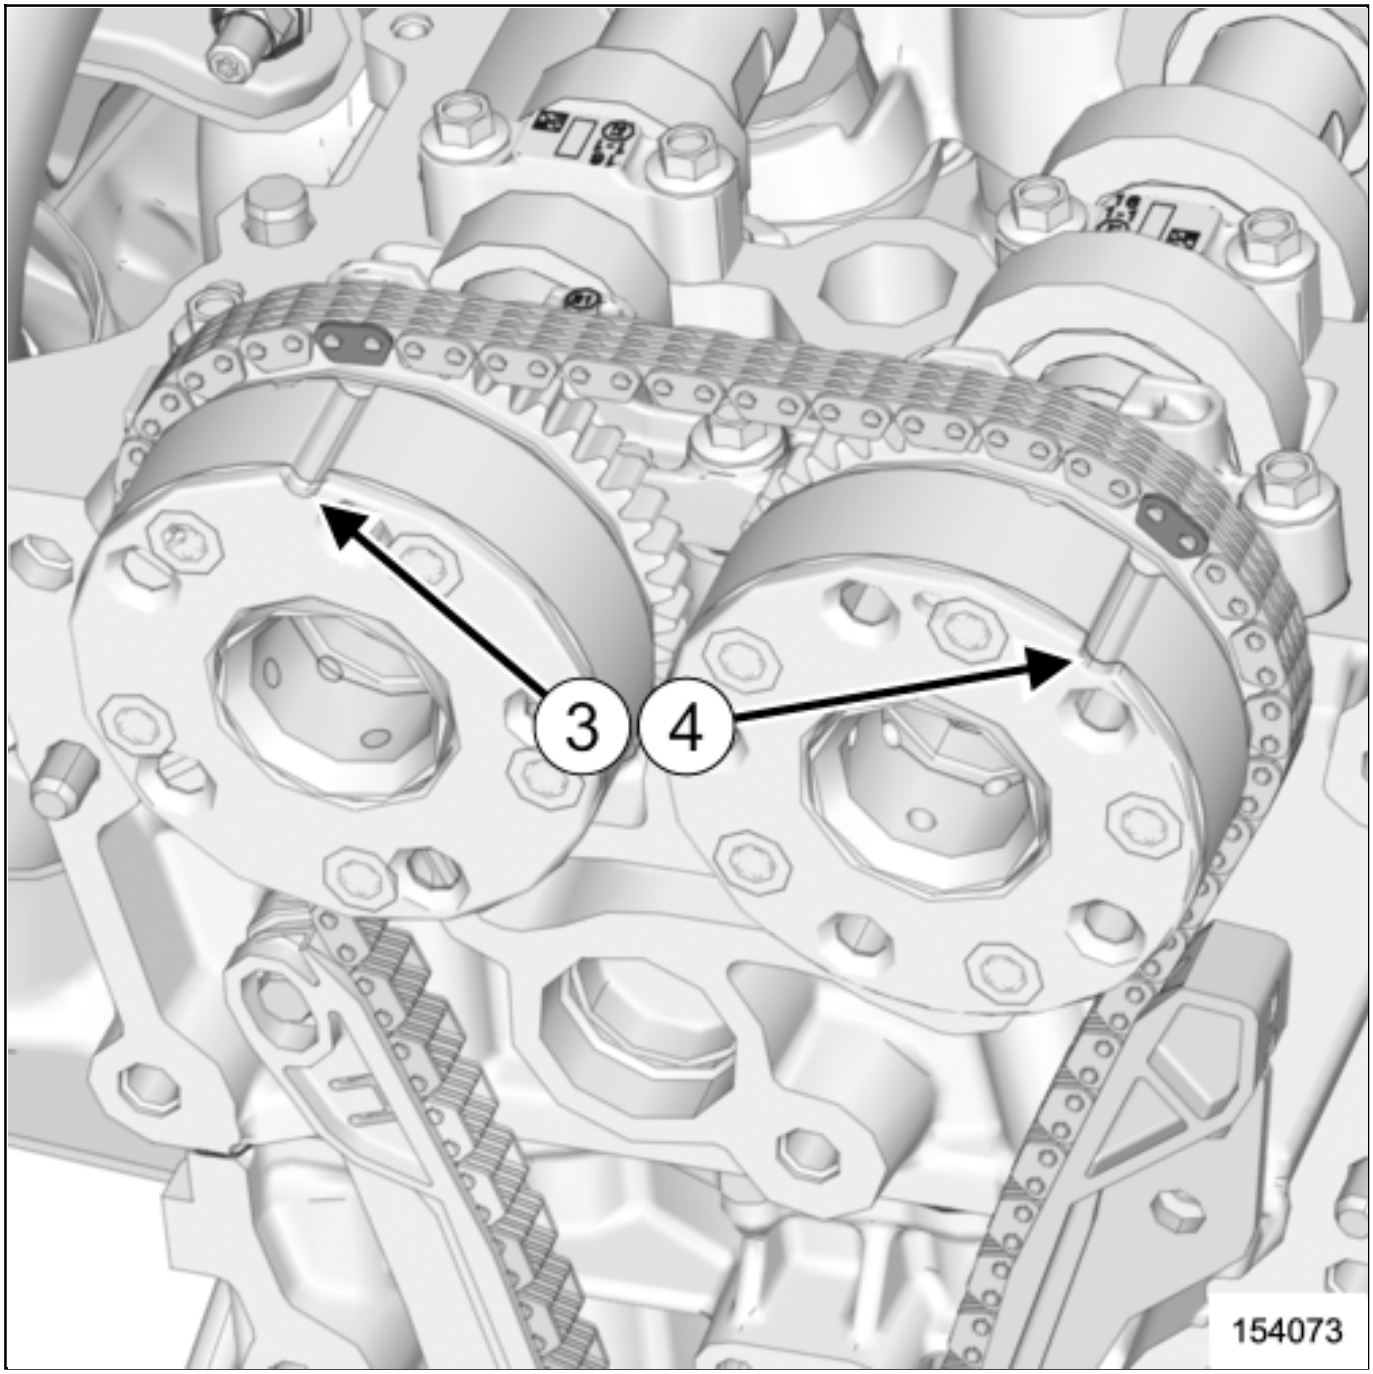
- Remove the "engine and gearbox" assembly Engine - gearbox assembly: Removal - Refitting .
- Separate the manual gearbox from the engine (see **Manual gearbox: Removal - Refitting**) .
- Separate the automatic gearbox from the engine Automatic gearbox: Removal - Refitting .
- Position the engine on the component support Engine support equipment: Use .
- Drain the engine (see **Engine oil: Draining - Refilling**) .
- Loosen the bolts of the coolant pump pulley Cylinder block assembly: Exploded view .
- Remove:
  - the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,



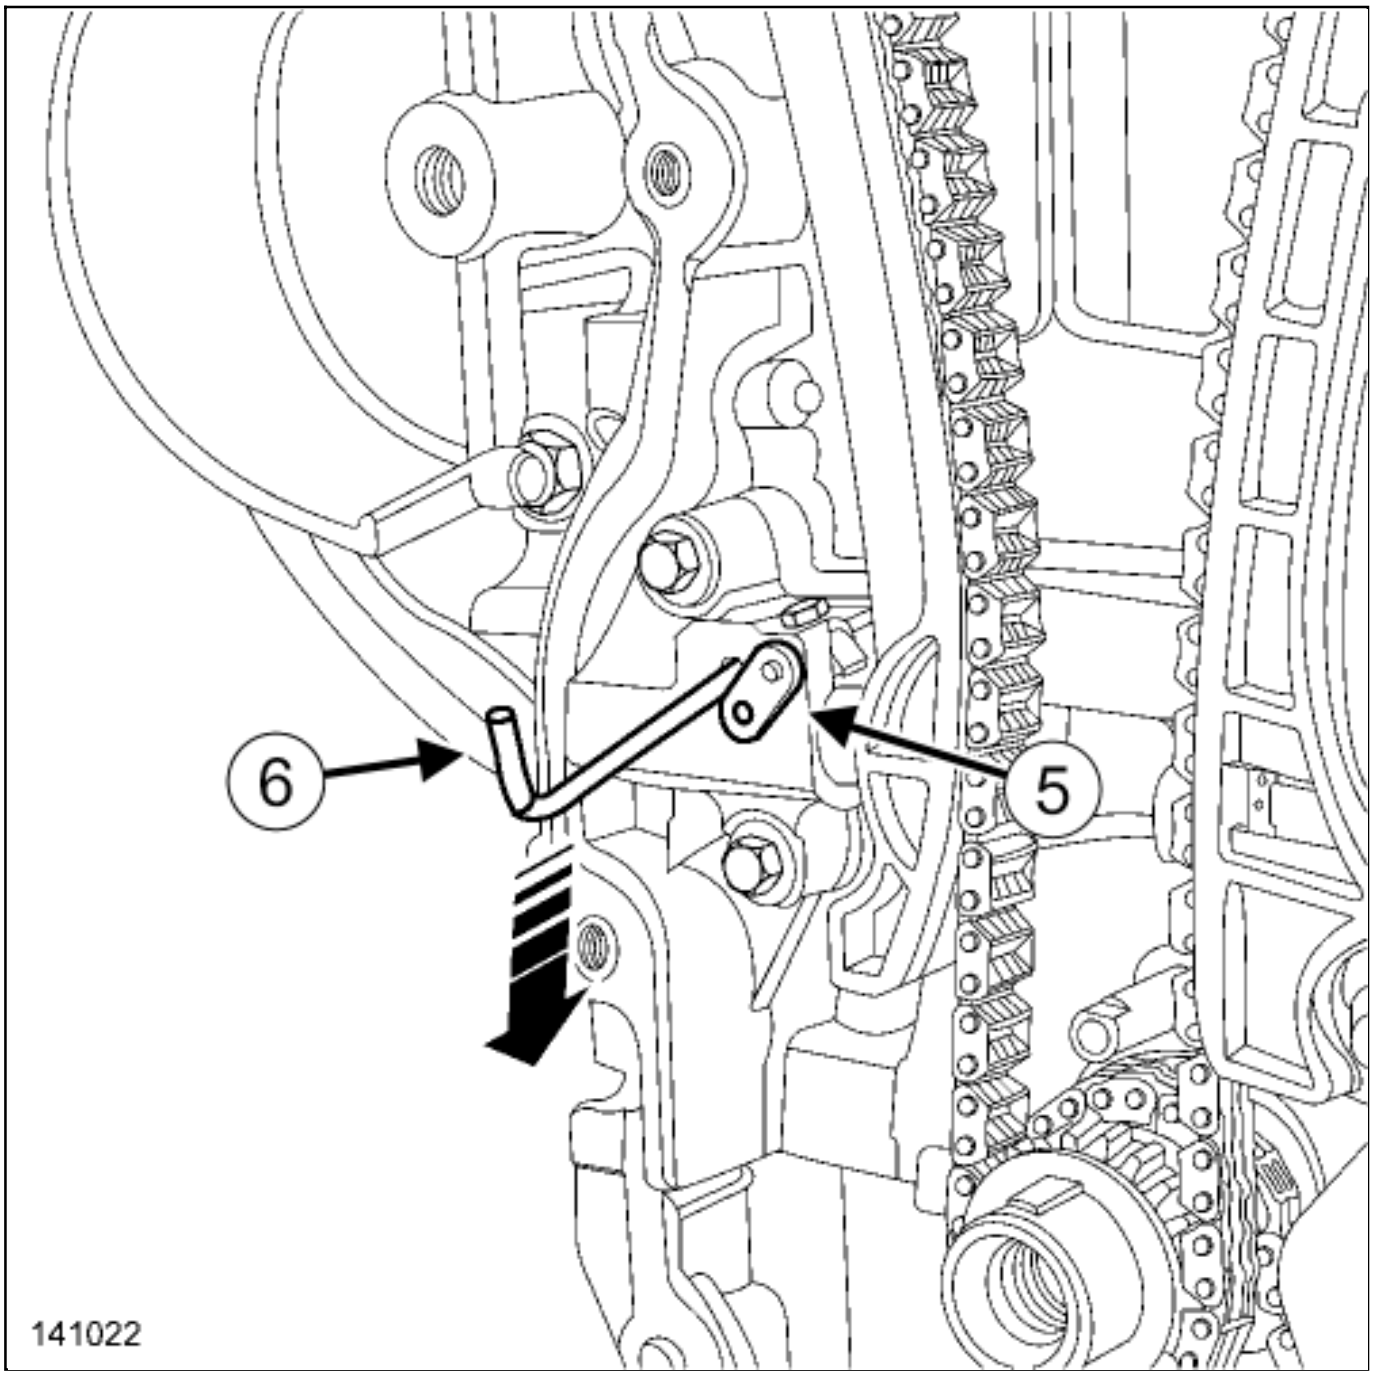
- the coolant pump pulley bolts Cylinder block assembly: Exploded view ,
- the coolant pump pulley Cylinder block assembly: Exploded view ,
- the design cover bolts (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the design cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the ingnition coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the upstream oxygen sensor Exhaust assembly in engine compartment: Exploded view ,
- the upper turbo-manifold heat shield, rear bolt Exhaust assembly in engine compartment: Exploded view ,
- the upper turbo-manifold heat shield, upper bolts Exhaust assembly in engine compartment: Exploded view ,
- the upper turbo-manifold heat shield Exhaust assembly in engine compartment: Exploded view ,
- the gasoline inlet high pressure pipe to high pressure rail bolt Petrol injection ,
- the gasoline inlet high pressure pipe to high pressure rail Petrol injection ,
- the gasoline high pressure pump bolts Petrol injection ,
- the gasoline high pressure pump Petrol injection ,
- the gasoline high pressure pump lifter Petrol injection ,
- the gasoline high pressure pump seal Petrol injection ,
- the inlet camshaft position sensor bolt (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the inlet camshaft position sensor (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the exhaust position sensor bolt (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,

- the exhaust position sensor (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the cylinder head cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view),
- the crankshaft accessories pulley (see 11A, Top and front of engine, Engine accessories assembly: Exploded view),
- the crankshaft seal on timing end (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the inlet timing dephaser bolt (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the inlet timing dephaser (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the exhaust camshaft dephaser solenoid valve bolt (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the exhaust camshaft dephaser solenoid valve (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the camshaft dephaser oil supply cover bolts (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the camshaft dephaser oil supply cover (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the camshaft dephaser oil supply cover seal (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the timing cover bolts (see 11A, Top and front of engine, Timing assembly: Exploded view).

1
160261

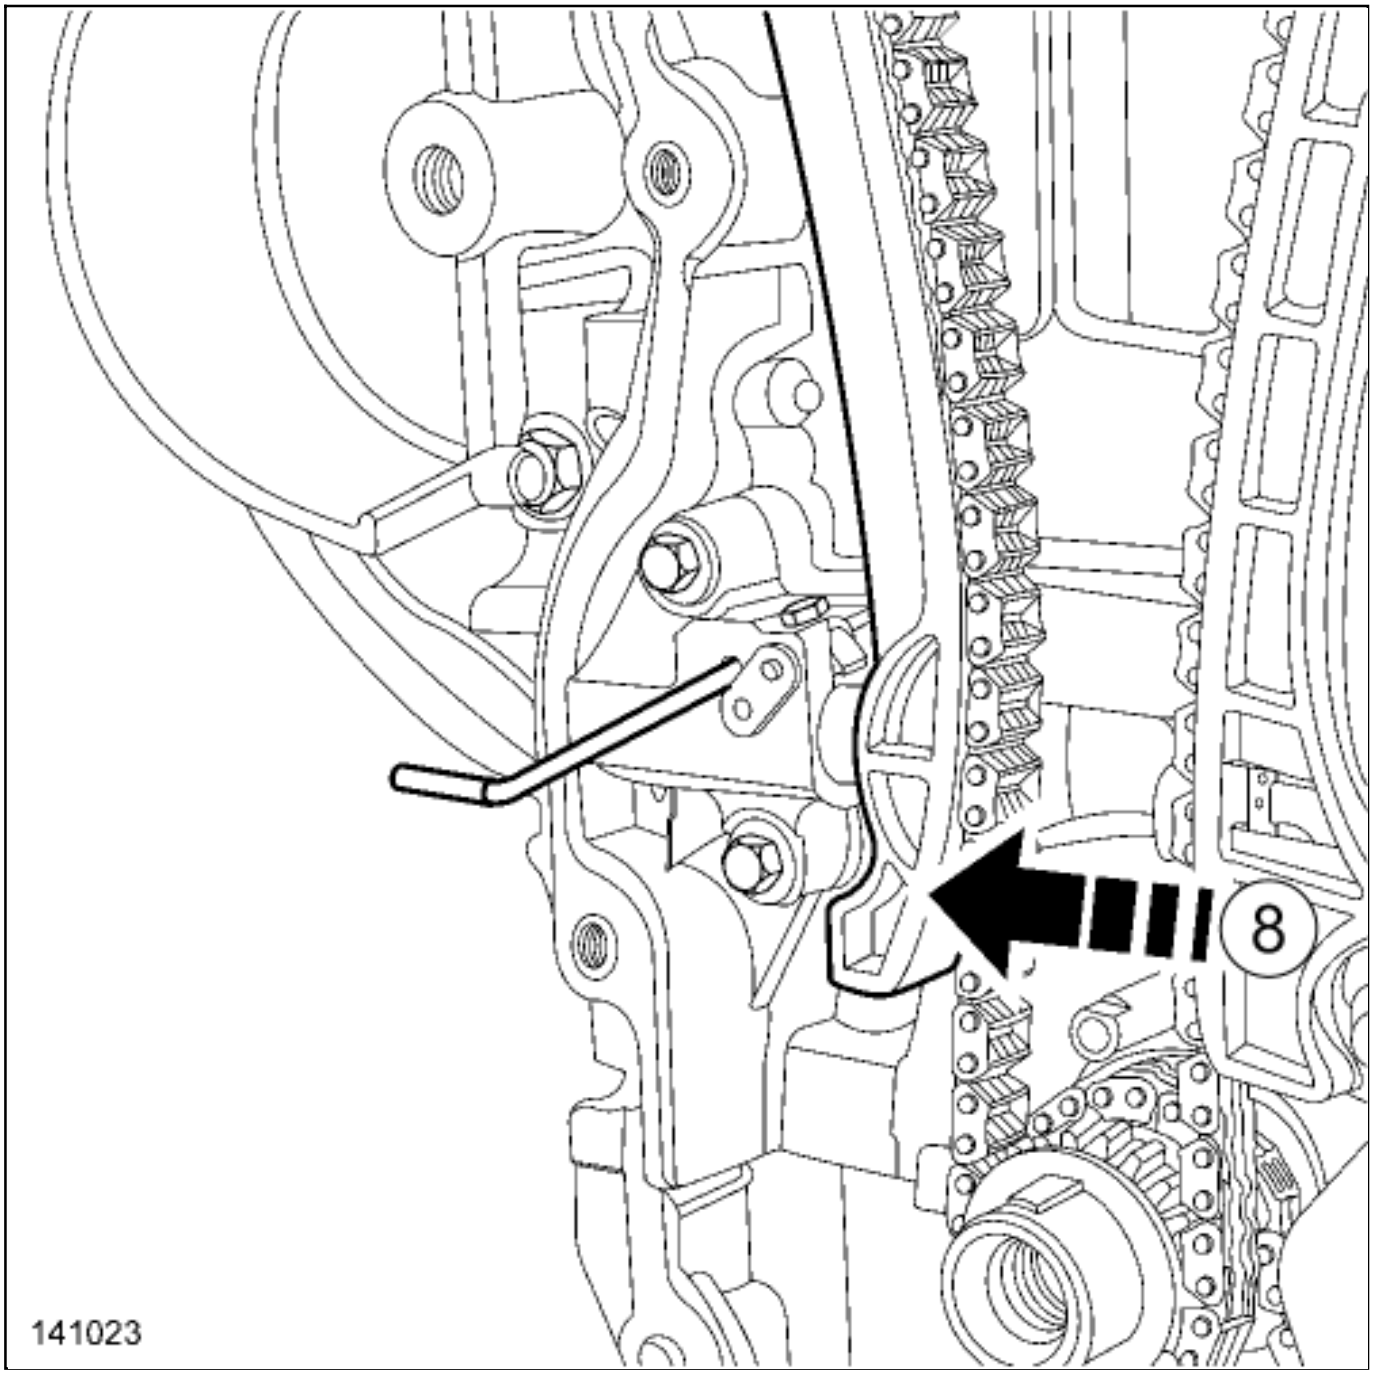


Very carefully separate the timing cover using a flat-blade screwdriver(1)



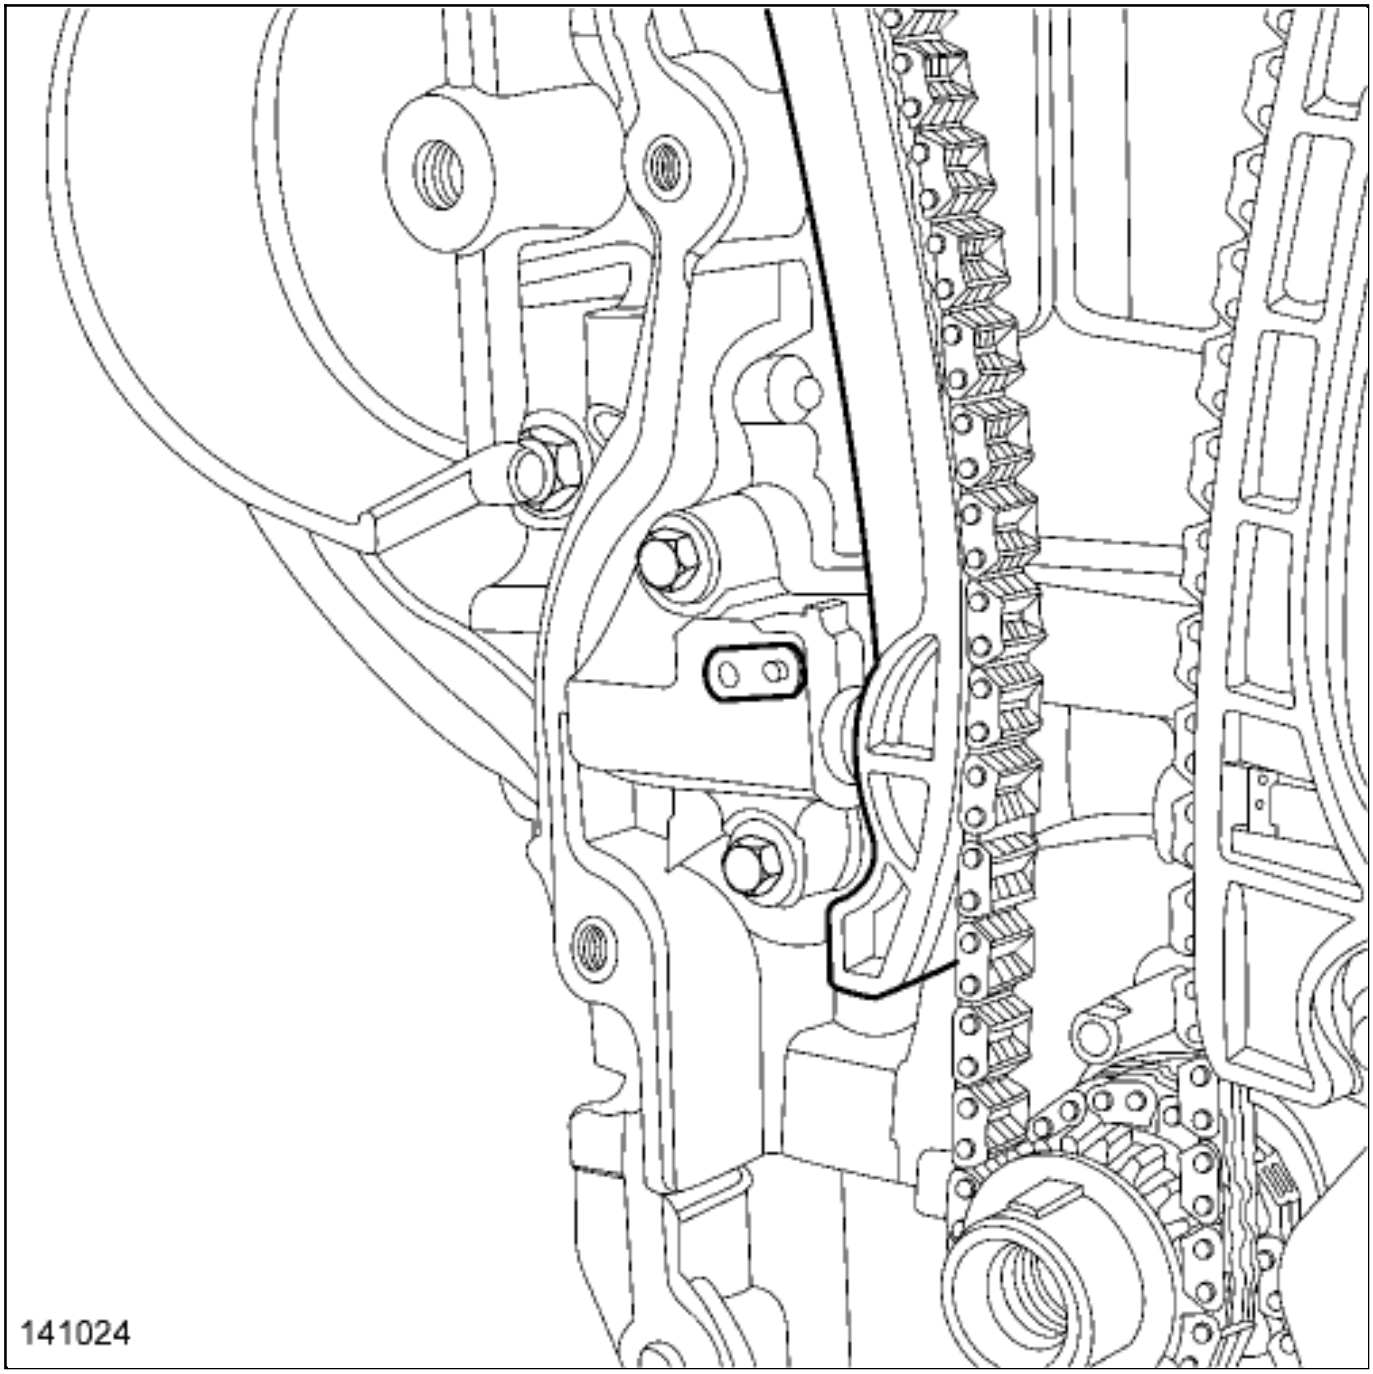
Tap the lifting eye using a mallet(2) to detach the timing cover.

Remove the timing cover(see 11A, Top and front of engine, Timing assembly: Exploded view) .

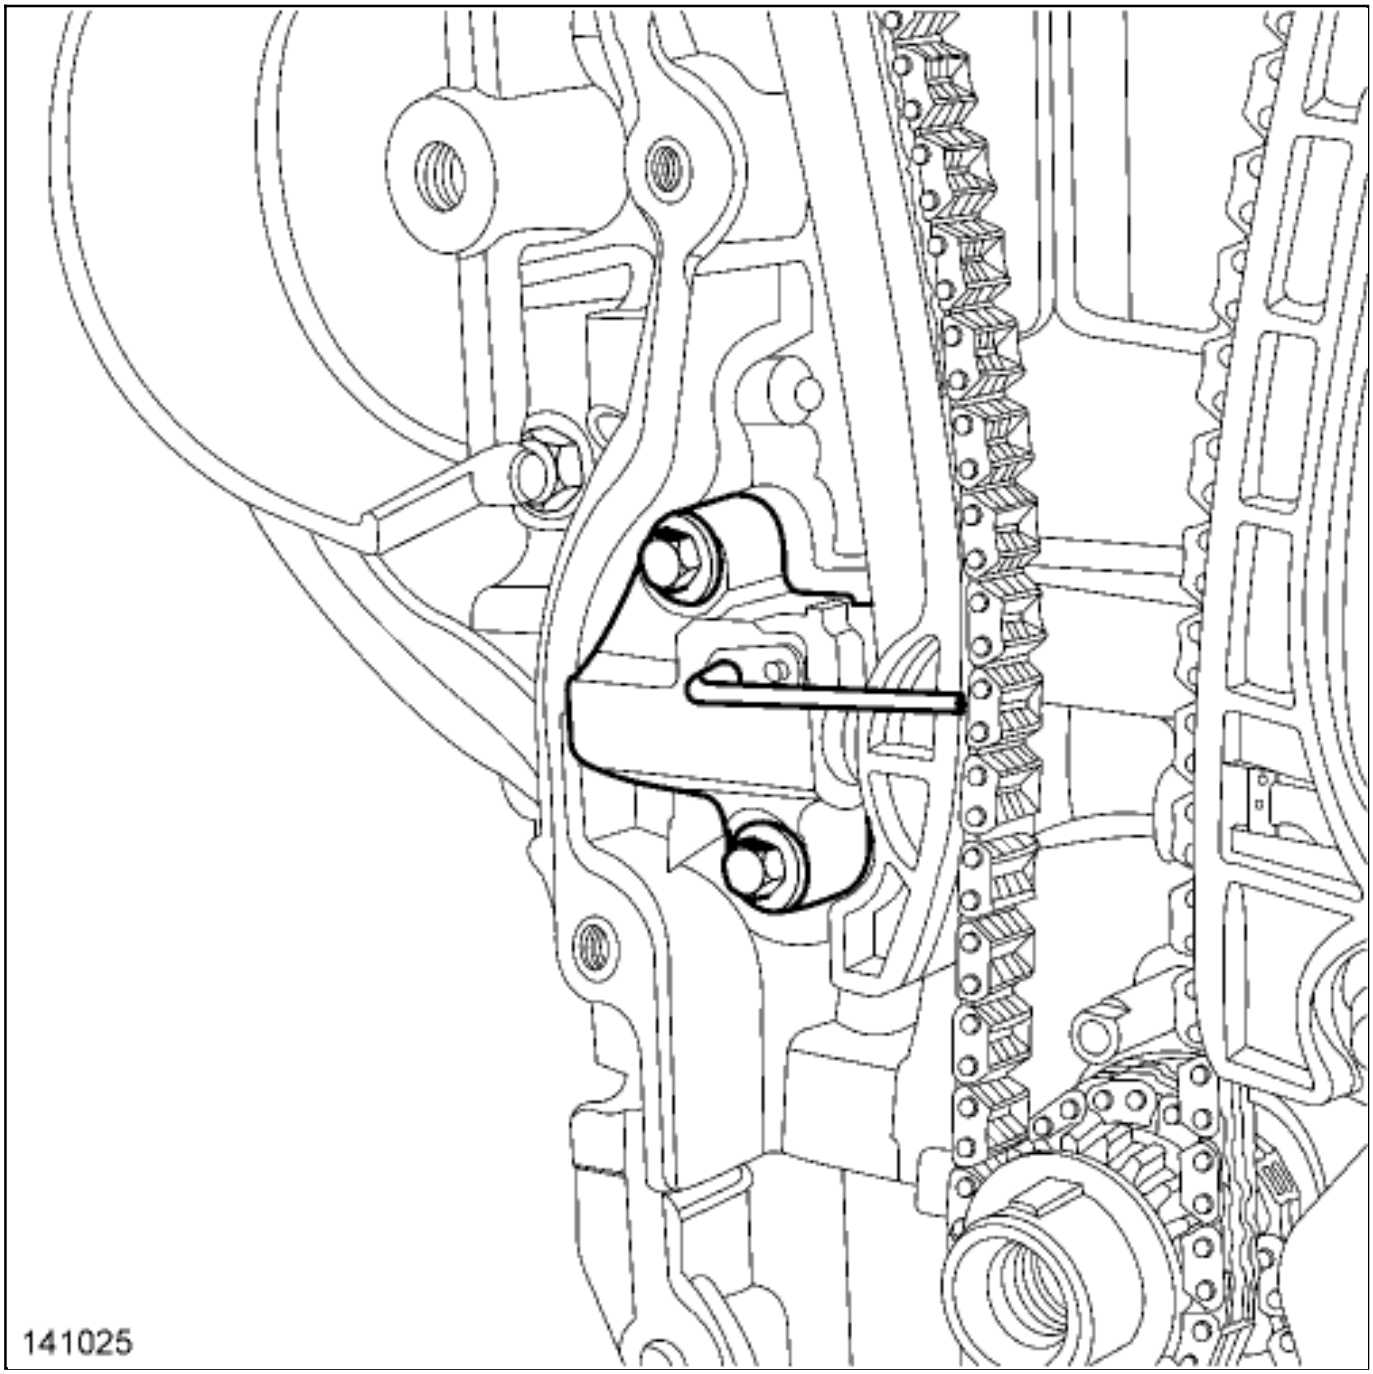


Check that the mark(3) of the exhaust camshaft timing sprocket and the mark(4) of the inlet camshaft timing sprocket are in the same position as shown in the illustration.

2. REMOVAL OPERATION



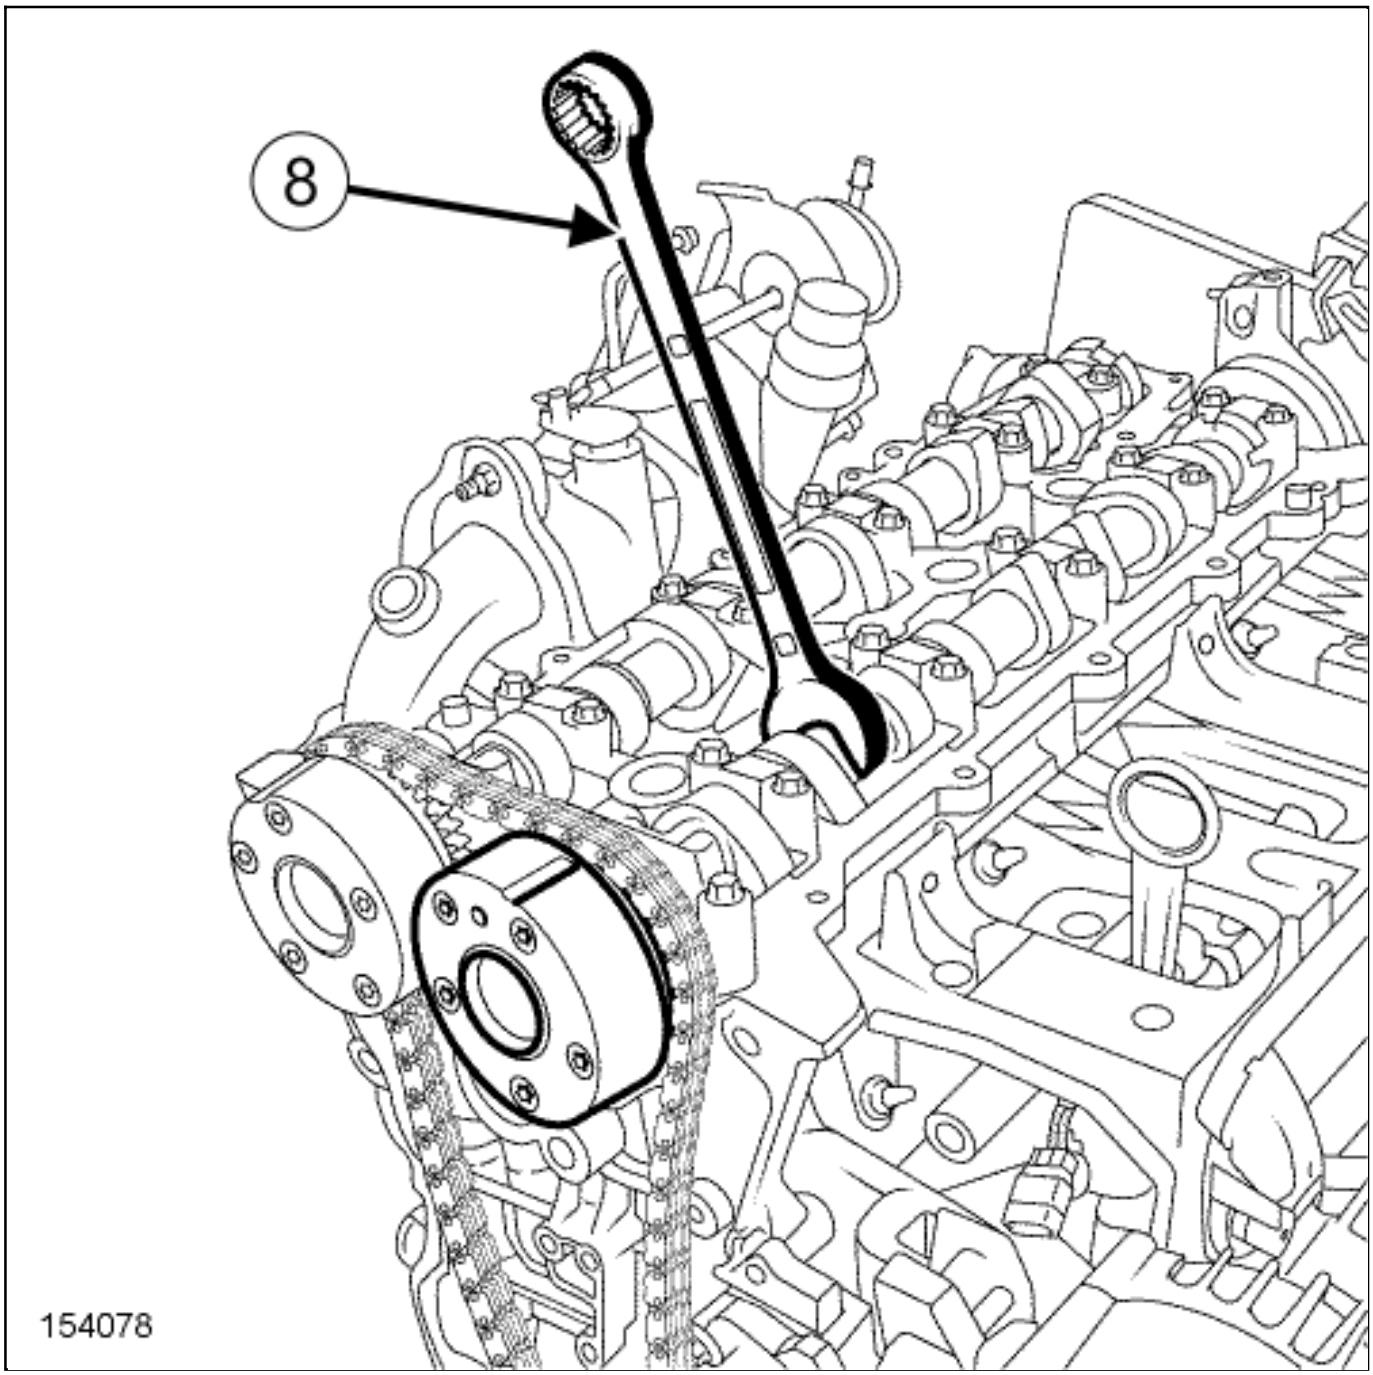
Lower the lever(5) of the timing hydraulic tensioner(see 11A, Top and front of engine, Timing assembly: Exploded view) as far as possible using a 2.5 mm Allen key(6) to release the tensioner piston.

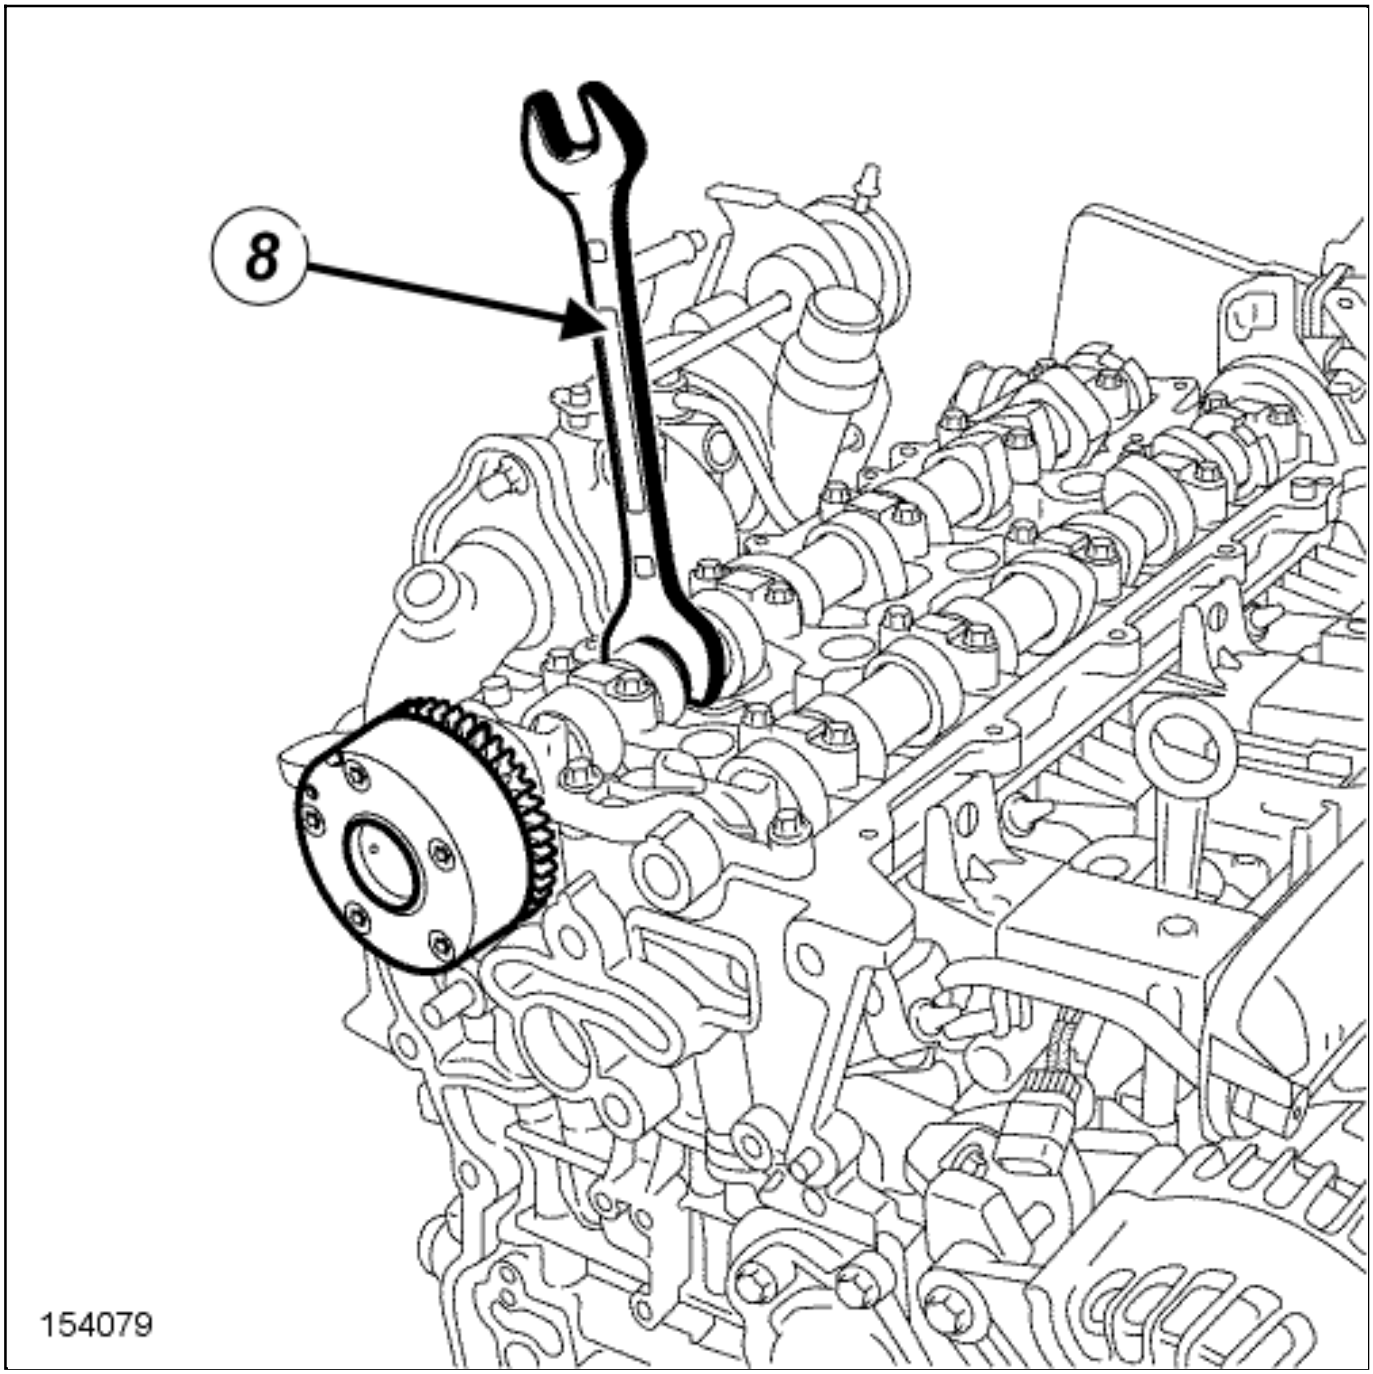


- Push on the timing chain tensioning guide (see 11A, Top and front of engine, Timing assembly: Exploded view) until the timing hydraulic tensioner piston is fully depressed (7) .

- Remove the 2.5 mm Allen key from the timing hydraulic tensioner.

Carefully release the timing chain tensioning guide until the tensioner lever is aligned with the opening on the tensioner casing.





Fit the 2.5 mm Allen keyin the hole on the timing hydraulic tensioner casing to lock the timing chain tensioner lever in the locking position.

Remove: **(see 11A, Top and front of engine, Timing assembly: Exploded view)**

- the timing hydraulic tensioner bolts,
- the timing chain tensioner, taking care not to unlock it,

- the timing chain tensioning guide from its shaft,
- the timing chain guide bolts,
- the timing chain guide.

To loosen the timing sprocket bolts, hold the camshafts using an open-jawed spanner(8) .

Remove : **(see 11A, Top and front of engine, Timing assembly: Exploded view)**

- the timing sprocket bolts,
- the exhaust camshaft timing sprocket,

- the inlet camshaft timing sprocket,
- the timing chain.

REFITTING

1. REFITTING PREPARATION OPERATION

Remove the silicone adhesive sealant residues from the joint faces using a plastic spatula.

CAUTION

Do not scrape the aluminium joint faces, any damage caused to the joint face will result in a risk of leaks.

Note:

The groove pattern ensures proper bonding of the silicone adhesive sealant on the joint faces and must not be altered.

Clean using SUPER CLEANING AGENT FOR JOINT FACES Vehicle: Parts and consumables for the repair the joint faces of:

- the cylinder head,
- the cylinder block,
- the timing cover.

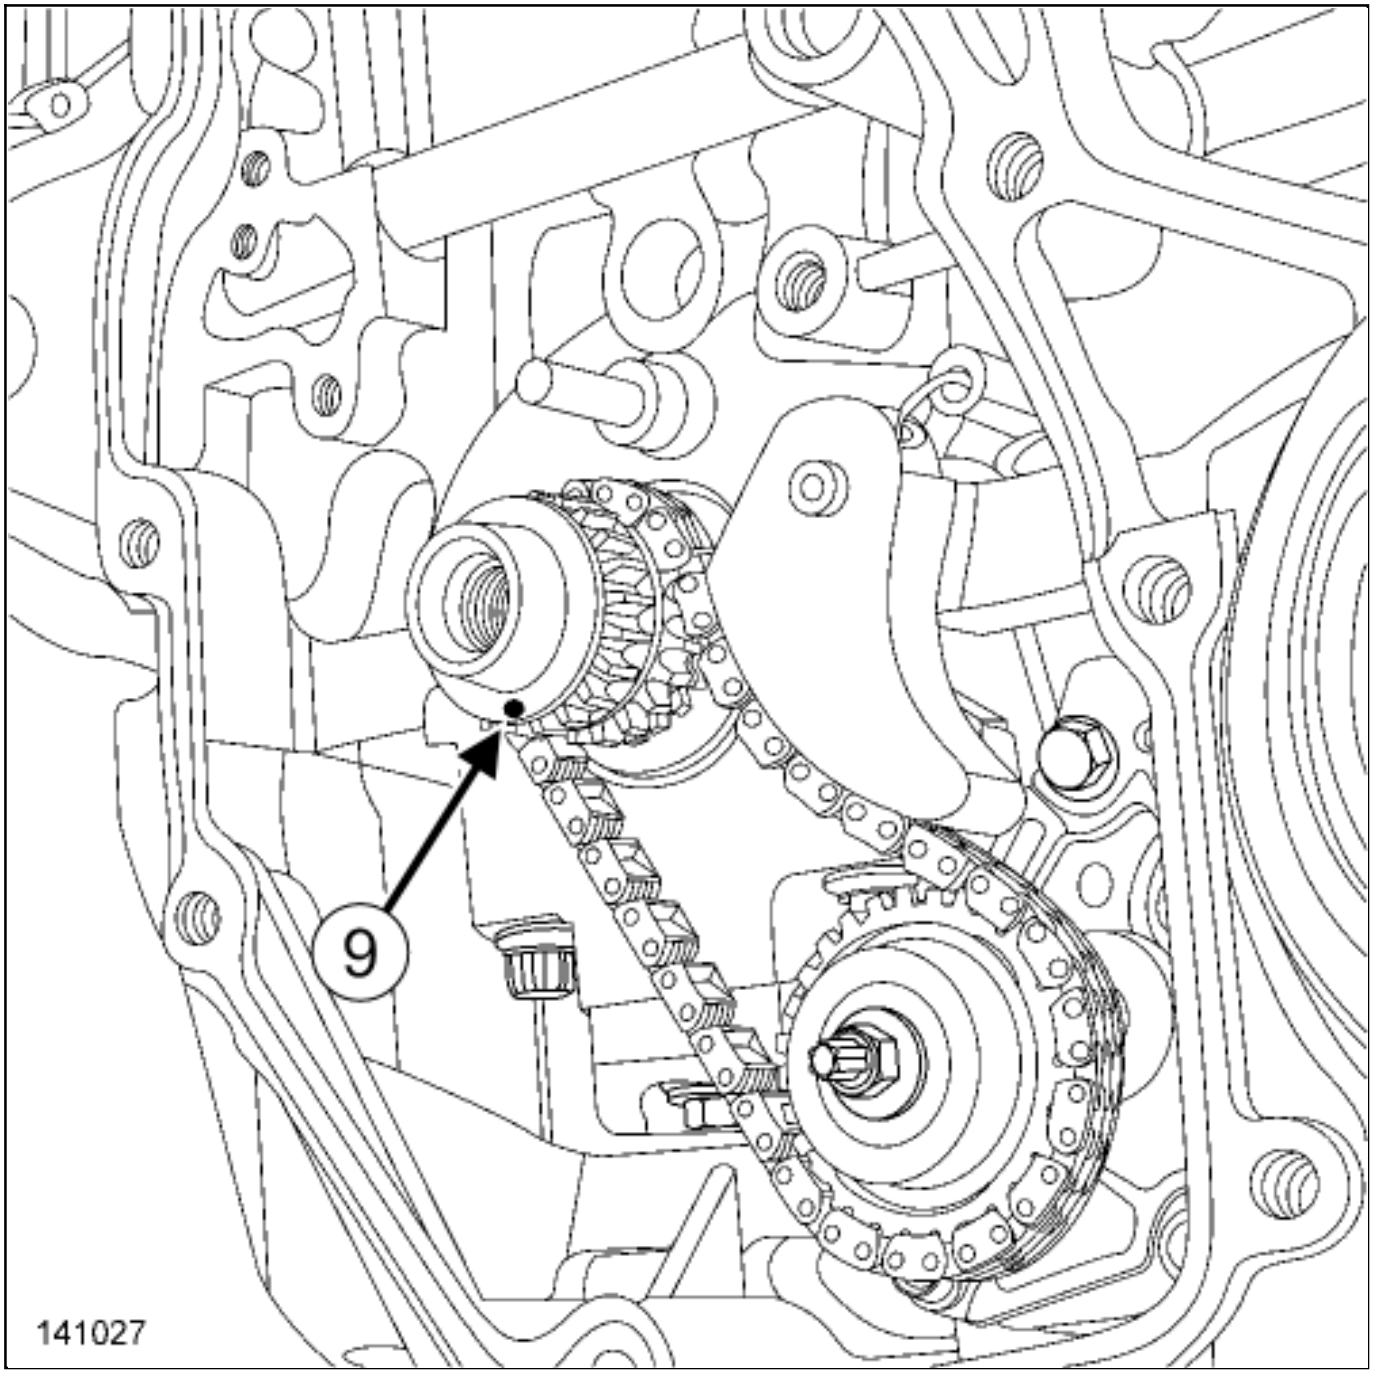
Finish cleaning the joint faces using a GREY ABRASIVE PAD Vehicle: Parts and consumables for the repair .

CAUTION

Do not use any kind of sandpaper.

Degrease using SURFACE CLEANER Vehicle: Parts and consumables for the repair the joint faces of:

- the cylinder head,
- the cylinder block,
- the timing cover.



CAUTION

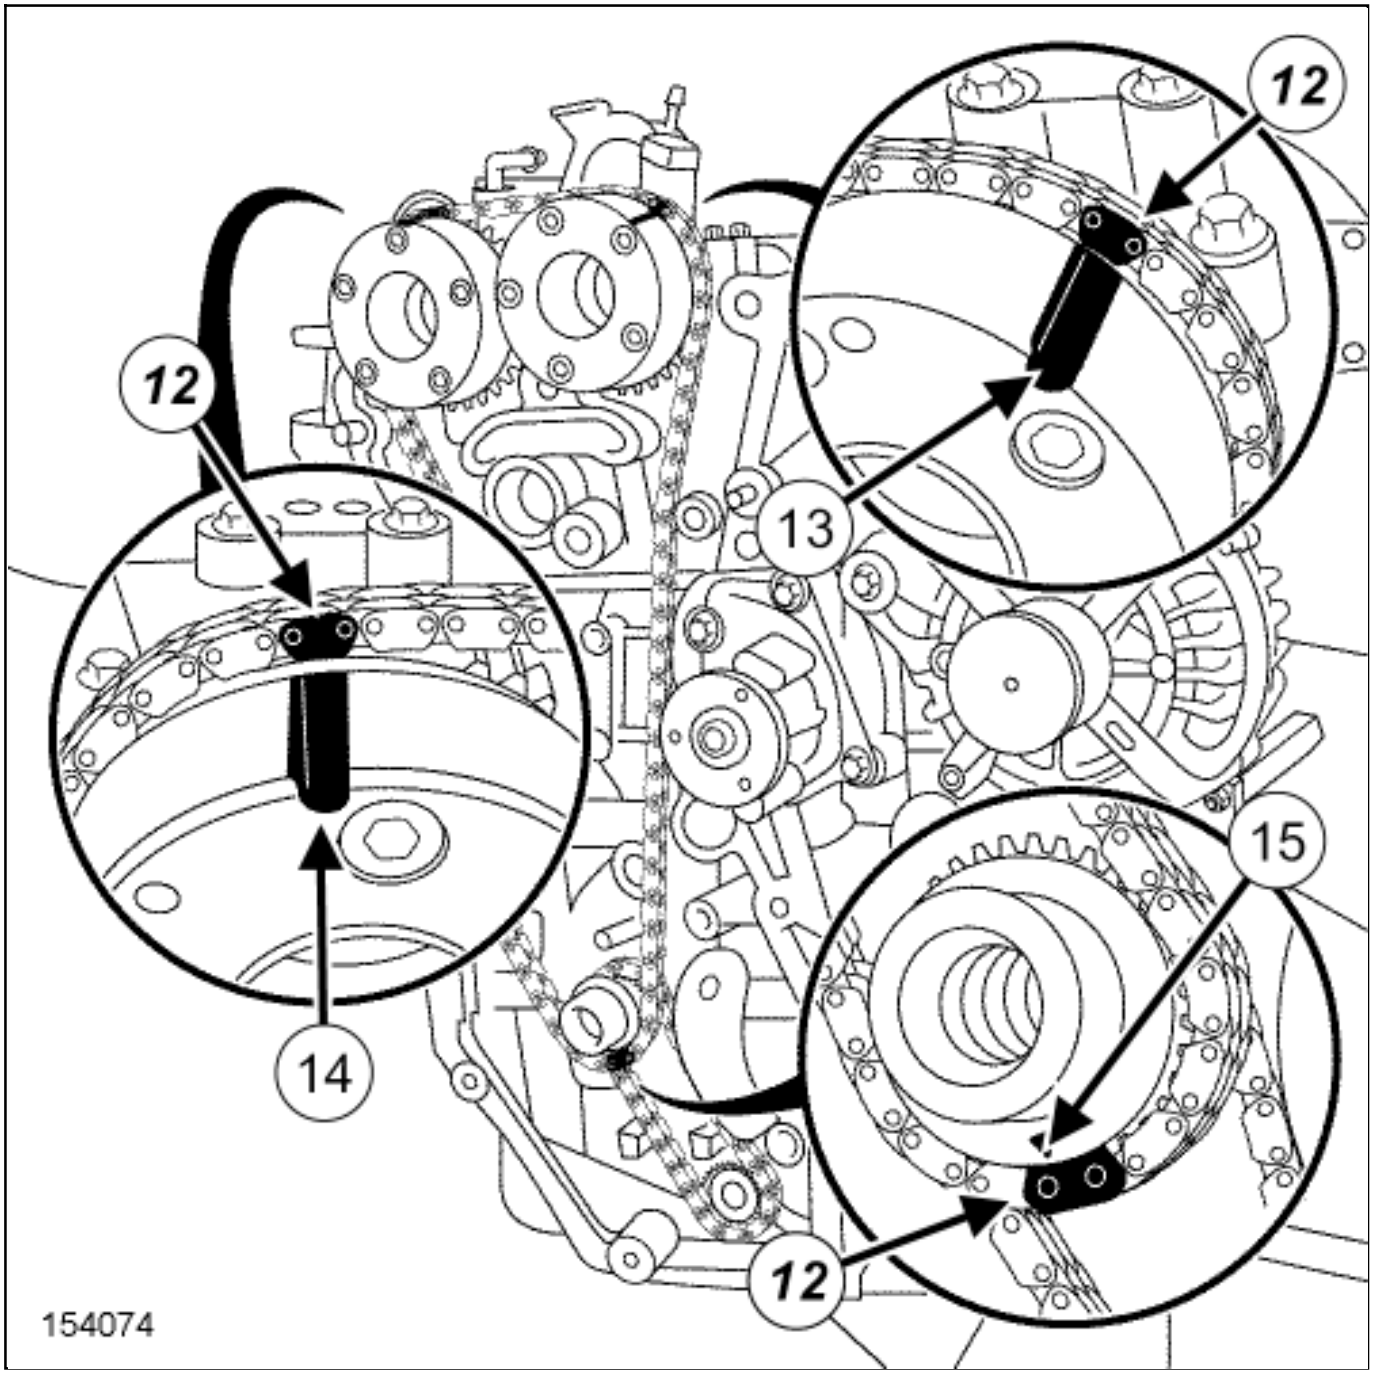
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

parts always to be replaced: Timing chain .

Always replace:

- the timing chain hydraulic tensioner,
- the timing chain tensioning guide,
- the timing chain guide.

Check that the crankshaft mark(9) is positioned vertically pointing downwards.



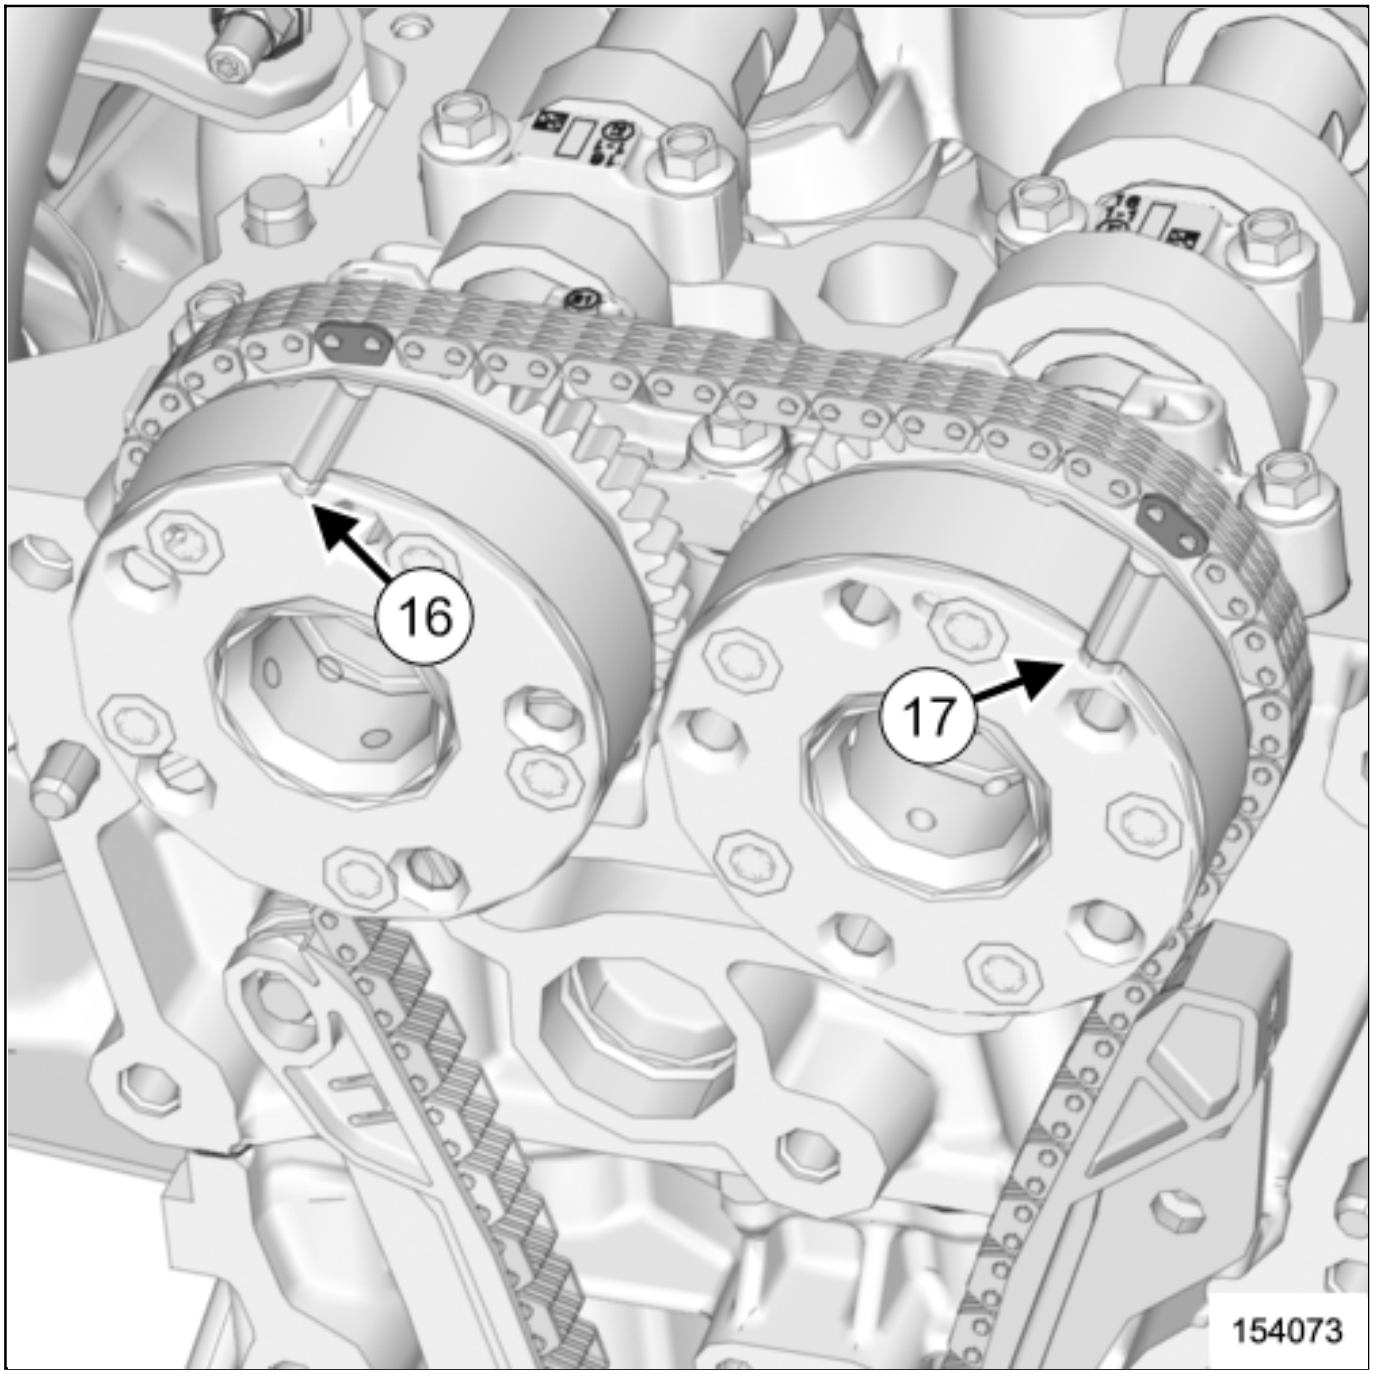
2. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the inlet camshaft timing sprocket,

the exhaust camshaft timing sprocket,

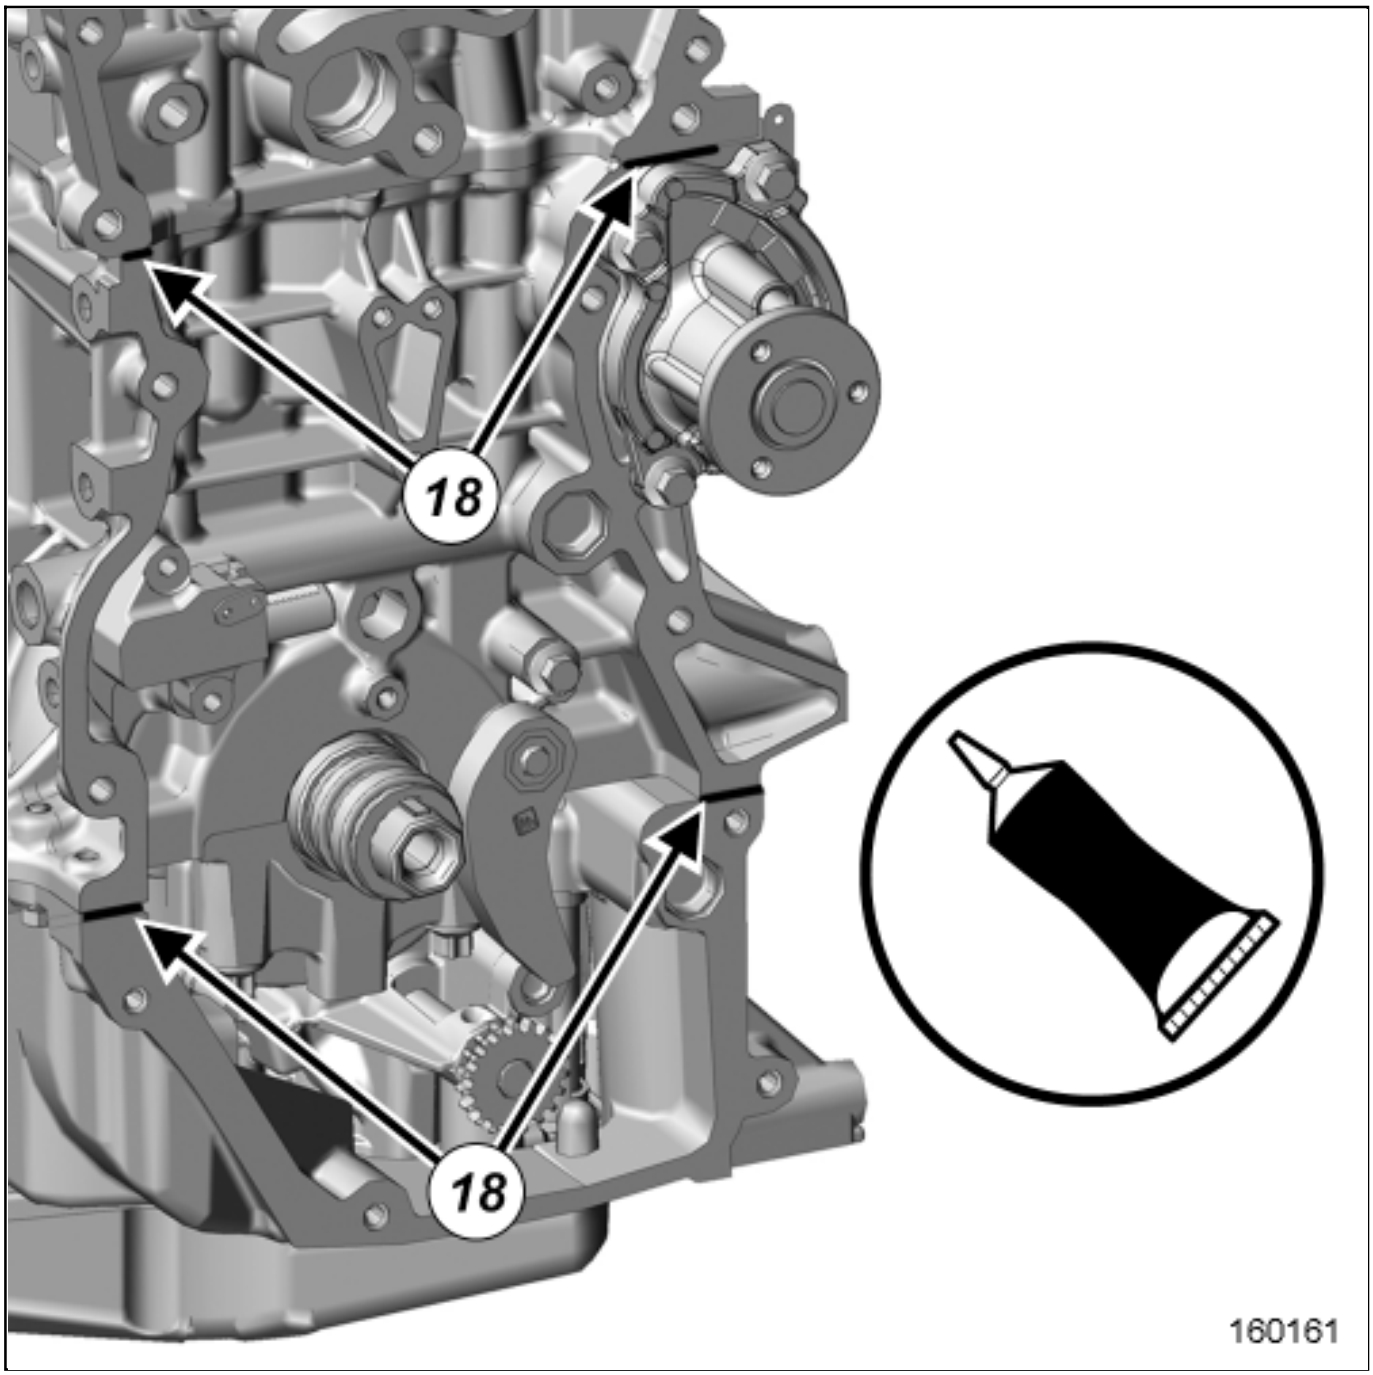
the timing sprocket bolts.



Refit:

a new timing chain, starting with the camshaft dephaser and by aligning the painted links(12) of the timing chain with the marks(13) on the inlet camshaft dephaser,(14) on the exhaust camshaft sprocket and(15) on the crankshaft sprocket,

- the new timing chain guide (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the timing chain guide bolts (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the new timing chain tensioning guide (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the new timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view),
- the timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view).



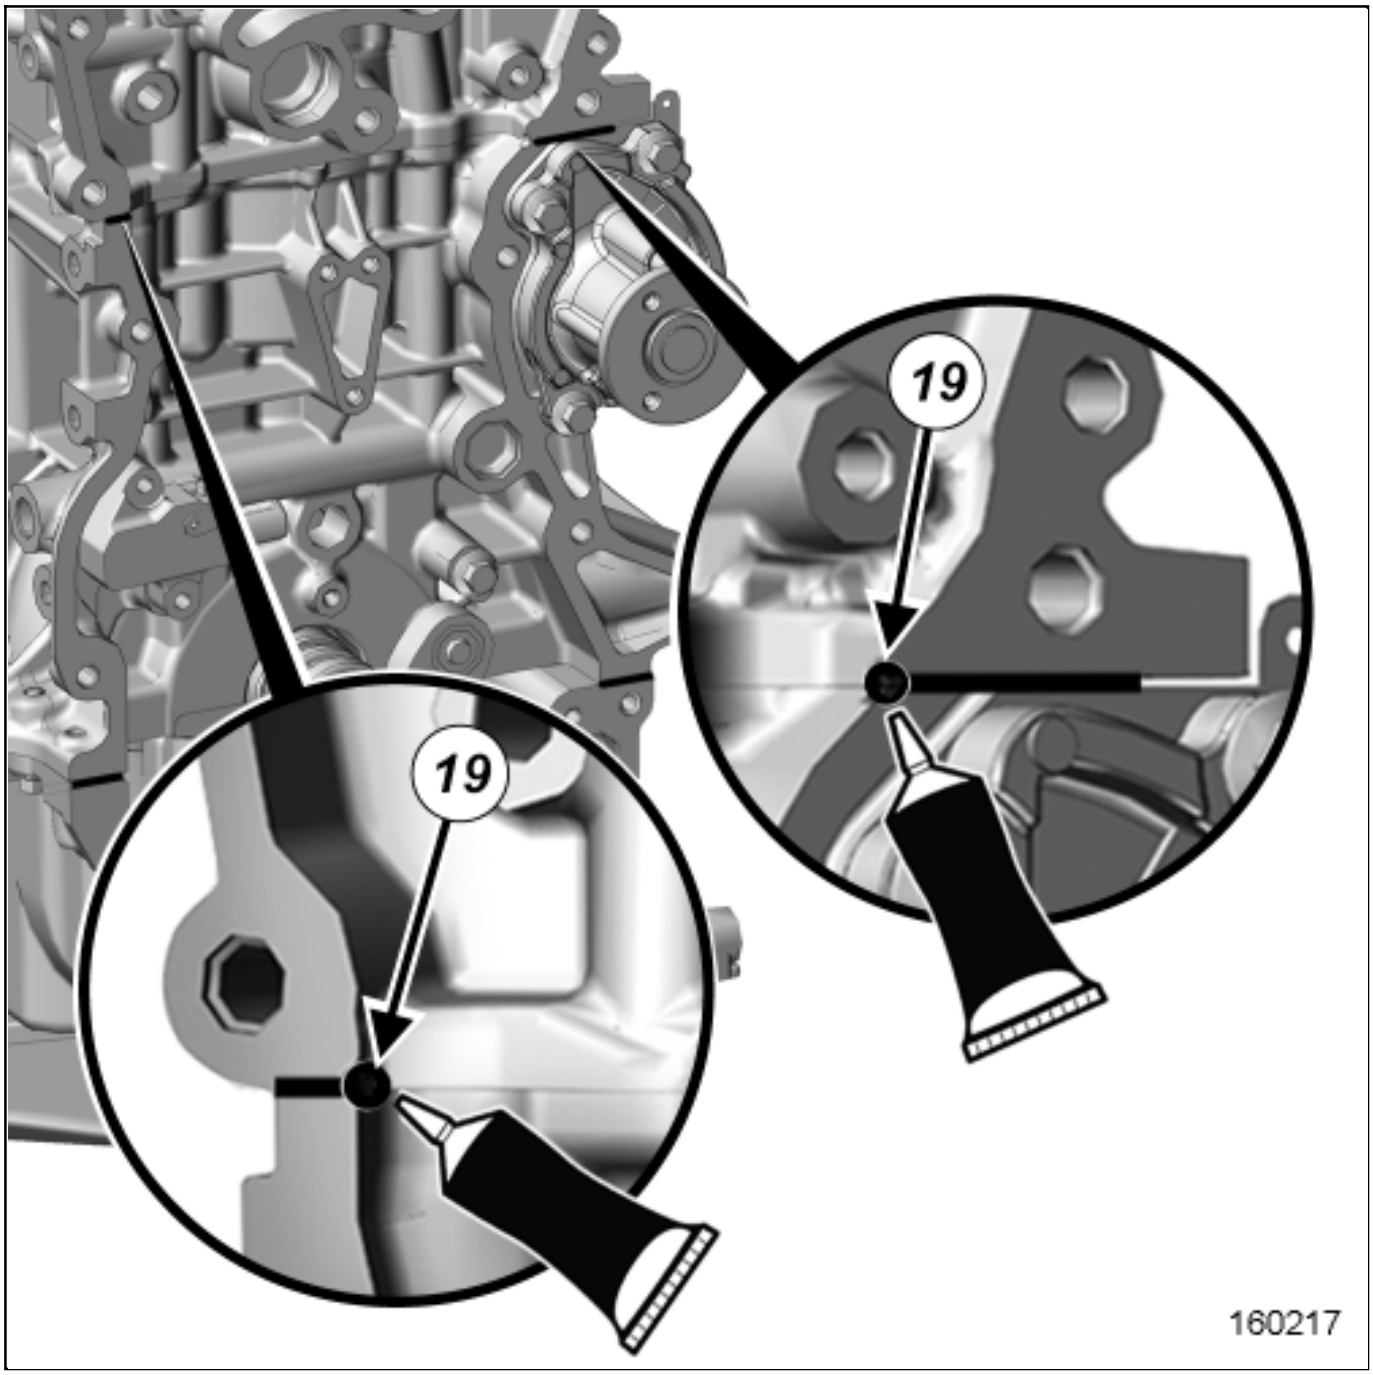
Unlock the timing hydraulic tensioner (see 11A, Top and front of engine, Timing assembly: Exploded view).

Rotate the crankshaft clockwise through two revolutions (timing end).

Check that the mark(16) of the exhaust camshaft timing sprocket and the mark(17) of the inlet camshaft timing sprocket are in the same position as shown in the illustration.

3. FINAL OPERATION

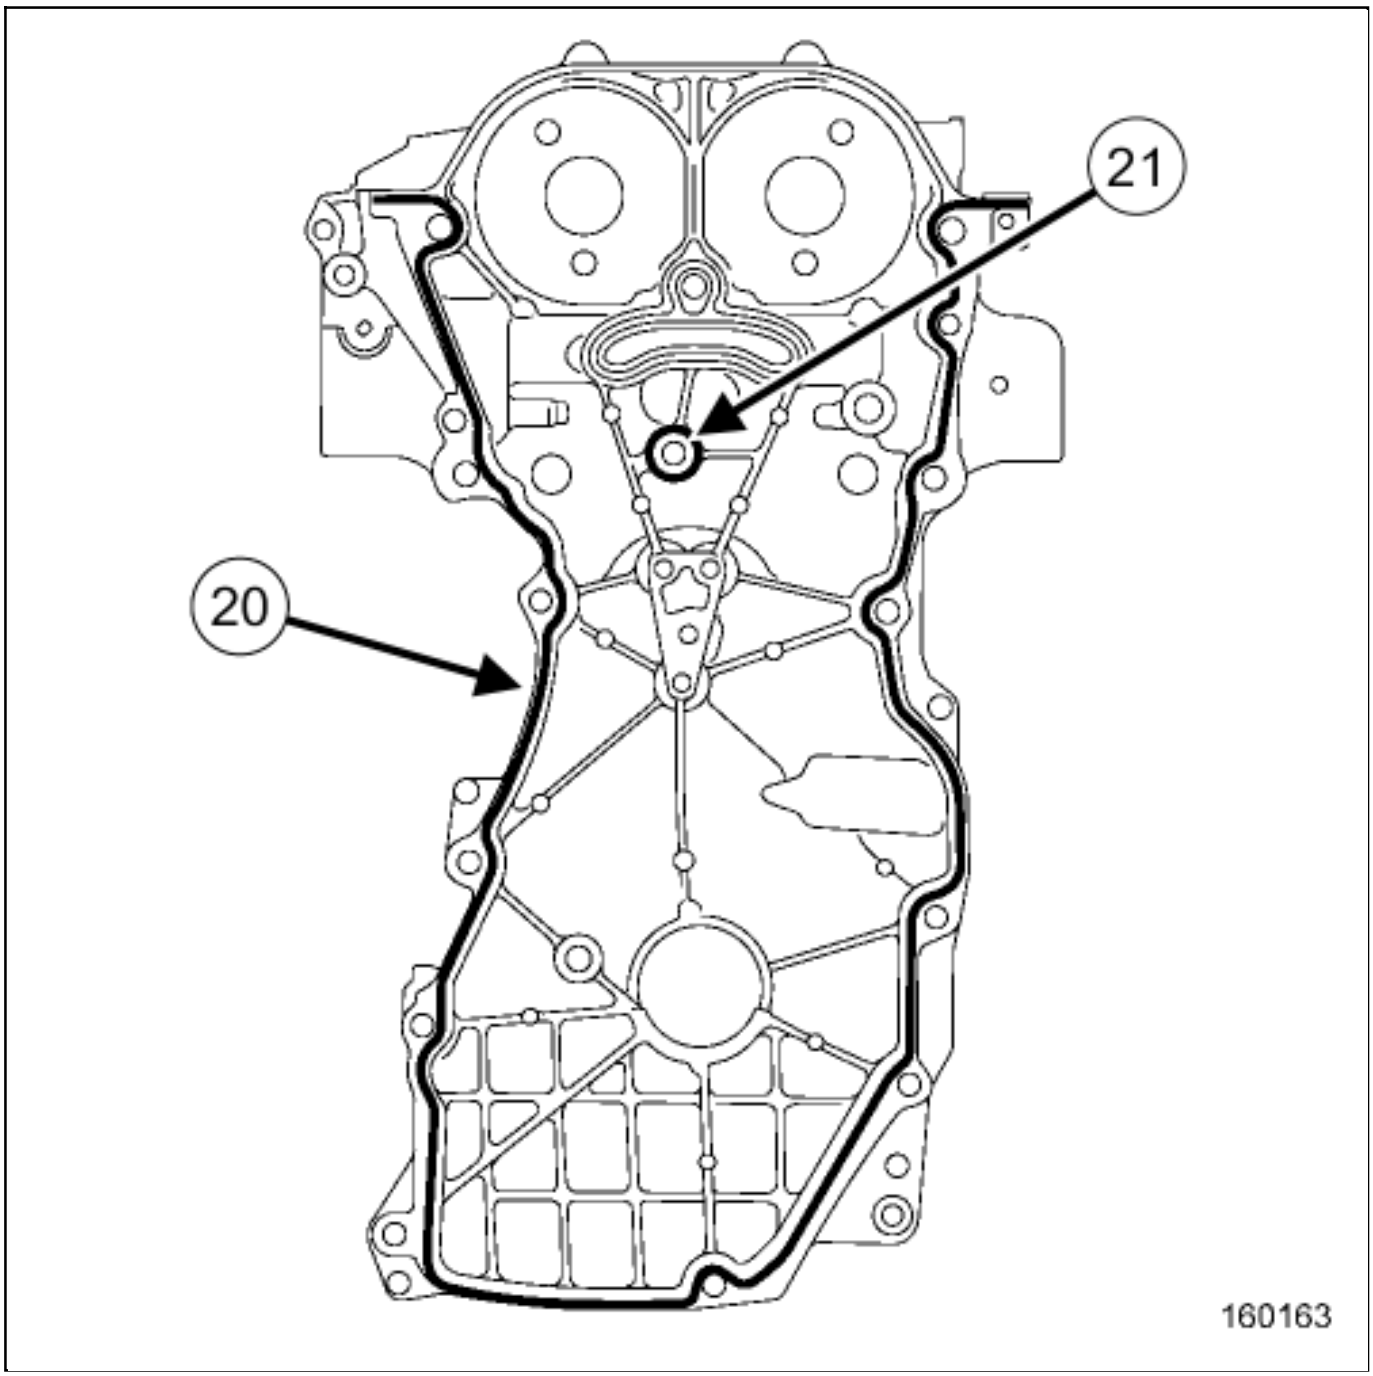
Degrease using SURFACE CLEANER[Vehicle: Parts and consumables for the repair] the joint faces of:



- the cylinder head,
- the cylinder block.

Apply 4 beads of SILICONE ADHESIVE SEALANT[Vehicle: Parts and consumables for the repair] at(18) with a diameter of 3 to 4 mmto fill the gaps between timing cover/cylinder head and timing cover/oil sump.

CAUTION



Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Remove any excess of silicone adhesive sealant using a plastic spatula.

Apply a drop of SILICONE ADHESIVE SEALANT Vehicle: Parts and consumables for the repair with a minimum thickness of 5 mm in the slots (19) to ensure complete sealing of the timing cover / cylinder block / cylinder head.

Degrease the joint faces of the timing cover using SURFACE CLEANER Vehicle: Parts and consumables for the repair

Apply a bead of SILICONE ADHESIVE SEALANTVehicle: Parts and consumables for the repair with a diameter of 3 to 4 mm:

- on the joint face of the timing cover(20) placed at a distance of 1 to 2 mmfrom the inside edge of the timing cover,
- on the center part(21) of the timing cover.

CAUTION

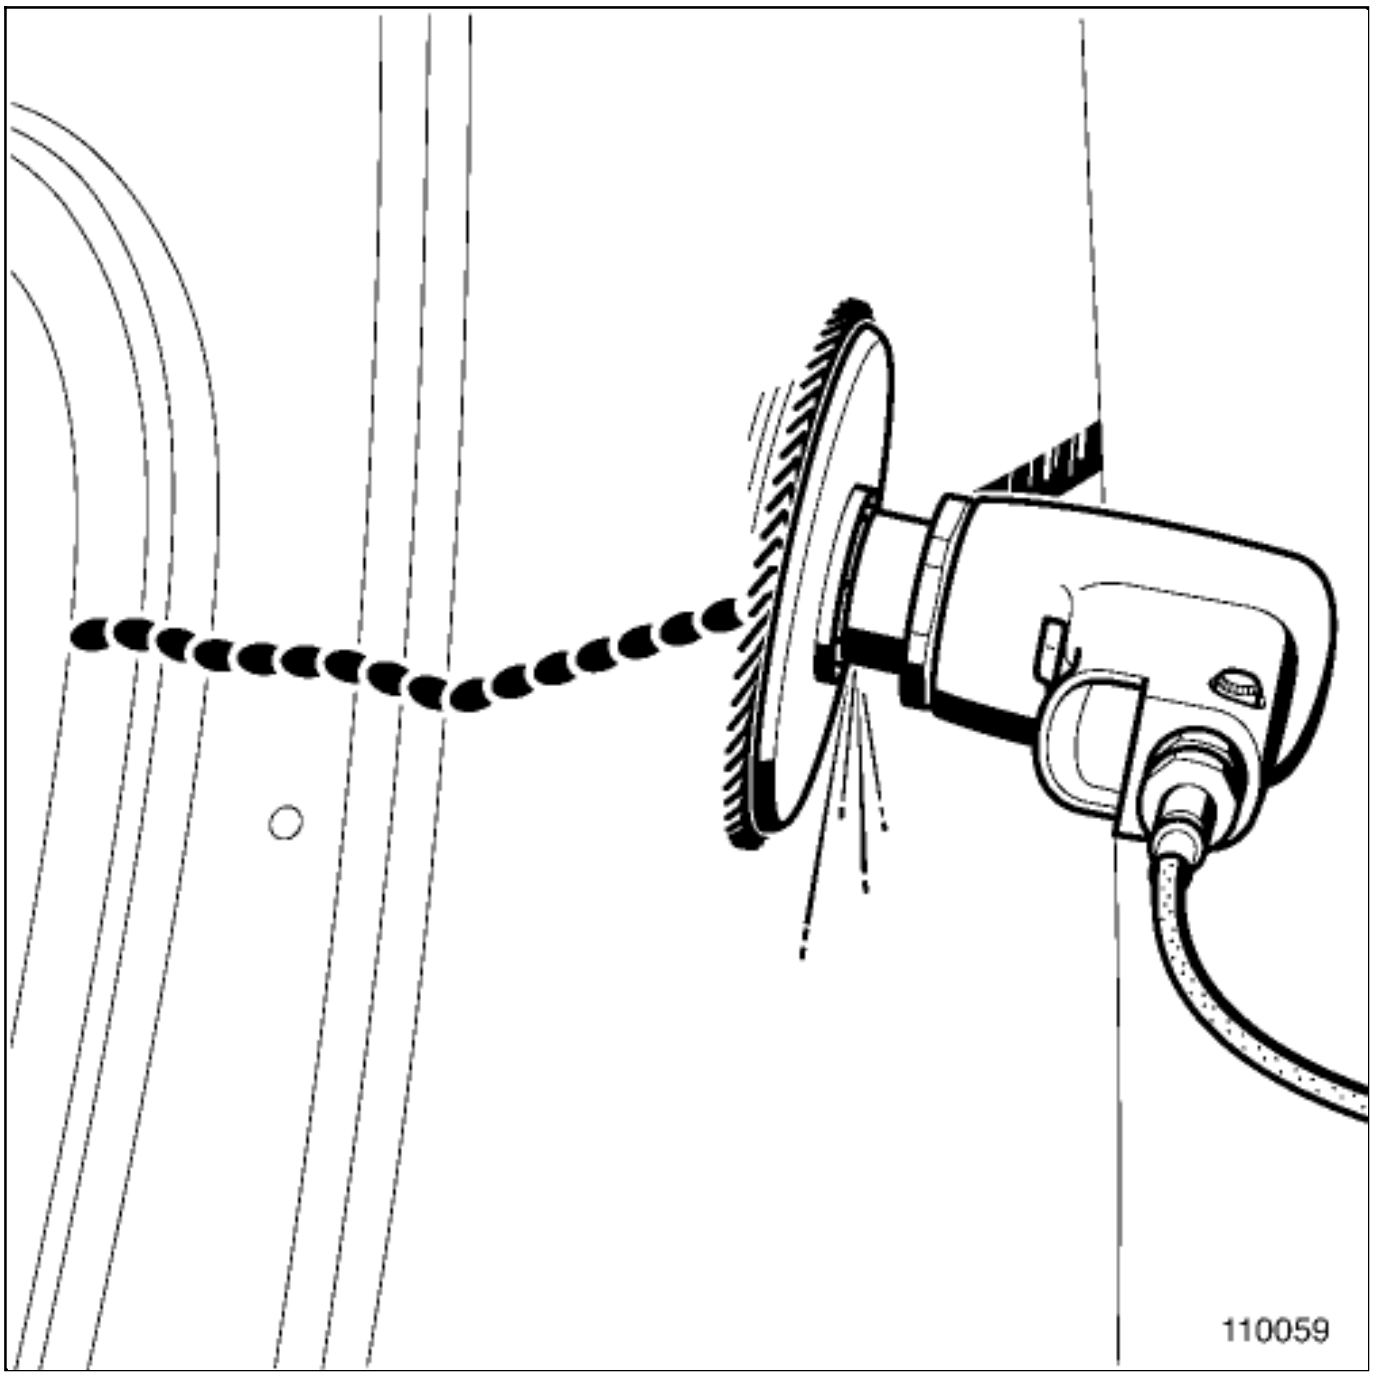
Applying excess sealant could cause it to be squeezed in when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Refit within 5 to 10 min(see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the timing cover,
- the timing cover bolts.

Torque tighten the timing cover bolts(see 11A, Top and front of engine, Timing assembly: Exploded view) .

Wipe off any excess of silicone adhesive sealant from the timing cover edges using a lint-free cloth Vehicle: Parts and consumables for the repair



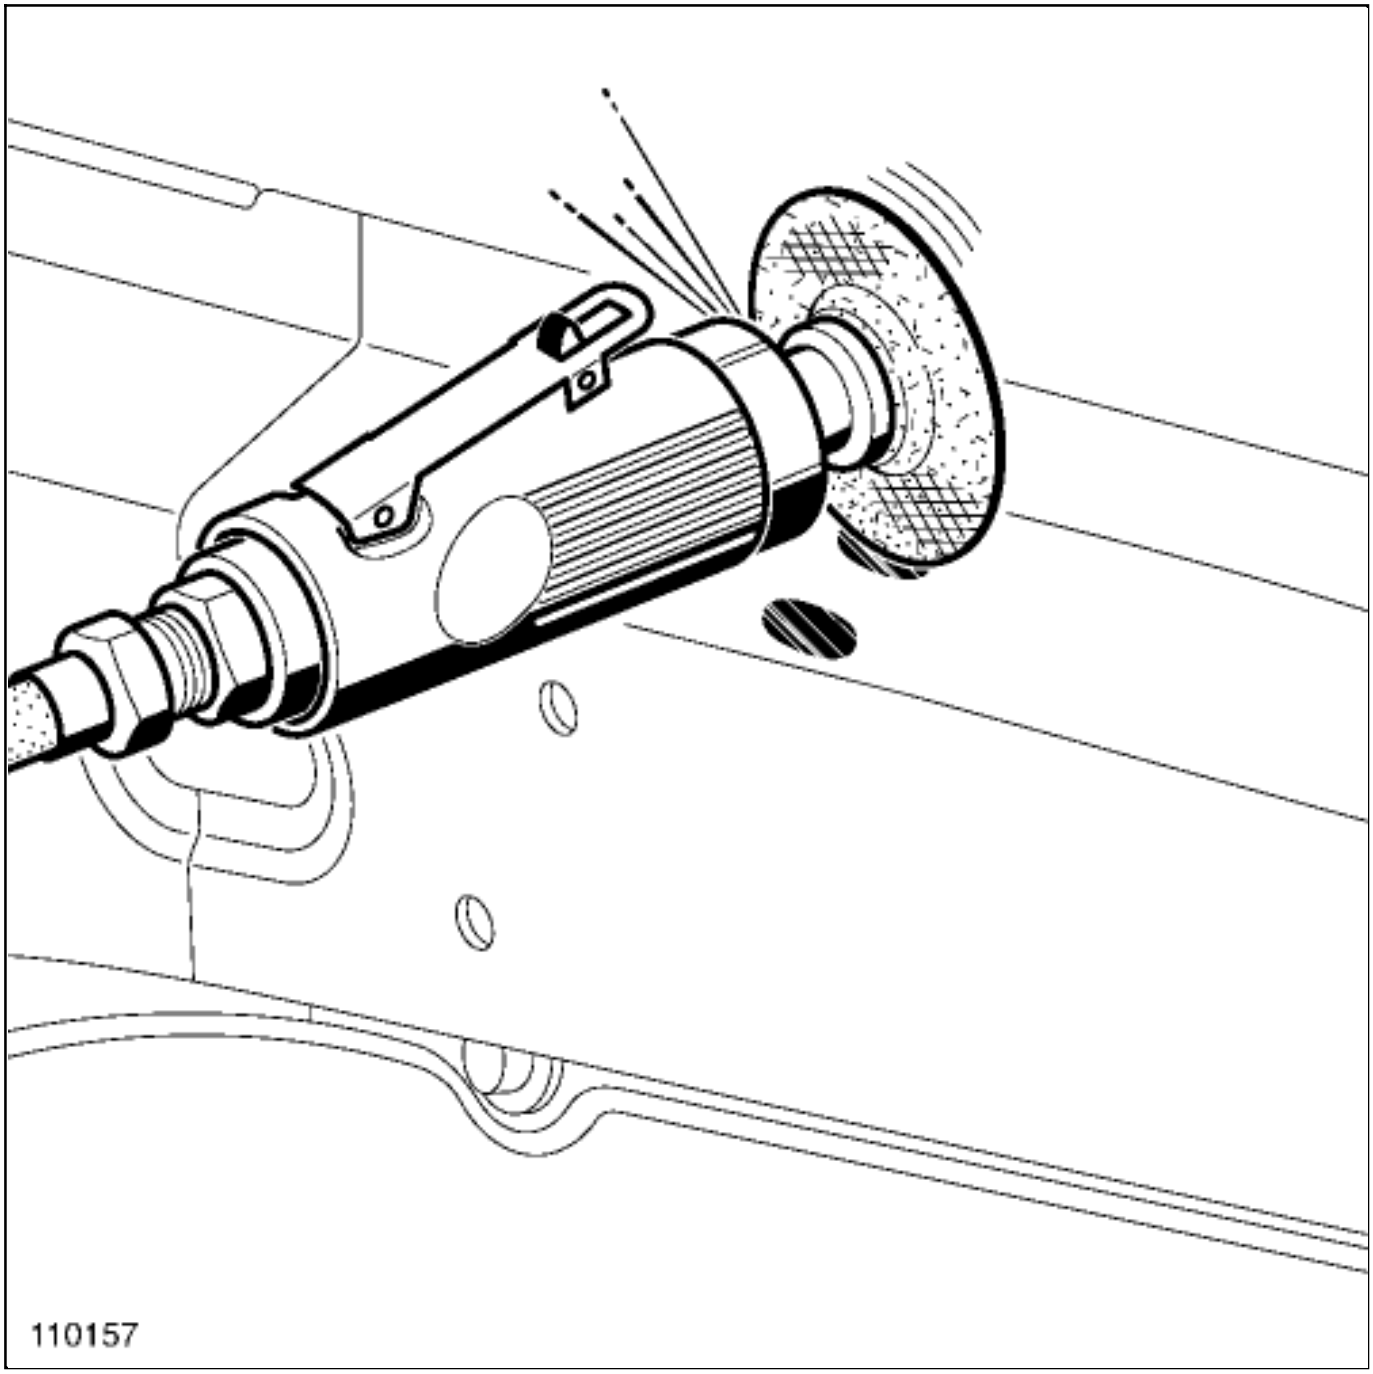
4. FINAL OPERATION

Proceed in the reverse order to removal.

TOOL FOR LEVELLING OFF WELD RESIDUE

1. FLAT FLUSH GRINDING

Use of a grinding disc on an angle grinder (5,000 rpm).



- Advantage:
  - Very rapid for flush grinding a large surface.

- Disadvantage:
  - Causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).

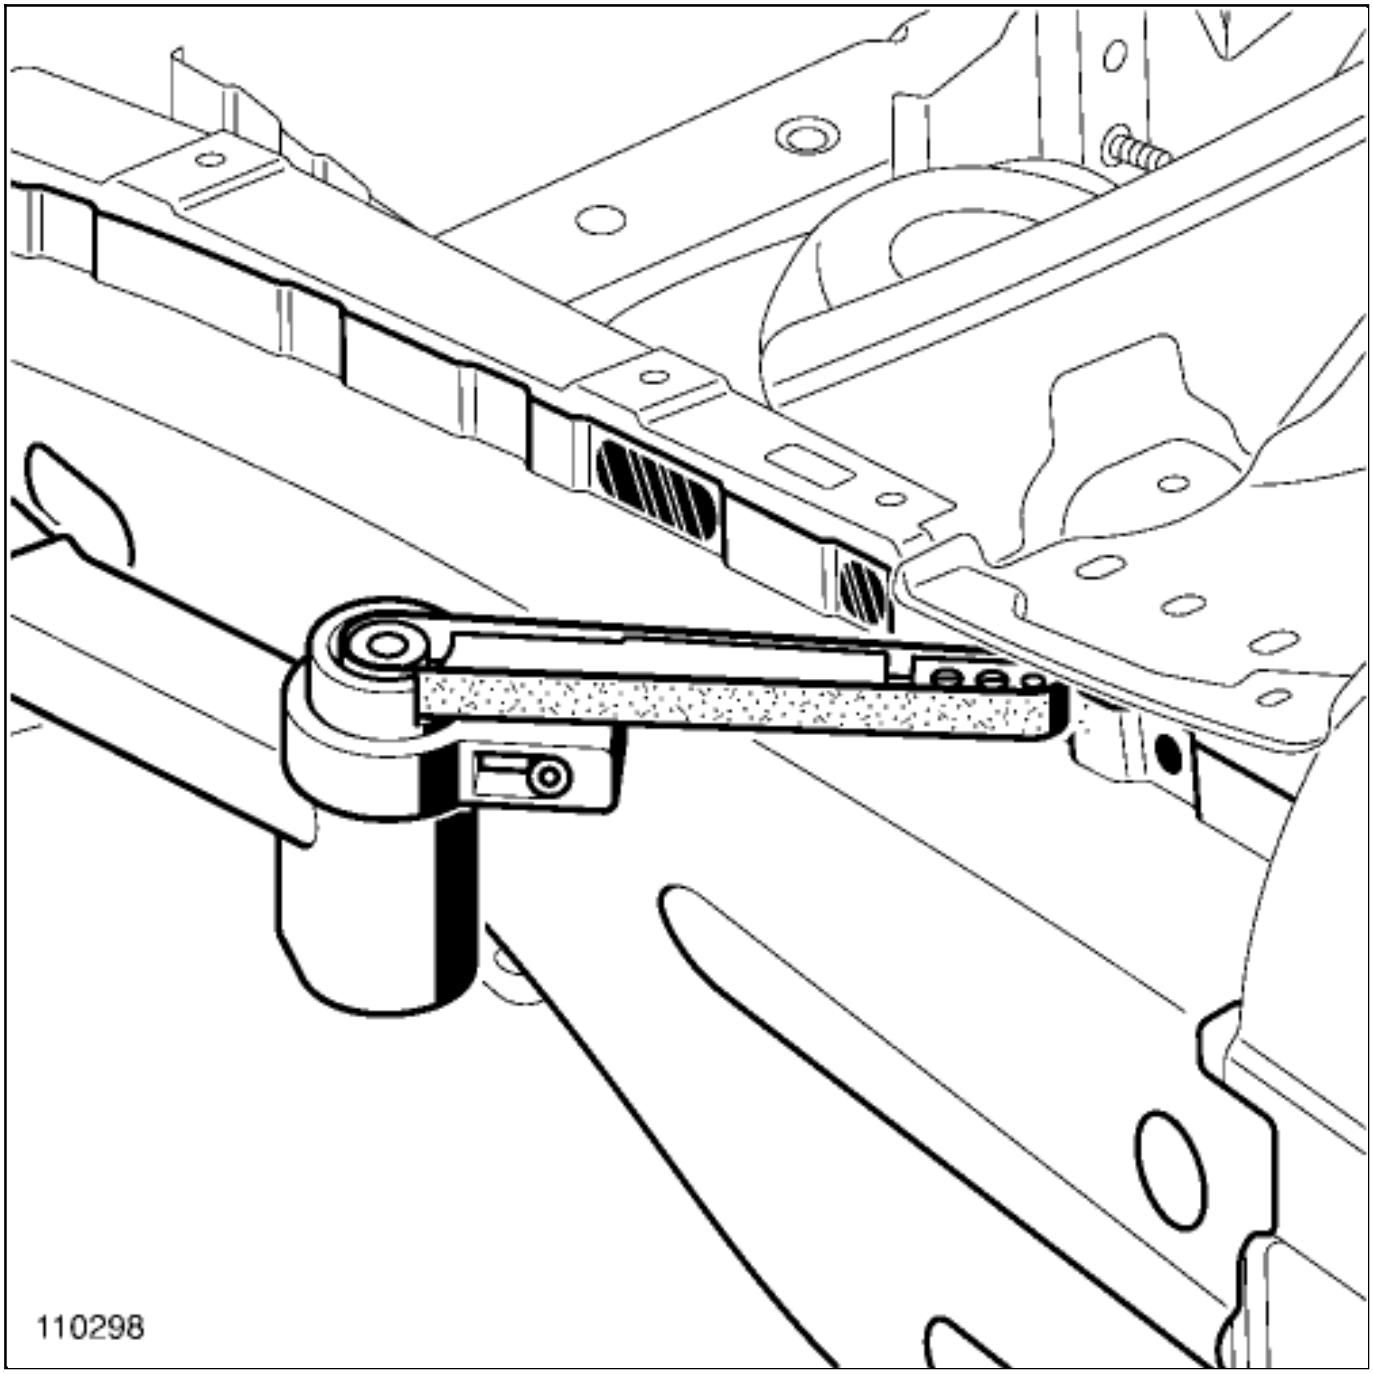
- Operator protection:
  - obligatory eye protection,
  - obligatory hand protection,
  - obligatory ears protection.
- Protection in the work area:
  - protection of interior fittings,
  - protection of internal and external window faces.

2. ANGLE FLUSH GRINDING

Use of a flush grinding disk on an angle grinder (10,000 rpm) fitted with speed control.

Advantage:

- Means for flush grinding in narrow areas.



Disadvantage:

- Causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).

- Operator protection:
  - obligatory eye protection,
  - obligatory hand protection,
  - obligatory ears protection.
- Protection in the work area:
  - protection of interior fittings,
  - protection of internal and external window faces.

3. CORNER FLUSH GRINDING

Use of a strip sander fitted with a 36grit strip.

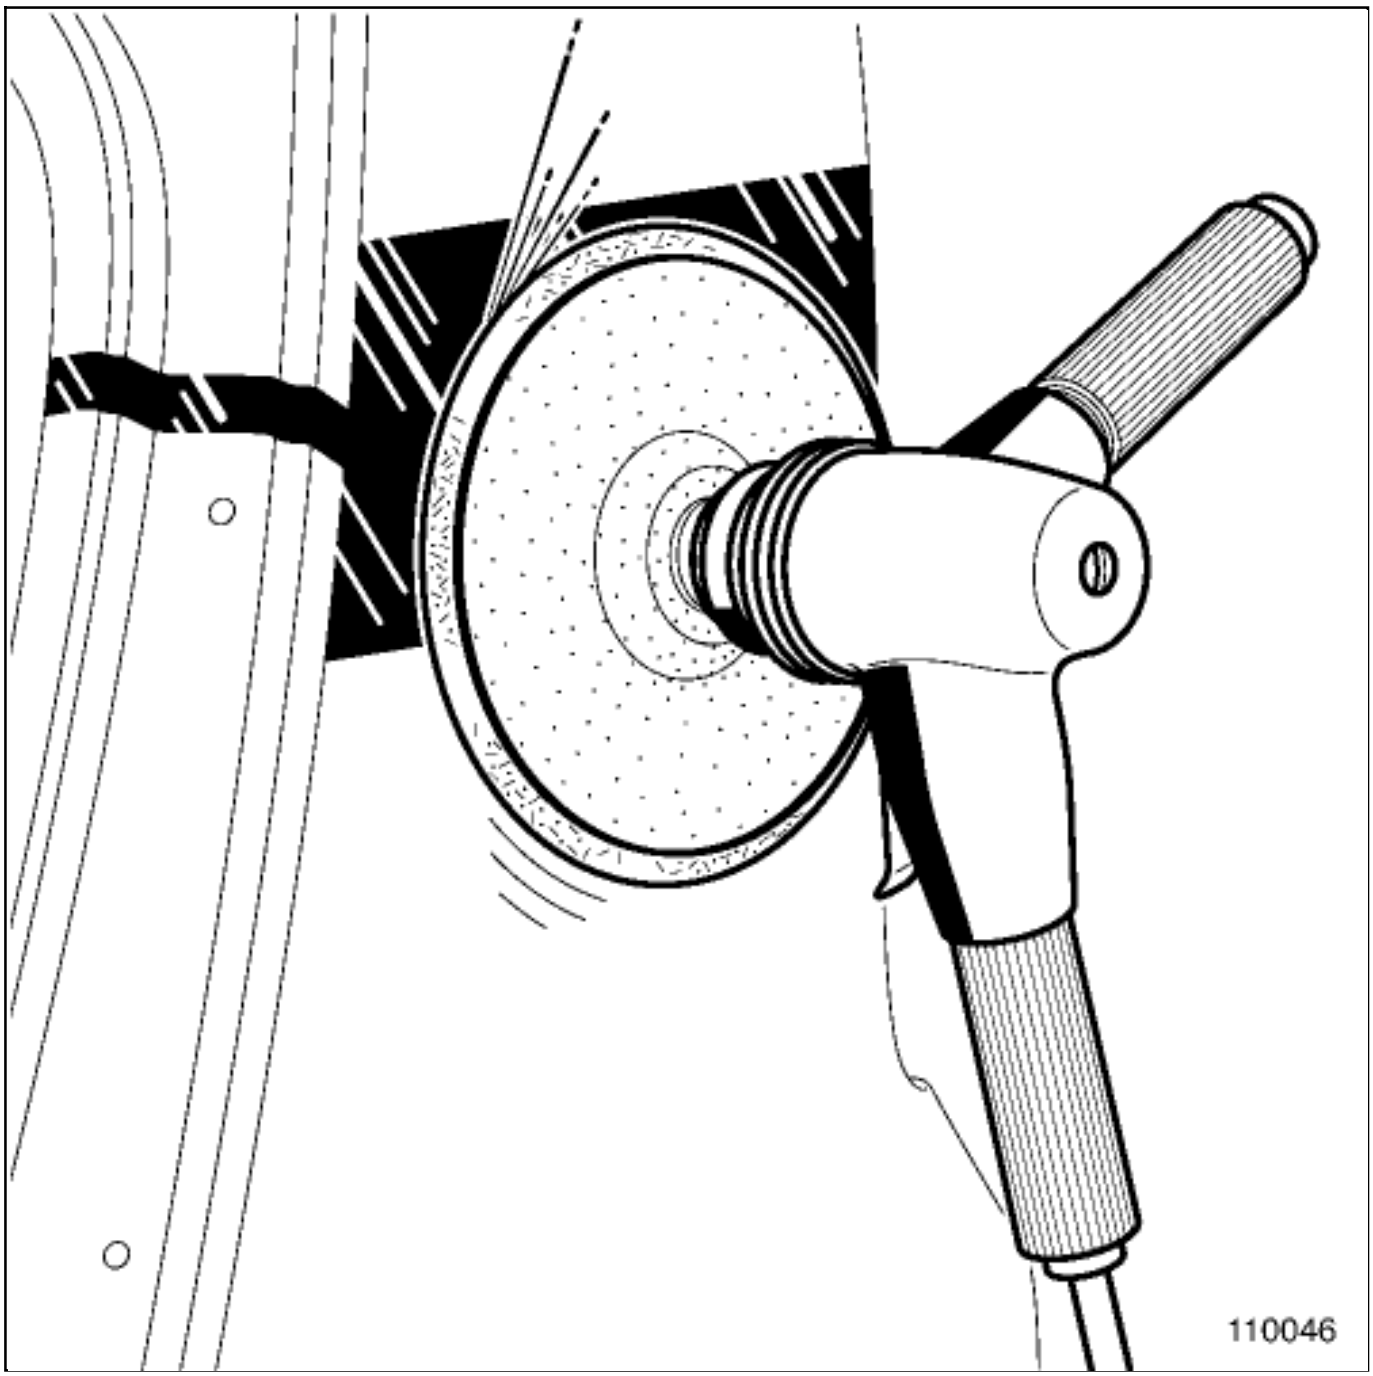
Advantage:

- Rapid means for flush grinding in corners.

Disadvantage:

- Lets off sparks which can be harmful close to sensitive components (windows, plastic components, fabric, etc.).

Operator protection:



- obligatory eye protection,
- obligatory hand protection,
- obligatory ears protection.

Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.

TOOL FOR SURFACING MATING FACES

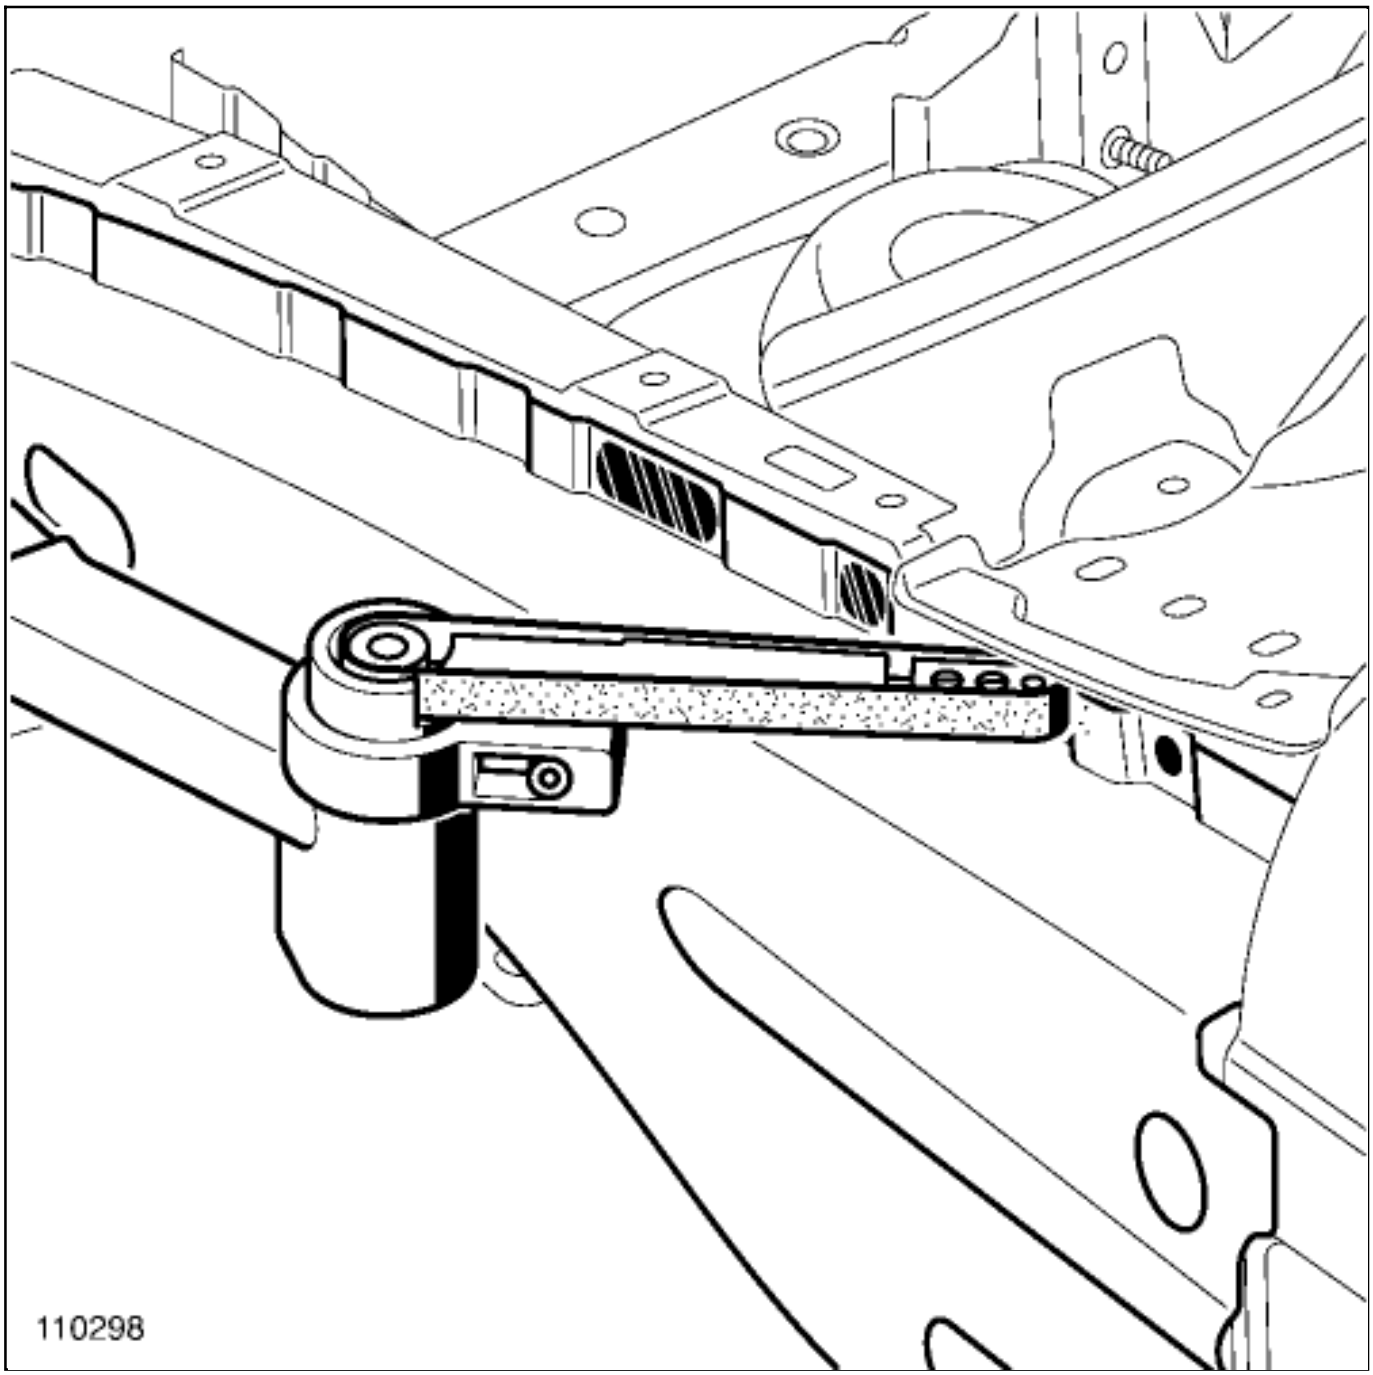
1. FLAT SURFACING

Use of a bladed disk mounted on a (5000 rpm) angle grinder.

- Advantage:
  - Fast method which allows wide area to be surfaced.

- Disadvantage:

- Lets off sparks which can be harmful close to sensitive components (windows, plastic components, fabric, etc.).



Operator protection:

- obligatory eye protection,
- obligatory hand protection,
- obligatory ears protection.

Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.

2. ANGLE AND CORNER SURFACING

Use of a strip sander fitted with a 50to 80grit strip.

Advantage:

Method which allows areas to be surfaced which are difficult to access.

Disadvantages:

Showers filings which can be harmful close to sensitive components (windows, plastic components, fabric,

etc.).

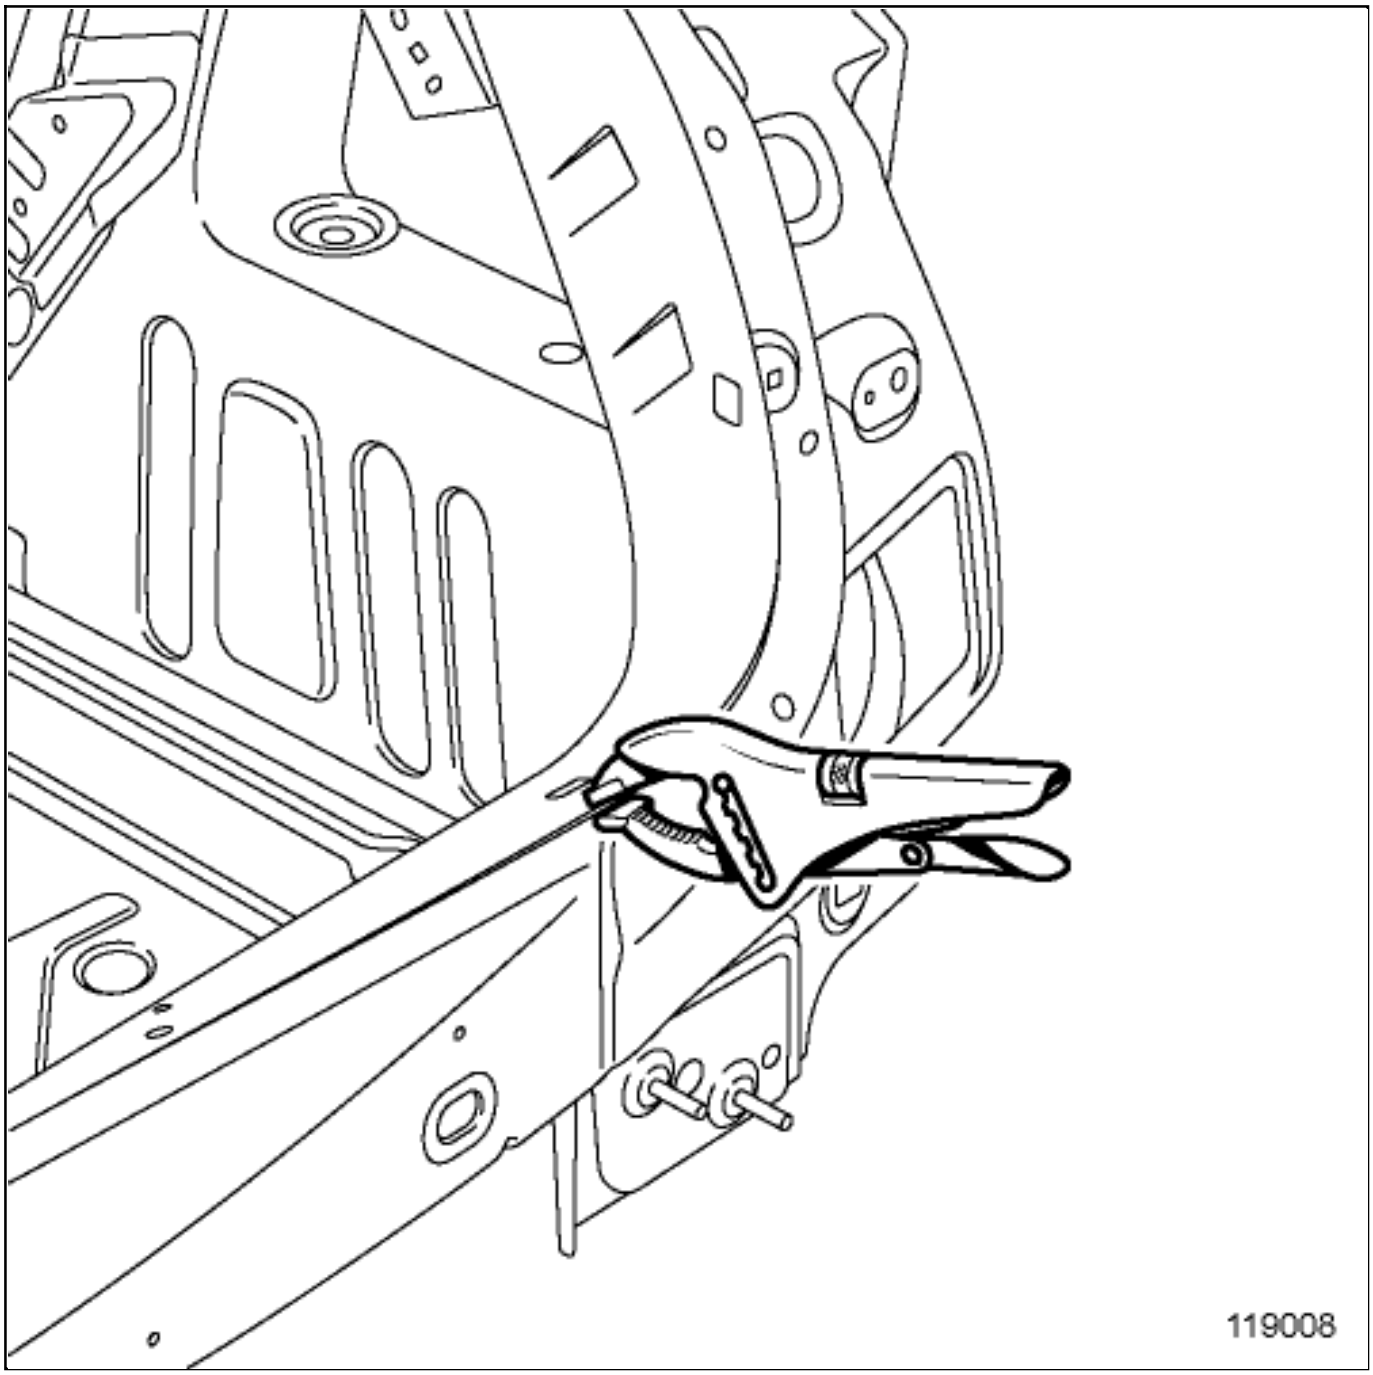
The surfacing is relatively slow.

Operator protection:

- obligatory eye protection,
- obligatory hand protection,
- obligatory ears protection.

Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.



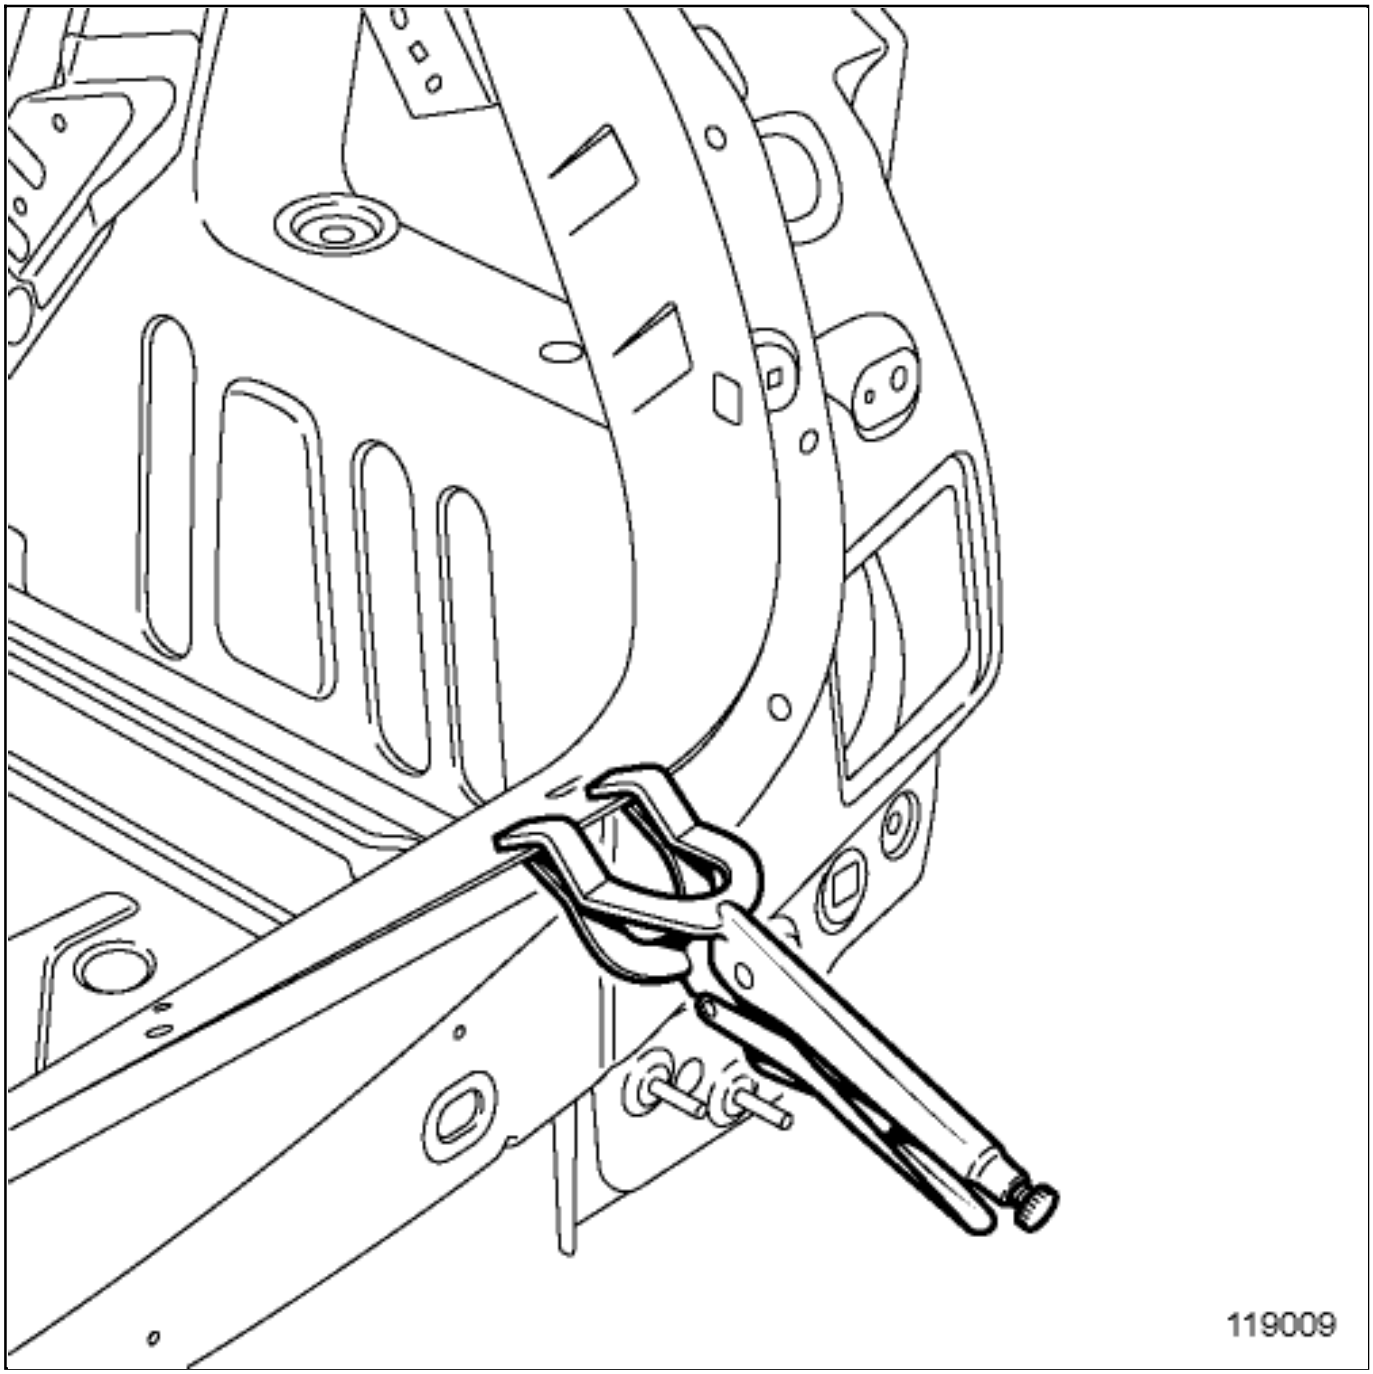
TOOLS FOR ADJUSTING AND SUPPORTING A STRUCTURAL COMPONENT: USE

1. VICE GRIPS

- Use to hold the flanges of parts in position.

There are several different vice grips depending on access and the environment.

1- STANDARD VICE GRIP



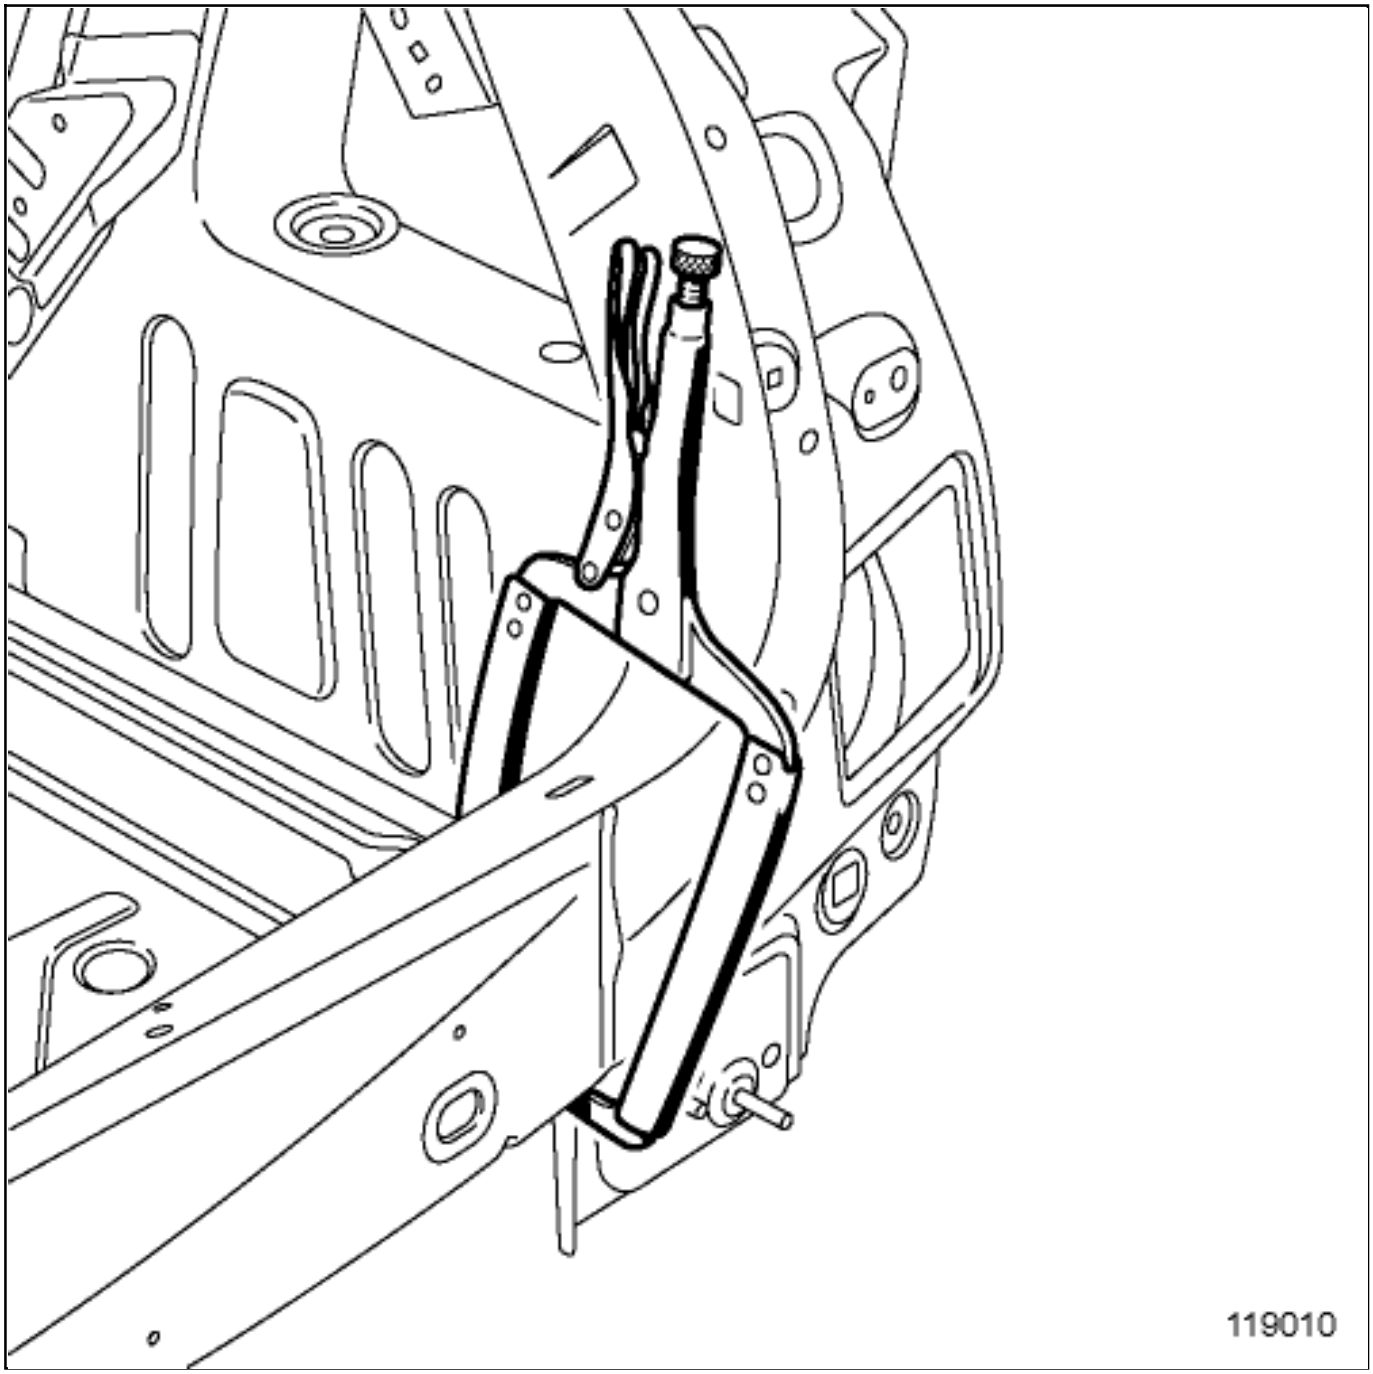
- Use to hold and adjust all types of part.

- Advantage:
  - easy to use.

- Disadvantage:
  - requires easy access.

2- WELDING VICE GRIP

- Used to hold and adjust all types of parts, allows access for a welding clamp or torch.



Advantage:

- easy to use.

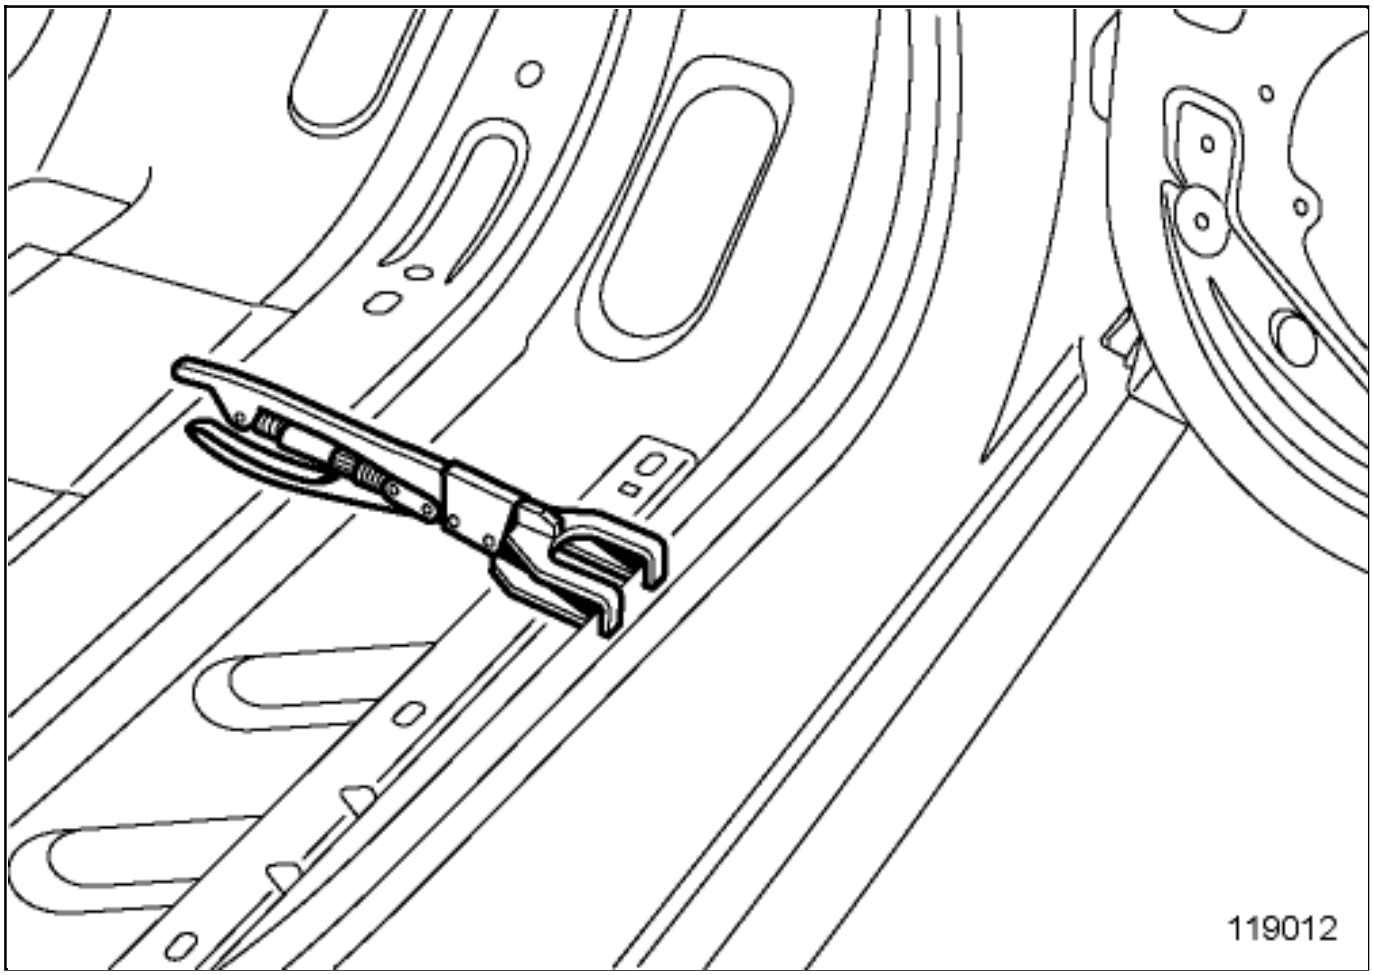
Disadvantage:

- requires easy access.

3- SWAN'S NECKVICE GRIP

Use to hold and adjust parts with an overlap that is away from the edge of the part.

Advantages:



- easy to use,

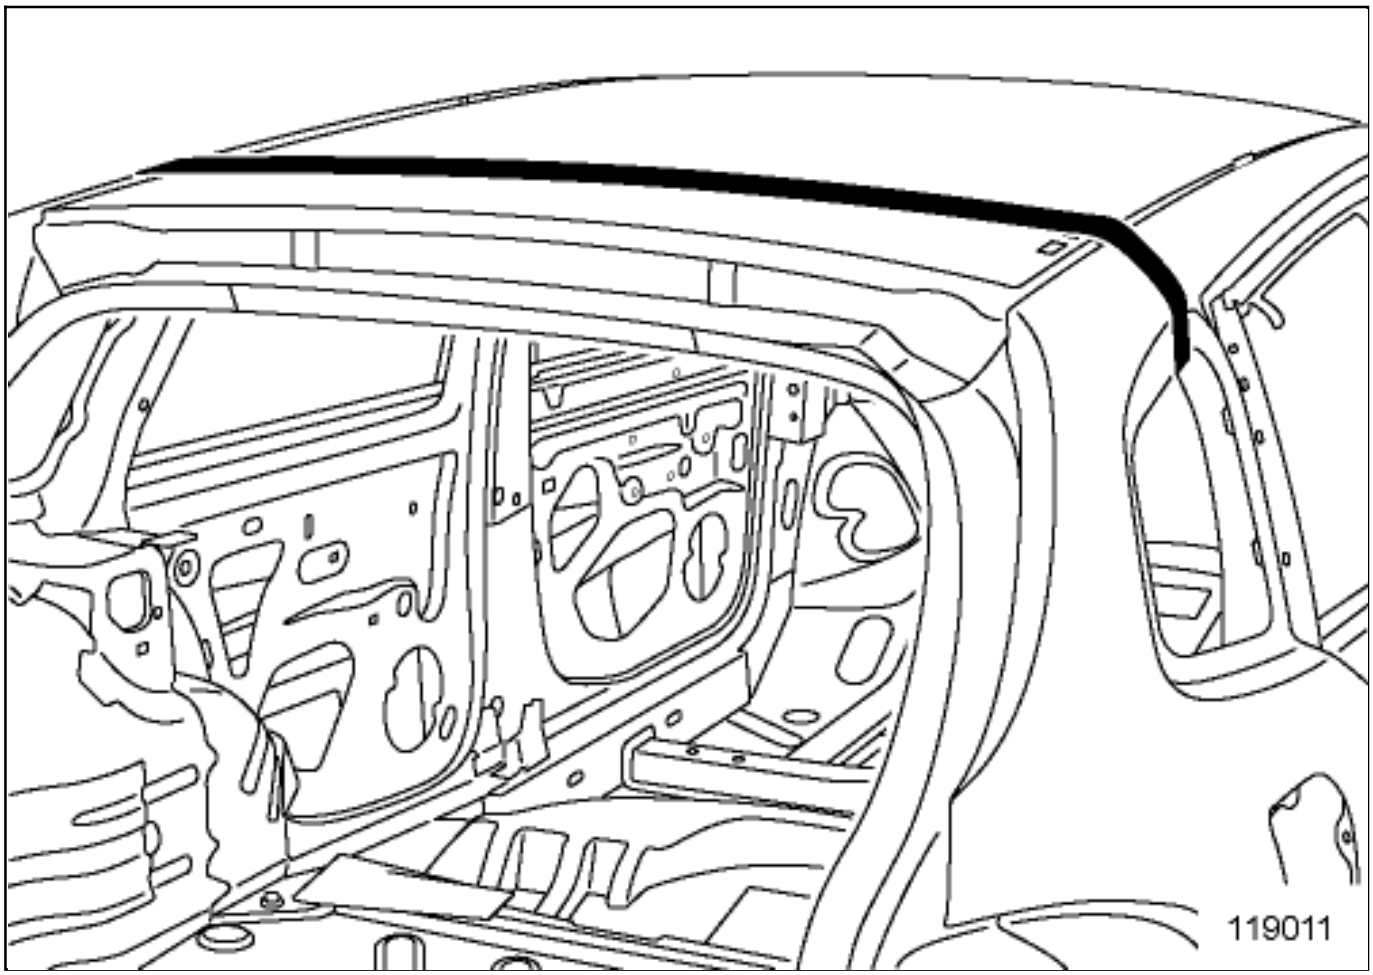
- makes it possible to fit around a member, or to make a floor type overlap.

Disadvantage:

- cumbersome.

4- MINI VICE GRIP (FLANGING)

Use to hold and adjust all types of flanged parts.



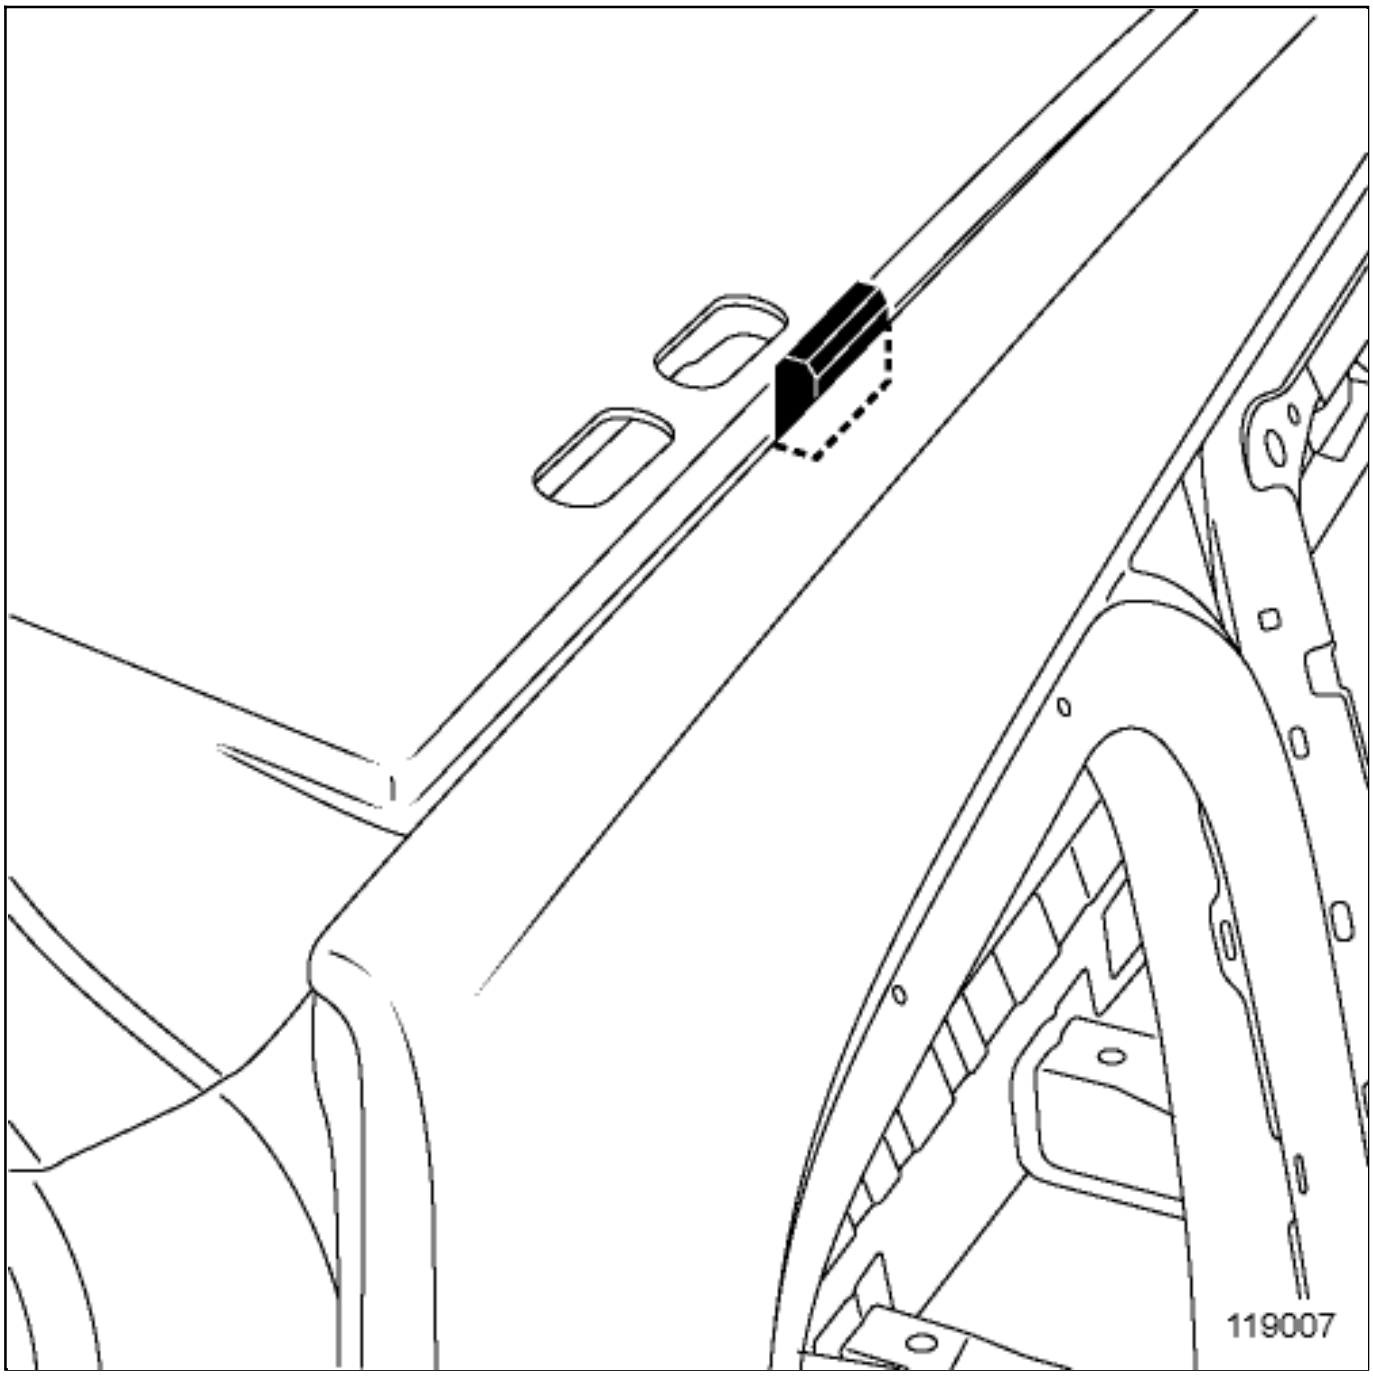
Advantages:

- easy to use,
- allows the opening elements to be adjusted as well as the replacement part.

Disadvantage:

- requires several vice grips to be positioned to carry out the adjustment.

2. STRAP

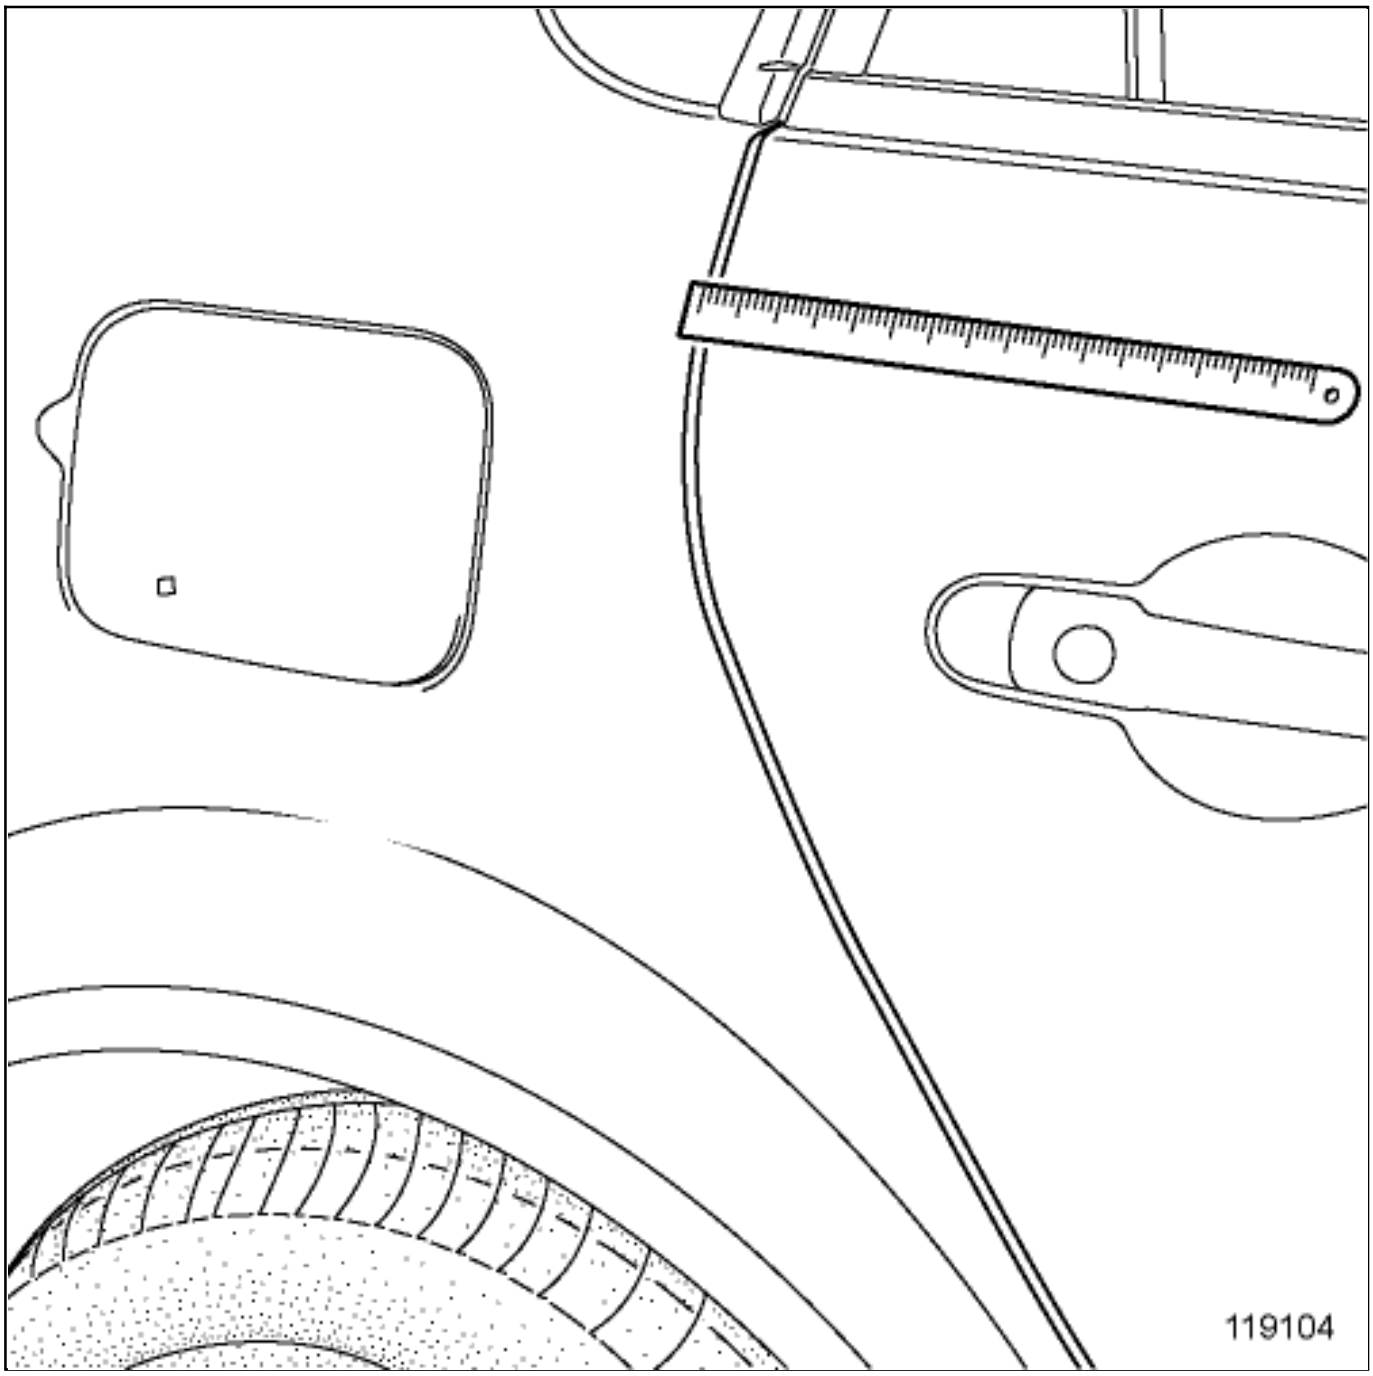


- Use to hold bonded roof type components.

- Advantage:
  - ensures constant support during drying times.

- Disadvantage:
  - two operators are required for fitting.

3. ADJUSTMENT SHIM

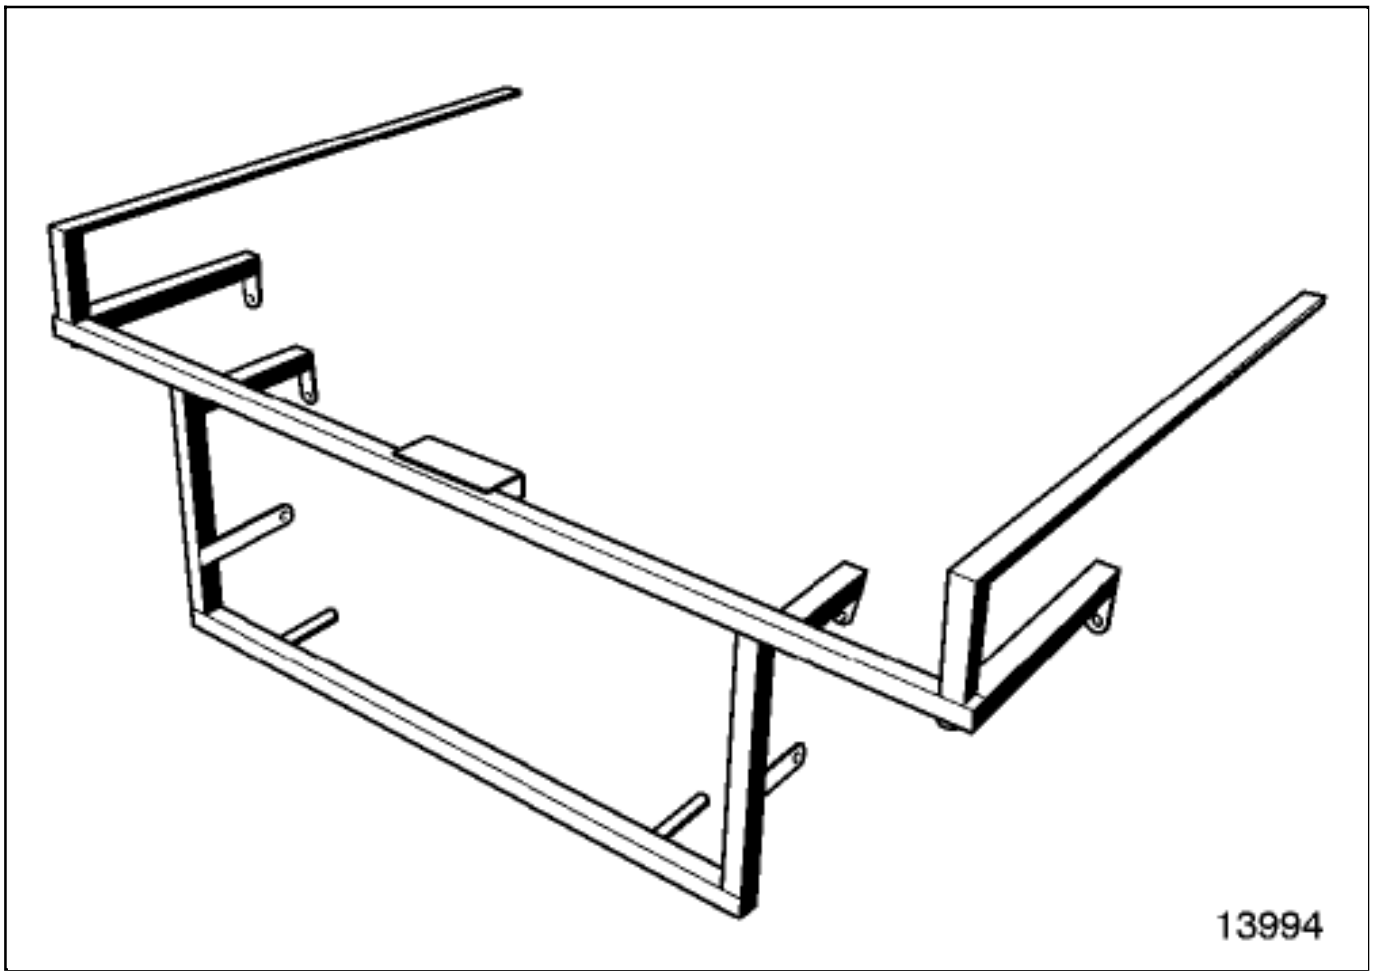


- Use to carry out adjustments to different parts during bonding type operations.

- Advantages:
  - easy to use,
  - allows precise adjustment.

- Disadvantage:
  - diversity relating to the vehicle.

4. RULER



- Use to measure the adjustment between several components.

- Advantages:
  - easy to use,
  - allows precise measurement of the adjustment.

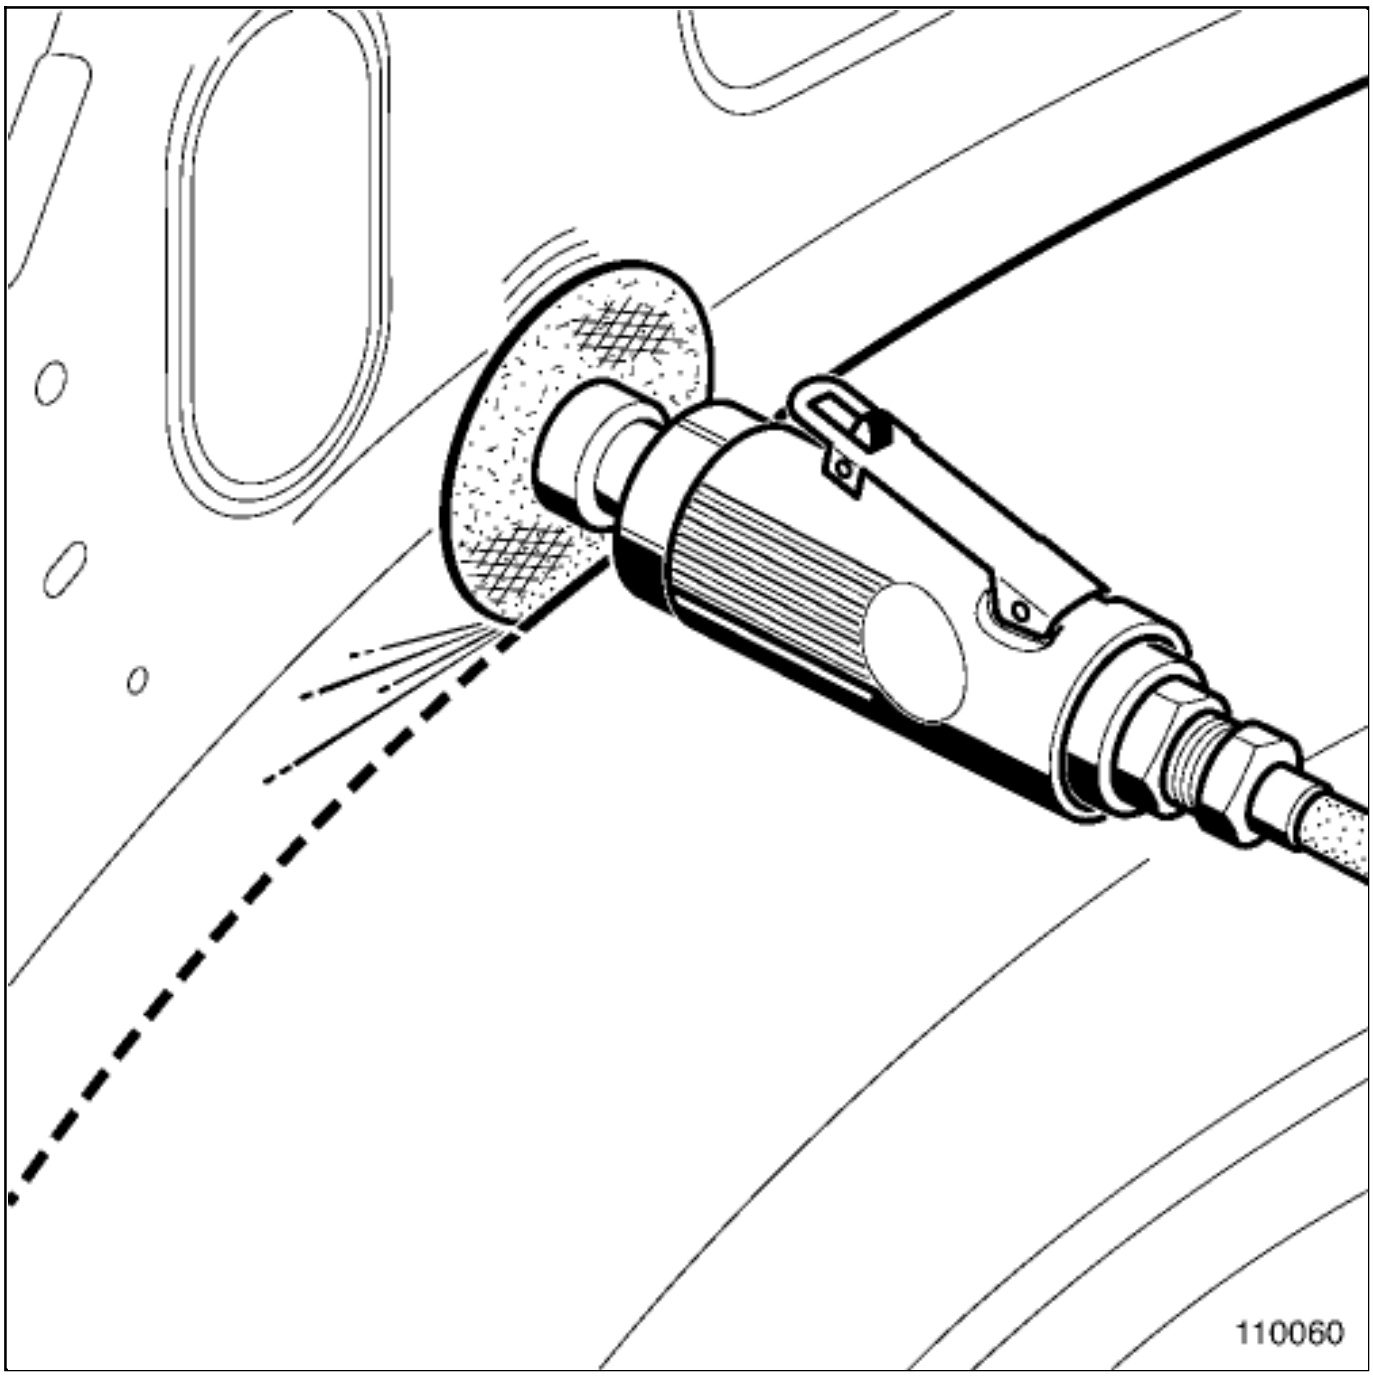
- Disadvantage:
  - difficult to measure in curves.

5. FRONT PANEL JIG

- Special tool to be used for adjusting and supporting the front end panel components.

- Advantages:
  - saves time after fitting (no need to dry fit the other components),
  - possibility of making connection directly with the jig in place.

-



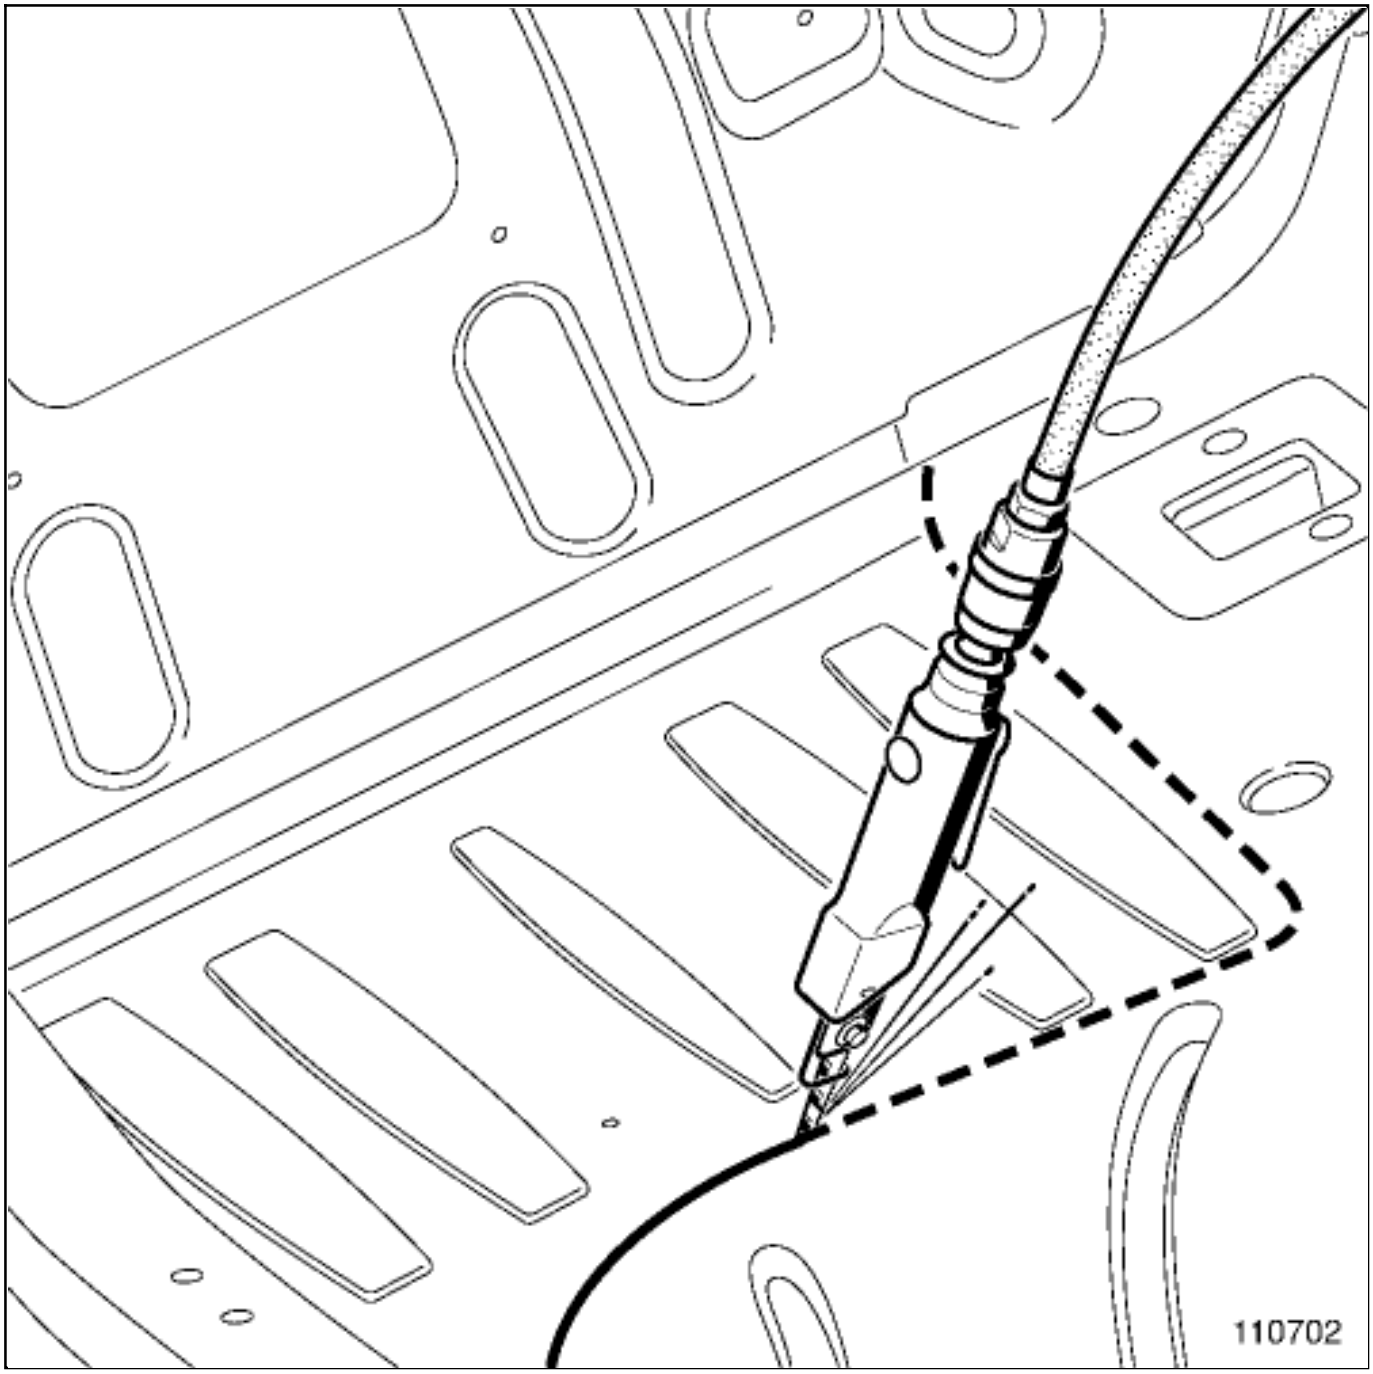
Disadvantages:

- cumbersome,
- time taken for fitting,
- each model specific to one vehicle.

TOOLS FOR CUTTING A STRUCTURAL COMPONENT

1. STRAIGHT LINE CUTTING

Use of a cutter wheel on an angle grinder (10,000 rpm) fitted with speed control.



Advantages:

- Direct cutting anywhere on the sheet without drilling.
- Ideal for cuts over partial replacements.

- Disadvantages:
  - Does not allow curved cutting.
  - Causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).
- Operator protection:
  - obligatory eye protection,
  - obligatory ears protection,
  - obligatory respiratory protection,
  - obligatory hand protection.
- Protection in the work area:
  - protection of interior fittings,
  - protection of internal and external window faces.

2. CURVED CUTTING

Use of a jigsaw with a small blade (5,000 cycles per minute).

Advantage:

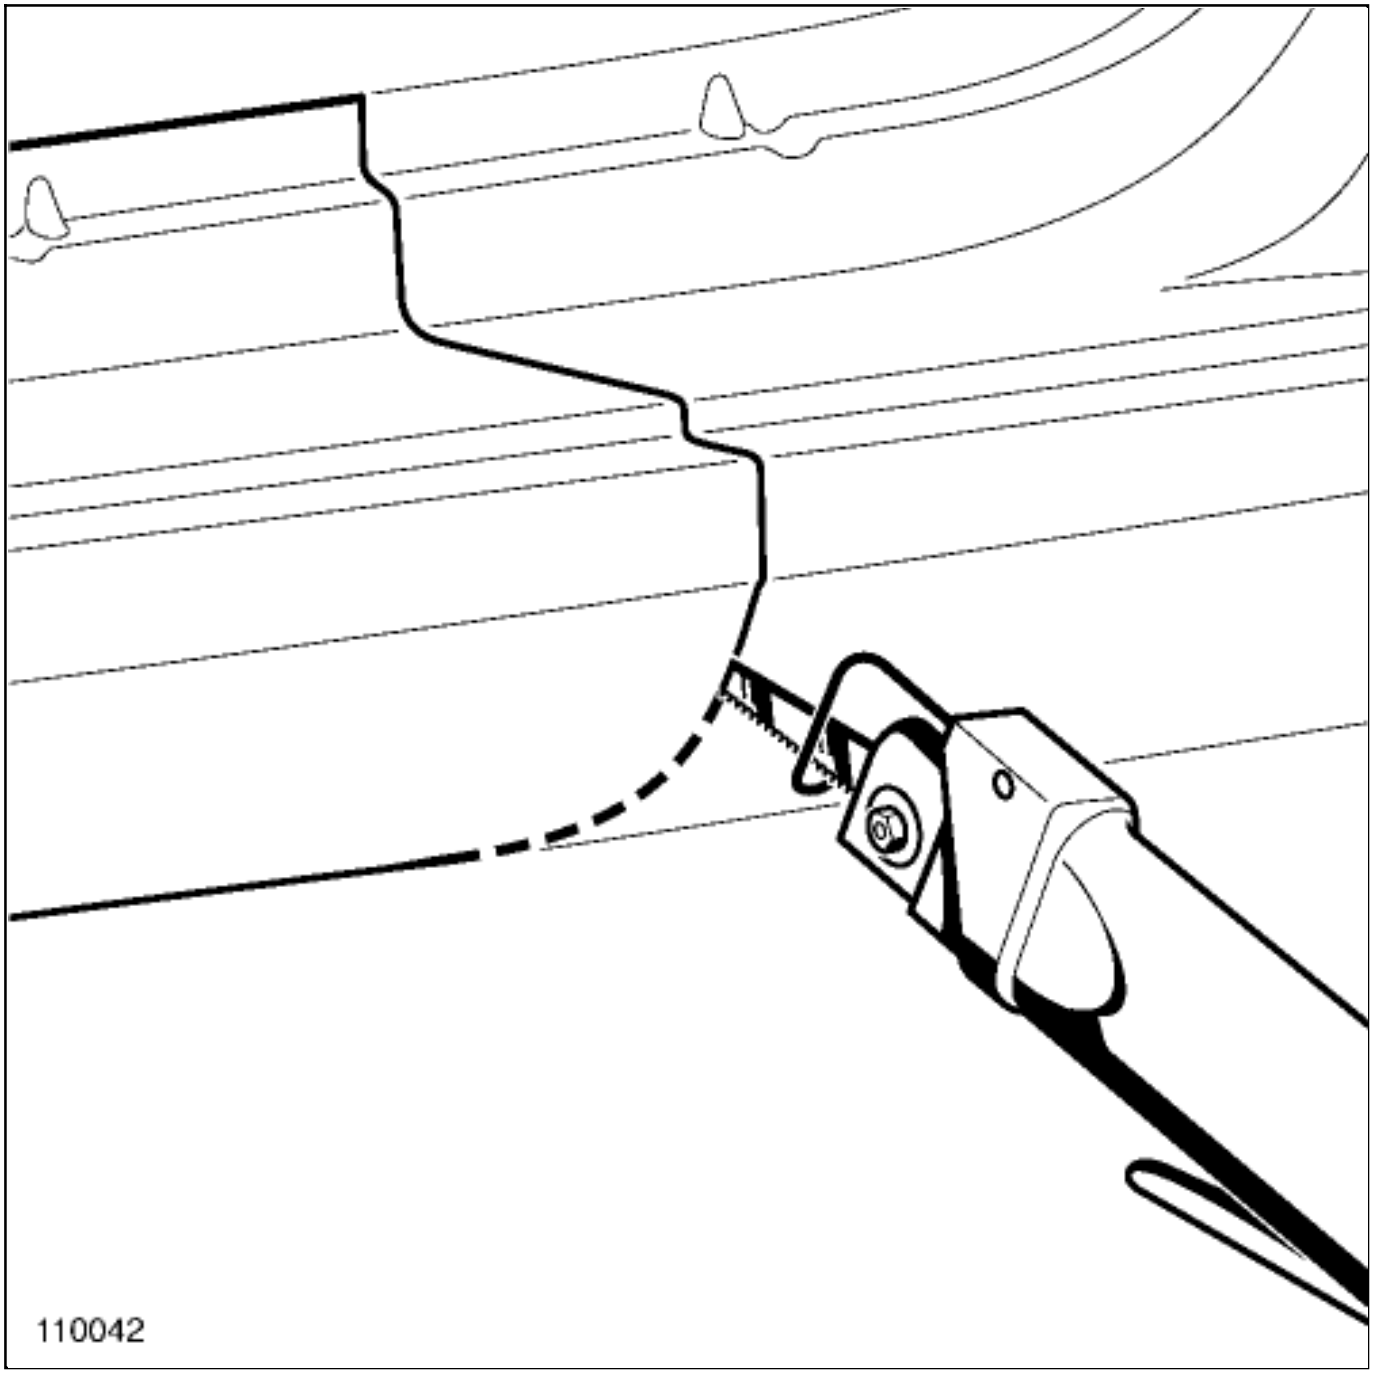
- Can be used for curved cuts with a minimum radius of 25 mm.

Disadvantages:

- Fine metal filings that get into fabric and the window weather strips.

Straight cutting very difficult.

Operator protection:



- obligatory eye protection,
- obligatory ears protection,
- obligatory respiratory protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.

3. STRUCTURE MEMBER CUTTING

Use of a jigsaw with a small blade (5,000 cycles per minute).

Advantage:

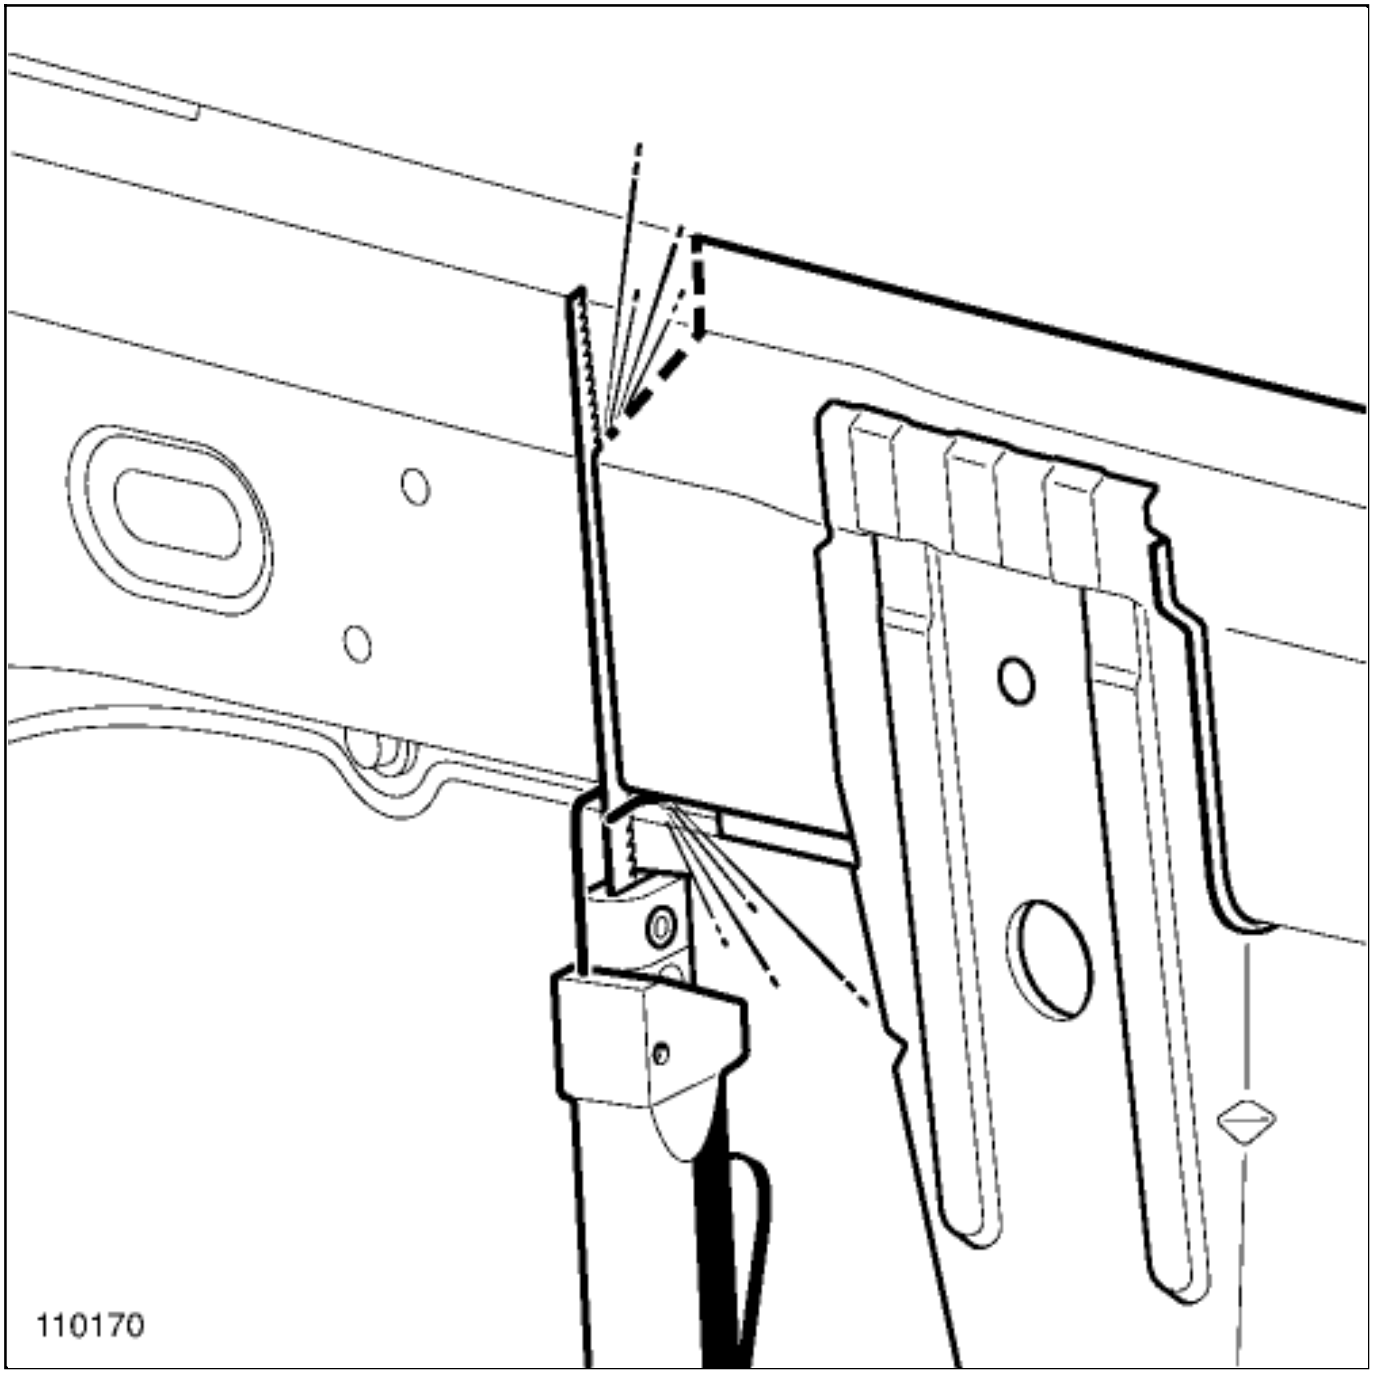
- Allows cutting in complex shapes.

Disadvantages:

- Fine metal filings that get into fabric and the window weather strips.

Straight cutting very difficult.

Operator protection:



- obligatory eye protection,
- obligatory ears protection,
- obligatory respiratory protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.

4. STRAIGHT CUTTING OF A STRUCTURE MEMBER

Use of a jigsaw with a large blade (5,000 cycles per minute).

Advantage:

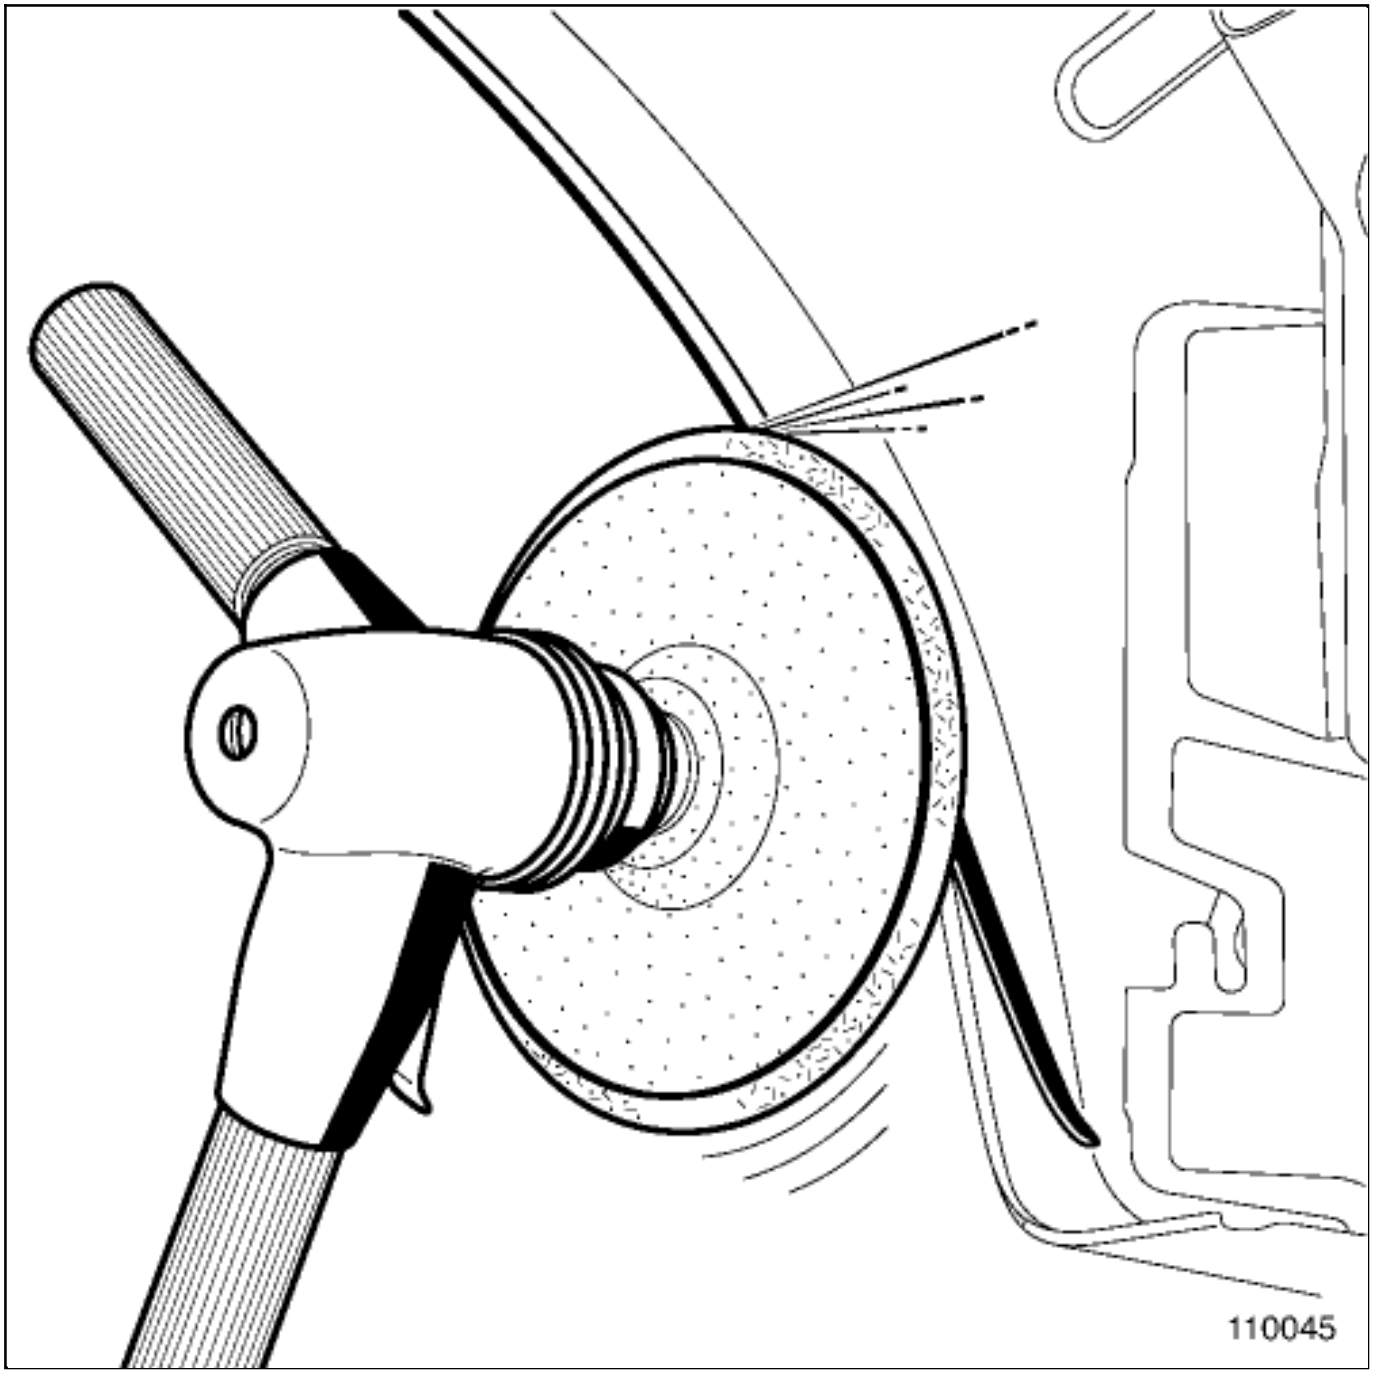
- Straight cutting of a big section.

Disadvantages:

- Fine metal filings that get into fabric and the window weather strips.

Precise curved cutting minimum radius 100 mm.

Operator protection:



- obligatory eye protection,
- obligatory ears protection,
- obligatory respiratory protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.

5. CUTTING A PROTRUDING SQUARE

Use of a deburring disk on a stone cutter (2,000 rpm).

Advantage:

- Cutting a protruding square out of a thin piece.

Disadvantages:

- Causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).

Makes a very sharp burr on the sheet edge.

Operator protection:

- obligatory eye protection,
- obligatory ears protection,
- obligatory respiratory protection,
- obligatory hand protection.

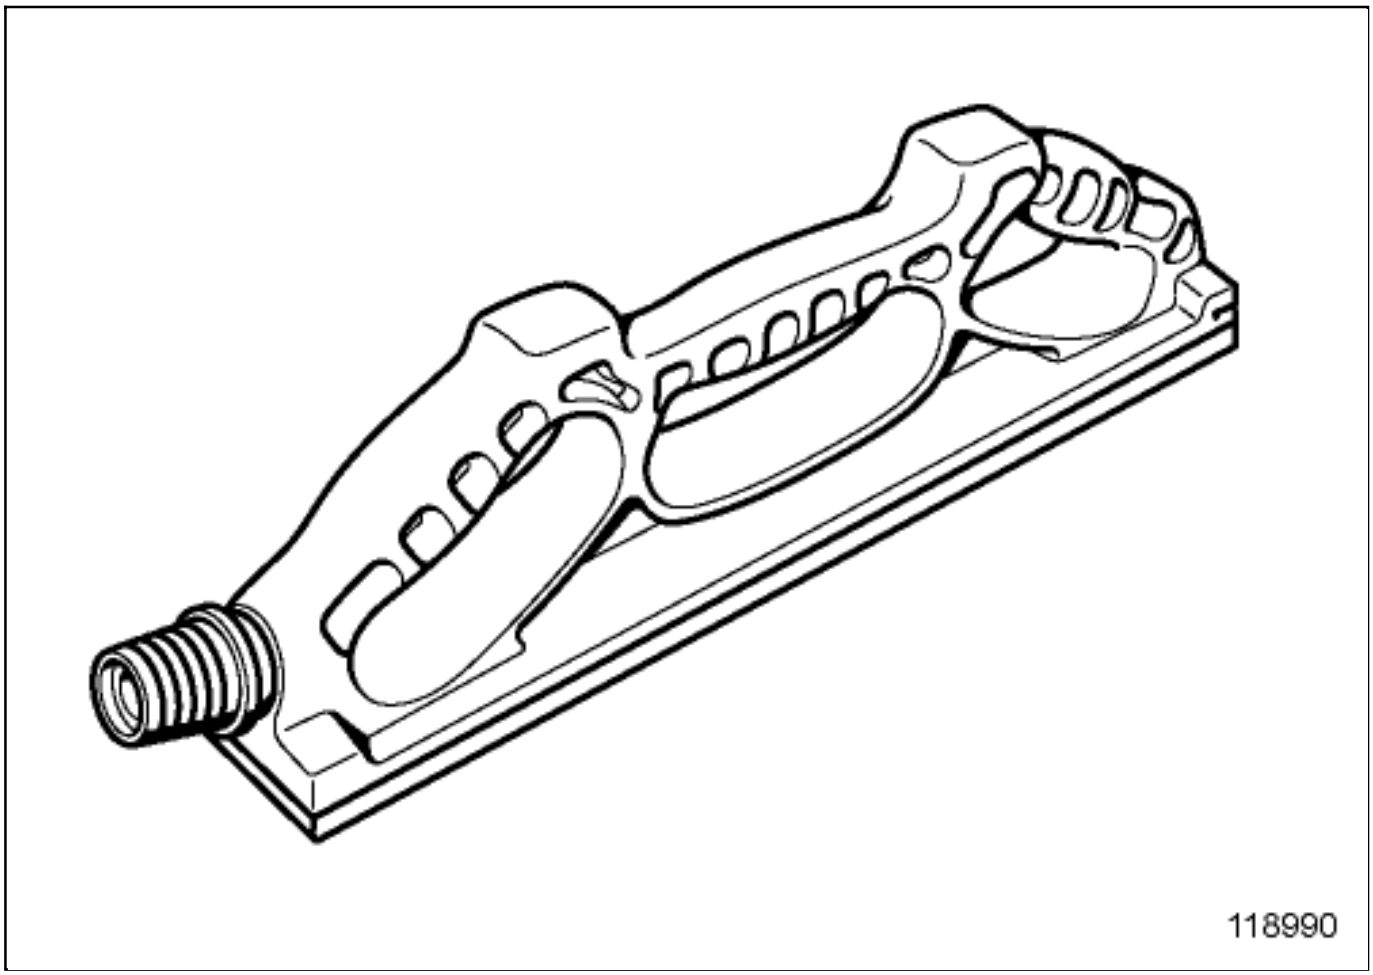
Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.

TOOLS FOR PLASTIC MATERIAL BODYWORK COMPONENTS: DESCRIPTION

1. RECOMMENDED TOOLS

- Orbital sander,
- Angle grinder/belt sander,
- Drill,
- Drill bit with a diameter of 4 mm,
- P 80to P 240sandpaper,
- Sanding block,
- Mastic knife,
- Air gun.



XSL version : 3.02 du 22/07/11

TOOLS FOR SANDING A STRUCTURAL COMPONENT: USE

1. SANDING LARGE SURFACES

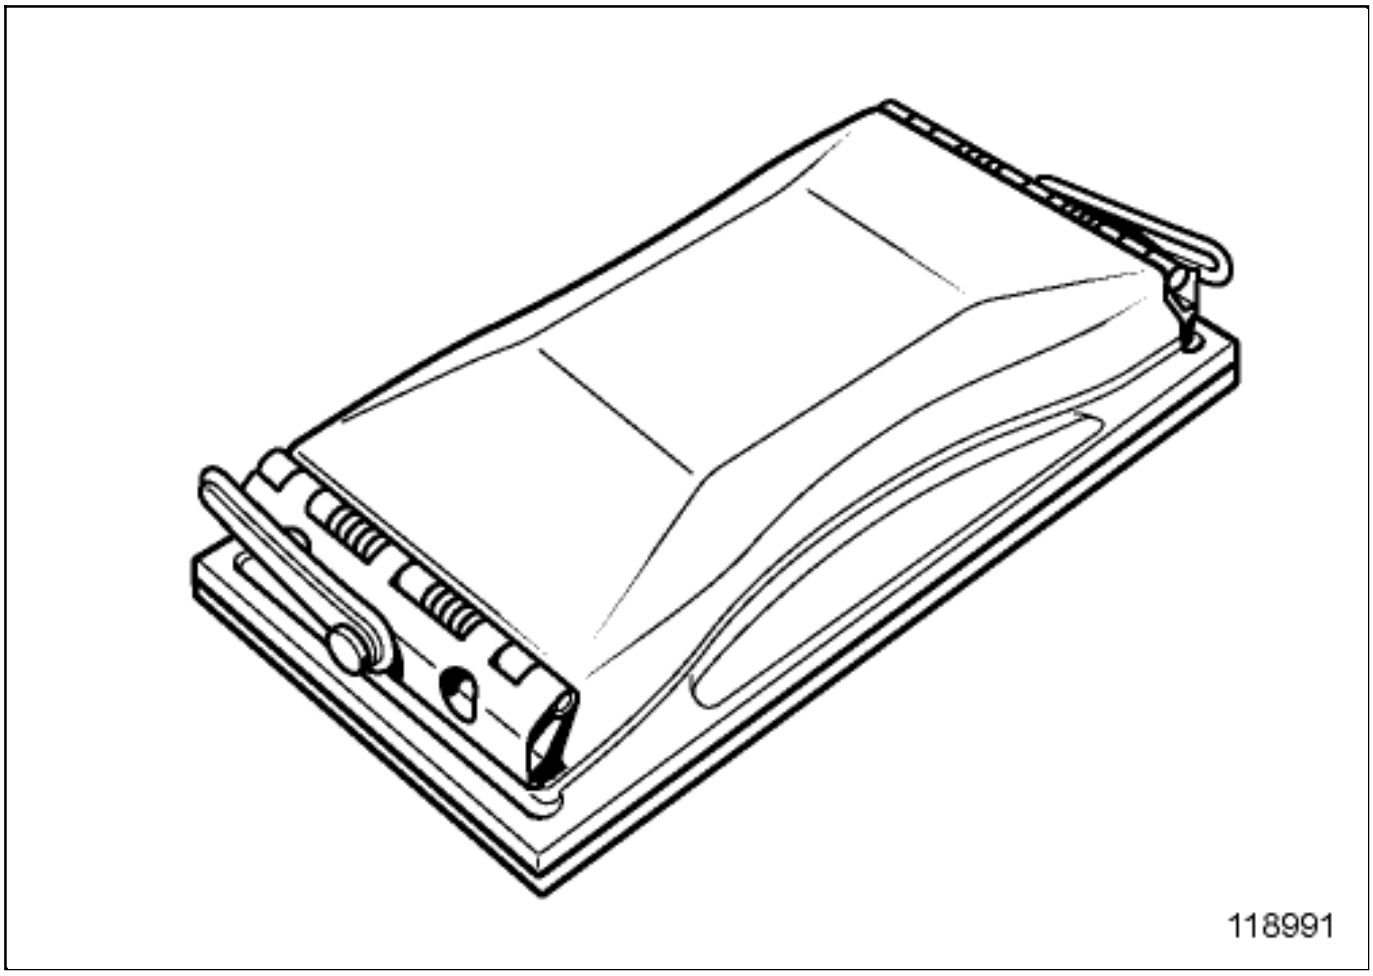
- Use a large manual sanding block with or without extractor.

1- VELCROTYPE SANDING BLOCK WITH EXTRACTOR FOR 115X226 MM, 100 OR 150 GRIT STRIPS

- Advantages:
  - allows the paper to be maintained in perfect contact with the block, preventing the paper from folding,
  - worn paper is easily replaced,
  - the extractor system avoids dust buildup.
-

Disadvantages:

suction pipe obstructs movement slightly.



Operator protection:

- obligatory respiratory protection.

Protection in the work area:

- None

2- KAUPPTYPE SANDING BLOCK

Advantages:

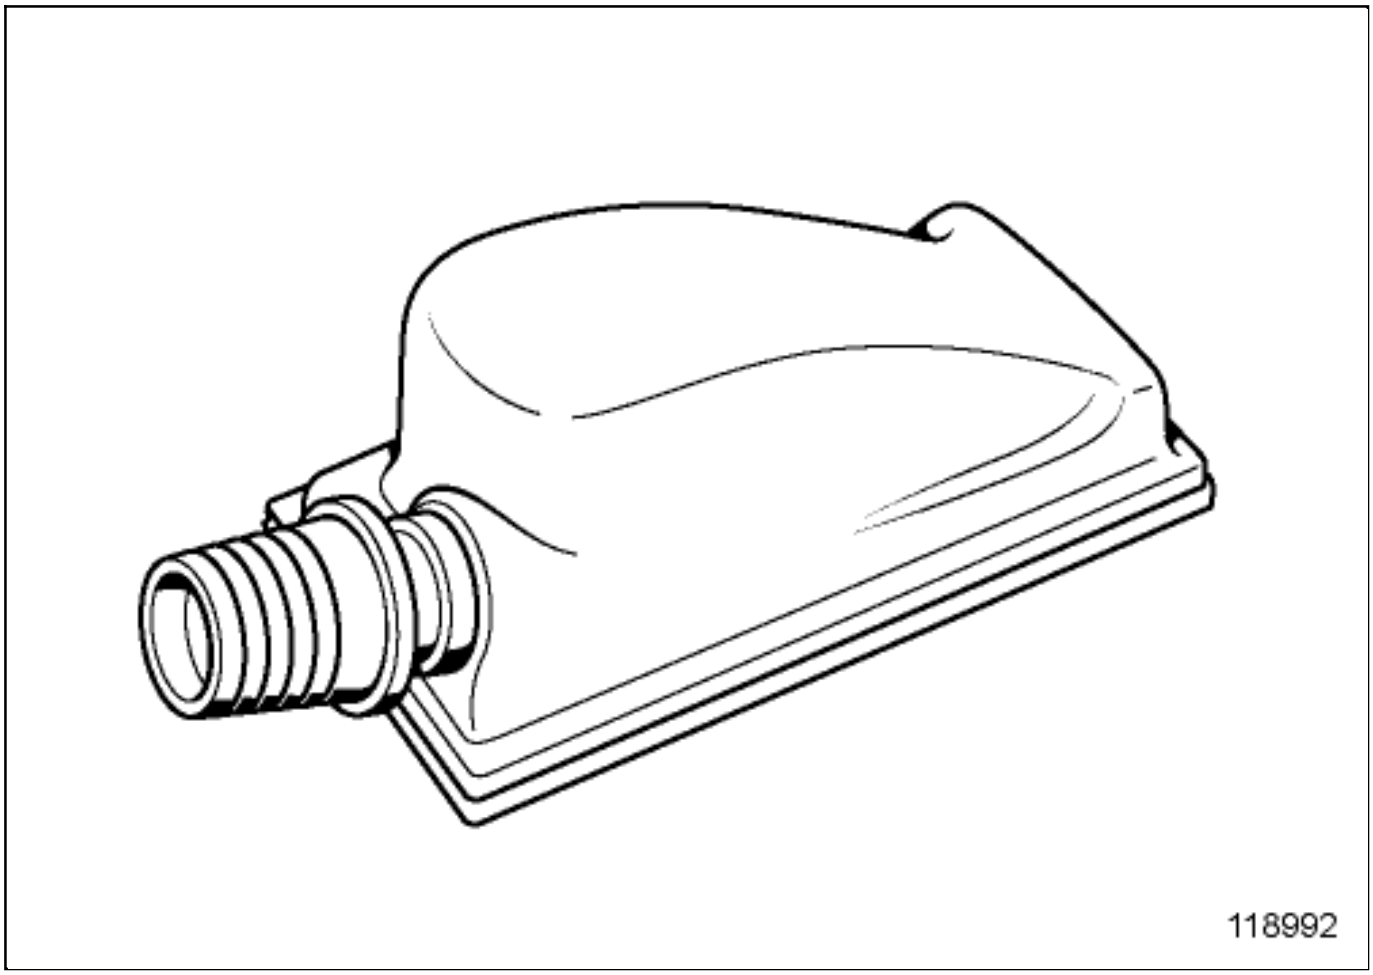
- is compatible with standard paper types,
- holds the paper during sanding.

Disadvantages:

- paper must be cut to size,
- extraction not possible.

Operator protection:

- obligatory respiratory protection.



Protection in the work area:

- None

2. ANGLE AND SMALL AREA SURFACING

Use a standard size manual sanding block with or without extractor.

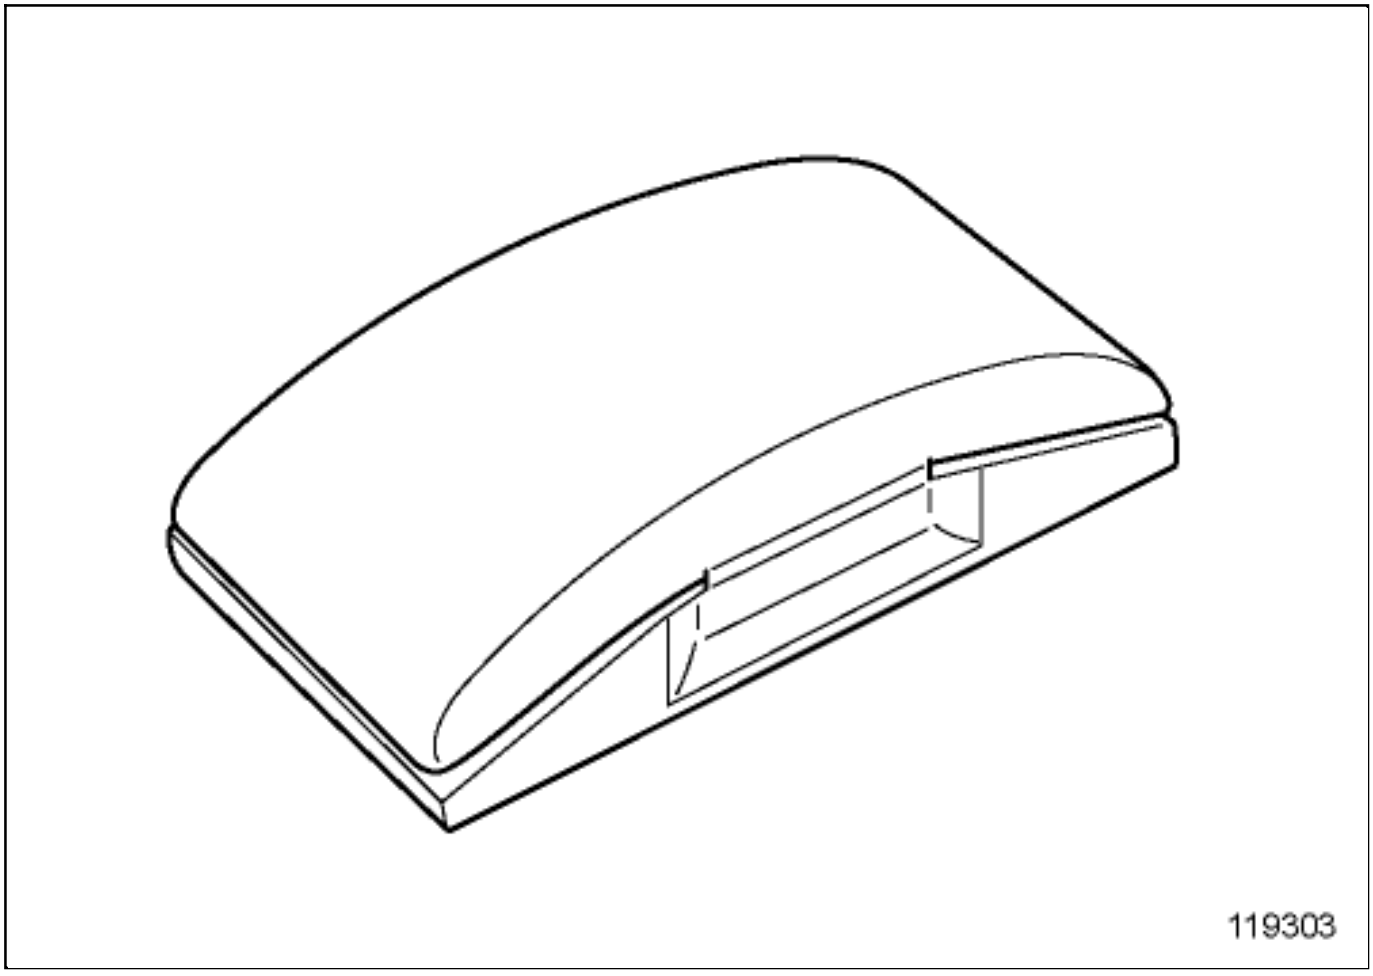
1- VELCROTYPE SANDING BLOCK WITH EXTRACTOR FOR 81 X 153 MM, 100 OR 150 GRIT STRIPS

Advantages:

- is compatible with orbital sander paper,
- allows the paper to be maintained in perfect contact with the block, preventing the paper from folding,
- worn paper is easily replaced,
- allows angles to be sanded,
- the extractor system avoids dust buildup.

Disadvantages:

- suction pipe obstructs movement slightly.



Operator protection:

- obligatory respiratory protection.

Protection in the work area:

- None

2- BLOCKTYPE SANDING BLOCK

Advantage:

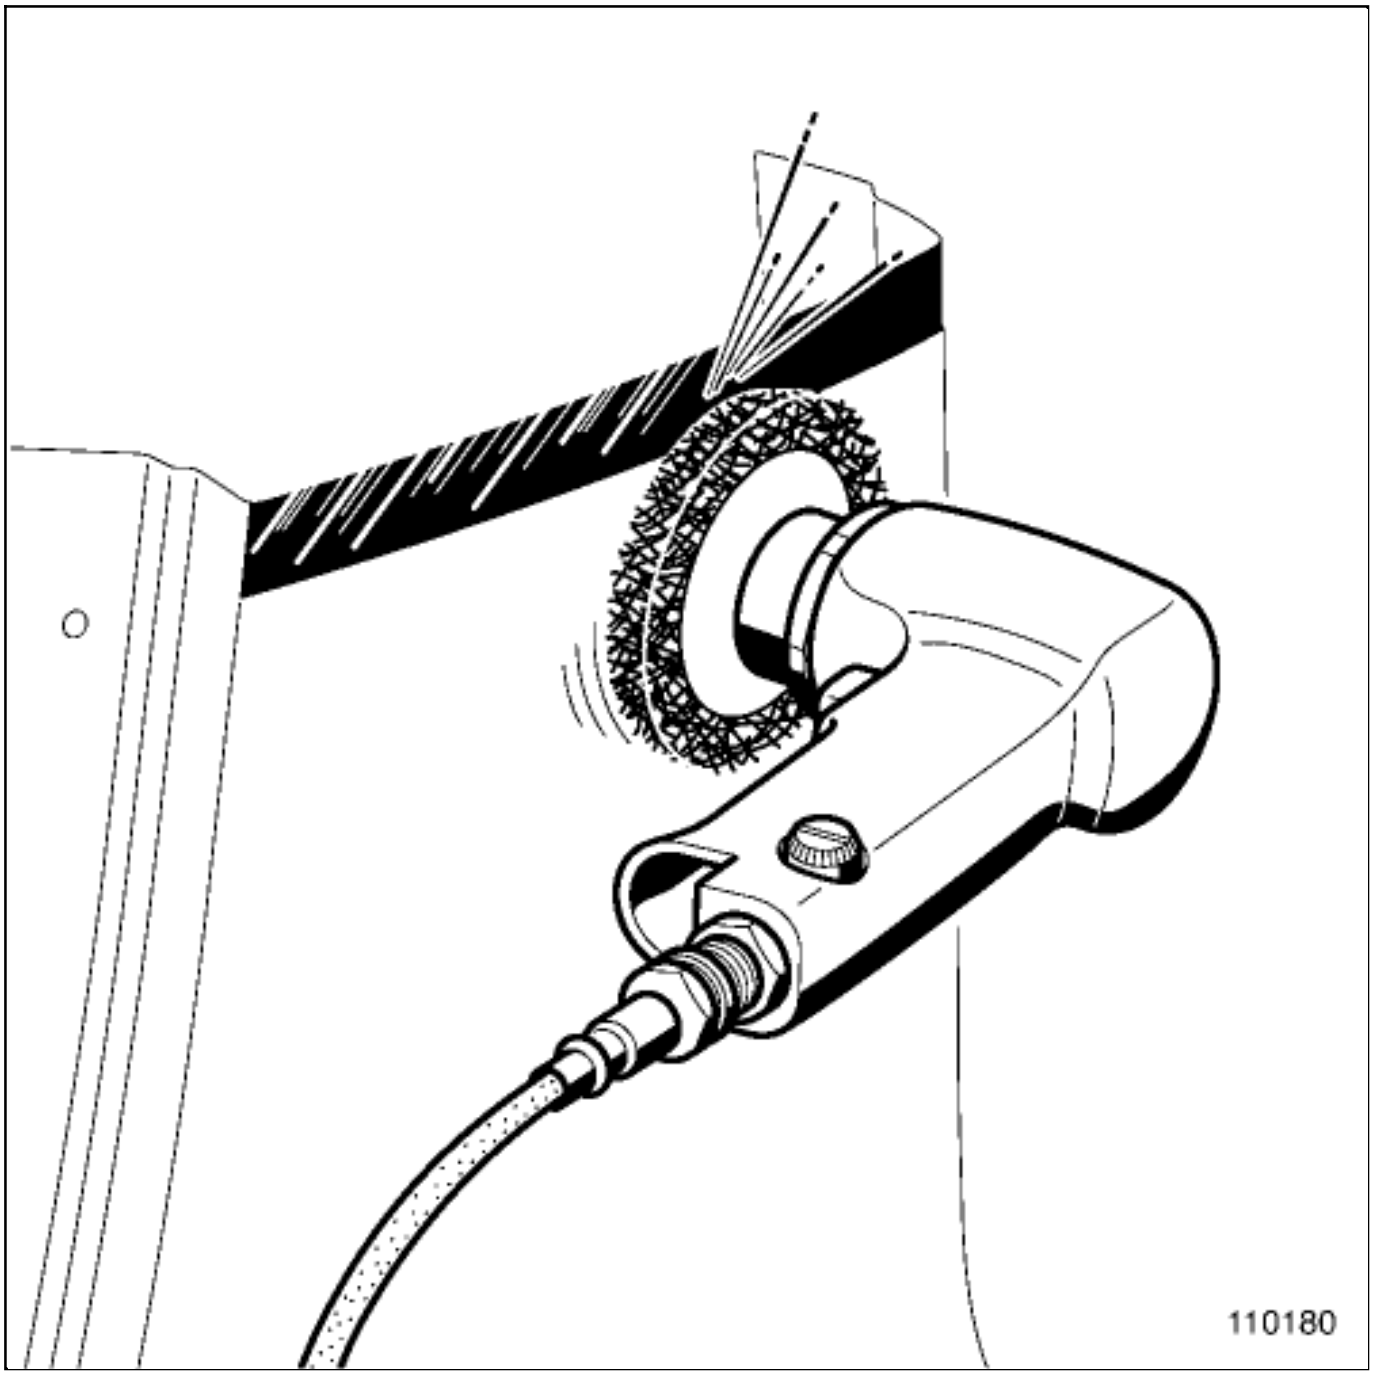
- is compatible with standard paper types.

Disadvantages:

- paper must be cut to size,
- does not hold the paper during sanding,
- extraction not possible.

Operator protection:

- obligatory respiratory protection.



Protection in the work area:

- None

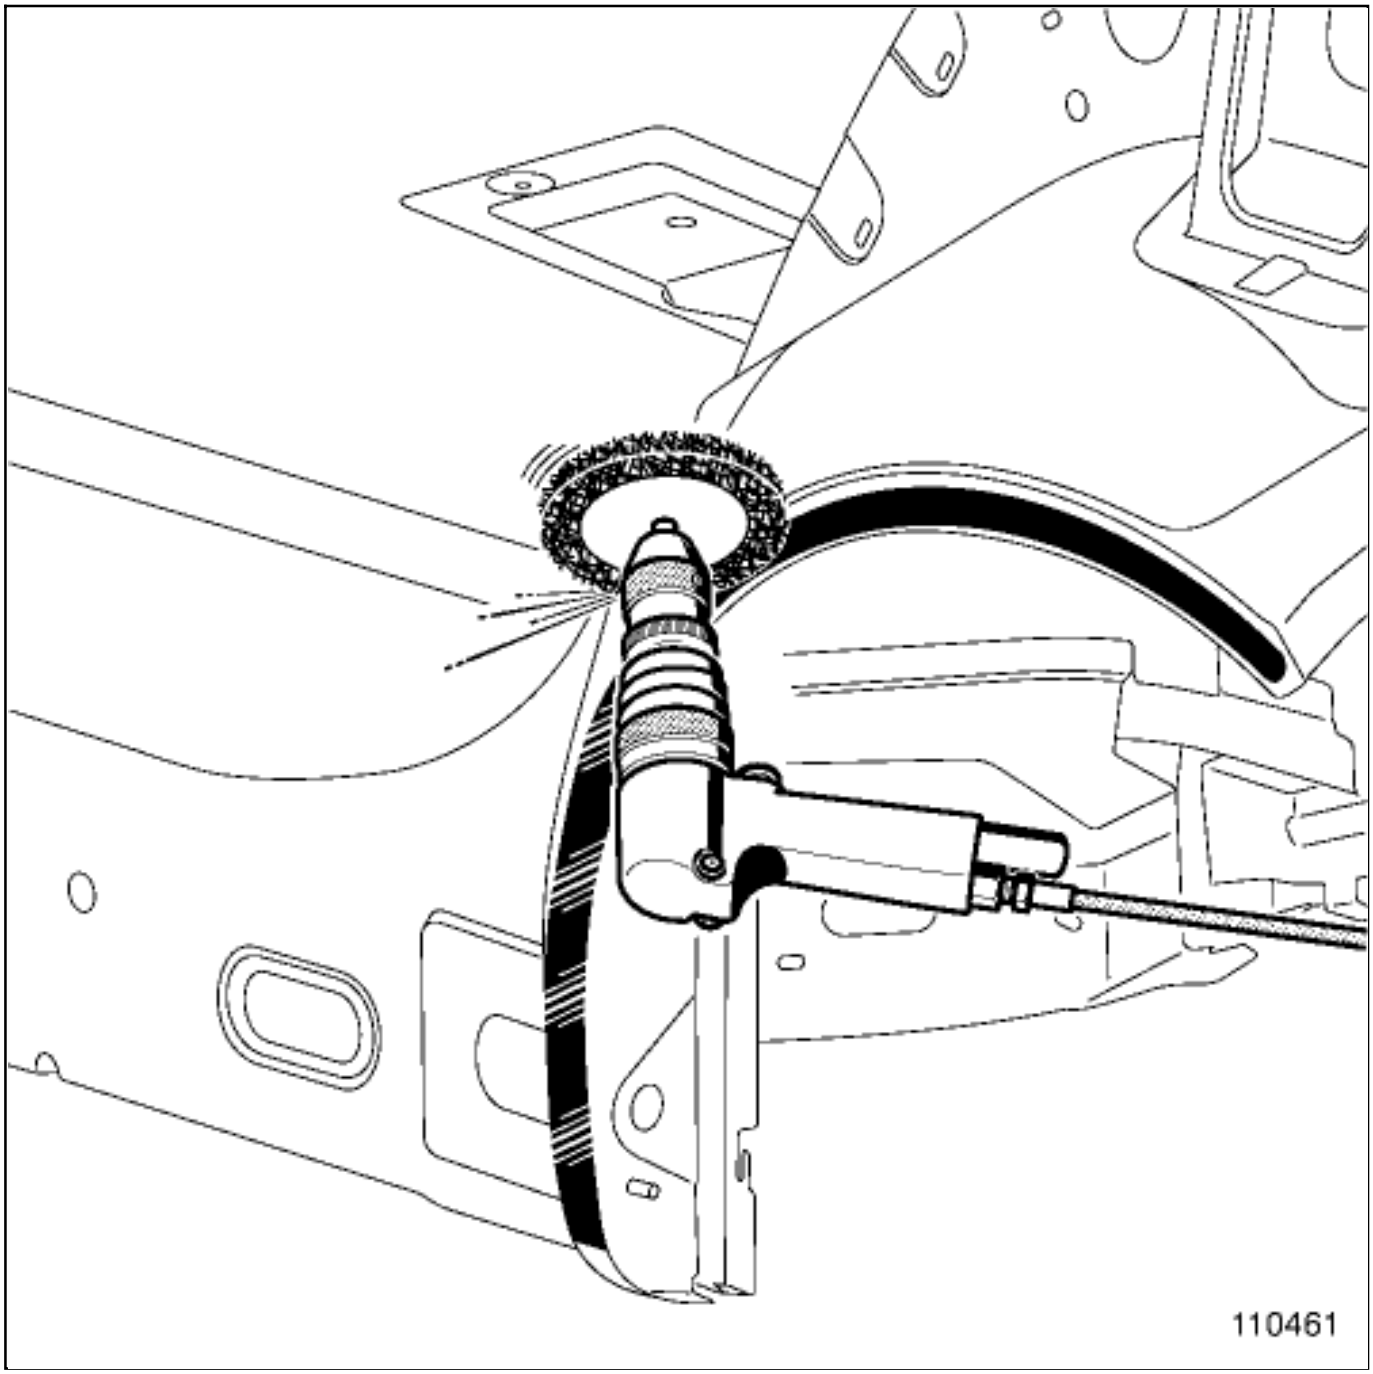
TOOLS FOR SCRAPING RIGID ADHESIVES AND PAINT: USE

1. FLAT STRIPPING

USE OF A PLASTIC FIBRE DISC, ON AN ANGLE GRINDER (5,000 RPM) FITTED WITH SPEED CONTROL

Advantage:

- Rapid means for cleaning a large painted surface with rigid adhesive mastic without damaging the support sheet and the galvanising.



Note:

When used on the edge of a sheet, the plastic fibre disc must be positioned parallel to the cut and should be applied from the centre of the part to the edge of the cut.

- Disadvantage:
  - Causes a large quantity of dust.
- Operator protection:
  - obligatory eye protection,
  - obligatory respiratory protection,
  - obligatory hand protection.
- Protection in the work area:
  - protection of interior fittings.

2. ANGLE STRIPPING

USE OF A PLASTIC FIBRE DISK ON A POWER DRILL (5,000 RPM)

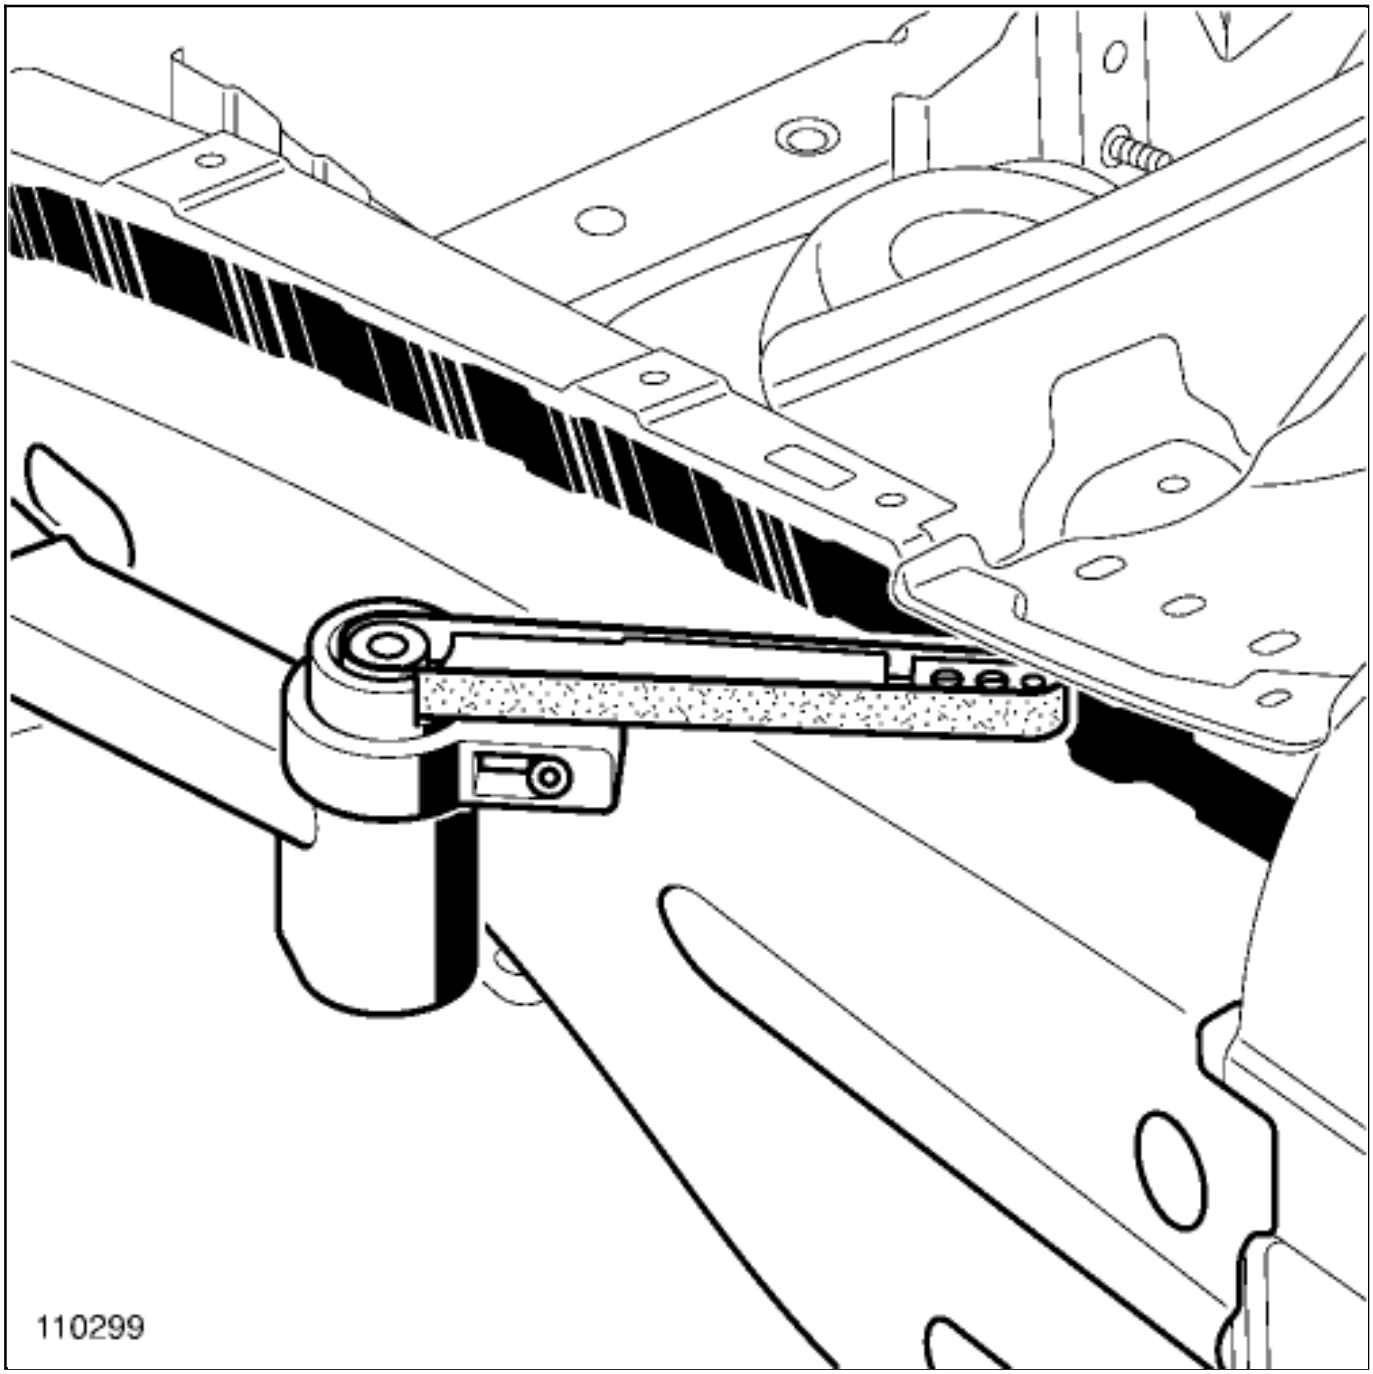
Advantage:

allows cleaning into corners without damaging the support sheet and galvanising.

Disadvantage:

Causes dust.

Operator protection:



- obligatory eye protection,
- obligatory respiratory protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.

3. CORNER STRIPPING

USE OF A STRIP SANDER WITH AN ABRASIVE STRIP (50 GRIT)

Advantage:

- Rapid means for stripping areas that are difficult to get to, corner or enclosed area stripping.

Disadvantages:

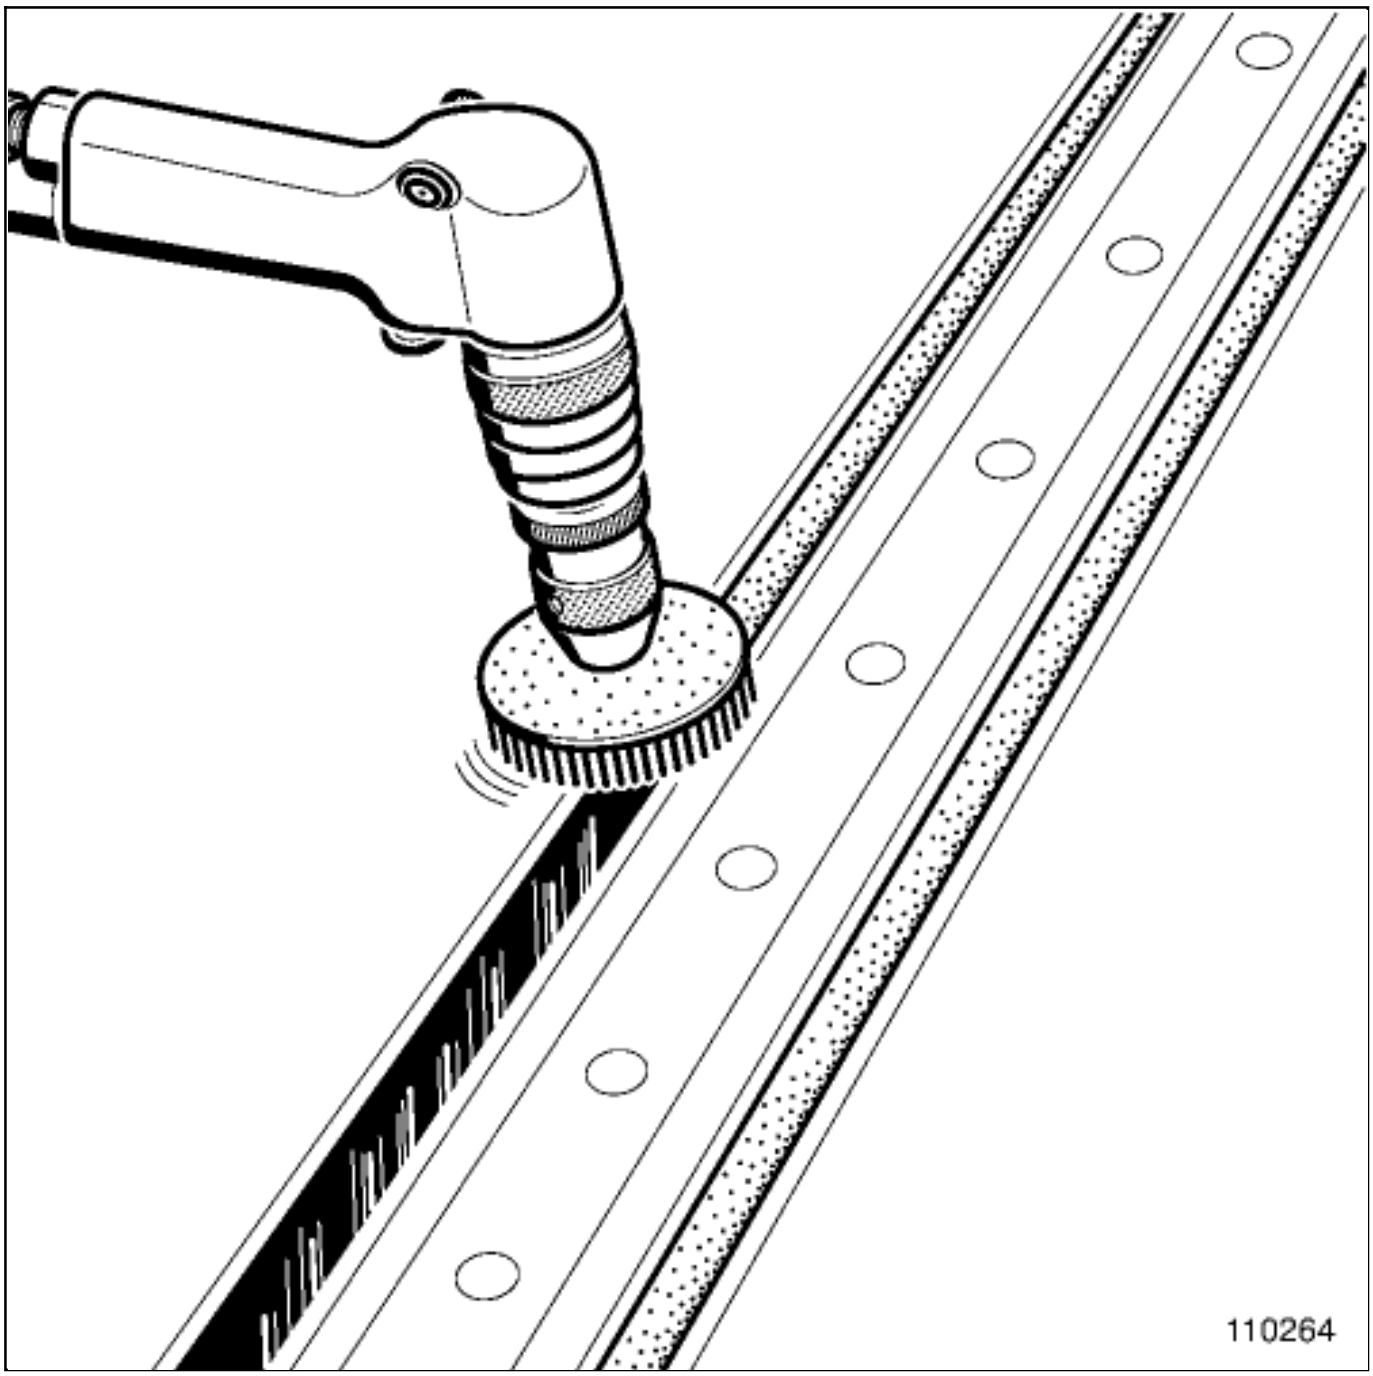
- Causes dust,
- Attacks the galvanising and the support sheet.

Operator protection:

- obligatory eye protection,
- obligatory respiratory protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.



XSL version : 3.02 du 22/07/11

TOOLS FOR STRIPPING VERY THICK SOFT MASTIC: USE

1. FLAT STRIPPING

Use of a plastic brush on a power drill (5.000 rpm).

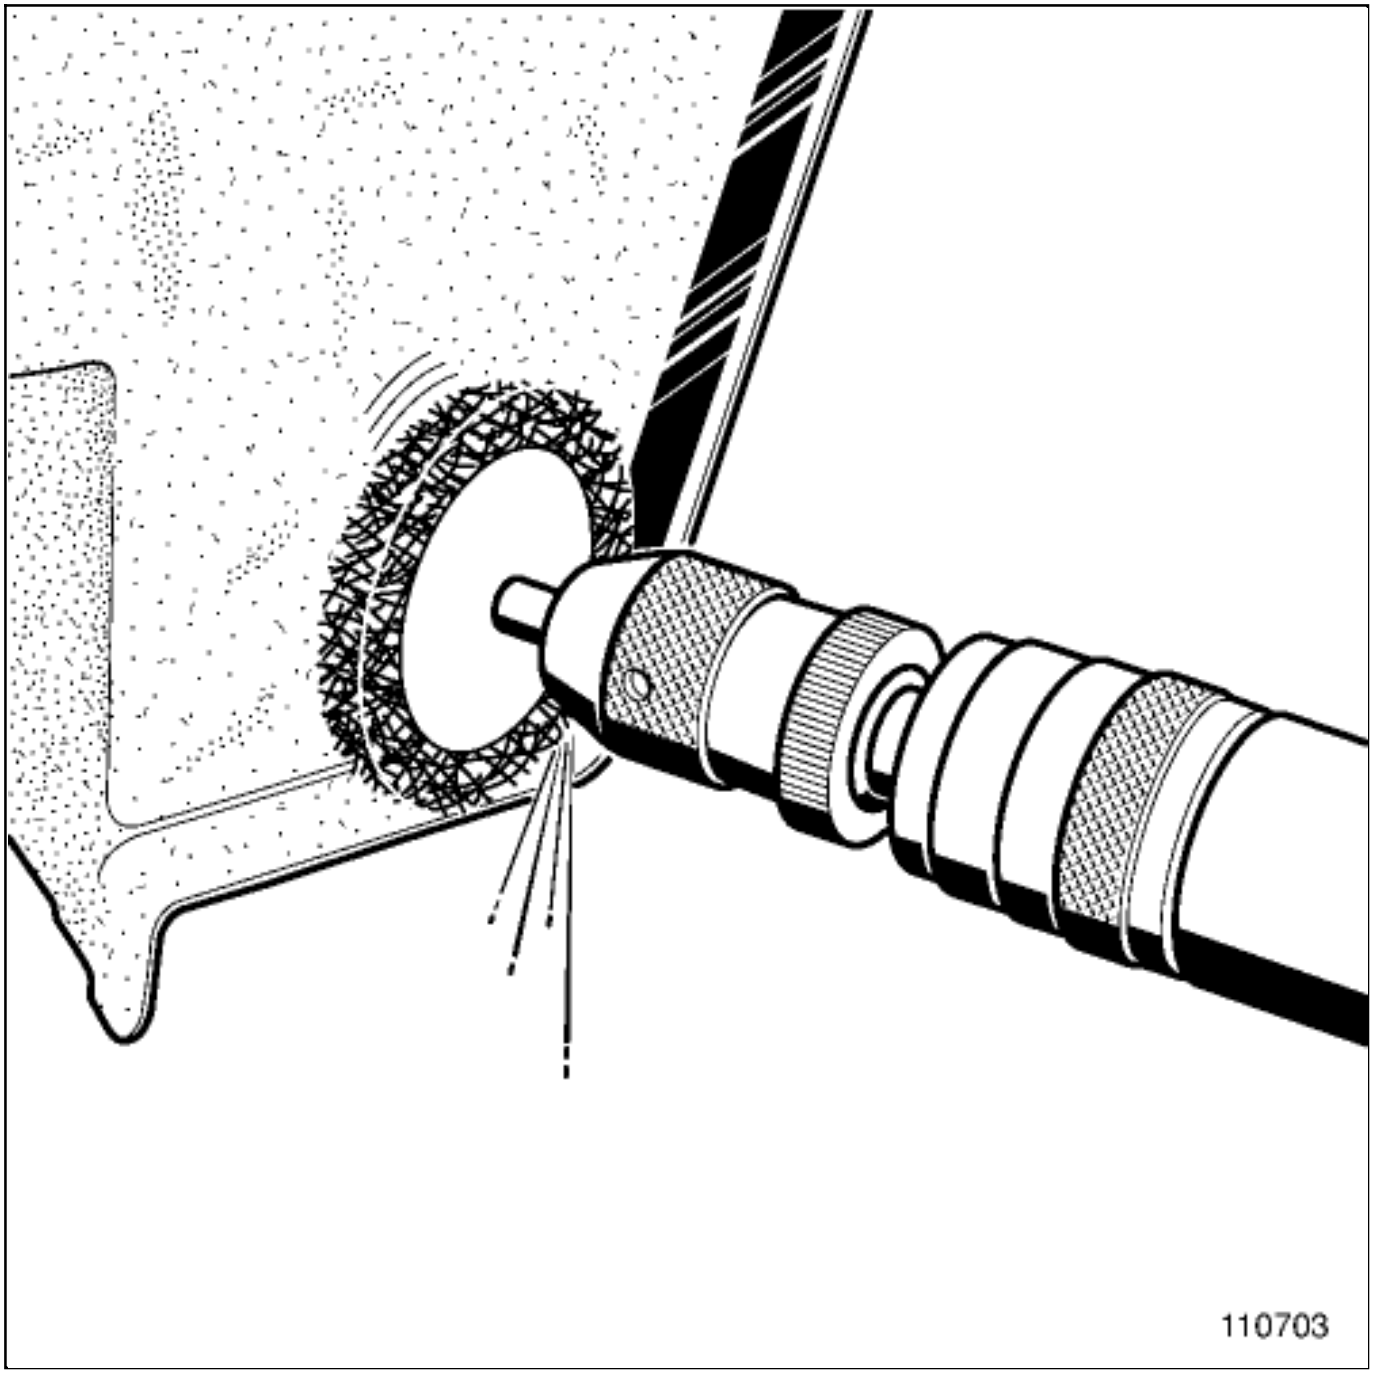
Advantages:

■ Rapid means for cleaning large anti-chip surfaces and setting mastic without damaging the support sheet and the galvanising.

Disadvantages:

- Causes a large quantity of shavings and dust.

Operator protection:



- obligatory eye and face protection,
- obligatory respiratory protection,
- obligatory ears protection,
- obligatory hand protection.

Protection of the environment:

- protection of interior fittings.

2. ANGLE STRIPPING

Use of a plastic fibre disk on a power drill (5,000 rpm).

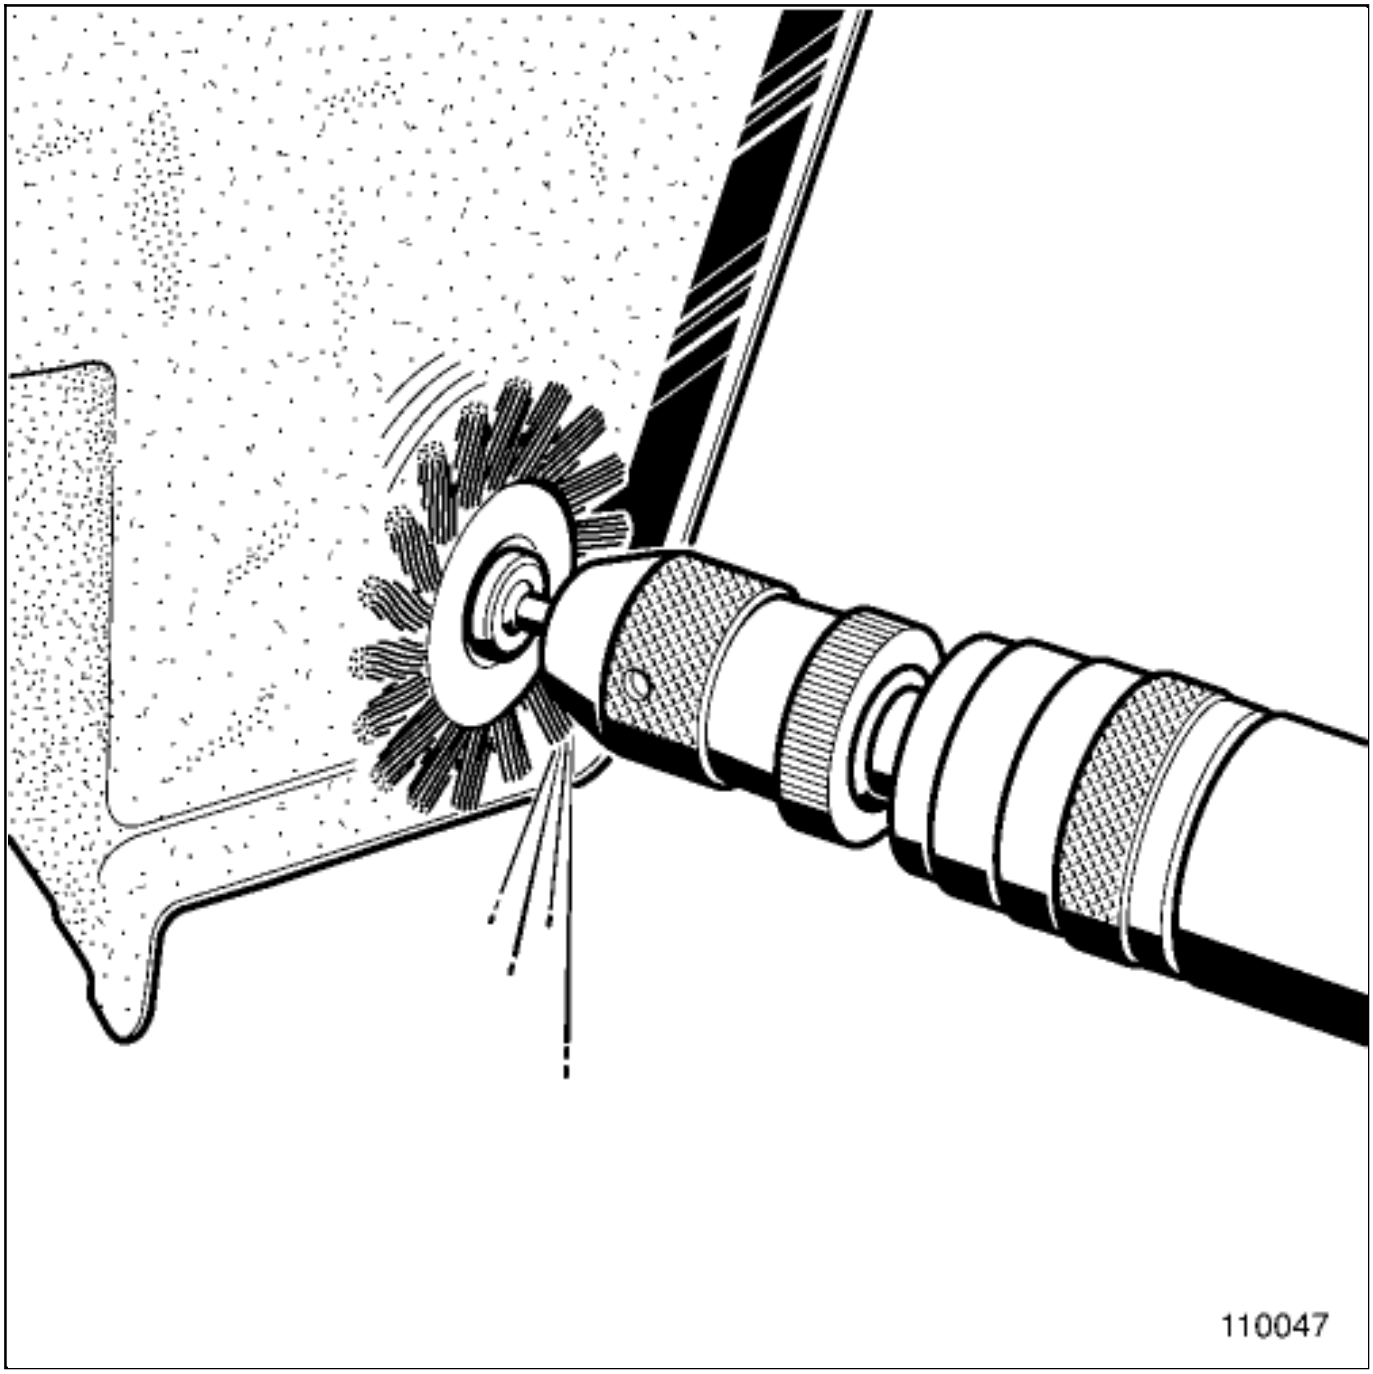
Advantages:

- Allows cleaning into corners without damaging the support sheet and galvanising.

Disadvantages:

- Causes a large quantity of shavings and dust.

Risk of the fibre getting caught on the sheet edge.



Operator protection:

- obligatory eye and face protection,
- obligatory respiratory protection,
- obligatory ears protection,
- obligatory hand protection.

Protection of the environment:

- protection of interior fittings.

Use of a steel brush disk on a power drill (5,000 rpm).

Advantage:

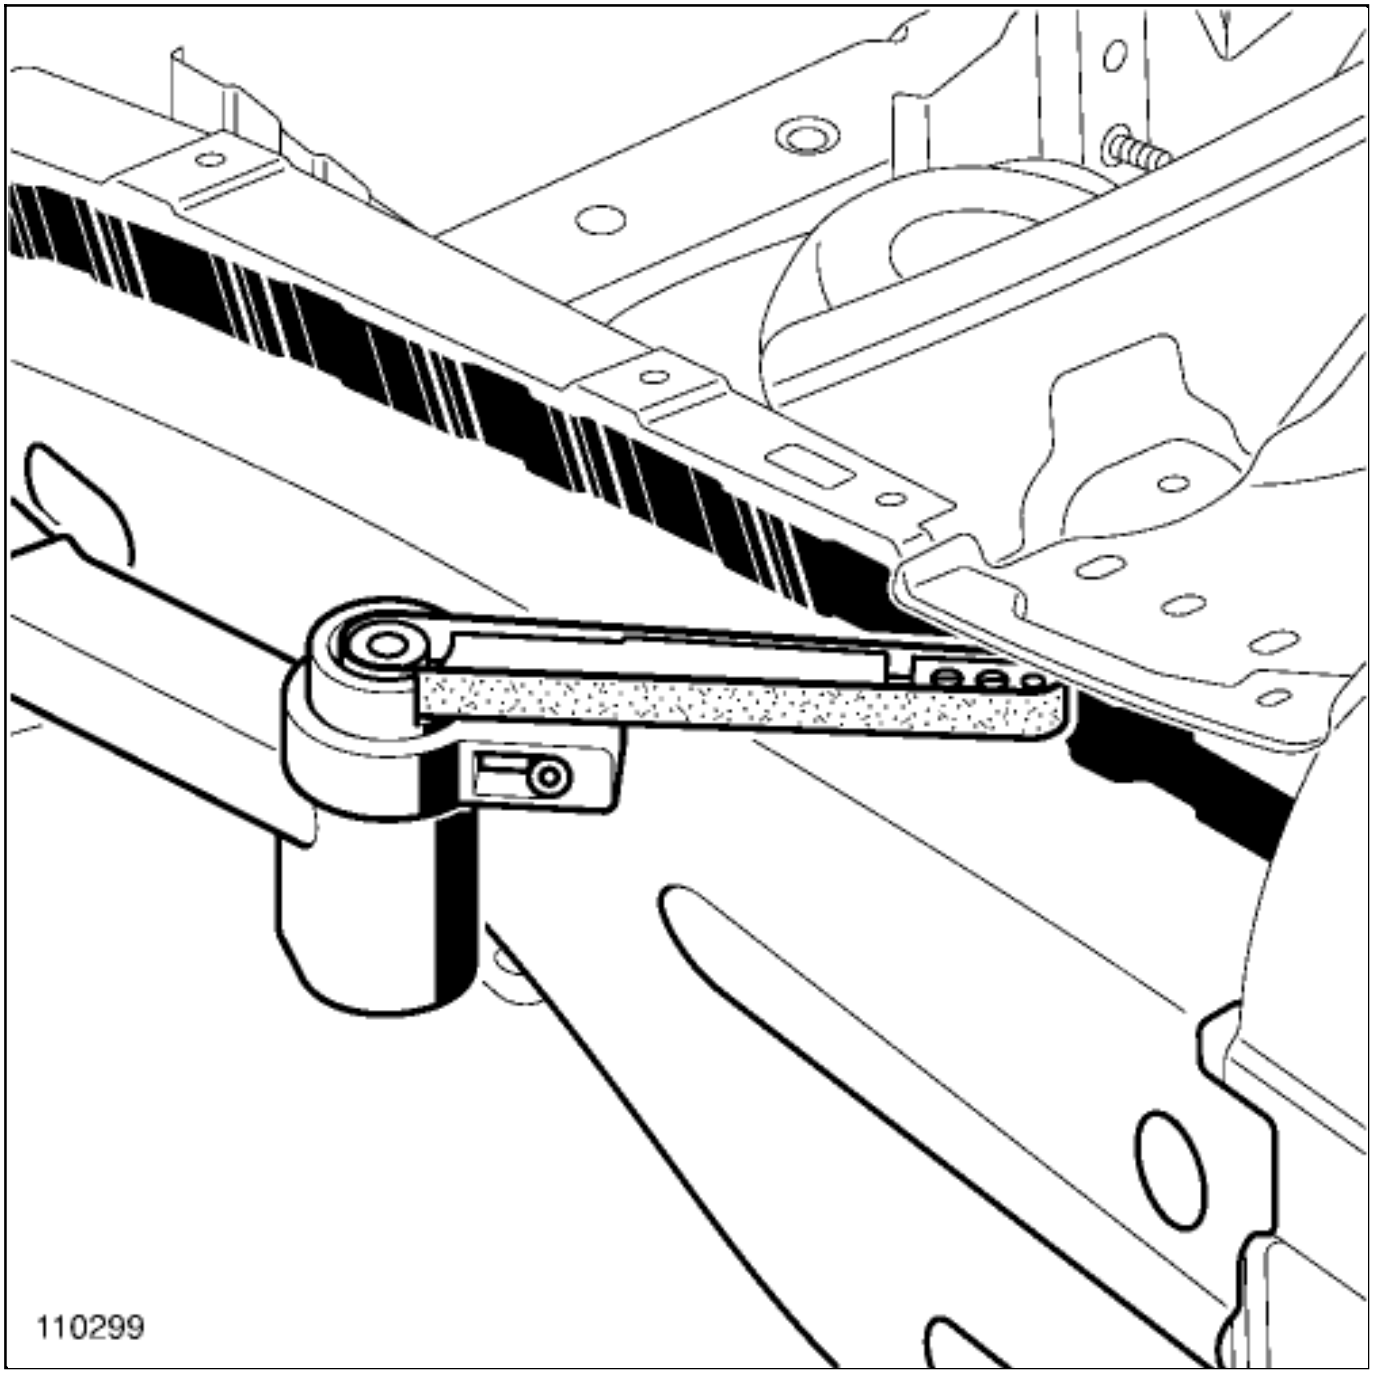
- Rapid method for cleaning in corners without damaging the support sheet.

Disadvantages:

- Causes shavings and dust.

Slightly attacks the galvanised protection.

Operator protection:



- obligatory eye and face protection,
- obligatory respiratory protection,
- obligatory ears protection,
- obligatory hand protection.

Protection of the environment:

- protection of interior fittings.

3. CORNER STRIPPING

Use of a strip sander with a 36grit strip.

Advantage:

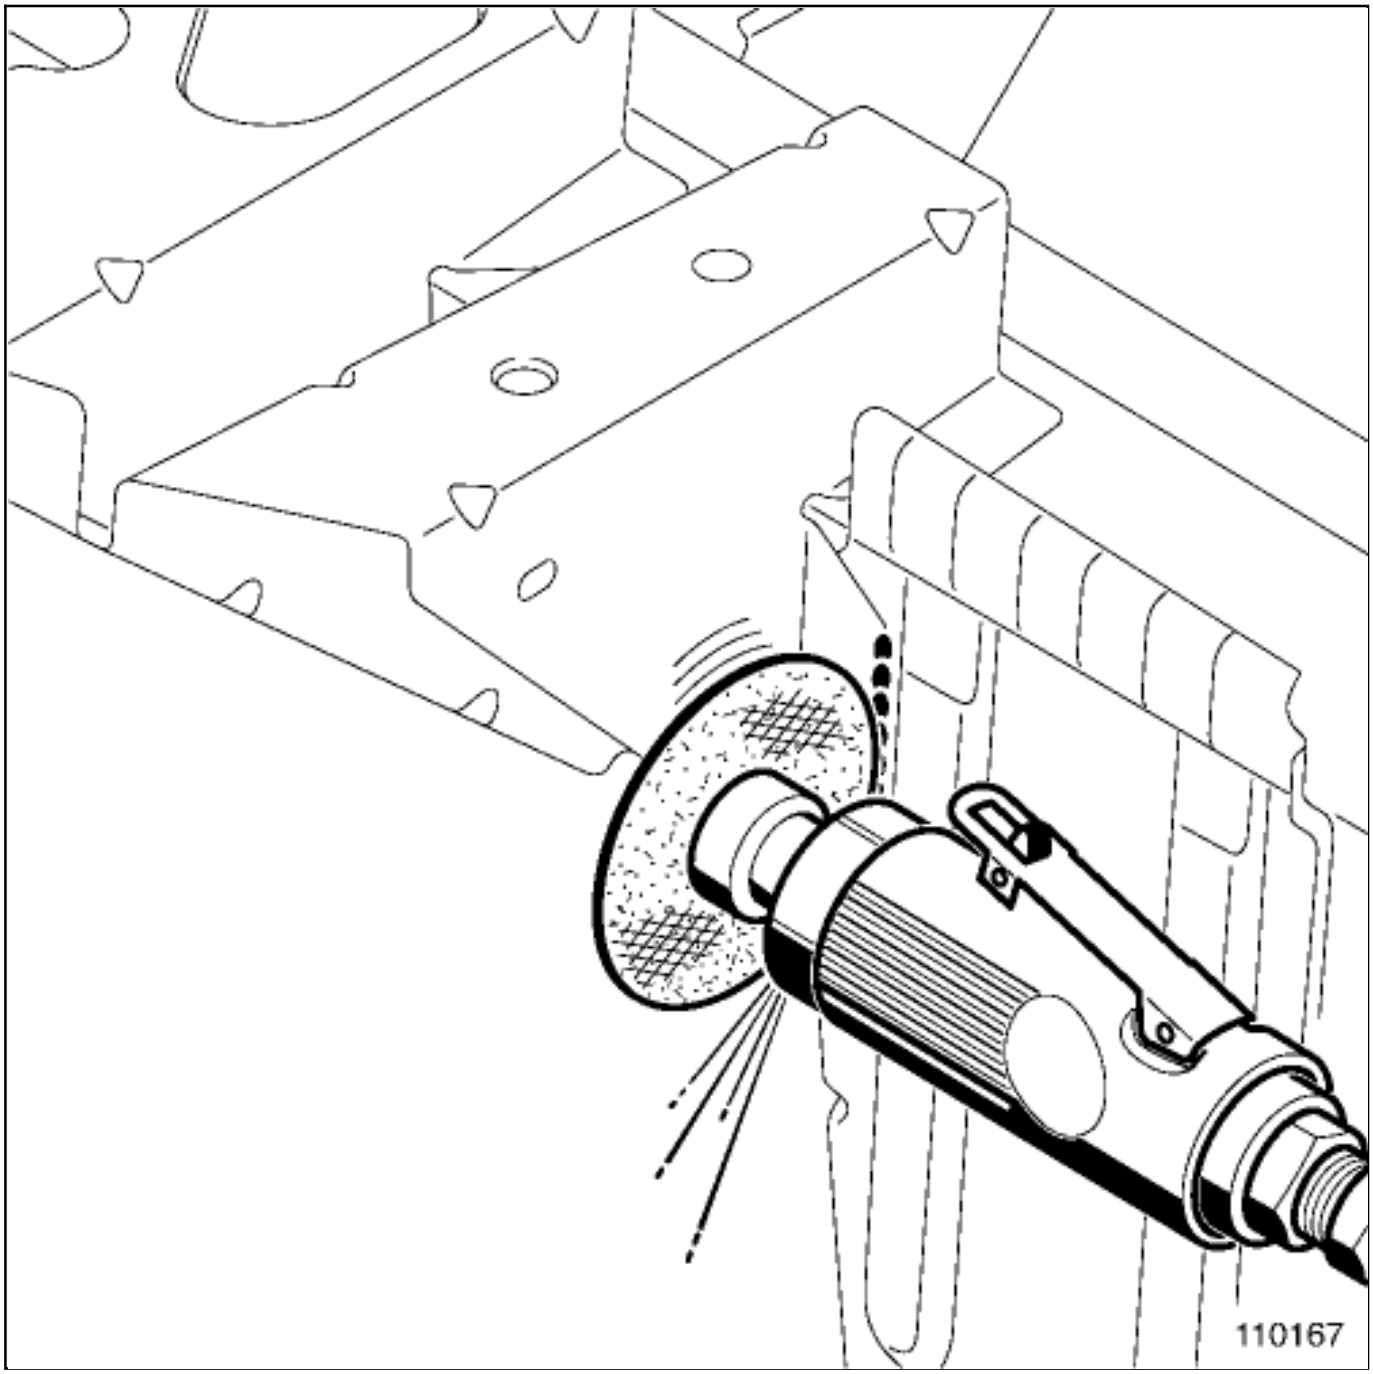
- Can be used to strip in areas difficult to access (stripping a corner or an enclosed area).

Disadvantages:

- Not a rapid means.

Attacks the galvanising and the support sheet.

Operator protection:



- obligatory eye and face protection,
- obligatory respiratory protection,
- obligatory ears protection,
- obligatory hand protection.

Protection of the environment:

- protection of interior fittings.

TOOLS FOR UNPICKING A STRUCTURAL COMPONENT: USE

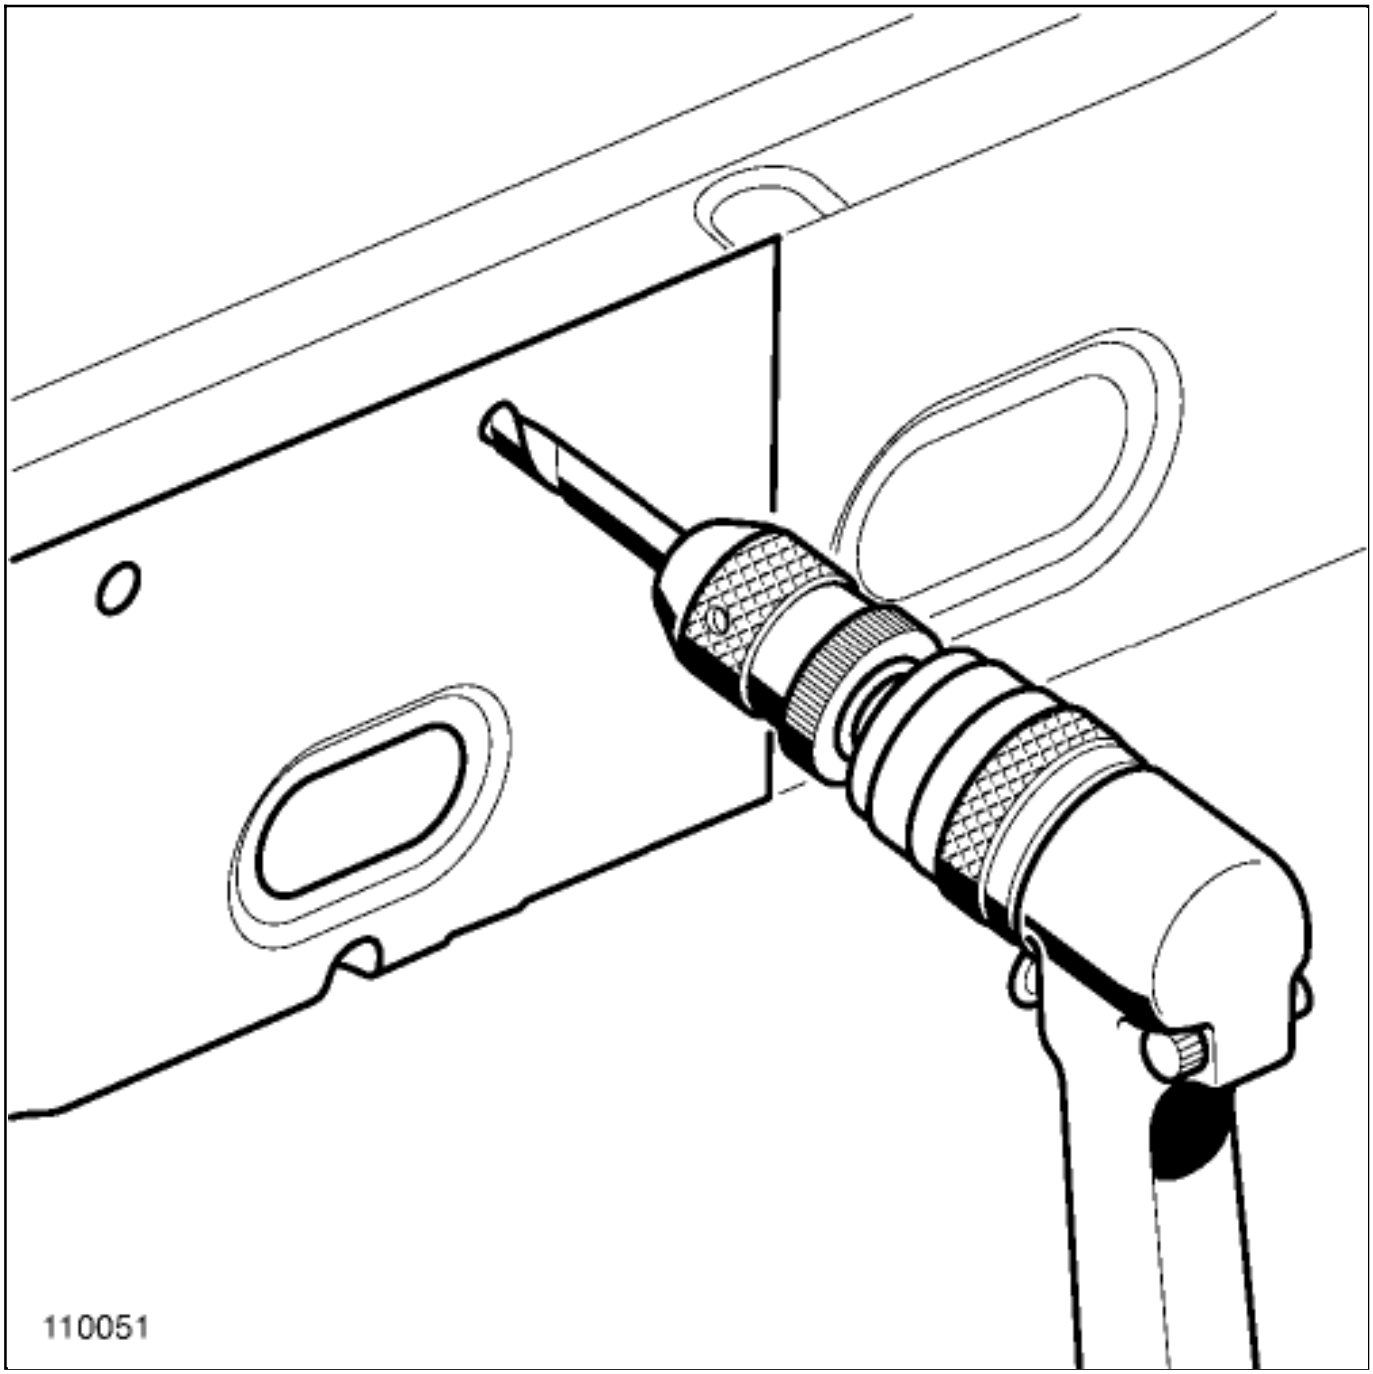
1. FLAT UNWELDING AND UNWELDING A WELD BEAD

- Use of a unwelding grinder ∅ 76 mmthickness 3 mm, fitted to a straight grinder (20000 rpm)fitted with speed control.

- Advantages:
  - a very fast method that causes the least damage to the sheet located underneath the mating surface overlap,

allows unwelding of THLE and UHLE sheets.

Disadvantages:



- causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).

Operator protection:

- obligatory eye protection,
- obligatory hand protection,
- obligatory ears protection,
- obligatory respiratory protection.

Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.

Use of a hardened steel bit ∅ 6 to 10 mm, fitted to a drill (2000 rpm), fitted with speed control.

Advantages:

- Rapid unwelding without projections,
- clean holes, ideal for plug welding the first sheet.

Disadvantages:

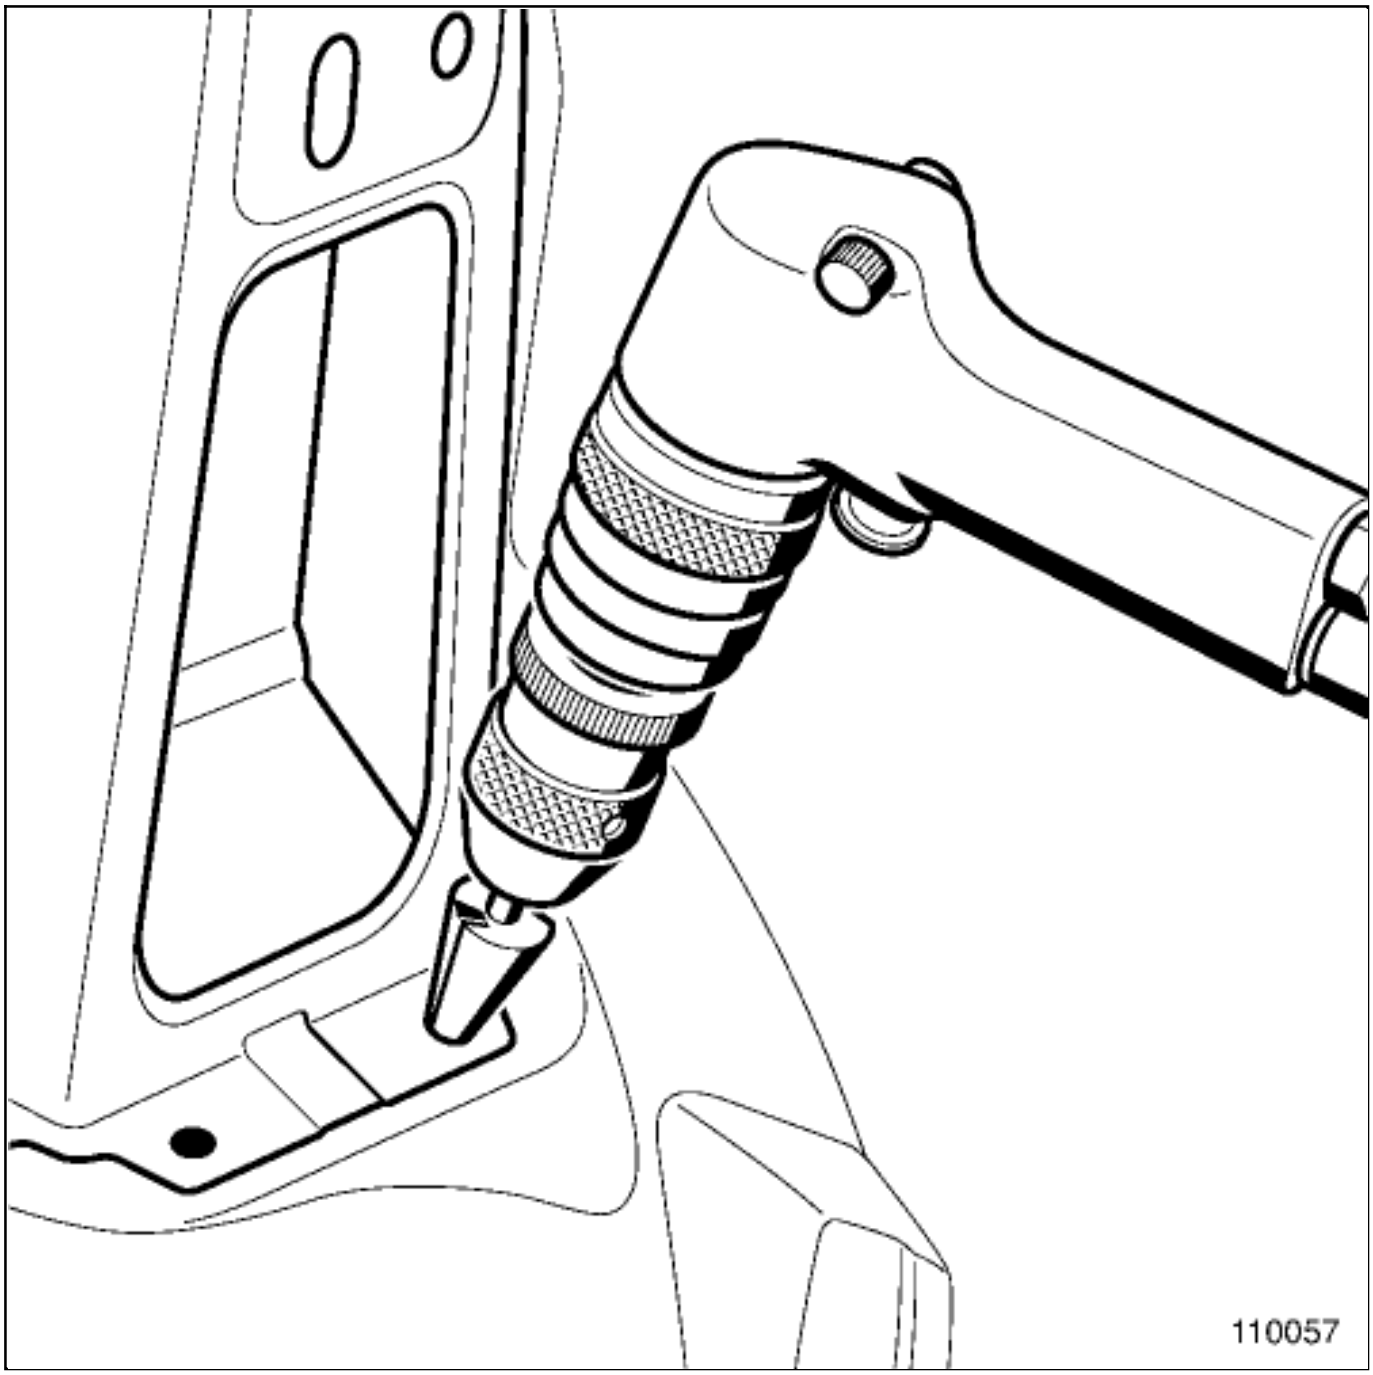
- it is necessary to drill vertically into the part,
- not for unwelding THLE and UHLE sheets.

Operator protection:

- obligatory eye protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.



Note:

The speed control is for optimising the cut and bit penetration, avoids premature wear, above all for drilling high tensile sheets.

In that case, use HSStype drill bits.

1- PARTICULAR CASE OF UNWELDING A SHEET LOCATED BEHIND, FOR TWO THICKNESSES

Use of a tapered drill bit, fitted to a drill (2000 rpm), fitted with speed control.

Advantages:

- clean hole and correctly matched to the spot weld diameter, allowing you to plug weld.

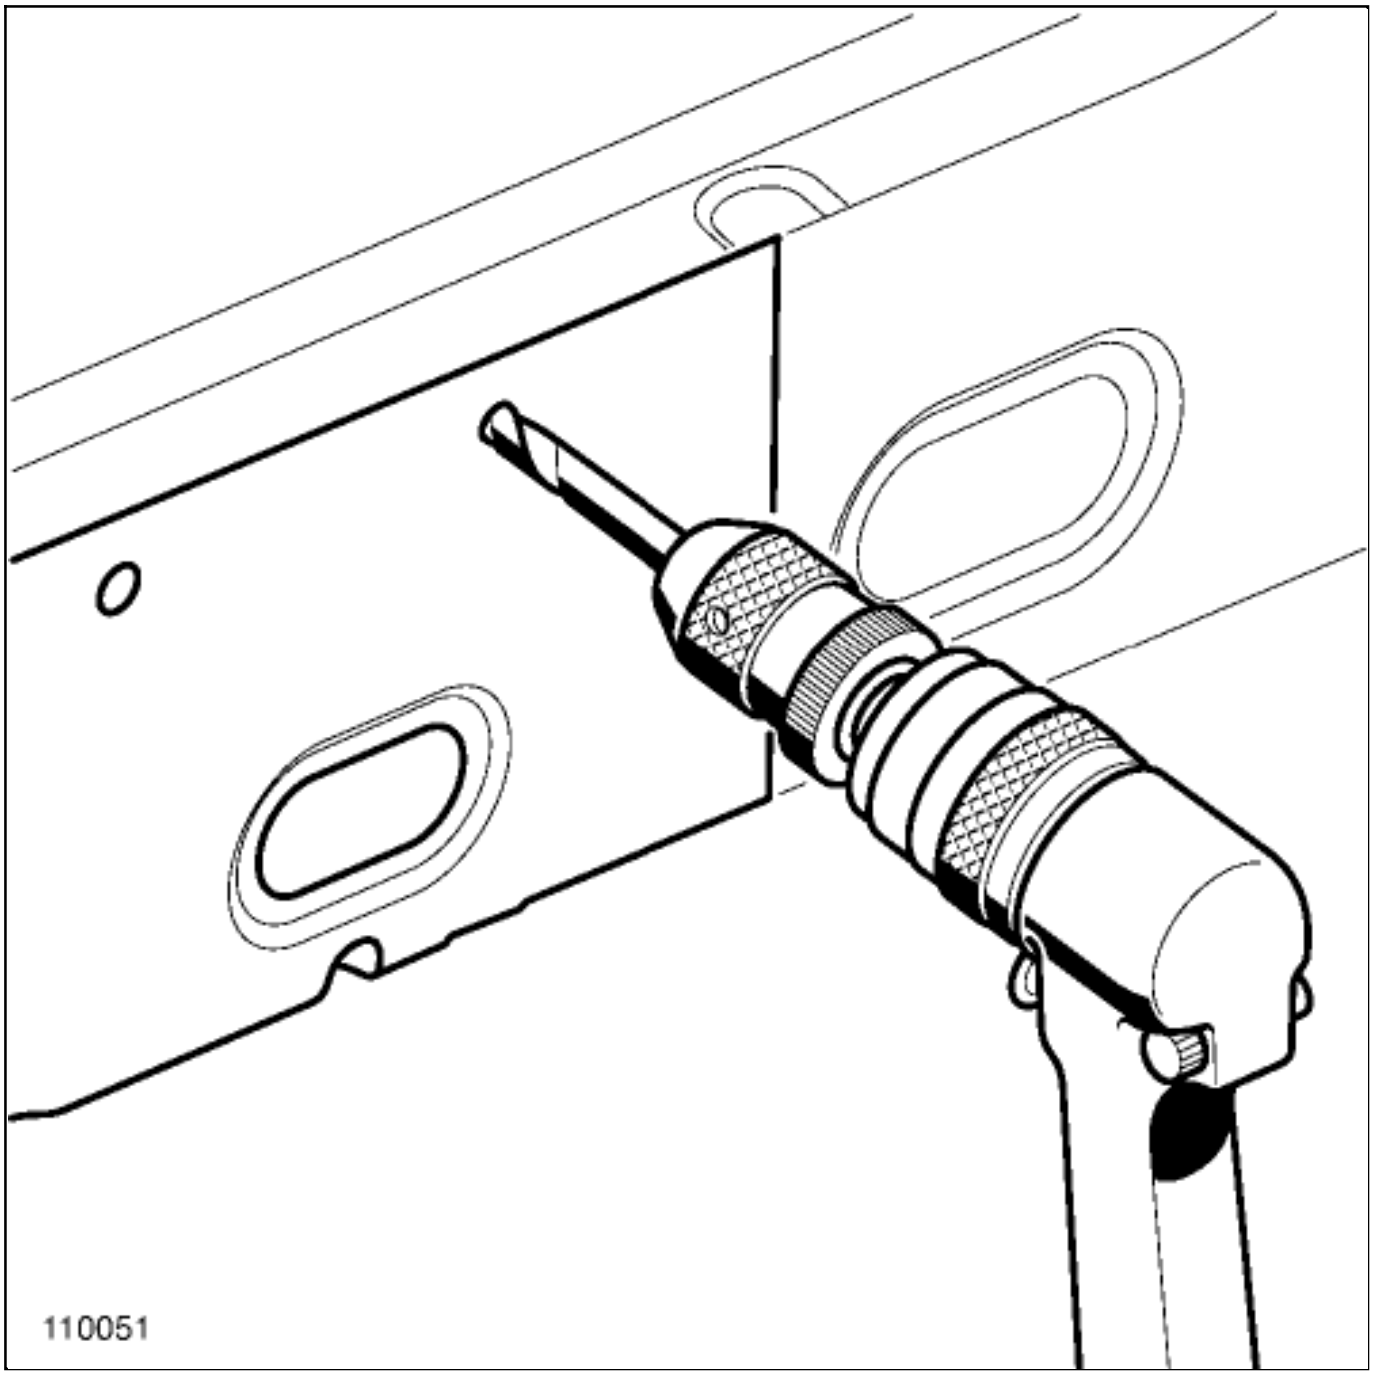
Disadvantages:

It is necessary to drill vertically into the part.

Operator protection:

- obligatory eye protection,
- obligatory hand protection.

Protection in the work area:



- protection of interior fittings.

Note:

Before drilling, you are advised to centre punch the point in such a way as the hole required for unpicking is as small as possible.

2- PARTICULAR CASE OF UNWELDING A SHEET LOCATED BEHIND, FOR THREE THICKNESSES

Use of a hardened steel bit, fitted to a drill (2000 rpm), fitted with speed control.

Advantages:

- enables you to drill the first hole by making a clean hole for plugging,
- unwelds the second sheet without damaging the third sheet.

Disadvantages:

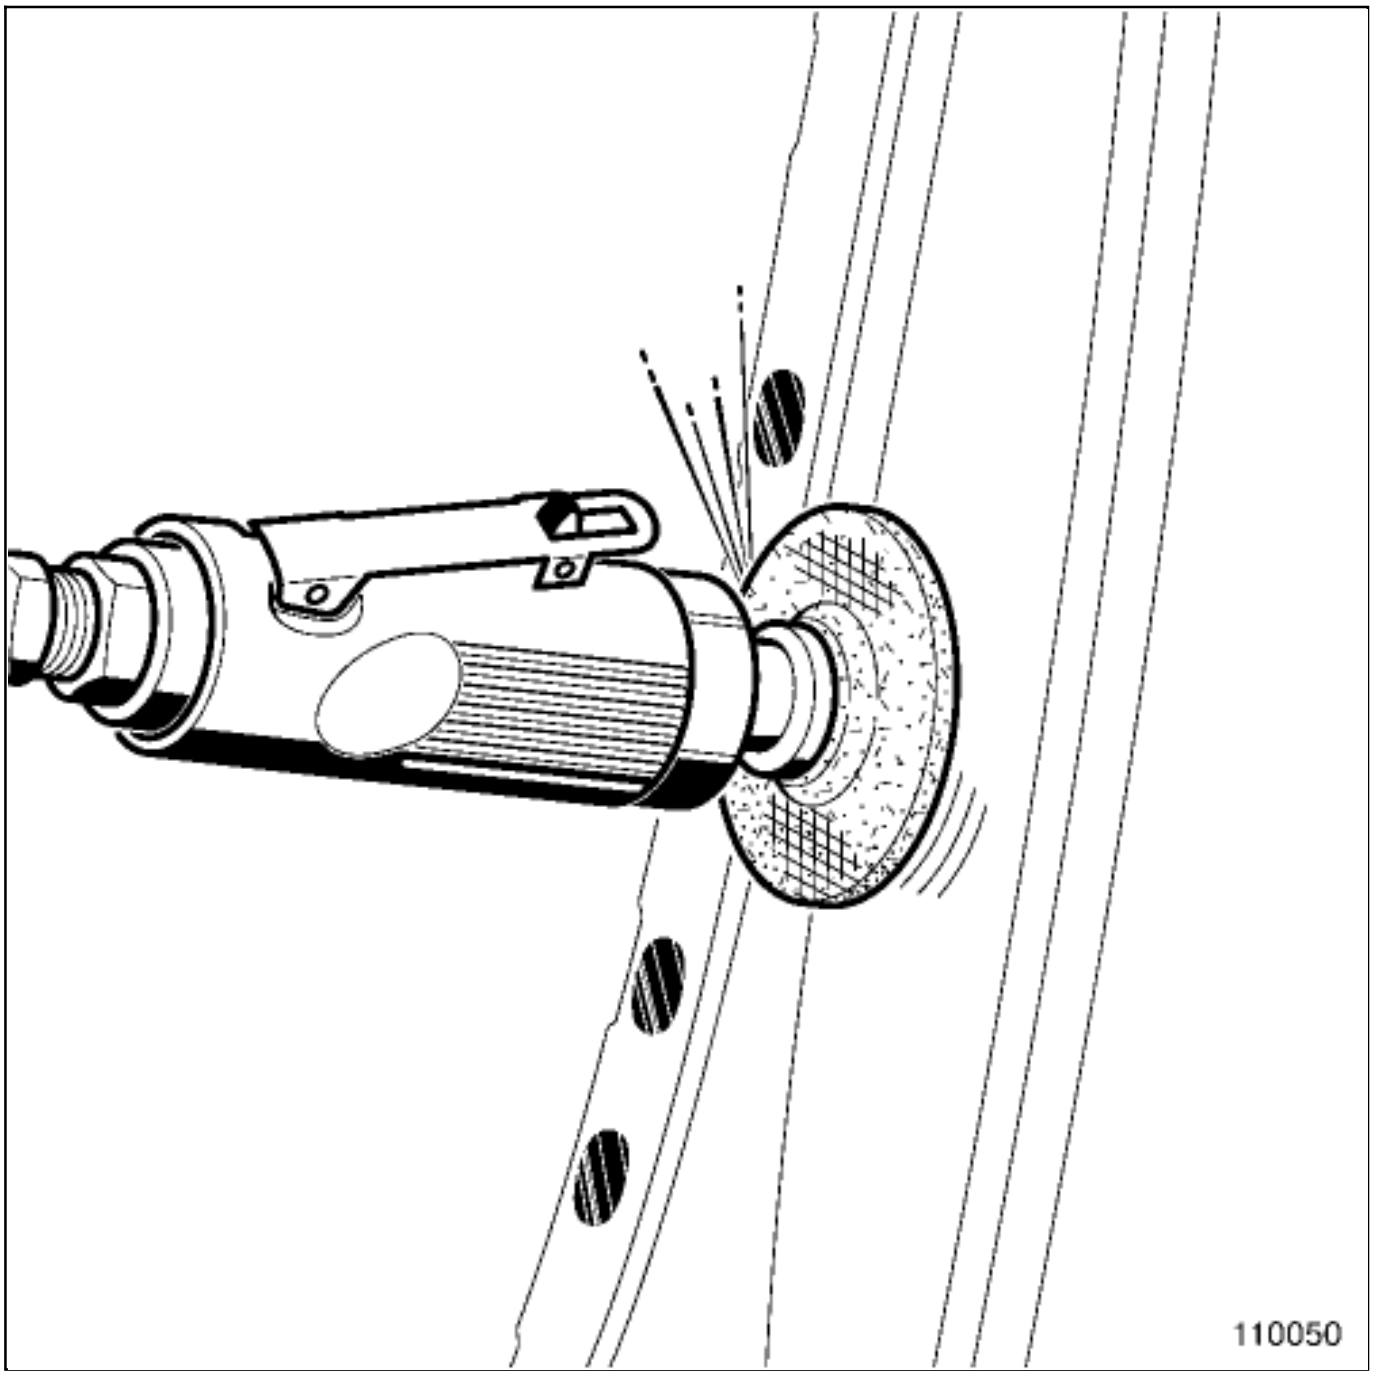
- requires certain precautions to avoid perforating the third sheet.
- it is necessary to drill vertically into the part.

Operator protection:

- obligatory eye protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.



Note:

The speed control is for optimising the cut and bit penetration, avoids premature wear, above all for drilling high tensile sheets.

In that case, use HSStype drill bits.

2. UNWELDING AT AN ANGLE

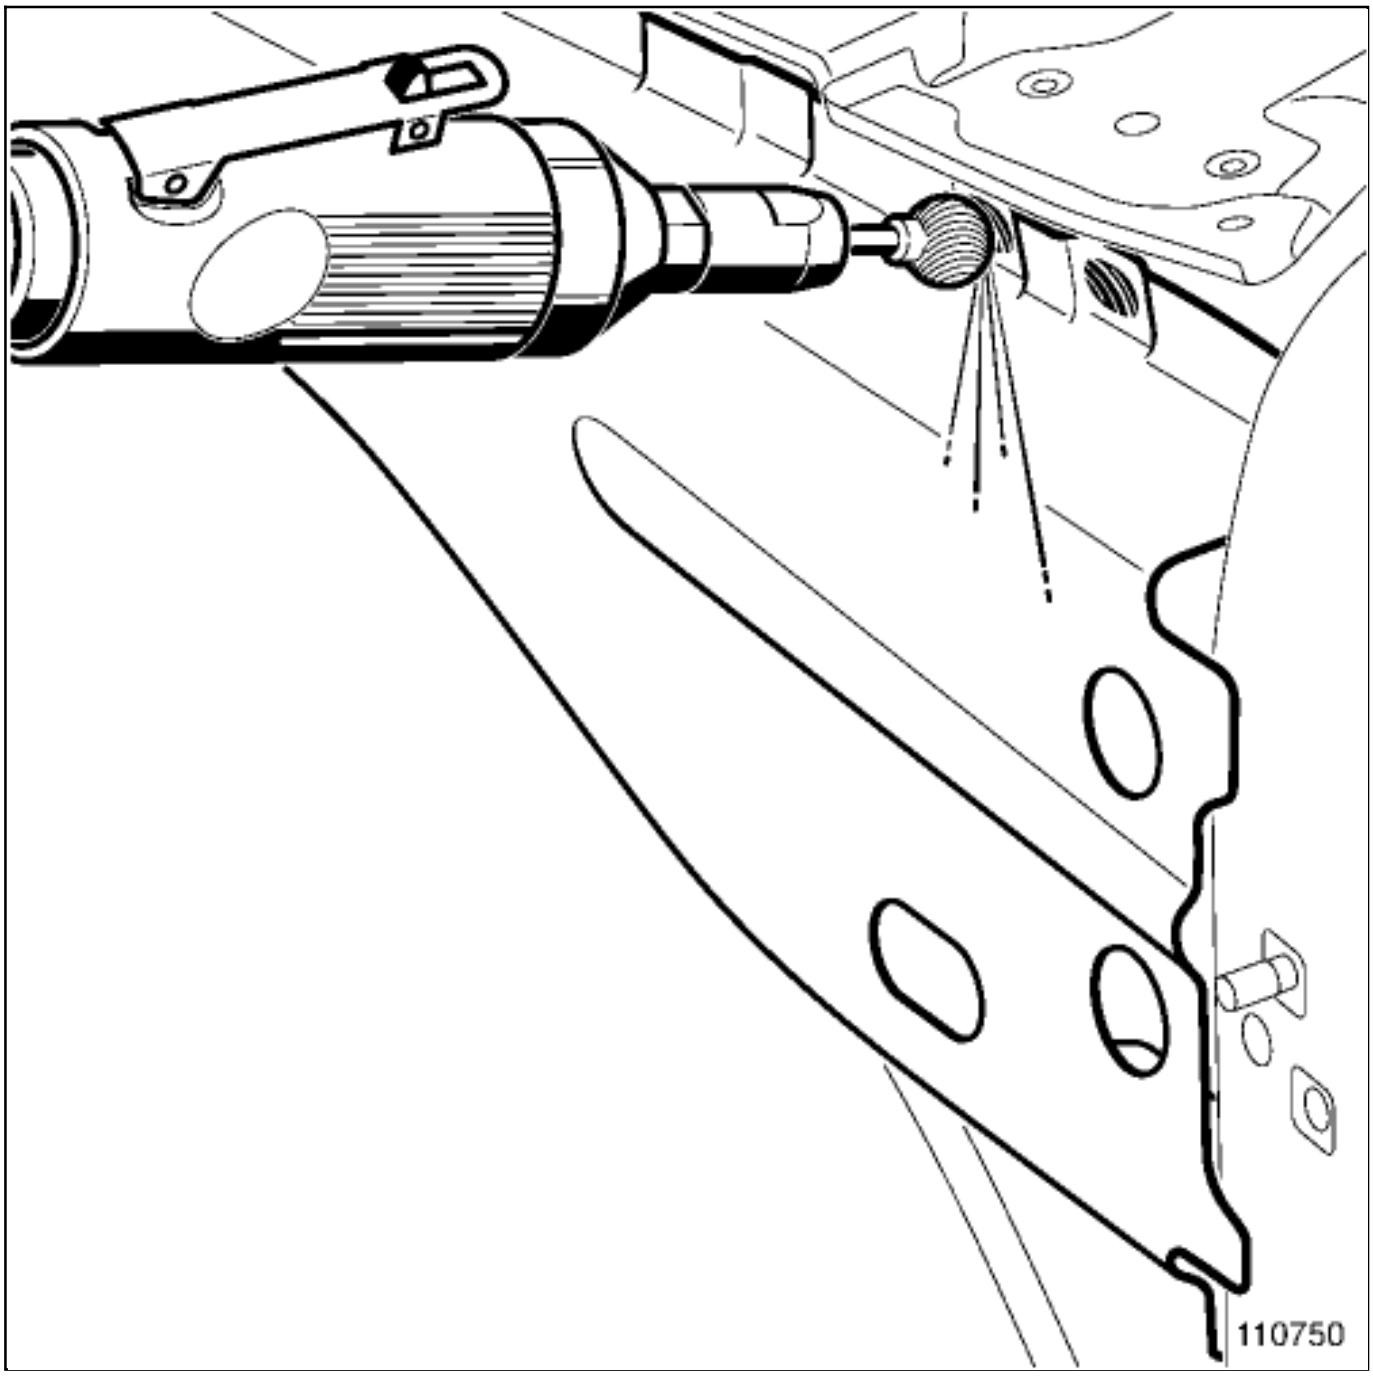
Use of a unwelding grinder ∅ 76 mmthickness 3 mm, fitted to a straight grinder (2000 rpm) fitted with speed control.

Advantages:

- a very fast method that causes the least damage to the sheet located underneath the mating surface overlap,
- allows unwelding of THLE and UHLE sheets.

Disadvantages:

- causes a large quantity of sparks that can damage nearby components (windows, plastic components, cloth, etc.).



Operator protection:

- obligatory eye protection,
- obligatory hand protection,
- obligatory ears protection.

Protection in the work area:

- protection of interior fittings,
- protection of internal and external window faces.

3. UNWELDING IN A CORNER

Use of a spherical burr on a straight grinder (20,000 rpm), equipped with speed control.

Advantages:

- a very fast method that causes the least damage to the sheet located underneath the mating surface overlap,
- allows unwelding of THLE and UHLE sheets.

Disadvantages:

- causes a large quantity of metal filings,
- it is forbidden to drill vertically into the part.

Operator protection:

- obligatory eye protection,
- obligatory hand protection.

Protection in the work area:

- protection of interior fittings.

TOXICITY SENSOR: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the battery(see **Battery: Removal - Refitting**) .
- Remove the dashboardDashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Disconnect the toxicity sensor connector.
- Remove the toxicity sensor(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REFITTING

- Proceed in the reverse order to removal.

TRACK ROD: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

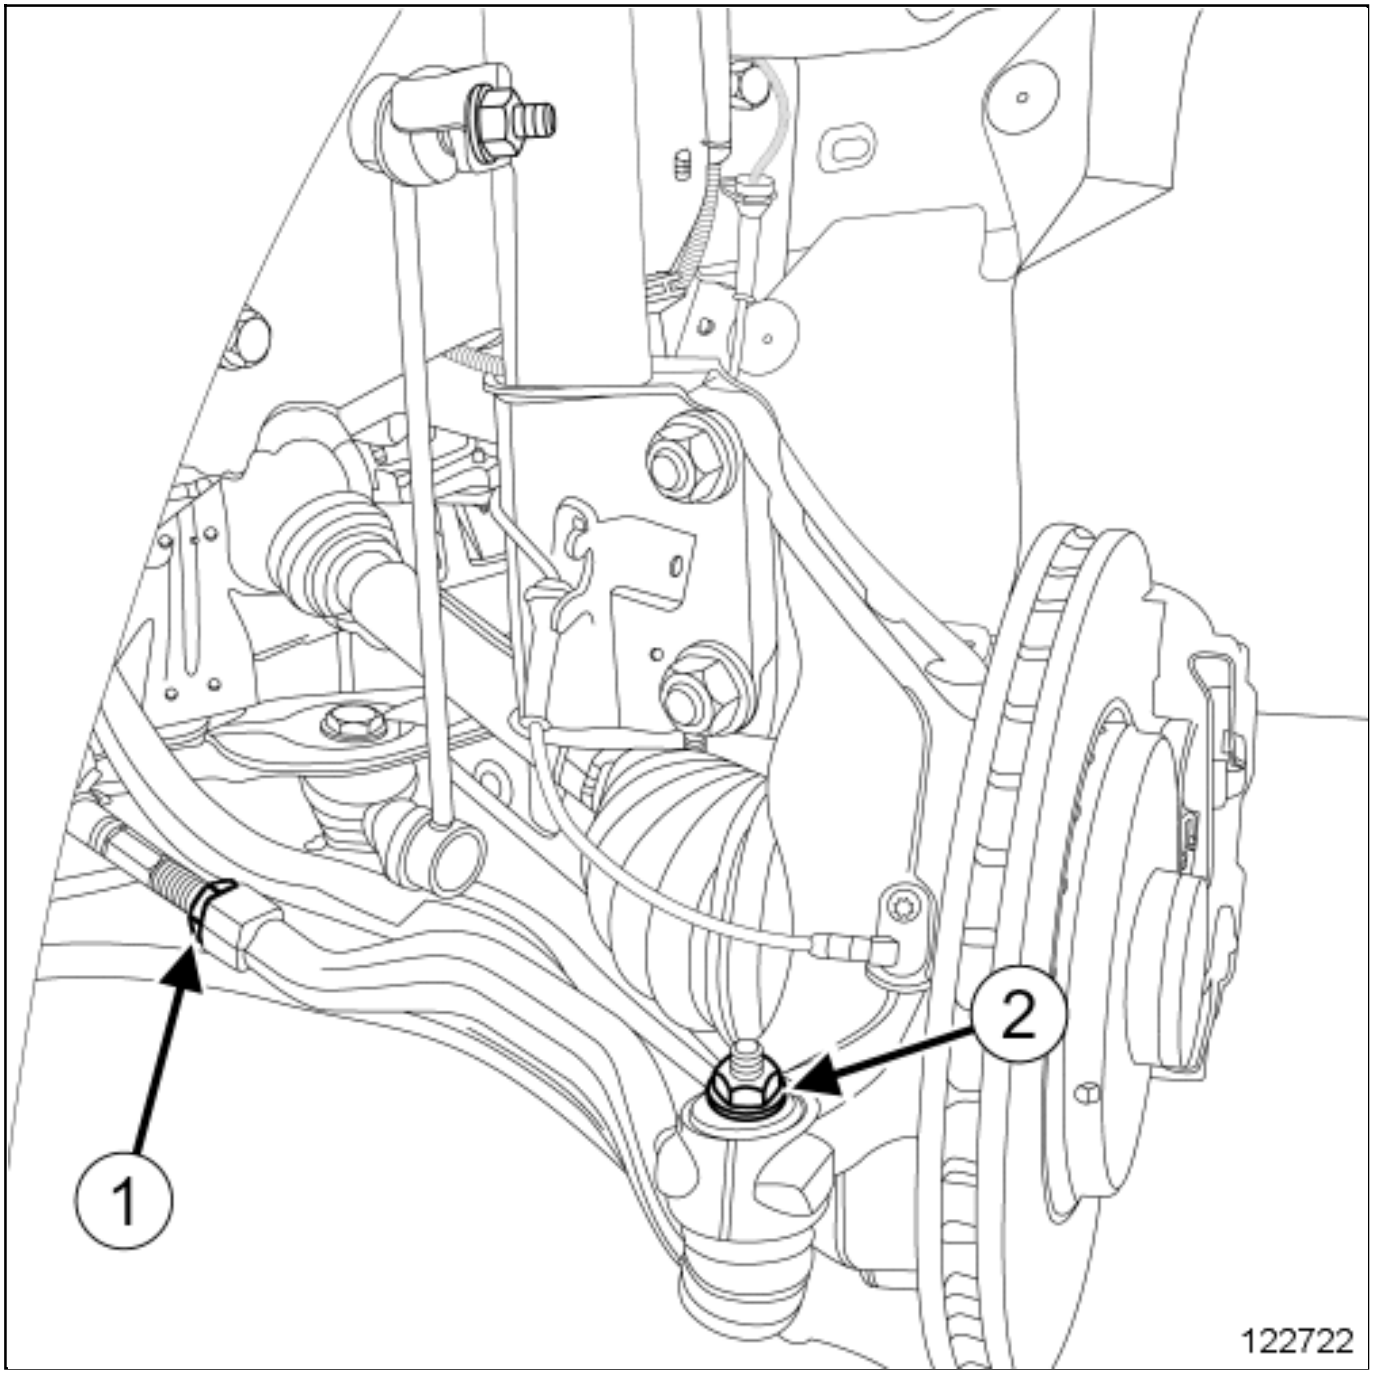
Special tooling required	
Ball joint extractor.	Tav. 476

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

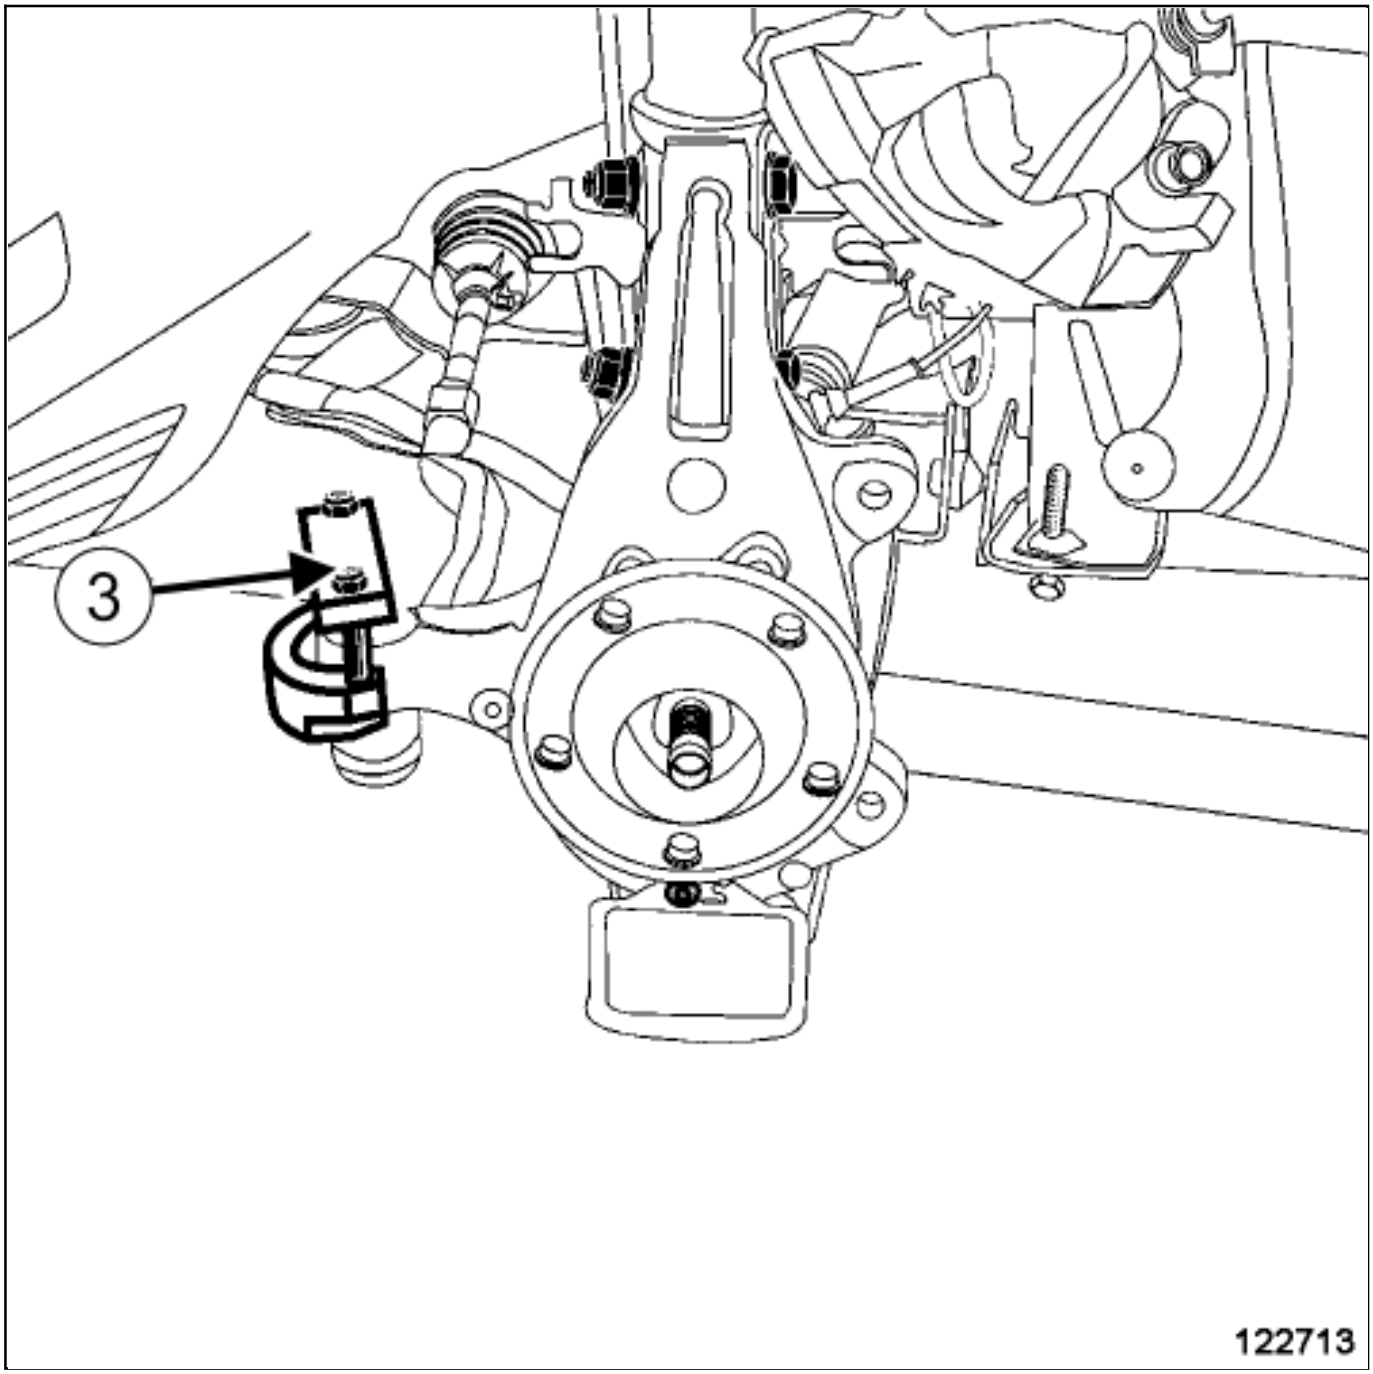
- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 36A, Steering assembly , Steering assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove the front wheelWheel: Removal - Refitting .

2. REMOVAL OPERATION

- Loosen the wheel alignment adjustment lock nut(1) .
- Remove the track rod ball joint nut(2) .

- Extract the ball joint using the toolBall joint extractor.(Tav. 476) (3) .

- Unscrew the track rod anti-clockwise and note the number of turns for refitting.

- Remove the track rod.

REFITTING

1. REFITTING OPERATION

- Screw the track rod back in place by the number of turns noted during removal.
- Fit the track rod end in the hub carrier.
- Refit the track rod ball joint nut.
- Torque tighten (see 36A, Steering assembly , Steering assembly: Exploded view) :
  - the track rod ball joint nut,
  - the wheel alignment adjusting lock nut.

2. FINAL OPERATION

- Refit the wheel Wheel: Removal - Refitting .
- Check the axle geometry Axle assemblies: Check .
- If necessary, adjust the geometry of the axle assemblies Front axle system: Adjustment .

TRACK ROD: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

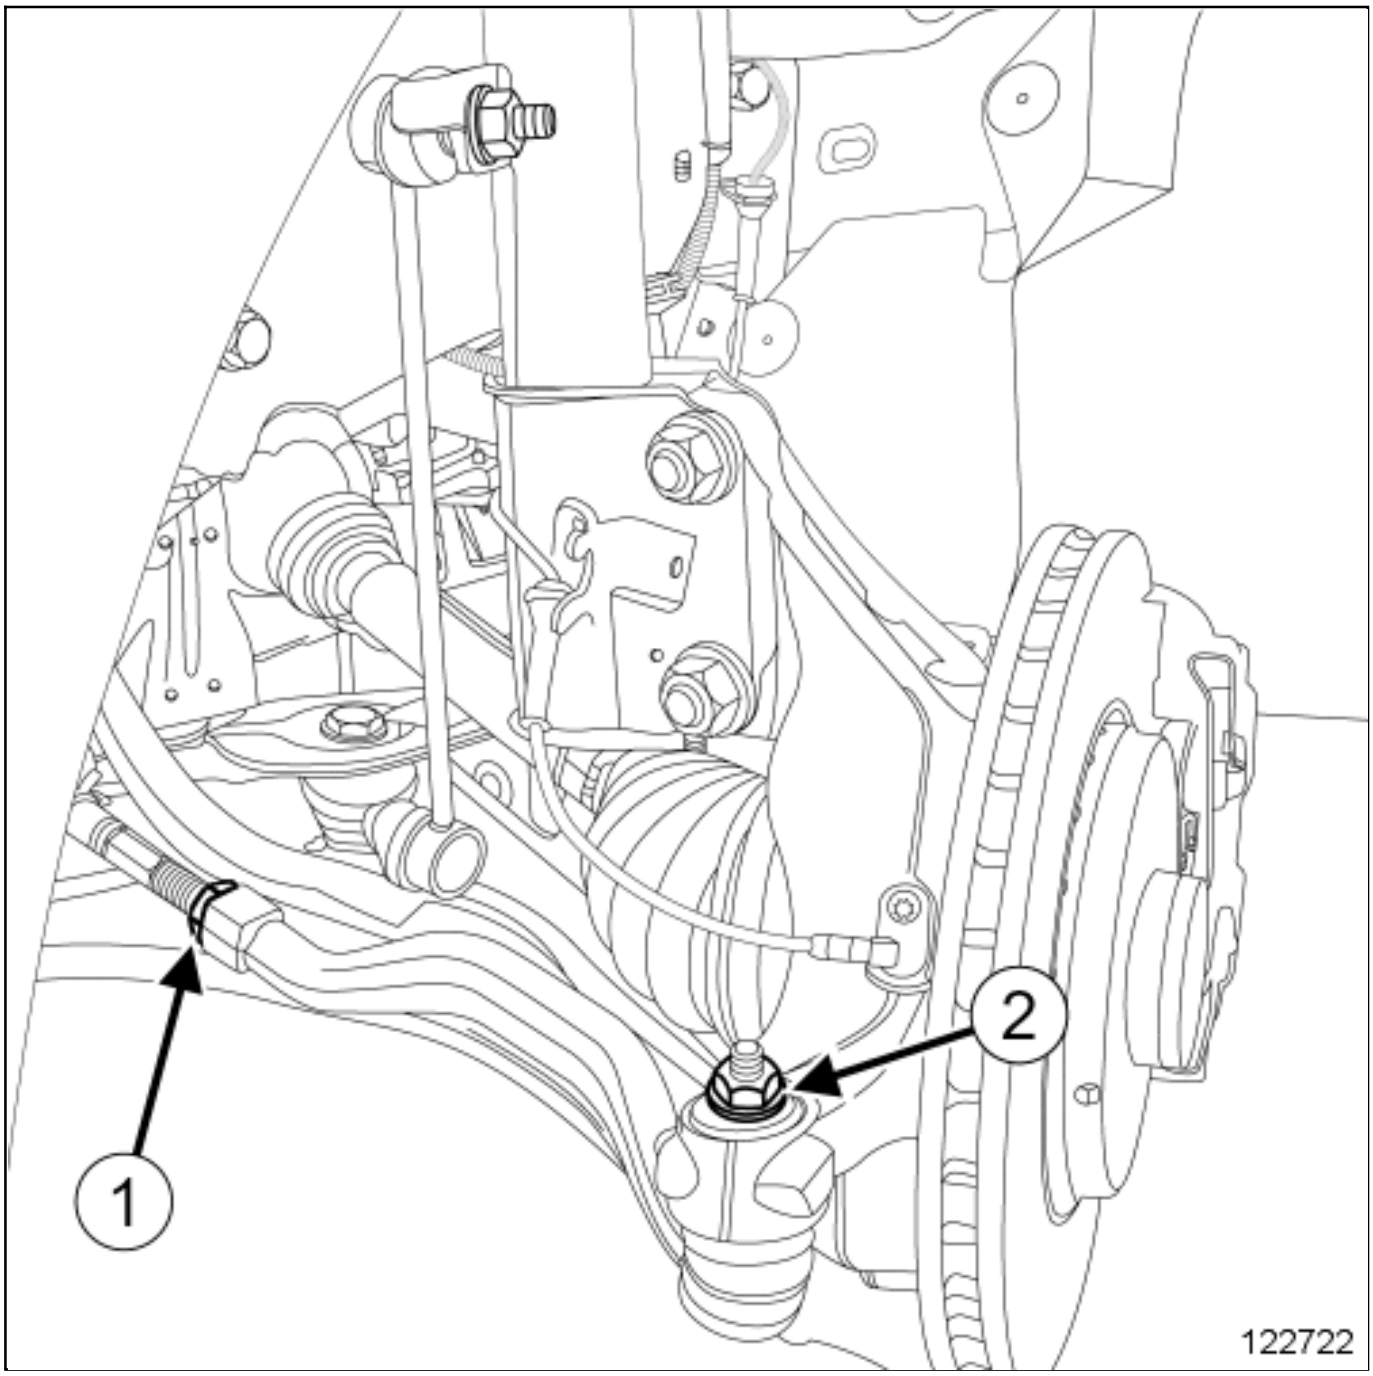
Special tooling required	
Ball joint extractor.	Tav. 476

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

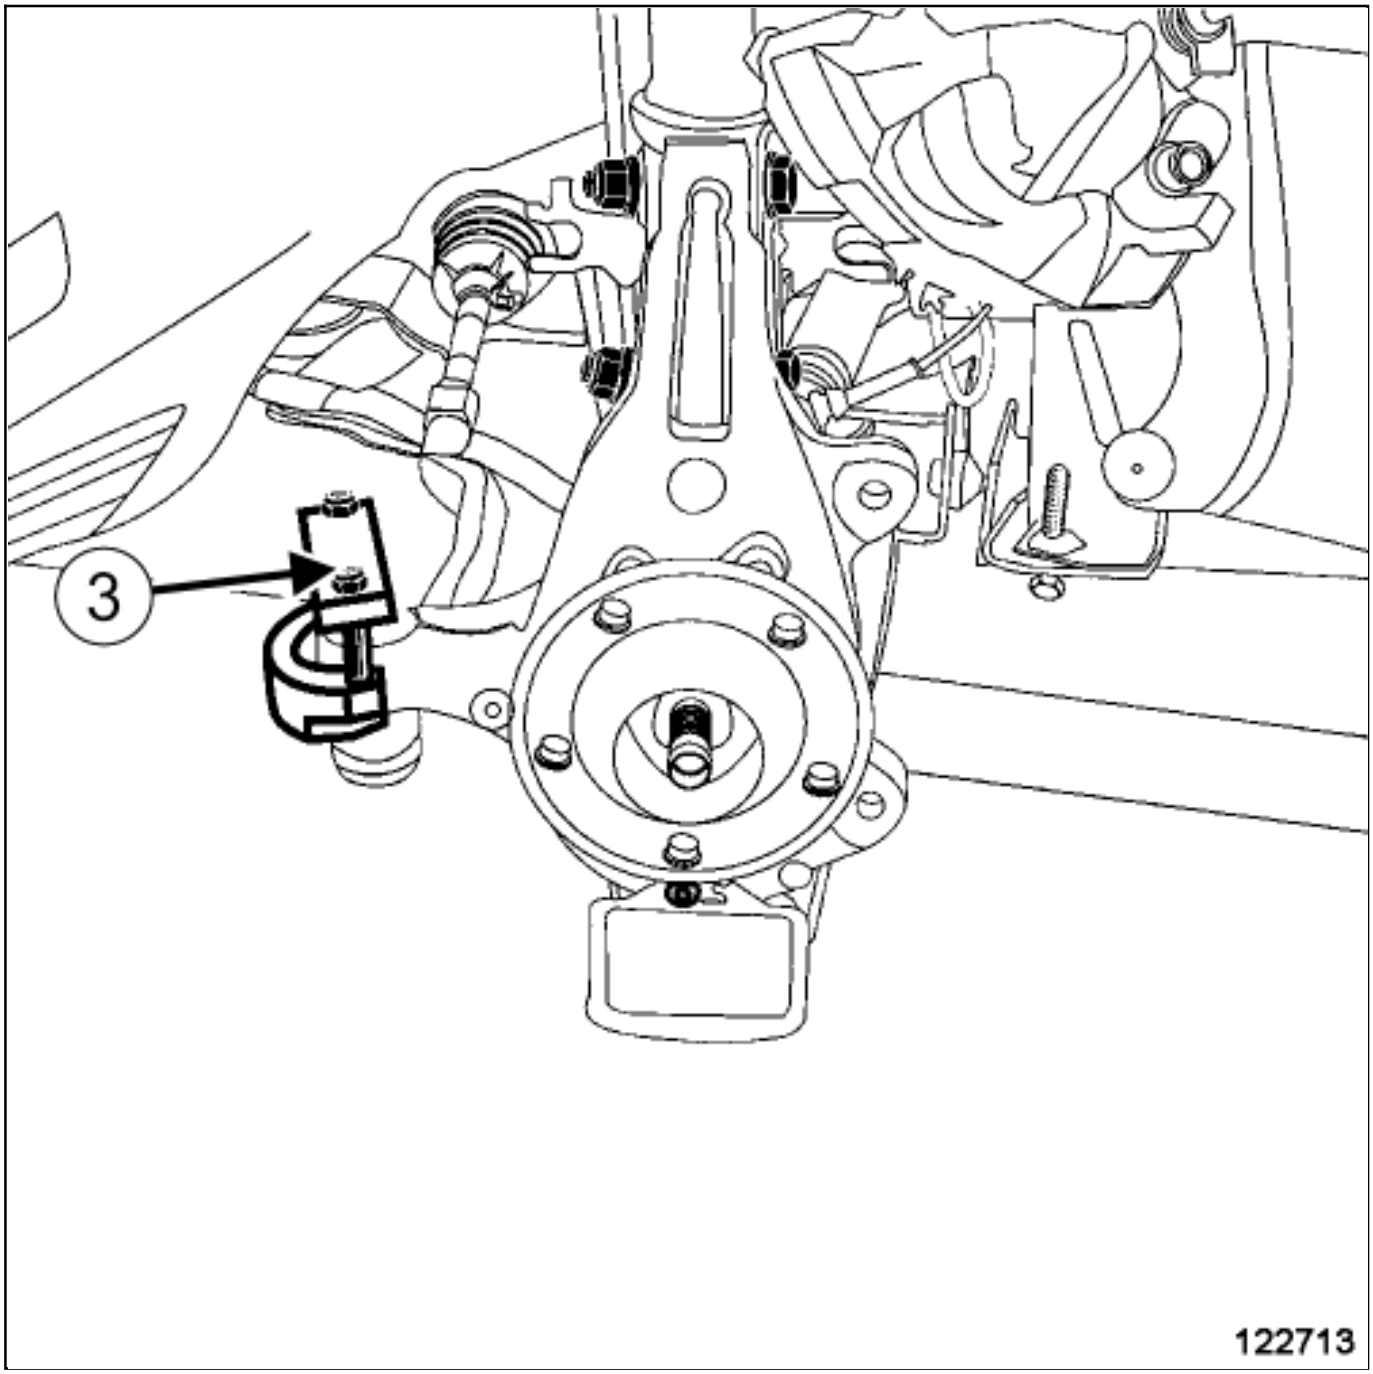
- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

Location and specifications (tightening torques, parts always to be replaced, etc.)Steering assembly: Exploded view .



REMOVAL

1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove the front wheelFront hub carrier assembly: Exploded view .

2. REMOVAL OPERATION

- Loosen the wheel alignment adjustment lock nut(1) .
- Remove the track rod ball joint nut(2) .

- Extract the ball joint usingBall joint extractor.(Tav. 476) .
- Unscrew the track rod anti-clockwise and note the number of turns for refitting.
- Remove the track rod.

REFITTING

1. REFITTING OPERATION

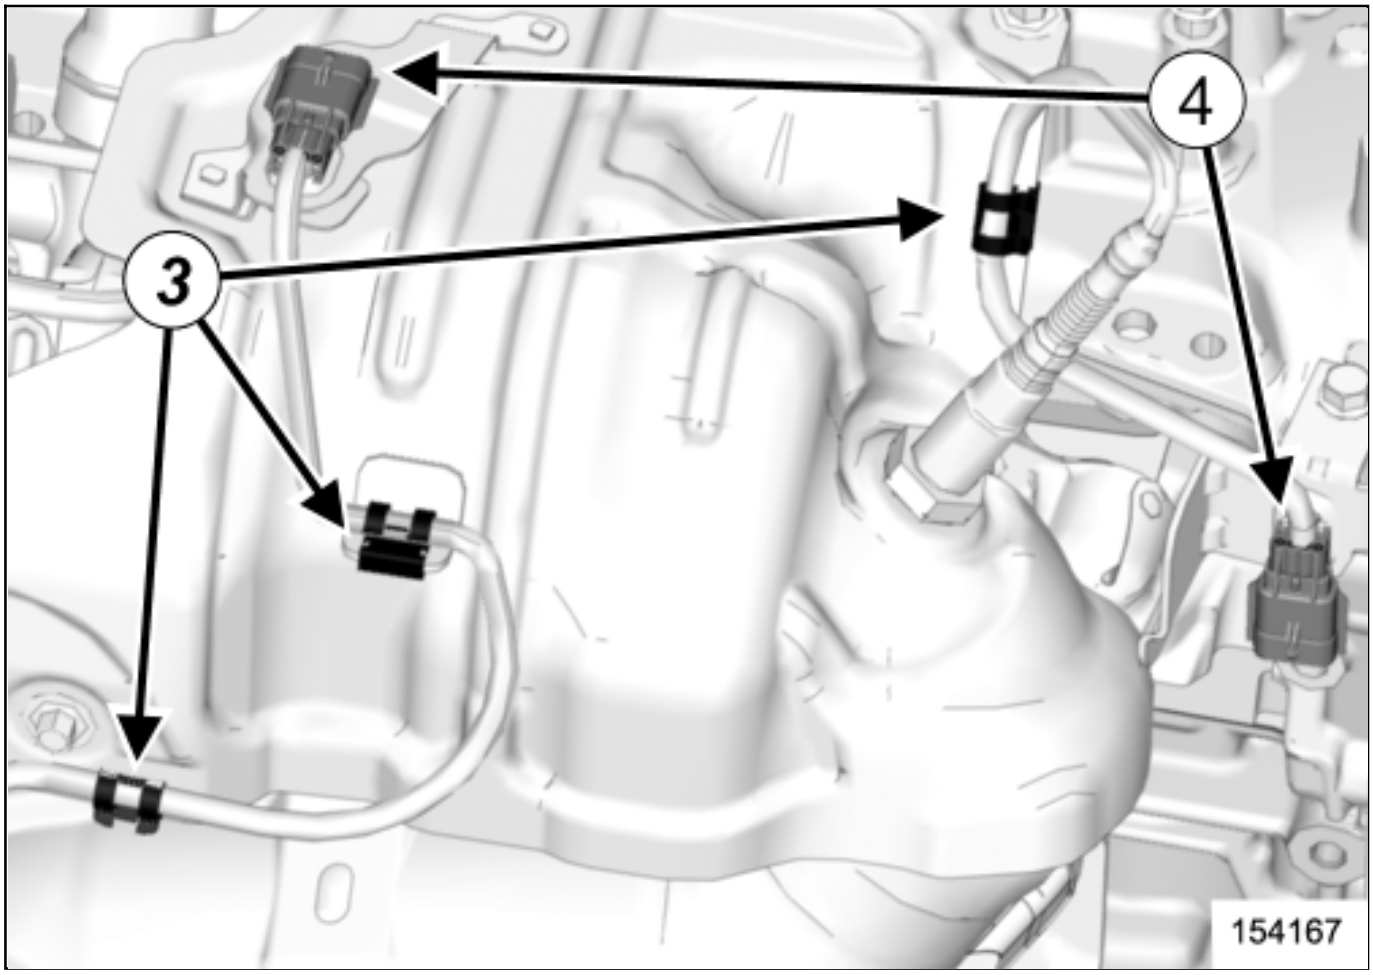
- Screw the track rod back in place by the number of turns noted during removal.
- Fit the track rod end in the hub carrier.
- Refit the track rod ball joint nut.
- Torque tighten Steering assembly: Exploded view :
  - the track rod ball joint nut,
  - the wheel alignment adjusting lock nut.

2. FINAL OPERATION

- Refit the front wheel Front hub carrier assembly: Exploded view .
- Check the axle geometry Axle assemblies: Check .
- If necessary, adjust the geometry of the axle assemblies Front axle system: Adjustment .

TURBOCHARGER COOLANT PIPE: REMOVAL - REFITTING

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583



parts always to be replaced:
Turbocharger coolant pipe

Locations and specifications (tightening torques, parts always to be replaced, etc.)Exhaust assembly in engine compartment: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the batteryBattery: Removal - Refitting .

- Unclip:
  - the oxygen sensor wiring clips(**3**) ,
  - the oxygen sensor connectors(**4**) .

- Remove the upstream oxygen sensor **Exhaust assembly in engine compartment: Exploded view** .

- Remove **Exhaust assembly in engine compartment: Exploded view** :
  - the upper turbo-manifold heat shield bolts,
  - the upper turbo-manifold heat shield.

2. REMOVAL OPERATION

- Fit toolsPipe clamps.(Ms. 583) Exhaust assembly in engine compartment: Exploded view :
  - on the turbo-manifold coolant pipe supply hose,
  - on the turbo-manifold coolant pipe outlet hose.
- Move the turbo-manifold coolant pipe hose clips using the toolRemote operation pliers for hose clips. (Mot. 1448) .
- Disconnect Exhaust assembly in engine compartment: Exploded view :
  - the turbo-manifold coolant pipe supply hose,
  - the turbo-manifold coolant pipe outlet hose.
- Remove Exhaust assembly in engine compartment: Exploded view :
  - the turbo-manifold coolant pipe bolts,
  - the turbo-manifold coolant pipe bracket bolt,
  - the turbo-manifold coolant pipe.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Turbocharger coolant pipe .

Using surface cleanerVehicle: Parts and consumables for the repair , clean and degrease the bearing faces of of the turbo-manifold.

2. REFITTING OPERATION

Refit Exhaust assembly in engine compartment: Exploded view :

- the new turbo-manifold coolant pipe,
- the turbo-manifold coolant pipe bolts,
- the turbo-manifold coolant pipe bracket bolt.

Torque tightenExhaust assembly in engine compartment: Exploded view :

- the turbo-manifold coolant pipe bracket bolt,
- the turbo-manifold coolant pipe bolts.

Connect Exhaust assembly in engine compartment: Exploded view v:

- the turbo-manifold coolant pipe supply hose,
- the turbo-manifold coolant pipe outlet hose.

Fit the turbo-manifold coolant pipe hose clips using the toolRemote operation pliers for hose clips. (Mot. 1448) .

Remove the toolsPipe clamps.(Ms. 583) Exhaust assembly in engine compartment: Exploded view :

- from the turbo-manifold coolant pipe supply hose,
- from the turbo-manifold coolant pipe outlet hose.

3. FINAL OPERATION

Refit Exhaust assembly in engine compartment: Exploded view :

- the upper turbo-manifold heat shield.
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield boltsExhaust assembly in engine compartment: Exploded view .

Proceed in the reverse order to removal.

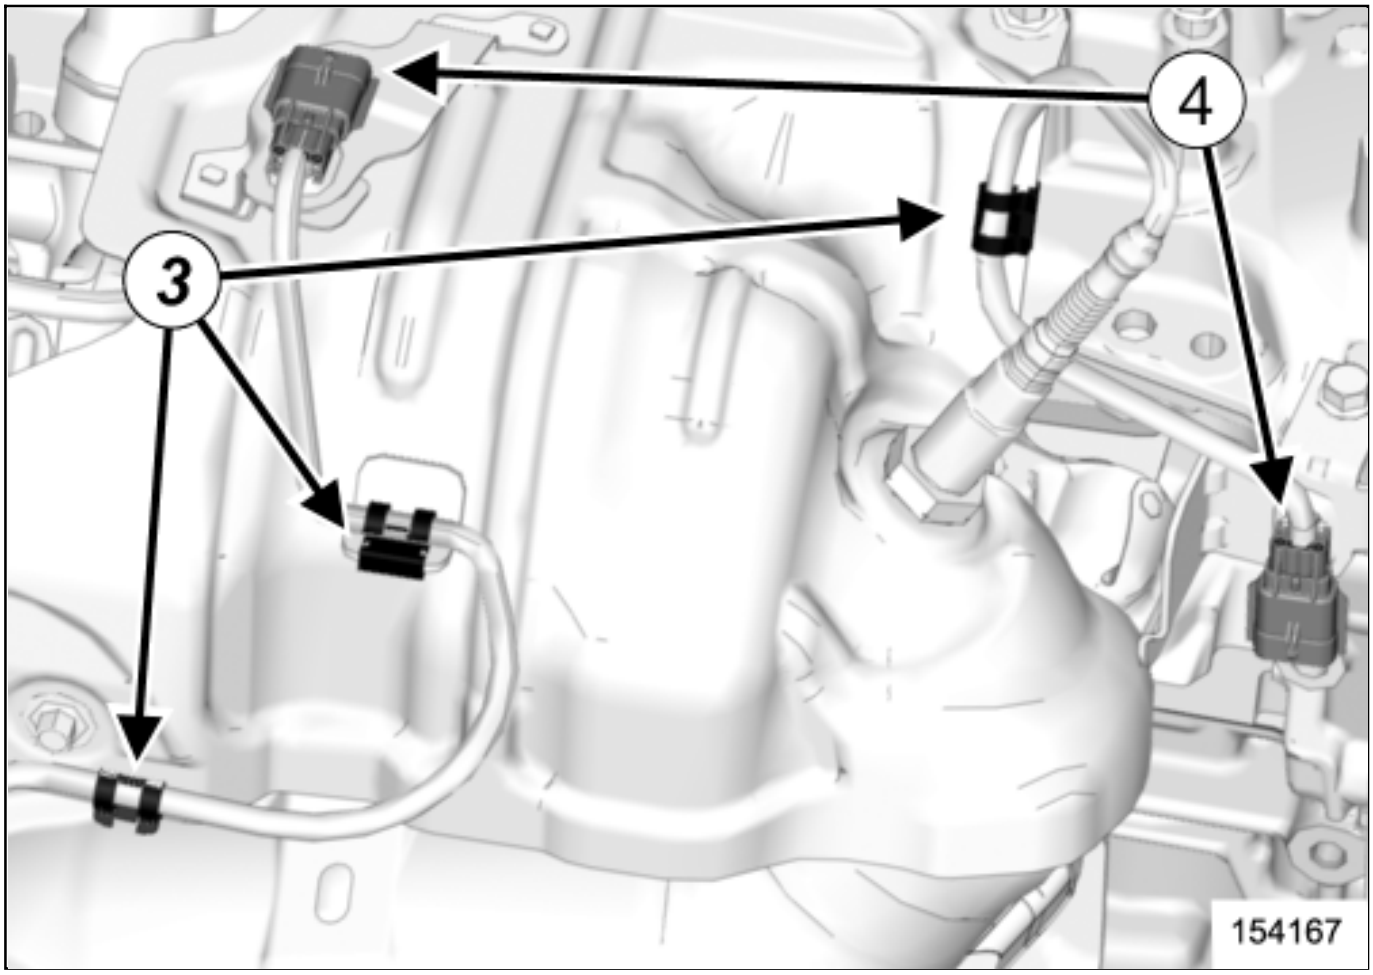
Perform the following operations:

- top up the coolant level,
- bleed the cooling systemCooling system: Draining - Refilling .

XSL version : 3.02 du 22/07/11

TURBOCHARGER COOLANT PIPE: REMOVAL - REFITTING

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583



parts always to be replaced:
Turbocharger coolant pipe

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the batteryBattery: Removal - Refitting .

- Unclip:
  - the oxygen sensor wiring clips(3) ,
  - the oxygen sensor connectors(4) .

- Remove the upstream oxygen sensor(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

- Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :
  - the upper turbo-manifold heat shield bolts,
  - the upper turbo-manifold heat shield.

2. REMOVAL OPERATION

- Fit toolsPipe clamps.(Ms. 583) (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :
  - on the turbo-manifold coolant pipe supply hose,
  - on the turbo-manifold coolant pipe outlet hose.
- Move the turbo-manifold coolant pipe hose clips using the toolRemote operation pliers for hose clips. (Mot. 1448) .
- Disconnect (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :
  - the turbo-manifold coolant pipe supply hose,
  - the turbo-manifold coolant pipe outlet hose.
- Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :
  - the turbo-manifold coolant pipe bolts,
  - the turbo-manifold coolant pipe bracket bolt,
  - the turbo-manifold coolant pipe.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Turbocharger coolant pipe .

Using surface cleanerVehicle: Parts and consumables for the repair , clean and degrease the bearing faces of of the turbo-manifold.

2. REFITTING OPERATION

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the new turbo-manifold coolant pipe,
- the turbo-manifold coolant pipe bolts,
- the turbo-manifold coolant pipe bracket bolt.

Torque tighten(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the turbo-manifold coolant pipe bracket bolt,
- the turbo-manifold coolant pipe bolts.

Connect (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) v:

- the turbo-manifold coolant pipe supply hose,
- the turbo-manifold coolant pipe outlet hose.

Fit the turbo-manifold coolant pipe hose clips using the toolRemote operation pliers for hose clips. (Mot. 1448) .

Remove the toolsPipe clamps.(Ms. 583) (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- from the turbo-manifold coolant pipe supply hose,
- from the turbo-manifold coolant pipe outlet hose.

3. FINAL OPERATION

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upper turbo-manifold heat shield.
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield bolts(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Proceed in the reverse order to removal.

Perform the following operations:

- top up the coolant level,
- bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

XSL version : 3.02 du 22/07/11

TURBOCHARGER OIL PIPE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:
turbocharger oil supply pipe
Turbocharger oil return pipe

WARNING

Wear heat protective gloves during the operation.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

Note:

This procedure deals with removal and refitting of the turbo-manifold oil supply pipe and the turbo-manifold oil return pipe.

Locations and specifications (tightening torques, parts always to be replaced, etc.)Exhaust assembly in engine compartment: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the battery Battery: Removal - Refitting ,
- the air filter unit Air inlet assembly: Exploded view ,
- the front right-hand wheel Front hub carrier assembly: Exploded view .

Remove the engine undertray.

Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

Remove the front right-hand wheel driveshaft Front hub carrier assembly: Exploded view .

Remove:

- the lower engine tie-bar Engine-gearbox unit support assembly: Exploded view ,
- the upstream oxygen sensor Exhaust assembly in engine compartment: Exploded view ,
- the catalytic pre-converter Exhaust assembly in engine compartment: Exploded view .

2. REMOVAL OPERATION

1- REMOVAL OF THE TURBO-MANIFOLD OIL SUPPLY PIPE

Remove Exhaust assembly in engine compartment: Exploded view :

- the turbo-manifold oil supply pipe hollow bolt from the engine,
- the turbo-manifold oil supply pipe bolt,
- the turbo-manifold oil supply pipe hollow bolt from the turbo-manifold,
- the turbo-manifold oil supply pipe.

2- REMOVAL OF THE TURBO-MANIFOLD OIL RETURN PIPE

Remove the turbo-manifold oil return pipe bolts from the turbo-manifold Exhaust assembly in engine compartment: Exploded view .

Disconnect the turbo-manifold oil return pipe from the cylinder block Exhaust assembly in engine compartment: Exploded view .

Remove the turbo-manifold oil return pipe Exhaust assembly in engine compartment: Exploded view .

REFITTING

1. REFITTING PREPARATION OPERATION

1- REFITTING THE TURBOCHARGER OIL SUPPLY PIPE

parts always to be replaced: turbocharger oil supply pipe .

Clean and degrease, using surface cleaner Vehicle: Parts and consumables for the repair the joint faces at the turbocharger oil supply pipe hollow bolts.

2- REFITTING THE TURBOCHARGER OIL RETURN PIPE

parts always to be replaced: Turbocharger oil return pipe .

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the turbocharger oil return pipe joint face,
- the cylinder block oil return pipe joint face.

Lubricate the O-ring of the turbocharger oil return pipe.

2. REFITTING OPERATION

1- REFITTING THE TURBO-MANIFOLD OIL SUPPLY PIPE

Refit Exhaust assembly in engine compartment: Exploded view :

- the new turbo-manifold oil supply pipe,
- the turbo-manifold oil supply pipe hollow bolt on the turbo-manifold,
- the turbo-manifold oil supply pipe hollow bolt on the engine,
- the turbo-manifold oil supply pipe bolt.

Torque tightenExhaust assembly in engine compartment: Exploded view :

- the turbo-manifold oil supply pipe hollow bolt on the turbo-manifold,

- the turbo-manifold oil supply pipe hollow bolt on the engine,
- the turbo-manifold oil supply pipe bolt.

Proceed in the reverse order to removal.

Top up the engine oil if necessary.

2- REFITTING THE TURBO-MANIFOLD OIL RETURN PIPE

Refit the new turbo-manifold oil return pipe Exhaust assembly in engine compartment: Exploded view .

Connect the turbo-manifold oil return pipe on the cylinder block Exhaust assembly in engine compartment: Exploded view .

Refit the turbo-manifold oil return pipe bolts on the turbo-manifold Exhaust assembly in engine compartment: Exploded view .

Torque tighten the turbo-manifold oil return pipe bolts on the turbo-manifold Exhaust assembly in engine compartment: Exploded view .

Proceed in the reverse order to removal.

Top up the engine oil if necessary.

TURBOCHARGER OIL PIPE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:
turbocharger oil supply pipe
Turbocharger oil return pipe

WARNING

Wear heat protective gloves during the operation.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

Note:

This procedure deals with removal and refitting of the turbo-manifold oil supply pipe and the turbo-manifold oil return pipe.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the battery Battery: Removal - Refitting ,
- the air filter unit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the front right-hand wheel Front hub carrier assembly: Exploded view .

Remove the engine undertray.

Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

Remove the front right-hand wheel driveshaft Front hub carrier assembly: Exploded view .

Remove:

- the lower engine tie-bar Engine-gearbox unit support assembly: Exploded view ,
- the upstream oxygen sensor (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) ,
- the catalytic pre-converter (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REMOVAL OPERATION

1- REMOVAL OF THE TURBO-MANIFOLD OIL SUPPLY PIPE

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the turbo-manifold oil supply pipe hollow bolt from the engine,
- the turbo-manifold oil supply pipe bolt,
- the turbo-manifold oil supply pipe hollow bolt from the turbo-manifold,
- the turbo-manifold oil supply pipe.

2- REMOVAL OF THE TURBO-MANIFOLD OIL RETURN PIPE

Remove the turbo-manifold oil return pipe bolts from the turbo-manifold(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Disconnect the turbo-manifold oil return pipe from the cylinder block(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Remove the turbo-manifold oil return pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

1- REFITTING THE TURBOCHARGER OIL SUPPLY PIPE

parts always to be replaced: turbocharger oil supply pipe .

Clean and degrease, using surface cleanerVehicle: Parts and consumables for the repair the joint faces

at the turbocharger oil supply pipe hollow bolts.

2- REFITTING THE TURBOCHARGER OIL RETURN PIPE

parts always to be replaced: Turbocharger oil return pipe .

Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease:

- the turbocharger oil return pipe joint face,
- the cylinder block oil return pipe joint face.

Lubricate the O-ring of the turbocharger oil return pipe.

2. REFITTING OPERATION

1- REFITTING THE TURBO-MANIFOLD OIL SUPPLY PIPE

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the new turbo-manifold oil supply pipe,
- the turbo-manifold oil supply pipe hollow bolt on the turbo-manifold,
- the turbo-manifold oil supply pipe hollow bolt on the engine,
- the turbo-manifold oil supply pipe bolt.

Torque tighten (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the turbo-manifold oil supply pipe hollow bolt on the turbo-manifold,
- the turbo-manifold oil supply pipe hollow bolt on the engine,
- the turbo-manifold oil supply pipe bolt.

Proceed in the reverse order to removal.

Top up the engine oil if necessary.

2- REFITTING THE TURBO-MANIFOLD OIL RETURN PIPE

Refit the new turbo-manifold oil return pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Connect the turbo-manifold oil return pipe on the cylinder block(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Refit the turbo-manifold oil return pipe bolts on the turbo-manifold(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Torque tighten the turbo-manifold oil return pipe bolts on the turbo-manifold(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Proceed in the reverse order to removal.

Top up the engine oil if necessary.

TURBOCHARGER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583

WARNING

Wear heat protective gloves during the operation.

CAUTION

The turbocharger pressure regulator rod must not be adjusted.

CAUTION

Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

Failure to observe the following instructions will lead to the turbocharger breaking again.

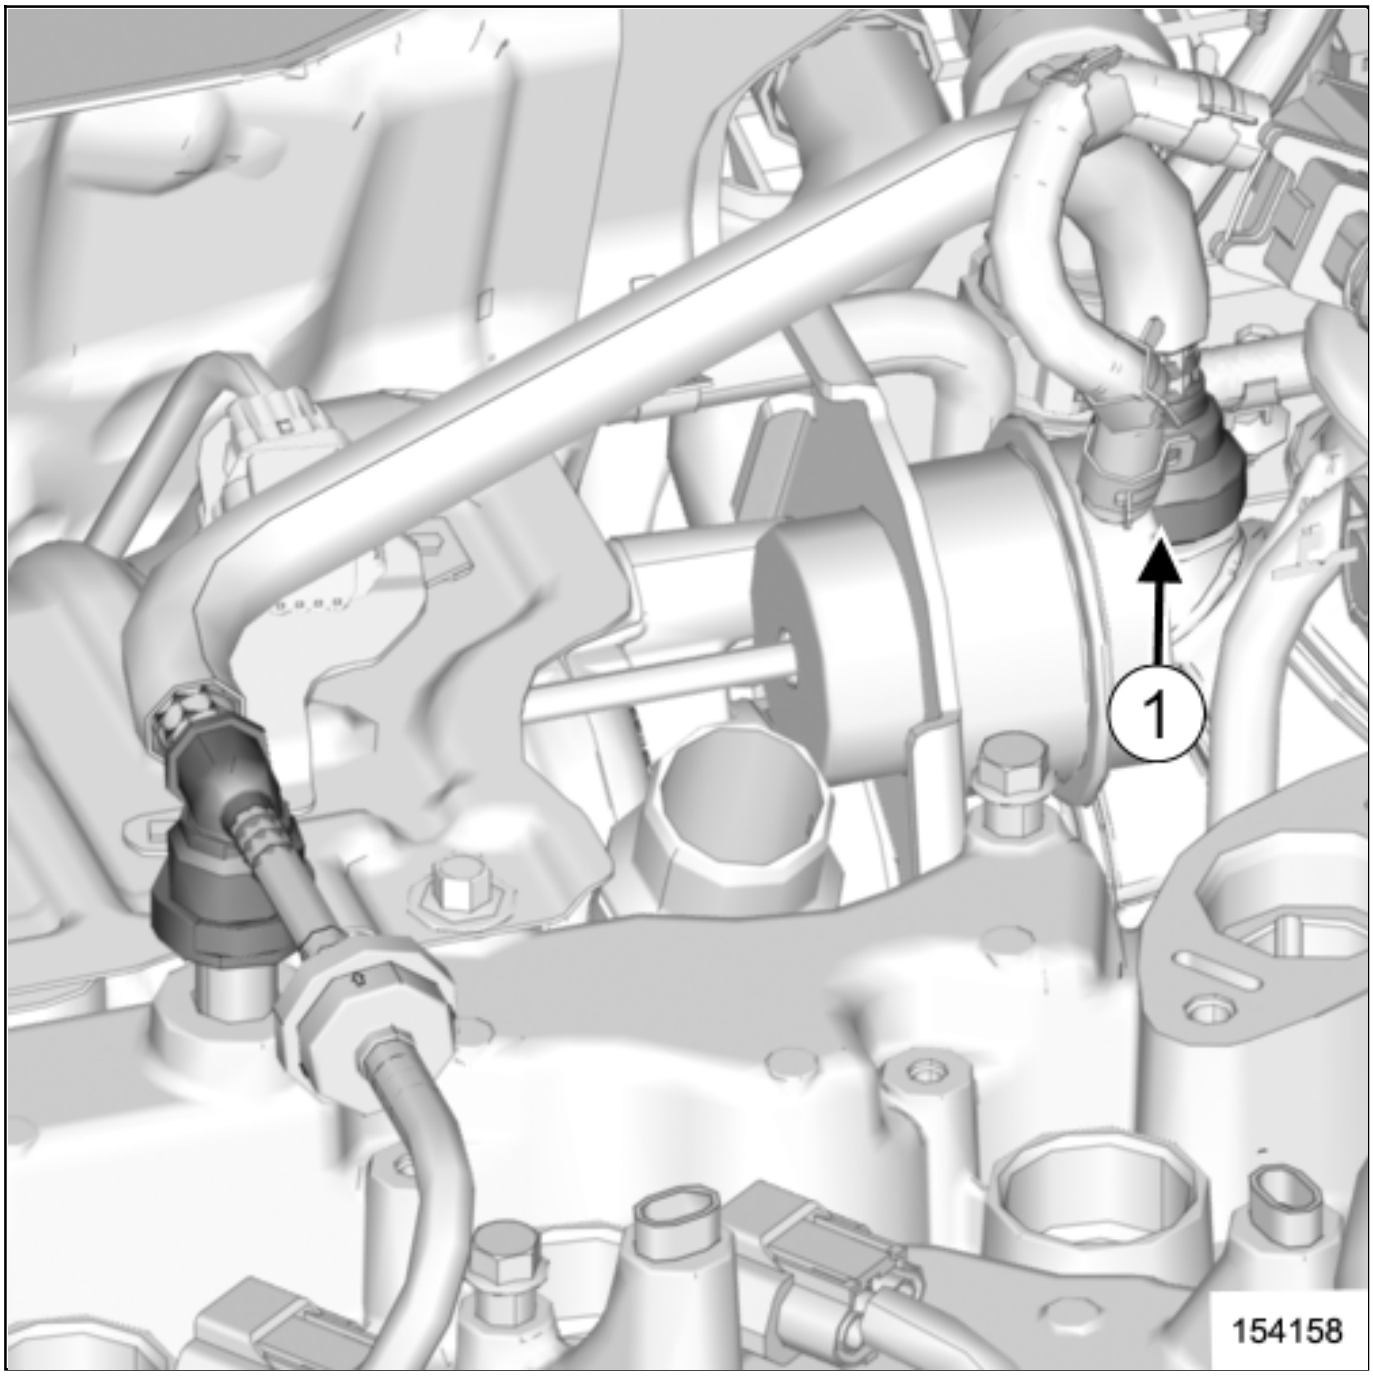
CAUTION

Following a turbocharger fault, check that the intercooler and air circuit assembly are not full of oil. If they are, remove them and clean them with a cleaning tray or station and dry them with a compressed air gun.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.



Locations and specifications (tightening torques, parts always to be replaced, etc.)Exhaust assembly in engine compartment: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the engine undertray,
  - the turbocharger air outlet pipeAir inlet assembly: Exploded view ,
  - the front right-hand wheelFront hub carrier assembly: Exploded view .
- Drain the automatic gearboxAutomatic gearbox oil: Draining - Filling
- Remove the front right-hand wheel driveshaftFront right-hand driveshaft: Removal - Refitting .
- Remove:

- the right-hand differential output seal Differential output seal: Removal - Refitting ,
- the lower engine tie-bar Engine-gearbox unit support assembly: Exploded view ,
- the upstream oxygen sensor,
- the catalytic pre-converter Exhaust assembly in engine compartment: Exploded view ,
- the turbo-manifold oil supply pipe Exhaust assembly in engine compartment: Exploded view ,
- the turbo-manifold oil return pipe Exhaust assembly in engine compartment: Exploded view .

- Disconnect the petrol vapour rebreathing pipe(1) .

- Move the clip from the exhaust gas pressure sensor pipeExhaust assembly in engine compartment: Exploded view .

- Disconnect the exhaust gas pressure sensor pipeExhaust assembly in engine compartment: Exploded view .

- Move the clip from the exhaust gas pressure take-off pipeExhaust assembly in engine compartment: Exploded view .

- Disconnect the exhaust gas pressure take-off pipeExhaust assembly in engine compartment: Exploded view .

- Move the high pressure discharge pipe clip from the turbo-manifold air inlet pipe using the tool Remote operation pliers for hose clips.(Mot. 1448) Air inlet assembly: Exploded view .

- Disconnect the high pressure discharge pipeAir inlet assembly: Exploded view .

2. REMOVAL OPERATION

- Fit the toolPipe clamps.(Ms. 583) on the turbo-manifold coolant hoses.

- Move the clips from the turbo-manifold coolant hoses using the toolRemote operation pliers for hose clips.(Mot. 1448) Coolant circuit assembly: Exploded view .

- Disconnect the turbo-manifold coolant hosesCoolant circuit assembly: Exploded view .

-

Loosen the clip from the turbo-manifold air inlet pipe Air inlet assembly: Exploded view .

Disconnect the turbo-manifold air inlet pipe Air inlet assembly: Exploded view .

Remove Exhaust assembly in engine compartment: Exploded view :

- the lower turbo-manifold heat shield bolts,
- the lower turbo-manifold heat shield.

Loosen the turbo-manifold air inlet pipe clip from the air filter unit Air inlet assembly: Exploded view .

Disconnect the turbo-manifold air inlet pipe from the air filter unit Air inlet assembly: Exploded view .

Remove the turbo-manifold air inlet pipe Air inlet assembly: Exploded view .

Remove Exhaust assembly in engine compartment: Exploded view :

- the turbo-manifold nuts,
- the turbo-manifold,
- the turbo-manifold seal.

1- IF REPLACING THE TURBOCHARGER

Remove the turbo-manifold cooling pipes Exhaust assembly in engine compartment: Exploded view .

REFITTING

1. REFITTING PREPARATION OPERATION

Parts always to be replaced:

- the turbo-manifold seal.

Use grey abrasive pads Vehicle: Parts and consumables for the repair to clean the gasket face:

- of the turbo-manifold if reused,
- of the cylinder block.

Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease the joint faces:

- of the turbo-manifold if reused,
- of the cylinder block.

Note:

If a stud becomes loose during the removal, replace it with a new stud and coat it with high strength thread lock Vehicle: Parts and consumables for the repair .

Torque tighten the new studs of the turbo-manifold Exhaust assembly in engine compartment: Exploded view .

CAUTION

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Check that there are no leaks. If there are, replace the part.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

1- IF REPLACING THE TURBOCHARGER

- Refit the turbo-manifold cooling pipes Exhaust assembly in engine compartment: Exploded view .

2. REFITTING OPERATION

- Refit Exhaust assembly in engine compartment: Exploded view :
  - the new turbo-manifold seal,
  - the turbo-manifold.
- Torque tighten in the order the turbo-manifold nuts Exhaust assembly in engine compartment: Exploded view .
- Refit the lower turbo-manifold heat shield Exhaust assembly in engine compartment: Exploded view .
- Torque tighten the lower turbo-manifold heat shield bolts Exhaust assembly in engine compartment: Exploded view .
- Proceed in the reverse order to removal.
- Top up and bleed the cooling system Cooling system: Draining - Refilling .
- Refill the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

XSL version : 3.02 du 22/07/11

TURBOCHARGER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448
Pipe clamps.	Ms. 583

WARNING

Wear heat protective gloves during the operation.

CAUTION

The turbocharger pressure regulator rod must not be adjusted.

CAUTION

Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

Failure to observe the following instructions will lead to the turbocharger breaking again.

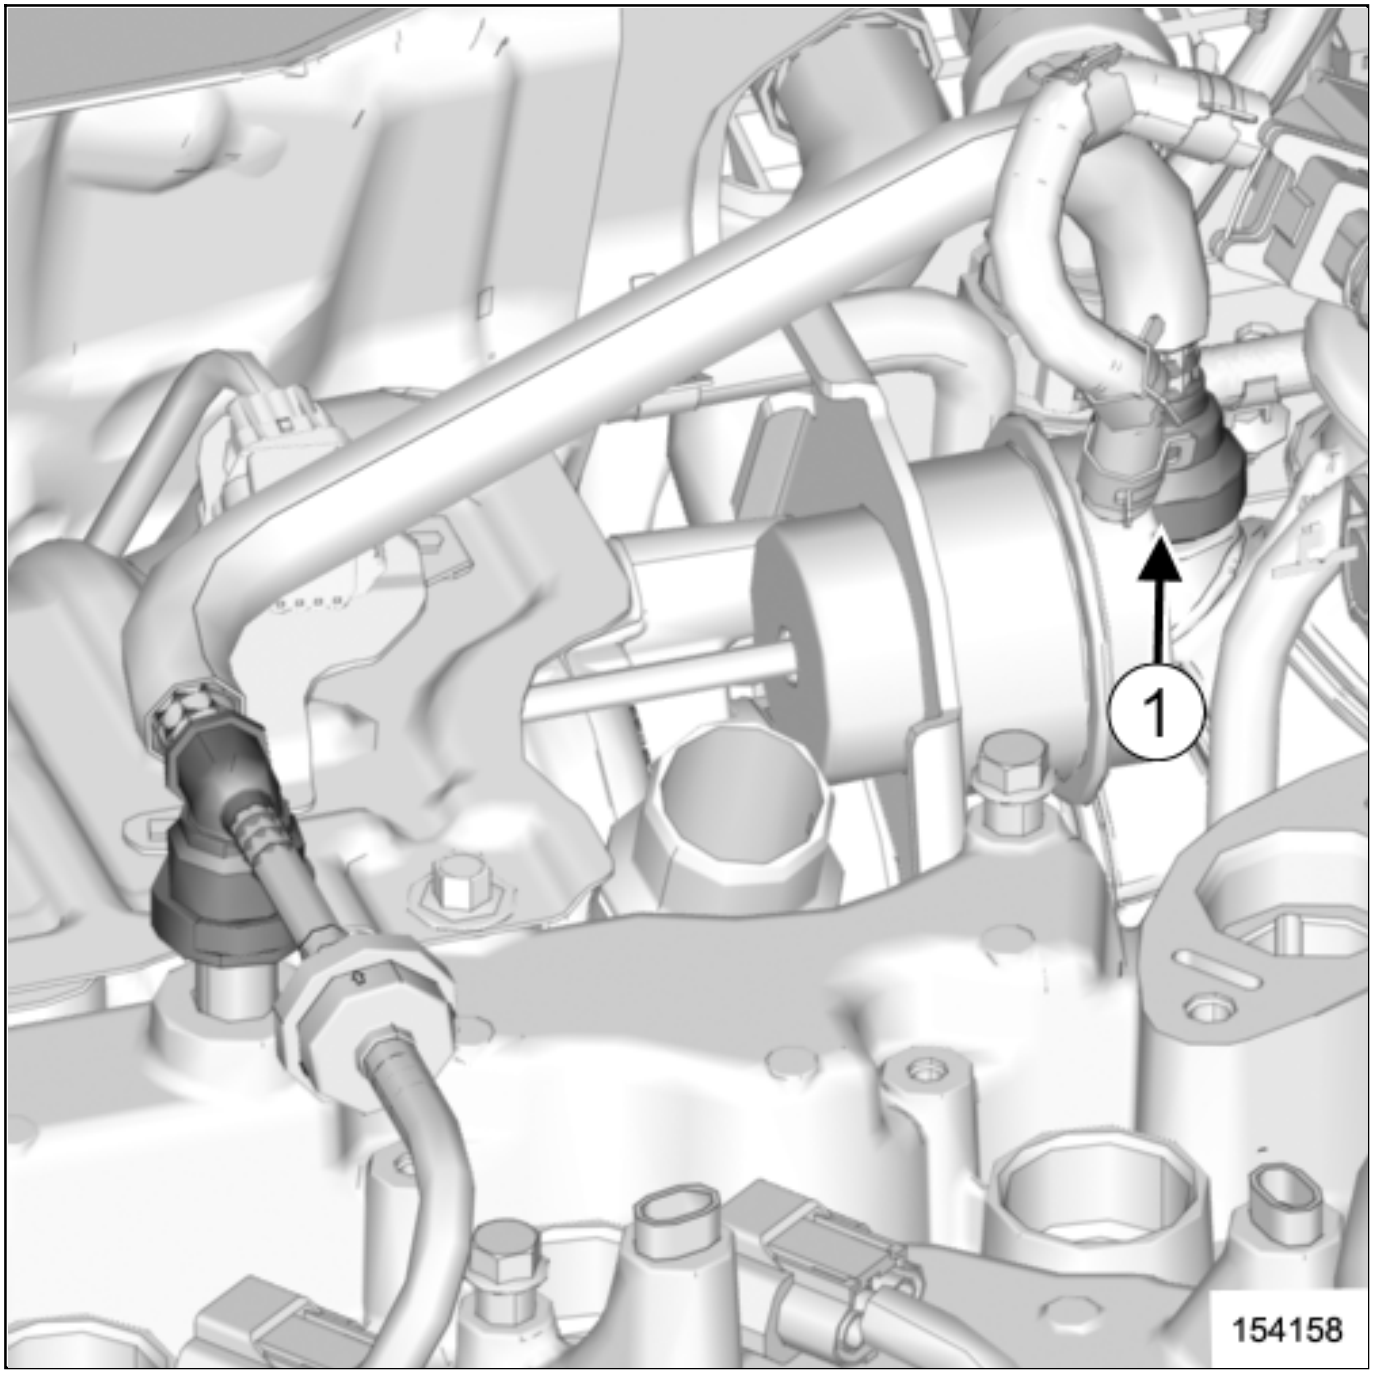
CAUTION

Following a turbocharger fault, check that the intercooler and air circuit assembly are not full of oil. If they are, remove them and clean them with a cleaning tray or station and dry them with a compressed air gun.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.



Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove:
  - the engine undertray,
  - the turbocharger air outlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the front right-hand wheel Front hub carrier assembly: Exploded view .
- Drain the automatic gearbox Automatic gearbox oil: Draining - Filling
- Remove the front right-hand wheel driveshaft Front right-hand driveshaft: Removal - Refitting .
- Remove:

- the right-hand differential output seal **Differential output seal: Removal - Refitting** ,
- the lower engine tie-bar **Engine-gearbox unit support assembly: Exploded view** ,
- the upstream oxygen sensor,
- the catalytic pre-converter **(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view)** ,
- the turbo-manifold oil supply pipe **(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view)** ,
- the turbo-manifold oil return pipe **(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view)** .

Disconnect the petrol vapour rebreathing pipe(1) .

Move the clip from the exhaust gas pressure sensor pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Disconnect the exhaust gas pressure sensor pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Move the clip from the exhaust gas pressure take-off pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Disconnect the exhaust gas pressure take-off pipe(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Move the high pressure discharge pipe clip from the turbo-manifold air inlet pipe using the tool Remote operation pliers for hose clips.(Mot. 1448) (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Disconnect the high pressure discharge pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REMOVAL OPERATION

Fit the toolPipe clamps.(Ms. 583) on the turbo-manifold coolant hoses.

Move the clips from the turbo-manifold coolant hoses using the toolRemote operation pliers for hose clips.(Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the turbo-manifold coolant hoses(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Loosen the clip from the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Disconnect the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the lower turbo-manifold heat shield bolts,

the lower turbo-manifold heat shield.

Loosen the turbo-manifold air inlet pipe clip from the air filter unit(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Disconnect the turbo-manifold air inlet pipe from the air filter unit(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove the turbo-manifold air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the turbo-manifold nuts,
- the turbo-manifold,
- the turbo-manifold seal.

1- IF REPLACING THE TURBOCHARGER

Remove the turbo-manifold cooling pipes(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Parts always to be replaced:

- the turbo-manifold seal.

Use grey abrasive pads Vehicle: Parts and consumables for the repair to clean the gasket face:

- of the turbo-manifold if reused,
- of the cylinder block.

Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease the joint faces:

- of the turbo-manifold if reused,
- of the cylinder block.

Note:

If a stud becomes loose during the removal, replace it with a new stud and coat it with high strength thread lock Vehicle: Parts and consumables for the repair .

Torque tighten the new studs of the turbo-manifold (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

CAUTION

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Check that there are no leaks. If there are, replace the part.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

1- IF REPLACING THE TURBOCHARGER

Refit the turbo-manifold cooling pipes(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REFITTING OPERATION

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the new turbo-manifold seal,
- the turbo-manifold.

Torque tighten in the order the turbo-manifold nuts(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Refit the lower turbo-manifold heat shield(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Torque tighten the lower turbo-manifold heat shield bolts(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

Proceed in the reverse order to removal.

Top up and bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

Refill the automatic gearbox oilAutomatic gearbox oil: Draining - Filling .

TURBOCHARGING: PRECAUTIONS FOR THE REPAIR

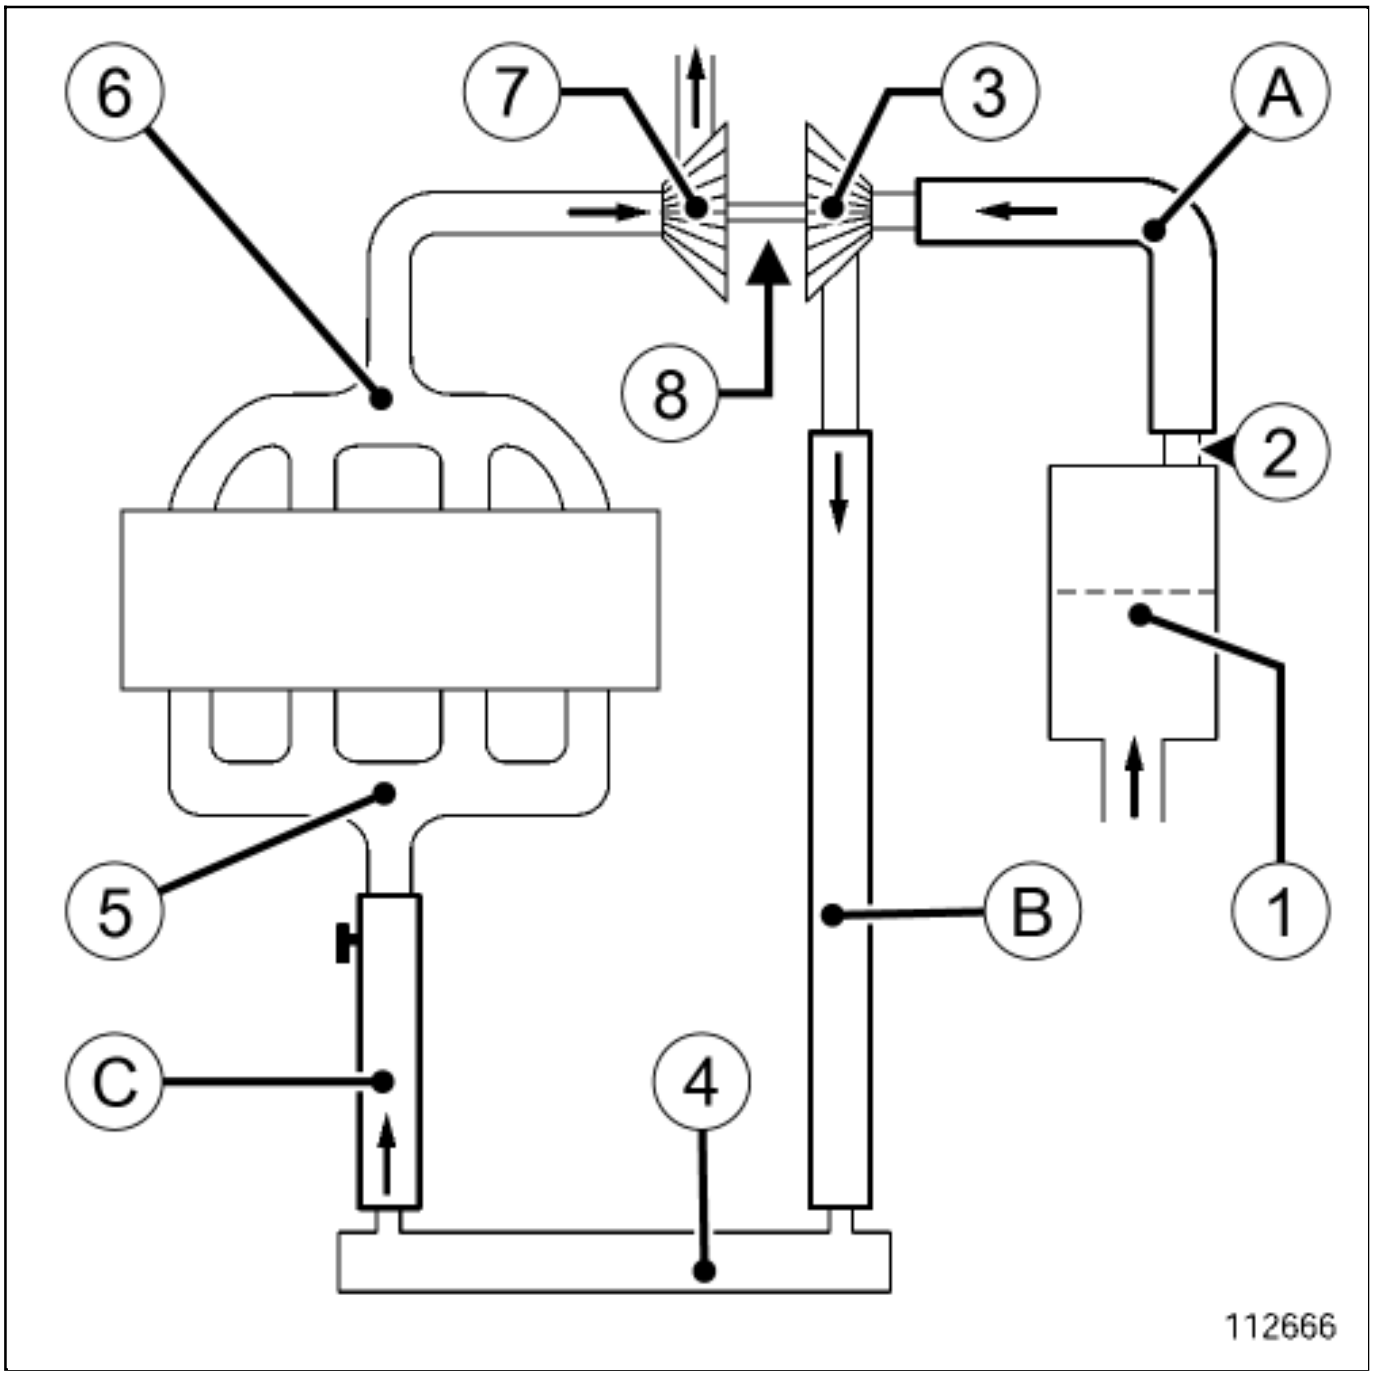
Note, one or more warnings are present in this procedure

Equipment required
parts washer

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

1. TURBOCHARGER: GENERAL INSTRUCTIONS



For the turbocharging pressure regulator check (see Fault finding - Tests) (TN 3419A, 12B, Turbocharging).

CAUTION

The turbocharger pressure regulator rod must not be adjusted.

2. TURBOCHARGER CIRCUIT DIAGRAM

(1) Air filter unit

(2) Air flowmeter

(3) Compressor wheel

(4) Intercooler

(5) Inlet distributor

(6) Exhaust manifold

(7) Turbine wheel

(8) Bearing system (bearing + wheel shaft)

(A) Air filter unit outlet pipe

(B) Turbocharger air outlet pipe

(C) Intercooler air outlet pipe

3. APPLICATION CONDITIONS OF INSTRUCTIONS

The instructions below must be followed when replacing a turbocharger due to mechanical damage:

- damage to the bearing system,
- broken shaft or turbine wheel,
- compressor wheel rubbing against the turbocharger casing,
- broken or damaged compressor wheel,
- extensive clogging of the turbine wheel casing (hard deposits).

FOR THE AIR CIRCUIT:

-Consequences:

- swarf or metal objects in the turbocharger inlet and outlet pipes,
- oil in the air circuit (collected in the intercooler).

-Risks (after replacing the turbocharger):

- metal objects sucked in by the compressor wheel (destruction of the turbocharger).

FOR THE LUBRICATION CIRCUIT:

-Consequences:

- swarf found in the engine oil circuit,
- circulation of swarf within the circuit.

-Risks (after replacing the turbocharger):

- premature wear on the bearing system (destruction of turbocharger).

CAUTION

Failure to observe the following instructions will lead to the turbocharger breaking again.

Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

INSTRUCTIONS:

- Drain the engine oil **Engine oil - Oil filter : Draining - Filling**
- Replace the oil filter **Engine oil - Oil filter : Draining - Filling** .
- Replace the seals and fittings,

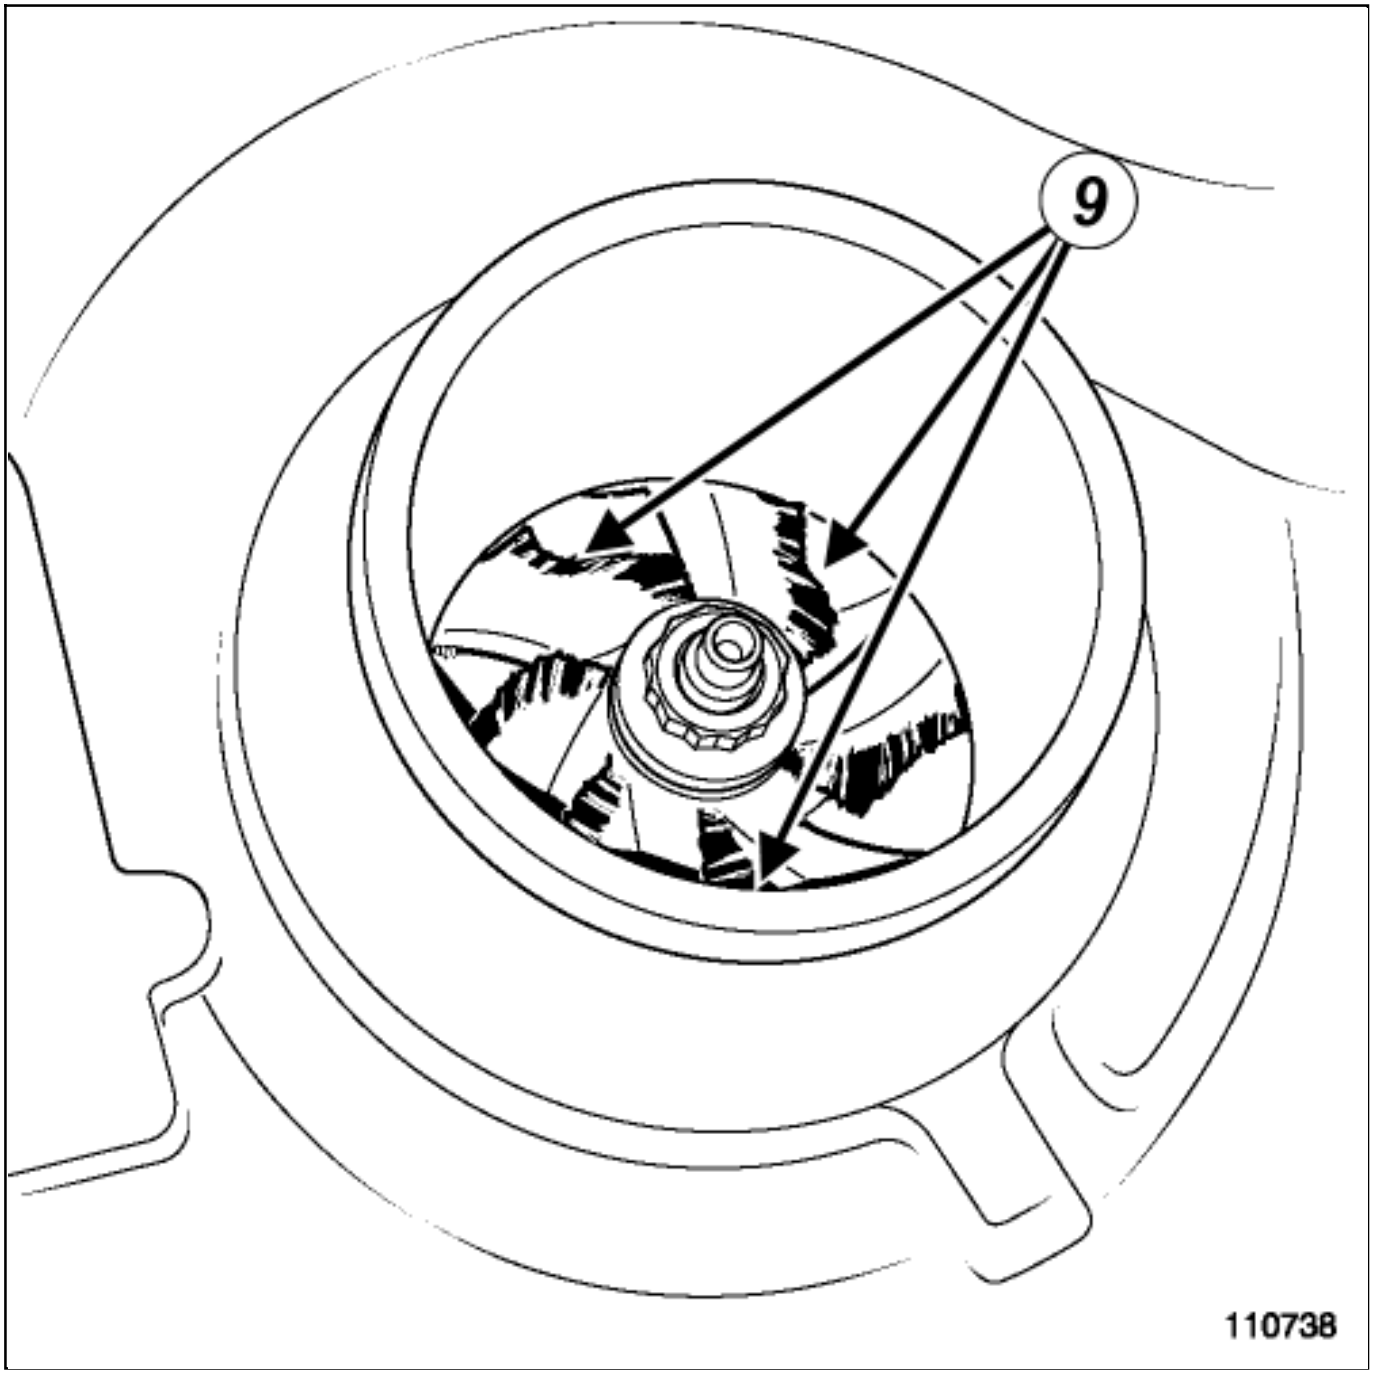
-Carry out the following only if the compressor wheel is broken or rubbing against the turbocharger casing:

- Drain the intercooler,
- Clean the turbocharger air pipes.

Note:

When carrying out an operation on the air or lubrication circuit, it is necessary to plug the open holes to prevent any risk of foreign bodies entering the system.

4. AIR CIRCUIT*: INSTRUCTIONS FOLLOWING MECHANICAL DAMAGE TO THE TURBOCHARGER



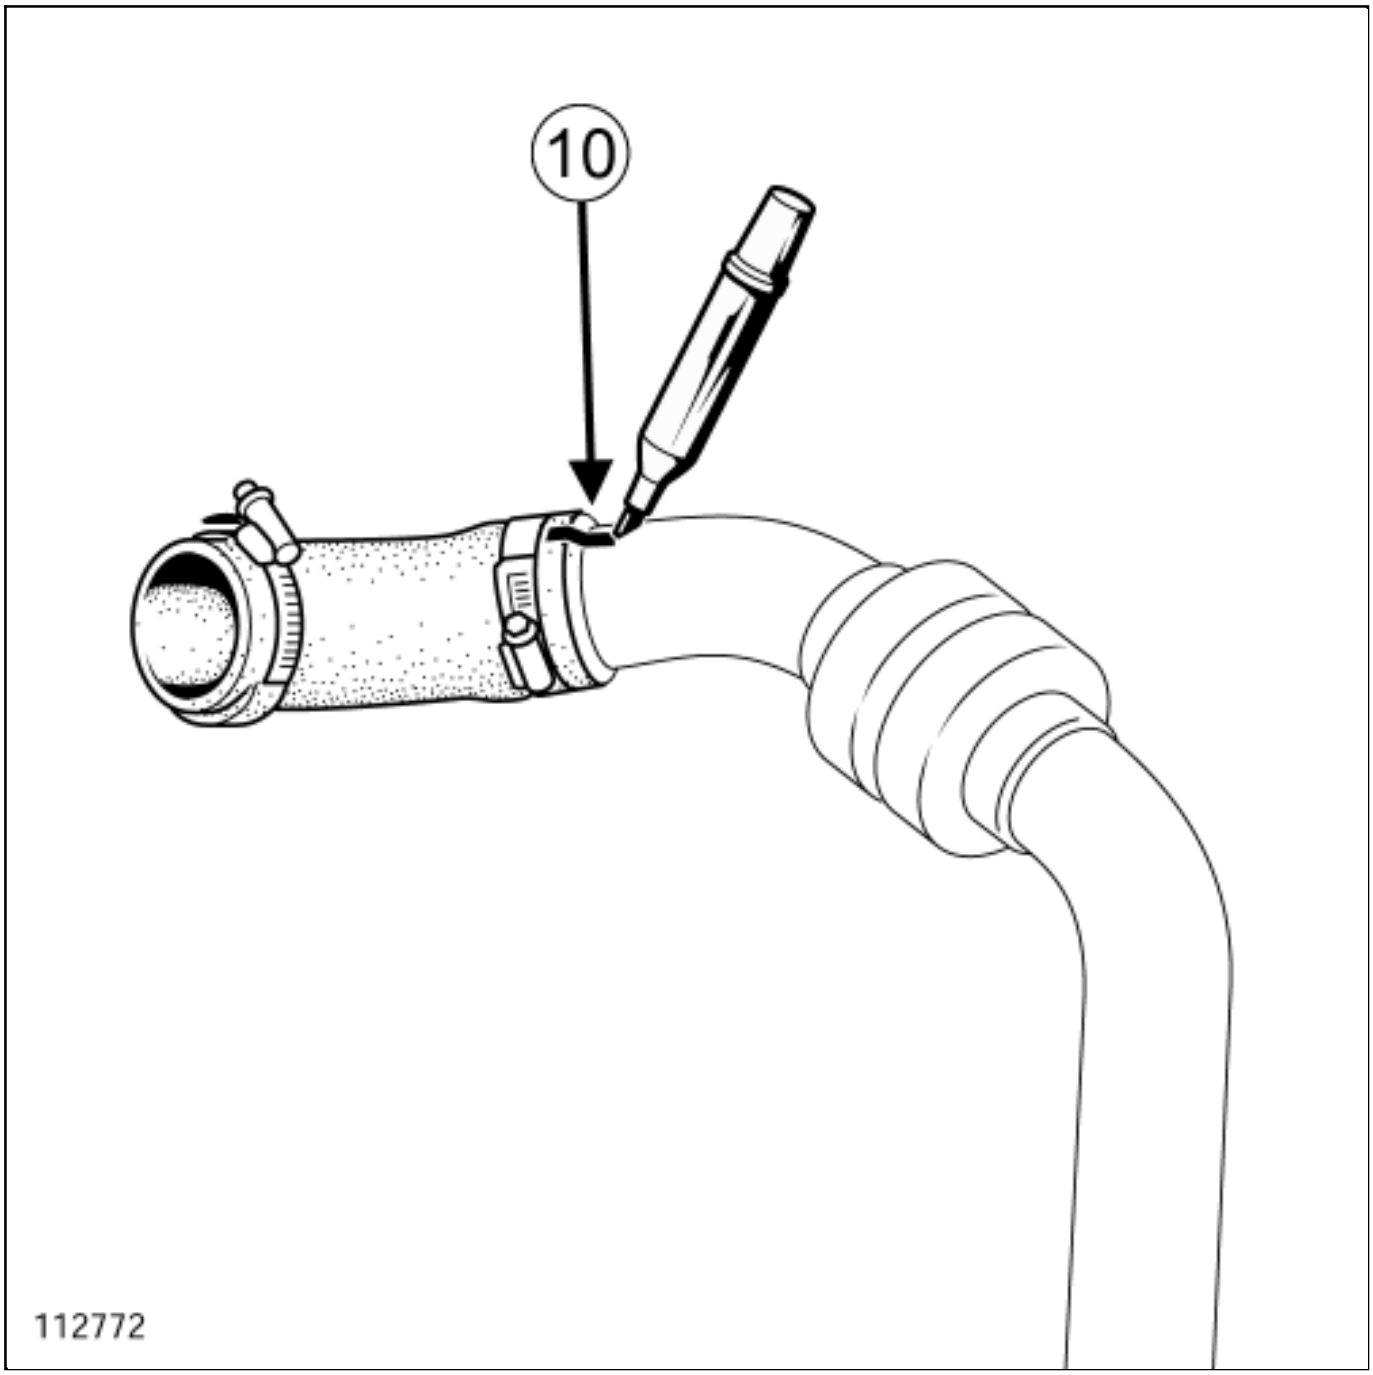
Note:

(*) These instructions for the air circuit are only to be followed in the case of:

- broken compressor wheel,
- compressor wheel rubbing against the turbocharger casing.

Remove the intercooler if fitted to the vehicle(see 12B, Turbocharging, Intercooler: Removal - Refitting) .

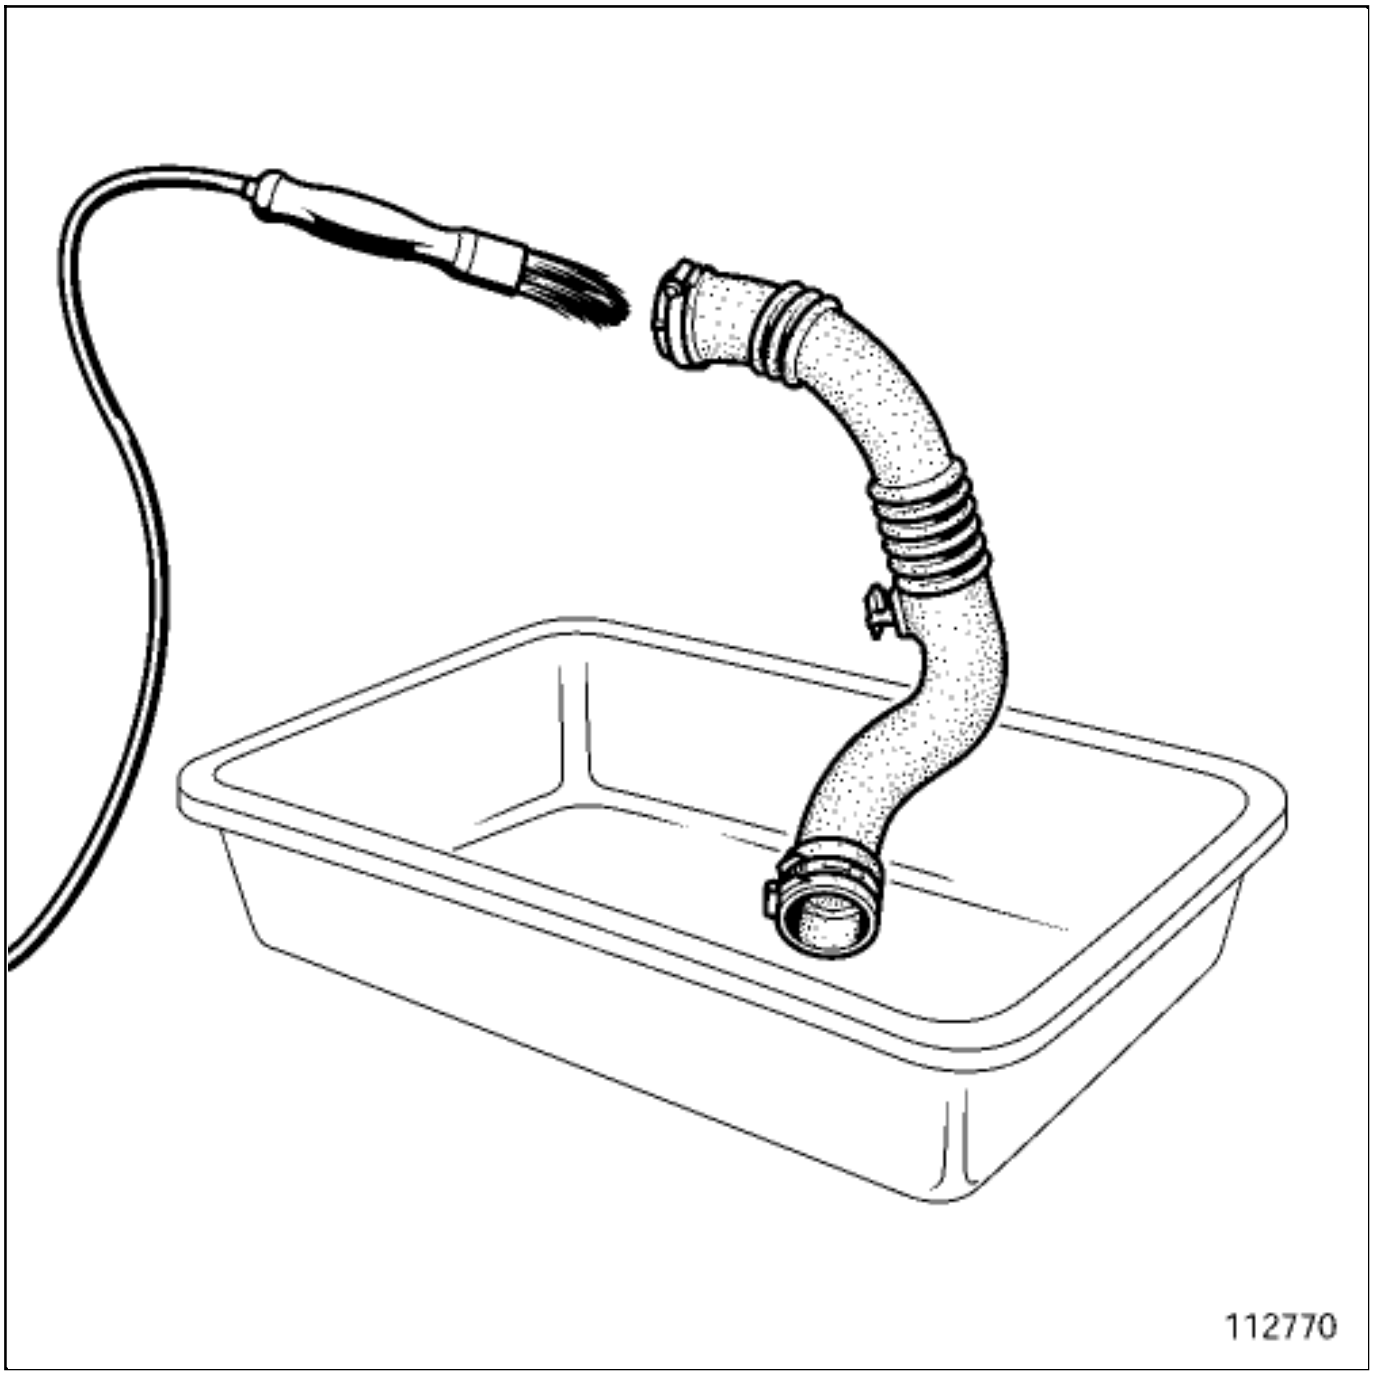
Turn the intercooler over and allow the oil inside to drain out.



Note:

If the compressor wheel(9) is damaged, metal objects are ejected inside the air pipes.

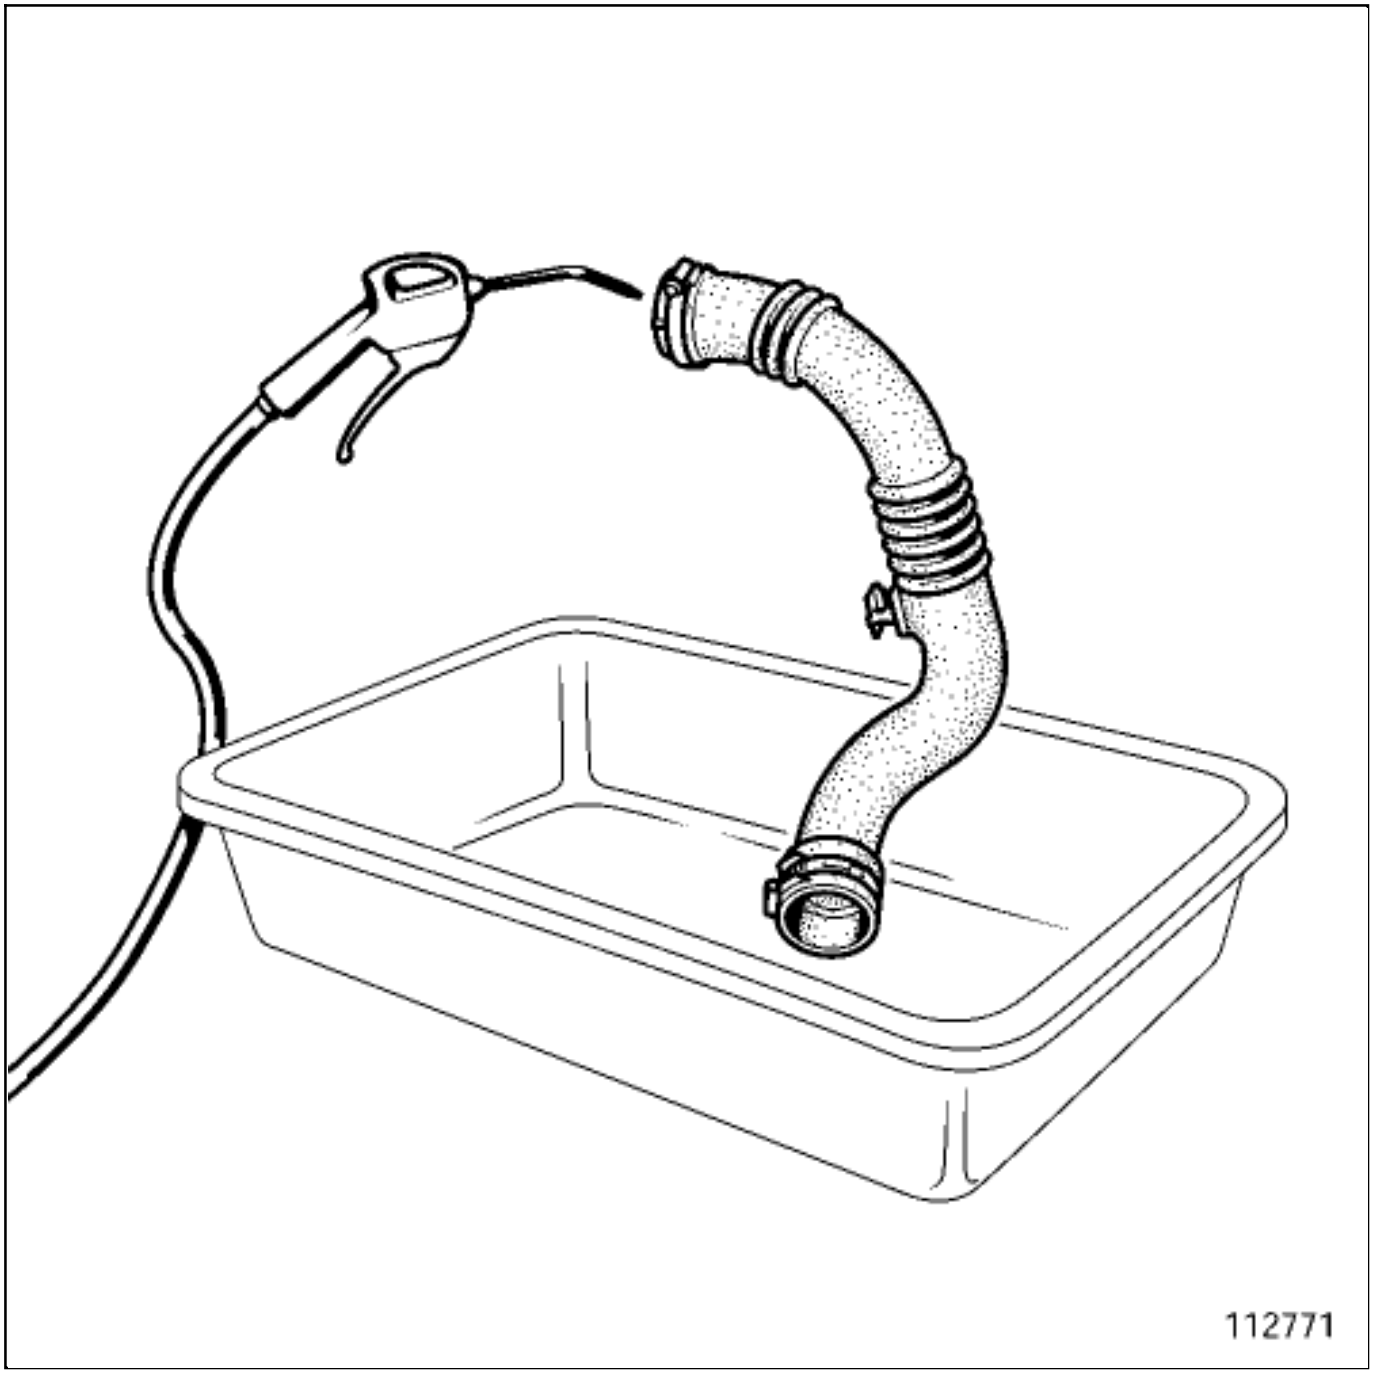
Check that there are no metal objects inside the air flowmeter(2) .



Remove:

- the air pipe (between the air filter unit and the turbocharger)(**A**) ,
- the air pipe(**B**) (between the turbocharger and the intercooler).

For air pipes comprising several components:



- mark(**10**) the fitting position of each component,
- separate all the components.

One by one, clean the pipes removed with the parts washer:

- brush as much of the inside of the pipe as possible (only use brushes with plastic bristles),
- wash plenty of cleaning product from the cleaning station through the pipe,
- allow the cleaned pipe to drain by standing it upright,

ensure the cleaning product has drained out completely (check areas where liquid may be retained, e.g. gaiters, resonators etc.).

Dry the pipes one by one using a compressed air spray gun.

For pipes comprising several components:

assemble the components, taking note of their correct fitting position(**10**) .

Refit:

- the air pipe(between the air filter unit and the turbocharger)(A) ,
- the air pipe(B) (between the turbocharger and the intercooler).

Refit the intercooler, if fitted to the vehicle(see 12B, Turbocharging, Intercooler: Removal - Refitting) .

5. LUBRICATION CIRCUIT**: INSTRUCTIONS FOLLOWING MECHANICAL DAMAGE TO THE TURBOCHARGER

Note:

(**) These instructions relating to the lubrication circuit must always be followed in all cases of mechanical damage as listed above.

Drain the engine oilEngine oil - Oil filter : Draining - Filling .

Replace the oil filterEngine oil - Oil filter : Draining - Filling .

Only fill the engine with a suitable oil typeEngine oil: Specifications (TN 6013A, 04A, Lubricants).

6. GENERAL INSTRUCTIONS TO BE FOLLOWED WHEN REMOVING A TURBOCHARGER

Always replace:

- all seals that have been removed,
- all fittings that have been removed.

-the oil supply pipe:

- if the pipe is blocked, even partially (due to scale, carbonised oil etc.),
- if the pipe is fitted with self-retaining seals.

-the oil return pipe:

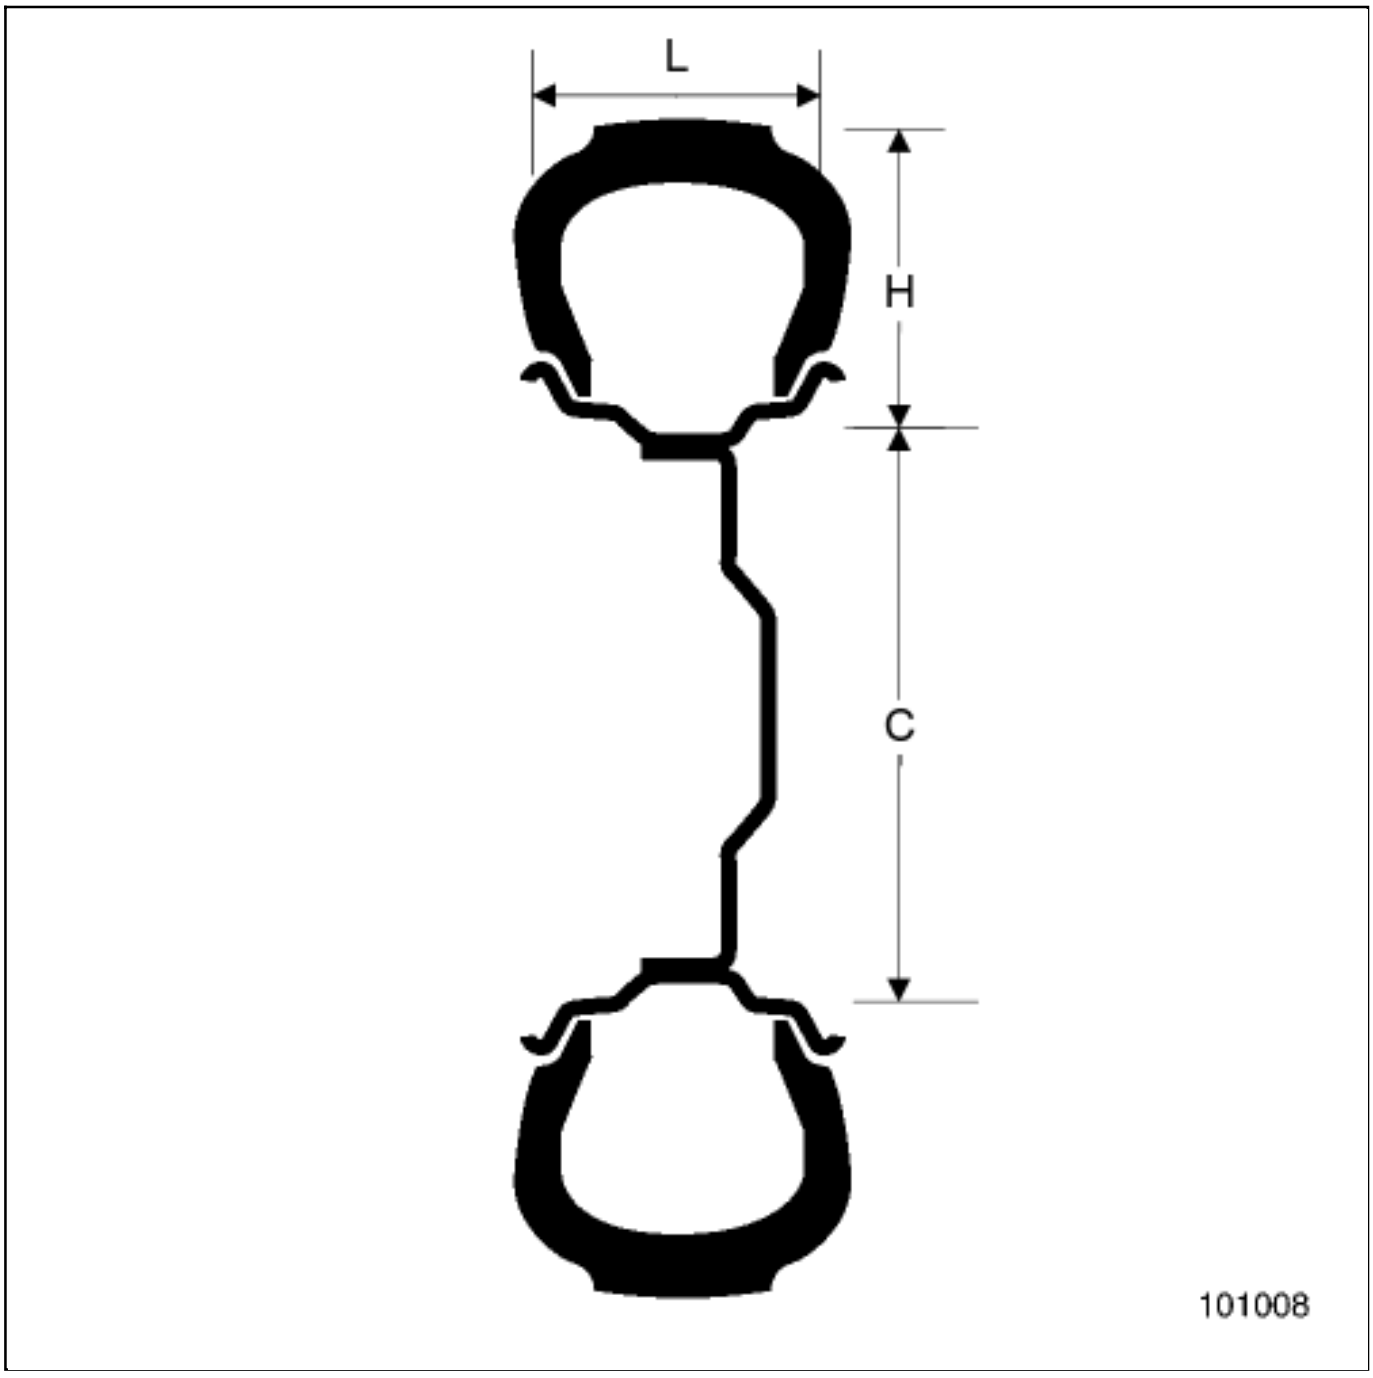
if the pipe is blocked, even partially (due to scale, carbonised oil etc.), if the pipe is fitted with self-retaining seals.

CAUTION

Failure to observe the following instructions will lead to the turbocharger breaking again.

Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

CAUTION



Failure to observe the following procedure may lead to destruction of the turbocharger.

When starting the engine:

- do not accelerate,
- allow the engine to run for 1 minute, the time taken for the oil circuit pressure to increase (until the oil pressure warning light on the instrument panel goes out),
- accelerate several times at no load,
- check the air circuit and the oil circuit for leaks.

Repair-13x05x02-02x07-2-21-1.xml

TYRE: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. CLEANLINESS

Clean:

- the tyre bead,
- the tyre bead/wheel rim contact surface.

Remove any grit trapped in the tyre treads.

Clean the bearing surfaces on:

- the wheels,
- the discs,
- the hubs.

2. GENERAL RECOMMENDATIONS

CAUTION

If checking the pressure when hot, increase the tyre inflation pressure by 0.2to 0.3 bar above the recommended pressure.

CAUTION

In order to remove any flat spots on the tread after the vehicle has stopped, it is essential to carry out a road test for a minimum distance of 1 mile (2 km)before balancing the wheels.

CAUTION

To avoid detachment of the balance weights, use only weights which correspond to the vehicle wheel rims.

Repair-13x05x02-02x60-1-3-1.xml

XSL version : 3.02 du 22/07/11

TYRE: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. CLEANLINESS

Clean:

- the tyre bead,
- the tyre bead/wheel rim contact surface.

Remove any stones trapped in the tyre tread.

2. GENERAL RECOMMENDATIONS

CAUTION

If checking the pressure when hot, increase the tyre inflation pressure by 0.2to 0.3 bar above the recommended pressure.

CAUTION

In order to remove any flat spots on the tread after the vehicle has stopped, it is essential to carry out a road test for a minimum distance of 1.2 miles (2 km)before balancing the wheels.

CAUTION

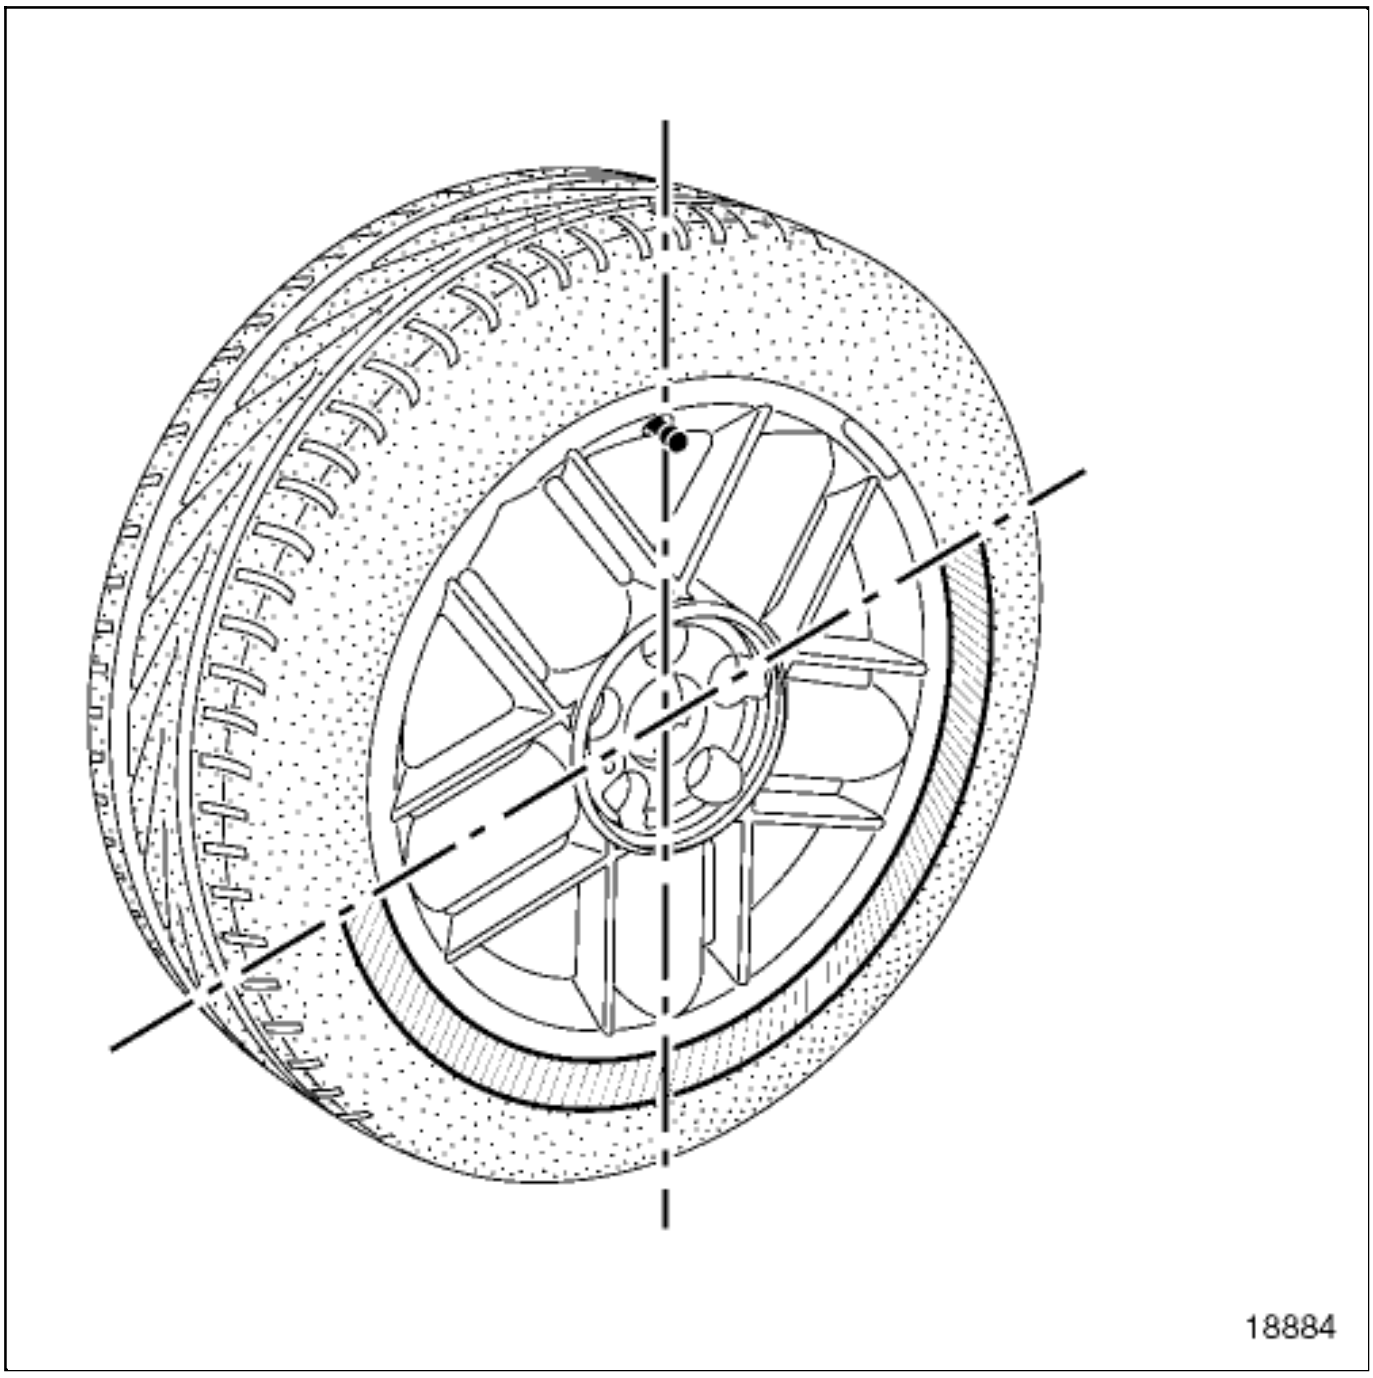
To avoid detachment of the balance weights, use only weights which correspond to the vehicle wheel rims.

XSL version : 3.02 du 22/07/11

TYRES: REMOVAL - REFITTING

parts always to be replaced:

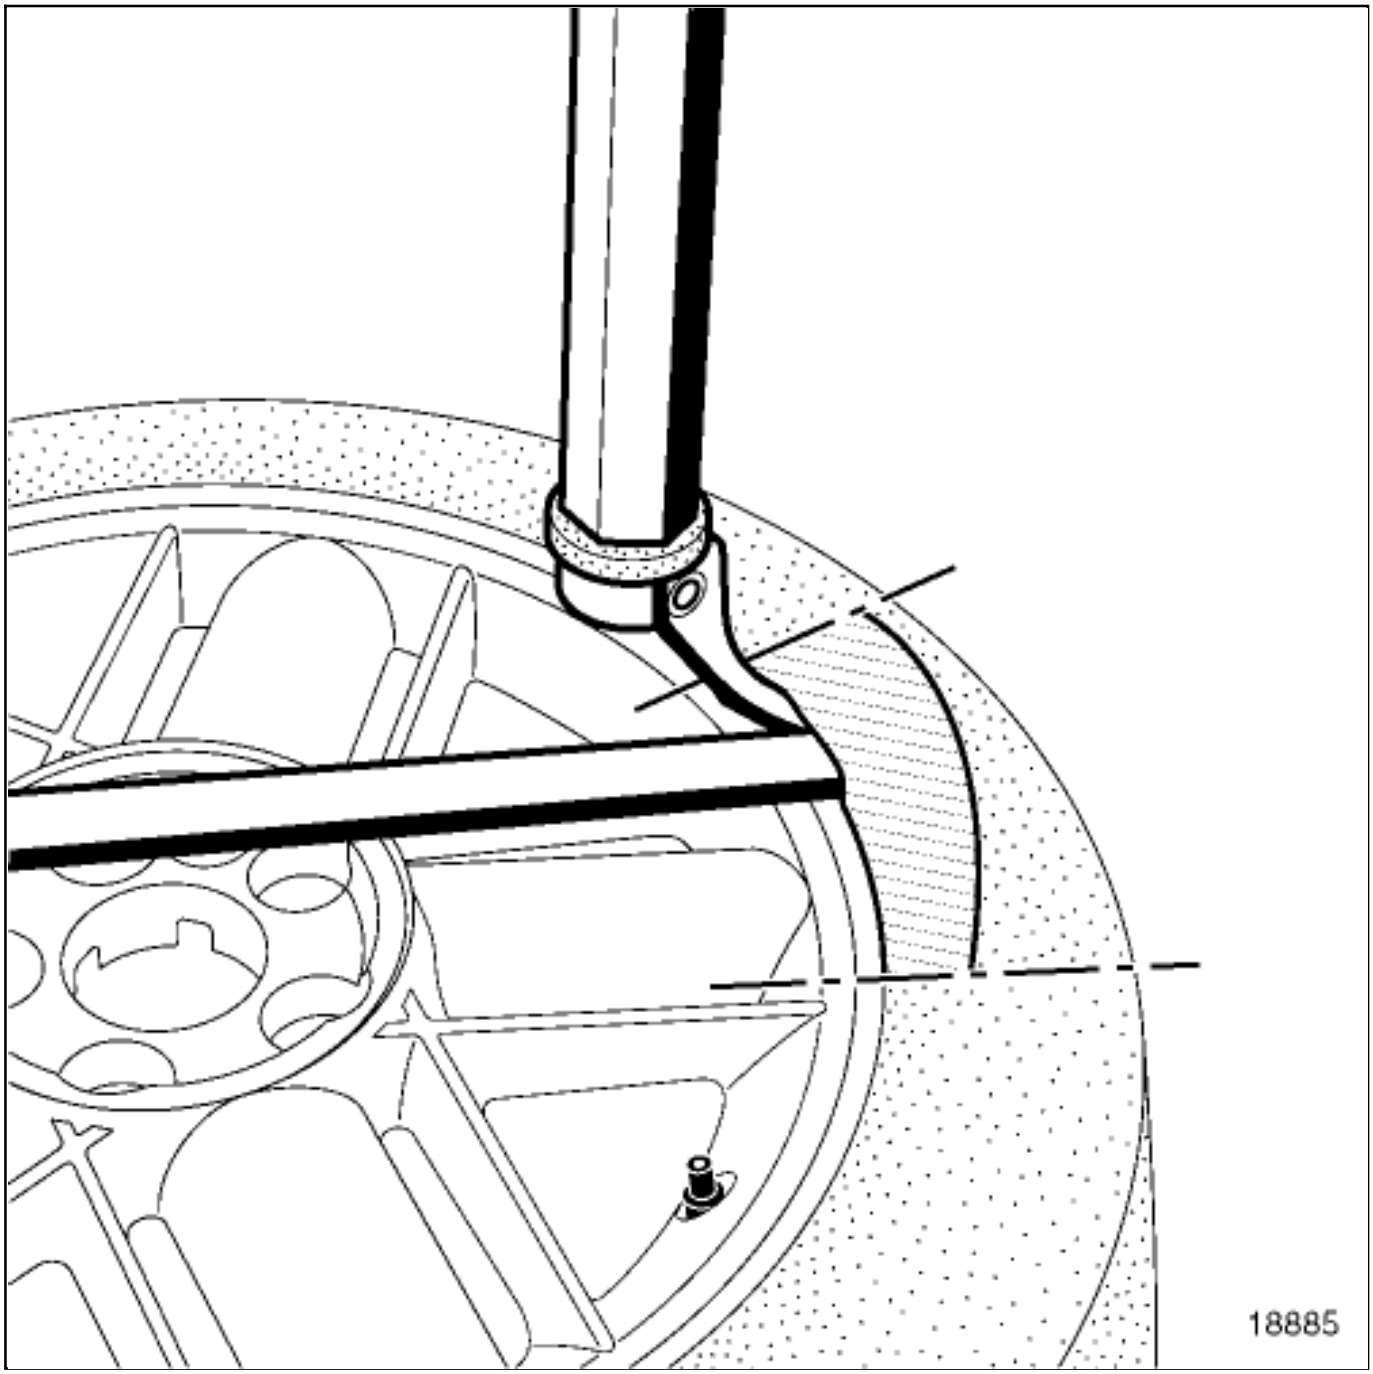
Tyre valve



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).



- Remove:
  - the wheel in question (see 35A, Wheels and tyres, Wheel: Removal - Refitting) ,
  - the balance weights,
  - the valve mechanism.

2. OPERATION FOR REMOVAL OF PART CONCERNED

Detach:

- the bead from the outside of the tyre, starting with the side opposite the valve,
- the bead from the inside of the tyre.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the exterior bead from the tyre.

Remove the exterior bead of the tyre, finishing at the valve.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the bead from inside the tyre.

- Remove the interior bead of the tyre, finishing at the valve.

REFITTING

1. REFITTING PREPARATION OPERATION

- parts always to be replaced: Tyre valve .

- Lubricate the two tyre beads correctly using the tyre paste Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

2. REFITTING OPERATION FOR PART CONCERNED

- Engage the lower tyre bead approximately 15 cm after the valve.
- Finish fitting the tyre at the valve.
- Fit the exterior bead approximately 15 cm after the valve using the tyre lever.
- Inflate the tyre to 3.5 bar to press the tyre beads against the wheel rim.

3. FINAL OPERATION

- Refit the valve mechanism.
- Inflate the tyre to the recommended pressure (see **Tyre pressure: Identification**) .

Note:

It is not necessary to drive the vehicle before and after a new wheel is balanced.

Balance the wheel(see 35A, Wheels and tyres, Wheel: Balancing) .

Refit the wheel in question(see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

TYRES: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

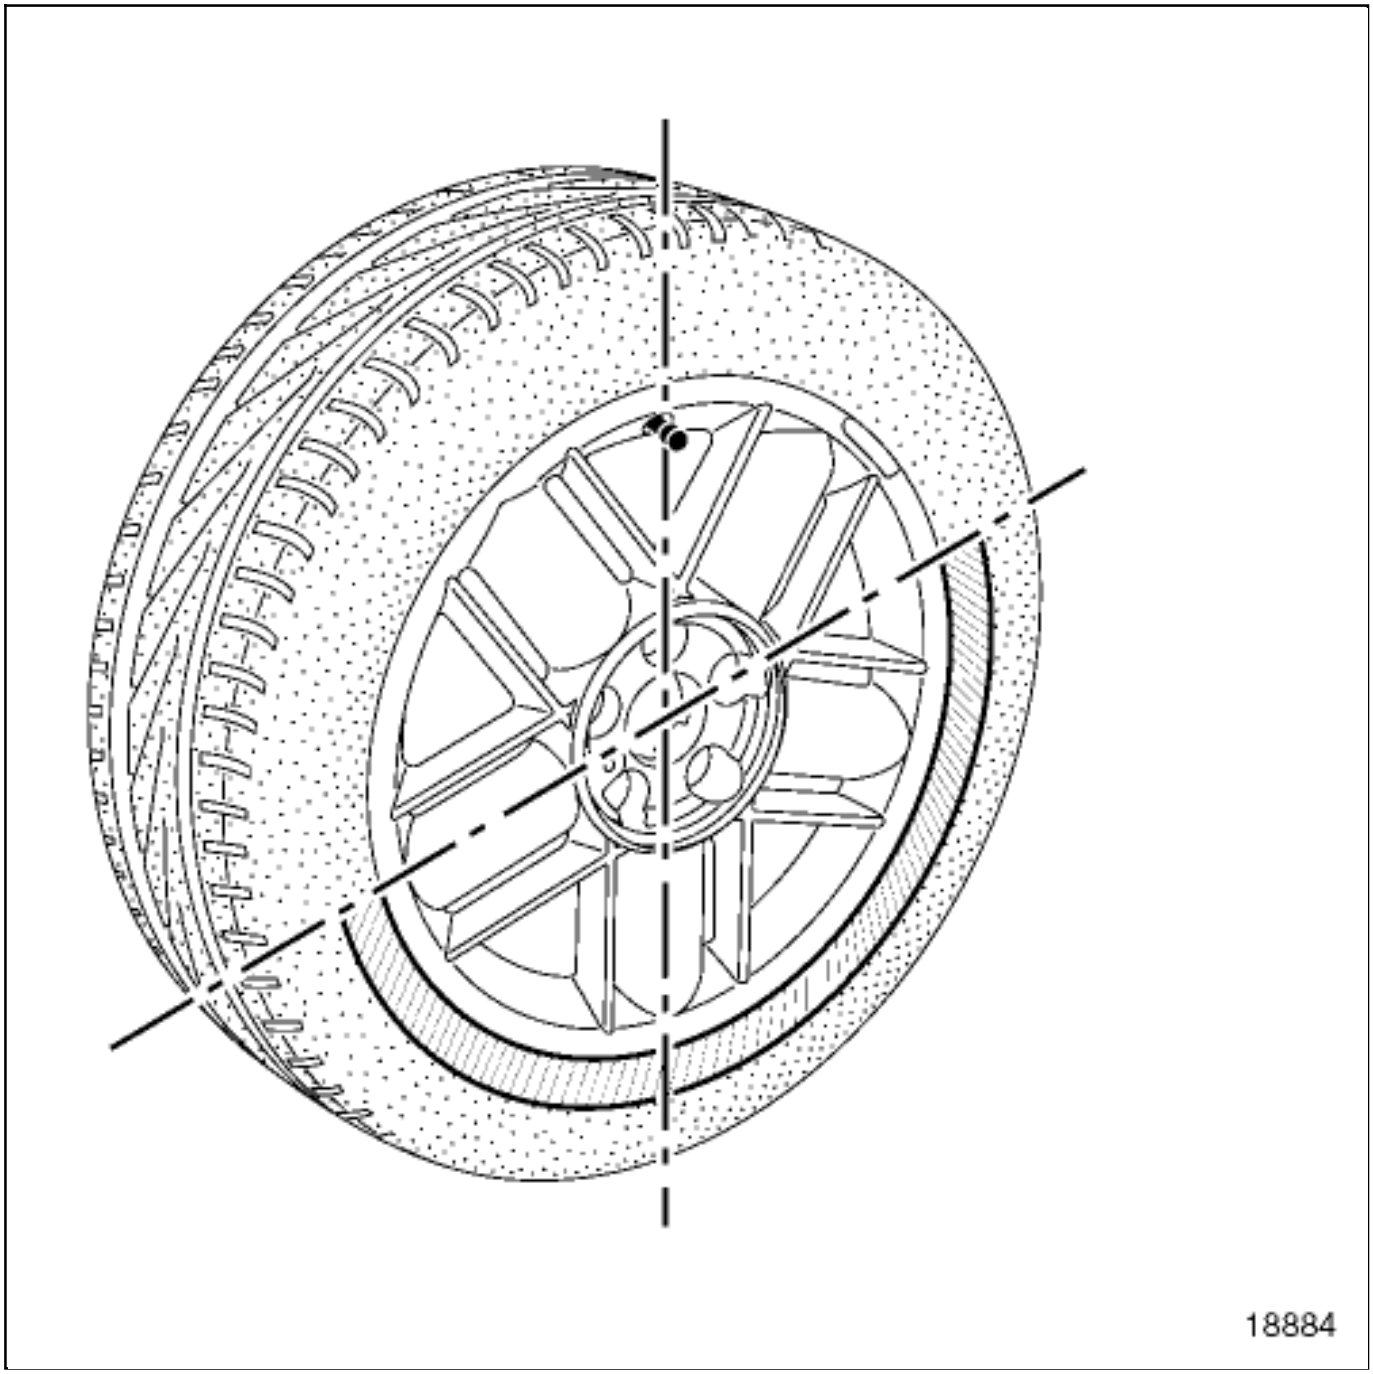
parts always to be replaced:

Tyre valve

REMOVAL

1. REMOVAL PREPARATION OPERATION

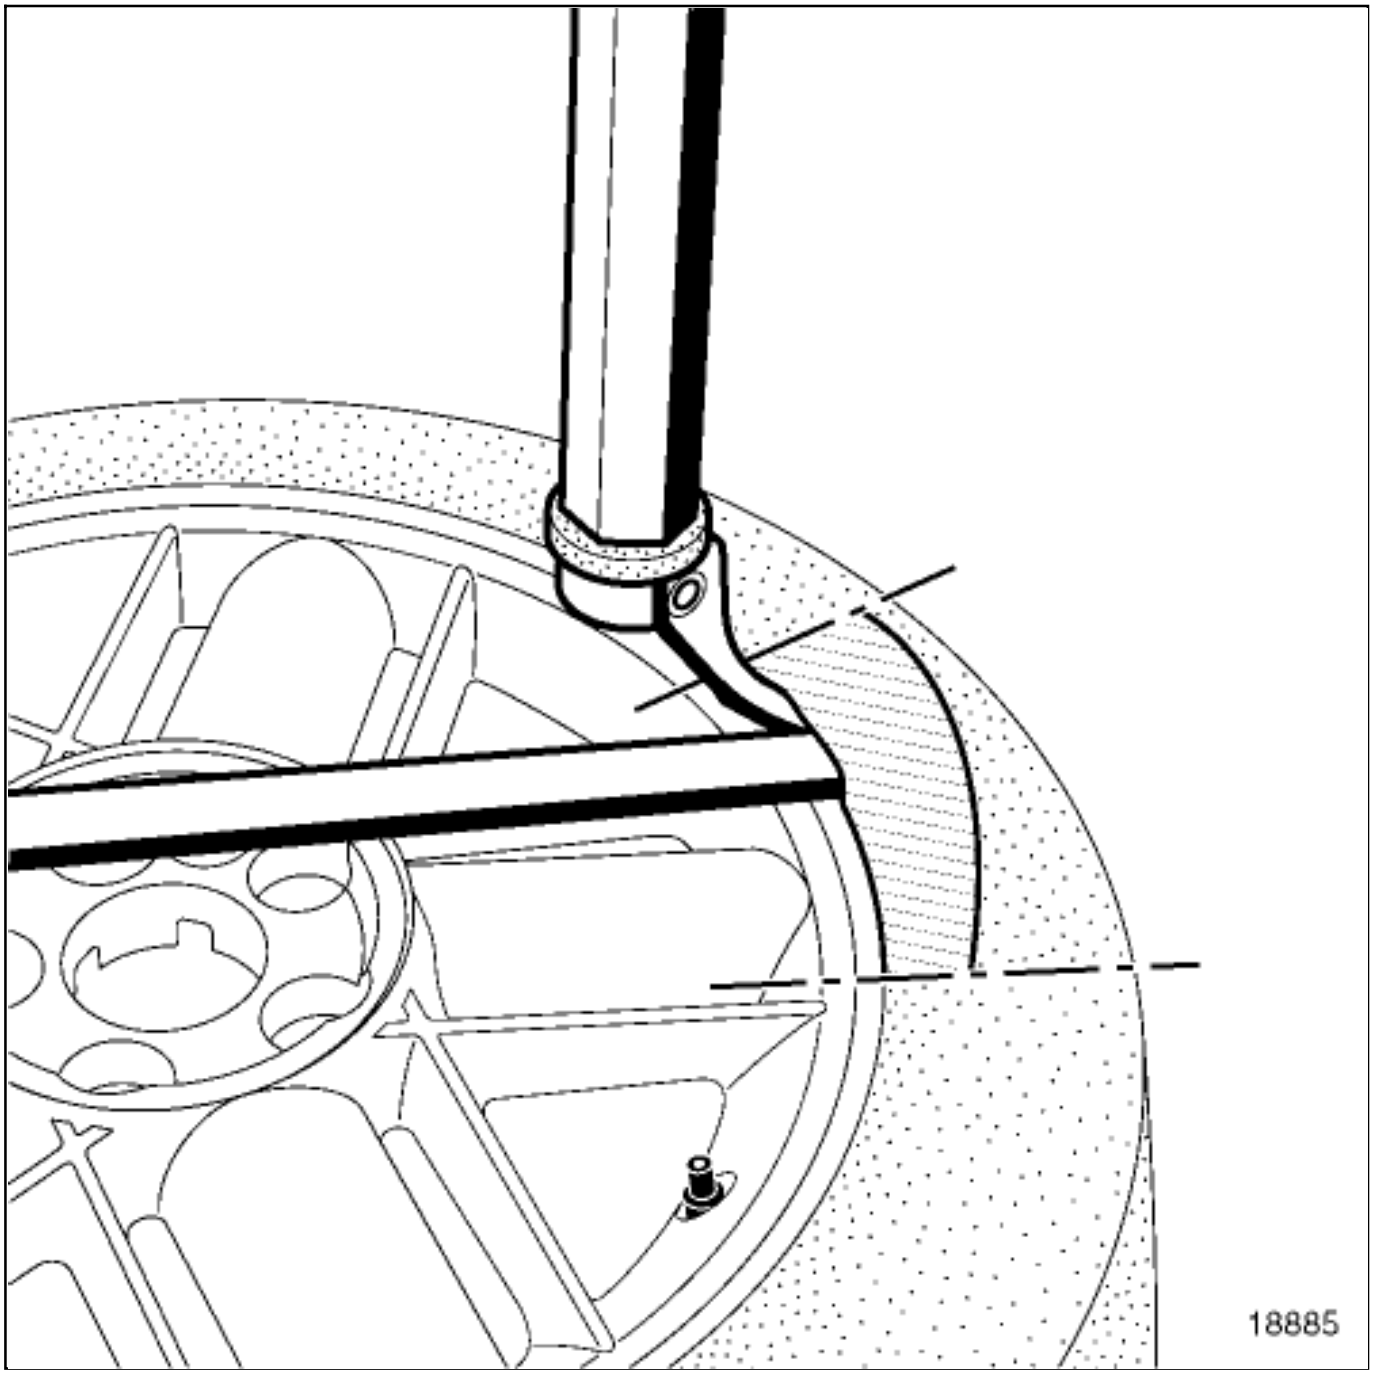
Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).



Remove:

- the wheel in question (see 35A, Wheels and tyres, Wheel: Removal - Refitting) ,
- the balance weights,
- the valve mechanism.

2. REMOVAL OPERATION



CAUTION

To avoid any damage to the sensor, make sure the tyre bead never presses on the sensor.

Detach:

- the bead from the outside of the tyre, starting with the side opposite the valve,
- the bead from the inside of the tyre.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the exterior bead from the tyre.

Remove the exterior bead of the tyre, finishing at the valve.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the bead from inside the tyre.

Remove the interior bead of the tyre, finishing at the valve.

Remove the pressure sensor Pressure sensor: Removal - Refitting .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced:  Tyre valve  .

Always replace the pressure sensor bolt.

Lubricate the two tyre beads correctly using the tyre paste Vehicle: Parts and consumables for the repair .

2. REFITTING OPERATION

Refit the pressure sensor Pressure sensor: Removal - Refitting .

Engage the lower tyre bead approximately 15 cm after the valve.

Finish fitting the tyre at the valve.

Fit the exterior bead approximately 15 cmafter the valve using the tyre lever.

Inflate the tyre to 3.5 barto press the tyre beads against the wheel rim.

3. FINAL OPERATION

Refit the valve mechanism.

Inflate the tyre to the recommended pressure Tyre pressure: Identification .

> Note:
>
> It is not necessary to drive the vehicle before and after a new wheel is balanced.

Balance the wheel (see 35A, Wheels and tyres, Wheel: Balancing) .

Refit the wheel in question (see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

TYRES: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

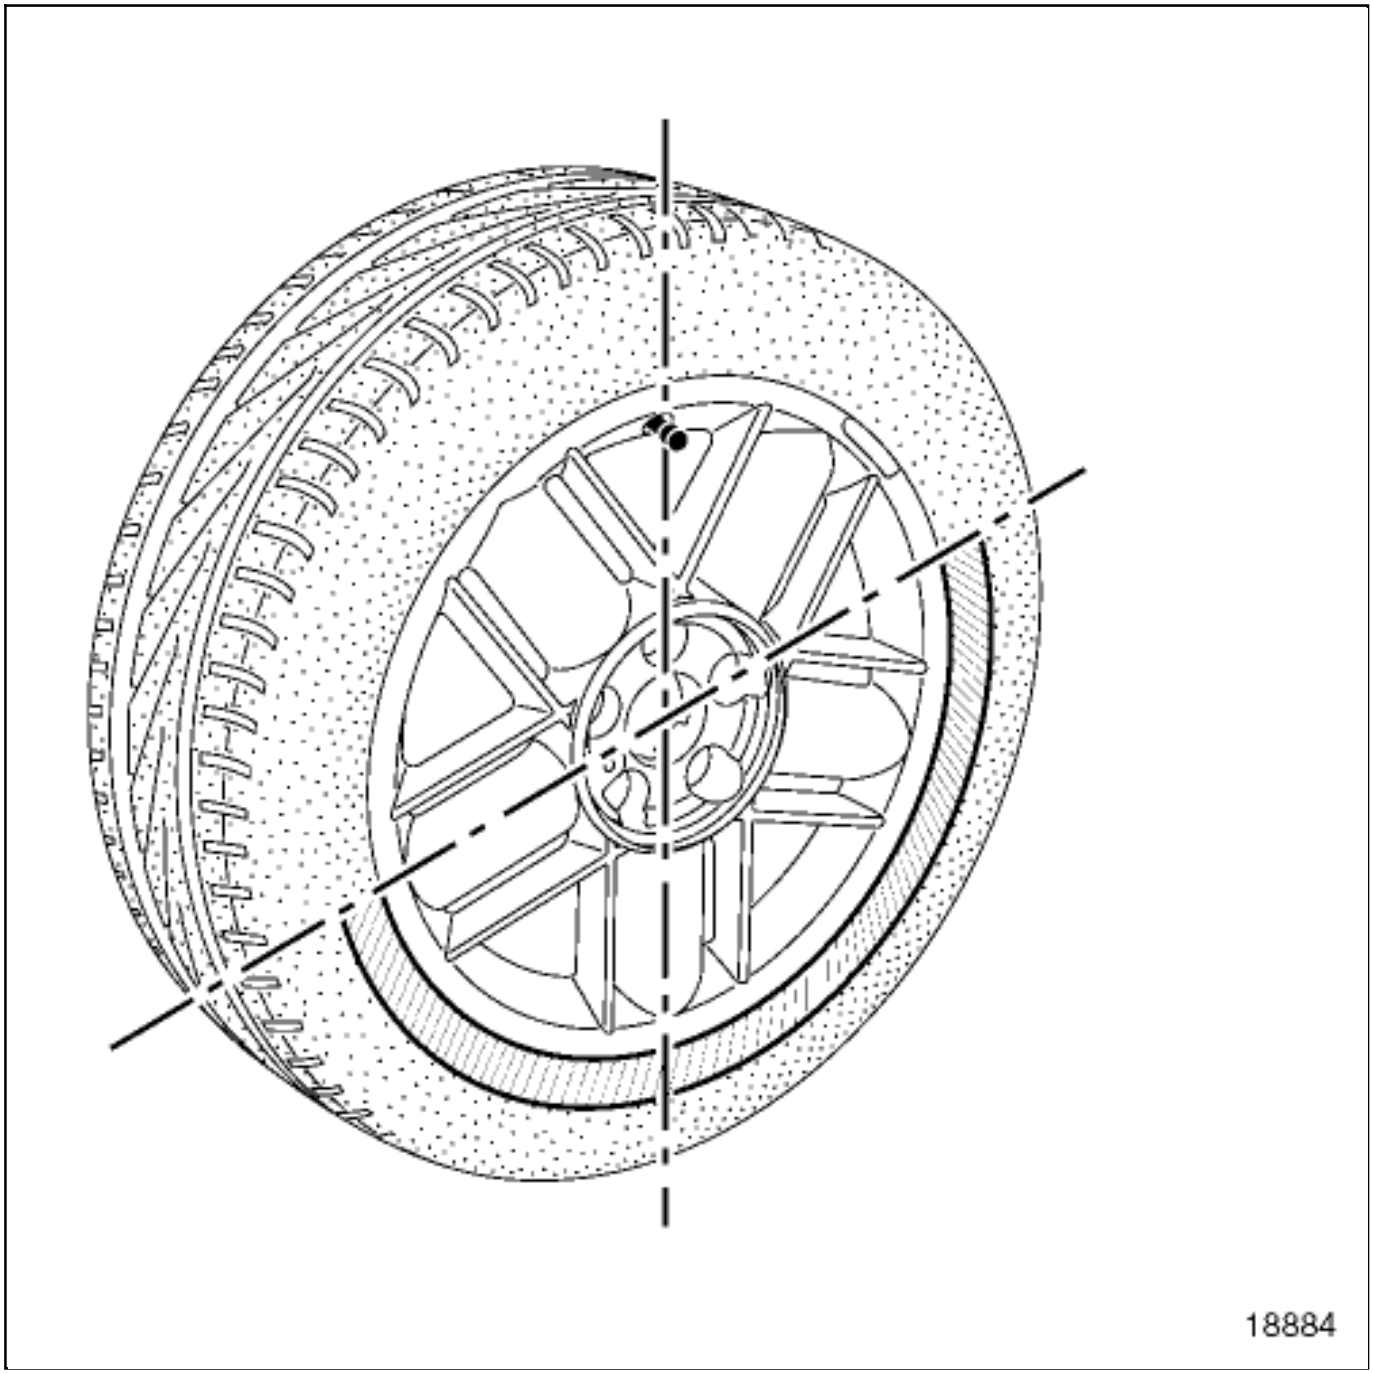
parts always to be replaced:

Tyre valve

REMOVAL

1. REMOVAL PREPARATION OPERATION

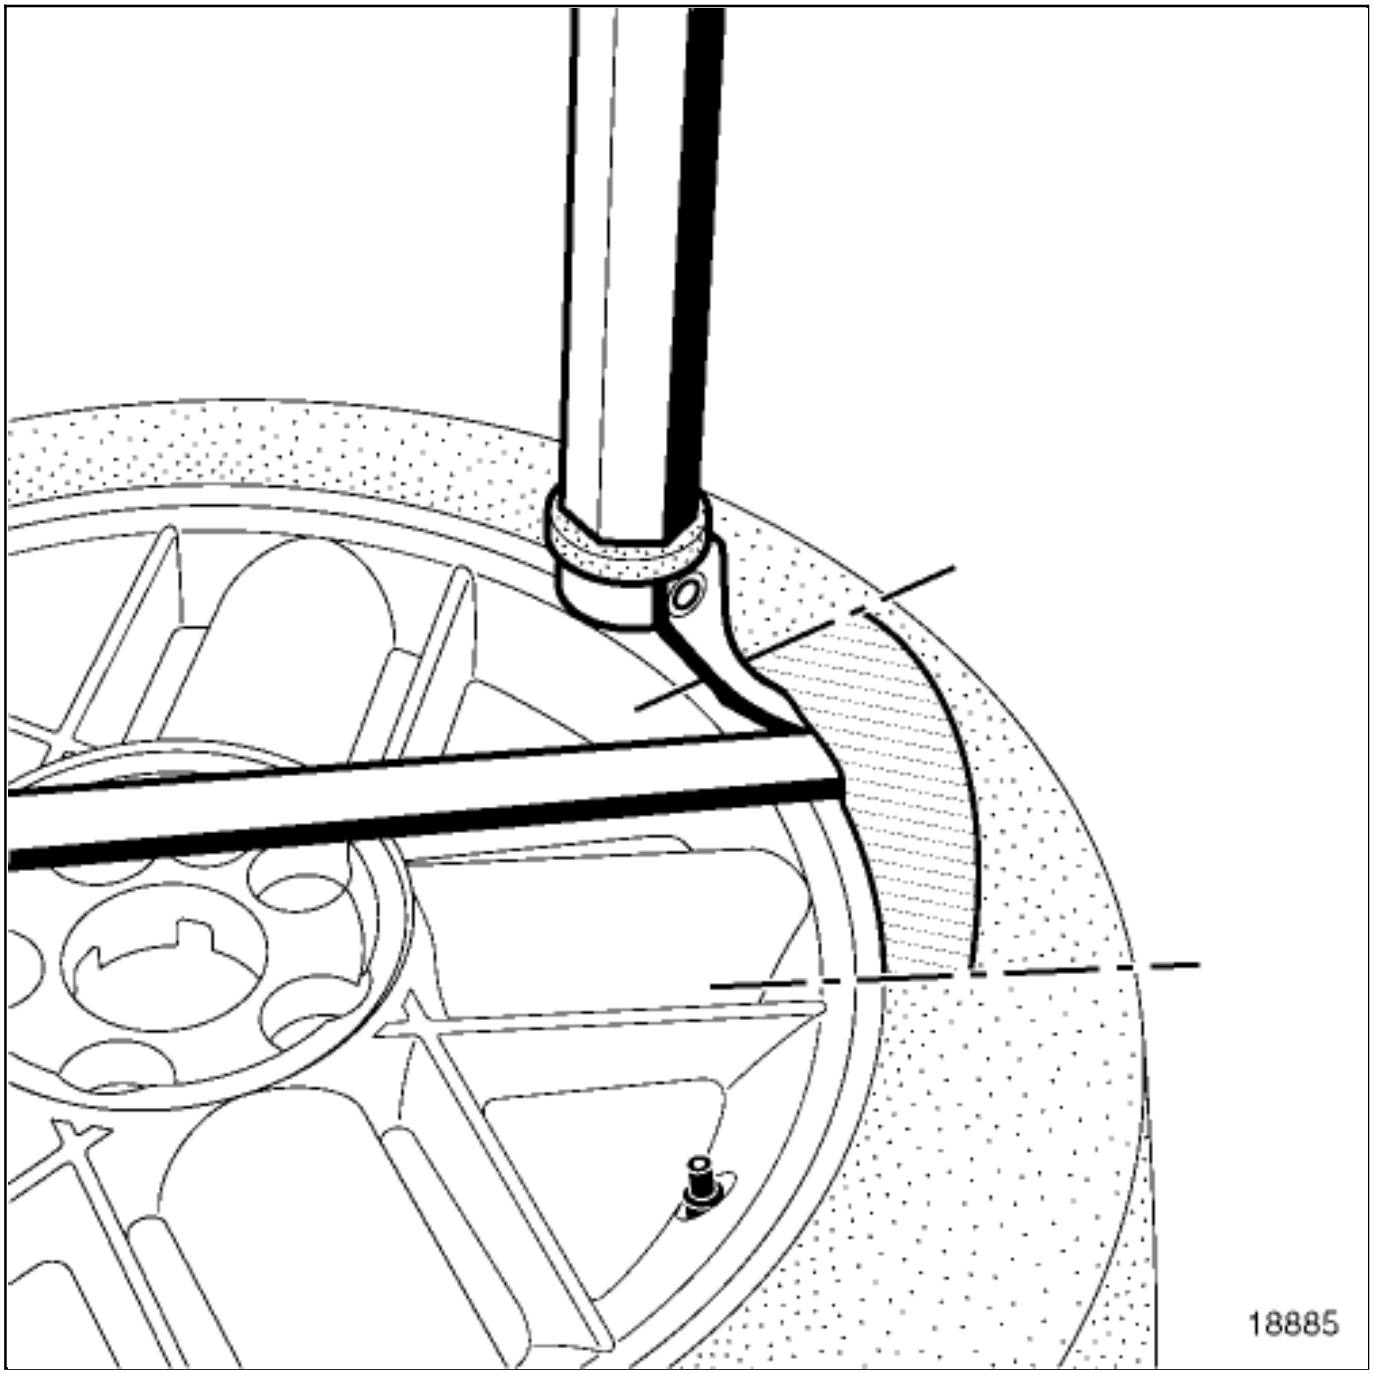
Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).



Remove:

- the wheel in question (see 35A, Wheels and tyres, Wheel: Removal - Refitting) ,
- the balance weights,
- the valve mechanism.

2. REMOVAL OPERATION



CAUTION

To avoid any damage to the sensor, make sure the tyre bead never presses on the sensor.

Detach:

- the bead from the outside of the tyre, starting with the side opposite the valve,
- the bead from the inside of the tyre.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the exterior bead from the tyre.

Remove the exterior bead of the tyre, finishing at the valve.

Position the tyre lever approximately 15 cmfrom the valve on the outside of the wheel rim in order to remove the bead from inside the tyre.

Remove the interior bead of the tyre, finishing at the valve.

Remove the pressure sensor Pressure sensor: Removal - Refitting .

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced:  Tyre valve  .

Always replace the pressure sensor bolt.

Lubricate the two tyre beads correctly using the tyre paste Vehicle: Parts and consumables for the repair .

2. REFITTING OPERATION

Refit the pressure sensor Pressure sensor: Removal - Refitting .

Engage the lower tyre bead approximately 15 cm after the valve.

Finish fitting the tyre at the valve.

Fit the exterior bead approximately 15 cmafter the valve using the tyre lever.

Inflate the tyre to 3.5 barto press the tyre beads against the wheel rim.

3. FINAL OPERATION

Refit the valve mechanism.

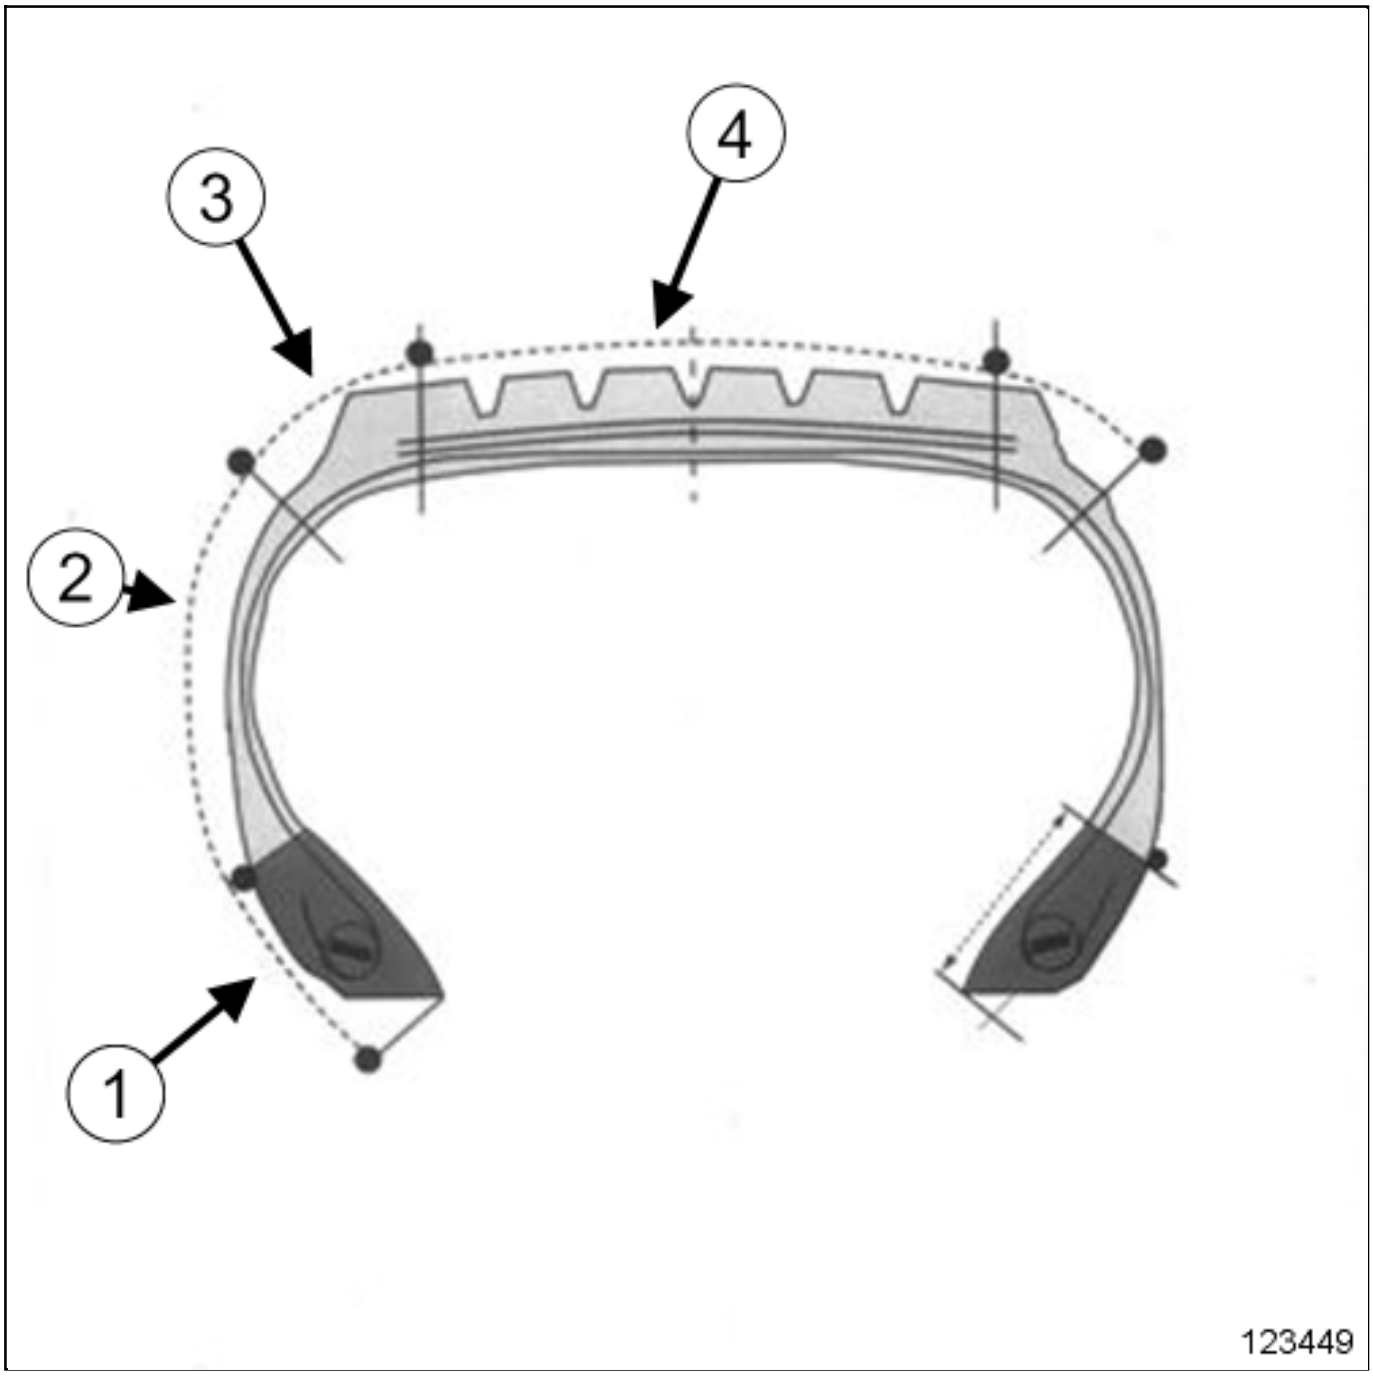
Inflate the tyre to the recommended pressure Tyre pressure: Identification .

> Note:
>
> It is not necessary to drive the vehicle before and after a new wheel is balanced.

Balance the wheel (see 35A, Wheels and tyres, Wheel: Balancing) .

Refit the wheel in question (see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

TYRE: REPAIR



Perforation

There are two types of perforation:

- single perforation: perforation caused by nail etc. not requiring a reinforced tyre boot and which can be repaired when the tyres are cold,
- damage: rubber detachment etc. requiring repair and reinforcement of damaged plies.

This repair method only covers single perforations.

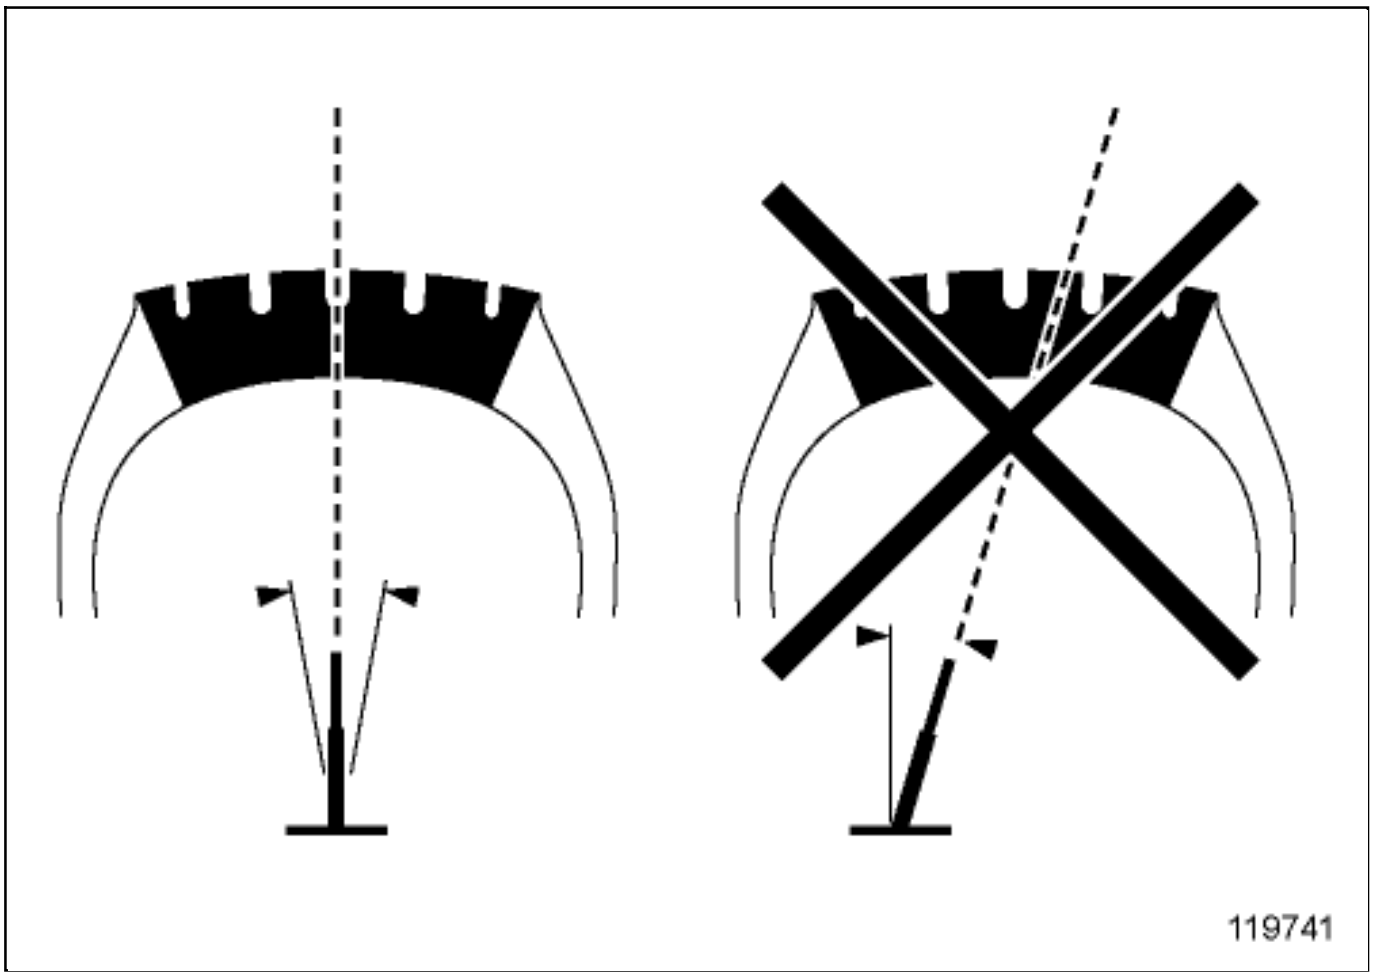
Tyre areas

- Areas which cannot be repaired:
  - tyre bead(1) ,
  - shoulder(3) .
- Areas which can be repaired:
  - sidewall(2) ,
  - crown(4) .

Perforation table *

	Area	
	Crown: max Ø in mm	Sidewall: max Ø in mm
LV speed rating less than or equal to T	6	3
LV speed rating greater than or equal to H	6	0
LCV load index less than or equal to 121	6	3
HGV load index 122 to 177 (inc.)	10	3

LV: Light Vehicle



LCV: Light Commercial Vehicle

HGV: Heavy Goods Vehicle

* If the diameter of the puncture is greater than these figures, replace the tyre.

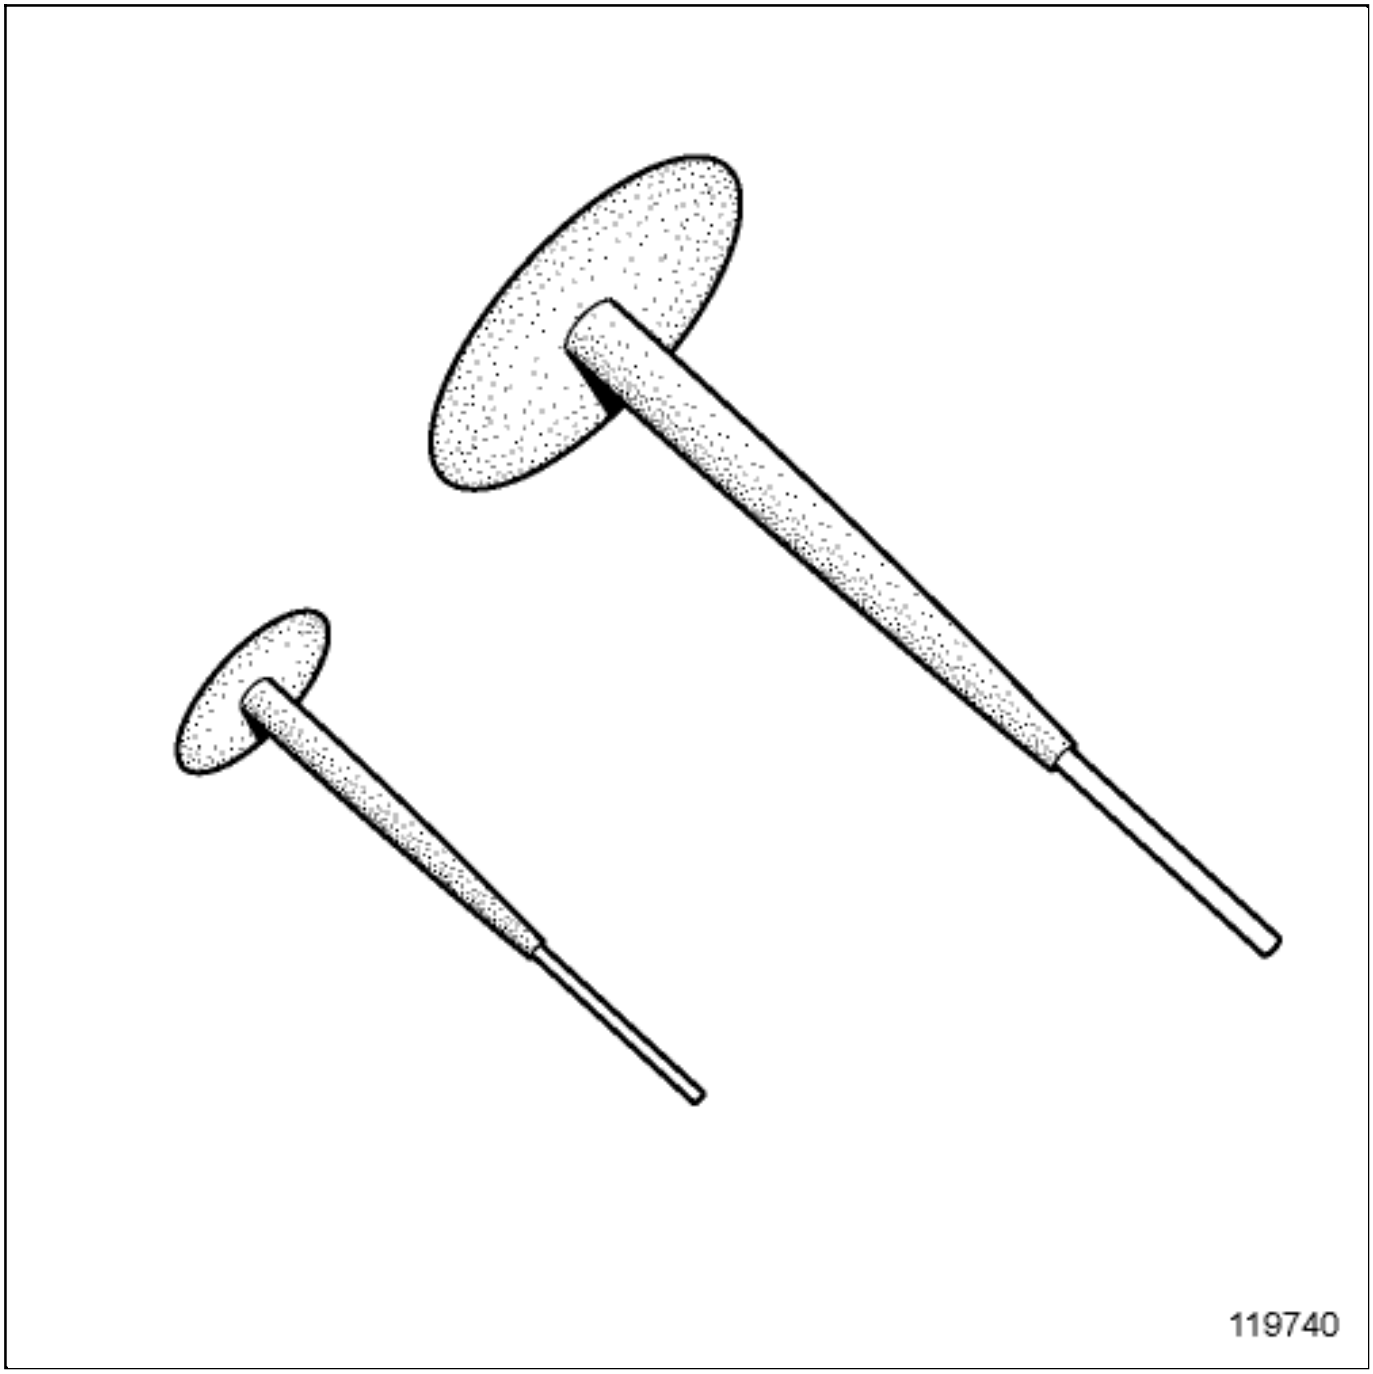
- The tyre cannot be repaired if:
  - a compulsory marking has been worn away(see 35A, Wheels and tyres, Tyres: Identification) ,
  - the interior of the tyre shows signs of under-inflation or overloading,
  - the rubber shows signs of chemical damage (hydrocarbons and other corrosive substances),
  - incorrect and irreversible repairs have previously been made to the tyre,
  - the carcass has been damaged,
  - cuts or circumferential wear (cracks) are visible on the interior or exterior of the tyre,
  - the tyre bead has been damaged (ply visible),
  - the tyre's bead wires are visible, damaged or deformed,
  - the tyre shows an irregular wear pattern which may impair vehicle handling,
  - the repair requires two tyre boots to be overlapped,

- the manufacturer has expressly prohibited any repairs, in writing,
- there is damage to the shoulder area (junction between the sidewall and the crown),
- the angle of the perforation channel (hole) is greater than 15˚.

Tyre inflation kit

using the tyre inflation kit, supplied with vehicles or available from retailers, will leave a film on the inner surface of the tyre.

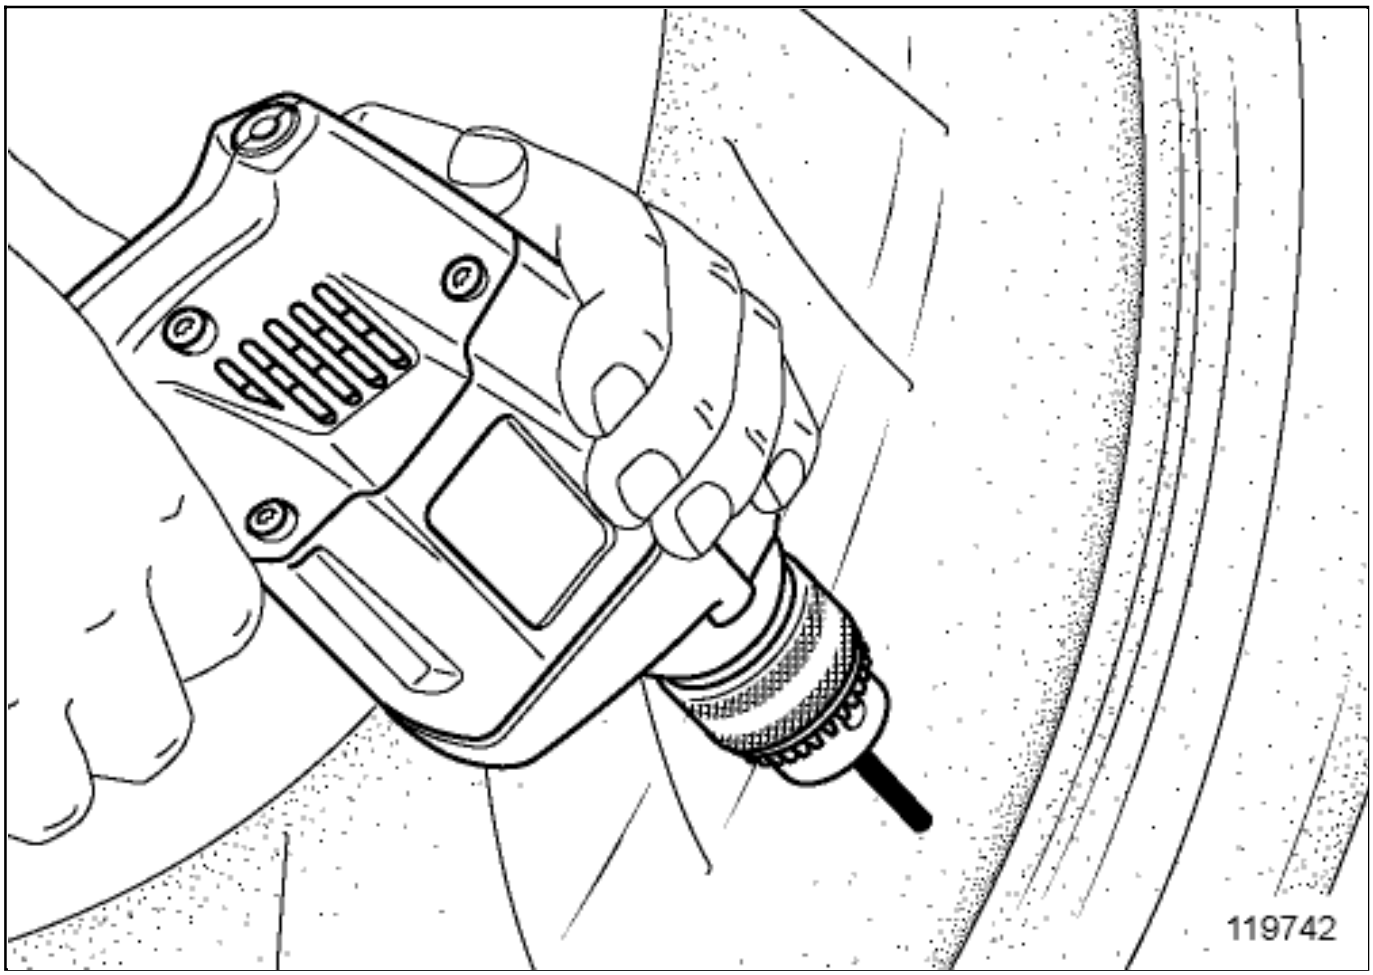
Before carrying out the repair, clean the inner surface of the tyre and the valve with water.



If the tyre cannot be cleaned in this way, contact the tyre supplier for details of cleaning products which can be used.

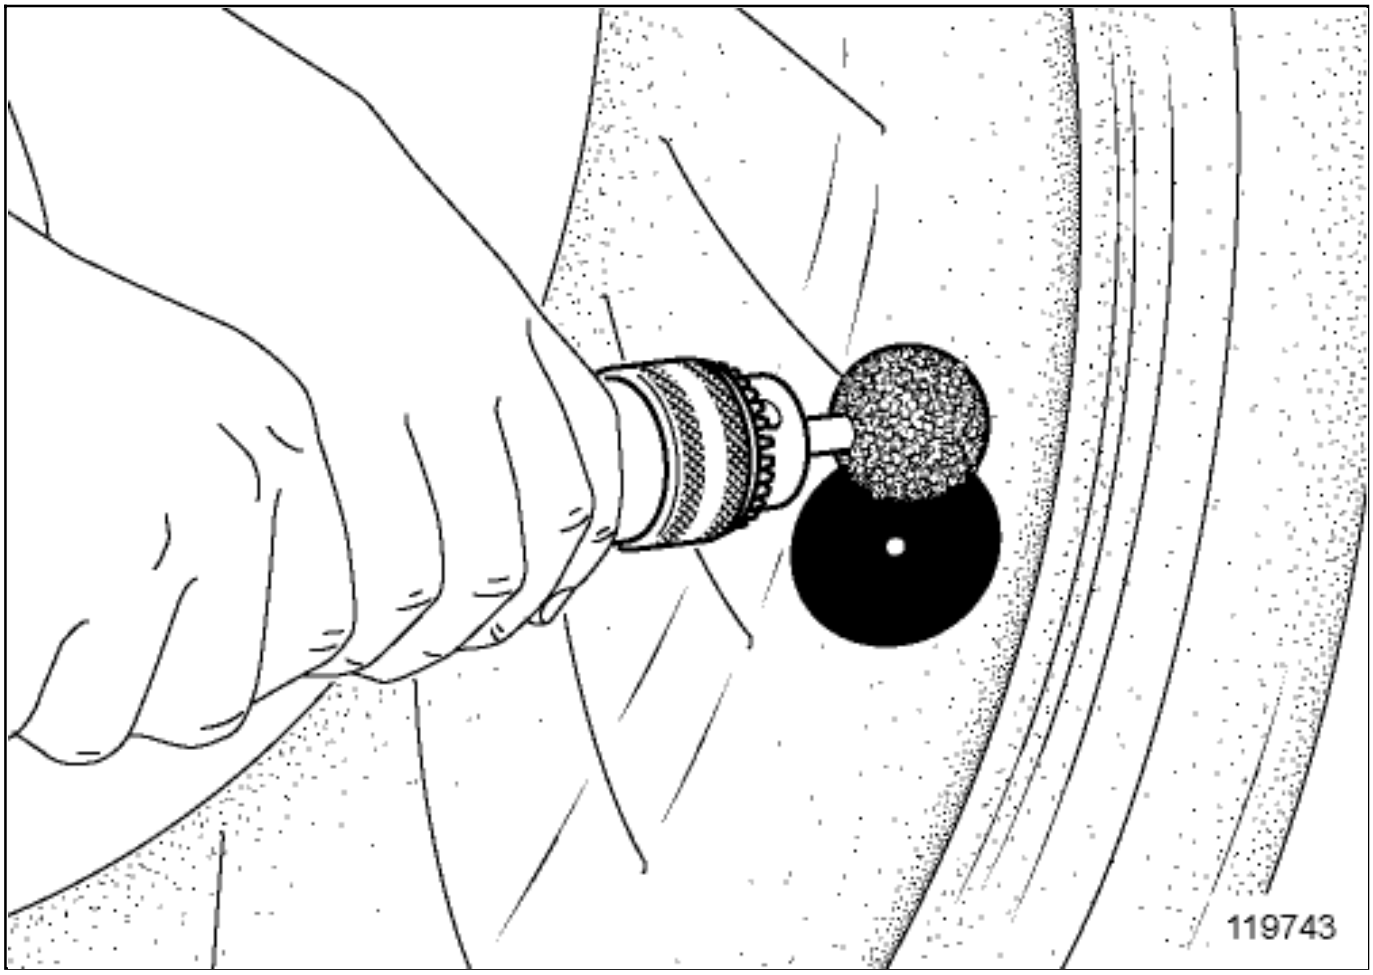
REPAIR

1. REPAIR PREPARATION OPERATION



- Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).
- Remove the wheel (see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

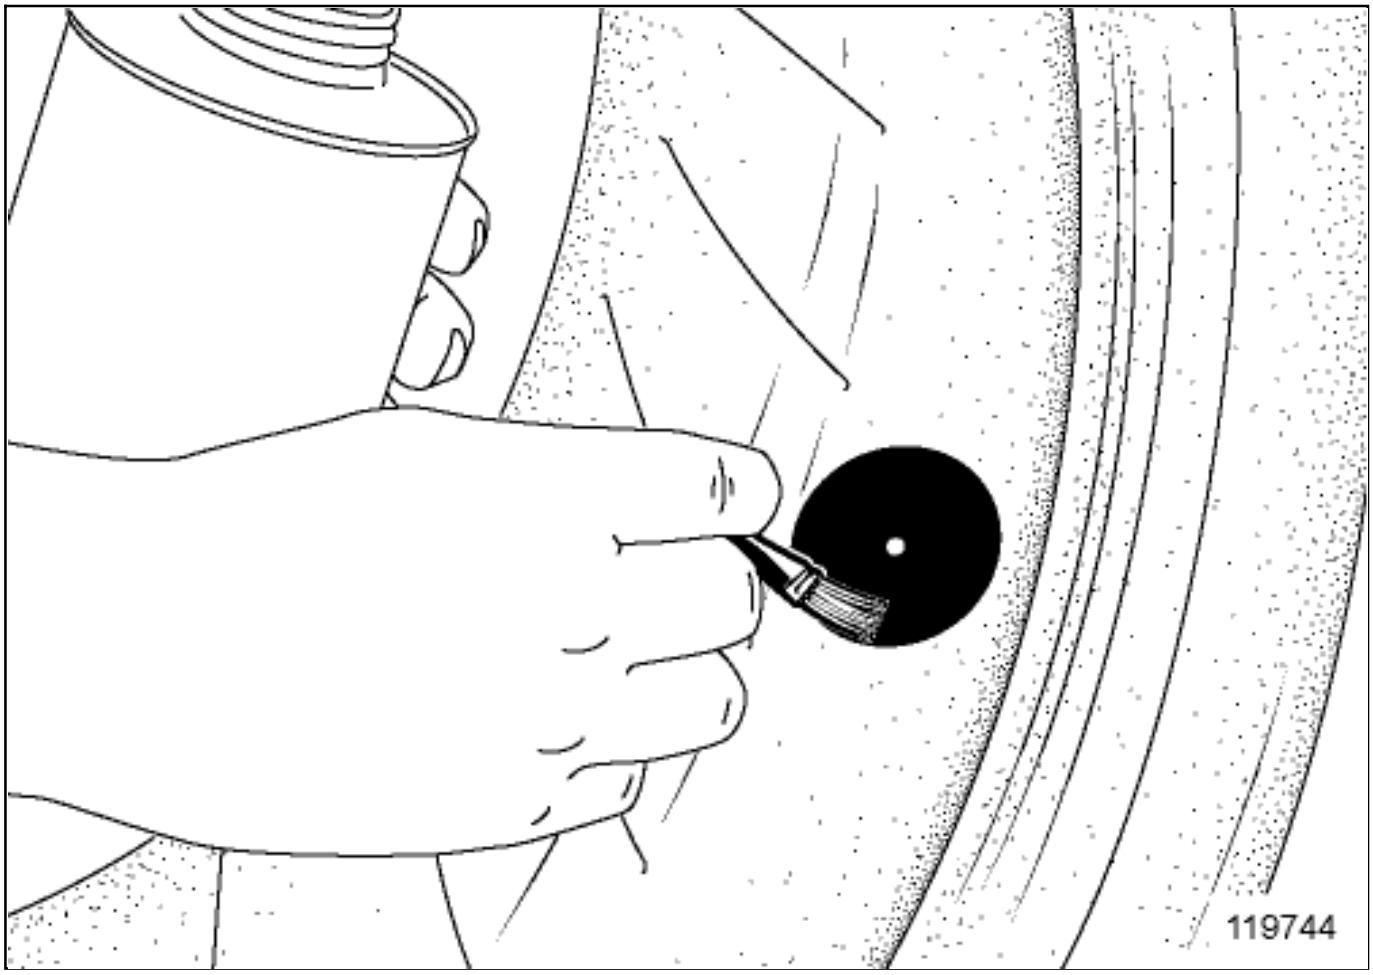
- Inflate the tyre.
- Locate the perforation on the exterior of the tyre and mark it with chalk.
- Remove the tyre.
- Locate the perforation on the interior of the tyre and mark it with chalk.
- Remove the foreign body which caused the puncture.
- Determine the direction of the perforation channel.
- Determine the size of the hole:
  - measure the size of the foreign body,
  - measure the extent of the damage to the tyre.



Choose the size of plug (mushroom type plug) depending on the size of the hole.

2. REPAIR OPERATION

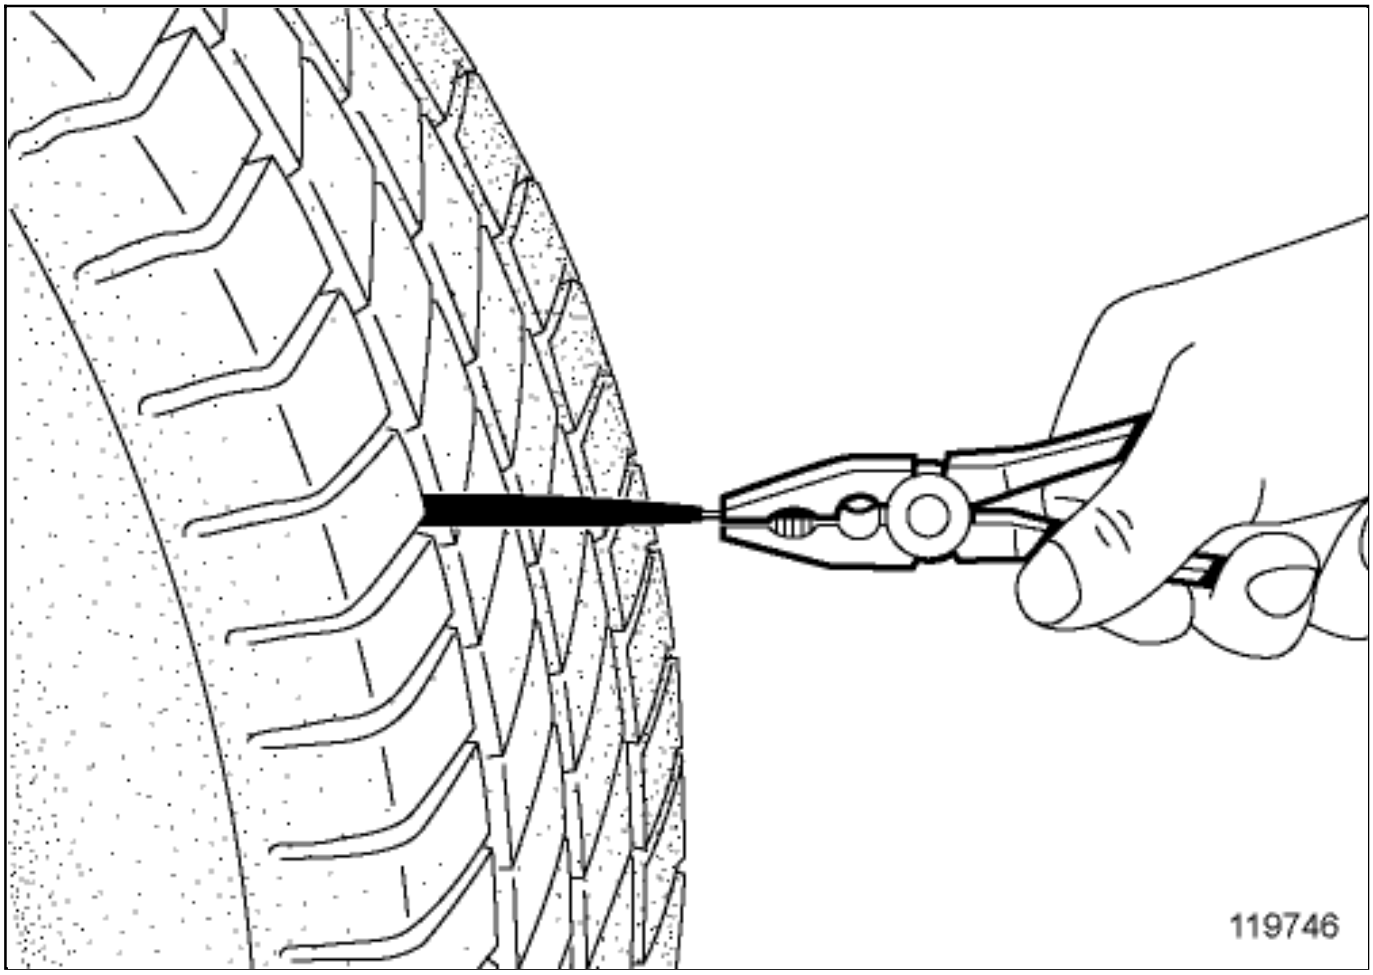
Use a drill fitted with a suitable bit, perpendicular to the surface of the tyre, to bore the interior then the exterior of the perforation channel.



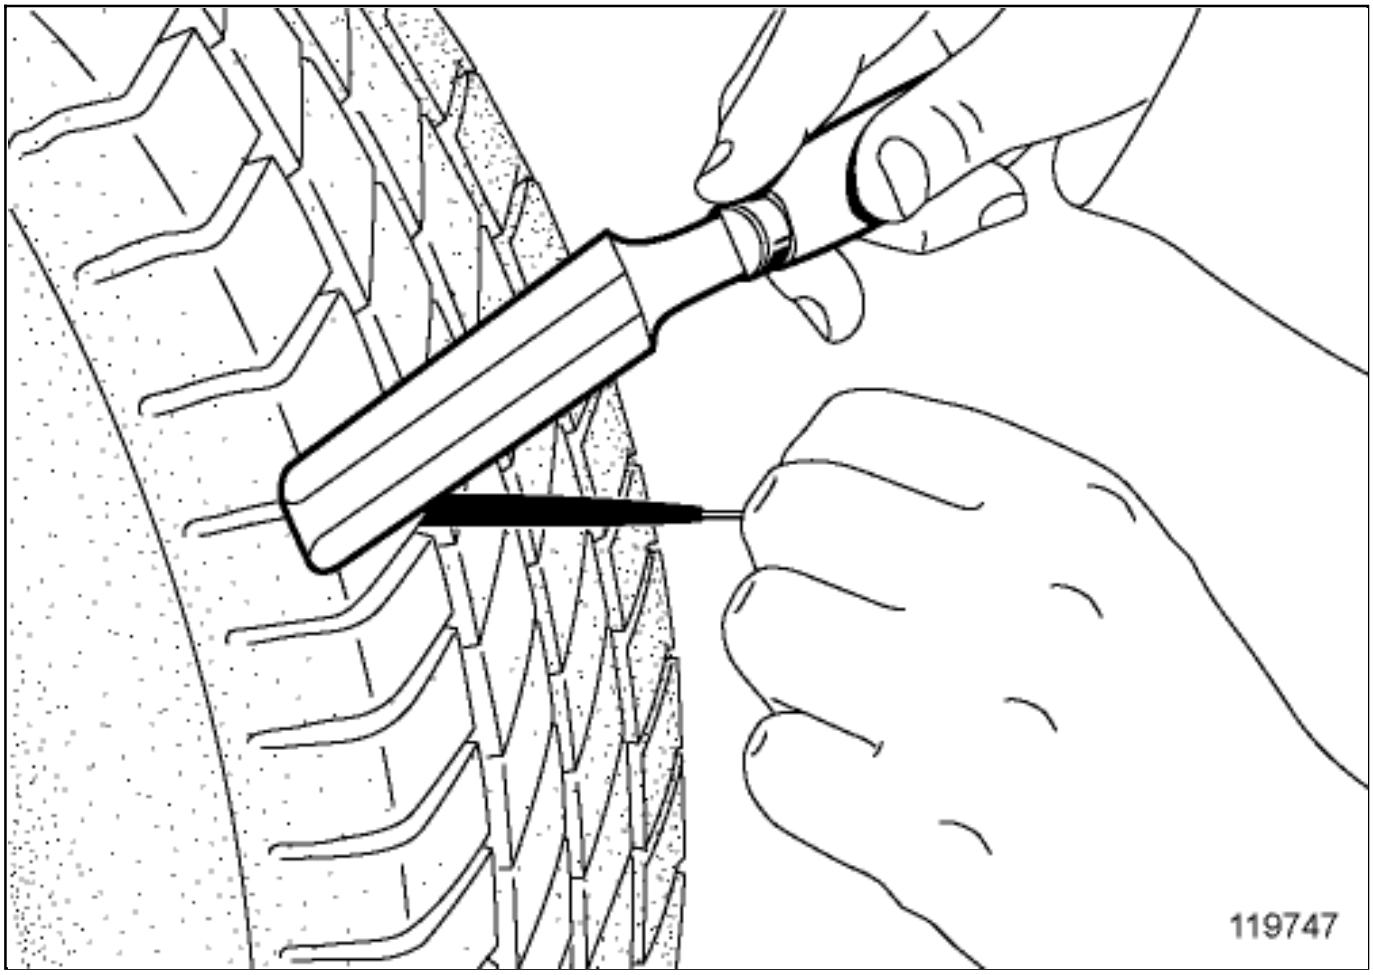
Carefully scrape the rubber seal around the perforation, to the size of the base of the plug (mushroom type plug).

Note:

If the rubber seal is damaged during this operation, replace the tyre.



Remove any dust and remaining particles of rubber using a clean, dry cloth.



Apply the solution to the scraped surface.

Note:

Respect the required drying time for the solution.

- Fit the (mushroom type) plug via the interior of the tyre by pulling on it using pliers.
- Press gently on the base of the mushroom plug, inside the tyre.
- Refit the tyre.
- Inflate the tyre(see **Tyre pressure: Identification**) .

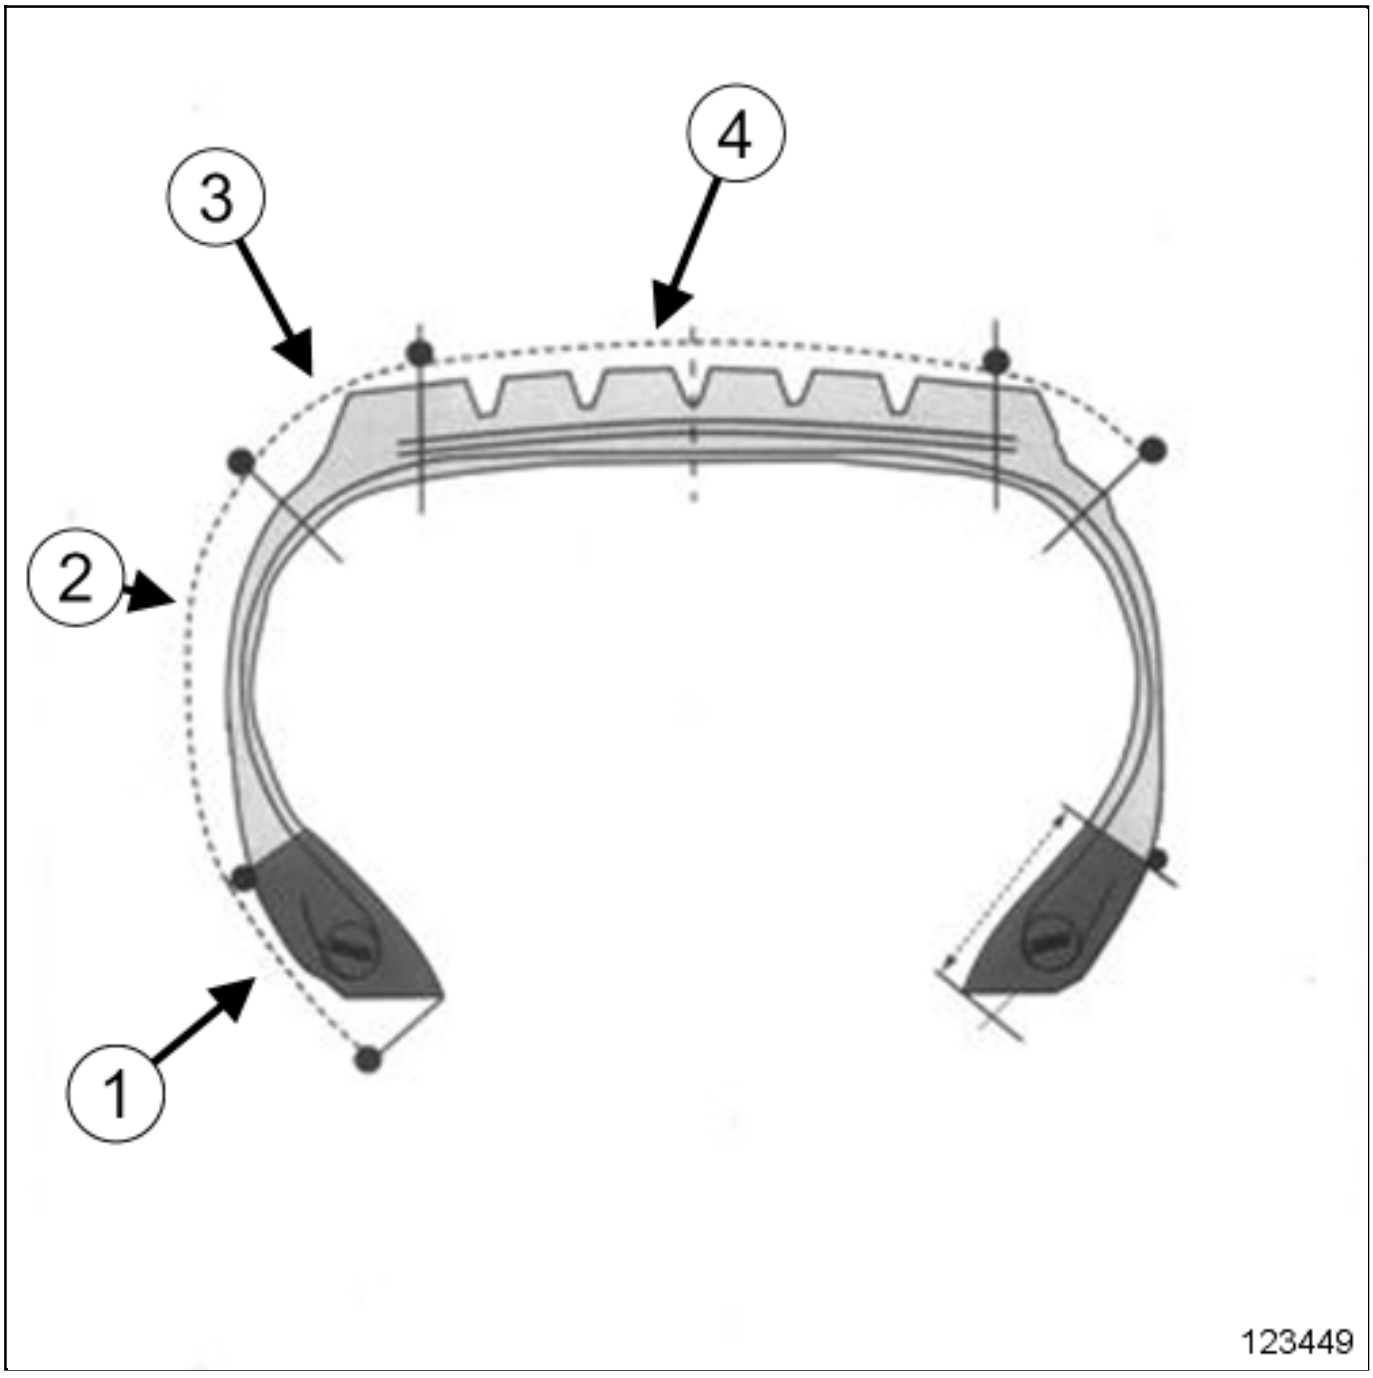
- Cut the protruding end of the stalk without pulling on it.
- Check the tyre seal.

3. FINAL OPERATION.

- Balance the wheel(see 35A, Wheels and tyres, Wheel: Balancing) .
- Refit the wheel(see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

XSL version : 3.02 du 22/07/11

TYRE: REPAIR



Perforation

There are two types of perforation:

- single perforation: perforation caused by nail etc. not requiring a reinforced tyre boot and which can be repaired when the tyres are cold,
- damage: rubber detachment etc. requiring repair and reinforcement of damaged plies.

This repair method only covers single perforations.

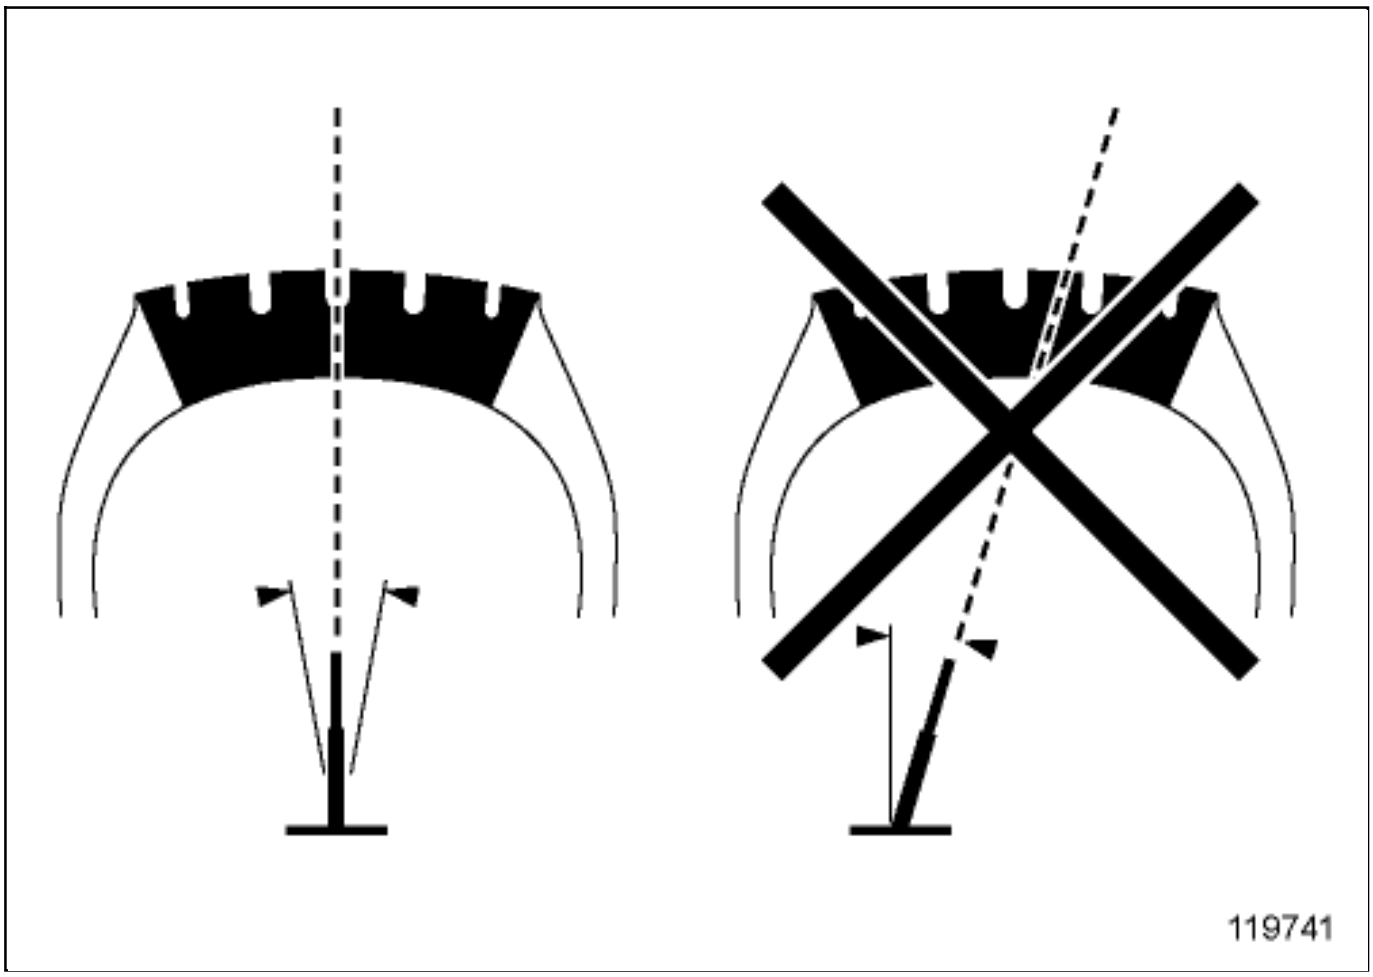
Tyre areas

- Areas which cannot be repaired:
  - tyre bead(1) ,
  - shoulder(3) .
- Areas which can be repaired:
  - sidewall(2) ,
  - crown(4) .

Perforation table *

	Area	
	Crown: max Ø in mm	Sidewall: max Ø in mm
LV speed rating less than or equal to T	6	3
LV speed rating greater than or equal to H	6	0
LCV load index less than or equal to 121	6	3
HGV load index 122 to 177 (inc.)	10	3

LV: Light Vehicle



LCV: Light Commercial Vehicle

HGV: Heavy Goods Vehicle

* If the diameter of the puncture is greater than these figures, replace the tyre.

- The tyre cannot be repaired if:
  - a compulsory marking has been worn away(see 35A, Wheels and tyres, Tyres: Identification) ,
  - the interior of the tyre shows signs of under-inflation or overloading,
  - the rubber shows signs of chemical damage (hydrocarbons and other corrosive substances),
  - incorrect and irreversible repairs have previously been made to the tyre,
  - the carcass has been damaged,
  - cuts or circumferential wear (cracks) are visible on the interior or exterior of the tyre,
  - the tyre bead has been damaged (ply visible),
  - the tyre's bead wires are visible, damaged or deformed,
  - the tyre shows an irregular wear pattern which may impair vehicle handling,
  - the repair requires two tyre boots to be overlapped,

- the manufacturer has expressly prohibited any repairs, in writing,
- there is damage to the shoulder area (junction between the sidewall and the crown),
- the angle of the perforation channel (hole) is greater than 15˚.

Tyre inflation kit

using the tyre inflation kit, supplied with vehicles or available from retailers, will leave a film on the inner surface of the tyre.

Before carrying out the repair, clean the inner surface of the tyre and the valve with water.

If the tyre cannot be cleaned in this way, contact the tyre supplier for details of cleaning products which can be used.

REPAIR

1. REPAIR PREPARATION OPERATION

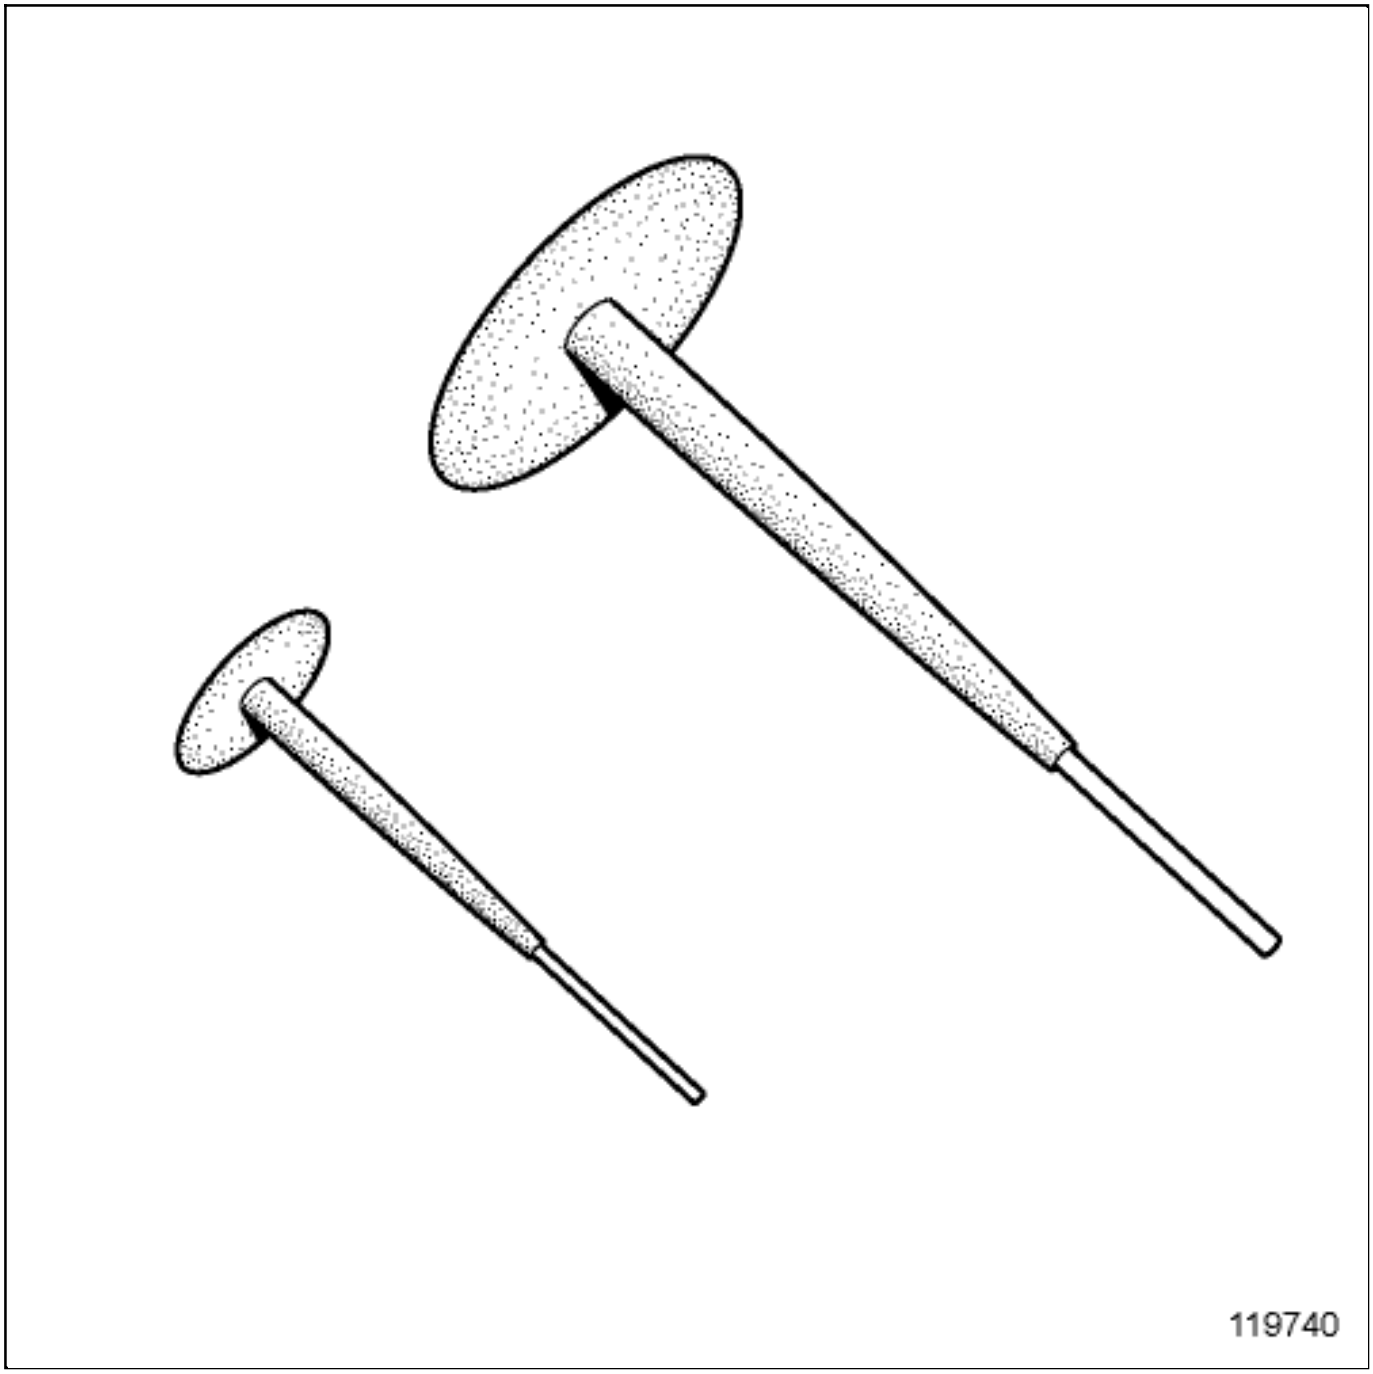
Position the vehicle on a two-post lift Vehicle: Towing and lifting (02A, Lifting equipment).

Remove the wheel (see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

Inflate the tyre.

Locate the perforation on the exterior of the tyre and mark it with chalk.

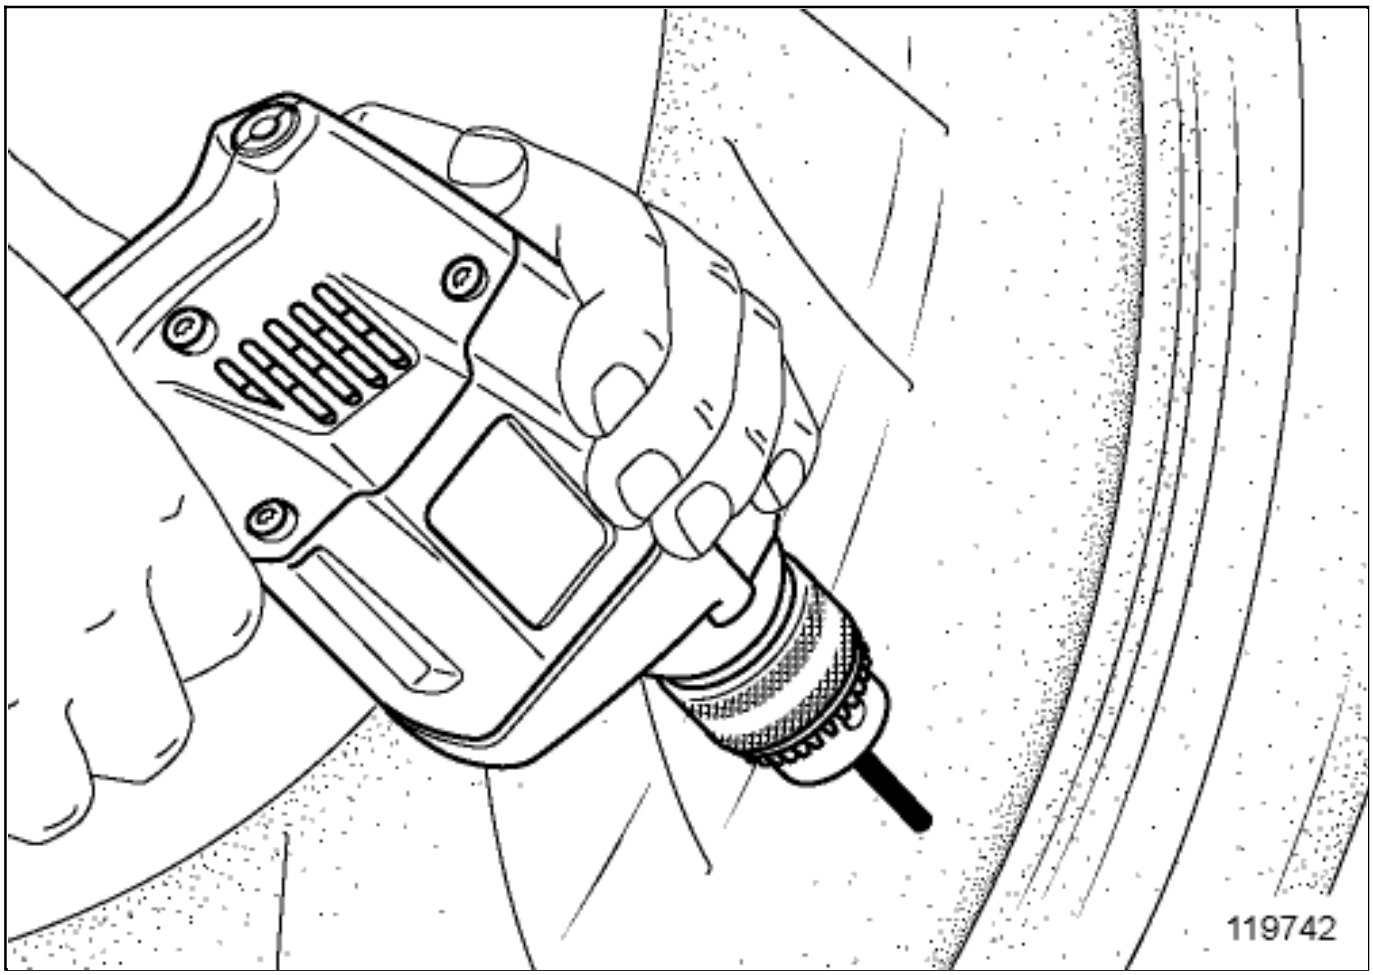
Remove the tyre.



Locate the perforation on the interior of the tyre and mark it with chalk.

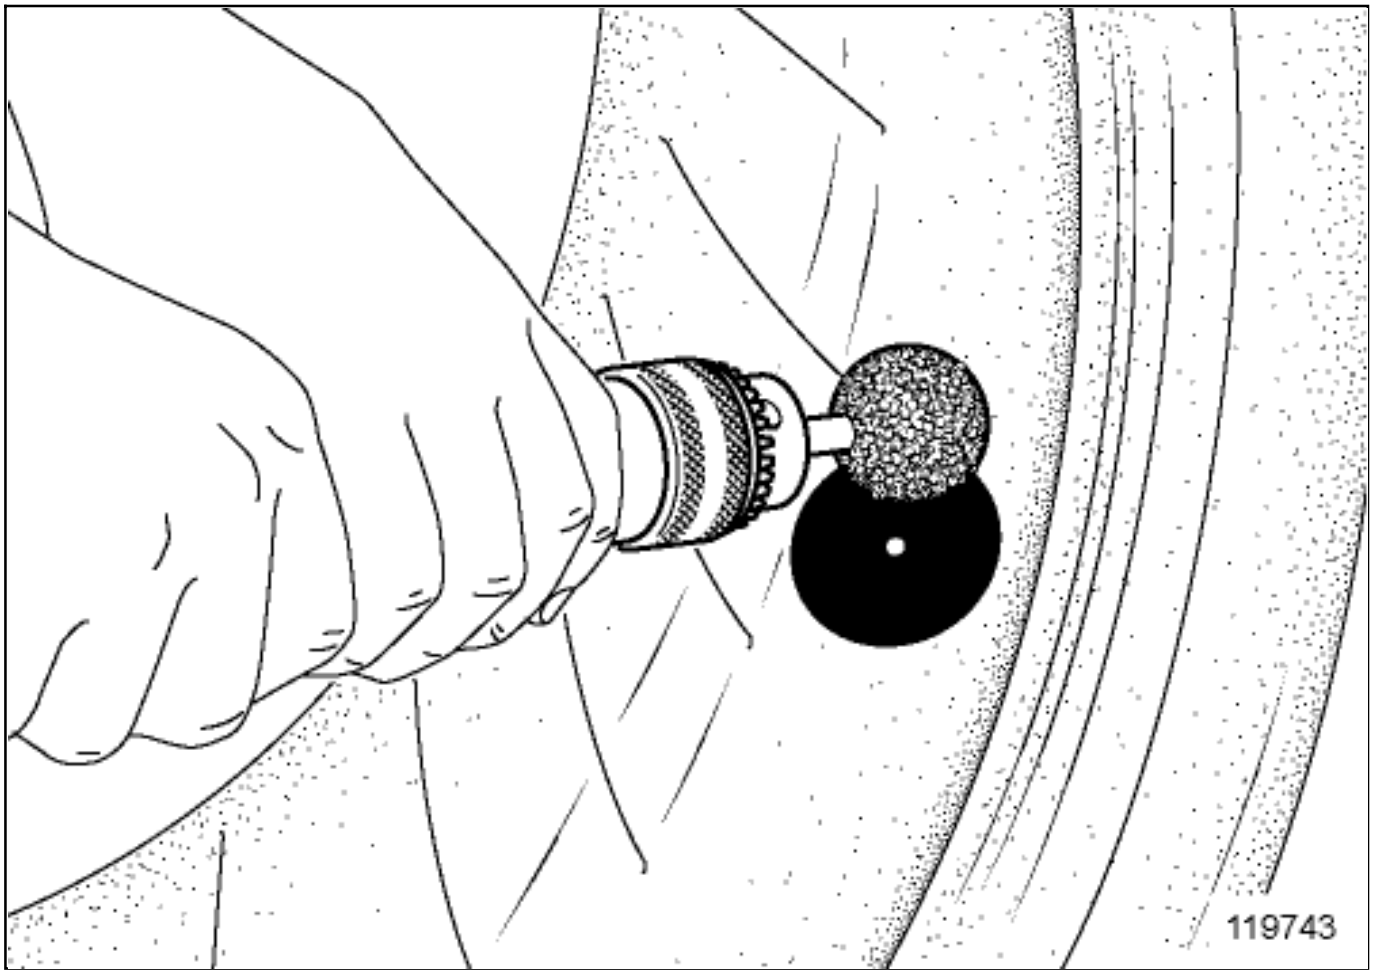
Remove the foreign body which caused the puncture.

Determine the direction of the perforation channel.



Determine the size of the hole:

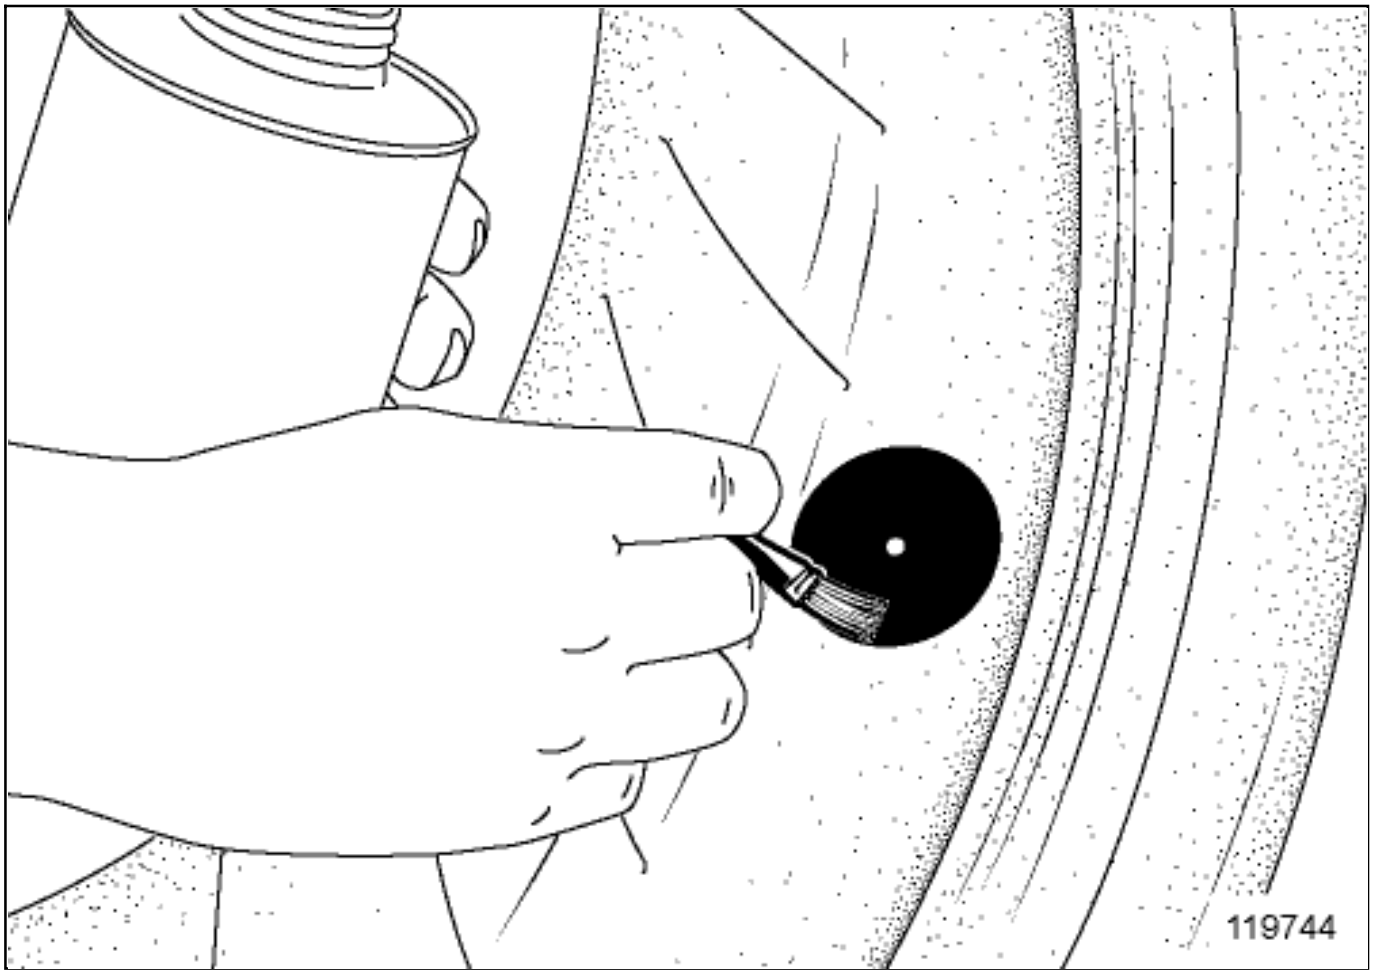
- measure the size of the foreign body,
- measure the extent of the damage to the tyre.



Choose the size of plug (mushroom type plug) depending on the size of the hole.

2. REPAIR OPERATION

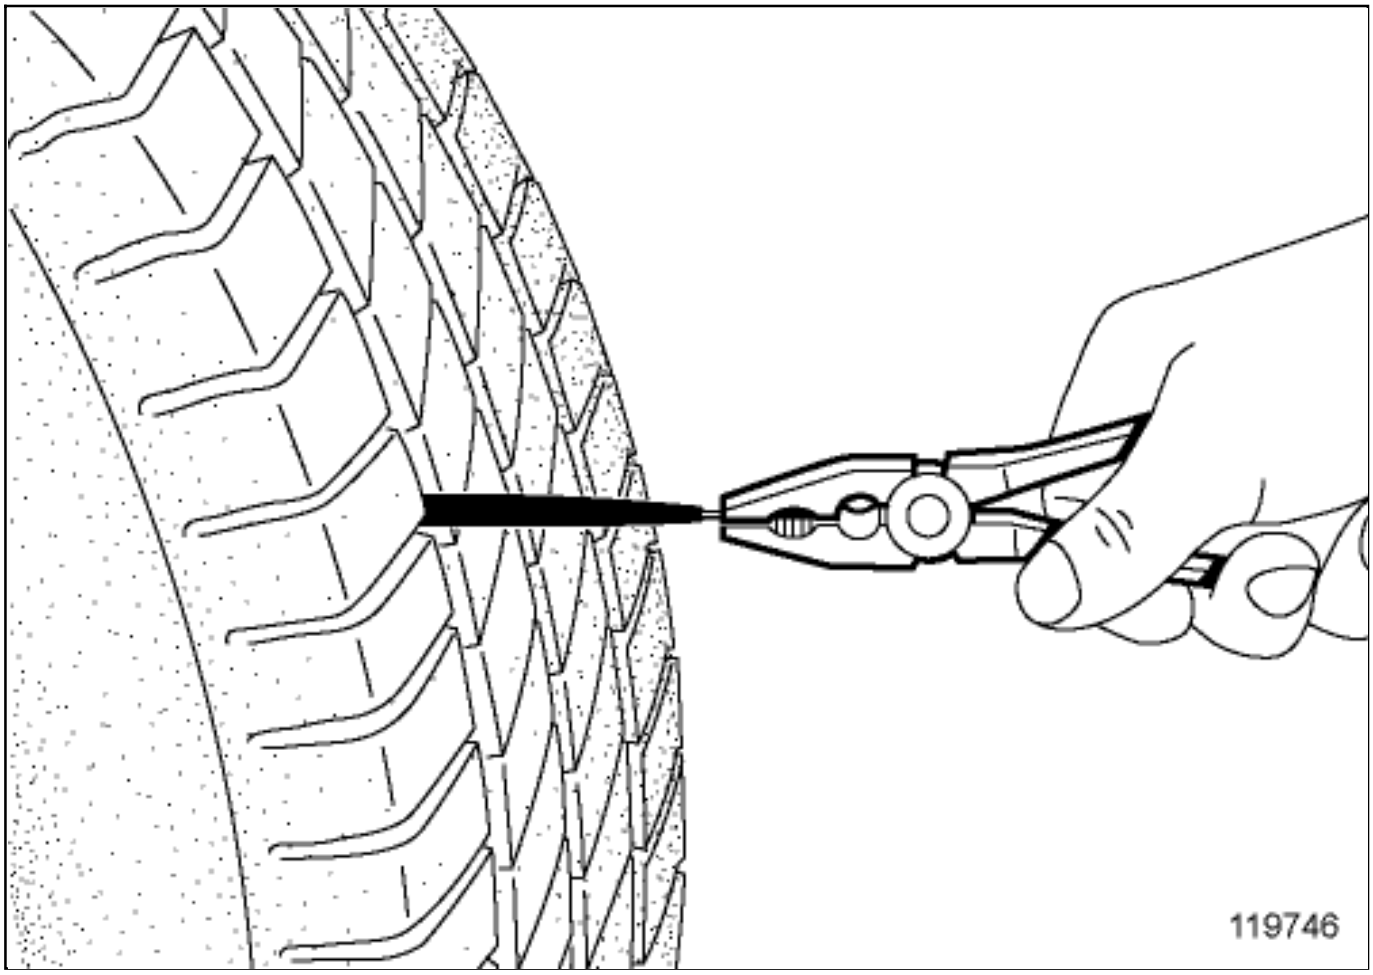
Use a drill fitted with a suitable bit, perpendicular to the surface of the tyre, to bore the interior then the exterior of the perforation channel.



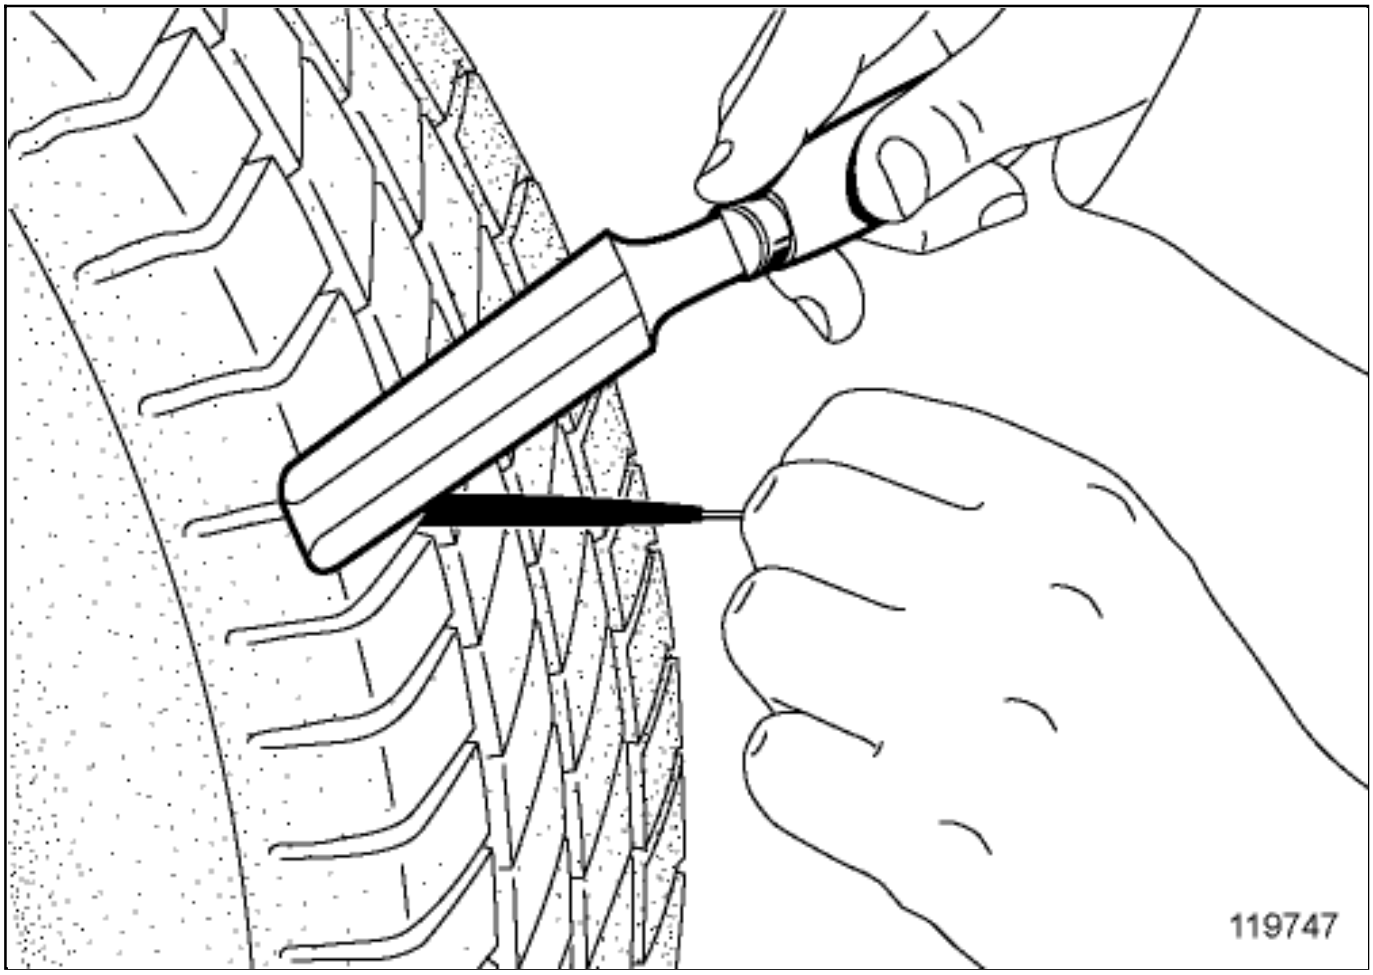
Carefully scrape the rubber seal around the perforation, to the size of the base of the plug (mushroom type plug).

Note:

If the rubber seal is damaged during this operation, replace the tyre.



Remove any dust and remaining particles of rubber using a clean, dry cloth.



Apply the solution to the scraped surface.

Note:

Respect the required drying time for the solution.

- Fit the (mushroom type) plug via the interior of the tyre by pulling on it using pliers.
- Press gently on the base of the mushroom plug, inside the tyre.
- Refit the tyre.
- Inflate the tyre **Tyre pressure: Identification** .

- Cut the protruding end of the stalk without pulling on it.
- Check the tyre seal.

3. FINAL OPERATION.

- Balance the wheel(see 35A, Wheels and tyres, Wheel: Balancing) .
- Refit the wheel(see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

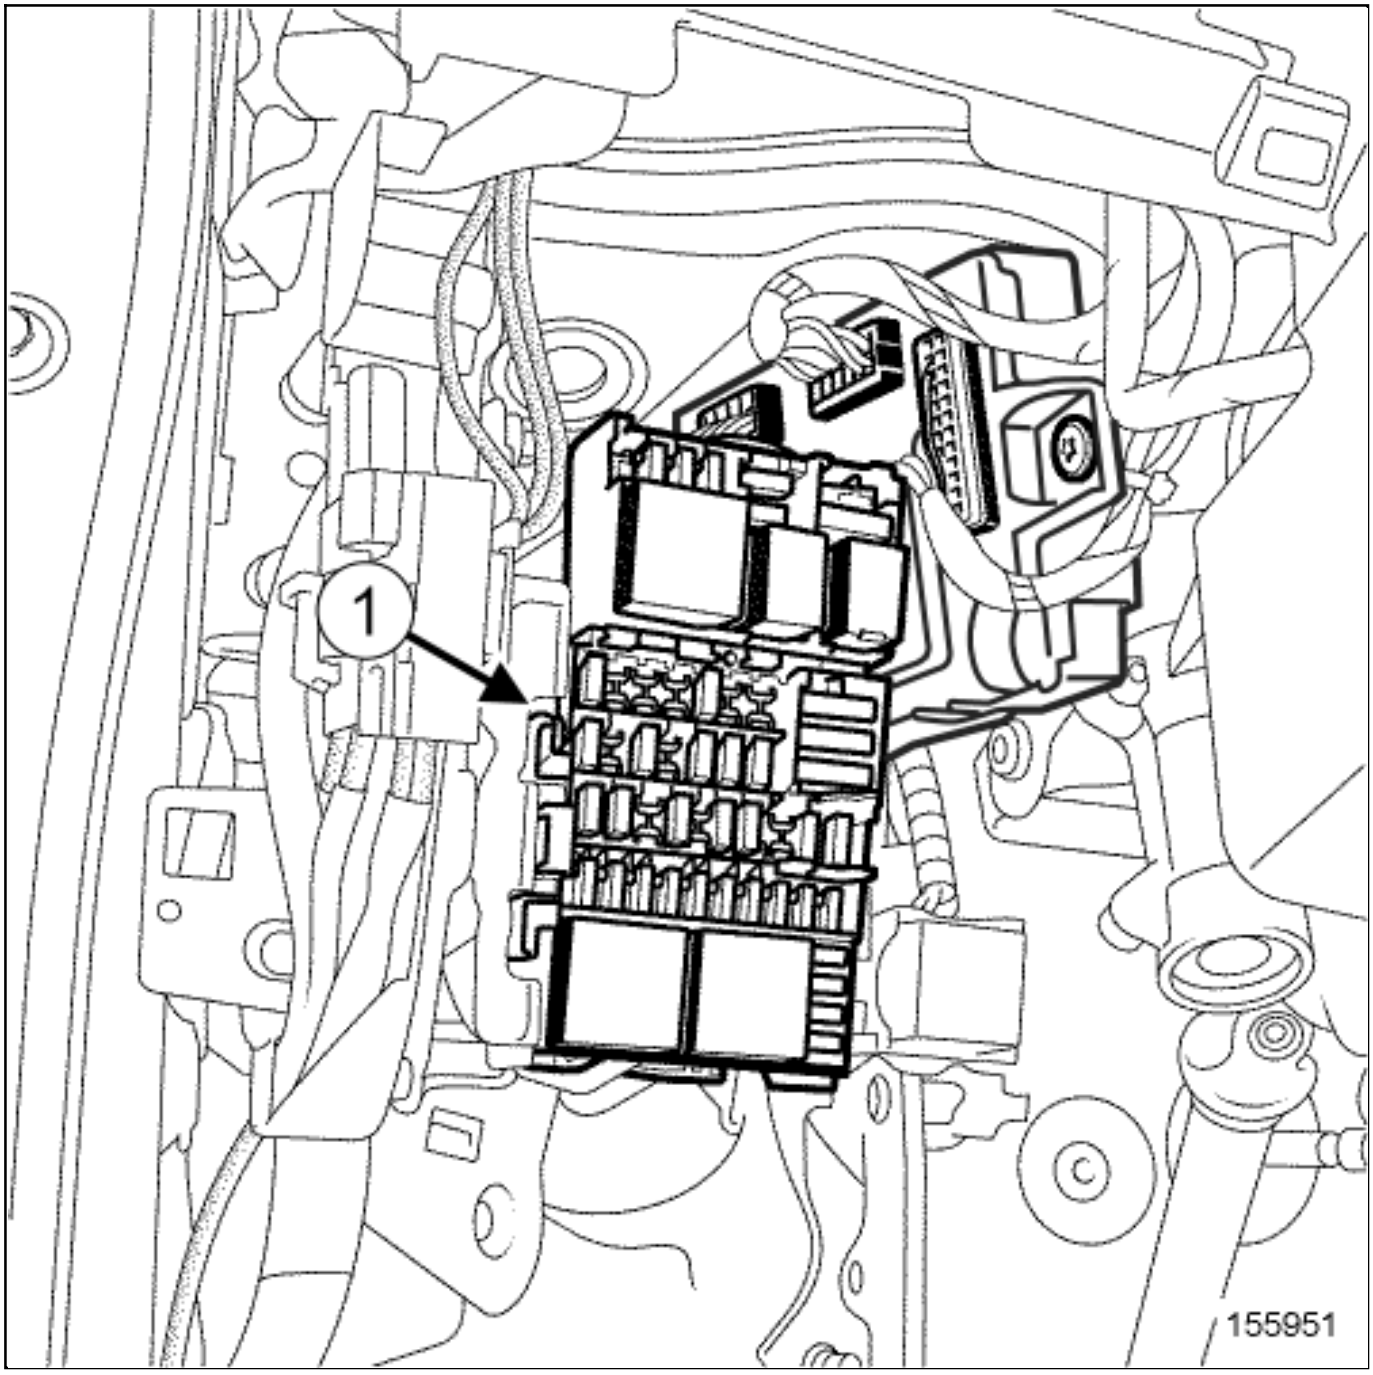
XSL version : 3.02 du 22/07/11

UCH: REMOVAL - REFITTING

Equipment required
Diagnostic tool

REMOVAL

1. REMOVAL PREPARATION OPERATION

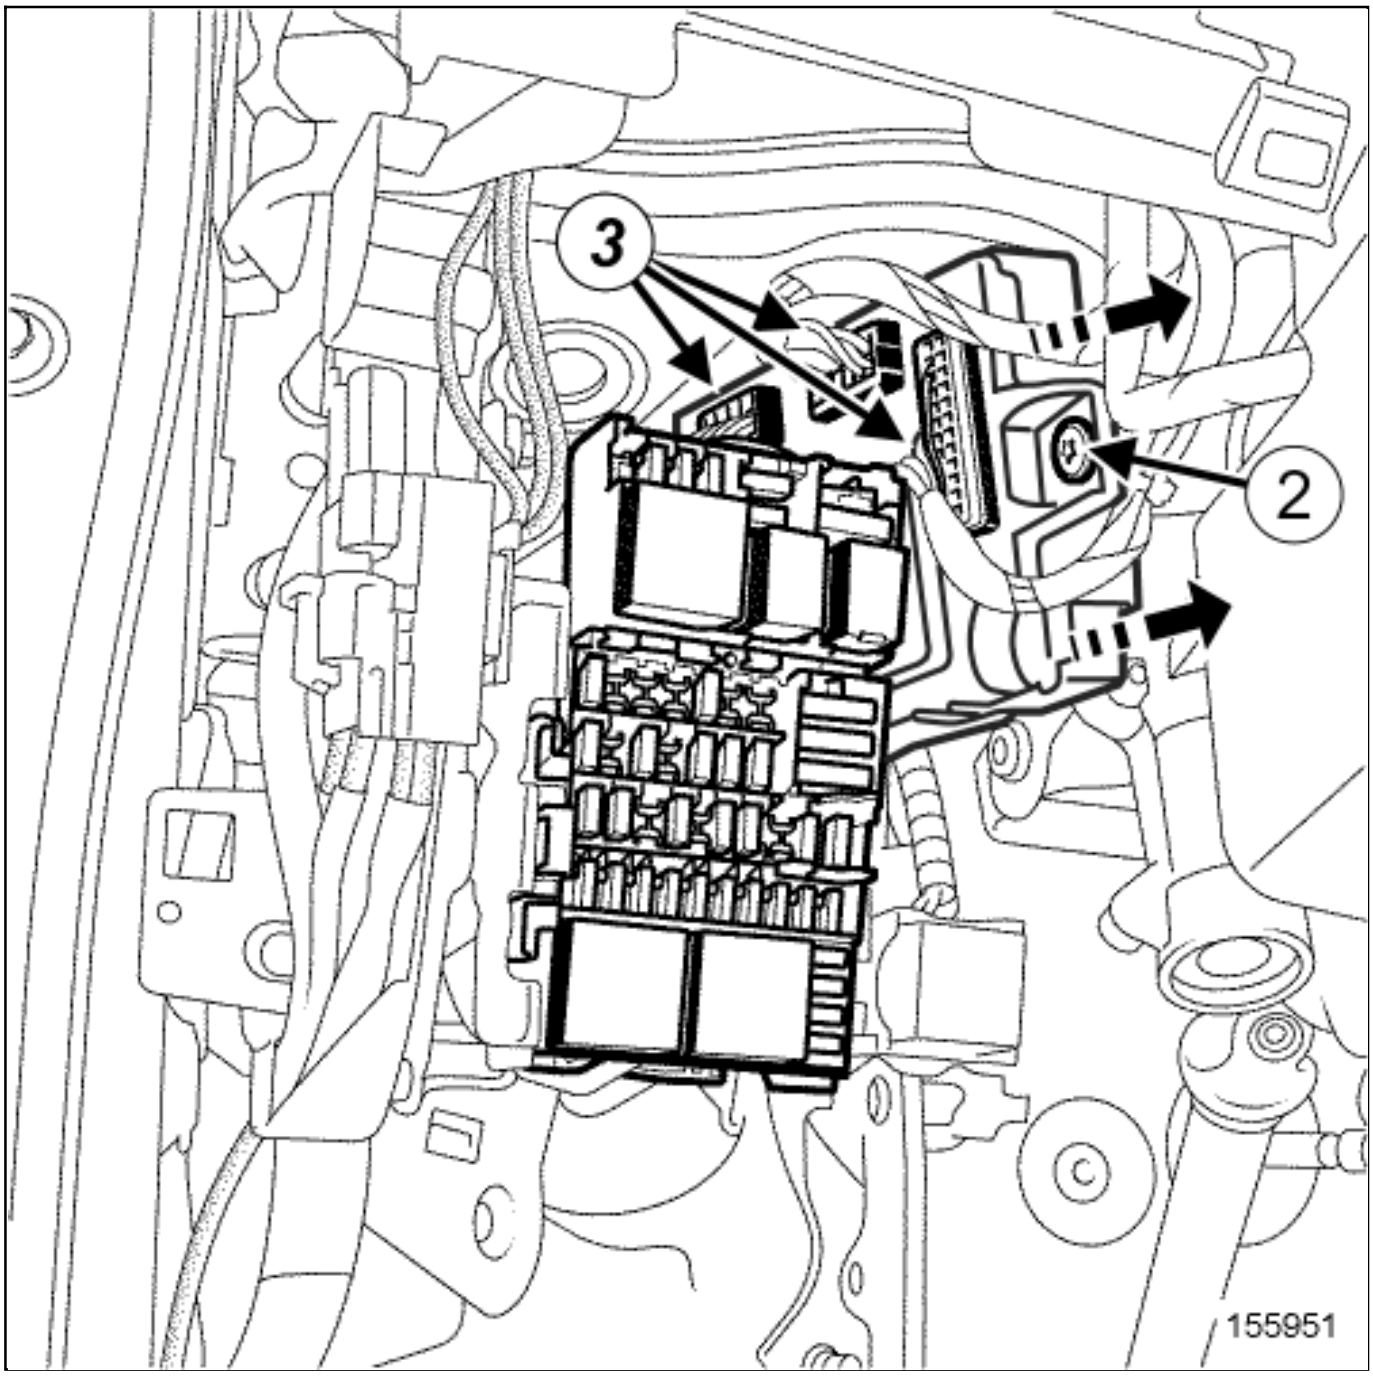


- Apply the before repair procedure using the Diagnostic tool Diagnostic tool : Use :

-Computer concerned by the Before repair procedure:

■"UCH" .

- Disconnect the battery Battery: Removal - Refitting .



- Remove the dashboard lower trim Dashboard assembly: Exploded view .

Unclip the passenger compartment fuse and relay box plate(1) from the dashboard cross member.

Move aside the passenger compartment fuse and relay box.

2. REMOVAL OPERATION

- Remove the UCH screw(2) .
- Disconnect the UCH connectors(3) .
- Remove the UCH.

REFITTING

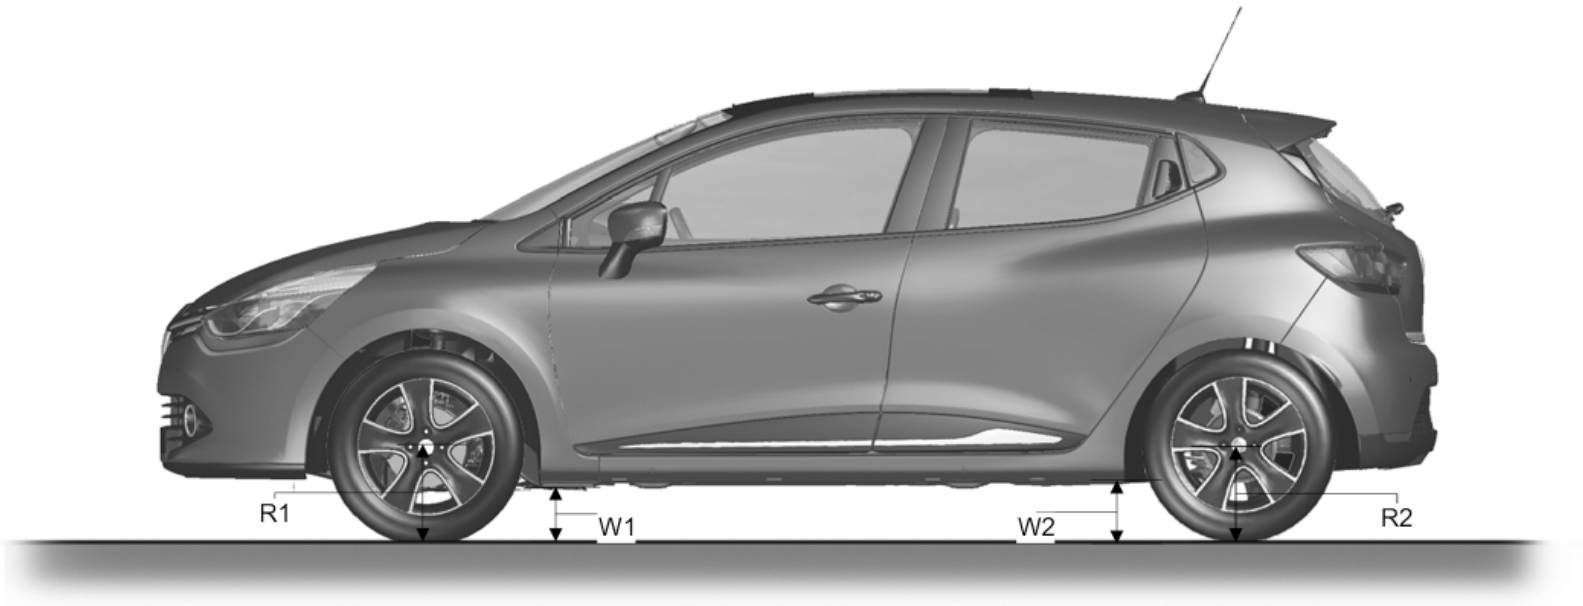
1. REFITTING OPERATION

Proceed in the reverse order to removal.

2. FINAL OPERATION

Apply the after repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:



"UCH" .

Repair-32x05x01x06-01x37-1-39-1.xml

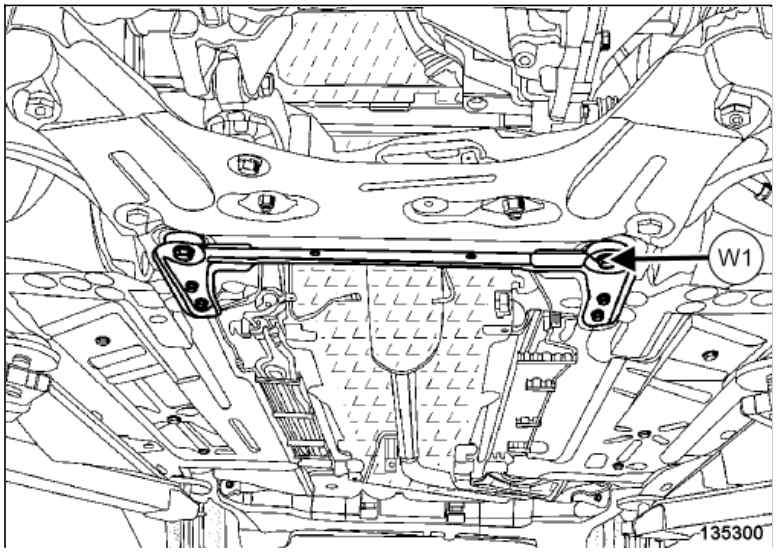
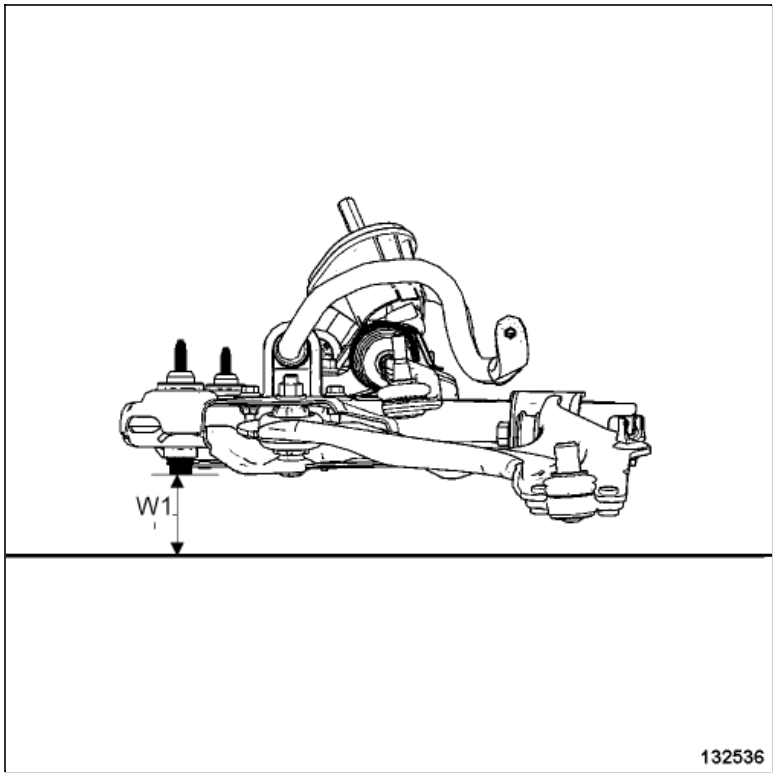
UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

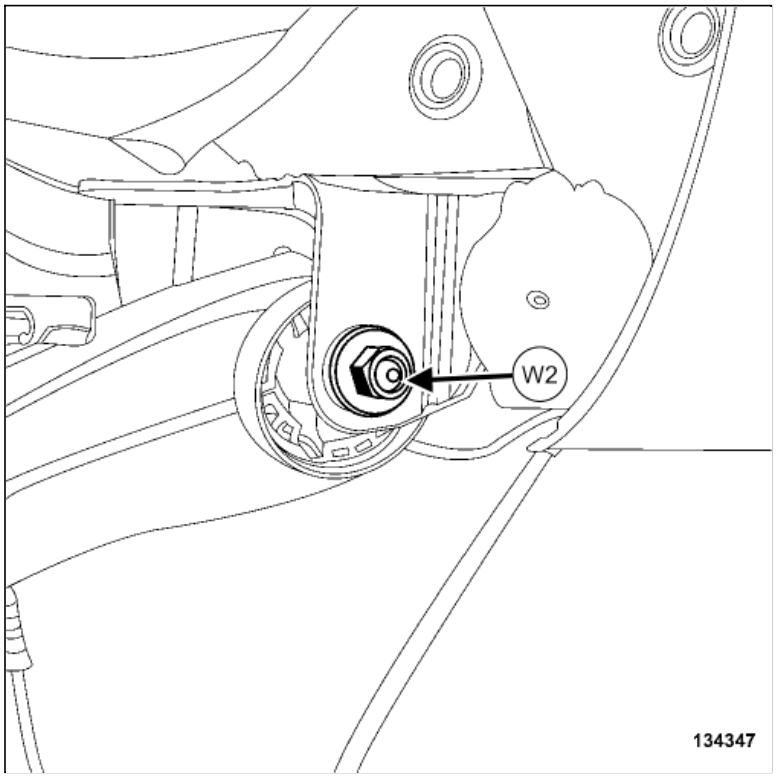




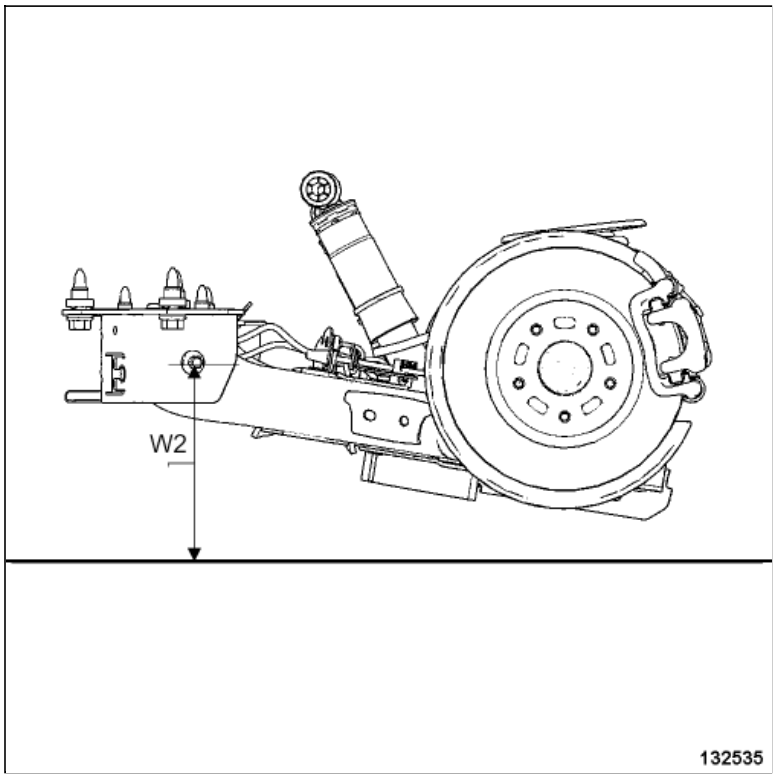
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

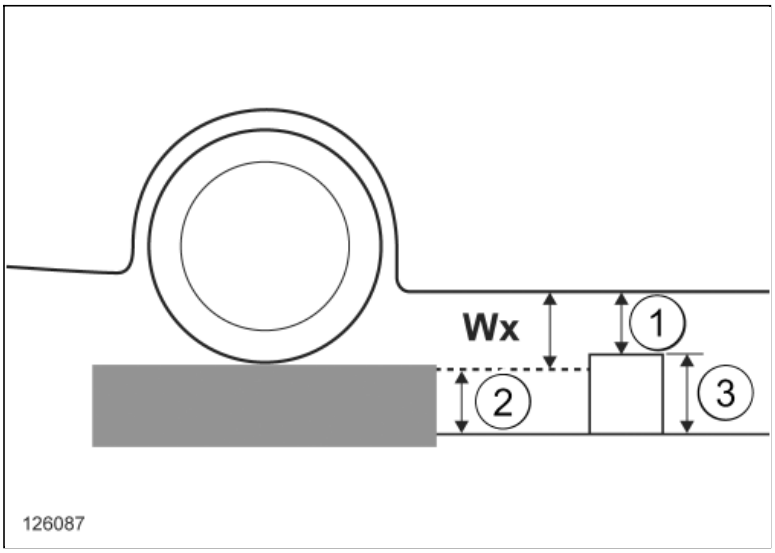
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

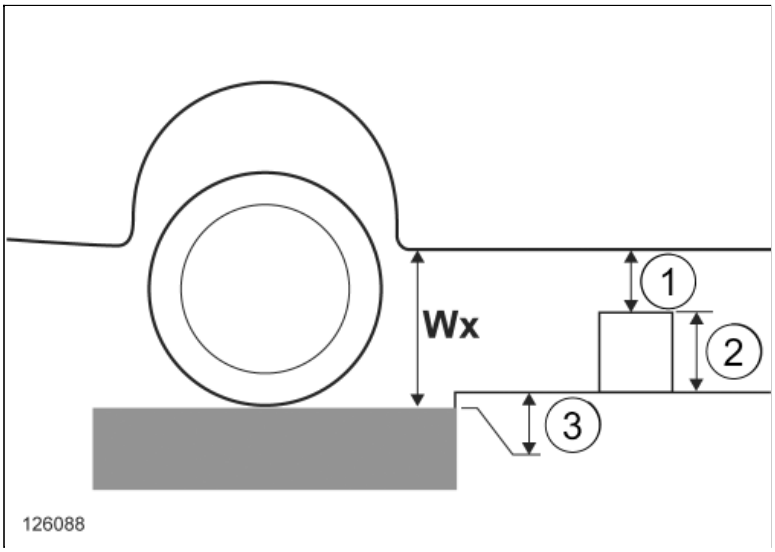
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

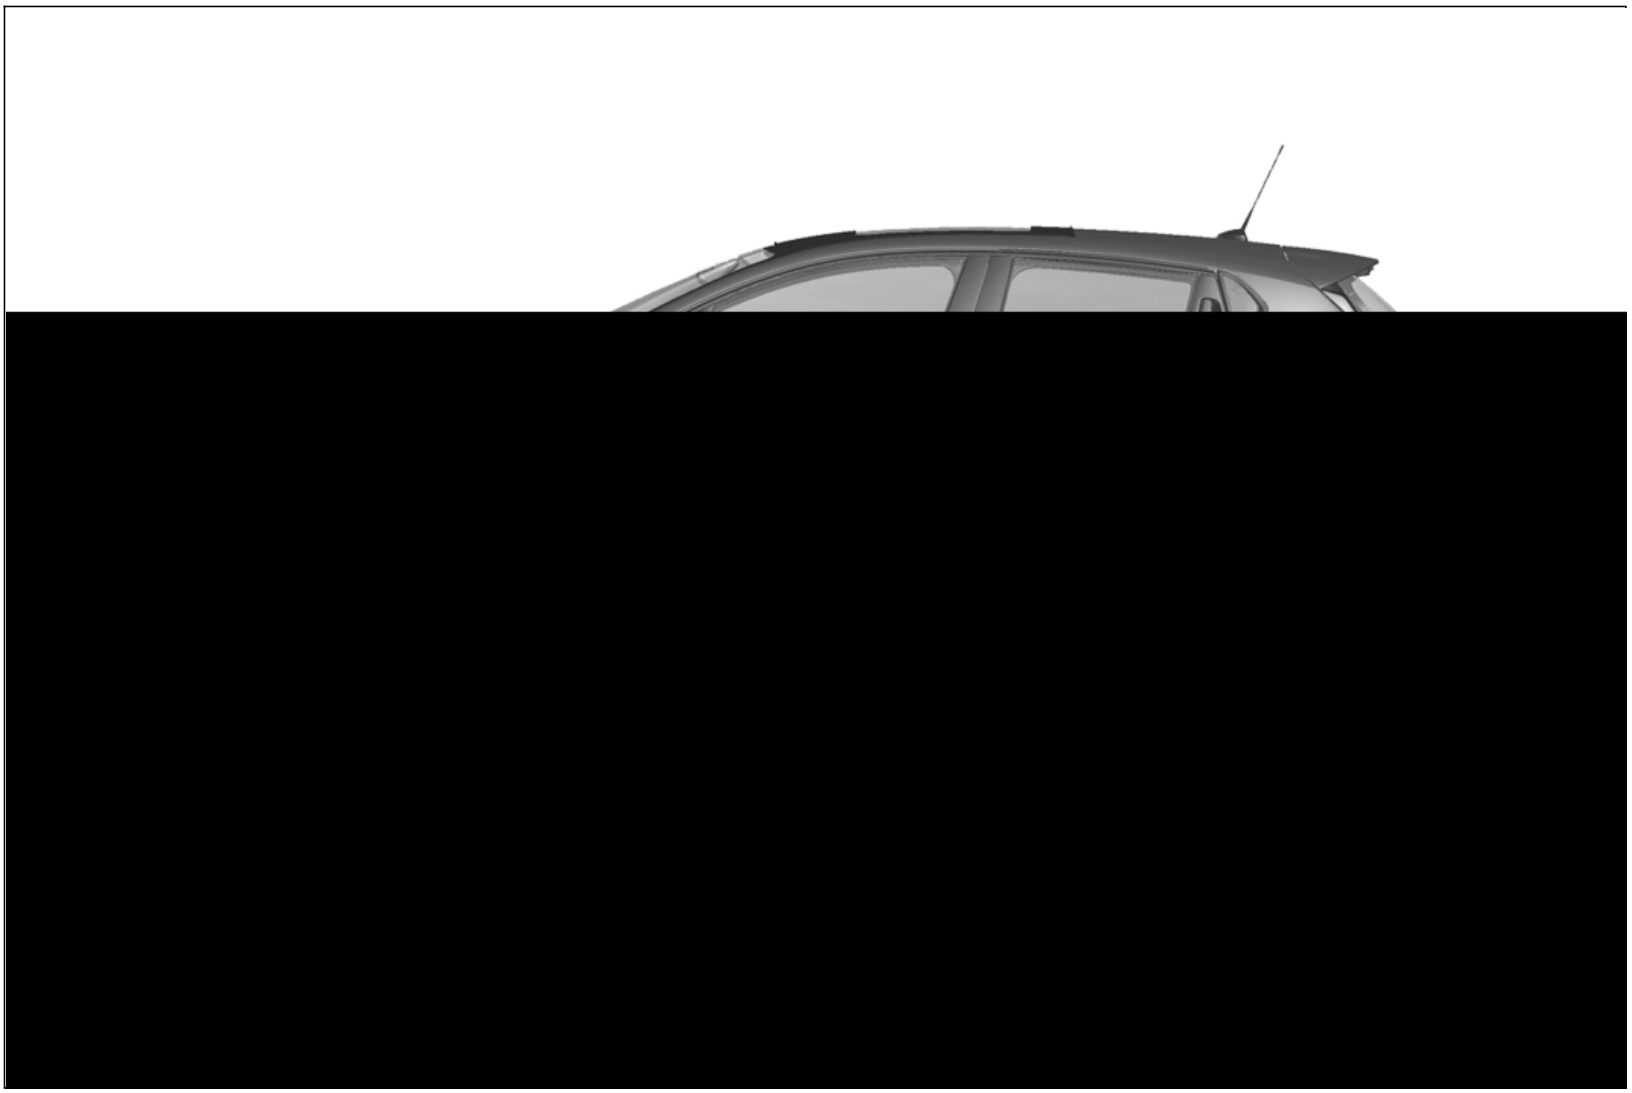
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

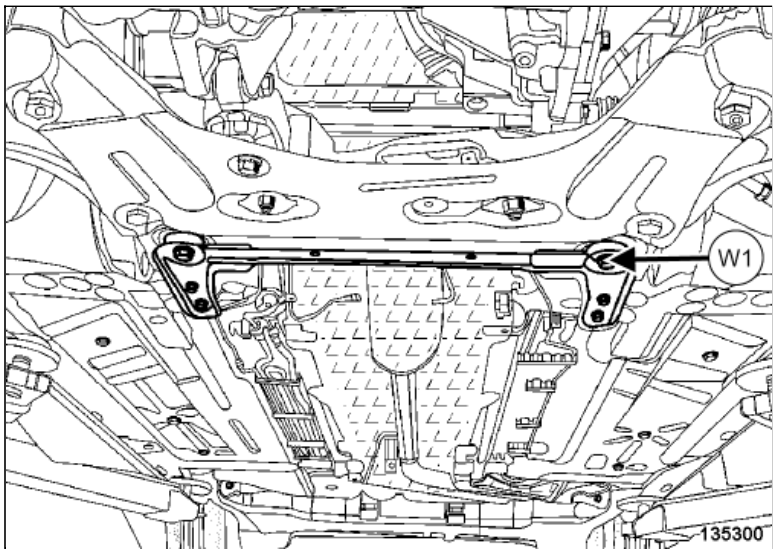
- tank full,
- empty vehicle (without luggage, etc.).



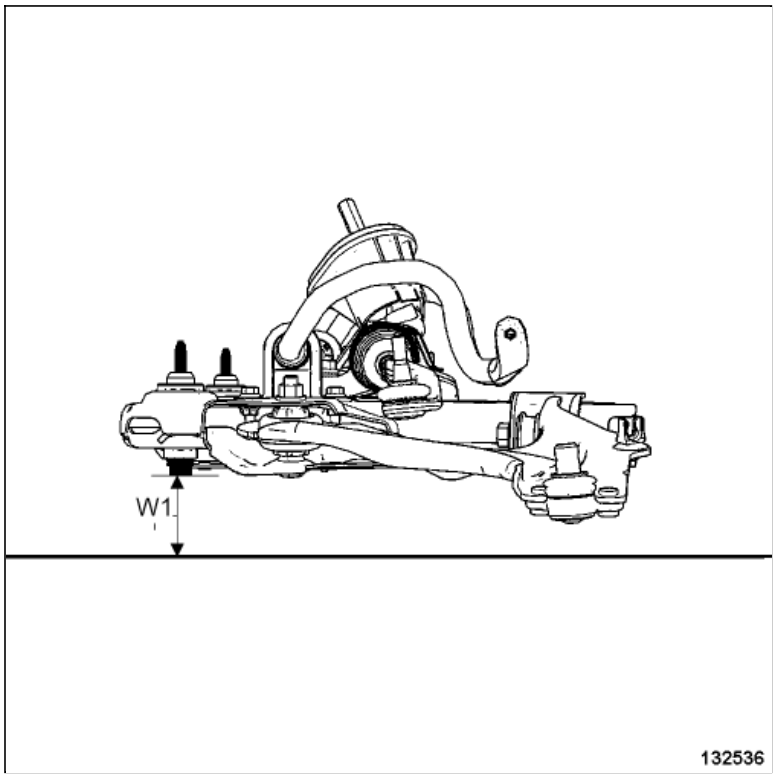
Note:

The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

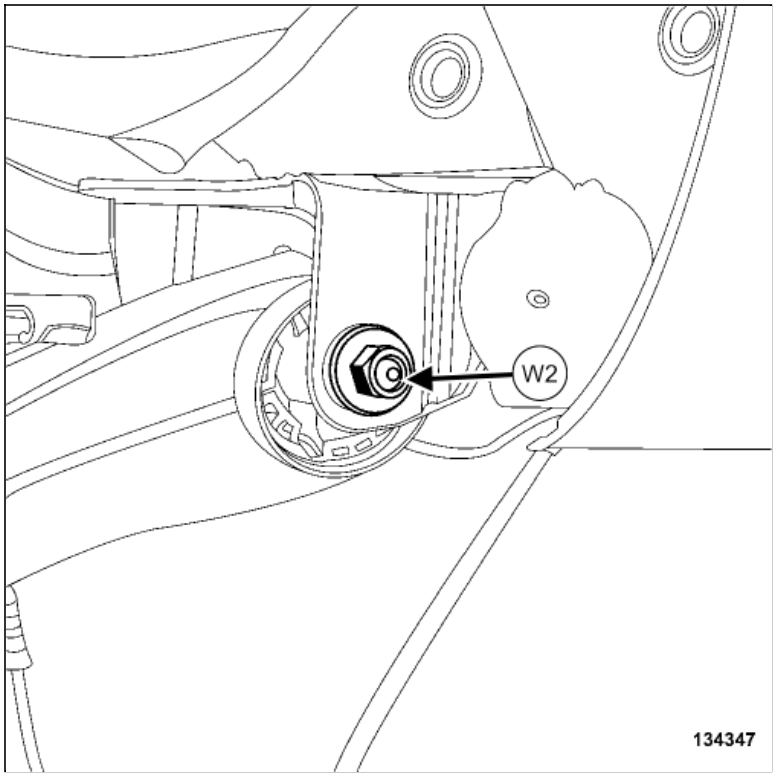


UNDERBODYHEIGHTS:ADJUSTMENTVALUE

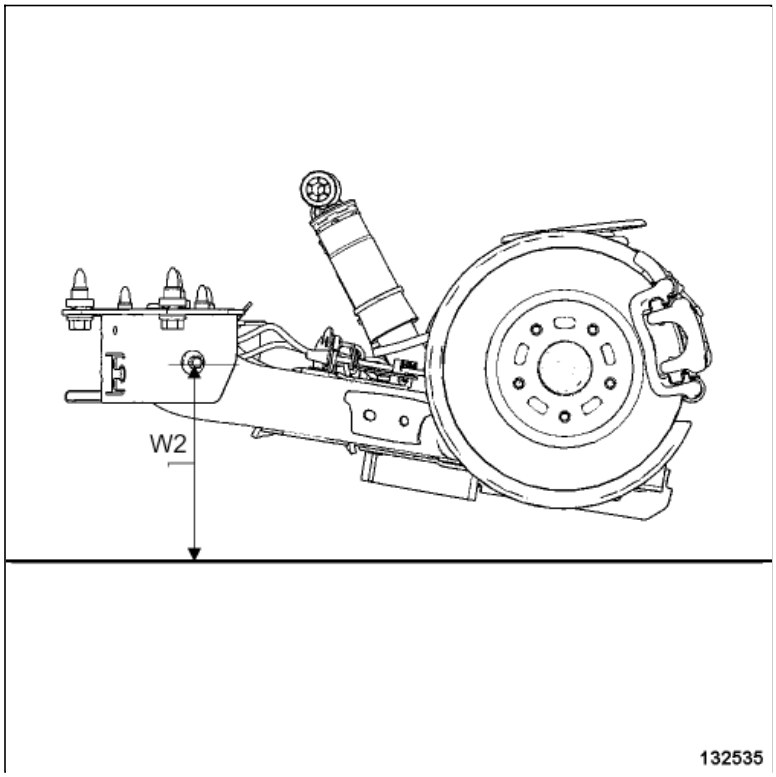


1. MEASURING POINTS

- Radius under load:
  - (R1) : Distance between the ground and the front wheel axis
  - (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

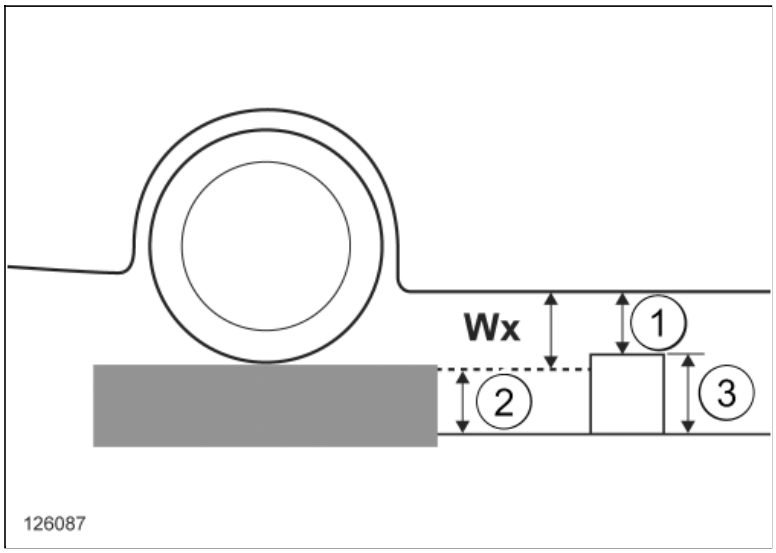
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

- Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

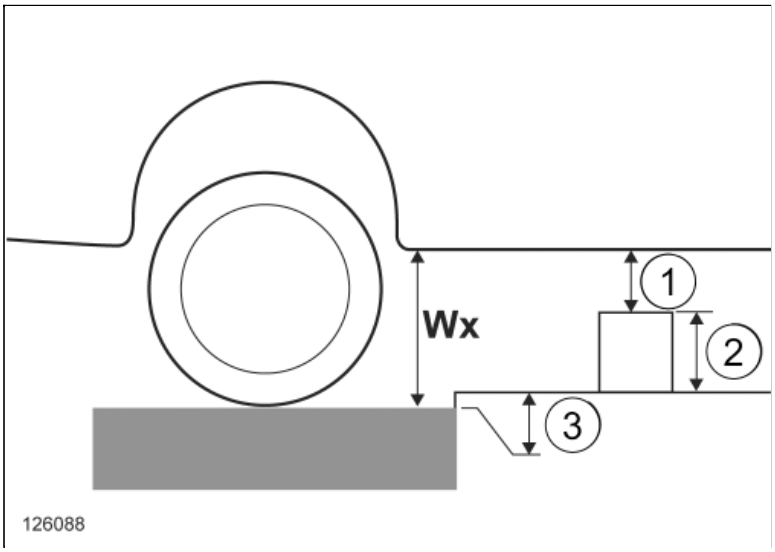
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1), (2), (3).



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2),

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

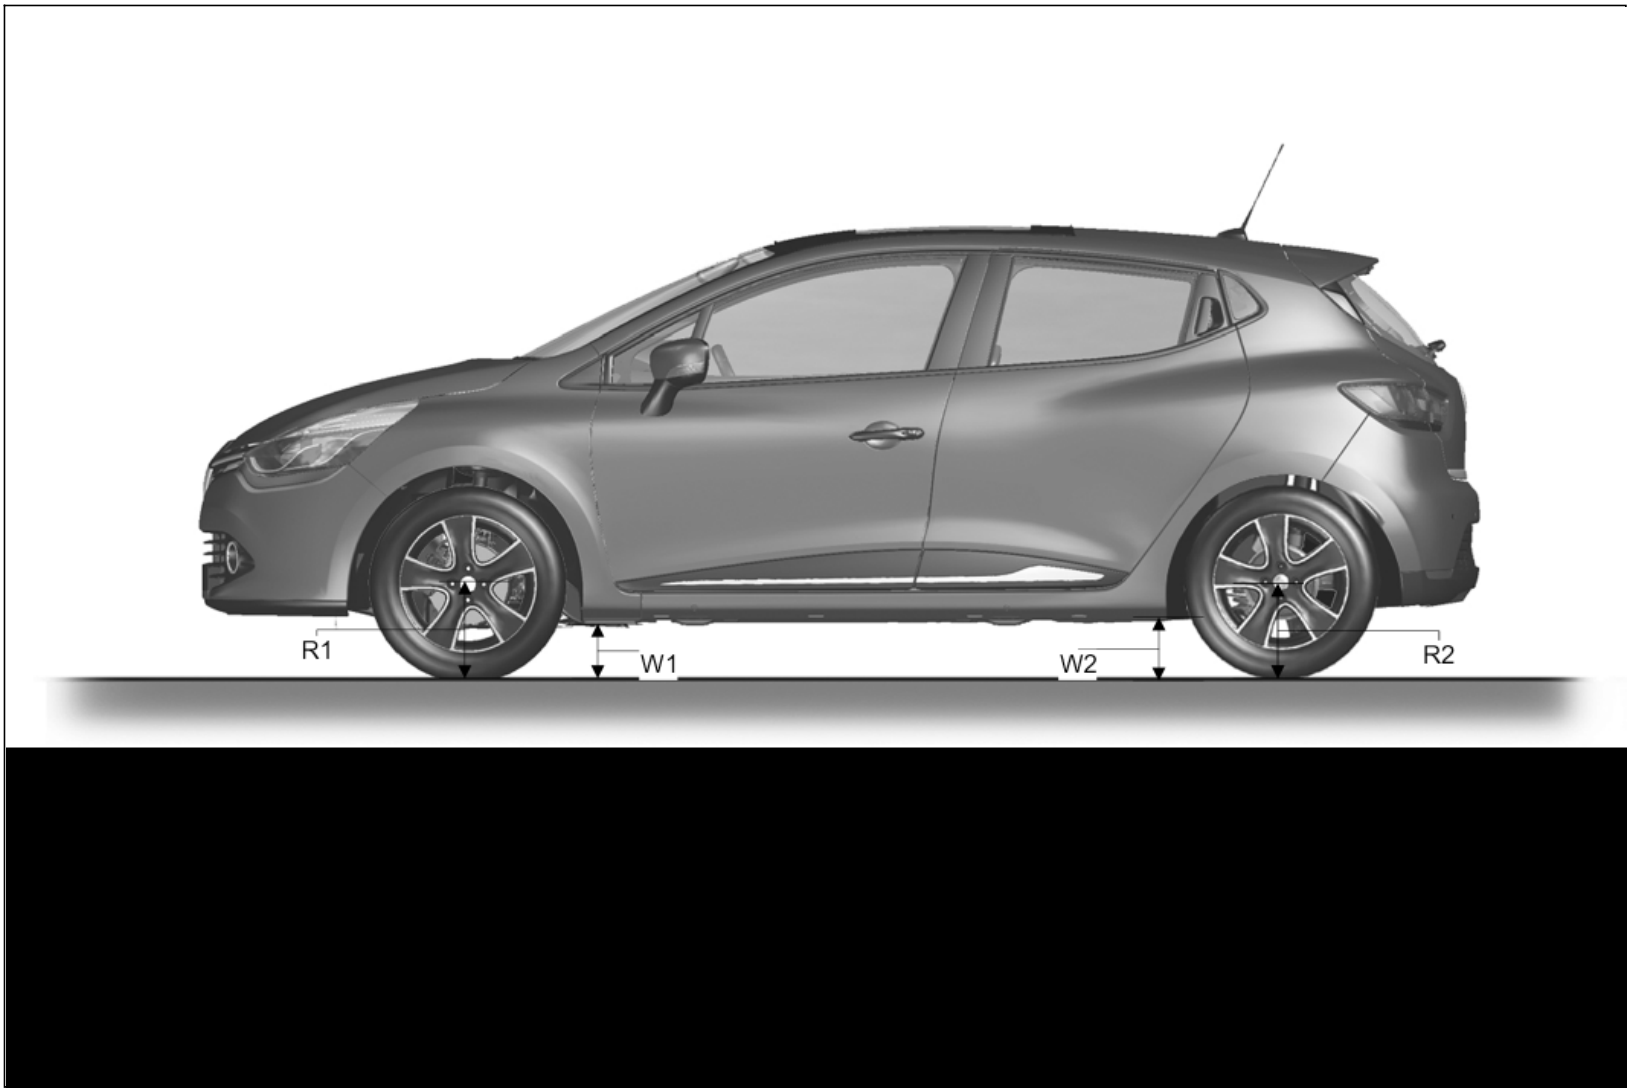
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).

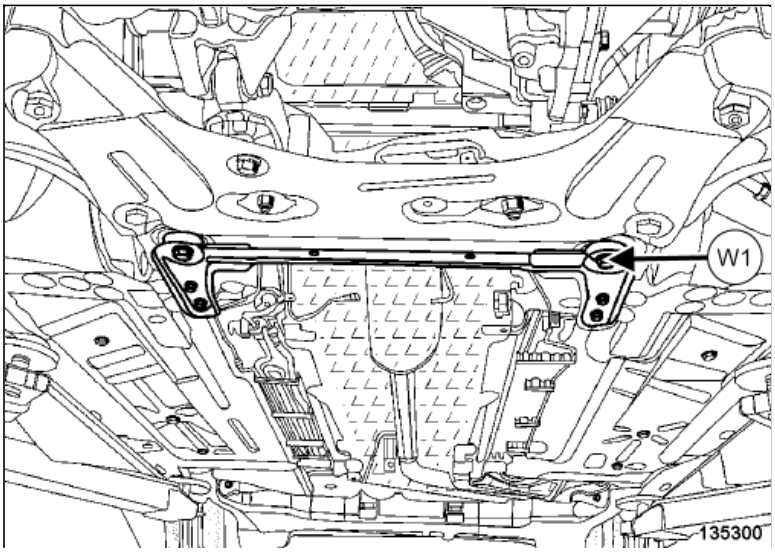


Note:

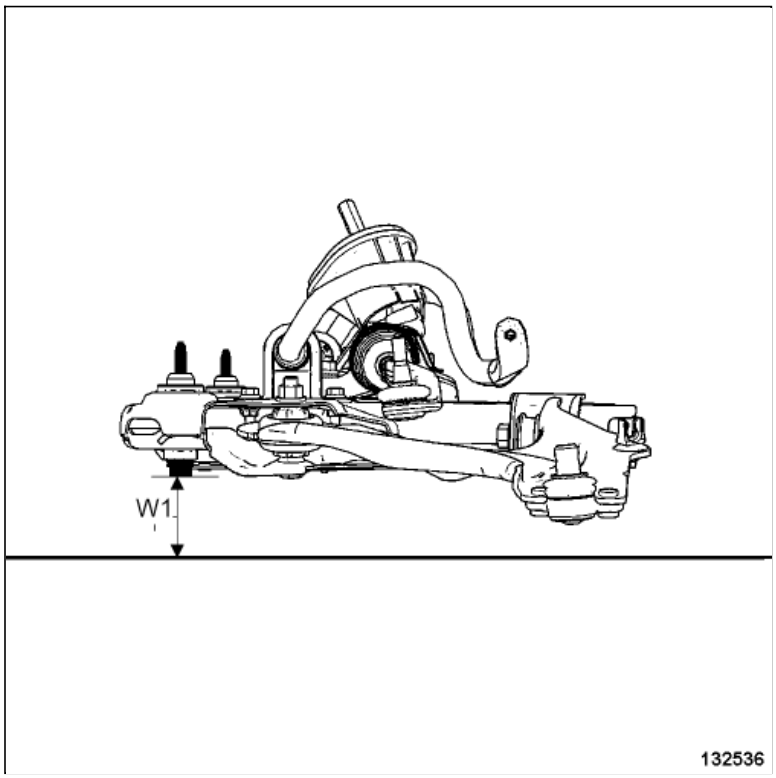
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

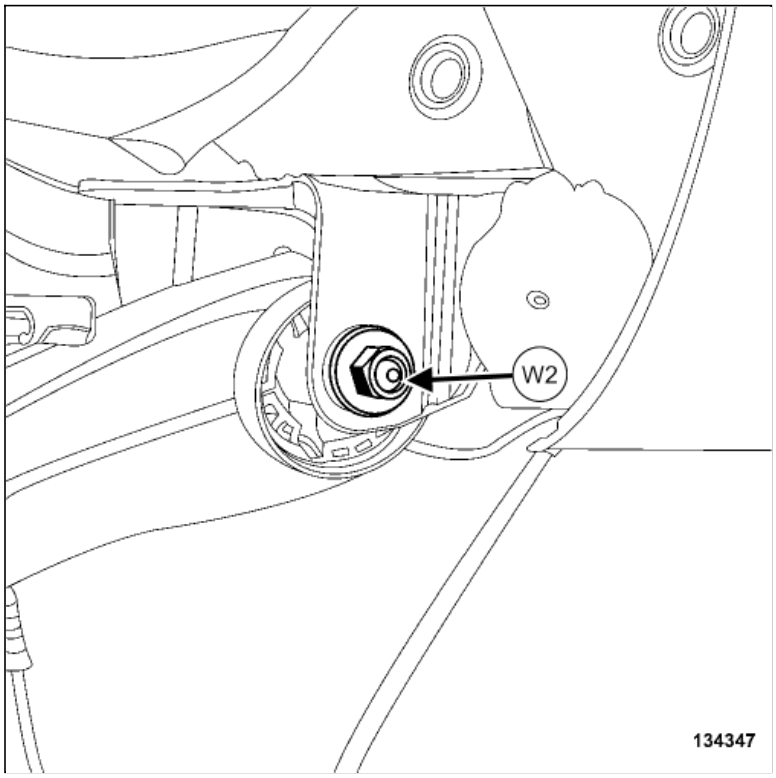


1. MEASURING POINTS

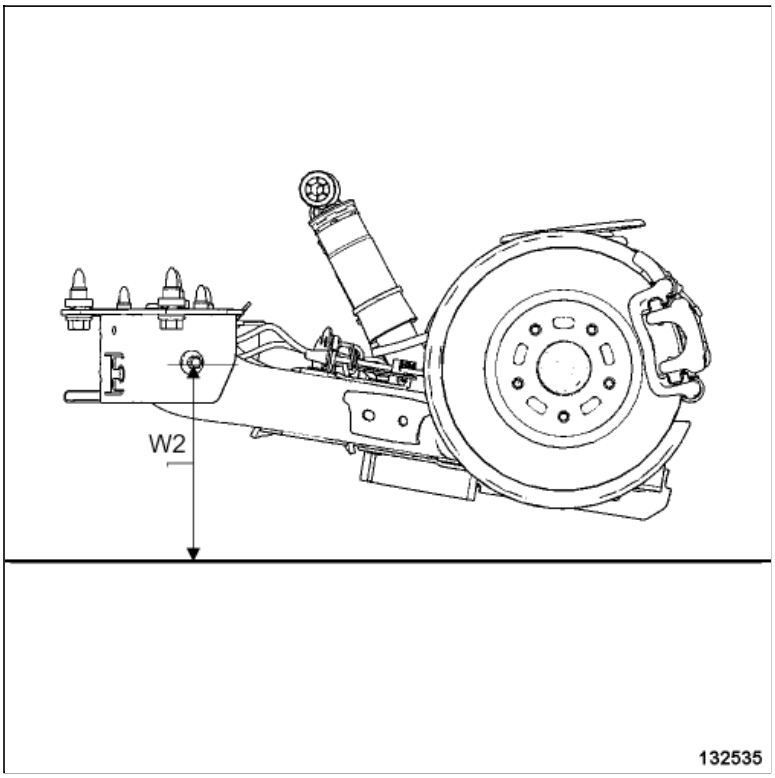


Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

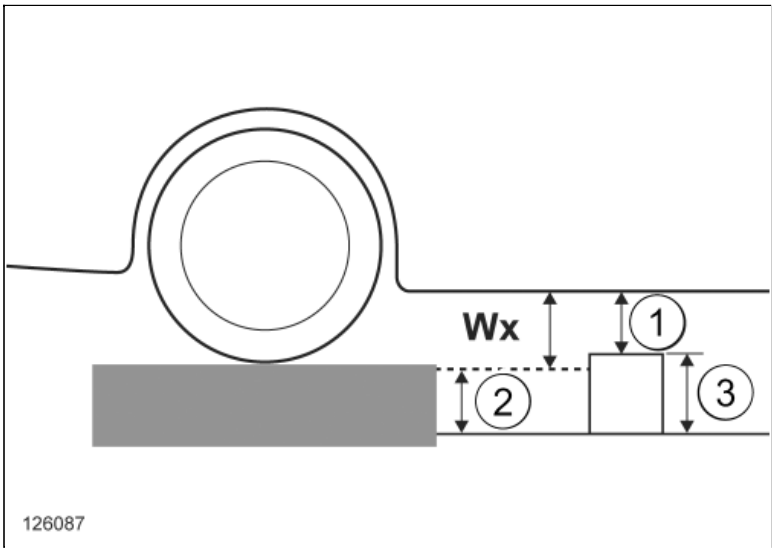
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

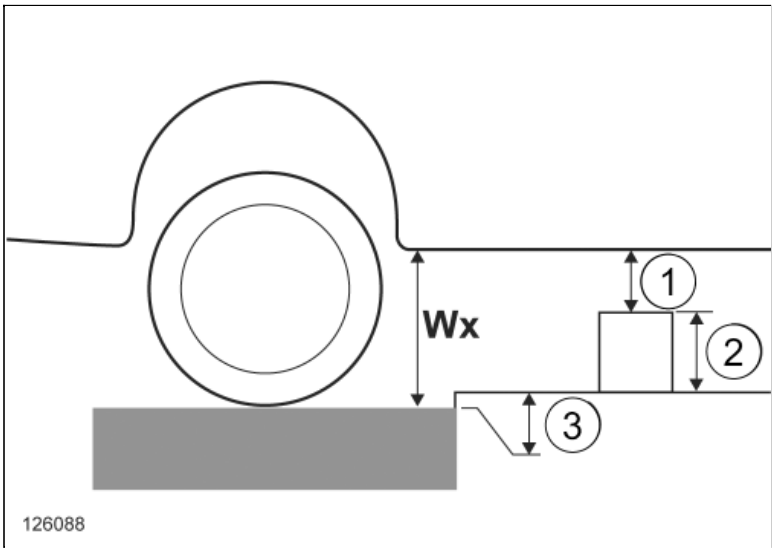
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

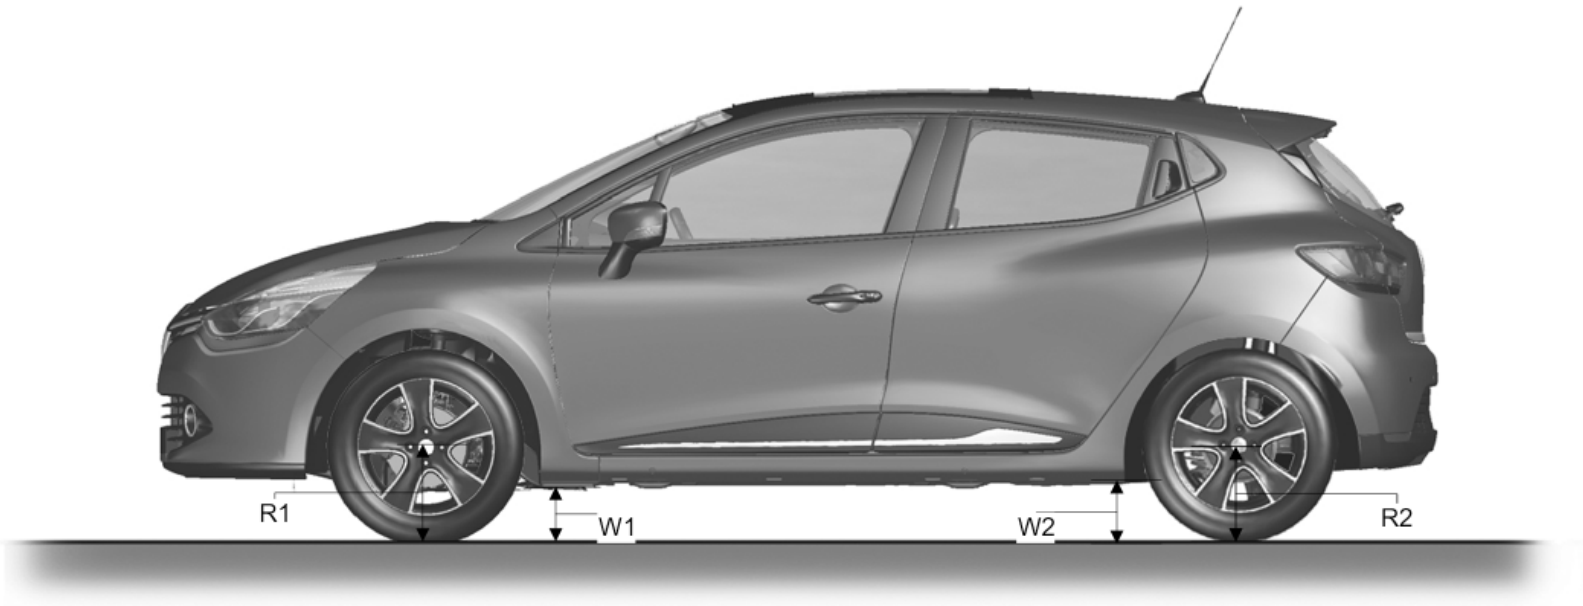
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

- VODM (Vehicle in working order) position:
  - tank full,

empty vehicle (without luggage, etc.).



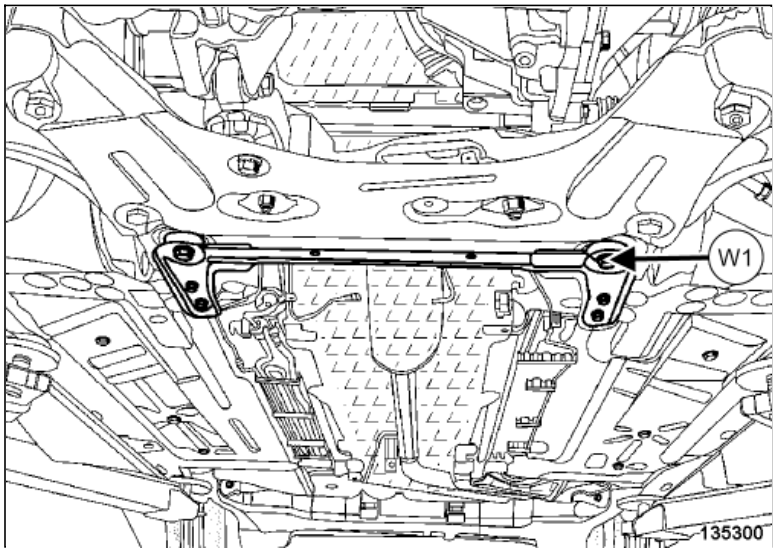
Note:

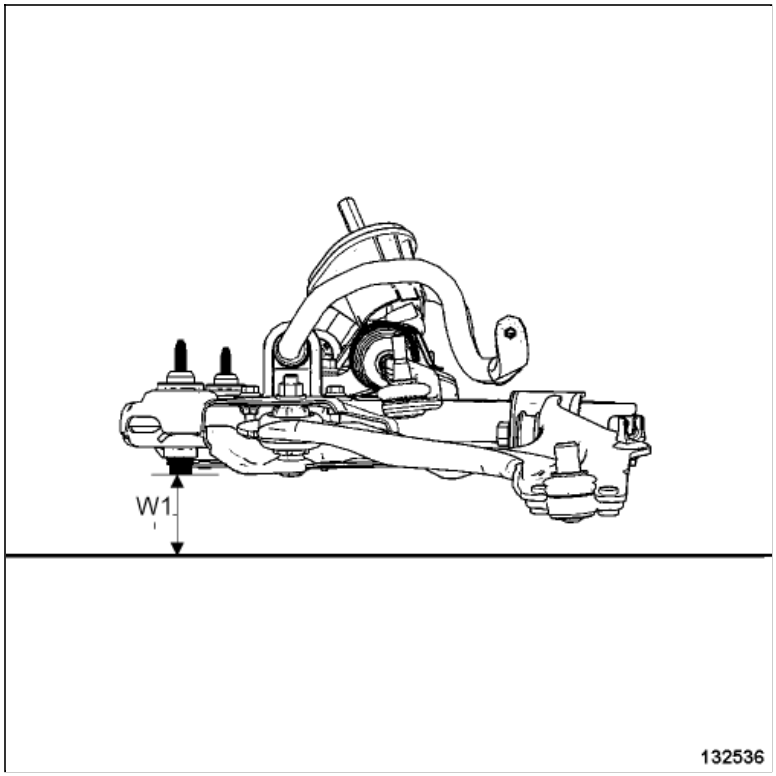
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

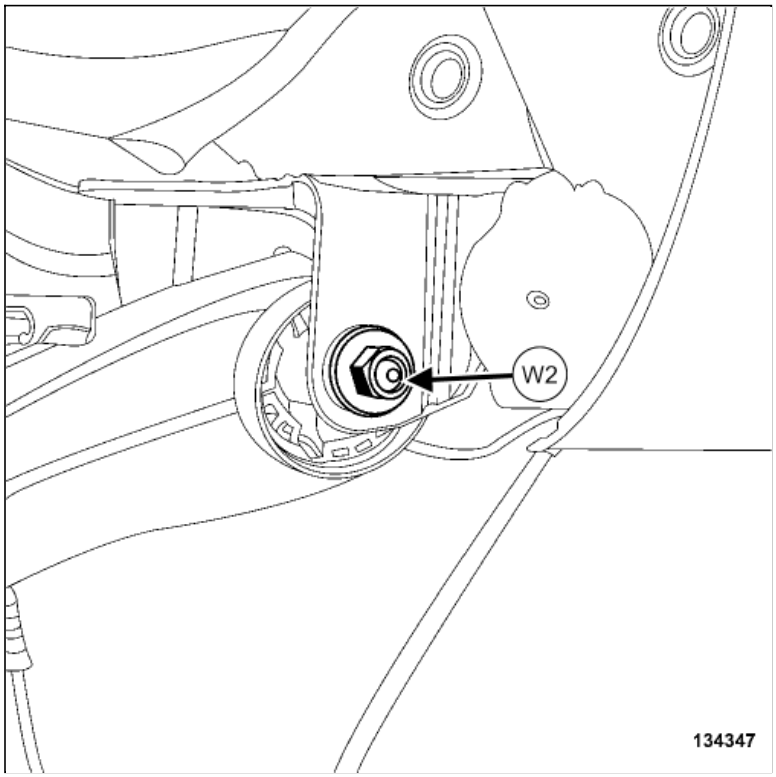




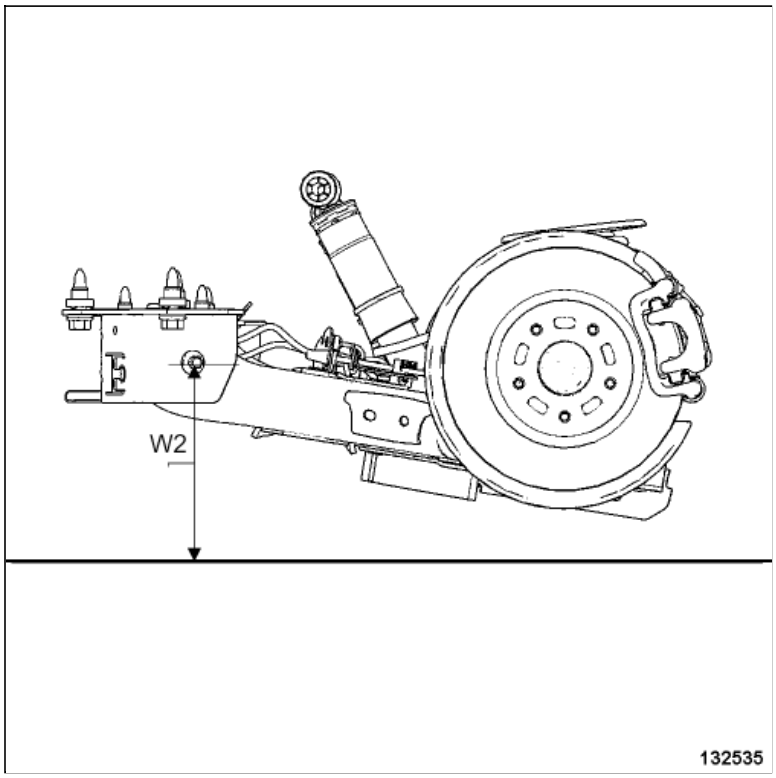
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

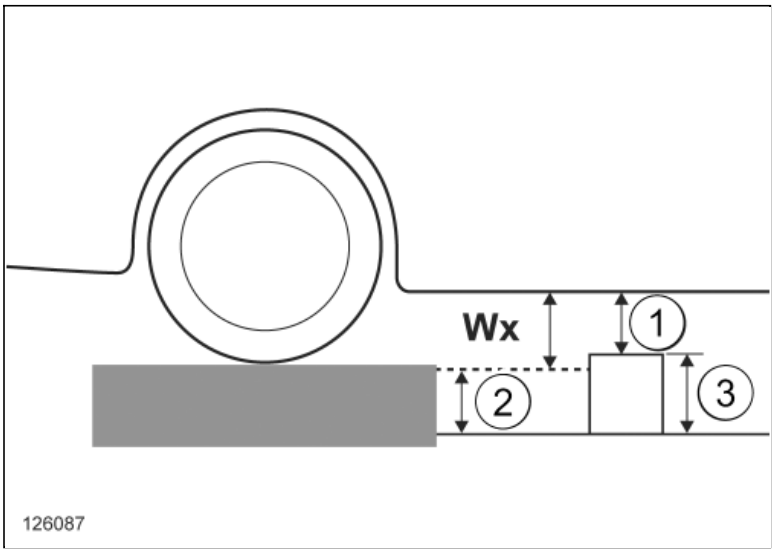
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

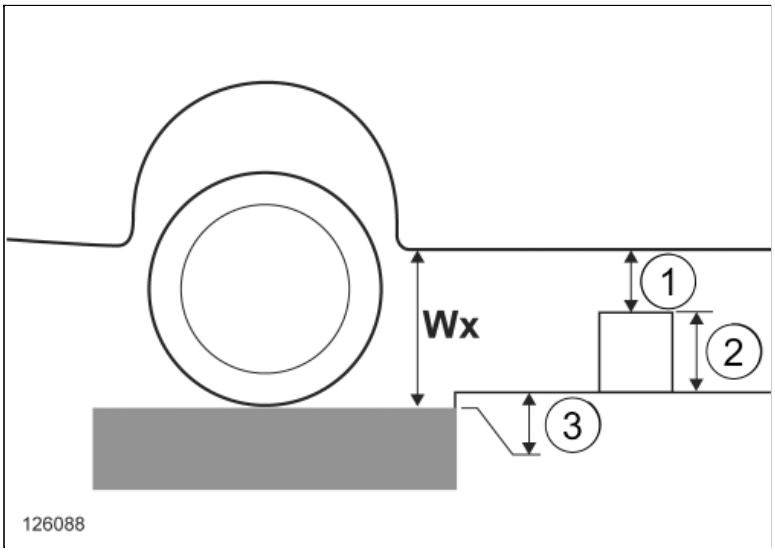
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

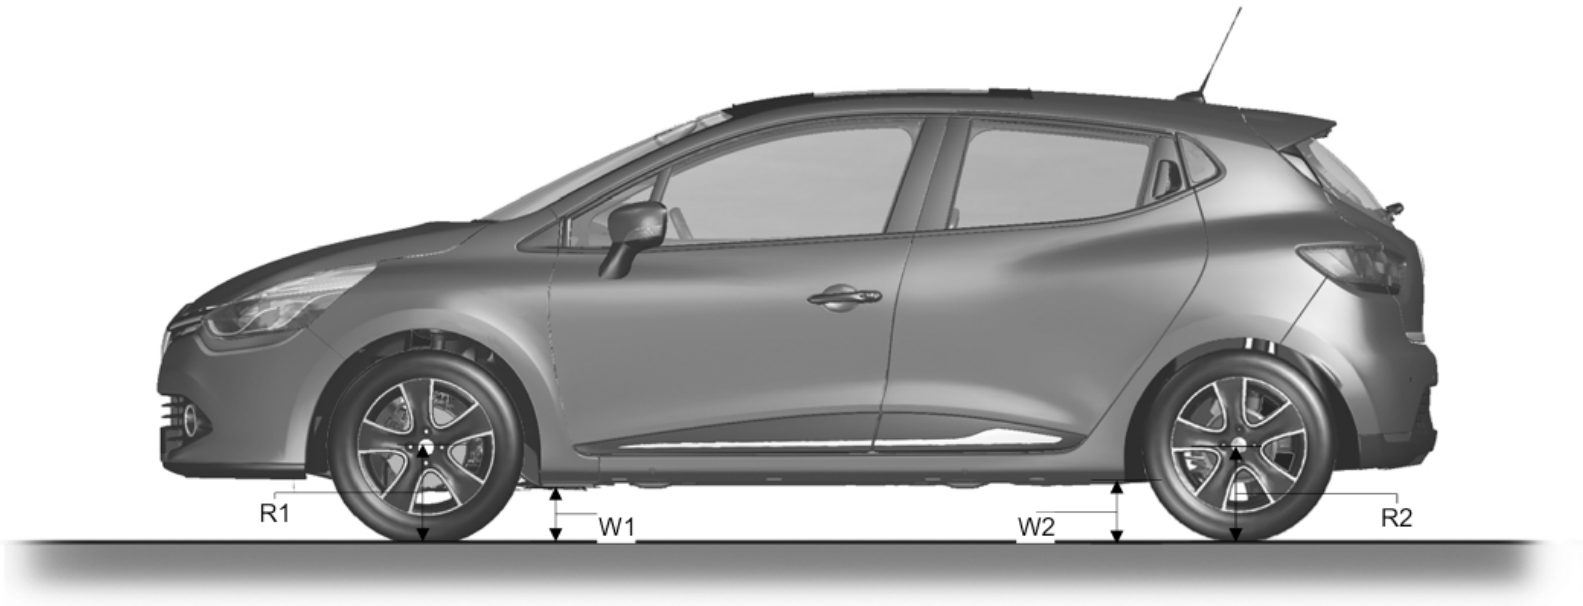
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).



Note:

The position of the vehicle varies according to:

- the weight of the engine,

(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

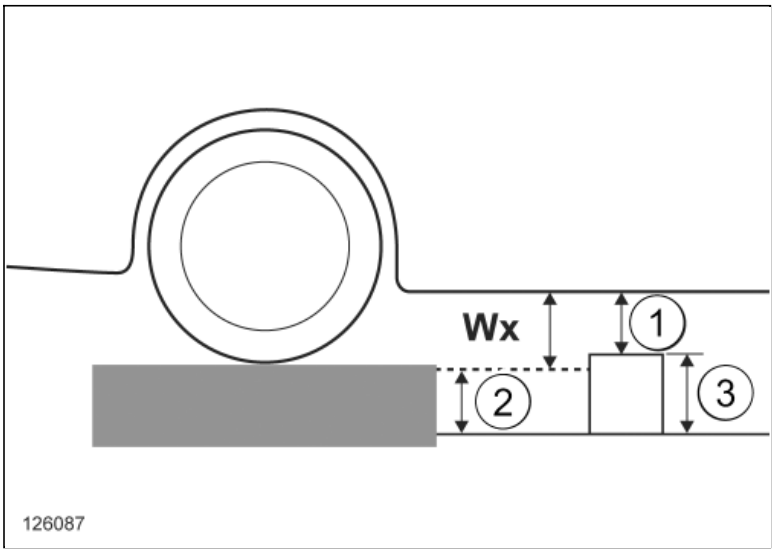
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

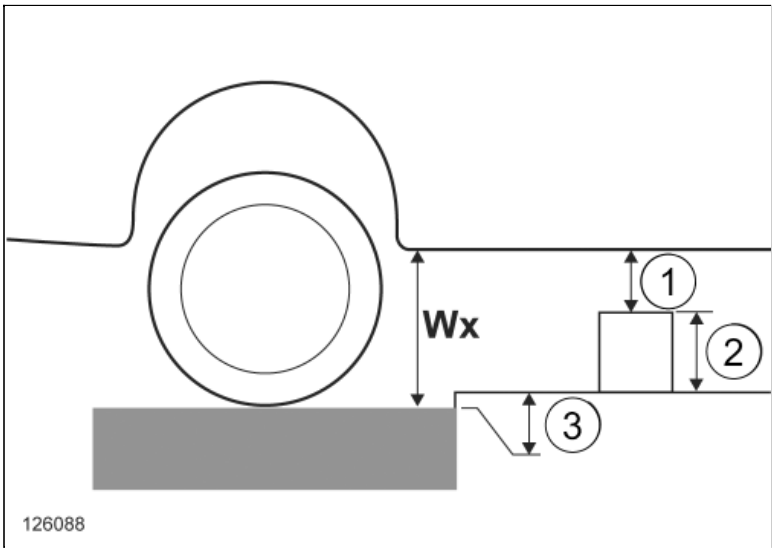
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

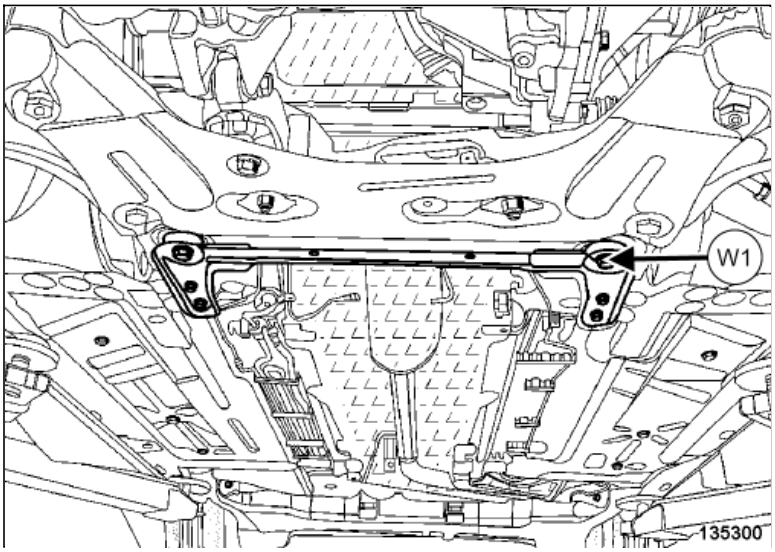
VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).

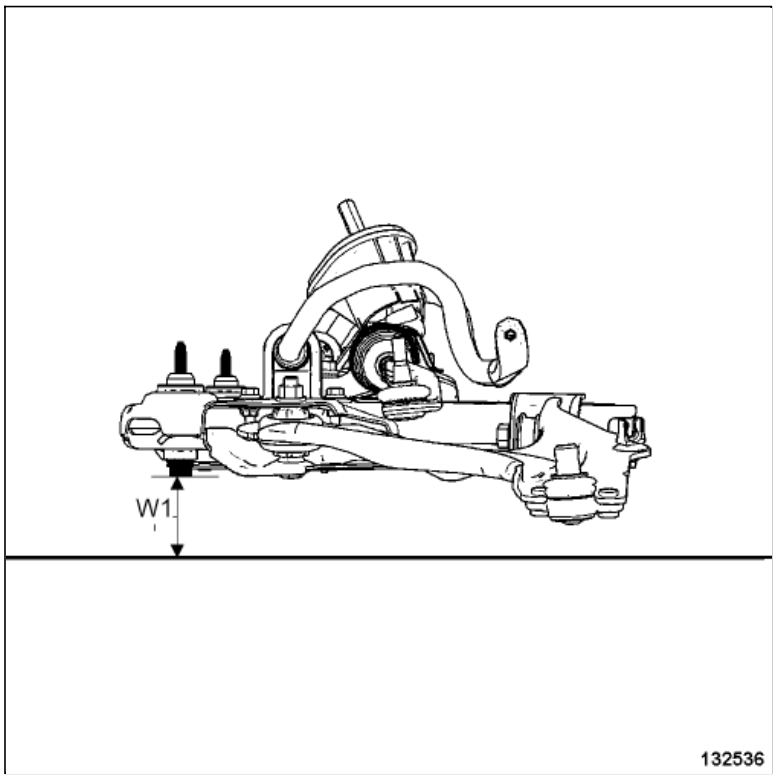
Note:

The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

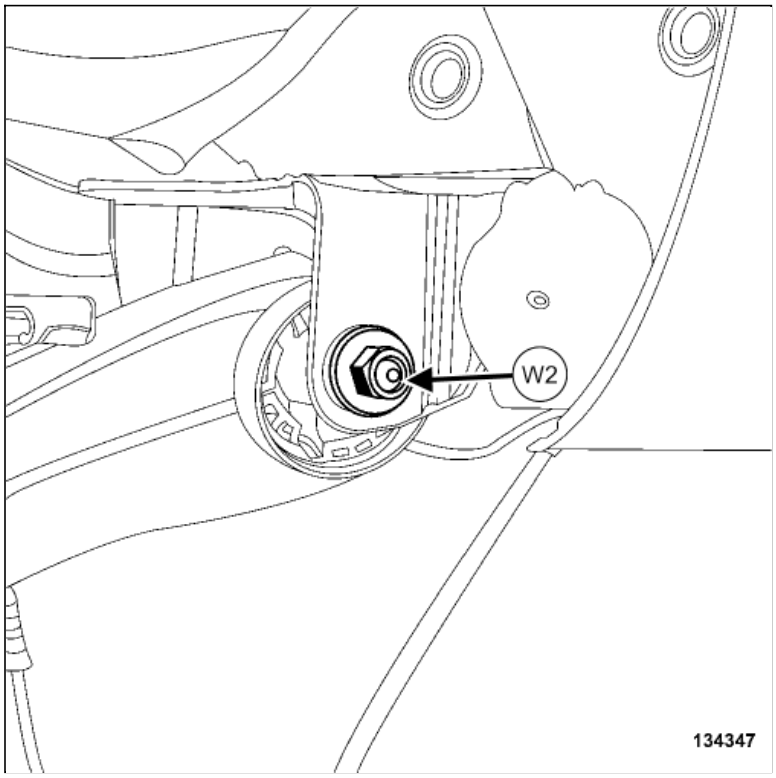


UNDERBODYHEIGHTS:ADJUSTMENTVALUE

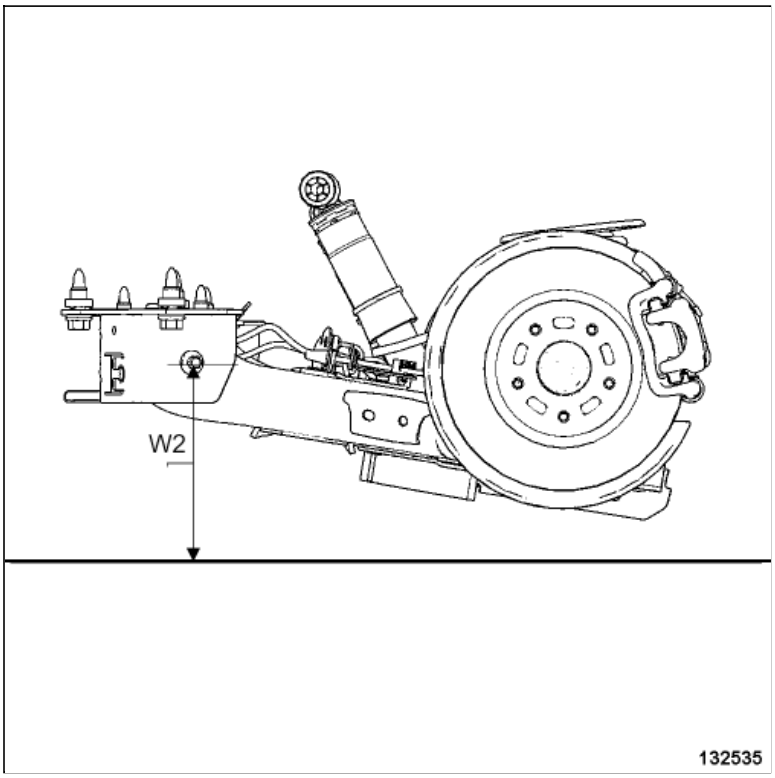


1. MEASURING POINTS

- Radius under load:
  - (R1) : Distance between the ground and the front wheel axis
  - (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

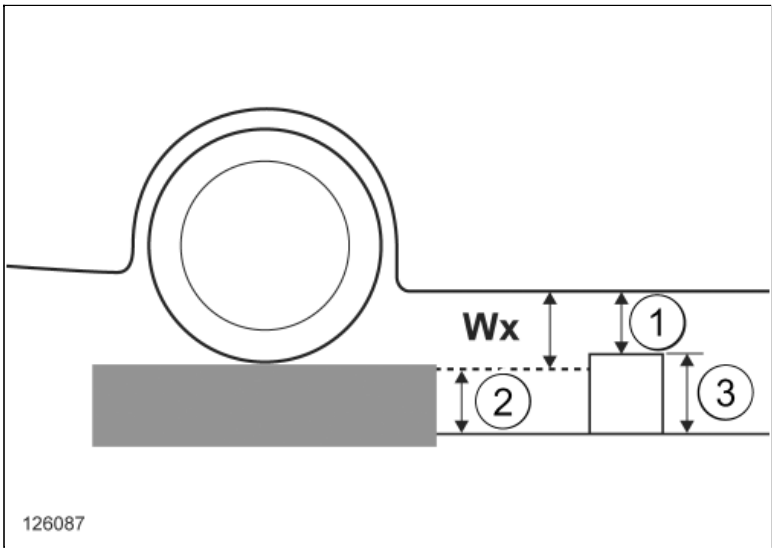
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

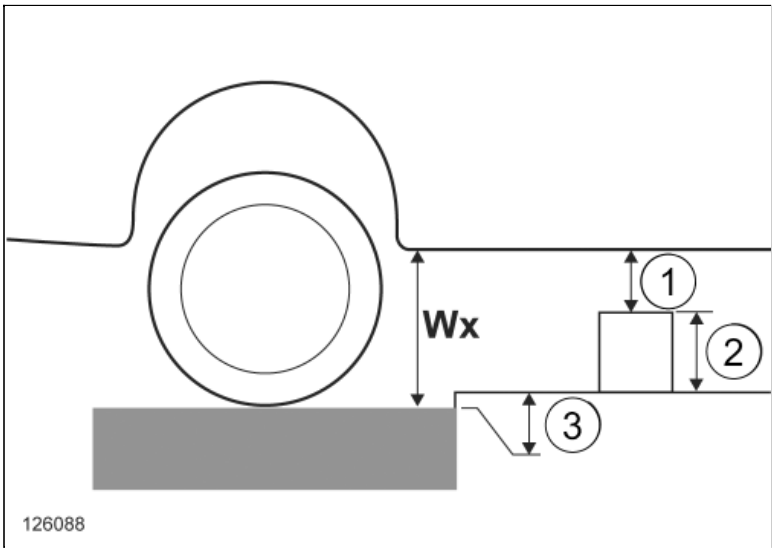
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

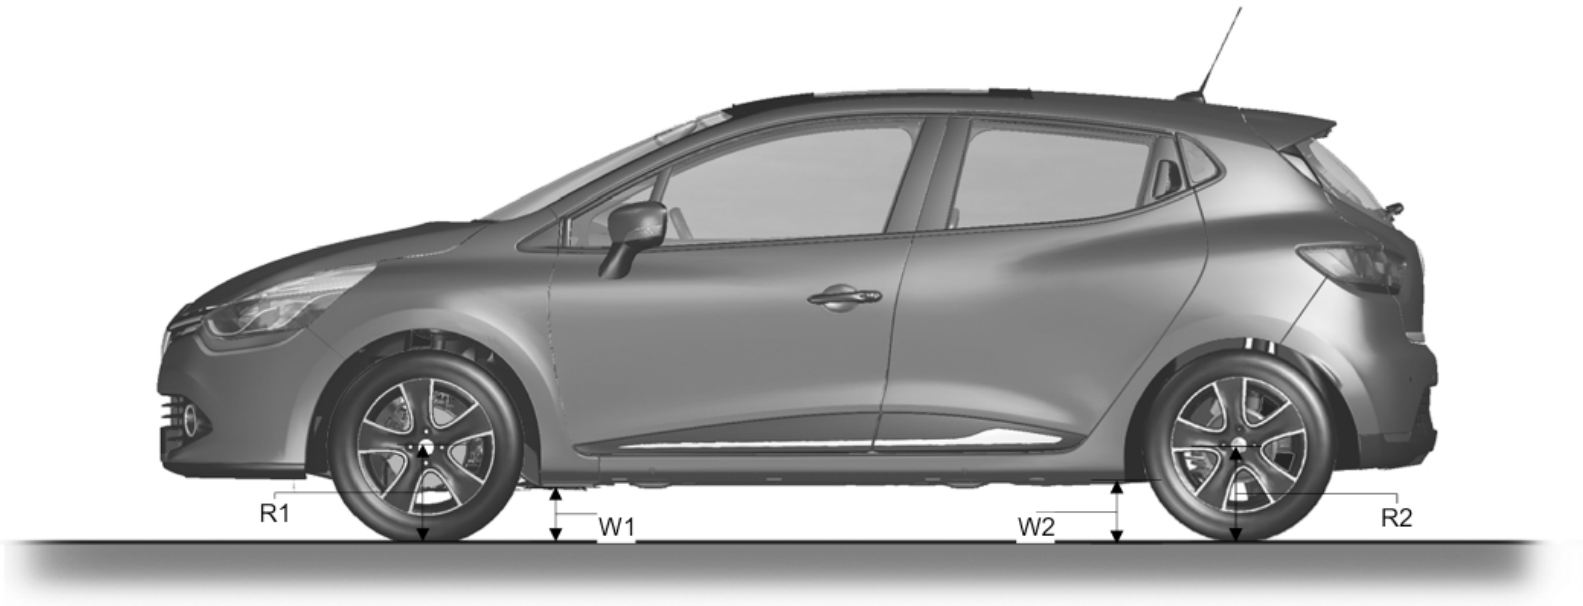
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

- VODM (Vehicle in working order) position:
  - tank full,

empty vehicle (without luggage, etc.).



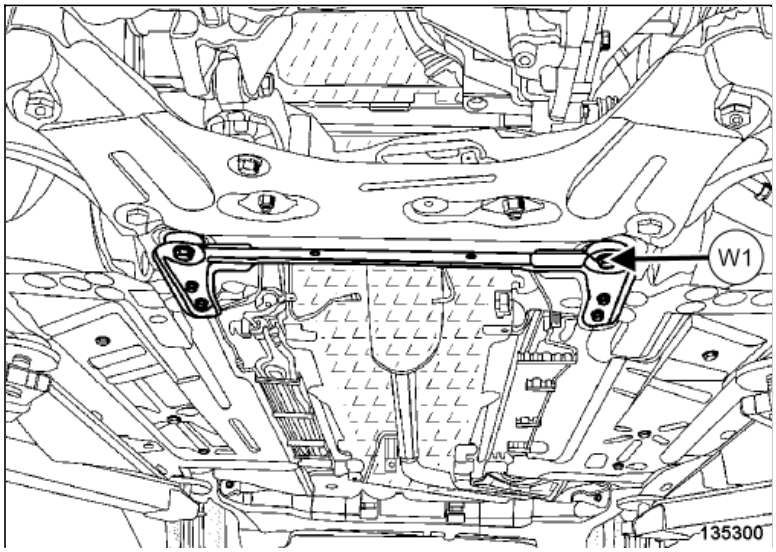
Note:

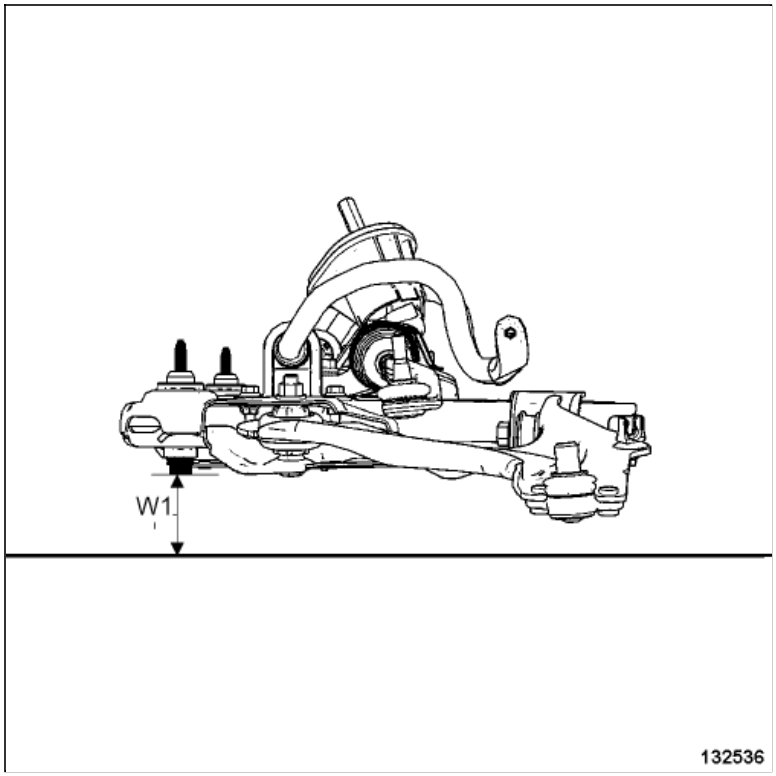
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

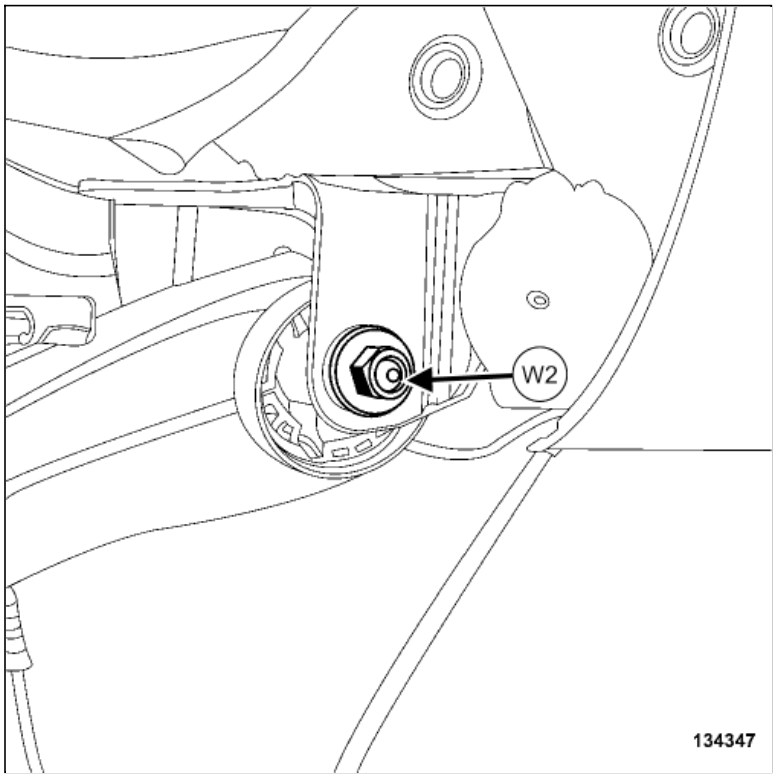




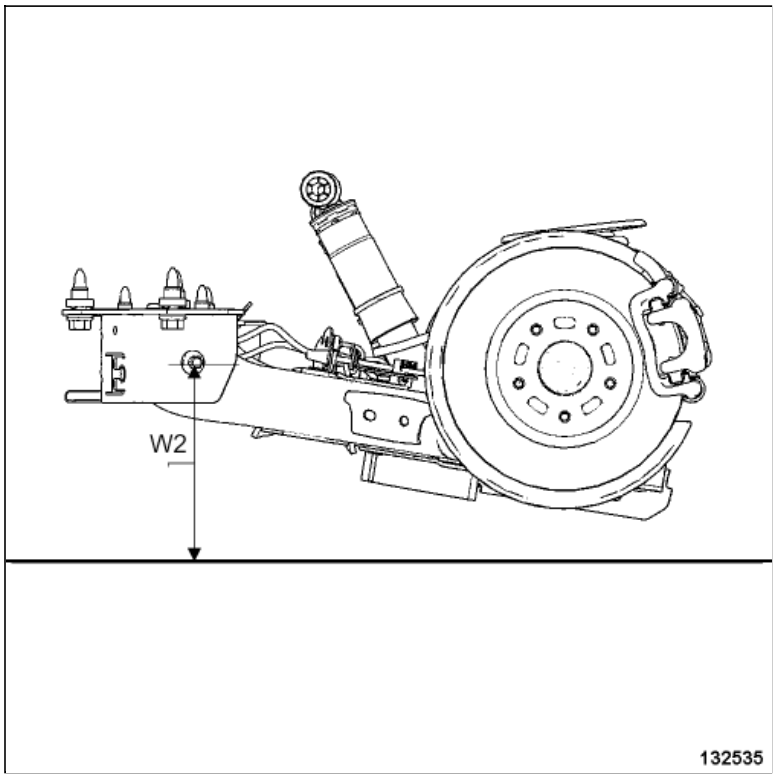
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

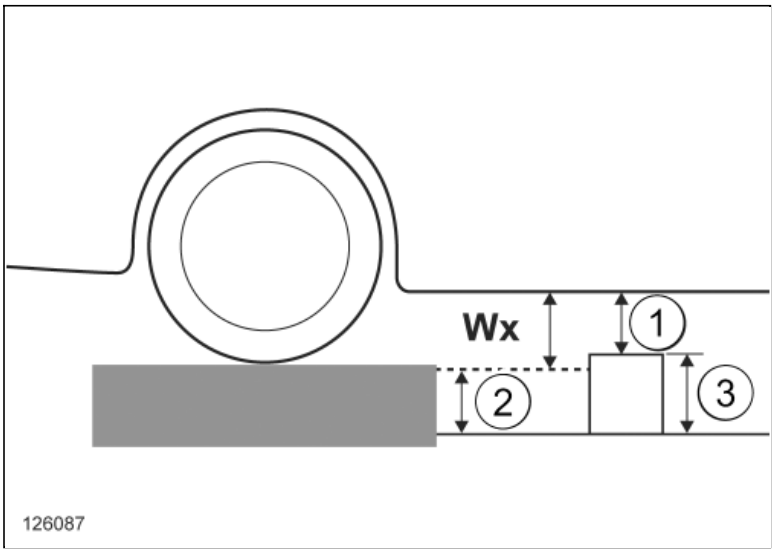
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

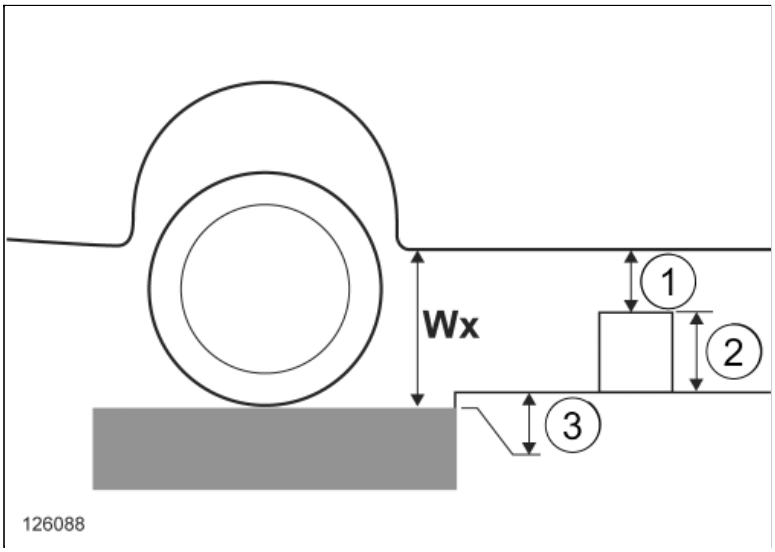
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

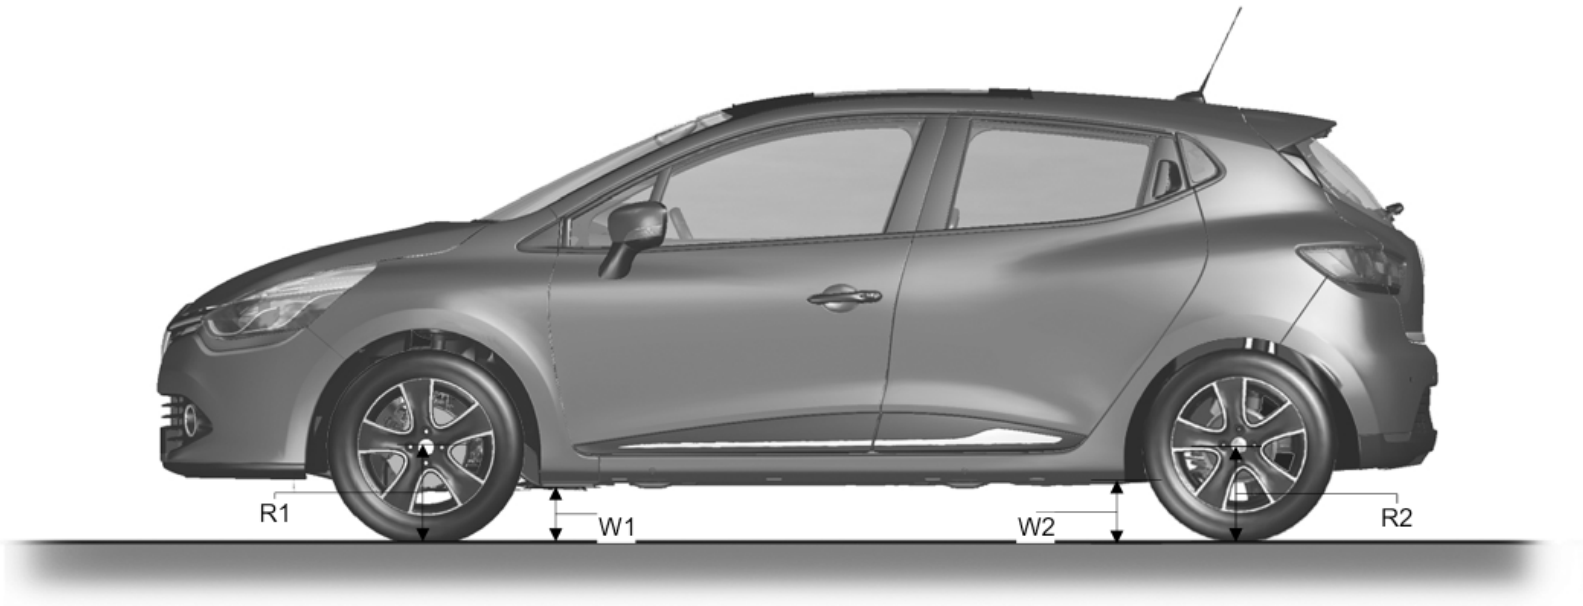
Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).



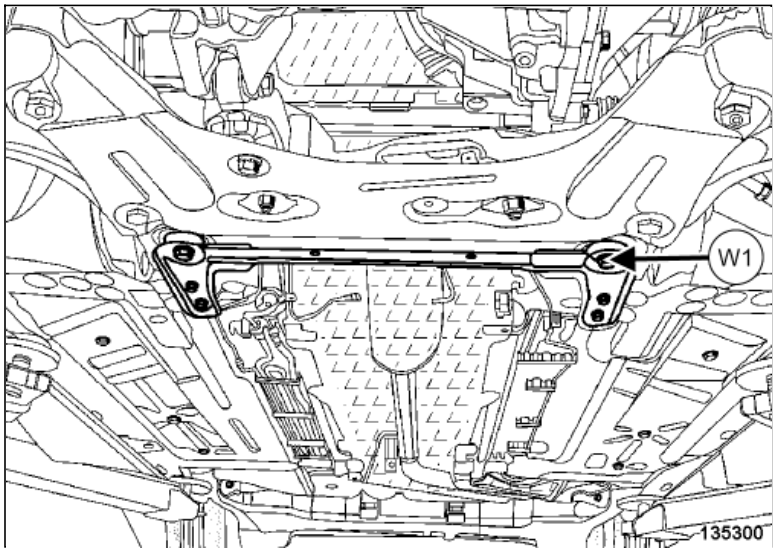
Note:

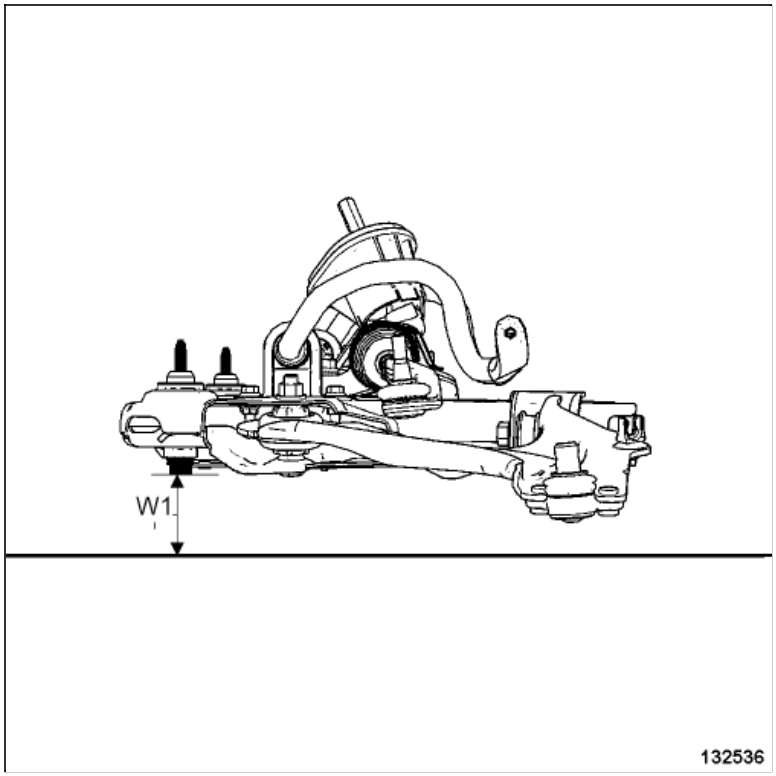
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

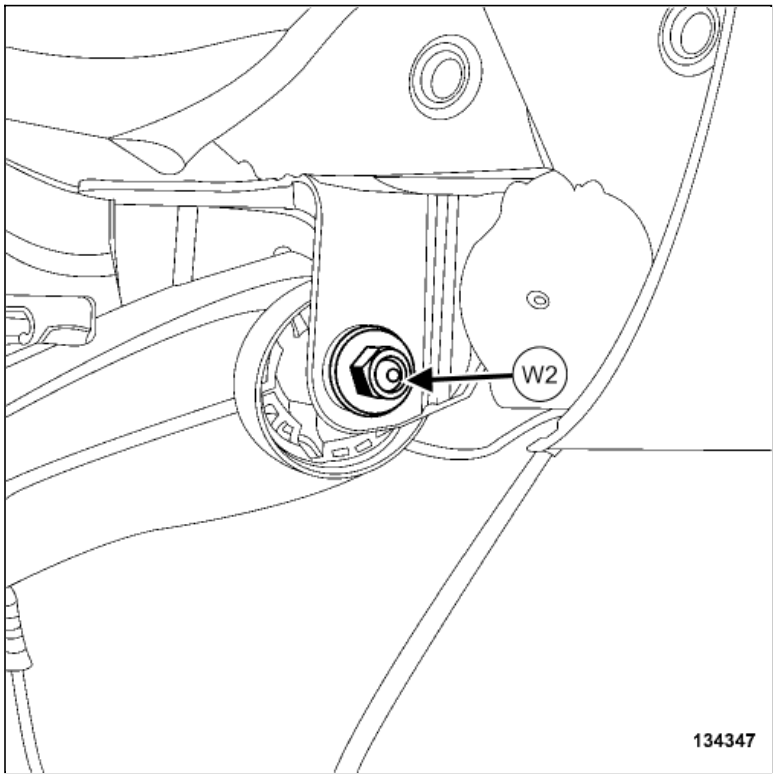




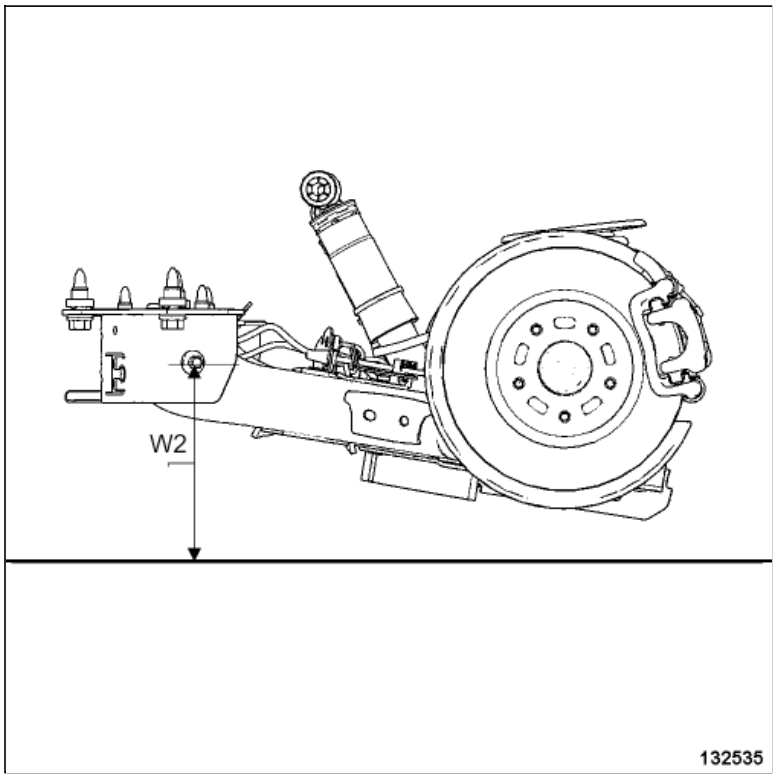
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

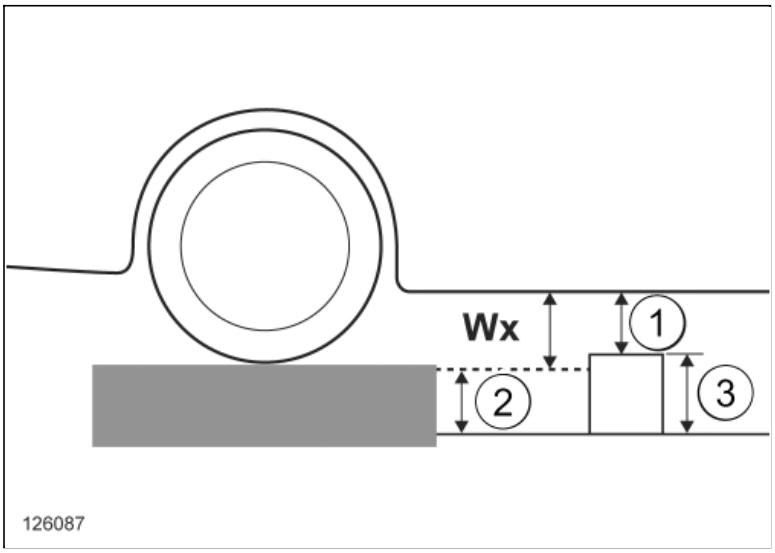
Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:



The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

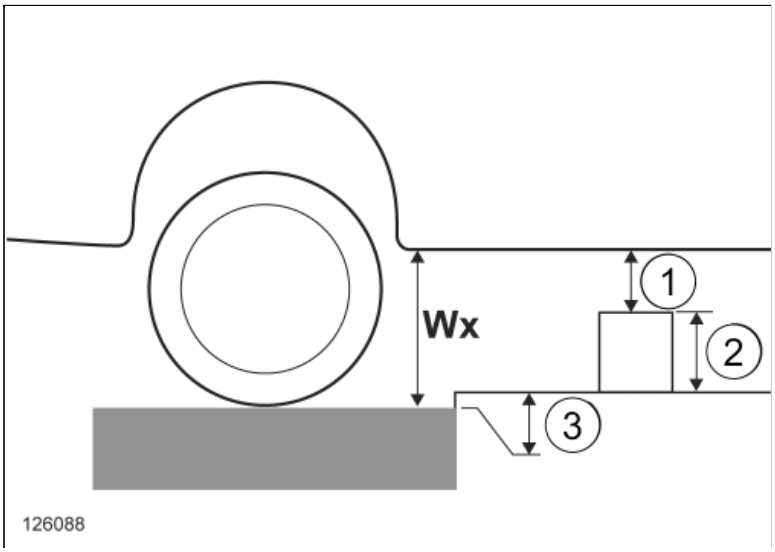
Specific case:

Note:

If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).

Note:

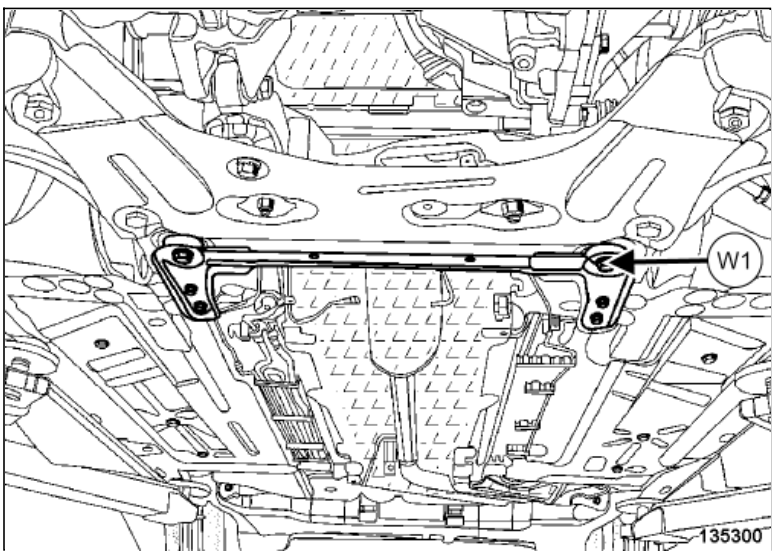
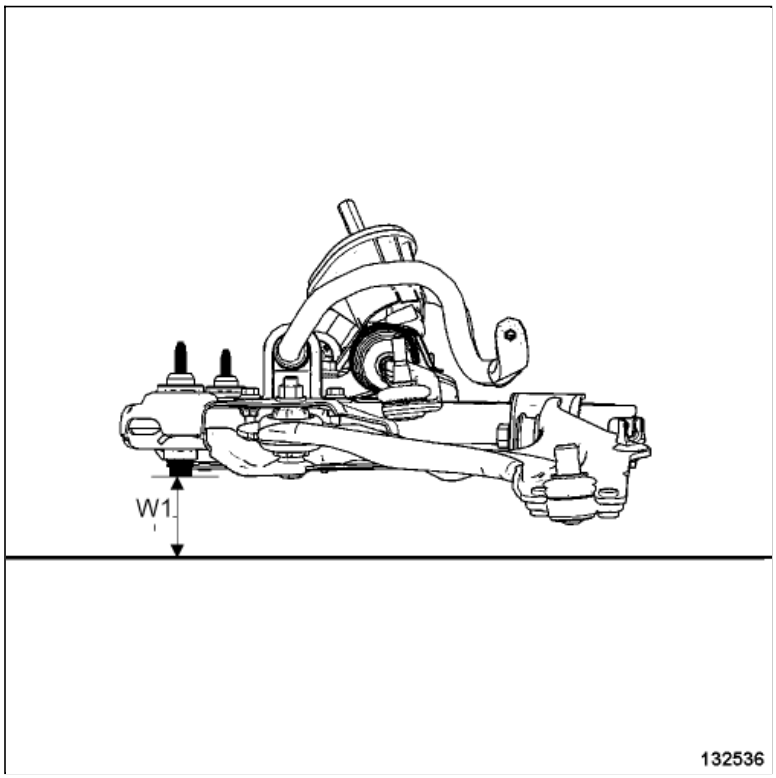
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

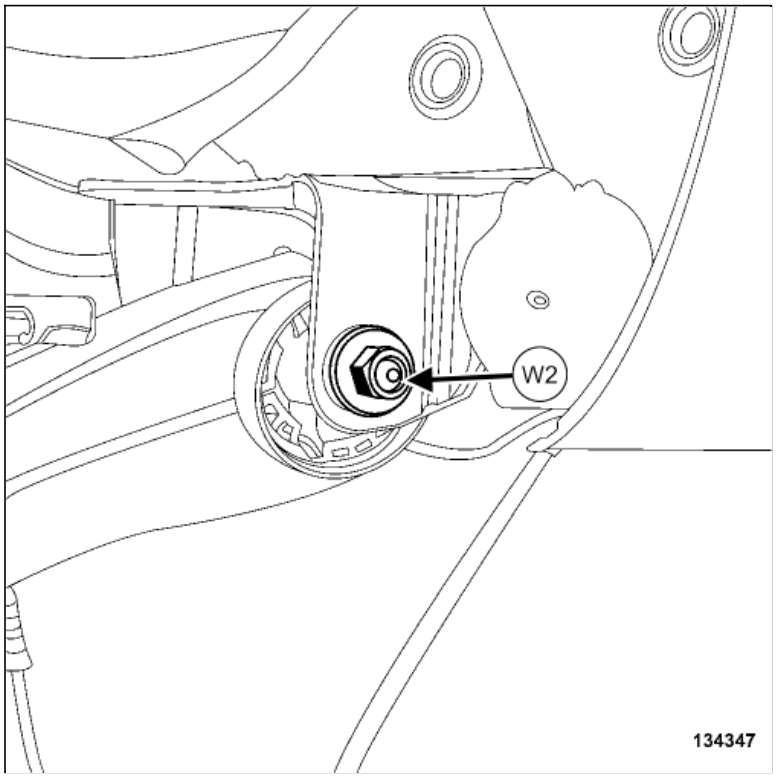




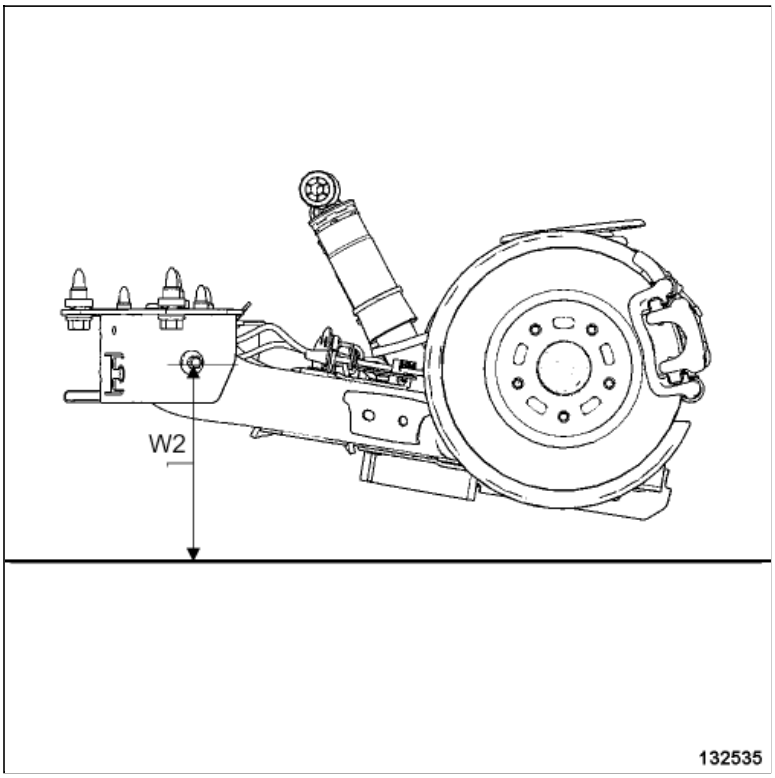
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:

The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

Specific case:

Note:

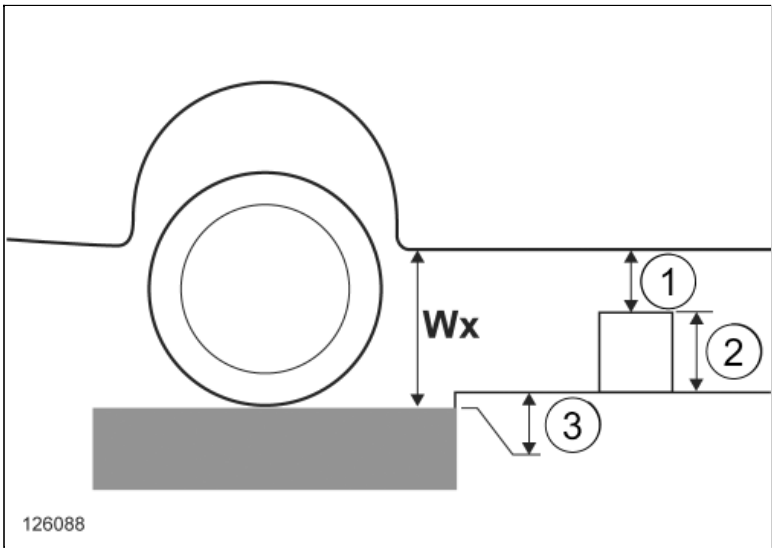
If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

- VODM (Vehicle in working order) position:
  - tank full,

empty vehicle (without luggage, etc.).

Note:

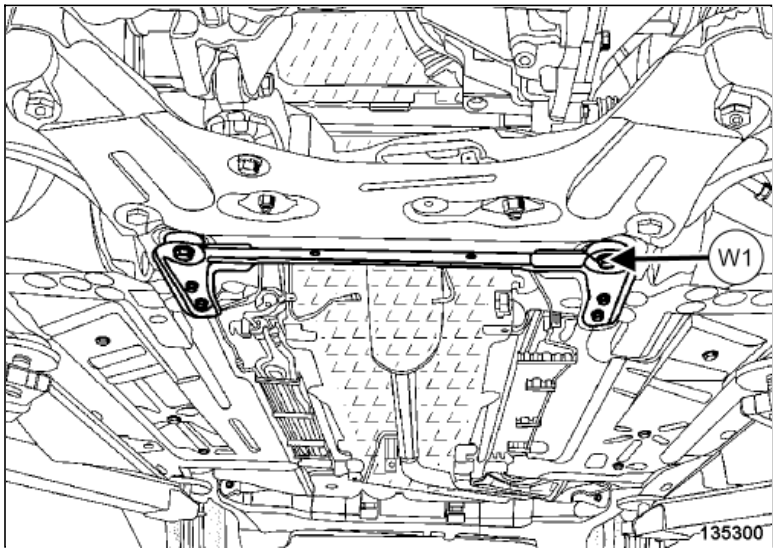
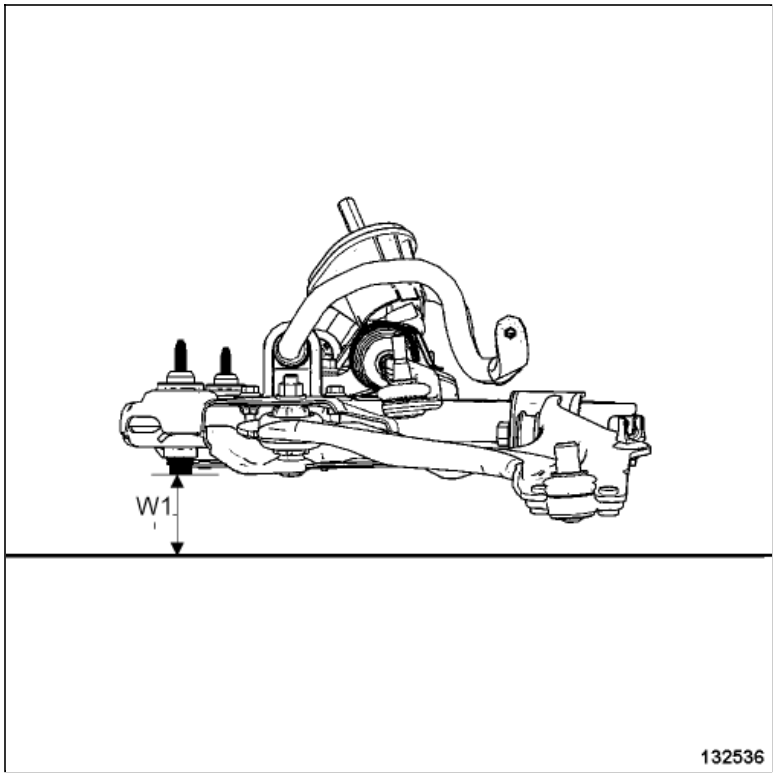
The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERBODYHEIGHTS:ADJUSTMENTVALUE

1. MEASURING POINTS

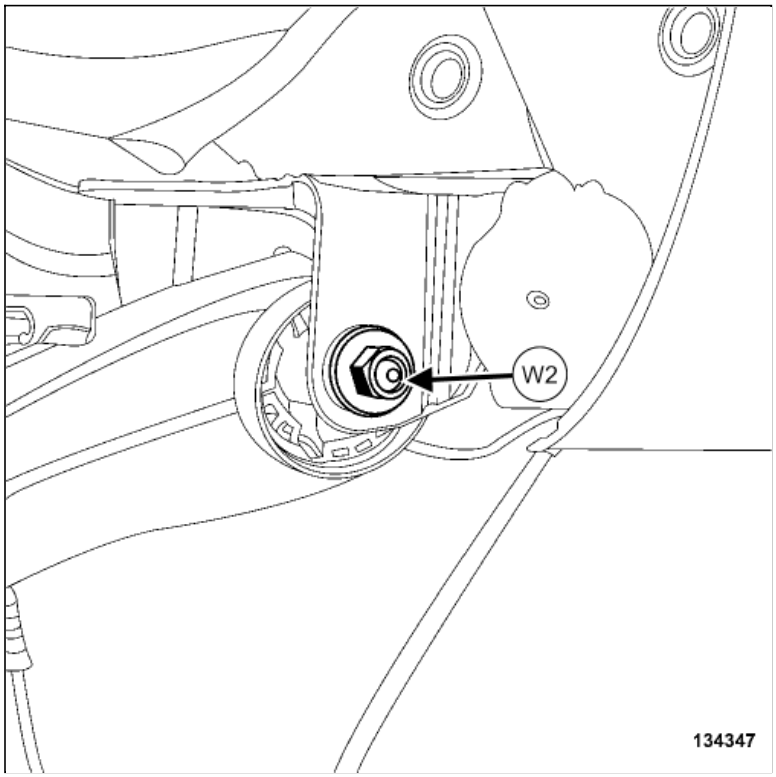




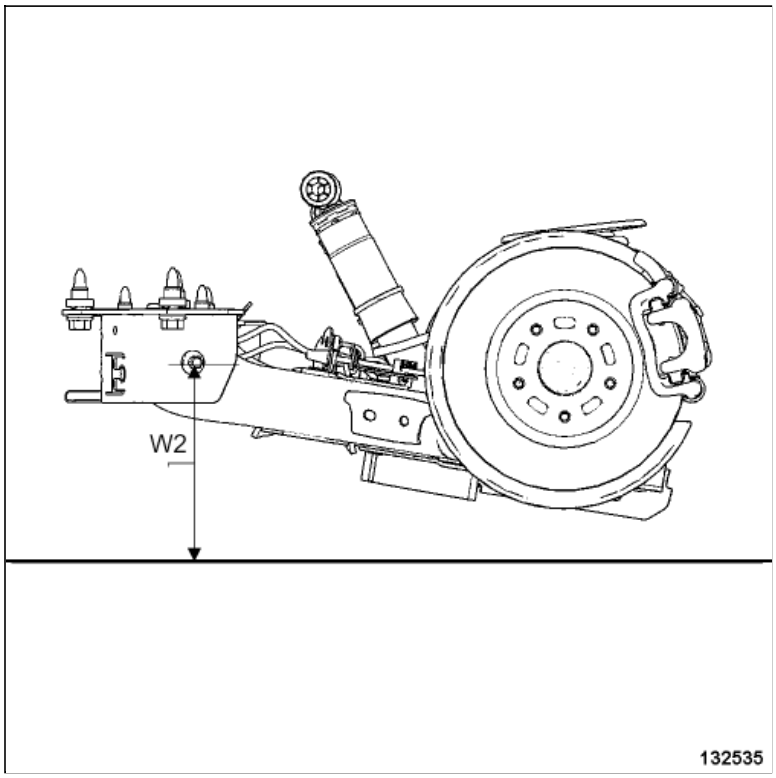
154955

Radius under load:

- (R1) : Distance between the ground and the front wheel axis
- (R2) : Distance between the ground and the rear wheel axis



1- FRONT HEIGHT (W1)



(W1) : Height between the ground and the rear cross member bolt head

2- REAR HEIGHT

(W2) : Height between the ground and the shaft of the rubber bush on the bearing

2. MEASURING PROCEDURE

Note:

For measurements(W1) and (W2) , take into account the height difference between the plates and the lift.

Measure the heights:

- R1,
- R2,
- W1: right-hand and left-hand,
- W2 right-hand and left-hand.

Note:

The value of Wx to be entered into the geometry bench is the average of the W1 heights, right-hand and left-hand and of the W2 heights, right-hand and left-hand.

Specific case:

Note:

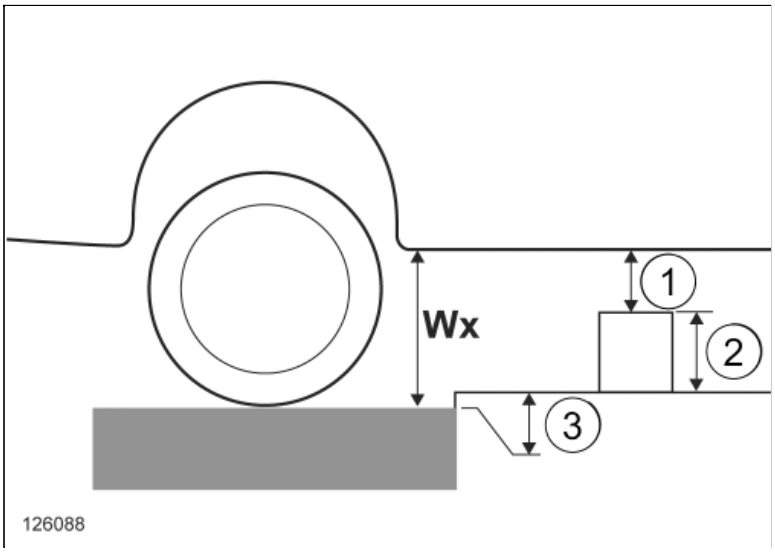
If the measuring points are located in empty space (between the rails of the lift), use a bar.

1- PLATE HIGHER THAN THE LIFT:

Measure the heights(1) , (2) , (3) .



Example: (1) = 13 cm, (2) = 8 cm, (3) = 10 cm.

Calculate the height Wx:

Wx = height(1) + height(3) - height(2) ,

Wx = 15 cm.

2- PLATE LOWER THAN THE LIFT:

Measure the heigths(1) , (2) , (3) .

Example: (1) = 8 cm, (2) = 10 cm, (3) = 4 cm,

Calculate the height Wx:

Wx = height(1) + height(2) + (3) ,

Wx= 22 cm.

3- VEHICLE IN RUNNING ORDER POSITION

VODM (Vehicle in working order) position:

- tank full,
- empty vehicle (without luggage, etc.).

Note:

The position of the vehicle varies according to:

- the weight of the engine,
- the springs and shock absorbers,
- the tyres,
- the amount of fuel in the tank.

UNDERSIDE OF THE VEHICLE: PREPARATION AND PAINT RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Use extra ventilation source.

Steps	Description	Special notes
1	Clean the subframe	Soapy water
2	Rinse / Blow	
3	Strip the PVC mastic from the subframe on the areas to be repaired	Tools for stripping very thick soft mastic: Use Tools for scraping rigid adhesives and paint: Use (40A, General information)
4	Wipe / blow	
5	Sand the PVC mastic remaining from the repair, slightly overlapping by 150to 200 mm	P180-P240 / Red pad
6	Wipe / blow	
7	Degrease	Lint-free cloth soaked in surface cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products). wipe with a dry lint-free cloth
8	Masking	Masking paper
9	Apply a pre-treatment primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Remove solvent	
11	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
12	Remove solvent / dry	
13	Sand the primer	P400 to P500dry / P400 to P800water

14	Wipe / blow	
16	Degrease	Lint-free cloth soaked in surface cleaner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). wipe with a dry lint-free cloth
17	Masking	Masking paper
18	Apply a sealing mastic	Anti-corrosion protection products after assembly: Use (40A, General information) Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
19	Apply the paint finishing	

UNDERSIDE OF THE VEHICLE: SEALING CHECK

Note:

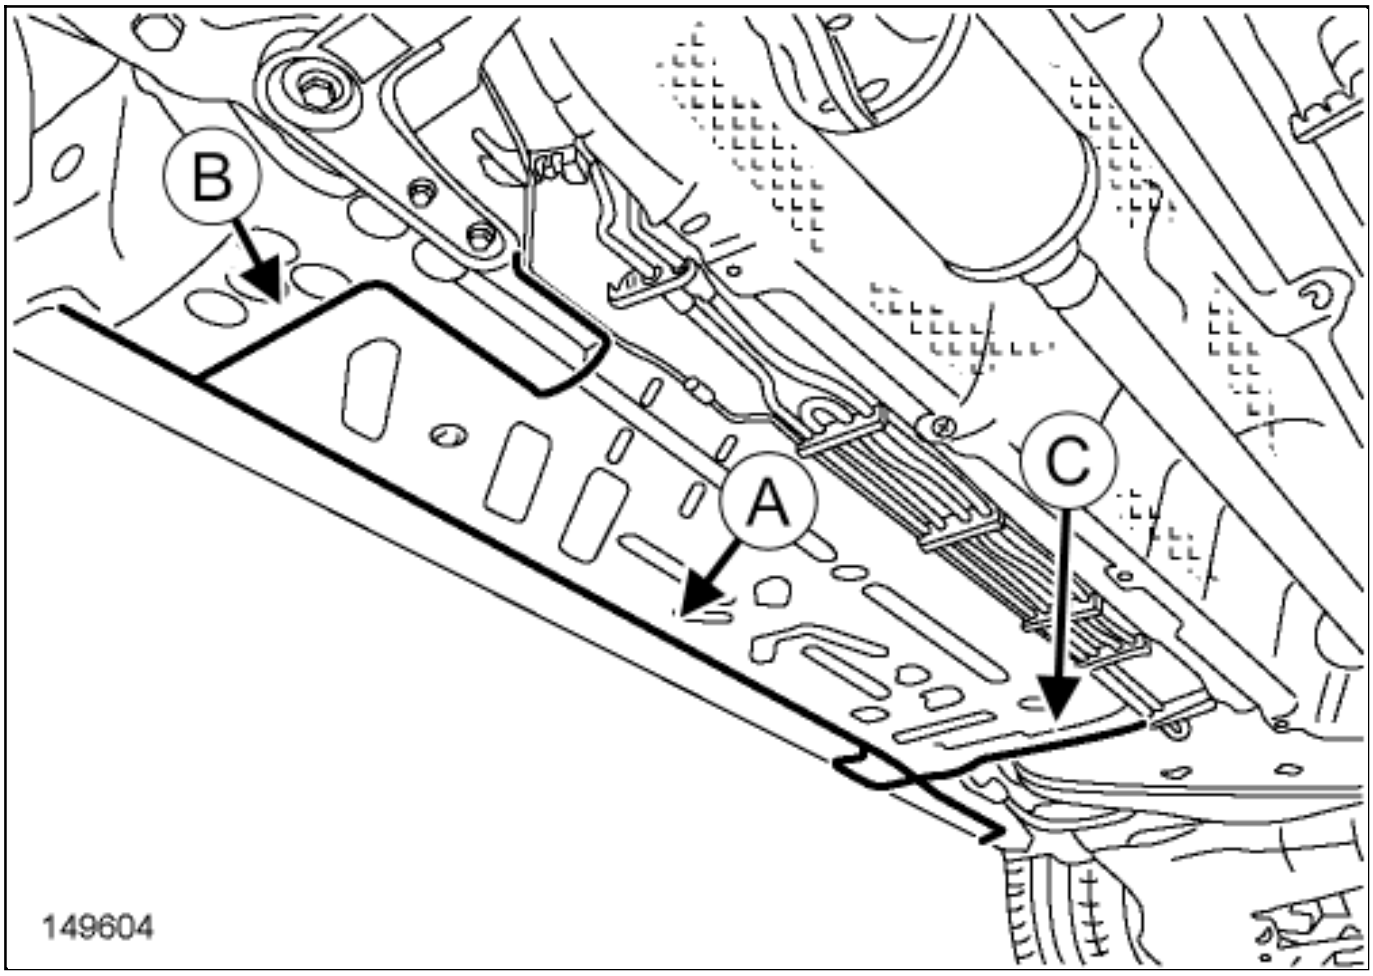
Before any operation, check the water outlets. if necessary, clean any residue which has accumulated (for example: dead leaves, twigs, etc.) and check that water flows out correctly.

Note:

When checking the sealing of the underside of the vehicle, the interior trims must be partially removed to enable the sealing check (see MR for the vehicle concerned).

Note:

The list of the joint areas dealt with here is general. Additional zones may exist depending on the layout of each vehicle (see MR for the vehicle concerned).



1. PREPARATION OPERATION FOR CHECKING THE SEALING

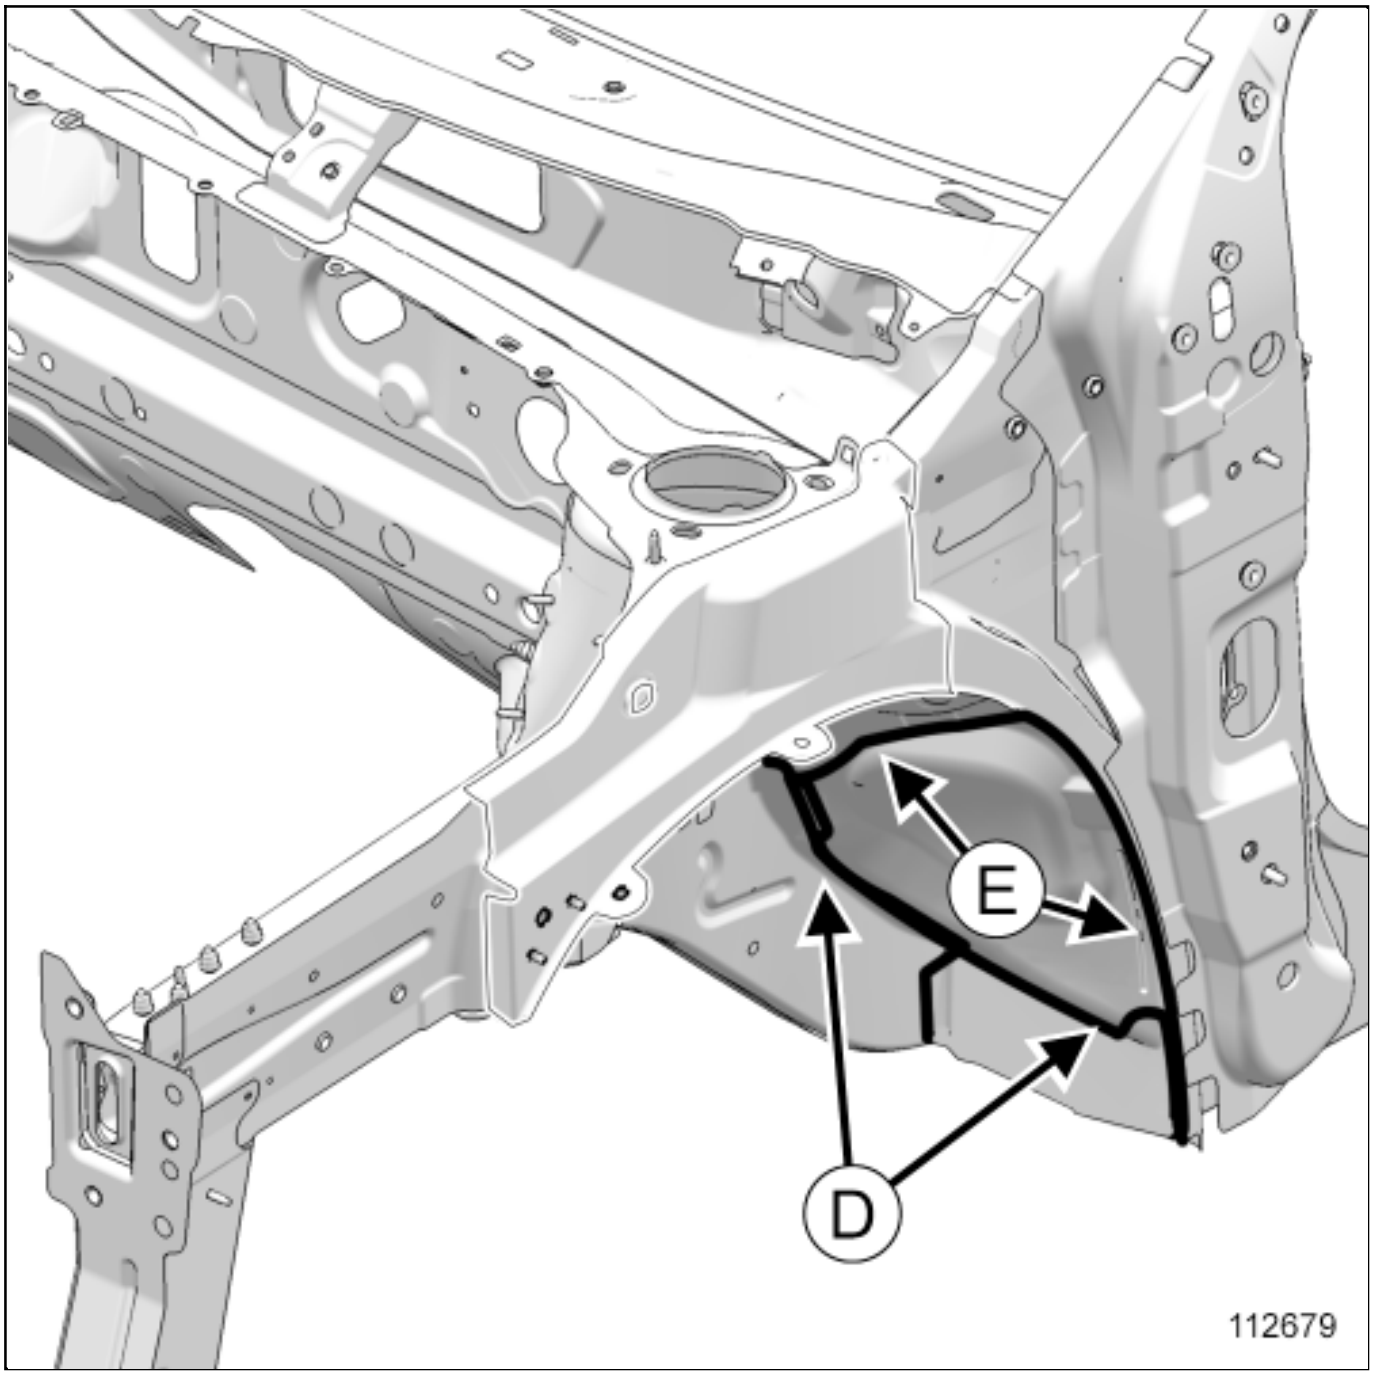
1- CONDITIONS TO RESPECT BEFORE CHECKING THE SEALING

- Position the vehicle on a level washing area(see 60A, General information, Vehicle sealing: General information) .
- Check that all the opening elements are closed(see 60A, General information, Vehicle sealing: General information) .
- Prepare the equipment to perform the operation(see 60A, General information, Sealing tools: Use) ,(see 60A, General information, Sealing tools: Description) and(see 60A, General information, Vehicle sealing: General information) .
- Adjust the flow of the water jet(see 60A, General information, Sealing tools: Use) .

2. OPERATION FOR CHECKING THE SEALING

1- CENTRE FLOOR

- Spray by sweeping the joint area between the centre floor / inner sill panel(A) .
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Spray by sweeping the joint area between the centre floor / centre floor centre cross member(B) .
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Spray by sweeping the joint area between the centre floor / rear floor front section(C) .
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
-



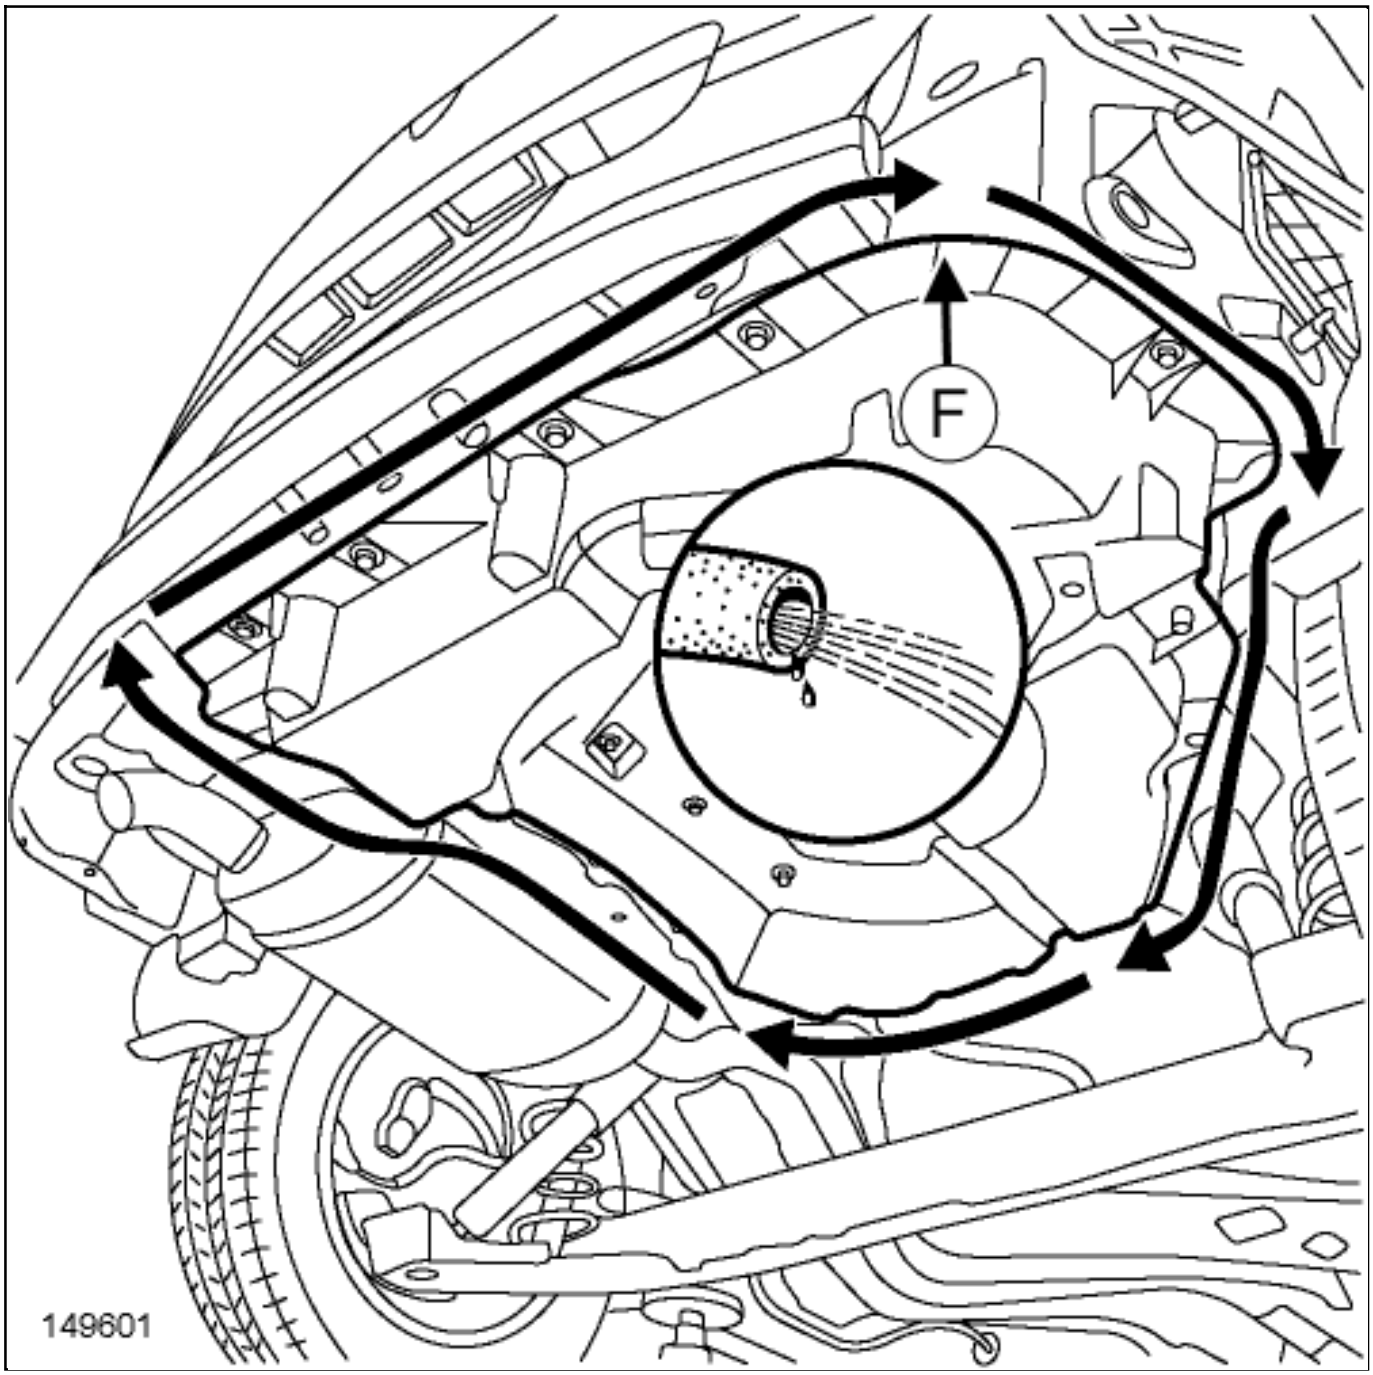
Spray the edge of the blanking covers of the centre floor in a circular manner.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray by sweeping the joint area of the centre floor right-hand side section / centre floor left-hand side section.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

2- FRONT WHEEL ARCH



Spray the wheel arch / front bulkhead joint area gradually from the bottom upwards(D) .

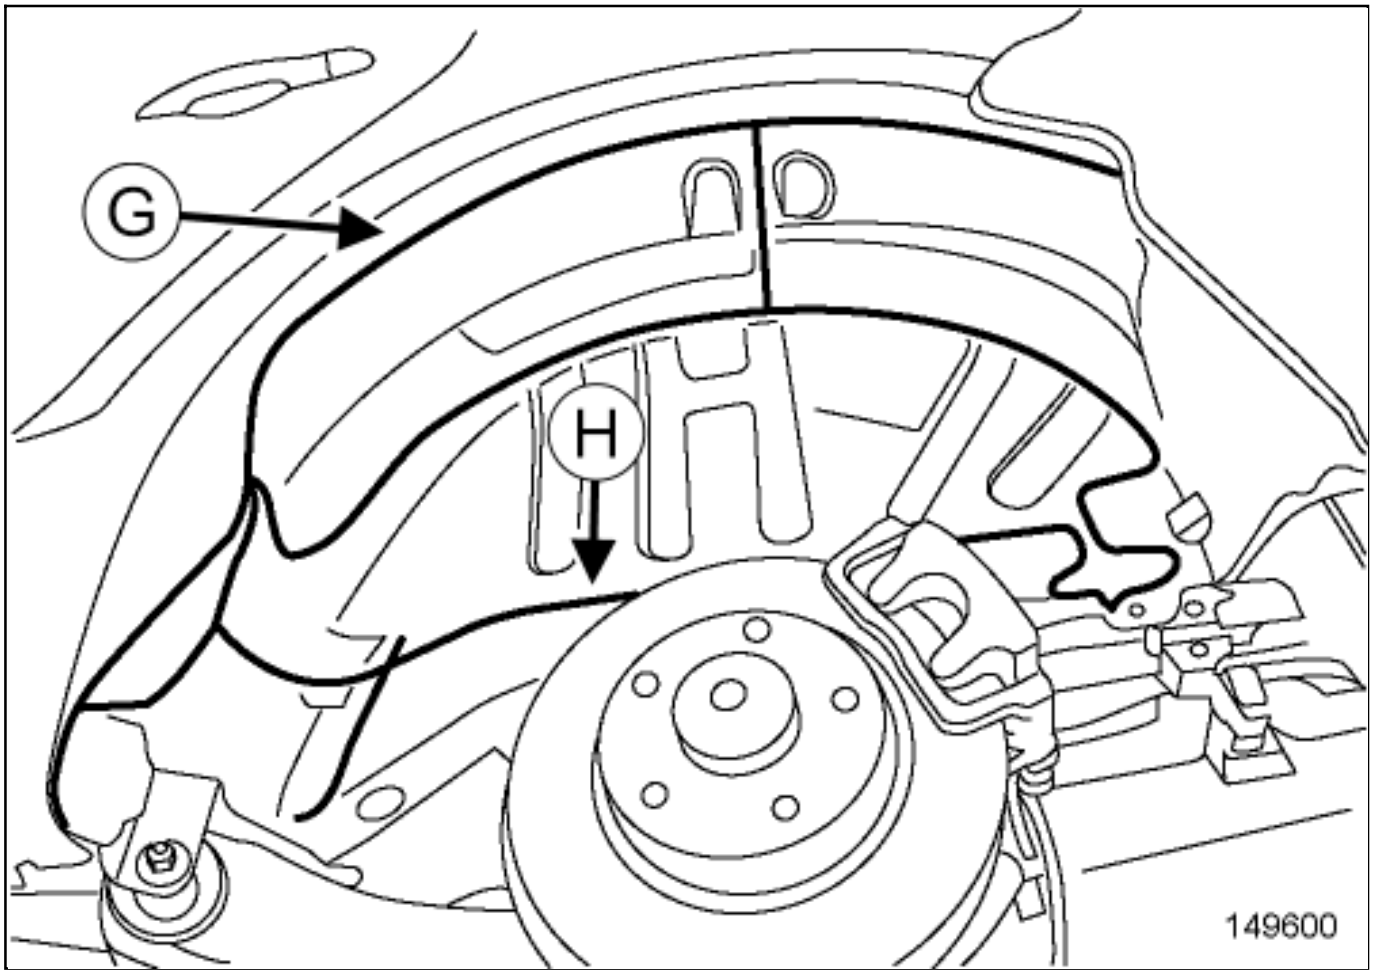
Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the wheel arch / scuttle side panel / bulkhead joint area gradually from the bottom upwards (E) .

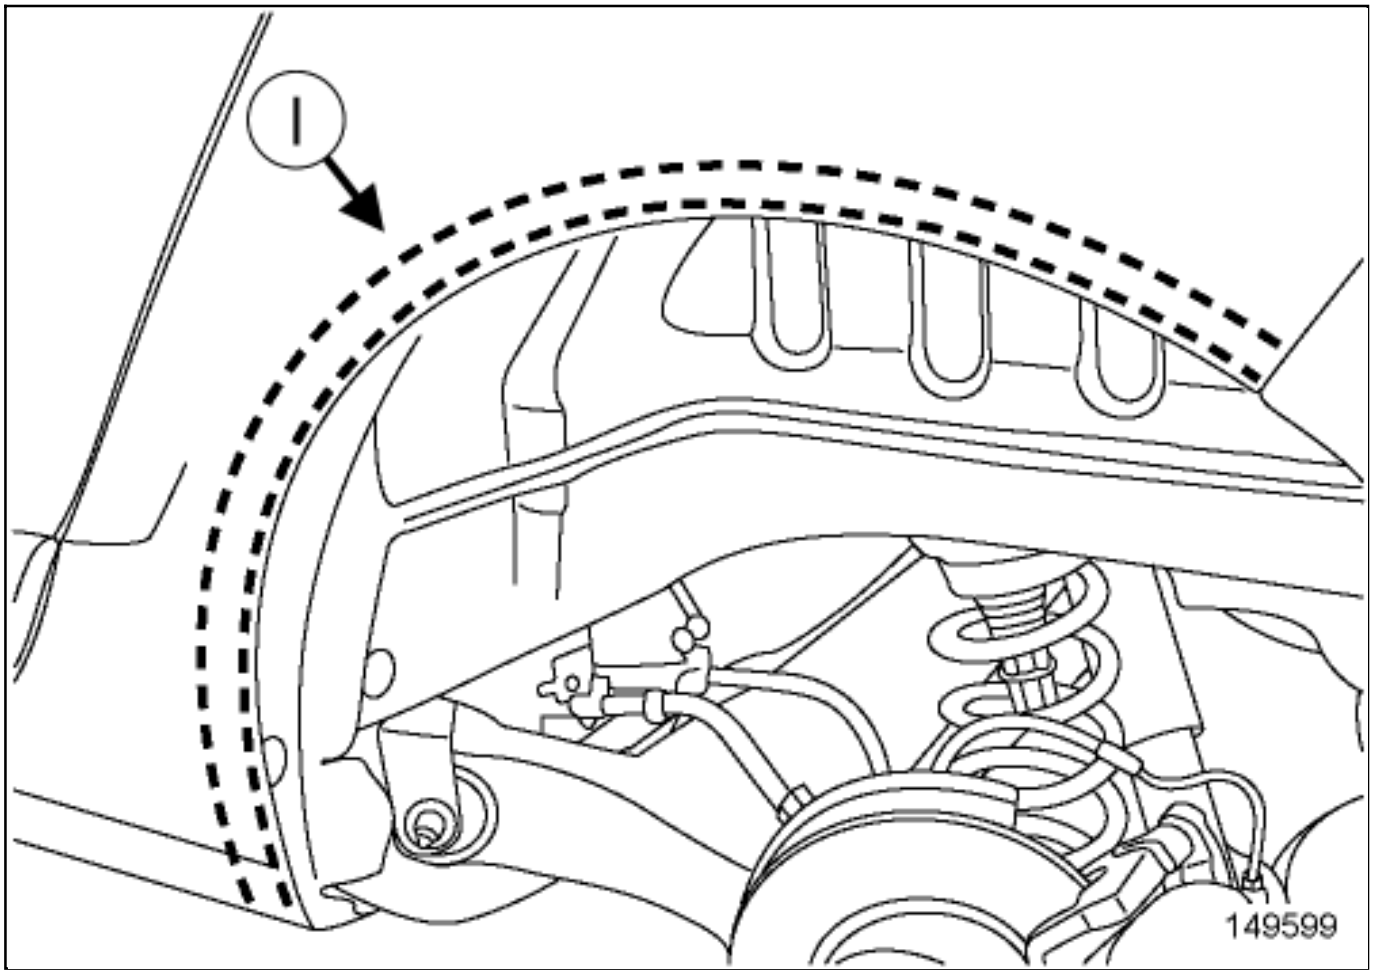
Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

3- BOLTED AND WELDED REAR FLOOR

- Spray the edge(F) of the rear floor by sweeping the zone.



- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle



sealing: General information) .

- Spray the edge of the blanking covers of the rear floor in a circular manner.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

4- REAR WHEEL ARCH

- Spray the inner wheel arch / outer wheel arch joint area gradually from the bottom upwards(G) .

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

- Spray by sweeping the inner wheel arch / rear floor joint area(H) .

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

- Spray the outer wheel arch / rear wing panel joint area gradually from the bottom upwards(I) .

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle

sealing: General information) .

Spray the edge of the wheel arch blanking covers in a circular manner.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the contact zone of the rear shock absorbers in a circular manner.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

5- CHECKING THE SEALING WITH THE TRIM REMOVED

If the customer complaint could not be reproduced in accordance with the procedure, remove the interior trims (see Body internal trim of the vehicle's repair manual) then repeat the sealing check from step 1; extend the sealing check to the surrounding areas(see 60A, General information, Vehicle: Sealing check) .

UNDERSIDE OF THE VEHICLE: SEALING REPAIR

Note:

Before repairing the sealing, check the sealing of the zone concerned(see 60A, General information, Vehicle: Sealing check) .

1. PREPARATION OPERATION FOR REPAIRING THE SEALING

1- CHECK THE POSITION AND ADJUST IF NECESSARY:

- the blanking covers,
- the rear shock absorbers(see **Rear axle components: Removal - Refitting**) (33A, Rear axle components),
- the sealing mastic.

2- WAS ANY ACTION PERFORMED?

☐ NO: move on to the next step.

☐ YES: check the sealing of the zone(see 60A, General information, Underside of the vehicle: Sealing check) .

☐ Was water present in the passenger compartment of the vehicle?

- YES: move on to the next step.
- NO: fault resolved.

2. SEALING REPAIR OPERATION

1- REPAIRING THE SEALING OF THE CENTRE FLOOR

☐ Is water present in the passenger compartment after the centre floor sealing has been checked?

☐

NO: move on to the next step.

☐

YES:

-

a) if the blanking covers of the centre floor are detached, refit the blanking covers of the centre floor,

b) if the blanking covers of the centre floor are deformed or cracked, replace the blanking covers of the centre floor,

c) if the sealing mastics of the centre floor are detached, faulty or incorrectly positioned, clean the faulty mastics **Tools for stripping very thick soft mastic: Use** (05B, Equipment and tools),

apply extruded mastic and sprayed mastic to the cleaned zones**Anti-corrosion protection products after assembly: Use** (04F, Bodywork products and mountings).

Check the sealing of the centre floor**(see 60A, General information, Underside of the vehicle: Sealing check)** .

2- REPAIRING THE SEALING OF THE FRONT WHEEL ARCH

Is water present in the passenger compartment after the front wheel arch sealing has been checked?

NO: move on to the next step.

YES:

a) if the front wheel arch liner is incorrectly positioned, refit the front wheel arch liner**Front wheel arch liner: Removal - Refitting** (55A, Exterior protections),

b) if the front wheel arch liner is deformed or cracked, replace the front wheel arch liner**Front wheel arch liner: Removal - Refitting** (55A, Exterior protections),

c) if the blanking covers of the front wheel arch are detached, refit the blanking covers of the front wheel arch,

d) if the blanking covers of the front wheel arch are deformed or cracked, replace the blanking covers of the front wheel arch,

e) if the sealing mastics of the front wheel arch are detached, faulty or incorrectly positioned, clean the

faulty mastics**Tools for stripping very thick soft mastic: Use** (05B, Equipment and tools),

apply extruded mastic and sprayed mastic to the cleaned zones**Anti-corrosion protection products after assembly: Use** (04F, Bodywork products and mountings).

Check the sealing of the front wheel arch**(see 60A, General information, Underside of the vehicle: Sealing check)** .

3- REPAIRING THE SEALING OF THE REAR FLOOR

1)BOLTED REAR FLOOR

Is water present in the passenger compartment after the bolted rear floor sealing has been checked?

NO: move on to the next step.

YES:

a) if the rear floor mountings are loosened, tighten the rear floor mountings**Rear floor, rear section: Removal - Refitting** (41D, Rear lower structure),

b) if the sealing mastic of the rear floor is faulty or incorrectly positioned, replace the sealing mastic of the rear floor**Rear floor, rear section: Removal - Refitting** (41D, Rear lower structure).

2)WELDED REAR FLOOR

Is water present in the passenger compartment after the welded rear floor sealing has been checked?

NO: move on to the next step.

YES:

a) if the blanking covers of the rear floor are detached, refit the blanking covers of the rear floor,

b) if the blanking covers of the rear floor are deformed or cracked, replace the blanking covers of the rear floor.

c) if the sealing mastics of the rear floor are detached, faulty or incorrectly positioned, clean the faulty mastics **Tools for stripping very thick soft mastic: Use** (05B, Equipment and tools),

apply extruded mastic and sprayed mastic to the cleaned zones**Anti-corrosion protection products after assembly: Use** (04F, Bodywork products and mountings).

Check the sealing of the rear floor**(see 60A, General information, Underside of the vehicle: Sealing check)**.

4- REPAIRING THE SEALING OF THE REAR WHEEL ARCH

Is water present in the passenger compartment after the rear wheel arch sealing has been checked?

NO: fault resolved.

YES:

a) if the rear wheel arch liner is incorrectly positioned, refit the rear wheel arch liner**Rear wheel arch liner: Removal - Refitting** (55A, Exterior protections),

b) if the rear wheel arch liner is deformed or cracked, replace the rear wheel arch liner**Rear wheel arch liner: Removal - Refitting** (55A, Exterior protections),

c) if the blanking covers of the rear wheel arch are detached, refit the blanking covers of the rear wheel arch,

d) if the blanking covers of the rear wheel arch are deformed or cracked, replace the blanking covers of the rear wheel arch,

e) if the sealing mastics of the rear wheel arch are detached, faulty or incorrectly positioned, clean the faulty mastics**Tools for stripping very thick soft mastic: Use** (05B, Equipment and tools),

apply extruded mastic and sprayed mastic to the cleaned zones**Anti-corrosion protection products after assembly: Use** (04F, Bodywork products and mountings).

f) if the upper mounting of the shock absorber is incorrectly positioned, refit the upper sealing component of the shock absorber(see **Rear axle components: Removal - Refitting**) (33A, Rear axle components).

Check the sealing of the rear wheel arch**(see 60A, General information, Underside of the vehicle: Sealing check)** .

VEHICLE INVOLVED IN AN IMPACT: MECHANICAL IMPACT FAULT FINDING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

This procedure aids the assessment of a vehicle involved in an impact, in particular to specify the parts always to be replaced. Under no circumstances does it replace the assessment carried out on the vehicle.

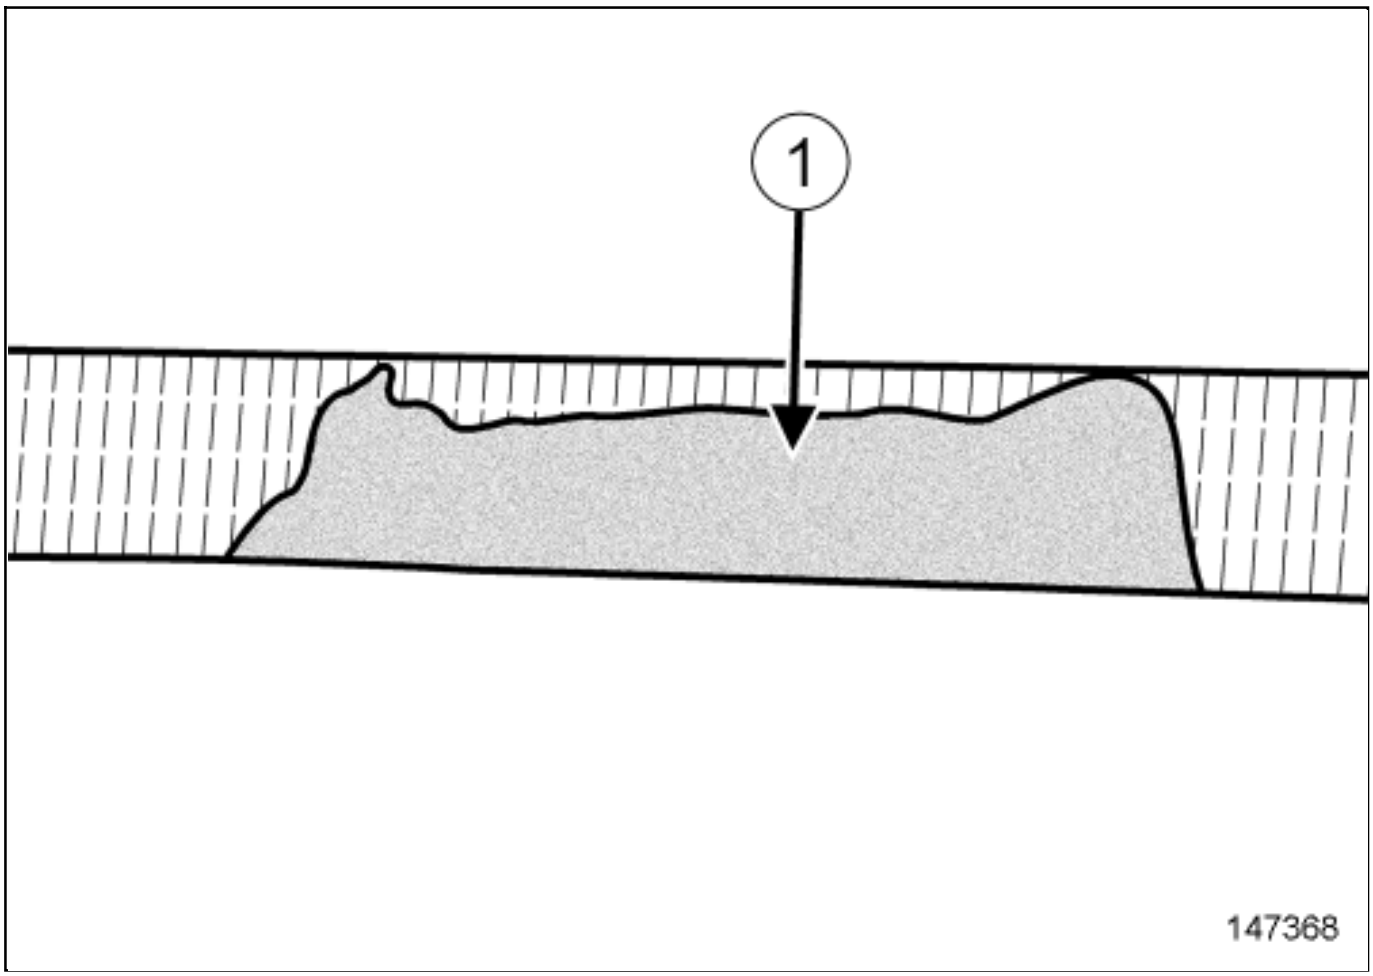
WARNING

In this document, the term "collision" designates a mechanical impact which has triggered at least one pyrotechnic component or at least caused the airbag computer to lock.

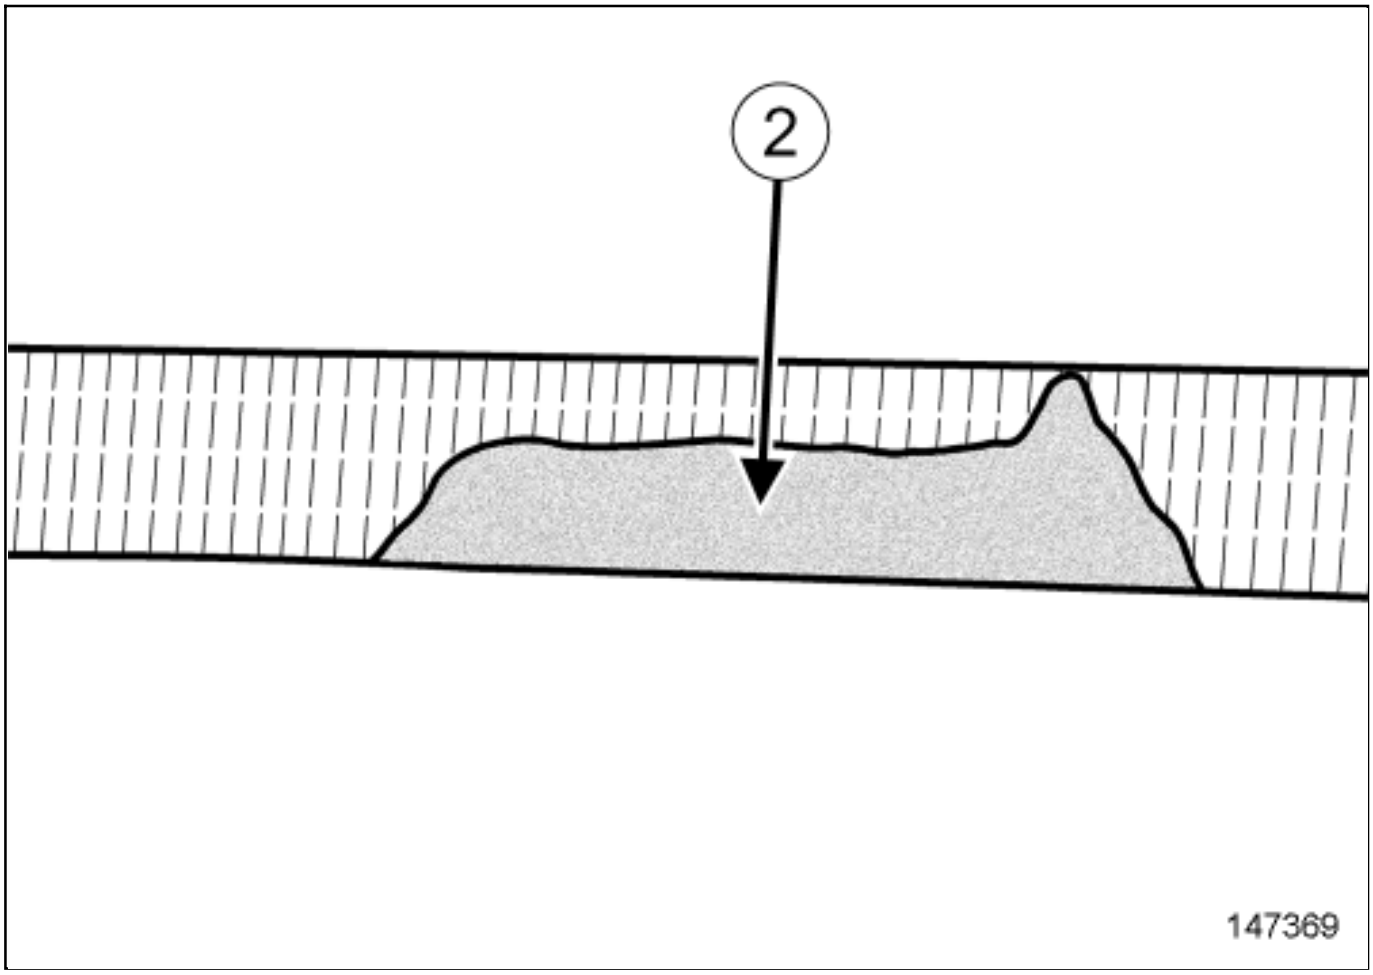
MECHANICAL IMPACT FAULT FINDING

1. SEAT BELT FAULT FINDING AFTER A COLLISION

- Replace all seat belts and buckles which were fastened at the time of the impact as well as their mountings.



Note:



If a baby seat was secured by a seat belt, always replace the seat belt and the associated buckle, as well as their mountings.

On 3-door vehicles, if the seat belt rail on the sill panel lining is deformed, it is essential to replace the seat belt, the seat belt rail, the buckle associated with this seat belt and their mountings.

If there is any doubt over whether a seat belt was fastened during an impact, always replace this seat belt, the buckle and the mounting.

SIGNS OF BURNING ON THE SEAT BELT STRAP

- Unwind the seat belt strap completely.

- Check whether the seat belt strap presents signs of burning(1) or (2) . If signs of burning are noted, replace the seat belt, the stalk and their mountings.

2. FAULT FINDING ON PYROTECHNIC SAFETY SYSTEMS AFTER A COLLISION

Note:

It is essential to connect the diagnostic tool to check the locked components

- Switch on the ignition.

- Connect Diagnostic tool.
- Select "Airbag computer".

Read the impact context (this command enables the list of trigger lines activated and the system status at the moment of impact to be accessed in the computer to be replaced).

- Replace the airbag computer and all parts locked by the computer.

Note:

If the passenger's airbag was inhibited at the moment of the collision and was therefore not triggered, it is obligatory to replace it (doubt over the condition of the igniter).

Note:

In order to create a reliable database, always send the locked airbag computer back to the technical department.

3. FAULT FINDING ON OTHER VEHICLE COMPONENTS AFTER A FRONTAL IMPACT COLLISION

1- STEERING WHEEL

- Remove the steering wheel.
- Fit the circular part of the steering wheel on a flat surface.
- Check that the steering wheel rests on its edge all the way around.

If the circular part of the steering wheel rests completely on the flat surface:

- the steering wheel is correct.

If the circular part of the steering wheel does not rest completely on the flat surface:

- replace the steering wheel,
- replace the steering column.

2- STEERING COLUMN

If the driver's frontal airbag was triggered, always replace the steering column.

If the steering rack is damaged:

- replace the steering column or the intermediate shaft if it is sold separately,
- replace the steering rack

3- PEDAL ASSEMBLY

After the driver's frontal airbag has been triggered, always replace the pedal assembly.

4- DASHBOARD CROSS MEMBER

After the driver's frontal airbag has been triggered, replace the brake pedal impacter.

When refitting the dashboard cross member on the vehicle, if the cross member cannot be refitted

correctly, replace the dashboard cross member.

5- DASHBOARD

After frontal airbags have been triggered, replace the dashboard.

6- FRONT SEAT

Note:

An unoccupied seat means a seat without a passenger on the seat and an unfastened seat belt.

Note:

The seat frame is involved in passive safety. During an impact, if the seat is occupied, the seat is considered to be deformed to ensure the occupier's safety.

After the frontal airbags have been triggered:

Front seat occupied:

- replace the complete frame of the seat.

Front seat unoccupied:

- retain the seat frame.

7- REAR SEAT OR REAR BENCH SEAT

After the frontal airbags have been triggered:

- Rear seat occupied:
  - replace the complete frame of the seat.
- Rear bench seat occupied:
  - replace the complete frame of the bench seat.
- Rear seat unoccupied:
  - retain the seat frame.
- Rear bench seat unoccupied:
  - retain the frame of the bench seat.

4. FAULT FINDING ON VEHICLE COMPONENTS AFTER A SIDE IMPACT COLLISION

1- IMPACT SIDE

Note:

An unoccupied seat means a seat without a passenger on the seat and an unfastened seat belt.

Note:

If there is any doubt over whether the seat was occupied, you must consider the seat occupied.

Replace the side impact sensor.

Seat occupied or unoccupied:

- replace the complete frame of the seat.

Bench seat occupied or unoccupied:

- replace the complete frame of the bench seat.

2- OPPOSITE SIDE TO IMPACT

Seat occupied:

- replace the complete frame of the seat.

Bench seat occupied:

- replace the complete frame of the bench seat.

Seat unoccupied:

- retain the seat frame.

Bench seat unoccupied:

- retain the frame of the bench seat.

VEHICLE INVOLVED IN AN IMPACT: MECHANICAL IMPACT FAULT FINDING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

This procedure aids the assessment of a vehicle involved in an impact, in particular to specify the parts always to be replaced. Under no circumstances does it replace the assessment carried out on the vehicle.

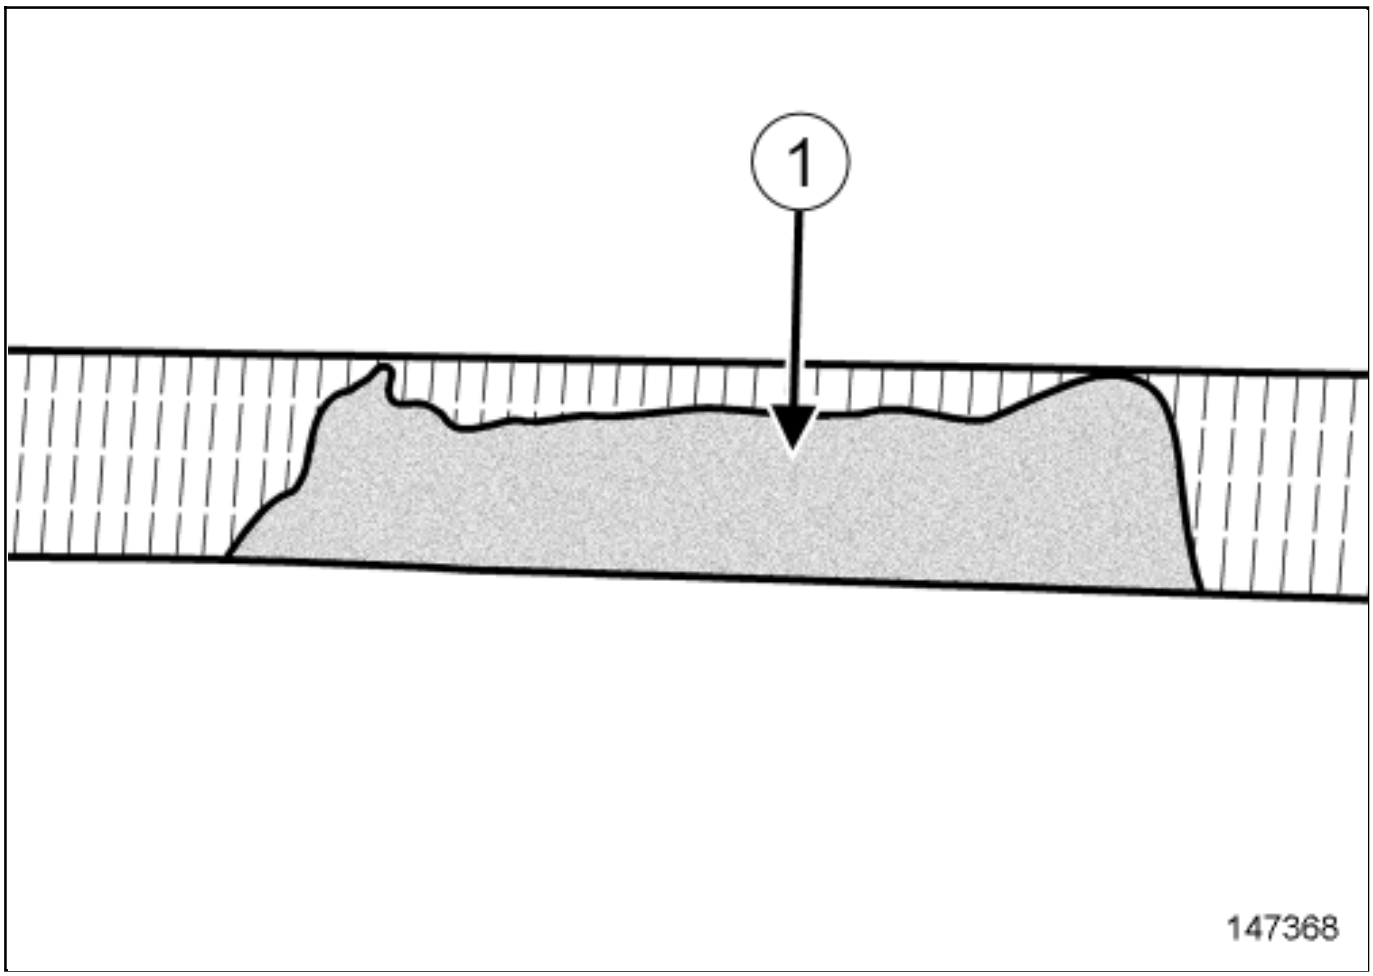
WARNING

In this document, the term "collision" designates a mechanical impact which has triggered at least one pyrotechnic component or at least caused the airbag computer to lock.

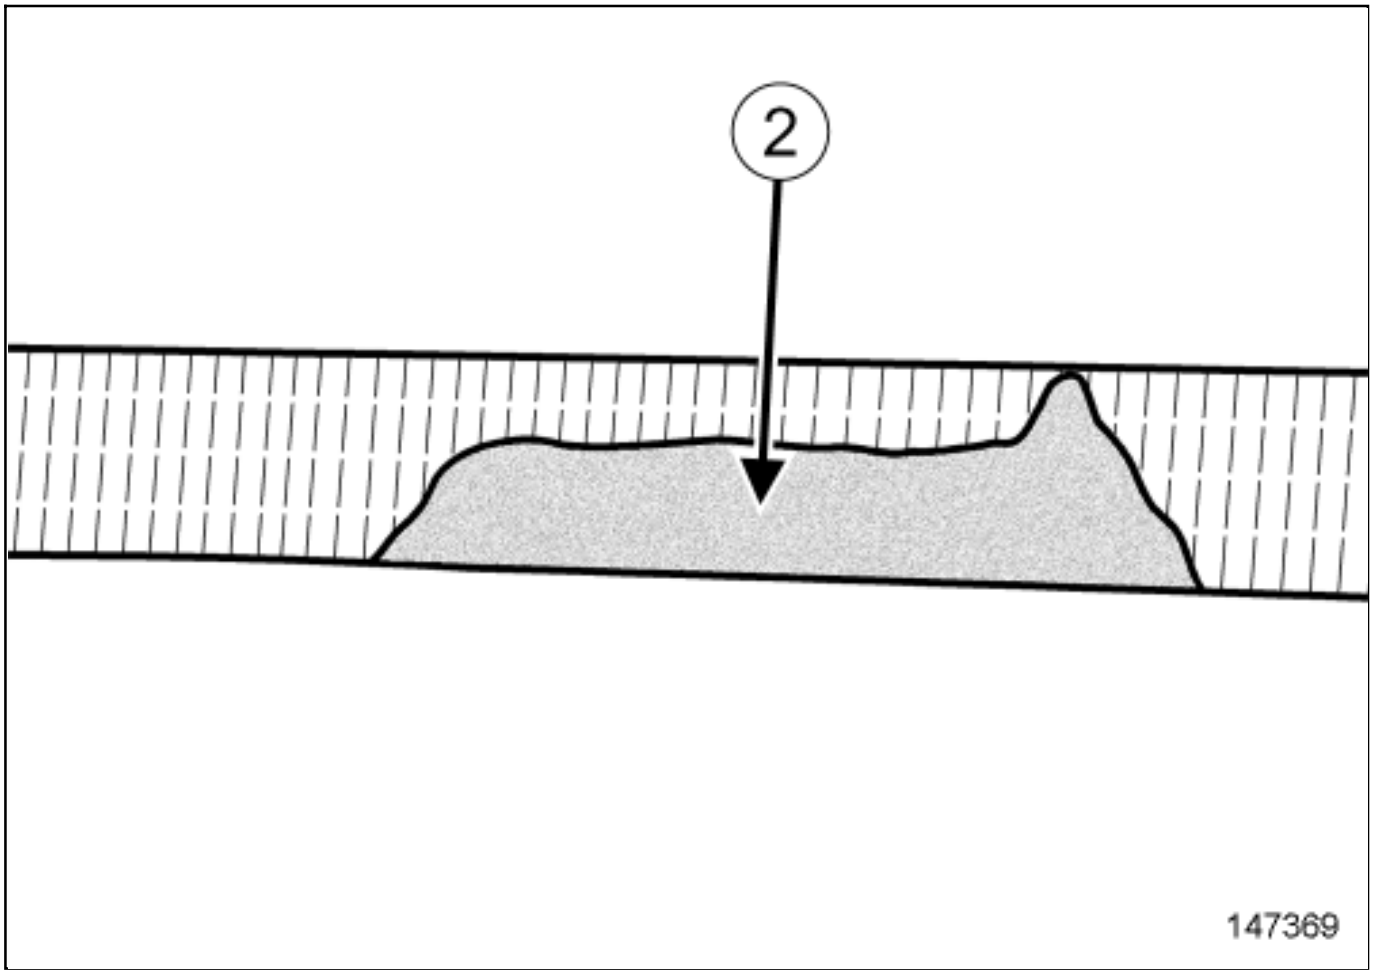
MECHANICAL IMPACT FAULT FINDING

1. SEAT BELT FAULT FINDING AFTER A COLLISION

Replace all seat belts and buckles which were fastened at the time of the impact as well as their mountings.



Note:



If a baby seat was secured by a seat belt, always replace the seat belt and the associated buckle, as well as their mountings.

On 3-door vehicles, if the seat belt rail on the sill panel lining is deformed, it is essential to replace the seat belt, the seat belt rail, the buckle associated with this seat belt and their mountings.

If there is any doubt over whether a seat belt was fastened during an impact, always replace this seat belt, the buckle and the mounting.

SIGNS OF BURNING ON THE SEAT BELT STRAP

- Unwind the seat belt strap completely.

- Check whether the seat belt strap presents signs of burning(1) or (2) . If signs of burning are noted, replace the seat belt, the stalk and their mountings.

2. FAULT FINDING ON PYROTECHNIC SAFETY SYSTEMS AFTER A COLLISION

Note:

It is essential to connect the diagnostic tool to check the locked components

- Switch on the ignition.

- Connect Diagnostic tool.
- Select "Airbag computer".

Read the impact context (this command enables the list of trigger lines activated and the system status at the moment of impact to be accessed in the computer to be replaced).

- Replace the airbag computer and all parts locked by the computer.

Note:

If the passenger's airbag was inhibited at the moment of the collision and was therefore not triggered, it is obligatory to replace it (doubt over the condition of the igniter).

Note:

In order to create a reliable database, always send the locked airbag computer back to the technical department.

3. FAULT FINDING ON OTHER VEHICLE COMPONENTS AFTER A FRONTAL IMPACT COLLISION

1- STEERING WHEEL

- Remove the steering wheel.
- Fit the circular part of the steering wheel on a flat surface.
- Check that the steering wheel rests on its edge all the way around.

If the circular part of the steering wheel rests completely on the flat surface:

- the steering wheel is correct.

If the circular part of the steering wheel does not rest completely on the flat surface:

- replace the steering wheel,
- replace the steering column.

2- STEERING COLUMN

If the driver's frontal airbag was triggered, always replace the steering column.

If the steering rack is damaged:

- replace the steering column or the intermediate shaft if it is sold separately,
- replace the steering rack

3- PEDAL ASSEMBLY

After the driver's frontal airbag has been triggered, always replace the pedal assembly.

4- DASHBOARD CROSS MEMBER

After the driver's frontal airbag has been triggered, replace the brake pedal impacter.

When refitting the dashboard cross member on the vehicle, if the cross member cannot be refitted

correctly, replace the dashboard cross member.

5- DASHBOARD

After frontal airbags have been triggered, replace the dashboard.

6- FRONT SEAT

Note:

An unoccupied seat means a seat without a passenger on the seat and an unfastened seat belt.

Note:

The seat frame is involved in passive safety. During an impact, if the seat is occupied, the seat is considered to be deformed to ensure the occupier's safety.

After the frontal airbags have been triggered:

Front seat occupied:

- replace the complete frame of the seat.

Front seat unoccupied:

- retain the seat frame.

7- REAR SEAT OR REAR BENCH SEAT

After the frontal airbags have been triggered:

Rear seat occupied:

- replace the complete frame of the seat.

Rear bench seat occupied:

- replace the complete frame of the bench seat.

Rear seat unoccupied:

- retain the seat frame.

Rear bench seat unoccupied:

- retain the frame of the bench seat.

4. FAULT FINDING ON VEHICLE COMPONENTS AFTER A SIDE IMPACT COLLISION

1- IMPACT SIDE

Note:

An unoccupied seat means a seat without a passenger on the seat and an unfastened seat belt.

Note:

If there is any doubt over whether the seat was occupied, you must consider the seat occupied.

Replace the side impact sensor.

Seat occupied or unoccupied:

- replace the complete frame of the seat.

Bench seat occupied or unoccupied:

- replace the complete frame of the bench seat.

2- OPPOSITE SIDE TO IMPACT

Seat occupied:

- replace the complete frame of the seat.

Bench seat occupied:

- replace the complete frame of the bench seat.

Seat unoccupied:

- retain the seat frame.

Bench seat unoccupied:

retain the frame of the bench seat.

VEHICLE:MAINTENANCE

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions(see 01D, Mechanical introduction, Vehicle: Precautions for the repair)

The Renault maintenance programme includes all checks, top-ups, adjustments, and part replacements necessary for vehicle maintenance. For information on the specific service intervals for the vehicle, refer to themaintenance bookletor to theICM.

1. CONTENT OF THE DIFFERENT TYPES OF SERVICES AND THE ANNUAL INTERMEDIATE VISIT:

1-SERVICES:

The types of service (Maintenance Service, General Service, Renault Service) and the operations to be performed may vary depending on the vehicle and the date of manufacture. Thus to know which specific checks and operations should be performed on the vehicle, refer to the vehicle'smaintenance booklet.

1- ANNUAL INTERMEDIATE VISIT:

For vehicles for which the service maintenance is to be performed no later than every 2 years, a non-obligatory visit including the following operations is advised:

- check the engine oil level,
- check the level, condition, and sealing of the brake fluid circuit,
- check the coolant level,
- check the level, condition, and sealing of the power-assisted steering circuit,
- check the washer fluid level,
- electronic fault finding of the battery with the test tool,
- electronic fault finding of the computers,
- condition of the windscreen and rear view mirrors,
- wear of the windscreen wiper and rear wiper blades,
- check the exterior lighting and signals,
- condition and pressure of the tyres (including emergency spare wheel or tyre repair aerosol),
- condition of gaiters, rubber mounting bushes, and ball joints,

- check the exhaust system,
- sealing of the front and rear shock absorbers,
- wear of the front and rear brake pads and brake discs.

NOTE: the content of the intermediate visit, as well as its commercial name, may vary from one country to another. Thus additional checks and / or operations could be added to this list. For more information, please contact the manufacturer's technical teams in your country

2. VEHICLES FITTED WITH OCS:

The OCS (Oil Control System) function fitted on certain models detects driving profiles that cause premature degradation of the engine oil. Under certain conditions of use (frequent driving at low speeds, door to door driving, extended driving at idle speed, driving towing a trailer caravan of more than 500 kg), the vehicle will alert the driver that a service (in particular, an oil change) is necessary. This service alert is indicated to the driver via the "service or oil change interval" information provided by the instrument panel.

MODELS FITTED WITH THE OCS:

Model	engine	Engine suffix	Vehicles affected:
TWINGO II	D4F	780	All
TWINGO II	K9K	718	All
CLIO III and MODUS	D4F	784	All
CLIO III	D4F	742	Vehicles manufactured from 24/06/08
MODUS	D4F	742	All
MODUS	K9K	764	Vehicles manufactured from 23/08/07

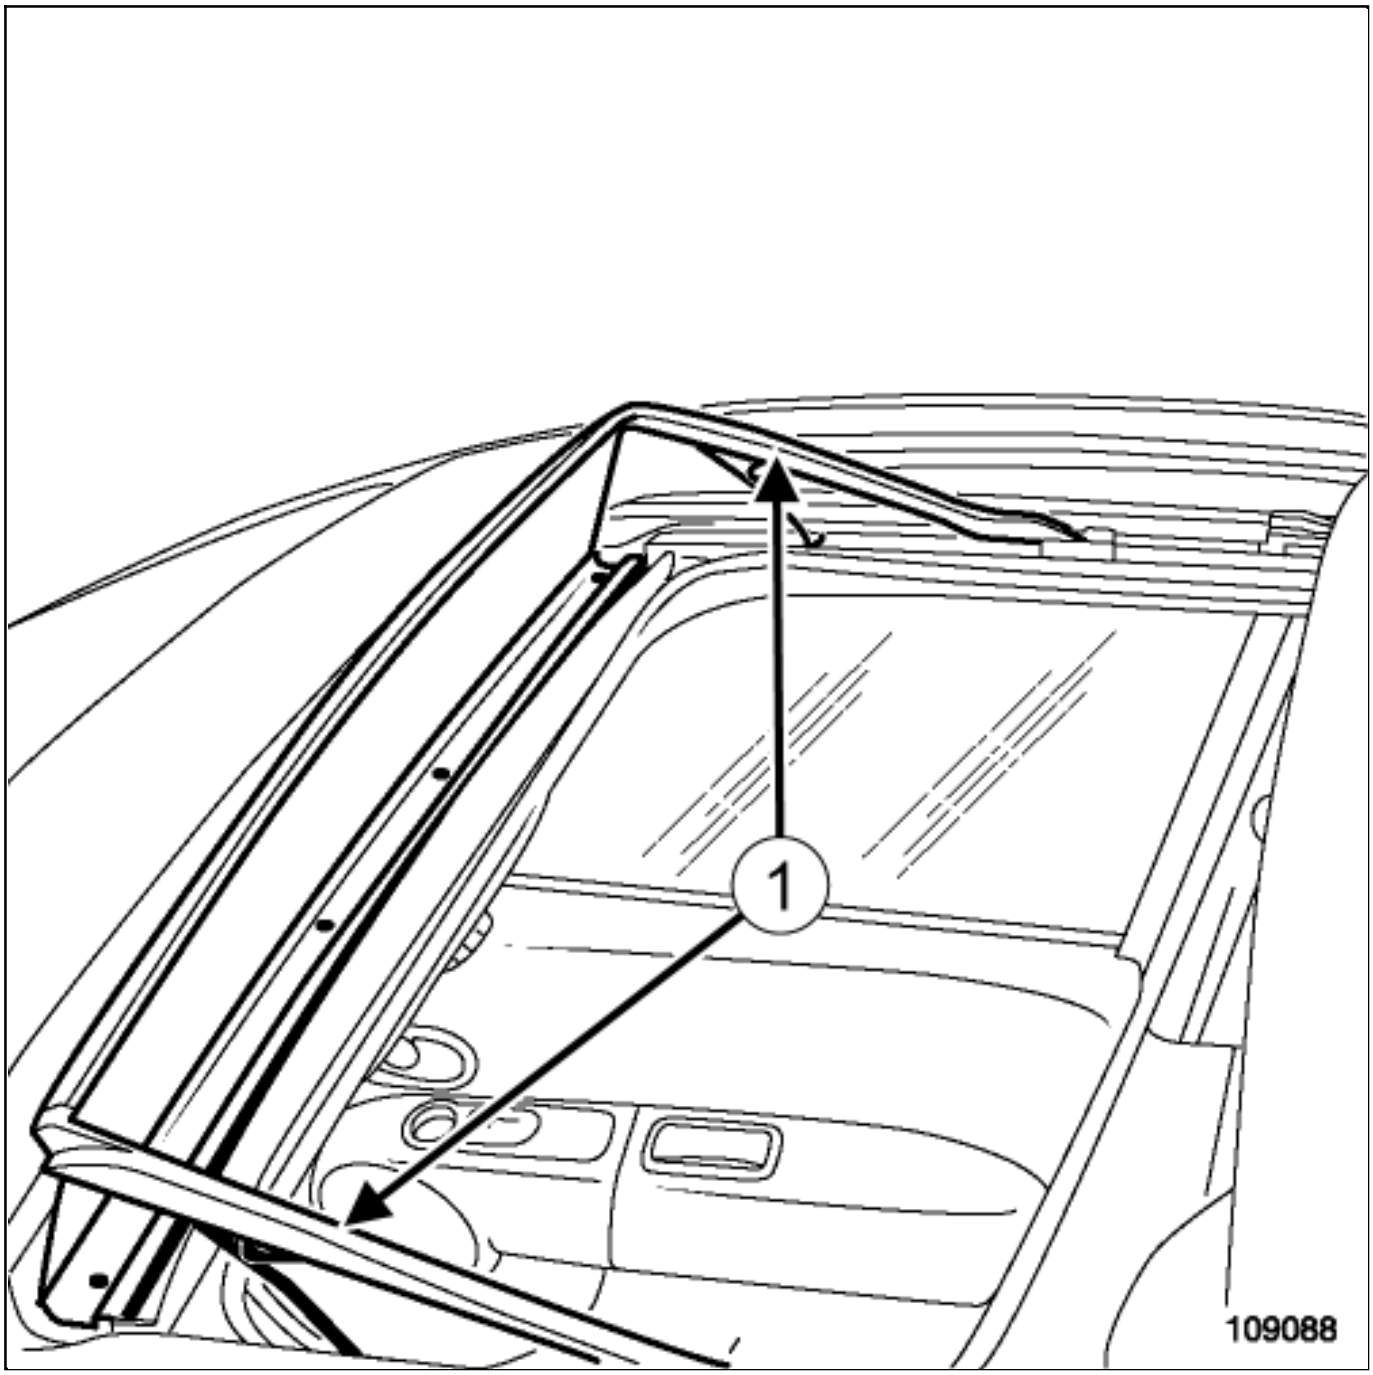
3. PROCEDURES FOR PERFORMING OPERATIONS AND CHECKS DURING THE MAINTENANCE OR SERVICE:

The customer must be warned if a check reveals a fault.

Checks marked with an asterisk depend on the vehicle or the country.

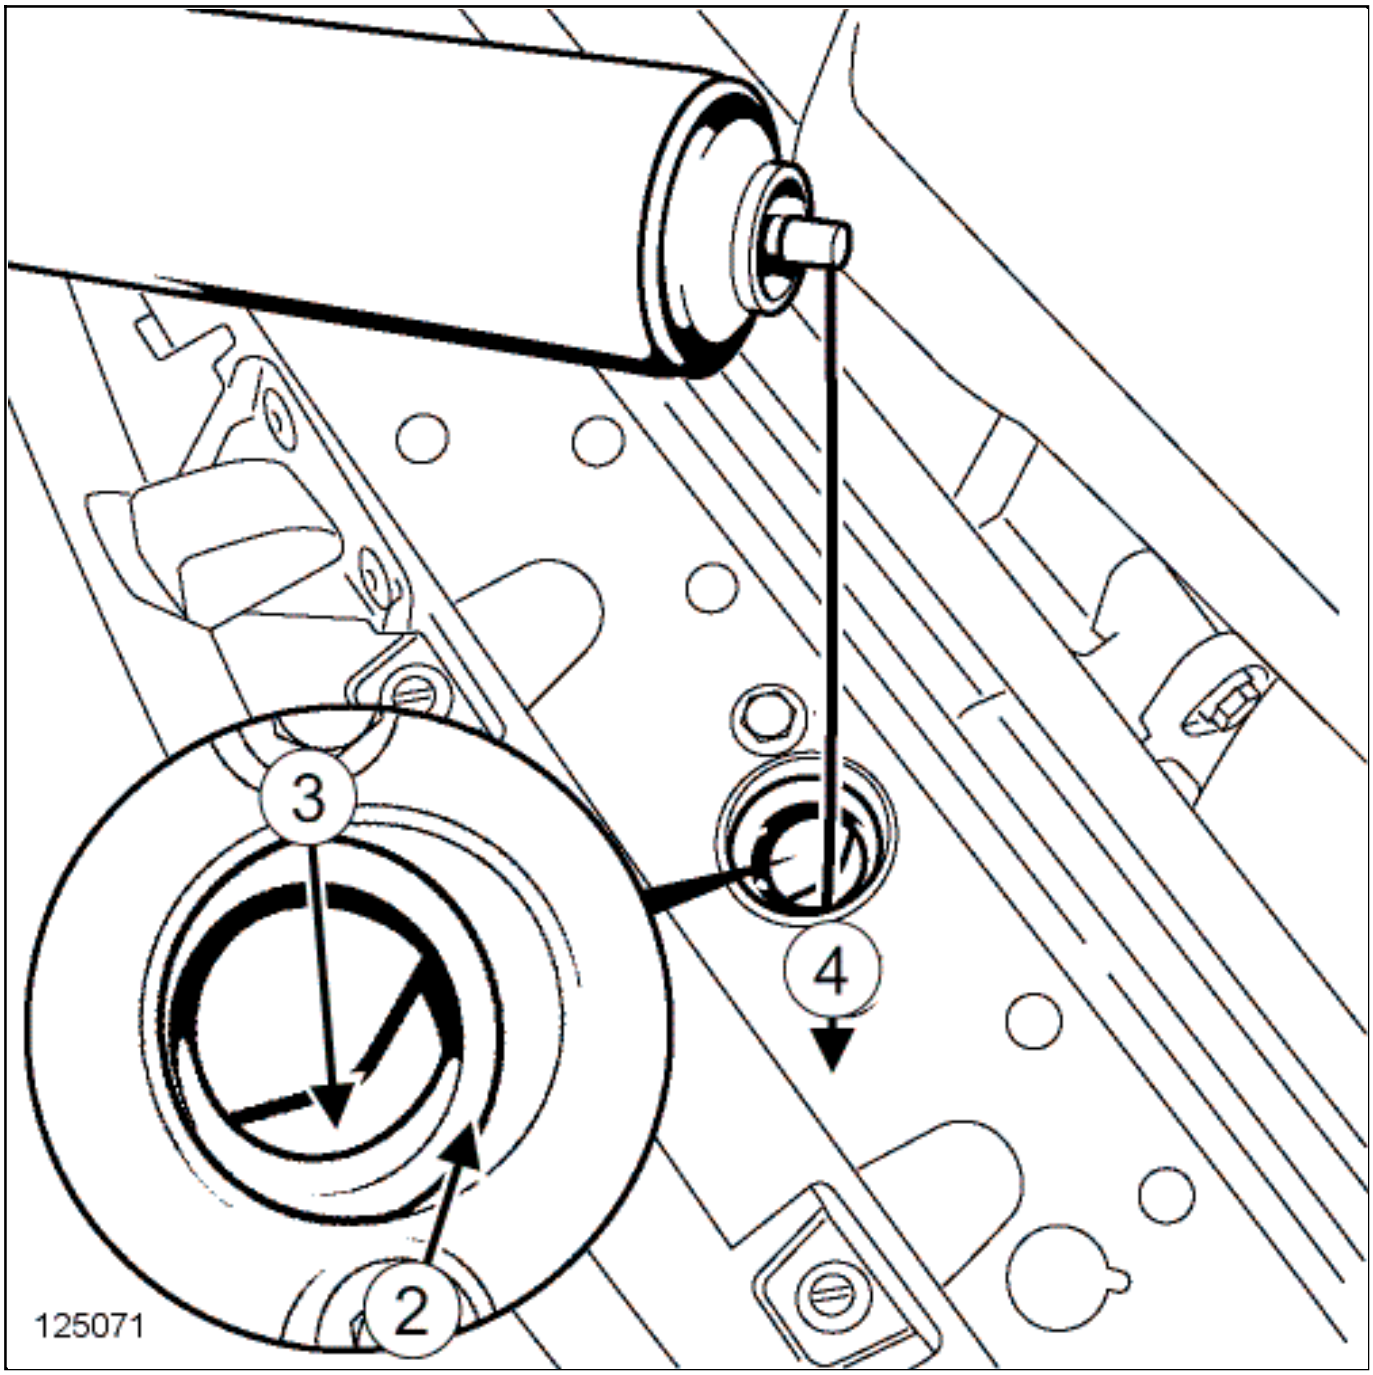


1- BODYWORK: ANTICORROSION CHECK

- Visually inspect the condition of the:
  - vehicle,
  - underside of the vehicle,
  - wheel arches.

Indicate any damage to the underbody protection, and all cuts, ruptures, scratches or corrosion anywhere on the vehicle.

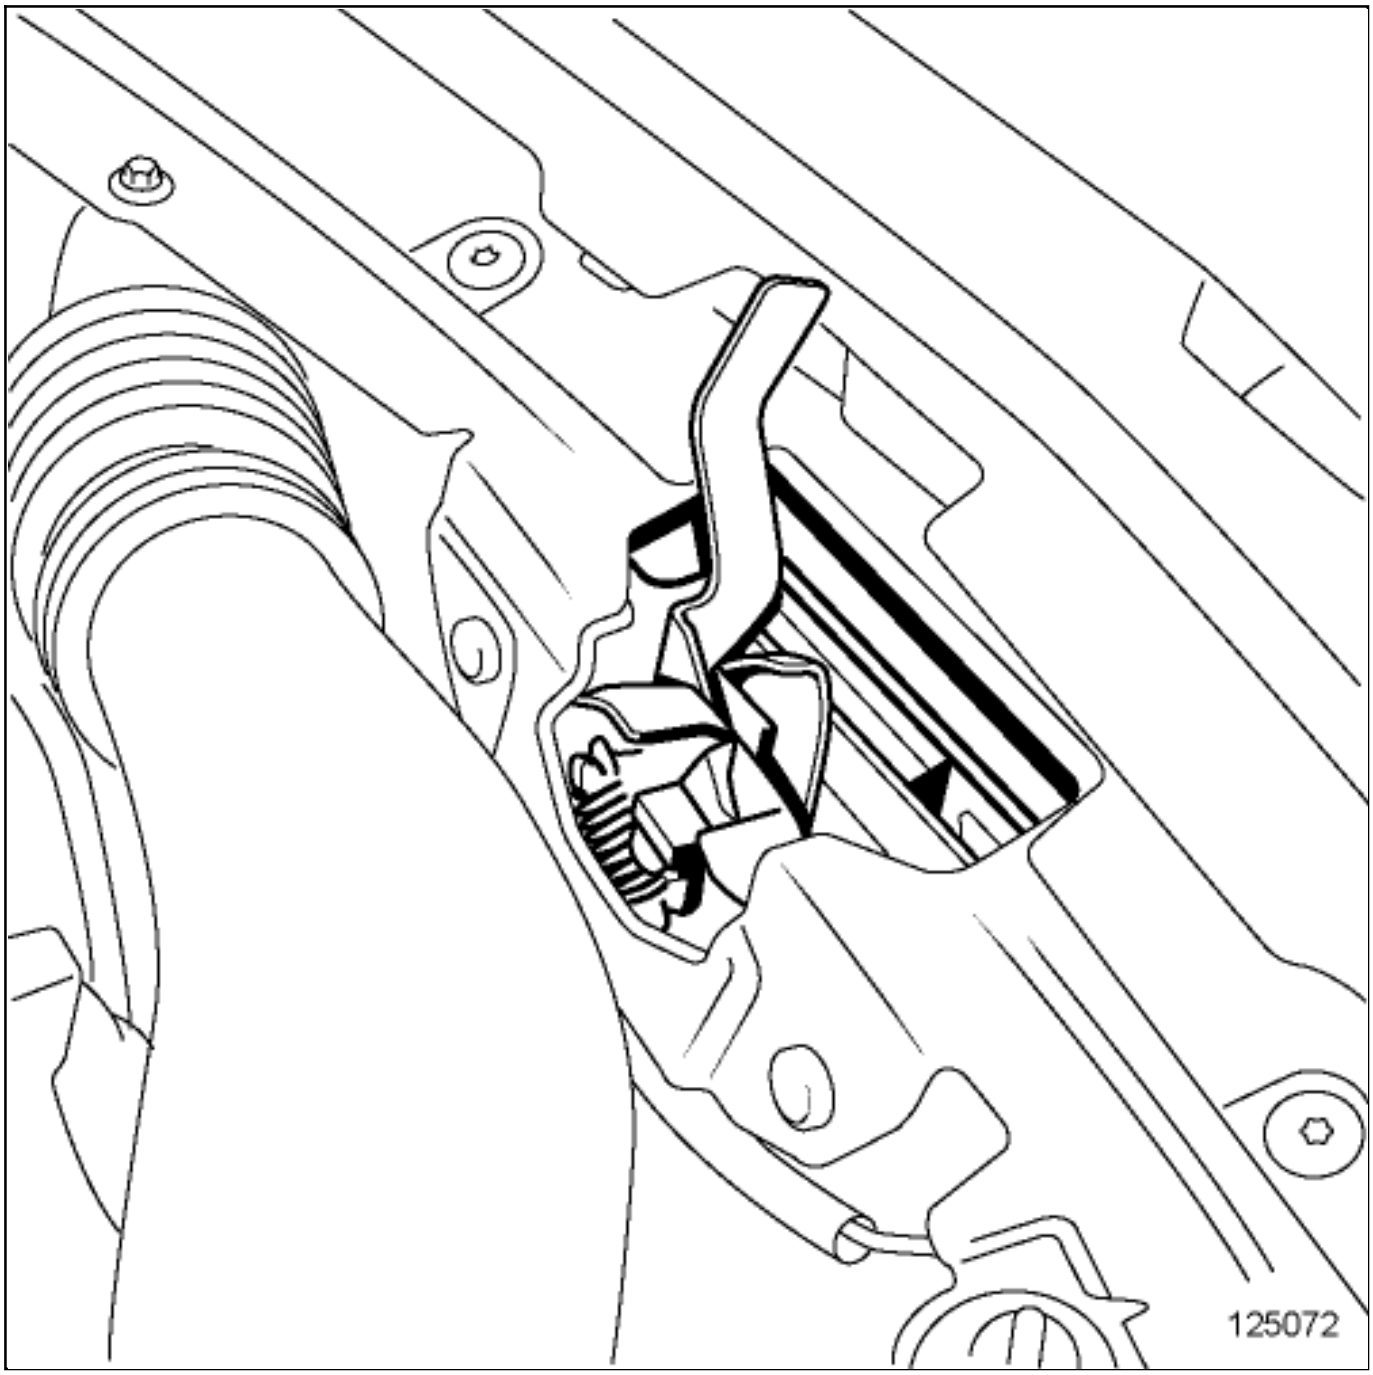
This inspection contributes to the validity of the anticorrosion warranty. It is therefore necessary to complete themaintenance sheetsin themaintenance booklet.



2- BODYWORK: CLEANING THE DEFLECTOR ARMS AND PANORAMIC SUNROOF MOBILE PANEL

Use a dry, lint-free cloth to clean the sunroof deflector arms(1) and the section of the mobile panel with which they come into contact.

3- BODYWORK: CHECKING THE BONNET LOCK LUBRICATION AND OPERATION



1)GUILLOTINE TYPE LOCK

As shown in the photo above, apply silicone-free lubricant Vehicle: Parts and consumables for the repair (04B, Consumables - Products) between the casing of the catch(2) and the catch segment(3) in the direction of the catch segment hinge shaft(4).

Let it set for 1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

2)OTHER TYPES OF LOCK

Apply silicone-free lubricant Vehicle: Parts and consumables for the repair (04B, Consumables - Products) to the catch assembly.

Let it set for 1 minute, then manoeuvre 10 times from the bonnet release catch in the passenger compartment.

4- ENGINE: DRAINING THE ENGINE OIL

The oil grade is essential for maintaining the service life of the engine. Carefully follow the manufacturer's recommendations specified in the Technical Note Engine oil: Specifications (Technical Note 6013A, 04A,

Lubricants).

Use the correct quantity of oil and the correct sump plug sealing washer(see **Engine oil: Draining - Refilling**) (10A, Engine and peripherals).

After topping up, let the oil run for approximately 10 minutes before checking the level. The oil level maximum mark on the dipstick must never be exceeded (risk of damage to the engine).

5- ENGINE: REPLACING THE OIL FILTER

Replace the engine oil filter after each oil service(see **Oil filter: Removal - Refitting**) (10A, Engine and peripherals).

6- ENGINE: CHECKING THE EXHAUST SYSTEM

Visually inspect:

- that there is no corrosion, piercing or impact to the silencer, expansion chamber, catalytic converter and particle filter*,
- that the rubber mounting bushes are not torn or cracked,
- that the exhaust pipe is not in contact with the underside of the vehicle.

7- ENGINE: BLEEDING WATER FROM THE FUEL FILTER* (IF THE PART HAS NOT REACHED ITS REPLACEMENT INTERVAL)

Bleed the water from the fuel filter by unscrewing the water bleed cap and letting the water run into a suitable container**Fuel filter: Removal - Refitting** (13A, Fuel supply).

8- ENGINE: CHECKING THE CLUTCH PLAY* (EXCEPT FOR AUTOMATIC COMPENSATION)

(Logan and Sandero only) Use the recommended checking procedure(see **Clutch control: Adjustment**) (37A, Mechanical component controls).

9- CHECKING THE LEVELS, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC POWER-ASSISTED STEERING*

Check the hydraulic steering fluid level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

10- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: COOLING

Check the coolant level: it should be between the minimum and maximum level on the reservoir.

Visually check the circuit sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

11- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: HYDRAULIC BRAKE/CLUTCH*

Visually check the circuit sealing, checking the condition and that there are no leaks around the engine compartment, under the vehicle or at the unions.

Check the brake fluid level:

If the level is between the minimum and maximum, do not add brake fluid as wear on the discs, pads, drums and linings leads to a progressive drop in the brake fluid level in the tank which will usually be rectified once these components are replaced. However, the brake fluid level should never drop below the minimum mark.

If there is an abnormal loss of fluid, the cause of which cannot be found with this check, advise the customer.

12- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC UNIT*

Check the hydraulic unit oil level: it should be between the minimum and maximum level on the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

13- CHECKING THE LEVEL, CONDITION AND SEALING OF THE HYDRAULIC CIRCUITS: SEQUENTIAL GEARBOX HYDRAULIC CLUTCH*

Check the hydraulic clutch fluid level, it should be at the middle level of the reservoir.

Visually check the sealing, ensuring that there are no leaks, or any abnormal loss of fluid.

Top up, if necessary.

14- CHECKING THE CHASSIS: CONDITION OF THE GAITERS, RUBBER MOUNTING BUSHES AND BALL JOINTS

Check the condition of the driveshaft and steering rubber gaiters, all ball joints and the rubber mounting bushes. There must not be any signs of tearing or cracks.

15- CHECKING THE CHASSIS: TYRE CONDITION AND PRESSURE (INCLUDING EMERGENCY SPARE WHEEL OR PRESENCE OF TYRE-REPAIR AEROSOL)

Check that the tread depth of the tyres has not reached the wear warning strips, explain the degree of tyre wear to the customer.

Check that there is no abnormal tyre wear, and no bulges, blisters, tears or foreign objects (sharp object, screw, etc.).

Check and readjust the tyre inflation pressure when cold according to the type of driving.

Check the pressure and condition of the emergency spare wheel, or if not supplied with the vehicle, check that there is a tyre repair aerosol in the vehicle.

Adhere to the recommended pressure shown on the label on the door (if the vehicle does not have one, refer to theDriver's Handbookor(see **Tyre pressure: Identification**) (35A, Wheels and tyres).

16- CHECKING THE CHASSIS: PRESENCE OF THE WHEEL VALVE CAPS

Check that each valve cap is present.

17- CHECKING THE CHASSIS: SEALING OF THE FRONT AND REAR SHOCK ABSORBERS

Visually check that there is no oil leaking along the length of the shock absorbers.

18- CHECKING THE CHASSIS: WEAR ON THE FRONT AND REAR BRAKE DISCS AND PADS*

When carrying out a quality check, it is essential to remove the wheels (an impact wrench may only be used to remove the wheels)**Wheel: Removal - Refitting** (35A, Wheels and tyres).

Check the thickness of the brake pads and compare to the minimum authorised value**Brake: Specifications** (30A, General information). In case of partial wear, advise the customer of the degree of wear to the brake pads.

Check the thickness of the front brake discs(see **Front brake disc: Description**) (31A, Front axle components) and the thickness of the rear brake discs(see **Rear brake disc: Description**) (33A, Rear axle components). In case of partial wear, advise the customer of the degree of wear to the brake discs.

19- CHECKING VISIBILITY: EXTERIOR LIGHTING AND SIGNALS

Check the side lights, dipped headlights, main beam headlights, front and rear fog lights, the direction indicators and side mounted indicators, the reversing lights, the hazard warning lights, the brake lights, the registration plate lighting and the additional cornering lights*.

20- CHECKING VISIBILITY: INTERIOR LIGHTING

Checking door lighting, interior lights and sun visors, glovebox and luggage compartment lights.

21- CHECKING VISIBILITY: CONDITION OF THE WINDSCREEN AND DOOR MIRRORS

Check that there are no cracks or chips.

22- CHECKING VISIBILITY: WEAR ON THE FRONT AND REAR WINDSCREEN WIPER BLADES

Check the quality of the wiping function and check that the wiper blades are not torn or cracked.

23- CHECKING VISIBILITY: FRONT AND REAR WINDSCREEN WASHER FLUID LEVEL

Check that there is windscreen washer fluid present.

Top up, if necessary.

24- LABELS: CHECKING THE AIRBAG SAFETY AND ENGINE COMPARTMENT LABELS ARE PRESENT AND CORRECTLY POSITIONED

Check that the vehicle has the following original safety labels:

- airbag, located on the windscreen, sun visor and passenger side of the dashboard,
- battery, oil, cooling system, heating and air conditioning system, engine cooling fan located in the engine compartment.

25- ELECTRONIC FAULT FINDING: BATTERY WITH TEST TOOL

Check the condition of the battery with the MIDTRONICS R330tool **Battery: Removal - Refitting** (Technical Note 6002A, 80A, Battery).

26- ELECTRONIC FAULT FINDING: COMPUTERS WITH FAULT FINDING COMPUTER

Note:

Always check the condition of the battery before carrying out fault finding on the computers as insufficient voltage can affect the computers.

The purpose of this procedure is to see if any of the computers are faulty.

The following tools are essential for carrying out fault finding on these systems:

- a Diagnostic tool,
- a CAN probe.

Running fault finding on the computers shows up possible faults not displayed by the system self-test procedure, and allows them to be cleared, following the procedure.

27- ELECTRONIC FAULT FINDING: OPERATION OF THE INSTRUMENT PANEL WARNING LIGHTS

Check that the following warning lights come on when the ignition is switched on:

- STOP warning light,
- SERVICE warning light.

28- REINITIALISATION: MAINTENANCE/OIL SERVICE DISPLAY*

Reset the maintenance/oil service interval display (seeDriver's Handbook).

29- SERVICE SHEETS: AFFIXING THE SERVICE LABEL IN THE ENGINE COMPARTMENT*

Fill in theétiquette d'entretienand affix it in the engine compartment.

4. SUPPLEMENTARY OPERATIONS:

The removal and refitting procedures and some of the checks to be carried out during maintenance are set out in therepair manualsor thetechnical notes. The information and repair procedures given below are specific to the maintenance programme.

For an exhaustive description of the operations to be carry out during the maintenance operation, refer to the vehicle'smaintenance booklet.

1- REPLACEMENT OF THE ACCESSORIES BELT, ROLLERS, AND PULLEYS (PULLEY TO BE REPLACED DEPENDING ON THE VEHICLE)

When replacing the belt, it is essential to replace the tensioning rollers and fixed rollers across the whole range. It is also necessary to replace the damper pulley (also known as the crankshaft accessories pulley) or the alternator pulley on certain engines, see below.

Table of pulleys to be replaced during maintenance only according to the accessories belt replacement frequency. The vehicles concerned are those for which the maintenance booklets mention a replacement for certain engines. The detail of the vehicle variants concerned is given below (vehicles manufactured after June 2006):

1)IN EUROPE

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley during maintenance operations
F4R	714, 715, 720, 760, 761, 762, 763, 764, 765, 766, 767, 770, 771, 774, 776, 784, 786, 787, 792, 794, 795, 796, 797, 800, 811, 820, 830, 867, 870, 886, 887, 896, 897.	To be replaced every time the accessories belt and its rollers are replaced
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
M9R	610, 700, 720, 721, 722, 740, 760, 761, 780, 812.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	813	To be replaced every time the accessories belt and its rollers are replaced

2)OUTSIDE EUROPE

RECOMMENDATIONS FOR REPLACING THE DAMPER PULLEY (CRANKSHAFT ACCESSORIES PULLEY):

Engine type	Engine suffix	Recommendation for replacing the damper pulley
K4J equipped with air conditioning	730, 732, 740, 770, 780.	To be replaced every time the accessories belt and its rollers are replaced
K4M equipped with air conditioning	680, 690, 694, 697, 698, 716, 760, 761, 762, 764, 766, 768, 780, 782, 788.790, 791, 794, 800, 801, 804, 812, 813, 814, 824, 830, 831, 844, 848, 856.

K9K	278, 282, 288, 292, 732, 734, 764, 772, 780, 804, 806, 832, 836.	
F9Q	260, 262, 264, 660, 664, 670, 674, 680, 755, 757, 758, 759, 794, 800, 803, 804, 808, 812, 814, 816, 818, 820.	
G9T equipped with air conditioning	600 ,605, 606, 607, 642, 645, 702, 703, 706, 707, 710, 712, 720, 722, 742, 743, 750.	
G9U equipped with air conditioning	630, 632, 650, 720, 724, 730, 750, 754.	
M9R	610, 700, 720, 721, 722, 740, 742, 760, 761, 780, 812.	

M9R	742, 802, 803, 805, 809, 816, 830, 832, 833.	To be replaced every other time the accessories belt and its rollers are replaced

RECOMMENDATIONS FOR REPLACING THE ALTERNATOR PULLEY:

Engine type	Engine suffix	Recommendations for replacing the alternator pulley during maintenance
F4R	813	To be replaced every time the accessories belt and its rollers are replaced

2- REPLACING THE TIMING BELT AND ROLLERS

When replacing the belt, it is essential to replace the tensioning and fixed rollers across the whole range. Certain vehicle/engine specifications require associated parts to be replaced, therefore it is necessary to consult the repair procedure for the vehicle and engine for further details**Timing belt: Removal - Refitting** (11A, Top and front of engine).

3- CHECKING THE REAR BRAKE LININGS FOR VEHICLES FITTED WITH DRUMS

Check the wheel cylinders for any possible leaks.

Remove any dust from the brake linings using a brake cleaning product.

Check the thickness of the drum linings and compare it to the minimum authorised thickness**Brake: Specifications** (30A, General information).

4- CLEANING THE AIR CONDITIONING SYSTEM

The air conditioning system is cleaned by cleaning the evaporator**Evaporator: Cleaning** (62A, Air conditioning) or **Evaporator: Cleaning** (Technical Note 6001A, 62A, Air conditioning).

5- SPECIAL NOTES FOR LPG VEHICLES:

Only authorised personnel, i.e. those with specific LPG vehicle training, may work on the LPG system of a vehicle.

1)CHECKING THE SAFETY SOLENOID VALVE:

- Put the LPG switch in the LPG position,
- switch on the ignition, the tank solenoid valve should "click".

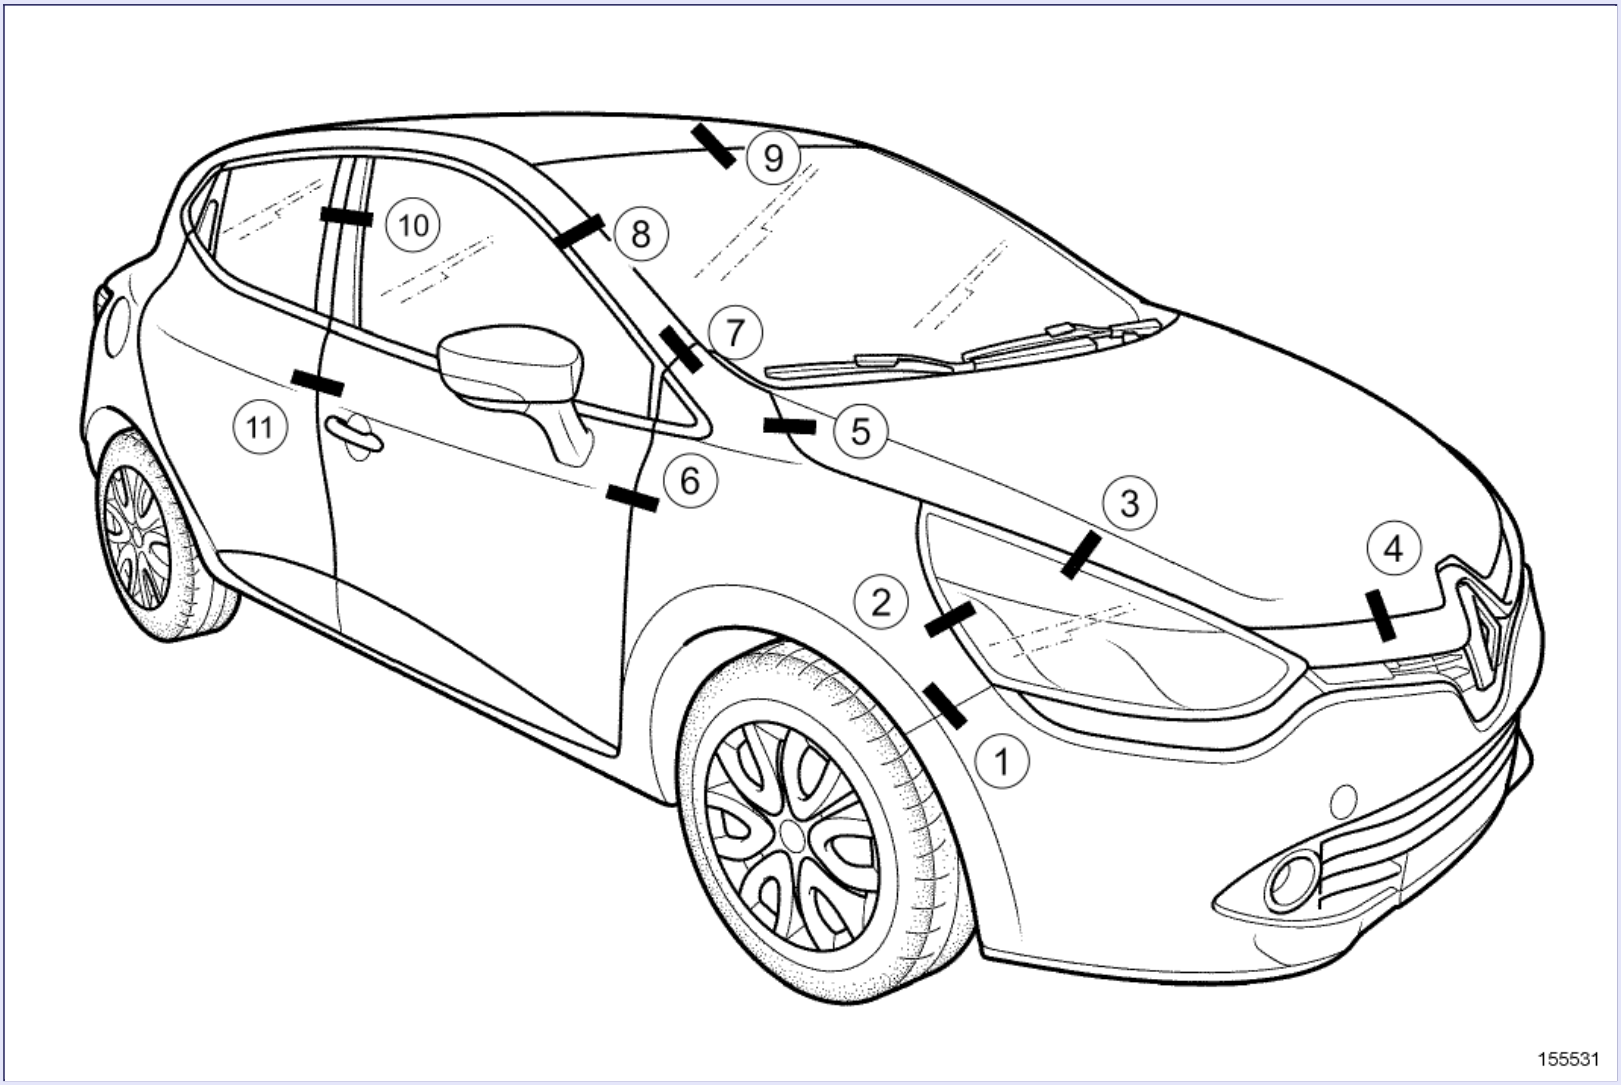
2)CHECKING THAT THERE IS A PLASTIC BLANKING COVER ON THE SAFETY VALVE:

Confirm that there is a blanking cover on the LPG tank overpressure valve.

3)BLEEDING THE EXPANSION VALVE:

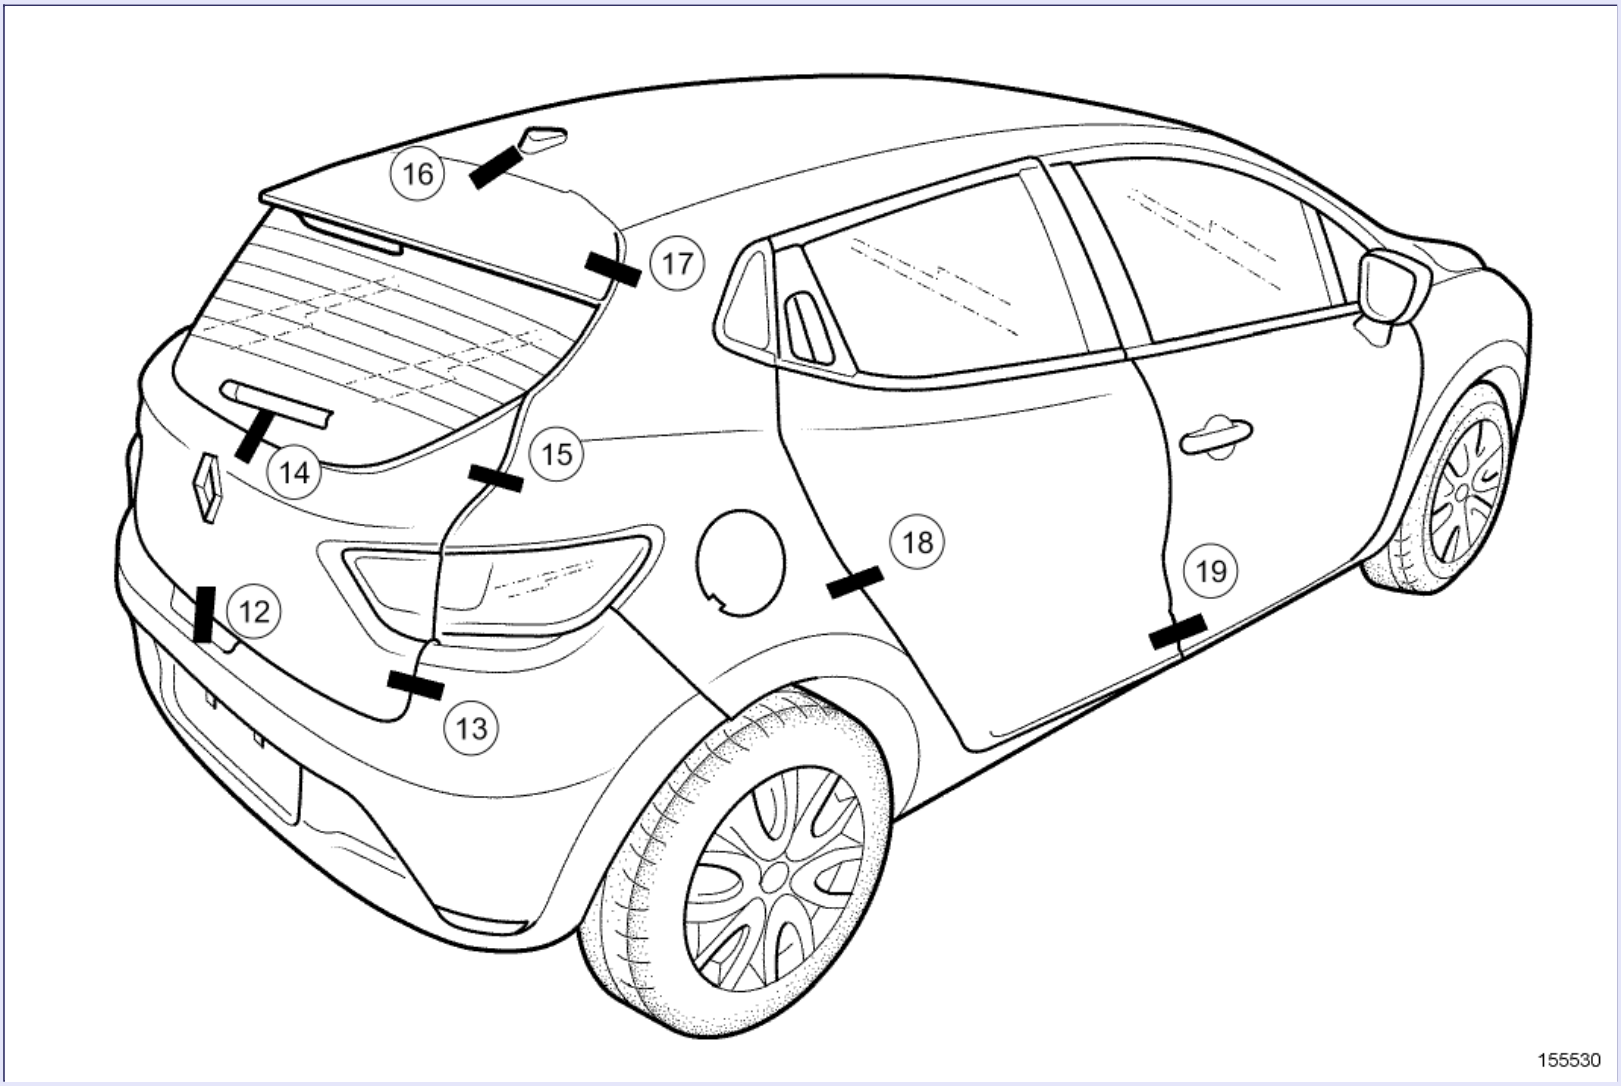
The operation should be carried out with the engine warm and stopped:

- Undo the bleed screw of the LPG expansion valve and allow the liquid residue to flow out for approximately a minute into an appropriate container.



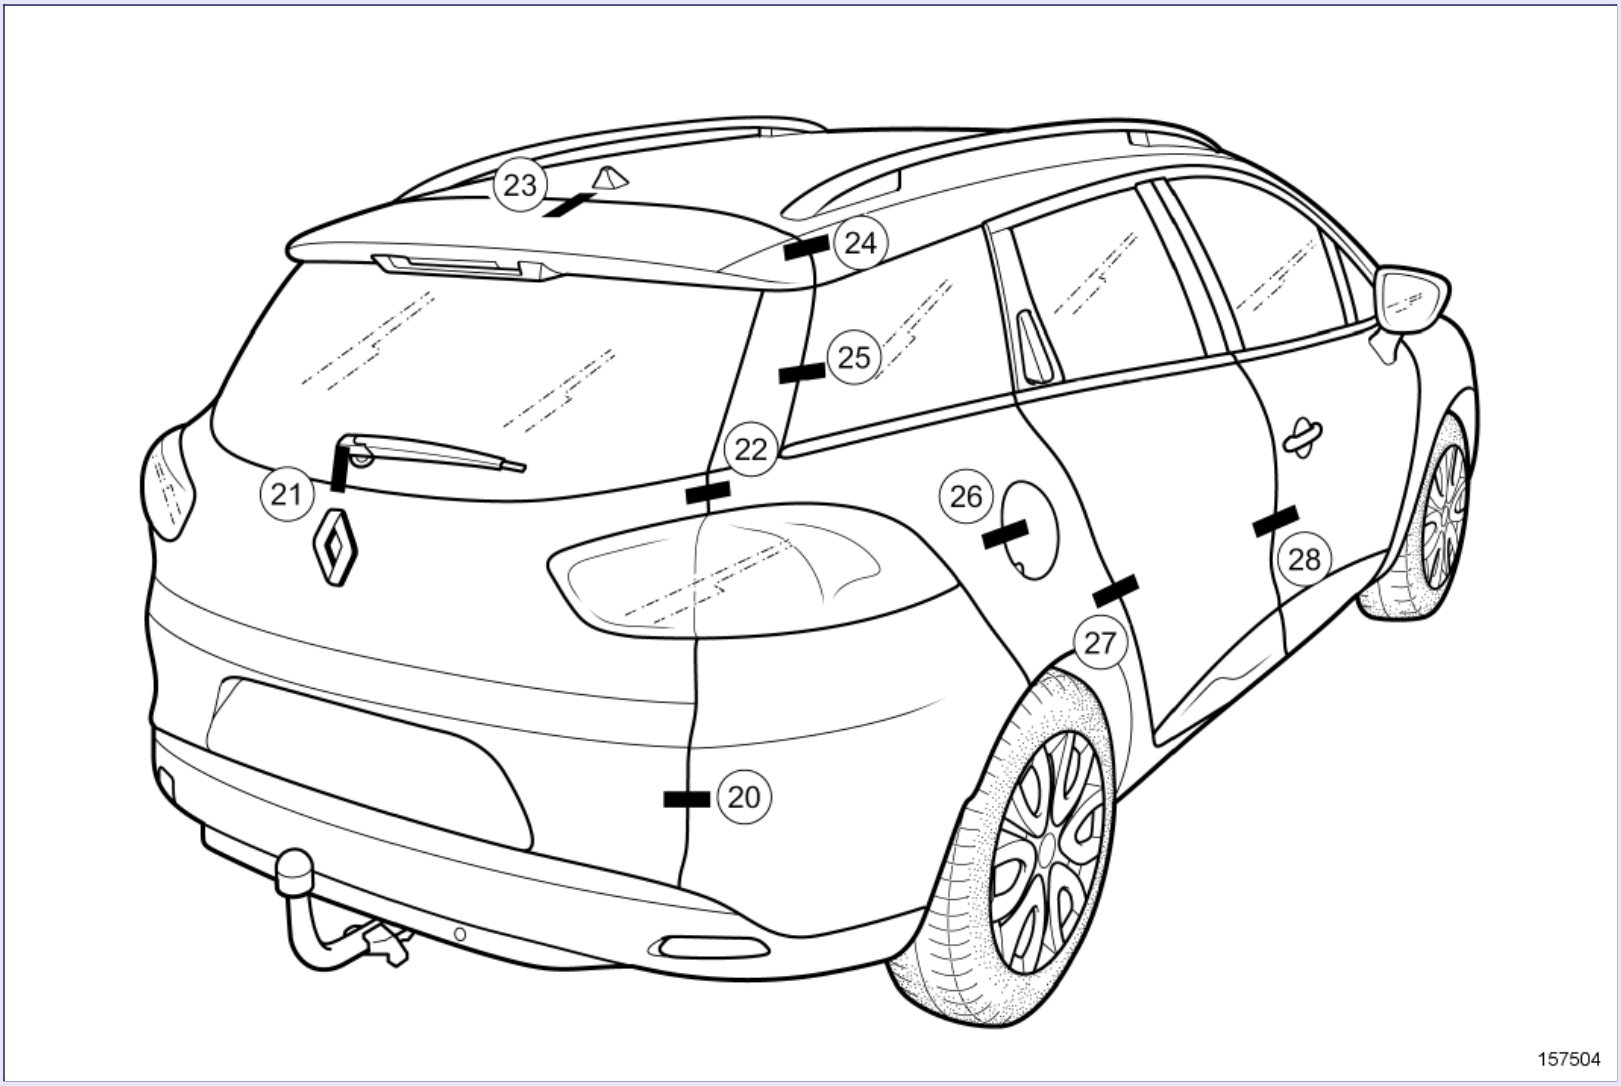
6- SPECIAL NOTES FOR CNG VEHICLES

Only authorised personnel, i.e. those with specific CNG vehicle training, may work on the CNG system of a vehicle.



1)VISUAL INSPECTION OF THE TANK AND ITS SUPPORT:

Check that there is no evidence of corrosion, impact, chips or scratches on the CNG tank. Check that the support is in good condition.



VEHICLE PANEL GAPS: ADJUSTMENT VALUE

No.	Location	Clearances (mm)
(1)	Front bumper - front wing	0 ± 1

(28)	Front door protective strip - rear door protective strip	6 ± 2.8

VEHICLE: PARTS AND CONSUMABLES FOR THE REPAIR

CONSUMABLES FOR MECHANICAL REPAIR:

DEFINITION	PACKAGING	PART NUMBER
MECHANICAL SEALANTS		
SILICOR Sealing paste	85 g tube	77 11 236 470
MASTIXO Joint face seal	100 g tube	77 11 428 232
Bearing sealing kit For crankshaft bearing cap side sealing	Kit	77 11 428 232
Transparent sealing mastic	45 g tube	77 11 223 369
Silicojoint	90 g tube	77 11 236 469
LOCTITE ADHESIVE 597 Sealing paste for PXX gearboxes	Cartridge	77 11 219 705
RESIN ADHESIVEor SEALING RESIN Sealing resin for engine and gearbox covers	25 ml tube	77 11 427 907
Leak detector	400 ml aerosol	77 11 236 176
ADHESIVES		
FRENETANCHE Sealing the threading at low and medium pressure	50 ml bottle	77 11 236 471

HIGH-STRENGTH THREADLOCK For locking bolts	50 ml bottle	77 11 230 112
SEALING RESIN For locking the bearings	50 ml bottle	77 11 236 472
LUBRICANT CLEANERS		
Nételec Avoid bad contacts in electrical circuits	150 ml aerosol	77 11 225 871
Injector cleaner	355 ml container	77 11 224 188 or 77 11 425 574
Cloth for injection system		77 11 211 707
Super releasing agent	500 ml aerosol	77 11 429 184
Super cleaner for joint faces For cleaning joint faces	300 ml aerosol	77 11 238 181
Surface cleaner	5 L container	77 01 404 178
Silicone lubricant	500 ml aerosol	77 11 429 447
Silicone-free lubricant	500 ml aerosol	77 11 236 167
Brake cleaner	150 ml aerosol	77 11 422 413
	600 ml aerosol	77 11 422 414
Bio brake cleaner	750 ml spray bottle	77 11 427 217

Air conditioning cleaner	250 ml aerosol	77 11 424 850
Carburettor cleaner	Aerosol	77 11 236 177
Ixtar engine cleaner	400 ml can	77 11 229 365
GREASE		
BR2+ GREASE For: ■ the lower arm bearings, ■ the anti-roll bar grooves, ■ the driveshaft splines.	1 kgpack	77 01 421 145
OLISTA LONGTIME GREASE Grease for DC4 gearbox	80 g tube	77 11429 041
Silicone grease For: ■ the tubular rear axle bushes, ■ the anti-roll bar bushes.	100 g tube	77 11 419 216
COPPER ANTI-SEIZE GREASE Grease for turbochargers (high temperature)	85 g tube	77 11 236 173
Copper-aluminium lubricant Grease for turbochargers (high temperature)	500 ml aerosol	77 11 429 448
Grease For driveshaft seals	180 g sachets	77 11 429 899
WHITE GREASE For wheel sensors	400 ml aerosol	77 11 236 174

Multipurpose grease	500 ml aerosol	77 11 429 449
	250 ml aerosol	77 11 429 450
Fluostar 2L Silicone-free electric sealing grease	100 g tube	82 00 168 855
LACQUER		
Jelt argent Varnish for repairing heated rear screens	5 g bottle	77 11 230 111
BRAKE		
DOT 4, ISO Class 6, Renault standard: 03-50-006, For vehicles with and without electronic stability program (ESP)	0.5 L container	77 11 218 589

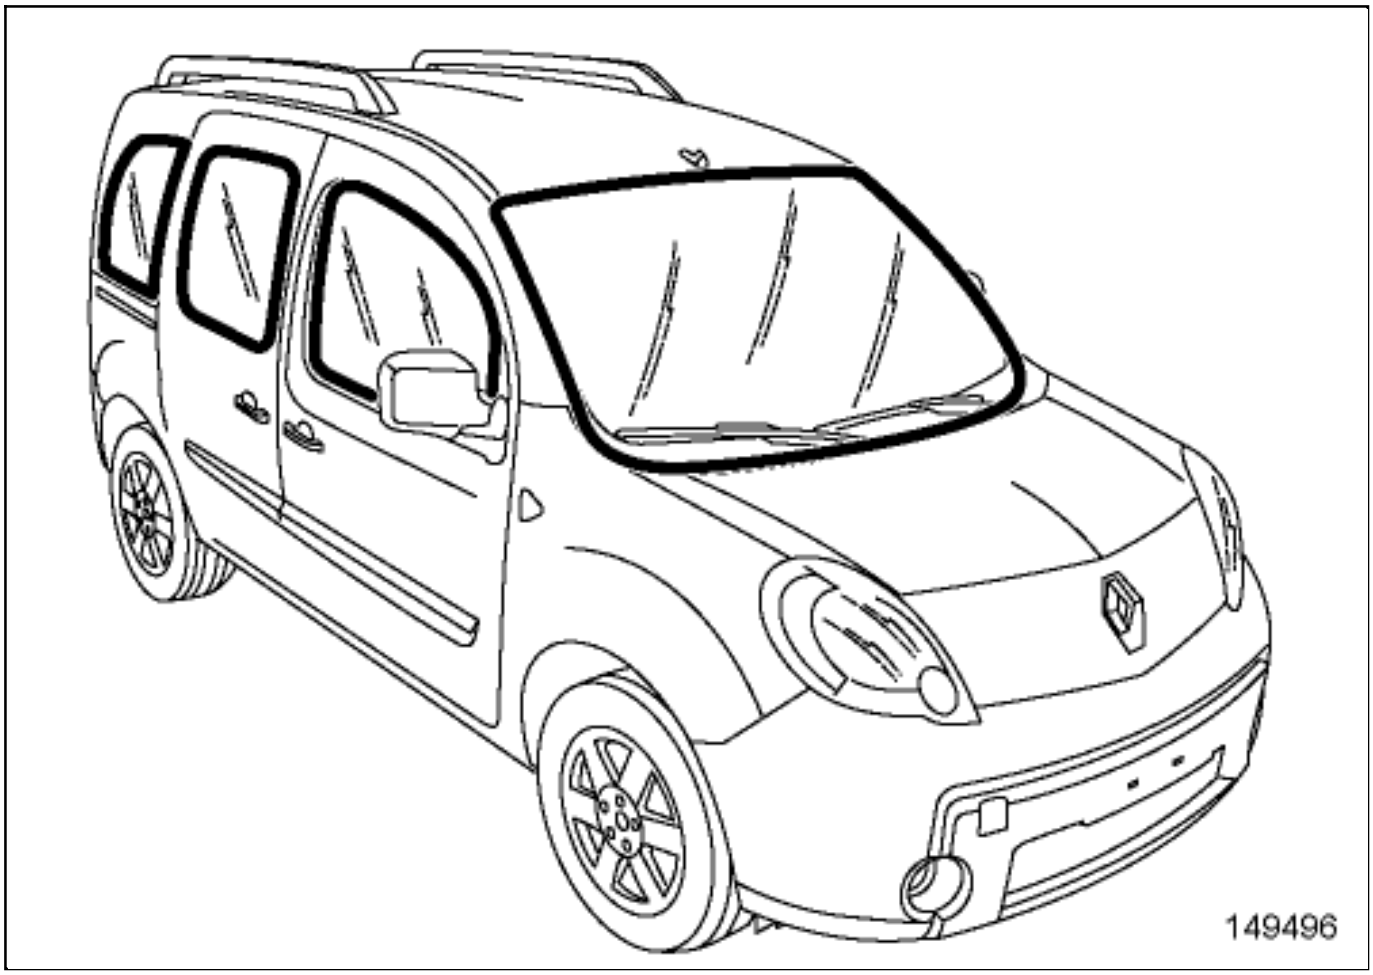
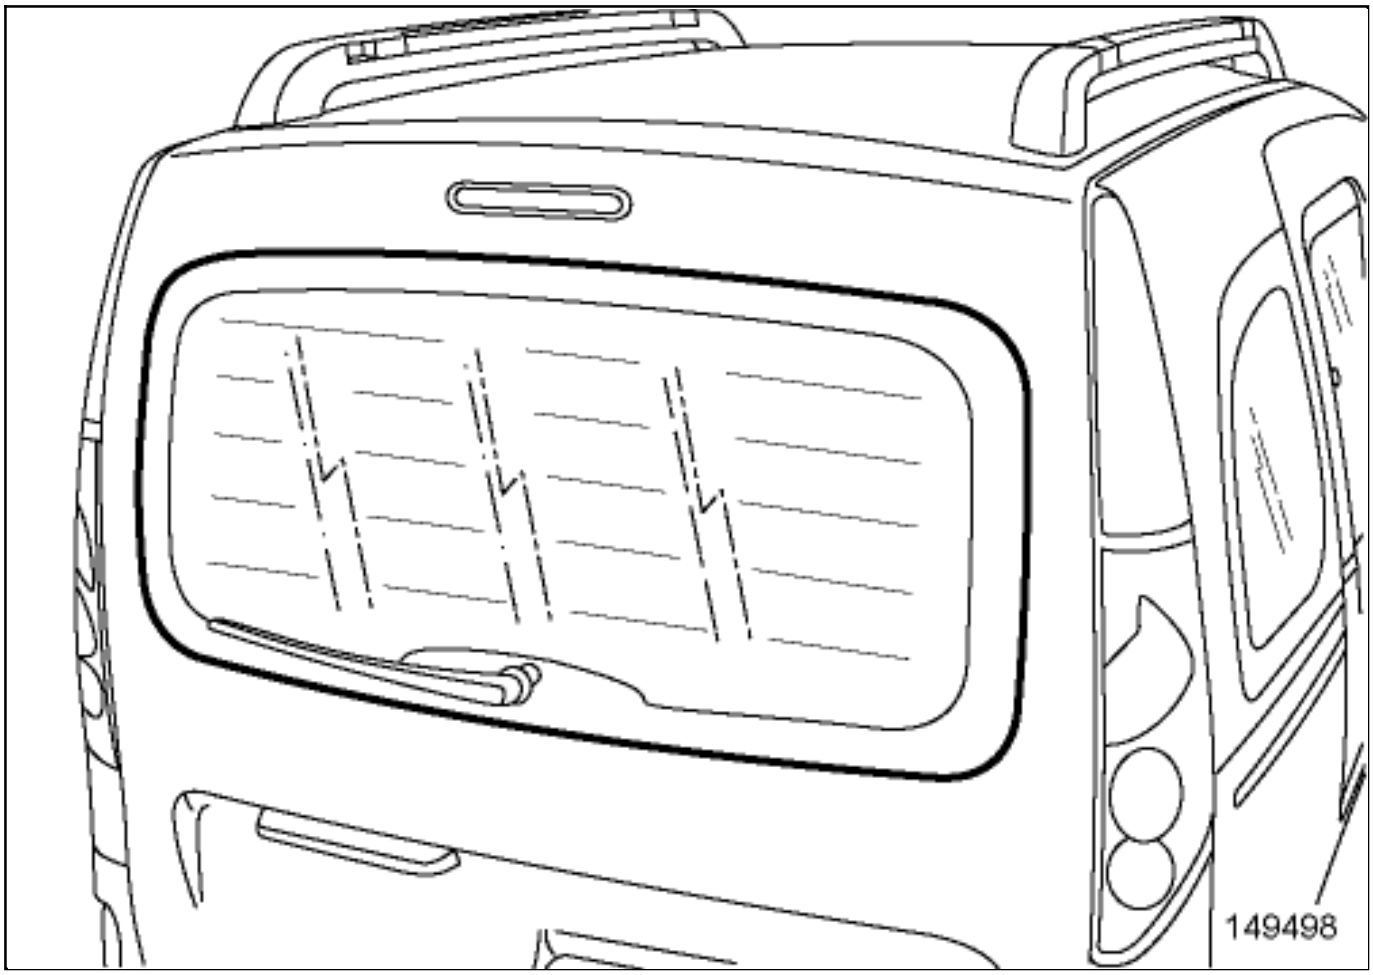
VEHICLE: SEALING CHECK

Note:

In order to make the sealing check easier, the vehicle has been divided into several zones.



These zones are split specifically to allow for a focused search.

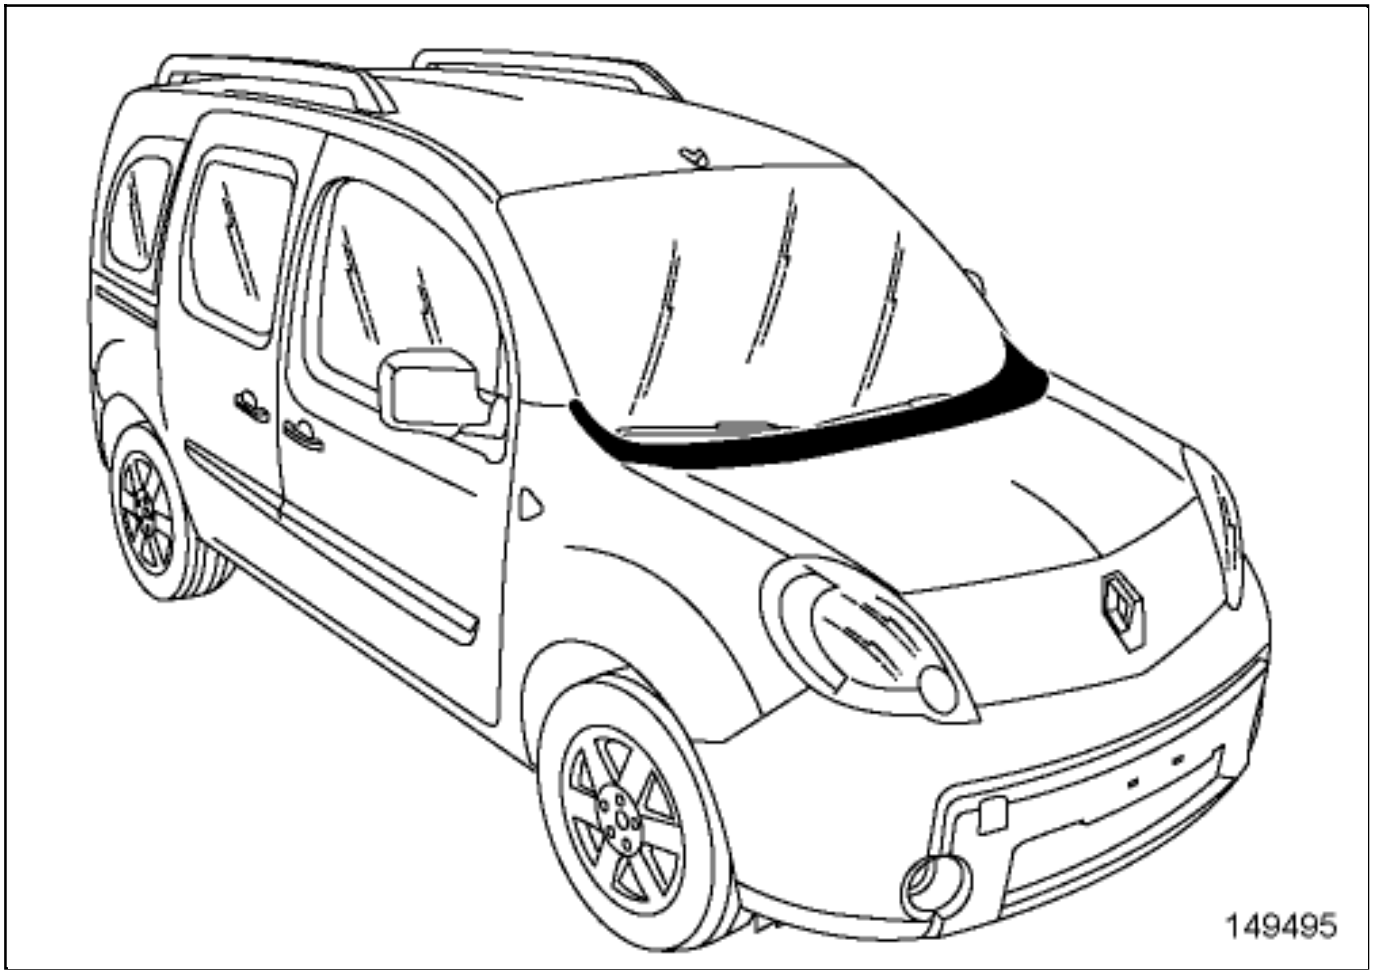


Note:

You will find below the links to access the methods for checking the sealing of the zones concerned.

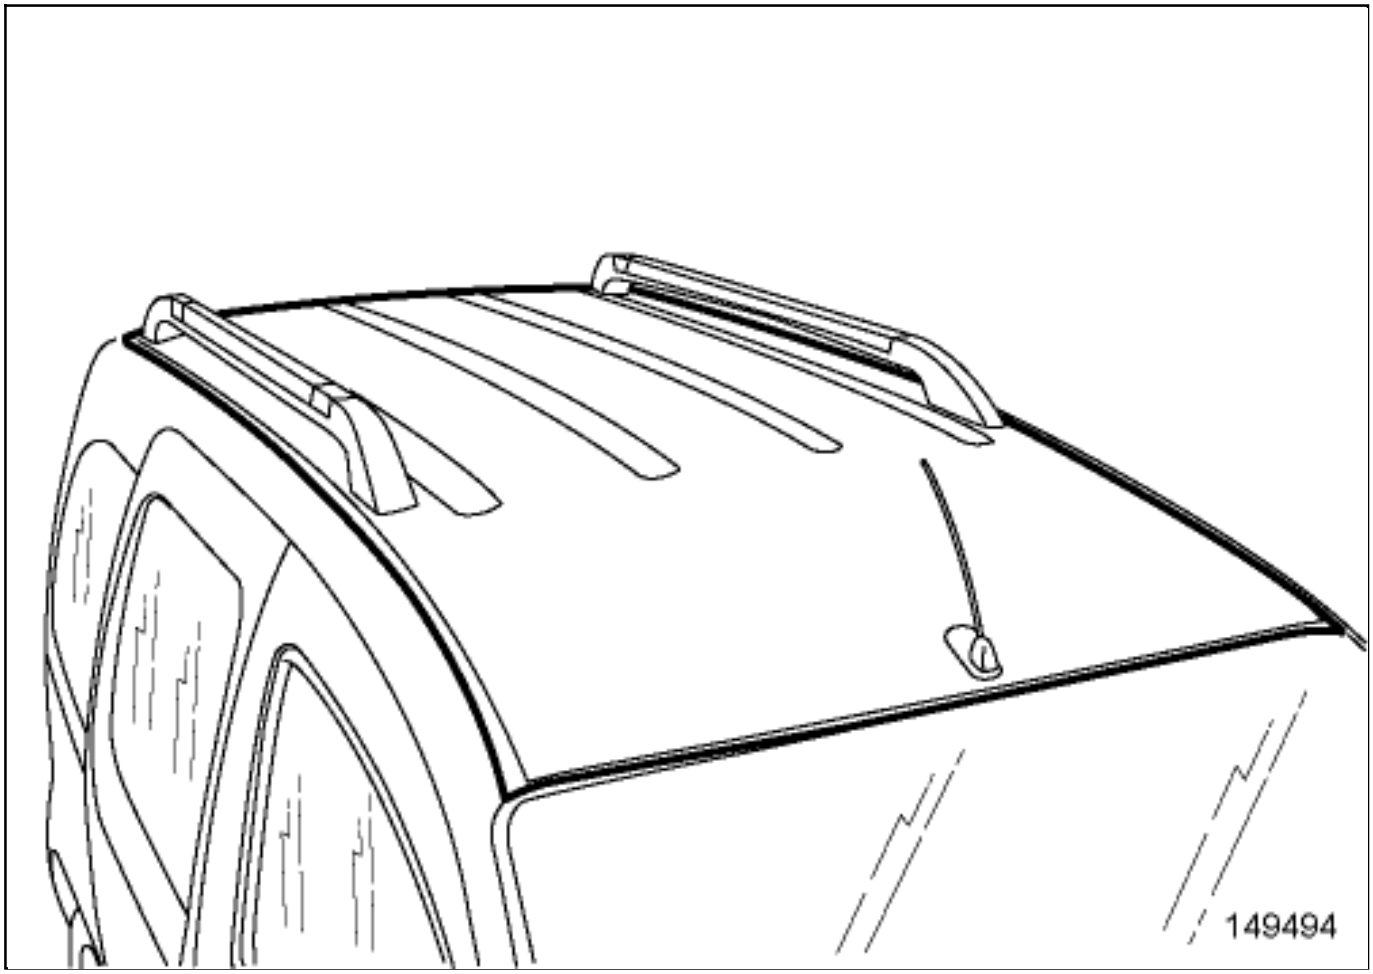
1. DISTRIBUTION OF ZONES

ZONE 1



Zone 1:

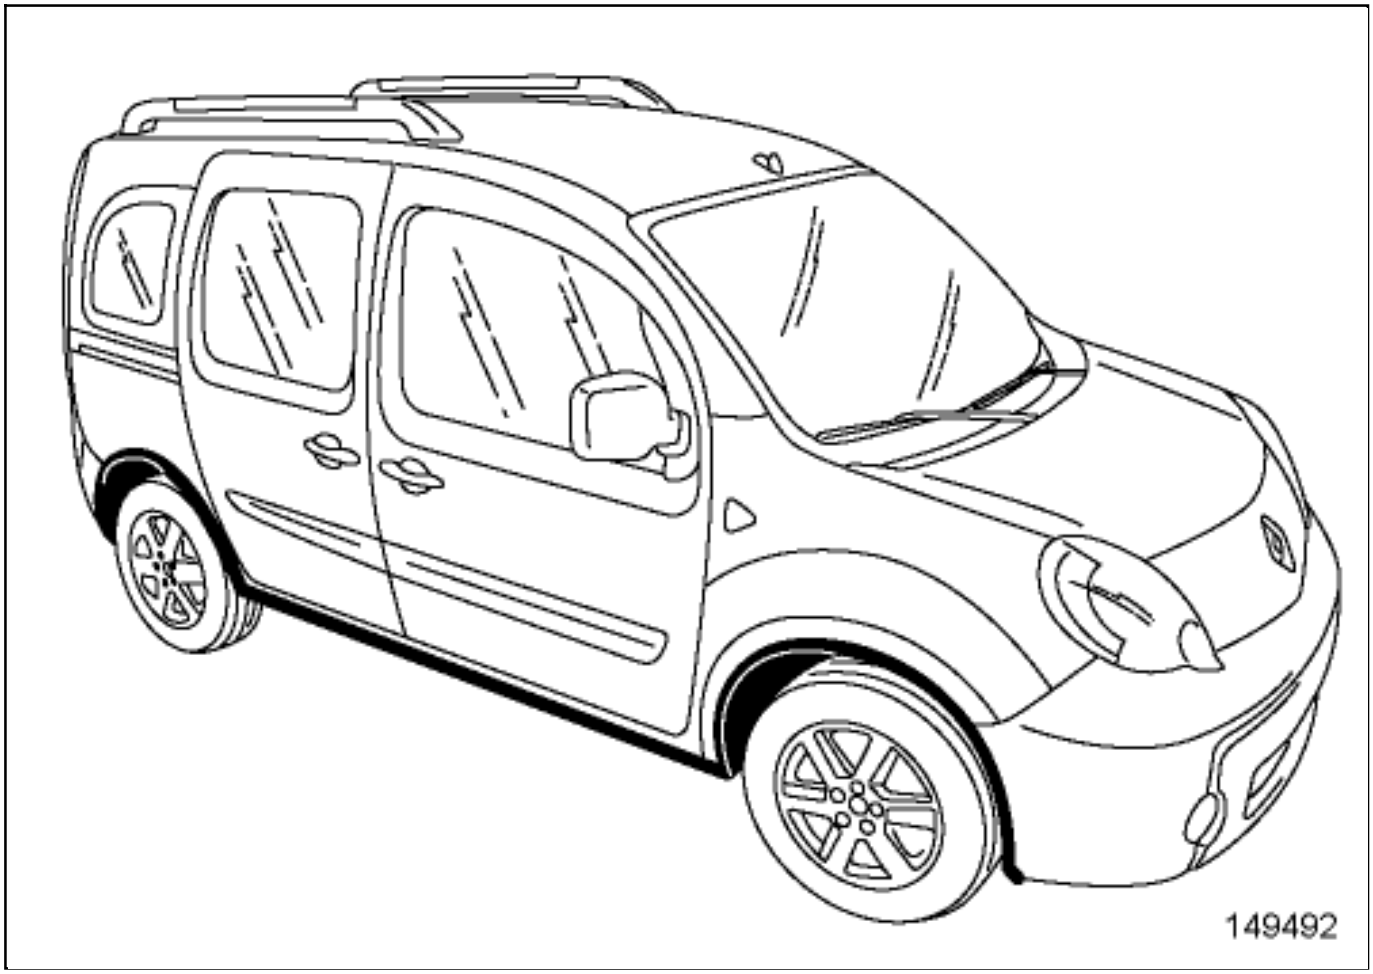
Windows(see 60A, General information, Windows: Sealing check)



ZONE 2

Zone 2:

Front section of the vehicle: Checking the sealing (see 60A, General information, Front section of the vehicle: Sealing check) .

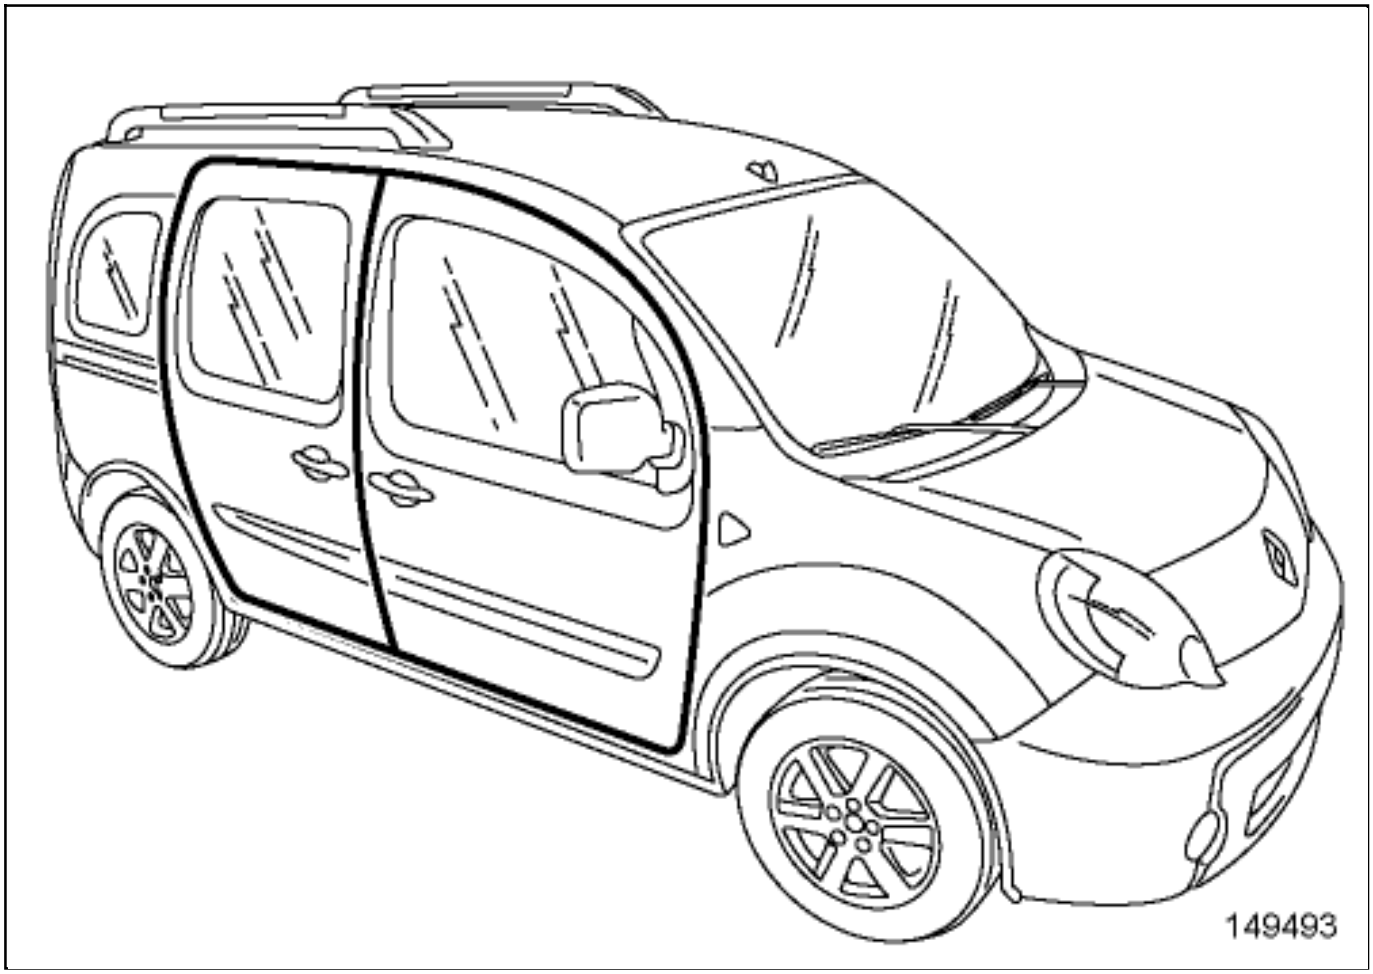


ZONE 3

Zone 3:

- Roof(see 60A, General information, Roof: Sealing check) and retractable roof(see 60A, General information, Retractable roof: Sealing check) .

ZONE 4

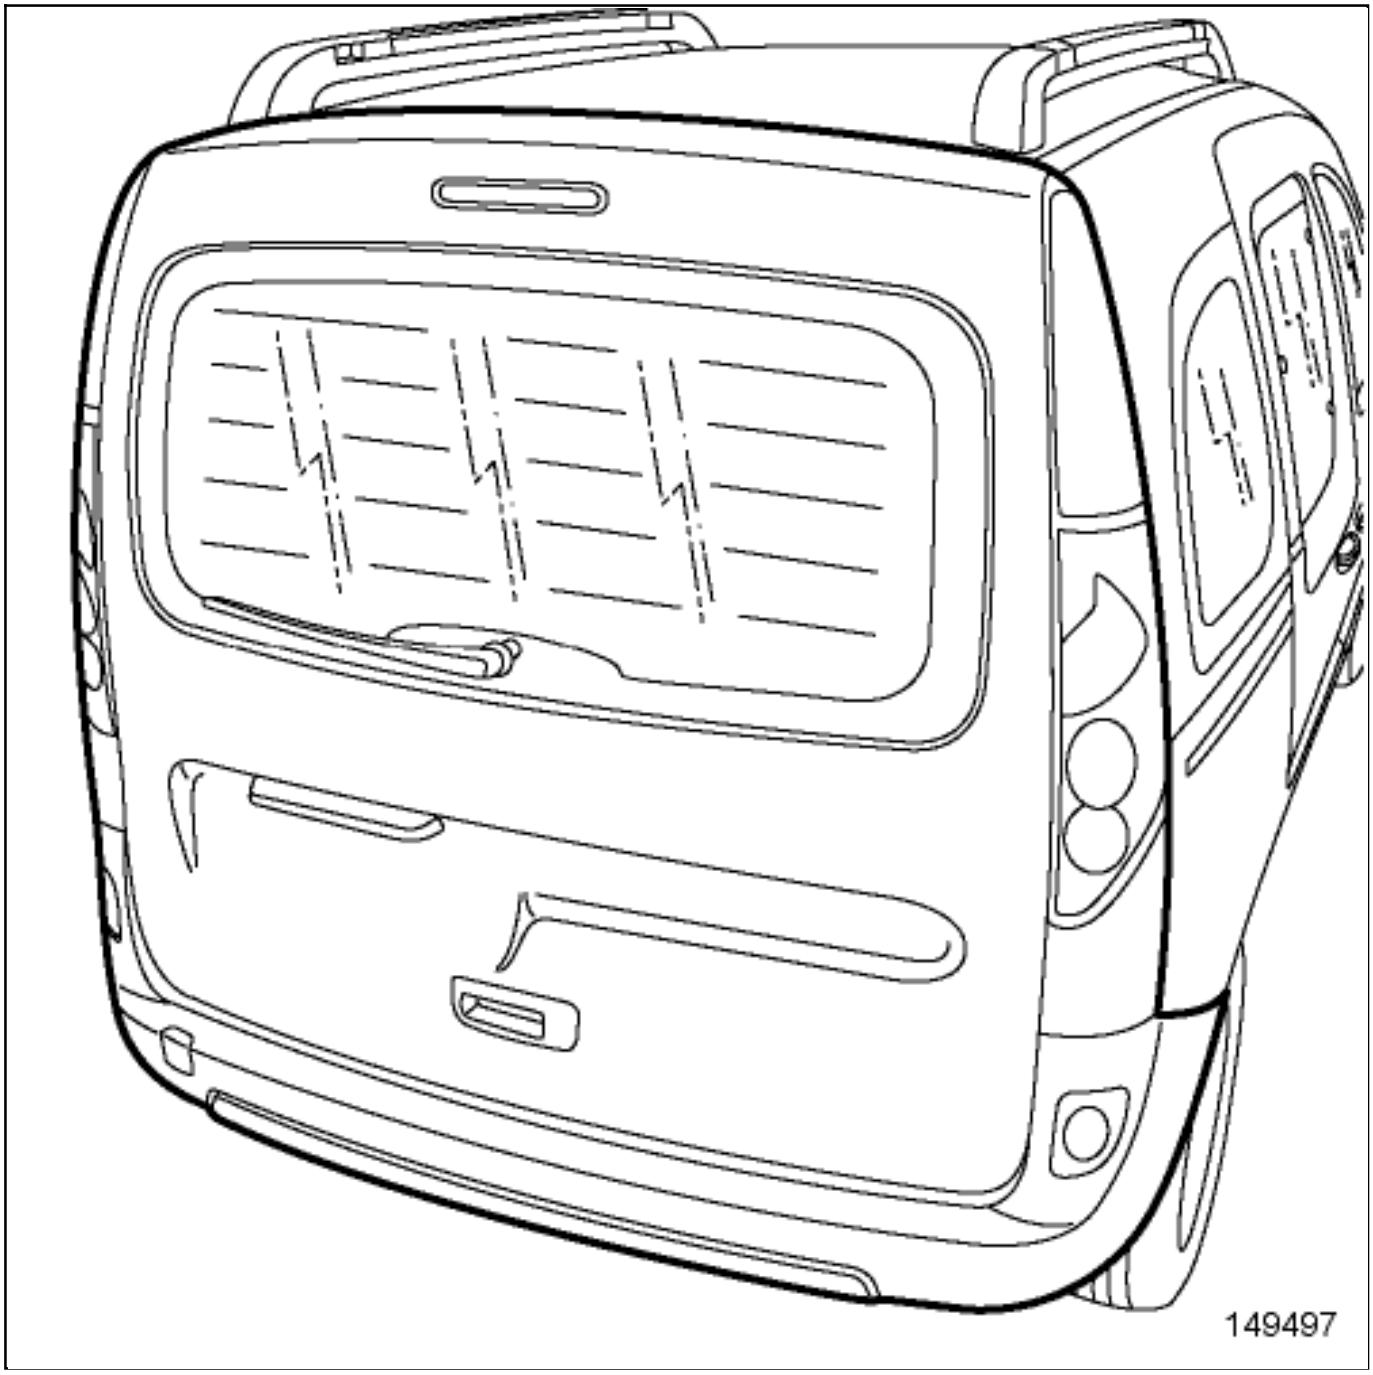


Zone 4:

■

Underside of the vehicle: Checking the sealing(see 60A, General information, Underside of the vehicle: Sealing check) .

ZONE 5



Zone 5:

■

Side opening elements: Checking the sealing(see 60A, General information, Side opening elements: Sealing check) .

ZONE 6

Zone 6:

■

Rear section of the vehicle: Checking the sealing(see 60A, General information, Rear section of the vehicle: Sealing check) .

Note:

When checking the sealing of a zone, if the customer complaint was not reproduced, extend the sealing check to neighbouring zones.

As the flow of water can sometimes be complex, water may enter through a zone opposite to where the water is actually present.

VEHICLESEALING:GENERALINFORMATION

1. DEFINITION

1- SEALING RING

Rendering a component watertight means stopping or diverting the flow of fluid.

For vehicles, this means protecting a passenger compartment against any ingress of water.

- The design and production of the vehicle bodywork, generally speaking, depend on:
  - the shape of the bodywork (design, aerodynamics, etc.),
  - safety,
  - the variety and number of parts it comprises (means of manufacture and assembly),
  - the anti-corrosion protection of the structure,
  - the raw materials and products it comprises (plastic, rubber, mastic, adhesives, etc.).

- A certain number of faults may appear in After-Sales, even though they do not necessarily appear when the vehicle exits the production line, despite all the means made use of in the assembly plant:
  - various checks during assembly,
  - systematic passage of all vehicles through a multi-jet wash.

During the "first few days of a vehicle's life", the bodywork is subjected to various stresses.

These stresses may be determining factors for possible sealing faults.

In a vehicle, certain zones are designed to allow water to flow out.

The water outlet zones are therefore located at the lower section of the components (opening element box sections, sill panel, central or side section of the scuttle panels, front and rear sections of the sunroofs, etc.).

2- CHECKING THE SEALING

Vehicle spraying methodology.

3- REPAIRING THE SEALING

Procedure for resolving water ingress.

2. PREPARATION BEFORE CHECKING AND REPAIRING THE SEALING

Before any operation involving checking the sealing, check that all of the opening elements are correctly closed (sliding and tilting windows, sunroof mobile panel, etc.).

All the checks must be performed in the washing area of the workshop equipped with sealing tools. In the event of a customer fault, the check must reproduce the conditions described by the customer (as much as possible).

Note:

Ask the customer questions before any operation; information collected about the environment and position of the vehicle are important to locate the leak.

Example:

- vehicle parked forwards or backwards on a significant slope or parked partially on a pavement,
- very heavy rain, accompanied by a gust of wind,
- washing with a high pressure cleaning device without respecting the manufacturer's recommendations described in the driver's handbook,
- automatic car washes may clog the outlet holes,
- jet washing by an untrained operator directing a flow of water at the air inlets and outlets, etc.,
- vehicle parked under vegetation (accumulation of dead leaves in the scuttle panel, etc.),
- identify the nature of the liquid present in the vehicle (rainwater, washer fluid or coolant, etc.),

Does using the air conditioning cause the presence of water?

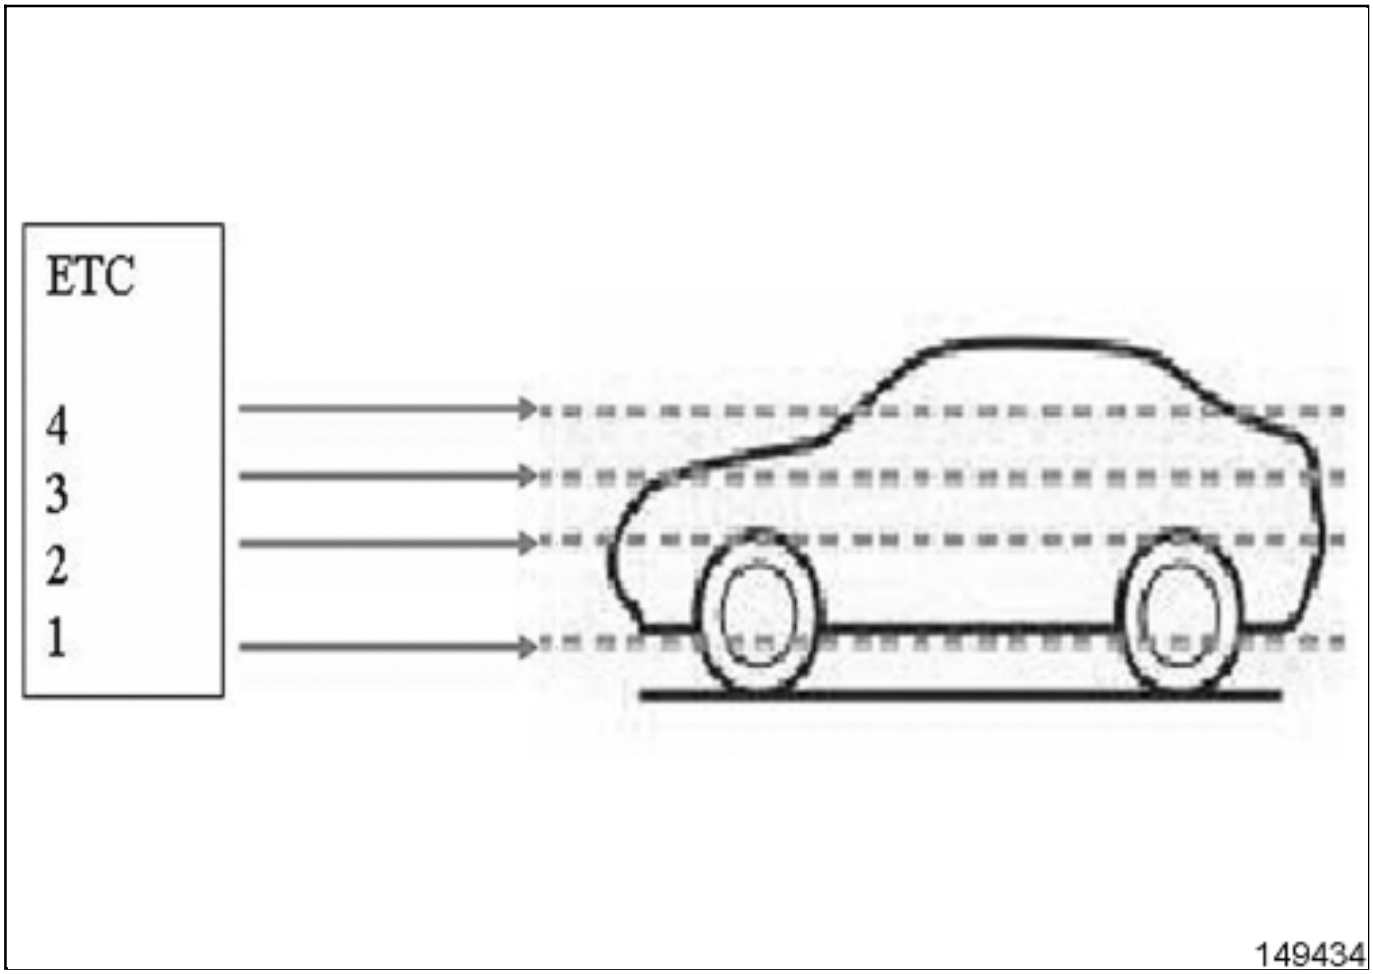
1- VISUAL INSPECTION

Before beginning to spray the vehicle, perform a "First visual inspection" to look for any dry signs of infiltration.

Inspecting the vehicle enables visible points of infiltration to be identified (seals which are not flush or damaged, incorrect positioning of a grommet, blanking cover, mastic bead, etc.).

2- PREPARATION OF THE TOOLS

(see 60A, General information, Sealing tools: Description) .



3. CHECKING THE SEALING

1- SPRAYING THE VEHICLE

"Spraying" the vehicle is an important point in the method and detection of water ingress.

Start spraying the vehicle at the lowest zones. If water is not found to be present in the vehicle, eliminate the sprayed zone as a zone of water ingress and spray increasingly higher.

1)SPRAYING LEVEL

2)SPRAYING ZONE

In order to make it easier to check the sealing, the vehicle is split into several zones(see 60A, General

information, Vehicle: Sealing check) .

2- LOOKING FOR WATER INGRESS

It may sometimes be necessary to request the help of a second operator:

- one person directs the jet in the area to be checked.
- the other operator, inside the passenger compartment, observes and locates the origin of the infiltration (obtain a door mirror glass and a pocket torch for areas which cannot be seen directly or are not well lit).

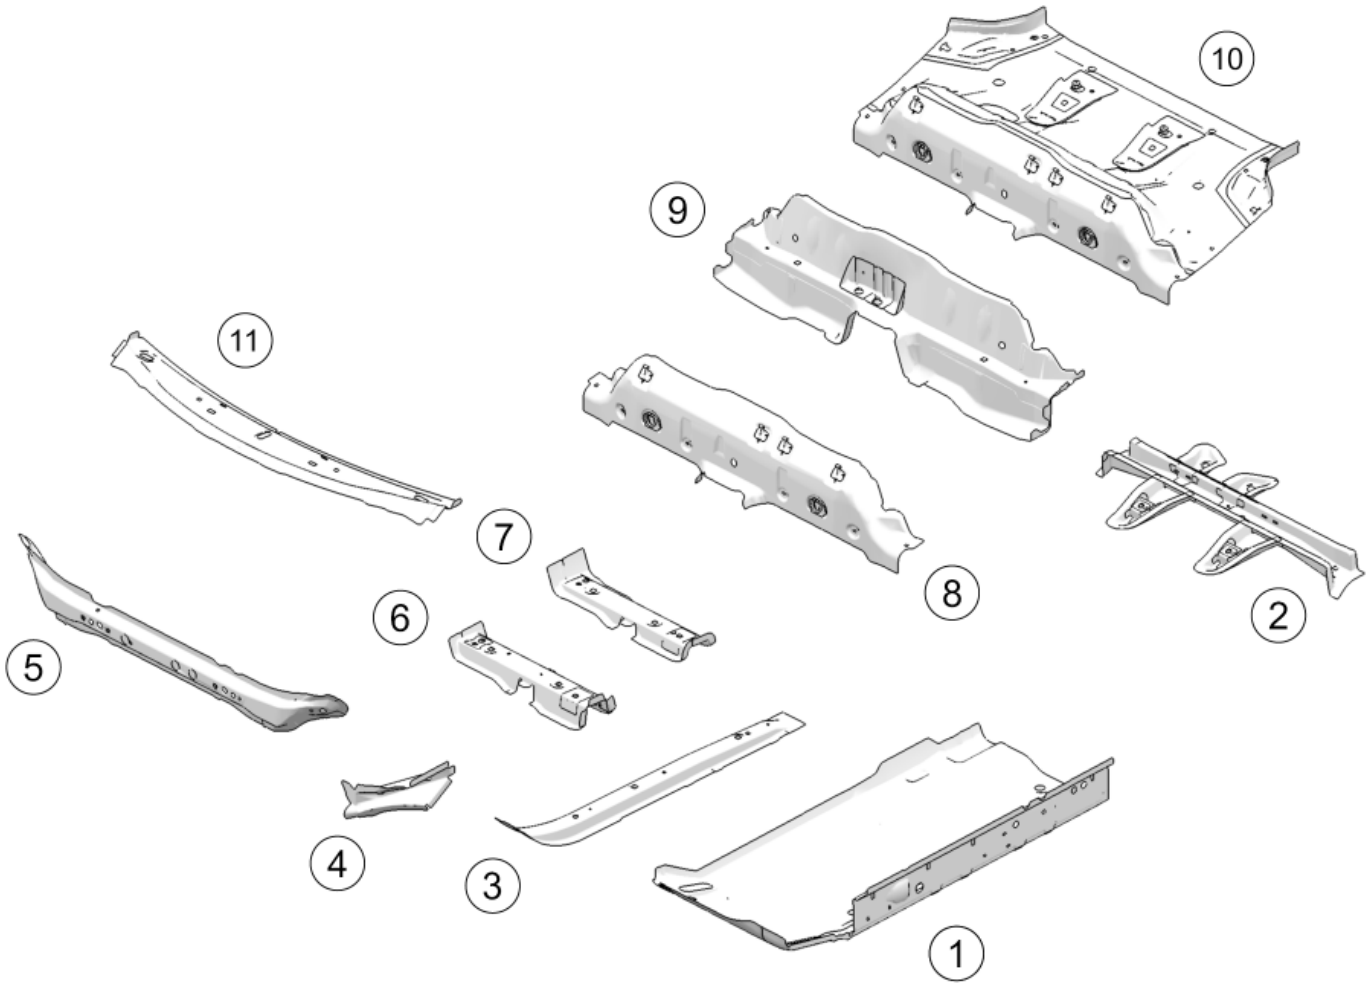
4. REPAIRING THE SEALING

1- POSSIBLE CAUSES OF WATER INGRESS

The infiltrations are generally due to:

- a mastic seal next to the assembly line or partially detached or cracked,
- (micro) holes made by air bubbles when applying mastic,
- incorrect window bonding,
- incorrect mating between two parts (welded, removable, bonded, etc.),
- incorrect positioning of the various grommets or blanking covers,
- incorrect positioning of or damage to the various rubber profiles (door seals, luggage compartment, glass run channels, etc.),
- a dirty seal,
- partially obstructed or crushed drain pipes,
- a door sealing film which is deformed, poorly positioned, torn, etc.,

poorly performed repair operations.

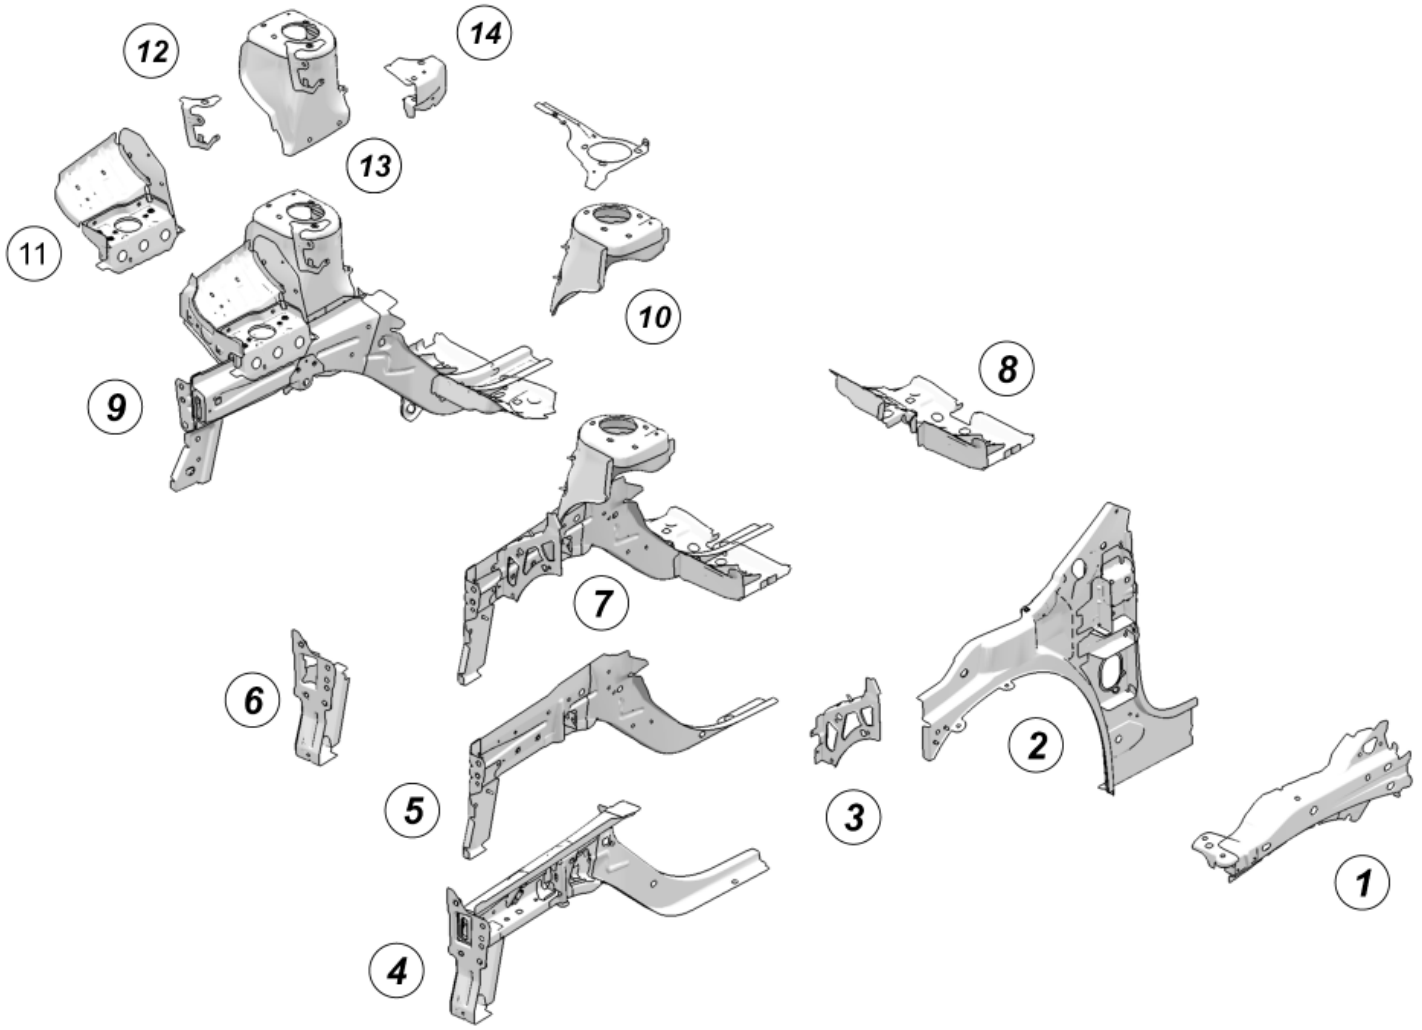


2- REPAIRING THE SEALING

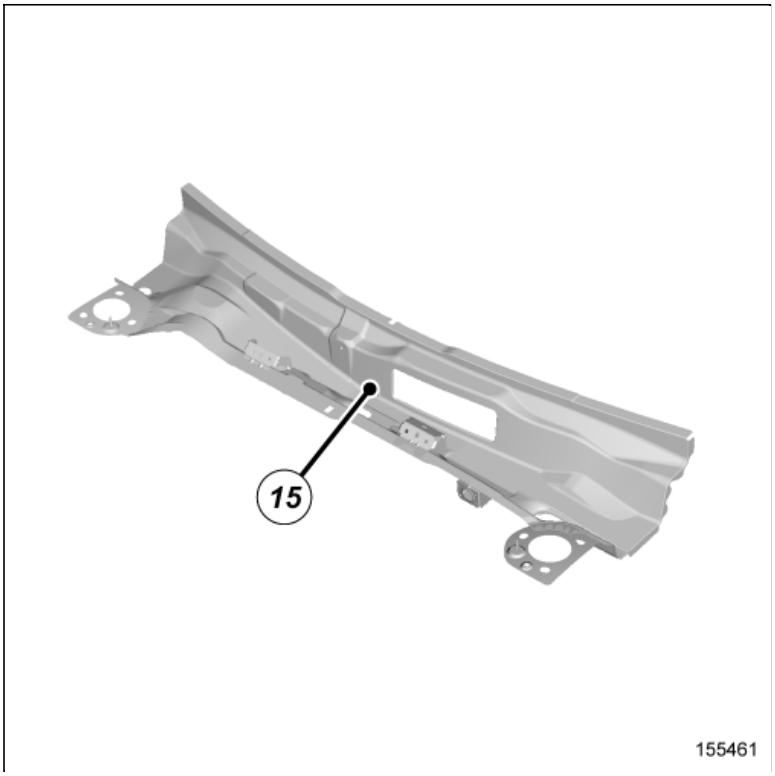
Sealing repair consists of:

- individually testing the possible causes of the water ingress detected.
- stopping the identified cause.
- checking the repair.
- continue the checking cycle to ensure that there is no other ingress of water.
- confirm the repair through a checking cycle of the zone.

VEHICLE STRUCTURE, CENTRE SECTION: DESCRIPTION



1. CENTRAL STRUCTURE



No.	Description	Classification	Type	Thickness (mm)
(1)	Centre floor, side section	Centre floor, side section: Replacement	HLE	0.65/1.2
(2)	Rear floor centre cross member		HLE	1.2
(3)	Front side member, centre section		Very high yield strength	2
(4)	Bulkhead side reinforcement		Very high yield strength	1.5
(5)	Bulkhead lower cross member		Very high yield strength	2

VEHICLE

Note, one or more warnings are present in this procedure

Equipment required
safety strap(s)

1. TOWING

CAUTION

See the current towing regulations in each country.

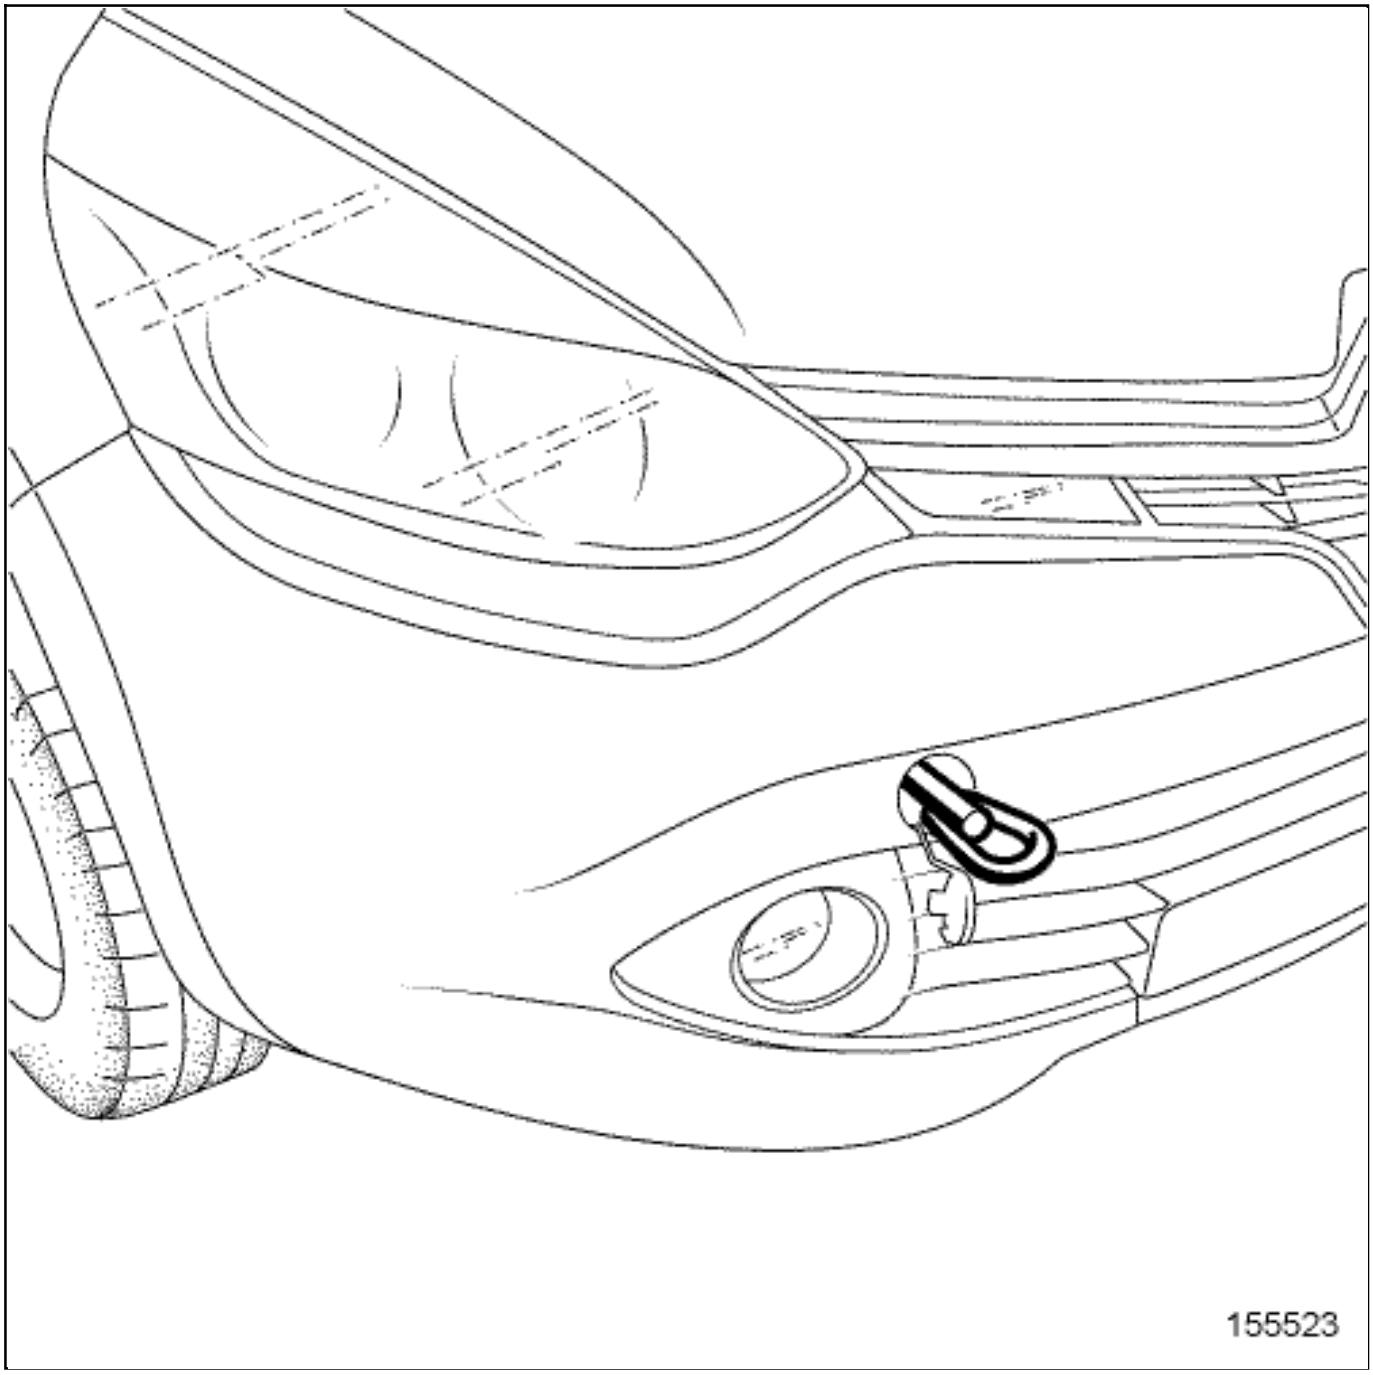
Never use the drive shafts as attachment points.

The towing points may only be used for towing on the road.

Never use the towing points for removing the vehicle from a ditch or to lift the vehicle, either directly or indirectly.

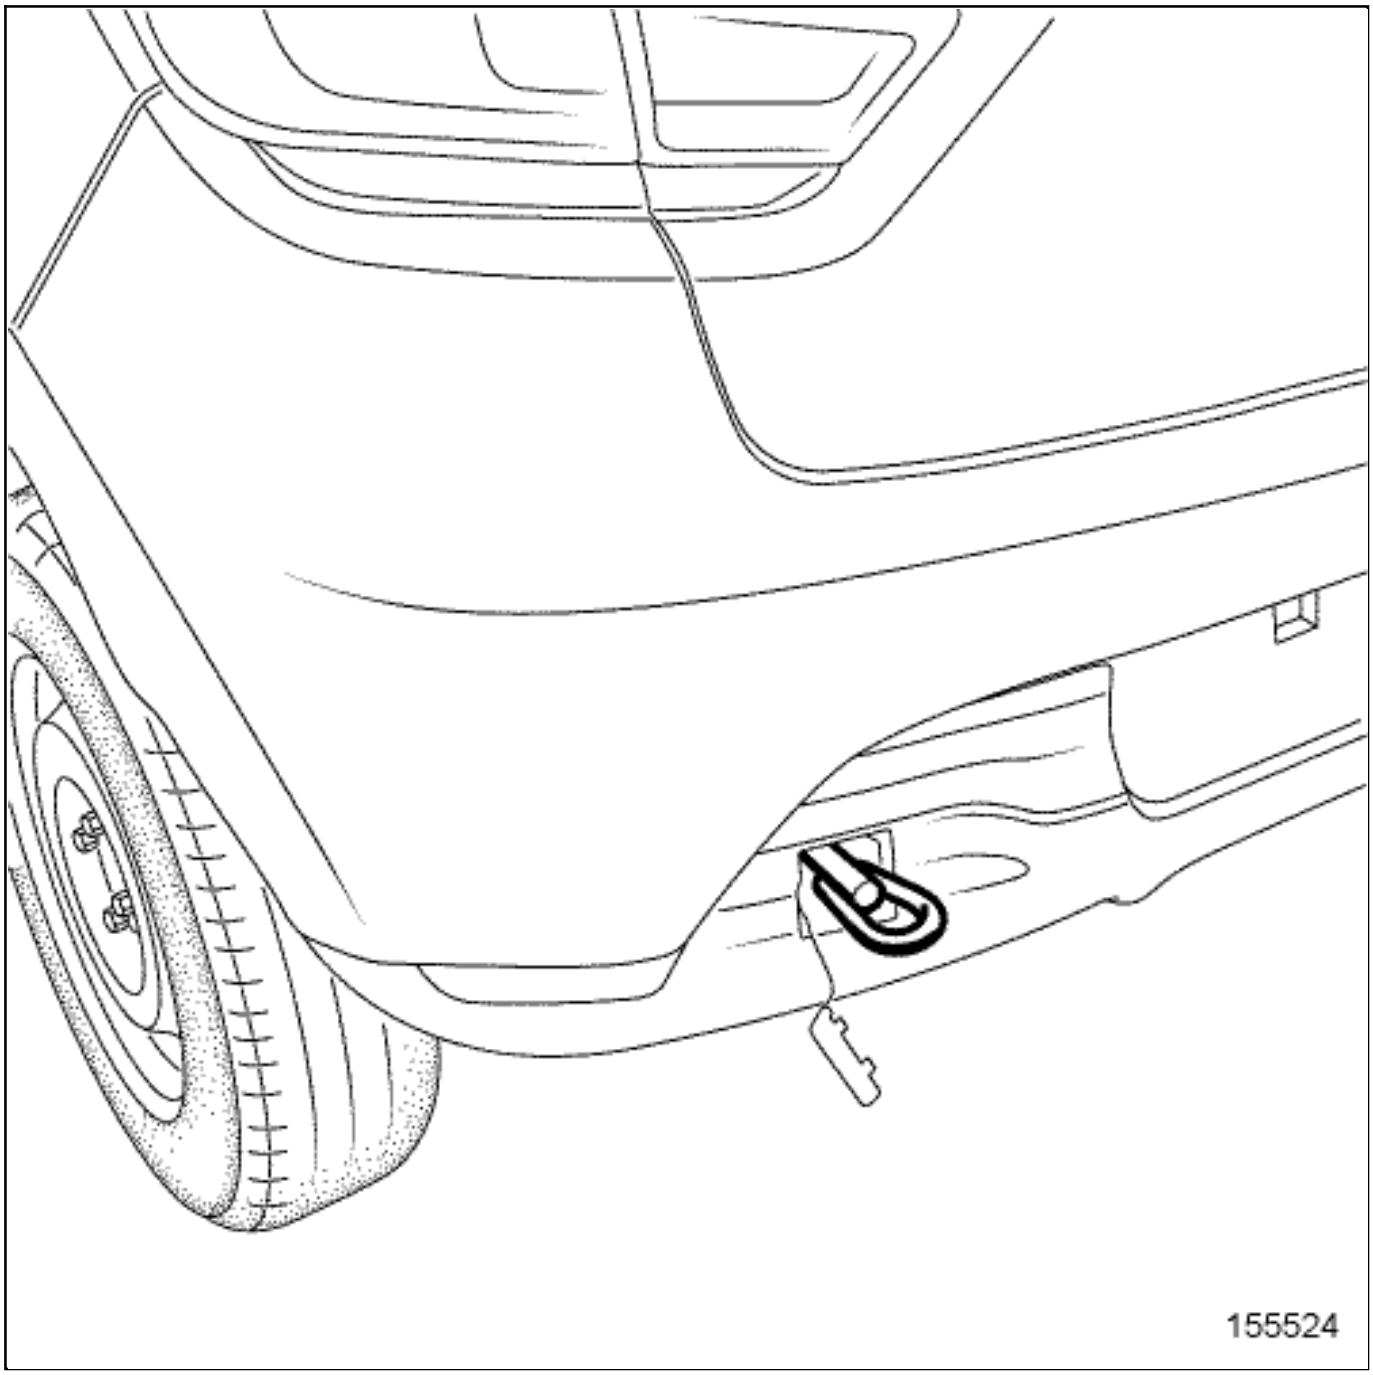
Screw in and lock the towing ring before towing.

- Vehicles fitted with automatic transmission:



The vehicle should preferably be transported on a platform or towed by lifting the front wheels. As an exception, the vehicle may be towed with the wheels on the ground but at a speed below 12 mph (20km/h) and over a maximum distance of 18 miles (30 km)(with the gear lever in neutral).

- Vehicles fitted with Renault Card:



If the vehicle battery is flat, the steering column remains locked. In this case, fit a new battery or connect to an electrical source to lock the airbag computer using the diagnostic tool, (see Fault finding - Replacement of components) (88C, Airbags and pretensioners), which unlocks the steering column.

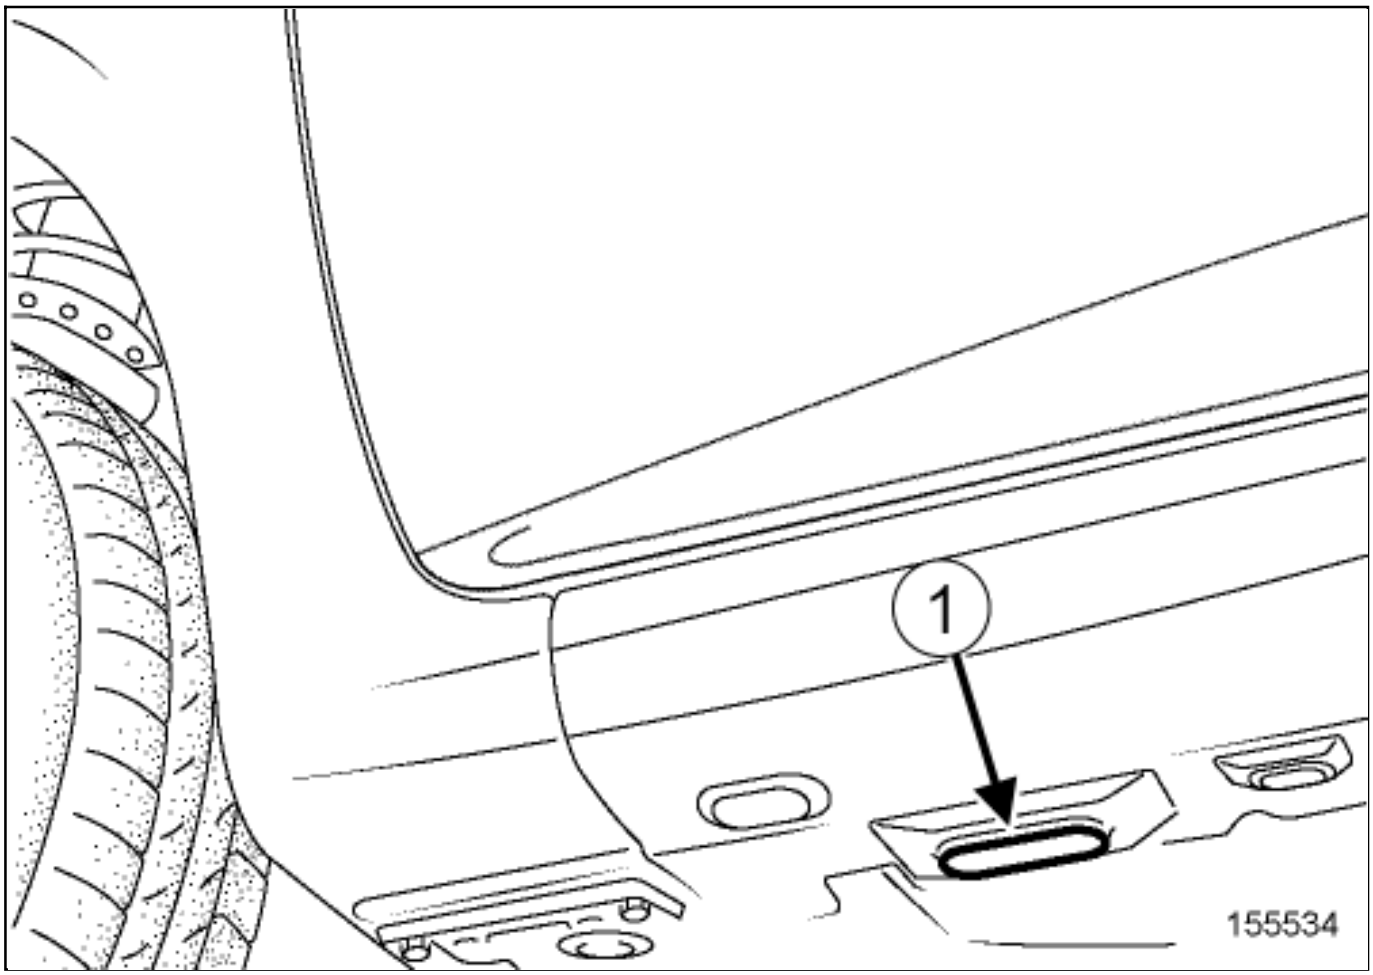
If it is not possible to lock the airbag computer, the front of the vehicle must be lifted.

1- POSITION OF FRONT ATTACHMENT POINT

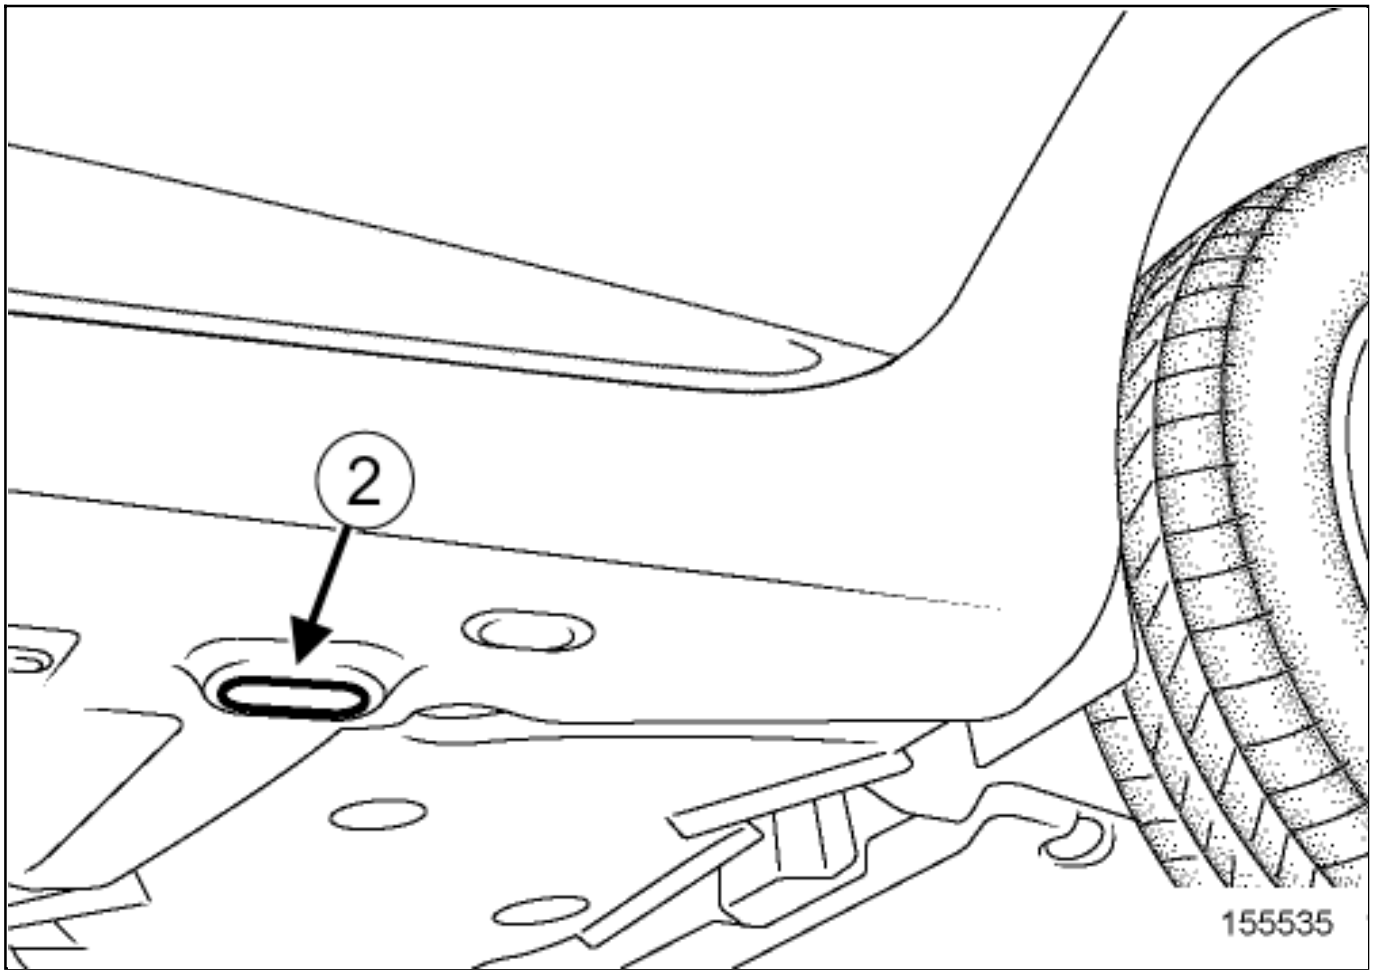
2- POSITION OF REAR ATTACHMENT POINT

Fully screw in the tow eye supplied in the onboard vehicle tool kit located in the boot inside the emergency spare wheel.

2. LIFTING BY TROLLEY JACK



WARNING

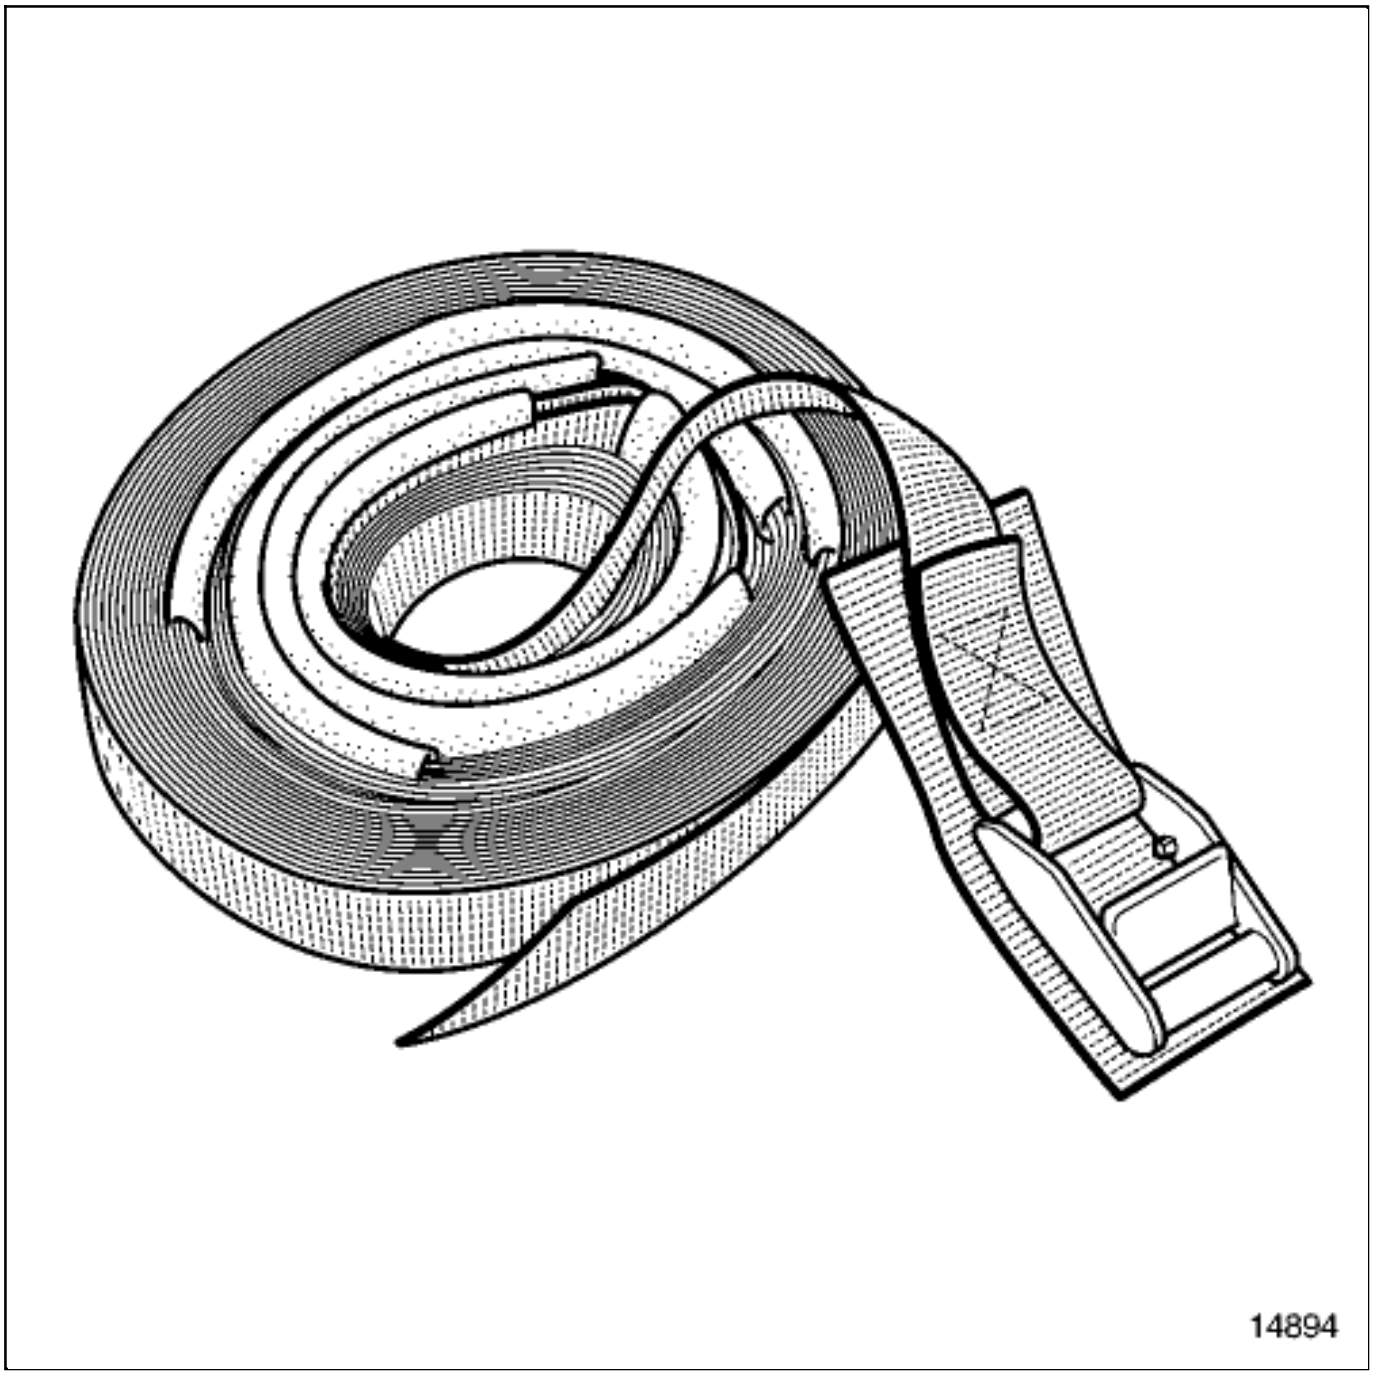


To prevent any accidents, the trolley jack must only be used to lift and/or move the vehicle. The vehicle height must be maintained with axle stands which are strong enough to support the weight of the vehicle.

CAUTION

To avoid any damage to the original protection, use equipment fitted with rubber pads to prevent the equipment coming into direct contact with the vehicle.

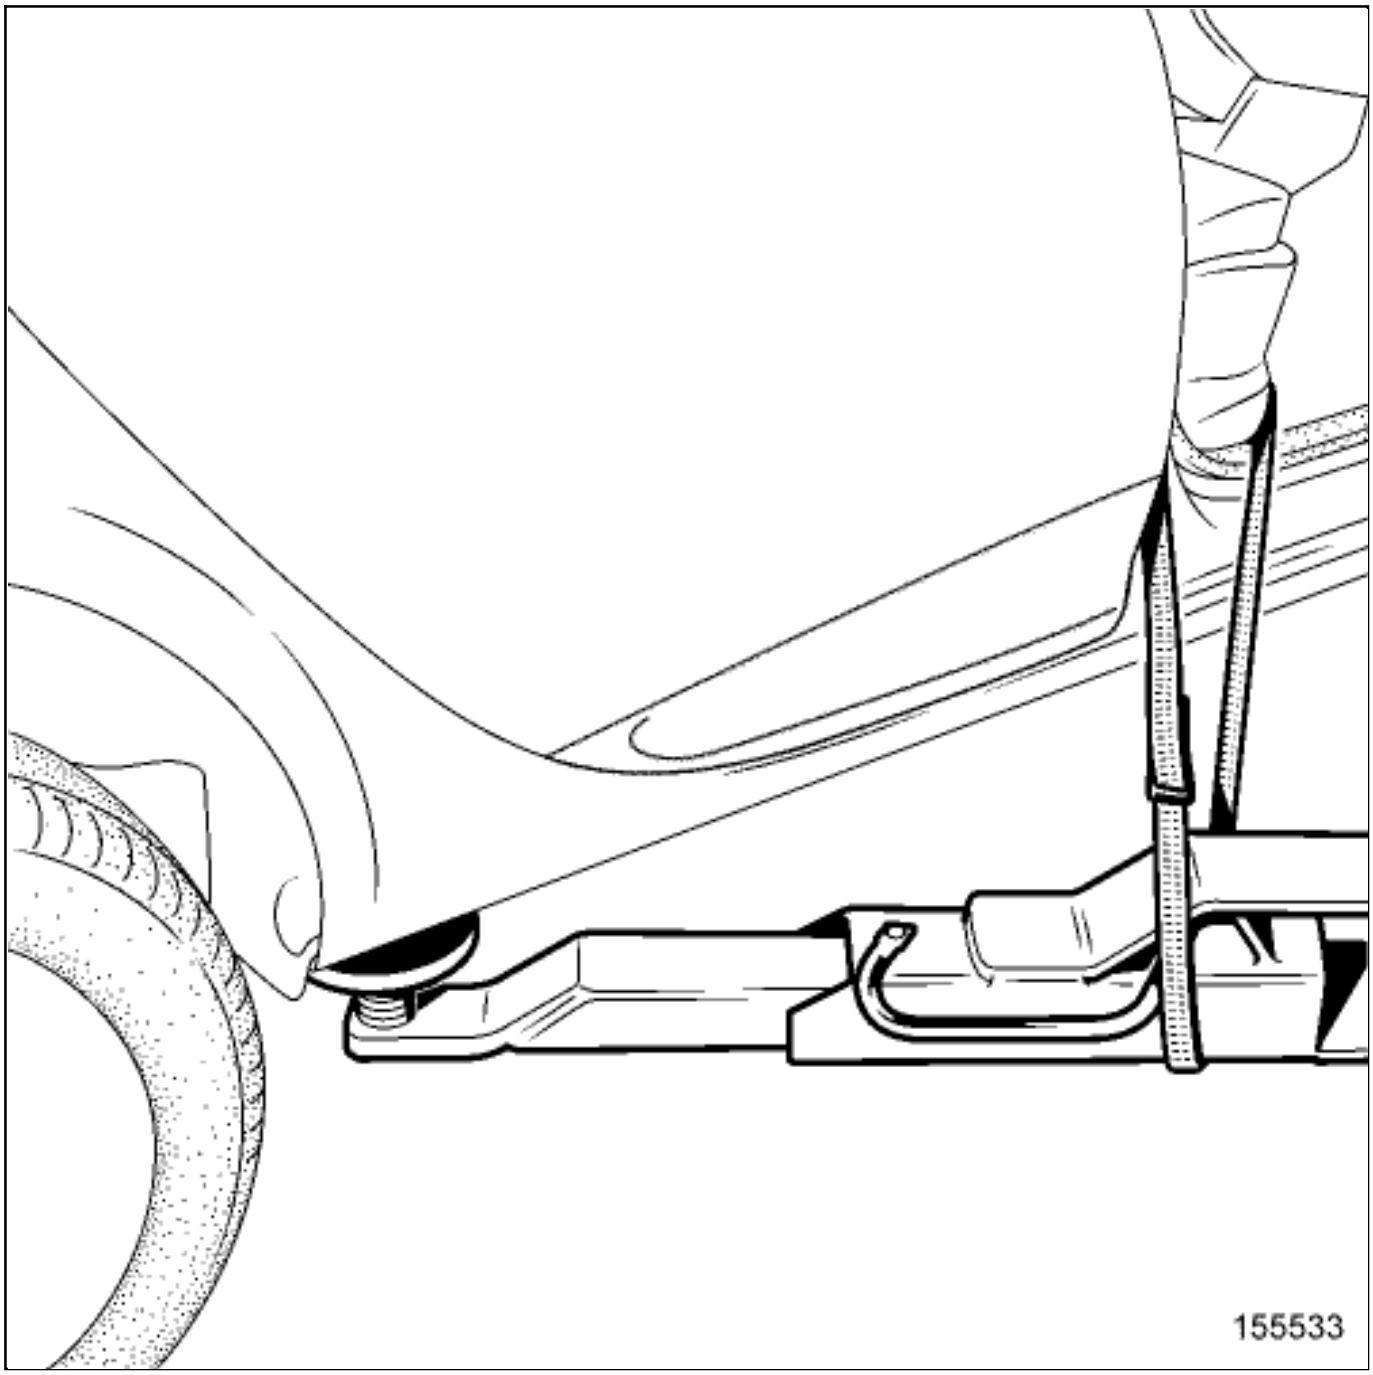
To avoid any damage to the axle assemblies, the vehicle must not be raised using the front suspension arms for support or under the rear axle.



To mount the vehicle on axle stands, the entire vehicle must be lifted on one side and axle stands must be placed under the body reinforcements which are used as jacking points at(1) or (2) .

3. LIFTING ON A LIFT

1- SAFETY ADVICE REMINDER



Safety advice reminder:

If it is necessary to remove heavy components from the vehicle, it is preferable to use a four-post lift.

There is a danger that the vehicle will tilt on a two-post lift after certain components have been removed (e.g. engine and transmission assembly, rear axle, gearbox). Fit the safety strap(s)available from the Parts Department .

2- FITTING THE STRAPS

Fitting the straps:

For safety reasons, these straps must always be in perfect condition. Replace them as soon as they show signs of wear.

When fitting the straps, check that the seats and fragile parts of the vehicle are correctly protected.

1)TILTING TOWARDS THE FRONT

Pass the strap under the rear right-hand arm of the lift.

Pass the strap through the inside of the vehicle.

Pass the strap under the rear left-hand arm of the lift.

Pass the belt through the inside of the vehicle again.

Tighten the strap.

2)TILTING TOWARDS THE REAR

Pass the strap under the front right-hand arm of the lift.

Pass the strap through the inside of the vehicle.

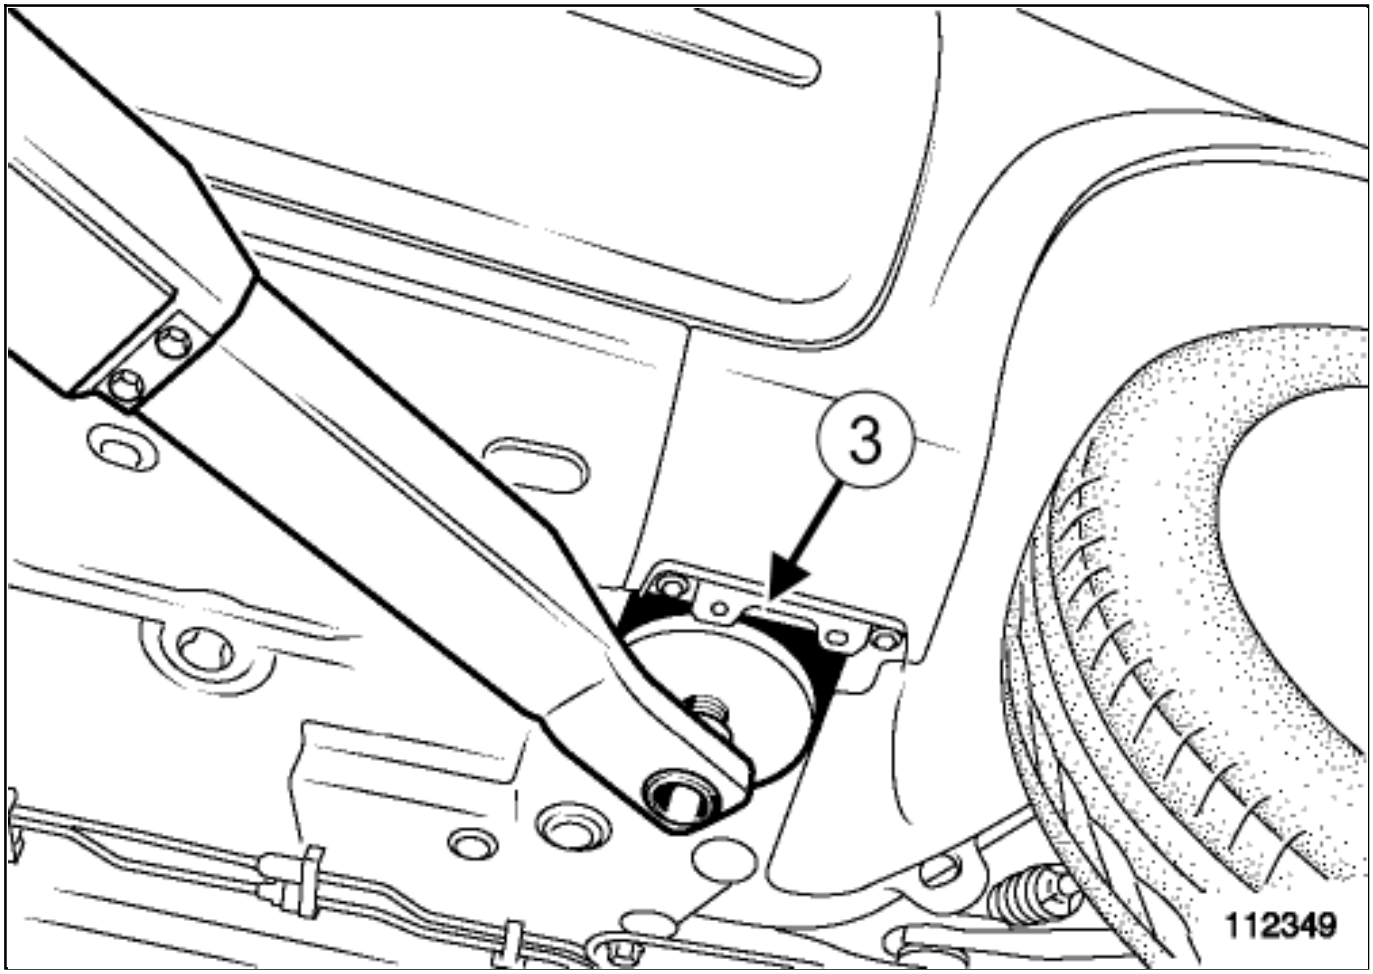
Pass the strap under the front left-hand arm of the lift.

Pass the belt through the inside of the vehicle again.

Tighten the strap.

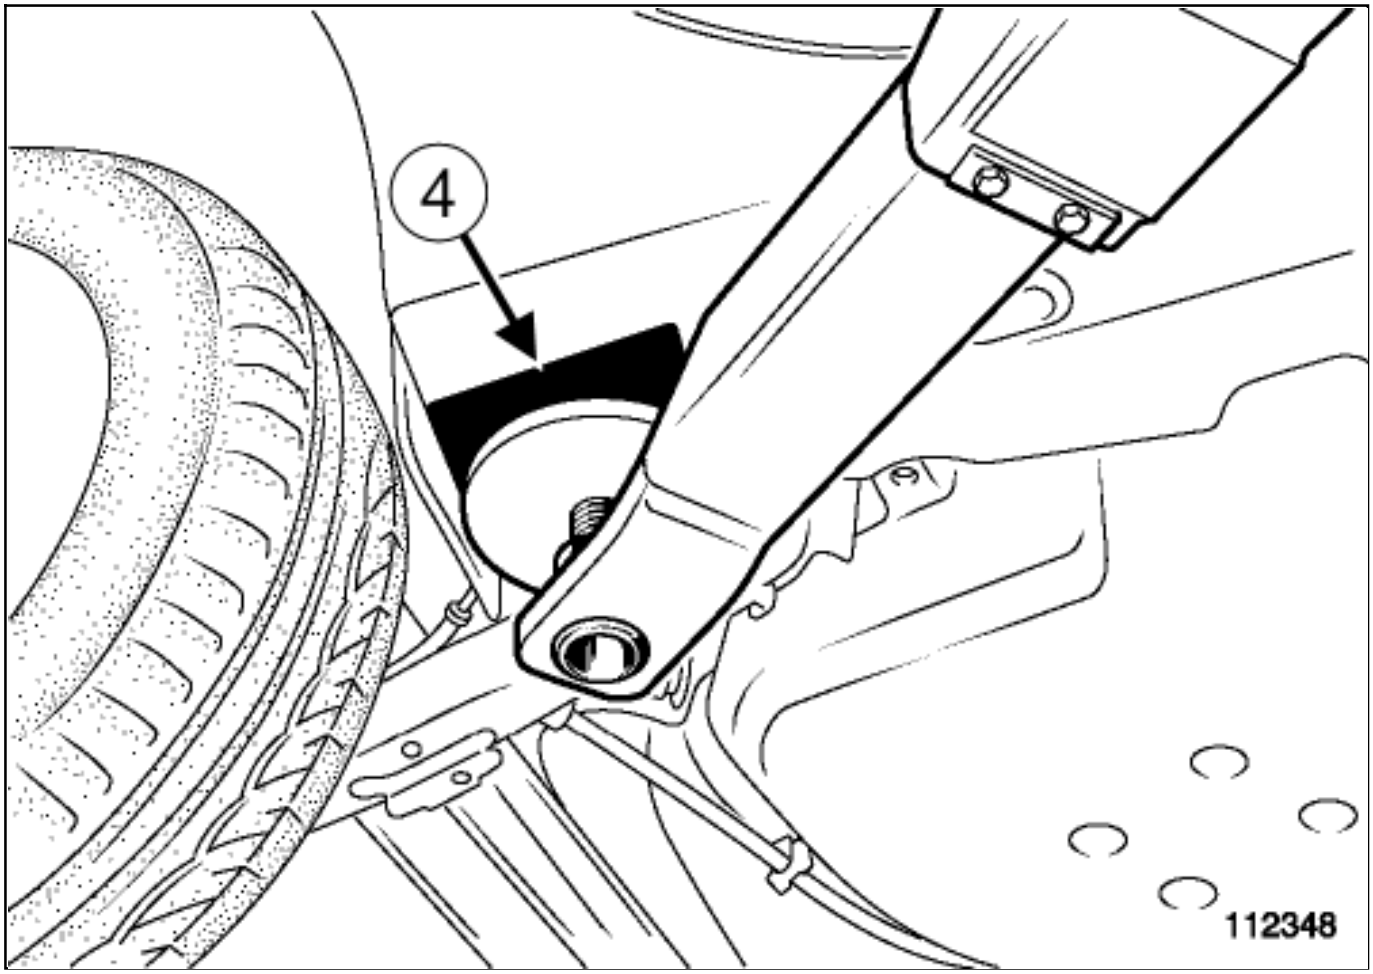
3- PERMITTED LIFTING POINTS

To raise the vehicle, position the pads of the lifting arms as indicated below, taking care not to damage the end of the front wing or the underside of the sill panel.



WARNING

Only the jacking points described in this section allow the vehicle to be raised in complete safety.

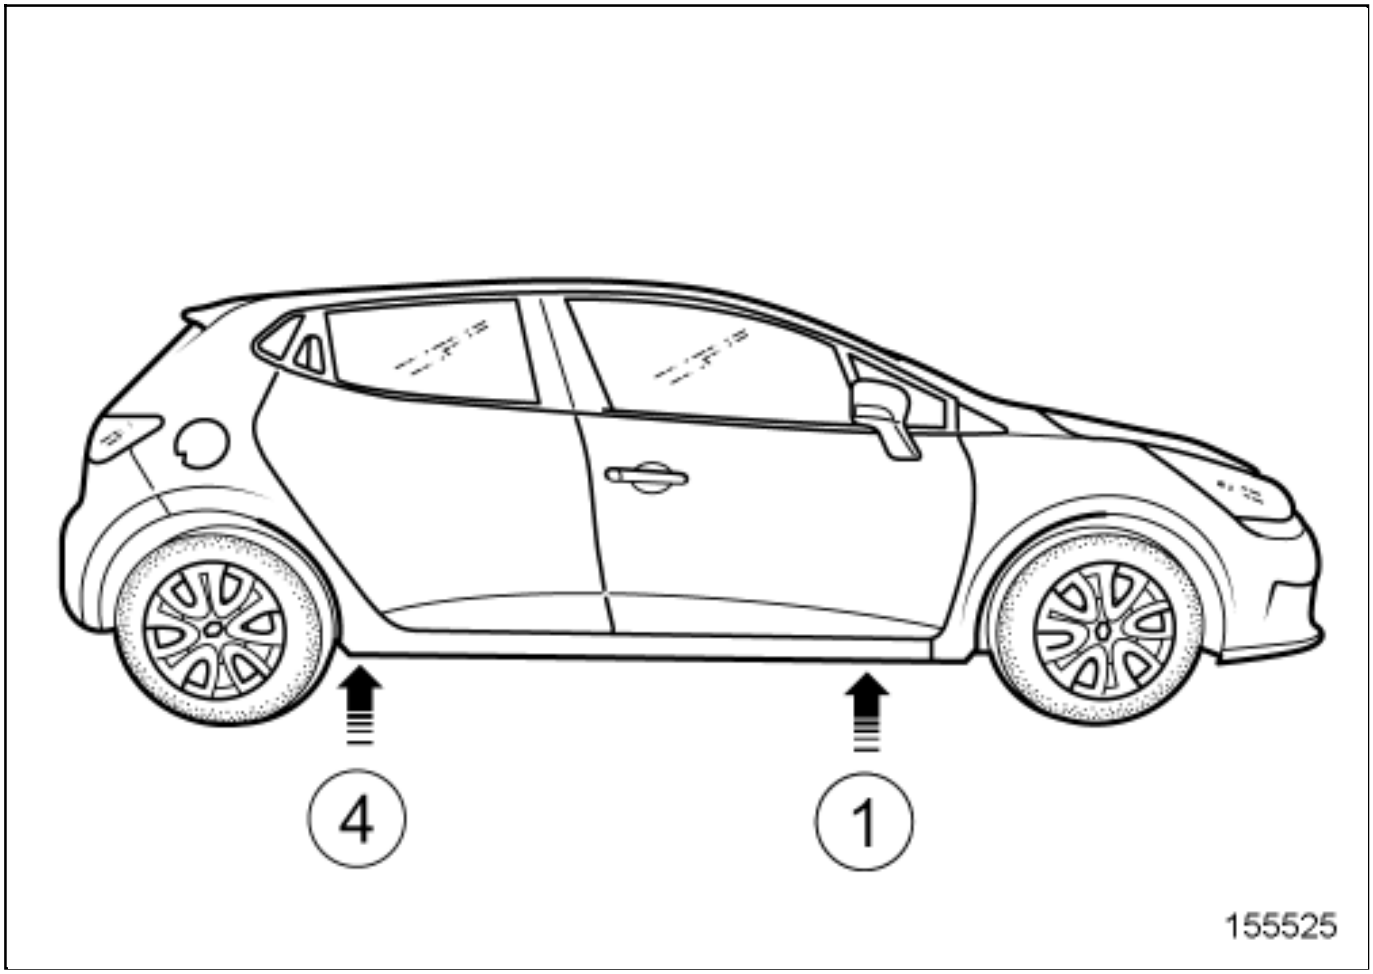


Do not raise the vehicle using points other than those described in this section.

FRONT LIFTING POINTS

Position the lift arms under the side cross members.

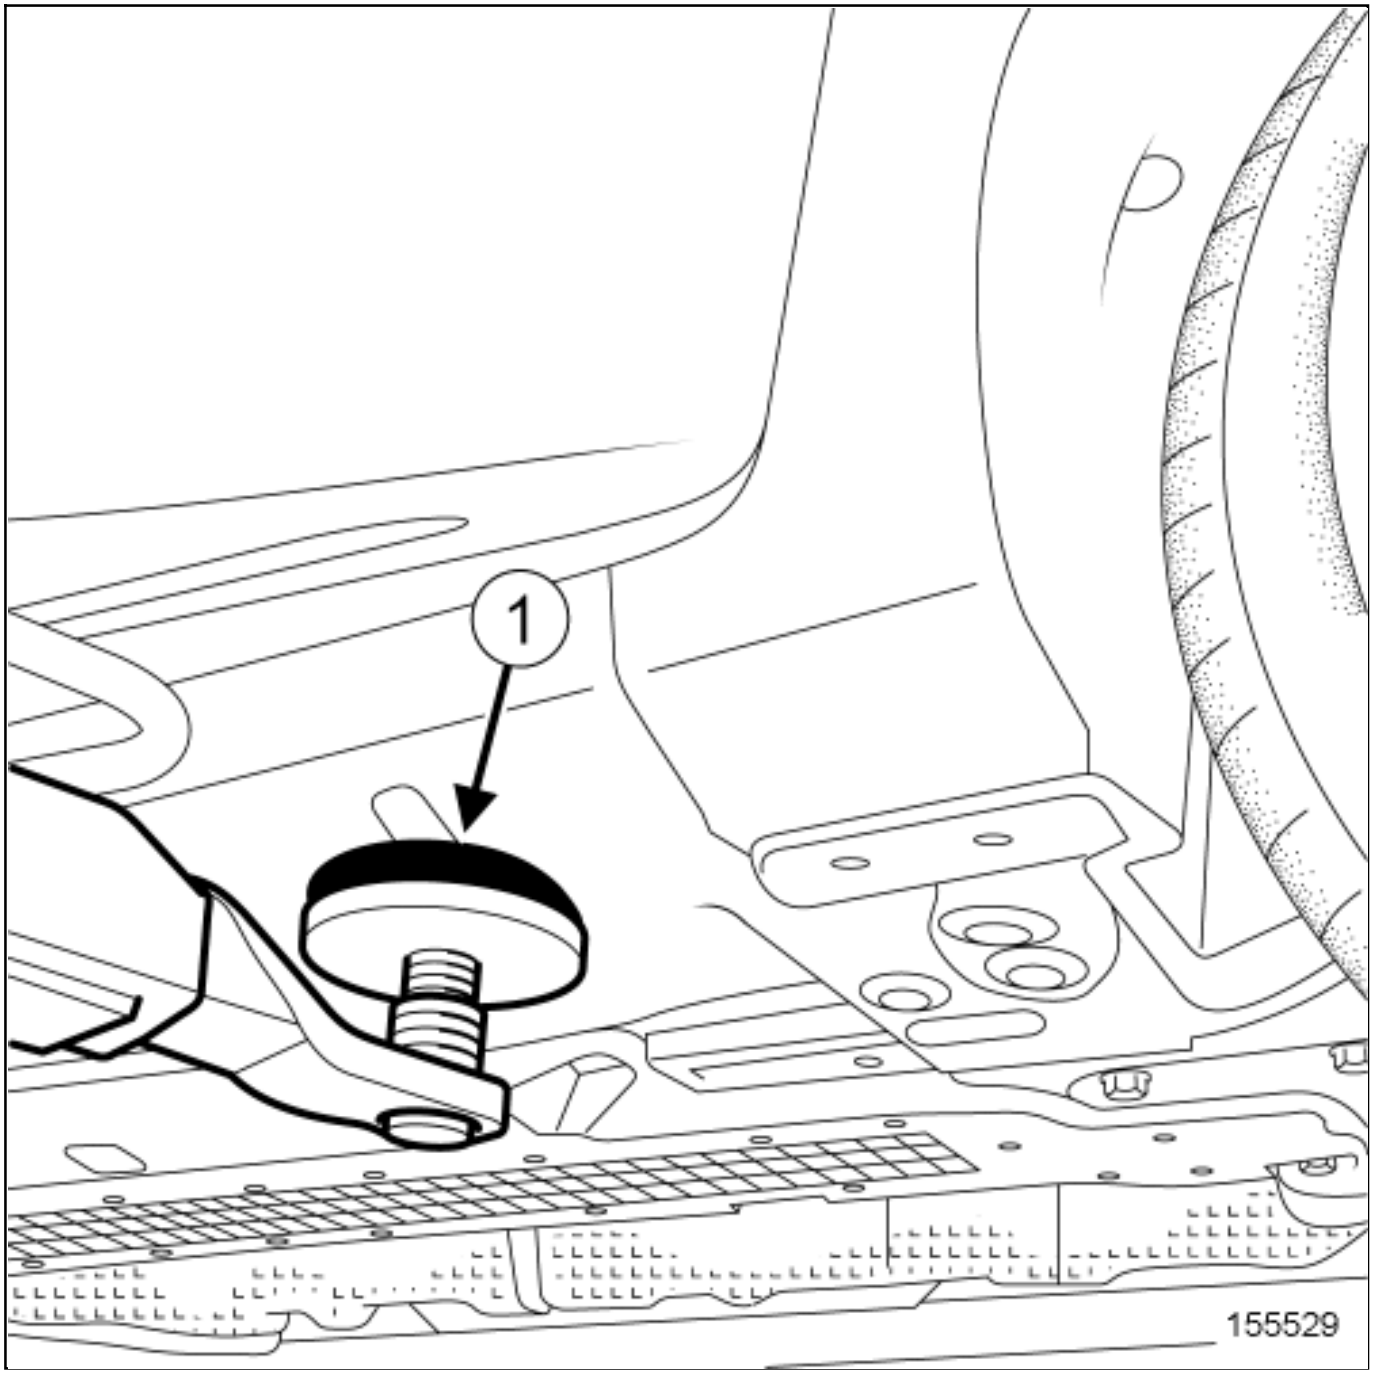
REAR LIFTING POINTS



Position the lift arms under the end of the sill panel body flanges.

Note:

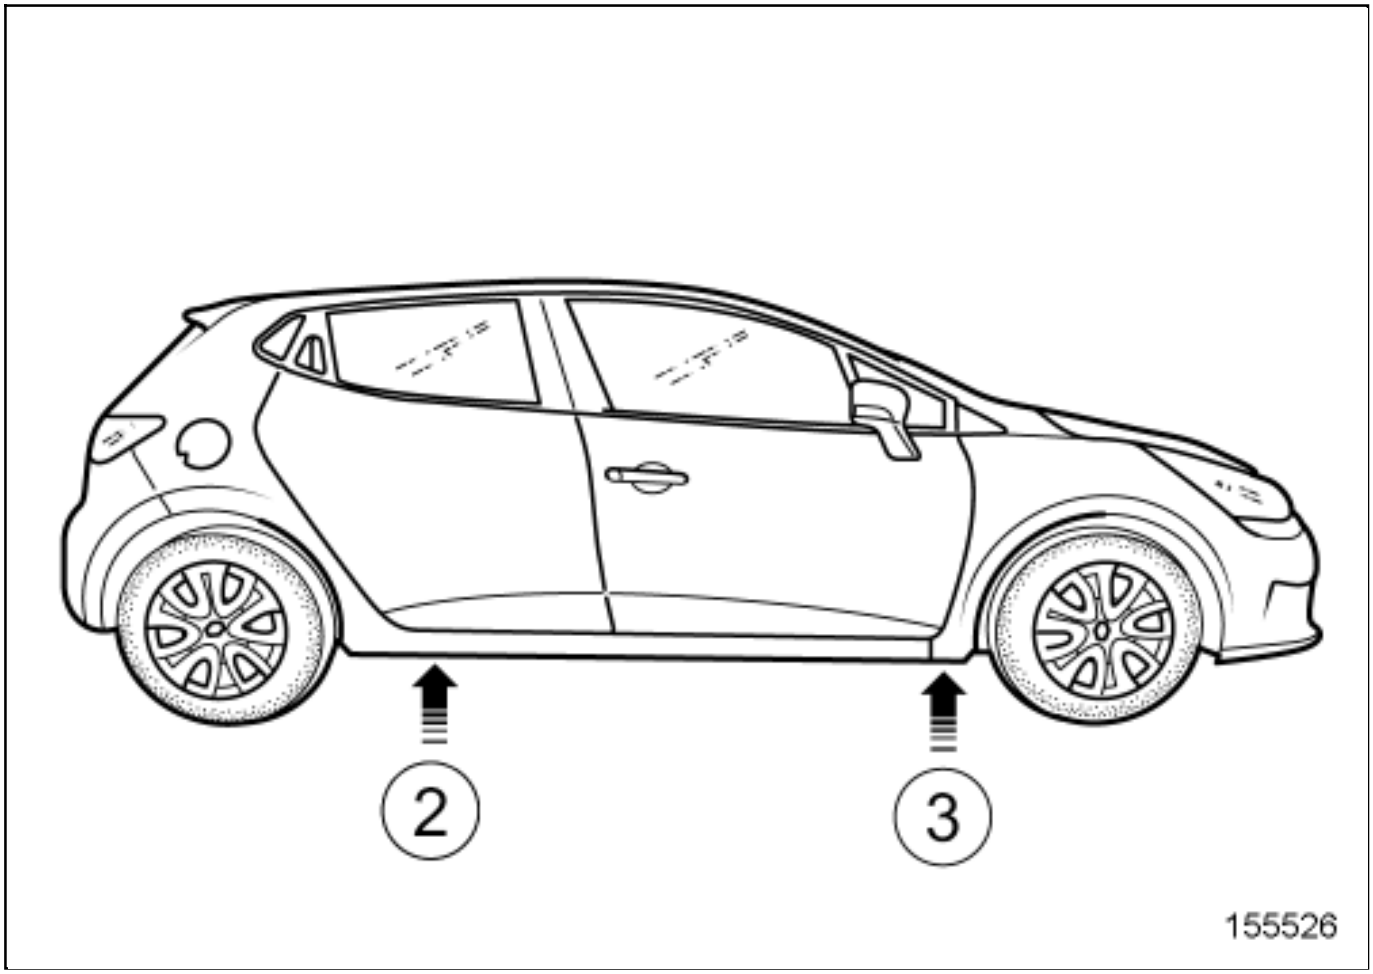
If this arrangement is not possible, notably when underbody supports are being used for bodywork rebuilding on a body jig bench, proceed as follows:



4. DISENGAGEMENT OF THE CROSS MEMBERS

DISENGAGEMENT OF THE FRONT SIDE CROSS MEMBERS:

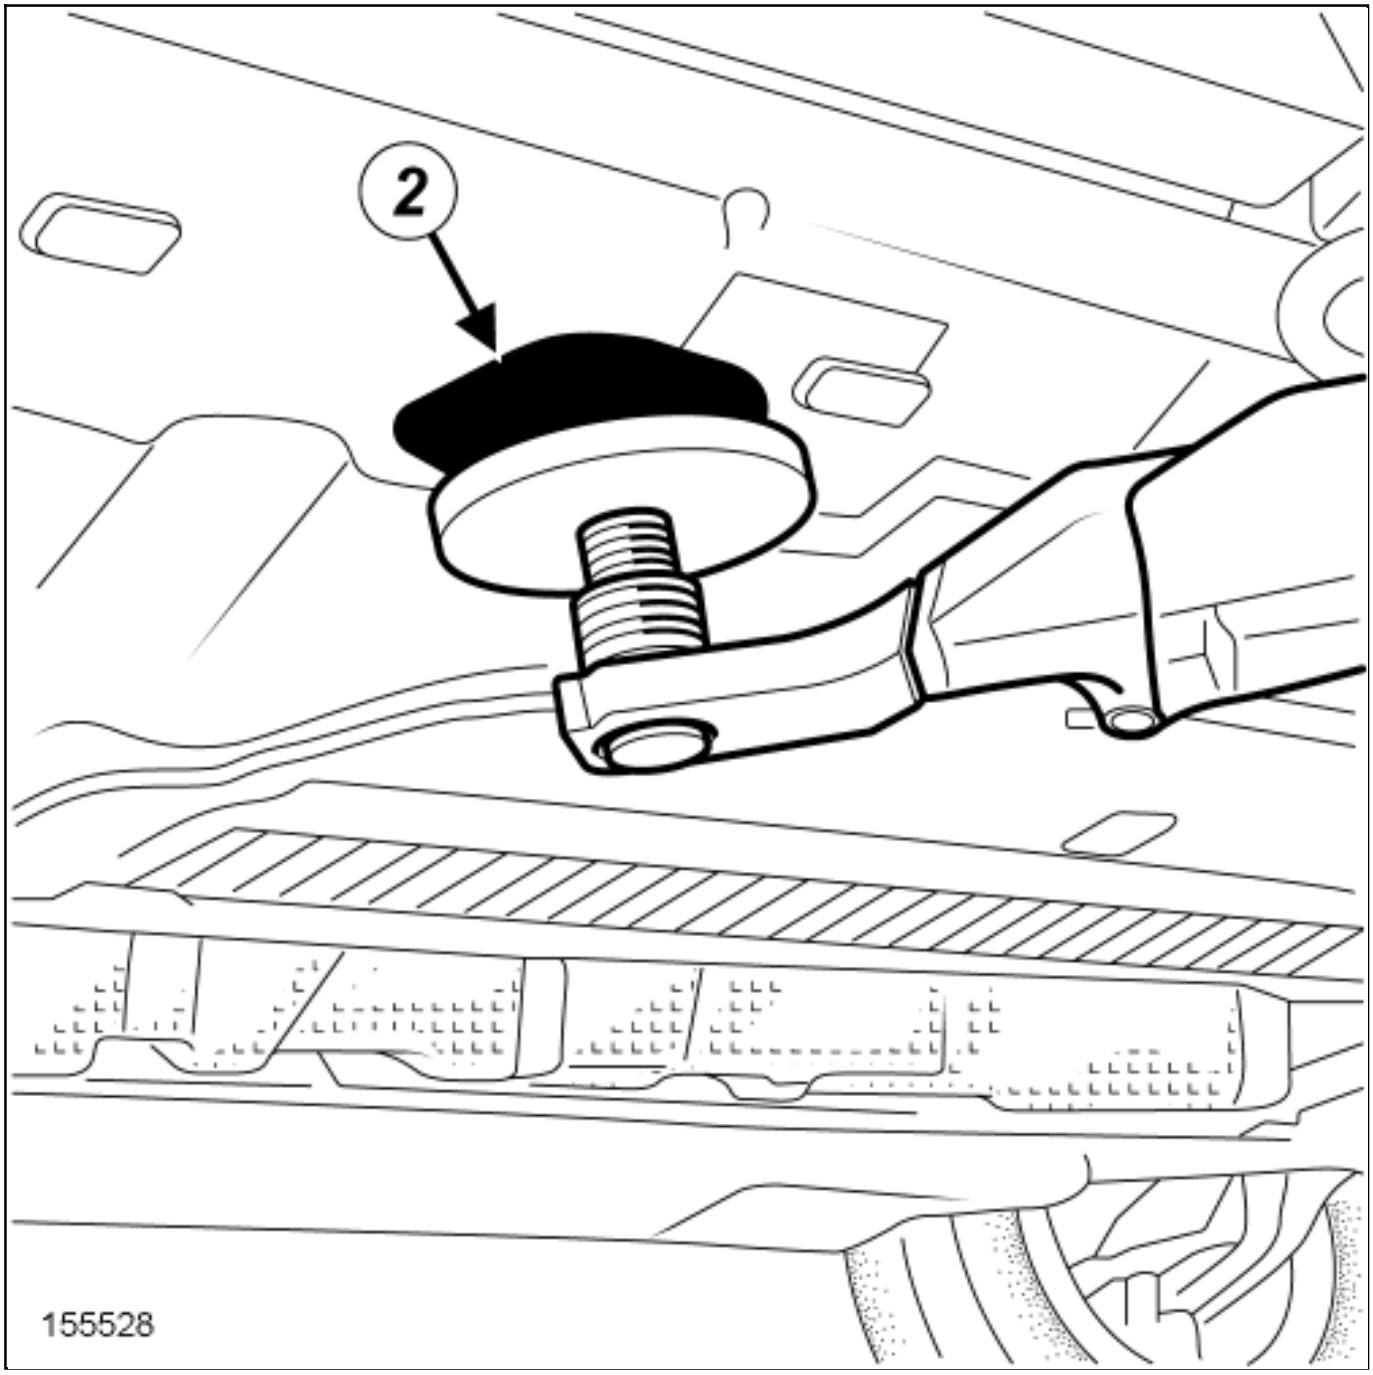
Support the vehicle at the jacking points at the front(1) and under the sill panel body flanges at the rear (4) .



DETAILED VIEW

WARNING

This situation increases the risk of the vehicle tilting forwards; removing components from the rear section of the vehicle is therefore prohibited.



DISENGAGEMENT OF THE REAR SIDE CROSS MEMBERS:

Position the lifting arms under the sub-frame body flanges.

Support the vehicle under the side cross members at the front(3) , taking care not to damage the end of the front wing, and under the jacking points at the rear(2) .

DETAILED VIEW

WARNING

In this instance, the risk of the vehicle tilting towards the rear is high. It is forbidden to remove components from the front section of the vehicle.

WATER CHAMBER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

- To avoid any risk of serious burns when the engine is hot:
  - do not open the expansion bottle cap,
  - do not drain the cooling system,
  - do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C 2for cold and temperate countries,
  - protection down to -40°C 2for very cold countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Disconnect the batteryBattery: Removal - Refitting .

Remove:

- the engine undertray bolts,
- the engine undertray,
- the intercooler air inlet pipeAir inlet assembly: Exploded view ,
- the intercooler air outlet pipeAir inlet assembly: Exploded view ,
- the throttle valveAir inlet assembly: Exploded view ,
- the inlet distributorAir inlet assembly: Exploded view .

Drain the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

2. REMOVAL OPERATION

Move aside the clip from the cooling hose between expansion bottle and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the cooling hose between expansion bottle and the water inlet housing(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Unclip the cooling hose between expansion bottle and the water inlet housing.

Move aside the clip from the cooling hoses between the oil-coolant heat exchanger and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the cooling hoses between the oil-coolant heat exchanger and the water inlet housing (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Move aside the clip from the cooling hose between the water chamber and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the cooling hose between the water chamber and the water inlet housing(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Move aside the clips from the bottom coolant hose using the toolRemote operation pliers for hose clips. (Mot. 1448) (see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Disconnect the bottom coolant hose(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

Unclip from the water inlet housing:

- the water inlet housing connector wiring,
- the wiring of the air conditioning compressor.

Disconnect the water inlet housing connector.

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water inlet housing bolts,
- the water inlet housing,
- the water inlet housing seal.

REFITTING

1. REFITTING PREPARATION OPERATION

Parts always to be replaced:

- the water inlet housing seal.

Use SURFACE CLEANER Vehicle: Parts and consumables for the repair to clean and degrease:

- the cylinder block joint face.

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

2. REFITTING OPERATION

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the new water inlet housing seal,
- the water inlet housing,
- the water inlet housing bolts.

Proceed in the reverse order to removal.

Fill and bleed the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

WATER CHAMBER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Remote operation pliers for hose clips.	Mot. 1448

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

- To avoid any risk of serious burns when the engine is hot:
  - do not open the expansion bottle cap,
  - do not drain the cooling system,
  - do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C 2for cold and temperate countries,
  - protection down to -40°C 2for very cold countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the engine undertray bolts,
  - the engine undertray,
  - the intercooler air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the intercooler air outlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the throttle valve(see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the inlet distributor(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Drain the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

2. REMOVAL OPERATION

Move aside the clip from the cooling hose between expansion bottle and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Disconnect the cooling hose between expansion bottle and the water inlet housing**(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Unclip the cooling hose between expansion bottle and the water inlet housing.

Move aside the clip from the cooling hoses between the oil-coolant heat exchanger and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Disconnect the cooling hoses between the oil-coolant heat exchanger and the water inlet housing **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Move aside the clip from the cooling hose between the water chamber and the water inlet housing using the toolRemote operation pliers for hose clips.(Mot. 1448) **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Disconnect the cooling hose between the water chamber and the water inlet housing**(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Move aside the clips from the bottom coolant hose using the toolRemote operation pliers for hose clips. (Mot. 1448) **(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Disconnect the bottom coolant hose**(see 19A, Cooling, Coolant circuit assembly: Exploded view)** .

Unclip from the water inlet housing:

- the water inlet housing connector wiring,

the wiring of the air conditioning compressor.

Disconnect the water inlet housing connector.

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the water inlet housing bolts,
- the water inlet housing,
- the water inlet housing seal.

REFITTING

1. REFITTING PREPARATION OPERATION

Parts always to be replaced:

- the water inlet housing seal.

Use SURFACE CLEANER Vehicle: Parts and consumables for the repair to clean and degrease:

- the cylinder block joint face.

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

2. REFITTING OPERATION

- Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :
  - the new water inlet housing seal,
  - the water inlet housing,
  - the water inlet housing bolts.
- Proceed in the reverse order to removal.
- Fill and bleed the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) .

WHEEL:BALANCING

 **Note, one or more warnings are present in this procedure** 

1. PREREQUISITES FOR WHEEL BALANCING

Wheel balancing is a measurement operation.

Several conditions must be met to achieve a reliable result in a single operation.

The wheel balancer must be installed in accordance with the manufacturer's instructions.

It is essential to calibrate the balancer according to the frequency recommended by the manufacturer.

Do not grease the threaded shaft.

Check the condition of the supports, centring components and mountings.

Replace any faulty parts (see manufacturer's instructions).

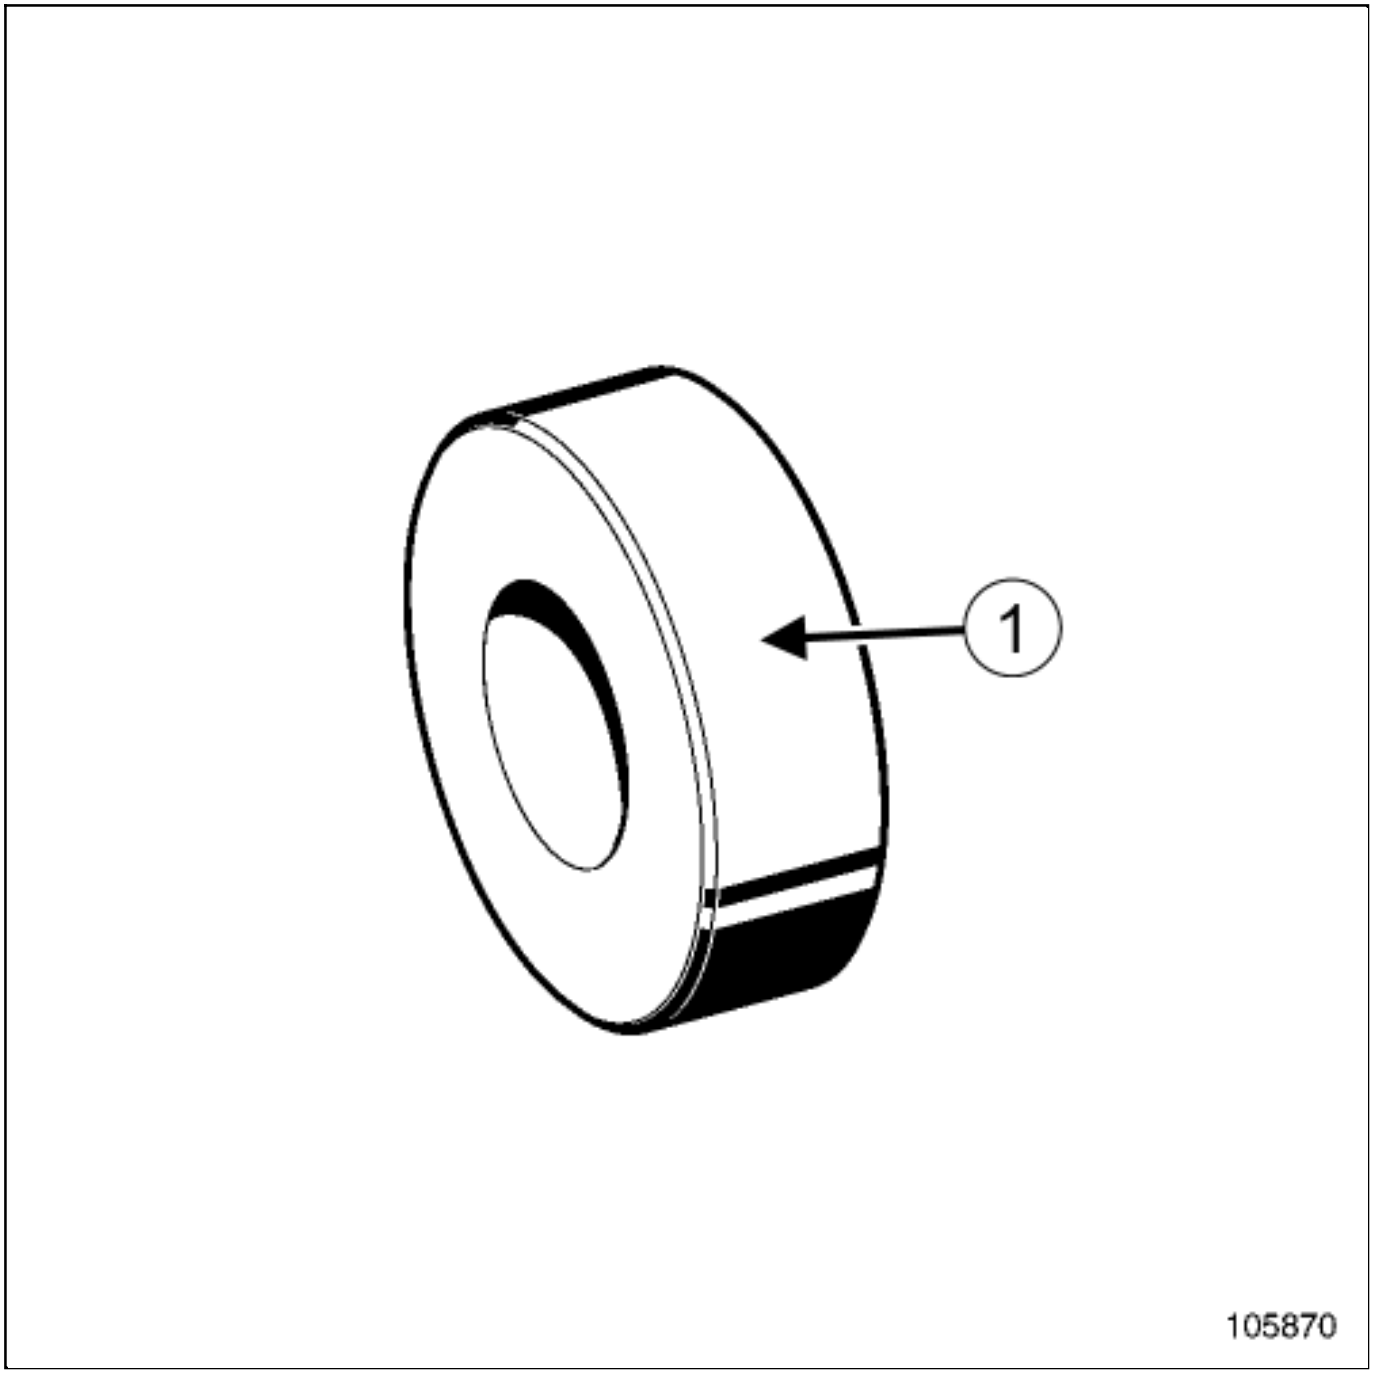
The wheel and the wheel balancer must be clean.

1- DRIVER'S PERCEPTION

If the wheels are not correctly balanced this causes the steering wheel and/or the vehicle floor to vibrate.

These vibrations appear between 54 mph (90 km/h)and 90 mph (150 km/h).

2. BALANCING PREPARATION OPERATION



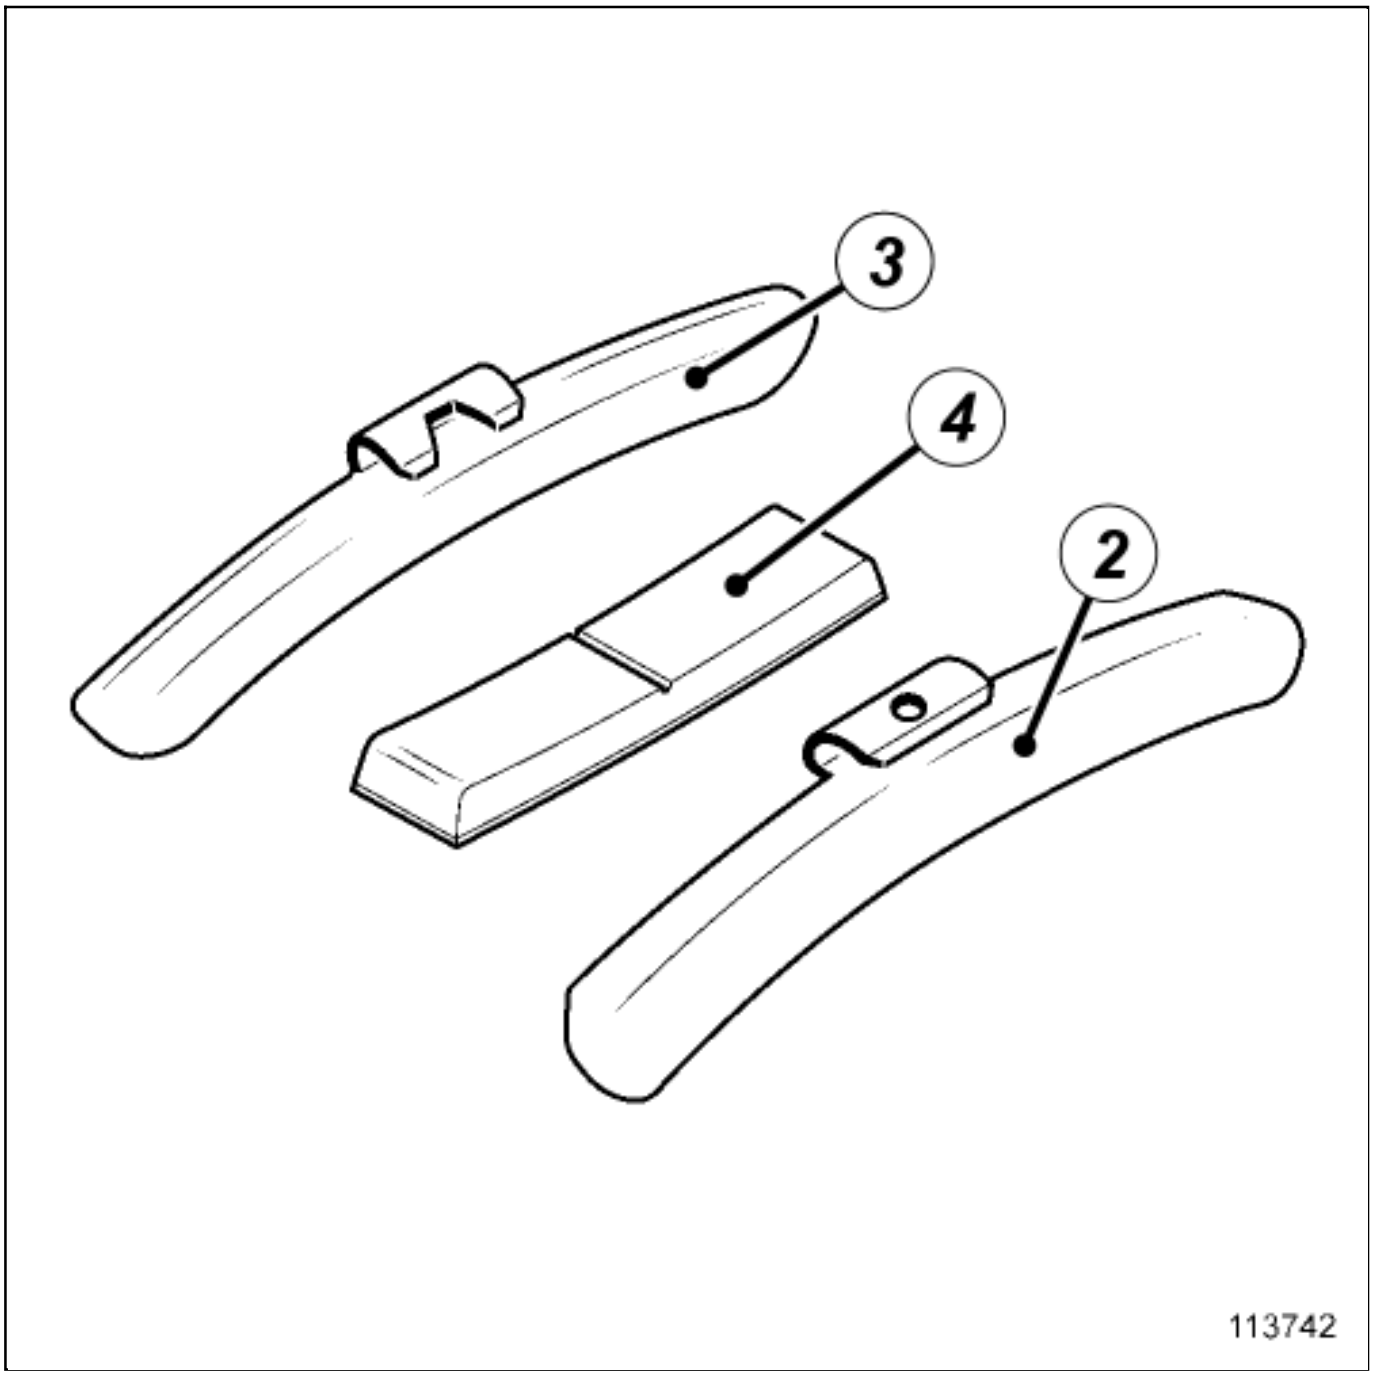
Adjust the tyre pressure(see **Tyre pressure: Identification**) .

Always carry out a road test for a minimum distance of 1 mile (2 km)before balancing the

wheels, in order to remove any flat spots on the tread caused by the vehicle being immobilised.

Actions to be carried out immediately after the test drive:

- Position the vehicle on a two-post vehicle lift**Vehicle: Towing and lifting** ,
- raise the vehicle,
- leave the four wheels hanging free,
- release the parking brake.



Note:

The ring is available from the supplier of the equipment used.

To reproduce the exact vehicle wheel assembly, use a ring(1) of diameter:

60 mm

There are three types of weight:

(2) Steel wheel with flange

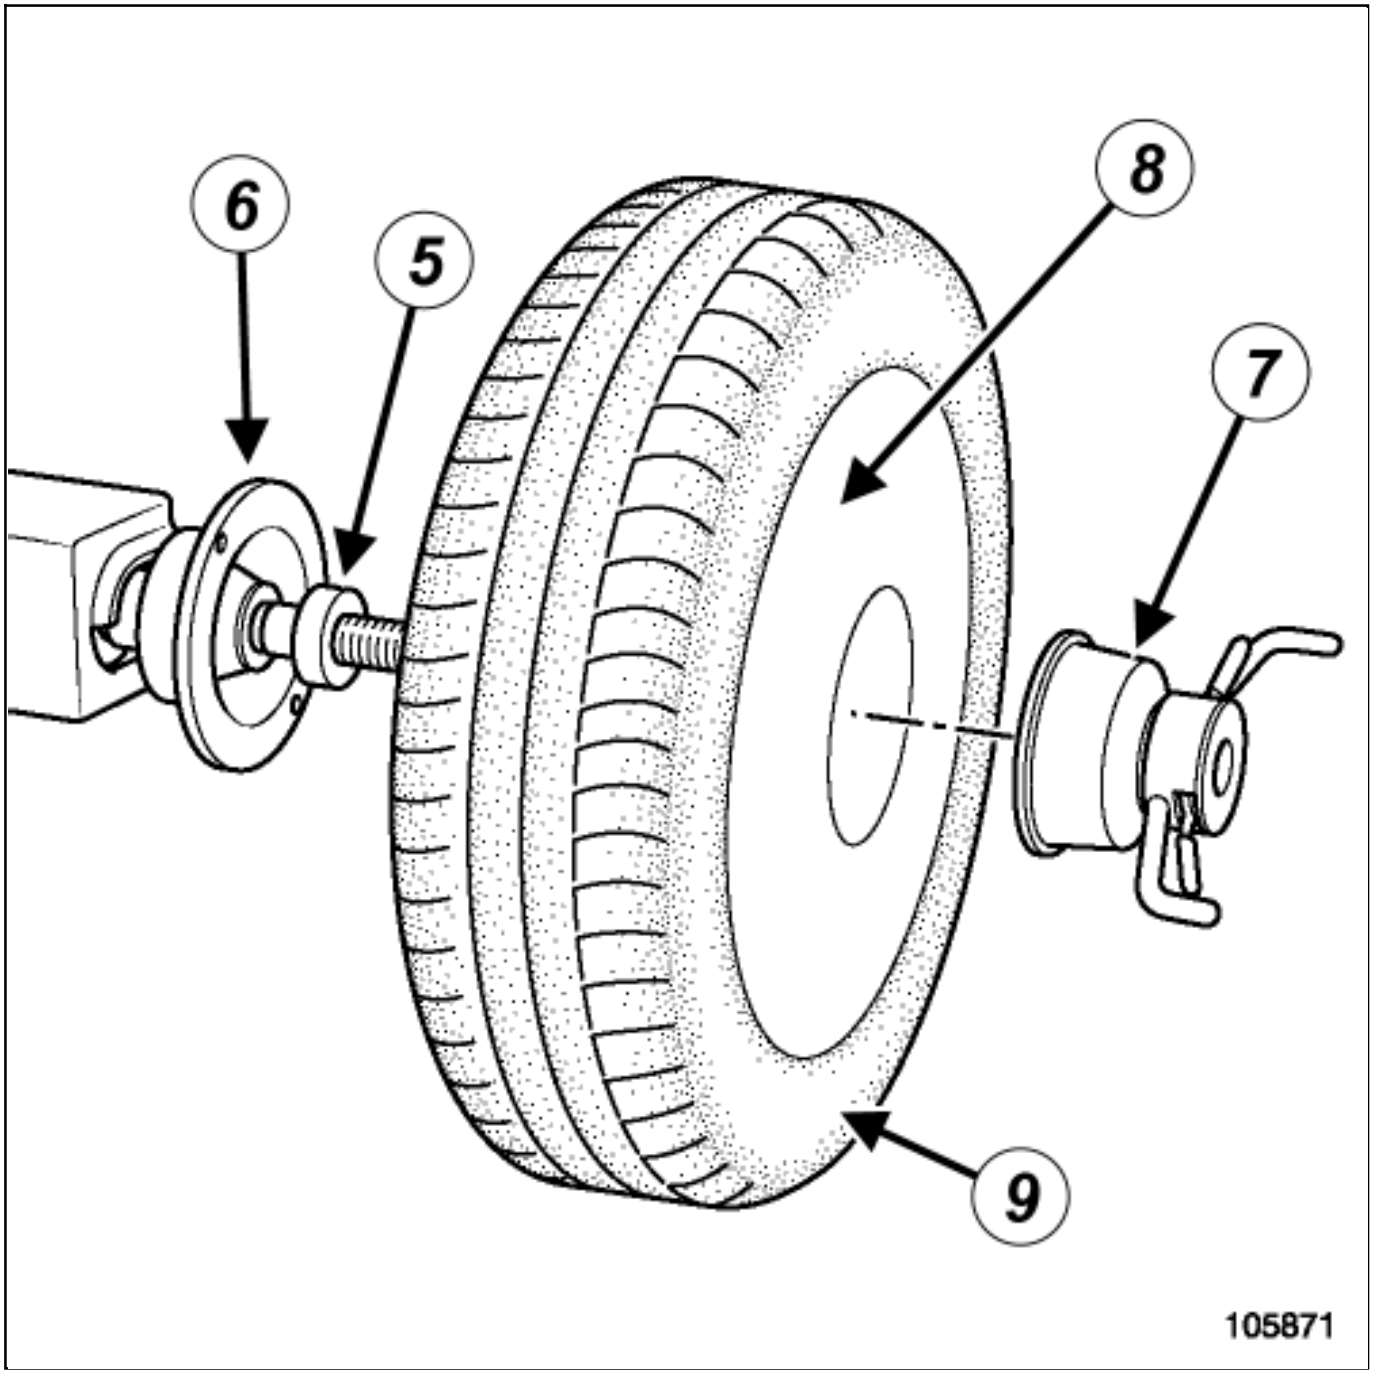
(3) Alloy wheel with flange

(4) Alloy wheel without flange

In some countries, the use of lead weights is forbidden; in this case it is recommended to use

ZAMAK weights instead.

Only use weights provided by the Parts Department.

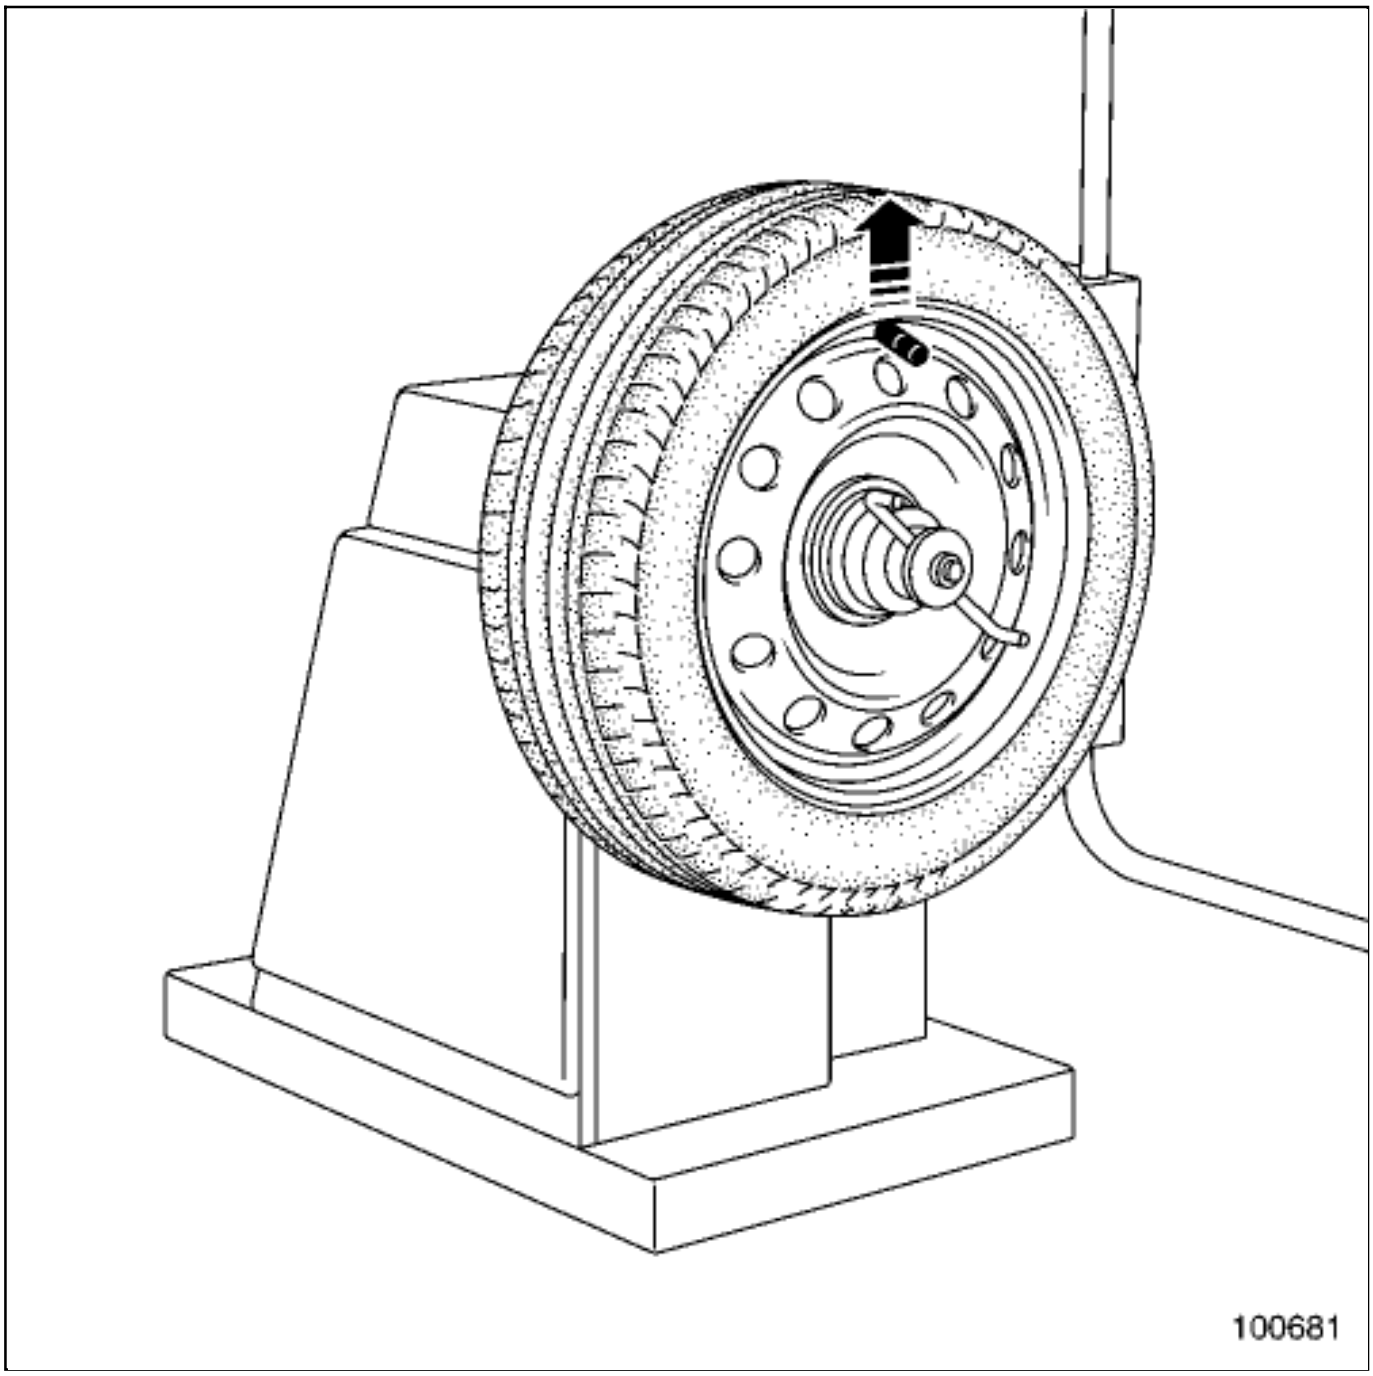


- Remove the wheels (see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

- Always clean the wheel, disc, and hub bearing surfaces.

3. PROCEDURE FOR BALANCING THE WHEEL IN QUESTION

- Make sure that the wheel balancer bearing surface and all the centring equipment (ring, thrust plate, etc.) are kept clean.



- Try not to scratch the (alloy) wheel rim with the wheel tightening device.

The wheel is fitted on the wheel balancer as follows:

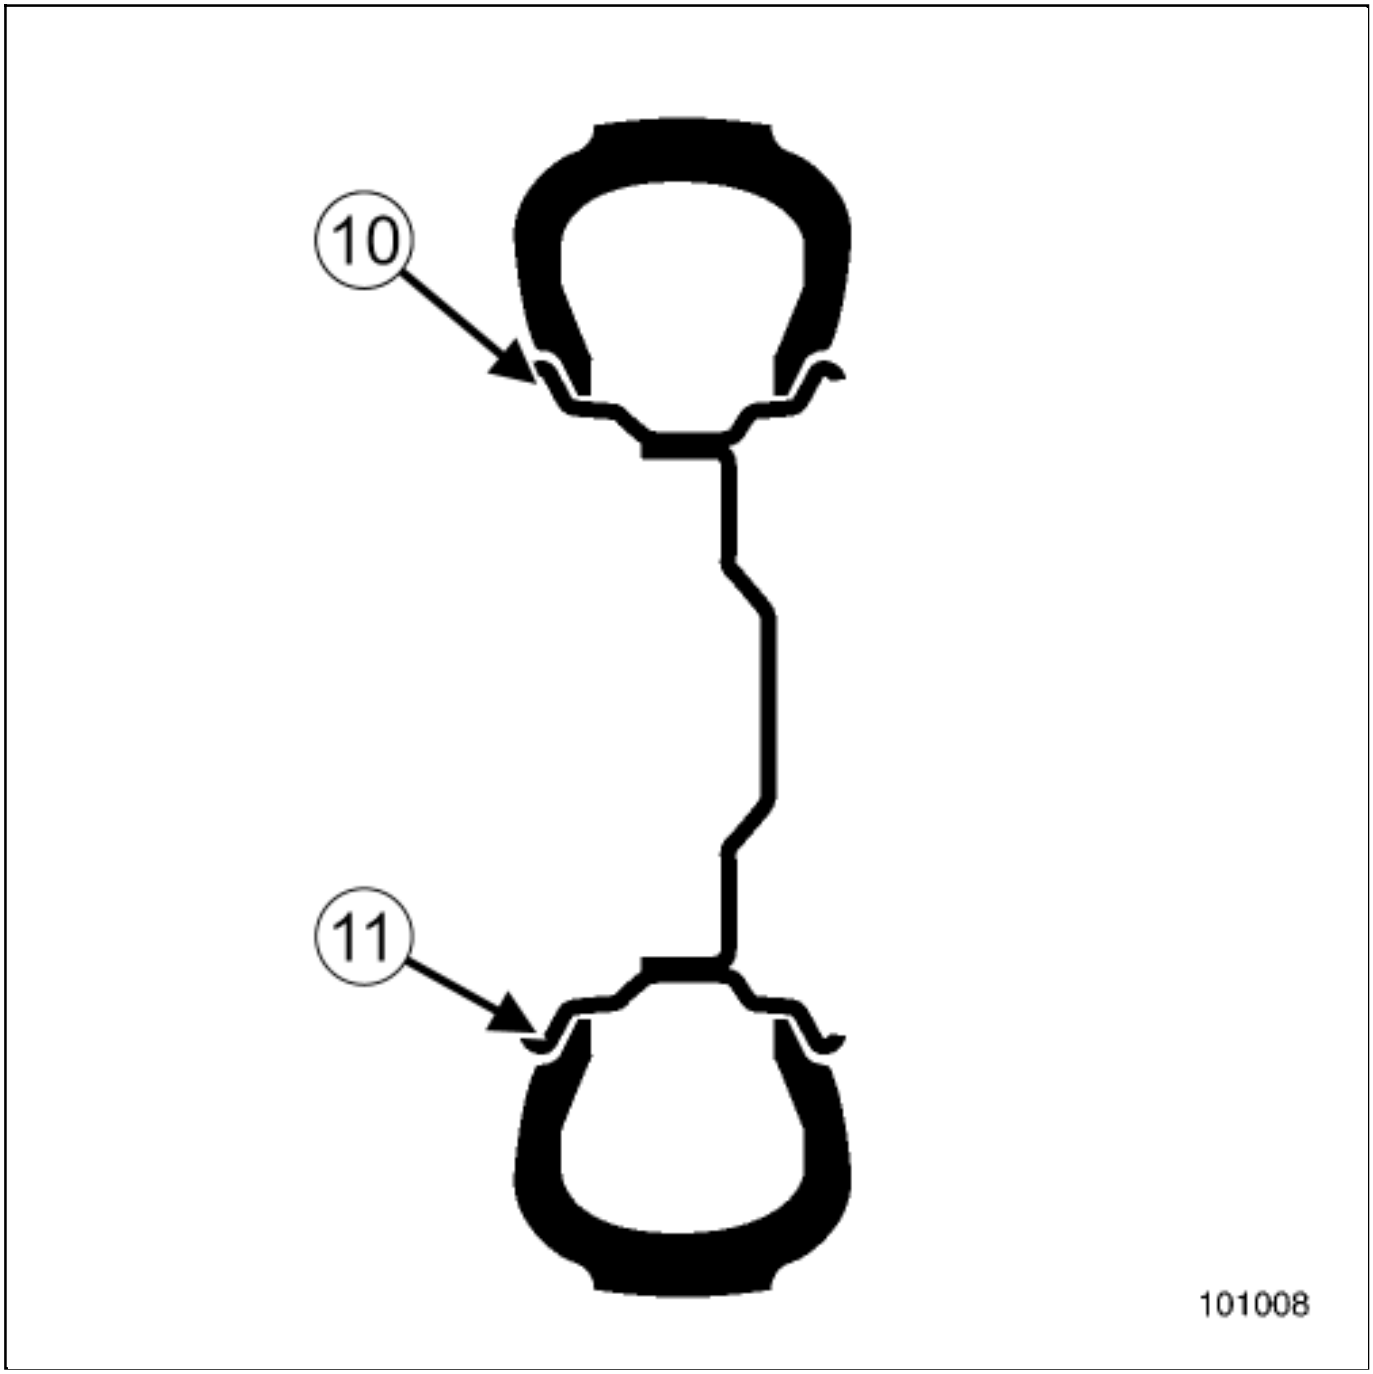
- (5) ring,
- (6) wheel balancer back-plate,
- (7) wheel tightening device (certain alloy wheels require a device 200 mm in diameter to ensure that the wheel has been correctly tightened),
- (8) outer wheel plane,

(9) wheel.

Place the wheel on the wheel balancer, with the valve at the top, then lock the wheel in place.

Remove any stones trapped in the tyre tread.

Enter the specific wheel parameters when starting the wheel balancer.



Start the wheel balancer and check the wheel balance, which should be 0 gon each plane of the wheel.

If this is not the case, remove the old wheel balancing weights and repeat the wheel balancing procedure, checking that the wheel balance equals 0on each wheel plane.

CAUTION

To avoid detachment of the balance weights, use only weights which correspond to the vehicle wheel rims.

To ensure that the wheels are balanced correctly:

- Position a 10 g adhesive weight (10) on the interior of the wheel rim,
- Repeat the wheel balancing procedure; the wheel balancer should indicate an equivalent weight (± 4 g) opposite the weight added(11) ,
- Repeat the balancing method from the start if this is not the case.

Remove the adhesive weight.

4. FINAL OPERATION

Refit the wheel(see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

Repair-13x05x01-01x80-1-16-1.xml

XSL version : 3.02 du 22/07/11

WHEEL:BALANCING

 **Note, one or more warnings are present in this procedure** 

1. PREREQUISITES FOR WHEEL BALANCING

Wheel balancing is a measurement operation.

Several conditions must be met to achieve a reliable result in a single operation.

The wheel balancer must be installed in accordance with the manufacturer's instructions.

It is essential to calibrate the balancer according to the frequency recommended by the manufacturer.

Do not grease the threaded shaft.

Check the condition of the supports, centring components and mountings.

Replace any faulty parts (see manufacturer's instructions).

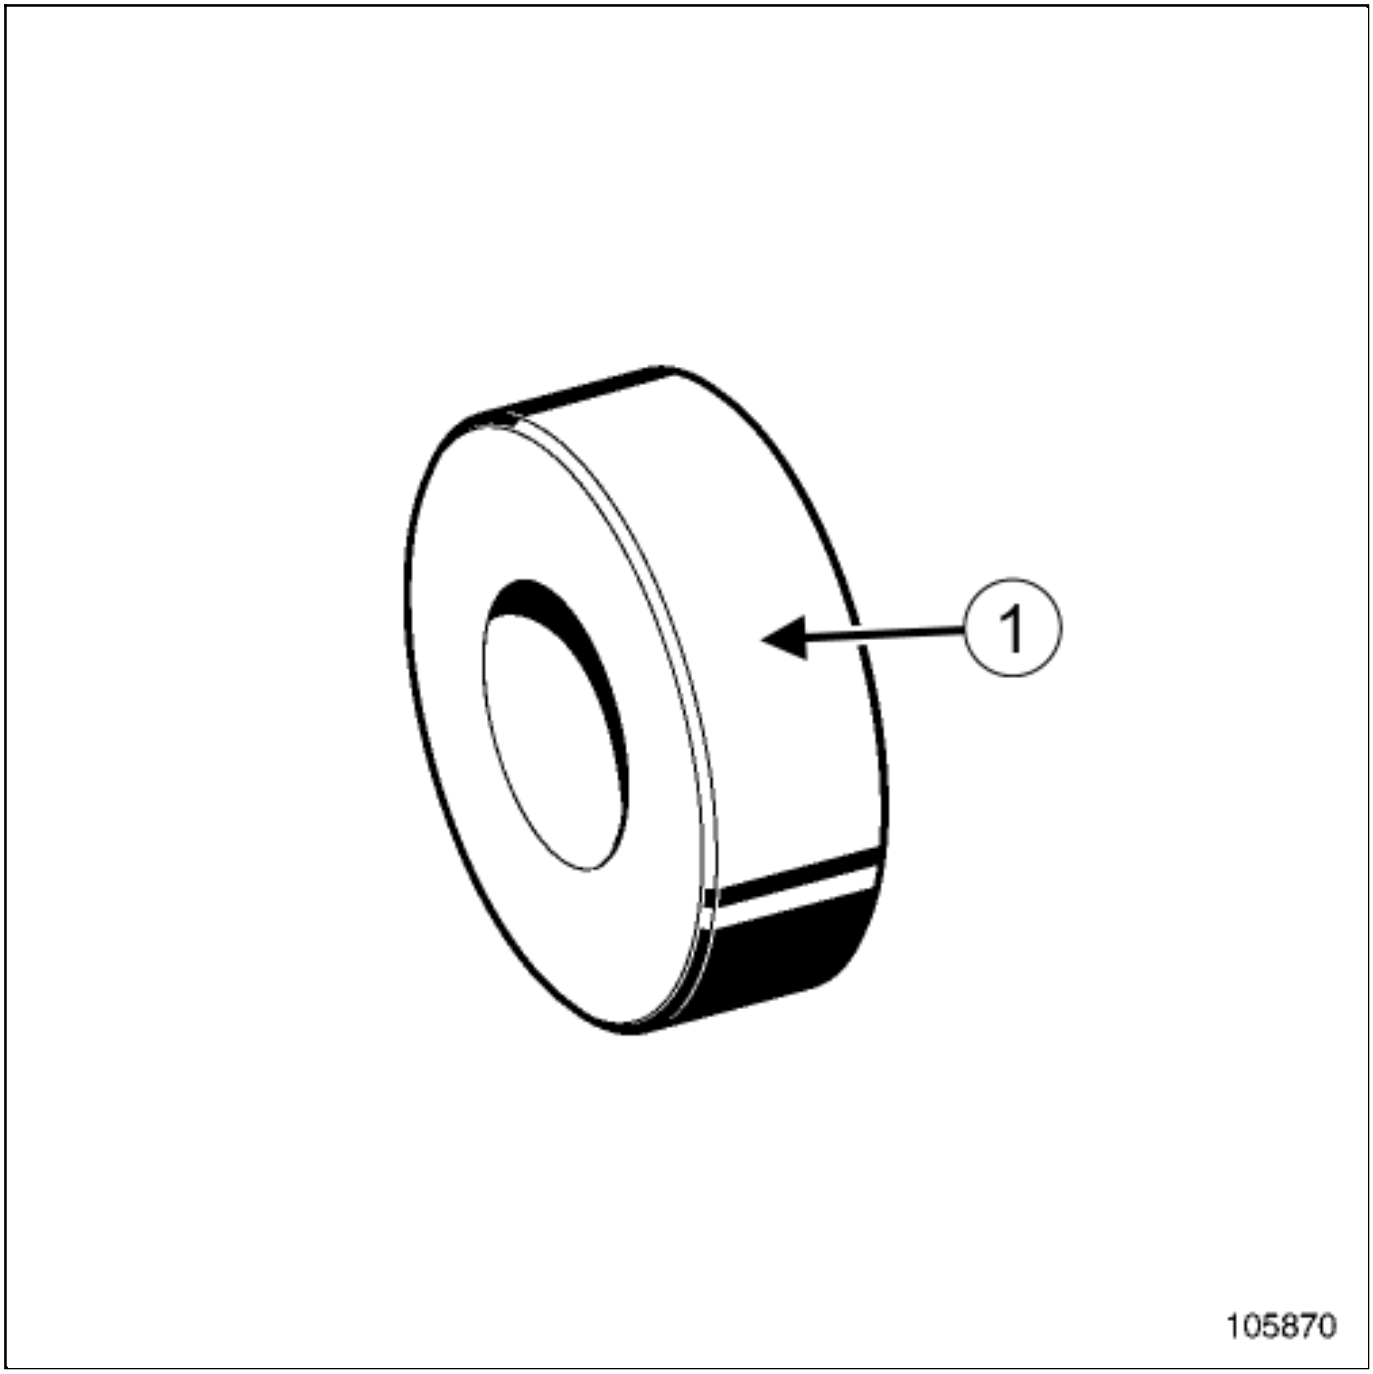
The wheel and the wheel balancer must be clean.

1- DRIVER'S PERCEPTION

If the wheels are not correctly balanced this causes the steering wheel and/or the vehicle floor to vibrate.

These vibrations appear between 54 mph (90 km/h)and 90 mph (150 km/h).

2. BALANCING PREPARATION OPERATION



Adjust the tyre pressureTyre pressure: Identification .

Always carry out a road test for a minimum distance of 1 mile (2 km)before balancing the

wheels, in order to remove any flat spots on the tread caused by the vehicle being immobilised.

Actions to be carried out immediately after the test drive:

- Position the vehicle on a two-post vehicle lift**Vehicle: Towing and lifting** ,

- Repeat the wheel balancing procedure; the wheel balancer should indicate an equivalent weight (± 4 g) opposite the weight added(11) ,
- Repeat the balancing method from the start if this is not the case.

Remove the adhesive weight.

4. FINAL OPERATION

Refit the wheel(see 35A, Wheels and tyres, Wheel: Removal - Refitting) .

Repair-13x05x01-01x80-1-16-1.xml

XSL version : 3.02 du 22/07/11

WHEEL: REMOVAL - REFITTING

The removal - refitting procedure is the same for all wheels.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Release the parking brake.
- Remove the trim .
- Position the wheel so that the valve is at the top.
- Mark the position of the wheel on the hub.

Note:

- This mark is required in order to:
  - Note the original position of the wheel on the hub,
  - perform the balancing operation.

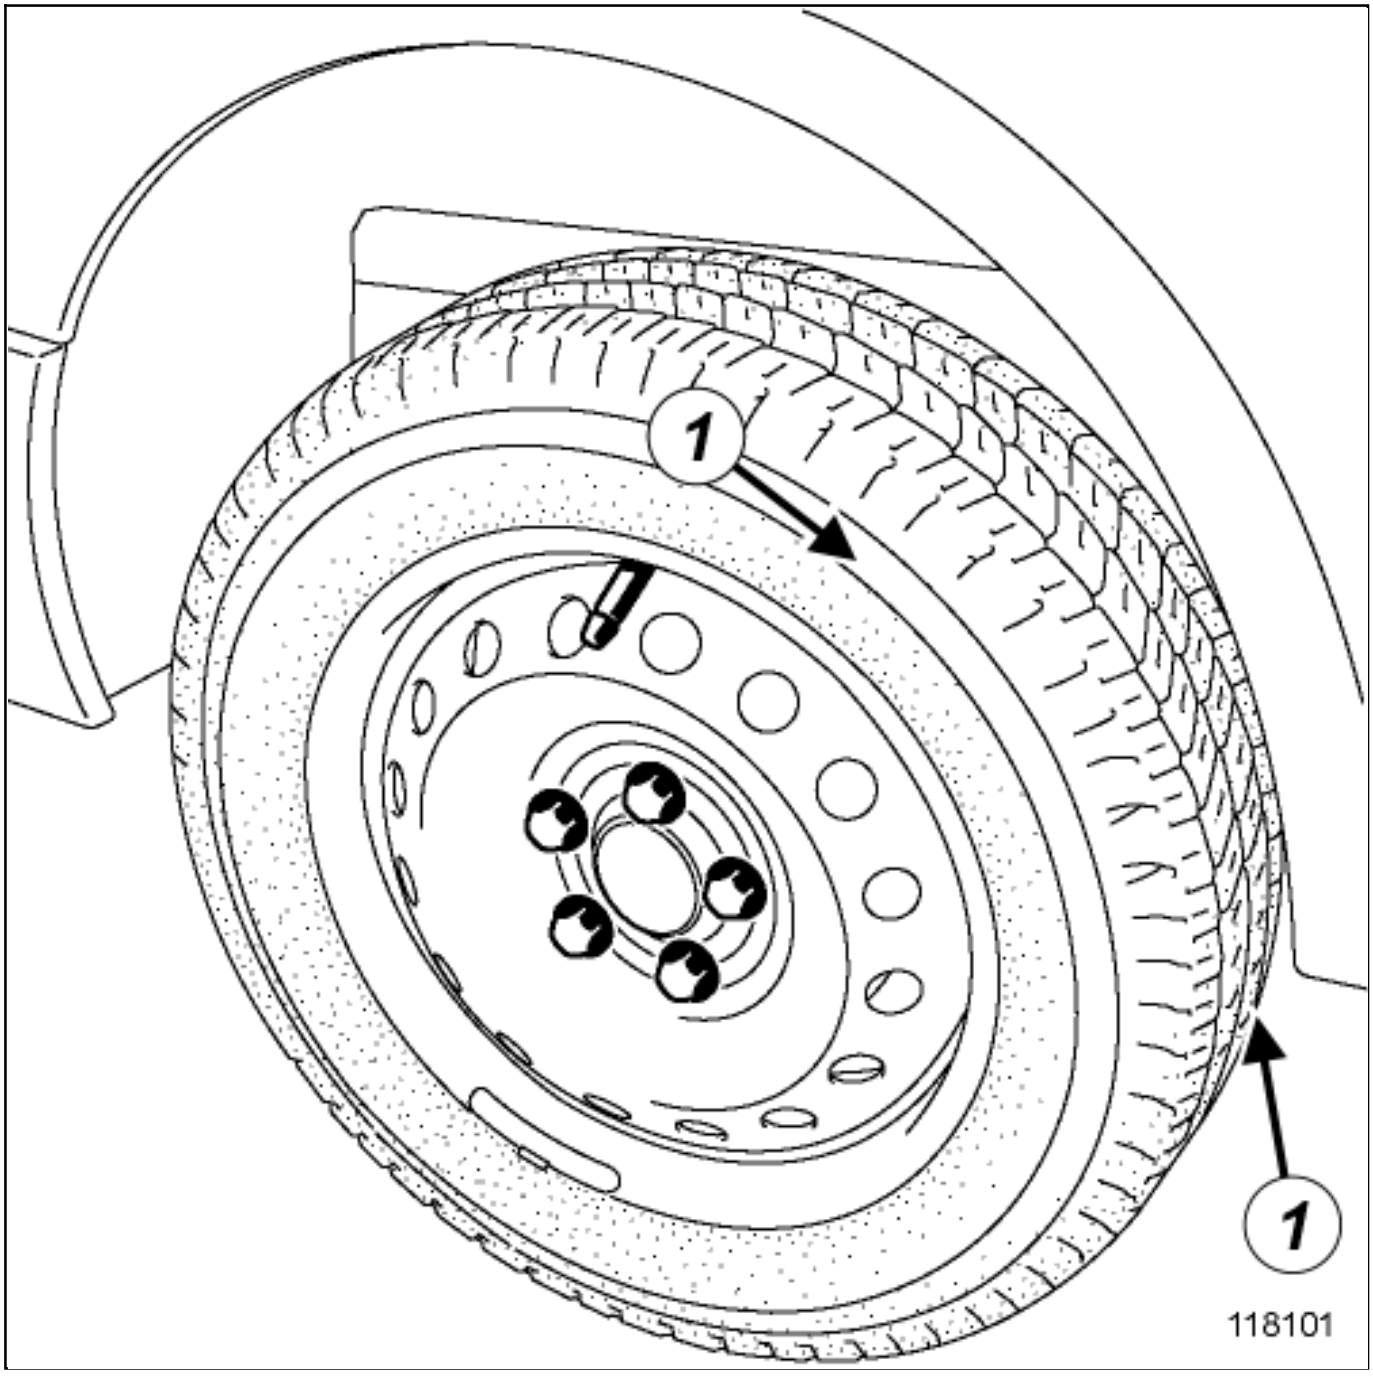
2. REMOVAL OPERATION

- Loosen the wheel bolts with the wheel on the ground.

Note:

Use sockets with protective sheaths in order to avoid scratching the alloy wheel rims.

- Raise the lift.
- Remove:
  - the wheel bolts,



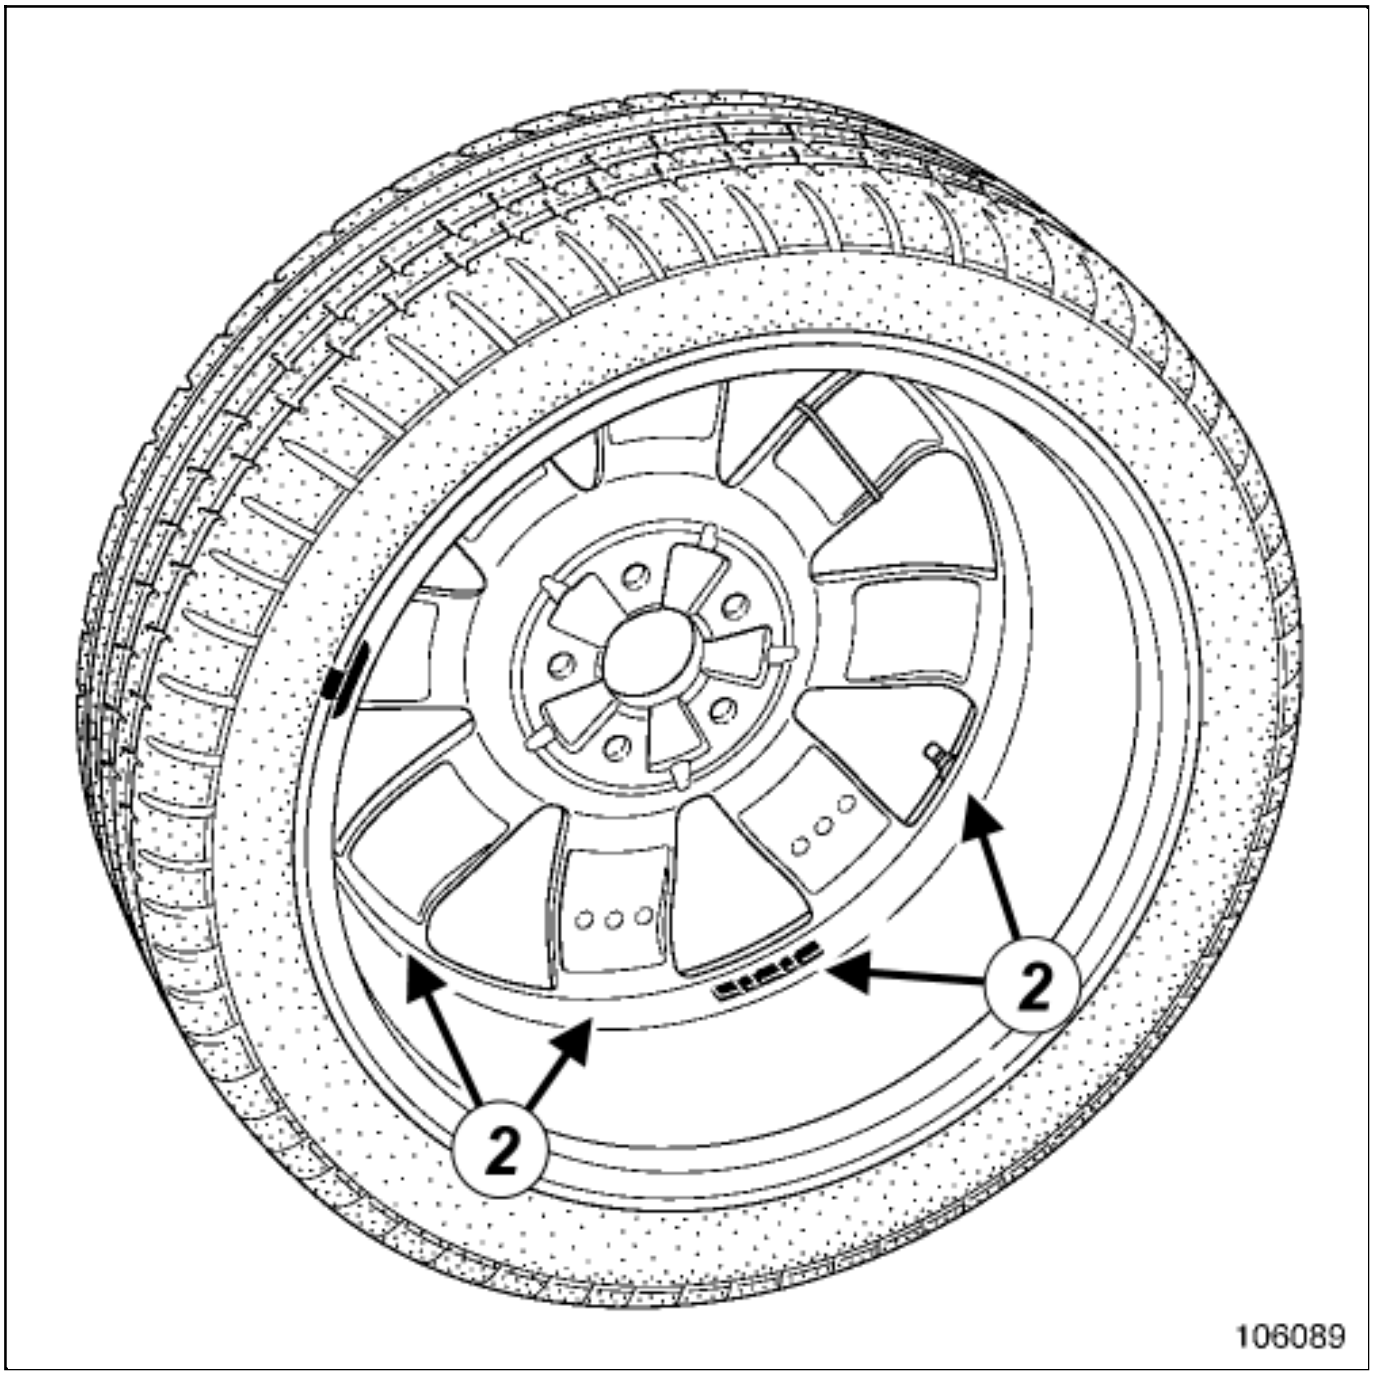
the wheel.

1- IF THE WHEEL CANNOT BE REMOVED AFTER THE BOLT HAS BEEN UNDONE:

Position all the wheel bolts.

Tighten the wheel bolts to bring all the bolt heads into contact with the wheel.

Undo the wheel bolts by one turn.



Strike around the edge of the tyre walls(1) several times using a mallet on the inner and outer surfaces of the wheel to detach the wheel.

Remove:

- the wheel bolts,
- the wheel.

1)IF THIS PROCEDURE DOES NOT WORK:

Strike the inner surface of the wheel(2) using a mallet and a wooden block to detach it.

Note:

Do not strike the surface of the wheel using excessive force as this may damage it.

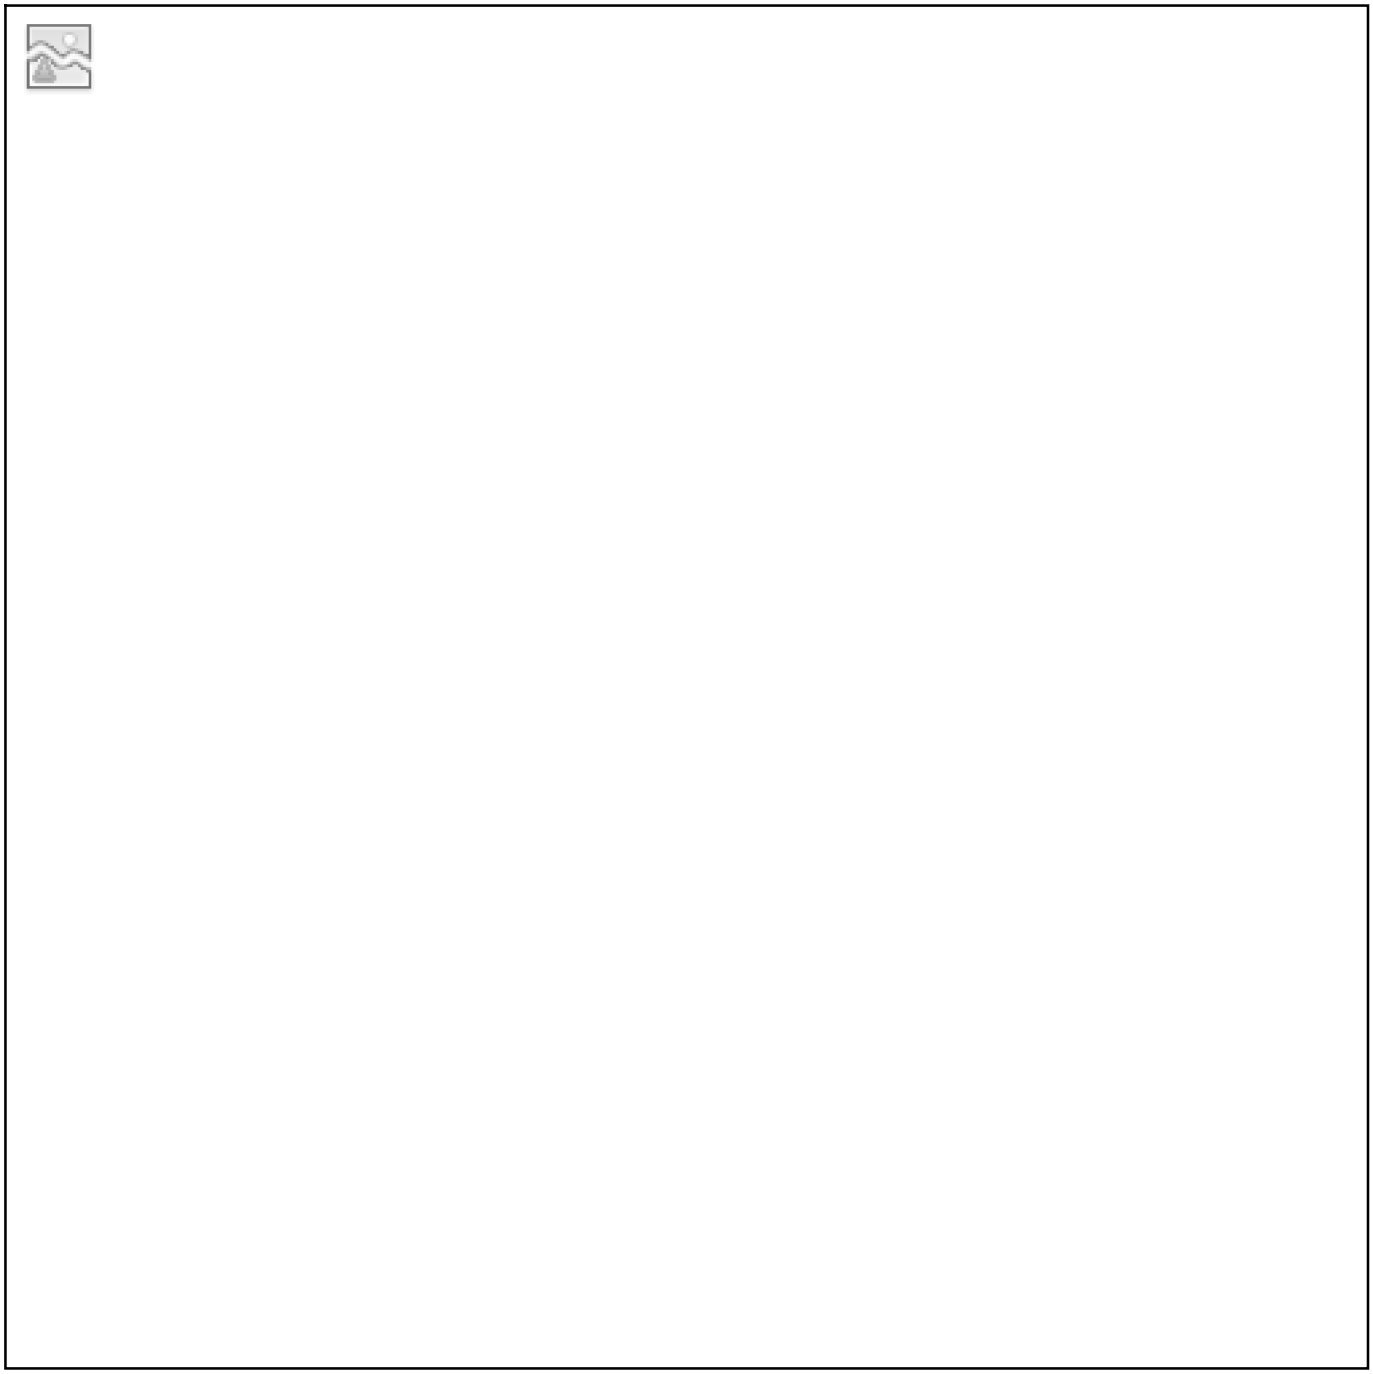
Remove:

- the wheel bolts,
- the wheel.

REFITTING

1. REFITTING PREPARATION OPERATION

- Clean the hub carrier using a wire brush.



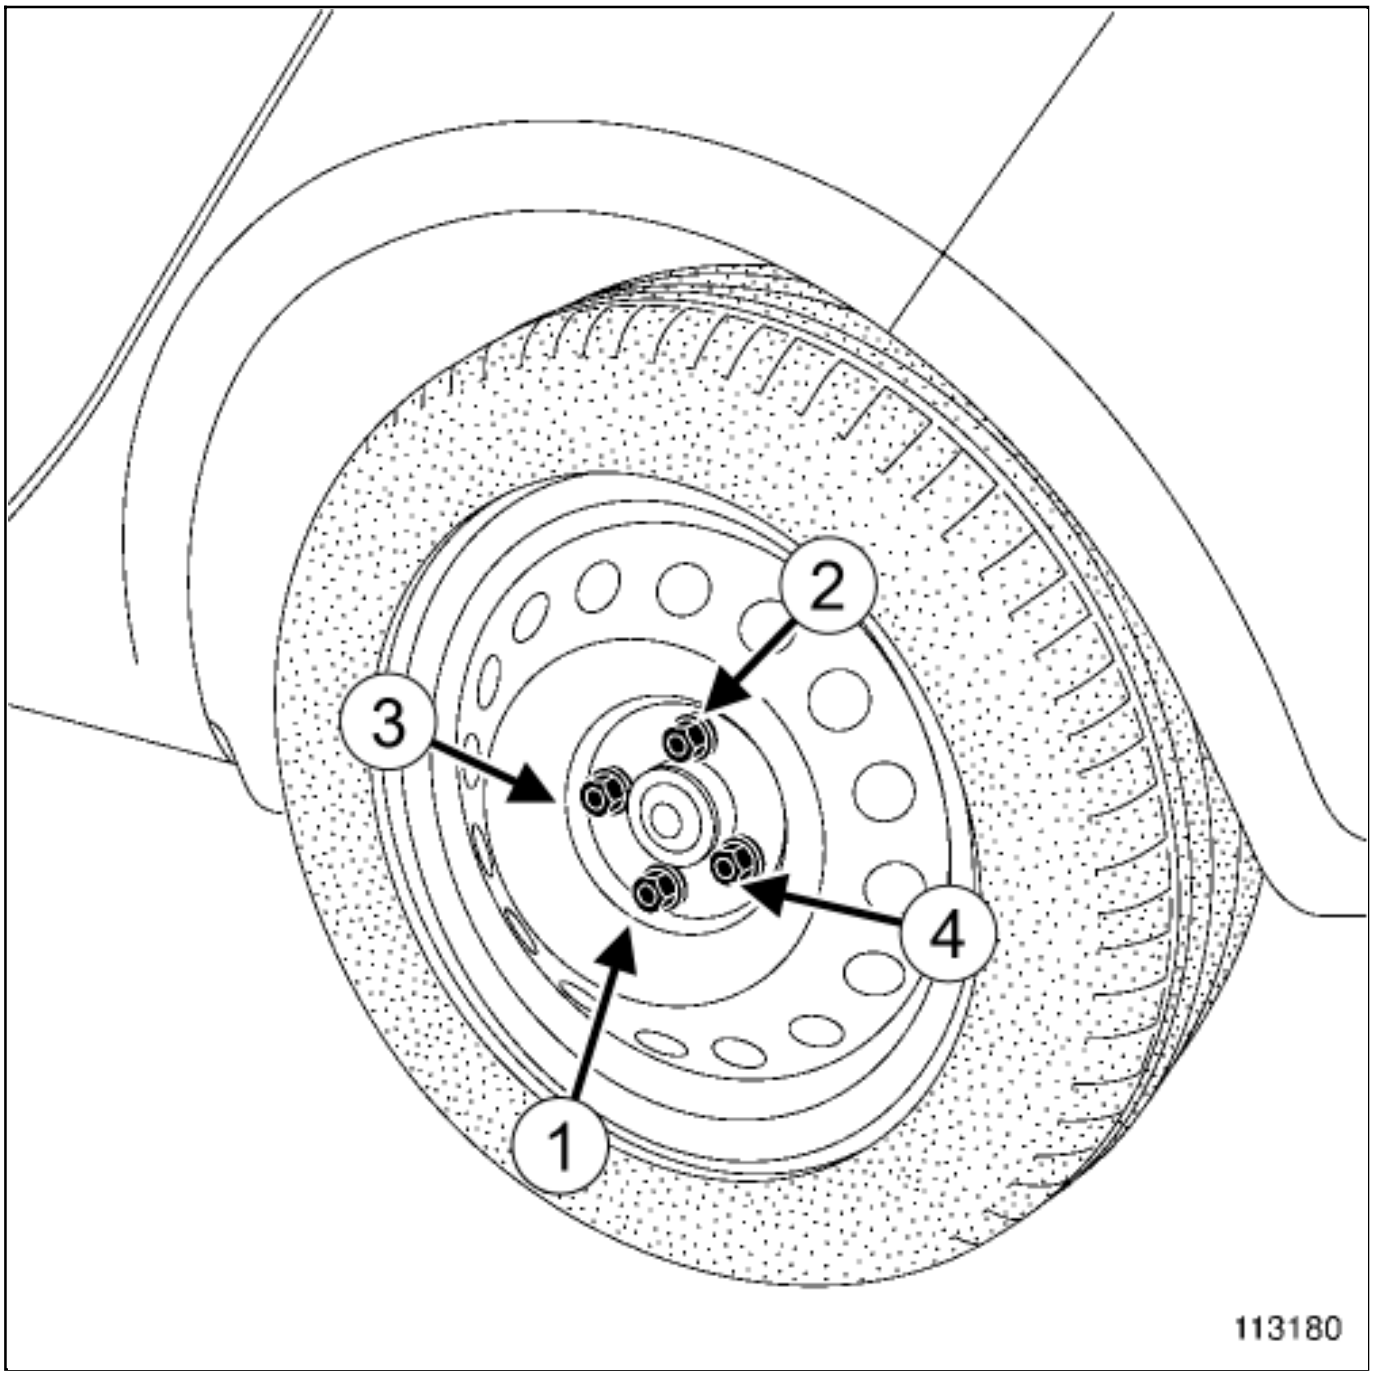
Note:

There are two types of wheel bolts for alloy and steel wheel rims; do not swap them.

- Check the condition of the tyre.
- Do not move or remove the balance weights.

2. REFITTING OPERATION

- Clean the mating surfaces between the wheel and the hub carrier using a wire brush.



Coat the wheel mating face(3) with COPPER ANTI-SEIZURE GREASE**Vehicle: Parts and consumables for the repair** .

Align the mark on the wheel with the mark made on the hub when it was removed.

Fit the wheel to the vehicle, positioning the valve at the top.

Insert the wheel bolts.

Tighten the wheel bolts to bring all the bolt heads into contact with the wheel.

Pretighten the wheel bolts to 30 N.m, with the wheel suspended, starting with the bolts at the bottom.

Rotate the wheel through 180˚to bring the valve into the bottom position.

Position the vehicle on its wheels.

Note:

Use sockets with protective sheaths in order to avoid scratching the alloy wheel rims.

Torque tighten the wheel bolts:

- **Front hub carrier assembly: Exploded view** ,
- **Rear hub carrier assembly: Exploded view** .

Refit the trim piece.

WHEEL: REMOVAL - REFITTING

The removal - refitting procedure is the same for all wheels.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Release the parking brake.
- Remove the trim .
- Position the wheel so that the valve is at the top.
- Mark the position of the wheel on the hub.

Note:

- 

  This mark is required in order to:
  - Note the original position of the wheel on the hub,
  - perform the balancing operation.

2. REMOVAL OPERATION

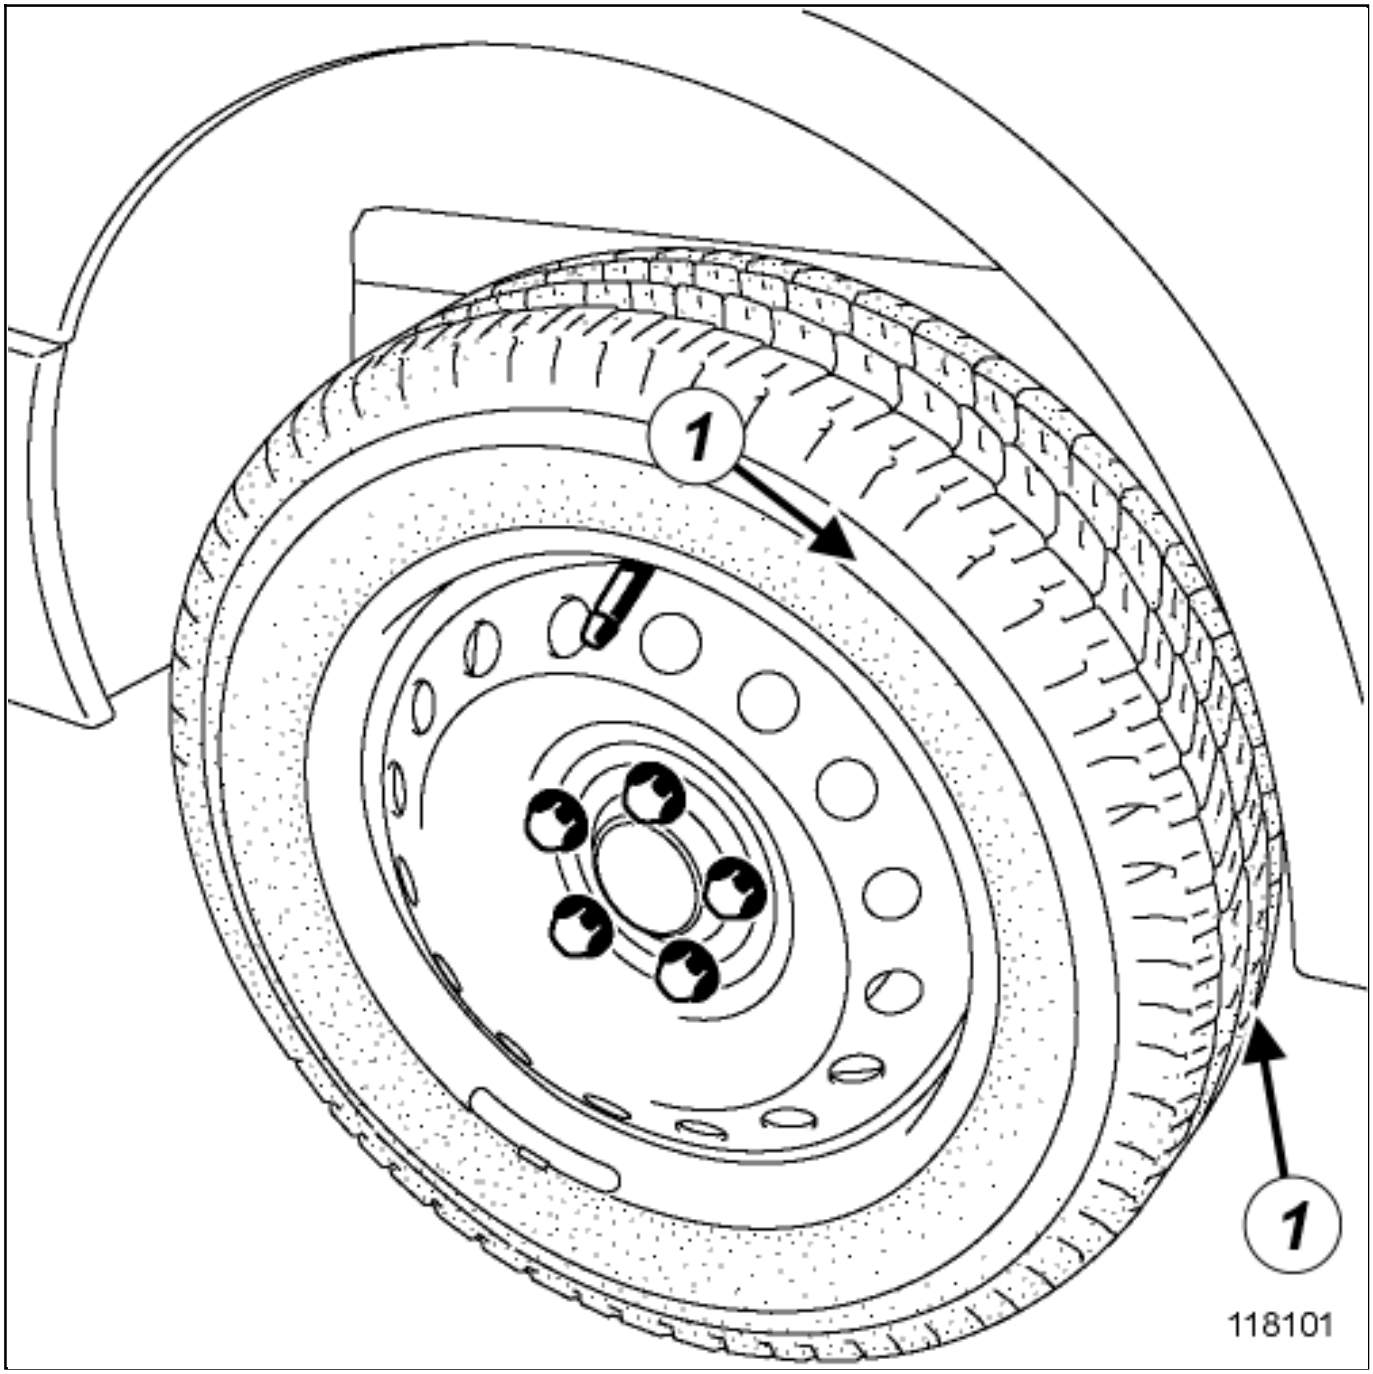
- Loosen the wheel bolts with the wheel on the ground.

Note:

Use sockets with protective sheaths in order to avoid scratching the alloy wheel rims.

Raise the lift.

Remove:



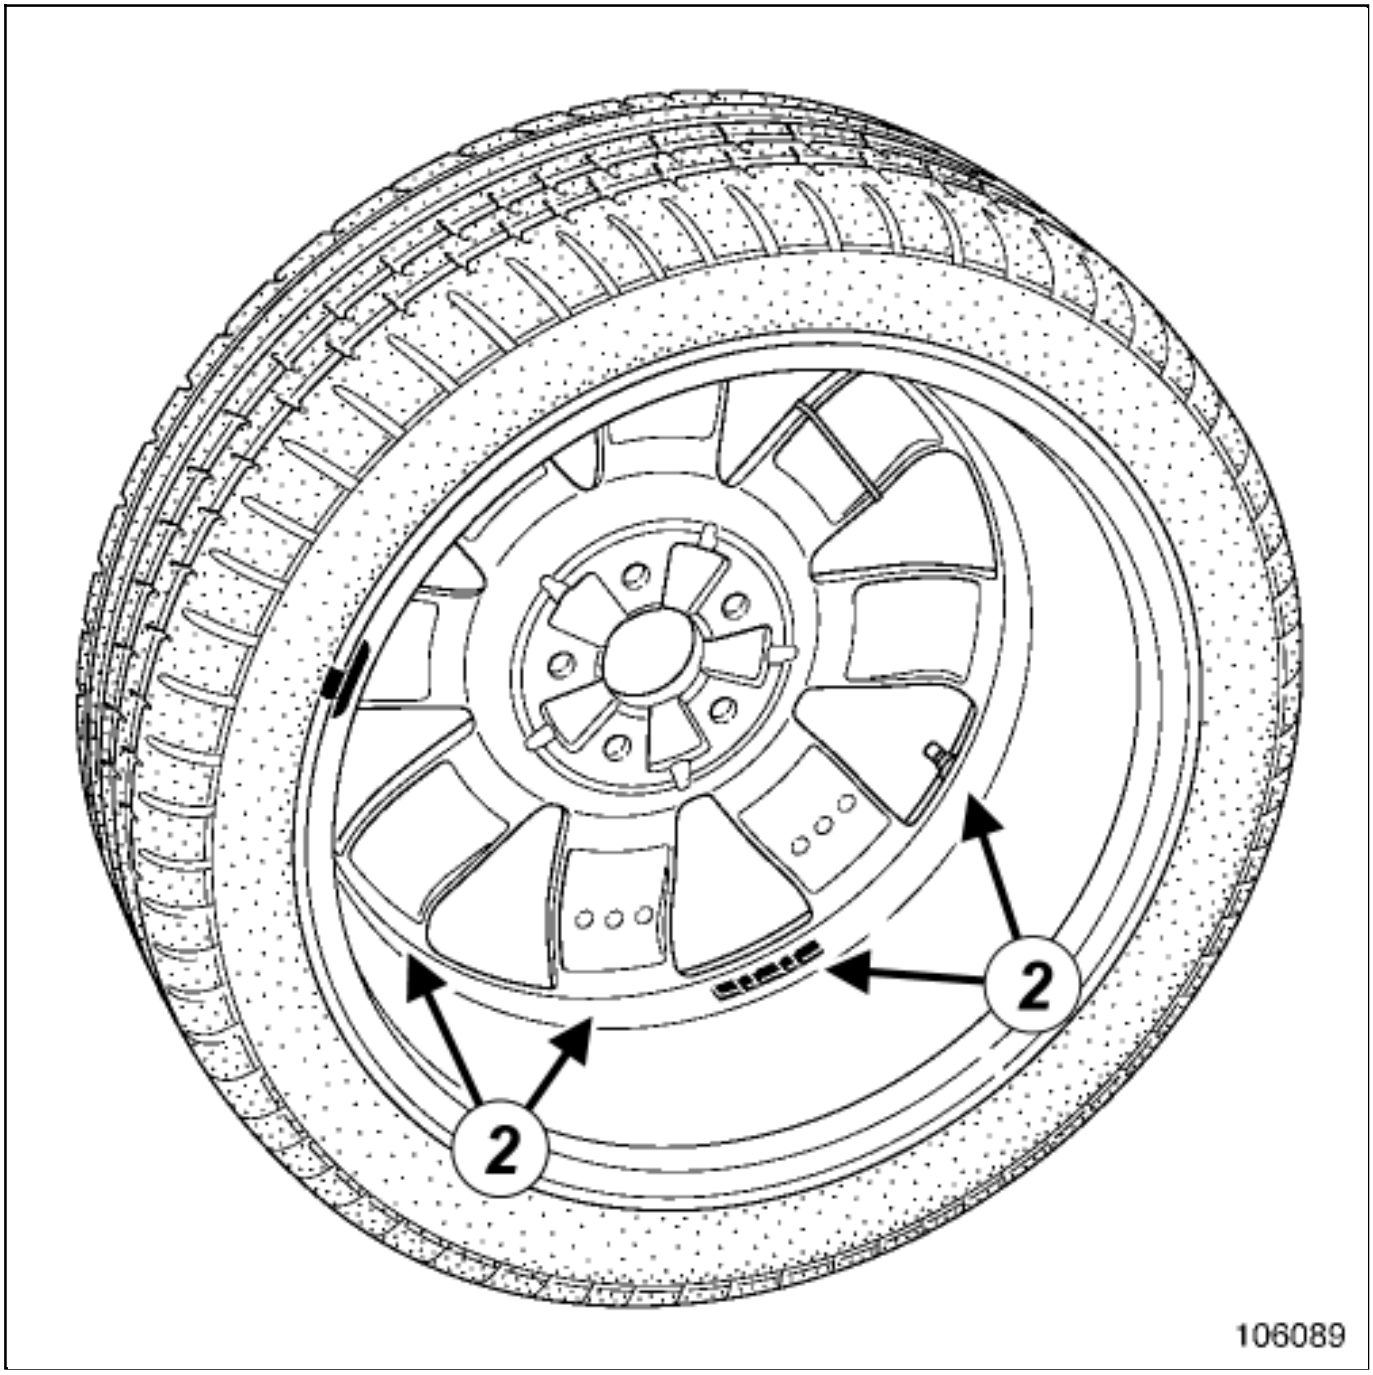
- the wheel bolts,
- the wheel.

1- IF THE WHEEL CANNOT BE REMOVED AFTER THE BOLT HAS BEEN UNDONE:

Position all the wheel bolts.

Tighten the wheel bolts to bring all the bolt heads into contact with the wheel.

Undo the wheel bolts by one turn.



Strike around the edge of the tyre walls(1) several times using a mallet on the inner and outer surfaces of the wheel to detach the wheel.

Remove:

- the wheel bolts,
- the wheel.

1)IF THIS PROCEDURE DOES NOT WORK:

Strike the inner surface of the wheel(2) using a mallet and a wooden block to detach it.

Note:

Do not strike the surface of the wheel using excessive force as this may damage it.

Remove:

- the wheel bolts,
- the wheel.

REFITTING

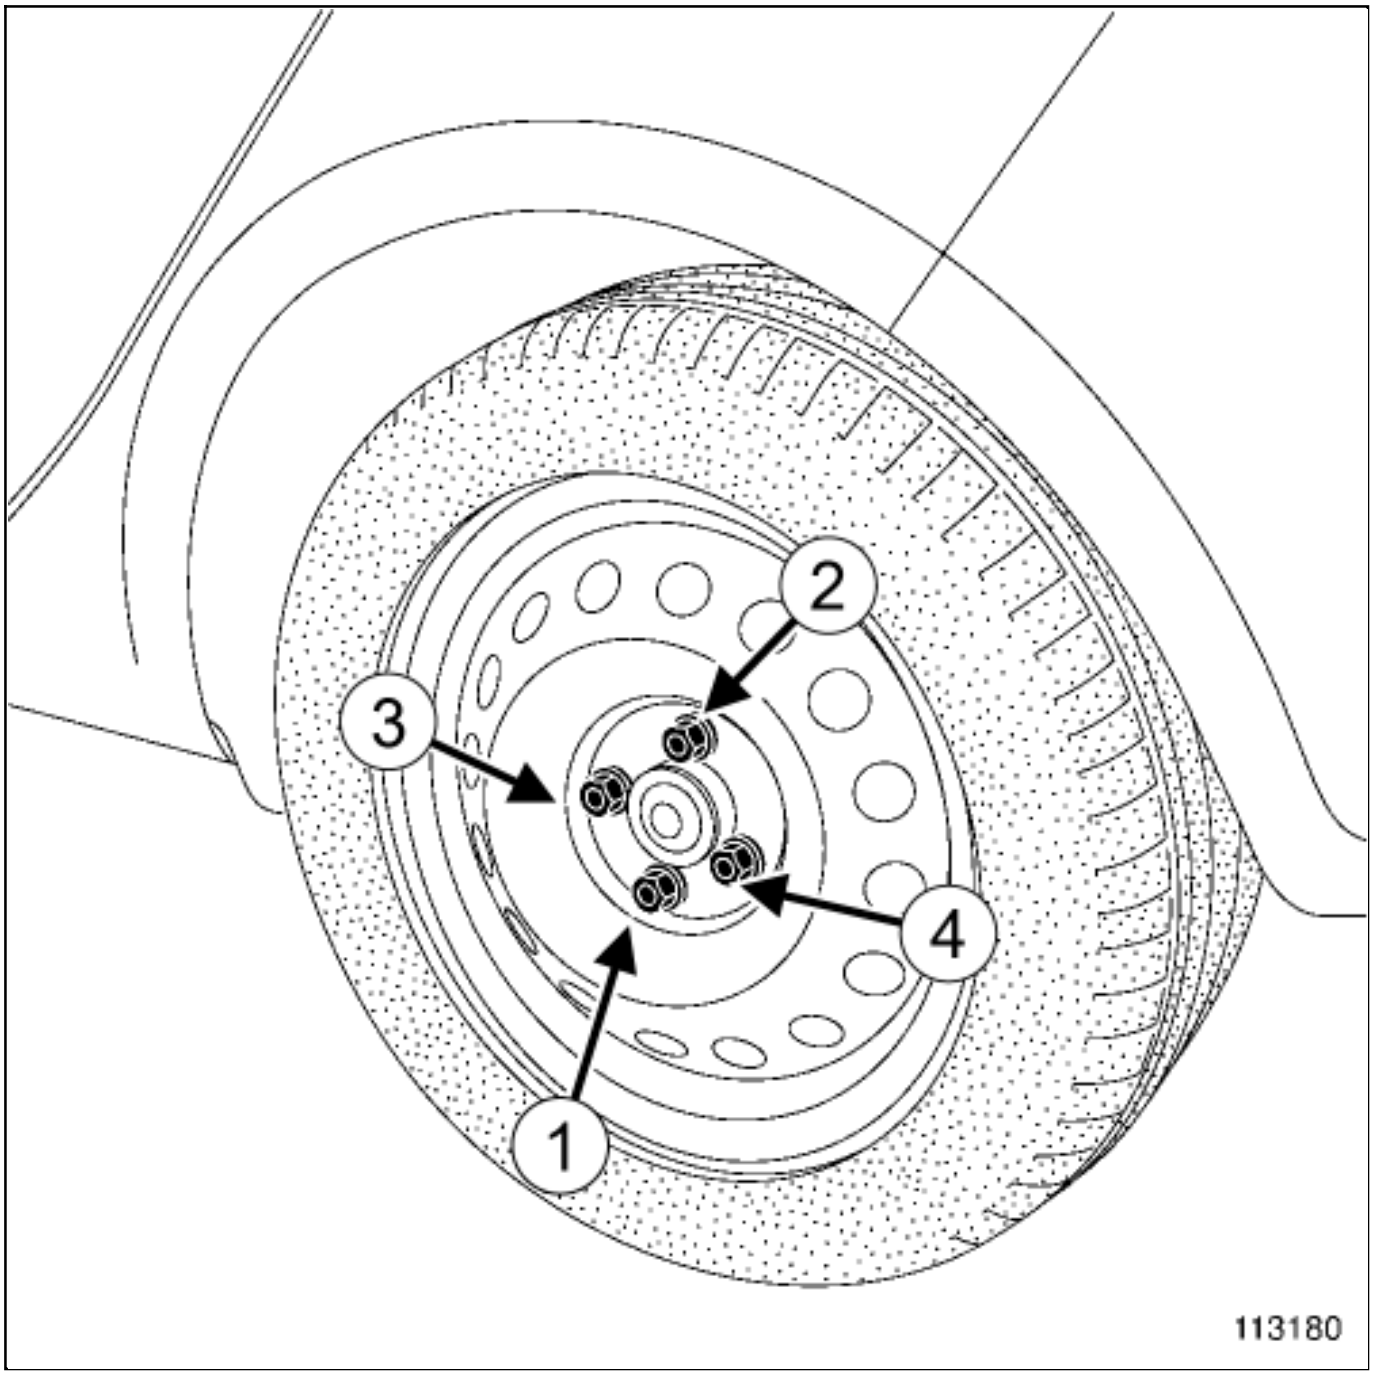
1. REFITTING PREPARATION OPERATION

Clean the hub carrier using a wire brush.

> Note:
>
> There are two types of wheel bolts for alloy and steel wheel rims; do not swap them.

Check the condition of the tyre.

Do not move or remove the balance weights.



2. REFITTING OPERATION

Clean the mating surfaces between the wheel and the hub carrier using a wire brush.

Align the mark on the wheel with the mark made on the hub when it was removed.

Fit the wheel to the vehicle, positioning the valve at the top.

Insert the wheel bolts.

Tighten the wheel bolts to bring all the bolt heads into contact with the wheel.

Pretighten the wheel bolts to 30 N.m, with the wheel suspended, starting with the bolts at the bottom.

Rotate the wheel through 180˚to bring the valve into the bottom position.

Position the vehicle on its wheels.

Note:

Use sockets with protective sheaths in order to avoid scratching the alloy wheel rims.

Torque tighten the wheel bolts:

- Front hub carrier assembly: Exploded view ,
- Rear hub carrier assembly: Exploded view .

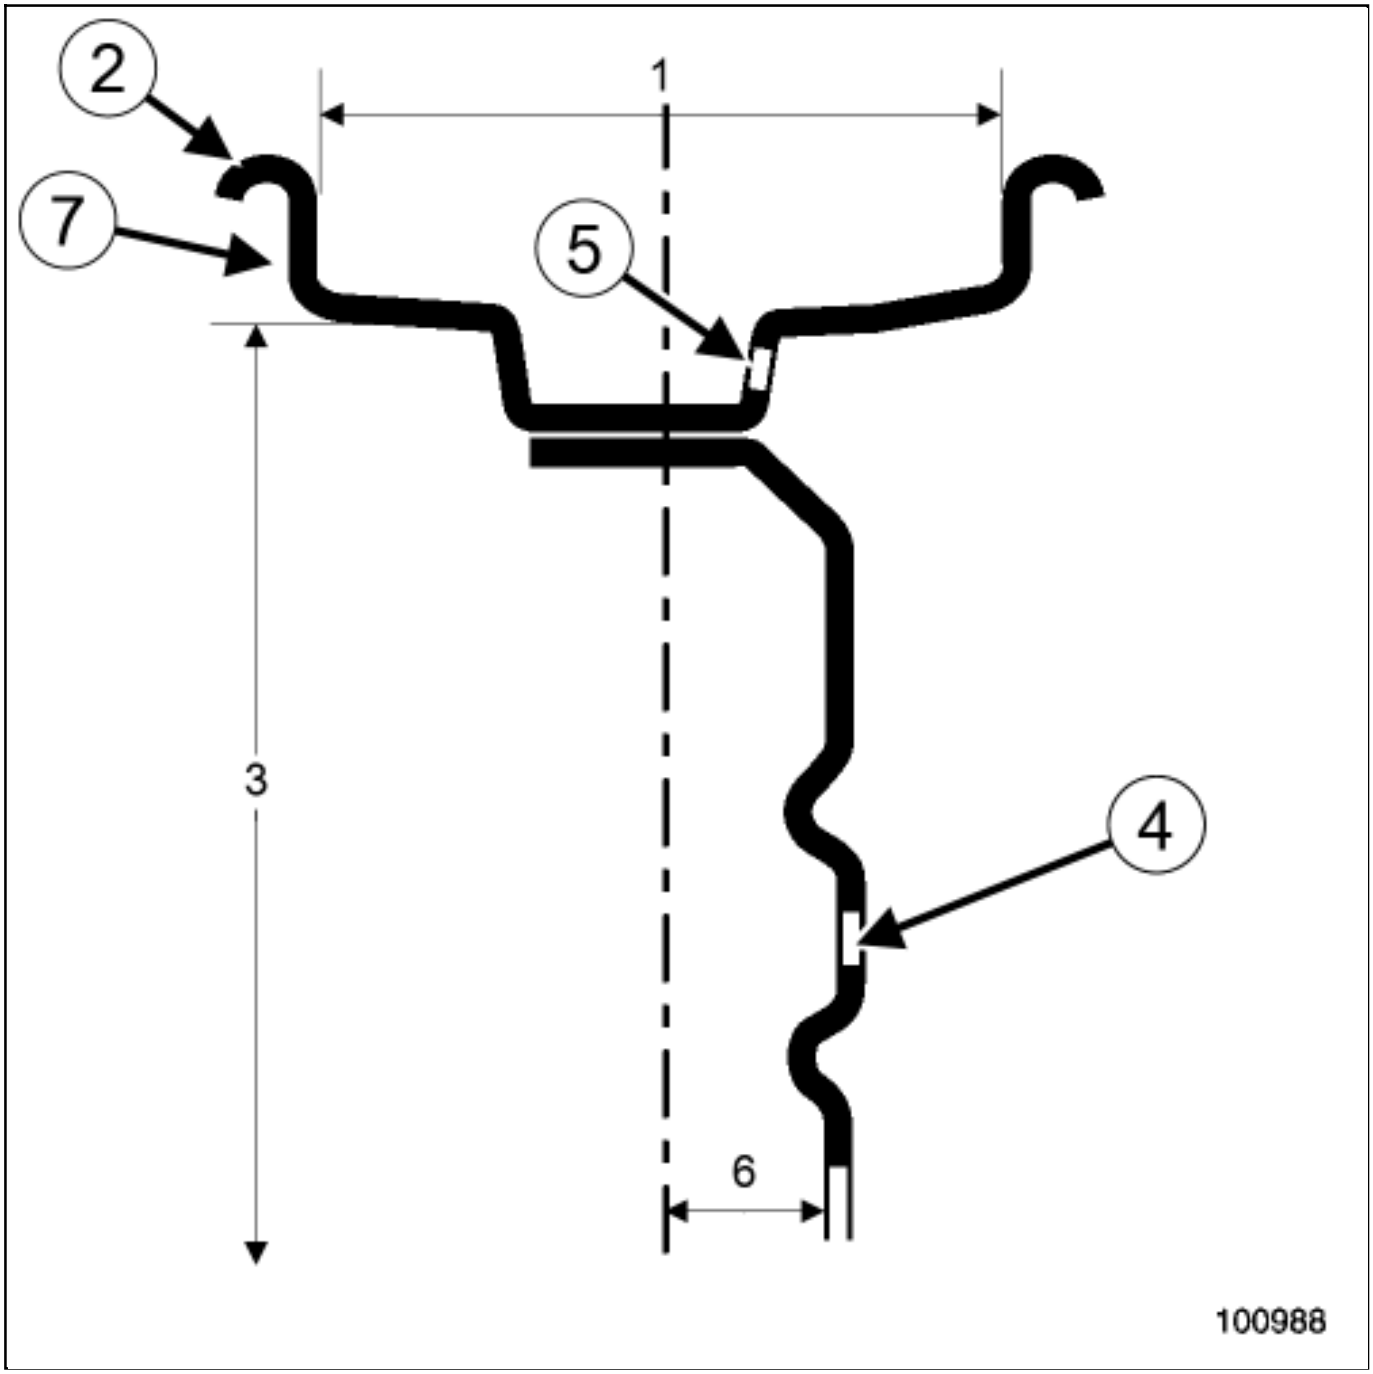
Refit the trim piece.

WHEELRIMIDENTIFICATION

1. IDENTIFICATION

1- MARKING

There are two types of identification marking on the wheel rims:



- engraved marking for steel wheel rims,
- cast marking for alloy wheel rims.

The marking gives the main dimensional specifications of the wheel rim.

This marking may be:

- complete, for example 6 J 15 5 CH 36,
- simplified, for example 6 J 15.

	Wheel type	6 J 15
1	Width (in inches)	6
2	Rim edge profile	J
3	Nominal diameter (in inches)	15
4	Number of holes	5
5	Anchorage profile of the tyre	CH
6	Offset (in mm)	36

There are 3 types of wheel rim edges(2) :

- those with two flat edges,
- those with two raised edges,
- those with one flat edge and one raised edge.

2- INSTALLATION DIAMETER FOR THE WHEEL BOLTS

The wheel bolts are positioned with a pitch circle diameter of 100 mm(4 holes).

3- RIM RUN-OUT

The maximum run-out is measured at the wheel rim edge(7) .

Steel wheel rims: 0.8 mm

Alloy wheel rims: 0.3 mm

4- OUT-OF-ROUNDNESS

The maximum out-of-round value is measured on the tyre bead bearing surface.

Steel wheel rims: 0.7 mm

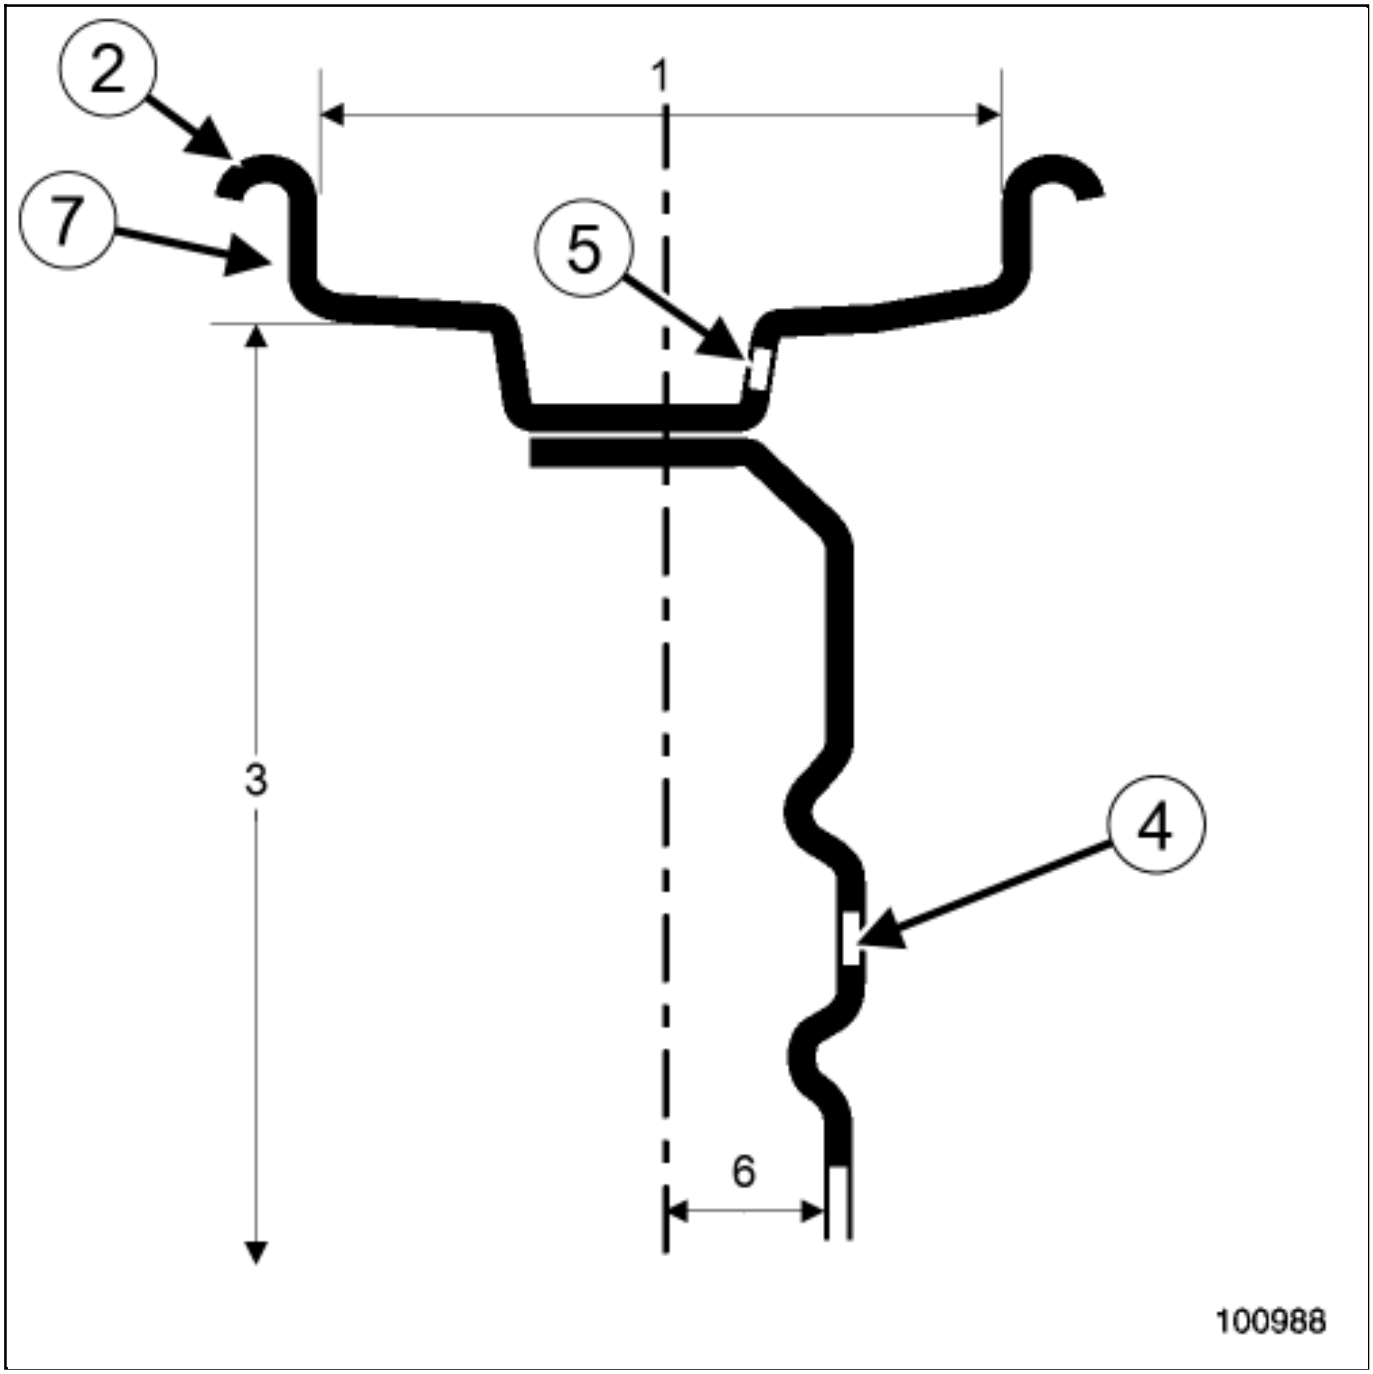
Alloy wheel rims: 0.3 mm

WHEELRIMIDENTIFICATION

1. IDENTIFICATION

1- MARKING

There are two types of identification marking on the wheel rims:



- engraved marking for steel wheel rims,
- cast marking for alloy wheel rims.

The marking gives the main dimensional specifications of the wheel rim.

This marking may be:

- complete, for example 6 J 15 5 CH 36,
- simplified, for example 6 J 15.

	Wheel type	**6 J 15**
1	Width (in inches)	6
2	Rim edge profile	J
3	Nominal diameter (in inches)	15
4	Number of holes	5
5	Anchorage profile of the tyre	CH
6	Offset (in mm)	36

There are 3 types of wheel rim edges(2) :

- those with two flat edges,
- those with two raised edges,
- those with one flat edge and one raised edge.

2- INSTALLATION DIAMETER FOR THE WHEEL BOLTS

The wheel bolts are positioned with a pitch circle diameter of 100 mm(4 holes).

3- RIM RUN-OUT

The maximum run-out is measured at the wheel rim edge(7) .

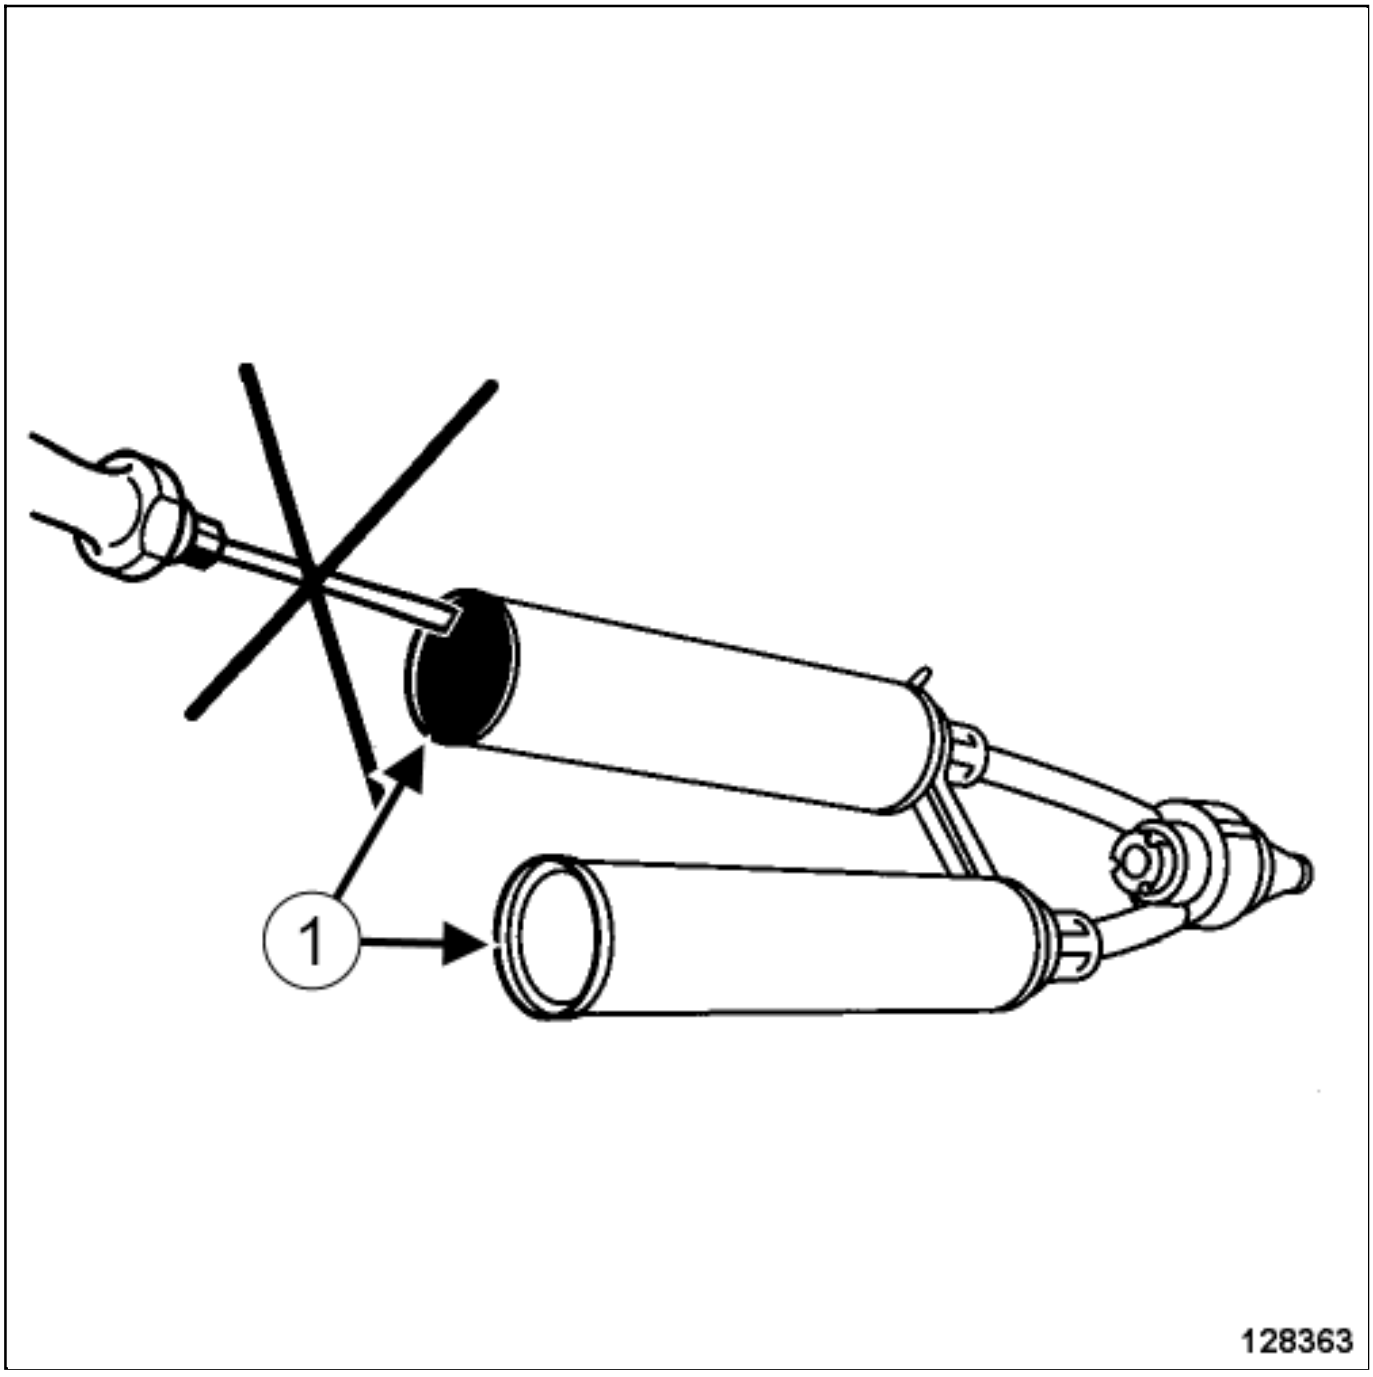
Steel wheel rims: 0.8 mm

Alloy wheel rims: 0.3 mm

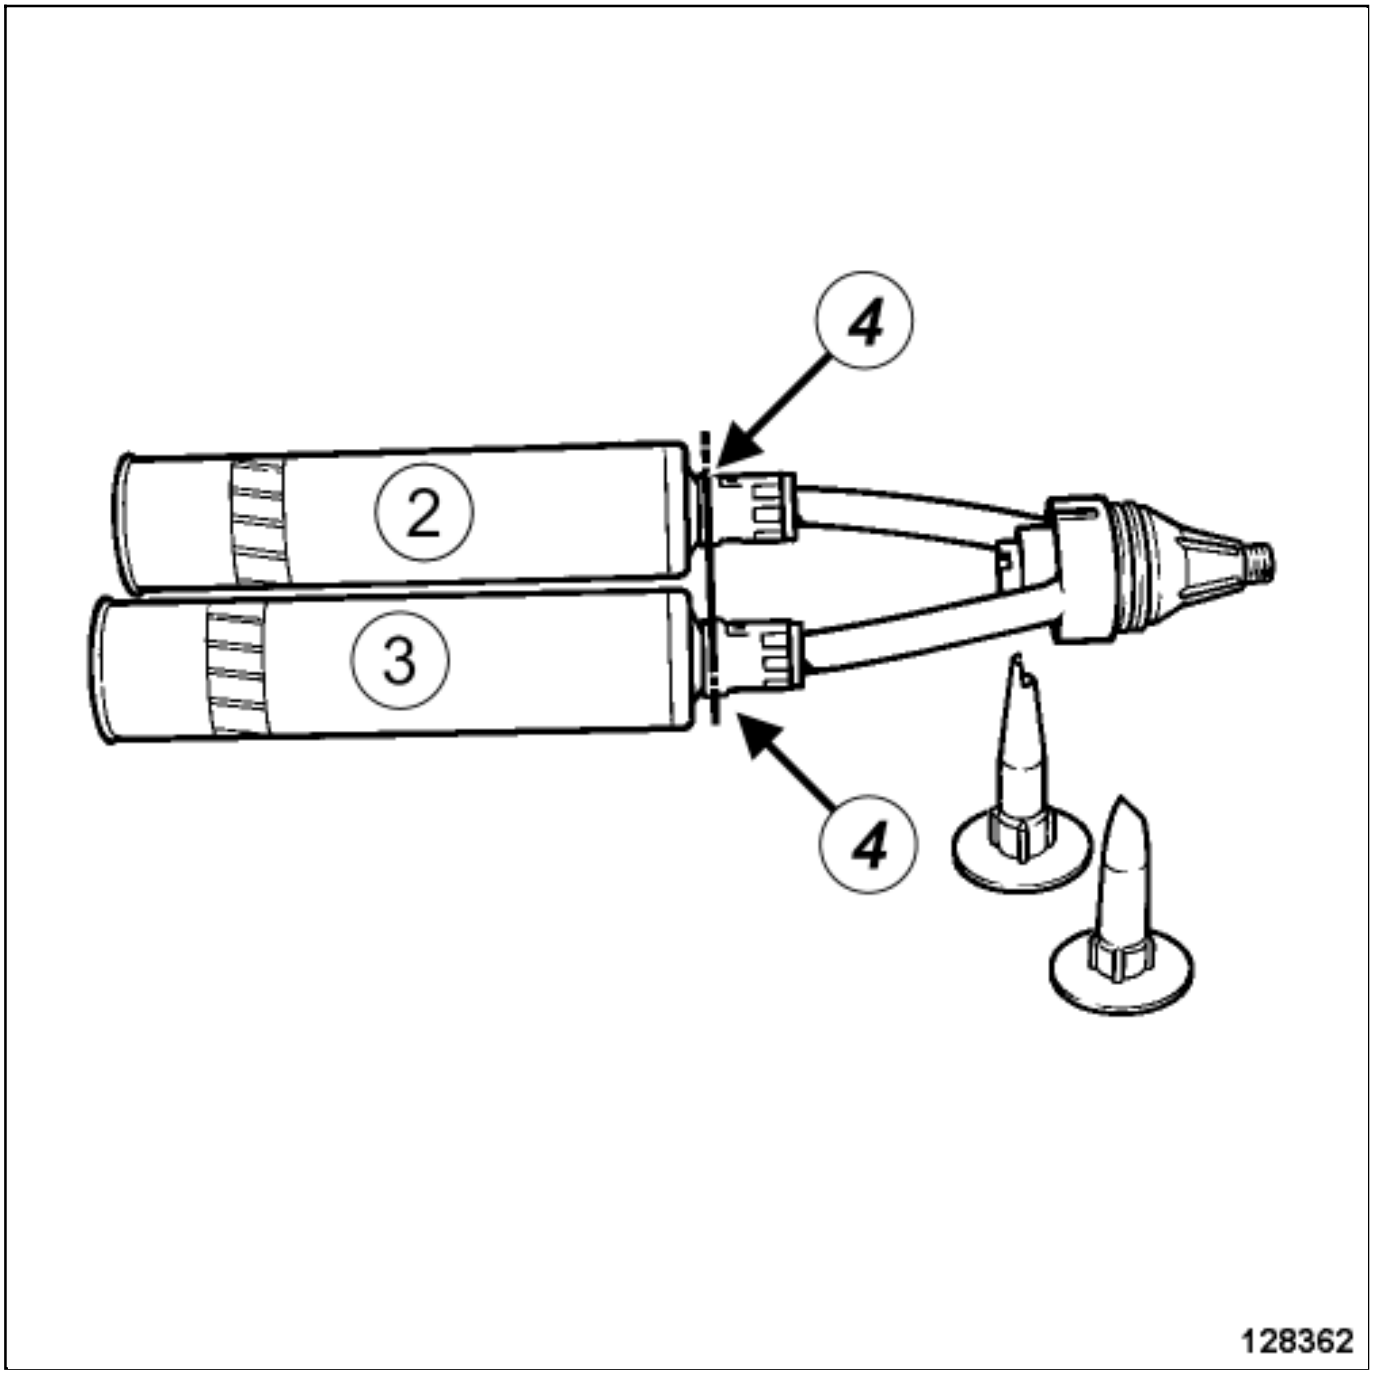
4- OUT-OF-ROUNDNESS

The maximum out-of-round value is measured on the tyre bead bearing surface.

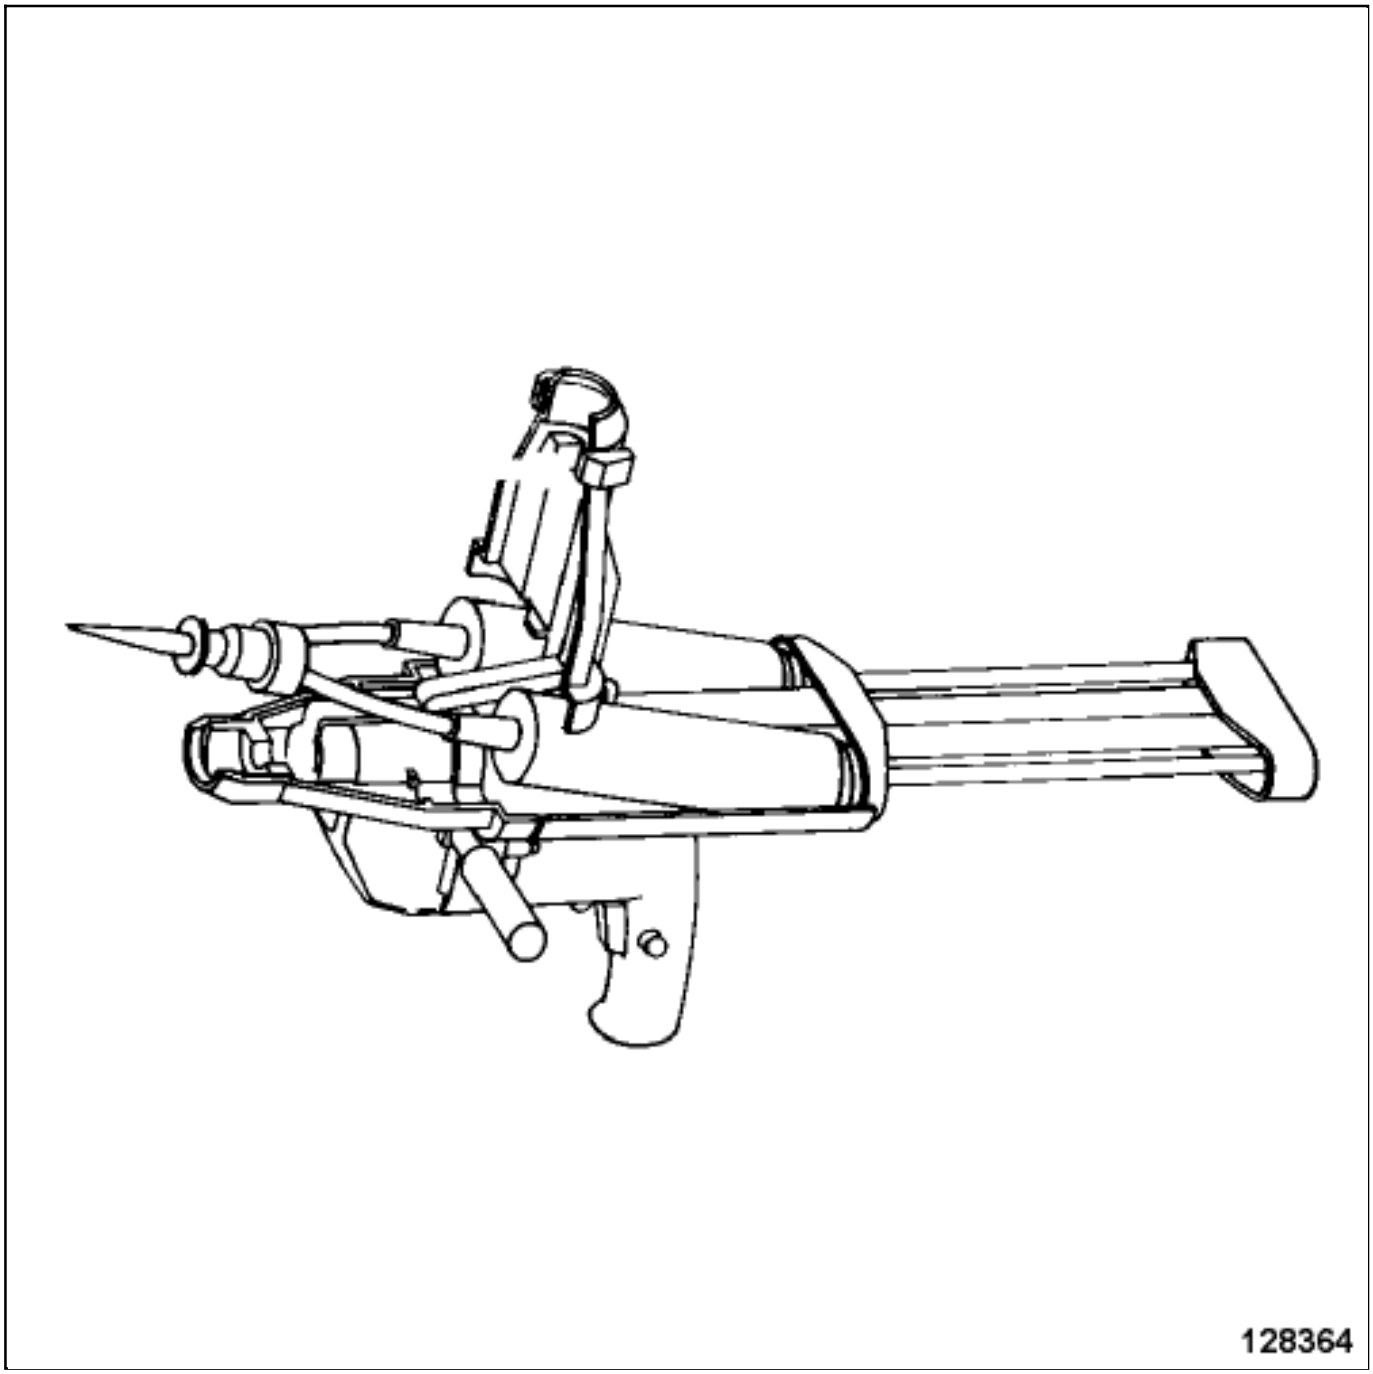
Steel wheel rims: 0.7 mm



Alloy wheel rims: 0.3 mm



WINDOW BONDING TOOL: USE



Note:

When bonding windows using a two-component mastic, in order to guarantee good bonding you must always take the following recommendations into account.

1. TWIN MASTIC AND ACTIVATOR CARTRIDGE PROTECTIVE CAPS

4
2
3
4
128362

- The twin cartridges of the two-component mastic kit have pre-cut metal protective caps(1) .

These discs are automatically removed when theBETAGUNis operated.

When the two actuating arms of the gun are pushed in, the protective caps separate from the cartridges and the two products(2) and (3) pass simultaneously to their ends(4) on the mixer nozzle side.

The mastic and its activator can then be extruded and mixed.

Note:

Do not remove the front protective caps(1) before fitting the twin cartridges in the glue gun.

If these protective caps are not present, the gun presses directly on the plastic pistons and compresses the mastic and activator before it strikes the cartridges.

As the products are of different densities, the two cartridges do not burst simultaneously and the mixture of the two products is no longer guaranteed.

WINDOW BONDING: DESCRIPTION

1. PREPARATION AND BONDING PROCEDURES

Special notes on the preparation and bonding operations for windows

For cutting(see 54A, Windows, Window detachment: Description) operations.

On bodywork components	
Original bodywork component: Example: "removal - refitting" and/or replacement of windows	Procedure 1
Bodywork component repaired and/or replaced: Example: replacement of roof, windscreen frame	Procedure 2
New bodywork component(Parts department): Example: bare body supplied painted, cataphoretic steel tailgate, primed plastic tailgate	Procedure 3

On windows	
New windows(Parts Department)	Procedure 4
New POLYCARBONATE windows(Parts Department)	Procedure 5
Removed window (with residual bead)	Procedure 6
Removed POLYCARBONATE window(with residual bead)	Procedure 7

2. PROCEDURE 1: ON ORIGINAL BODYWORK COMPONENT

1- FOR ALL BODY TYPES

Carefully clean the bonding area with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products) avoiding the cement bead.

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Grind the residual beading (leave a thickness of 1 to 2 mm of cement bead).

Note:

In the case of paint damage larger than 1 mm, apply a layer of primer (green and red marking) with a single, uniform stroke over the entire damaged area.

Let it dry for a minimum of 10 minutes.

Apply the primer with a single, uniform stroke onto the entire bonding area (residual/lacquer beading).

Let it dry for a minimum of 10 minutes.

Prepare the window (see procedure 4 or 5).

Apply the cement bead (preferably onto the window).

Bond the window immediately.

3. PROCEDURE 2: ON REPAIRED AND/OR REPLACED BODYWORK COMPONENT

1- BEFORE PAINTING

Carefully clean the bonding area with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products) avoiding the cement bead.

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Before applying the paint range, protect the bonding area with masking tape.

2- AFTER PAINTING

Remove the masking tape.

Clean the bonding area carefully with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Grind the residual beading (leave a thickness of 1 to 2 mm of cement bead).

Apply the primer with 2 uniform strokes over the entire bonding area, waiting a minimum of 10 minutes between strokes.

Let it dry for a minimum of 10 minutes.

Note:

Apply the primer 1 hour after the component is completely dry and cooled.

Prepare the window (see procedure 4 or 5).

Apply the cement bead (preferably onto the window).

Bond the window immediately.

4. PROCEDURE 3: ON NEW BODYWORK COMPONENT (PARTS DEPARTMENT)

1- BEFORE PAINTING

Sand lightly using a grey pad Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Clean the bonding area carefully with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Before applying paint range, protect the bonding area with masking tape.

2- AFTER PAINTING

1)FOR ALL BODY TYPES

Remove the masking tape.

Clean the bonding area carefully with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Apply the primer over the entire bonding area.

Note:

Apply the primer 1 hour after the component is completely dry and cooled.

Let it dry for a minimum of 10 minutes.

Prepare the window (see procedure 4 or 5).

Apply the cement bead (preferably onto the window).

Bond the window immediately.

5. PROCEDURE 4: ON A NEW WINDOW (PARTS DEPARTMENT)

Ensure you have the correct window.

Check that there are no faults or cracks.

Clean the bonding area carefully with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Fit the trims (according to the vehicle).

Carry out a test assembly for the vehicle window.

Apply the glass cleaner/activator with a pre-soaked wipe.

Clean immediately with the dry wipe.

Apply the primer with a single, uniform stroke around the outside edge of the window, along the bonding line.

Let it dry for a minimum of 10 minutes.

Apply the cement bead.

Bond the window immediately.

6. PROCEDURE 5: ON NEW POLYCARBONATE WINDOWS

7. PROCEDURE 6: ON REMOVED WINDOW (WITH RESIDUAL BEADING)

Check that there are no faults or cracks.

Carefully clean the bonding area with heptane Vehicle: Parts and consumables for the repair (04B, Consumables - Products) avoiding the cement bead.

Wipe the bonding area using a lint-free cloth Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Grind the residual beading (leave a thickness of 1 to 2 mm of cement bead).

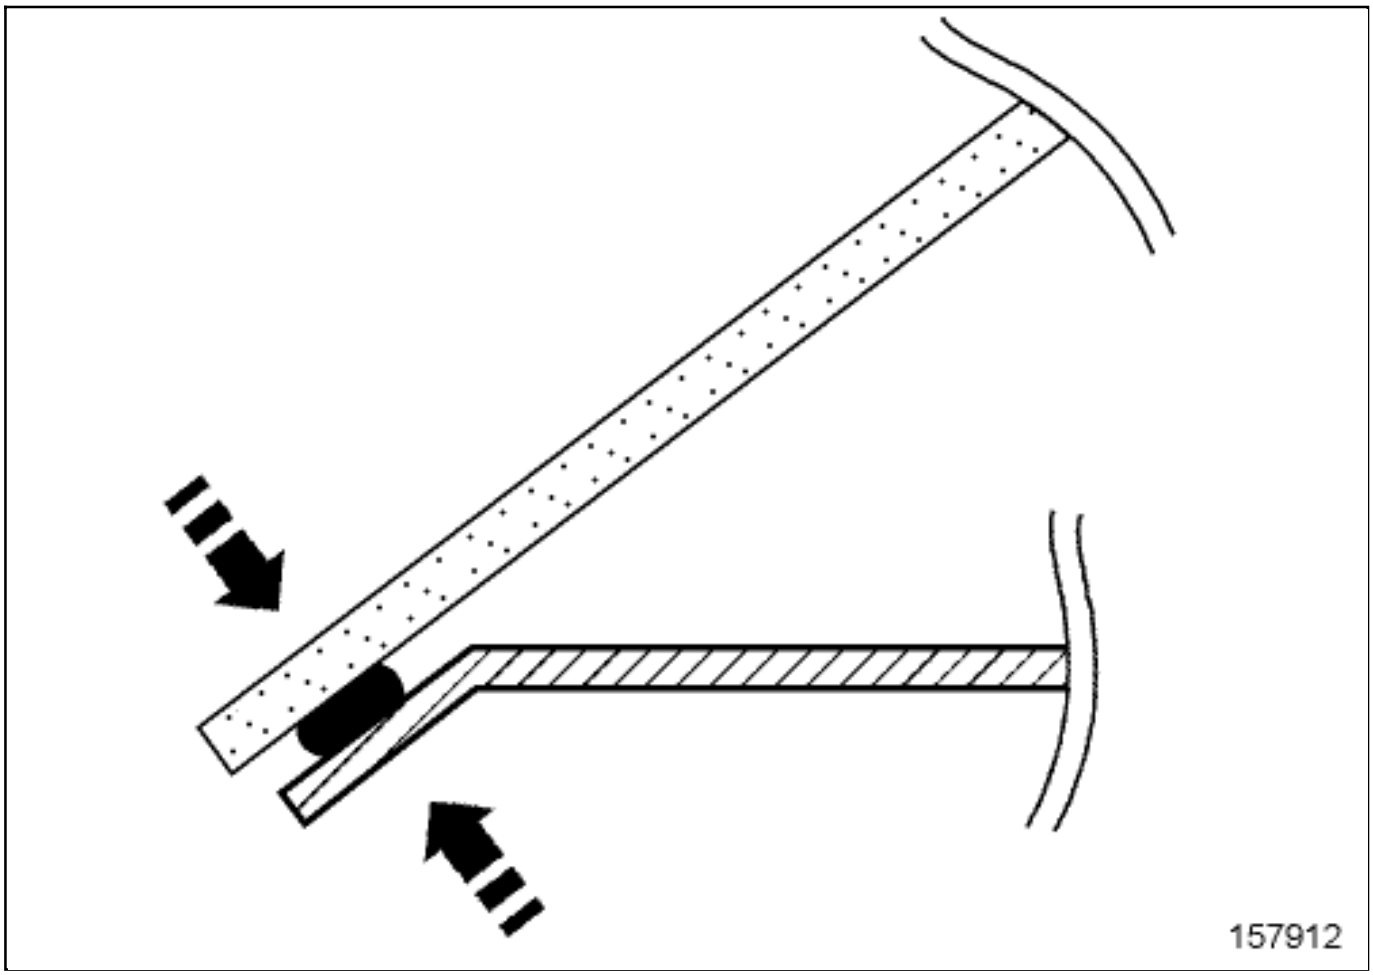
Fit the trims (according to the vehicle).

Carry out a test assembly for the vehicle window.

Note:

If there is an area with no residual beading on the window (for example: difficulty in adhering):

- apply the glass cleaner/activator using a pre-soaked wipe along the bonding line,
- wipe with a dry cloth.



Apply the primer (green and red marking) with a single, uniform stroke over the entire bonding area.

Let it dry for a minimum of 10 minutes.

Apply the cement bead.

Bond the window immediately.

8. PROCEDURE 7: ON REMOVED POLYCARBONATE WINDOW (WITH RESIDUAL BEADING)

Refit the windscreen starting from the top.

Keep the windscreen in position using a dual suction cup between the windshield and the roof.

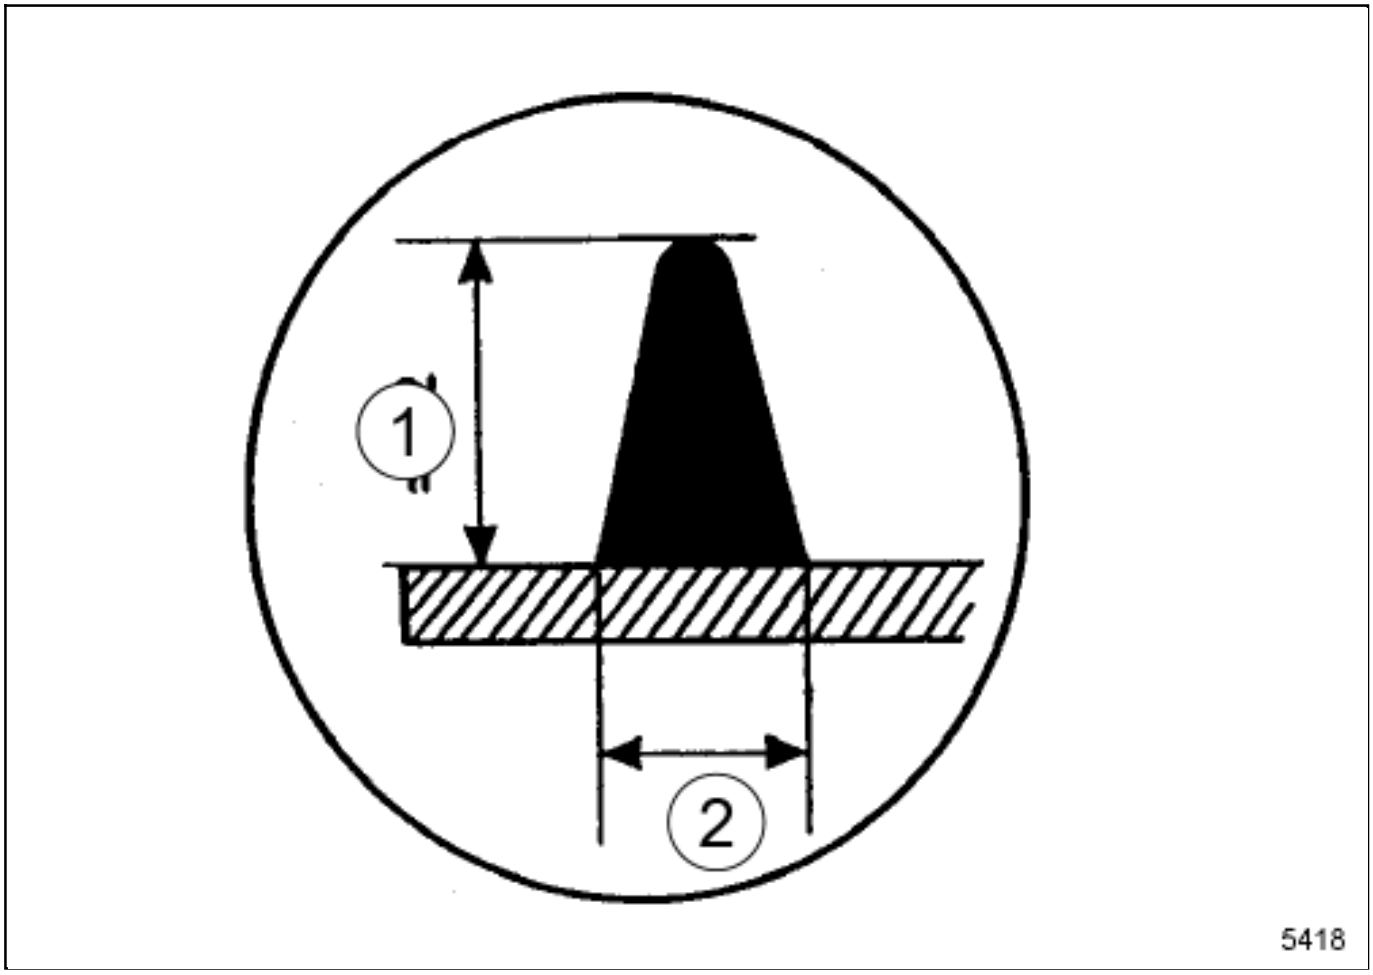
Once the windshield is in place, bring manualy the windshield near the windshield aperture lower cross member.

WINDOW CEMENT BEAD: DESCRIPTION

Note, one or more warnings are present in this procedure

Note:

If using a BIPAC EVOLUTIONbonding kit, extrude 100 to 150 mmof cement bead so that the product is uniformly mixed before application.



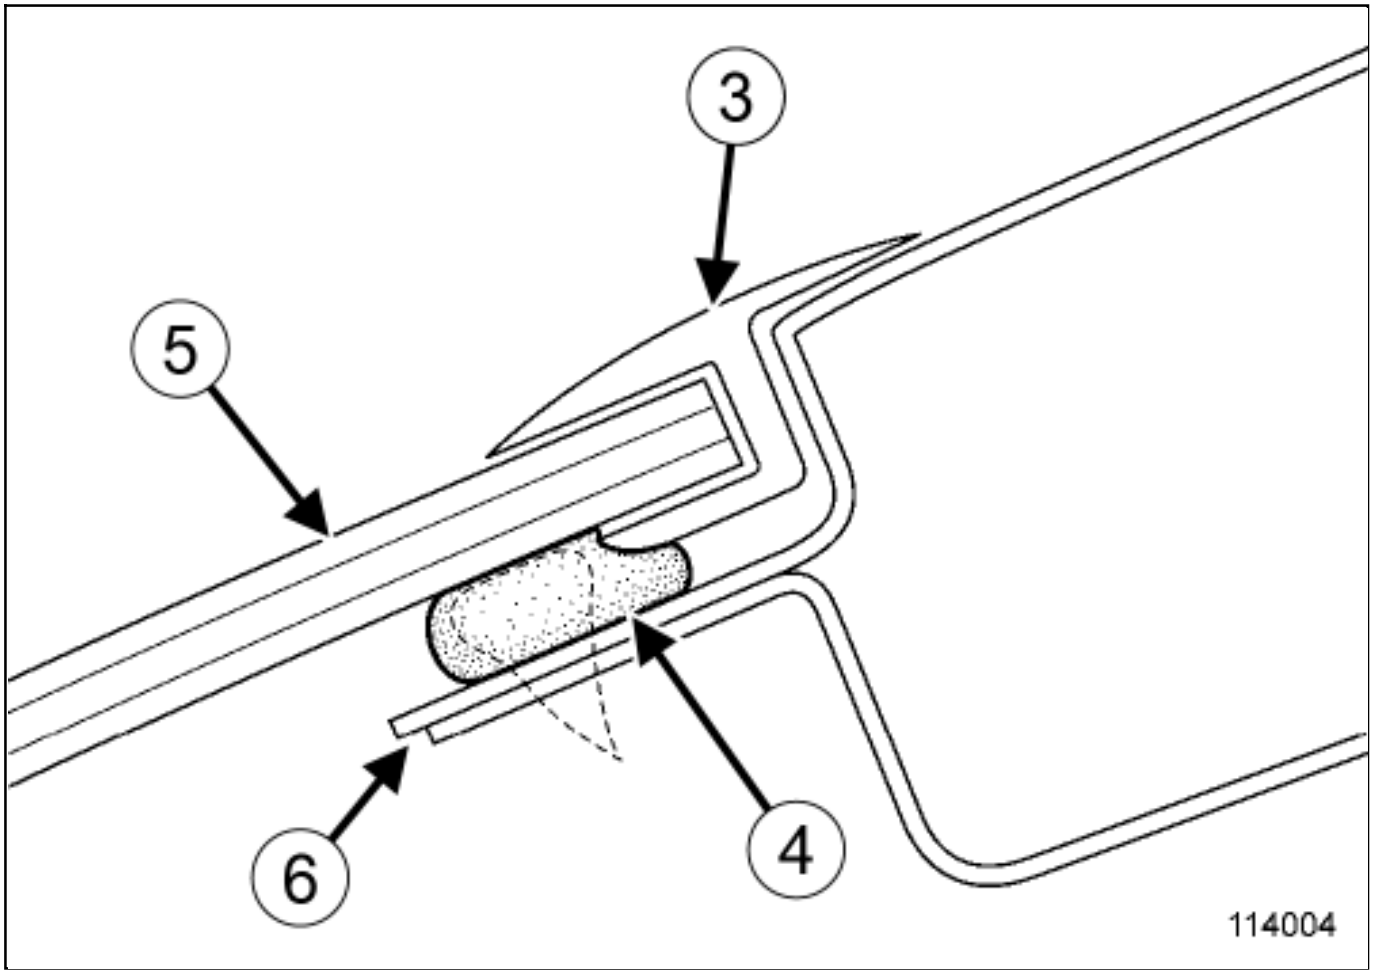
CAUTION

To prevent the risk of interfering with the radio reception if the vehicle's aerial is integrated into the window and to prevent the risk of corrosion on an aluminium structure, use a non-conducting adhesive.

1. APPLICATION

Level the residual beading at the last possible minute to maximise cleanliness (reduced risk of contamination).

The cement bead must be triangular in shape (an adhesive application nozzle is supplied in each bonding kit).



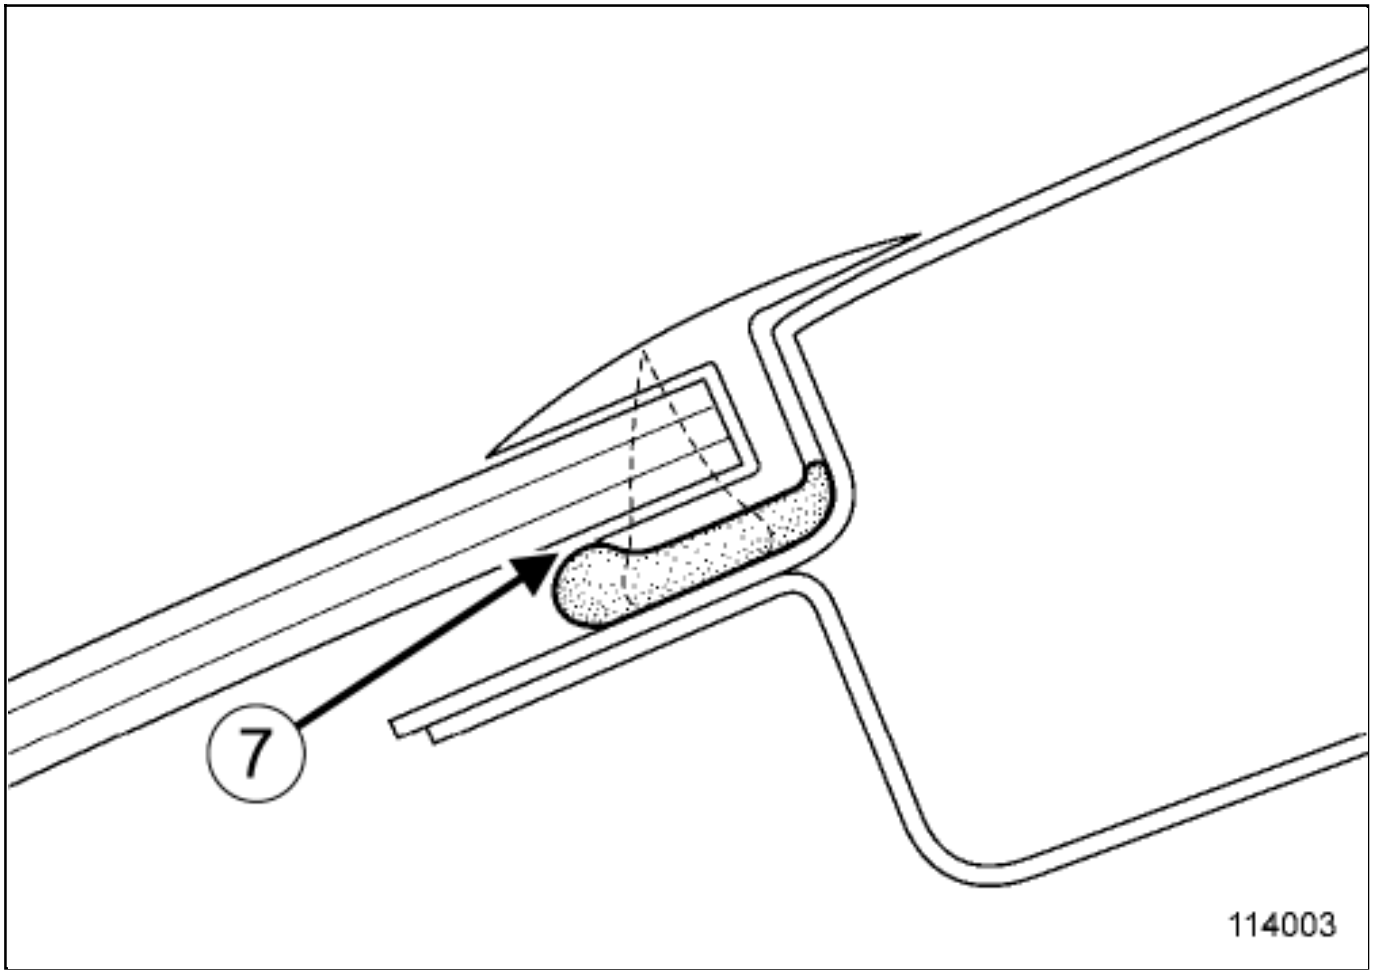
(1) : 12 mm

(2) : 8 mm

If there is no specific nozzle, follow the dimensions of the beading.

Apply adhesive to the windows (rather than the mounting) for the following reasons:

APPLICATION ON WINDOWS



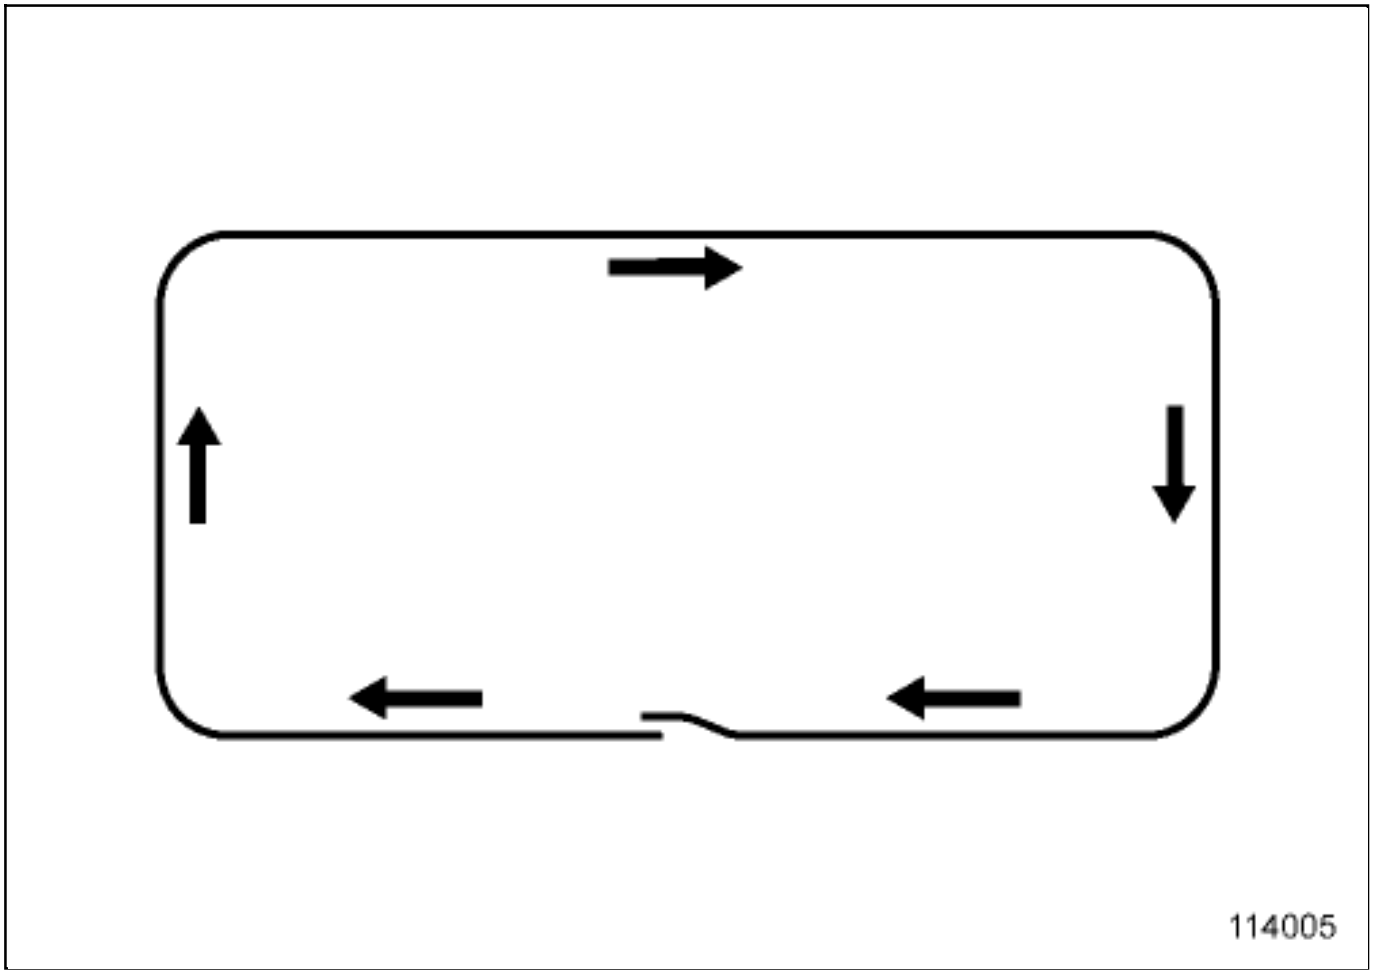
Ideal working position.

The trim(3) may be used as a guide.

When the cement bead(4) is applied in the correct position, it forms a link between the window(5) and the mounting(6) .

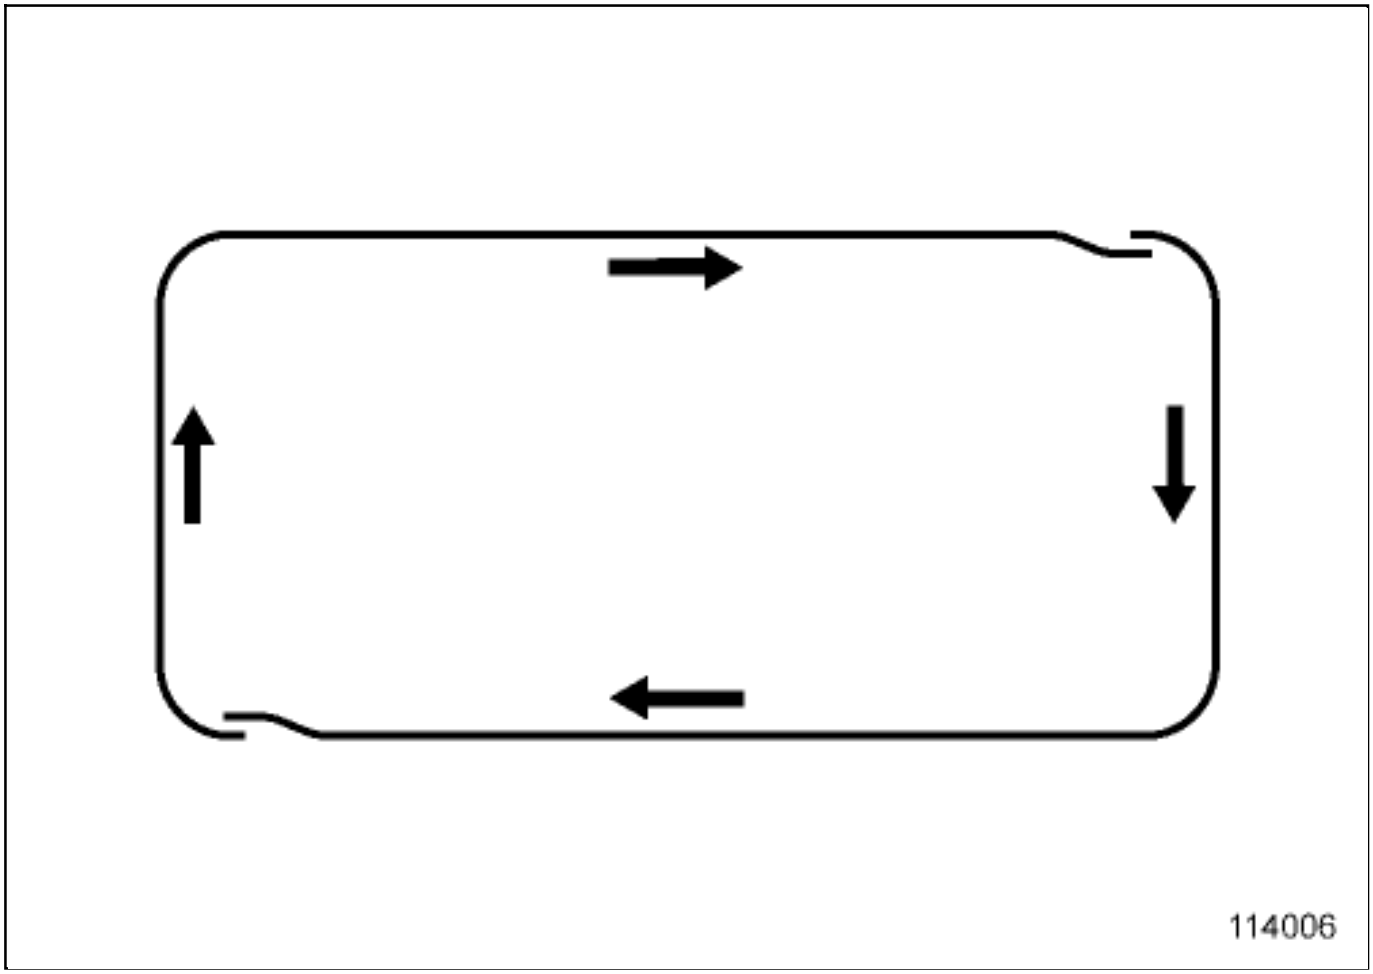
APPLICATION ON MOUNTING

Incorrect working position.



There is no marking to aid the application of the cement bead.

If applied without a guide, there is a risk that the cement bead will no longer come into contact with the window (7) and this will cause a sealing fault.



The cement bead must be even and applied perpendicular to the bonding area (starting with the bottom and centre of the mounting when bonding a window).

At the end of the application procedure, a union is formed by juxtaposing the cement beads by 50 mm.

APPLICATION ON WINDOW OR MOUNTING

APPLICATION ON SUNROOF MECHANISM OR MOUNTING

Note:

After laying down the cement bead, immediately fit the window or sunroof mechanism to the vehicle.

WINDOWDETACHMENT:DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Wire insertion tool for removing bonded mirror glass.	Car. 1033
Universal protector	Car. 1847

1. PREPARATION

WARNING

Wear protective gloves and goggles when cutting the window or sunroof operating mechanism.

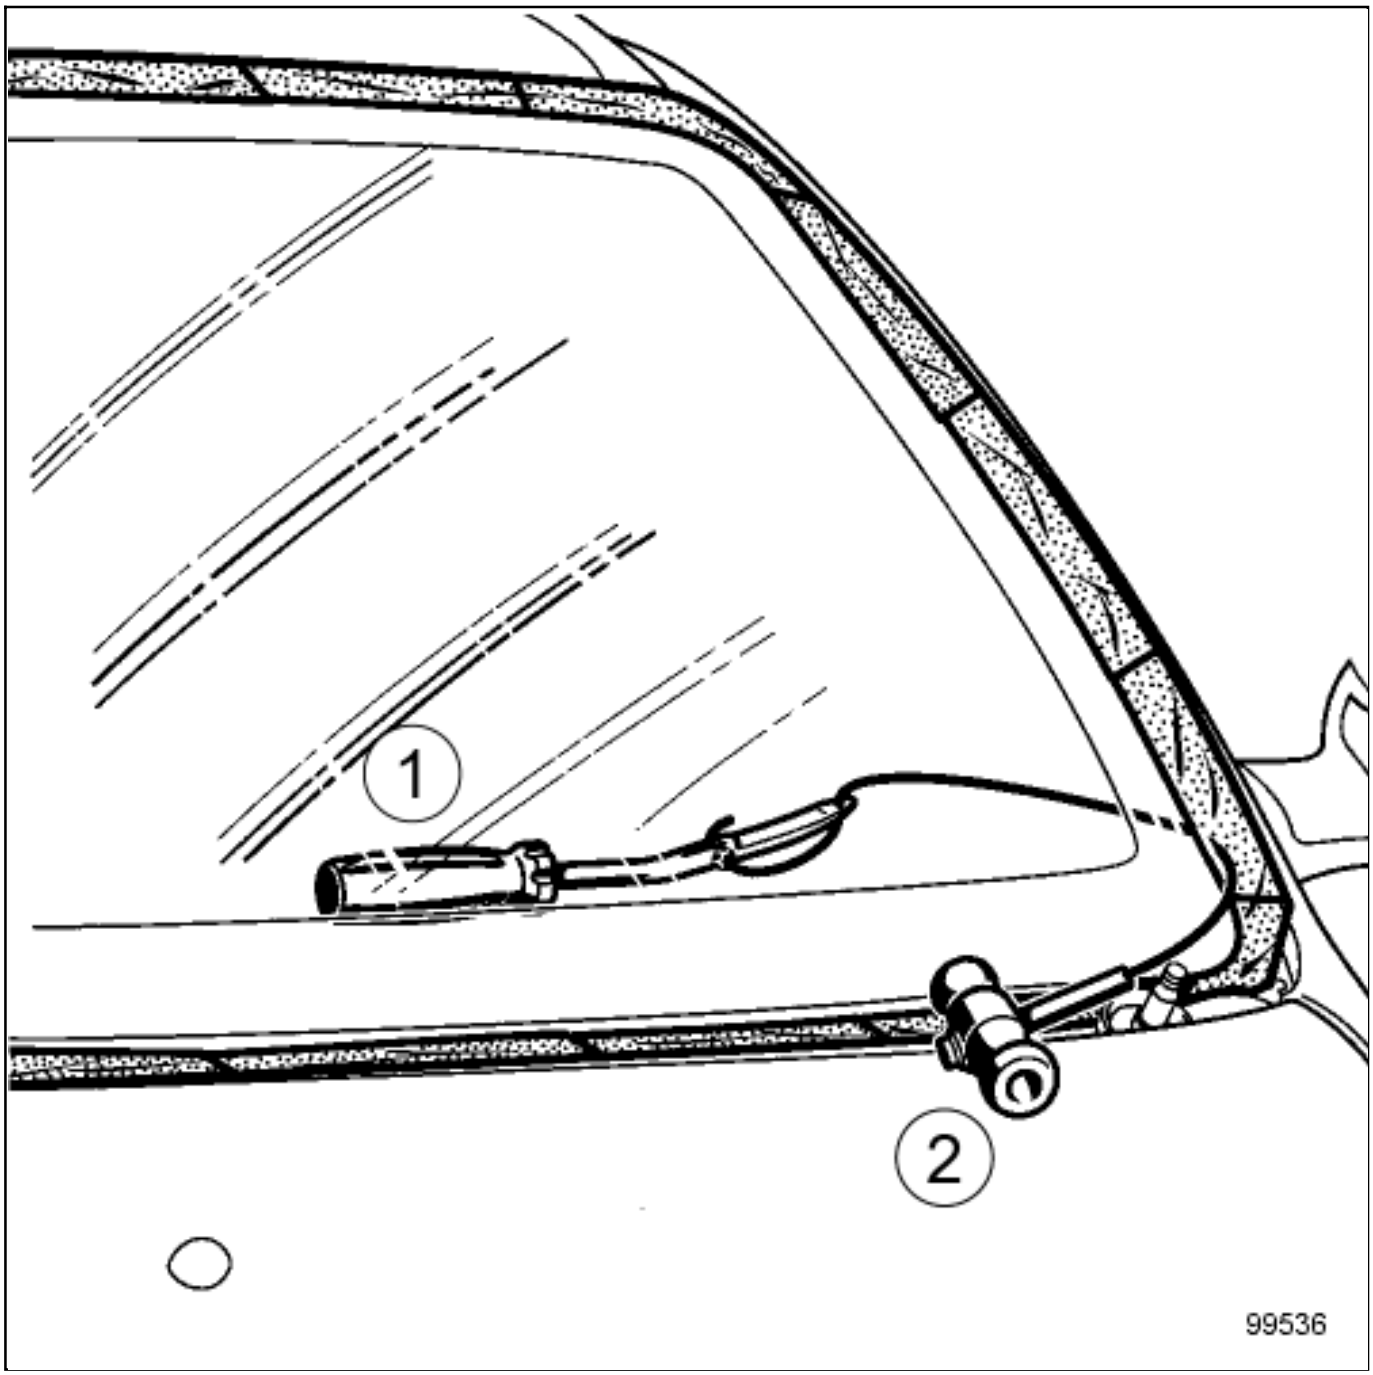
Use an appropriate work station when replacing a window or sunroof mechanism.

Protect the vehicle interior.

Remove the various trims and interior and exterior equipment (see the MR of vehicle concerned).

Protect the bodywork around the window using masking tape.

Position the universal guardUniversal protector (Car. 1847) or remove the upper section of the dashboard (according to vehicle).



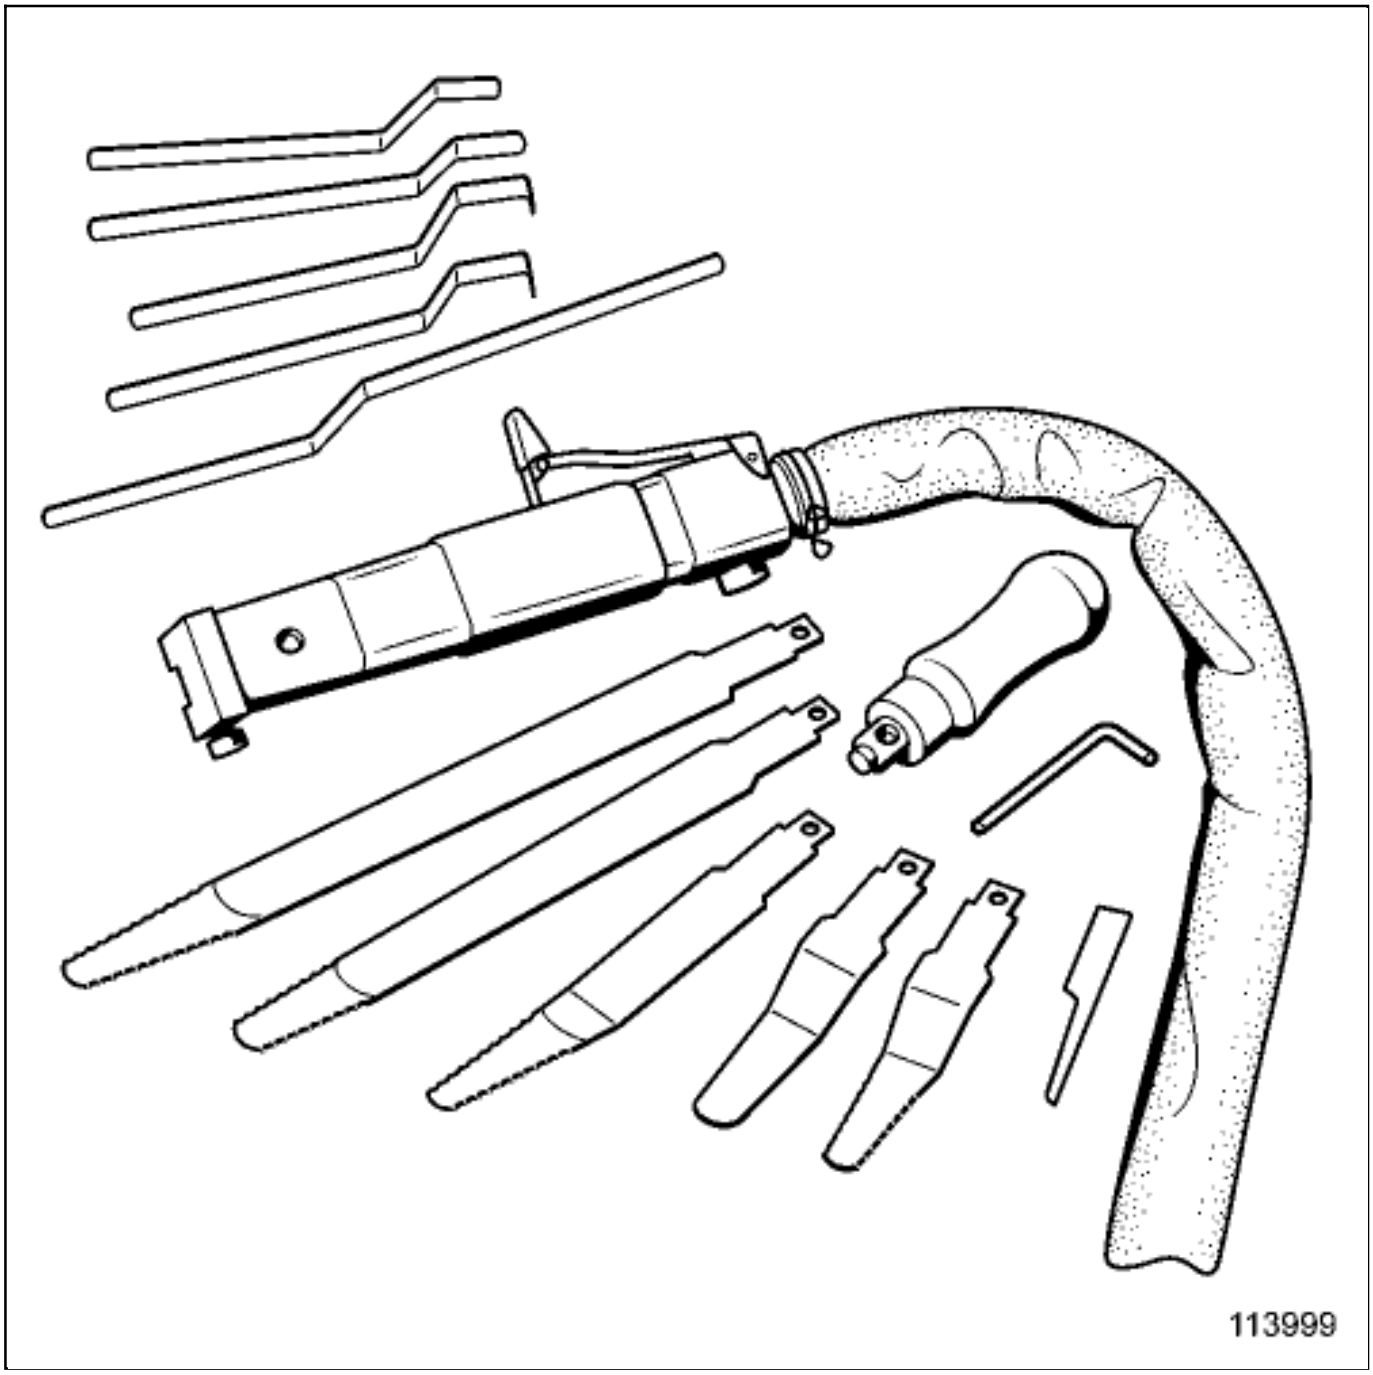
2. CUTTING

1- FIRST PROCEDURE

Make a hole in the cement bead with a wire insertion tool.

Note:

Place the wire insertion tool into the most accessible part of the window or sunroof mechanism.



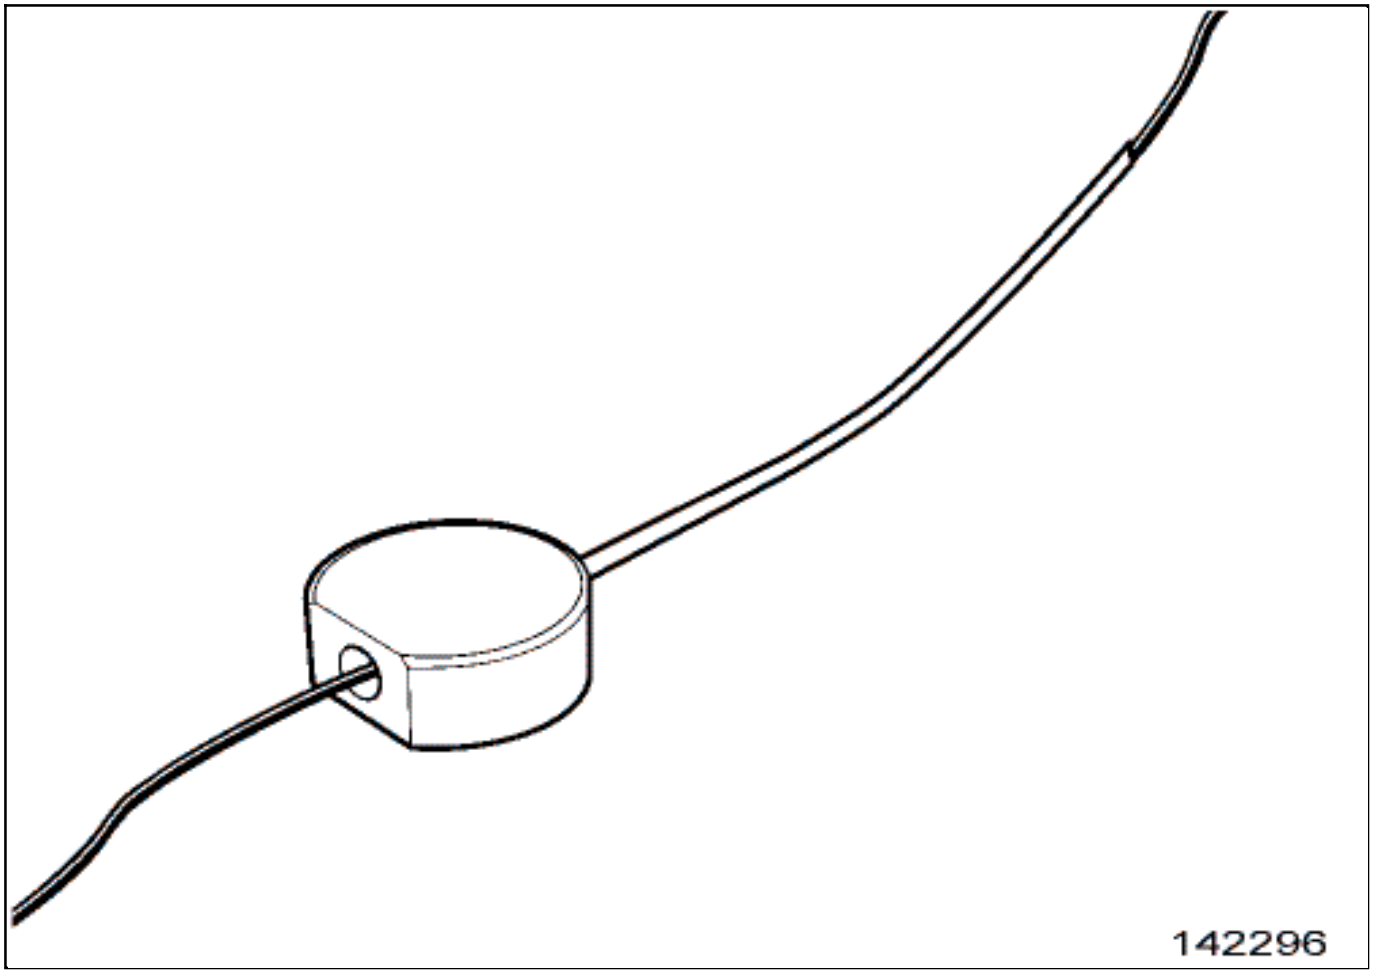
The first person places the retaining tool(1) on the cement bead, from inside the vehicle at approximately 300 mmfrom where the wire passes through.

The second person pulls the pulling handle(2) from outside the vehicle towards the first person's tool.

Repeat this operation until the cement bead has been completely cut.

CAUTION

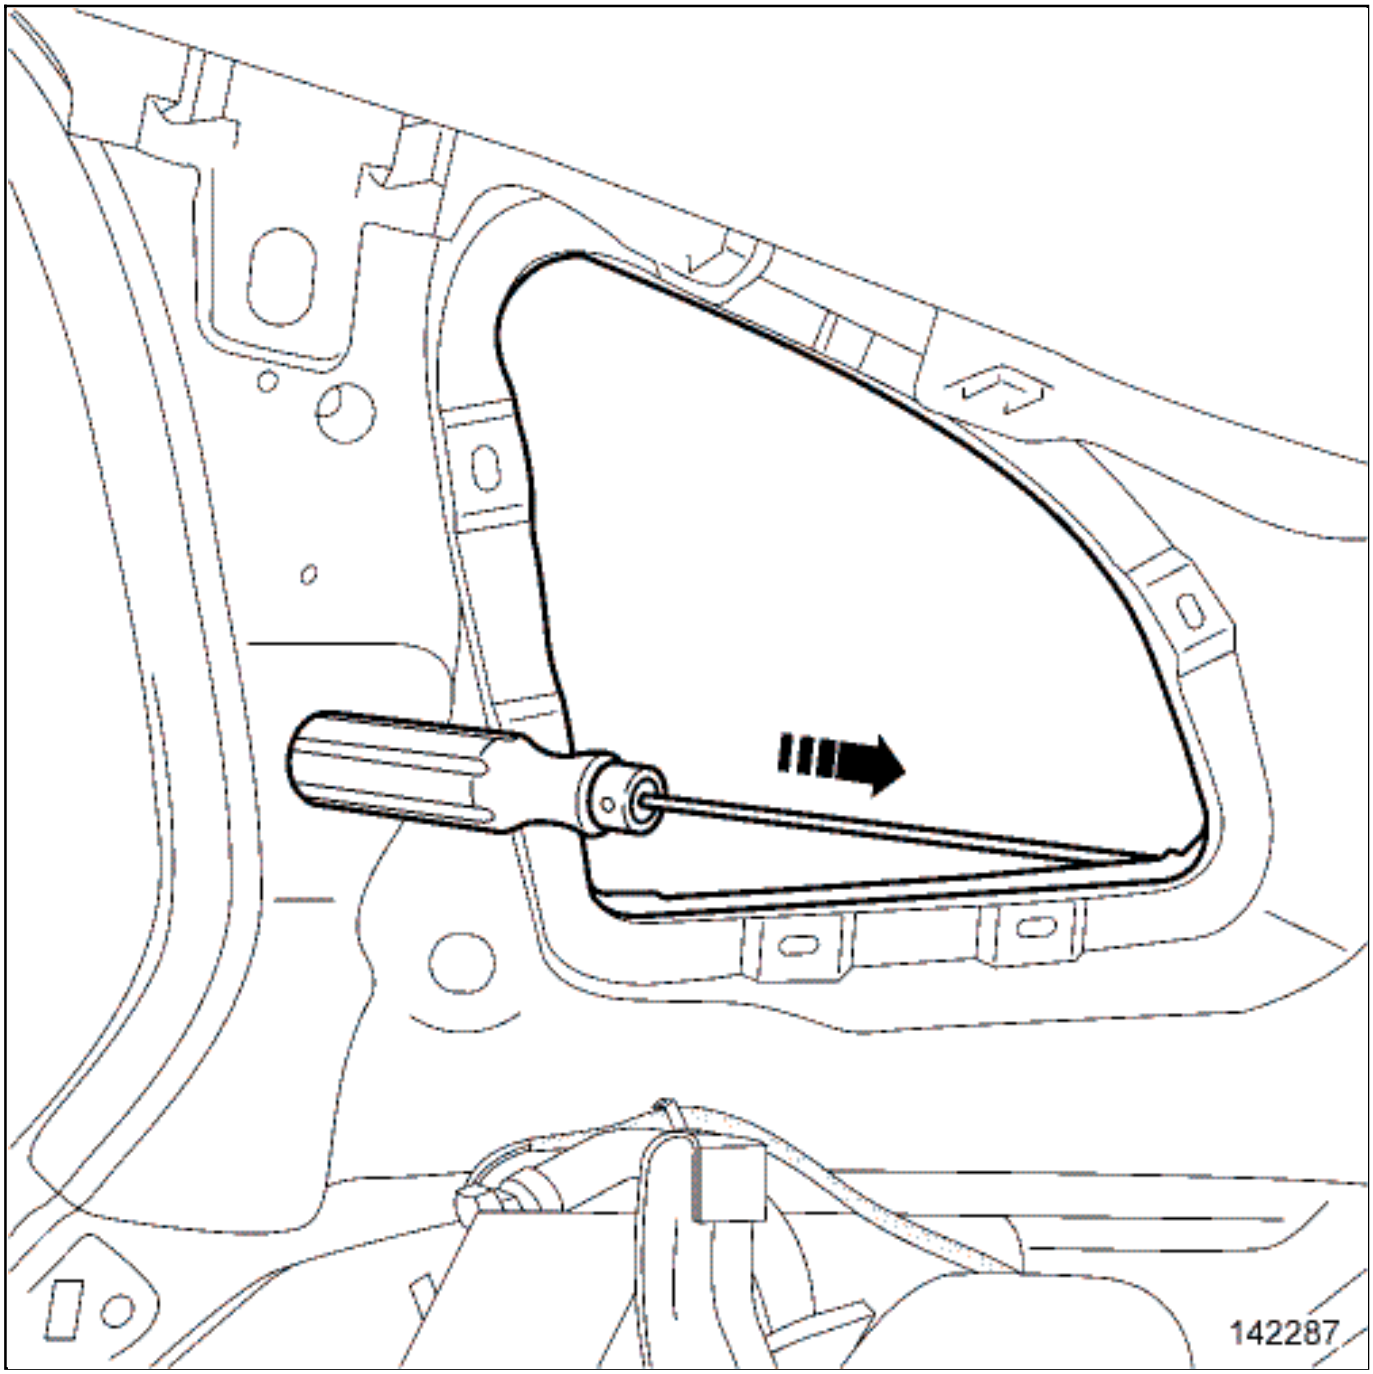
To prevent any bonded component from being damaged during the cutting operation, make sure that the wire does not damage the parts near the cement bead.



Part no.: 77 11 171 946

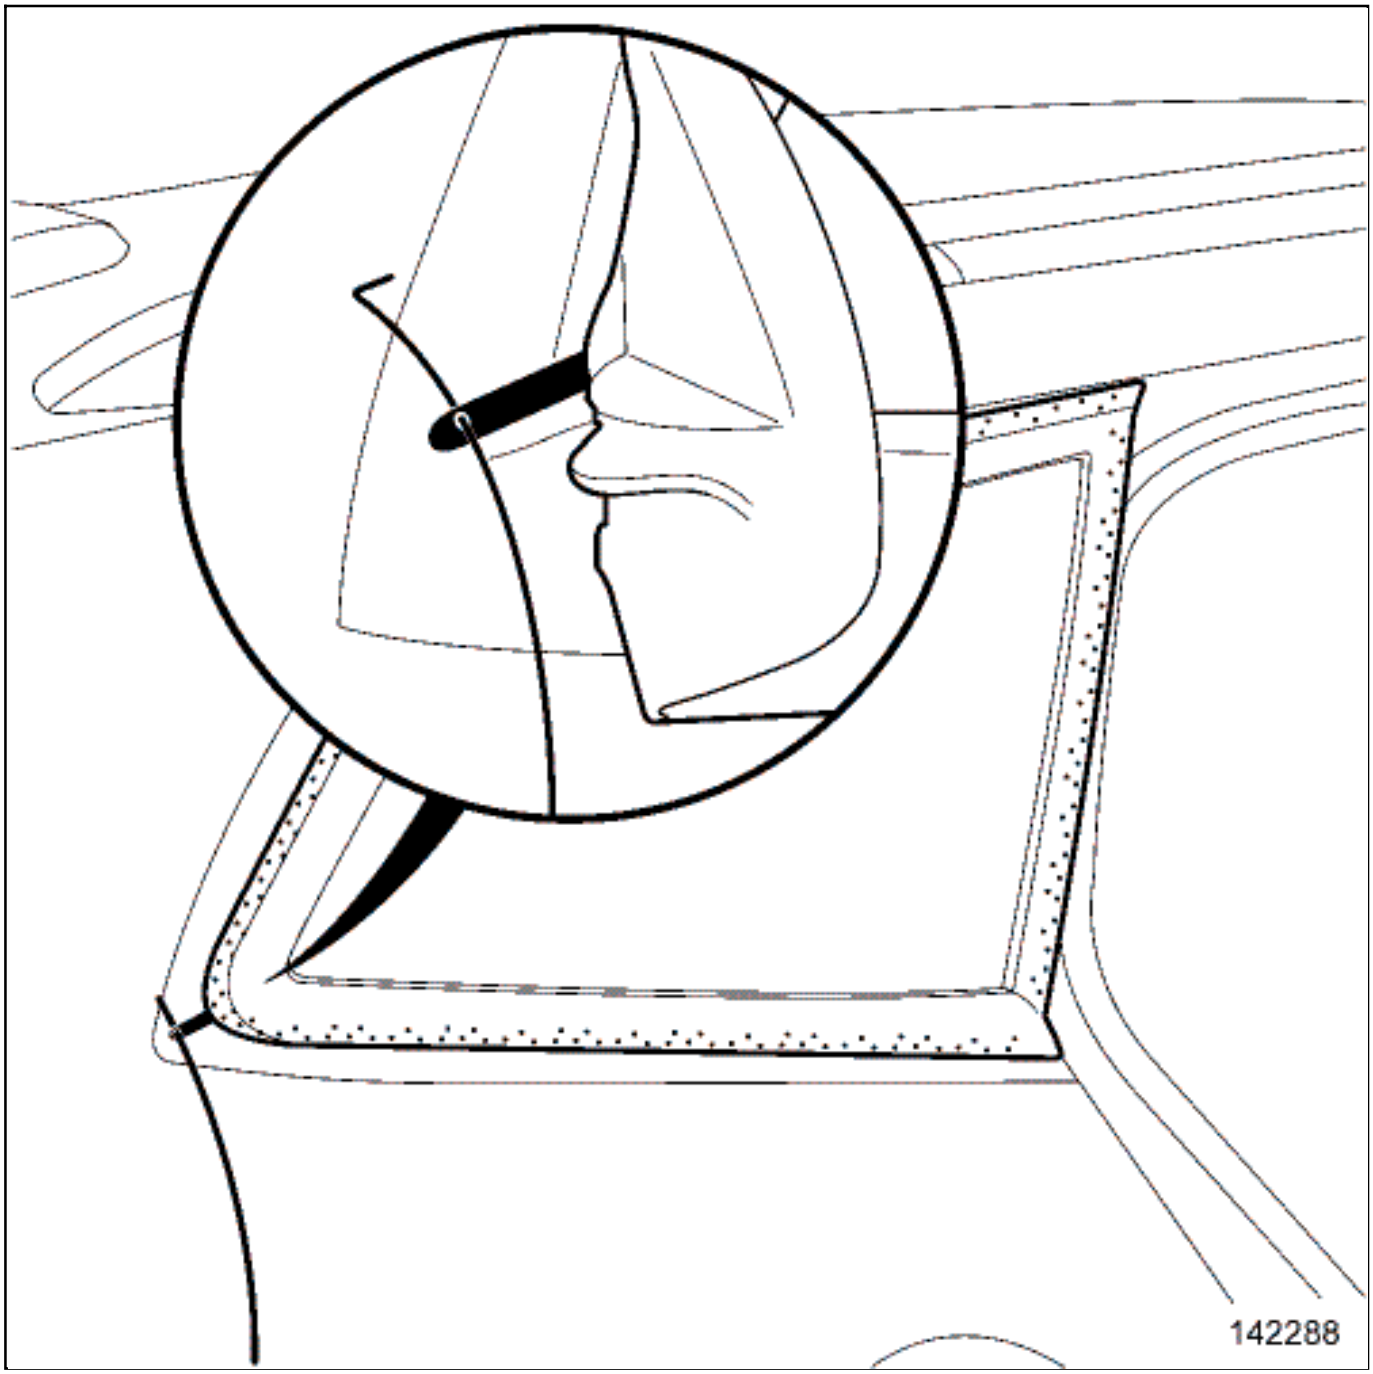
The cement bead can be cut using a pneumatic cutting tool(see 54A, Windows, Window removal tool: Use) .

2- SECOND PROCEDURE

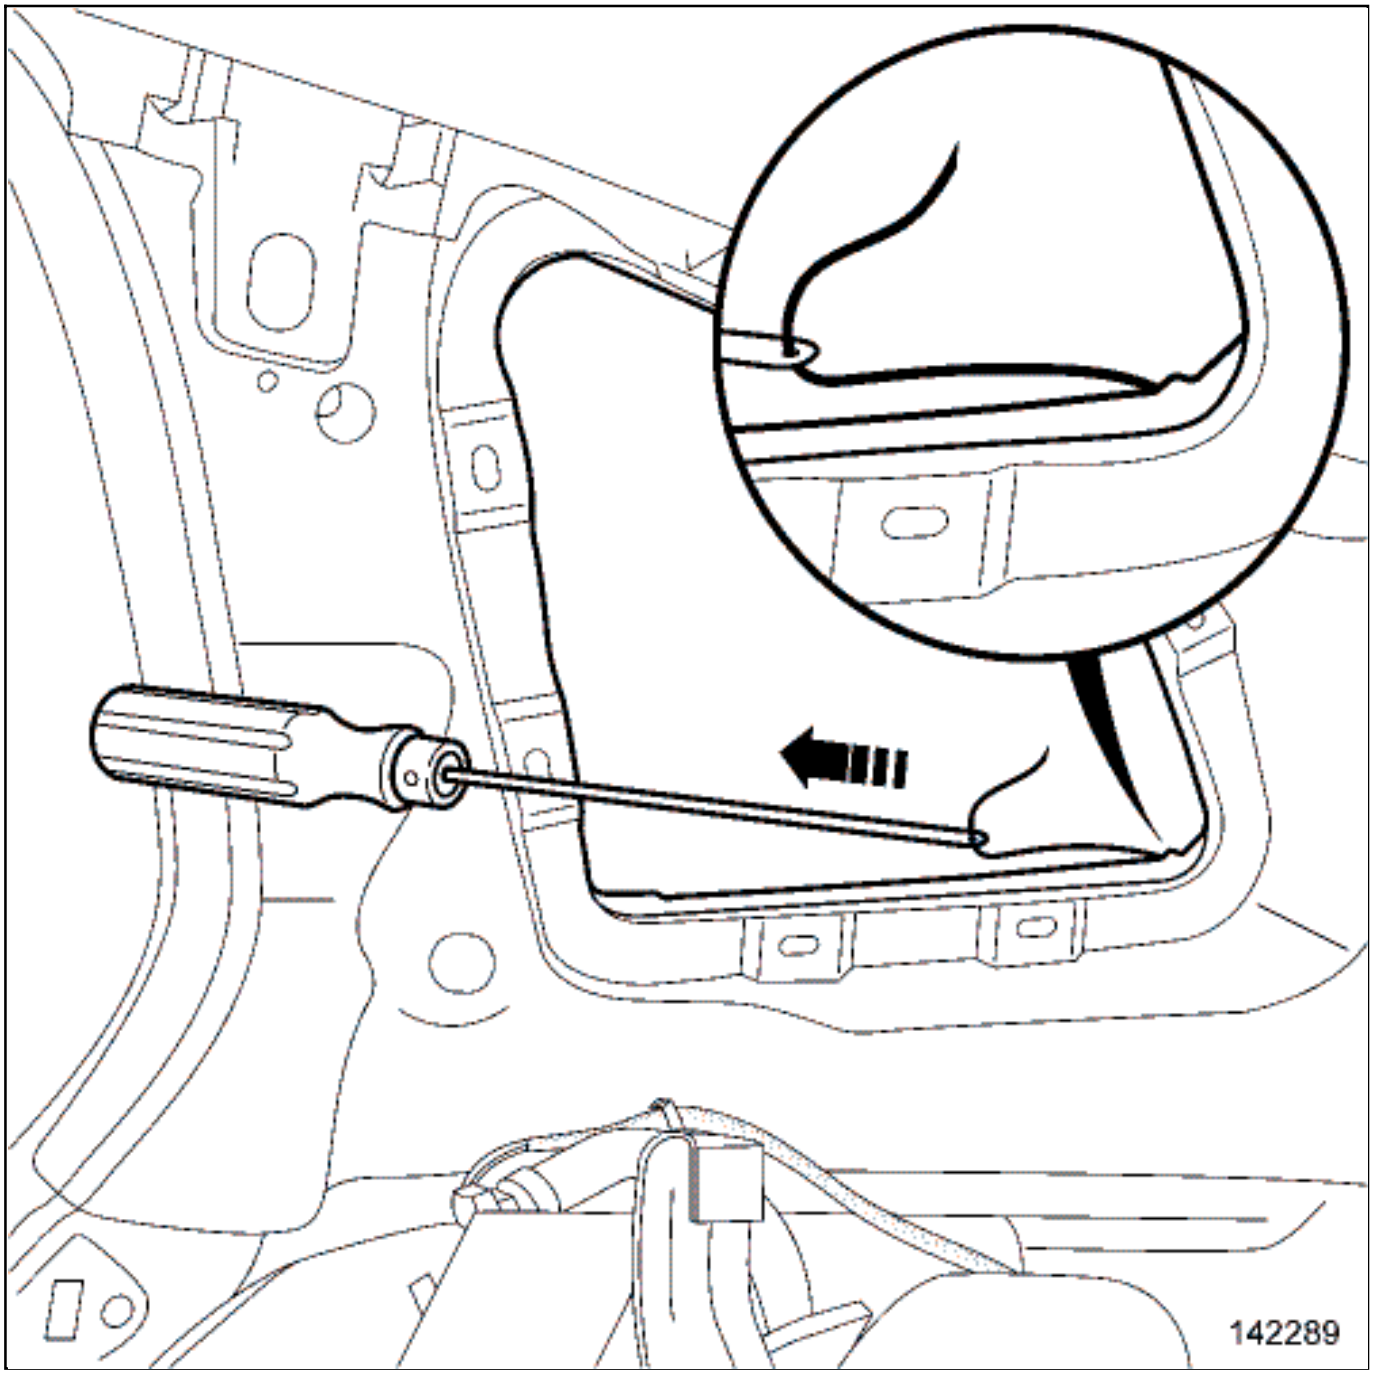


Note:

Use a cutting wire with a square cross-section.

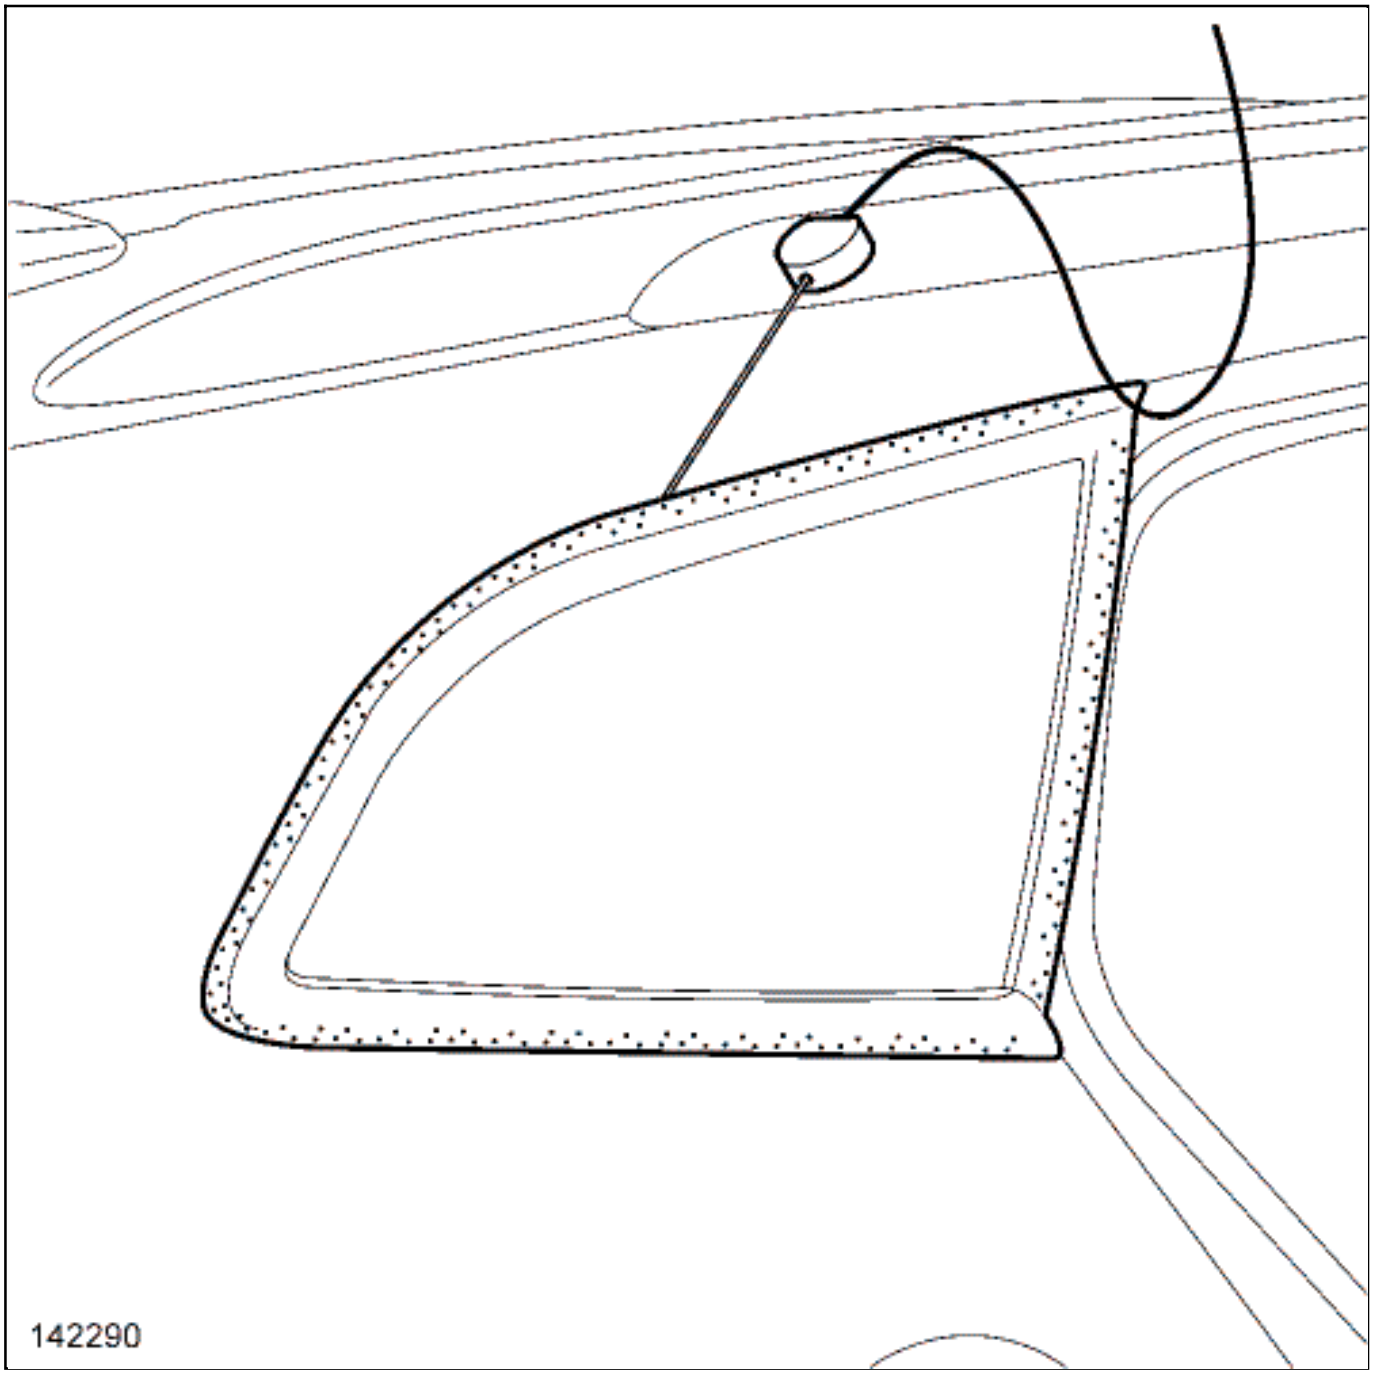


Part no.: 77 11 171 909



Insert the cutting wire in the wire insertion tool, or in a small 2.5 mmdiameter tube.

Using the Wire insertion tool for removing bonded mirror glass.(Car. 1033) , pierce the cement bead of the window at the most accessible place.

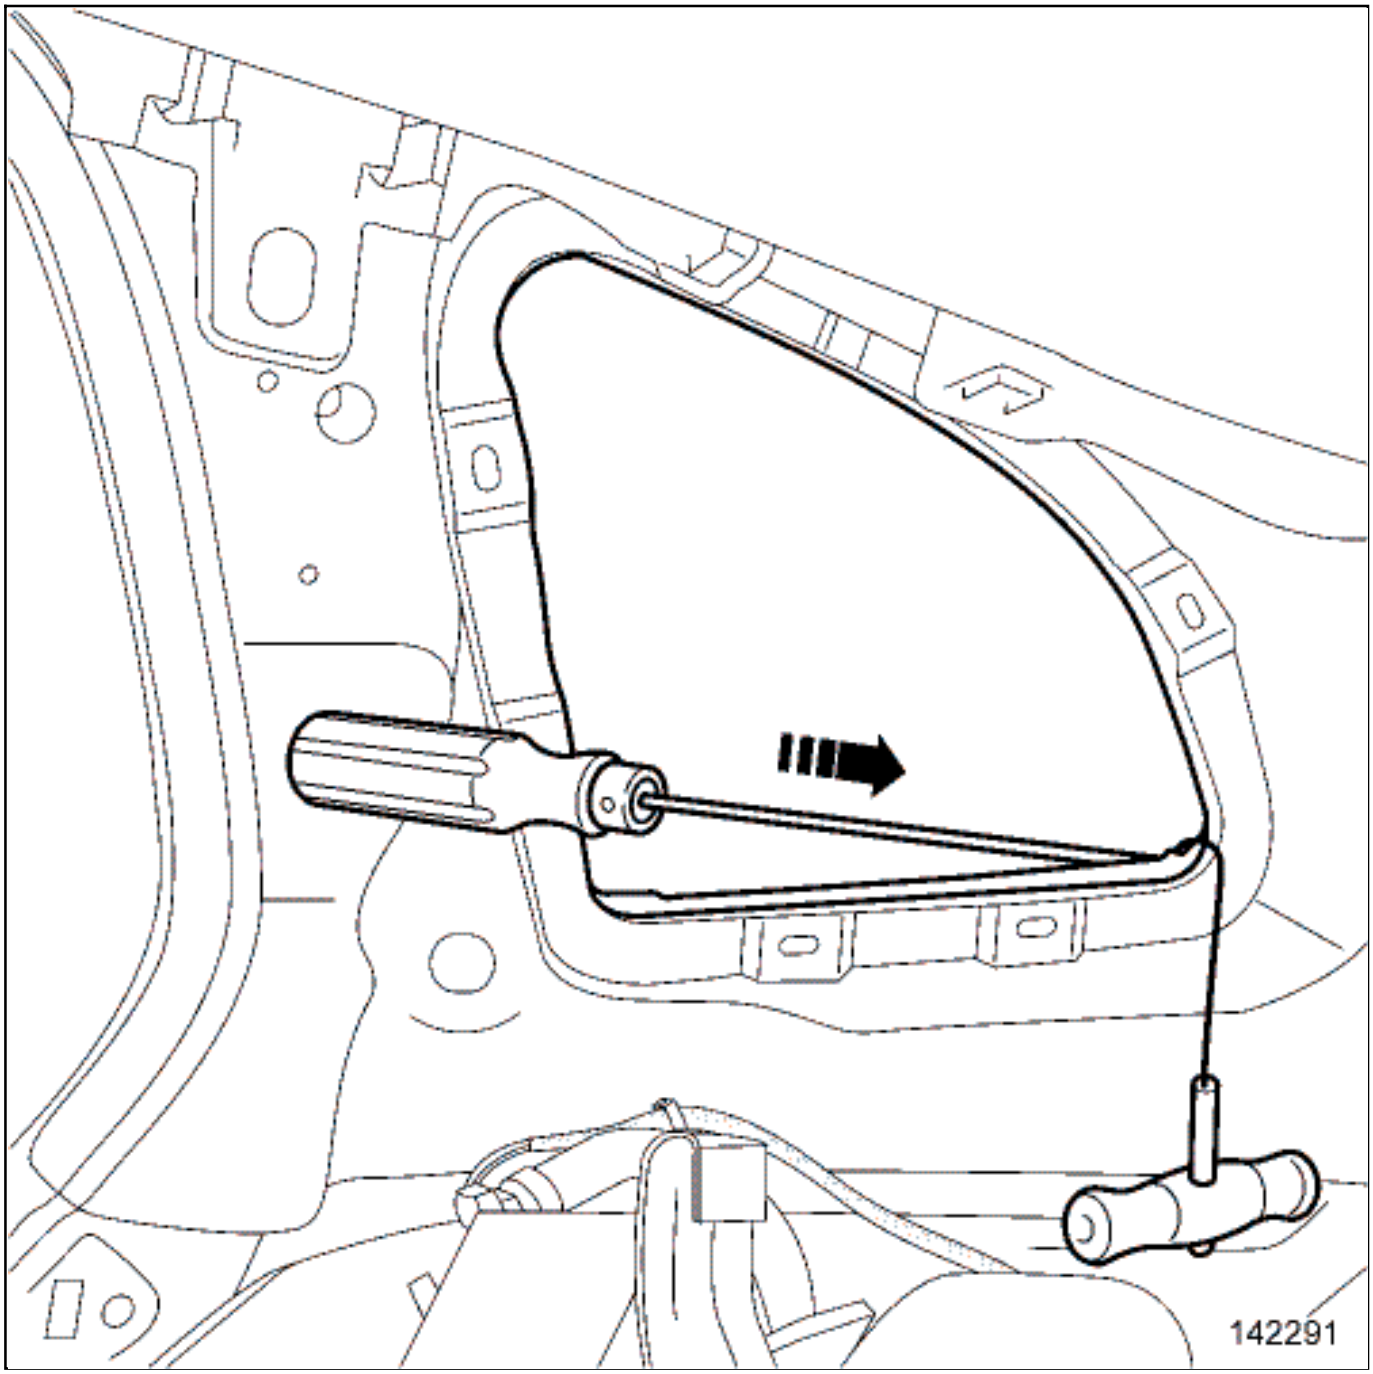


Insert the cutting wire in theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

Pass the cutting wire from the exterior towards the interior using theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

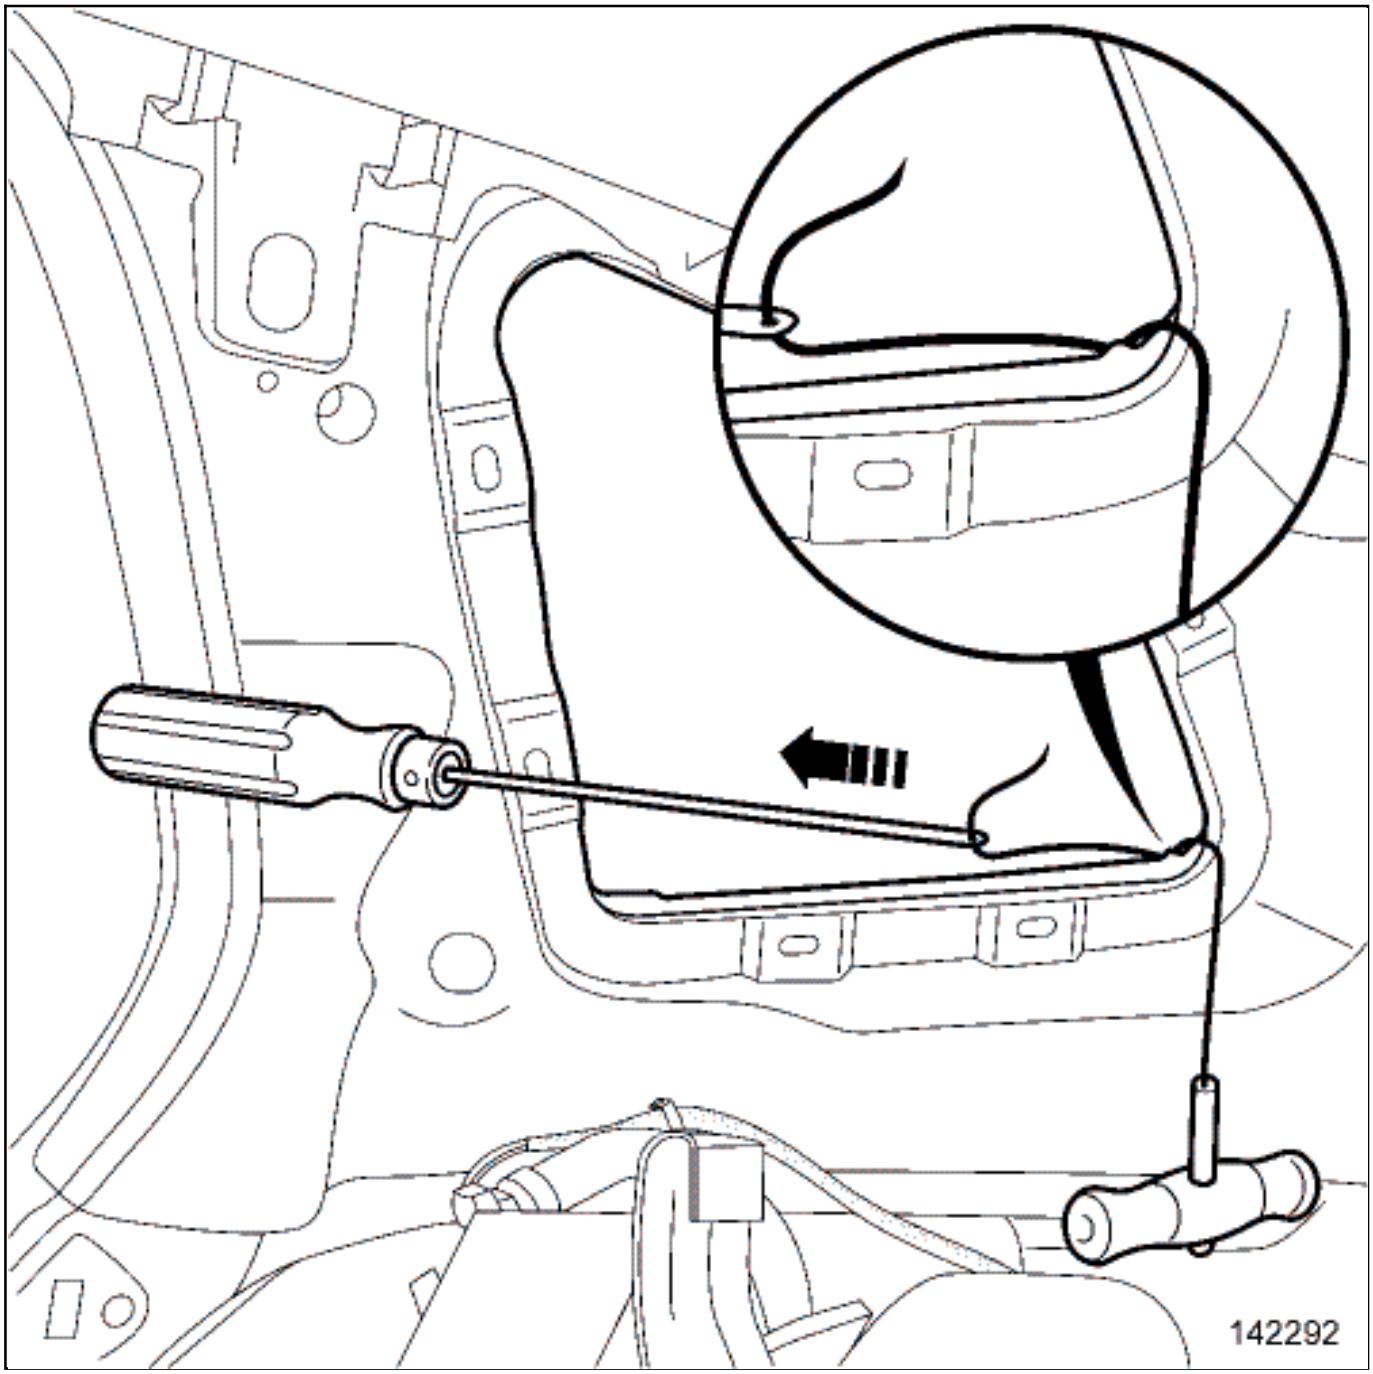
Fit the first pulling handle on the section of the cutting wire inside the vehicle.

Using the wire insertion tool, slide the cutting wire between the rear quarter panel window and the panelwork around the entire edge outside the vehicle.



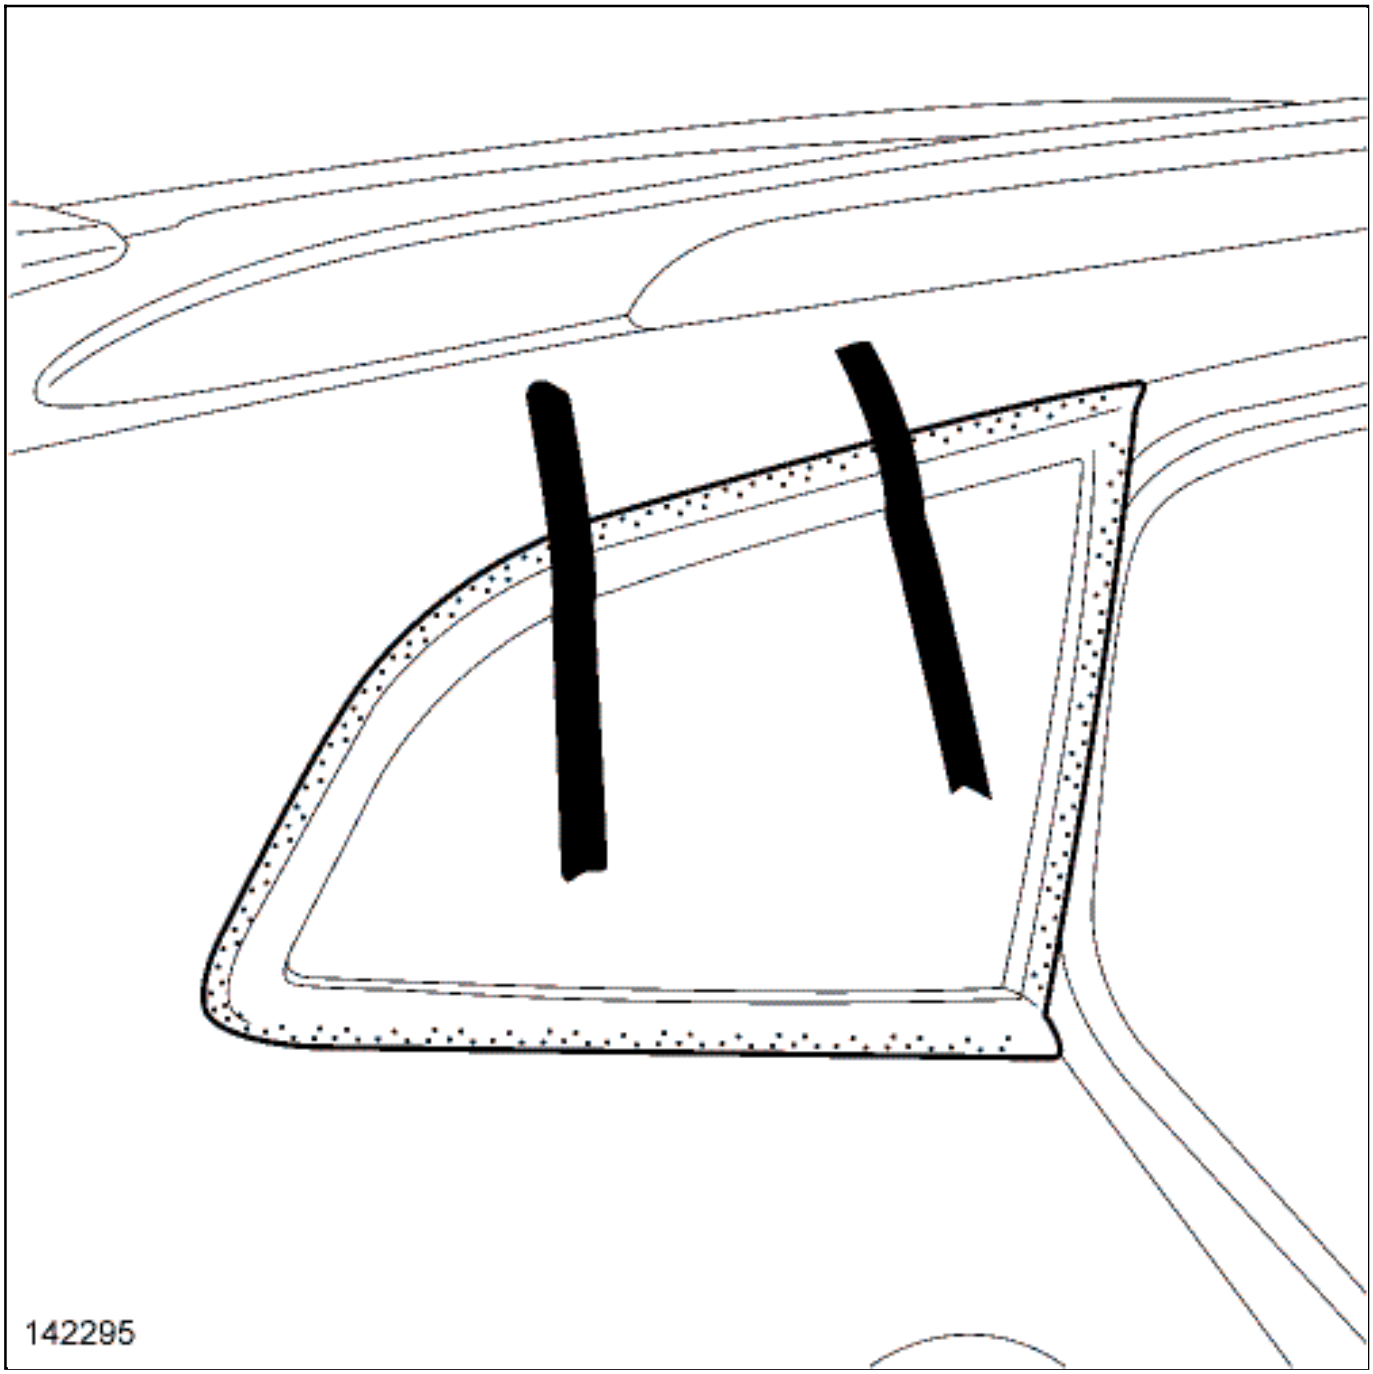
Cut a sufficient length of cutting wire.

Remove the cutting wire insertion tool.

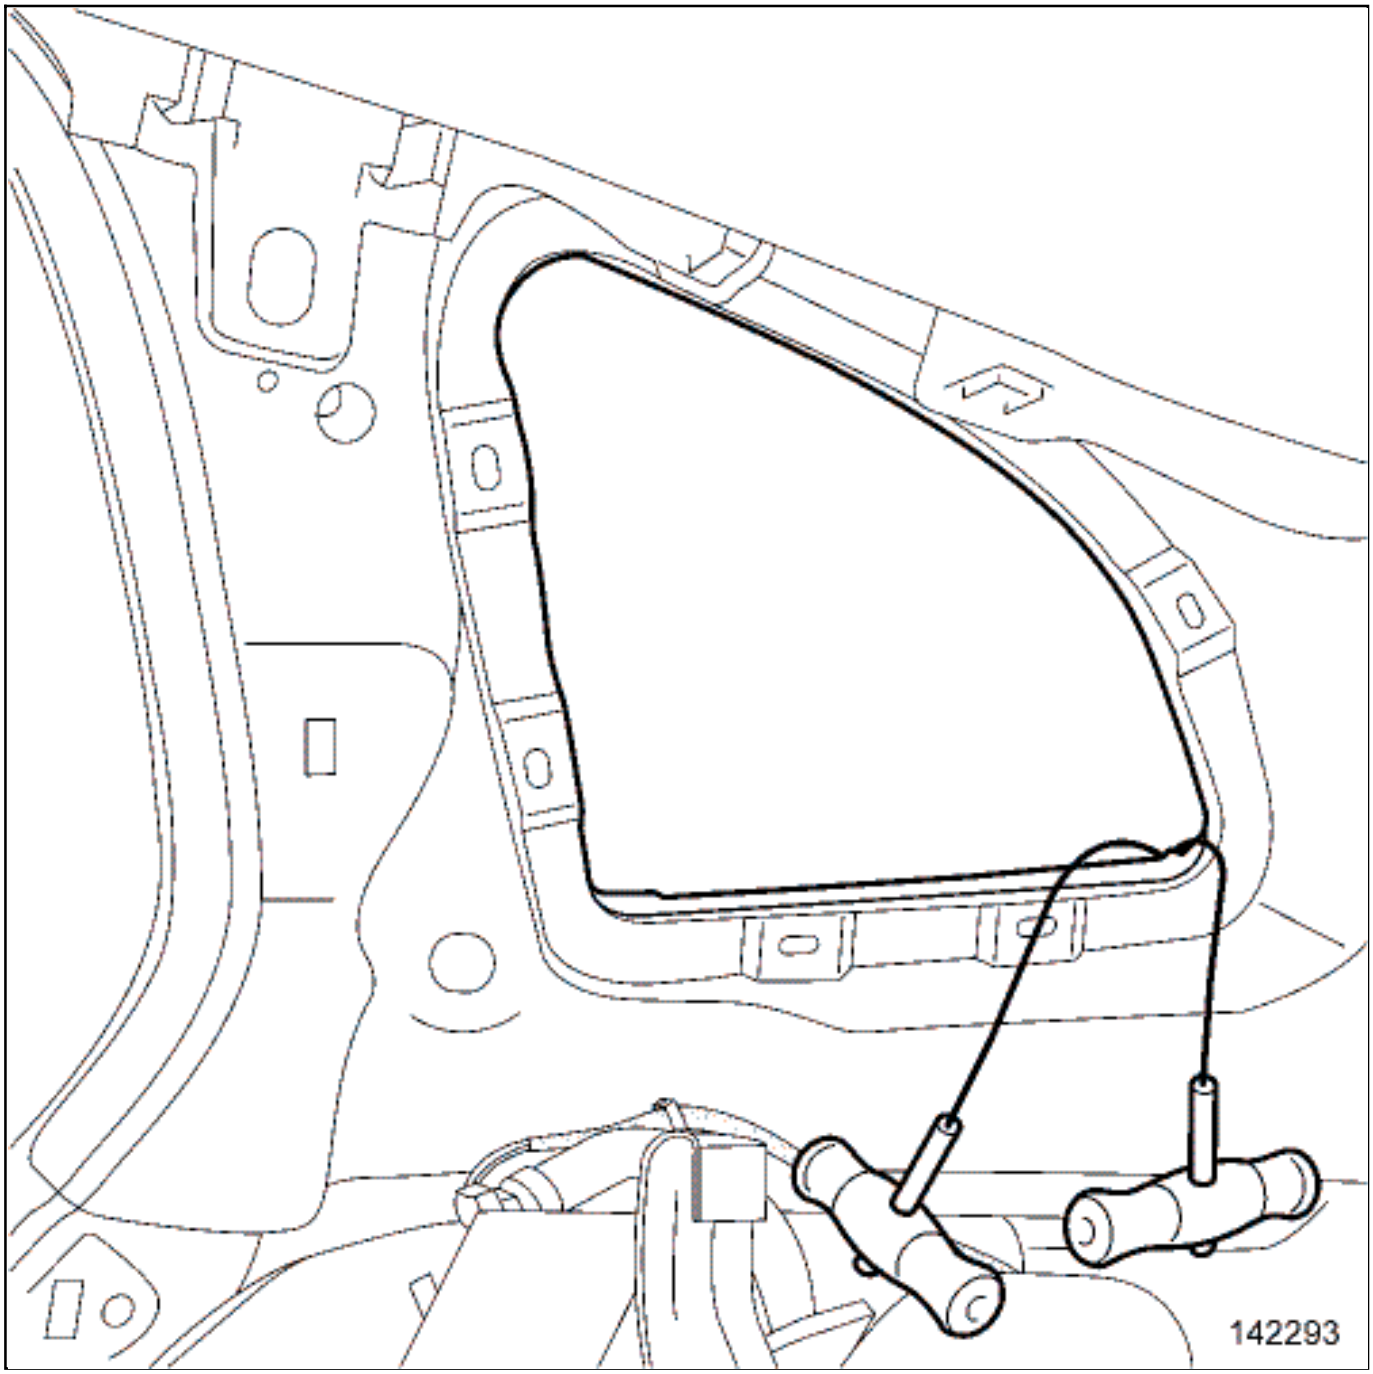


Note:

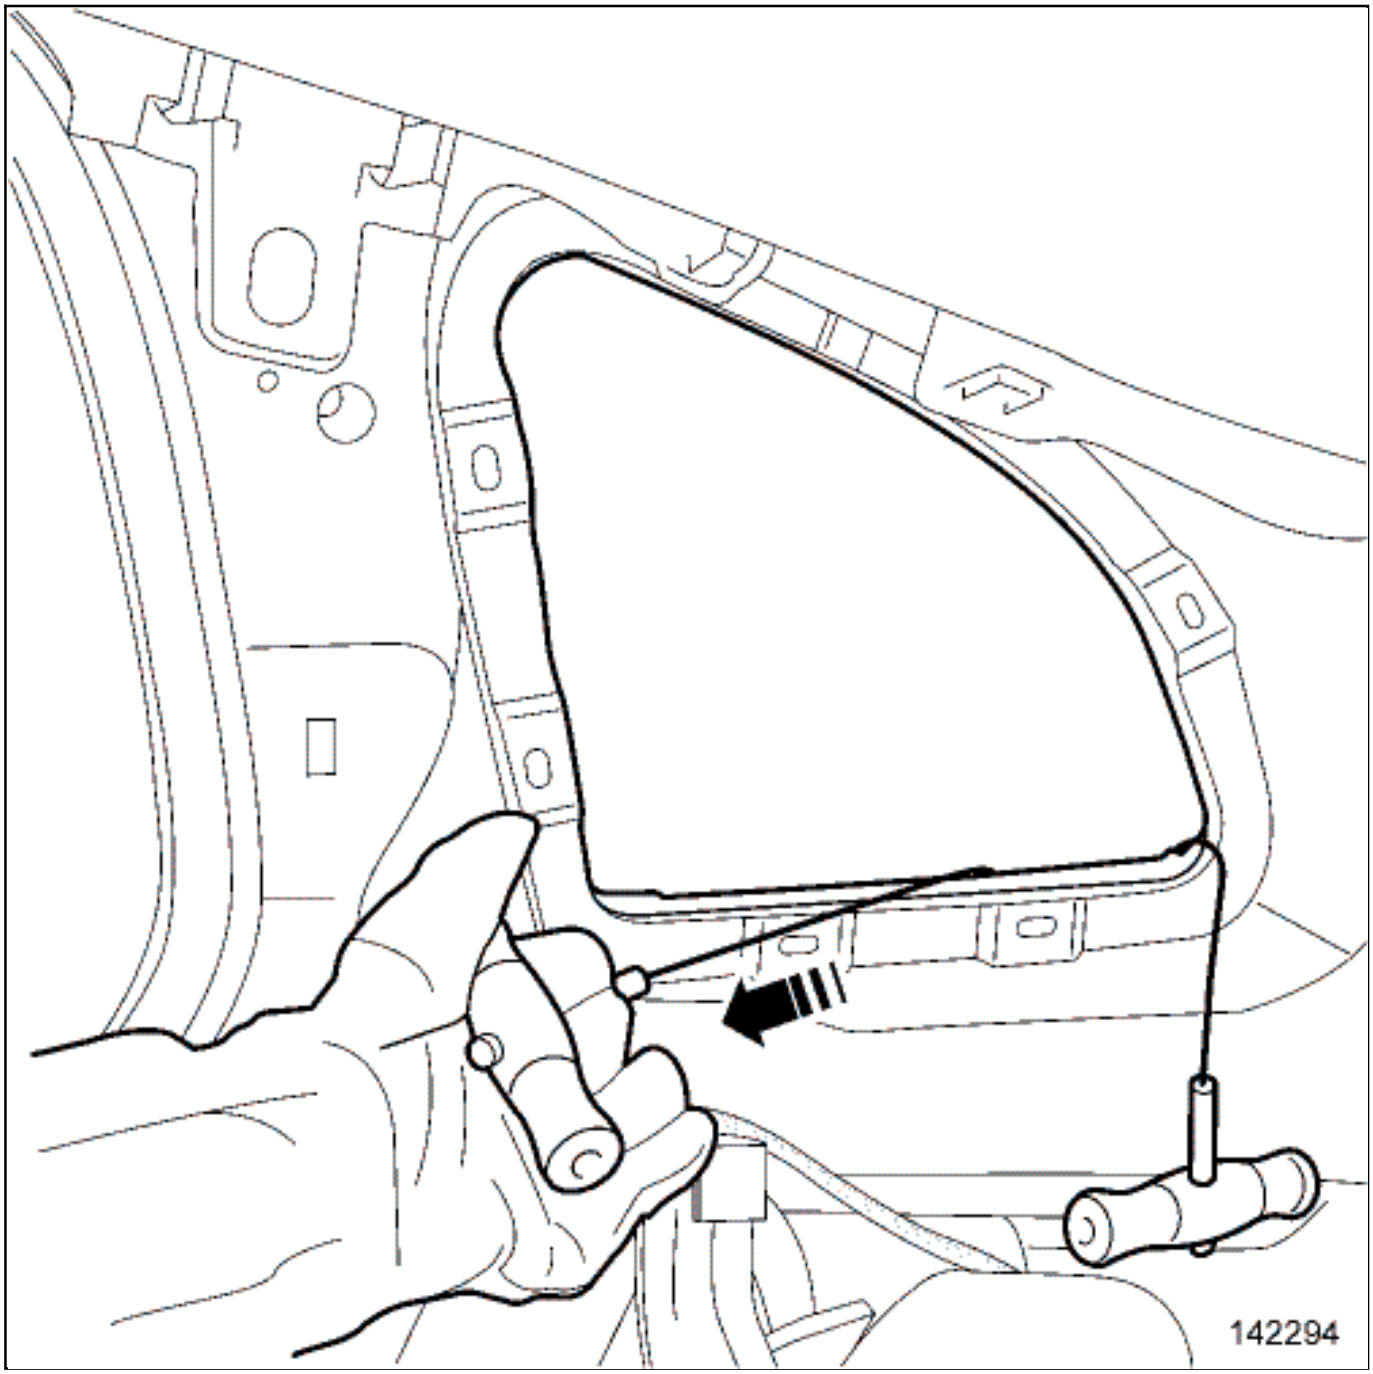
When passing the cutting wire into the vehicle interior, be careful not to cross the 2 wires.



This would make cutting impossible.



Pass the Wire insertion tool for removing bonded mirror glass.(Car. 1033) near the first piercing of the cement bead.

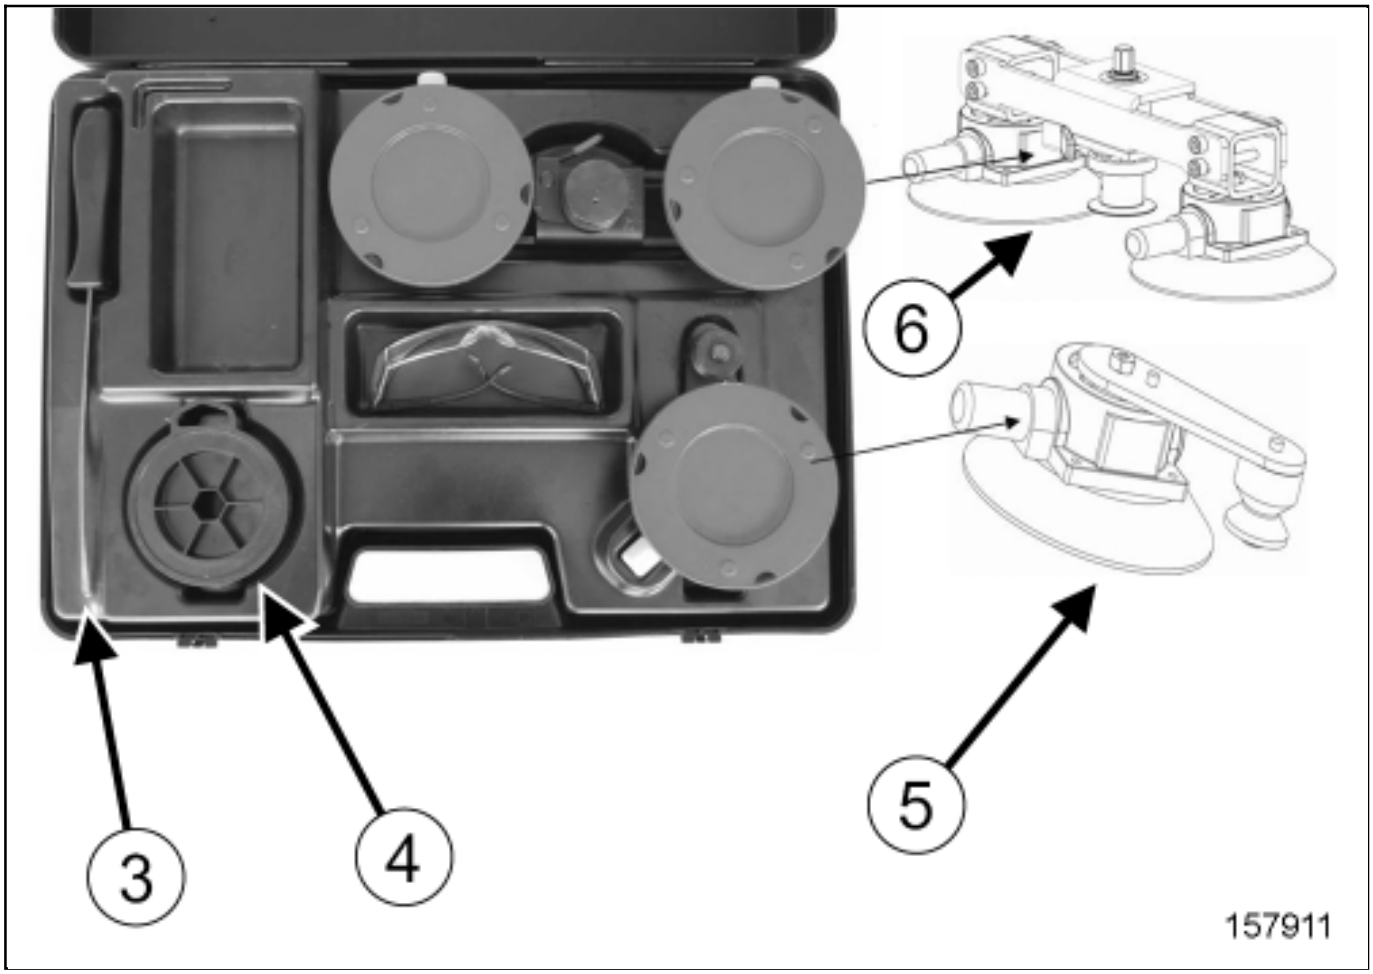


Pass the cutting wire from the exterior towards the interior using theWire insertion tool for removing bonded mirror glass.(Car. 1033) .

Secure the window on the panelwork using masking tape.

Fit the second pulling handle on the other section of the cutting wire inside the vehicle.

Pull one of the two pulling handles until the cement bead is completely cut.



Note:

Reduce the length of the cutting wire as you cut.

Remove the window.

3- THIRD PROCEDURE

PART NO.: 77 11 573 521

(3) Wire insertion tool

(4) Cutting wire

(5) Roller

(6) Winding device

Wind the cutting wire(7) around a mounting bolt.

Pass the cutting wire from the exterior towards the interior using the wire insertion tool.

Note:

While tensioning the cutting wire ensure that the cutting wire is in the correct position under the windshield.

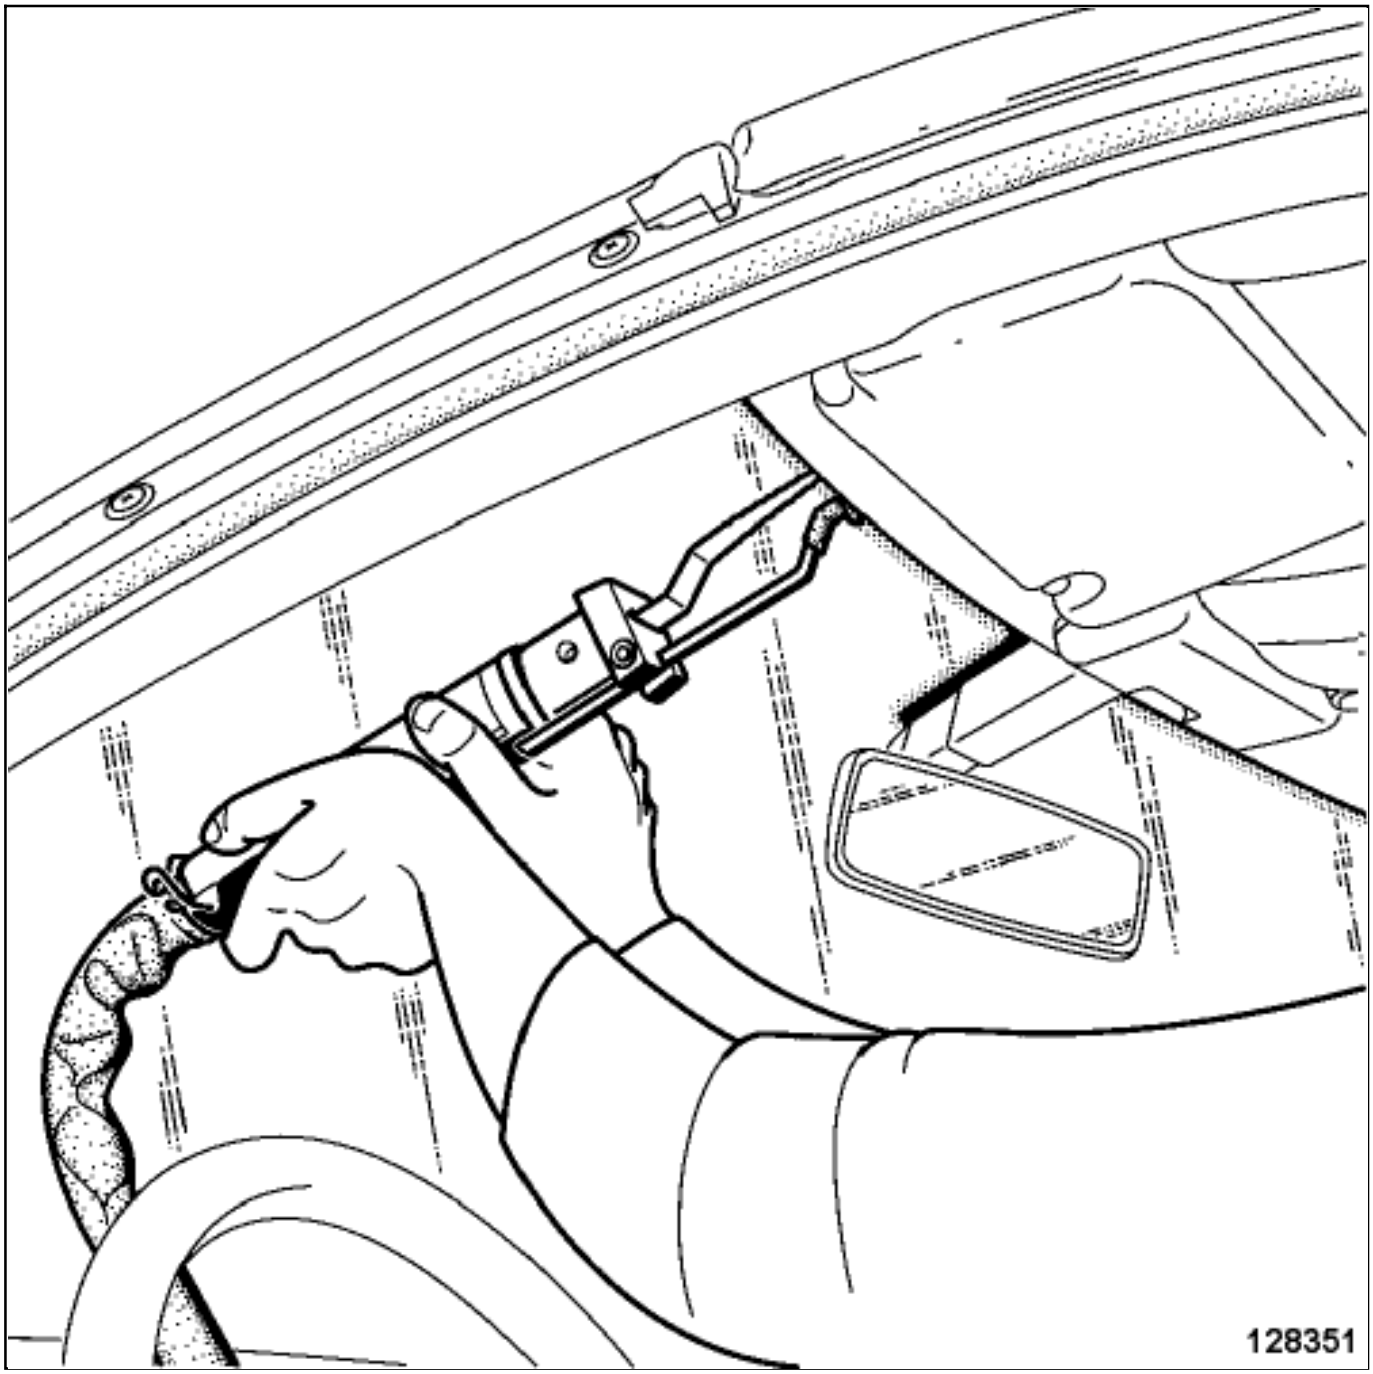
Grip the other end of the cutting wire on the winding device .

Cut the cement bead until the middle of the windshield.

Note:

The angle must be between 0˚and 45˚and the winding of the cutting wire on the winding device must be done correctly.

Move the winding device and install the roller as the cutting progresses.



Continue the cutting until the cutting wire can't be guided by roller.

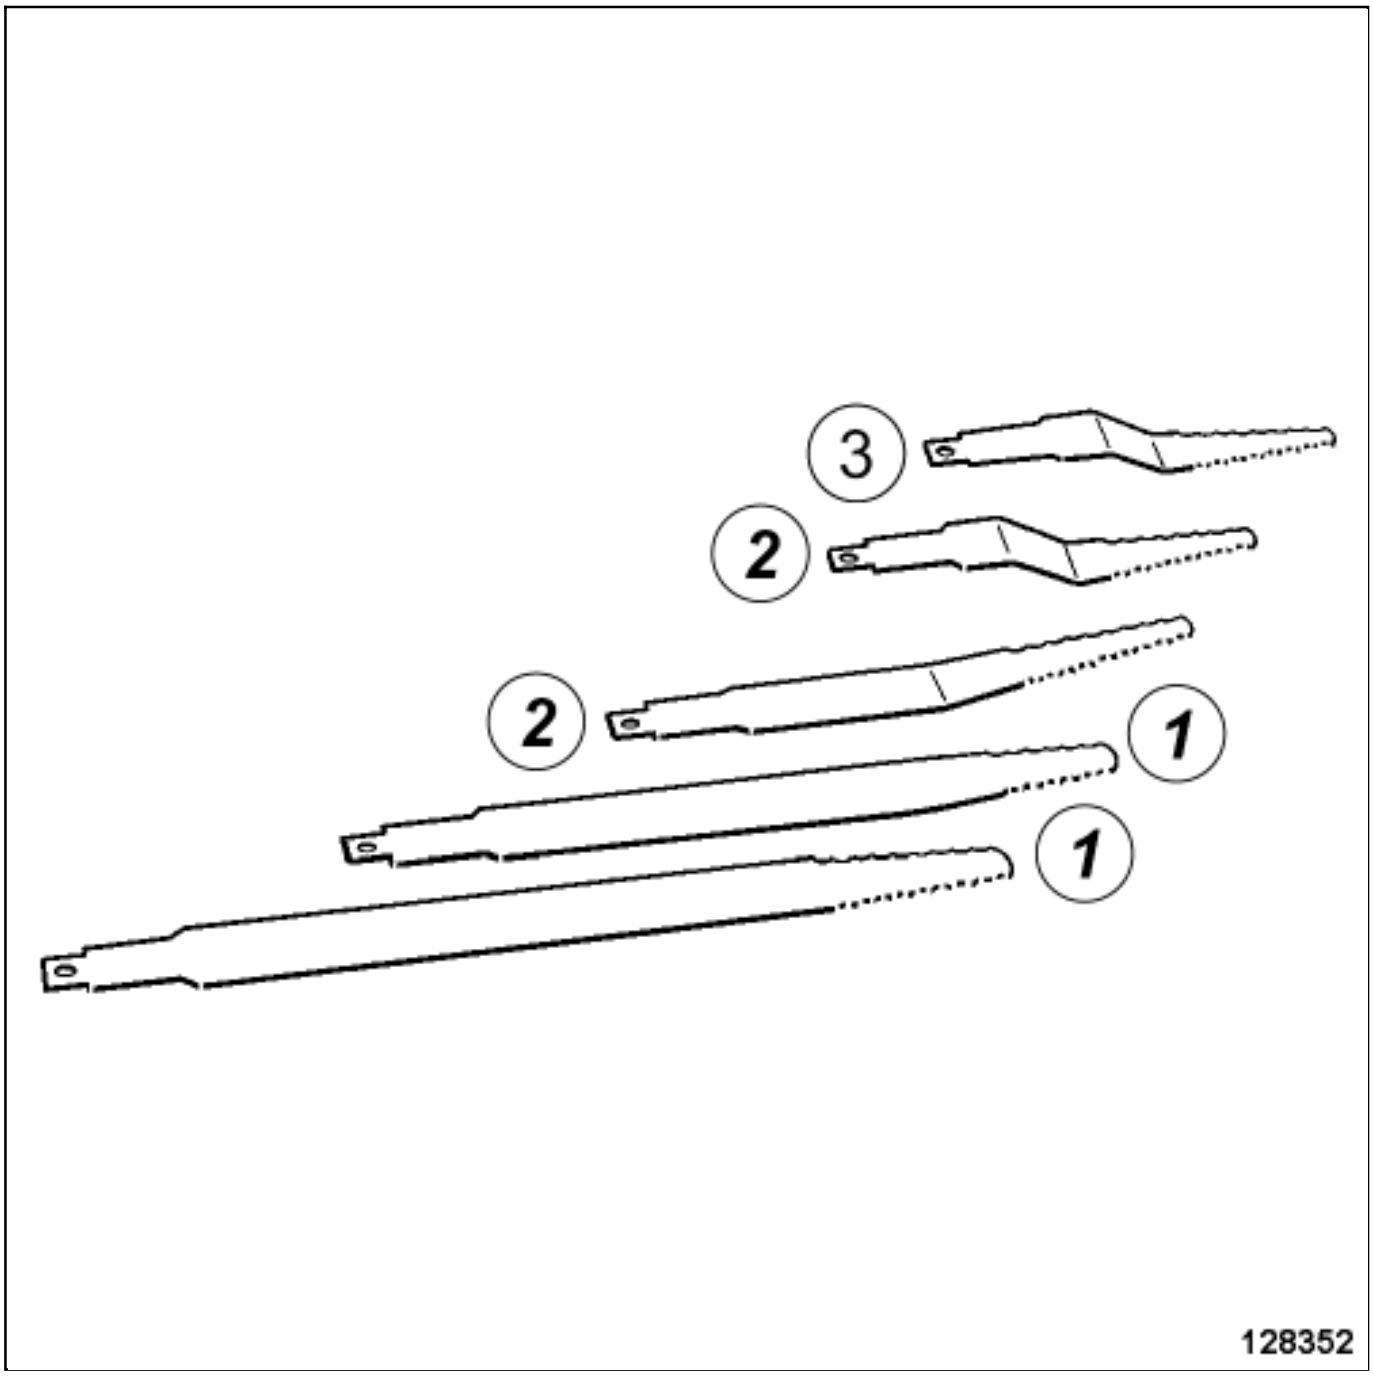
Remove the roller and continue the cutting.

Repeat the operation until the cutting is complete.

WINDOW REMOVAL TOOL: USE

1. DESCRIPTION

The cutting principle is based on short reciprocating strokes like those of a jigsaw.



The tool is equipped with a flat rigid sharpened blade with saw teeth.

The cutting operation is generally done from the interior side of the window.

The principal advantages are:

- the removal of all the windows including the "mouldings" ,
- a single operator for the removal,
- an accessory kit comprising blades that can also cut sheet metal or plastic panels.

2. CHOOSING BLADES

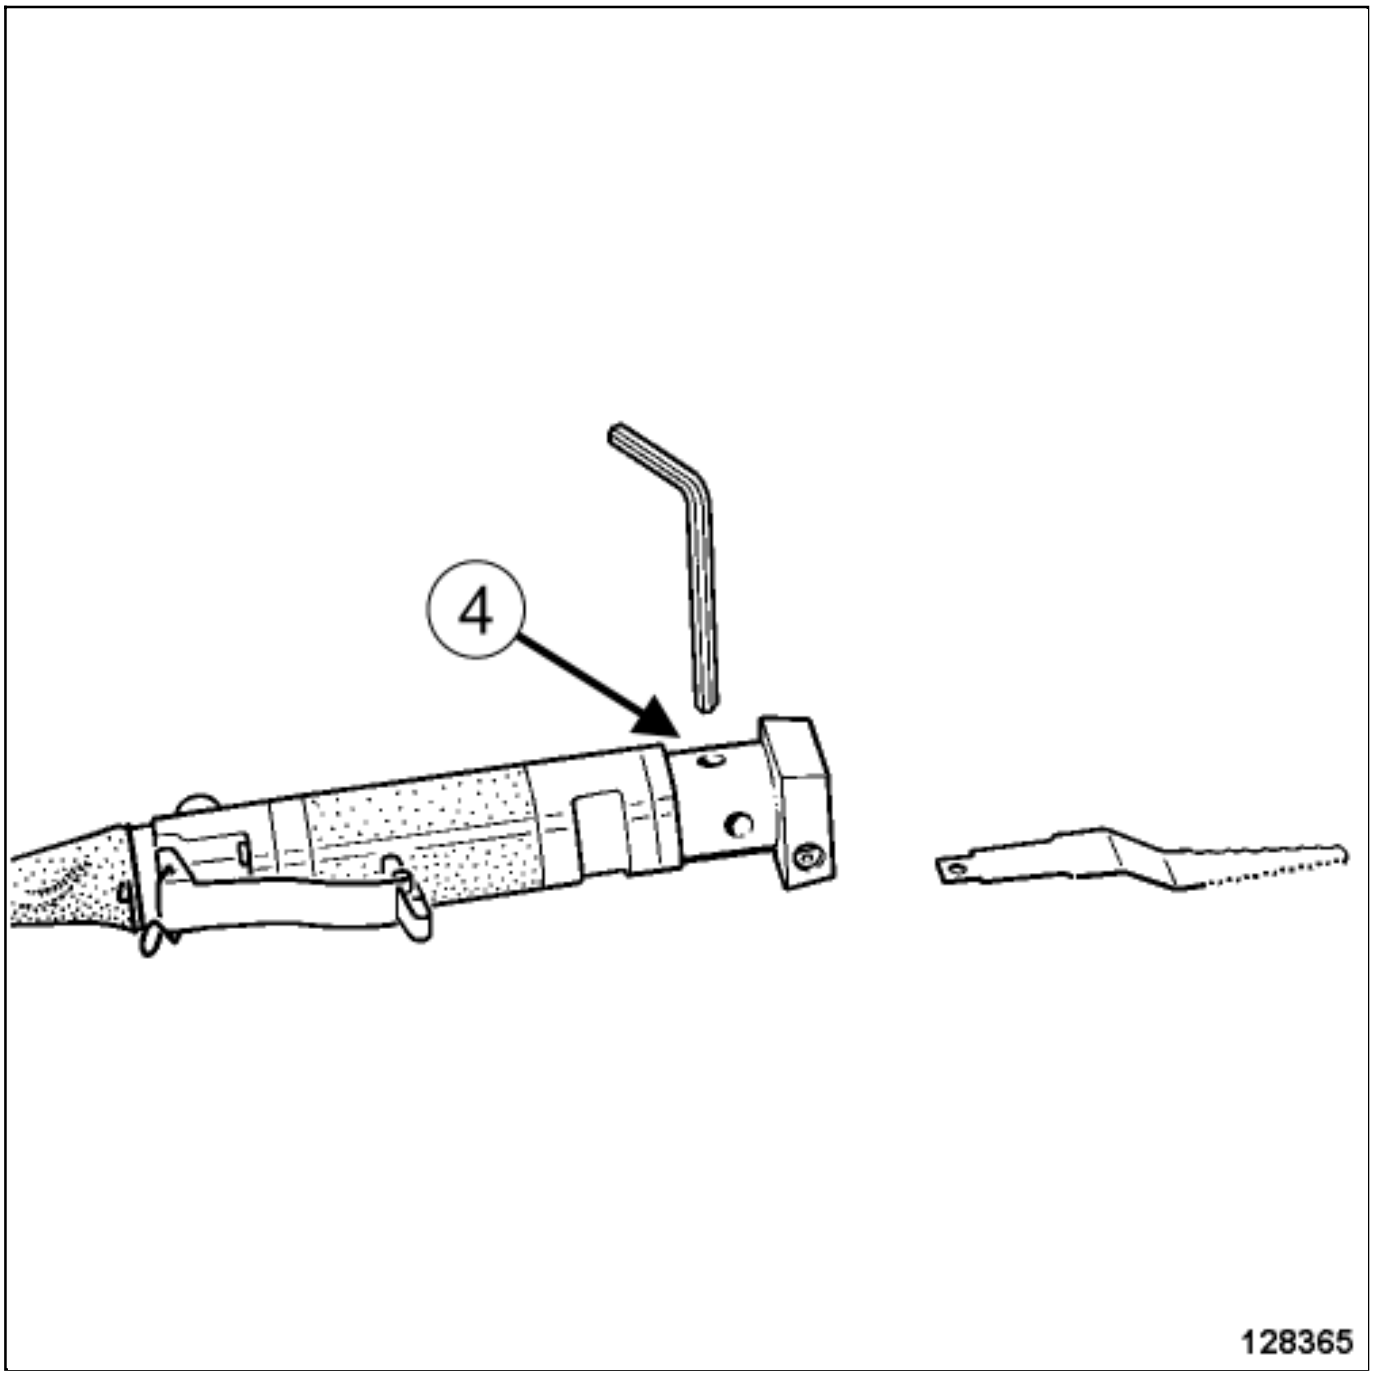
All these blades have efficient micro-teeth at the ends for cutting the cement bead quickly and easily.

The cutting kit comprises two types of blades.

1- LONG BLADES

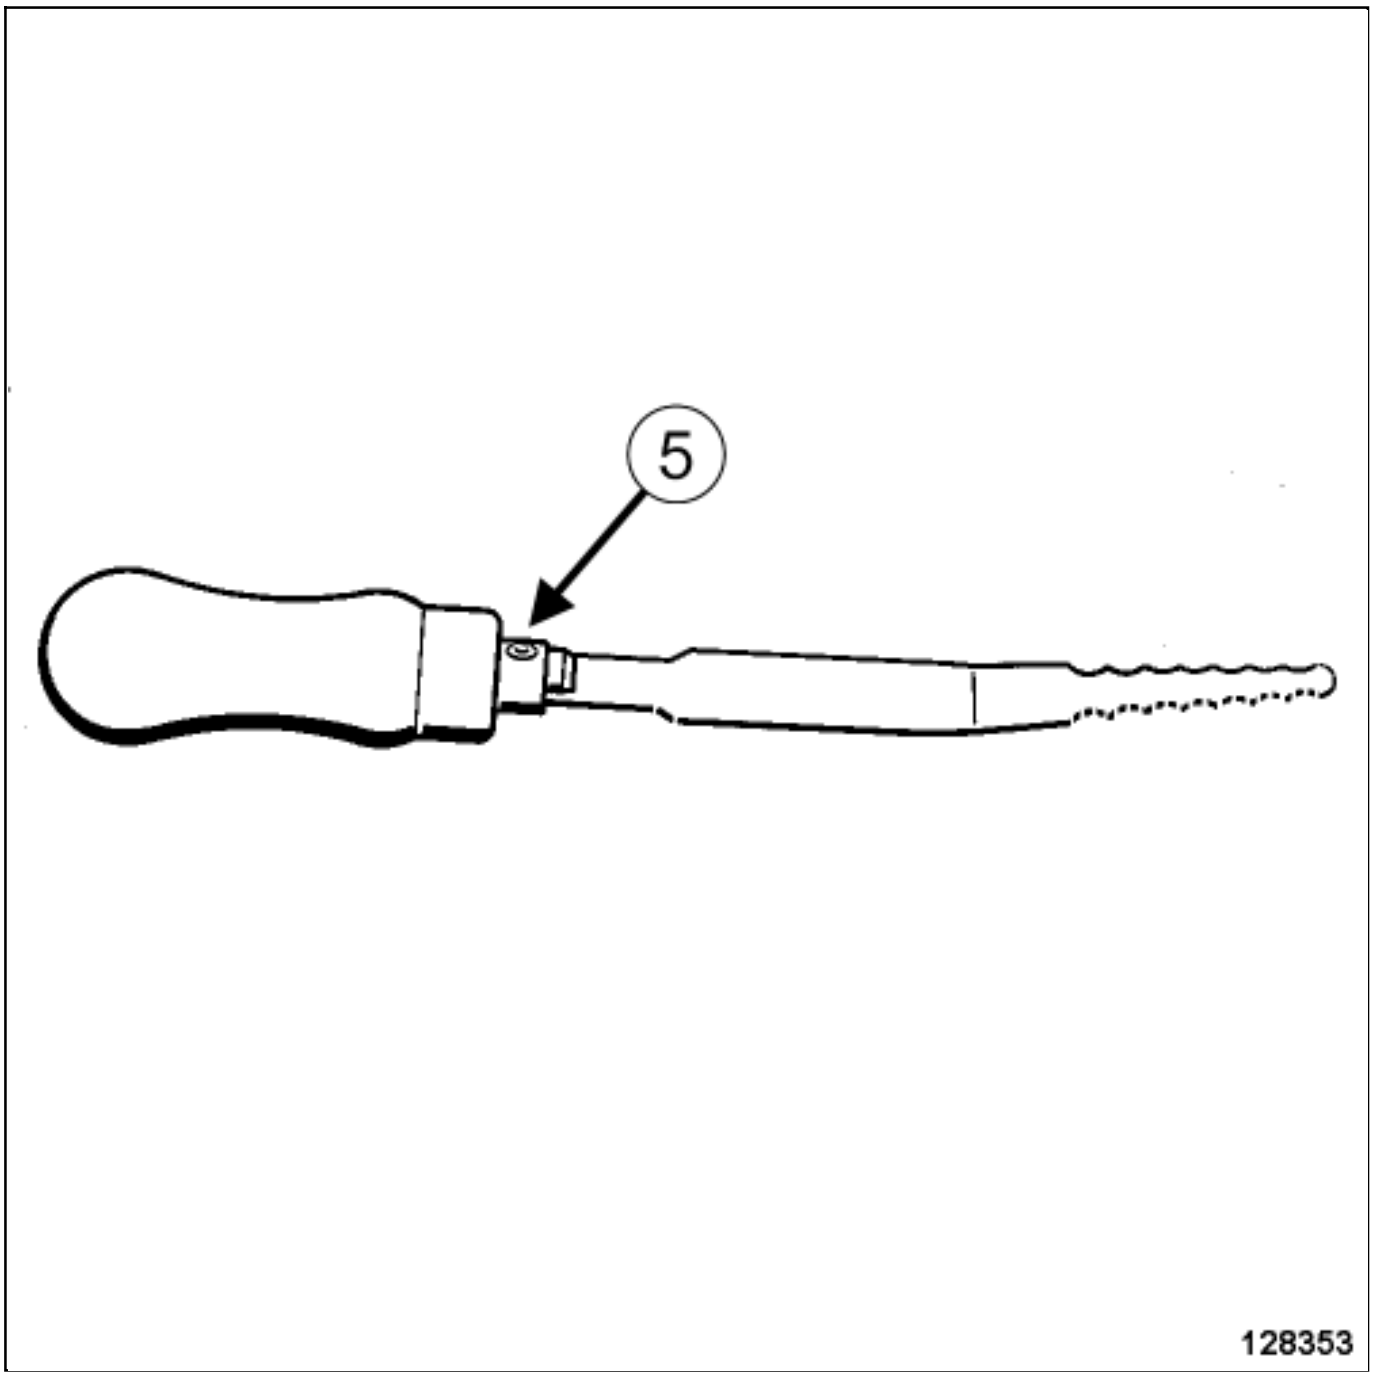
The long blades(1) WK1SC andWK2SC enable the bottom of the windscreen to be cut out by plunging them between the dashboard and the windscreen.

These blades can also be used for removing rear quarter panel windows in zones that are difficult to reach.



2- SHORT BLADES

The short blades(2) WK24SC andWK24ZSC enable the windscreen to be cut out at the roof and its pillars.

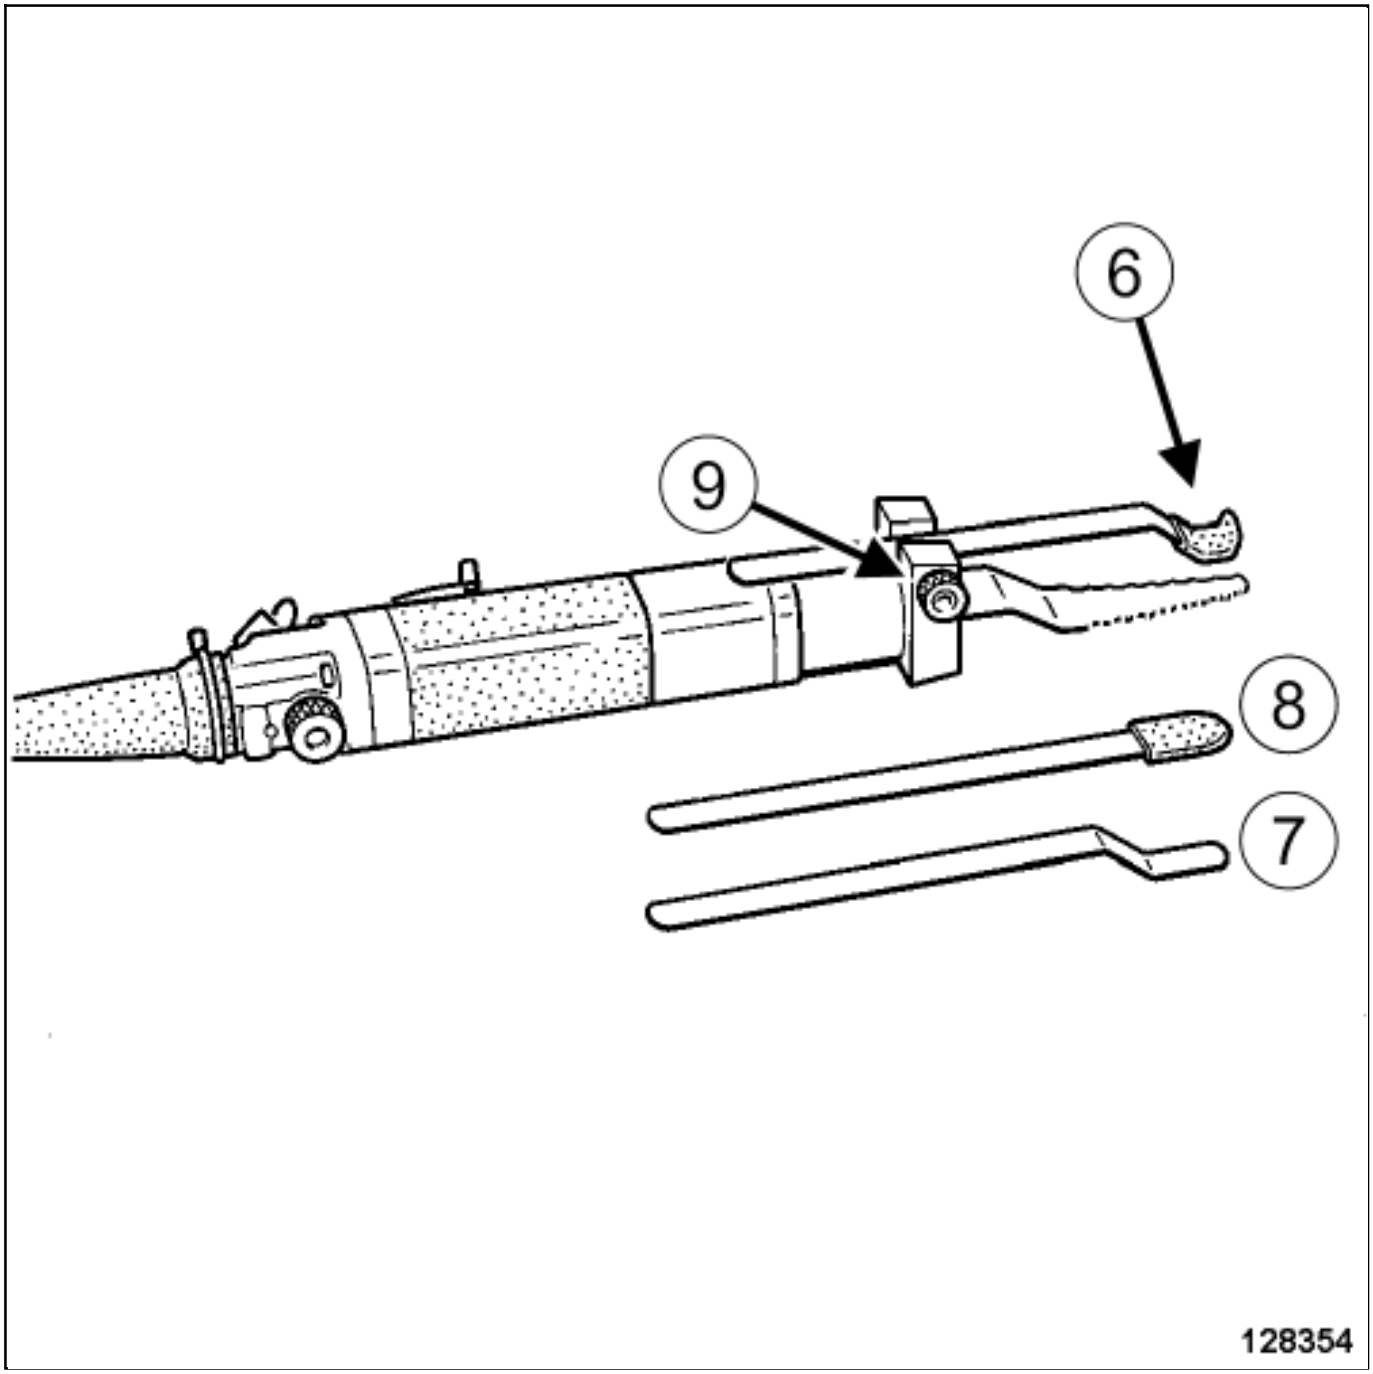


The blade(3) WK24ZR is only for cutting windows with moulded seals.

3. FITTING BLADES

- Loosen the bolt(4) .
- Insert the blade as far as it will go into the slit in the tool.
- Tighten the bolt(4) .

4. MANUAL BLADE HOLDER



- The kit includes a manual blade holder for manual cutting to complete the removal of the window.
- Loosen the bolt(5) .
- Insert the blade as far as it will go into the slit in the manual blade holder.

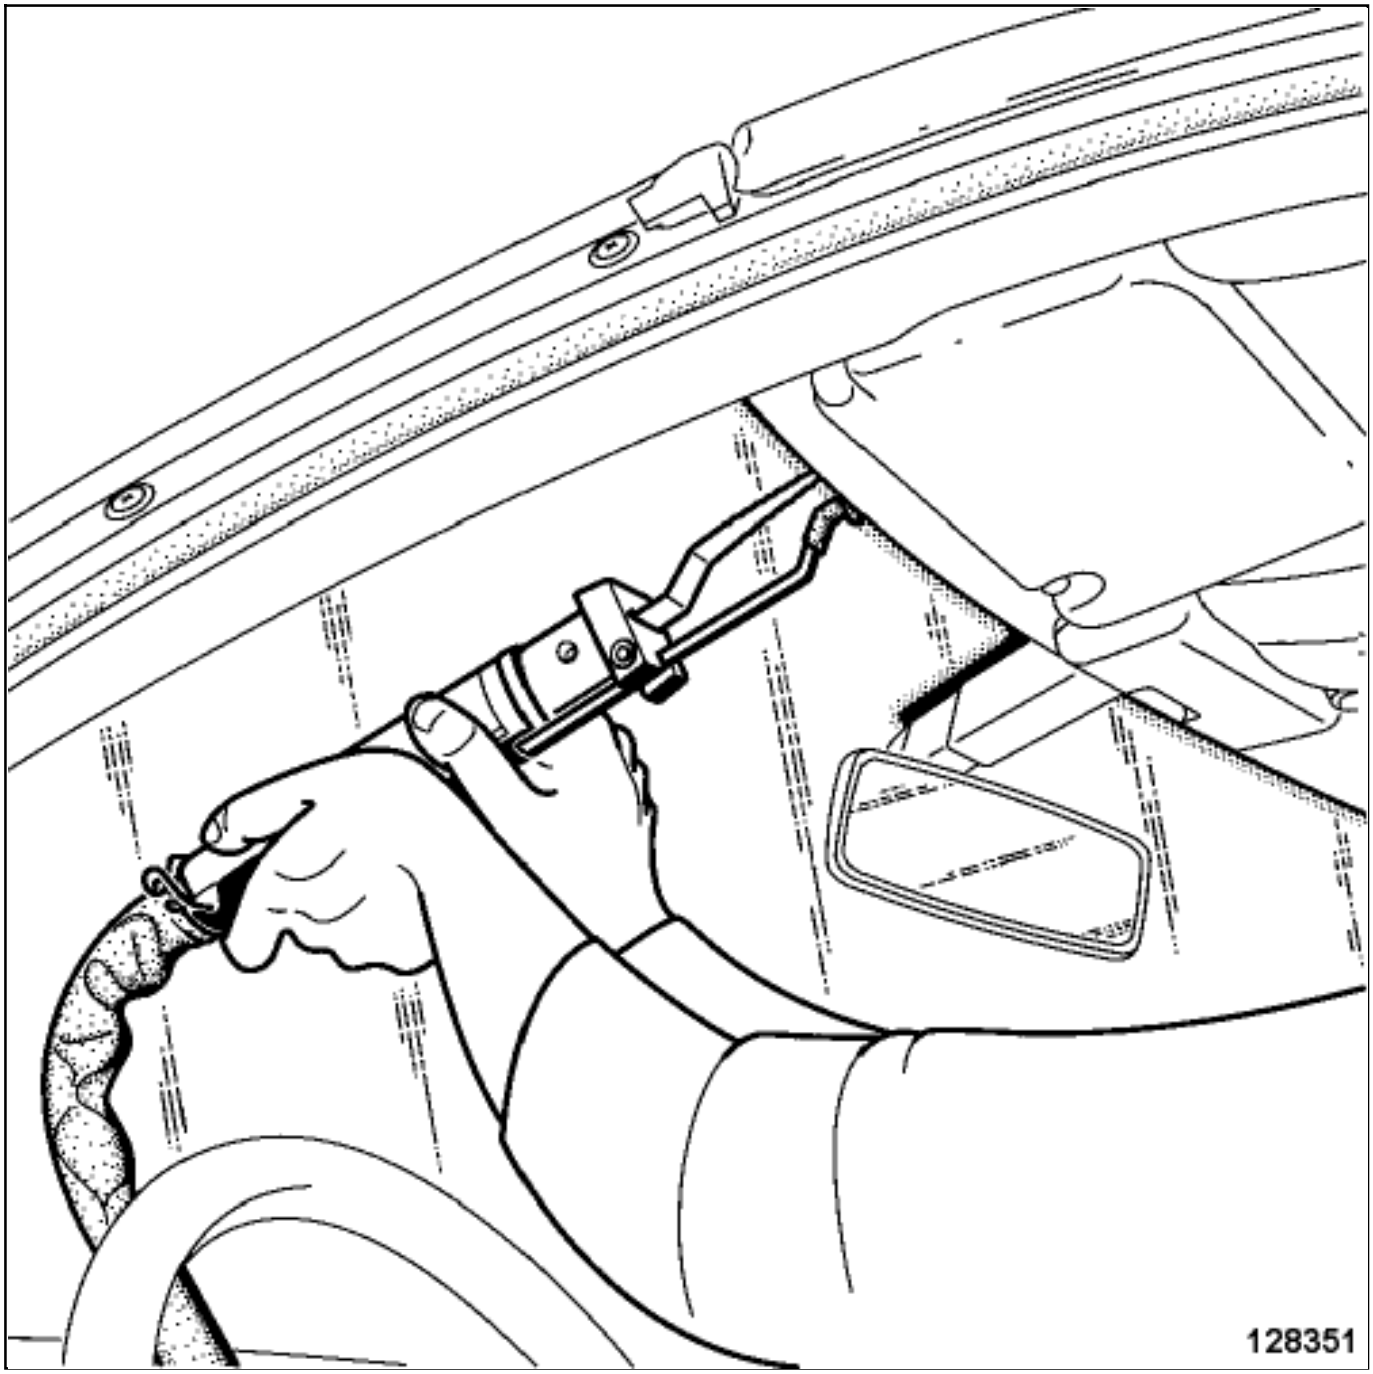
Note:

Only the long(1) and short(2) blades can be inserted into the manual blade holder

- Tighten the bolt(5) .

5. FITTING CUTTING GUIDES

To avoid any damage to the paint in the surrounding area when cutting with the toothed blade, a depth guide should be used to ensure that the blade protrudes as much as possible.



This guide can be supported either on the surrounding trim for type(6) guides, or on the cement bead itself for type(7) guides.

The type(8) guide only acts as a shim when removing windows with moulded seals (see cutting windows with moulded seals).

These guides are quickly fitted and adjusted on the tool head with the help of a manual tightening wheel (9) .

6. ADJUSTING CUTTING GUIDES

Fit the guide most suited to the working area and slide it in without tightening the manual tightening wheel (9) .

Position the tool at right angles to the cement bead and carefully push the blade in until it has gone all the way through the cement bead.

Note:

To perform the adjustment, it is recommended that you stand outside the vehicle in order to see the moment when the blade emerges through the cement bead.

The stroke of the blade must be adjusted so that during its alternating movement it cuts the cement

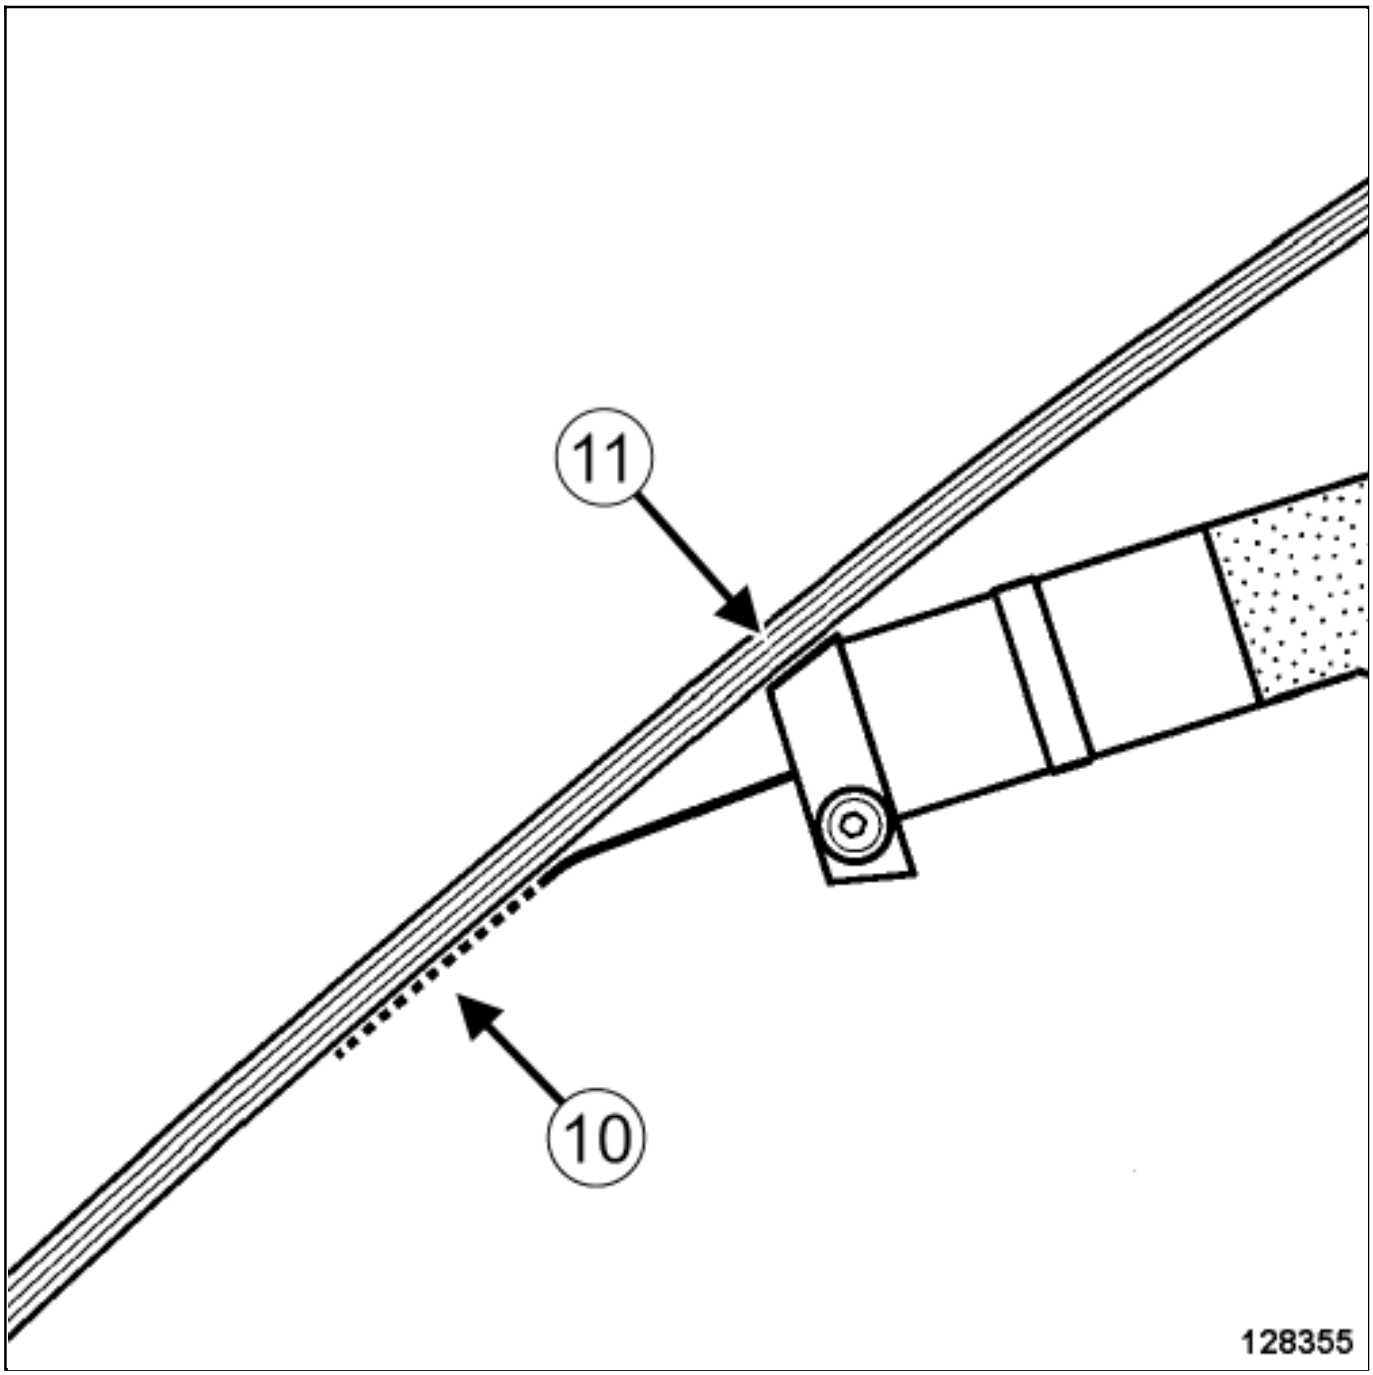
bead without risk of damaging the paintwork.

- Stop the tool and without moving it, put the depth guide in contact with the trim.

Note:

Take into account the fact that in the "tool stopped" position the blade is located approximately 6 mmback from the end of its stroke.

- Tighten the manual tightening wheel(9) .
- Detach the tool from the cement bead.



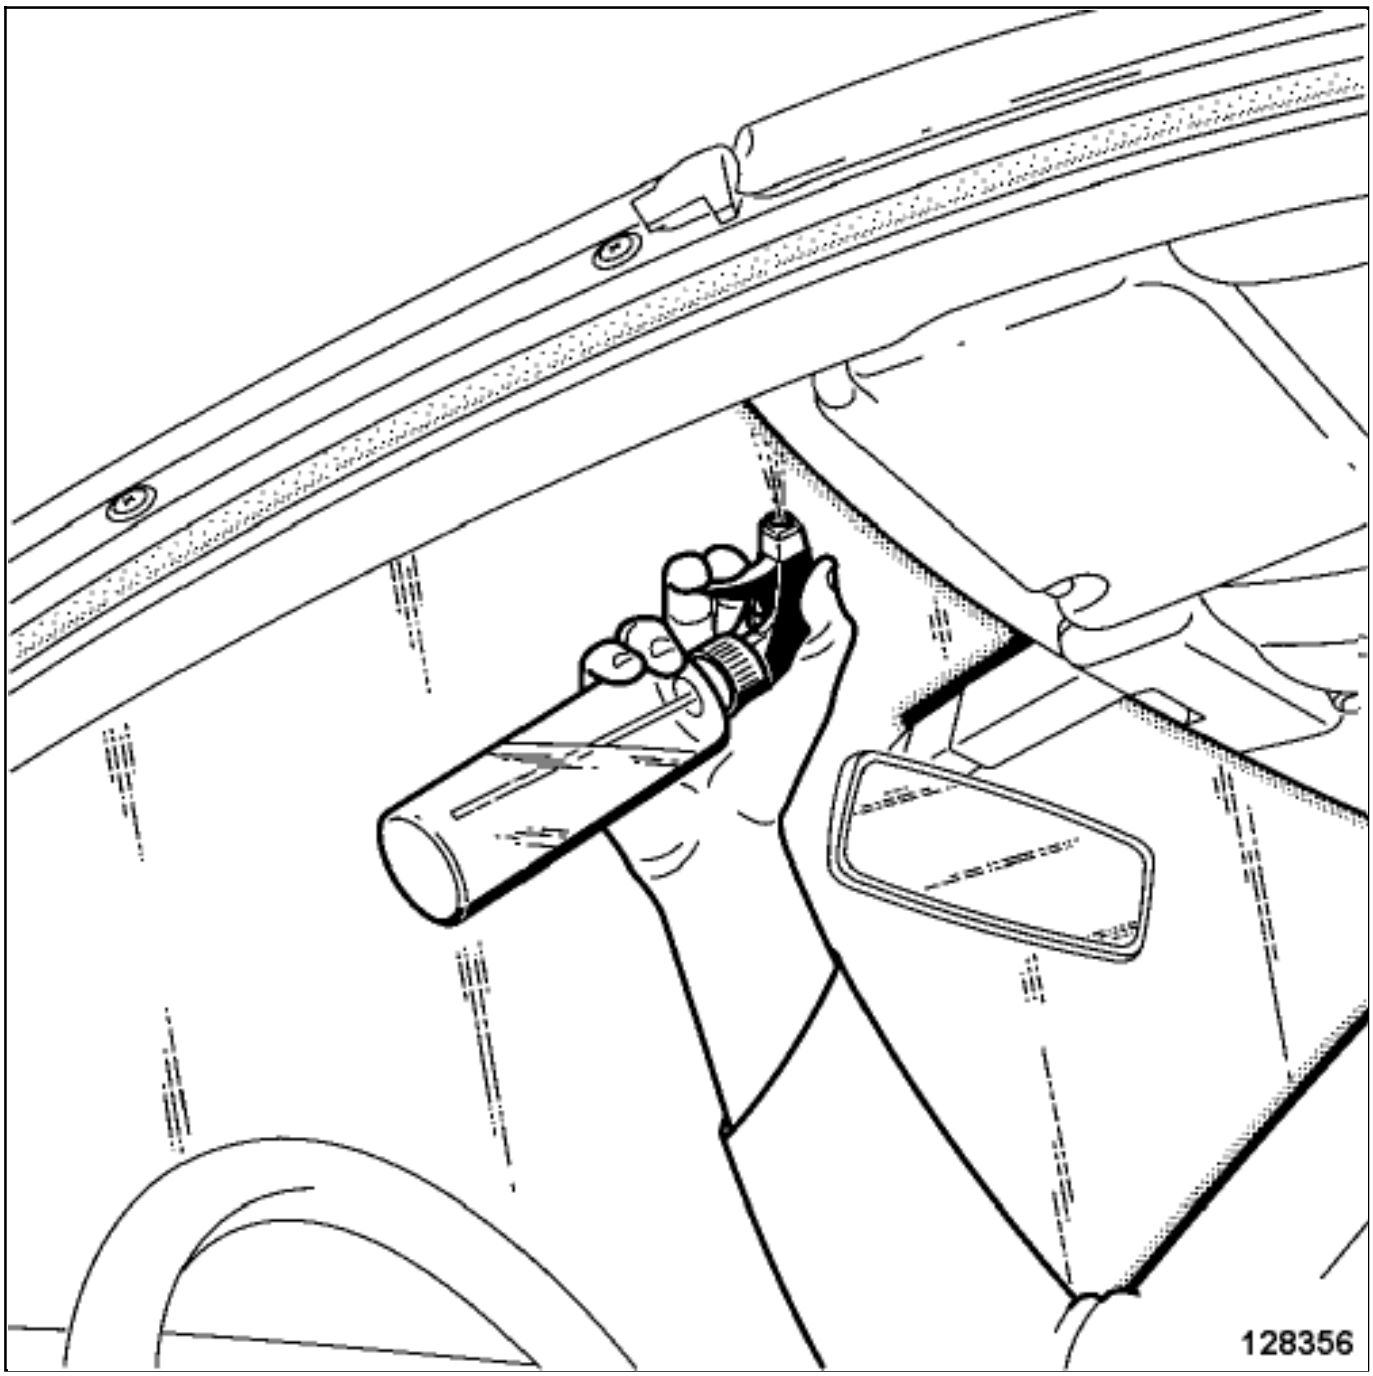
Note:

Do not use the depth guide when cutting the window corners.

You are advised to watch the blade from the outside and limit its depth by eye.

On certain vehicles, the bottom of the windscreen frame does not require the use of a depth guide.

7. PRECAUTIONS WHEN CUTTING



To ensure that the cement bead is cut under the best conditions, follow the instructions below:

- always to keep part(**10**) of the blade flat and parallel with the glass,
- the stop(**11**) always must be in permanent contact with the glass,
- it is imperative to hold the tool body with two hands when cutting the cement bead,
- use a depth guide if necessary,

- start the tool outside the cement bead before beginning cutting,

- cut the cement bead by drawing the tool towards yourself. This allows better control of the movement of the tool during cutting.

Note:

Before any action with the tool, spray water on the cement bead using the atomiser provided in the cutting kit.

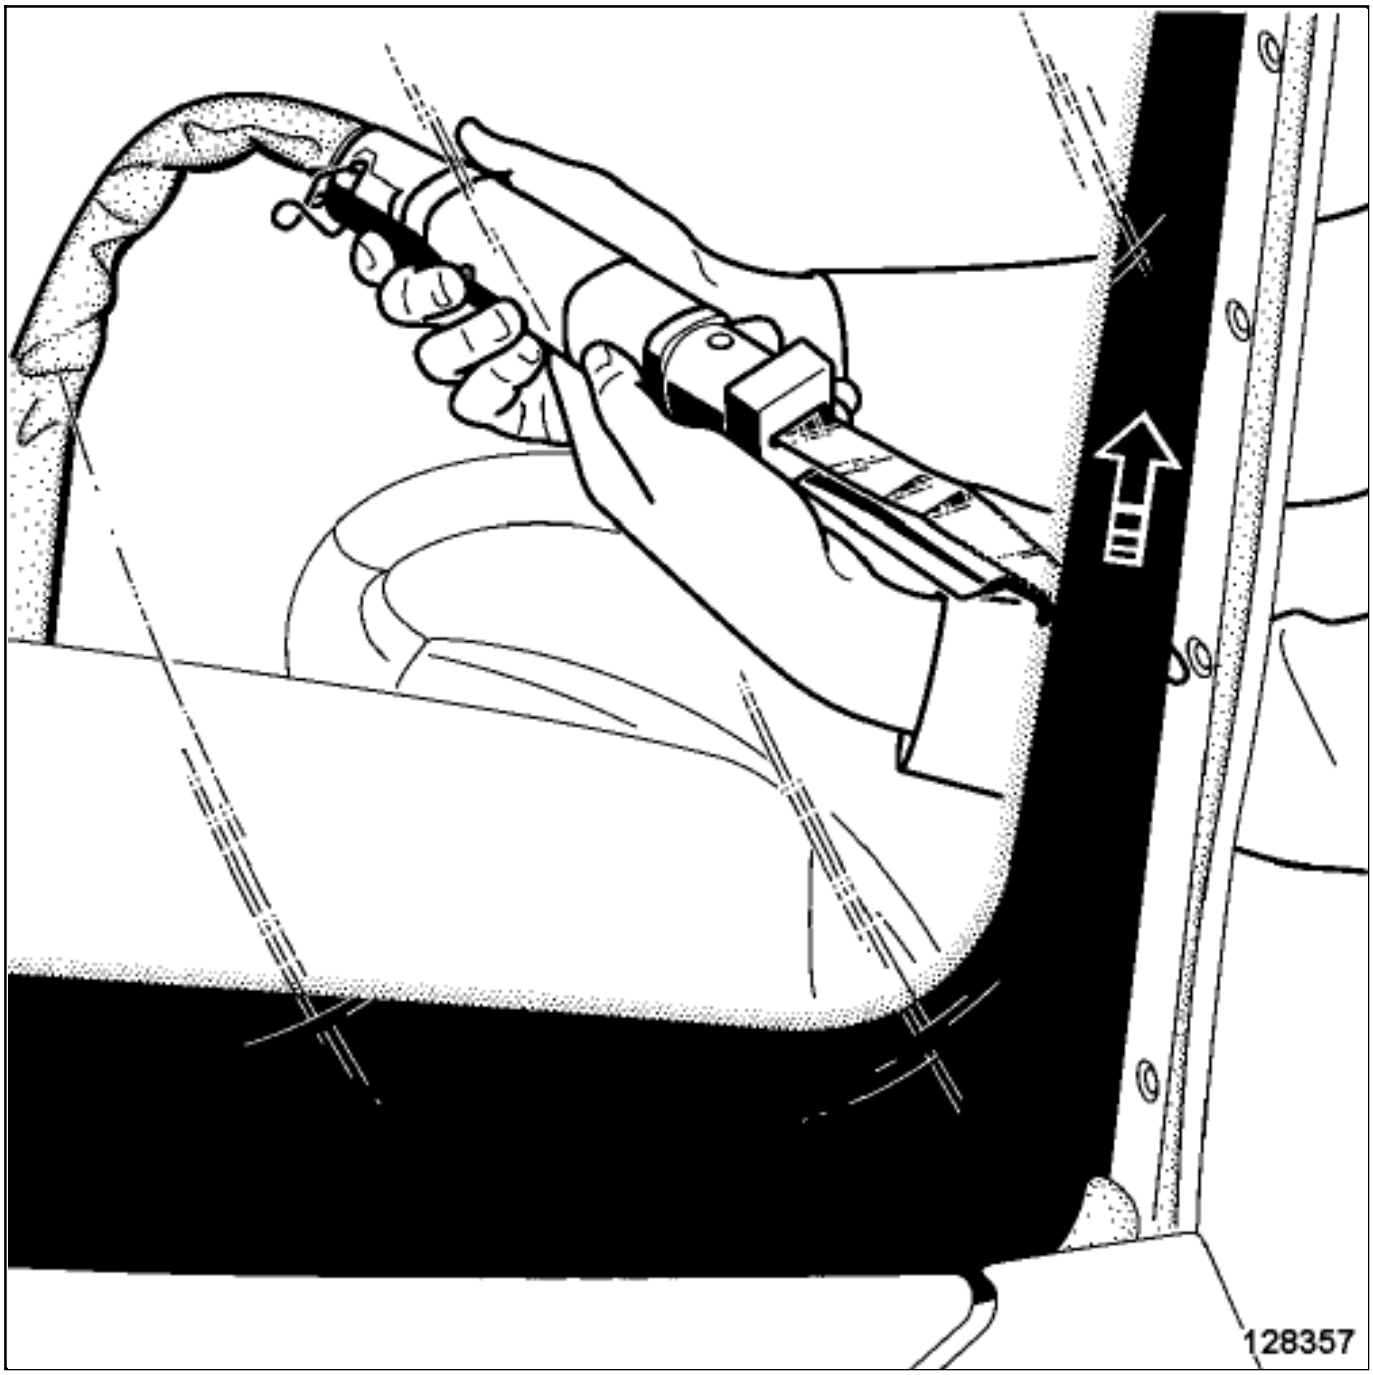
The water allows the blade to slide and cut the cement bead more easily.

8. POSITION OF THE OPERATOR

Note:

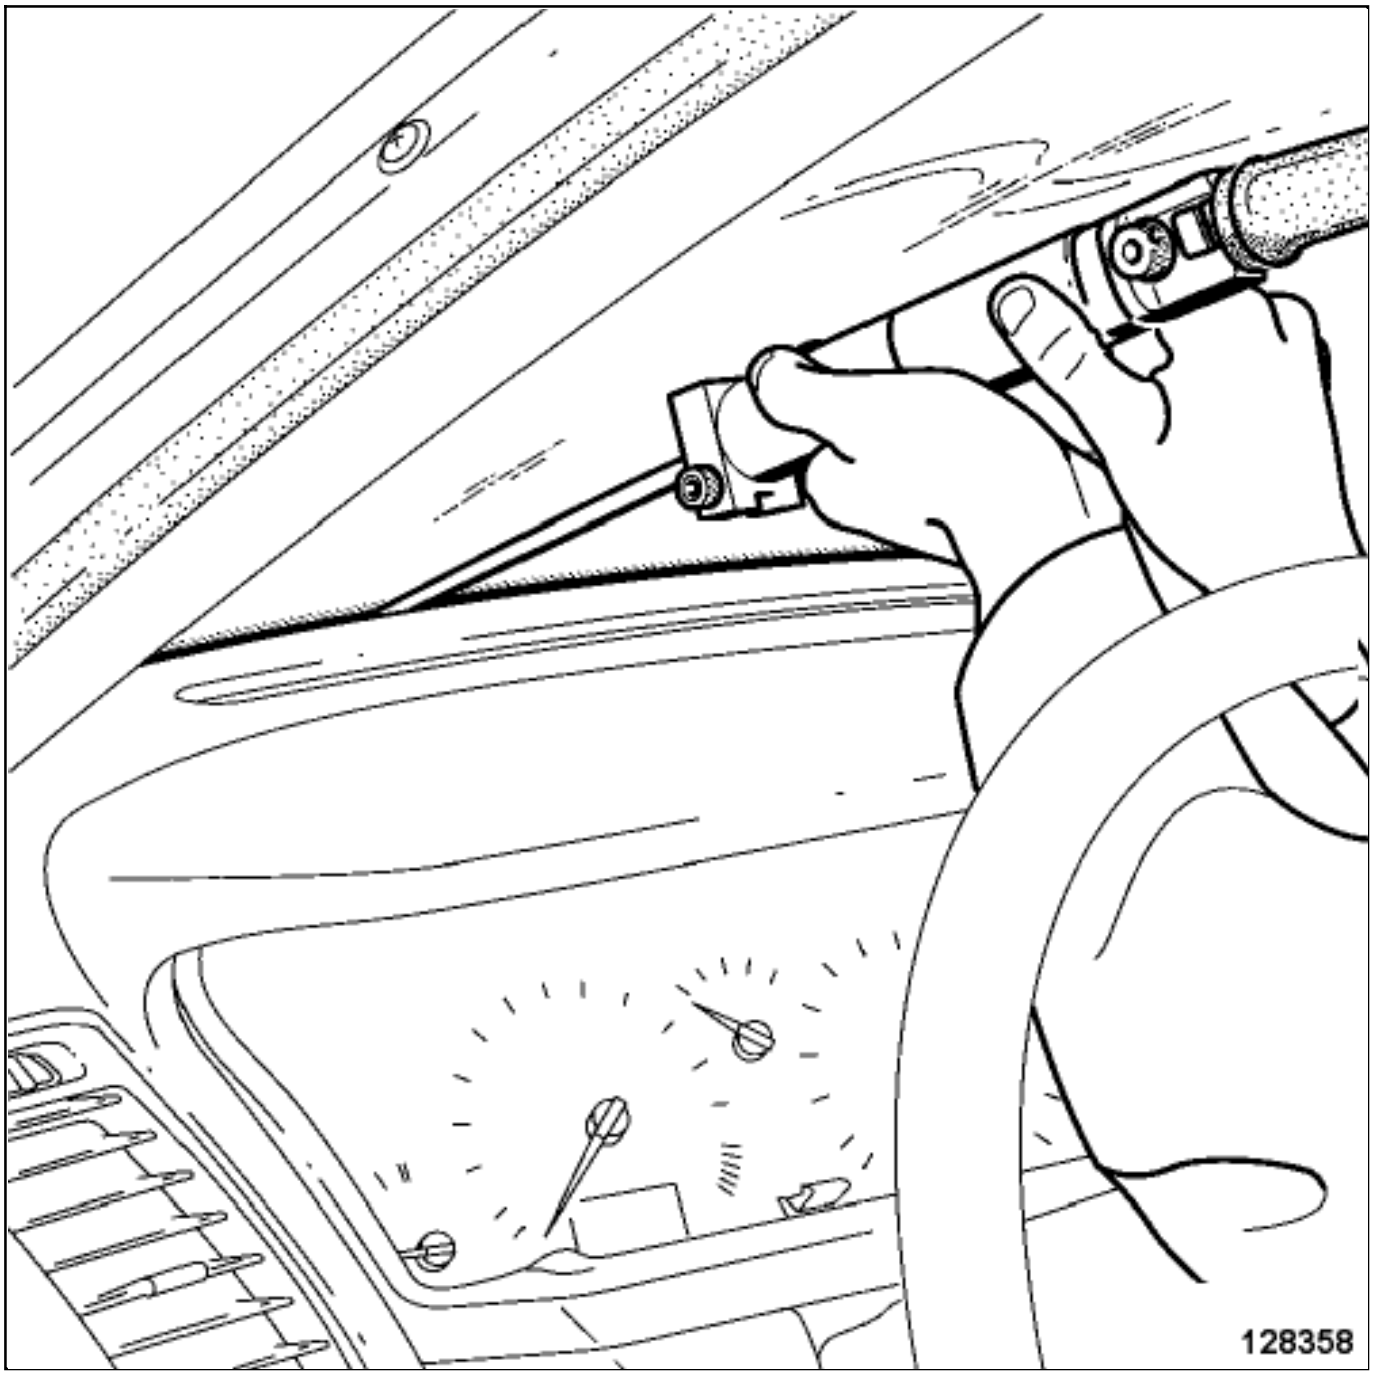
When cutting at the window pillars and upper section of the windows do not use a long blade as this carries a risk of overhanging.

Spray water on the cement bead, before cutting it and spray regularly during the cutting operation to avoid all release of fumes due to the blade heating up.



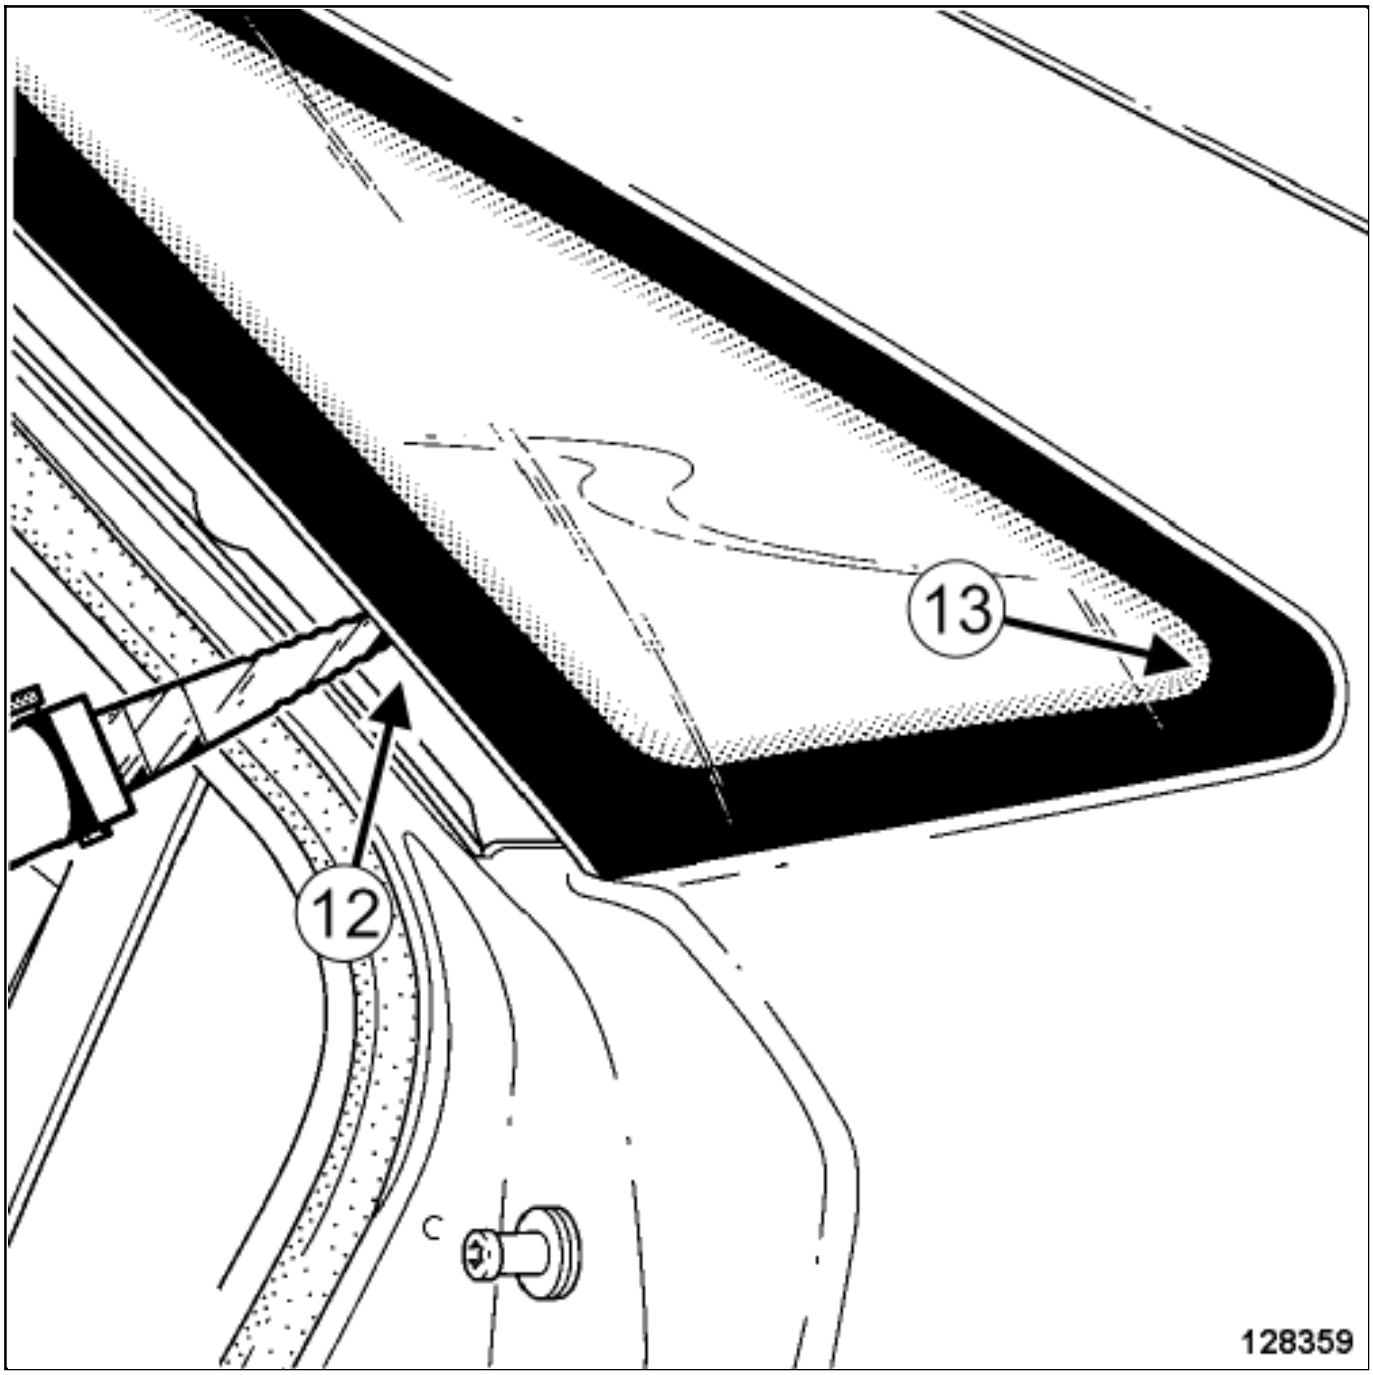
Ensure that the depth guide is always in contact with its reference surface during cutting of the cement bead.

If the blade has difficulty in cutting very thick cement bead, make progressive cuts into the area until the blade passes through it.



To avoid all risk of accident during the cutting operation, do not place yourself directly in line with the blade.

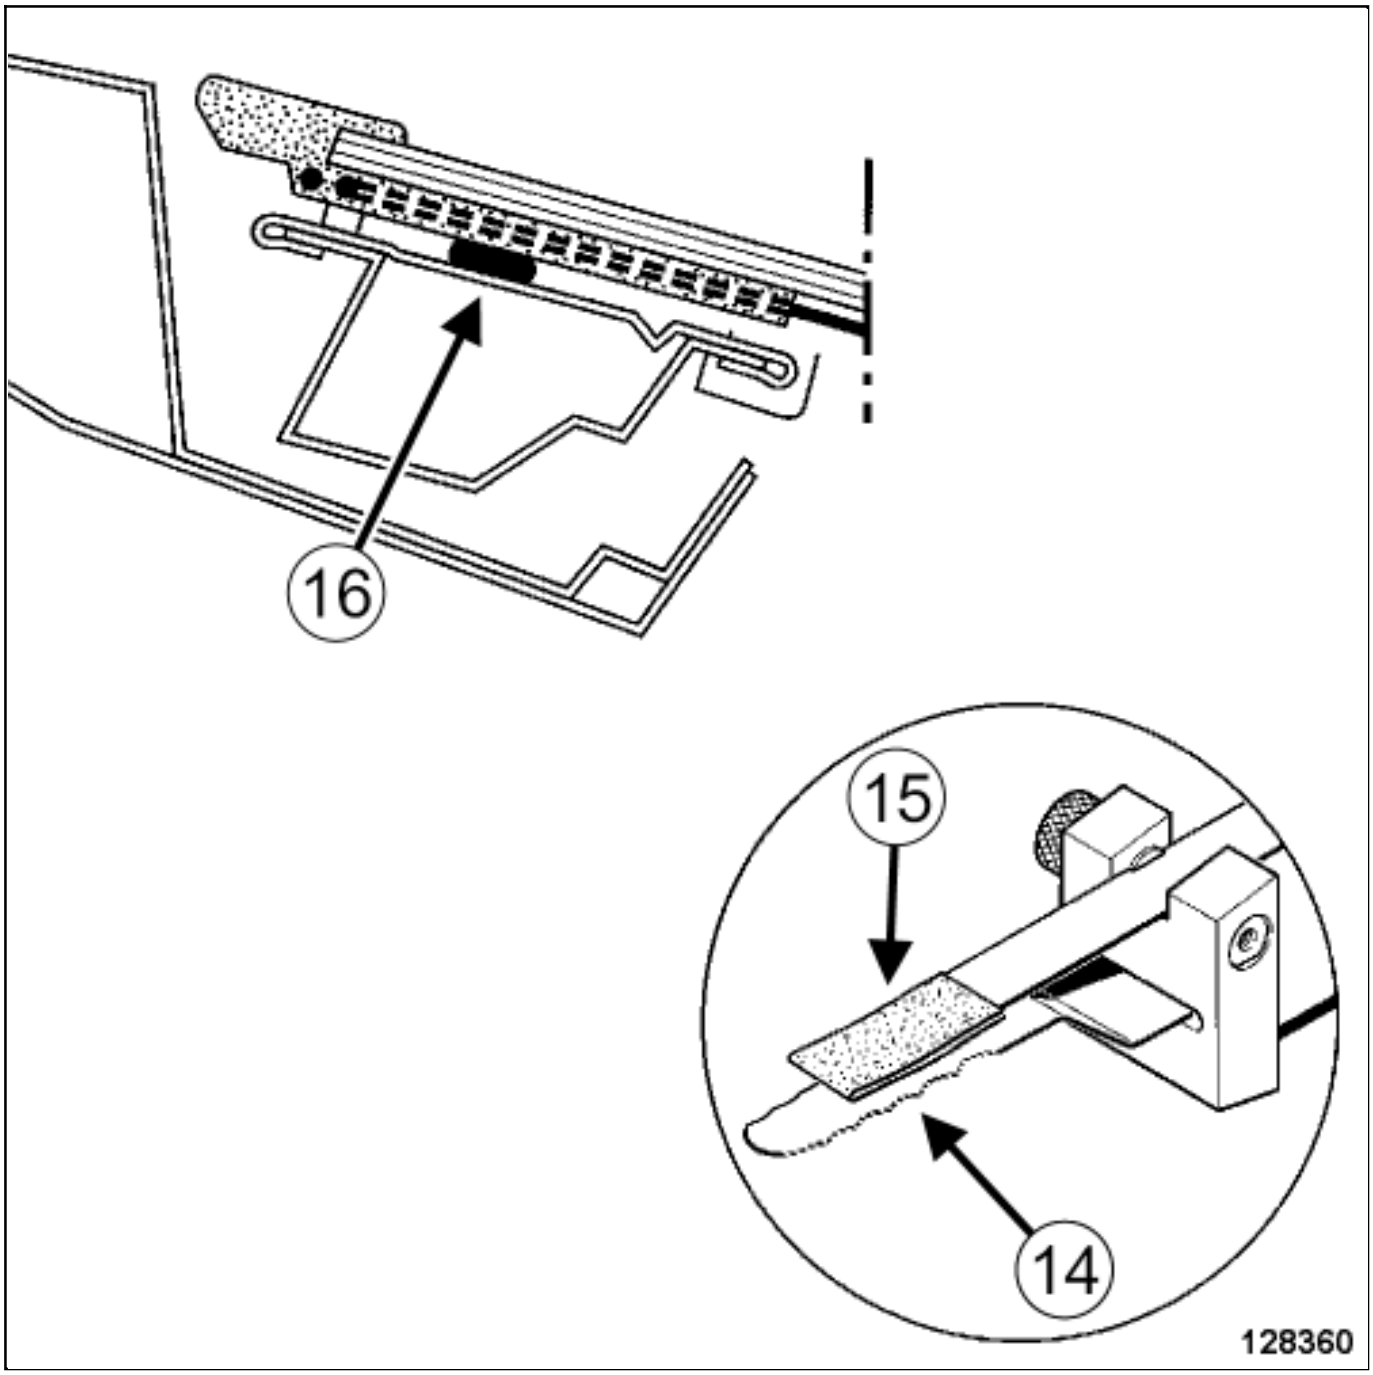
1- CUTTING SIDE SECTIONS



Stand outside the vehicle, start at the bottom of the windows and cut the beading by drawing the tool as far as the top corner.

2- CUTTING UPPER AND LOWER SECTIONS OF WINDOWS

Go inside the vehicle and work by bringing back the tool towards yourself.



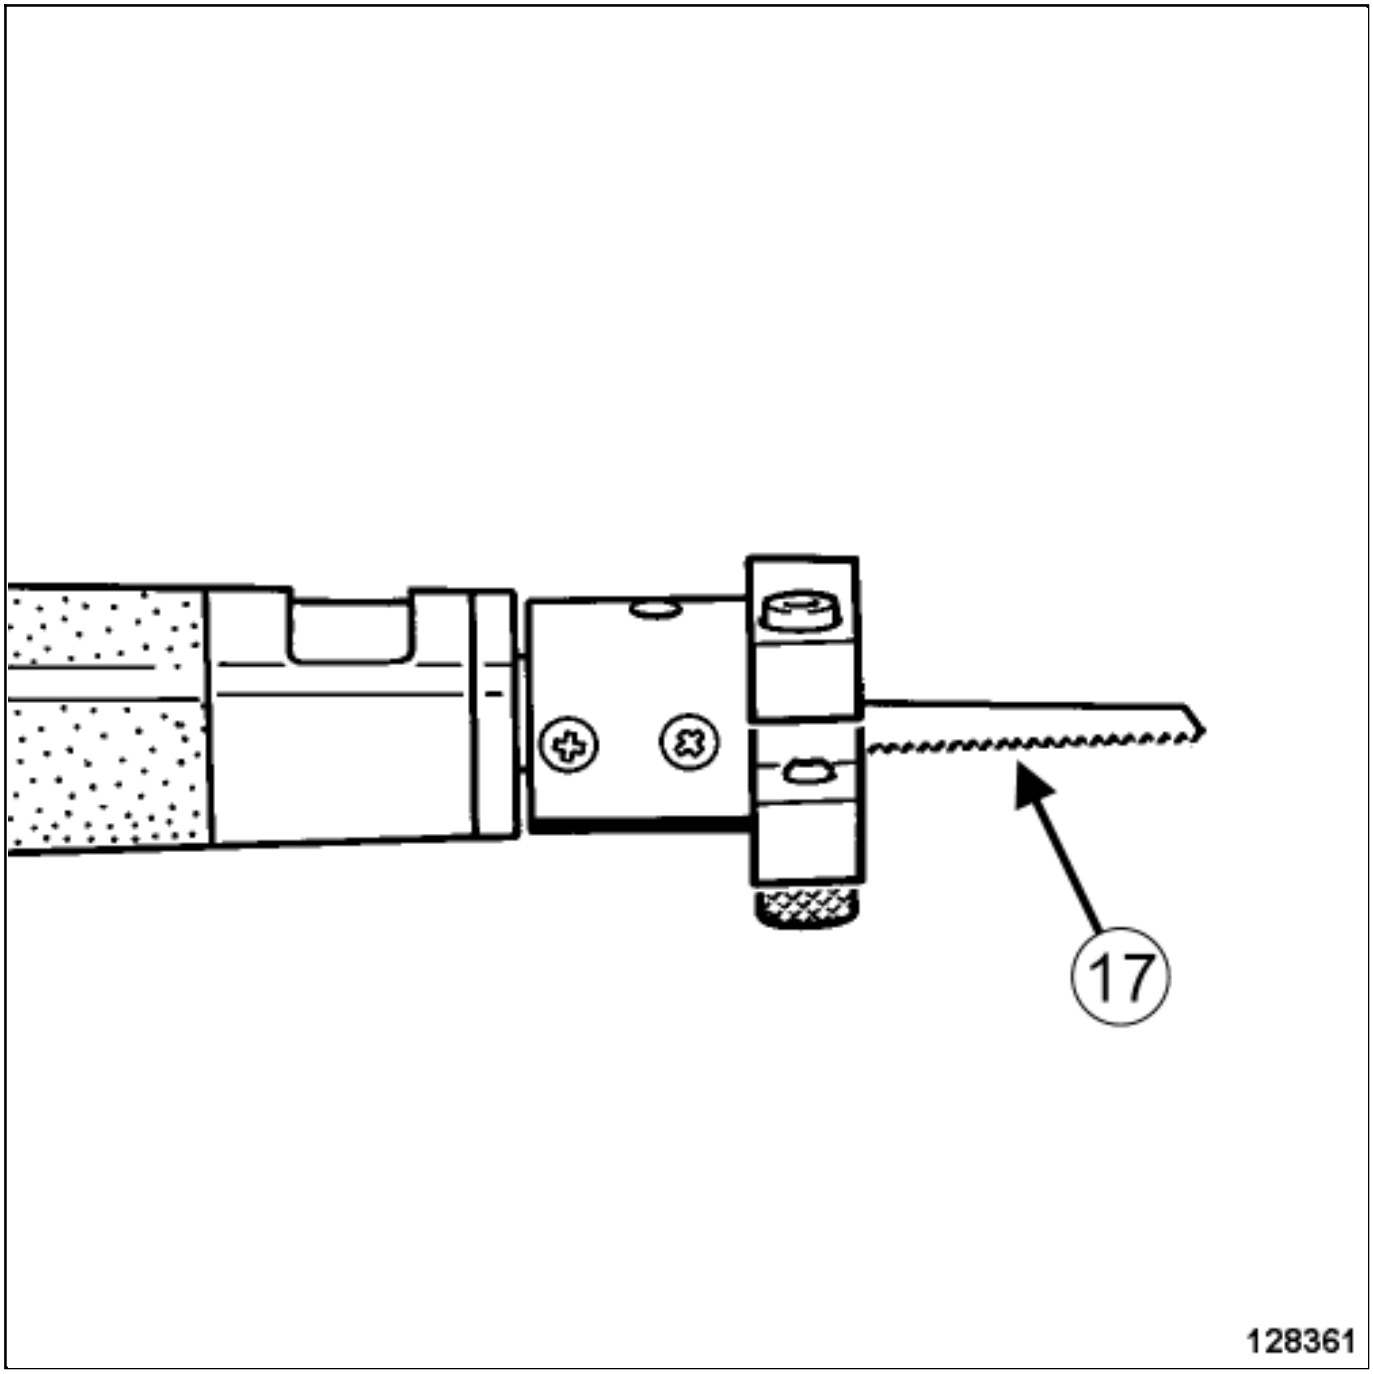
3- CUTTING THE REAR QUARTER PANEL WINDOW

Cut the most accessible part(12) from outside.

Using the long bladeWK1SC, cut the remainder of the cement bead as far as the corner(13) by inserting the blade at(12) .

4- CUTTING WINDOWS WITH MOULDED SEALS

Use a specific bladeWK 24ZRthat does not damage the moulding of the windows.



The cutting teeth of the blade(14) are oriented to the rabbet side and the other side is slightly convex so as to limit the damage to the moulding.

The straight guide(15) fitted on the tool must be kept in contact with the glass in order to bring the blade as close as possible to the rabbet when cutting the cement bead(16) .

Note:

You must always cover the end of the guide(15) with a layer of Velcro (supplied in the cutting kit) in order not to damage the screen printing of the windows.

9. USE AS A JIGSAW

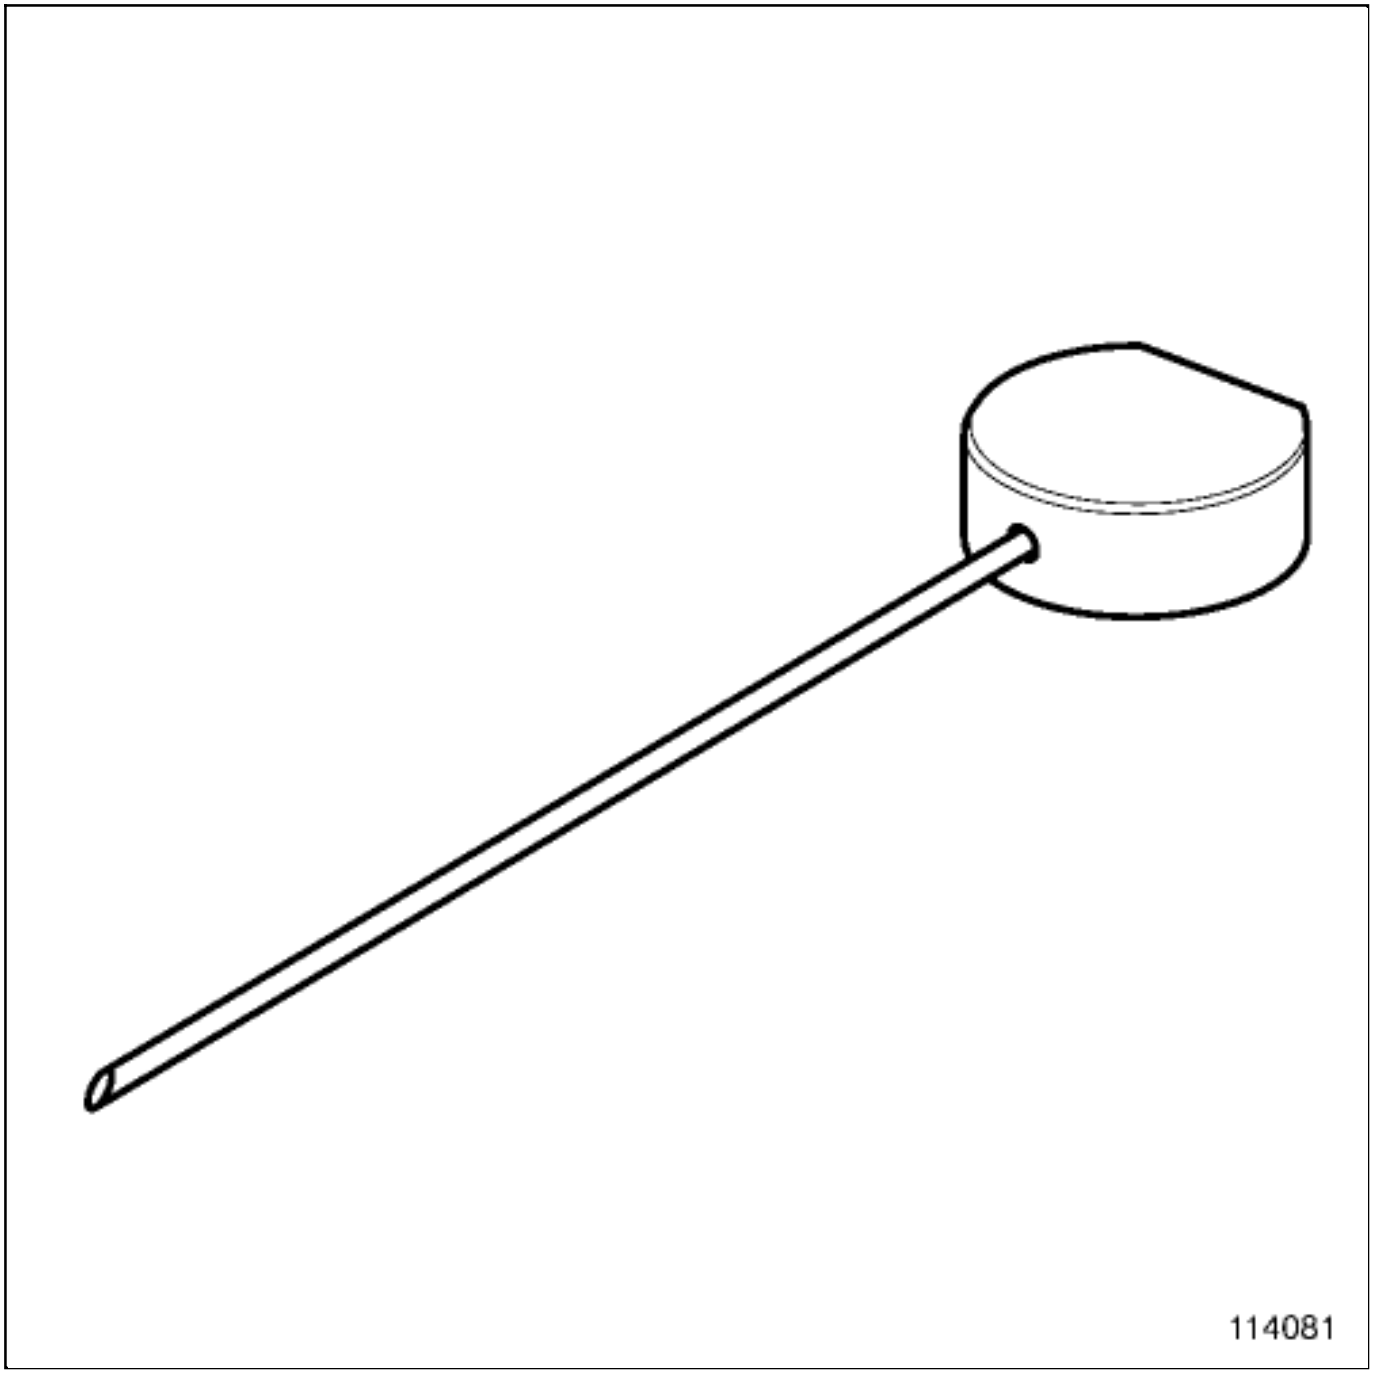
It is possible to use the tool as jigsaw.

A blade(17) and a specific guide are supplied in the cutting kit.

The blade can cut sheet metal or plastic panels with ease.

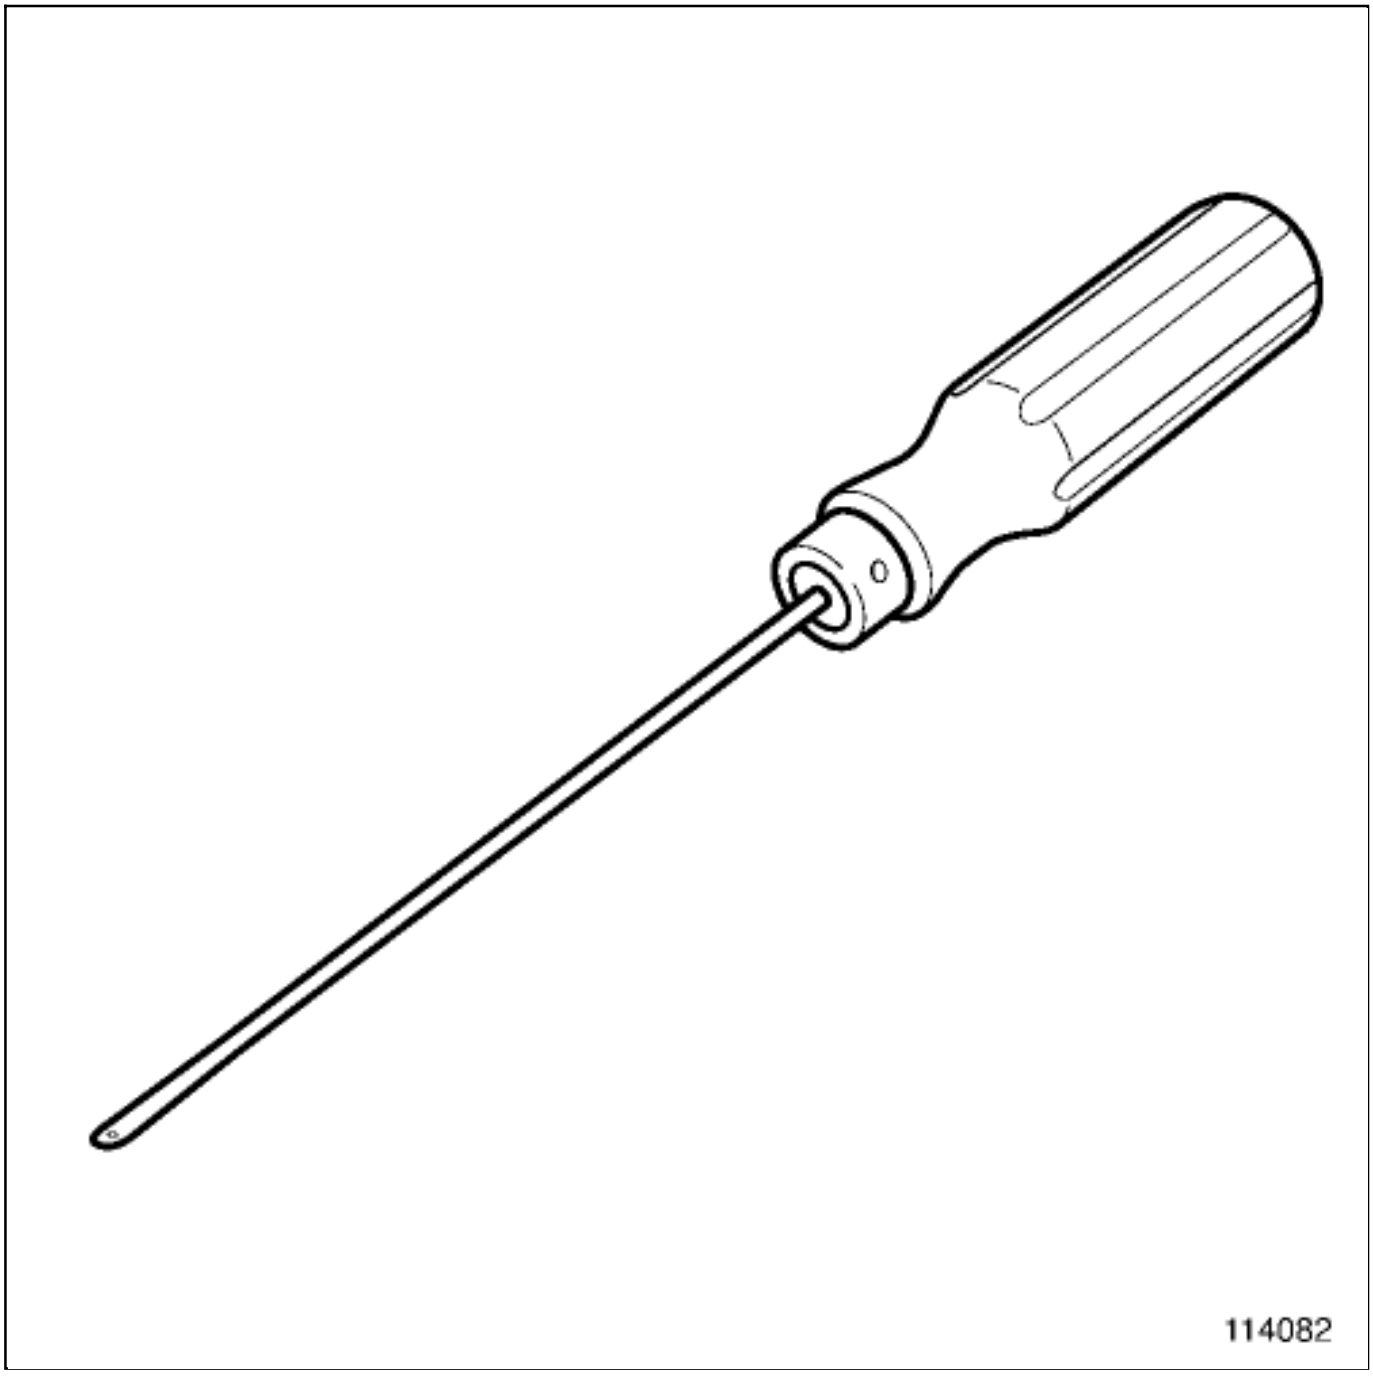
WINDOW TOOLS: DESCRIPTION

Examples of equipment and tools:

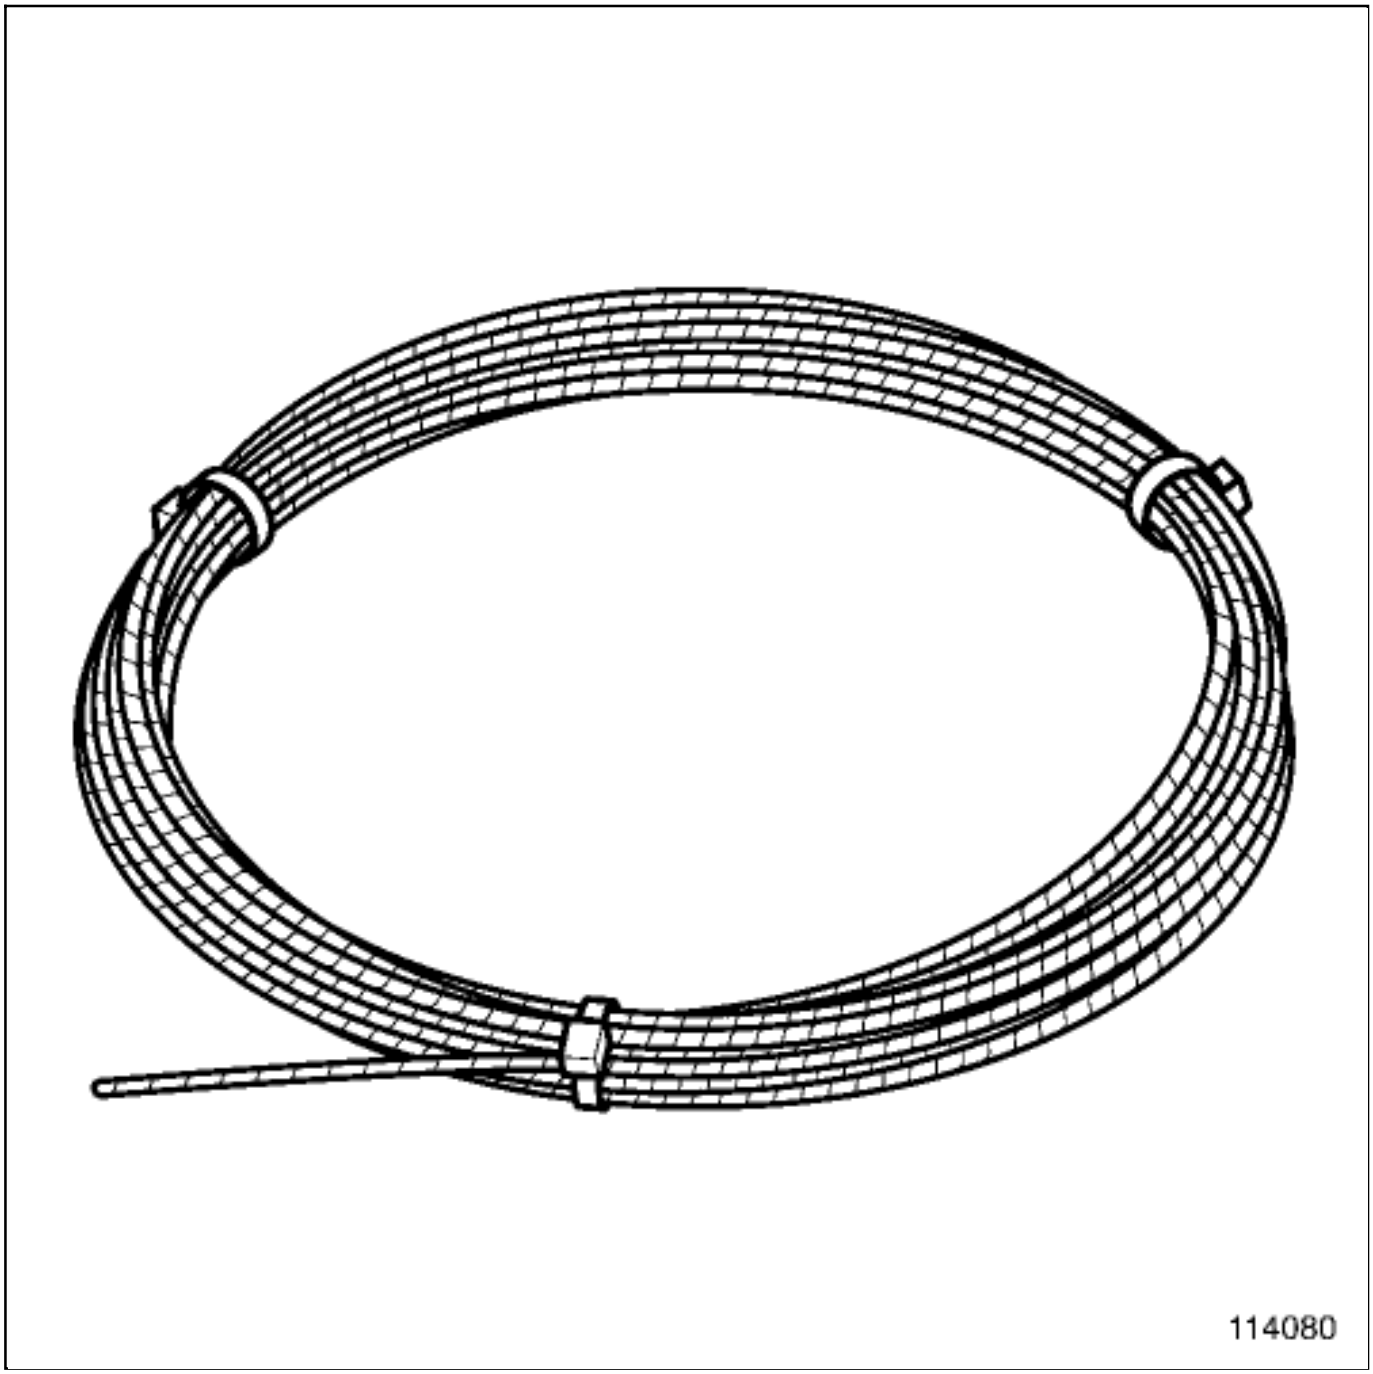


1. PROTECTION

UNIVERSAL PROTECTOR (CAR.1847)

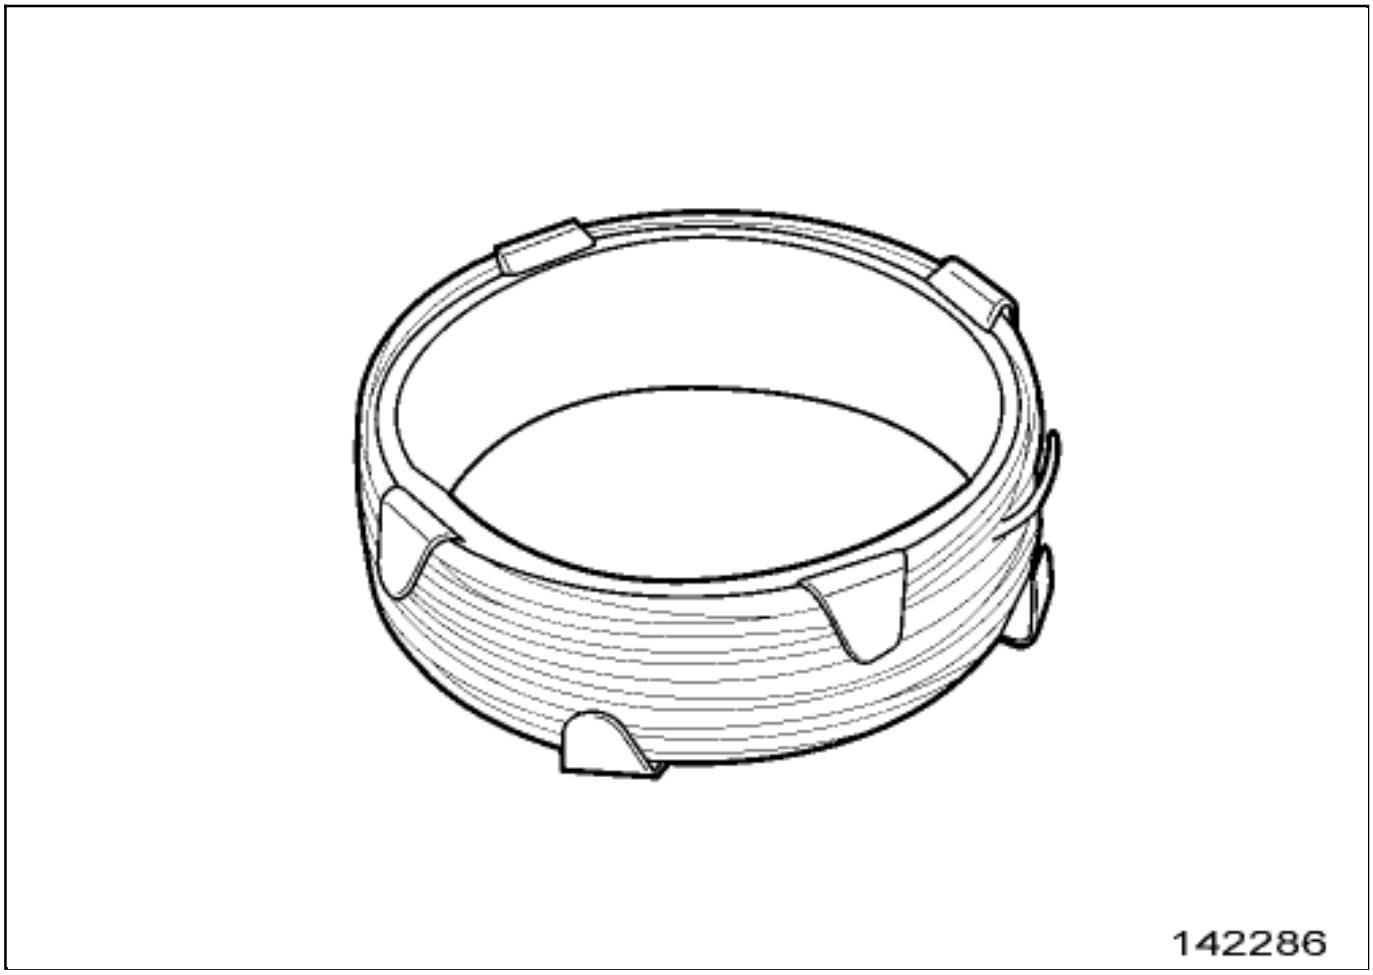


2. CUTTING

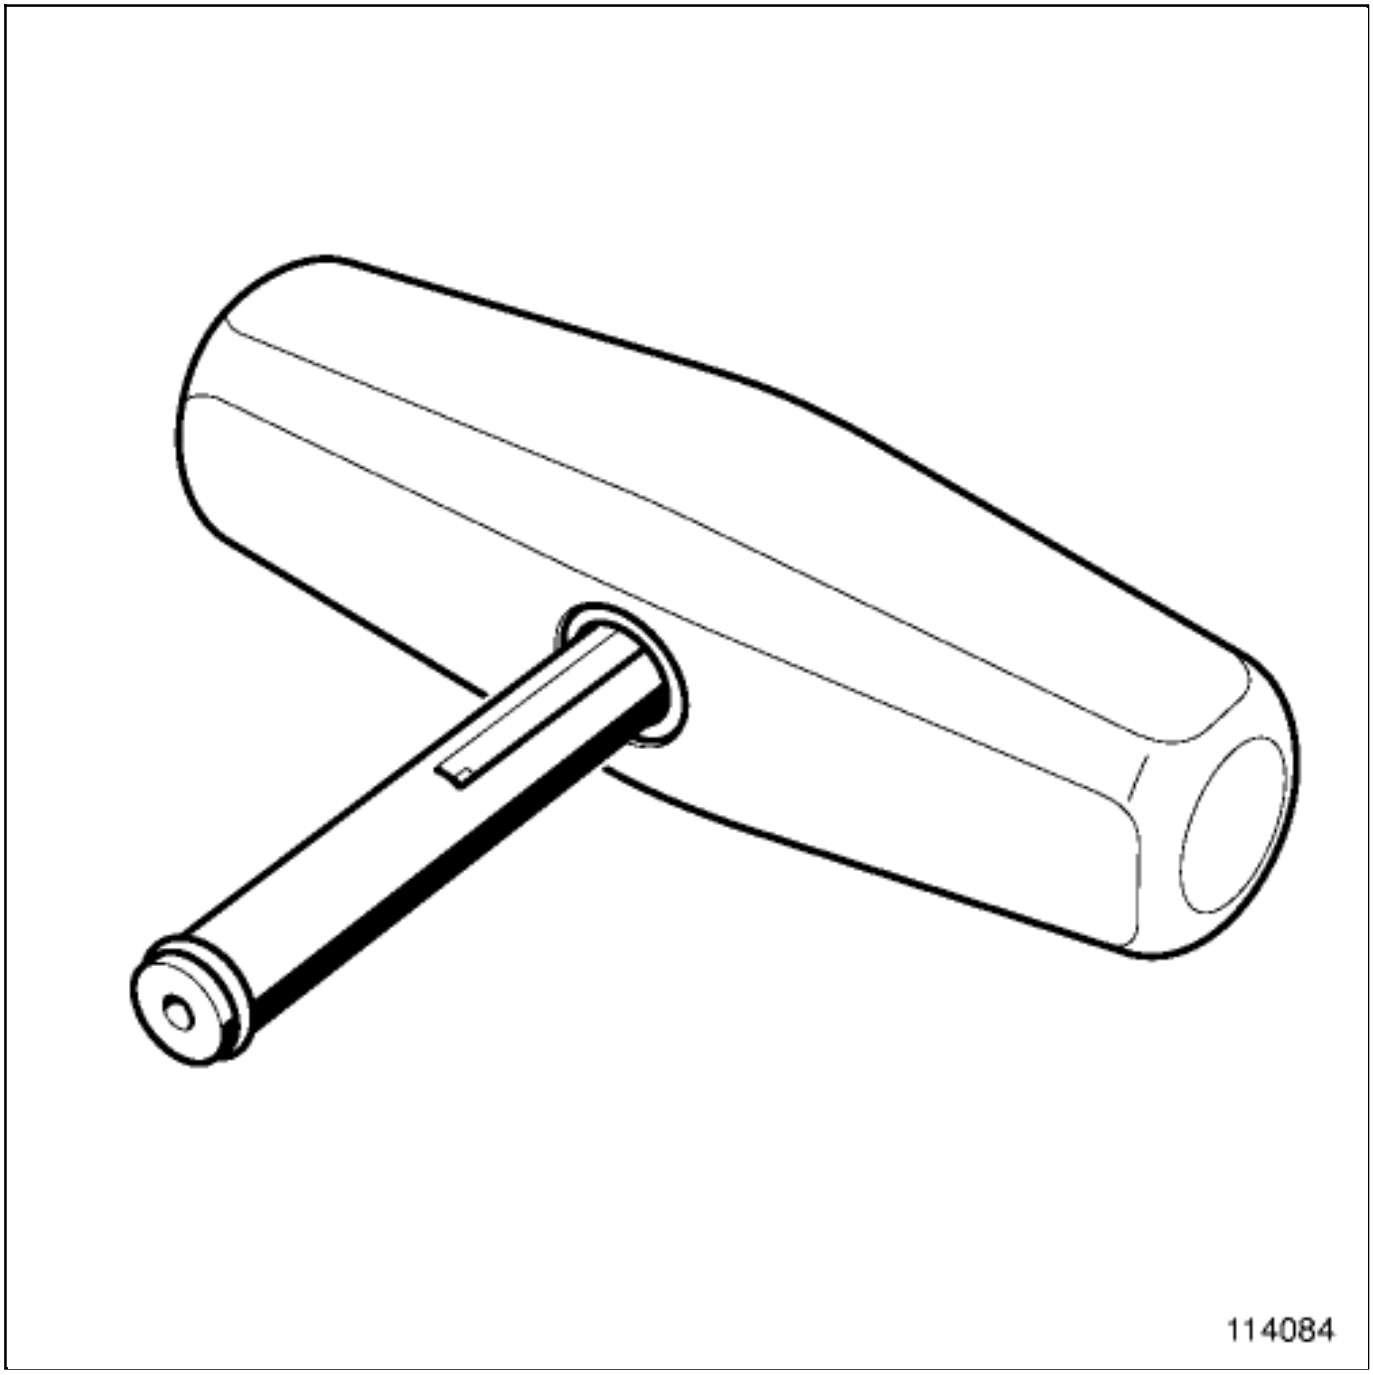


CUTTING WIRE INSERTION TOOL

WIRE INSERTION TOOL (CAR.1033)

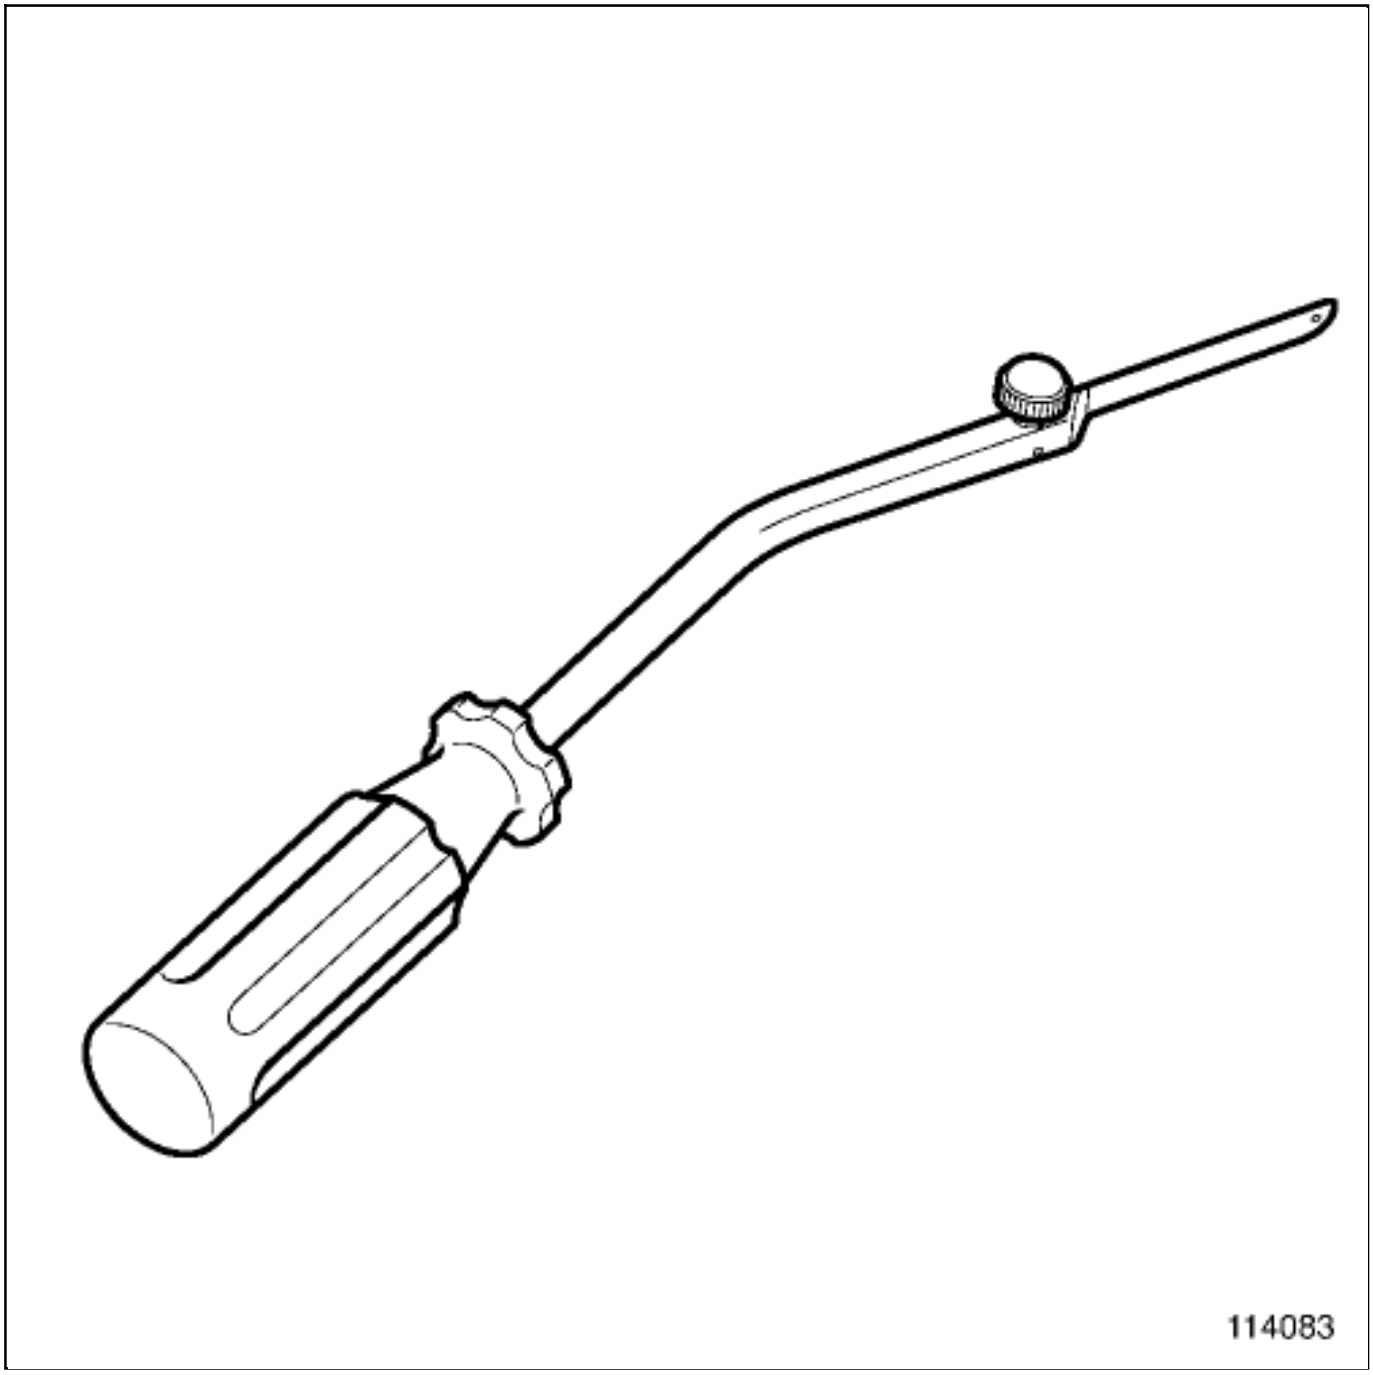


CUTTING WIRE (TWISTED)

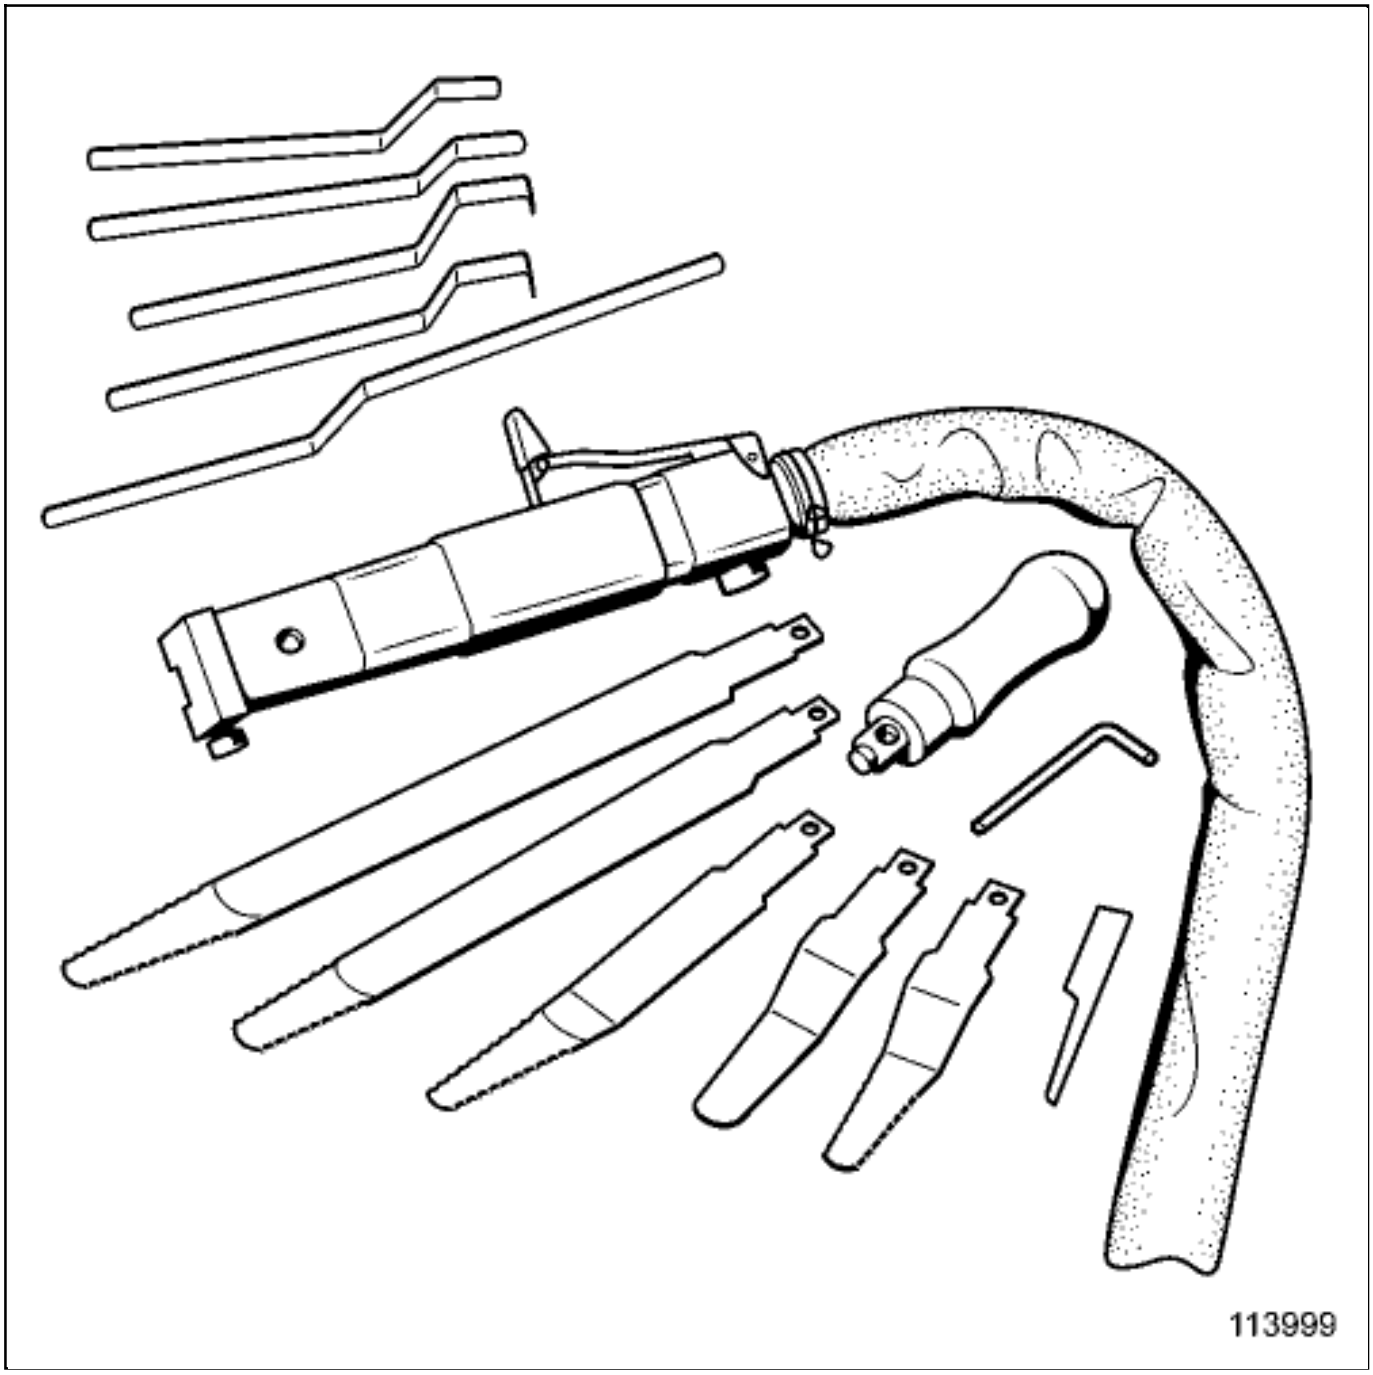


Part no.: 77 11 210 485

CUTTING WIRE (SQUARE)

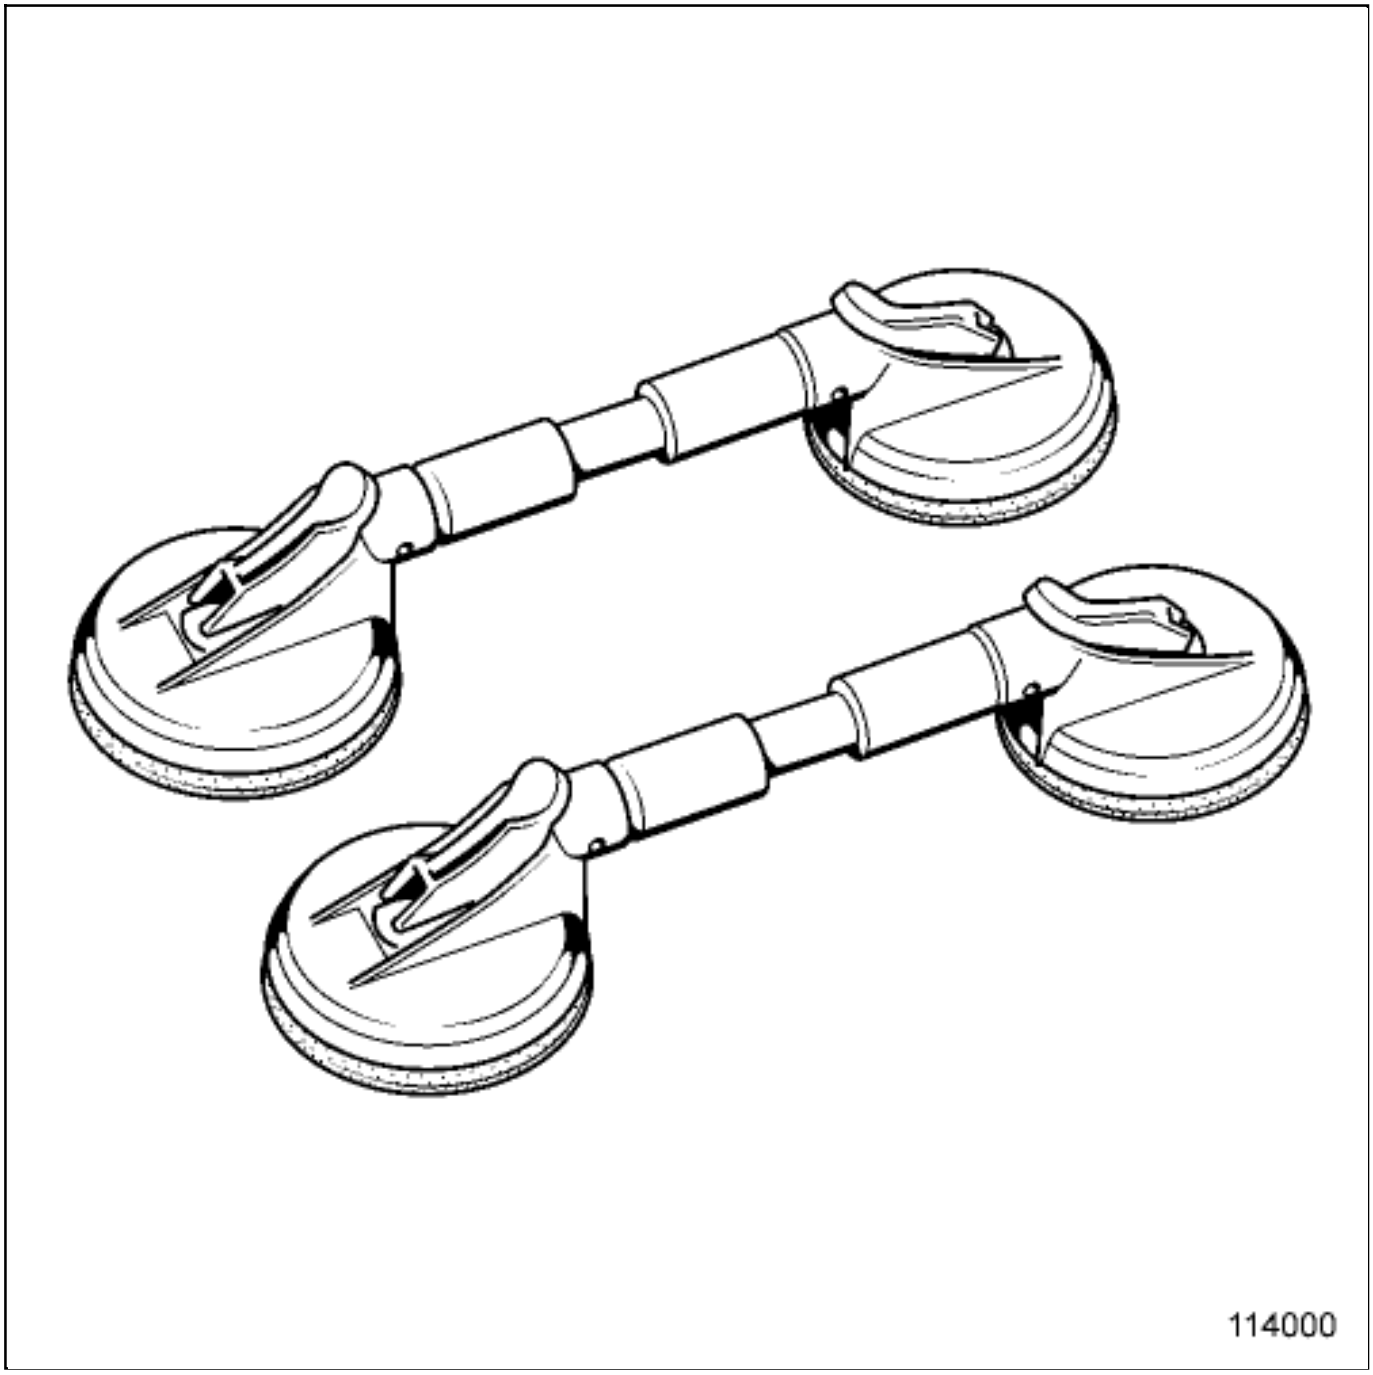


Part no.: 77 11 431 073

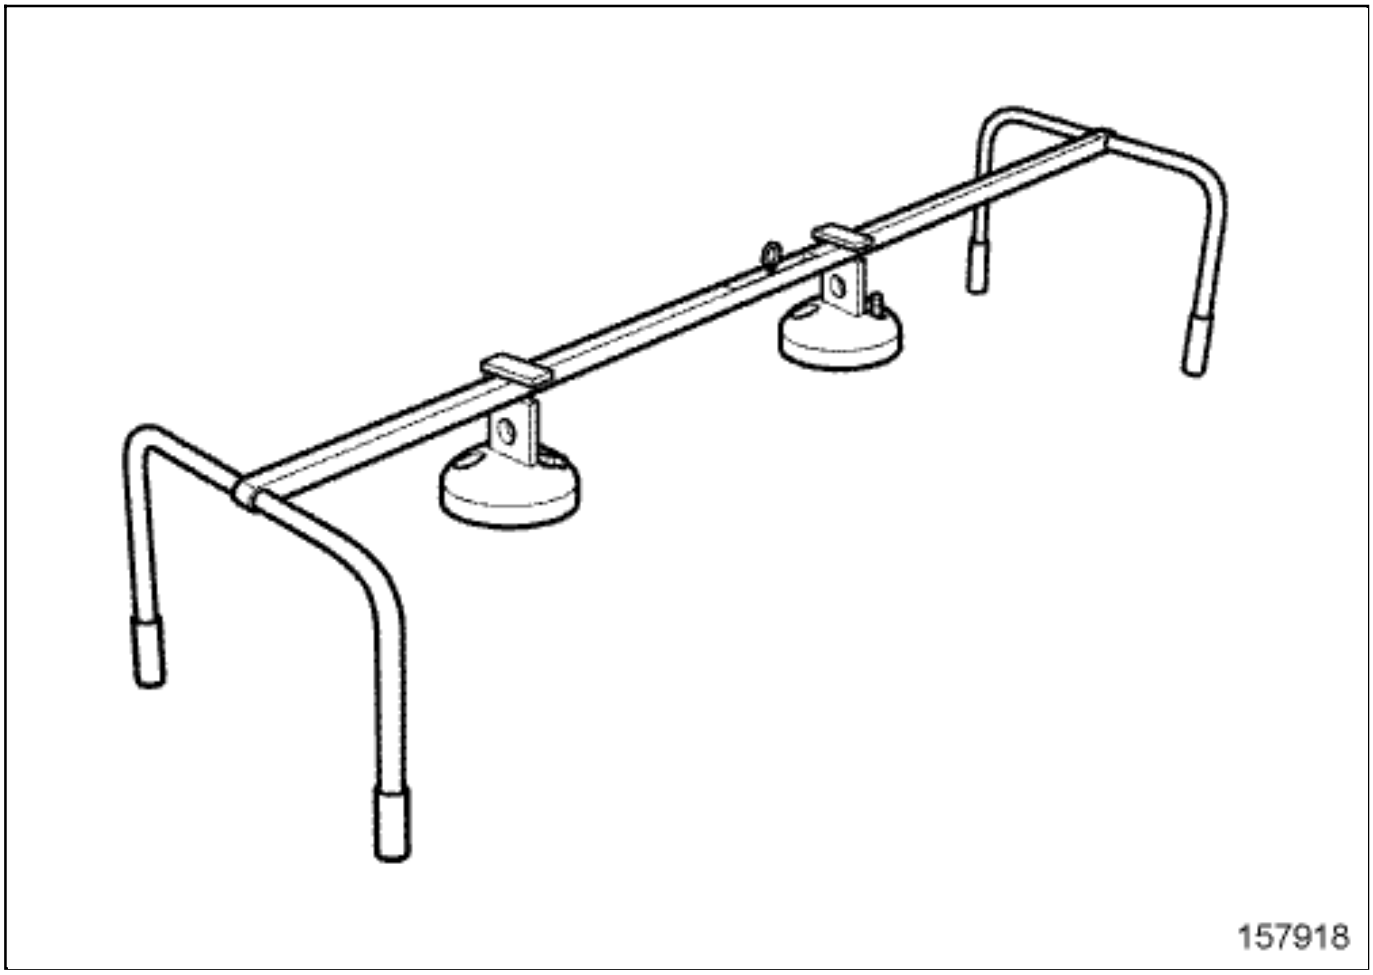


PULLING HANDLE

SUPPORT TOOL



PNEUMATIC OR ELECTRIC CUTTING TOOL

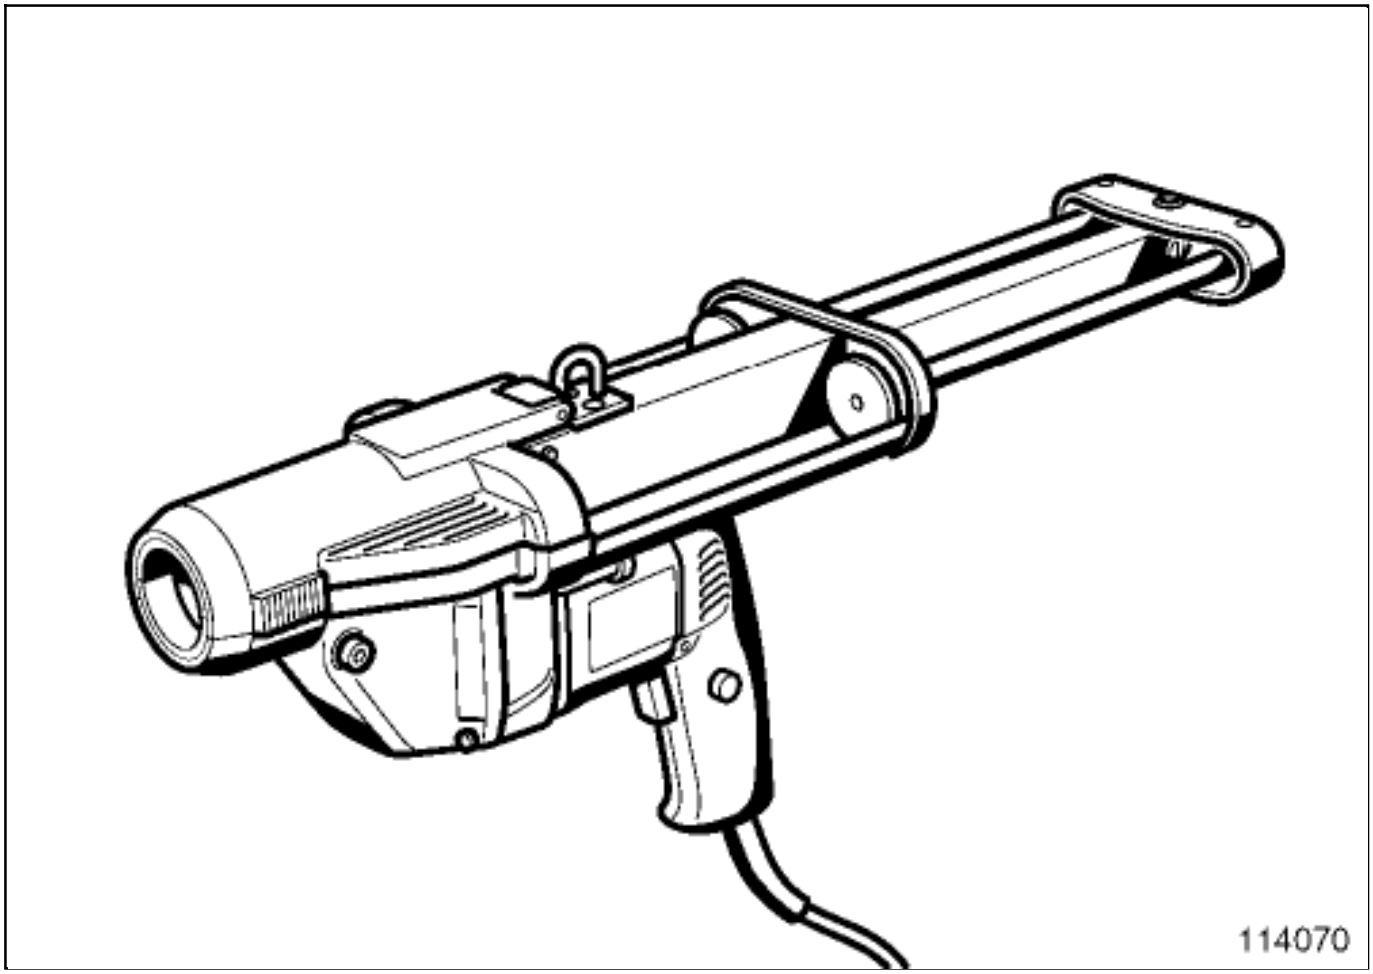


Part no.: 77 11 171 946

3. PREHENSION

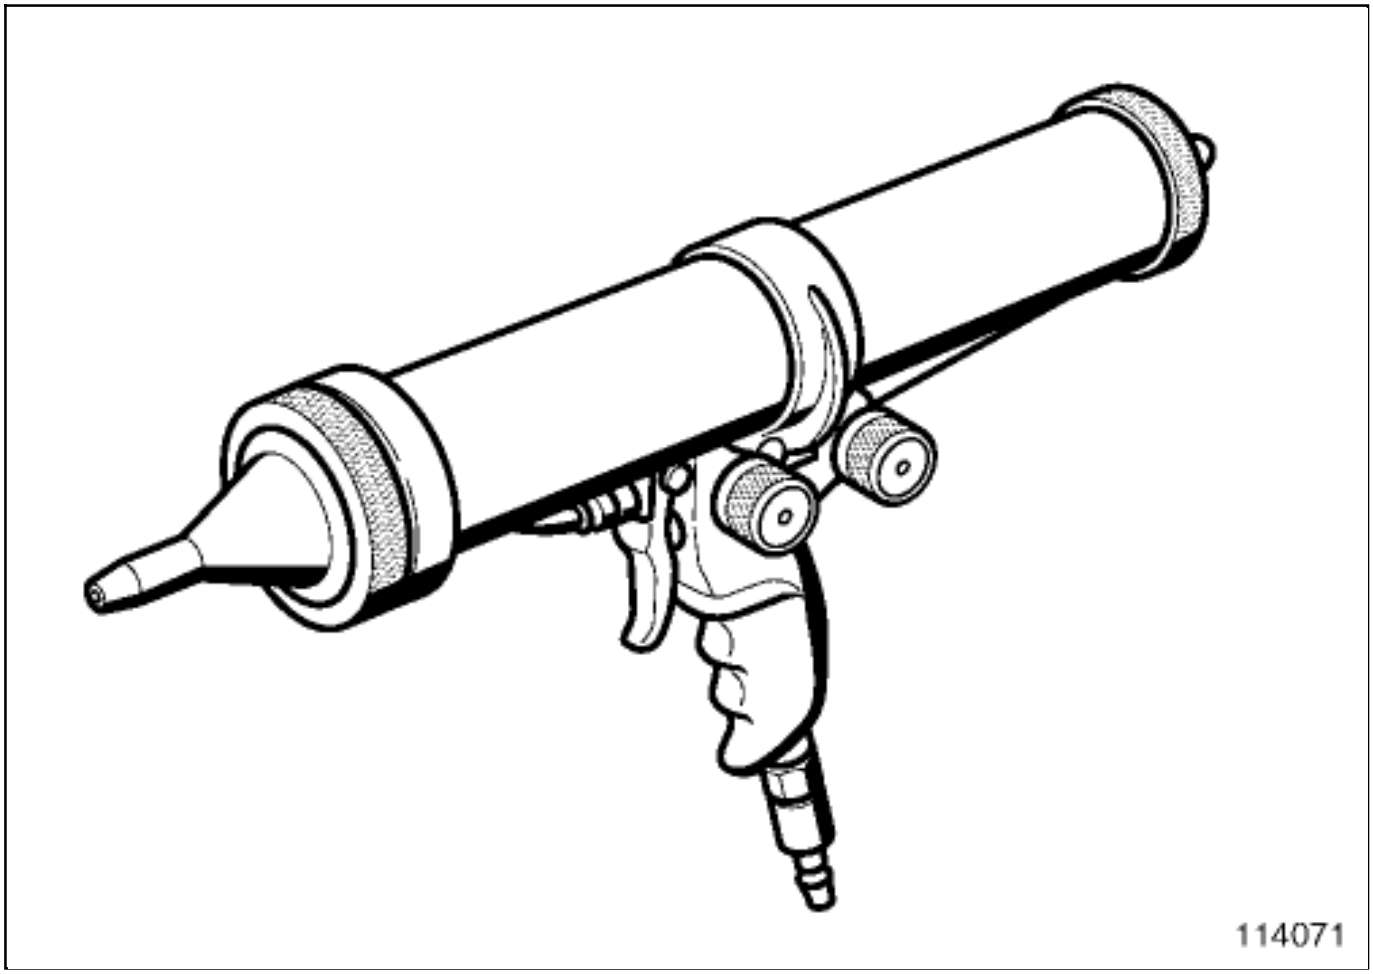
RETAINING SUCTION CUP

114000



Note:

For the "removal - refitting" of the sunroof cassette, use two tools.



4. APPLICATION

NOZZLE FOR DUAL COMPONENT ADHESIVE

Part no.: 77 11 408 909

NOZZLE FOR SINGLE COMPONENT ADHESIVE

Part no.: 77 11 171 310

Repair-00x04x03x20-02x21-1-1-1.xml

XSL version : 3.02 du 22/07/11

WINDOW WINDER: BEFORE/AFTER REPAIR PROCEDURE

Equipment required
Diagnostic tool

Procedure to be applied when removing and refitting an electric window motor:

Before refitting the electric window motor, activate the electric window motor for 5 secondsin the window raising direction, then for 5 secondsin the window lowering direction. This action deinitialises the electric window motor stops,

After refitting the electric window motor, manually initialise the electric window motor by raising the window to the upper stop and maintaining the supply for at least 2 seconds.

Note:

A system which has not been initialised operates in a jerky manner. Each time the control switch is pressed, the motor operates over a distance of 50 mmto the upper stop.

Carry out a function test.

Procedure to be applied when replacing the driver's electric window motor:

connect the Diagnostic tool,

select "Driver's door electric window computer" if the motor is fitted on the driver's side front door,

go to repair mode,

display the "before/after repair procedure" for the computer selected,

carry out the operations described in the "After repair procedure" section.

Carry out a function test.

Repair-80x05-01x92-1-1-1.xml

XSL version : 3.02 du 22/07/11

WINDOWS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. INTRODUCTION

Bonded windows form an integral part of the vehicle structure.

To maintain the stiffness of origin of the vehicle and its performance in crash tests,RENAULTrequires that windshield adhesives meet the Technical Specifications. All products in the rangeIXELLhave been tested and validated byRENAULTengineering.

To ensure optimum safety and product quality, carefully observe:

-
- the safety instructions,
- use recommended products,
- the repair procedures.

This note may change depending on the products, equipment and tools.

2. PROTECTIVE GEAR

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

3. REPAIR TIME

Vehicle which is equipped with:	No airbag One airbag	Two airbags
Bipac evolution	30 minutes	1 hour
S-P KIT	30 minutes	1 hour
BASICPAC	1 hour	2 hours
SIKAFLEX - 222 UV	12 hours	

All times shown are the minimum times for which the vehicle should be immobilised in a temperature of 20˚C with 50%relative humidity.

Do not use the products at temperatures below 10˚C.

Always adhere to these minimum immobilisation times to ensure maximum safety.

Never mix the products when carrying out any adhesive bonding process.

Only products contained in the selected bonding kit must be used.

Shake the primers for a minimum of 1 minutebefore use.

4. PROHIBITED PRODUCTS

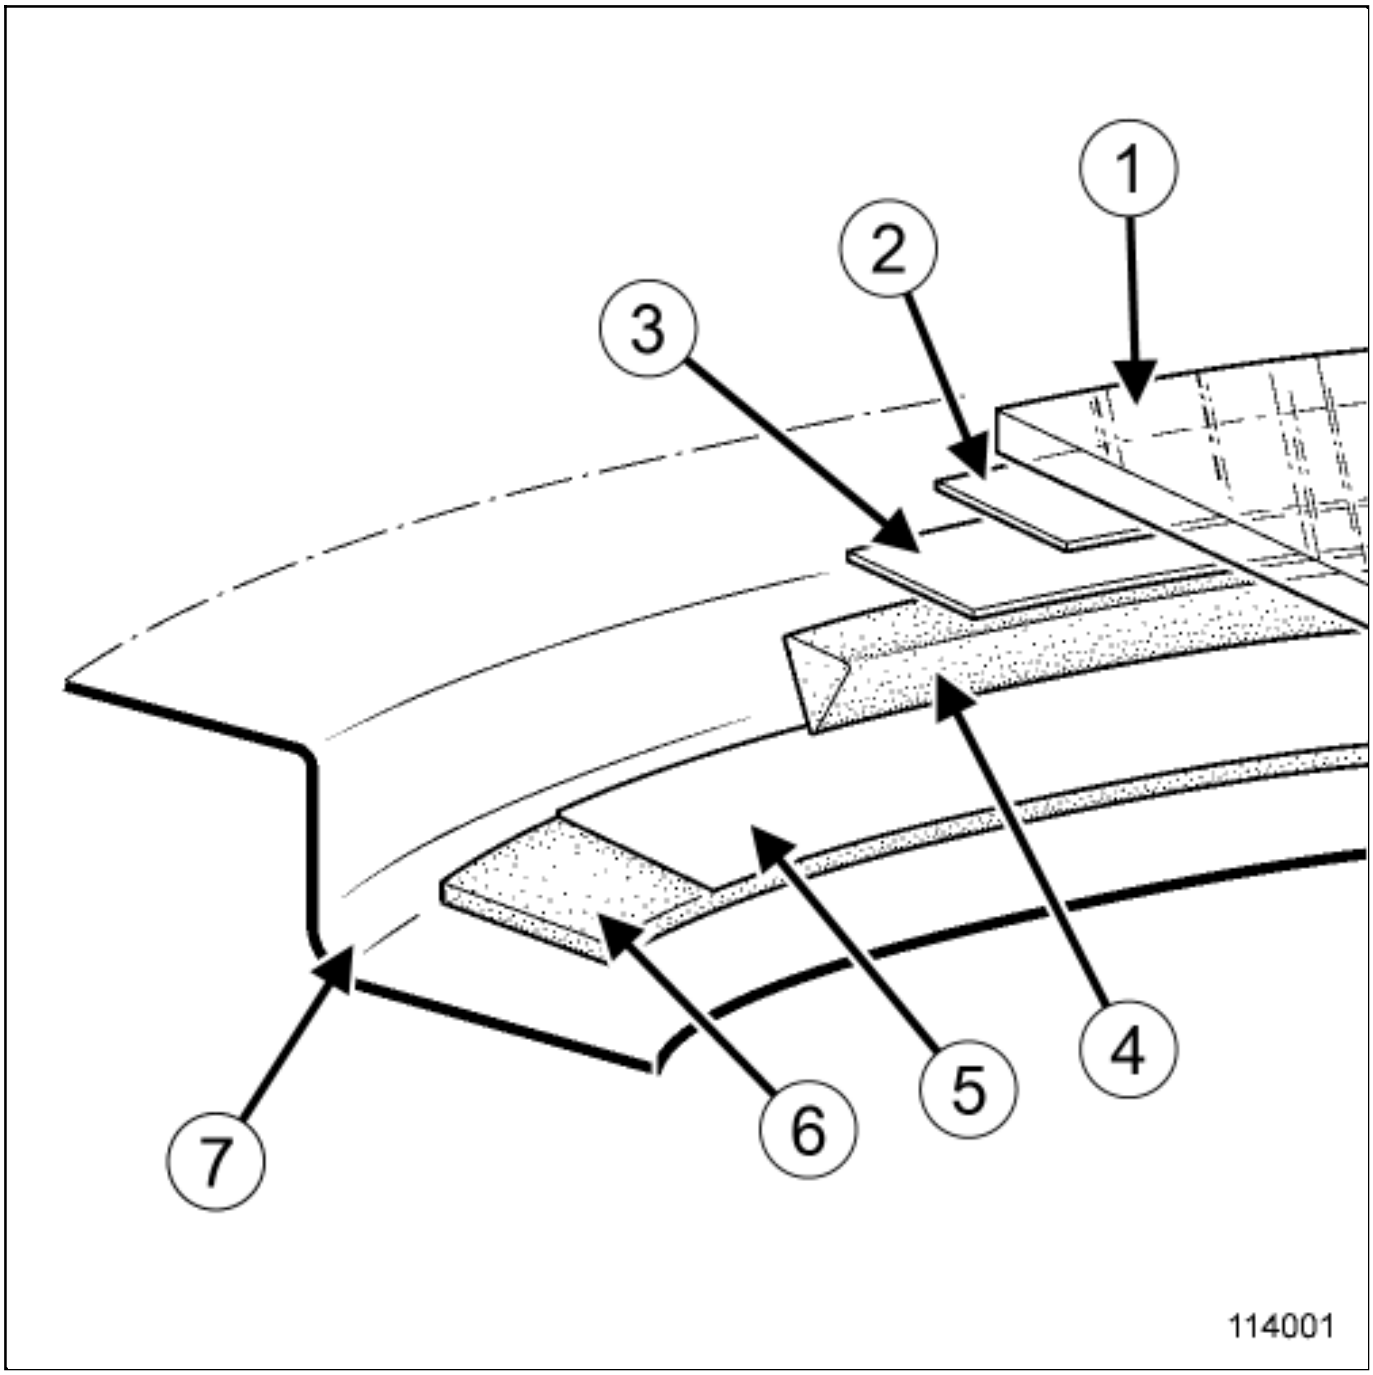
Contact between the adhesive product and any of the following products is prohibited:

- thinner,
- grease,
- oil,
- alcohol,

- pre-treatment primer (before drying),
- silicone products,
- soap and soapy water.

For significant impurities (silicone type) before any preparation operation, clean with distilled water.

5. DIAGRAMS



Note:

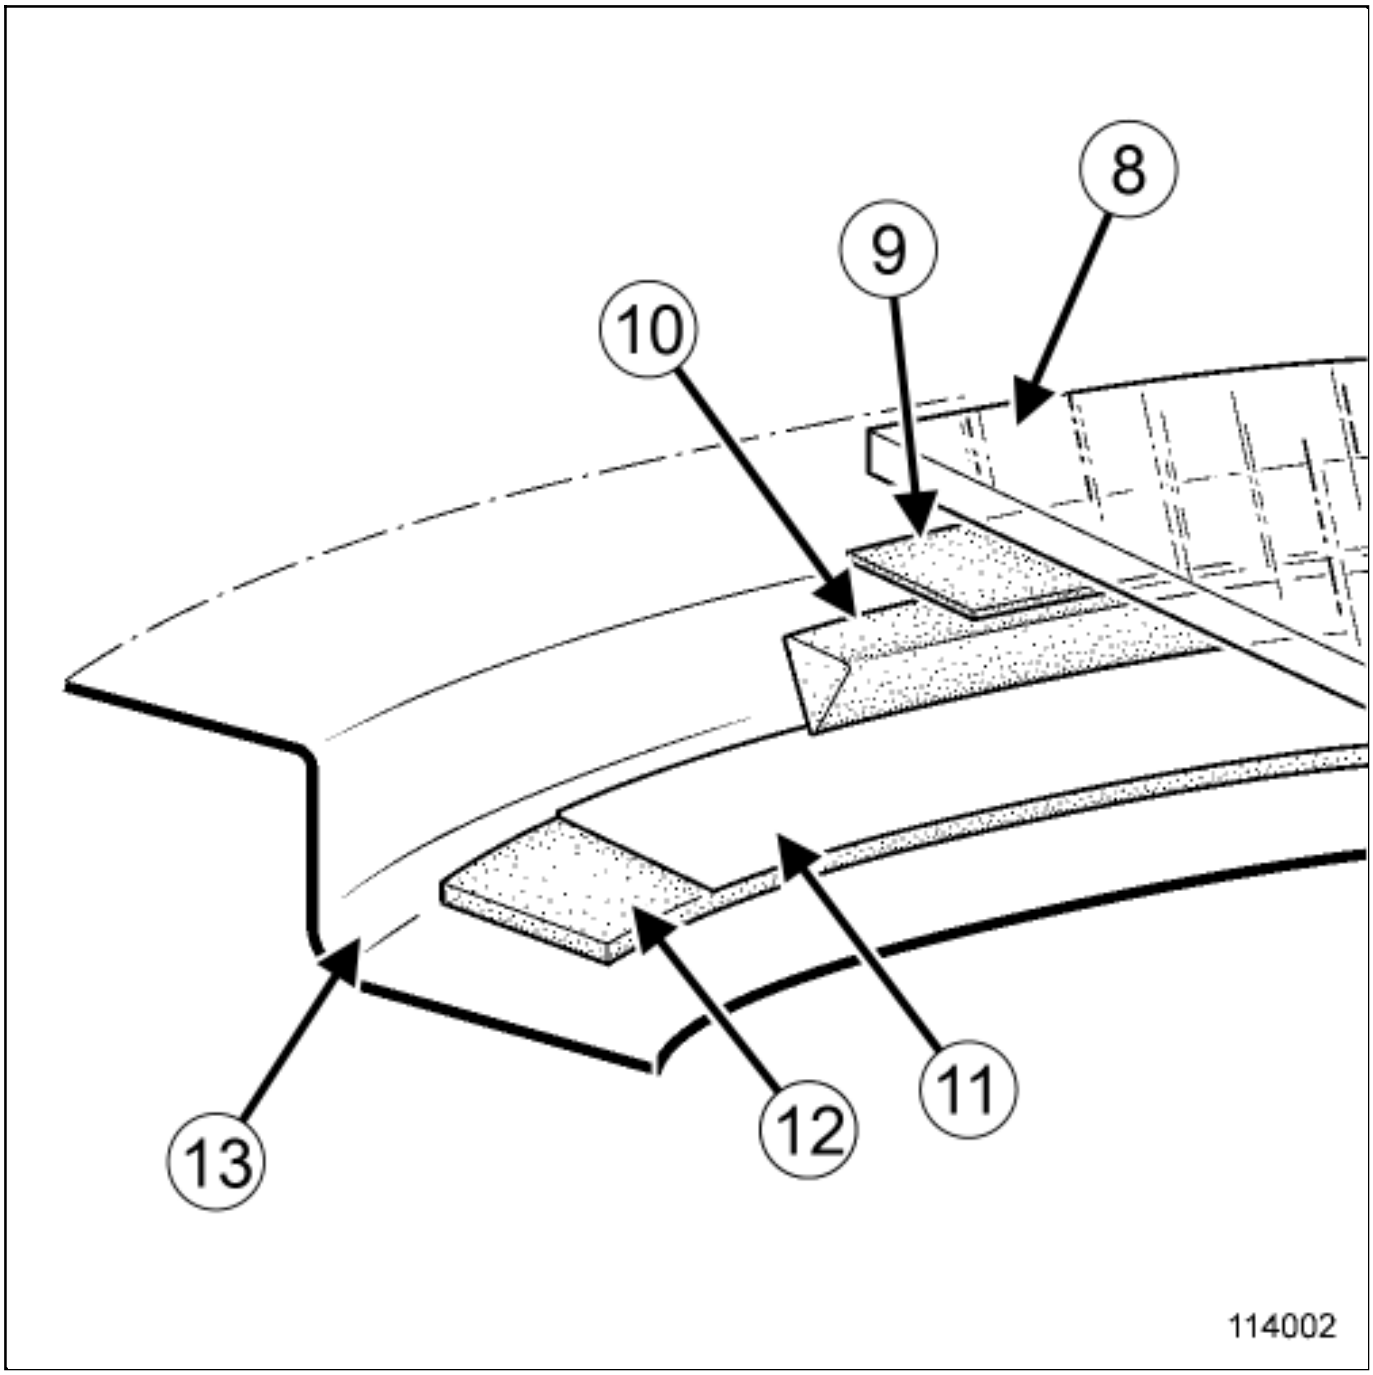
Most cases of water ingress result from failure to adhere to bonding procedures.

Lay down the cement bead so that it is perpendicular to the mounting to be bonded.

1- TO REPLACE A WINDOW OR SUNROOF MECHANISM

(1) Glass + screen printing or sunroof mechanism (Parts Department)

(2) Glass cleaner



(3) Primer on glass

(12) Residual bead

(13) Bodywork mounting

WINDOWS: REPAIR

1. AREAS OF APPLICATION

- The chip must be recent and located outside the field of vision of the driver(8) .

The area can be defined simply using the sweep of the wipers(9) .

2. PRECAUTIONS FOR THE USE AND STORAGE OF THE PRODUCTS

- Before beginning all operations, check that the windscreen to be repaired is clean and dry and at an ideal temperature.

The ideal conditions are between 15˚and 25˚.

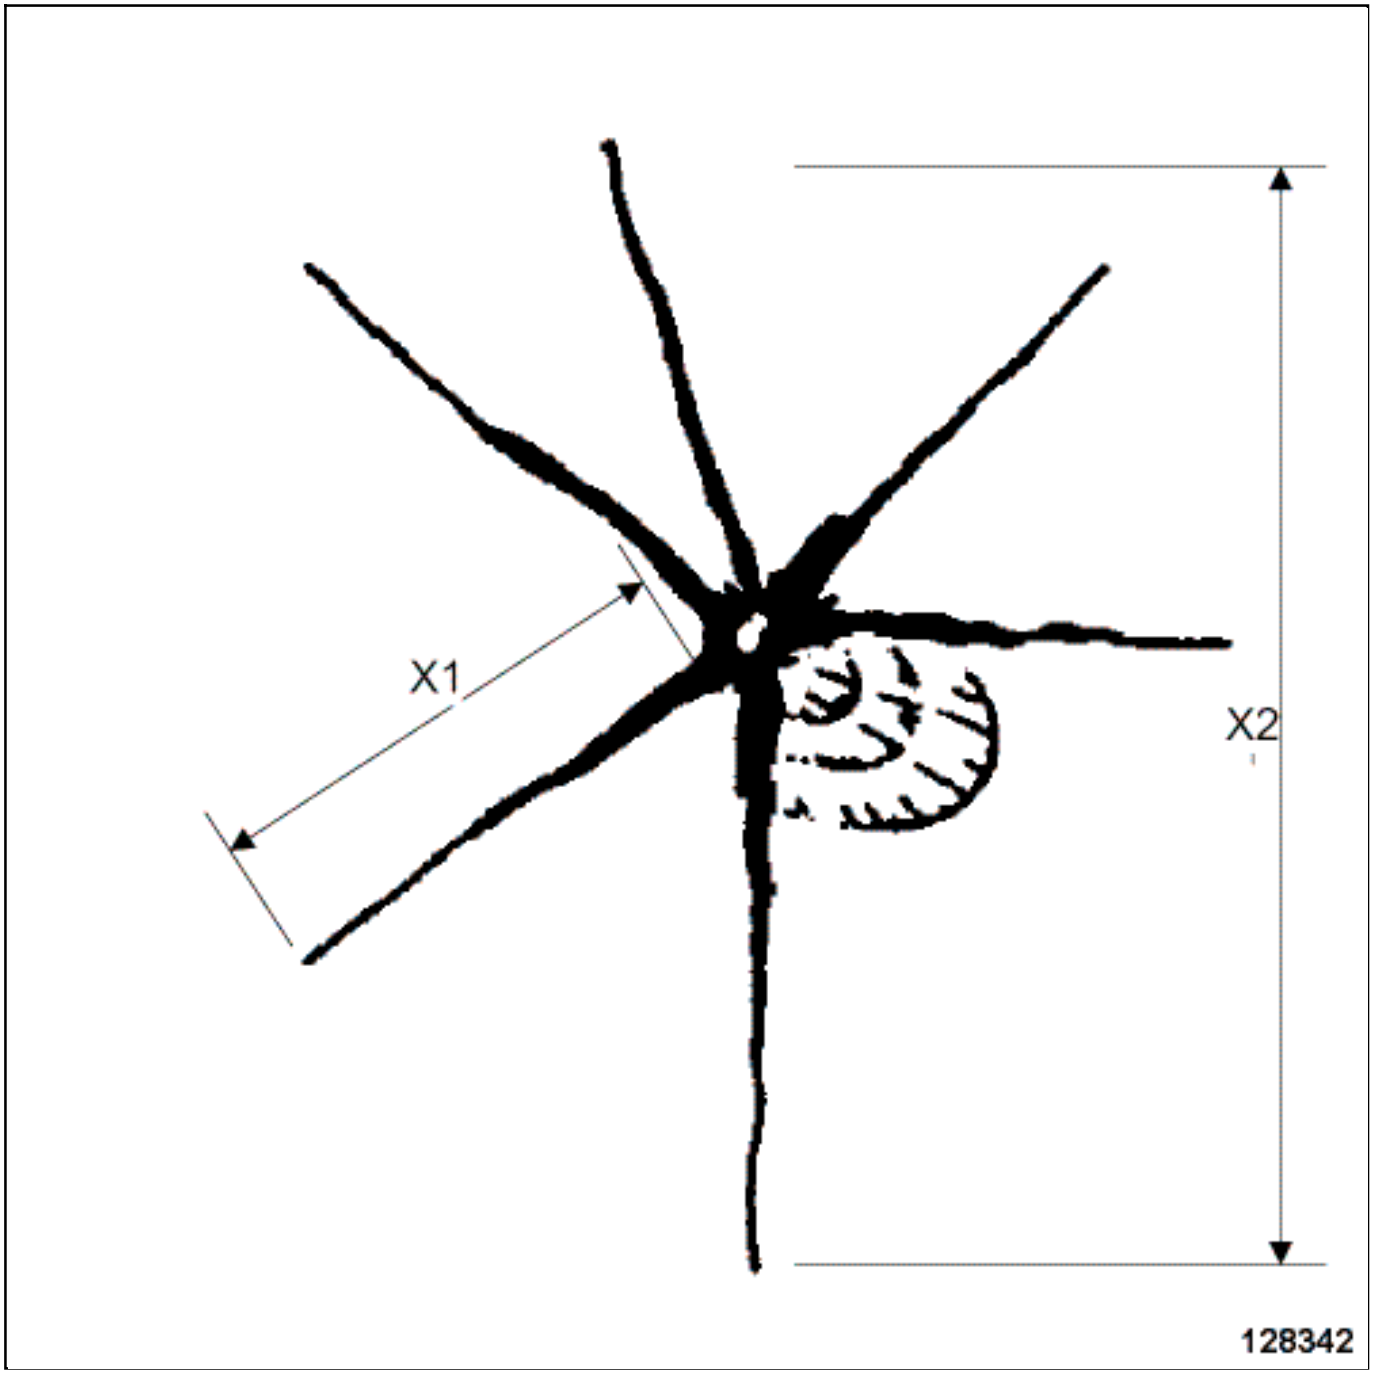
If this is not the case, leave the vehicle engine running for a few minutes with de-icing at the maximum until the windscreen is slightly warm.

- Do not store resin or cans of resin with food.

- To keep the resin in good condition, these cans must be stored in the dark, in a cool dry place.

Note:

Do not expose the resin to frost.

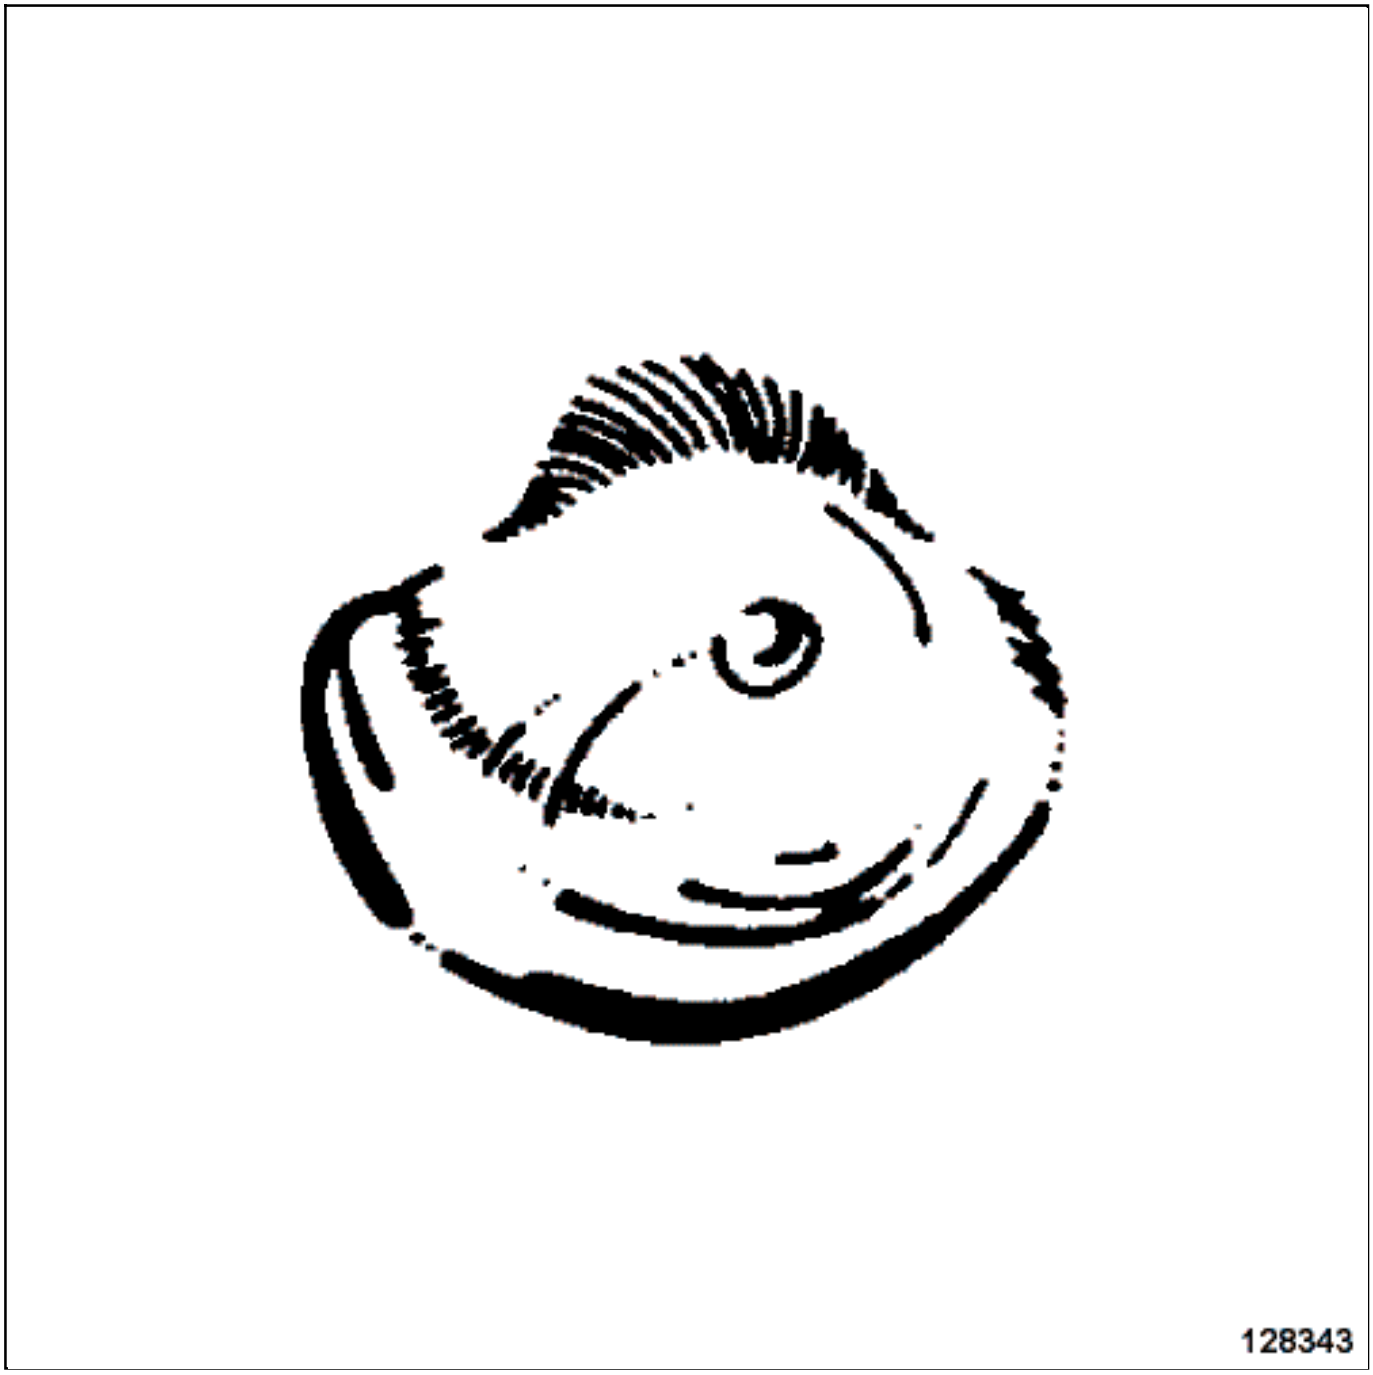


- Do not expose the products to the sun or to a fluorescent light.

- Do not open the protective envelope before using the resin.

- The resin reacts to exposure to ultra-violet radiation (UV). That means that the light changes the resin from a liquid state to a solid state.

3. WHAT CAN BE REPAIRED

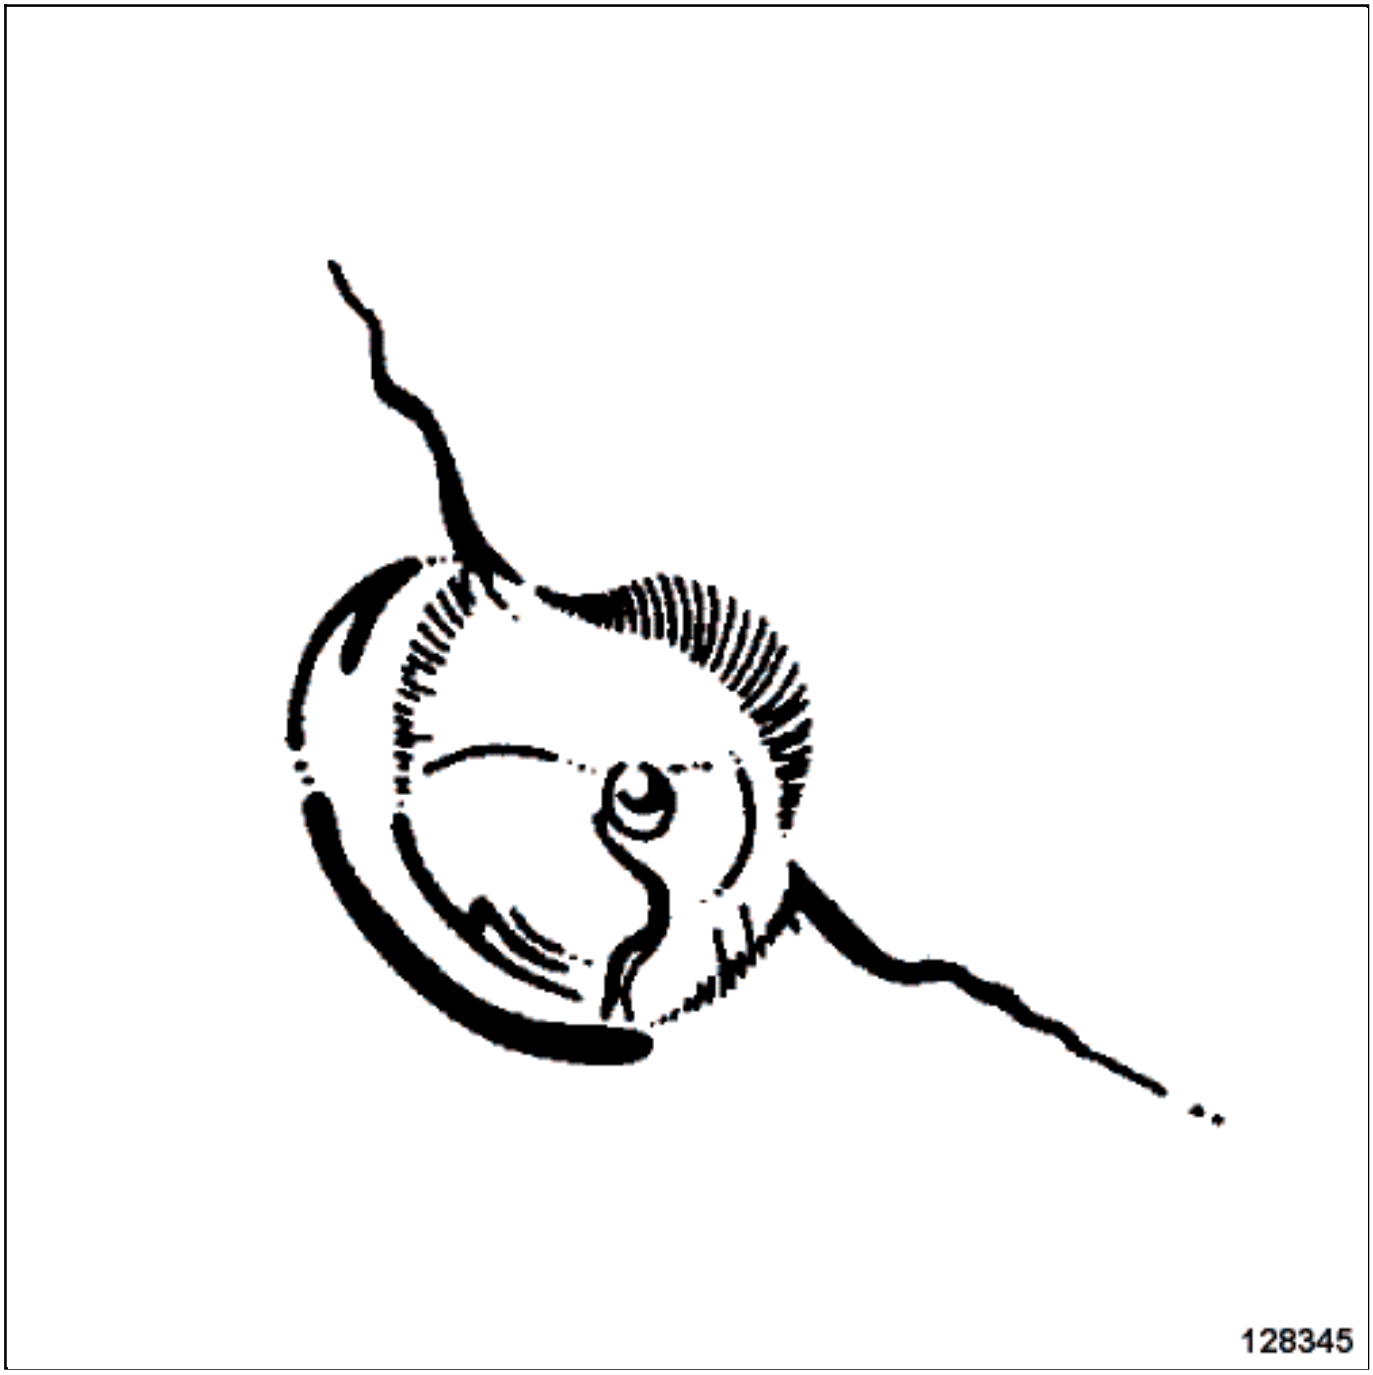


STAR

- "Arm" of the star(x_1) = 10 mmto 12 mm.

"Arm" of the star(x_2) = 40 mm.

BUBBLE



Bubble max ∅ = 20 mm.

HALF BUBBLE

Half bubble max dia. = 20 mm.

STAR + BUBBLE + CRACKS

Star + bubble + crack max = 40 mm.

4. WHAT MUST NOT BE REPAIRED

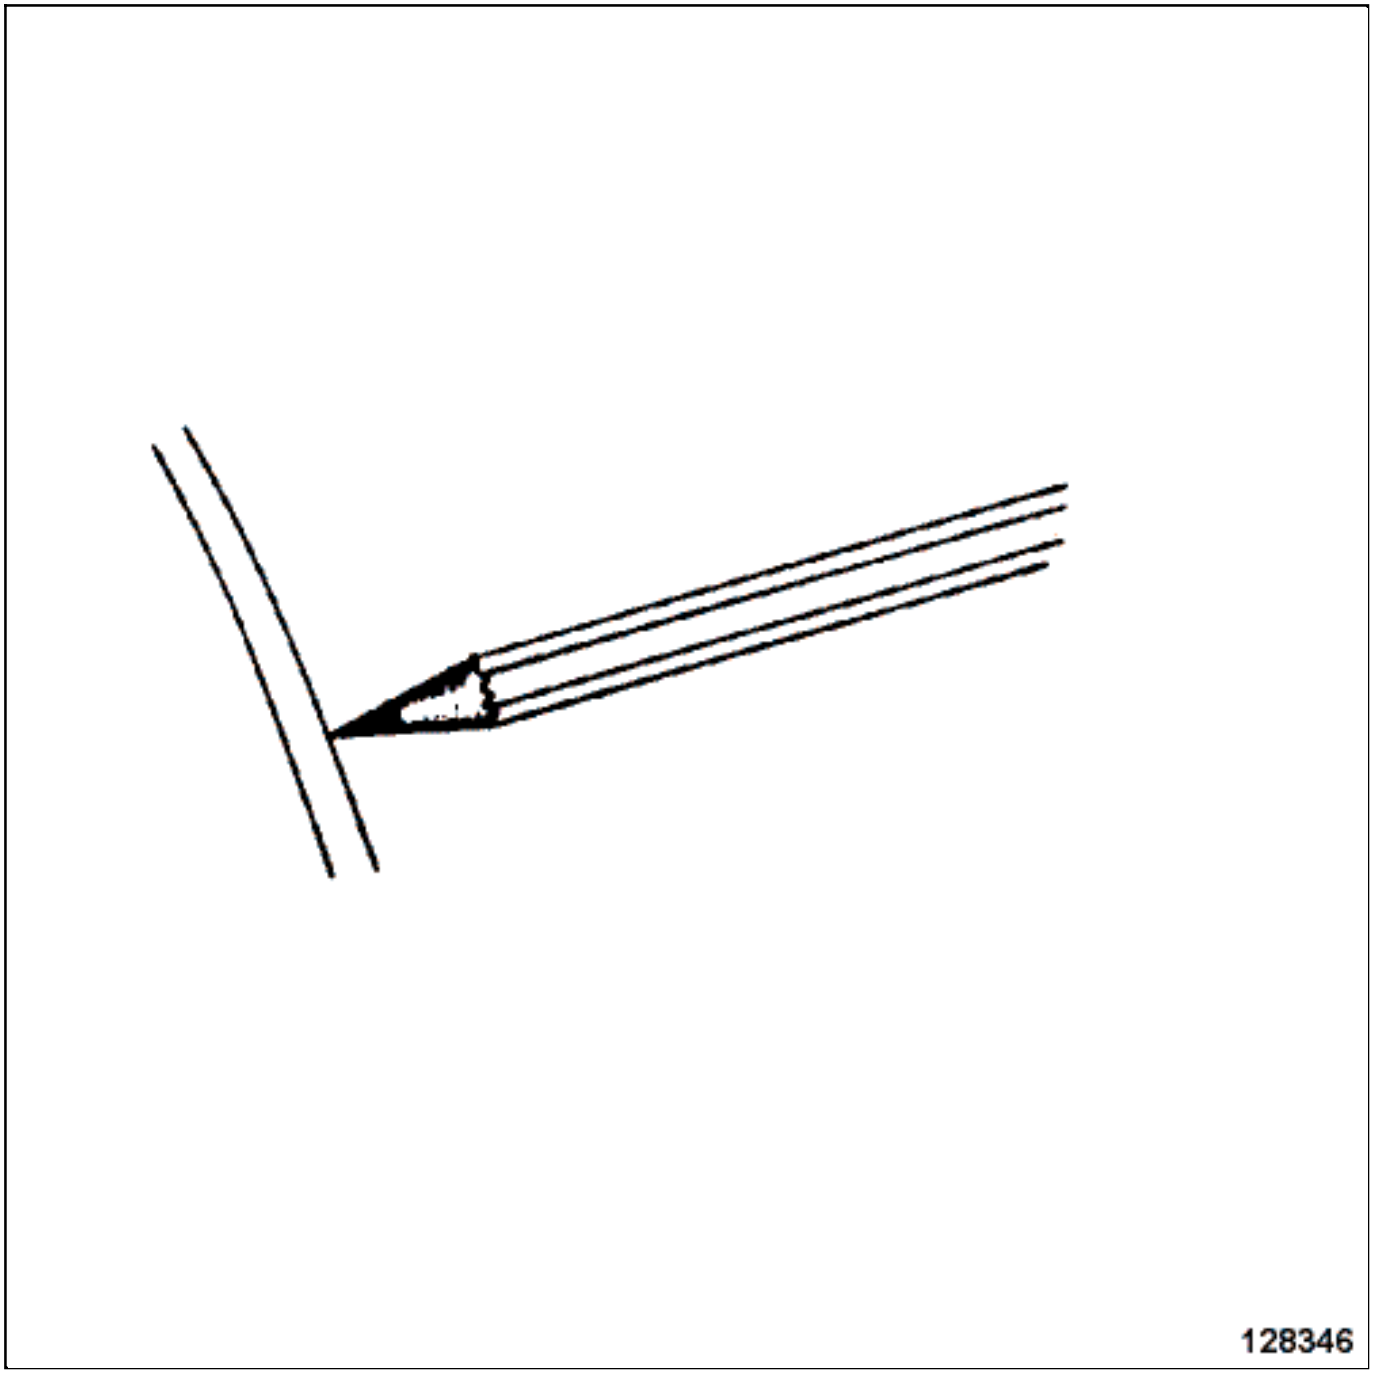
- athermic windscreen,
- heated windscreen,

- the circular area of 300 mm diameter in the field of driver's vision(8) ,
- any crack more than 60 mm long,
- any chip at less than 40 mm from the edge of the windscreen,
- any chip at less than 20 mm from any sensor,
- if there are more than three chips,
- any chip that has resulted on oxidation of the intermediate layer.

Note:

This oxidation is characterized by a round opaque zone.

5. GENERAL REPAIR METHOD



Note:

This section considers the basic procedures for repair with the appropriate tools.

1- INSPECTION OF CHIP AND USE OF THE CARBIDE-TIPPED STYLUS

- Take great care when examining the chip.
- Check whether the radial cracks spread and note their length and the depth.
- Decide whether holes should be drilled at the ends of the cracks.
- Repair only the first layer.

Use the carbide tip of the stylus to gently scratch away any dirt or glass in the chip crater.

Note:

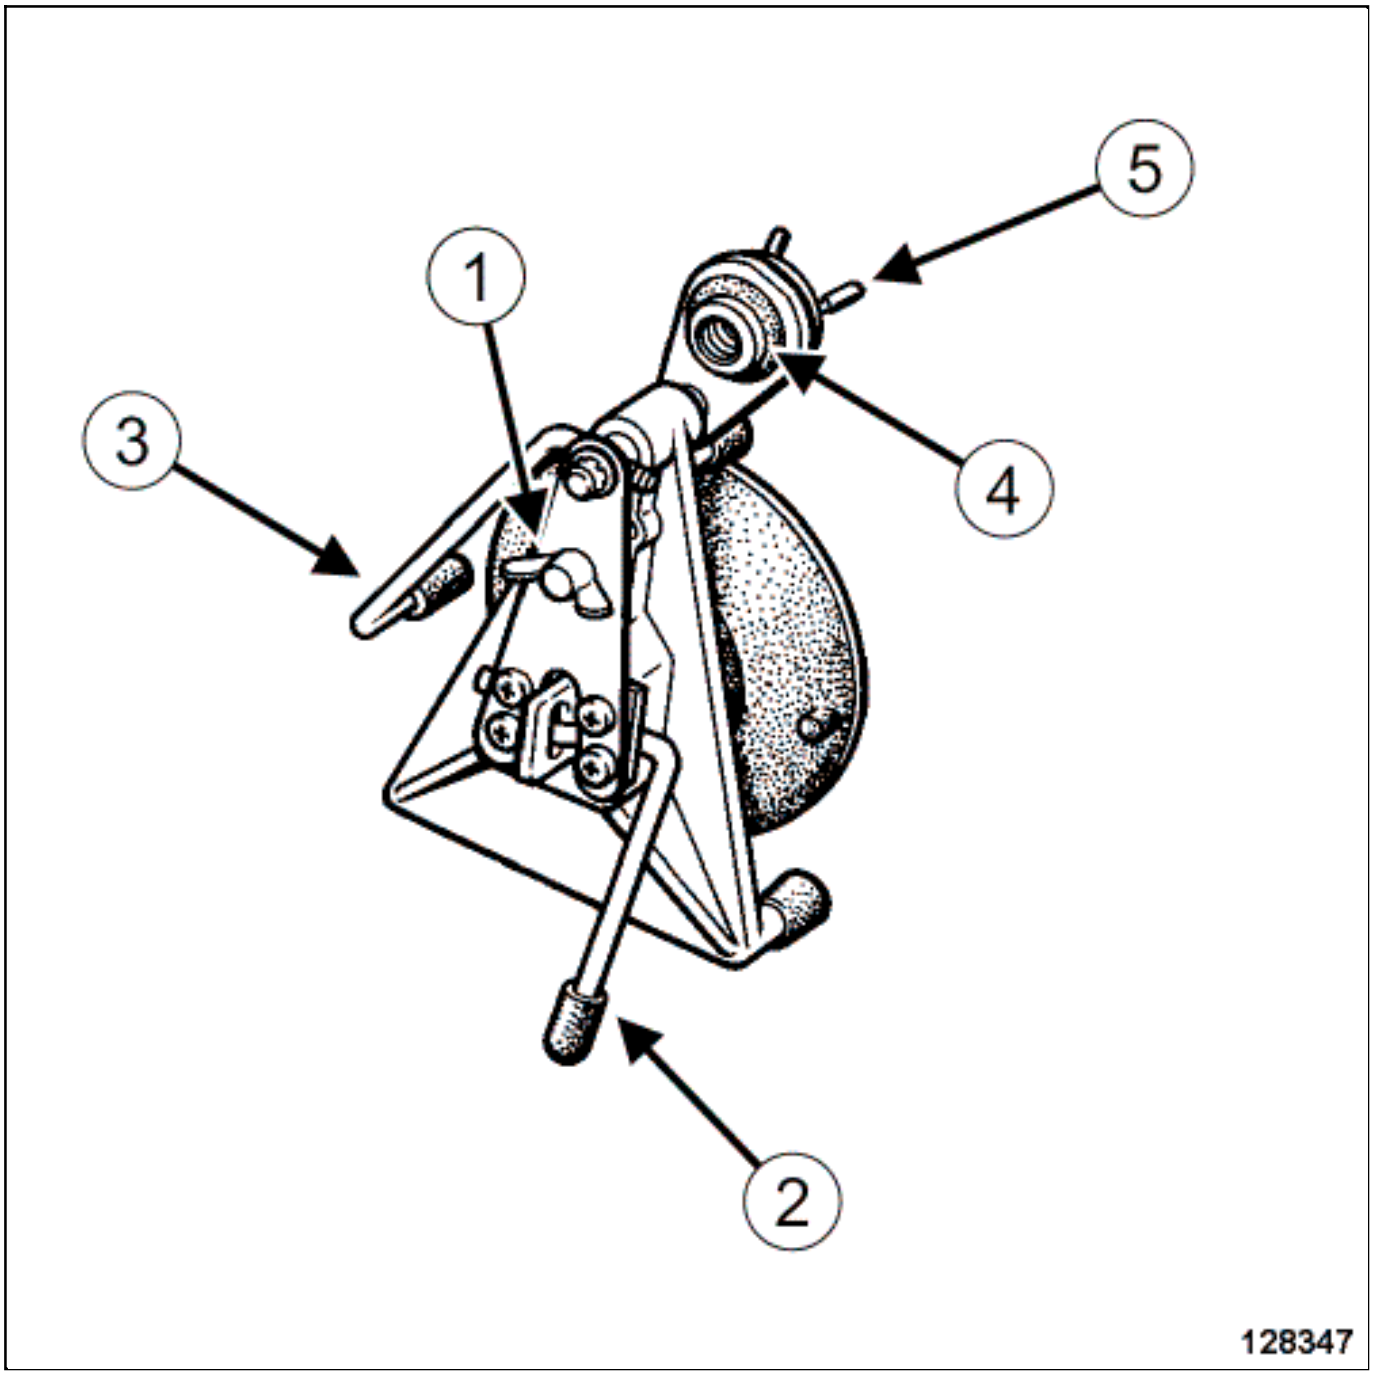
Do not enlarge the chip.

2- FITTING THE MAGNIFYING MIRROR

Place the magnifying mirror on the inside of the windscreen so that the chip on the outside is clearly visible.

The magnifying mirror enables you to see the progress of the repair clearly.

3- FITTING THE TOOL HOLDER



This is your most important tool.

It is used for injecting the resin when it is equipped with the injector.

Find a position that makes operation easy.

It is desirable to locate the tool holder below the chip.

1)FITTING THE TOOL HOLDER

- Fully undo the spider support(1) so as not to put pressure on the chip.
- Apply lubricating gel to the edge of the suction cup.
- Check that the suction cup lever(2) is pointing forward.
- Hold the tool holder so that the control lever(3) is right up against the left-hand side of the tool

holder.

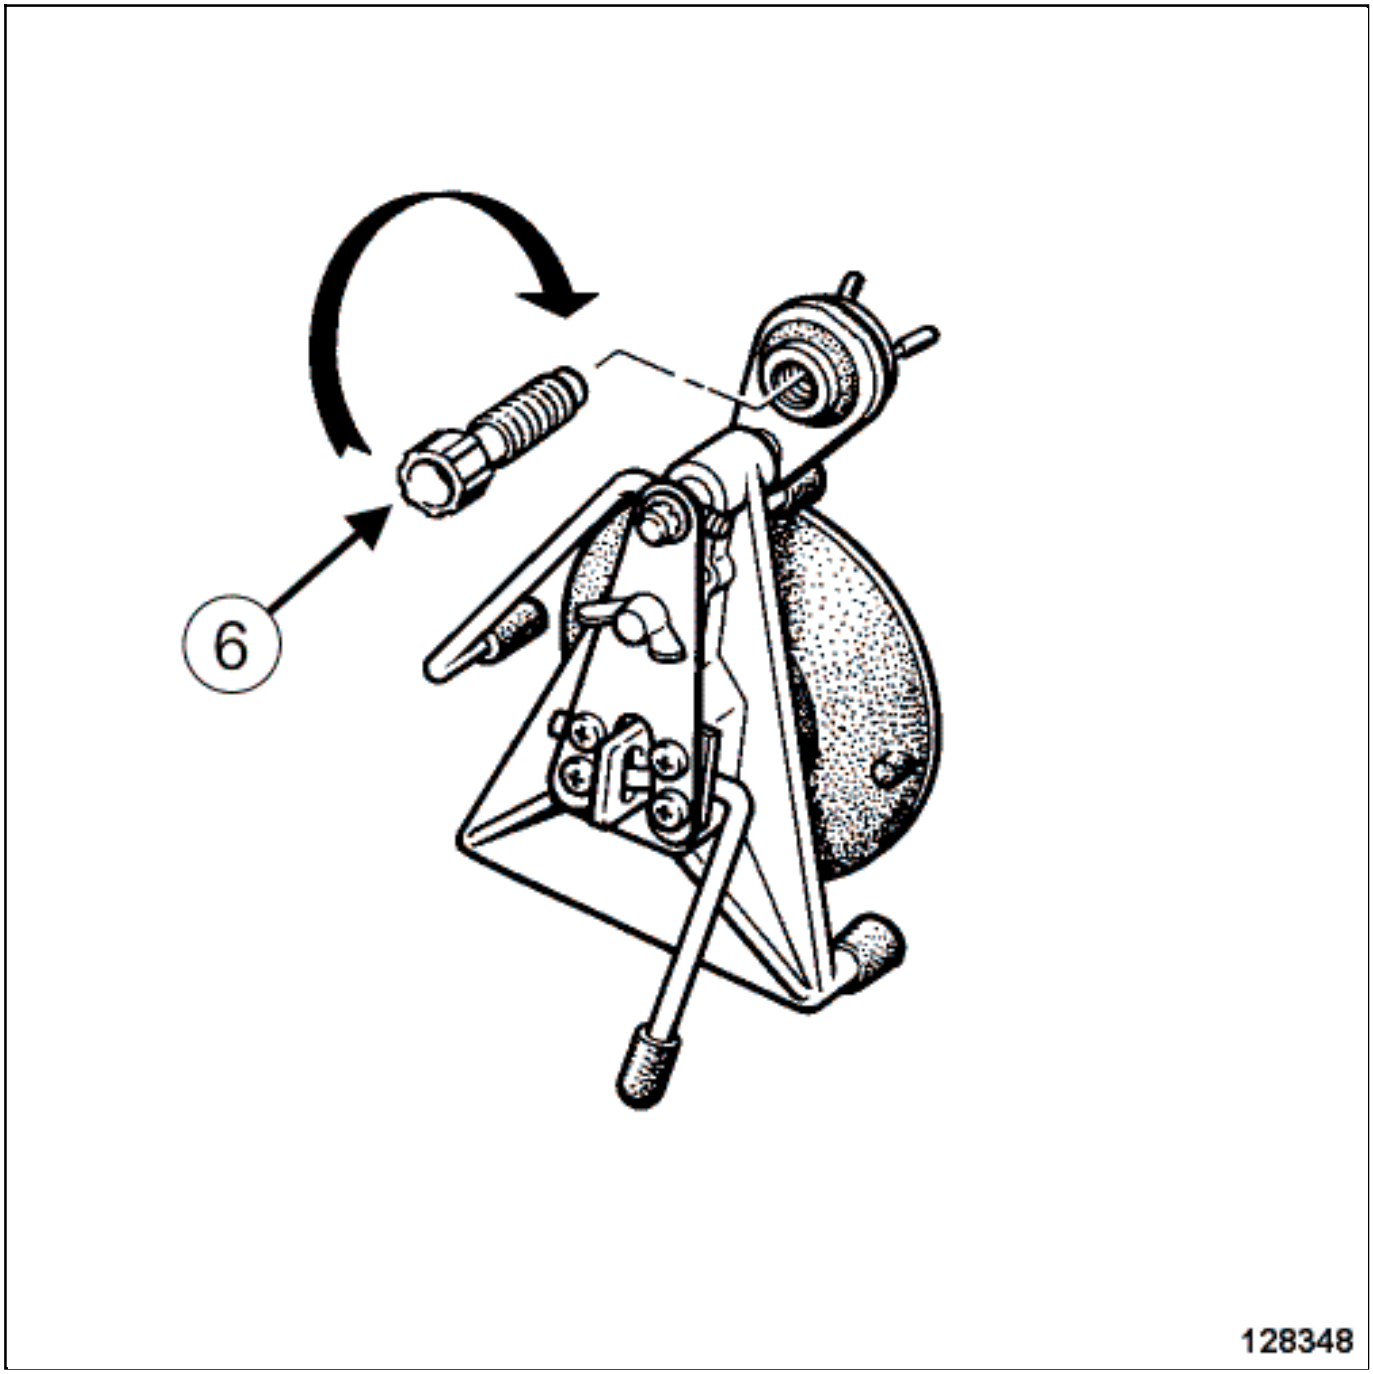
Centre the injector holder(4) above the point of impact of the chip.

Press the tool holder firmly so that the suction cup is correctly pressed against the windscreen.

Use the lever(2) to lock the suction cup.

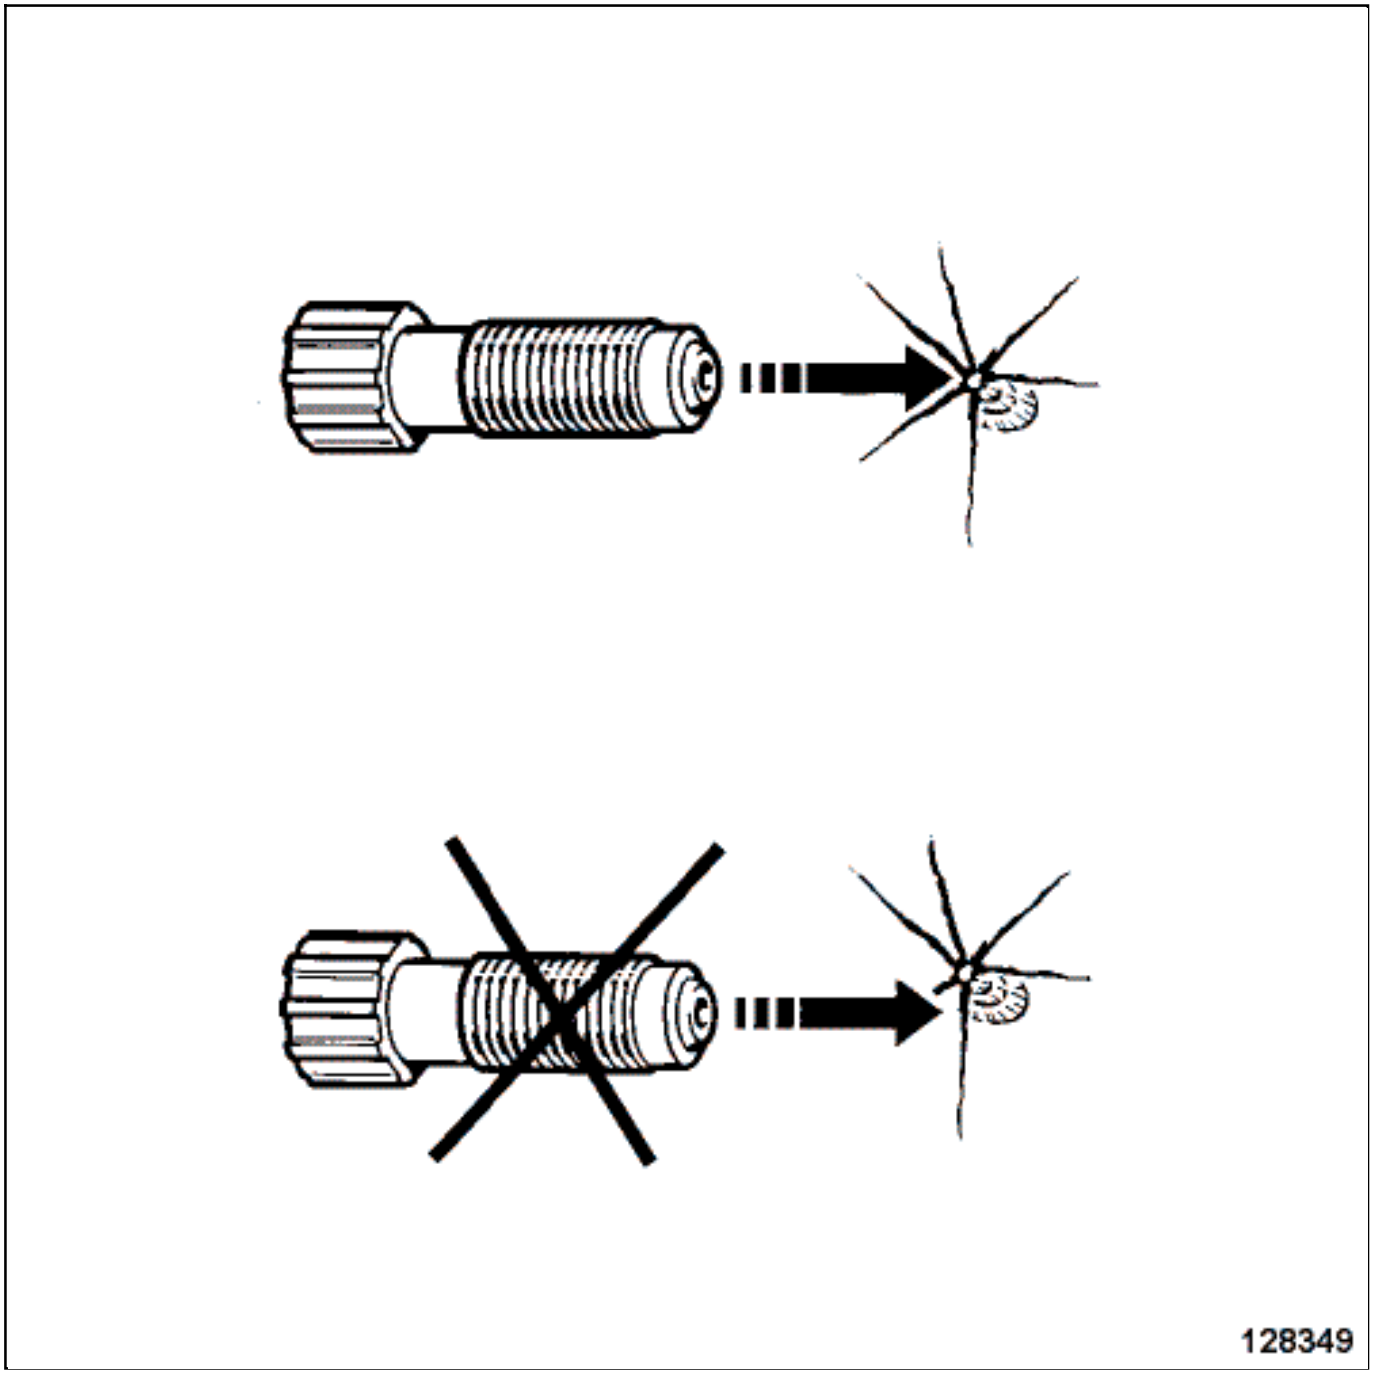
The spider of the threaded gun can then be handled freely.

Tighten the pressure bolt(1) of the threaded gun until the spider(5) is immobilised on the windscreen.



Note:

Check that the spider feet are definitely in contact with the glass.



This is very important as it ensures a perfectly perpendicular position for injection.

4- INJECTION

A resin sachet contains a bottle of resin and a plastic injector.

Without tightening the injector(6) , place it on the injector holder to bring it in contact with the glass.

- Centre the injector opposite the crater of the chip.
- Remove the injector, taking care of not to move the injector holder.
- Take the bottle of resin and remove the small protective plug.

Cut off the tip of the bottle using the scraper blade (supplied in the kit).

Unscrew the piston of the injector by 5to 6 mm.

Fill the injector with resin up to the edge on the white rubber seal side.

Note:

To fill the injector more easily, use the resin bottle as a dropper.

Check that the edge of the white rubber seal is clean and dry, wiping off any resin that may be there.

Put the flask of resin away where it will not be exposed to daylight.

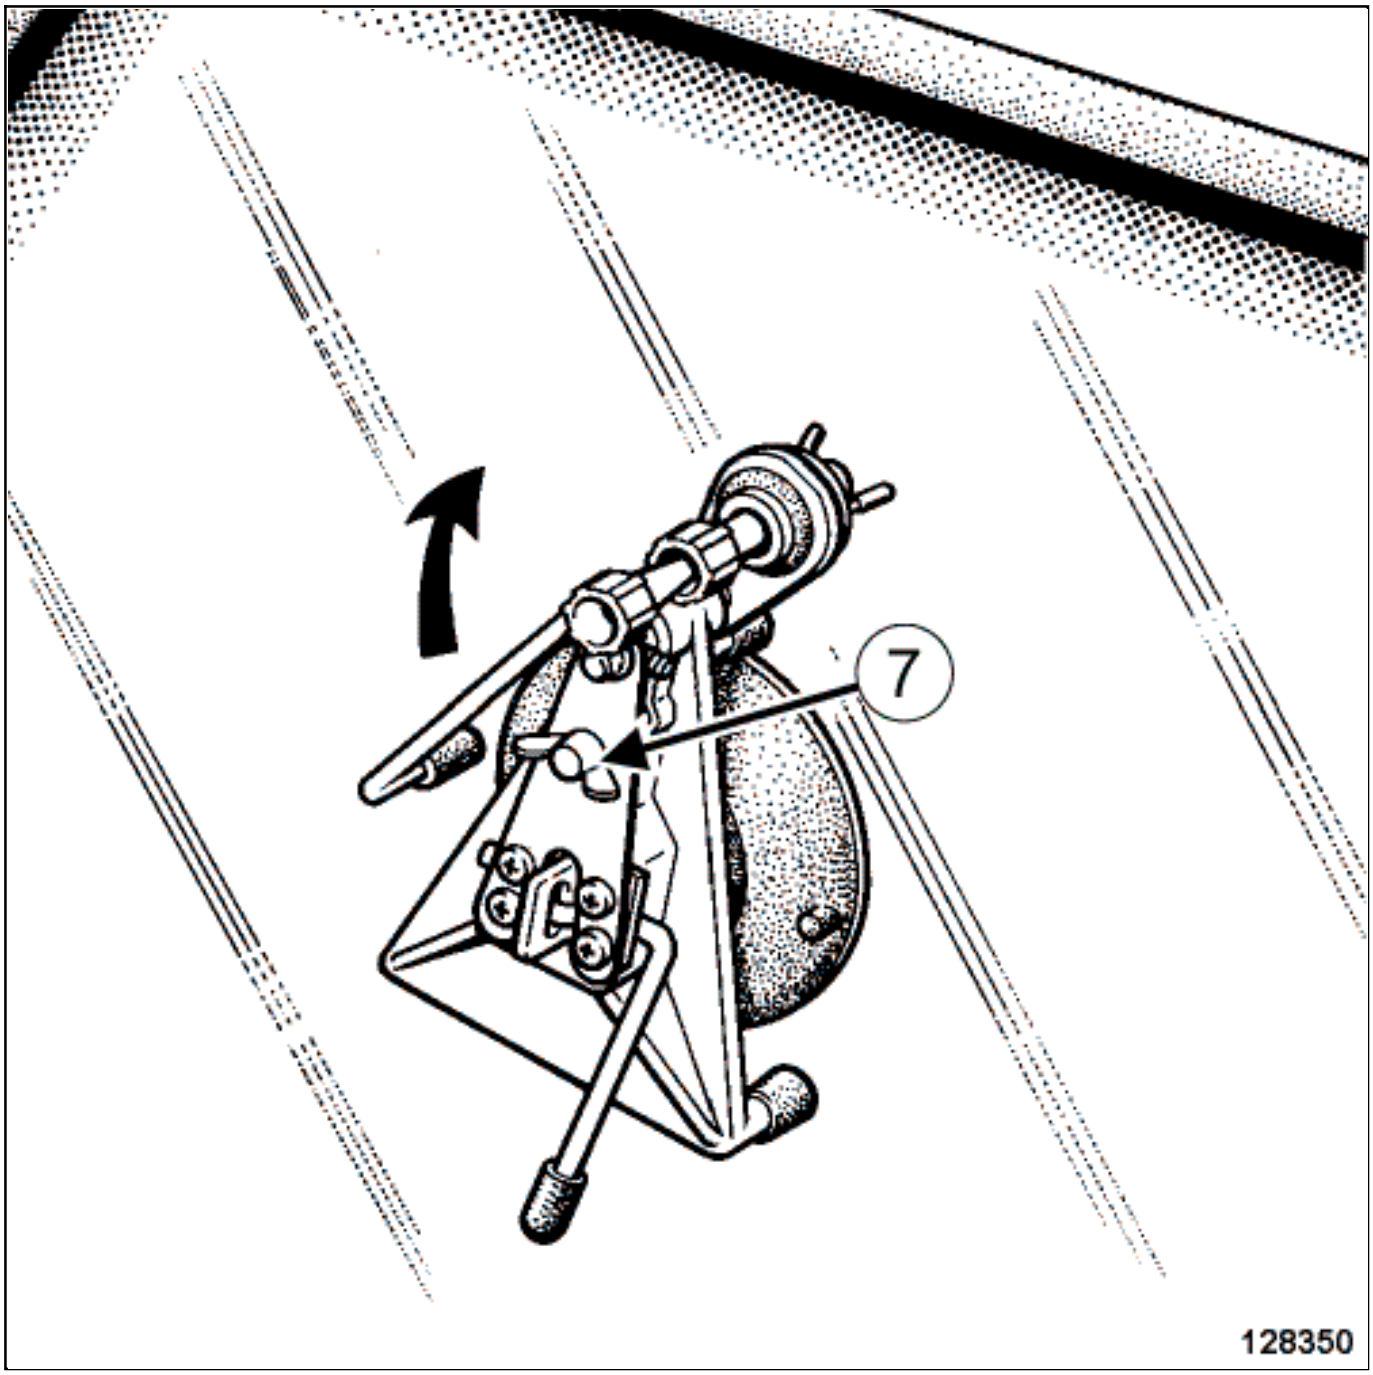
Refit the injector on the injector holder but do not tighten it.

When the white rubber seal comes into contact with the glass, tighten it by one or two additional turns in order to obtain the seal needed for applying pressure to the resin.

Do this by holding the body of the injector with two fingers and screwing the piston very slowly with the other hand.

During this operation, look in the mirror to observe the moment when the seal of the injector expands slightly.

Continue to screw the piston in by no more than one turn, then do not touch it any more.



Wait for 1 minutes, then observe what happens in the mirror. You would normally expect to see an improvement.

To accelerate the process of transferring the resin to the inside of the chip, from time to time you can undo the piston of the injector a little more than it was when you filled it with resin, without changing the position, and wait for a few seconds, then screw the piston up again until the seal expands once more.

Repeat this operation several times until the chip has completely disappeared.

The resin takes 2to 5 minutesto spread to the furthest ends of the cracks.

5- INSPECTION OF THE REPAIR

- Release the spider pressure using the bolt(7) .
- Rotate the injector assembly to free the area of the chip.

This will relieve all pressure on the repair area.

- Check and inspect the crack under different angles.

If no chip modification can be seen after 5 minutes, the glass must be drilled at the location of the crater (see When and how it is necessary to drill).

this means that when the projectile came into contact with it, the windscreen broke as a result of the shock wave but the glass was not perforated.

6- FINISHING

When the chip has disappeared, remove the tool holder, which is no longer needed.

Fit:

- a drop or two of finishing resin above the crater and put the plastic sheet or film over the repair (the quantity of resin will have to protrude slightly in order to take into account the effect of "contraction" at the time of polymerisation),
- the UV lamp astride the repair on the windscreen after first applying gel to the suction cups.

Drying time: as per supplier's instructions.

Once polymerisation has finished, use a scraper blade to remove the surplus resin that is on the windscreen. Scratch at right angles to the glass surface until only what is needed is left.

Fit the felt disc in the drill mandrel.

Apply a little polish to the area where the repair has been done.

Polish the repair without putting too much pressure on the window in order to obtain the right appearance.

7- WHEN AND HOW IS IT NECESSARY TO DRILL?

In certain cases, despite the application of pressure to the resin, nothing happens.

It is then necessary to drill to access the inside of the chip.

That means that the glass has broken internally under the effect of the shock wave, without the outer glass being damaged.

1)DRILLING

Put the carbide drill bit on the drill.

Drill in successive and brief operations in order to avoid the tool overheating.

When the plastic film separating the two layers of glass is reached, stop drilling.

Carry out the repair as described below.

2)REPAIR AFTER DRILLING

If repairing a crack, drill at the end of the crack to prevent it from propagating.

Inject the resin through this hole.

This will move up the crack by capillarity.

Harden this part using the UV lamp.

Position the injector holder so that the injector is located astride the slit, 5 cmaway from the end of the resin just injected.

By capillarity, the resin will distribute itself on either side of the injector.

Harden this part, and continue progressively until the whole of the crack is repaired.

Note:

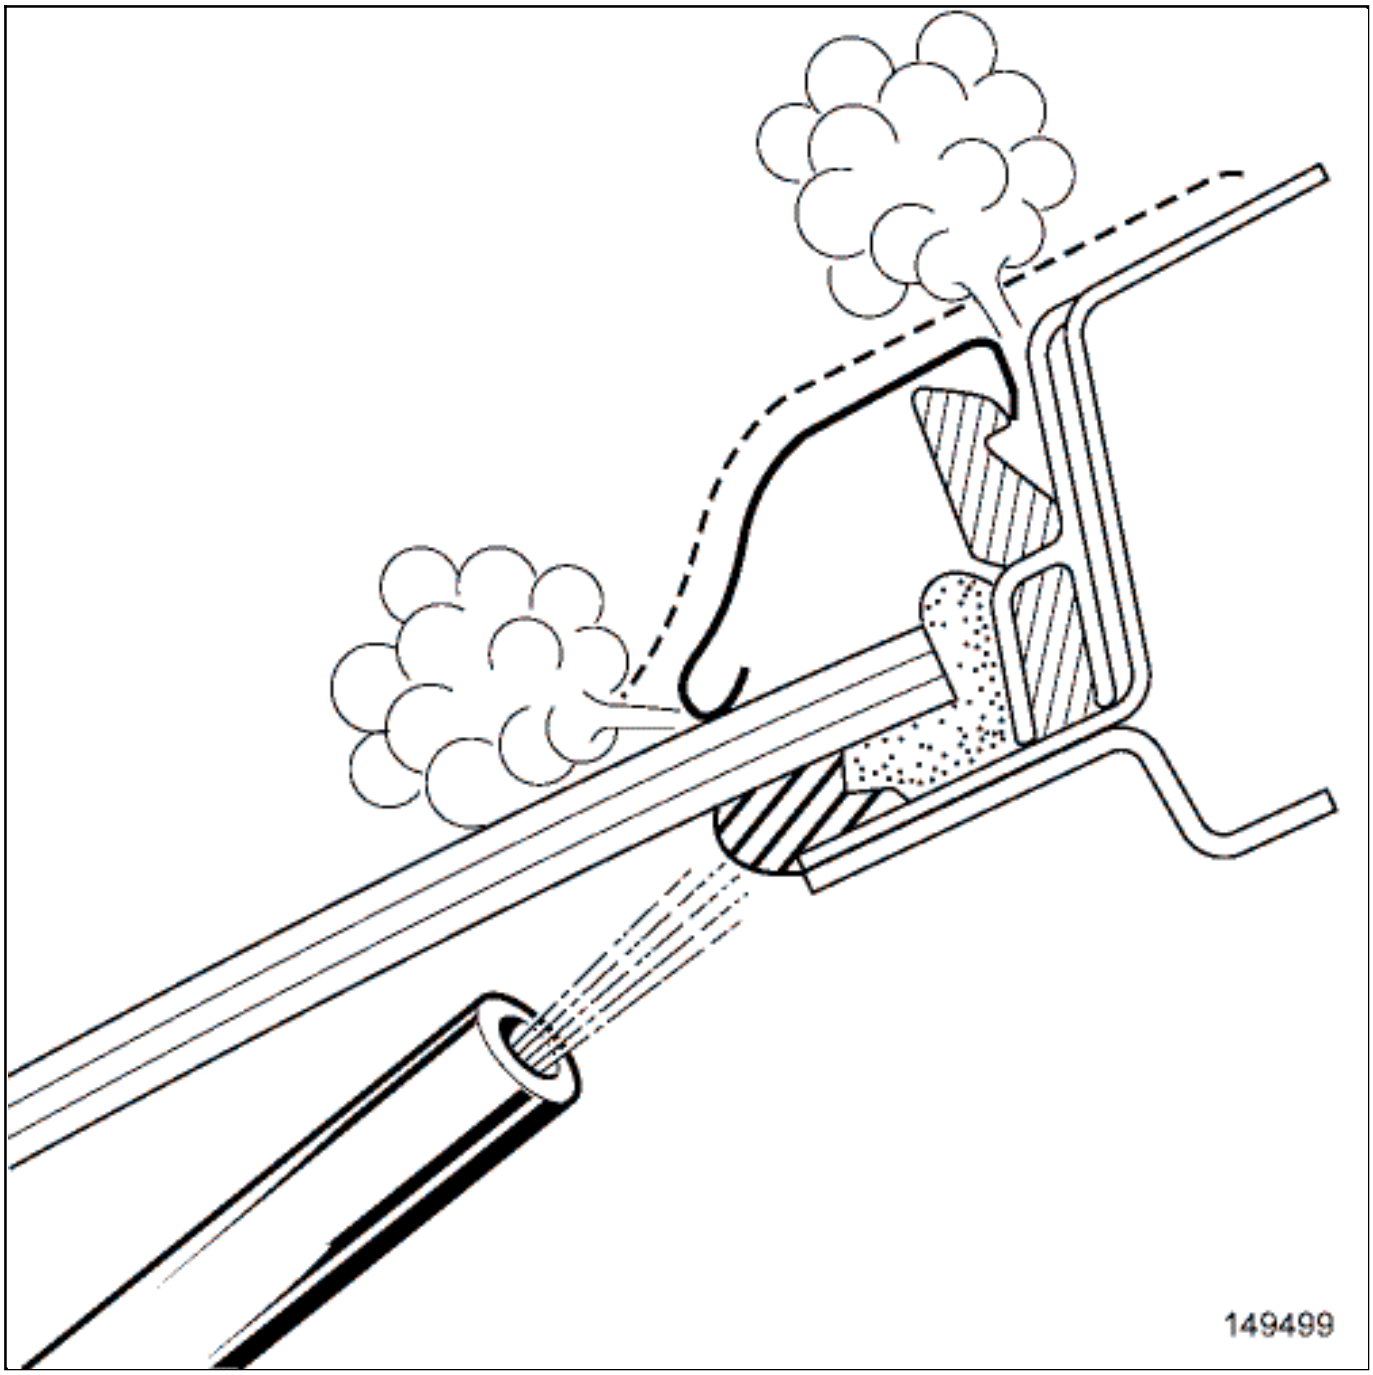
Only drill once at the end of the crack.

WINDOWS: SEALING CHECK

Note:

Before any operation, check the water outlet openings. Clean any residue which has accumulated (for example: dead leaves, twigs, etc.) and check that water flows out correctly.

1. PREPARATION OPERATION FOR CHECKING THE SEALING



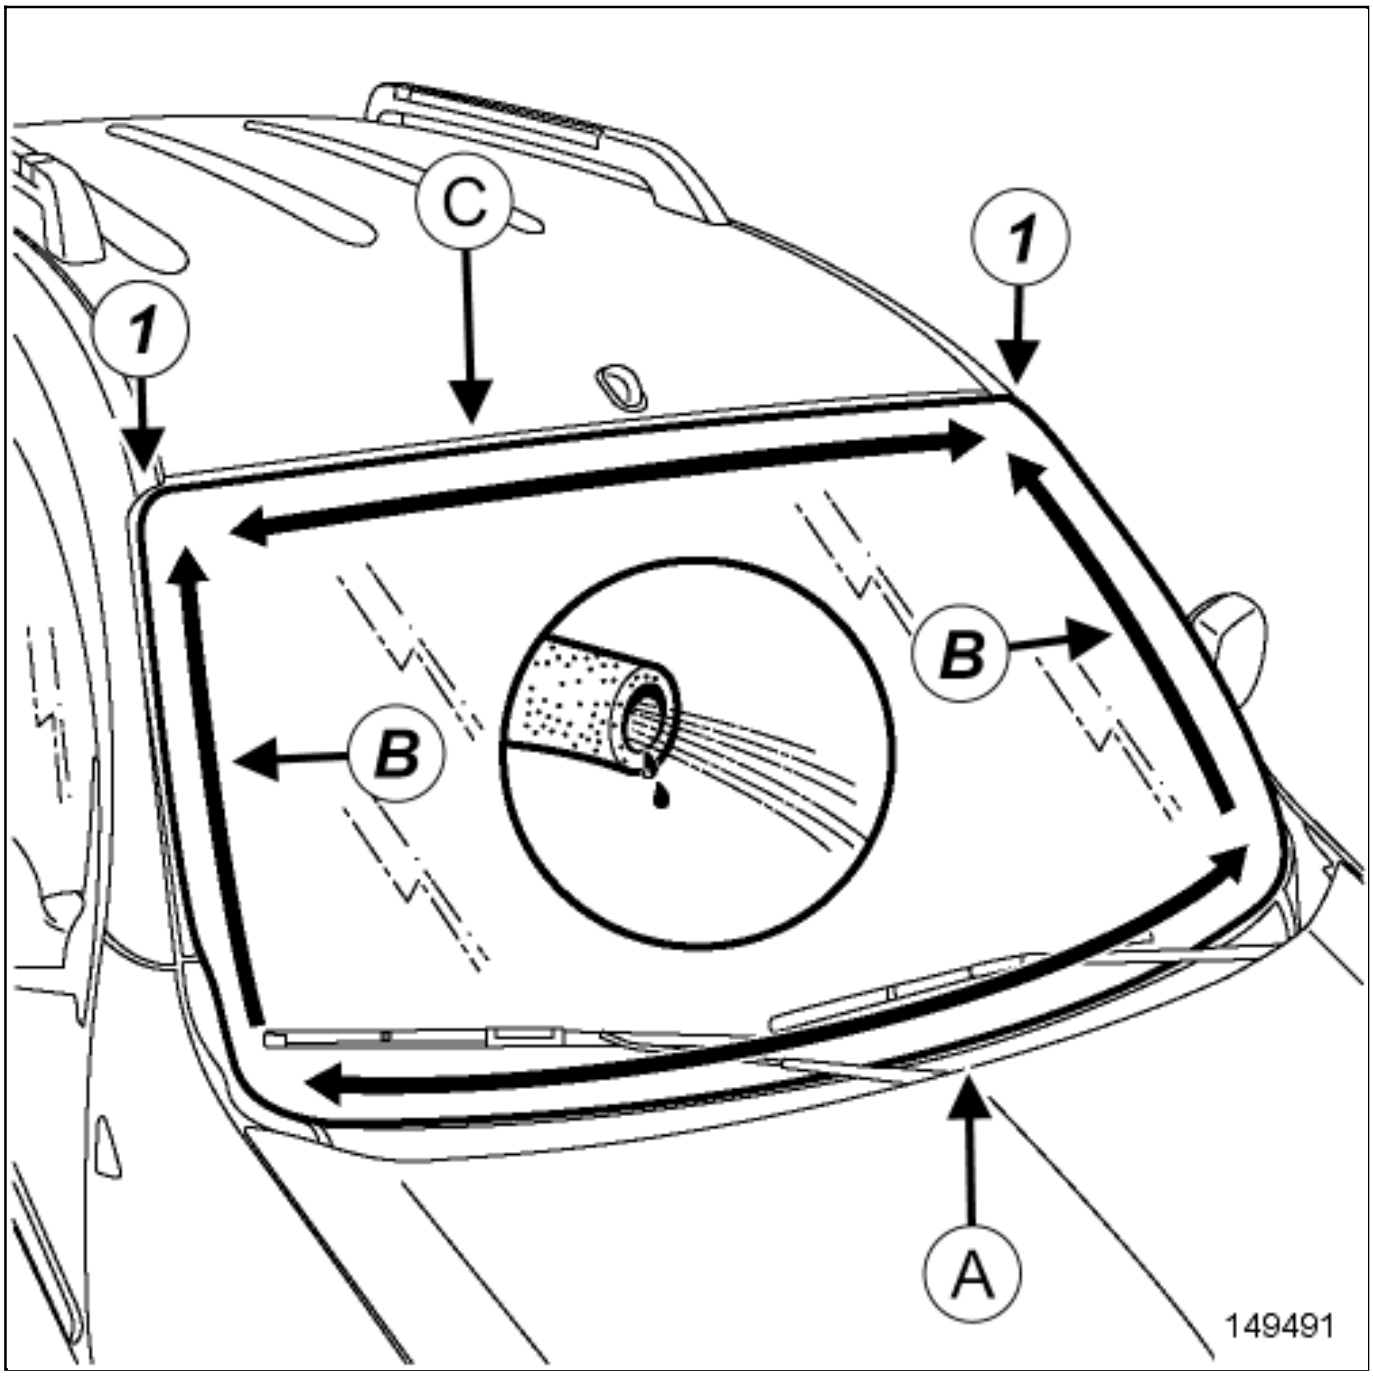
1- CONDITIONS TO RESPECT BEFORE CHECKING THE SEALING

- Position the vehicle on a level washing area(see 60A, General information, Vehicle sealing: General information) .
- Check that all the opening elements are closed(see 60A, General information, Vehicle sealing: General information) .
- Prepare the equipment to perform the operation(see 60A, General information, Sealing tools: Use) and (see 60A, General information, Vehicle sealing: General information) .
- Adjust the flow of the water jet(see 60A, General information, Sealing tools: Use) .

2. OPERATION FOR CHECKING THE SEALING

1- BONDED WINDOWS

1)FIRST PROCEDURE



- Wet the exterior edge of the windows using soapy water(see 60A, General information, Bodywork sealing products: Description) .

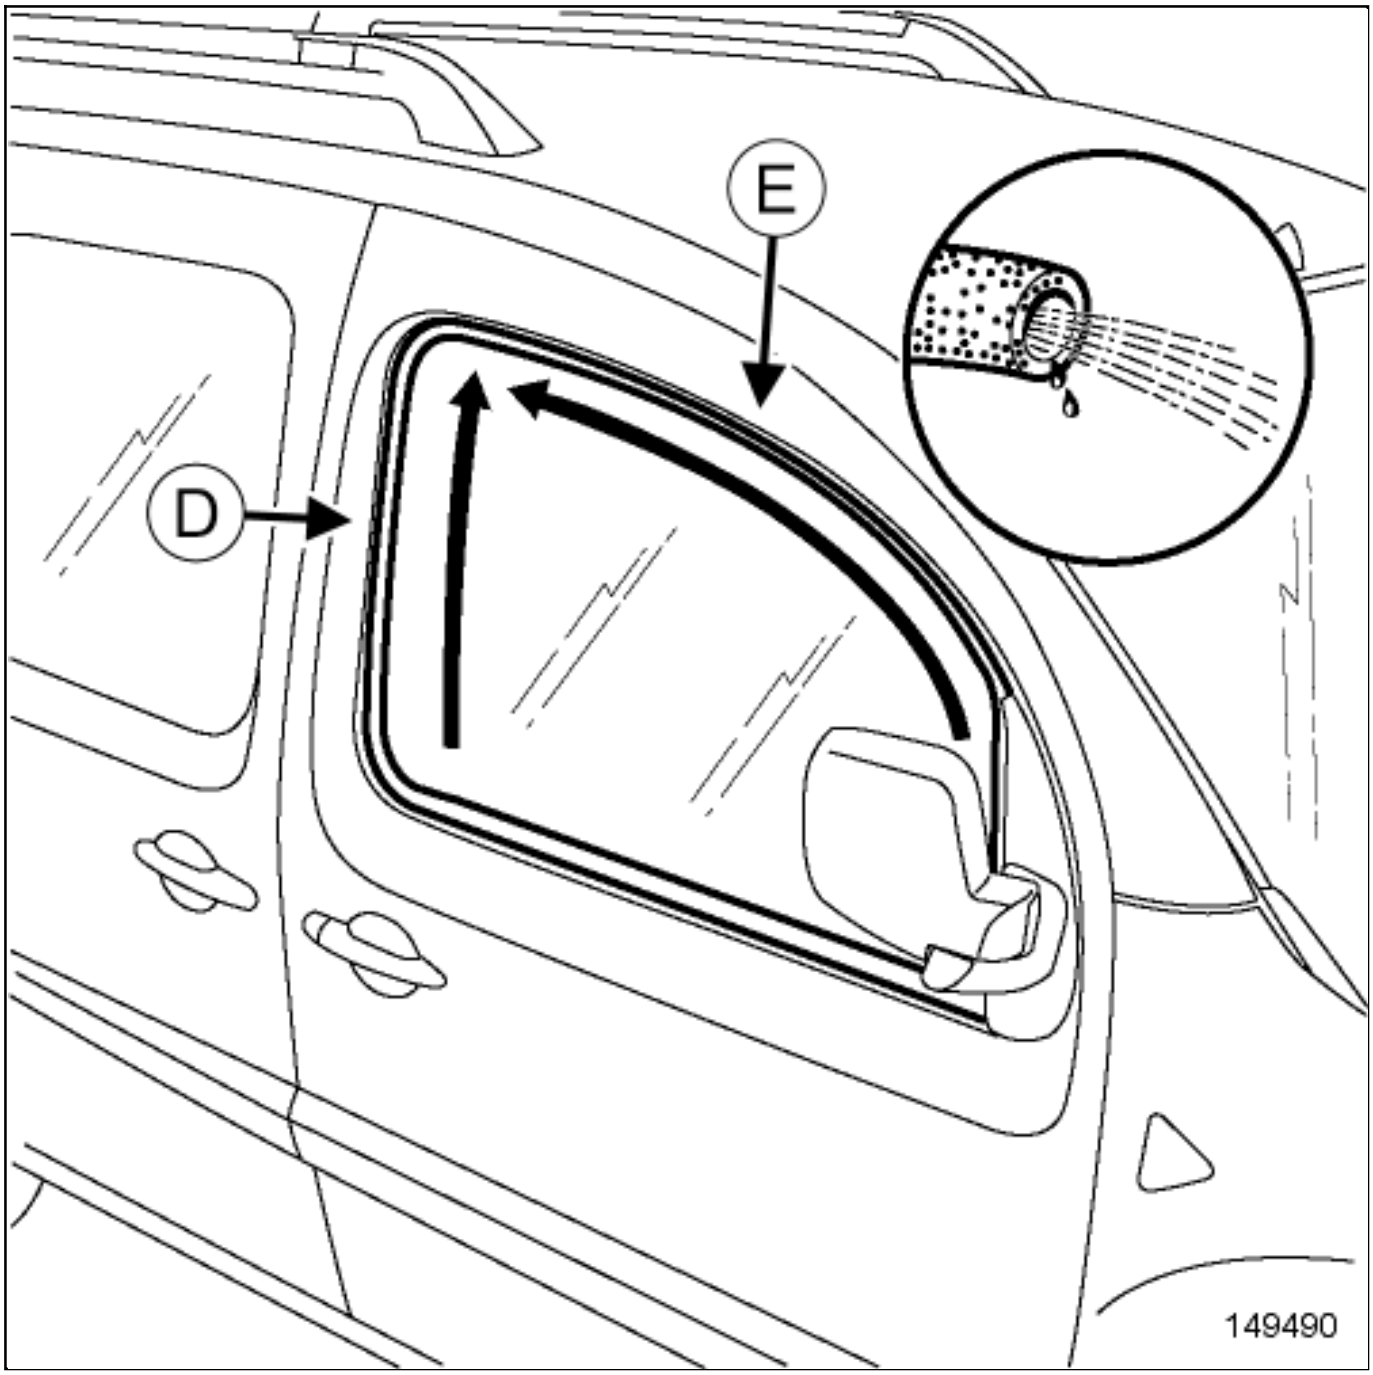
- From inside the vehicle, blow the entire zone using the air gun(see 60A, General information, Sealing tools: Description) .

- Visually inspect for the presence of bubbles around the windows.

2)SECOND PROCEDURE

Spray the lowest section(A) of the windows by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

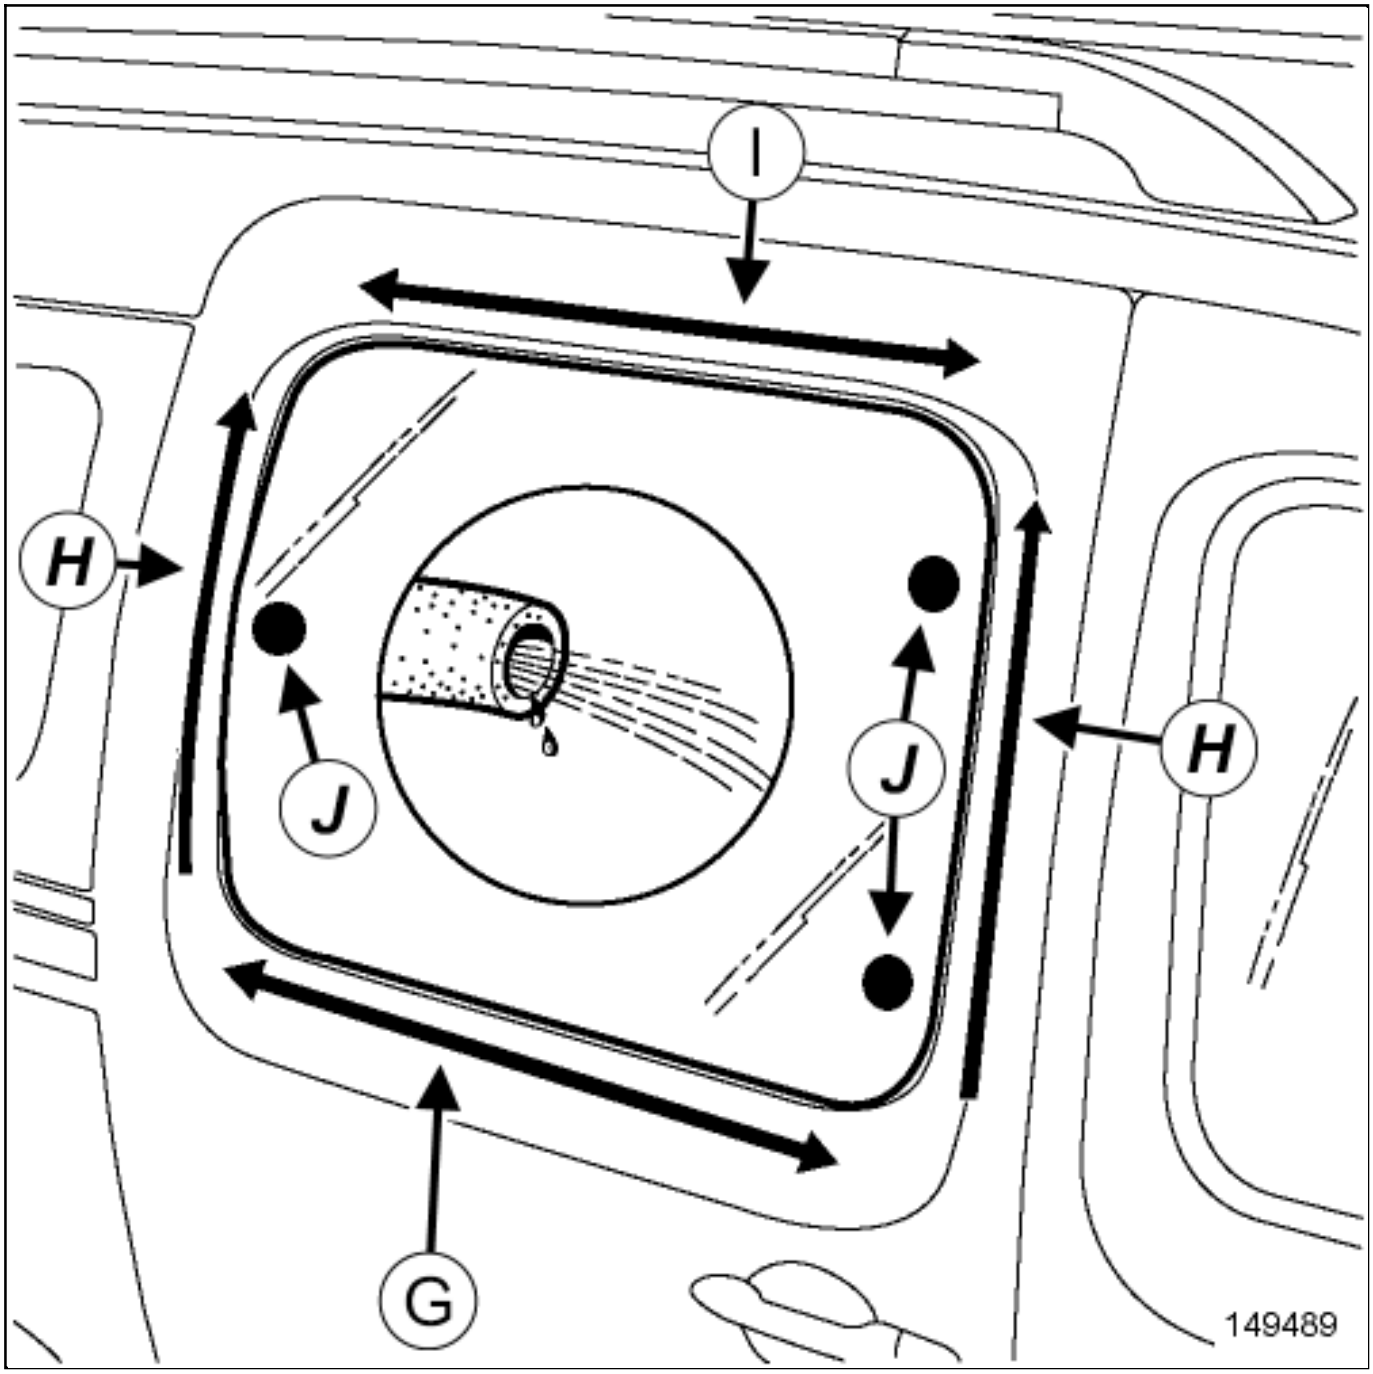


Gradually spray the window pillars(B) from the bottom upwards to point(1) .

- Visually inspect for the presence of water inside the vehicle (see 60A, General information, Vehicle sealing: General information) .

- Spray the upper section(C) of the windows by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle (see 60A, General information, Vehicle sealing: General information) .

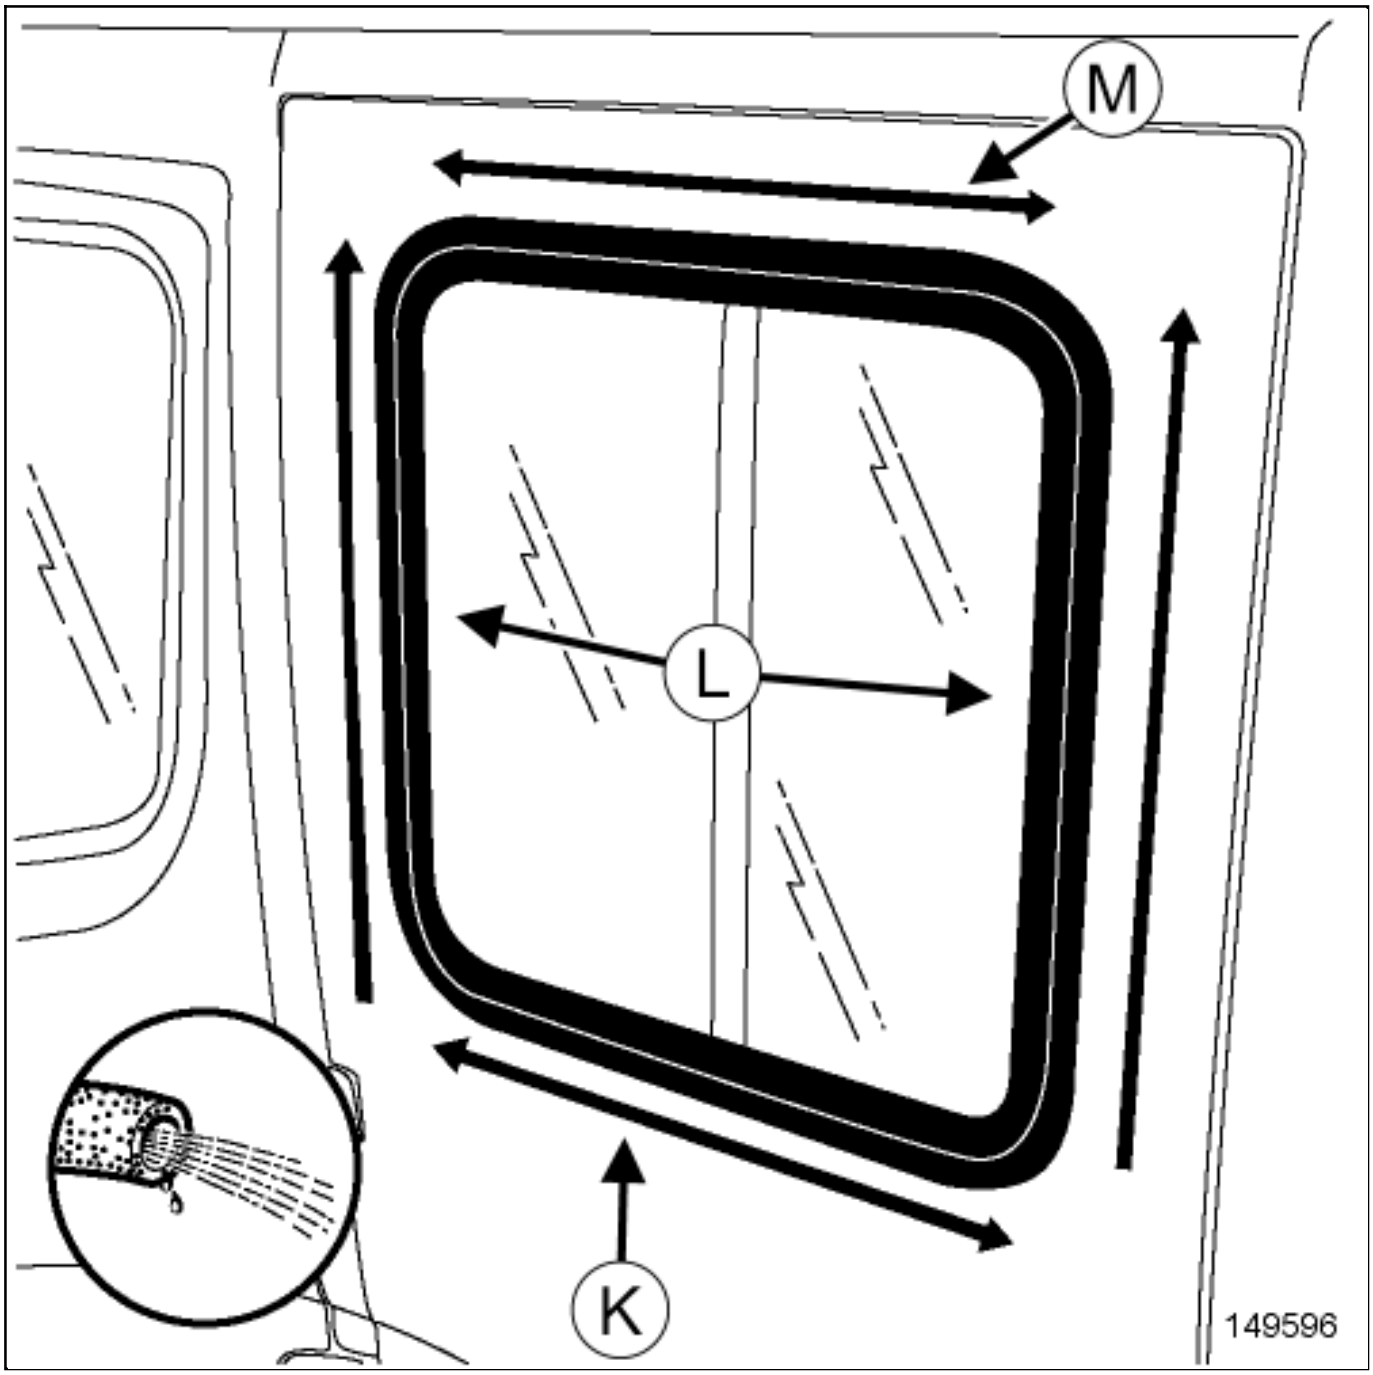


2- SLIDING WINDOWS

- Gradually spray the window pillar(D) from the bottom upwards to the upper section.
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Gradually spray the window pillar(E) from the bottom upwards to the upper section.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

3- HINGED WINDOWS



- Spray the lowest section(G) of the windows by sweeping the zone from right to left.

- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle

sealing: General information) .

- Gradually spray the window sections(H) from the bottom upwards to the upper section.
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Spray the upper section(I) of the windows by sweeping the zone from right to left.
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Spray the window mountings directly without moving(J) .
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

4- FITTED WINDOWS

- Spray the lowest section(K) of the windows by sweeping the zone from right to left.
- Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .
- Gradually spray the window sections(L) from the bottom upwards to the upper section.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

Spray the upper section(M) of the windows by sweeping the zone from right to left.

Visually inspect for the presence of water inside the vehicle(see 60A, General information, Vehicle sealing: General information) .

5- CHECKING THE SEALING WITH THE TRIM REMOVED

If the customer complaint could not be reproduced in accordance with the procedure, remove the interior trims (see Body internal trim in the vehicle's repair manual) then repeat the sealing check from step 1; extend the sealing check to the surrounding areas(see 60A, General information, Vehicle: Sealing check) .

WINDOWS: SEALING REPAIR

Note:

Before performing a sealing repair, check the sealing of the zone concerned (see 60A, General information, Vehicle: Sealing check) .

1. PREPARATION OPERATION FOR REPAIRING THE SEALING

1- CHECK AND ADJUST IF NECESSARY:

a) for bonded windows:

- the trim pieces.

b) for mobile windows:

- the front sliding window glass run channel Front side door window run channel: Removal - Refitting (66A, Window sealing) or rear sliding window glass run channel Rear side door window run channel: Removal - Refitting (66A, Window sealing),
- the front sliding window exterior weatherstrip Front side door exterior weatherstrip: Removal - Refitting (66A, Window sealing) or rear sliding window exterior weatherstrip Rear side door window run channel: Removal - Refitting (66A, Window sealing),
- the seal of the pivoting windows,
- the clearances and flush fitting of the side windows Side windows: Adjustment (54A, Windows),
- the opening rear screen seal,
- the rear quarter panel window mountings Rear quarter panel window: Removal - Refitting (54A, Windows),
- the opening rear screen mountings Opening rear screen: Removal - Refitting (54A, Windows).

Note:

If the seals are dirty, clean them in soapy water(see 60A, General information, Vehicle sealing: General information) .

c) for the fitted windows:

the seal.

2- WAS ANY ACTION PERFORMED?

NO: move on to the next step.

YES: check the sealing of the zone(see 60A, General information, Windows: Sealing check) .

Was water present in the passenger compartment of the vehicle?

YES: move on to the next step.

NO: fault resolved.

2. SEALING REPAIR OPERATION

1- REPAIRING THE SEALING OF BONDED WINDOWS

Is water present in the passenger compartment after the sealing of the bonded windows has been checked?

NO: move on to the next step.

YES:

If the mastic of the bonded windows is faulty:

- remove the windows **Windscreen: Removal - Refitting** (54A, Windows) or **Rear quarter panel window: Removal - Refitting** (54A, Windows) or **Rear screen: Removal - Refitting** (54A, Windows),
- re-apply the window bonding range **Window bonding: Description** (Technical Note 0560A, 54A, Windows) or **Bonding sunroof operating mechanisms: Description** (Technical Note 0560A, 54A, Windows).

Check the sealing of the bonded window **(see 60A, General information, Windows: Sealing check)** .

2- REPAIRING THE SEALING OF SLIDING WINDOWS

Is water present in the passenger compartment after the sealing of the sliding windows has been checked?

- NO: move on to the next step.
- YES:
  - a) if the sliding mobile window channel is deformed or cut, replace the sliding window glass run channel **Front side door window run channel: Removal - Refitting** (66A, Window sealing) or **Rear side door window run channel: Removal - Refitting** (66A, Window sealing),
  - b) if the panelwork is deformed in the fitting zone of the mobile window channel, flatten the contact zone, check the channel, replace the channel if necessary **Front side door window run channel: Removal - Refitting** (66A, Window sealing) or **Rear side door window run channel: Removal - Refitting** (66A, Window sealing).

Check the sealing of the mobile window **(see 60A, General information, Windows: Sealing check)** .

3- REPAIRING THE SEALING OF HINGED WINDOWS

Is water present in the passenger compartment after the sealing of the hinged windows has been checked?

NO: move on to the next step.

YES:

a) if the seal of the mobile window is deformed or cut, replace the mobile window seal,

b) if the panelwork is deformed in the fitting zone of the mobile window seal, flatten the contact zone, check the seal of the mobile window, replace the mobile window seal if necessary,

c) if the mountings and hinges of the mobile window are deformed, replace the mountings and hinges of the mobile windowRear quarter panel window: Removal - Refitting (54A, Windows) or(see **Rear side door window: Removal - Refitting**) (54A, Windows) orRear screen: Removal - Refitting (54A, Windows).

Check the sealing of the hinged window(see 60A, General information, Windows: Sealing check) .

4- REPAIRING THE SEALING OF FITTED WINDOWS

Is water present in the passenger compartment after the sealing of the hinged windows has been checked?

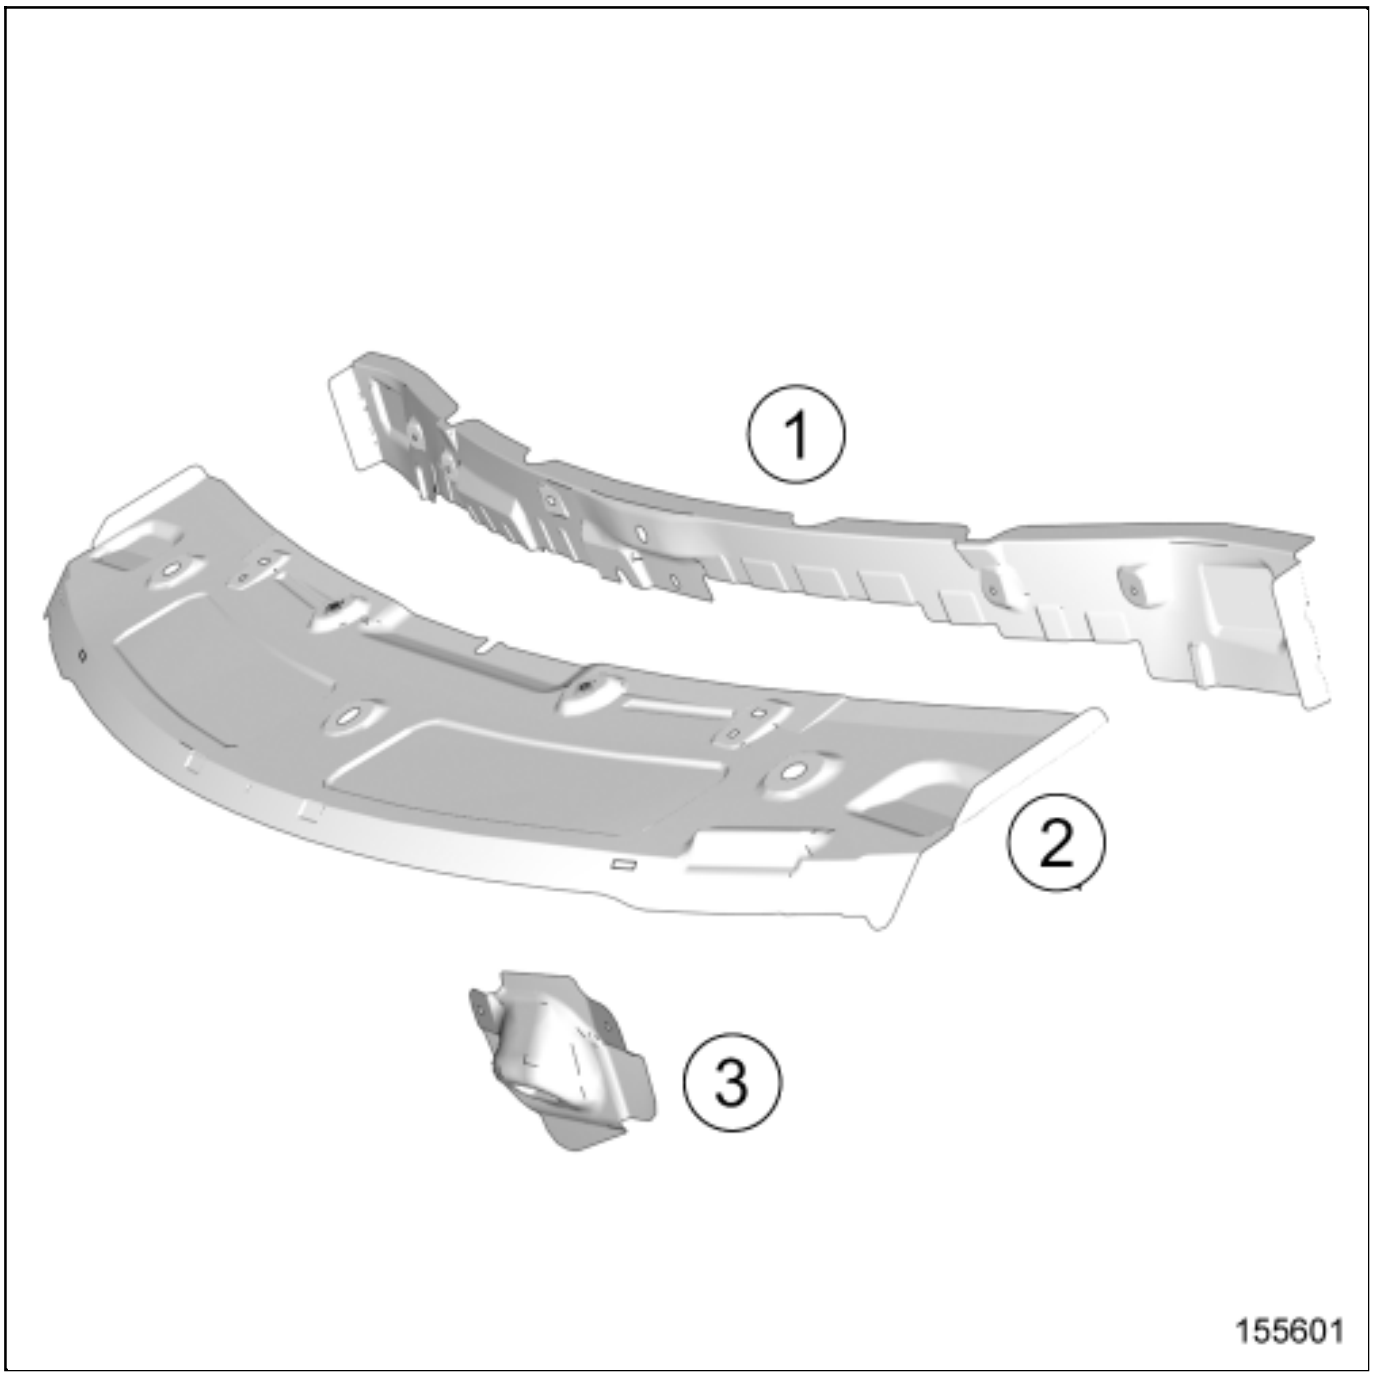
NO: fault resolved.

YES:

a) if the seal of the fitted window is deformed or cut, replace the fitted window seal,

b) if the panelwork is deformed in the contact zone of the fitted window seal, flatten the contact zone, check the seal and replace the seal if necessary,

c) if the fitted window seal does not present any faults, apply window sealing mastic between the seal and the panel and between the seal and the window(see 60A, General information, Sealing tools: Description) ,(see 60A, General information, Sealing tools: Use) and(see 60A, General information, Bodywork sealing products: Description) .



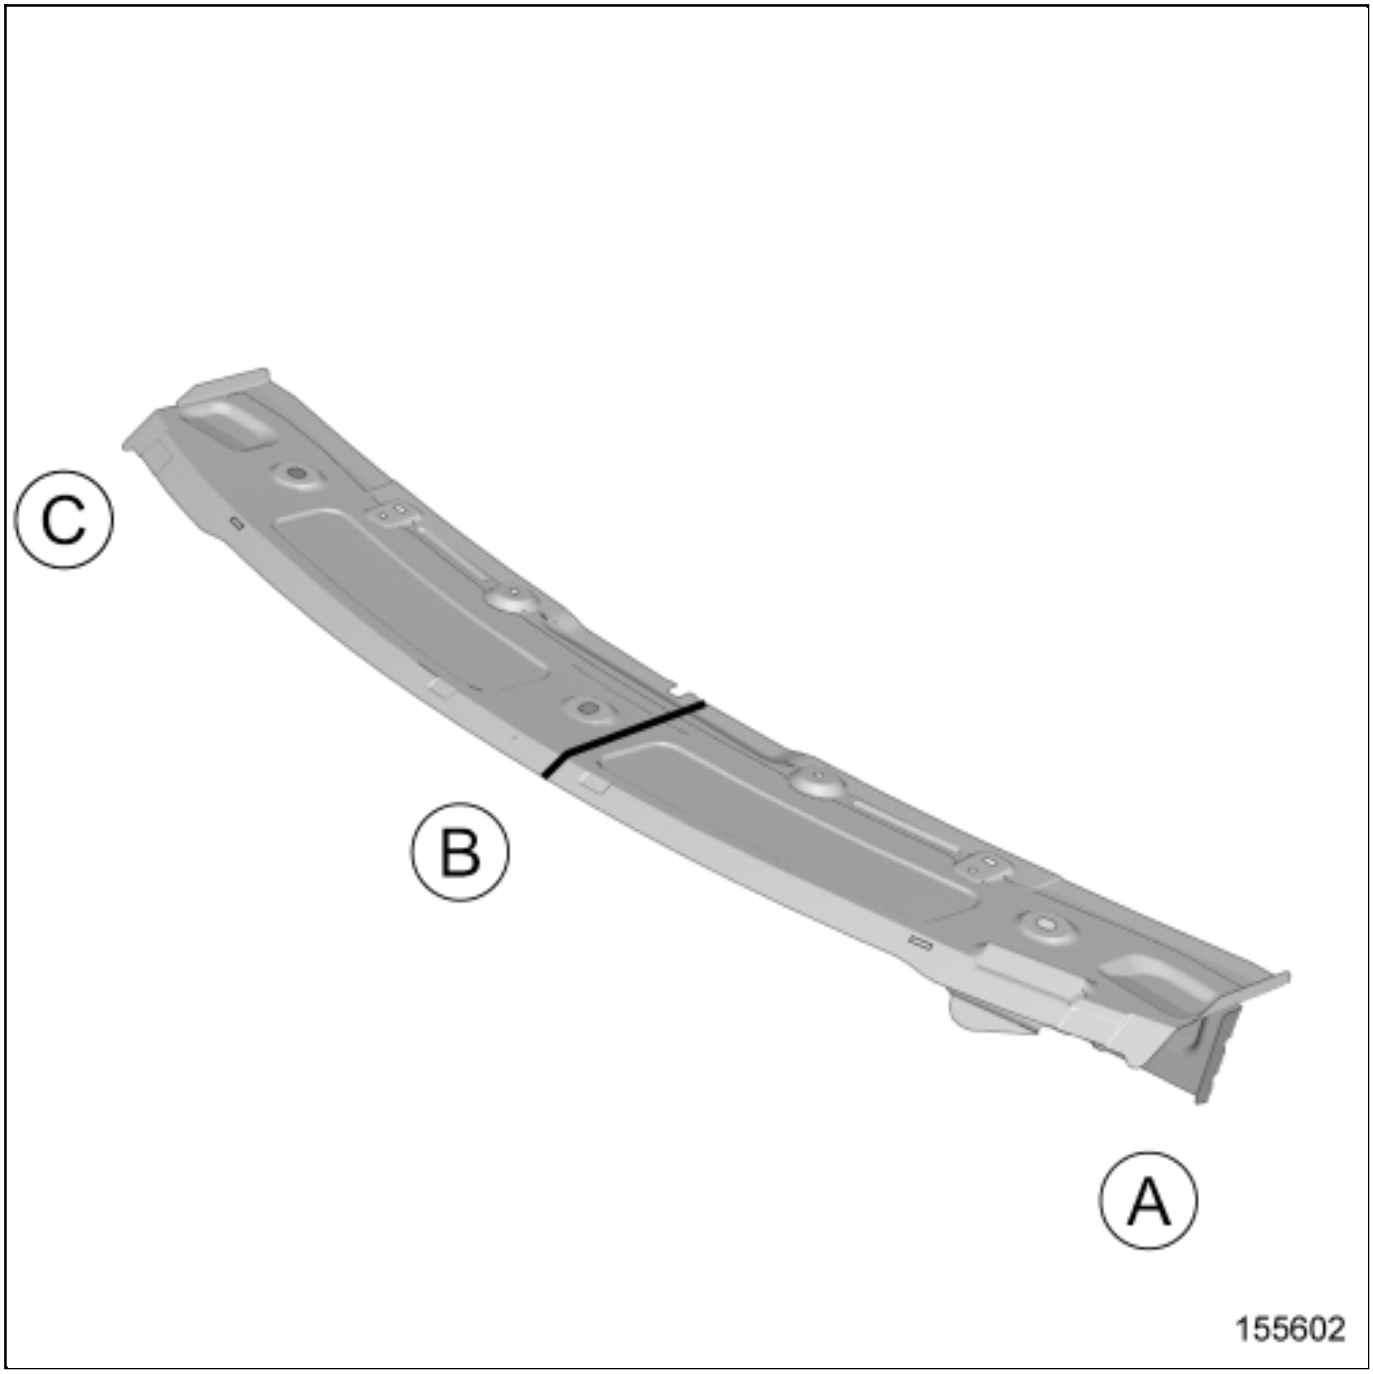
Check the sealing of the fitted window(see 60A, General information, Windows: Sealing check) .

XSL version : 3.02 du 22/07/11

WINDSCREEN APERTURE LOWER CROSS MEMBER: REPLACEMENT

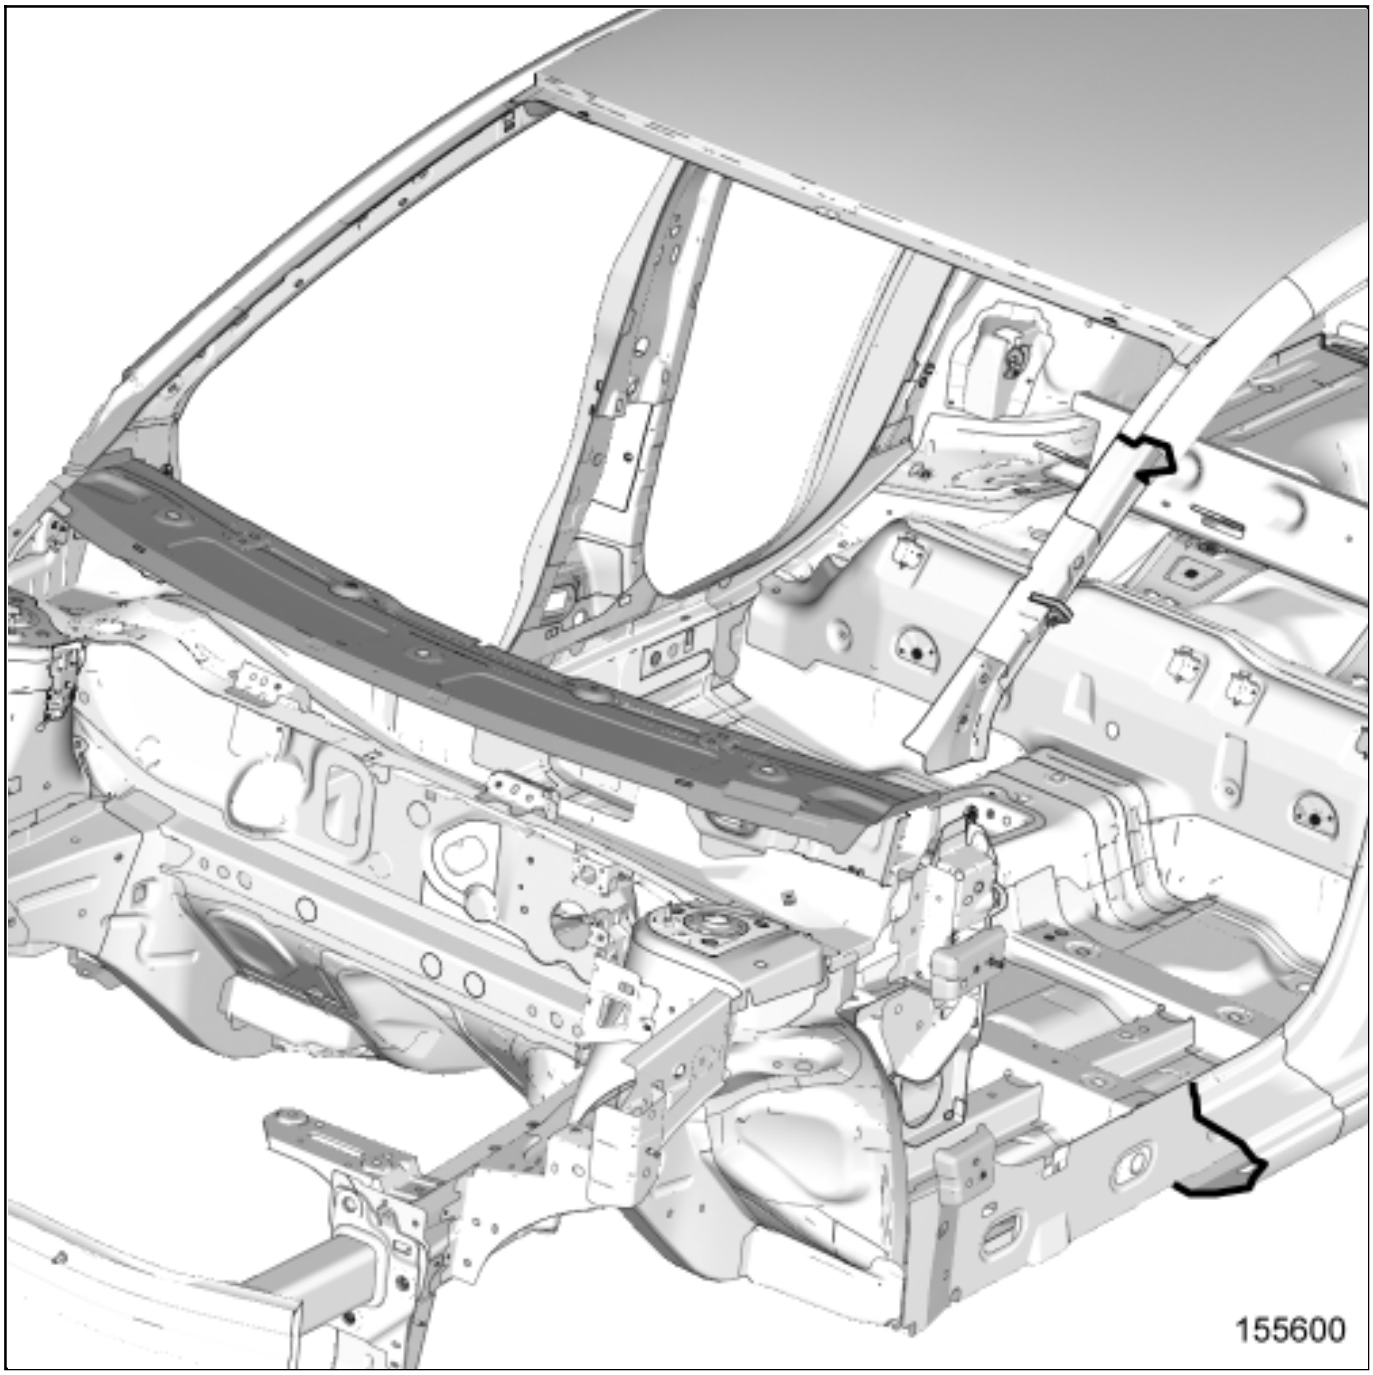
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART



No.	Description	Type	Thickness (mm)
(1)	Windscreen aperture lower cross member	Mild steel	0.7
(2)	windscreen aperture lower cross member closure panel	Mild steel	0.7
(3)	Wiper motor bridge piece	Mild steel	1.5

2. IN THE EVENT OF REPLACEMENT



The options for replacing this part are as follows:

- complete replacement A-C,
- partial replacement A-B.

1- COMPLETE REPLACEMENT A-C

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

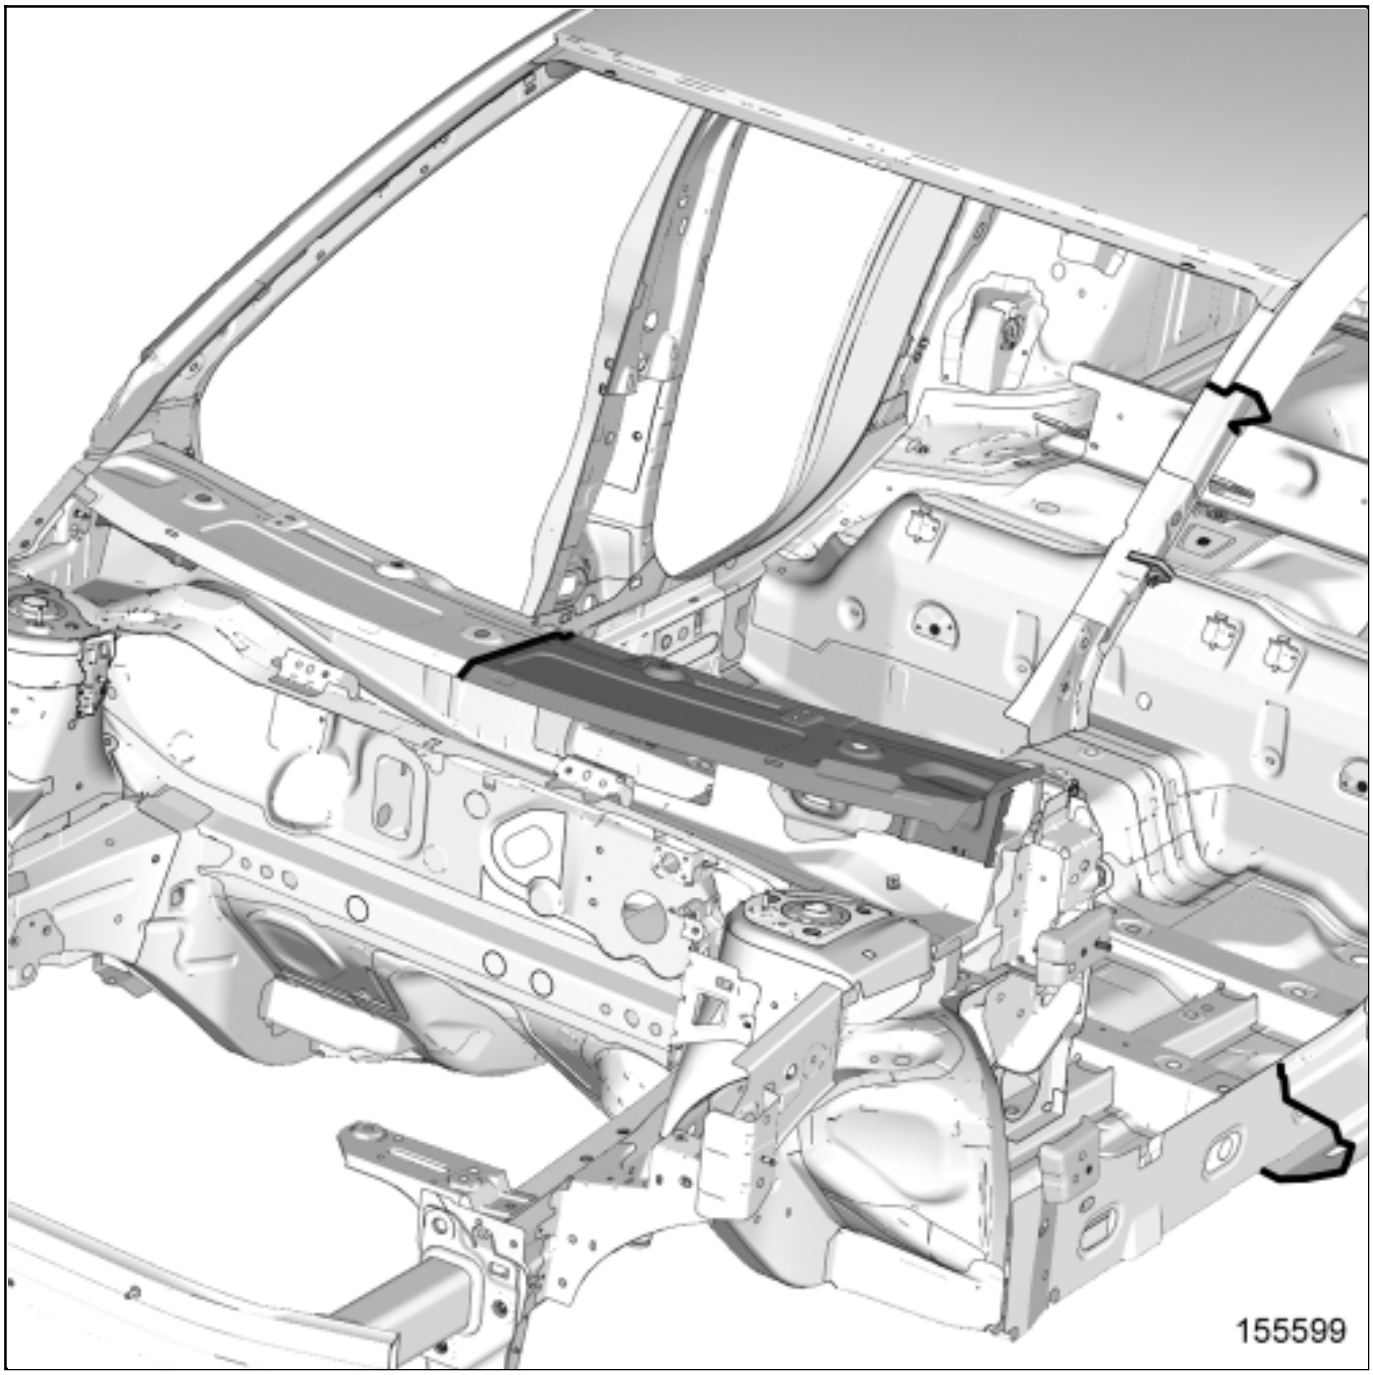
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

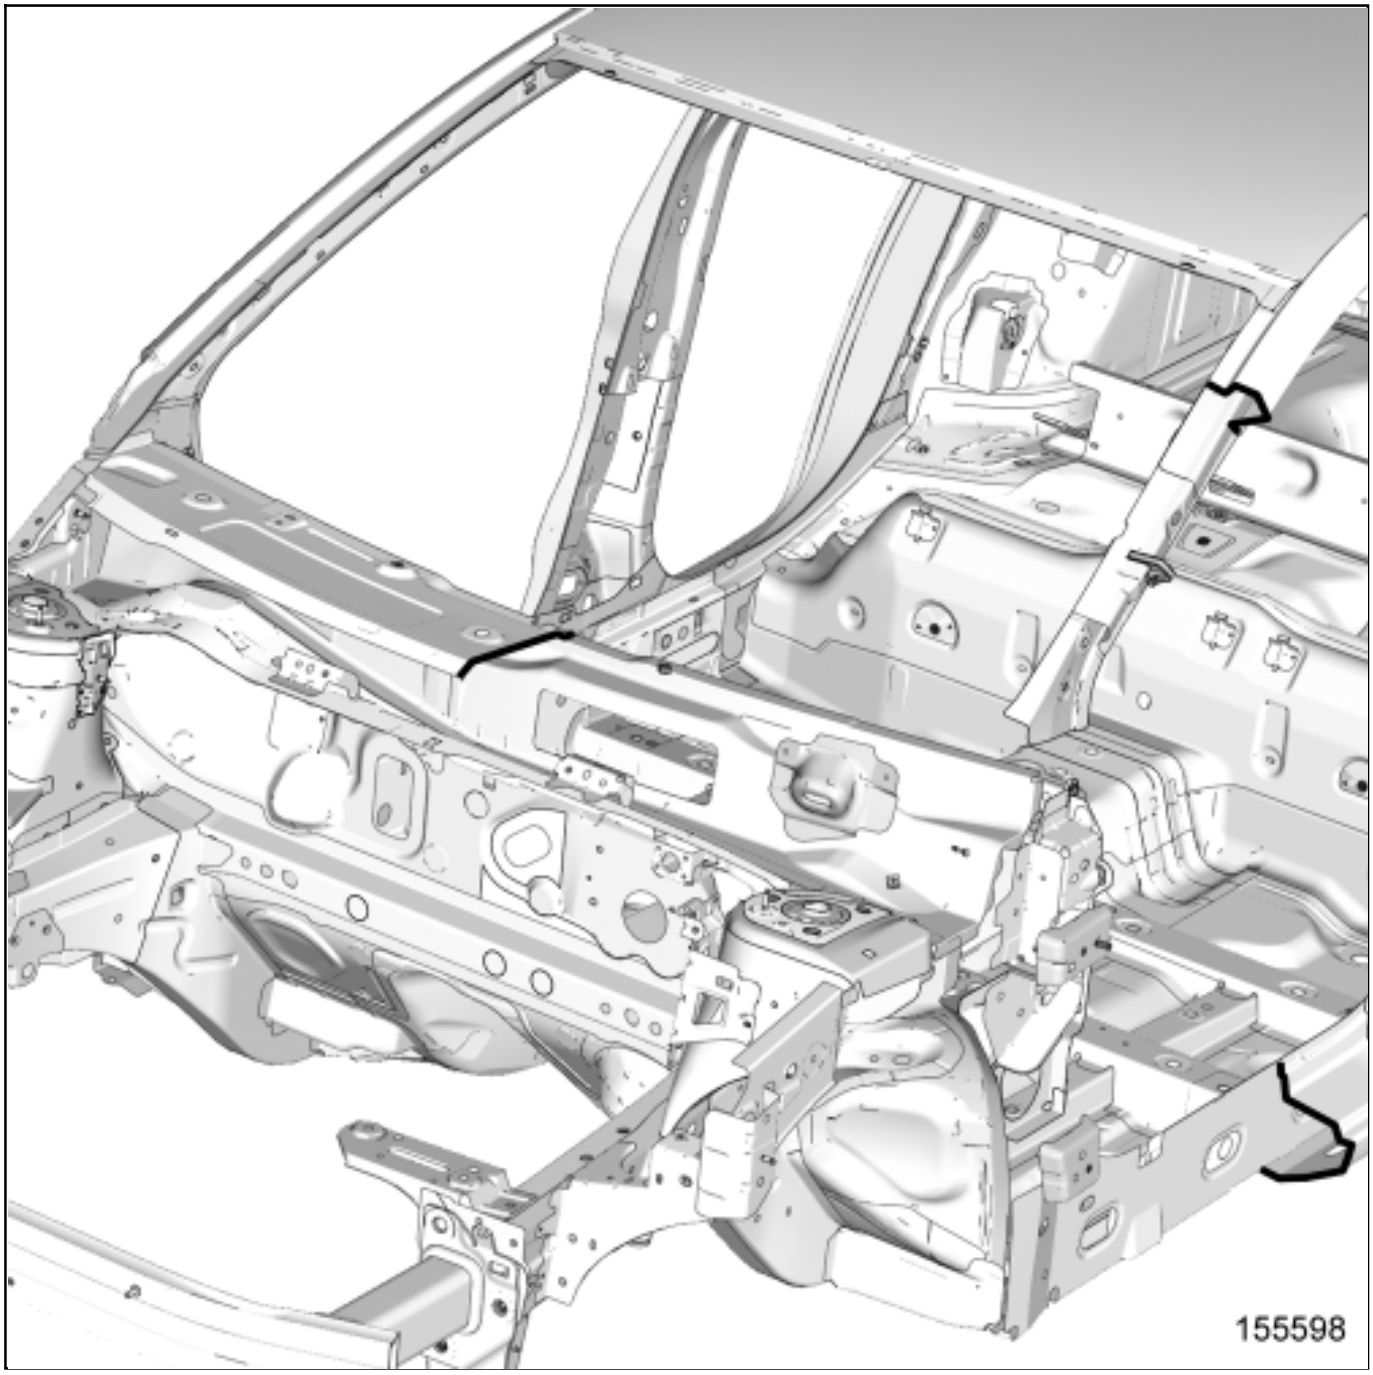
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

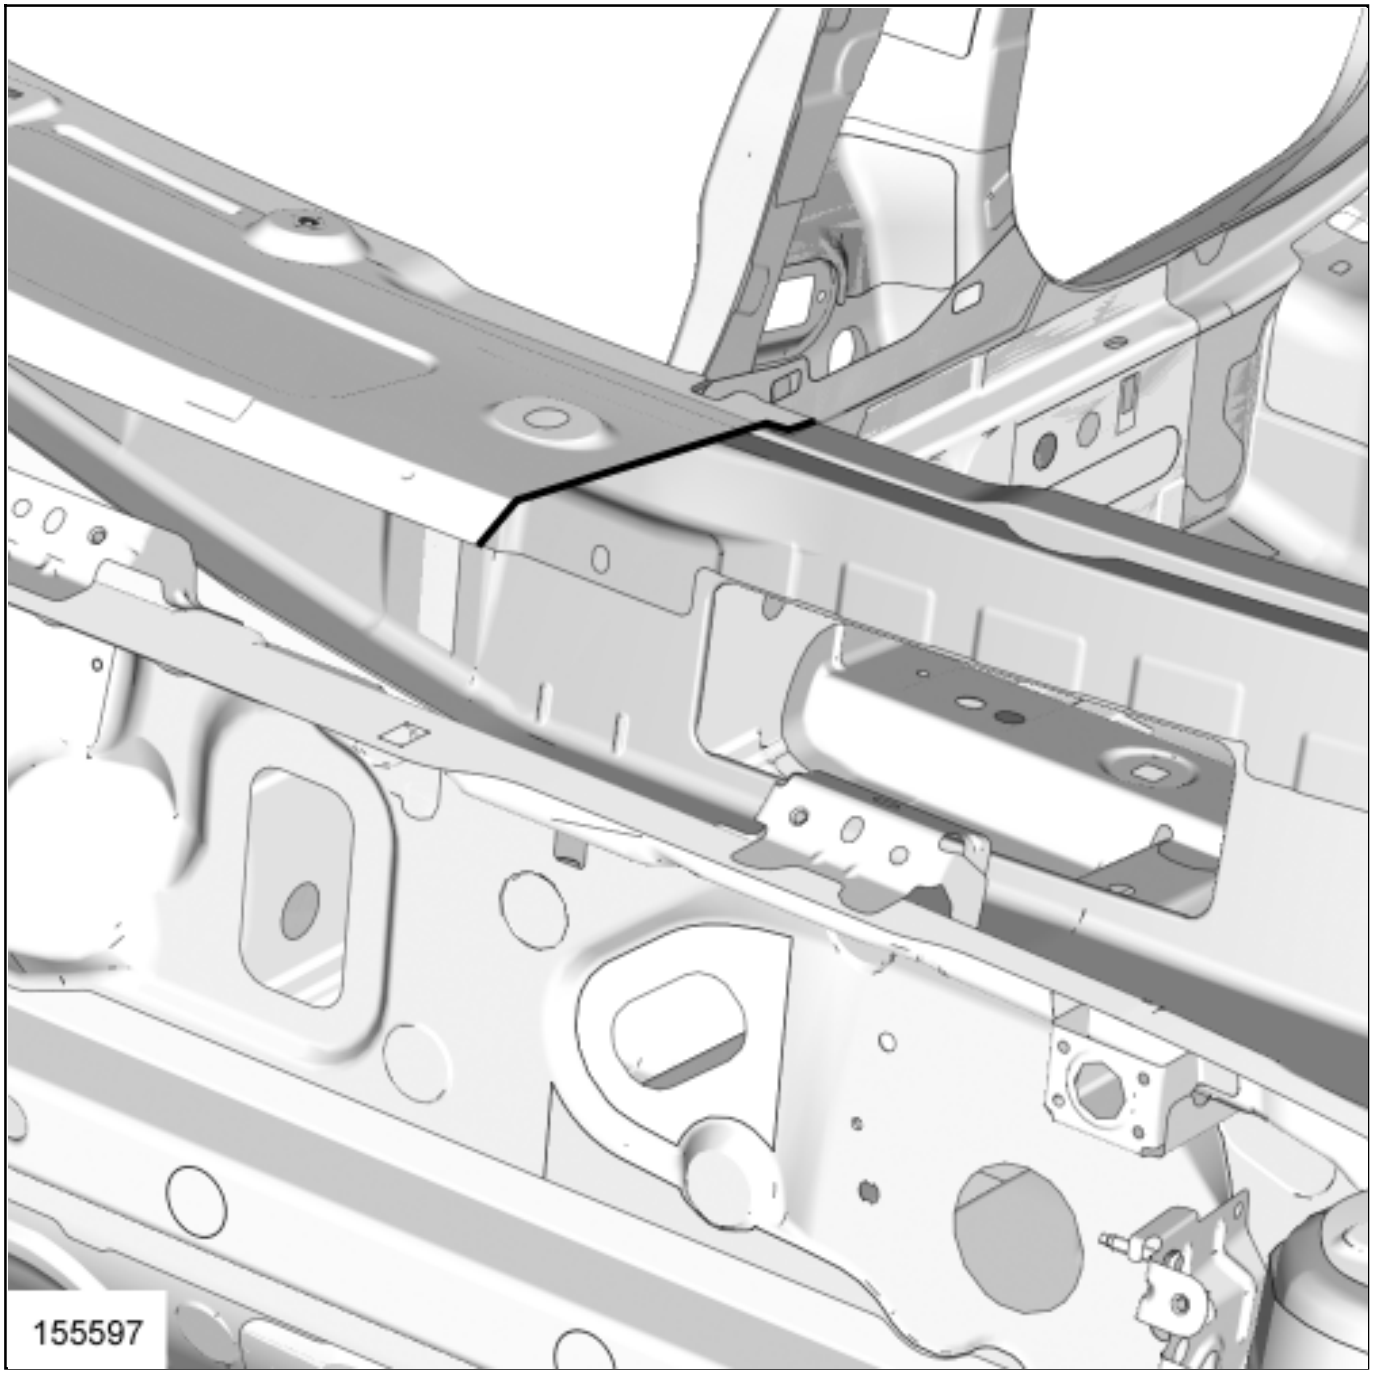


CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT A-B



1)PART IN POSITION

VIEW WITHOUT PART

DETAILED VIEW OF CUT B

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

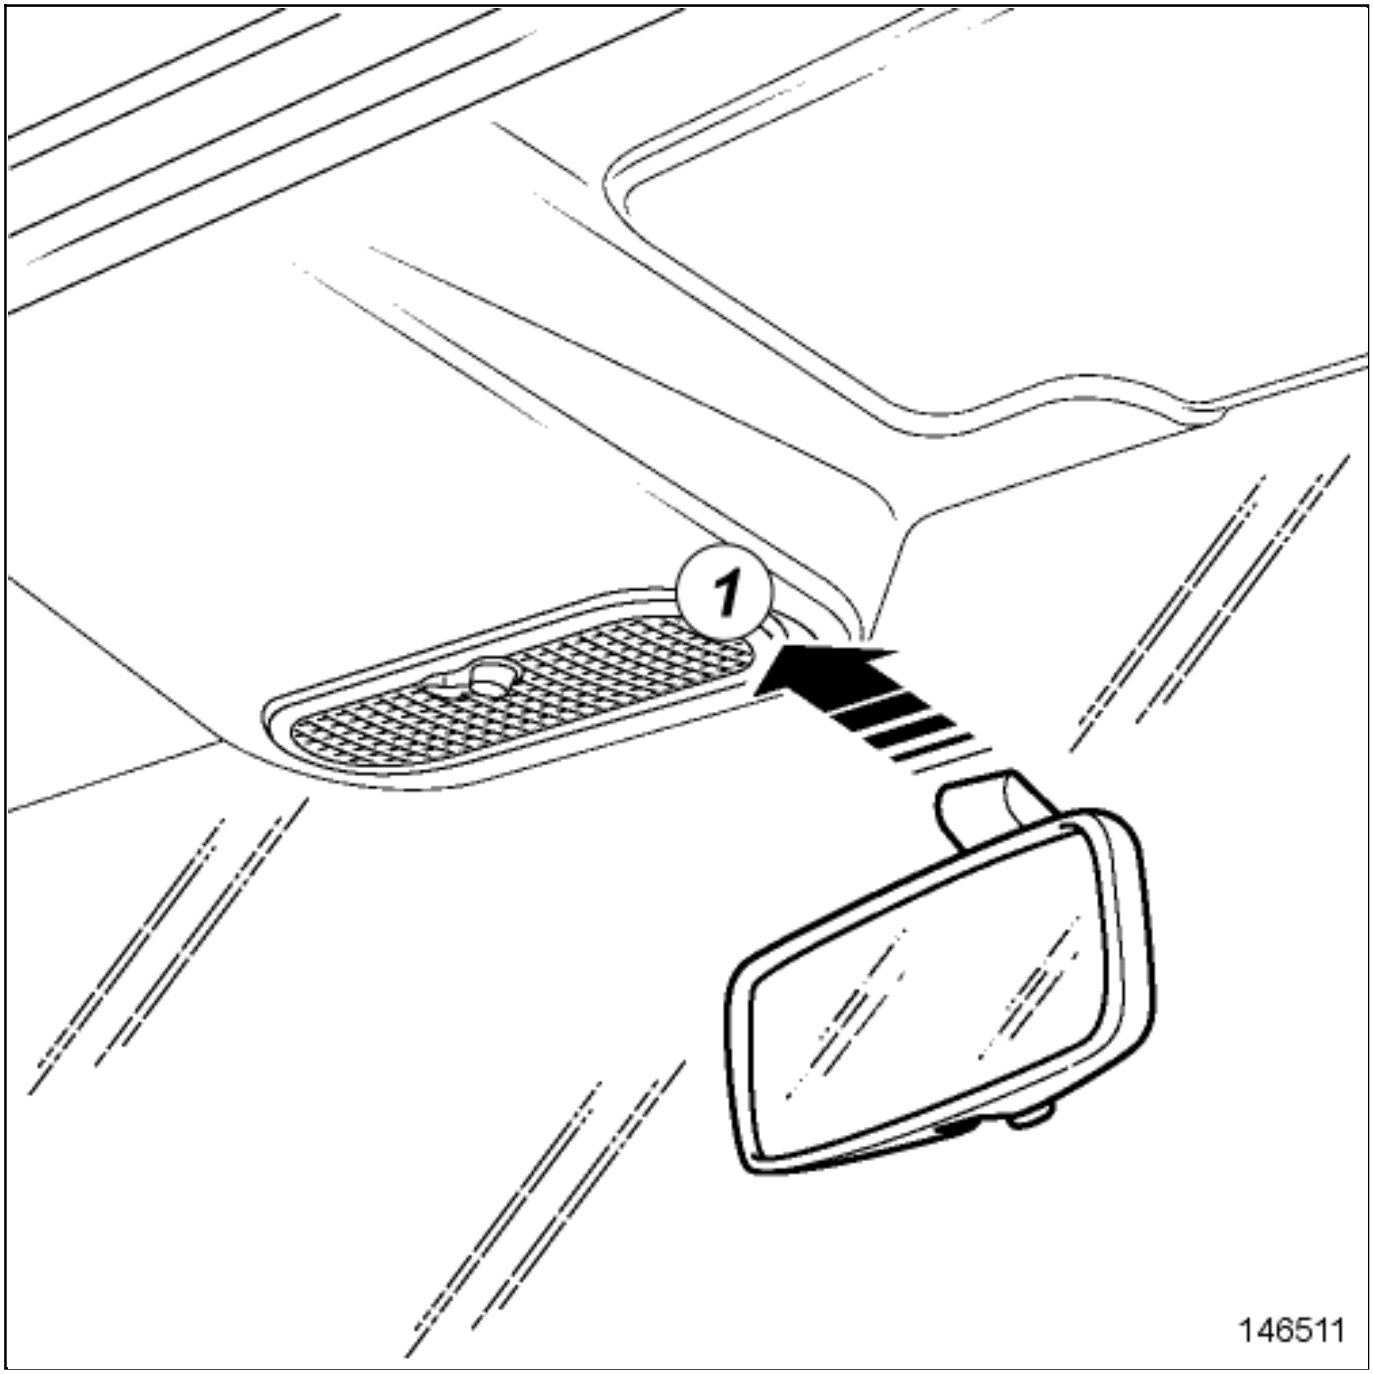
CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

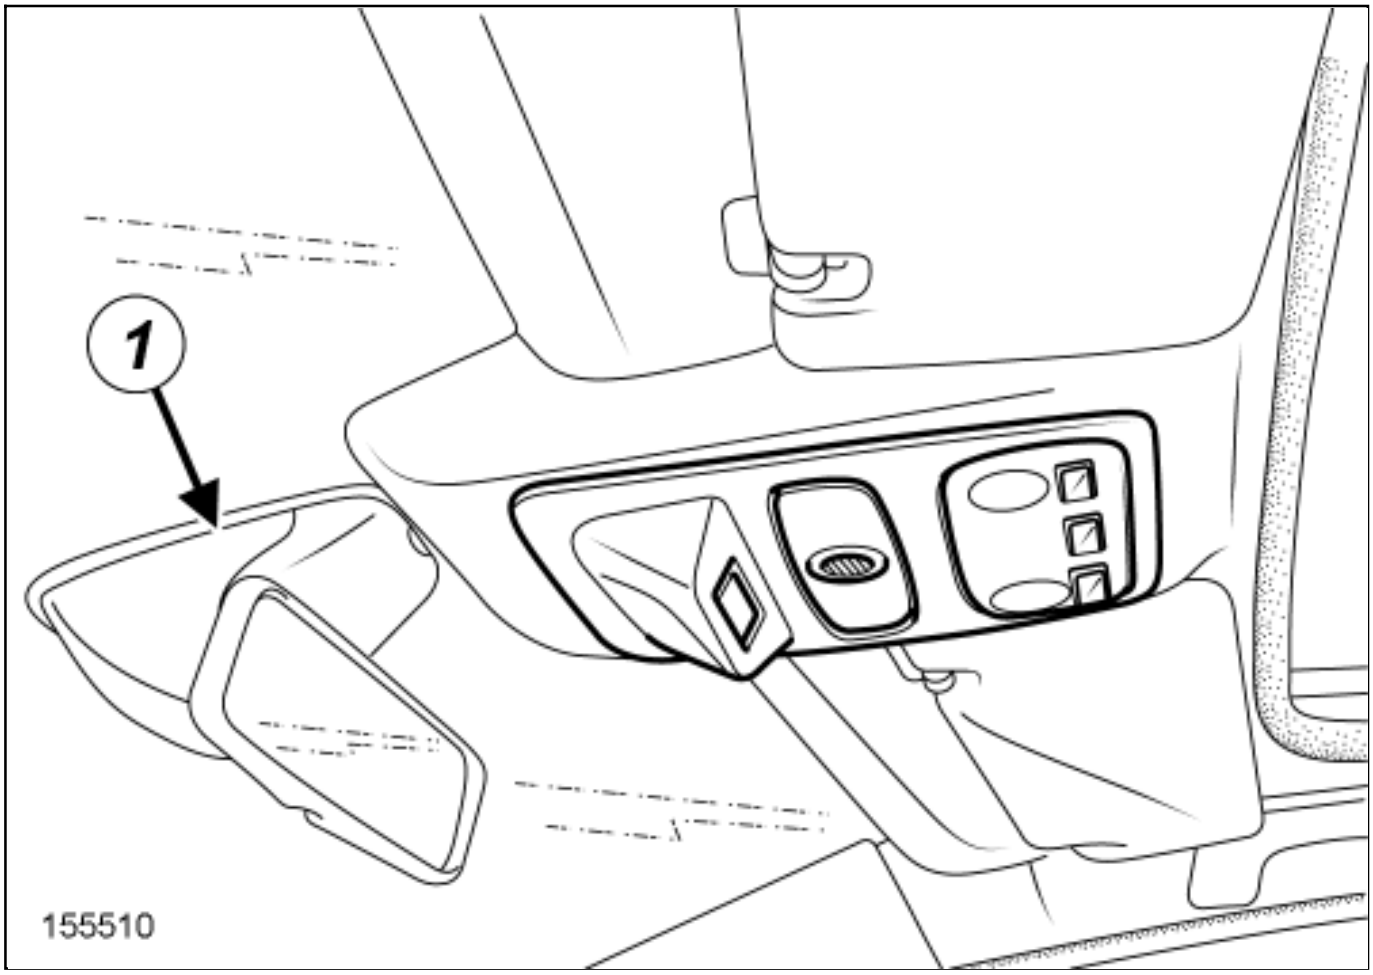
WINDSCREEN: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Universal protector	Car. 1847



parts always to be replaced:



- Windscreen adjusting shim
- rain and light sensor base

REMOVAL

1. REMOVAL PREPARATION OPERATION

Open the bonnet.

1
146511

Remove:

- the interior rear-view mirror(1) ,
- the windscreen pillar trimsInterior body side trim assembly: Exploded view ,
- the courtesy lightInterior lighting: List and location of components .

Remove:

- the windscreen wiper armsWiping and washing: List and location of components ,
- the scuttle panel grilleScuttle panel grille: Removal - Refitting ,

the scoop under the scuttle panel grille.

Protect the windscreen surround and the headlining with masking tape.

Fit the toolUniversal protector (Car. 1847) on the dashboard.

2. REMOVAL OPERATION

CAUTION

When cutting the cement bead, take care not to cut the wiring harness.

Note:

When cutting the cement bead, protect the engine compartment with a protective bodywork cover.

Cut the cement beadWindow bonding tool: Use and Window detachment: Description .

Remove the windscreen (this operation requires two people).

Note:

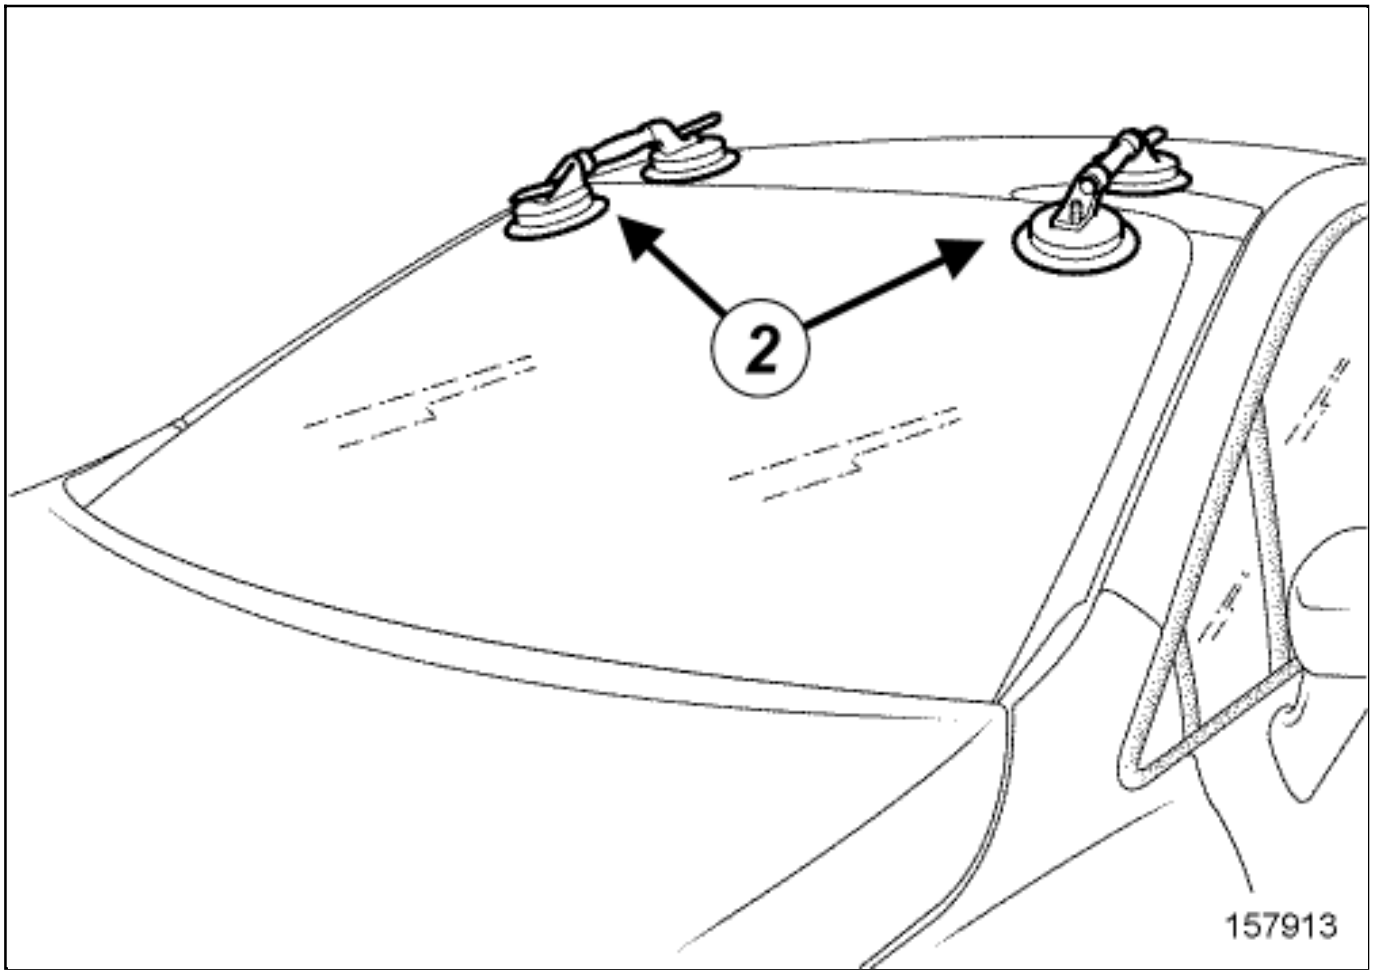
When removing the windscreen, lift the lower part first, then the upper.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Windscreen adjusting shim .

- Fit the new shims and retaining thrust bearings.
- For preparation and bonding Products for preparing and bonding windows: Description .



> Note:
>
> To bond the windscreen using a Bi-component, this allows to return the vehicle 2 hours after bonding.

2. REFITTING OPERATION

- Close the bonnet.
- Bond the windscreen Window bonding: Description .

> Note:
>
> This operation requires two operators.

- Position the windscreen in the upper part and lower part.
- Check the position of the shims and retaining thrust bearings at the bottom and side of the windscreen.

Respect the following clearances and flush fitting[Vehicle panel gaps: Adjustment value] :

- "windscreen - roof panel" ,
- "windscreen - windscreen pillar" .

Position on each upper part of the windscreen a suction cup(2) to hold the windscreen in position while the cement is drying.

Manually pinch the windscreen aperture lower cross member towards the windscreen on the whole width.

Proceed in the reverse order to removal.

Carry out a sealing test (see Technical Note 0653A).

XSL version : 3.02 du 22/07/11

Position the windscreen in the upper part and lower part.

Check the position of the shims and retaining thrust bearings at the bottom and side of the windscreen.

Respect the following clearances and flush fitting Vehicle panel gaps: Adjustment value :

- "windscreen - roof panel" ,
- "windscreen - windscreen pillar" .

Position on each upper part of the windscreen a suction cup(2) to hold the windscreen in position while the cement is drying.

Manually pinch the windscreen aperture lower cross member towards the windscreen on the whole width.

Refit **Wiping and washing: List and location of components** :

- a new adhesive base for the rain and light sensor,
- the rain and light sensor.

Proceed in the reverse order to removal.

Carry out a sealing test (see Technical Note 0653A).

WINDSCREEN WIPER MOTOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Switch on the ignition.

CAUTION

To ensure that the wiper arms can travel smoothly, the wiper motor must be initialised.

- Turn the wiper stalk from (0) to (1), and then from (1) to (0).
- Switch off the ignition.
- Mark the position of the windscreen wiper arms on the windscreen.
- Disconnect the battery Battery: Removal - Refitting .

Note:

Mark the position of the motor shaft linkage in relation to the mechanism before removing it.

Remove (see 85A, Wiping - Washing, Wiping and washing: List and location of components) :

- the windscreen wiper arms,
- the scuttle panel grille,
- the scoop under the scuttle panel grille.

2. REMOVAL OPERATION

Remove (see 85A, Wiping - Washing, Wiping and washing: List and location of components) :

- the motor shaft linkage nut,
- the bolts from the windscreen wiper motor,
- the windscreen wiper motor.

REFITTING

1. FINAL OPERATION

CAUTION

To ensure that the wiper arms can travel smoothly, the wiper motor must be initialised.

Proceed in the reverse order to removal.
