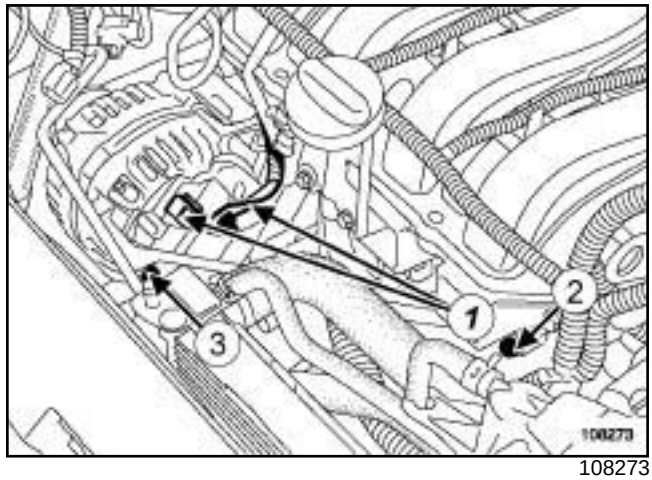
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .



109468

❏ Remove the air inlet duct.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) ,
- the front left-hand wheel arch liner partially (see **Front wheel arch liner: Removal - Refitting**) ,
- the bumper (see **Front bumper: Removal - Refitting**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

108273

❏ Disconnect the electrical connections from the alternator (**1**) .

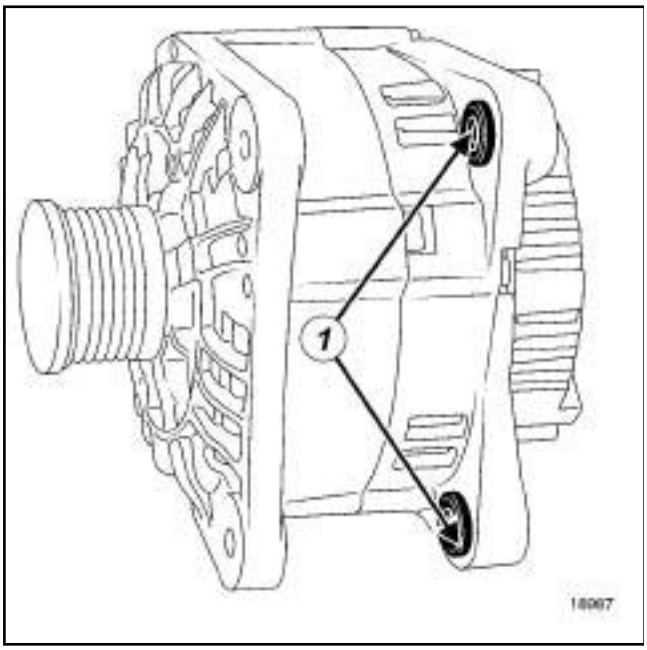
❏ Undo the strut mounting bolt on the cylinder block (**2**) .

❏ Remove the strut mounting bolt on the alternator (**3**) .

❏ Separate the mounting strut from the alternator.

❏ Remove the front right-hand air deflector.

II - REMOVAL OF PART CONCERNED



❏ Remove the upper mounting bolt from the alternator.

❏ Undo the lower alternator mounting bolt.

❏ Remove the alternator with its lower mounting bolt through the front of the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

18987

❑ Push in the rings (**1**) to make fitting easier.

II - REFITTING PART CONCERNED

❑ Refit the alternator.

❑ Torque tighten the **alternator mounting bolts (21 N.m)**.

III - FINAL OPERATION.

❑ Reconnect the alternator electrical connections.

❑ Refit:

- Refit the front right-hand air deflector,
- the new accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the bumper (see **Front bumper: Removal - Refitting**) ,
- the front left-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) .

❑ Reconnect the battery (see **Battery: Removal - Refitting**) .

❑ Refit the air inlet duct.

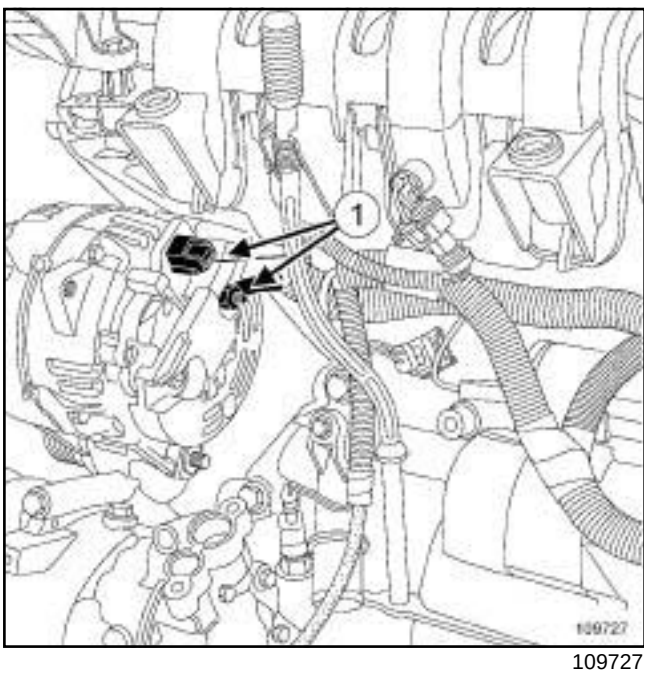
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

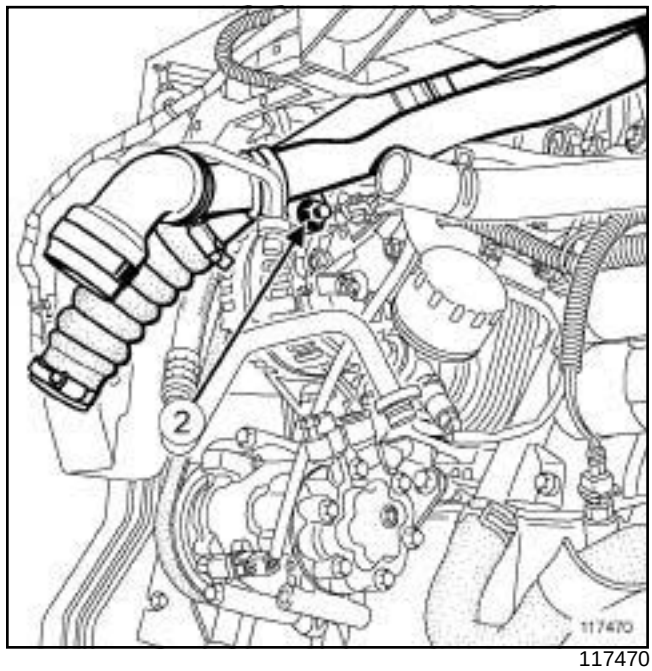
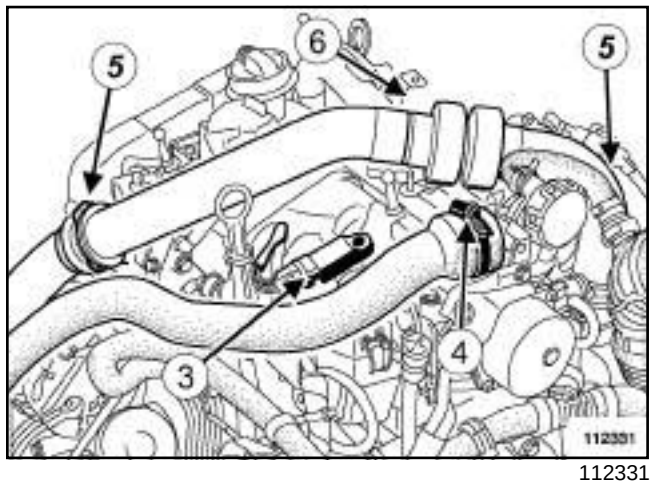
❏ Remove the front engine cover.



113700

❏ Remove the air filter inlet air pipe (**1**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

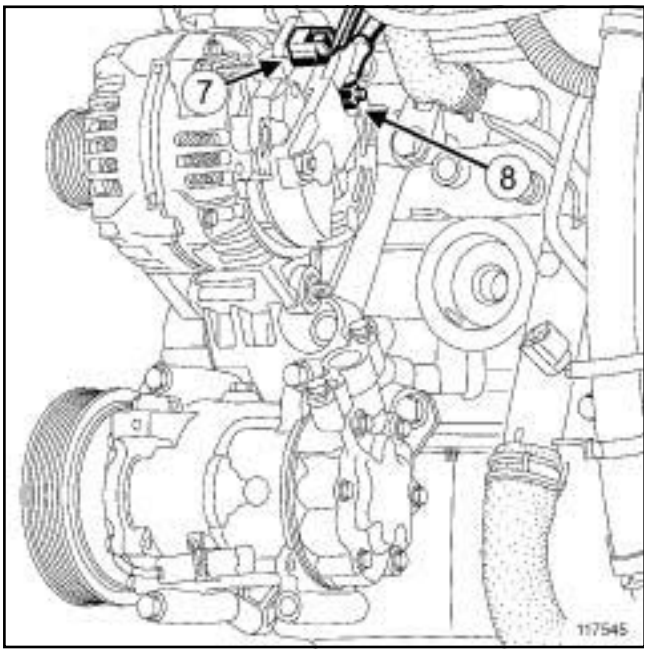
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the headlights (see **Halogen headlight: Removal - Refitting**) (MR 392, 80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (MR 392, 80C, Xenon bulbs),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

117470

❏ Remove the bolt (**2**) from the intercooler inlet and outlet pipes.

112331

❏ Disconnect the connector (**3**) from the inlet air pressure sensor.



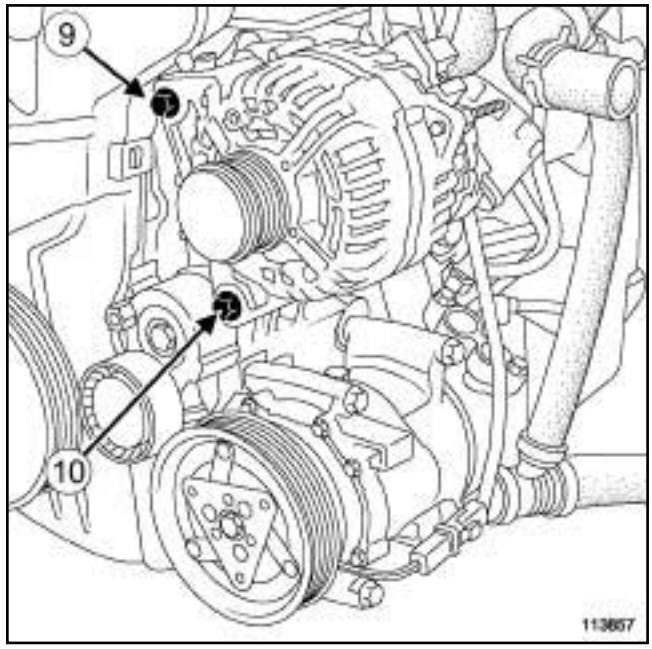
❏ Undo the clip (**4**) from the intercooler outlet air pipe.

❏ Remove:

- the intercooler outlet air pipe,
- the clips (**5**) from the intercooler inlet air pipe,

- the nut (**6**) from the intercooler inlet air pipe,
- the intercooler inlet air pipe.

II - OPERATION FOR REMOVAL OF PART CONCERNED



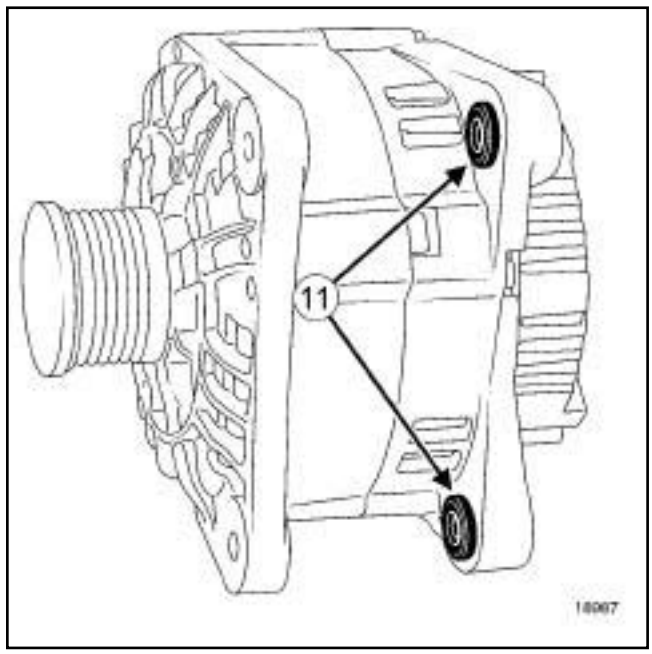
117545

❏ Disconnect the alternator connector (**7**) .

❏ Remove the nut (**8**) from the alternator positive terminal.

❏ Disconnect the alternator positive terminal wire.

113857

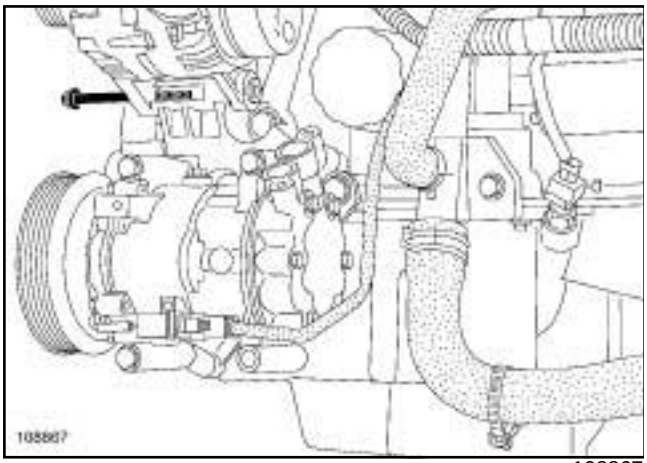


❏ Remove the alternator upper bolt (**9**) .

❏ Loosen the alternator lower bolt (**10**) .

❏ Remove the alternator with its lower bolt.

REFITTING



I - REFITTING PREPARATION OPERATION

18987

❏ Refit the rings (**11**) using pliers or a vice.

II - REFITTING OPERATION FOR PART CONCERNED

108867

❏ Refit the alternator with its lower bolt.

❏ Screw in the alternator bolts, without tightening them.

❏ Torque tighten the **alternator bolts (21 Nm)**.

❏ Connect the wire to the alternator positive terminal.

❏ Refit the alternator positive terminal nut.

❏ Connect the alternator connector.

III - FINAL OPERATION.

❏ Refit:

- the intercooler air inlet pipe,
- the nut to the intercooler inlet air pipe,
- the clips to the intercooler inlet air pipe,
- the intercooler outlet air pipe.

❏ Torque tighten the **intercooler outlet air pipe clip (5.5 Nm)**.

❏ Connect the inlet air pressure sensor connector.

❏ Remove:

- the intercooler inlet and outlet pipe bolts,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the headlights (see **Halogen headlight: Removal - Refitting**) (MR 392, 80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (MR 392, 80C, Xenon bulbs),
- the bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit:

- the air filter inlet air pipe,
- the engine cover.

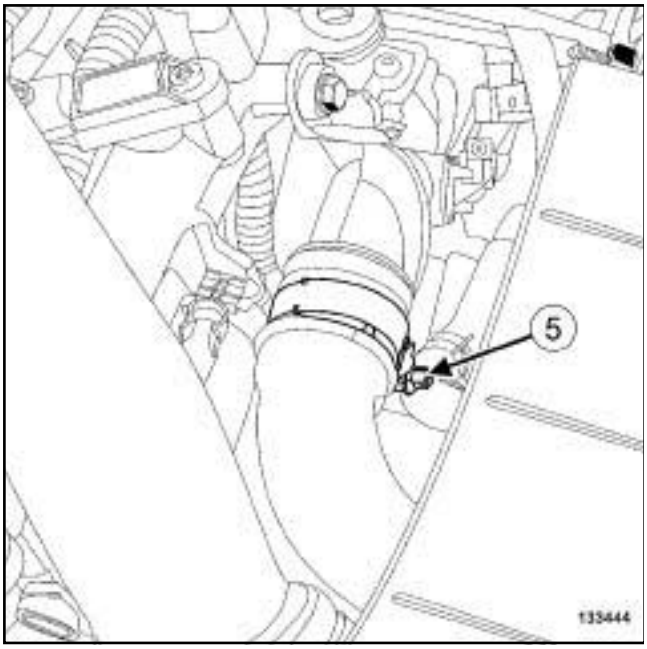
121813

❏ Remove the bolt (**1**) from the turbocharger air outlet pipe on the inlet distributor.

133441



❏ Separate the clip (**2**) of the turbocharger air outlet pipe.

Note:

If the clip (**3**) is removed from the flexible heat shield (**4**) , the latter must be replaced.

❏ Move aside the turbocharger air outlet pipe.

D4F, and 784

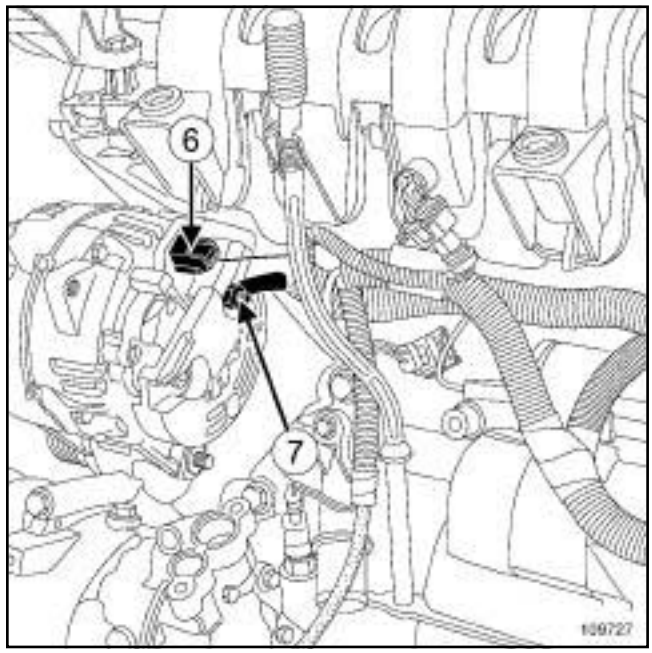
133444

❏ Loosen the clip (**5**) on the intercooler intermediate pipe.

❏ Remove:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure).

AIR CONDITIONING



❏ Disconnect the air conditioning compressor clutch connector.

❏ Detach the air conditioning pipe from the body between the compressor and expansion valve.

❏ Remove the air conditioning compressor bolts.

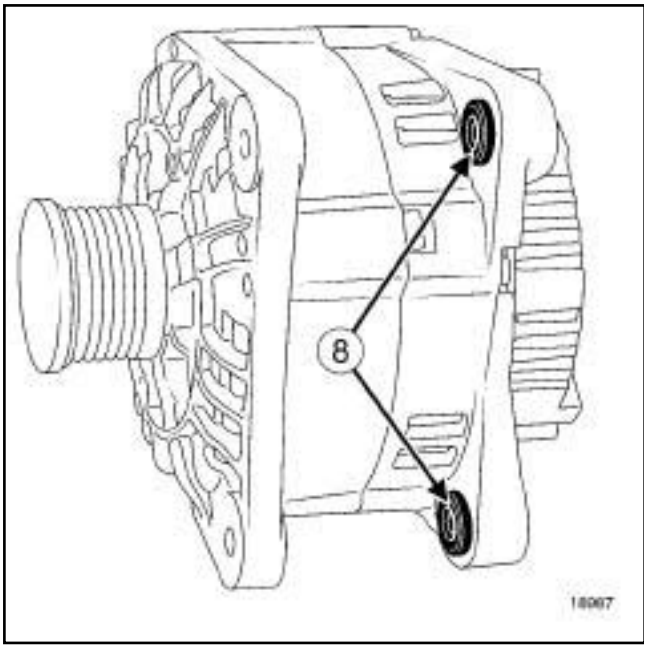
❏ Position the air conditioning compressor on the radiator mounting cross member.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109727

❏ Disconnect the alternator wiring connector (**6**) .

❏ Remove:



- the alternator wiring nut (**7**) ,
- the alternator bolts,
- the alternator.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Clean the alternator pulley V-grooves to remove any deposits.

D4F, and 784

18987

❏ Press in the rings (**8**) using pliers or a vice to make the fitting operation easier.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the alternator,
- the alternator bolts.

❏ Torque tighten the **alternator bolts (25 N.m)**.

❏ Refit the alternator wiring nut.

❏ Connect the alternator wiring connector.

III - FINAL OPERATION

AIR CONDITIONING

❏ Refit:

- the air conditioning compressor ,
- the air conditioning compressor bolts.

❏ Torque tighten the **air conditioning compressor bolts (25 N.m)**.

❏ Attach the air conditioning pipe to the body between the compressor and expansion valve.

❏ Connect the air conditioning compressor clutch connector.

❏ Refit:

- the turbocharger air outlet pipe,
- the clip of the turbocharger air outlet pipe,
- the turbocharger air outlet pipe bolt on the inlet manifold,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,

REMOVAL

I - REMOVAL PREPARATION OPERATION

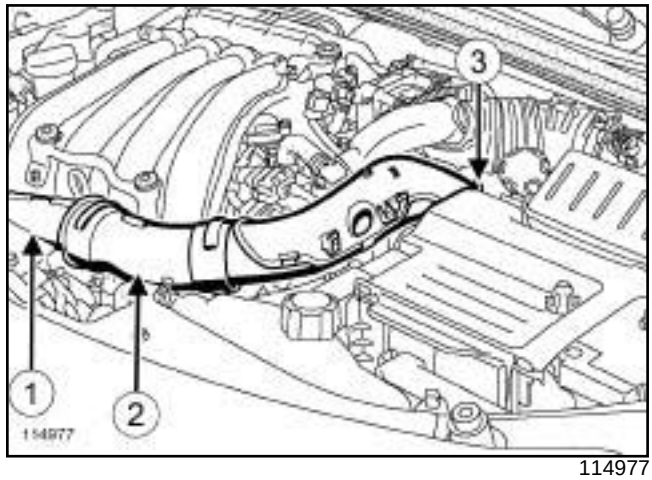
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



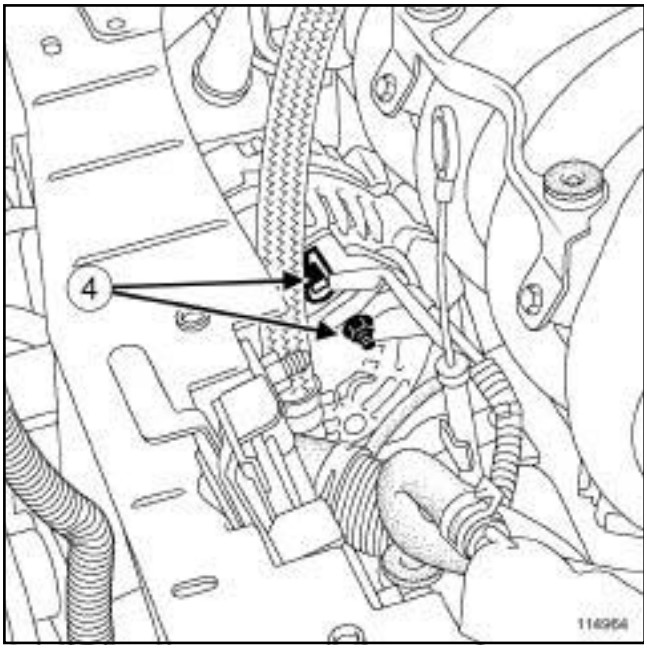
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

114978

❑ Lift the air resonator (**A**) to remove it from the battery cover.

❑ Pull the air resonator towards the front of the vehicle (**B**) to remove it.

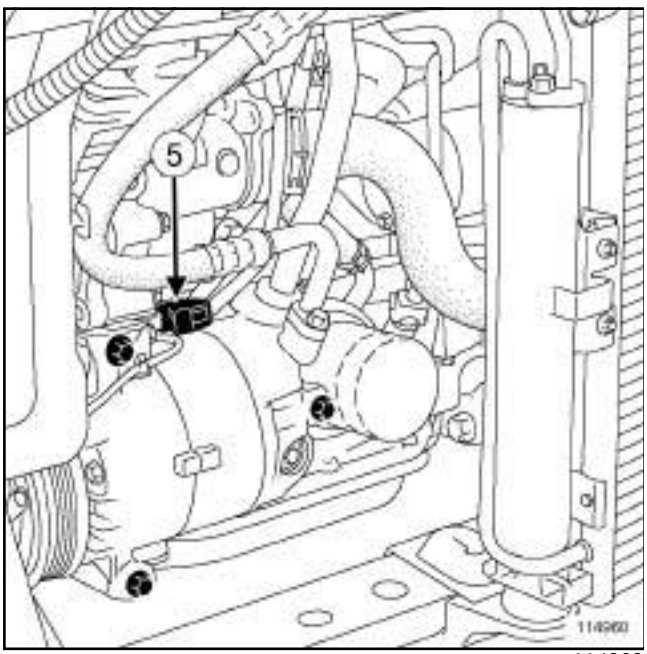
114977



❑ Detach the air intake sleeve:

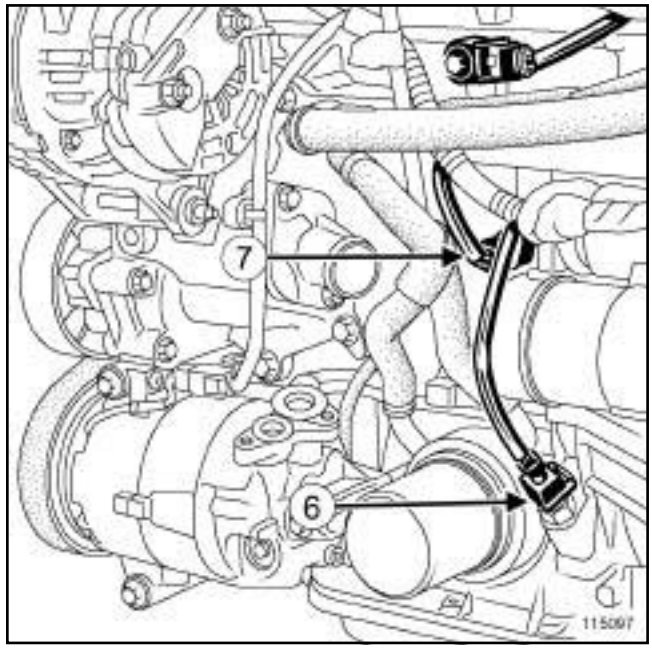
- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❑ Remove the air intake sleeve.



❑ Remove:

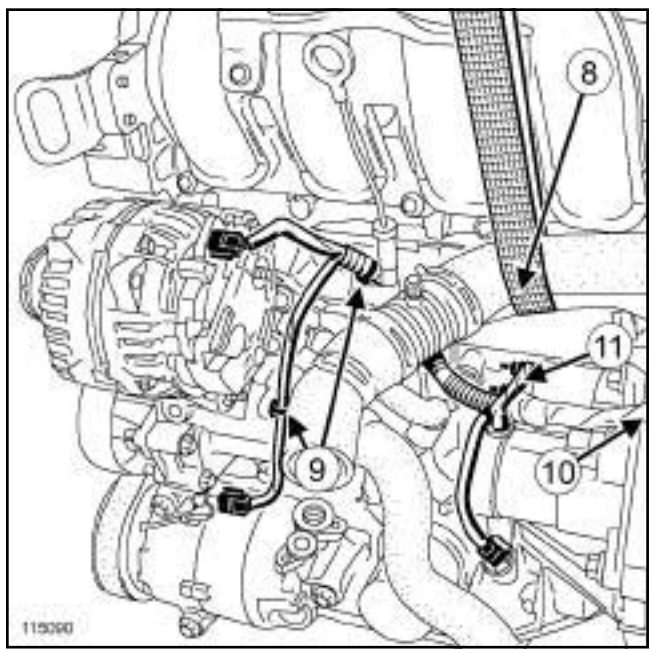
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .



114964

❏ Disconnect the alternator connectors (**4**) .

114960



❏ Disconnect the connector (**5**) from the air conditioning compressor.

115097

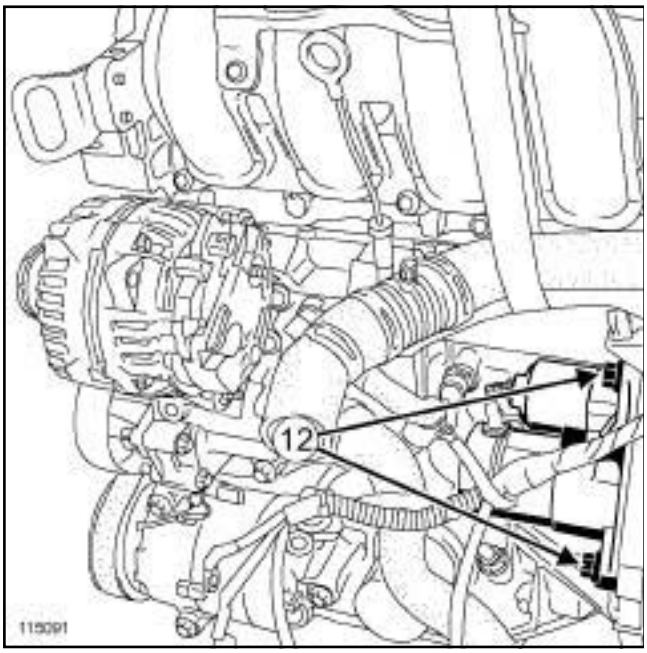
❏ Disconnect:

- the oil level sensor connector (**6**) ,
- the oil pressure sensor (**7**) .

115090

❏ Strap the hoses (**8**) to the front end panel in order to access the starter.

❏ Unclip the wiring harness at (**9**) .



❏ Cut the wiring harness retaining clip on the neck at (**10**) .

❏ Disconnect the starter connector (**11**) .

❏ Move the wiring harness to one side.

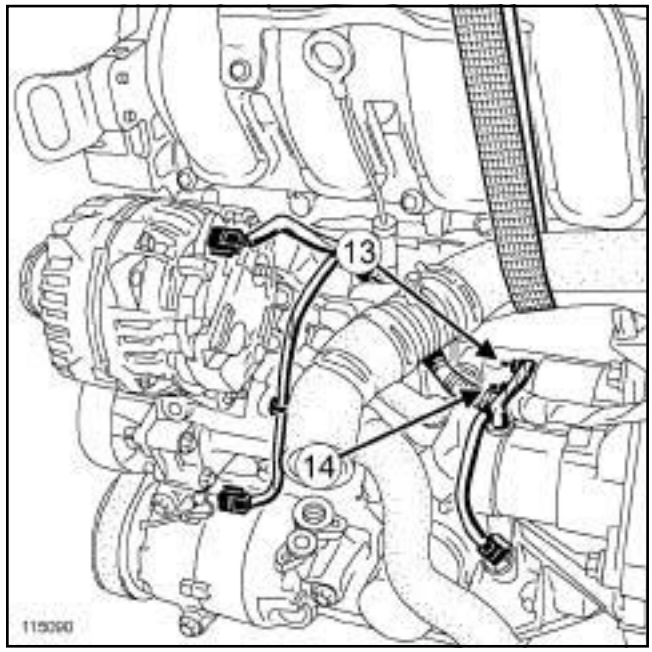
M4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

115091

❑ Remove:

- the mounting bolts (**12**) from the starter,
- the starter through the space left by the air resonator in the front end panel.



REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the starter.

❑ Torque tighten the **starter mounting bolts (62 Nm)**.

II - FINAL OPERATION.

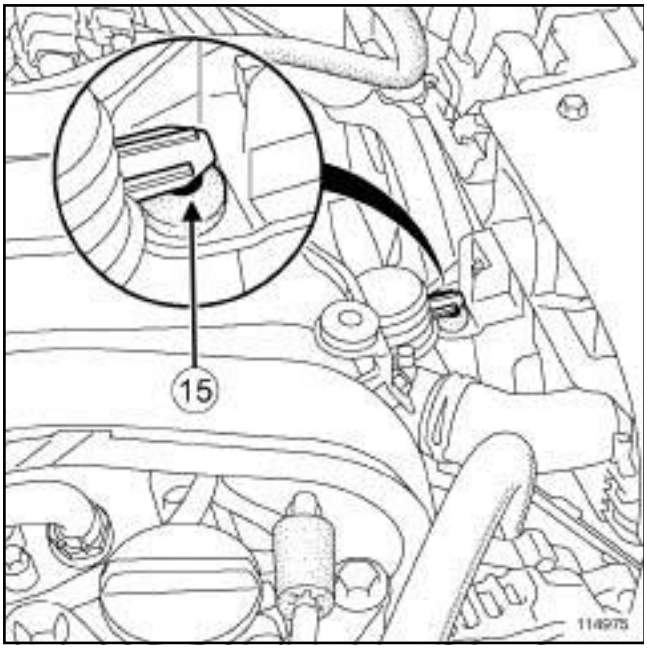
115090

❑ Connect:

- the starter motor connectors,
- the oil pressure sensor connector,
- the oil level sensor connector,
- the alternator connectors.
- the air conditioning compressor connector.

❑ Torque tighten:

- the **starter excitation connector bolt (5 Nm)** at (**13**) ,
- the **starter power supply connector bolt (9 Nm)** at (**14**) .

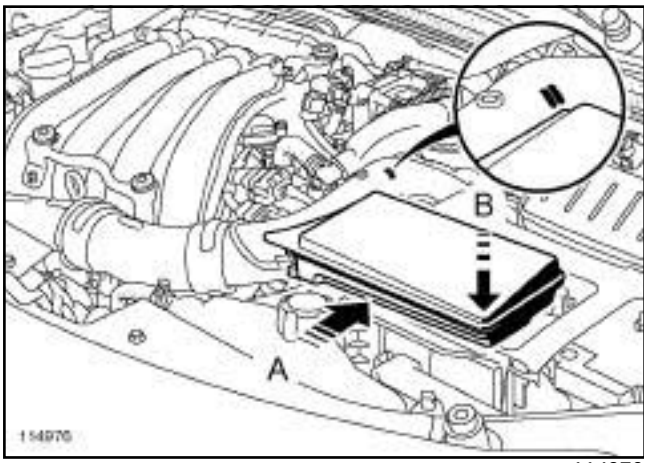


❑ Clip on the wiring harness.

❑ Refit a wiring harness retaining clip to the neck.

❑ Remove the retaining belt from the hoses.

❑ Refit:



- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

114975

❏ Before refitting the air intake sleeve, check that the air resonator's upper mounting in the front end panel is correctly clipped at (**15**) .

❏ Refit the air intake sleeve.

114976

❏ Push the air resonator towards the rear of the vehicle (**A**) until the corner of the air resonator is between the two lines marked on the air intake sleeve.

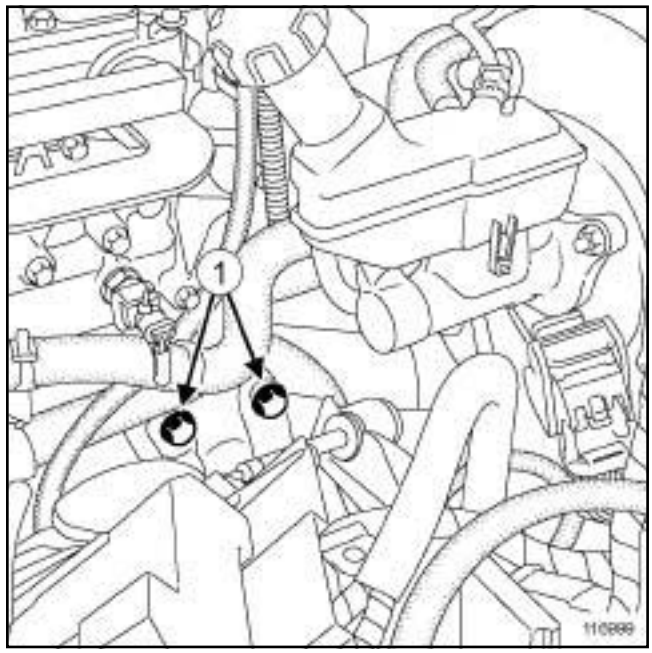
❏ Push the air resonator (**B**) to fit it onto the battery cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

F4R

Tightening torques ▽	
starter lower bolt	**38 N.m**
starter upper bolts	**38 N.m**
bolts of the lower cross member	**62 N.m**

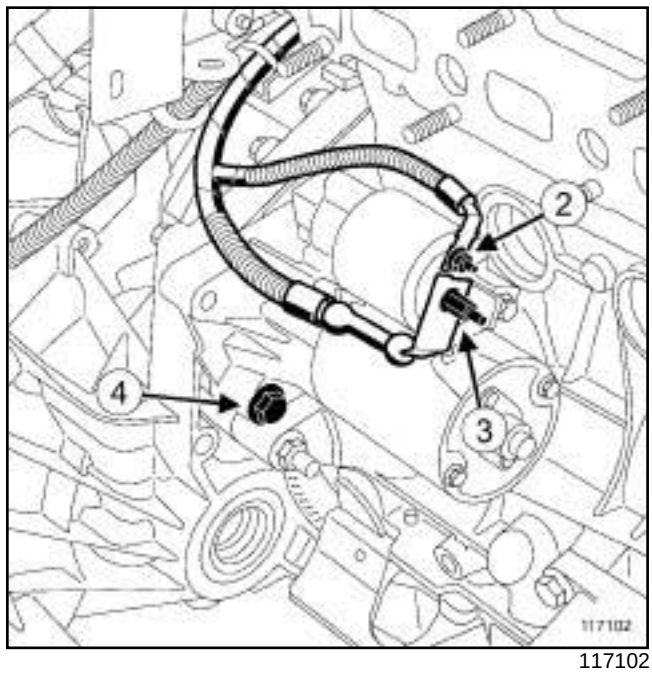
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

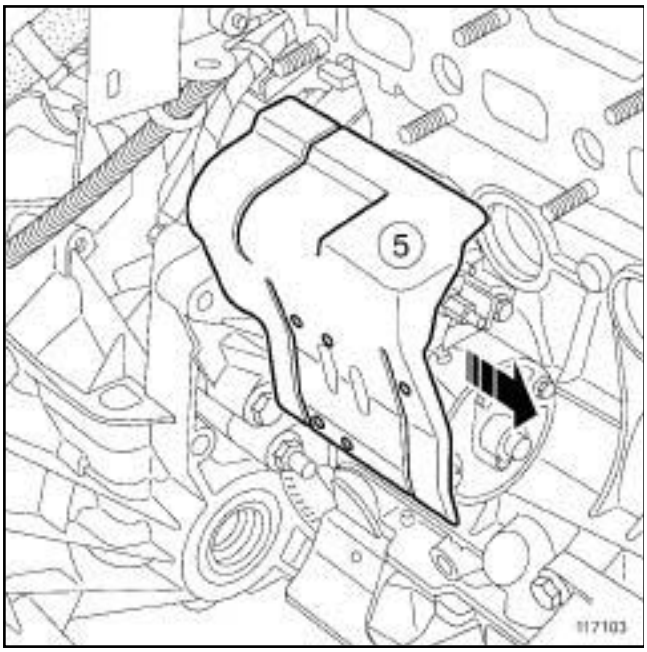


- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray,
- the lower cross member.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116999

❏ Remove the upper bolts (**1**) from the starter.

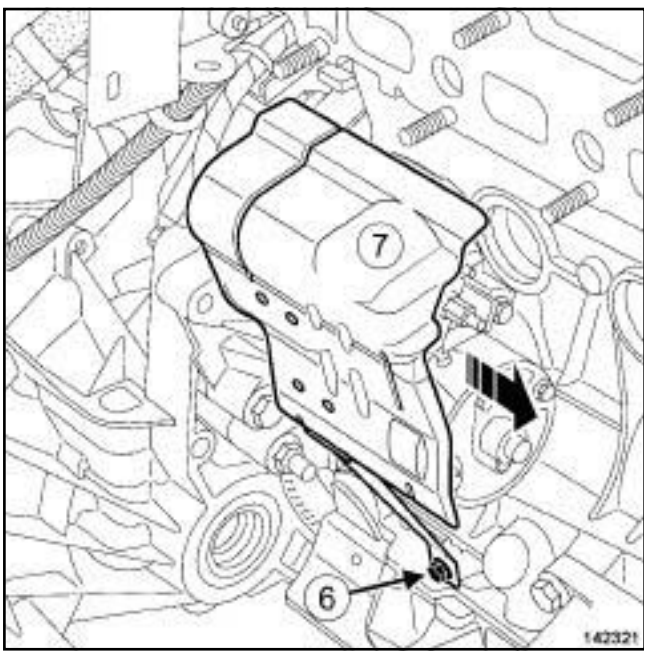


117102

❏ Remove:

- the excitation wiring terminal (**2**) on the starter,
- the power wiring terminal (**3**) on the starter.

F4R



F4R, and 830

117103

❑ Remove the starter heat shield (**5**) by sliding it along the starter on the timing end.

F4R, and 832

142321

❑ Remove:

- the starter heat shield bolt (**6**) ,
- the starter heat shield (**7**) by sliding it along the starter on the timing end.

❑ Remove the starter lower bolt ***(4)*** .

❑ Remove the starter motor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check the presence and condition of the centring device on the starter.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Fit the starter.

❑ Refit the starter lower bolt.

❑ Torque tighten the **starter lower bolt (38 N.m)**.

❑ Refit the starter heat shield by sliding it along the starter on the timing end.

F4R, and 832

❑ Refit the starter heat shield bolt.

❑ Refit:

- the excitation wiring terminal on the starter,
- the power wiring terminal on the starter.

❑ Refit the upper bolts on the starter.

❑ Torque tighten the **starter upper bolts (38 N.m)**.

III - FINAL OPERATION

❑ Refit the lower cross member.

❑ Torque tighten the **bolts of the lower cross member (62 N.m)**.

❑ Refit:

- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),

F4R

- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K, and 772

Tightening torques ▽	
starter lower mounting bolt	**44 Nm**
starter upper bolt	**44 Nm**
clip for the air inlet duct between the intercooler and the air inlet box on the air inlet box	**5.5 Nm**

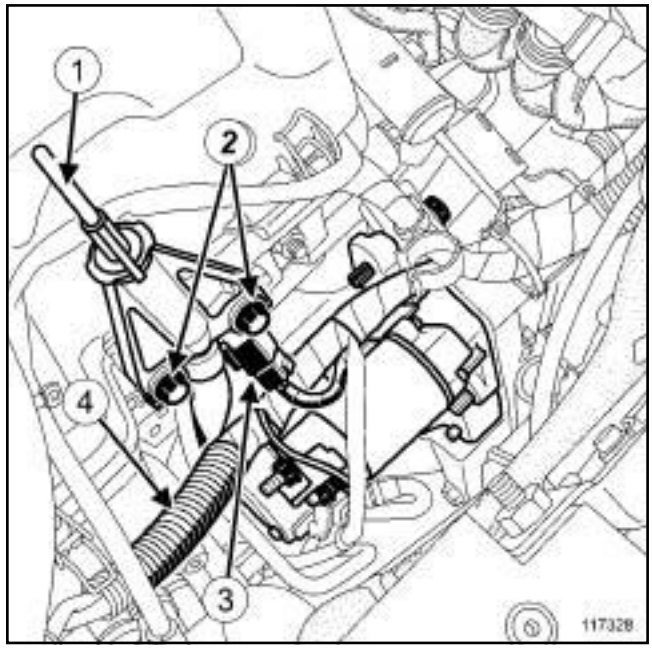
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the front engine cover.



❏ Remove:

- the air duct at the air filter box inlet,
- the nut from the air inlet pipes on the alternator.

❏ Loosen the air inlet duct clip between the intercooler and the air box unit on the air inlet box.

❏ Move the air inlet duct between the intercooler and the air inlet box to one side.

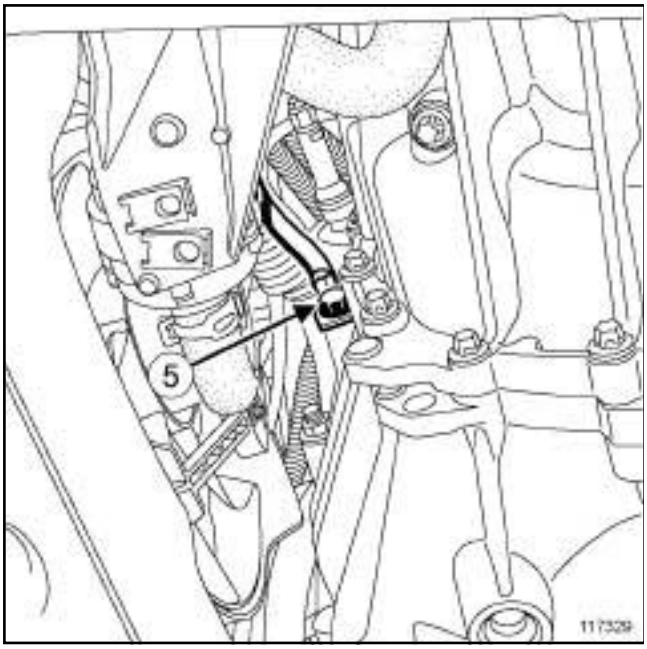
❏ Detach the relay box from the battery tray.

117328

❏ Remove:

- the dipstick (**1**) ,
- the dipstick duct bolts (**2**) .

❏ Disconnect the injector rail pressure sensor connector (**3**) .

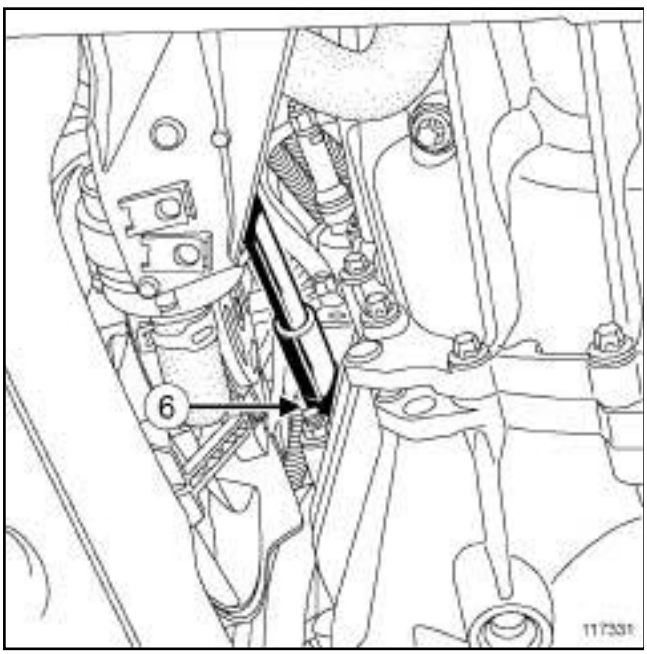


❏ Detach the emission control cover wiring harness (**4**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove:

- the starter excitation lead,
- the starter power lead,
- the starter upper bolt,
- the front left-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front left-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 57A, Interior equipment),
- the engine undertray.



K9K, and 772

117329

❏ Remove the bolt (**5**) from the earth wiring on the gearbox.

❏ Unclip the diesel runoff pipe from the sump.

117331

❏ Remove:

- the starter lower bolt (**6**) ,
- the starter from underneath, placing the starter solenoid on timing end.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the starter,
- the starter lower mounting bolt.

❏ Torque tighten the **starter lower mounting bolt (44 Nm)**.

❏ Refit the earth wiring bolt on the gearbox.

❏ Clip the diesel runoff pipe onto the sump.

❏ Refit:

- the engine undertray,
- the front left-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 57A, Interior equipment),
- the front left-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the starter upper mounting bolt.

❏ Torque tighten the **starter upper bolt (44 Nm)**.

❏ Refit:

- the starter power lead,
- the starter excitation lead.

II - FINAL OPERATION.

❏ Attach the emission control cover wiring harness.

❏ Connect the injector rail pressure sensor connector.

❏ Refit:

- the dipstick duct bolts,
- the dipstick.

❏ Attach the relay box onto the battery tray.

❏ Position the air inlet duct between the intercooler and the air inlet box.

❏ Torque tighten the **clip for the air inlet duct between the intercooler and the air inlet box on the air inlet box (5.5 Nm)**.

❏ Refit:

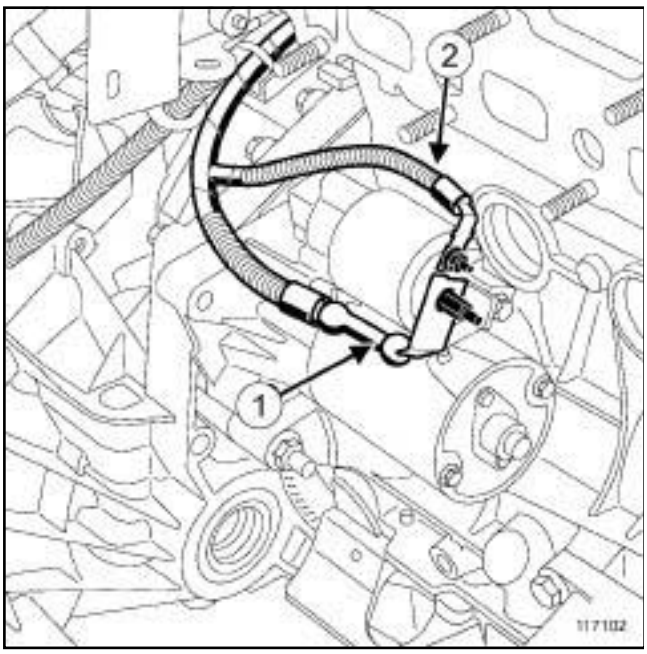
- the air inlet pipe nut on the alternator,
- the air duct at the air filter unit inlet.

❏ Refit the engine cover.

❏ Connect the battery (see **80A, Battery, Battery: Removal - Refitting**).

K9K, and 750 or 752

Tightening torques ▽	
starter bolts	**44 Nm**
solenoid feed wire nut	**5 Nm**
starter feed wire nut	**8 Nm**



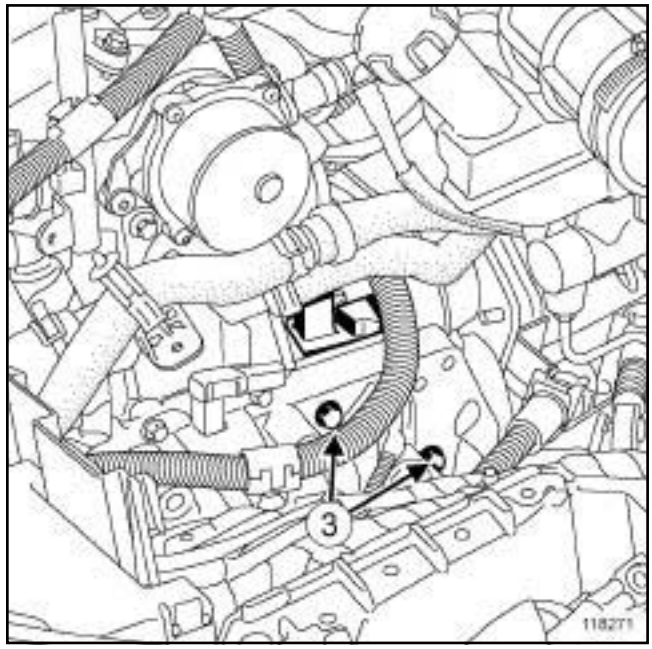
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove:

- the air filter box air inlet pipe,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED



117102

❏ Remove:

- the nut (**1**) from the starter feed wire,
- the nut (**2**) from the solenoid feed wire.

❏ Move the starter wiring harness to one side.

118271

❏ Remove:

- the starter bolts (**3**) ,
- the starter from above.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check that the centring dowel is in place

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the starter,
- the starter bolts.

❏ Torque tighten the **starter bolts (44 Nm)**.

❏ Fit the starter wiring harness.

❏ Refit:

- the solenoid feed wire nut,
- the starter feed wire nut.

❏ Torque tighten:

- the **solenoid feed wire nut (5 Nm)**,
- the **starter feed wire nut (8 Nm)**.

K9K, and 750 or 752

III - FINAL OPERATION.

❑ Refit:

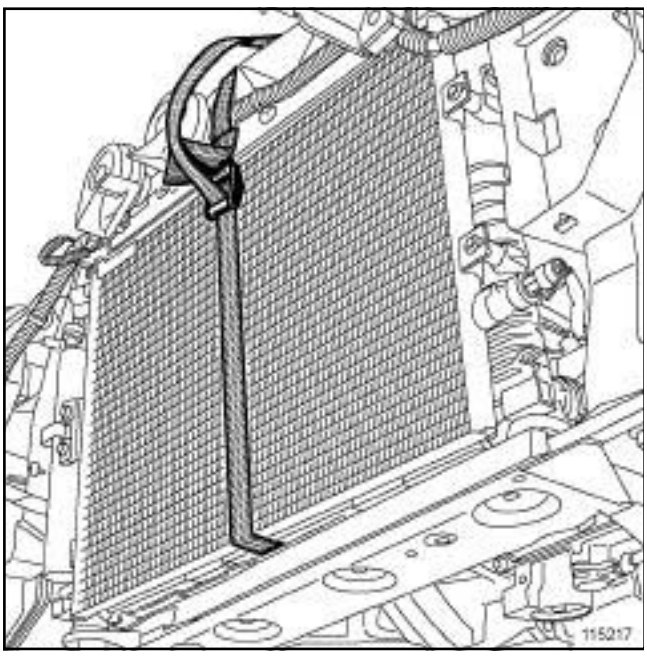
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit air inlet pipe.

D4F, and 784

Equipment required
safety strap(s)

Tightening torques ▽	
starter bolts	**44 Nm**

REMOVAL

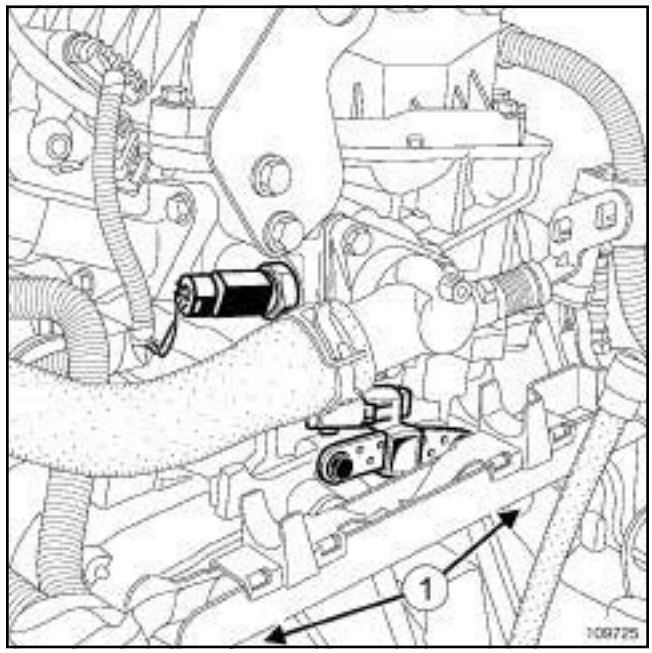


I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

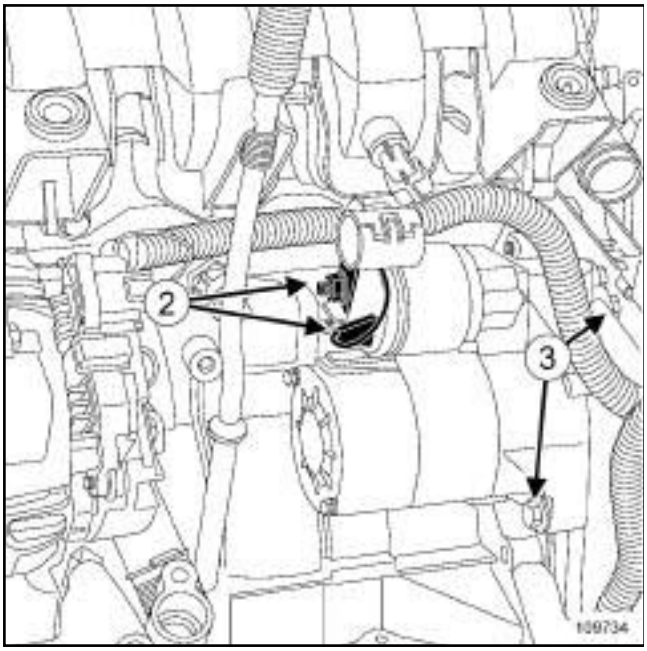


- the air filter box air inlet pipe,
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray,
- the front section of the left and right-hand wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

115217

❏ Attach the cooling assembly using a **safety strap(s)**.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).



109725

❏ Remove the engine wiring harness neck bolts (**1**) .

❏ Move the wiring harness away from the engine.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

109734

❑ Remove the starter wiring harness (**2**) .

> Note:
>
> Depending on fitting, the starter wiring harness is screwed on or clipped on for solenoid excitation.

❑ Remove:

- the starter bolts (**3**) ,
- the starter from underneath the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check that the centring dowel is in place.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the starter,
- the starter bolts.

❑ Torque tighten the **starter bolts (44 Nm)**.

❑ Refit the starter wiring harness.

III - FINAL OPERATION.

❑ Refit:

- the engine's electrical wiring channel bolts,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❑ Separate the cooling assembly.

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front section of the left and right-hand wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray,
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the air filter box air inlet pipe.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Ignition: Specifications

D4F or F4R or K4J or K4M or M4R

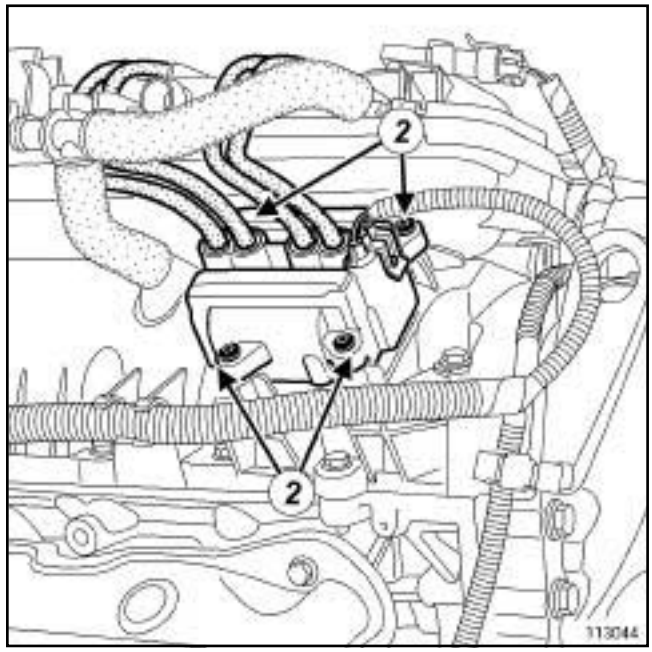
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

108805



❑ Disconnect:

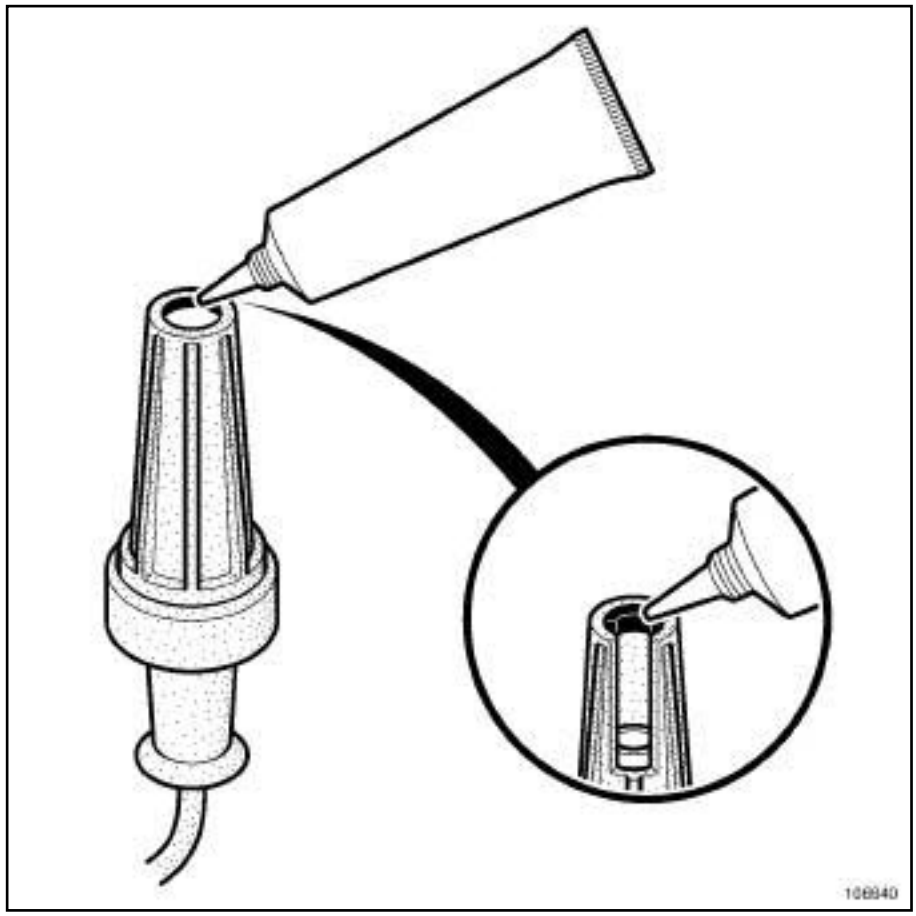
- the four spark plug leads,
- the connector (**1**) from the ignition coil.

WARNING

To disconnect the spark plug leads, never pull on the leads but by the extensions.

II - REMOVAL OF PART CONCERNED

113044



❑ Remove:

- the ignition coil mounting bolts (**2**) ,
- the ignition coil.

D4F, and 740 or 742 or 764

REFITTING

I - REFITTING PREPARATION OPERATION

106640

❑ When refitting spark plug leads, it is essential to apply a bead of **FLUORINATED GREASE (PART NUMBER 82 00 168 855)** with a diameter of **2 mm** around the inner edge of the high-tension caps.

II - REFITTING PART CONCERNED

❑ Refit:

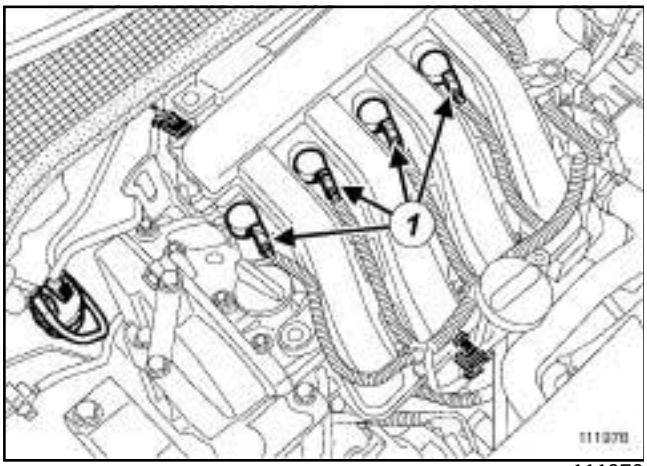
- the ignition coil,
- the ignition coil mounting bolts.

III - FINAL OPERATION.

❑ Connect:

- the four spark plug leads,
- the ignition coil connector.

❑ Refit the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

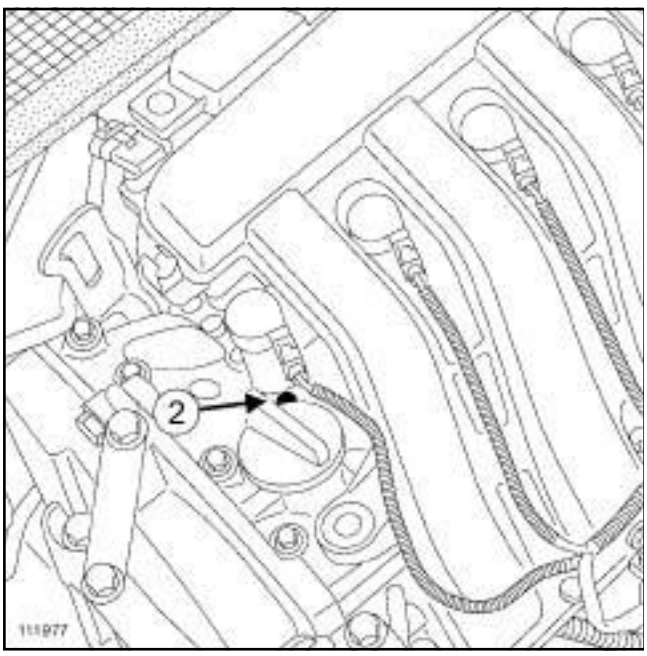


❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M

Tightening torques ▽	
coil bolts	**14 N.m**

REMOVAL



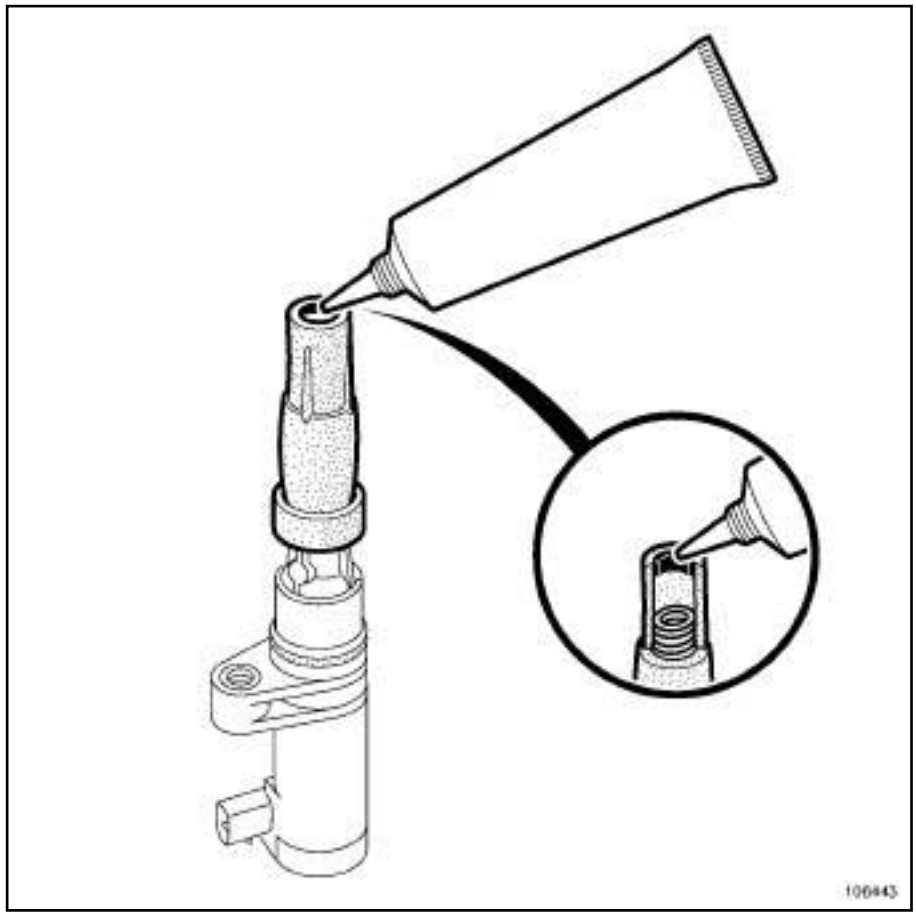
OPERATION FOR REMOVAL OF PART CONCERNED

111976

❏ Disconnect the coil connectors (**1**) .

❏ Be sure to replace any damaged connectors.

111977



❏ Remove:

- the coil bolts (**2**) ,
- the coils.

K4J or K4M

REFITTING

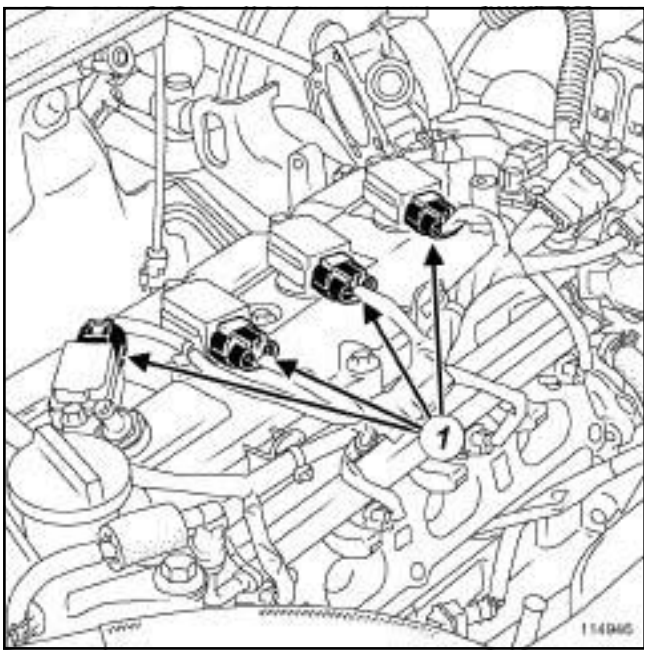
I - REFITTING PREPARATION OPERATION

106443

- ❏ On the ignition coils, apply a bead of **FLUOSTAR 2L** (see **Vehicle: Parts and consumables for the repair**) , **2 mm** in diameter around the inner edge of the high-tension cap.
- ❏ If necessary, replace the coil O-rings.

II - REFITTING PART CONCERNED

- ❏ Part always to be replaced: coil bolts.
- ❏ Refit:
  - the coils,
  - the coil bolts.
- ❏ Torque tighten the **coil bolts (14 N.m)**.
- ❏ Connect the coil connectors.

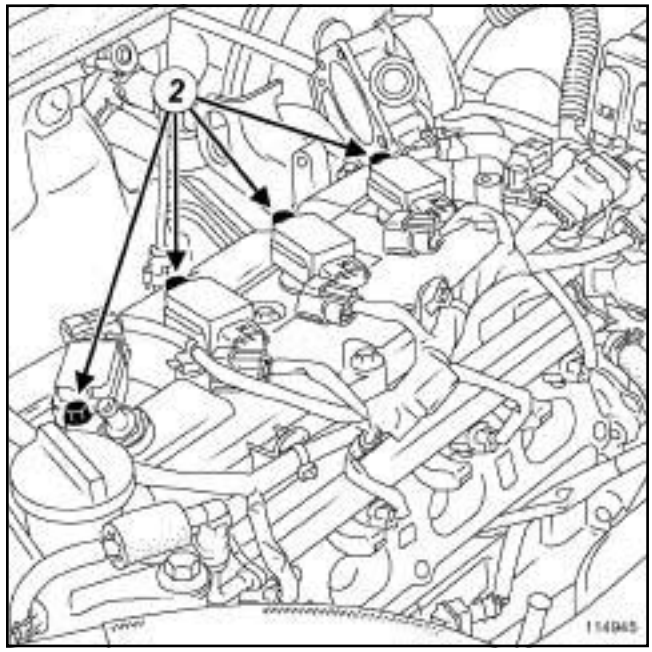


Tightening torques ▽	
ignition coil mounting bolts	7 Nm

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .



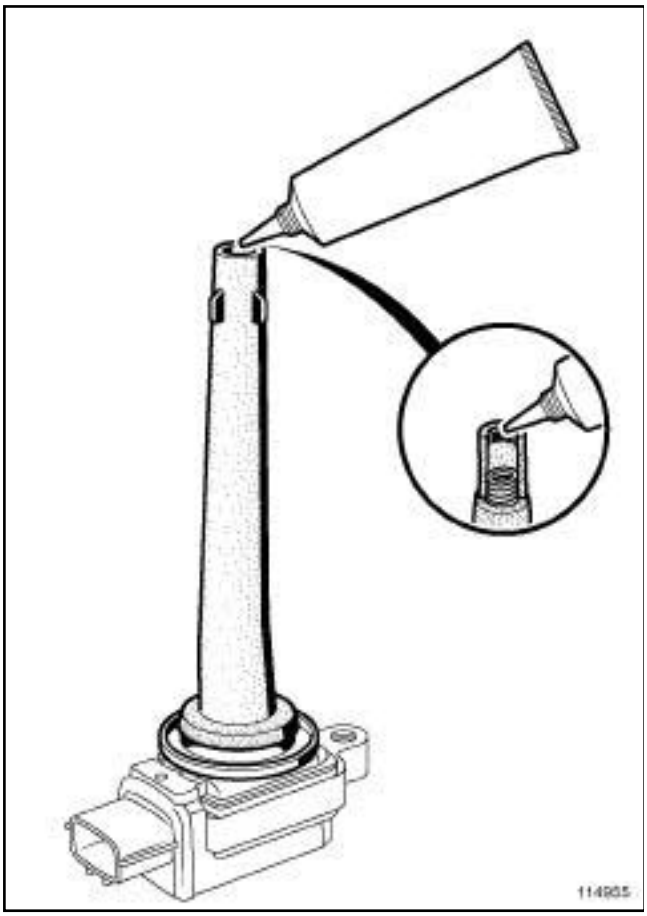
❏ Remove the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

114946

❏ Disconnect the ignition coil connectors (**1**) .

II - REMOVAL OF PART CONCERNED

114945



❏ Remove:

- the ignition coil mounting bolts (**2**) ,
- the ignition coils.

M4R

REFITTING

I - REFITTING PREPARATION OPERATION

114955

❑ Apply to the ignition coils a bead of **FLUORINATED GREASE, PART NO. 82 00 168 855** with a diameter of **2mm** around the inner edge of the high pressure cap.

II - REFITTING THE PART CONCERNED

❑ Put the ignition coils into position.

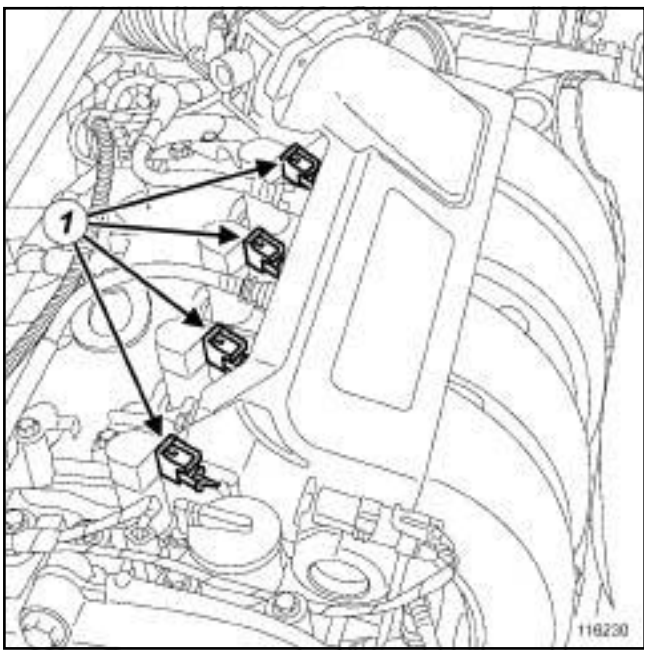
❑ Tighten to torque the **ignition coil mounting bolts (7 Nm)**.

III - FINAL OPERATION

❑ Connect the ignition coil connectors.

❑ Refit the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) .

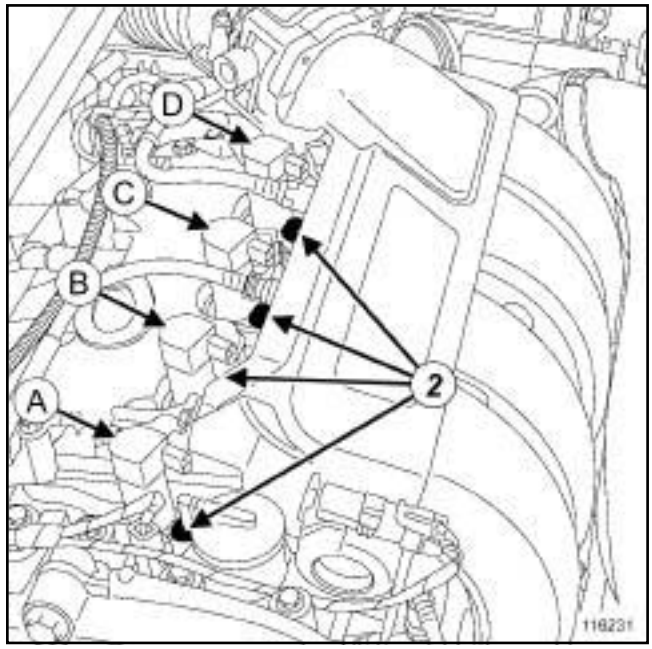


Tightening torques ▽	
ignition coil mounting bolts	**15 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



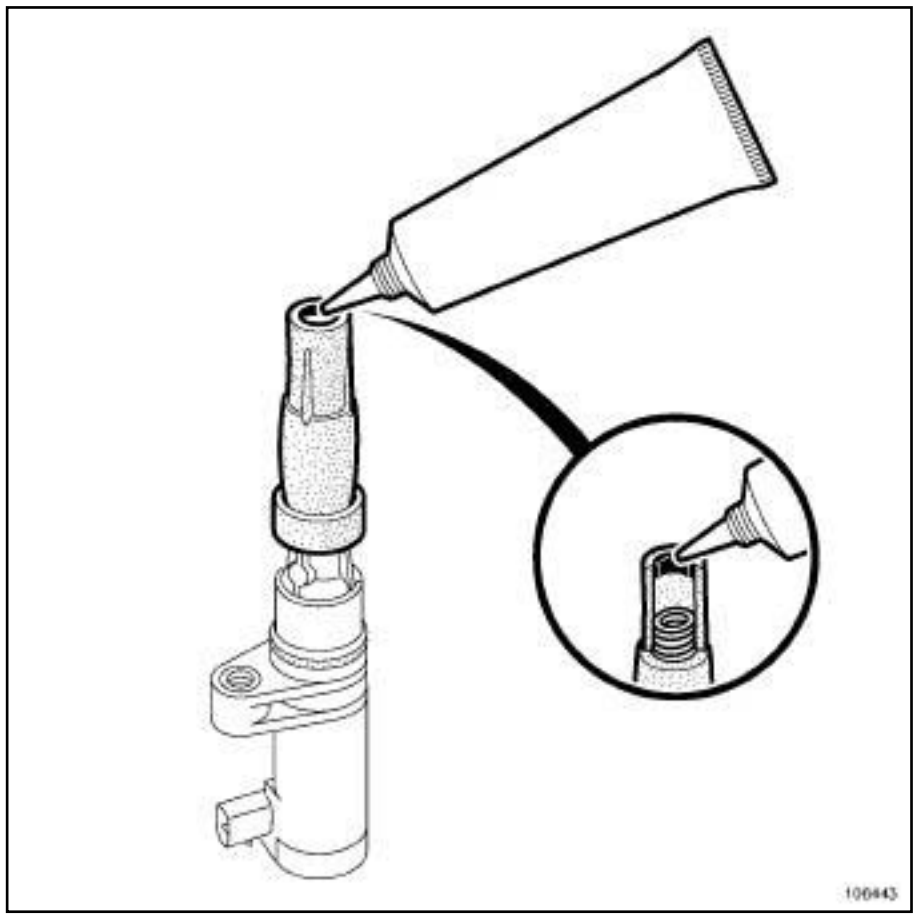
II - OPERATION FOR REMOVAL OF PART CONCERNED

116230

❑ Disconnect:

- the ignition coil connectors (**1**) ,
- the camshaft dephaser solenoid valve connector.

116231



❑ Remove:

- the ignition coil mounting bolts (**2**) ,
- the ignition coils (**B**) , (**C**) and (**D**) ,
- the camshaft dephaser solenoid valve,
- the ignition coil (**A**) .

F4R

REFITTING

I - REFITTING PREPARATION OPERATION

106443

❏ Apply to the four ignition coils a bead of **fluorine grease (part no. 82 00 168 855) 2 mm** in diameter around the inner edge of the high-tension cap.

❏ If necessary, replace the ignition coil O-rings.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the cylinder ignition coils ***(A)*** , ***(B)*** , ***(C)*** ,and ***(D)*** ,
- the camshaft dephaser solenoid valve,
- the ignition coil mounting bolts.

❏ Torque tighten the **ignition coil mounting bolts (15 Nm)**.

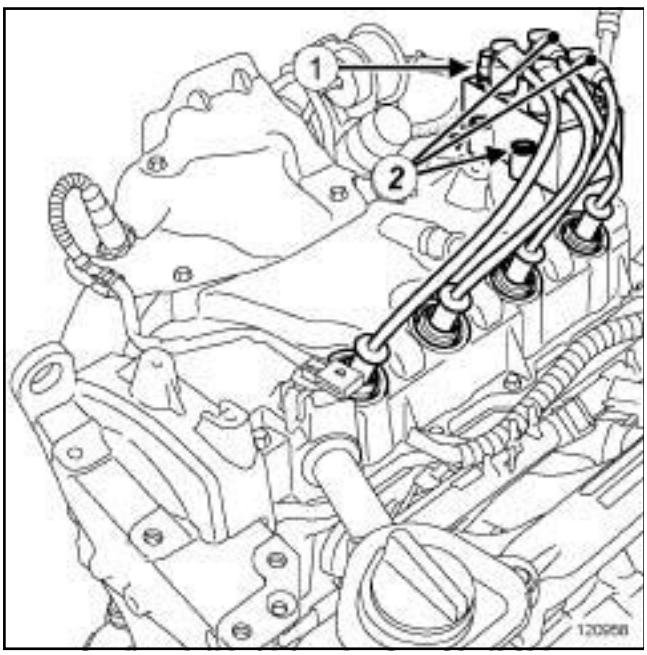
❏ Connect:

- the ignition coil connectors,
- the camshaft dephaser solenoid valve connector.

III - FINAL OPERATION.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784



Tightening torques ▽	
ignition coil bolts	**10 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the front engine cover.

II - OPERATION FOR REMOVAL OF PART CONCERNED

120958

❑ Disconnect:

- the ignition coil connector (**1**) ,
- the spark plug lead high-tension caps from the ignition coil.

WARNING
To disconnect the spark plug leads, never pull on the leads but by the extensions.

❑ Remove:

- the bolts (**2**) from the ignition coil,
- the ignition coil.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ It is essential to apply a bead of **FLUOSTAR 2L** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) with a diameter of **2 mm** to the inner edge of the high-tension caps on the spark plug and ignition coil side.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the ignition coil,
- the ignition coil bolts.

❑ Torque tighten the **ignition coil bolts (10 Nm)**.

❑ Check the spark plug leads and ignition coil leads match.

❑ Connect:

- the spark plug lead high-tension caps to the ignition coil,
- the ignition coil connector.

III - FINAL OPERATION.

❑ Refit the engine cover.

D4F, and 740 – D4F, and 784

❑ Torque tighten the **spark plugs (28 N.m)** using **(Ele. 1382)** fitted with the **grey** sleeve.

III - FINAL OPERATION

❑ Refit the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

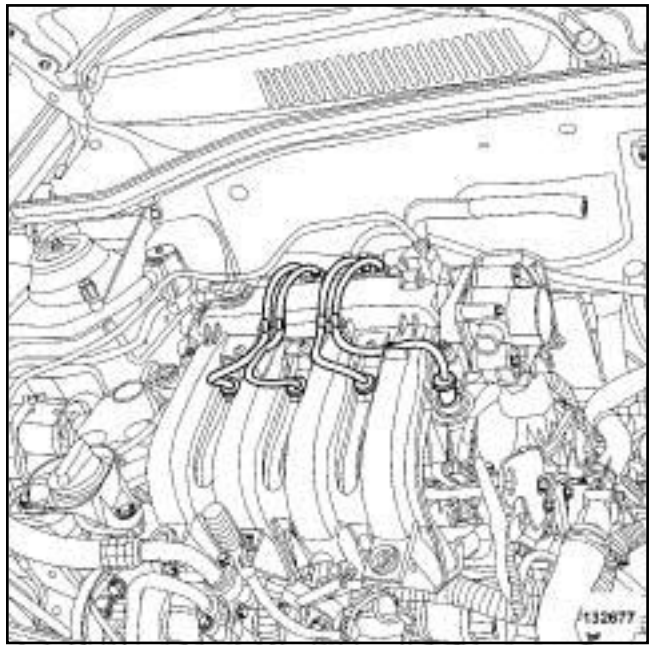
D4F, and 740 – D4F, and 742 or 764

Special tooling required	
Ele. 1933	23 N.m tightening wrench for spark plugs
Ele. 1382-01	14 mm Plug spanner.

Equipment required
set of feeler gauges

Tightening torques ▽	
spark plugs	**23 N.m**

Spark plug electrode gap



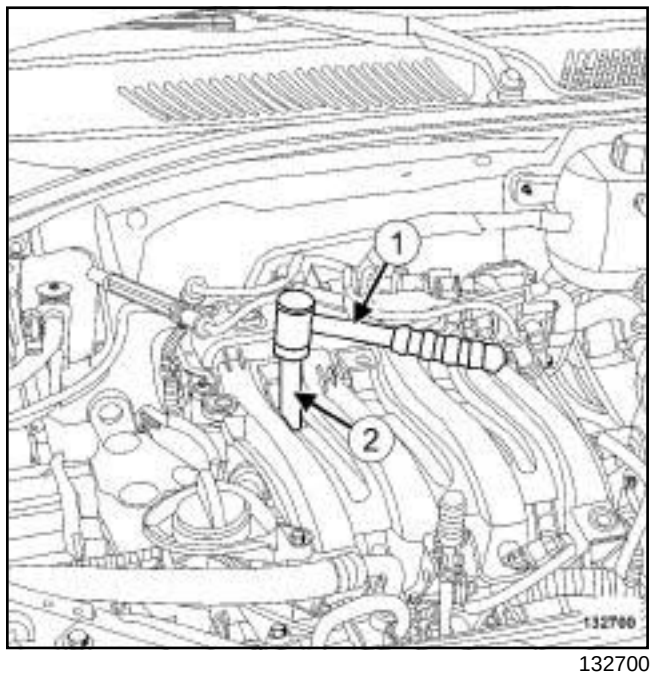
Type of spark plug	Gap (mm)
CHAMPION	0.90 ± 0.05
NGK	0.85 ± 0.05

REMOVAL

I - REMOVAL PREPARATION OPERATION

D4F, and 740 – D4F, and 742 or 764

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .



132677

❑

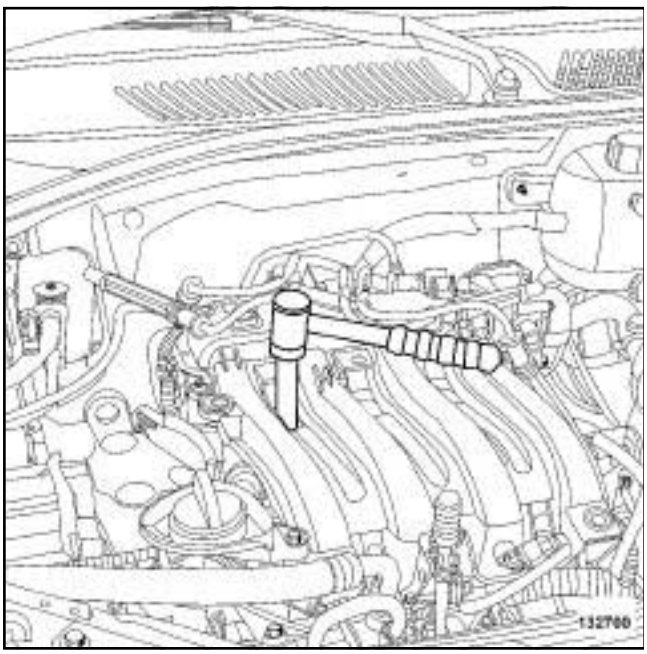
WARNING
To disconnect the spark plug leads, pull on the extensions and not on the leads.

Disconnect the spark plug wiring.

II - OPERATION FOR REMOVAL OF PART CONCERNED

132700

❑ Remove the spark plugs using the **(Ele. 1933)** (**1**) equipped with the **(Ele. 1382-01)** (**2**) .



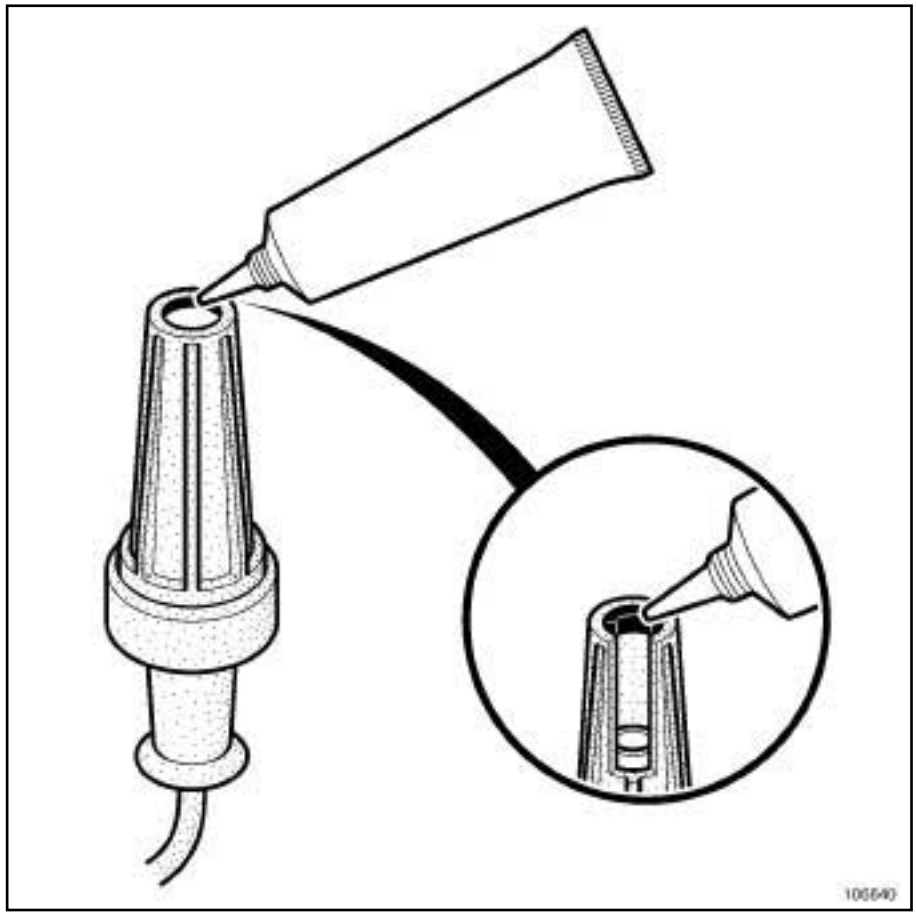
D4F, and 740 – D4F, and 742 or 764

REFITTING

I - REMOVAL PREPARATION OPERATION

❑ Check and, if necessary, correct the spark plug electrode gaps using a **set of feeler gauges**.

II - REFITTING OPERATION FOR PART CONCERNED



132700

❑ Refit the spark plugs.

❑ Torque tighten the **spark plugs (23 N.m)** using the **(Ele. 1933)** fitted with the **(Ele. 1382-01)**.

D4F, and 740 – D4F, and 742 or 764

III - FINAL OPERATION

106640

❏ Apply a bead of **FLUORSTAR 2L** grease (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) **2 mm** in diameter on the internal perimeter of the high-tension caps at the spark plug end.

❏ Connect the spark plug wiring.

D4F, and 740 – D4F, and 742 or 764

❏ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

D4F, and 740 or 742 or 764

Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

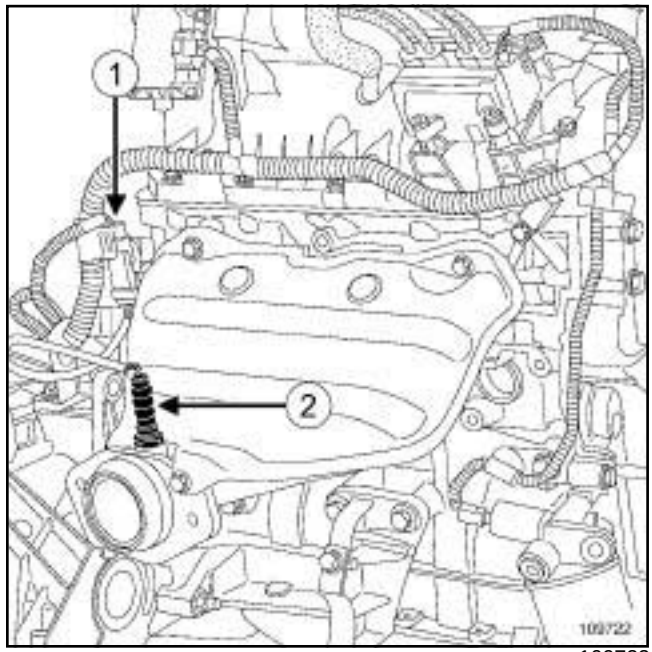
Tightening torques ▽	
upstream oxygen sensor	**45 Nm**
downstream oxygen sensor	**45 Nm**

WARNING
Do not use any product designed to improve electrical contact in the injection computer connectors and oxygen sensors and on the oxygen sensor body. Failure to respect this advice prevents the oxygen sensor from operating correctly and results in failure to comply with the emission control standard.

WARNING
If the connections are corroded, repair the wiring (see **Wiring: Precautions for the repair**) (Technical Note 6015, 88A, Wiring).

REMOVAL

I - REMOVAL PREPARATION OPERATION



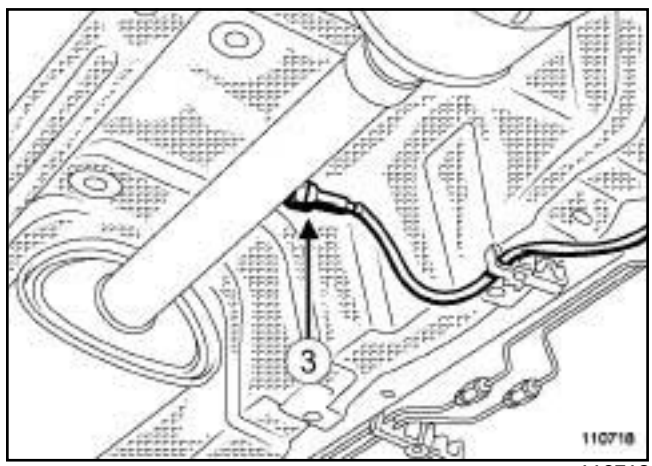
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - Upstream oxygen sensor



109722

❏ Disconnect the upstream oxygen sensor connector (**1**) .

❏ Remove the upstream oxygen sensor (**2**) using the **(Mot. 1495-01)**.

2 - Downstream oxygen sensor

110718

❏ Disconnect the downstream oxygen sensor connector.

❏ Remove the downstream oxygen sensor (**3**) using the **(Mot. 1495-01)**.

D4F, and 740

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

1 - Upstream oxygen sensor

❑ Torque tighten the **upstream oxygen sensor (45 Nm)** using the **(Mot. 1495-01)**.

❑ Connect the upstream oxygen sensor connector.

2 - Downstream oxygen sensor

❑ Torque tighten the **downstream oxygen sensor (45 Nm)** using the **(Mot. 1495-01)**.

❑ Connect the downstream oxygen sensor connector.

II - FINAL OPERATION.

❑ Refit the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J – K4M, and 800 or 801 or 804

Special tooling required	
Mot. 1495	22 mm socket for removal - refitting of oxygen sensors - 1/2" square drive and 24 mm hexagonal ext.

Equipment required
open-ended spanner for torque wrench

Tightening torques ▽	
oxygen sensors	**45 N.m**

WARNING

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

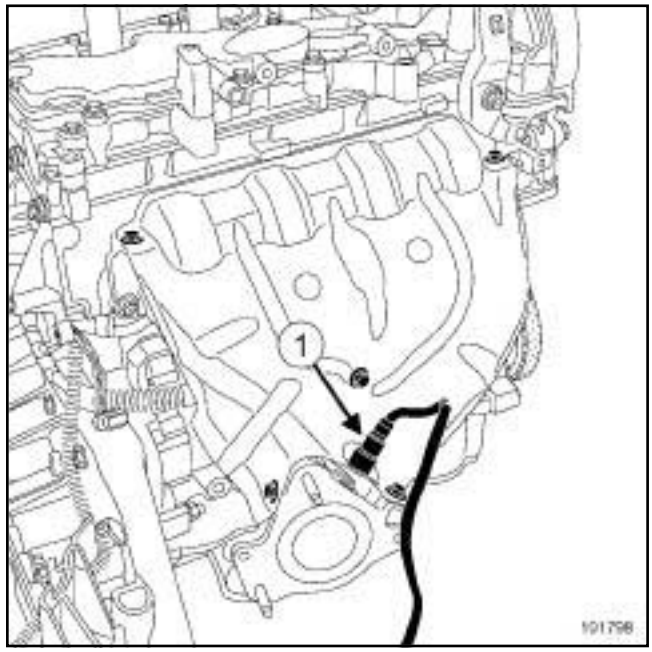
WARNING

If the connections are corroded, repair the wiring (see **Wiring: Precautions for repair**) (88A, Wiring).

Note:

This procedure is for removal - refitting of the upstream oxygen sensor and the downstream oxygen sensor.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

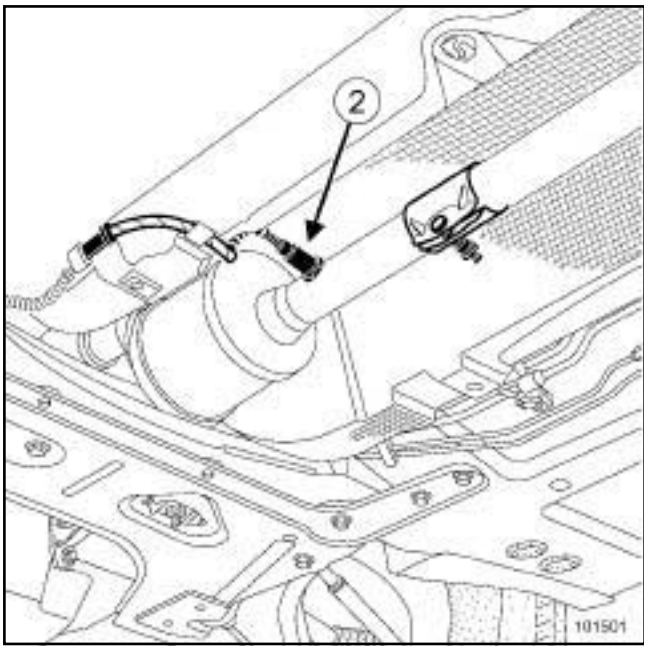
II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - Upstream oxygen sensor

101798

❏ Remove:

- the lifting eye on the timing end,
- the fuel vapour absorber solenoid valve connector,



❏ Unclip the oxygen sensor wiring.

❏ Disconnect the oxygen sensor connector.

❏ Remove the upstream oxygen sensor (**1**) using the **(Mot. 1495)**.

K4J – K4M, and 800 or 801 or 804

2 - Downstream oxygen sensor

101501

❏ Unclip the downstream oxygen sensor wiring.

❏ Disconnect the downstream oxygen sensor connector.

❏ Remove the downstream oxygen sensor (**2**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Clean the threading of the upstream and downstream oxygen sensors using a **WIRE BRUSH**.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the thread hole of the oxygen sensor on the exhaust manifold,
- the threading of the oxygen sensor if it is to be reused.

II - REFITTING OPERATION FOR PART CONCERNED

1 - Upstream oxygen sensor

❏ Refit the upstream oxygen sensor.

❏ Connect the upstream oxygen sensor connector.

❏ Attach the upstream oxygen sensor wiring.

❏ Refit:

- the fuel vapour absorber solenoid valve connector,
- the front lifting eye at the timing end.

2 - Downstream oxygen sensor

❏ Refit the downstream oxygen sensor.

❏ Clip on the downstream oxygen sensor wiring.

❏ Connect the downstream oxygen sensor connector.

3 - Upstream and downstream oxygen sensors

❏ Torque tighten the **oxygen sensors (45 N.m)** using the **(Mot. 1495)** for the upstream oxygen sensor and using a **24 mm open-ended spanner for torque wrench** for the downstream oxygen sensor.

III - FINAL OPERATION

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R

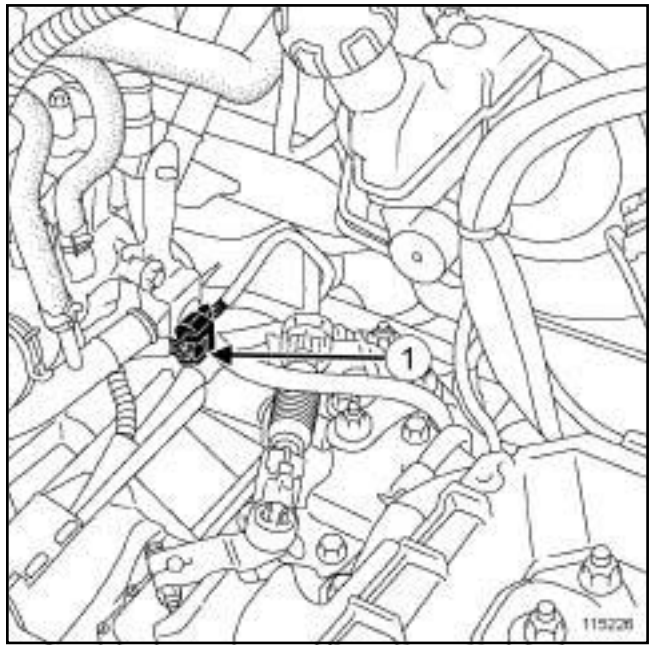
Equipment required
open-ended spanner for torque wrench

Tightening torques ▽	
upstream oxygen sensor	**45 N.m**
downstream oxygen sensor	**45 N.m**

WARNING
Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

WARNING
If the connections are corroded, repair the wiring (see **Wiring: Precautions for repair**)(Technical Note 6015A, 88A, Wiring).



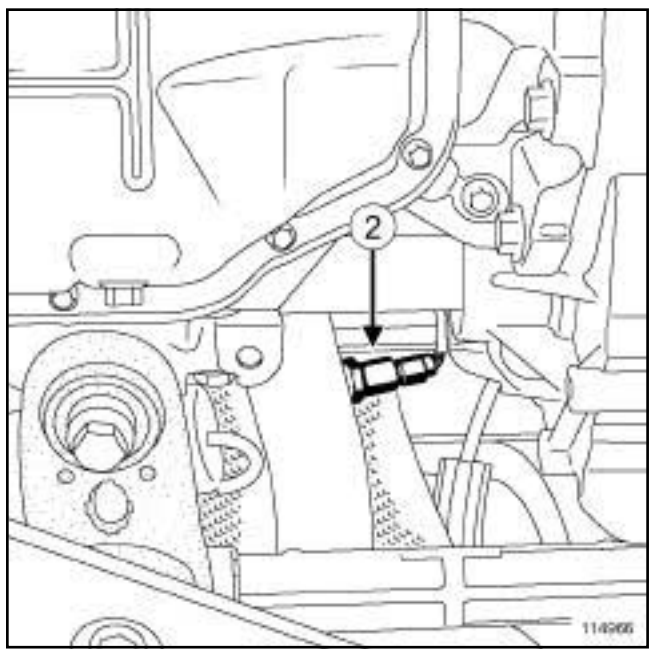
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

II - REMOVING THE UPSTREAM OXYGEN SENSOR

❏ Remove the engine cover.

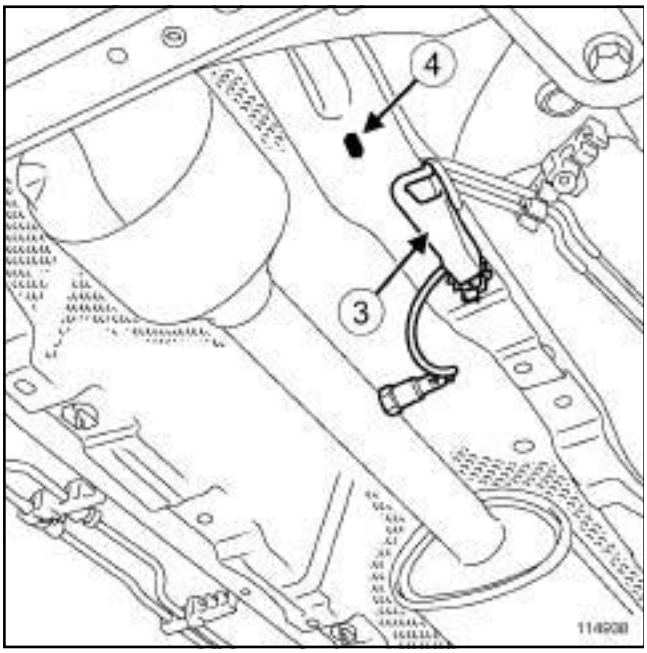


115226

❏ Unclip the upstream oxygen sensor connector at (**1**) .

❏ Disconnect the upstream oxygen sensor connector.

❏ Remove the engine undertray.

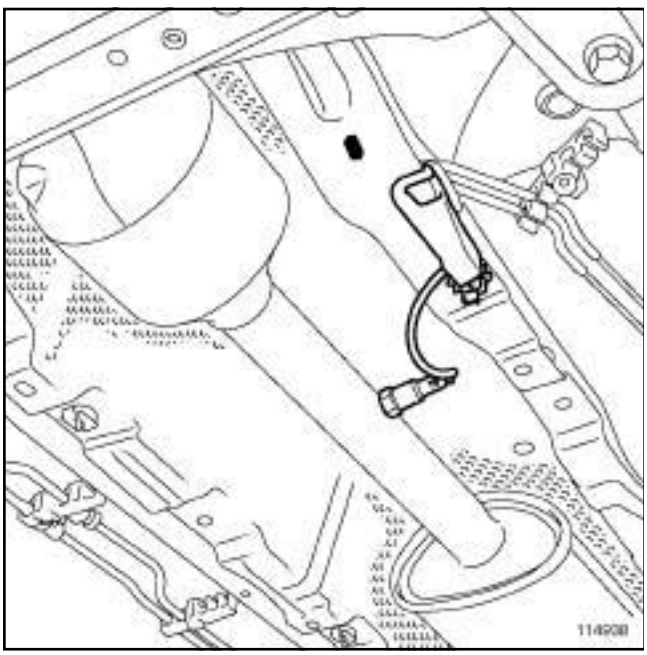


114966

❏ Remove the upstream oxygen sensor (**2**) .

M4R

III - REMOVAL OF THE DOWNSTREAM OXYGEN SENSOR



114938

❏ Remove the plastic cover (**3**) .

❏ Detach the downstream oxygen sensor connector at (**4**) .

❏ Disconnect the downstream oxygen sensor connector.

114938

❏ Remove the downstream oxygen sensor.

REFITTING

I - REFITTING THE UPSTREAM OXYGEN SENSOR

❏ Refit the upstream oxygen sensor.

❏ Torque tighten the **upstream oxygen sensor (45 N.m)** using a **open-ended spanner for torque wrench**.

❏ Refit the engine undertray.

❏ Connect the upstream oxygen sensor connector.

❏ Clip the oxygen sensor connector.

❏ Refit the engine cover.

II - REFITTING THE DOWNSTREAM OXYGEN SENSOR

❏ Refit the downstream oxygen sensor.

❏ Torque tighten the **downstream oxygen sensor (45 N.m)** using a **open-ended spanner for torque wrench**.

❏ Connect the downstream oxygen sensor connector.

❏ Clip the downstream oxygen sensor connector.

❏ Refit the plastic cover.

F4R

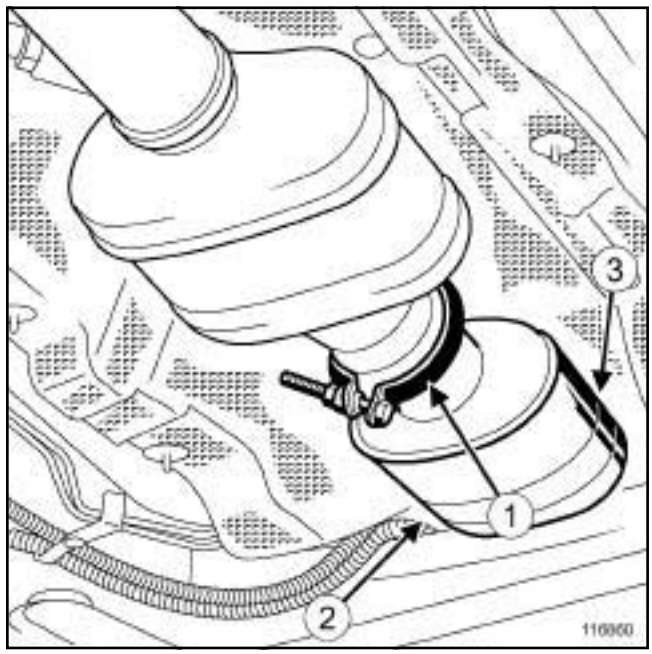
Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
upstream oxygen sensor	**45 N.m**
downstream oxygen sensor	**45 N.m**

WARNING
Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

WARNING
If the connections are corroded, repair the wiring (see **Wiring: Precautions for repair**)(Technical Note 6015A, 88A, Wiring).



REMOVAL

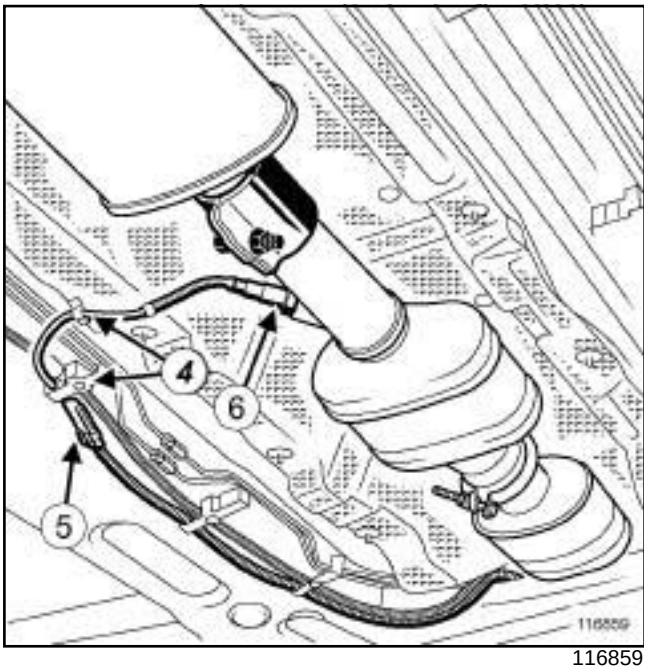
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

II - REMOVAL OPERATION FOR THE OXYGEN SENSOR

1 - Removing the upstream oxygen sensor

116860



❑ Remove the connecting clip (**1**) between the « manifold - catalytic converter » assembly and the expansion chamber.

❑ Lower the catalytic converter slightly.

❑ Disconnect the upstream oxygen sensor connector (**2**) .

❑ Remove the upstream oxygen sensor (**3**) .

2 - Removal of the downstream oxygen sensor

116859

❑ Unclip the downstream oxygen sensor harness at (**4**) .

❑ Disconnect the downstream oxygen sensor connector (**5**) .

❑ Remove the downstream oxygen sensor (**6**) .

REFITTING

REFITTING OPERATION FOR THE OXYGEN SENSOR

1 - Refitting the upstream oxygen sensor

❑ Refit the upstream oxygen sensor.

❑ Torque tighten the **upstream oxygen sensor (45 N.m)** using the **(Mot. 1495-01)**.

❑ Align the exhaust pipe.

❑ Refit the connecting clip between the «manifold - catalytic converter» assembly and the expansion chamber.

❑ Connect the upstream oxygen sensor connector.

2 - Refitting the downstream oxygen sensor

❑ Refit the downstream oxygen sensor.

❑ Torque tighten the **downstream oxygen sensor (45 N.m)** using the tool **(Mot. 1495-01)**.

❑ Connect the downstream oxygen sensor connector.

❑ Clip on the heat shield downstream oxygen sensor connector.

D4F, and 784

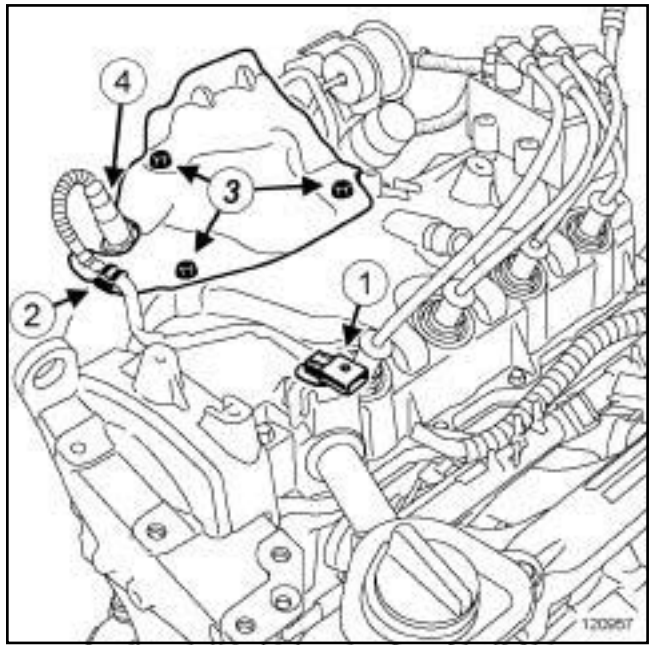
Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
upstream oxygen sensor	**45 N.m**
heat shield bolts	**8 N.m**
downstream oxygen sensor	**45 N.m**

WARNING

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.



WARNING

If the connections are corroded, repair the wiring (see **Wiring: Precautions for repair**)(Technical Note 6015A, 88A, Wiring).

REMOVAL

I - REMOVING THE UPSTREAM OXYGEN SENSOR

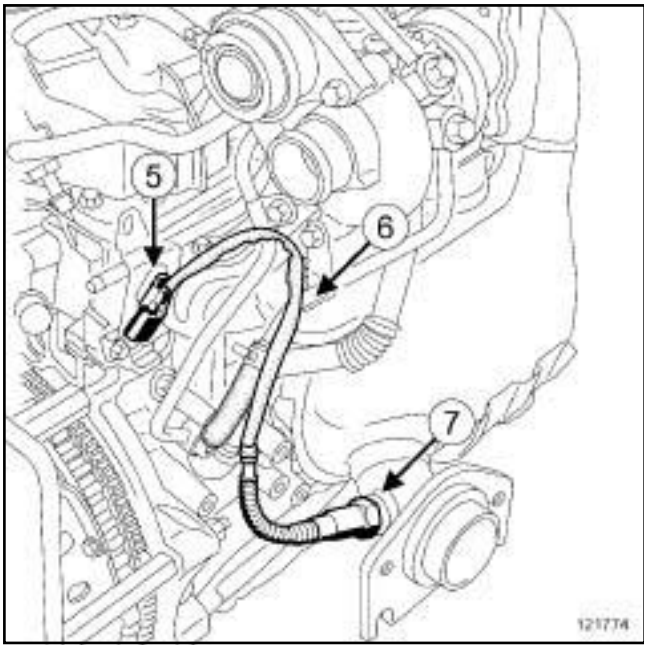
❏ Remove the engine cover.

120957

❏ Disconnect the upstream oxygen sensor connector (**1**) .

❏ Unclip the upstream oxygen sensor connector.

❏ Detach the upstream oxygen sensor wiring harness at (**2**) .



❏ Remove:

- the bolts (**3**) from the heat shield,
- the heat shield,
- the upstream oxygen sensor (**4**) using the **(Mot. 1495-01)**.

II - REMOVING THE DOWNSTREAM OXYGEN SENSOR

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

D4F, and 784

121774

❏ Disconnect the downstream oxygen sensor connector (**5**) .

❏ Unclip the downstream oxygen sensor connector from the catalytic converter.

❏ Detach the downstream oxygen sensor wiring harness from the catalytic converter at (**6**) .

❏ Remove:

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the downstream oxygen sensor from the catalytic converter (**7**) using the **(Mot. 1495-01)**.

REFITTING

I - REFITTING THE UPSTREAM OXYGEN SENSOR

❏ Refit the upstream oxygen sensor.

❏ Torque tighten the **upstream oxygen sensor (45 N.m)** using the **(Mot. 1495-01)**.

❏ Refit:

- the heat shield,
- the heat shield bolts.

❏ Torque tighten the **heat shield bolts (8 N.m)**.

❏ Attach the upstream oxygen sensor wiring harness.

❏ Fit the upstream oxygen sensor connector.

❏ Connect the upstream oxygen sensor connector.

❏ Refit the engine cover.

II - REFITTING THE DOWNSTREAM OXYGEN SENSOR

❏ Refit the downstream oxygen sensor.

❏ Torque tighten the **downstream oxygen sensor (45 N.m)** using the tool **(Mot. 1495-01)**.

❏ Refit the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

❏ Attach the downstream oxygen sensor wiring harness.

❏ Fit the downstream oxygen sensor connector.

❏ Connect the downstream oxygen sensor connector.

❏ Refit the engine undertray.

K4M, and 862

Tightening torques ▽	
upstream oxygen sensor	90°
downstream oxygen sensor	44 N.m

WARNING

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice causes the oxygen sensor to malfunction and results in failure to comply with the emission control standard.

WARNING

If the connections are corroded, repair the wiring (see **Wiring: Precautions for repair**)(Technical Note 6015A, 88A, Wiring).

Note:

This procedure is for removing and refitting the upstream oxygen sensor and the downstream oxygen sensor.

REMOVAL

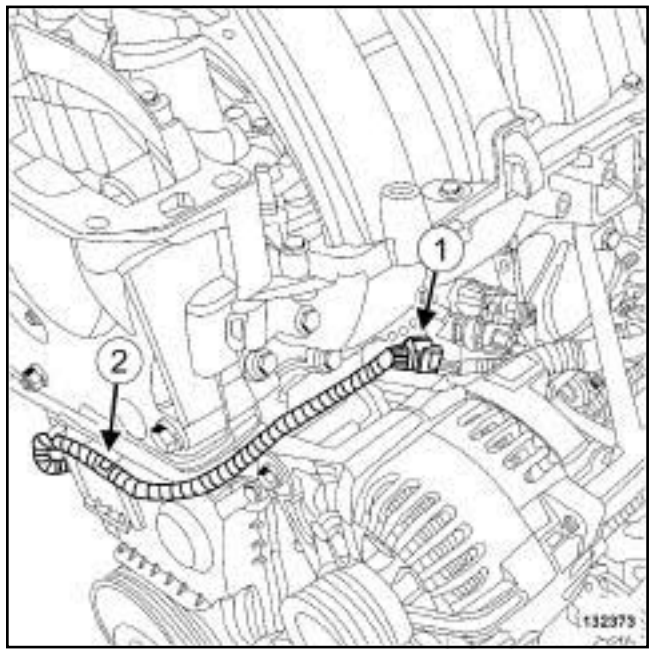
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

1 - Upstream oxygen sensor

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection).



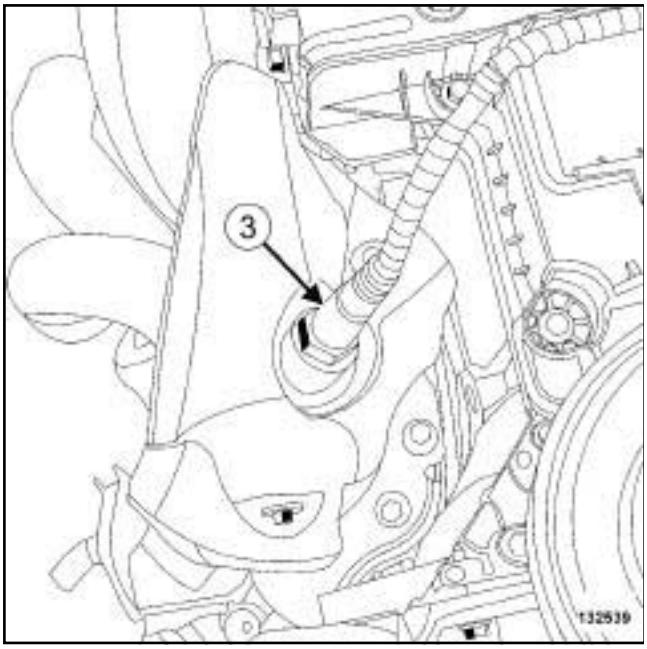
2 - Downstream oxygen sensor

❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

II - OPERATION FOR REMOVAL OF PART CONCERNED

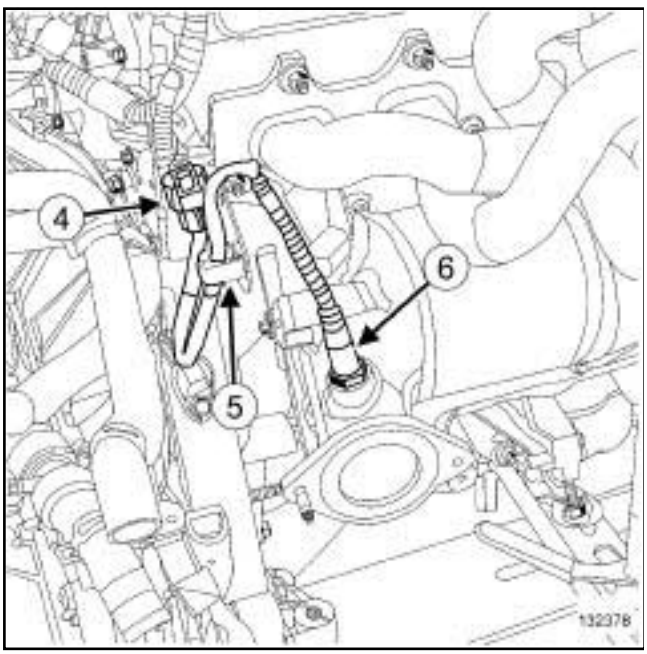
1 - Upstream oxygen sensor



132373

❏ Disconnect the upstream oxygen sensor connector (**1**) .

❏ Unclip the wiring from the upstream oxygen sensor at (**2**) .



K4M, and 862

132539

❏ Remove the upstream oxygen sensor (**3**) .

2 - Downstream oxygen sensor

132378

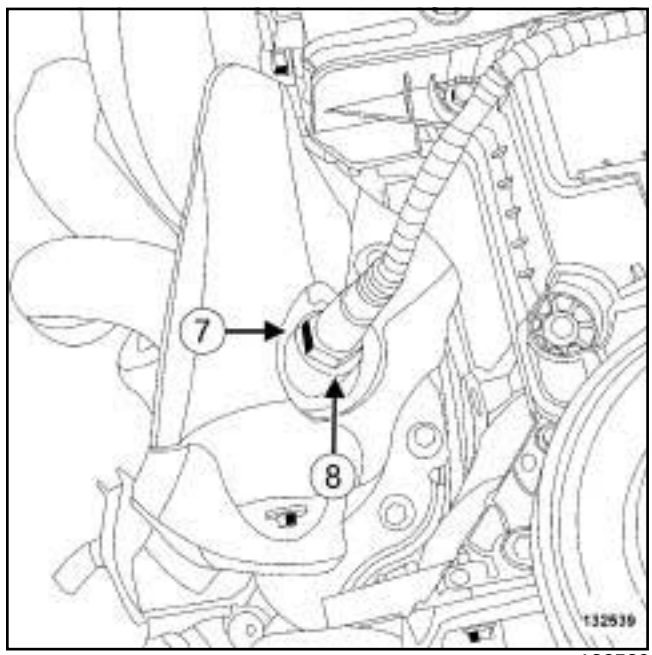
❏ Disconnect the downstream oxygen sensor connector (**4**) .

❏ Unclip the wiring from the downstream oxygen sensor at (**5**) .

❏ Remove the downstream oxygen sensor (**6**) .

REFITTING

I - REMOVAL PREPARATION OPERATION



❏ Clean the threading of the upstream and downstream oxygen sensors using a **WIRE BRUSH**.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the thread hole of the oxygen sensor on the exhaust manifold,
- the threading of the oxygen sensor if it is to be reused.

II - REFITTING OPERATION FOR PART CONCERNED

1 - Upstream oxygen sensor

132539

❏ Refit the upstream oxygen sensor.

❏ Angle tighten the **upstream oxygen sensor (90°)**.

Note:

For angle tightening, make a mark (**7**) on the catalytic converter in the middle of the flat surface of the upstream oxygen sensor. Move the upstream oxygen sensor stop (**8**) to the mark (**7**) .

❏ Attach the upstream oxygen sensor wiring.

❏ Connect the upstream oxygen sensor connector.

K4M, and 862

2 - Downstream oxygen sensor

❏ Refit the downstream oxygen sensor.

❏ Torque tighten the **downstream oxygen sensor (44 N.m)**.

❏ Clip on the downstream oxygen sensor wiring.

❏ Connect the downstream oxygen sensor connector.

III - FINAL OPERATION

1 - Upstream oxygen sensor

❏ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

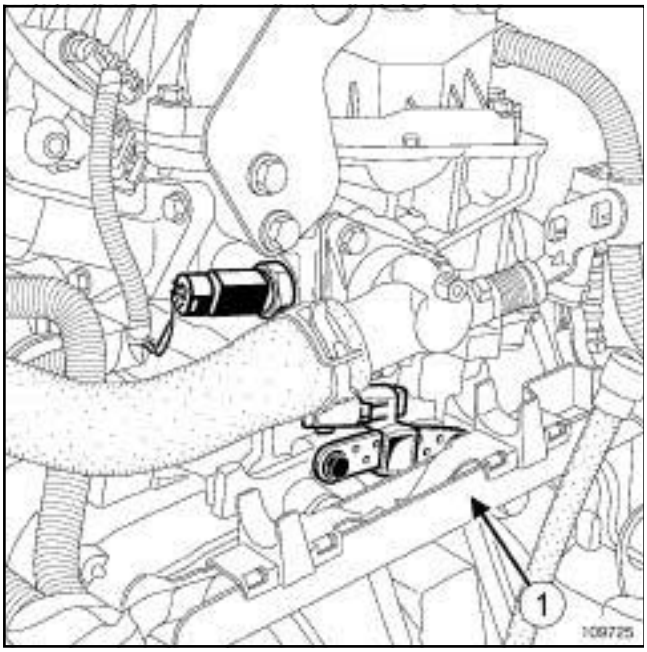
2 - Downstream oxygen sensor

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the engine undertray.

D4F, and 740 or 742 or 764

REMOVAL



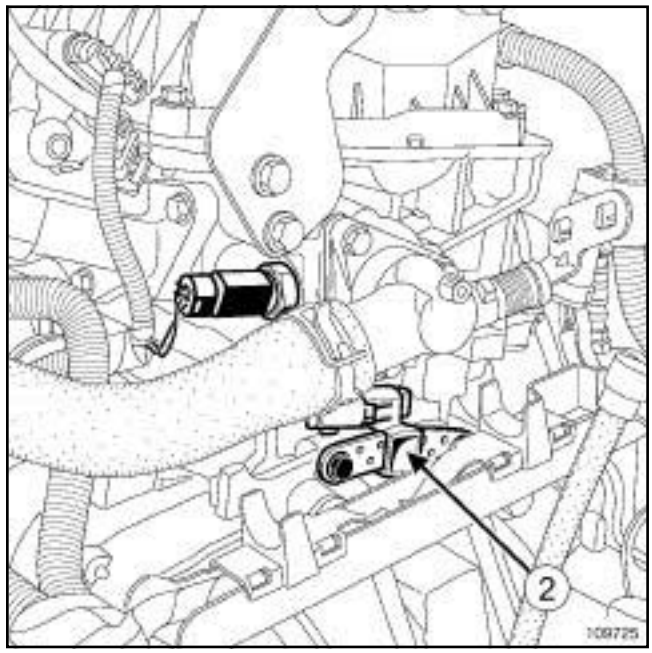
I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Move the cooling hose away from the engine wiring harness bracket.

❏ Disconnect the engine speed and position sensor connector.



109725

❏ Remove the engine wiring harness bracket mountings (**1**) from the gearbox.

❏ Move the engine wiring harness bracket to one side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109725

❏ Remove the engine speed and position sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the engine speed and position sensor.

II - FINAL OPERATION.

❏ Refit the engine wiring harness bracket.

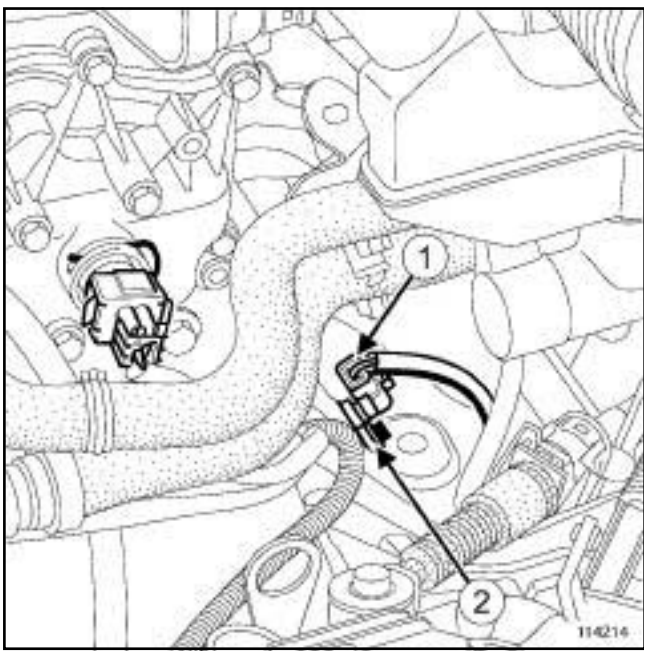
❏ Connect the engine speed and position sensor connector.

❏ Refit:

- the cooling hose onto the engine wiring harness bracket,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) .

K4J or K4M



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Put the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

114214

❏ Disconnect the engine speed and position sensor connector (**1**) .

❏ Remove the engine speed and position sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the engine speed and position sensor.

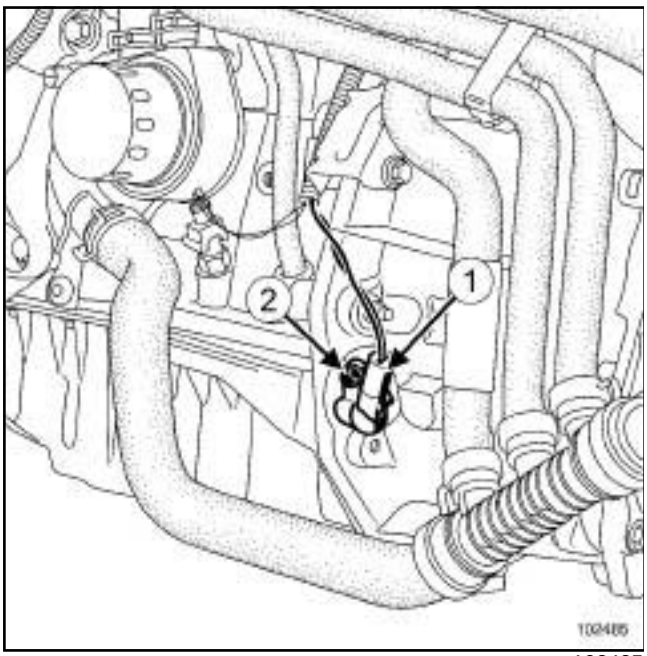
❏ Connect the engine speed and position sensor connector.

II - FINAL OPERATION

❏ Connect the battery (see **Battery: Removal - Refitting**) .

F4R

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray

II - OPERATION FOR REMOVAL OF PART CONCERNED

102485

❏ Disconnect the connector (**1**) from the engine speed and position sensor.

❏ Remove:

- the speed and position sensor mounting bolt (**2**) ,
- the engine speed and position sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Clean the removed sensor using a dry, lint-free cloth.

II - REFITTING OPERATION FOR PART CONCERNED

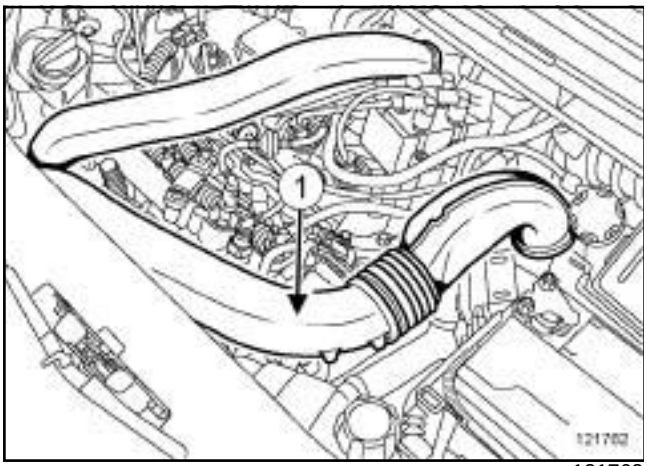
❏ Fit the speed and position sensor in place.

❏ Refit the speed and position sensor mounting bolt.

❏ Connect the connector to the speed and position sensor.

III - FINAL OPERATION.

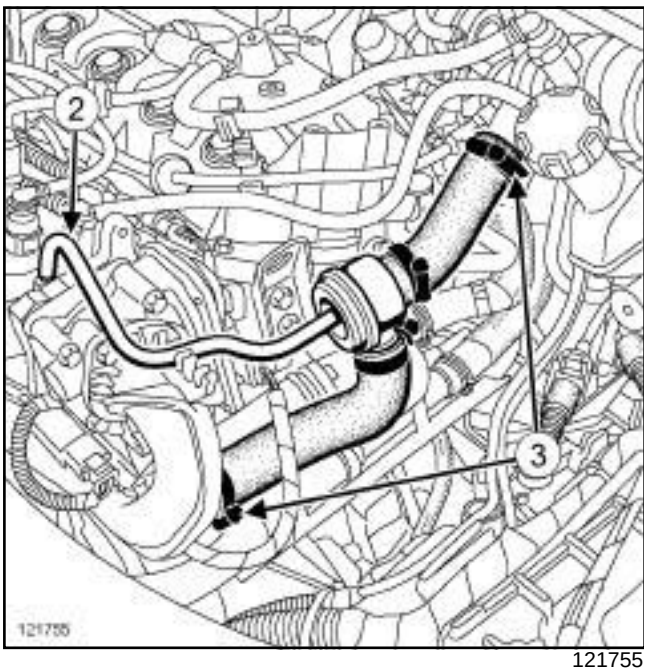
❏ Refit the engine undertray.



❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784

REMOVAL

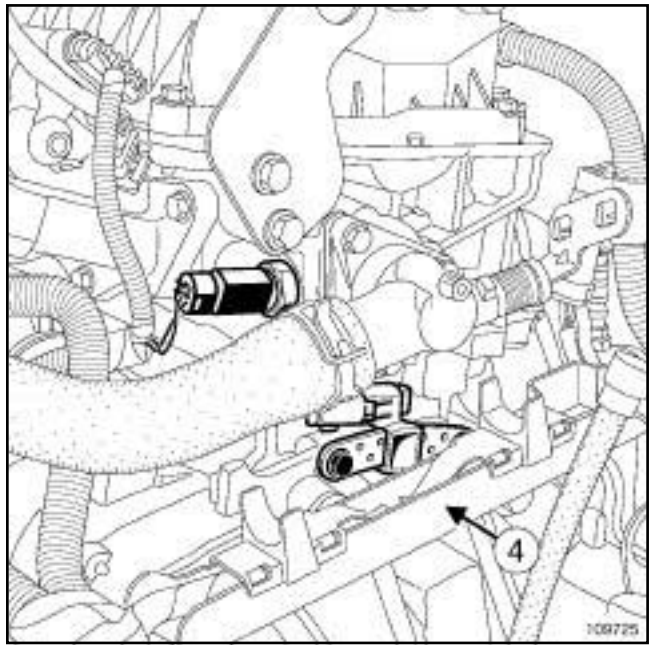


I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

121762

❑ Remove the air filter unit air inlet pipe (**1**) .



121755

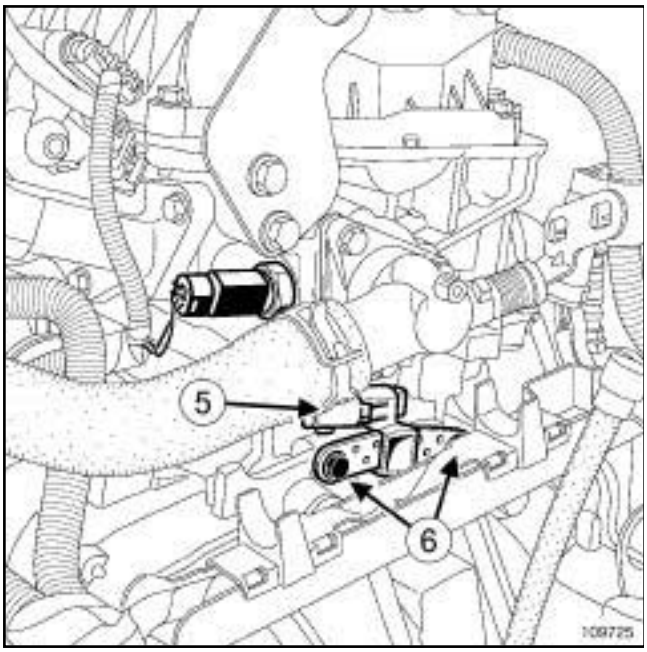
❑ Disconnect the vacuum pipe (**2**) .

❑ Undo the compressor discharge valve pipe clips (**3**) .

❑ Disconnect the compressor discharge valve pipe.

❑ Remove the compressor discharge valve pipe.

109725



❑ Move the cooling hose away from the engine wiring harness bracket.

❑ Remove the engine wiring mounting bolts (**4**) from the gearbox.

❑ Move the engine wiring harness bracket to one side.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

109725

❏ Disconnect the connector (**5**) from the engine speed and position sensor.

❏ Remove:

- the engine speed and position sensor bolts (**6**) ,
- the engine speed and position sensor.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the speed and position sensor,
- the engine speed and position sensor bolts.

❏ Connect the engine speed and position sensor connector.

II - FINAL OPERATION.

❏ Refit:

- the engine wiring harness bracket,
- the engine wiring harness bracket bolts,
- the cooling hose.

❏ Refit the compressor discharge valve pipe.

❏ Connect the compressor discharge valve pipe.

❏ Tighten the compressor discharge valve pipe clips.

❏ Connect the vacuum pipe.

❏ Refit the air filter box air inlet pipe.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Program the engine speed and position sensor (see **Fault finding - Replacement of components**) (MR 394, 17B, Petrol injection).

D4F, and 740 or 742 or 764

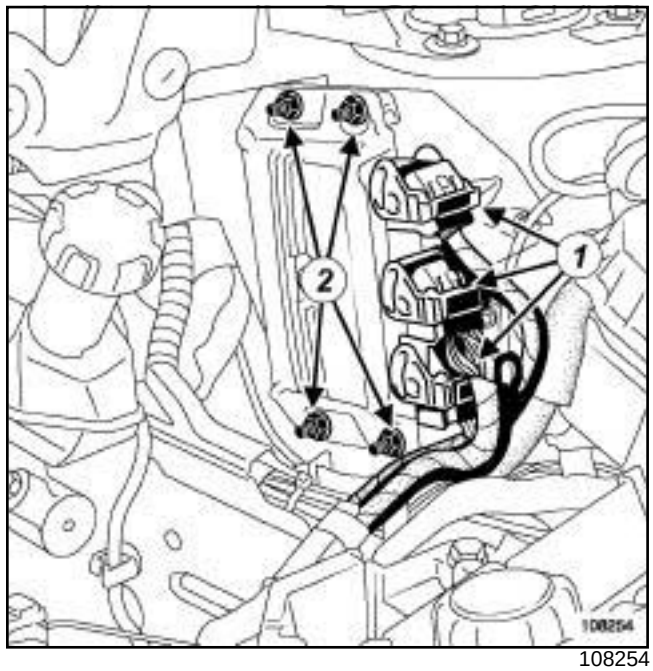
Equipment required
Diagnostic tool

Tightening torques ▽	
injection computer bolts	**10 N.m**

WARNING

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors. Failure to respect this advice prevents the oxygen sensor from operating correctly and results in failure to comply with the emission control standard.

WARNING



If the connections are corroded, repair the wiring (see **Wiring: Precautions for the repair**) (Technical Note 6015, 88A, Wiring).

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

108254

❑ Disconnect the three connectors (**1**) from the petrol injection computer.

❑ Remove:

- the petrol injection computer bolts (**2**) ,
- the petrol injection computer.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Position the petrol injection computer.

❑ Torque tighten the **injection computer bolts (10 N.m)**.

❑ Connect the three petrol injection computer connectors.

II - FINAL OPERATION.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

1 - Programming the motorised throttle valve stops

❑ Switch on the ignition.

❑ Wait **30 seconds** : the injection computer automatically programs the MIN and MAX stops.

❑ Switch off the ignition.

D4F, and 740 or 742 or 764

- ❏ Wait **30 seconds** : the injection computer automatically stores the programming of the stops.
- ❏ Check with the **Diagnostic tool** that this programming has been carried out correctly **ET051 « Apprentissage butées papillon »** .

2 - Programming procedure for flywheel position and engine speed sensor

- ❏ The engine coolant temperature must be greater than **35°C**.
- ❏ Whilst driving the vehicle in third gear at an engine speed between **3000 rpm** and **3500 rpm**, decelerate first for at least **5 seconds**.
- ❏ Whilst driving the vehicle in third gear at an engine speed of between **2000 rpm** and **2400 rpm**, decelerate again for at least **5 seconds**.
- ❏ Check with the **Diagnostic tool** that this programming has been carried out correctly using the command **ET089: « Apprentissage cible volant moteur : Effectué »** .
- ❏ Read the fault codes using the **Diagnostic tool**.
- ❏ Repair if necessary.
- ❏ Clear the fault codes.
- ❏ Check that the vehicle is working correctly.

K4J – K4M – M4R – F4R – D4F, and 784

Tightening torques ▽	
injection computer mounting nuts	8 Nm

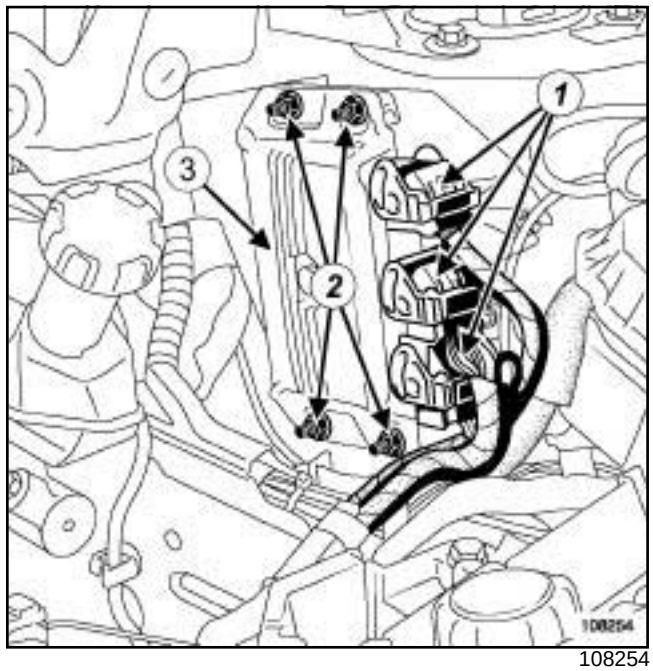
WARNING

Do not use any product designed to improve the electrical contact in the injection computer and oxygen sensor connectors or on the bodies of the oxygen sensors.

Failure to respect this advice prevents the oxygen sensor from operating correctly and results in failure to comply with the emission control standard.

WARNING

If the connection is corroded, repair the wiring (see **Wiring: Precautions for the repair**) (Technical Note 6015, 88A, Wiring).



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

108254

❑ Disconnect the injection computer connectors (**1**) .

❑ Remove:

- the injection computer nuts (**2**) ,
- the injection computer (**3**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the injection computer.

❑ Torque tighten the **injection computer mounting nuts (8 Nm)**.

❑ Connect the injection computer connectors.

II - FINAL OPERATION

❑ Refit:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Program the engine speed sensor and motorised throttle valve (see **Fault finding - Replacement of components**)(MR 387, 17B, Petrol injection).

INGREDIENT

Coolant **GLACEOL RX (TYPE D)**

Note:

Ready-to-use coolant or antifreeze must be diluted with distilled water in accordance with the guide-lines marked on the container.

IMPORTANT

The circuits are designed to be pressurized, so be careful at high temperatures (risk of serious burns).

Never remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed valve(s) while the engine is running.

Only use recommended coolants: **GLACEOL RX (TYPE D)**.

WARNING

- The coolant helps to keep the engine running properly (heat exchange).
- The system does not operate using pure water.

WARNING

Take care not to damage the cooling unit fins (radiator, condenser, etc.) during handling. When carrying out a repair that requires a complete circuit drain, it is essential to flush the circuit with clean water, blow compressed air through the circuit to eliminate water, fill and drain the circuit and then « measure the effective protection » . The parameters to be observed are:

- protection down to **- 25°C ± 2** for cold and temperate countries,
- protection down to **- 40 °C ± 2** for very cold countries.

WARNING

- Drain and refill with the engine warm.
- Flush and refill with oil with the engine cold or warm.
- Never flush a warm engine (risk of major thermal shock).

Vehicles in the current range have cooling systems with the following basic specifications:

- hermetically-sealed pressurised circuit (expansion chamber valve),
- circuit using type « D » liquid,
- passenger compartment heating systems equipped with a « heater matrix » type radiator located under the dashboard which helps to cool the engine.

Coolant quantities

Engine	Quantity (litres)	Grade
D4F 764	5	Concentrated ANTIFREEZE (type D)
D4F 740/742	5	**GLACEOL RX (type D)** Only use coolant
D4F 784	5.5	
K4J	5.5	
K4M	6.5	
M4R 701	5.9	
F4R 830/832	5	
K9K 764	6.5	
K9K 766	6.5	
K9K 768	6.5	
K9K 772	6.5	
K9K 750	6.5	
K9K 752	6.5	

Special notes:

- protection down to **- 25°C ± 2** for cold and temperate countries,
- protection down to **- 37°C ± 2** for very cold countries.

Note:

Only use extreme cold coolant (Concentrated anti-freeze type D) for the **D4F 764** engine, with Parts Department numbers **77 11 170 548 (1 l) or 77 11 219 692 (2.5 l)**. Dilute **0.2 litres** of concentrated antifreeze for **1 litre** of Glaceol RX liquid (temperate countries). The mixture can also be made up of distilled water with a dilution ratio of **50%** concentrated antifreeze to **50%** distilled water.

Thermostat opening temperatures

Engine	Start of opening (°C)	End of opening (°C)
D4F 740/742	**89**	**99 ± 2**
D4F 764 Thermostat in non-actuated mode	**108 ± 2**	**120**

Engine	Start of opening (°C)	End of opening (°C)
D4F 764 Thermostat in actuated mode	**100 ± 2**	**120**
D4F 784	**89**	**99 ± 2**
K4J	**89**	**99 ± 2**
K4M	**89**	**99 ± 2**
M4R	Cylinder head thermostat	
	93.5	**96.5**
	Cylinder block thermostat	
	80.5	**83.5**
F4R 830/832	**75**	**87**
K9K	**89**	**99 ± 2**

Special tooling required	
Mot. 1700	Fault finding and filling - bleeding the cooling circuit.
Ms. 554-07	Instrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06

IMPORTANT

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

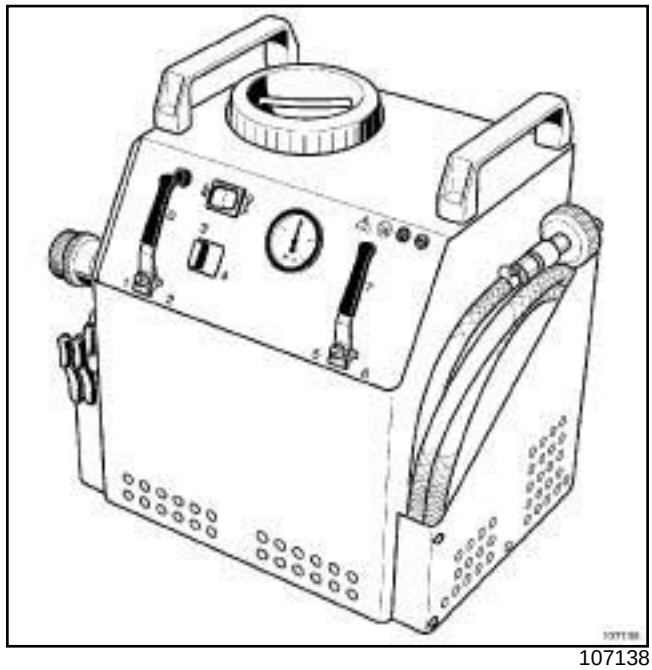
Note:

There are two procedures for checking the cooling system:

- the procedure using the **(Mot. 1700)**
- the procedure using the **(Ms. 554-07)**

Expansion bottle cap valve rating:

Expansion bottle cap with ...	Valve rating
... a brown circle	**1.2 bar**
... a yellow marking	**1.4 bar**
... a white marking	**1.6 bar**
... a grey marking	**1.8 bar**



I - CHECKING THE COOLING SYSTEM USING THE TOOL (MOT. 1700)

❑

WARNING

If the coolant is leaking from the expansion bottle cap, replace the valve.

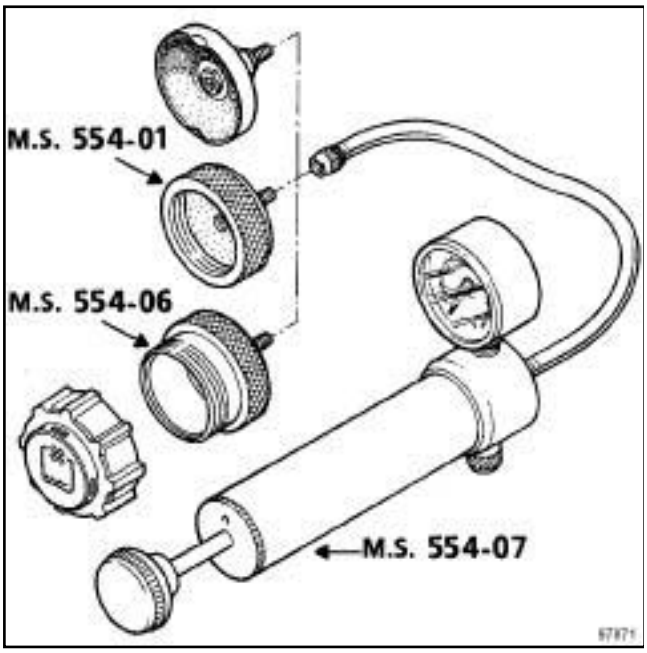
1 - Checking the expansion bottle cap valve

107138

❑ Use the cooling system filling and diagnostic tool **(Mot. 1700)**. Consult the user's manual for this tool (see **Cooling system filling and diagnostic tool: Use**) (Technical Note 3857A, 19A, Cooling).

2 - Checking the sealing of the cooling circuit

❑ Use the cooling system filling and diagnostic tool **(Mot. 1700)**. Consult the user's manual for this tool (see **Cooling system filling and diagnostic tool: Use**) (Technical Note 3857A, 19A, Cooling).



II - CHECKING THE COOLING SYSTEM USING THE TOOL (MS. 554-07)

❑

WARNING

If the coolant is leaking from the expansion bottle cap, replace the valve.

1 - Checking the expansion bottle cap valve

97871

❏ Fit onto the tester **(Ms. 554-07)**, the adapter **(Ms. 554-06)**.

❏ Fit the expansion bottle cap to the adapter **(Ms. 554-06)**.

> Note:
>
> The pressure should not drop; if it does, look for the leak.

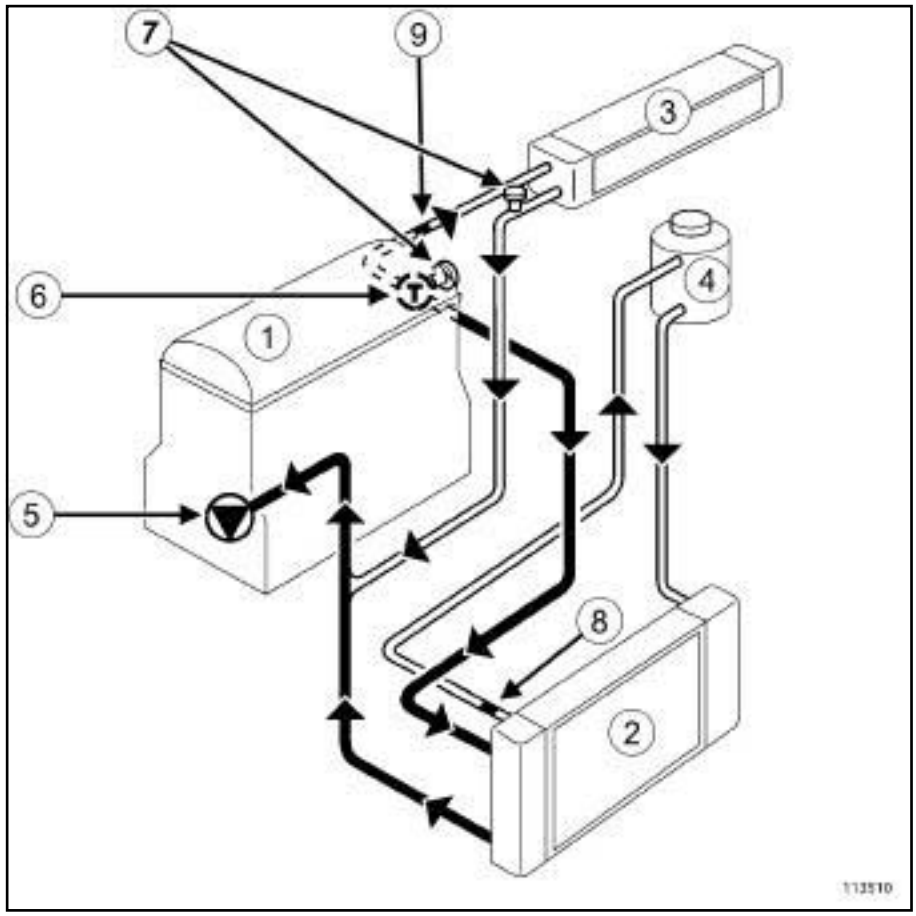
❏ Pump with the **(Ms. 554-07)**, the pressure should stabilise at the expansion bottle cap valve rating with a test tolerance of ± **0.1 bar.**

2 - Checking the sealing of the cooling circuit

❏ Replace the expansion bottle cap with the adapter **(Ms. 554-01)**.

❏ Connect on the adapter **(Ms. 554-01)** the tool **(Ms. 554-07)**.

❏ Pump with the **(Ms. 554-07)** to put the cooling circuit under pressure.



❏ Stop pumping at **0.1 bar** below the valve rating for the expansion bottle cap valve with.

> Note:
>
> The pressure should not drop; if it does, look for the leak.

❏ Gradually unscrew the union of the **(Ms. 554-07)** to decompress the cooling system then remove the adapter **(Ms. 554-01)** and refit the expansion bottle cap.

Special tooling required	
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1700	Fault finding and filling - bleeding the cooling circuit.
Ms. 554-07	Instrument for testing the cooling circuit and the expansion bottle valve. Contains caps 554-01, 554-04, 554-06

Equipment required
coolant recovery tray
compressed air nozzle
pedal press

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING

Before the operation, protect the electrical accessories to prevent any risk of short circuiting and protect the belts to avoid damaging them.

DRAINING

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the expansion bottle cap,
- the engine undertray.

❏ Position the **coolant recovery tray** under the vehicle.

❏ Remove the cooling radiator bottom hose clip using the **(Mot. 1202-01)** or **(Mot. 1202-02)** or **(Mot. 1448)**.

❏ Open the cooling system by disconnecting the bottom hose from the cooling radiator.

❏ Use a **compressed air nozzle** to blow air into the system through the expansion bottle opening to remove as much coolant as possible.

CLEANING

❏ Fill the cooling system with water through the expansion bottle.

❏ Let the water run until the water collected from the cooling radiator bottom hose becomes clear.

❏ Use a **compressed air nozzle** to blow air into the circuit through the expansion bottle opening to remove as much water as possible.

❏ Refit:

- the cooling radiator bottom hose,
- the cooling radiator bottom hose clip with the **(Mot. 1202-01)** or **(Mot. 1202-02)** or **(Mot. 1448)**.

FILLING

❏

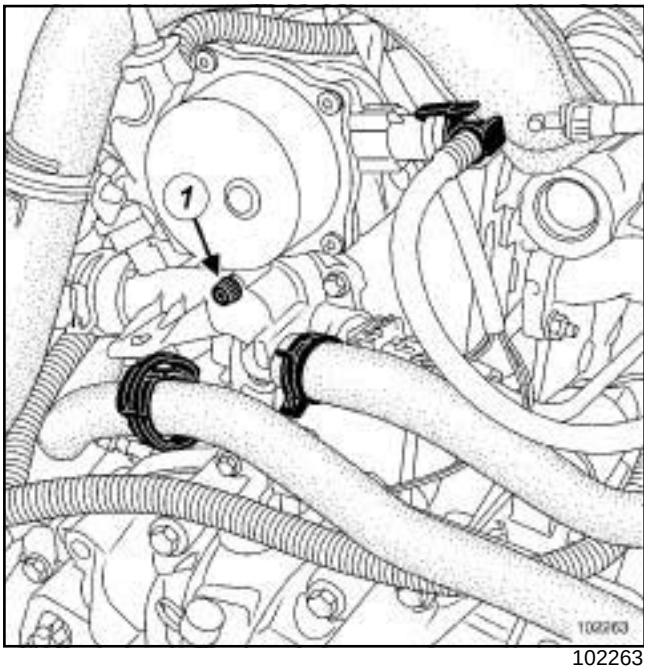
Note:

There are two procedures for filling the cooling system:

- the procedure using the **(Mot. 1700)** recommended by Renault which saves a considerable amount of time as the cooling system bleed screws do not need to be opened,
- the procedure without a special tool.

I - FILLING PROCEDURE USING THE TOOL (MOT. 1700)

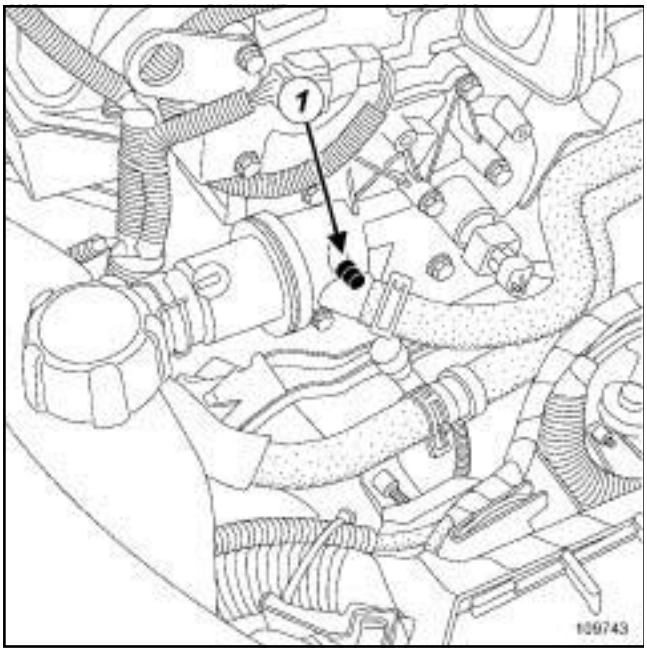
❏ Fill the cooling system with engine coolant recommended by the manufacturer (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) using the **(Mot. 1700)** (see **Cooling system: Filling**) (Technical Note 3857A, 19A, Cooling).



II - FILLING PROCEDURE WITHOUT A SPECIAL TOOL

❑

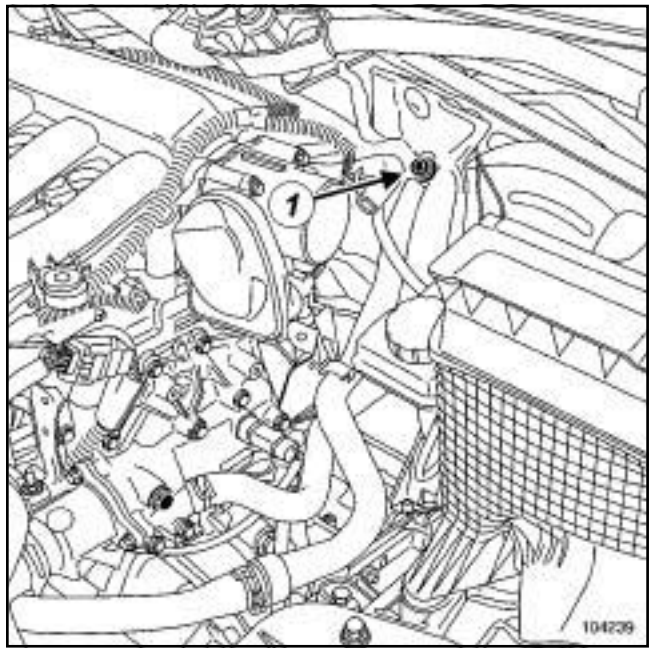
WARNING



It is essential to open all of the bleed screws to remove as much as air as possible in the cooling system. Failure to perform this procedure may prevent the cooling system from filling properly and may damage the engine.

Location of the bleed screw on the K9K water chamber

102263



Location of the bleed screw on the D4F, K4J, K4M water chamber

109743

Location of the bleed screw on the D4F, K4M, K4J,

K9K heater radiator hose

104239

❑ Open the bleed screws (**1**) .

❑ Fill the cooling system with the engine coolant recommended by the manufacturer (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) via the expansion bottle until it overflows.

❑ Close all the bleed screws as soon as the coolant starts to flow in a continuous stream.

❑ Pressurise the system using the **(Ms. 554-07)** to check that there are no leaks (see **19A**, **Cooling**, **Engine cooling system: Check**, page **19A-5**) .

❑ Refit the expansion bottle cap.

❑ Clean any surfaces soiled by the coolant.

BLEEDING

❑

WARNING

Do not open the bleed screw whilst the engine is running; this would damage the engine.

❑ Start the engine.

D4F, and 740 or 742 or 764

❑ Maintain the engine speed at **2500 rpm**, using the **pedal press** for **5 minutes**.

❑ Stabilise the engine speed at **2000 rpm** until the fan assembly has been activated twice.

D4F, and 784

- ❏ Maintain the engine speed at **2500 rpm**, using the **pedal press** for **5 minutes**
- ❏ Stabilise the engine speed at **2000 rpm** until the fan assembly is activated.
- ❏ Note the coolant level in the expansion bottle after this first activation.
- ❏ Accelerate at a minimum of **4000 rpm** for a few seconds, until the coolant fluid level in the expansion bottle drops.

K9K

- ❏ Maintain the engine speed at **1500 rpm** rapidly varying the engine speed (until maximum speed is reached) **2 to 3** times approximately every two minutes until the fan assembly starts for a second time.

F4R or K4J or K4M

- ❏ Run the engine at **2500 rpm**, until the engine cooling fan has started to operate three times (time required for automatic degassing).

M4R

- ❏ Let the engine run at **3000 rpm**, until the engine cooling fan has been activated three times (time required for automatic degassing).

- ❏ Check that the heating is operating correctly.
- ❏ Allow the engine to cool until the coolant temperature is less than **50°C**.
- ❏ Make sure the coolant fluid level is at the « Maximum » mark.
- ❏ Refit the expansion bottle cap.

FINAL OPERATION.

- ❏ Remove the **coolant recovery tray**.
- ❏ Refit the engine undertray.

D4F, and 740 or 742 or 764, and STANDARD HEATING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the expansion bottle valve,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Attach the cooling radiator to the front end panel.

❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).
- the engine fuse box cover,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❏ Disconnect the fan unit connector.

❏ Unclip the wiring harness on the fan assembly.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the cooling radiator from the front end panel.

❏ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the cooling radiator

❏ Remove the expansion bottle hose clamps using **(Mot. 1448)**.

❏ Using the **(Car. 1363)**, remove:

- the radiator expansion bottle bottom hose,
- the radiator expansion bottle top hose.

❏ Remove the radiator fan unit.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❏ Refit:

- the radiator fan unit,
- the radiator expansion bottle top hose,
- the radiator expansion bottle bottom hose,

❏ Refit the expansion bottle hose clamps using **(Mot. 1448)**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the front end panel rubber pads,
- the cooling radiator.

III - FINAL OPERATION

❏ Connect the fan unit connector.

❏ Clip the wiring harness onto the fan assembly.

❏ Refit:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the engine fuse box cover,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),

D4F, and 740 or 742 or 764, and STANDARD HEATING

- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

D4F, and 740 or 742 or 764, and AIR CONDITIONING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

Tightening torques ▽	
air conditioning pipe union mounting bolts on the condenser	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

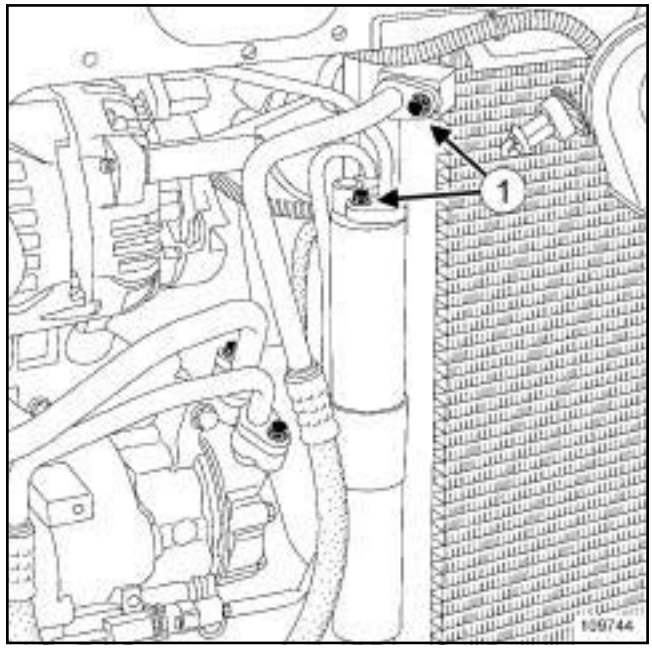
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the expansion bottle valve,
- the engine undertray.

❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).



❏ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Attach the cooling radiator to the front end panel.

❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the engine fuse box cover,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❏ Unclip the wiring harness of the pressure switch on the condenser.

109744

❏ Remove:

- the pressure switch from the condenser,
- the air conditioning compressor clutch connector,
- the mounting bolts (**1**) securing the air conditioning pipe unions to the condenser,
- the fan assembly connector.

❏ Disconnect the air conditioning pipe unions.

❏ Insert plugs in the air conditioning pipe unions.

❏ Unclip the fan unit wiring harness.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the cooling radiator from the front end panel.

❏ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the cooling radiator

❏ Remove:

- the dehydration canister clamp bolts,
- the dehydrator reservoir.

❏ Remove the expansion bottle hose clamps using **(Mot. 1448)**.

❏ Using the **(Car. 1363)**, remove:

- the radiator expansion bottle bottom hose,

- the radiator expansion bottle top hose.

❑ Remove the radiator fan unit.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❑ Refit:

- the radiator fan unit,
- the radiator expansion bottle top hose,
- the radiator expansion bottle bottom hose,

❑ Refit the expansion bottle hose clamps using **(Mot. 1448)**.

❑ Refit:

- the dehydrator reservoir,
- the dehydration canister clamp bolts.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the front end panel rubber pads,
- the cooling radiator.

III - FINAL OPERATION

❑ Clip the wiring harness onto the fan assembly.

❑ Remove the caps from the air conditioning pipe unions.

❑ Replace the seals on the air conditioning pipe unions.

❑ Refit:

- the fan unit connector,
- the air conditioning compressor clutch connector,
- the pressure switch from the condenser,
- the air conditioning pipe unions,
- the air conditioning pipe union mounting bolts on the condenser.

❑ Torque tighten the **air conditioning pipe union mounting bolts on the condenser (8 N.m)**.

❑ Clip the pressure switch wiring harness on the condenser.

❑ Refit:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the engine fuse box cover,
- the battery cover,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Refill:

- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K4J or K4M, and STANDARD HEATING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine fuse box cover,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Attach the cooling radiator to the front end panel.

❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

❏ Disconnect the blower assembly connector.

❏ Unclip the fan unit wiring harness.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the cooling radiator from the front end panel.

❏ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the radiator

❏ Using the **(Mot. 1448)**, remove:

- the radiator expansion bottle bottom hose clamps,
- the radiator expansion bottle top hose clamp.

❏ Using the **(Car. 1363)**, remove:

- the expansion bottle bottom hose on the radiator,
- the expansion bottle top hose on the radiator,

❏ Remove the radiator fan unit.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❏ Refit:

- the radiator fan unit,
- the expansion bottle top hose on the radiator,
- the expansion bottle bottom hose.

❏ Using the **(Mot. 1448)**, refit:

- the radiator expansion bottle top hose clamp.
- the radiator expansion bottle bottom hose clamp.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the front end panel rubber pads,
- the cooling radiator.

III - FINAL OPERATION

❏ Connect the fan assembly connector.

❏ Clip the wiring harness onto the fan assembly.

❏ Refit:

- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,

K4J or K4M, and STANDARD HEATING

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine fuse box cover,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

K4J or K4M, and AIR CONDITIONING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

Tightening torques ▽	
air conditioning pipe union mounting bolts on the condenser	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

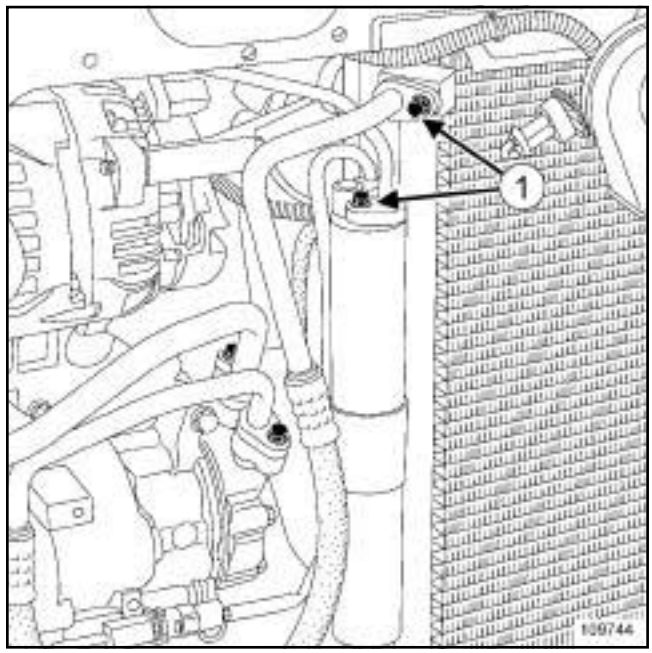
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine fuse box cover,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the expansion bottle valve.

❑ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).



❑ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Attach the cooling radiator to the front end panel.

❑ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

❑ Unclip the wiring harness of the pressure switch on the condenser.

109744

❑ Remove:

- the pressure switch from the condenser,
- the air conditioning compressor clutch connector,
- the mounting bolts (**1**) securing the air conditioning pipe unions to the condenser,
- the fan assembly connector.

❑ Disconnect the air conditioning pipe unions.

❑ Insert plugs in the air conditioning pipe unions.

❑ Unclip the wiring harness on the fan assembly.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Detach the cooling radiator from the front end panel.

❑ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the radiator

❑ Using the **(Mot. 1448)**, loosen:

- the clamp of the bottom hose of the expansion bottle on the radiator,
- the clamp of the top hose of the expansion bottle on the radiator,

K4J or K4M, and AIR CONDITIONING

❑ Using the **(Car. 1363)**, remove:

- the bottom hose of the expansion bottle on the radiator,
- the top hose of the expansion bottle on the radiator,

❑ Remove:

- the radiator fan assembly,
- the dehydrator reservoir.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❑ Refit:

- the dehydrator reservoir,
- the radiator fan unit
- the top hose of the expansion bottle on the radiator,
- the bottom hose of the expansion bottle on the radiator.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the front end panel rubber pads,
- the cooling radiator.

III - FINAL OPERATION

❑ Clip the wiring harness onto the fan assembly.

❑ Remove the caps from the air conditioning pipe unions.

❑ Replace the seals on the air conditioning pipe unions.

❑ Refit:

- the fan assembly connector,
- the air conditioning compressor clutch connector,
- the pressure switch from the condenser,
- the air conditioning pipe unions,
- the mounting bolts of the air conditioning pipe unions.

❑ Torque tighten the **air conditioning pipe union mounting bolts on the condenser (8 N.m)**.

❑ Clip the pressure switch wiring harness on the condenser.

❑ Refit:

- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine fuse box cover,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Refill:

- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

K9K, and AIR CONDITIONING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

Tightening torques ▽	
air conditioning pipe union mounting bolts on the condenser	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

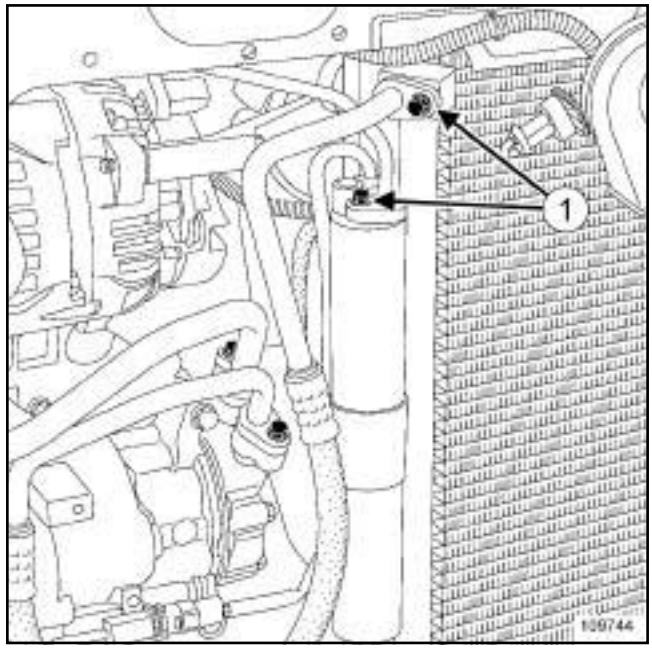
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the expansion bottle valve,
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Drain the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).



❏ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Attach the cooling radiator to the front end panel.

❏ Remove:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❏ Unclip the wiring harness of the pressure switch on the condenser.

109744

❏ Remove:

- the pressure switch from the condenser,
- the air conditioning compressor clutch connector,
- the mounting bolts (**1**) securing the air conditioning pipe unions to the condenser,
- the fan assembly connector.

❏ Disconnect the air conditioning pipe unions.

❏ Insert plugs in the air conditioning pipe unions.

❏ Unclip the fan unit wiring harness.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the cooling radiator from the front end panel.

❏ Remove:

- the cooling radiator,
- the front end panel rubber pads.

K9K, and AIR CONDITIONING

Stripping the cooling radiator

❑ Remove:

- the mounting bolts of the dehydration canister clamp,
- the dehydrator reservoir.

❑ Using the **(Mot. 1448)**, remove:

- the clamp of the bottom hose of the expansion bottle on the radiator,
- the clamp of the top hose of the expansion bottle on the radiator,

❑ Using the **(Car. 1363)**, remove:

- the bottom hose of the expansion bottle on the radiator,
- the top hose of the expansion bottle on the radiator,

❑ Remove the radiator fan unit.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❑ Refit:

- the dehydrator reservoir,
- the dehydration canister mounting bolts,
- the radiator fan unit,
- the top hose of the expansion bottle on the radiator,
- the bottom hose of the expansion bottle on the radiator.

❑ Using the **(Mot. 1448)**, refit:

- the clamp of the top hose of the expansion bottle on the radiator,
- the clamp of the bottom hose of the expansion bottle on the radiator.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the rubber pads on the front end panel,
- the cooling radiator.

III - FINAL OPERATION

❑ Clip the wiring harness onto the fan assembly.

❑ Remove the plugs from the air conditioning pipe unions.

❑ Replace the seals on the air conditioning pipe unions.

❑ Refit:

- the fan assembly connector,
- the air conditioning compressor clutch connector,
- the pressure switch from the condenser,
- the air conditioning pipe unions,
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the air conditioning pipe union mounting bolts on the condenser.

❑ Torque tighten the **air conditioning pipe union mounting bolts on the condenser (8 N.m)**.

❑ Clip the pressure switch wiring harness on the condenser.

❑ Refit:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❑ Refill:

- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).
- the engine undertray,

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K9K, and STANDARD HEATING

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the expansion bottle valve,
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Attach the cooling radiator to the front end panel.

❏ Remove:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❏ Disconnect the fan unit connector.

❏ Unclip the wiring harness on the fan assembly.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the cooling radiator from the front end panel.

❏ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the cooling radiator

❏ Using the **(Mot. 1448)**, remove:

- the clamp of the bottom hose of the expansion bottle on the radiator,
- the clamp of the top hose of the expansion bottle on the radiator,

❏ Using the **(Car. 1363)**, remove:

- the bottom hose of the expansion bottle on the radiator,
- the top hose of the expansion bottle on the radiator.

❏ Remove the fan assembly of the radiator.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❏ Refit:

- the radiator fan unit,
- the top hose of the expansion bottle on the radiator,
- the bottom hose of the expansion bottle on the radiator.

❏ Using the **(Mot. 1448)**, refit:

- the clamp of the top hose of the expansion bottle on the radiator,
- the clamp of the bottom hose of the expansion bottle on the radiator.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the front end panel rubber pads,
- the cooling radiator.

III - FINAL OPERATION

❏ Connect the fan unit connector.

❏ Clip the wiring harness onto the fan assembly.

❏ Refit:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),

K9K, and STANDARD HEATING

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

M4R

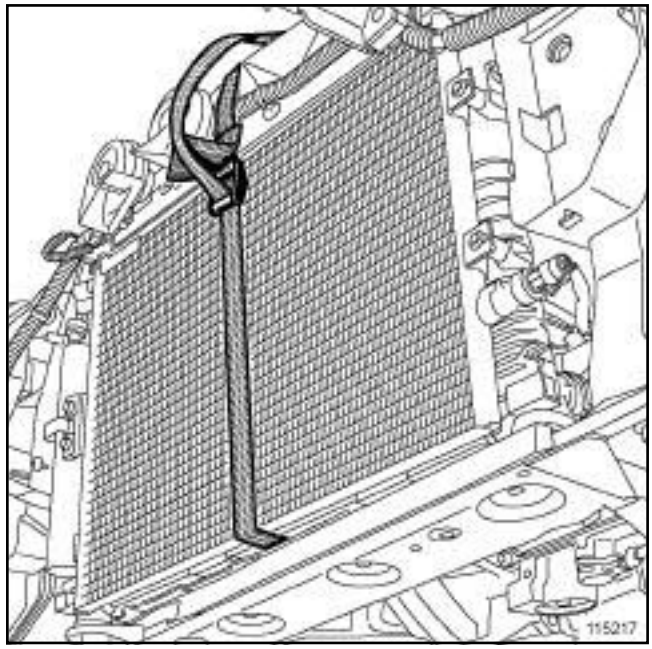
Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
air conditioning pipe union mounting bolts on the condenser	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



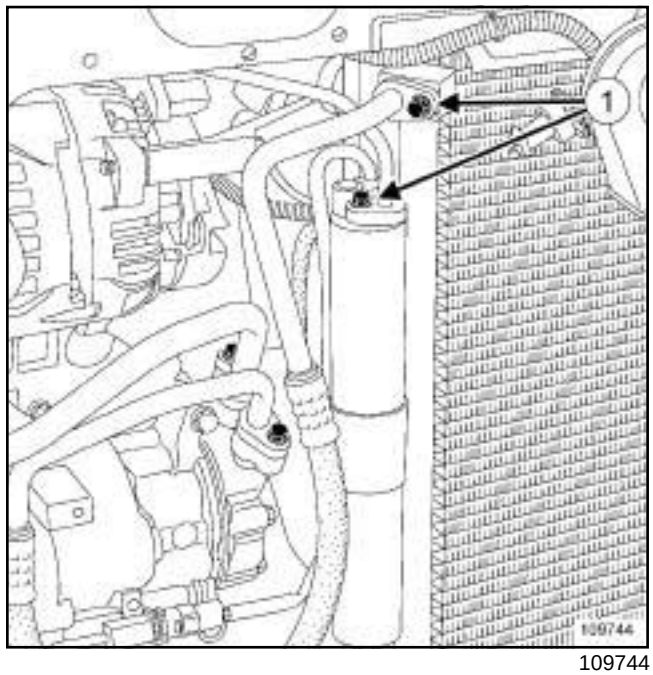
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

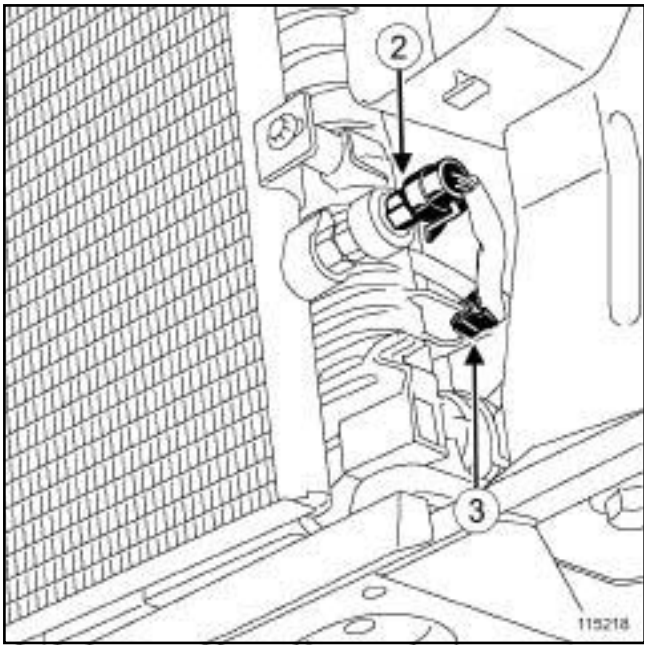
❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).



115217

❏ Attach the radiator to the front end panel.



❏ Remove:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

109744

❏ Remove the bolts (**1**) mounting the air conditioning pipe unions on the condenser.

115218

❑ Disconnect:

- the pressostat connector (**2**) on the condenser,
- the radiator top hose, using the **(Mot. 1448)**,
- the fan unit connectors.

❑ Unclip:

- the pressostat wiring harness from the condenser (**3**) ,
- the wiring harness from the fan unit.

❑ Disconnect the air conditioning pipe unions.

❑ Insert protective plugs in the air conditioning pipe unions.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Detach the cooling radiator from the front end panel.

❑ Remove:

- the cooling radiator,
- the front end panel rubber pads.

Stripping the cooling radiator

❑ Remove:

- the mounting bolts of the dehydration canister clamp,
- the dehydrator reservoir.

❑ Remove the radiator fan unit.

REFITTING

I - REFITTING PREPARATION OPERATION

Rebuilding the cooling radiator

❑ Refit:

- the dehydrator reservoir,
- the dehydration canister mounting bolts,
- the radiator fan unit.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the rubber pads on the front end panel,
- the cooling radiator.

M4R

III - FINAL OPERATION

❑ Clip the harness onto the fan unit.

❑ Remove the plugs from the air conditioning pipe unions.

❑ The air conditioning pipe union seals must be replaced.

❑ Refit:

- the fan assembly connector,
- the air conditioning compressor clutch connector,
- the pressure switch from the condenser,
- the air conditioning pipe unions,
- the bolts mounting the air conditioning pipe unions on the condenser,
- the radiator hoses using the **(Mot. 1448)**.

❑ Torque tighten the **air conditioning pipe union mounting bolts on the condenser (8 N.m)**.

❑ Clip the pressostat wiring harness to the condenser.

❑ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).
- the engine undertray,

❑ Refill:

- the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

F4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot. Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for "extreme cold" countries.

WARNING

Drain with the engine warm.

Flush and refill with the engine cold or warm.

Never flush a hot engine (risk of major thermal shock).

REMOVAL

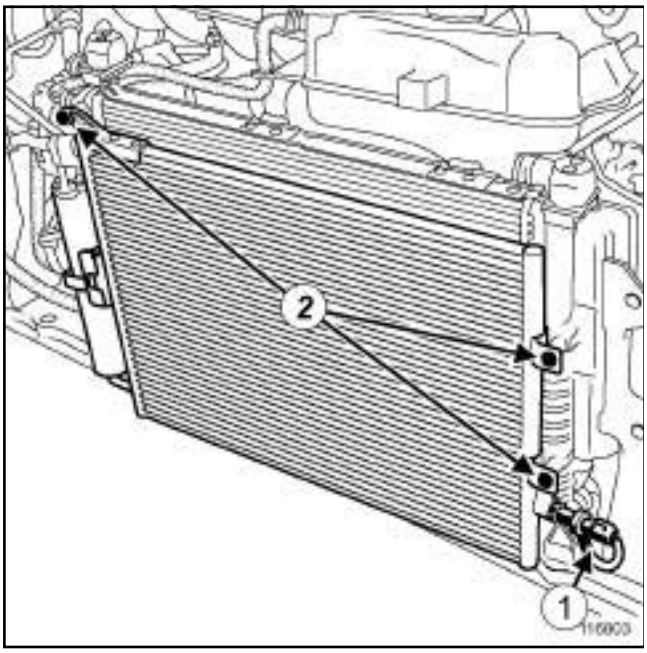
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the engine undertray.

❑ Perform the following operations:



- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- clean the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure).

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - Removing the « motor-driven fan assembly - radiator » assembly

116803

❑ Disconnect:

- the engine cooling fan assembly connectors,
- the pressure sensor connector (**1**) ,
- the cooling radiator hoses using the **(Mot. 1448)**.

❑ Remove the mounting bolts (**2**) from the air conditioning condenser.

❑ Move the air conditioning condenser slightly to one side.

WARNING
Do not deform the air conditioning pipes.

WARNING
Do not damage the cooling unit vanes (radiator, condenser, etc) during handling.

❑ Remove the « expansion bottle - radiator - motor-driven fan assembly » assembly.

2 - Stripping the radiator

❑ Separate the motor-driven fan assembly from the cooling radiator (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-85**) .

WARNING
Do not damage the cooling unit vanes (radiator, condenser, etc) during handling.

❑ Disconnect the expansion bottle hoses on the cooling radiator using the **(Mot. 1448)**.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Connect the expansion bottle hoses to the cooling radiator.

❑ Refit the engine cooling fan assembly to the cooling radiator.

WARNING
Do not damage the cooling unit vanes (radiator, condenser, etc) during handling.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the « expansion bottle - radiator - motor-driven fan assembly » assembly to the radiator mounting cross member,
- the air conditioning condenser to the cooling radiator.

WARNING
Do not damage the cooling unit vanes (radiator, condenser, etc) during handling.

❑ Refit the air conditioning condenser mounting bolts to the cooling radiator.

❑ Connect:

- the cooling radiator hoses using the **(Mot. 1448)**.
- the pressure sensor connector,
- the fan assembly connectors.

F4R

III - FINAL OPERATION

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Check that there are no coolant leaks.

❑ Refit the engine undertray.

Cooling radiator: Removal - Refitting

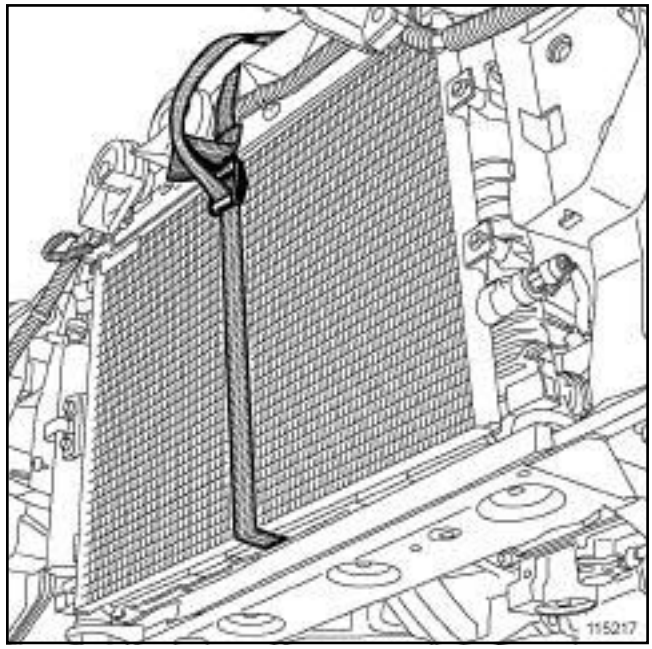
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

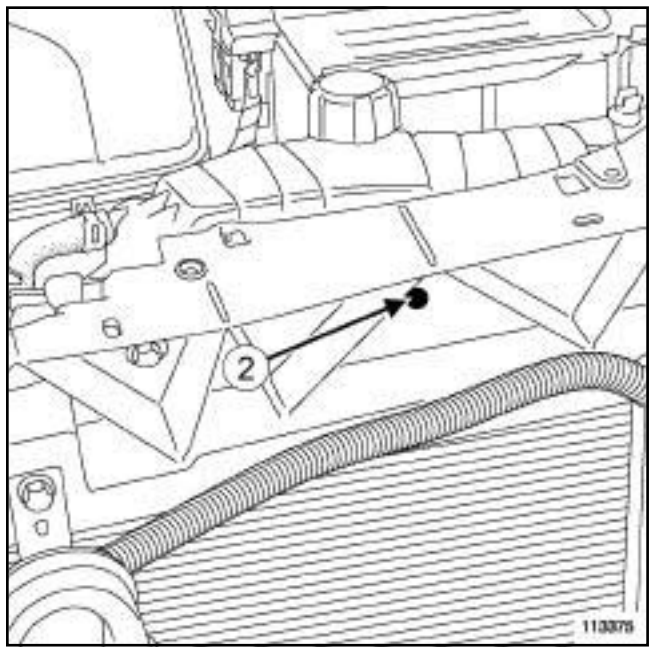


121762

❏ Remove the air filter unit air inlet pipe (**1**) .

❏ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

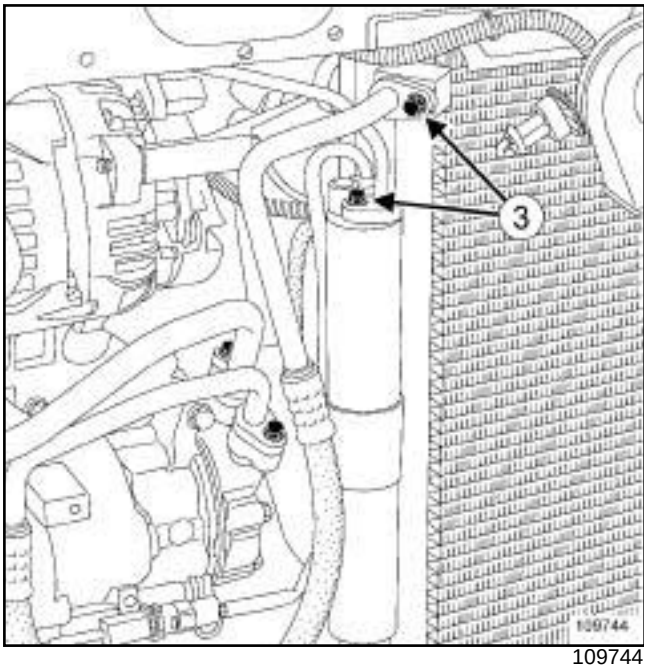


❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

115217

❏ Attach the « radiator - condenser - cooling fan » assembly using a **safety strap(s)**.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).



113375

❏ Remove the clip (**2**) from the expansion bottle.

❏ Remove the expansion bottle.

D4F, and 784

AIR CONDITIONING

109744

❏ Drain the air conditioning circuit using **refrigerant charging station**.

❏ Remove the bolts (**3**) from the air conditioning pipes on the dehydrator reservoir and on the condenser.

❏ Uncouple the air conditioning pipes on the dehydrator reservoir and on the condenser.

❏ Plug the openings.

❏ Disconnect the pressostat connector.

❏ Disconnect the motor-driven fan assembly connectors.

❏ Unclip the wiring harness on the fan assembly.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Detach the « radiator - condenser - cooling fan » assembly from the front end panel.

❏ Remove:

- the « radiator - condenser - motor-driven fan » assembly,
- the front end panel rubber pads.

Stripping the cooling radiator

❏ Remove:

- the dehydration canister clamp bolts,
- the air conditioning pipe bolt,
- the dehydration canister.

❏ Move the hose clips away from the expansion bottle using **(Mot. 1448)**.

❏ Disconnect:

- the bottom hose of the expansion bottle on the radiator,
- the top hose of the expansion bottle on the radiator.

❏ Unclip the cooling fan assembly.

REFITTING

I - REFITTING PREPARATIONS OPERATION

Rebuilding the cooling radiator

❏ Clip on the cooling fan assembly.

❏ Connect:

- the bottom hose of the expansion bottle on the radiator,
- the top hose of the expansion bottle on the radiator.

❏ Fit the clips on the expansion bottle hoses using the **(Mot. 1448)**.

❏ Refit:

- the dehydrator reservoir.
- the air conditioning pipe bolt,
- the dehydration canister clamp bolts.

❏ Torque tighten the **air conditioning pipe bolt (8 Nm)**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the front end panel rubber pads,
- the « radiator - condenser - engine motor-driven fan » assembly.

III - FINAL OPERATION.

❏ Refit the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

D4F, and 784

❏ Clip the wiring harness onto the motor-driven fan assembly.

❏ Connect the motor-driven fan assembly connectors.

AIR CONDITIONING

❏ Connect the pressostat connector.

❏ Remove the blanking plugs.

❏ Refit:

- the air conditioning pipes on the dehydrator reservoir and on the condenser,
- the bolts for the air conditioning pipes on the dehydrator reservoir and on the condenser.

❏ Torque tighten the **air conditioning pipe bolts (8 Nm)**.

❏ Refit:

- the expansion bottle,
- the expansion bottle clip,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the air filter unit air inlet pipe.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

AIR CONDITIONING

❏ Fill the air conditioning circuit with **refrigerant charging station**.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit the engine undertray.

Coolant pump: Removal - Refitting

D4F, and 740 or 742 or 764

Tightening torques ▽	
coolant pump bolts	**9 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see **19A**, **Cooling**, **Engine cooling: Precautions for the repair**, page **19A-2**) ,
- (see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

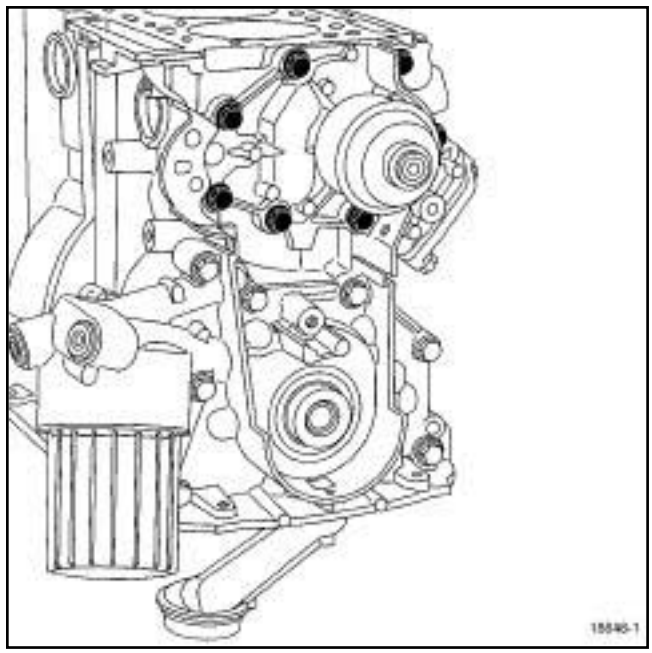
❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand deflector,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) (11A, Top and front of engine),
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) (16A, Starting - Charging),
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) (11A, Top and front of engine).

❏ Drain the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (19A, Cooling).

AIR CONDITIONING

❏ Disconnect the air conditioning compressor clutch connector.



❏ Remove the air conditioning compressor bolts.

❏ Attach the air conditioning compressor to the radiator lower cross member.

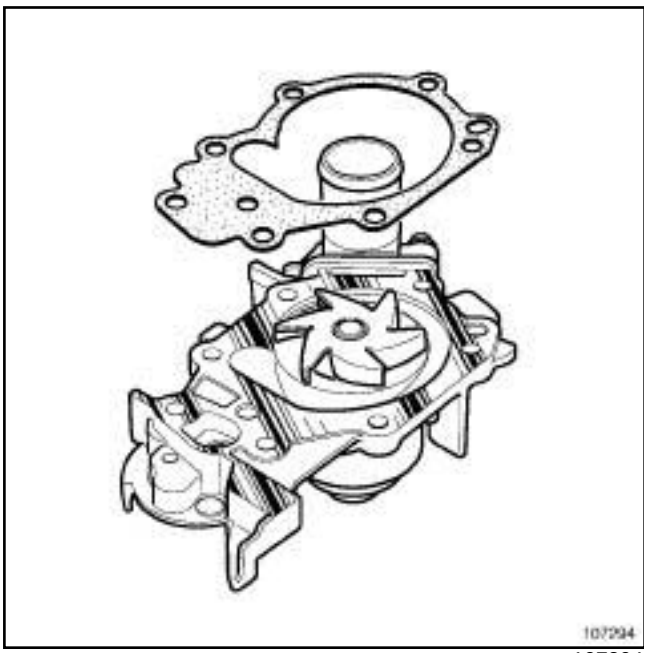
❏ Remove:

- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) (10A, Engine and cylinder block assembly),
- the coolant pump inlet pipe (see **19A**, **Cooling**, **Coolant pump inlet pipe: Removal - Refitting**, page **19A-93**) (19A, Cooling).

II - OPERATION FOR REMOVAL OF PART CONCERNED

18646-1

❏ Remove:



- the coolant pump bolts,
- the coolant pump,
- the coolant pump seal.

D4F, and 740 or 742 or 764

REFITTING

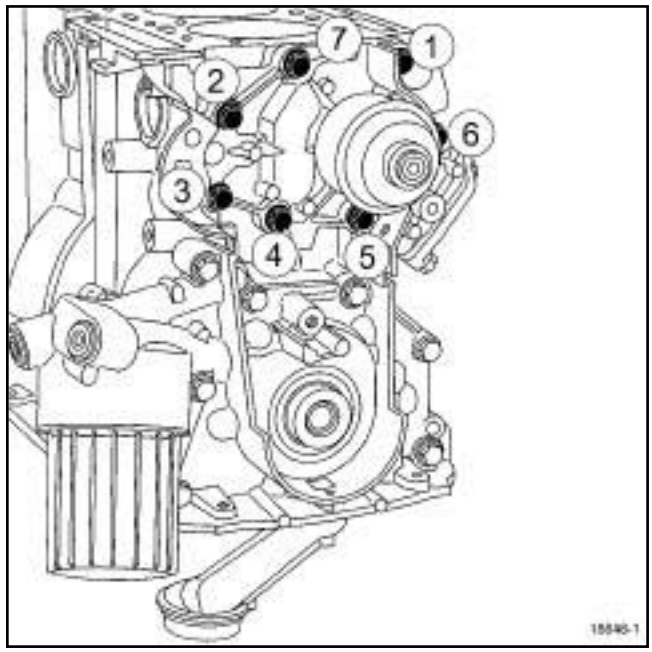
I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: coolant pump seal (10,06,01,21)**.

107294

❑

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.



IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Wear goggles with side protectors for this operation.

❑ Clean the joint faces with **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve any part of the seal still adhering.

❑ Apply the product to the section to be cleaned; wait approximately ten minutes, then remove the residue using a wooden spatula.

II - REFITTING OPERATION FOR PART CONCERNED

18646-1

❑

WARNING
To ensure proper sealing, the joint faces must be clean, dry and not greasy (avoid any finger marks).

WARNING
To check the sealing of parts delivered with a seal, fit the seal without sealing resin.

❑ Refit a new coolant pump seal.

WARNING
Failure to observe the following procedure may cause irreparable damage to the coolant pump.

Note:
To fit the coolant pump on the two pins of the cylinder block, never use the coolant pump pinion for support. Instead, use the coolant pump bolts by pretightening them.

❑ Refit:

- the coolant pump,
- the coolant pump bolts.

❑ Tighten to torque and in order the **coolant pump bolts (9 N.m)**.

D4F, and 740 or 742 or 764

III - FINAL OPERATION

❑ Refit:

- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) (10A, Engine and cylinder block assembly),

- the coolant pump inlet pipe (see **19A**, **Cooling**, **Coolant pump inlet pipe: Removal - Refitting**, page **19A-93**) (19A, Cooling).

AIR CONDITIONING

❑ Refit the air conditioning compressor.

❑ Connect the air conditioning compressor clutch connector.

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) (11A, Top and front of engine),

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) (16A, Starting - Charging),

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) (11A, Top and front of engine),

- the front right-hand deflector,

- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Fill up and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (19A, Cooling).

Coolant pump: Removal - Refitting

K4J or K4M

Tightening torques ▽	
bolts (2) to (8) of the coolant pump	**10 N.m**
bolt 1 of the coolant pump	**27 N.m**

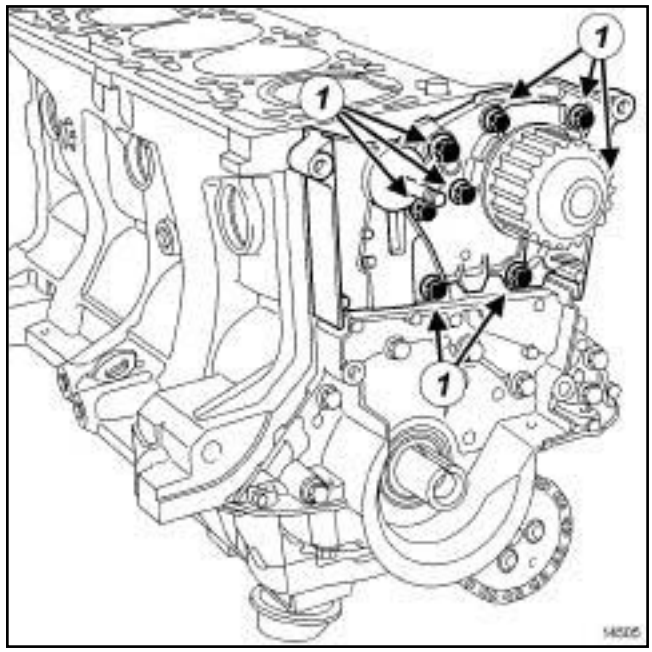
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:



- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

STANDARD HEATING

❑ Remove the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

14505

❑ Remove:

- the coolant pump bolts (**1**) ,
- the coolant pump.

REFITTING

I - REFITTING PREPARATION OPERATION

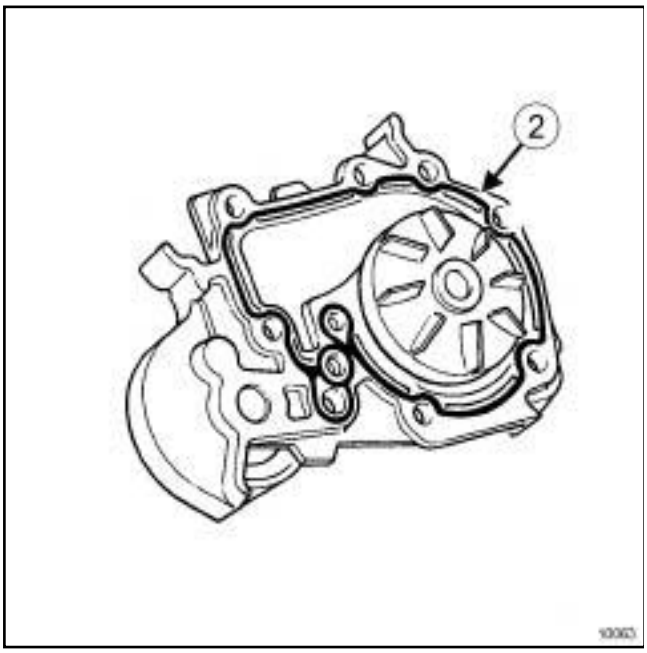
❑

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



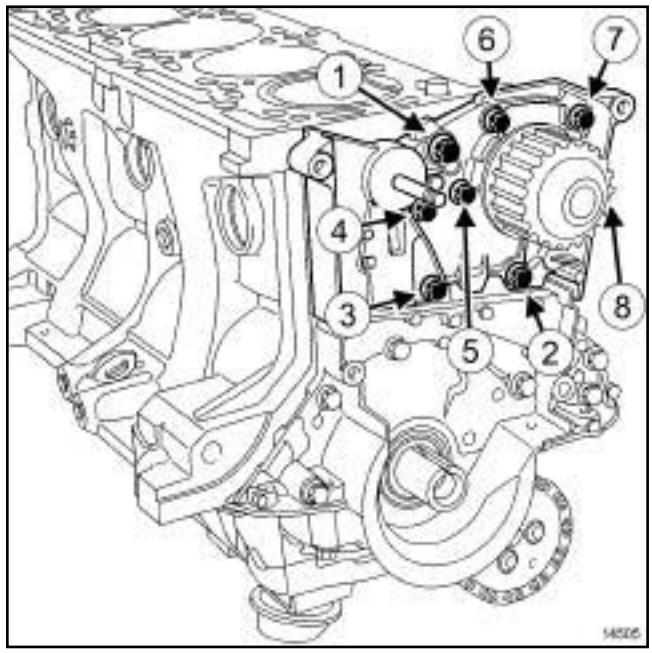
K4J or K4M

❑ Use **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the coolant pump sealing face if it is to be reused,
- the cylinder block gasket face.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

- the coolant pump joint face if the pump is to be reused,
- the cylinder block joint face.



10063

❑

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Apply at (**2**) a bead of **RESIN ADHESIVE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) **0.6 to 1 mm** wide.

II - REFITTING OPERATION FOR PART CONCERNED

14505

❑

Note:
Apply one to two drops of **FRENETANCHE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the coolant pump bolts (**1**) and (**4**) .

Note:
To fit the coolant pump on the two pins of the cylinder block, never use the coolant pump pinion for support. Instead, use the coolant pump bolts by pretightening them.

❑ Refit:

- the coolant pump,
- the coolant pump bolts.

❑ Tighten to torque and in order:

- **bolts (2) to (8) of the coolant pump (10 N.m)**,
- **bolt 1 of the coolant pump (27 N.m)**.

K4J or K4M

III - FINAL OPERATION

STANDARD HEATING

❑ Refit the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) .

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K9K

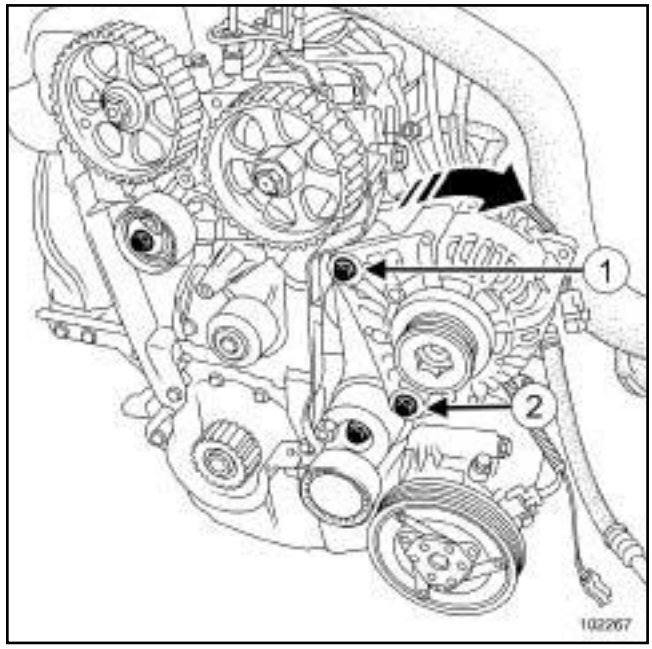
Tightening torques ▽	
coolant pump bolts	**11 N.m**
inner timing cover bolts	**9 N.m**
alternator bolts	**21 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



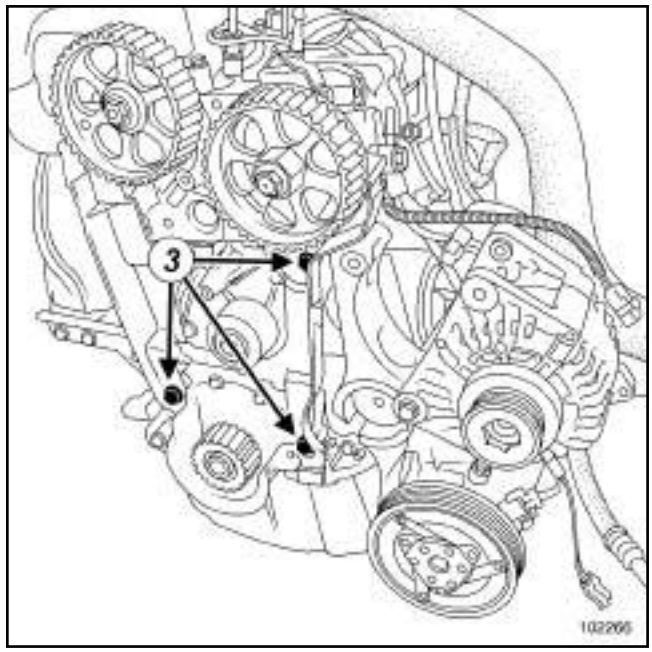
❏ Remove:

- the engine undertray,
- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Clean the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .



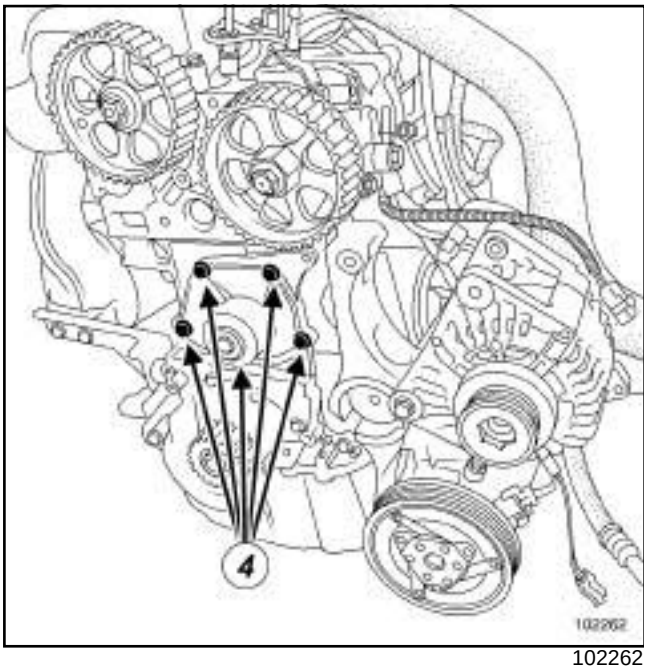
102267

❏ Disconnect the electrical connections from the alternator.

❏ Remove the alternator upper bolt (**1**) .

❏ Loosen the alternator lower bolt (**2**) .

❏ Tip the alternator towards the front of the vehicle.



102266

❏ Remove:

- the inner timing cover bolts (**3**) ,
- the inner timing cover.

K9K

II - REMOVAL OF THE PART CONCERNED

102262

❑ Remove:

- the coolant pump bolts (**4**) ,
- the coolant pump,
- the coolant pump seal,

REFITTING

I - REFITTING PREPARATION OPERATION

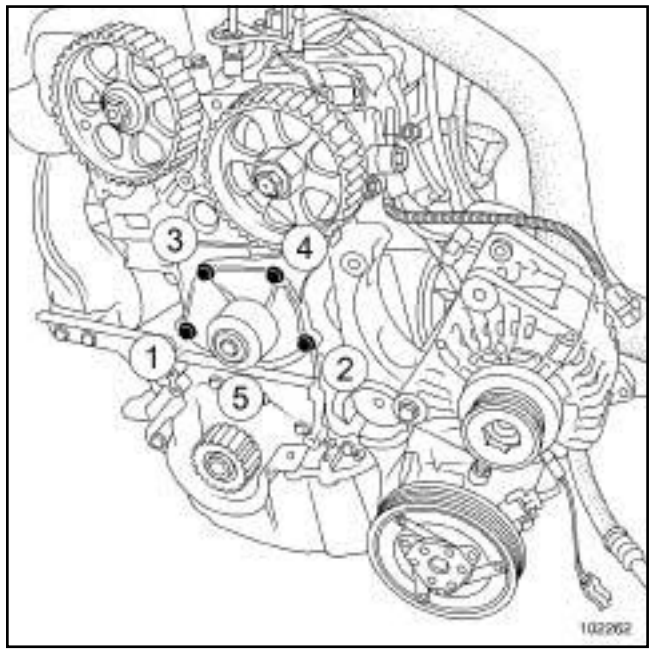
❑ Clean the joint faces with **SUPER DÉCAPANT FOR JOINT FACES** to dissolve any remaining parts of the seal.

Apply the product to the sections to be cleaned; wait for approximately ten minutes, then remove the residue using a wooden spatula.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear gloves during this operation.



II - REFITTING PART CONCERNED

❑ Replace the coolant pump seal every time the coolant pump is removed.

❑ Position the coolant pump fitted with a new seal.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

Note:
Apply one or two drops of **FRENETANCHE** on the coolant pump bolts.

102262

❑ Tighten to torque and in order the **coolant pump bolts (11 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the inner timing cover,
- the inner timing cover bolts.

❑ Tighten to torque the **inner timing cover bolts (9 N.m)**.

❑ Refit the alternator upper bolt.

❑ Torque tighten the **alternator bolts (21 N.m)**.

❑ Connect the alternator electrical connections.

K9K

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the engine undertray,
- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

Coolant pump: Removal - Refitting

M4R

Special tooling required	
Mot. 1672	Lower engine support.

Tightening torques ▽	
coolant pump mounting bolts	**25 N.m**

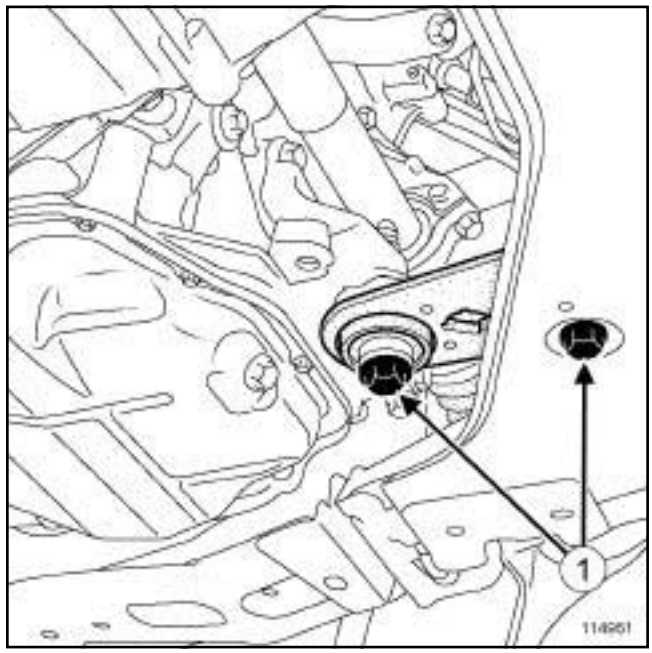
bolts mounting the rubber mounting bush on the body	**62 N.m**
bolts mounting the rubber mounting bush on the engine	**105 N.m**
upper engine tie-bar mounting bolts	**105 N.m**
bolt mounting the engine tie-bar on the subframe	**105 N.m**
bolt mounting the engine tie-bar on the engine	**180 N.m**
radiator mounting cross member right-hand mounting bolt	**105 N.m**
subframe tie-rod left-hand mounting bolt	**105 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



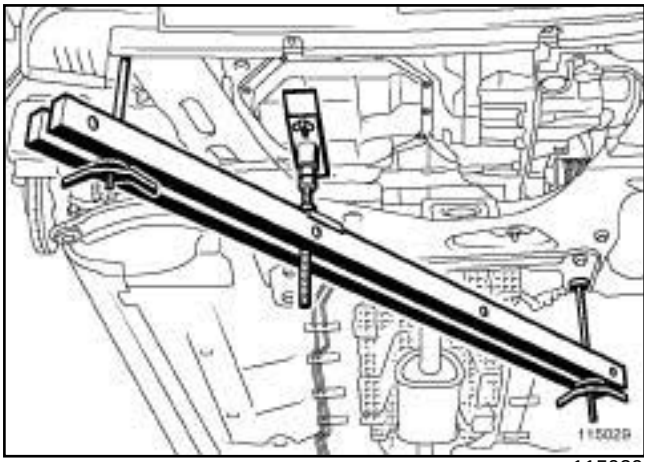
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

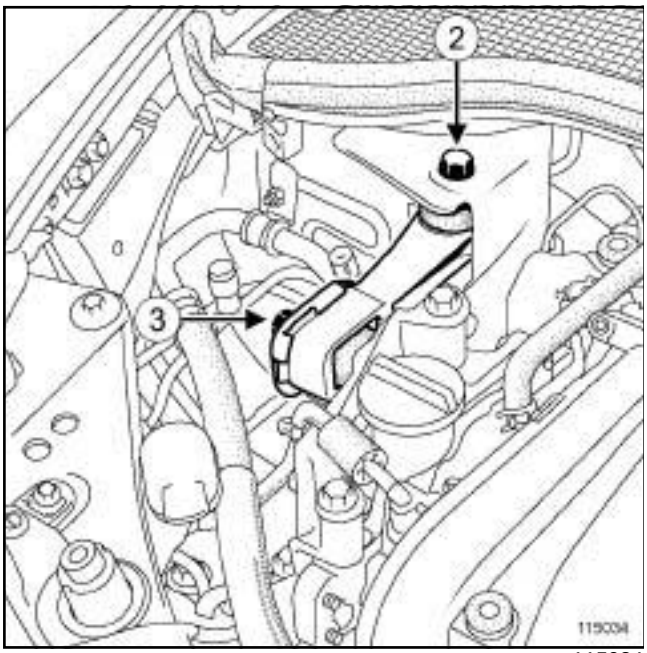
❑ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the right-hand wheel arch liner see (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .



114951

❑ Remove:

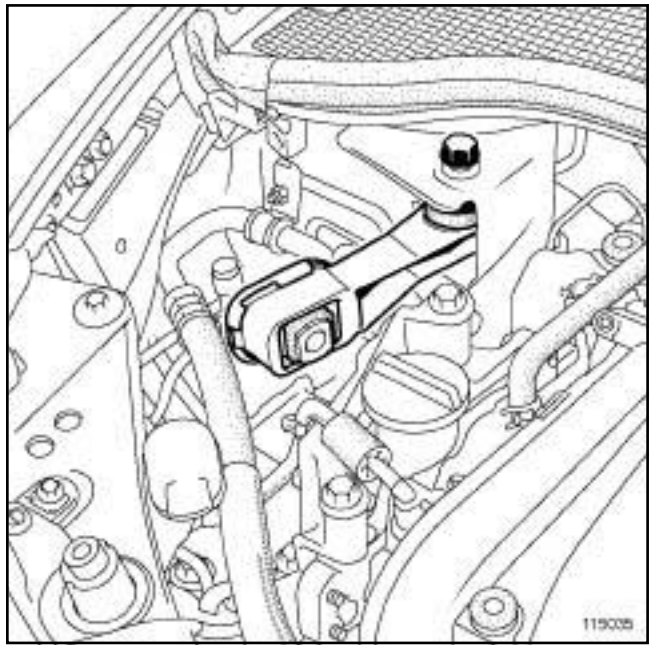


- the engine tie-bar mounting bolts (**1**) ,
- the engine tie-bar .

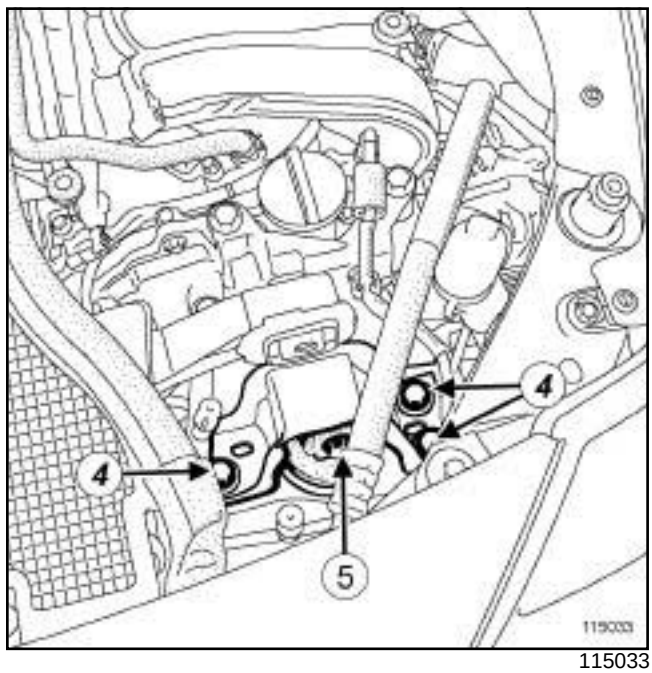
❑ Remove:

- the right-hand mounting bolt from the radiator support cross member,
- the left-hand mounting bolt from the sub-frame tie-rod.

115029



❏ Fit the lower engine support tool **(Mot. 1672)**.



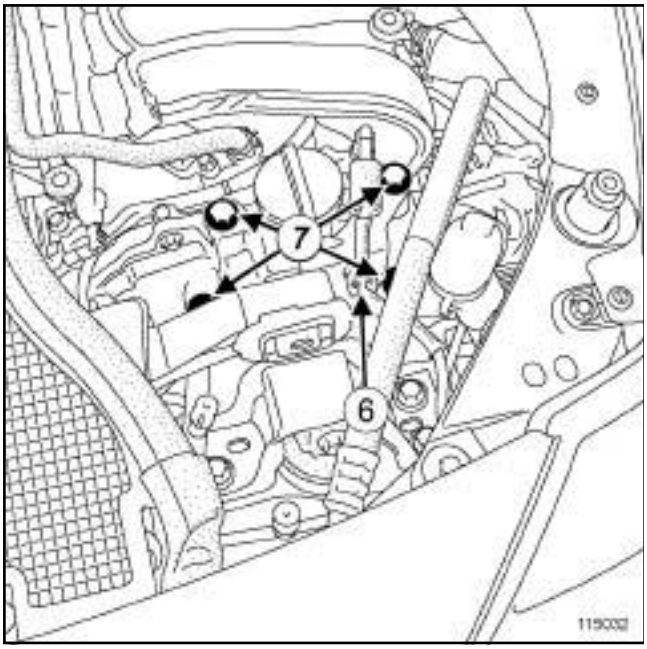
115034

❏ Undo the upper engine tie-bar mounting bolt (**2**) .

❏ Remove the upper engine tie-bar mounting bolt (**3**) .

115035

❏ Remove the upper engine tie-bar.

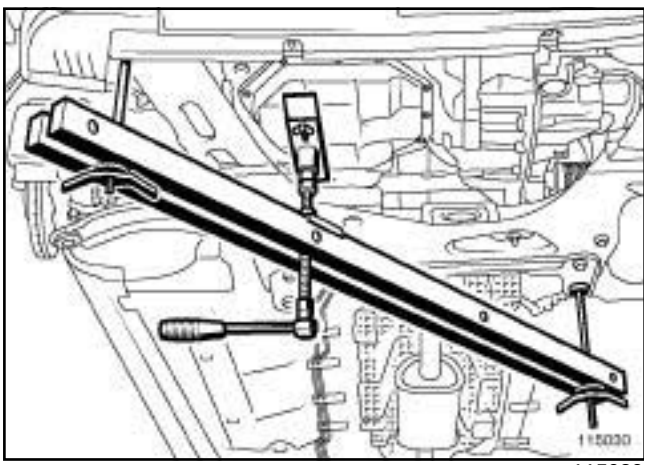


115033

❏ Remove:

- the engine cover rubber mounting bush mounting bolt (**4**) ,
- the rubber mounting bush mounting bolts (**5**) on the body.

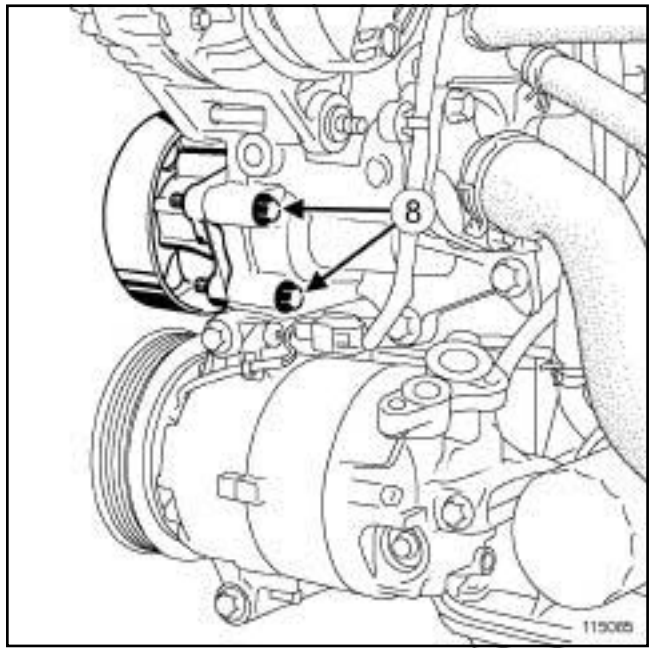
M4R



115032

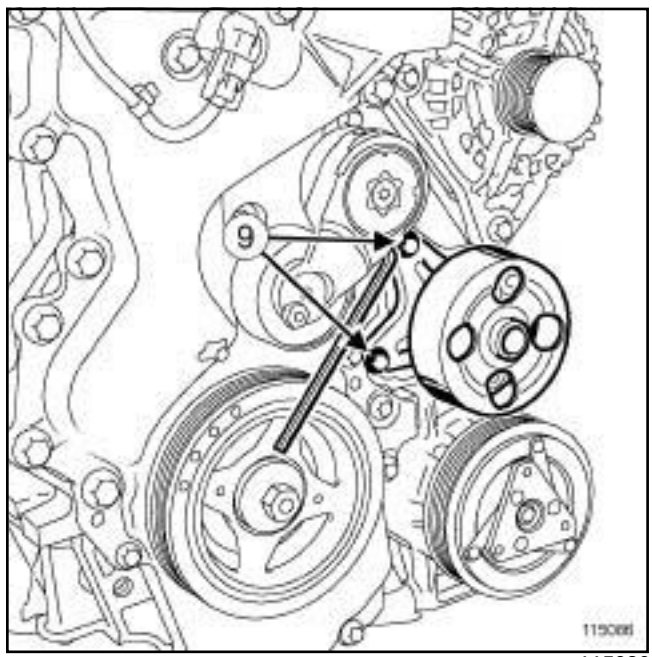
❏ Unclip the fuel supply pipe at (**6**) .

❏ Remove:



- the engine cover mounting bolts (**7**) ,
- the engine cover,
- the rubber mounting bush.

115030



❏ Lower the engine until the timing cover makes contact with the half sub-frame.

II - REMOVAL OF PART CONCERNED

115085

❏ Remove the water pump mounting bolts (**8**) .

115086

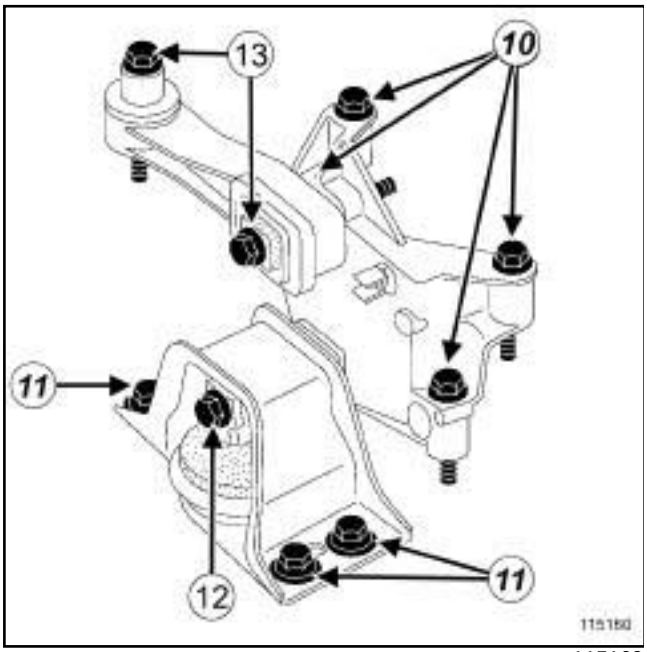
❏

- the coolant pump mounting bolts (**9**) ,
- the coolant pump,
- the coolant pump seal,

M4R

REFITTING

I - REFITTING PREPARATION OPERATION



❏ The coolant pump seal must be replaced.

II - REFITTING PART CONCERNED

❏ Refit the coolant pump.

❏ Tighten to torque the **coolant pump mounting bolts (25 N.m)**.

III - FINAL OPERATION

115160

❏ Fit:

- the rubber mounting bush,
- the engine cover.

❏ Pretighten:

- the engine cover mounting bolts (**10**) ,
- the rubber mounting bush mounting bolts (**11**) on the body.

Note:
Allow the two parts to move freely.

❏ Raise the engine to fit the bolt securing the rubber mounting bush to the engine cover.

❏ Tighten to torque and in order:

- the **engine cover mounting bolts (62 N.m)** at (**10**) ,
- the **bolts mounting the rubber mounting bush on the body (62 N.m)** at (**11**) ,
- the **bolts mounting the rubber mounting bush on the engine (105 N.m)** at (**12**) ,
- the **upper engine tie-bar mounting bolts (105 N.m)** at (**13**) .

❏ Remove the lower engine support tool **(Mot. 1672)**.

❏ Torque tighten:

- the **bolt mounting the engine tie-bar on the subframe (105 N.m)**,
- the **bolt mounting the engine tie-bar on the engine (180 N.m)**.
- the **radiator mounting cross member right-hand mounting bolt (105 N.m)**,
- the **subframe tie-rod left-hand mounting bolt (105 N.m)**.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front section of the right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) ,
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❏ Connect the battery (see **80A, Battery, Battery: Removal - Refitting**).

❏ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

Coolant pump: Removal - Refitting

F4R

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1453-01	Additional handle nut for engine lifting support tool Mot. 1453.

Tightening torques ▽	
coolant pump mounting bolts	**17 N.m**

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot. Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for "extreme cold" countries.

WARNING

Drain with the engine warm.

Flush and refill with the engine cold or warm.

Never flush a hot engine (risk of major thermal shock).

REMOVAL

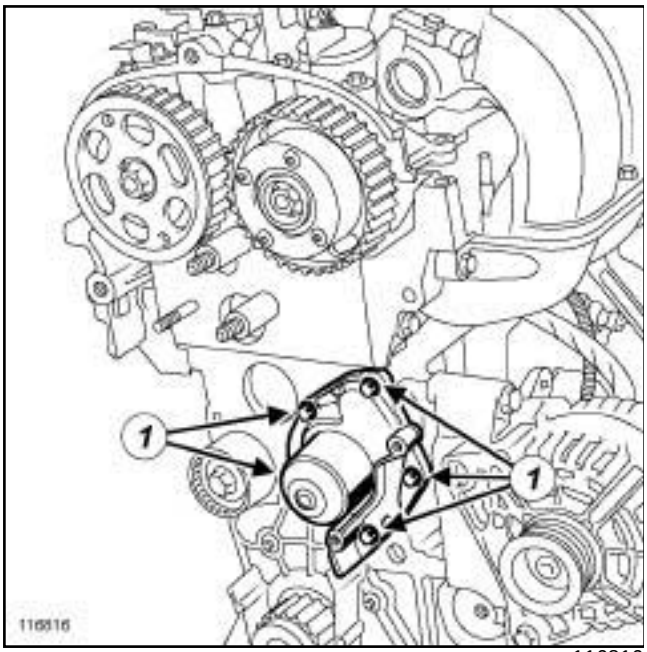
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **02A, Lifting equipment, Vehicle: Towing and lifting**).

❑ Disconnect the battery (see **80A, Battery, Battery: Removal - Refitting**).

❑ Remove:

- the battery (see **80A, Battery, Battery: Removal - Refitting**),
- the front right-hand wheel (**35A, Wheels and tyres, Wheel: Removal - Refitting**),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the engine undertray.



❑ Perform the following operations:

- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Fit the engine lifting eye at the timing end (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❑ Remove the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) using the **(Mot. 1453)** fitted with the **(Mot. 1453-01)**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116816

❑ Remove:

- the water pump mounting bolts (**1**) ,
- the coolant pump.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Clean the joint faces.

> **IMPORTANT**
> Do not scratch the aluminium sealing surfaces.
> Wear goggles.
> Wear gloves during the operation.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the coolant pump fitted with a new seal.

❑ Refit the coolant pump mounting bolts.

❑ Torque tighten the **coolant pump mounting bolts (17 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel (**35A, Wheels and tyres, Wheel: Removal - Refitting**),
- the battery (see **80A, Battery, Battery, Removal - Refitting**).

❑ Remove the engine lifting eye at the timing end (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❑ Connect the battery (see **80A, Battery, Battery: Removal - Refitting**).

❑ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Check that there are no coolant leaks.

❑ Refit the engine undertray.

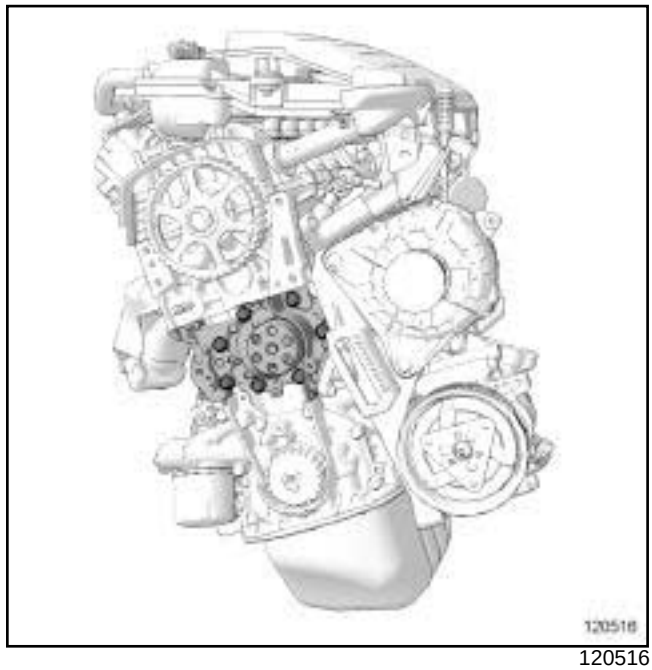
D4F, and 784

Tightening torques ▽	
coolant pump bolts	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine cover,
- the engine undertray,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

120516

❏ Remove:

- the coolant pump bolts,
- the coolant pump,
- the coolant pump seal,

REFITTING

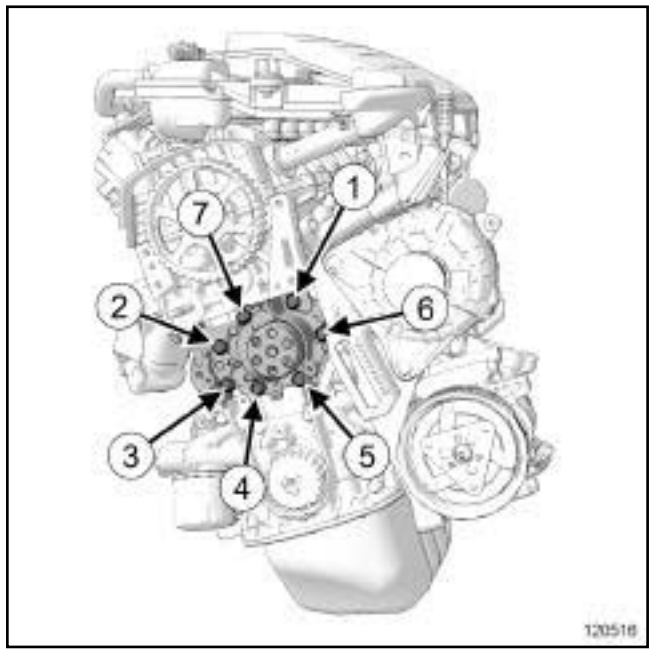
I - REFITTING PREPARATION OPERATION

❏

WARNING
Do not scrape the aluminium joint faces of the, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Wear goggles with side protectors for this operation.



❏ Clean the joint faces with **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve any part of the seal still adhering.

D4F, and 784

❑ Apply the product to the section to be cleaned; wait approximately ten minutes, then remove the residue using a wooden spatula.

❑ Always replace the coolant pump seal.

II - REFITTING OPERATION FOR PART CONCERNED

120516

❑

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING

To check the sealing of parts delivered with a seal, fit the seal without sealing resin.

❑ Refit a new seal for the coolant pump.

WARNING

Failure to observe the following procedure may cause irreparable damage to the coolant pump.

Note:

Do not push on the pinion when fitting the coolant pump, use the bolts instead.

❑ Refit the coolant pump.

❑ Tighten to torque and in order the **coolant pump bolts (10 N.m)**.

D4F, and 784

III - FINAL OPERATION

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the engine undertray,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Refill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

M4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
coolant inlet union mounting bolts	**17 N.m**

Note:

This engine has two thermostats: one thermostat is located on the cylinder head and the other is on the cylinder block.

REMOVAL OF THE CYLINDER HEAD THERMOSTAT

I - REMOVAL PREPARATION OPERATION

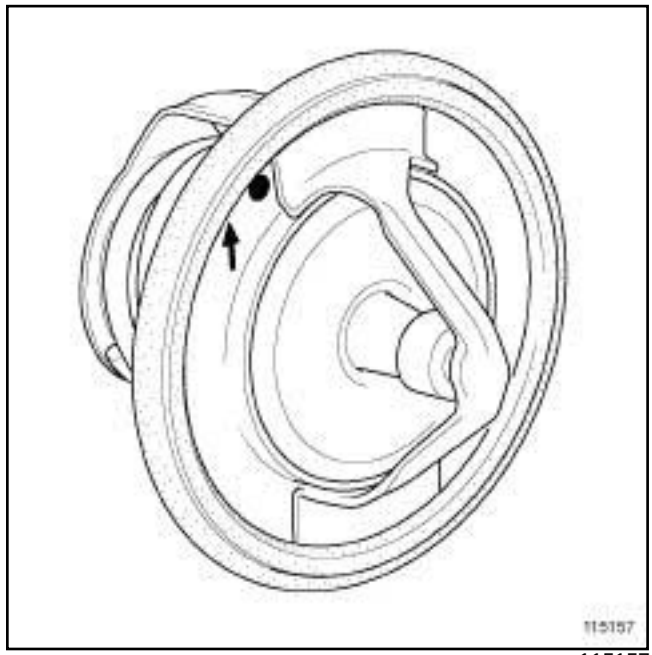
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove the engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .



❏ Remove the water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) .

II - REMOVAL OF PART CONCERNED

❏ Remove the cylinder head thermostat.

REFITTING THE CYLINDER HEAD THERMOSTAT

I - REFITTING PART CONCERNED

115157

❏ Refit the cylinder head thermostat, respecting the direction indicated in the diagram.

II - FINAL OPERATION

❏ Refit the coolant outlet unit (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit:

- the engine undertray,
- the engine cover.

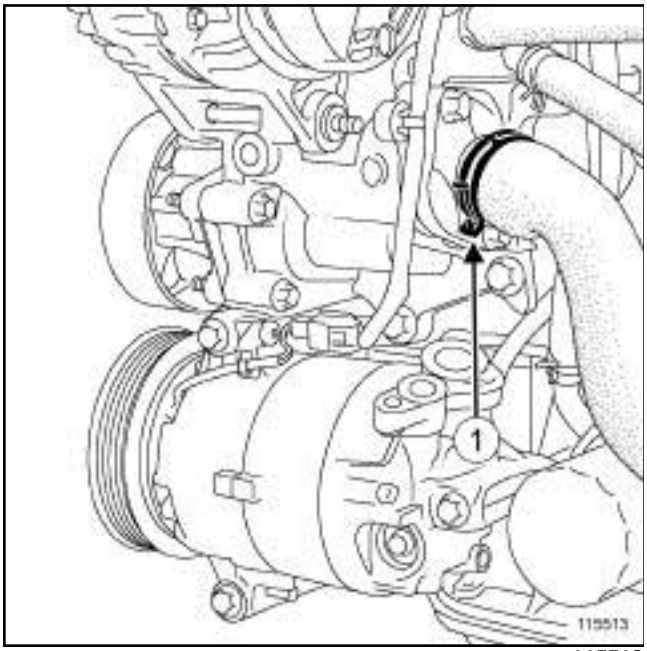
❏ Carry out the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

REMOVAL OF THE CYLINDER BLOCK THERMOSTAT

I - REMOVAL PREPARATION OPERATION

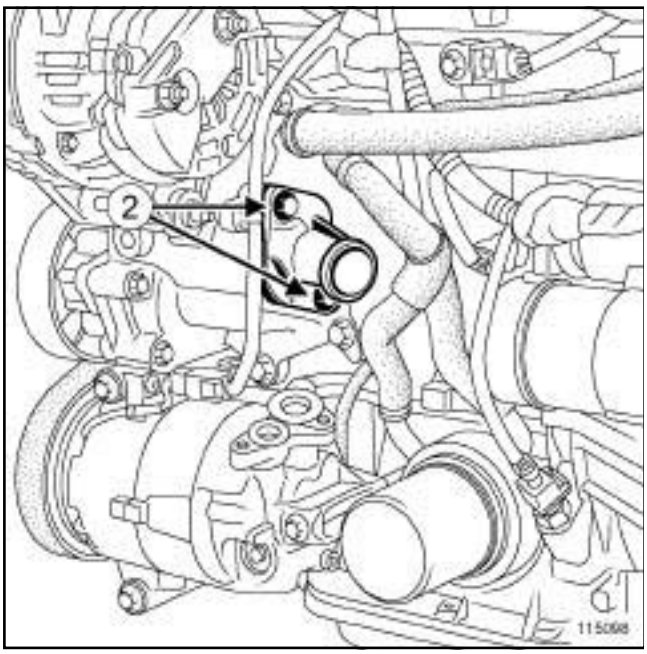
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



M4R

❑ Remove the engine cover.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❑ Remove the engine undertray.

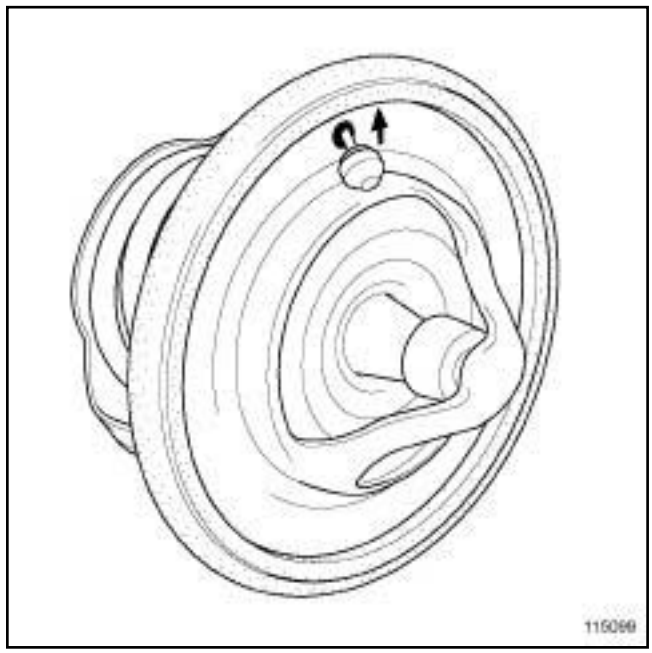
❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

115513

❑ Disconnect the coolant inlet union hose (**1**) using the **(Mot. 1448)**.

115098

❑ Remove:



- the mounting bolts (**2**) from the coolant inlet union,
- the coolant outlet union.

II - REMOVAL OF PART CONCERNED

❑ Remove the cylinder block thermostat.

REFITTING THE CYLINDER BLOCK THERMOSTAT

I - REFITTING PART CONCERNED

115099

❑ Refit the cylinder block thermostat, respecting the direction indicated in the diagram.

II - FINAL OPERATION

❑ Tighten to torque the **coolant inlet union mounting bolts (17 N.m)**.

❑ Connect the coolant inlet union hose using the **(Mot. 1448)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Refit:

- the engine undertray,
- the engine cover.

❑ Carry out the following operations:

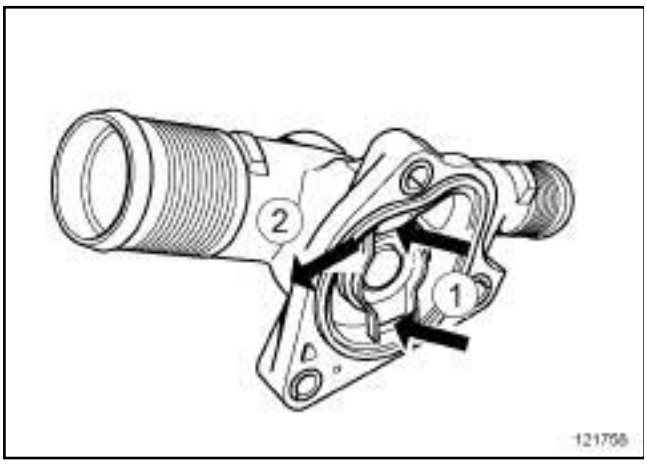
- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **Cooling system: Bleed**) .

M4R

D4F, and 784

REMOVAL

I - REMOVAL PREPARATION OPERATION

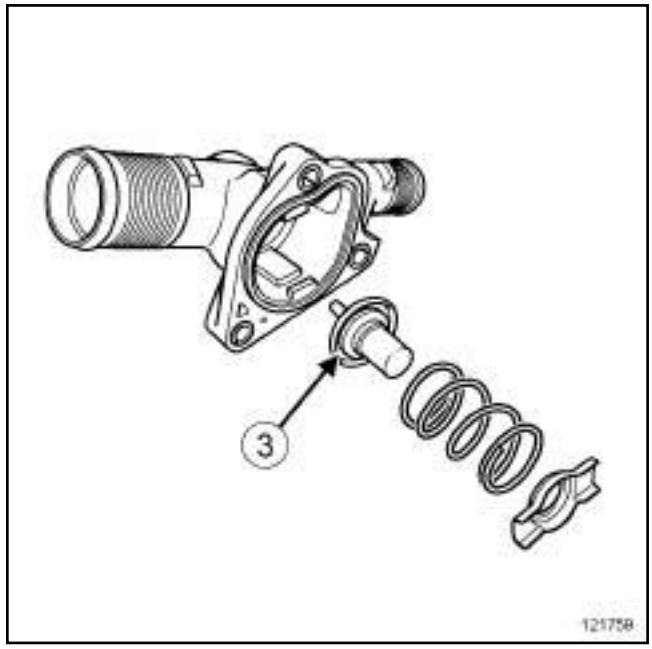


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine cover,
- the water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) .



II - OPERATION FOR REMOVAL OF PART CONCERNED

121758

❑ Press on the spring mounting at (**1**) .

❑ Turn the spring mounting at (**2**) .

121759

❑ Remove the thermostat (**3**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the thermostat.

❑ Fit:

- the spring,
- the spring mounting.

❑ Press on the spring mounting.

❑ Turn the spring mounting.

II - FINAL OPERATION.

❑ Refit:

- the water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) ,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

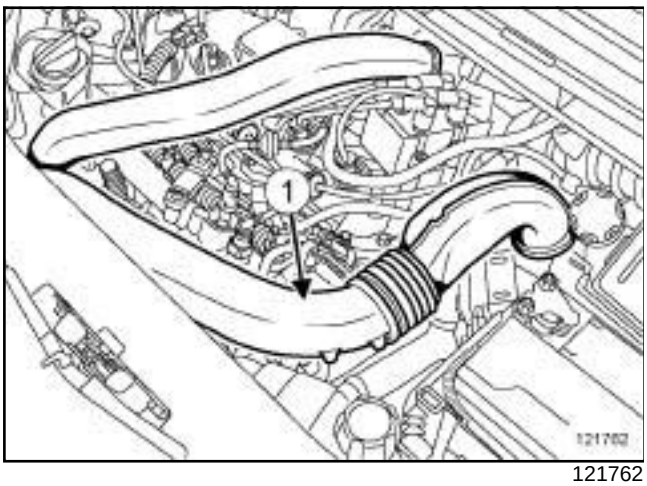
D4F, and 740 or 742 or 784

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
water chamber bolts	**9 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

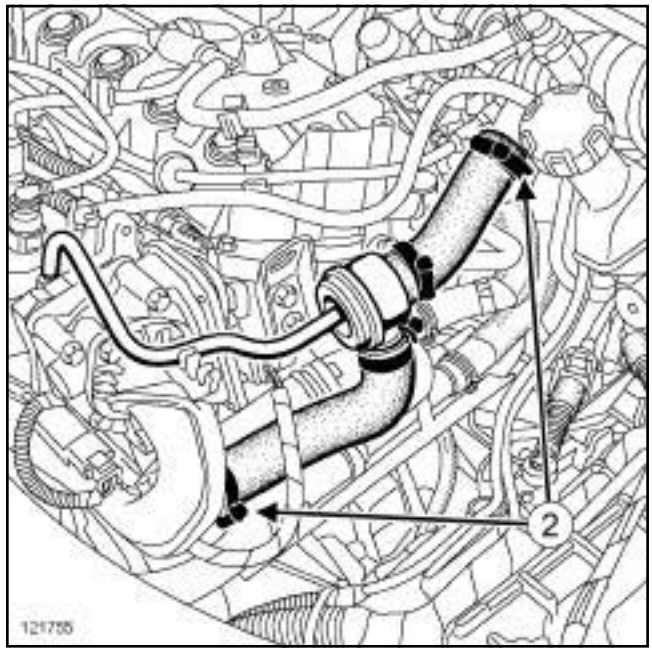


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 740 or 742

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture).



D4F, and 784

121762

❑ Remove the air filter unit air inlet pipe (**1**) .

D4F, and 784

121755

❑ Undo the compressor discharge valve pipe clips (**2**) .

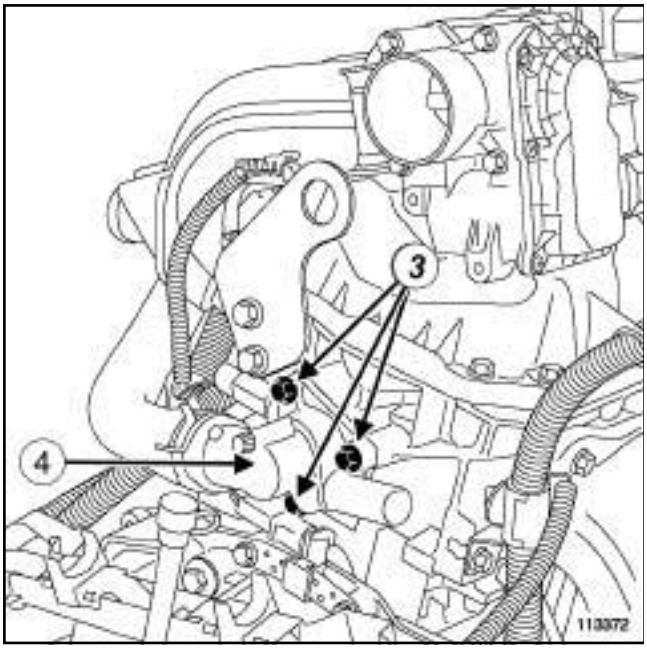
❑ Disconnect the compressor discharge valve pipe.

❑ Remove the compressor discharge valve pipe.

❑ Remove the engine undertray.

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

II - OPERATION FOR REMOVAL OF PART CONCERNED



❑ Remove the water chamber hose clips using the **(Mot. 1448)**.

Note:

Protect the TDC sensor with a cloth to prevent coolant entering the gearbox aperture.

❑ Disconnect the water chamber hoses.

D4F, and 740 or 742 or 784

113372

❑ Remove:

- the water chamber bolts (**3**) ,
- the water chamber (**4**) ,
- the water chamber seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear protective gloves during the operation.

IMPORTANT
Wear goggles with side protectors for this operation.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

❑ The water chamber seal must be replaced.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the water chamber with a new seal.

❑ Screw on the water chamber bolts without tightening them.

❑ Torque tighten the **water chamber bolts (9 N.m)**.

❑ Connect the water chamber hoses.

❑ Refit the water chamber hose clips using the **(Mot. 1448)**.

III - FINAL OPERATION

D4F, and 784

❑ Refit the compressor discharge valve pipe.

❑ Connect the compressor discharge valve pipe.

❑ Tighten the compressor discharge valve pipe clips.

❑ Refit the air filter unit air inlet pipe.

D4F, and 740 or 742

❑ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Refit the engine undertray.

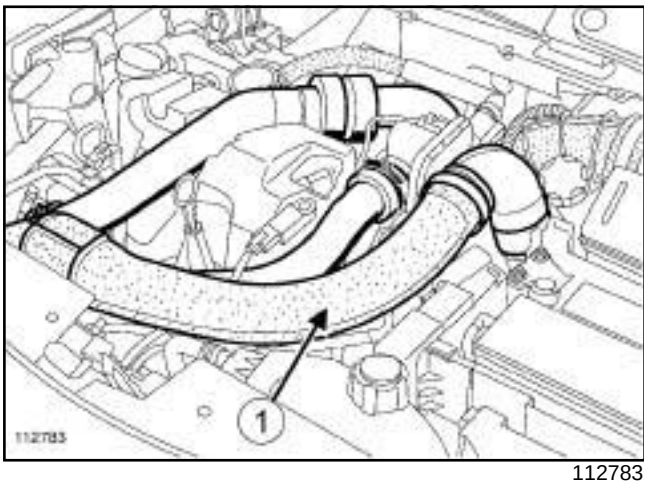
K9K

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)

Tightening torques ▽	
water chamber bolts	**12 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

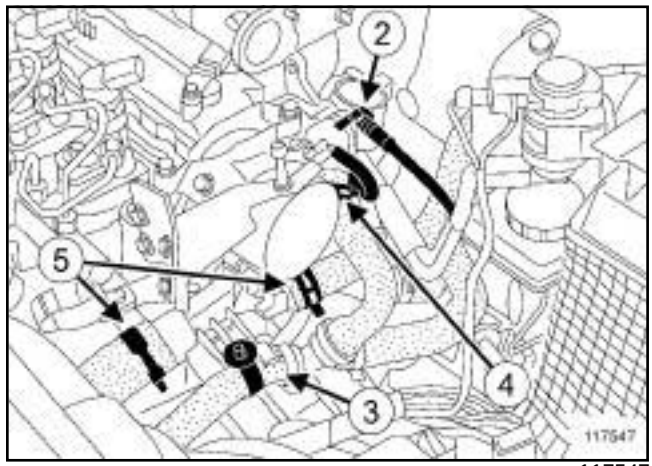


❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine cover,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).



❏ Clean the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

112783

❏ Remove:

- the air filter unit air inlet pipe (**1**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture).

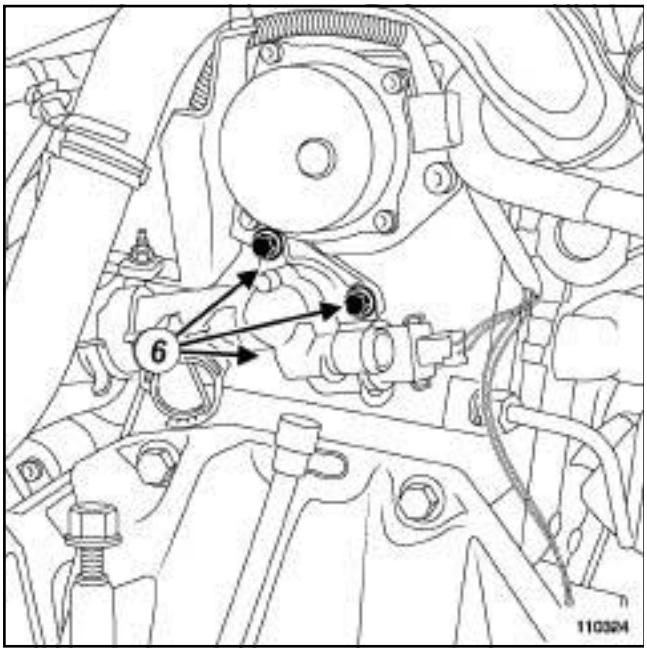
117547

❏ Disconnect the vacuum pipe (**2**) from the vacuum pump.

❏ Unclip the coolant hose (**3**) .

❏ Remove the clip (**4**) from the coolant hose using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the coolant hose.



❏ Move the water chamber hose clips (**5**) to one side using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect:

- the water chamber hoses,
- the coolant temperature sensor connector.

K9K

II - REMOVAL OF THE PART CONCERNED

110324

❑ Remove:

- the water chamber bolts (**6**) ,
- the water chamber.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

> **WARNING**
> The joint faces must be clean, dry and free from grease (avoid finger marks).

❑ Replace the seal of the water chamber.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the water chamber.

❑ Screw on the water chamber bolts without tightening them.

❑ Torque tighten the **water chamber bolts (12 N.m)**.

III - FINAL OPERATION

❑ Connect:

- the coolant temperature sensor connector,
- the water chamber hoses.

❑ Fit the water chamber hose clips using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Disconnect the coolant hose.

❑ Fit the coolant hose clip using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Clip the coolant hose.

❑ Connect the vacuum pipe to the vacuum pump.

❑ Refit:

- the engine undertray,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter inlet air pipe,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

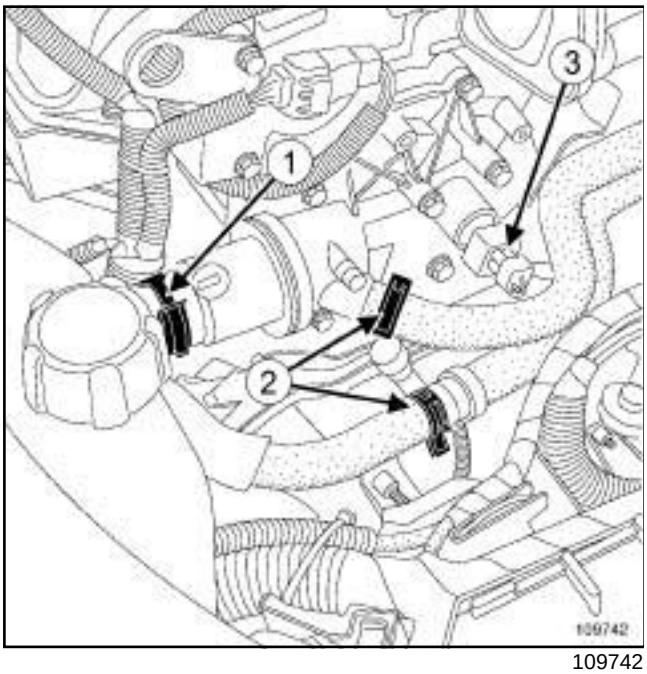
- fill the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling),
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Refit the engine cover.

K4J or K4M

Tightening torques ▽	
mounting bolts no. 9, 2, 8, 1, 4, 5, 6, 7, 3, 1	**11 N.m**

REMOVAL



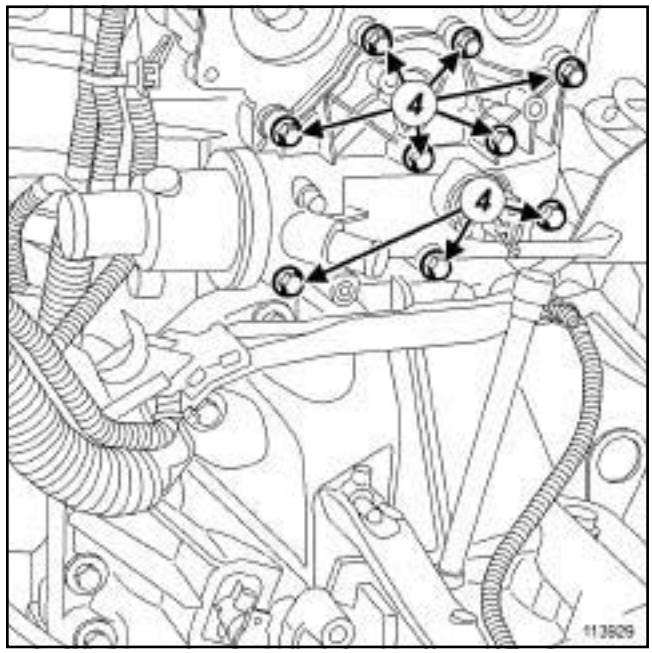
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air intake ducts,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).



109742

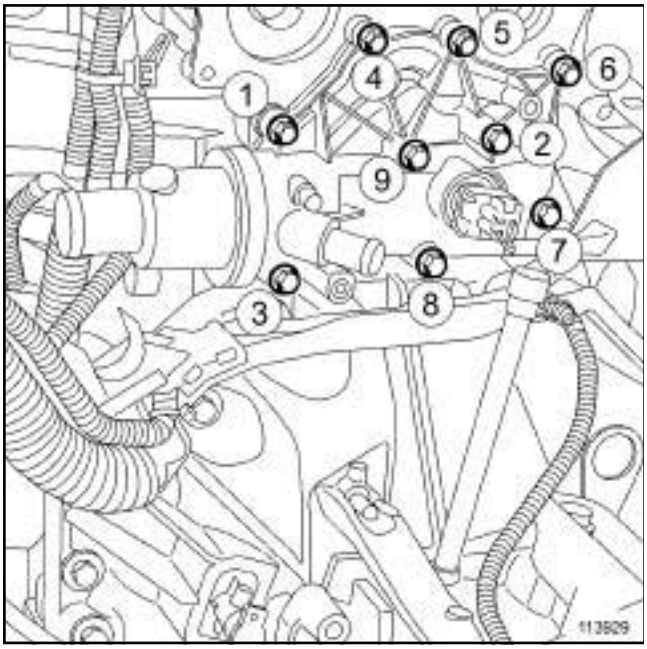
❑ Disconnect:

- the top hose (**1**) on the water chamber,
- the passenger compartment heating hoses (**2**) ,
- the coolant temperature sensor (**3**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

113929

❑ Remove



- the mounting bolts (**4**) from the water chamber,
- the water chamber.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the water chamber.

K4J or K4M

113929

❏ Tighten the water chamber mounting bolts,

❏ Pre-tighten the following mounting bolts in order and to torque: **mounting bolts no. 9, 2, 8, 1, 4, 5, 6, 7, 3, 1 (4 N.m)**.

❏ Tighten to torque and in order **mounting bolts no. 9, 2, 8, 1, 4, 5, 6, 7, 3, 1 (11 N.m)**.

II - FINAL OPERATION

❏ Connect:

- the coolant temperature sensor,
- the passenger compartment heating hoses,
- the top hose to the water chamber.

❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air intake ducts,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

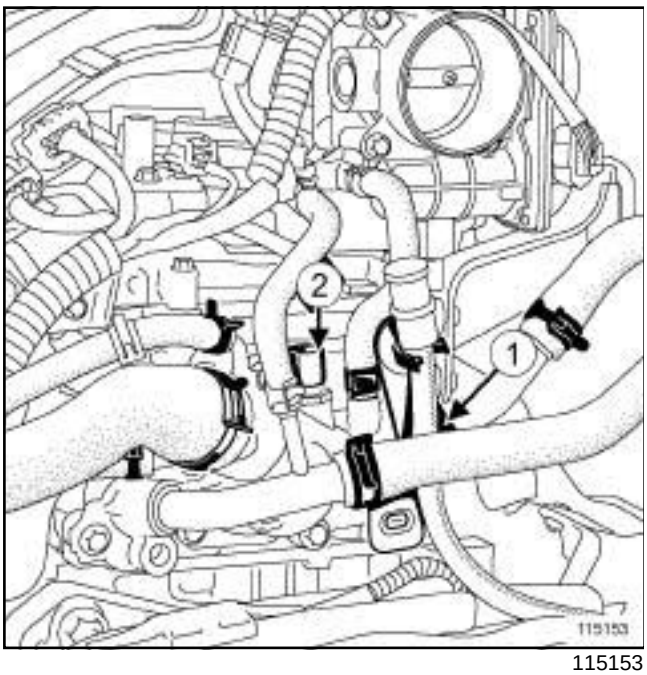
M4R

Tightening torques ▽	
water chamber mounting bolts	25 N.m

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



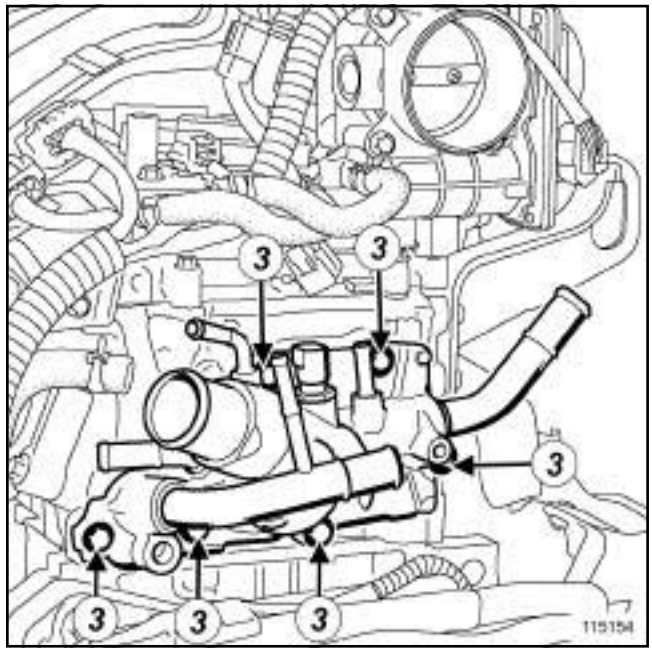
❏ Remove the engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).



115153

❏ Remove the gearbox breather mounting bracket (**1**) .

❏ Disconnect:

- the coolant temperature sensor connector (**2**) ,
- the hoses from the plenum chamber.

II - REMOVAL OF PART CONCERNED

115154

❏ Remove:

- the mounting bolts (**3**) from the water chamber,
- the water chamber,
- the water chamber seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ The water chamber seal must be replaced.

II - REFITTING PART CONCERNED

❏ Torque tighten the **water chamber mounting bolts (25 N.m)**.

III - FINAL OPERATION

❏ Connect:

- the coolant temperature sensor connector,
- the hoses from the plenum chamber.

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

M4R

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Refit the engine cover.

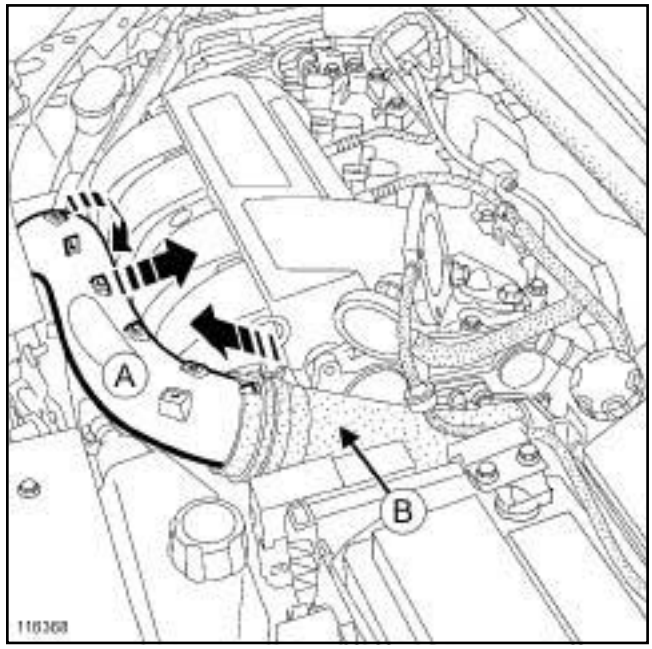
F4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
coolant outlet unit mounting bolts	**13 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

❏ Perform the following operations:

- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling),
- flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

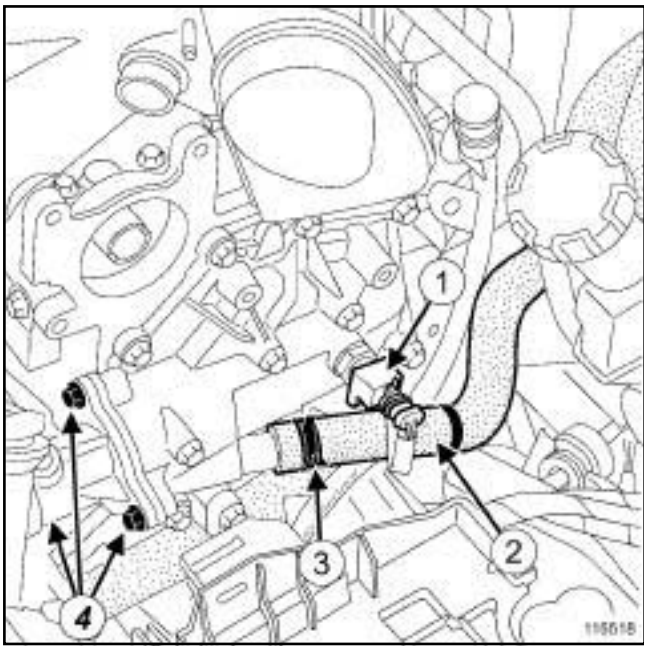
116368

❏ Remove the air inlet duct (**A**) :

- unclip it from the front end panel,
- turn it and disconnect it.

❏ Disconnect the duct (**B**) :

- air resonator side,
- air filter unit side.



❏ Remove:

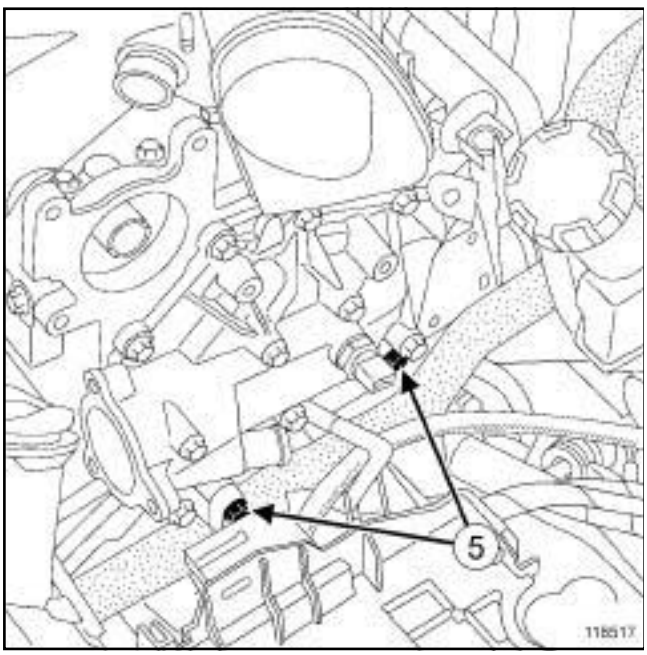
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Unclip the breather pipe from the gearbox.

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

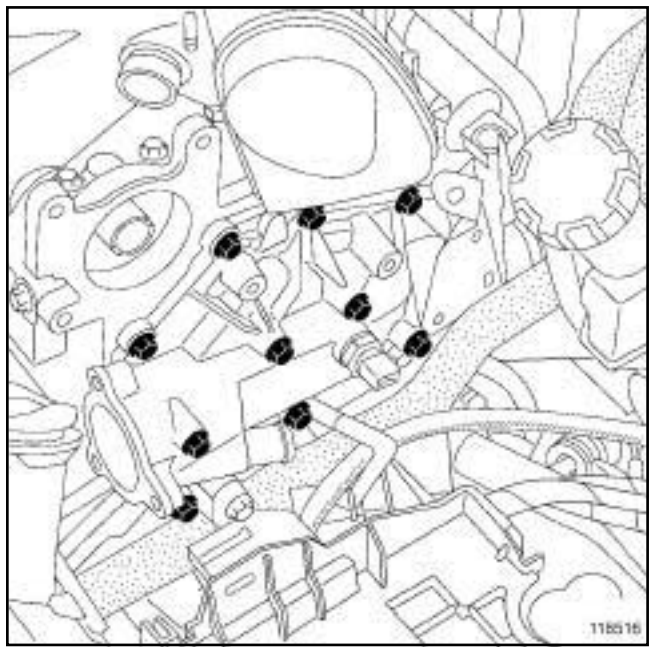
116518



❏ Disconnect:

- the coolant temperature sensor connector (**1**) ,
- the cooling hose (**2**) on the unit, separating the clip (**3**) using the **(Mot. 1448)**.

❏ Remove the thermostat cover mounting bolts (**4**) .



❏ Move the thermostat cover to one side.

❏ Remove the thermostat.

116517

❏ Remove the wiring harness channel mounting bolts (**5**) .

116516

❏ Remove:

- the coolant outlet unit mounting bolts,
- the water chamber.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Clean the joint faces.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the water chamber fitted with a new seal,
- the plenum chamber mounting bolts.

❏ Torque tighten the **coolant outlet unit mounting bolts (13 N.m)**.

❏ Refit:

- the thermostat fitted with a new seal,
- the thermostat cover,
- the thermostat cover mounting bolts,
- the coolant hose mounting bolts.

❏ Connect the coolant hose to the coolant outlet unit.

❏ Fit the hose clip using the **(Mot. 1448)**.

❏ Connect the coolant temperature sensor connector.

F4R

III - FINAL OPERATION

❏ Clip the breather pipe to the gearbox.

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Connect the duct ***(B)*** :

- to air filter unit,
- to the air resonator.

❏ Refit the air inlet duct ***(A)*** :

- rotate it and connect it,
- clip it to the front end panel.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling),
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Check that there are no leaks.

❏ Refit the engine undertray.

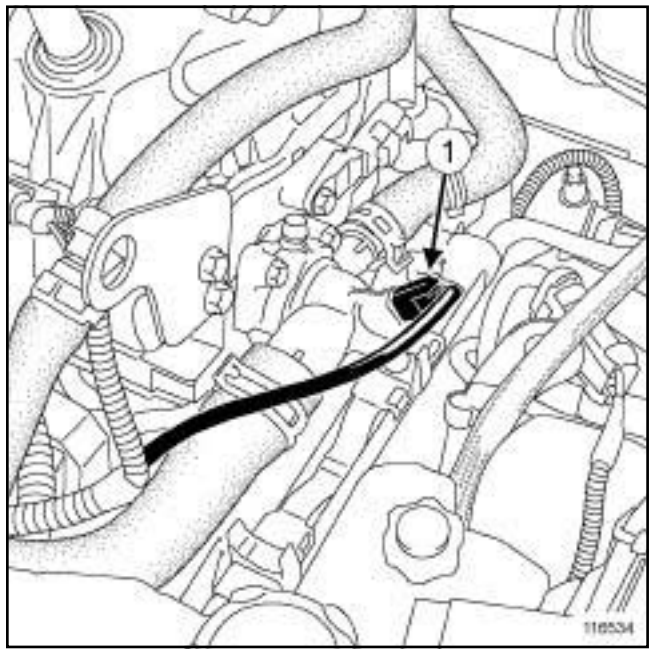
D4F, and 764

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
cylinder head water chamber bolts	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

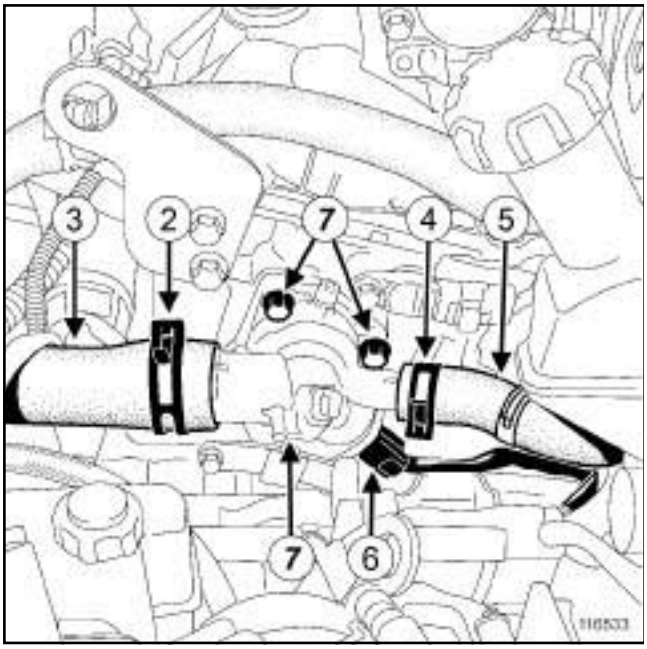
❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the engine undertray.

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

II - OPERATION FOR REMOVAL OF PART CONCERNED

116534



❑

Note:

Protect the TDC sensor with a cloth to prevent coolant entering the gearbox aperture.

❑ Disconnect the thermostat control connector (**1**) .

D4F, and 764

116533

❑ Remove using the **(Mot. 1448)** :

- the engine cooling radiator hose clip (**2**) ,
- the heater matrix hose clip (**4**) .

❑ Disconnect:

- the engine cooling radiator hose (**3**) ,
- the heater matrix hose (**5**) .

❑ Disconnect the coolant temperature sensor connector (**6**) .

❑ Remove:

- the water chamber bolts (**7**) ,
- the water chamber.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear protective gloves during the operation.

IMPORTANT
Wear goggles with side protectors for this operation.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

❑ The water chamber seal must be replaced.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the water chamber with a new seal.

❑ Screw on the water chamber bolts without tightening them.

❑ Torque tighten the **cylinder head water chamber bolts (10 N.m)**.

❑ Connect:

- the coolant temperature sensor connector,
- the heater matrix hose,
- the cooling radiator hose.

❑ Using the **(Mot. 1448)**, fit:

- the heater matrix hose clip,
- the engine cooling radiator hose clip.

❑ Connect the thermostat control connector.

III - FINAL OPERATION

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Refit:

- the engine undertray,

D4F, and 764

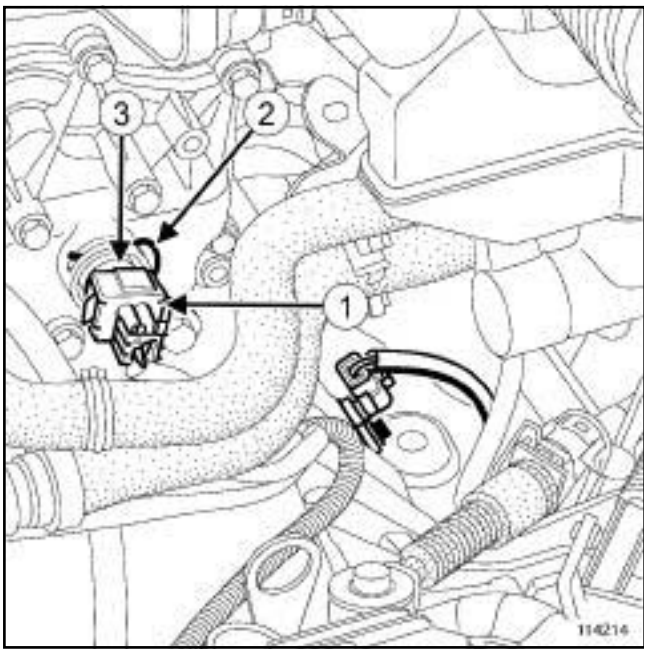
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

Coolant temperature sensor: Removal - Refitting

K4J or K4M

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the engine cover,
- the air intake sleeve.

II - OPERATION FOR REMOVAL OF PART CONCERNED

114214

❑ Disconnect the coolant temperature sensor connector (**1**) .

❑ Unclip the retaining clip (**2**) on the coolant temperature sensor.

❑ Remove the coolant temperature sensor (**3**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace the coolant temperature sensor O-ring.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the coolant temperature sensor.

❑ Secure the coolant temperature sensor with the retaining clip.

❑ Connect the coolant temperature sensor connector.

III - FINAL OPERATION

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑

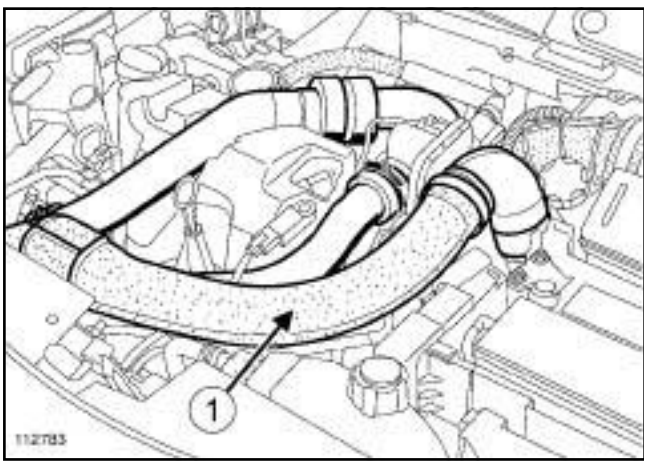
Refit:

- the air intake sleeve,
- the engine cover.

Coolant temperature sensor: Removal - Refitting

K9K

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)



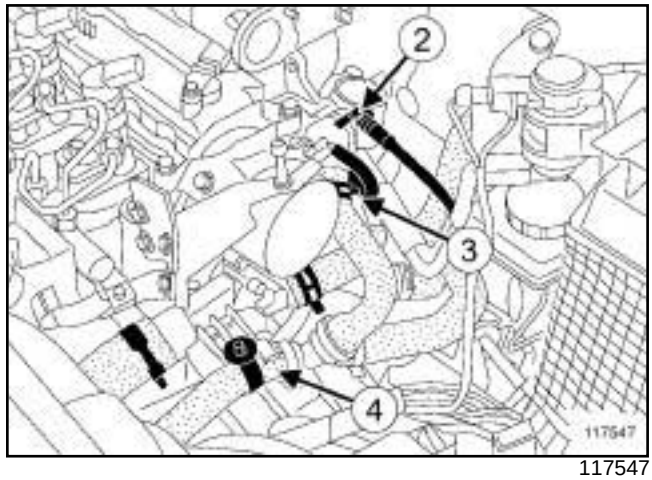
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine cover.



112783

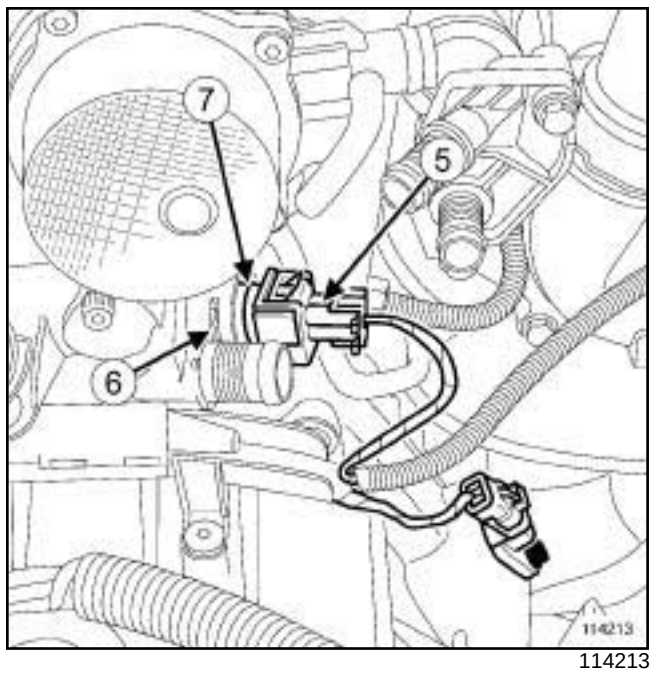
❏ Remove:

- the air filter inlet air pipe (**1**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Clean the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

117547



❏ Disconnect the vacuum pipe (**2**) from the vacuum pump.

❏ Remove the clip (**3**) from the coolant hose using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the coolant hose.

❏ Unclip the coolant hose (**4**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

114213

❏ Disconnect the coolant temperature sensor connector (**5**) .

❏ Remove:

- the coolant temperature sensor retaining clip (**6**) ,
- the coolant temperature sensor (**7**) ,
- the coolant temperature sensor O-ring.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

❏ The coolant temperature sensor O-ring must always be replaced.

❏ Connect the coolant temperature sensor connector.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the coolant temperature sensor,
- the coolant temperature sensor retaining clip.

III - FINAL OPERATION

❏ Connect the coolant hose.

❏ Fit the coolant hose clip using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Clip the coolant hose.

❏ Connect the vacuum pipe to the vacuum pump.

❏ Refit:

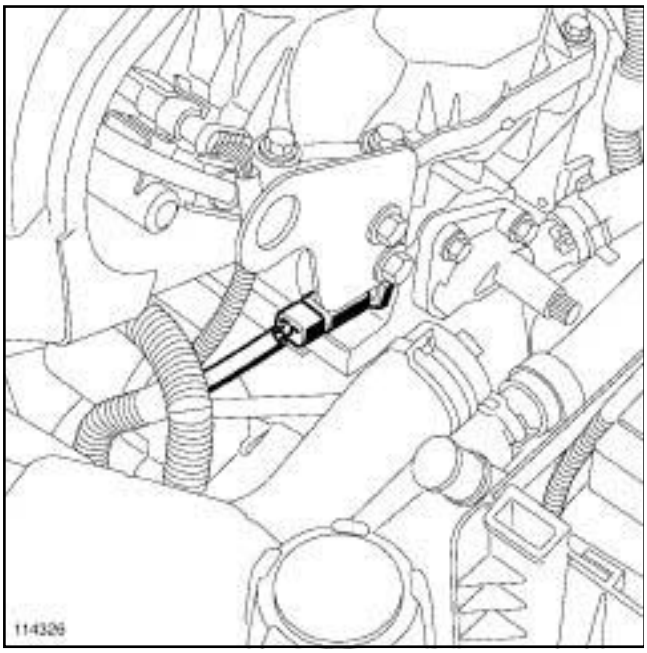
- the engine undertray,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter inlet air pipe,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),

❏ Perform the following operations:

- fill the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling),
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Refit the engine cover.

D4F, and 740 or 742 or 764



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

114326

❏ Disconnect the coolant temperature sensor connector.

❏ Remove the coolant temperature sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the coolant temperature sensor O-ring.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the coolant temperature sensor O-ring,
- the coolant temperature sensor.

❏ Connect the coolant temperature sensor connector.

III - FINAL OPERATION

❏ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

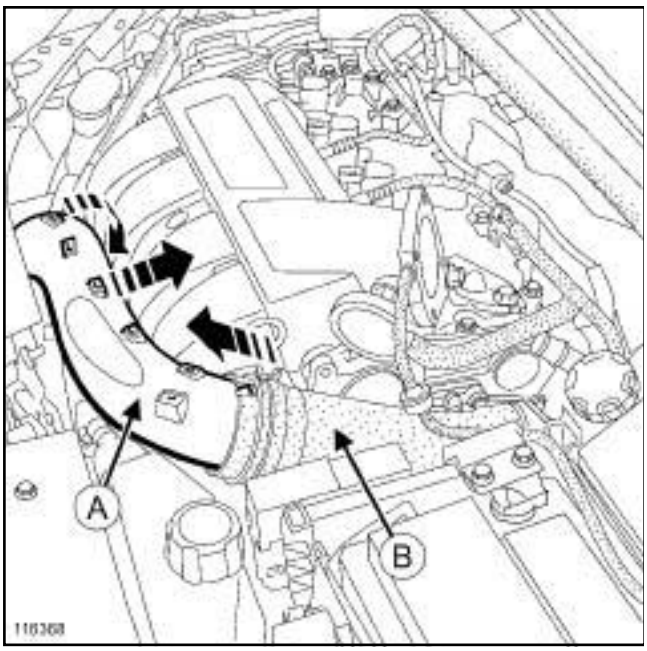
Coolant temperature sensor: Removal - Refitting

F4R

Tightening torques ▽	
coolant temperature sensor	33 N.m

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

❏ Perform the following operations:

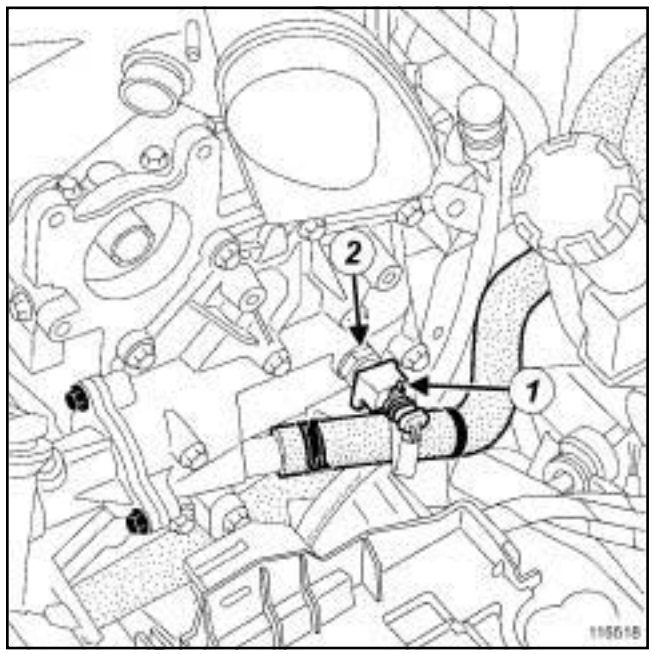
- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- flush out the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

116368

❏ Remove the air inlet duct (**A**) :

- unclip it from the front end panel,
- turn it and disconnect it.

❏ Disconnect the duct (**B**) :



- air resonator side,
- air filter unit side.

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Unclip the breather pipe from the gearbox.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116518

❏ Disconnect the coolant temperature sensor connector (**1**) .

❏ Remove the coolant temperature sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the coolant temperature sensor fitted with a new seal.

❏ Tighten to torque the **coolant temperature sensor (33 N.m)**.

❏ Connect the coolant temperature sensor connector.

F4R

II - FINAL OPERATION

❑ Clip the breather pipe to the gearbox.

❑ Connect the duct ***(B)*** :

- to air filter unit,
- to the air resonator.

❑ Refit:

- the air inlet duct ***(A)*** ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Connect the battery ((see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling),
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Check that there are no leaks.

❑ Refit the engine undertray.

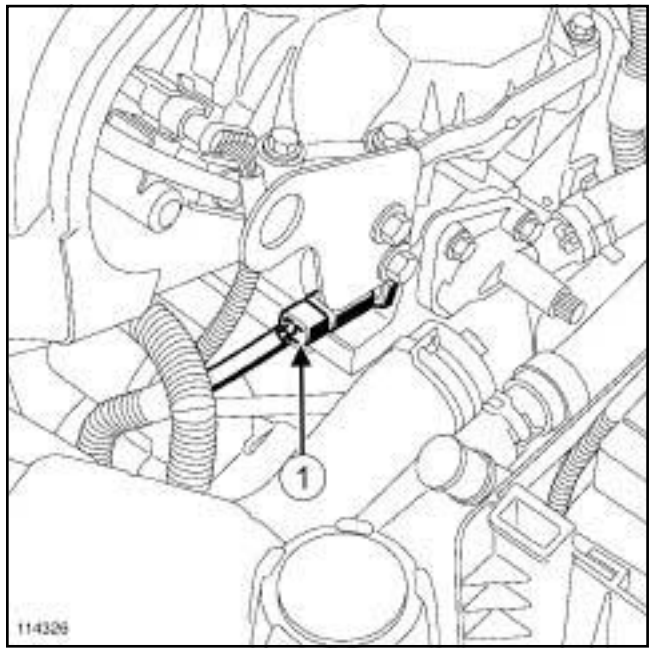
D4F, and 784

Tightening torques ▽	
coolant temperature sensor	**23 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the engine cover,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

II - OPERATION FOR REMOVAL OF PART CONCERNED

114326

❏ Disconnect the coolant temperature sensor connector (**1**) .

❏ Remove the coolant temperature sensor.

Remove:

- the coolant temperature sensor,
- the coolant temperature sensor O-ring.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the coolant temperature sensor O-ring.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the coolant temperature sensor O-ring,
- the coolant temperature sensor.

❏ Torque tighten the **coolant temperature sensor (23 N.m)**.

❏ Connect the coolant temperature sensor connector.

D4F, and 784

III - FINAL OPERATION

❑ Refit:

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

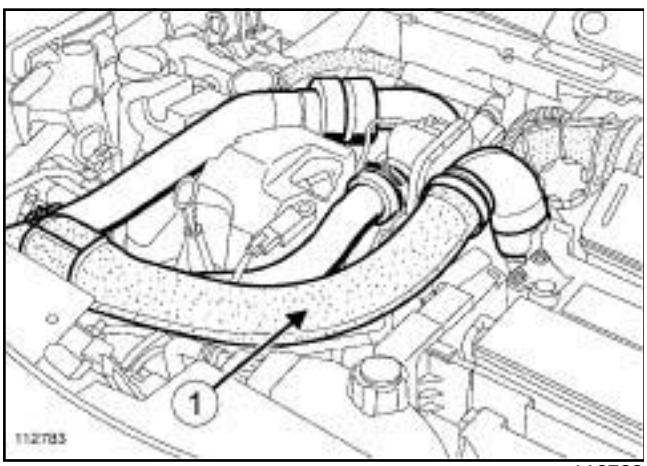
❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Refit the engine undertray.

Engine cooling fan assembly: Removal - Refitting

K9K

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)



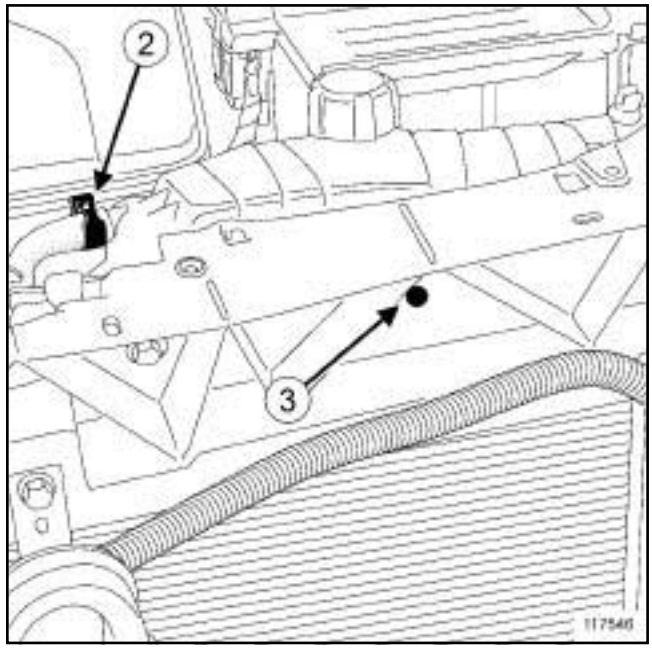
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the engine cover,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

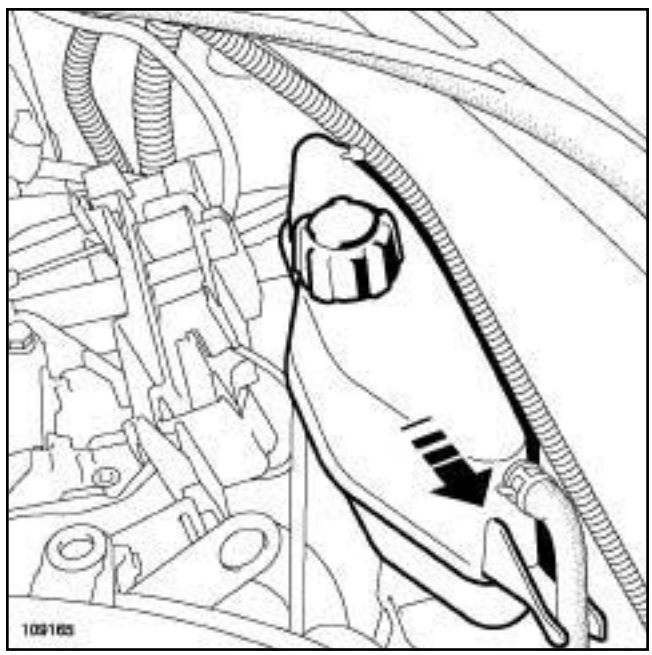


112783

❏ Remove:

- the air filter inlet air pipe (**1**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Fit a hose clamp **(Ms. 583)** to the expansion bottle top hose.



117546

❏ Open the clip (**2**) on the expansion bottle top hose using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the expansion bottle top hose.

❏ Remove the clip (**3**) from the expansion bottle.

109165

❏ Remove the expansion bottle, following the direction of the arrow.

❏ Unclip the wiring harness of the turbocharger solenoid valve on the fan assembly.

❏ Remove the engine undertray.

K9K

❏ Disconnect the motor-driven fan assembly connectors.

❏ Unclip the fan assembly wiring harness.

❏ Unclip the coolant bottom hose.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the blower unit.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the blower unit.

II - FINAL OPERATION.

❏ Clip the coolant bottom hose.

❏ Clip the fan assembly wiring harness.

❏ Connect the fan assembly connectors.

❏ Refit the engine undertray.

❏ Clip the wiring harness of the turbocharger solenoid valve on the fan assembly.

❏ Position the expansion bottle.

❏ Refit the clip to the expansion bottle.

❏ Connect the expansion bottle top hose.

❏ Fit the expansion bottle top hose clip using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Remove the hose clamp **(Ms. 583)** on the expansion bottle top hose.

❏ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter inlet air pipe,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine cover.

Engine cooling fan assembly: Removal - Refitting

D4F, and 740 or 742 or 764

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

STANDARD HEATING

❏ Disconnect the motor-driven fan assembly connectors.

❏ Unclip the fan assembly wiring.

❏ Remove the electrical earth from the gearbox.

AIR CONDITIONING

❏ Remove the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Disconnect:

- the pressure switch connector,
- the fan assembly connectors.

❏ Unclip the fan assembly wiring.

❏ Remove the electrical earth from the gearbox.

❏ Attach the cooling radiator assembly.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❏ Separate the fan assembly from the cooling radiator.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the blower unit.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the fan assembly.

II - FINAL OPERATION.

STANDARD HEATING

❏ Refit the electrical earth to the gearbox.

❏ Clip the fan assembly wiring.

❏ Connect the motor-driven fan assembly connectors.

AIR CONDITIONING

❏ Refit the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❏ Detach the cooling radiator assembly.

❏ Refit the electrical earth to the gearbox.

❏ Clip the fan assembly wiring.

❏ Connect:

- the engine cooling fan assembly connectors,
- the pressostat connector.

❏ Refit the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

Engine cooling fan assembly: Removal - Refitting

F4R or K4J or K4M

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot. Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air inlet duct,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Fit a hose clamp to the expansion bottle degassing hose.

❏ Remove

- the expansion bottle degassing hose clip using the **(Mot. 1448)**,
- the expansion bottle degassing hose.

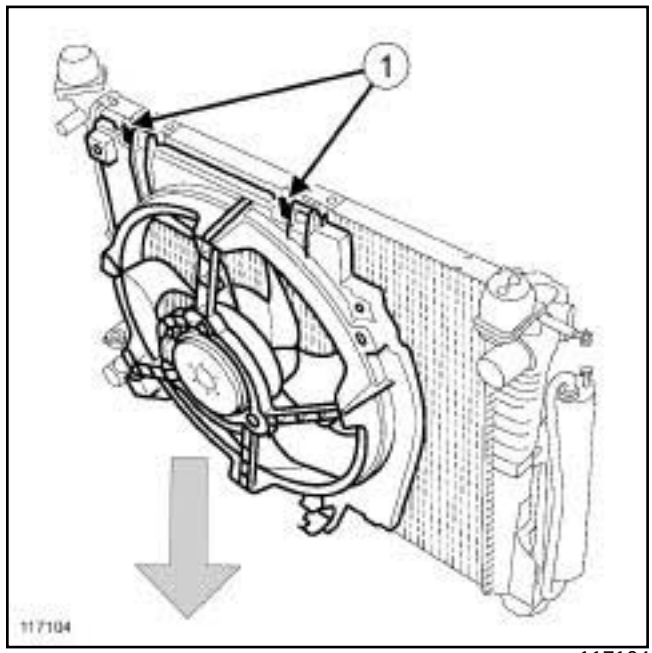
❏ Remove the expansion bottle.

❏ Unclip the air resonator upper clip.

❏ Attach the cooling radiator assembly to the front end panel.

❏ Remove:

- the air resonator,
- the left and right-hand wheel arch liners (see **MR 393 Bodywork, 55A, Exterior protection, Front wheel arch liners: Removal - Refitting**),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).



❏ Disconnect the motor-driven fan assembly connectors.

❏ Unclip the wiring harness on the motor-driven fan assembly.

❏ Remove the electrical earth from the gearbox.

❏ Remove the bottom hose on the motor-driven fan assembly.

II - OPERATION FOR REMOVAL OF PART CONCERNED

117104

❏ Move the brackets (**1**) apart.

❏ Lower the motor-driven fan assembly in the direction of the arrow.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Position the motor-driven fan assembly.

❏ Clip the retaining brackets.

II - FINAL OPERATION.

❏ Refit the bottom hose onto the motor-driven fan assembly.

❏ Refit the electrical earth to the gearbox.

F4R or K4J or K4M

❏ Clip the wiring harness onto the motor-driven fan assembly.

❏ Connect the motor-driven fan assembly connectors.

❏ Refit:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the air resonator.

❏ Detach the cooling radiator assembly from the front end panel.

❏ Clip the air resonator upper clip.

❏ Refit:

- the expansion bottle,
- the expansion bottle degassing hose,
- the expansion bottle degassing hose clip using the **(Mot. 1448)**.

❏ Remove the hose clamp from the expansion bottle degassing hose.

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air inlet duct,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Check that the engine cooling fan is operating correctly.

M4R

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

❏ Disconnect:

- the pressostat connector,
- the fan assembly connectors.

❏ Unclip the wiring harness from the fan assembly.

❏ Attach the cooling radiator assembly.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❏ Separate the fan assembly from the cooling radiator.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the blower unit.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the blower unit.

II - FINAL OPERATION.

❏ Refit the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❏ Detach the cooling radiator assembly.

❏ Refit the electrical earth to the gearbox.

❏ Clip the fan assembly wiring.

❏ Connect:

- the engine cooling fan assembly connectors,
- the pressostat connector.

❏ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Engine cooling fan assembly: Removal - Refitting

D4F, and 784

Equipment required
safety strap(s)

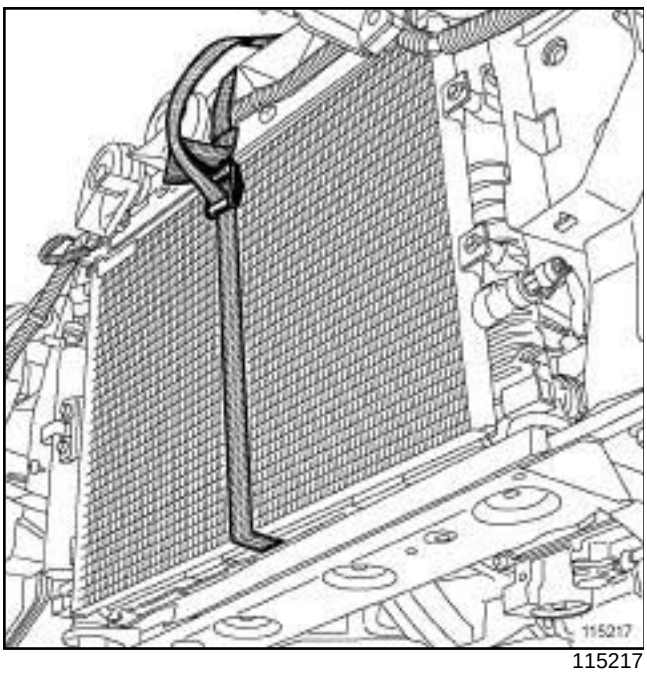
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:



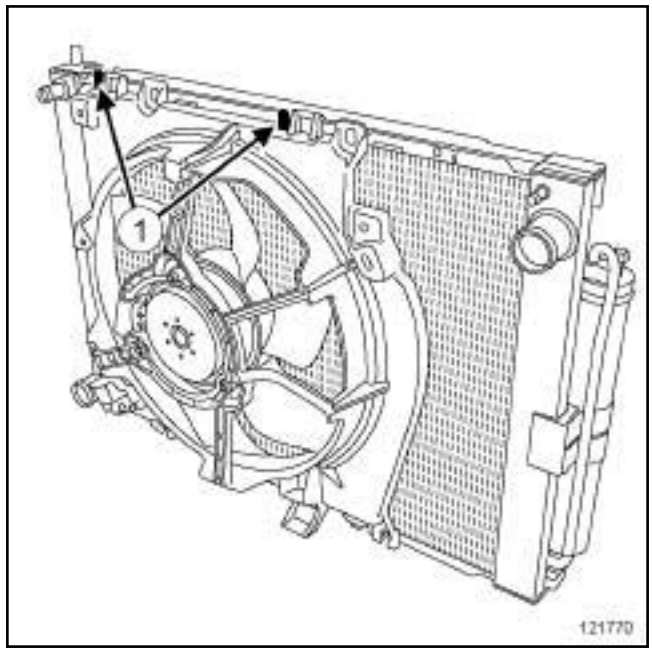
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Disconnect:

- the pressostat connector,
- the fan assembly connectors.

❏ Unpick the blower unit harness.

❏ Remove the earth cable from the gearbox.



115217

❏ Attach the cooling radiator assembly using a **safety strap(s)**.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

II - OPERATION FOR REMOVAL OF PART CONCERNED

121770

❏ Remove the tabs (**1**) .

❏ Remove the motor-driven fan assembly from underneath.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the blower unit.

❏ Clip the tabs into place.

II - FINAL OPERATION.

❏ Refit the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

❏ Remove the **safety strap(s)**.

❏ Refit the earth cable on the gearbox.

❏ Clip the blower unit wiring harness.

❏ Connect:

- the pressostat connector,
- the fan assembly connectors.

❏ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

D4F, and 784

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Coolant pump inlet pipe: Removal - Refitting

D4F, and 740 or 742 or 764

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
coolant pump inlet pipe bolt	**12 N.m**

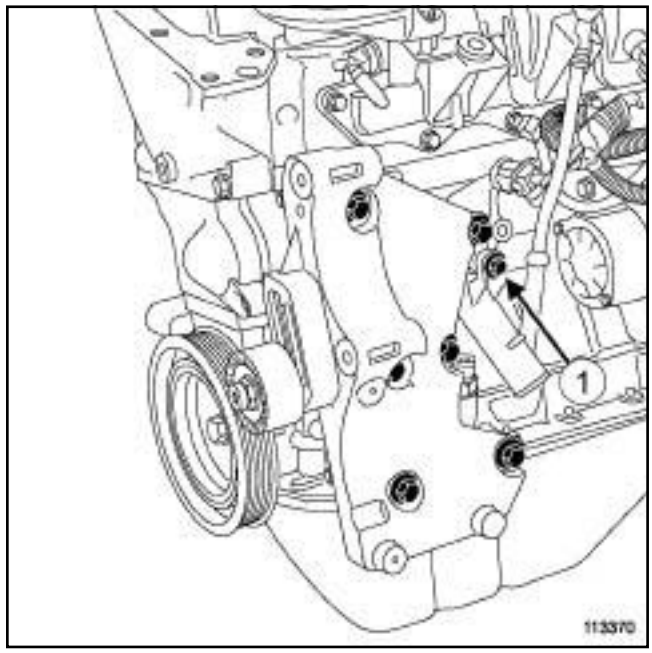
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

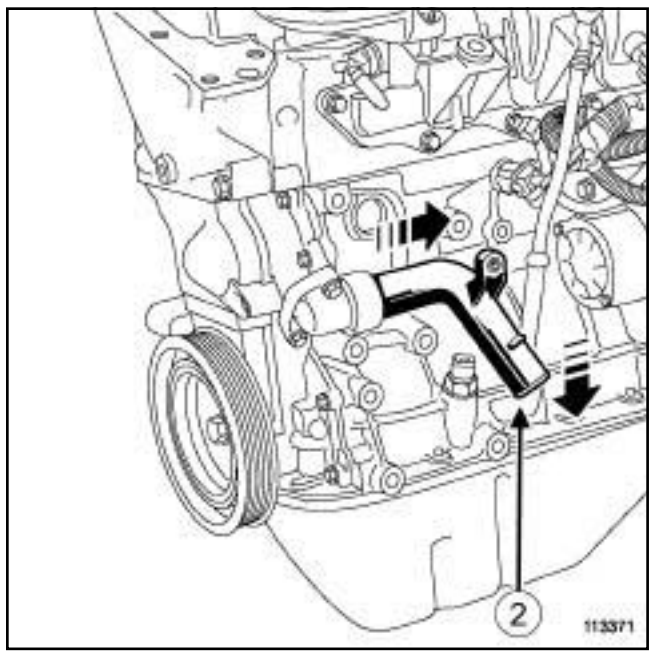
❏ Remove:



- the engine undertray bolts,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Separate the clip on the cooling radiator bottom hose on the coolant pump inlet pipe side using the tool **(Mot. 1448)**.



❏ Disconnect the cooling radiator bottom hose on the coolant pump inlet pipe side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113370

❏ Remove the bolt (**1**) from the coolant pump inlet pipe.

113371

❏ Remove:

- the coolant pump inlet pipe (**2**) ,
- the coolant pump inlet pipe seal.

D4F, and 740 or 742 or 764

REFITTING

I - REFITTING PREPARATION OPERATION

- ❑ **parts always to be replaced: seal between coolant pump inlet pipe and coolant pump inlet union (10,06,01,23)**.
- ❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:
  - the housing of the seal on the coolant pump inlet pipe if it is to be reused,
  - the housing of the coolant pump inlet union seal.

> **WARNING**
> To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

- ❑ Refit a new coolant pump inlet pipe seal on the coolant pump inlet pipe.

II - REFITTING OPERATION FOR PART CONCERNED

- ❑ Refit the coolant pump inlet pipe.
- ❑ Torque tighten the **coolant pump inlet pipe bolt (12 N.m)**.

III - FINAL OPERATION

- ❑ Connect the cooling radiator bottom hose to the coolant pump inlet pipe.
- ❑ Fit the cooling radiator bottom hose clip to the coolant pump inlet pipe using the tool **(Mot. 1448)**.
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .
- ❑ Refit the engine undertray.

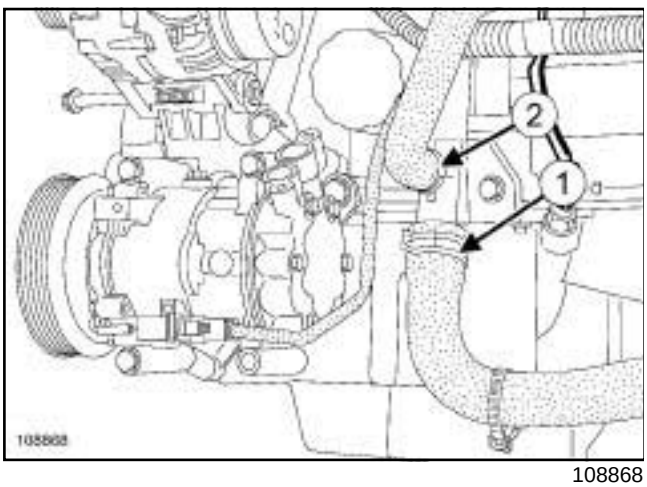
coolant pump inlet pipe mounting bolts	**25 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

108868

❑ Disconnect the cooling radiator bottom hose (**1**) and the heater hose (**2**) using the **(Mot. 1202-01)** or **(Mot. 1202-02)** or **(Mot. 1448)**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Remove:

- the mounting bolts of the water pump inlet pipe,
- the coolant pump inlet pipe.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the pump inlet pipe.

❑ Torque tighten the **coolant pump inlet pipe mounting bolts (25 N.m)**.

II - FINAL OPERATION

❑ Connect the cooling radiator bottom hose and the heater hose using the **(Mot. 1202-01)** or **(Mot. 1202-02)** or **(Mot. 1448)**.

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Coolant pump inlet pipe: Removal - Refitting

REMOVAL

I - REMOVAL PREPARATION OPERATION

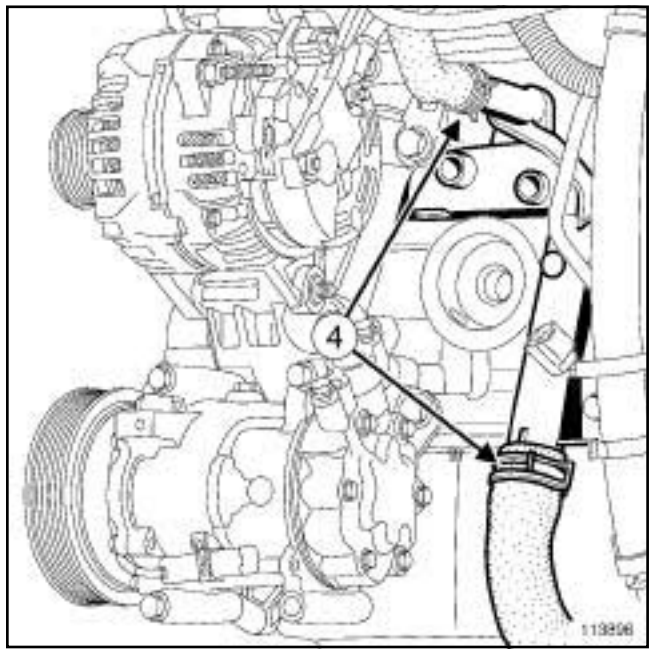
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the engine undertray,
- the front sections of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .



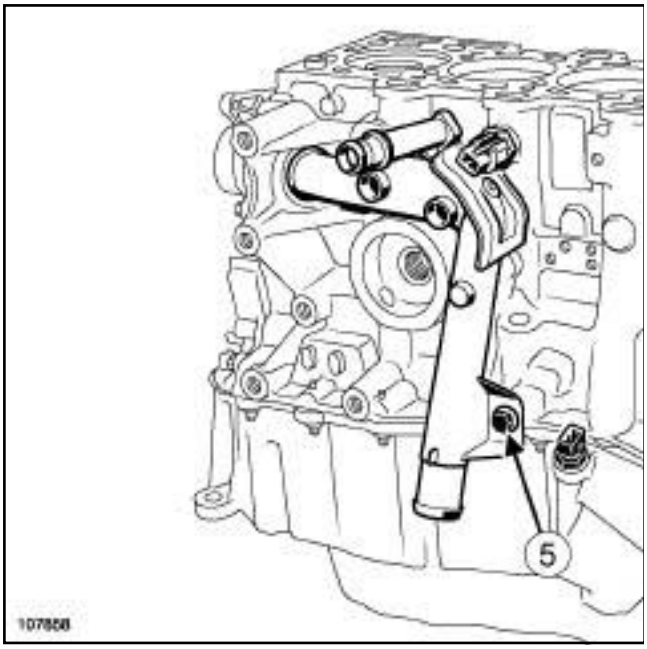
❏ Clean the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) .

❏ Remove the oil-water heat exchanger (see **10A**, **Engine and cylinder block assembly**, **Oil-coolant heat exchanger: Removal - Refitting**, page **10A-26**) .

II - REMOVAL OF THE PART CONCERNED



113896

❏ Remove the clips (**4**) from the water pump inlet pipe hoses using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the water hoses of the water pump inlet pipes.

K9K

107858

❑ Remove:

- the coolant pump inlet pipe bolt (**5**) ,
- the water pump inlet pipe.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace the water pump inlet pipe seals.

❑ Clean the bearing faces on the coolant-oil heat exchanger and the cylinder block.

❑ Always replace the coolant-oil heat exchanger seals.

II - REFITTING PART CONCERNED

❑ Refit the water inlet pipe on the water pump.

❑ Torque tighten the **water pump inlet pipe bolt (22 N.m)**.

❑ Connect the water hoses on the water pump inlet pipes.

❑ Fit the water pump inlet pipe hose clips using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

III - FINAL OPERATION

❑ Refit the oil-water heat exchanger (see **10A**, **Engine and cylinder block assembly**, **Oil-coolant heat exchanger: Removal - Refitting**, page **10A-26**) .

❑ Connect the oil pressure sensor connector.

❑ Refit:

- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front sections of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❑ Top up the engine (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the engine undertray,
- the engine cover,

Coolant pump inlet pipe: Removal - Refitting

F4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

REMOVAL

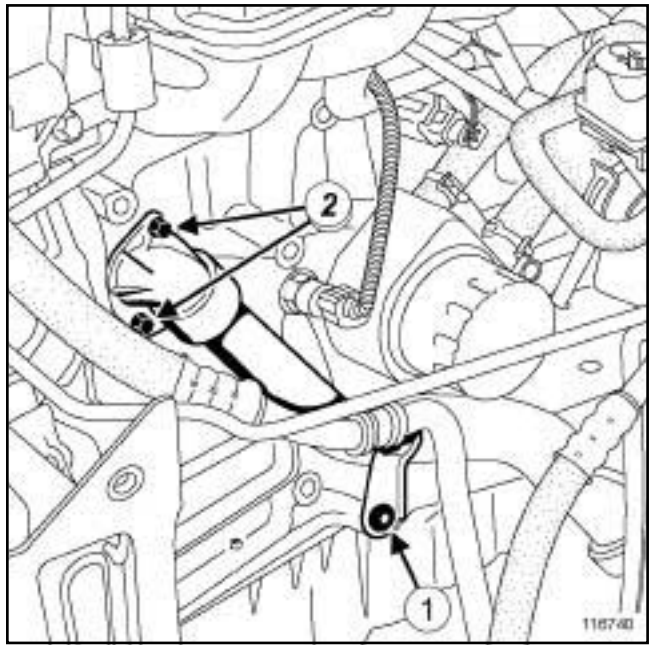
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the engine undertray.

❑ Perform the following operations:



- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- flush the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Remove:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Remove the clip from the hose using the **(Mot. 1448)**.

116740

❑ Remove:

- the coolant pump inlet pipe mounting bolt (**1**) ,
- the coolant pump inlet pipe elbow mounting bolts (**2**) ,
- the coolant pump inlet pipe.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the coolant pump inlet pipe fitted with a new seal,
- the coolant pump inlet pipe elbow mounting bolts,
- the coolant pump inlet pipe mounting bolt.

❑ Connect the hose on the coolant pump inlet pipe.

❑ Fit the clip using the **(Mot. 1448)**.

II - FINAL OPERATION

❑ Refit:

- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-97**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Coolant pump inlet pipe: Removal - Refitting

F4R

❏ Perform the following operations:

- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Check that there are no coolant leaks.

❏ Refit the engine undertray.

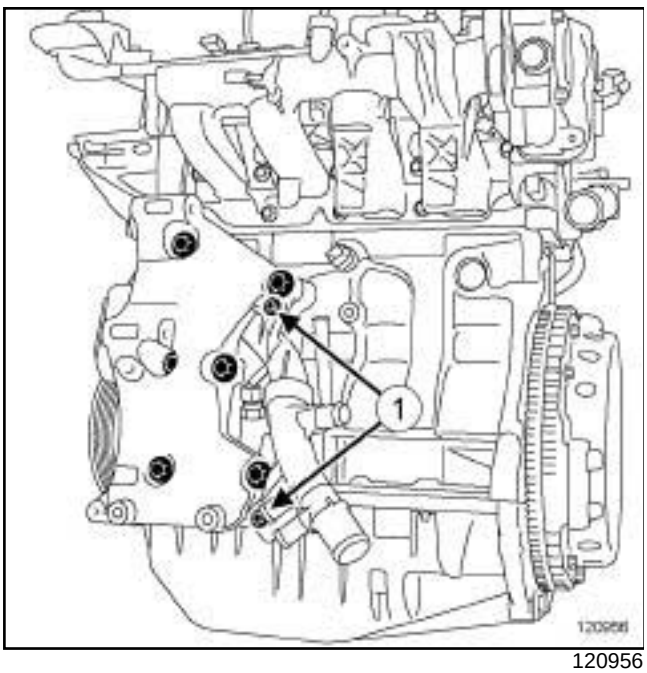
Coolant pump inlet pipe: Removal - Refitting

D4F, and 784

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
coolant pump inlet pipe bolts	**10 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

120956

❏ Remove the coolant pump inlet pipe hose clips using the **(Mot. 1448)**.

❏ Disconnect the coolant pump inlet pipe hoses.

❏ Remove:

- the bolts (**1**) from the coolant pump inlet pipe,
- the coolant pump inlet pipe.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Always replace the coolant pump inlet pipe seal.

❏ Clean the coolant pump inlet pipe bearing faces.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the coolant pump inlet pipe,
- the coolant pump inlet pipe bolts.

❏ Torque tighten the **coolant pump inlet pipe bolts (10 Nm)**.

❏ Connect the coolant pump inlet pipe hoses.

❏ Refit the coolant pump inlet pipe hose clips using the **(Mot. 1448)**.

III - FINAL OPERATION.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

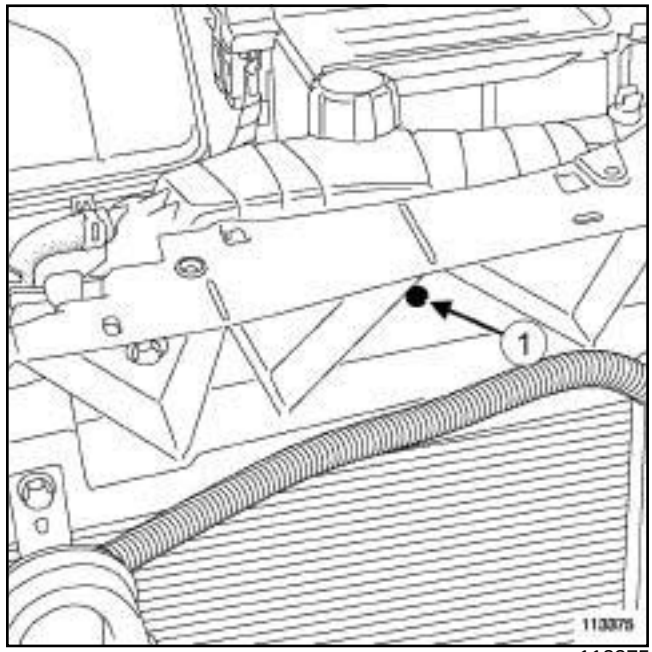
❏ Refit the engine undertray.

Expansion bottle: Removal - Refitting

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 393, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113375

❏ Remove the clip (**1**) .

❏ Remove the expansion bottle.

❏ Fit hose clamps to the expansion bottle hoses.

❏ Using the **(Mot. 1448)**, remove:

- the clamp of the bottom hose of the expansion bottle,
- the clamp of the top hose of the expansion bottle,

❏ Disconnect:

- the expansion bottle's bottom hose,
- the expansion bottle's top hose.

❏ Remove the expansion bottle.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Connect:

- the expansion bottle's top hose,
- the expansion bottle bottom hose.

❏ Using the **(Mot. 1448)**, refit:

- the clamp of the top hose of the expansion bottle,
- the clamp of the bottom hose of the expansion bottle.

❏ Remove the hose clamps.

❑ Refit:

- the expansion bottle,
- the expansion bottle clip.

II - FINAL OPERATION.

❑ Top-up the coolant level in the expansion bottle.

❑ Refit:

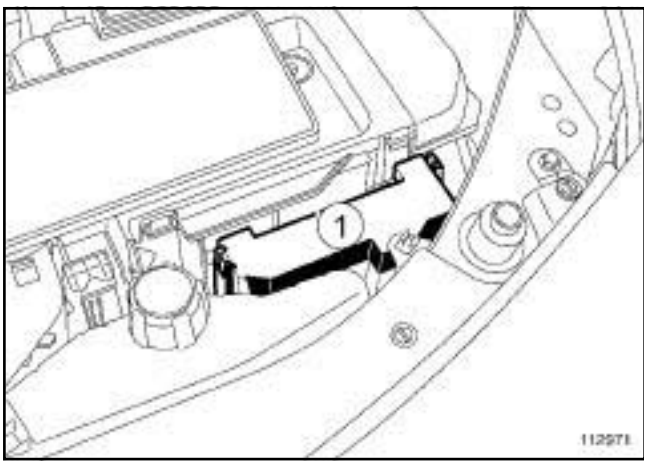
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

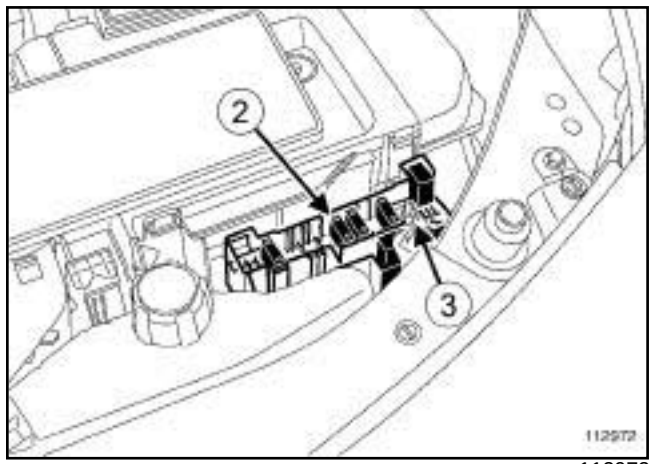
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

112971

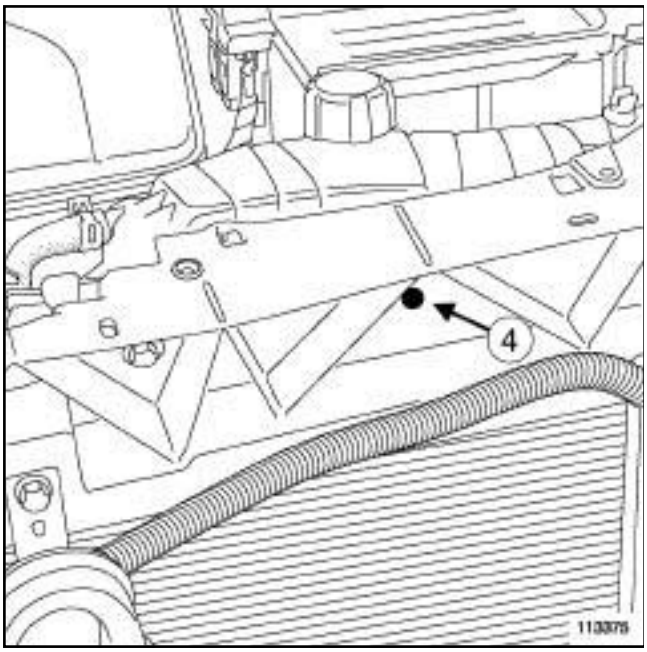
❏ Remove the cover (**1**) from the power feed fuse board mounting.

112972

❏ Remove the green fuse (**2**) **(30 A)**.

❏ Detach the fuse connector from the fuse mounting.

❏ Remove the power wiring harness nut (**3**) from the fuse mounting.



❏ Remove the power wiring harness from the fuse mounting.

❏ Detach the fuse board.

❏ Remove the air filter box air inlet pipe.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

113375

❏ Remove clip (**4**) .

❏ Remove the expansion bottle.

❏ Fit the **(Ms. 583)** to the expansion bottle hoses.

❏ Using the **(Mot. 1448)**, remove:

- the expansion bottle bottom hose clip,
- the expansion bottle top hose clip.

❏ Disconnect:

- the expansion bottle's bottom hose,
- the expansion bottle top hose.

❏ Remove the expansion bottle.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Connect:

- the expansion bottle's top hose,
- the expansion bottle bottom hose.

❏ Using the **(Mot. 1448)**, refit:

- the clamp of the top hose of the expansion bottle,
- the clamp of the bottom hose of the expansion bottle.

❏ Remove the **(Ms. 583)**.

❏ Refit:

- the expansion bottle,
- the expansion bottle clip.

II - FINAL OPERATION.

❏ Clip the fuse board onto the battery tray.

❏ Position the fuse board wiring harness.

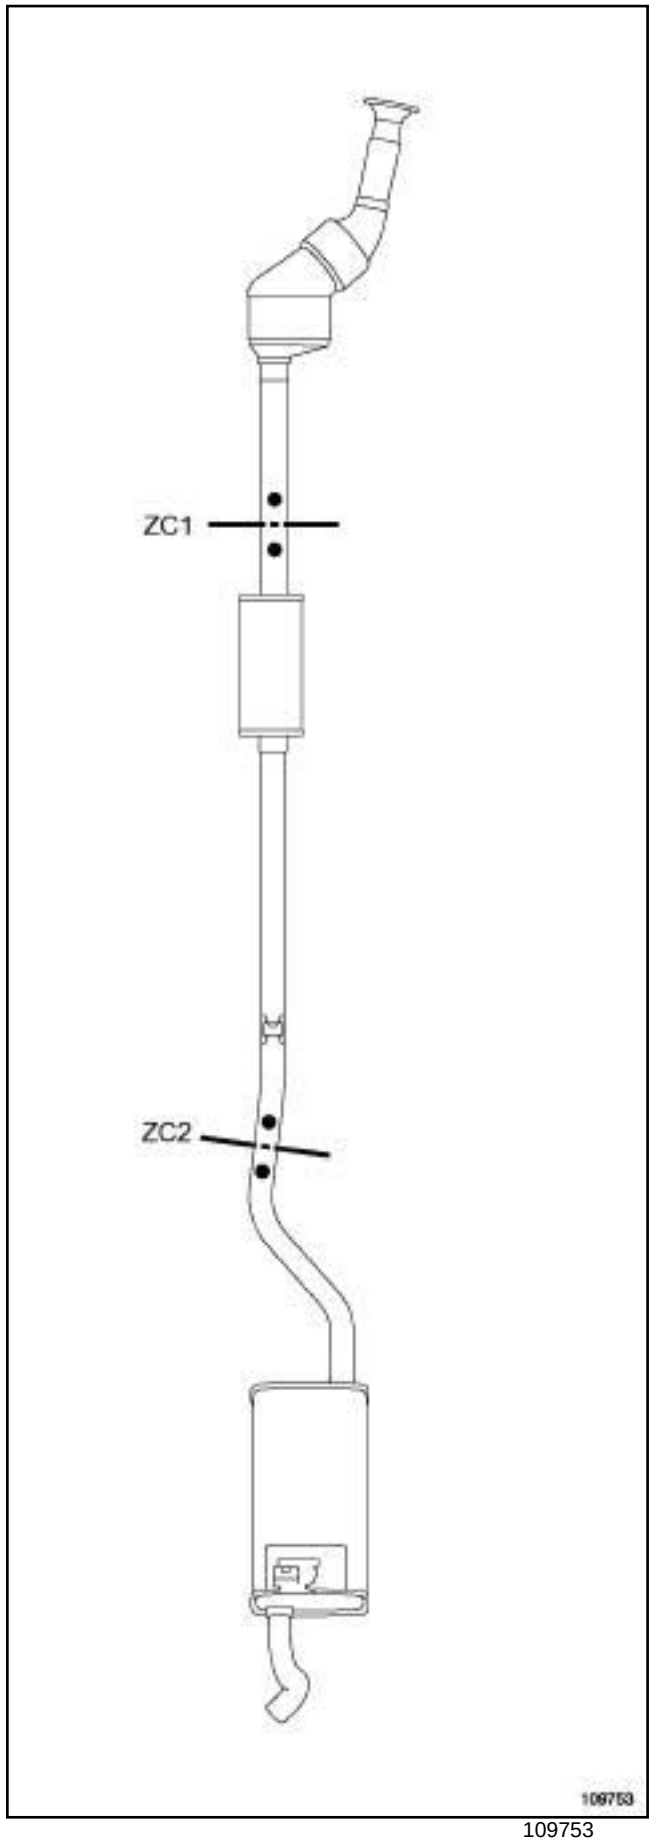
❏ Refit the fuse board wiring harness nut.

❏ Clip the **30 A** fuse connector onto the fuse board.

❏ Refit:

- the **30 A** fuse,
- the fuse board mounting cover,
- the air filter unit air inlet pipe.

❏ Top-up the coolant level in the expansion bottle.



❏ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.

I - PARTS AND CONSUMABLES FOR THE REPAIR

1 - Parts always to be replaced:

- the exhaust trunking (if fitted)

- the seal or sealing ring on the connection between the catalytic converter or catalytic pre-converter and the rest of the exhaust system

- the exhaust clip(s) (if fitted)

2 - Consumables (see part no. in Technical Note 5068, 04B, Consumables - Products):

- exhaust mastic

- surface cleaner

- abrasive pads

II - ADVICE TO OBSERVE

IMPORTANT
Do not park and run the engine in a place where combustible substances and materials such as grass or leaves can come into contact with the hot exhaust system.

IMPORTANT
Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

1 - During removal and refitting, the catalytic converter or catalytic pre-converter must not receive any knocks or impacts as this could damage it.

2 - The whole exhaust pipe is made of stainless steel.

3 - After working on the bracket between the catalytic converter or catalytic pre-converter and the rest of the exhaust system, ensure that the connection is perfectly sealed.

To do this:

- clean the pressure faces of the connection using the **ABRASIVE PADS**,

- degrease the pressure faces of the connection using **SURFACE CLEANER** and clean cloths,

- always replace the seal or sealing ring on the connection.

III - SPECIAL NOTES ON THE SINGLE UNIT EXHAUST PIPE

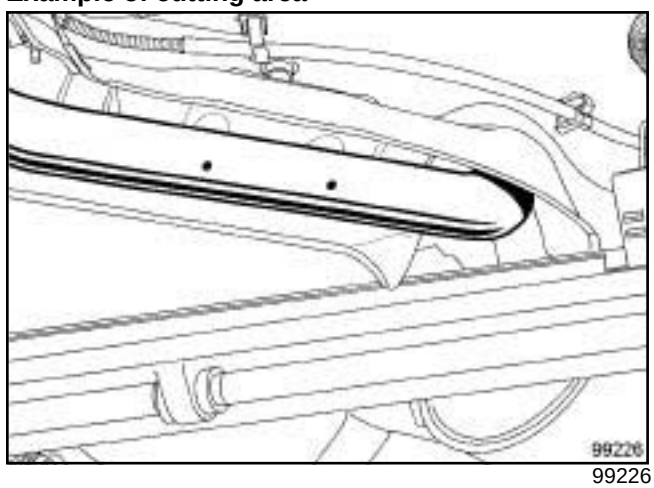
1 - Cutting the single unit exhaust pipe

The exhaust pipe is a « single unit type » .

To replace different parts of the exhaust system it must be cut.

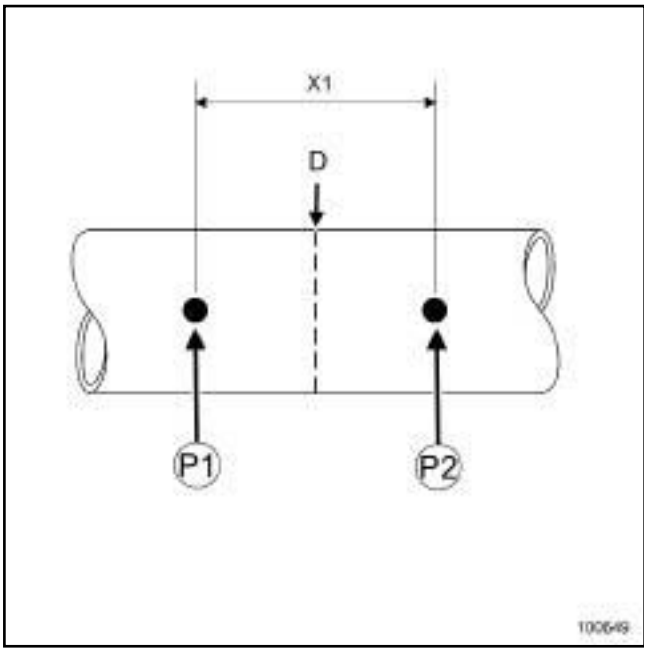
To do this be sure to carry out these precautions in the following order:

- correctly identify the area to be cut, as explained below,



- use the cutting tool correctly **(Mot. 1199-01)**,

- position the exhaust trunking correctly.



2 - Identifying the area of the exhaust system to be cut

Two marks made on the exhaust system define the area to be cut (see **Exhaust: Parts and consumables for the repair**) (see MR for vehicle concerned, 19B, Exhaust).

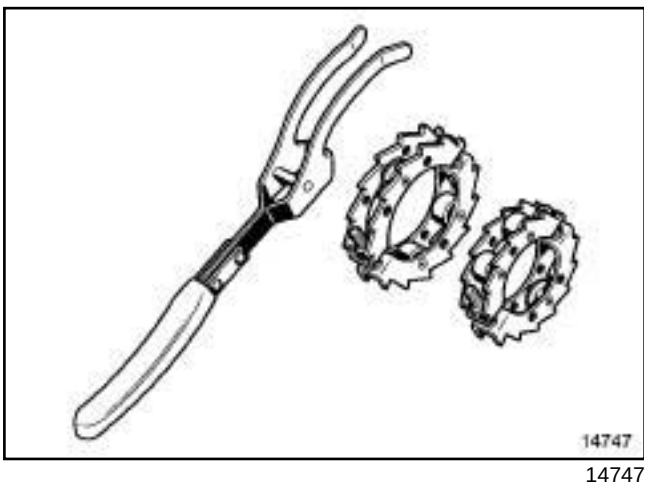
Example of cutting area

99226

100649

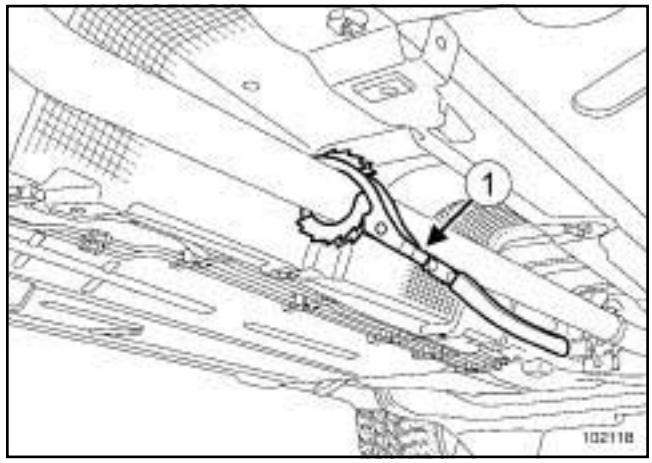
Before cutting the exhaust system, draw a line (**D**) between the two marks (**P1**) and (**P2**) .

The distance between the two marks on the exhaust pipe is (**X1**) : **90 mm** (all types except RENAULT SPORT).



The distance between the two marks on the exhaust pipe is (**X1**) : **80 mm** (RENAULT SPORT).

Note:



For CLIO II RENAULT SPORT with F4R*730, F4R*732 and F4R*736 engines, the cutting area is shown by a single mark on the exhaust pipe.

Cut the exhaust pipe by placing the **(Mot. 1199-01)** on the mark.

3 - Operate tool Mot. 1199-01

14747

102118

Fit the **(Mot. 1199-01)** (**1**) on the exhaust pipe.

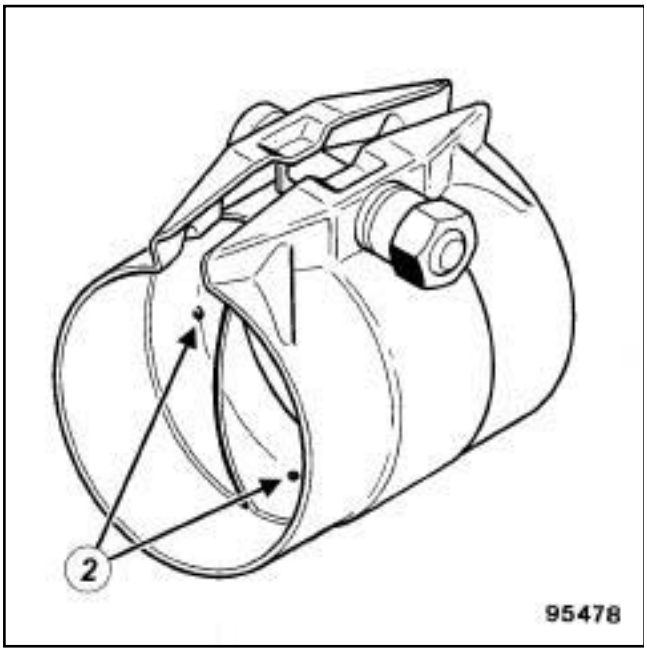
Tighten the two bolts on the tool until they touch the pipe in order to clamp the tool onto the pipe.

Turn the cutting tool using the handle and pressing it against the pipe (as indicated in the diagram above).

Tighten the two bolts on the tool whilst cutting, until the pipe is completely cut.

Note:

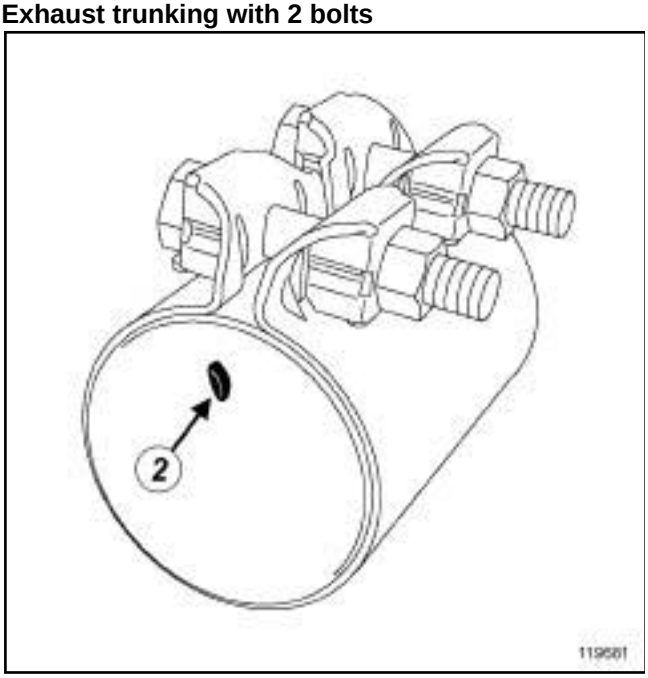
Do not over-tighten the tool onto the pipe to avoid deforming it.



Once the pipe is cut, file and deburr the end of the pipe to be used on the vehicle again.

4 - Positioning the exhaust trunking

WARNING



Do not reuse an old exhaust trunking.

Exhaust trunking with 1 bolt

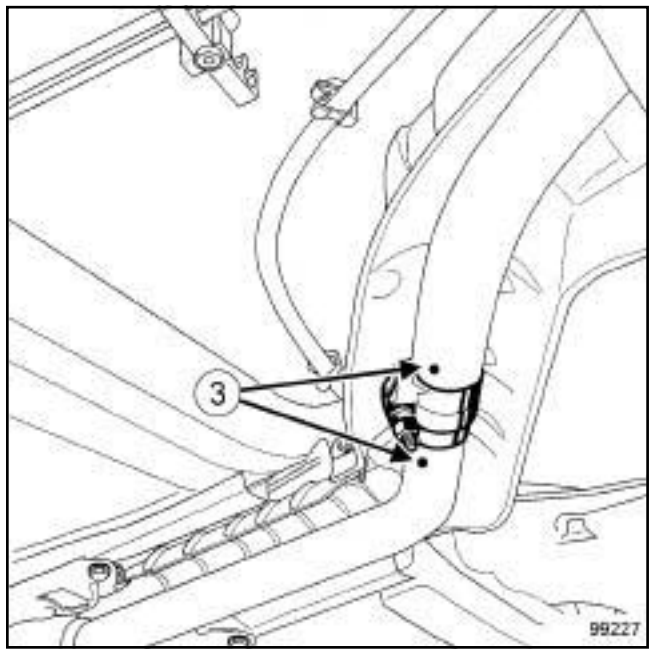
95478

Exhaust trunking with 2 bolts

119681

Fit the exhaust trunking onto the part of the exhaust system fitted to the vehicle.

Position the pipe onto the lugs (**2**) inside the exhaust trunking.



Tighten the exhaust trunking bolt(s) slightly (depending on the version).

Position the second part of the exhaust system under the vehicle, fitting it in the exhaust trunking.

Note:

If necessary, use a workshop jack to lift and hold the heavy and bulky components of the exhaust system.

Position the second exhaust pipe onto the lugs inside the exhaust trunking.

99227

Check that the two cut marks (**3**) are aligned (if applicable).

Position the trunking so that there is no risk of contact between its bolt or bolts and the heat shields.

Torque tighten

- the **exhaust trunking nut with 1 bolt (25 N.m)** (if fitted),
- the **exhaust trunking nuts with 2 bolts (18 N.m)** (if fitted).

Check the following and deal with if necessary:

- no underbody contact between the exhaust system and the heat shields,
- all of the heat shields are present and secure.

Note:

Any damaged heat shields must be replaced.

Start the engine.

Check that there are no leaks: deal with any leaks.

Note:

If there are leaks from the **EXHAUST TRUNKING WITH 1 BOLT**, apply **EXHAUST MASTIC** to the trunking (see part no. in Technical Note 5068, 04B, Consumables - Products).

If the application of exhaust mastic does not fix the leak:

- remove and replace the used exhaust trunking,
- check the condition of the exhaust pipes (condition of the pipe surface, deburring of the area cut, damage to the pipes).
- fit the new trunking in accordance with the instructions given before.

K9K, and 772

Tightening torques ▽	
catalytic pre-converter studs on the turbo-charger	**7 N.m**
turbocharger studs on the flexible pipe	**7 N.m**
catalytic pre-converter diesel injector cooler studs	**7 N.m**
catalytic pre-converter nuts on the turbo-charger	**26 N.m**
catalytic pre-converter upstream stay bolts on the engine	**44 N.m**
catalytic pre-converter downstream stay bolt and nut on the gearbox	**21 N.m**
catalytic pre-converter upstream stay bolts on the catalytic pre-con-verter	**26 N.m**
catalytic pre-converter downstream stay bolt on the catalytic pre-con-verter	**21 N.m**
diesel injector cooler nuts	**25 N.m**
flexible pipe nuts on the catalytic pre-converter	**21 N.m**

PARTS AND CONSUMABLES FOR THE REPAIR WORK

❏ Parts always to be replaced:

- the seal between the catalytic pre-converter and the turbocharger,
- the seal between the catalytic pre-converter and the flexible pipe.

❏ Consumables:

- abrasive pads,
- surface cleaner **77 01 404 178**,
- clean cloths.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

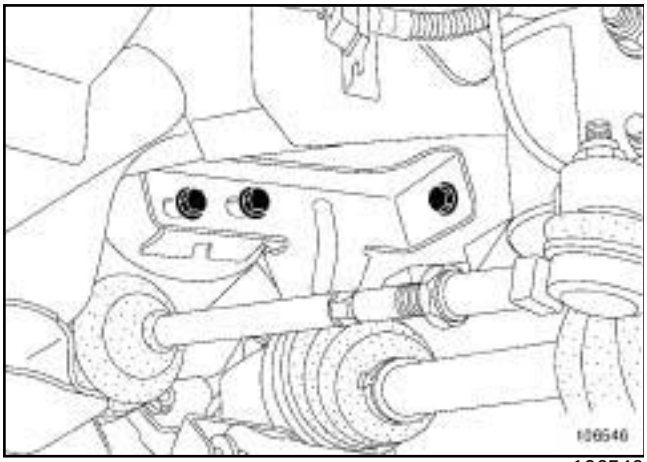
❏ Disconnect the connector from the turbocharger upstream exhaust gas temperature sensor.

❏ Detach the turbocharger upstream exhaust gas temperature sensor connector from the timing end lifting eye.

❏ Remove:

- the bolts from the lifting eye, timing end,
- the lifting eye on the timing end.

II - OPERATION FOR REMOVAL OF PART CONCERNED



❏ Remove:

- the catalytic pre-converter nuts on the turbocharger,
- the engine undertray,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

❏ Remove:

- the connecting hose nuts on the catalytic pre-converter,

K9K, and 772

106546

❑ Remove the bolt from the downstream stay on the catalytic pre-converter.

❑ Undo the downstream stay bolts on the cylinder block.

❑ Remove the catalytic pre-converter downstream stay.

❑ Remove the catalytic pre-converter upstream stay upper bolts.

❑ Undo the catalytic pre-converter upstream stay lower bolt.

❑ Remove the catalytic pre-converter upstream stay.

❑ Remove the catalytic pre-converter diesel injector cooler nuts.

❑ Discard the catalytic pre-converter diesel injector cooler seal.

❑ Remove the catalytic pre-converter by moving it towards the timing end and moving aside the catalytic pre-converter diesel injector cooler.

❑ Remove the catalytic pre-converter from the engine compartment by moving the engine towards the front of the vehicle.

❑ Remove:

- the seal between the catalytic pre-converter and the turbocharger,
- the seal between the catalytic pre-converter and the flexible pipe.

❑ Discard:

- the seal between the catalytic pre-converter and the turbocharger,
- the seal between the catalytic pre-converter and the flexible pipe.

REFITTING

I - REMOVAL PREPARATION OPERATION

❑ Using **ABRASIVE PADS**, clean the pressure faces:

- of the turbocharger and the catalytic pre-converter,
- of the catalytic pre-converter and the exhaust pipe.

❑ Next, degrease these pressure faces using **SURFACE CLEANER AND CLEAN CLOTHS 77 01 404 178**.

❑ If replacing, torque tighten:

- the **catalytic pre-converter studs on the turbocharger (7 N.m)**,
- the **turbocharger studs on the flexible pipe (7 N.m)**,
- the **catalytic pre-converter diesel injector cooler studs (7 N.m)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ From underneath the vehicle, fit:

- the catalytic pre-converter fitted with a new seal between the catalytic pre-converter and the turbocharger,
- one of the catalytic pre-converter nuts on the turbocharger,
- the diesel injector cooler on the catalytic pre-converter,
- the diesel injector cooler nuts.

WARNING
Check that there is no contact between the catalytic pre-converter and the turbocharger oil return pipe during the entire catalytic pre-converter tightening operation.

❑ Torque tighten in order:

- the catalytic pre-converter upstream stay bolts on the engine,
- the catalytic pre-converter downstream stay bolt and nut on the gearbox,
- the catalytic pre-converter upstream stay bolts on the catalytic converter,
- the catalytic pre-converter downstream stay bolt on the catalytic converter,
- the catalytic pre-converter nuts on the turbocharger,

K9K, and 772

- the diesel injector cooler nuts.

❏ Torque tighten in order:

- the **catalytic pre-converter nuts on the turbocharger (26 N.m)**,
- the **catalytic pre-converter upstream stay bolts on the engine (44 N.m)**,
- the **catalytic pre-converter downstream stay bolt and nut on the gearbox (21 N.m)**,
- the **catalytic pre-converter upstream stay bolts on the catalytic pre-converter (26 N.m)**,
- the **catalytic pre-converter downstream stay bolt on the catalytic pre-converter (21 N.m)**,
- the **diesel injector cooler nuts (25 N.m)**.

❏ Refit a new seal between the catalytic pre-converter and the flexible pipe on the catalytic pre-converter.

❏ Position the connecting hose on the catalytic pre-converter.

❏ Refit the flexible pipe nuts on the catalytic pre-converter.

❏ Torque tighten the **flexible pipe nuts on the catalytic pre-converter (21 N.m)**.

III - FINAL OPERATION

❏ Refit the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

❏ Refit:

- the lifting eye on the timing end,
- the timing end lifting eye bolts.

❏ Clip the turbocharger upstream exhaust gas temperature sensor connector on the timing end lifting eye.

❏ Connect the turbocharger upstream exhaust gas temperature sensor connector.

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.

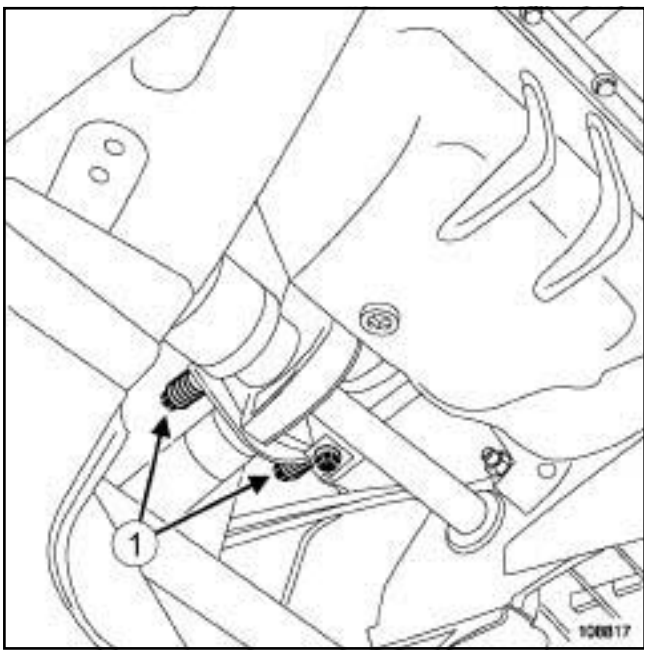
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the engine undertray.

D4F, and 784

REMOVAL

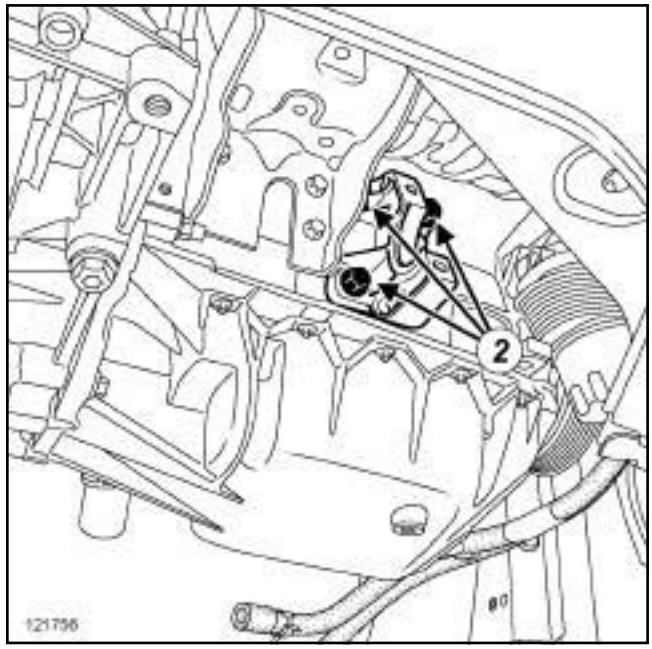
REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

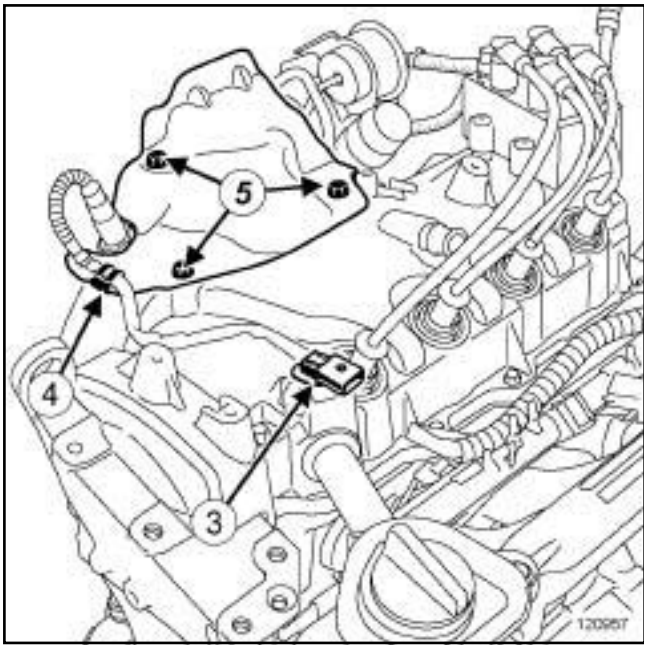


- the engine protector,
- the engine cover.

❑ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

108817

❑ Remove the nuts (**1**) from the exhaust bracket at the outlet of the catalytic pre-converter.



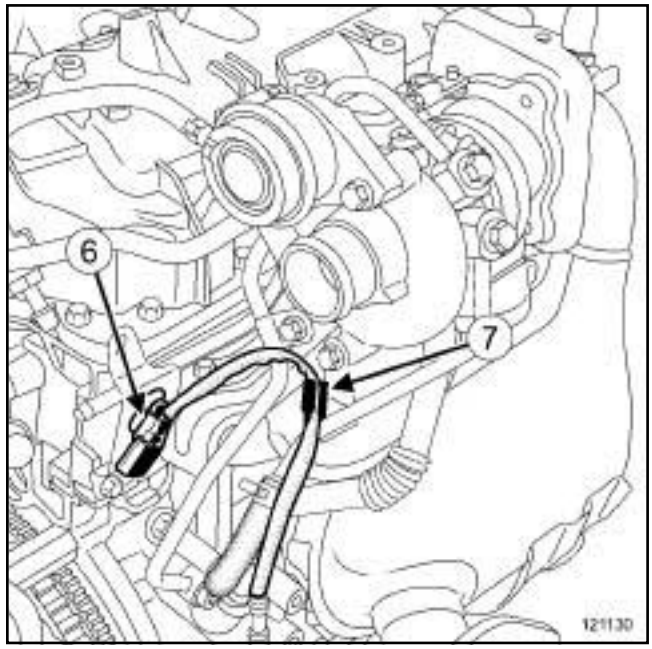
121756

❑ Remove:

- the front right-hand driveshaft (see **29A, Driveshafts, Front right-hand driveshaft: Removal - Refitting),**
- the front right-hand wheel driveshaft bearing nuts (**2**) ,
- the front right-hand wheel driveshaft bearing.

D4F, and 784

120957



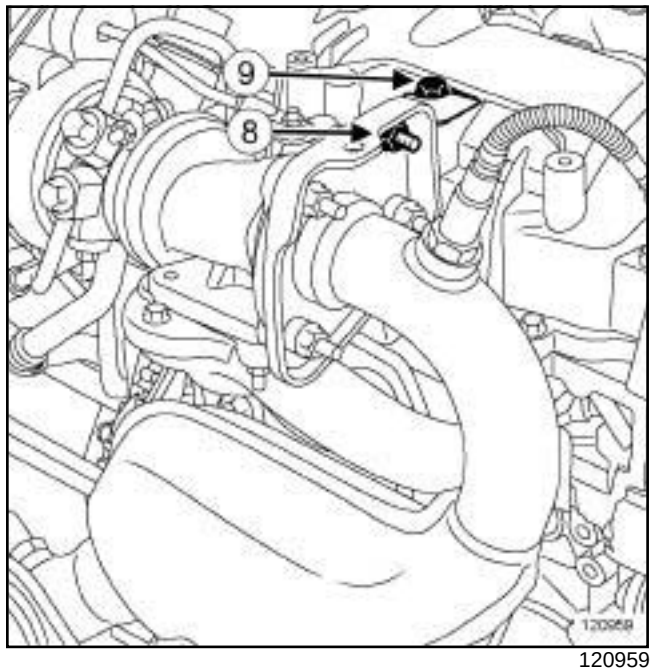
❏ Disconnect the catalytic pre-converter upstream oxygen sensor connector (**3**) .

❏ Unclip the catalytic pre-converter upstream oxygen sensor connector.

❏ Detach the catalytic pre-converter upstream oxygen sensor wiring harness at (**4**) .

❏ Remove:

- the bolts (**5**) from the turbocharger heat shield,
- the turbocharger heat shield.

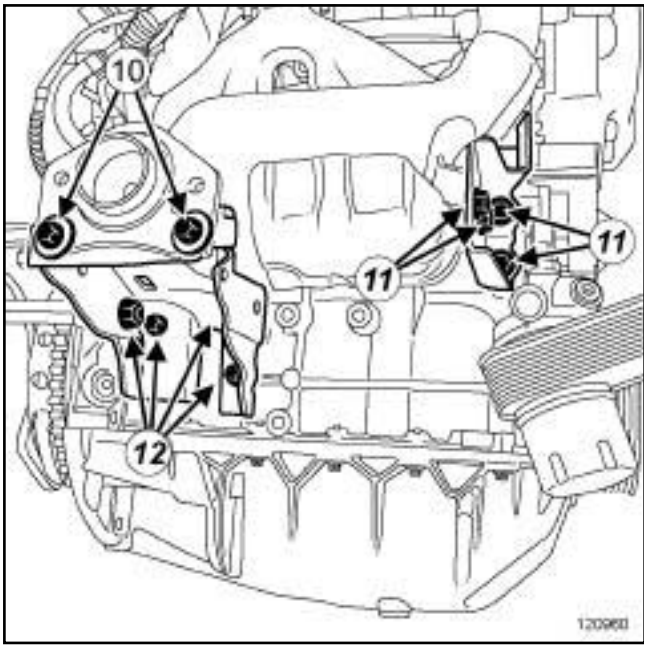


121130

❏ Disconnect the catalytic pre-converter downstream oxygen sensor connector (**6**) .

❏ Unclip the catalytic pre-converter downstream oxygen sensor connector.

❏ Detach the catalytic pre-converter downstream oxygen sensor wiring harness at (**7**) .



120959

❏ Remove:

- the nut (**8**) from the turbocharger strut,
- the bolt (**9**) from the turbocharger strut,
- the turbocharger strut.

D4F, and 784

120960

❏ Disconnect the oil pressure sensor connector.

❏ Undo the bolts (**10**) on the catalytic pre-converter primary strut.

❏ Remove:

- the catalytic pre-converter upstream strut bolts (**11**) ,
- the catalytic pre-converter upstream stay,
- the bolts (**12**) from the catalytic pre-converter primary strut,
- the primary strut on the catalytic pre-converter.

K4J or K4M

Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

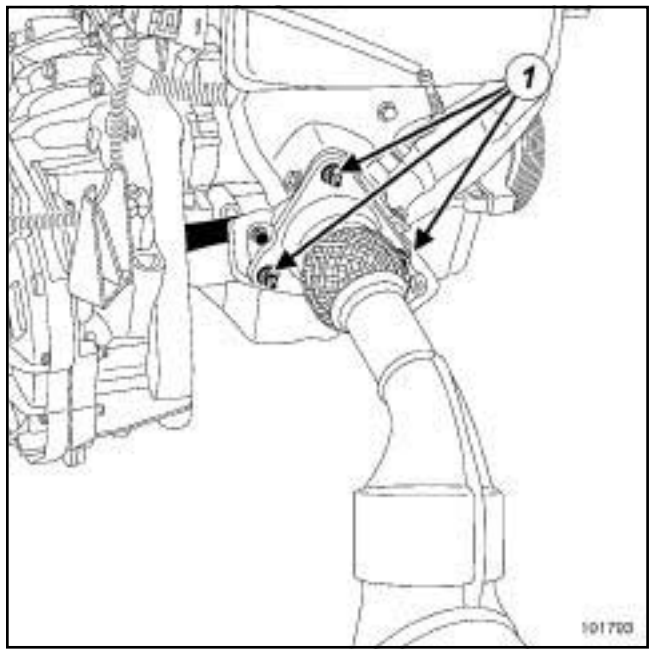
Tightening torques ▽	
oxygen sensor	**45 Nm**
manifold studs	**7 Nm**
nuts mounting the catalytic converter on the exhaust manifold	**21 Nm**
exhaust sleeve	**25 Nm**
exhaust manifold studs	**8 Nm**
exhaust sleeve	**25 Nm**

IMPORTANT

Catalytic converters contain ceramic fibres: these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Remove the connector from the downstream oxygen sensor.

❏ Unclip the wiring harness from the downstream oxygen sensor.

❏ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

101793

❏ Remove:

- the catalytic converter mounting nuts (**1**) from the exhaust manifold
- the exhaust catalytic converter,
- the downstream oxygen sensor of the catalytic converter using tool **(Mot. 1495-01)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Refit the oxygen sensor.

❏ Torque tighten the **oxygen sensor (45 Nm)**.

❏ Replace the exhaust flange seal.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Torque tighten the **manifold studs (7 Nm)**.

❏ Fit:

- the catalytic converter,
- the catalytic converter sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❏ Torque tighten the **nuts mounting the catalytic converter on the exhaust manifold (21 Nm)**.

K4J or K4M

III - FINAL OPERATION

❏ Torque tighten:

- the **exhaust sleeve (25 Nm)** while supporting the exhaust pipe to ensure correct alignment,
- the **exhaust manifold studs (8 Nm)**,
- the **exhaust sleeve (25 Nm)** while supporting the exhaust pipe to ensure correct alignment.

❏ Connect the oxygen sensor connector.

❏ Make sure that all the exhaust pipe heat shields are in place and properly secured.

❏ Refit the engine undertray.

❏ Make sure that there is no contact with the underbody.

WARNING

Make sure:

- position the sleeve « bolt - tightening nut» assembly vertically with the nut facing downwards to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.

K9K

Tightening torques ▽

bolts mounting the upstream strut on the catalytic converter	**26 N.m**
bolt mounting the downstream strut on the catalytic converter	**21 N.m**
exhaust clamp studs on the catalytic converter output	**7 N.m**
exhaust bracket nuts	**21 N.m**
exhaust pipe rubber mounting bush mountings on the body	**62 N.m**

IMPORTANT

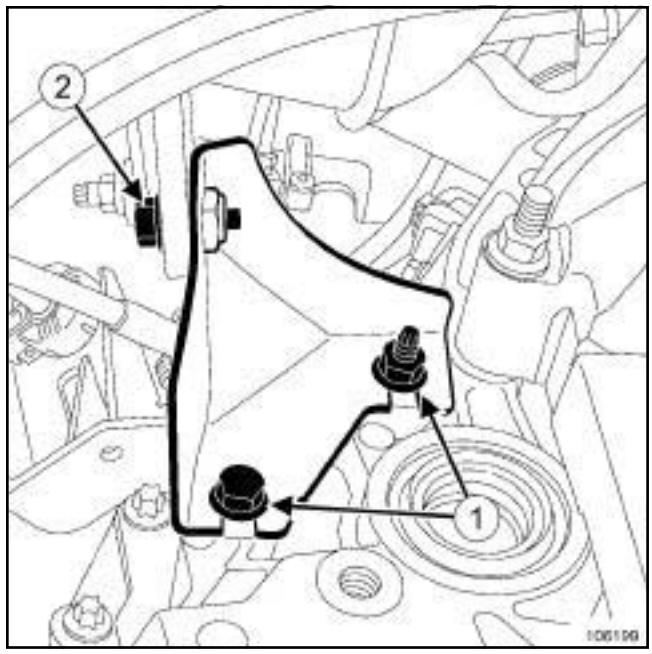
Catalytic converters contain ceramic fibres; these are contained within a closed unit and cannot be dispersed. Drilling or cutting catalytic converters is prohibited.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

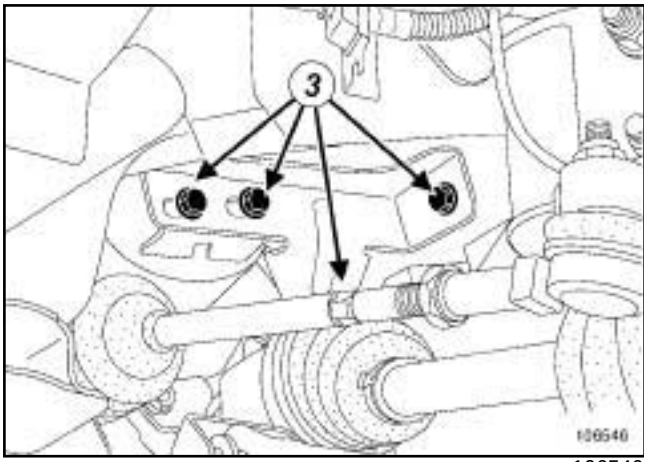


❏ Remove:

- the engine cover,
- the air inlet duct,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the two shock absorber cup covers,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray.

❏ Remove:

- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the wiring harness mountings between the catalytic converter and the exhaust pipe,
- the rubber bush mountings of the exhaust pipe on the bodywork.

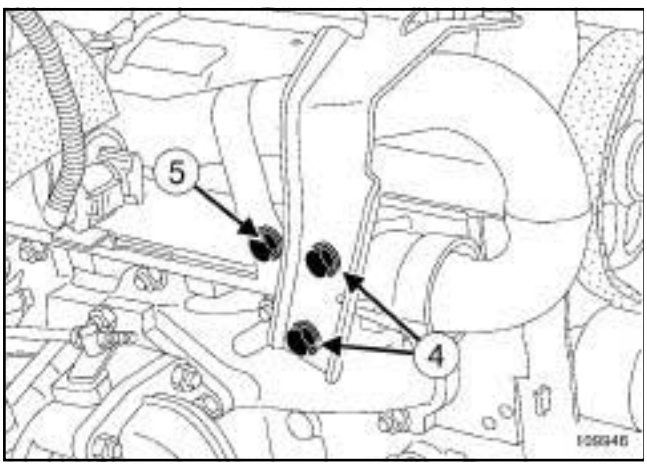


❏ Withdraw the exhaust pipe.

106199

❏ Remove:

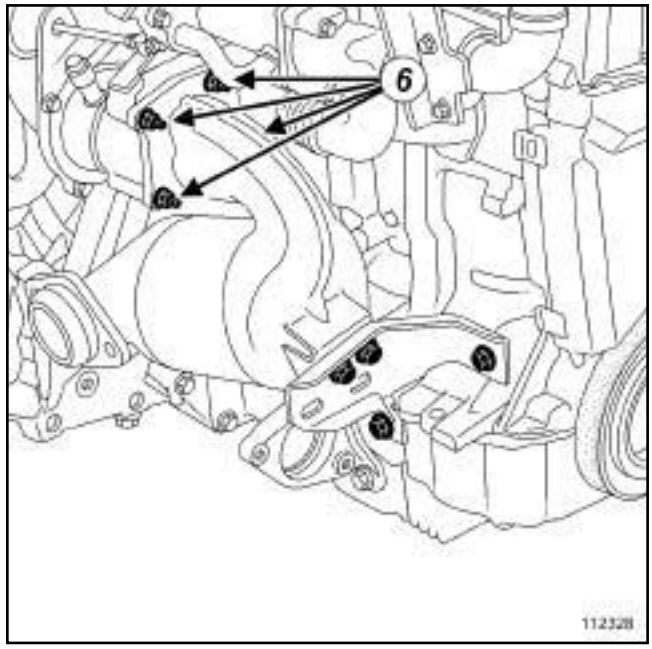
- the downstream strut mountings (**1**) on the gearbox,
- the catalytic converter downstream strut mounting bolt (**2**) ,
- the downstream strut.



106546

❑ Remove:

- the upstream strut mountings (**3**) ,
- the upstream strut.



II - OPERATION FOR REMOVAL OF PART CONCERNED

109946

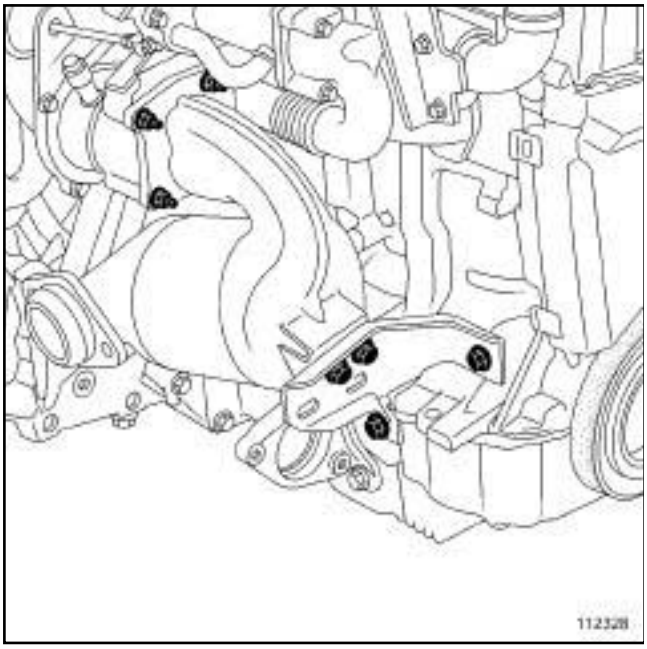
❑ Remove:

- the lifting eye mounting bolts (**4**) on the timing end,
- the lifting eye on the timing end,
- the mounting bolt (**5**) from the air inlet tube,
- the air inlet duct.

112328

❑ Remove:

- the bolts (**6**) mounting the catalytic converter to the turbocharger,
- the catalytic converter and its seal on the turbocharger,
- the sealing ring or the seal (depending on the version) then dispose of them in a waste bin.



REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Clean the bearing faces of the turbocharger and catalytic converter using an abrasive pad (see **Vehicle: Parts and consumables for the repair**) .

❑ Degrease the bearing faces using surface cleaner and clean cloths (see **Vehicle: Parts and consumables for the repair**) .

K9K

112328

❑ In case of replacement, torque tighten the **turbocharger output studs (7 N.m)**.

❑ Fit the catalytic converter equipped with a new seal on the turbocharger.

❑ Pretighten in order:

- the upstream strut bolts on the engine,
- the downstream strut bolts on the gearbox,
- the upstream strut bolts on the catalytic converter,
- the downstream strut bolts on the catalytic converter,
- the catalytic converter/turbocharger mounting nuts.

❑ Tighten to torque and in order:

- the **catalytic converter mounting nuts on the turbocharger (26 N.m)**,
- the **bolts mounting the upstream strut on the engine (44 N.m)**,
- the **bolts mounting the downstream strut on the gearbox (21 N.m)**,
- the **bolts mounting the upstream strut on the catalytic converter (26 N.m)**,
- the **bolt mounting the downstream strut on the catalytic converter (21 N.m)**.

❑ Refit:

- the air inlet duct,
- the lifting eye,
- the exhaust pipe,
- the rubber bush mountings of the exhaust pipe on the bodywork.

WARNING

Make sure there is no contact between the catalytic converter and the turbocharger oil return pipe.

❑

WARNING

Always replace the sealing ring between the catalytic converter and the exhaust pipe with a new component.

❑ Refit a new sealing ring or a new seal (depending on the version).

❑ Torque tighten:

- in the event of replacement, the **exhaust clamp studs on the catalytic converter output (7 N.m)**,
- the **exhaust bracket nuts (21 N.m)**.

II - FINAL OPERATION

❑ Torque tighten the **exhaust pipe rubber mounting bush mountings on the body (62 N.m)**.

❑ Make sure that there is no contact with the underbody.

❑ Refit the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

WARNING

Check:

- the exhaust pipe is not touching the body,
- all the heat shields are present.

❑ Refit:

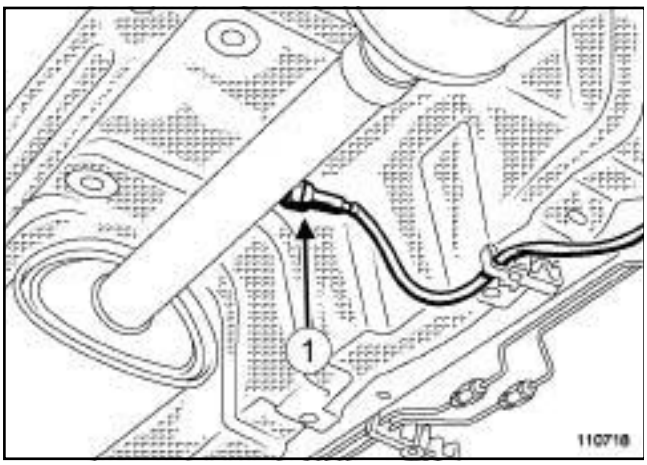
- the engine undertray,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the two shock absorber cup covers,

K9K

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the air inlet duct,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 740 or 764



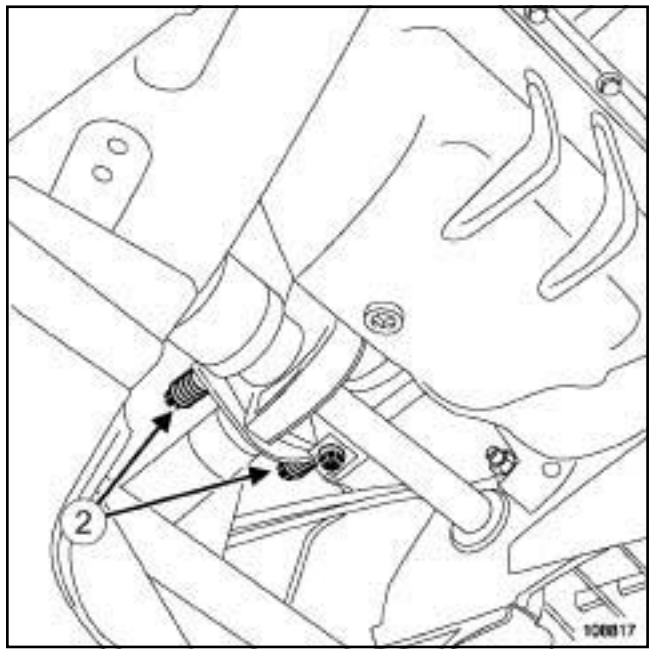
Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
manifold output bracket studs	**7 Nm**
exhaust bracket mounting bolts	**25 Nm**
oxygen sensor	**45 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



110718

❑ Remove:

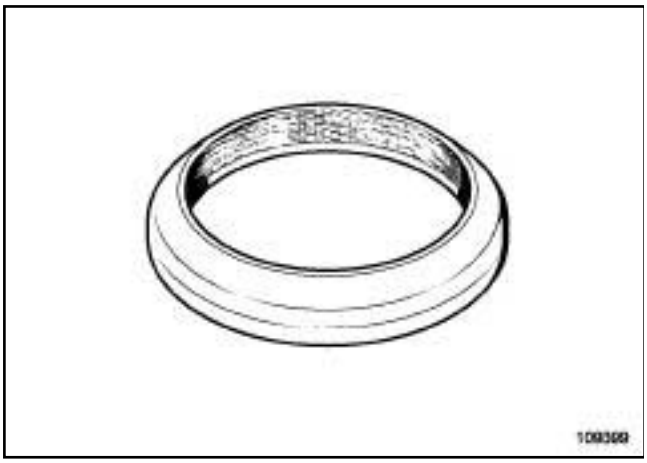
- the engine undertray mounting bolts,
- the engine undertray,
- the downstream oxygen sensor (**1**) using the **(Mot. 1495-01)**.

❑ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

108817

❑ Remove:



- the exhaust clamp mounting bolts (**2**) ,
- the catalytic converter.

IMPORTANT
Catalytic converters contain ceramic fibres; these are contained within a closed unit and cannot be dispersed. Drilling or cutting catalytic converters is prohibited.

D4F, and 740 or 764

REFITTING

I - REFITTING PREPARATIONS OPERATION

109399

❑

WARNING
It is essential to replace the sealing ring between the exhaust manifold and the catalytic converter.

❑ Position the after sales sleeve on the catalytic converter (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - REFITTING OPERATION FOR PART CONCERNED

❑ When replacing, torque tighten the **manifold output bracket studs (7 Nm)**.

❑ Refit the catalytic converter.

❑ Torque tighten the **exhaust bracket mounting bolts (25 Nm)**.

❑ Torque tighten the after-sales sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

III - FINAL OPERATION.

❑ Torque tighten the **oxygen sensor (45 Nm)** using the **(Mot. 1495-01)**.

❑ Refit:

- the engine undertray,
- the engine undertray mounting bolts,

❑ Check:

- that there is no contact with the underbody,
- all the exhaust pipe heat shields are in place and properly attached.

WARNING
Any damaged heat shields must be replaced.

M4R

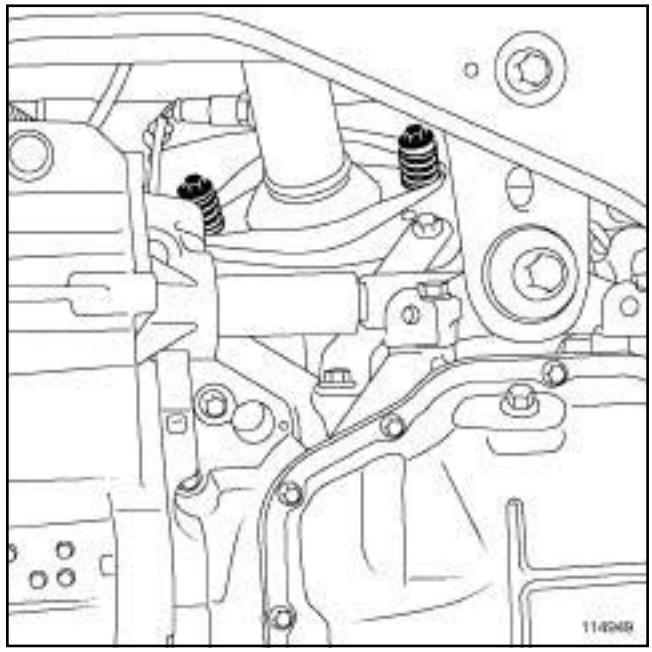
Tightening torques ▽	
exhaust flange mounting bolts	**21 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Put the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove the engine cover.



❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove:

- the engine undertray,
- the upstream and downstream oxygen sensors (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

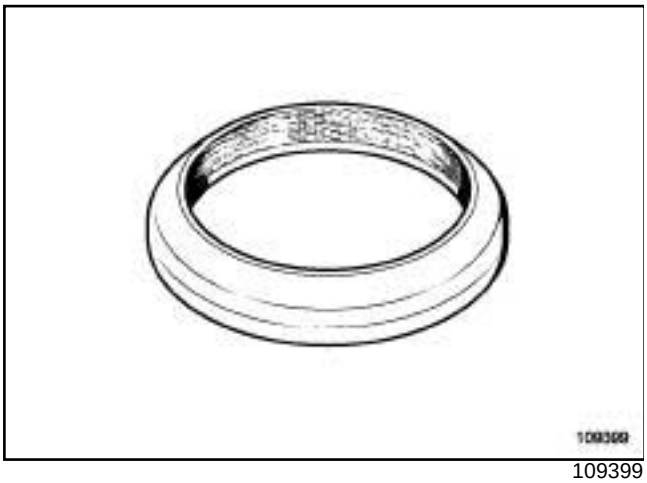
❏ Cut the exhaust pipe in the area to be cut number 1 (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) and (see **Exhaust: Parts and consumables for the repair**) .

II - REMOVAL OF PART CONCERNED

114949

❏ Remove:

- the exhaust clamp mounting bolts,
- the catalytic converter,
- the exhaust flange sealing ring.



IMPORTANT

Catalytic converters contain ceramic fibres; these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

M4R

REFITTING

I - REFITTING PREPARATION OPERATION

109399

❑ Always replace the exhaust flange sealing ring.

II - REFITTING THE PART CONCERNED

❑ Position the after sales sleeve on the catalytic converter (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❑ Torque tighten the **exhaust flange mounting bolts (21 Nm)**.

III - FINAL OPERATION

❑ Refit:

- the upstream and downstream oxygen sensors (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) ,
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) .

❑ Refit the engine cover.

F4R

The emission control assembly is comprised of two catalytic converters on the vehicle:

- one integrated into the exhaust manifold,

- one integrated into the exhaust pipe.

The method below deals with the operating procedure on the catalytic converter integrated into the exhaust pipe.

Note:

The catalytic converter integrated into the exhaust manifold cannot be separated from the latter. When removing - refitting the catalytic converter, the catalytic converter - exhaust manifold assembly must be removed (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) . When replacing the catalytic converter, the catalytic converter - exhaust manifold assembly must be replaced.

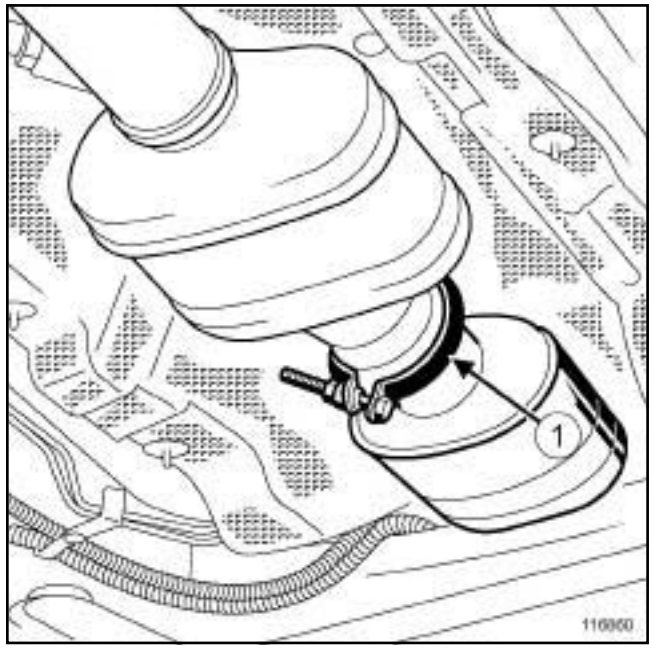
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED



1 - Removing the catalytic converter integrated into the exhaust manifold

❑ Remove the exhaust manifold (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) .

2 - Removing the catalytic converter integrated into the exhaust pipe

❑ Remove the downstream oxygen sensor (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

❑ Cut the exhaust system at the cutting area **ZC1** for this purpose (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

116860

❑ Remove:

- the exhaust pipe clamp (**1**) ,

- the catalytic converter integrated into the exhaust pipe.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

1 - Refitting the catalytic converter integrated into the exhaust manifold

❑ Refit the exhaust manifold (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) .

2 - Refitting the catalytic converter integrated into the exhaust pipe

❑ Fit the catalytic converter integrated into the exhaust pipe.

❑ Tighten the new exhaust pipe clamp by several turns.

❑ Fit the new After-Sales sleeve following the instructions supplied (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❑ Remove the downstream oxygen sensor (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

F4R

II - FINAL OPERATION

❑ Make sure there is no contact with the underbody.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Start the engine and check that there are no leaks: deal with any problems as necessary.

Catalytic converter: Removal - Refitting

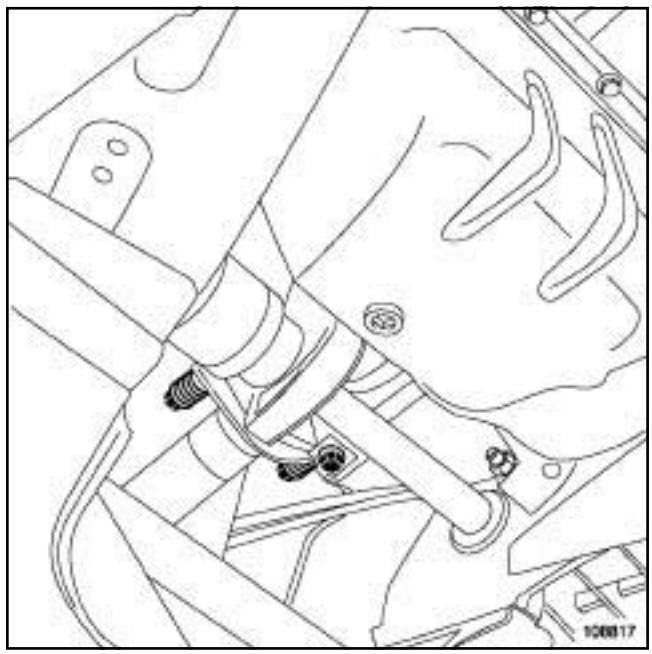
D4F, and 784

Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
upstream and downstream oxygen sensors	**45 Nm**
primary strut bolts on the cylinder block	**25 Nm**
primary strut bolt on the gearbox	**44 Nm**
catalytic converter nuts on the turbocharger (initial torque)	**20 Nm**
catalytic converter nuts on the turbocharger	**30 Nm**
primary strut bolts on the catalytic converter (initial torque)	**20 Nm**
primary strut bolts on the catalytic converter	**30 Nm**
catalytic converter upstream strut bolts on the catalytic converter	**21 Nm**
catalytic converter upstream strut bolts on the cylinder block	**21 Nm**
turbocharger strut nut	**21 Nm**
turbocharger strut bolt	**21 Nm**
turbocharger heat shield bolts	**8 Nm**
front right-hand wheel driveshaft relay bearing nuts	**44 Nm**
exhaust bracket bolts at the catalytic converter outlet	**9 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

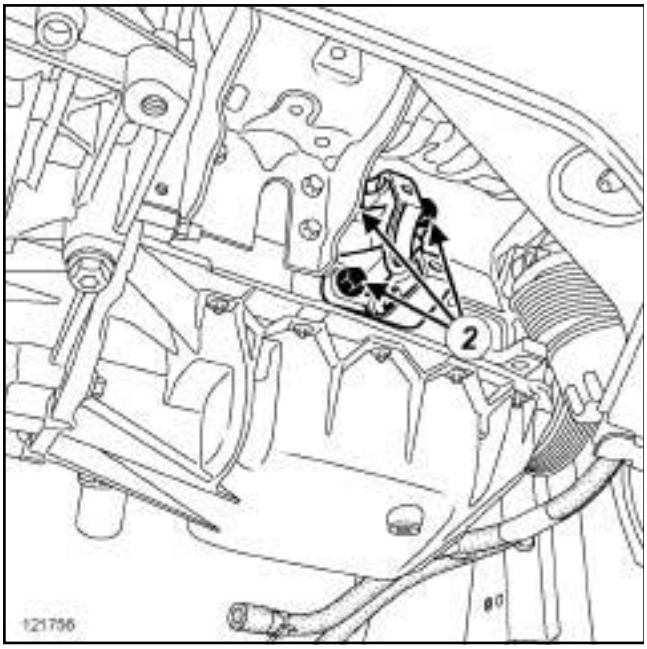


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

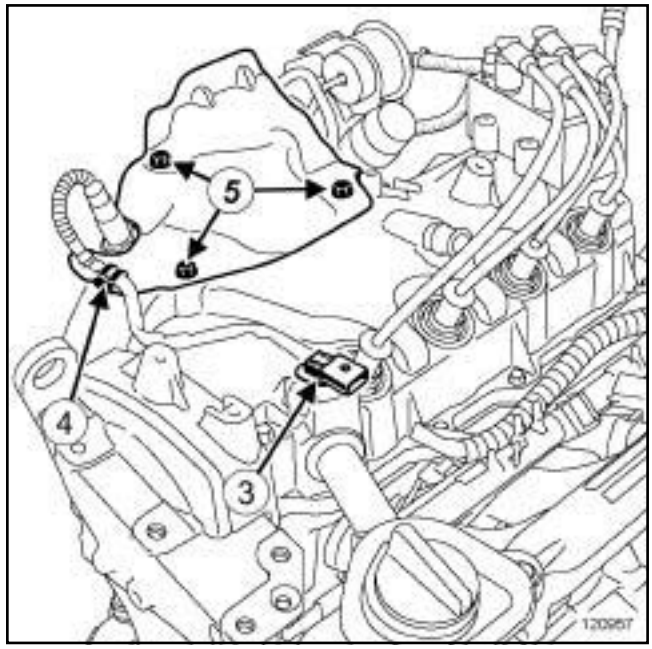
- the engine cover,
- the engine undertray.



❑ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

108817

❑ Remove the nuts from the exhaust bracket at the catalytic converter outlet.



D4F, and 784

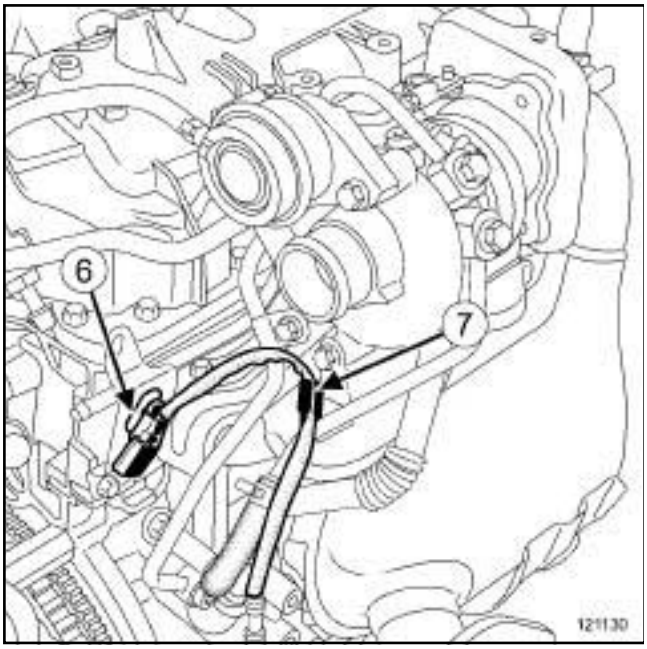
121756

❏ Remove:

- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front right-hand wheel driveshaft relay bearing nuts (**2**) ,
- the front right-hand wheel driveshaft relay bearing.

120957

❏ Disconnect the upstream oxygen sensor connector (**3**) .



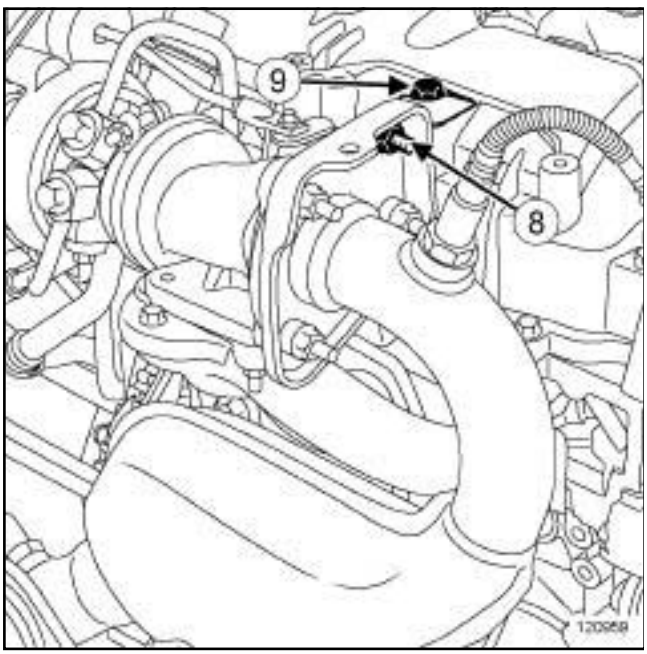
❏ Unclip the upstream oxygen sensor connector.

❏ Detach the upstream oxygen sensor wiring harness at (**4**) .

❏ Remove:

- the bolts (**5**) from the turbocharger heat shield,
- the turbocharger heat shield.

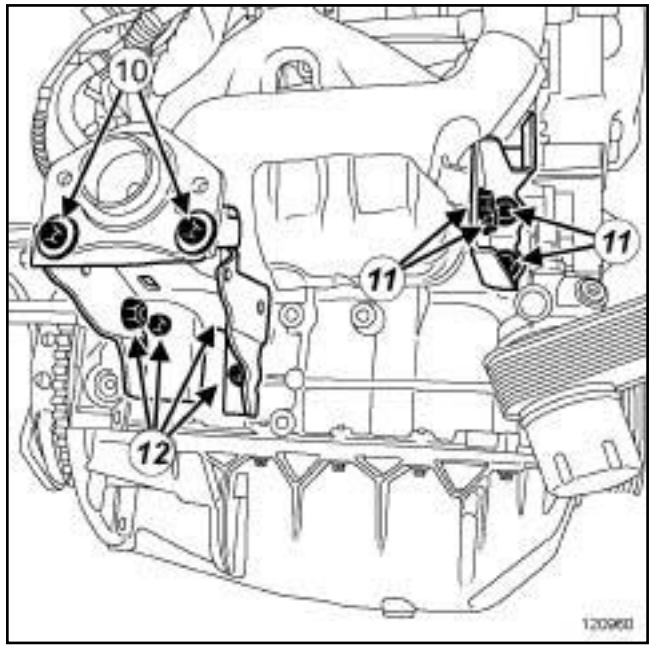
D4F, and 784



121130

❏ Disconnect the downstream oxygen sensor connector (**6**) .

❏ Unclip the downstream oxygen sensor connector.

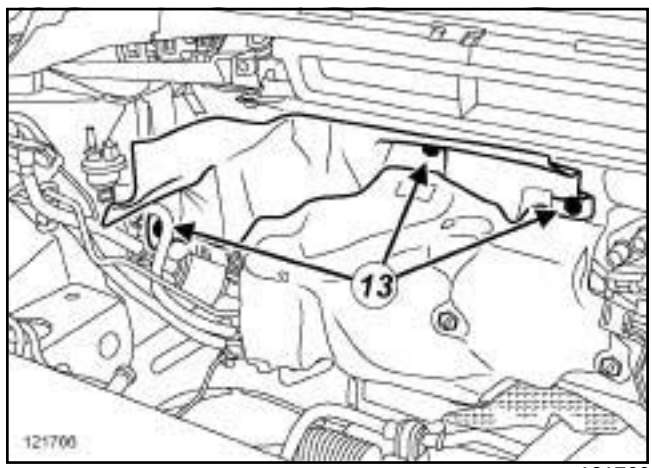


❏ Detach the downstream oxygen sensor wiring harness at (**7**) .

120959

❏ Remove:

- the nut (**8**) from the turbocharger strut,
- the bolt (**9**) from the turbocharger strut,
- the turbocharger strut.



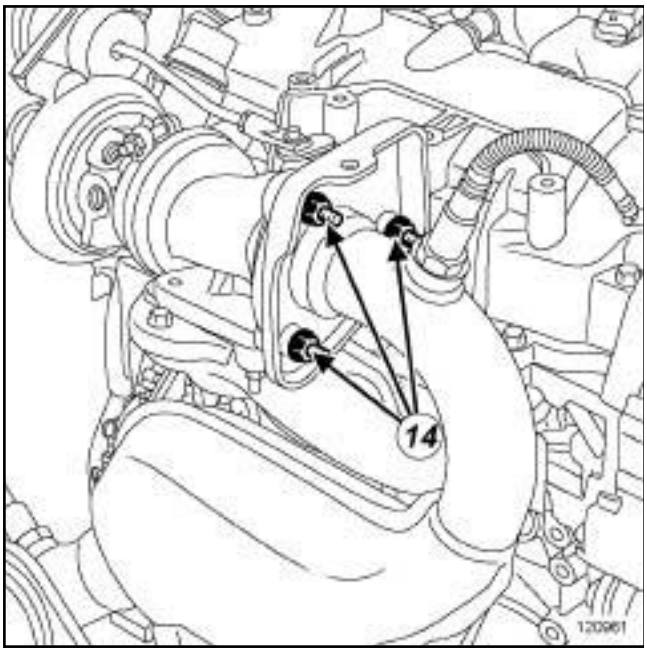
120960

❏ Disconnect the oil pressure sensor connector.

❏ Undo the bolts (**10**) on the catalytic converter primary strut.

❏ Remove:

- the catalytic converter upstream strut bolts (**11**) ,
- the catalytic converter upstream stay,
- the bolts (**12**) on the cylinder block primary strut,
- the primary strut from the cylinder block.



121766

❏ remove:

- the clips (**13**) from the upper heat shield,
- the upper heat shield.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

120961

❑ Remove:

- the nuts (**14**) mounting the catalytic converter on the turbocharger and the spacers,
- the catalytic converter,
- the catalytic converter seal on the turbocharger.

IMPORTANT
Catalytic converters contain ceramic fibres; these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

❑ When replacing the catalytic converter, remove the upstream and downstream oxygen sensors on the workbench using the **(Mot. 1495-01)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

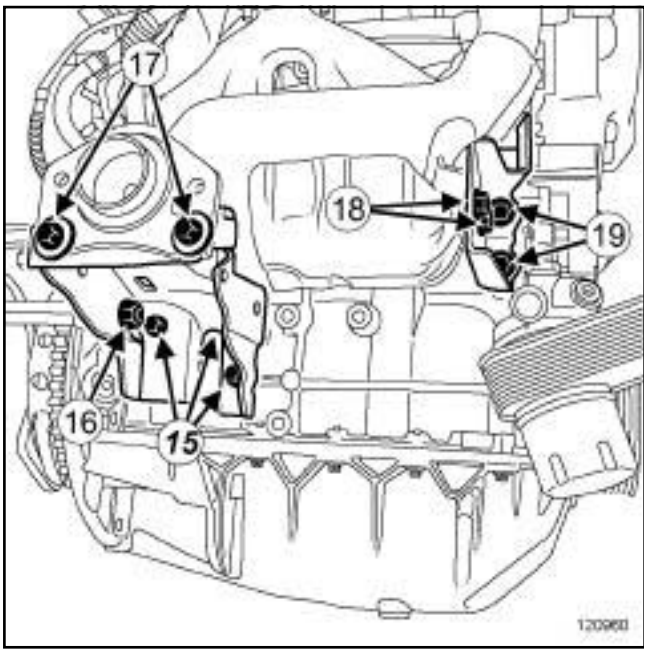
❑ When replacing the catalytic converter, refit the upstream and downstream oxygen sensors on the workbench.

❑ Torque tighten the **upstream and downstream oxygen sensors (45 Nm)** using the **(Mot. 1495-01)**.

❑ Always replace:

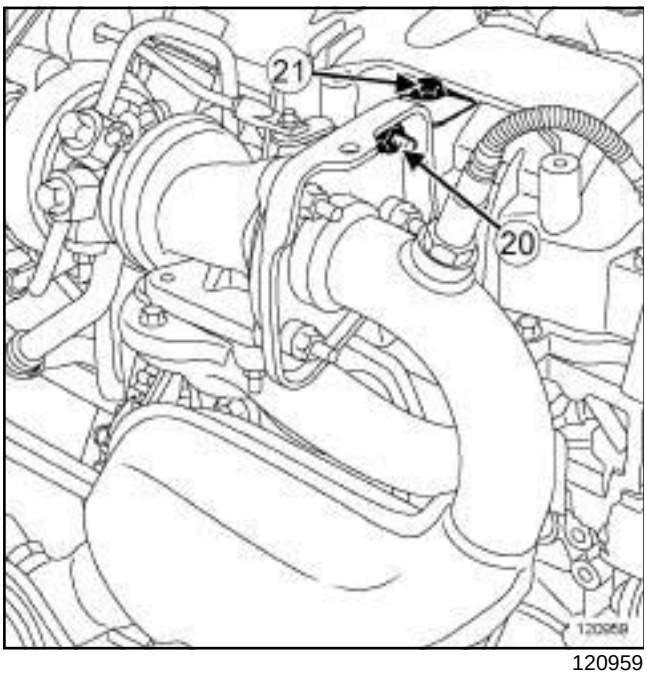
- the catalytic converter seal,
- the catalytic converter nuts on the turbocharger,

❑ Use abrasive pads to clean the bearing faces of:



- the turbocharger,
- the catalytic converter.

❑ Degrease the pressure faces using **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) and a clean cloth:



- the turbocharger,
- the catalytic converter.

D4F, and 784

II - REFITTING OPERATION FOR PART CONCERNED

120960

120959

❑ Refit:

- the catalytic converter seal on the turbocharger,
- the catalytic converter,
- the new nuts with the catalytic converter spacers on the turbocharger,
- the catalytic converter primary strut,
- the bolts (**15**) on the cylinder block primary strut,
- the primary strut bolt (**16**) on the gearbox,
- the catalytic converter upstream stay,
- the catalytic converter upstream strut bolts (**18**) and (**19**) ,
- the turbocharger strut.
- the bolt (**21**) from the turbocharger strut,
- the turbocharger strut nut (**20**) .

❑ Torque tighten:

- the **primary strut bolts on the cylinder block (25 Nm)** by locking the strut on the gearbox lug at (**15**) ,
- the **primary strut bolt on the gearbox (44 Nm)** at (**16**) ,
- the **catalytic converter nuts on the turbocharger (initial torque) (20 Nm)**,
- the **catalytic converter nuts on the turbocharger (30 Nm)**,
- the **primary strut bolts on the catalytic converter (initial torque) (20 Nm)** at (**17**) ,
- the **primary strut bolts on the catalytic converter (30 Nm)**,
- the **catalytic converter upstream strut bolts on the catalytic converter (21 Nm)** at (**18**) ,
- the **catalytic converter upstream strut bolts on the cylinder block (21 Nm)** at (**19**) ,
- the **turbocharger strut nut (21 Nm)** at (**20**) ,
- the **turbocharger strut bolt (21 Nm)** at (**21**) .

III - FINAL OPERATION.

❑ Refit:

- the upper heat shield,
- the clips on the upper heat shield.

❑ Connect the oil pressure sensor connector.

❑ Attach the downstream oxygen sensor wiring harness.

❑ Fit the downstream oxygen sensor connector.

❑ Connect the downstream oxygen sensor connector.

❑ Refit:

- the turbocharger heat shield,
- the turbocharger heat shield bolts.

❑ Torque tighten the **turbocharger heat shield bolts (8 Nm)**.

❑ Attach the upstream oxygen sensor wiring harness.

❑ Fit the upstream oxygen sensor connector.

❑ Connect the upstream oxygen sensor connector.

D4F, and 784

❏ Refit:

- the front right-hand wheel driveshaft relay bearing,
- the front right-hand wheel driveshaft relay bearing nuts.

❏ Torque tighten the **front right-hand wheel driveshaft relay bearing nuts (44 Nm)**.

❏ Refit:

- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- exhaust bracket nuts.

❏ Torque tighten the **exhaust bracket bolts at the catalytic converter outlet (9 Nm)**.

❏ Fill the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

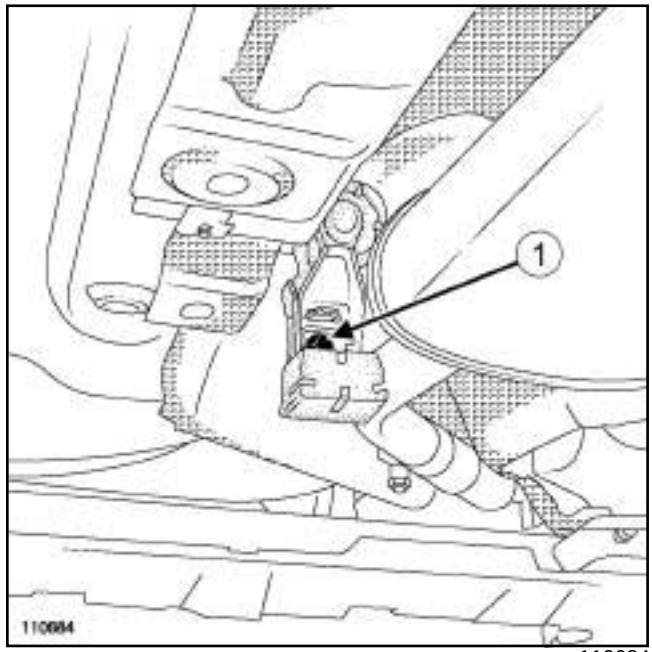
❏ Refit:

- the engine cover,
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Tightening torques ▽	
new expansion chamber mounting bolt on the rubber mounting bush	**8 Nm**
exhaust sleeves	**25 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Remove the engine undertray.

❑ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

110684

❑ Remove:

- the bolt (**1**) mounting the expansion chamber to the exhaust rubber mounting bush,
- the expansion chamber.

> Note:
>
> If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the expansion chamber,
- the sleeves,
- the rubber mounting bush damper.

❑ Torque tighten:

- the **new expansion chamber mounting bolt on the rubber mounting bush (8 Nm)**,
- the **exhaust sleeves (25 Nm)** while lifting the exhaust pipe to ensure correct alignment (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - FINAL OPERATION.

❑ Check:

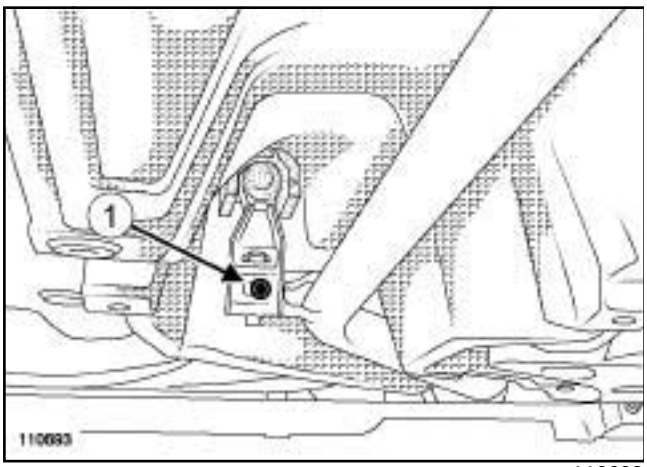
- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

Tightening torques ▽	
new mounting bolts on the connector pipe on the rubber mounting bush	**8 Nm**
exhaust sleeves	**25 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (see **Exhaust: Parts and consumables for the repair**) (MR 392, 19A, Exhaust).

110693

❑ Remove:

- the bolt (**1**) mounting the connector pipe to the rubber mounting bush support,
- the connector pipe.

Note:

If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the connector pipe,
- the sleeves.

❑ Torque tighten:

- the **new mounting bolts on the connector pipe on the rubber mounting bush (8 Nm)**,
- the **exhaust sleeves (25 Nm)** while lifting the exhaust pipe to ensure correct alignment (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (MR 392, 19A, Exhaust).

II - FINAL OPERATION.

❑ Make sure that all the exhaust pipe heat shields are in place and properly secured.

❑ Make sure that there is no contact with the underbody.

WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

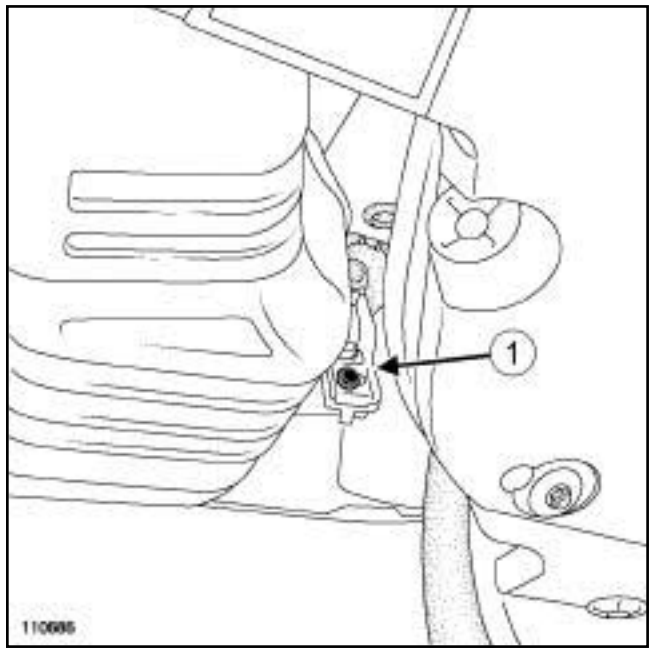
Tightening torques ▽	
rubber mounting bush support bolts on the silencer	**8 Nm**
exhaust sleeve	**25 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (see **Exhaust: Parts and consumables for the repair**) (MR 392, 19A, Exhaust).

II - OPERATION FOR REMOVAL OF PART CONCERNED

110686

❑ Remove:

- the bolt (**1**) mounting the silencer on the rubber mounting bush support,
- the silencer.

Note:

If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the silencer,
- the sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (MR 392, 19A, Exhaust).

❑ Torque tighten:

- the **rubber mounting bush support bolts on the silencer (8 Nm)**,
- the **exhaust sleeve (25 Nm)** while lifting the exhaust pipe to ensure correct alignment.

D4F or K4J or K4M or K9K or M4R

II - FINAL OPERATION.

- ❑ Make sure that all the exhaust pipe heat shields are in place and properly secured.
- ❑ Make sure that there is no contact with the underbody.

WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- position the new component in such a way that the marks on the area to be cut are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

F4R

Equipment required
component jack

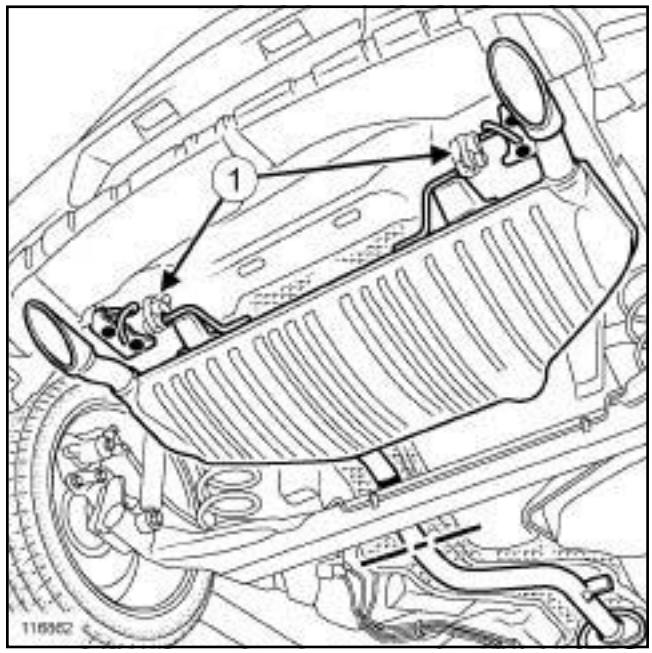
Tightening torques ▽	
bolts of the rubber mounting bush supports on the body	**21 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove the diffuser on the rear bumper (see **Aerodynamic diffuser: Removal - Refitting**) (55A, Exterior protection).



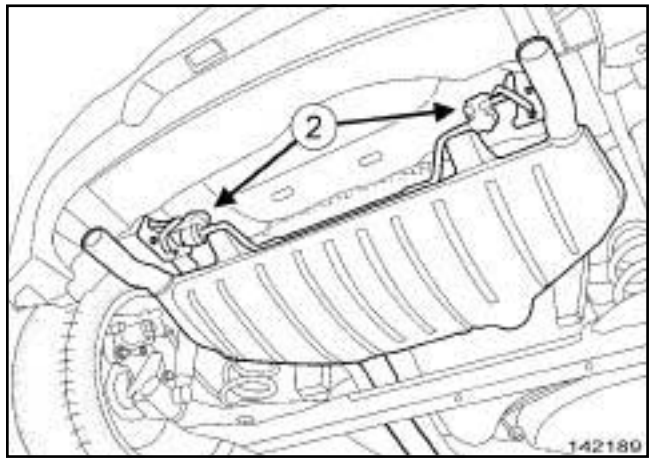
II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) in the designated area to be cut (see **19B**, **Exhaust**, **Exhaust: List and location of components**, page **19B-1**) .

❑ Fit a **component jack** under the silencer.

WARNING
If removing the support from the rubber mounting bush on the body, mark its position on the body beforehand, using a pen.

F4R, and 830



116862

❑ Remove:

- the rubber mounting bushes (**1**) using the tool **Mot. 1857**,
- the silencer.

F4R, and 832

142189

❑ Remove:

- the rubber mounting bushes (**2**) using the tool **Mot. 1857**,

- the silencer.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the silencer and hold it with a **component jack**.

❏ If removing the supports from the rubber mounting bushes, fit the mounting bolts of the rubber mounting bush supports on the body without tightening them.

❏ Fit the retaining rubber mounting bushes of the silencer.

> Note:
>
> Lubricate inside the holes of the rubber mounting bush using brake cleaner (see **Vehide: Parts and consumables for the repair**) to fit it more easily on the support on the body and on the silencer.

❏ Fit the exhaust trunking (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❏ Adjust the silencer in relation to the rear bumper in order to align the splines horizontally.

❏ Torque tighten the **bolts of the rubber mounting bush supports on the body (21 N.m)** if they were removed.

II - FINAL OPERATION

❏ Check that the exhaust pipe heat shields are in place and properly attached.

❏ Check that there are no leaks.

> **WARNING**
>
> Check that the exhaust pipe is not touching the body.
>
> Check that all the heat shields are present.

❏ Refit the diffuser on the rear bumper (see **Aerodynamic diffuser: Removal - Refitting**) (55A, Exterior protection).

EQUIPMENT LEVEL EAG

Tightening torques ▽	
rubber mounting bush support bolts on the silencer	**8 N.m**

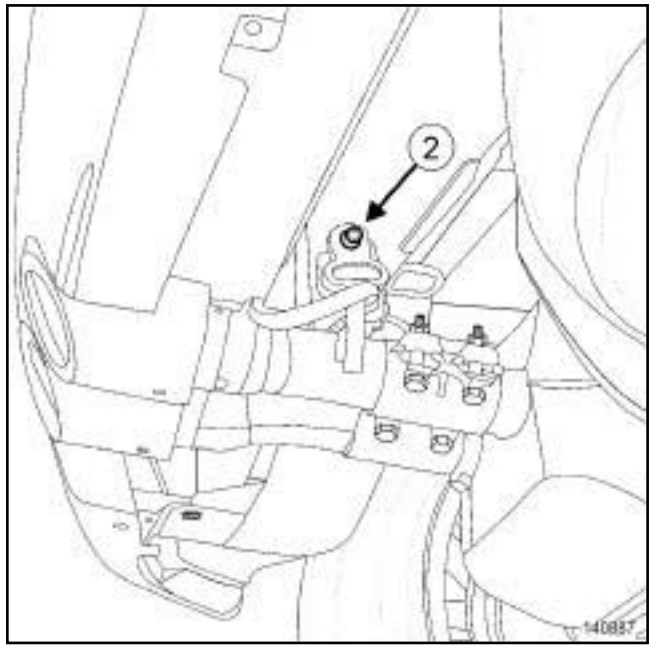
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) in the designated area to be cut (see **Exhaust: Parts and consumables for the repair**) (19A, Exhaust).

II - OPERATION FOR REMOVAL OF PART CONCERNED

110686

❏ Remove the silencer bolts (**1**) on the rubber mounting bush support.

140887

❏ Unclip the silencer from the rubber mounting bush at (**2**) .

❏ Remove the silencer.

> Note:
>
> If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the silencer.

❏ Clip the silencer onto the rubber mounting bush.

❏ Fit a new After-Sales sleeve between the expansion chamber and the silencer (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

> **WARNING**
>
> Position the « nut and bolt securing the sleeve » assembly so that the assembly cannot come into contact with the underbody.

❏ Tighten to torque:

- the **rubber mounting bush support bolts on the silencer (8 N.m)**,

EQUIPMENT LEVEL EAG

- the **exhaust sleeve (25 N.m)** whilst supporting the exhaust pipe.

II - FINAL OPERATION

❑ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody,
- that there are no leaks.

K9K, and 772

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.

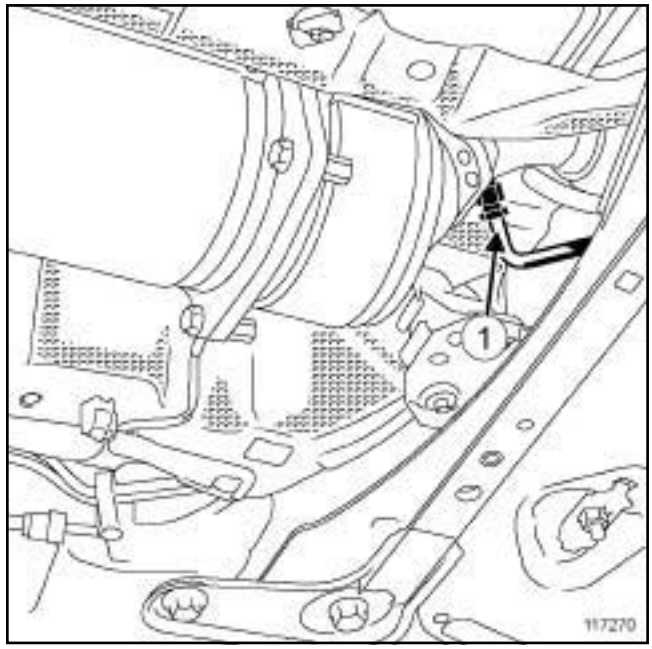
Equipment required
Diagnostic tool

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

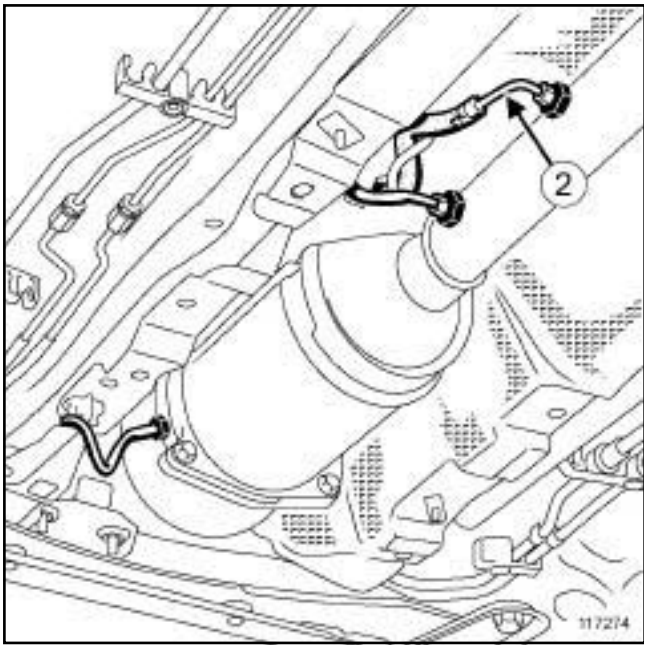


❏ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Disconnect the blue connector from the upstream temperature sensor on the steering rack.

❏ Remove:



- the downstream temperature sensor from its adapter on the exhaust pipe.
- the temperature sensor between the catalytic converter and the particle filter,

117270

❏ Remove the upstream pressure measurement connection (**1**) from its adapter bolted to the exhaust pipe.

K9K, and 772

117274

❑ Remove the downstream pressure measurement connection (**2**) from its adapter bolted to the exhaust pipe.

WARNING
When removing the pipe, the adapter must be held using a lock wrench.

WARNING
The pressure measurement circuit must never be opened except at the pressure measurement adapters.

❑ Remove the connecting hose nuts on the catalytic pre-converter.

❑ Remove the particle filter rubber mounting bush bolts on the sub-frame.

❑ Cut the exhaust pipe at **Area to be cut 1** using the **(Mot. 1199-01)** (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❑ Remove the particle filter.

❑ If removing the particle filter, remove:

- the upstream temperature sensor (see **19B**, **Exhaust**, **Particle filter temperature sensors: Removal - Refitting**, page **19B-60**) ,
- the connecting hose (see **Connecting hose: Removal - Refitting**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Deburr the cut marks on the exhaust pipe and on the particle filter if it is to be re-used.

WARNING
When fitting the particle filter, be sure to pass the downstream pressure measurement connection behind the heat shield.

WARNING
Always replace any adapter that has been removed from the exhaust pipe.

Note:
It is essential to thoroughly clean the pressure faces at:
- the catalytic pre-converter - connecting hose connecting brackets,
- the particle filter - connecting hose connecting brackets.

❑ If replacing the particle filter, refit:

- the upstream temperature sensor (see **19B**, **Exhaust**, **Particle filter temperature sensors: Removal - Refitting**, page **19B-60**) ,
- the connecting hose equipped with a new seal (see **Connecting hose: Removal - Refitting**) .

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the new seal between the catalytic pre-converter and the connecting hose.

❑ Fit:

- the particle filter,
- the sleeve.

❑ Refit:

- the rubber mounting bush bolts on the sub-frame,
- the connecting hose nuts on the catalytic pre-converter.

❑ Tighten the sleeve bolt.

❑ Coat the threadings of the upstream and downstream pressure measurement connections with **ANTI-SEIZE COPPER GREASE** or **COPPER-ALUMINIUM LUBRICANT**.

K9K, and 772

❑ Refit:

- the downstream temperature sensor,
- the temperature sensor between the catalytic converter and the particle filter,
- the downstream pressure measurement connection on its adapter bolted to the exhaust pipe,
- the upstream pressure measurement connection on its adapter bolted to the exhaust pipe.

❑ Connect the upstream temperature sensor connector.

III - FINAL OPERATION

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Before starting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

❑ Refit the engine undertray.

❑ If replacing the particle filter, reinitialise the particle filter parameters (see **Fault finding - Replacement of components**) (MR 394, 13B, Diesel injection).

Particle filter pressure sensor: Removal - Refitting

K9K, and 772

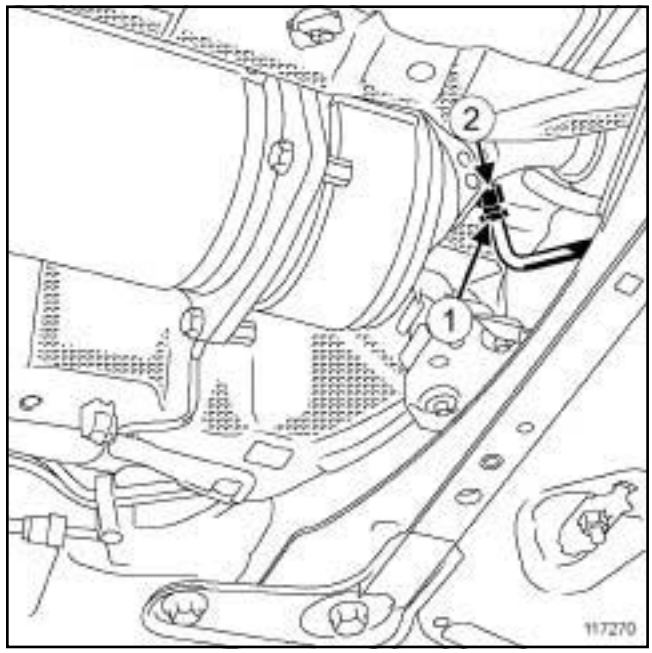
Equipment required
Diagnostic tool

Tightening torques ▽	
adapter	**44 N.m**
downstream pressure measurement connection union on its adapter	**21 N.m**
upstream pressure measurement connection union on its adapter	**21 N.m**

The pressure measurement circuit must only ever be opened at the adapters on the exhaust pipe.

REMOVAL

I - REMOVAL PREPARATION OPERATION



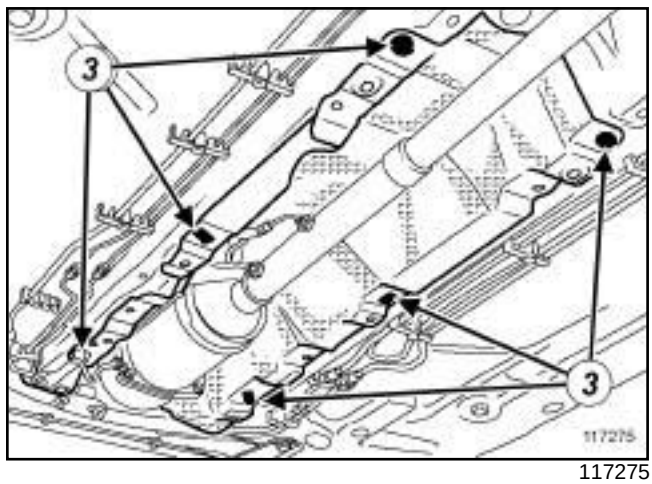
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the engine undertray.

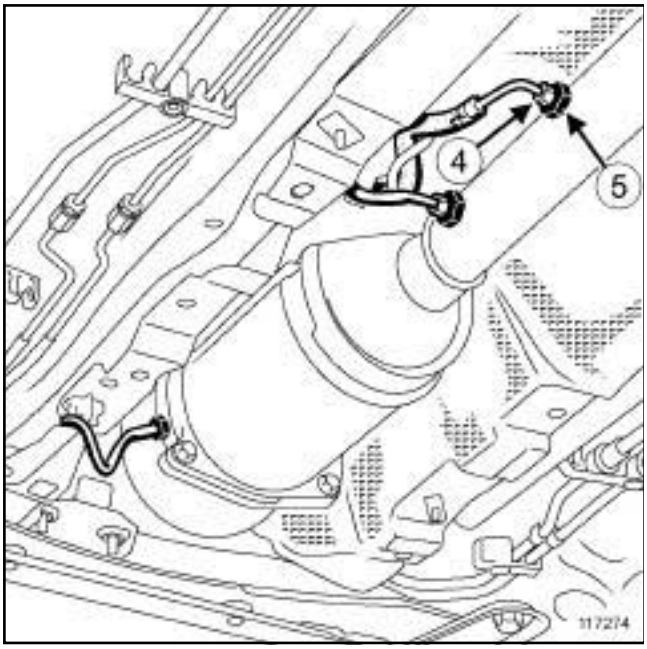
II - OPERATION FOR REMOVAL OF PART CONCERNED



117270

❏ Remove the upstream pressure measurement connection (**1**) from its adapter (**2**) bolted to the exhaust pipe.

WARNING

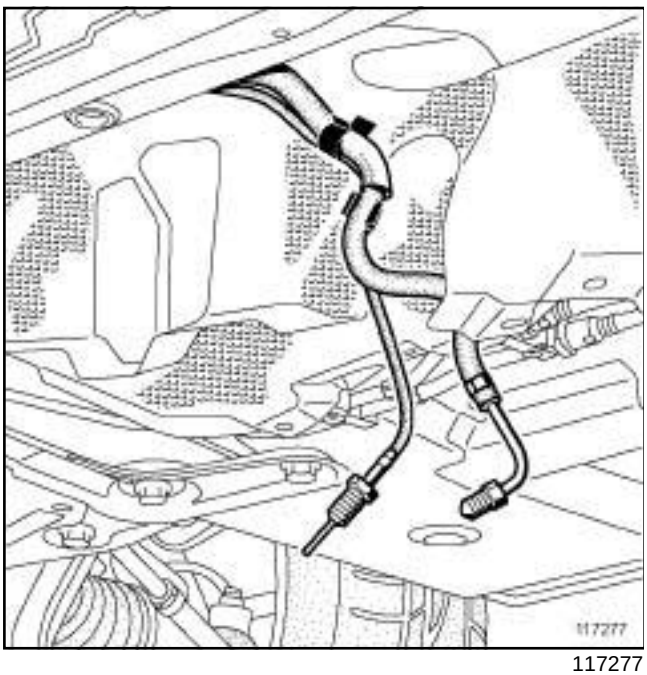


When the pressure measurement connection is removed, the adapter must be held with a lock spanner.

117275

❏ Remove the clips (**3**) from the heat shield.

K9K, and 772



117274

❑ Remove the downstream pressure measurement connection (**4**) from its adapter (**5**) bolted onto the exhaust pipe.

WARNING

When the pressure measurement connection is removed, the adapter must be held with a lock spanner.

117277

❑ Detach the downstream pressure measurement connection from the heat shield.

❑ Remove:

- the pressure sensor nut on the steering box,
- the pressure sensor equipped with its upstream and downstream pressure measurement connections.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING

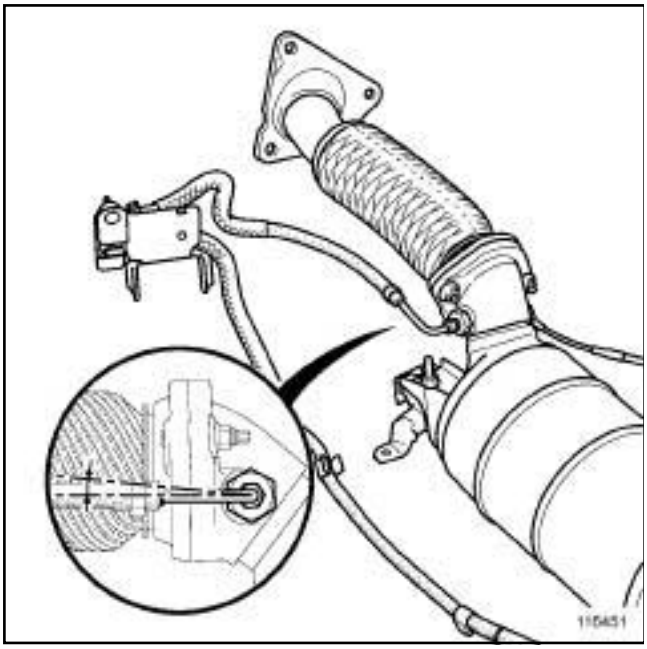
Always replace any adapter that has been removed from the exhaust pipe.

In the event of replacement, torque tighten the **adapter (44 N.m)**.

❑ Coat the temperature sensor threading with **ANTI-SEIZE COPPER GREASE** or **COPPER-ALUMINIUM LUBRICANT**.

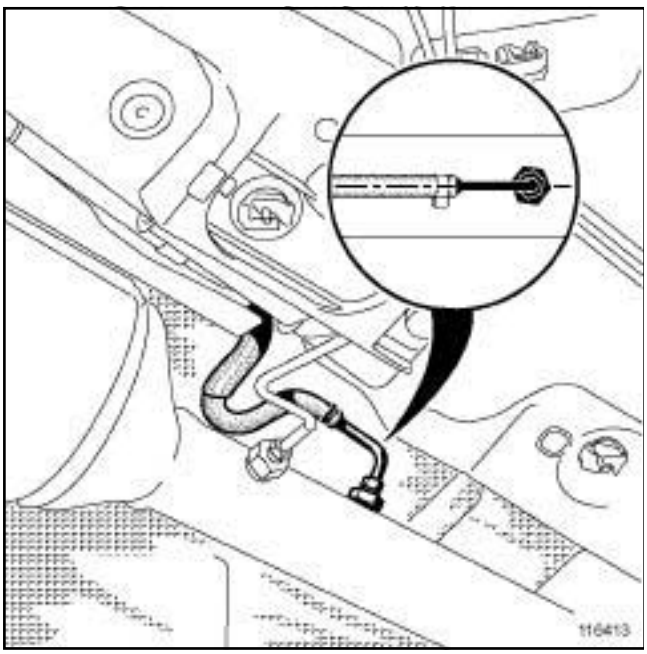
WARNING

Make sure that the grease does not run over the threading.



II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:



- the pressure sensor equipped with its upstream and downstream pressure measurement connections.
- the pressure sensor nut.

❑ Clip the downstream pressure measurement connection on the heat shield.

K9K, and 772

116451

116413

❑ Refit the downstream pressure measurement connection bolted to the exhaust pipe, observing an angle of **+3°** for the rigid section relative to the exhaust pipe.

❑ Torque tighten the **downstream pressure measurement connection union on its adapter (21 N.m)**, maintaining the angle of the rigid section.

❑ Refit the upstream pressure measurement connection bolted to the exhaust pipe, observing an angle of **+3°** for the rigid section relative to the exhaust pipe.

❑ Torque tighten the **upstream pressure measurement connection union on its adapter (21 N.m)**, maintaining the angle of the rigid section.

III - FINAL OPERATION

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Before starting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

❑ Refit:

- the engine undertray,
- the engine cover.

K9K, and 772

Equipment required
Diagnostic tool

Tightening torques ▽	
adapter	**44 N.m**
catalytic converter upstream temperature sensor	**30 N.m**
particle filter upstream temperature sensor	**21 N.m**
particle filter down-stream temperature sensor	**30 N.m**

The particle filter must be removed in order to remove the catalytic converter upstream temperature sensor.

REMOVAL

I - REMOVAL PREPARATION OPERATION

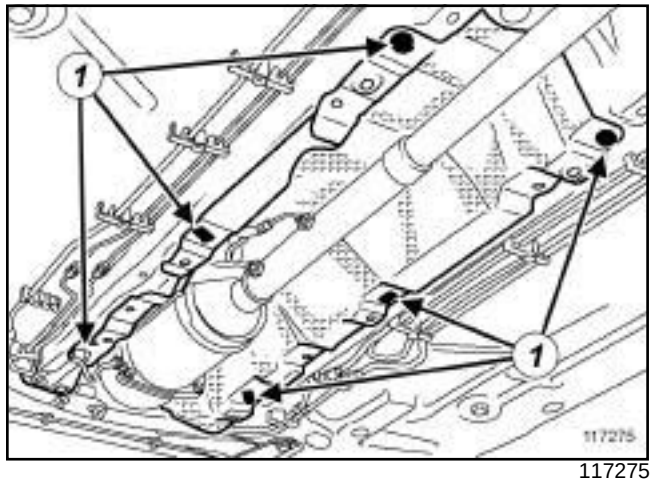
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the engine undertray.

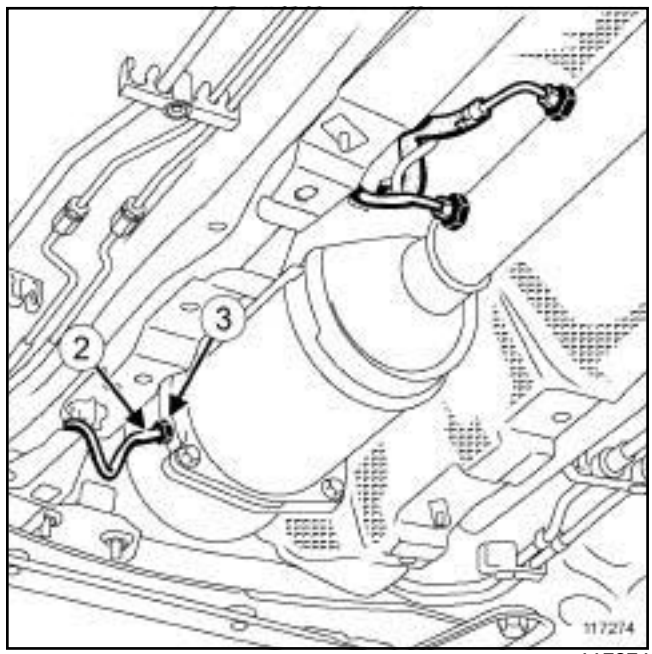
II - OPERATION FOR REMOVAL OF PART CONCERNED



1 - Catalytic converter upstream temperature sensor

❏ Remove the particle filter (see **19B**, **Exhaust**, **Particle filter: Removal - Refitting**, page **19B-54**) .

❏ Remove the catalytic converter upstream temperature sensor from its adapter bolted to the exhaust pipe.

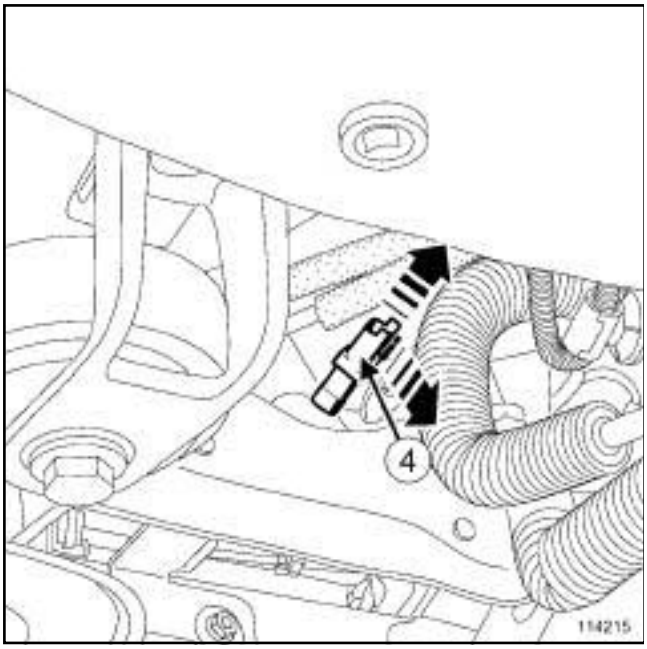


WARNING
When removing the particle filter temperature sensor, the adapter must be held with a lock wrench.

2 - Particle filter upstream temperature sensor

117275

❏ Remove the heat shield clips (**1**)

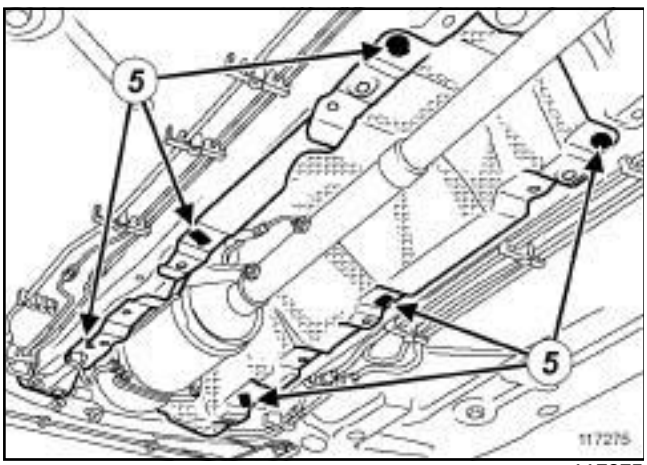


117274

❏ Remove the particle filter upstream temperature sensor (**2**) from its adapter (**3**) bolted to the exhaust pipe.

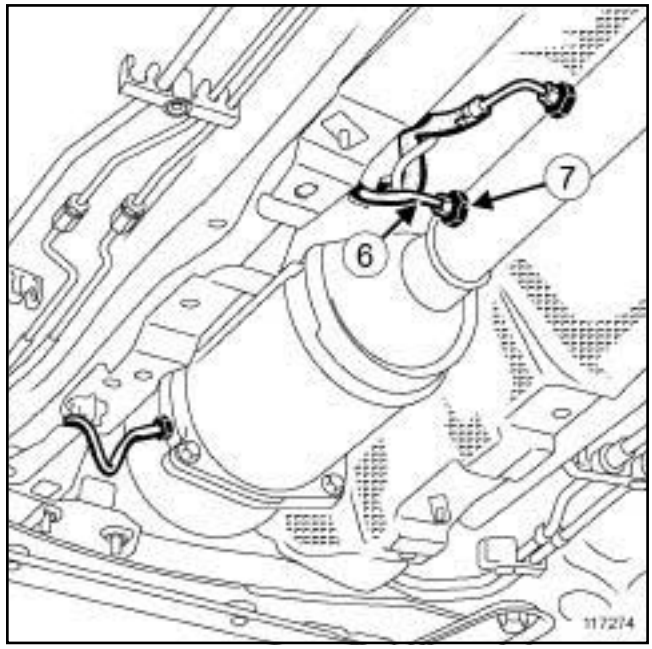
WARNING
When removing the particle filter temperature sensor, the adapter must be held with a lock wrench.

K9K, and 772



114215

❑ Disconnect the green connector from the temperature sensor.

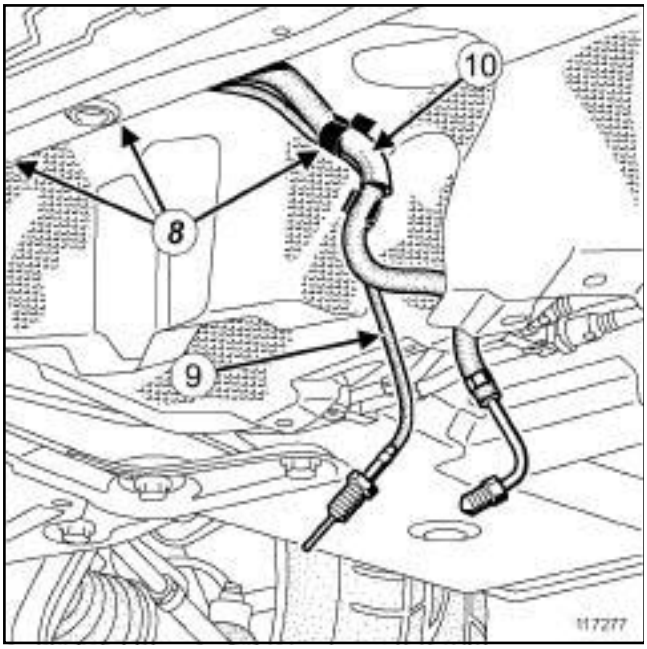


❑ Remove the particle filter upstream temperature sensor.

3 - Particle filter downstream temperature sensor

117275

❑ Remove the heat shield clips (**5**)



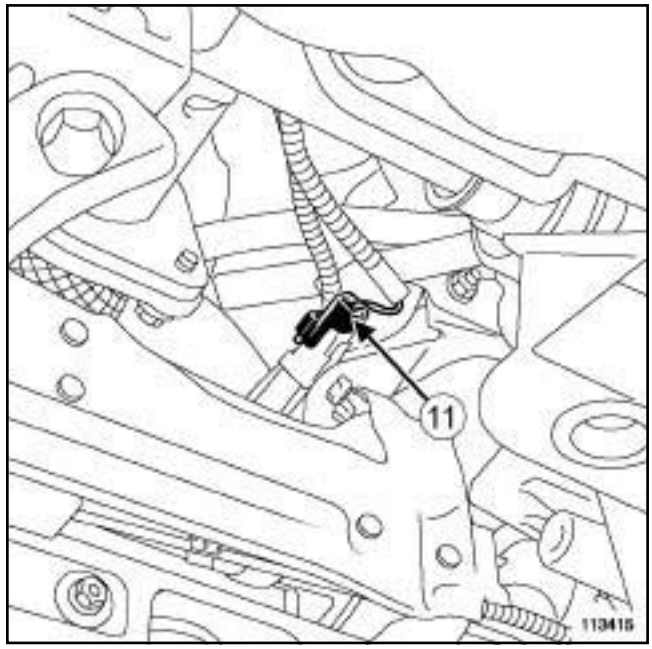
117274

❑ Remove the particle filter downstream temperature sensor (**6**) from its adapter (**7**) bolted to the exhaust pipe.

WARNING

When removing the particle filter temperature sensor, the adapter must be held with a lock wrench.

K9K, and 772



117277

❑ Detach the temperature sensor wiring harness (**8**) from the heat shield at (**9**) , moving the heat shield aside.

Note:

It may be necessary to detach the downstream pressure measurement connection (**10**) so as not to damage the temperature sensor wiring harness.

113415

❑ Disconnect the black connector (**11**) from the temperature sensor.

❑ Remove the particle filter downstream temperature sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
Always replace any adapter that has been removed from the exhaust pipe.

In the event of replacement, torque tighten the **adapter (44 N.m)**.

❑ Coat the temperature sensor threading with **ANTI-SEIZE COPPER GREASE** or **COPPER-ALUMINIUM LUBRICANT**.

WARNING
Make sure that the grease does not run over the threading.

K9K, and 772

II - REFITTING OPERATION FOR PART CONCERNED

1 - Catalytic converter upstream temperature sensor

❏ Refit the catalytic converter upstream temperature sensor on its adapter bolted to the exhaust pipe.

❏ Torque tighten the **catalytic converter upstream temperature sensor (30 N.m)**.

❏ Refit the particle filter (see **19B**, **Exhaust**, **Particle filter: Removal - Refitting**, page **19B-54**) .

2 - Particle filter upstream temperature sensor

❏ Refit the particle filter upstream temperature sensor to its adapter bolted to the exhaust pipe.

❏ Torque tighten the **particle filter upstream temperature sensor (21 N.m)**.

❏ Connect the temperature sensor connector.

❏ Clip the temperature sensor wiring harness to the heat shield.

❏ Fit the heat shield.

❏ Refit the heat shield clips

3 - Particle filter downstream temperature sensor

❏ Refit the particle filter downstream temperature sensor to its adapter bolted to the exhaust pipe.

❏ Torque tighten the **particle filter downstream temperature sensor (30 N.m)**.

❏ Connect the temperature sensor connector.

❏ Clip:

- the temperature sensor wiring harness on the heat shield,
- the downstream pressure measurement connection.

❏ Fit the heat shield.

❏ Refit the heat shield clips.

III - FINAL OPERATION

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Before starting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

❏ Refit:

- the engine undertray,
- the engine cover.

Exhaust fuel injector: Removal - Refitting

K9K, and 772

Equipment required
Diagnostic tool

Tightening torques ▽	
mounting bolt of the diesel injector retaining bracket	**21 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- **see Exhaust: Precautions for repair** (19B, Exhaust),
- **see Vehicle: Precautions for repair** (01D, Mechanical introduction).

IMPORTANT

Wear protective gloves during the operation.

IMPORTANT

Wear heat protective gloves during the operation.

PARTS AND CONSUMABLES FOR THE REPAIR WORK

❑ Parts always to be replaced:

- the diesel injector seal on its cooler.

❑ Consumables:

- cleaning cloths (part no. **77 11 211 707**).

REMOVAL

I - REMOVAL PREPARATION OPERATION

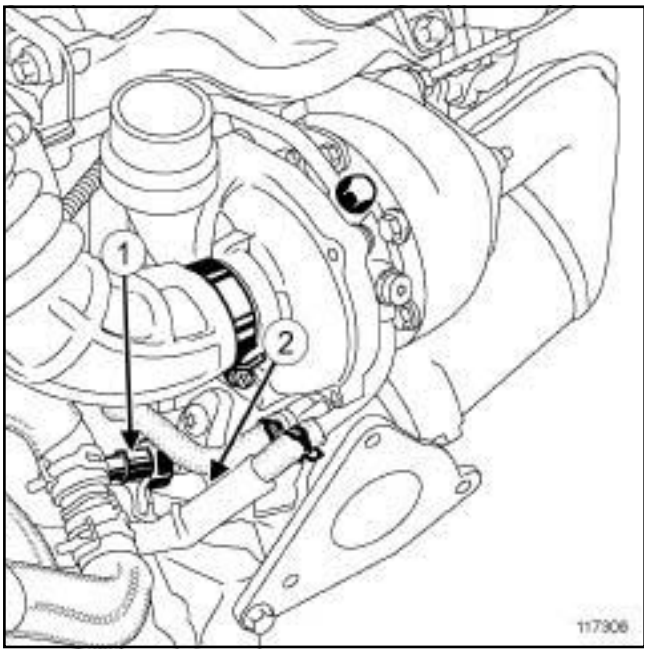
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Connect **Diagnostic tool** to the vehicle.

❑ Run command **AC238** "Fuel pump relay" in order to lower the fuel pressure in the exhaust fuel injector supply system.

Note:

Repeat this operation 4 times in order to discharge the residual pressure as much as possible.



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

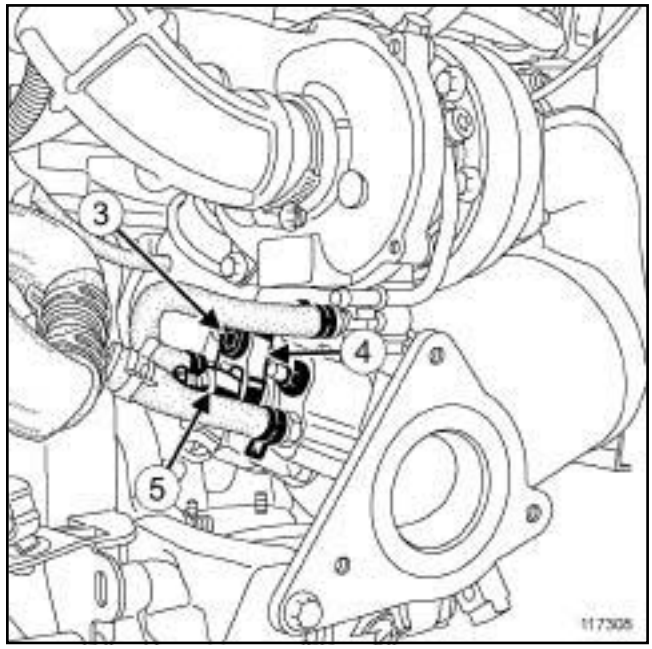
- the engine cover,
- the engine undertray
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 772

II - OPERATION FOR REMOVAL OF PART CONCERNED

117306

❑ From underneath the engine compartment, disconnect from the diesel injector on the catalytic pre-converter:



- the diesel supply pipe union (**1**) ,
- the electrical connector (**2**) .

Note:

Be careful not to damage the connector.

Note:

Prepare for diesel outflow (pressurised circuit).

117308

❑ Remove:

- the retaining bracket bolt (**3**) from the diesel injector on the catalytic pre-converter using a ratchet fitted with an extension and a **T45 male torx socket**,
- the diesel injector retaining bracket (**4**) on the catalytic pre-converter,
- the diesel injector (**5**) with its seal.

Note:

To remove and refit the injector, lift the vehicle and operate from underneath.

❑ Discard the diesel injector cooler seal.

REFITTING

I - CLEANING THE DIESEL INJECTOR

❑ Immerse the injector in a container of diesel.

❑ Wipe using new cleaning cloths (part no. **77 11 211 707**).

WARNING

It is strictly forbidden to clean the injectors with:

- a wire brush,
- an emery cloth,
- an ultrasonic cleaner.

K9K, and 772

II - REFITTING OPERATION FOR PART CONCERNED

❑ Always replace the diesel injector seal on its cooler.

❑ Fit the diesel injector fitted with its new seal and its retaining bracket on the cooler.

WARNING

Before tightening the bracket, check that the injector is correctly positioned in relation to the bracket.

Note:

Before tightening the bracket bolt, ensure that the injector is positioned properly in relation to its bracket: flat surfaces to guide the bracket on the injector ensure this correct position.

If the injector is incorrectly positioned, the entire particle filter will not work properly as the diesel fuel jet will not be correctly oriented.

❑ Torque tighten the **mounting bolt of the diesel injector retaining bracket (21 N.m)**.

❑ Connect to the diesel injector:

- the diesel supply pipe union,
- the electrical connector.

III - FINAL OPERATION

❑ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Connect the **Diagnostic tool** to the vehicle.

❑ Run command **AC 237** : fuel pump relay.

❑ Wait for the command to end, then lift the vehicle and check that there are no leaks on the injector circuit: deal with any leaks.

❑ Refit:

- the engine cover,
- the engine undertray.

Exhaust fuel injector cooler: Removal - Refitting

K9K, and 772

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

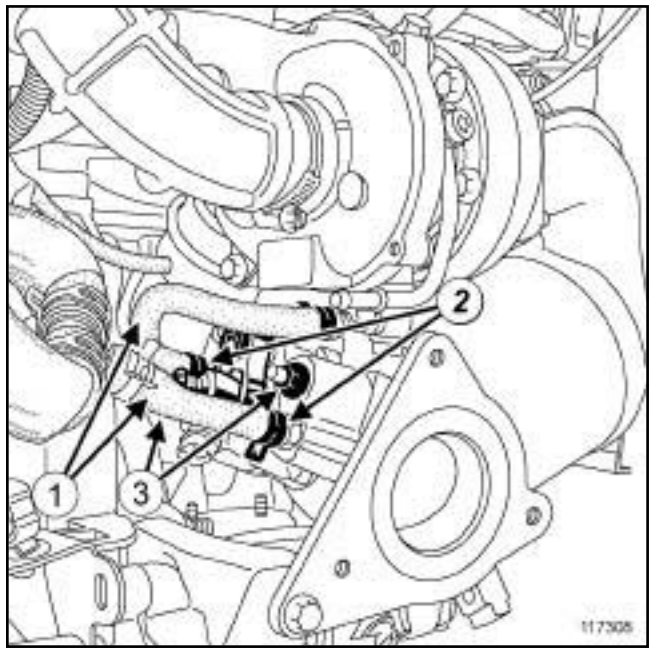
Equipment required
Diagnostic tool

Tightening torques ▽	
diesel injector cooler studs	**on the catalytic pre-converter9 N.m**
diesel injector cooler nuts on the catalytic pre-converter	**25 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



❏ Apply the discharge procedure for the exhaust injector fuel supply system (see **19B**, **Exhaust**, **Exhaust fuel injector: Removal - Refitting**, page **19B-64**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the diesel injector from the catalytic pre-converter (see **19B**, **Exhaust**, **Exhaust fuel injector: Removal - Refitting**, page **19B-64**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

117308

❏ Place a **(Ms. 583)** or a hose clamp on the hoses (**1**) of the catalytic pre-converter diesel injector cooler.

❏ Release the clips (**2**) using the **(Mot. 1448)**.

❏ Disconnect the diesel injector cooler hoses on the catalytic pre-converter.

Note:

Be prepared for the escape of coolant.

❏ Remove:

- the catalytic pre-converter diesel injector cooler nuts (**3**) ,
- the diesel injector cooler on the catalytic pre-converter,
- the seal from the diesel injector cooler on the catalytic pre-converter, then discard it.

Note:

Be prepared for the escape of coolant.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ If replacing, torque tighten the **diesel injector cooler studs (on the catalytic pre-converter9 N.m)**.

K9K, and 772

❑ Refit:

- the diesel injector cooler on the catalytic pre-converter fitted with a new seal,
- the diesel injector cooler nuts on the catalytic pre-converter.

❑ Torque tighten the **diesel injector cooler nuts on the catalytic pre-converter (25 N.m)**.

❑ Connect the diesel injector cooler inlet and outlet hoses to the catalytic pre-converter.

❑ Fit the clips using the **(Mot. 1448)**.

❑ Remove the hose clamps from the catalytic pre-converter diesel injector cooler hoses.

II - FINAL OPERATION

❑ Refit:

- the diesel injector on the catalytic pre-converter (see **19B**, **Exhaust**, **Exhaust fuel injector: Removal - Refitting**, page **19B-64**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

- top up the coolant level in the expansion bottle,
- bleed the cooling system (see **Cooling system: Bleed**) .

❑ Connect the **Diagnostic tool**

❑ Run command **AC 237** : fuel pump relay.

❑ Wait for the command to end, then lift the vehicle and check that there are no leaks on the injection circuit: deal with any leaks.

❑ Refit:

- the engine undertray,
- the engine cover.

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.

I - PARTS AND CONSUMABLES FOR THE REPAIR

1 - Parts always to be replaced:

- the exhaust trunking (if fitted)

- the seal or sealing ring on the connection between the catalytic converter or catalytic pre-converter and the rest of the exhaust system

- the exhaust clip(s) (if fitted)

2 - Consumables (see part no. in Technical Note 5068, 04B, Consumables - Products):

- exhaust mastic

- surface cleaner

- abrasive pads

II - ADVICE TO OBSERVE

IMPORTANT
Do not park and run the engine in a place where combustible substances and materials such as grass or leaves can come into contact with the hot exhaust system.

IMPORTANT
Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

1 - During removal and refitting, the catalytic converter or catalytic pre-converter must not receive any knocks or impacts as this could damage it.

2 - The whole exhaust pipe is made of stainless steel.

3 - After working on the bracket between the catalytic converter or catalytic pre-converter and the rest of the exhaust system, ensure that the connection is perfectly sealed.

To do this:

- clean the pressure faces of the connection using the **ABRASIVE PADS**,

- degrease the pressure faces of the connection using **SURFACE CLEANER** and clean cloths,

- always replace the seal or sealing ring on the connection.

III - SPECIAL NOTES ON THE SINGLE UNIT EXHAUST PIPE

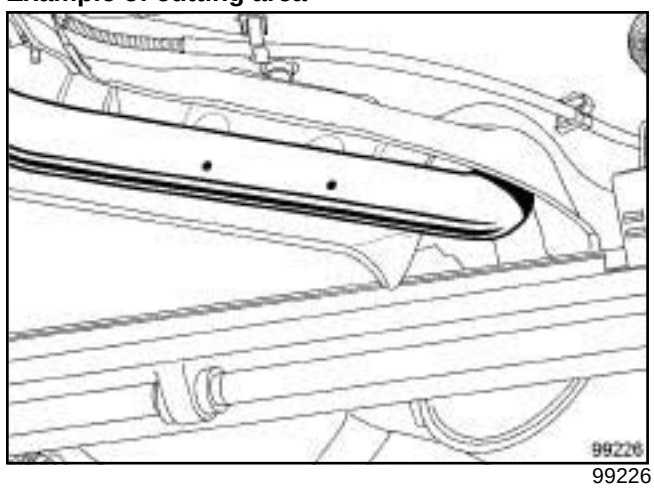
1 - Cutting the single unit exhaust pipe

The exhaust pipe is a « single unit type » .

To replace different parts of the exhaust system it must be cut.

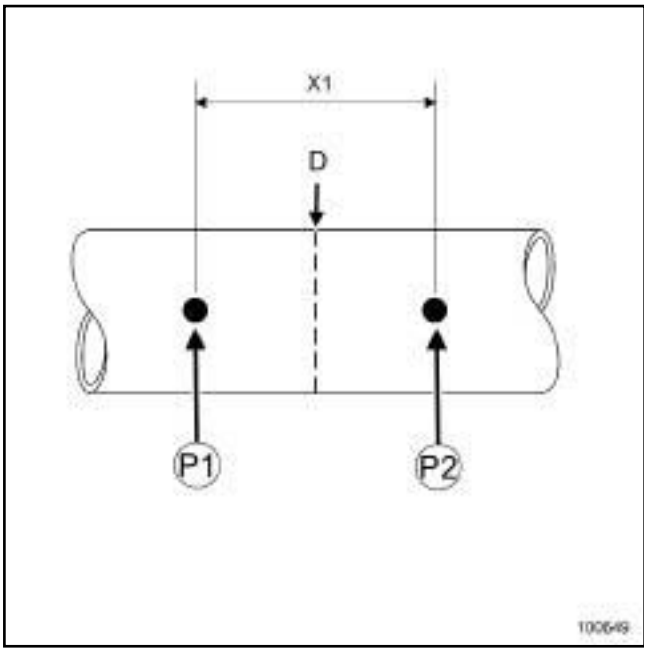
To do this be sure to carry out these precautions in the following order:

- correctly identify the area to be cut, as explained below,



- use the cutting tool correctly **(Mot. 1199-01)**,

- position the exhaust trunking correctly.



2 - Identifying the area of the exhaust system to be cut

Two marks made on the exhaust system define the area to be cut (see **Exhaust: Parts and consumables for the repair**) (see MR for vehicle concerned, 19B, Exhaust).

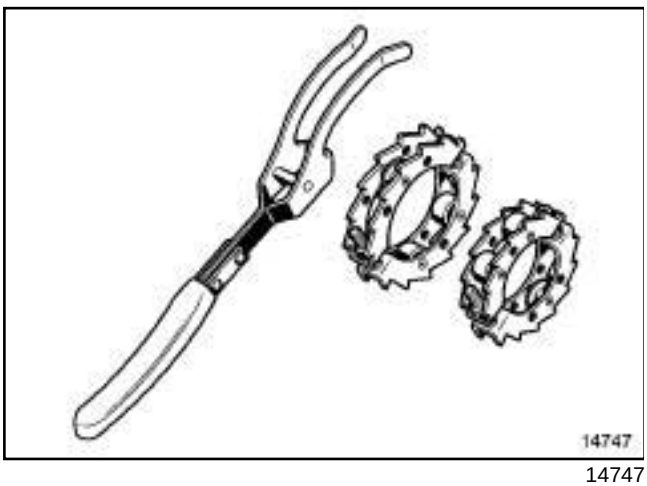
Example of cutting area

99226

100649

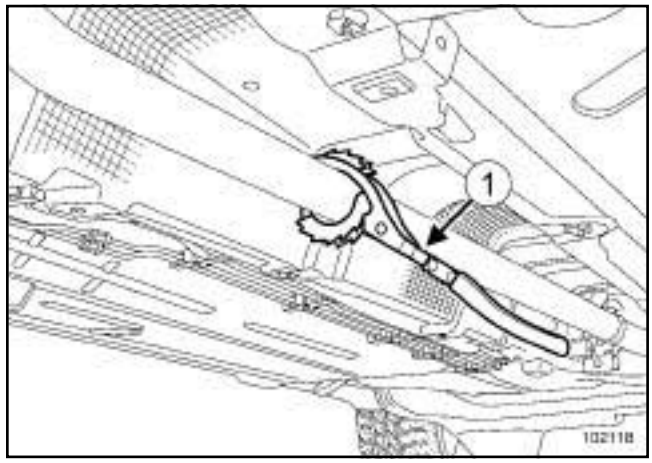
Before cutting the exhaust system, draw a line (**D**) between the two marks (**P1**) and (**P2**) .

The distance between the two marks on the exhaust pipe is (**X1**) : **90 mm** (all types except RENAULT SPORT).



The distance between the two marks on the exhaust pipe is (**X1**) : **80 mm** (RENAULT SPORT).

Note:



For CLIO II RENAULT SPORT with F4R*730, F4R*732 and F4R*736 engines, the cutting area is shown by a single mark on the exhaust pipe.

Cut the exhaust pipe by placing the **(Mot. 1199-01)** on the mark.

3 - Operate tool Mot. 1199-01

14747

102118

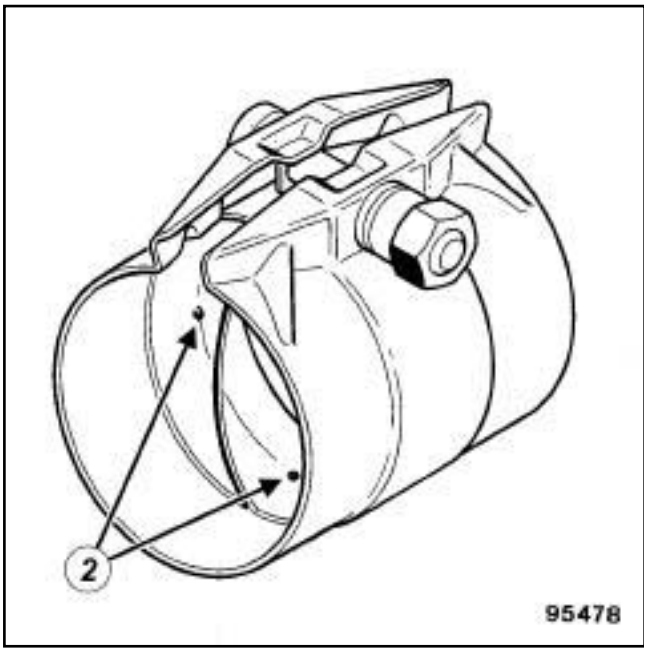
Fit the **(Mot. 1199-01)** (**1**) on the exhaust pipe.

Tighten the two bolts on the tool until they touch the pipe in order to clamp the tool onto the pipe.

Turn the cutting tool using the handle and pressing it against the pipe (as indicated in the diagram above).

Tighten the two bolts on the tool whilst cutting, until the pipe is completely cut.

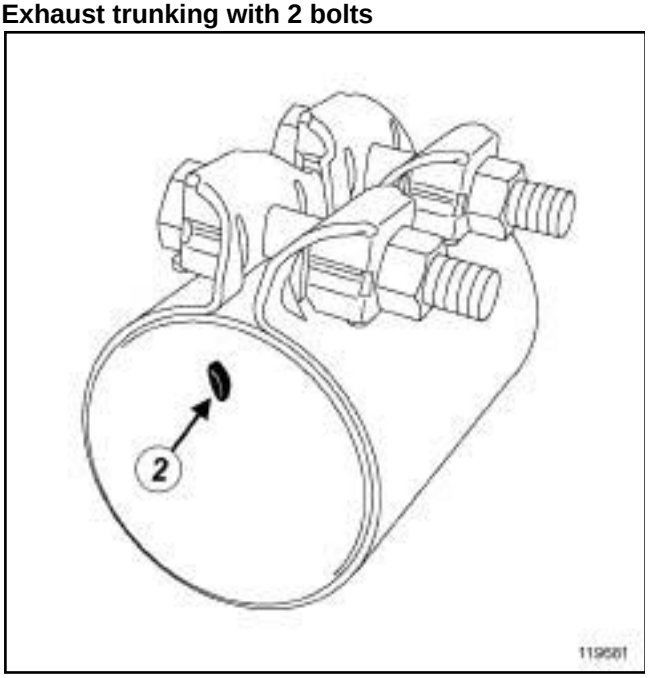
Note:



Do not over-tighten the tool onto the pipe to avoid deforming it.

Once the pipe is cut, file and deburr the end of the pipe to be used on the vehicle again.

4 - Positioning the exhaust trunking



WARNING
Do not reuse an old exhaust trunking.

Exhaust trunking with 1 bolt

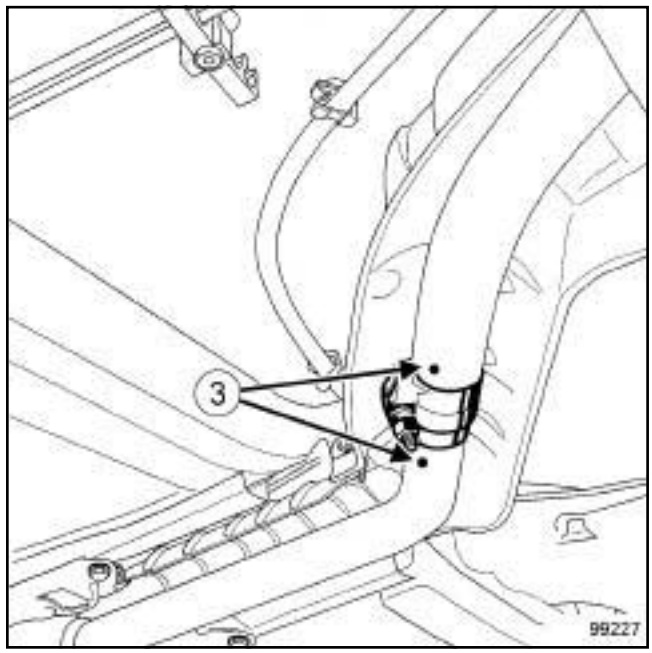
95478

Exhaust trunking with 2 bolts

119681

Fit the exhaust trunking onto the part of the exhaust system fitted to the vehicle.

Position the pipe onto the lugs (**2**) inside the exhaust trunking.



Tighten the exhaust trunking bolt(s) slightly (depending on the version).

Position the second part of the exhaust system under the vehicle, fitting it in the exhaust trunking.

Note:

If necessary, use a workshop jack to lift and hold the heavy and bulky components of the exhaust system.

Position the second exhaust pipe onto the lugs inside the exhaust trunking.

99227

Check that the two cut marks (**3**) are aligned (if applicable).

Position the trunking so that there is no risk of contact between its bolt or bolts and the heat shields.

Torque tighten

- the **exhaust trunking nut with 1 bolt (25 N.m)** (if fitted),
- the **exhaust trunking nuts with 2 bolts (18 N.m)** (if fitted).

Check the following and deal with if necessary:

- no underbody contact between the exhaust system and the heat shields,
- all of the heat shields are present and secure.

Note:

Any damaged heat shields must be replaced.

Start the engine.

Check that there are no leaks: deal with any leaks.

Note:

If there are leaks from the **EXHAUST TRUNKING WITH 1 BOLT**, apply **EXHAUST MASTIC** to the trunking (see part no. in Technical Note 5068, 04B, Consumables - Products).

If the application of exhaust mastic does not fix the leak:

- remove and replace the used exhaust trunking,
- check the condition of the exhaust pipes (condition of the pipe surface, deburring of the area cut, damage to the pipes).
- fit the new trunking in accordance with the instructions given before.

K4J or K4M

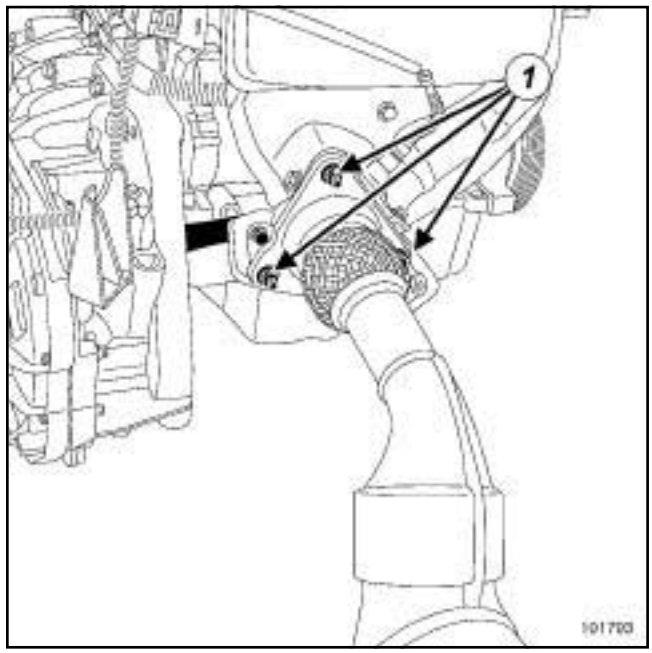
Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
oxygen sensor	**45 Nm**
manifold studs	**7 Nm**
nuts mounting the catalytic converter on the exhaust manifold	**21 Nm**
exhaust sleeve	**25 Nm**
exhaust manifold studs	**8 Nm**
exhaust sleeve	**25 Nm**

IMPORTANT
Catalytic converters contain ceramic fibres: these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Remove the connector from the downstream oxygen sensor.

❏ Unclip the wiring harness from the downstream oxygen sensor.

❏ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

101793

❏ Remove:

- the catalytic converter mounting nuts (**1**) from the exhaust manifold
- the exhaust catalytic converter,
- the downstream oxygen sensor of the catalytic converter using tool **(Mot. 1495-01)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Refit the oxygen sensor.

❏ Torque tighten the **oxygen sensor (45 Nm)**.

❏ Replace the exhaust flange seal.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Torque tighten the **manifold studs (7 Nm)**.

❏ Fit:

- the catalytic converter,
- the catalytic converter sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❏ Torque tighten the **nuts mounting the catalytic converter on the exhaust manifold (21 Nm)**.

K4J or K4M

III - FINAL OPERATION

❏ Torque tighten:

- the **exhaust sleeve (25 Nm)** while supporting the exhaust pipe to ensure correct alignment,
- the **exhaust manifold studs (8 Nm)**,
- the **exhaust sleeve (25 Nm)** while supporting the exhaust pipe to ensure correct alignment.

❏ Connect the oxygen sensor connector.

❏ Make sure that all the exhaust pipe heat shields are in place and properly secured.

❏ Refit the engine undertray.

❏ Make sure that there is no contact with the underbody.

WARNING

Make sure:

- position the sleeve « bolt - tightening nut» assembly vertically with the nut facing downwards to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.

K9K

Tightening torques ▽	
turbocharger output studs	**7 N.m**
catalytic converter mounting nuts on the turbocharger	**26 N.m**
bolts mounting the upstream strut on the engine	**44 N.m**
bolts mounting the downstream strut on the gearbox	**21 N.m**
bolts mounting the upstream strut on the catalytic converter	**26 N.m**
bolt mounting the downstream strut on the catalytic converter	**21 N.m**
exhaust clamp studs on the catalytic converter output	**7 N.m**
exhaust bracket nuts	**21 N.m**
exhaust pipe rubber mounting bush mountings on the body	**62 N.m**

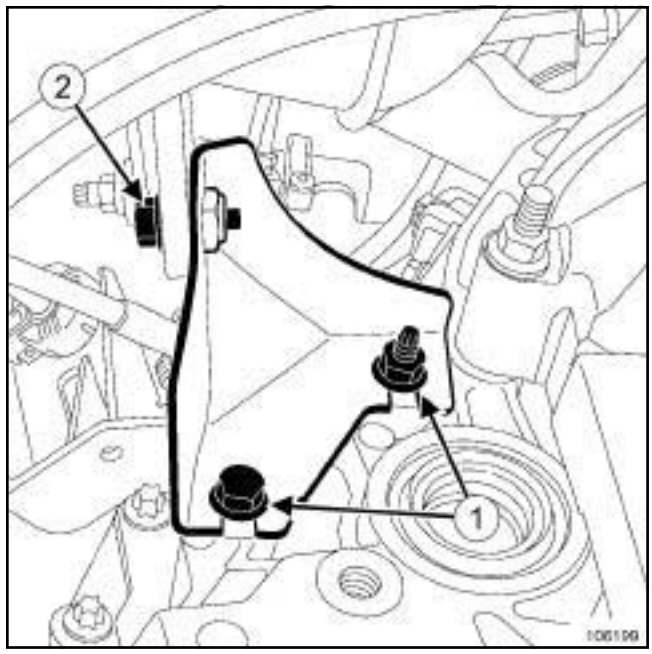
IMPORTANT
Catalytic converters contain ceramic fibres; these are contained within a closed unit and cannot be dispersed. Drilling or cutting catalytic converters is prohibited.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



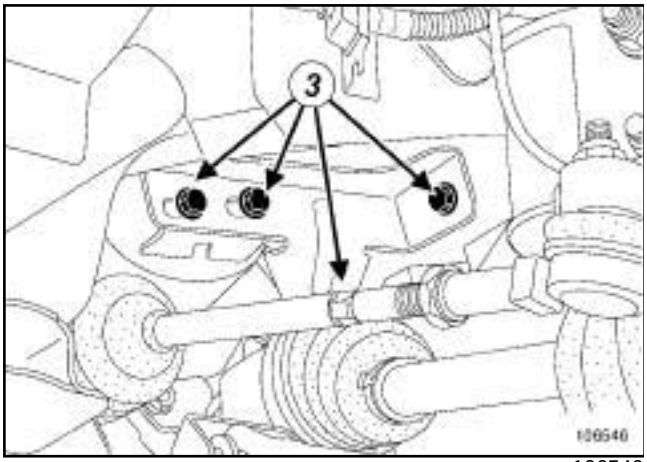
❏ Remove:

- the engine cover,
- the air inlet duct,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the two shock absorber cup covers,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray.

❏ Remove:

- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the wiring harness mountings between the catalytic converter and the exhaust pipe,
- the rubber bush mountings of the exhaust pipe on the bodywork.

❏ Withdraw the exhaust pipe.

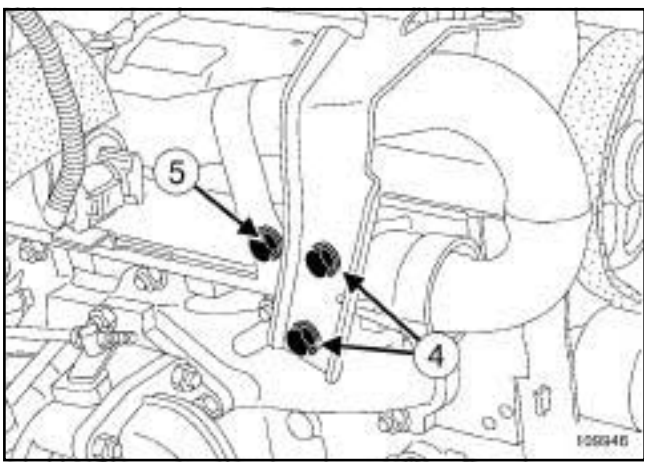


106199

❏ Remove:

- the downstream strut mountings (**1**) on the gearbox,
- the catalytic converter downstream strut mounting bolt (**2**) ,
- the downstream strut.

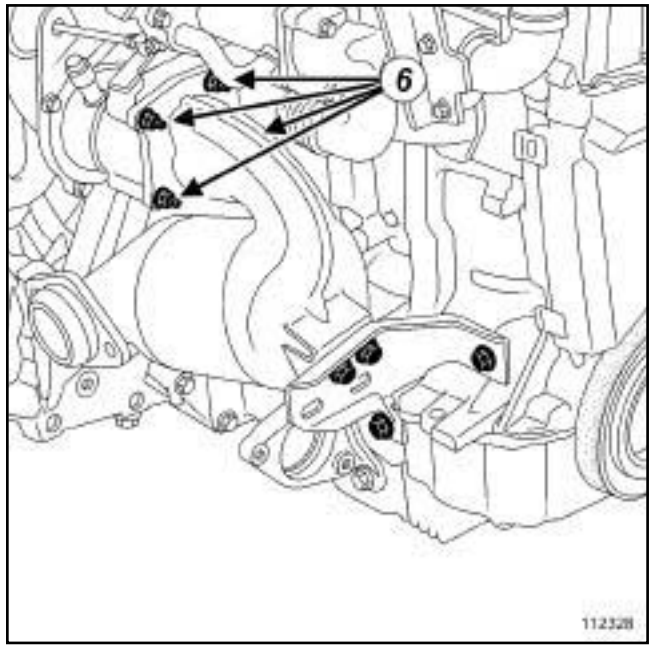
K9K



106546

❑ Remove:

- the upstream strut mountings (**3**) ,
- the upstream strut.



II - OPERATION FOR REMOVAL OF PART CONCERNED

109946

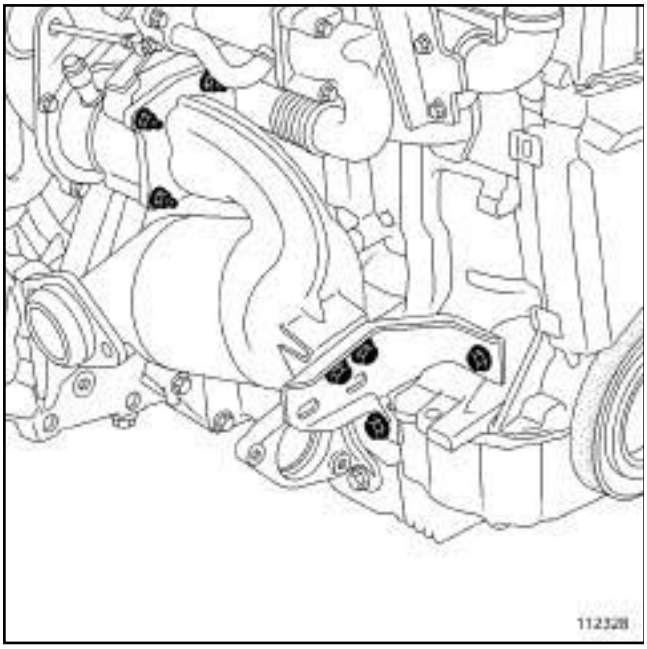
❑ Remove:

- the lifting eye mounting bolts (**4**) on the timing end,
- the lifting eye on the timing end,
- the mounting bolt (**5**) from the air inlet tube,
- the air inlet duct.

112328

❑ Remove:

- the bolts (**6**) mounting the catalytic converter to the turbocharger,
- the catalytic converter and its seal on the turbocharger,
- the sealing ring or the seal (depending on the version) then dispose of them in a waste bin.



REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Clean the bearing faces of the turbocharger and catalytic converter using an abrasive pad (see **Vehicle: Parts and consumables for the repair**) .

❑ Degrease the bearing faces using surface cleaner and clean cloths (see **Vehicle: Parts and consumables for the repair**) .

K9K

112328

❑ In case of replacement, torque tighten the **turbocharger output studs (7 N.m)**.

❑ Fit the catalytic converter equipped with a new seal on the turbocharger.

❑ Pretighten in order:

- the upstream strut bolts on the engine,
- the downstream strut bolts on the gearbox,
- the upstream strut bolts on the catalytic converter,
- the downstream strut bolts on the catalytic converter,
- the catalytic converter/turbocharger mounting nuts.

❑ Tighten to torque and in order:

- the **catalytic converter mounting nuts on the turbocharger (26 N.m)**,
- the **bolts mounting the upstream strut on the engine (44 N.m)**,
- the **bolts mounting the downstream strut on the gearbox (21 N.m)**,
- the **bolts mounting the upstream strut on the catalytic converter (26 N.m)**,
- the **bolt mounting the downstream strut on the catalytic converter (21 N.m)**.

❑ Refit:

- the air inlet duct,
- the lifting eye,
- the exhaust pipe,
- the rubber bush mountings of the exhaust pipe on the bodywork.

WARNING

Make sure there is no contact between the catalytic converter and the turbocharger oil return pipe.

❑

WARNING

Always replace the sealing ring between the catalytic converter and the exhaust pipe with a new component.

❑ Refit a new sealing ring or a new seal (depending on the version).

❑ Torque tighten:

- in the event of replacement, the **exhaust clamp studs on the catalytic converter output (7 N.m)**,
- the **exhaust bracket nuts (21 N.m)**.

II - FINAL OPERATION

❑ Torque tighten the **exhaust pipe rubber mounting bush mountings on the body (62 N.m)**.

❑ Make sure that there is no contact with the underbody.

❑ Refit the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

WARNING

Check:

- the exhaust pipe is not touching the body,
- all the heat shields are present.

❑ Refit:

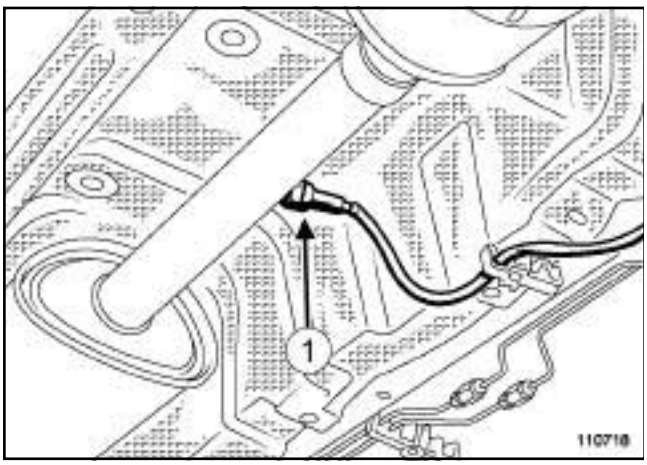
- the engine undertray,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the two shock absorber cup covers,

K9K

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the air inlet duct,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 740 or 764



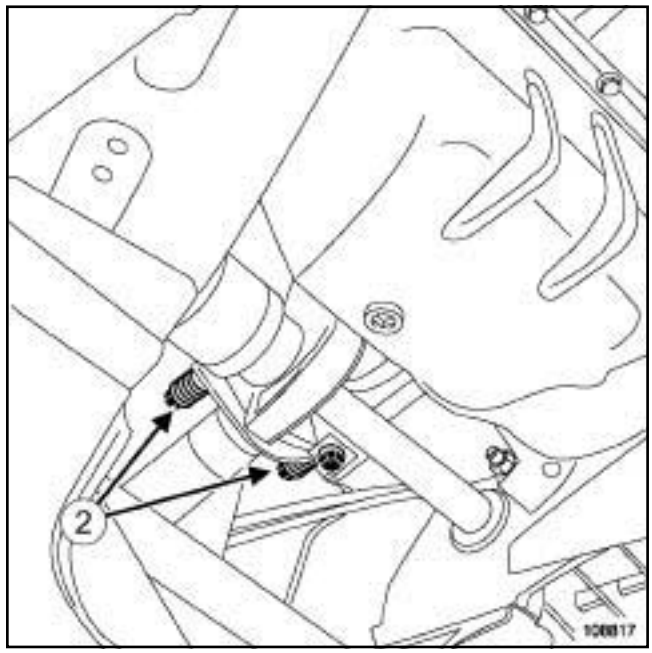
Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
manifold output bracket studs	**7 Nm**
exhaust bracket mounting bolts	**25 Nm**
oxygen sensor	**45 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



110718

❑ Remove:

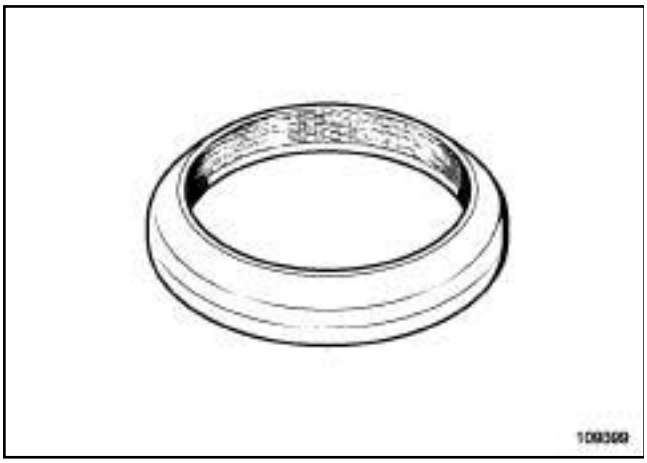
- the engine undertray mounting bolts,
- the engine undertray,
- the downstream oxygen sensor (**1**) using the **(Mot. 1495-01)**.

❑ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

108817

❑ Remove:



- the exhaust clamp mounting bolts (**2**) ,
- the catalytic converter.

IMPORTANT
Catalytic converters contain ceramic fibres; these are contained within a closed unit and cannot be dispersed. Drilling or cutting catalytic converters is prohibited.

D4F, and 740 or 764

REFITTING

I - REFITTING PREPARATIONS OPERATION

109399

❑

WARNING
It is essential to replace the sealing ring between the exhaust manifold and the catalytic converter.

❑ Position the after sales sleeve on the catalytic converter (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - REFITTING OPERATION FOR PART CONCERNED

❑ When replacing, torque tighten the **manifold output bracket studs (7 Nm)**.

❑ Refit the catalytic converter.

❑ Torque tighten the **exhaust bracket mounting bolts (25 Nm)**.

❑ Torque tighten the after-sales sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

III - FINAL OPERATION.

❑ Torque tighten the **oxygen sensor (45 Nm)** using the **(Mot. 1495-01)**.

❑ Refit:

- the engine undertray,
- the engine undertray mounting bolts,

❑ Check:

- that there is no contact with the underbody,
- all the exhaust pipe heat shields are in place and properly attached.

WARNING
Any damaged heat shields must be replaced.

M4R

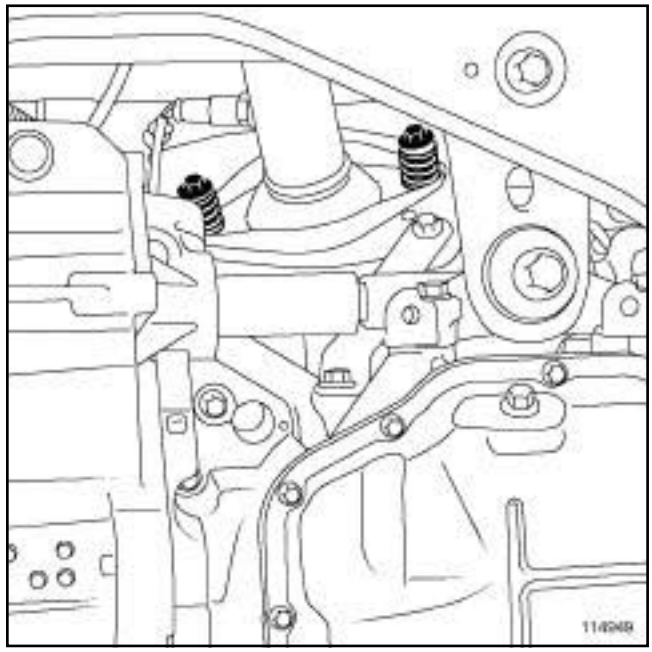
Tightening torques ▽	
exhaust flange mounting bolts	**21 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Put the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove the engine cover.



❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove:

- the engine undertray,
- the upstream and downstream oxygen sensors (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

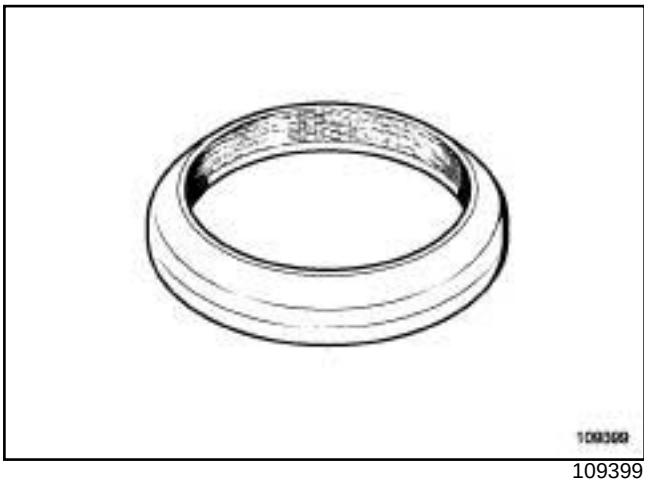
❏ Cut the exhaust pipe in the area to be cut number 1 (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) and (see **Exhaust: Parts and consumables for the repair**) .

II - REMOVAL OF PART CONCERNED

114949

❏ Remove:

- the exhaust clamp mounting bolts,
- the catalytic converter,
- the exhaust flange sealing ring.



IMPORTANT

Catalytic converters contain ceramic fibres; these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

M4R

REFITTING

I - REFITTING PREPARATION OPERATION

109399

❑ Always replace the exhaust flange sealing ring.

II - REFITTING THE PART CONCERNED

❑ Position the after sales sleeve on the catalytic converter (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❑ Torque tighten the **exhaust flange mounting bolts (21 Nm)**.

III - FINAL OPERATION

❑ Refit:

- the upstream and downstream oxygen sensors (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) ,
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) .

❑ Refit the engine cover.

F4R

The emission control assembly is comprised of two catalytic converters on the vehicle:

- one integrated into the exhaust manifold,

- one integrated into the exhaust pipe.

The method below deals with the operating procedure on the catalytic converter integrated into the exhaust pipe.

Note:

The catalytic converter integrated into the exhaust manifold cannot be separated from the latter. When removing - refitting the catalytic converter, the catalytic converter - exhaust manifold assembly must be removed (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) . When replacing the catalytic converter, the catalytic converter - exhaust manifold assembly must be replaced.

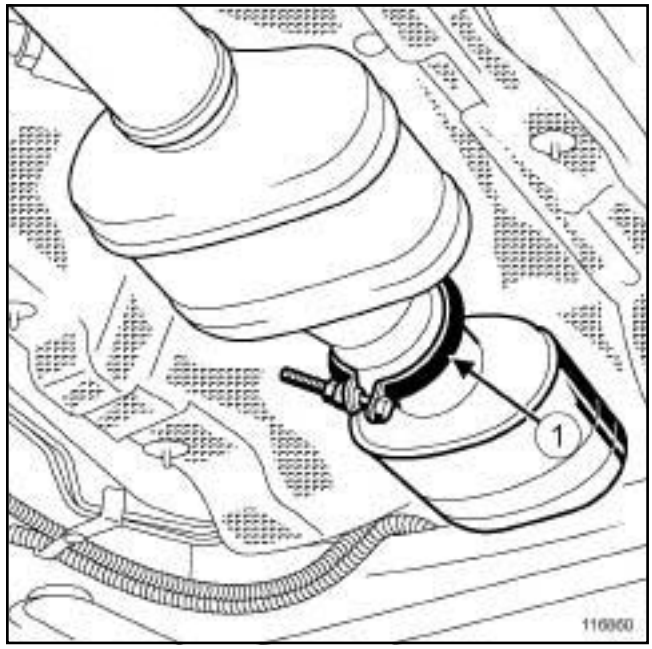
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED



1 - Removing the catalytic converter integrated into the exhaust manifold

❑ Remove the exhaust manifold (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) .

2 - Removing the catalytic converter integrated into the exhaust pipe

❑ Remove the downstream oxygen sensor (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

❑ Cut the exhaust system at the cutting area **ZC1** for this purpose (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

116860

❑ Remove:

- the exhaust pipe clamp (**1**) ,

- the catalytic converter integrated into the exhaust pipe.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

1 - Refitting the catalytic converter integrated into the exhaust manifold

❑ Refit the exhaust manifold (see **12A**, **Fuel mixture**, **Exhaust manifold: Removal - Refitting**, page **12A-75**) .

2 - Refitting the catalytic converter integrated into the exhaust pipe

❑ Fit the catalytic converter integrated into the exhaust pipe.

❑ Tighten the new exhaust pipe clamp by several turns.

❑ Fit the new After-Sales sleeve following the instructions supplied (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❑ Remove the downstream oxygen sensor (see **17B**, **Petrol injection**, **Oxygen sensors: Removal - Refitting**, page **17B-19**) .

F4R

II - FINAL OPERATION

❑ Make sure there is no contact with the underbody.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Start the engine and check that there are no leaks: deal with any problems as necessary.

Catalytic converter: Removal - Refitting

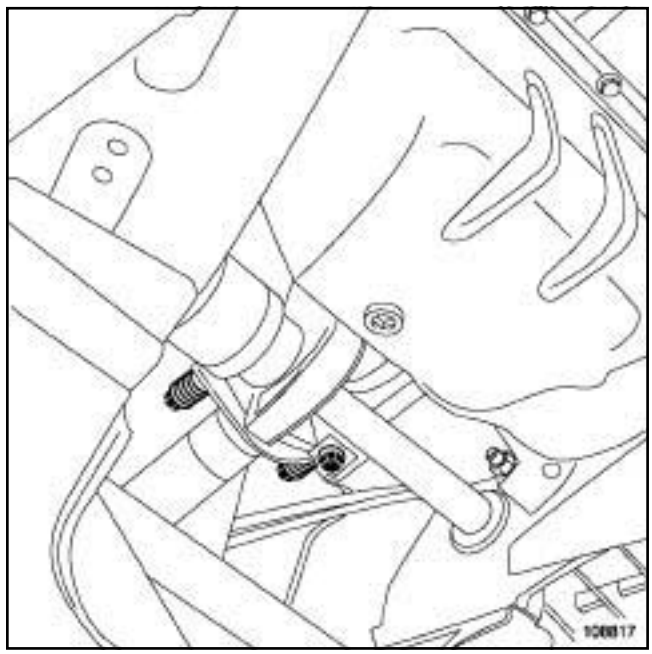
D4F, and 784

Special tooling required	
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Tightening torques ▽	
upstream and downstream oxygen sensors	**45 Nm**
primary strut bolts on the cylinder block	**25 Nm**
primary strut bolt on the gearbox	**44 Nm**
catalytic converter nuts on the turbocharger (initial torque)	**20 Nm**
catalytic converter nuts on the turbocharger	**30 Nm**
primary strut bolts on the catalytic converter (initial torque)	**20 Nm**
primary strut bolts on the catalytic converter	**30 Nm**
catalytic converter upstream strut bolts on the catalytic converter	**21 Nm**
catalytic converter upstream strut bolts on the cylinder block	**21 Nm**
turbocharger strut nut	**21 Nm**
turbocharger strut bolt	**21 Nm**
turbocharger heat shield bolts	**8 Nm**
front right-hand wheel driveshaft relay bearing nuts	**44 Nm**
exhaust bracket bolts at the catalytic converter outlet	**9 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

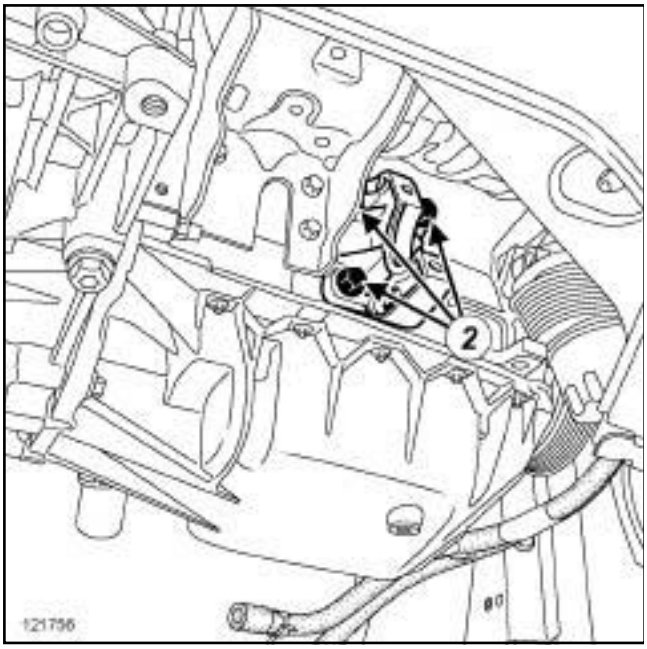


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

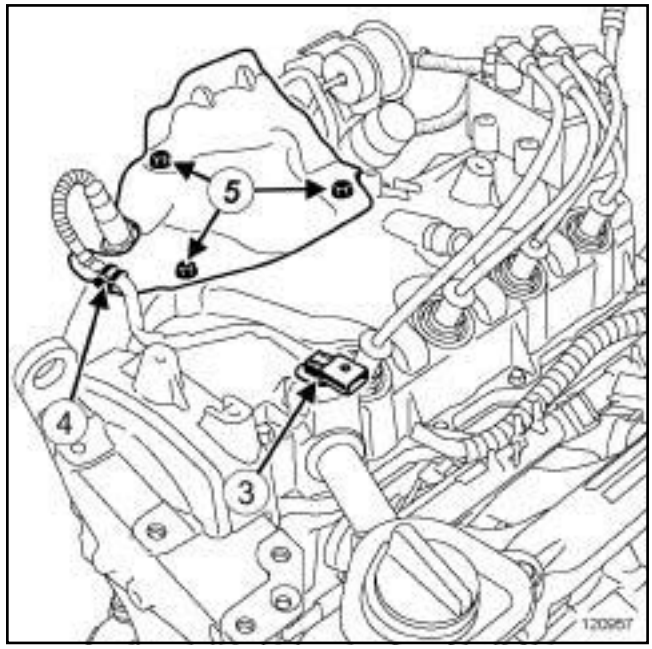
- the engine cover,
- the engine undertray.



❑ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

108817

❑ Remove the nuts from the exhaust bracket at the catalytic converter outlet.



D4F, and 784

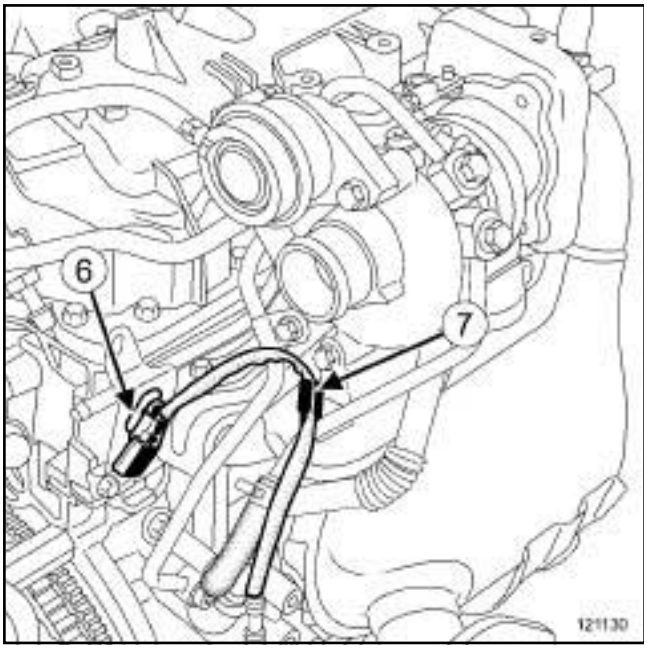
121756

❏ Remove:

- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front right-hand wheel driveshaft relay bearing nuts (**2**) ,
- the front right-hand wheel driveshaft relay bearing.

120957

❏ Disconnect the upstream oxygen sensor connector (**3**) .



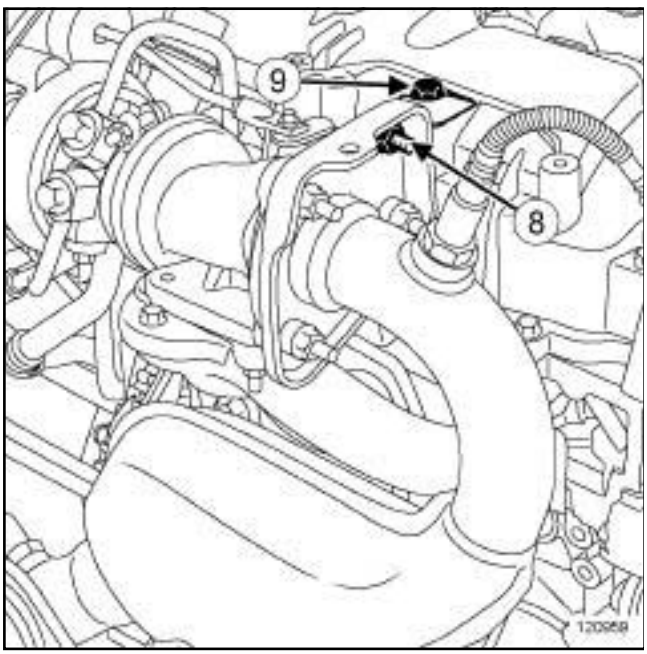
❏ Unclip the upstream oxygen sensor connector.

❏ Detach the upstream oxygen sensor wiring harness at (**4**) .

❏ Remove:

- the bolts (**5**) from the turbocharger heat shield,
- the turbocharger heat shield.

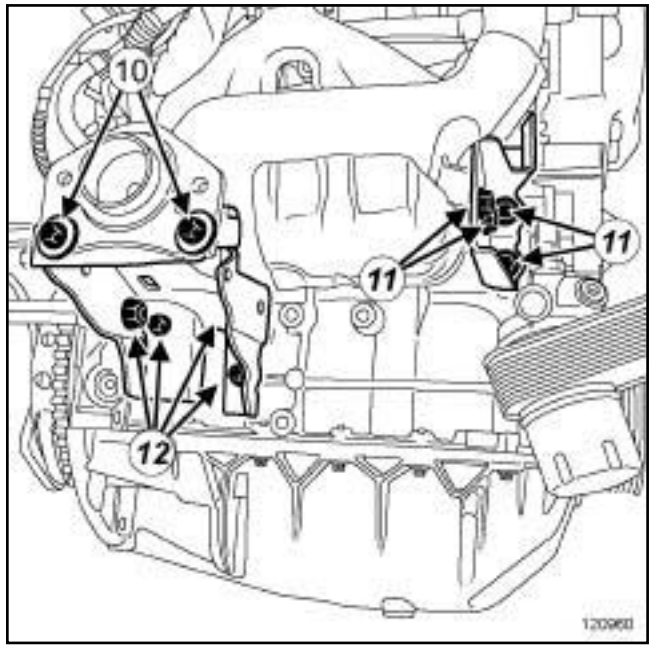
D4F, and 784



121130

❏ Disconnect the downstream oxygen sensor connector (**6**) .

❏ Unclip the downstream oxygen sensor connector.

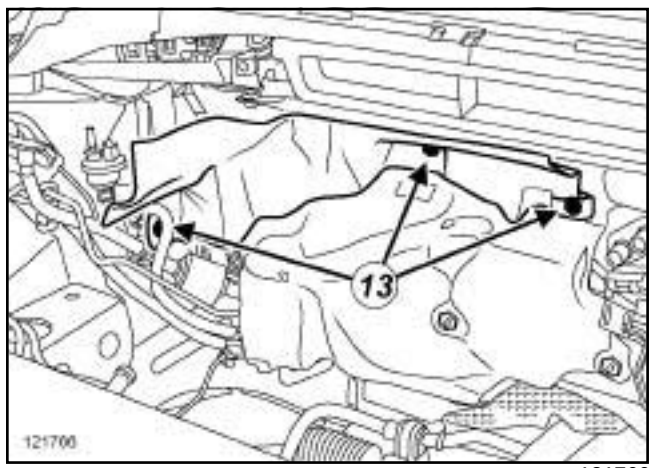


❏ Detach the downstream oxygen sensor wiring harness at (**7**) .

120959

❏ Remove:

- the nut (**8**) from the turbocharger strut,
- the bolt (**9**) from the turbocharger strut,
- the turbocharger strut.



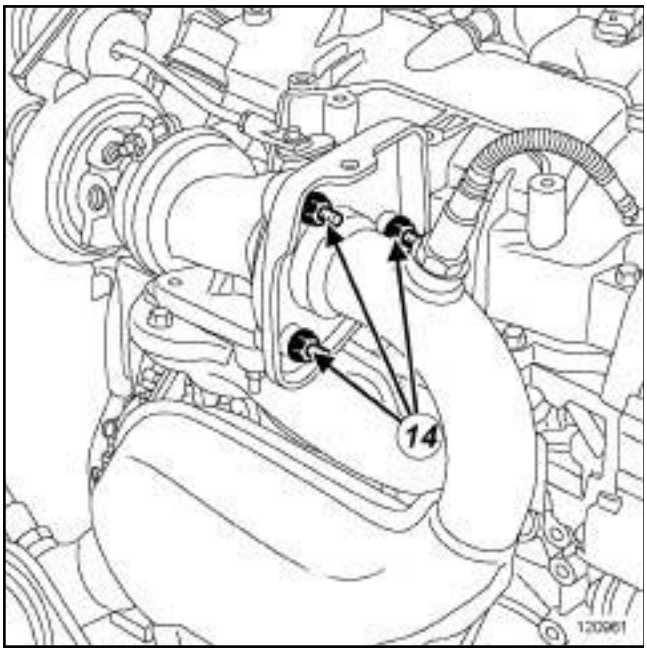
120960

❏ Disconnect the oil pressure sensor connector.

❏ Undo the bolts (**10**) on the catalytic converter primary strut.

❏ Remove:

- the catalytic converter upstream strut bolts (**11**) ,
- the catalytic converter upstream stay,
- the bolts (**12**) on the cylinder block primary strut,
- the primary strut from the cylinder block.



121766

❏ remove:

- the clips (**13**) from the upper heat shield,
- the upper heat shield.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

120961

❑ Remove:

- the nuts (**14**) mounting the catalytic converter on the turbocharger and the spacers,
- the catalytic converter,
- the catalytic converter seal on the turbocharger.

IMPORTANT
Catalytic converters contain ceramic fibres; these are contained within a closed unit, and cannot disperse. Cutting or drilling catalytic converters is prohibited.

❑ When replacing the catalytic converter, remove the upstream and downstream oxygen sensors on the workbench using the **(Mot. 1495-01)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

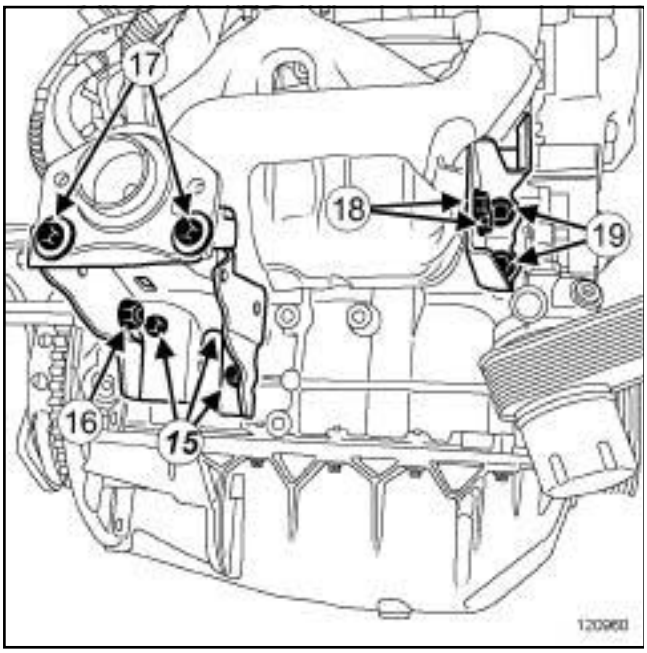
❑ When replacing the catalytic converter, refit the upstream and downstream oxygen sensors on the workbench.

❑ Torque tighten the **upstream and downstream oxygen sensors (45 Nm)** using the **(Mot. 1495-01)**.

❑ Always replace:

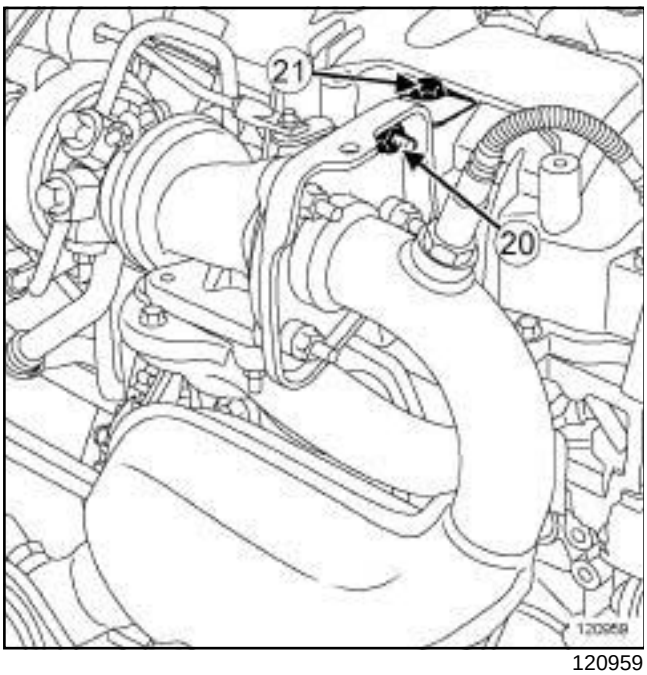
- the catalytic converter seal,
- the catalytic converter nuts on the turbocharger,

❑ Use abrasive pads to clean the bearing faces of:



- the turbocharger,
- the catalytic converter.

❑ Degrease the pressure faces using **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) and a clean cloth:



- the turbocharger,
- the catalytic converter.

D4F, and 784

II - REFITTING OPERATION FOR PART CONCERNED

120960

120959

❏ Refit:

- the catalytic converter seal on the turbocharger,
- the catalytic converter,
- the new nuts with the catalytic converter spacers on the turbocharger,
- the catalytic converter primary strut,
- the bolts (**15**) on the cylinder block primary strut,
- the primary strut bolt (**16**) on the gearbox,
- the catalytic converter upstream stay,
- the catalytic converter upstream strut bolts (**18**) and (**19**) ,
- the turbocharger strut.
- the bolt (**21**) from the turbocharger strut,
- the turbocharger strut nut (**20**) .

❏ Torque tighten:

- the **primary strut bolts on the cylinder block (25 Nm)** by locking the strut on the gearbox lug at (**15**) ,
- the **primary strut bolt on the gearbox (44 Nm)** at (**16**) ,
- the **catalytic converter nuts on the turbocharger (initial torque) (20 Nm)**,
- the **catalytic converter nuts on the turbocharger (30 Nm)**,
- the **primary strut bolts on the catalytic converter (initial torque) (20 Nm)** at (**17**) ,
- the **primary strut bolts on the catalytic converter (30 Nm)**,
- the **catalytic converter upstream strut bolts on the catalytic converter (21 Nm)** at (**18**) ,
- the **catalytic converter upstream strut bolts on the cylinder block (21 Nm)** at (**19**) ,
- the **turbocharger strut nut (21 Nm)** at (**20**) ,
- the **turbocharger strut bolt (21 Nm)** at (**21**) .

III - FINAL OPERATION.

❏ Refit:

- the upper heat shield,
- the clips on the upper heat shield.

❏ Connect the oil pressure sensor connector.

❏ Attach the downstream oxygen sensor wiring harness.

❏ Fit the downstream oxygen sensor connector.

❏ Connect the downstream oxygen sensor connector.

❏ Refit:

- the turbocharger heat shield,
- the turbocharger heat shield bolts.

❏ Torque tighten the **turbocharger heat shield bolts (8 Nm)**.

❏ Attach the upstream oxygen sensor wiring harness.

❏ Fit the upstream oxygen sensor connector.

❏ Connect the upstream oxygen sensor connector.

D4F, and 784

❏ Refit:

- the front right-hand wheel driveshaft relay bearing,
- the front right-hand wheel driveshaft relay bearing nuts.

❏ Torque tighten the **front right-hand wheel driveshaft relay bearing nuts (44 Nm)**.

❏ Refit:

- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- exhaust bracket nuts.

❏ Torque tighten the **exhaust bracket bolts at the catalytic converter outlet (9 Nm)**.

❏ Fill the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

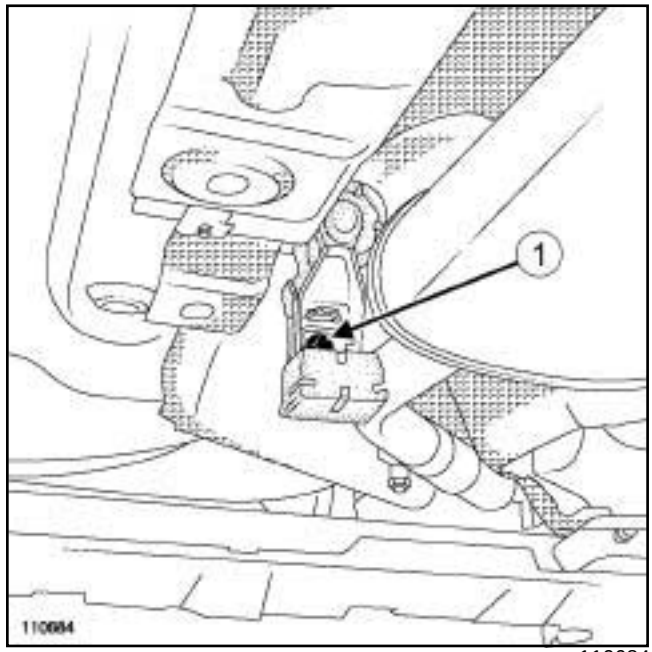
❏ Refit:

- the engine cover,
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Tightening torques ▽	
new expansion chamber mounting bolt on the rubber mounting bush	**8 Nm**
exhaust sleeves	**25 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Remove the engine undertray.

❑ Cut the exhaust pipe (see **Exhaust: Parts and consumables for the repair**) and (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

110684

❑ Remove:

- the bolt (**1**) mounting the expansion chamber to the exhaust rubber mounting bush,
- the expansion chamber.

> Note:
>
> If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the expansion chamber,
- the sleeves,
- the rubber mounting bush damper.

❑ Torque tighten:

- the **new expansion chamber mounting bolt on the rubber mounting bush (8 Nm)**,
- the **exhaust sleeves (25 Nm)** while lifting the exhaust pipe to ensure correct alignment (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

II - FINAL OPERATION.

❑ Check:

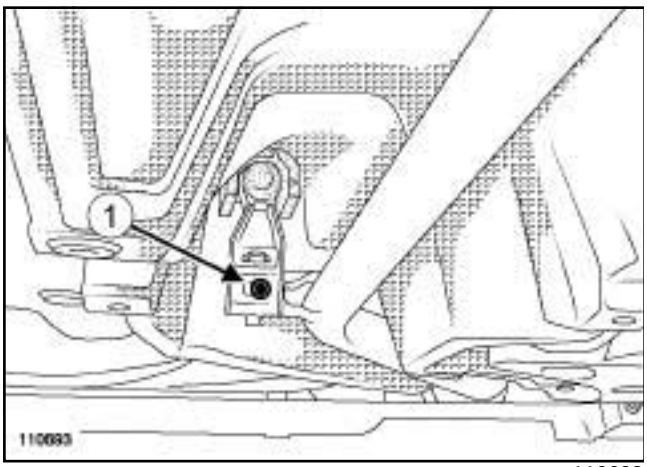
- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

Tightening torques ▽	
new mounting bolts on the connector pipe on the rubber mounting bush	**8 Nm**
exhaust sleeves	**25 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (see **Exhaust: Parts and consumables for the repair**) (MR 392, 19A, Exhaust).

110693

❑ Remove:

- the bolt (**1**) mounting the connector pipe to the rubber mounting bush support,
- the connector pipe.

Note:

If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the connector pipe,
- the sleeves.

❑ Torque tighten:

- the **new mounting bolts on the connector pipe on the rubber mounting bush (8 Nm)**,
- the **exhaust sleeves (25 Nm)** while lifting the exhaust pipe to ensure correct alignment (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (MR 392, 19A, Exhaust).

II - FINAL OPERATION.

❑ Make sure that all the exhaust pipe heat shields are in place and properly secured.

❑ Make sure that there is no contact with the underbody.

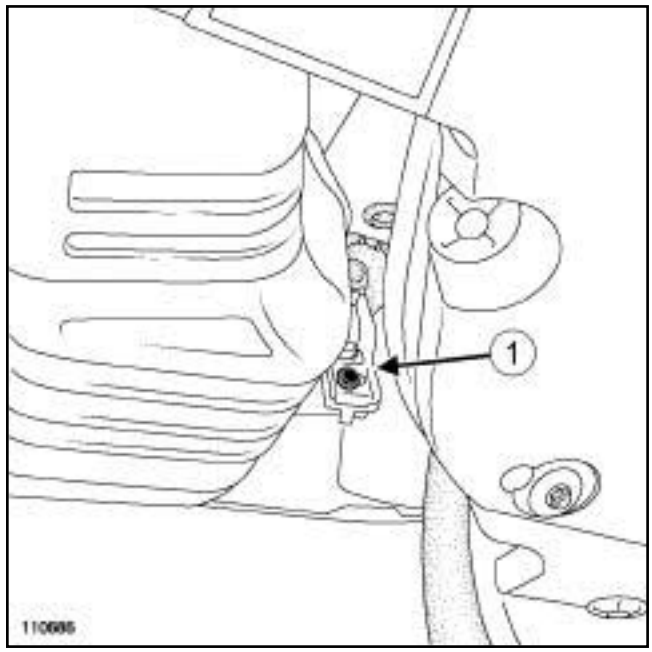
WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

D4F or K4J or K4M or K9K or M4R

Tightening torques ▽	
rubber mounting bush support bolts on the silencer	**8 Nm**
exhaust sleeve	**25 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (see **Exhaust: Parts and consumables for the repair**) (MR 392, 19A, Exhaust).

II - OPERATION FOR REMOVAL OF PART CONCERNED

110686

❑ Remove:

- the bolt (**1**) mounting the silencer on the rubber mounting bush support,
- the silencer.

Note:

If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Fit:

- the silencer,
- the sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) (MR 392, 19A, Exhaust).

❑ Torque tighten:

- the **rubber mounting bush support bolts on the silencer (8 Nm)**,
- the **exhaust sleeve (25 Nm)** while lifting the exhaust pipe to ensure correct alignment.

D4F or K4J or K4M or K9K or M4R

II - FINAL OPERATION.

- ❑ Make sure that all the exhaust pipe heat shields are in place and properly secured.
- ❑ Make sure that there is no contact with the underbody.

WARNING

Make sure:

- that the sleeve « nut-bolt tightening » assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- position the new component in such a way that the marks on the area to be cut are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.
- that the bolts securing the rubber mounting bushes to the exhaust pipe have been replaced with new ones.

F4R

Equipment required
component jack

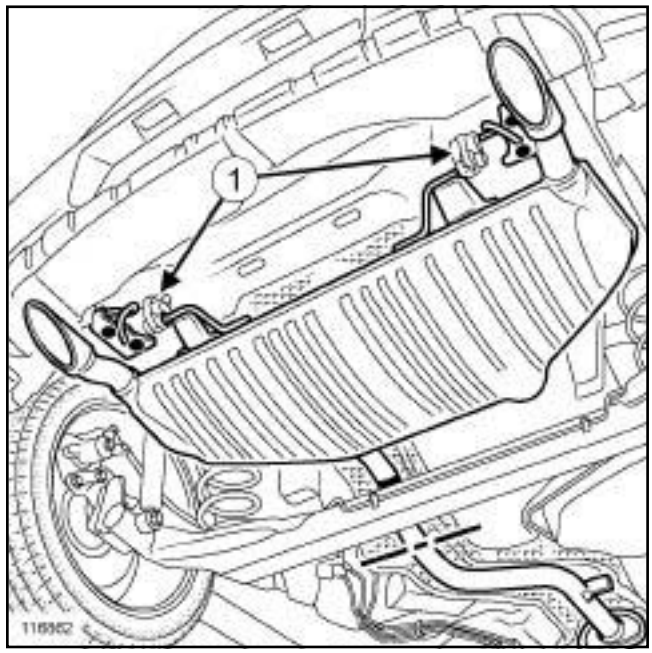
Tightening torques ▽	
bolts of the rubber mounting bush supports on the body	**21 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove the diffuser on the rear bumper (see **Aerodynamic diffuser: Removal - Refitting**) (55A, Exterior protection).



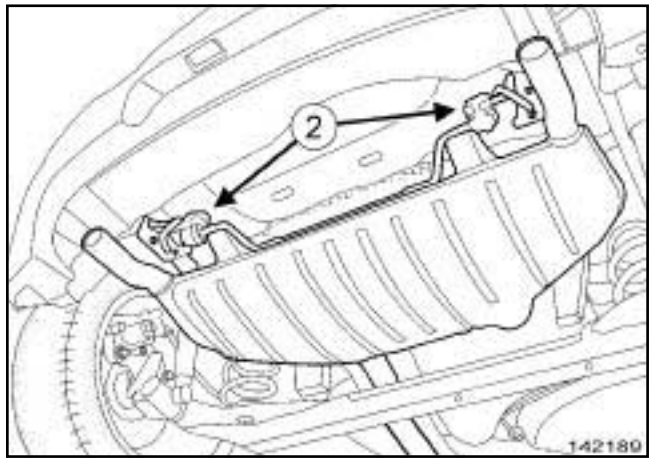
II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) in the designated area to be cut (see **19B**, **Exhaust**, **Exhaust: List and location of components**, page **19B-1**) .

❑ Fit a **component jack** under the silencer.

WARNING
If removing the support from the rubber mounting bush on the body, mark its position on the body beforehand, using a pen.

F4R, and 830



116862

❑ Remove:

- the rubber mounting bushes (**1**) using the tool **Mot. 1857**,
- the silencer.

F4R, and 832

142189

❑ Remove:

- the rubber mounting bushes (**2**) using the tool **Mot. 1857**,

- the silencer.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the silencer and hold it with a **component jack**.

❏ If removing the supports from the rubber mounting bushes, fit the mounting bolts of the rubber mounting bush supports on the body without tightening them.

❏ Fit the retaining rubber mounting bushes of the silencer.

Note:

Lubricate inside the holes of the rubber mounting bush using brake cleaner (see **Vehide: Parts and consumables for the repair**) to fit it more easily on the support on the body and on the silencer.

❏ Fit the exhaust trunking (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

❏ Adjust the silencer in relation to the rear bumper in order to align the splines horizontally.

❏ Torque tighten the **bolts of the rubber mounting bush supports on the body (21 N.m)** if they were removed.

II - FINAL OPERATION

❏ Check that the exhaust pipe heat shields are in place and properly attached.

❏ Check that there are no leaks.

WARNING

Check that the exhaust pipe is not touching the body.

Check that all the heat shields are present.

❏ Refit the diffuser on the rear bumper (see **Aerodynamic diffuser: Removal - Refitting**) (55A, Exterior protection).

EQUIPMENT LEVEL EAG

Tightening torques ▽	
rubber mounting bush support bolts on the silencer	**8 N.m**

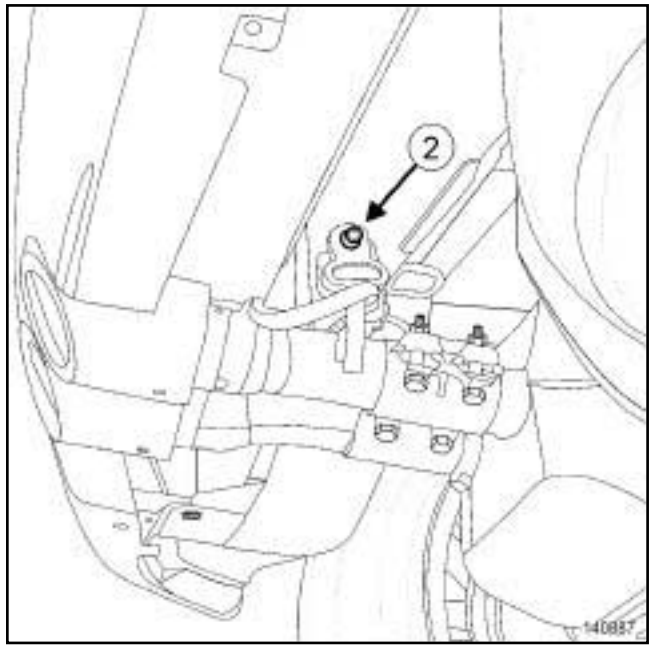
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Cut the exhaust pipe (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) in the designated area to be cut (see **Exhaust: Parts and consumables for the repair**) (19A, Exhaust).

II - OPERATION FOR REMOVAL OF PART CONCERNED

110686

❏ Remove the silencer bolts (**1**) on the rubber mounting bush support.

140887

❏ Unclip the silencer from the rubber mounting bush at (**2**) .

❏ Remove the silencer.

> Note:
>
> If the rubber mounting bushes are damaged, mark the position of the support on the body, then replace the « support - rubber mounting bush » assembly.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the silencer.

❏ Clip the silencer onto the rubber mounting bush.

❏ Fit a new After-Sales sleeve between the expansion chamber and the silencer (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-17**) .

> **WARNING**
>
> Position the « nut and bolt securing the sleeve » assembly so that the assembly cannot come into contact with the underbody.

❏ Tighten to torque:

- the **rubber mounting bush support bolts on the silencer (8 N.m)**,

EQUIPMENT LEVEL EAG

- the **exhaust sleeve (25 N.m)** whilst supporting the exhaust pipe.

II - FINAL OPERATION

❑ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody,
- that there are no leaks.

Fuel tank: Removal - Refitting

D4F or F4R or K4J or K4M or K9K or M4R – S85

Equipment required
component jack

Tightening torques ▽	
fuel tank bolts	**21 Nm**
silencer rubber mounting bush bolt on the body	**21 Nm**
expansion chamber rubber mounting bush bolt on the body	**21 Nm**
fuel tank filler neck bolt	**21 N.m**

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear latex gloves during the operation.

WARNING

To prevent impurities from entering the circuit, plugs must be fitted to the openings of all the fuel circuit components exposed to the open air.

WARNING

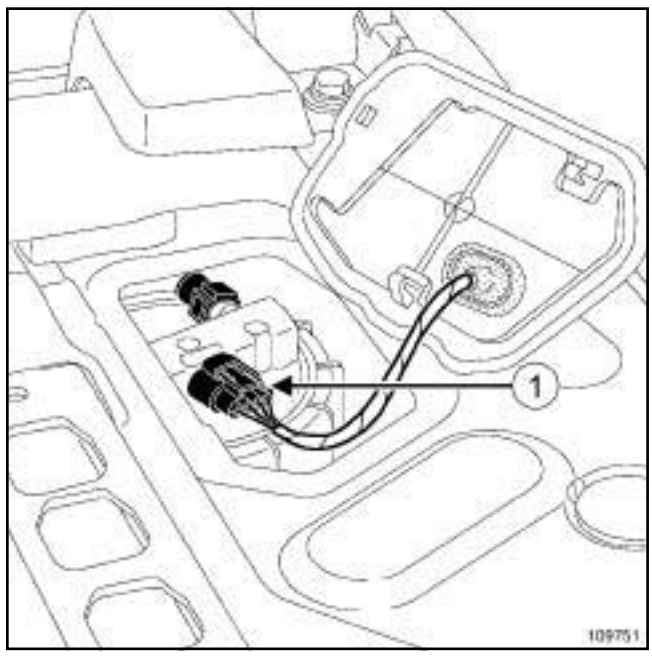
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Drain the fuel tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-8**) .



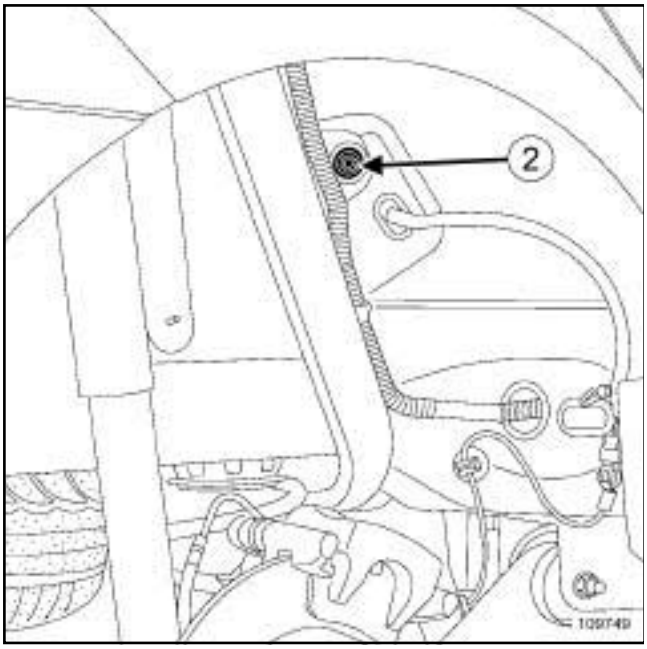
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Raise the rear bench seat.

S85

❏ Remove the rear loading trim (see **Rear loading trim: Removal - Refitting**) (71A, Body internal trim).

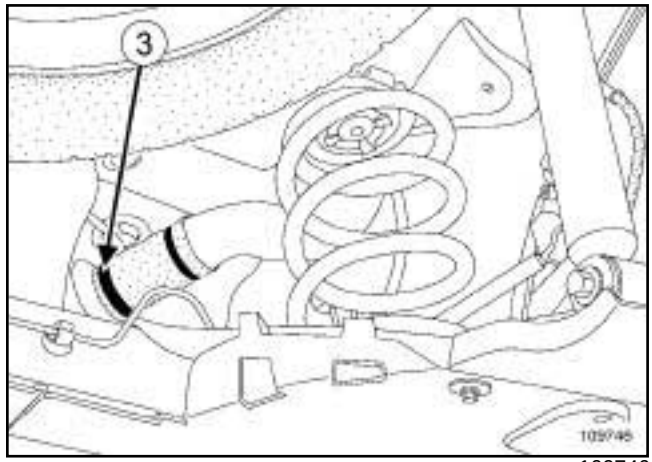
❏ Open the inspection flap.



109751

❏ Disconnect the connector (**1**) from the « fuel sender module » .

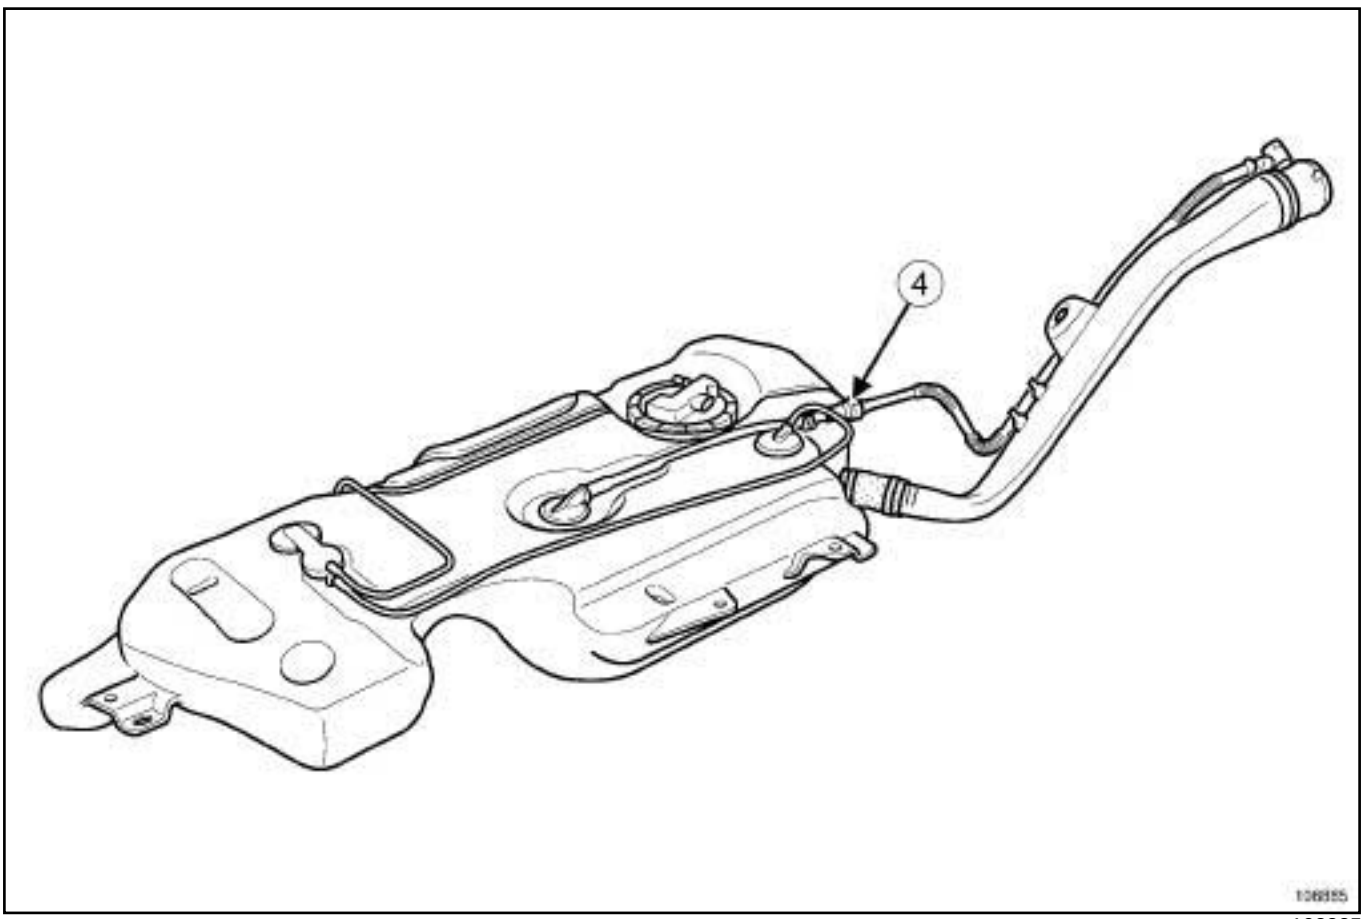
❏ Remove:



- the rear right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the rear right-hand wheel arch liner (see **Rear wheel arch liner: Removal - Refitting**) (55A, Exterior protection).

D4F or F4R or K4J or K4M or K9K or M4R – S85

109749

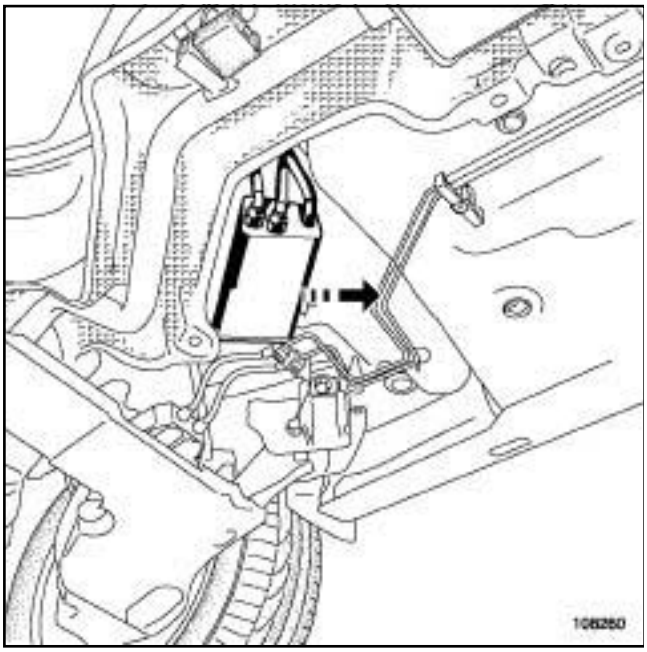


❑ Remove the bolt (**2**) from the fuel tank filler neck.

109746

❑ Remove the clip (**3**) from the fuel tank filler neck.

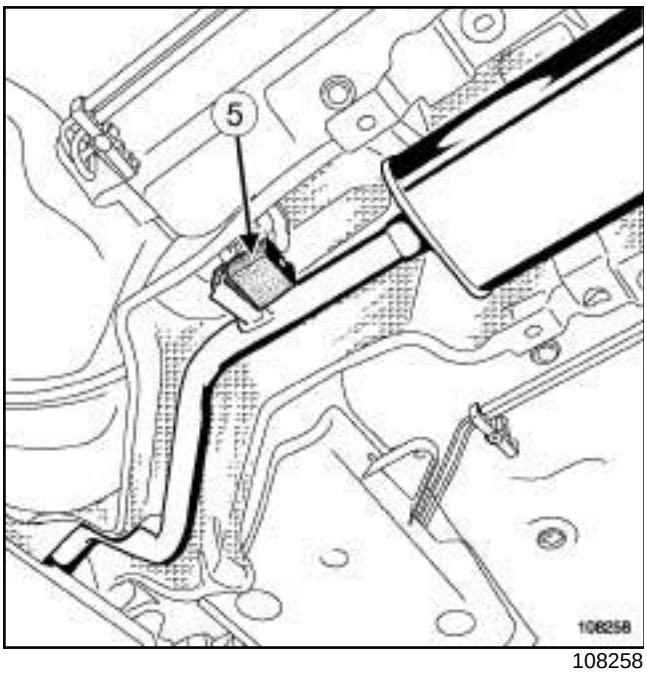
❑ Separate the filler neck from the fuel tank.



108885

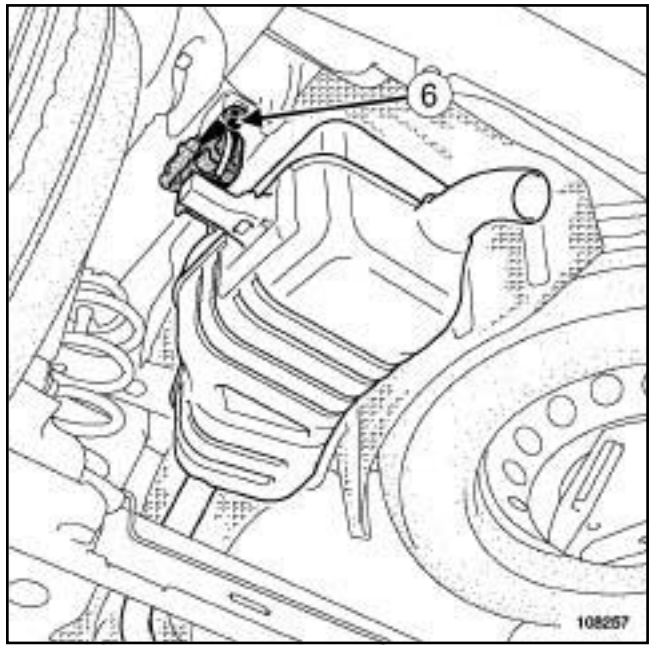
❑ Disconnect the anti-discharge pipe (**4**) from the fuel tank.

D4F or F4R or K4J or K4M or K9K or M4R – S85



D4F or F4R or K4J or K4M or M4R

108260

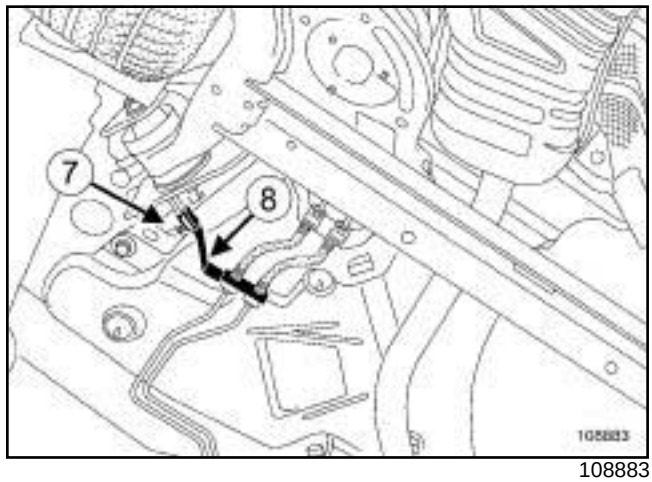


❏ Disconnect the pipes connected to the fuel vapour absorber.

❏ Remove the petrol vapour absorber.

108258

❏ Remove the rubber mounting bush bolt (**5**) from the expansion chamber on the body.



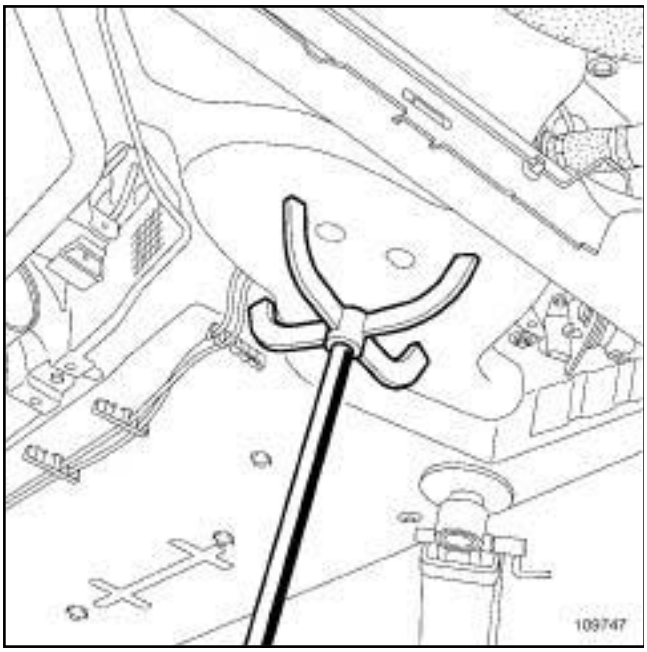
108257

❏ Remove the rubber mounting bush bolt (**6**) from the silencer on the body.

❏ Position the exhaust pipe resting on the rear axle.

❏ Remove the heat shield.

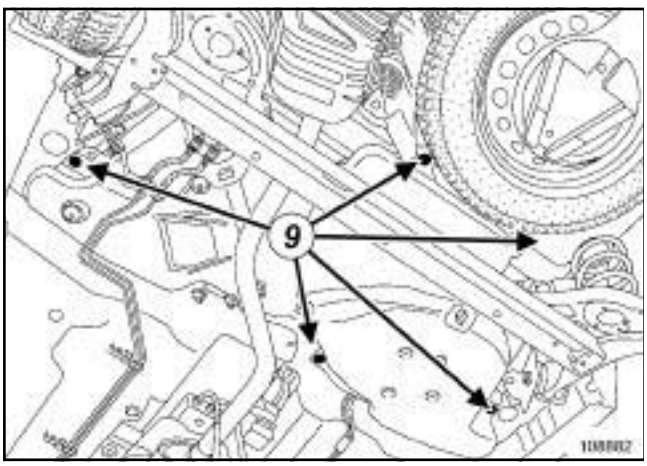
108883



❏ Undo the brake pipe strut bolt (**7**) on the rear axle.

❏ Remove the brake pipe strut (**8**) on the rear axle.

❏ Remove the parking brake cables at the drum brakes or at the rear disc brake callipers (see **Parking brake cables: Removal - Refitting**) (37A, Mechanical component controls).



D4F or F4R or K4J or K4M or K9K or M4R – S85

II - OPERATION FOR REMOVAL OF PART CONCERNED

109747

❏ Fit a **component jack** under the fuel tank.

108882

❏ Remove the bolts (**9**) from the fuel tank.

❏ Gently lower the fuel tank.

❏ Unclip the fuel supply pipes from the fuel tank.

❏ Disconnect the fuel sender module fuel union.

❏ Remove the fuel tank by turning it around the exhaust pipe (this operation requires two people).

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always fit a new clip to the filler neck - fuel tank connecting hose.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the fuel tank by turning it around the exhaust pipe (this operation requires two people).

❏ Connect the fuel sender module fuel union.

❏ Connect the fuel supply pipes to the fuel tank.

❏ Torque tighten the **fuel tank bolts (21 Nm)**.

❏ Remove the **component jack**.

III - FINAL OPERATION.

❏ Refit:

- the parking brake cables (see **Parking brake cables: Removal - Refitting**) (37A, Mechanical component controls),
- the brake pipe strut ***(8)*** on the rear axle.

❏ Tighten the brake pipe strut bolt ***(7)*** on the rear axle.

❏ Refit the heat shield.

❏ Tighten to torque:

- the **silencer rubber mounting bush bolt on the body (21 Nm)**,
- the **expansion chamber rubber mounting bush bolt on the body (21 Nm)**.

D4F or F4R or K4J or K4M or M4R

❏ Refit the fuel vapour absorber.

❏ Connect the pipes connected to the fuel vapour absorber.

❏ Connect the anti-discharge pipe ***(4)*** to the fuel tank.

❏ Fit the filler neck on the fuel tank.

❏ Refit the new fuel tank filler neck clip ***(3)*** .

❏ Torque tighten the **fuel tank filler neck bolt (21 N.m)**.

❏ Refit:

- the rear right-hand wheel arch liner (see **Rear wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the rear right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Connect the connector ***(1)*** for the « fuel sender » module.

❏ Close the inspection flap.

D4F or F4R or K4J or K4M or K9K or M4R – S85

❑ Refit the rear bench seat.

S85

❑ Refit the rear loading trim (see **Rear loading trim: Removal - Refitting**) (71A, Body internal trim).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

D4F or F4R or K4J or K4M or K9K or M4R

Tightening torques ▽	
filler neck earth bolt	**21 Nm**

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear latex gloves during the operation.

WARNING

To prevent impurities from entering the circuit, plugs must be fitted to the openings of all the fuel circuit components exposed to the open air.

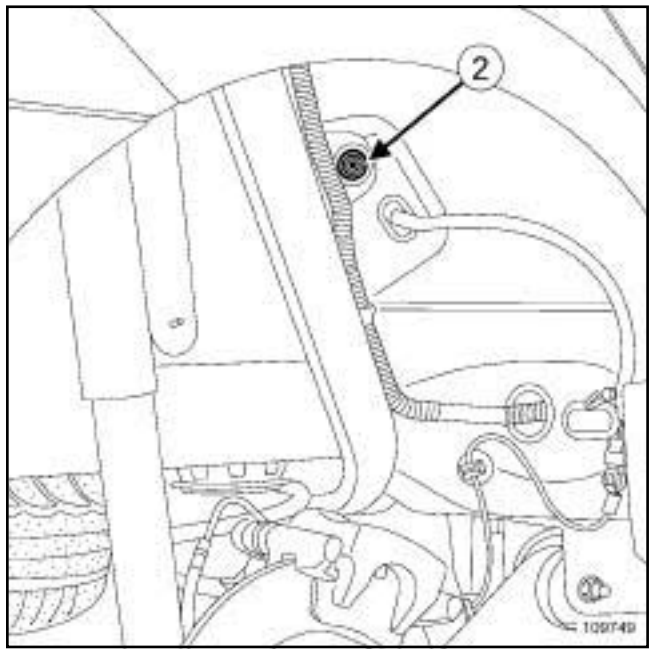
WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION

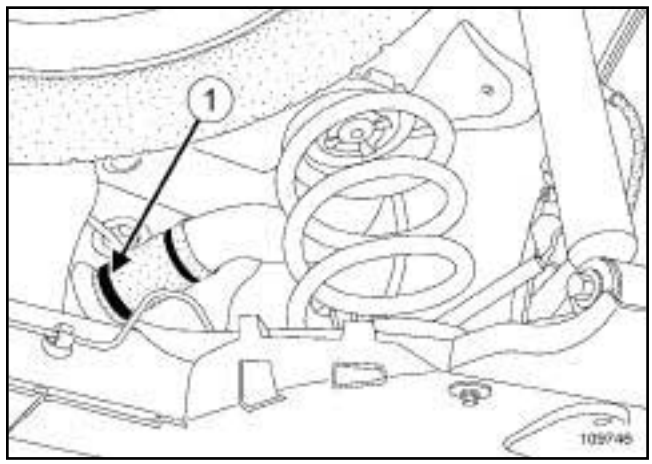
❏ Drain the tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-8**) .



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

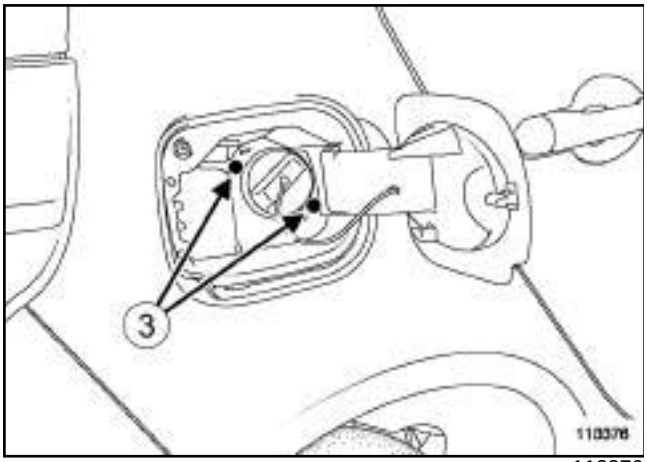


- the rear right-hand wheel,
- the rear right-hand wheel arch liner.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109749

❏ Remove the earth bolt (**2**) from the filler neck.



109746

❏ Disconnect the anti-return pipe.

❏ Remove the filler pipe clip (**1**) .

D4F or F4R or K4J or K4M or K9K or M4R

113376

❏ Remove:

- the filler neck bolts (**3**) ,
- the filler neck.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Always replace the clips with new ones.

❏ Refit:

- the filler neck,
- the filler neck earth bolt
- the filler neck bolts,
- the new clip on the filler pipe.

❏ Torque tighten the **filler neck earth bolt (21 Nm)** ***(2)*** .

❏ Fit the new filler pipe clip.

❏ Disconnect the anti-return pipe.

II - FINAL OPERATION.

❏ Refit:

- the rear right-hand wheel arch liner (see **Rear wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the rear right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

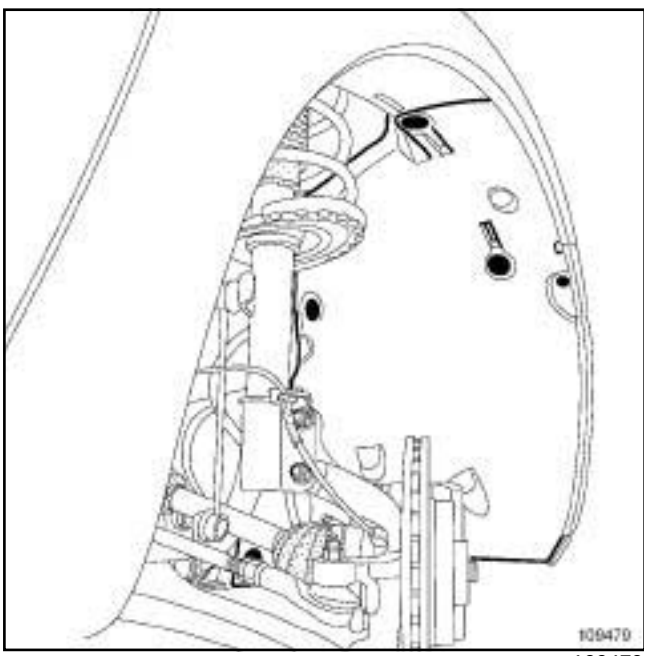
K9K, and 750 or 752 or 764 or 766 or 768

Tightening torques ▽	
fuel filter protector nuts	**21 Nm**

IMPORTANT

during this operation, it is essential to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

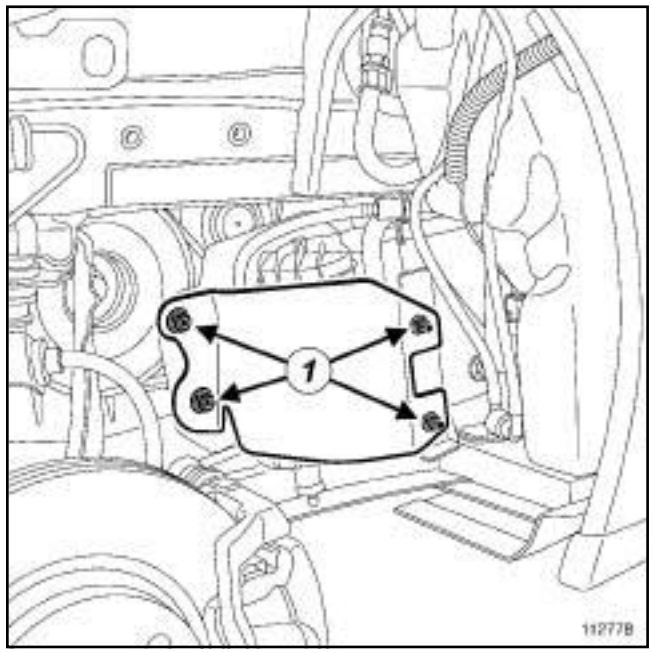


IMPORTANT

Wear gloves during this operation.

IMPORTANT

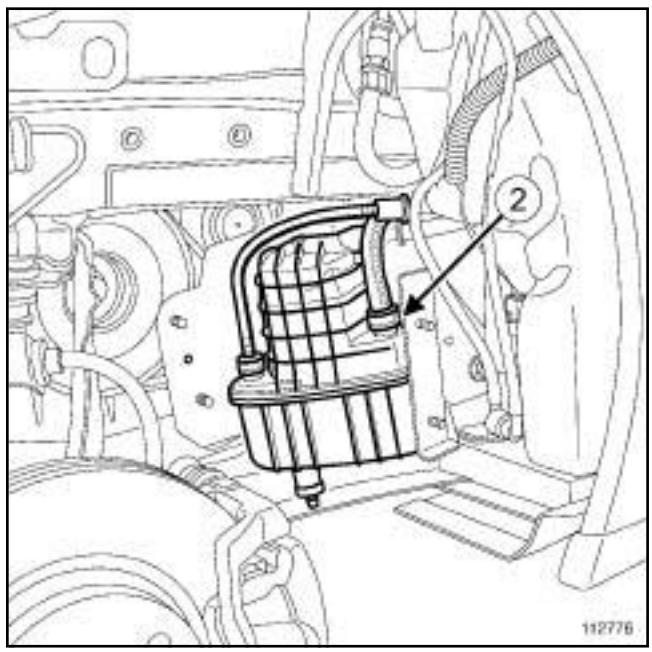
Wear goggles with side protectors for this operation.



I - OIL SERVICE

109479

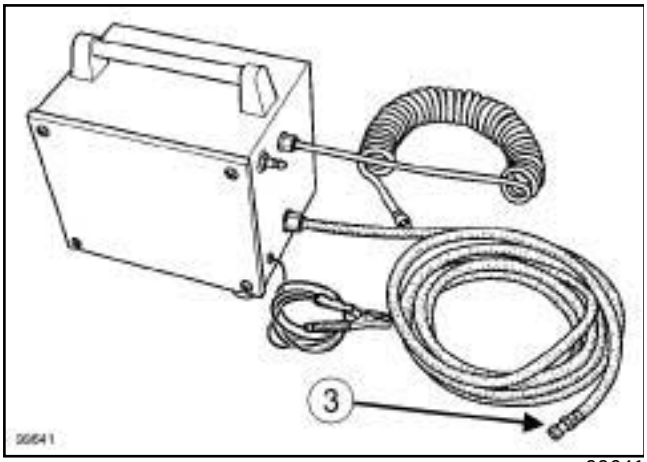
❏ Remove:



- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

112778

❏ Remove:



- the nuts (**1**) from the fuel filter guard,
- the fuel filter guard.

112776

❏ Disconnect the fuel inlet pipe (**2**) from the fuel filter.

❏ Make preparations for fuel outflow.

99641

❏ Connect the rubber pneumatic pump vacuum pipe (**3**) onto the fuel supply pipe.

❏ Activate the pneumatic pump.

❏ Let the fuel flow out until it the flow is intermittent.

II - REFITTING

❏ Connect the fuel supply pipe to the fuel filter pipe.

❏ Refit the fuel filter guard.

❏ Torque tighten the **fuel filter protector nuts (21 Nm)**.

❏ Refit:

- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

D4F or K4J or K4M or M4R

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

Equipment required
pneumatic transfer pump for fuels

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

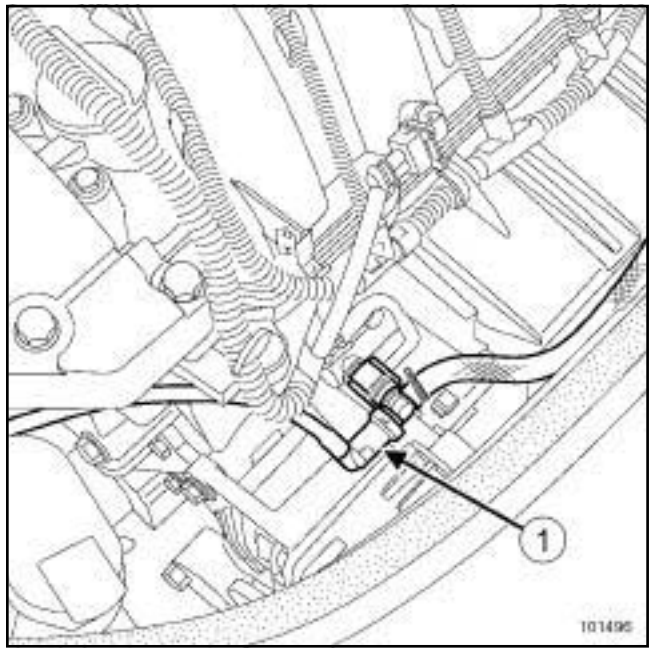
Wear latex gloves during the operation.

WARNING

To prevent impurities from entering the circuit, plugs must be fitted to the openings of all the fuel circuit components exposed to the open air.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



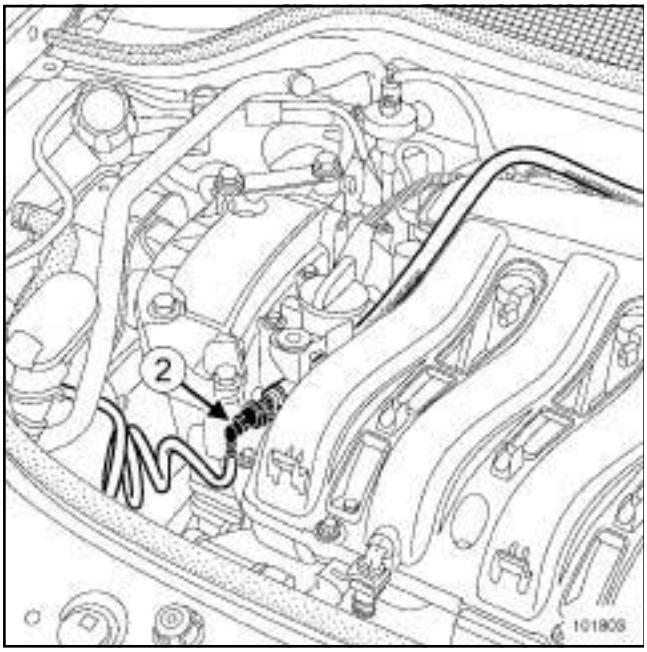
I - DRAINING PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M or M4R – D4F, and 784

❑ Remove the front engine cover.

K4J



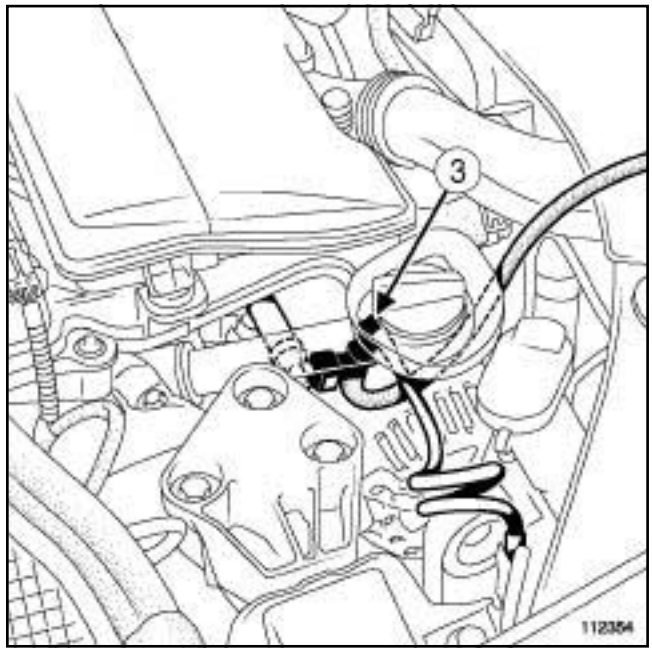
101496

❑ Disconnect the fuel supply union (**1**) from the injector rail.

❑ Fit a « T » union **(Mot. 1311-08)**.

D4F or K4J or K4M or M4R

K4M

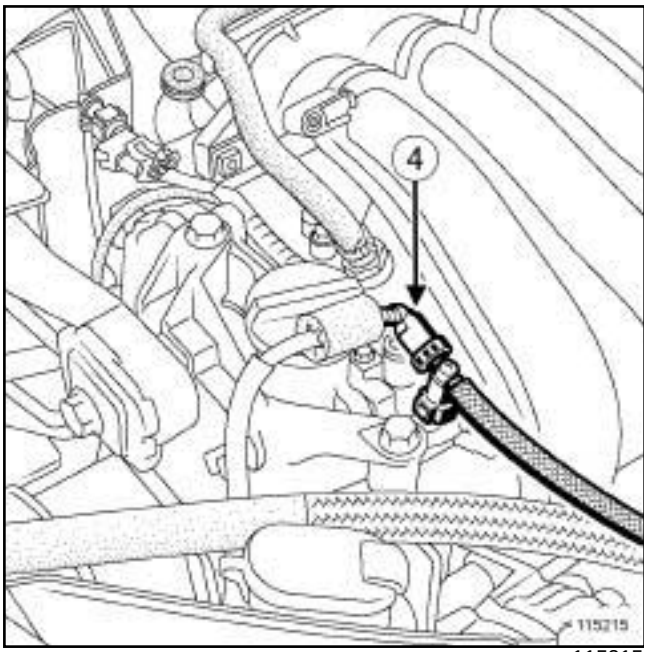


101803

❏ Disconnect the fuel supply union (**2**) from the injector rail.

❏ Fit a « T » union **(Mot. 1311-08)**.

D4F



112354

❏ Disconnect the fuel supply union (**3**) from the injector rail.

❏ Fit a « T » union **(Mot. 1311-08)**.

D4F or K4J or K4M or M4R

M4R

115215

❑ Disconnect the fuel supply union (**4**) from the injector rail.

❑ Fit a « T » union **(Mot. 1311-08)**.

II - FUEL TANK DRAINING PROCEDURE

❑ Connect a **pneumatic transfer pump for fuels** to the « T » union output.

❑ Drain the fuel tank.

III - FINAL OPERATION.

❑ Disconnect the **pneumatic transfer pump for fuels**.

❑ Remove the « T » union **(Mot. 1311-08)**.

❑ Connect:

- fuel supply union ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M or M4R – D4F, and 784

❑ Refit the engine cover.

F4R

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

Equipment required
pneumatic transfer pump for fuels

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

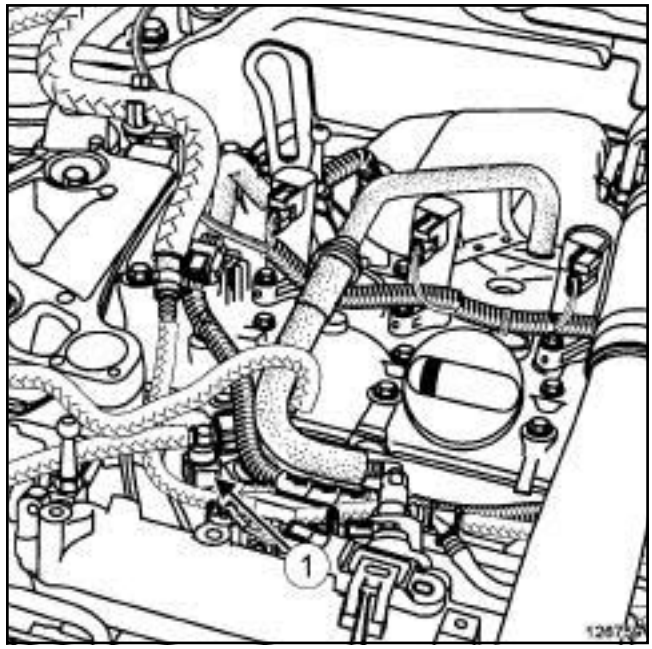
IMPORTANT

Wear latex gloves during the operation.

WARNING

To prevent impurities from entering the circuit, plugs must be fitted to the openings of all the fuel circuit components exposed to the open air.

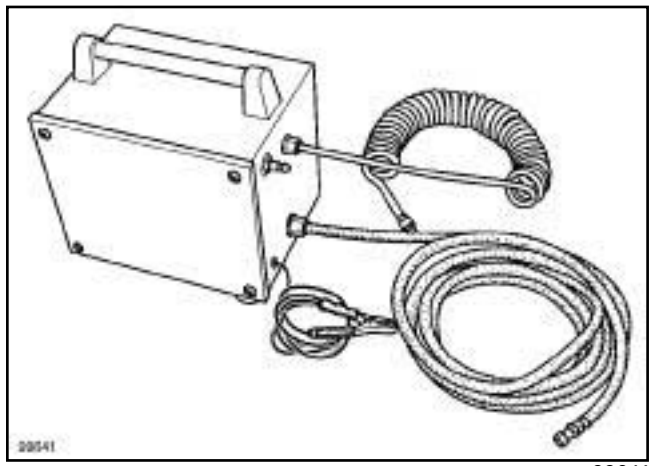
WARNING



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

DRAINING

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❏ Remove the front engine cover.

❏ Disconnect the fuel supply pipe union from the injector rail.

126759

❏ Fit a « T » union **(Mot. 1311-08)** (**1**) .

99641

❏ Connect a **pneumatic transfer pump for fuels** on the « T » union outlet.

❏ Drain the fuel tank.

REFITTING

❏ Disconnect the **pneumatic transfer pump for fuels** from the « T » union outlet.

❏ Remove the « T » union **(Mot. 1311-08)**.

❏ Connect:

- the fuel supply union on the injector rail,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Refit the engine cover.

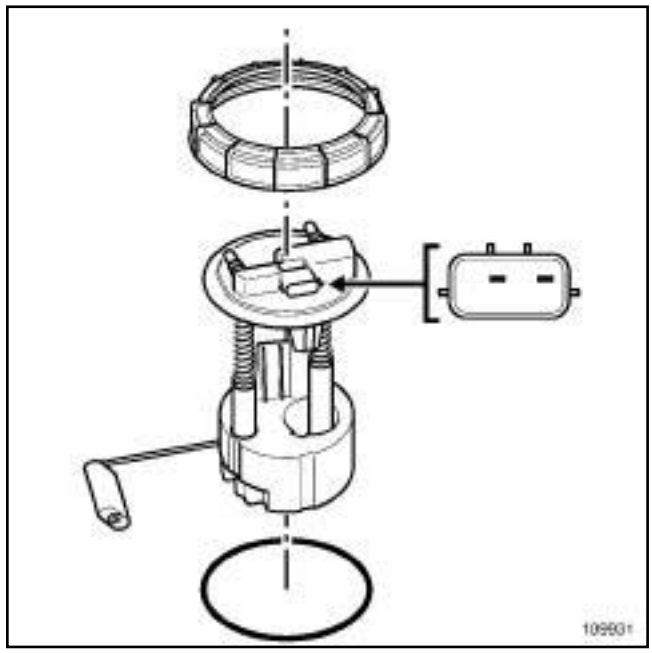
K9K

Special tooling required	
Mot. 1397	Universal spanner for removing fuel gauge nuts.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



❑ Drain the fuel tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-8**) .

❑ Remove the battery covers.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

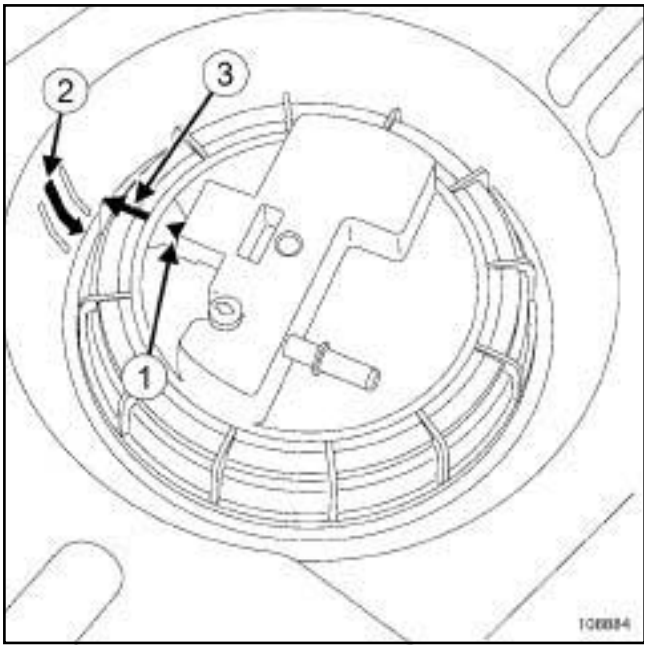
II - OPERATION FOR REMOVAL OF PART CONCERNED

109931

❑ Remove the mounting nut from the sender unit using **(Mot. 1397)**

❑ Let the fuel drain from the sender.

❑ Remove the sender unit, being careful with the float.



WARNING

Refit the sender nut as soon as the sender has been removed to prevent any deformation of the fuel tank.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Replace the O-ring.

108884

❑ Refit the pump - sender by positioning the mark (**1**) on the sender opposite the mark (**2**) on the tank.

❑ Position the sender mounting nut.

❑ Tighten the sender mounting nut using the **(Mot. 1397)** until the mark on the nut (**3**) lines up with the mark (**2**) on the tank and the mark (**1**) on the sender.

II - FINAL OPERATION.

❑ Refit the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 772

Special tooling required	
Mot. 1397	Universal spanner for removing fuel gauge nuts.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

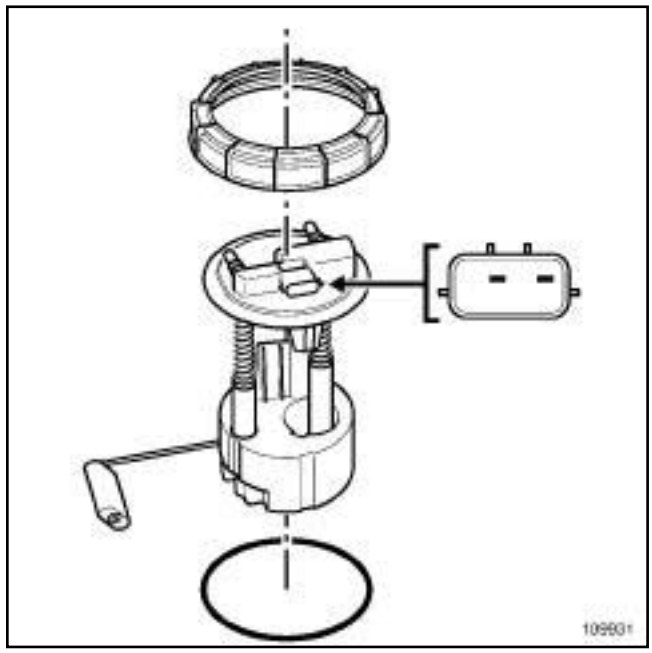
IMPORTANT

Wear gloves during this operation.

IMPORTANT

Wear goggles with side protectors for this operation.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **02A, Lifting equipment, Vehicle: Towing and lifting**).

❏ Drain the fuel tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-8**) .

❏ Remove the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

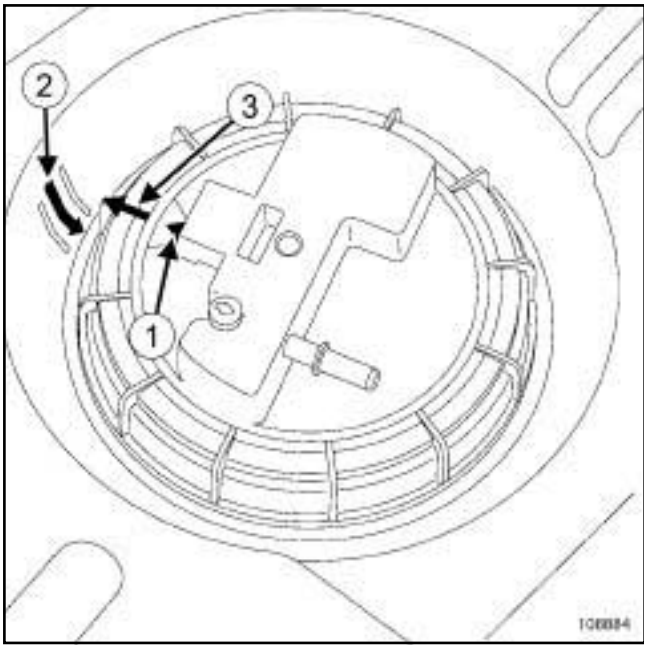
109931

❏ Remove the nut from the pump - sender using the **(Mot. 1397)**.

❏ Let the fuel in the pump - sender flow out.

❏ Remove the pump - sender, being careful with the float.

WARNING



Refit the pump - sender nut as soon as the pump - sender has been removed to prevent any deformation of the fuel tank.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Replace the pump - sender O-ring seal and nut.

K9K, and 772

108884

❑ Refit the pump - sender by positioning the mark (**1**) on the sender opposite the mark (**2**) on the tank.

❑ Position the nut for the sender.

❑ Tighten the pump - sender nut using the **(Mot. 1397)** until the mark on the nut (**3**) lines up with the mark (**2**) on the tank and the mark (**1**) on the pump - sender.

II - FINAL OPERATION

❑ Refit the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

D4F or F4R or K4J or K4M or M4R

Special tooling required	
Mot. 1397	Universal spanner for removing fuel gauge nuts.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear latex gloves during the operation.

WARNING

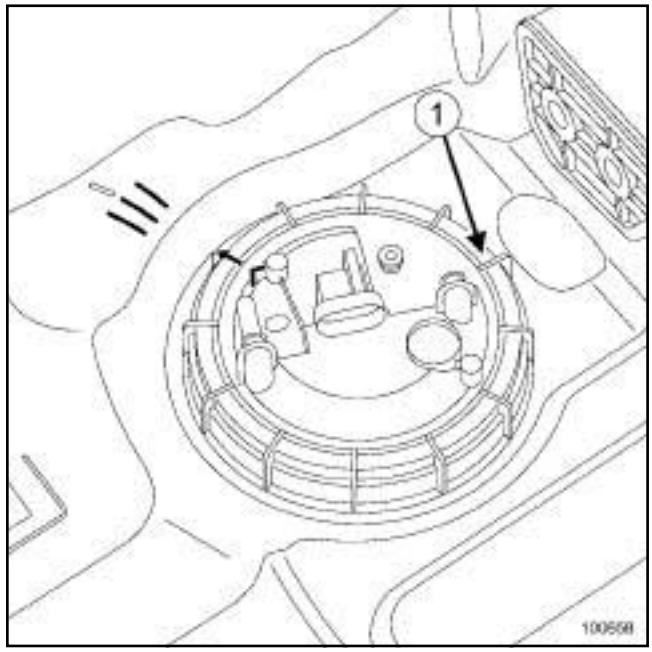
To prevent impurities from entering the circuit, plugs must be fitted to the openings of all the fuel circuit components exposed to the open air.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Drain the fuel tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-8**) .

❑ Remove the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

100658

❑ Remove the nut (**1**) from the fuel sender module using the **(Mot. 1397)**.

Note:

Take care to ensure that the float is not damaged during the operation.

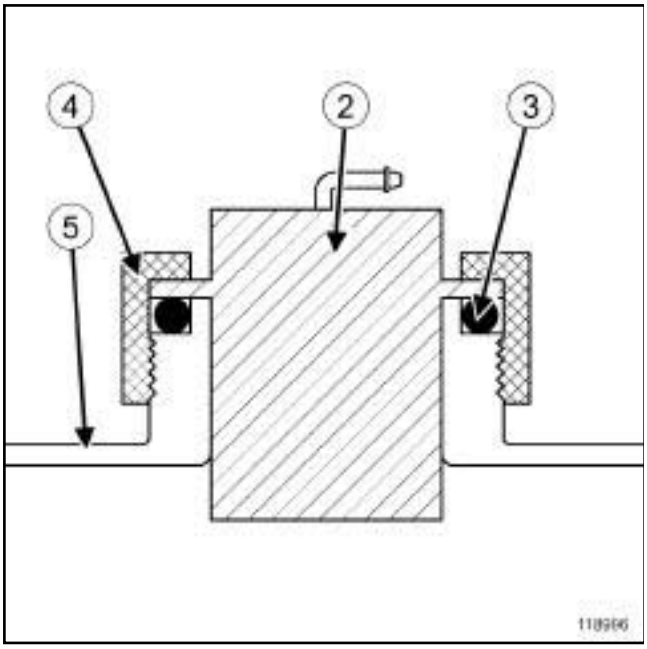
❑ Remove the fuel sender module, preparing for the flow of fuel.

WARNING

In order to avoid any damage to the tank, refit the « pump-sender-filter » assembly nut as soon as the assembly is removed.

REFITTING

I - REFITTING PREPARATIONS OPERATION



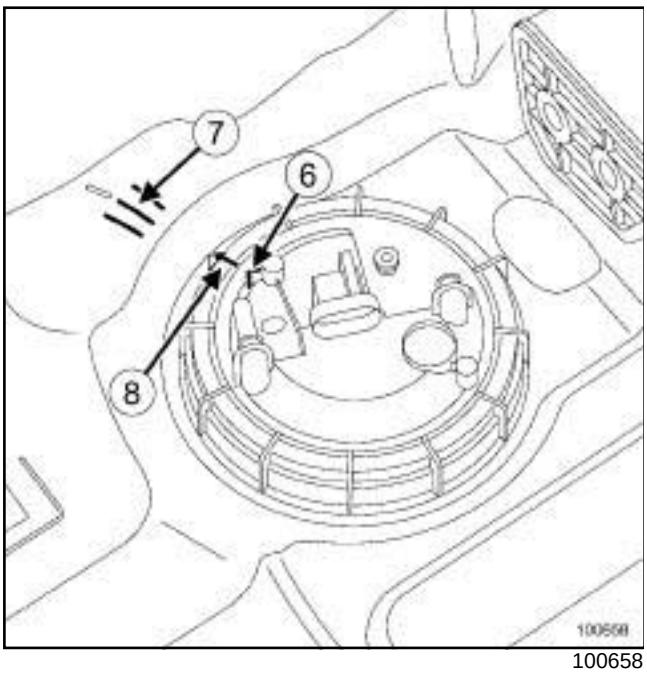
❑ Always replace:

- the fuel sender module nut,
- the O-ring seal.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the fuel sender module.

D4F or F4R or K4J or K4M or M4R



118996

❏ Correctly position the seal (**3**) in the neck.

❏ Position the fuel sender module (**2**) on the tank (**5**) ; a lug on the fuel sender module and a recess in the tank ensure correct fitting in the tank.

❏ Press on the "fuel sender" module to secure the seal, manually pre-tighten the "fuel sender" module nut (**4**) on the tank.

100658

❏ Tighten the fuel sender module nut using the **(Mot. 1397)** until the index (**8**) corresponds with the tank index (**7**) and the "fuel sender" module index (**6**) .

III - FINAL OPERATION.

❏ Refit the fuel tank (see **19C**, **Tank**, **Fuel tank: Removal - Refitting**, page **19C-1**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Check that there are no fuel leaks:

- run the engine at idle speed,
- accelerate several times at no load,
- switch off the ignition,
- check that there is no fuel escaping.

D4F or K4J or K4M or M4R

Value between the terminals 2 and 4 (Ω)	Capacity	Height H (mm ± 6 mm)
28 ± 11	full tank	upper stop
83 ± 22	tank 3/4 full	144
142 ± 23	tank 1/2 full	112
213 ± 23	tank 1/4 full	73
287 ± 24	reserve	39
317 ± 7	tank empty	lower stop

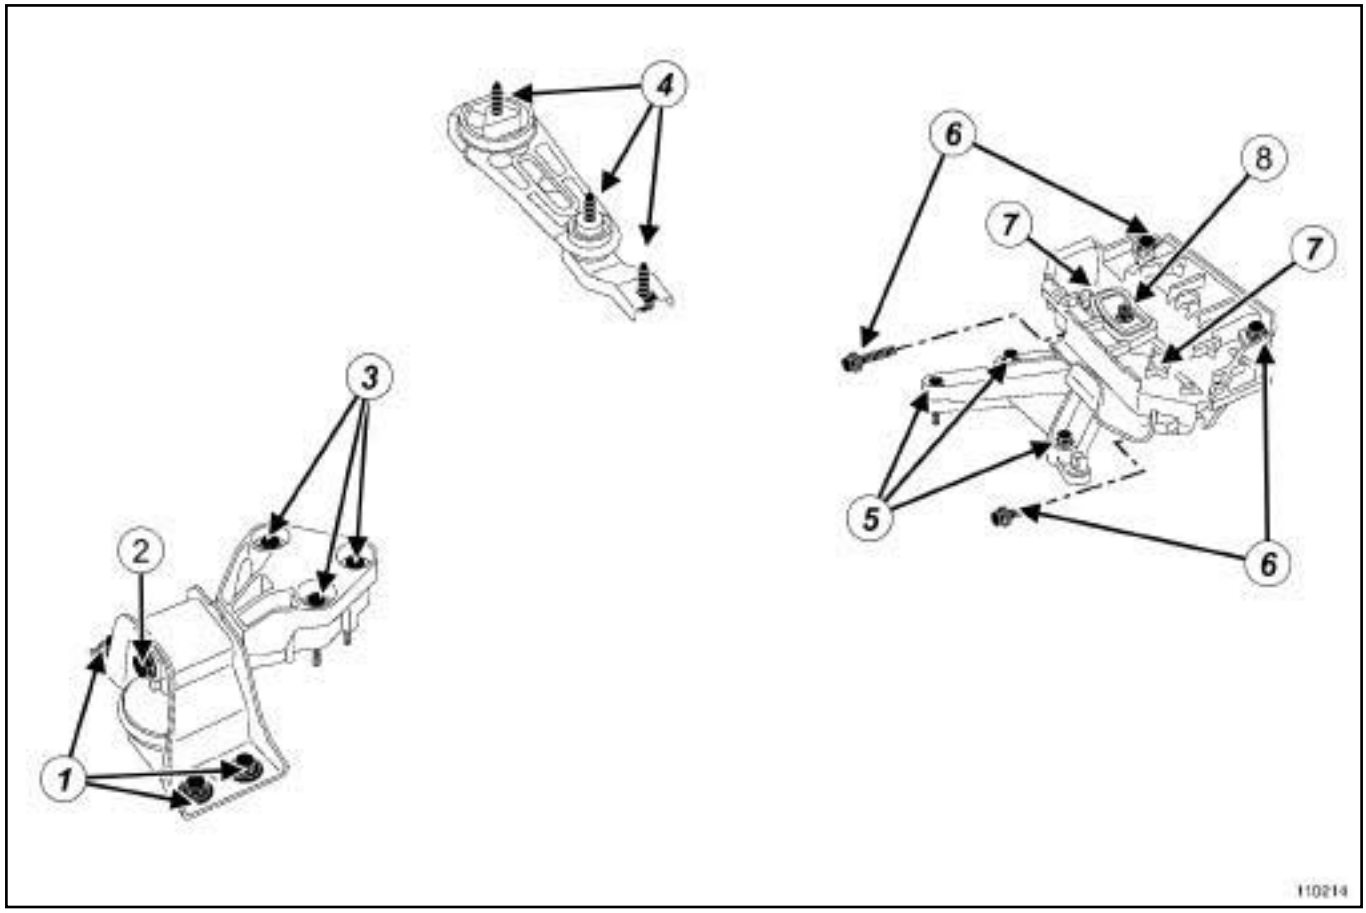
Check that the resistance varies when the float is moved.

Place the sender unit on a flat surface.

H is the height between the sender unit float pivot and the flat surface.

K9K

Value between the terminals 2 and 4 (Ω)	Capacity	Height H (mm ± 6 mm)
55 ± 11	full tank	upper stop
110 ± 23	tank 3/4 full	144
164 ± 23	tank 1/2 full	112
230 ± 23	tank 1/4 full	73
290 ± 24	reserve	39
317 ± 7	tank empty	lower stop



Check that the resistance varies when the float is moved.

Place the sender unit on a flat surface.

H is the height between the sender unit float pivot and the flat surface.

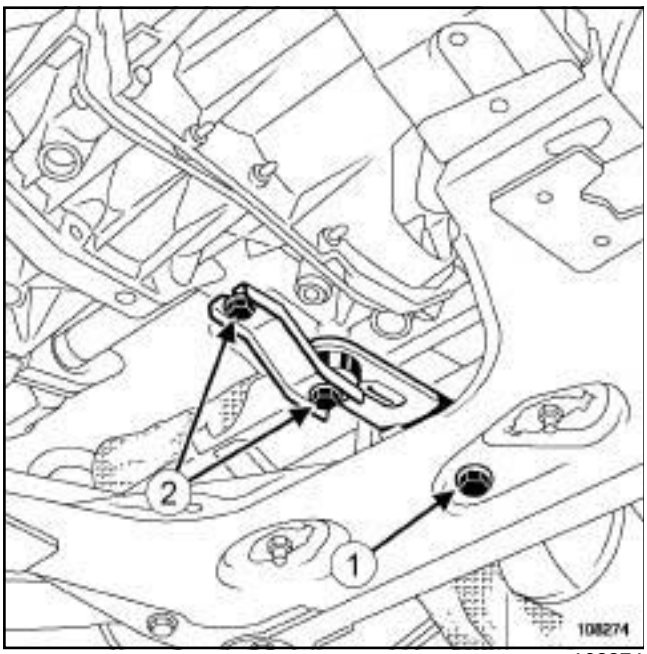
REMOVAL

I - REMOVAL PREPARATION OPERATION



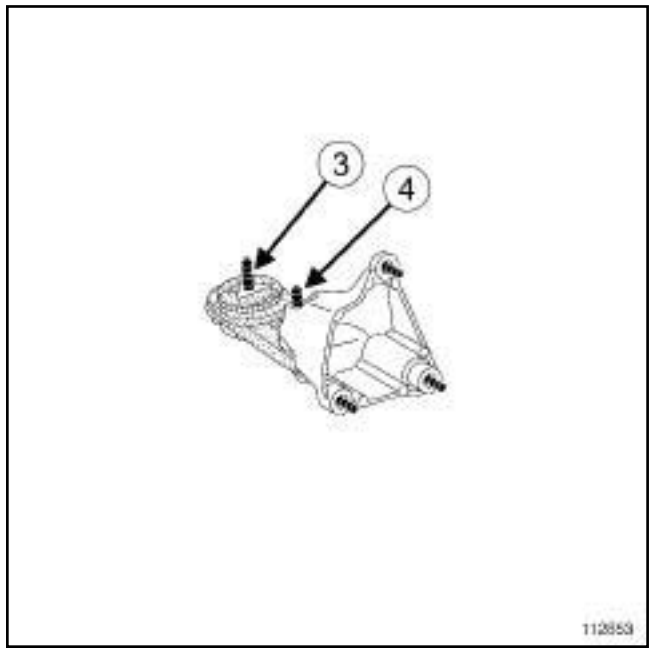
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

JH3 or JR5



108274

❏ Remove:

- the engine tie-bar bolt (**1**) on the subframe,
- the (**2**) engine tie-bar bolt on the gearbox.

TL4

112653

❏ Remove:

- the engine tie-bar bolt (**3**) from the subframe,
- the bolt (**4**) mounting the engine tie-bar on its support.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

JH3 or JR5

❏ Screw in without tightening the engine tie-bar bolts.

❏ Torque tighten the **engine tie-bar bolts (105 Nm)**.

K9K

TL4

❑ Refit:

- the engine tie-bar bolt on its support,
- the engine tie-bar bolt on the subframe.

❑ Screw in without tightening the engine tie-bar bolts.

❑ Torque tighten:

- the **engine tie-bar bolt on its support (180 Nm)**,
- the **engine tie-bar bolt on the subframe (105 Nm)**.

II - FINAL OPERATION.

❑ Refit the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the mounting bolt (**1**) for the engine tie-bar on the subframe,
- the bolts (**2**) mounting the engine tie-bar on the gearbox.

K4M

DP0

110238

❑

Remove:

- the mounting bolt (**3**) for the engine tie-bar on the subframe,
- the bolts (**4**) mounting the engine tie-bar on the gearbox.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the bolts mounting the engine tie-bar on the gearbox,
- the bolt mounting the engine tie-bar on the subframe.

DP0

❑ Torque tighten the **bolts mounting the engine tie-bar on the gearbox (62 Nm)**

❑ Torque tighten:

- the **bolts mounting the engine tie-bar on the gearbox (105 Nm)**,
- the **bolt mounting the engine tie-bar on the subframe (105 Nm)**.

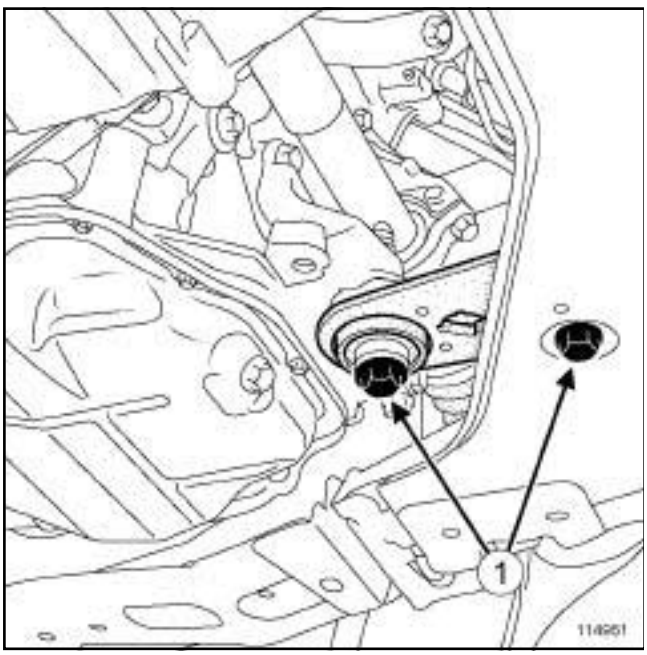
II - FINAL OPERATION.

❑ Refit the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

M4R

Tightening torques ▽	
engine tie-bar mounting bolt on the sub-frame	**105 Nm**
mounting bolt securing the engine tie-bar on the engine	**180 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Fit the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove the engine undertray.

II - REMOVAL OF PART CONCERNED

114951

❏ Remove:

- the mounting bolts (**1**) from the engine tie-bar,
- the engine tie-bar.

REFITTING

I - REFITTING PART CONCERNED

❏ Refit the engine tie-bar.

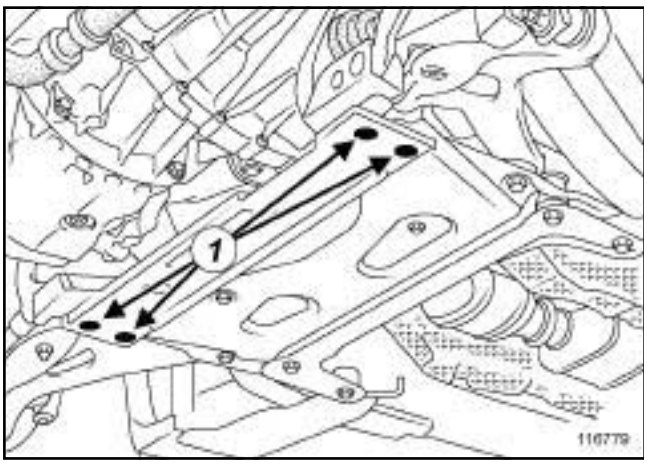
❏ Tighten to torque:

- the **engine tie-bar mounting bolt on the sub-frame (105 Nm)**,
- the **mounting bolt securing the engine tie-bar on the engine (180 Nm)**.

II - FINAL OPERATION

❏ Refit the engine undertray.

F4R



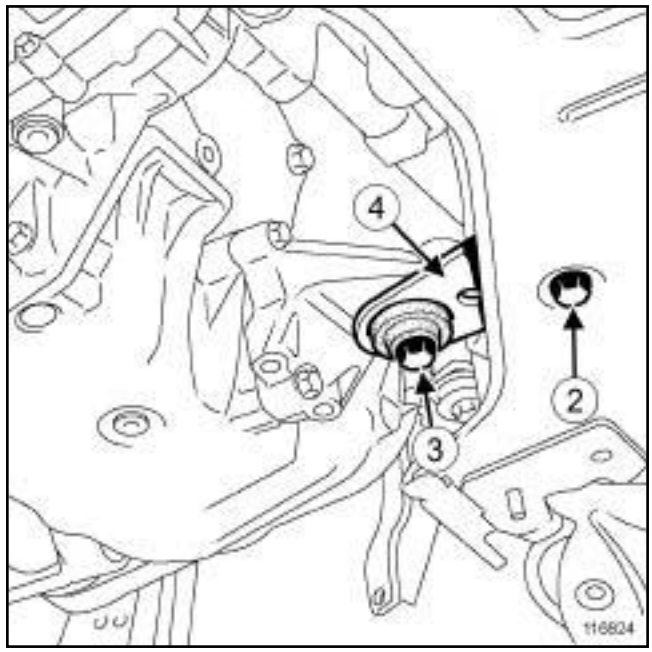
Tightening torques ▽	
lower engine tie-bar support mounting bolts	**62 Nm**
lower engine tie-bar mounting bolts on the support	**180 Nm**
lower engine tie-bar mounting bolts on the sub-frame	**105 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

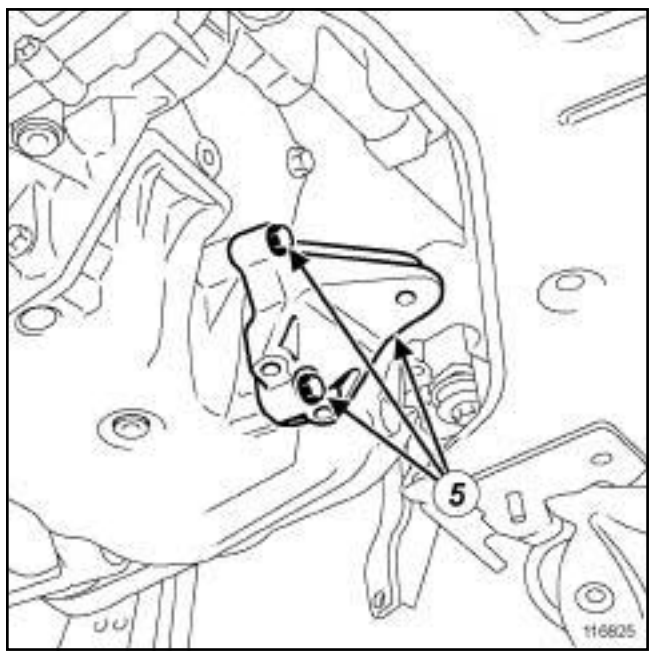
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



116779

❏ Remove:

- the engine undertray,
- the sub-frame stiffener cross member mounting nuts (**1**) ,
- the sub-frame stiffener cross member.



II - OPERATION FOR REMOVAL OF PART CONCERNED

116824

❏ Remove:

- the bolt (**2**) mounting the lower engine tie-bar on the sub-frame,
- the bolt (**3**) mounting the lower engine tie-bar on the support,
- the lower engine tie-bar (**4**) .

116825

❏ Remove:

- the lower engine tie-bar support mounting bolts (**5**) ,

- the lower engine tie-bar support.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the lower engine tie-bar support,
- the lower engine tie-bar support mounting bolts.

❑ Torque tighten the **lower engine tie-bar support mounting bolts (62 Nm)**.

❑ Refit:

- the lower engine tie-bar,
- the lower engine tie-bar mounting bolt onto the support,
- the lower engine tie-bar mounting bolt onto the sub-frame.

❑ Torque tighten:

- the **lower engine tie-bar mounting bolts on the support (180 Nm)**,
- the **lower engine tie-bar mounting bolts on the sub-frame (105 Nm)**.

II - FINAL OPERATION.

❑ Refit:

- the sub-frame stiffener cross member
- the sub-frame stiffener cross member mounting nuts.

❑ Torque tighten the cross member.

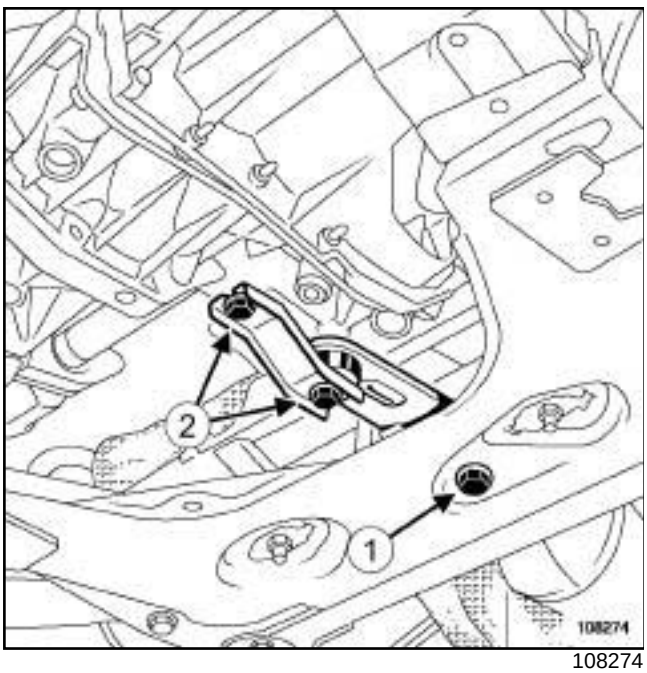
❑ Refit the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M, and TL4

Tightening torques ▽	
engine tie-bar bolts on the gearbox	**105 N.m**
engine tie-bar bolt on the subframe	**105 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the engine undertray bolts,
- the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

108274

❑ Remove:

- the engine tie-bar bolt (**1**) from the subframe,
- the bolts (**2**) from the engine tie-bar on the gearbox,
- the engine tie-bar.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the engine tie-bar,
- the bolts of the engine tie-bar on the gearbox,
- the engine tie-bar bolt on the subframe.

❑ Tighten to torque:

- the **engine tie-bar bolts on the gearbox (105 N.m)**,
- the **engine tie-bar bolt on the subframe (105 N.m)**.

II - FINAL OPERATION

❑ Refit the engine undertray.

D4F or K9K, and JH3

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽	
right-hand suspended mounting support bolts on the engine	**62 Nm**
suspended mounting bolts on the body	**62 Nm**

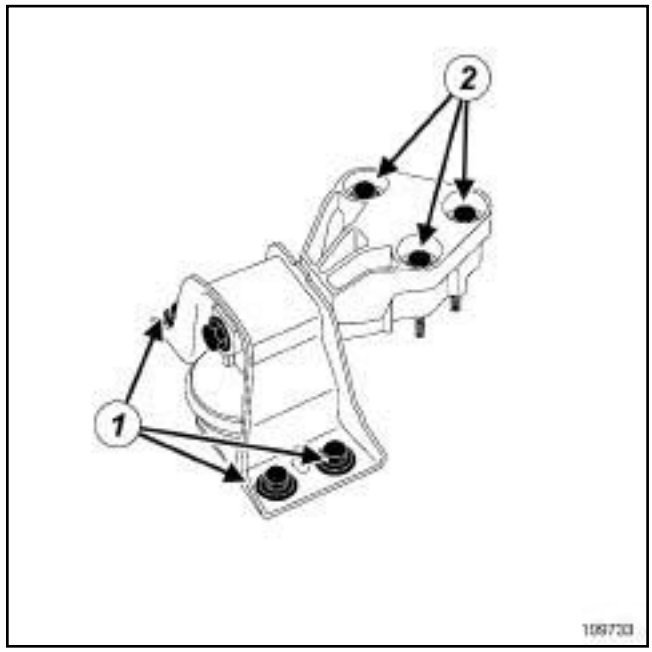
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).



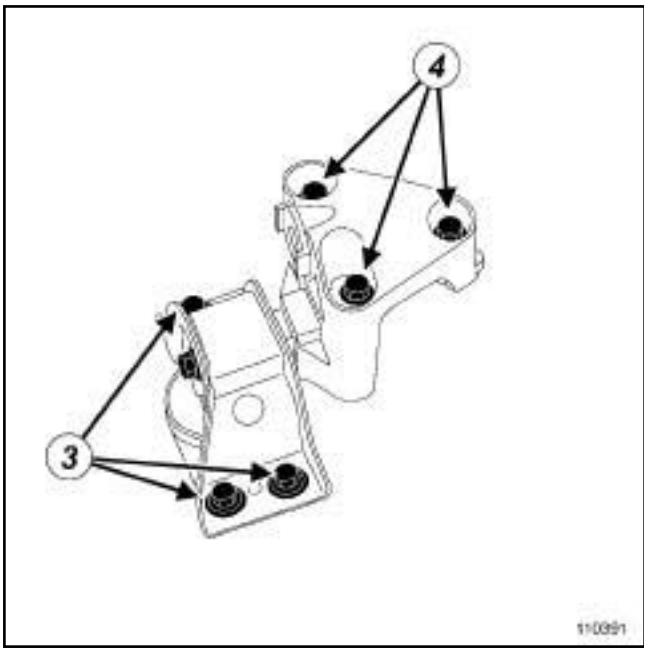
112788

❏ Position tool **(Mot. 1453)**.

❏ Mark the position of the suspended engine mounting on the body.

II - OPERATION FOR REMOVAL OF PART CONCERNED

D4F, and 740 or 784



109733

❏ Remove:

- the bolts (**1**) from the suspended mounting on the body,
- the bolts (**2**) from the suspended mounting on the engine,
- the suspended engine mounting.

D4F or K9K, and JH3

K9K, and 750 or 752 or 768

110391

❑ Remove:

- the bolts (**3**) from the suspended mounting on the body,
- the bolts (**4**) from the suspended mounting on the engine,
- the suspended engine mounting.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the right-hand suspended mounting support,
- the bolts for the right-hand suspended mounting support on the engine,
- the bolts mounting the suspended mounting on the body.

❑ Torque tighten:

- the **right-hand suspended mounting support bolts on the engine (62 Nm)**,
- the **suspended mounting bolts on the body (62 Nm)**,
- the **right-hand rubber pad bolts (if changed) (105 Nm)**

II - FINAL OPERATION.

❑ Remove the **(Mot. 1453)**.

❑ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

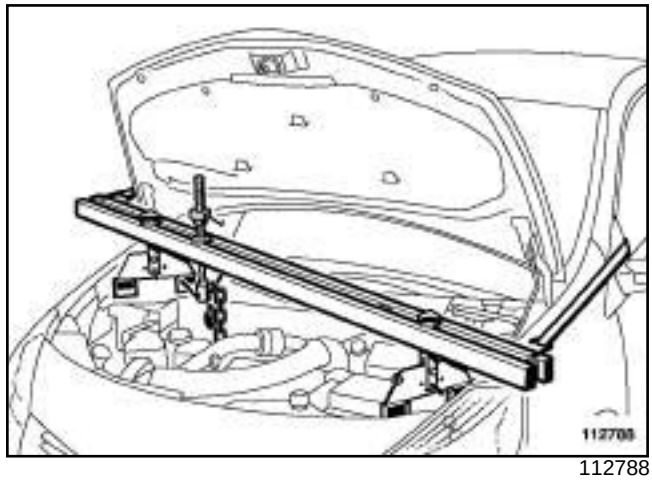
bolt mounting the upper engine tie-bar on the suspended engine mounting (if it has been changed)	**105 Nm**



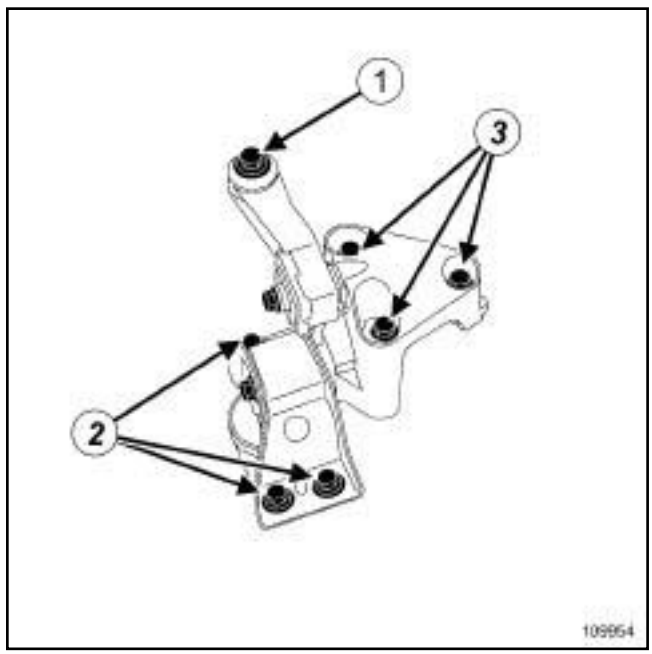
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).



112788

❏ Position tool **(Mot. 1453)**.

❏ Mark the position of the suspended engine mounting on the body.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109954

❏

Remove:

- the bolt (**1**) mounting the engine tie-bar on the body,
- the suspended mounting bolts (**2**) on the body,
- the suspended mounting bolts (**3**) on the engine,
- the suspended engine mounting.

K9K, and JR5 or TL4

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the right-hand suspended mounting.

❏ Refit:

- the bolts mounting the right-hand suspended mounting support on the engine,
- the bolts mounting the suspended mounting on the body,
- the bolt mounting the engine tie-bar on the body.

❏ Torque tighten:

- the **bolt mounting the engine tie-bar on the body (105 Nm)**,
- the **bolts mounting the right-hand suspended mounting support on the engine (62 Nm)**,
- the **bolts mounting the suspended mounting on the body (62 Nm)**,
- the **right-hand rubber pad mounting bolt (if it has been changed) (105 Nm)**,
- the **bolt mounting the upper engine tie-bar on the suspended engine mounting (if it has been changed) (105 Nm)**.

II - FINAL OPERATION.

❏ Remove the **(Mot. 1453)**.

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

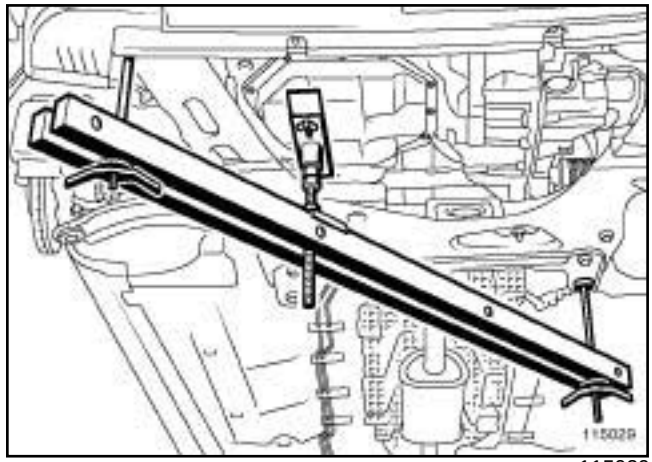
Mot. 1672	Lower engine support.

Tightening torques ▽	
right-hand side radiator mounting cross member bolt	**105 Nm**
left-hand subframe tie-rod bolt	**105 Nm**

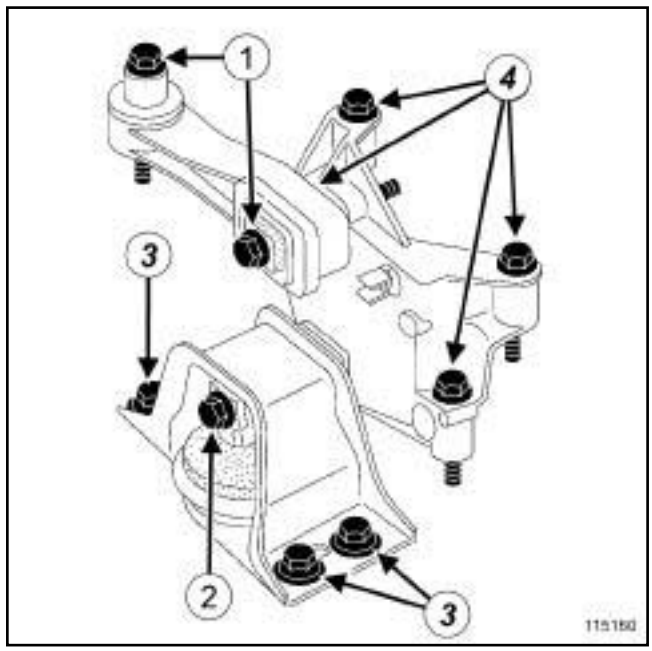


REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Remove:



- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the right-hand wheel arch liner bolts on the front bumper,
- the bolt from the right-hand side radiator mounting cross member,
- the subframe tie-rod bolt on the left-hand side.

115029

❑ Fit the lower engine support tool **(Mot. 1672)**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

115160

❑ Remove:

- the upper engine tie-bar bolts (**1**) ,
- the upper engine tie-bar.
- the bolt (**2**) from the rubber mounting bush on the engine cover,
- the bolts (**3**) from the rubber mounting bush on the body,
- the rubber mounting bush,
- the bolts (**4**) from the engine cover,
- the engine cover.

M4R

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the engine cover,
- the engine cover bolts,
- the rubber mounting bush,
- the bolts for the rubber mounting bush on the body,
- the bolt for the rubber mounting bush on the engine cover,
- the upper engine tie-bar.
- the upper engine tie-bar bolts.

❑ Torque tighten (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) :

- the engine cover bolts,
- the bolts for the rubber mounting bush on the body,
- the bolt for the rubber mounting bush on the engine cover,
- the upper engine tie-bar bolts.

II - FINAL OPERATION.

❑ Remove the lower engine support tool **(Mot. 1672)**.

❑ Refit:

- the radiator mounting cross member bolt on the right-hand side,
- the subframe tie-rod bolt on the left-hand side.

❑ Torque tighten:

- the **right-hand side radiator mounting cross member bolt (105 Nm)**,
- the **left-hand subframe tie-rod bolt (105 Nm)**.

❑ Refit:

- the right-hand wheel arch liner bolts on the front bumper.
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.

F4R

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽

upper engine tie-bar mounting bolt on the body	**105 Nm**

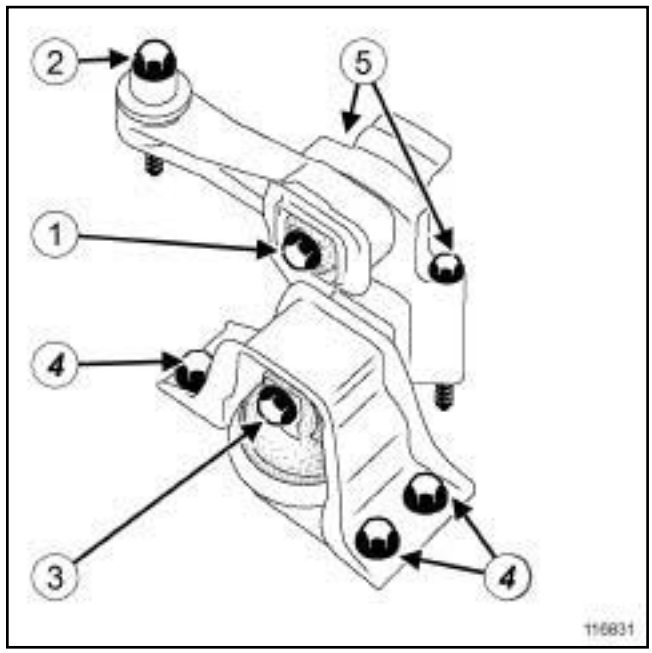
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Have to hand the timing end lifting eye and its mounting bolts (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❏ Fit the timing end lifting eye (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Fit the **(Mot. 1453)**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116831

❏ Remove:

- the upper engine tie-bar mounting bolt (**1**) in the engine compartment,
- the upper engine tie-bar mounting bolt (**2**) on the body,
- the upper engine tie-bar.
- the rubber pad mounting bolt (**3**) ,
- the suspended engine mounting bolts (**4**) on the body side,
- the suspended engine mounting bolts (**5**) in the engine compartment,
- the right-hand suspended engine mounting.

WARNING
Do not deform the air conditioning pipes.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the right suspended engine mounting.

WARNING
Do not deform the air conditioning pipes.

F4R

❏ Refit:

- the suspended engine mounting bolts on the body side,
- the suspended engine mounting bolts in the engine compartment,
- the rubber pad mounting bolt.

❏ Torque tighten:

- the **suspended engine mounting bolt on the body side (62 Nm)**,
- the **suspended engine mounting bolt in the engine compartment (62 Nm)**,
- the **rubber pad mounting bolt (105 Nm)**.

❏ Refit:

- the upper engine tie-bar.
- the upper engine tie-bar mounting bolt in the engine compartment,
- the upper engine tie-bar mounting bolt on the body.

❏ Torque tighten:

- the **upper engine tie-bar mounting bolt in the engine compartment (105 Nm)**,
- the **upper engine tie-bar mounting bolt on the body (105 Nm)**.

II - FINAL OPERATION.

❏ Remove:

- the **(Mot. 1453)**,
- the lifting eye on the timing end (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the timing end lifting eye and its mounting bolt in the luggage compartment (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

K4M, and TL4

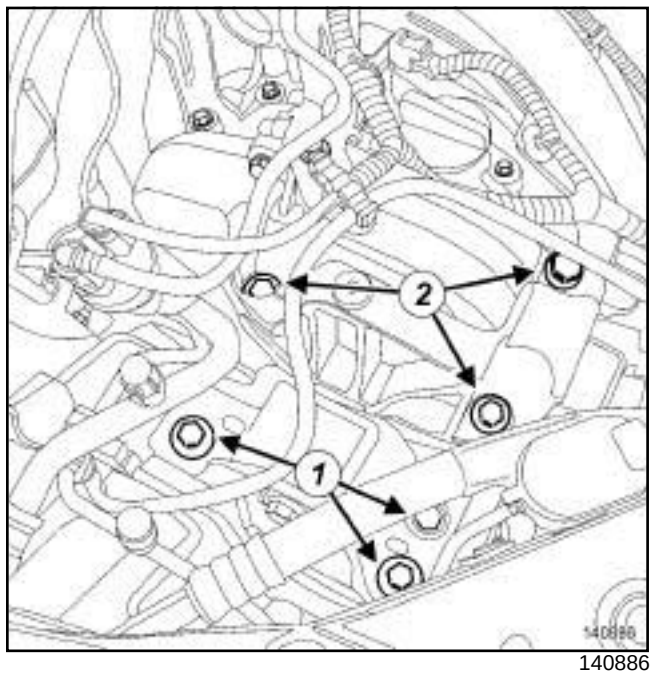
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Towing and lifting).

❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).



141615

❏ Position the tool **(Mot. 1453)** and **(Mot. 1453-01)**.

❏ Mark the position of the suspended engine mounting on the body using a **indelible pencil**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

140886

❏ Remove the bolts (**1**) from the right-hand suspended engine mounting rubber pad.

❏ Slightly raise the engine using the tool **(Mot. 1453)** until the rubber pad detaches from the right-hand suspended engine mounting.

❏ Remove:

- the bolts (**2**) from the right-hand suspended engine mounting cover,
- the right-hand suspended engine mounting.

K4M, and TL4

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the suspended engine mounting.

❏ Torque tighten the **right-hand suspended engine mounting cover bolts (62 N.m)**.

❏ Lower the engine until the rubber pad touches the right-hand suspended engine mounting.

❏ Position the right-hand suspended engine mounting rubber pad in line with the mark made during removal.

❏ Torque tighten the **right-hand suspended engine mounting rubber pad bolts (62 N.m)**.

II - FINAL OPERATION

❏ Remove the **(Mot. 1453)** and **(Mot. 1453-01)**.

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the engine undertray.

K4M, and DP0

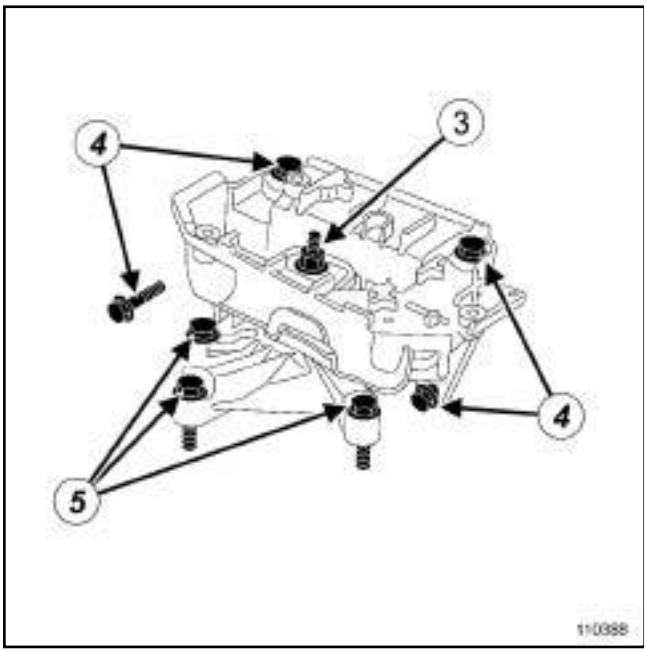
- the computer and its mounting (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the engine undertray.

109155

❑ Remove the wiring channel mounting nut (**1**) .

❑ Detach the wiring channel (**2**) .



113165

❑ Position tool **(Mot. 1453)**.

❑ Mark the position of the suspended engine mounting on the body.

K4M, and DP0

II - OPERATION FOR REMOVAL OF PART CONCERNED

110388

❑ Remove:

- the gearbox left-hand rubber pad mounting nut (**3**) ,
- the bolts (**4**) mounting the left-hand suspended mounting on the body,
- the left-hand suspended mounting from the body,
- the bolts (**5**) mounting the left hand suspended mounting on the gearbox,
- the gearbox left-hand suspended mounting.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Reposition the left-hand suspended mounting on the gearbox.

❑ Refit the bolts mounting the left-hand suspended mounting on the gearbox.

❑ Torque tighten:

- the **bolts mounting the left-hand suspended mounting on the gearbox (62 Nm)**,
- the **gearbox suspended engine mounting stud (if it has been replaced) (180 Nm)**.

❑ Reposition the left-hand suspended mounting on the body.

❑ Refit the bolts mounting the left-hand suspended mounting on the body,

❑ Torque tighten:

- the **bolts mounting the left-hand suspended mounting support on the body (62 Nm)**,
- the **gearbox left-hand rubber pad mounting nut (62 Nm)**.

K4M, and DP0

II - FINAL OPERATION.

❑ Remove the **(Mot. 1453)**.

❑ Position the wiring channel.

❑ Torque tighten the **wiring channel mounting nut (10 Nm)**.

❑ Refit:

- the computer and its mounting (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the battery tray mounting (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,

- the engine undertray.

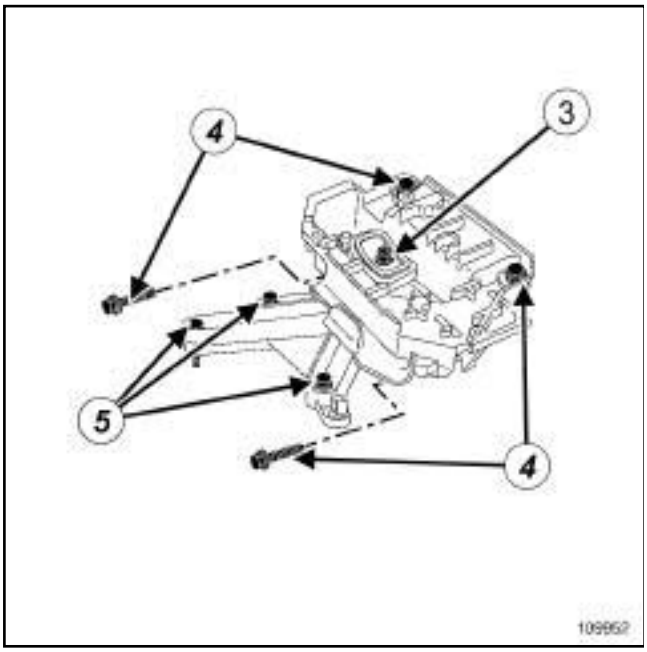
109155

❏ Remove the wiring harness channel nut (**1**) .

❏ Detach the wiring harness channel (**2**) .

122262



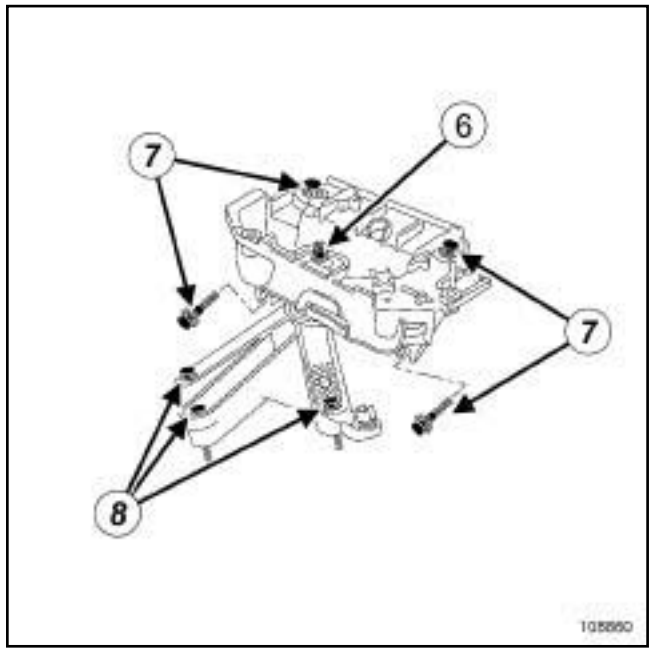
❏ Position tool **(Mot. 1453)**.

❏ Mark the position of the suspended engine mounting on the body.

D4F, and JH3 – K9K – K4J, and JH3 – K4M, and JH3

II - OPERATION FOR REMOVAL OF PART CONCERNED

D4F – K9K



109952

❑ Remove:

- the nut (**3**) from the gearbox left-hand rubber pad,
- the bolts (**4**) from the left-hand suspended mounting on the body,
- the left-hand suspended mounting from the body,
- the bolts (**5**) from the gearbox left-hand suspended mounting,
- the gearbox left-hand suspended mounting.

K4J – K4M, and 800

108860

❑ Remove:

- the nut (**6**) from the gearbox left-hand rubber pad,
- the bolts (**7**) from the left-hand suspended mounting on the body,
- the left-hand suspended mounting from the body,
- the bolts (**8**) from the gearbox left-hand suspended mounting,
- the gearbox left-hand suspended mounting.

D4F, and JH3 – K9K – K4J, and JH3 – K4M, and JH3

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the left-hand suspended mounting on the gearbox,
- the left hand suspended mounting bolts on the gearbox.

❏ Torque tighten:

- the **bolts mounting the left-hand suspended mounting on the gearbox (62 Nm)**,
- If it has been replaced, the **left-hand suspended mounting stud on the gearbox (180 Nm)**.

❏ Refit:

- the left-hand suspended mounting from the body,
- the left-hand suspended mounting bolts on the body.

❏ Torque tighten the **left-hand suspended mounting bolts on the body (62 Nm)**.

❏ Refit the left-hand gearbox rubber pad nut.

❏ Tighten to torque the **left-hand rubber pad nut on the gearbox (62 Nm)**.

II - FINAL OPERATION.

❏ Remove the **(Mot. 1453)**.

❏ Position the wiring harness channel.

❏ Torque tighten the **wiring harness channel nut (10 Nm)**.

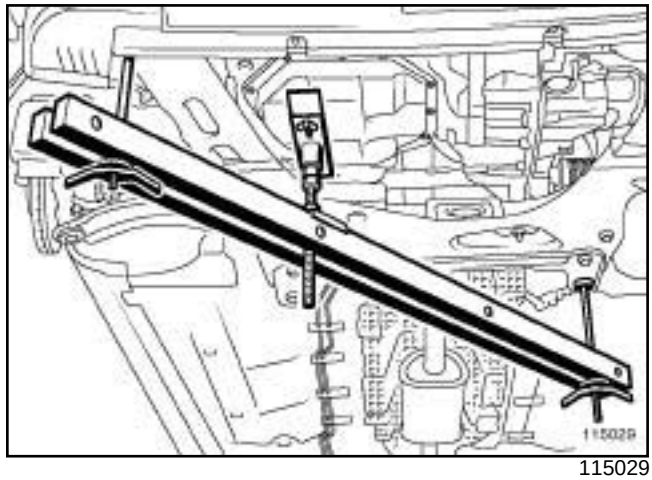
❏ Refit:

- the computer and its mounting (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray.

M4R, and DP0

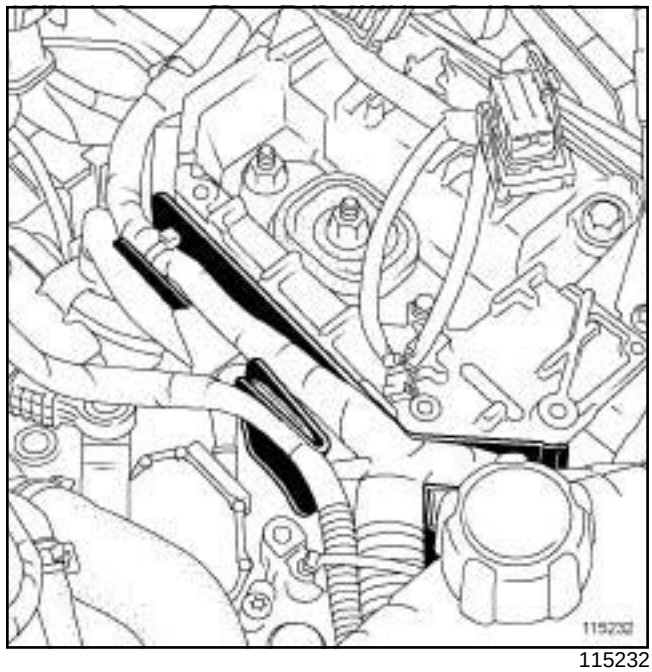
Special tooling required	
Mot. 1672	Lower engine support.

Tightening torques ▽	
gearbox cover mounting bolts	**62 Nm**
mounting bolts securing the gearbox support to the body	**62 Nm**
mounting studs securing the rubber mounting bush to the gearbox support	**62 Nm**
mounting nut securing the rubber mounting bush to the gearbox cover	**62 Nm**
right-hand mounting bolt of the radiator support cross member	**105 Nm**
left-hand mounting bolt of the sub-frame tie-rod	**105 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

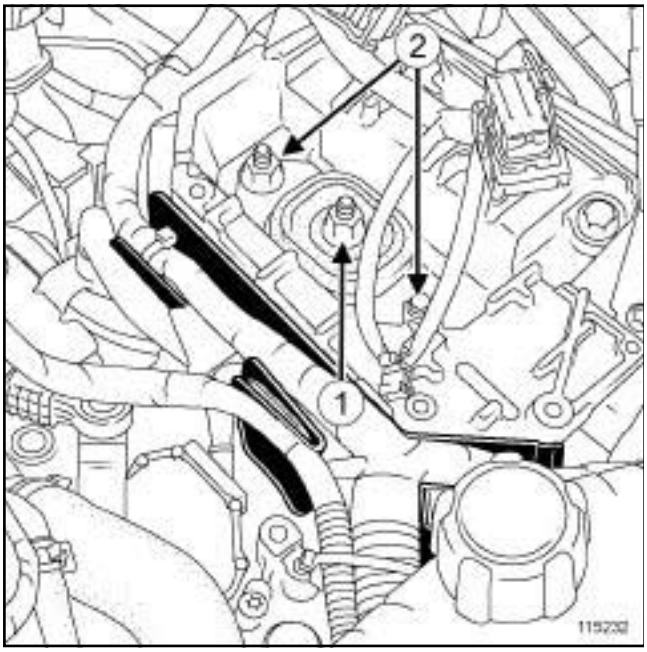


❏ Fit the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove:

- the engine cover,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) ,
- the right-hand mounting bolt from the radiator support cross member,
- the left-hand mounting bolt from the sub-frame tie-rod.

115029



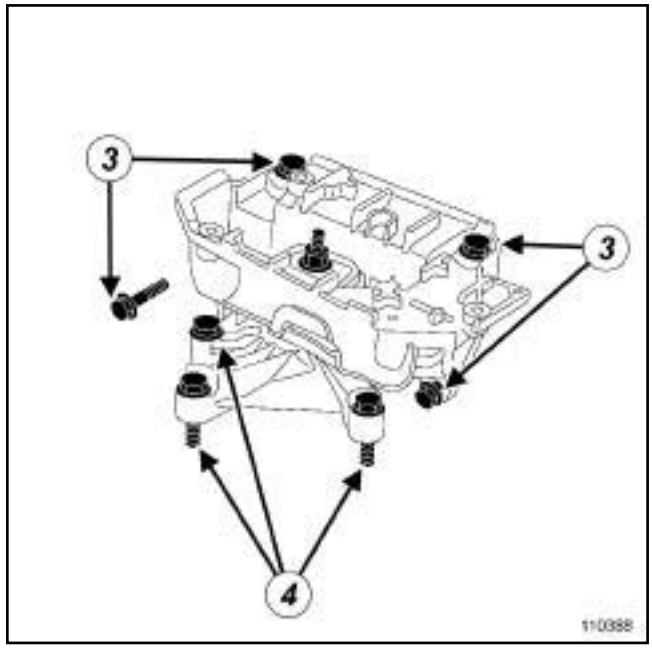
❏ Fit the lower engine support tool **(Mot. 1672)**.

115232

❏ Remove the gearbox mounting wiring harness neck.

M4R, and DP0

II - REMOVAL OF PART CONCERNED



115232

❑ Remove:

- the gearbox cover rubber mounting bush mounting nut (**1**) ,
- the gearbox support rubber mounting bush mounting studs (**2**) ,
- the rubber mounting bush.

Note:

If necessary, lower the engine a few millimetres using **(Mot. 1672)** then hit the stud with a copper hammer.

110388

❑ Remove:

- the mounting bolts (**3**) securing the gearbox support on the body,
- the gearbox support,
- the mounting bolts (**4**) securing the gearbox cover to the gearbox,
- the gearbox cover.

REFITTING

I - REFITTING PART CONCERNED

❑ Refit:

- the gearbox cover,
- the gearbox cover mounting bolts,

❑ Tighten to torque the **gearbox cover mounting bolts (62 Nm)**.

❑ Refit:

- the gearbox support,
- the mounting bolts securing the gearbox support to the body,
- the rubber mounting bush,
- the mounting studs securing the rubber mounting bush to the gearbox support,
- the mounting nut securing the rubber mounting bush to the gearbox cover.

M4R, and DP0

❏ Tighten to torque:

- the **mounting bolts securing the gearbox support to the body (62 Nm)**,
- the **mounting studs securing the rubber mounting bush to the gearbox support (62 Nm)**,
- the **mounting nut securing the rubber mounting bush to the gearbox cover (62 Nm)**.

II - FINAL OPERATION

❏ Fit the wiring harness neck to the gearbox support.

❏ Remove the lower engine support tool **(Mot. 1672)**.

❏ Tighten to torque:

- the **right-hand mounting bolt of the radiator support cross member (105 Nm)**,
- the **left-hand mounting bolt of the sub-frame tie-rod (105 Nm)**.

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) ,
- the battery (see **Battery: Removal - Refitting**) ,
- the engine cover,
- the engine undertray.

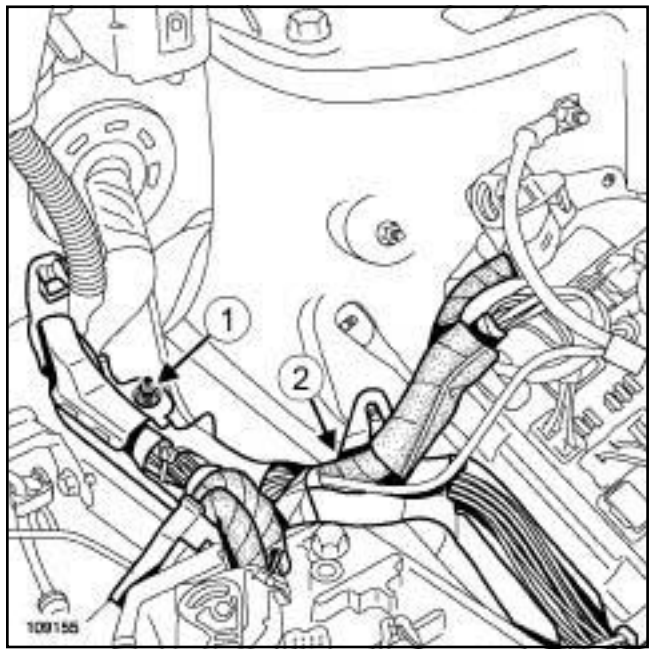
F4R

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽	
suspended engine mounting bolts on the gearbox side	**62 N.m**
suspended engine mounting bolts on the body side	**62 Nm**
left-hand suspended engine mounting rubber pad mounting bolts	**62 Nm**
left-hand suspended engine mounting rubber pad mounting nut	**62 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Have to hand the gearbox side lifting eye and its mounting bolts (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

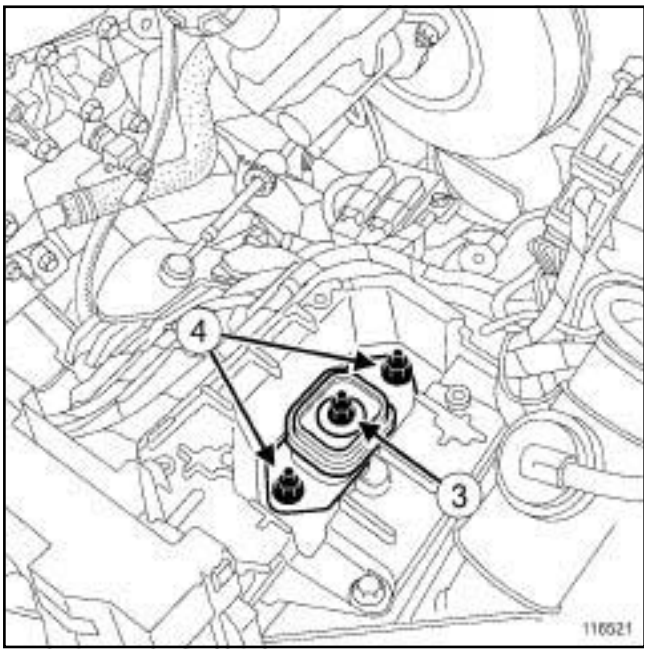
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray mounting (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the petrol injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) .

109155

❏ Remove the wiring harness channel mounting nut (**1**) .

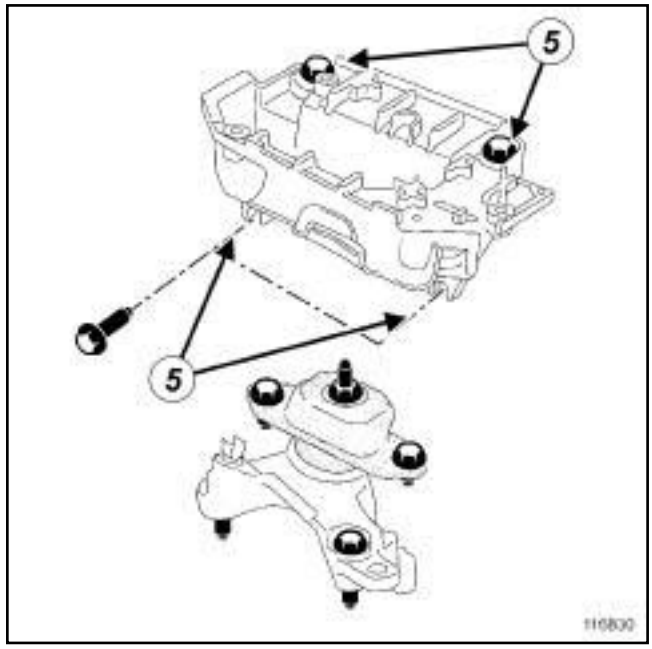


❏ Move aside the wiring harness channel (**2**) .

❏ Fit the gearbox side lifting eye (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Fit the **(Mot. 1453)**.

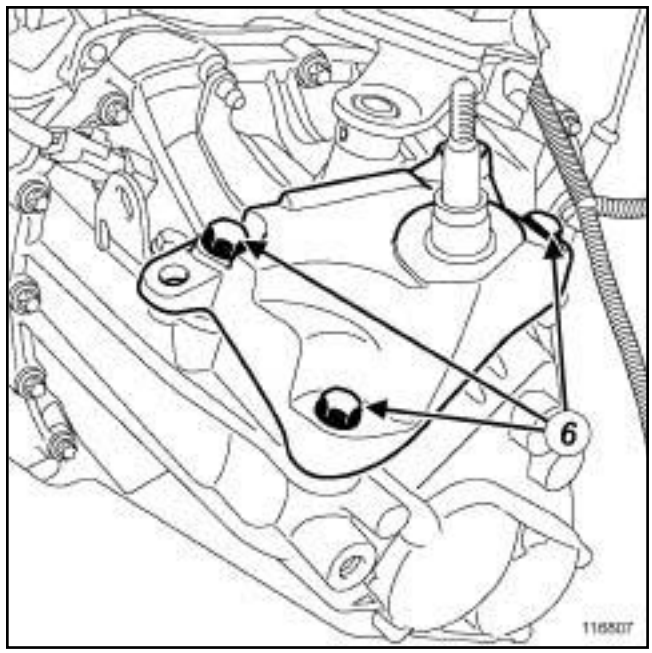
F4R



II - OPERATION FOR REMOVAL OF PART CONCERNED

116521

❑ Remove:



- the rubber pad mounting nut (**3**) from the left-hand suspended engine mounting,
- the rubber pad mounting bolt (**4**) from the left-hand suspended engine mounting,
- the rubber pad from the left-hand suspended engine mounting

116830

❑ Remove:

- the bolts (**5**) mounting the left-hand suspended engine mounting support on the body side,
- the left-hand suspended engine mounting support on the body side.

116807

❑ Remove:

- the bolts (**6**) mounting the left-hand suspended engine mounting support on the gearbox side,
- the left-hand suspended engine mounting support on the gearbox side.

F4R

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Remove:

- the left-hand suspended engine mounting support on the gearbox side,
- the bolts mounting the left-hand suspended engine mounting support on the gearbox side.

❏ Torque tighten the **suspended engine mounting bolts on the gearbox side (62 N.m)**.

❏ Refit:

- the left-hand suspended engine mounting support on the body side,
- the bolts mounting the left-hand suspended engine mounting support on the body side.

❏ Torque tighten the **suspended engine mounting bolts on the body side (62 Nm)**.

❏ Refit:

- the rubber pad on the left-hand suspended engine mounting,
- the rubber pad mounting bolt on the left-hand suspended engine mounting,
- the rubber pad mounting nut on the left-hand suspended engine mounting.

❏ Torque tighten:

- the **left-hand suspended engine mounting rubber pad mounting bolts (62 Nm)**,
- the **left-hand suspended engine mounting rubber pad mounting nut (62 Nm)**.

II - FINAL OPERATION.

❏ Remove:

- the **(Mot. 1453)**,
- the gearbox side lifting eye (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Fir the wiring harness channel.

❏ Refit:

- the wiring harness channel mounting nut,
- the petrol injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the battery tray mounting (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

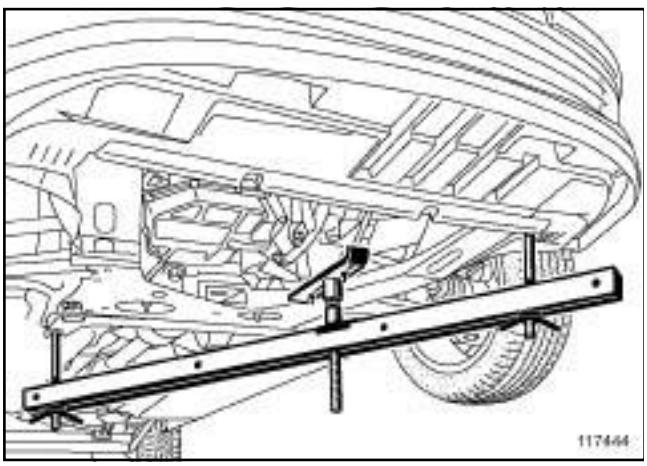
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the gearbox side lifting eye and its mounting bolts in the luggage compartment (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

M4R, and TL4

Special tooling required	
Mot. 1672	Lower engine support.

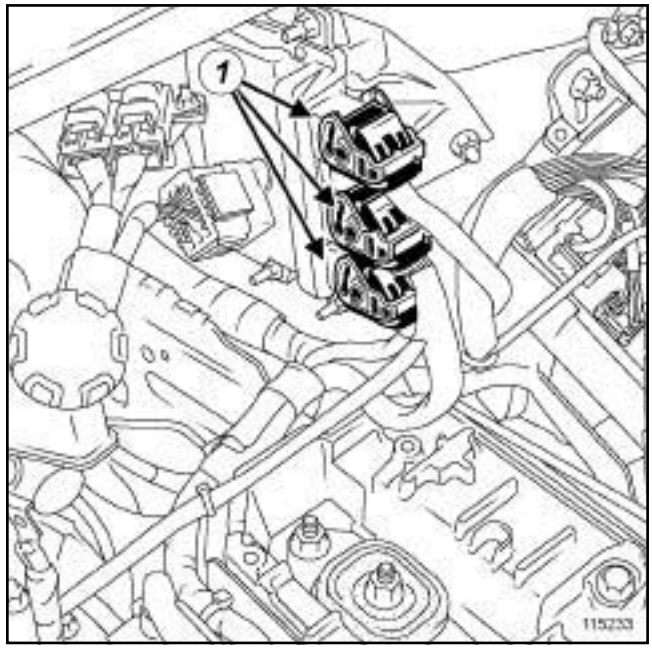
Tightening torques ▽	
subframe tie-rod right-hand bolt	**105 Nm**
radiator mounting cross member left-hand bolt	**105 Nm**



REMOVAL

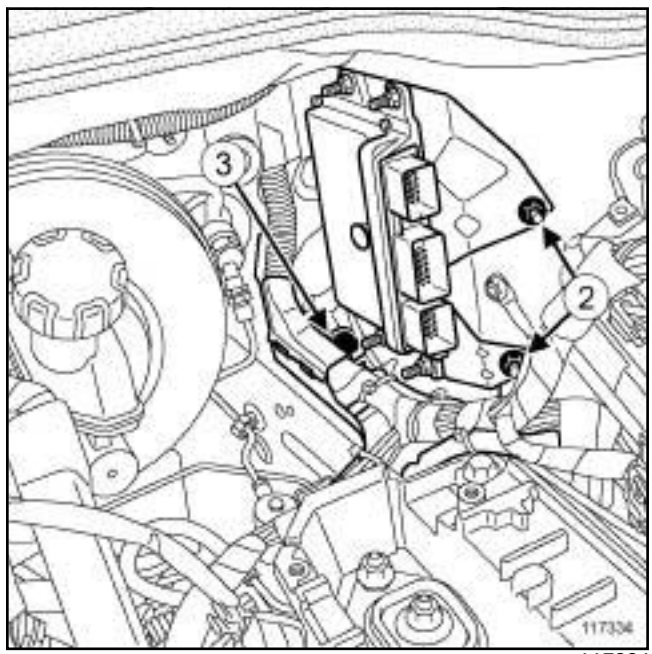
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



❏ Remove:

- the engine cover,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the radiator mounting cross member left-hand bolt,
- the subframe tie-rod right-hand bolt.



117444

❏ Fit the lower engine support tool **(Mot. 1672)**.

115233

❏ Disconnect the injection computer connectors (**1**) .

117334

❏ Remove:

- the bolts (**2**) from the injection computer support,
- the bolt (**3**) from the wiring harness channel.

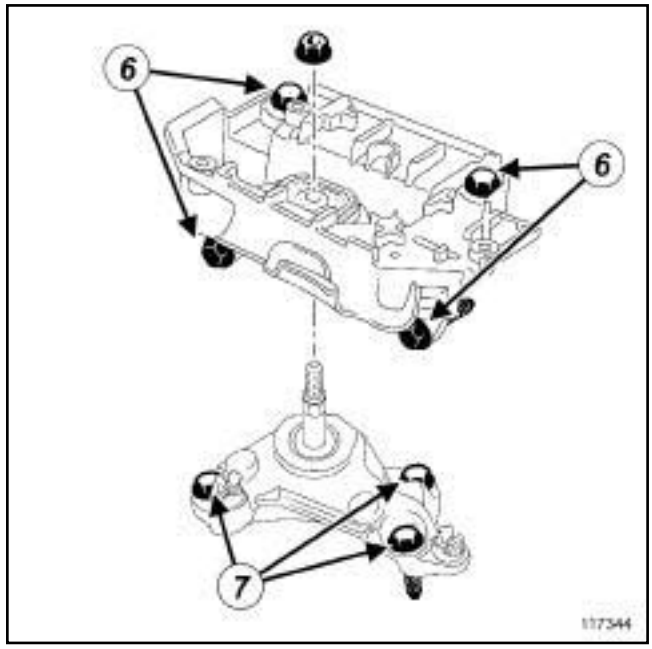
❏ Remove:

- the injection computer mounting,
- the wiring harness channel.

M4R, and TL4

II - OPERATION FOR REMOVAL OF PART CONCERNED

115232



❏ Separate the wiring harness channel from the gearbox support.

❏ Remove:

- the nut (**4**) mounting the gearbox cover on the gearbox support,
- the bolts (**5**) from the gearbox support rubber mounting bush,
- the rubber mounting bush.

Note:

If necessary, lower the engine a few millimetres using the **(Mot. 1672)** then hit the stud with a copper hammer.

117344

❏ Remove:

- the bolts (**6**) mounting the gearbox support on the body,
- the gearbox support,
- the bolts (**7**) mounting the gearbox cover on the gearbox,
- the gearbox cover.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the gearbox cover,
- the bolts mounting the gearbox cover on the gearbox.

❏ Torque tighten the gearbox cover bolts (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) .

❏ Refit:

- the gearbox support,
- the gearbox support bolts on the body,
- the rubber mounting bush,
- the bolts to the gearbox support rubber mounting bush,
- the nut mounting the gearbox cover on the gearbox support.

M4R, and TL4

❏ Tighten to torque and in order (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) :

- the gearbox support bolts on the body,
- the bolts to the gearbox support rubber mounting bush,
- the nut mounting the gearbox cover on the gearbox support.

II - FINAL OPERATION.

❏ Fit the wiring harness channel to the gearbox support.

❏ Remove the lower engine support tool **(Mot. 1672)**.

❏ Fit:

- the harness channel,
- the injection computer support.

❏ Refit:

- the injection computer support bolts,
- the wiring harness channel bolts.

❏ Connect the injection computer connectors.

❏ Refit:

- the subframe tie-rod right-hand bolt,
- the radiator mounting cross member left-hand bolt.

❏ Torque tighten:

- the **subframe tie-rod right-hand bolt (105 Nm)**,
- the **radiator mounting cross member left-hand bolt (105 Nm)**.

❏ Refit:

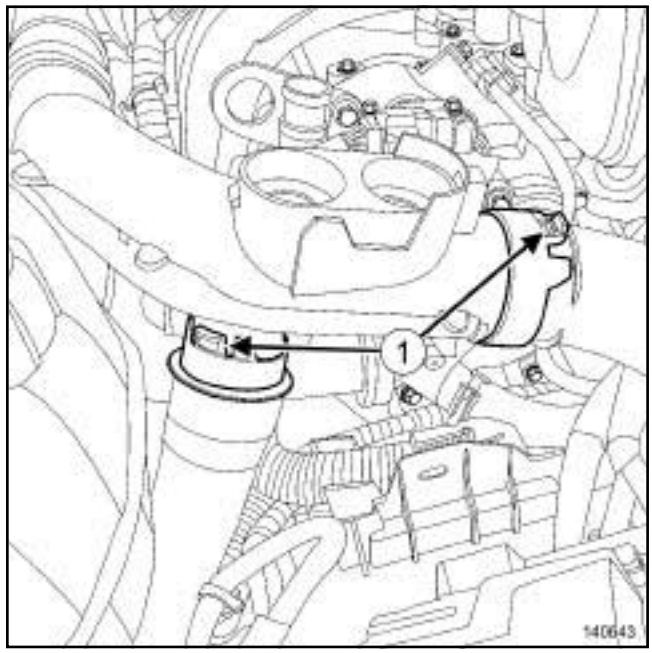
- the engine undertray,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine cover.

K4M, and TL4

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Equipment required
indelible pencil

Tightening torques ▽	
bolts of the left-hand suspended engine mounting support on the gearbox	**62 N.m**
bolts of the left-hand suspended engine mounting support on the body	**62 N.m**
left-hand suspended engine mounting shaft nut	**62 N.m**
earth nut on the body	**8 N.m**



REMOVAL

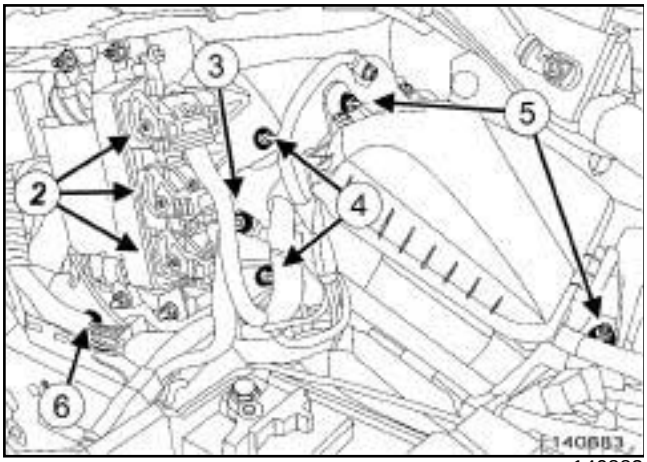
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

140643



❏ Unclip the air inlet pipe from the air filter unit (**1**) .

❏ Move aside the air inlet pipe from the air filter unit.

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

K4M, and TL4

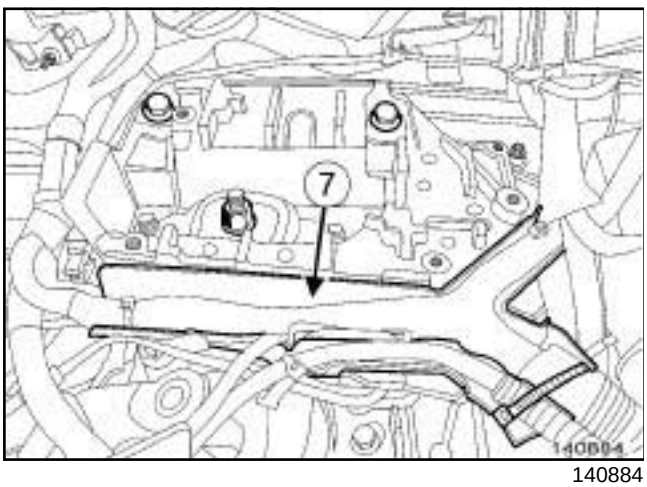
140883

❏ Disconnect the connectors (**2**) from the petrol injection computer.

❏ Remove:

- the earth nut (**3**) on the body,
- the petrol injection computer nuts (**4**) .

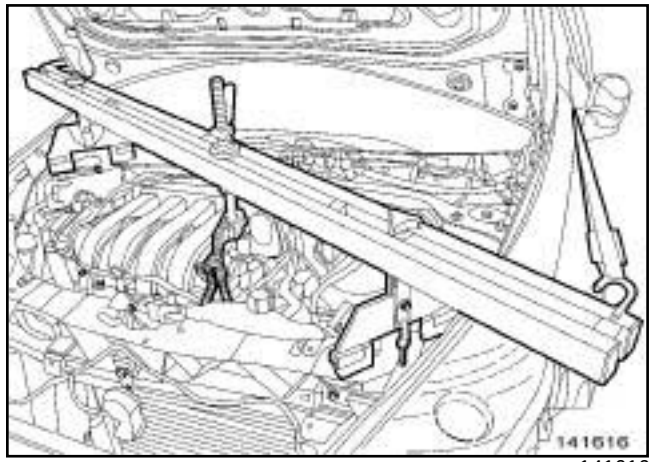
❏ Move aside the wiring of the petrol injection computer.



❏ Remove:

- the petrol injection computer,
- the Protection and Switching Unit nuts (**5**) .

❏ Move aside the Protection and Switching Unit.

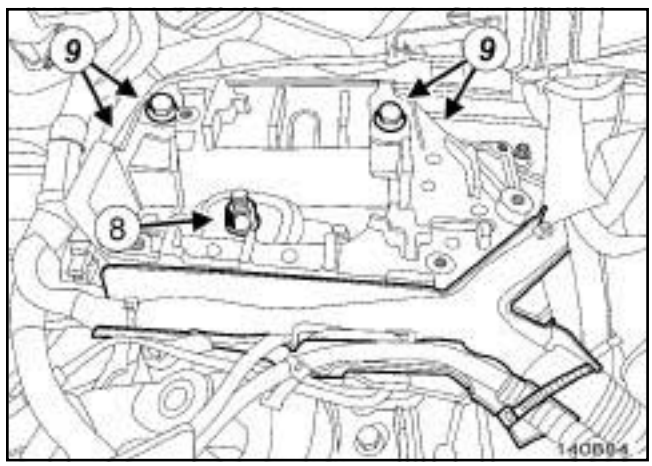


❏ Remove the wiring channel nut (**6**) .

❏ Move aside the wiring channel on the body.

140884

❏ Unclip the wiring channel (**7**) from the left-hand suspended engine mounting.

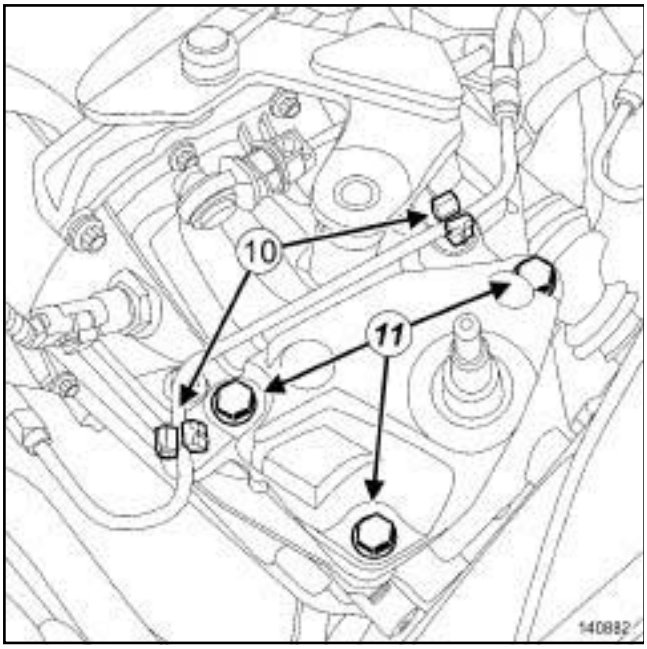


141616

❏ Position the **(Mot. 1453)**.

❏ Mark the position of the suspended engine mounting on the body using a **indelible pencil**.

II - OPERATION FOR REMOVAL OF PART CONCERNED



140884

❏ Remove:

- the left-hand suspended engine mounting shaft nut (**8**) ,
- the bolts (**9**) of the left-hand suspended engine mounting support on the body,
- the left-hand suspended engine mounting support on the body.

K4M, and TL4

140882

❑ Unclip the clutch pipe (**10**) .

❑ Remove:

- the left-hand suspended engine mounting support bolts (**11**) on the gearbox,
- the left-hand suspended engine mounting support on the gearbox.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the left-hand suspended engine mounting support on the gearbox.

❑ Torque tighten the **bolts of the left-hand suspended engine mounting support on the gearbox (62 N.m)**.

❑ Attach the clutch pipe.

❑ Refit the left-hand suspended engine mounting support on the body.

❑ Torque tighten the **bolts of the left-hand suspended engine mounting support on the body (62 N.m)**.

❑ Refit the left-hand suspended engine mounting shaft nut.

❑ Torque tighten the **left-hand suspended engine mounting shaft nut (62 N.m)**.

II - FINAL OPERATION

❑ Remove the tool **(Mot. 1453)**.

❑ Fit the wiring channel on the left-hand suspended engine mounting.

❑ Refit:

- the wiring channel on the body,
- the Protection and Switching Unit,
- the petrol injection computer,
- the earth on the body.

❑ Torque tighten the **earth nut on the body (8 N.m)**.

❑ Connect the connectors of the petrol injection computer.

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit air inlet pipe,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the engine undertray.

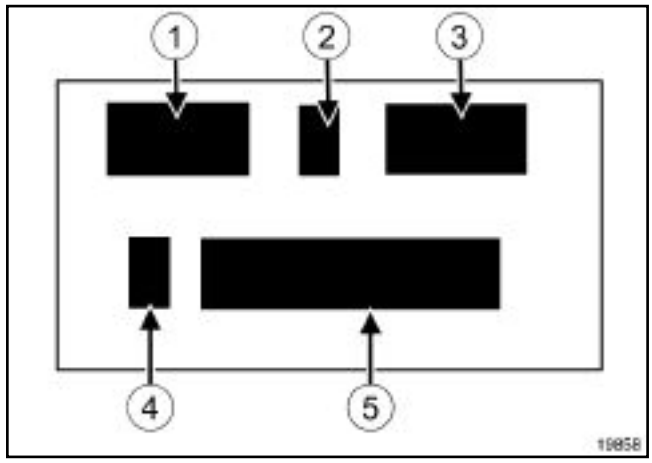
Engine: Refitting 10A-329
Timing belt: Removal 10A-336
Timing belts: Refitting 10A-351

I - ENGINE IDENTIFICATION



107307

113741

The engine can be identified by markings (**6**) located on the cylinder block.

Details of markings

19858

The markings consist of:

- (**1**) : the engine type
- (**2**) : the engine approval letter
- (**3**) : the engine suffix
- (**4**) : the factory where the engine was fitted
- (**5**) : the engine production number

II - ENGINE SPECIFICATION TABLES

Vehicle	After-Sales Type:	Engine type	Engine suffix	Cubic capacity (cc)	Bore (mm)	Stroke (mm)	Compression ratio

Equipment required
offset thread repair kit

I - SAFETY

General information

All information contained in these manuals is intended exclusively for automotive industry professionals.

The documentation is intended to cover all vehicles in the **RENAULT** range throughout the world, but may not cover equipment designed for use in specific countries.

The methods and fault finding procedures recommended and described in this manual have been designed by automotive industry repair professionals.

a - General recommendations

Observe basic principles of vehicle repair.

The quality of repair depends first and foremost on the care exercised by the person in carrying it out.

To ensure good repair:

- use recommended professional products and original Renault parts,
- observe the tightening torques,
- replace the recommended roll pins, nuts or bolts, after each removal,
- clean and degrease the sections to be bonded, to ensure they bond correctly.

The design quality of our vehicles demands that nothing is left to chance in making a good repair, and it is essential to refit parts or components exactly as they were originally (for instance: heat shields, wiring routing, pipe routing).

Use professional products and apply them with care, for example do not apply too much sealant to the joint face.

b - Special tooling - ease of use

The repair procedures have been designed using special tools; they must therefore be carried out using these tools to ensure a high degree of working safety and quality of repair.

The equipment we have approved has undergone careful research and testing, and must be used and maintained with care.

c - Reliability - updating

Since component specifications are subject to change during their commercial life, it is essential to check whether there are any Technical Note updates when seeking information.

d - Safety

Certain devices and parts must be handled with particular attention to safety and cleanliness and, above all, with due care.

The safety symbol used in this manual indicates that special attention must be paid to the procedure or the tightening torque values.

WARNING
Do not use flammable products to clean parts.

Working safely:

- use appropriate tools which are in good condition (using «multipurpose» tools, such as adjustable pliers, should be avoided wherever possible),
- adopt a correct posture and technique when performing heavy work or lifting loads,
- check that the working area is clean and tidy during the operation,
- use personal protection (gloves, safety goggles, work shoes, masks, skin barrier creams, etc.),
- always follow the safety instructions associated with the operation to be performed,
- do not smoke when working on vehicles,
- do not use toxic products in unventilated rooms,
- do not ingest any chemicals (brake fluid, coolant, etc.).

Respecting the environment:

- sort waste according to its particular qualities,
- do not burn waste products (tyres, etc.).

e - Conclusion

The procedures contained in this document merit your attention. Please read them carefully in order to reduce the risk of injury, and avoid using incorrect procedures that could damage the vehicle or make it dangerous to use.

Following the recommended procedures will help you to provide a quality of service which will ensure the vehicles achieve the highest levels of performance and reliability.

Maintenance and repair operations must be carried out under the proper conditions to ensure that our vehicles run safely and reliably.

II - CLEANLINESS

Risks relating to contamination

The high-pressure direct injection system is highly sensitive to contamination. The risks caused by contamination are:

- damage to or destruction of the high-pressure injection system,
- a component seizing,
- a component not being properly sealed.

All After-Sales operations must be performed under very clean conditions. Having carried out an operation in good conditions means that no impurities (particles a few microns in size) have penetrated the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?

- metal or plastic chips,
- paint,
- fibres:
  - cardboard,
  - brushes,
  - paper,
  - clothing,
  - cloth,
- foreign bodies such as hair,
- ambient atmosphere,
- etc.

WARNING
Cleaning the engine using a high-pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create electrical connection faults.

a - Cleaning cloths

Use lint free cleaning cloths (part number **77 11 211 707**).

The use of rags or ordinary paper towels is prohibited: these produce lint and lose fibres, which then contaminate the fuel circuit.

Each cloth must only be used once.

b - Blanking plugs

The blanking plugs are used to cap the fuel circuit once it is opened and to therefore prevent contaminants from entering.

A set of blanking plugs should be used once only and used plugs must be discarded after use: once used, the plugs are soiled and cleaning them is not sufficient to make them reusable.

Unused plugs must also be discarded and not used again for any other operation on an injection system.

Blanking plug kit part number:

- K9K (**DELPHI** injection): **77 01 206 804**
- K9K (**SIEMENS** injection): **77 01 476 857**

c - Protective bags

Use hermetically resealable plastic bags, using adhesive tape, for example, to store components which will be refitted and reused. Stored parts will therefore be less subject to the risk of contamination.

These bags must be used once only: once they have been used, they are to be discarded.

d - Cleaning products

Two cleaning products can be used:

- an aerosol spray brake cleaner (part number **77 11 226 128**).
- an injector cleaner (part number **77 11 224 188**),

To use the injector cleaner, be sure to have a clean brush in good condition (the brush must not lose any bristles) as well as a clean container which has no impurities in it.

Note:
Use a new injector cleaner each time work is carried out (a used cleaning agent will contain impurities).

III - GENERAL RECOMMENDATIONS

1 - Advice to be followed before any operation

1) Carry out the work in a clean working area and take care to protect removed components from dust using plastic bags which are hermetically resealable, for example.

2) Always order the following from the Parts Department before carrying out work:

- **a new blanking plug kit** ; these are specific to the engine
- a sufficient number of lint free **cleaning cloths** .
- one of the two **cleaning products** for fuel pipe unions,
- **the parts always to be replaced** after each removal operation mentioned in the operational procedures specific to the vehicle.

3) Wear safety goggles fitted with side shields to prevent the cleaning product from splashing the eyes.

4) Wear latex safety gloves to avoid prolonged contact with the skin.

Note:

If wearing leather protective gloves, cover these with latex gloves.

5) Before any operation on the injection system, using plastic bags or clean cloths, protect:

- the accessories and timing belts,
- the electrical accessories (starter, alternator, power-assisted steering pump, sensors and electrical connectors),
- the flywheel face.

2 - Instructions to be followed during the operation

Wash your hands before and while carrying out the work.

Change the latex safety gloves if they become soiled or damaged.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been capped.

Reseal the bag hermetically using adhesive tape, for example, even if the bag must be opened shortly afterwards: ambient air can be a source of pollution.

After opening the fuel circuit, the use of brushes, cleaning agents, air blow guns, rifle-type brushes or standard cloths is strictly prohibited: These items are likely to allow impurities to enter the system.

When replacing a component with a new one or when refitting it after storing it in a plastic bag, do not unpack it until it is time to fit it on the vehicle.

3 - Cleaning

There are currently two procedures for cleaning the fuel circuit before opening it in order to carry out work in the workshop.

These procedures enable the fuel circuit to be cleaned to prevent contamination from entering: they both have the same end result and neither is preferred over the other.

a - Using the injector cleaning agent

Clear the access to the unions that need opening, following the work procedures specific to the vehicle (see the relevant Workshop Repair Manual).

Protect sections which are sensitive to fuel leaks.

Pour the injector cleaning agent into a container which is free from impurities.

IMPORTANT

Wear latex safety gloves when using the cleaning agent.

Dip a clean brush, which is not shedding bristles, into the container of injector cleaning agent.

IMPORTANT

Wear safety goggles fitted with side shields during this operation.

Clean the unions carefully using the brush and the injector cleaning agent.

Blast the components that have been cleaned with compressed air (tools, workbench, and also parts, unions and around the injection system). Make sure there are no brush bristles remaining and that the area is clean.

Wipe the sections that were cleaned with fresh cleaning cloths.

Open the circuit at the unions and immediately fit the relevant blanking plugs.

WARNING

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cleaning cloths only, if necessary.

b - Using the brake cleaning agent

Clear the access to the unions that need opening, following the work procedures specific to the vehicle (see the relevant Workshop Repair Manual).

Protect sections which are sensitive to fuel leaks.

IMPORTANT

Wear latex safety gloves when using the cleaning agent.

IMPORTANT

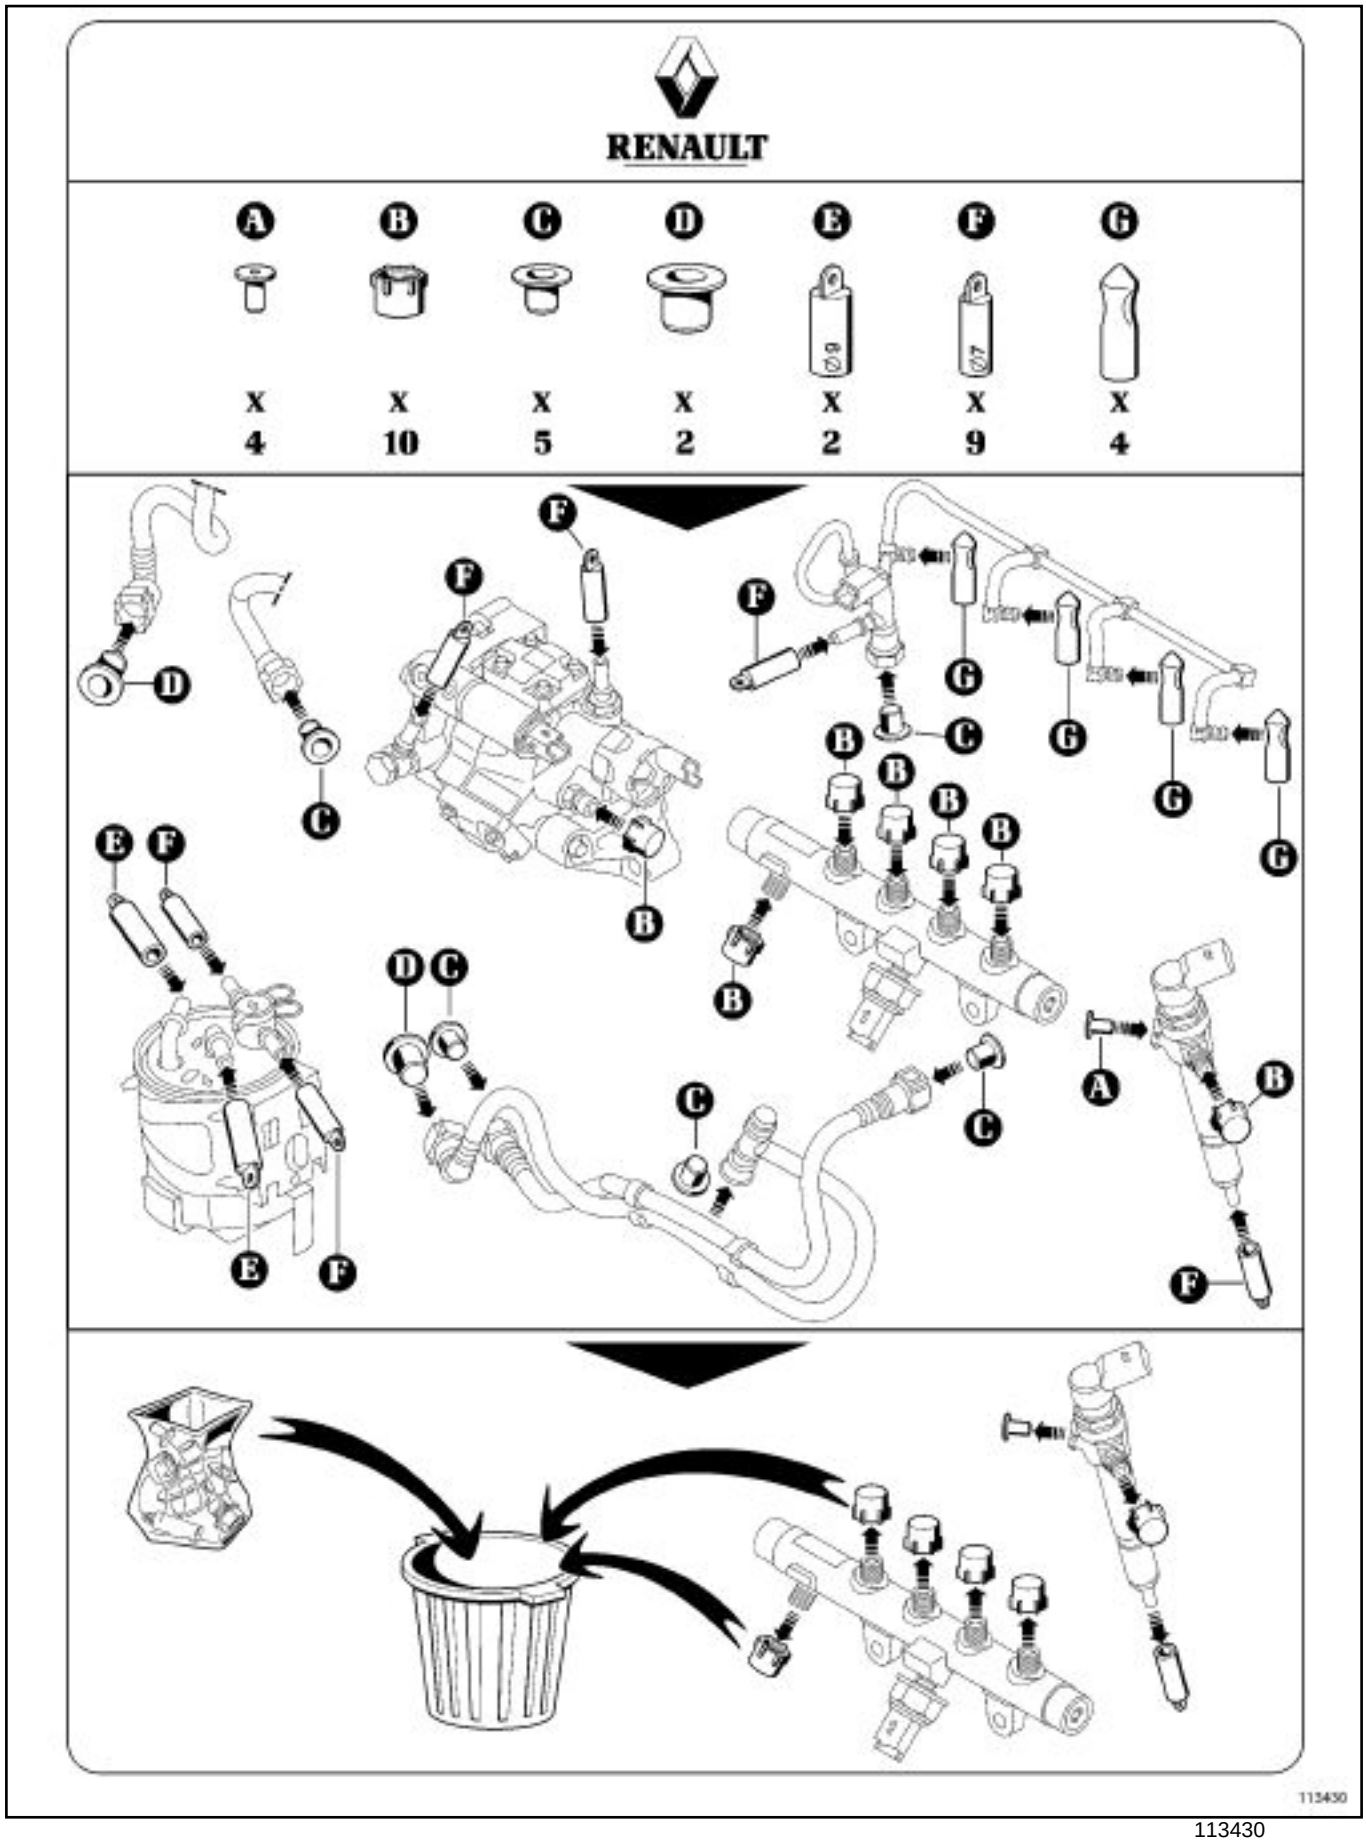
Wear safety goggles fitted with side shields during this operation.

Spray the brake cleaning agent onto the unions to be opened.

Clean the unions carefully using fresh cleaning cloths.

Blast the components that have been cleaned with compressed air (tools, workbench, and also parts, unions and around the injection system). Make sure there are no brush bristles remaining and that the area is clean.

Open the circuit at the unions and immediately fit the relevant blanking plugs.



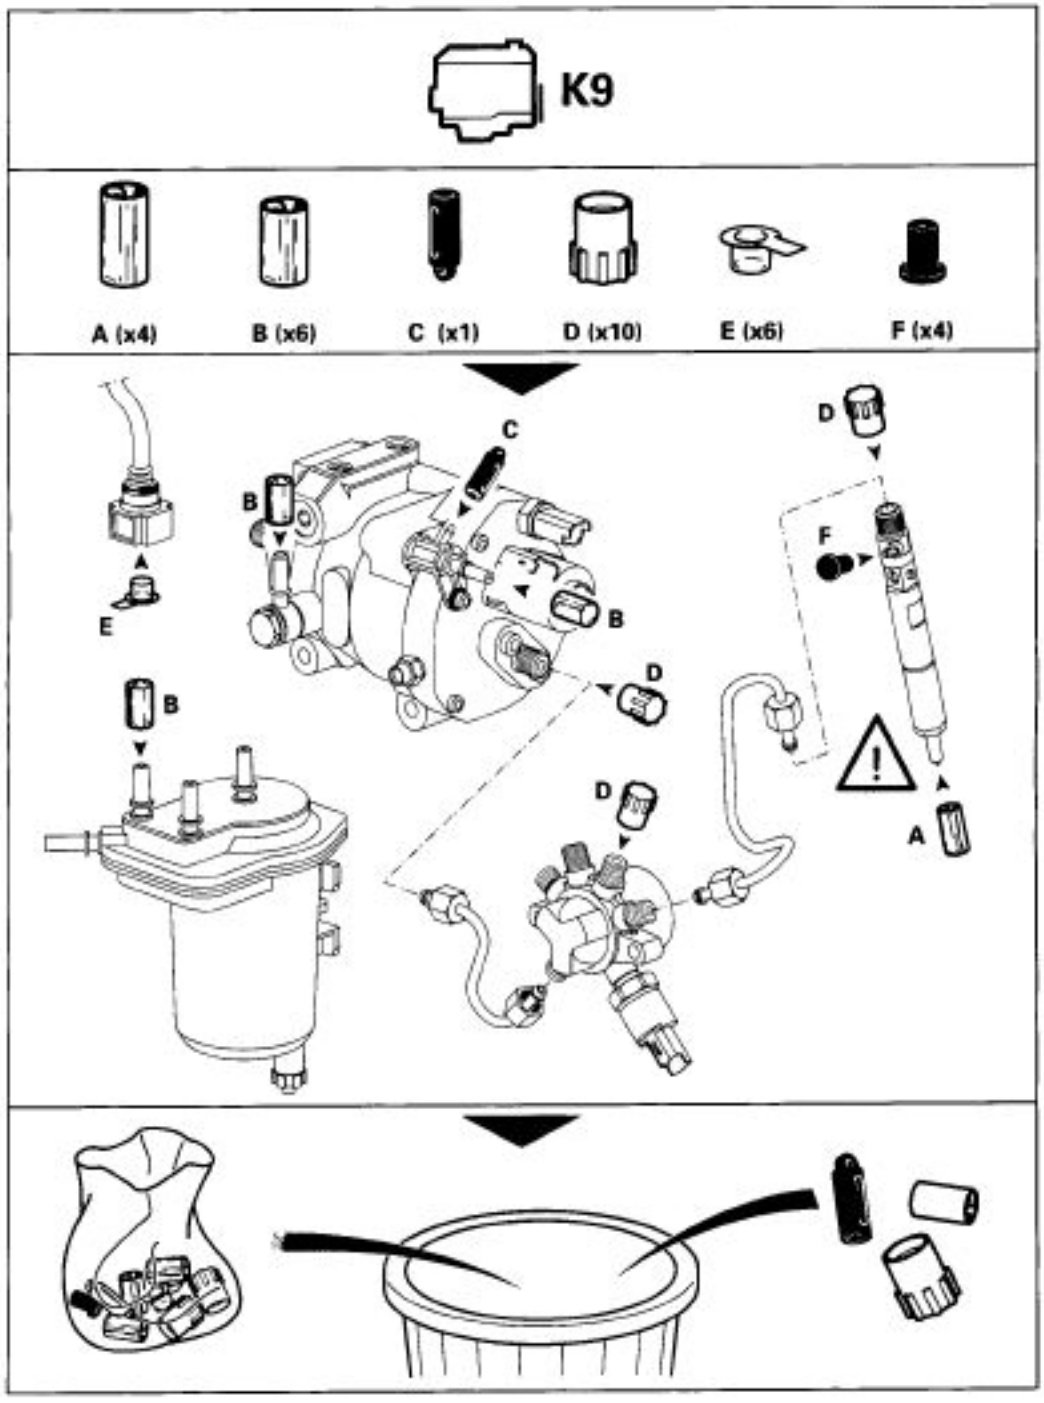
WARNING

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cleaning cloths only, if necessary.

4 - Instructions for fitting the plugs

K9K, and 732 or 764

Part no. 77 01 476 857



113430

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 714 or 716 or 718 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 766 or 768 or 790	

Part no. 77 01 206 804

20977

5 - Engine cleaning

Protect the various accessories to prevent water and cleaning products splashing on them.

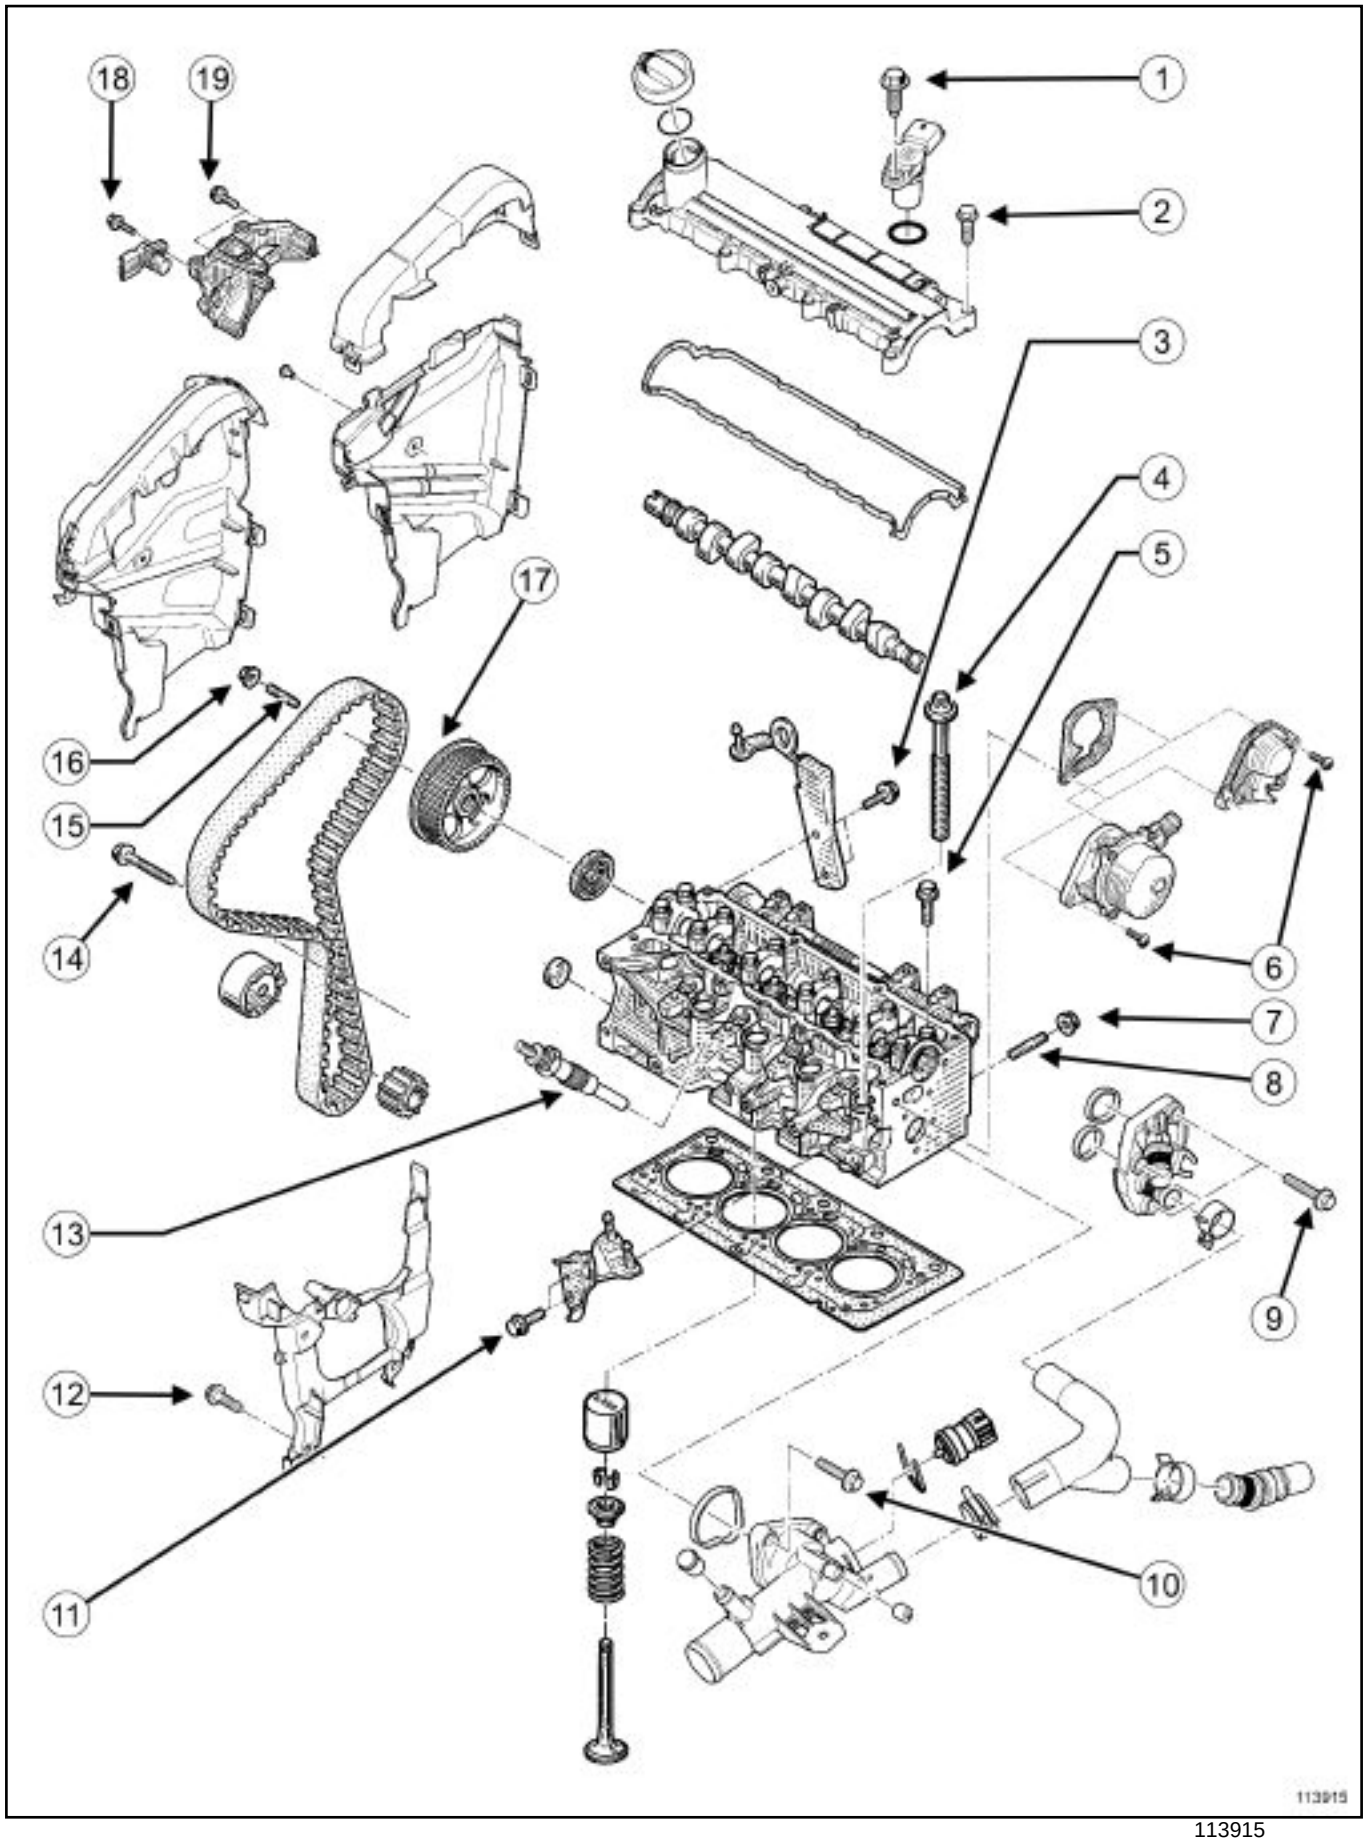
Do not allow water to enter the inlet pipes.

6 - Cleaning the engine parts

WARNING
When cleaning parts, it is essential to not knock the parts against each other, or their mating faces may be damaged and therefore their adjustments may be altered, which could damage the engine.

7 - Fitting relieved threads

The tapped holes of all parts including the engine (except the rocker cover) may be repaired using the **offset thread repair kit** .



I - PARTS ALWAYS TO BE REPLACED AFTER REPAIRING THE ENGINE

- All seals
- The oil filter
- The copper washers on the injector holders,
- The high pressure injection pipes,
- The pipe plugs,
- The valve guides
- The valve stem seals
- The cooling jets at the bottom of the piston
- The engine flywheel bolts
- The crankshaft bearing cap bolts
- The con rod cap bolts
- The camshaft pulley nut
- The tensioning rollers and pulleys for the accessories and timing belts
- The bolts for the accessories belt mechanical tensioning roller
- The accessories and timing belts
- The crankshaft accessories pulley bolt
- The cooling circuit hoses if they are damaged
- The thermostat
- The turbocharger plastic pipes.

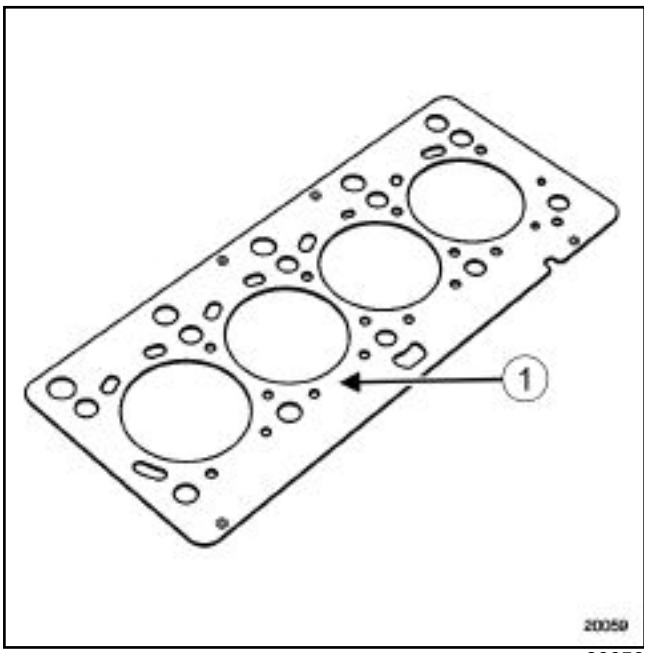
Cylinder **no. 1** is at the flywheel end.



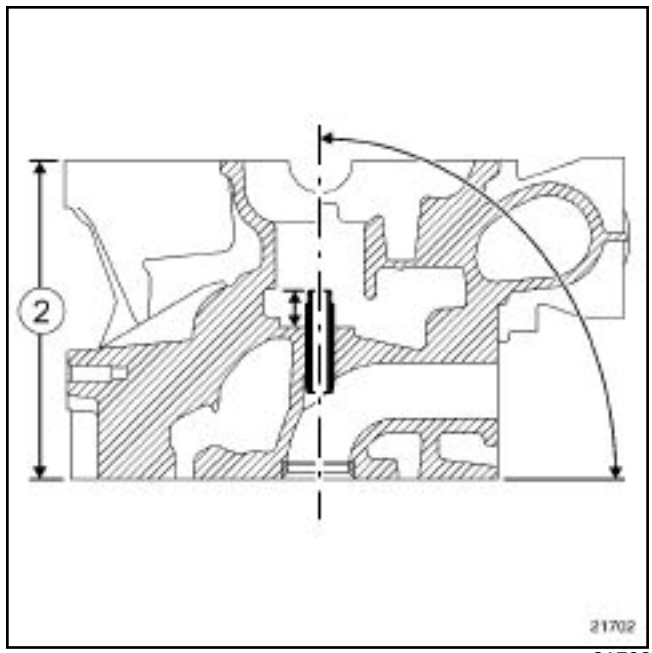
II - INJECTION SEQUENCE

The injection sequence is **1-3-4-2** .

III - HEATER PLUG

Type of plug	Resistance
BERU	**0.6 Ω**
CHAMPION	

IV - CYLINDER HEAD GASKET



20059

The thickness of the cylinder head gasket is measured at (**1**) .

Engine type	Thickness of the cylinder head gasket in mm
K9K 260-270-272 K9K 700-702-704-710 **up until 19/05/2004** . K9K 722 **up until 16/07/2004** .	**0.68 ± 0.03**
K9K 700-702-704-710 **from 19/05/2004** . K9K 722 **from 16/07/2004** . K9K 274-276-706-712-714-716-718-724-728-729-732-750-752-760-762-764-766--768-790-792	**0.71 ± 0.03**

V - CYLINDER HEAD

21702

1 - Cylinder head height

The cylinder head height ***(2)*** is **127mm** .

2 - Cylinder head gasket face bow

The maximum cylinder head gasket face bow is **0.05mm** .

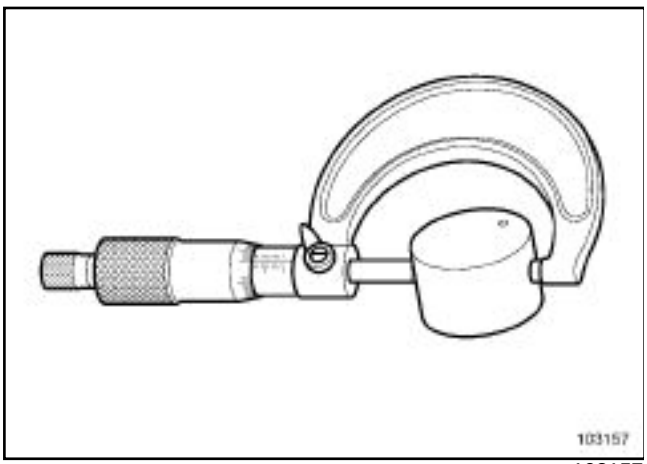
3 - Cylinder block gasket face bow

The maximum cylinder block gasket face bow is **0.03mm** .

4 - Cylinder head testing

Test the cylinder head for possible cracks using the **cylinder head test kit** .

5 - Cylinder head regrinding



WARNING
No regrinding is permitted.

VI - TAPPET

1 - Tappet type

The tappet is the monobloc type.

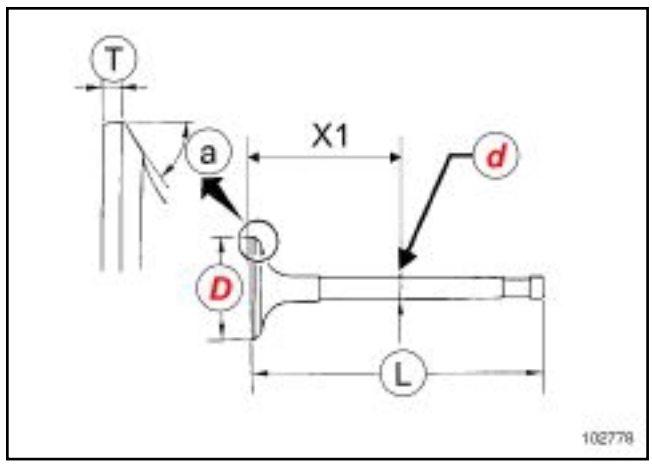
2 - Outer diameter of tappet

103157

The outer diameter of the tappet is **34.975 ± 0.01mm** .

3 - Diameter of the tappet housing in the cylinder head

The diameter of the tappet housing in the cylinder head is **35.02 ± 0.02mm**

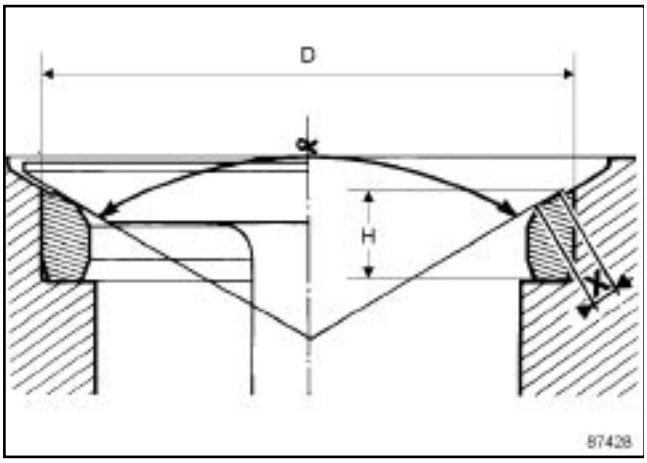


4 - Clearance between the tappet and its housing

The clearance between the tappet and its housing is between **0.015 and 0.075mm** .

VII - ADJUSTING VALVE CLEARANCES

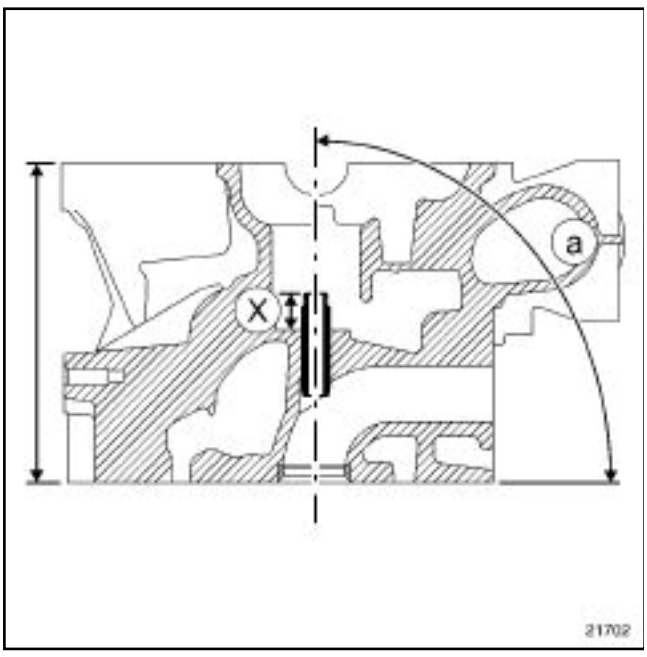
Valves	Cold valve clearance in mm
Inlet	**0.20 + 0.05 / - 0.075**
Exhaust	**0.40 + 0.05 / - 0.075**



VIII - VALVES

102778

	Inlet valve	Exhaust valve
Diameter ***(D)*** of the valve stem is measured at point ***(X1)***	***(D)*** = **5.977 ± 0.008mm** at ***(X1)*** = **41mm** .	***(D)*** = **5.963 ± 0.008mm** at ***(X1)*** = **31mm** .
Diameter ***(D)*** of the valve face	**33.5 ± 0.12mm**	**29 ± 0.12mm**
Thickness ***(T)*** of the valve head	**1mm**	**1mm**
Length ***(L)*** of the valve	**100.95 ± 0.21mm**	**100.75 ± 0.21mm**
Valve seat angle ***(A)***	**90°**	**90°**
Valve lift	**8mm**	**8.6mm**



IX - VALVE SEATS

87428

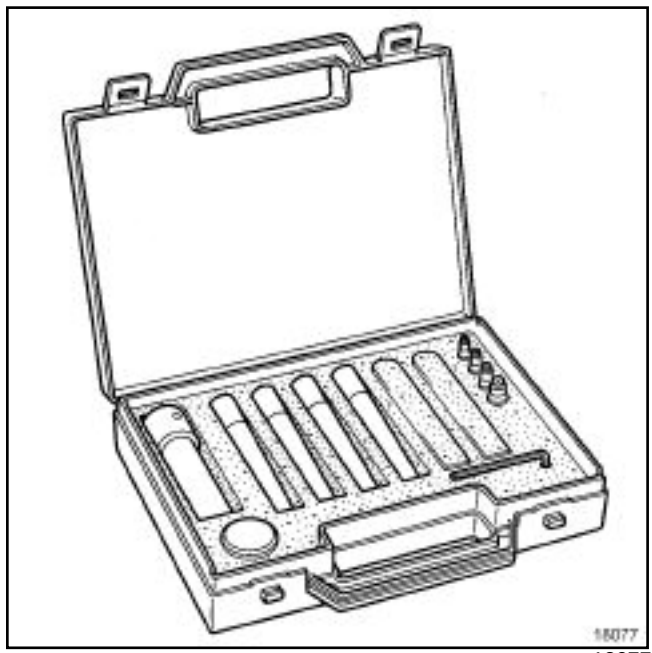
	Inlet valve seat	Exhaust valve seat
Internal diameter of the valve seat housing (**D**) in the cylinder head	**34.459 ± 0.015mm**	**29.97 ± 0.015mm**
Outer diameter (**D**) of the valve seat	**34.542 ± 0.008mm**	**30.042 + 0.006 / - 0.007mm**
Valve seat housing depth (**H**) in the cylinder head	**6mm**	**7mm**
Valve seat height (**H**)	**4.65 ± 0.04mm**	**5.67 ± 0.04mm**
Width of mating faces X	**1.8mm**	**1.8mm**
Angle α of the valve seat	**89°30'**	**89°30'**

X - VALVE GUIDES

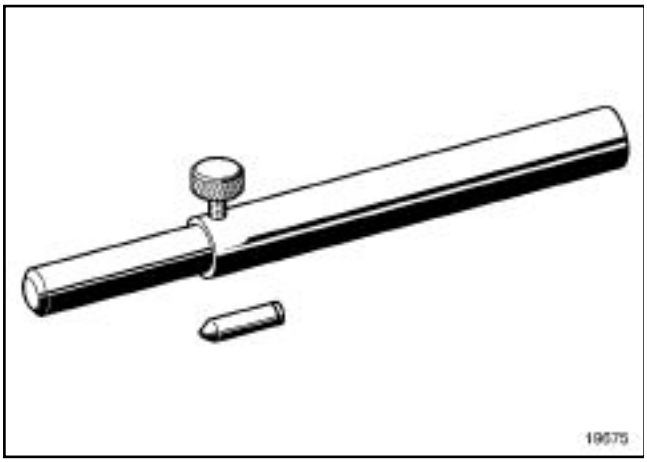
21702

	Inlet guide	Exhaust guide
Length of the valve guide	**40.5 ± 0.15mm**	
External diameter of guide:	**11 + 0.062 / + 0.044mm**	
Diameter of the guide housing in the cylinder head:	**11mm**	
Internal diameter of the valve guide Non machined Machined *	**5 + 0.12 / 0mm** **6.009 ± 0.009mm**	
Valve guide angle of inclination (**A**)	**90°**	
Valve guide position (**X**)	**14mm**	**14.2mm**
Clearance between the valve guide and the valve	**0.02 to 0.05mm**	**0.03 to 0.063mm**

*** This dimension is measured with the guide fitted in the cylinder head.**



XI - VALVE STEM SEALS



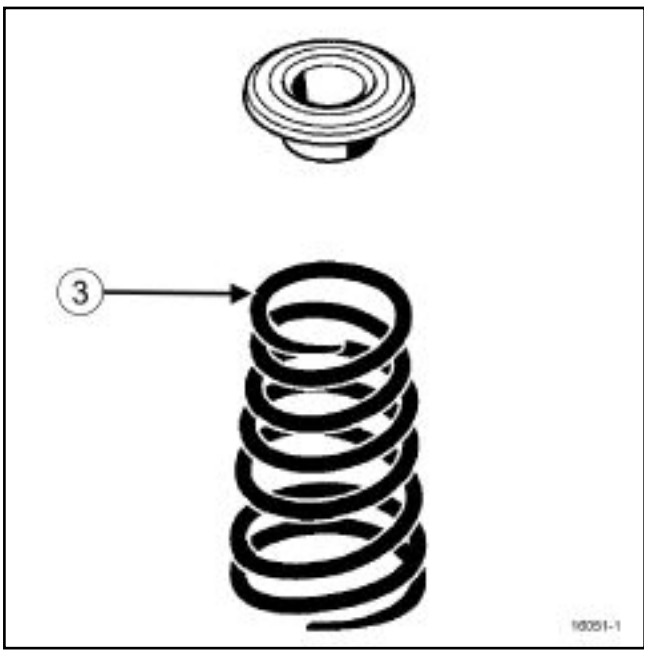
The inlet and exhaust guides have valve stem seals.

These must be replaced each time the valves are removed.

98503

The removal of the valve stem seals is carried out using (**Mot. 1335**).

18077

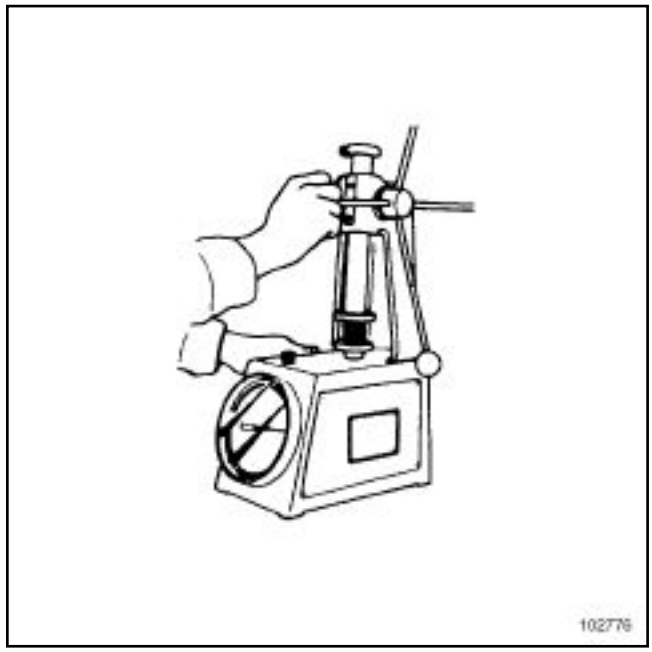


19675

The valve stem seals are refitted using either:

- a suitable tool, or
- tool (**Mot. 1511-01**).

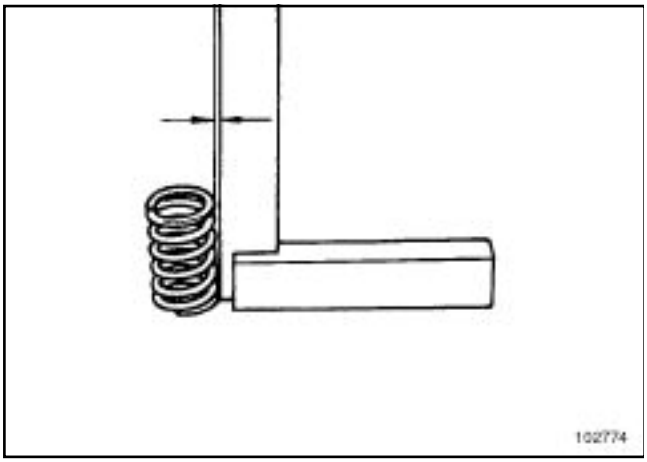
XII - VALVE SPRINGS



16051-1

The inlet and exhaust valve springs are identical.

The valve springs are the **conical** type and part (**3**) of the spring must face upwards.



WARNING

CE MOTEUR NE POSSEDE PAS DE RONDELLES INFERIEURES DE RESSORT DE SOUPAPE.

	-	-	N	**41.773 to 41.814**

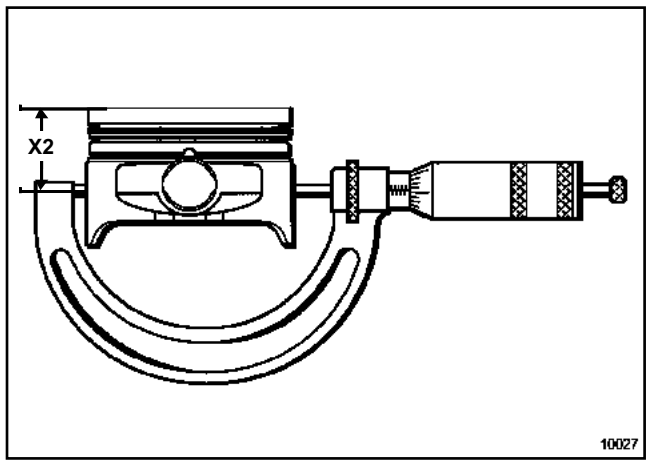
Note:

***** = piston sold by the Parts Department.

WARNING

- For engines **K9K 260-270-274-700-702-704-706-710-714-716-722-750-752-762-768-790-792** fitted with gudgeon pins of diameter D = **25 or 26mm** , the Parts Department will only supply four categories of piston **K, L, M, N** .

- If the engine is fitted with a category **P** piston, replace it with a category **N** piston.



WARNING

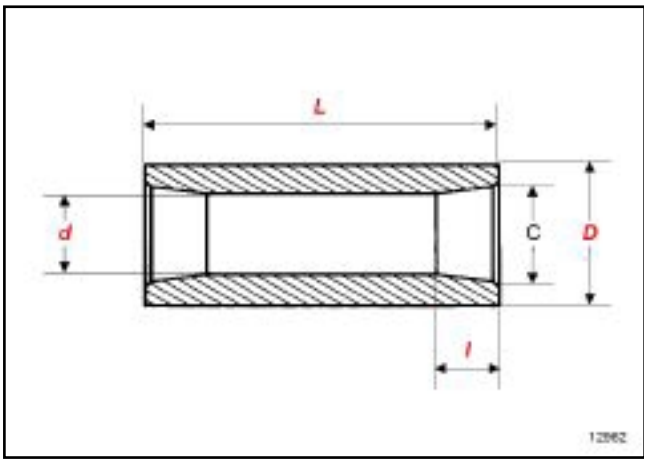
- For engines **K9K 276-712-718-724-728-729-732-760-764-766** , the Parts Department will only supply three categories of piston **K, L, M** .

- If the engine is fitted with a category **J** piston, replace it with a category **K** piston.

- If the engine is fitted with a category **N** piston, replace it with a category **M** piston.

5 - Piston diameter

10027



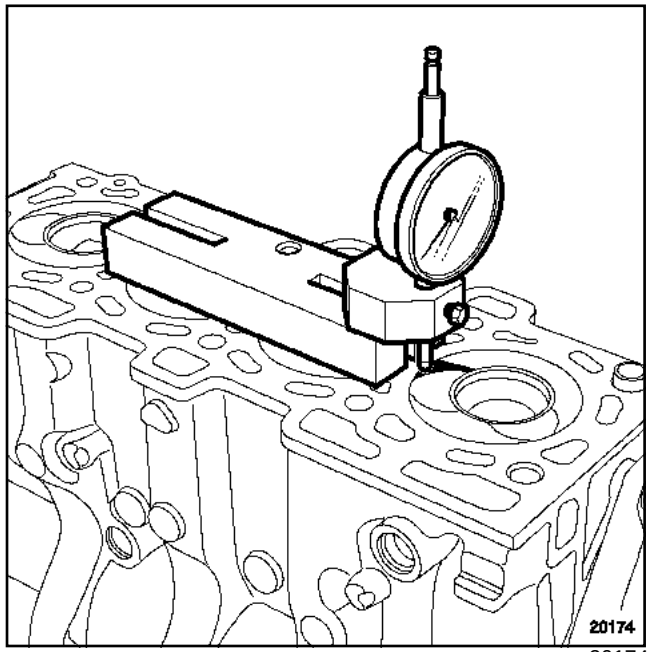
The piston diameter must be measured with (**X2**) = **56mm**

Engine type	Piston diameter in mm
K9K 260-270-272-274-700-702-704-706-710-714-716-722-750-752-762-768-790-792	**75.949 ± 0.007**
K9K 276-712-718-724-728-729-732-760-764-766	**75.945 ± 0.007**

6 - Gudgeon pin

Fitting the free floating pin in the con rod and in the piston.

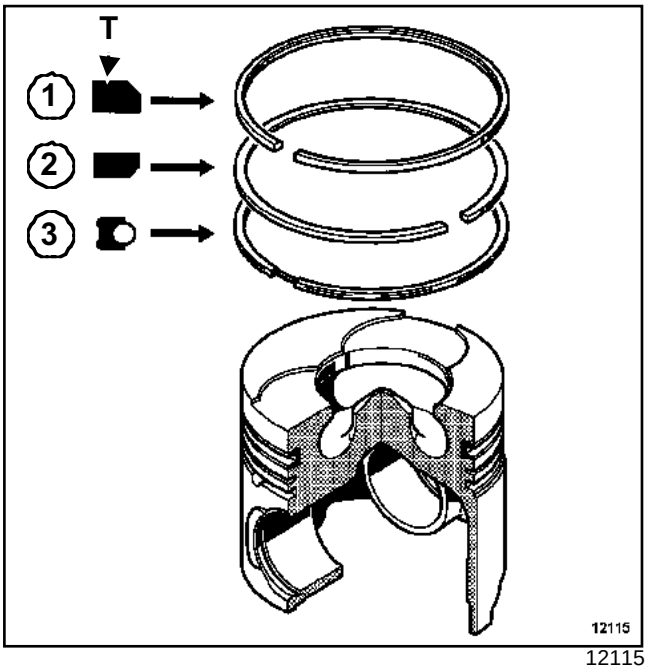
The gudgeon pin is retained by circlips.



12962

	Gudgeon pin dimensions in mm	Engine type
Length (**L**)	**60 +0 / -0.3**	All K9K
External diameter (**D**)	**25 +0 / -0.005**	K9K 260-700-702-704-710-722 **up until 25/11/2002**
	26 +0 / -0.005	K9K 260-700-702-704-710-722 **from 25/11/2002** K9K 270-272-274-276-706-712-714-716-718-724-728-729-732-750-752-760-762-764-766-768-790-792
Internal diameter (**d**)	**13.75 +0.1 / -0.2**	K9K 260-700-702-704-710-722 **up until 25/11/2002**
	13.5 +0.1 / -0.2	K9K 260-700-702-704-710-722 **from 25/11/2002** K9K 270-272-274-276-706-712-714-716-718-724-728-729-732-750-752-760-762-764-766-768-790-792
Chamfer diameter (**C**)	**20 ± 0.25**	K9K 732-764
Chamfer length (**l**)	**6**	

7 - Piston protrusion



WARNING
The dial gauge rod must not be in a valve clearance.

20174

Engine type	Piston protrusion in mm
K9K 260-700-702-704-710-722 **up until 25/11/2002**	**0.192 ± 0.093**
K9K 260-700-702-704-710-722 **from 25/11/2002** K9K 270-272-706-750-752-790	**0.154 ± 0.130**
K9K 274-276-712-714-716-718-724-728-729-732-760-762-764-766-768-792	**0.159 ± 0.129**

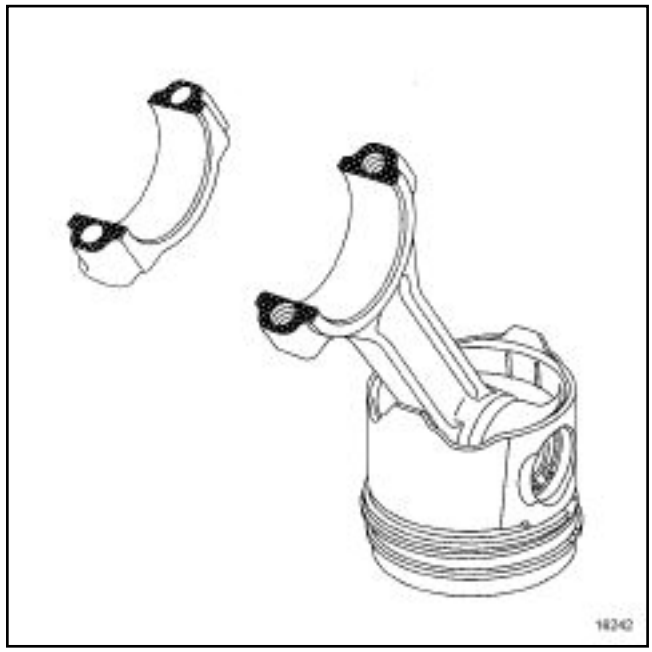
II - PISTON RINGS

12115

Piston rings are supplied ready adjusted.

(**T**) = TOP

1 - Thickness of the piston rings



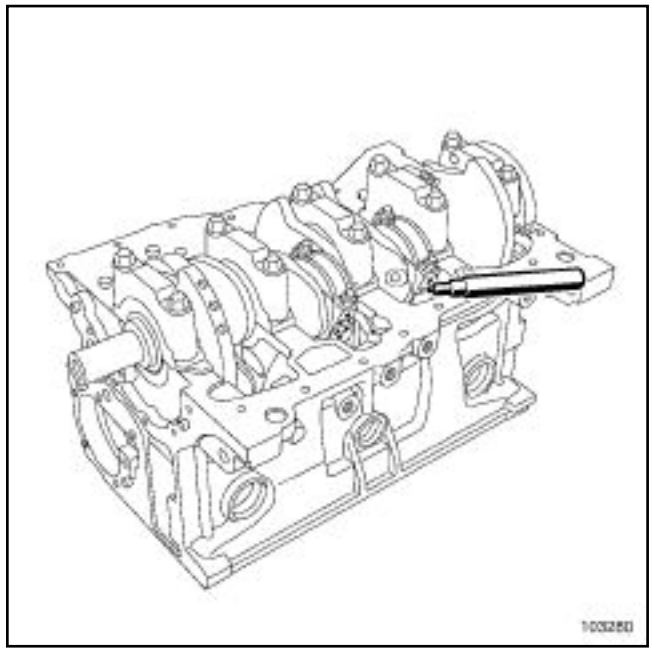
Piston rings	Thickness (in mm)
Compression ring ***(1)***	**2 -0.01 / -0.03**
Sealing ring ***(2)***	**2 -0.01 / -0.03**
Scraper ring ***(3)***	**2.5 -0.01 / -0.03**

2 - Piston ring clearance in groove

Piston rings	Piston ring clearance in mm
Compression	**0.2 to 0.35**
Sealing	**0.7 to 0.9**
Scraper	**0.25 to 0.5**

III - CON RODS

1 - Type of con rod



16242

The con rods are of the "SPLIT" type.

Note: The con rod small end bushes cannot be replaced.

2 - Guidelines for marking con rods

103280

WARNING
Do not use a punch or an etching tool to mark the con rod caps to match their bodies, to prevent incipient breakage of the con rod.

Use an indelible marker pen.

3 - Weigh difference for the con rod-piston-gudgeon pin assembly

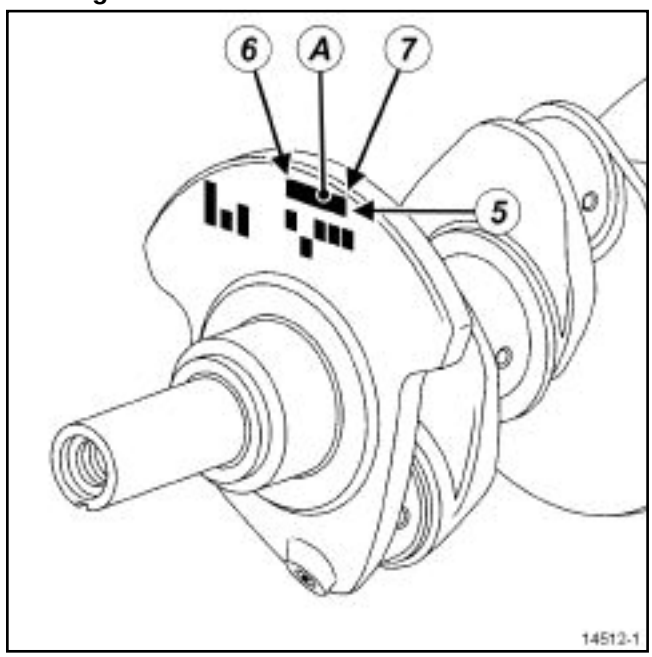
The maximum weight difference for the con rod-piston-gudgeon pin assembly for the same engine must be **25 g** .

4 - Con rod dimensions

	Con rod dimensions in mm	**Engine type**
Distance between big end and little end centres	**133.75**	All K9K
Big end diameter	**47.619 ± 0.009**	All K9K
Small end diameter (with bush)	**25.019 ± 0.006**	K9K 260-700-702-704-710-722 **up until 25/11/2002**
	26.019 ± 0.006	K9K 260-700-702-704-710-722 **from 25/11/2002** K9K 270-272-274-276-706-712-714-716-718-724-728-729-732-750-752-760-762-764-766-768-790-792

5 - Big end longitudinal play

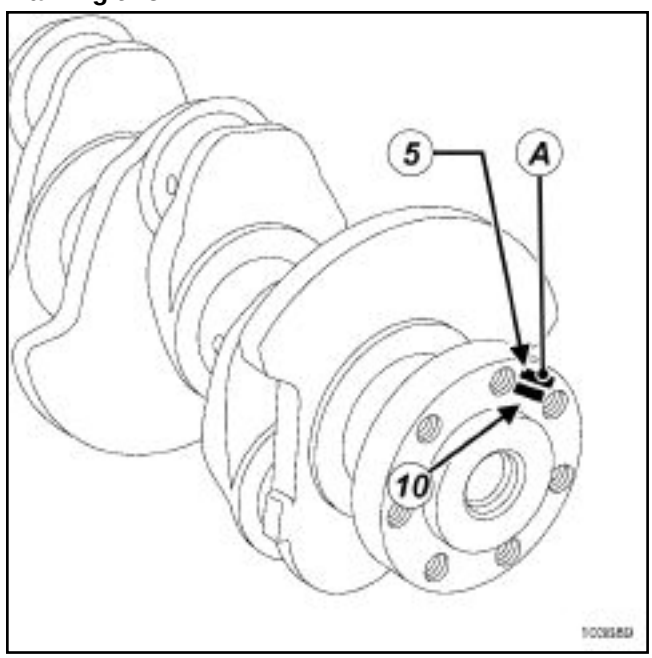
The longitudinal play must be between **0.205 and 0.467mm** .



6 - Big end radial play

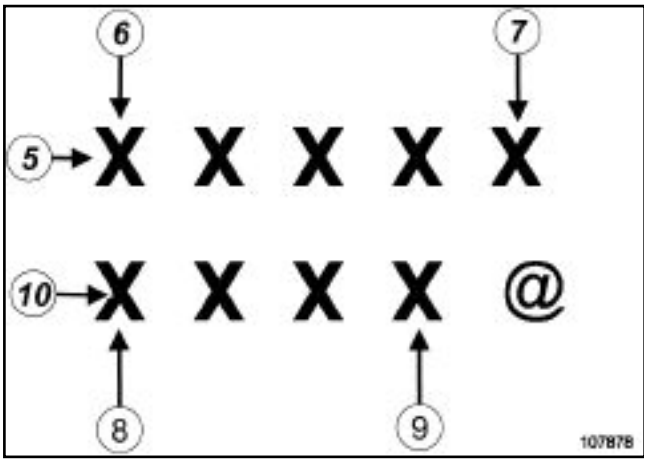
The radial play must be between **0.010 and 0.064mm** .

IV - CRANKSHAFT



1 - Crankshaft markings

Marking one



14512-1

Marking two

103689

Marking "A" in detail

107878

(**5**) : line indicating the diameter category of the journals,

(**6**) : diameter category of journal no. 1, flywheel end,

(**7**) : diameter category of journal no. 5, timing end,

(**8**) : diameter category of crankpin no. 1, flywheel end,

(**9**) : diameter category of crankpin no. 4, timing end,

(**10**) : line indicating the diameter category of the crankpins.

2 - Categories of journal diameters

Table of journal diameter categories

Journal category mark on the crankshaft	Journal diameter categories (mm)
A, G, K, R,W	**D1 = 47.990 to 47.997 exclusive**
B, H, L, S,Y	**D2 = 47.997 inclusive to 48.003 exclusive**
C, J, O, T, Z	**D3 = 48.003 inclusive to 48.010**

3 - Crankshaft dimensions

Diameter of the journals	**48 ± 0.01mm**
Crankpin diameter	**43.97 ± 0.01**
Maximum run-out allowed on the flywheel bearing face of the flywheel	**0.6mm**

4 - Crankshaft lateral play:

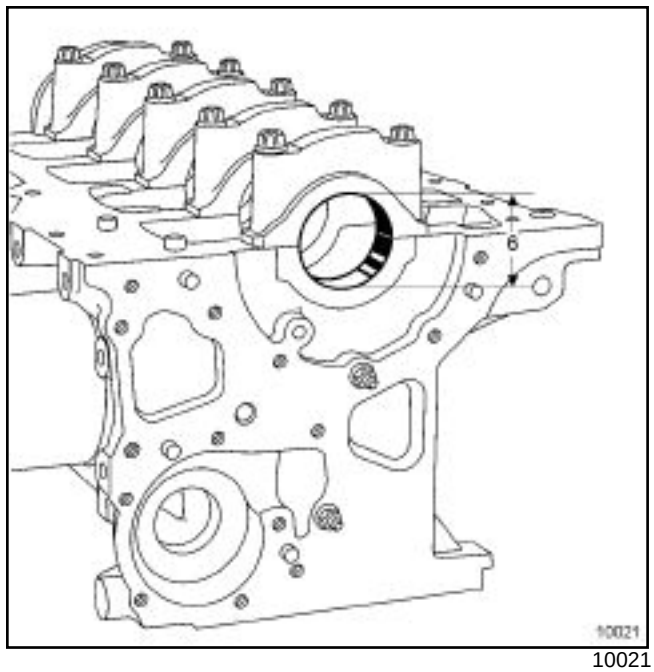
The lateral play of the crankshaft must be between:

- Without crankshaft lateral shim wear **0.045 and 0.252mm** ,
- With crankshaft lateral shim wear **0.045 and 0.852mm** .

5 - Journal radial play

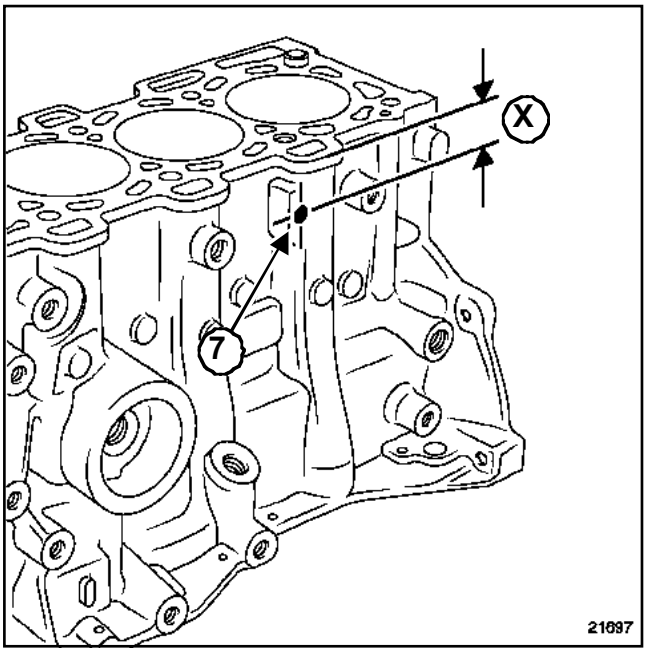
The radial play of the journals must be between **0.010 and 0.054mm** .

6 - Number of journals



There are **5** journals.

V - CYLINDER BLOCK



1 - Diameter of the shafts

This engine only has one category of shaft diameter **76.009 ± 0.015mm**

2 - Identifying the bearing journal diameters on the cylinder block

10021

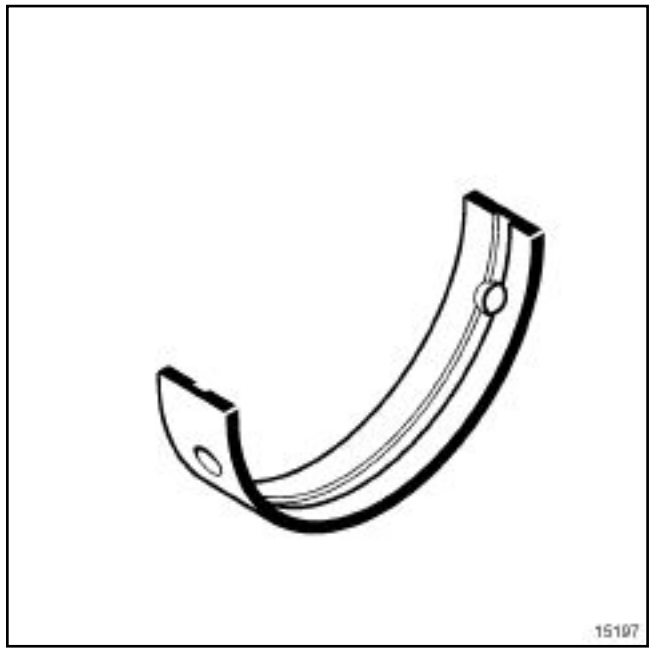
21697

The cylinder block bearing diameters (**6**) are marked with a drill hole on it (**7**) located above the oil filter.

For every engine there can only be one category of crankshaft bearing diameter.

3 - Table of bearing diameter classes

Positions of hole (7)	Category marking	Cylinder block bearing diameter (mm)
X = 33mm	1 or Blue	**51.936 to 51.942 exclusive**
X = 43mm	2 or Red	**51.942 inclusive to 51.949**

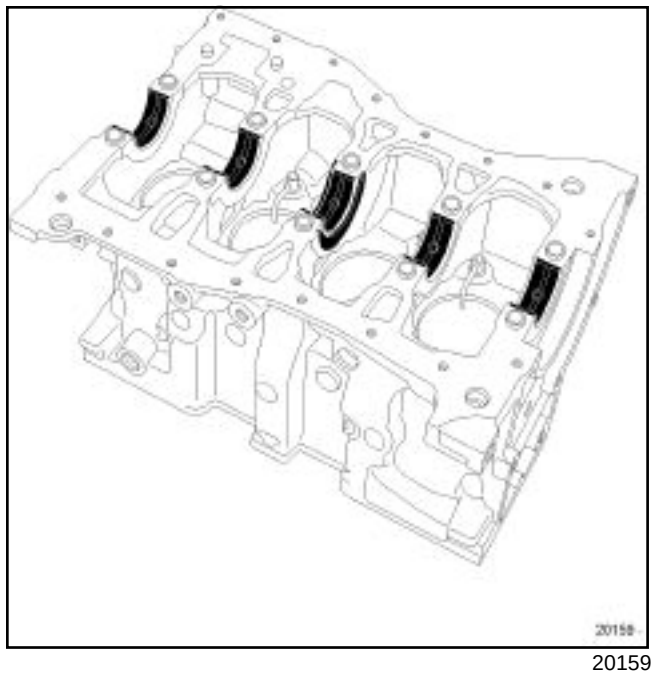


4 - Cylinder block gasket face bow

The maximum cylinder block gasket face bow is **0.03mm** .

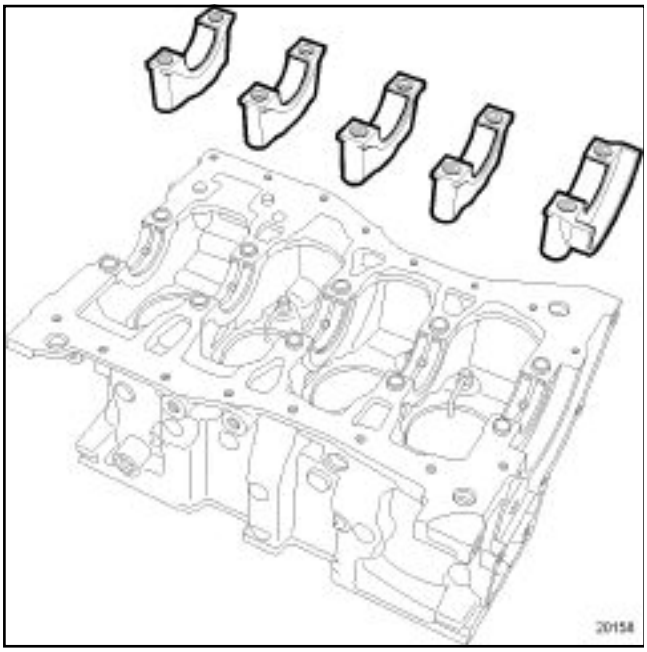
VI - BEARING SHELLS

1 - Crankshaft bearing shells



The engine is fitted with bearing shells without fool-proofing.

15197

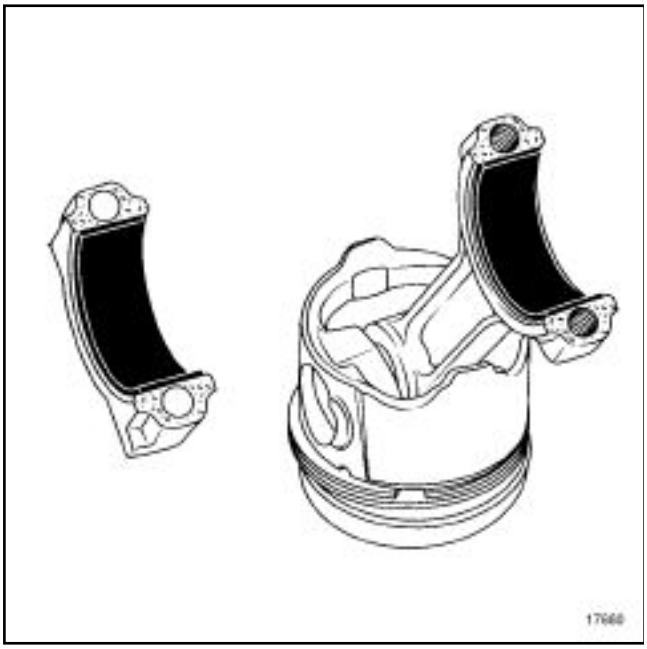


The crankshaft bearing shells are fitted on the cylinder block and the bearings using the **Mot. 1493-01** .

a - Direction of fitting the journal shells

20159

Fit the **grooved** bearing shells on all the bearings on the cylinder block



20158

Fit the **non-grooved** bearing shells on the bearing caps.

b - Matching the journal shells to the cylinder block

Cylinder block bearing diameter categories	**Crankshaft journal diameter category**		
	D1	**D2**	**D3**
1	C1 1.949 to 1.955 Yellow	C2 1.946 to 1.952 Blue	C3 1.943 to 1.949 Black
2	C4 1.953 to 1.959 Red	C1 1.949 to 1.955 Yellow	C2 1.946 to 1.952 Blue
	Bearing shell thickness and category		

2 - Conrod bearing shells

17680

The engine is fitted with bearing shells without fool-proofing.

The con rod bearing shells are fitted using tools (**Mot. 1492**) and (**Mot. 1492-03**).

Bearing shell width

Note:
The upper and lower con rod bearing shells are not the same width.

Bearing shell width:

- Con rod shank bearing: **20.625 ± 0.125mm** ,
- Con rod cap bearing: **17.625 ± 0.125mm** .

3 - Crankshaft lateral shims

a - Direction of fitting of lateral shims

Position the **lateral shim grooves facing the crankshaft** .

b - Position of lateral shims

The lateral shims are located on crankshaft bearing **no. 3** .

c - Thickness of lateral shims

There are two lateral shim thicknesses: **2.80mm** and **2.85mm** .

STANDARD EXCHANGE ENGINE

1 - Preparation of the old engine for return

Clean the engine.

Drain the oil and coolant from the old engine.

Secure the old engine to the stand and in the same conditions as the standard exchange engine:

- fit plastic plugs and covers,
- fit the cardboard cover over the whole assembly.

2 - Parts to leave on the old engine

Parts to leave on the old engine or to include in the return box:

- the dipstick,
- the oil filter,
- the oil filter seat,
- the oil cooler,
- the oil level sensor,
- the rocker cover,
- the coolant pump,
- the vacuum pump,
- the high-pressure pump,
- the injector rail,
- the injectors,
- the heater plugs,
- the entire timing end (crankshaft sprocket, belt, tensioner, camshaft sprocket),
- the timing covers,
- the crankshaft accessories pulley,
- the flywheel or the drive plate,
- the clutch pressure plate and driven plate,
- the lifting eyes,
- the cylinder head suspended mounting.

3 - Parts to remove from the old engine

Parts to remember to remove from the old engine:

- all the coolant system pipes,
- the oil pressure switch,
- the pinking sensor,
- the coolant inlet hose,
- the coolant outlet unit,
- the inlet manifold,
- the exhaust manifold,
- the turbocharger,
- the exhaust gas recirculation valve,
- the catalytic converter,
- the accessories (alternator, air conditioning compressor, power-assisted steering pump),
- the accessories multifunction support.

Special tooling required	
Mot. 1378	Engine support studs X & Y for use with stud A for Desvil engine support
Mot. 792-03	Engine support plate for Desvil engine stand
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Mot. 1723	Engine support for DESVIL engine support stand.
Mot. 1018	Sump plug tool.

I - RECOMMENDATIONS FOR REPAIR

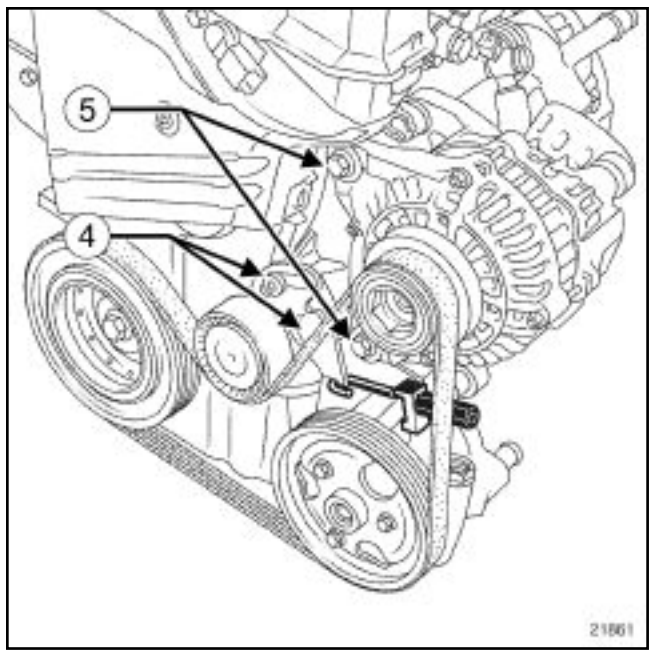
100606

IMPORTANT
In order to work on the engine in complete safety, it is essential to use the new stand, or have the old stand modified by the manufacturer. When the engine is on the stand, it is essential to fit mounting pads (**1**) .

II - EQUIPMENT REQUIRED

- Engine stand,
- Workshop crane,
- Load positioner
- Male torx socket,
- **8mm** Square drive drain plug spanner
- Protective gloves.

III - PREPARING THE ENGINE TO BE MOUNTED ON THE STAND



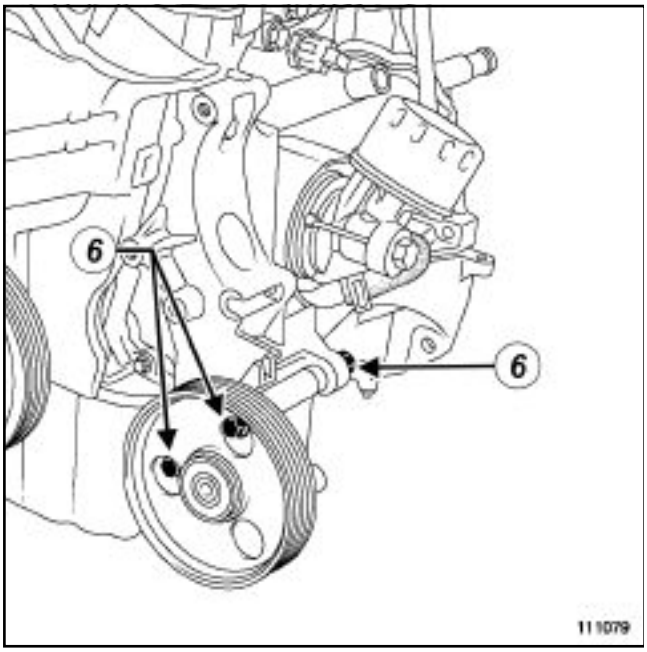
There are two procedures for securing the engine to the stand:

- by fitting tool (**Mot. 792-03**) to the cylinder block (oil filter end),
- by fitting tool (**Mot. 1723**) to the cylinder block (flywheel end).

1 - Fitting the engine to the stand fitted with Mot. 792-03 (oil filter end)

This mounting refers to the following engines only: K9K 260-270-272-700-702-704-706-710-722-750-752-790.

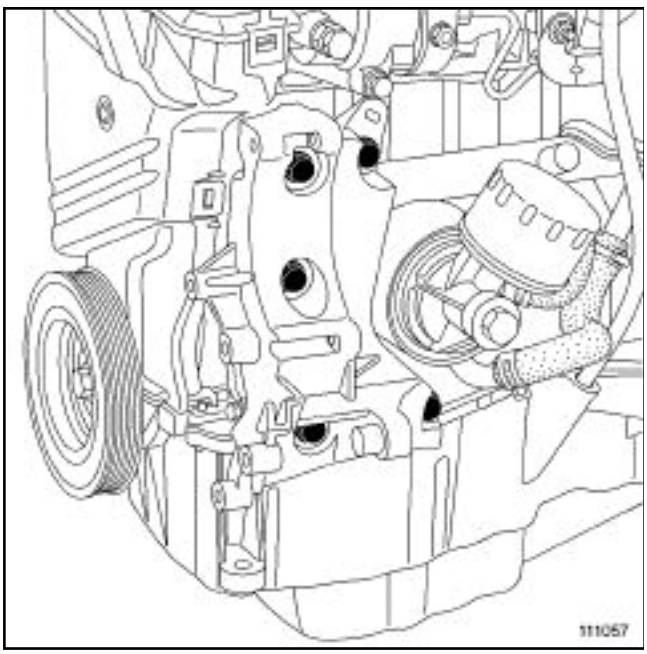
a - Engine without air conditioning



21861

Loosen the tensioning roller mounting bolts (**4**) .

Remove:

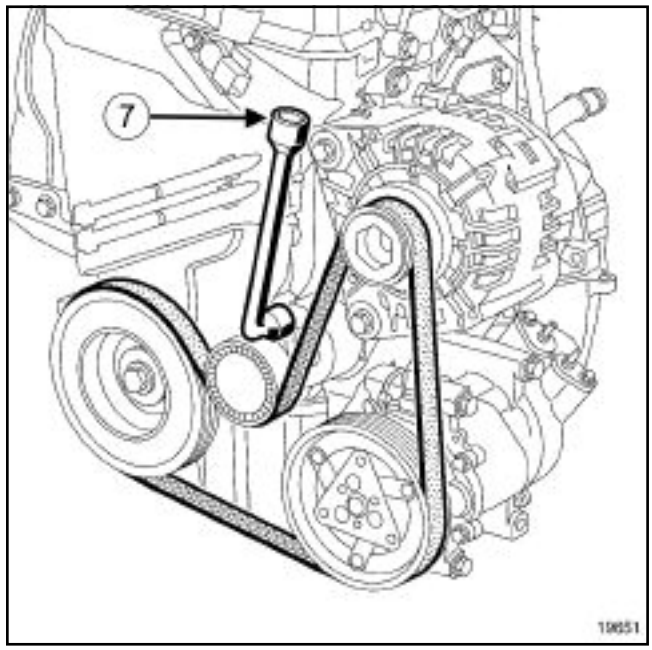


- the accessories belt,
- the accessory belt tensioning roller,
- the alternator mounting bolts (**5**) ,
- the alternator.

111079

Remove:

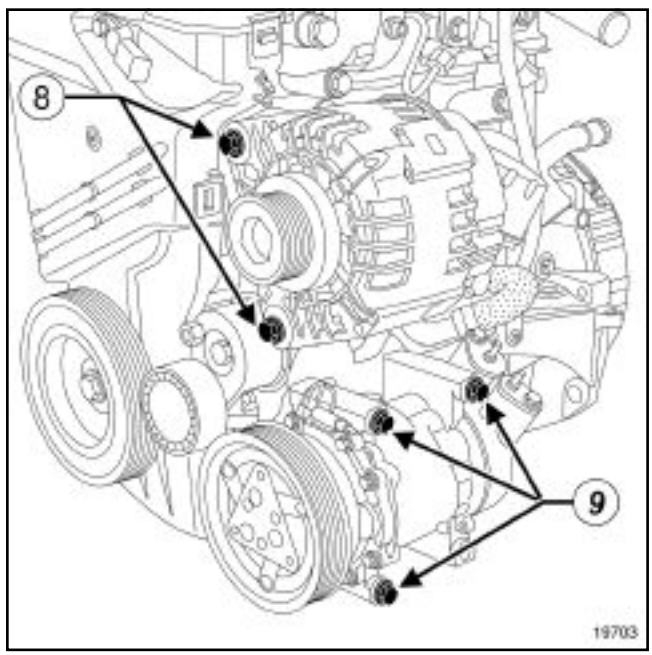
- the power-assisted steering pump or dummy pulley mounting bolts (**6**) ,
- the power-assisted steering pump or dummy pulley.



111057

Remove:

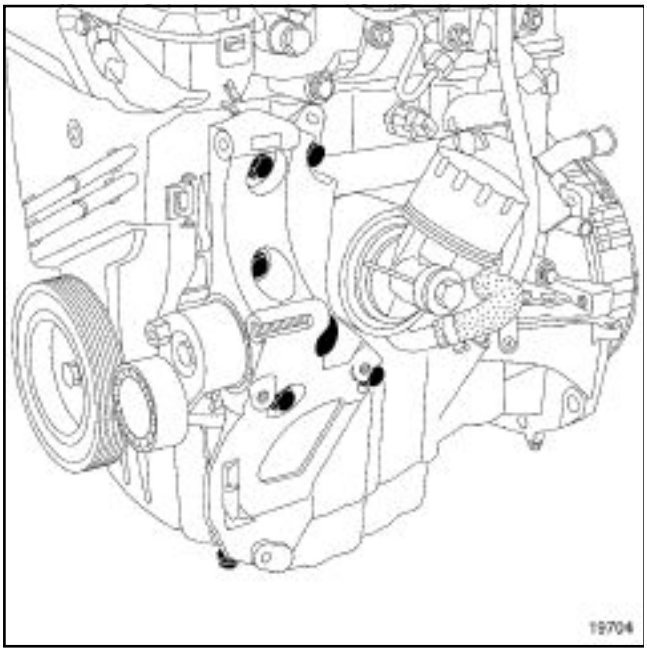
- the multifunction support mounting bolts,
- the multifunction support.



b - Engine with air conditioning

19651

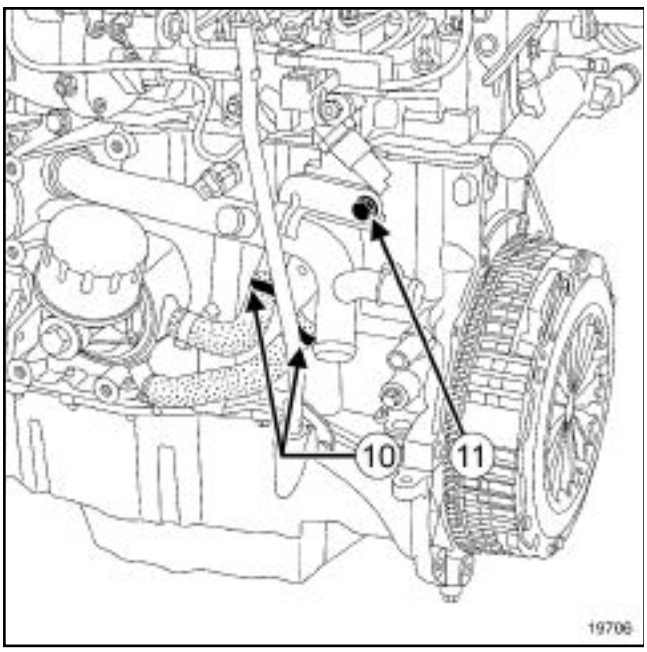
Rotate the tensioning roller using a wrench (**7**) to slacken the belt.



Remove the accessories belt.

19703

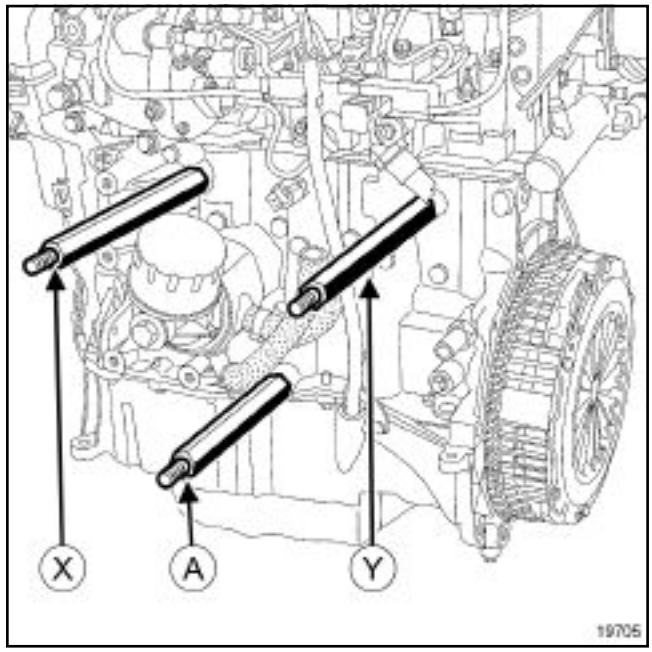
Remove:



- the alternator mounting bolts (**8**) ,
- the alternator,
- the air conditioning compressor mounting bolts (**9**) ,
- the air conditioning compressor.

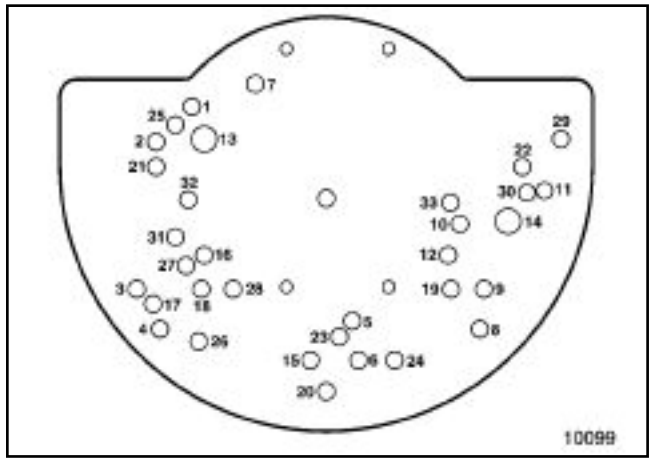
19704

Remove:



- the auto tensioner,
- the multifunction support mounting bolts,
- the multifunction support.

19706



Remove:

- the coolant hoses (**10**) from the coolant pump inlet pipe,
- the coolant pump inlet pipe mounting bolt (**11**) ,
- the coolant pump inlet pipe.

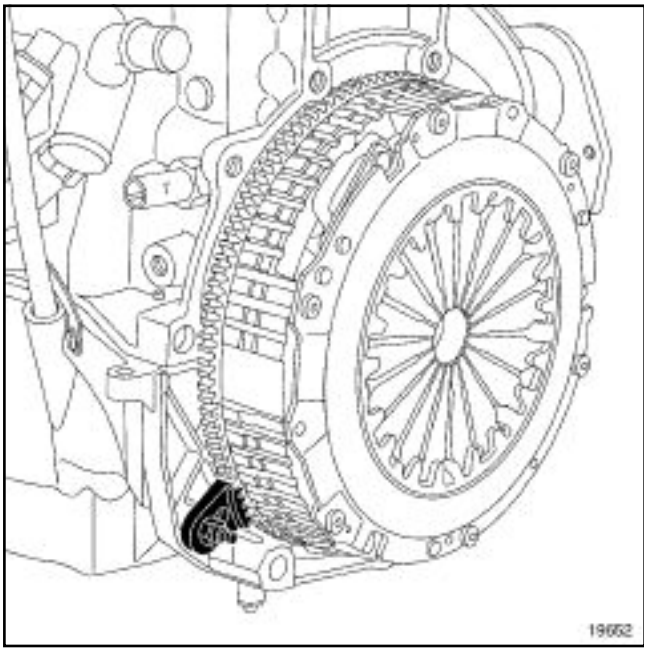
19705

Fit the support studs (**X**) , (**Y**) of **(Mot. 1378)** and the support stud (**A**) of **(Mot. 792-03)** to the cylinder block.

10099

Fit the (**Mot. 792-03**) plate onto the engine fitted with support studs by lining up:

- the support stud ***(A)*** with hole **20** on the plate,
- the support stud ***(X)*** with hole **33** on the plate,
- the support stud ***(Y)*** with hole **32** on the plate.



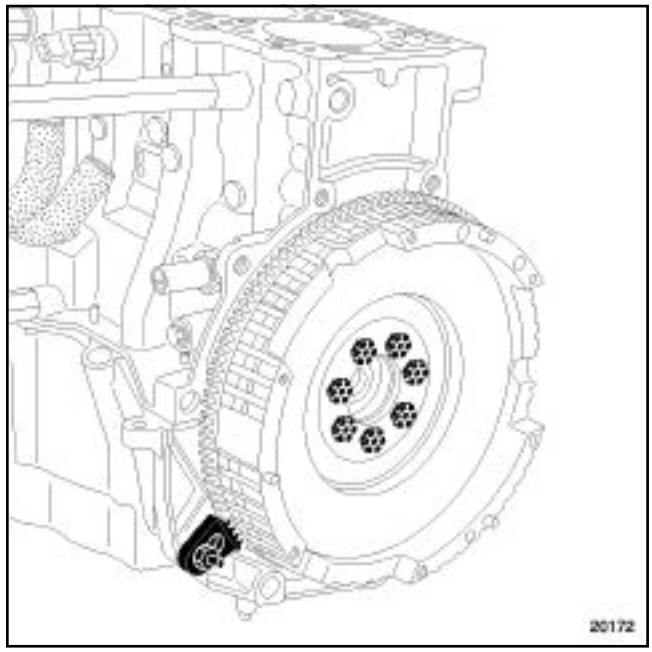
Fit the engine complete with plate onto the engine stand.

2 - Fitting the engine to the stand fitted with Mot. 1723 (flywheel end)

This fitting relates to all K9K engines .

Note:

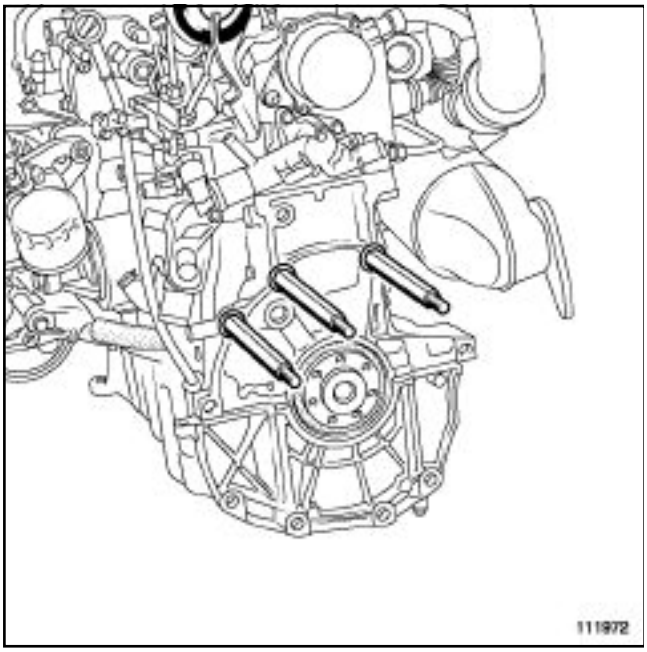
The flywheel must be removed on engines with the starter motor at the exhaust end.



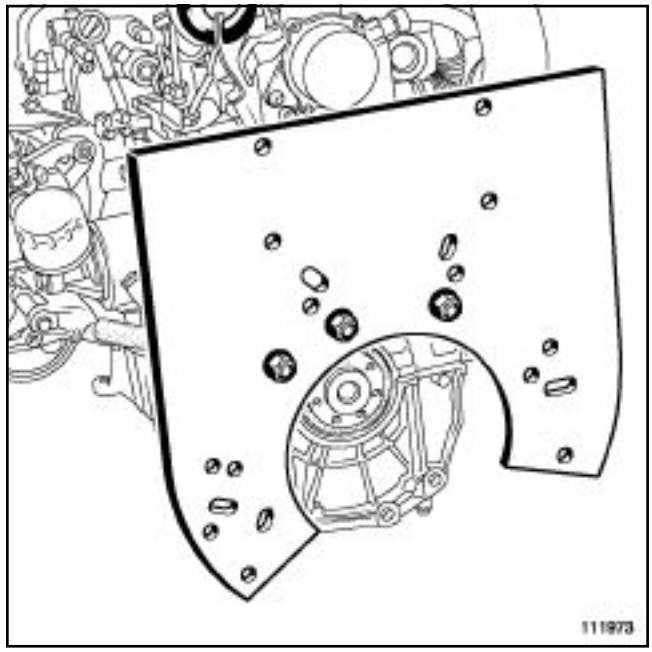
19652

Fit flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .

Remove:

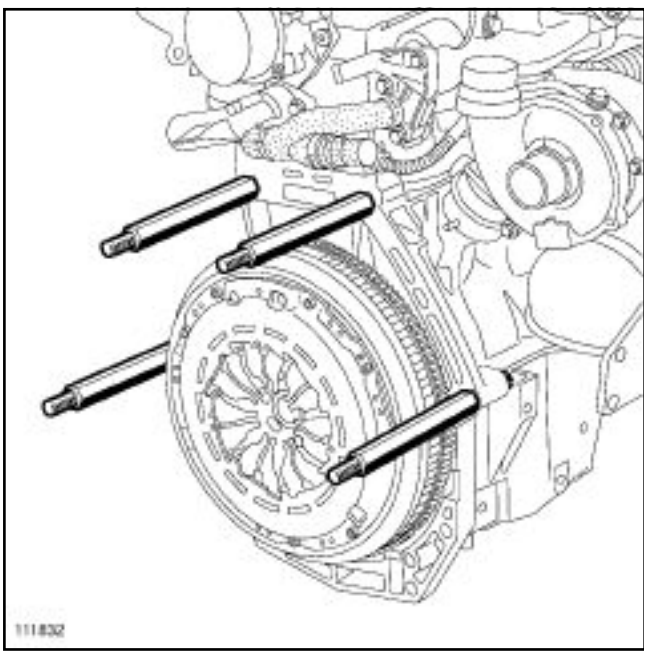


- the clutch pressure plate securing bolt,
- the clutch pressure plate,
- the friction plate.



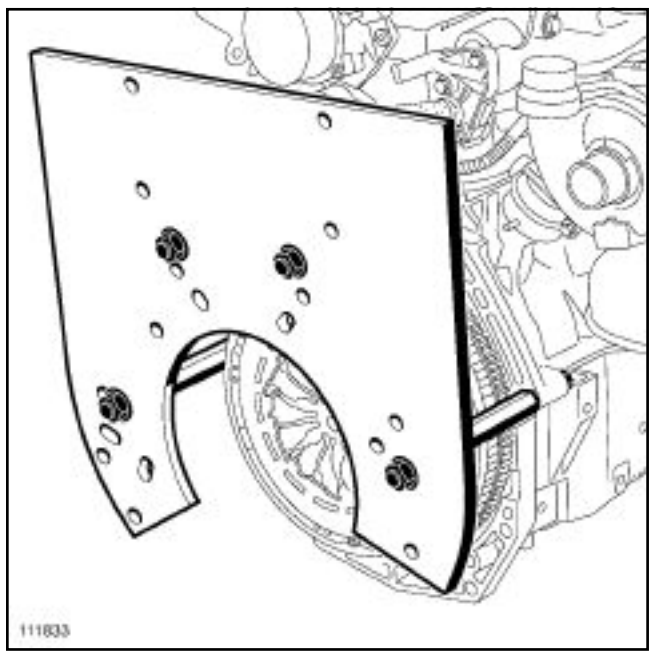
20172

Remove:



- the flywheel mounting bolts,
- the flywheel,
- the flywheel locking tool (**Mot. 582-01**) or (**Mot. 1677**).

111972



111973

111832

Fit the support stud of **(Mot. 1723)** to the cylinder block.

111833

Fit the (**Mot. 1723**) plate onto the engine fitted with support studs by lining up:

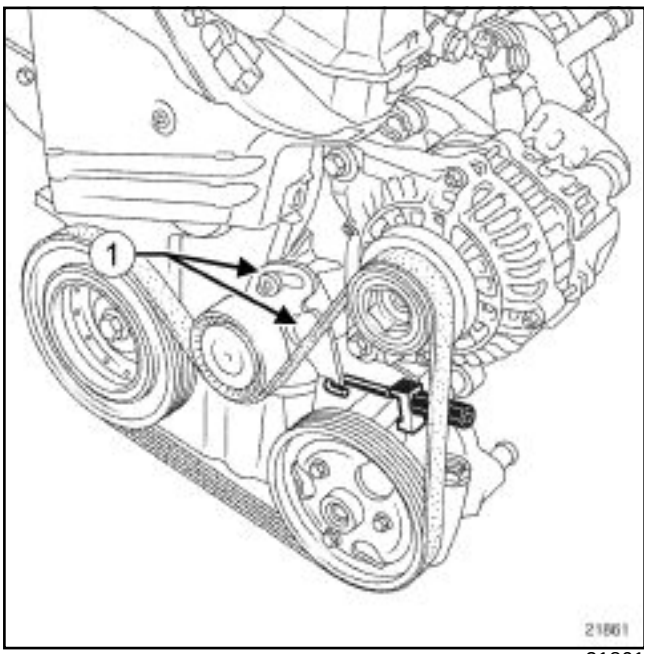
- the support studs with holes **5, 6 and 7** on the plate (for engines with starter on the exhaust side),
- the support studs with holes **1, 2, 10 and 12** on the plate (for engines with starter on the oil filter side).

Fit the engine complete with plate onto the engine stand.

Remove the engine wiring harness.

Remove the drain plug from the sump using **(Mot. 1018)** or using **a drain plug spanner (8mm square drive)** .

I - RECOMMENDATIONS FOR REPAIR



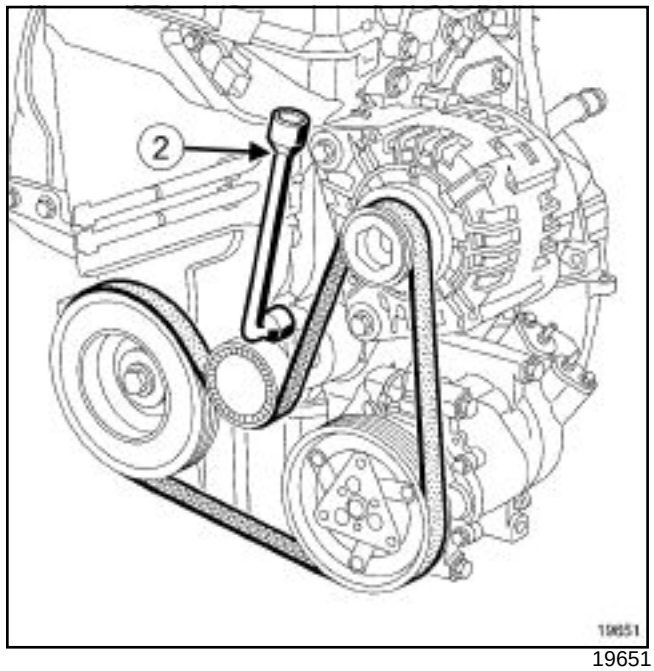
IMPORTANT
Wear protective gloves during every operation.

II - EQUIPMENT REQUIRED

- Protective gloves.

III - REMOVAL

1 - Engine without air conditioning

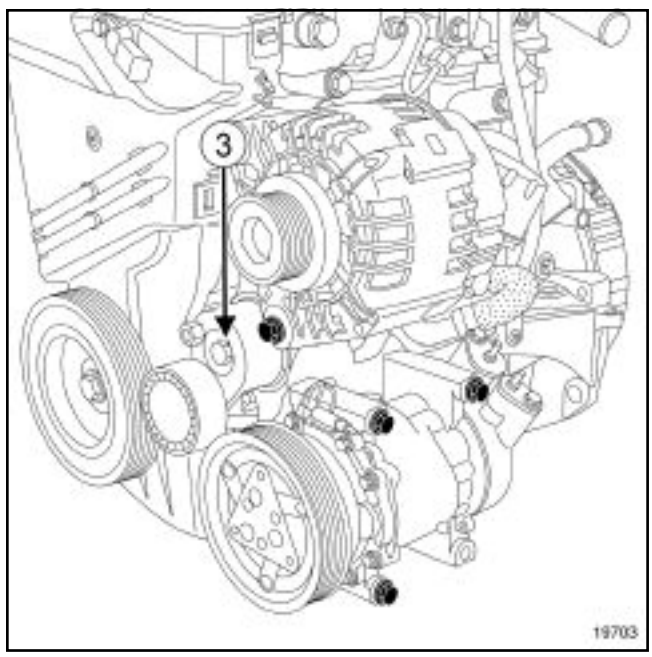


21861

Undo the tensioning roller mounting bolts (**1**) .

Remove:

- the accessories belt,
- the accessories belt tensioning roller.



2 - Engine with air conditioning

19651

Rotate the tensioning roller using a wrench (**2**) to slacken the belt.

Remove the accessories belt.

19703

Remove:

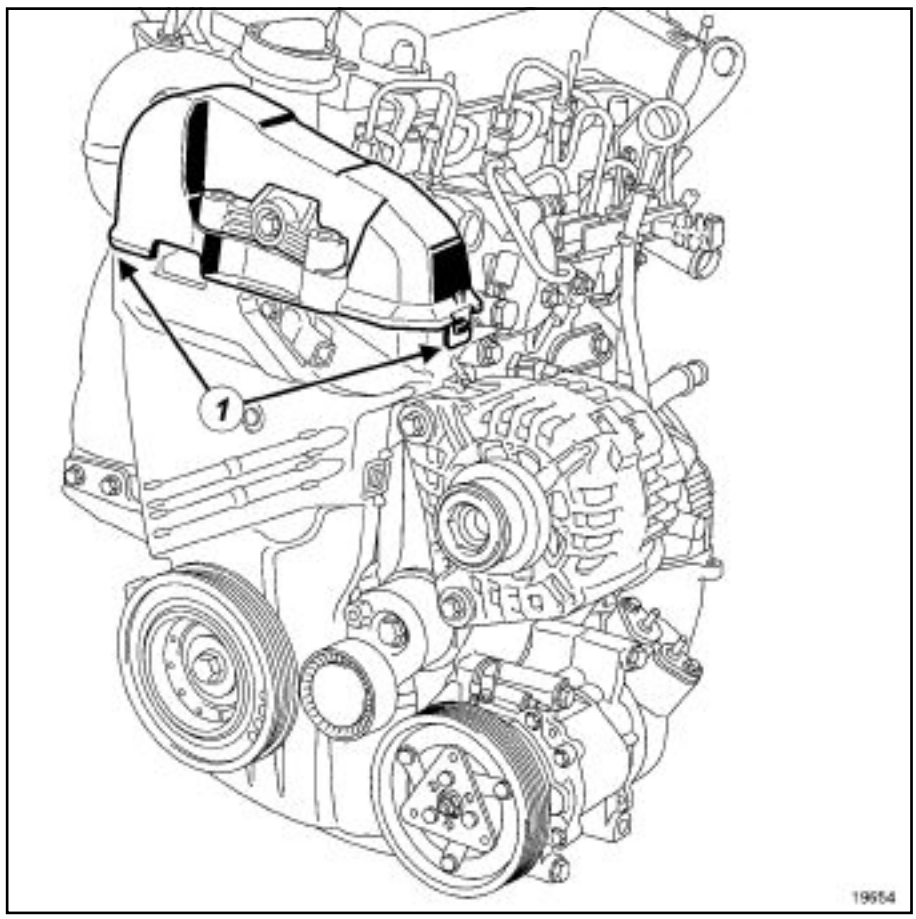
- the accessories belt tensioning roller mounting bolt (**3**) ,
- the accessories belt tensioning roller.

Timing - cylinder head: Removal

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Mot. 1573	Cylinder head support

I - TIMING GEAR REMOVAL

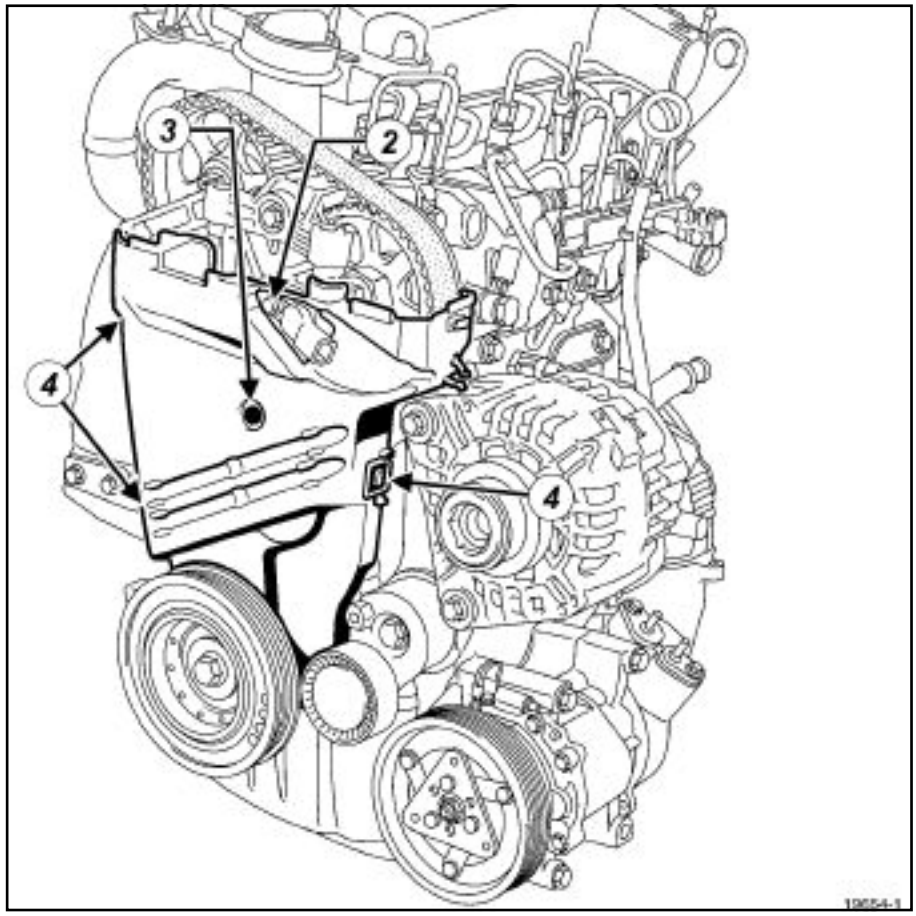


II - GUIDELINES FOR REPAIRS TO THE TIMING GEAR

IMPORTANT
Wear protective gloves during every operation.

III - EQUIPMENT REQUIRED FOR THE TIMING GEAR

- Protective gloves,
- Large screwdriver,
- Allen key (**6mm**),
- Female torx socket (**14**).



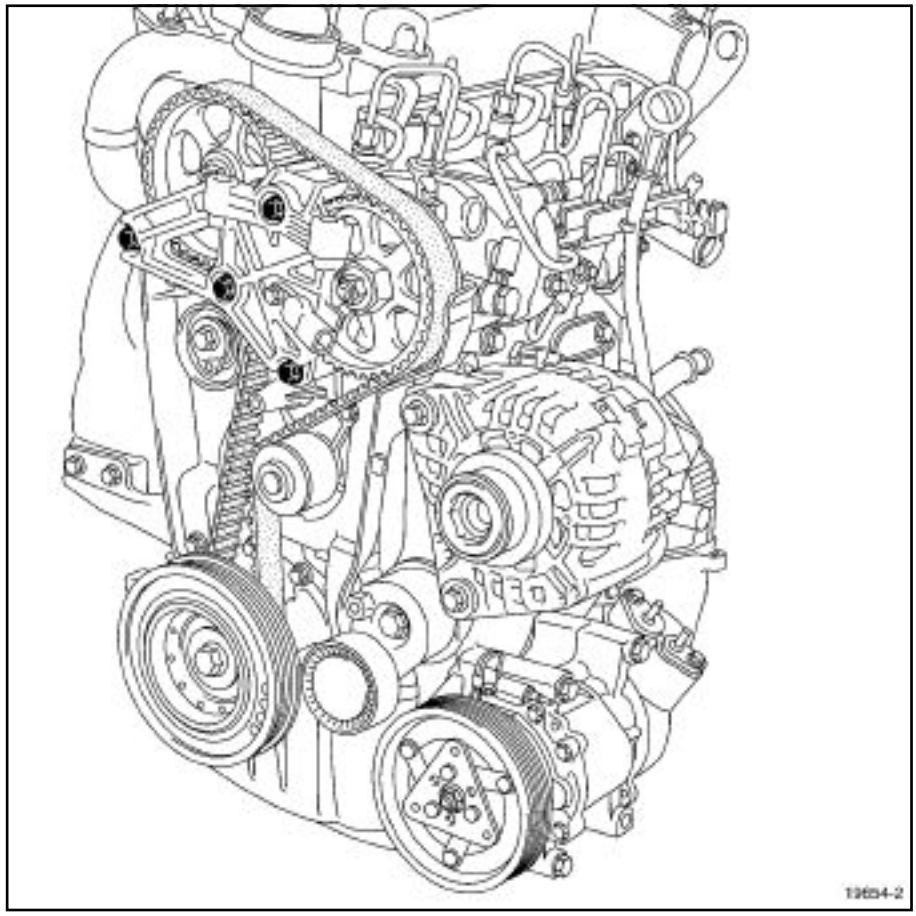
IV - REMOVAL

19654

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

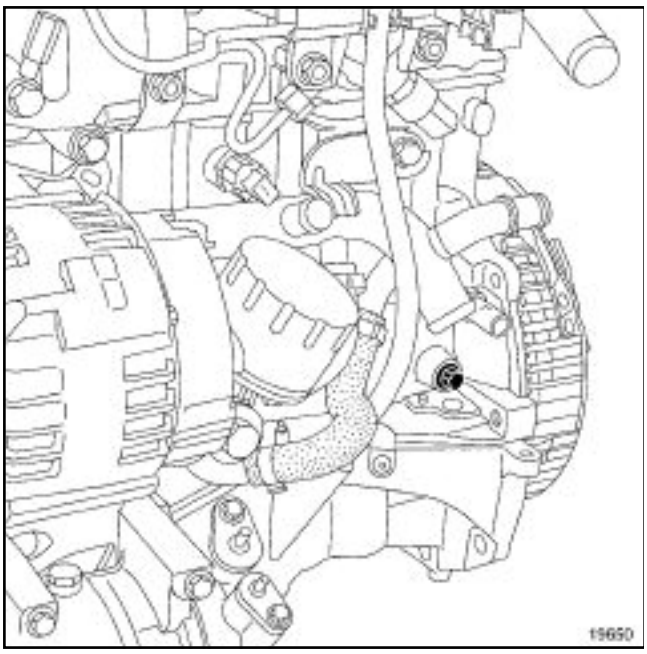
19654-1



Remove:

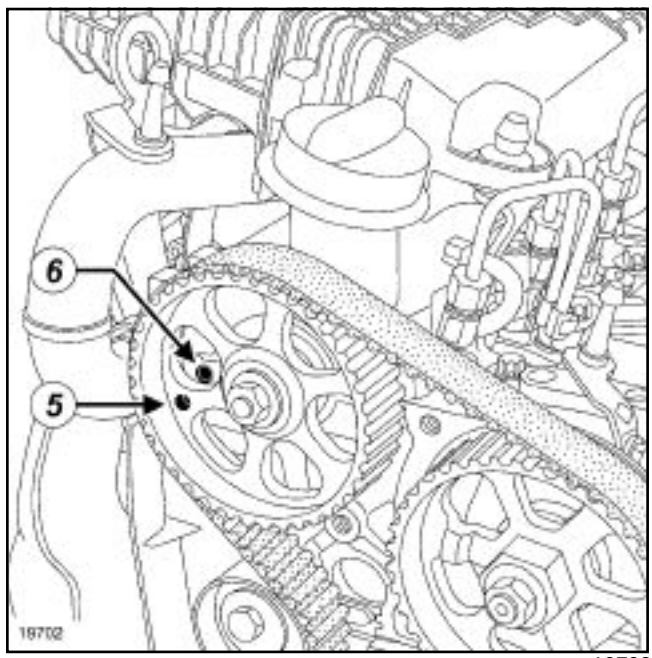
- the high pressure pump position sensor (**2**) ,
- the plastic bolt (**3**) .

Unclip the three tabs (**4**) .



Remove the lower timing cover.

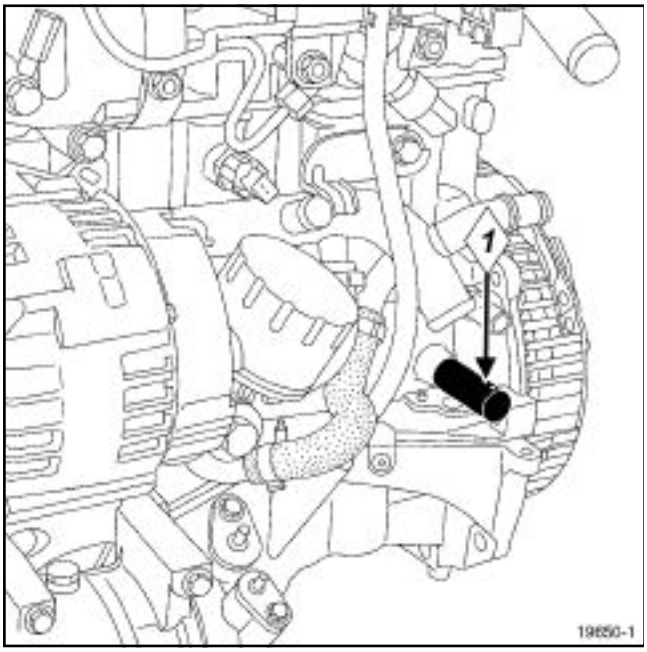
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19654-2

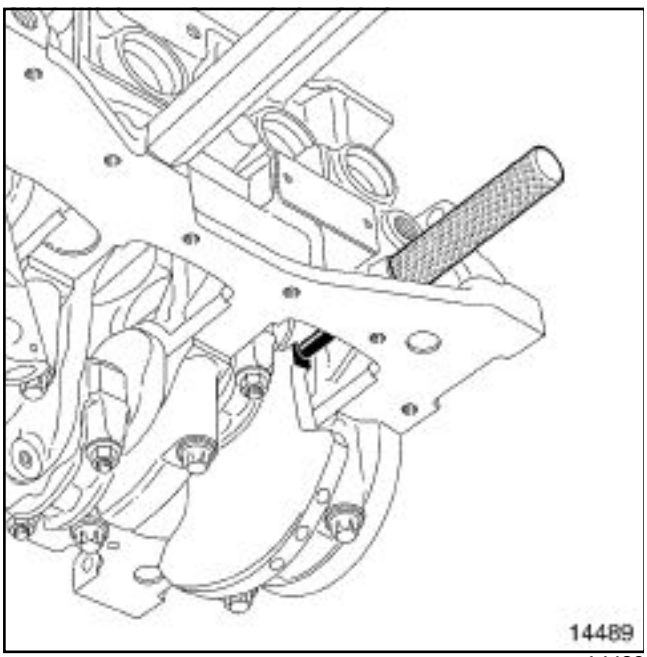
Remove the cylinder head suspended mounting.

19650



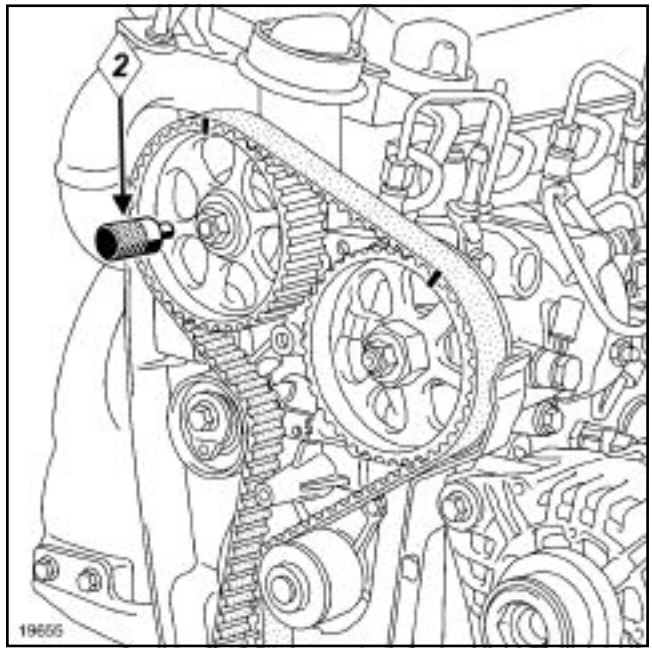
Remove the TDC setting pin plug using a number **14** female torx socket.

19702



Turn the crankshaft to position the hole (**5**) of the camshaft pulley almost opposite the hole (**6**) in the cylinder head.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

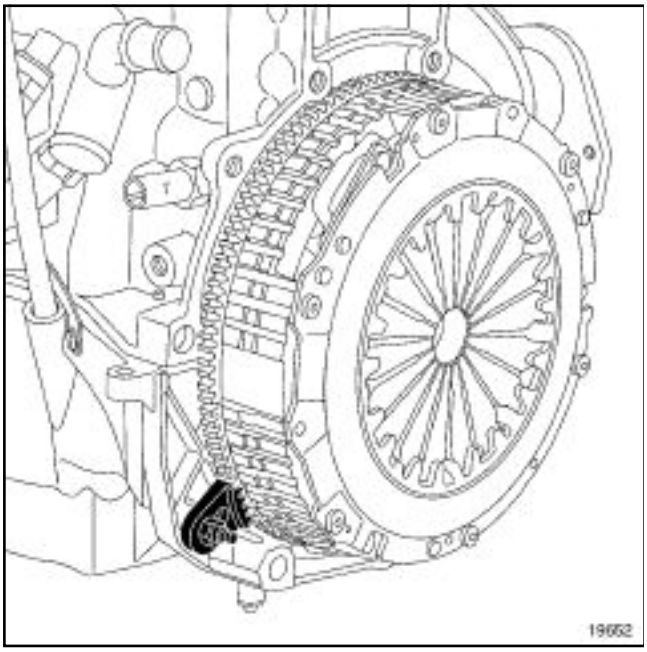


19650-1

Screw in the TDC setting pin (**1**) **(Mot. 1489)** .

14489

Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.



19655

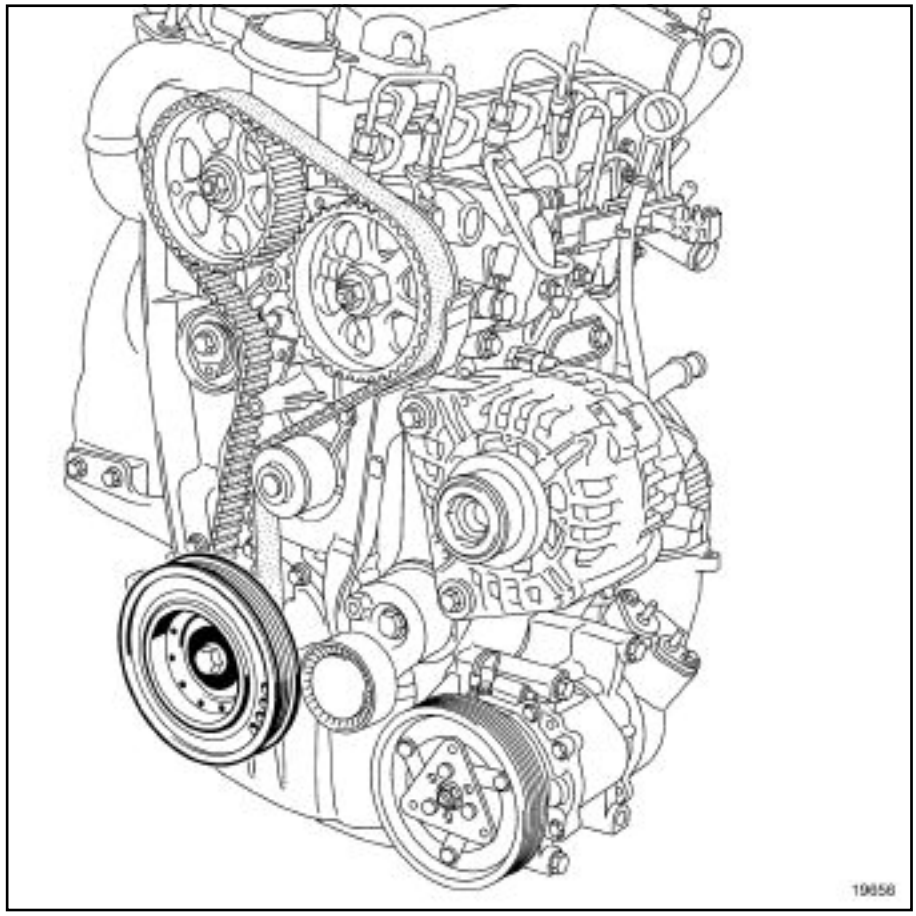
Insert the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.

Remove:

- the camshaft pulley timing pin **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)**

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19652

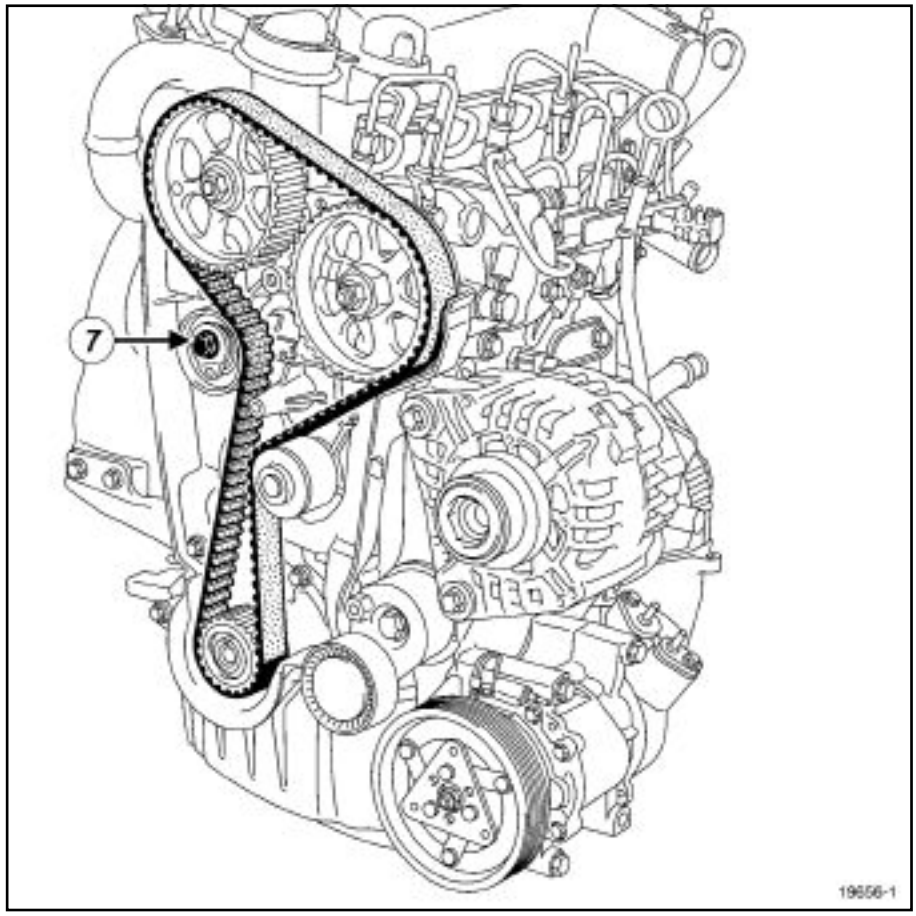


Fit flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .

Note:

For engines that have already had the flywheel removed, screw two used flywheel bolts into the crankshaft to lock it using a large screwdriver.

Timing - cylinder head: Removal



K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19656

Remove the crankshaft accessories pulley.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19656-1

Slacken the tensioning roller bolt (**7**) .

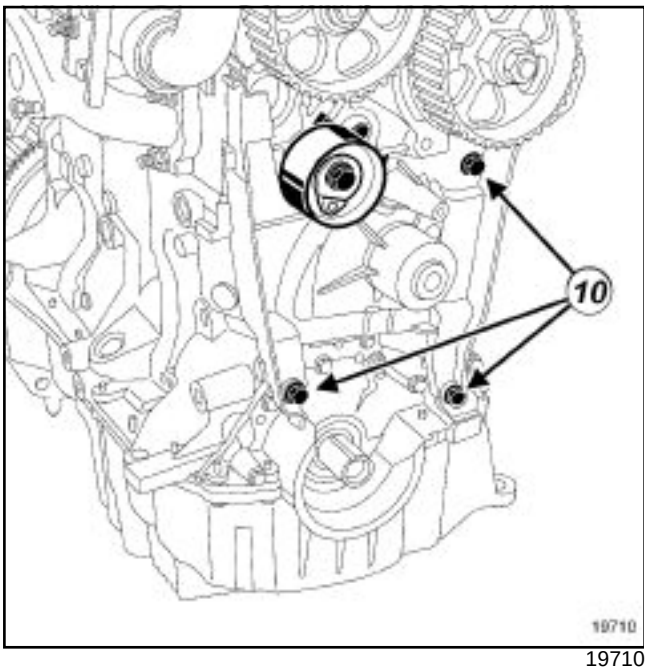
Loosen the timing tensioning roller by turning the eccentric cam using a **6mm** Allen key.

Remove:

- the timing belt taking care not to let the crankshaft timing sprocket fall out,
- the timing tensioning roller.

V - CYLINDER HEAD REMOVAL

VI - GUIDELINES FOR REPAIRS TO THE CYLINDER HEAD

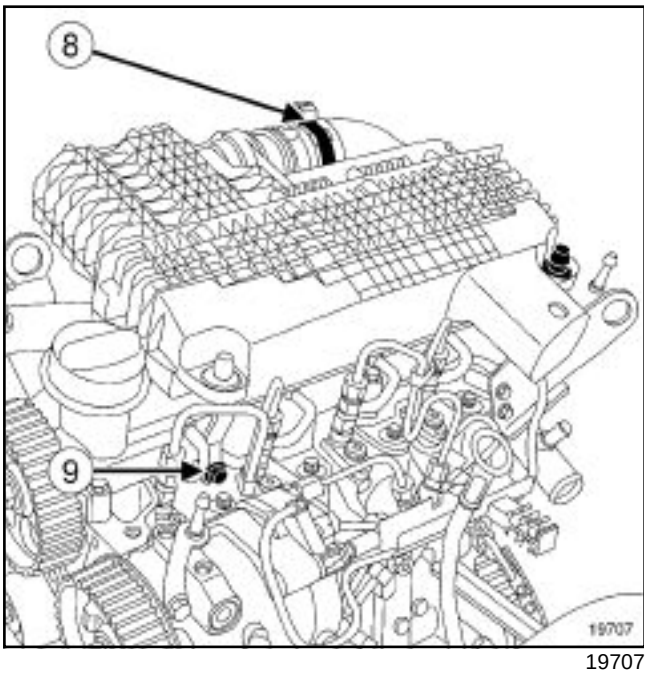


IMPORTANT
Wear protective gloves during every operation.

VII - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

- Male torx socket,
- Female torx socket.

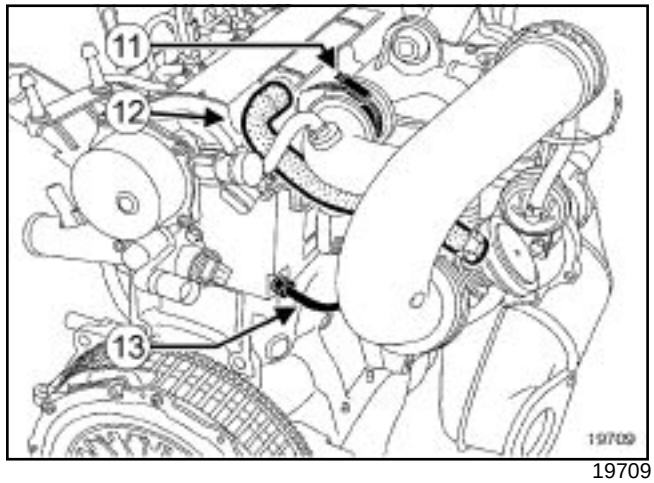
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



VIII - REMOVAL

19710

Remove:

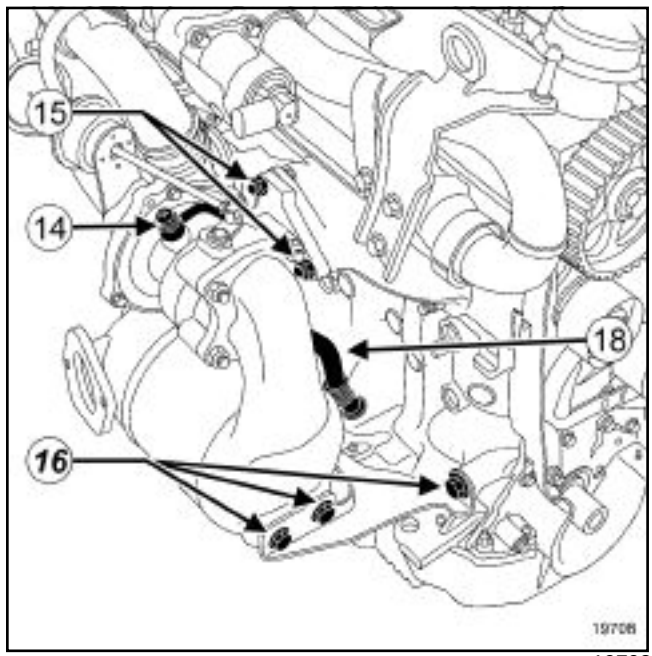


- the inner timing cover mounting bolts (**10**) ,
- the inner timing cover (by tilting the alternator if necessary).

19707

Remove:

- the clip (**8**) ,
- the air filter unit mounting bolt (**9**) ,
- the air filter unit.



19709

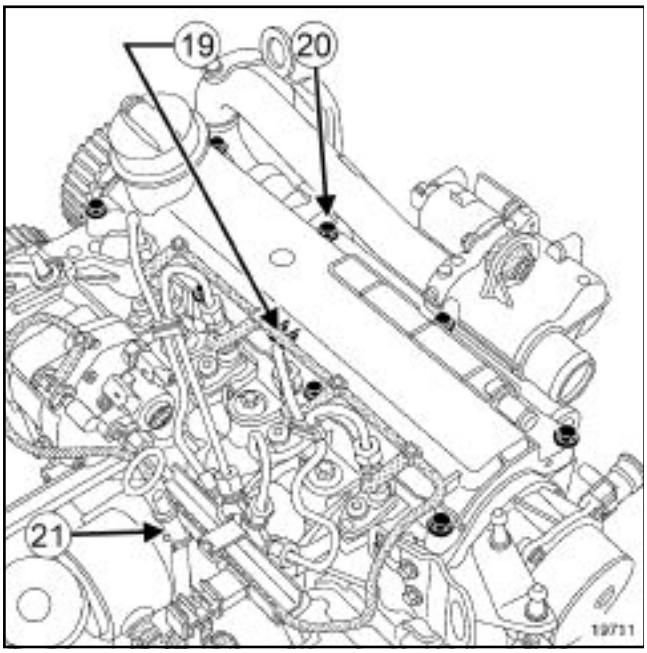
Loosen the clip (**11**) .

Remove the oil vapour rebreathing pipe (**12**) from the rocker cover.

Undo the turbocharger oil supply pipe nut (**13**) .

19708

Remove:



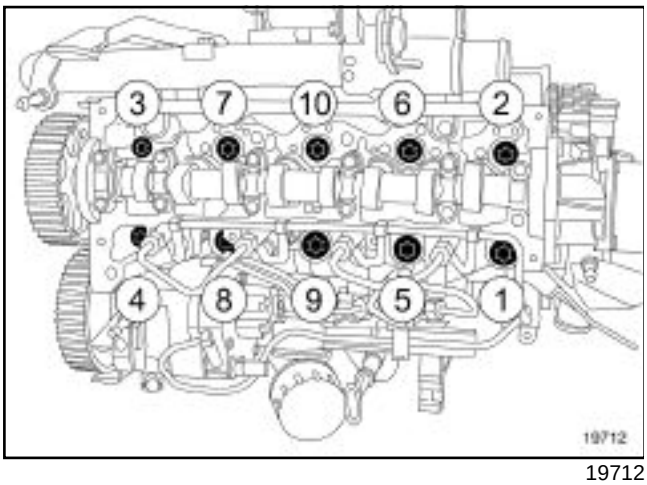
- the turbocharger oil supply pipe bolt (**14**) using a male torx socket,
- the turbocharger oil supply pipe.

Remove:

- the turbocharger oil return pipe bolts (**18**) ,
- the catalytic convertor stay bolts (**16**) ,
- the exhaust flange bolts (**15**) on the turbocharger.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

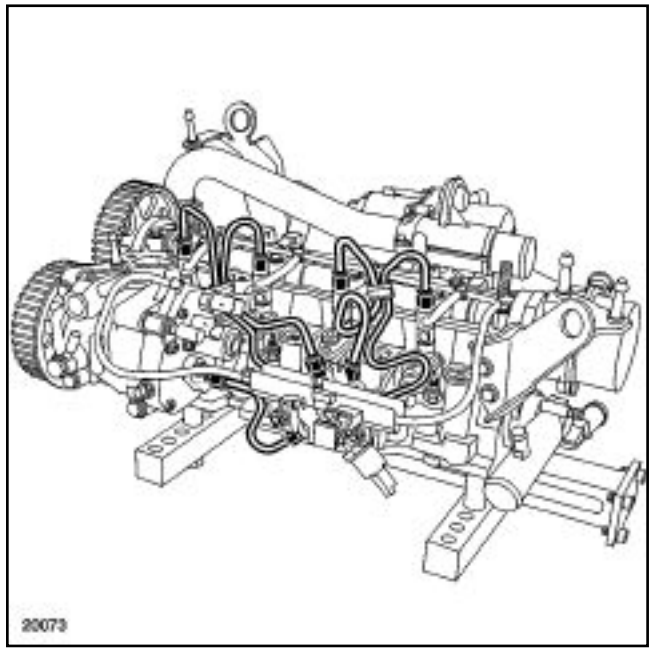
Remove the turbocharger-catalytic converter assembly, taking care **not to damage the turbocharger oil return pipe** ***(18)*** .



19711

Unclip the fuel return pipe from the rocker cover (**19**) .

Remove:



- the dipstick guide tube (**21**) ,
- the rocker cover mounting bolts (**20**) ,
- the rocker cover.

19712

Remove:

- the cylinder head bolts in the order specified using a female torx socket,
- the cylinder head.

20073

Fit the cylinder head onto the cylinder head support **(Mot. 1573)** .

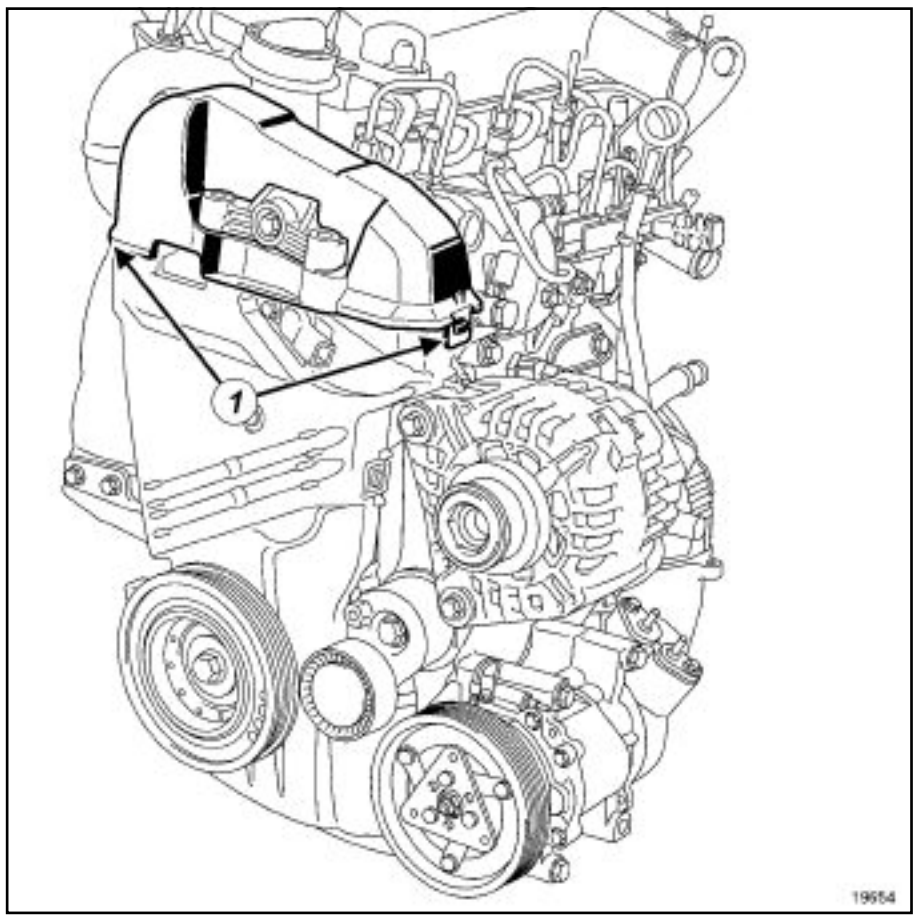
Remove the cylinder head gasket from the cylinder block.

Timing - cylinder head: Removal

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Mot. 1573	Cylinder head support

I - TIMING GEAR REMOVAL

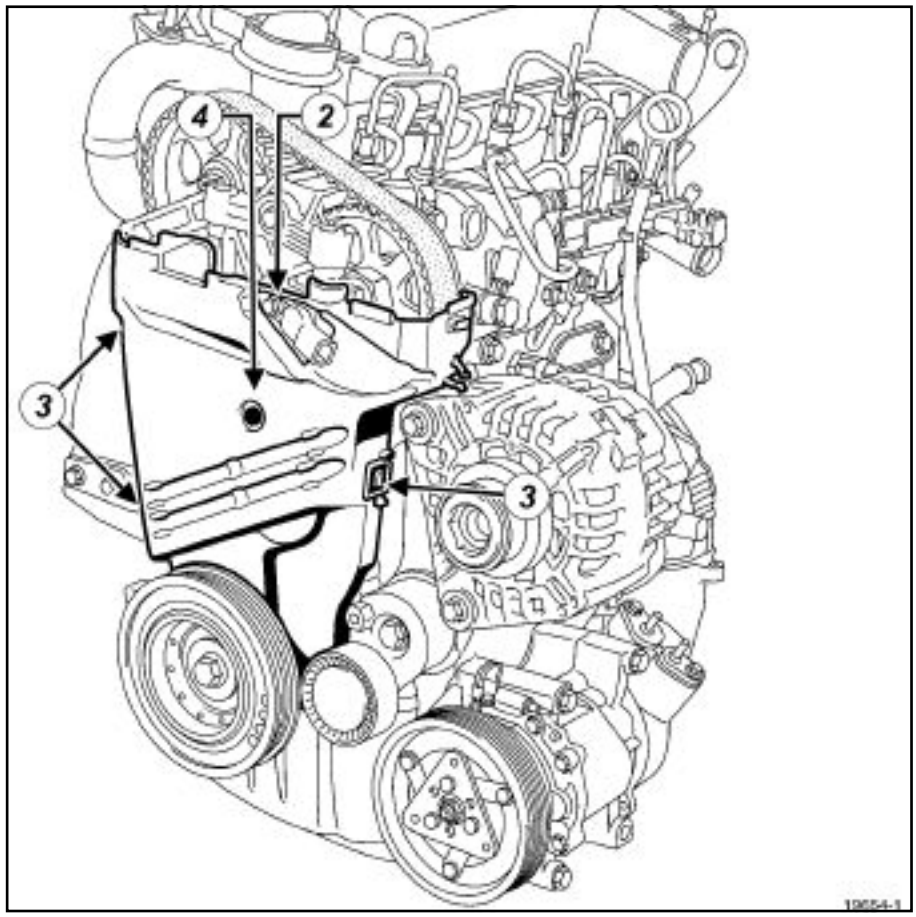


II - GUIDELINES FOR REPAIRS TO THE TIMING GEAR

IMPORTANT
Wear protective gloves during every operation.

III - EQUIPMENT REQUIRED FOR THE TIMING GEAR

- Protective gloves,
- Large screwdriver,
- Allen key (**6mm**),
- Number **14** torx socket.

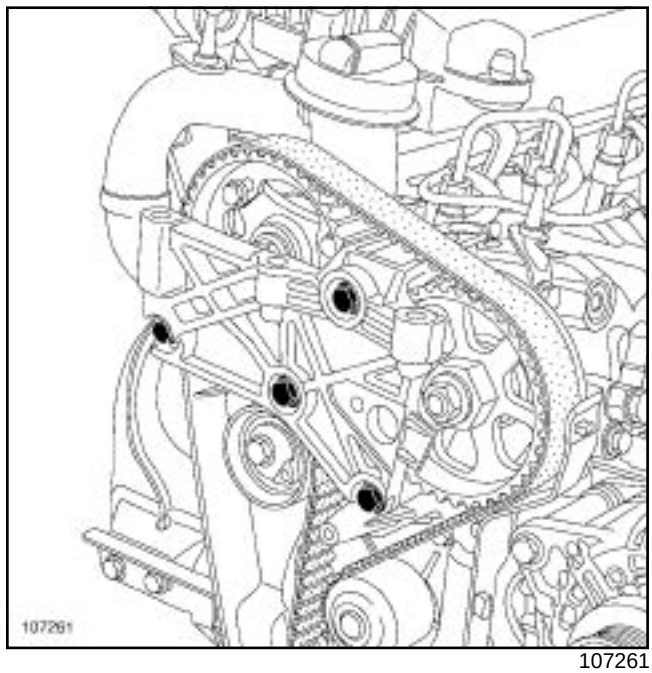


IV - REMOVAL

19654

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

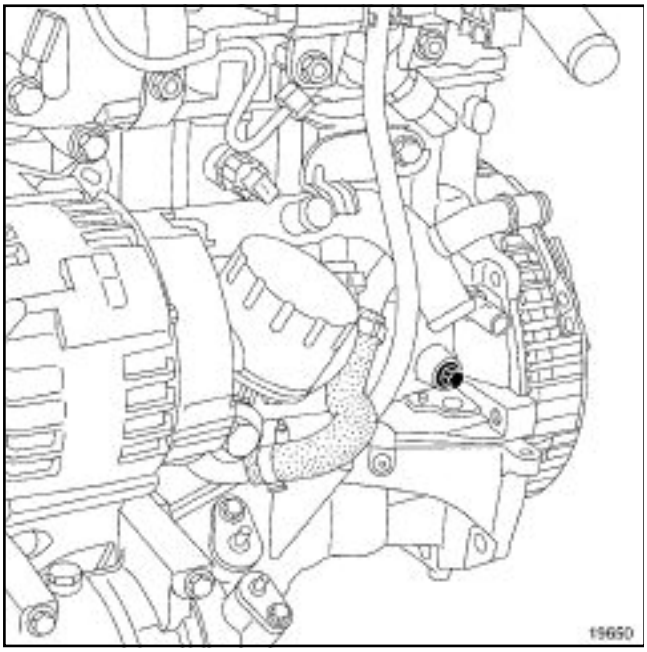


19654-1

Remove:

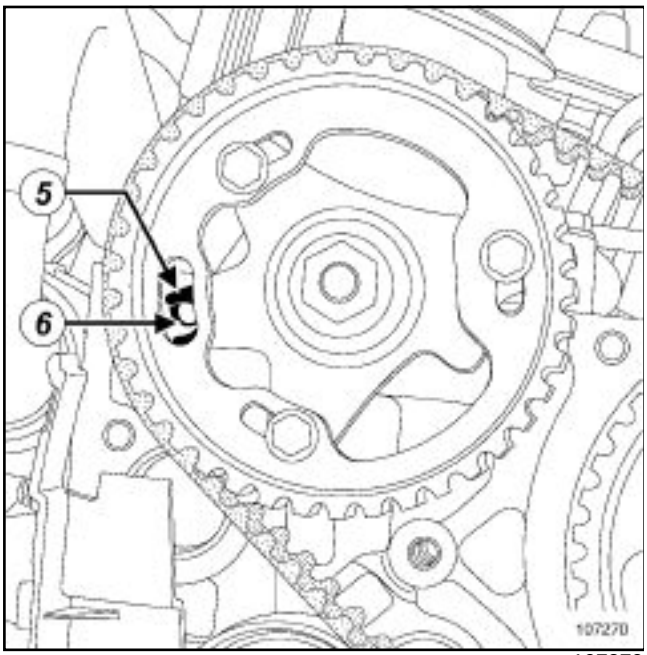
- the high pressure pump position sensor (**2**) ,
- the plastic bolt (**4**) .

Unclip the three tabs (**3**) .



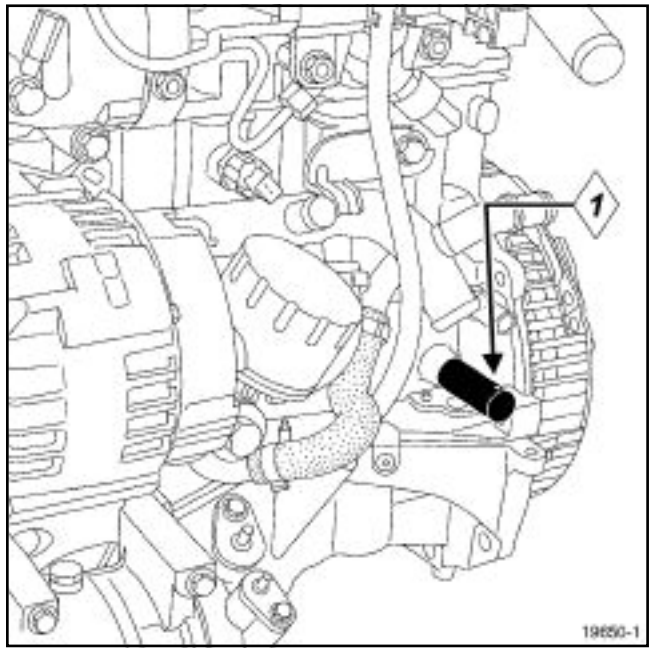
Remove the lower timing cover.

107261



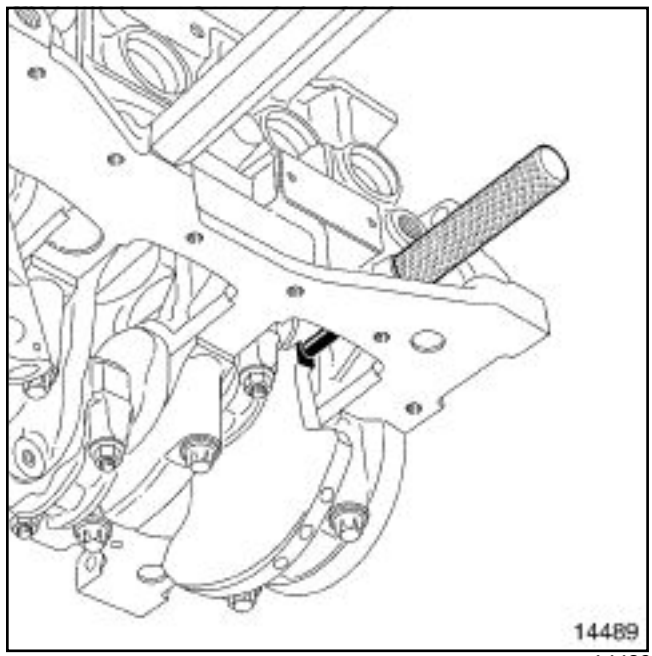
Remove the cylinder head suspended mounting.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



19650

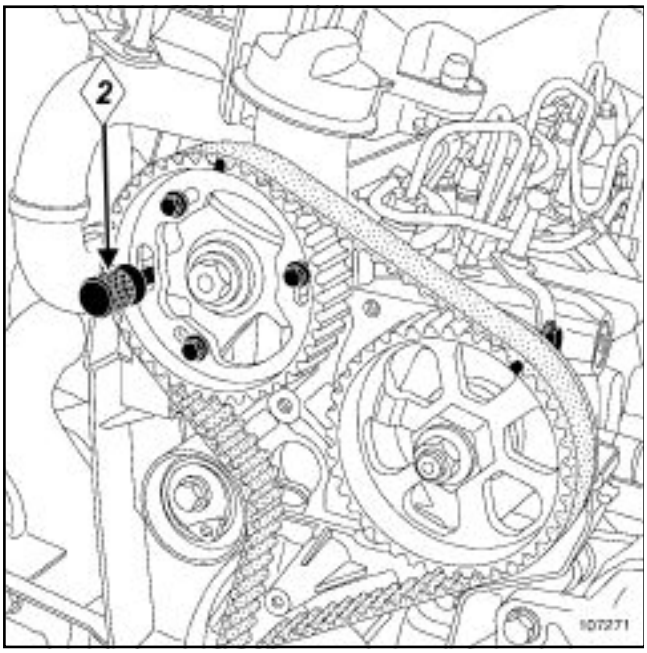
Remove the TDC setting pin plug using a female torx socket (**14**).



107270

Turn the crankshaft to position the hole (**5**) of the camshaft pulley almost opposite the hole (**6**) in the cylinder head.

19650-1

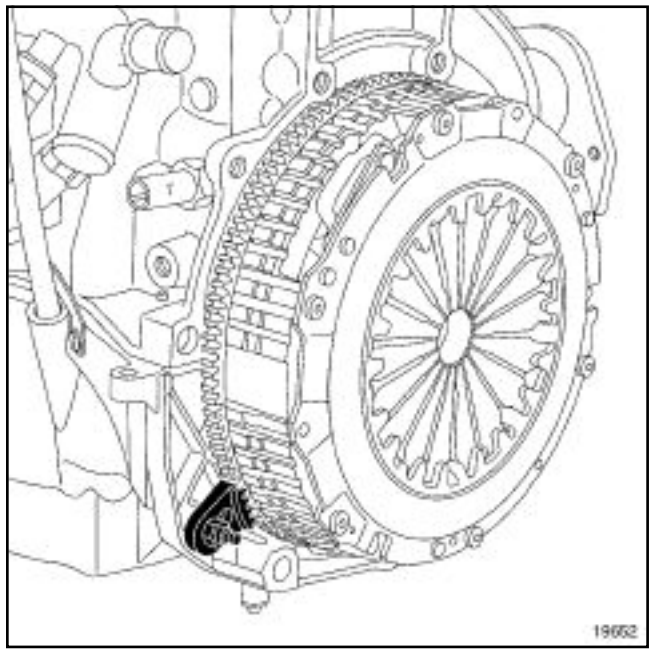


Screw in the TDC setting pin (**1**) **(Mot. 1489)** .

14489

Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

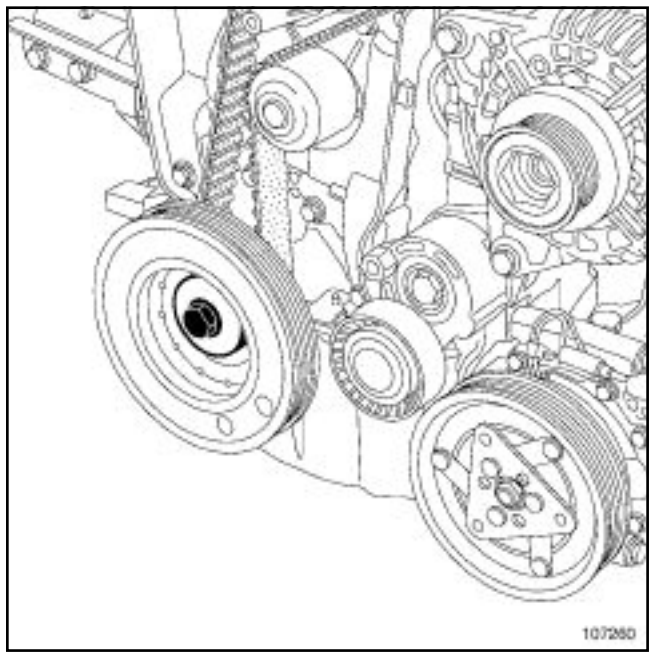


107271

Insert the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.

Remove:

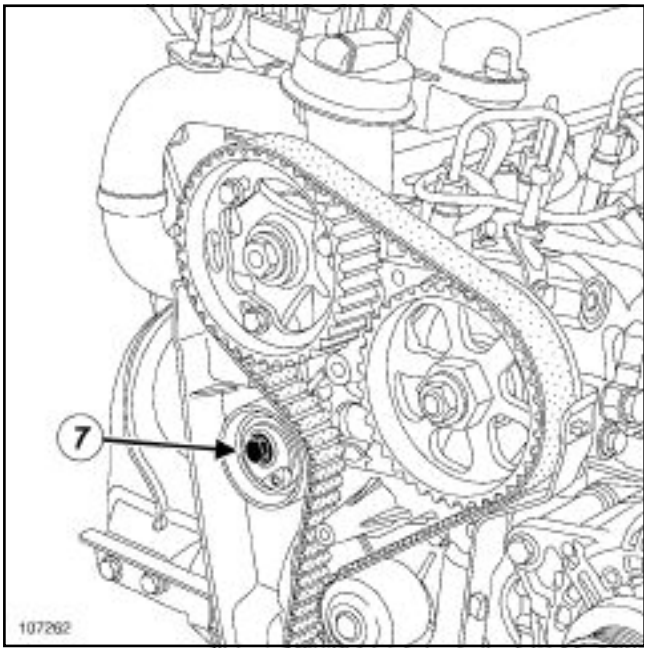
- the camshaft pulley timing pin **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)** .



19652

Fit the flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .

Note:



For engines that have already had the flywheel removed, screw two used flywheel bolts into the crankshaft to lock it using a large screwdriver.

107260

Remove the crankshaft accessories pulley.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

107262

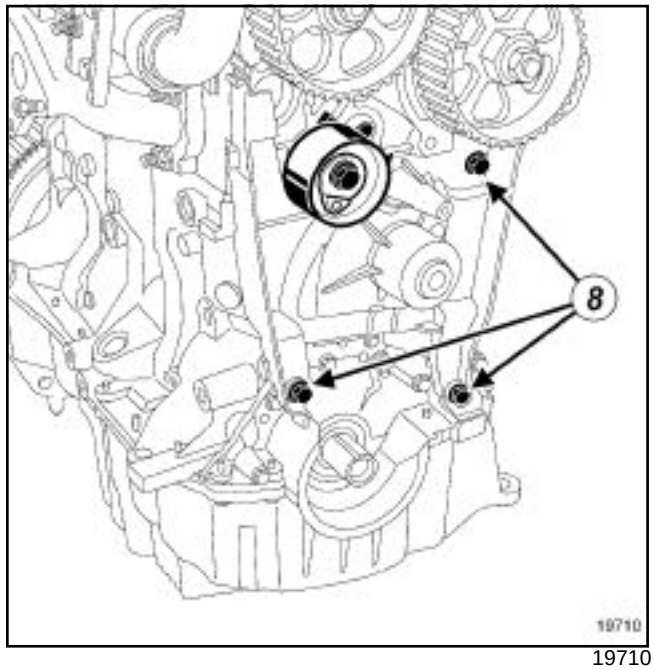
Slacken the tensioning roller bolt (**7**) .

Loosen the timing tensioning roller by turning the eccentric cam using a **6mm** Allen key.

Remove:

- the timing belt,
- the timing tensioning roller.

V - CYLINDER HEAD REMOVAL

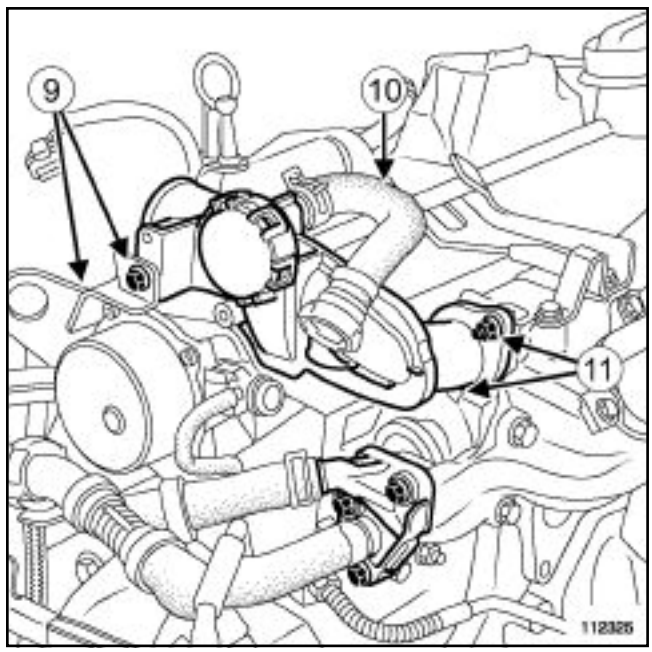


VI - GUIDELINES FOR REPAIRS TO THE CYLINDER HEAD

IMPORTANT
Wear protective gloves during every operation.

VII - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

- Female torx socket.

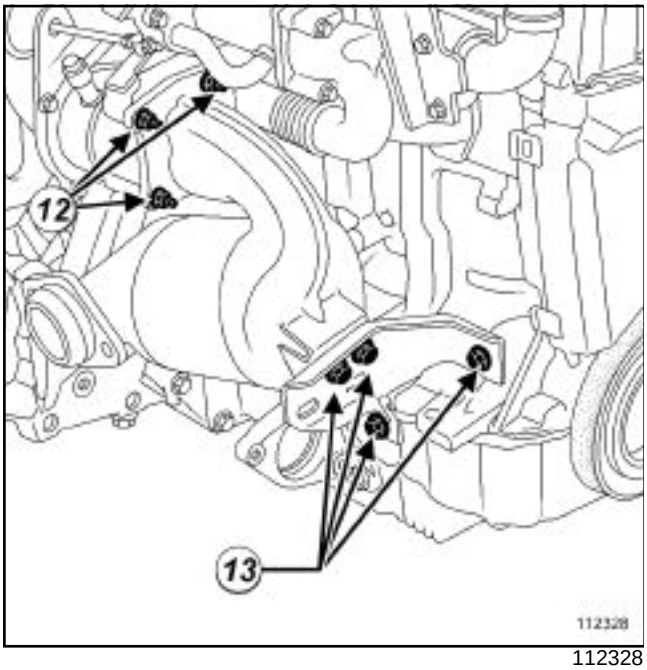


VIII - REMOVAL

19710

Remove:

- the inner timing cover mounting bolts (**8**) ,
- the inner timing cover (by tilting the alternator if necessary).

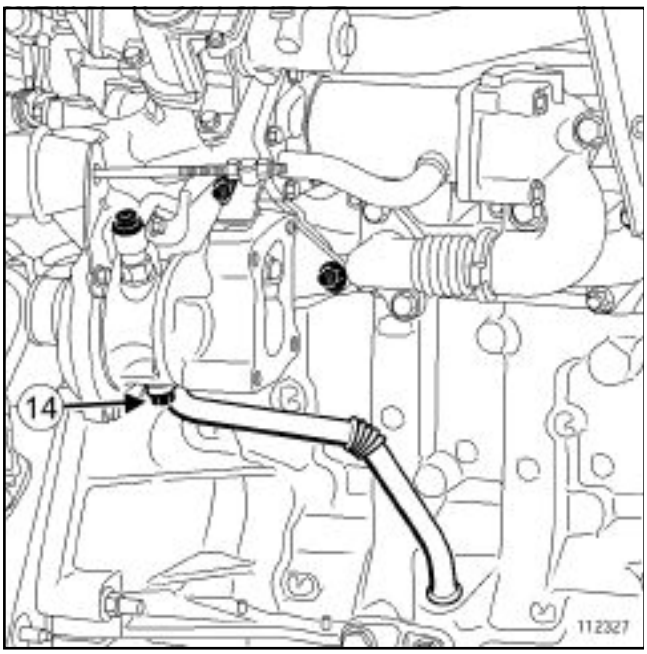


112325

Disconnect the oil vapour recirculation pipe (**10**) .

Remove:

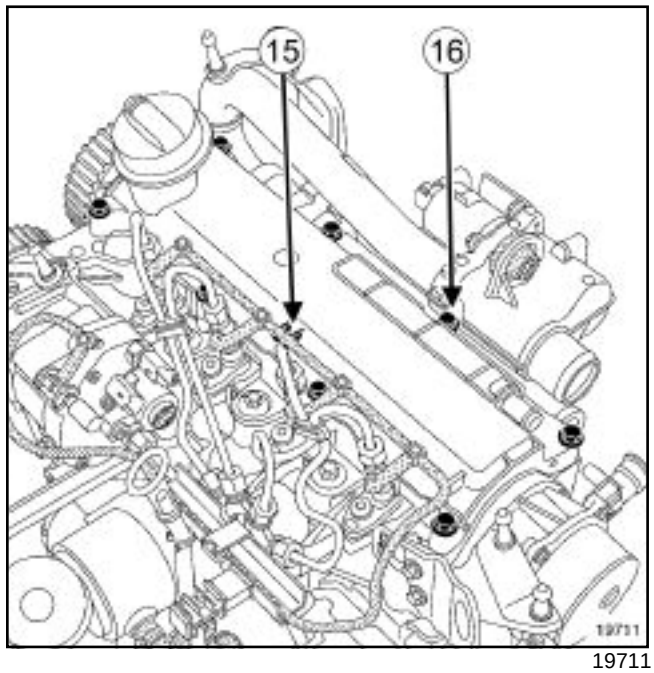
- the oil vapour recirculation valve bolts (**11**) ,
- the oil vapour recirculation valve mounting bracket bolts (**9**) ,



- the oil vapour recirculation valve.

112328

Remove:

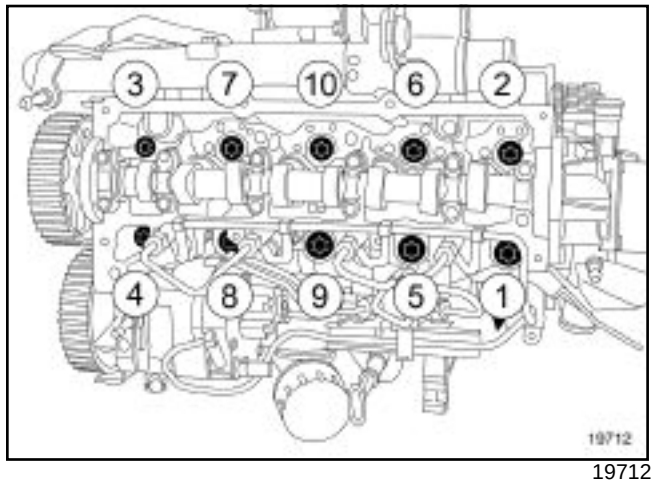


- the catalytic convertor stay bolts (**13**) ,
- the catalytic convertor nuts (**12**) on the turbocharger,
- the catalytic converter.

112327

Remove:

- the turbocharger oil return pipe mounting bolts (**14**) ,
- the turbocharger oil return pipe.

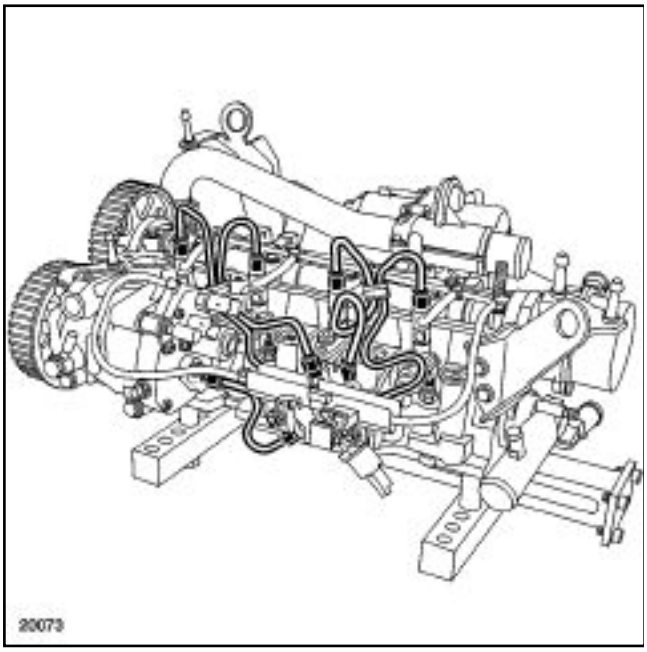


19711

Unclip the fuel return pipe from the rocker cover (**15**) .

Remove:

- the dipstick guide,
- the rocker cover mounting bolts (**16**) ,
- the rocker cover.



19712

Remove:

- the cylinder head bolts in the order specified using a female torx socket,
- the cylinder head.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

20073

Fit the cylinder head onto the cylinder head support **(Mot. 1573)** .

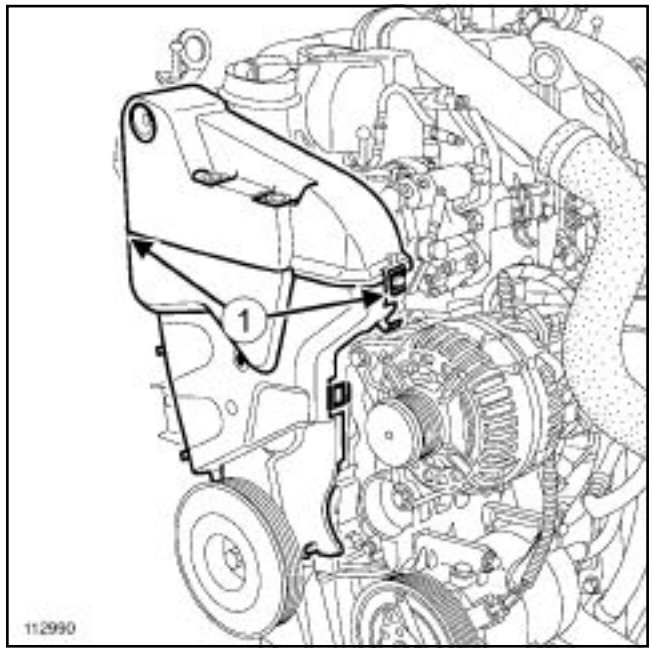
Remove the cylinder head gasket from the cylinder block.

K9K, and 732 or 764

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1677	Flywheel locking tool.
Mot. 1573	Cylinder head support

I - TIMING GEAR REMOVAL

II - GUIDELINES FOR REPAIRS TO THE TIMING GEAR

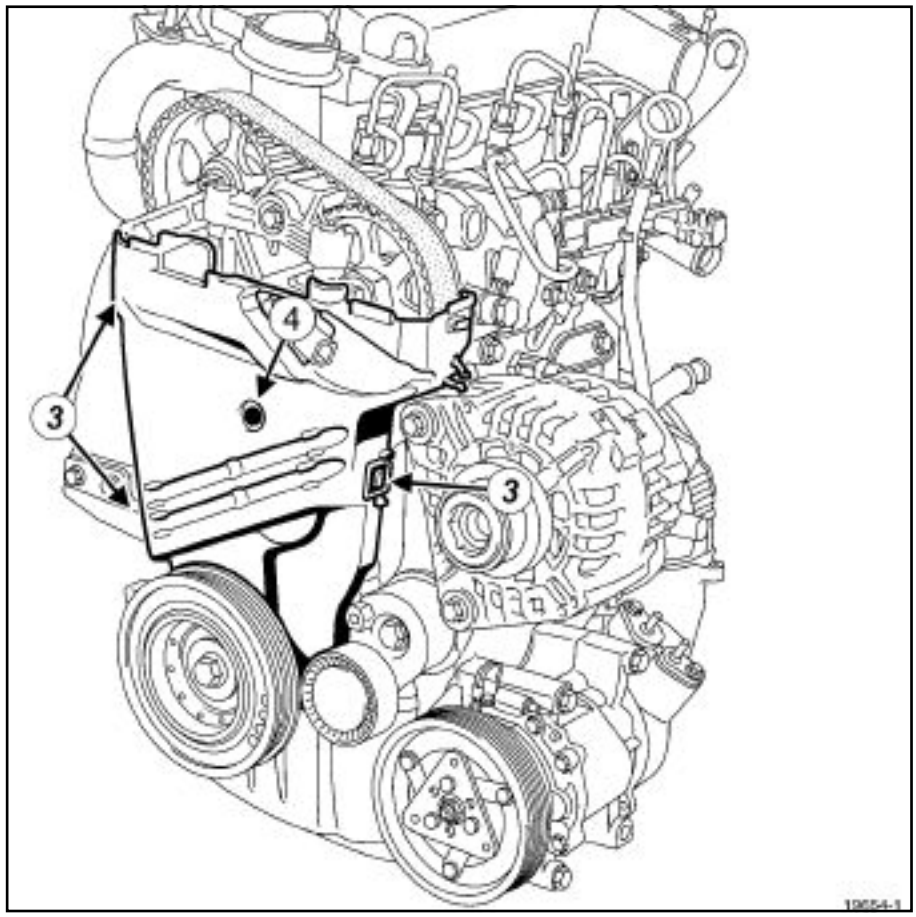


IMPORTANT
Wear protective gloves during every operation.

III - EQUIPMENT REQUIRED FOR THE TIMING GEAR

- Protective gloves,
- Large screwdriver,
- Allen key **(6mm),**
- Torx socket (**14**).

IV - REMOVAL

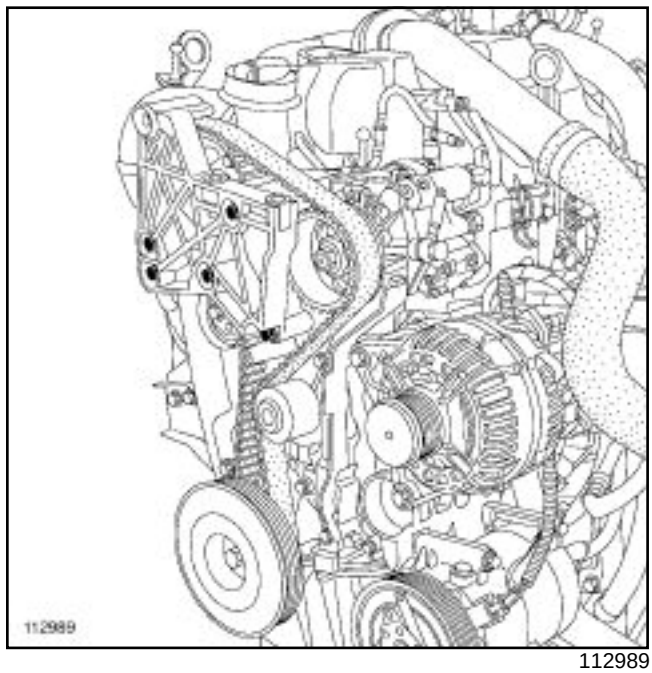


K9K, and 732

112990

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 732 or 764

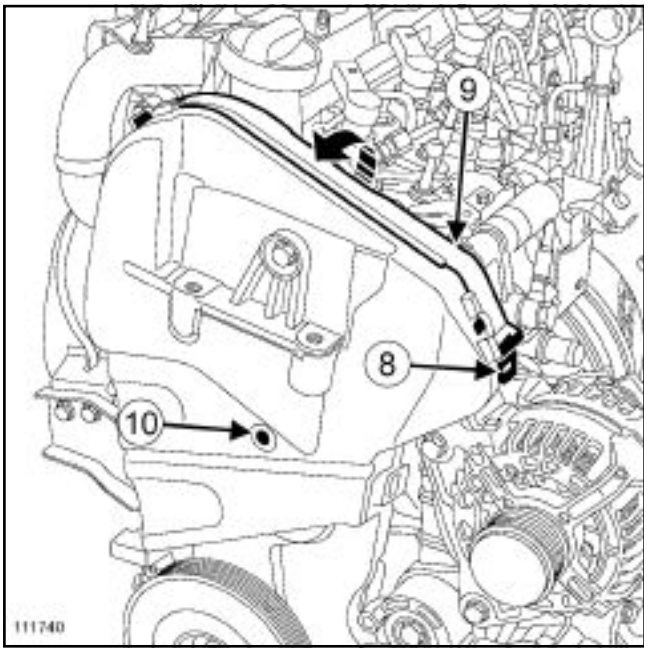


19654-1

Remove the plastic bolt (**4**) .

Unclip the three tabs (**3**) .

Remove the lower timing cover.

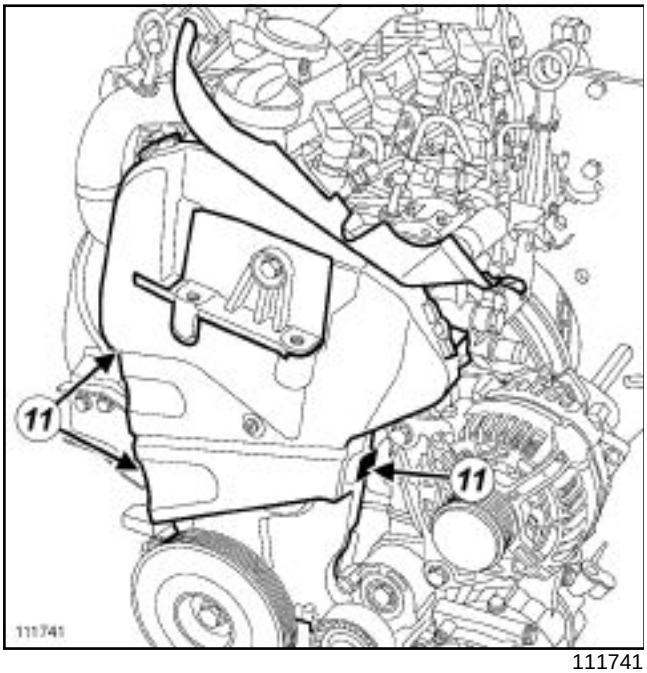


112989

Remove the cylinder head suspended mounting.

K9K, and 732 or 764

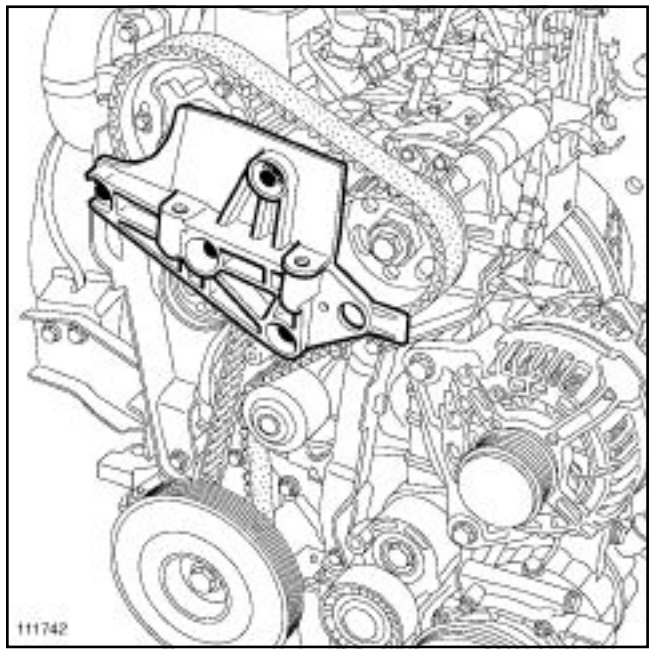
K9K, and 764



111740

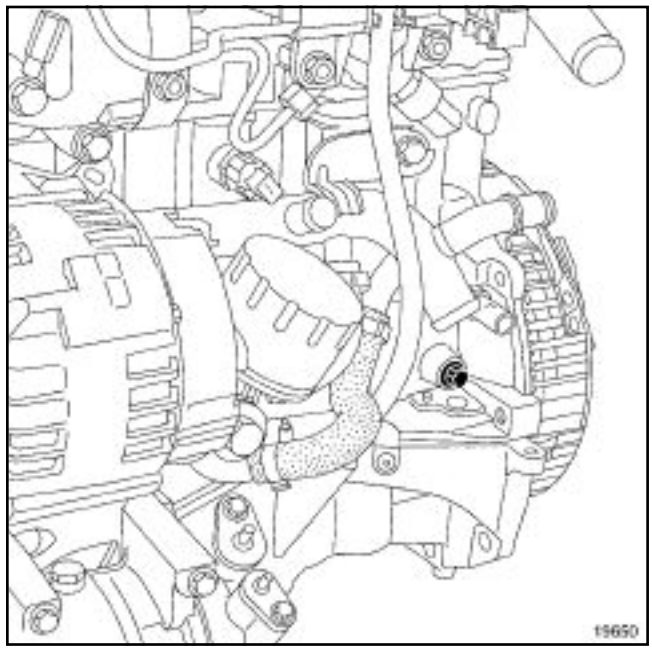
Unclip the tab (**8**) .

Rotate the timing cover (**9**) in the direction of the arrow.



Remove the plastic bolt (**10**) .

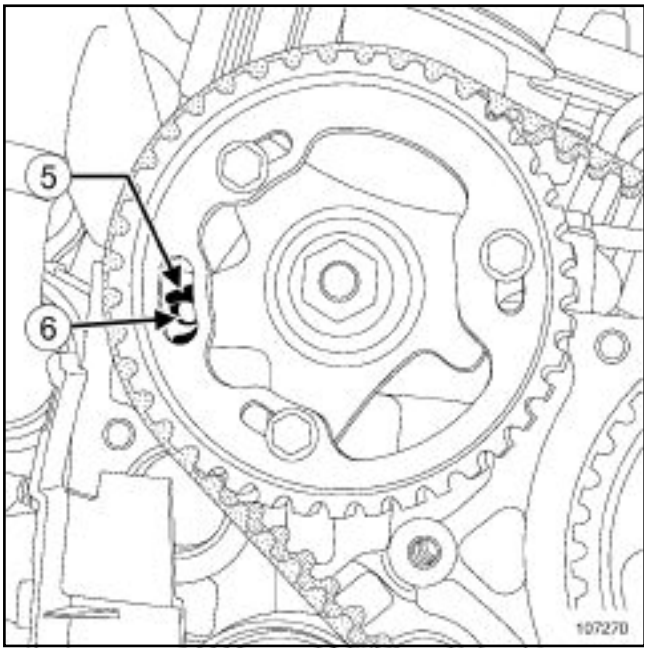
111741



Unclip the three tabs (**11**) .

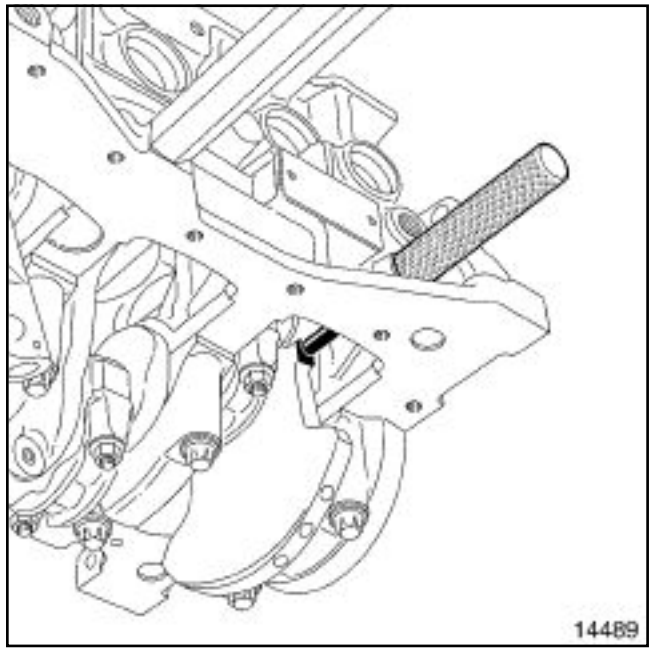
Remove the timing cover.

111742



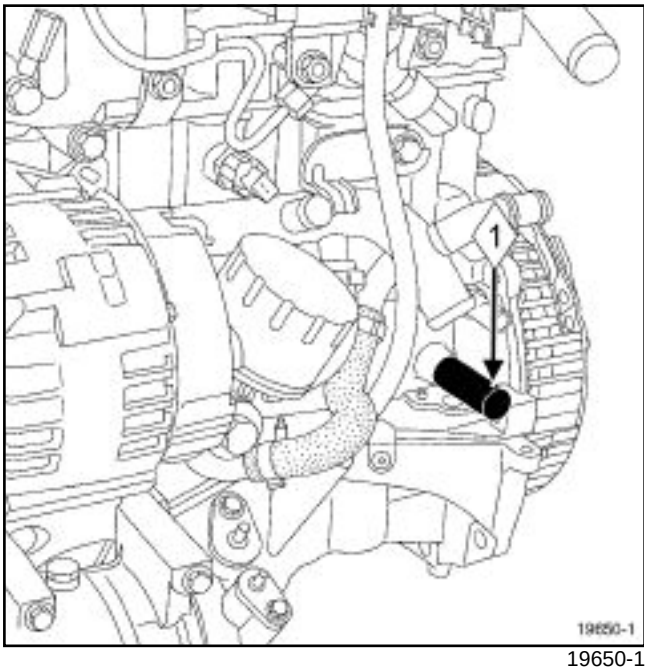
Remove the cylinder head suspended mounting.

19650



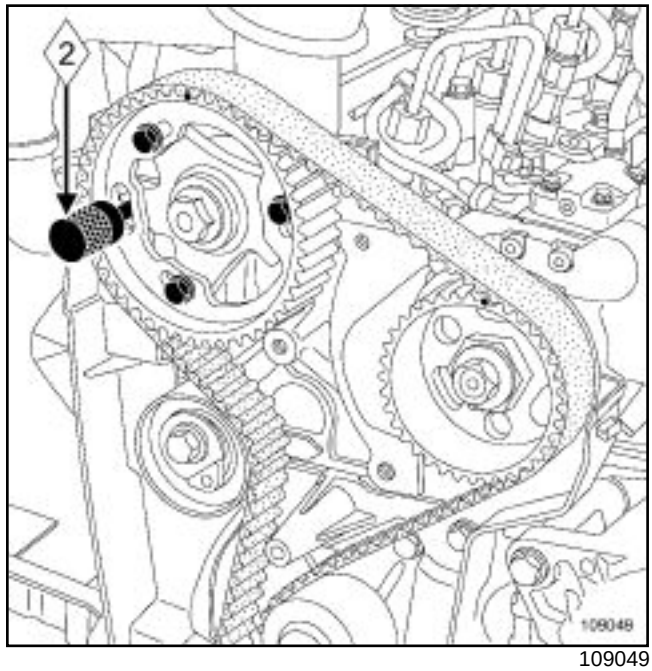
Remove the TDC setting pin plug using a female torx socket (**14**).

K9K, and 732 or 764



107270

Turn the crankshaft to position the hole (**5**) of the camshaft pulley almost opposite the hole (**6**) in the cylinder head.

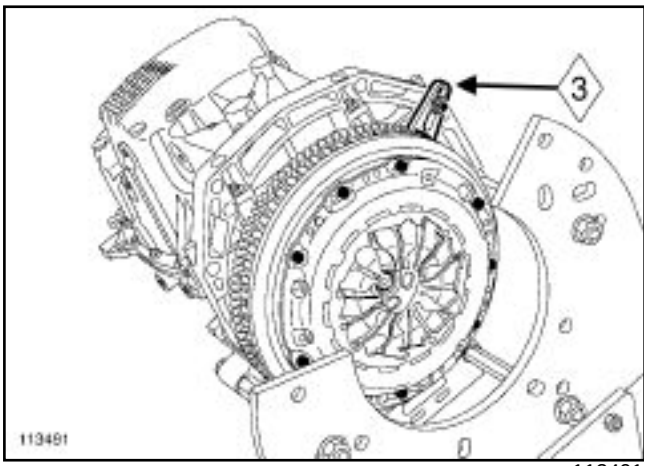


14489

Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

19650-1

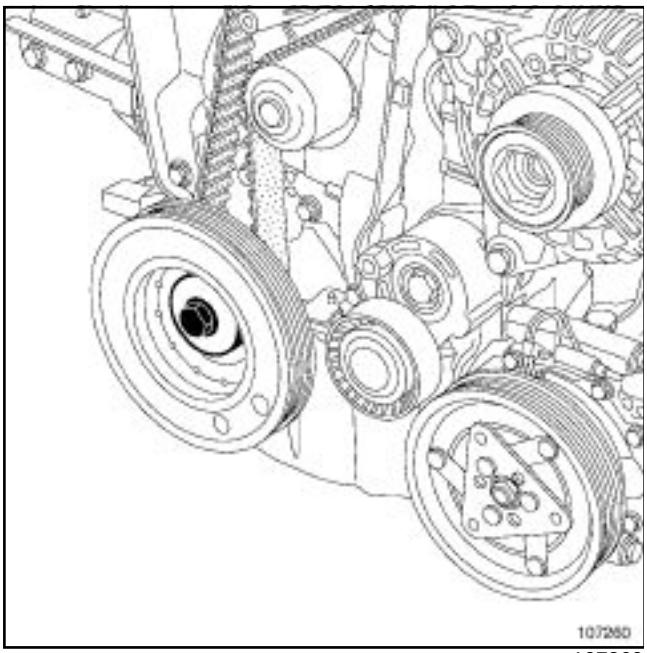
Screw in the TDC setting pin (**1**) **(Mot. 1489)** .



109049

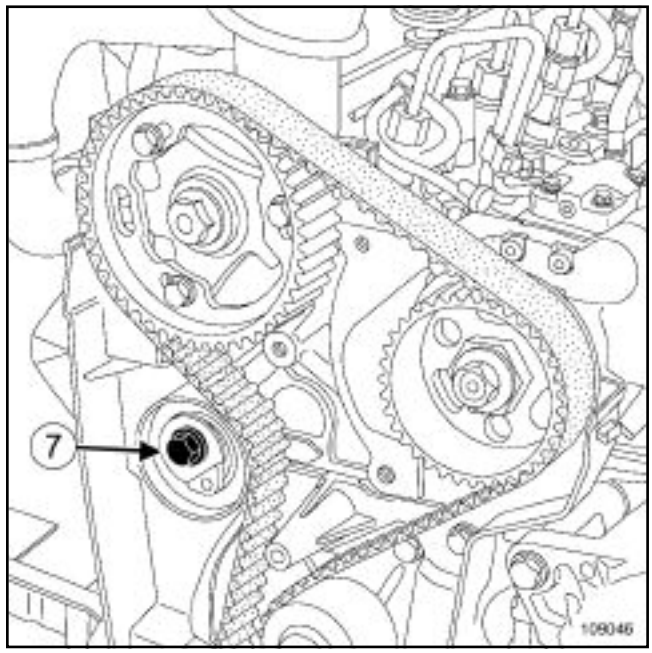
Insert the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.

Remove:



- the camshaft pulley timing pin **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)** .

K9K, and 732 or 764



113491

Fit the flywheel locking tool (**3**) **(Mot. 1677)** .

107260

Remove the crankshaft accessories pulley.

109046

Slacken the tensioning roller bolt (**7**) .

Slacken the timing tension wheel by turning the eccentric cam using a **6mm** allen key

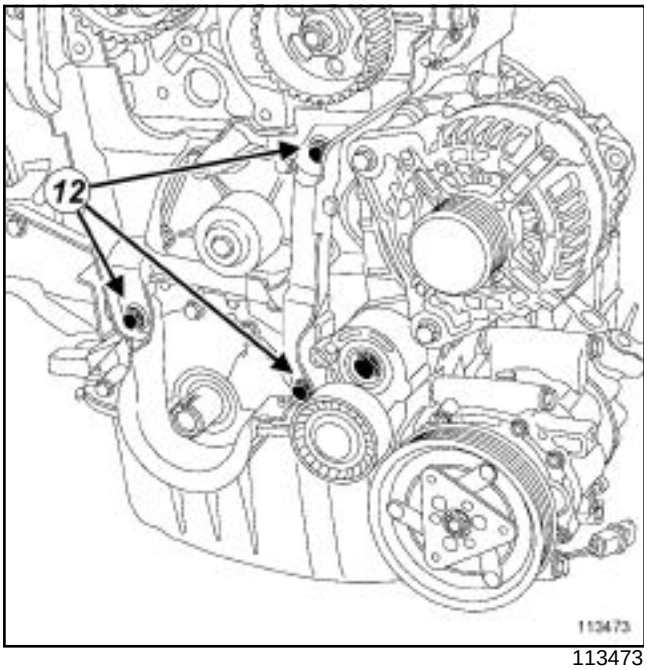
Remove:

- the timing belt,

- the timing tensioning roller.

V - CYLINDER HEAD REMOVAL

VI - GUIDELINES FOR REPAIRS TO THE CYLINDER HEAD

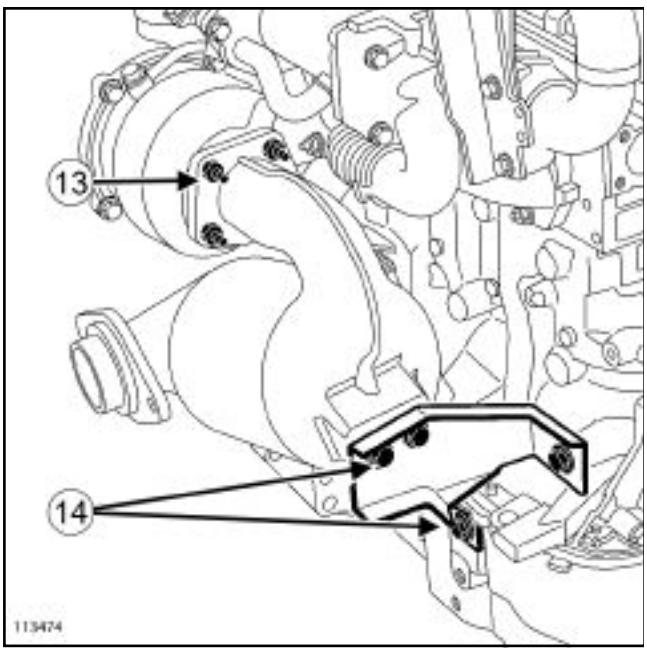


IMPORTANT
Wear protective gloves during every operation.

VII - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

- Female torx socket.

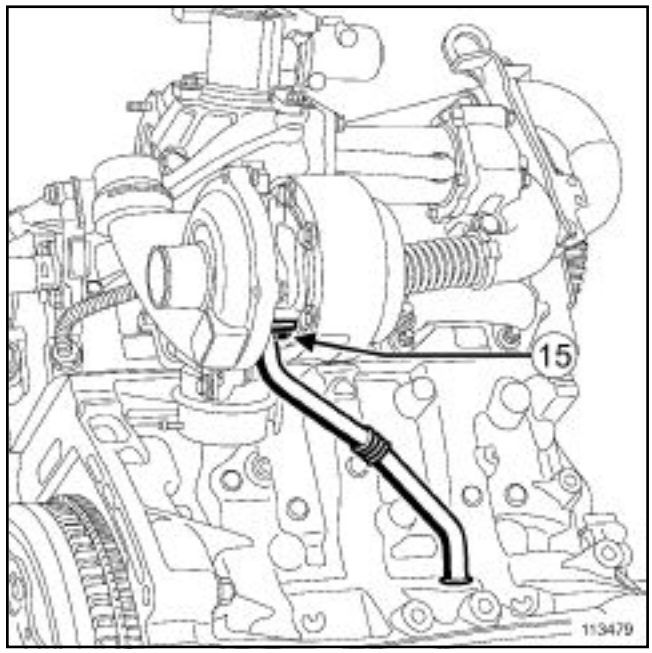
K9K, and 732 or 764



VIII - REMOVAL

113473

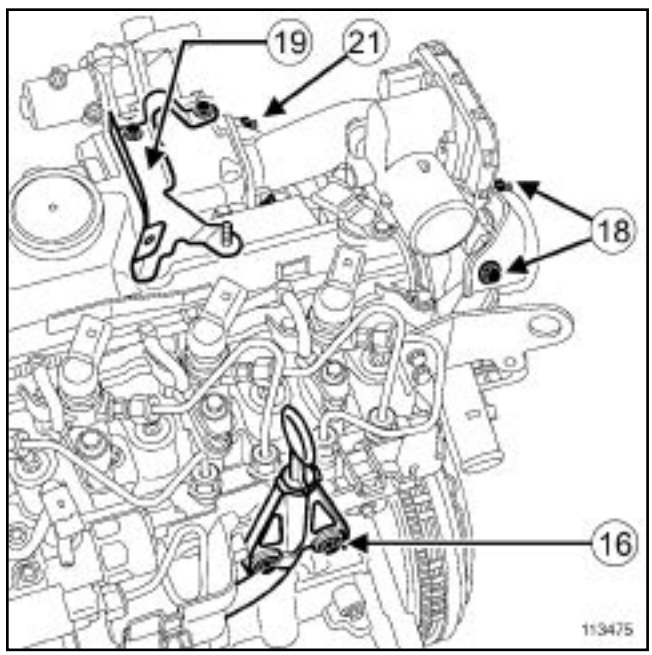
Remove:



- the inner timing cover mounting bolts (**12**) ,
- the inner timing cover (by tilting the alternator if necessary).

113474

Remove:

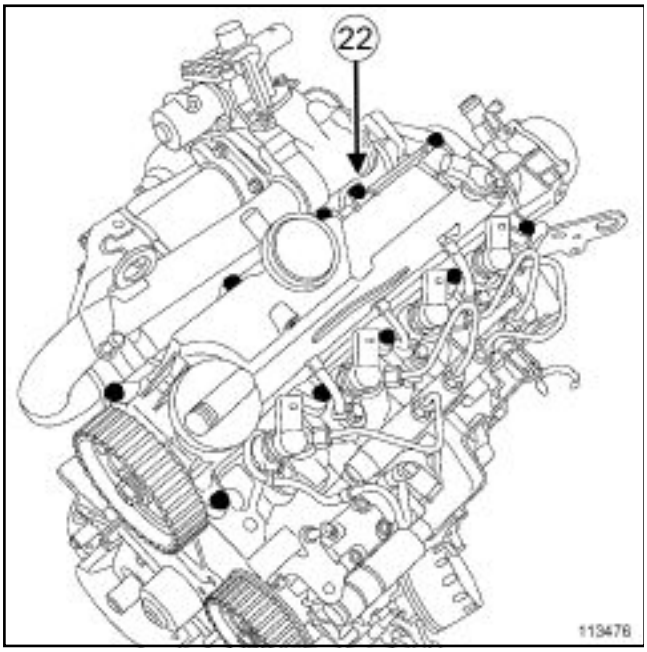


- the catalytic convertor mounting bolts (**14**) ,
- the catalytic convertor nuts (**13**) on the turbocharger,
- the catalytic converter.

113479

Remove:

- the turbocharger oil return pipe mounting bolts (**15**) ,
- the turbocharger oil return pipe.

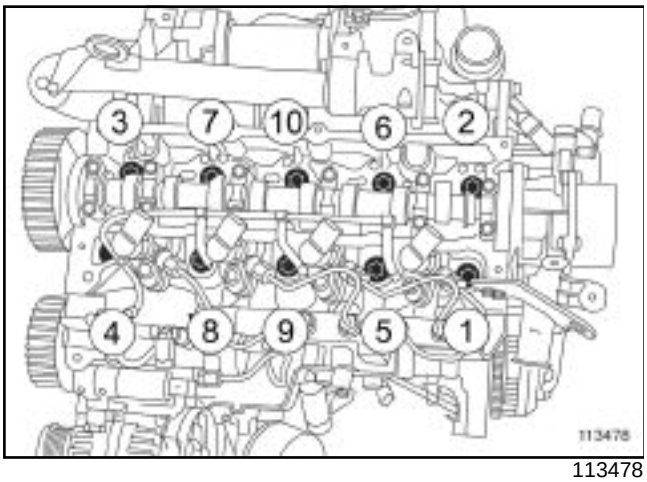


113475

Remove:

- the dipstick guide mounting nuts (**16**) ,
- the dipstick guide,
- the damper valve mounting bracket bolts (**18**) ,
- the damper valve mounting bolts (**21**) ,
- the damper valve,

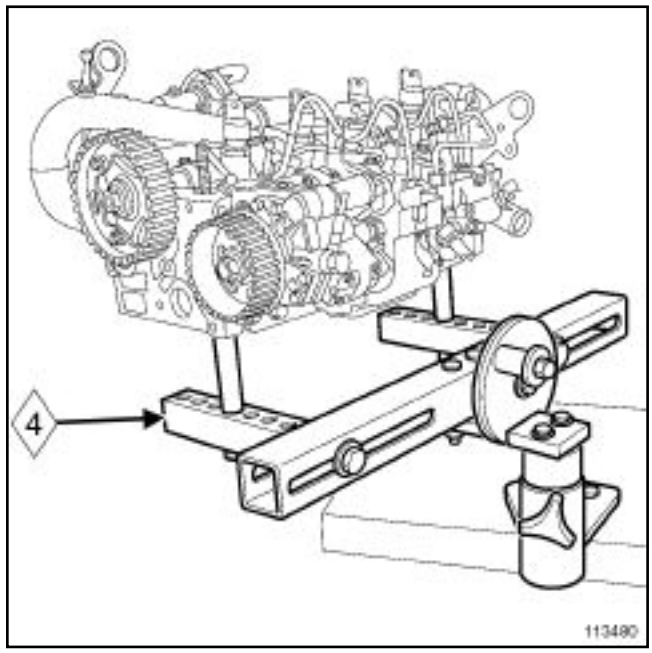
K9K, and 732 or 764



- the EGR valve retaining bracket (**19**) .

113476

Remove:



- the rocker cover mounting bolts (**22**) ,
- the rocker cover.

113478

Remove:

- the cylinder head bolts in the order specified using a female torx socket,
- the cylinder head.

113480

Fit the cylinder head onto the cylinder head support (**4**) **(Mot. 1573)** .

Remove the cylinder head gasket from the cylinder block.

Cylinder head: Dismantling

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Special tooling required	
Mot. 1566	Spanner for removing high pressure pipes.
Mot. 1746	Offset spanner for tightening high pressure pump pipes.
Mot. 1567	Long nose pliers for EGR duct clips.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1502	Valve lifting tool for removing valves.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

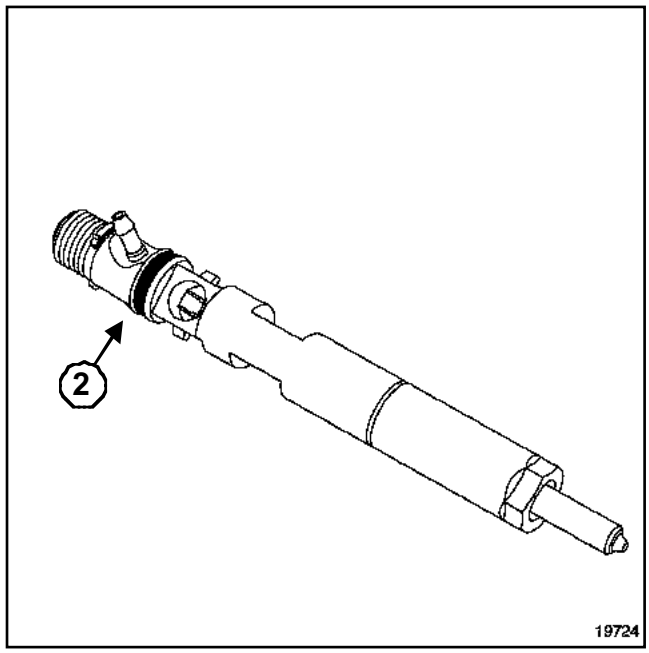
- It is essential to follow the cleanliness guidelines (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) ,
- Wear latex safety gloves when using the cleaning agent,
- Wear safety goggles fitted with side shields.

WARNING

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cleaning cloths only, if necessary.

II - PARTS AND CONSUMABLES FOR THE REPAIRS

Consumables



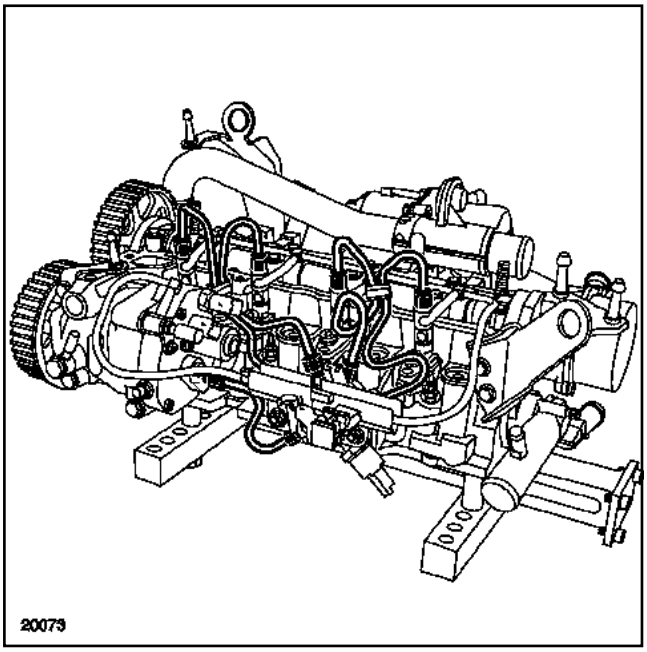
- Set of blanking plugs, part number **77 01 206 804** ,
- Cleaning cloths, part number **77 11 211 707** ,
- Brake cleaner, part number **77 11 226 128** ,
- Injector cleaner, part number **77 11 224 188** .

III - EQUIPMENT REQUIRED

- Protective goggles (with side shields),
- Latex protective gloves,
- Indelible marker,
- Plastic bags,
- Valve spring compressor,
- Tweezers,
- Spanner for the high pressure pipes,
- Crow foot spanner,
- Wrench with hinge for heater plugs,
- Male torx sockets.

IV - STRIPPING DOWN THE CYLINDER HEAD

Clean the high pressure pipe unions (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) .

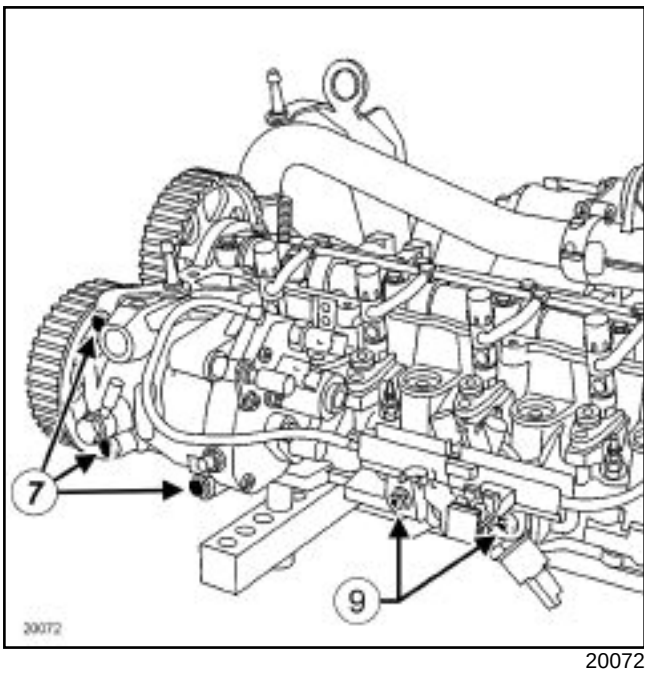


19724

Note:

It is essential that the injector intermediate union (**2**) is secured when loosening the high pressure pipes.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

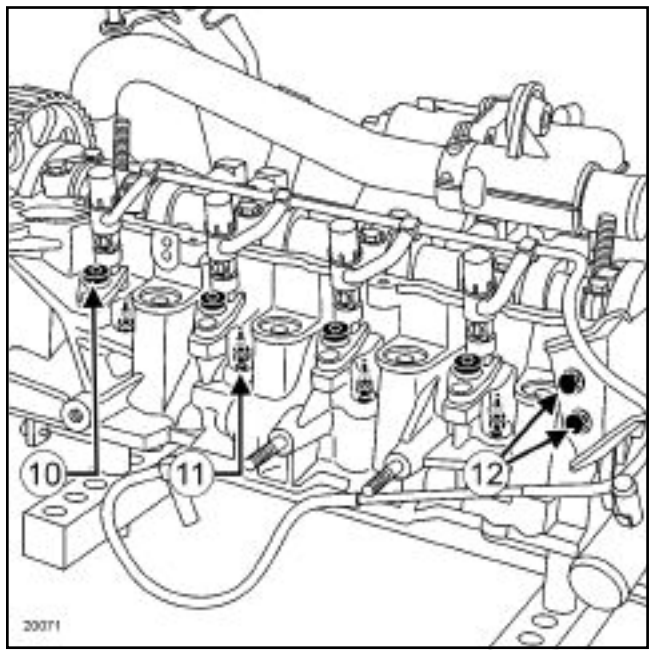


20073

Remove the high pressure pipes using the **(Mot. 1566)** and **(Mot. 1746)** or using a pipe wrench.

Fit blanking plugs:

- to the high pressure pump,
- to the rail,
- to the injectors.



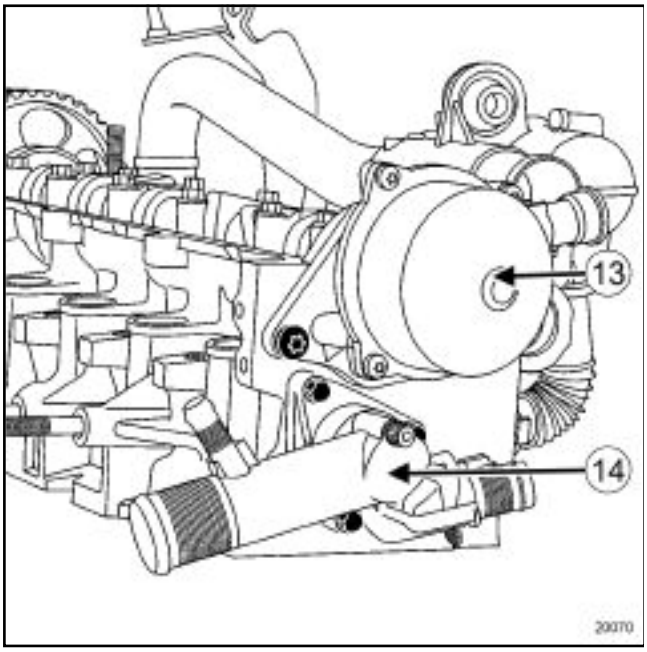
20072

Remove:

- the high pressure pump mounting bolts (**7**) ,
- the high-pressure pump,
- the high pressure rail mounting nuts (**9**) ,
- the rail.

Note:

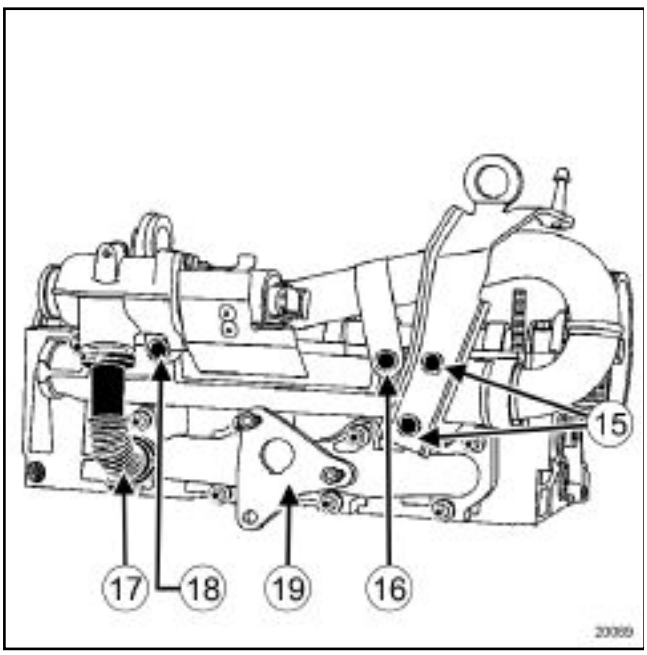
It is essential to match the injectors to their respective cylinders using an indelible marker.



20071

Remove:

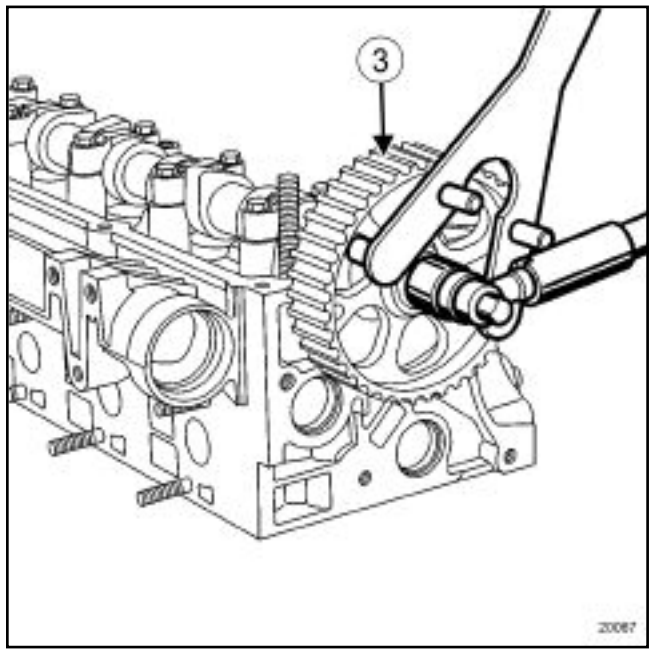
- the injector clamp bolts (**10**) ,
- the injectors,
- the heater plugs (**11**) using a hinged wrench,
- the engine lifting eye (flywheel end) bolts (**12**) ,
- the engine lifting eye (flywheel end),



K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

20070

Remove:

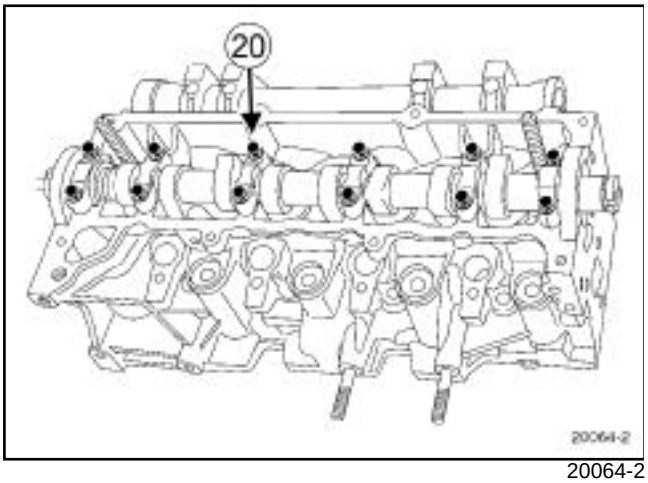


- the vacuum pump bolts (**13**) ,
- the vacuum pump,
- the cylinder head coolant outlet unit mounting bolts (**14**)
- the cylinder head coolant outlet housing

20069

Remove:

- the engine lifting eye (timing end) mounting bolts (**15**) ,
- the engine lifting eye (timing end),
- the exhaust gas recirculation pipe clips (**17**) using the **(Mot. 1567)** ,
- the exhaust gas recirculation pipe,
- the air inlet duct mounting bolt (**16**) ,
- the inlet duct,
- the exhaust gas recirculation valve mounting bolts (**18**) ,
- the exhaust gas recirculation valve,
- the exhaust manifold mounting nuts (**19**) ,
- the exhaust manifold.



20067

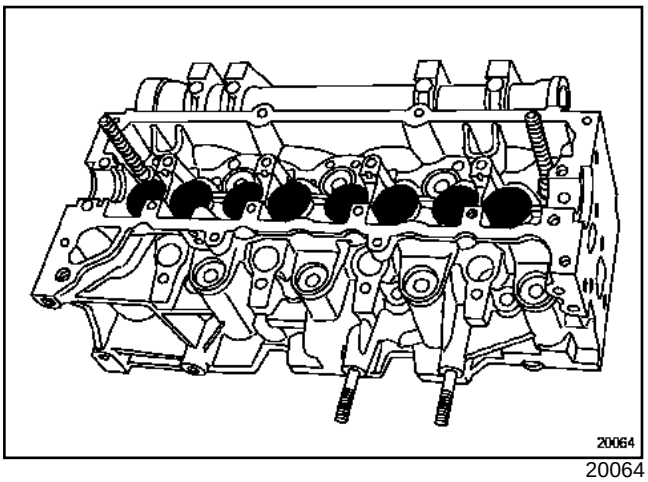
Lock the camshaft pulley using the **(Mot. 799-01)**

Remove:

- the camshaft pulley mounting nut,
- the camshaft pulley.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

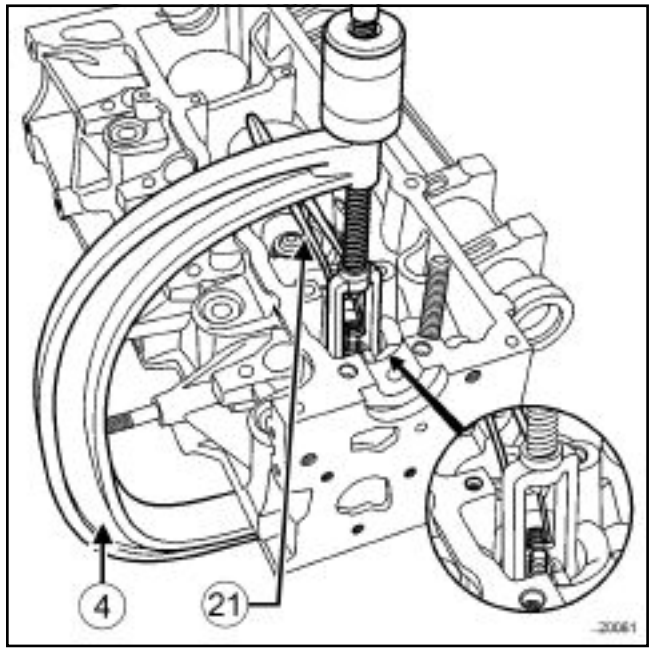
20064-2



Remove:

- the camshaft bearing cap mounting bolts (**20**) ,
- the camshaft bearing caps.

Remove the camshaft.



Note:

It is essential to match the valve tappets to their respective cylinders using an indelible marker.

20064

Remove the valve tappets.

20061

Compress the valve springs using the **(Mot. 1502)** (**4**) or using a valve spring compressor.

Remove:

- the collets using tweezers ***(21)*** ,
- the valve spring upper cups,
- the valve springs,
- the valves.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1566	Spanner for removing high pressure pipes.
Mot. 1746	Offset spanner for tightening high pressure pump pipes.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1502	Valve lifting tool for removing valves.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

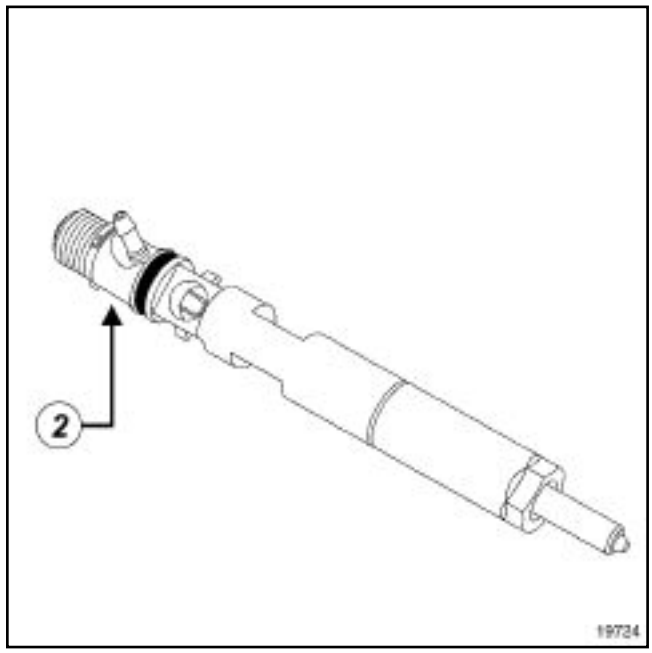
- It is essential to follow the cleanliness guidelines (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) ,
- Wear latex gloves while using the cleaning product,
- Wear goggles with side guards,

WARNING

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cleaning cloths only, if necessary.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Consumables



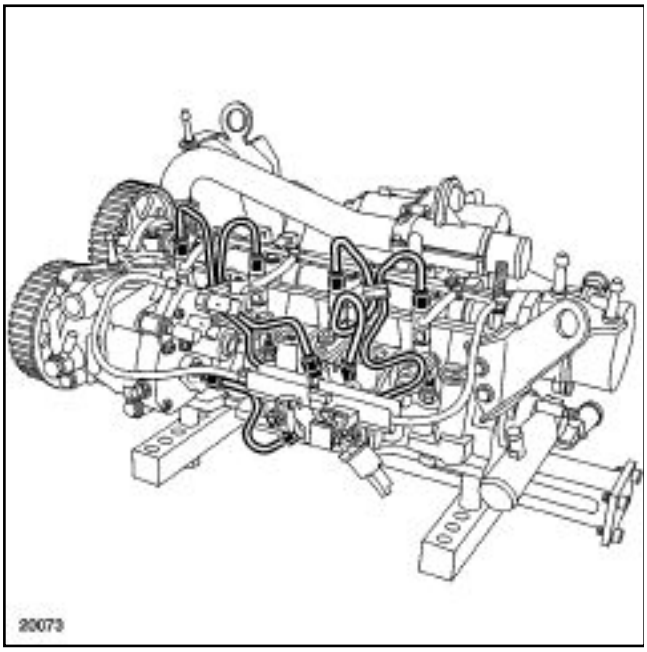
- Set of blanking plugs, part no. **77 01 206 804** ,
- Cleaning cloths, part no. **77 11 211 707** ,
- Brake cleaner, part no. **77 11 226 128** ,
- Injector cleaner, part no. **77 11 224 188** ,

III - EQUIPMENT REQUIRED

- Protective goggles (with side guards),
- Latex protective gloves,
- Indelible pencil,
- Plastic bags,
- Valve wrench,
- Tweezers,
- Wrench for the high-pressure pipes,
- Crow foot wrench,
- Wrench with hinge for heater plugs,
- Male torx sockets.

IV - STRIPPING THE CYLINDER HEAD

Cleaning the high-pressure pipe unions (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) .

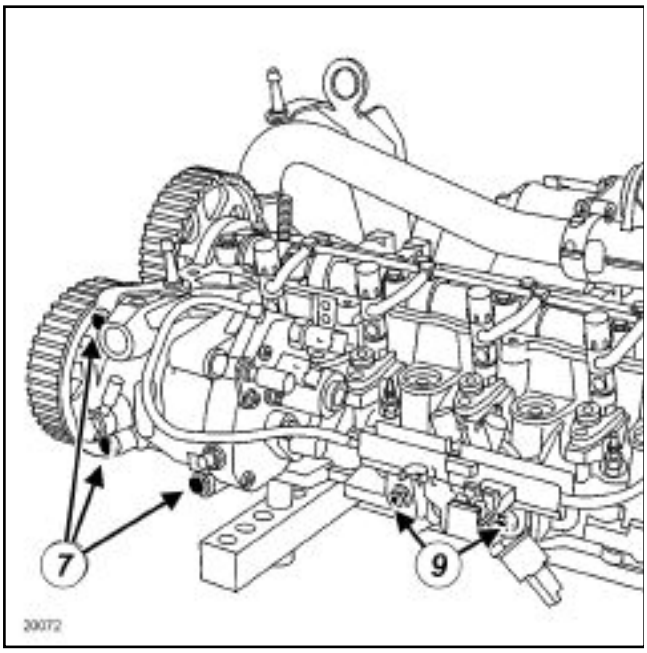


19724

Note:

When loosening the high-pressure pipes, it is essential to hold injector intermediate union (2) .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

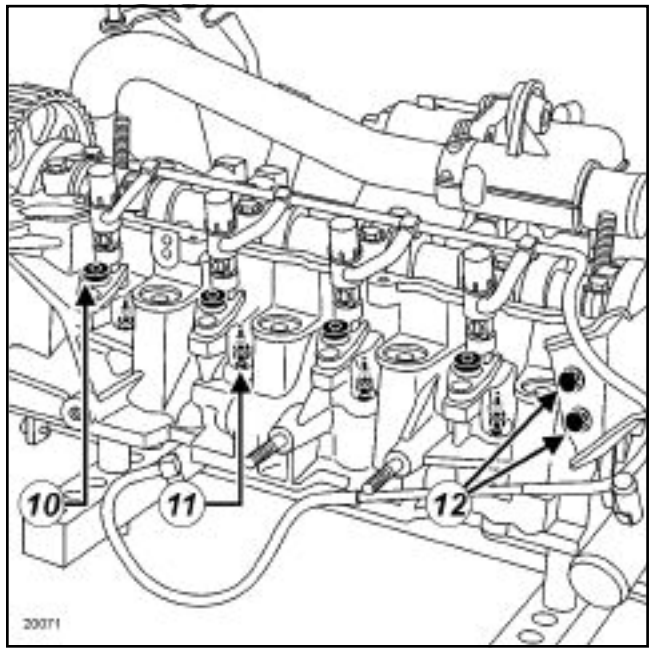


20073

Remove the high-pressure pipes using the **(Mot. 1566)** , **(Mot. 1746)** or with a pipe wrench.

Fit plugs to maintain cleanliness:

- on the high-pressure pump,
- on the rail,
- on the injectors.

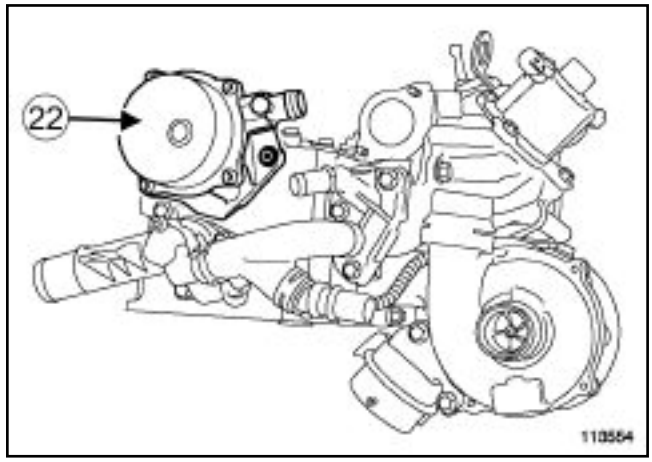


20072

Remove:

- the high-pressure pump mounting bolts (**7**) ,
- the high-pressure pump,
- the high-pressure pump mounting nuts (**9**) ,
- the rail.

Note:

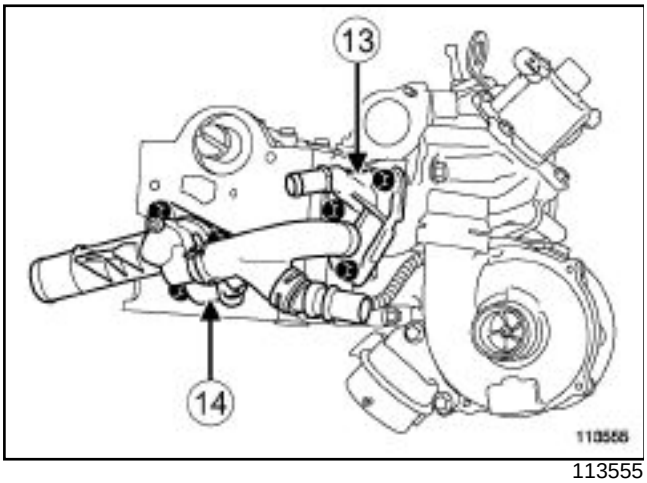


It is essential to mark the injectors relative to their cylinders using an indelible pencil.

20071

Remove:

- the injector bracket bolts (**10**) ,
- the injectors,
- the heater plugs (**11**) , using a wrench with hinge,
- the bolts (**12**) from the engine lifting eye (flywheel end),
- the engine lifting eye (flywheel end),

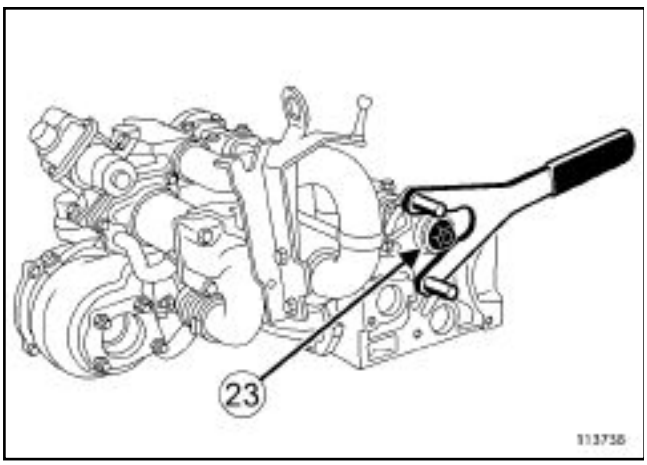


113554

Remove:

- the mounting bolts from the vacuum pump (**22**) ,

- the vacuum pump.

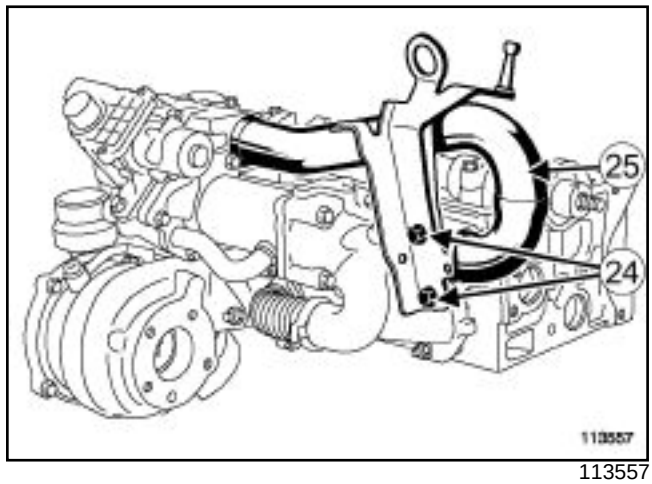


113555

Remove:

- the EGR exchanger cover bolts (**13**) ,
- the EGR exchanger cover,
- the cylinder head coolant outlet unit bolts, (**14**)
- the cylinder head coolant outlet housing

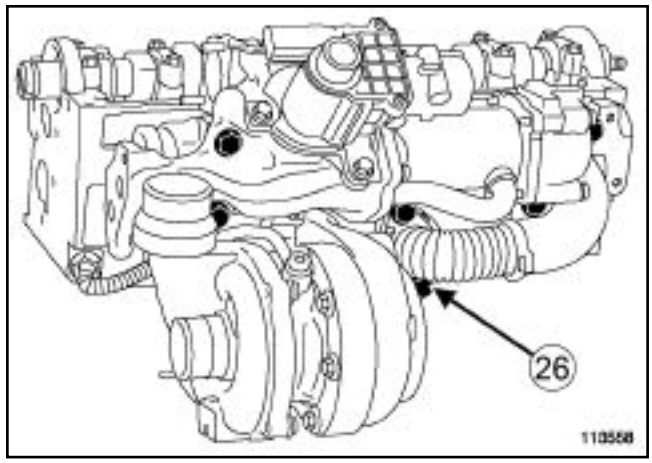
Remove the camshaft pulley.



113738

Immobilise the camshaft pulley hub using the **(Mot. 799-01)** .

Remove:

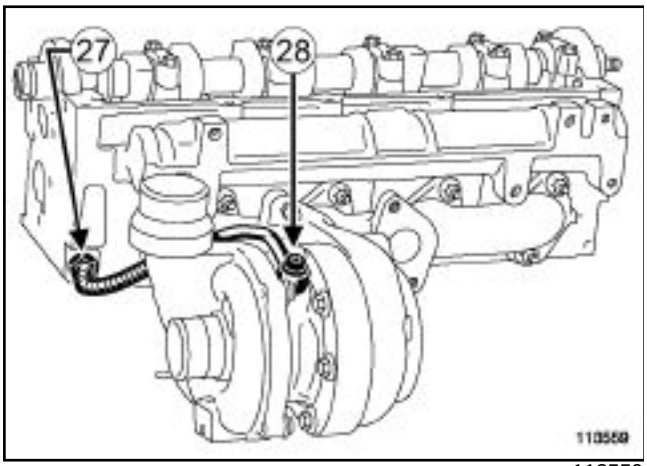


- the camshaft pulley hub mounting nut (**23**) ,
- the camshaft pulley hub.

113557

Remove:

- the engine lifting eye mounting bolts (**24**) (timing end),
- the engine lifting eye (timing end),
- the inlet duct.

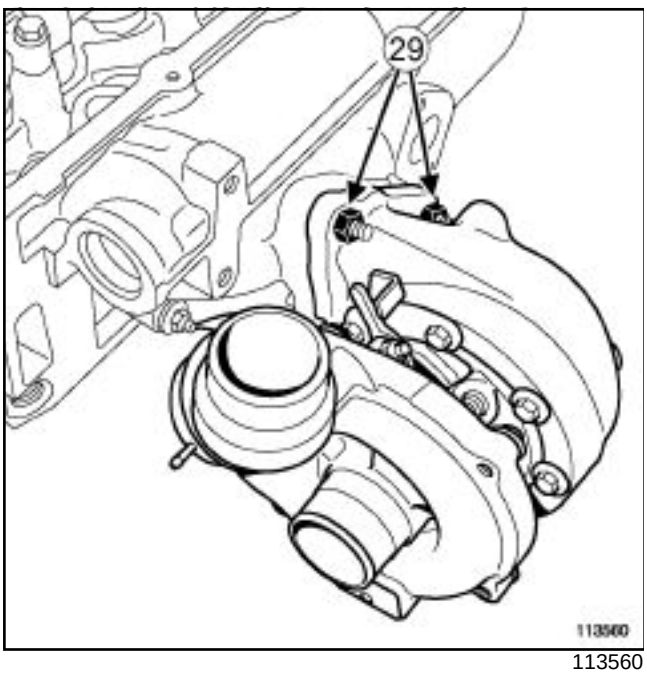


113558

Remove:

- the six mounting bolts (**26**) from the EGR valve-exchanger assembly,
- the EGR valve-exchanger assembly.

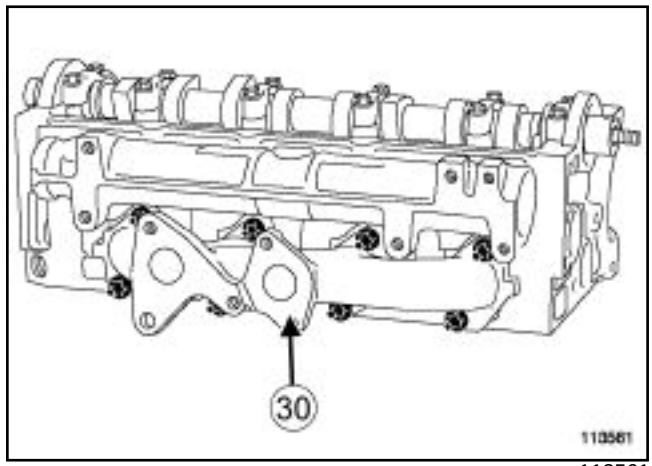
K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



113559

Loosen the mounting nut (**27**) from the turbocharger oil supply pipe (cylinder head end).

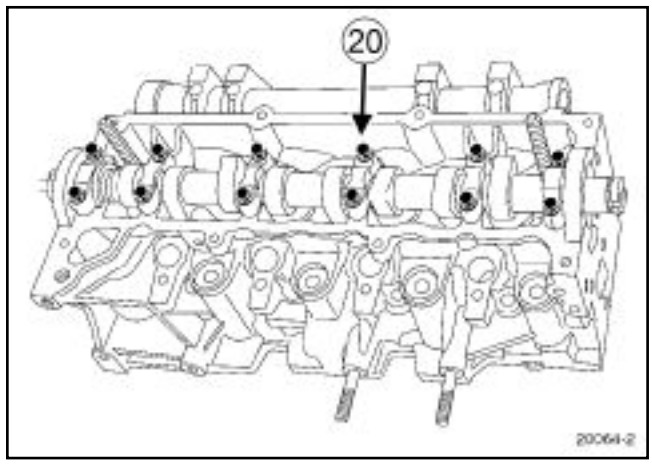
Remove:



- the mounting bolt (**28**) from the turbocharger oil supply pipe (turbocharger end),
- the turbocharger oil supply pipe.

113560

Remove:



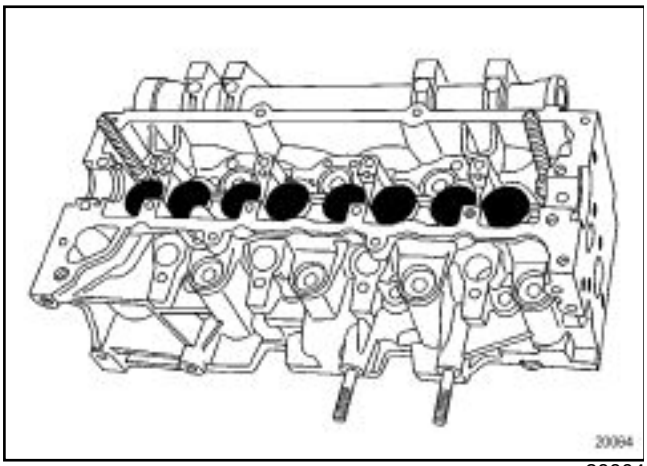
- the three turbocharger mounting nuts (**29**) ,
- the turbocharger.

113561

Remove:

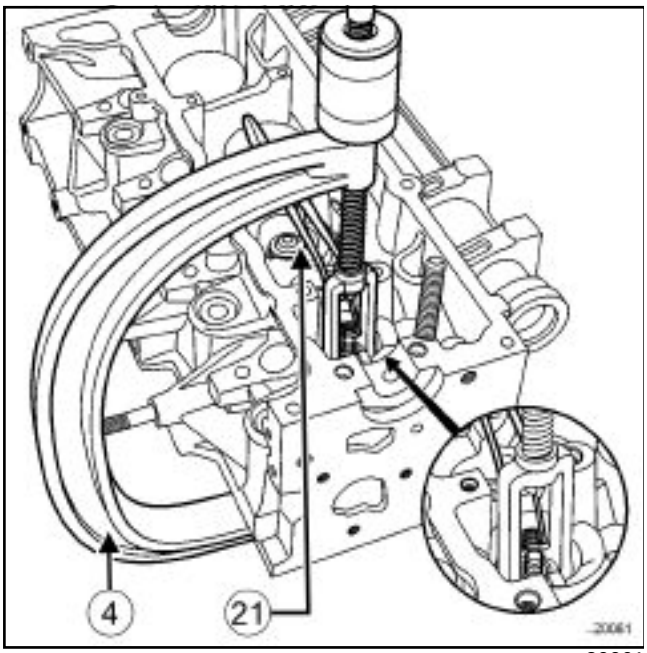
- the mounting nuts from the exhaust manifold (**30**) ,
- the exhaust manifold.

20064-2



Remove:

- the mounting bolts (**20**) from the camshaft bearing caps,
- the camshaft bearing caps.



Remove the camshaft.

Note:

It is essential to mark the valve pushrods relative to their cylinders using an indelible pencil.

20064

Remove the valve pushrods.

20061

Compress the valve springs using the **(Mot. 1502)** (**4**) or a valve wrench.

Remove:

- the cotters using tweezers ***(21)*** ,
- the valve spring upper cups,
- the valve springs,
- the valves.

K9K, and 732 or 764

Special tooling required	
Mot. 1746	Offset spanner for tightening high pressure pump pipes.
Mot. 1566	Spanner for removing high pressure pipes.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1502	Valve lifting tool for removing valves.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

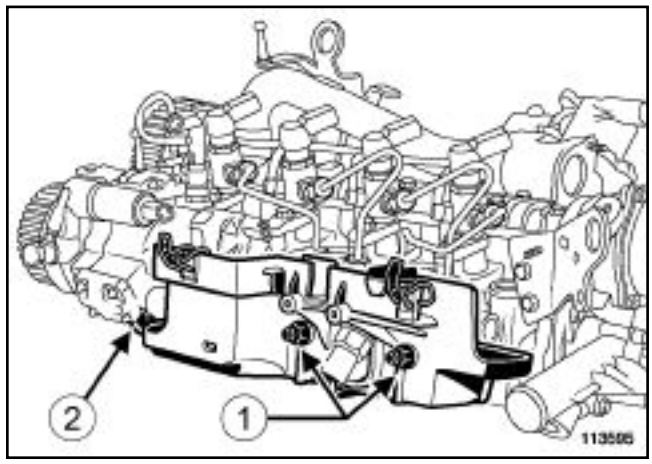
- It is essential to follow the cleanliness guidelines (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) ,
- Wear latex gloves while using the cleaning product,
- Wear goggles with side guards,

WARNING

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cleaning cloths only, if necessary.

II - PARTS AND CONSUMABLES FOR THE REPAIRS

Consumables



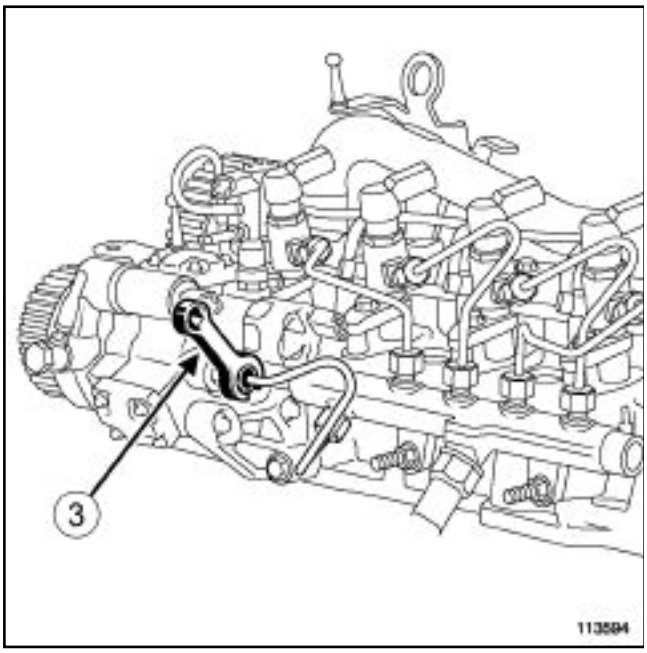
- Set of blanking plugs, part no. **77 01 476 857** ,
- Cleaning cloths, part no. **77 11 211 707** ,
- Brake cleaner, part no. **77 11 226 128** ,
- Injector cleaner, part no. **77 11 224 188** ,

III - EQUIPMENT REQUIRED

- Protective goggles (with side guards),
- Latex protective gloves,
- Indelible pencil,
- Plastic bags,
- Valve wrench,
- Tweezers,
- Flat-blade and thin screwdriver,
- Wrench for the high-pressure pipes,
- Crow foot wrench,
- Wrench with hinge for heater plugs,
- Male torx sockets.

IV - STRIPPING THE CYLINDER HEAD

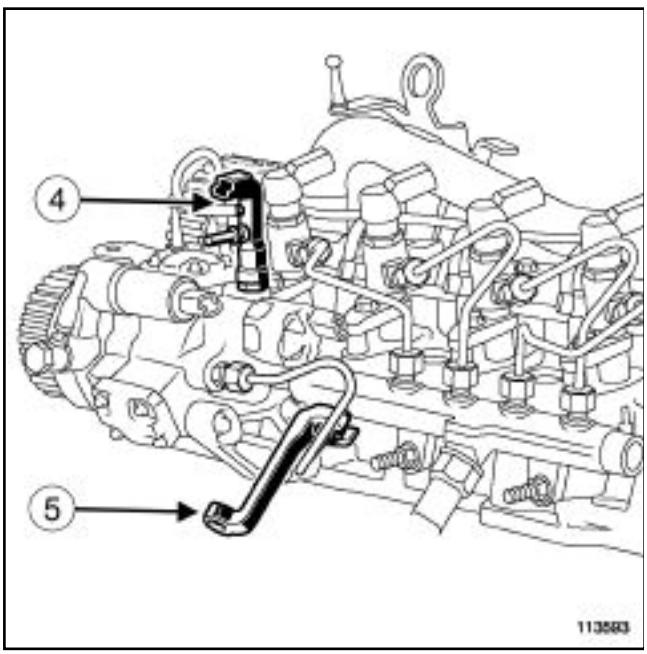
Cleaning the high-pressure pipe unions (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) .



113595

Remove:

- the mounting bolt (**2**) and nuts (**1**) from the high-pressure protector,
- the high-pressure protector.



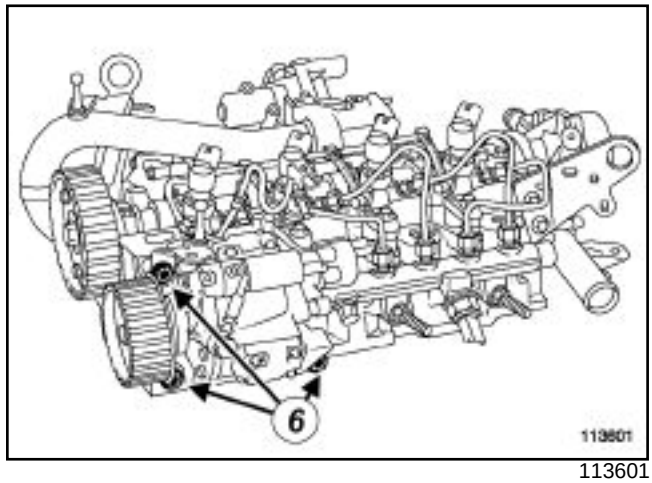
Clean the high-pressure pipe unions (see **10A**, **Engine and lower engine assembly**, **Engine: Precautions for repair**, page **10A-4**) .

K9K, and 732 or 764

113594

Loosen the high-pressure pipe nut (high-pressure pump side) using the **(Mot. 1746)** (**3**) or a crow foot wrench.

113593



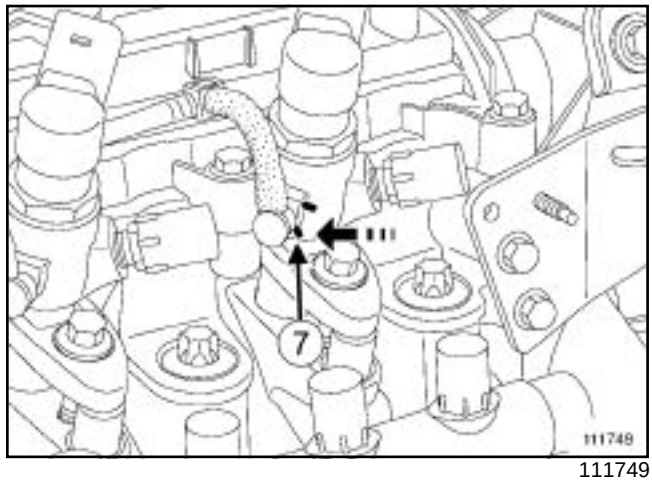
Remove the high-pressure pump fuel return union (**4**) .

Loosen the high-pressure pipe nut (high-pressure pump side) using the **(Mot. 1566)** (**5**) or a pipe wrench.

Remove the high-pressure pipe between the high-pressure pump and the rail.

Fit plugs to maintain cleanliness:

- on the high-pressure pump,
- on the rail.

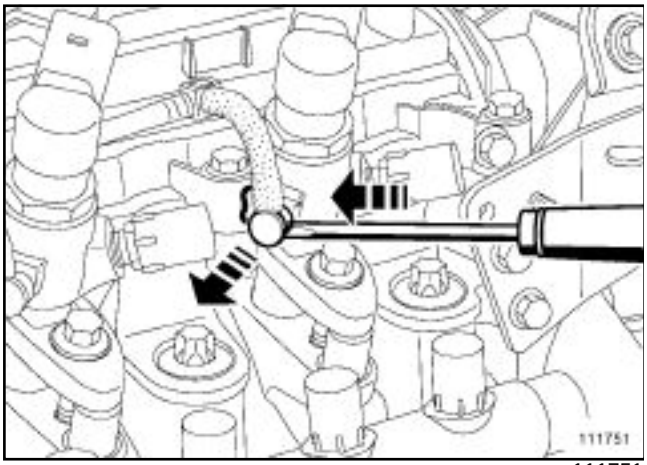


113601

Remove:

- the high-pressure pump mounting bolts (**6**) ,
- the high-pressure pump.

Note:

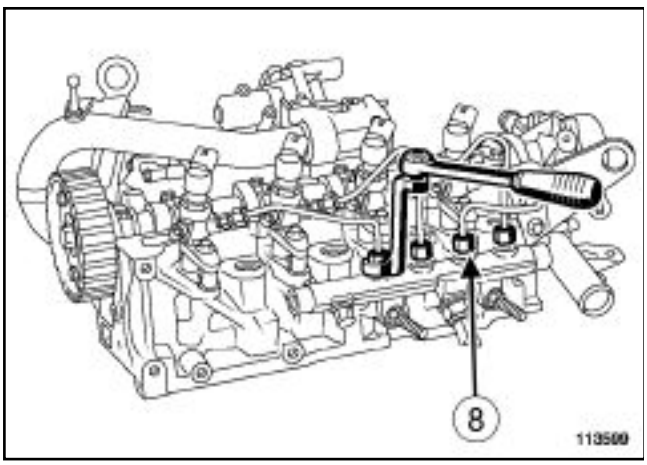


Take care not to completely remove the clip from its proper position as it may become deformed.

111749

Push in the direction of the arrow and at (**7**) on the lower section of the retaining clip of the fuel return pipe on the injector using a thin, flat-blade screwdriver.

K9K, and 732 or 764



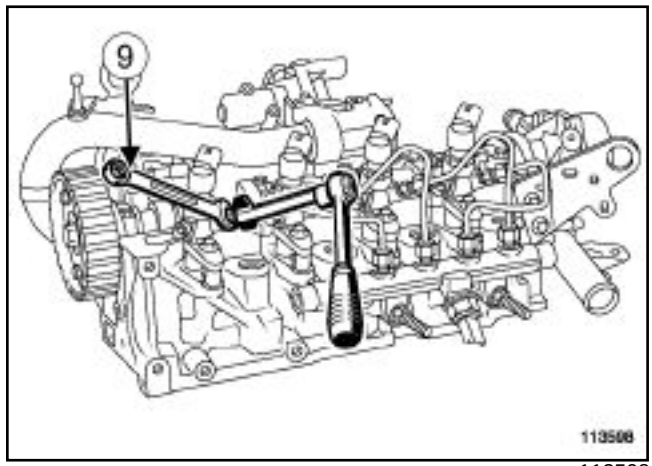
111751

Pushing the lower bracket of the retaining clip downwards, pull out the injector fuel return pipe union.

Remove the fuel return pipe from the injector.

Repeat the operation on the other fuel return pipe unions.

Fit the correct blanking plugs.

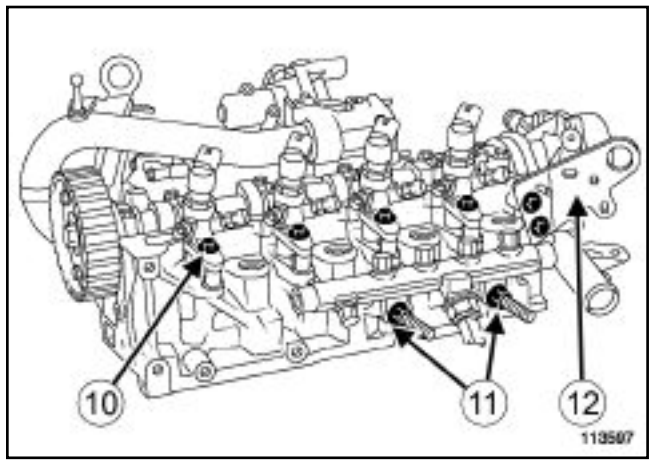


113599

Loosen the high-pressure pipe nuts on the rail side using the **(Mot. 1566)** or a pipe wrench.

Note:

When loosening the high-pressure pipe nuts, it is essential to hold the injector intermediate union with a wrench *(9)* .



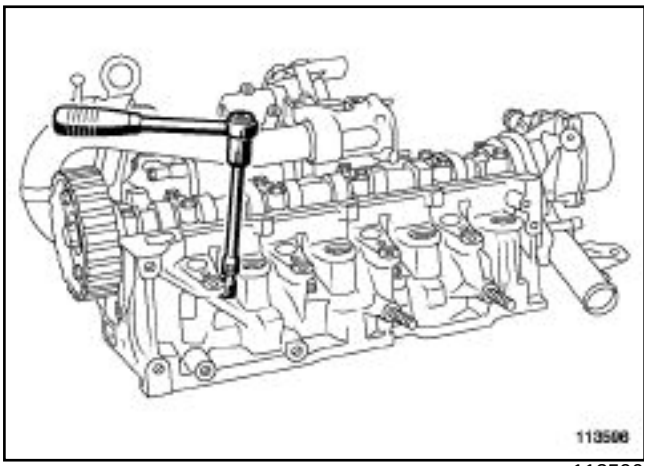
113598

Loosen the high-pressure pipe nuts on the injector side using the **(Mot. 1566)** or a pipe wrench, while holding the intermediate union with an open-jawed spanner.

Fit the correct blanking plugs.

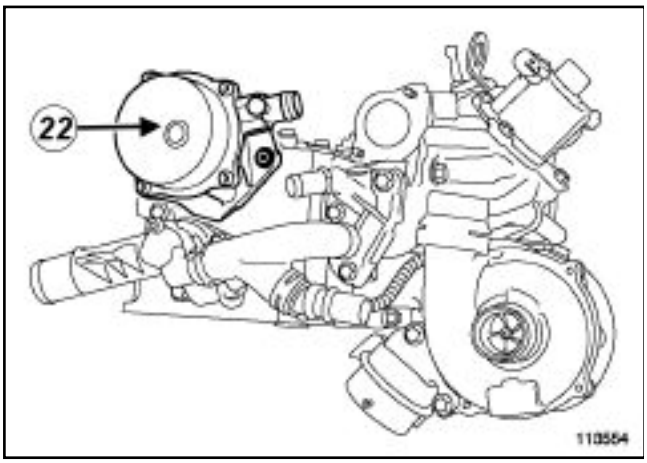
Note:

It is essential to mark the injectors relative to their cylinders using an indelible pencil.



113597

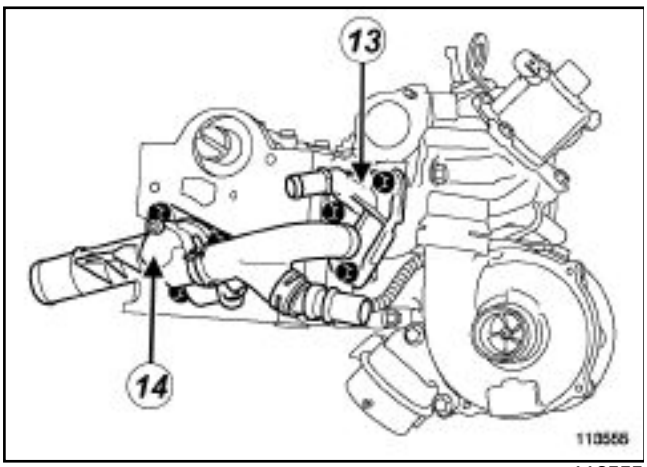
Remove:



- the mounting bolts from the engine lifting eye (**12**) (timing end),
- the engine lifting eye,
- the high-pressure pump mounting nuts (**11**) ,
- the high-pressure rail,
- the injector bracket bolts (**10**) ,
- the injectors.

K9K, and 732 or 764

113596

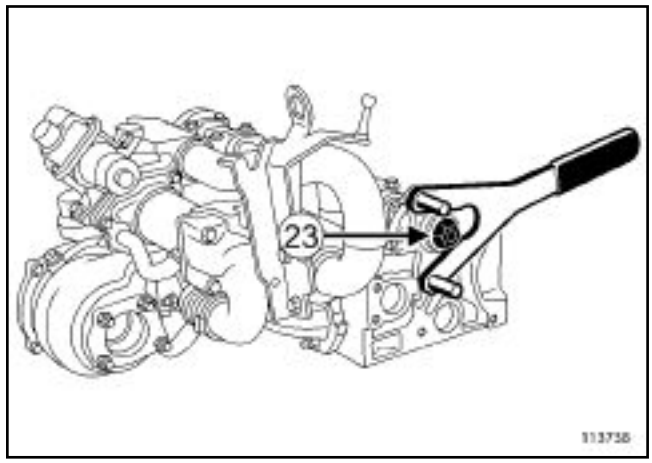


Remove the heater plugs using a wrench with hinge,

113554

Remove:

- the mounting bolts from the vacuum pump (**22**) ,
- the vacuum pump.

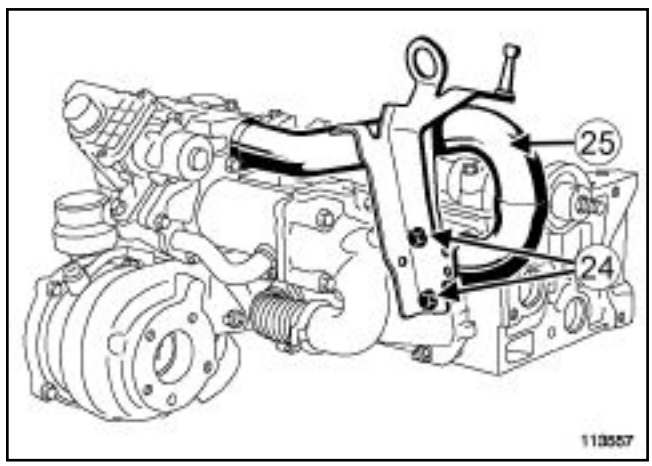


113555

Remove:

- the EGR exchanger cover bolts (**13**) ,
- the EGR exchanger cover,
- the cylinder head coolant outlet unit bolts (**14**) ,
- the cylinder head coolant outlet unit

Remove the camshaft pulley.

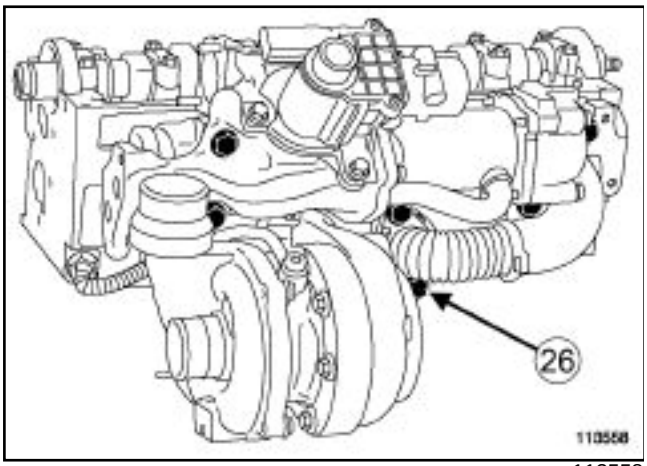


113738

Immobilise the camshaft pulley hub using the **(Mot. 799-01)** .

Remove:

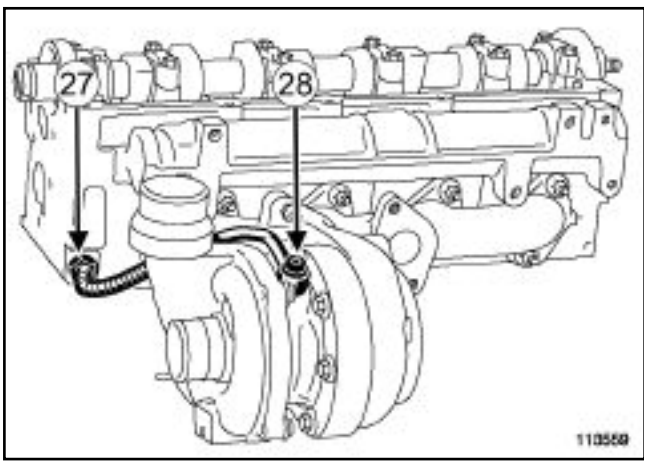
- the mounting nut (**23**) from the camshaft pulley hub,
- the camshaft pulley hub.



113557

Remove:

- the mounting bolts (**24**) from the engine lifting eye (timing end),
- the engine lifting eye (timing end),
- the inlet duct.

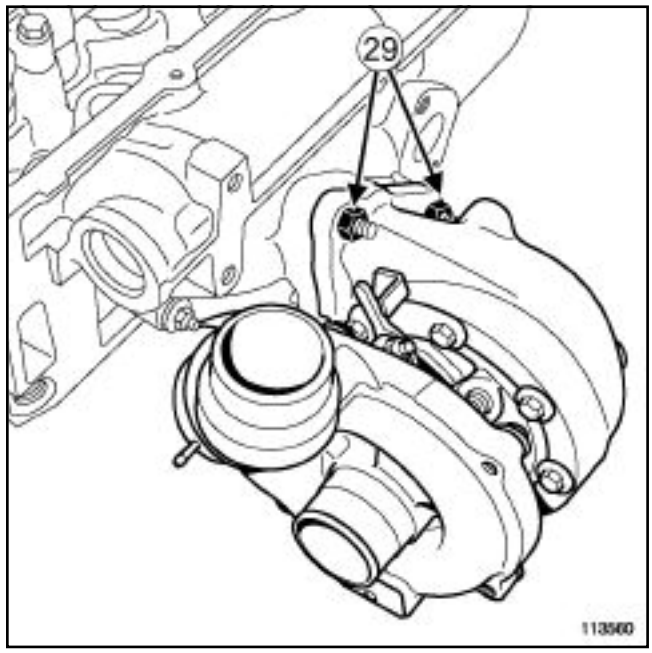


K9K, and 732 or 764

113558

Remove:

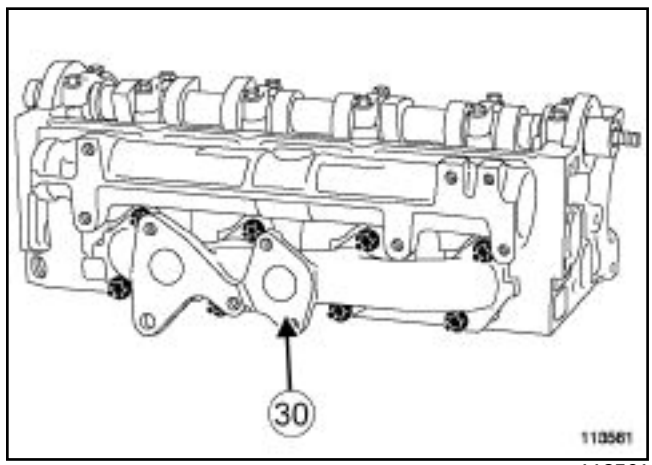
- the six mounting bolts (**26**) from the EGR valve-exchanger assembly,
- the EGR valve-exchanger assembly.



113559

Loosen the mounting nut (**27**) from the turbocharger oil supply pipe (cylinder head end).

Remove:

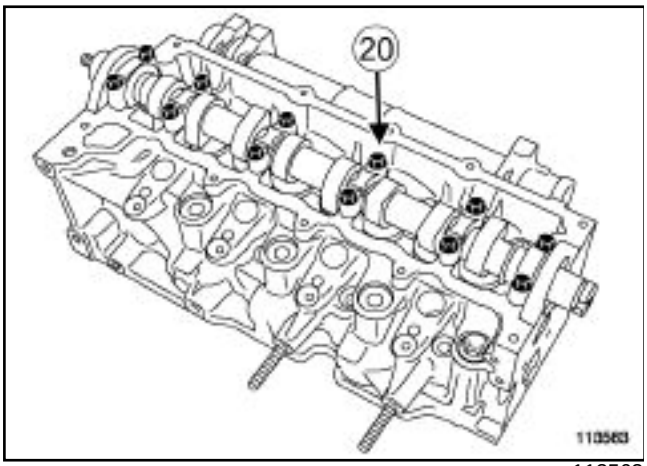


- the mounting nut (**28**) from the turbocharger oil supply pipe (turbocharger end),
- the turbocharger oil supply pipe.

113560

Remove:

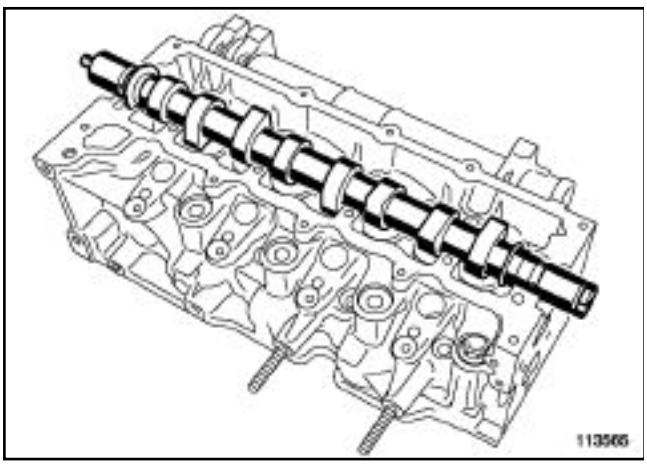
- the three turbocharger mounting nuts (**29**) ,
- the turbocharger.



113561

Remove:

- the mounting nuts from the exhaust manifold (**30**) ,
- the exhaust manifold.

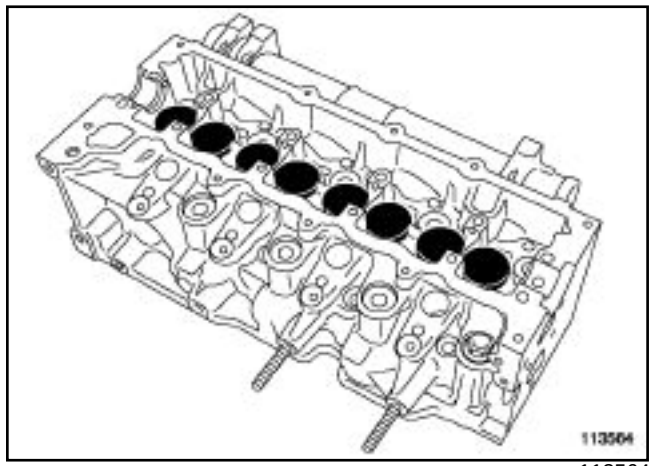


K9K, and 732 or 764

113563

Remove:

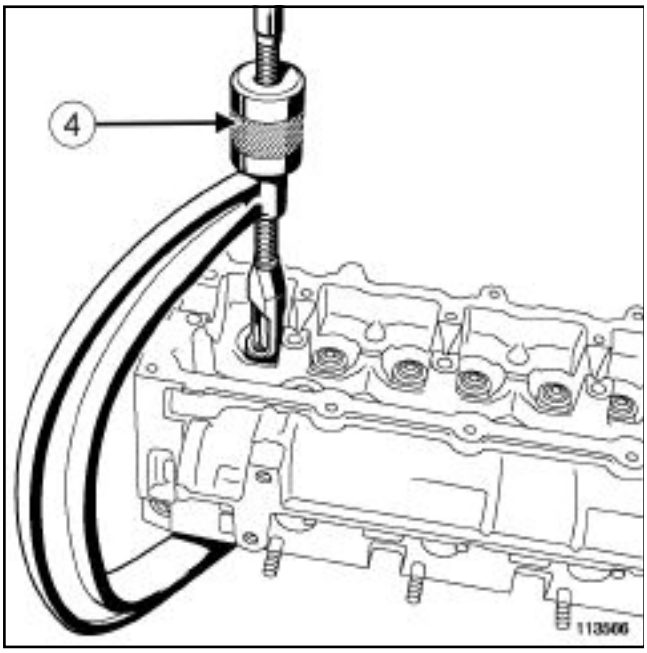
- the mounting bolts (**20**) from the camshaft bearing caps,
- the camshaft bearing caps.



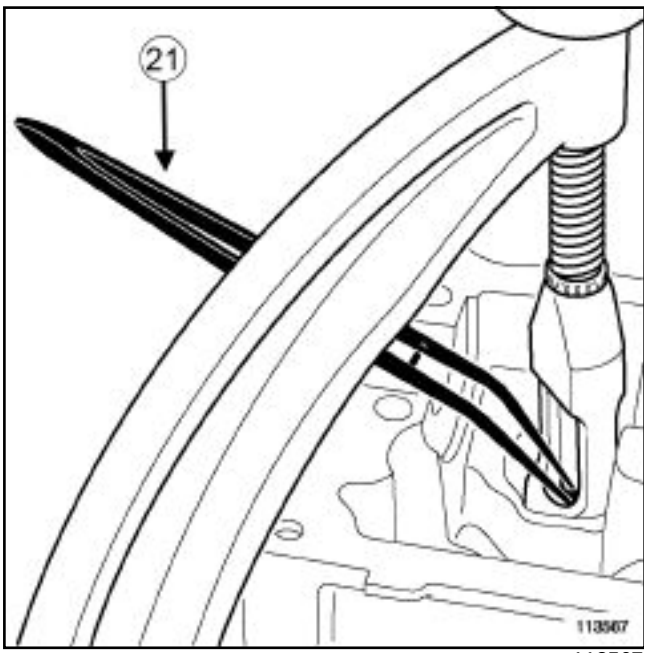
113565

Remove the camshaft.

Note:



It is essential to mark the valve pushrods relative to their cylinders using an indelible pencil.



113564

Remove the valve pushrods.

K9K, and 732 or 764

113566

113567

Compress the valve springs using the **(Mot. 1502)** (**4**) or a valve wrench.

Remove:

- the cotters using tweezers ***(21)*** ,
- the valve spring upper cups,
- the valve springs,
- the valves.

Special tooling required	
Mot. 1729	Pin wrench for removing the EGR valve.
Mot. 1757	EGR solenoid valve actuator.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

Do not scratch the aluminium sealing surfaces.

Wear goggles.

Wear gloves during the operation.

WARNING

Do not allow this product to drip on to the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

When cleaning parts, it is essential to not knock the parts against each other, or their mating faces may be damaged and therefore their adjustments may be altered, which could damage the engine.

Cleaning recommendation for the EGR solenoid valve :

- do not wet the electrical part of the solenoid valve with the cleaning product.
- keep the solenoid valve tilted with the connector at the top.
- only use brushes with plastic or non-corrosive metal (brass) bristles.
- cleaning using hard or corrosive tools (e.g: screwdriver) may damage the valves or their shafts, and lead to leaking valves with a consequent loss of power. Or a loss of the upper valve leading to destruction of the engine.

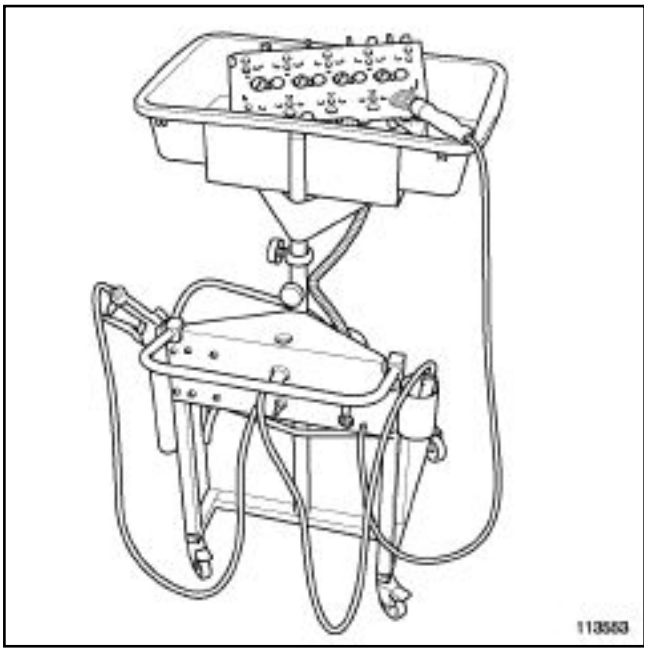
II - PARTS AND CONSUMABLES FOR THE REPAIR

Consumables

- Décapjoint, part no. **77 01 405 952** ,
- Grey sanding pad, part no. **77 01 405 943** .
- Carburettor cleaner, part no. **77 11 171 437** ,

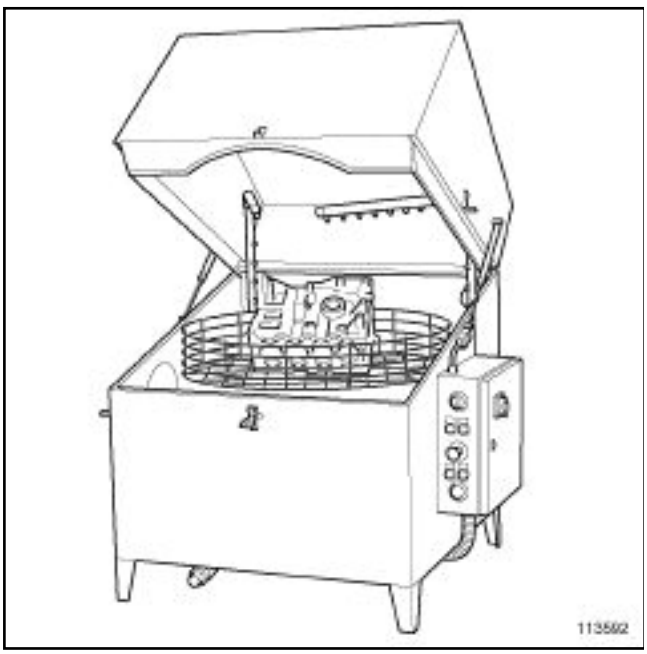
III - EQUIPMENT REQUIRED

- Protective goggles,
- Protective gloves,
- Wooden spatula,
- Brushes with plastic or non-scratch metal (brass) bristles,
- Compressed air gun,
- Cleaning fountain,
- Cleaning bench.



IV - CLEANING THE UPPER ENGINE

Apply the **Décapjoint** product to the sections to be cleaned.



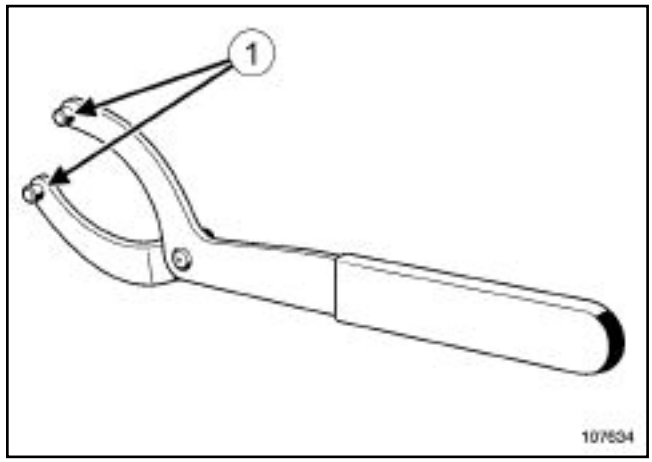
Leave for around ten minutes.

Remove residues with a wooden spatulas

Finish cleaning the parts using a grey polishing pad.

113553

113592

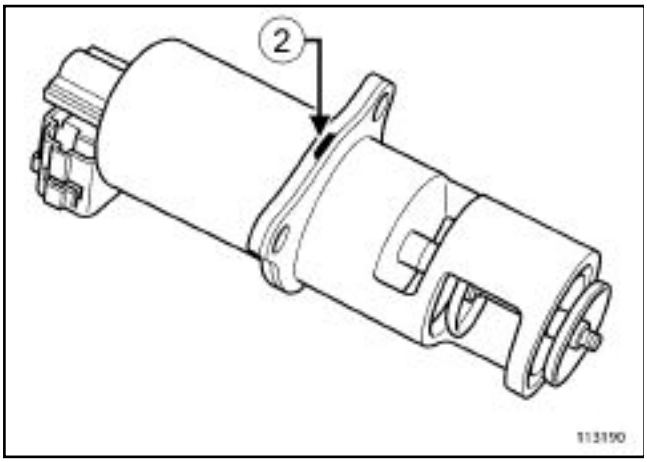


Wash the cylinder head parts using a cleaning fountain or a heated cleaning bath.

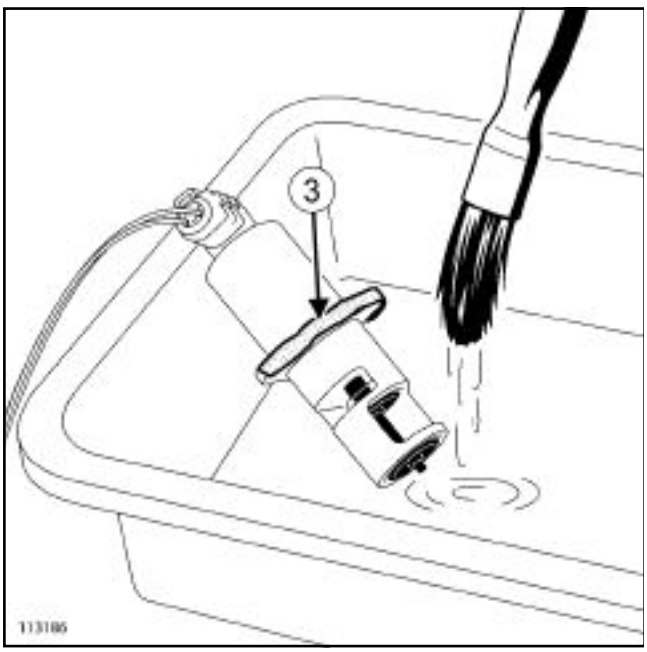
V - CLEANING THE EGR SOLENOID VALVE

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 728 or 729 or 750 or 752

Place the exhaust gas recirculation unit in a vice with clamping jaws.



Remove the EGR solenoid valve mounting bolts.



107634

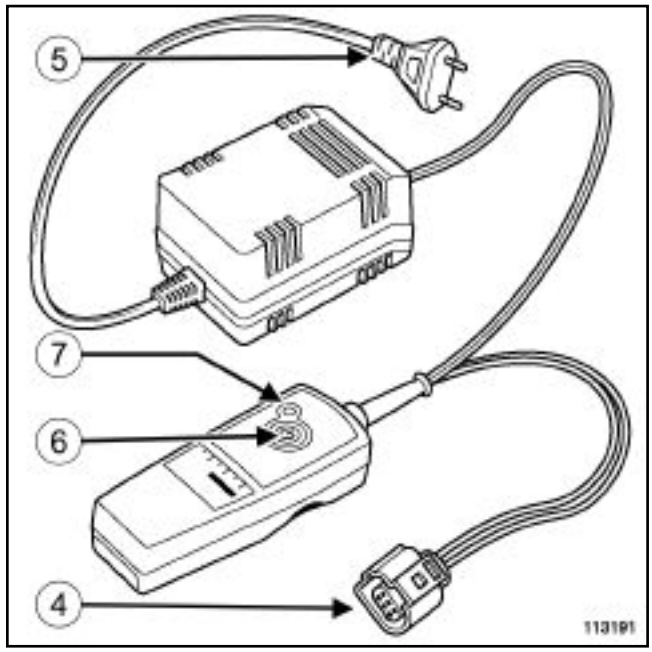
Fully insert the spigots (**1**) of tool **(Mot. 1729)** in the mounting holes of the EGR solenoid valve.

Remove the EGR solenoid valve, with small rotating movements to detach the EGR solenoid valve from its housing.

113190

113186

Protect the vent holes (**2**) of the solenoid valve using adhesive tape (**3**) .



Freely wet the mechanical part only of the EGR solenoid valve with cleaning fluid, while brushing the EGR solenoid valve for **1 min** .

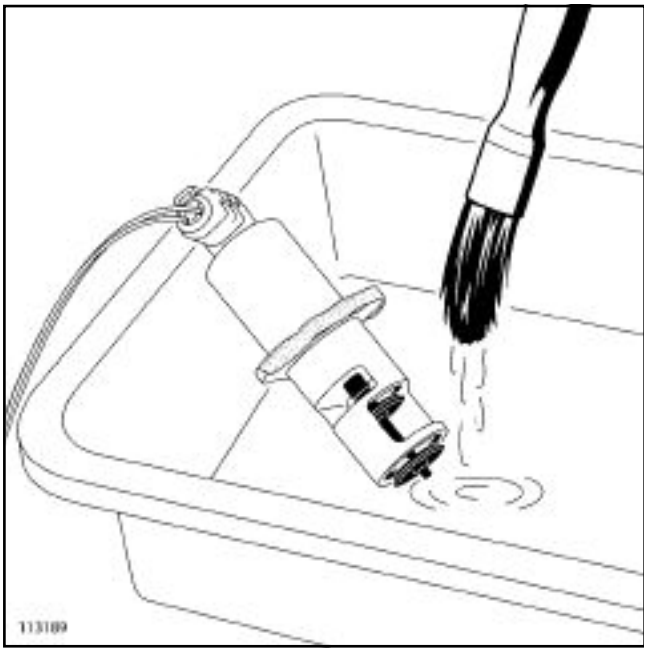
Note:

The EGR solenoid valve actuator tool can be used to check the solenoid valve.

An indicator will sound in case of:

- incorrect connection of the tool to the solenoid valve,
- solenoid valve short circuit,
- break in the solenoid valve circuit.

113191



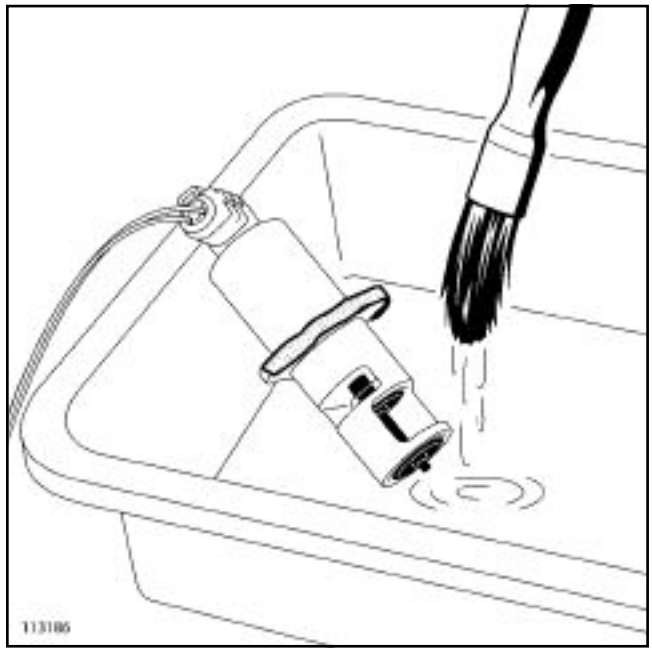
Connect:

- the connector (**4**) of the **(Mot. 1757)** to the solenoid valve,
- the adaptor (**5**) of the **(Mot. 1757)** to a power supply.

Briefly press the button ***(6)*** to open the solenoid valve valves.

Note:

In the open position (with power to the solenoid valve) the warning light ***(7)*** is on.



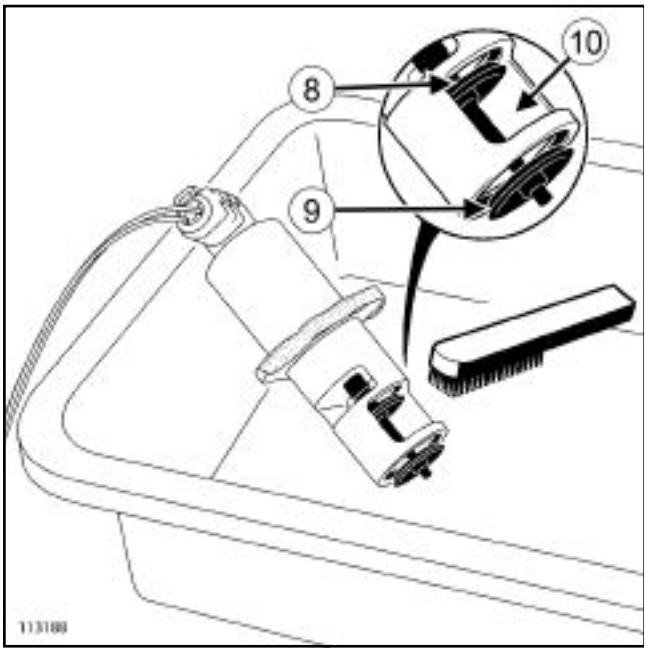
113189

Clean the mechanical part of the solenoid valve by simultaneously scrubbing and drenching with cleaning product for **2 min** , paying particular attention to:

- the valve seats,
- the surfaces of the valves,
- the shaft guide of the valves.

Briefly press the button ***(6)*** to close the solenoid valve valves.

Start an open/close cycle of the solenoid valve using the **(Mot. 1757)** keeping the button pressed ***(6)*** .



113186

Clean the mechanical section of the solenoid valve (during the open/close cycle) by scrubbing and drenching with cleaning product (simultaneously), paying attention to:

- the valve seats,
- the surfaces of the valves,
- the shaft guide of the valves.

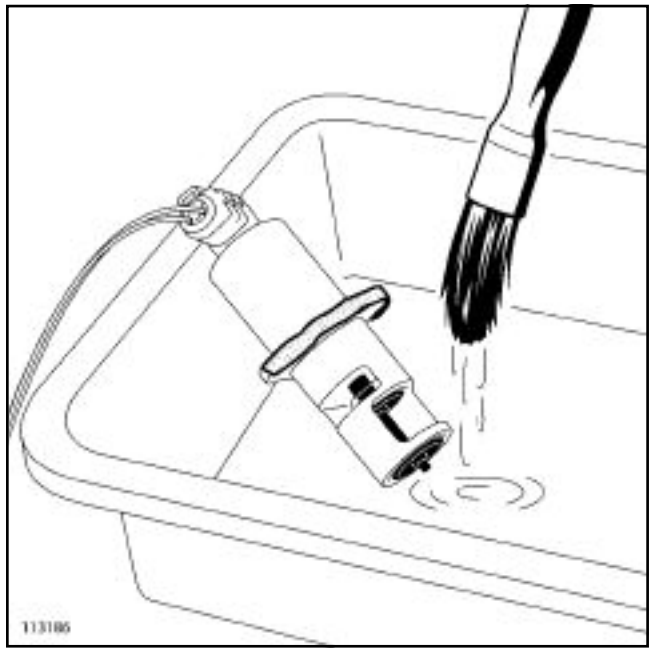
Briefly press the button ***(6)*** to open the solenoid valve valves.

113188

Scrub the upper valve (**9**) over its entire surface and circumference.

Scrub the part of the lower valve (**8**) which is accessible through the window (**10**) .

Hold the upper valve (**9**) .



Quarter turn the valve.

Scrub the part of the lower valve (**8**) which is accessible through the window (**10**) .

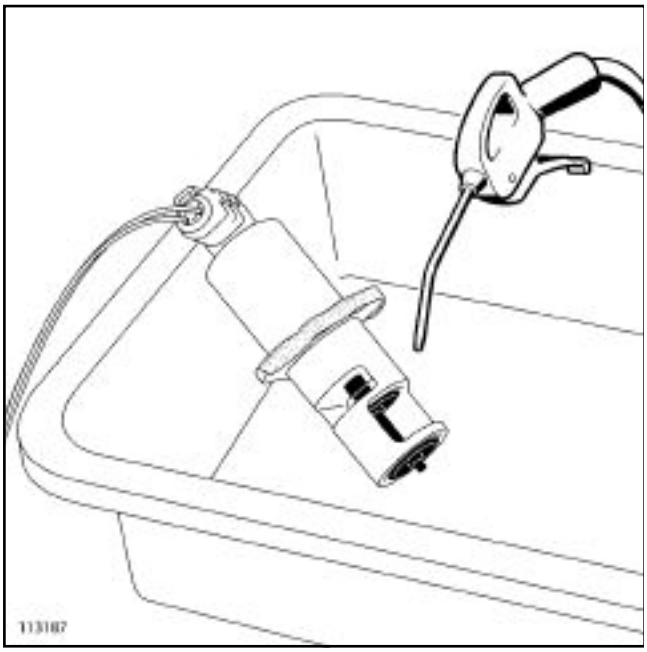
Continue until the valve has been cleaned over its entire circumference.

Briefly press the button ***(6)*** to close the solenoid valve valves.

Run the open/close cycle of the solenoid valve twice using the **(Mot. 1757)** keeping the button pressed ***(6)*** .

113186

Clean the mechanical part of the solenoid valve (during the open/close cycle) by scrubbing and drenching with cleaning product (simultaneously), paying attention to:



- the valve seats,

- the surfaces of the valves,

- the shaft guide of the valves.

Check there are no bristles from the brush in the solenoid valve.

Briefly press the button ***(6)*** to open the solenoid valve valves.

113187

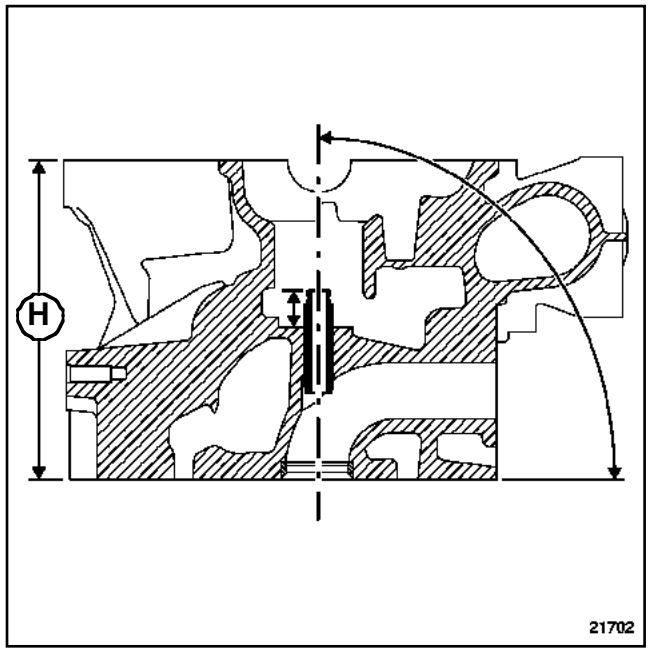
Blow the solenoid valve dry using a compressed air gun.

Briefly press the button ***(6)*** to close the solenoid valve valves.

Remove the adhesive tape from the vent holes of the solenoid valve.

Special tooling required	
Mot. 588	Cylinder block liner clamps.
Mot. 251-01	Dial gauge support.
Mot. 252-01	Dial gauge support thrust plate.

I - RECOMMENDATIONS FOR REPAIR



WARNING
Parts should be clean before examining and testing them.

II - EQUIPMENT REQUIRED

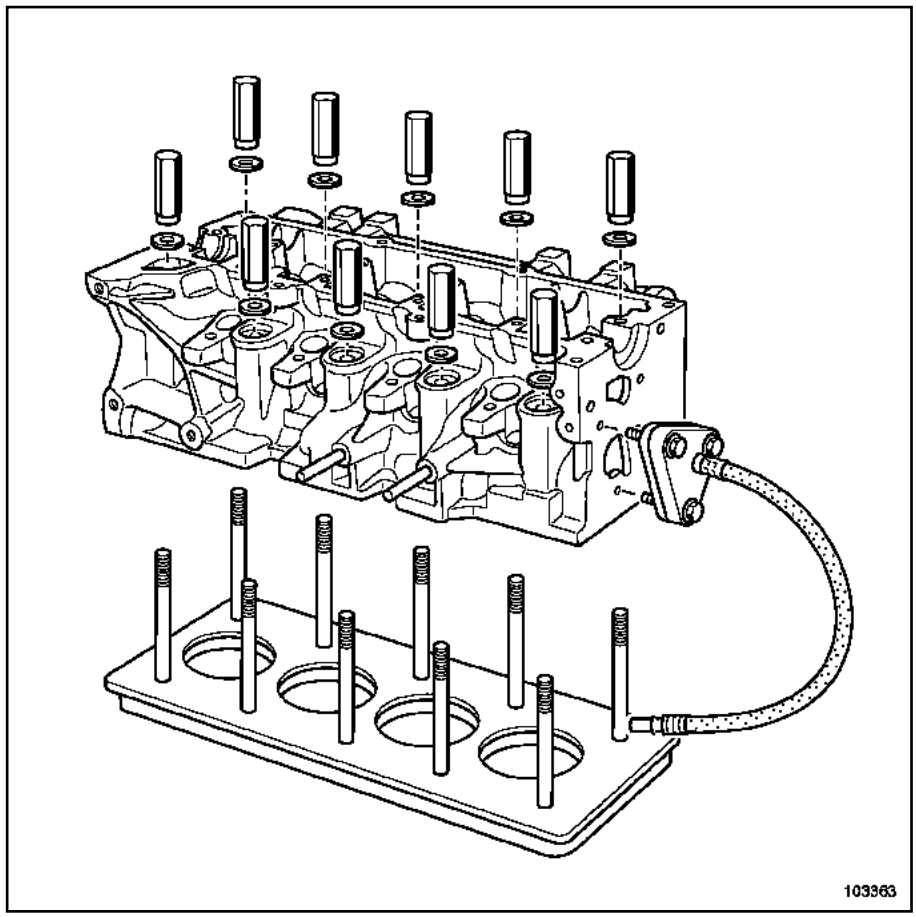
- Torque wrench and cylinder head bolt tightening gauge (angular measuring type),
- Torque/angle wrench,
- Radial play measuring tape.
- Tool for checking the valve spring loading
- Pressure/vacuum pump
- Sliding calliper,
- Depth gauge
- Mortice gauge,
- Micrometer,
- Dial gauge,
- Body jig bench and a pair of v-blocks.
- Magnetic holder,
- Multimeter,
- The valve stem seal fitting kit,
- The cylinder head test tools,
- Set of shims,
- Cylinder head rule.

III - CHECKING THE UPPER ENGINE

1 - Check height of cylinder head

21702

Measure the height of the cylinder head (**H**) which should be **127 mm** using a mortice gauge.



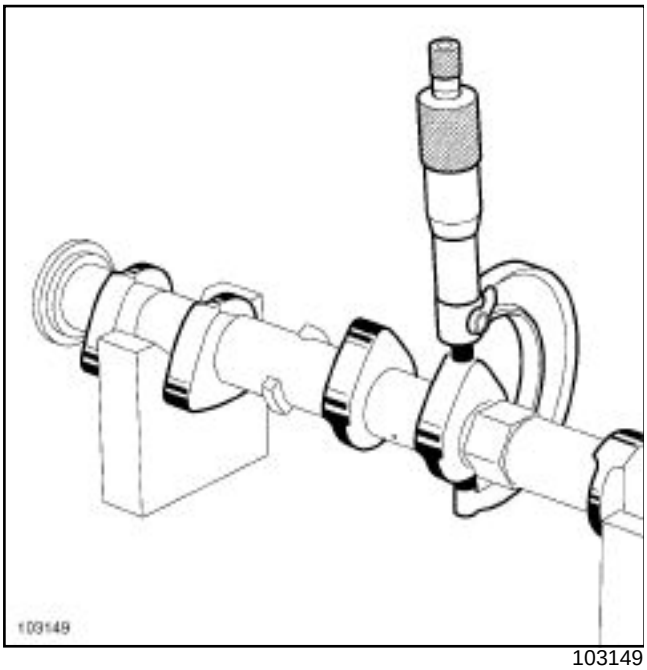
2 - Checking the cylinder head gasket face

Use a cylinder head adjuster and set of feeler gauges to check the gasket face bow.

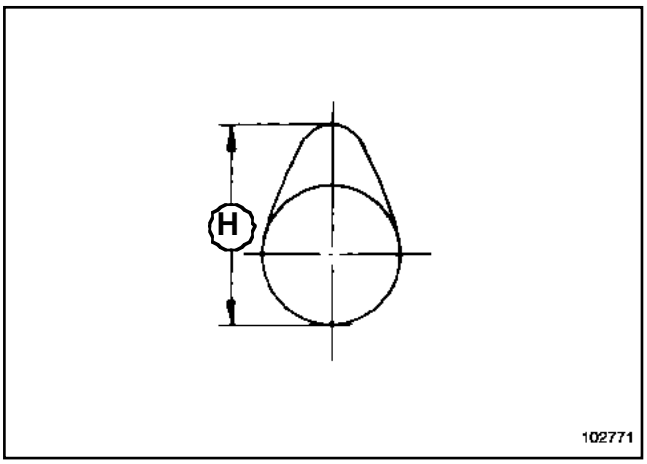
Maximum distortion: **0.05 mm**

The cylinder head cannot be adjusted.

3 - Checking the cylinder head seal



103363

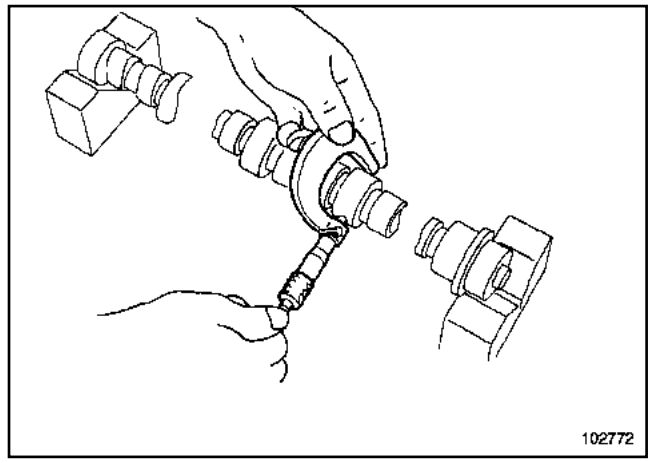


Test the cylinder head for possible cracks with the cylinder head test kit.

For the use of the cylinder head test unit (see **Technical Note 2781E**).

4 - Cam height checks

103149

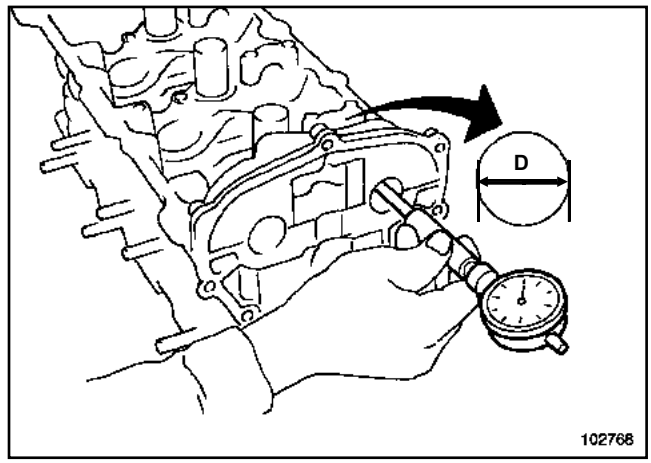


102771

Position camshaft bearings 2 and 4 on the v-blocks.

Using a micrometer, measure the height of the cams (**H**) which should be:

- Inlet: **44.015 ± 0.03 mm** ,
- Exhaust: **44.595 ± 0.03 mm** .

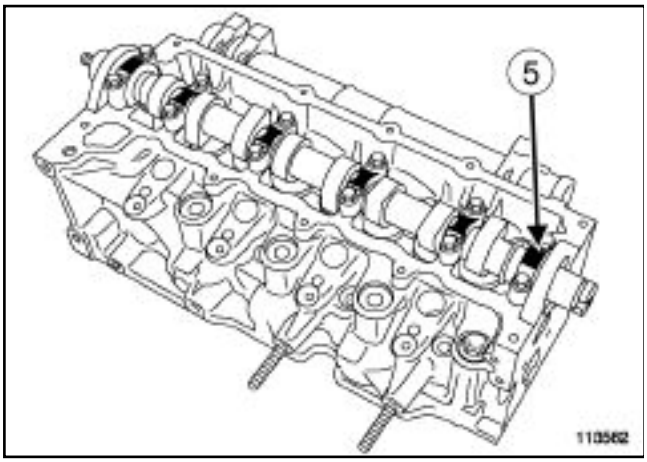


5 - Check the camshaft bearing diameters

102772

Using a micrometer, measure the external diameter of each camshaft bearing:

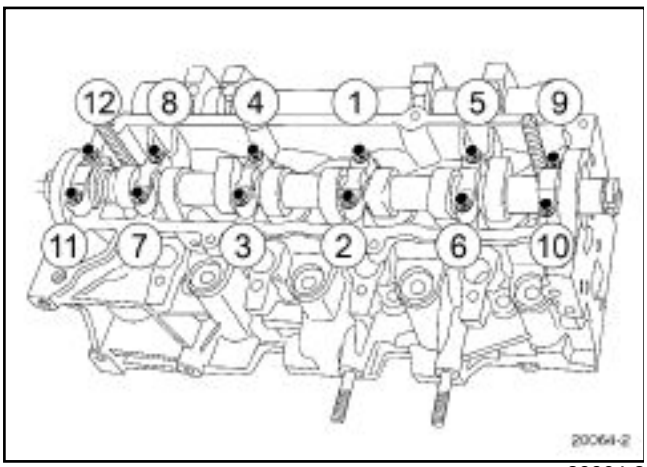
- bearing nos. 1,2,3,4,5: **24.9895 ± 0.0105 mm** ,
- bearing no. 6: **27.9895 ± 0.0105 mm** .



102768

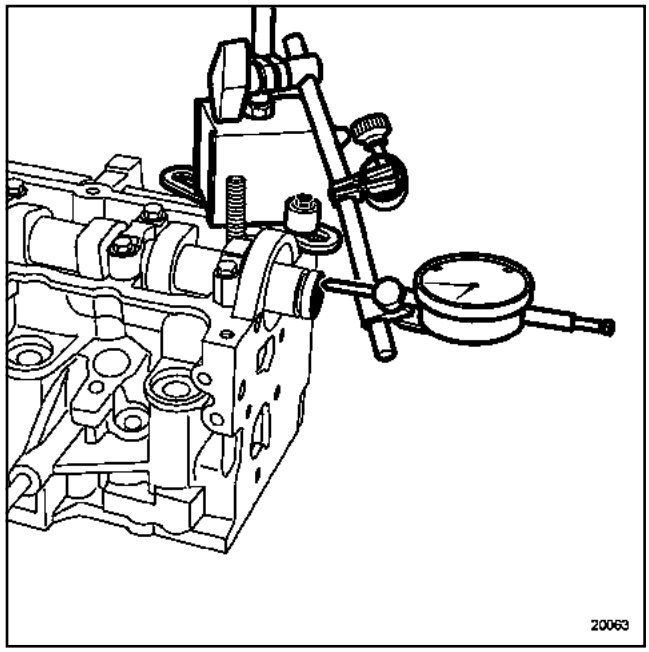
Using a micrometer, measure the internal diameter of each cylinder head bearing:

- bearings No.1, 2, 3, 4, 5: **25.05 ± 0.01 mm** ,
- bearing No.6: **28.05 ± 0.01 mm** .



6 - Checking camshaft end play

Refit the camshaft.



113562

Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**5**) engine flywheel end).

20064-2

Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 Nm)** .

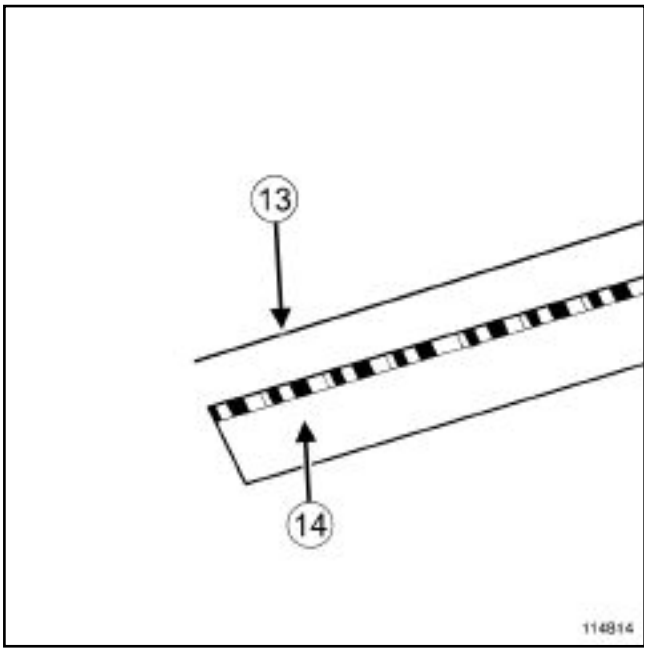
20063

Place the **(Mot. 588)** on the cylinder head, fixing it using the rocker cover bolt and a cross piece with dimensions as follows:

- external diameter **18 mm** ,
- internal diameter **9 mm** ,
- height **15 mm** .

Fix the magnetic holder to the cylinder head.

Using a dial gauge, measure the longitudinal gap which should be between **0.08 and 0.178 mm** .



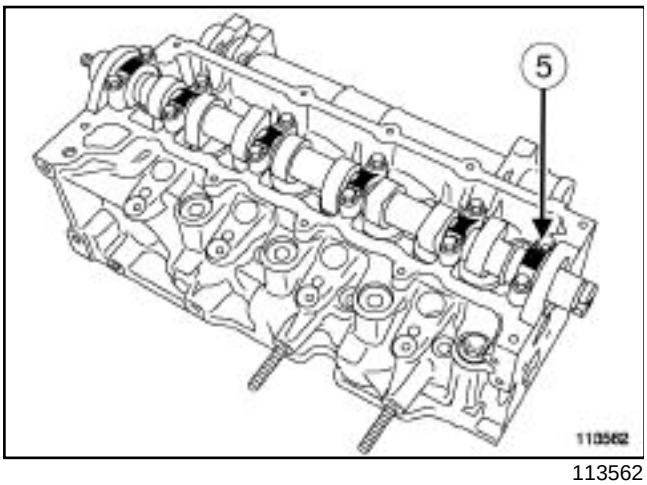
Remove:

- the camshaft bearing caps,
- the camshaft.

7 - Checking the camshaft diametric clearance

Remove any oil that may be on the camshaft bearings and the camshaft bearing caps.

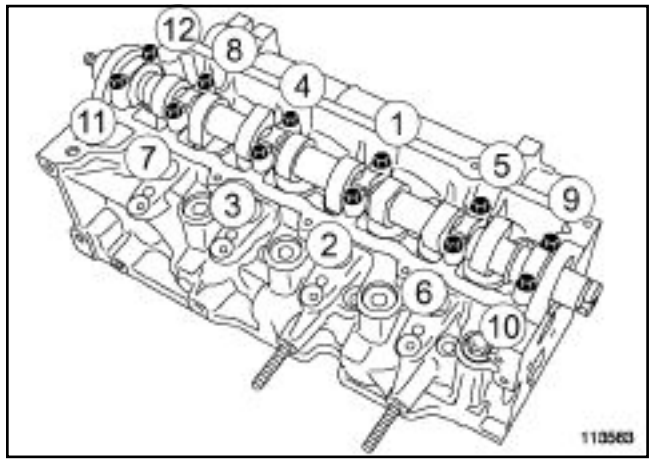
Refit the camshaft.



114814

Cut pieces of measuring wire (**13**) .

Place the wire in the camshaft shaft.



Note:

Do not allow the camshaft to turn during the operation in order to avoid distorting the measurement.

113562

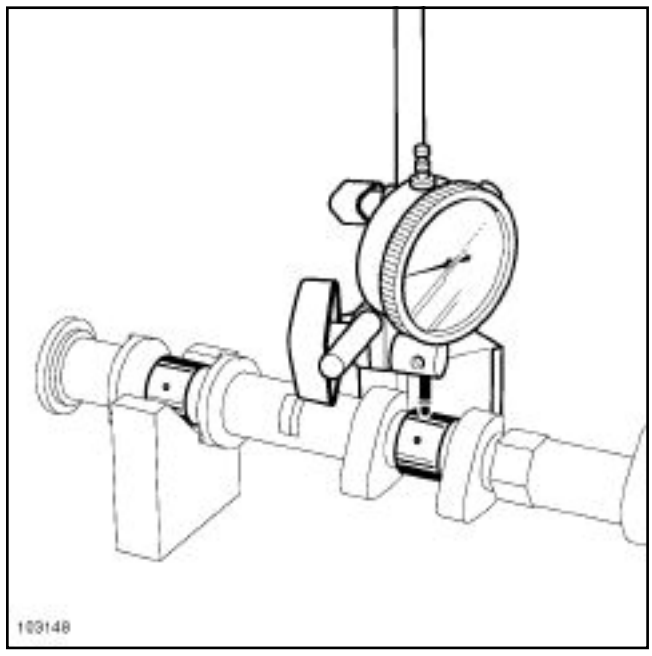
Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**5**) engine flywheel end).

113563

Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 Nm)** .

Remove:

- the camshaft bearing caps,



- the camshaft.

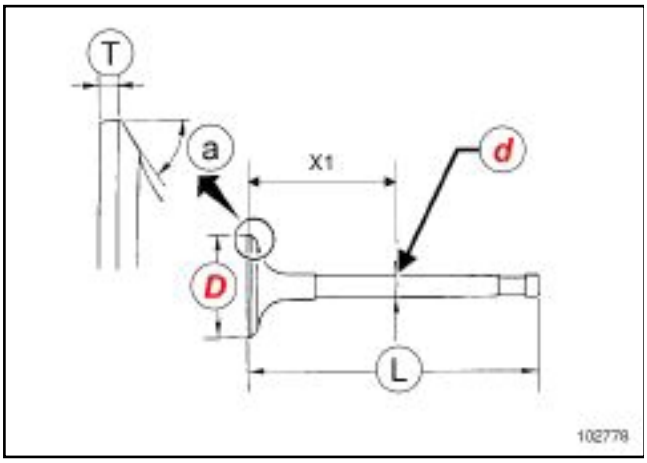
Measure the flattening of the clearance measuring wire using the packaging paper ***(14)*** .

Check the value of the diametric clearance which should be between **0.04 and 0.081 mm** .

Clean any traces of measuring wire off the camshaft and the camshaft bearing caps.

8 - Checking the radial deviation of the camshaft

103148



Position camshaft bearings 2 and 4 on the v-blocks.

Position a dial gauge vertically on camshaft bearing 3.

Turn the camshaft by hand.

Measure the radial deviation which should not be in excess of **0.05 mm** .

9 - Checking the valves

102778

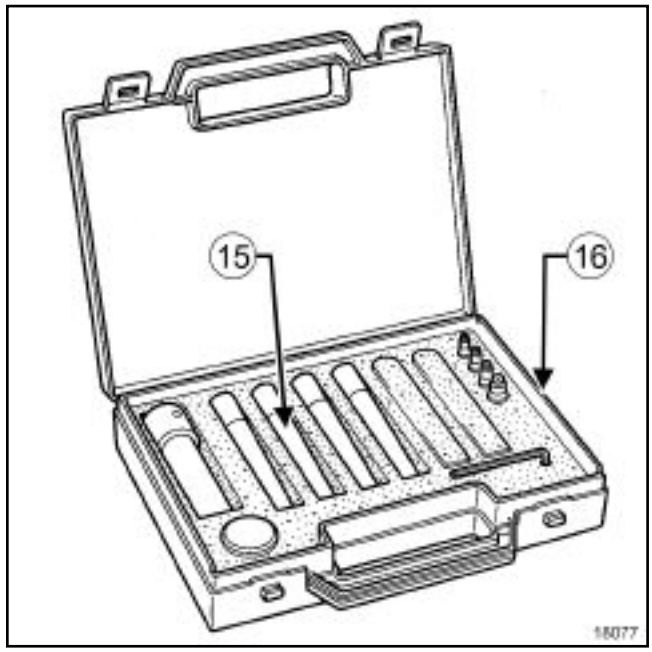
Measure the valve stem diameter (**D**) at (**X1**) :

- Inlet: **5.977 ± 0.008 mm** at (**X1**) = **41 mm** ,
- Exhaust: **5.963 ± 0.008 mm** at (**X1**) = **41 mm** ,

Measure the valve head diameter (**D**) :

- Inlet: **33.5 ± 0.12 mm** ,
- Exhaust: **29 ± 0.12 mm** .

Measure the valve length (**L**) :



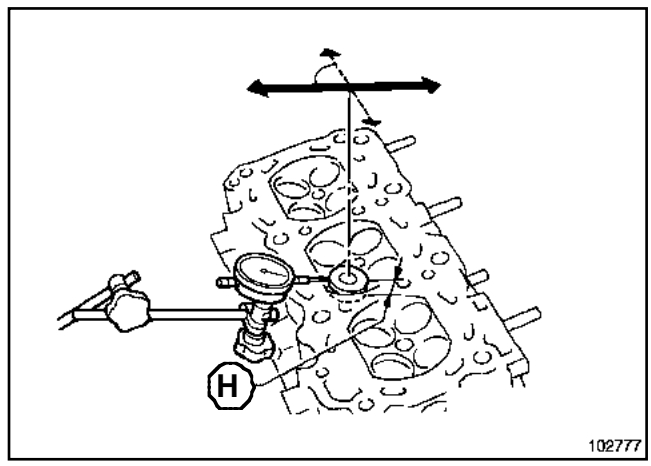
- Inlet: **100.95 ± 0.22 mm** ,
- Exhaust: **100.75 ± 0.22 mm** .

Measure the seat angle (**A**) :

- Inlet: **90˚** ,
- Exhaust: **90˚** .

Thickness (**T**) of the valve head:

- Inlet: **1 mm** ,
- Exhaust: **1 mm** .

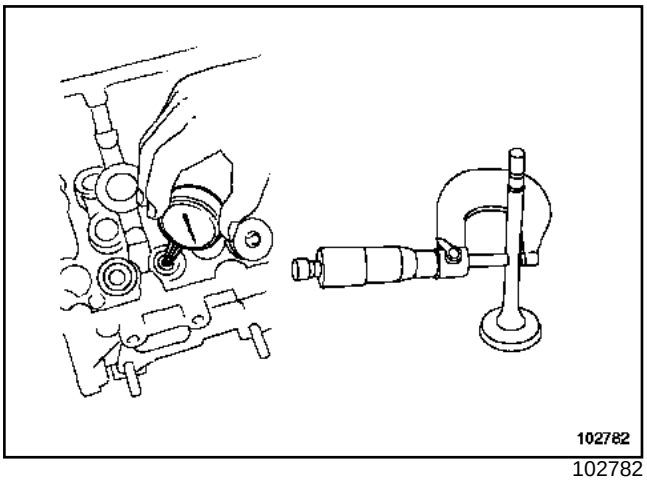


18077

Insert **(without forcing)** the valve in the guide tube (**15**) (with the same diameter as the valve) of the valve stem seal fitting set (**16**) to check:

- that the valve is not twisted,
- that the end of the valve (wedge end) is not strained.

10 - Checking the clearance between the valve and the guide

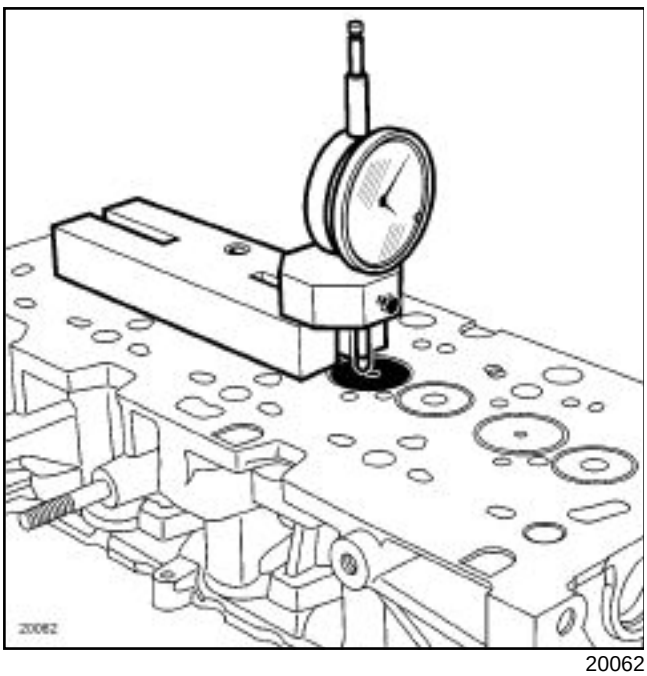


The clearance between the valve and the guide can be checked in two different ways.

102777

Press the head of the valve to a height (**H**) of **25mm** , then, using a dial gauge, take the measurement in the direction of the arrows, keeping to an angle of

90° to the camshaft shaft. The clearance between the valve and the guide is equal to half the measured value.

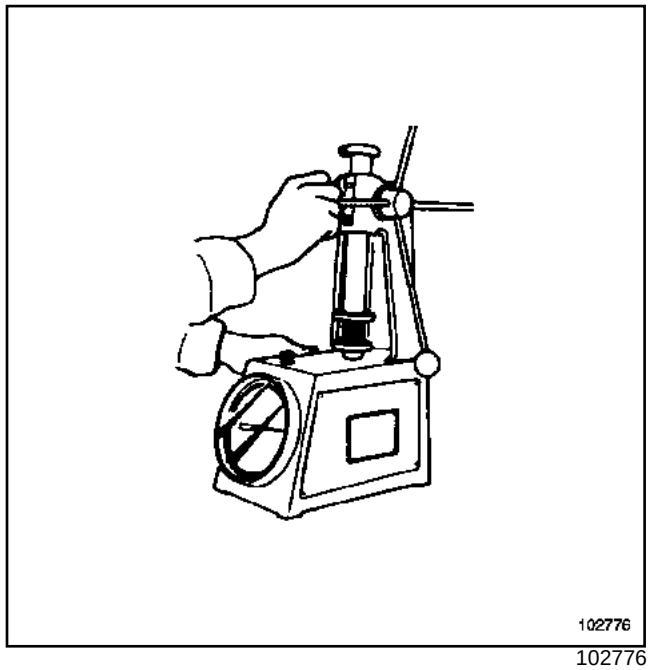


102782

Or using a micrometer measure the external diameter of the valve stem and interior diameter of the valve guide.

Clearance between the valve and the valve guide should be:

- Inlet: **0.02 to 0.05 mm** ,
- Exhaust: **0.03 to 0.063 mm** .



11 - Valve recess

20062

Check the valve recess using **(Mot. 251-01)** , **(Mot. 252-01)** and a dial gauge, which should be **0 ± 0.07 mm** .

12 - Checking the valve springs

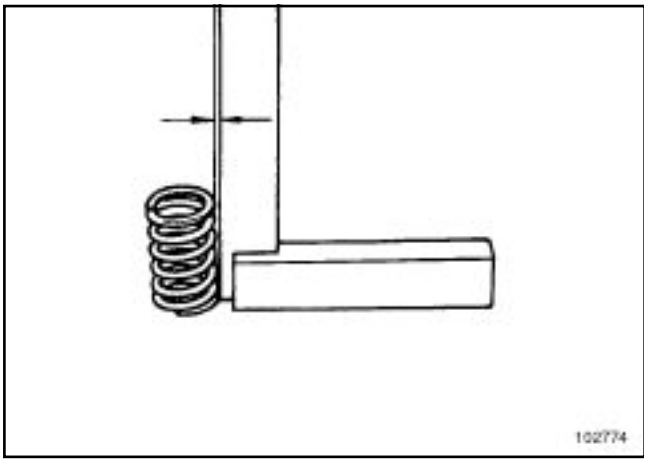
102776

Checking the calibration of the springs.

Length under load:

- **230 ± 12 N** : **33.80 mm** ,
- **500 ± 23 N** : **24.80 mm** .

Length of coiled seals: **23.40 mm** .

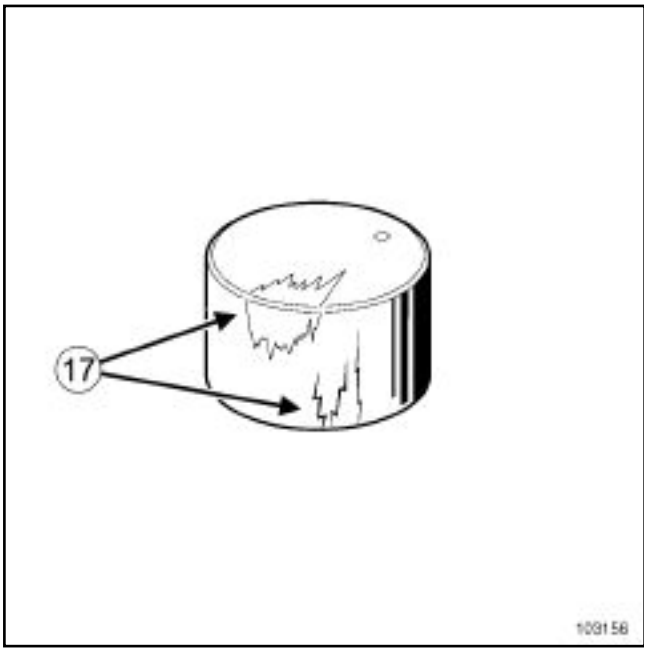


Wire diameter: **3.45 mm** .

Internal diameter:

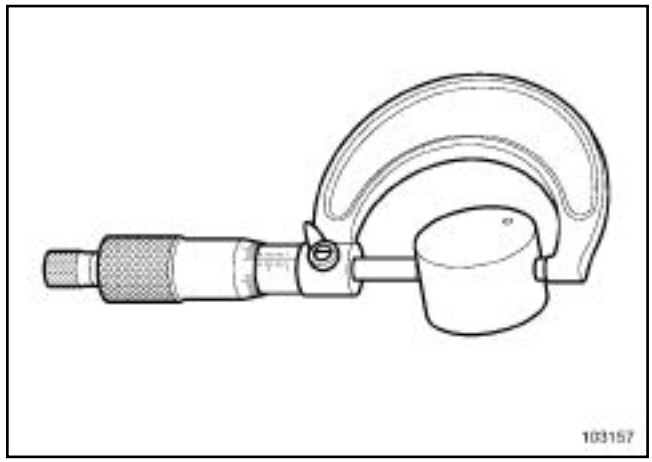
- at the base of the spring **18.80 ± 0.2 mm** ,
- at the top of the spring **14.10 ± 0.2 mm** ,

External diameter:



- at the base of the spring **25.70 ± 0.2 mm** ,
- at the top of the spring **21 ± 0.2 mm** ,

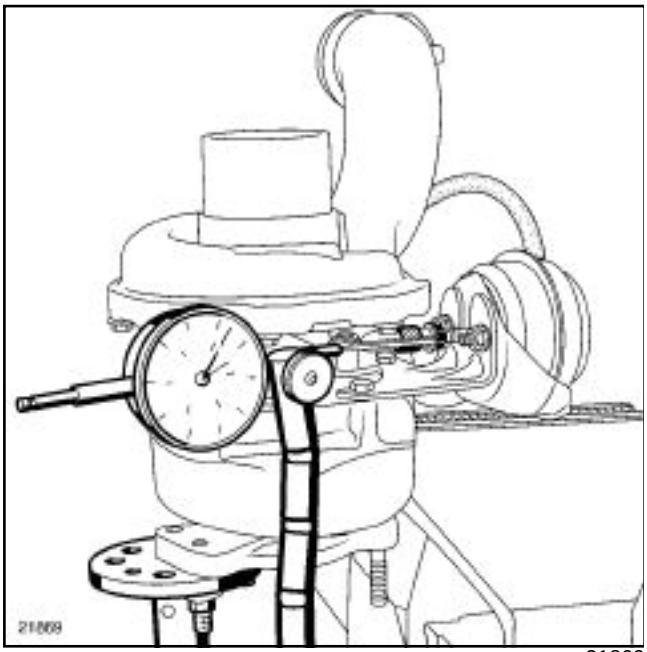
102774



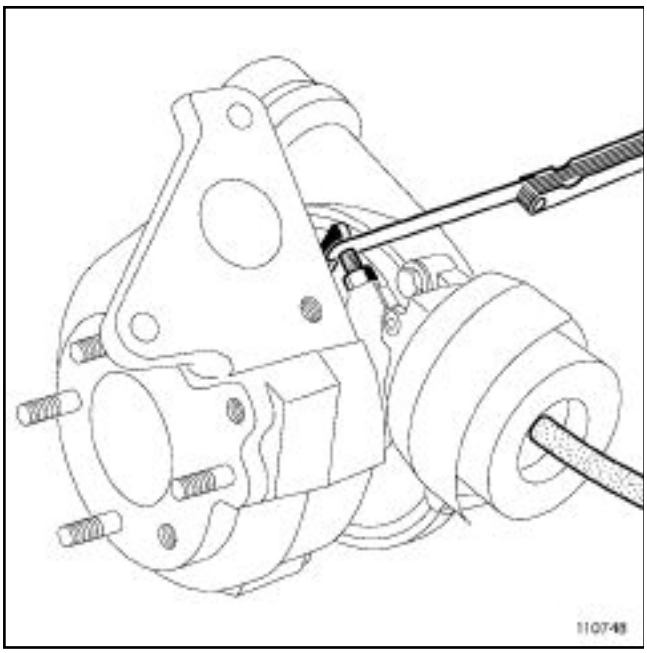
Check that the perpendicularity of the spring is not in excess of **1.2 mm** .

13 - Valve pushrod

103156



Check the condition of the tappet (worn or coating cracked (**17**)).



103157

Measure the external diameter of the tappet using a micrometer **34.975 ± 0.01 mm** .

14 - Turbocharger

21869

110748

Check the turbocharger pressure valve.

Use a magnetic holder fitted with a dial gauge or a set of shims positioned at the end of the regulating valve stem or between the regulating valve stem and the valve guard (in the axis of the stem).

Progressively apply pressure or a vacuum to the regulation valve using a pressure/vacuum pump (see **10A**, **Engine and lower engine assembly**, **Upper engine: Specifications**, page **10A-28**) .

15 - Heater plugs

Check the resistance of the plug using a multimeter. The resistance should be **0.6 ω** .

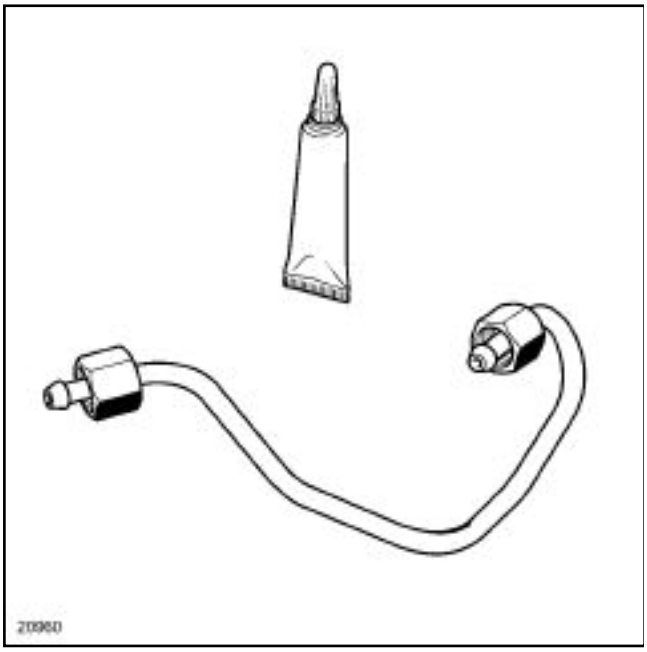
Cylinder head: Refitting

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Special tooling required	
Mot. 1511-01	Valve stem seal fitting tool adapter.
Mot. 1335	Pliers for removing valve stem seals.
Mot. 1502	Valve lifting tool for removing valves.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 856-02	Dial gauge support.
Mot. 252-01	Dial gauge support thrust plate.
Mot. 1632	Tool for fitting PTFE camshaft seal
Mot. 1567	Long nose pliers for EGR duct clips.
Mot. 1746	Offset spanner for tightening high pressure pump pipes.
Mot. 1566	Spanner for removing high pressure pipes.

Tightening torques ▽	
the crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
the camshaft pulley mounting stud	**12 ± 2 Nm**
the crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
the mounting nut for the camshaft pulley	**30 ± 3 Nm + 86° ± 6°**
exhaust manifold mounting nuts	**26 ± 2.6 Nm**
EGR recirculation unit mounting bolts	**21 ± 2.1 Nm**
the inlet duct mounting bolt	**21 ± 2.1 Nm**

Tightening torques ▽	
the engine lifting eye mounting bolts (timing end)	**M8 to 21 ± 2.1 Nm or M6 to 10 ± 1 Nm**
the cylinder head coolant outlet unit mounting bolts	**11 ± 1.1 Nm**
the vacuum pump bolts	**21 ± 2.1 Nm**
the heater plugs	**15 ± 1.5 Nm**
the engine lifting eye mounting bolts (flywheel end)	**13 ± 1.3 Nm**
the injector bracket bolts	**28 ± 2.8 Nm**
the high-pressure pump mounting bolts	**21 ± 2.1 Nm**
injector rail mounting nuts	**28 ± 2.8 Nm**
the pump-rail high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**
the rail-injectors high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**



I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

It is essential to follow the cleanliness guidelines (see **Engine: Precautions during repair**).

Wear latex gloves while using the cleaning product.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

20960

WARNING

Before fitting a new high-pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high-pressure pipe.

Do not lubricate high-pressure pipes supplied without an applicator; these pipes are self-lubricating.

Do not remove the blanking plugs from each component until the last moment.

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system.

Tighten to torque (**38 ± 3.8 Nm**) the pump-rail and rail-injectors high-pressure pipes, part nos.:

- **77 01 207 025**
- **77 01 207 026**
- **77 01 207 027**
- **77 01 207 028**
- **77 01 207 029**

For the high-pressure pipes with the remaining part nos, tighten to a torque of (**24 ± 2.4 Nm**).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

The gaskets must always be replaced.

The camshaft pulley mounting stud must be replaced if it comes loose as the camshaft pulley is removed.

Do not grease the valve stem seals.

II - PARTS AND CONSUMABLES FOR THE REPAIR

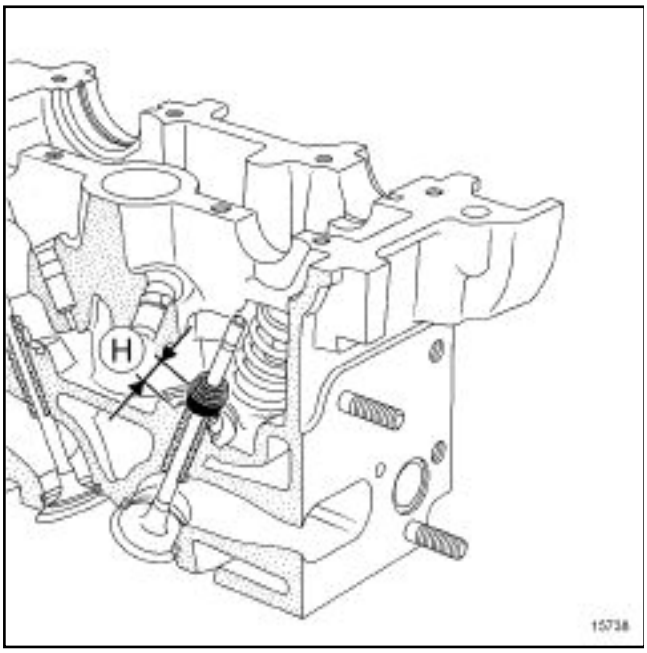
Parts always to be replaced

- Camshaft pulley nut,
- Camshaft seal (timing end),
- The injector heat protection washers,
- High-pressure pipes,
- The vacuum pump seal,

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

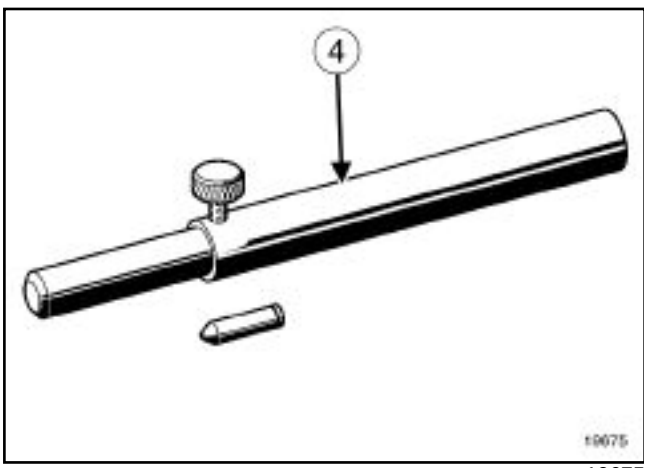
- The cylinder head coolant outlet unit seal,
- The exhaust manifold gasket,
- The inlet tube gasket,
- The exhaust gas recirculation pipe,
- The EGR solenoid valve seal,
- Valve stem seals

Consumables



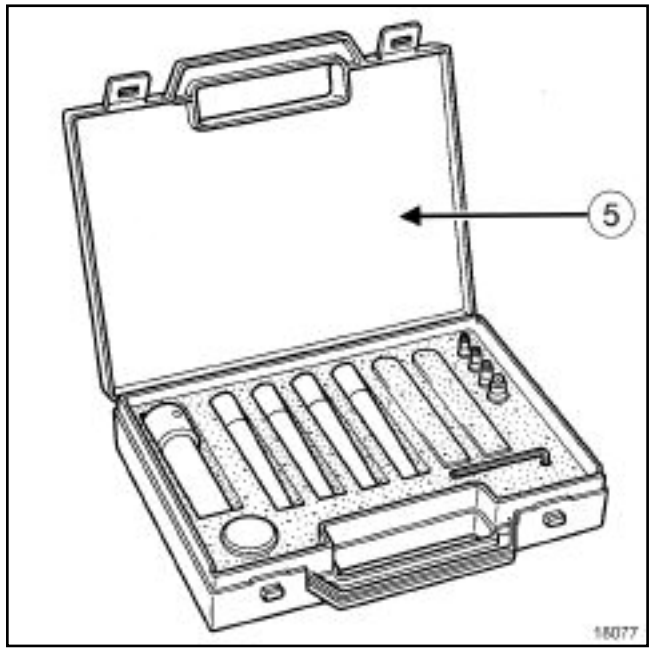
- Loctite 518, part no. **77 01 421 162** ,
- Degreasing agent, part no. **77 11 224 559** .

III - EQUIPMENT REQUIRED



- Latex protective gloves,
- high-pressure pipes valve wrench,
- Tweezers,
- Wrench for the high-pressure pipes,
- Crow foot wrench,
- Wrench with hinge for heater plugs,
- Roller-type stud removal tool
- The valve stem seal fitting kit,
- Dial gauge,
- Magnetic holder,
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



IV - REASSEMBLING THE CYLINDER HEAD

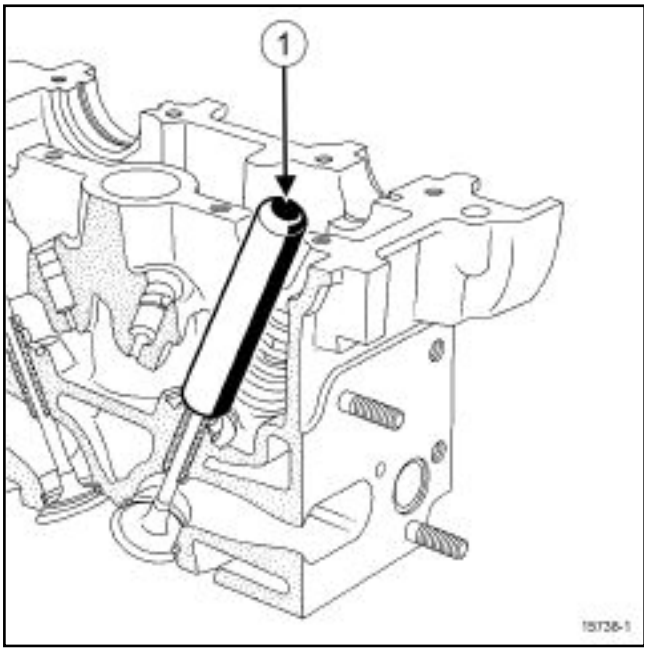
15738

19675

18077

Note:

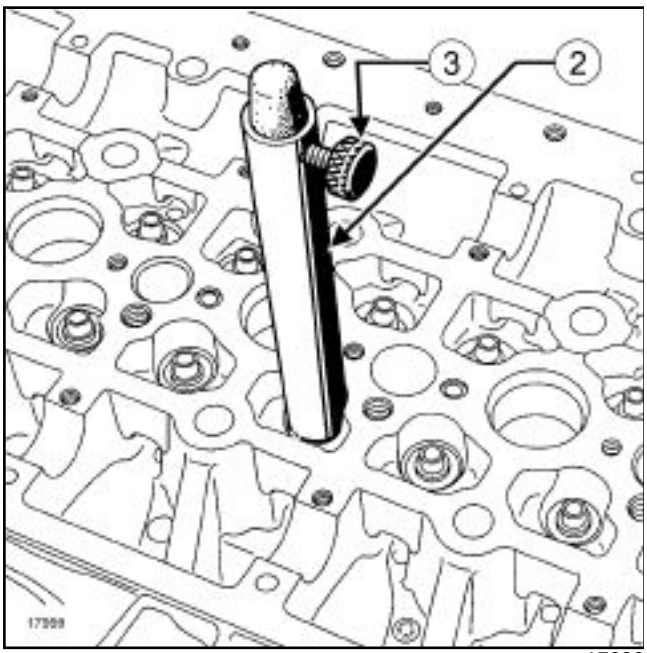
Before removing the valve stem seals, it is essential to note the position *(H)* of the old seals on the inlet side, then the exhaust side as the fitting dimension of the seals may be different between the inlet and the exhaust.



Fit a valve.

Compare dimension (**H**) of an old seal with the cylinder head using the **(Mot. 1511-01)** (**4**) or the valve stem seal fitting kit (**5**) .

Note:



The internal diameter of the pushrod *(1)* should be identical to that of the valve; In addition, the bottom of the pushrod must be snug against the metal upper section of the valve stem seal.

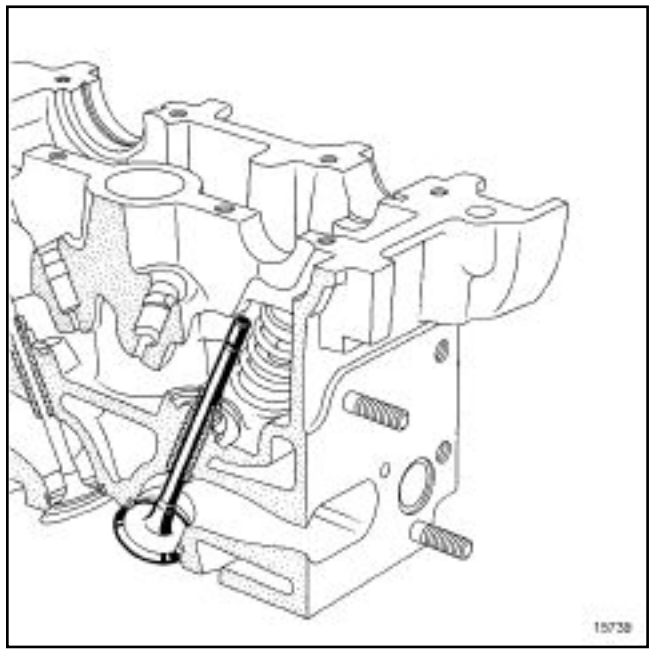
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

15738-1

Place the pushrod (**1**) over the valve stem seal.

17999

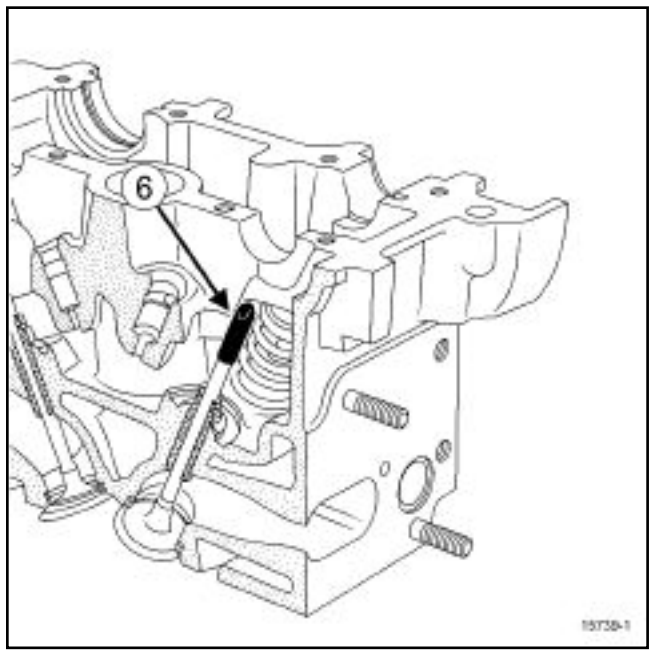
Fit the guide tube (**2**) above the pushrod until it comes into contact with the cylinder head.



Lock the pushrod with the wheel (**3**) .

Remove the guide tube-pushrod assembly, being careful not to loosen the wheel.

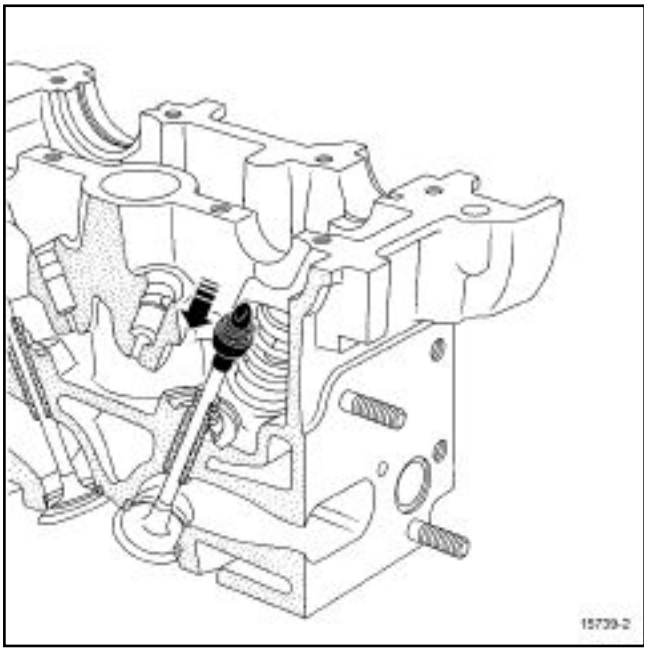
Remove:



- the valve,
- the valve stem seals (inlet end then exhaust end) using the **(Mot. 1335)** .

Apply engine oil to the inside of the valve guide.

15739

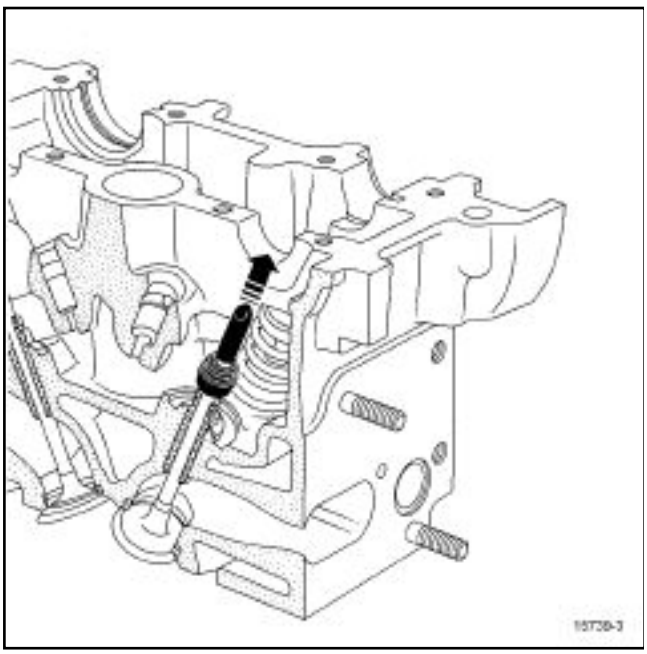


Place the valve in the cylinder head.

15739-1

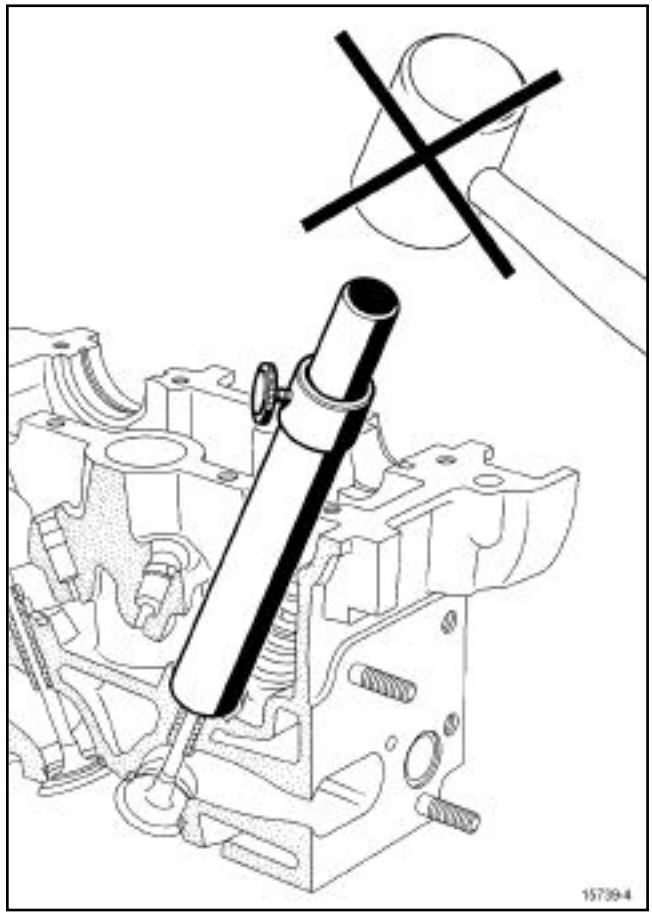
Place the valve insert (**6**) on the valve stem (the diameter of the valve insert should be identical to that of the valve stem).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



15739-2

Keep the valve pressed against its seat.

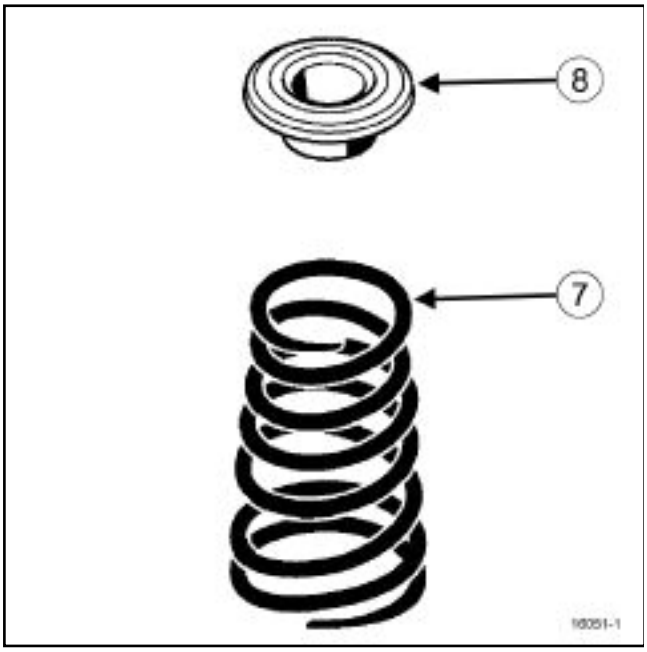


Mount the valve stem seal (not lubricated) over the valve insert.

Push the valve stem seal until it goes past the valve insert.

15739-3

Remove the valve insert.

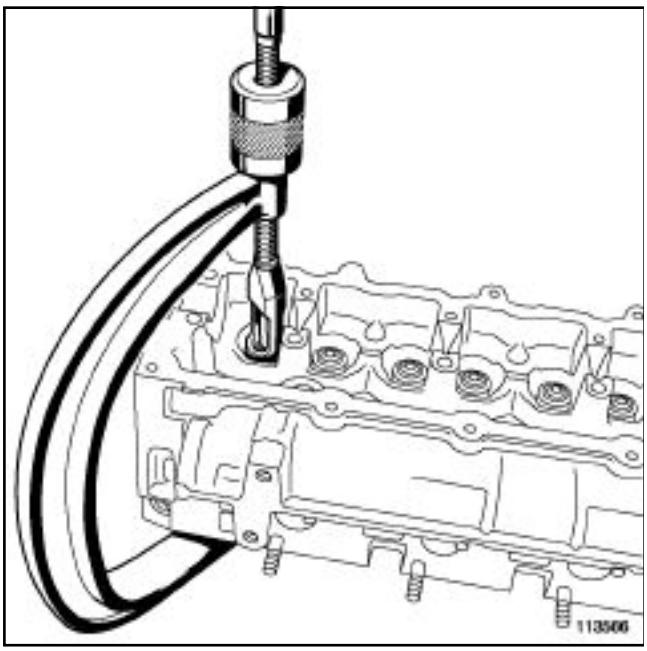


15739-4

Fit the guide tube-pushrod assembly on the valve stem seal.

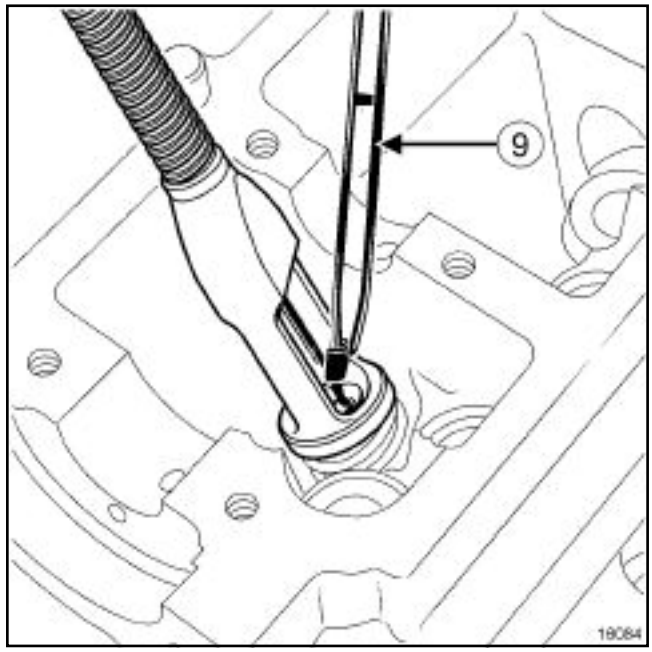
Push home the valve stem seal by gently striking the pushrod with the palm of the hand, until the guide tube makes contact with the cylinder head.

Repeat the preceding operations on all the inlet and exhaust valves.



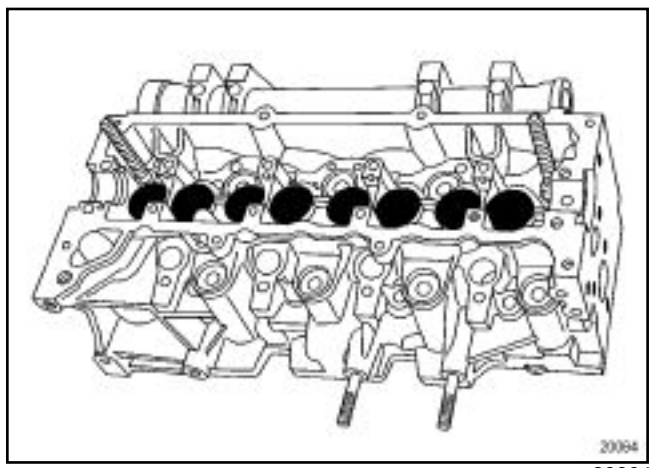
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

16051-1



Refit:

- the valve springs, positioning the conical part (**7**) of the spring at the top,
- the valve spring upper cups (**8**) ,

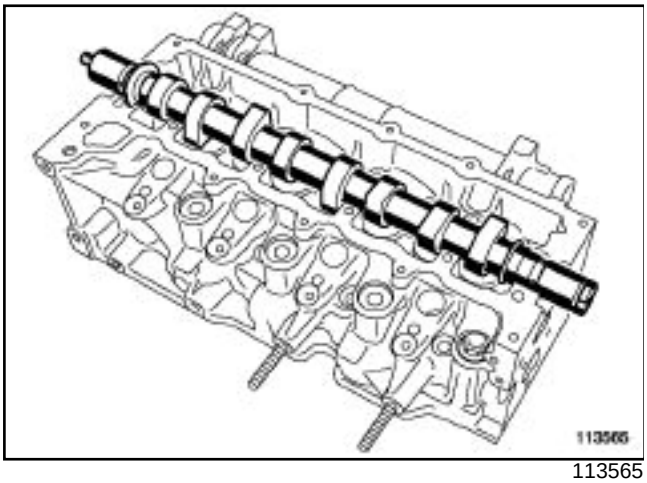


113566

Compress the valve springs using the **(Mot. 1502)** or a valve wrench.

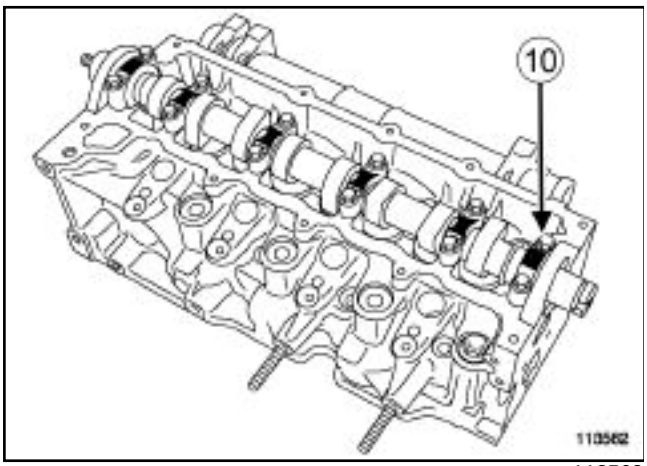
16084

Refit the cotters using tweezers.



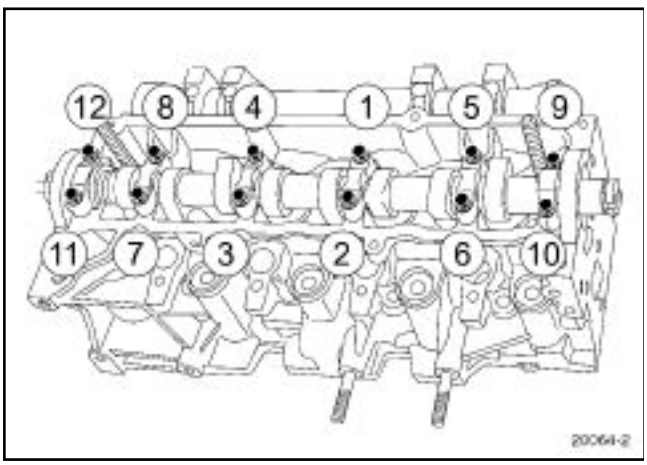
20064

Refit the pushrods observing their original position.



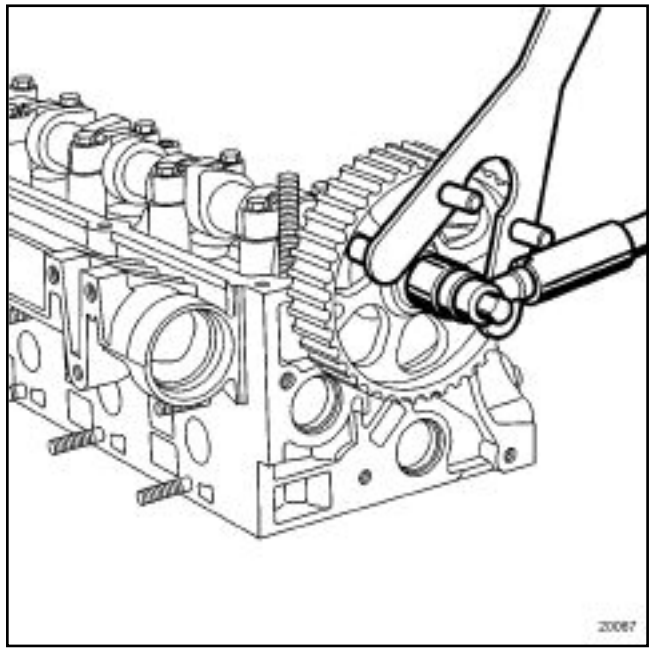
Oil the valve pushrods and the camshaft bearings with engine oil.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



113565

Refit the camshaft.



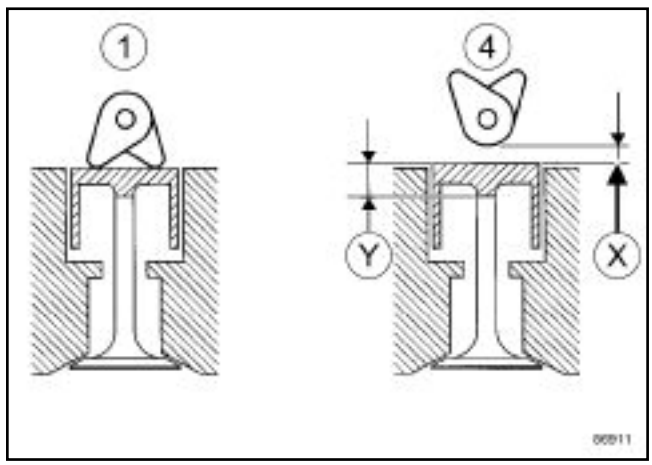
113562

Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**10**) engine flywheel end).

20064-2

Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .

20067



Refit:

- the camshaft pulley,

- the old exhaust camshaft pulley mounting nut.

Tighten to torque **the mounting nut for the camshaft pulley (15 ± 1.5 Nm)** , blocking the camshaft pulley with the **(Mot. 799-01)** .

Check and adjust the valve clearances following the procedure below.

86911

Position the cylinder valves (**1**) in the end of exhaust stroke, beginning of inlet stroke position.

Measure the valve clearance (**X**) of the cylinder (**4**) using a set of shims.

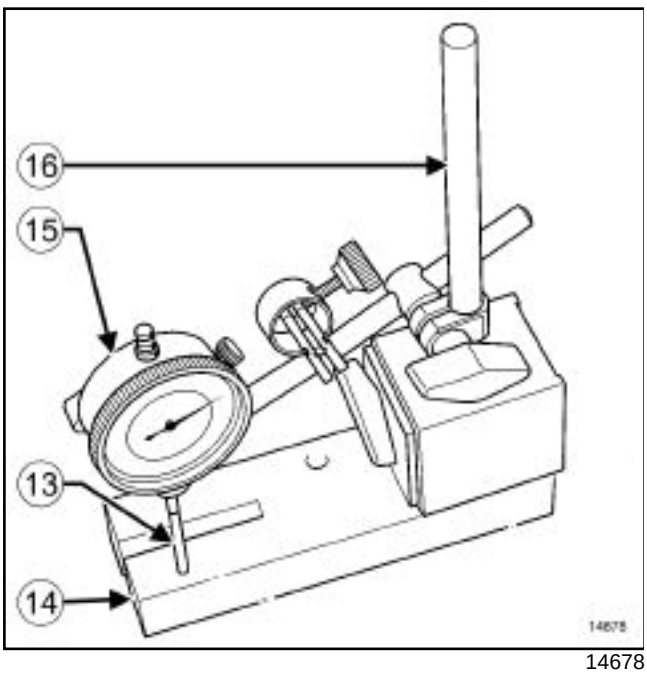
- inlet valve clearance **0.20 mm** ,

- exhaust valve clearance **0.40 mm** ,

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Note the clearance values.

Repeat the above operations on the other cylinders:



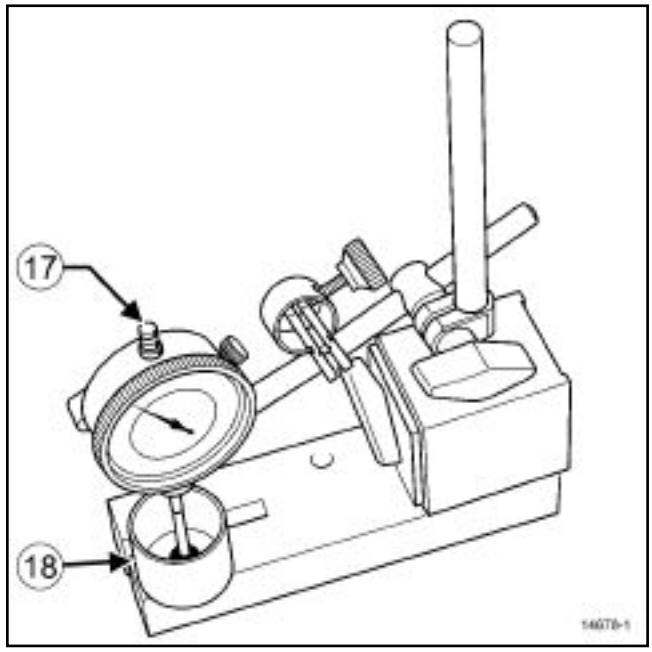
- position cylinder No. **3** at an angle and measure the clearance of cylinder No. **2** ,
- position cylinder No. **4** at an angle and measure the clearance of cylinder No. **1** ,
- position cylinder No. **2** at an angle and measure the clearance of cylinder No. **3** ,

Compare the values noted with the specified values.

Remove:

- the nut from the camshaft pulley,
- the camshaft pulley,
- the camshaft bearing caps,
- the camshaft,
- the pushrod(s) which are outside of permitted tolerance values, noting their original position.

Undertake the following installation to determine the class of thickness of the valve pushrod.



14678

Screw the extension piece (**13**) of the **(Mot. 856-02)** to a dial gauge (**15**) .

Fix the dial gauge (**15**) to a magnetic holder (**16**) .

Mount the dial gauge-magnetic holder assembly on the plate (**14**) of the tool **(Mot. 252-01)** .

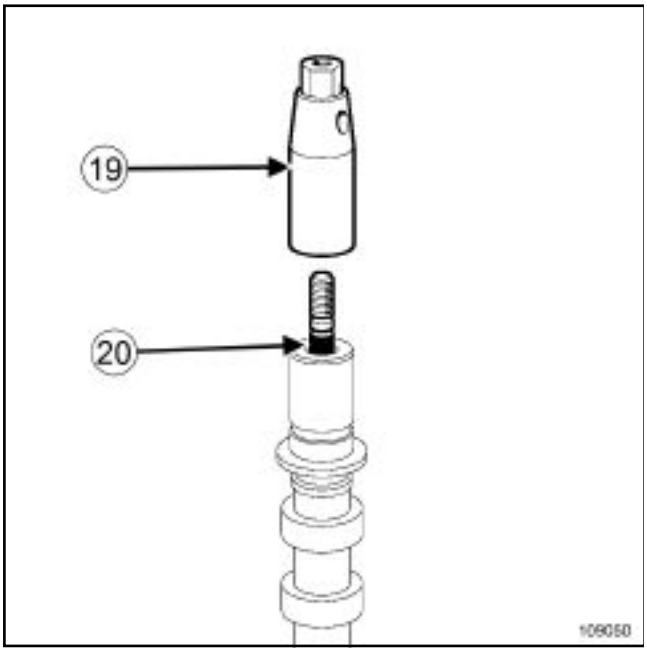
Calibrate the dial gauge.

14678-1

Lift the top piece (**17**) of the dial gauge (without changing the position of the dial gauge-magnetic holder assembly).

Mount the valve pushrod (**18**) to be measured on the plate of the **(Mot. 252-01)** .

Take the measurement ***(Y)*** .



Repeat the preceding operations for the other valve pushrods to be measured.

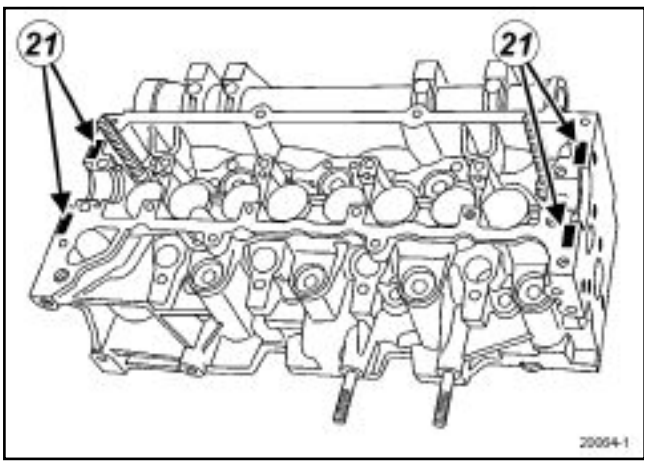
Refit the new valve pushrod(s) in the cylinder head.

Check that the camshaft pulley mounting stud has not come loose. If so, the stud must be replaced following the procedure described below.

Place the camshaft in a vice fitted with a clamping jaw.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

109050

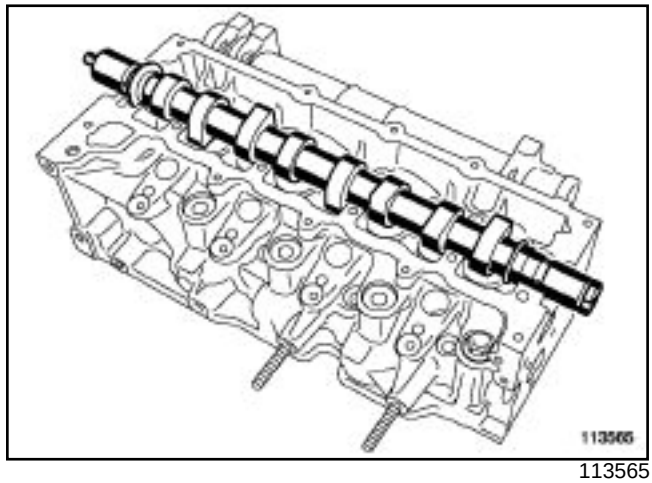


Remove the piston rings using a roller-type stud removal tool (**19**) .

Clean the threaded hole of the camshaft carefully to prevent foreign bodies from entering the latter.

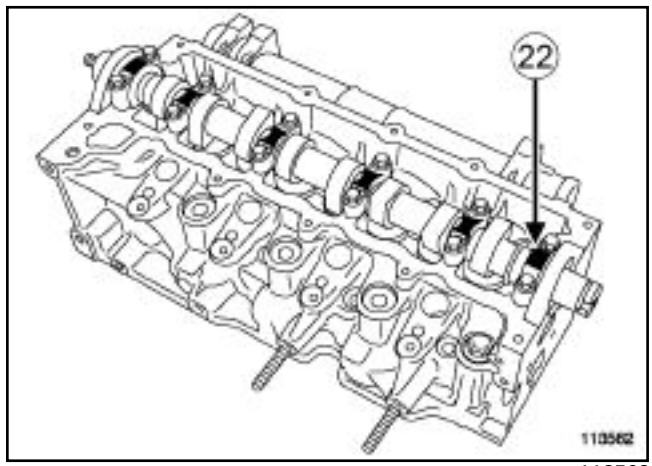
Fit the new stud on the camshaft (precoated section ***(20)*** on the camshaft side).

Tighten to torque **the camshaft pulley mounting stud (12 ± 2 Nm)** using a roller-type stud removal tool ***(19)*** .



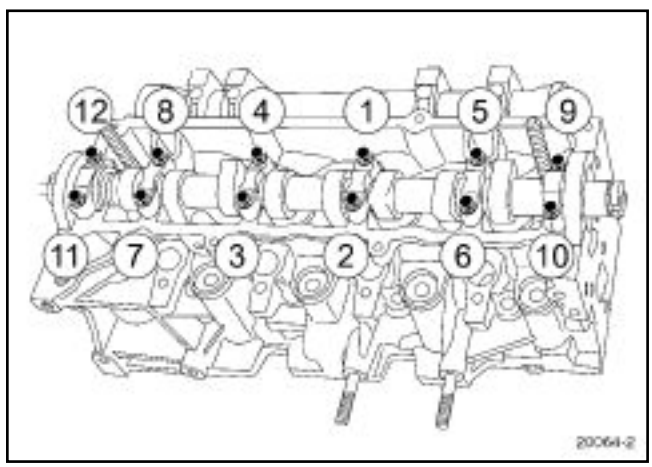
Oil the top of the valve pushrods and the camshaft bearings with engine oil.

20064-1



Degrease the surfaces of the camshaft bearing gaskets nos. 1 and 6 (**21**) using degreaser.

Apply four beads of **LOCTITE 518** of a width of **1 mm** to camshaft bearings nos. 1 and 6 (**21**) .

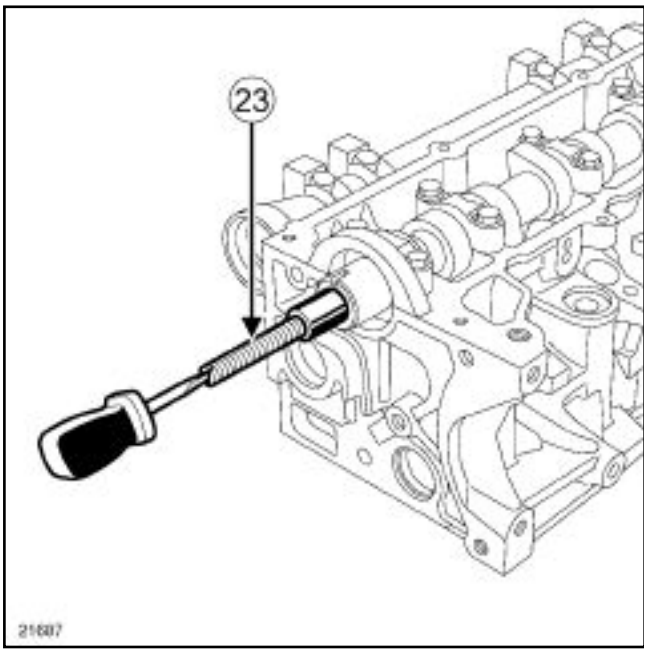


113565

Refit the camshaft.

113562

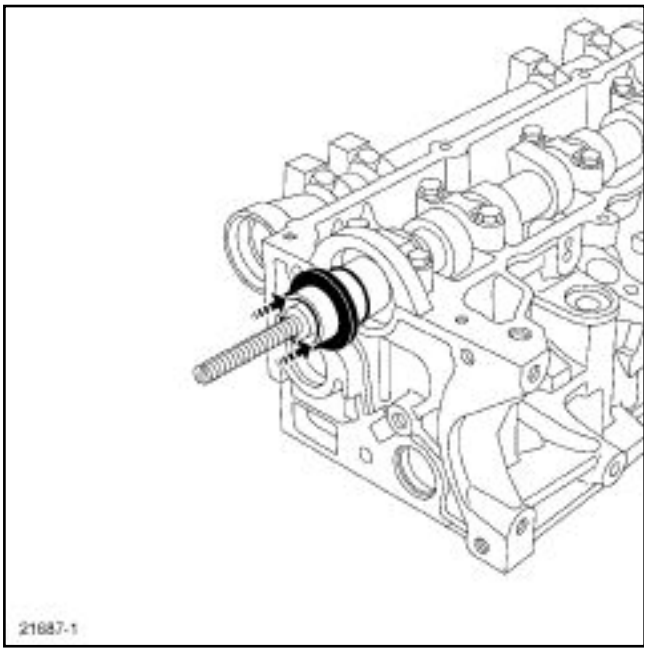
Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**22**) engine flywheel end).



20064-2

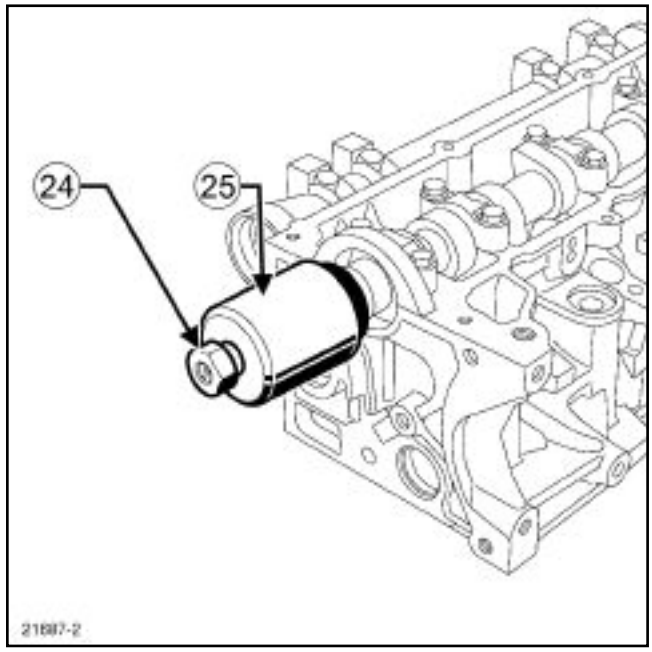
Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



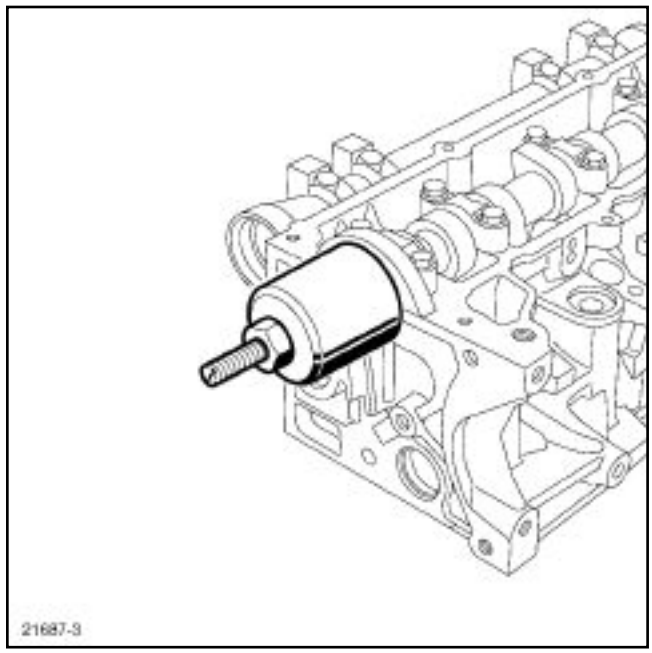
Apply degreaser to:

- the end of the camshaft at the timing end,
- the housing on the cylinder head of the camshaft gasket.



21687

Screw the shoulder stud (**23**) of the **(Mot. 1632)** onto the mounting stud of the camshaft pulley.

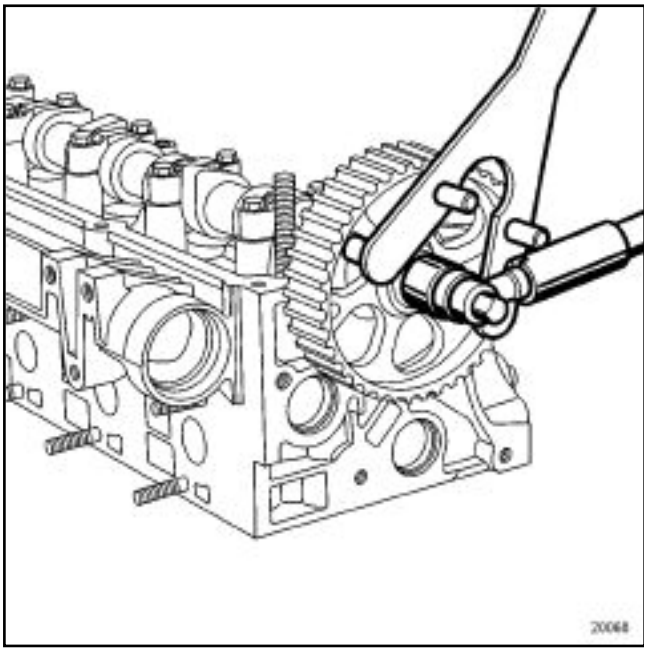


21687-1

Refit the camshaft gasket.

21687-2

Position the cover (**25**) and collar nut (**24**) of the **(Mot. 1632)** .



21687-3

Screw on the collar nut until the cover touches the cylinder head.

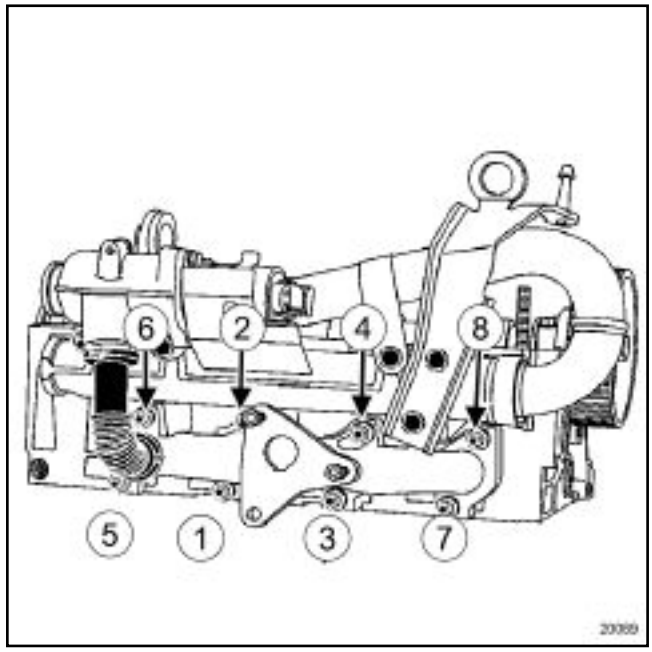
Remove:

- the collar nut,
- the cap,
- the shoulder stud.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

20068

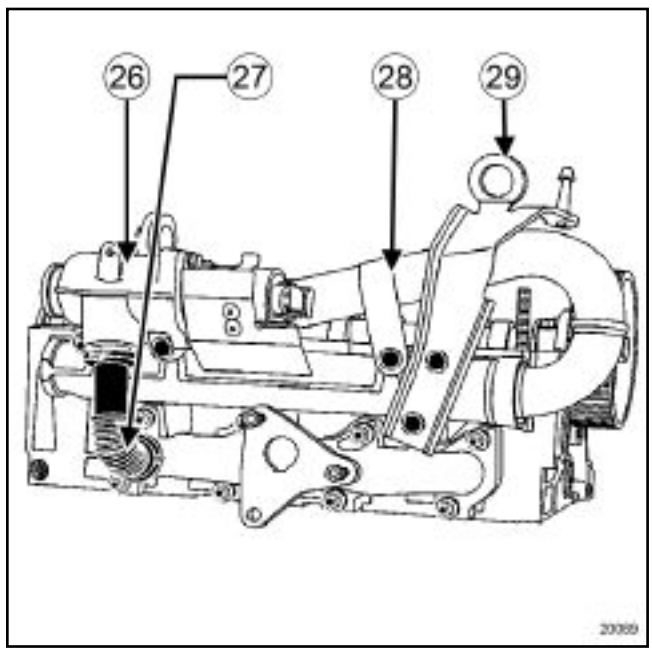
Refit:



- the camshaft pulley,
- the new camshaft pulley mounting nut.

Tighten to torque and angle **the mounting nut for the camshaft pulley (30 ± 3 Nm + 86° ± 6°)** , blocking the camshaft pulley with the **(Mot. 799-01)** .

Using degreaser, degrease the surfaces of the exhaust manifold and cylinder head gaskets at the exhaust end.



Refit:

- a new turbocharger-exhaust manifold gasket,
- the exhaust manifold,
- the exhaust manifold mounting nuts.

20069

Tighten to torque and in order the **exhaust manifold mounting nuts (26 ± 2.6 Nm)** .

20069

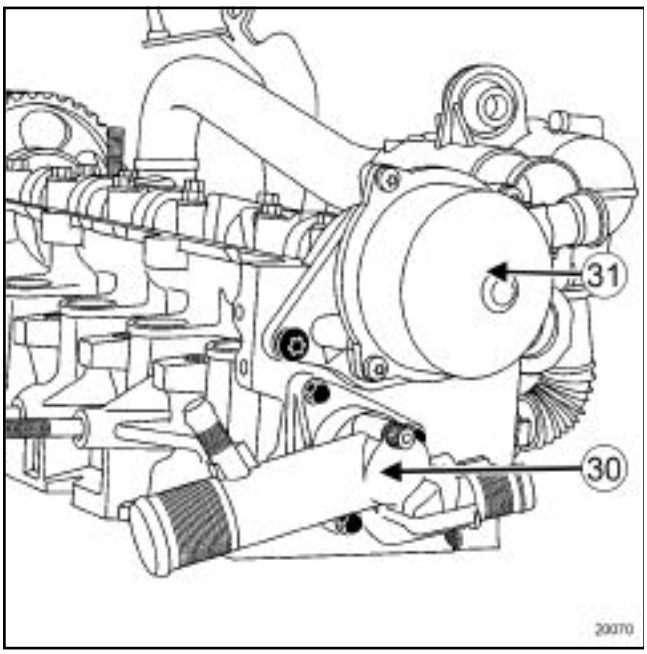
Refit:

- the EGR recirculation unit (**26**) without tightening the bolts,
- the exhaust gas recirculation pipe (**27**) ,
- the mounting clips of the exhaust gas recirculation pipe.

Tighten the clips of the exhaust gas recirculation pipe using the **(Mot. 1567)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Tighten to torque the **EGR recirculation unit mounting bolts (21 ± 2.1 Nm)** .



Refit:

- a new seal on the inlet duct,
- the inlet duct ***(28)*** ,
- the engine lifting eye ***(29)*** (timing end).

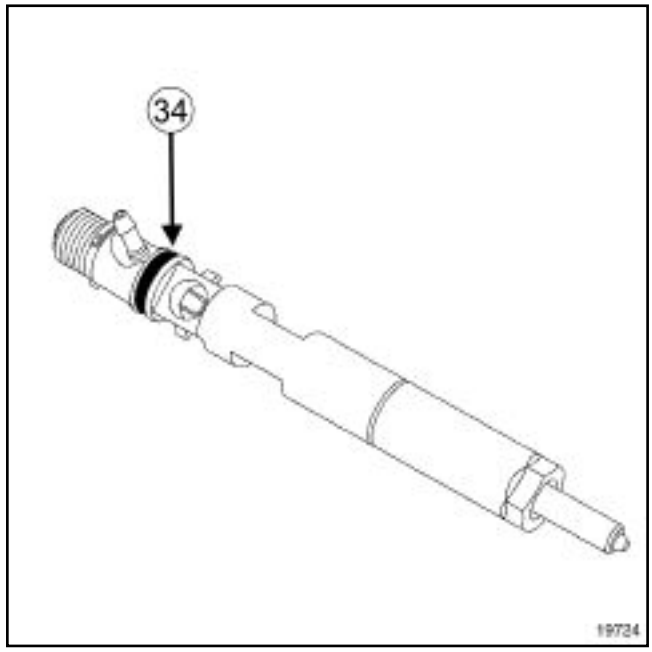
Tighten to torque:

- **the inlet duct mounting bolt (21 ± 2.1 Nm)** ,
- **the engine lifting eye mounting bolts (timing end) (M8 to 21 ± 2.1 Nm or M6 to 10 ± 1 Nm)** .

Using degreaser, degrease the seal surfaces where the vacuum pump enters and at the cylinder head coolant outlet.

20070

Refit:



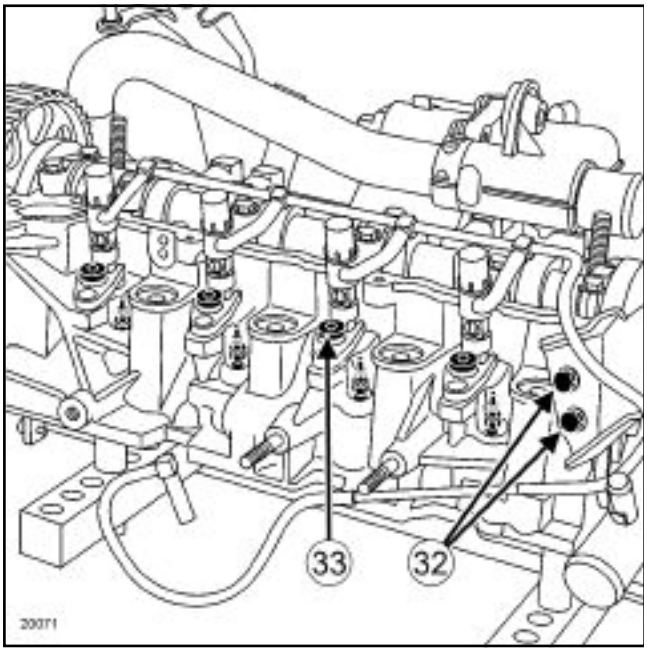
- the cylinder head coolant outlet unit (**30**) fitted with a new seal,
- the vacuum pump (**31**) fitted with a new seal.

Tighten to torque:

- **the cylinder head coolant outlet unit mounting bolts (11 ± 1.1 Nm)** ,
- **the vacuum pump bolts (21 ± 2.1 Nm)** .

Refit the heater plugs.

Tighten to torque **the heater plugs (15 ± 1.5 Nm)** using a wrench with hinge.

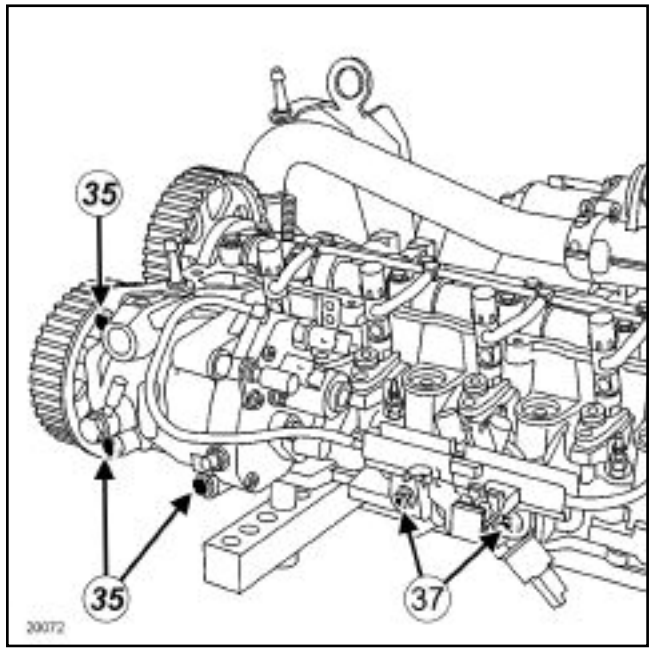


19724

Note:

If one or more injectors are replaced, note the alphanumeric code (C2I) (**34**) and the number of the cylinder on which it is fitted.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



20071

Refit:

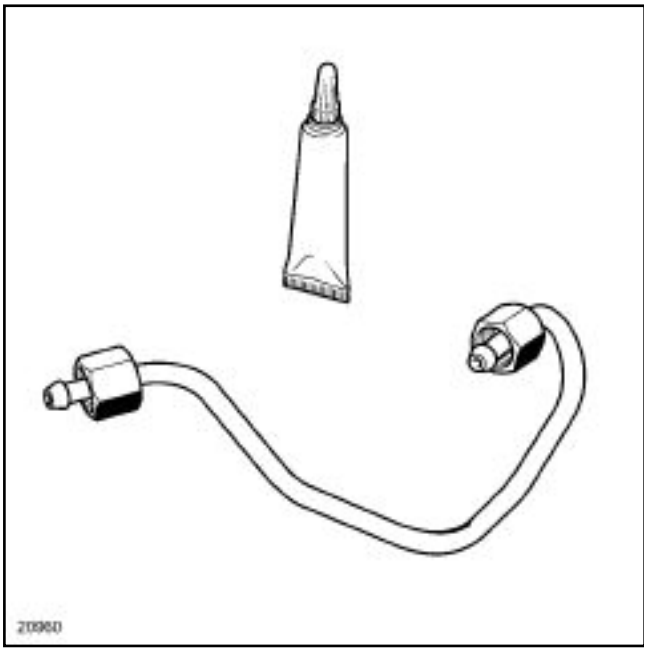
- engine lifting eye (flywheel end),
- the new heat protection washers,
- the injectors (observing their positions),
- the injector brackets.

Tighten to torque:

- **the engine lifting eye mounting bolts (flywheel end) (13 ± 1.3 Nm)** (**32**) ,
- **the injector bracket bolts (28 ± 2.8 Nm)** (**33**) .

20072

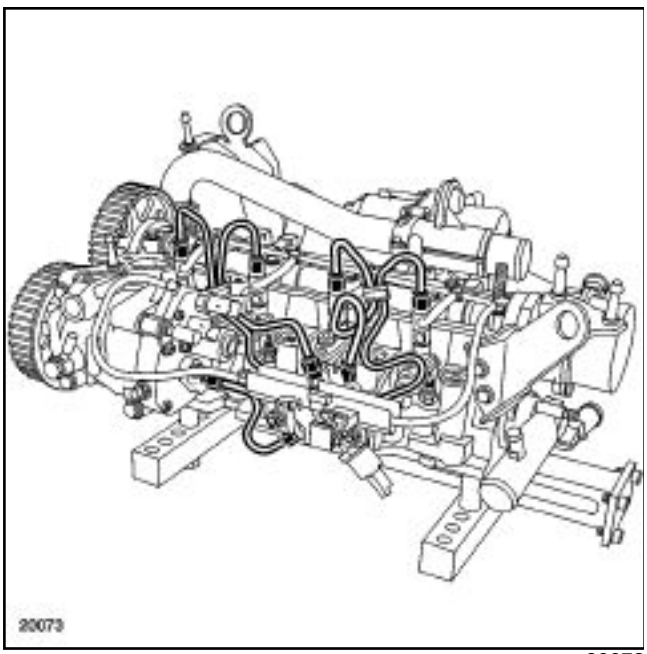
Refit:



- the high-pressure pump,
- the injector rail **(without tightening the nuts)** .

Tighten to torque **the high-pressure pump mounting bolts (21 ± 2.1 Nm)** .

Note:

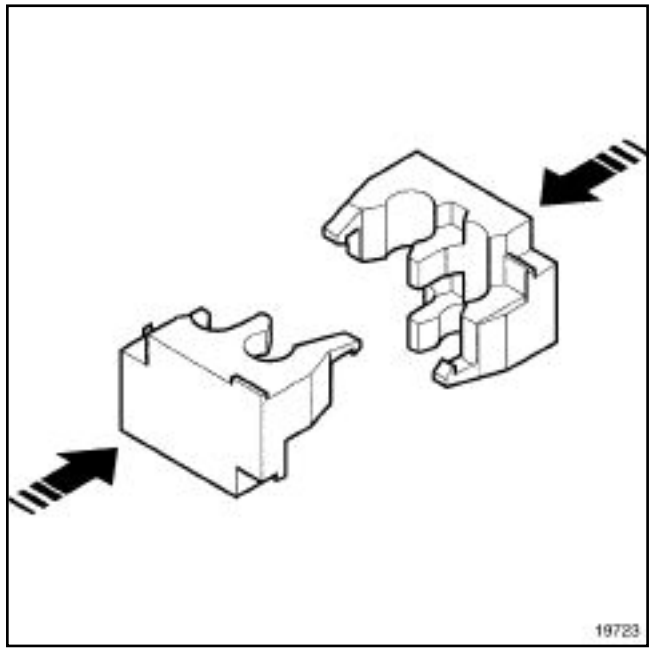


Do not lubricate high-pressure pipes **supplied without an applicator; these pipes are self-lubricating.**

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

20960

Lightly lubricate the nut threads with oil from the applicator supplied with the new part, taking care not to insert it in the pipe.



20073

Insert the high-pressure pipe olive in the injector high-pressure inlet taper.

Insert the high-pressure pipe olive in the rail high-pressure outlet taper.

Finger tighten the high-pressure pipe nuts, starting with the one located on the injector end.

Lightly tighten the nuts of the high-pressure pipes.

19723

Fit the new clip provided with the new high-pressure pipe.

Tighten to torque the **injector rail mounting nuts (28 ± 2.8 Nm)** .

Note:

Completely tighten one high-pressure pipe before moving to the next one.

Tighten to torque and in order (according to the part no. of the pipe) **the pump-rail high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

- high-pressure pump side, using the **(Mot. 1746)** or a crow foot wrench,
- injector rail side, using the **(Mot. 1746)** or a crow foot wrench,

Tighten to torque and in order (according to the part no. of the pipe) **the rail-injectors high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

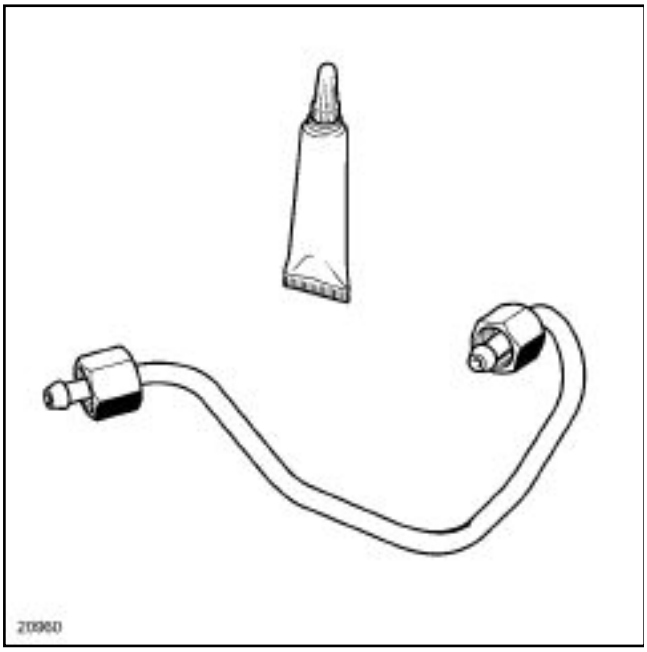
- injector side using the **(Mot. 1566)** or with a wrench for high-pressure pipes.
- injector rail side, using the **(Mot. 1566)** or a crow foot wrench,

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1511-01	Valve stem seal fitting tool adapter.
Mot. 1335	Pliers for removing valve stem seals.
Mot. 1502	Valve lifting tool for removing valves.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 856-02	Dial gauge support.
Mot. 252-01	Dial gauge support thrust plate.
Mot. 1632	Tool for fitting PTFE camshaft seal
Mot. 1567	Long nose pliers for EGR duct clips.
Mot. 1746	Offset spanner for tightening high pressure pump pipes.
Mot. 1566	Spanner for removing high pressure pipes.

Tightening torques ▽	
the crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
the camshaft pulley mounting stud	**12 ± 2 Nm**
the crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
exhaust manifold mounting nuts	**26 ± 2.6 Nm**
turbocharger mounting nuts	**26 ± 2.6 Nm**
the turbocharger oil supply pipe mounting bolt (turbocharger end)	**23 ± 2.3 Nm**
the turbocharger oil supply pipe mounting nut (cylinder head end)	**collar nut 35 ± 3.5 Nm or no collar nut 23 ± 2.3 Nm**

Tightening torques ▽	
EGR valve-exchanger mounting bolts	**25 ± 2.5 Nm**
mounting bolts of the exhaust gas recirculation pipe	**35 ± 3.5 Nm**
engine lifting eye mounting bolts (timing end)	**21 ± 2.1 Nm**
camshaft pulley hub nut	**30 ± 3 Nm + 86° ± 6°**
the cylinder head coolant outlet bolt	**11 ± 1.1 Nm**
the EGR exchanger cover mounting bolt	**12 ± 1.2 Nm**
vacuum pump mounting bolts	**21 ± 2.1 Nm**
the heater plugs	**15 ± 1.5 Nm**
the engine lifting eye mounting bolts (flywheel end)	**13 ± 1.3 Nm**
the injector bracket bolts	**28 ± 2.8 Nm**
high-pressure pump mounting bolts	**21 ± 2.1 Nm**
injector rail mounting nuts	**28 ± 2.8 Nm**
the pump-rail high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**
the rail-injectors high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**



I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

It is essential to follow the cleanliness guidelines (see **Engine: Precautions during repair**).

Wear latex gloves while using the cleaning product.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

20960

WARNING

Before fitting a new high-pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high-pressure pipe.

Do not lubricate high-pressure pipes supplied without an applicator; these pipes are self-lubricating.

Do not remove the blanking plugs from each component until the last moment.

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system.

Tighten to torque (**38 ± 3.8 Nm**) the pump-rail and rail-injectors high-pressure pipes, part nos.:

- **77 01 207 025**
- **77 01 207 026**
- **77 01 207 027**
- **77 01 207 028**
- **77 01 207 029**

For the high-pressure pipes with the remaining part nos, tighten to torque (**24 ± 2.4 Nm**).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

The gaskets must always be replaced.

The camshaft pulley mounting stud must be replaced if it comes loose as the camshaft pulley is removed.

Do not grease the valve stem seals.

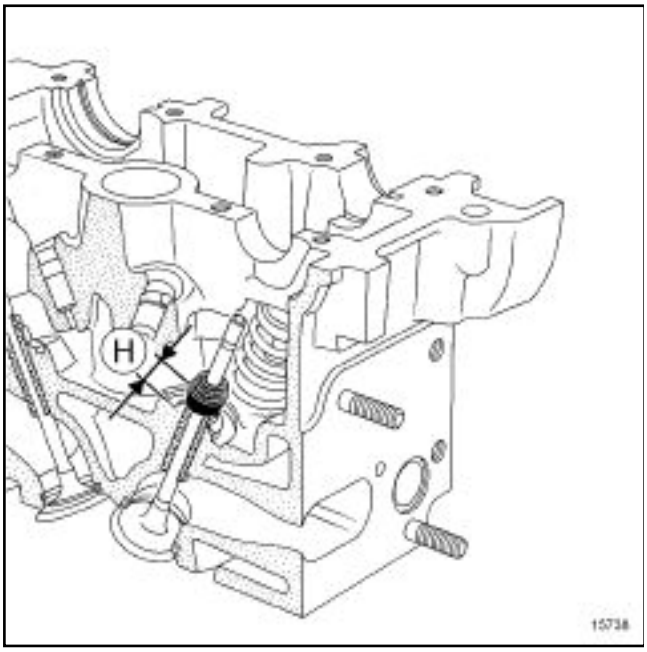
II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

- Camshaft pulley nut,
- Camshaft seal (timing end),
- The injector heat protection washers,
- High-pressure pipes,
- The EGR exchanger cover seal,
- The vacuum pump seal,

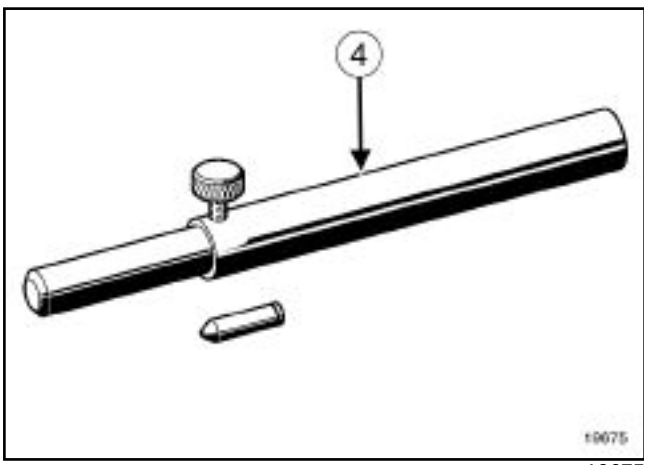
- The cylinder head coolant outlet unit seal,
- The exhaust manifold gasket,
- The turbocharger seal
- The inlet duct gasket,
- The exhaust gas recirculation pipe,
- The EGR solenoid valve seal,
- Valve stem seals

Consumables



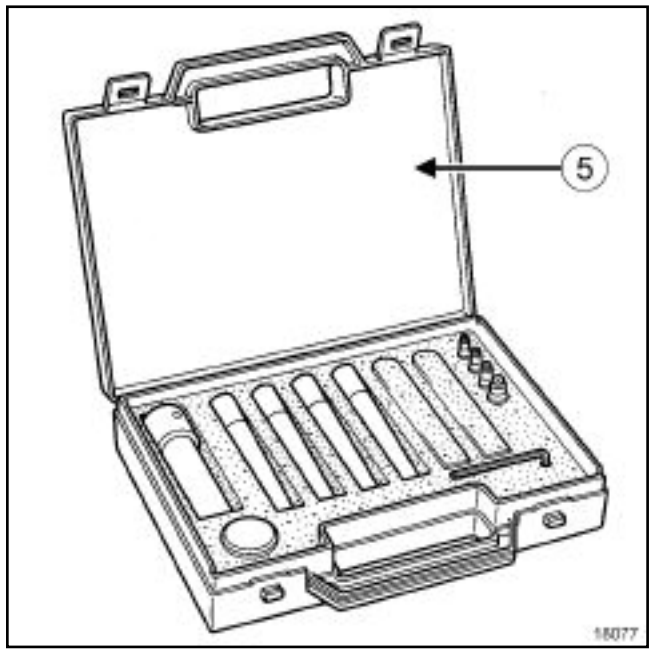
- Loctite 518 part no. **77 01 421 162** ,
- High-resistance bolt locking product, part no. **77 11 230 112** ,
- Degreasing agent, part no. **77 11 224 559** .

III - EQUIPMENT REQUIRED



- Latex protective gloves,
- Valve wrench,
- Tweezers,
- Wrench for the high-pressure pipes,
- Crow foot wrench,
- Wrench with hinge for heater plugs,
- Roller-type stud removal tool
- Oil can,
- The valve stem seal fitting kit,
- Dial gauge,
- Magnetic holder,
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



IV - REASSEMBLING THE CYLINDER HEAD

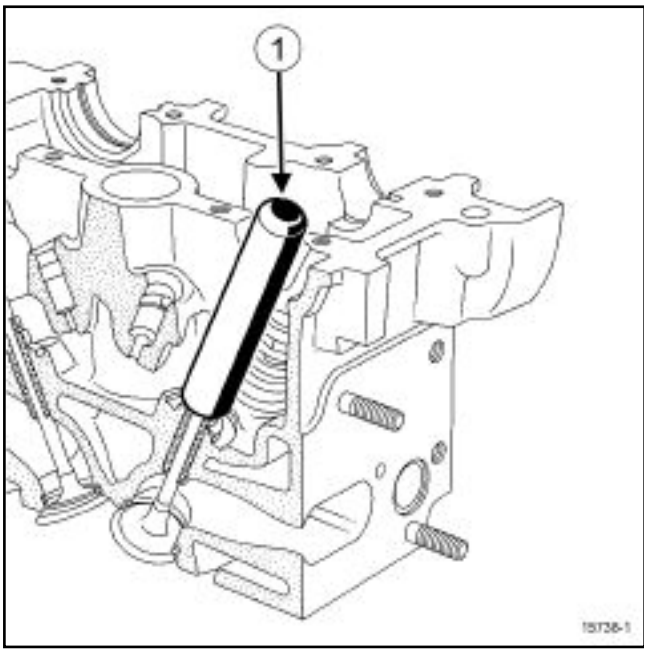
15738

19675

18077

Note:

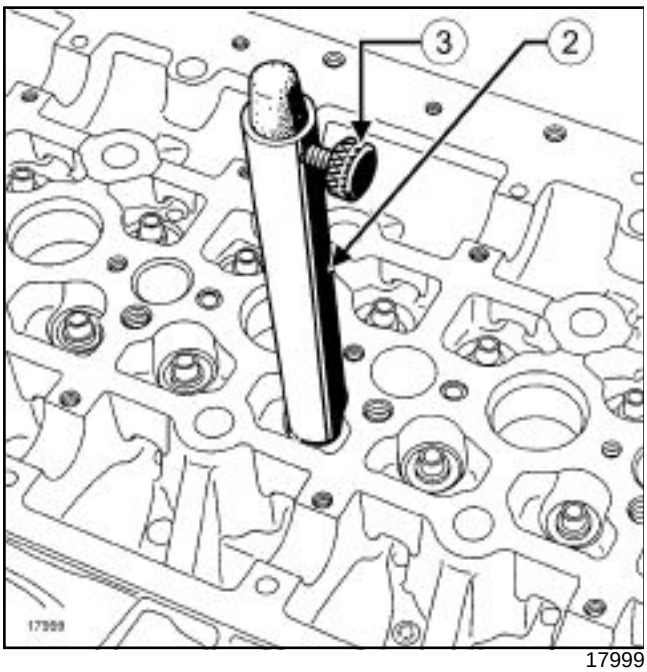
Before removing the valve stem seals, it is essential to note the position *(H)* of the old seals on the inlet side, then the exhaust side, as the fitting dimensions of the seals may be different between the inlet and the exhaust.



Fit a valve.

Compare dimension (**H**) of an old seal with the cylinder head using the **(Mot. 1511-01)** (**4**) or the valve stem seal fitting kit (**5**) .

Note:



The internal diameter of the pushrod *(1)* should be identical to that of the valve; In addition, the bottom of the pushrod must be snug against the metal upper section of the valve stem seal.

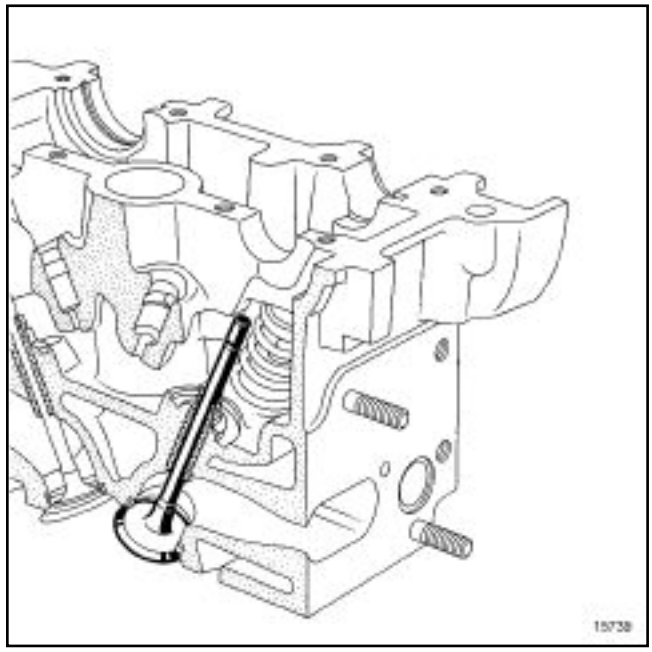
K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

15738-1

Place the pushrod (**1**) over the valve stem seal.

17999

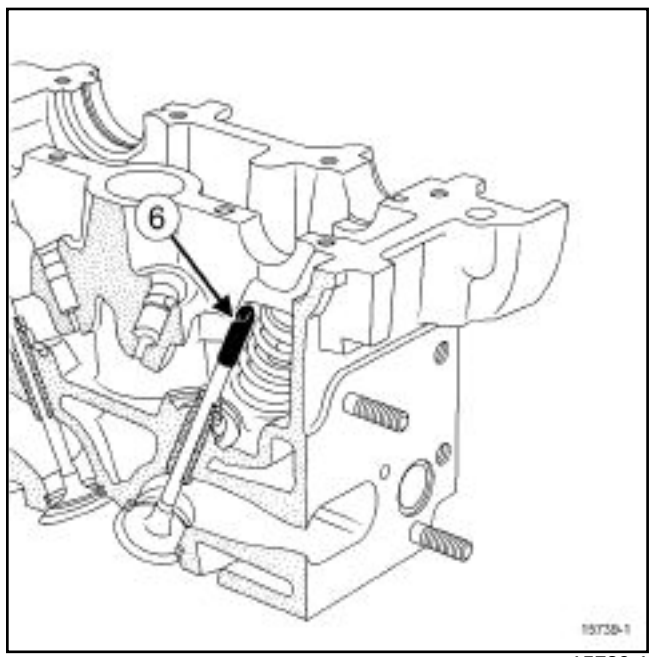
Fit the guide tube (**2**) above the pushrod until it comes into contact with the cylinder head.



Lock the pushrod with the wheel (**3**) .

Remove the guide tube-pushrod assembly, being careful not to loosen the wheel.

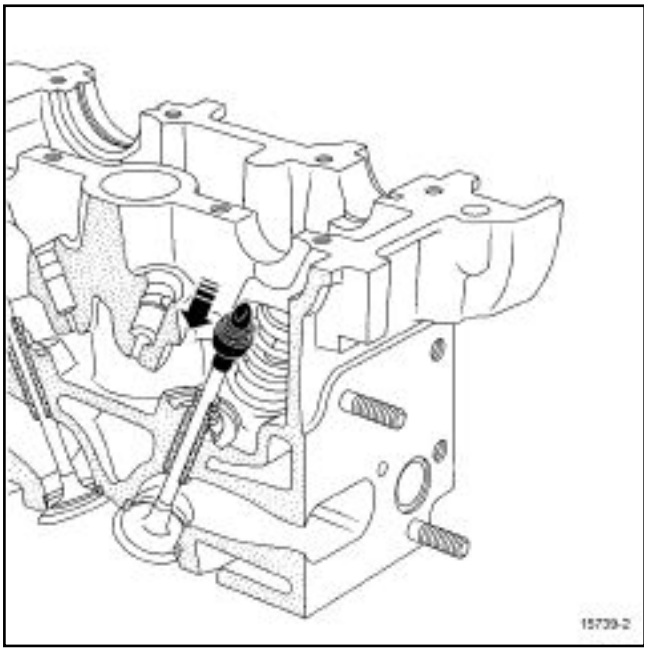
Remove:



- the valve,
- the valve stem seals (inlet end then exhaust end) using the **(Mot. 1335)** .

Apply engine oil to the inside of the valve guide.

15739

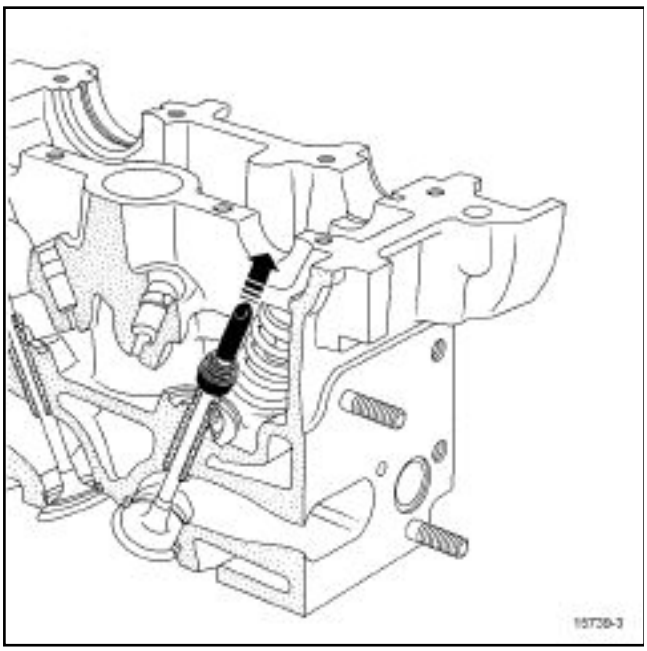


Place the valve in the cylinder head.

15739-1

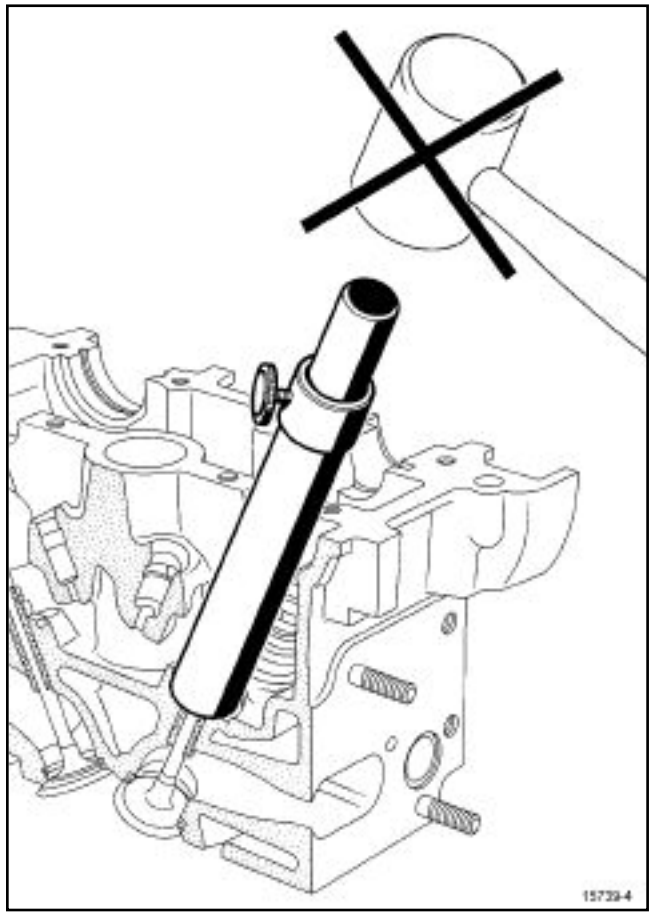
Place the valve insert (**6**) on the valve stem (the diameter of the valve insert should be identical to that of the valve stem).

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



15739-2

Keep the valve pressed against its seat.

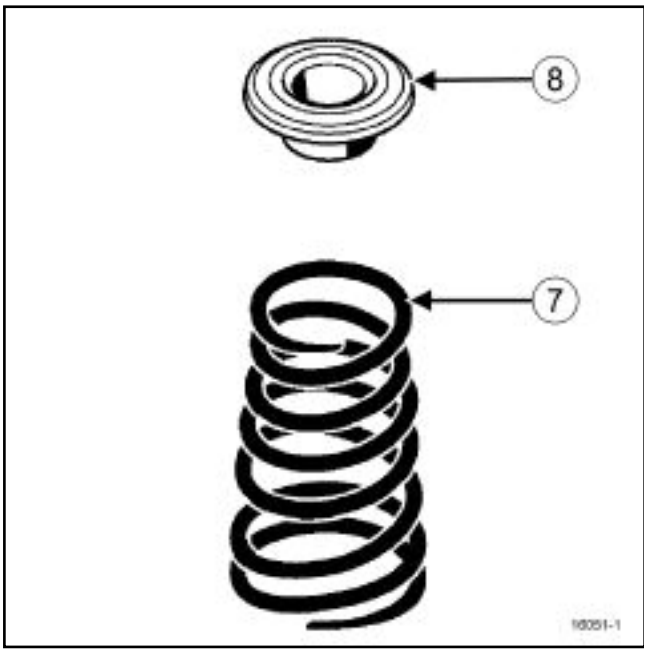


Mount the valve stem seal (not lubricated) over the valve insert.

Push the valve stem seal until it goes past the valve insert.

15739-3

Remove the valve insert.

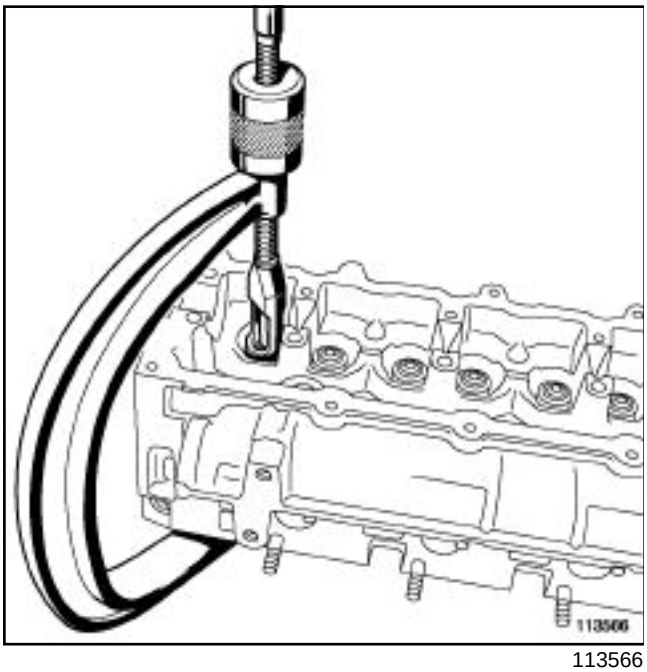


15739-4

Fit the guide tube-pushrod assembly on the valve stem seal.

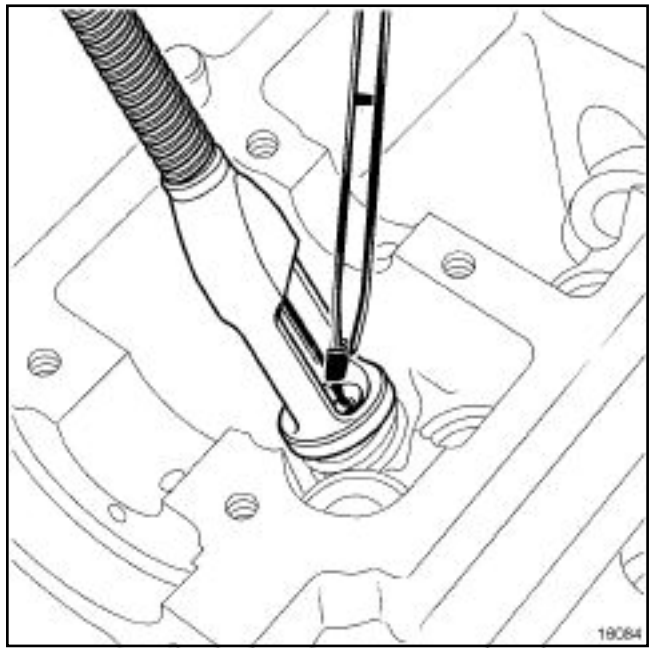
Push home the valve stem seal by gently striking the pushrod with the palm of the hand, until the guide tube makes contact with the cylinder head.

Repeat the preceding operations on all the inlet and exhaust valves.



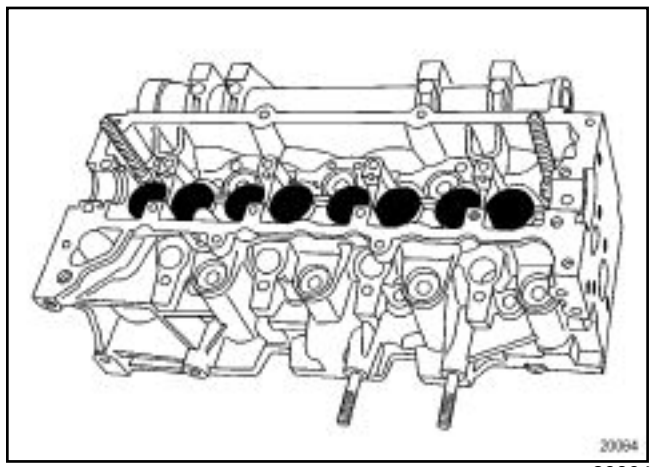
K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

16051-1



Refit:

- the valve springs, positioning the conical part (**7**) of the spring at the top,
- the valve spring upper cups (**8**) ,

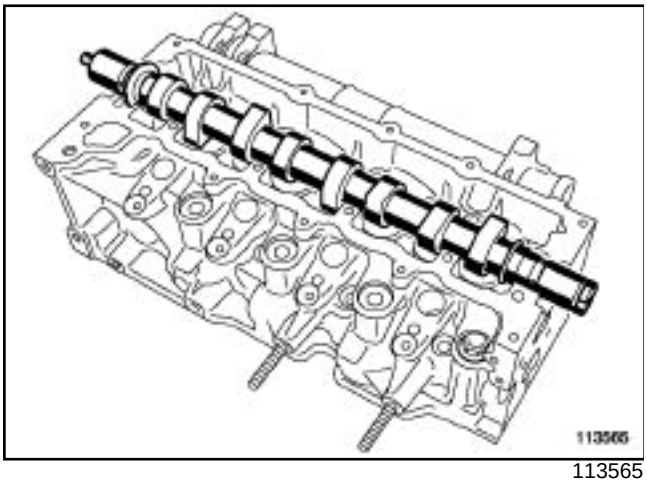


113566

Compress the valve springs using the **(Mot. 1502)** or a valve wrench.

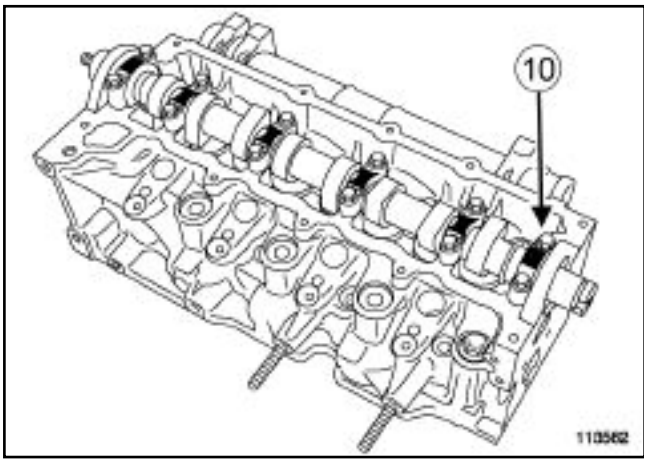
16084

Refit the cotters using tweezers.



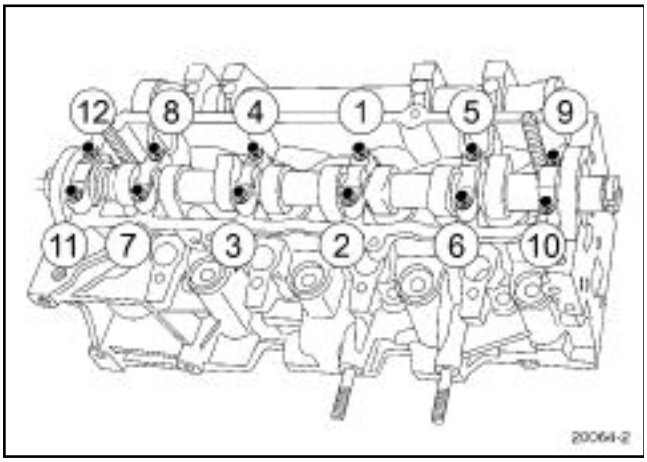
20064

Refit the pushrods observing their original position.



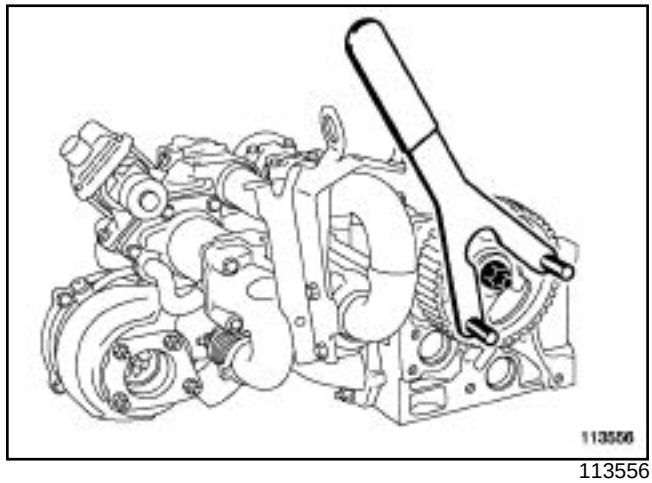
Oil the valve pushrods and the camshaft bearings with engine oil.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



113565

Refit the camshaft.

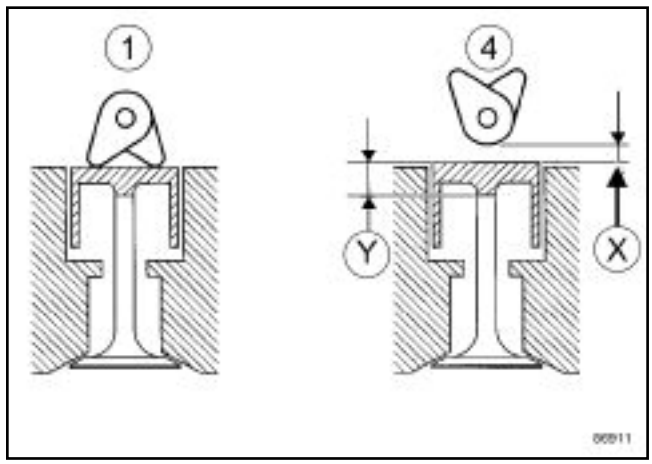


113562

Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**10**) engine flywheel end).

20064-2

Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .



113556

Refit:

- the camshaft pulley hub,
- the camshaft pulley,
- the old exhaust camshaft pulley mounting nut.

Tighten to torque **the mounting nut for the camshaft pulley (15 ± 1.5 Nm)** , blocking the camshaft pulley with the **(Mot. 799-01)** .

Check and adjust the valve clearances following the procedure below.

86911

Position the cylinder valves (**1**) in the end of exhaust stroke, beginning of inlet stroke position.

Measure the valve clearance (**X**) of the cylinder (**4**) using a set of shims.

- inlet valve clearance **0.20 mm** ,
- exhaust valve clearance **0.40 mm** ,

Note the clearance values.

Repeat the above operations on the other cylinders:

- position cylinder No. **3** at an angle and measure the clearance of cylinder No. **2** ,

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

- position cylinder No. **4** at an angle and measure the clearance of cylinder No. **1** ,

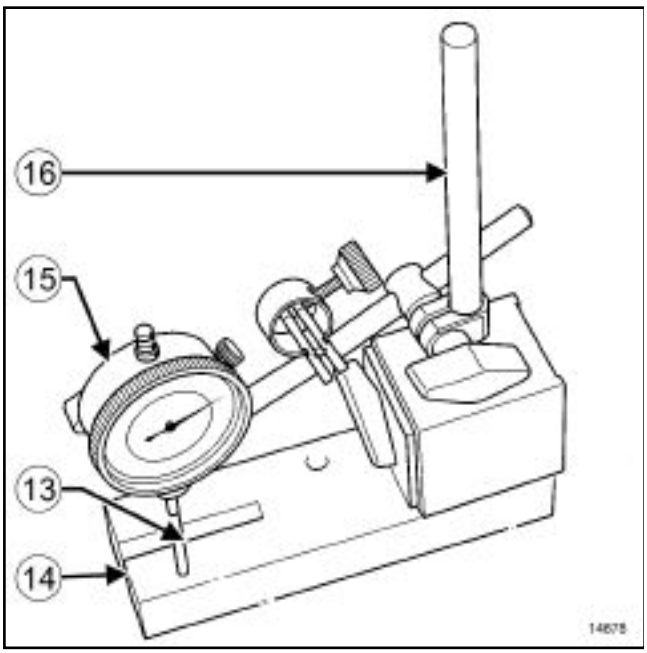
- position cylinder No. **2** at an angle and measure the clearance of cylinder No. **3** ,

Compare the values noted with the specified values.

Remove:

- the nut from the camshaft pulley,

- the camshaft pulley,



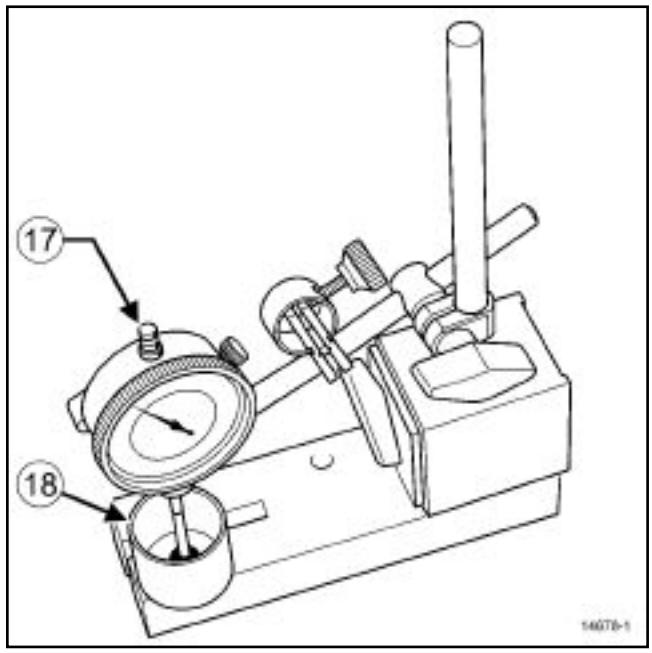
- the camshaft pulley hub,

- the camshaft bearing caps,

- the camshaft,

- the pushrod(s) which are outside of permitted tolerance values, noting their original position.

Undertake the following installation to determine the class of thickness of the valve pushrod.



14678

Screw the extension piece (**13**) of the **(Mot. 856-02)** to a dial gauge (**15**) .

Fix the dial gauge (**15**) to a magnetic holder (**16**) .

Mount the dial gauge-magnetic holder assembly on the plate (**14**) of the tool **(Mot. 252-01)** .

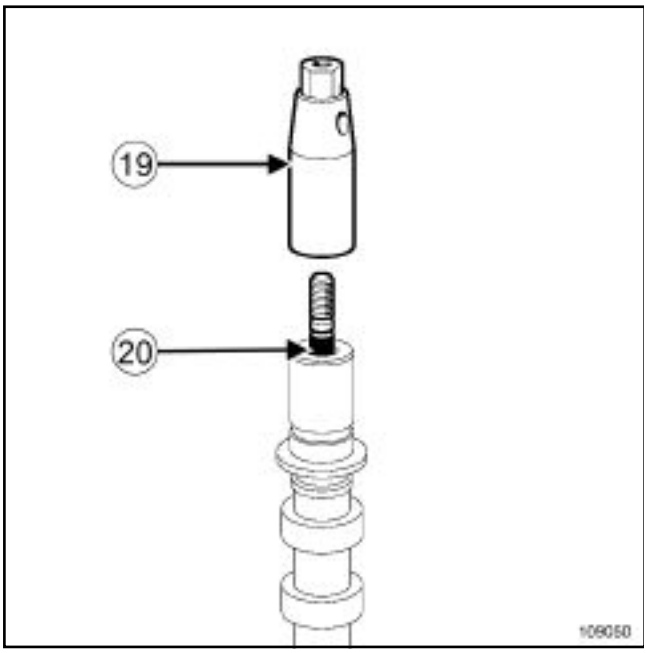
Calibrate the dial gauge.

14678-1

Lift the top piece (**17**) of the dial gauge (without changing the position of the dial gauge-magnetic holder assembly).

Mount the valve pushrod (**18**) to be measured on the plate of the **(Mot. 252-01)** .

Take the measurement ***(Y)*** .



Repeat the preceding operations for the other valve pushrods to be measured.

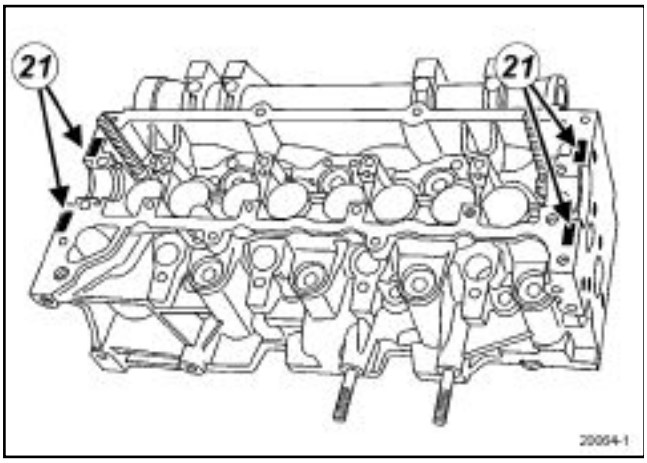
Fit the new valve pushrod(s) in the cylinder head.

Check that the camshaft pulley mounting stud has not come loose. If so, the stud must be replaced following the procedure described below.

Place the camshaft in a vice fitted with a clamping jaw.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

109050

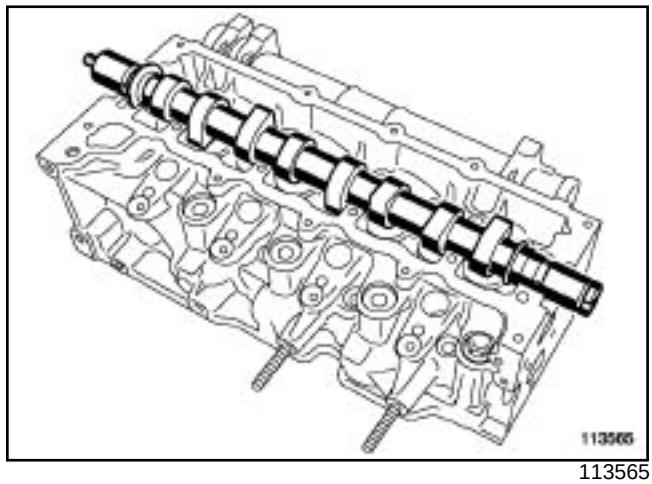


Remove the piston rings using a roller-type stud removal tool (**19**) .

Clean the threaded hole of the camshaft carefully to prevent foreign bodies from entering the latter.

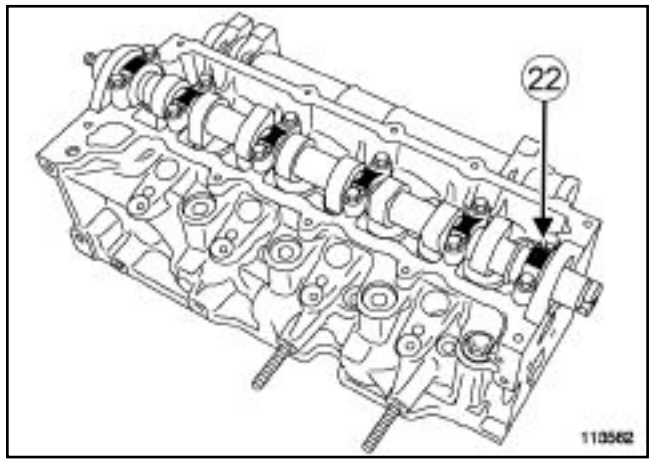
Fit the new stud on the camshaft (precoated section ***(20)*** on the camshaft side).

Tighten to torque **the camshaft pulley mounting stud (12 ± 2 Nm)** using a roller-type stud removal tool ***(19)*** .



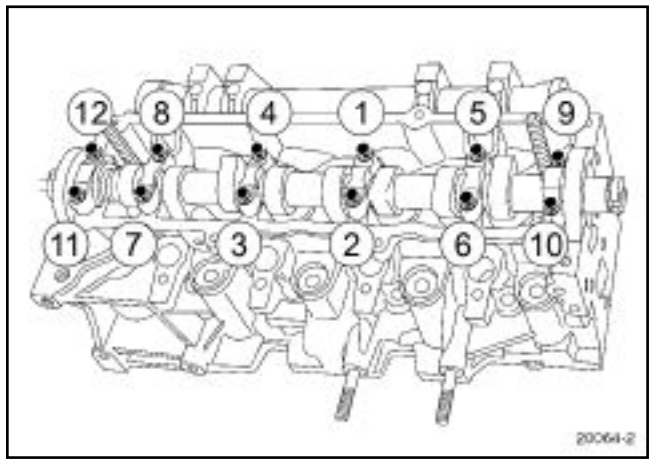
Oil the top of the valve pushrods and the camshaft bearings with engine oil.

20064-1



Degrease the surfaces of the camshaft bearing gaskets nos. 1 and 6 (**21**) using degreaser.

Apply four beads of **LOCTITE 518** of a width of **1 mm** to camshaft bearings nos. 1 and 6 (**21**) .

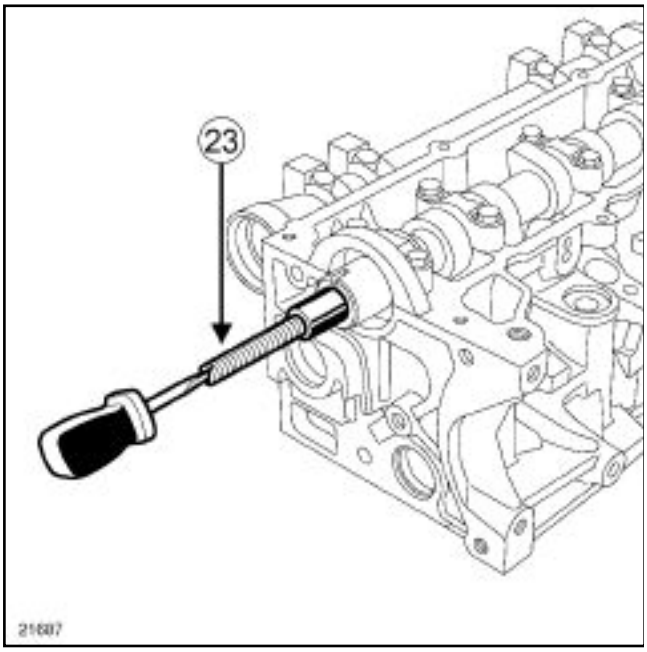


113565

Refit the camshaft.

113562

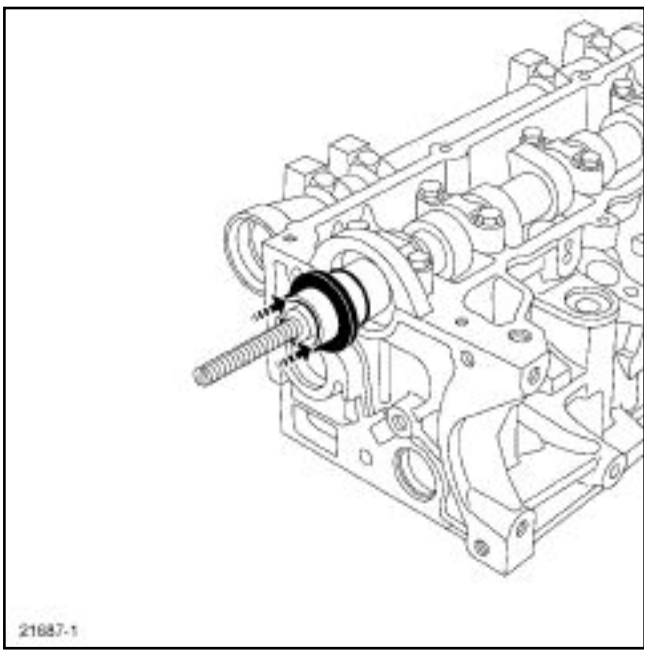
Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**22**) engine flywheel end).



20064-2

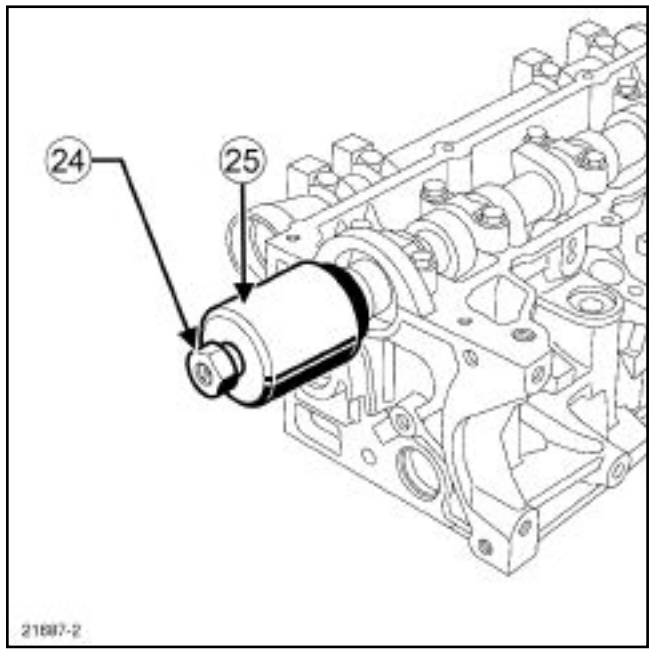
Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



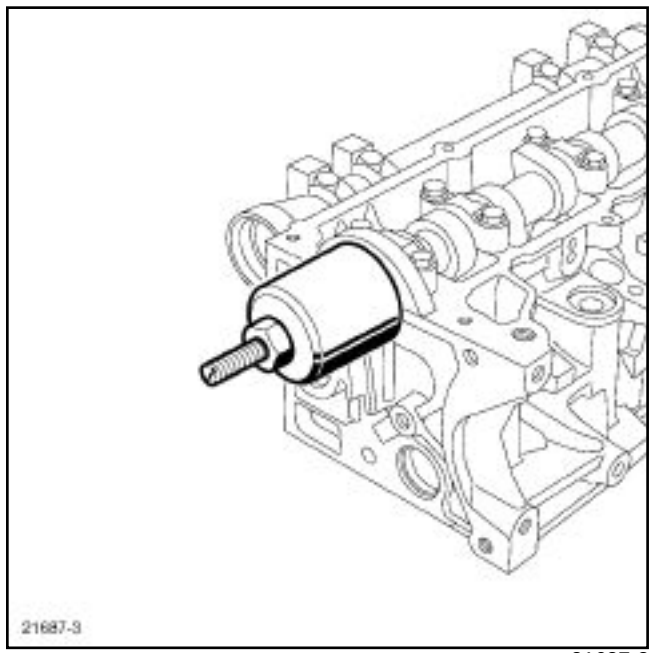
Apply degreaser to:

- the end of the camshaft at the timing end,
- the housing on the cylinder head of the camshaft gasket.



21687

Screw the shouldered stud (**23**) of the **(Mot. 1632)** onto the mounting stud of the camshaft pulley.



21687-1

Refit the camshaft gasket.

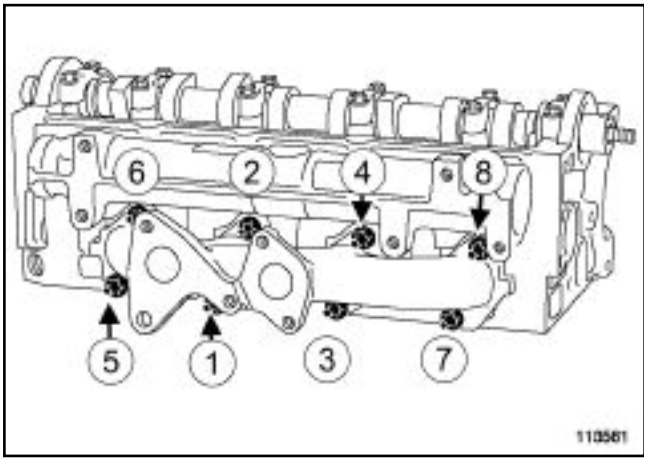
21687-2

Position the cover (**25**) and collar nut (**24**) of the **(Mot. 1632)** .

21687-3

Screw on the collar nut until the cover touches the cylinder head.

Remove:

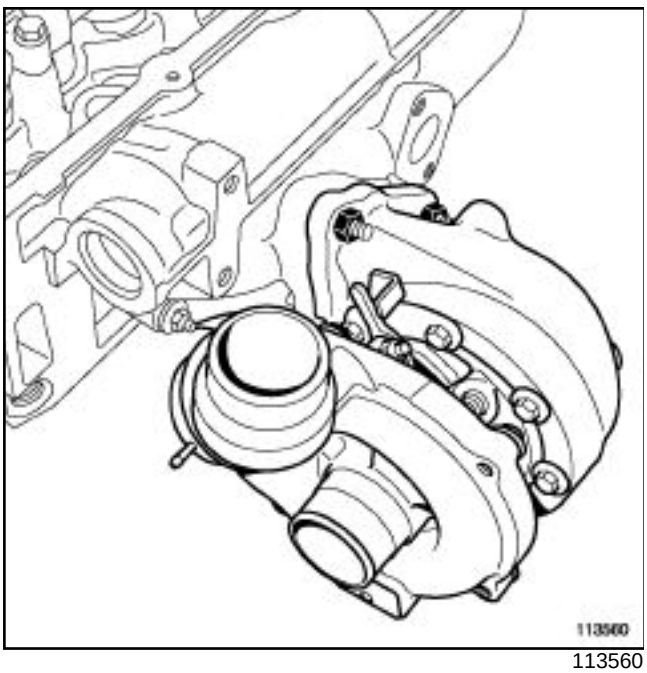


- the collar nut,
- the cap,
- the collared stud.

Using degreaser, degrease the surfaces of the exhaust manifold and cylinder head gaskets at the exhaust end.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Refit:

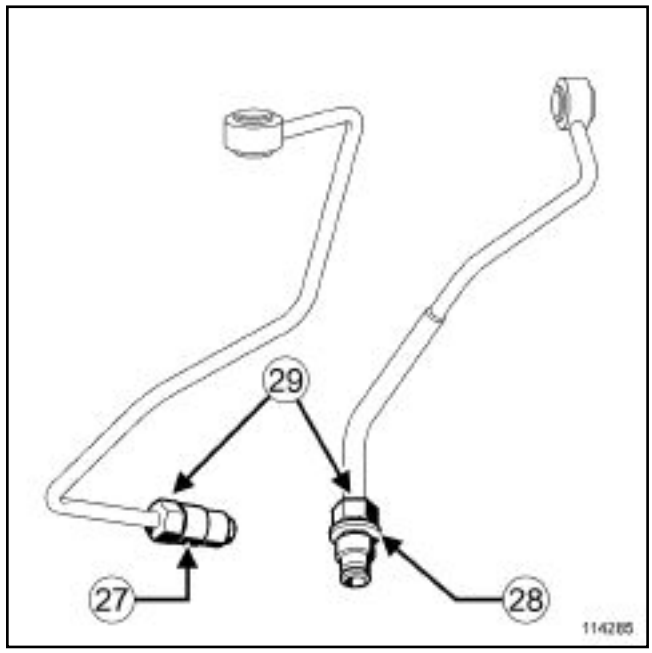


- a new exhaust manifold gasket,
- the exhaust manifold,
- the exhaust manifold mounting nuts.

113561

Tighten to torque and in order the **exhaust manifold mounting nuts (26 ± 2.6 Nm)** .

Using degreaser, degrease the surfaces of the exhaust manifold (where the turbocharger enters) and the turbocharger gaskets.



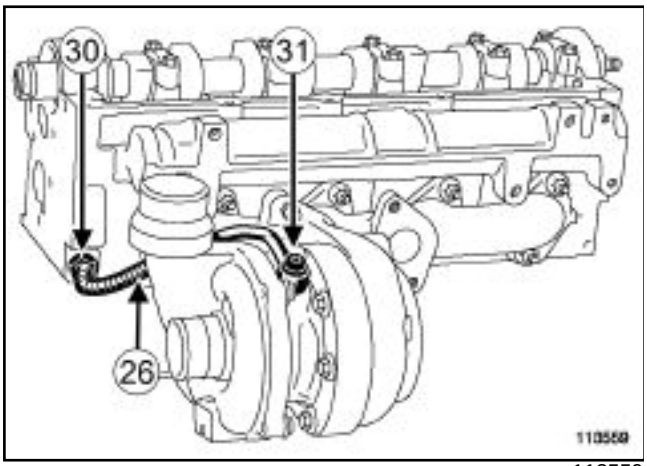
113560

Refit:

- the new turbocharger seal,
- the turbocharger.
- the turbocharger mounting nuts.

Tighten to torque the **turbocharger mounting nuts (26 ± 2.6 Nm)** .

Put a little engine oil from an oil can in the oil circuit of the turbocharger.



114285

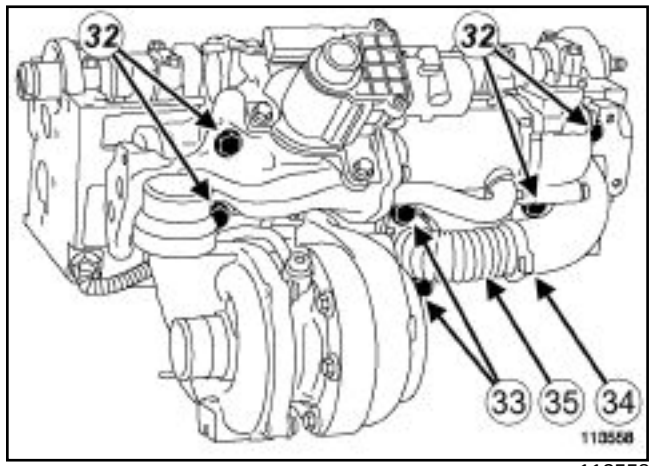
Note:

These two turbocharger oil supply pipes may be used on the same engine. The tightening torque of the end pieces (**29**) on the cylinder head is different, depending on the following:

- if the end piece is **shouldered** (**28**) , in this case there will be no need to place the high-resistance bolt locking product on the end piece thread,
- if the end piece is **not shouldered** (**27**) , in this case it is essential to place the high-resistance bolt locking product on the end piece thread,

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

113559



Refit the turbocharger oil supply pipe (**26**) .

Screw on:

- the nut (**30**) on the cylinder head,
- the bolt (**31**) on the turbocharger.

Tighten to torque:

- **the turbocharger oil supply pipe mounting bolt (turbocharger end) (23 ± 2.3 Nm)** ,
- **the turbocharger oil supply pipe mounting nut (cylinder head end) (collar nut 35 ± 3.5 Nm or no collar nut 23 ± 2.3 Nm)** .

113558

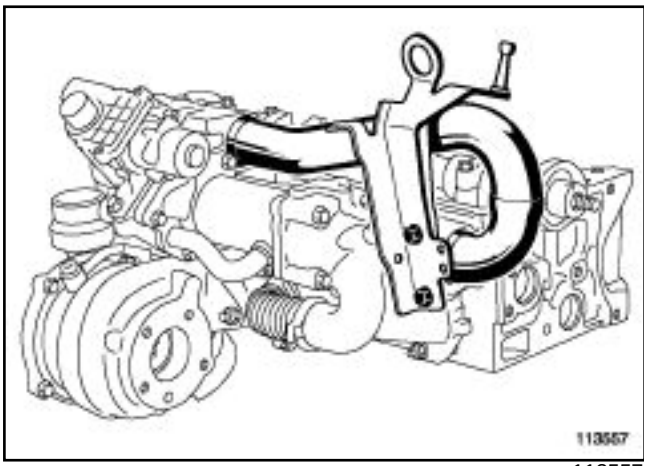
Refit:

- the EGR valve-exchanger assembly,
- the mounting bolts (**32**) (without tightening them) of the EGR valve-exchanger.

Tighten to torque the **EGR valve-exchanger mounting bolts (25 ± 2.5 Nm)** . (**32**)

Refit:

- the new exhaust gas recirculation pipe (**35**) fitted with its new snap-on clip (**34**) ,
- the mounting bolts (**33**) of the exhaust gas recirculation pipe.



Adjust the exhaust gas recirculation pipe in relation to the cooler support.

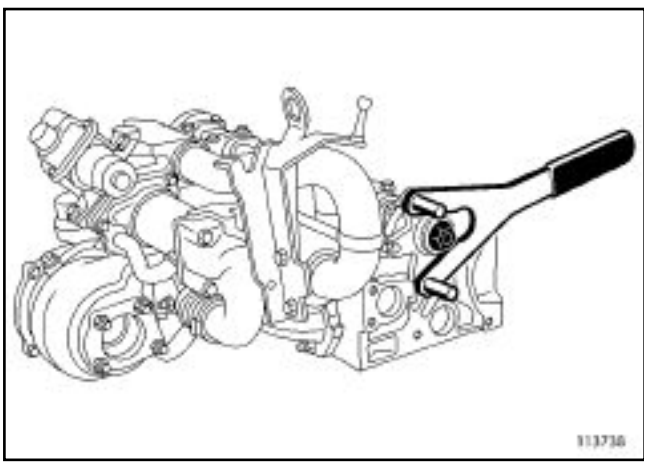
Lock the snap-on clip of the exhaust gas recirculation pipe using the **(Mot. 1567)** .

Tighten to torque the **mounting bolts of the exhaust gas recirculation pipe (35 ± 3.5 Nm)** (**33**) .

Fit the new O-ring seals to the inlet pipe.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

113557



Refit:

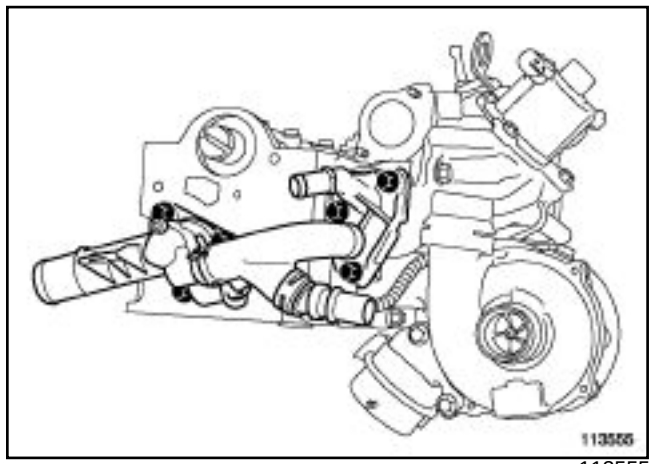
- the inlet duct,
- the engine lifting eye (timing end),
- the engine lifting eye mounting bolts.

Tighten to torque the **engine lifting eye mounting bolts (timing end) (21 ± 2.1 Nm)** .

Refit:

- the camshaft pulley hub,
- the new exhaust camshaft pulley hub mounting nut.

113738



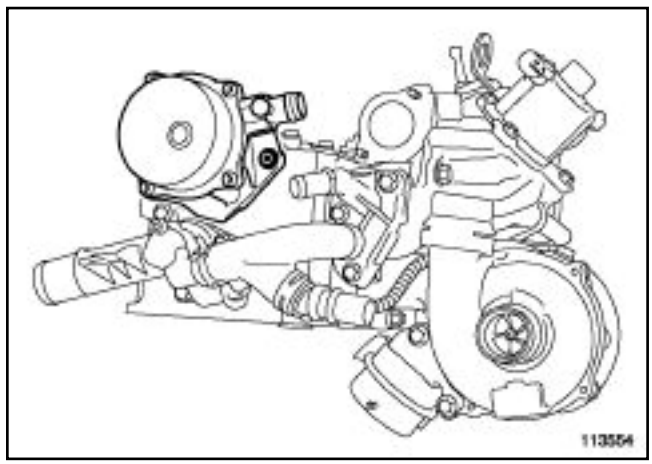
Immobilise the hub using the **(Mot. 799-01)** .

Tighten to torque and angle the **camshaft pulley hub nut (30 ± 3 Nm + 86° ± 6°)** .

Refit the camshaft pulley (without tightening the mounting bolts).

Using degreaser, degrease the surfaces of the seals where the vacuum pump enters, the cylinder head coolant outlet and the EGR exchanger cover.

Fit new seals to the cylinder head coolant outlet and the EGR exchanger cover.



113555

Refit:

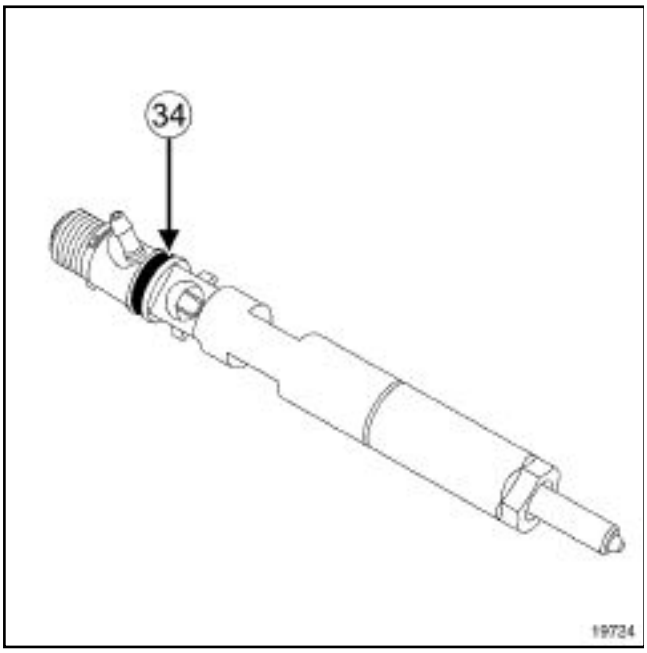
- the cylinder head coolant outlet unit-EGR exchanger cover assembly,
- the cylinder head coolant outlet unit mounting bolts,
- the EGR exchanger cover mounting bolts.

Tighten to torque:

- **the cylinder head coolant outlet bolt (11 ± 1.1 Nm)** ,
- **the EGR exchanger cover mounting bolt (12 ± 1.2 Nm)** .

113554

Refit:

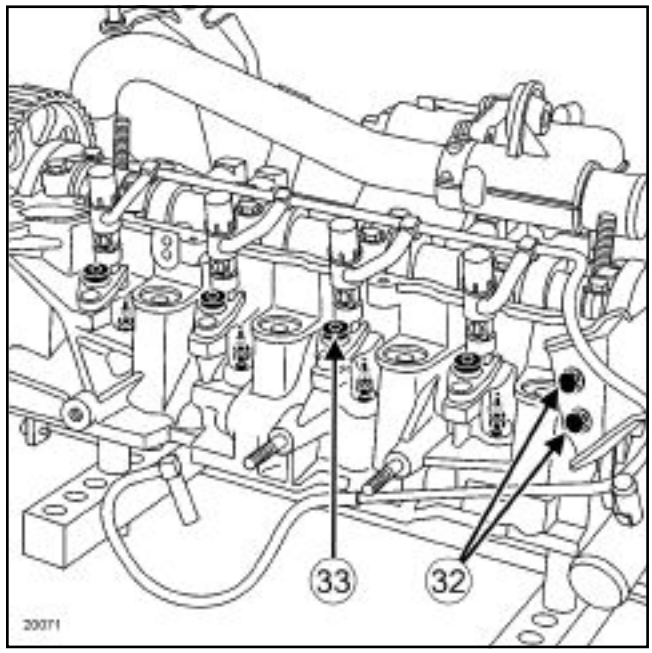


- the vacuum pump,
- the vacuum pump mounting bolts,

Tighten to torque the **vacuum pump mounting bolts (21 ± 2.1 Nm)** .

Refit the heater plugs.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



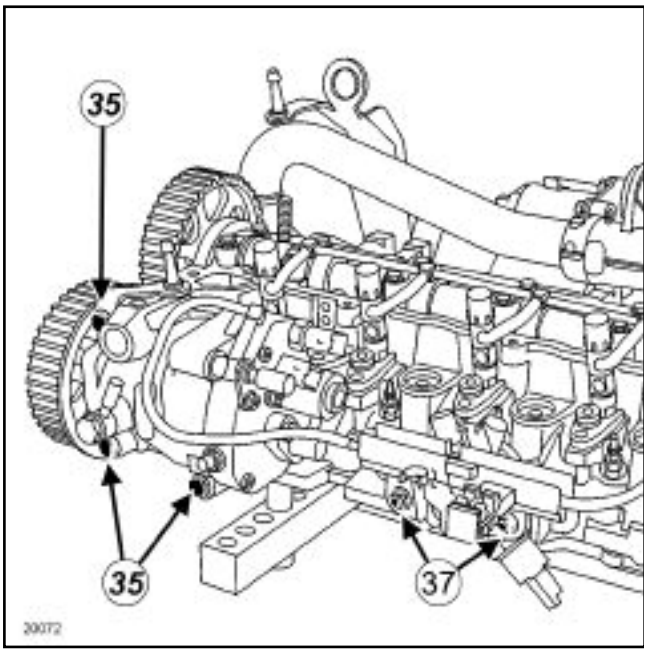
Tighten to torque **the heater plugs (15 ± 1.5 Nm)** using a wrench with hinge.

19724

Note:

If one or more injectors are replaced, note the alphanumeric code (C2I) (**34**) and the number of the cylinder on which it is fitted.

20071



Refit:

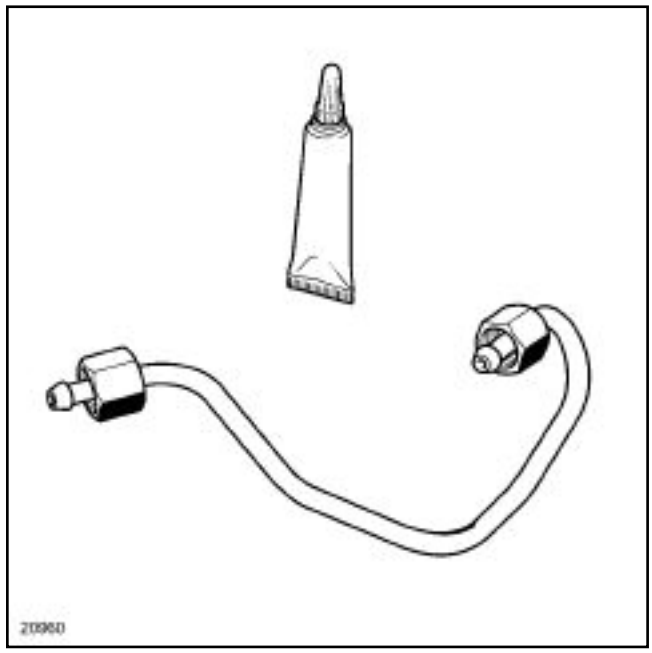
- the engine lifting eye (flywheel end),
- the new heat protection washers,
- the injectors (observing their positions),
- the injector brackets.

Tighten to torque:

- **the engine lifting eye mounting bolts (flywheel end) (13 ± 1.3 Nm)** (**32**) ,
- **the injector bracket bolts (28 ± 2.8 Nm)** (**33**) .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

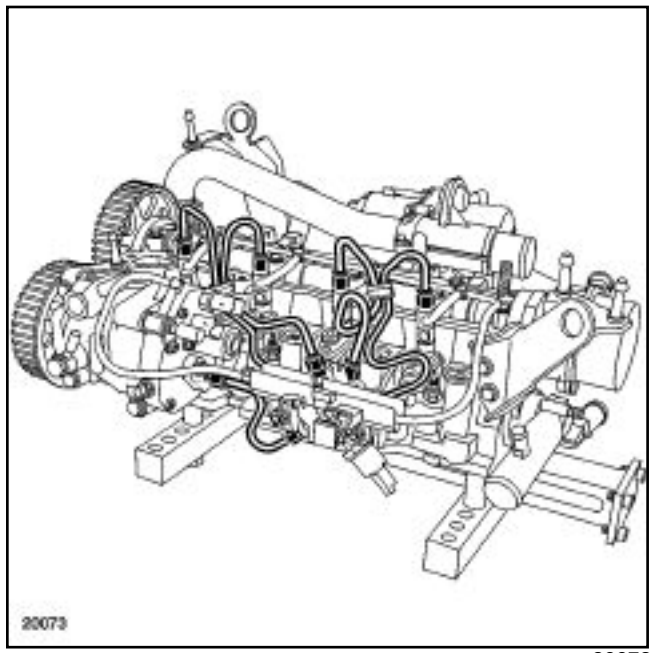
20072



Refit:

- the high-pressure pump,
- the injector rail **(without tightening the nuts)** ,

Tighten to torque the **high-pressure pump mounting bolts (21 ± 2.1 Nm)** .

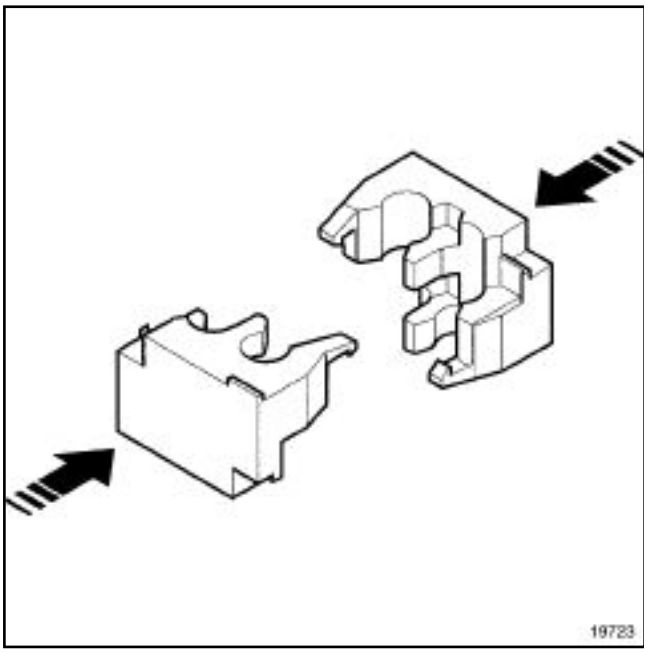


Note:

Do not lubricate high-pressure pipes **supplied without an applicator; these pipes are self-lubricating.**

20960

Lightly lubricate the nut threads with oil from the applicator supplied with the new part, taking care not to insert it in the pipe.



20073

Insert the high-pressure pipe olive in the injector high-pressure inlet taper.

Insert the high-pressure pipe olive in the rail high-pressure outlet taper.

Finger tighten the high-pressure pipe nuts, starting with the one located on the injector end.

Lightly tighten the nuts of the high-pressure pipes.

19723

Fit the new clip provided with the new high-pressure pipe.

Tighten to torque the **injector rail mounting nuts (28 ± 2.8 Nm)** .

Note:

Completely tighten one high-pressure pipe before moving to the next one.

Tighten to torque and in order (according to the part no. of the pipe) **the pump-rail high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

- the high-pressure pump side, using the **(Mot. 1746)** or a crow foot wrench,
- the injector rail side, using the **(Mot. 1746)** or a crow foot wrench,

Tighten to torque and in order (according to the part no. of the pipe) **the rail-injectors high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

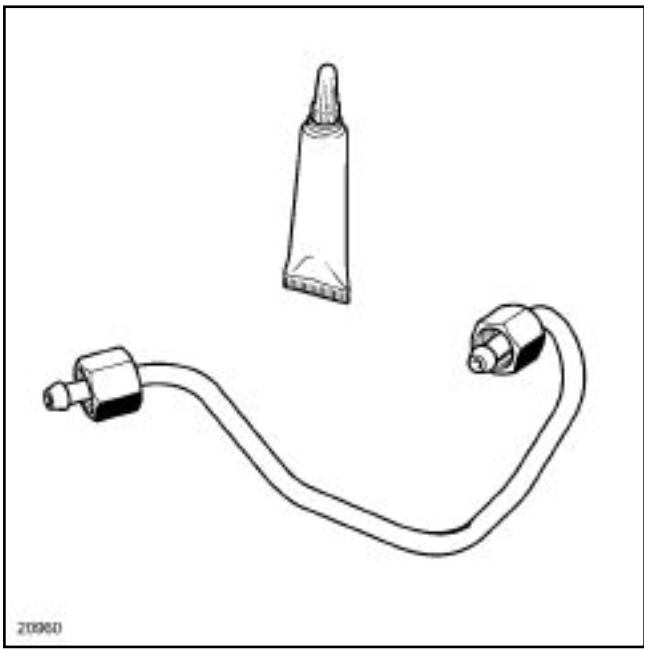
- the injector side using the **(Mot. 1566)** or with a wrench for high-pressure pipes.
- the injector rail side, using the **(Mot. 1566)** or a crow foot wrench,

K9K, and 732 or 764

Special tooling required	
Mot. 1511-01	Valve stem seal fitting tool adapter.
Mot. 1335	Pliers for removing valve stem seals.
Mot. 1502	Valve lifting tool for removing valves.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 856-02	Dial gauge support.
Mot. 252-01	Dial gauge support thrust plate.
Mot. 1632	Tool for fitting PTFE camshaft seal
Mot. 1567	Long nose pliers for EGR duct clips.
Mot. 1566	Spanner for removing high pressure pipes.
Mot. 1746	Offset spanner for tightening high pressure pump pipes.

Tightening torques ▽	
the crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
the camshaft pulley mounting stud	**12 ± 2 Nm**
crankshaft bearing cap mounting bolts	**11 ± 1.1 Nm**
exhaust manifold mounting nuts	**26 ± 2.6 Nm**
turbocharger mounting nuts	**26 ± 2.6 Nm**
the turbocharger oil supply pipe mounting bolt (turbocharger end)	**23 ± 2.3 Nm**
the turbocharger oil supply pipe mounting nut (cylinder head end)	**35 ± 3.5 Nm**

Tightening torques ▽	
EGR valve-exchanger mounting bolts	**25 ± 2.5 Nm**
mounting bolts of the exhaust gas recirculation pipe	**35 ± 3.5 Nm**
engine lifting eye mounting bolts (timing end)	**21 ± 2.1 Nm**
camshaft pulley hub nut	**30 ± 3 Nm + 86° ± 6°**
the cylinder head coolant outlet unit bolt	**11 ± 1.1 Nm**
the EGR exchanger cover mounting bolt	**12 ± 1.2 Nm**
vacuum pump mounting bolts	**21 ± 2.1 Nm**
the heater plugs	**15 ± 1.5 Nm**
the injector bracket mounting bolts	**30 ± 3 Nm**
injector rail mounting nuts	**28 ± 2.8 Nm**
the rail-injectors high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**
high-pressure pump mounting bolts	**21 ± 2.1 Nm**
the rail-injectors high-pressure pipe nuts	**24 ± 2.4 or 38 ± 3.8 Nm**
high-pressure protector bolts and nuts	**21 ± 2.1 Nm**



I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

It is essential to follow the cleanliness guidelines (see **Engine: Precautions during repair**).

Wear latex gloves while using the cleaning product.

K9K, and 732 or 764

20960

WARNING

Before fitting a new high-pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high-pressure pipe.

Do not lubricate high-pressure pipes supplied without an applicator; these pipes are self-lubricating.

Do not remove the blanking plugs from each component until the last moment.

Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system.

Tighten to torque (**38 ± 3.8 Nm**) the pump-rail and rail-injectors high-pressure pipes, part nos.:

- **77 01 207 025**
- **77 01 207 026**
- **77 01 207 027**
- **77 01 207 028**
- **77 01 207 029**

For the high-pressure pipes with the remaining part nos, tighten to a torque of (**24 ± 2.4 Nm**).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

The gaskets must always be replaced.

The camshaft pulley mounting stud must be replaced if it comes loose as the camshaft pulley is removed.

Do not grease the valve stem seals.

II - PARTS AND CONSUMABLES FOR THE REPAIR

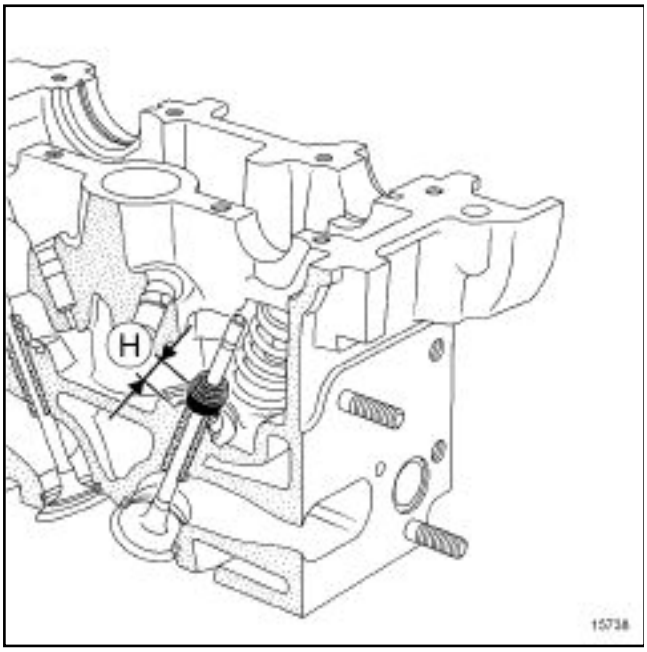
Parts always to be replaced

- Camshaft pulley nut,
- Camshaft seal (timing end),
- The injector heat protection washers,
- high-pressure pipes,
- The EGR exchanger cover seal,
- The vacuum pump seal,

K9K, and 732 or 764

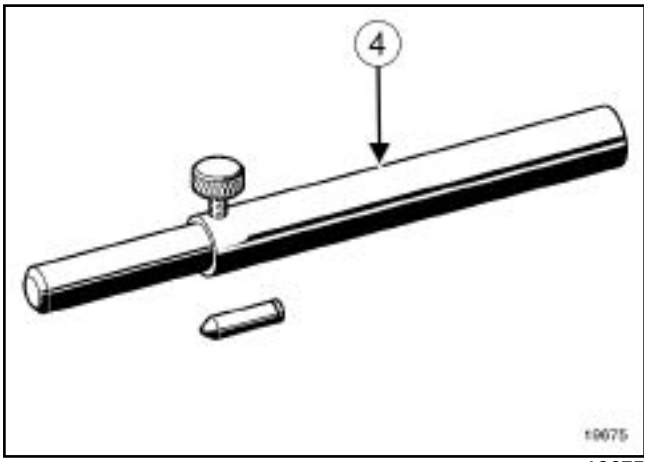
- The cylinder head coolant outlet unit seal,
- The exhaust manifold gasket,
- The turbocharger seal
- The inlet tube gasket,
- The exhaust gas recirculation pipe,
- The EGR solenoid valve seal,
- Valve stem seals

Consumables



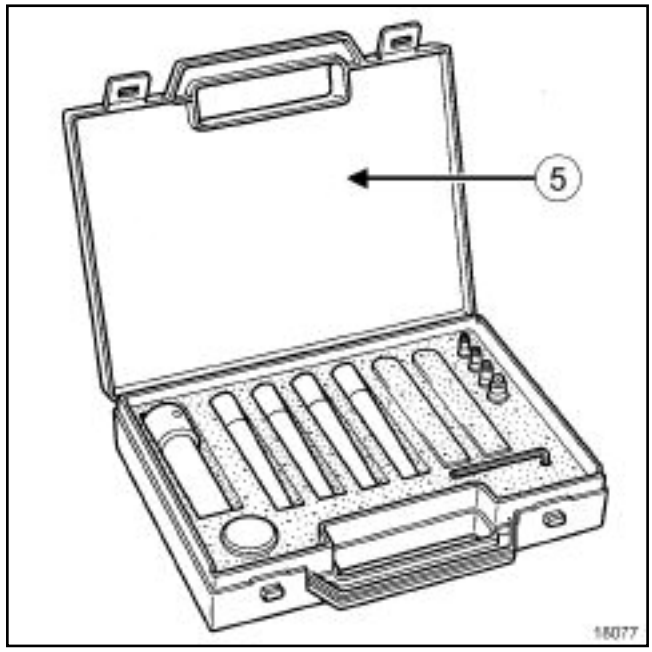
- Loctite 518, part no. **77 01 421 162** ,
- High-resistance bolt locking product, part no. **77 11 230 112** ,
- Degreasing agent, part no. **77 11 224 559** .

III - EQUIPMENT REQUIRED



- Latex protective gloves,
- Valve wrench,
- Tweezers,
- Wrench for the high-pressure pipes,
- Crow foot wrench,
- Wrench with hinge for heater plugs,
- Roller-type stud removal tool
- Oil can,
- The valve stem seal fitting kit,
- Dial gauge,
- Magnetic holder,
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

IV - REASSEMBLING THE CYLINDER HEAD



K9K, and 732 or 764

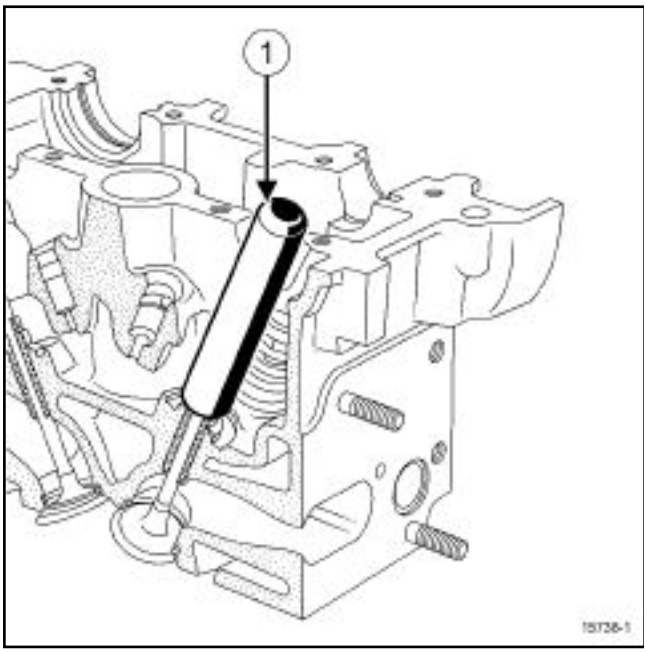
15738

19675

18077

Note:

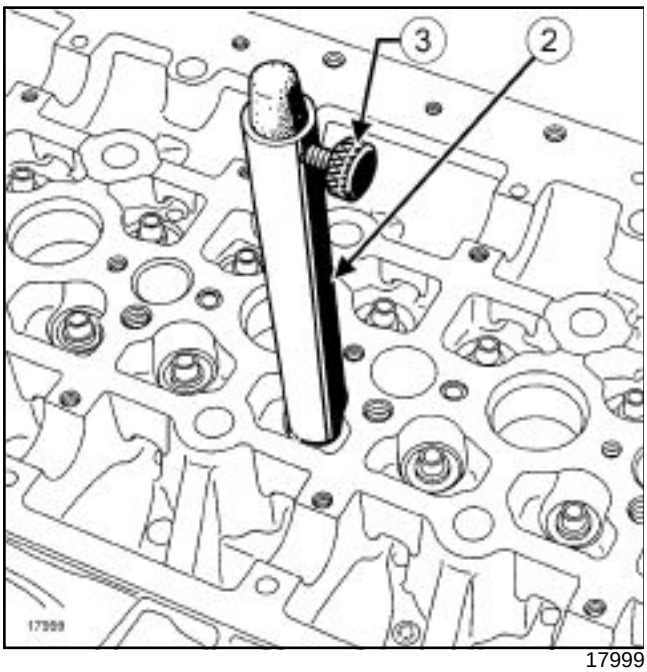
Before removing the valve stem seals, it is essential to note the position *(H)* of the former seals on the inlet side, then the exhaust side as the fitting dimension of the seals may be different between the inlet and the exhaust.



Fit a valve.

Compare the dimension (**H**) of an old seal with the cylinder head using the **(Mot. 1511-01)** (**4**) or the valve stem seal fitting set (**5**) .

Note:



The internal diameter of the pushrod *(1)* should be identical to that of the valve; In addition, the bottom of the pushrod must be snug against the metal upper section of the valve stem seal.

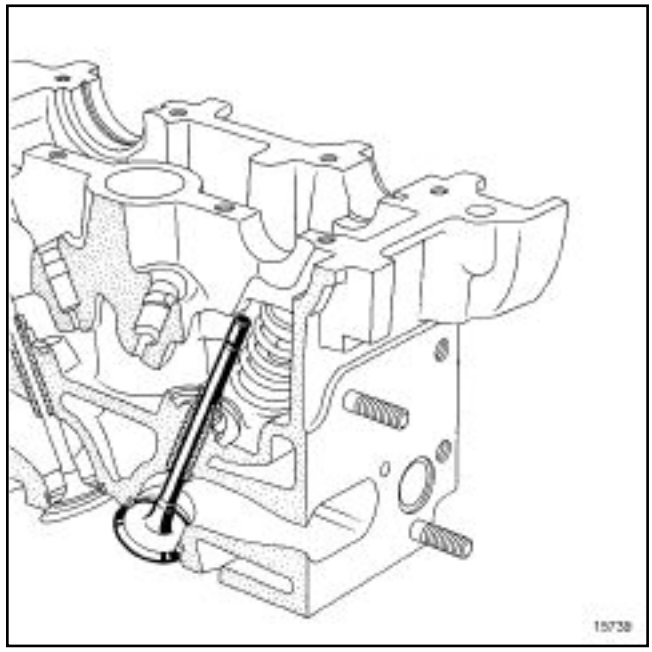
K9K, and 732 or 764

15738-1

Place the pushrod (**1**) over the valve stem seal.

17999

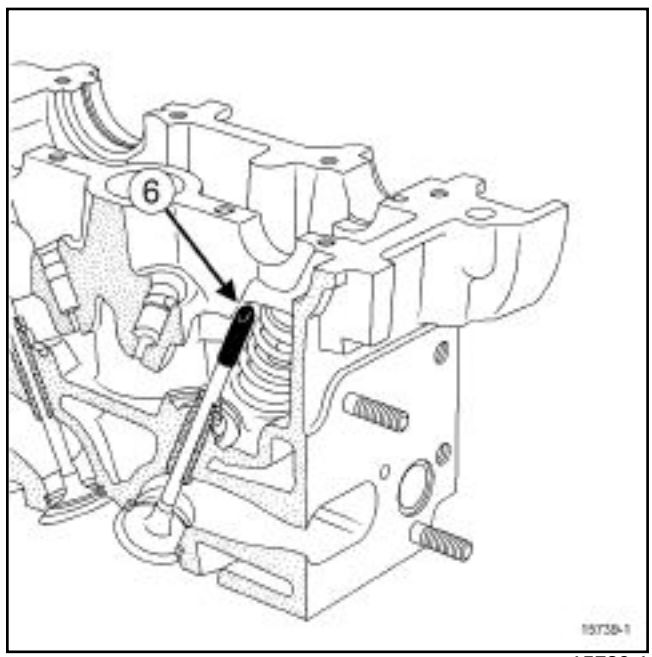
Fit the guide tube (**2**) above the pushrod until it comes into contact with the cylinder head.



Lock the pushrod with the wheel (**3**) .

Remove the guide tube-pushrod assembly, being careful not to loosen the wheel.

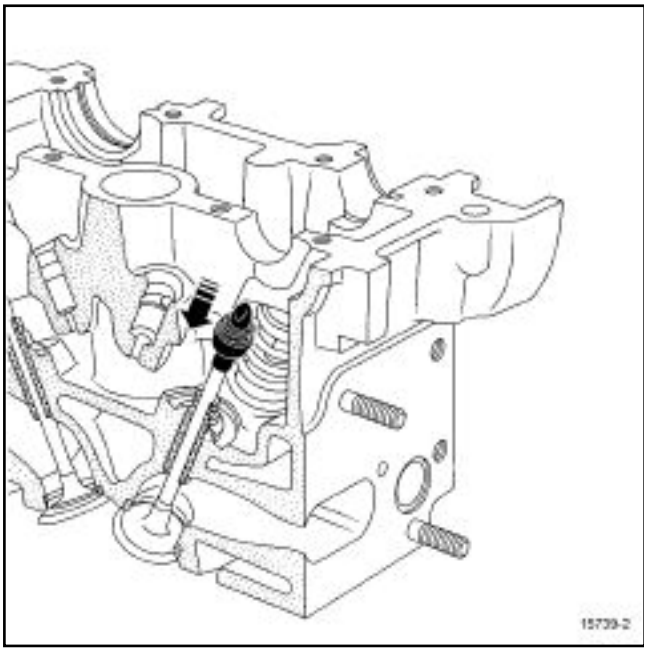
Remove:



- the valve,
- the valve stem seals (inlet end then exhaust end) using the **(Mot. 1335)** .

Apply engine oil to the inside of the valve guide.

15739

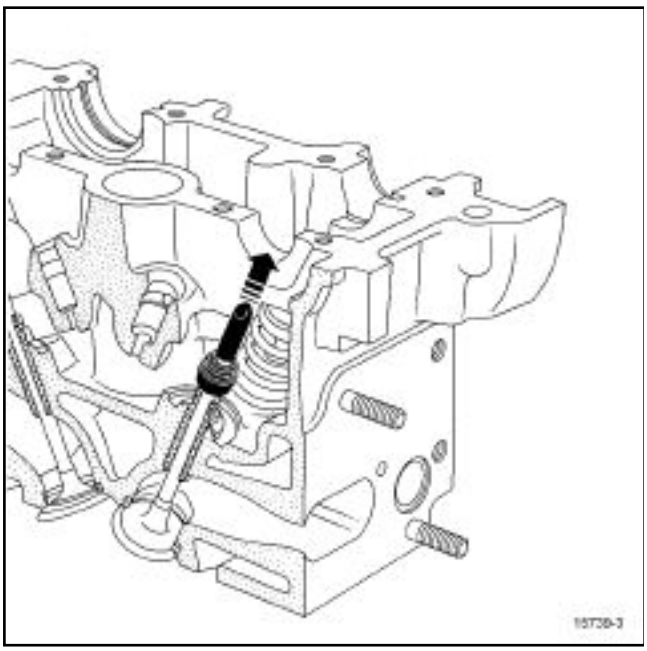


Place the valve in the cylinder head.

15739-1

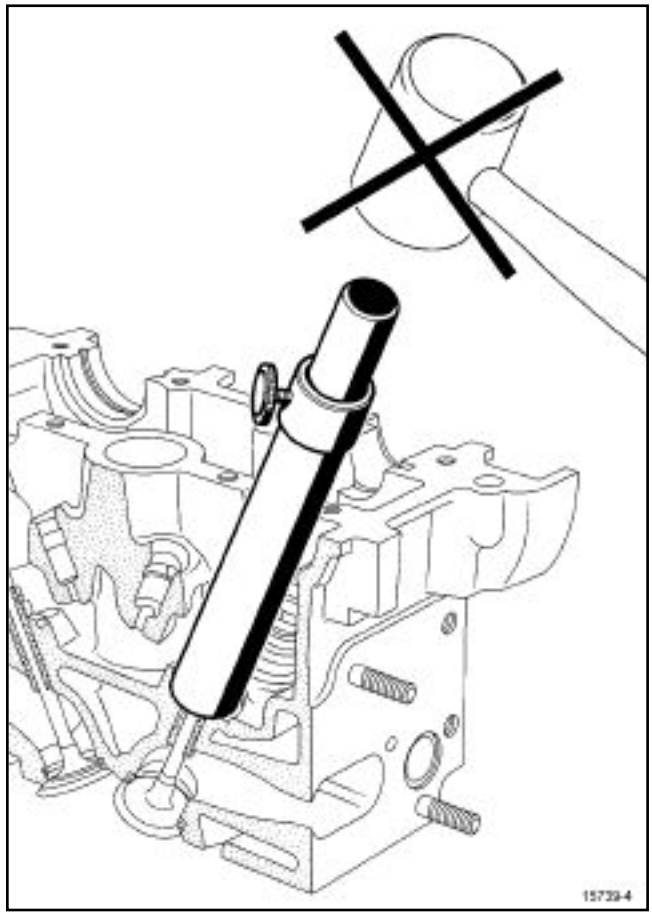
Place the valve insert (**6**) on the valve stem (the diameter of the valve insert should be identical to that of the valve stem).

K9K, and 732 or 764



15739-2

Keep the valve pressed against its seat.

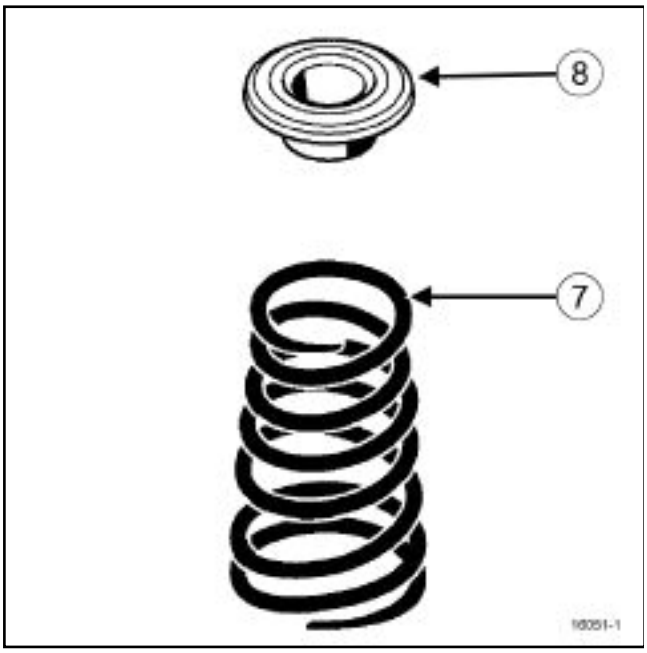


Mount the valve stem seal (not lubricated) over the valve insert.

Push the valve stem seal until it goes past the valve insert.

15739-3

Remove the valve insert.

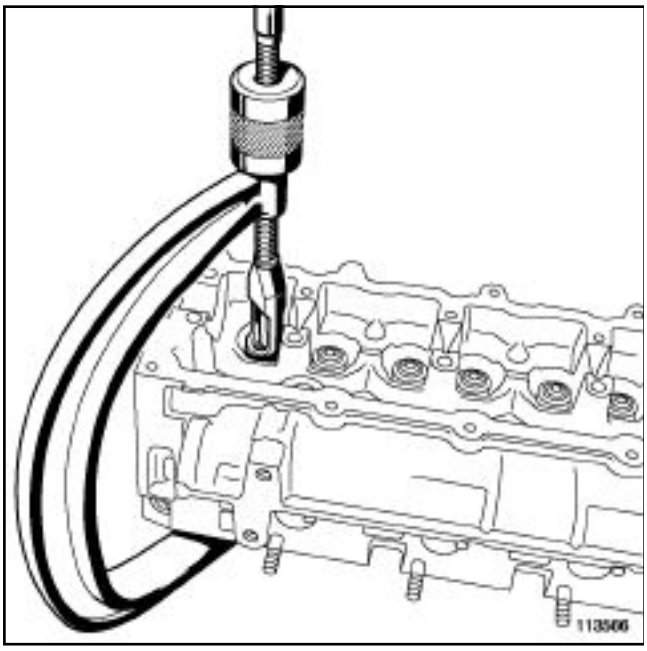


15739-4

Fit the guide tube-pushrod assembly on the valve stem seal.

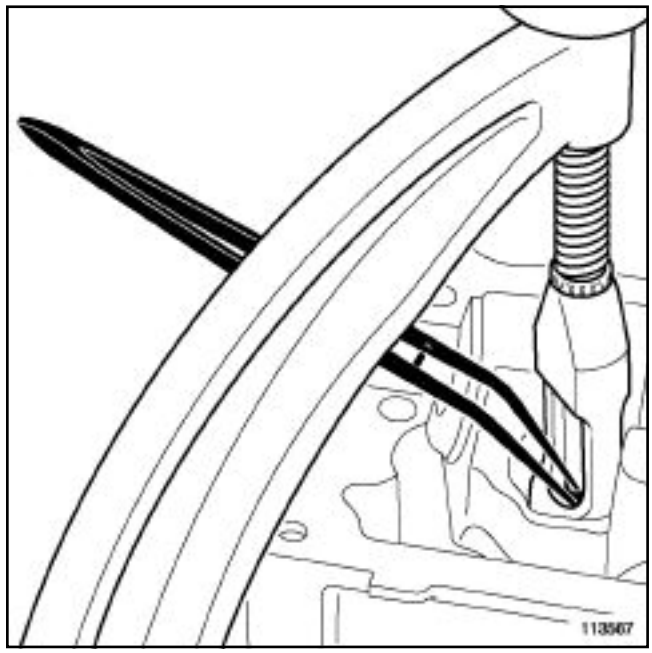
Push home the valve stem seal by gently striking the pushrod with the palm of the hand, until the guide tube makes contact with the cylinder head.

Repeat the preceding operations on all the inlet and exhaust valves.



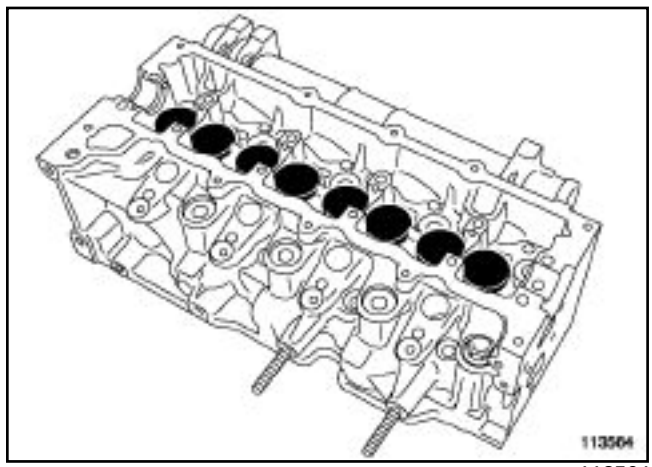
K9K, and 732 or 764

16051-1



Refit:

- the valve springs, positioning the conical part (**7**) of the spring at the top,
- the valve spring upper cups (**8**) .

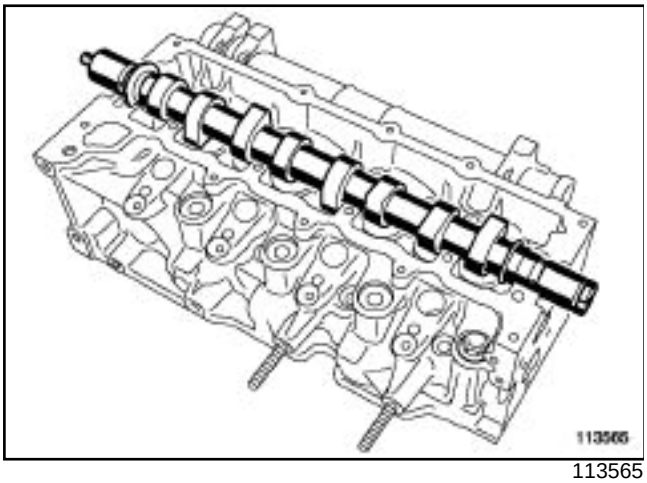


113566

Compress the valve springs using the **(Mot. 1502)** or a valve wrench.

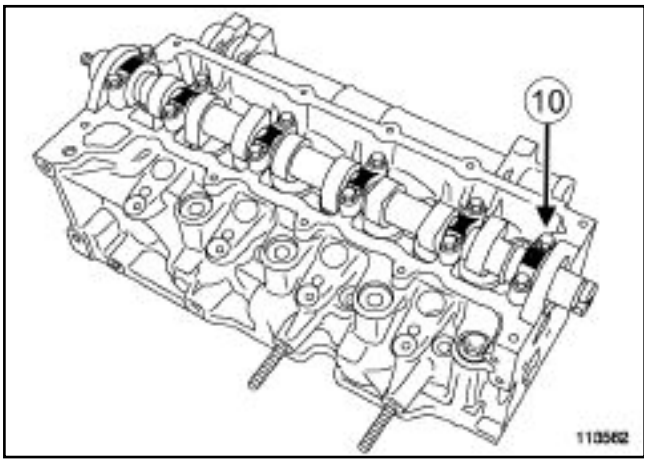
113567

Refit the cotters using tweezers.



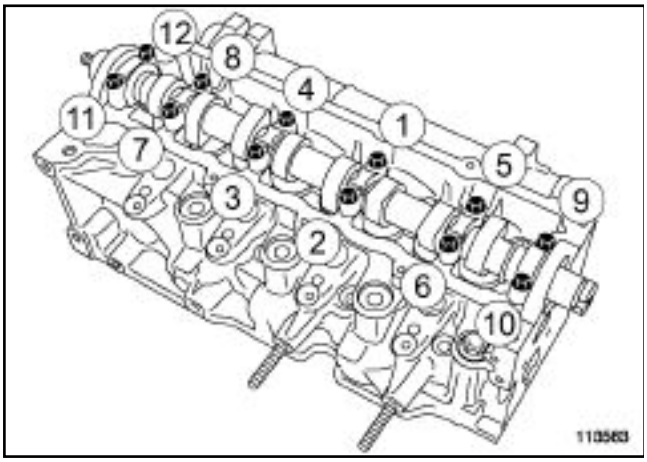
113564

Refit the pushrods observing their original position.



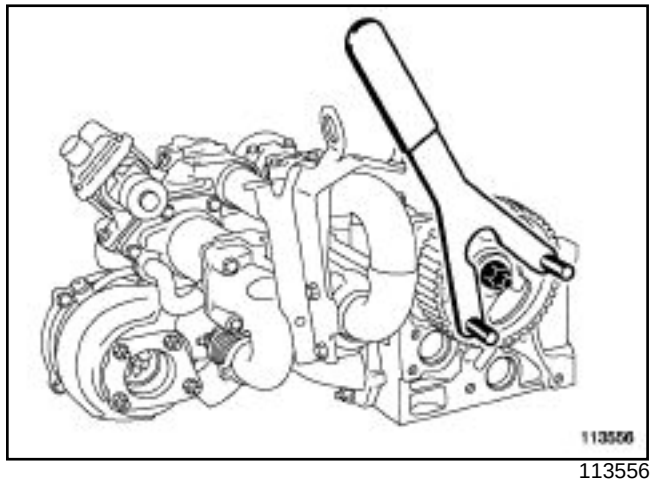
Lubricate the valve pushrods and the camshaft bearings with engine oil.

K9K, and 732 or 764



113565

Refit the camshaft.

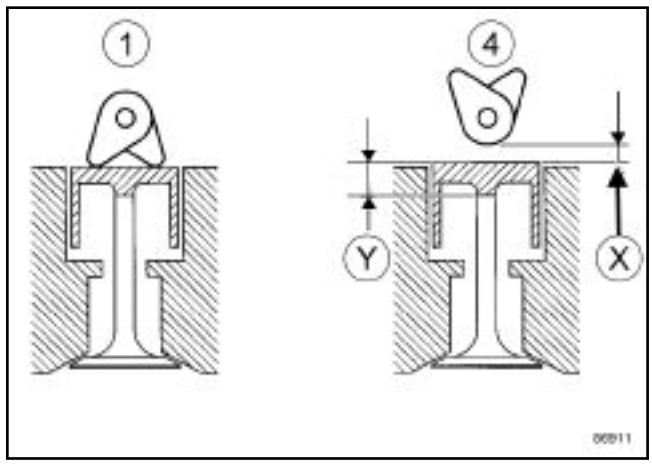


113562

Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**10**) engine flywheel end).

113563

Tighten to torque and in order **the crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .



113556

Refit:

- the camshaft pulley hub,
- the camshaft pulley,
- the old camshaft pulley mounting nut.

Tighten to torque **the mounting nut for the camshaft pulley (15 ± 1.5 Nm)** , blocking the camshaft pulley with the **(Mot. 799-01)** .

Check and adjust the valve clearance following the procedure below.

86911

Position the cylinder valves (**1**) in the end of exhaust stroke, beginning of inlet stroke position.

Measure the valve clearance (**X**) of the cylinder (**4**) using a set of shims:

- inlet valve clearance **0.20 mm** ,
- exhaust valve clearance **0.40 mm** ,

Note the clearance values.

Repeat the above operations on the other cylinders:

- position cylinder No. **3** at an angle and measure the clearance of cylinder No. **2** ,

K9K, and 732 or 764

- position cylinder No. **4** at an angle and measure the clearance of cylinder No. **1** ,

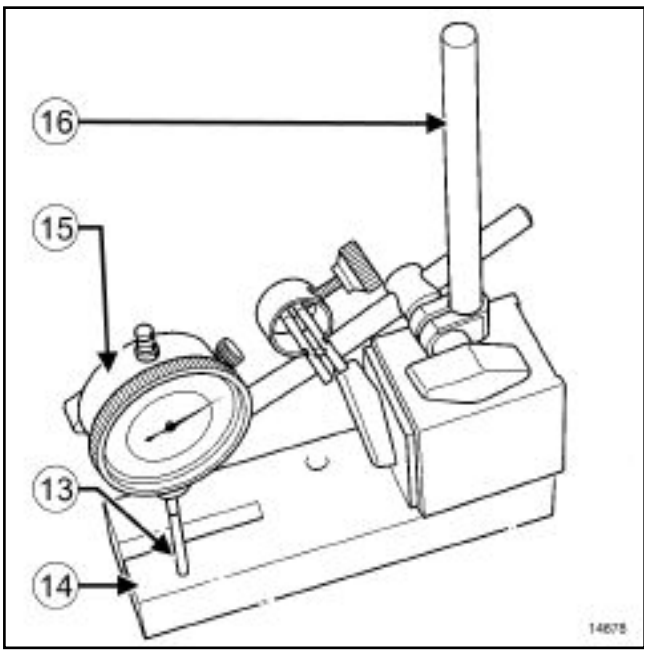
- position cylinder No. **2** at an angle and measure the clearance of cylinder No. **3** ,

Compare the values noted with the specified values.

Remove:

- the nut from the camshaft pulley,

- the camshaft pulley,



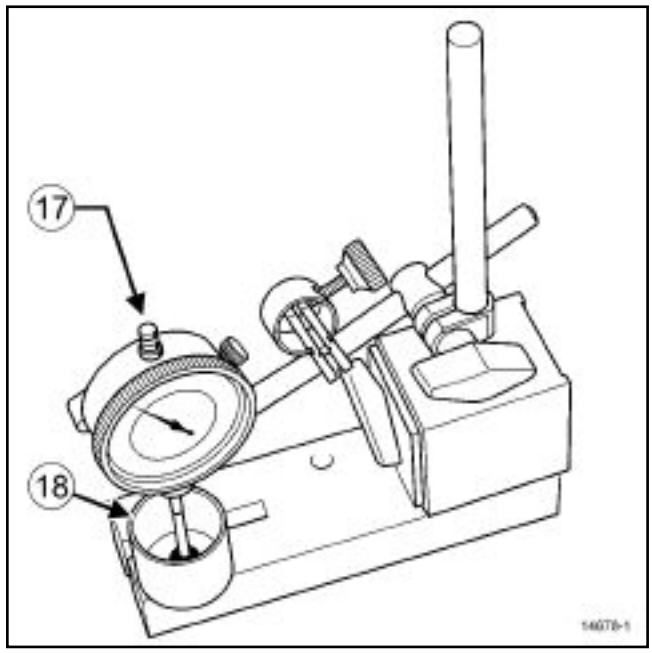
- the camshaft pulley hub,

- the camshaft bearing caps,

- the camshaft,

- the pushrod(s) which are outside of permitted tolerance values, noting their original position.

Undertake the following installation to determine the class of thickness of the valve pushrod.



14678

Screw the extension piece (**13**) of the **(Mot. 856-02)** to a dial gauge (**15**) .

Fix the dial gauge (**15**) to a magnetic holder (**16**) .

Mount the dial gauge-magnetic holder assembly on the plate (**14**) of the **(Mot. 252-01)** .

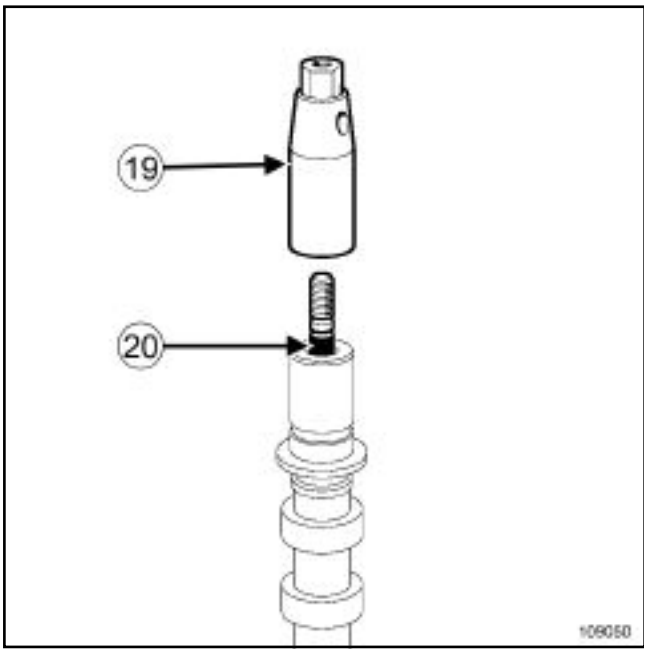
Calibrate the dial gauge.

14678-1

Lift the top piece (**17**) of the dial gauge (without changing the position of the dial gauge-magnetic holder assembly).

Mount the valve pushrod (**18**) to be measured on the plate of the **(Mot. 252-01)** .

Take the measurement ***(Y)*** .



Repeat the preceding operations for the other valve pushrods to be measured.

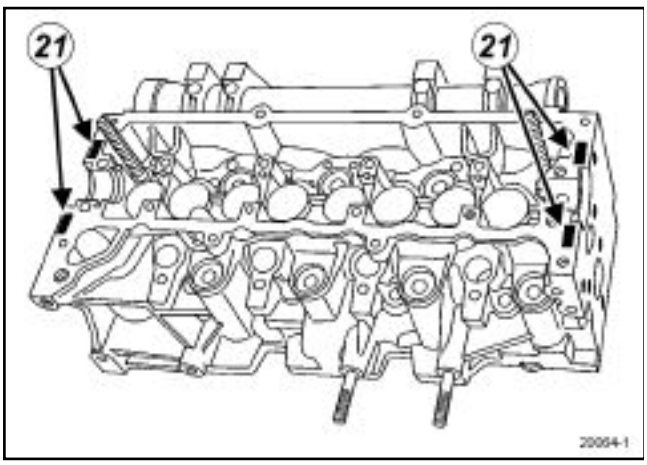
Fit the new valve pushrod(s) in the cylinder head.

Check that the camshaft pulley mounting stud has not come loose. If so, the stud must be replaced following the procedure described below.

Place the camshaft in a vice fitted with a clamping jaw.

K9K, and 732 or 764

109050

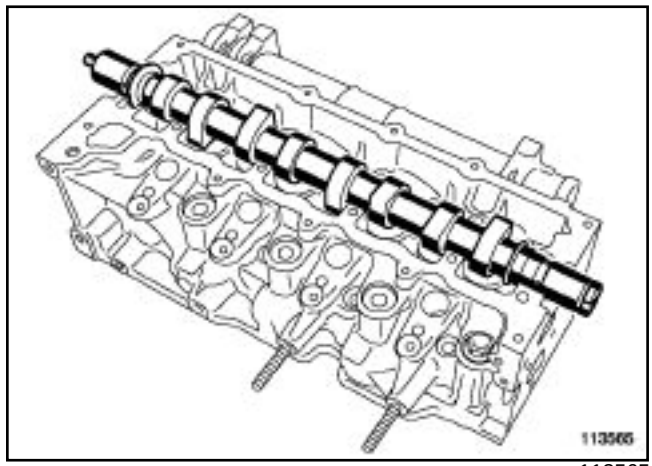


Remove the piston rings using a roller-type stud removal tool (**19**) .

Clean the threaded hole of the camshaft carefully to prevent foreign bodies from entering the latter.

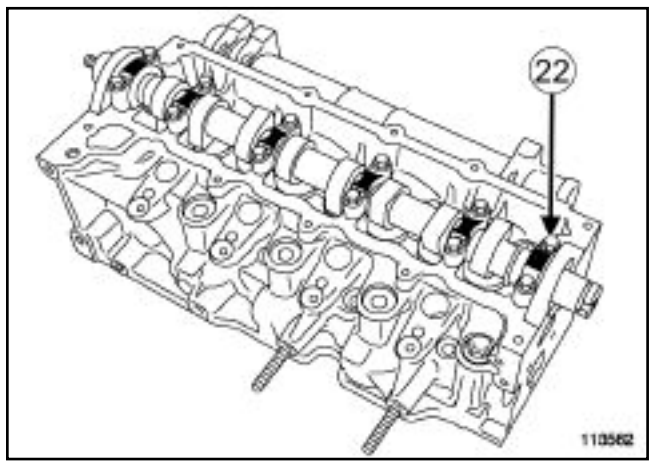
Fit the new stud on the camshaft (precoated section ***(20)*** on the camshaft side).

Tighten to torque **the camshaft pulley mounting stud (12 ± 2 Nm)** using a roller-type stud removal tool ***(19)*** .



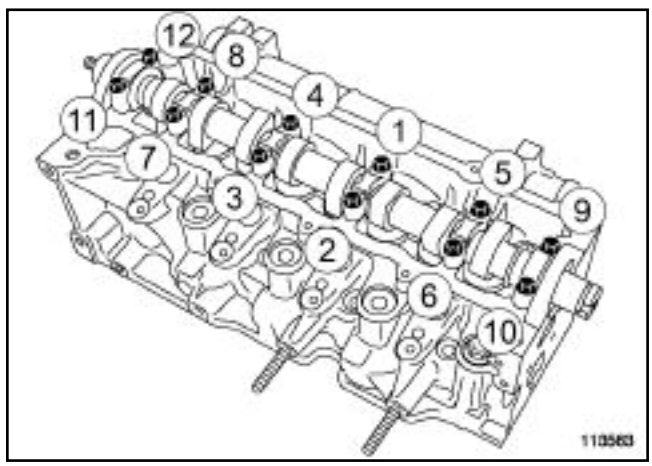
Oil the top of the valve pushrods and the camshaft bearings with engine oil.

20064-1



Degrease the surfaces of the camshaft bearing gaskets nos. 1 and 6 (**21**) using degreaser.

Apply four beads of **LOCTITE 518** of a width of **1 mm** to camshaft bearings nos. 1 and 6 (**21**) .

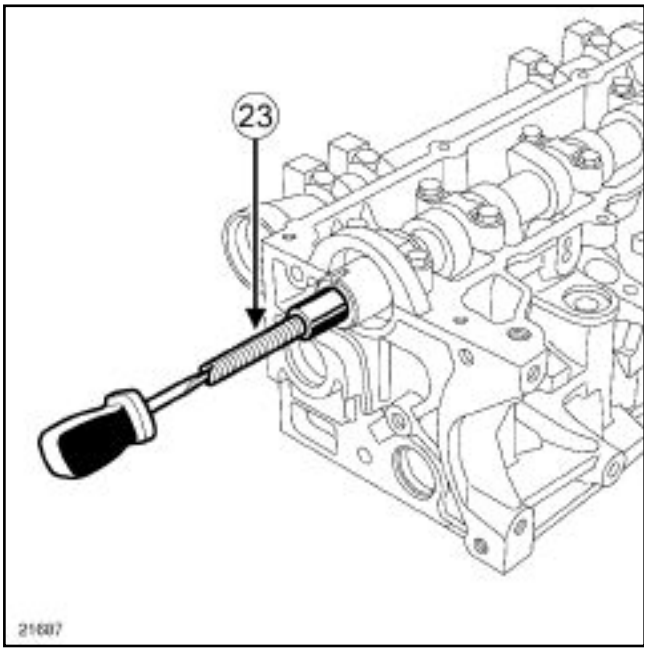


113565

Refit the camshaft.

113562

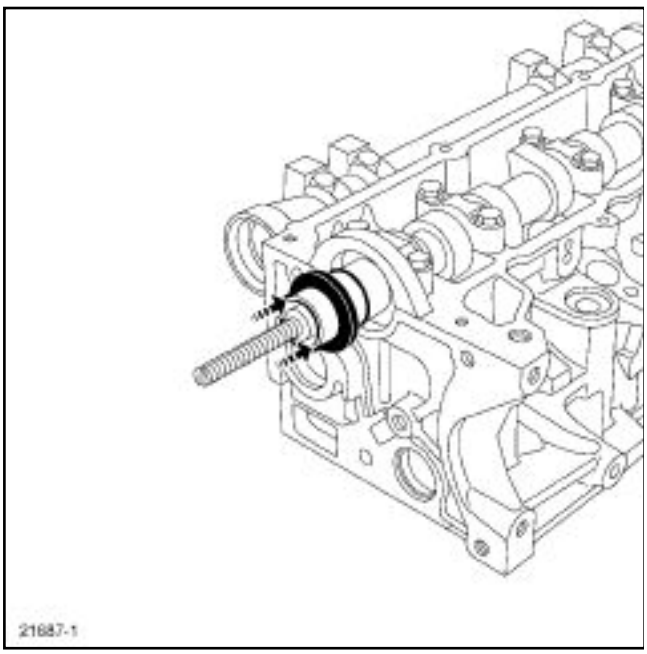
Refit the camshaft bearing caps (observing their original positions, bearing No. 1 (**22**) engine flywheel end).



113563

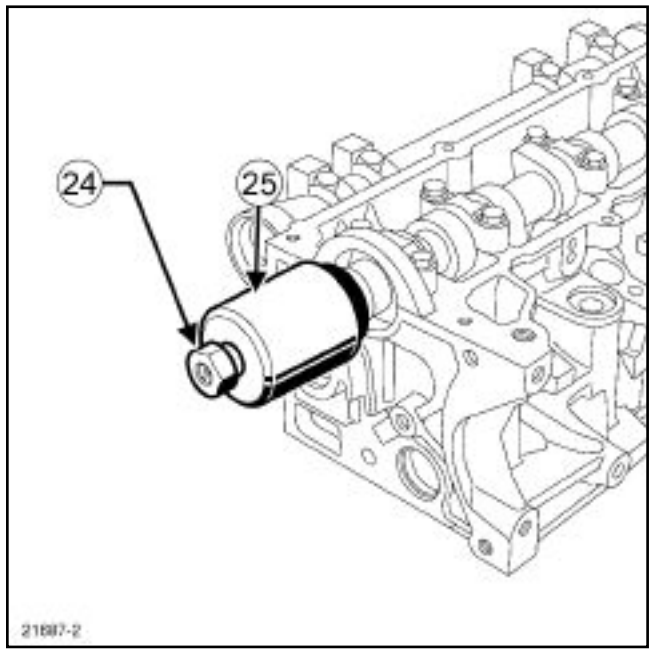
Tighten to torque and in order the **crankshaft bearing cap mounting bolts (11 ± 1.1 Nm)** .

K9K, and 732 or 764



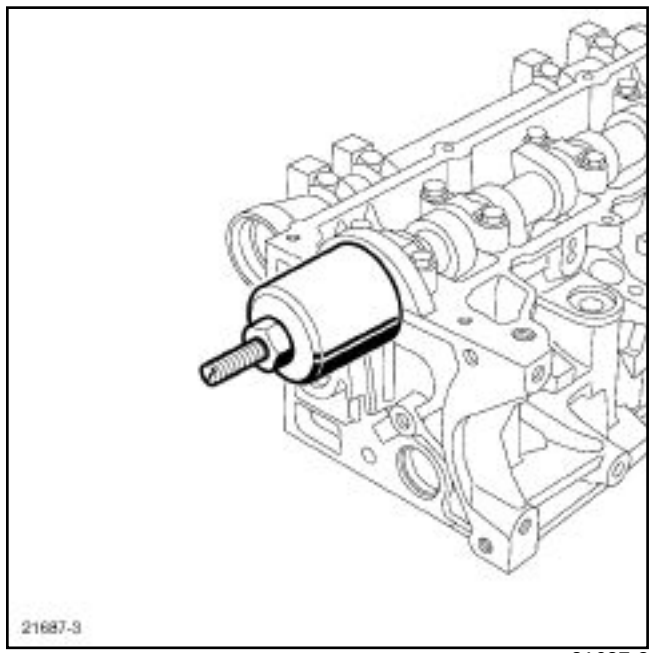
Apply degreaser to:

- the end of the camshaft at the timing end,
- the housing on the cylinder head of the camshaft gasket.



21687

Screw the shoulder stud (**23**) of the **(Mot. 1632)** onto the mounting stud of the camshaft pulley.



21687-1

Refit the camshaft gasket.

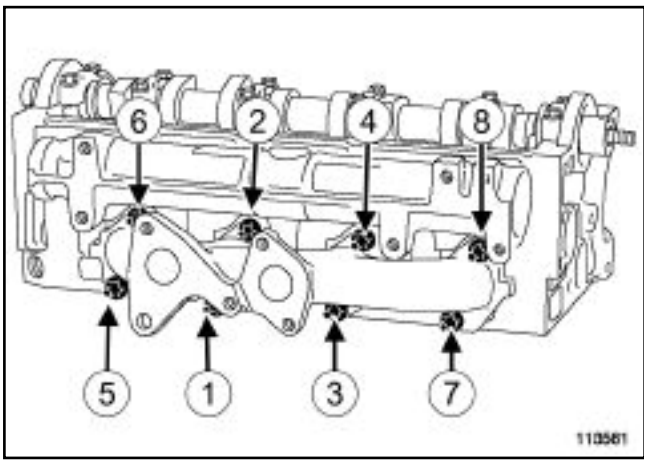
21687-2

Position the cover (**25**) and collar nut (**24**) of the tool **(Mot. 1632)** .

21687-3

Screw on the collar nut until the cover touches the cylinder head.

Remove:

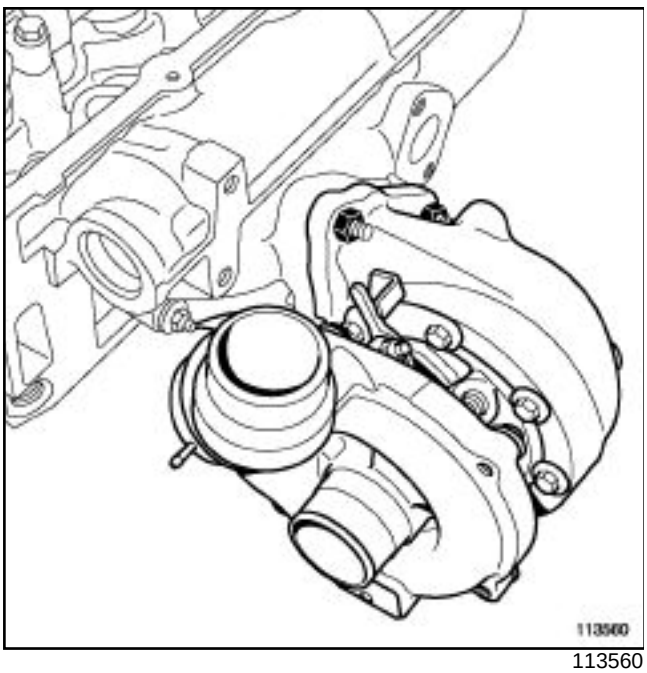


- the collar nut,
- the cap,
- the shoulder stud.

Using degreaser, degrease the surfaces of the exhaust manifold and cylinder head gaskets at the exhaust end.

K9K, and 732 or 764

Refit:

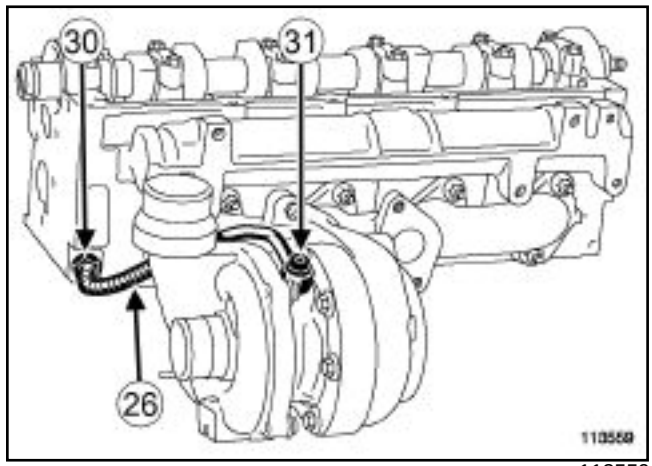


- a new turbocharger-exhaust manifold gasket,
- the exhaust manifold,
- the exhaust manifold mounting nuts.

113561

Tighten to torque and in order the **exhaust manifold mounting nuts (26 ± 2.6 Nm)** .

Using degreaser, degrease the surfaces of the exhaust manifold (where the turbocharger enters) and the turbocharger gaskets.



113560

Refit:

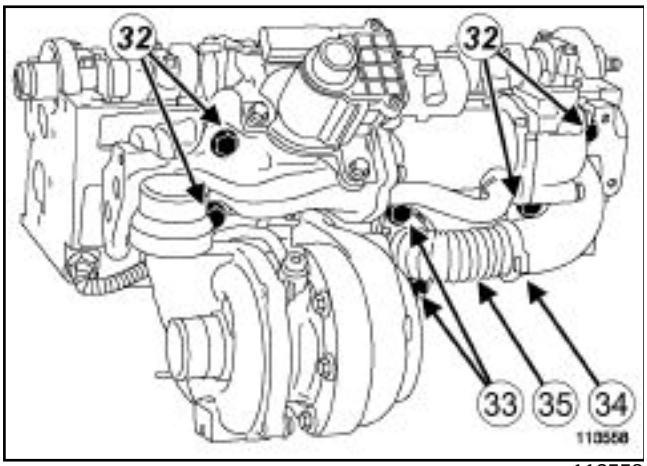
- the new turbocharger gaskets,
- the turbocharger.
- the turbocharger mounting nuts

Tighten to torque the **turbocharger mounting nuts (26 ± 2.6 Nm)** .

Put a little engine oil from an oil can in the oil circuit of the turbocharger.

113559

Refit the turbocharger oil supply pipe (**26**) .



Screw:

- the cylinder head nut (**30**) ,
- the bolt (**31**) on the turbocharger.

Tighten to torque:

- **the turbocharger oil supply pipe mounting bolt (turbocharger end) (23 ± 2.3 Nm)** ,
- **the turbocharger oil supply pipe mounting nut (cylinder head end) (35 ± 3.5 Nm)** .

K9K, and 732 or 764

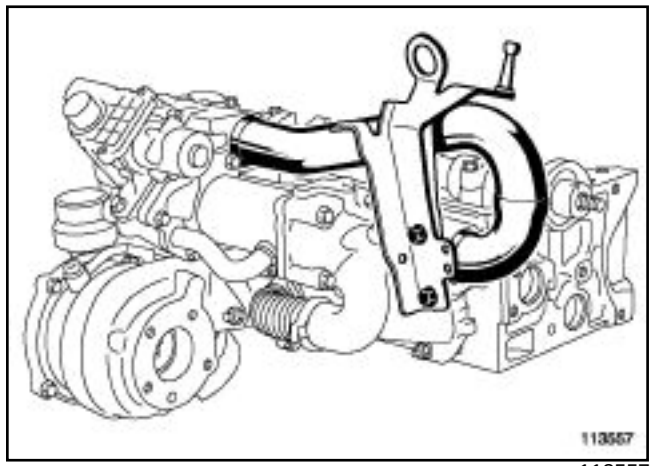
113558

Refit:

- the EGR valve-exchanger assembly,
- the mounting bolts (**32**) (without tightening them) of the EGR valve-exchanger.

Tighten to torque the **EGR valve-exchanger mounting bolts (25 ± 2.5 Nm)** . (**32**)

Refit:



- the new exhaust gas recirculation pipe (**35**) fitted with its new snap-on clip (**34**) ,
- the mounting bolts (**33**) of the exhaust gas recirculation pipe.

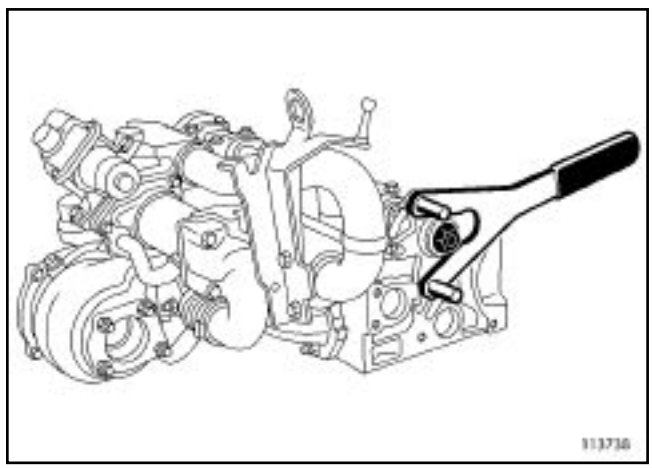
Adjust the exhaust gas recirculation pipe in relation to the cooler support.

Lock the snap-on clip of the exhaust gas recirculation pipe using the **(Mot. 1567)** .

Tighten to torque the **mounting bolts of the exhaust gas recirculation pipe (35 ± 3.5 Nm)** (**33**) .

Fit the new O-ring seals to the inlet pipe.

113557



Refit:

- the inlet duct,
- the engine lifting eye (timing end),
- the engine lifting eye mounting bolts.

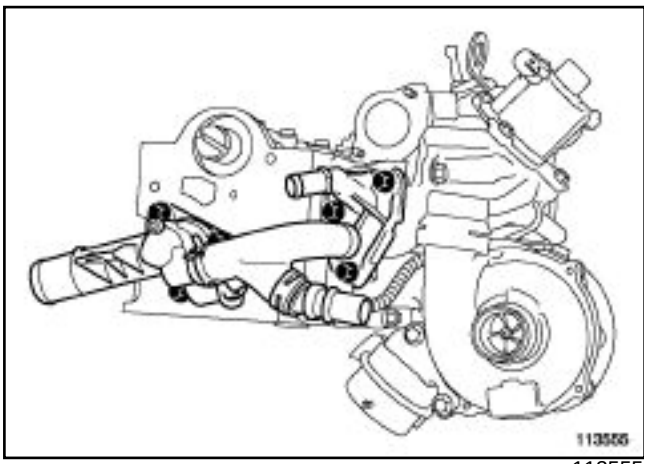
Tighten to torque the **engine lifting eye mounting bolts (timing end) (21 ± 2.1 Nm)** .

Refit:

- the camshaft pulley hub,
- the new camshaft pulley hub mounting nut.

113738

Immobilise the hub using the **(Mot. 799-01)** .



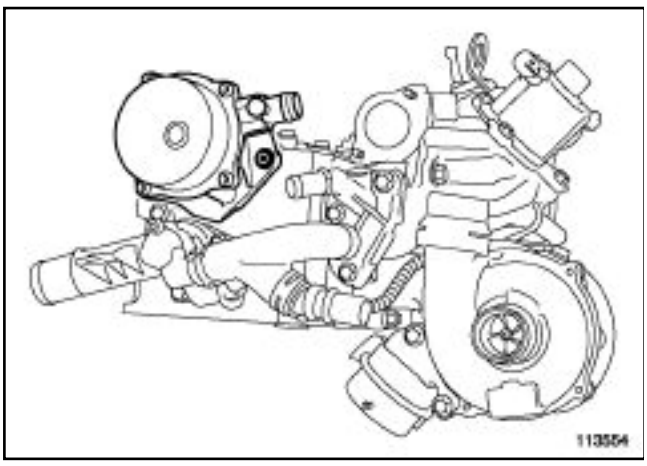
Tighten to torque and angle the **camshaft pulley hub nut (30 ± 3 Nm + 86° ± 6°)** .

Refit the camshaft pulley (without tightening the mounting bolts).

Using degreaser, degrease the surfaces of the seals where the vacuum pump enters, the cylinder head coolant outlet and the EGR exchanger cover.

K9K, and 732 or 764

Refit new seals to the cylinder head coolant outlet and the EGR exchanger cover.



113555

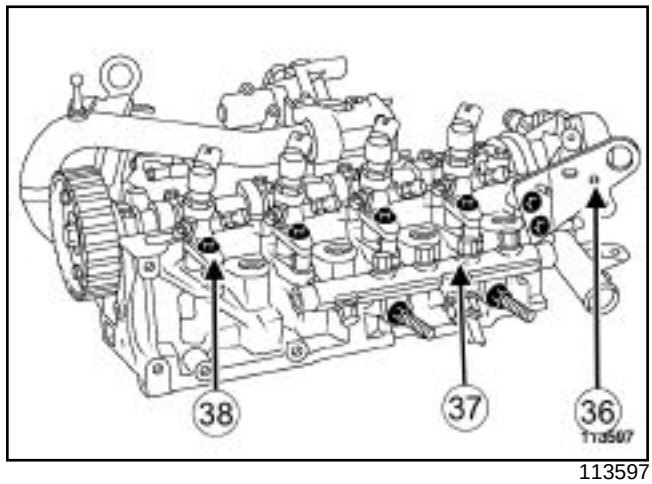
Refit:

- the cylinder head coolant outlet unit-EGR exchanger cover assembly,
- the cylinder head coolant outlet unit mounting bolts,
- the EGR exchanger cover mounting bolts.

Tighten to torque:

- **the cylinder head coolant outlet unit bolt (11 ± 1.1 Nm)** ,
- **the EGR exchanger cover mounting bolt (12 ± 1.2 Nm)** .

113554



Refit:

- the vacuum pump,
- vacuum pump mounting bolts,

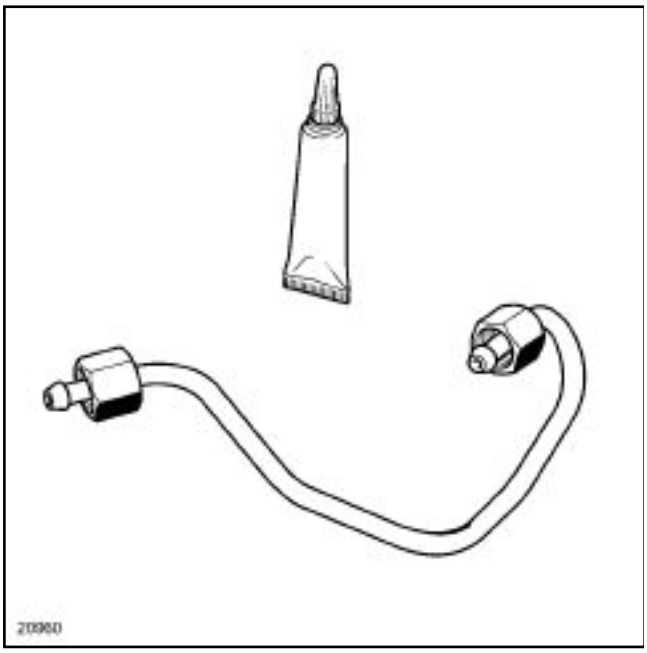
Tighten to torque the **vacuum pump mounting bolts (21 ± 2.1 Nm)** .

Refit the heater plugs.

Tighten to torque **the heater plugs (15 ± 1.5 Nm)** using a hinged wrench.

113597

Refit:



- engine lifting eye (flywheel end) (**36**) ,
- the injector rail **(without tightening the nuts)** ,
- the new heat protection washers,
- the injectors (observing their positions),
- the injector bracket spacer,
- the injector brackets,
- the injector bracket mounting bolts (**38**) .

Tighten to torque **the injector bracket mounting bolts (30 ± 3 Nm)** .

Note:

Do not lubricate high-pressure pipes **supplied without an applicator; these pipes are self-lubricating.**

K9K, and 732 or 764

20960

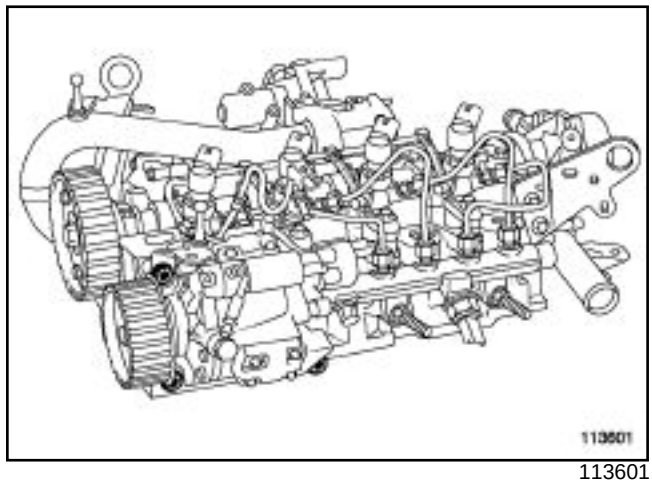
Lightly lubricate the nut threads with oil from the applicator supplied with the new part, taking care not to insert it in the pipe.

Insert the high-pressure pipe olive in the injector high-pressure inlet taper.

Insert the high-pressure pipe olive in the rail high-pressure outlet taper.

Finger tighten the high-pressure pipe nuts, starting with the one located on the injector end.

Lightly tighten the nuts of the high-pressure pipes.



Tighten to torque the **injector rail mounting nuts (28 ± 2.8 Nm)** .

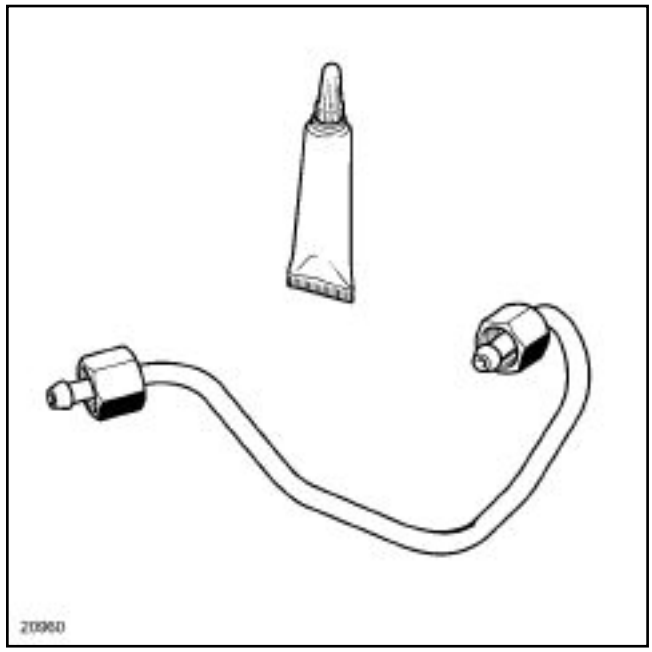
Note:

Completely tighten one high-pressure pipe before moving to the next one.

Tighten to torque and in order (according to the part no. of the pipe) **the rail-injectors high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

- injector rail side, using the **(Mot. 1566)** or a crow foot wrench,
- injector side using the **(Mot. 1566)** or with a wrench for high-pressure pipes.

113601



Refit:

- the high-pressure pump,
- the mounting bolts of the high-pressure pump

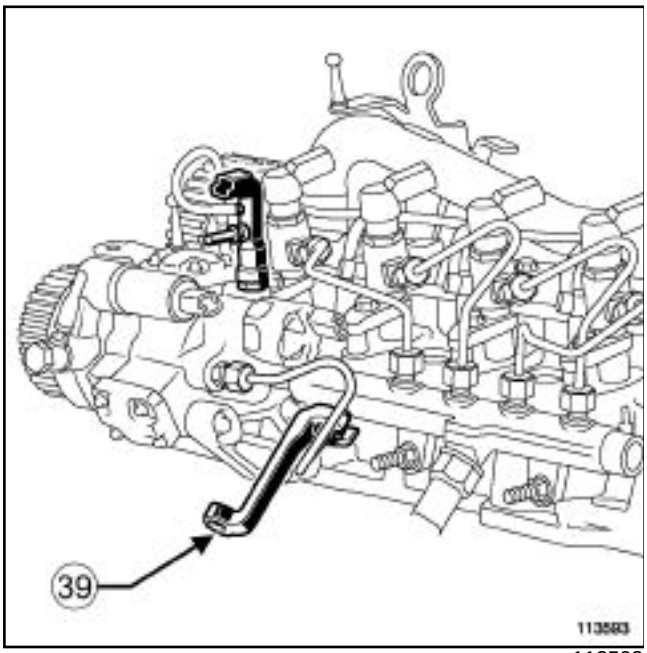
Tighten to torque the **high-pressure pump mounting bolts (21 ± 2.1 Nm)** .

Note:

Do not lubricate high-pressure pipes **supplied without an applicator; these pipes are self-lubricating.**

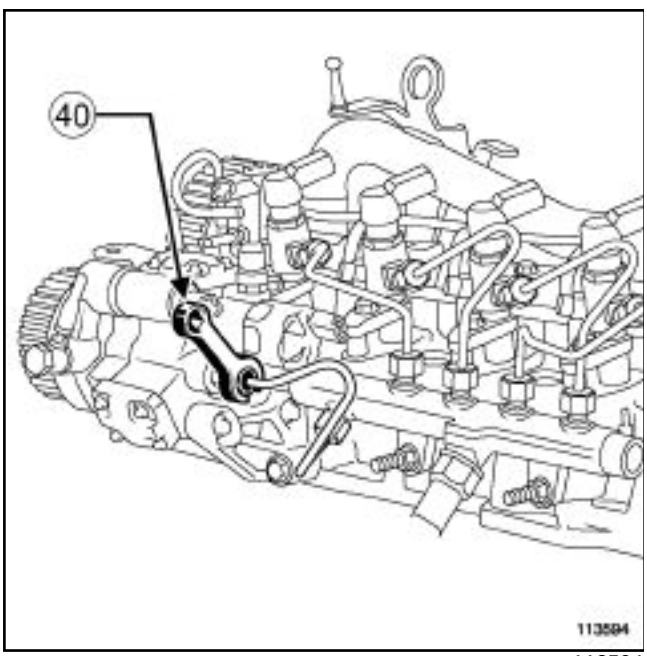
20960

Lightly lubricate the nut threads with oil from the applicator supplied with the new part, taking care not to insert it in the pipe.



Position the high-pressure pipe olive in the high-pressure spherical injector rail inlet.

K9K, and 732 or 764

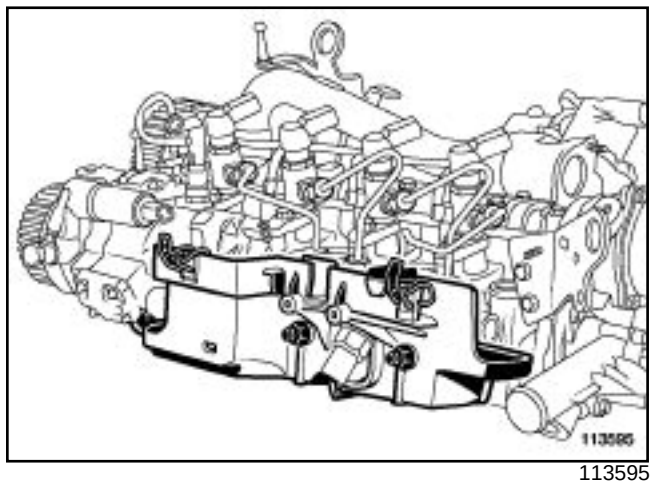


Insert the high-pressure pipe olive in the high-pressure pump high-pressure outlet taper.

Finger tighten the high-pressure pipe nuts, starting with the one at the injector rail side.

Lightly tighten the nuts of the high-pressure pipes.

113593



113594

Tighten to torque and in order (according to the part no. of the pipe) **the rail-injectors high-pressure pipe nuts (24 ± 2.4 or 38 ± 3.8 Nm)** :

- the injector rail side using the **(Mot. 1566)** (**39**) ,
- the high-pressure pump side using the **(Mot. 1746)** (**40**) .

Refit the fuel return pipe.

113595

Refit:

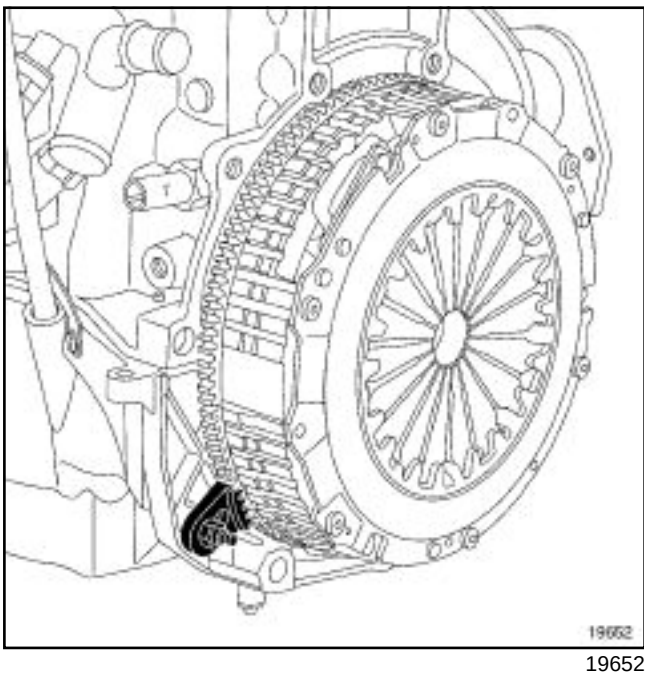
- the high-pressure protector,
- the mounting bolt and nuts of the high-pressure protector,

Tighten to torque the **high-pressure protector bolts and nuts (21 ± 2.1 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

Special tooling required	
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Emb. 1596	24mm socket for removing/refitting clutch master cylinder.
Mot. 1329	Oil filter removing tool (76 mm diameter).

I - RECOMMENDATIONS FOR REPAIR



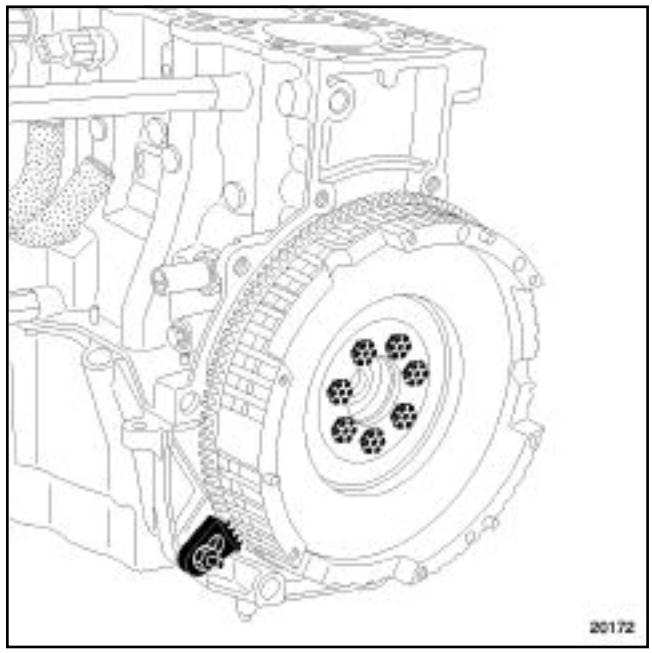
IMPORTANT
Wear protective gloves during every operation.

II - EQUIPMENT REQUIRED

- Wide, flat-blade screwdriver,
- Male torx socket.

III - STRIPPING THE CYLINDER BLOCK

1 - For engines fixed to the oil filter side

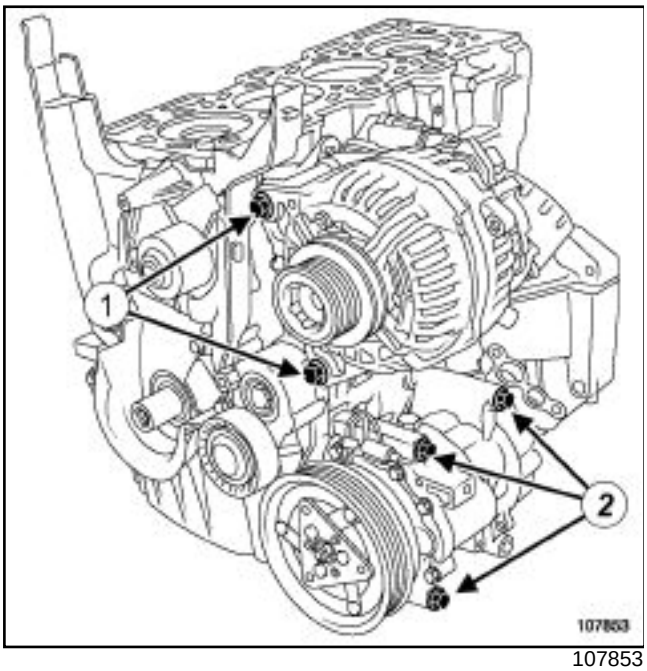


19652

Fit the engine flywheel lock **(Mot. 582-01)** or **(Mot. 1677)** .

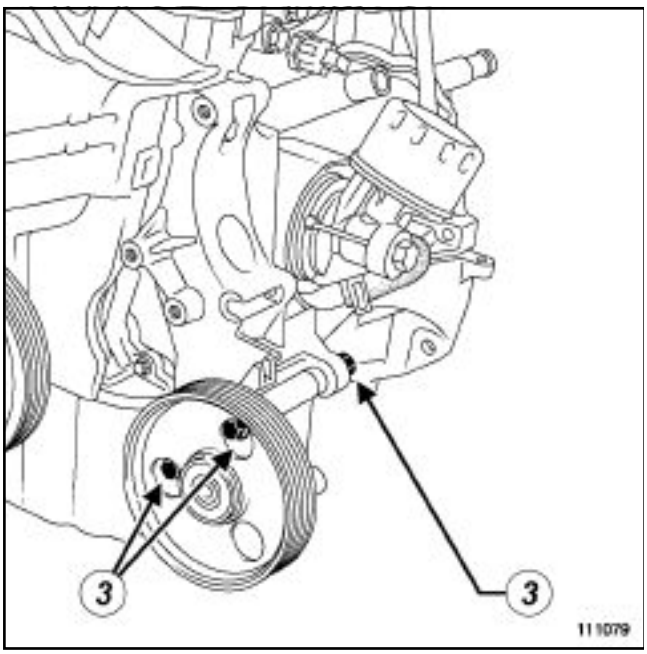
Remove:

- the clutch mechanism mounting bolts,
- the clutch pressure plate,
- the clutch plate.



20172

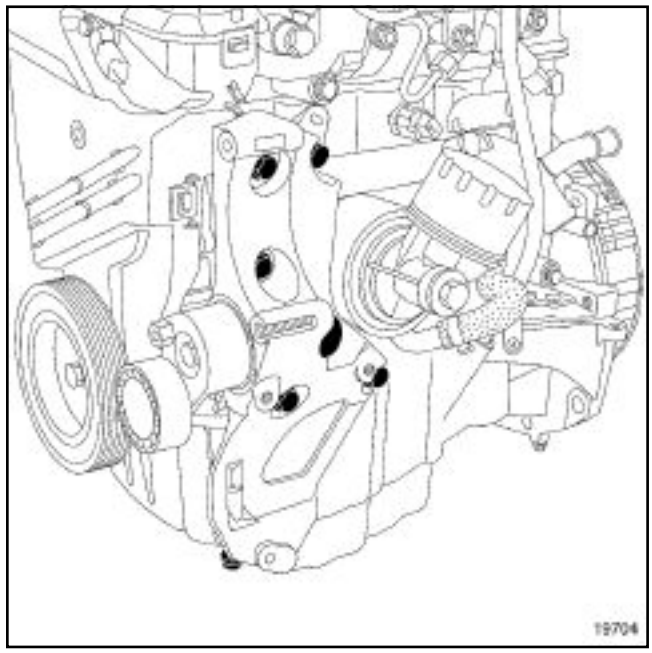
Remove:



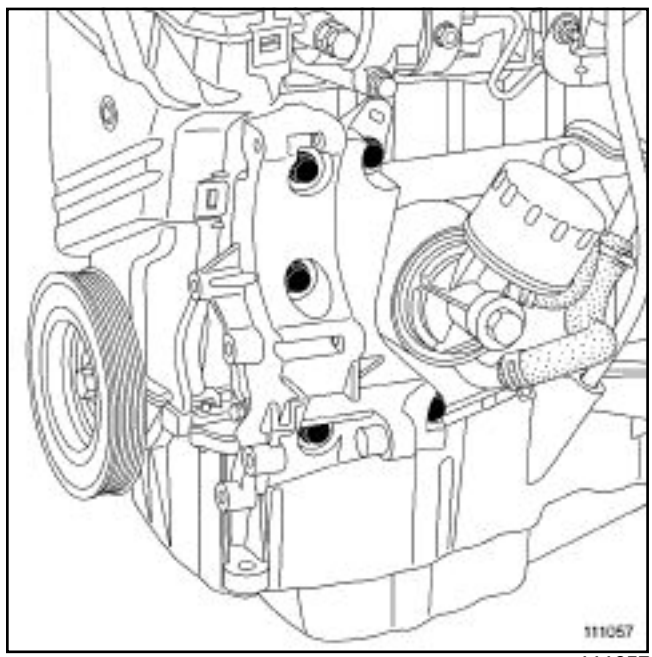
- the flywheel mounting bolts,
- the **(Mot. 582-01)** or **(Mot. 1677)** ,
- the flywheel.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

2 - For engines fixed to the flywheel side



107853

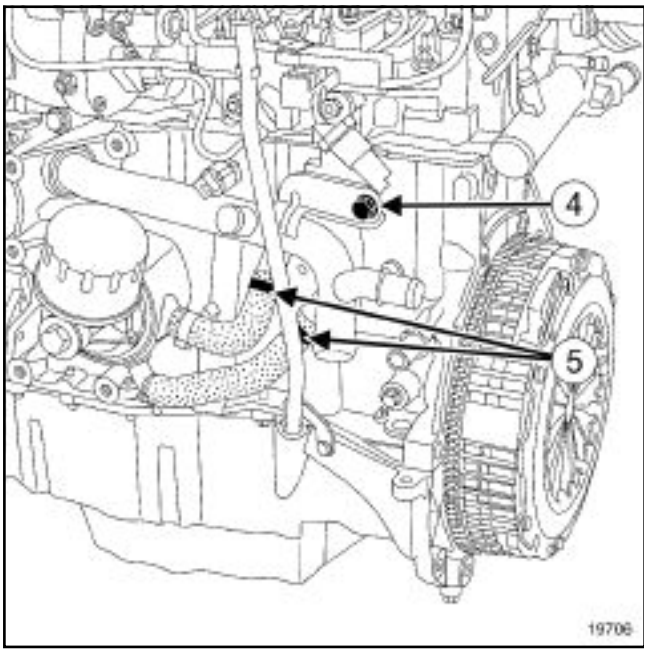


111079

Remove:

- the alternator mounting bolts (**1**) ,
- the alternator using a wide, flat-blade screwdriver (if necessary),
- the mounting bolts (**2**) of the air conditioning compressor (if fitted),
- the air conditioning compressor,
- the mounting bolts (**3**) of the power assisted steering pump or the dummy pulley (if fitted),
- the power assisted steering pump or the dummy pulley.

19704

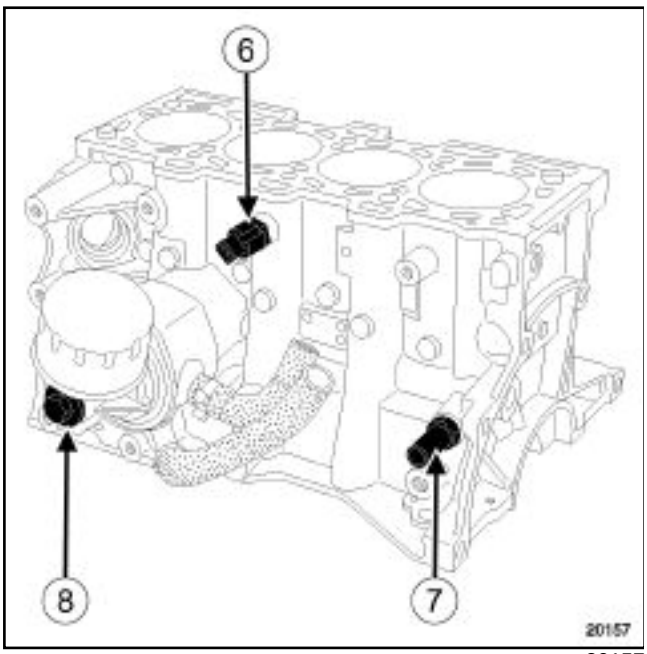


111057

Remove:

- the multifunction support mounting bolts,
- the multifunction support.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

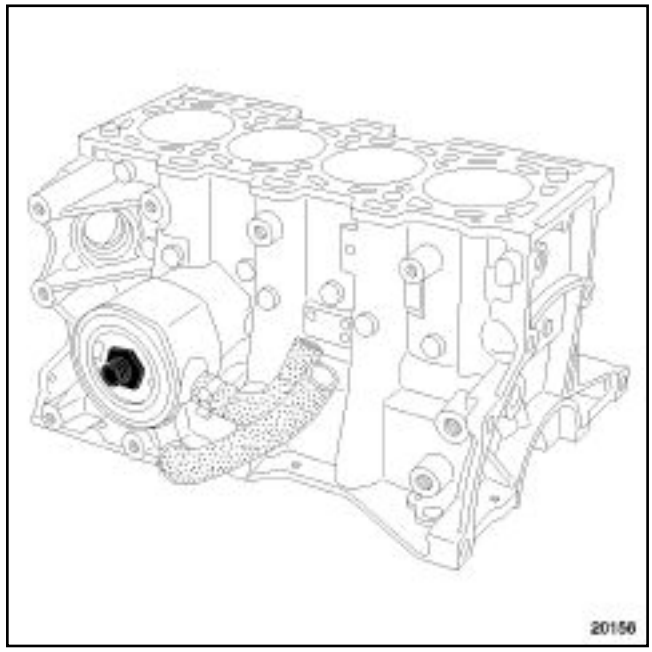


19706

Unclip the hose connections (**5**) of the coolant pump inlet pipe.

Remove:

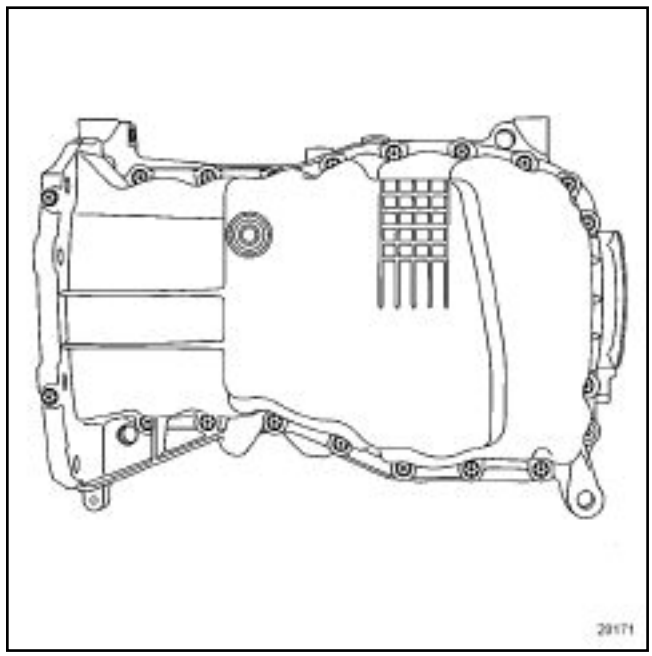
- the mounting bolt (**4**) of the coolant pump inlet pipe,
- the coolant pump inlet pipe.



3 - For engines fixed to the oil filter side or the flywheel side

20157

Remove:

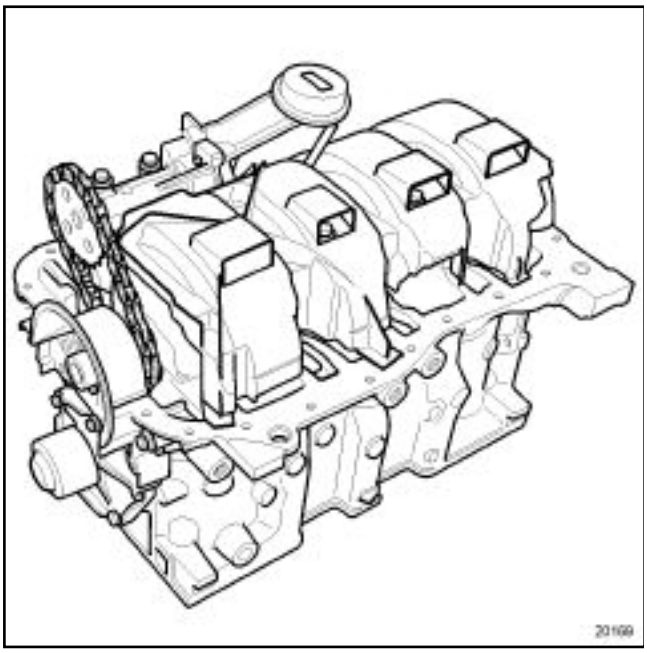


- the acceleration meter (**6**) using tool **(Emb. 1596)** ,
- the oil pressure sensor (**7**) ,
- the oil filter using the **(Mot. 1329)** ,
- the oil filter holder mounting bolt (**8**) ,

20156

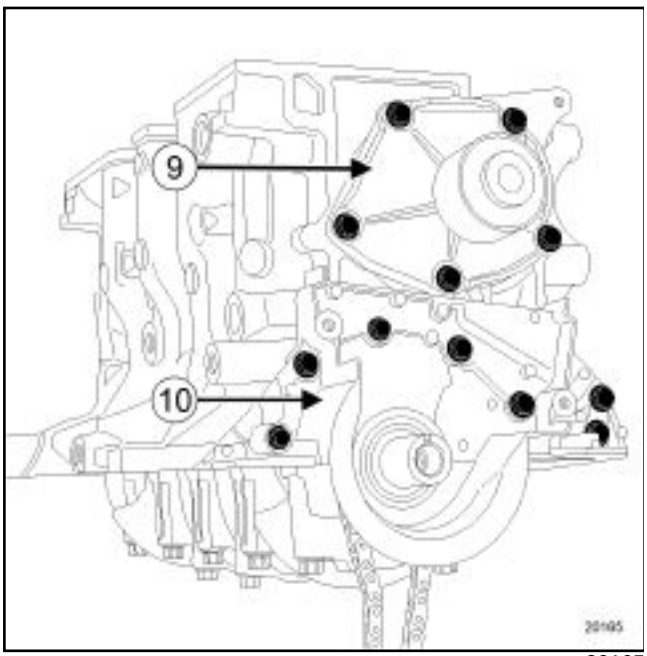
Remove:

- the oil/coolant heat exchanger mounting bolt,
- the oil/coolant heat exchanger.



20171

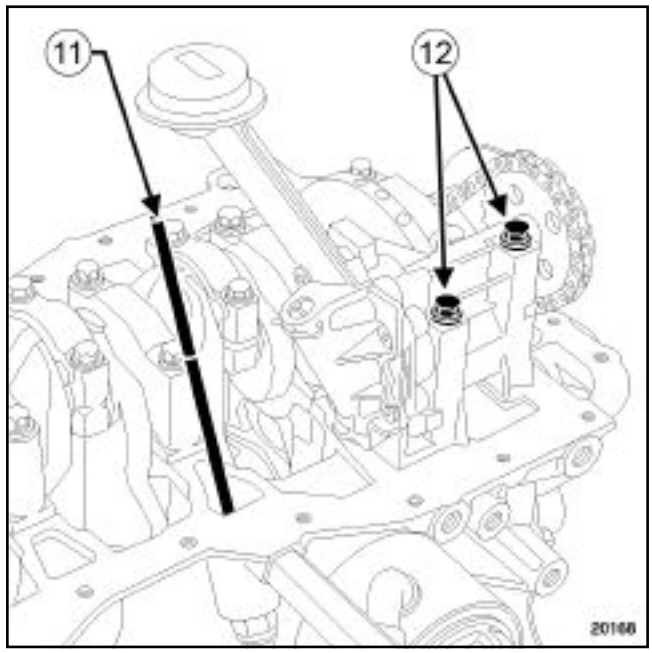
Remove:



- the oil sump mounting bolts.
- the engine oil sump.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

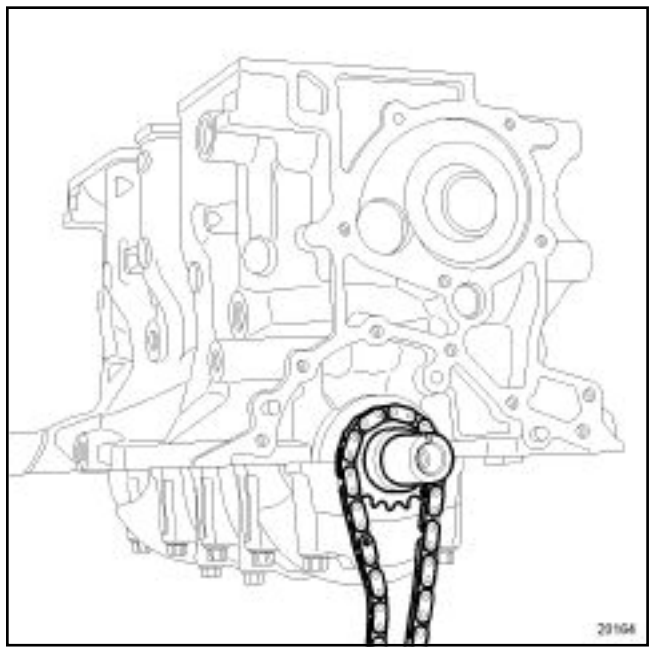
20169



Remove the oil splash plate.

20165

Remove:



- the coolant pump mounting bolts (**9**) ,
- the coolant pump,
- the crankshaft nose closure panel mounting bolt (**10**) ,
- the crankshaft nose closure panel

20168

Remove:

- the oil level sensor (**11**) ,
- the oil pump mounting bolts (**12**) ,
- the oil pump.

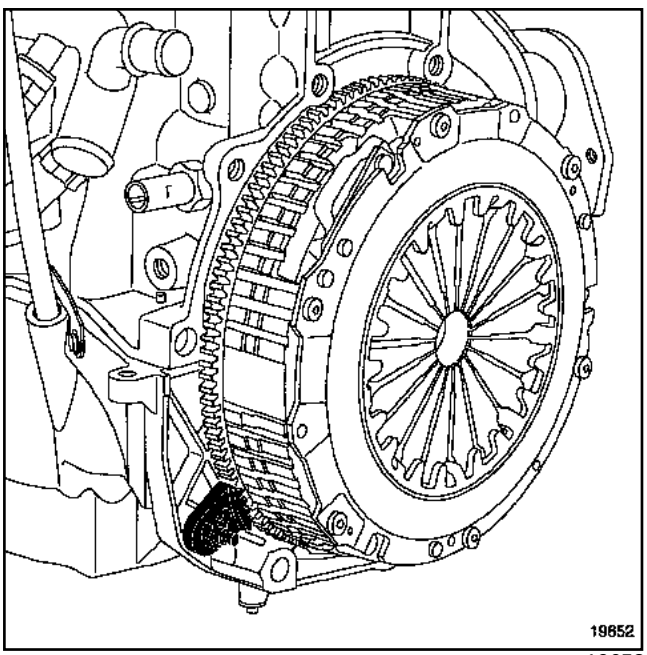
20164

Remove:

- the oil pump chain,
- the oil pump drive sprocket.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

Special tooling required	
Mot. 1677	Flywheel locking tool.
Mot. 1329	Oil filter removing tool (76 mm diameter).
Emb. 1596	24 mm socket for removing/refitting clutch master cylinder.



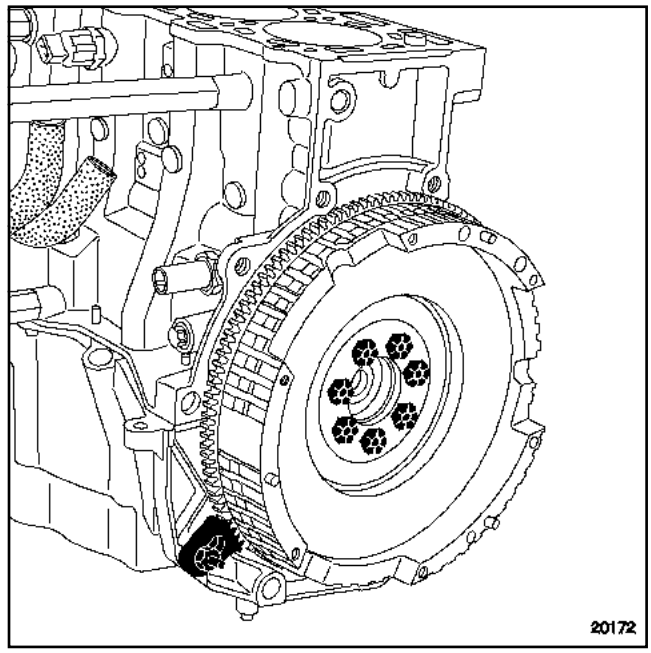
I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

II - EQUIPMENT REQUIRED

- Wide, flat-blade screwdriver,
- Male torx socket.

III - STRIPPING THE CYLINDER BLOCK

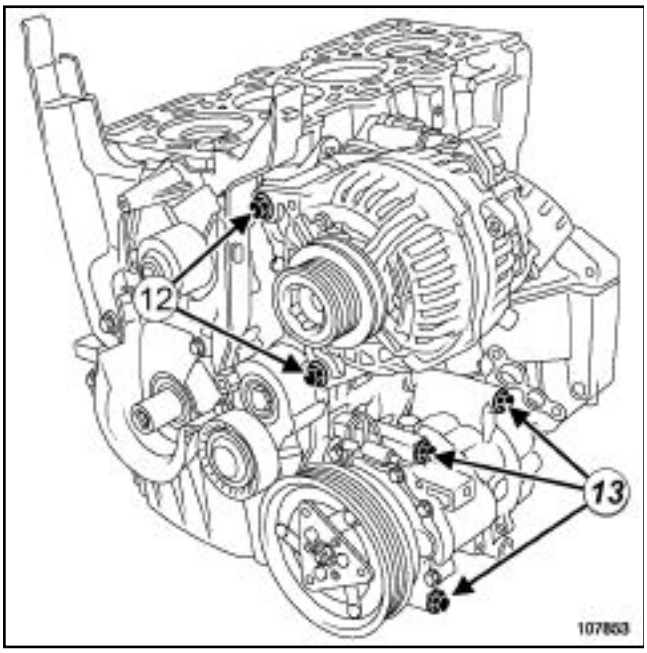


19652

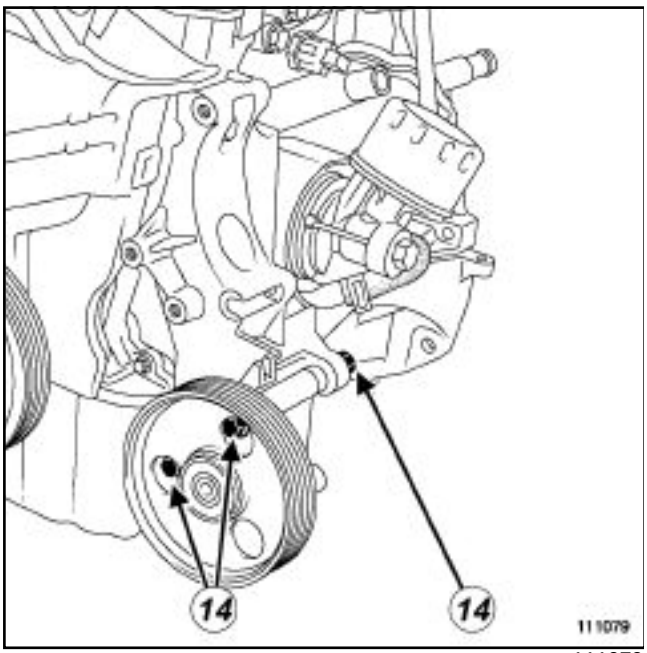
Fit the engine flywheel lock **(Mot. 1677)** .

Remove:

- the clutch mechanism mounting bolts,
- the clutch pressure plate,
- the clutch plate.



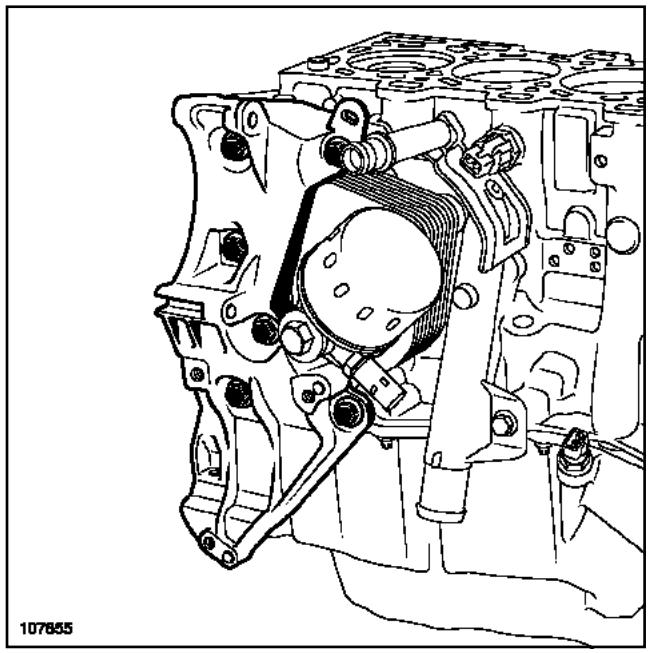
20172



Remove:

- the flywheel mounting bolts,
- **(Mot. 1677)** ,
- the flywheel.

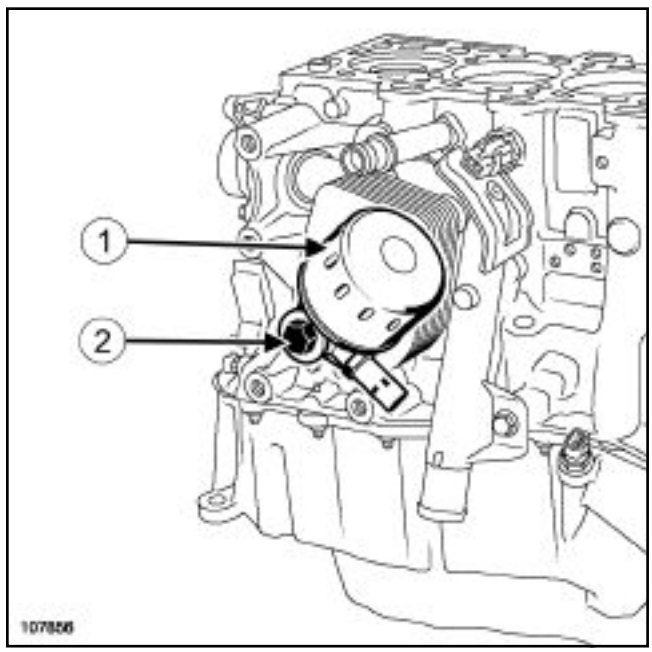
K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768



107853

111079

Remove:

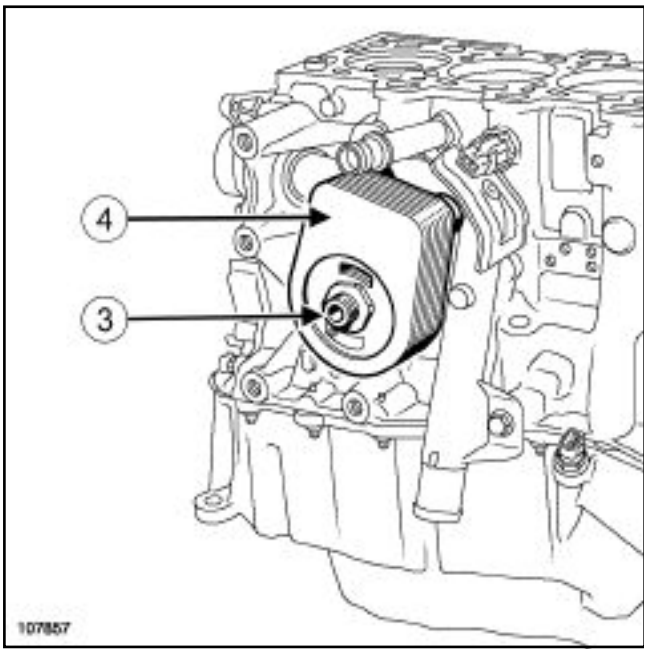


- the alternator mounting bolts (**12**) ,
- the alternator using a wide flat-blade screwdriver (if necessary),
- the mounting bolts (**13**) of the air conditioning compressor (if fitted),
- the air conditioning compressor,
- the mounting bolts (**14**) of the power assisted steering pump or the dummy pulley if fitted,
- the power assisted steering pump or the dummy pulley.

107855

Remove:

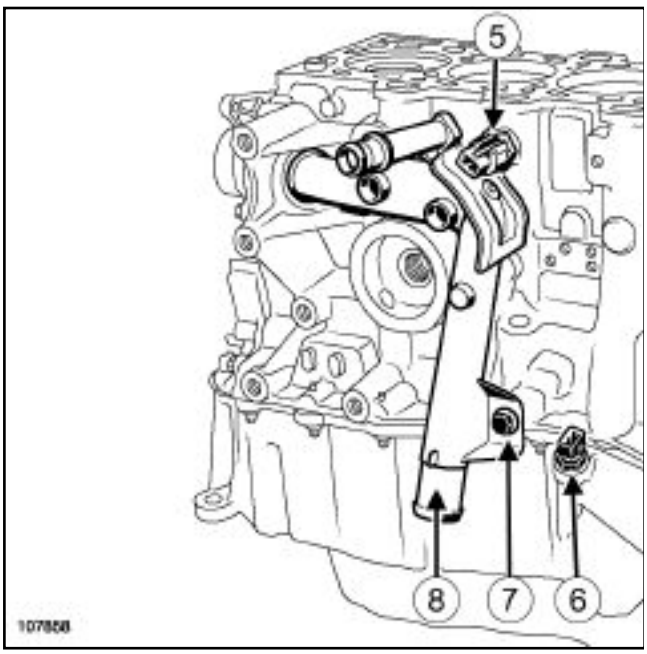
- the multifunction support mounting bolts,
- the multifunction support.



107856

Remove:

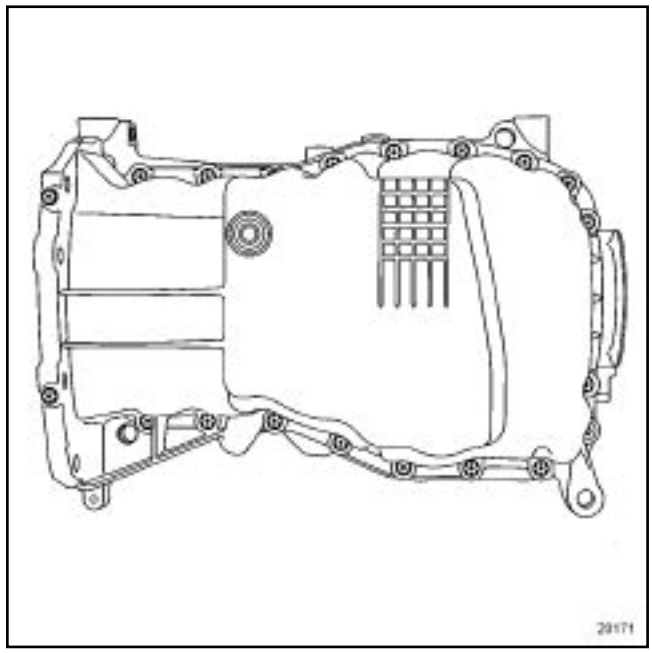
- the oil filter (**1**) using the **(Mot. 1329)** ,
- the oil filter holder mounting bolt (**2**) ,
- the oil filter holder.



K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

107857

Remove:

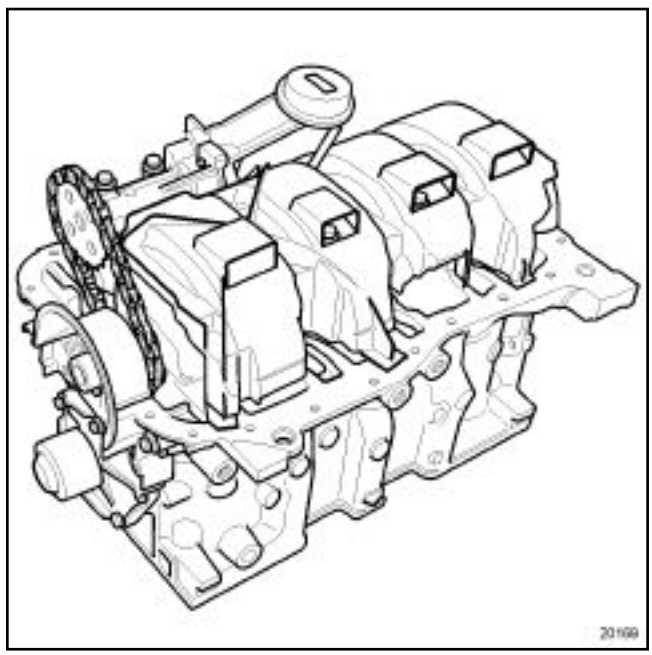


- the mounting bolt (**3**) from the oil/coolant heat exchanger,
- the oil/coolant heat exchanger (**4**) .

107858

Remove:

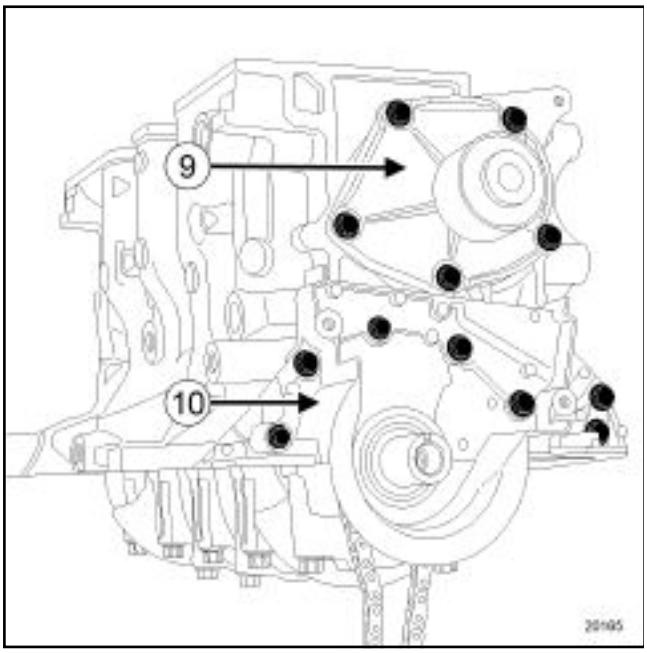
- the acceleration meter (**5**) using the **(Emb. 1596)** ,
- the oil level sensor (**6**) ,
- the mounting bolt (**7**) of the coolant pump inlet pipe,
- the coolant pump inlet pipe (**8**) .



20171

Remove:

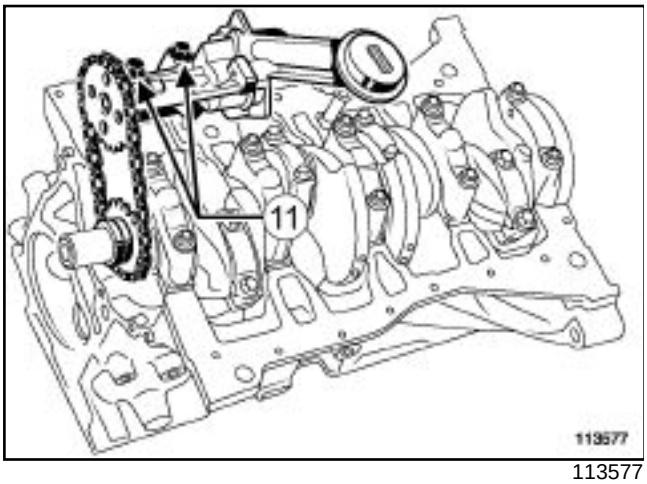
- the engine oil sump mounting bolts,
- the engine oil sump.



K9K, and 712 or 728

20169

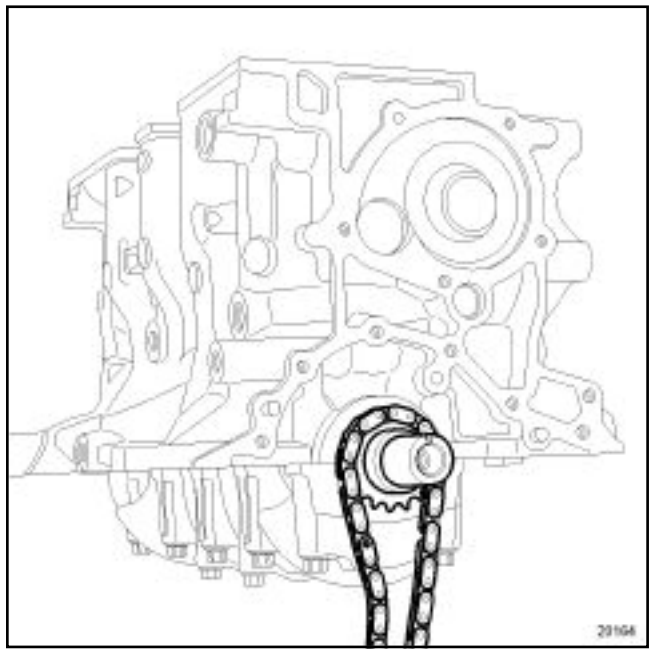
Remove the oil splash plate.



K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

20165

Remove:



- the coolant pump mounting bolts (**9**) ,
- the coolant pump,
- the crankshaft nose closure panel mounting bolt (**10**) ,
- the crankshaft nose closure panel

113577

Remove:

- the oil pump mounting bolts (**11**) ,
- the oil pump.

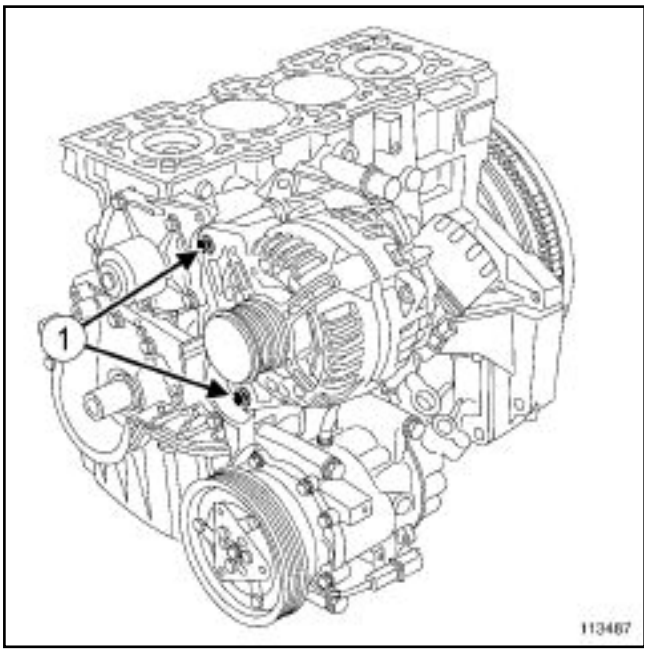
20164

Remove:

- the oil pump chain,
- the oil pump drive sprocket.

K9K, and 732 or 764

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter).
Mot. 1677	Flywheel locking tool.

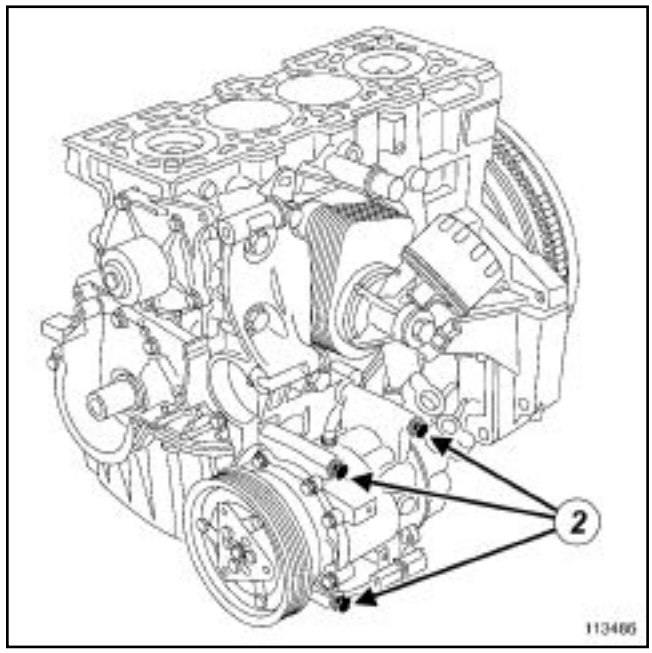


I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

II - EQUIPMENT REQUIRED

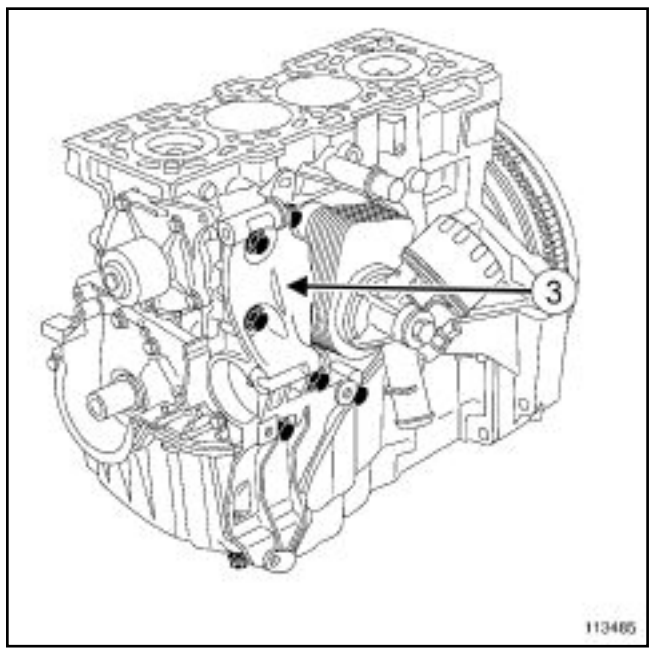
- Wide, flat-blade screwdriver,
- Male torx socket.



III - STRIPPING THE CYLINDER BLOCK

113487

Remove:

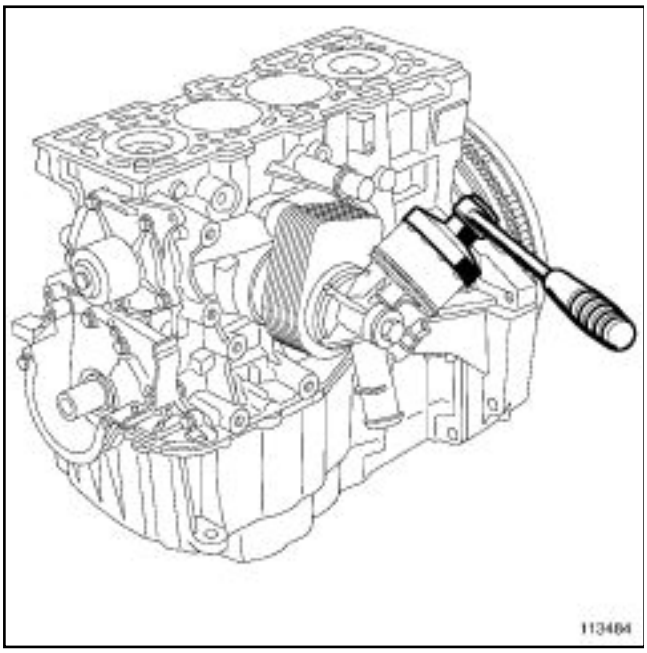


- the alternator mounting bolts (**1**) ,
- the alternator using a wide flat-blade screwdriver (if necessary),

113486

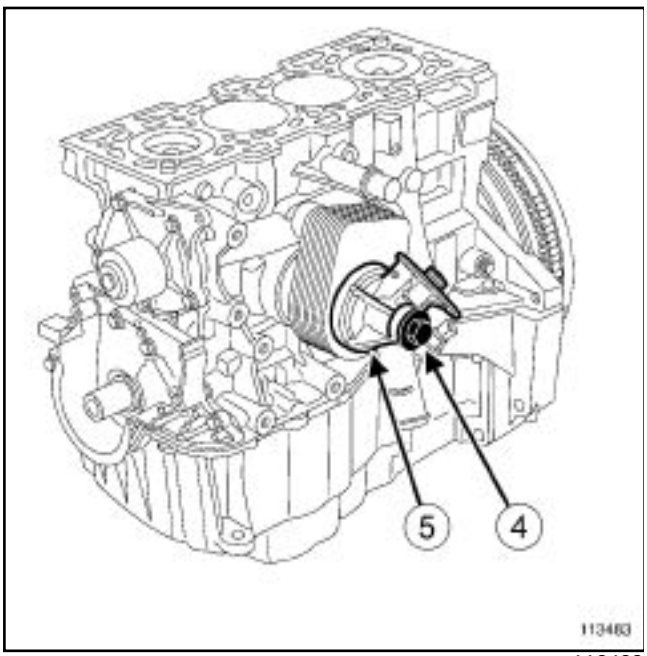
Remove:

- the air conditioning compressor mounting bolts,
- the air conditioning compressor.



113485

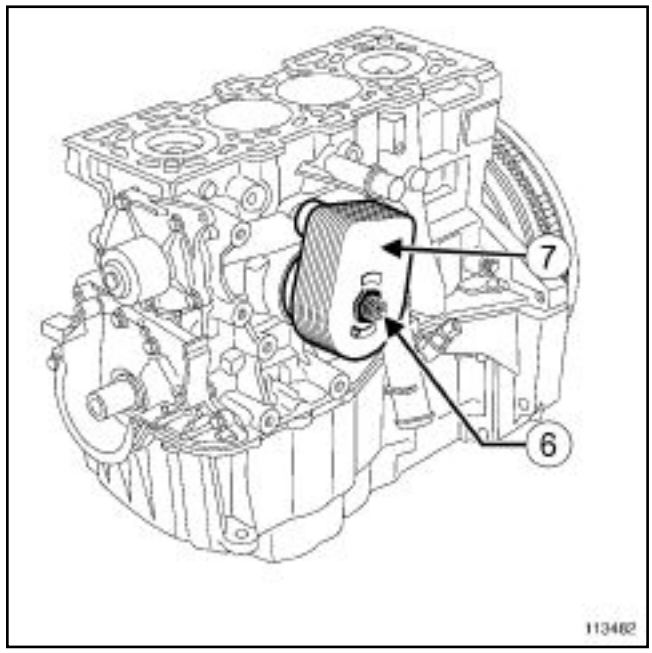
Remove:



- the multifunction support mounting bolts,
- the multifunction support (**3**) .

K9K, and 732 or 764

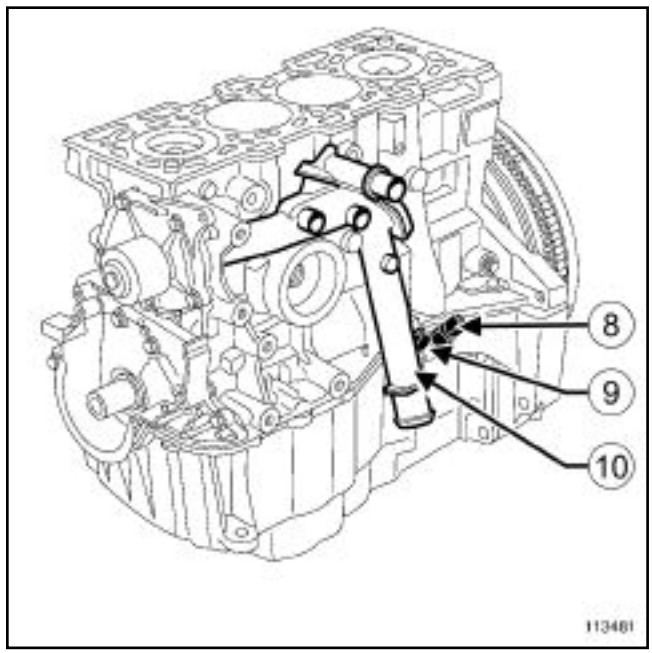
113484



Remove the oil filter using the **(Mot. 1329)** .

113483

Remove:

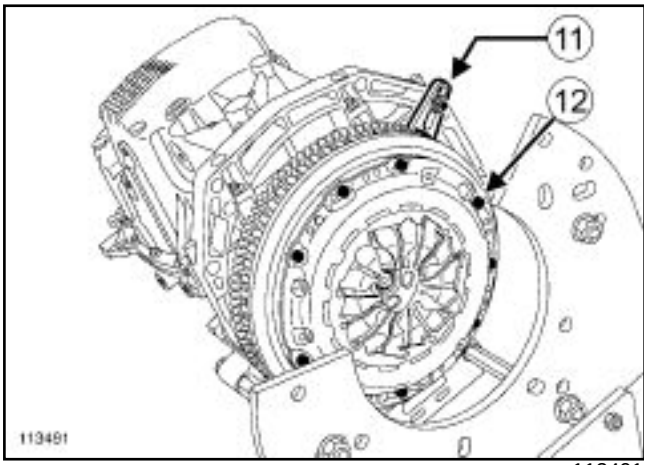


- the oil filter holder mounting bolt (**4**) ,
- the oil filter holder (**5**) .

113482

Remove:

- the mounting bolt (**6**) from the oil/coolant heat exchanger,
- the oil/coolant heat exchanger (**7**) .

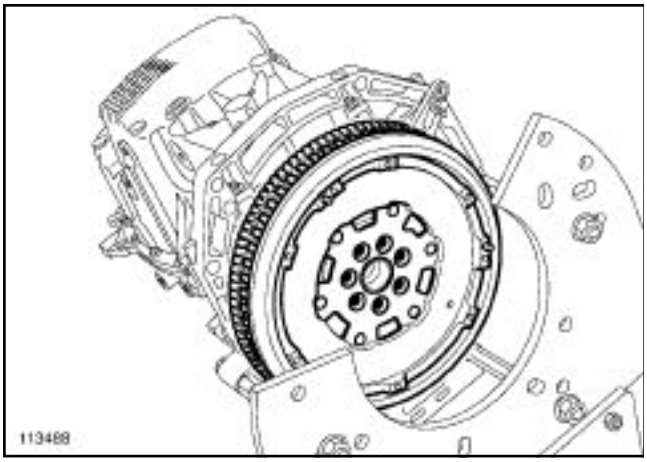


113481

Remove:

- the oil level sensor (**8**) ,
- the mounting bolt (**9**) of the coolant pump inlet pipe,
- the coolant pump inlet pipe (**10**) .

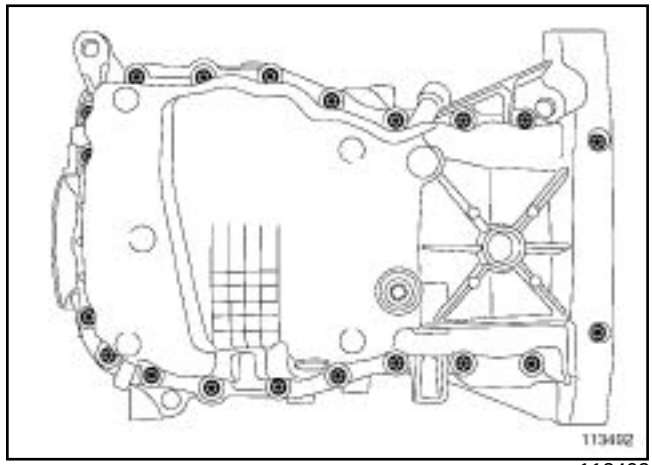
K9K, and 732 or 764



113491

Fit the engine flywheel lock **(Mot. 1677)** (**11**) .

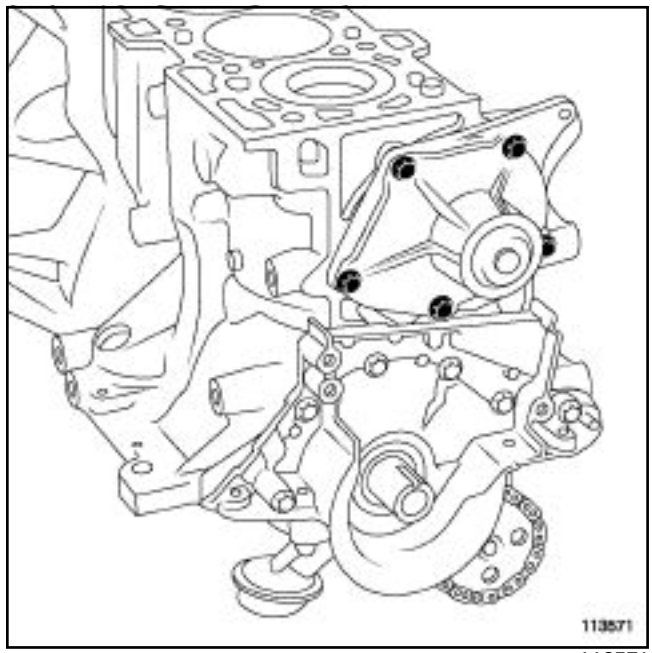
Remove:



- the mounting bolts (**12**) of the clutch pressure plate, using a male torx socket,
- the clutch pressure plate,
- the friction plate.

113488

Remove:

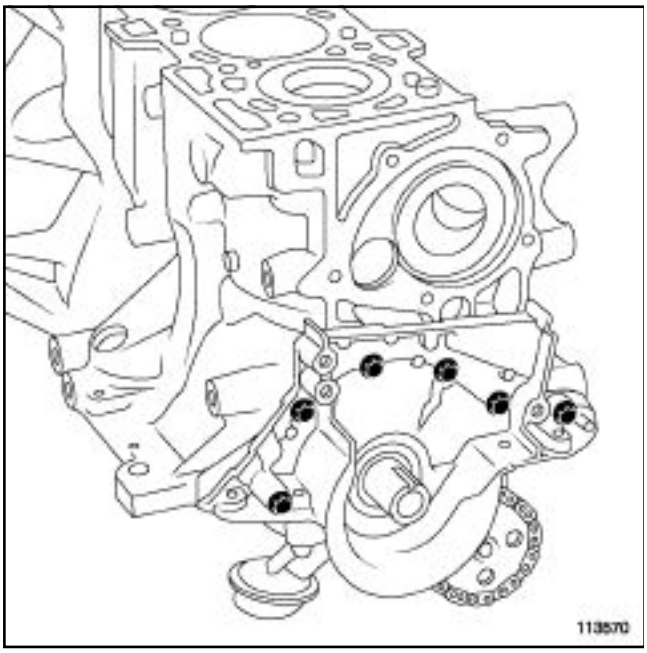


- the mounting bolts of the flywheel, using a male torx socket,
- the flywheel block **(Mot. 1677)** ,
- the flywheel.

113492

Remove:

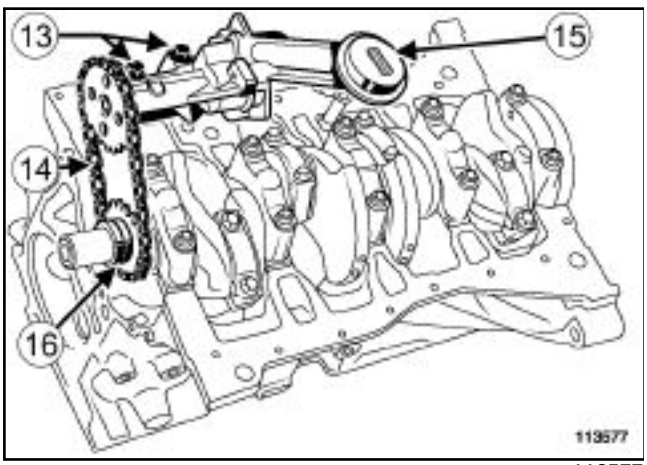
- the engine oil sump mounting bolts,
- the engine oil sump.



113571

Remove:

- the coolant pump mounting bolts,
- the coolant pump.



K9K, and 732 or 764

113570

Remove:

- the crankshaft nose closure panel mounting bolt,
- the crankshaft nose closure panel.

113577

Remove:

- the oil pump mounting bolts (**13**) ,
- the oil pump (**15**) ,
- the oil pump chain (**14**) ,
- the oil pump drive sprocket (**16**) .

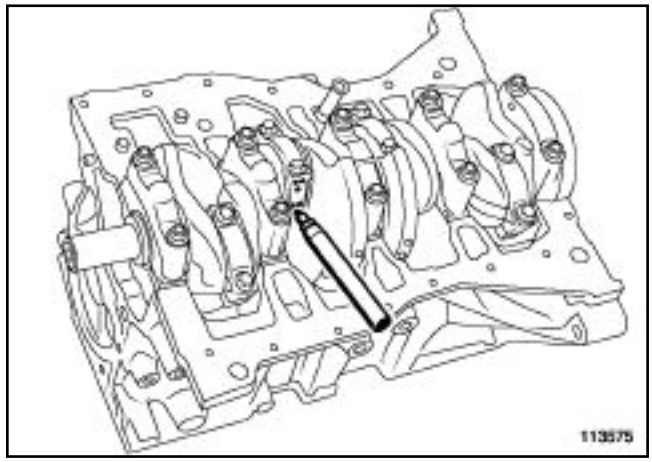
I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
Do not use a punch or an etching tool to mark the con rod caps to match their bodies, to prevent incipient breakage of the con rod.

Use an indelible marker pen.

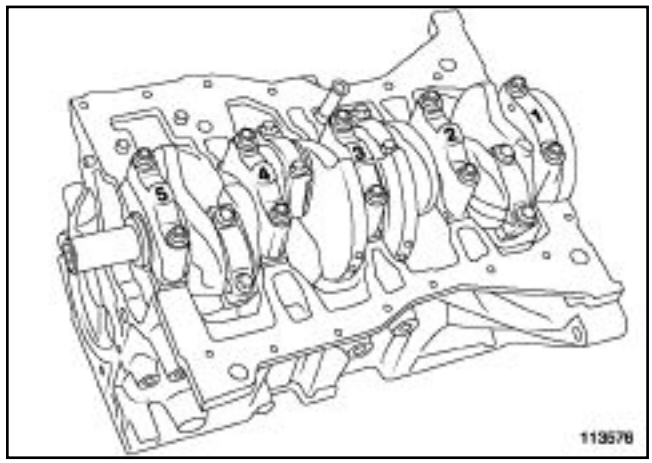
Note:



It is essential to mark:

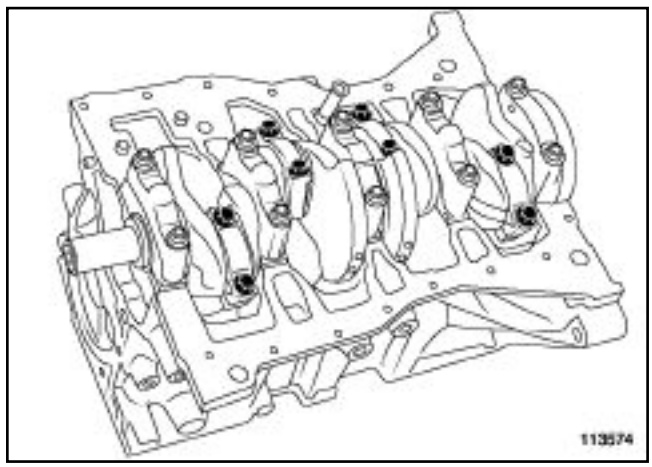
- the position of the crankshaft bearings as the class may be different for each bearing,
- the height class of the pistons in relation to the cylinders,
- the gudgeon pin in relation to the piston.

II - EQUIPMENT REQUIRED



- Indelible pencil,
- Female torx socket.
- Mallet,
- Roll pin punch (**10 mm** in diameter).
- Male Allen key (**10 mm**),
- Piston ring compressor,
- Flat-blade screwdriver,

III - REMOVING THE ROTATING PARTS

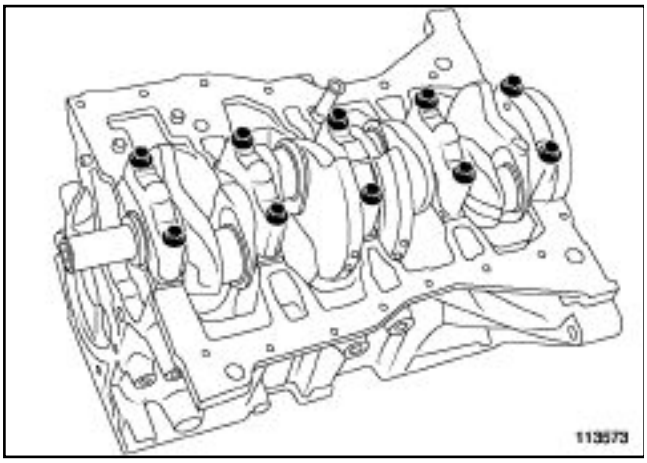


113575

Mark the con rod caps in relation to their bodies using an indelible pencil.

113576

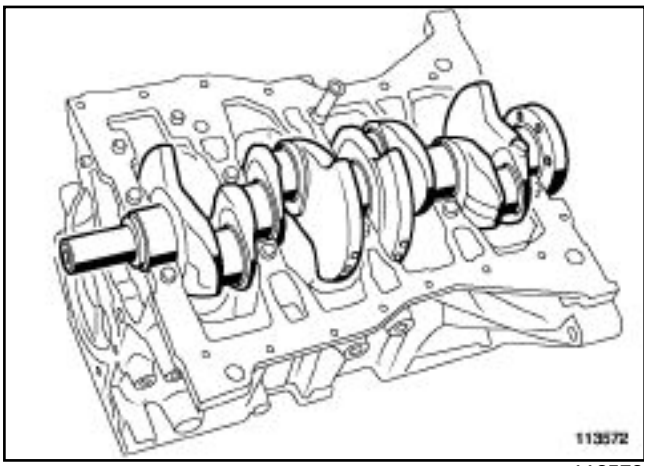
Mark the crankshaft bearing caps (bearing No. 1 at the flywheel end) with an indelible pencil.



113574

Remove:

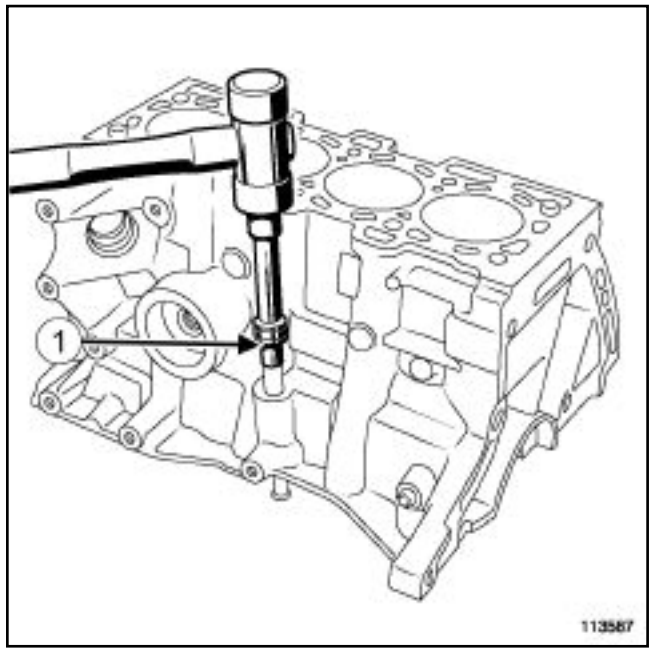
- the con rod cap mounting bolts.
- the con rod caps,



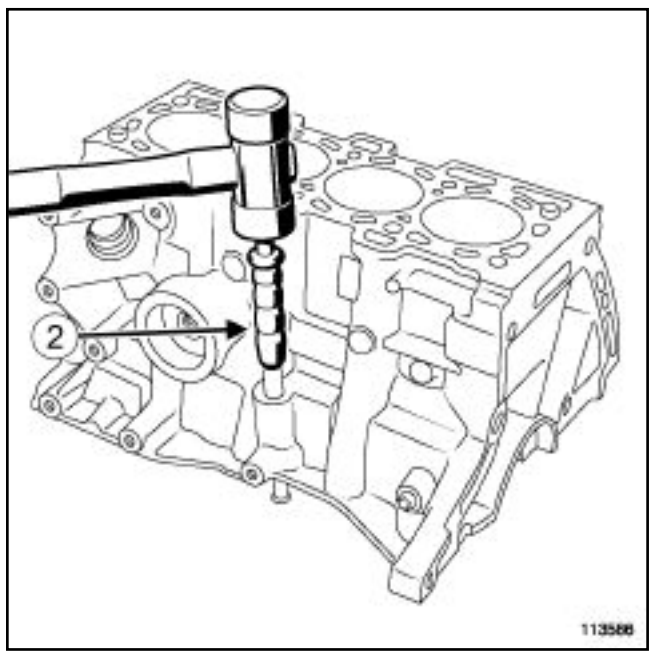
- the con rod-piston assemblies.

113573

Remove:



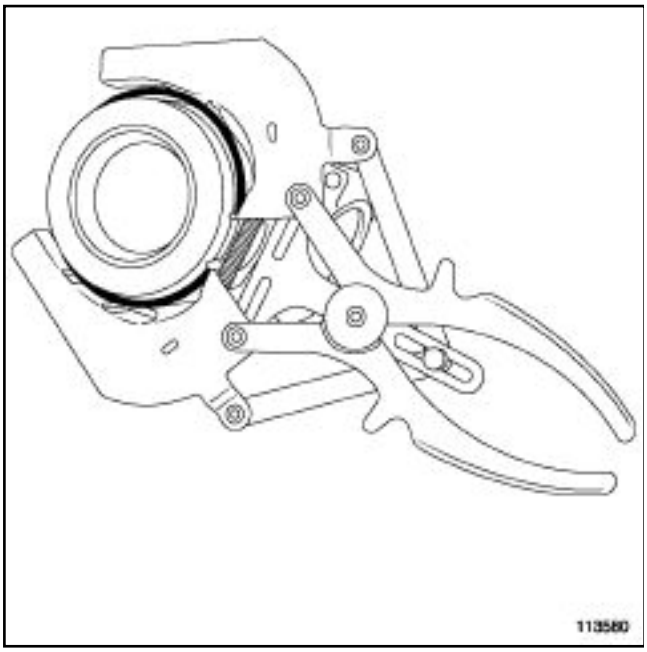
- the crankshaft bearing cap mounting bolts.
- the crankshaft bearing caps.



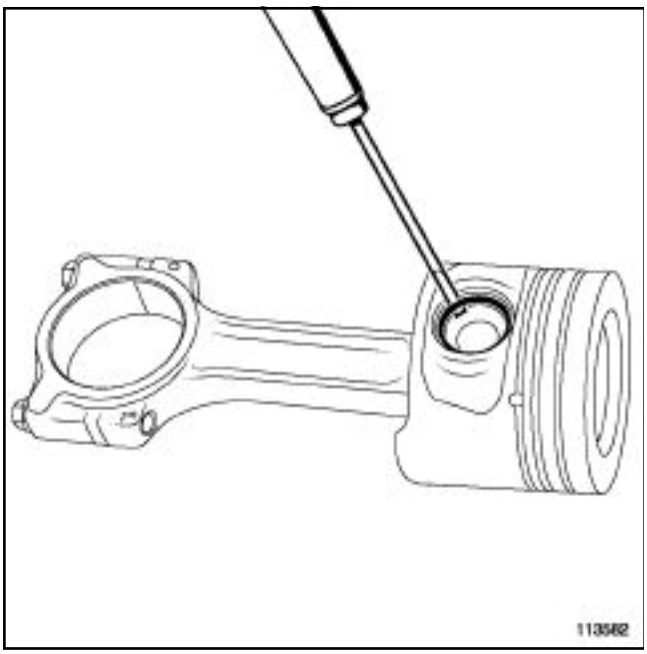
113572

Remove the crankshaft.

Remove the thrust washer from the crankshaft.



113587



113586

Remove the dipstick guide tube (if the cylinder block is fitted with one) using a **10mm** (**1**) Allen key or a **10mm** (**2**) pin punch.

113580

Remove the piston rings using a piston ring compressor.

113582

Remove the circlip using a flat-blade screwdriver.

Mark the gudgeon pins in relation to the pistons using an indelible pencil.

Remove the gudgeon pin.

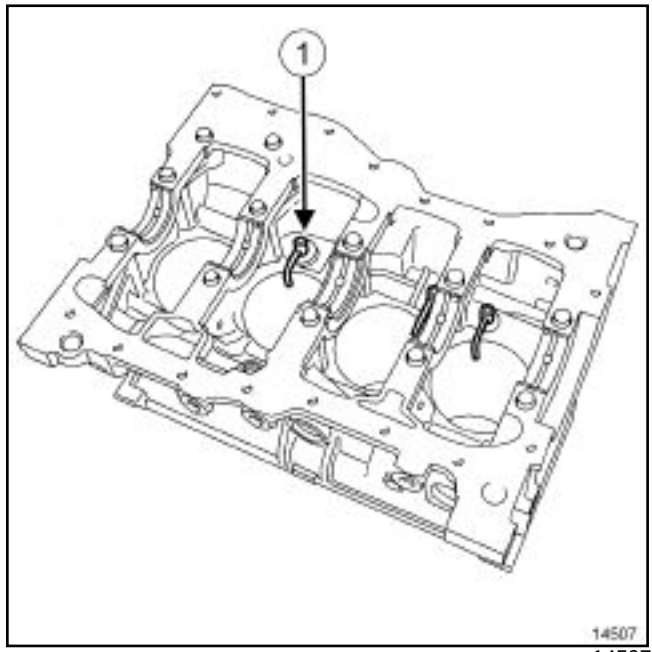
Special tooling required	
Mot. 1485-01	Tool for removing piston coolers.
Emb. 880	Pin extractor.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

Wear:

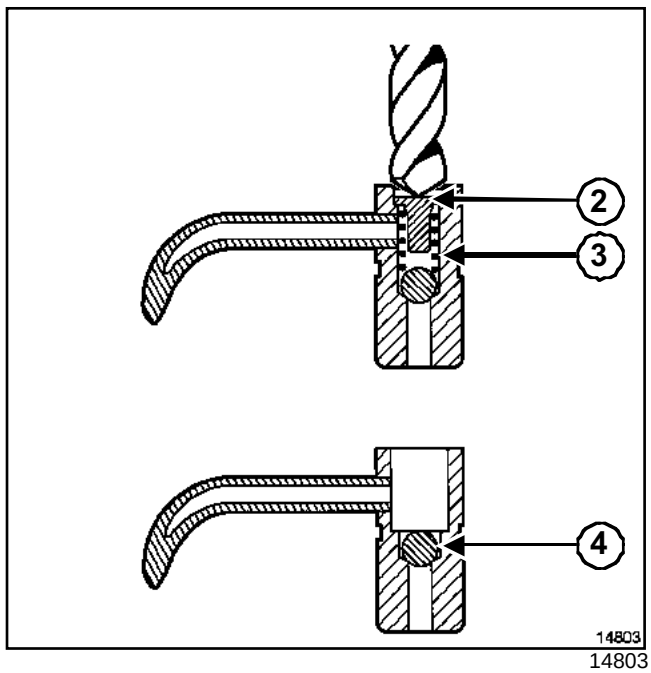
- goggles,
- protective gloves during the whole operation.



WARNING

Do not withdraw the ball of the piston base cooling nozzle, to prevent swarf falling into the oil circuit.

II - EQUIPMENT REQUIRED



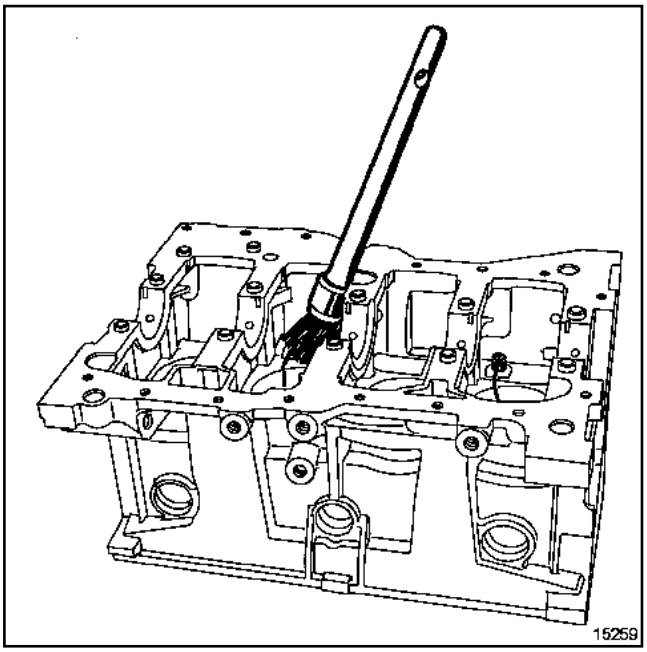
- Drill bit **7 mm in diameter**
- Allen key (**6 mm**),
- Brush,
- Protective goggles,
- Compressed air gun.

III - REMOVING THE PISTON BASE COOLING JETS

14507

Drill the piston base cooling jets (**1**) using a **7 mm** diameter drill bit.

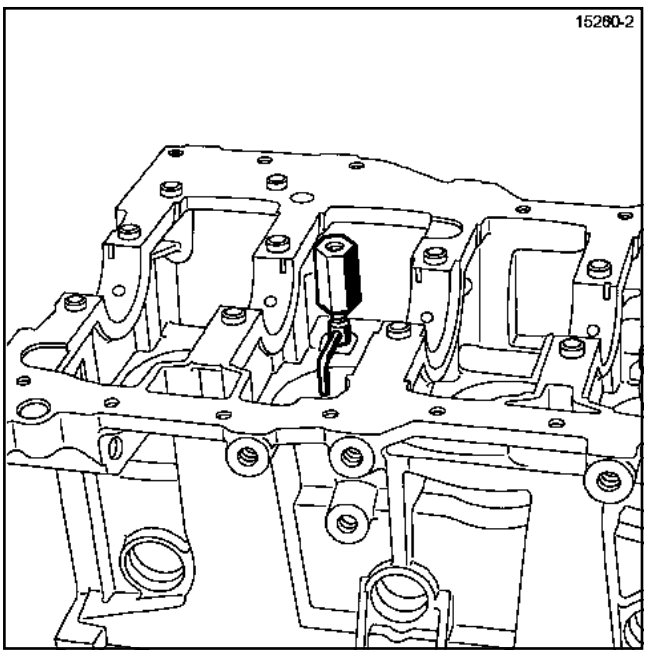
14803



Note:

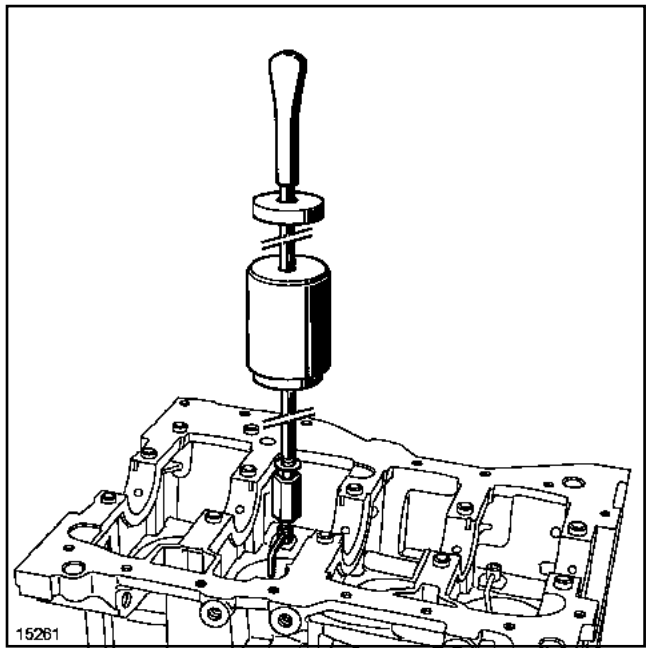
Do not remove the ball (**4**) .

Remove:



- the spring stop (**2**) ,
- the spring (**3**) .

Wear protective goggles.



15259

Move any swarf using a brush and compressed air gun.

15260-2

Screw the **(Mot. 1485-01)** into the drilled jet with a **6 mm** Allen key, which should slide into the tool.

15261

Screw the large slide hammer **(Emb. 880)** on the **(Mot. 1485-01)** .

Remove the piston base cooling jets.

Special tooling required	
Mot. 923	Engine lifting ring.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

Do not scratch the aluminium sealing surfaces.

Wear goggles.

Wear gloves during the operation.

WARNING

Do not allow this product to drip on to the paintwork.

Clean the cylinder block components carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

When cleaning parts, it is essential to not knock the parts against each other, or their mating faces may be damaged and therefore their adjustments may be altered, which could damage the engine.

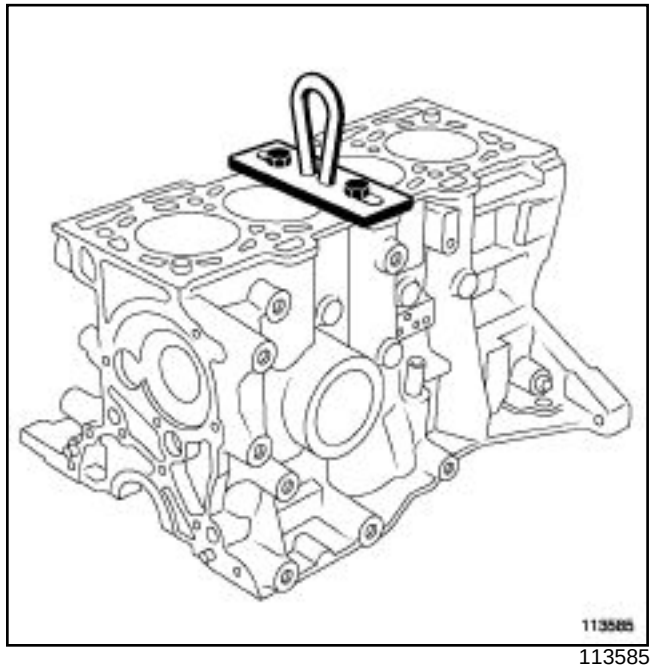
II - PARTS AND CONSUMABLES FOR THE REPAIR

Consumables

- Décapjoint, part no. **77 01 405 952** ,
- Grey sanding pad, part no. **77 01 405 943** .

III - EQUIPMENT REQUIRED

- Protective goggles,
- Protective gloves,
- Wooden spatula,
- Compressed air gun,
- Load positioner,
- Workshop hoist,
- Cleaning fountain,
- Cleaning bench.

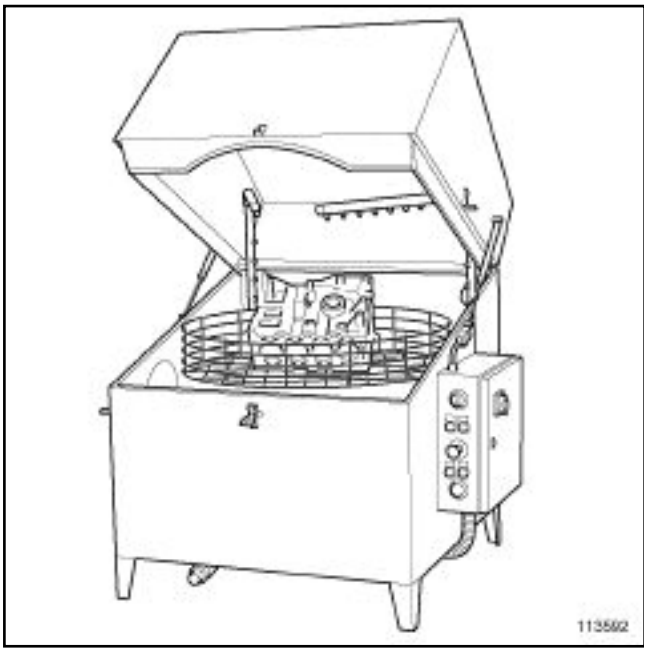


IV - CLEANING THE CYLINDER BLOCK

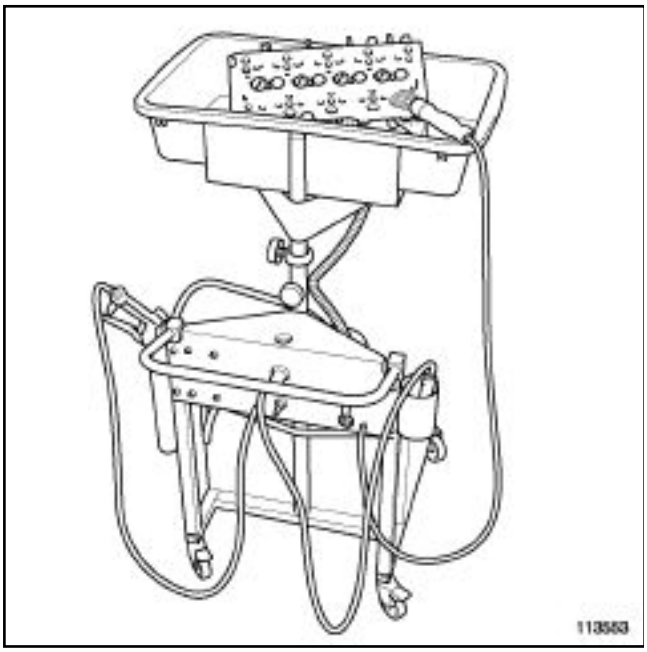
Apply the **DÉCAPJOINT** product to the sections to be cleaned.

Leave for around ten minutes.

Remove residues with a wooden spatula.



Finish cleaning the parts using a grey polishing pad.



113585

Position the **(Mot. 923)** on the cylinder block.

Remove the cylinder block from the engine stand using a load positioner and a workshop hoist.

113592

113553

Wash the cylinder block parts using a cleaning fountain or a heated cleaning bath.

Special tooling required	
Mot. 1493-01	Crankshaft bearing centring tool.
Mot. 1492-03	Tool for fitting main bearing shells.
Mot. 1492	Tool for fitting main bearing shells.

I - RECOMMENDATIONS FOR REPAIR

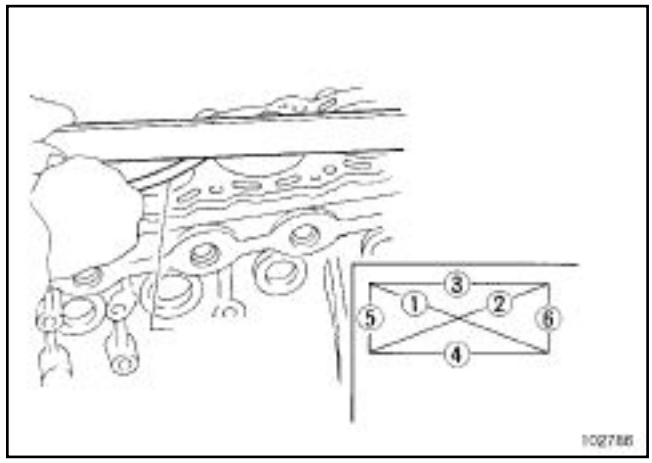
WARNING

Parts should be clean before examining and testing them.

No adjustment is authorised to the cylinder block or the crankshaft.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Consumables



- Degreasing agent, part no. **77 11 224 559** .

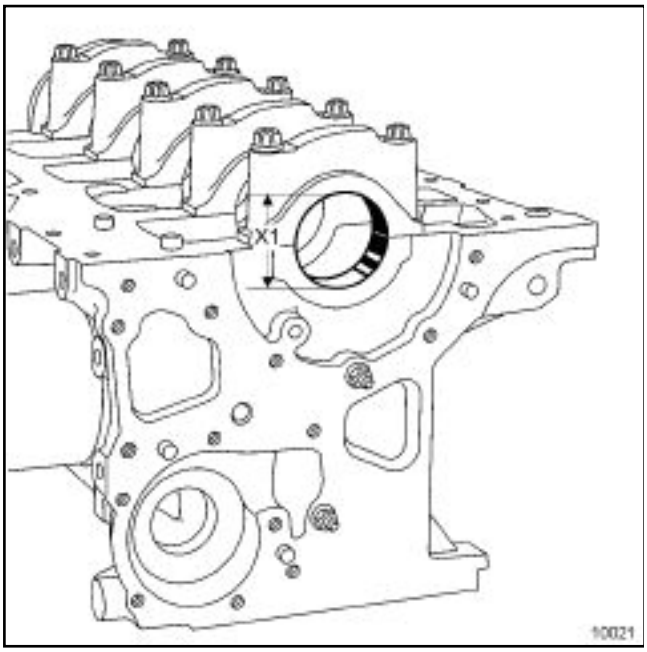
III - EQUIPMENT REQUIRED

- Torque wrench and cylinder head bolt tightening gauge (angular measuring type),
- Torque/angle wrench,
- Radial play measuring tape.
- Sliding calliper,
- Micrometer,
- Dial gauge,
- Body jig bench and a pair of v-blocks.
- Magnetic holder,
- Set of shims,
- Cylinder head rule.

IV - CYLINDER BLOCK CHECK

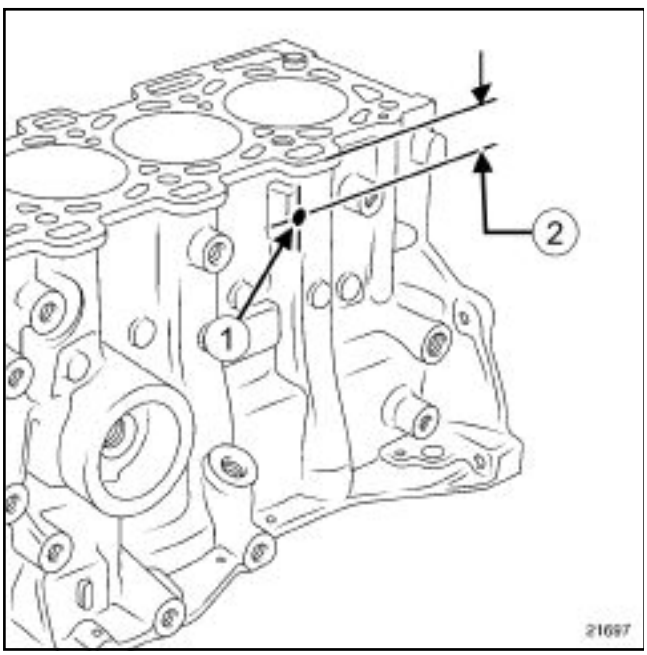
1 - Checking the cylinder block gasket face

102786



Use a cylinder head adjuster and set of shims to check the seal face bow.

Maximum deformation: **0.03 mm** .



2 - Checking the diameter of the crankshaft bearings on the cylinder block

Refit the crankshaft bearing caps, fitting cap no. **1** at the flywheel end.

Torque and angle tighten **the main bearing cap mounting bolts (25 ± 2.5 Nm + 47° ± 6)** .

10021

21697

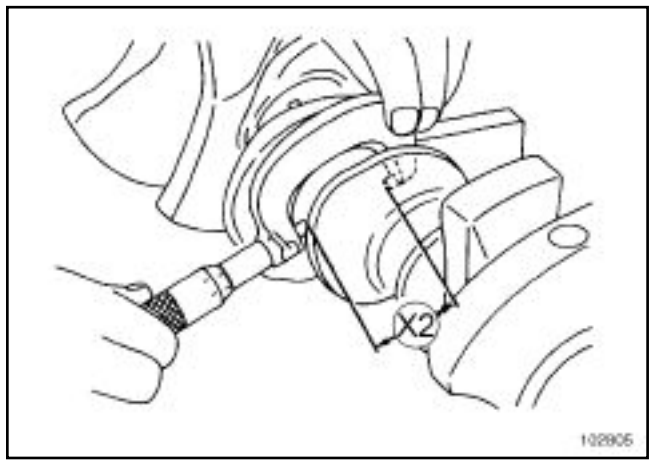
Note:

The hole (**1**) defines the diameter category of the crankshaft bearings on the cylinder block.

It is only possible to have one diameter category of crankshaft bearings on one engine.

Measure the dimension (**2**) to identify the diameter category of the crankshaft bearings on the cylinder block.

(2) = **33 mm** :

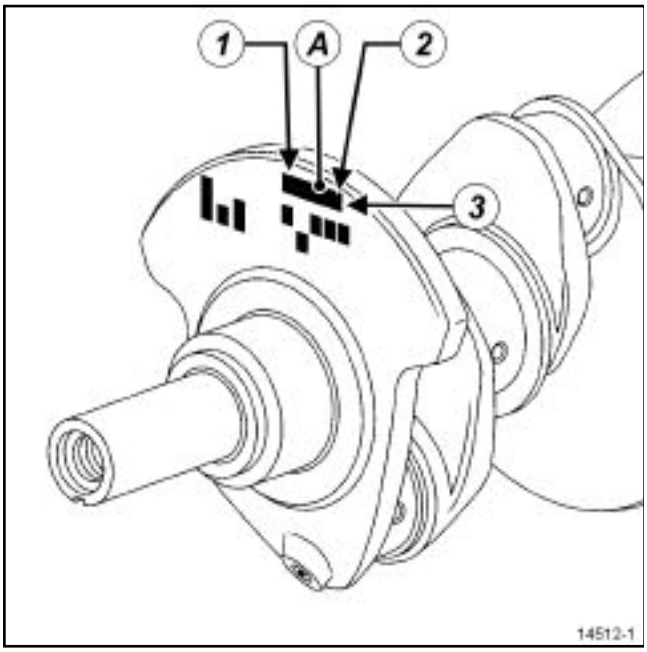


- the diameter category is **1** ,
- the diameter of the crankshaft bearings on the cylinder block is **51.936 to 51.942 mm excl.** .

(2) = **43 mm** :

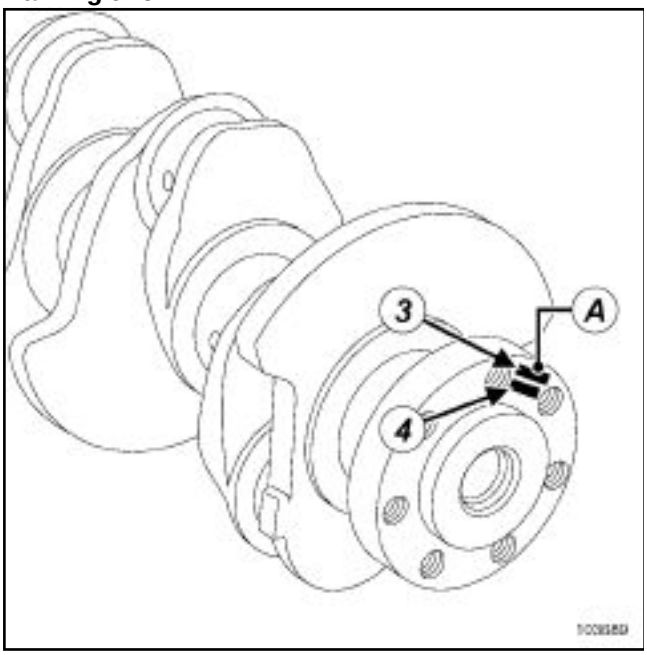
- the diameter category is **2** ,
- the diameter of the crankshaft bearings on the cylinder block is **51.942 incl. to 51.949 mm** .

Remove the crankshaft bearing caps.



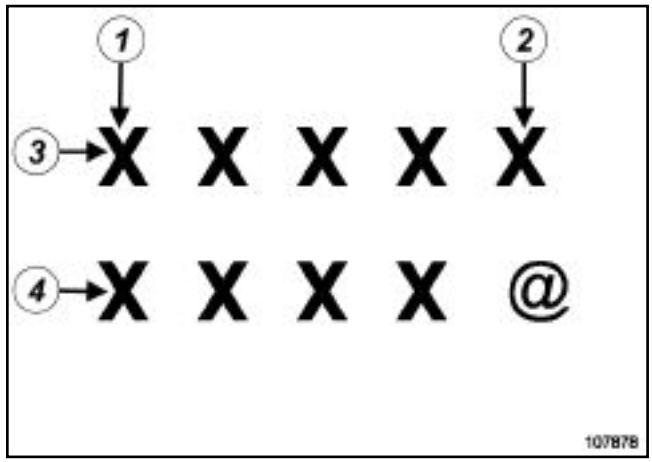
3 - Check the diameter of the crankshaft journals

102805



Measure the diameter of the journals using a micrometer (**X2**) .

Marking one



14512-1

Marking two

103689

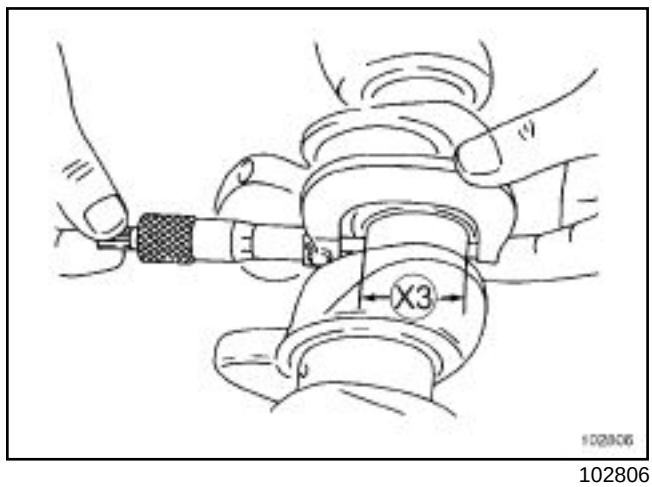
Detail of marking "A".

107878

(**1**) diameter category of journal no.1, flywheel end,

(**2**) diameter category of journal no.5, timing end,

(**3**) line indicating the diameter class of the journals,



(**4**) line indicating the diameter class of the crankpins.

The marks of journal category **A, G, K, R,W** correspond to a diameter of **47.990 to 47.997 mm excl.** ,

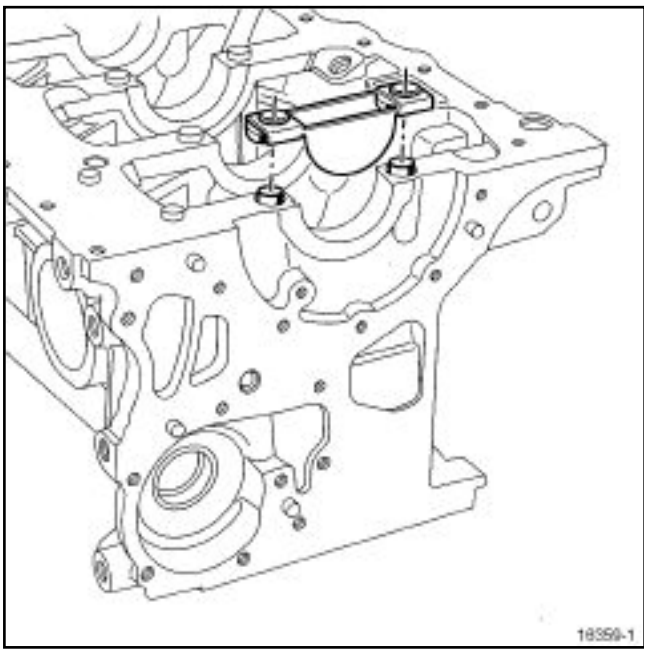
The marks of journal category **B, H, L, S, Y** correspond to a diameter of **47.997 incl. to 48.003 mm excl.** ,

The marks of journal category **C, J, O, T, Z** correspond to a diameter of **48.003 incl. to 48.010 mm excl.** ,

4 - Check the diameter of the crankshaft crankpins

102806

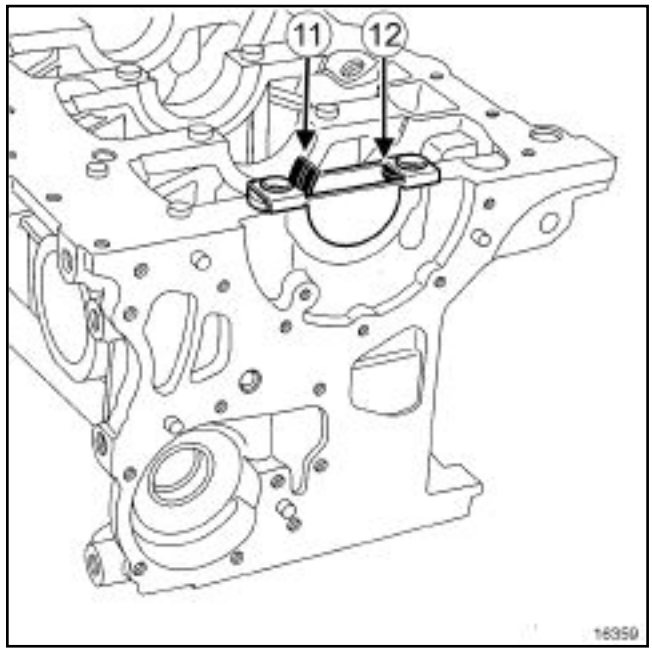
Using a micrometer, measure the diameter of the crankpins (**X3**) which should be **43.97 ± 0.01 mm** .



5 - Check for deformation of the contact surface of the crankshaft flywheel

Position the crankshaft on the v-blocks

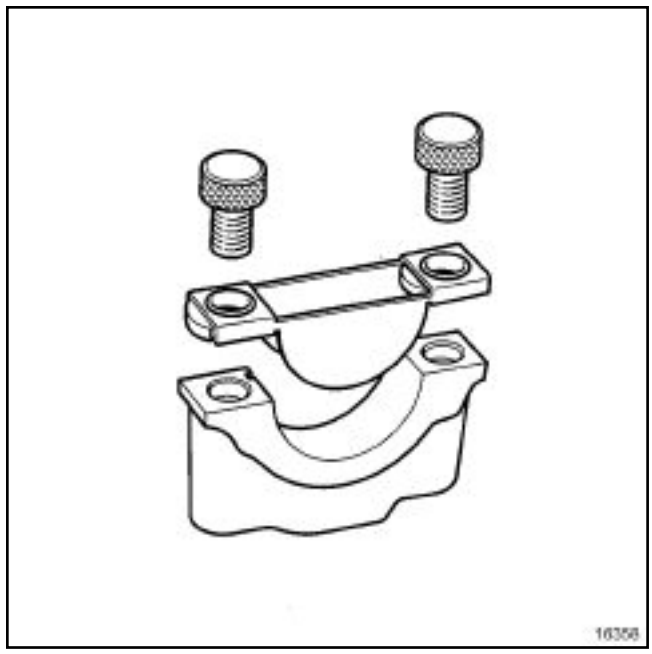
Place the dial gauge at the base of the crankshaft.



Measure the deformation of the contact surface of the flywheel which should not be greater than **0.6 mm** .

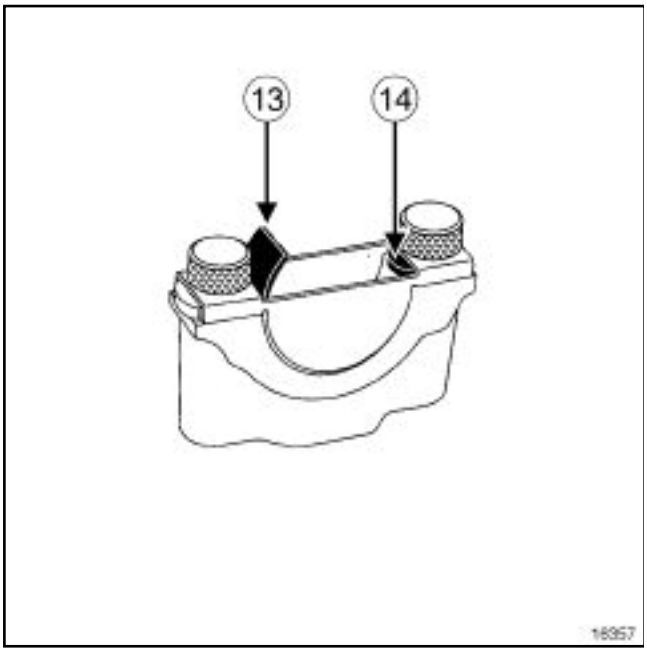
6 - Checking the crankshaft lateral clearance

16359-1



Position the **(Mot. 1493-01)** on the cylinder block.

16359

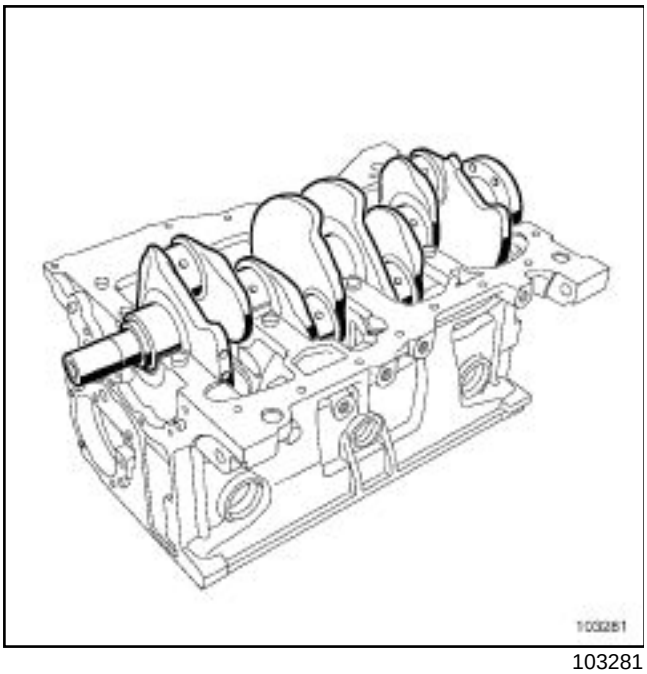


Mount the grooved bearing shell on the **(Mot. 1493-01)** .

Press at (**11**) on the bearing until it is in contact with the tool at (**12**) .

16358

Position the **(Mot. 1493-01)** on the crankshaft bearing cap.



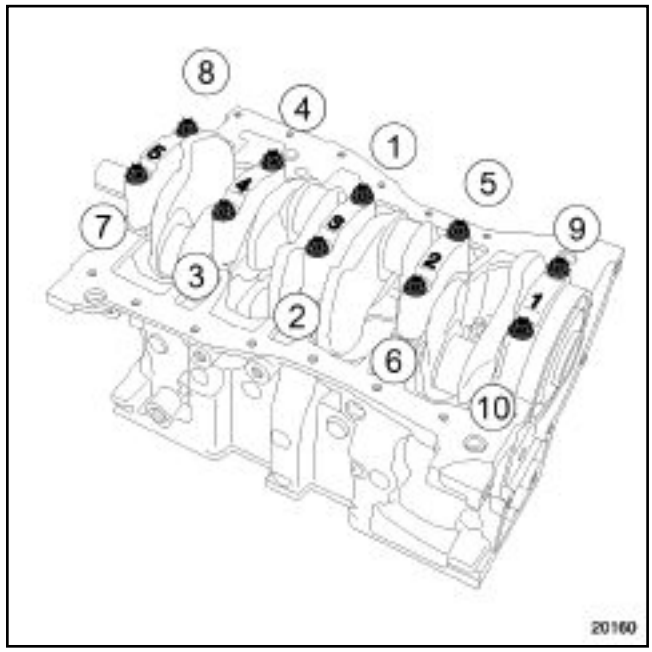
16357

Fit the non grooved bearing shell into the **(Mot. 1493-01)** .

Press at (**13**) on the bearing until it is in contact with the tool at (**14**) .

Lubricate:

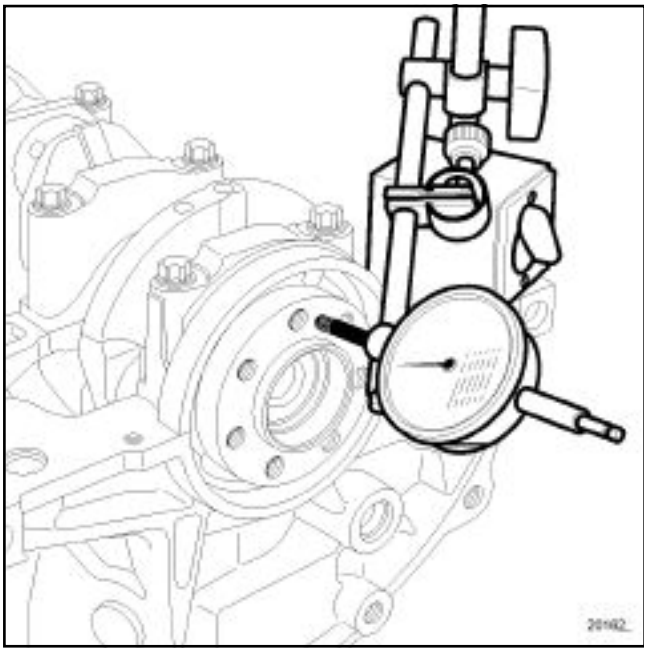
- the crankshaft bearing shells (only the surface in contact with the crankshaft).
- the crankshaft journals.



103281

Refit:

- the crankshaft,
- the crankshaft thrust washer on bearing **No.3** , positioning the grooves of the thrust washers at the crankshaft end.



Refit the crankshaft bearing caps (positioning bearing cap No. 1 at the flywheel end).

20160

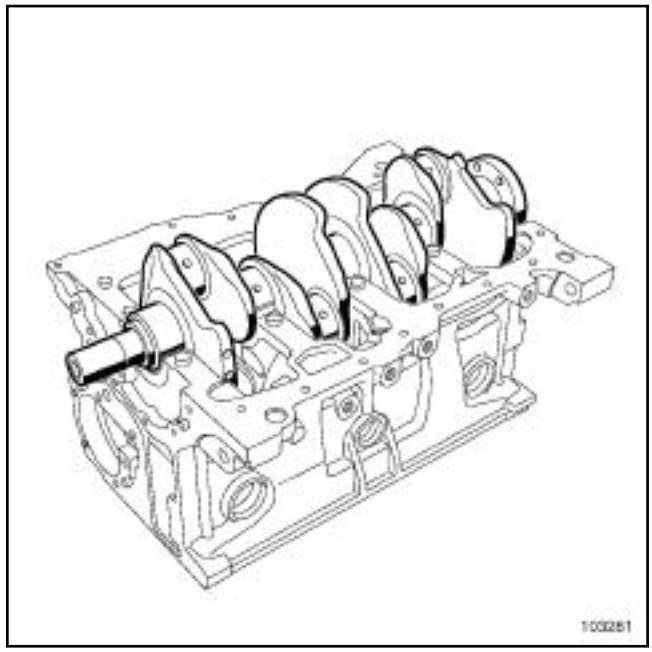
Torque and angle tighten in order **the crankshaft bearing cap mounting bolts (25 ± 2.5 Nm + 47° ± 6°)** .

Check that the crankshaft turns freely, with no resistance.

20162

Check the lateral clearance of the crankshaft, which must be:

- without thrust washer wear: **0.045 to 0.252 mm** ,
- with thrust washer wear: **0.045 to 0.852 mm** .

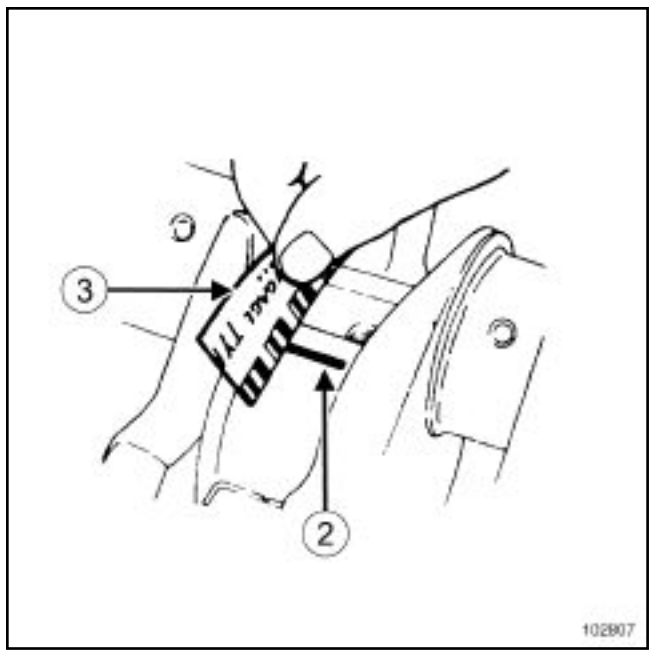


Remove:

- the crankshaft bearing caps,
- the crankshaft.

7 - Checking the crankshaft diametric clearance

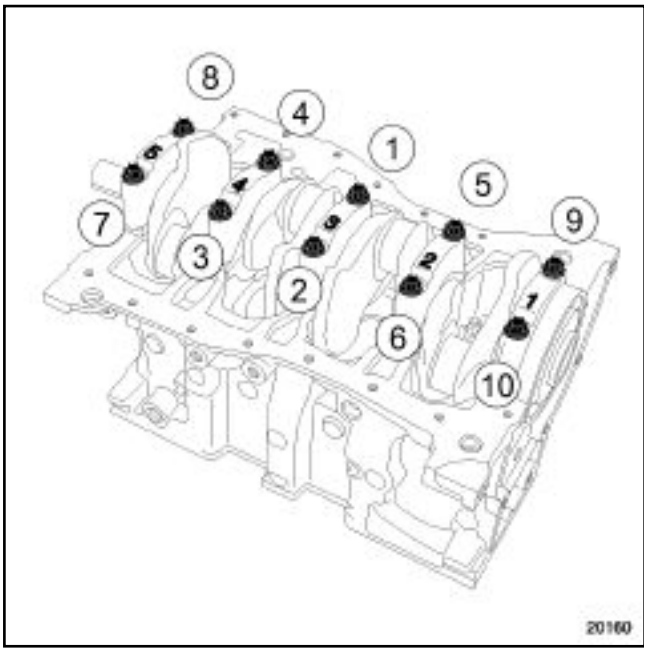
Note:
Never turn the crankshaft during the operation.



Remove any oil that may be on the crankshaft journals and cylinder block bearings.

103281

Refit:



- the crankshaft,
- the crankshaft thrust washer on bearing **No.3** (grooves at crankshaft end).

102807

Cut bits of wire (**2**) to measure the clearance.

Insert the wire into the axis of the crankshaft journals (avoiding the bearing lubrication holes).

20160

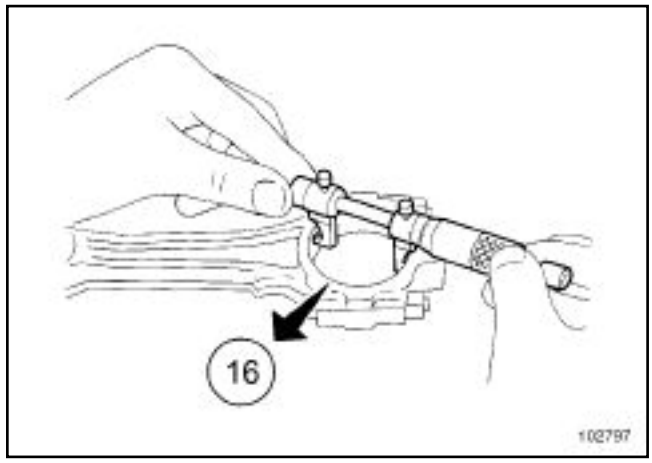
Refit the crankshaft bearing caps, fitting **No.1** at the flywheel end.

Torque and angle tighten in order **the crankshaft bearing cap mounting bolts (25 ± 2.5 Nm + 47° ± 6°)** .

Remove:

- the crankshaft bearing caps,
- the crankshaft.

Measure the flattening of the clearance measuring wire using packaging paper **(3)** .



Check the clearance value, which must be between **0.010 and 0.054 mm** .

Clean any traces of measuring wire off the crankshaft and the bearing shells using degreasing agent.

8 - Checking the centre distance of the con rod

The distance between the small end and big end of the con rod should be **133.75 mm** .

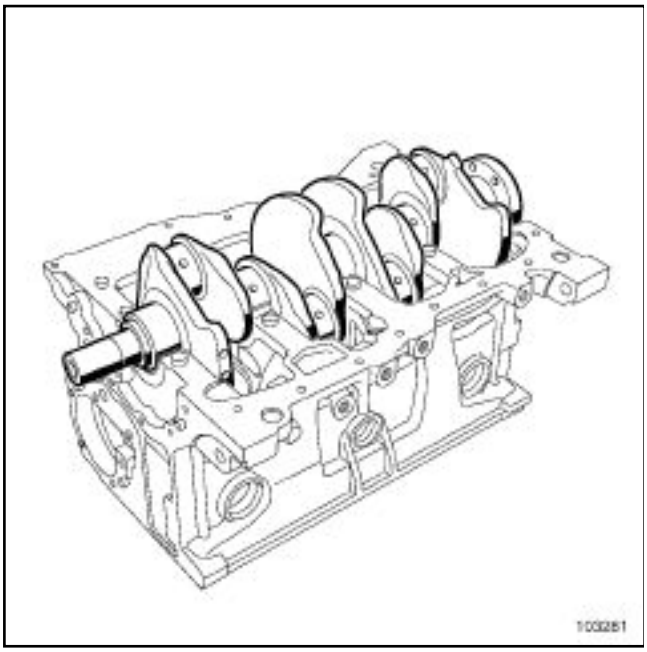
9 - Checking the centre distance of the con rod

102797

Using a micrometer, measure the diameter of the big end, which should be **47.619 ± 0.009 mm** .

10 - Checking the diameter of the con rod small end

Using a micrometer, measure the diameter of the con rod small end (with ring):

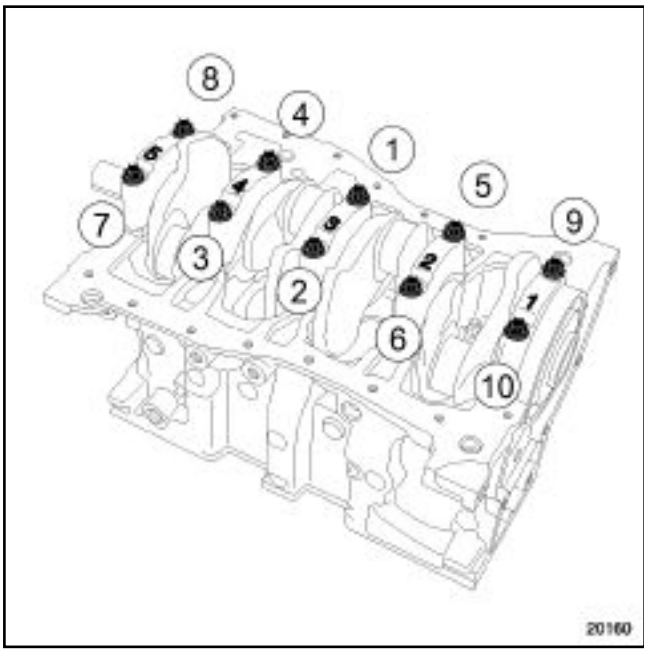


- For engines K9K 260-700-702-704-710-722 manufactured up to 25/11/2002 the diameter should be **25.019 ± 0.006 mm** ,
- For engines K9K 260-700-702-704-710-722 from 25/11/2002 and engines K9K 270-272-274-276-706-712-714-716-718-724-728-729-732-750-752-760-762-764-766-768-790-792, the diameter should be between **26.019 ± 0.006 mm** .

11 - Checking the diametric clearance of the big ends

Note:

Never turn the crankshaft during the operation.

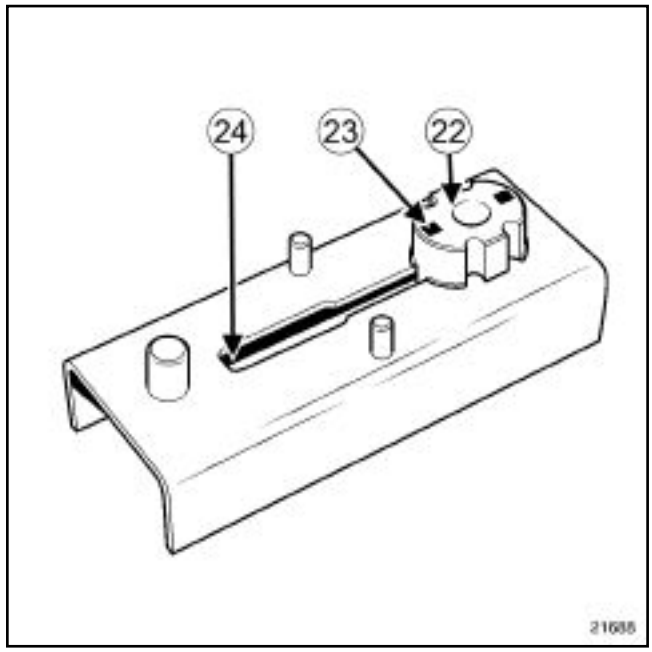


Remove any oil that may be on the crankshaft journals and cylinder block bearings.

103281

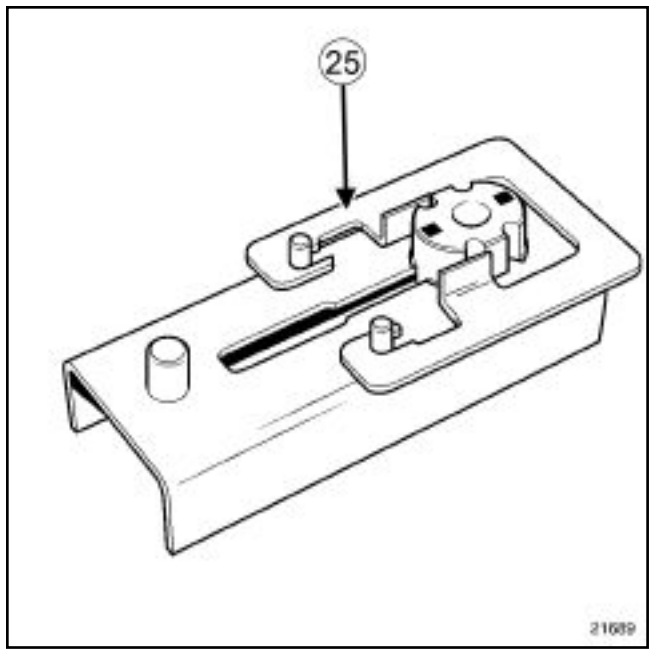
Refit:

- the crankshaft,
- the crankshaft thrust washers on bearing **No.3** (grooves at crankshaft end).



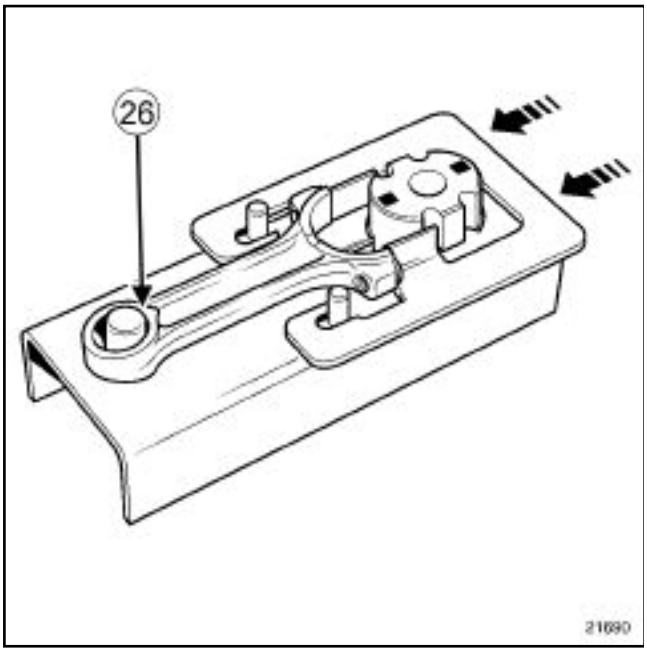
20160

Refit the crankshaft bearing caps, fitting **No.1** at the flywheel end.



Torque and angle tighten in order **the crankshaft bearing cap mounting bolts (25 ± 2.5 Nm + 47° ± 6°)** .

Refitting the con rod bearings on the con rod body.

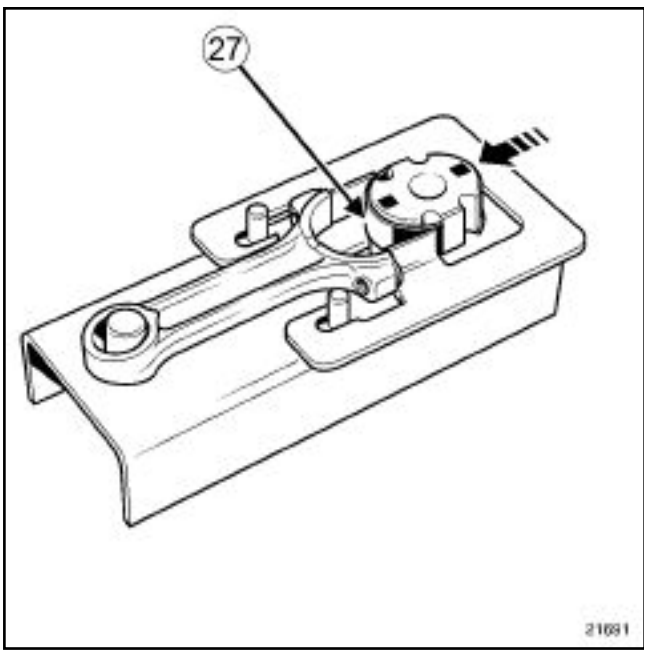


21688

Slide the bearing support (**22**) (positioning the marking "A" (**23**) as indicated in the diagram) of the **(Mot. 1492-03)** in the groove (**24**) of the tool block **(Mot. 1492)** .

21689

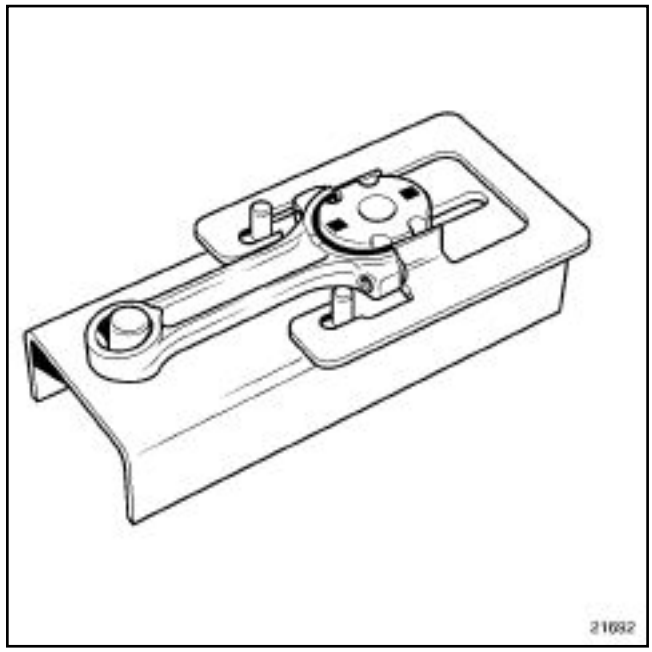
Place the rail (**25**) of the **(Mot. 1492-03)** on the base.



21690

Mount the con rod body on the base.

Check that the lower part (**26**) of the small end is in contact with the centring pin.

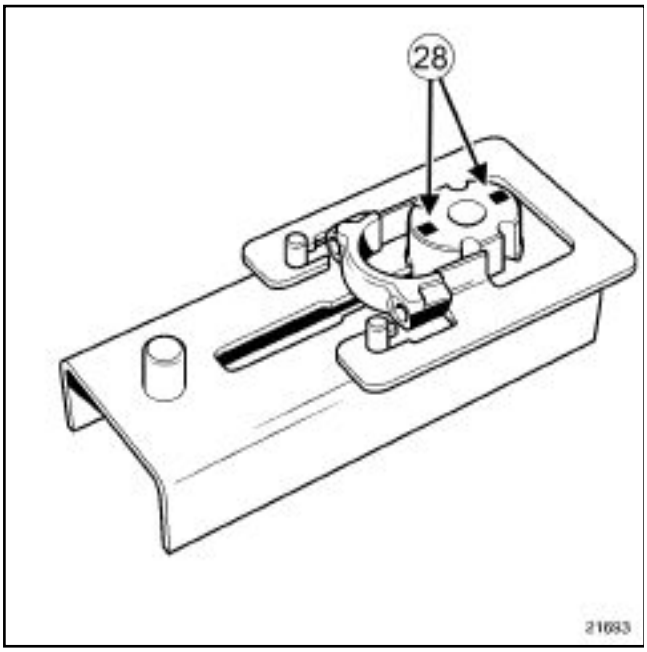


Push the rail (in the direction shown by the arrow) until the rail presses against the con rod end.

21691

Mount the bearing shell (**27**) (with a width of **20.625 mm** on the bearing shell support.

Push the bearing shell support in the direction shown by the arrow.



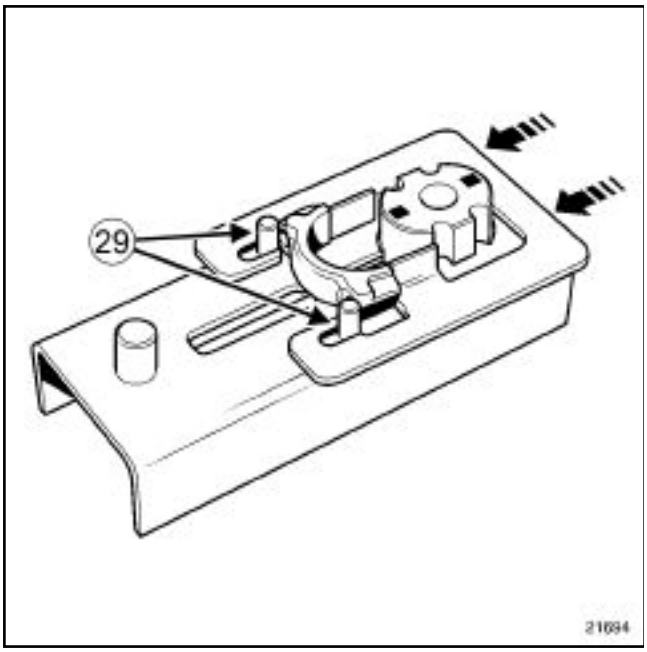
21692

Bring the bearing shell support to the end of the con rod body base.

Remove the support shell from the con rod body.

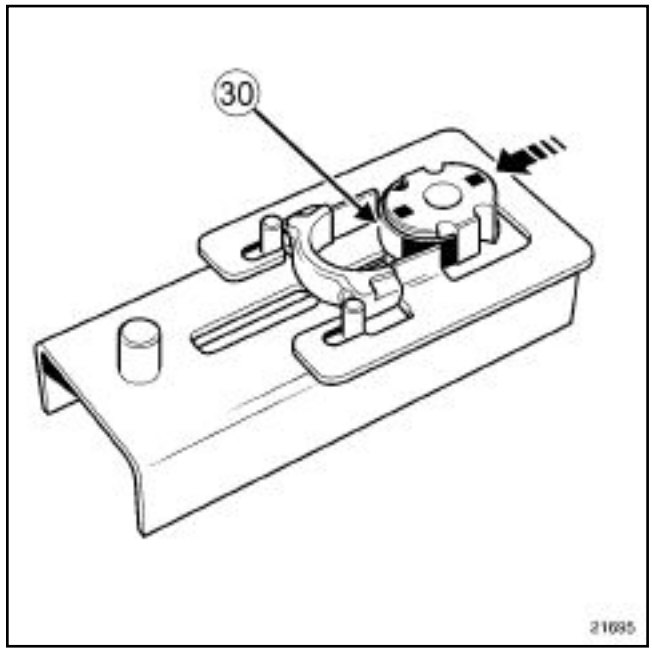
Repeat the operation for the other con rod bodies.

Refitting the con rod bearings on the con rod cap.



21693

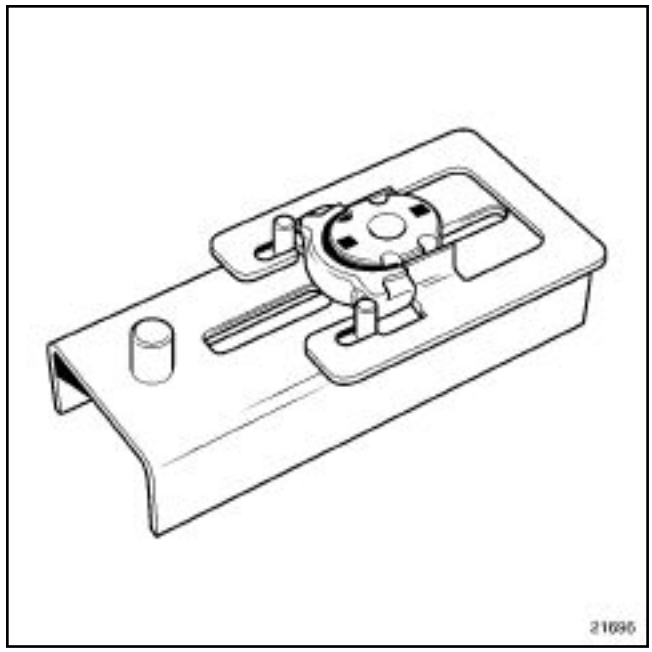
Position the bearing shell support, aligning the marking "A" or "B" (**28**) on the side of the cap as follows:



- a bearing shell width of **20.625 mm** corresponds to "A",
- a bearing shell width of **17.625 mm** corresponds to "B",

Mount the con rod cap on the base.

21694



Push the rail in the direction shown by the arrow until the con rod cap presses against the pins (**29**) on the base.

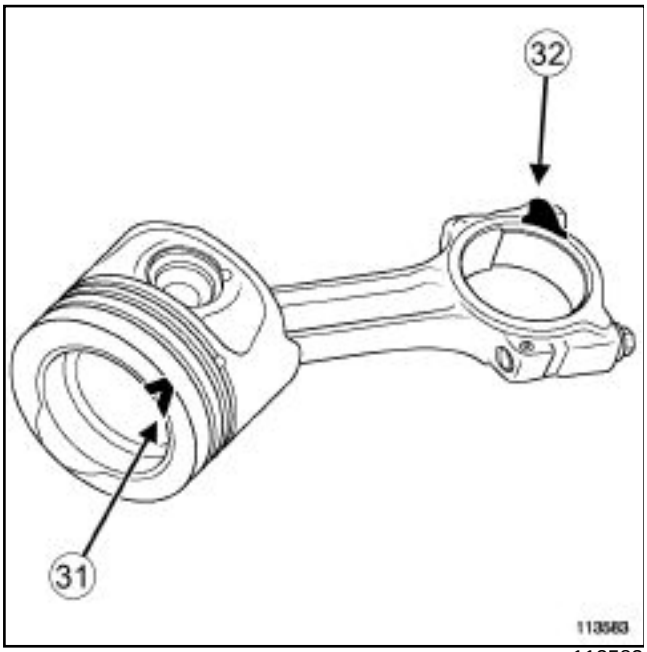
21695

Mount the bearing shell (**30**) on the bearing shell support.

Push the bearing shell support in the direction shown by the arrow.

21696

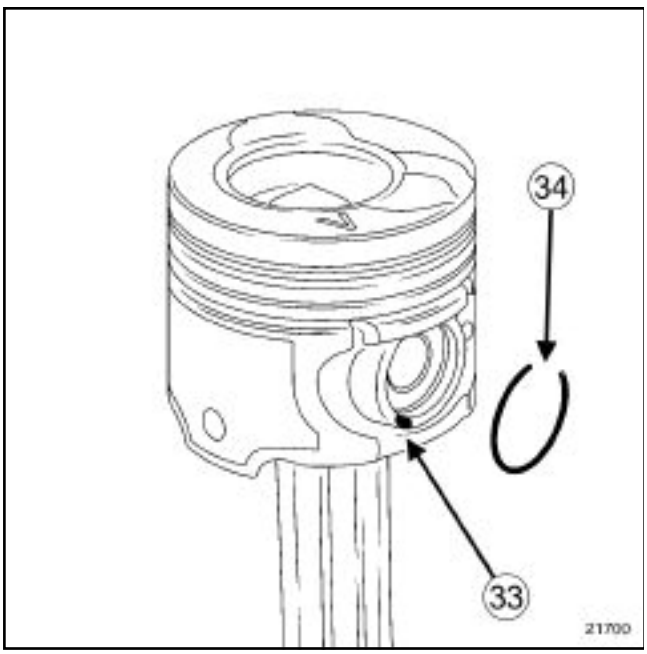
Bring the bearing shell support to the end of the con rod cap base.



Remove the bearing shell from the con rod cap.

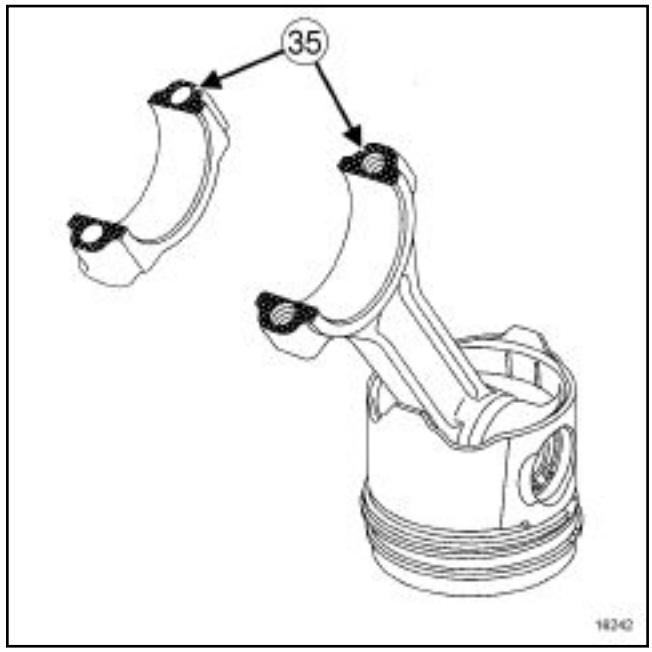
Repeat the operation for the other con rod caps.

Using an indelible pencil, mark the gudgeon pin position in relation to the piston.



Lubricate gudgeon pin with engine oil.

Check that the gudgeon pin slides and turns freely in the piston.



113583

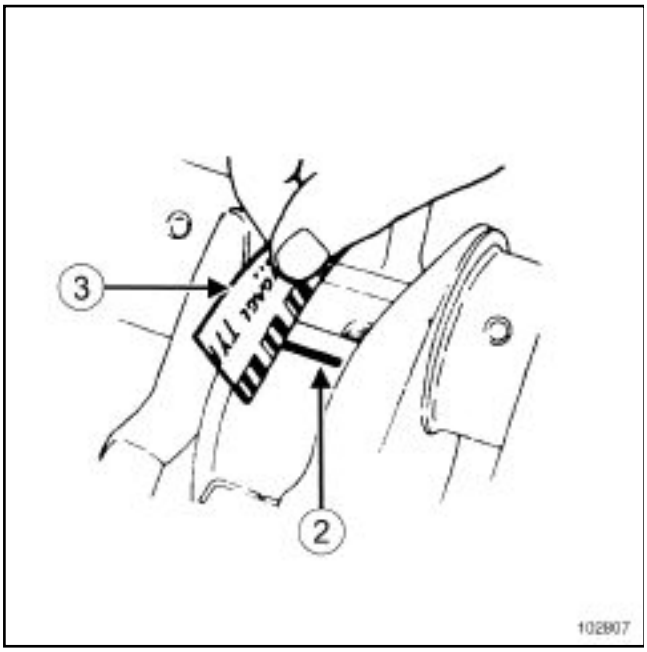
Position the mark **"V"** (**31**) of the piston and the flat surface (**32**) of the con rod cap as indicated in the illustration.

21700

Refit the circlip of the gudgeon pin, positioning the opening (**34**) of the circlip opposite the notch (**33**) .

16242

Using degreasing agent, degrease the contact surfaces (**35**) between the cap and body of the con rod.

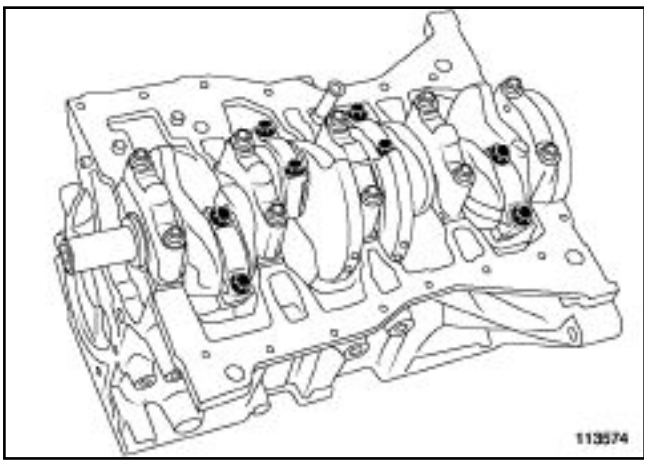


Note:

Ensure that the piston matches the cylinder block barrel (No.1 at flywheel end) .

Ensure the correct con rod-piston orientation, positioning the "V" engraved on the piston crown towards the flywheel .

Refit the con rod-piston assembly (without piston rings) onto the cylinder block.



Mount the con rod heads on the crankshaft crankpins.

102807

Cut bits of wire (**2**) used to measure the clearance.

Insert the wire into the axis of the crankshaft crankpins (avoiding the bearing lubrication holes).

113574

Refit:

- the con rod caps, ensuring correct matching,
- the con rod cap mounting bolts.

Torque and angle tighten **the con rod cap mounting bolts (20 ± 2 Nm + 45° ± 6)** .

Remove:

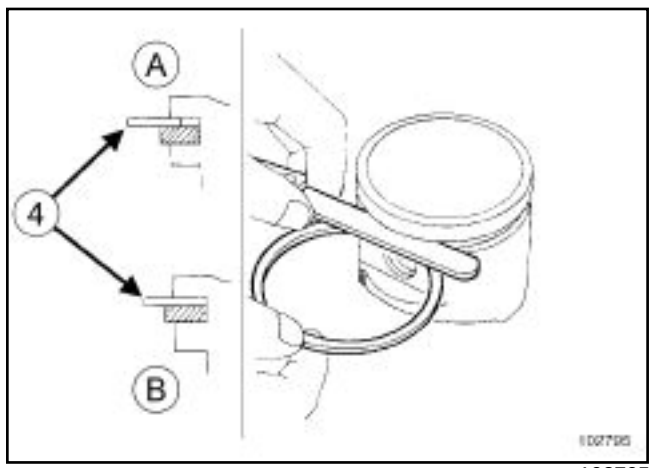
- the con rod caps,
- the con rod-piston assembly.

Measure the flattening of the clearance measuring wire using packaging paper **(3)** .

Check the clearance value, which must be between **0.010 and 0.064 mm** .

Clean any traces of measuring wire off the crankshaft and the bearing shells using degreasing agent.

Remove:



- the crankshaft bearing caps,
- the con rod pistons,
- the crankshaft.

12 - Checking the thickness of the piston rings

Measure the thickness of the piston rings using a micrometer.

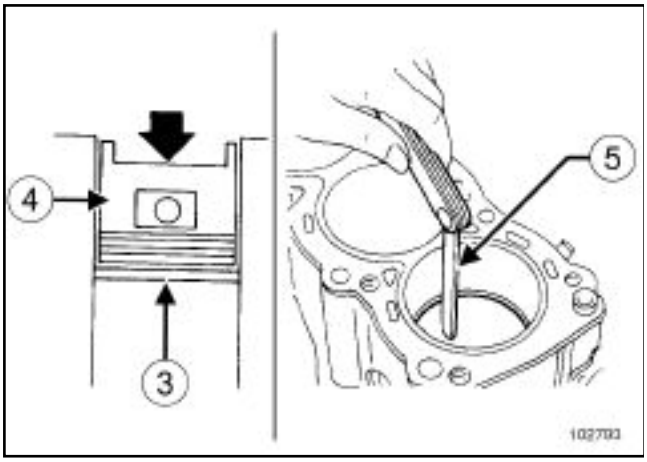
- the compression ring must be **2 mm -0.01 / -0.03** .
- the sealing ring must be **2 mm -0.01 / -0.03** .
- the scraper ring must be **2.5 mm -0.01 / -0.03** .

13 - Checking the clearance between the piston grooves and the piston rings

102795

Measure the clearance between the piston grooves and piston rings using a set of shims (**4**) .

- (**A**) : Set of shims incorrectly positioned,
- (**B**) : Set of shims correctly positioned.



The compression ring clearance must be **0.10 to 0.12 mm** .

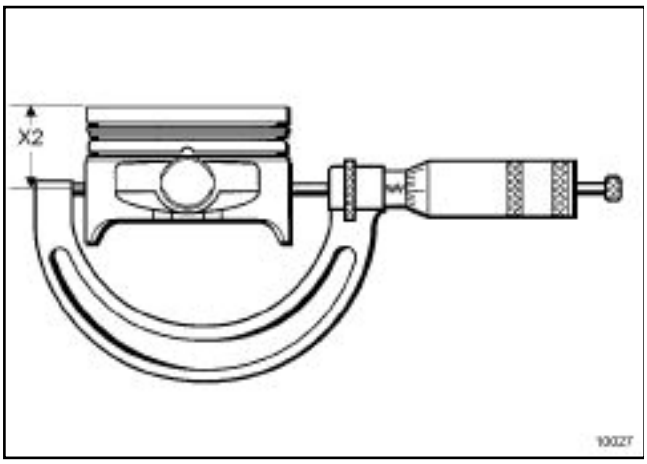
The clearance for the sealing ring must be **0.08 to 0.10 mm** .

the scraper ring clearance must be **0.03 to 0.05 mm** .

If the clearance is not within tolerance, replace the piston-gudgeon pin assembly, or the piston rings.

14 - Checking clearance at the ring section

102793



Position the ring (**3**) in the cylinder

Push the piston ring (**3**) to the centre of the cylinder using the piston (**4**) .

Measure the piston ring end clearance using a set of shims (**5**) .

- Compression ring end clearance must be **0.20 to 0.35 mm** ,
- Sealing ring end clearance must be **0.70 to 0.90 mm** .
- Oil control ring end clearance should be **0.25 to 0.50 mm** .

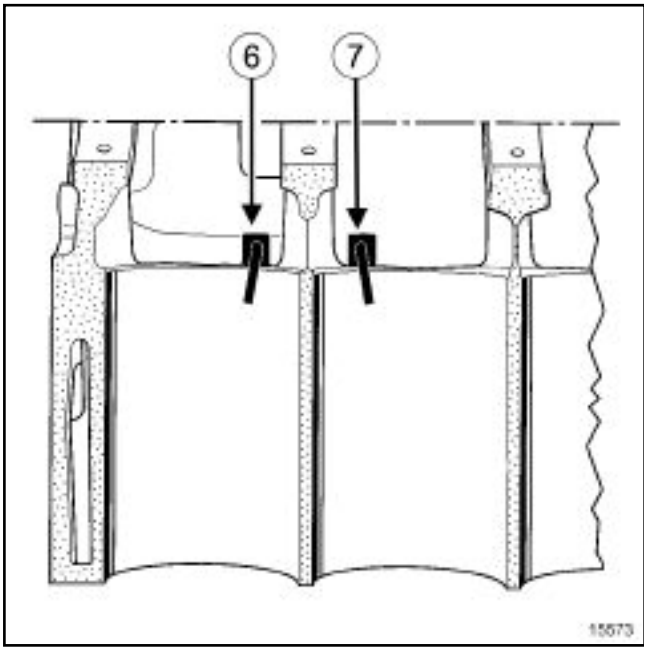
15 - Checking the piston diameter

10027

The piston diameter should be measured at height (**X2**) = **56 mm** .

The diameter of the piston must be:

- **75.949 ± 0.007 mm** for engines K9K 260-270-272-274-700-702-704-706-710-714-716-722-750-752-762-768-790-792,
- **75.945 ± 0.007 mm** for engines K9K 276-712-718-724-728-729-732-760-764-766.



16 - Checking the coolant pump

Check that there is no play nor resistance at the coolant pump.

Special tooling required	
Mot. 1494	Tool for refitting piston coolers.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

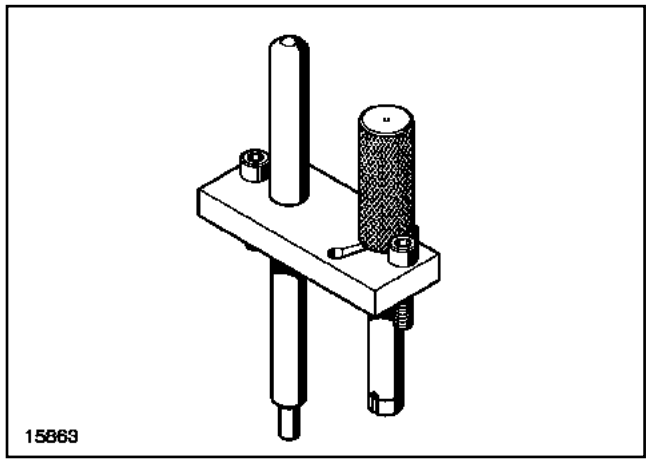
15573

(**6**) orientation of the piston base cooling jets for cylinders 2 and 4,

(**7**) orientation of the piston base cooling jets for cylinders 1 and 3,

WARNING
Check the orientation of the base of the piston base cooling jet which should be aimed towards the centre of the cylinder.

II - PARTS AND CONSUMABLES FOR THE REPAIR

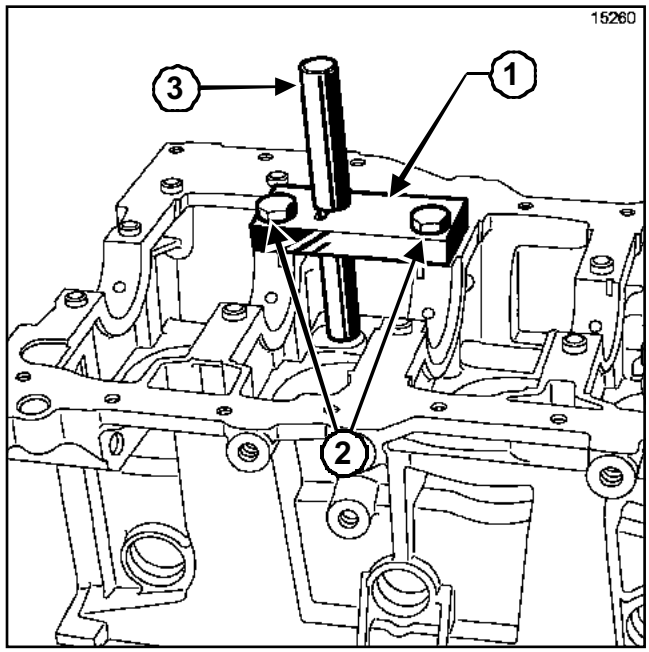


Parts always to be replaced

- the piston base cooling jets,

III - EQUIPMENT REQUIRED

- A hammer.



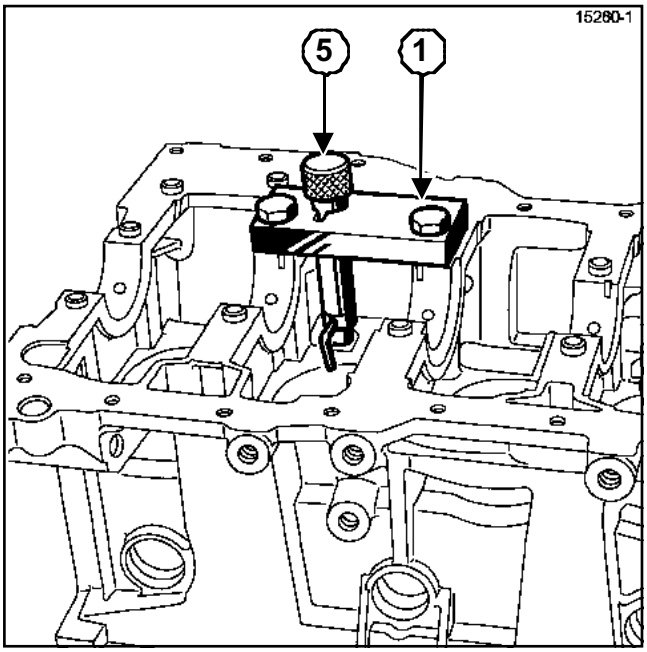
IV - REFITTING THE PISTON BASE COOLING JETS

15863

The piston base cooling jets must be replaced using the **(Mot. 1494)** .

1 - Fitting the jets for cylinders 1 and 3

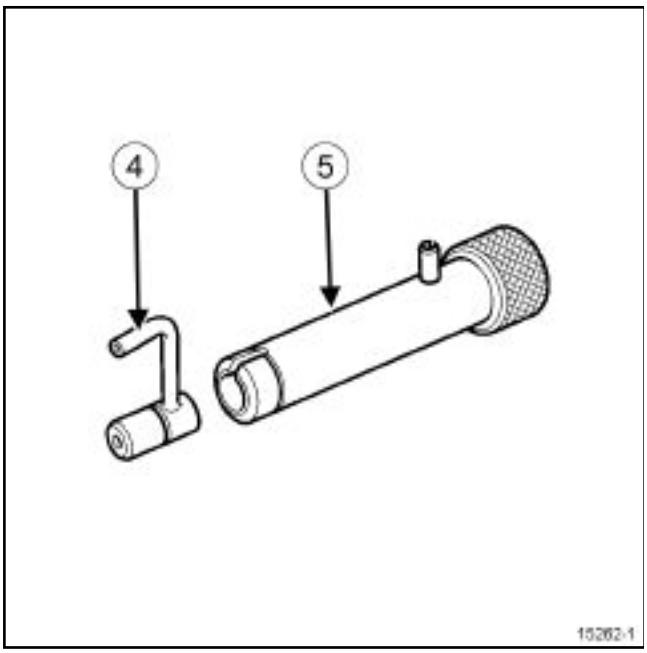
15260



Position plate (**1**) of tool **(Mot. 1494)** on the cylinder block without tightening the two bolts (**2**) .

Place the guide rod (**3**) in the plate (**1**) .

Position the end of the guide rod in the hole of the piston base cooling jet to centre the plate (**1**) .

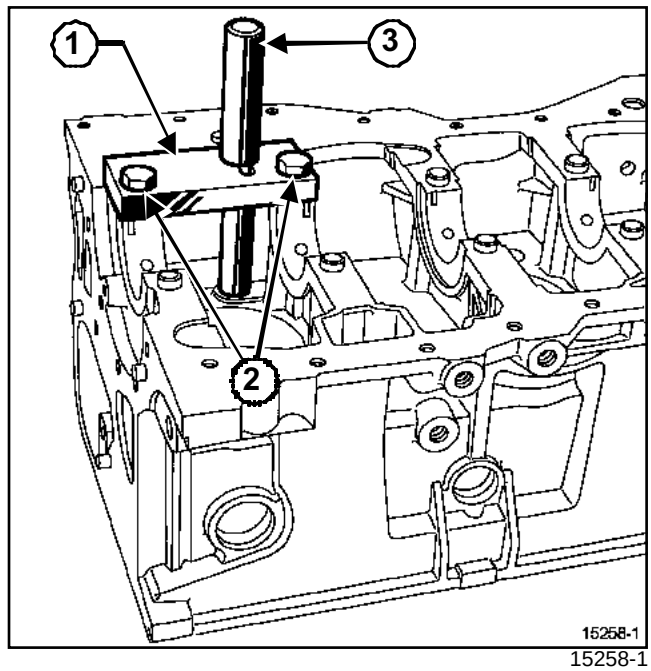


Lock the two bolts (**2**) .

Remove the guide rod.

15260-1

Insert the pushrod in place of the guide rod.



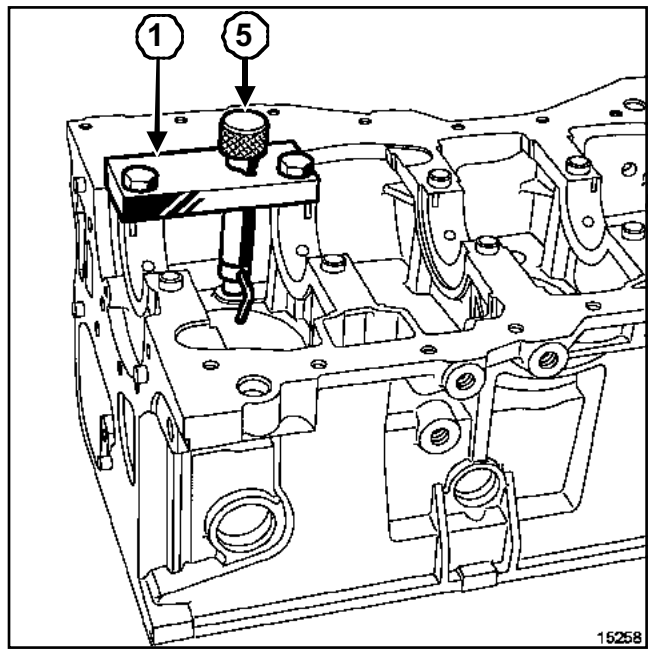
15262-1

Insert the jet (**4**) into the pushrod (**5**) .

Using a hammer, tap the pushrod down until the pushrod collar ***(5)*** is touching the plate ***(1)*** .

2 - Fitting the jets for cylinders 2 and 4

15258-1

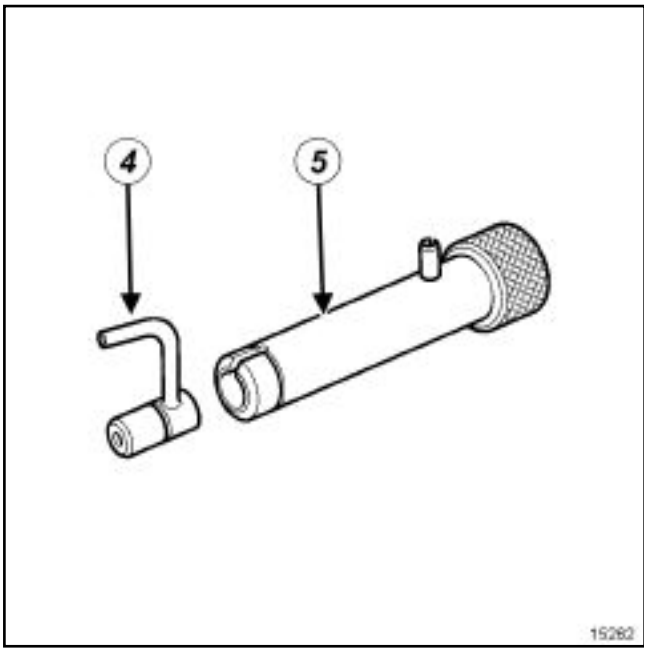


Position plate (**1**) of the **(Mot. 1494)** on the cylinder block without tightening the two bolts (**2**) .

Place the guide rod (**3**) in the plate (**1**) .

Position the end of the guide rod in the hole of the piston base cooling jet to centre the plate (**1**) .

Tighten the two bolts (**2**) .



Remove the guide rod.

15258

Insert the pushrod in place of the guide rod.

Piston base cooling jet: Refitting

15262

Insert the jet (**4**) into the pushrod (**5**) .

Using a hammer, tap the pushrod down until the pushrod collar ***(5)*** is touching the plate ***(1)*** .

Remove the **(Mot. 1494)** from the cylinder block.

Special tooling required	
Mot. 1493-01	Crankshaft bearing centring tool.
Mot. 1319-01	Gauge for measuring height of crankpins.
Mot. 1489	TDC locating pin.
Mot. 1319	Gauge for measuring height of crankpins.
Mot. 1492	Tool for fitting main bearing shells.
Mot. 1492-03	Tool for fitting main bearing shells.
Mot. 252-01	Dial gauge support thrust plate.
Mot. 251-01	Dial gauge support.

Tightening torques ▽	
the crankshaft bearing cap mounting bolts	**25 ± 2.5 Nm + 47° ± 6°**
the con rod cap mounting bolts	**20 ± 2 Nm + 45° ± 6°**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

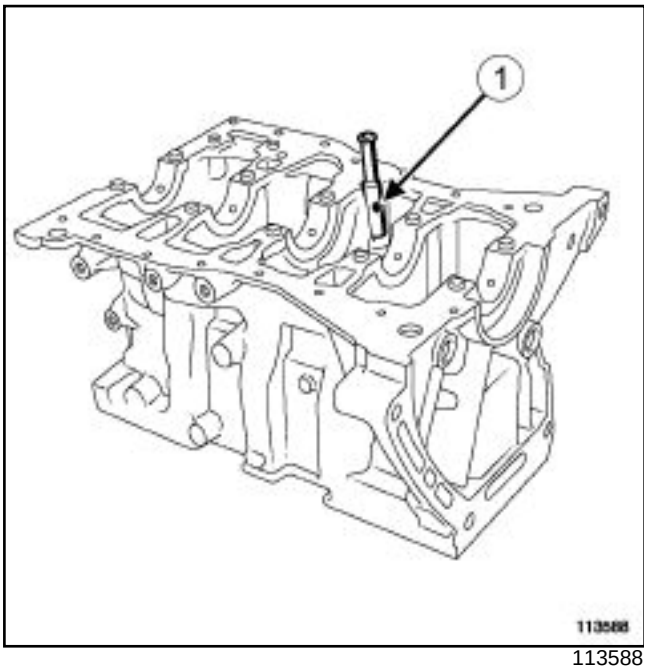
The con rod caps are positioned on the con rod body using the irregularities on the parting line.

Impacts or foreign bodies between the contact surfaces between the caps - con rod body could lead to a breakage of the con rod in the short term.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

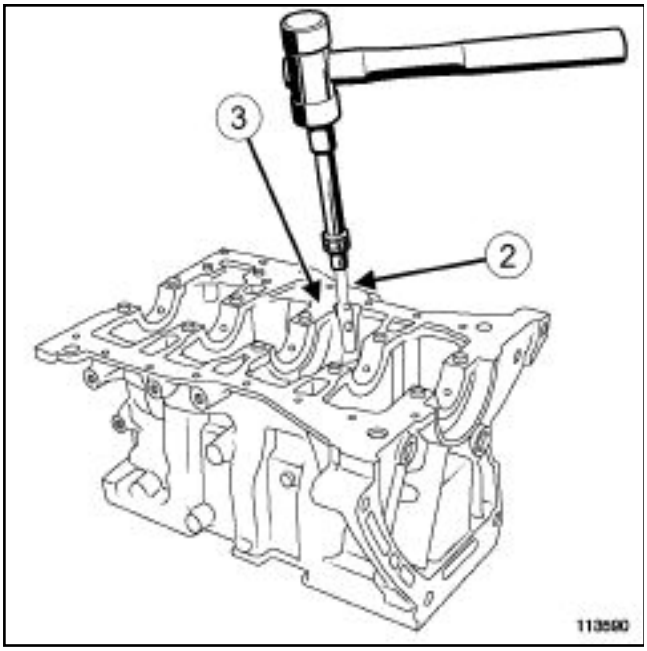
- Con rod cap bolts,
- Crankshaft bearing cap bolts.



Consumables

- Loctite 518, part no. **77 01 421 162** ,
- Degreasing agent, part no. **77 11 224 559** .

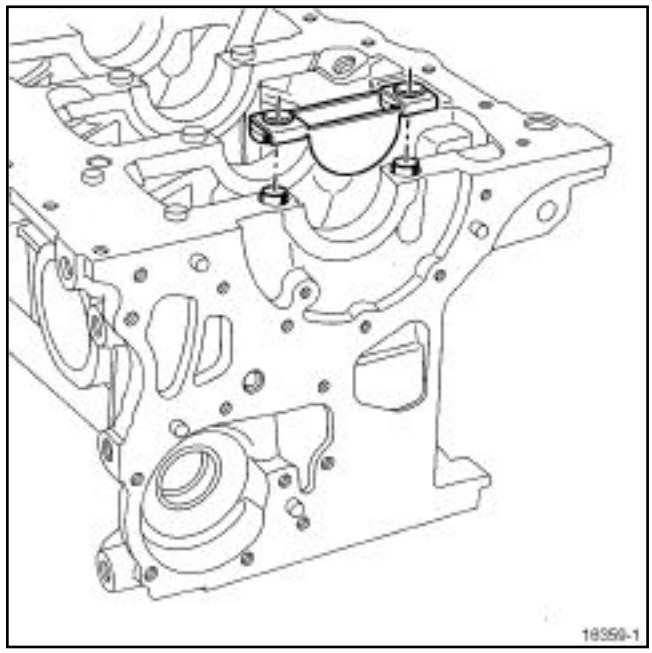
III - EQUIPMENT REQUIRED



- Female torx socket.
- Allen key (**8 mm**),
- Oil can,
- Dial gauge,
- Flat-blade screwdriver,
- Indelible pencil,
- Piston ring compressor,
- Piston mounting ring,
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Mallet,

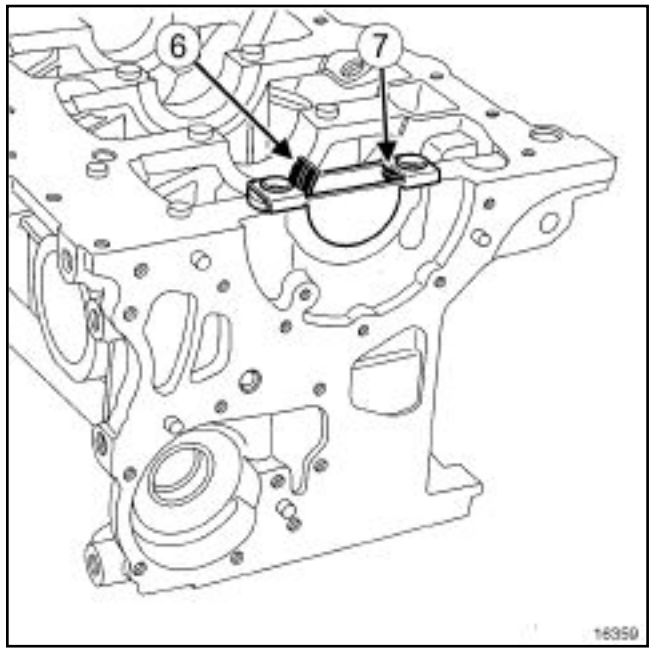
IV - REFITTING THE ROTATING PARTS

113588



Replace the dipstick guide tube in the cylinder block (if the cylinder block is fitted with one), aligning the orifice (**1**) of the dipstick guide tube as indicated in the diagram.

113590

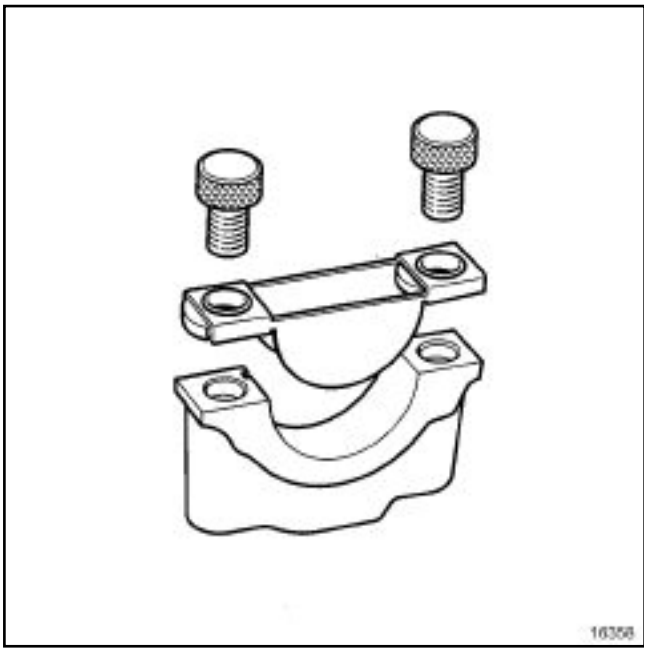


Insert the dipstick guide tube using an **8 mm** male Allen key, until the dipstick guide tube extends by **43 mm** (the end) (**2**) over the sealing surface (**3**) of the cylinder block.

Ensure that the crankshaft bearing journals are matched up with the crankshaft bearings on the cylinder block (see **10A**, **Engine and lower engine assembly**, **Engine peripherals: Specifications**, page **10A-36**) .

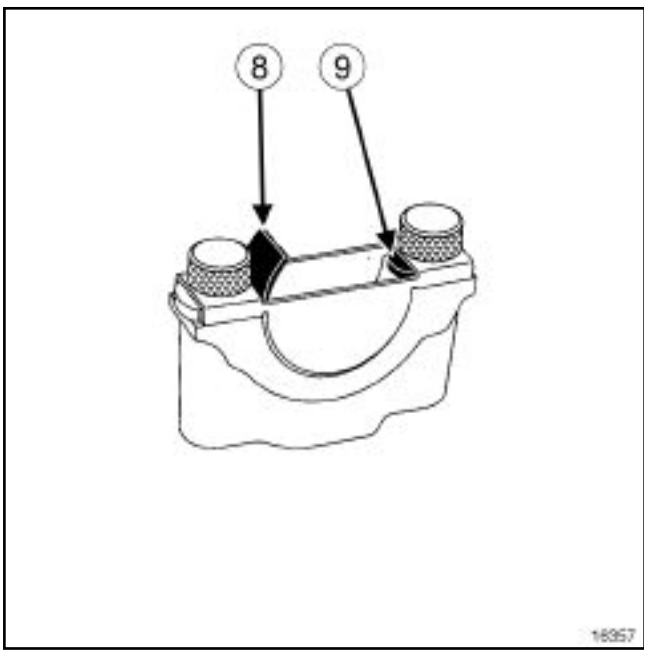
16359-1

Position the **(Mot. 1493-01)** on the cylinder block.



16359

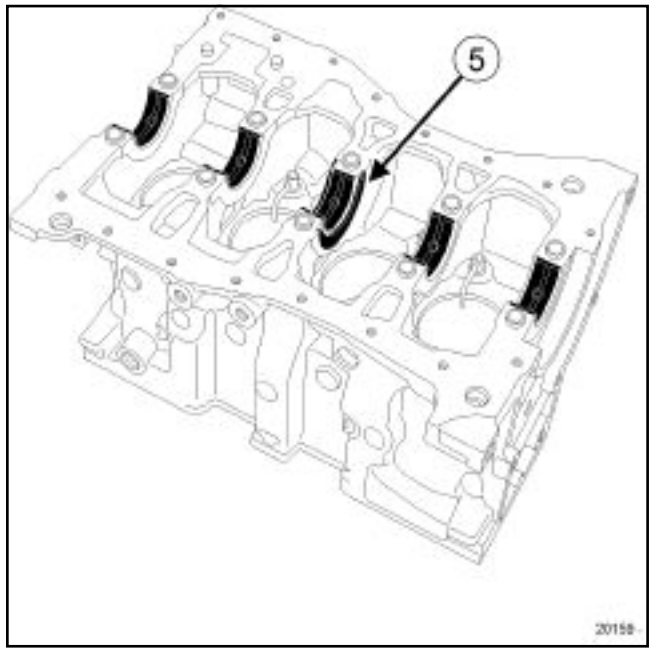
Mount the bearing shell **(grooved)** (**6**) in the **(Mot. 1493-01)** .



Push on the bearing until it is pressed against the stop (**7**) .

Repeat this process for other bearings.

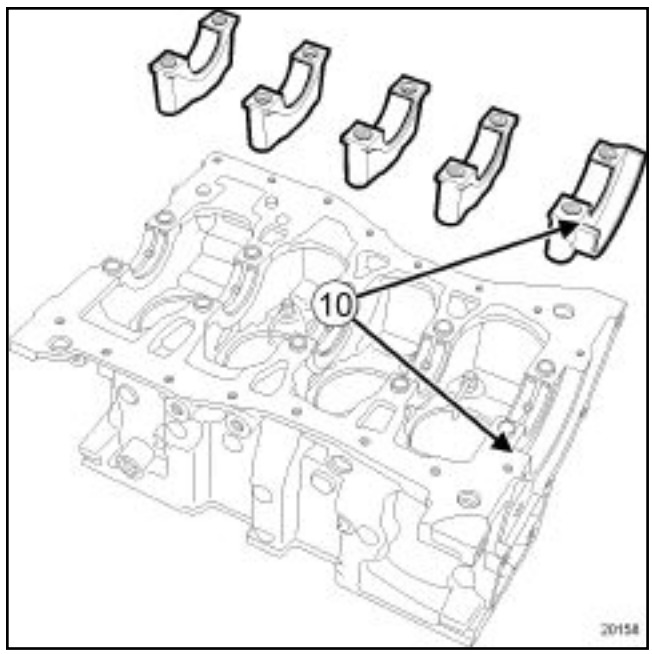
16358



Position the **(Mot. 1493-01)** on the crankshaft bearing cap.

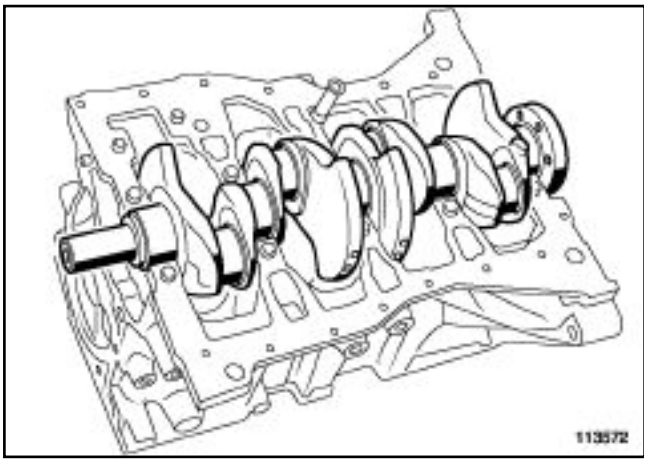
16357

Place the bearing shell **(non-grooved)** (**8**) in the **(Mot. 1493-01)** .



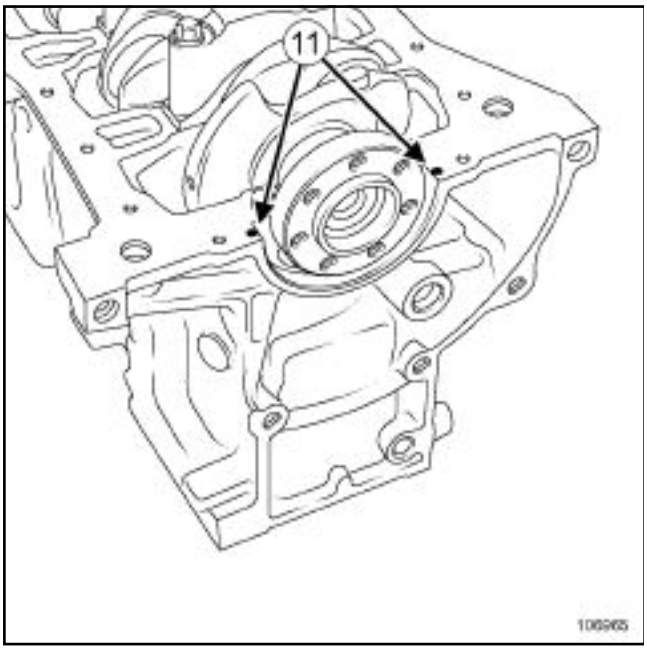
Push on the bearing until it is pressed against the stop (**9**) .

20159



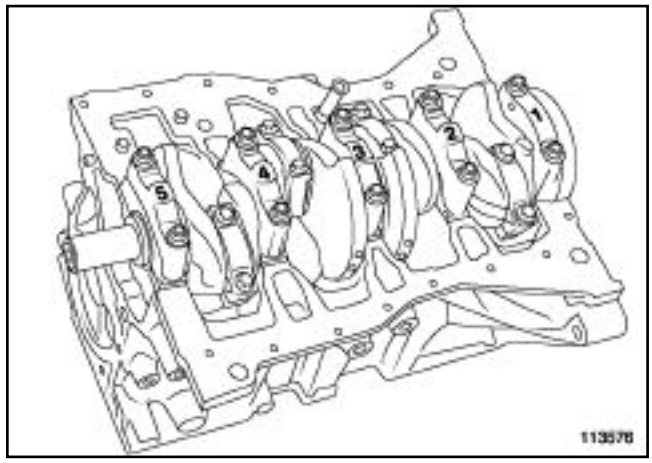
Refit the crankshaft thrust washers **positioning the grooves of the shims at crankshaft end** .

Oil the crankshaft bearing shells with engine oil (only the side of the bearing shell that comes in contact with the crankshaft).



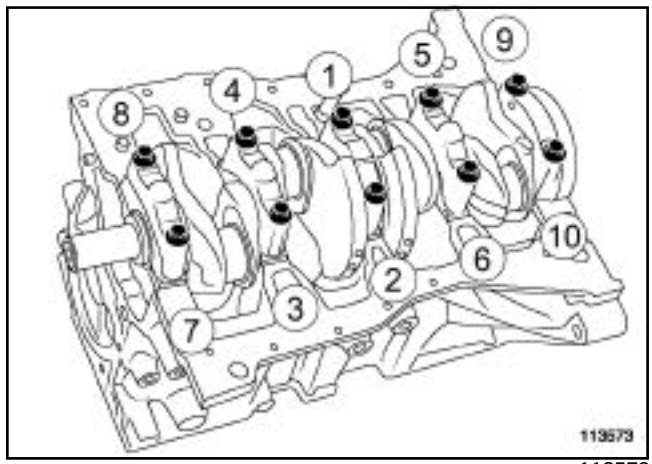
20158

Degrease the surfaces of the seals (**10**) of the cylinder block and the crankshaft bearing cap No. 1 using degreaser.



113572

Refit the crankshaft.



106965

Apply two drops (**11**) of **LOCTITE 518** of a diameter of **4 mm** to camshaft bearing no. 1.

113576

Refit the crankshaft bearing caps, ensuring that they are correctly positioned.

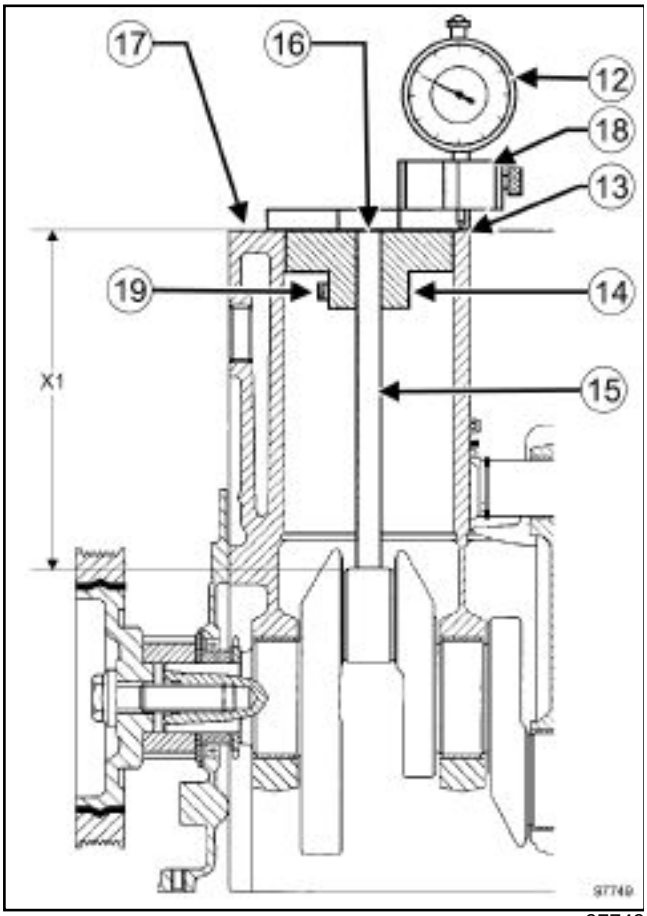
113573

Refit the new crankshaft bearing cap mounting bolts.

Tighten to torque in order and to angle **the crankshaft bearing cap mounting bolts (25 ± 2.5 Nm + 47° ± 6°)** .

Check that the crankshaft turns freely, with no resistance.

Note:



If replacing the con rods, the Parts Department will only supply con rods with a small end diameter of **26 mm** .

It is therefore essential to check that the gudgeon pin is **26 mm** in diameter.

It is essential to determine the height of the crankpin ***(X1)*** in the event of having to replace the con rods, crankshaft, cylinder block.

The height ***(X1)*** represents the distance between the crankpin at TDC and the surface of the seal on the combustion face of the cylinder block.

This measurement enables the piston class to be determined.

97749

Measuring the crankpin height for cylinders 1 and 4:

Insert the appropriate depth gauge of tool **(Mot. 1319-01)** (**15**) in the dummy piston (**14**) of the tool, **(Mot. 1319-01)** lining up the light of the depth gauge opposite the locking bolt (**19**) .

Tighten the locking bolt (**19**) .

Check that the depth gauge slides freely in the dummy piston.

Set the crankshaft at Top Dead Centre using the **(Mot. 1489)** .

Position the dummy piston ***(14)*** of the the **(Mot. 1319-01)** fitted with the depth gauge in cylinder No. 1.

Position the depth gauge ***(15)*** of the tool, **(Mot. 1319-01)** pressing on the crankshaft crankpin.

Place the dial gauge holder ***(18)*** of the **(Mot. 1319)** with dial gauge in place on the dummy piston ***(14)*** .

Calibrate the dial gauge ***(12)*** on the cylinder block, setting the mid-point between points ***(13)*** and ***(17)*** .

Slide the dial gauge holder to the centre ***(16)*** of the depth gauge ***(15)*** .

Measure the protrusion or recess of the depth gauge.

Note the value.

Carry out the same procedure for cylinder No. 4.

Measuring the crankpin height for cylinders 2 and 3:

Position approximately the crankpin for crankshaft No. 2 at Top Dead Centre.

Place the dummy piston-depth gauge assembly into cylinder No. 2.

Place the dial gauge holder, with dial gauge in place, in the centre of the depth gauge.

Gently turn the crankshaft to determine the crankpin top dead centre.

Calibrate the dial gauge ***(12)*** on the cylinder block, setting the mid-point between points ***(13)*** and ***(17)*** .

Slide the dial gauge holder to the centre ***(16)*** of the depth gauge ***(15)*** .

Measure the protrusion or recess of the depth gauge.

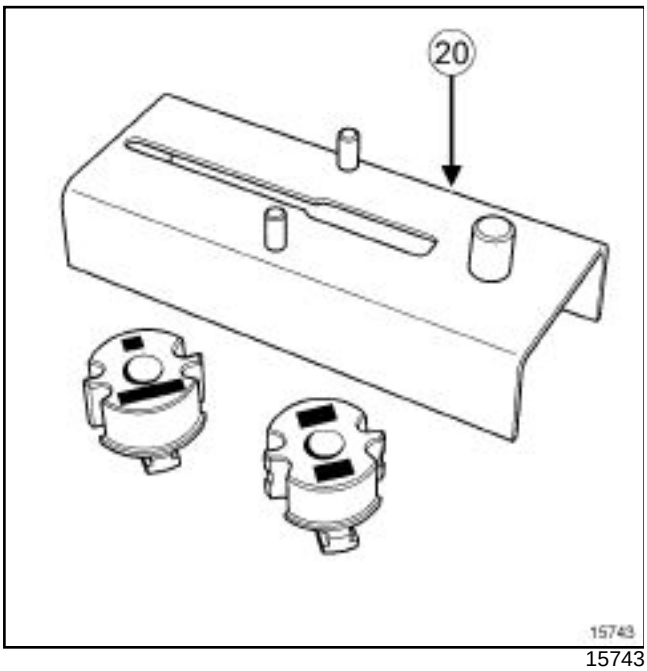
Note the value.

Carry out the same procedure for cylinder No. 3.

Determine the class of piston

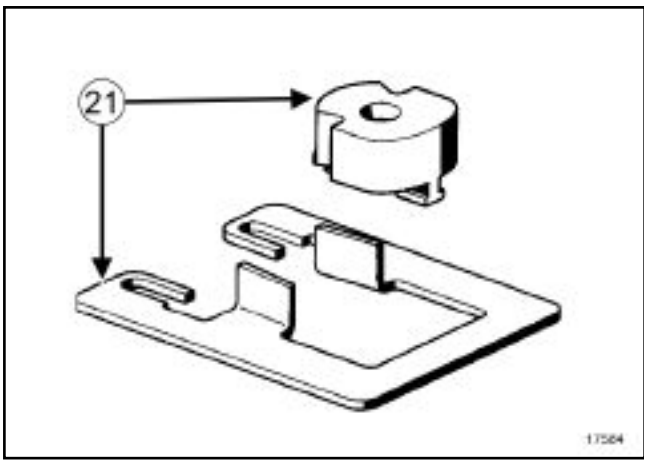
Add or subtract the values obtained of the length of the depth gauge in order to determine the dimension ***(X1)*** .

For example:



- length of depth gauge = **153.989 mm** ,
- measured protrusion (of the length of the depth gauge beyond the cylinder block) = **0.65 mm** ,
- the dimension ***(X1)*** = **153.989** - **0.65** = **153.339 mm** (in the event of a recess, the figures must be added).

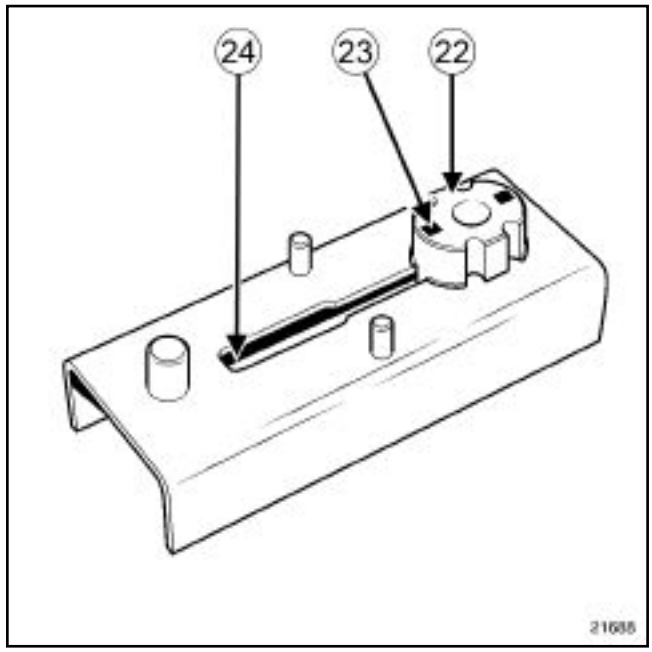
Determine **the height of the gudgeon pin** using the following formulae:



- For engines fitted with a gudgeon pin of diameter **25 mm** use formula (***(X1)*** - **111.535** = the height of the gudgeon pin),

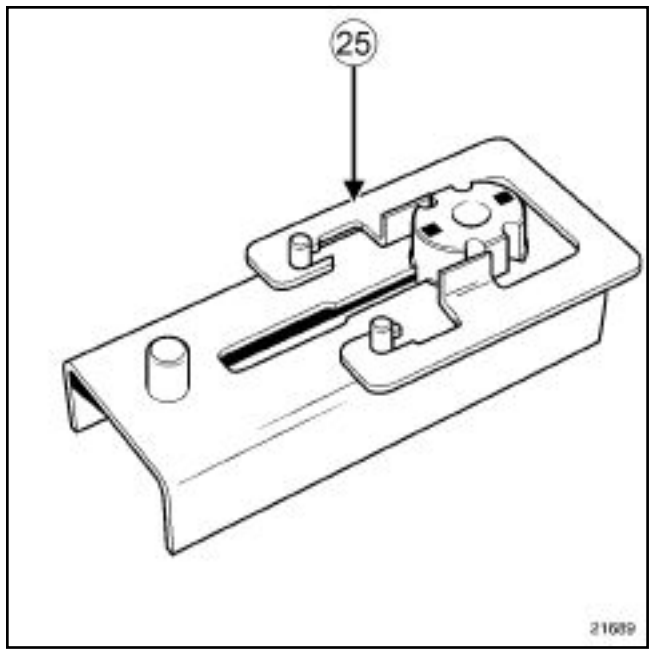
- For engines fitted with a gudgeon pin of diameter **26 mm** use formula (***(X1)*** - **111.576** = the height of the gudgeon pin),

Refer to the height classes table for the gudgeon pins in order to choose the correct piston class (see **10A**, **Engine and lower engine assembly**, **Engine peripherals: Specifications**, page **10A-36**) .



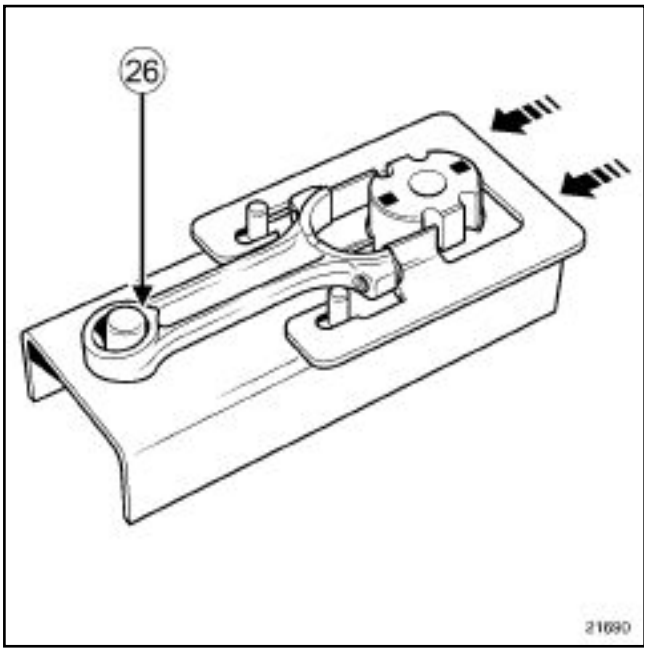
15743

17584



Fit the con rod bearings using the **(Mot. 1492)** (**20**) and **(Mot. 1492-03)** (**21**) .

Refitting the con rod bearings on the con rod body.

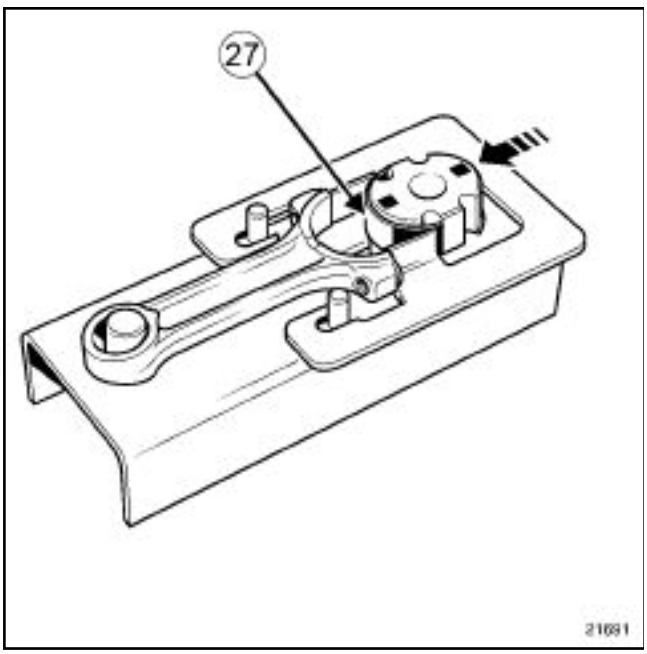


21688

Slide the bearing support (**22**) (positioning the marking "A" (**23**) as indicated in the diagram) of the tool **(Mot. 1492-03)** in the groove (**24**) of the tool base **(Mot. 1492)** .

21689

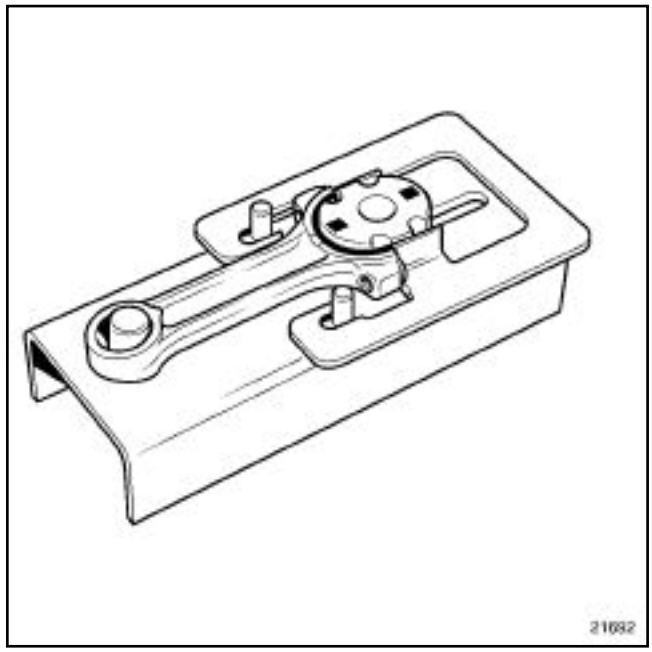
Place the rail (**25**) of the tool **(Mot. 1492-03)** on the base.



21690

Mount the con rod body on the base.

Check that the lower part (**26**) of the small end is in contact with the centring pin.

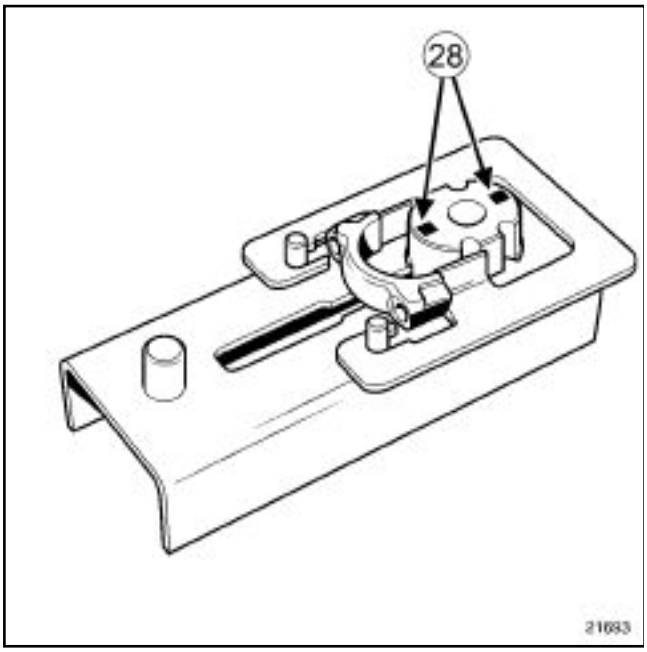


Push the rail (in the direction shown by the arrow) until the rail presses against the con rod end.

21691

Mount the bearing shell (**27**) (with a width of **20.625 mm** on the bearing shell support.

Push the bearing shell support in the direction shown by the arrow.



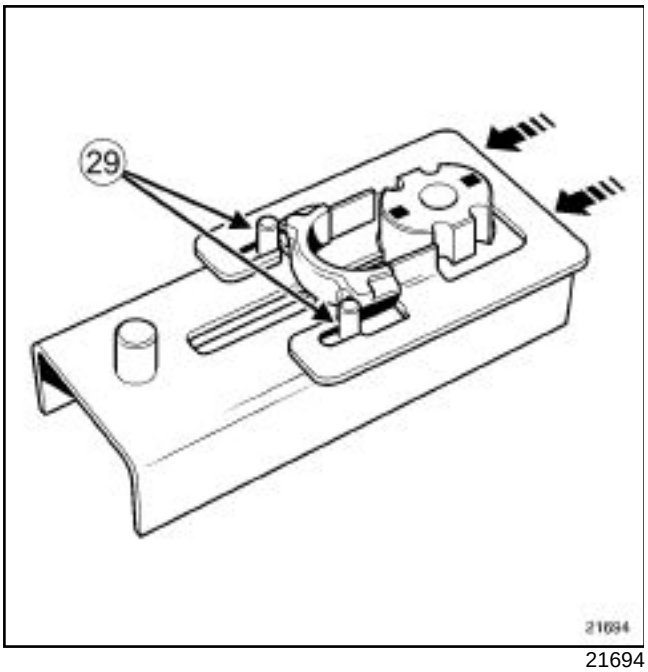
21692

Bring the bearing shell support to the end of the con rod body base.

Remove the support shell from the con rod body.

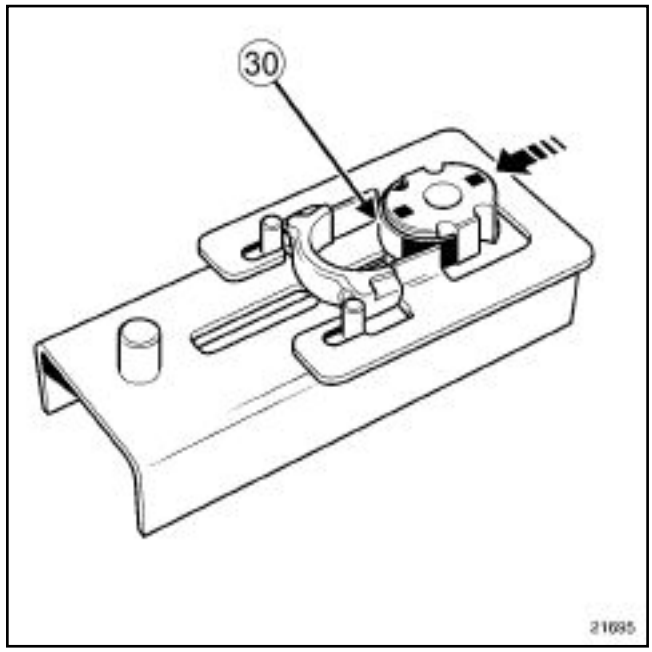
Repeat the operation for the other con rod bodies.

Refitting the con rod bearings on the con rod cap.



21693

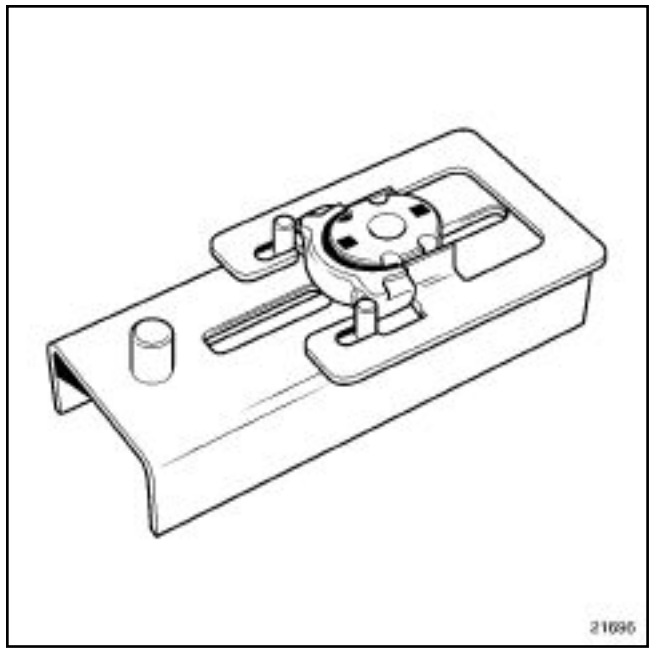
Position the bearing shell support, aligning the marking "A" or "B" (**28**) on the side of the cap as follows:



- a bearing shell width of **20.625 mm** corresponds to "A",
- a bearing shell width of **17.625 mm** corresponds to "B",

Mount the con rod cap on the base.

21694



Push the rail in the direction shown by the arrow until the con rod cap presses against the pins (**29**) on the base.

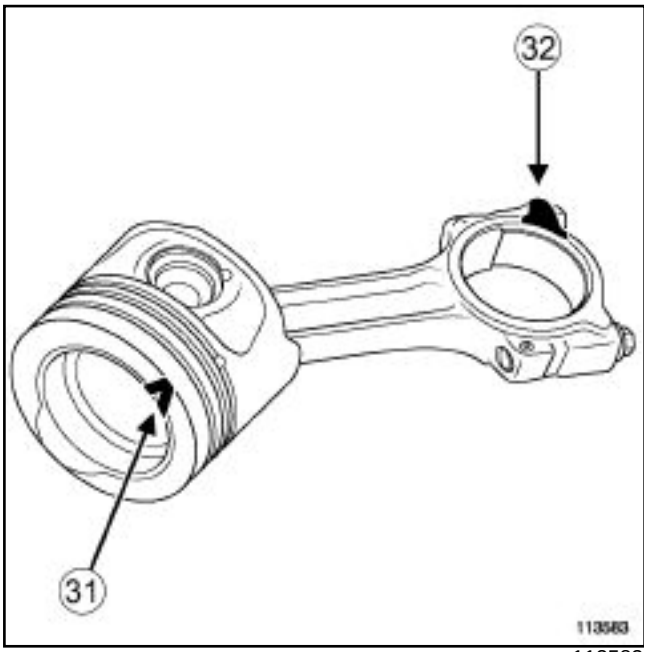
21695

Mount the bearing shell (**30**) on the bearing shell support.

Push the bearing shell support in the direction shown by the arrow.

21696

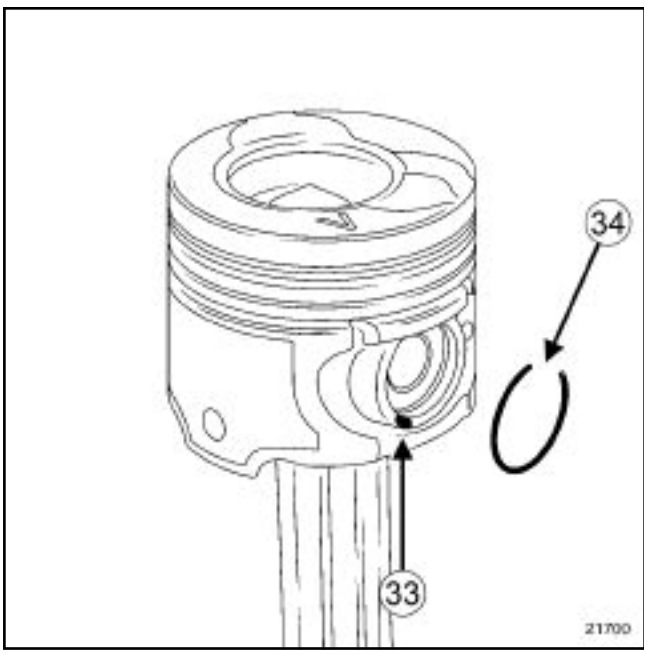
Bring the bearing shell support to the end of the con rod cap base.



Remove the bearing shell from the con rod cap.

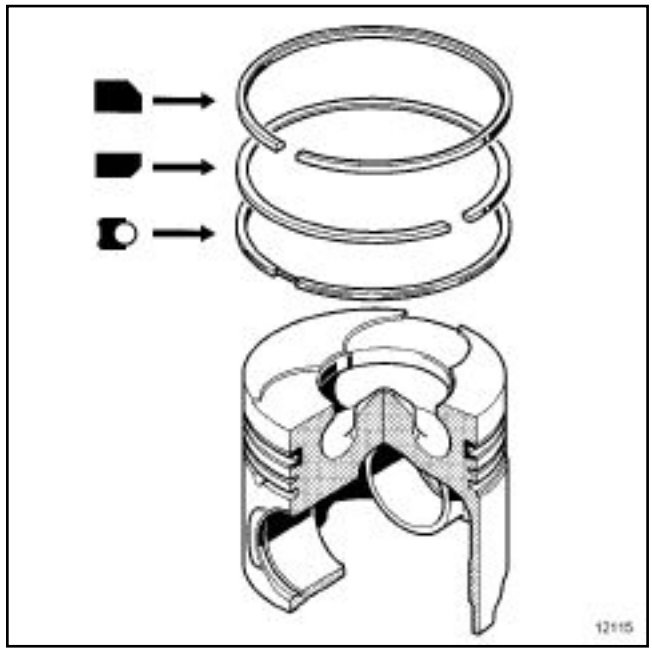
Repeat the operation for the other con rod caps.

Using an indelible pencil, mark the gudgeon pin position in relation to the piston.



Lubricate gudgeon pin with engine oil.

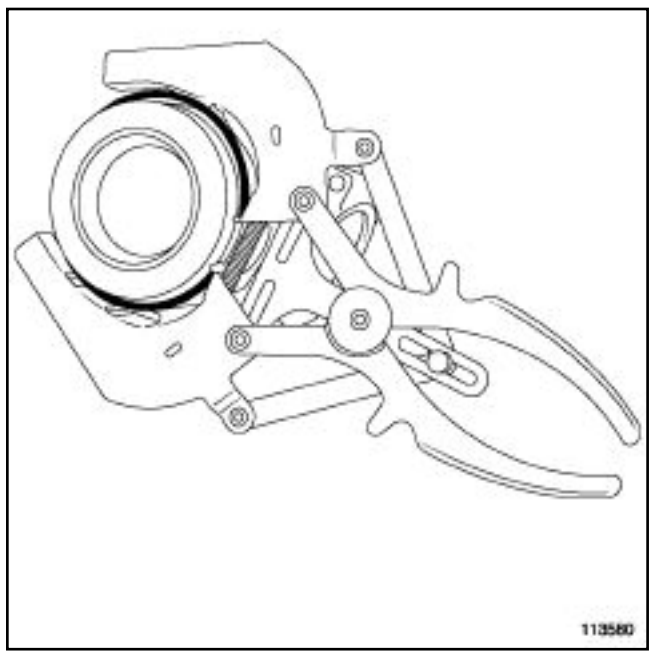
Check that the gudgeon pin slides and turns freely in the piston.



113583

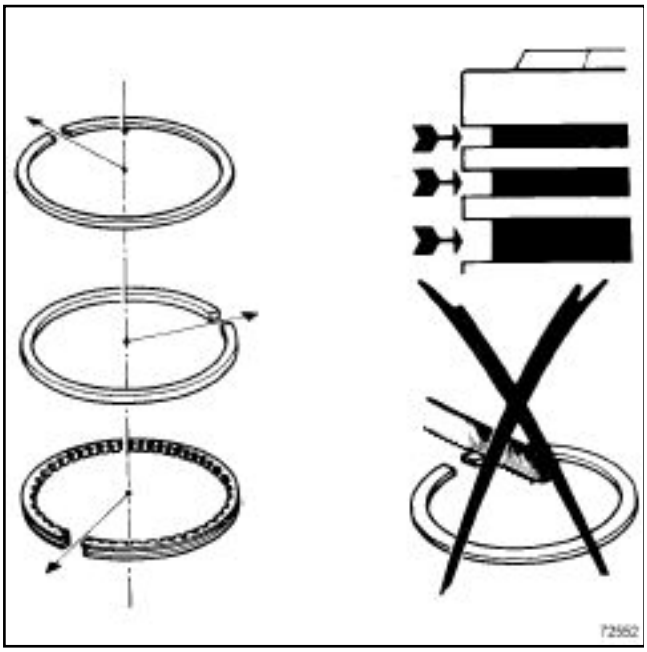
Position the mark **"V"** (**31**) of the piston and the flat surface (**32**) of the con rod cap as indicated in the illustration.

21700



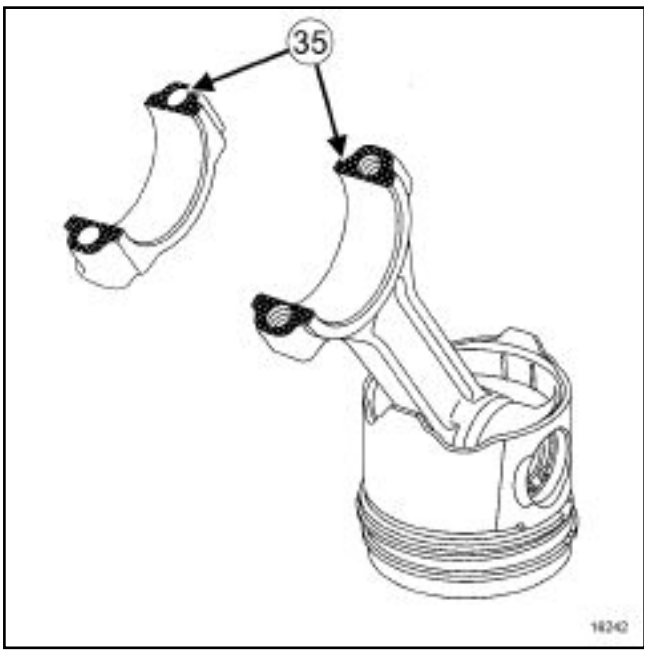
Refit the circlip of the gudgeon pin, positioning the opening (**34**) of the circlip opposite the notch (**33**) .

12115



Note:

Ensure the rings are fitted the right way round, with the word **TOP** pointing upwards.



113580

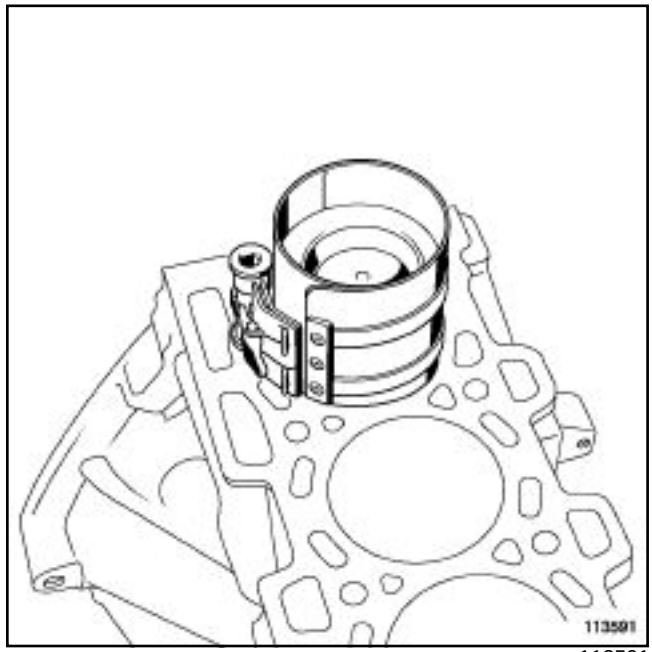
Refit the piston rings using a piston ring compressor.

72552

Fit the shoes such that the gaps are equally spaced around the piston.

16242

Using degreasing agent, degrease the contact surfaces (**35**) between the cap and body of the con rod.

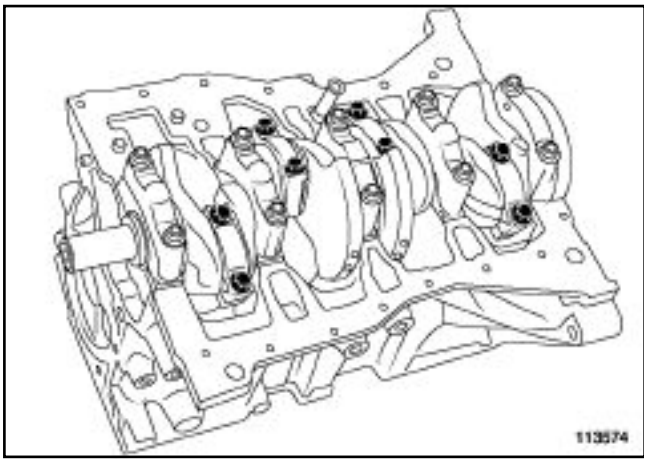


Lubricate with engine oil:

- the cylinder block barrels,
- the piston rings,
- the piston skirts,
- the crankshaft crankpins.

Note:

Ensure that the piston matches the cylinder block barrel (No.1 at flywheel end) .



Ensure the correct con rod-piston orientation, positioning the "V" engraved on the piston crown towards the flywheel .

113591

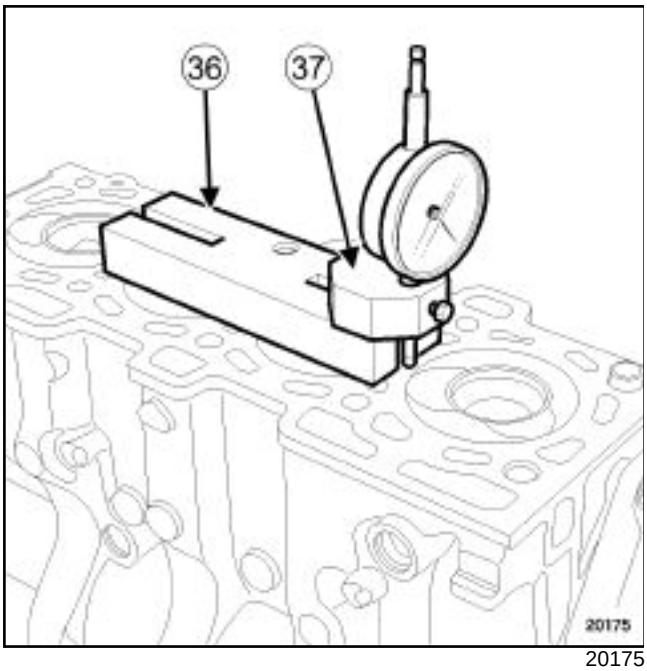
Refit the con rod-piston assembly using a piston assembly ring.

Mount the con rod heads on the crankshaft crankpins.

113574

Refit:

- the con rod caps, ensuring correct matching,



- the new con rod cap mounting bolts.

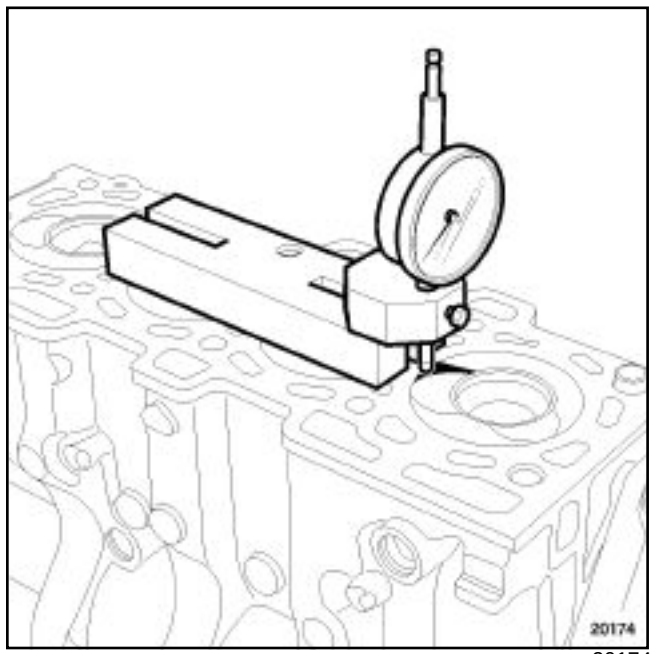
Torque and angle tighten **the con rod cap mounting bolts (20 ± 2 Nm + 45° ± 6°)** .

Check that the running gear turns freely, with no resistance.

Clean the piston crowns.

Set the crankshaft at Top Dead Centre.

20175



Mount the contact plate of the **(Mot. 252-01)** (**36**) on the cylinder block.

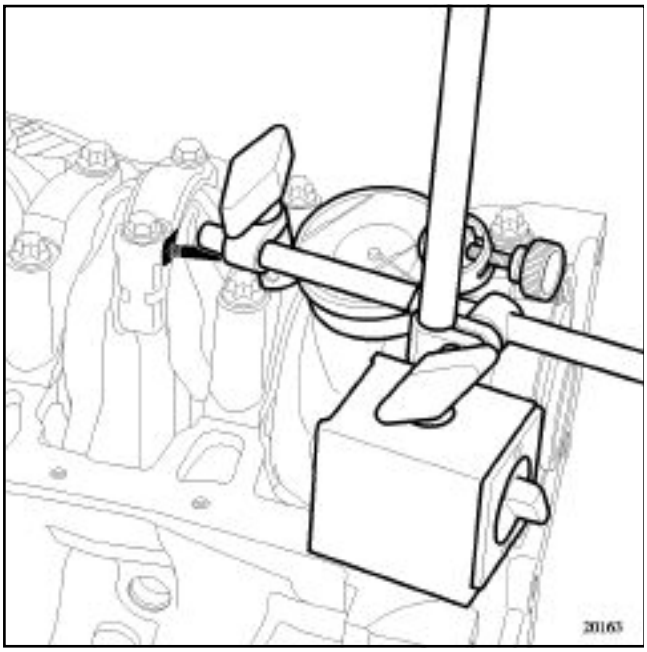
Mount the dial gauge support **(Mot. 251-01)** (**37**) , with a dial gauge, on the pressure plate.

Note:

The measurement is taken along the longitudinal axis of the crankshaft to eliminate play due to the movement of the piston .

Calibrate the dial gauge on the cylinder block.

20174



Measure the recess **(the sensor of the dial gauge should not be in a valve gap)** of the piston which should be:

- For engines **K9K 260-700-702-704-710-722 fitted with a gudgeon pin 25 mm in diameter** the recess is **0.192 ± 0.093 mm** ,

- For engines **K9K 260-270-272-700-702-704-706-710-722-750-752-790 fitted with a gudgeon pin 26 mm in diameter** the recess is **0.154 ± 0.130 mm** ,

- For engines **K9K 274-276-712-714-716-718-724-728-729-732-760-766-768-792-762-764 fitted with a gudgeon pin 26 mm in diameter** the recess is **0.159 ± 0.129 mm** ,

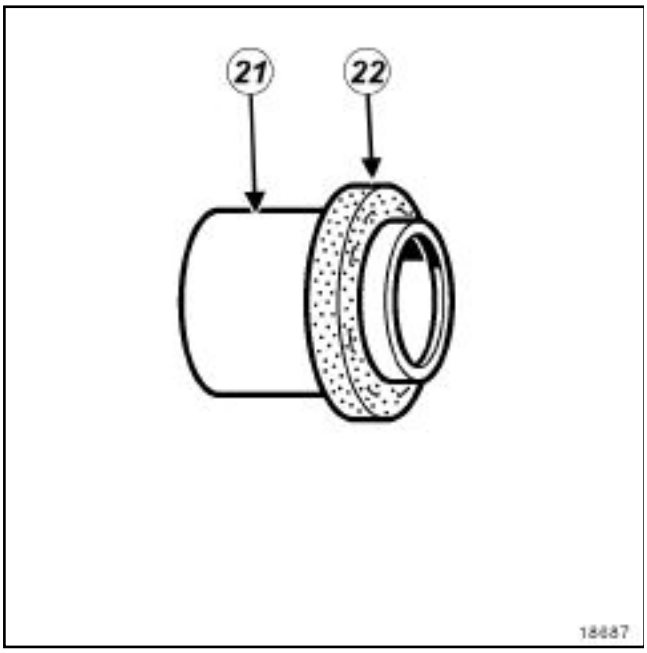
For cylinders No. 2 and No. 3, it is essential to find the Top Dead Centre of the piston before taking the recess measurement.

20163

Check the longitudinal clearance of the big ends, which must be between **0.205 and 0.467 mm** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

Special tooling required	
Mot. 1018	Sump plug tool.
Mot. 1586	Tool for fitting PTFE crankshaft seal, timing end.
Mot. 1714	Adapter for fitting PTFE crankshaft seal, timing end.
Mot. 1585	Tool for fitting PTFE crankshaft seal, flywheel end.
Emb. 1596	24 mm socket for removing/refitting clutch master cylinder.
Mot. 1329	Oil filter removing tool (76 mm diameter).
Mot. 923	Engine lifting ring.
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Emb. 1780	Set of clutch disc centring mandrels.



Tightening torques ▽	
the oil pump mounting bolts	**25 ± 2.5 Nm**
the oil level sensor	**25 ± 2.5 Nm**
the crankshaft nose closure unit mounting bolts	**11 ± 1.1 Nm**
the coolant pump mounting bolts	**11 ± 1.1 Nm**
the engine oil sump mounting bolts	**14 ± 1.4 Nm**
the drain plug of the engine oil sump	**20 ± 2 Nm**
the coolant pump pipe mounting bolt	**22 ± 2.2 Nm**
the coolant / oil heat exchanger mounting bolt	**45 ± 4.5 Nm**

Tightening torques ▽	
the oil filter holder mounting bolt	**45 ± 4.5 Nm**
the acceleration meter	**20 ± 2 Nm**
the oil pressure switch	**30 ± 3 to 35 ± 3.5 Nm**
the oil filter	**14 ± 2 Nm**
the multifunction support mounting bolts (from 1 to 6 or from 1 to 5)	**44 ± 4.4 Nm**
multifunction support mounting bolt (7)	**21 ± 2.1 Nm**
the mounting bolts of the power assisted steering pump or the dummy pulley	**21 ± 2.1 Nm**
the air conditioning compressor mounting bolts	**21 ± 2.1 Nm**
the alternator mounting bolts	**21 ± 2.1 Nm**
the coolant / oil heat exchanger mounting bolt	**45 ± 4.5 Nm**
the oil filter holder mounting bolt	**45 ± 4.5 Nm**
the acceleration meter	**20 ± 2 Nm**
the oil pressure switch	**30 ± 3 to 35 ± 3.5 Nm**
oil filter	**14 ± 2 Nm**
flywheel mounting bolts	**55 ± 5.5 Nm**
the clutch mechanism mounting bolts	**M6 to 14 ± 1.4 Nm and bolts M7 to 20 ± 2 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

18687

WARNING

This type of seal is very delicate. When handling, it is essential to hold the protective piece (**21**) . It is strictly forbidden to touch seal (**22**) ; this is to prevent any oil leaks once the oil seal is fitted to the engine.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

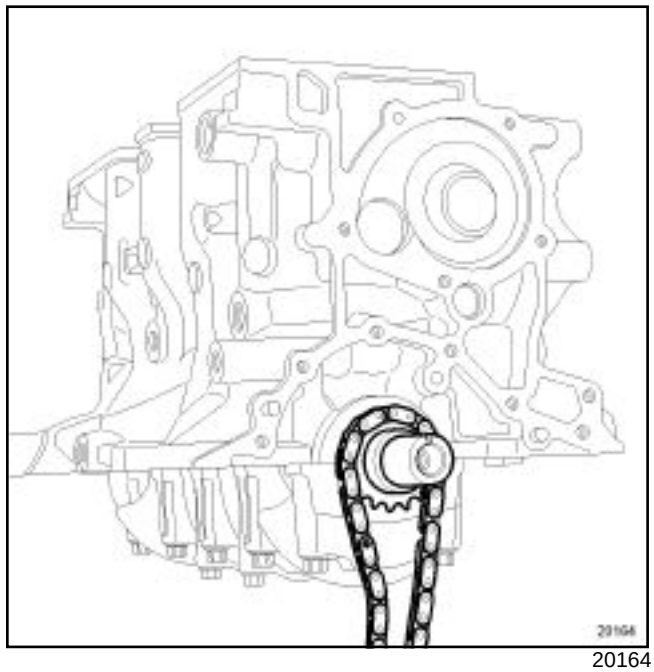
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

- The crankshaft nose closure unit seal,
- The coolant pump seal,
- The oil sump mounting seal,
- The clutch mechanism (if necessary),
- The friction disc (if necessary),
- Flywheel mounting bolt
- The coolant pump inlet pipe seal,
- The oil/coolant heat exchanger seals,
- The crankshaft seal, timing end,
- The crankshaft seal, flywheel end,
- Oil filter,
- The seal of the drain plug of the engine oil sump.

Consumables



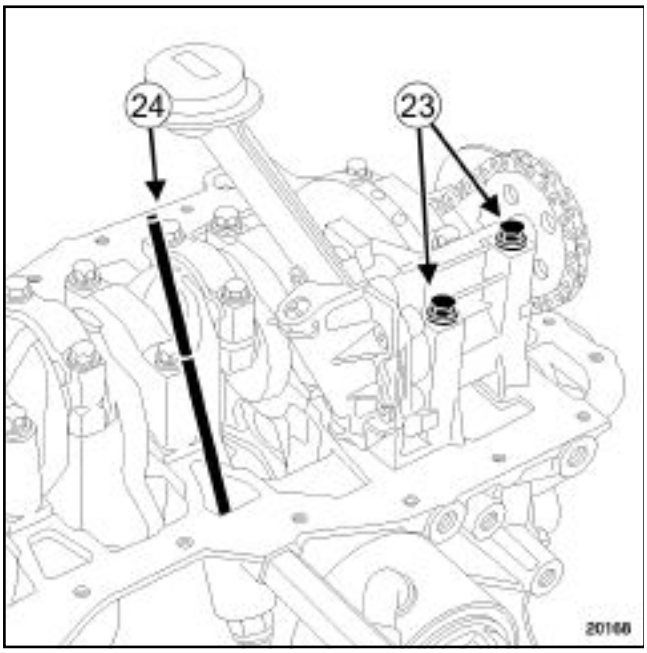
- Degreasing agent, part no. **77 11 224 559** .
- Silicone adhesive sealant, part no. **77 11 227 484** ,
- High-resistance bolt locking product, part no. **77 11 230 112** ,

III - EQUIPMENT REQUIRED

- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Rule,
- Male triangular drive drain plug spanner **8 mm** ,
- Male torx socket.
- Oil can,
- Workshop hoist.

IV - REASSEMBLING THE CYLINDER BLOCK

Put a little engine oil from an oil can in the oil pump via the oil sump filter.



20164

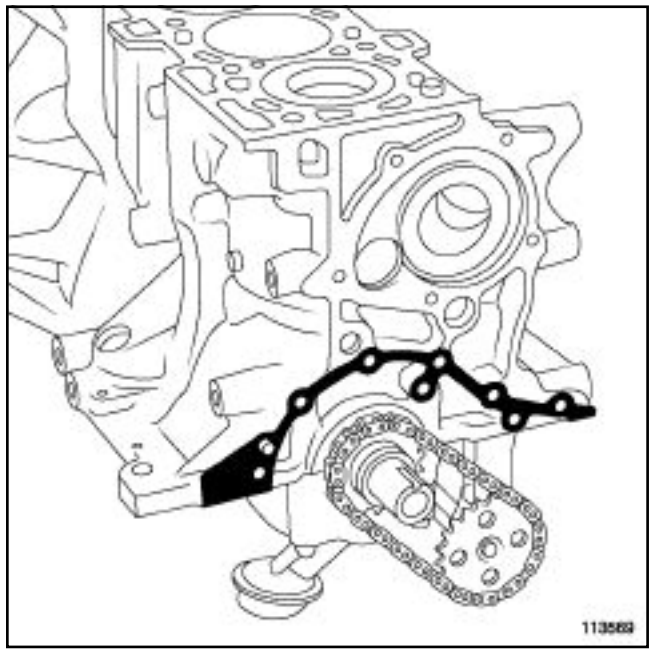
Refit:

- the oil pump drive sprocket,
- the oil pump chain.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20168

Refit:



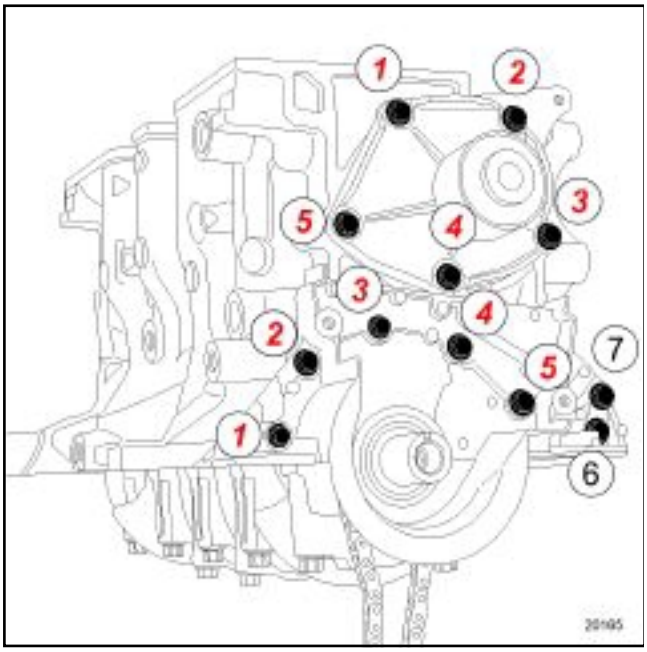
- the oil pump,
- the oil pump mounting bolts (**23**) ,
- the oil level sensor (**24**) .

Tighten to torque:

- **the oil pump mounting bolts (25 ± 2.5 Nm)** ,
- **the oil level sensor (25 ± 2.5 Nm)** .

Apply degreaser to:

- the crankshaft nose closure panel,
- the coolant pump,
- the surface of the seal of the crankshaft nose closure unit on the cylinder block,
- the surface of the coolant pump seal on the cylinder block.



113569

Fit a new seal to the crankshaft nose closure unit.

Check for the centring dowels on the crankshaft nose closure unit.

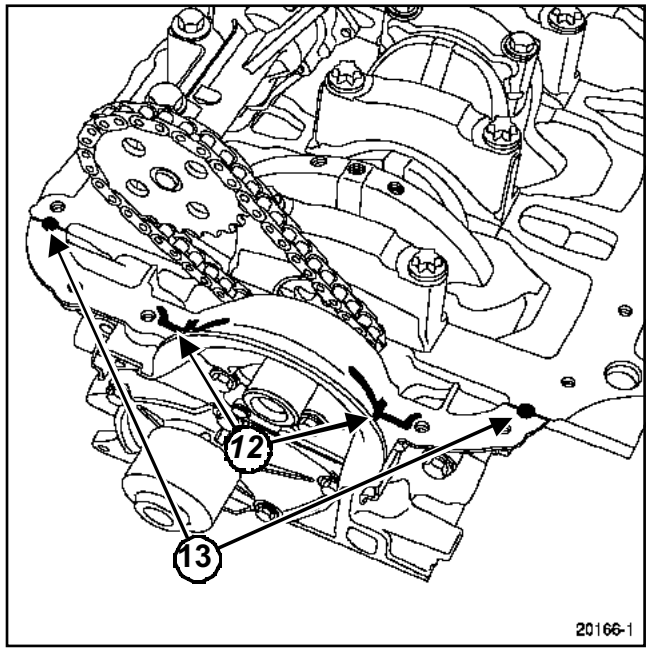
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20165

Refit:

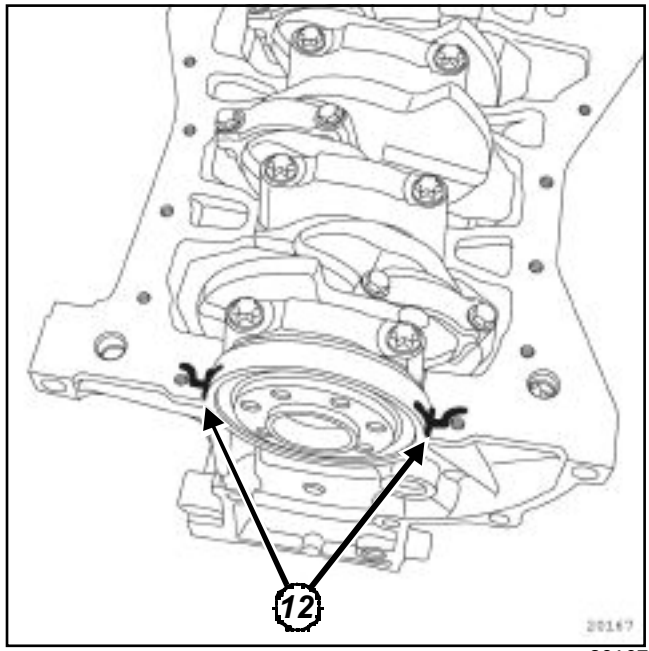
- the crankshaft nose closure unit,
- the crankshaft nose closure unit mounting bolt,

Tighten to torque and in order **the crankshaft nose closure unit mounting bolts (11 ± 1.1 Nm)** .



Apply a drop of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant pump mounting bolts.

Refit:

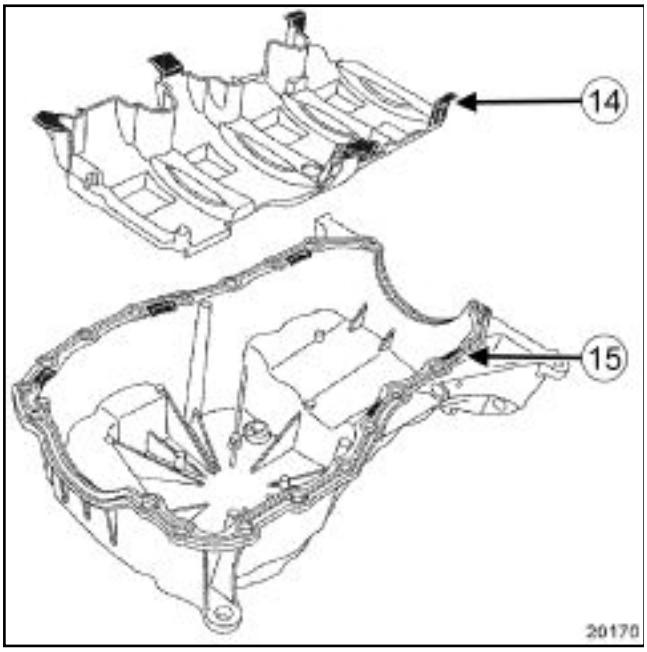


- the coolant pump fitted with a new seal,
- the coolant pump mounting bolts.

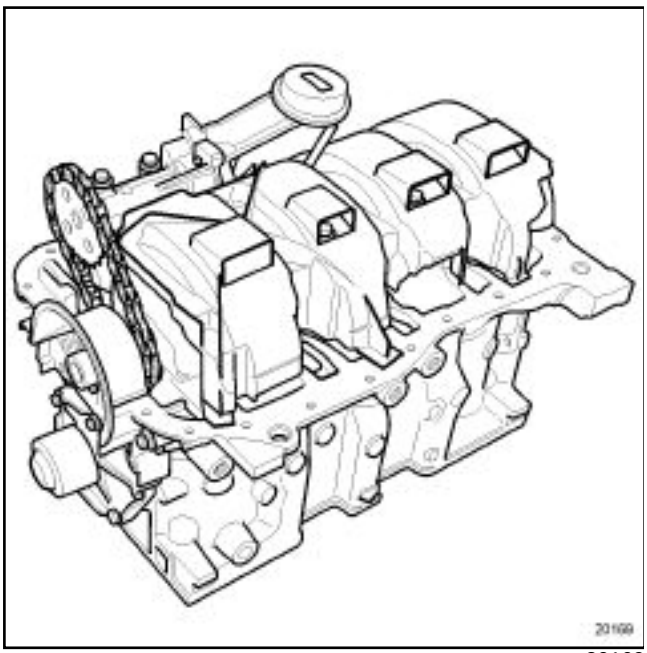
Tighten to torque and in order **the coolant pump mounting bolts (11 ± 1.1 Nm)** .

Using degreaser, degrease the seal surfaces of the lower part of the cylinder block and the oil sump.

20166



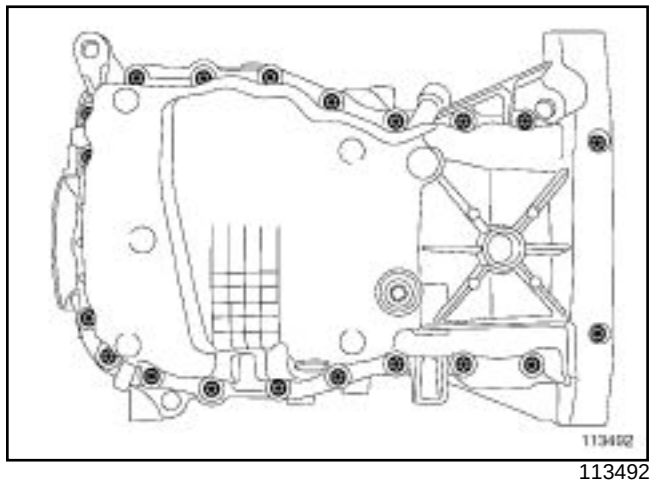
20167



Apply:

- four beads (**12**) of **SILICONE ADHESIVE SEALANT** with a diameter of **5 mm** ,
- two points (**13**) of **SILICONE ADHESIVE SEALANT 5 mm** in diameter, at the connection between the crankshaft nose closure panel and the cylinder block.

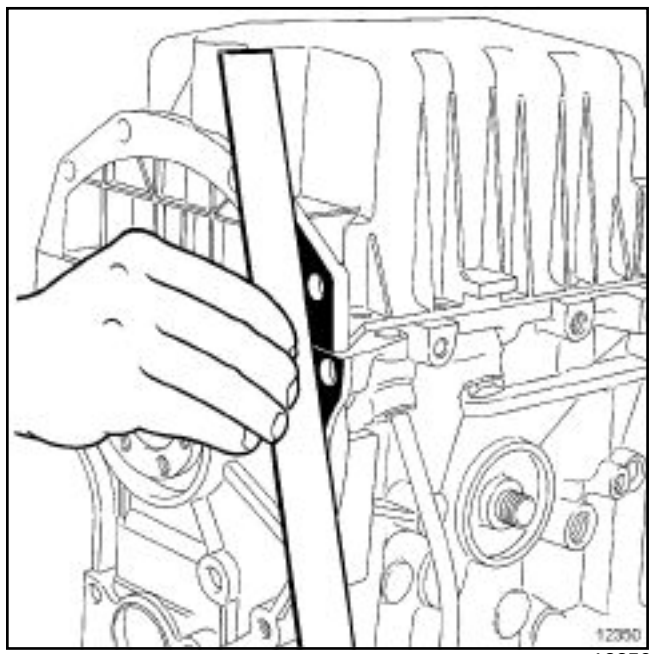
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



20170

20169

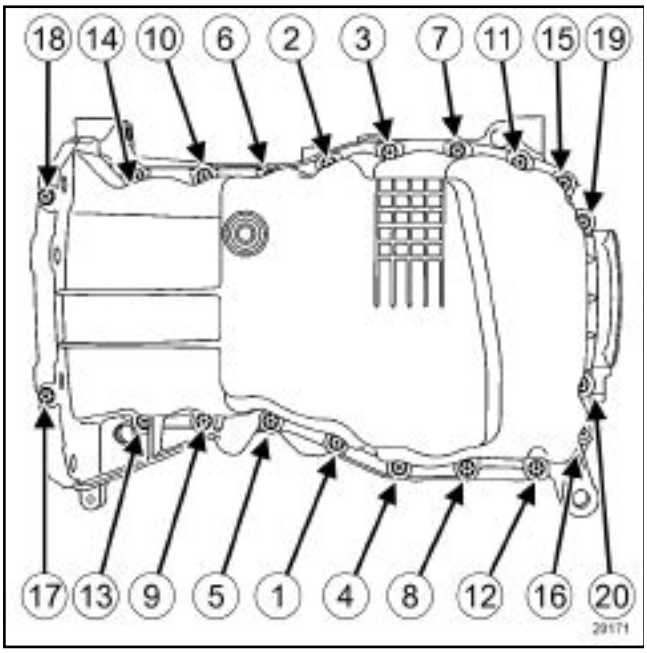
When refitting the engine oil sump check that the lugs (**14**) of the oil splash plate are correctly positioned facing the grooves (**15**) .



Refit the oil splash plate.

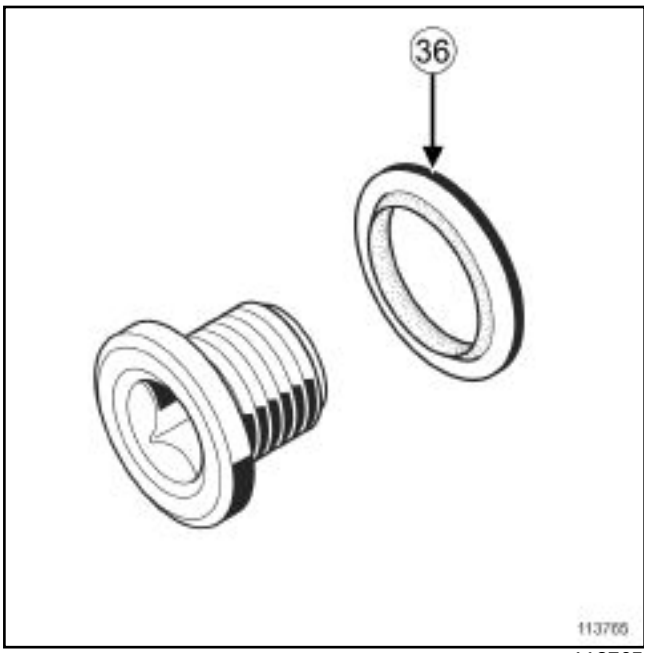
113492

Refit:



- the oil sump mounting seal,
- the engine oil sump,
- the oil sump mounting bolts,

12350

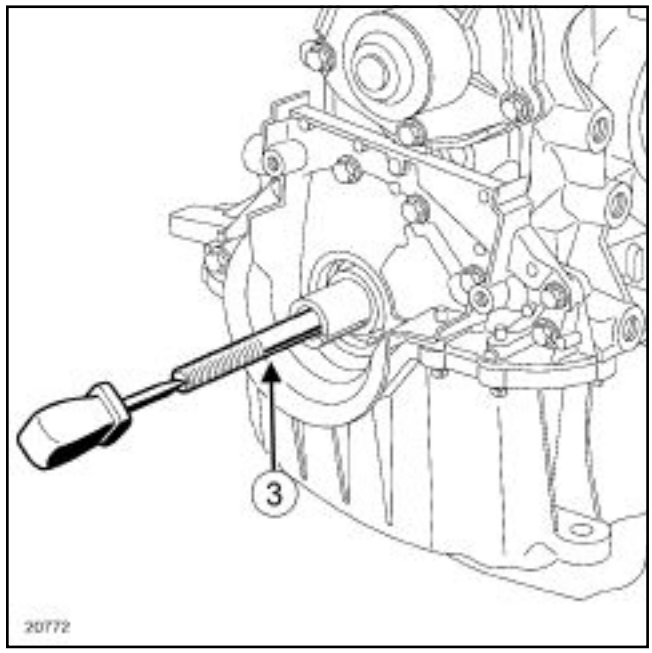


Using a ruler, align the engine oil sump with the cylinder block.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20171

Tighten to torque and in order **the engine oil sump mounting bolts (14 ± 1.4 Nm)** .

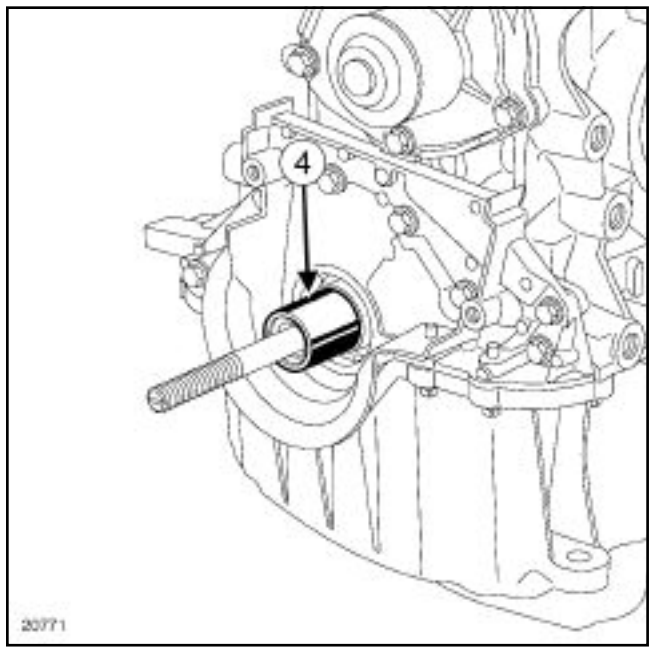


113765

Refit:

- a seal (**36**) on the drain plug of the engine oil sump,
- the drain plug of the engine oil sump, using the **(Mot. 1018)** .

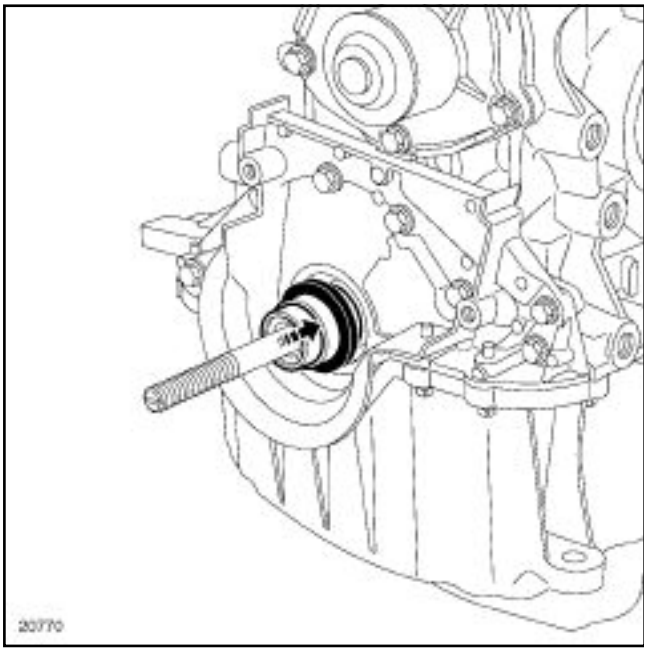
Tighten to torque **the drain plug of the engine oil sump (20 ± 2 Nm)** .



Using degreaser, degrease the seal mating face on the crankshaft and the crankshaft nose closure unit.

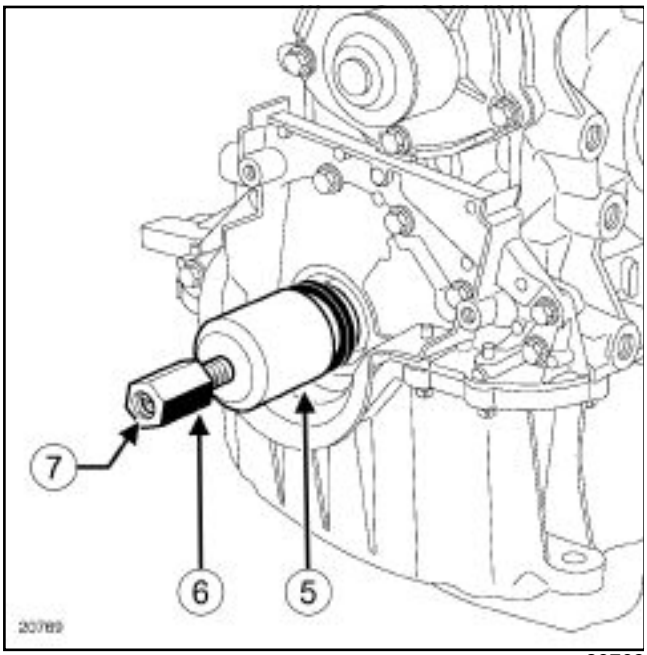
20772

Tighten the threaded rod (**3**) :



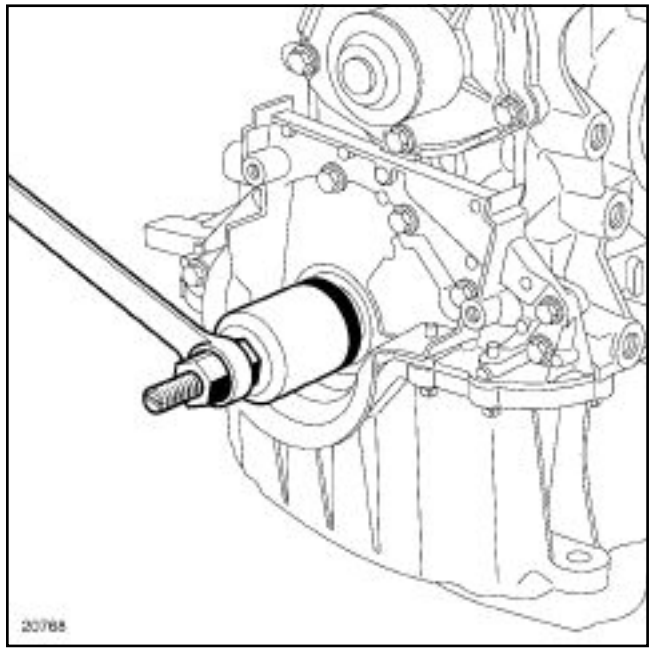
- of tool **(Mot. 1586)** in the crankshaft with an internal thread of **M12** ,
- of tool **(Mot. 1714)** in the crankshaft with an internal thread of **M14** ,

20771



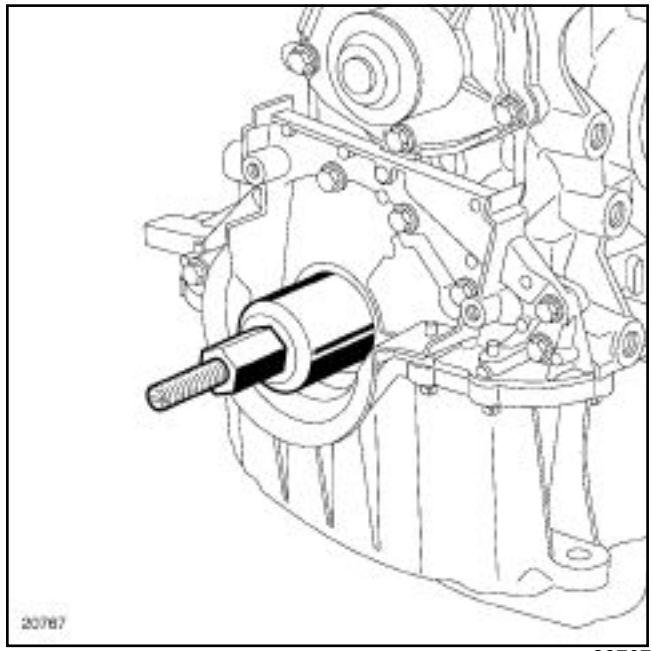
Insert the spacer (**4**) of tool **(Mot. 1586)** in the crankshaft.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



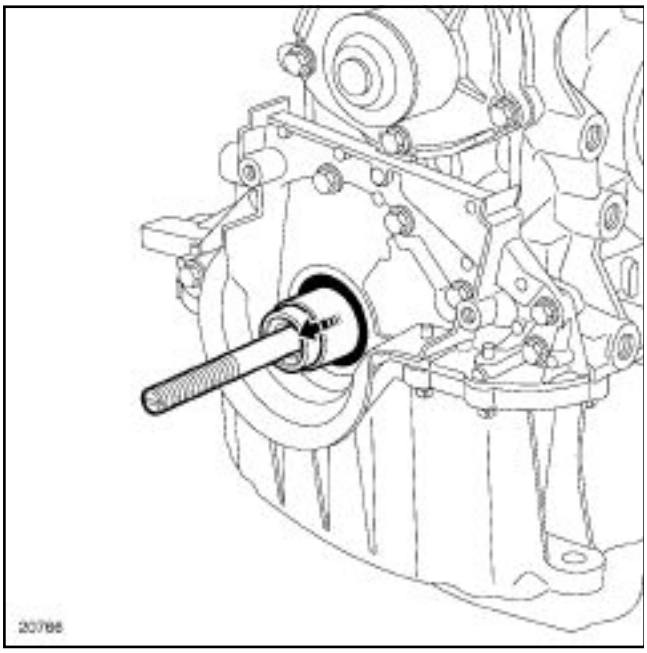
20770

Fit the protector with the new seal in place on the spacer, taking care not to touch the seal.



20769

Fit cover (**5**) and nut (**6**) (with the thread (**7**) of the nut towards the outside of the engine).

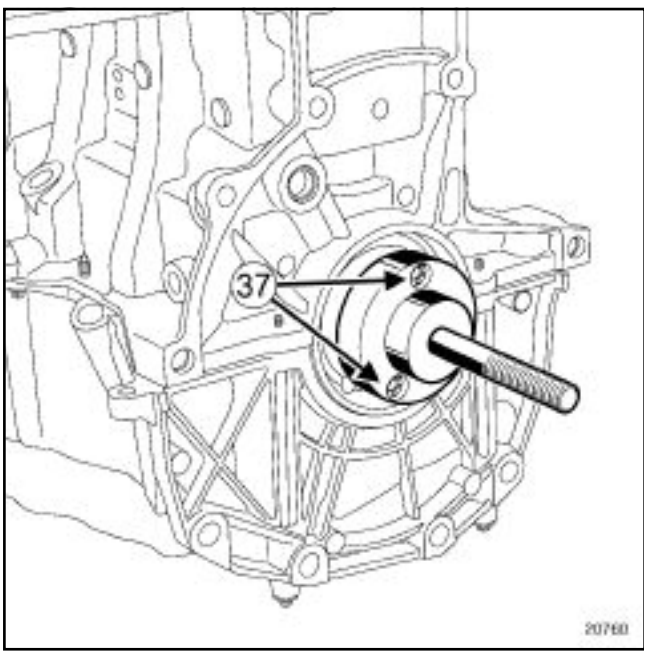


20768

20767

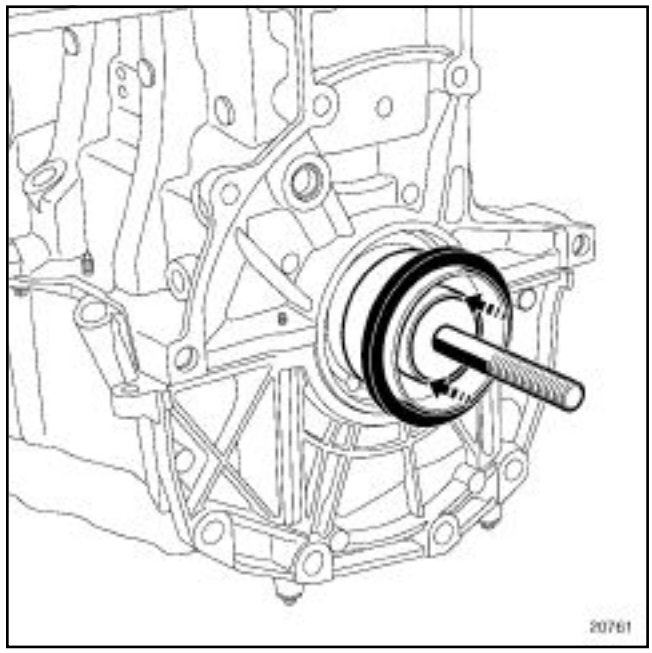
Screw on the nut until the cover touches the spacer.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



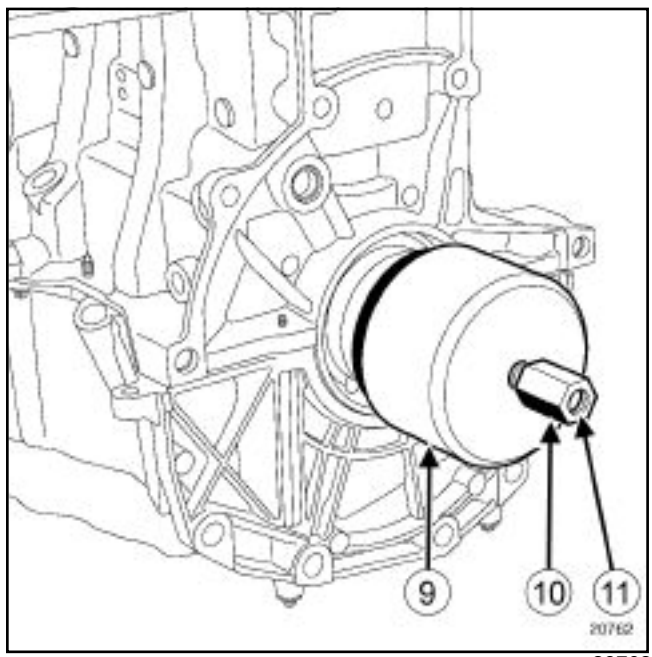
20766

Remove:



- the nut,
- the cap,
- the protector,
- the spacer,
- the threaded rod.

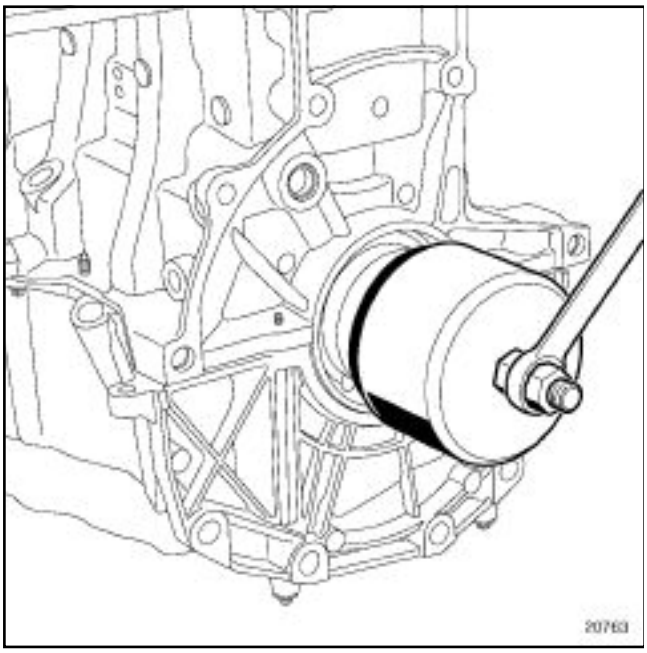
Using degreaser, degrease the seal mating face on the crankshaft and the cylinder block (flywheel end).



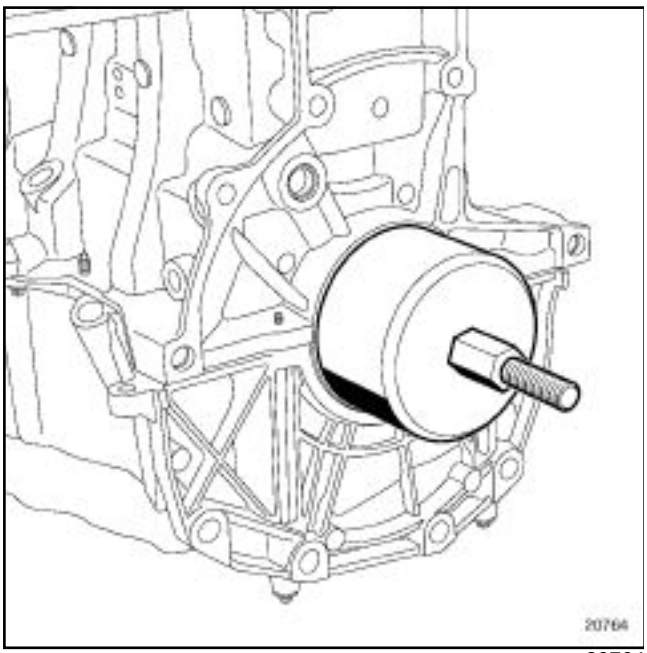
20760

Mount tool **(Mot. 1585)** on the crankshaft, securing it using bolts (**37**) .

20761



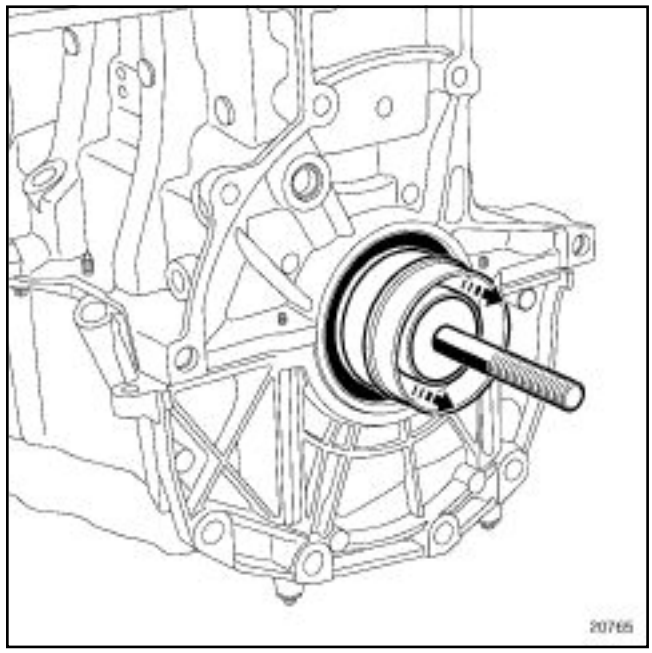
Fit the protector with its seal in place on tool, **(Mot. 1585)** taking care not to touch the seal.



20762

Fit cover (**9**) and nut (**10**) (with the thread (**11**) of the nut towards the outside of the engine).

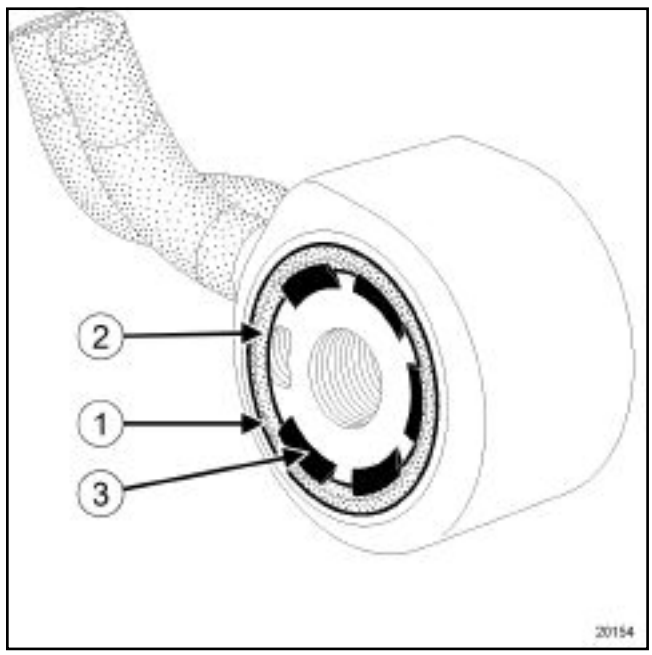
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



20763

20764

Screw on the nut until the cover touches the cylinder block.



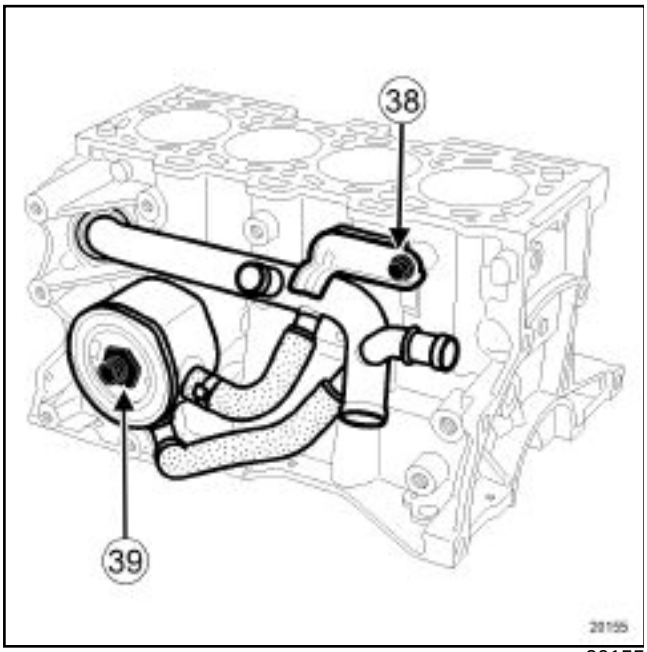
20765

Remove:

- the nut,
- the cap,
- the protector,
- the base.

Using degreaser, degrease the seal mating face of the cylinder block where it receives the coolant / oil heat exchanger.

20154



Replace the seal (**1**) of the coolant / oil heat exchanger, positioning the lip (**2**) of the joint behind the tabs (**3**) of the coolant / oil heat exchanger.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

1 - For engines fixed to the flywheel side

Refit a new o-ring seal to the coolant pump inlet pipe.

Put a little soapy water on the o-ring seal of the coolant pump inlet pipe.

20155

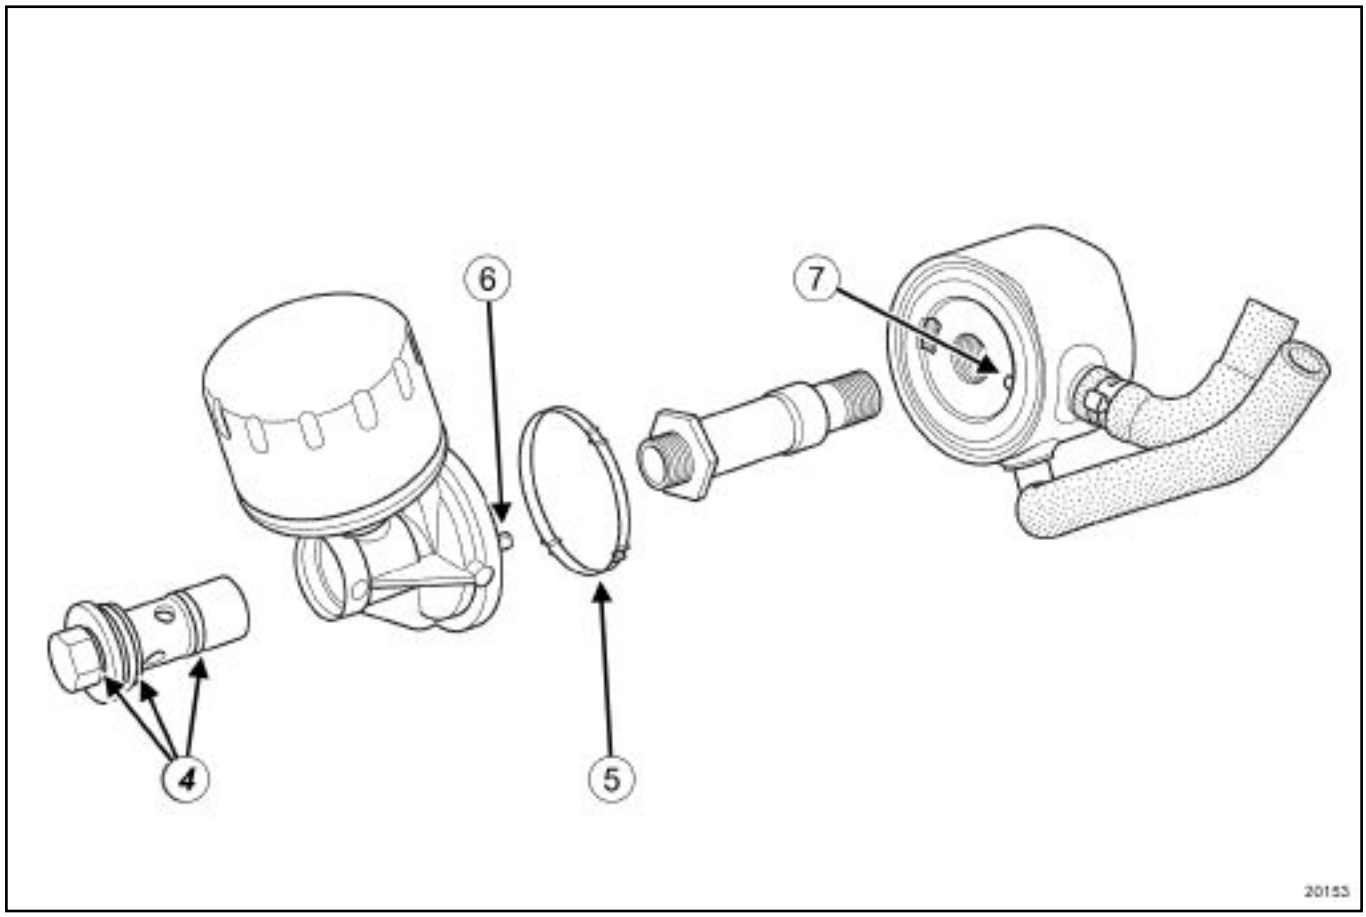
Refit:

- the coolant pump inlet pipe,
- the mounting bolt (**38**) of the coolant pump inlet pipe,

Tighten to torque **the coolant pump pipe mounting bolt (22 ± 2.2 Nm)** .

Position the coolant / oil heat exchanger (fitted with its coolant hoses), enclosing the coolant hoses in the inlet pipe of the coolant pump, in order to position correctly the coolant / oil heat exchanger.

Apply two drops of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant / oil heat exchanger mounting bolt.



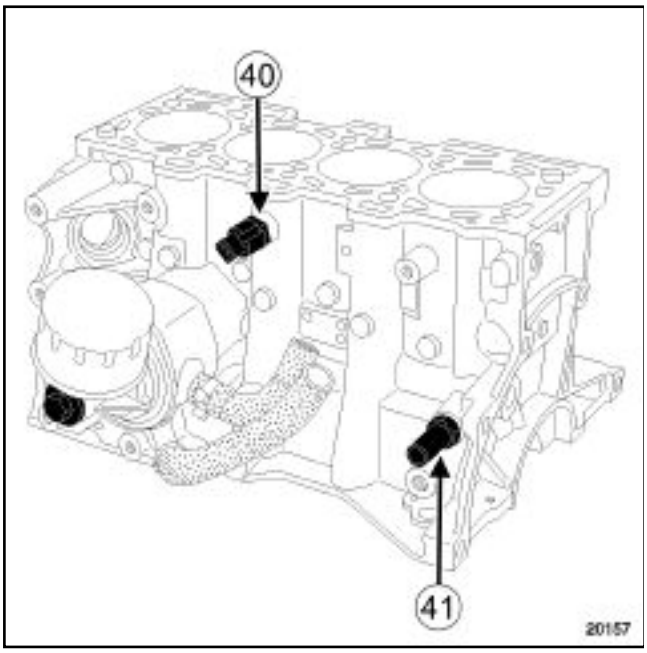
Refit:

- the coolant / oil heat exchanger,
- the mounting bolt (**39**) of the oil / coolant heat exchanger,

Tighten to torque **the coolant / oil heat exchanger mounting bolt (45 ± 4.5 Nm)** .

Using degreaser, degrease the seal mating face of the coolant / oil heat exchanger where it receives the oil filter holder.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



20153

Replace the seals (**4**) and (**5**) .

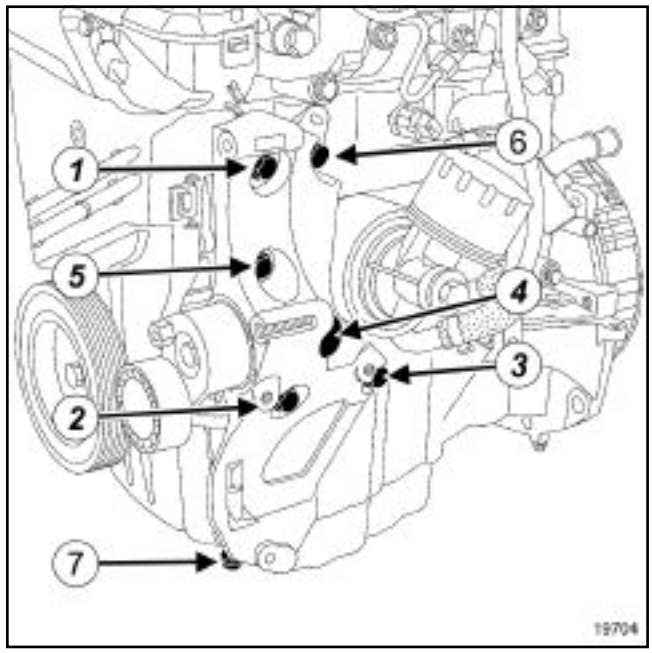
Refit the oil filter holder, positioning the lug (**6**) in the hole (**7**) on the coolant / oil heat exchanger.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20157

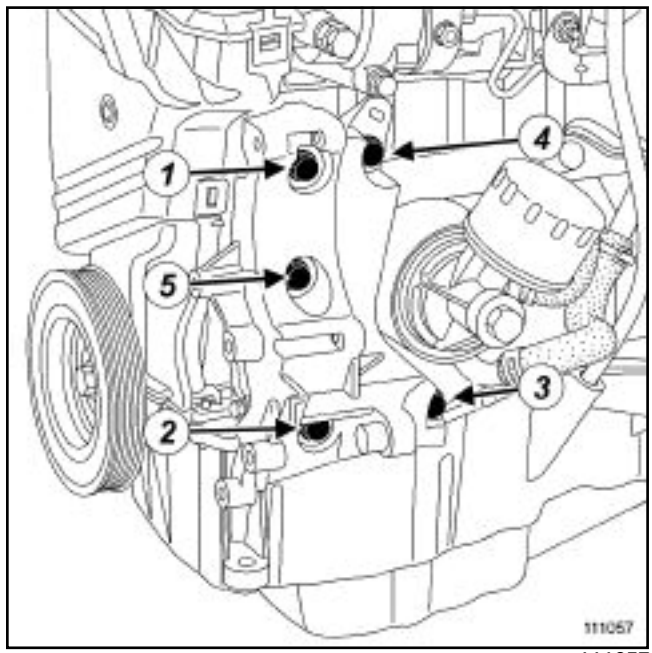
Refit:

- the acceleration meter (**40**) ,
- the oil pressure switch (**41**) .



Tighten to torque:

- **the oil filter holder mounting bolt (45 ± 4.5 Nm)** ,
- **the acceleration meter (20 ± 2 Nm)** using the tool **(Emb. 1596)** ,
- **the oil pressure switch (30 ± 3 to 35 ± 3.5 Nm)** .



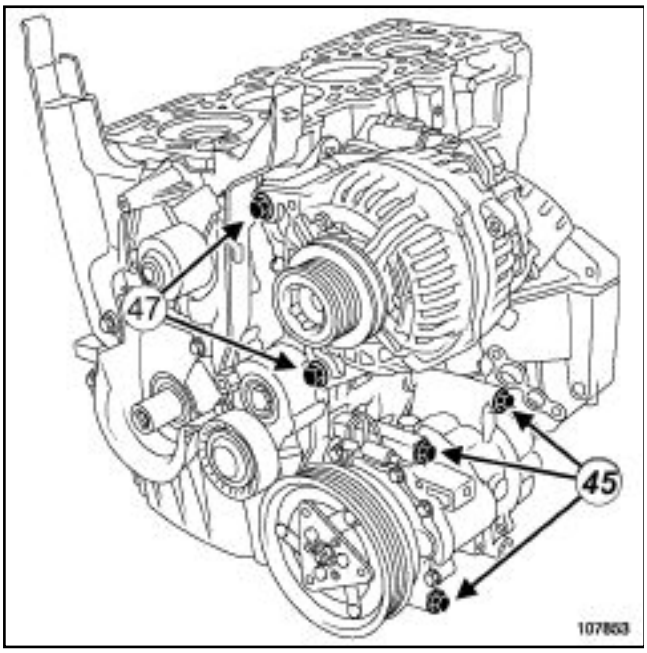
Lubricate the oil filter seal with new engine oil.

Refit the oil filter using the **(Mot. 1329)** .

Tighten to torque **the oil filter (14 ± 2 Nm)** .

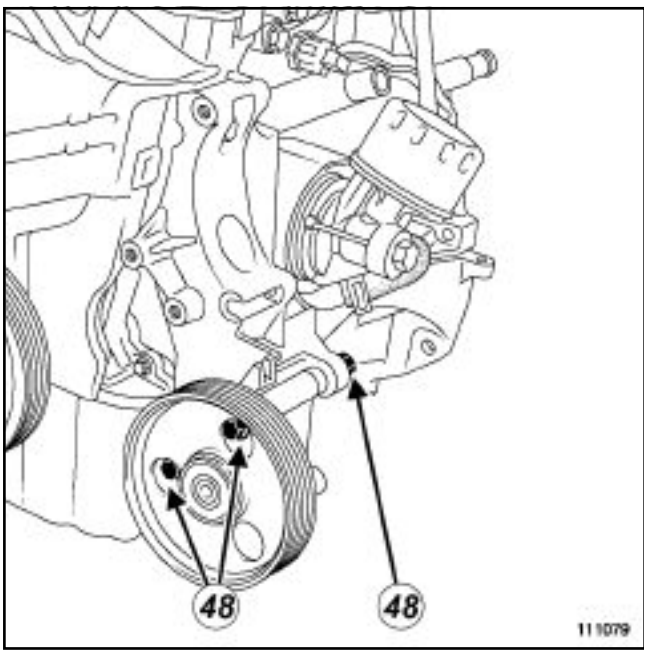
19704

111057



Refit:

- the multifunction support,
- the multifunction support mounting bolts.



Tighten to torque and in order **the multifunction support mounting bolts (from 1 to 6 or from 1 to 5) (44 ± 4.4 Nm)** .

Torque tighten the **multifunction support mounting bolt (7) (21 ± 2.1 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

107853

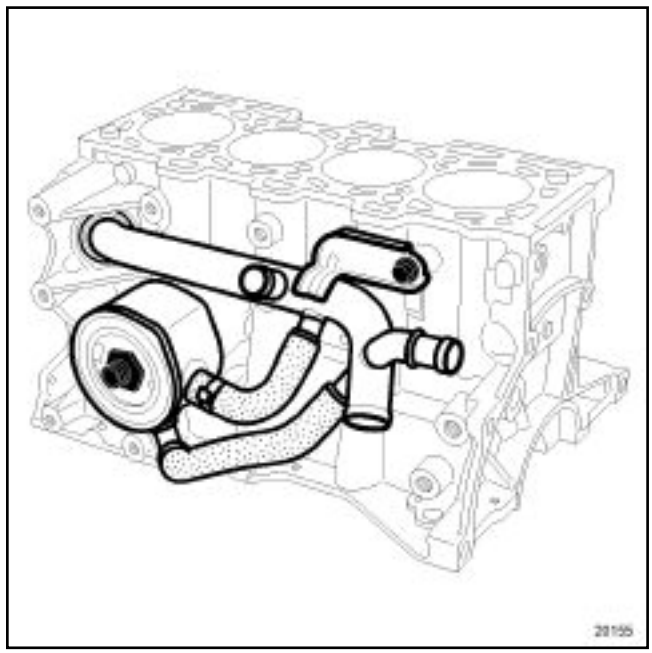
111079

Refit:

- the power assisted steering pump or the dummy pulley,
- the mounting bolts (**48**) of the power assisted steering pump or the dummy pulley,
- the air conditioning compressor (if fitted),
- the air conditioning compressor mounting bolts (**45**) ,
- the alternator,
- the alternator mounting bolts (**47**) .

Tighten to torque:

- **the mounting bolts of the power assisted steering pump or the dummy pulley (21 ± 2.1 Nm)** ,
- **the air conditioning compressor mounting bolts (21 ± 2.1 Nm)** ,
- **the alternator mounting bolts (21 ± 2.1 Nm)** .



2 - For engines fixed to the oil filter side

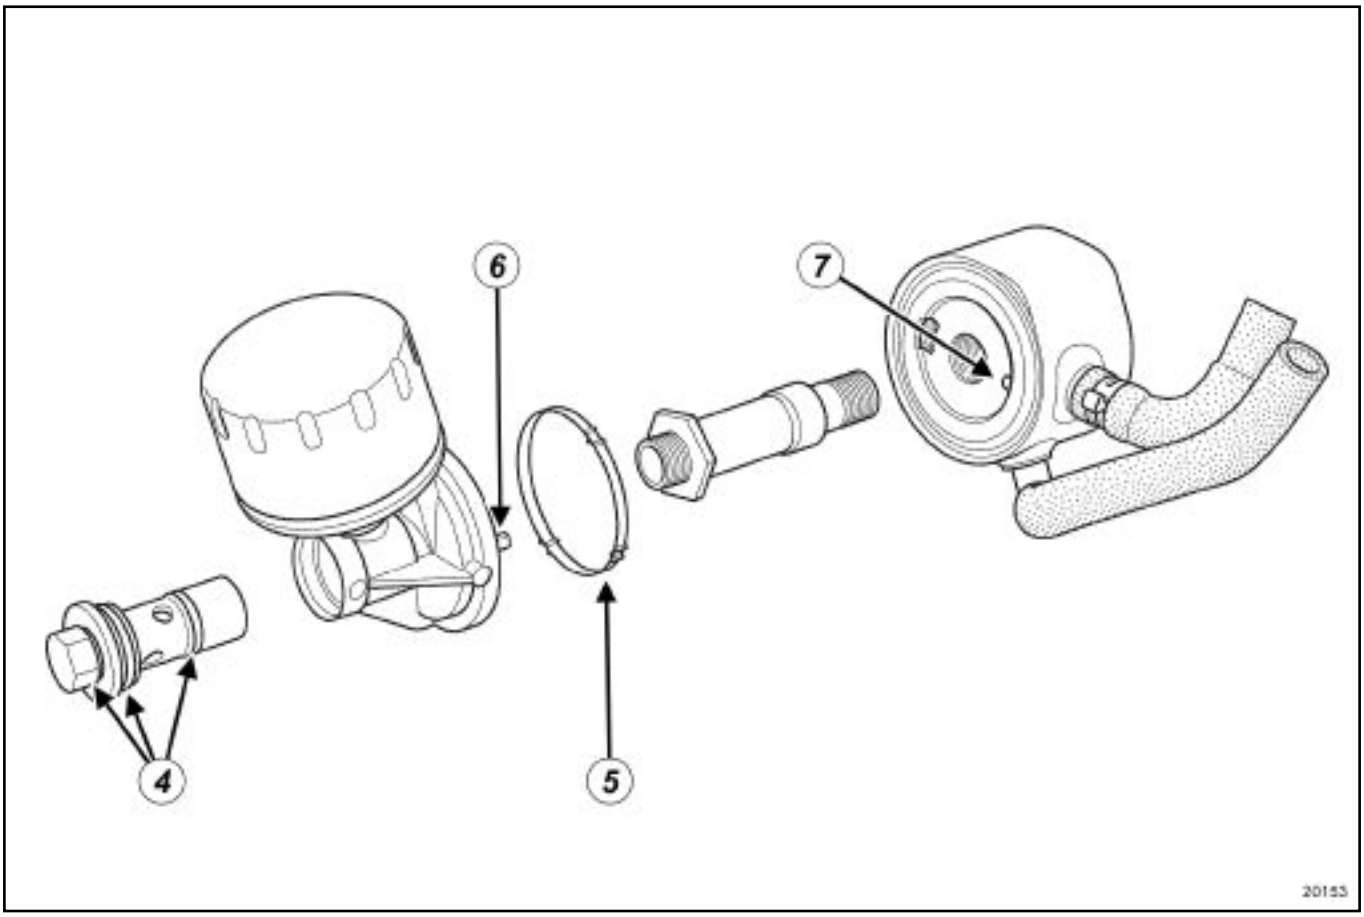
In order to position correctly the coolant / oil heat exchanger on the cylinder block it is essential to remove the cylinder block from the engine support using tool **(Mot. 923)** and a workshop hoist.

Remove the engine spindle from the cylinder block.

Refit:

- the coolant pump inlet pipe,
- the mounting bolt of the coolant pump inlet pipe.

20155



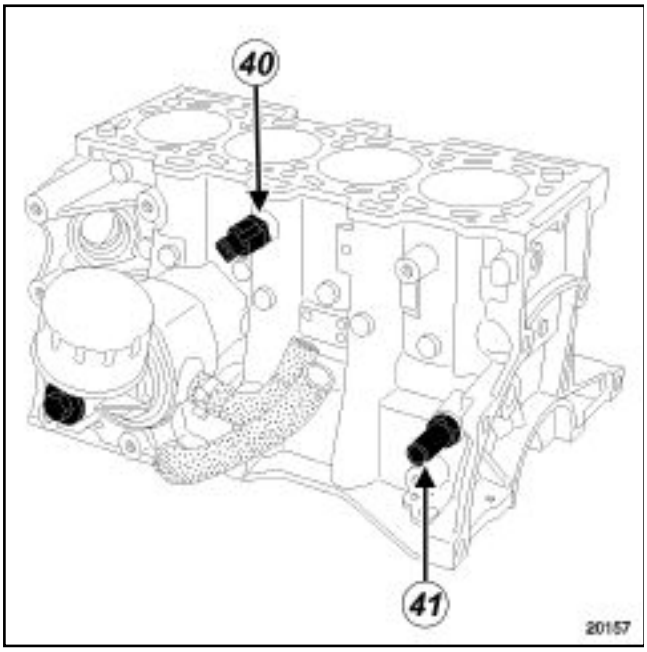
Position the coolant / oil heat exchanger (fitted with its coolant hoses), enclosing the coolant hoses in the inlet pipe of the coolant pump, in order to position correctly the coolant / oil heat exchanger.

Apply two drops of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant / oil heat exchanger mounting bolt.

Tighten to torque **the coolant / oil heat exchanger mounting bolt (45 ± 4.5 Nm)** .

Using degreaser, degrease the seal mating face of the coolant / oil heat exchanger where it receives the oil filter holder.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790



20153

Replace the seals (**4**) and (**5**) .

Refit the oil filter holder, positioning the lug (**6**) in the hole (**7**) on the coolant / oil heat exchanger.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20157

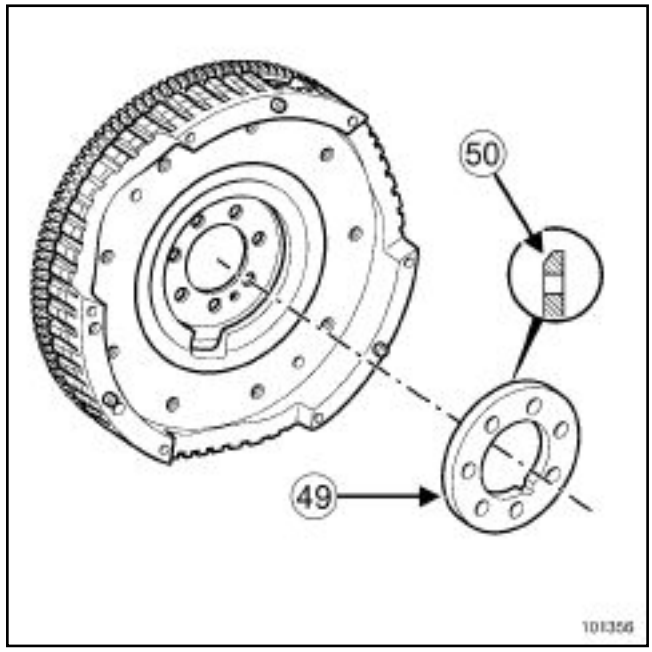
Refit:

- the acceleration meter (**40**) ,
- the oil pressure switch (**41**) .

Tighten to torque:

- **the oil filter holder mounting bolt (45 ± 4.5 Nm)** ,
- **the acceleration meter (20 ± 2 Nm)** using the tool **(Emb. 1596)** ,
- **the oil pressure switch (30 ± 3 to 35 ± 3.5 Nm)** .

Remove the coolant pump inlet pipe.



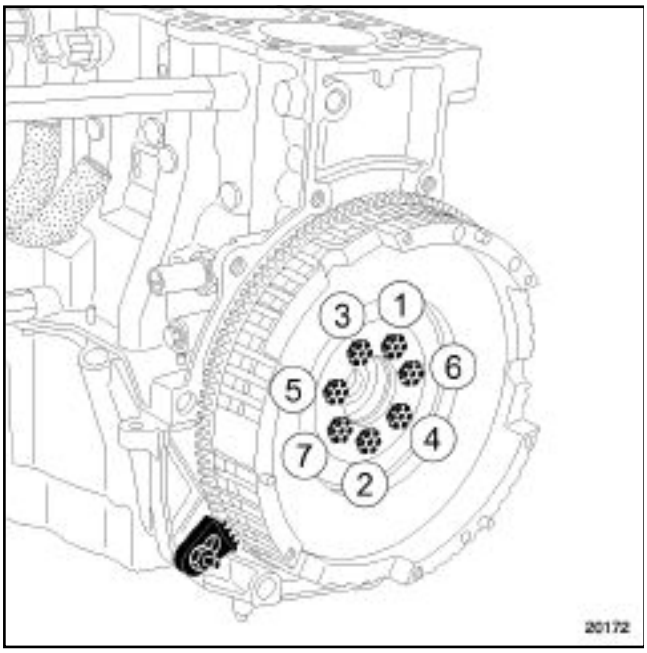
Refit:

- the engine spindle onto the cylinder block.
- the cylinder block onto the engine support.

Lubricate the oil filter seal with new engine oil.

Refit the oil filter using the tool **(Mot. 1329)** .

Tighten to torque the **oil filter (14 ± 2 Nm)** .



101356

Note:

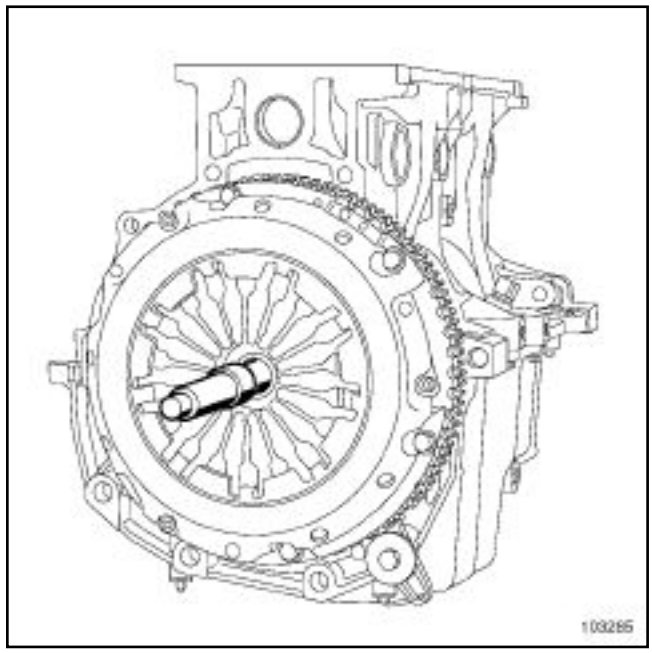
Certain flywheels have a shim (**49**) . **It is essential to position the chamfer** (**50**) **of the shim on the flywheel side** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 722 or 750 or 752 or 790

20172

Refit:

- the flywheel,
- the new flywheel mounting bolts,
- engine flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .



Tighten to torque and in order the **flywheel mounting bolts (55 ± 5.5 Nm)** .

Using degreasing agent, degrease the friction face on the flywheel.

Refit the friction disc (aligning it correctly).

Centre the friction disc using tool **(Emb. 1780)** .

Using degreasing agent, degrease the friction face on the clutch mechanism.

103285

Refit:

- the clutch pressure plate,
- the clutch mechanism mounting bolts.

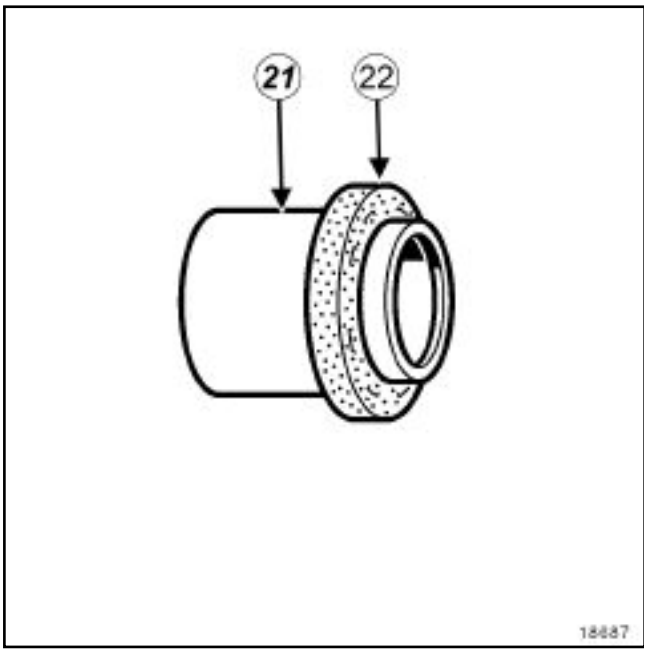
Gradually tighten the mounting bolts of the clutch pressure plate.

Tighten to torque **the clutch mechanism mounting bolts (M6 to 14 ± 1.4 Nm and bolts M7 to 20 ± 2 Nm)** .

Remove engine flywheel locking tool **(Mot. 582-01)** or. **(Mot. 1677)** .

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

Special tooling required	
Mot. 1018	Sump plug tool.
Mot. 1586	Tool for fitting PTFE crankshaft seal, timing end.
Mot. 1714	Adapter for fitting PTFE crankshaft seal, timing end.
Mot. 1585	Tool for fitting PTFE crankshaft seal, flywheel end.
Emb. 1596	24 mm socket for removing/refitting clutch master cylinder.
Mot. 1329	Oil filter removing tool (76 mm diameter).
Mot. 1677	Flywheel locking tool.
Emb. 1780	Set of clutch disc centring mandrels.



Tightening torques ▽	
oil pump mounting bolts	**25 ± 2.5 Nm**
the crankshaft nose closure unit mounting bolts	**11 ± 1.1 Nm**
the coolant pump mounting bolts	**11 ± 1.1 Nm**
the engine oil sump mounting bolts	**14 ± 1.4 Nm**
the drain plug of the engine oil sump	**20 ± 2 Nm**
the coolant pump inlet pipe mounting bolt	**22 ± 2.2 Nm**
the oil level sensor	**25 ± 2.5 Nm**
the acceleration meter	**20 ± 2 Nm**
the coolant/oil heat exchanger mounting bolt	**45 ± 4.5 Nm**
oil filter holder mounting bolt	**45 ± 4.5 Nm**

Tightening torques ▽	
oil filter	**14 ± 2 Nm**
the multifunction support mounting bolts (1 to 6)	**44 ± 4.4 Nm**
multifunction support mounting bolt (7)	**21 ± 2.1 Nm**
the mounting bolts of the power assisted steering pump or the dummy pulley	**21 ± 2.1 Nm**
the air conditioning compressor mounting bolts	**21 ± 2.1 Nm**
the alternator mounting bolts	**21 ± 2.1 Nm**
flywheel mounting bolts	**55 ± 5.5 Nm**
the clutch mechanism mounting bolts	**M6 to 14 ± 1.4 Nm and bolts M7 to 20 ± 2 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

18687

WARNING

This type of seal is very delicate. When handling, it is essential to grip protective piece (**21**) . It is strictly forbidden to touch seal; (**22**) this is to prevent any oil leaks once the oil seal is fitted to the engine.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

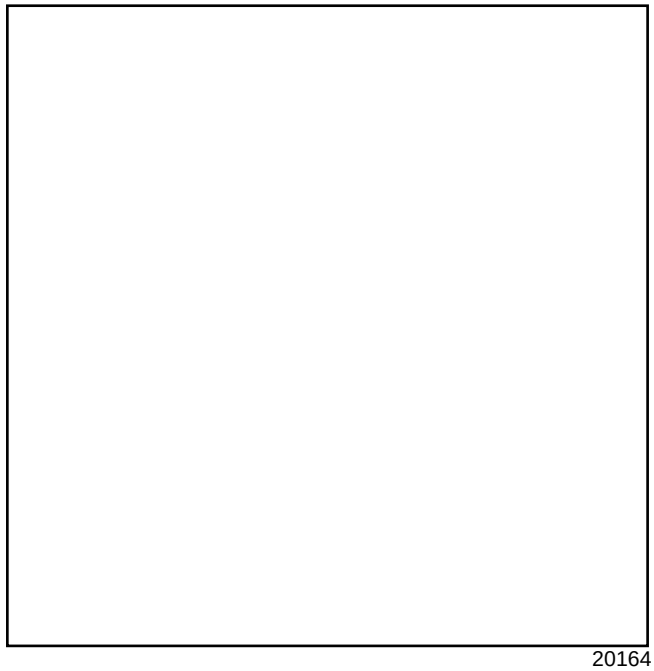
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

- The crankshaft nose closure unit seal,
- The coolant pump seal,
- The oil sump mounting seal,
- The clutch mechanism (if necessary),
- The friction disc (if necessary),
- Flywheel mounting bolt
- The coolant pump inlet pipe seal,
- The oil/coolant heat exchanger seals,
- The crankshaft seal, timing end,
- The crankshaft seal, flywheel end,
- Oil filter,
- The seal of the drain plug of the engine oil sump.

Consumables

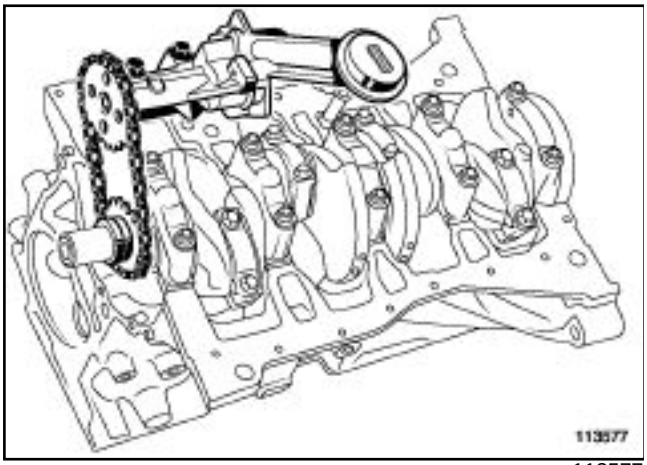


- Degreasing agent, part no. **77 11 224 559** .
- Silicone adhesive sealant, part no. **77 11 227 484** ,
- High-resistance bolt locking product, part no. **77 11 230 112** ,

III - EQUIPMENT REQUIRED

- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Rule,
- Male triangular drive drain plug spanner **8 mm** ,
- Male torx socket.
- Oil can,

IV - REASSEMBLING THE CYLINDER BLOCK



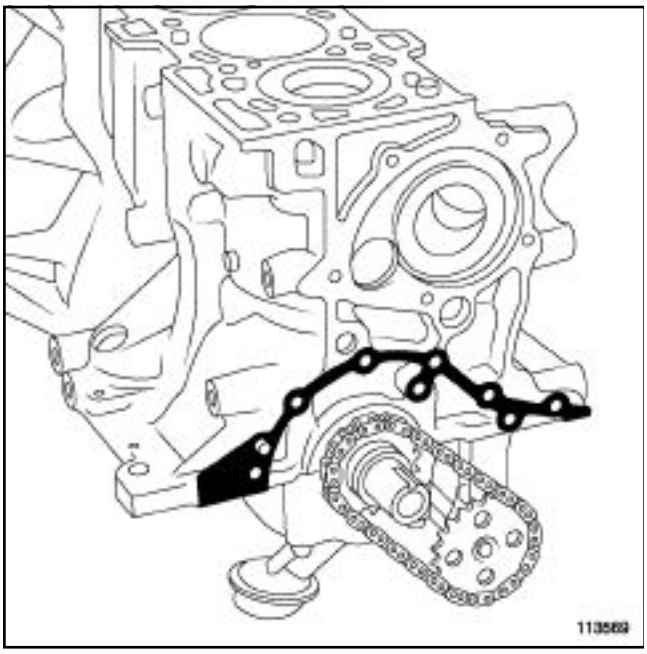
Put a little engine oil from an oil can in the oil pump via the oil sump filter.

20164

Refit:

- the oil pump drive sprocket,
- the oil pump chain.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

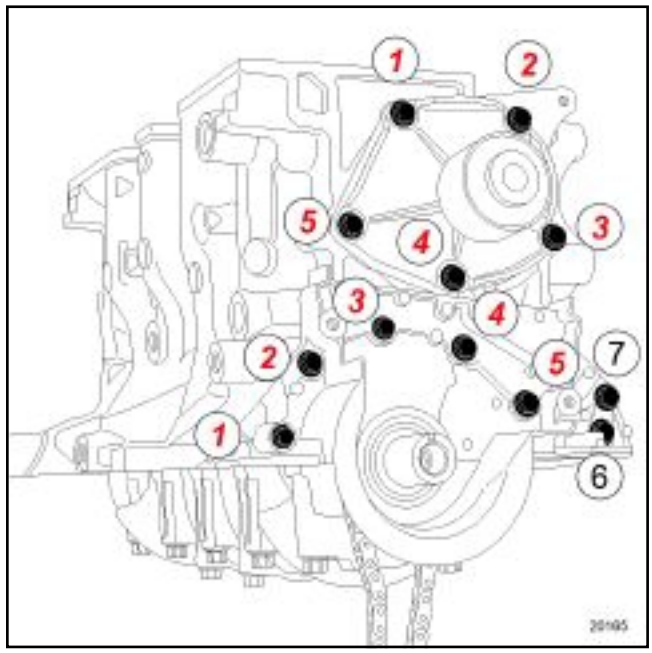


113577

Refit the oil pump.

Tighten to torque the **oil pump mounting bolts (25 ± 2.5 Nm)** .

Apply degreaser to:



- the crankshaft nose closure panel,
- the coolant pump,
- the surface of the seal of the crankshaft nose closure unit on the cylinder block,
- the surface of the coolant pump seal on the cylinder block.

113569

Fit a new seal to the crankshaft nose closure unit.

Check for the centring dowels on the crankshaft nose closure unit.

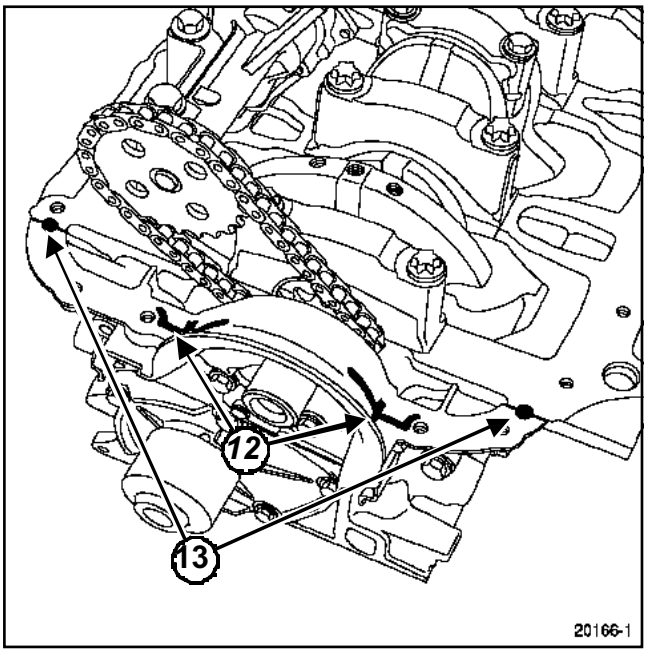
20165

Refit:

- the crankshaft nose closure panel,
- the crankshaft nose closure unit mounting bolt,

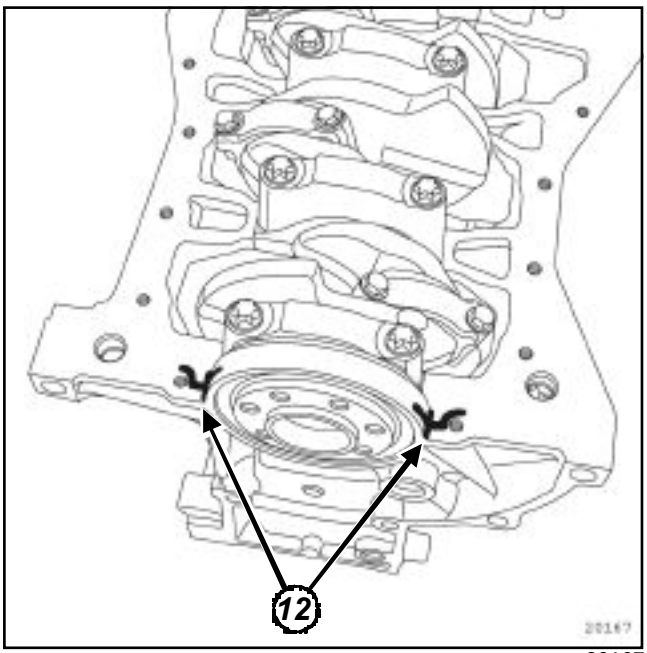
Tighten to torque and in order **the crankshaft nose closure unit mounting bolts (11 ± 1.1 Nm)** .

Apply a drop of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant pump mounting bolts.



Refit:

- the coolant pump fitted with a new seal,
- the coolant pump mounting bolts.

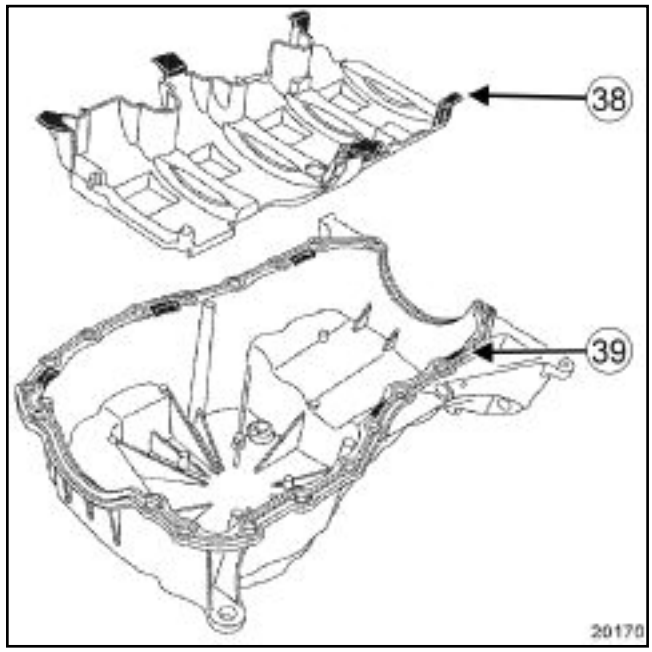


Tighten to torque and in order **the coolant pump mounting bolts (11 ± 1.1 Nm)** .

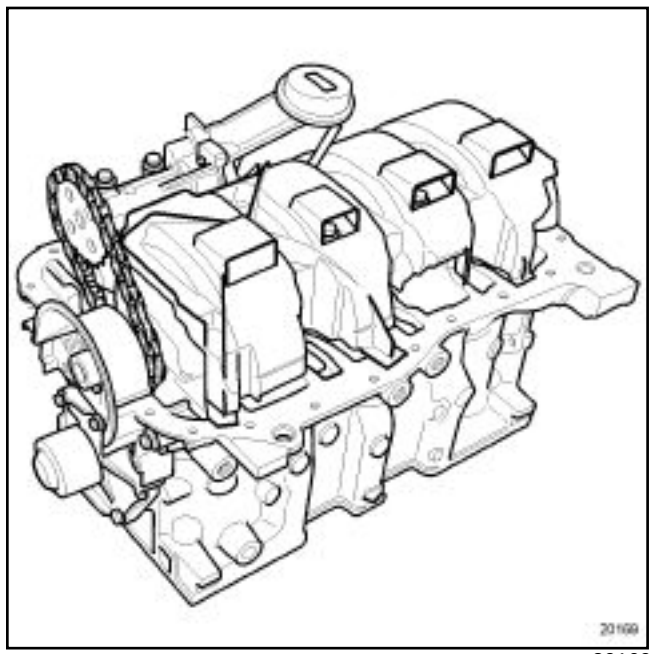
Using degreaser, degrease the seal surfaces of the lower part of the cylinder block and the oil sump.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

20166



20167

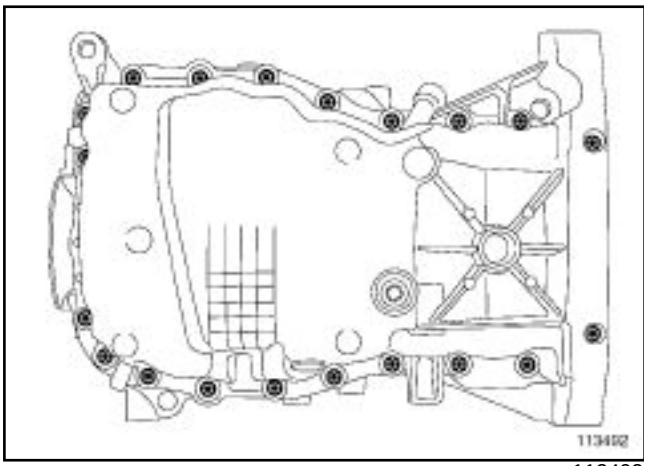


Apply:

- four beads (**12**) of **SILICONE ADHESIVE SEALANT** with a diameter of **5 mm** ,
- two points (**13**) of **SILICONE ADHESIVE SEALANT 5 mm** in diameter, at the connection between the crankshaft nose closure panel and the cylinder block.

K9K, and 712 or 728

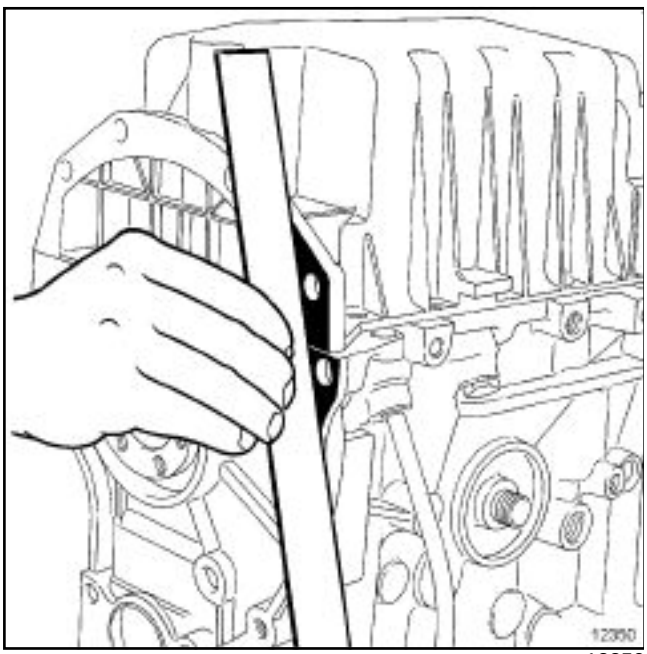
20170



20169

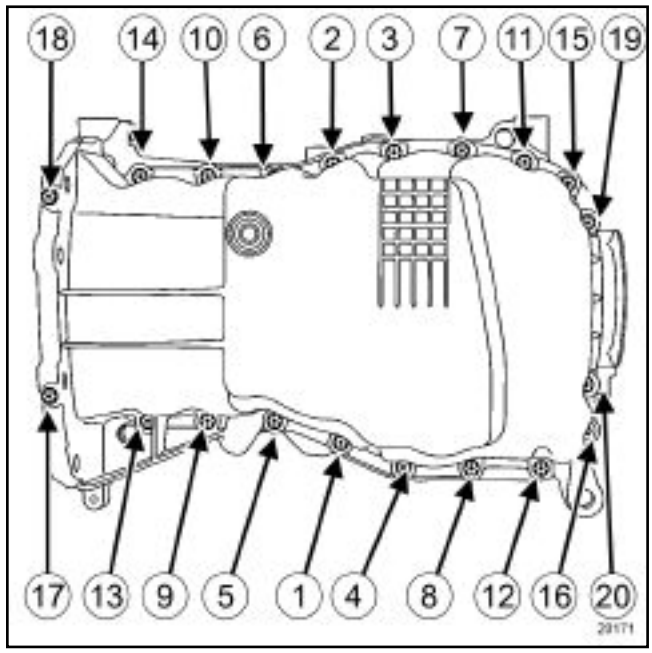
When refitting the engine oil sump check that the tabs (**38**) of the oil splash plate are correctly positioned facing the grooves (**39**) .

Refit the oil splash plate.



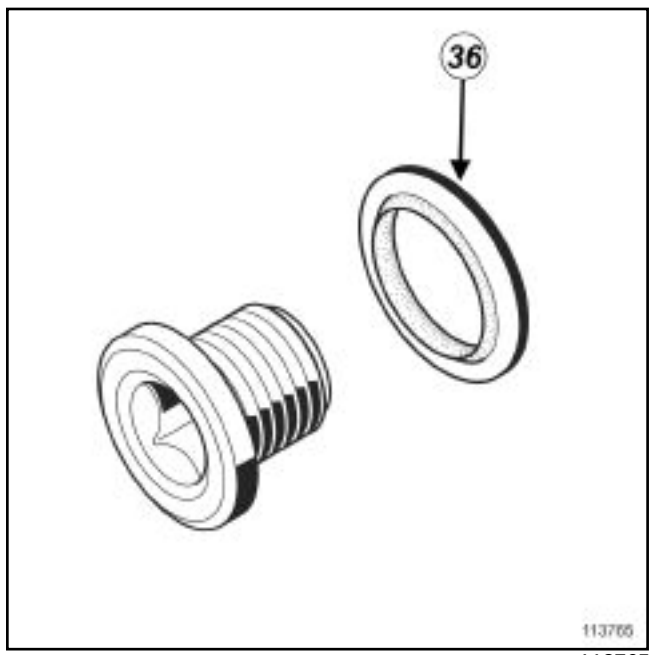
K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

113492



Refit:

- the oil sump mounting seal,
- the engine oil sump,
- the oil sump mounting bolts,



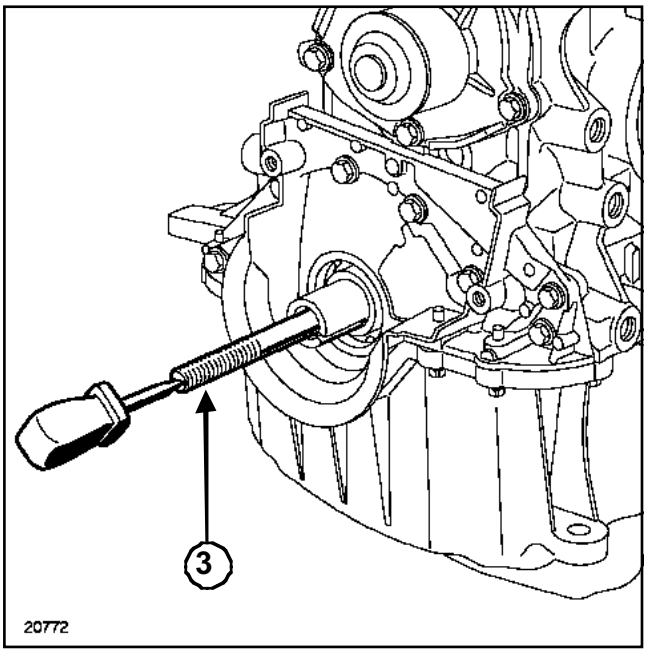
12350

Using a ruler, align the engine oil sump with the cylinder block.

20171

Tighten to torque and in order **the engine oil sump mounting bolts (14 ± 1.4 Nm)** .

113765

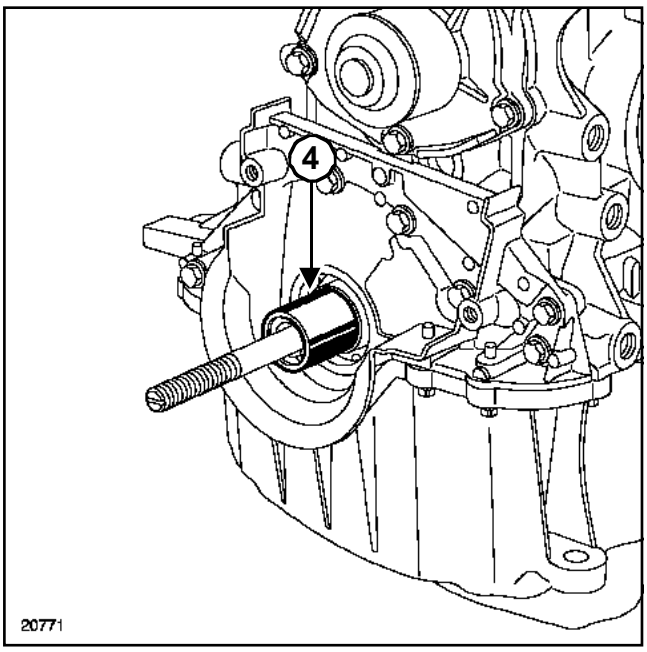


Refit:

- a seal (**36**) on the drain plug of the engine oil sump,
- the drain plug of the engine oil sump, using the **(Mot. 1018)** .

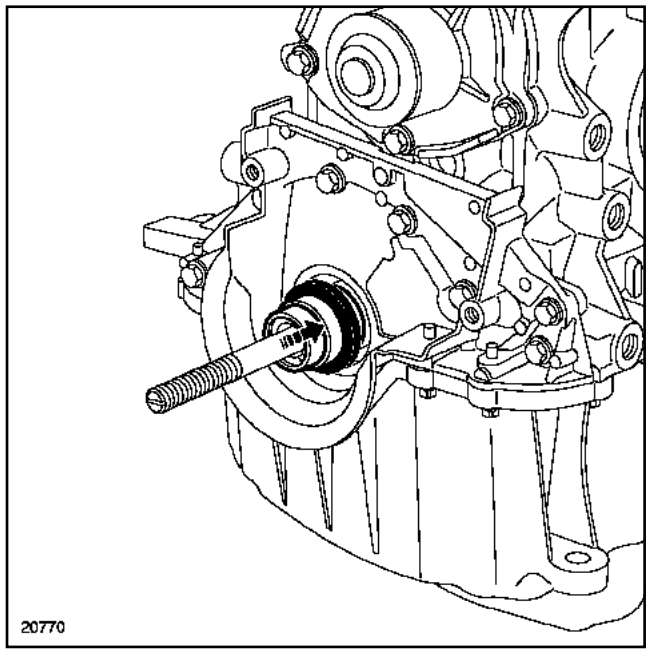
Tighten to torque **the drain plug of the engine oil sump (20 ± 2 Nm)** .

Using degreaser, degrease the seal mating face on the crankshaft and the crankshaft nose closure unit.



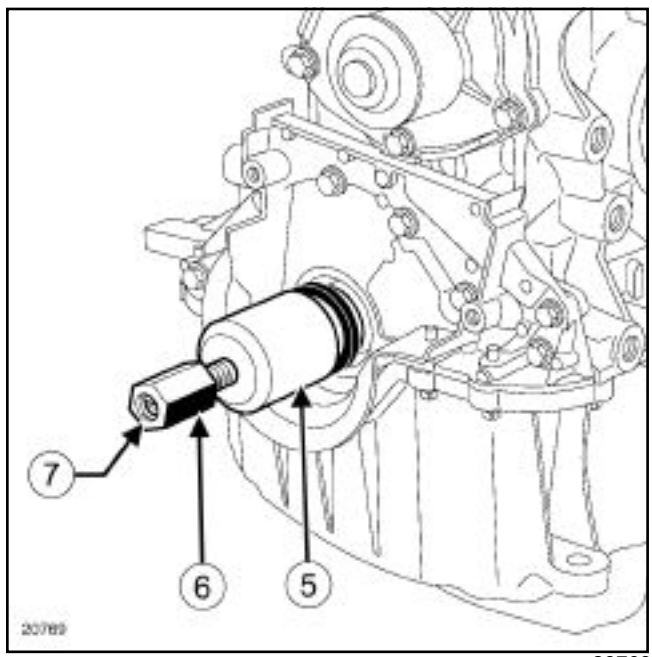
K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

20772



Tighten the threaded rod (**3**) :

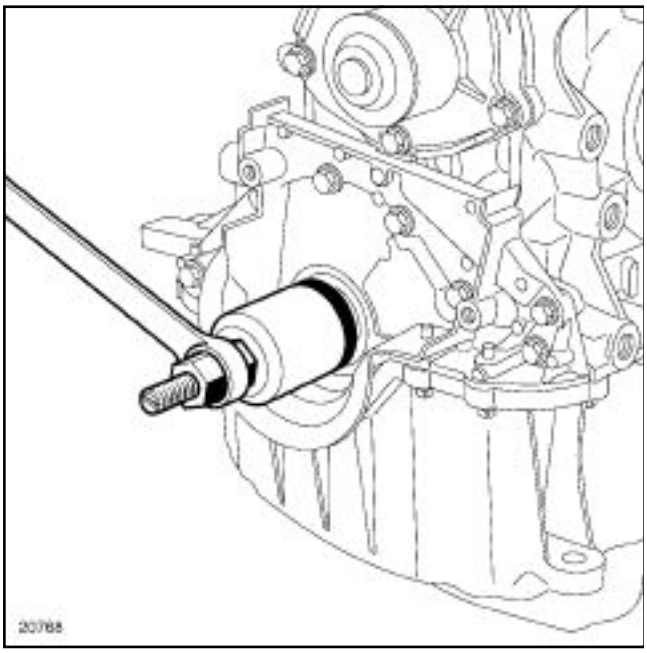
- of the **(Mot. 1586)** in the crankshaft with a **M12** thread hole,
- of the **(Mot. 1714)** in the crankshaft with a **M14** thread hole,



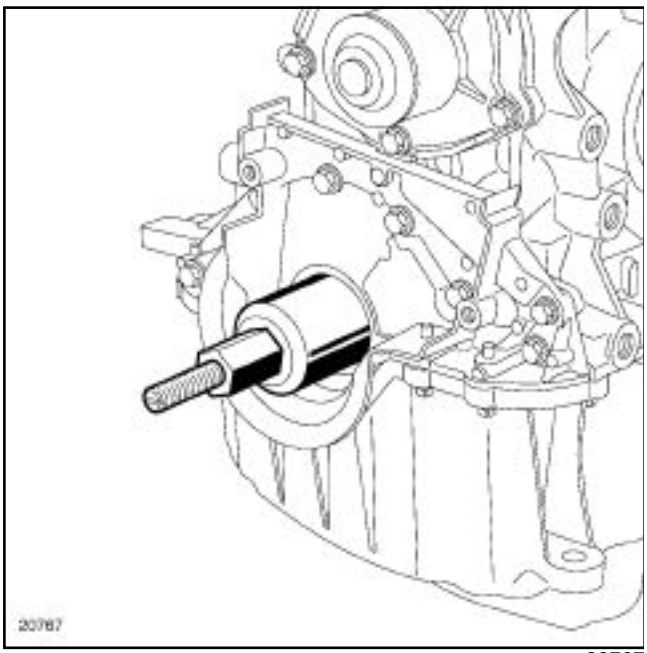
20771

Insert the spacer (**4**) of the **(Mot. 1586)** in the crankshaft.

20770



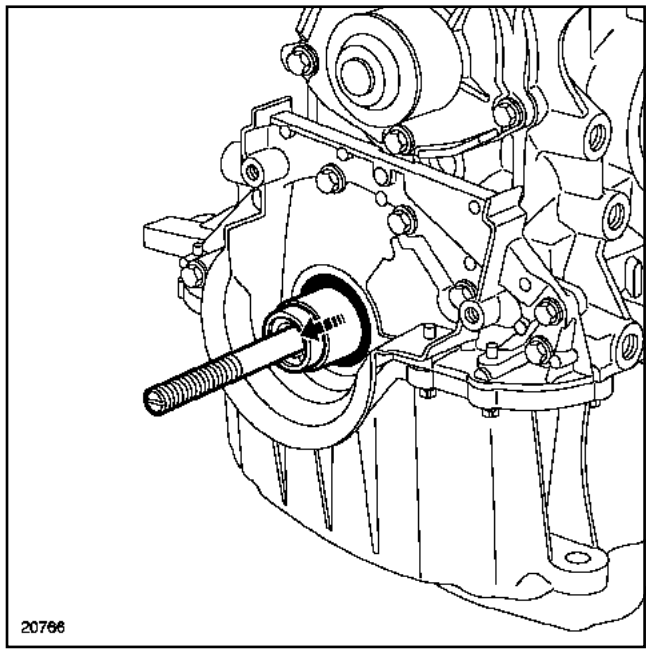
Fit the protector with the new seal in place on the spacer, taking care not to touch the seal.



20769

Fit cover (**5**) and nut (**6**) (with the thread (**7**) of the nut towards the outside of the engine).

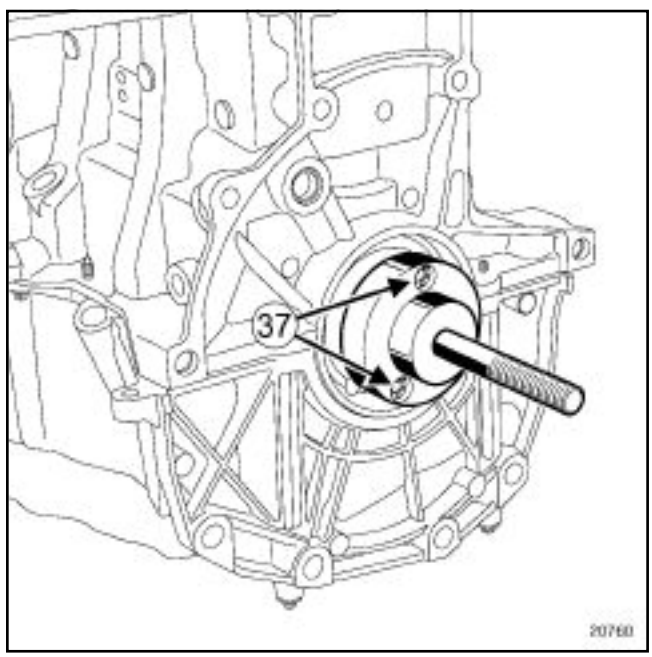
K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768



20768

20767

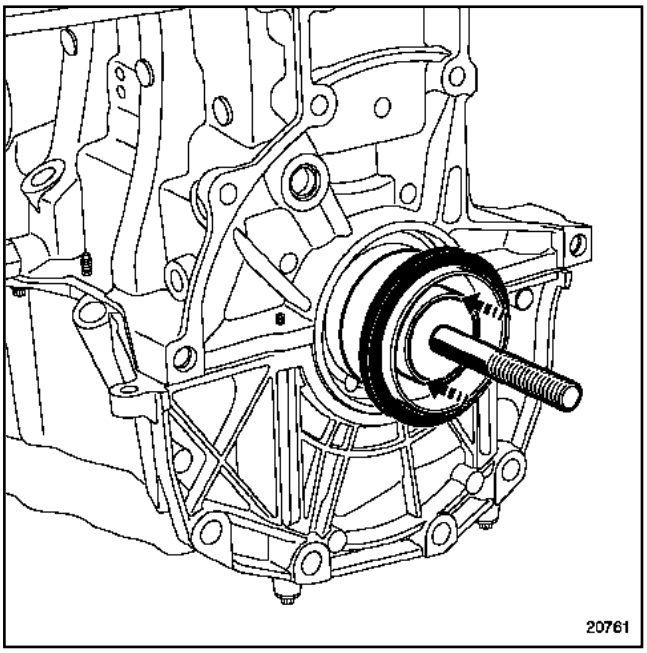
Screw on the nut until the cover touches the spacer.



20766

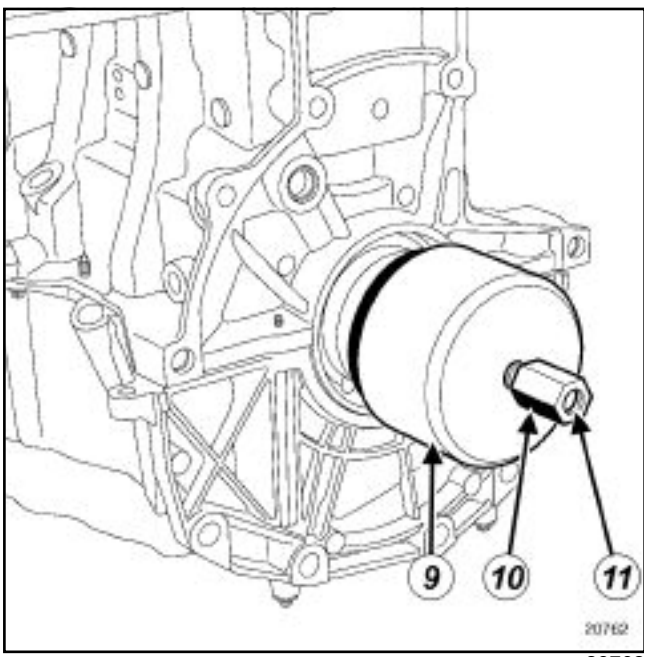
Remove

- the nut,
- the cap,
- the protector,
- the spacer,
- the threaded rod.



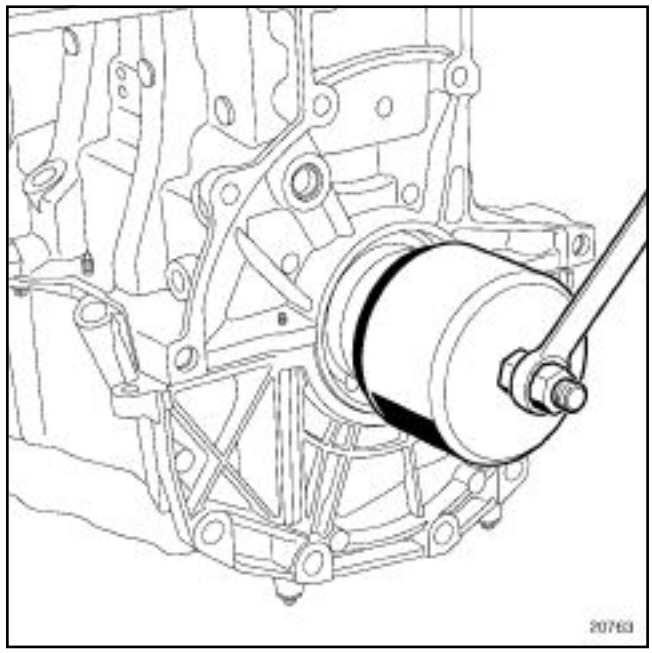
Using degreaser, degrease the seal mating face on the crankshaft and the cylinder block (flywheel end).

20760



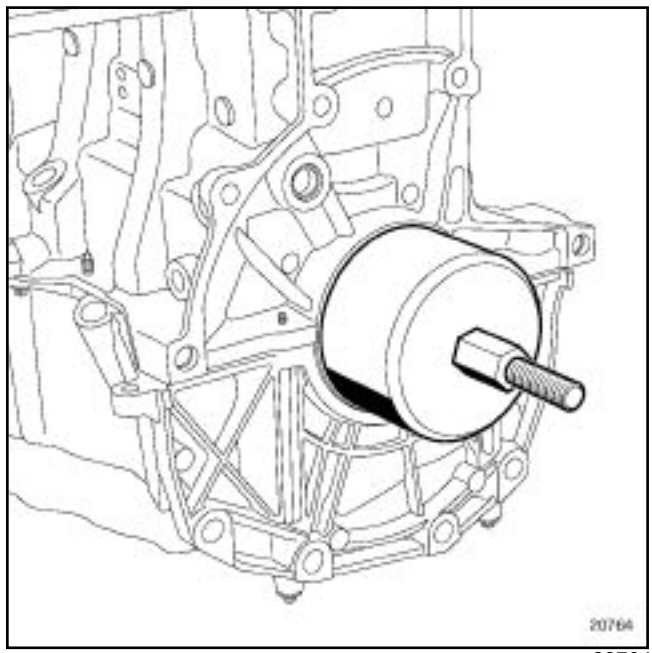
Mount the **(Mot. 1585)** on the crankshaft, securing it using bolts (**37**) .

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768



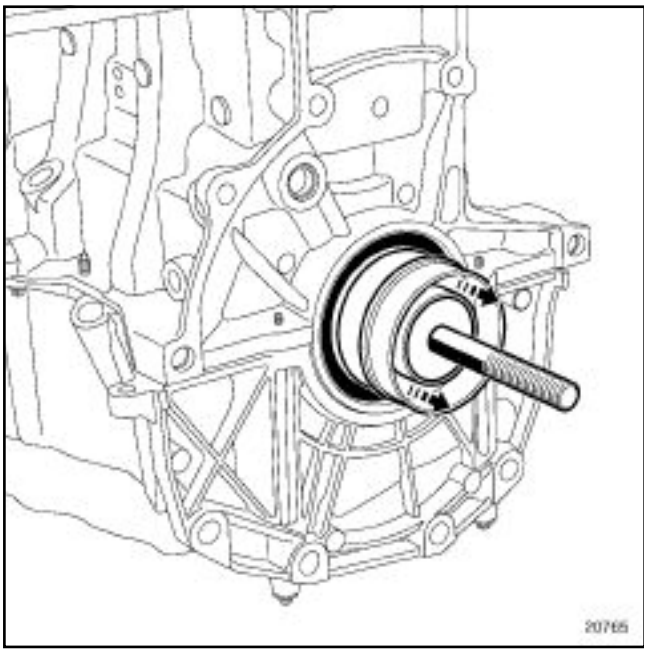
20761

Fit the protector with its seal in place on the **(Mot. 1585)** , taking care not to touch the seal.



20762

Fit cover (**9**) and nut (**10**) (with the thread (**11**) of the nut towards the outside of the engine).

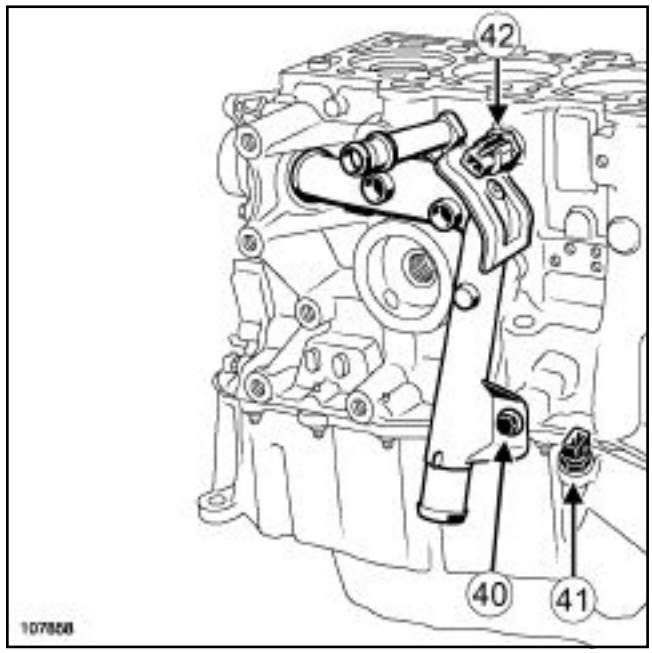


20763

20764

Screw on the nut until the cover touches the cylinder block.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768



20765

Remove:

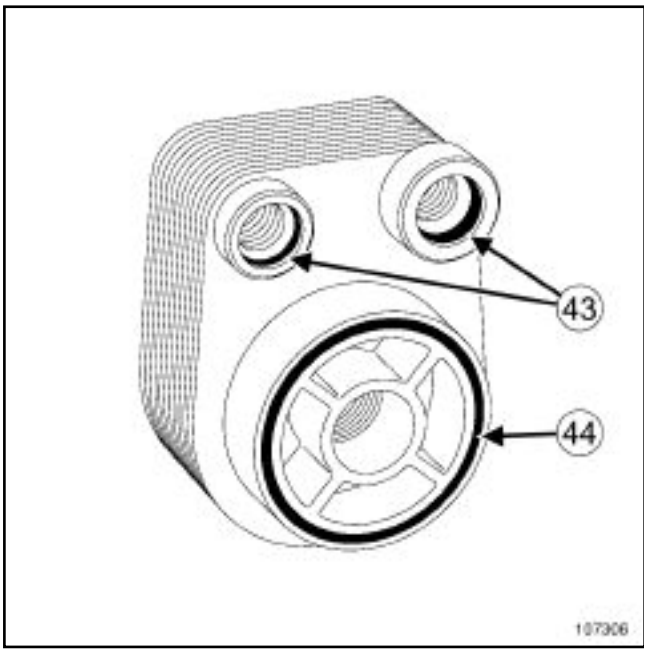
- the nut,
- the cap,
- the protector,
- the base.

Refit a new O-ring seal to the coolant pump inlet pipe.

Put a little soapy water on the O-ring seal of the coolant pump inlet pipe.

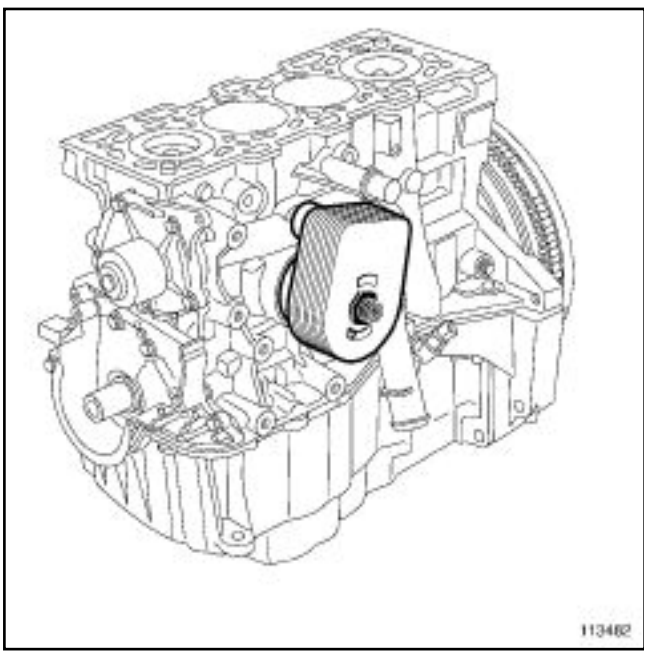
107858

Refit:



- the coolant pump inlet pipe,
- the mounting bolt (**40**) of the coolant pump inlet pipe,
- the oil level sensor (**41**) ,
- the acceleration meter (**42**) .

Tighten to torque:



- **the coolant pump inlet pipe mounting bolt (22 ± 2.2 Nm)** .
- **the oil level sensor (25 ± 2.5 Nm)** .
- **the acceleration meter (20 ± 2 Nm)** using the **(Emb. 1596)** .

Using degreaser, degrease the seal mating face of the cylinder block where it receives the coolant / oil heat exchanger.

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

107306

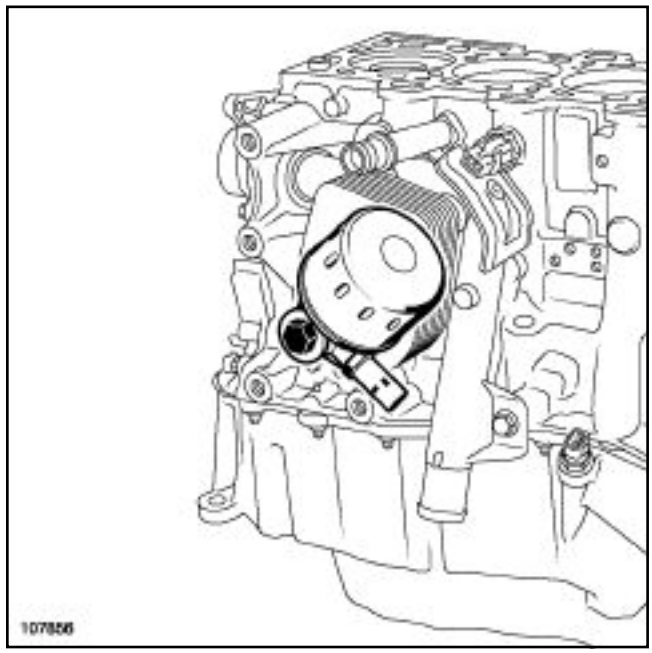
113482

Fit the new seals (**43**) and (**44**) on the coolant/oil heat exchanger.

Apply soapy water to the two seals (**43**) in contact with the inlet pipe of the coolant pump.

Apply two drops of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant/oil heat exchanger mounting bolt.

Refit:



- the coolant/oil heat exchanger,
- the mounting bolt of the oil/coolant heat exchanger,

Tighten to torque **the coolant/oil heat exchanger mounting bolt (45 ± 4.5 Nm)** .

Using degreaser, degrease the seal mating face of the coolant / oil heat exchanger where it receives the oil filter holder.

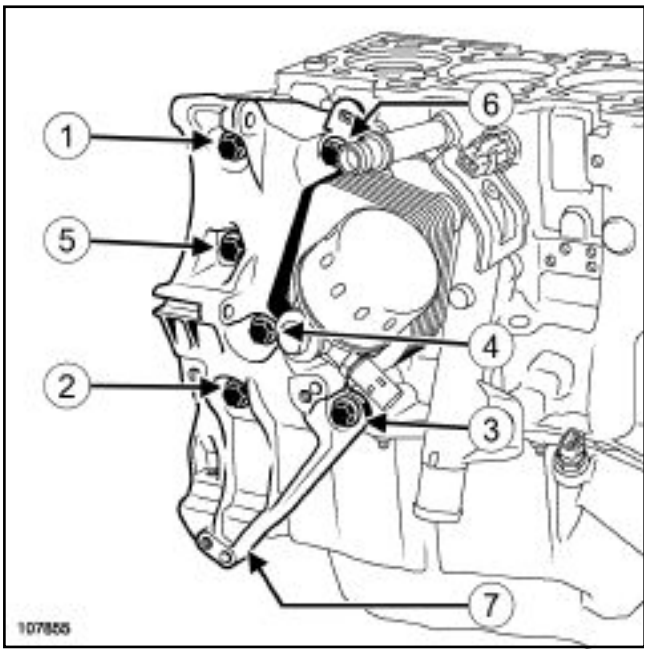
Refit:

- a new seal on the oil filter holder,
- a new seal on the oil filter holder mounting bolt.

107856

Refit:

- the oil filter holder,
- the oil filter holder mounting bolt



Tighten to torque the **oil filter holder mounting bolt (45 ± 4.5 Nm)** .

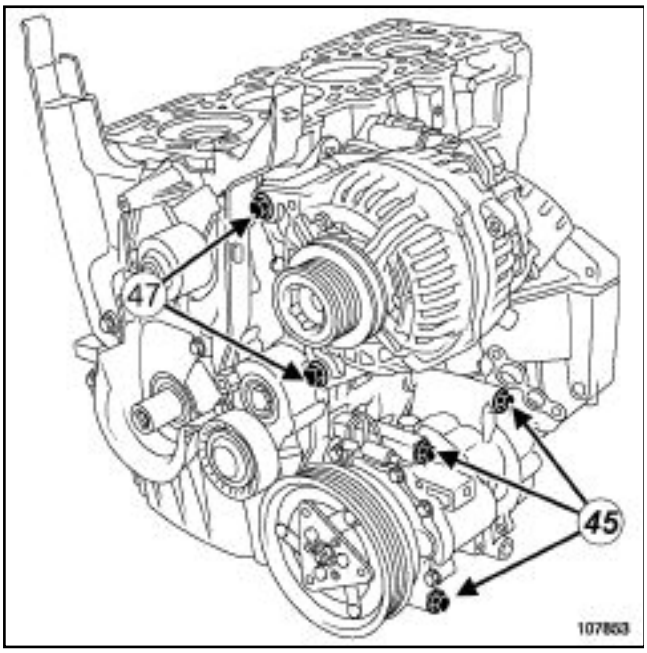
Lubricate the oil filter seal with new engine oil.

Refit the oil filter using the **(Mot. 1329)** .

Tighten to torque the **oil filter (14 ± 2 Nm)** .

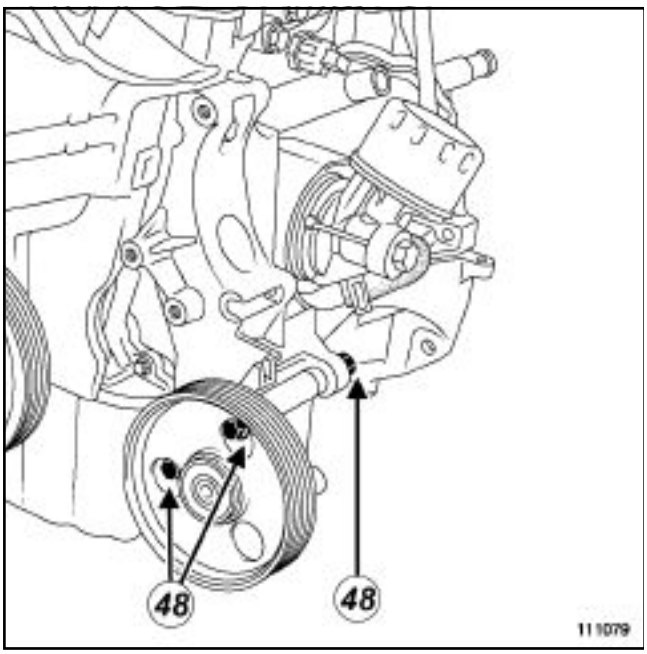
K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

107855



Refit:

- the multifunction support,
- the multifunction support mounting bolts.

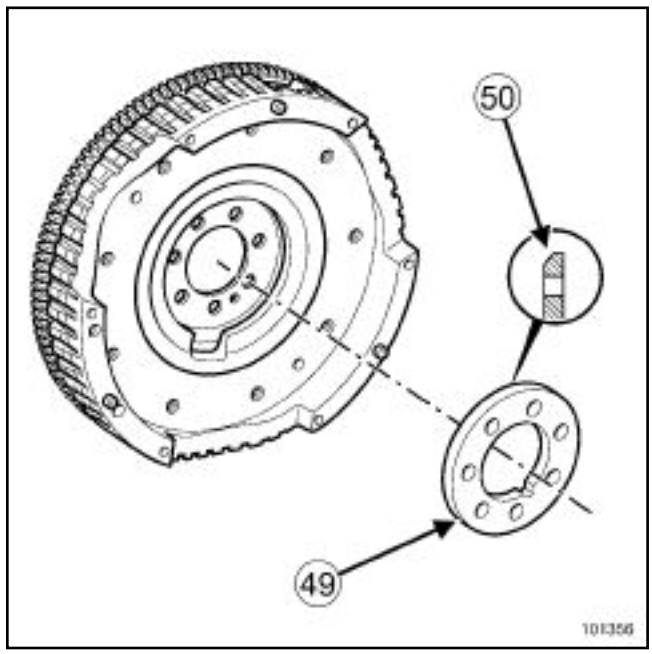


Tighten to torque and in order **the multifunction support mounting bolts (1 to 6) (44 ± 4.4 Nm)** .

Torque tighten the **multifunction support mounting bolt (7) (21 ± 2.1 Nm)** .

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

107853



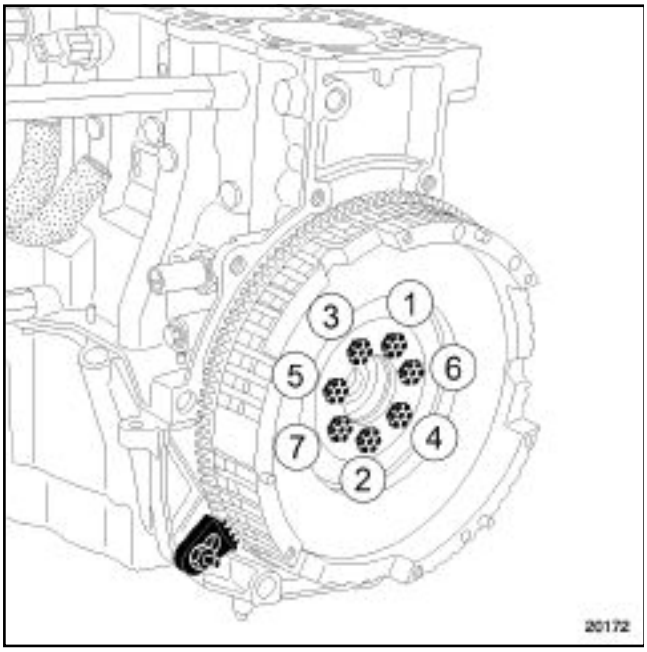
111079

Refit:

- the power assisted steering pump or the dummy pulley,
- the mounting bolts (**48**) of the power assisted steering pump or the dummy pulley,
- the air conditioning compressor (if fitted),
- the air conditioning compressor mounting bolts (**45**) ,
- the alternator,
- the alternator mounting bolts (**47**) .

Tighten to torque:

- **the mounting bolts of the power assisted steering pump or the dummy pulley (21 ± 2.1 Nm)** ,
- **the air conditioning compressor mounting bolts (21 ± 2.1 Nm)** ,
- **the alternator mounting bolts (21 ± 2.1 Nm)** .



101356

Note:

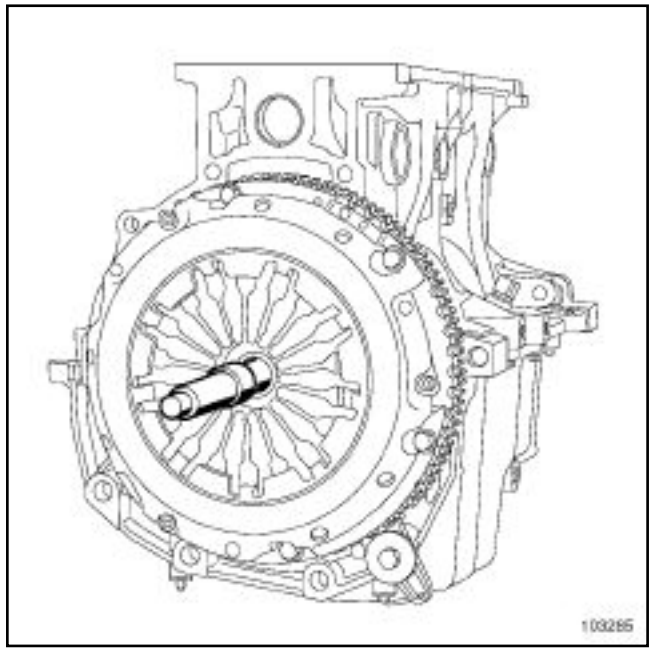
Certain flywheels have a shim (**49**) . **It is essential to position the chamfer** (**50**) **of the shim on the flywheel side** .

K9K, and 274 or 276 or 712 or 714 or 716 or 718 or 724 or 728 or 729 or 760 or 762 or 766 or 768

20172

Refit:

- the flywheel,
- the new flywheel mounting bolts,
- the engine flywheel locking tool **(Mot. 1677)** .



Tighten to torque and in order the **flywheel mounting bolts (55 ± 5.5 Nm)** .

Using degreasing agent, degrease the friction face on the flywheel.

Refit the friction plate (aligning it correctly).

Centre the friction plate using the **(Emb. 1780)** .

Using degreasing agent, degrease the friction face on the clutch mechanism.

103285

Refit:

- the clutch pressure plate,
- the clutch mechanism mounting bolts.

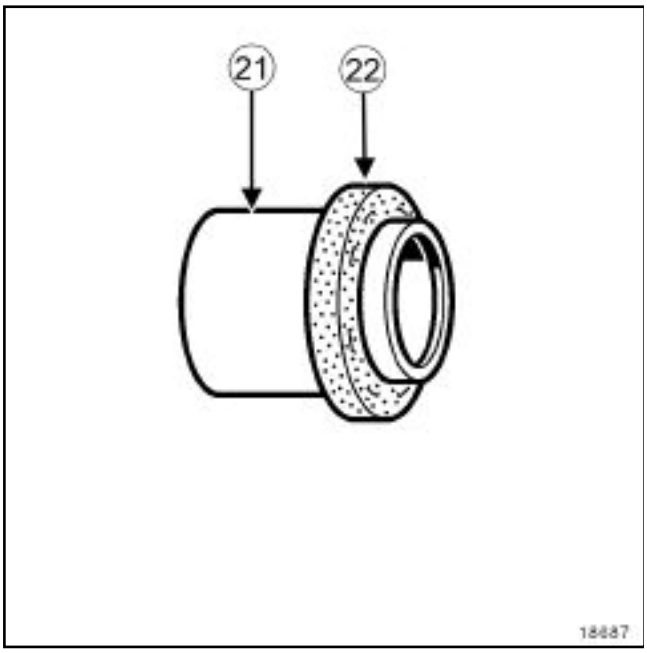
Gradually tighten the mounting bolts of the clutch pressure plate.

Tighten to torque **the clutch mechanism mounting bolts (M6 to 14 ± 1.4 Nm and bolts M7 to 20 ± 2 Nm)** .

Remove flywheel immobiliser tool **(Mot. 1677)** .

K9K, and 732 or 764

Special tooling required	
Mot. 1018	Sump plug tool.
Mot. 1586	Tool for fitting PTFE crankshaft seal, timing end.
Mot. 1714	Adapter for fitting PTFE crankshaft seal, timing end.
Mot. 1585	Tool for fitting PTFE crankshaft seal, flywheel end.
Mot. 1677	Flywheel locking tool.
Emb. 1780	Set of clutch disc centring mandrels.
Emb. 1761	Clutch pressure plate removal/refitting kit
Mot. 1329	Oil filter removing tool (76 mm diameter).



Tightening torques ▽	
oil pump mounting bolts	**25 ± 2.5 Nm**
the crankshaft nose closure unit mounting bolts	**11 ± 1.1 Nm**
the coolant pump mounting bolts	**11 ± 1.1 Nm**
the engine oil sump mounting bolts	**14 ± 1.4 Nm**
the drain plug of the engine oil sump	**20 ± 2 Nm**
the flywheel mounting bolts	**2 ± 20 Nm + 36° ± 6°**
clutch mechanism bolt	**14 ± 1.4 Nm**
the clutch mechanism bolt	**14 ± 1.4 Nm**
the coolant pump inlet pipe mounting bolt	**22 ± 2.2 Nm**
the oil level sensor	**25 ± 2.5 Nm**

Tightening torques ▽	
the coolant/oil heat exchanger mounting bolt	**45 ± 4.5 Nm**
oil filter holder mounting bolt	**45 ± 4.5 Nm**
oil filter	**14 ± 2 Nm**
the multifunction support mounting bolts (1 to 6)	**44 ± 4.4 Nm**
multifunction support mounting bolt (7)	**21 ± 2.1 Nm**
air conditioning compressor mounting bolts	**21 ± 2.1 Nm**
the alternator mounting bolts	**21 ± 2.1 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

K9K, and 732 or 764

18687

WARNING

This type of seal is very delicate. When handling, it is essential to grip protective piece. (**21**) It is strictly forbidden to touch seal, (**22**) this is to prevent any oil leaks once the oil seal is fitted to the engine.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

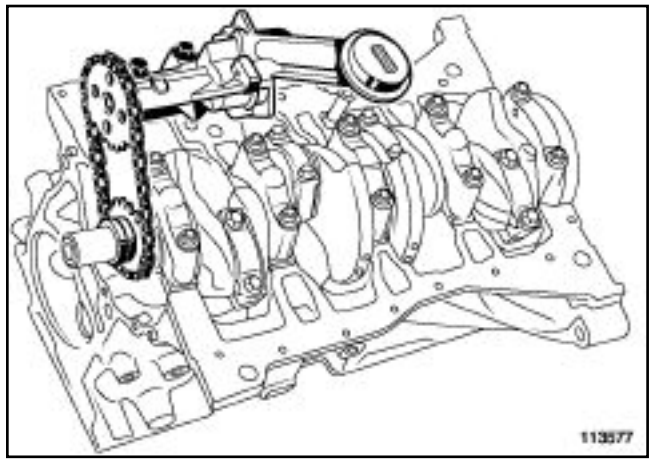
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

- The crankshaft nose closure unit seal,
- The coolant pump seal,
- The oil sump mounting seal,
- The clutch mechanism (if necessary),
- The friction disc (if necessary),
- Flywheel mounting bolt
- The coolant pump inlet pipe seal,
- The oil / coolant heat exchanger seals,
- The crankshaft, timing end, mounting seal,
- The crankshaft, flywheel end, mounting seal,
- Oil filter,
- The seal of the drain plug of the engine oil sump.

Consumables



- Degreasing agent, part no. **77 11 224 559** .
- Silicone adhesive sealant, part no. **77 11 227 484** ,
- High-resistance bolt locking product, part no. **77 11 230 112** ,

III - EQUIPMENT REQUIRED

- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Ruler,
- Square section drain wrench, male **8 mm** ,
- Male torx socket.
- Oil can,

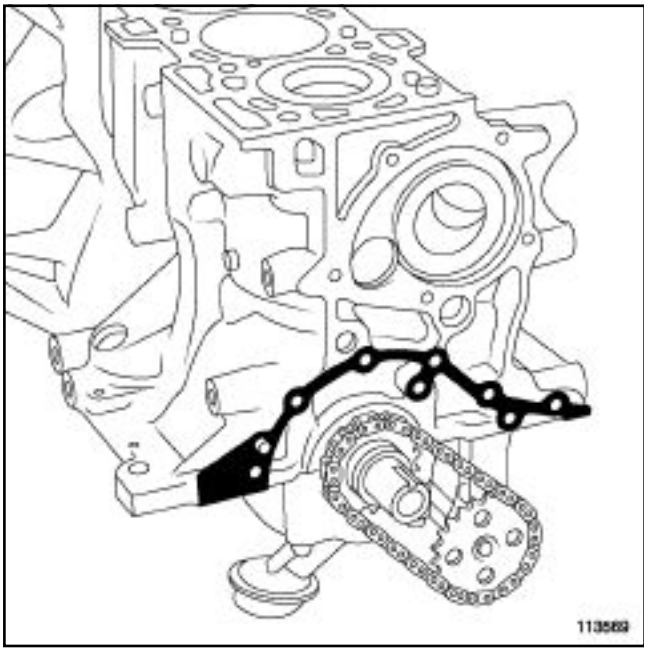
IV - REASSEMBLING THE CYLINDER BLOCK

Put a little engine oil from an oil can in the oil pump via the oil sump filter.

113577

Refit:

- the oil pump drive sprocket,
- the oil pump complete with its chain,
- the oil pump mounting bolts.

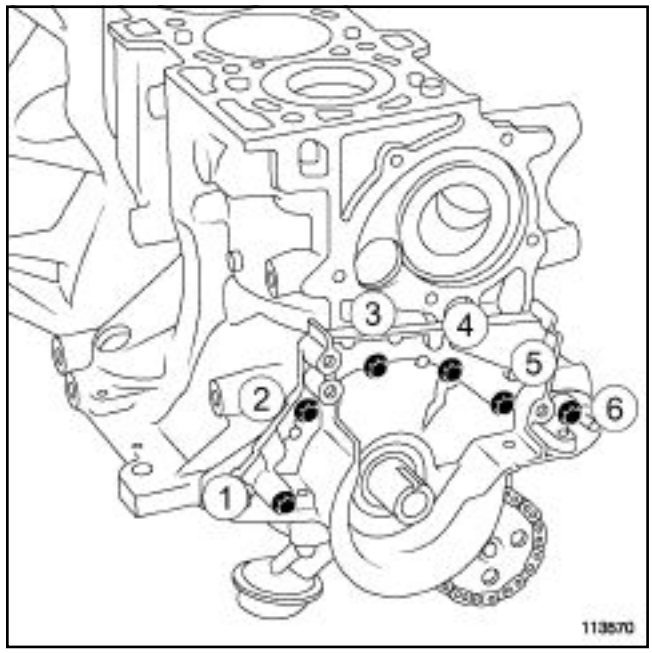


Tighten to torque the **oil pump mounting bolts (25 ± 2.5 Nm)** .

Apply degreaser to:

- the crankshaft nose closure panel,
- the coolant pump,

K9K, and 732 or 764



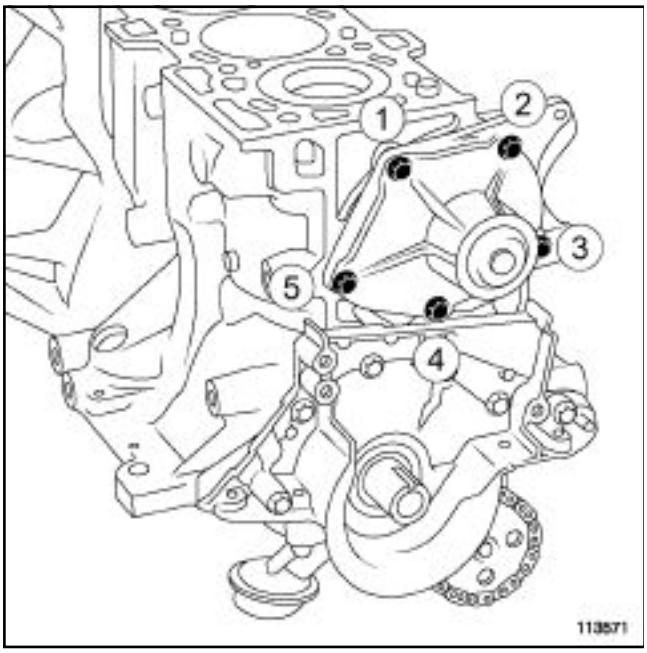
- the surface of the seal of the crankshaft nose closure unit on the cylinder block,
- the surface of the coolant pump seal on the cylinder block.

113569

Fit a new seal to the crankshaft nose closure unit.

Check for the centring dowels on the crankshaft nose closure unit.

113570



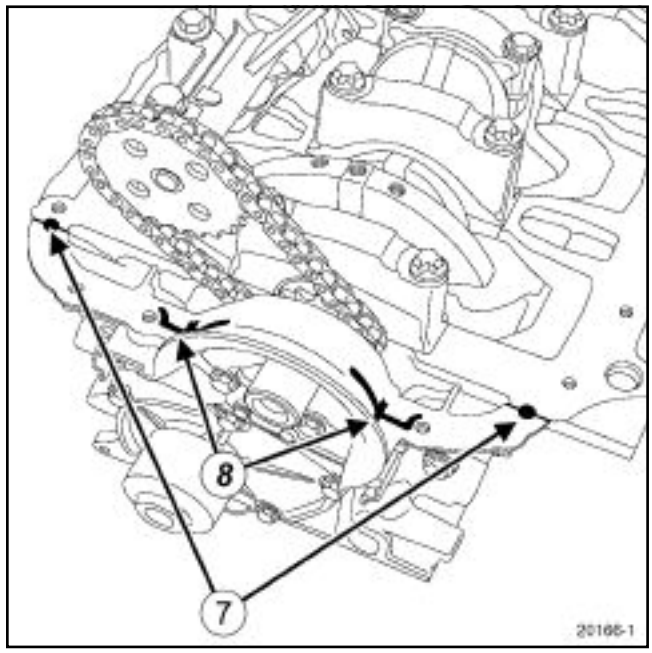
Refit:

- the crankshaft nose closure panel,
- the crankshaft nose closure unit mounting bolt,

Tighten to torque and in order **the crankshaft nose closure unit mounting bolts (11 ± 1.1 Nm)** .

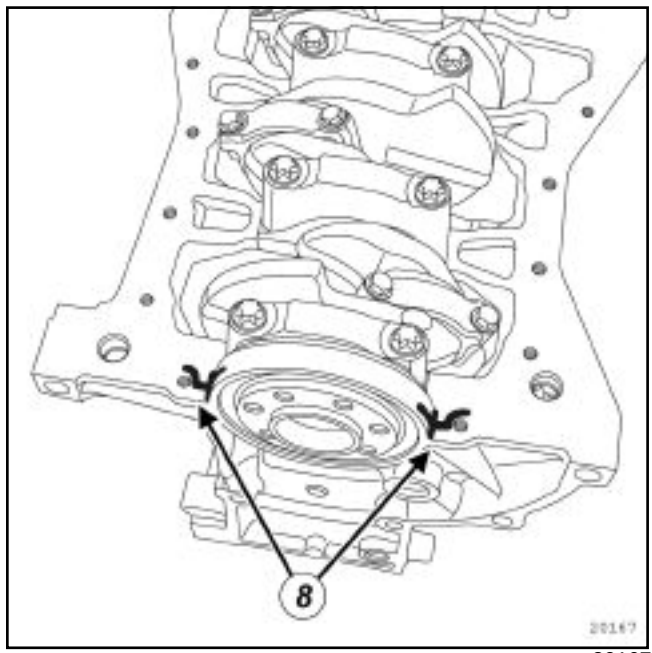
Apply a drop of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant pump mounting bolts.

K9K, and 732 or 764



113571

Refit:

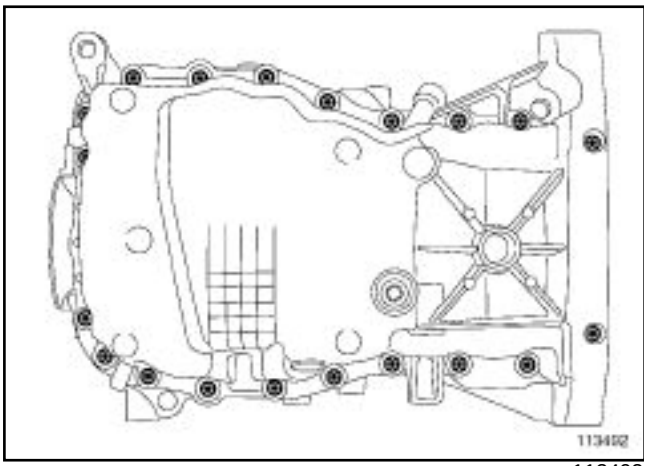


- the coolant pump fitted with a new seal,
- the coolant pump mounting bolts.

Tighten to torque and in order **the coolant pump mounting bolts (11 ± 1.1 Nm)** .

Using degreaser, degrease the seal surfaces of the lower part of the cylinder block and the oil sump.

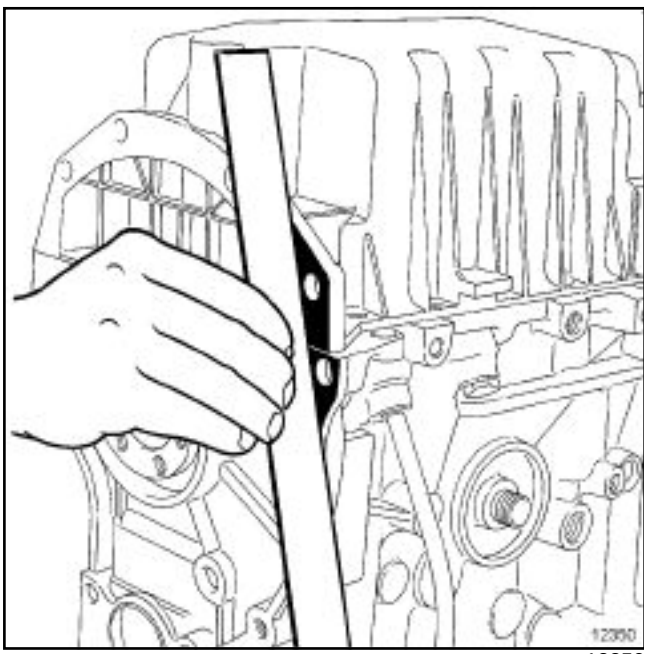
20166



20167

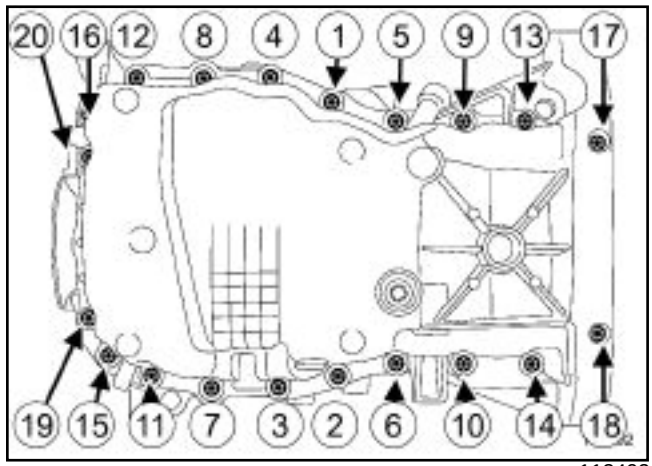
Apply:

- four beads (**8**) of **SILICONE ADHESIVE SEALANT** with a diameter of **5 mm** ,
- two points (**7**) of **SILICONE ADHESIVE SEALANT 5 mm** in diameter, at the connection between the crankshaft nose closure panel and the cylinder block.



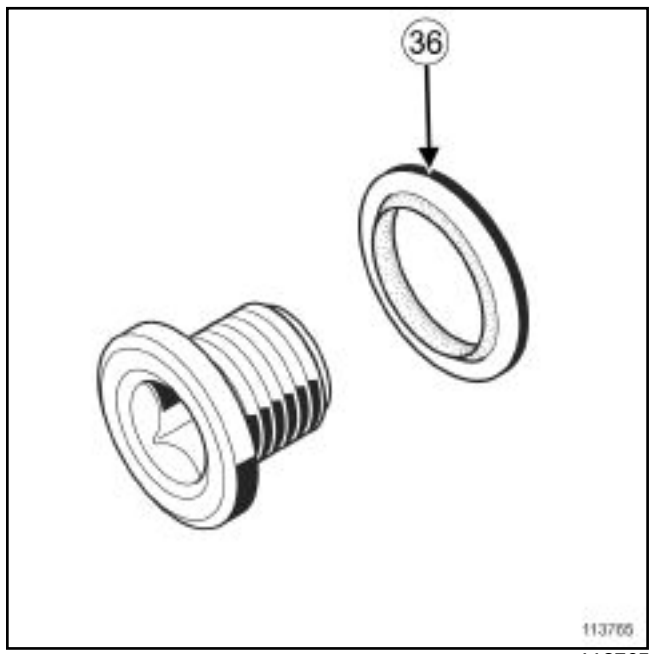
K9K, and 732 or 764

113492



Refit:

- the oil sump mounting seal,
- the engine oil sump,
- the oil sump mounting bolts,



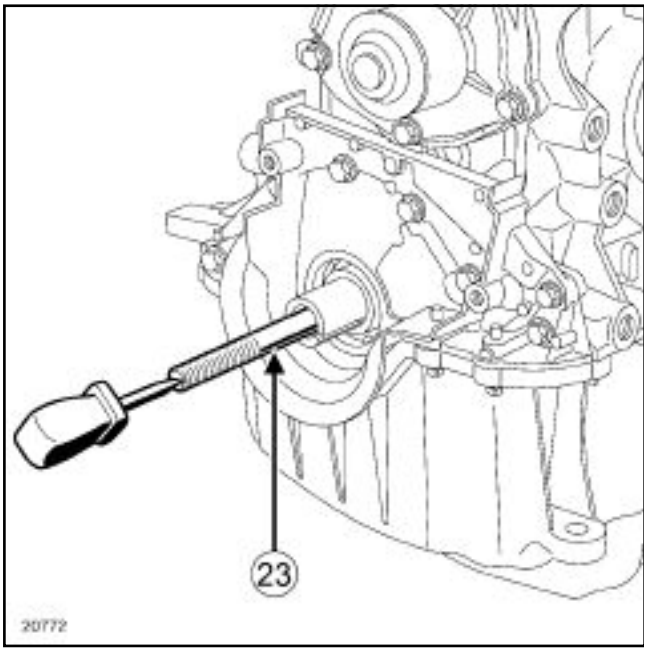
12350

Using a ruler, align the engine oil sump with the cylinder block.

113492

Tighten to torque and in order **the engine oil sump mounting bolts (14 ± 1.4 Nm)** .

113765

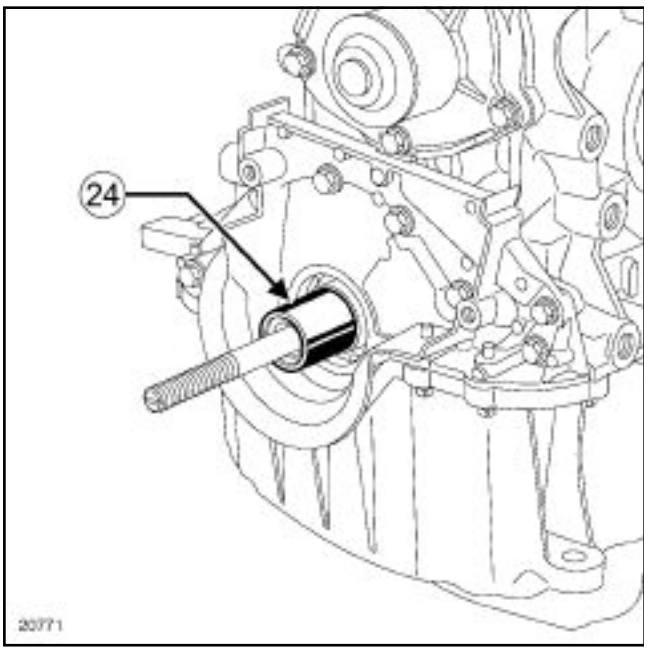


Refit:

- a seal (**36**) on the drain plug of the engine oil sump,
- the drain plug of the engine oil sump, using the **(Mot. 1018)** .

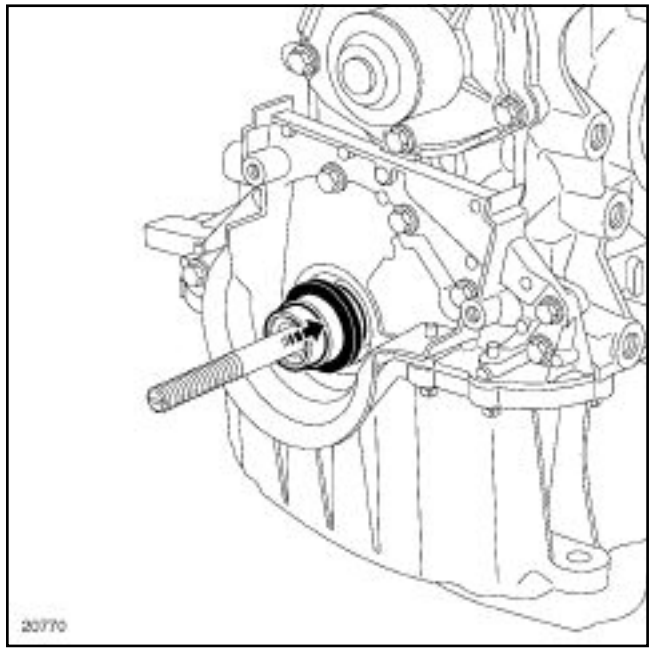
Tighten to torque **the drain plug of the engine oil sump (20 ± 2 Nm)** .

Using degreaser, degrease the seal mating face on the crankshaft and the crankshaft nose closure unit.



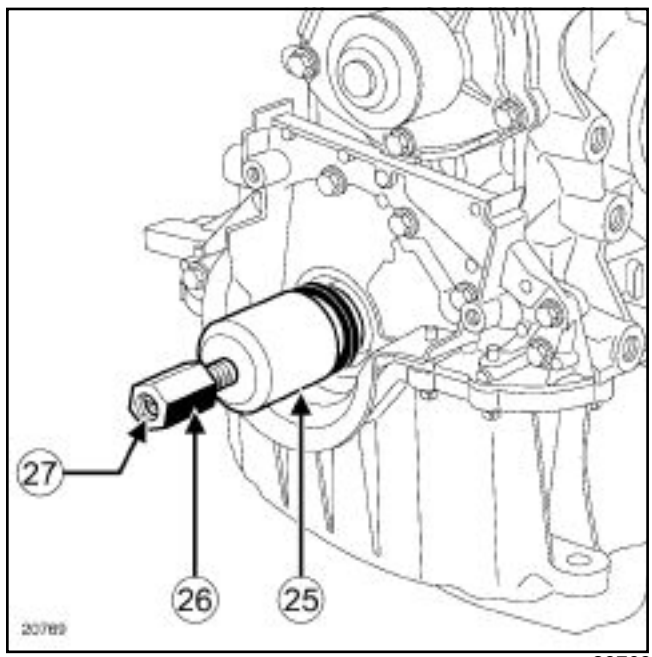
K9K, and 732 or 764

20772



Tighten the threaded rod (**23**) :

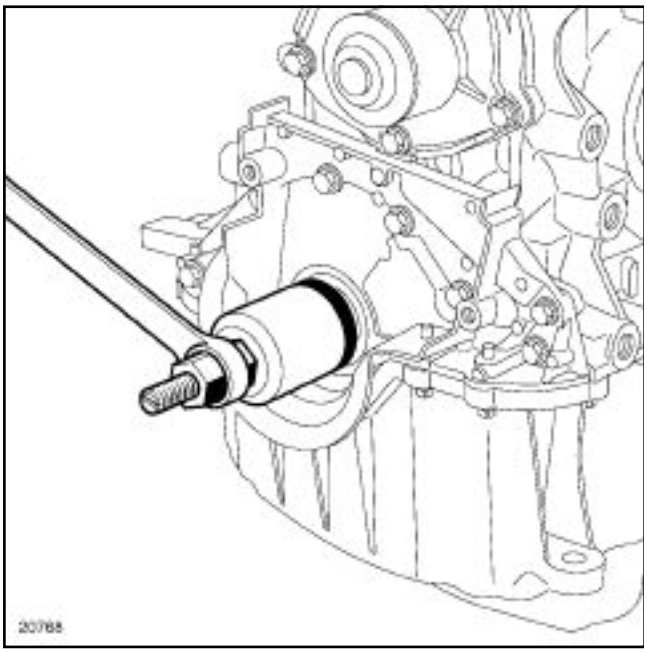
- of tool **(Mot. 1586)** in the crankshaft with an internal thread of **M12** ,
- of tool **(Mot. 1714)** in the crankshaft with an internal thread of **M14** ,



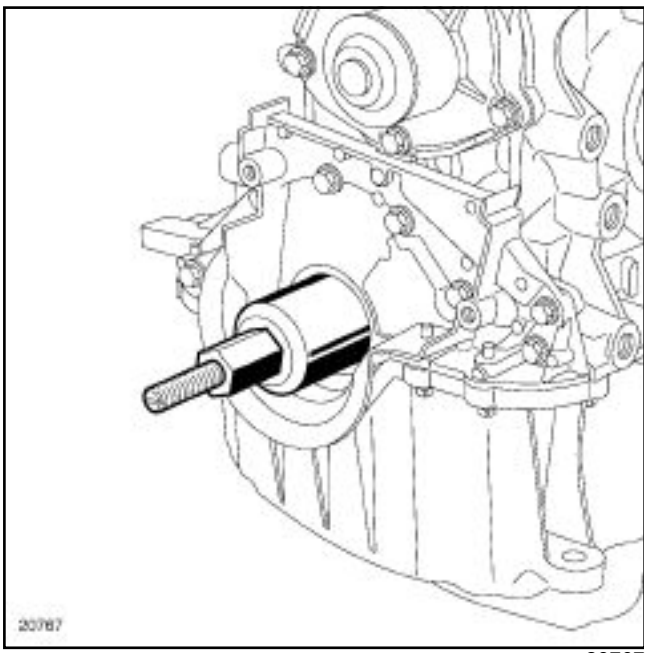
20771

Insert the spacer (**24**) of tool **(Mot. 1586)** in the crankshaft.

20770



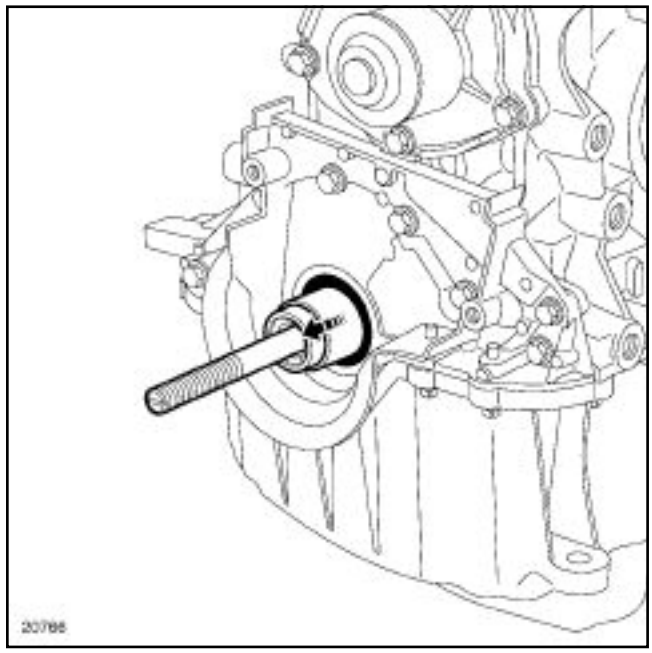
Fit the protector with the new seal in place on the spacer, taking care not to touch the seal.



20769

Fit cover (**25**) and nut (**26**) (with the thread (**27**) of the nut towards the outside of the engine).

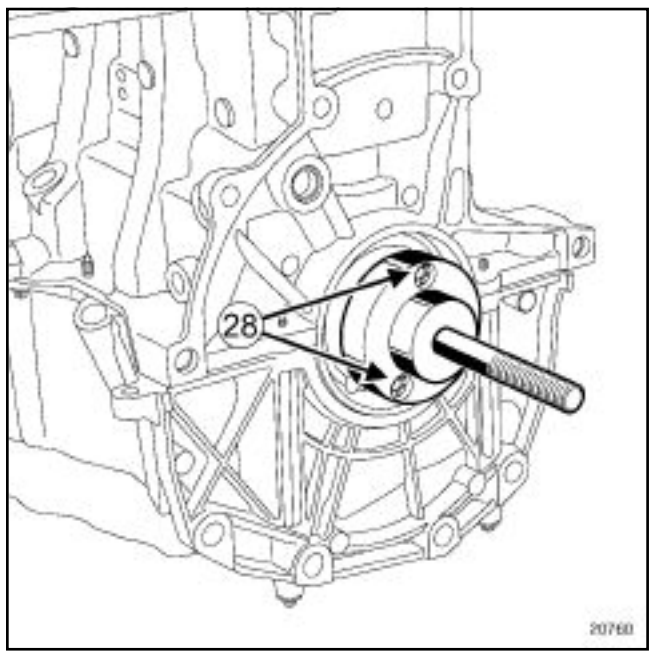
K9K, and 732 or 764



20768

20767

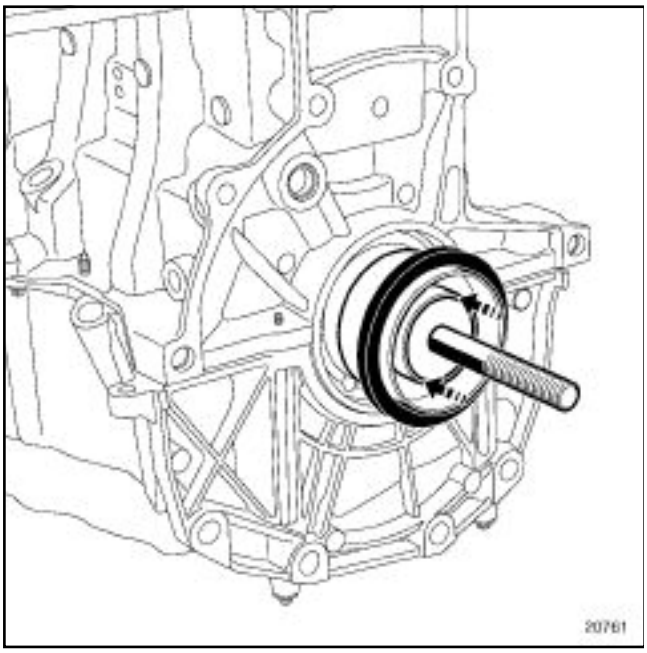
Screw on the nut until the cover touches the spacer.



20766

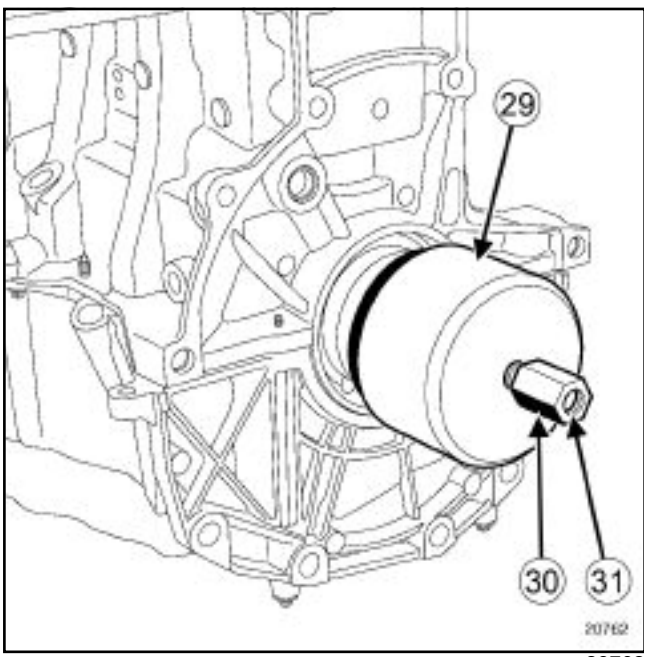
Remove:

- the nut,
- the cap,
- the protector,
- the spacer,
- the threaded rod.



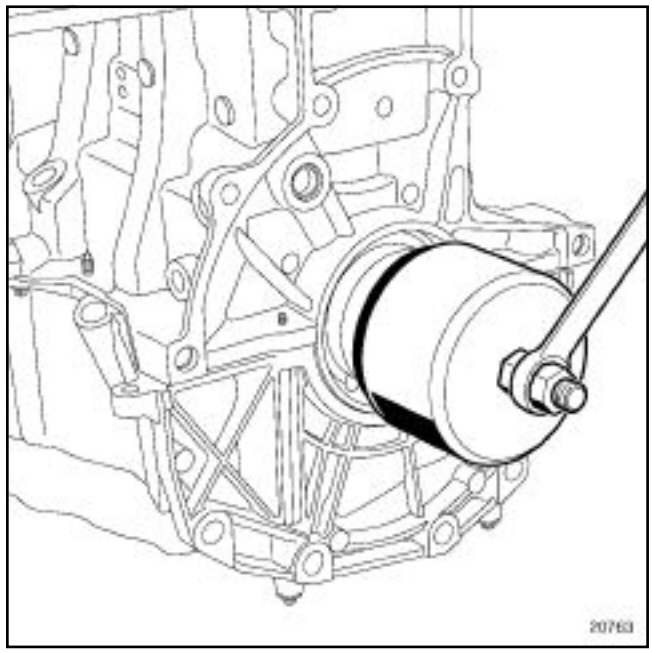
Using degreaser, degrease the seal mating face on the crankshaft and the cylinder block (flywheel end).

20760



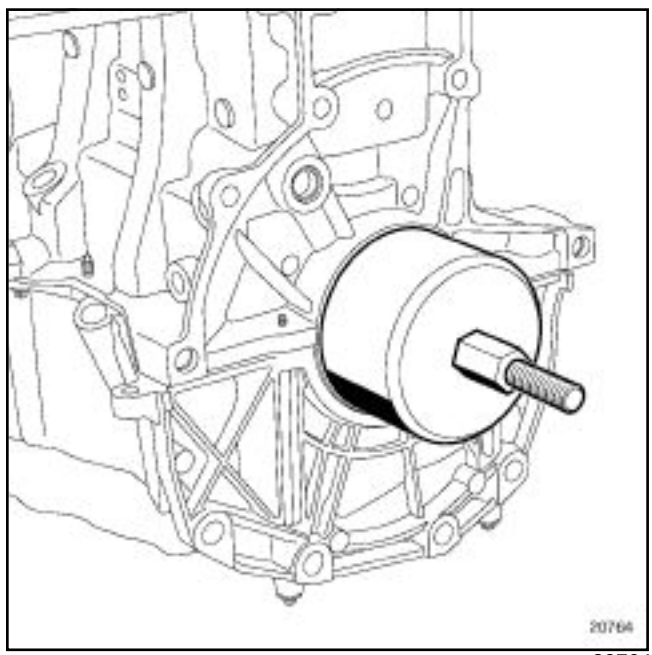
Mount the **(Mot. 1585)** on the crankshaft, securing it using bolts (**28**) .

K9K, and 732 or 764



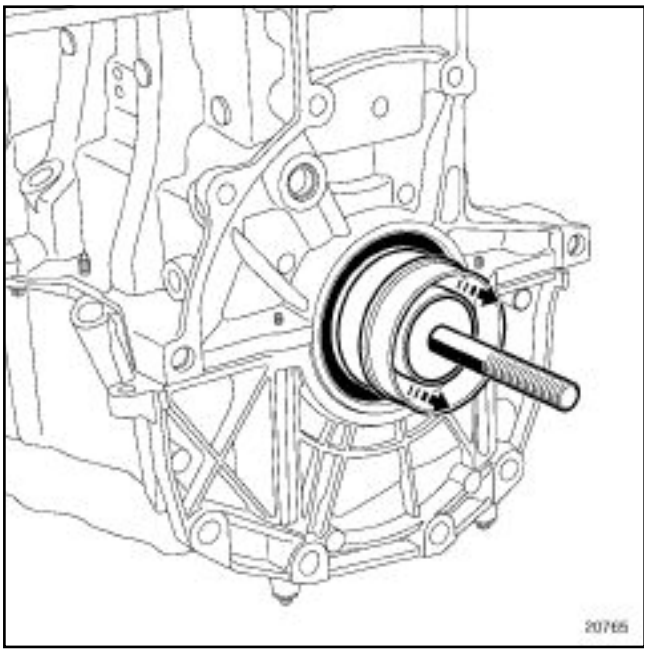
20761

Fit the protector with its seal in place on tool, **(Mot. 1585)** taking care not to touch the seal.



20762

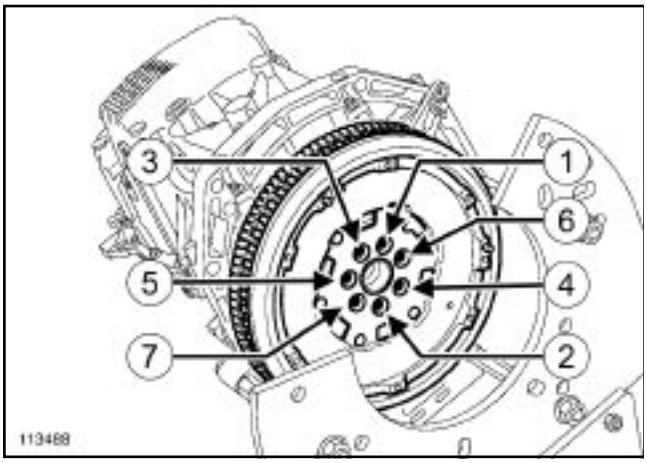
Fit cover (**29**) and nut (**30**) (with the thread (**31**) of the nut towards the outside of the engine).



20763

20764

Tighten the nut until the cover touches the cylinder block.

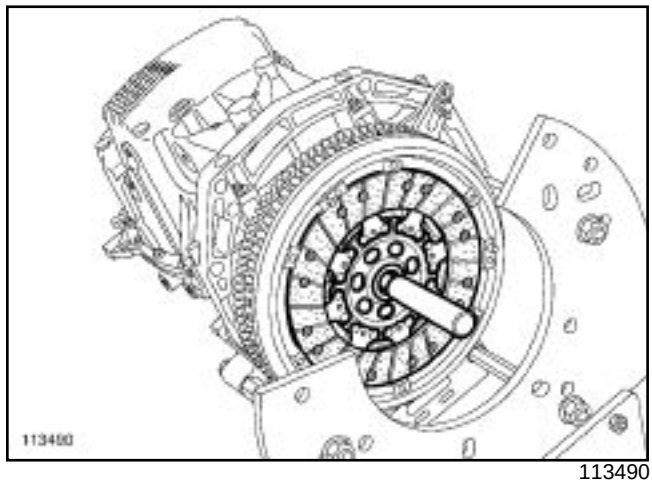


K9K, and 732 or 764

20765

Remove:

- the nut,
- the cap,
- the protector,
- the base.



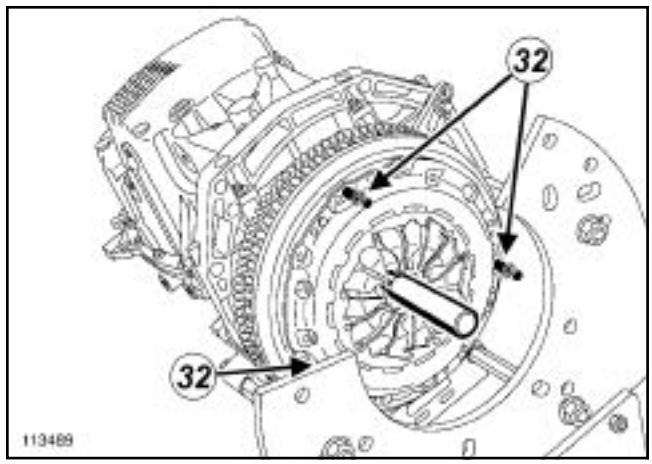
113488

Refit:

- the flywheel,
- the new flywheel mounting bolts,
- engine flywheel locking tool **(Mot. 1677)** .

Tighten to torque and in order **the flywheel mounting bolts (2 ± 20 Nm + 36° ± 6°)** .

Using degreasing agent, degrease the friction face on the flywheel.



113490

Refit the friction disc (aligning it correctly).

Centre the friction disc using the **(Emb. 1780)** .

Using degreasing agent, degrease the friction face on the clutch mechanism.

113489

Refit the clutch mechanism.

Position the mounting bolts of the clutch mechanism using tool **(Emb. 1761)** (**32**) .

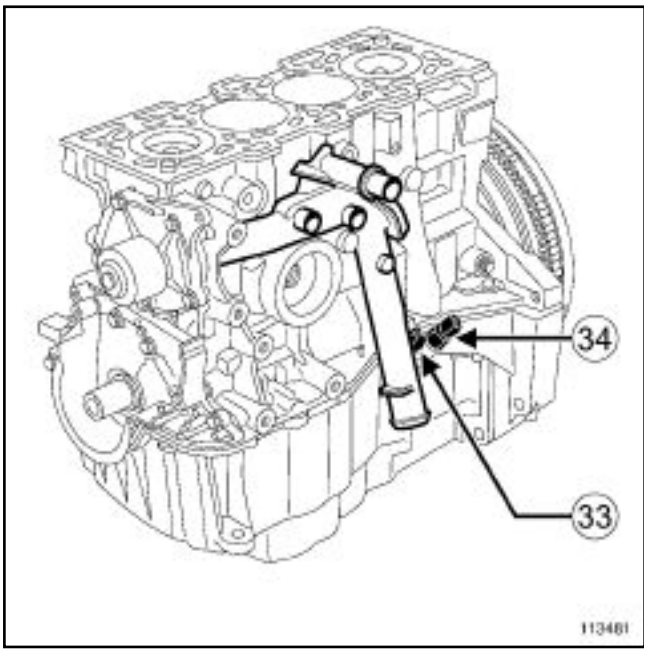
Position the clutch mechanism flat against the flywheel, tightening the nuts of tool **(Emb. 1761)** .

Refit the clutch mechanism mounting bolts.

Tighten to torque the **clutch mechanism bolt (14 ± 1.4 Nm)** .

Remove the **(Emb. 1761)** .

Refit the three clutch mechanism mounting bolts.



Tighten to torque **the clutch mechanism bolt (14 ± 1.4 Nm)** .

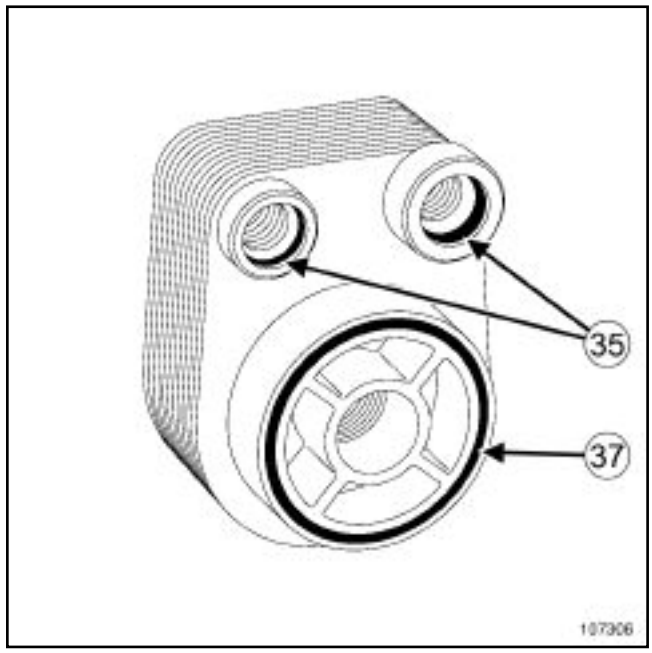
Remove flywheel immobiliser tool **(Mot. 1677)** .

Refit a new o-ring seal to the coolant pump inlet pipe.

K9K, and 732 or 764

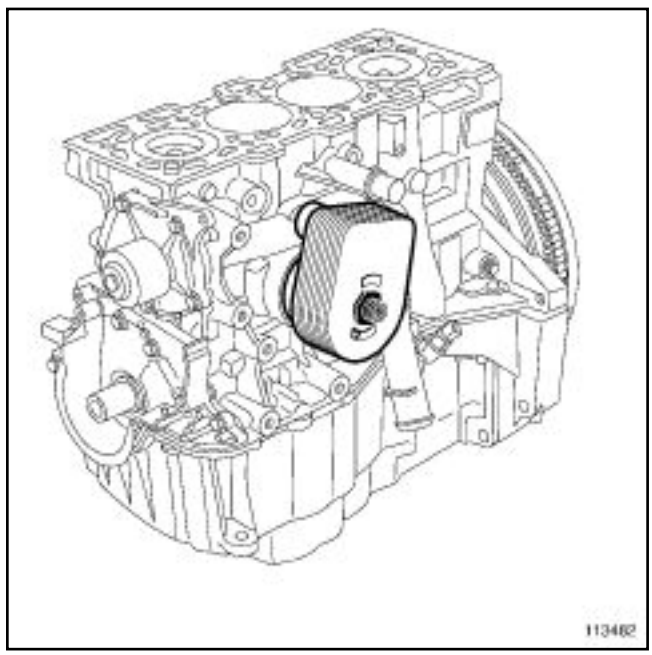
Put a little soapy water on the o-ring seal of the coolant pump inlet pipe.

113481



Refit:

- the coolant pump inlet pipe,
- the mounting bolt (**33**) of the coolant pump inlet pipe,
- the oil level sensor (**34**) .



Tighten to torque:

- **the coolant pump inlet pipe mounting bolt (22 ± 2.2 Nm)** ,
- **the oil level sensor (25 ± 2.5 Nm)** .

Using degreaser, degrease the seal mating face of the cylinder block where it receives the coolant / oil heat exchanger.

107306

113482

Fit the new seals (**35**) and (**37**) on the coolant / oil heat exchanger.

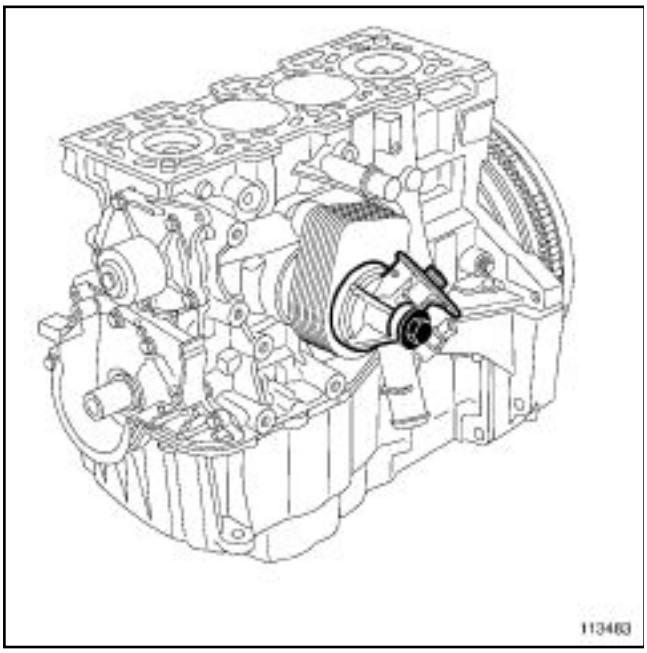
Apply soapy water to the two seals (**35**) in contact with the inlet pipe of the coolant pump.

Apply two drops of **HIGH-RESISTANCE BOLT LOCKING PRODUCT** to the coolant / oil heat exchanger mounting bolt.

Refit:

- the coolant/oil heat exchanger,
- the mounting bolt of the oil/coolant heat exchanger,

K9K, and 732 or 764



Tighten to torque **the coolant/oil heat exchanger mounting bolt (45 ± 4.5 Nm)** .

Using degreaser, degrease the seal mating face of the coolant/oil heat exchanger where it receives the oil filter holder.

Refit:

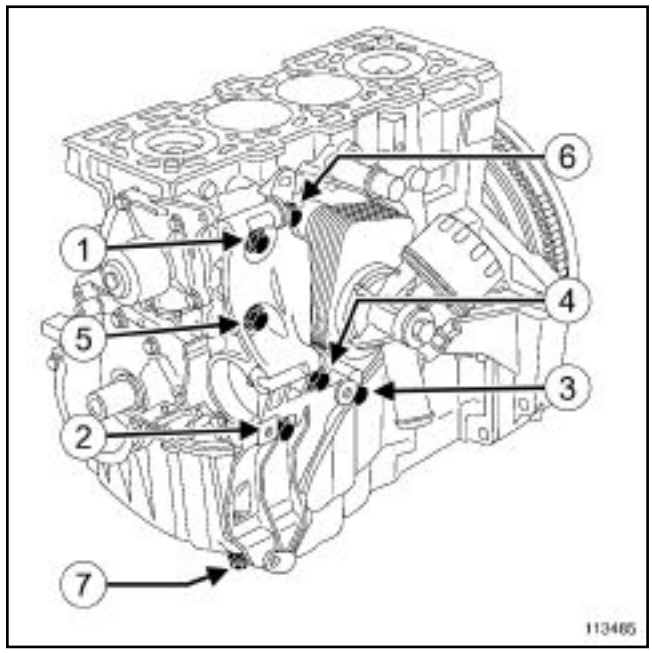
- a new seal on the oil filter holder,

- a new seal on the oil filter holder mounting bolt.

113483

Refit:

- the oil filter holder,



- the oil filter holder mounting bolt

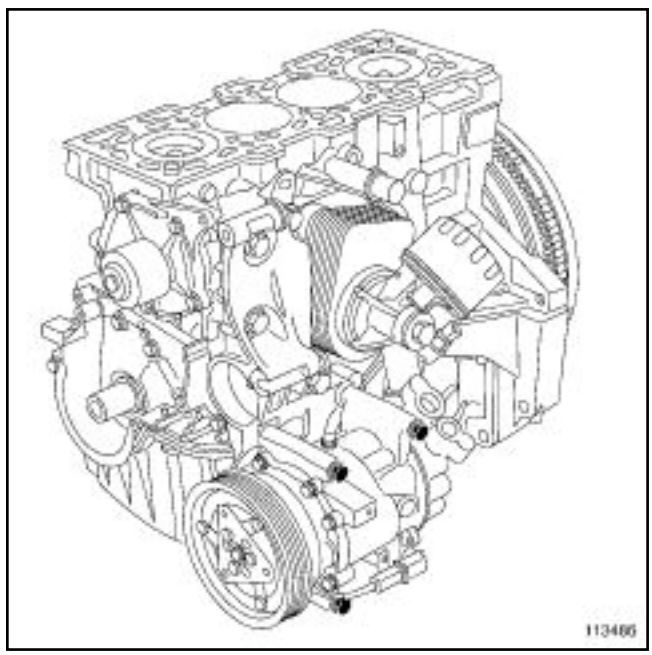
Tighten to torque the **oil filter holder mounting bolt (45 ± 4.5 Nm)** .

Lubricate the oil filter seal with new engine oil.

Refit the oil filter using the **(Mot. 1329)** .

Tighten to torque the **oil filter (14 ± 2 Nm)** .

113485



Refit:

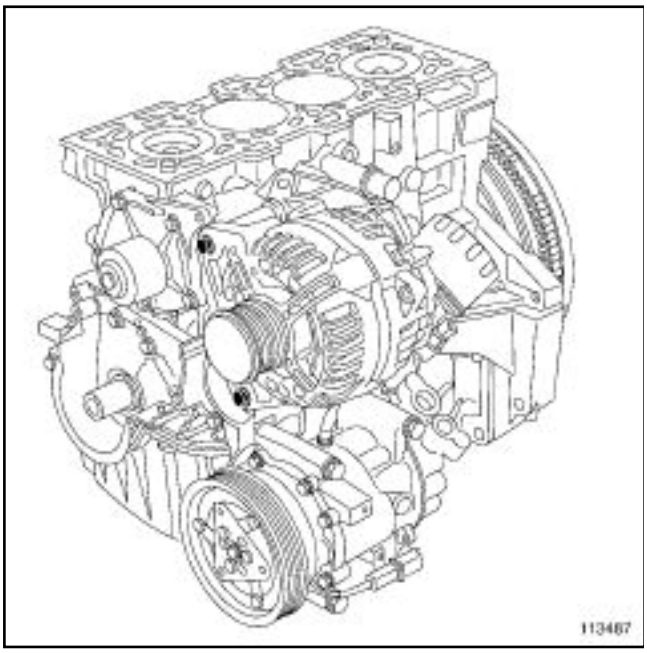
- the multifunction support,

- the multifunction support mounting bolts.

Tighten to torque and in order **the multifunction support mounting bolts (1 to 6) (44 ± 4.4 Nm)** .

Torque tighten the **multifunction support mounting bolt (7) (21 ± 2.1 Nm)** .

113486



Refit:

- the air conditioning compressor,

- the air conditioning compressor mounting bolts.

K9K, and 732 or 764

Tighten to torque the **air conditioning compressor mounting bolts (21 ± 2.1 Nm)** .

113487

Refit:

- the alternator,
- the alternator mounting bolts.

Tighten to torque **the alternator mounting bolts (21 ± 2.1 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
the cylinder head mounting bolts	**25 ± 2.5 Nm**
the cylinder head mounting bolts	**255° ± 10°**
the rocker cover bolts	**12 ± 1.2 Nm**
the turbocharger oil return pipe mounting bolts	**12 ± 1.2 Nm**
the turbocharger mounting nuts	**26 ± 2.6 Nm**
the catalytic converter stay mounting bolts on the engine	**44 ± 4.4 Nm**
the catalytic converter stay mounting bolts on the catalytic converter	**26 ± 2.6 Nm**
the mounting bolt of the turbocharger oil supply pipe (turbocharger end)	**23 ± 2.3 Nm**
the turbocharger oil supply pipe mounting nut (cylinder head end)	**collar nut 35 ± 3.5 Nm or no collar nut 23 ± 2.3 Nm**
the inner timing cover mounting bolts	**9 ± 0.9 Nm**
the tensioning roller bolt	**27 ± 2.7 Nm**
the crankshaft accessories pulley M12 mounting bolt	**60 ± 6 Nm + 100° ± 10°**
the crankshaft accessories pulley M14 mounting bolt	**120 ± 12 Nm + 95° ± 15°**

Tightening torques ▽	
the tensioning roller bolt	**27 ± 2.7 Nm**
the TDC pin plug cap	**20 ± 2 Nm**
the cylinder head suspended mounting bolts	**21 ± 2.1 Nm**
the high-pressure pump position sensor bolt	**8 ± 0.8 Nm**

I - RECOMMENDATIONS FOR THE REPAIR OF THE CYLINDER HEAD

IMPORTANT
Wear protective gloves during every operation.

WARNING
When handling the cylinder head gasket, it is essential to hold the cylinder head gasket by the part between barrels.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

To obtain correct tightening of the cylinder head bolts, remove any oil from the cylinder head mounting holes using a syringe.

Do not retighten the cylinder head bolts after applying this procedure.

Do not grease the new cylinder head mounting bolts.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced for the cylinder head

- The cylinder head gasket,
- The cylinder head bolts,
- The rocker cover gasket,
- The gasket between the exhaust manifold and the turbocharger,
- The seals on the turbocharger oil return pipe,

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

- The catalytic converter seal,

Consumables

- Degreasing agent, part no. **77 11 224 559** .
- High-resistance bolt locking product, part no. **77 11 230 112** ,
- Silicone adhesive sealant, part no. **77 11 227 484** .

III - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

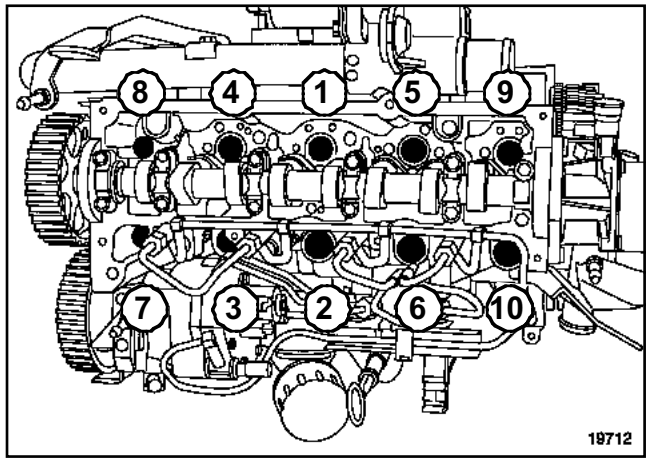
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Oil can,
- Female torx socket (**14**),
- Protective gloves.

IV - REFITTING THE CYLINDER HEAD

Position the pistons at mid-stroke.

Apply degreaser to:

- the combustion side of the cylinder head,
- the combustion face of the cylinder block.



Check for the cylinder head centring dowels on the cylinder block.

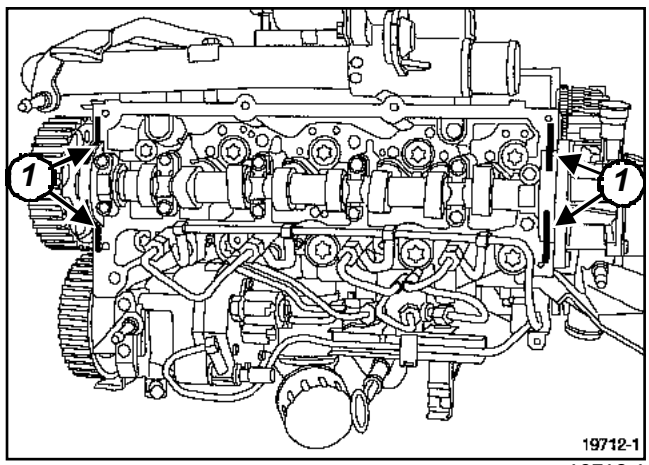
Refit the cylinder head gasket (positioning the TOP at the top) on the cylinder block.

Remove the cylinder head from the cylinder head support.

Refit:

- the cylinder head,
- the new cylinder head mounting bolts.

19712



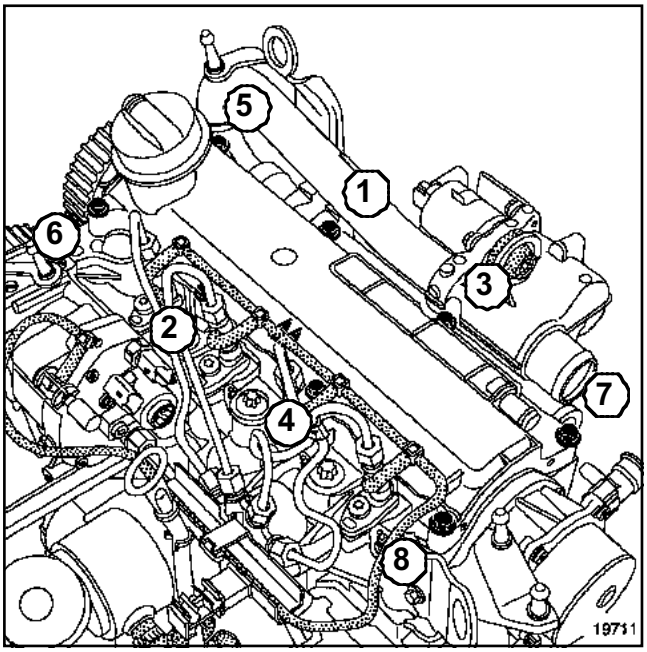
Torque tighten in order **the cylinder head mounting bolts (25 ± 2.5 Nm)** .

Check that all the **cylinder head mounting bolts** are correctly tightened to **(25 ± 2.5 Nm)** .

Tighten in order and to torque **the cylinder head mounting bolts (255° ± 10°)** .

Using degreasing agent, degrease the surface of the rocker cover bearing on the cylinder head.

Fit a new seal on the rocker cover.



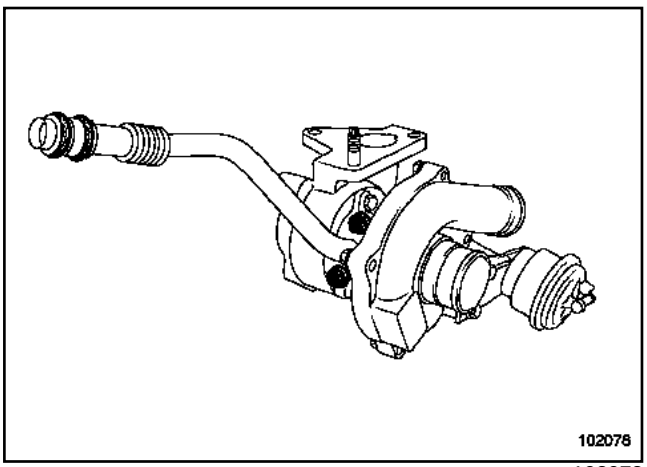
19712-1

Apply four beads (**1**) of **SILICONE SEALANT** with a diameter of **2 mm** .

Refit:

- the rocker cover,
- the rocker cover mounting bolts.

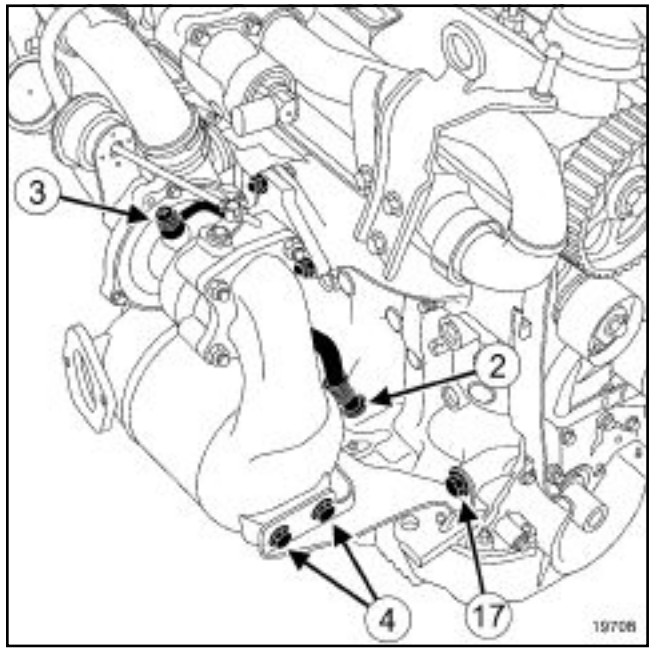
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19711

Tighten to torque and in order **the rocker cover bolts (12 ± 1.2 Nm)** .

Fit the new seals on the turbocharger oil return pipe.



Lubricate the O-ring seals of the turbocharger oil return pipe with engine oil.

102078

Tighten to torque **the turbocharger oil return pipe mounting bolts (12 ± 1.2 Nm)** .

Fit a new seal between the exhaust manifold and the turbocharger.

19708

Refit the turbocharger-catalytic converter assembly.

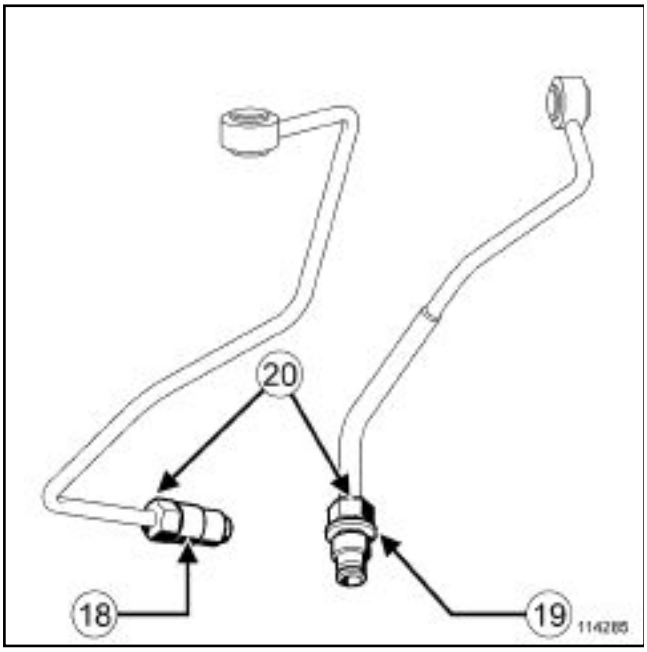
Fully insert the turbocharger oil return pipes on to the cylinder block at (**2**) .

Refit:

- the catalytic converter mounting stay,

- the catalytic converter stay mounting bolts.

Tighten to torque:



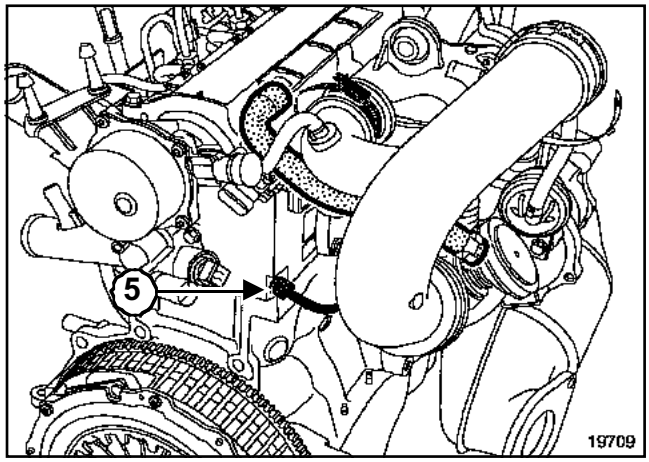
- **the turbocharger mounting nuts (26 ± 2.6 Nm)** ,

- **the catalytic converter stay mounting bolts on the engine (44 ± 4.4 Nm)** (**17**) ,

- **the catalytic converter stay mounting bolts on the catalytic converter (26 ± 2.6 Nm)** (**4**) ,

Put a little engine oil from an oil can in the oil circuit of the turbocharger.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



114285

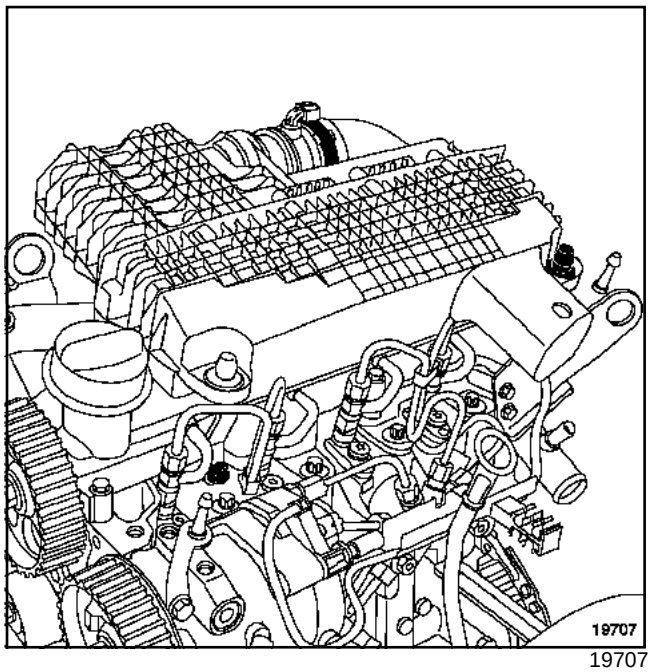
Note:

These two turbocharger oil supply pipes may be used on the same engine. The tightening torque of the end pieces (**20**) on the cylinder head is different, depending on the following:

- if the end piece is **shouldered** (**19**) , in this case there will be no need to place the high-resistance bolt locking product on the end piece thread,
- if the end piece is **not shouldered** (**18**) , in this case it is essential to place the high-resistance bolt locking product on the end piece thread,

19709

Refit the turbocharger oil supply pipe.

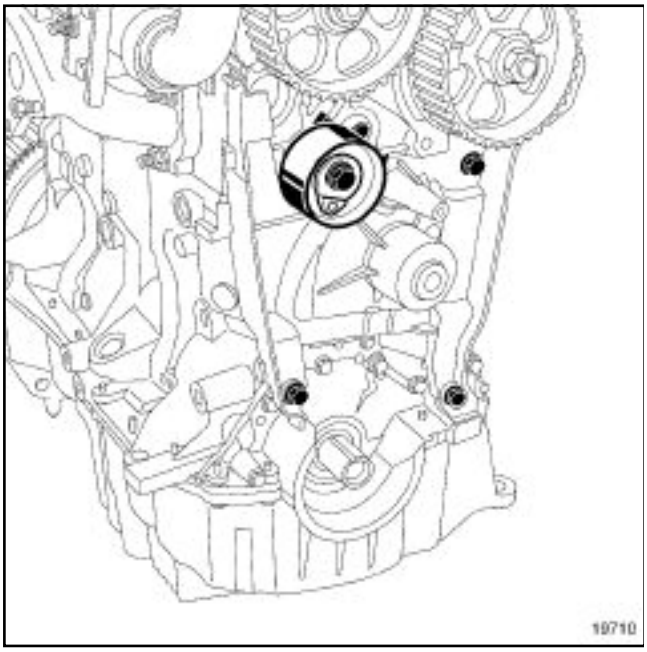


Screw in place each mounting of the turbocharger oil supply pipe.

Tighten to torque:

- **the mounting bolt of the turbocharger oil supply pipe (turbocharger end) (23 ± 2.3 Nm)** at **(3)** ,
- **the turbocharger oil supply pipe mounting nut (cylinder head end) (collar nut 35 ± 3.5 Nm or no collar nut 23 ± 2.3 Nm)** at (**5**) .

Refit:



- the oil vapour rebreather pipe,
- the new turbocharger air ducts.

19707

Refit the air filter unit.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19710

Refit:

- the inner timing cover (moving the alternator if necessary),
- the inner timing cover mounting bolts.

Tighten to torque **the inner timing cover mounting bolts (9 ± 0.9 Nm)** .

V - RECOMMENDATIONS FOR THE REPAIR OF THE TIMING GEAR

IMPORTANT
Wear protective gloves during every operation.

WARNING
The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

When replacing the belt, always replace the tensioning rollers and fixed rollers.

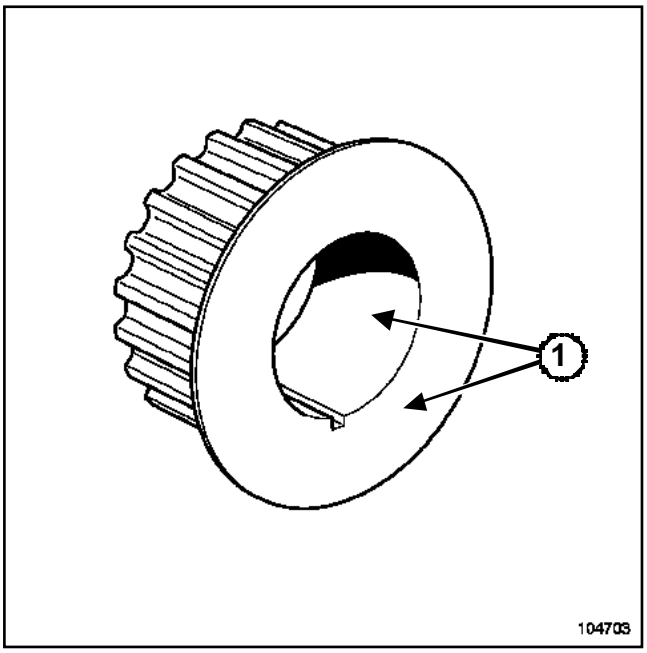
It is essential to remove the grease from the end of the crankshaft, the camshaft timing sprocket and the bearing face of the crankshaft accessories pulley. This is to avoid timing slippage.

VI - PARTS AND CONSUMABLES FOR THE REPAIR

Pièces à remplacer systématiquement pour la distribution

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Ingrédients



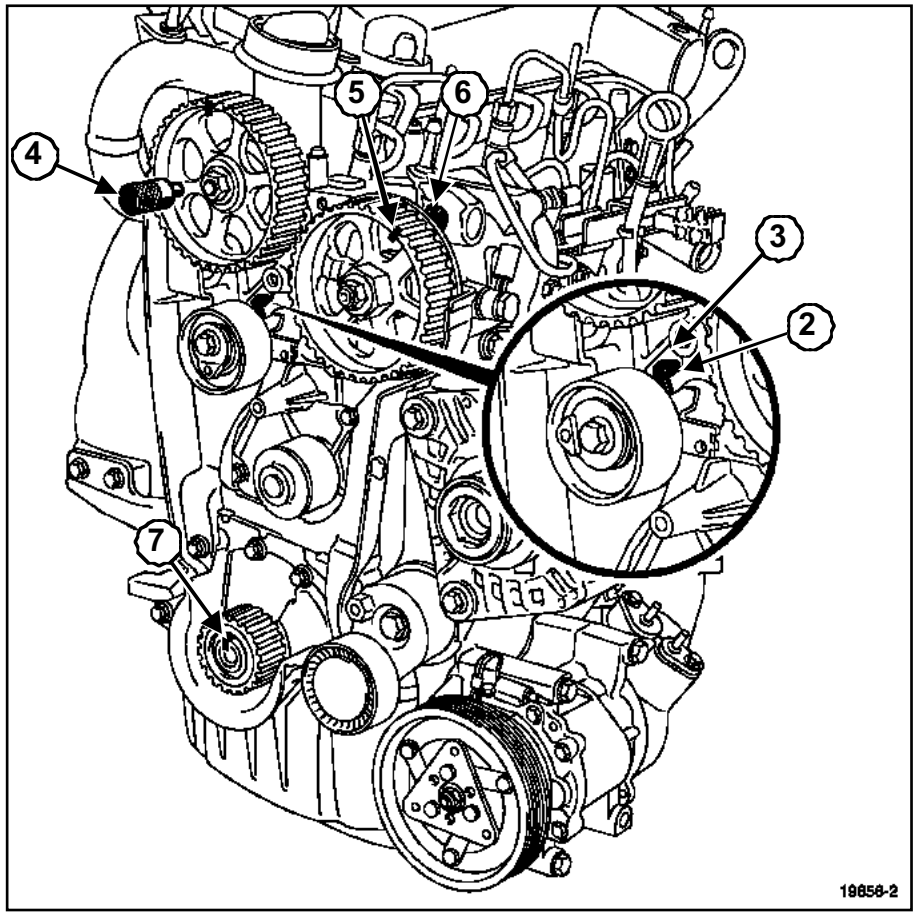
- Silicone adhesive sealant, part no. **77 11 227 484**
- Degreasing agent, part no. **77 11 224 559** .

VII - EQUIPMENT REQUIRED FOR THE TIMING GEAR

- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset spanner (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

VIII - REFITTING THE TIMING BELT



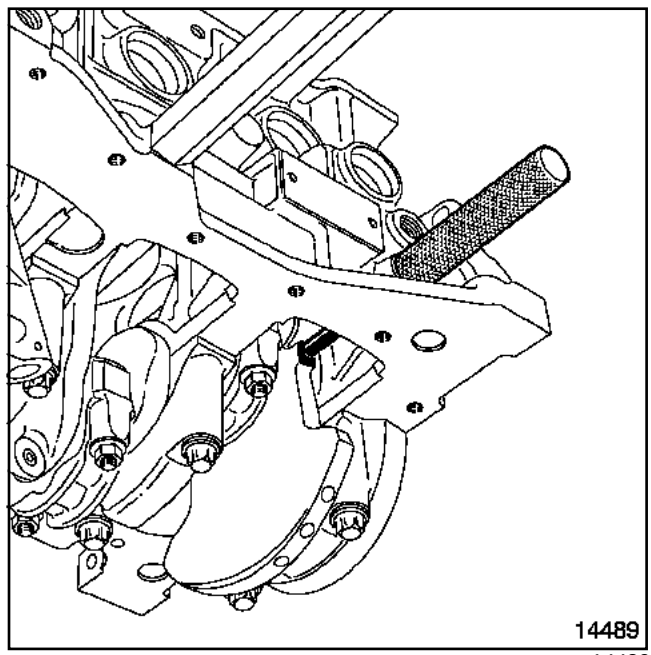
104703

Apply degreaser to:

- the end of the crankshaft (timing end),
- the timing sprocket bearing faces and bore at (**1**) ,
- the contact surfaces of the crankshaft accessories pulley.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19656-2

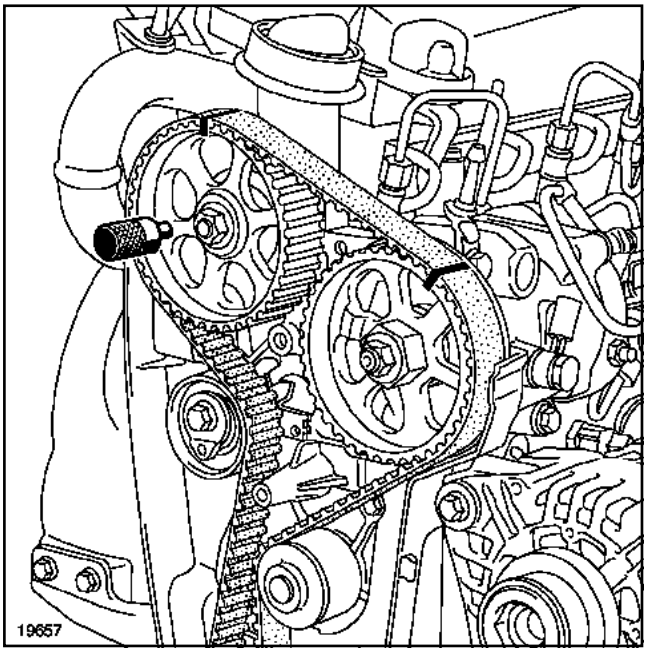


Refit:

- the crankshaft timing sprocket,
- the timing tensioning roller.

Position the spigot (**2**) of the tensioning roller in the groove (**3**) of the cylinder head.

Insert pin **(Mot. 1430)** in the cylinder head and camshaft pulley holes at (**4**) . Turning the camshaft using an **18 mm** offset spanner, if necessary.

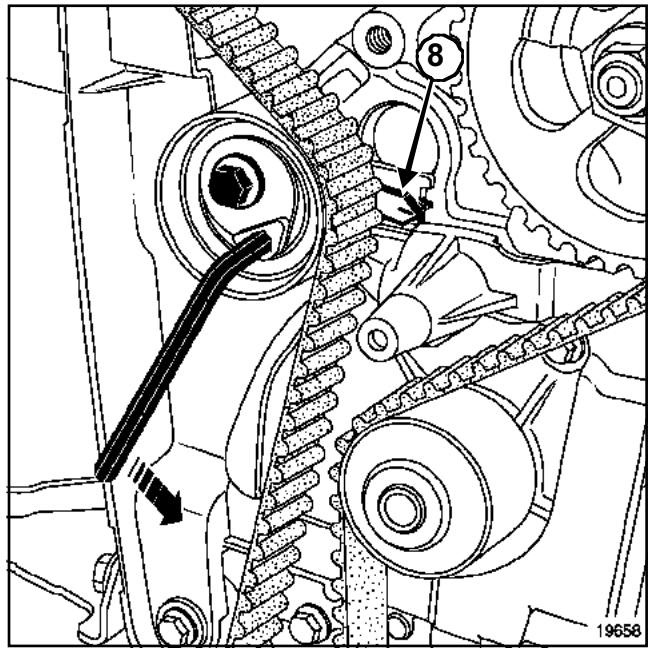


Check that high-pressure pump pulley marking (**5**) is opposite the bolt head (**6**) .

14489

Position the crankshaft so that is presses against the TDC setting pin **(Mot. 1489)** (crankshaft groove **(7)** must be at the top).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19657

Fit the timing belt, starting with the crankshaft sprocket, aligning the marks on the belt with those on the camshaft and high-pressure pump pulleys.

Note:

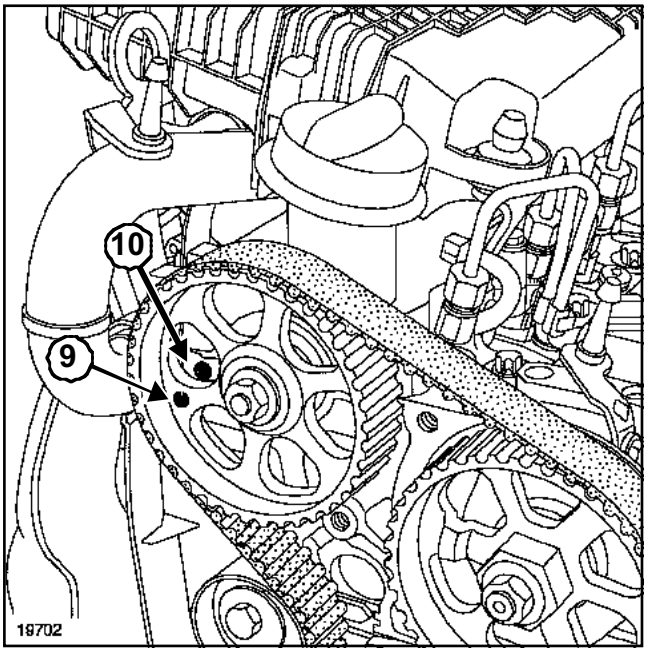
There must be 19 belt grooves between the marks of the high-pressure pump and camshaft pulleys.

19658

Position the tensioning roller adjustable index marker (**8**) opposite the spigot, turning the eccentric cam anti-clockwise using a **6 mm** Allen key.

Torque tighten **the tensioning roller bolt (27 ± 2.7 Nm)** .

Refit the accessories crankshaft pulley with a new bolt.



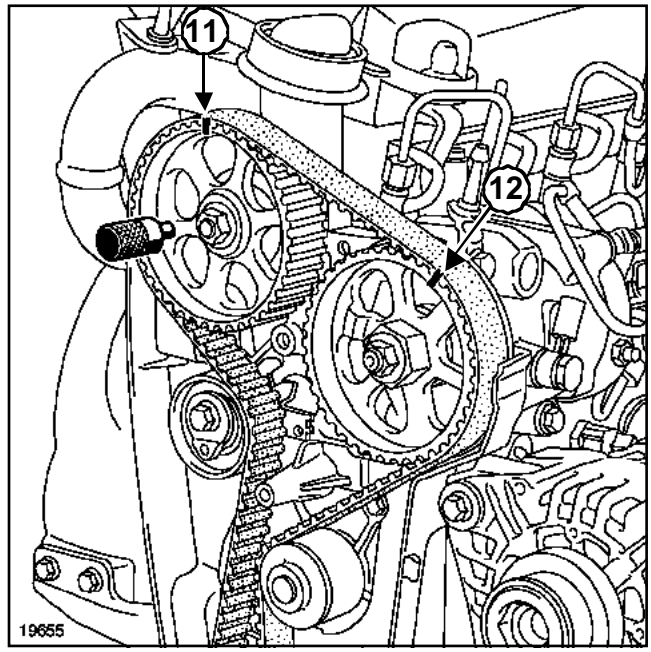
Torque and angle tighten (crankshaft pressed against the TDC setting pin):

- **the crankshaft accessories pulley M12 mounting bolt (60 ± 6 Nm + 100° ± 10°)** ,
- **the crankshaft accessories pulley M14 mounting bolt (120 ± 12 Nm + 95° ± 15°)** ,

Remove the following tools:

- the camshaft pulley timing pin **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)** ,

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19702

Rotate the crankshaft twice in a clockwise direction (timing end) before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

19655

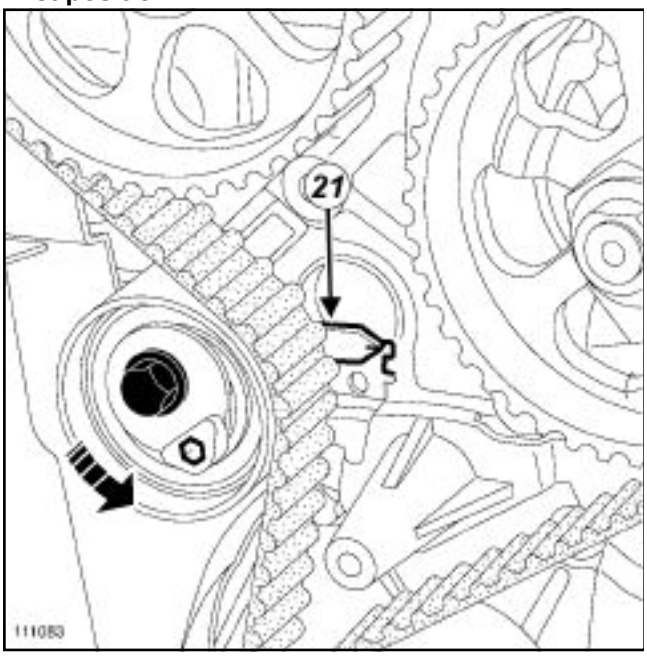
Set the camshaft pulley using the **(Mot. 1430)** .

Note:

There must be **19 belt grooves** between the marks of the camshaft pulley (**11**) and the high-pressure pump pulley (**12**) .

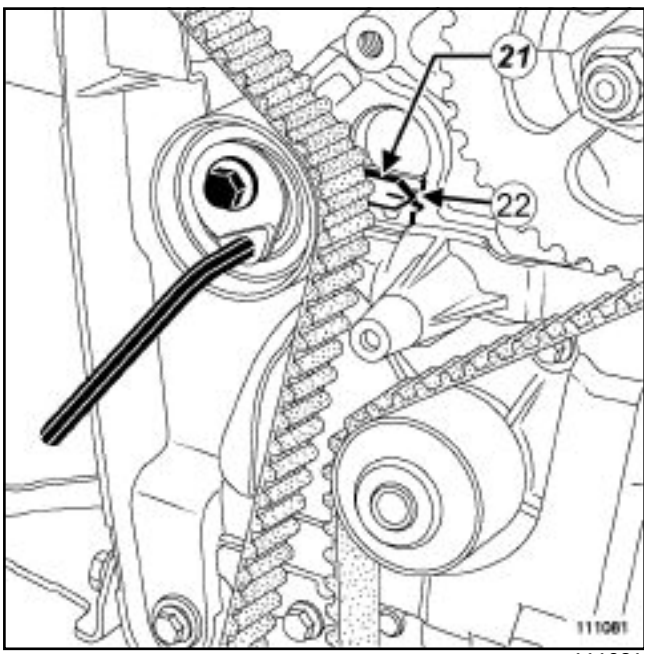
Remove:

- the TDC setting pin **(Mot. 1489)** ,
- the Set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .



Note:

After two turns, the tensioning roller index markers may be in two different positions.

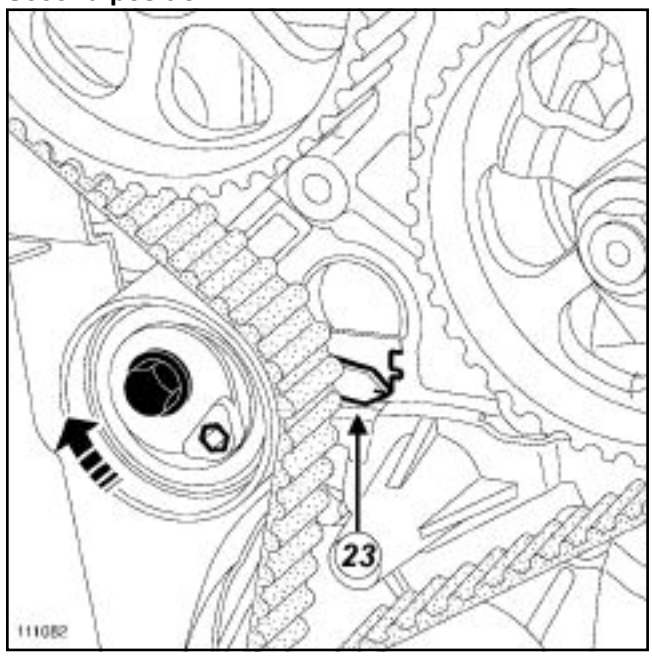


The rotation of the tensioning roller eccentric depends on the position.

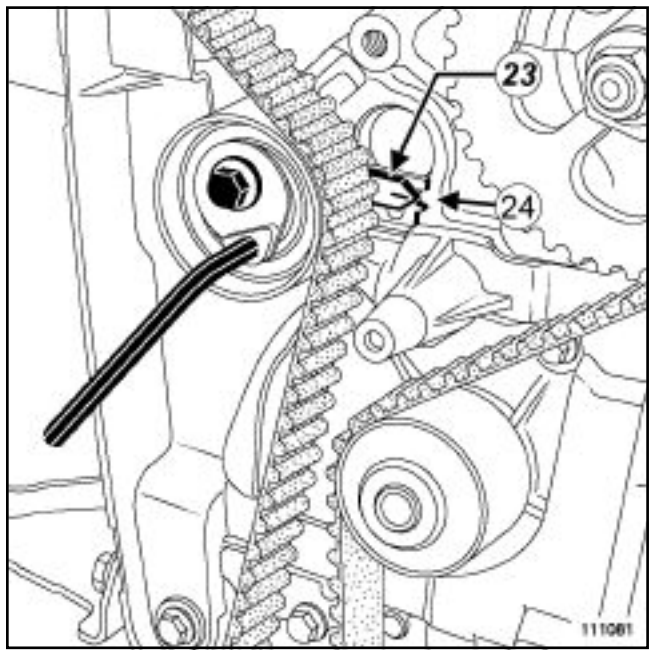
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

First position

111083



111081



Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index marker (**21**) to the middle of the timing window, (**22**) turning the key anti-clockwise.

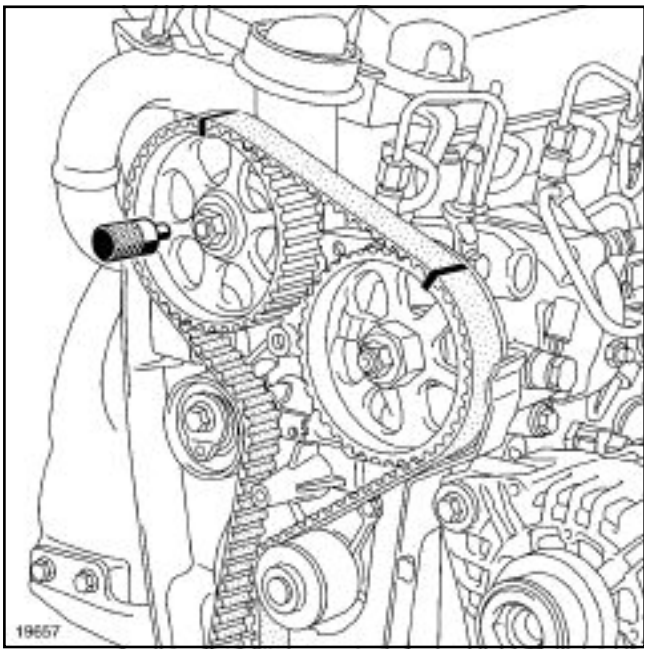
Second position

111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index marker (**23**) to the middle of the timing window, (**24**) turning the key clockwise.



Torque tighten **the tensioning roller bolt (27 ± 2.7 Nm)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

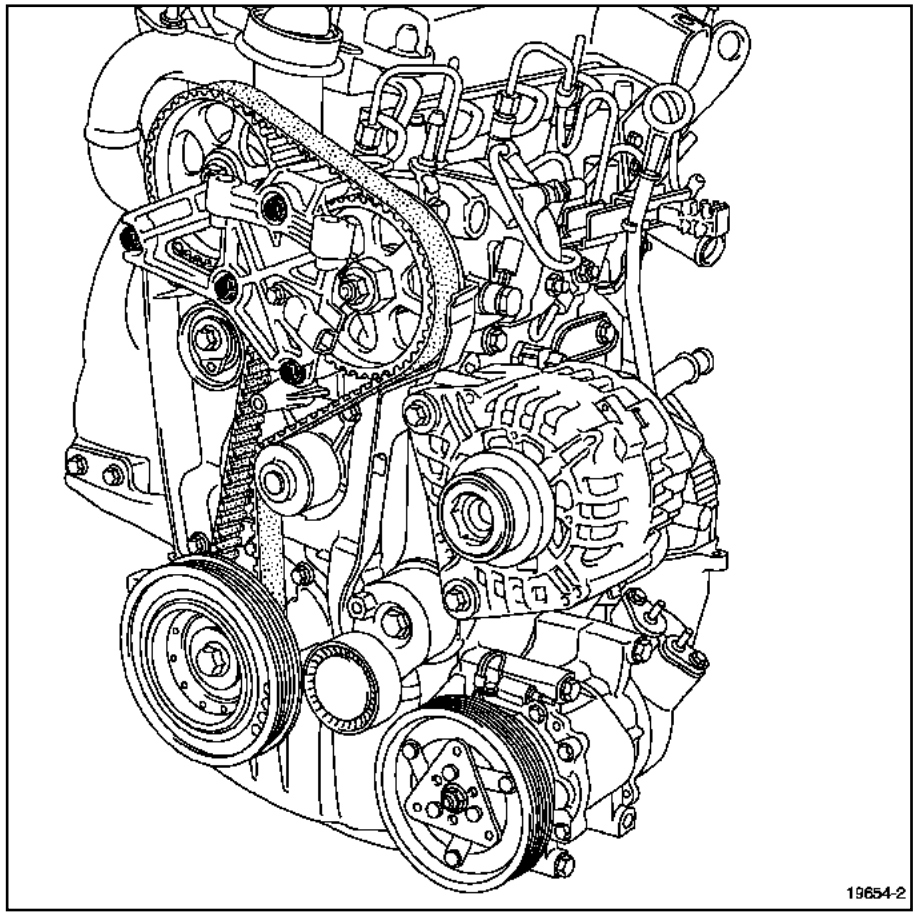
Bring the crankshaft slowly and smoothly against the TDC setting pin.

19657

Set the camshaft pulley using the **(Mot. 1430)** .

If this is not possible, repeat the timing belt refitting operation.

Remove the following tools:



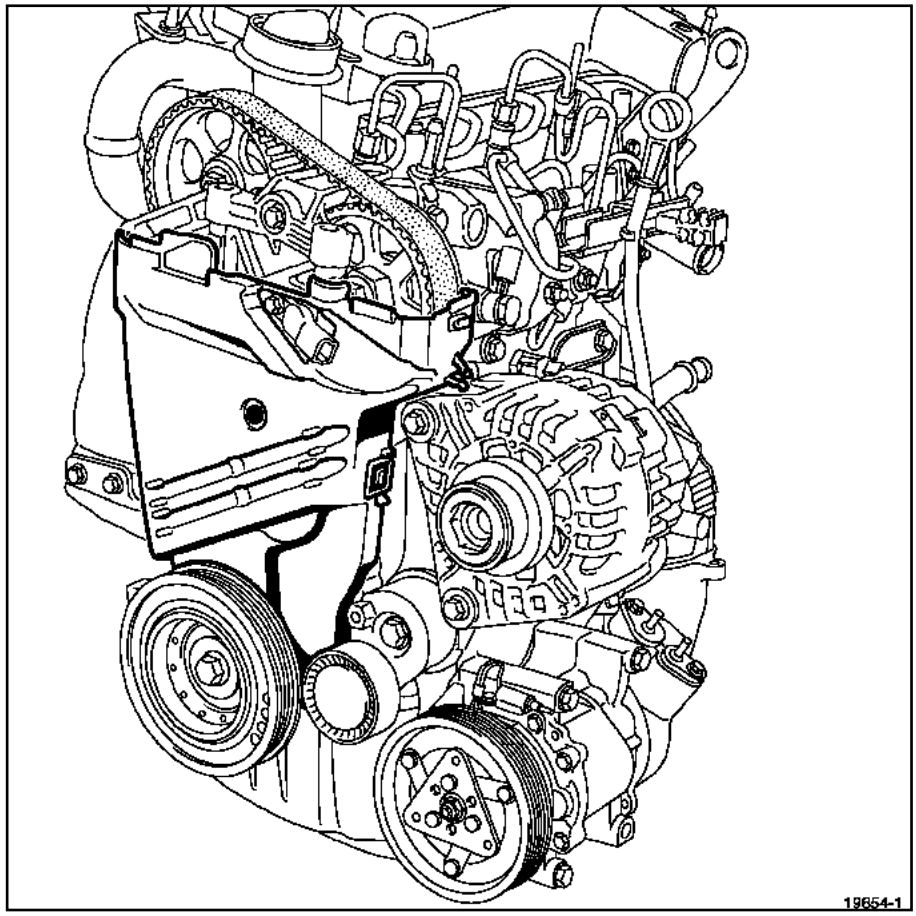
- TDC setting pin **(Mot. 1489)** ,
- set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Place a drop of **ADHESIVE SILICONE SEALANT** on the threading of the TDC pin plug.

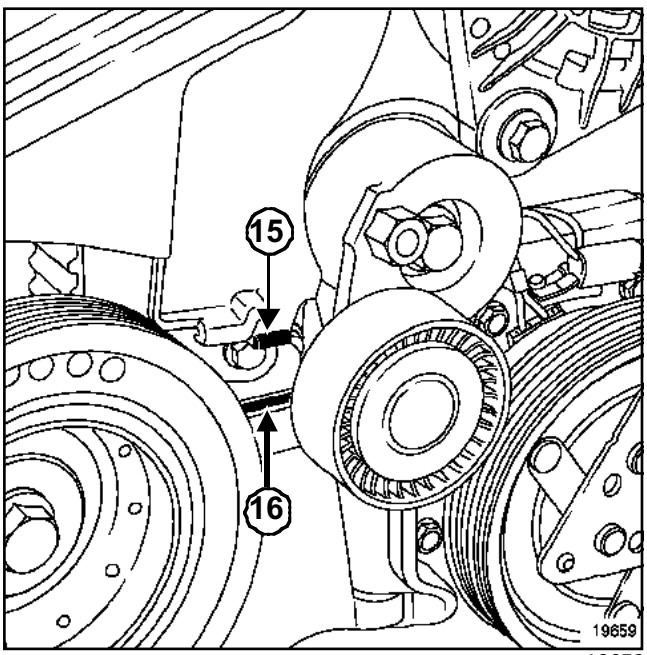
Tighten to torque **the TDC pin plug cap (20 ± 2 Nm)** .

Timing - cylinder head: Refitting

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



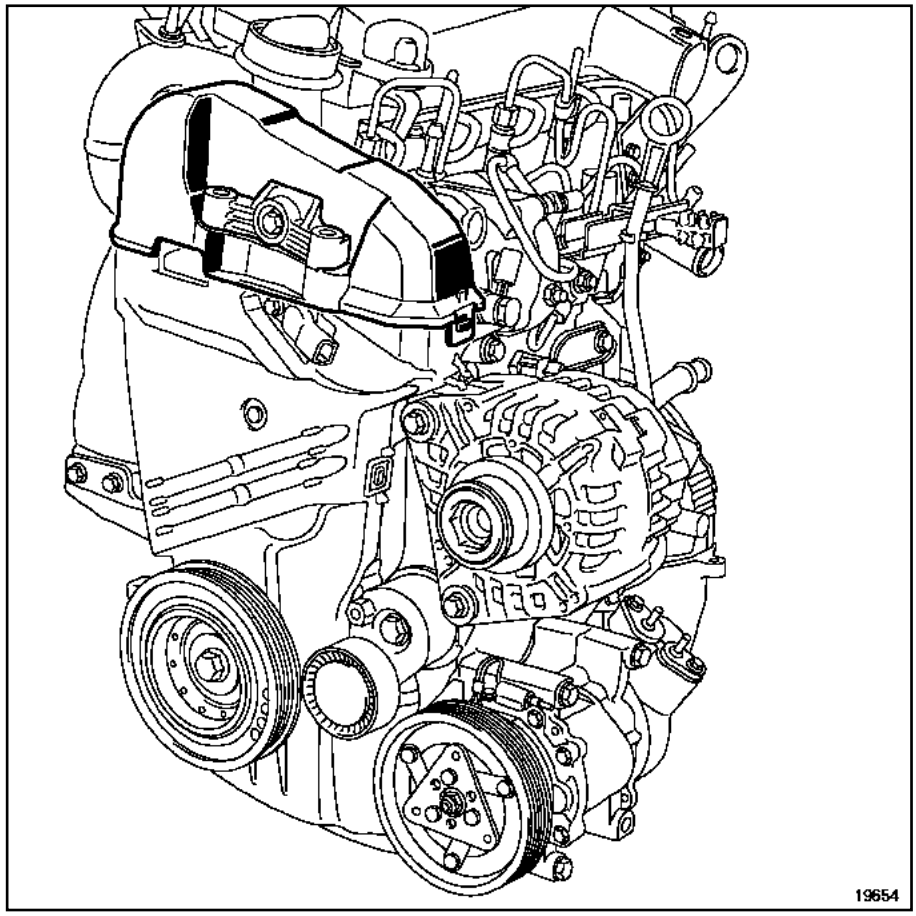
19654-2



Refit the cylinder head suspended mounting.

Tighten to torque **the cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19654-1

19659

Refit the timing cover, positioning tab (**15**) in lower timing cover opening. (**16**) .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19654

Refit the high-pressure pump position sensor.

Tighten to torque **the high-pressure pump position sensor bolt (8 ± 0.8 Nm)** .

Refit the upper timing cover.

Timing - cylinder head: Refitting

K9K, and 732 or 764

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
cylinder head mounting bolts	**25 ± 2.5 Nm**
cylinder head mounting bolts	**255° ± 10°**
rocker cover mounting bolts	**12 ± 1.2 Nm**
dipstick guide mounting nuts	**10 ± 1 Nm**
damper valve mounting nuts	**12 ± 1.2 Nm**
turbocharger oil return pipe mounting bolts	**12 ± 1.2 Nm**
the nuts mounting the catalytic converter on the turbocharger	**26 ± 2.6 Nm**
the bolts mounting the catalytic converter stay on the engine	**44 ± 4.4 Nm**
the bolts mounting the catalytic converter stay on the catalytic converter	**26 ± 2.6 Nm**
inner timing cover mounting bolts	**9 ± 0.9 Nm**
tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14 ± 1.4 Nm**
the tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14± 1.4 Nm**
the crankshaft accessories pulley M14 bolt	**120 ± 12 Nm + 95° ± 15°**

Tightening torques ▽	
TDC pin plug	**20 ± 2 Nm**
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**

I - RECOMMENDATIONS FOR REPAIRING THE CYLINDER HEAD

IMPORTANT
Wear protective gloves during every operation.

WARNING
When handling the cylinder head gasket, use the cylinder barrel to hold it.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

To obtain correct tightening of the cylinder head bolts, remove any oil from the cylinder head mounting holes using a syringe.

Do not retighten the cylinder head bolts after applying this procedure.

Do not lubricate the new cylinder head bolts.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced for the cylinder head

- The cylinder head gasket,
- The cylinder head bolts,
- The rocker cover gasket,
- The damper valve seal,
- The seals on the turbocharger oil return pipe,
- The catalytic converter seal.

Consumables

- Degreaser, part no. **77 11 224 559** ,
- Silicone adhesive sealant, part no. **77 11 227 484** .

K9K, and 732 or 764

III - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

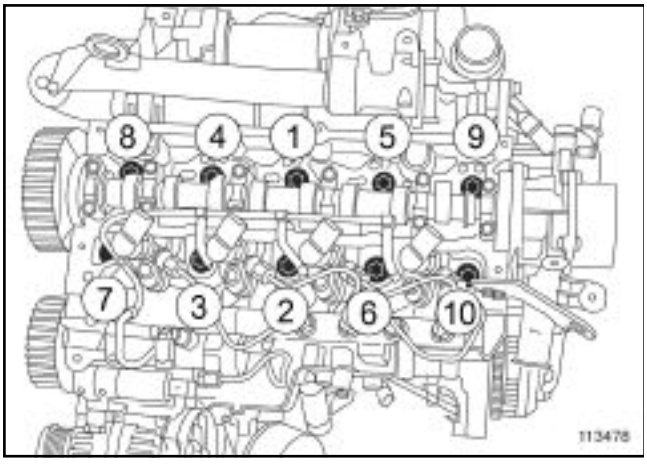
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Female torx socket (**14**),
- Protective gloves.

IV - REFITTING OF THE CYLINDER HEAD

Position the pistons at mid-stroke.

Apply degreaser to the:

- the combustion side of the cylinder head,
- the combustion face of the cylinder block.



Check for the cylinder head centring dowels on the cylinder block.

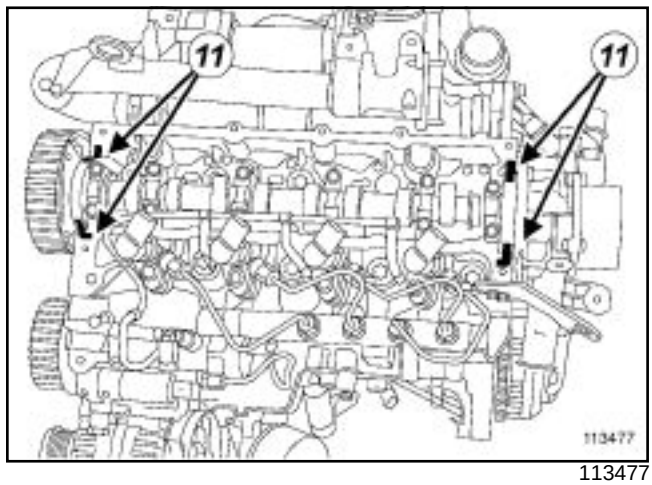
Refit the cylinder head gasket (positioning the TOP facing upwards) onto the cylinder block.

Remove the cylinder head from the cylinder head support.

Refit:

- the cylinder head,
- the new cylinder head mounting bolts.

113478



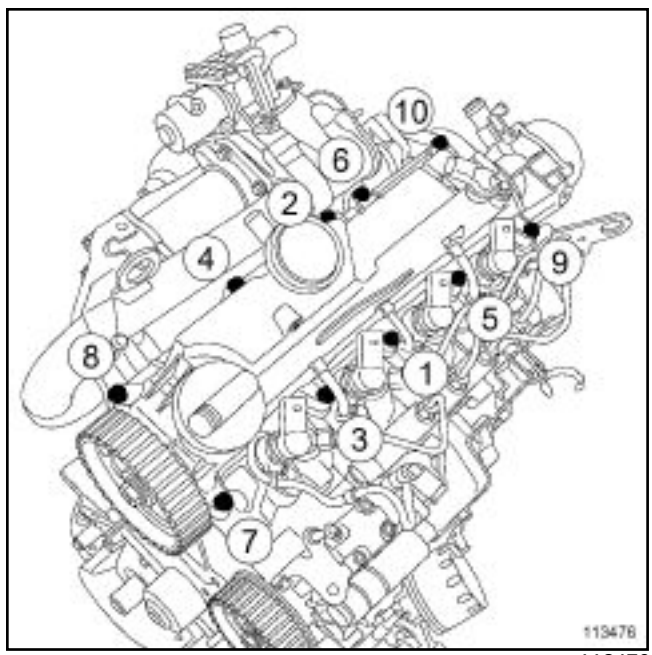
Tighten to torque and in order the **cylinder head mounting bolts (25 ± 2.5 Nm)** .

Check that all the **cylinder head mounting bolts** are tightened to **(25 ± 2.5 Nm)** .

Angle tighten in order the **cylinder head mounting bolts (255° ± 10°)** .

Degrease the rocker cover sealing surface on the cylinder head.

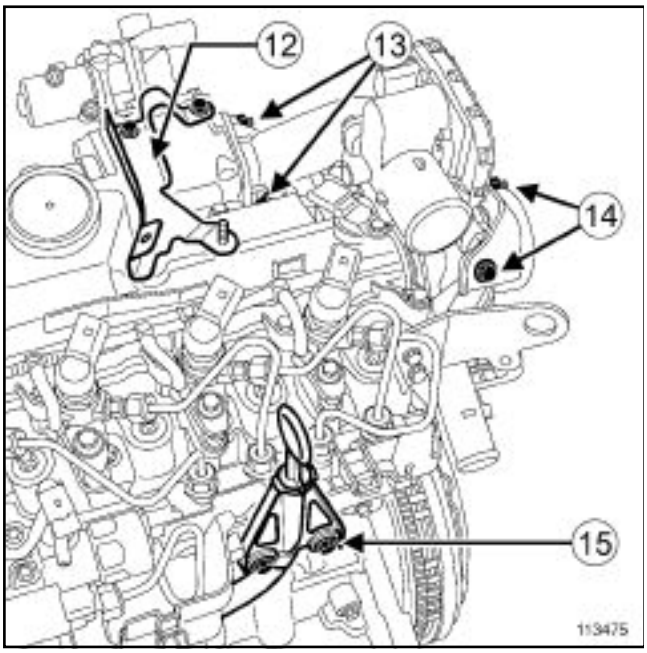
Fit a new seal onto the rocker cover.



113477

Apply four beads (**11**) of **SILICONE ADHESIVE SEALANT** (**2 mm** in diameter).

Refit:



- the rocker cover,
- the rocker cover mounting bolts.

113476

Tighten to torque and in order the **rocker cover mounting bolts (12 ± 1.2 Nm)** .

K9K, and 732 or 764

113475

Refit:

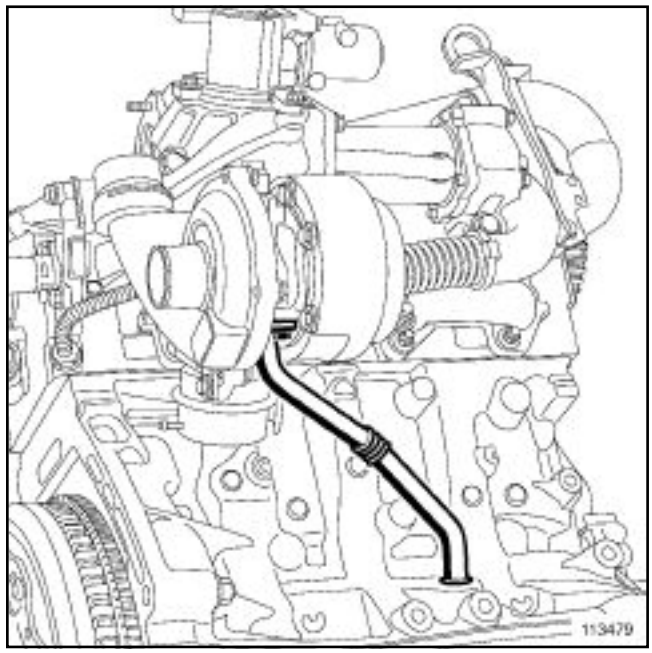
- the dipstick guide,
- the dipstick guide mounting nuts (**15**) .

Tighten to torque the **dipstick guide mounting nuts (10 ± 1 Nm)** .

Refit a new seal to the damper valve.

Refit:

- the damper valve,
- the damper valve mounting nuts (**13**) .



Tighten to torque the **damper valve mounting nuts (12 ± 1.2 Nm)** .

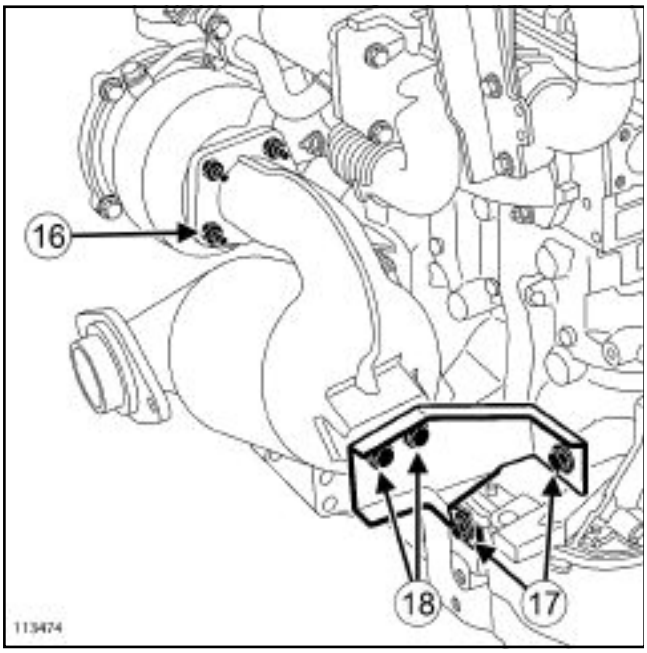
Refit:

- the damper valve mounting bracket,
- the mounting bolts securing the damper valve mounting bracket,
- the exhaust gas recirculation valve retaining bracket,
- the exhaust gas recirculation valve retaining bracket mounting bolts.

Fit the new seals onto the turbocharger oil return pipe.

Use engine oil to lubricate the turbocharger oil return pipe O-ring seals.

113479



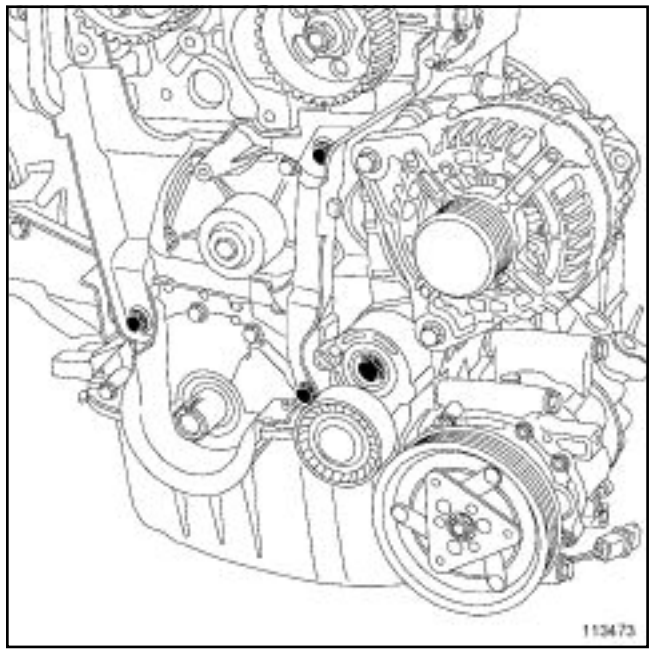
Refit:

- the turbocharger oil return pipe,
- the turbocharger oil return pipe mounting bolts.

Tighten to torque the **turbocharger oil return pipe mounting bolts (12 ± 1.2 Nm)** .

Fit a new seal between the turbocharger and the catalytic converter.

K9K, and 732 or 764



113474

Refit:

- the catalytic converter,
- the nuts mounting the catalytic converter on the turbocharger,
- the catalytic converter mounting stay,
- the catalytic converter stay mounting bolts.

Tighten to torque:

- **the nuts mounting the catalytic converter on the turbocharger (26 ± 2.6 Nm)** (**16**) ,
- **the bolts mounting the catalytic converter stay on the engine (44 ± 4.4 Nm)** (**17**) ,
- **the bolts mounting the catalytic converter stay on the catalytic converter (26 ± 2.6 Nm)** (**18**) .

113473

Refit:

- the inner timing cover (tilting the alternator if necessary),
- the inner timing cover mounting bolts.

Tighten to torque the **inner timing cover mounting bolts (9 ± 0.9 Nm)** .

V - RECOMMENDATIONS FOR REPAIRING THE TIMING

IMPORTANT

Wear protective gloves during every operation.

WARNING

The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

When replacing the belt, always replace the tensioning rollers and fixed rollers.

VI - PARTS AND CONSUMABLES

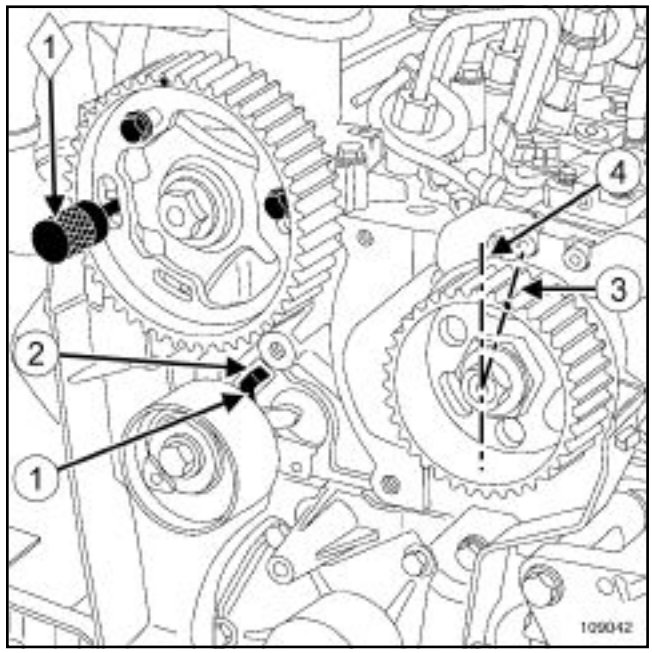
Parts always to be replaced for the timing

- Timing belt,

K9K, and 732 or 764

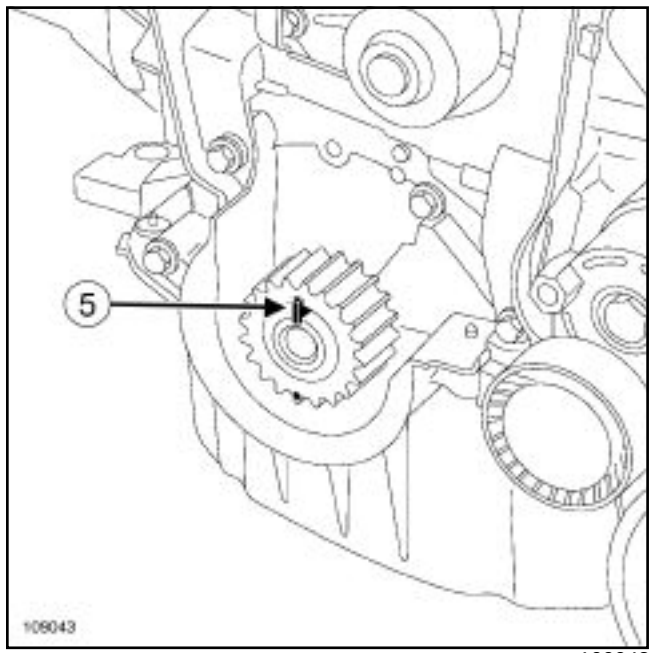
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Consumables



- Silicone adhesive sealant, part no. **77 11 227 484**

VII - EQUIPMENT REQUIRED FOR THE TIMING BELT



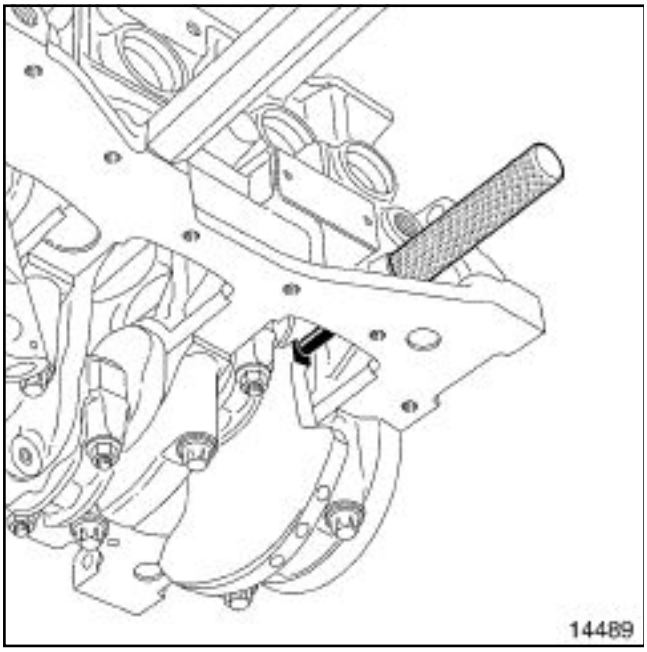
- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset wrench (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

VIII - REFITTING THE TIMING BELT

Refit the crankshaft timing sprocket.

109042

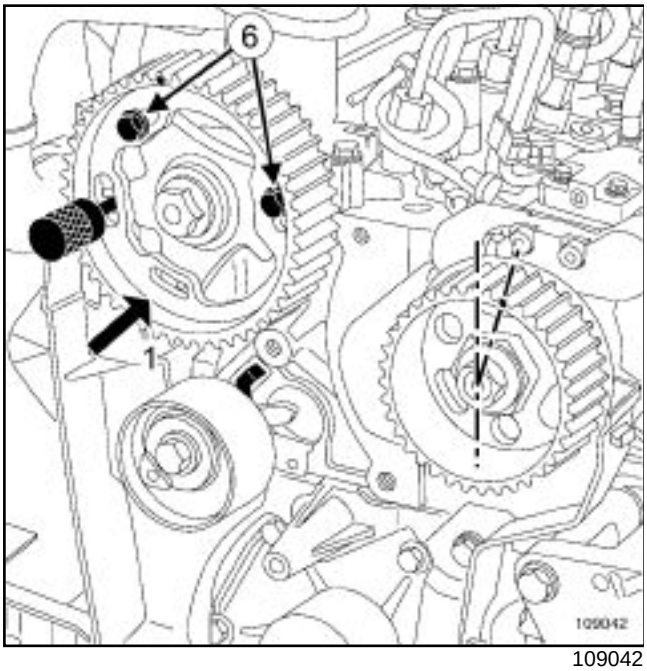
109043



Refit the timing tensioning roller.

Put the tensioning roller spigot (**1**) in the cylinder head groove (**2**) .

Engage the pin (**1**) **(Mot. 1430)** in the holes of the camshaft pulley and cylinder head, turning the camshaft using an **18 mm** offset wrench if necessary.

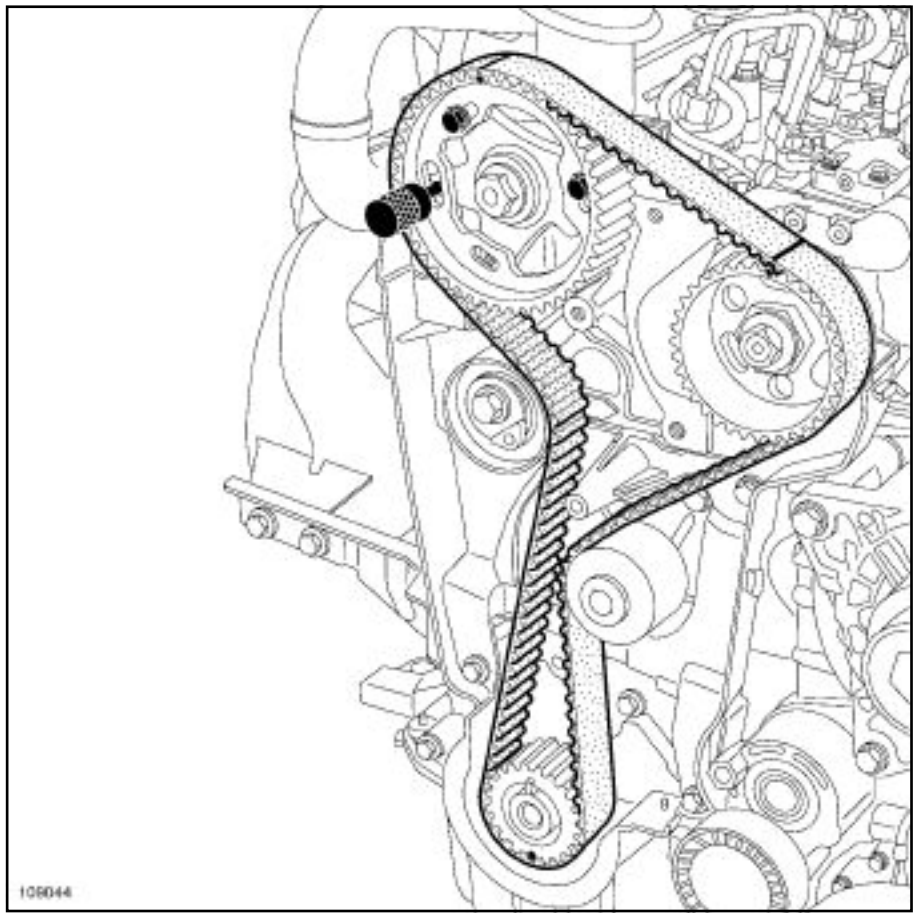


Check that the high-pressure pump mark (**3**) has shifted one tooth to the right of the vertical axle (**4**) .

K9K, and 732 or 764

14489

Position the crankshaft so that it presses on the TDC setting pin **(Mot. 1489)** (the crankshaft timing sprocket cotter ***(5)*** must face upwards)



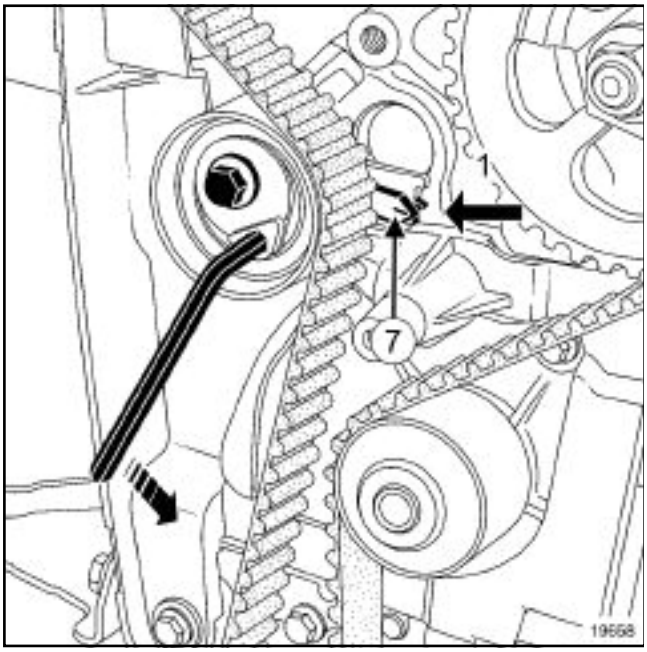
109042

Remove one bolt from the camshaft pulley wheel.

Loosen the two other camshaft pulley wheel bolts (**6**) by one turn.

Timing - cylinder head: Refitting

K9K, and 732 or 764

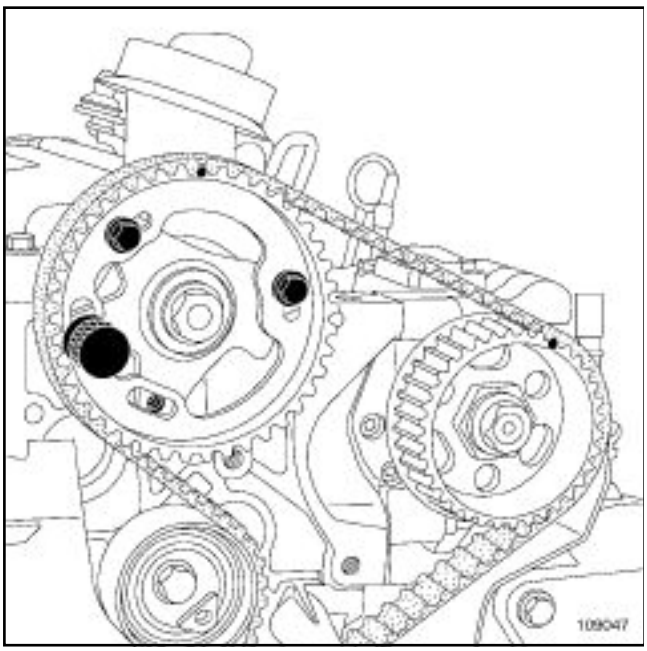


109044

Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft sprockets, the camshaft and the high-pressure pump.

note:

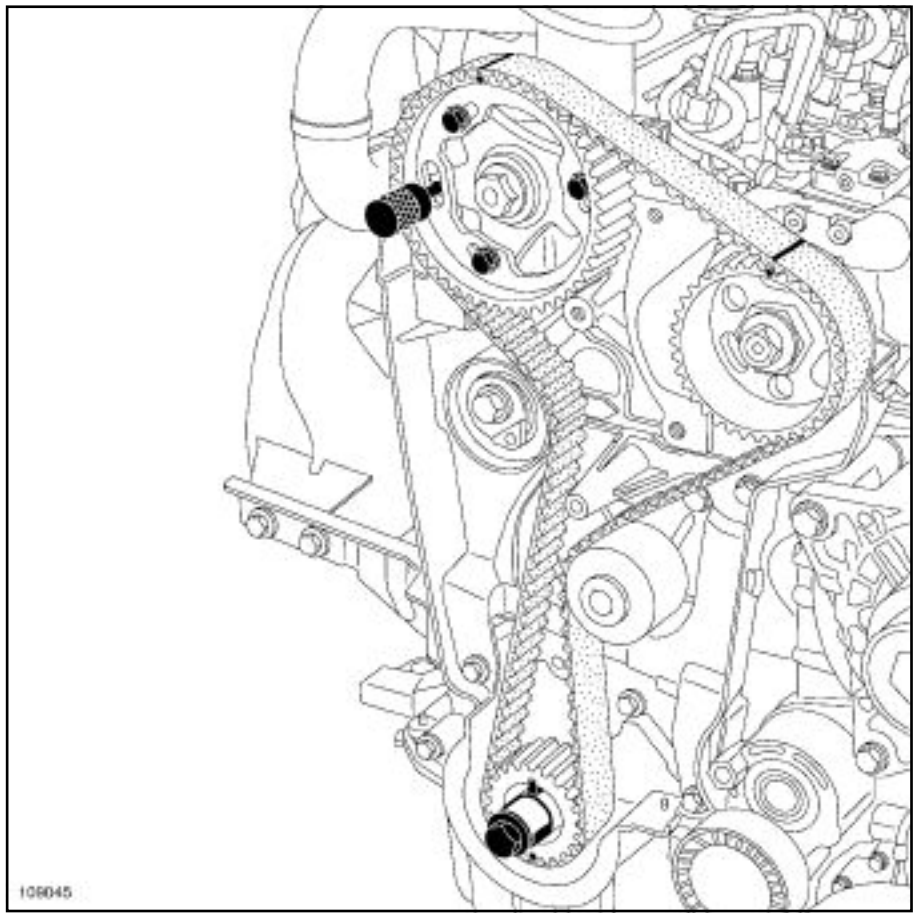
There should be 19 tooth belt grooves on the belt between the camshaft sprocket marks and the high-pressure pump, and 51 tooth belt grooves between the crankshaft sprockets and the high-pressure pump.



K9K, and 732 or 764

19658

Position the tensioning roller adjustable index (**7**) opposite the spigot, turning the eccentric cam anti-clockwise using a **6 mm** Allen key.

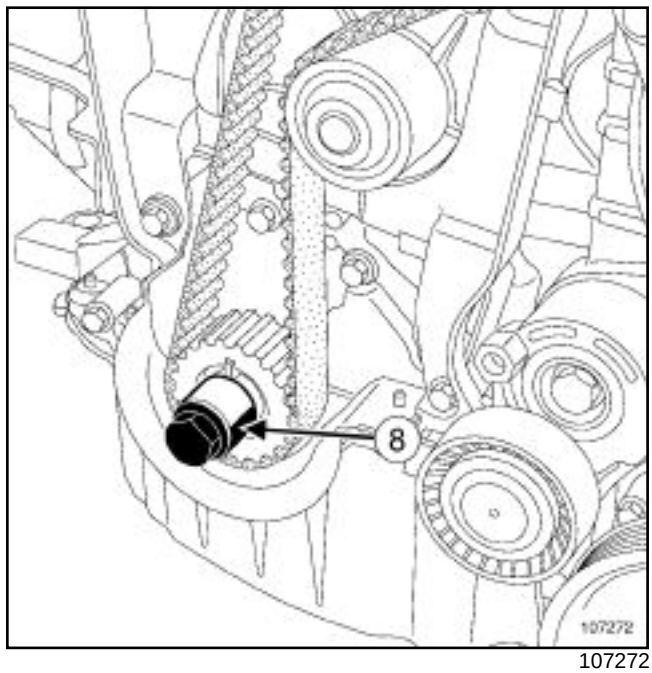


Tighten to torque the **tensioning roller bolt (27 ± 2.7 Nm)** .

109047

Check that the camshaft pulley hub bolts are not fully up against the camshaft pulley wheel.

K9K, and 732 or 764

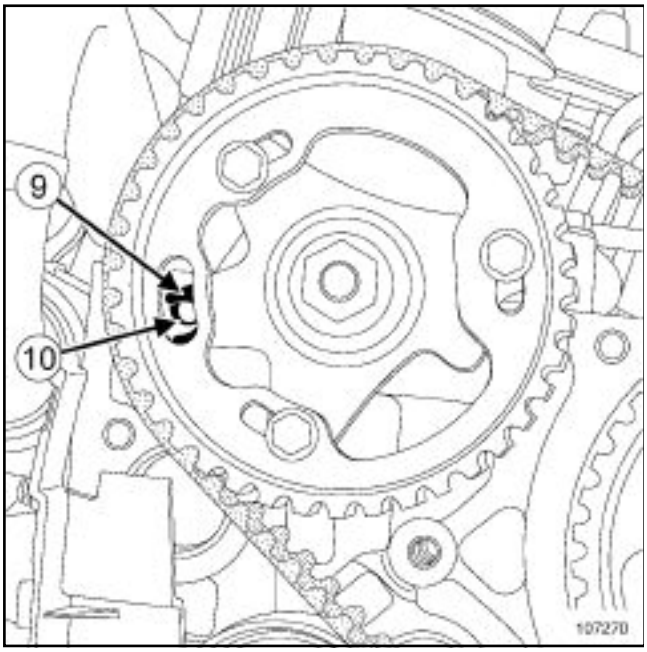


109045

Refit the bolt to the camshaft pulley wheel.

Tighten to torque **the camshaft pulley wheel bolts (14 ± 1.4 Nm)** .

Remove:

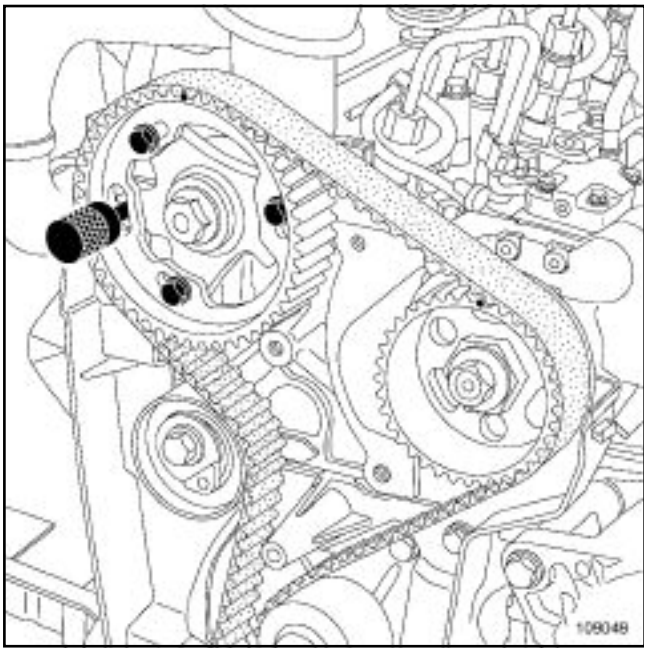


- the TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

107272

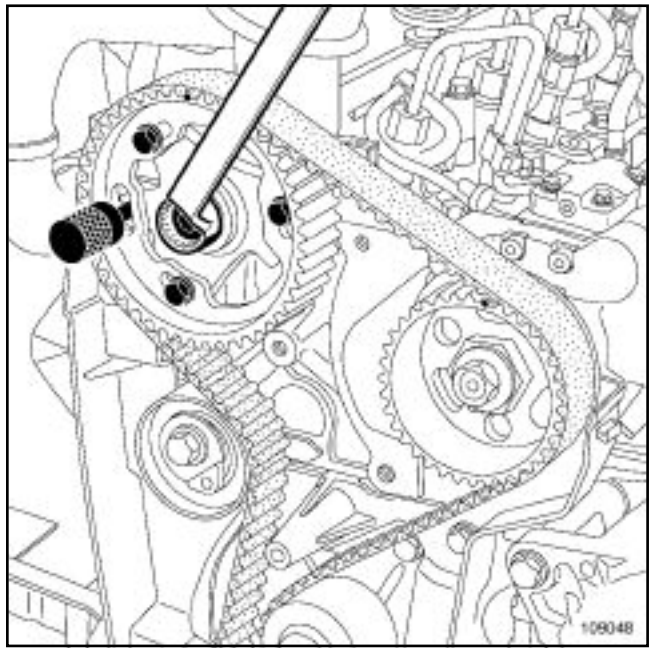
Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**8**) onto the crankshaft.

K9K, and 732 or 764



107270

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .



Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

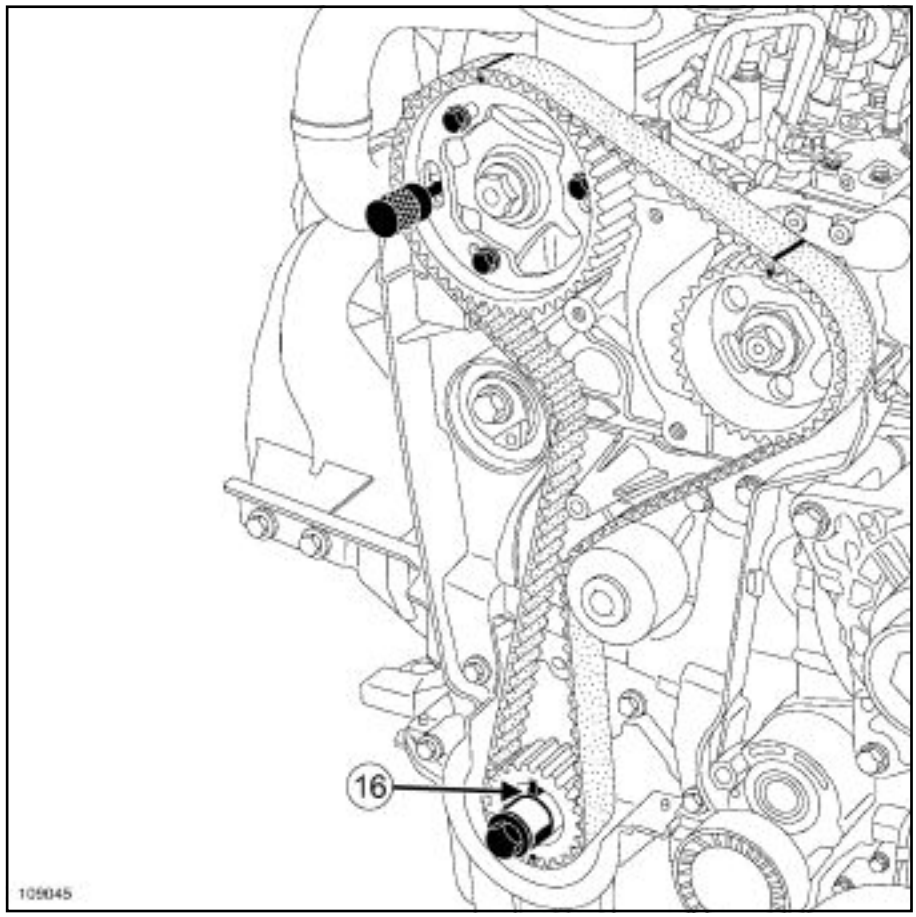
Bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

Set the camshaft pulley using the **(Mot. 1430)** .

109048

If the pin **(Mot. 1430)** does not engage:



loosen the camshaft pulley wheel bolts by one turn,

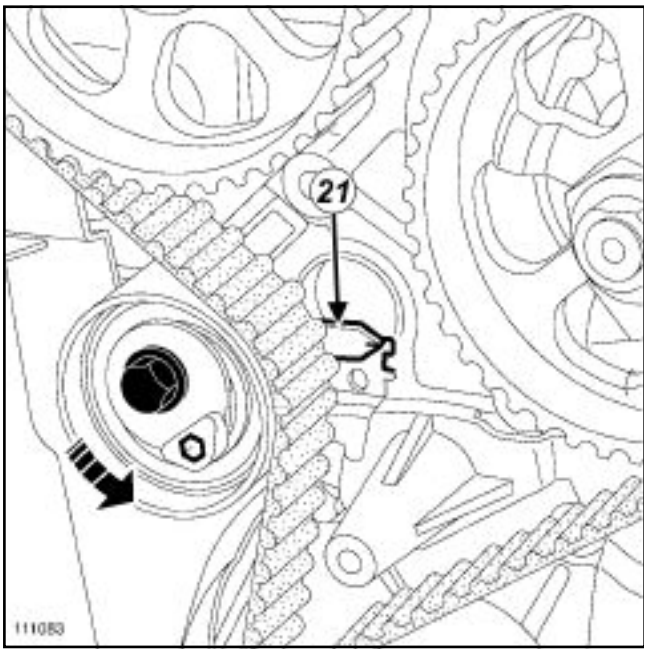
Turn the camshaft pulley hub using an **18 mm** offset wrench to set the camshaft pulley hub timing.

Do not retighten the camshaft pulley wheel bolts.

Timing - cylinder head: Refitting

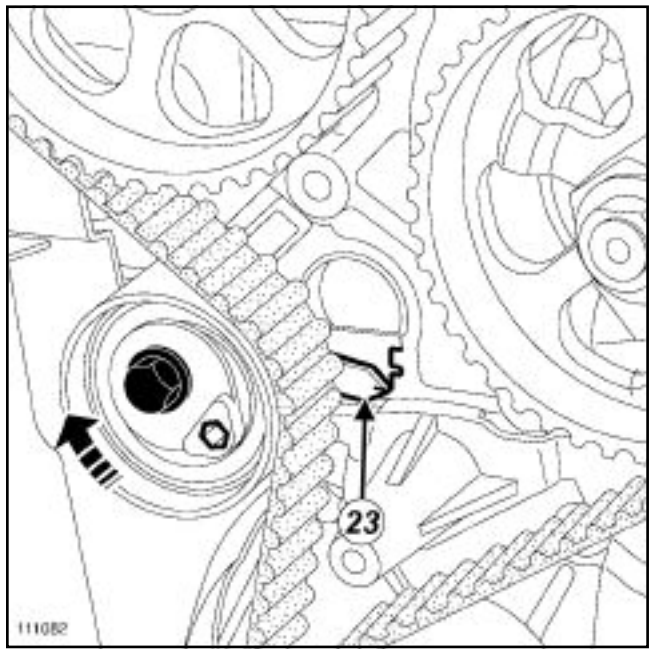
K9K, and 732 or 764

109045



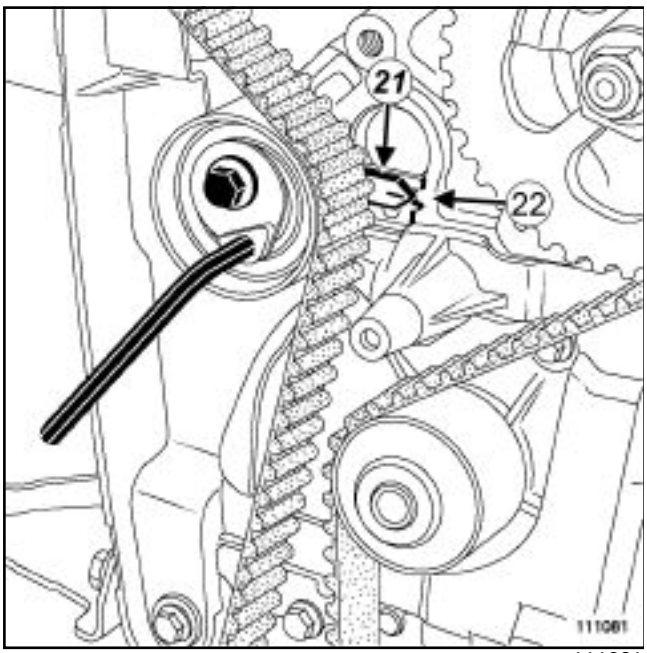
Check that the crankshaft timing sprocket cotter (**16**) is positioned vertically at the top.

note:



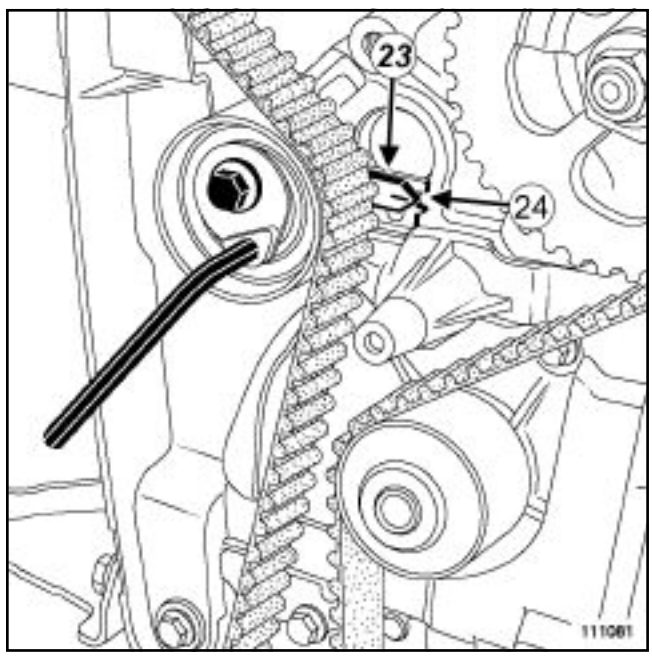
After two turns, the tensioning roller index markers may be in two different positions.

The rotation of the tensioning roller eccentric depends on the position.



K9K, and 732 or 764

111083



111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index (**21**) in the middle of the timing window (**22**) , turning the key anticlockwise.

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

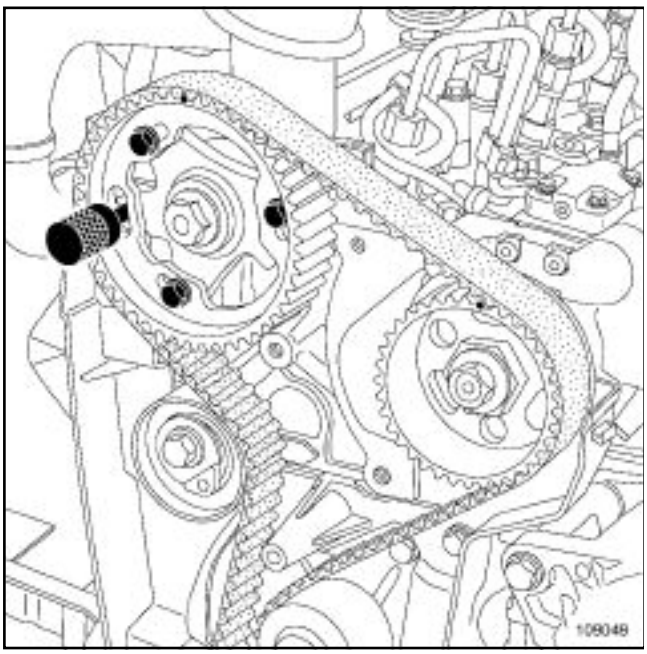
Gradually align the adjustable index (**23**) in the middle of the timing window (**24**) , turning the key clockwise.

Tighten to torque:

- **the tensioning roller bolt (27 ± 2.7 Nm)** ,
- **the camshaft pulley wheel bolts (14± 1.4 Nm)** .

Remove the following tools:

- TDC setting pin **(Mot. 1489)** ,

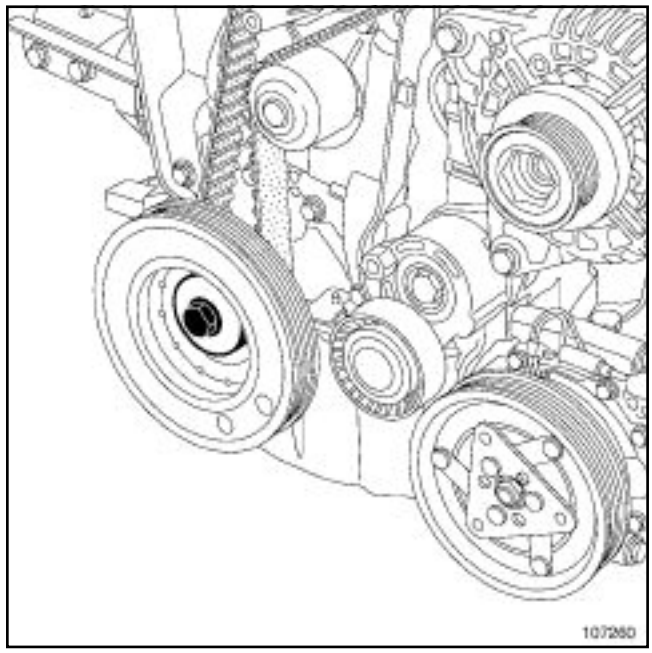


K9K, and 732 or 764

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.



Bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

Set the camshaft pulley using the **(Mot. 1430)** .

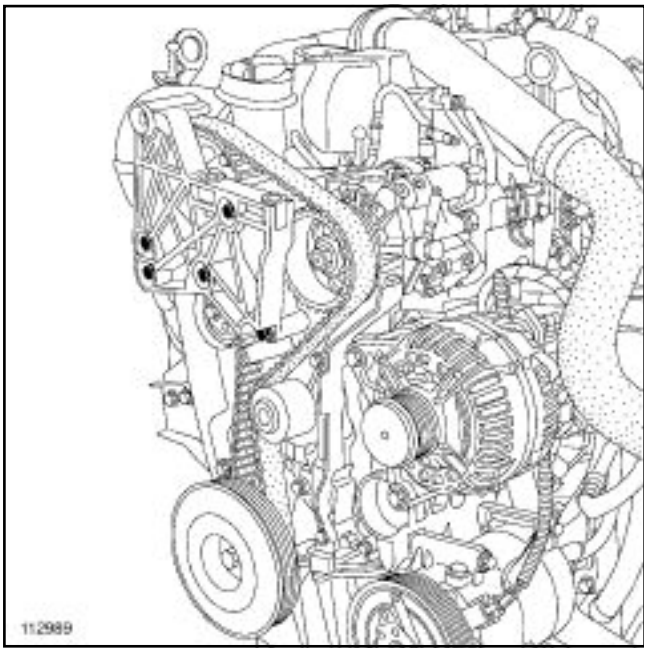
If this is not possible, repeat the timing belt refitting operation.

107260

Refit the accessories crankshaft pulley with a new bolt.

Tighten to torque and angle (crankshaft in contact with the TDC setting pin) **the crankshaft accessories pulley M14 bolt (120 ± 12 Nm + 95° ± 15°)** .

Remove the following tools:



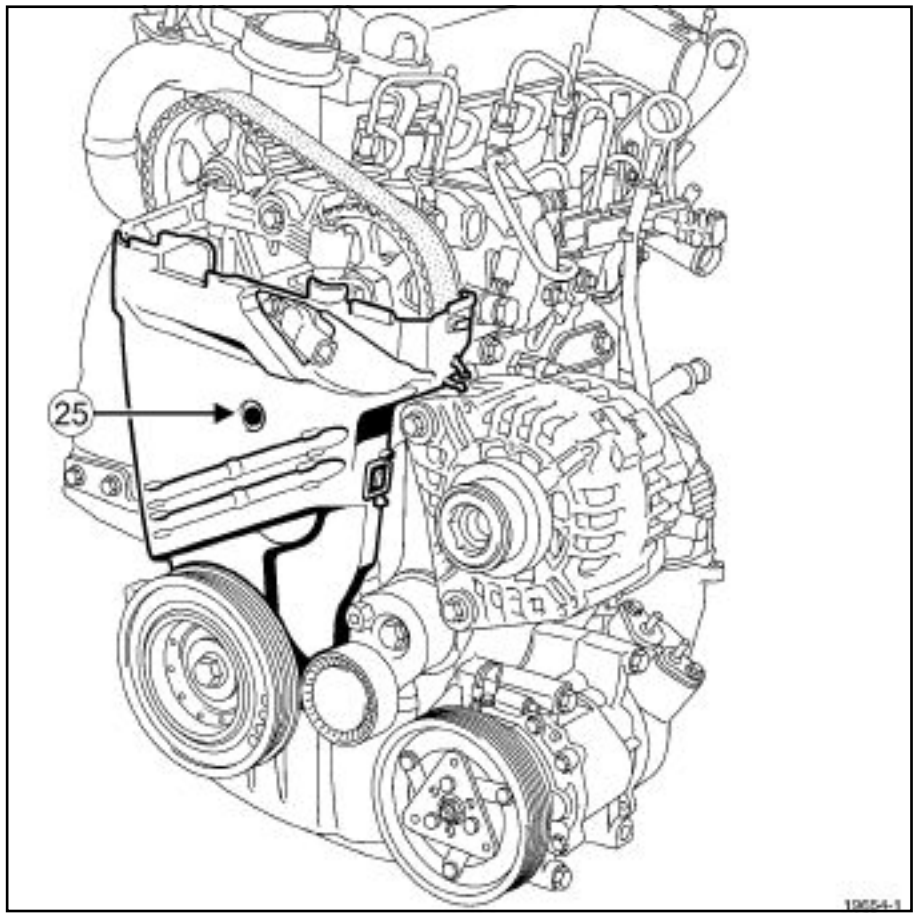
- TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Refit the TDC pin plug, coating the thread with **SILICONE ADHESIVE SEALANT** .

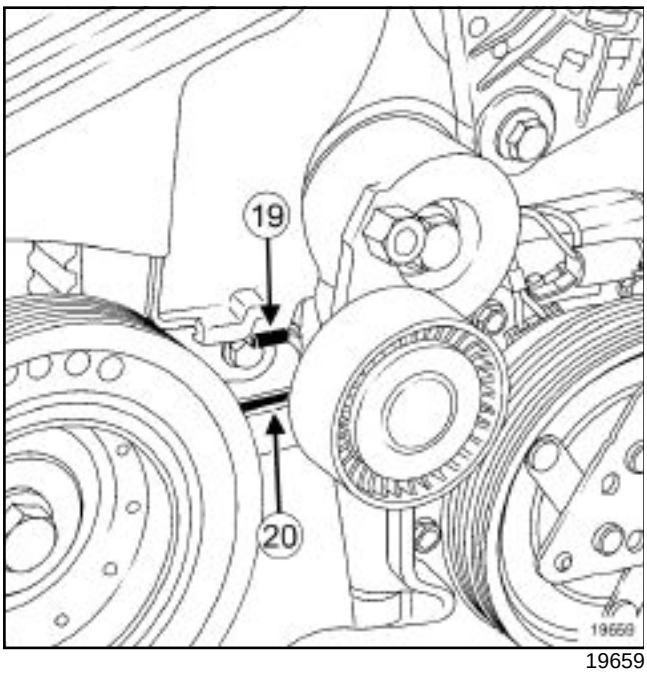
Tighten to torque the **TDC pin plug (20 ± 2 Nm)** .

K9K, and 732 or 764

K9K, and 732



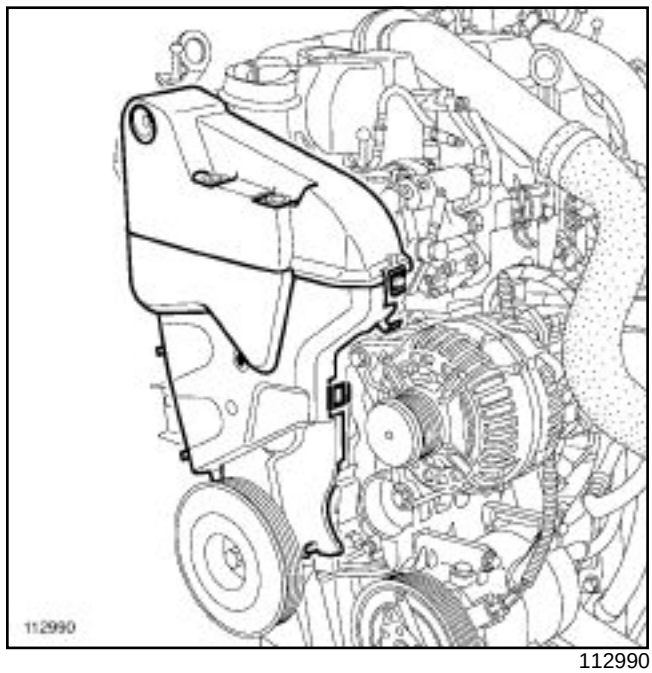
112989



Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

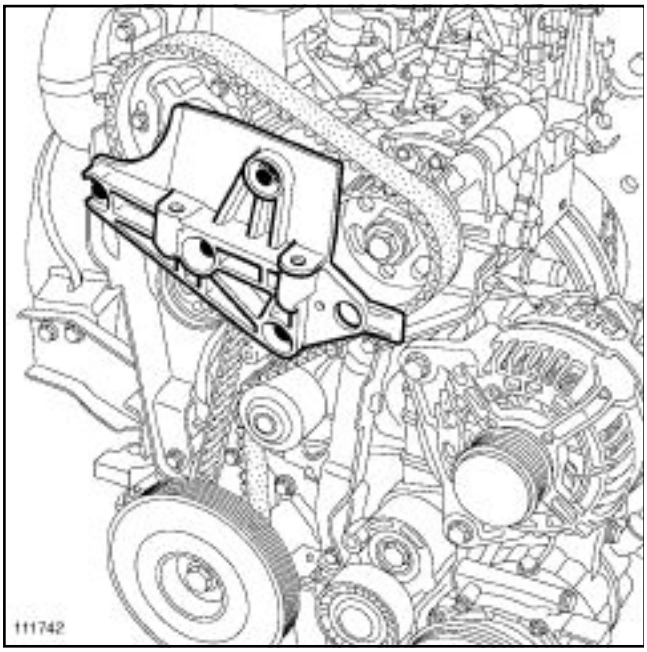
K9K, and 732 or 764



19654-1

19659

Refit:

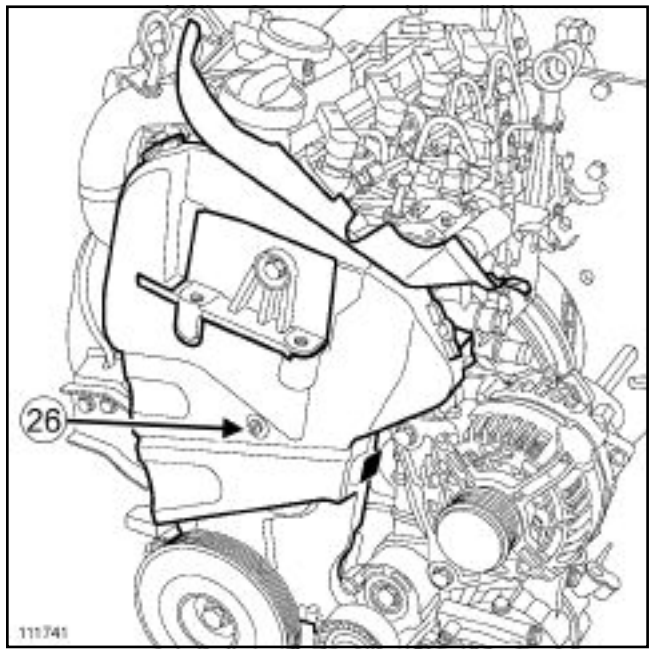


- the lower timing cover, positioning the tab (**19**) in the inner timing cover hole (**20**) ,
- the timing cover plastic bolt (**25**) .

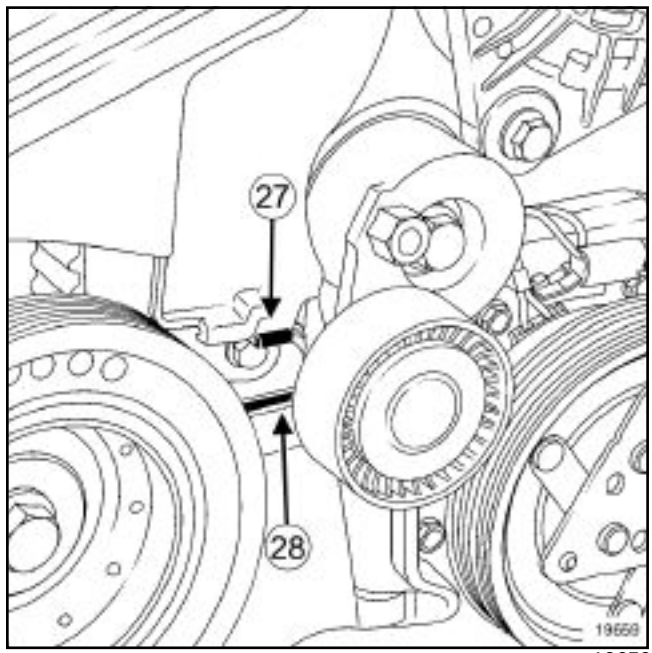
112990

Refit the upper timing cover.

K9K, and 732 or 764



K9K, and 764



111742

Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

111741

19659

Refit:

- the timing cover, positioning the tab (**27**) in the inner timing cover hole (**28**) ,
- the timing cover plastic bolt (**26**) .

Timing - cylinder head: Refitting

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
cylinder head mounting bolts	**25 ± 2.5 Nm**
cylinder head mounting bolts	**255° ± 10°**
rocker cover mounting bolts	**12 ± 1.2 Nm**
turbocharger oil return pipe mounting bolts	**12 ± 1.2 Nm**
the nuts mounting the catalytic converter on the turbocharger	**26 ± 2.6 Nm**
the bolts mounting the catalytic converter stay on the engine	**44 ± 4.4 Nm**
the bolts mounting the catalytic converter stay on the catalytic converter	**26 ± 2.6 Nm**
oil vapour recirculation valve mounting nuts	**12 ± 1.2 Nm**
inner timing cover mounting bolts	**9 ± 0.9 Nm**
tensioning roller bolt	**27 ± 2.7 N.m**
the camshaft pulley wheel bolts	**14 ± 1.4 Nm**
the tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14± 1.4 Nm**
the crankshaft accessories pulley M14 bolt	**120 ± 12 Nm + 95° ± 15°**
TDC pin plug	**20 ± 2 Nm**

Tightening torques ▽	
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**
high-pressure pump position sensor bolt	**8 Nm**

I - RECOMMENDATIONS FOR REPAIRING THE CYLINDER HEAD

IMPORTANT
Wear protective gloves during every operation.

WARNING
When handling the cylinder head gasket, use the cylinder barrel to hold it.

The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

To obtain correct tightening of the cylinder head bolts, remove any oil from the cylinder head mounting holes using a syringe.

Do not retighten the cylinder head bolts after applying this procedure.

Do not lubricate the new cylinder head bolts.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced for the cylinder head

- The cylinder head gasket,
- The cylinder head bolts,
- The rocker cover gasket,
- The oil vapour recirculation valve seal,
- The seals on the turbocharger oil return pipe,
- The catalytic converter seal.

Consumables

- Degreaser, part no. **77 11 224 559** ,
- Silicone adhesive sealant, part no. **77 11 227 484** .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

III - EQUIPMENT REQUIRED FOR THE CYLINDER HEAD

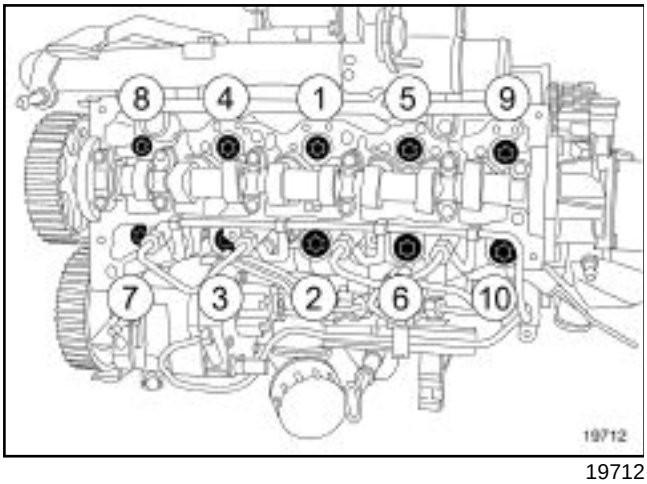
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type),
- Female torx socket (**14**),
- Protective gloves.

IV - REFITTING OF THE CYLINDER HEAD

Position the pistons at mid-stroke.

Apply degreaser to:

- the combustion side of the cylinder head,
- the combustion face of the cylinder block.



Check for the cylinder head centring dowels on the cylinder block.

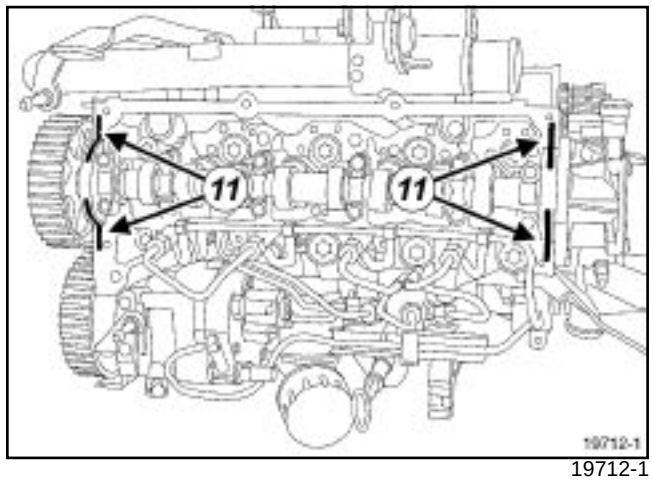
Refit the cylinder head gasket (positioning the TOP facing upwards) onto the cylinder block.

Remove the cylinder head from the cylinder head support.

Refit:

- the cylinder head,
- the new cylinder head mounting bolts.

19712



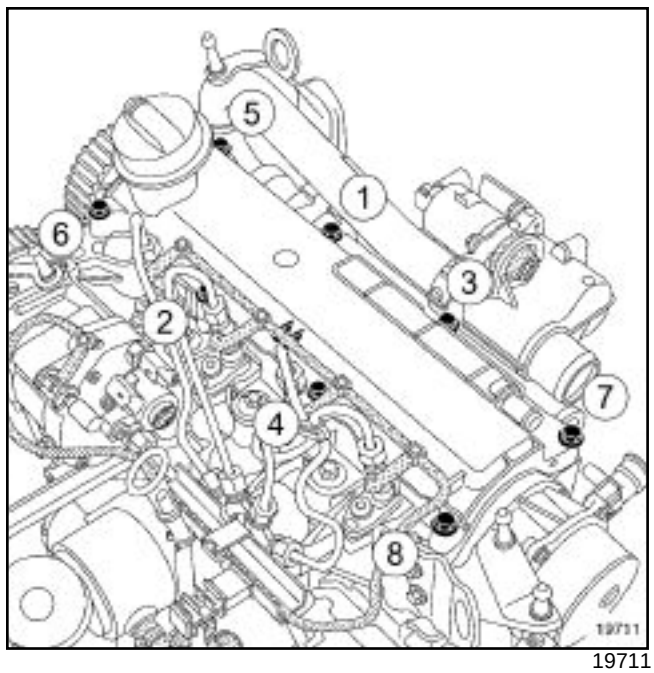
Tighten to torque and in order the **cylinder head mounting bolts (25 ± 2.5 Nm)** .

Check that all the **cylinder head mounting bolts** are tightened to **(25 ± 2.5 Nm)** .

Angle tighten in order the **cylinder head mounting bolts (255° ± 10°)** .

Degrease the rocker cover sealing surface on the cylinder head.

Refit a new seal onto the rocker cover.



19712-1

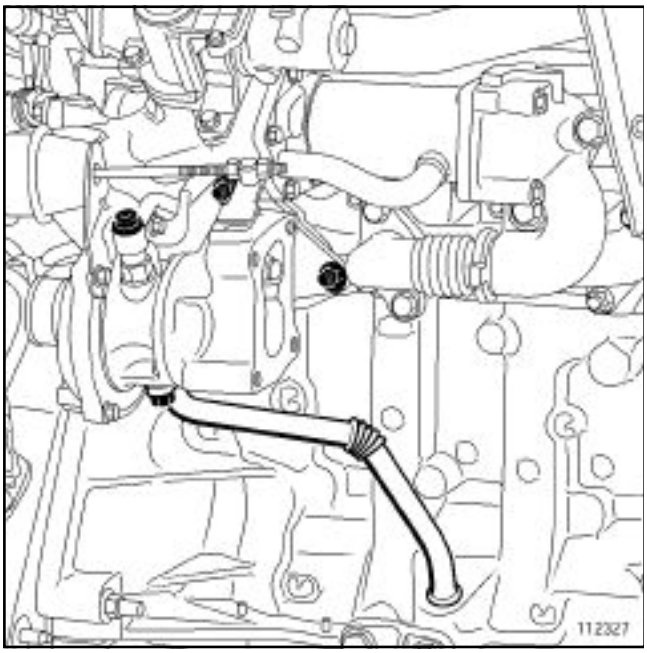
Apply four beads (**11**) of **SILICONE ADHESIVE SEALANT** (**2 mms** in diameter).

Refit:

- the rocker cover,
- the rocker cover mounting bolts.

19711

Tighten to torque and in order the **rocker cover mounting bolts (12 ± 1.2 Nm)** .



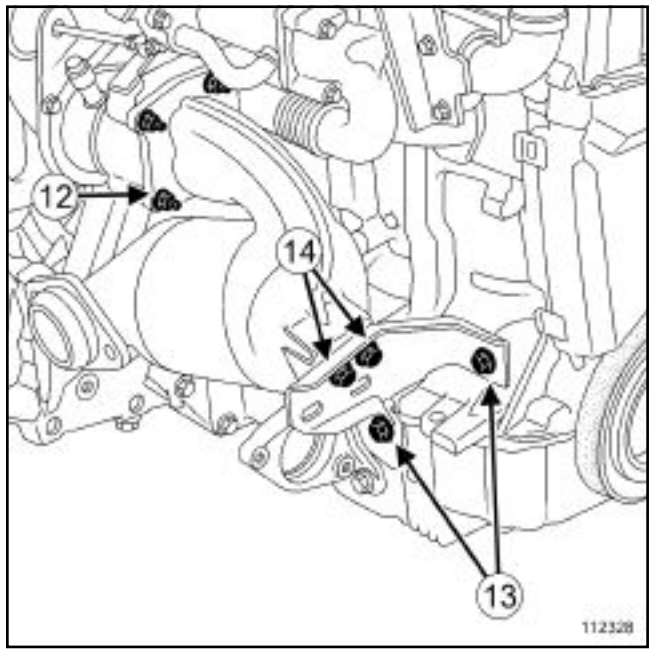
Refit the dipstick guide tube.

Clip the fuel return pipe onto the rocker cover.

Fit the new seals onto the turbocharger oil return pipe.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Use engine oil to lubricate the turbocharger oil return pipe O-ring seals.



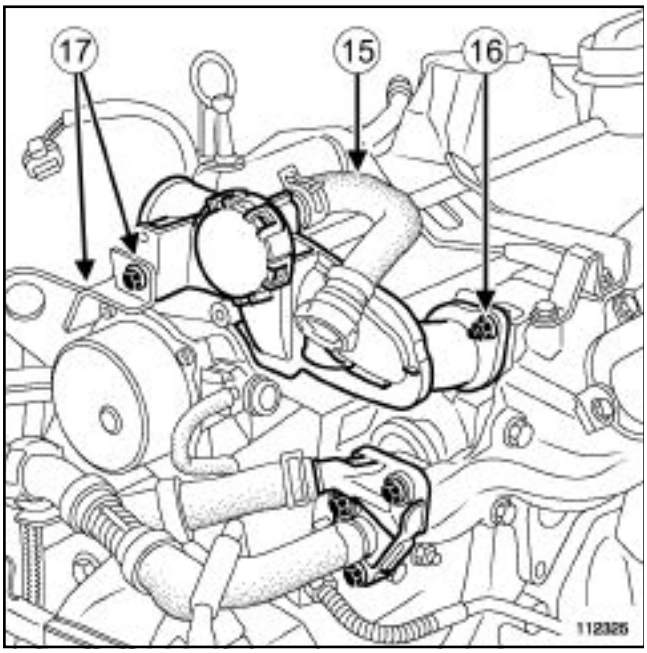
112327

Refit:

- the turbocharger oil return pipe,
- the turbocharger oil return pipe mounting bolts.

Tighten to torque the **turbocharger oil return pipe mounting bolts (12 ± 1.2 Nm)** .

Fit a new seal between the turbocharger and the catalytic converter.



112328

Refit:

- the catalytic converter,
- the nuts mounting the catalytic converter on the turbocharger,
- the catalytic converter mounting stay,
- the catalytic converter stay mounting bolts.

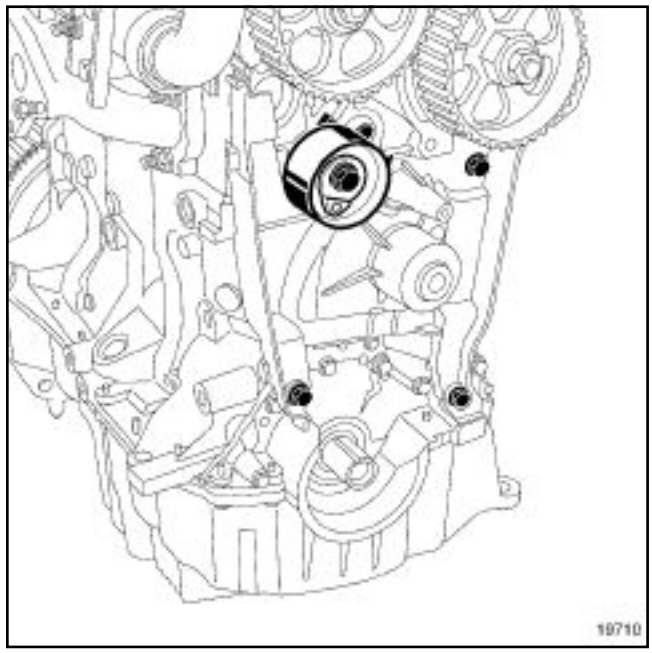
Tighten to torque:

- **the nuts mounting the catalytic converter on the turbocharger (26 ± 2.6 Nm)** (**12**) ,
- **the bolts mounting the catalytic converter stay on the engine (44 ± 4.4 Nm)** (**13**) ,
- **the bolts mounting the catalytic converter stay on the catalytic converter (26 ± 2.6 Nm)** (**14**) .

112325

Fit a new seal onto the oil vapour recirculation valve.

Refit:



- the oil vapour recirculation valve,
- the oil vapour recirculation valve mounting nuts (**16**) .

Tighten to torque the **oil vapour recirculation valve mounting nuts (12 ± 1.2 Nm)** .

Connect the oil vapour recirculation pipe (**15**) .

Refit:

- the oil vapour recirculation valve retaining bracket,
- the mounting bolts of the oil vapour recirculation valve retaining bracket.

19710

Refit:

- the inner timing cover (tilting the alternator if necessary),
- the inner timing cover mounting bolts.

Tighten to torque the **inner timing cover mounting bolts (9 ± 0.9 Nm)** .

V - RECOMMENDATIONS FOR REPAIRING THE TIMING BELT

IMPORTANT

Wear protective gloves during every operation.

WARNING

The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

When replacing the belt, always replace the tensioning rollers and fixed rollers.

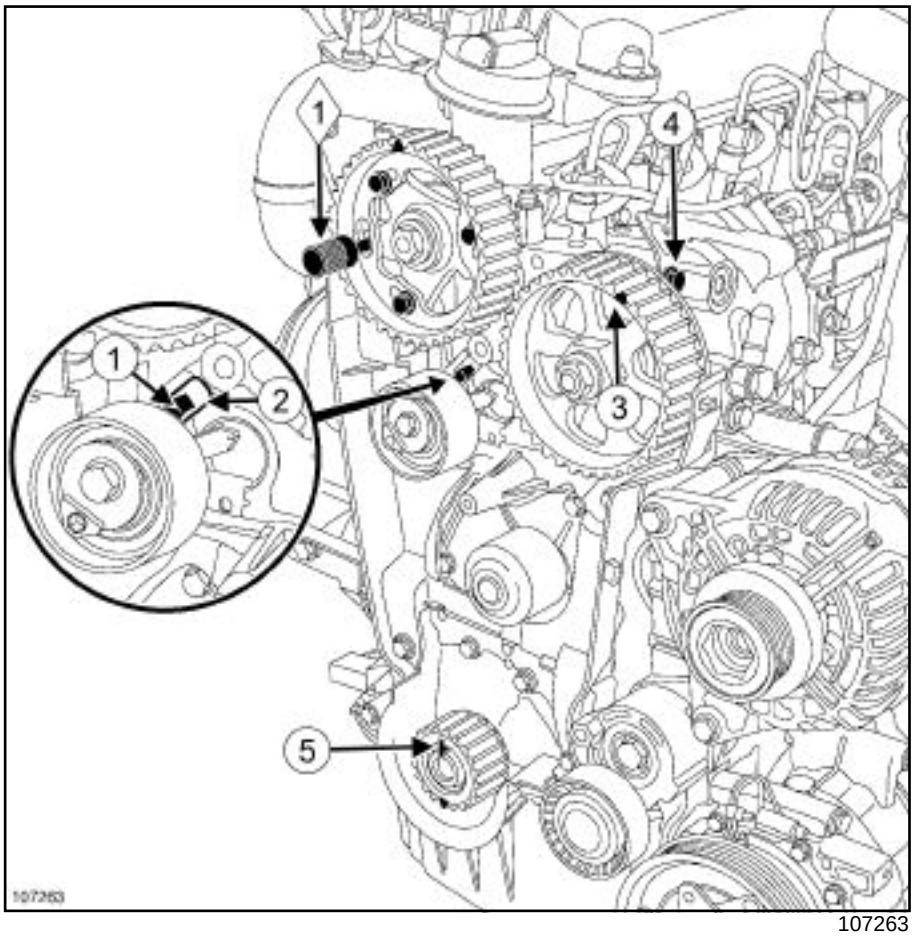
K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

VI - PARTS AND CONSUMABLES FOR THE REPAIR

Pièces à remplacer systématiquement pour la distribution

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Ingrédients



- Silicone adhesive sealant, part no. **77 11 227 484**

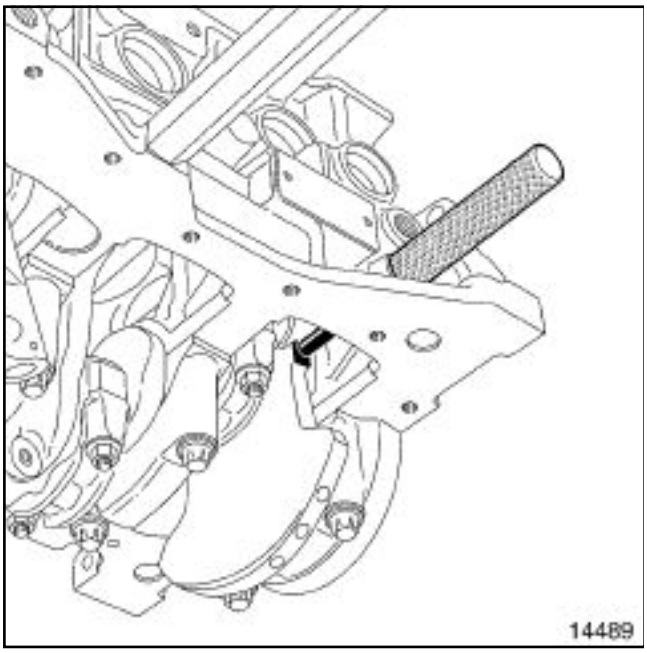
VII - EQUIPMENT REQUIRED FOR THE TIMING BELT

- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset wrench (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

VIII - REFITTING THE TIMING

Refit the crankshaft timing sprocket.

107263



Refit the timing tensioning roller.

Put the tensioning roller spigot (**1**) in the cylinder head groove (**2**) .

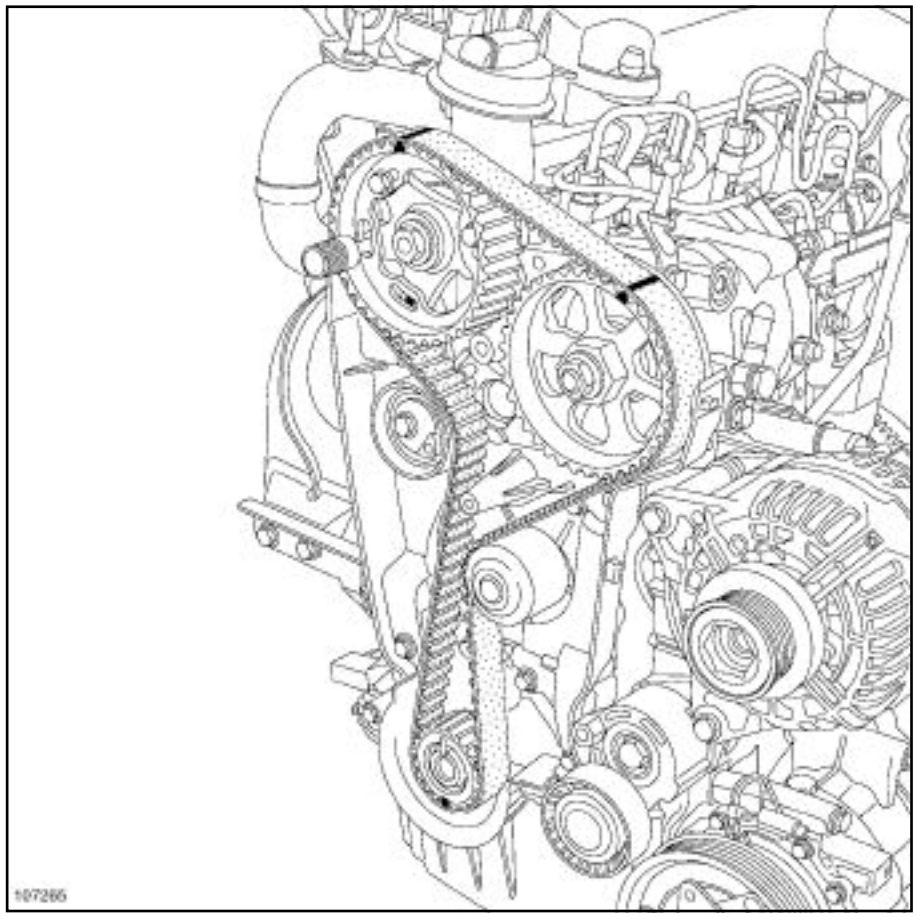
Engage the pin (**1**) **(Mot. 1430)** in the holes of the camshaft pulley and cylinder head, turning the camshaft using an **18 mm** offset wrench if necessary.

Check that the mark on the high-pressure pump (**3**) is opposite the bolt head (**4**) .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

14489

Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft sprocket cotter ***(5)*** must face upwards).

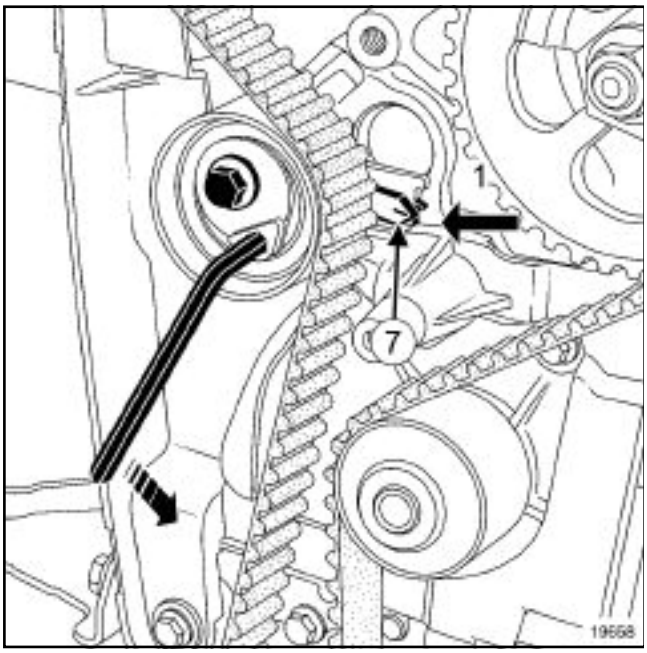


107264

Remove one bolt from the camshaft pulley wheel.

Loosen the two other camshaft pulley wheel bolts (**6**) by one turn.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

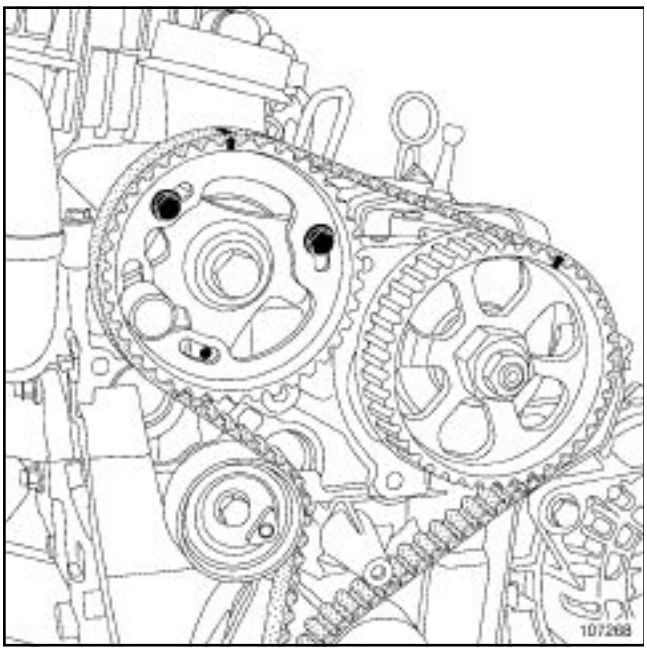


107265

Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft sprockets, the camshaft and the high-pressure pump.

note:

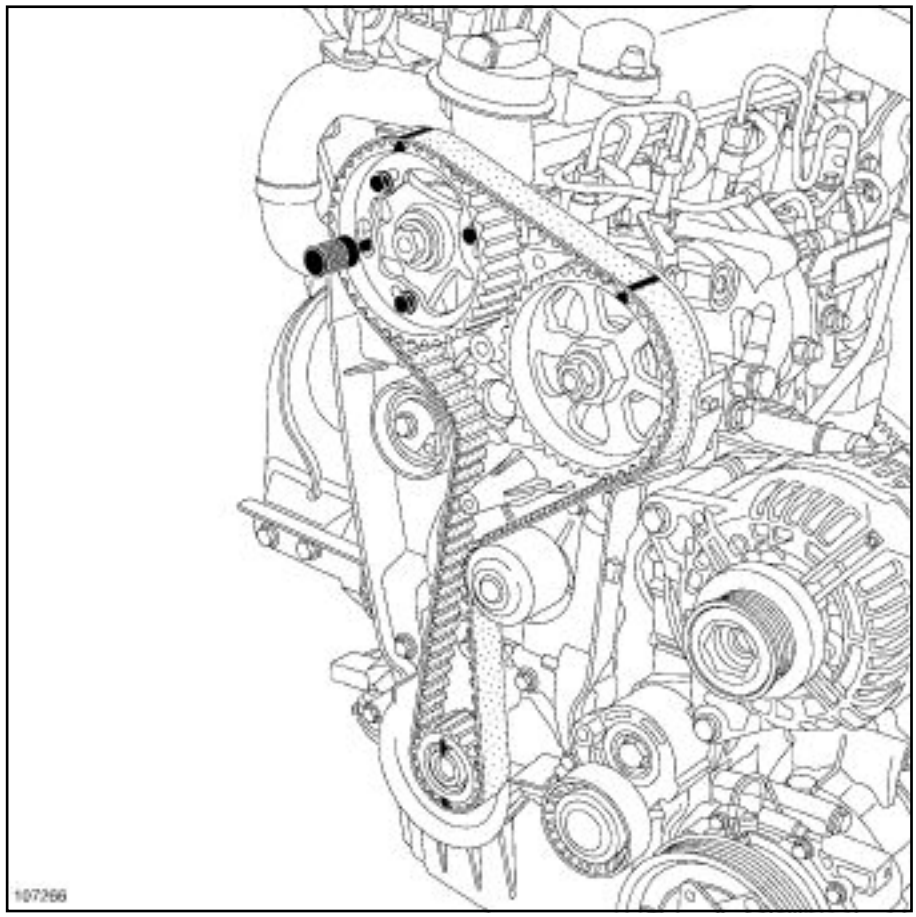
There should be 19 tooth belt grooves between the camshaft sprocket marks and the high-pressure pump, and 51 tooth valleys between the crankshaft sprockets and the high-pressure pump.



K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19658

Position the tensioning roller adjustable index (**7**) opposite the spigot, turning the eccentric cam anticlockwise using a **6 mm** Allen key.

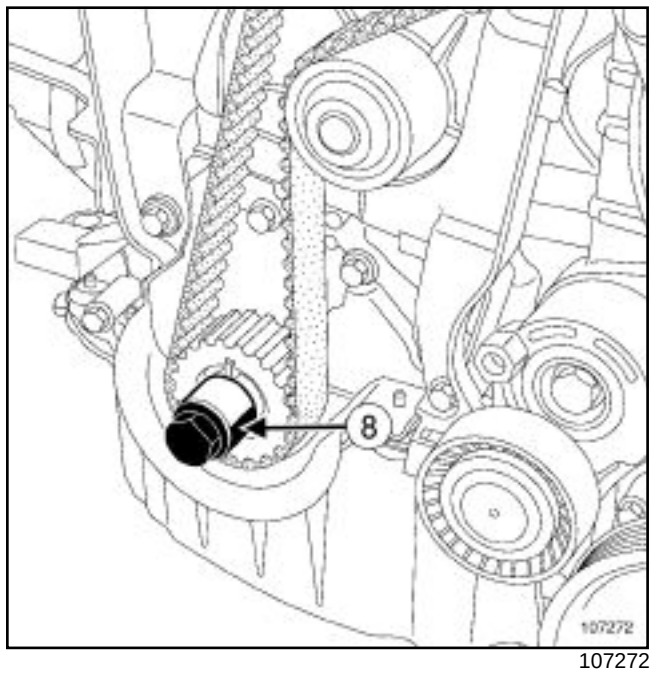


Tighten to torque the **tensioning roller bolt (27 ± 2.7 N.m)** .

107268

Check that the camshaft pulley hub bolts are not fully up against the camshaft pulley wheel.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

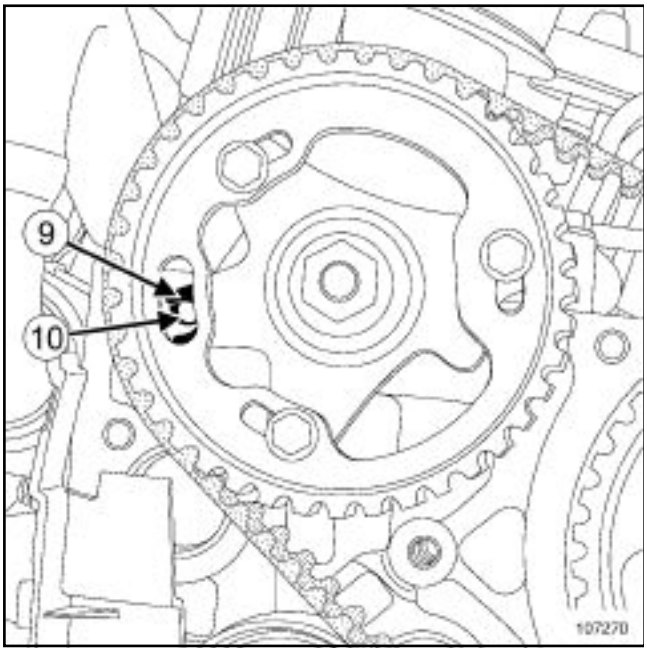


107266

Refit the bolt to the camshaft pulley wheel.

Tighten to torque **the camshaft pulley wheel bolts (14 ± 1.4 Nm)** .

Remove:

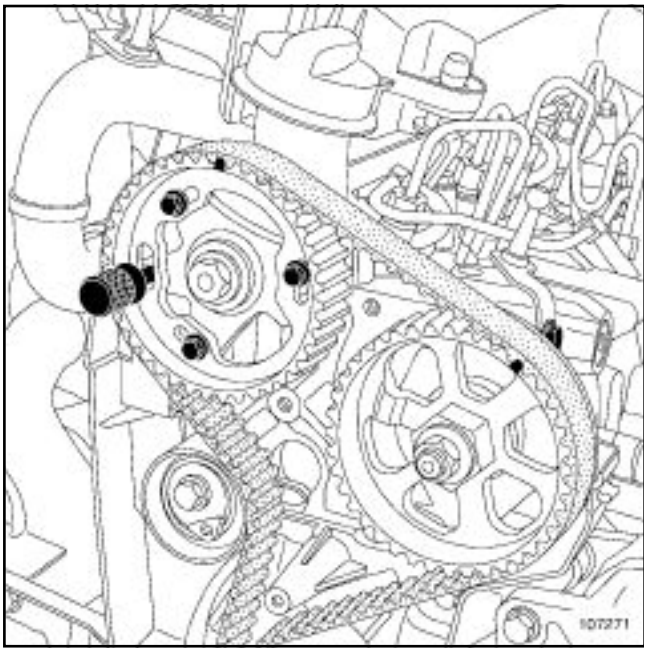


- the TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

107272

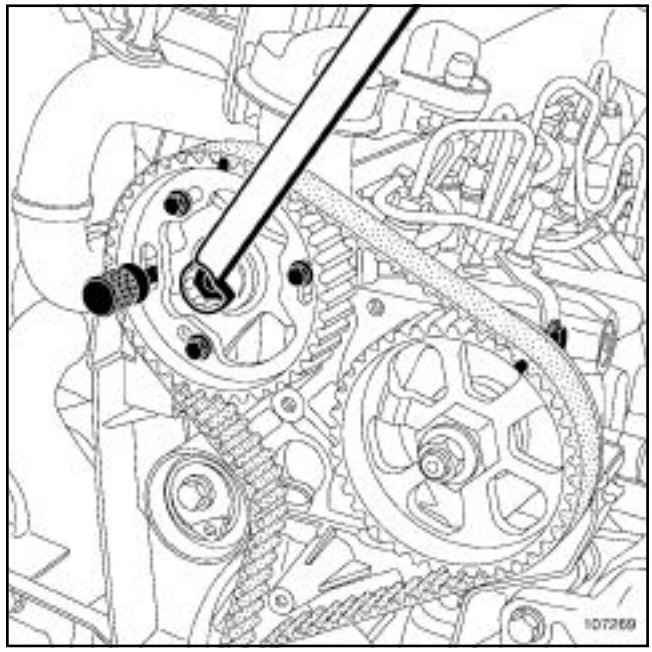
Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**8**) onto the crankshaft.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



107270

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .



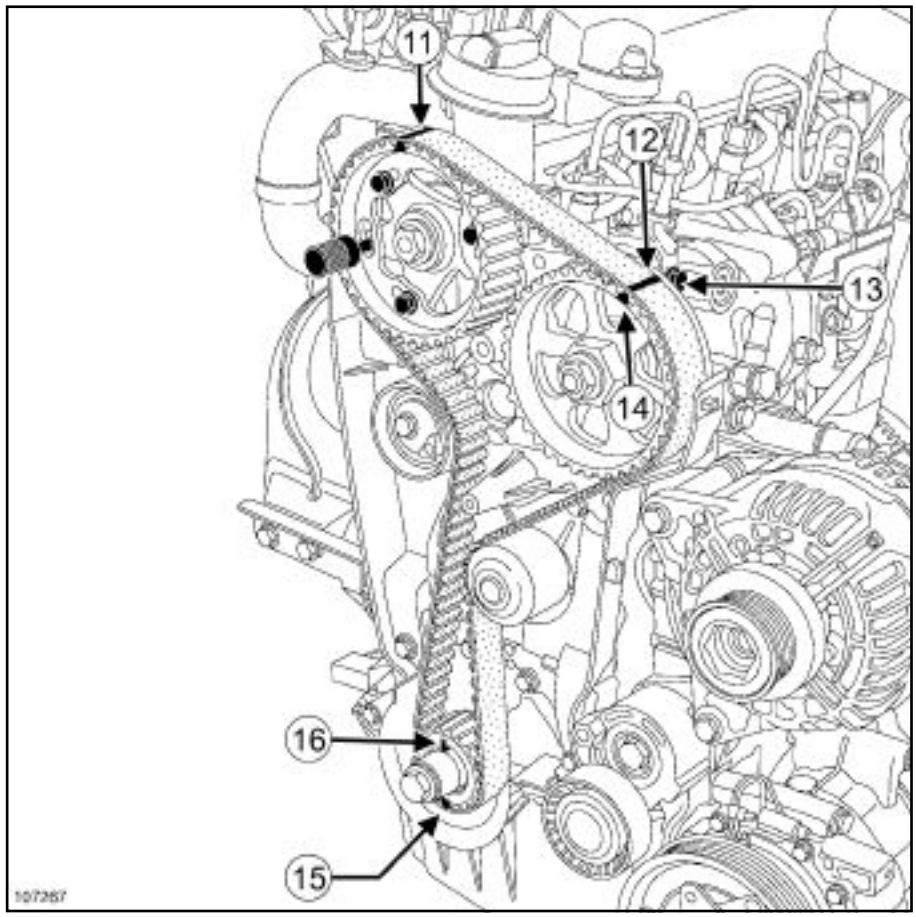
Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

Set the camshaft pulley using the **(Mot. 1430)** .

107269



If the pin **(Mot. 1430)** does not engage:

loosen the camshaft pulley wheel bolts by one turn at most,

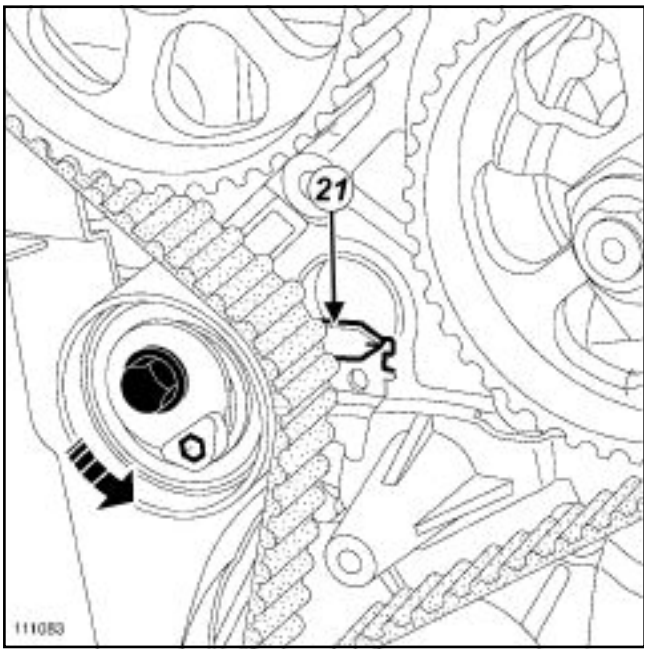
Turn the camshaft pulley hub using an **18 mm** offset wrench to set the camshaft pulley hub timing.

Do not retighten the camshaft pulley wheel bolts.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

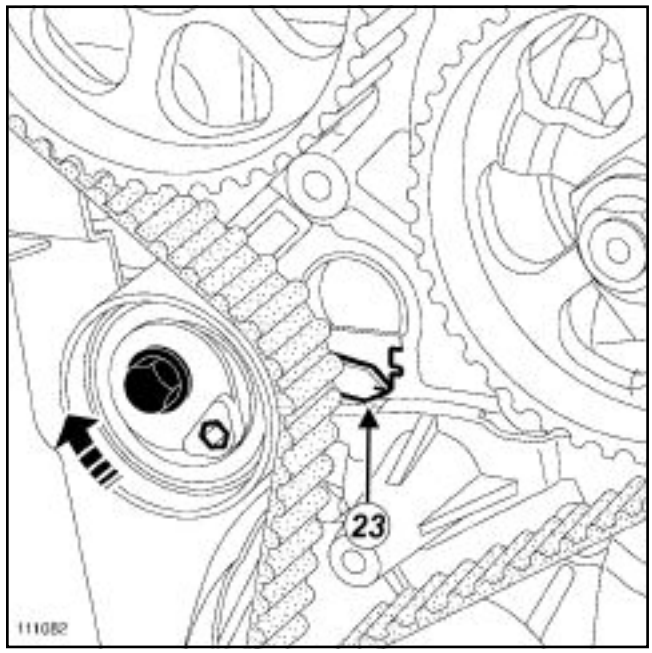
107267

Check:



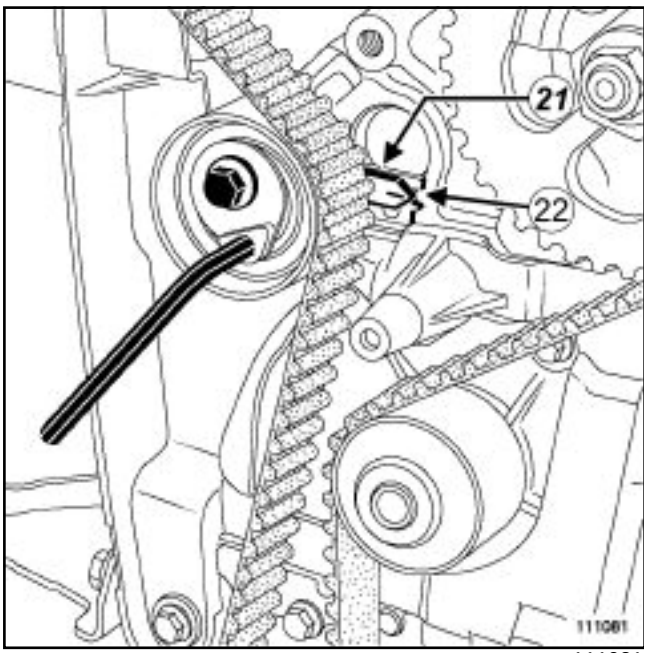
- that the high-pressure pump sprocket mark (**14**) is opposite the bolt head (**13**) ,
- that the crankshaft timing sprocket cotter (**16**) is positioned vertically at the top,
- that there are 19 tooth belt grooves between the camshaft sprocket marks (**11**) and the high-pressure pump sprocket (**12**) ,
- that there are 51 tooth belt grooves between the crankshaft sprocket marks (**15**) and the high-pressure pump sprocket (**12**) .

note:



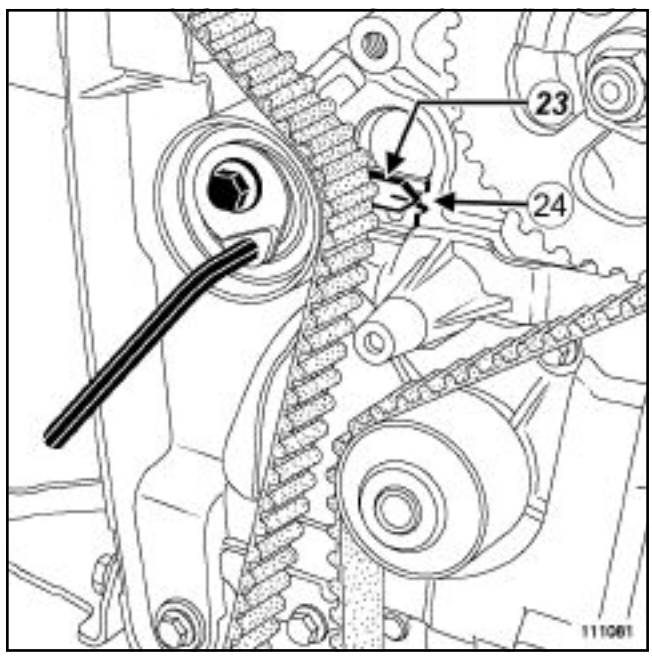
After two turns, the tensioning roller index markers may be in two different positions.

The rotation of the tensioning roller eccentric cam depends on the position.



K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

111083



111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index (**21**) in the middle of the timing window (**22**) , turning the key anticlockwise.

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

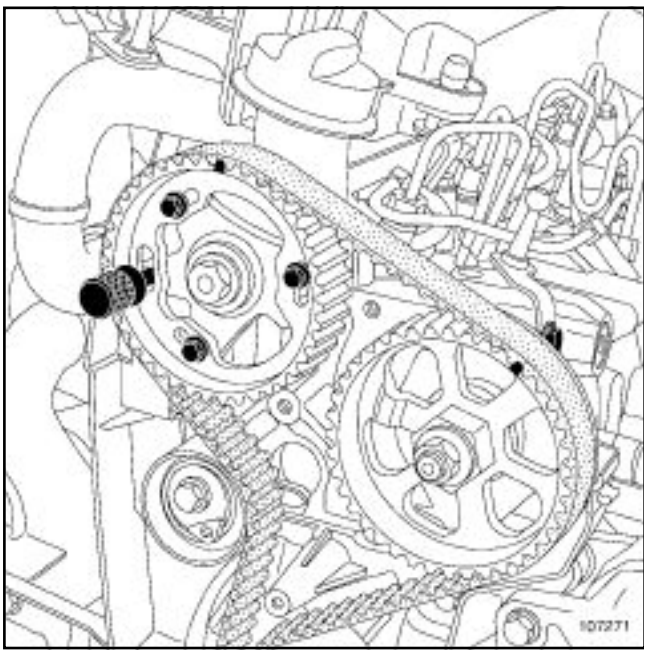
Gradually align the adjustable index (**23**) in the middle of the timing window (**24**) , turning the key clockwise.

Tighten to torque:

- **the tensioning roller bolt (27 ± 2.7 Nm)** ,
- **the camshaft pulley wheel bolts (14± 1.4 Nm)** .

Remove the following tools:

- TDC setting pin, **(Mot. 1489)**

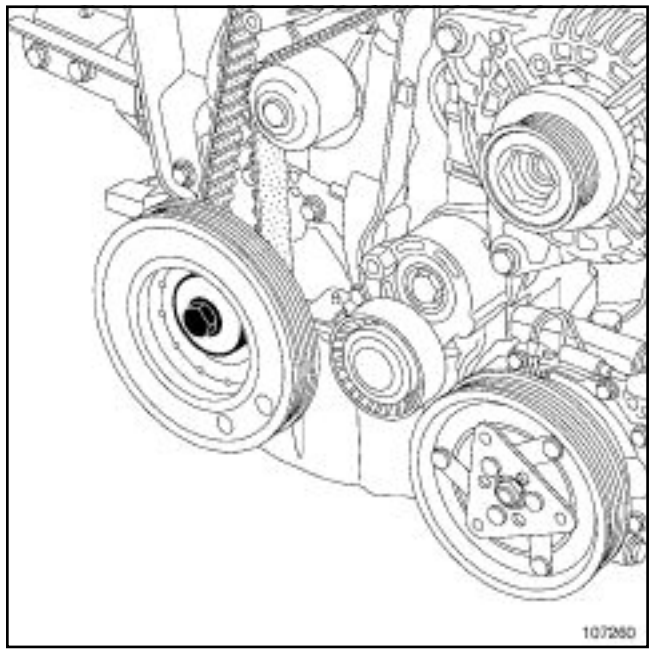


K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.



Bring the crankshaft slowly and smoothly into contact with the TDC setting pin.

107271

Set the camshaft pulley using the **(Mot. 1430)** .

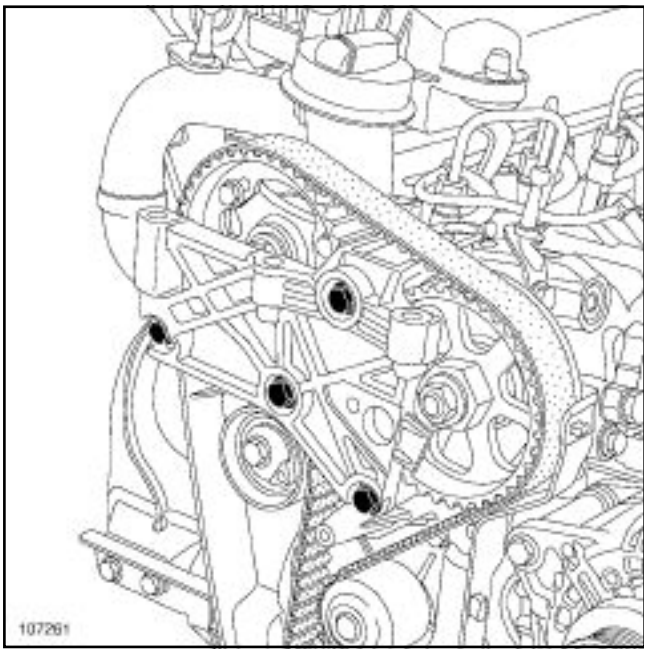
If this is not possible, repeat the timing belt refitting operation.

107260

Refit the accessories crankshaft pulley with a new bolt.

Tighten to torque and angle (crankshaft in contact with the TDC setting pin) **the crankshaft accessories pulley M14 bolt (120 ± 12 Nm + 95° ± 15°)** .

Remove the following tools:



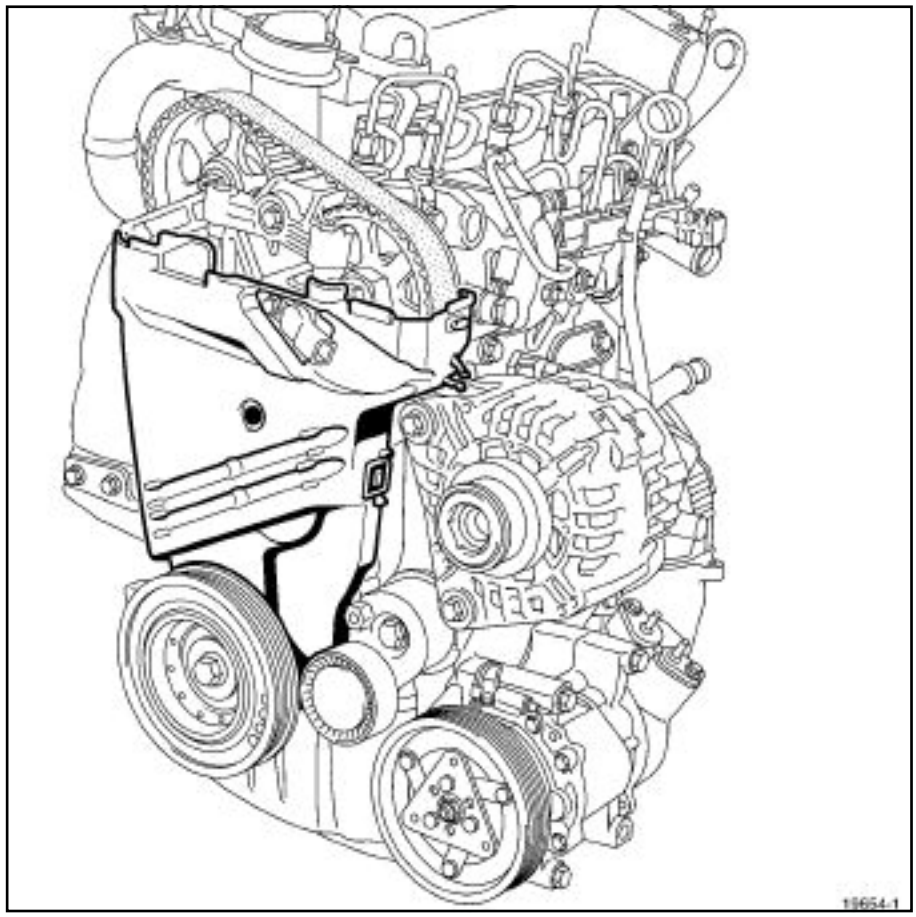
- TDC setting pin, **(Mot. 1489)**
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Refit the TDC pin plug, coating the thread with **SILICONE ADHESIVE SEALANT** .

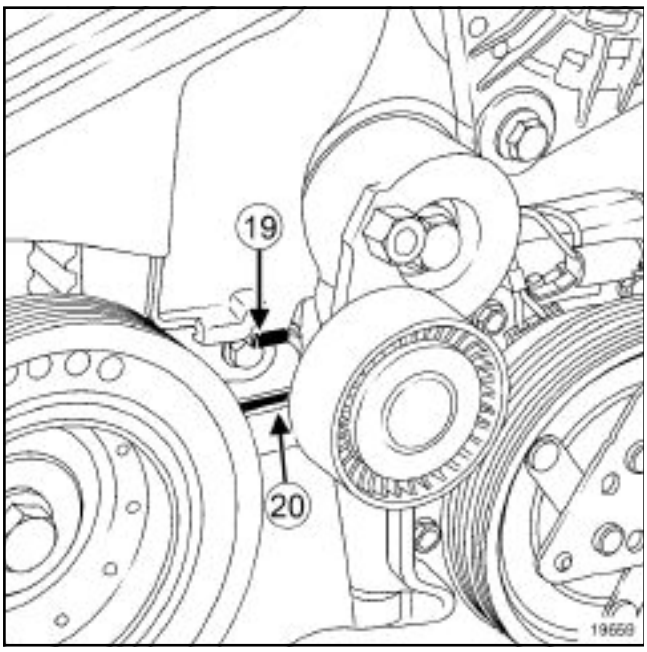
Tighten to torque the **TDC pin plug (20 ± 2 Nm)** .

Timing - cylinder head: Refitting

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



107261

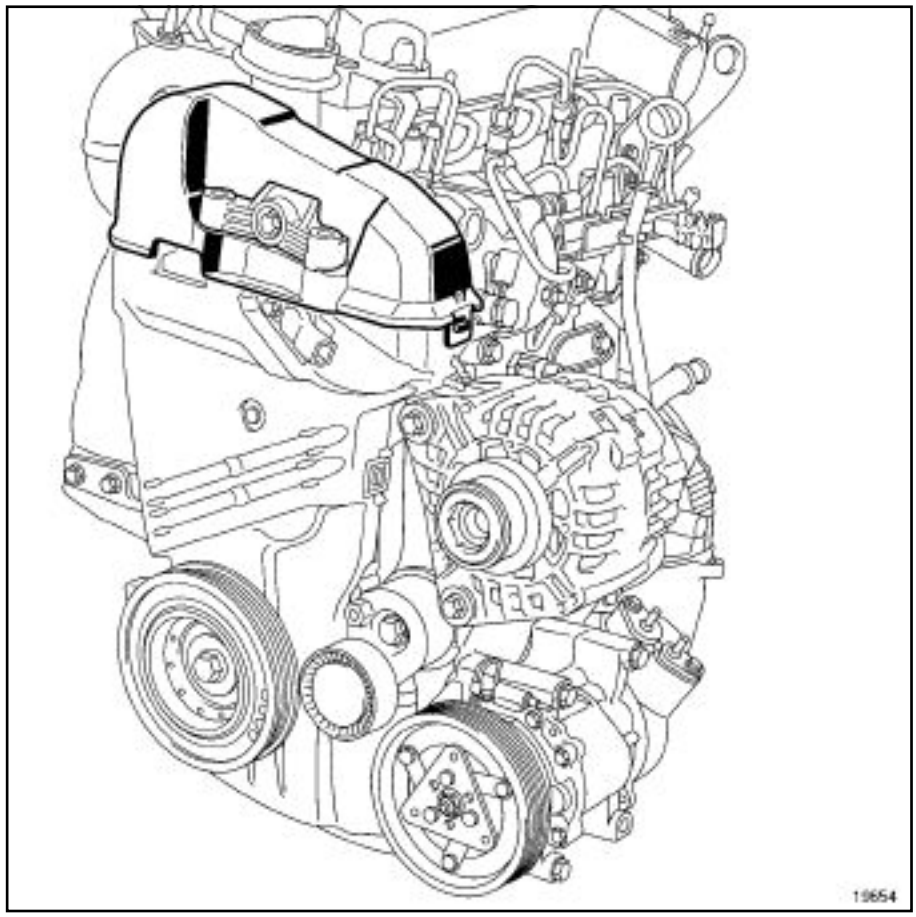


Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19654-1



19659

Refit:

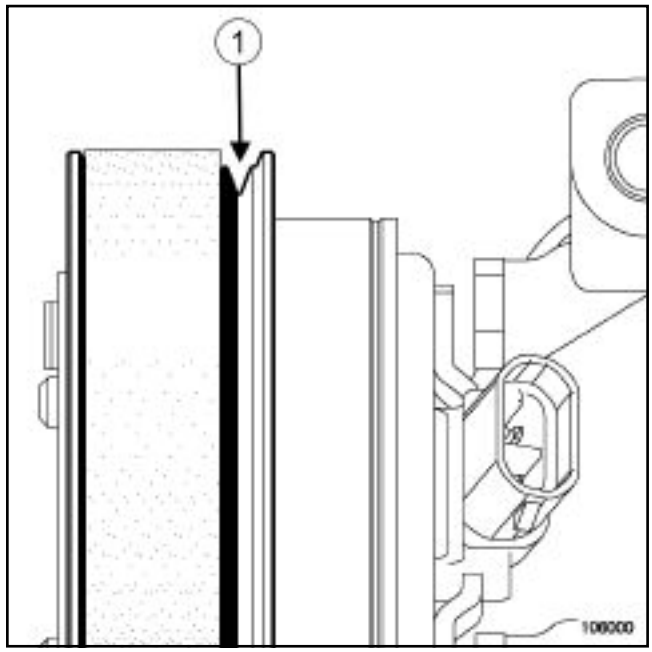
- the lower timing cover, positioning the tab (**19**) in the inner timing cover hole (**20**) ,
- the timing cover plastic mounting bolt.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19654

Refit the high-pressure pump position sensor.

Tighten to torque the **high-pressure pump position sensor bolt (8 Nm)** .



Refit the upper timing cover.

Special tooling required	
Mot. 1638	Accessories belt tension tool. For engines fitted with a mechanical tensioning roller.
Mot. 1505	Belt tension setting tool (frequency meter)
Mot. 1715	Belt tension checking tool (frequency indicator).

Tightening torques ▽	
mechanical tensioning roller mounting bolts	**35 ± 3.5 Nm**
auto tensioner mounting bolt	**40 ± 4 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

106000

WARNING
Certain accessories belts have five teeth whereas the air conditioning compressor pulley, power-assisted steering pump pulley, and alternator pulley all have six teeth. In this case, it is essential to check that the inner tooth (**1**) of the pulleys remains free when fitting the accessories belt.

Never turn the engine in the opposite direction to its normal operating direction.

Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.

For engines fitted with a mechanical tensioning roller, it is essential to replace the tensioning roller mounting bolts.

II - PARTS AND CONSUMABLES FOR THE REPAIR

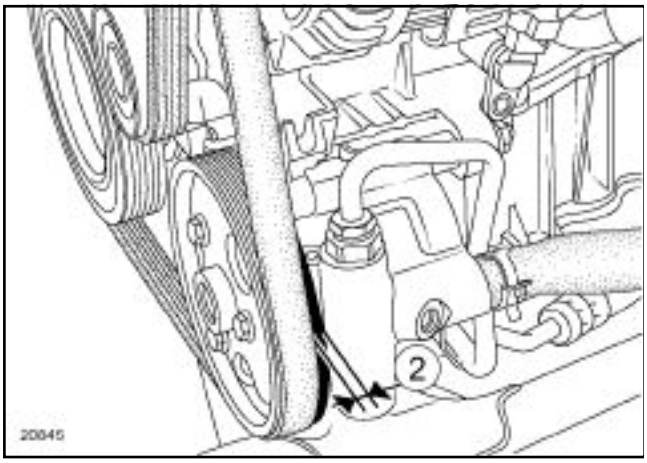
Parts always to be replaced

- The mechanical or automatic tensioning roller,
- The mechanical tensioning roller mounting bolts with **M8 bolts - 125 X 20** , part no. **77 03 002 059** ,
- The accessories belt.

III - EQUIPMENT REQUIRED

- Brush,
- Torque wrench

- Protective gloves,
- Tubular hexagon box spanner (**16 mm**),
- Offset wrench (**16 mm**).



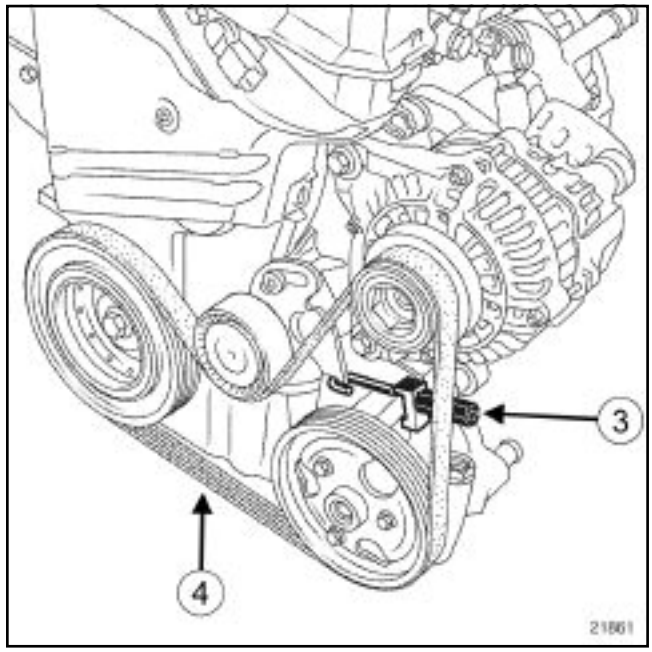
IV - REFITTING

1 - Engine without air conditioning

Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.

Refit:

- the tensioning roller,
- the new tensioning roller mounting bolts.



20845

It is essential to leave one inner tooth (**2**) of the pulleys free for engines fitted with a belt with five teeth for pulleys with six teeth.

Refit the accessories belt.

Check that the two mechanical tensioning roller bolts are not overtightened.

21861

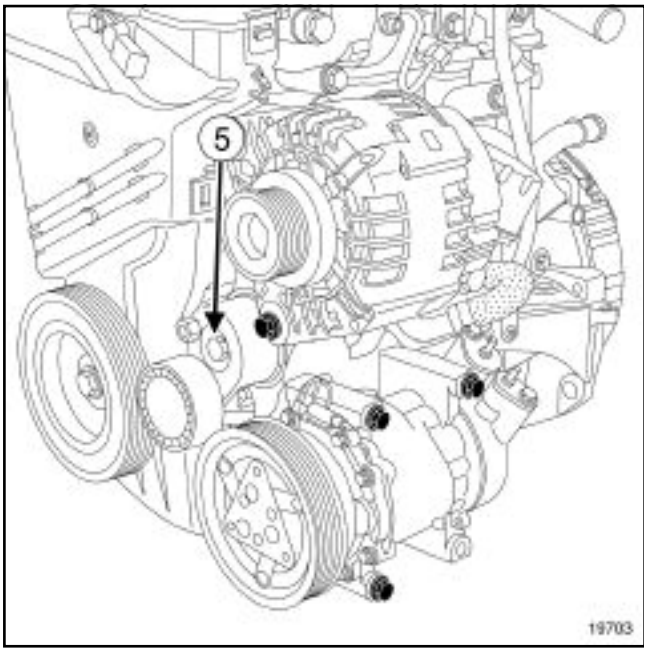
Fit the **(Mot. 1638)** into the tensioning roller notch (as indicated in the diagram).

Tension the accessories belt using the **(Mot. 1638)** by tightening nut (**3**) .

Check the accessories belt tension at (**4**) using the **(Mot. 1505)** or **(Mot. 1715)** .

The accessories belt tension must be between **223 and 245 Hz** .

It is essential to turn the engine through two revolutions to position the accessories belt correctly.



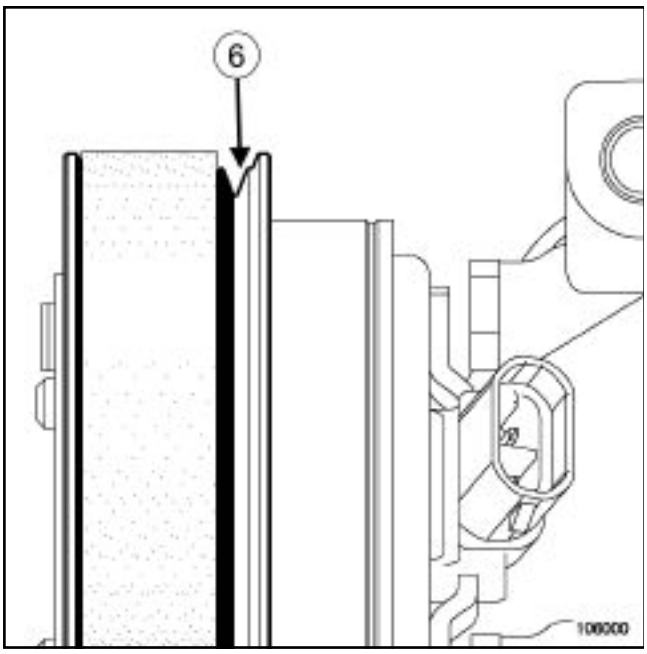
Check that the accessories belt tension is between **223 and 245 Hz** at measuring point ***(4)*** .

Adjust the accessories belt tension if necessary.

Tighten to torque the **mechanical tensioning roller mounting bolts (35 ± 3.5 Nm)** .

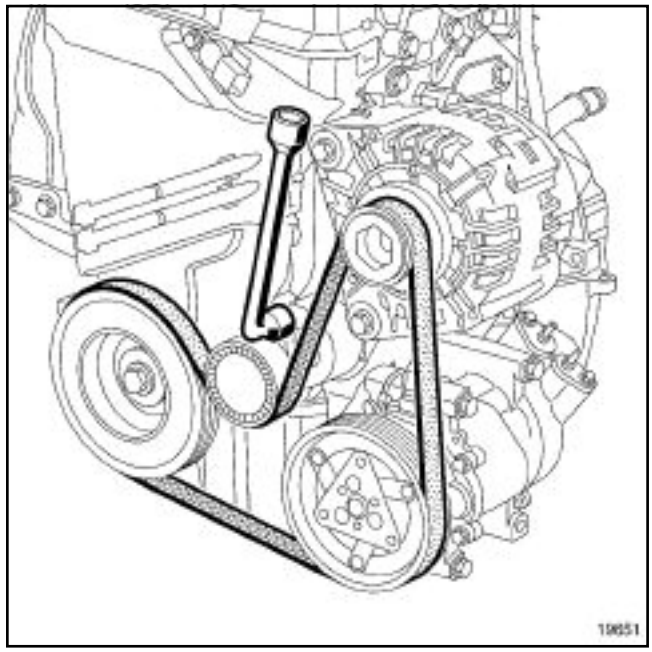
2 - Engine with air conditioning

Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.



19703

Refit:



- the auto tensioner,
- the auto tensioner mounting bolt (**5**) .

Tighten to torque the **auto tensioner mounting bolt (40 ± 4 Nm)** .

106000

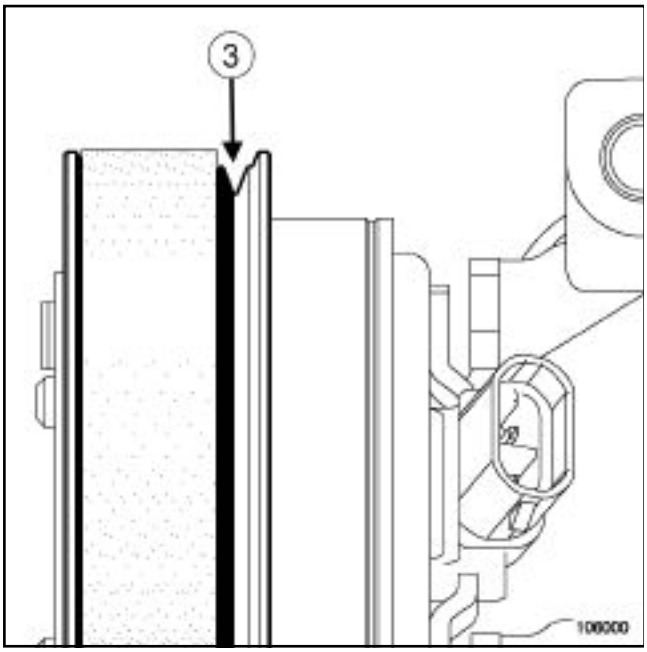
It is essential to leave one inner tooth (**6**) of the pulleys free for engines fitted with a belt with five teeth for pulleys with six teeth.

19651

Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

Refit the crankshaft accessories belt.

Rotate the crankshaft twice to position the accessories belt correctly.



Special tooling required	
Mot. 792-03	Engine support plate for Desvil engine stand
Mot. 1638	Accessories belt tension tool. For engines fitted with a mechanical tensioning roller.
Mot. 1505	Belt tension setting tool (frequency meter)
Mot. 1715	Belt tension checking tool (frequency indicator).
Mot. 1723	Engine support for DESVIL engine support stand.
Mot. 582-01	Flywheel locking tool.
Mot. 1677	Flywheel locking tool.
Emb. 1780	Set of clutch disc centring mandrels.

Tightening torques ▽	
coolant pump inlet pipe mounting bolt	**22 ± 2.2 Nm**
multifunction support mounting bolts (1 to 6 or 1 to 5)	**44 ± 4.4 Nm**
multifunction support mounting bolt (7)	**21 ± 2.1 Nm**
the power-assisted steering pump or dummy pulley mounting bolts	**21 ± 2.1 Nm**
the air conditioning compressor mounting bolts	**21 ± 2.1 Nm**
the alternator mounting bolts	**21 ± 2.1 Nm**
mechanical tensioning roller mounting bolts	**35 ± 3.5 Nm**
auto tensioner mounting bolt	**40 ± 4 Nm**

Tightening torques ▽	
the flywheel mounting bolts	**55 ± 5.5 Nm**
the dual-mass flywheel mounting bolts	**20 ± 2 Nm + 36° ± 6°**
clutch pressure plate mounting bolts	**M6 bolts to 14 ± 1.4 Nm and M7 bolt to 20 ± 2 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves throughout the operation.

106000

WARNING

Certain accessories belts have five teeth whereas the air conditioning compressor pulley, power-assisted steering pump pulley, and alternator pulley all have six teeth. In this case, it is essential to check that the inner tooth (**3**) of the pulleys remains free when fitting the accessories belt.

Never turn the engine in the opposite direction to its normal operating direction.

Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.

For engines fitted with a mechanical tensioning roller, it is essential to replace the tensioning roller mounting bolts.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

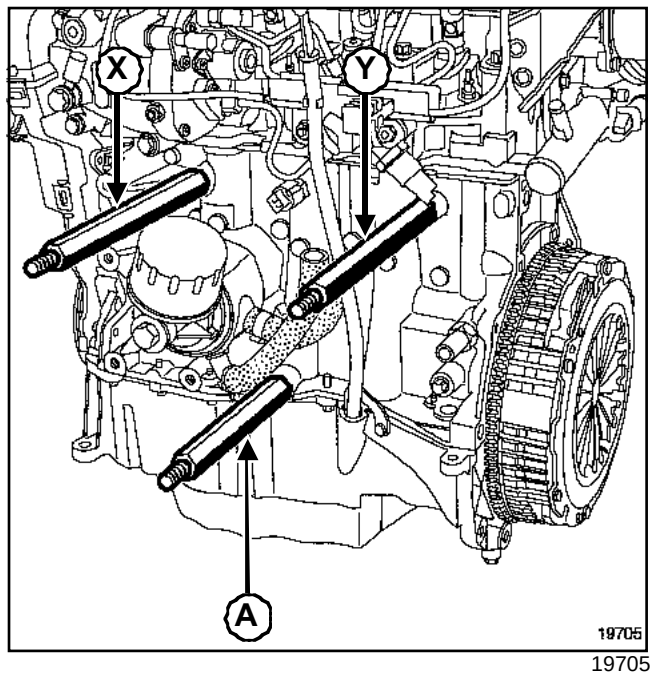
- Coolant pump inlet pipe seal,
- Flywheel mounting bolt,
- Accessories belt mechanical or auto tensioner,
- Mechanical tensioning roller mounting bolts with **M8 - 125 X20** bolts, part no. **77 03 002 059**
- Accessories belt.

Consumables

- Degreaser, part no. **77 11 224 559** .

III - ESSENTIAL EQUIPMENT

- Workshop crane,
- Load positioner,
- Brush,
- Offset wrench or tubular hexagon box spanner **16 mm** ,
- Protective gloves,
- Male torx socket,
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).



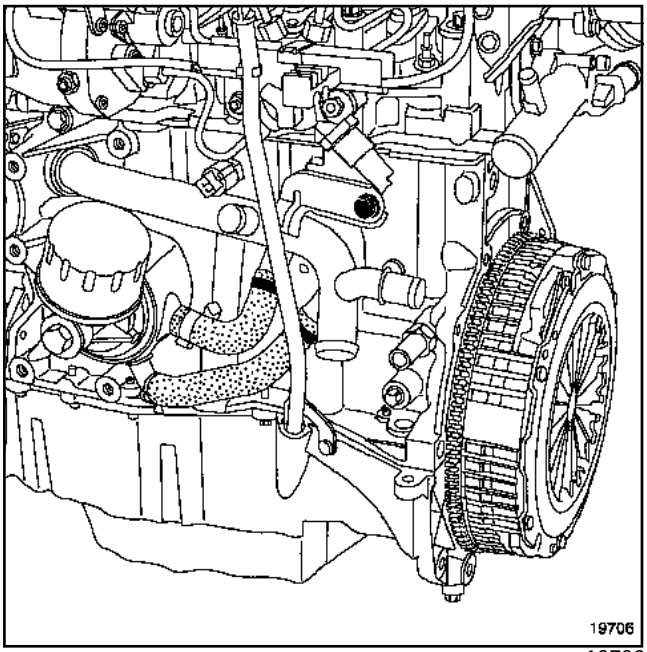
IV - REBUILDING THE ENGINE FOR ENGINES ATTACHED ON SIDE OF OIL FILTER

1 - This fitting operation only concerns K9K 260-270-272-700-702-704-706-710-722-750-752-790 engines.

Fit a load positioner onto the engine lifting eyes.

Remove the engine from the engine stand using a workshop hoist.

Remove the support plate **(Mot. 792-03)** from the engine.

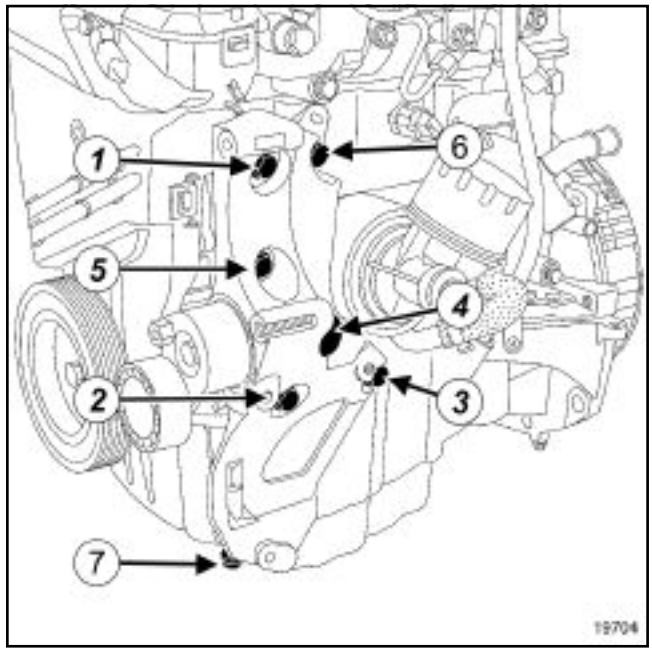


19705

Remove support studs (**A**) , (**X**) and (**Y**) from the cylinder block.

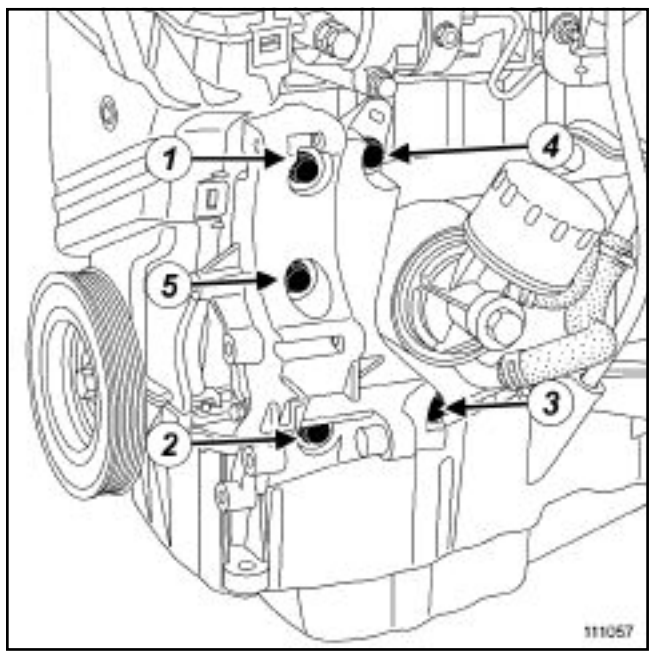
Refit a new O-ring onto the coolant pump inlet pipe.

Apply a small amount of soapy water to the coolant pump inlet pipe O-ring.



19706

Refit:

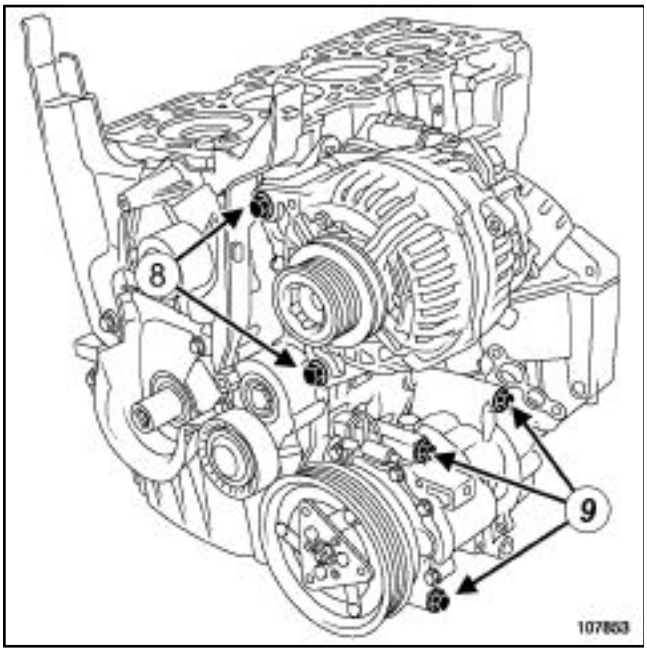


- the coolant pump inlet pipe,
- the coolant pump inlet pipe mounting bolt.

Tighten to torque the **coolant pump inlet pipe mounting bolt (22 ± 2.2 Nm)** .

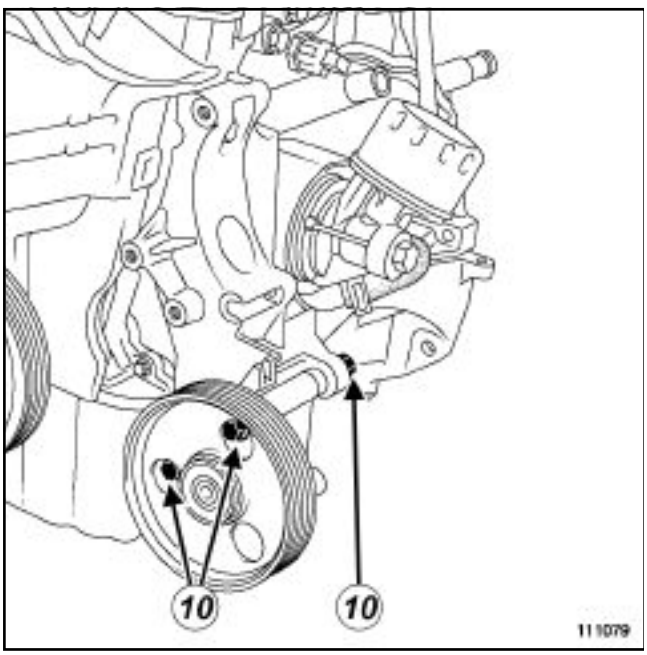
Connect the hoses to the coolant pump inlet pipe.

19704



111057

Refit:



- the multifunction support,
- the multifunction support mounting bolts.

Tighten to torque and in order the **multifunction support mounting bolts (1 to 6 or 1 to 5) (44 ± 4.4 Nm)**

Tighten to torque the **multifunction support mounting bolt (7) (21 ± 2.1 Nm)** .

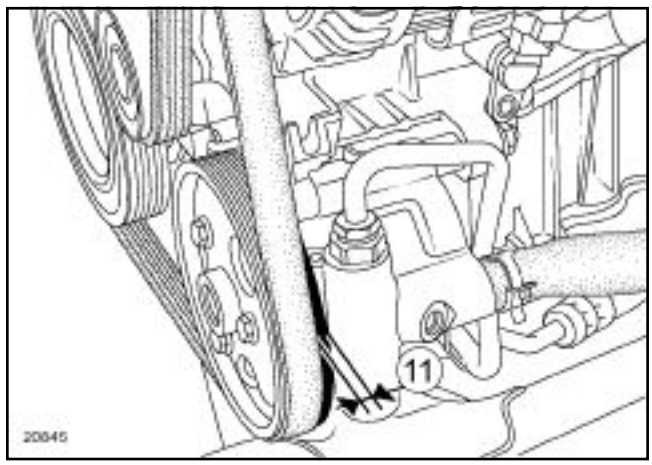
107853

111079

Refit:

- the power-assisted steering pump or dummy pulley,
- the power-assisted steering pump or dummy pulley mounting bolts (**10**) ,
- the air conditioning compressor (if fitted to the vehicle),
- the air conditioning compressor mounting bolts (**9**) ,
- the alternator,
- the alternator mounting bolts (**8**) .

Tighten to torque:



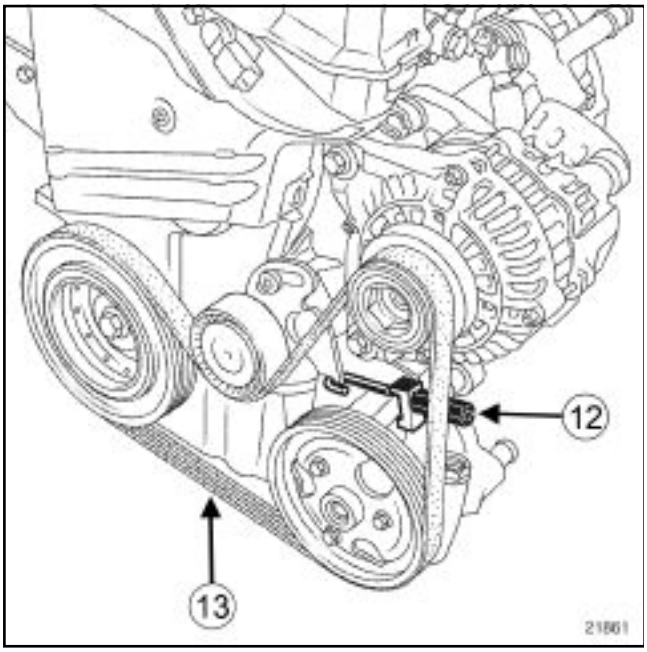
- **the power-assisted steering pump or dummy pulley mounting bolts (21 ± 2.1 Nm)** ,
- **the air conditioning compressor mounting bolts (21 ± 2.1 Nm)** ,
- **the alternator mounting bolts (21 ± 2.1 Nm)** .

2 - Refitting the accessories belt for engines without air conditioning

Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.

Refit:

- the tensioning roller,
- the new tensioning roller mounting bolts.



20845

It is essential to leave one inner tooth (**11**) of the pulleys free for engines fitted with a belt with five teeth for pulleys with six teeth.

Refit the accessories belt.

Check that the two mechanical tensioning roller bolts are not overtightened.

21861

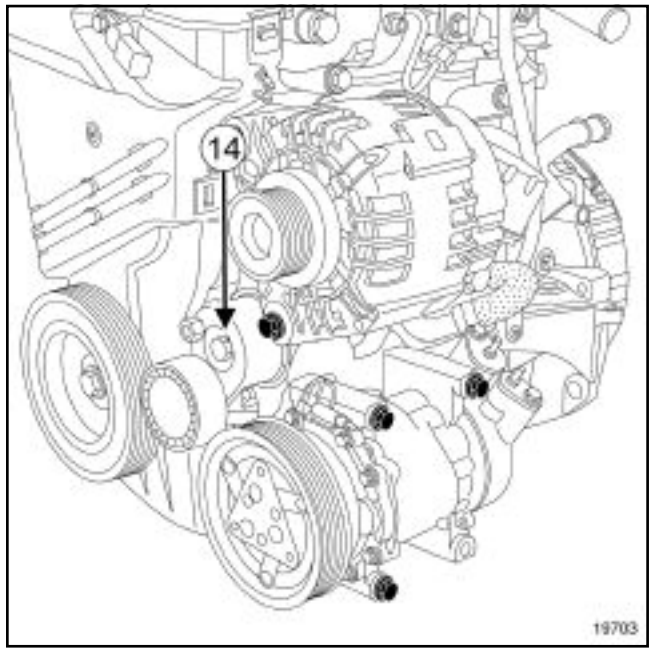
Fit the **(Mot. 1638)** into the tensioning roller notch (as indicated in the diagram).

Put the accessories belt under tension using the **(Mot. 1638)** by tightening nut (**12**) .

Check the accessories belt tension at (**13**) using the **(Mot. 1505)** or **(Mot. 1715)** .

The accessories belt tension must be between **223 to 245 Hz** .

It is essential to turn the engine through two revolutions to position the accessories belt correctly.



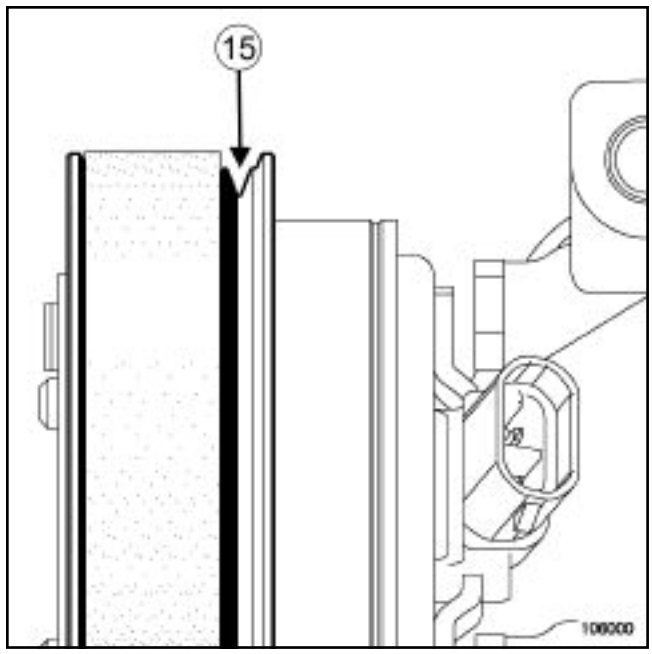
Check that the accessories belt tension is between **223 and 245 Hz** at measuring point ***(13)*** .

Adjust the accessories belt tension if necessary.

Tighten to torque the **mechanical tensioning roller mounting bolts (35 ± 3.5 Nm)** .

3 - Refitting the accessories belt for engines with air conditioning

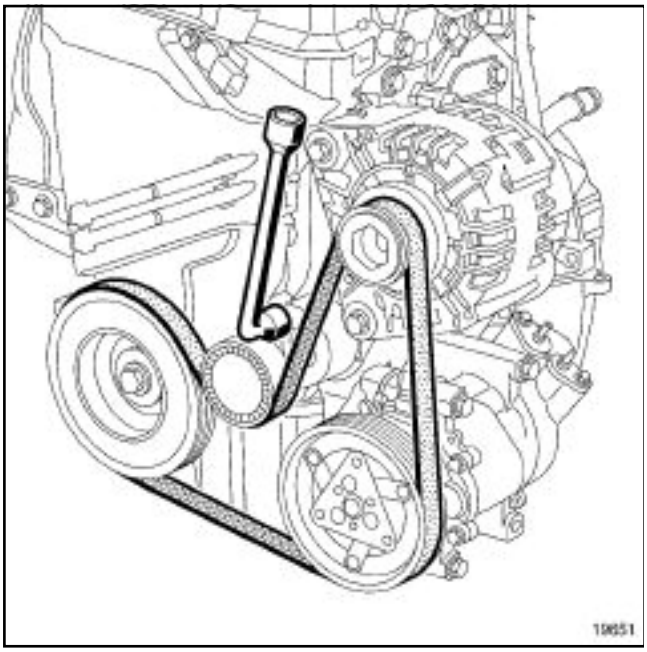
Use a brush to remove any deposits from the crankshaft accessories pulley V grooves.



19703

Refit:

- the auto tensioner,



- the auto tensioner mounting bolt (**14**) .

Tighten to torque the **auto tensioner mounting bolt (40 ± 4 Nm)** .

106000

It is essential to leave one inner tooth (**15**) of the pulleys free for engines fitted with a belt with five teeth for pulleys with six teeth.

19651

Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

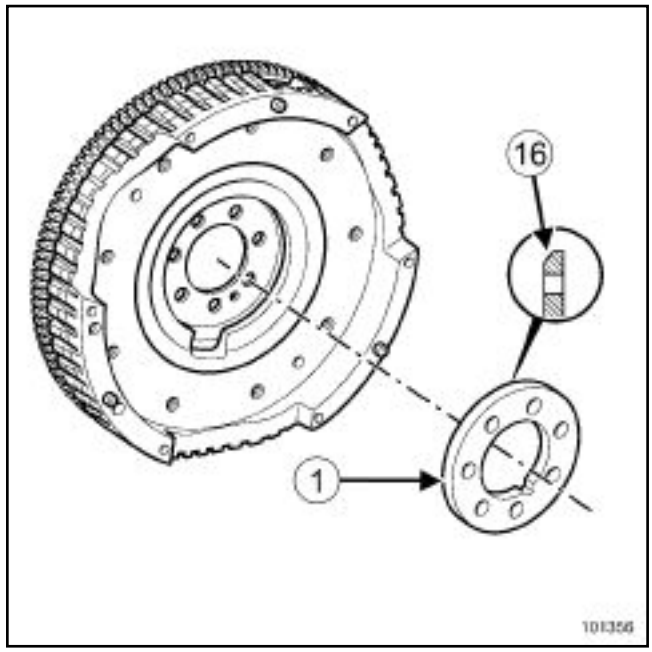
Refit the crankshaft accessories belt.

Rotate the crankshaft twice to position the accessories belt correctly.

V - REBUILDING THE ENGINE ATTACHED TO THE FLYWHEEL END

This fitting operation concerns all K9K engines

Fit a load positioner onto the engine lifting eyes.

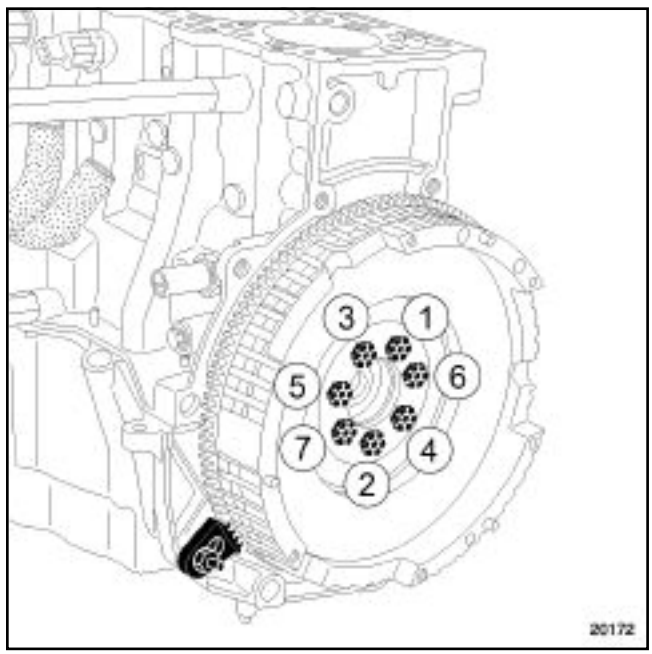


Remove the engine from the engine stand using a workshop hoist.

Remove:

- the engine from the support plate **(Mot. 1723)** ,
- the studs from the cylinder block.

Note:



For engines which have a starter located on the exhaust side, the flywheel must only be refitted after the engine has been removed from the engine stand.

101356

Note:

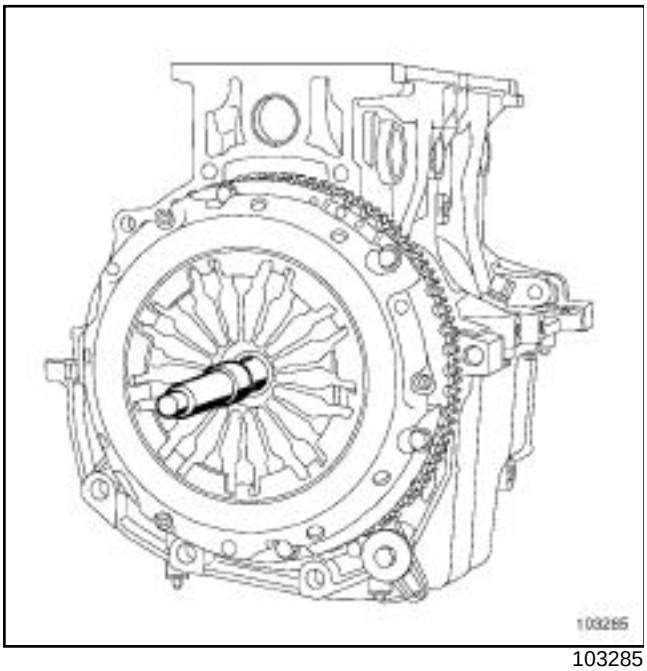
Certain flywheels have a shim (**1**) . **It is essential to position the shim chamfer** (**16**) **on the flywheel end** .

20172

Refit:

- the flywheel,
- the new flywheel mounting bolts,
- the engine flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .

Tighten to torque and in order:



- **the flywheel mounting bolts (55 ± 5.5 Nm)** ,
- **the dual-mass flywheel mounting bolts (20 ± 2 Nm + 36° ± 6°)** .

Degrease the flywheel friction surface using degreaser.

Refit the friction plate (orientating it correctly).

Centre the friction plate using the **(Emb. 1780)** .

Degrease the clutch pressure plate friction surface using degreaser.

103285

Refit:

- the clutch pressure plate,
- the clutch pressure plate mounting bolts.

Gradually tighten the clutch pressure plate mounting bolts.

Tighten to torque the **clutch pressure plate mounting bolts (M6 bolts to 14 ± 1.4 Nm and M7 bolt to 20 ± 2 Nm)** .

Remove the engine flywheel locking tool **(Mot. 582-01)** or **(Mot. 1677)** .

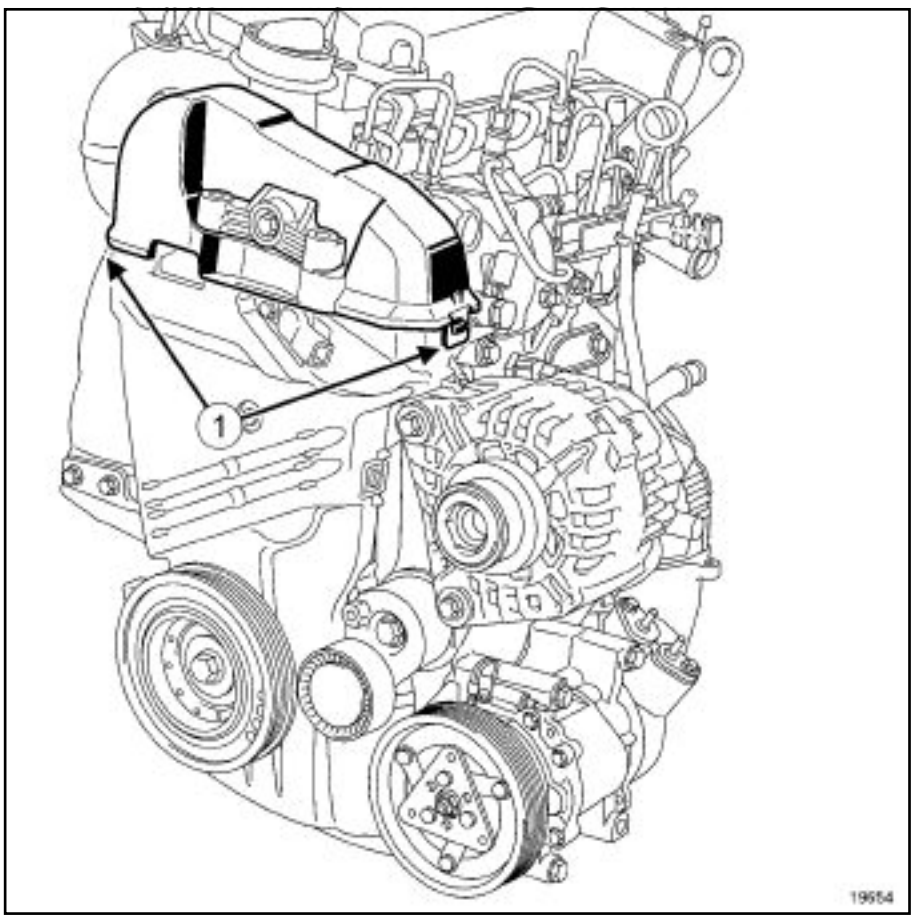
Timing belt: Removal

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

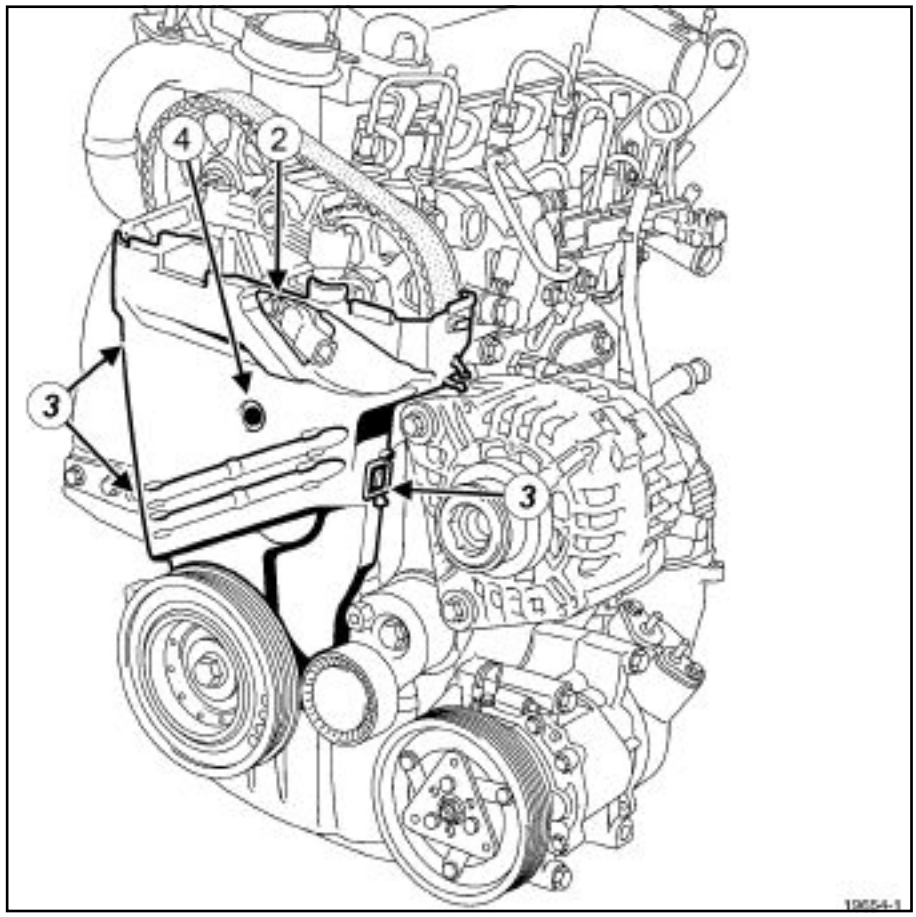


WARNING
Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

II - ESSENTIAL EQUIPMENT

- Protective gloves,
- Large screwdriver,
- Allen key (**6 mm**),
- Torx socket (**14**).

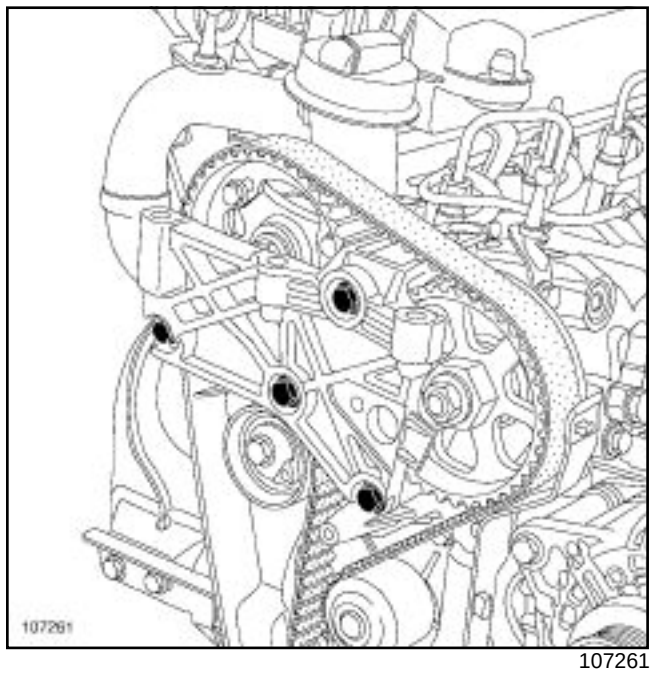


III - REMOVAL

19654

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

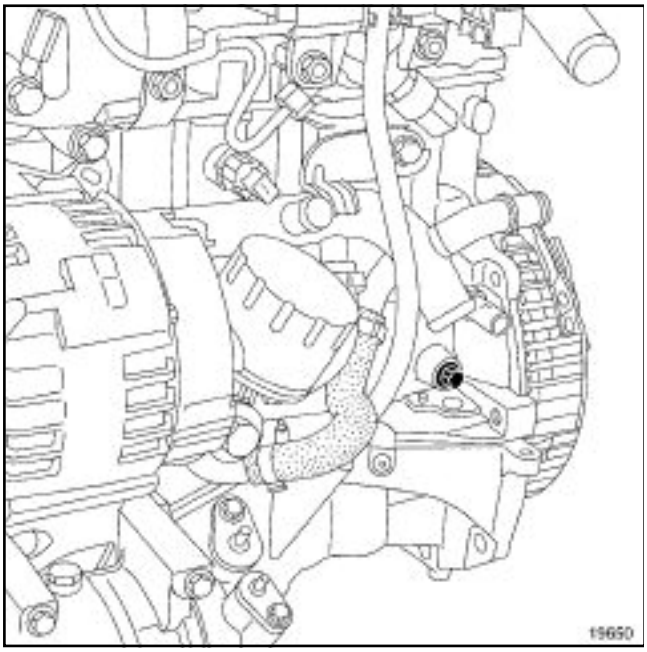


19654-1

Remove:

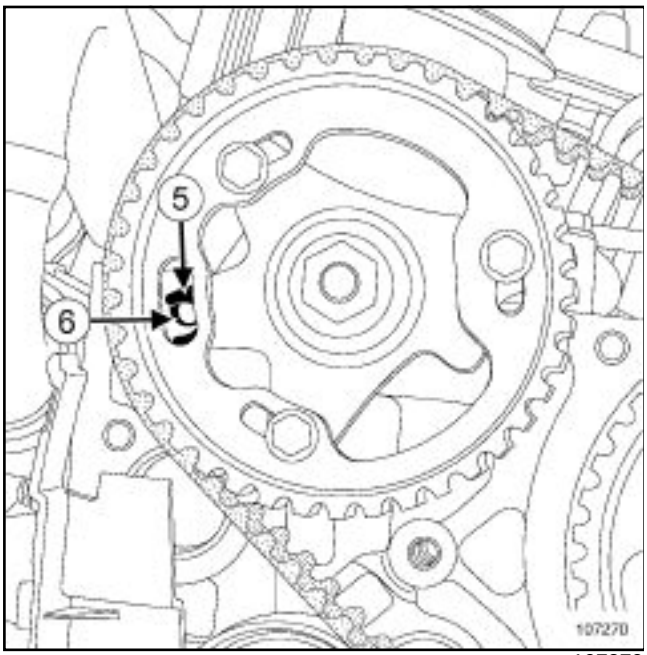
- the high-pressure pump position sensor (**2**) ,
- the plastic bolt (**4**) .

Unclip the three tabs (**3**) .



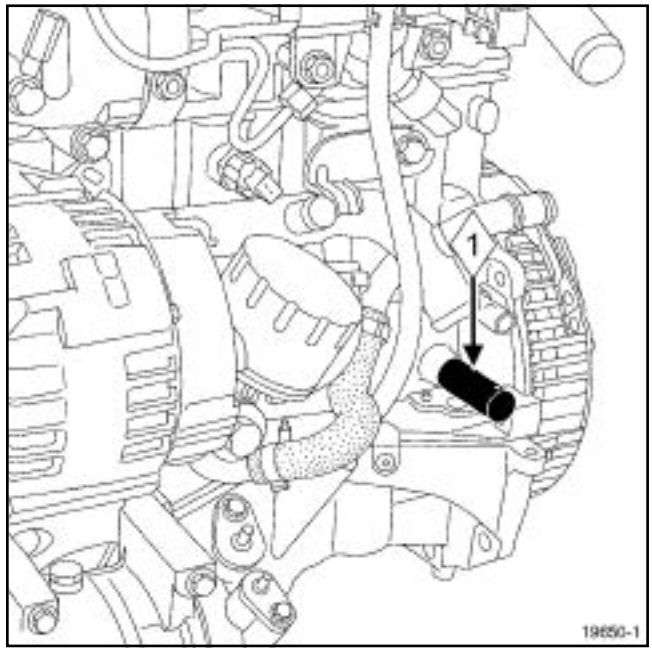
Remove the lower timing cover.

107261



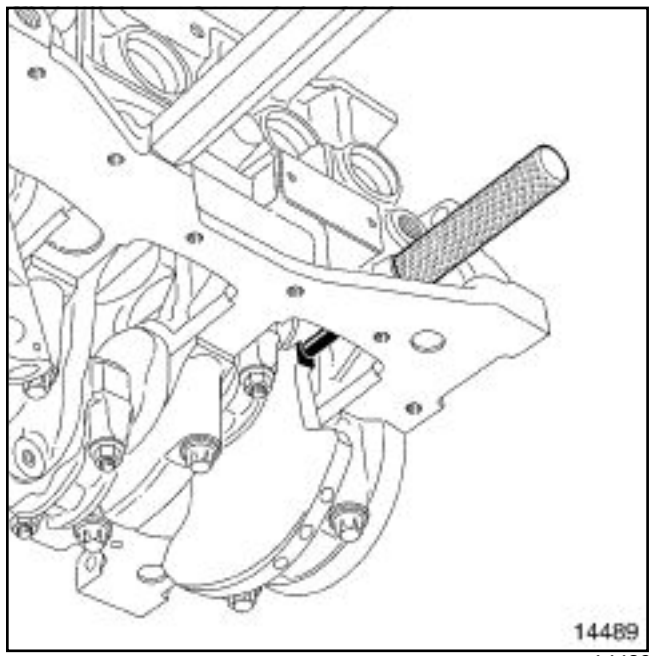
Remove the cylinder head suspended mounting.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



19650

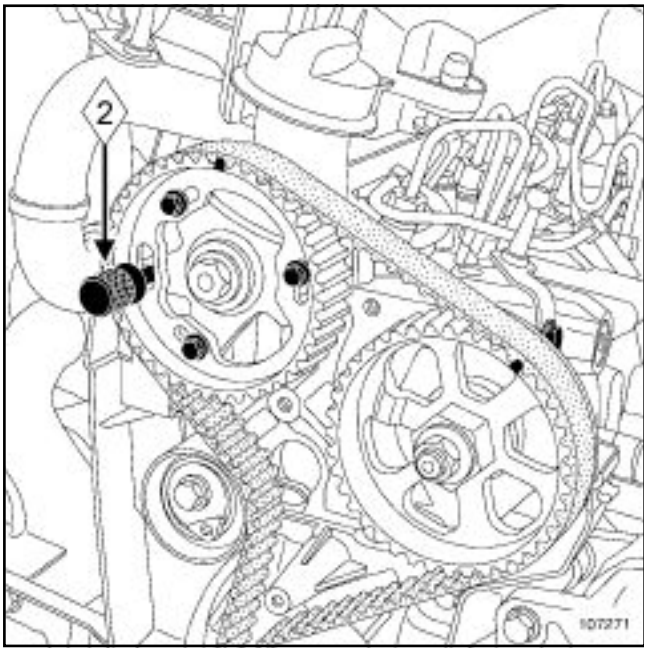
Remove the TDC setting pin plug using a female torx socket (**14**).



107270

Turn the crankshaft to position the camshaft pulley hole (**5**) almost opposite the cylinder head hole (**6**) .

19650-1

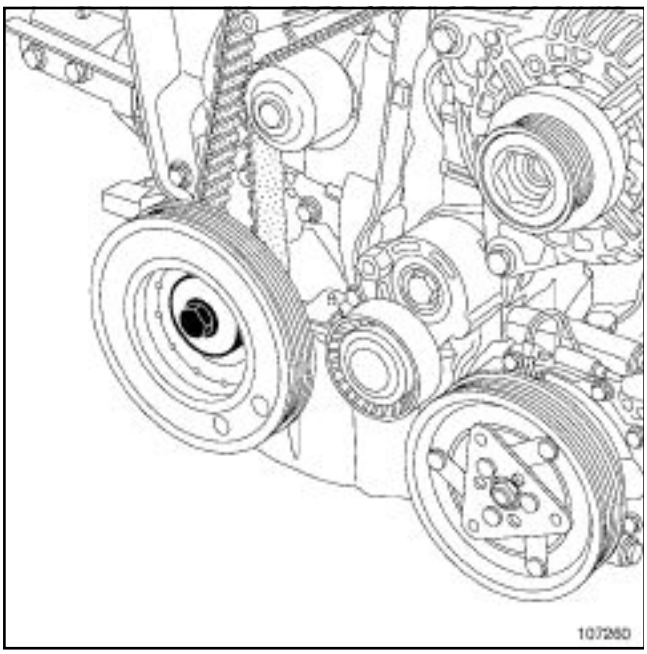


Screw in the TDC setting pin (**1**) **(Mot. 1489)** .

14489

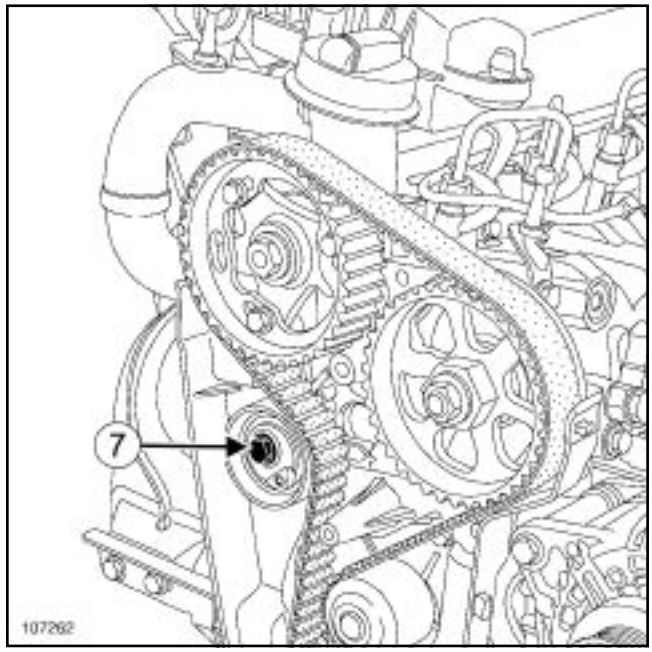
Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



107271

Engage the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.



Remove:

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)** .

107260

Remove the crankshaft accessories pulley, locking the flywheel with a screwdriver.

107262

Undo the tensioning roller bolt (**7**) .

Loosen the timing tensioning roller by turning the eccentric cam using a **6 mm** Allen key.

Remove:

- the timing belt,
- the timing tensioning roller.

Timing belt: Removal

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

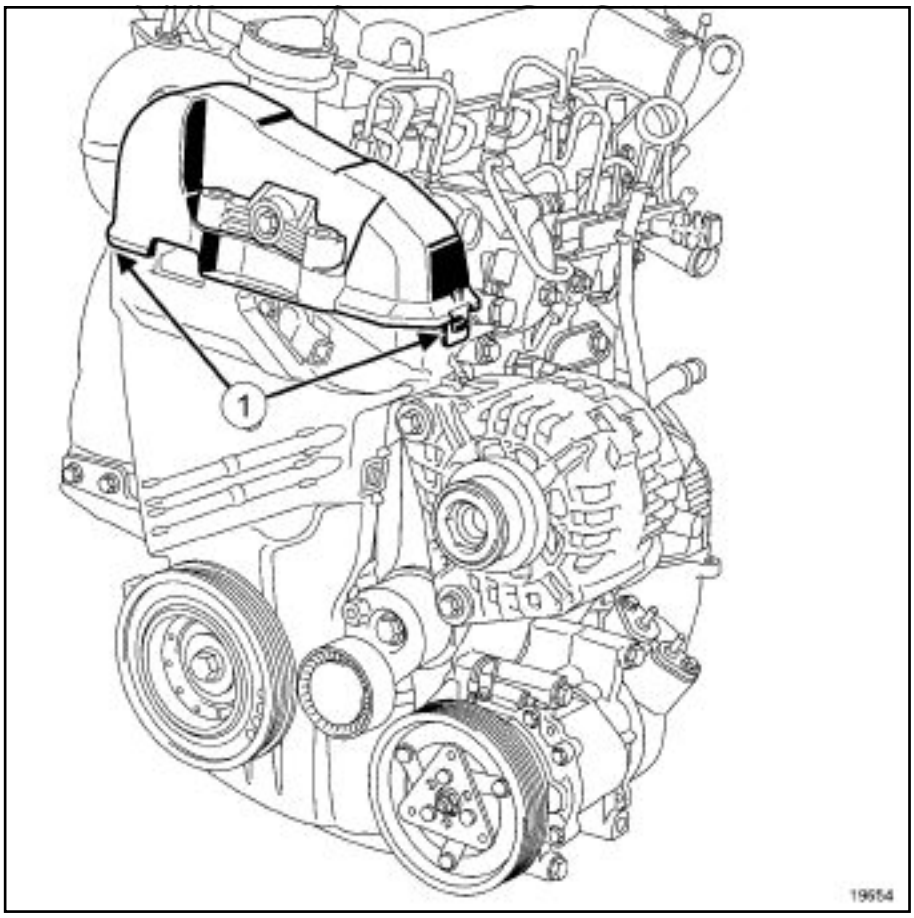
Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT

Wear protective gloves during every operation.

WARNING

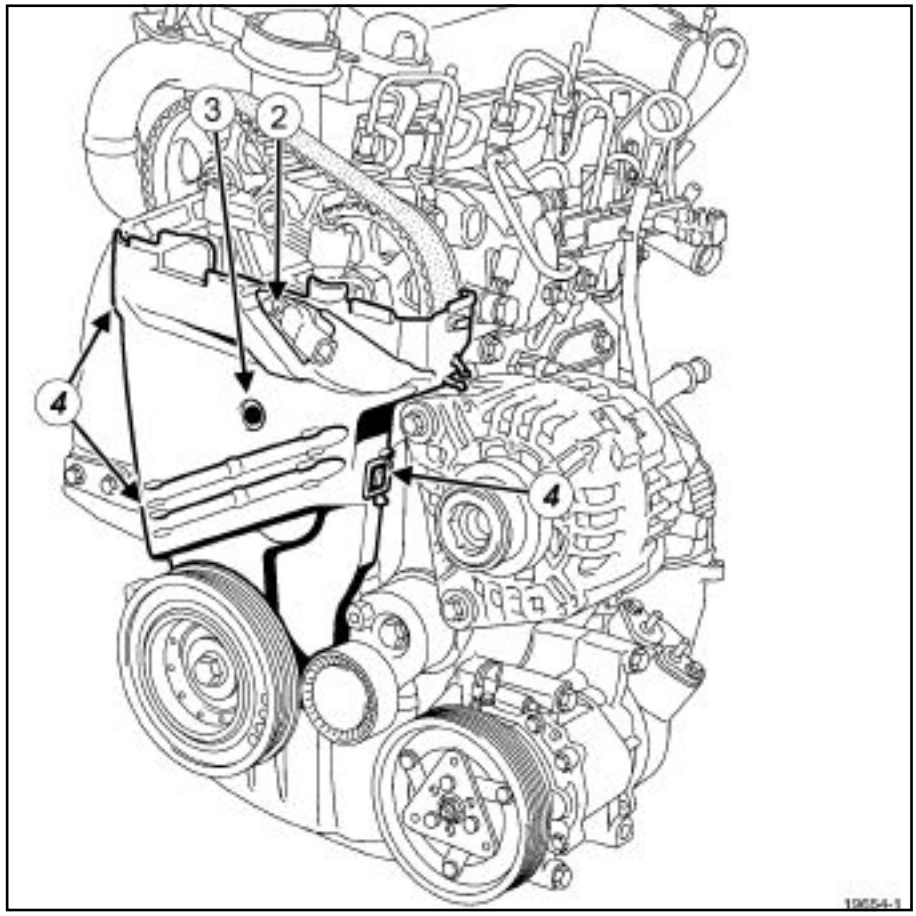


Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

II - ESSENTIAL EQUIPMENT

- Protective gloves,
- Large screwdriver,
- Allen key (**6 mm**),
- Torx socket (**14**).



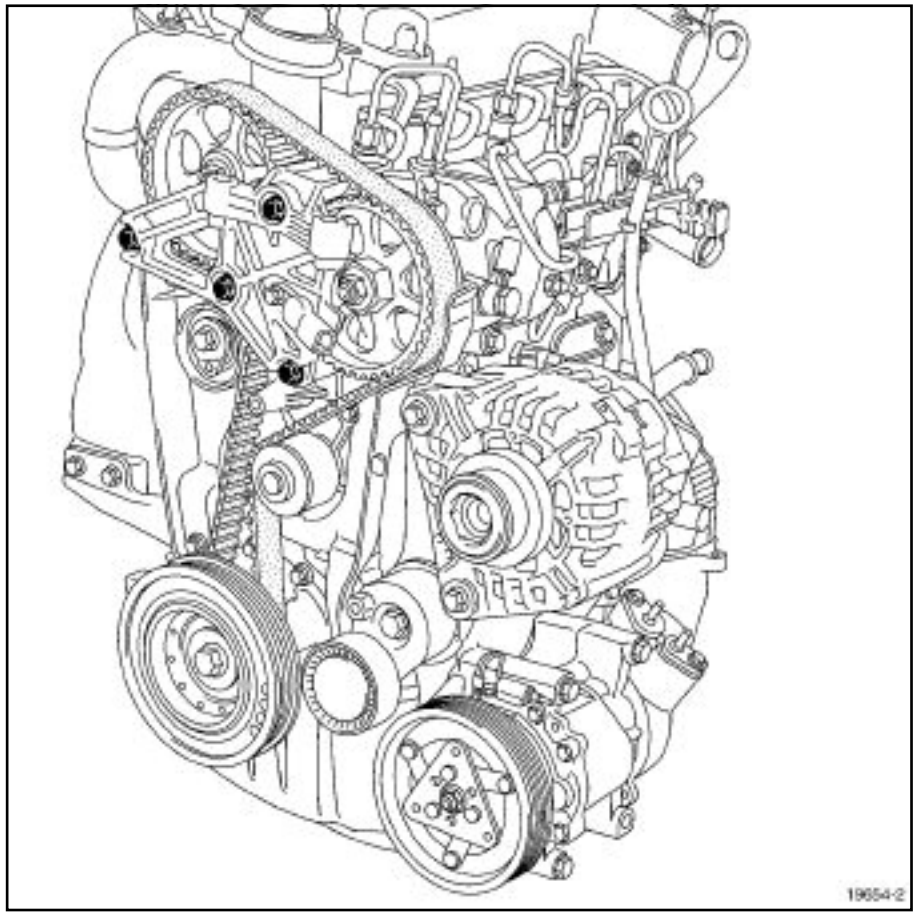
III - REMOVAL

19654

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

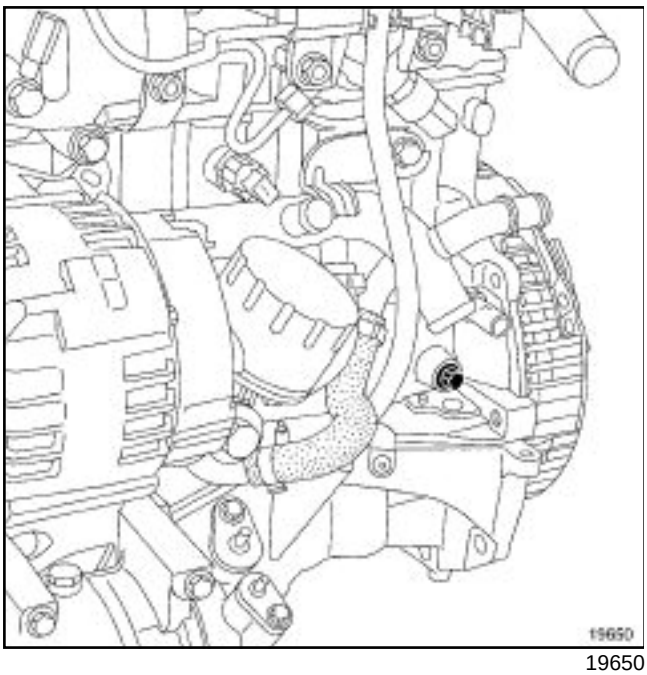
19654-1



Remove:

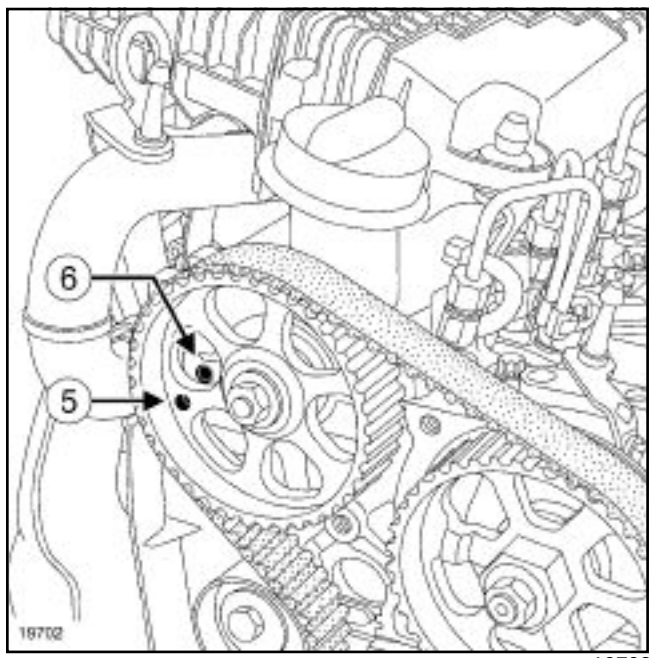
- the high-pressure pump position sensor (**2**) ,
- the plastic bolt (**3**) .

Unclip the three tabs (**4**) .



Remove the lower timing cover.

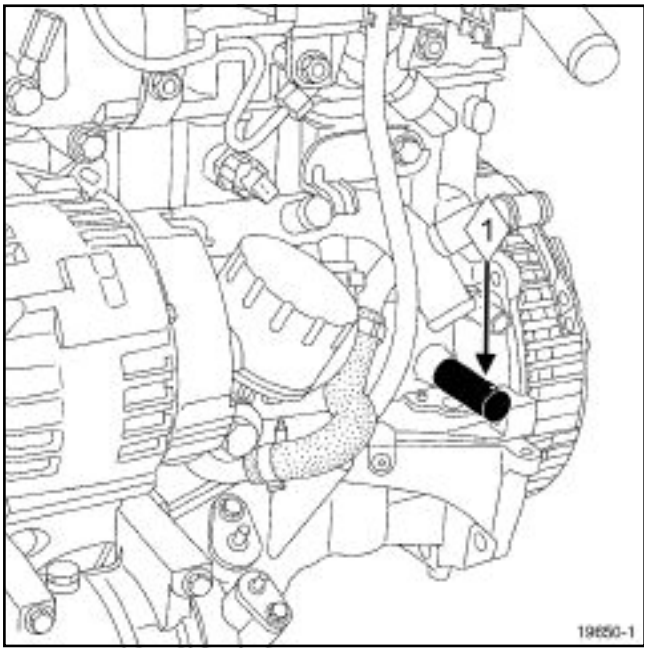
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19654-2

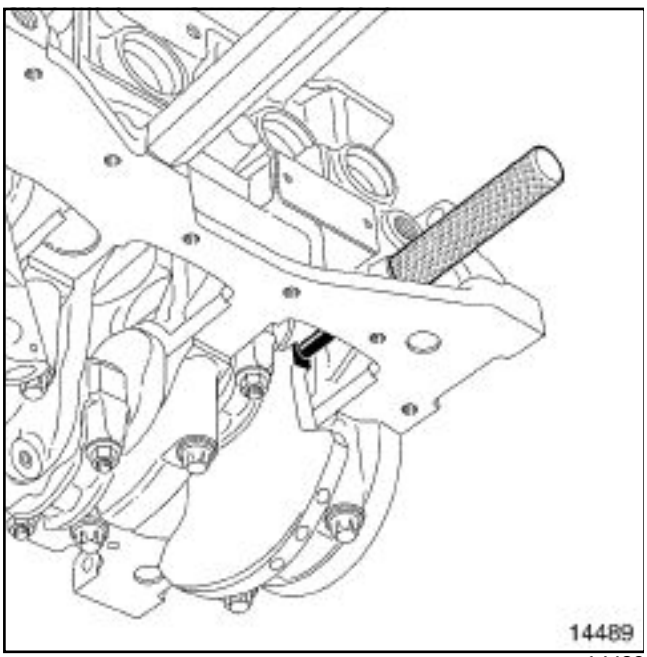
Remove the cylinder head suspended mounting.

19650



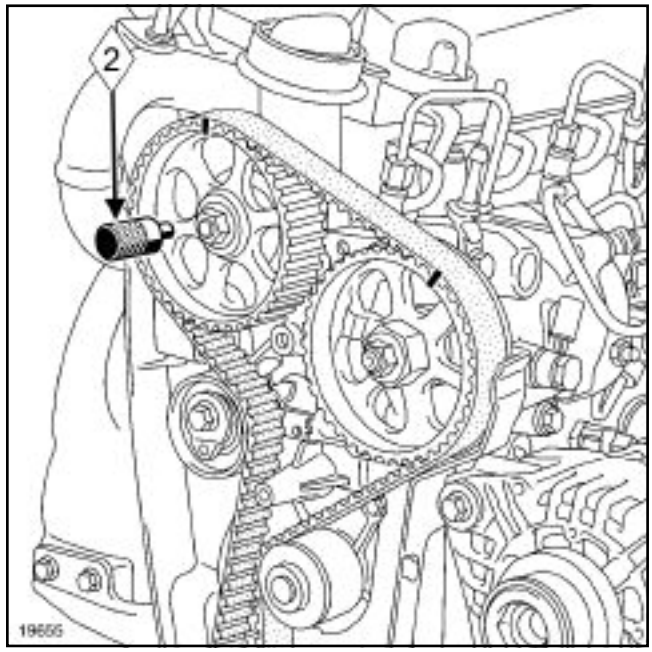
Remove the TDC pin plug using a female torx socket (**14**).

19702



Turn the crankshaft to position the camshaft pulley hole (**5**) almost opposite the cylinder head hole (**6**) .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



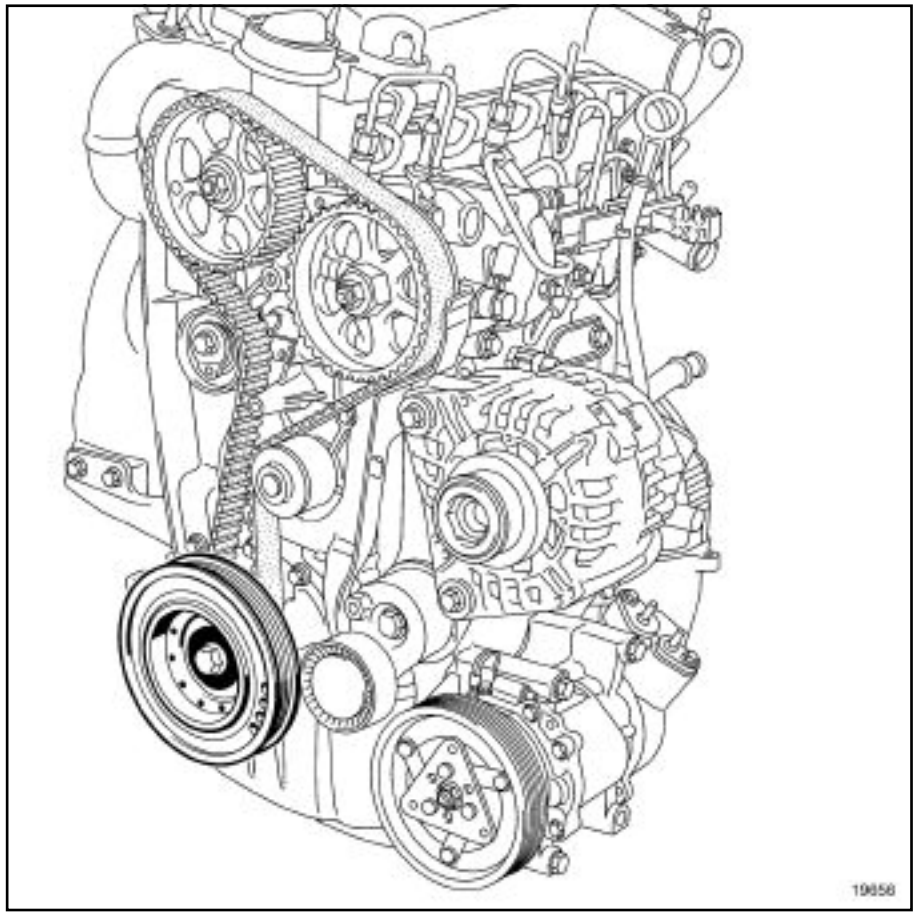
19650-1

Screw in the TDC setting pin **(Mot. 1489)** (**1**) .

14489

Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

19655



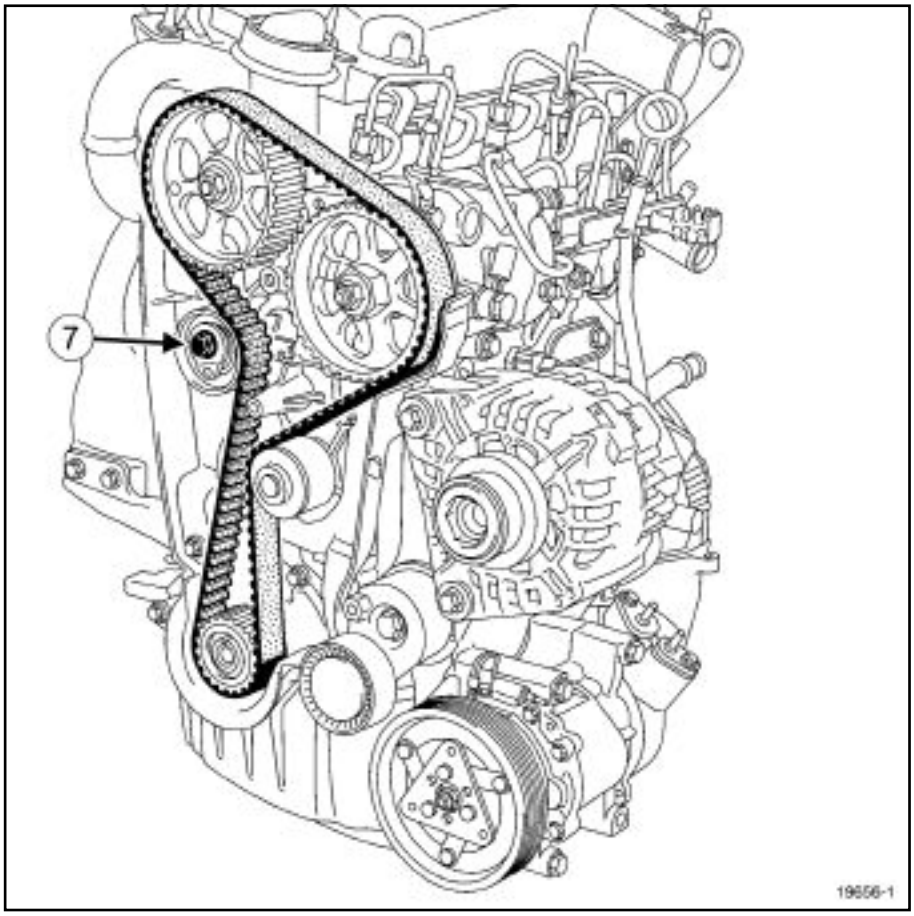
Engage the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.

Remove:

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)**

Timing belt: Removal

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19656

Remove the crankshaft accessories pulley by locking the flywheel with a large screwdriver.

Timing belt: Removal

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19656-1

Undo the tensioning roller bolt (**7**) .

Loosen the timing tensioning roller by turning the eccentric cam using a **6 mm** Allen key.

Remove:

- the timing belt taking care not to let the crankshaft timing sprocket fall out,
- the timing tensioning roller.

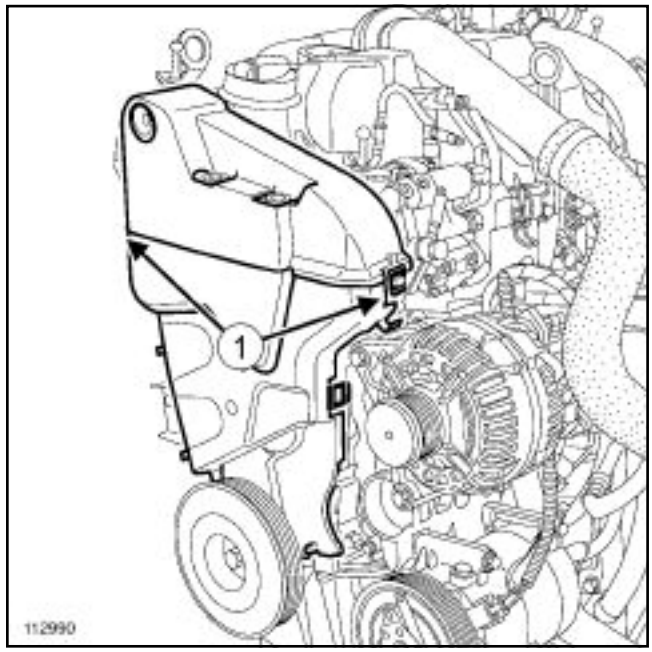
K9K, and 732 or 764

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
Never turn the engine in the opposite direction to its normal operating direction.

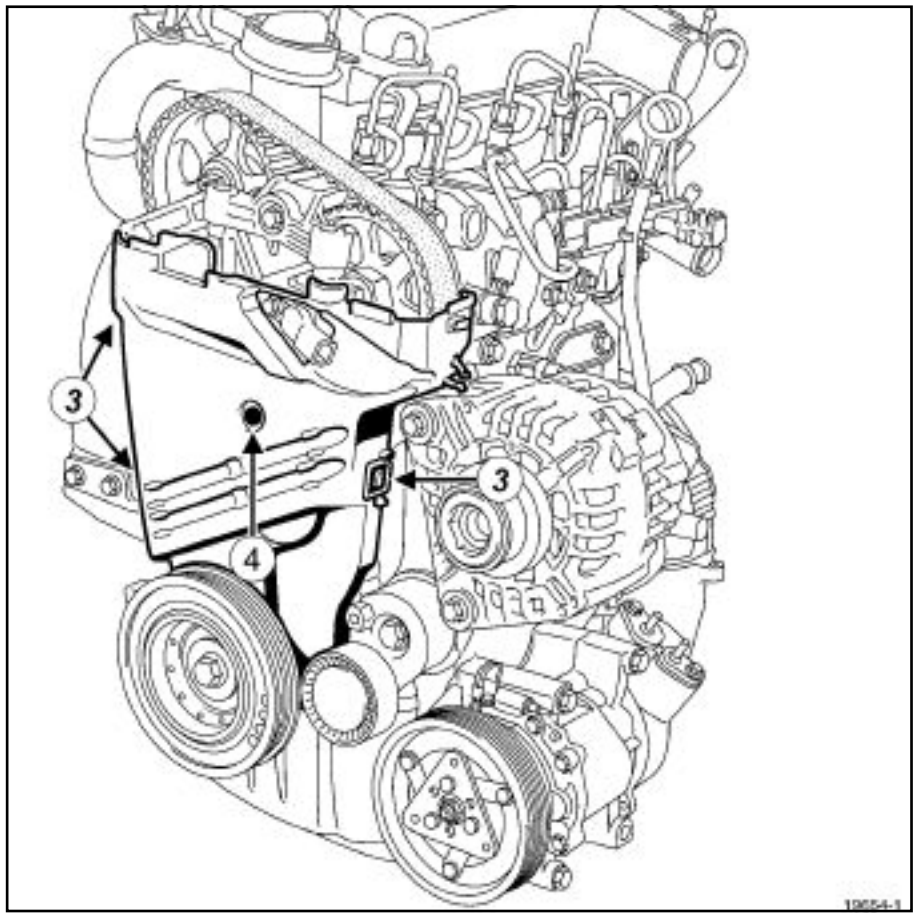


Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

II - EQUIPMENT REQUIRED

- Protective gloves,
- Large screwdriver,
- Allen key (**6 mm**),
- Torx socket (**14**).

III - REMOVAL

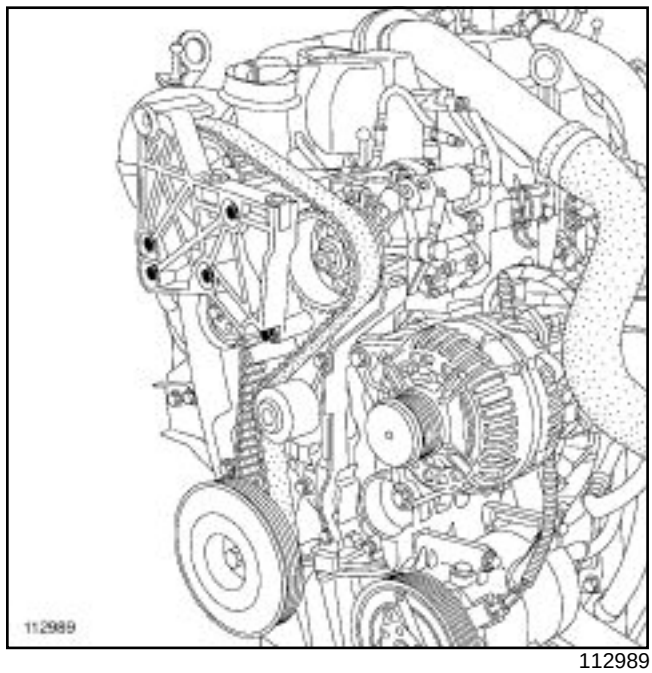


K9K, and 732

112990

Remove the upper timing cover by unclipping both tabs (**1**) .

K9K, and 732 or 764

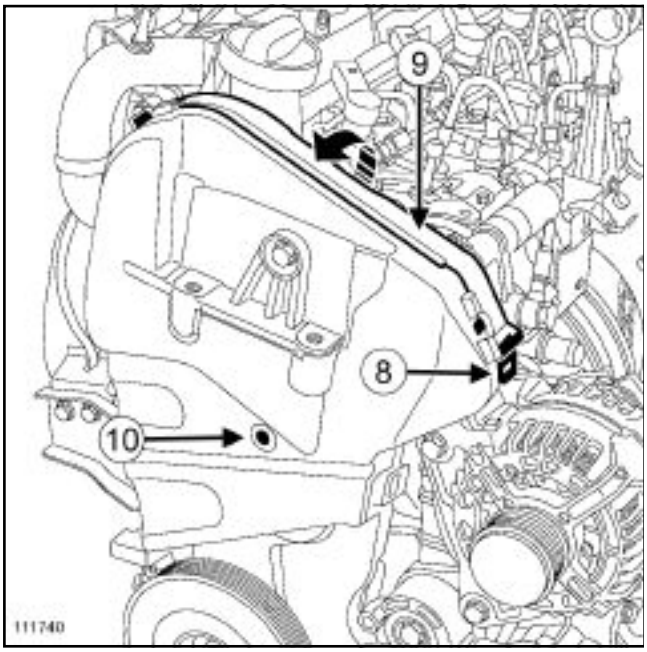


19654-1

Remove the plastic bolt (**4**) .

Unclip the three tabs (**3**) .

Remove the lower timing cover.

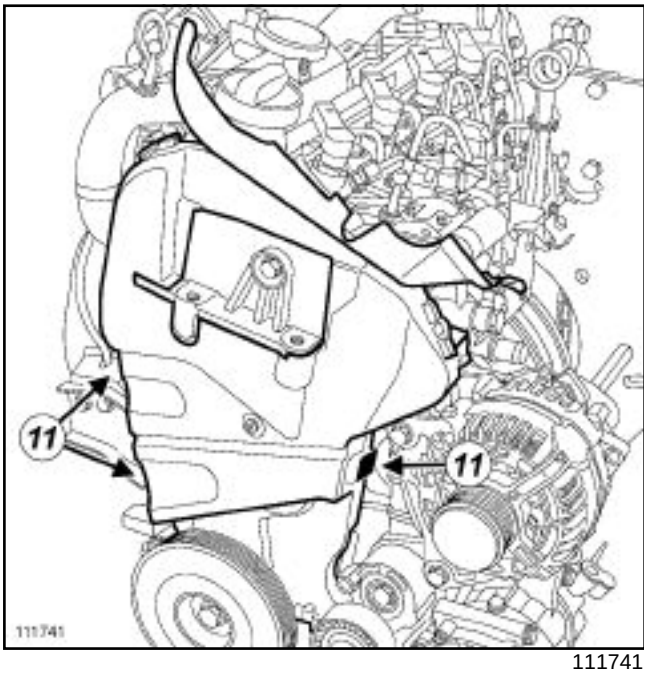


112989

Remove the cylinder head suspended mounting.

K9K, and 732 or 764

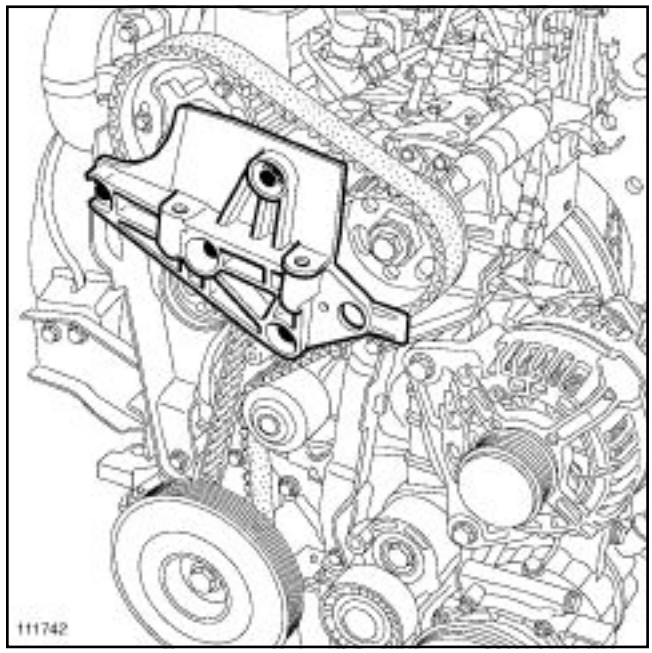
K9K, and 764



111740

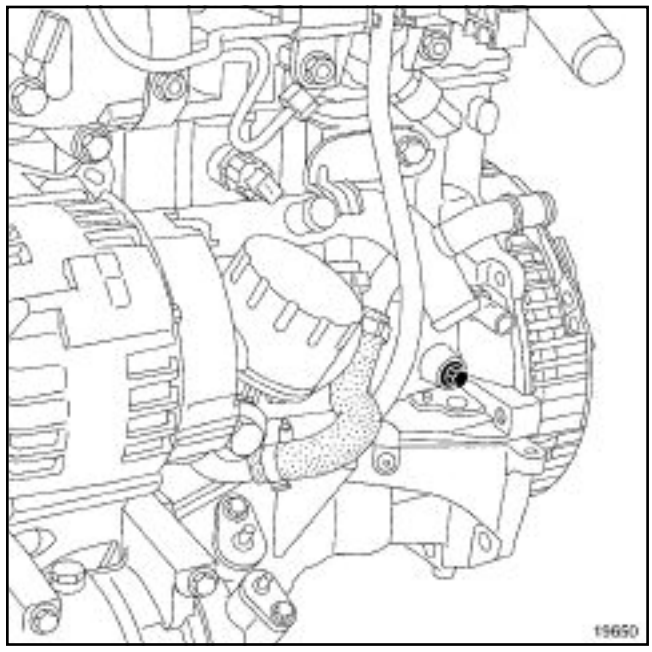
Unclip the tab (**8**) .

Turn the timing cover (**9**) in the direction of the arrow.



Remove the plastic bolt (**10**) .

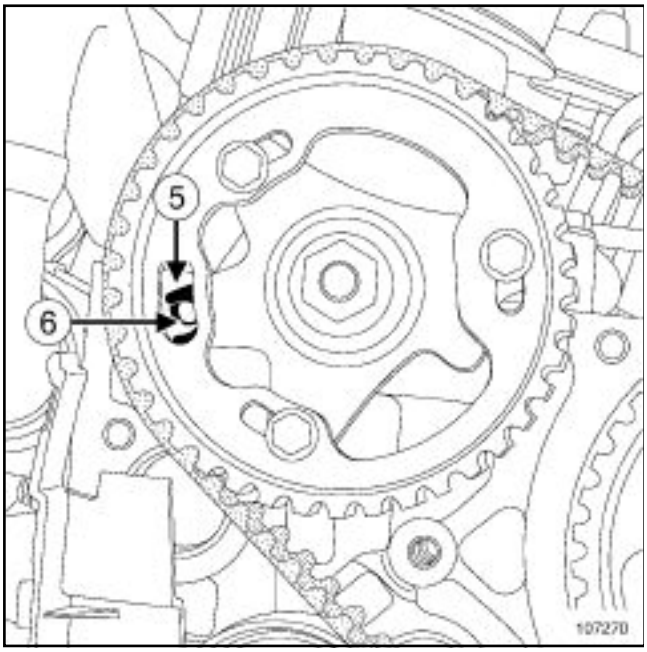
111741



Unclip the three tabs (**11**) .

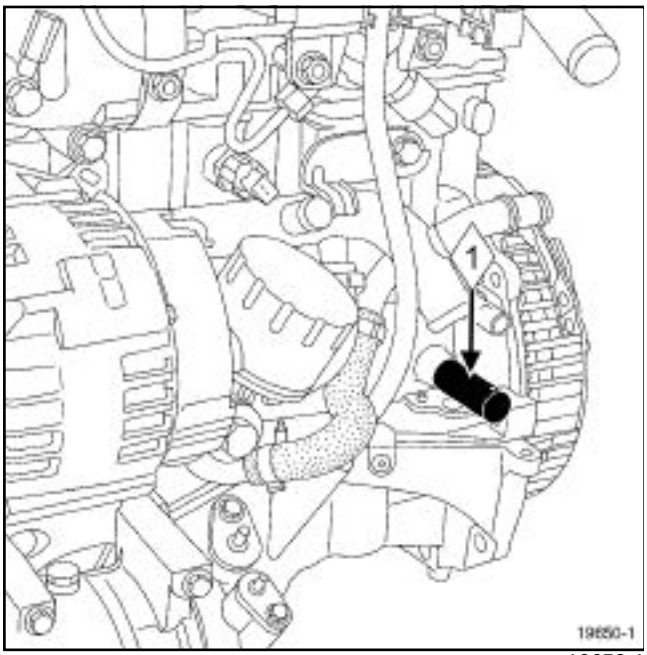
Remove the timing cover.

111742



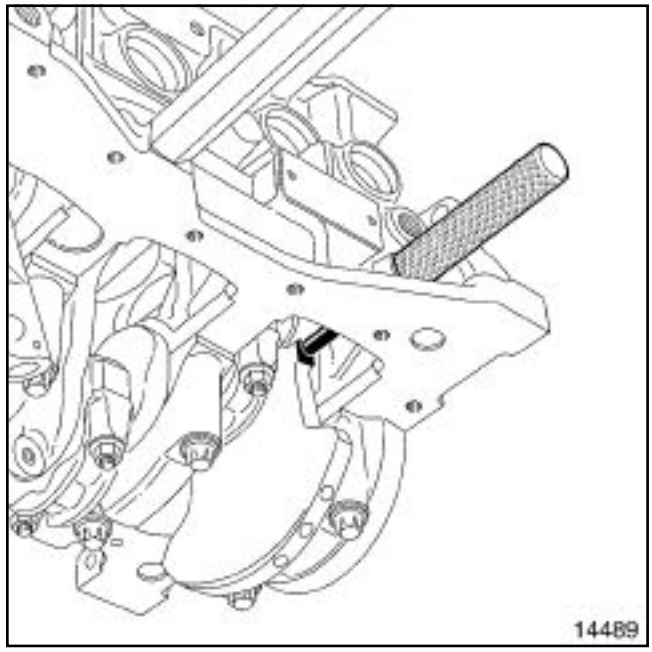
Remove the cylinder head suspended mounting.

19650



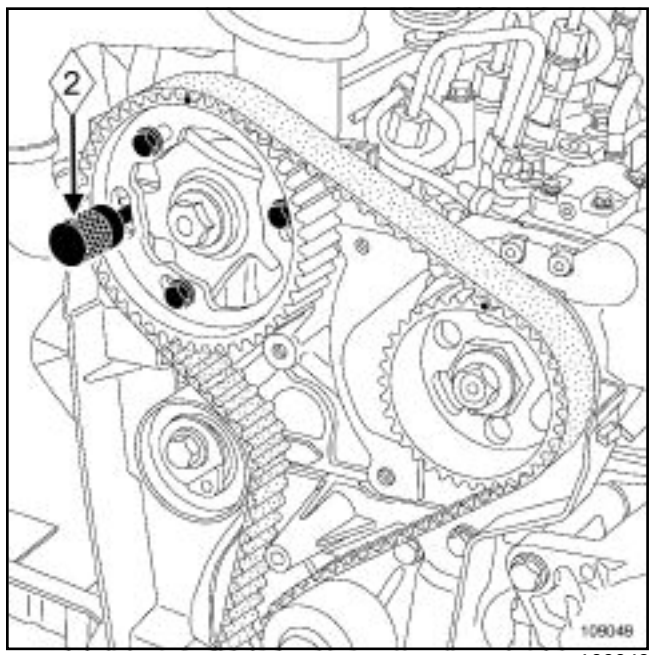
Remove the TDC setting pin plug using a female torx socket (**14**).

K9K, and 732 or 764



107270

Turn the crankshaft to position the camshaft pulley hole (**5**) almost opposite the cylinder head hole (**6**) .



19650-1

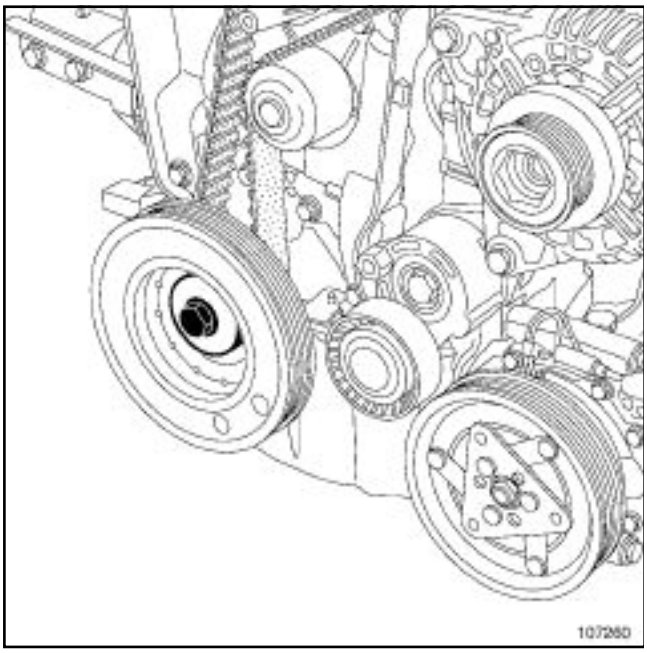
Screw in the TDC setting pin (**1**) **(Mot. 1489)** .

14489

Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

109049

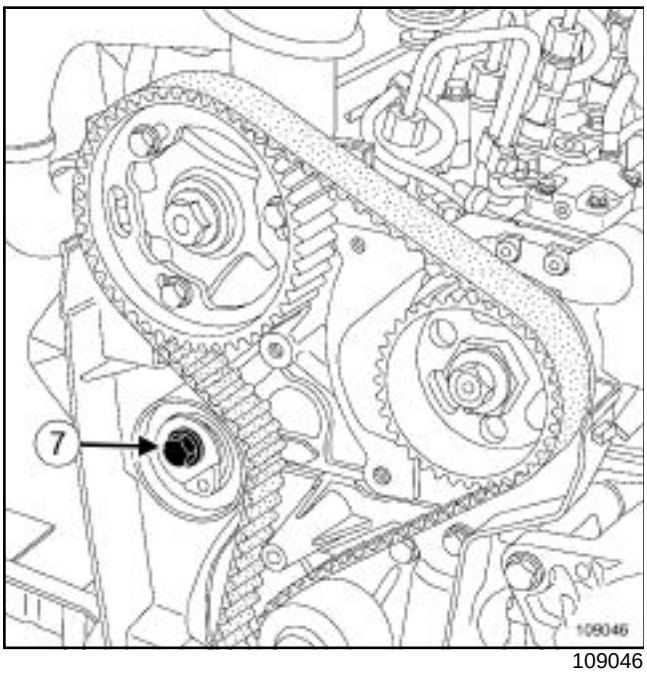
Engage the pin **(Mot. 1430)** (**2**) in the camshaft pulley and cylinder head holes.



Remove:

- the set of 5 pins for the camshaft and craknshaft pulleys **(Mot. 1430)** ,

- the TDC setting pin **(Mot. 1489)** .



Timing belt: Removal

K9K, and 732 or 764

107260

Remove the crankshaft accessories pulley, locking the flywheel with a screwdriver.

109046

Undo the tensioning roller bolt (**7**) .

Loosen the timing tensioning roller by turning the eccentric cam using a **6 mm** Allen key

Remove:

- the timing belt,

- the timing tensioning roller.

There are three distinct tension procedures that must be observed, according to the engine family.

Some engines require:

- a pretensioning torque to be applied (using the special tooling for the engine type) to the belt section to be measured to compensate for all the belt play.
- a **pre-stress T1** slightly greater than the **final fitting tension T2** to be applied.

The purpose of these two operations is to stabilise the belt's internal voltage, to make a reliable tension measurement.

WARNING
Replace any removed belt.

WARNING
When replacing the timing belt specified by the manufacturer, the belt, tension wheel and pulley(s) must be replaced.

Timing belts: Refitting

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14 ± 1.4 Nm**
the tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14± 1.4 Nm**
the crankshaft accessories pulley M14 bolt	**120 ± 12 Nm + 95° ± 15°**
TDC pin plug	**20 ± 2 Nm**
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**
high-pressure pump position sensor bolt	**8 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

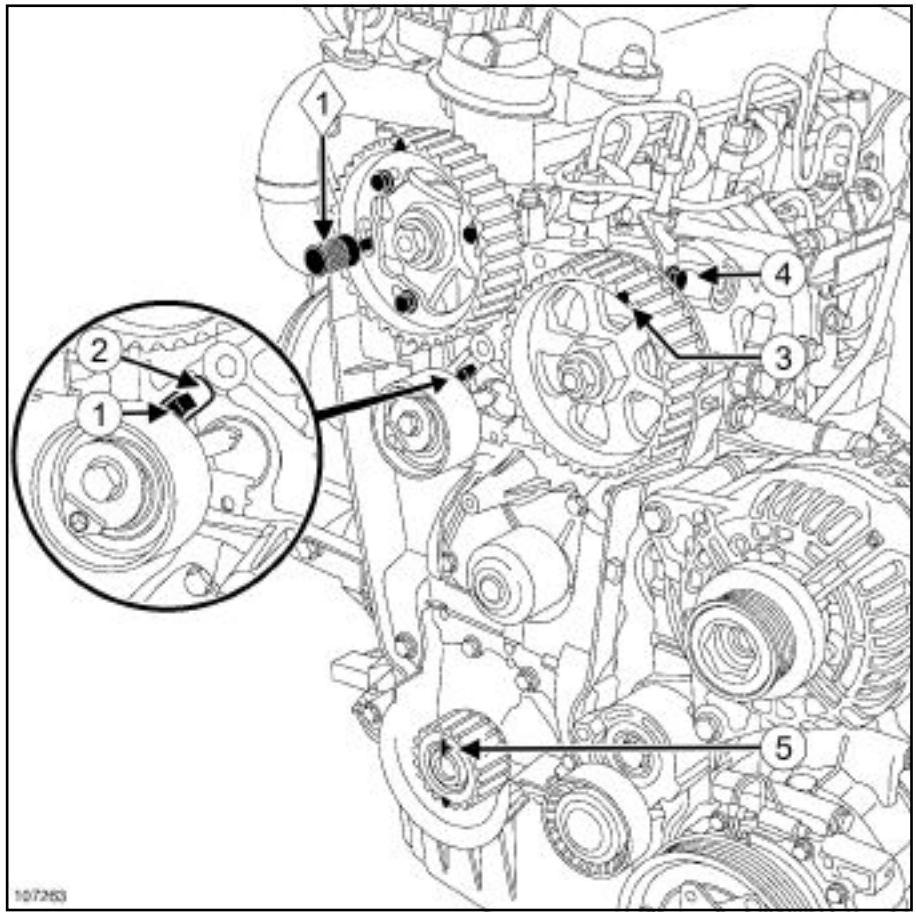
When replacing the belt, always replace the tensioning rollers and fixed rollers.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Pièces à remplacer systématiquement

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Ingrédients



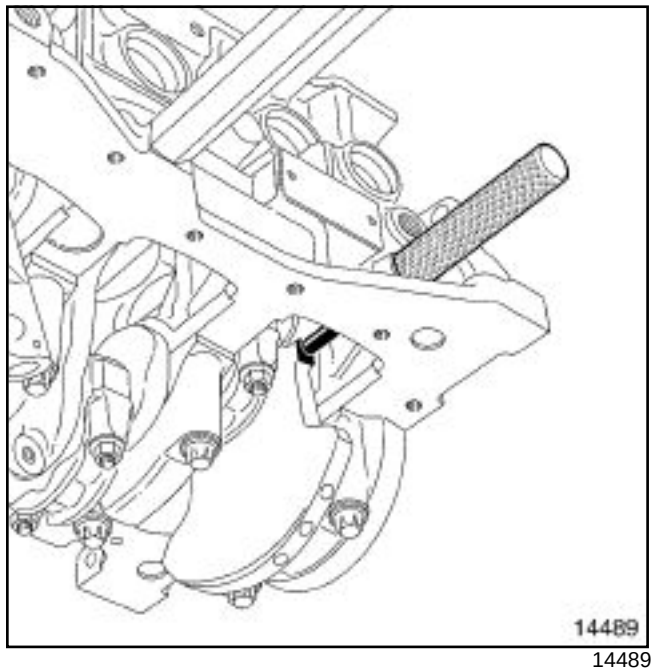
- Silicone adhesive sealant, part no. **77 11 227 484**

III - ESSENTIAL EQUIPMENT

- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset wrench (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

IV - REFITTING

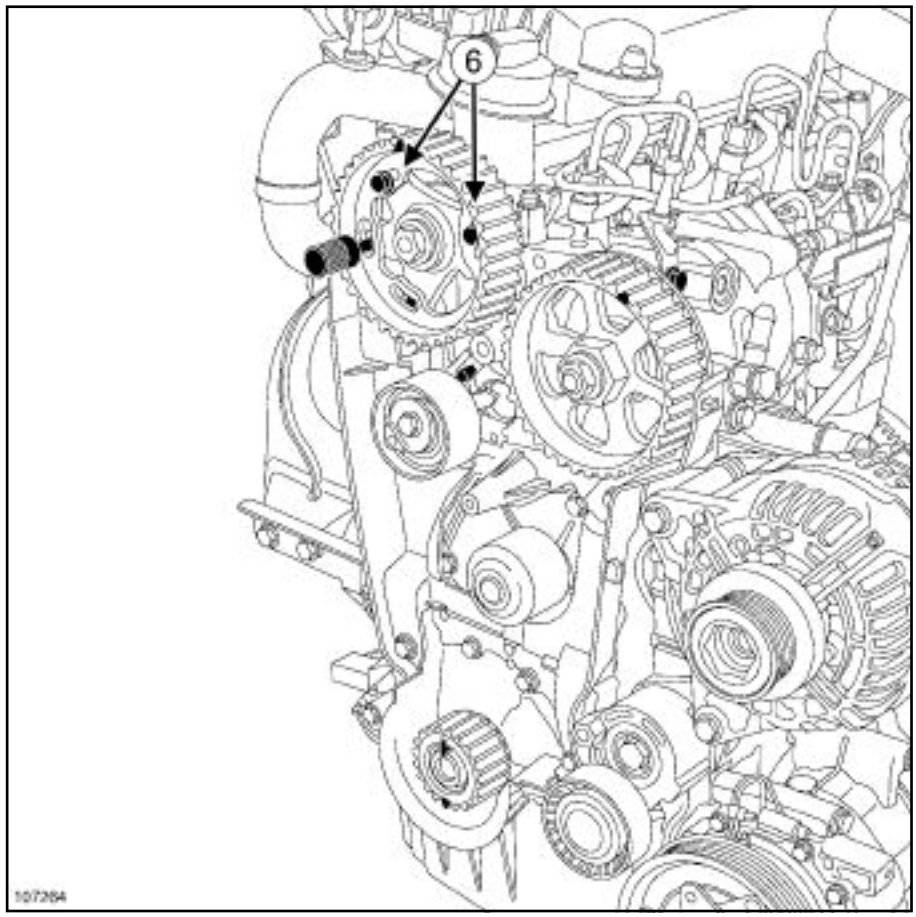


107263

Refit the timing tensioning roller.

Place the tensioning roller spigot (**1**) in the cylinder head groove (**2**) .

Engage the pin (**1**) **(Mot. 1430)** in the holes of the camshaft pulley and cylinder head, turning the camshaft using an **18 mm** offset wrench if necessary.

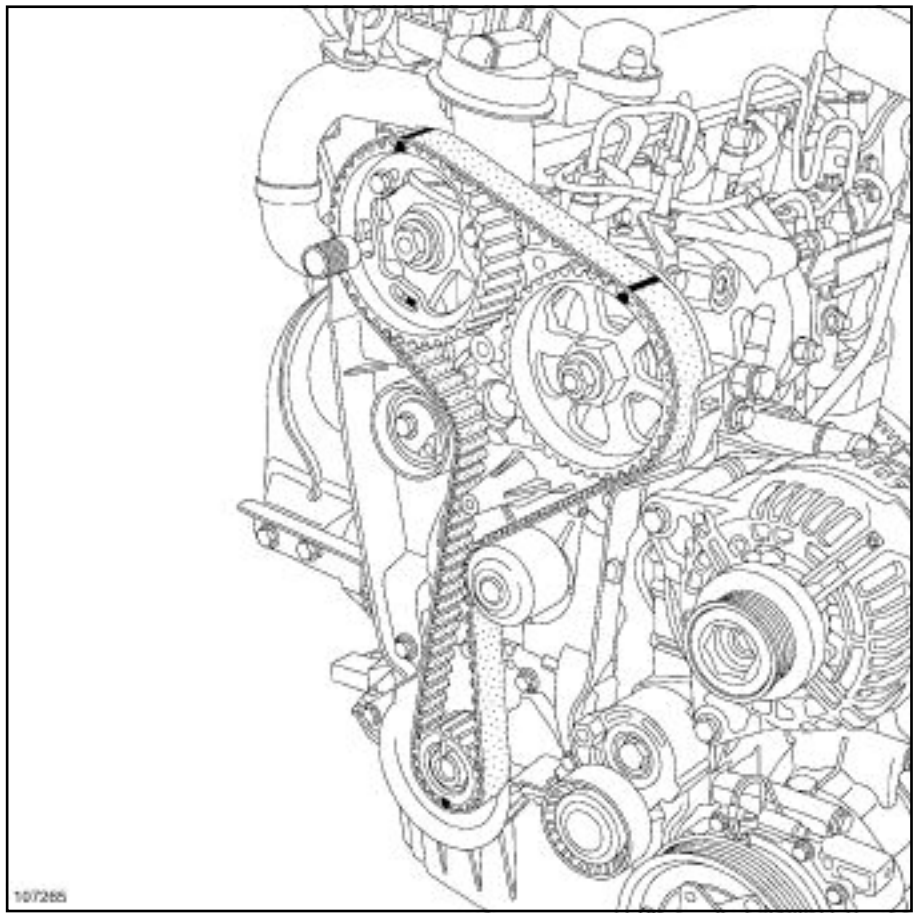


Check that the mark on the high-pressure pump (**3**) is opposite the bolt head (**4**) .

14489

Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft sprocket cotter ***(5)*** must face upwards).

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

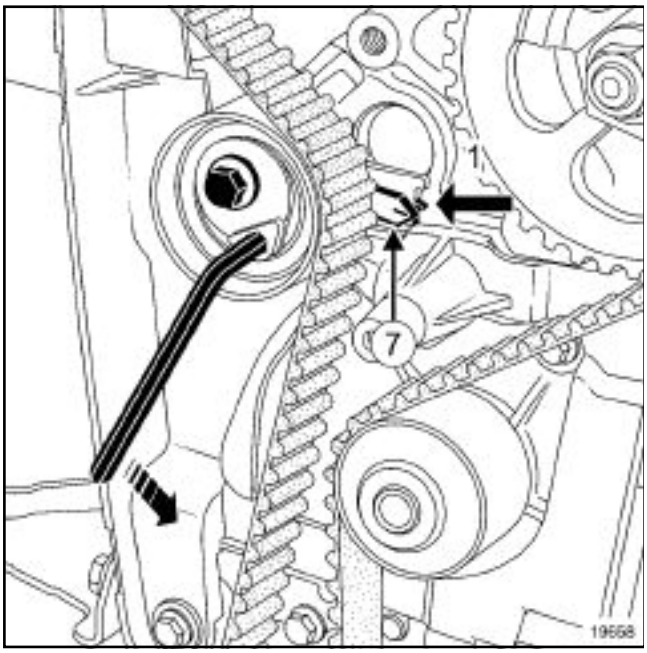


107264

Remove one bolt from the camshaft pulley wheel.

Loosen the two other camshaft pulley wheel bolts (**6**) by one turn.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

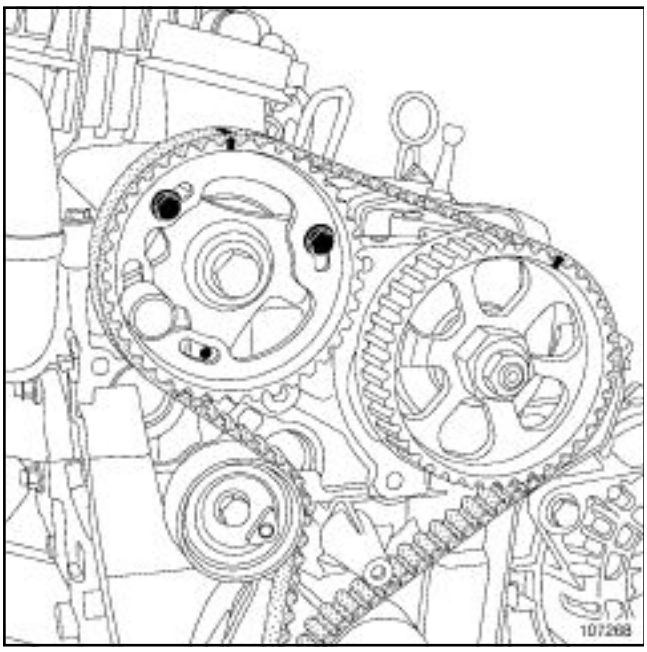


107265

Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft sprockets, the camshaft and the high-pressure pump.

Note:

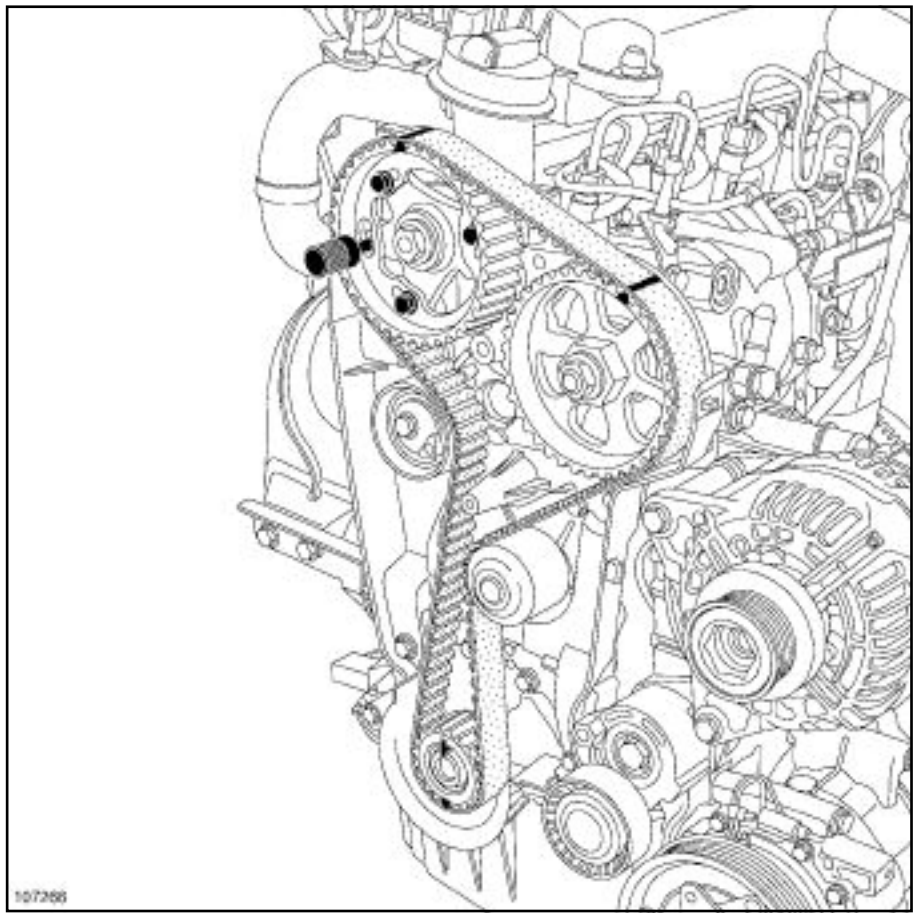
There should be 19 tooth belt grooves between the camshaft sprocket marks and the high-pressure pump, and 51 tooth belt grooves between the crankshaft sprockets and the high-pressure pump.



K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19658

Position the tensioning roller adjustable index (**7**) opposite the spigot, turning the eccentric cam anti-clockwise using a **6 mm** Allen key.

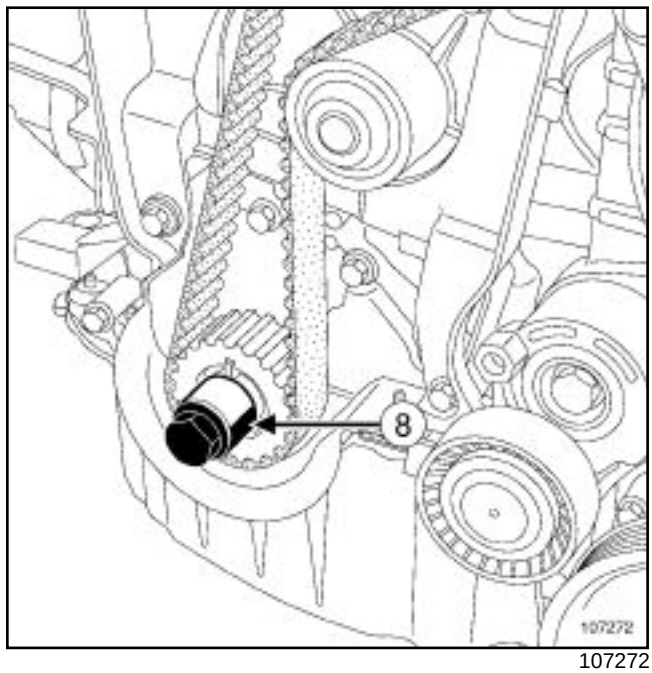


Tighten to torque the **tensioning roller bolt (27 ± 2.7 Nm)** .

107268

Check that the camshaft pulley hub bolts are not fully up against the camshaft pulley wheel.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

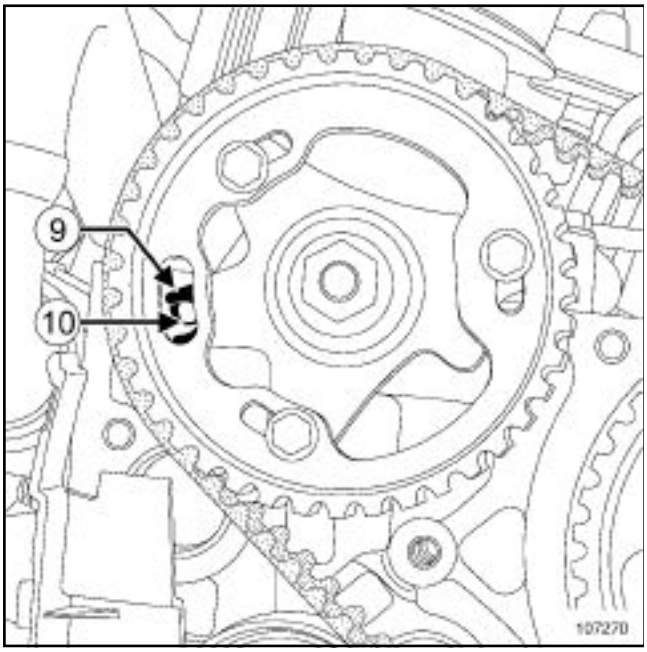


107266

Refit the bolt to the camshaft pulley wheel.

Tighten to torque **the camshaft pulley wheel bolts (14 ± 1.4 Nm)** .

Remove:

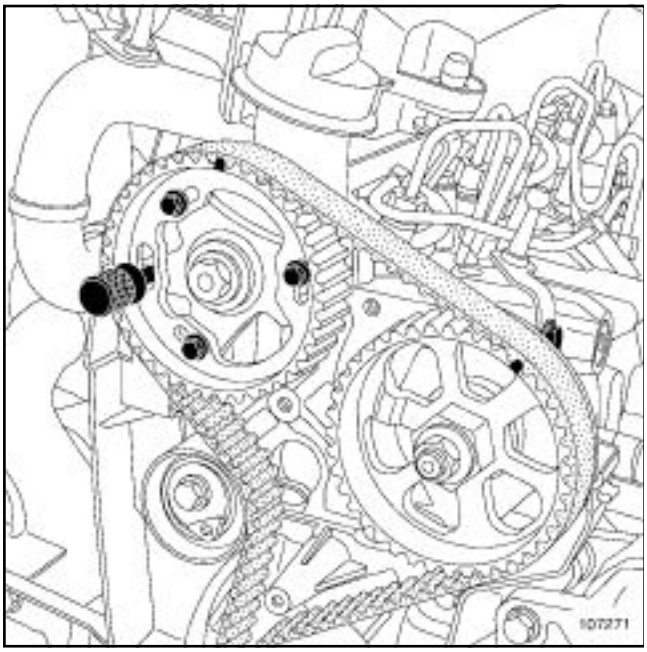


- the TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

107272

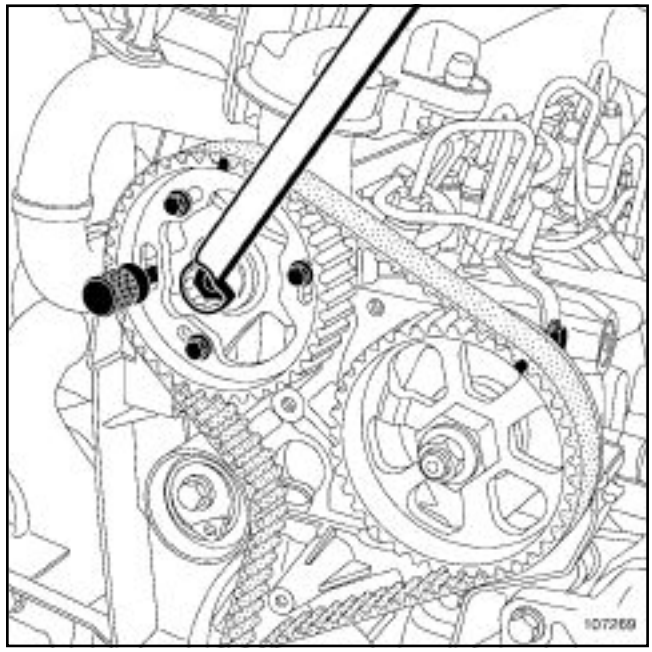
Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**8**) onto the crankshaft.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768



107270

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .



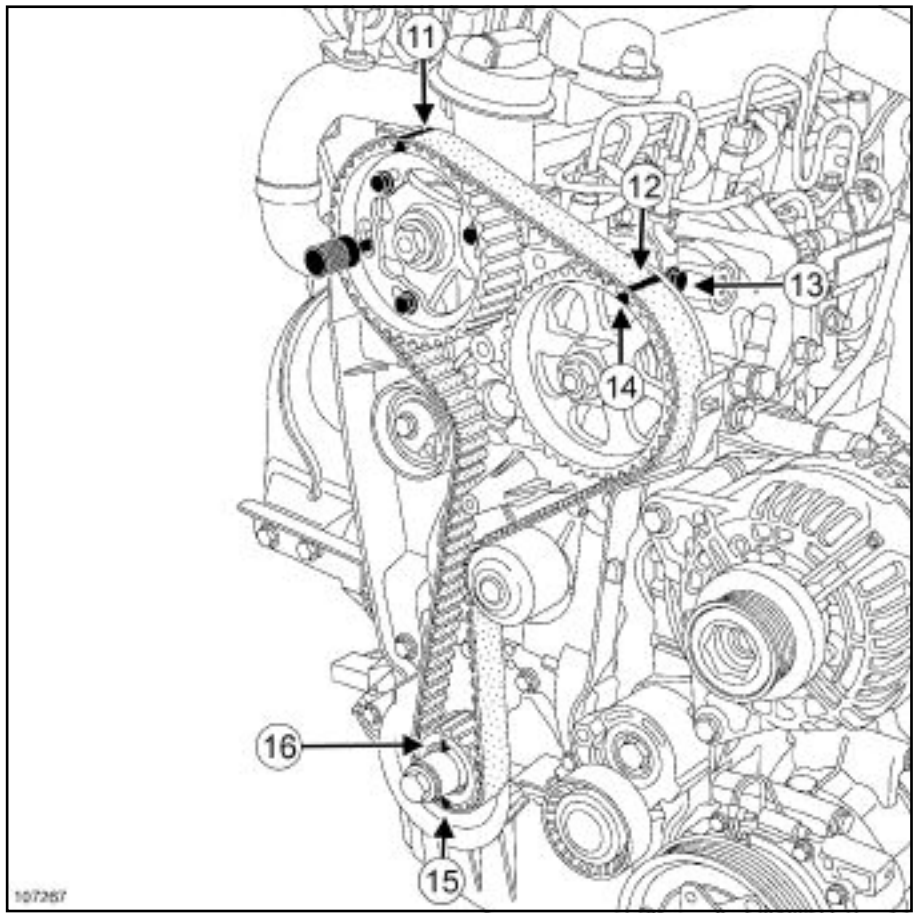
Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

Set the camshaft pulley using the **(Mot. 1430)** .

107269



If the pin **(Mot. 1430)** does not engage:

loosen the camshaft pulley wheel bolts by one turn at most,

Turn the camshaft pulley hub using an **18 mm** offset wrench to set the camshaft pulley hub timing.

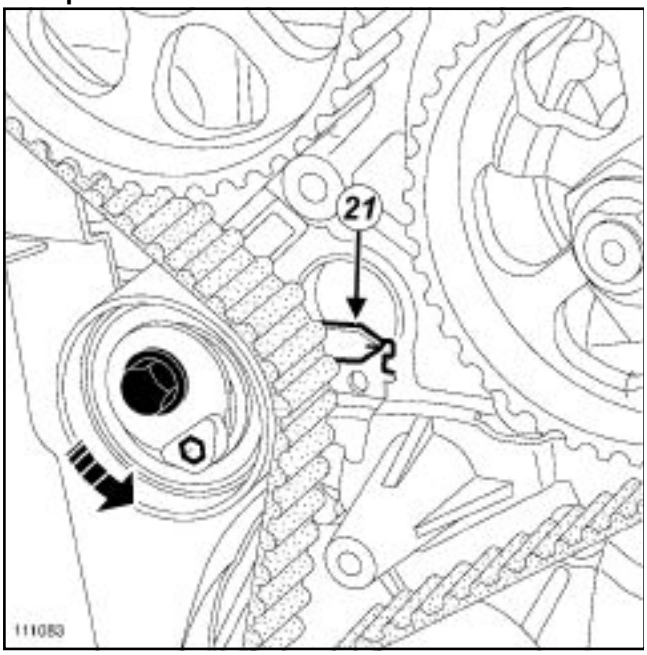
Do not retighten the camshaft pulley wheel bolts.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

107267

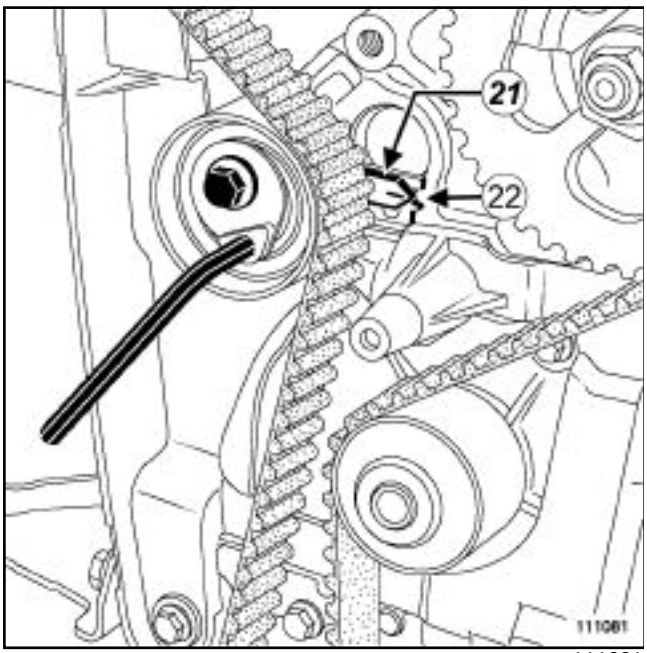
Check:

- that the high-pressure pump sprocket mark (**14**) is opposite the bolt head (**13**) ,
- that the crankshaft timing sprocket cotter (**16**) is positioned vertically at the top,
- that there are 19 tooth belt grooves between the camshaft sprocket marks (**11**) and the high-pressure pump sprocket (**12**) ,
- that there are 51 tooth belt grooves between the crankshaft sprocket marks (**15**) and the high-pressure pump sprocket (**12**) .



Note:

After two turns, the tensioning roller index markers may be in two different positions.

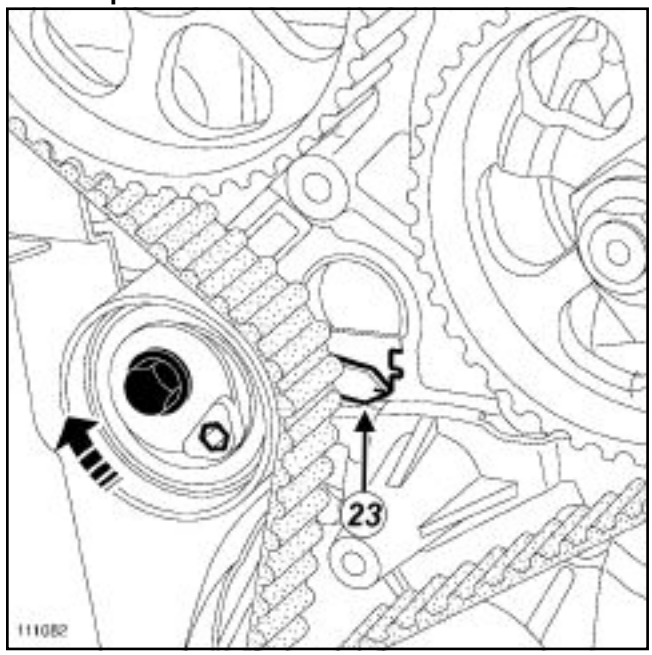


The rotation of the tensioning roller eccentric depends on the position.

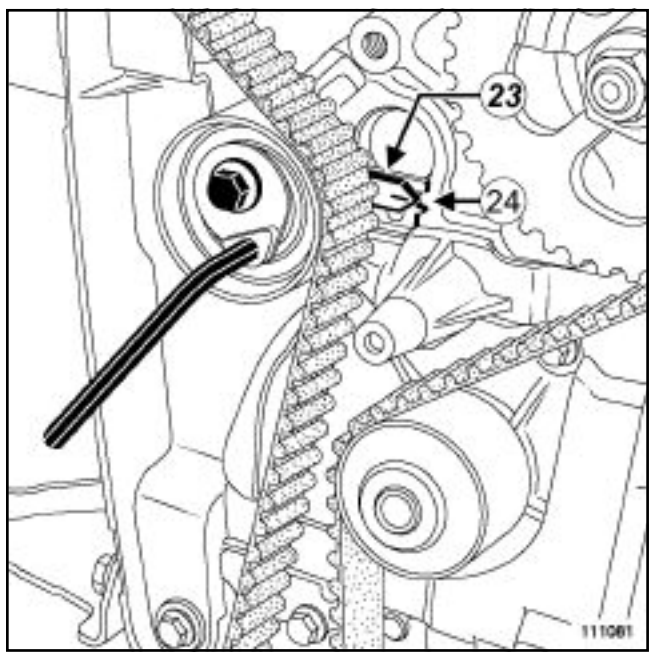
K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

First position

111083



111081



Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index (**21**) in the middle of the timing window (**22**) , turning the key anticlockwise.

Second position

111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

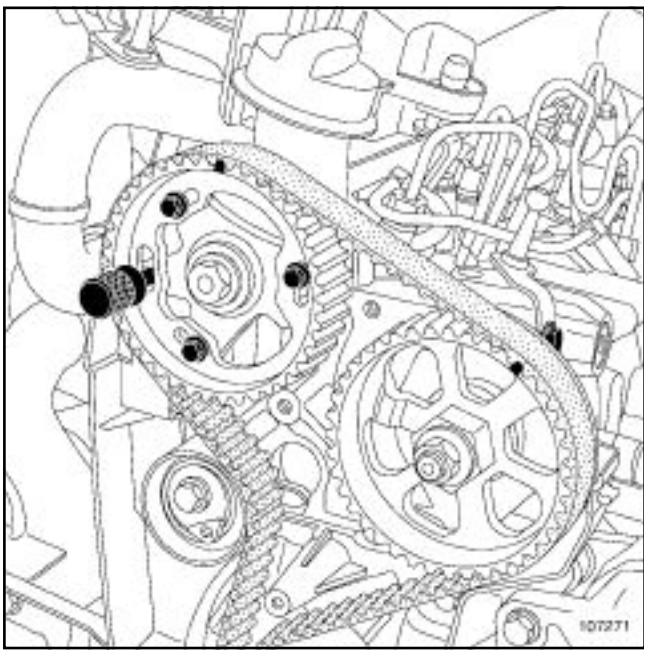
Gradually align the adjustable index (**23**) in the middle of the timing window (**24**) , turning the key clockwise.

Tighten to torque:

- **the tensioning roller bolt (27 ± 2.7 Nm)** ,
- **the camshaft pulley wheel bolts (14± 1.4 Nm)** .

Remove the following tools:

- TDC setting pin **(Mot. 1489)** ,

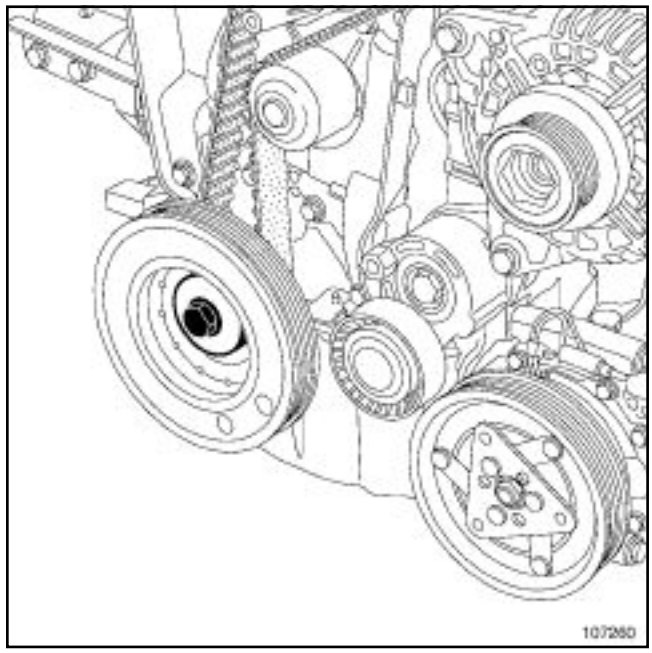


K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.



Bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

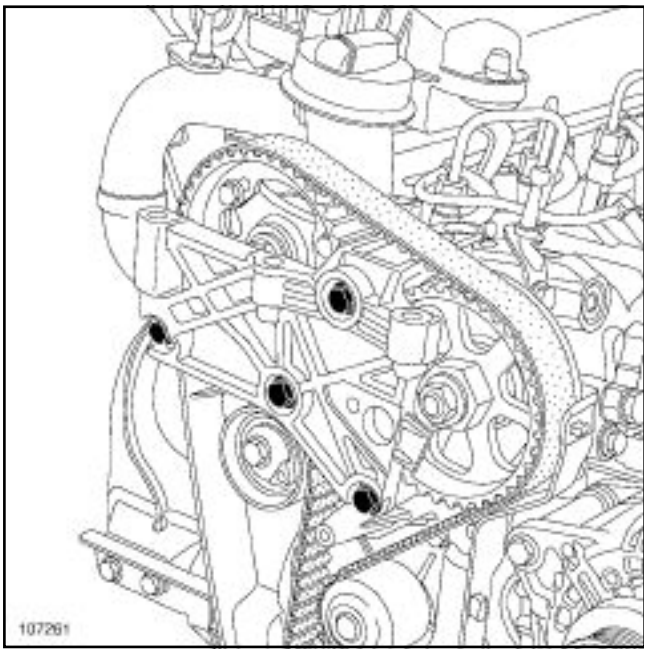
Set the camshaft pulley using the **(Mot. 1430)** .

If this is not possible, repeat the timing belt refitting operation.

107260

Refit the accessories crankshaft pulley with a new bolt.

Tighten to torque and angle (crankshaft in contact with the TDC setting pin) **the crankshaft accessories pulley M14 bolt (120 ± 12 Nm + 95° ± 15°)** .



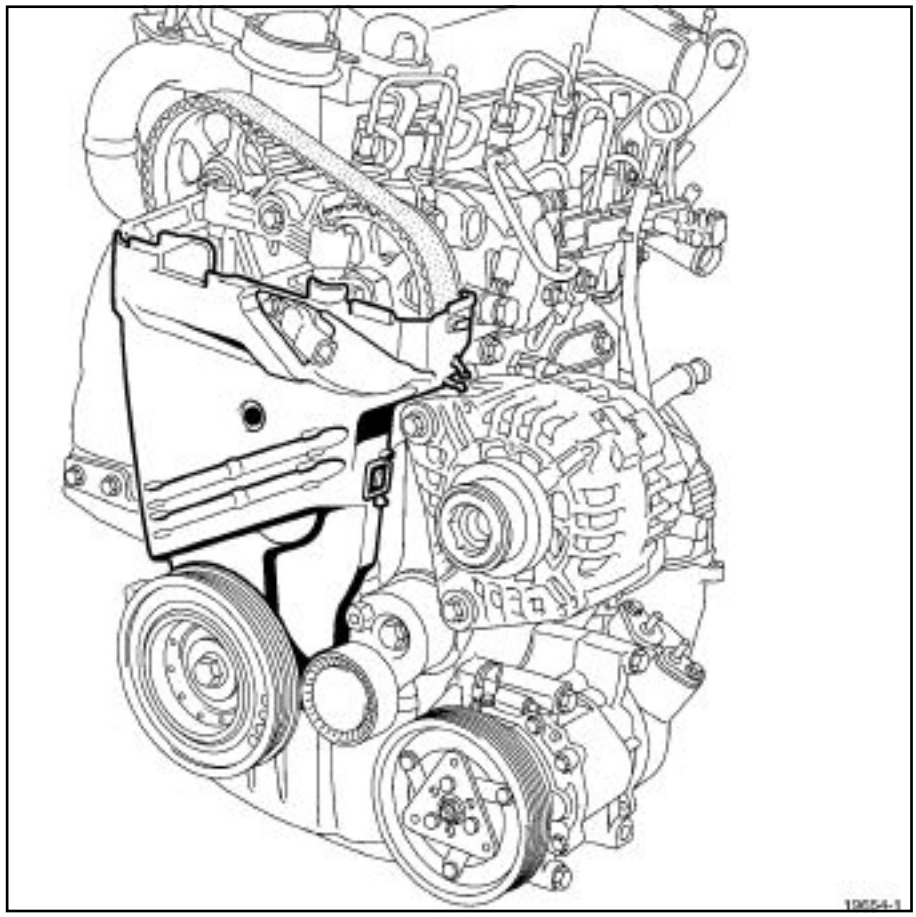
Remove the following tools:

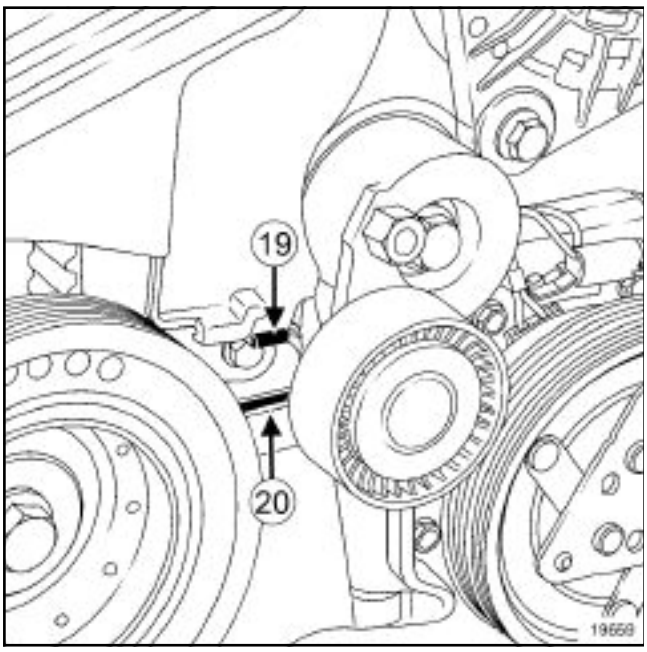
- TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Refit the TDC pin plug, coating the thread with **SILICONE ADHESIVE SEALANT** .

Tighten to torque the **TDC pin plug (20 ± 2 Nm)** .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768





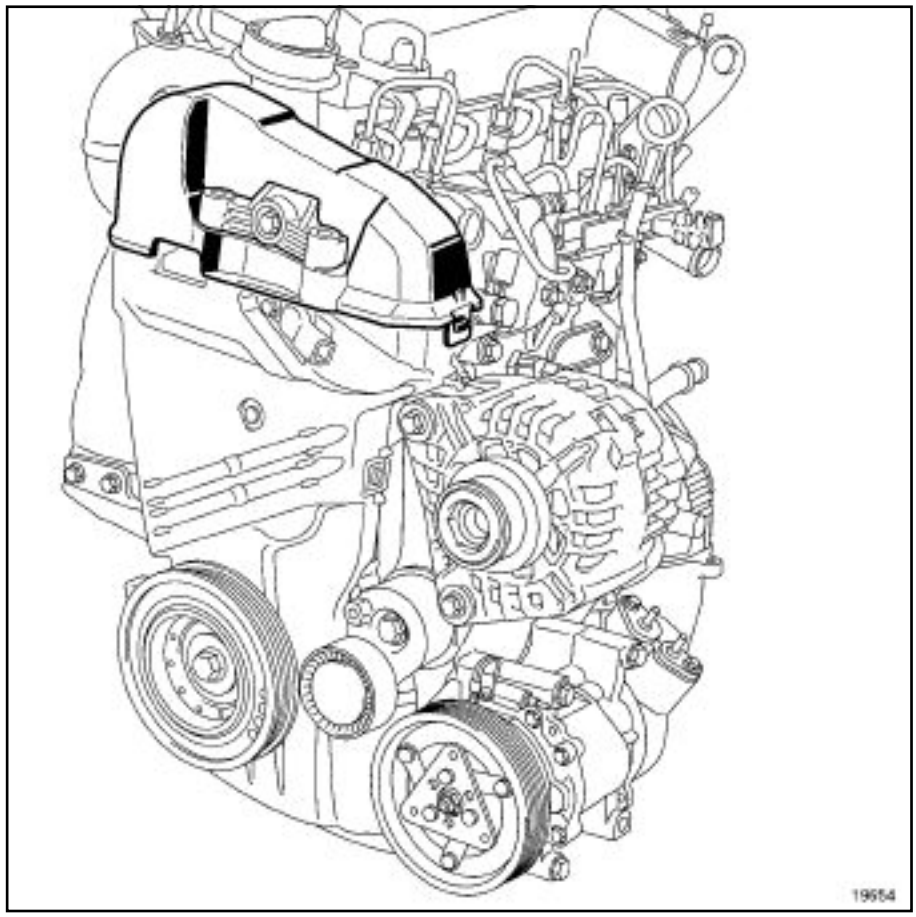
107261

Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19654-1



19659

Refit:

- the lower timing cover, positioning the tab (**19**) in the inner timing cover hole (**20**) ,
- the timing cover plastic mounting bolt.

K9K, and 274 or 276 or 714 or 716 or 718 or 766 or 768

19654

Refit the high-pressure pump position sensor.

Tighten to torque the **high-pressure pump position sensor bolt (8 Nm)** .

Refit the upper timing cover.

Timing belts: Refitting

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
timing pulley bolt	**27 Nm**
the crankshaft accessories pulley M12 bolt	**60 Nm + 100° ± 10°**
the crankshaft accessories pulley M14 bolt	**120 Nm + 95° ± 15°**
tensioning roller bolt to	**27 Nm**
TDC cap	**20 Nm**
cylinder head suspended mounting bolt	**21 Nm**
high-pressure pump position sensor bolt	**8 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

When replacing the belt, always replace the tensioning rollers and fixed rollers.

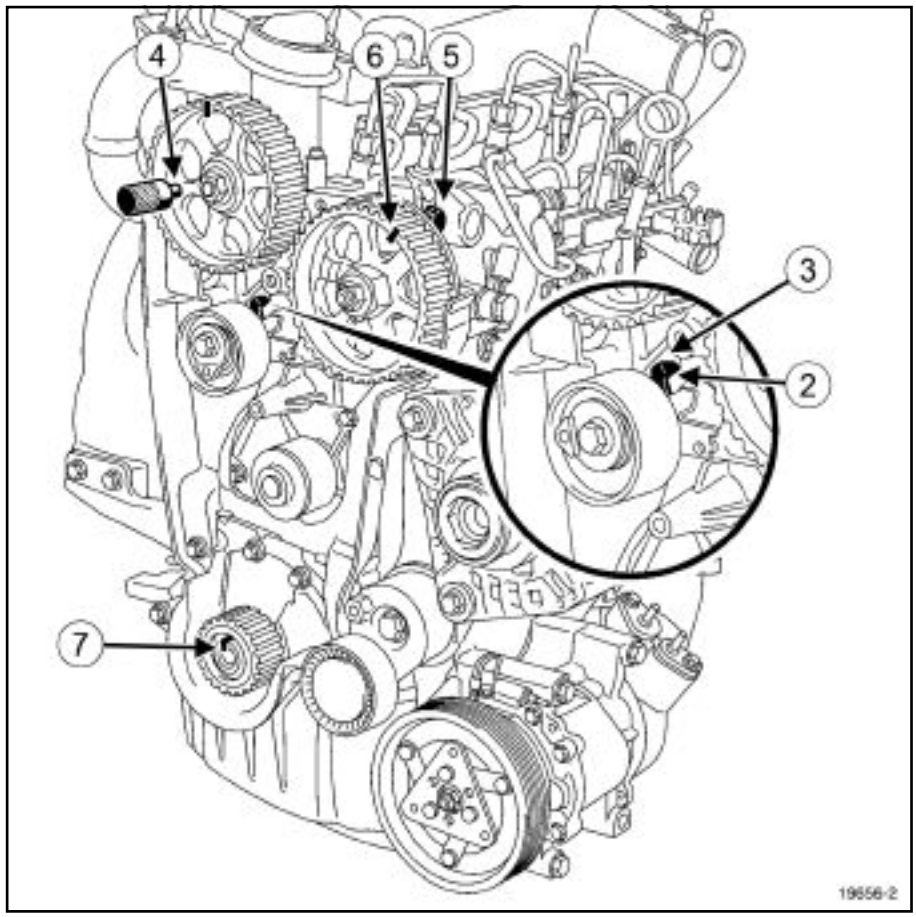
It is essential to remove the grease from the end of the crankshaft, the camshaft timing sprocket and the bearing face of the crankshaft accessories pulley. This is to avoid timing slippage.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Pièces à remplacer systématiquement

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Ingrédients



- Silicone adhesive sealant, part no. **77 11 227 484** ,
- Degreaser, part no. **77 11 224 559** .

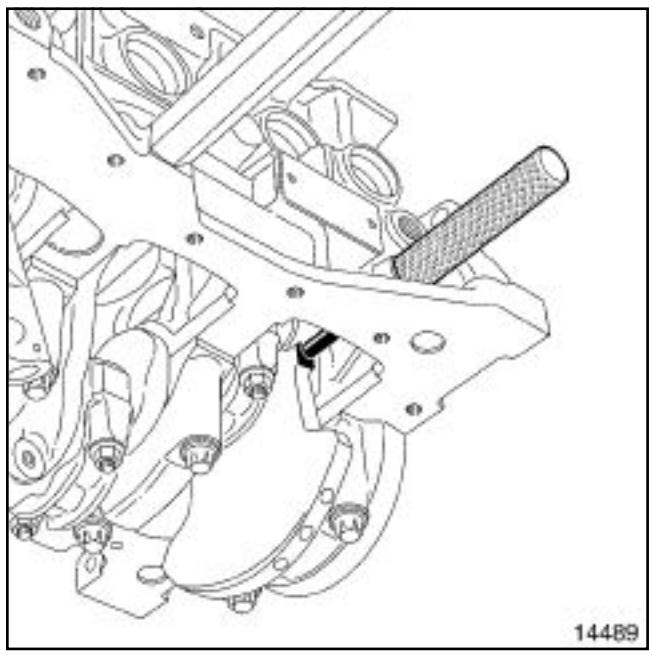
III - EQUIPMENT REQUIRED

- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset wrench (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

IV - REFITTING

19656-2

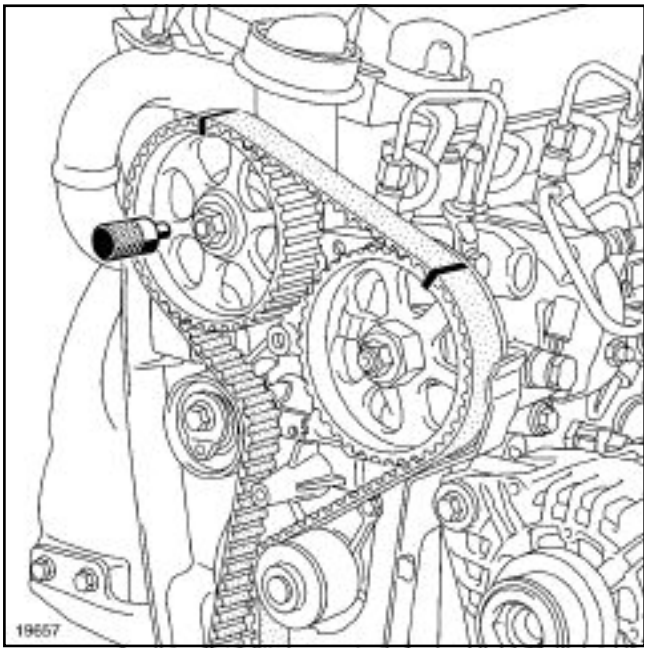


Refit:

- the crankshaft timing sprocket,
- the timing tensioning roller.

Put the tensioning roller spigot (**2**) in the cylinder head groove (**3**) .

Engage the pin **(Mot. 1430)** in the camshaft pulley and cylinder head holes at (**4**) . Turn the camshaft using an **18 mm** offset wrench if necessary.

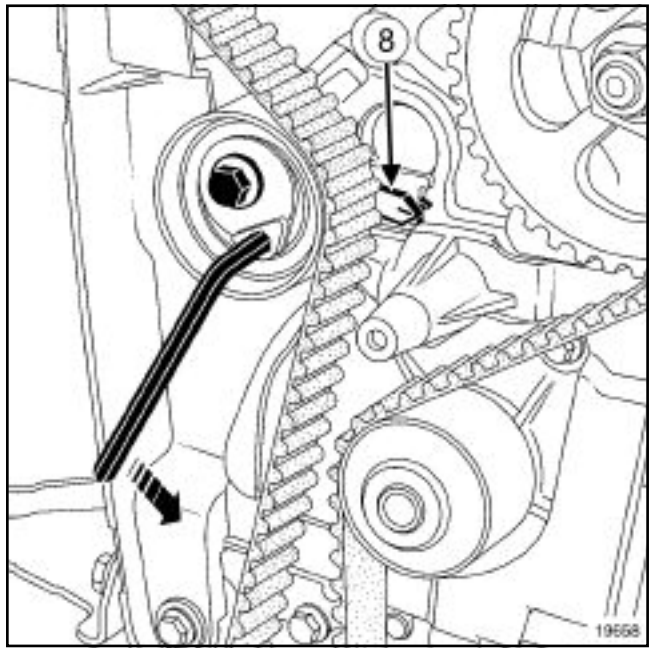


Check that the mark on the high-pressure pump pulley (**6**) is opposite the bolt head (**5**) .

14489

Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft groove ***(7)*** must face upwards).

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19657

Fit the timing belt, starting with the crankshaft sprocket, aligning the marks on the belt with those on the camshaft and high-pressure pump pulleys.

Note:

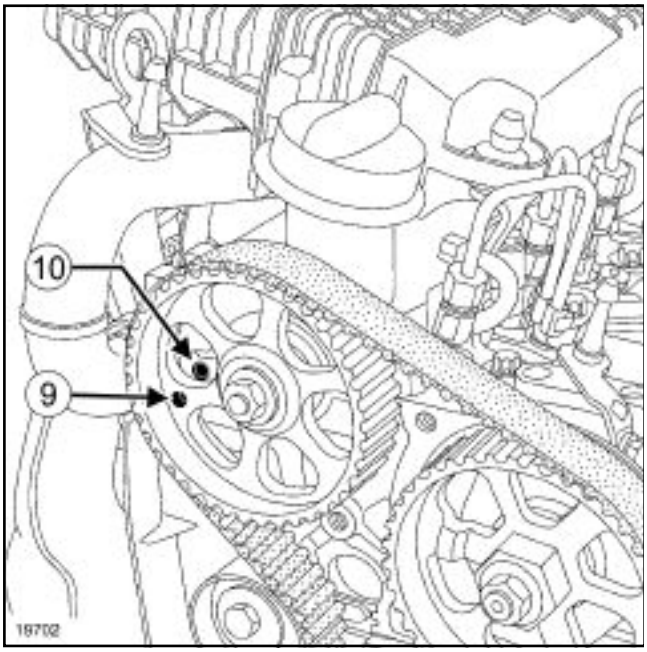
There must be 19 tooth belt grooves between the marks of the high-pressure pump and camshaft pulleys.

19658

Position the tensioning roller adjustable index (**8**) opposite the spigot, turning the eccentric cam anticlockwise using a **6 mm** Allen key.

Tighten to torque the **timing pulley bolt (27 Nm)** .

Refit the accessories crankshaft pulley with a new bolt.



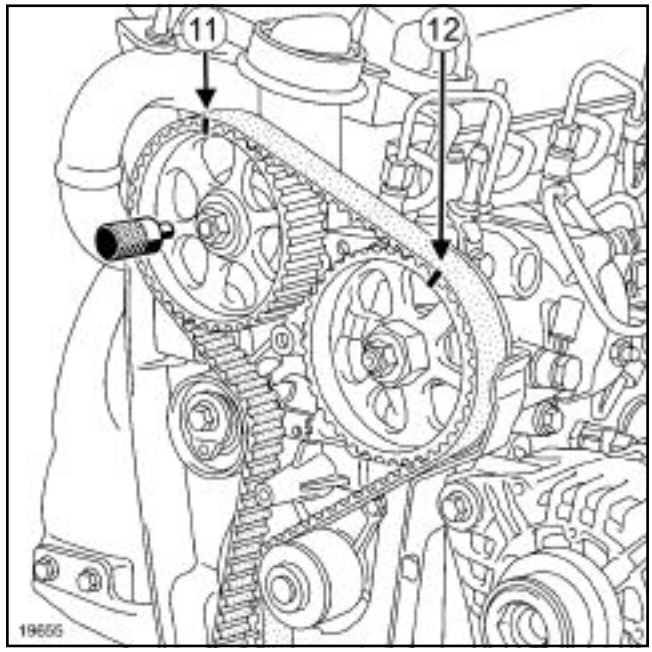
Torque and angle-tighten (crankshaft in contact with the TDC setting pin):

- **the crankshaft accessories pulley M12 bolt (60 Nm + 100° ± 10°)** ,
- **the crankshaft accessories pulley M14 bolt (120 Nm + 95° ± 15°)**

Remove the following tools:

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** ,
- the TDC setting pin **(Mot. 1489)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19702

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

19655

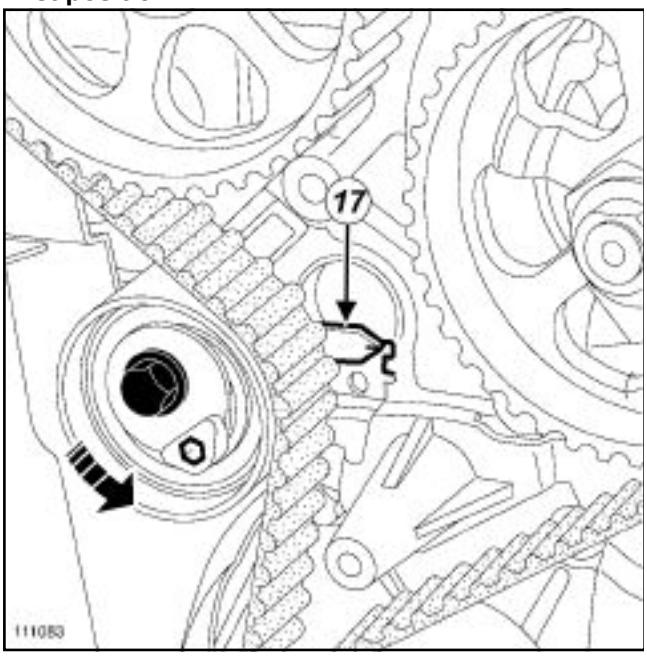
Set the camshaft pulley using the **(Mot. 1430)** .

Note:

There must be **19 tooth belt grooves** between the camshaft pulley marks (**11**) and the high-pressure pump pulley (**12**)

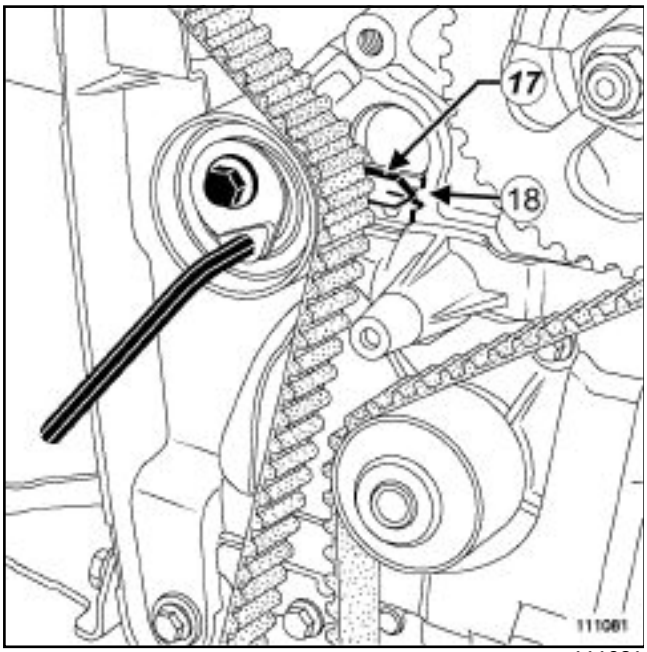
Remove:

- the TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .



Note:

After two turns, the tensioning roller index markers may be in two different positions.

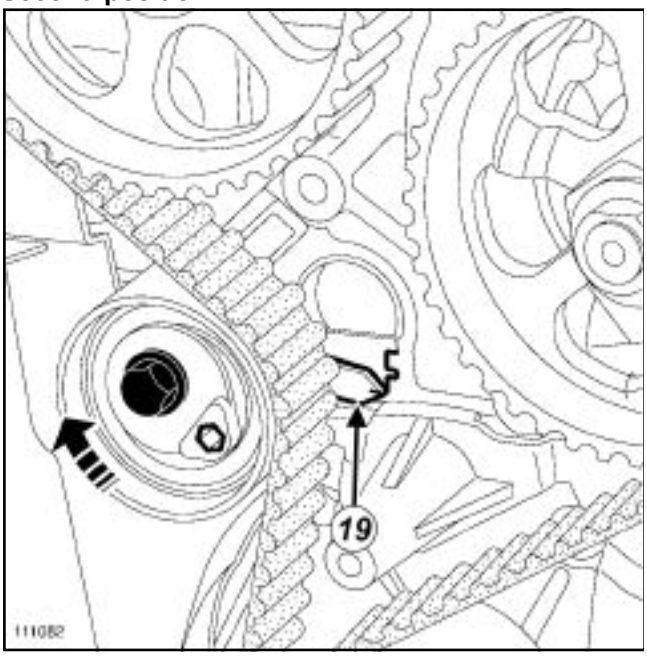


The rotation of the tensioning roller eccentric cam depends on the position.

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

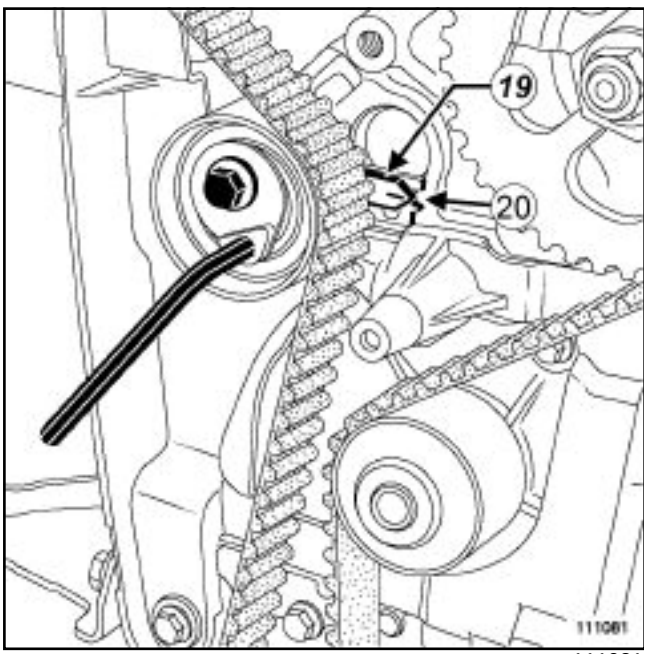
First position

111083



111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.



Gradually align the adjustable index (**17**) in the middle of the timing window (**18**) , turning the key anti-clockwise.

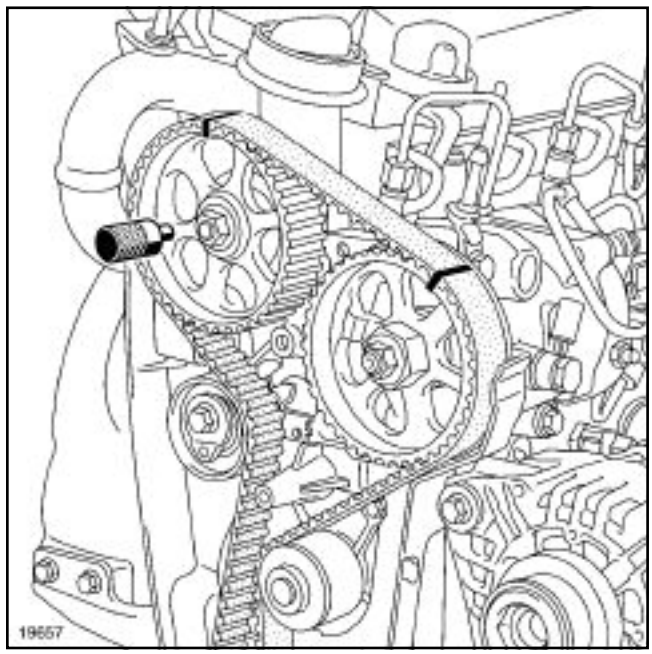
K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

Second position

111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.



Gradually align the adjustable index (**19**) in the middle of the timing window (**20**) , turning the key clockwise.

Tighten to torque the **tensioning roller bolt to (27 Nm)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

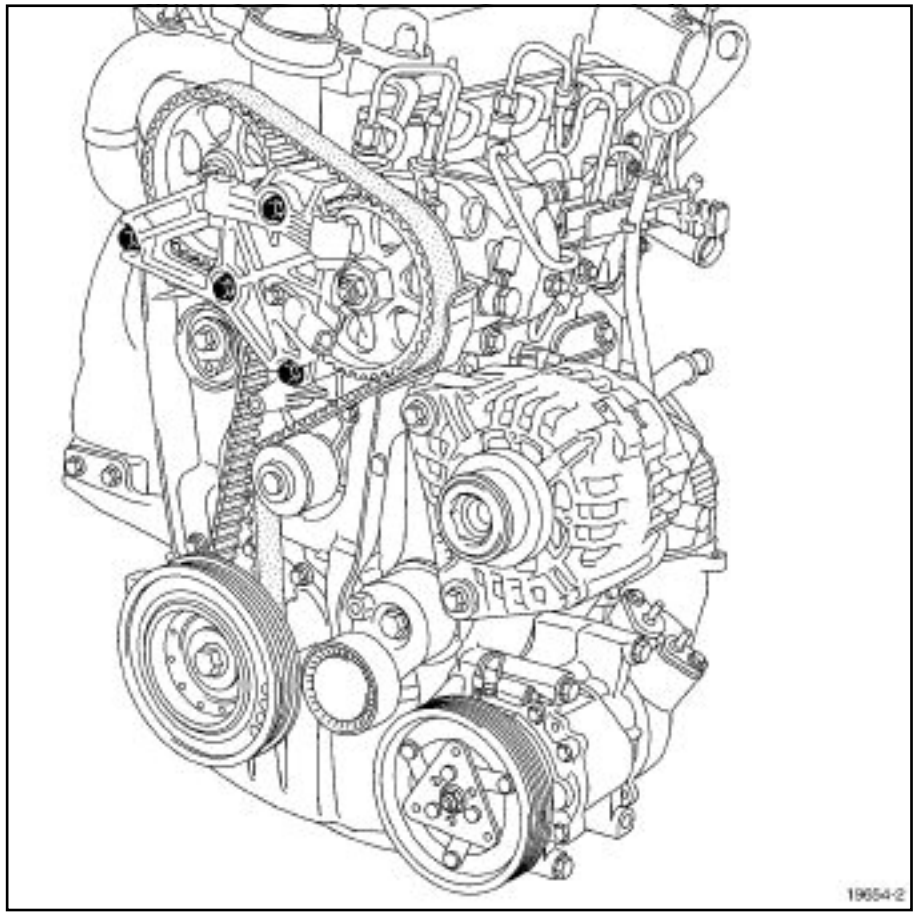
Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

19657

Set the camshaft pulley using the **(Mot. 1430)** .

If this is not possible, repeat the timing belt refitting operation.



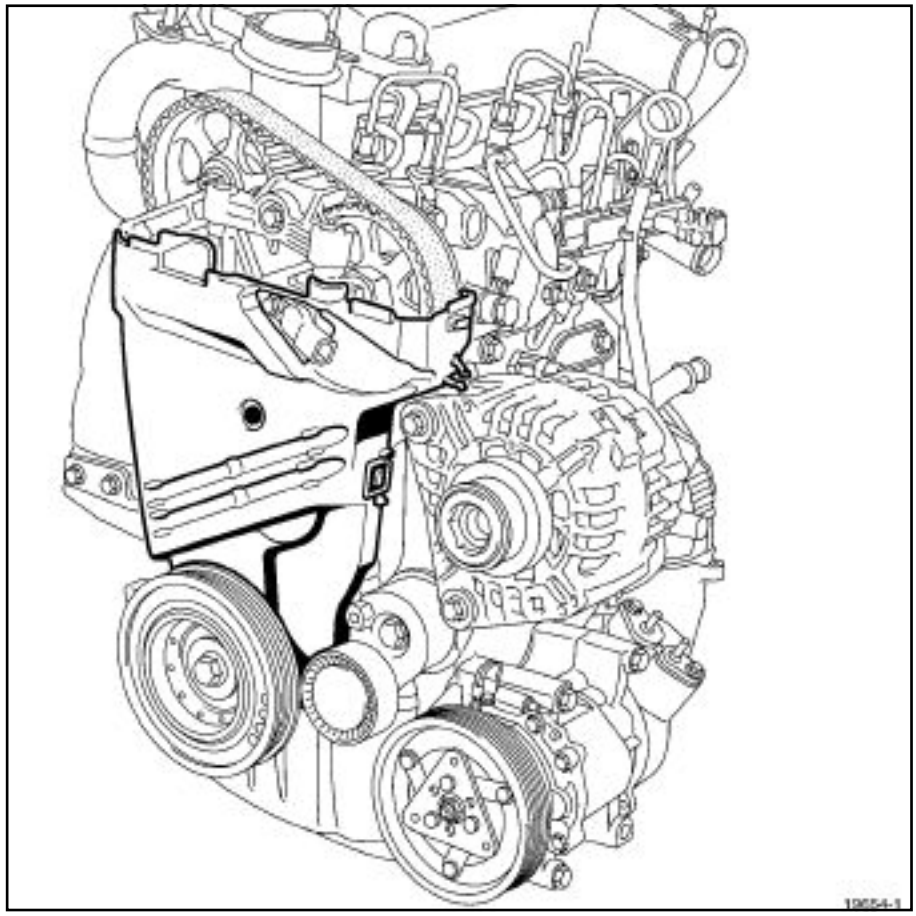
Remove the following tools:

- TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)**

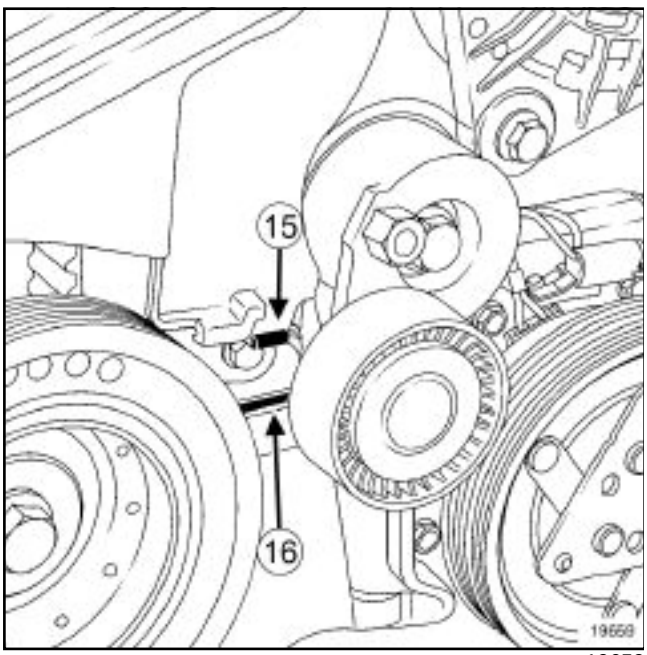
Place a drop of **SILICONE ADHESIVE SEALANT** on the threading of the TDC pin plug.

Tighten to torque the **TDC cap (20 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



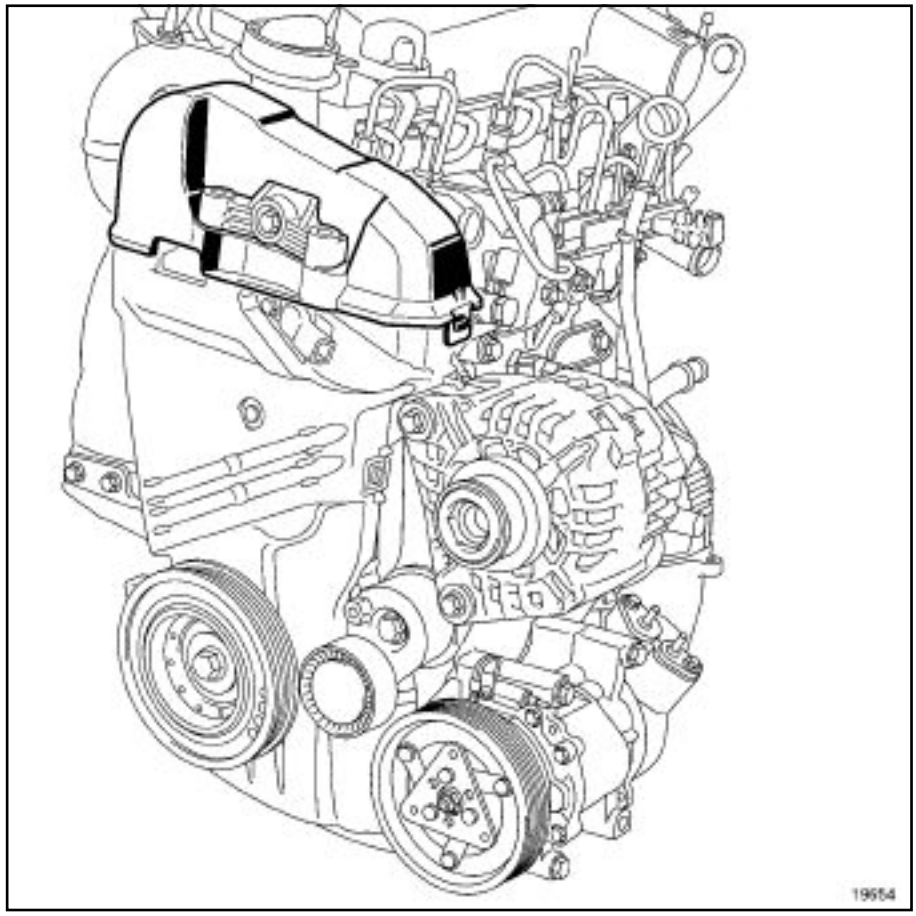
19654-2



Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolt (21 Nm)** .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790



19654-1

19659

Refit the timing cover, positioning the tab (**15**) in the inner timing cover hole (**16**) .

K9K, and 260 or 270 or 272 or 700 or 702 or 704 or 706 or 710 or 712 or 722 or 724 or 728 or 729 or 750 or 752 or 760 or 762 or 790

19654

Refit the high-pressure pump position sensor.

Tighten to torque the **high-pressure pump position sensor bolt (8 Nm)** .

Refit the upper timing cover.

Timing belts: Refitting

K9K, and 732 or 764

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1489	TDC locating pin.

Tightening torques ▽	
tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14 ± 1.4 Nm**
the tensioning roller bolt	**27 ± 2.7 Nm**
the camshaft pulley wheel bolts	**14± 1.4 Nm**
the crankshaft accessories pulley M14 bolt	**120 ± 12 Nm + 95° ± 15°**
TDC pin plug	**20 ± 2 Nm**
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**
cylinder head suspended mounting bolts	**21 ± 2.1 Nm**

I - RECOMMENDATIONS FOR REPAIR

IMPORTANT
Wear protective gloves during every operation.

WARNING
The belt must be replaced with a new one if it has been removed.

Never turn the engine in the opposite direction to its normal operating direction.

Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

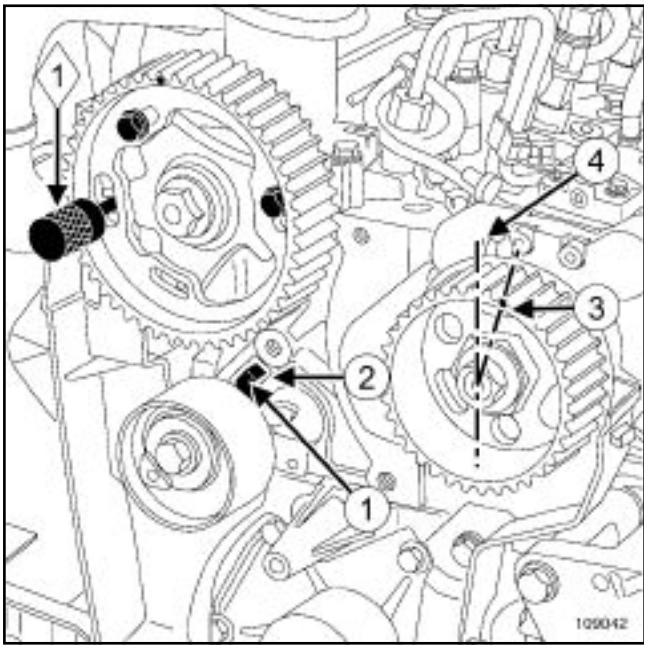
When replacing the belt, always replace the tensioning rollers and fixed rollers.

II - PARTS AND CONSUMABLES FOR THE REPAIR

Parts always to be replaced

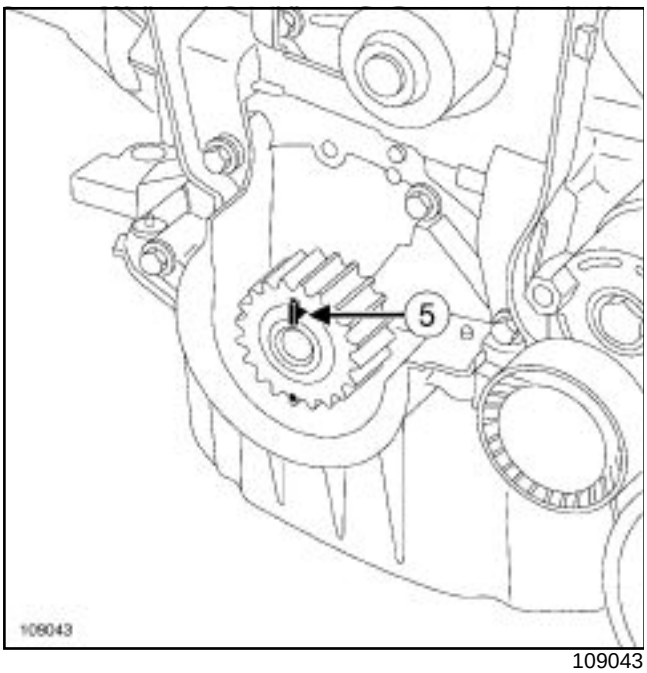
- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

Consumables



- Silicone adhesive sealant, part no. **77 11 227 484**

III - ESSENTIAL EQUIPMENT

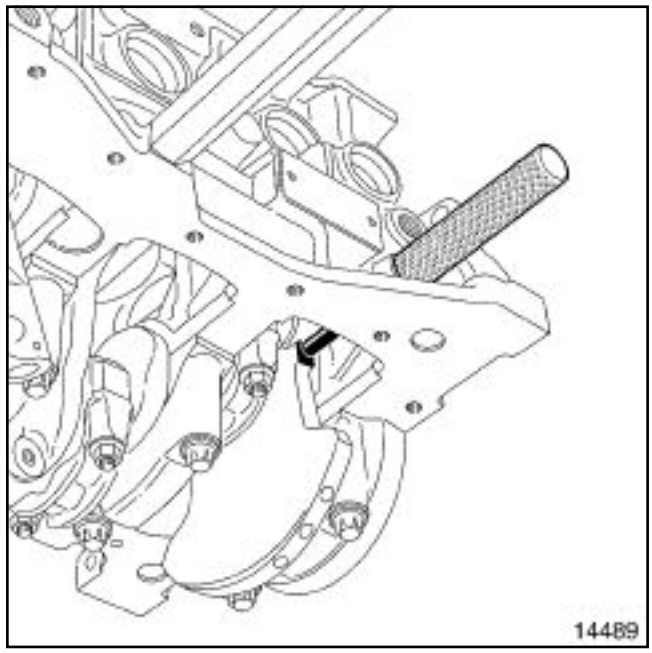


- Protective gloves,
- Allen key (**6 mm**),
- Female torx socket (**14**),
- Offset wrench (**18 mm**),
- Torque/angle wrench,
- Torque wrench
- Cylinder head bolt tightening gauge (angular measuring type).

K9K, and 732 or 764

IV - REFITTING

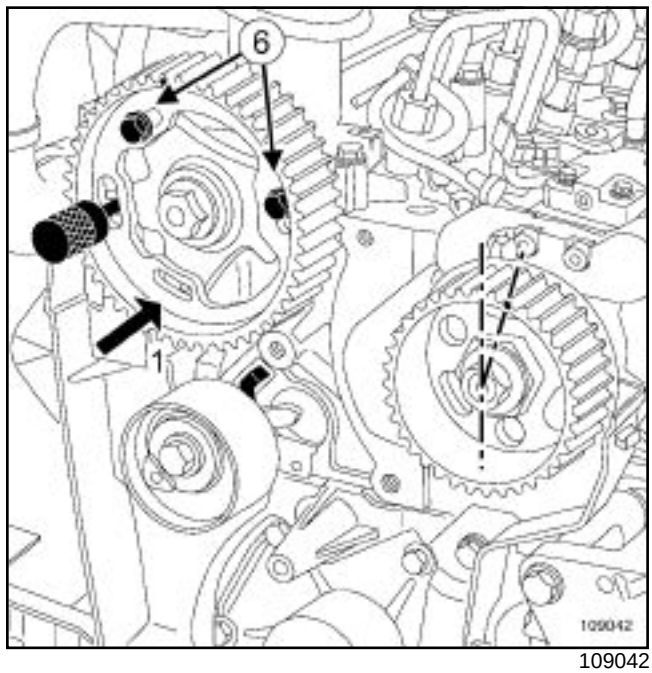
109042



109043

Refit the timing tensioning roller.

Put the tensioning roller spigot (**1**) in the cylinder head groove (**2**) .

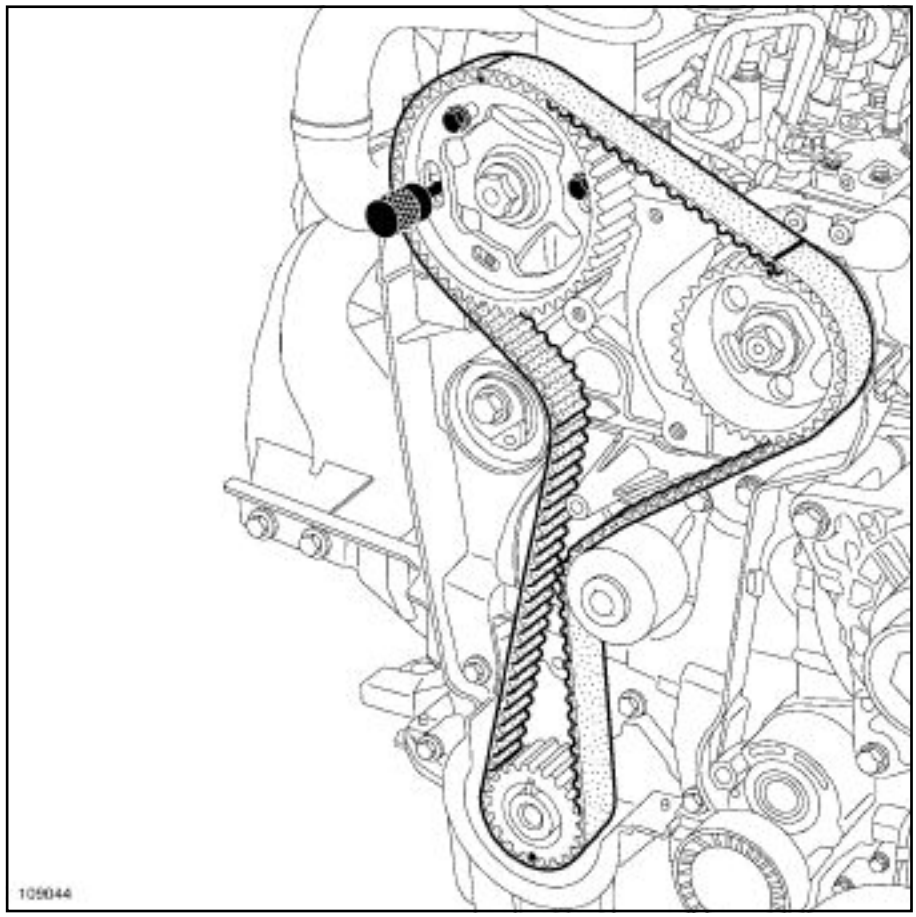


Engage the pin (**1**) **(Mot. 1430)** in the holes of the camshaft pulley and cylinder head, turning the camshaft using an **18 mm** offset wrench if necessary.

Check that the high-pressure pump mark (**3**) has shifted one tooth to the right of the vertical axle (**4**) .

14489

Position the crankshaft so that it presses on the TDC setting pin **(Mot. 1489)** (the crankshaft timing sprocket cotter ***(5)*** must face upwards).

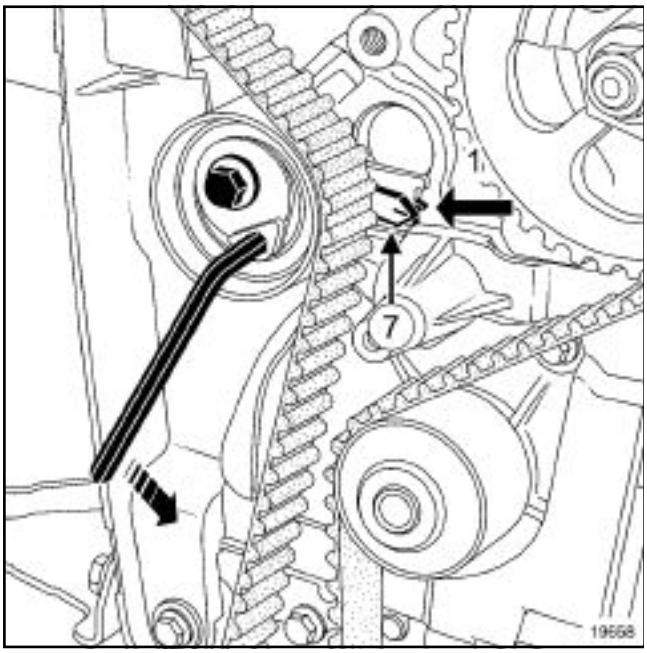


109042

Remove one bolt from the camshaft pulley wheel.

Loosen the two other camshaft pulley wheel bolts (**6**) by one turn.

K9K, and 732 or 764

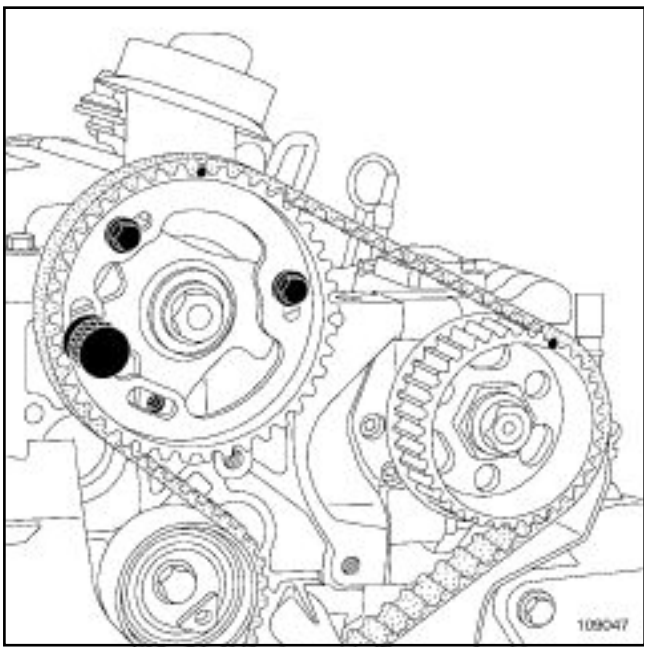


109044

Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft sprockets, the camshaft and the high-pressure pump.

Note:

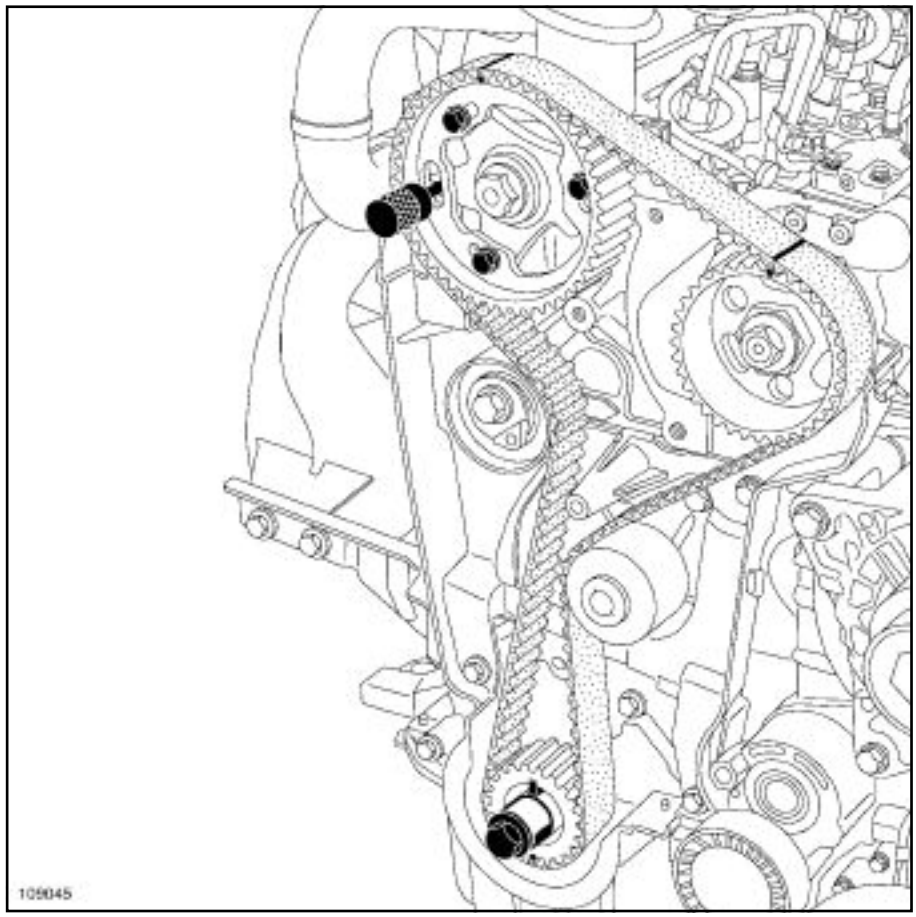
There should be 19 tooth belt grooves between the camshaft sprocket marks and the high-pressure pump, and 51 tooth belt grooves between the crankshaft sprockets and the high-pressure pump.



K9K, and 732 or 764

19658

Position the tensioning roller adjustable index (**7**) opposite the spigot, turning the eccentric cam anticlockwise using a **6 mm** Allen key.

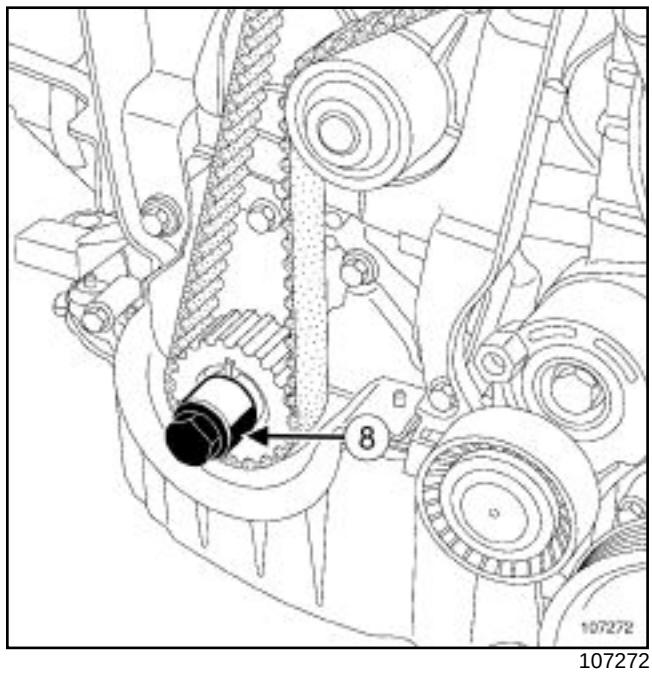


Tighten to torque the **tensioning roller bolt (27 ± 2.7 Nm)** .

109047

Check that the camshaft pulley hub bolts are not fully up against the camshaft pulley wheel.

K9K, and 732 or 764

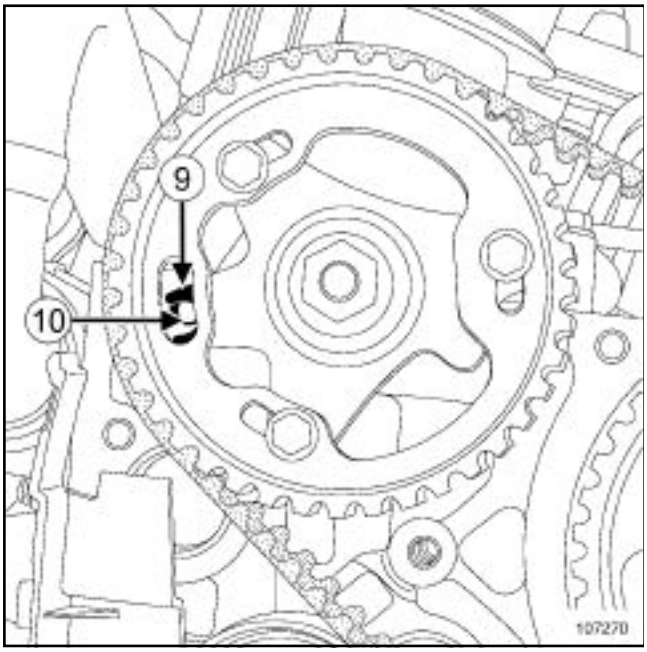


109045

Refit the bolt to the camshaft pulley wheel.

Tighten to torque **the camshaft pulley wheel bolts (14 ± 1.4 Nm)** .

Remove:

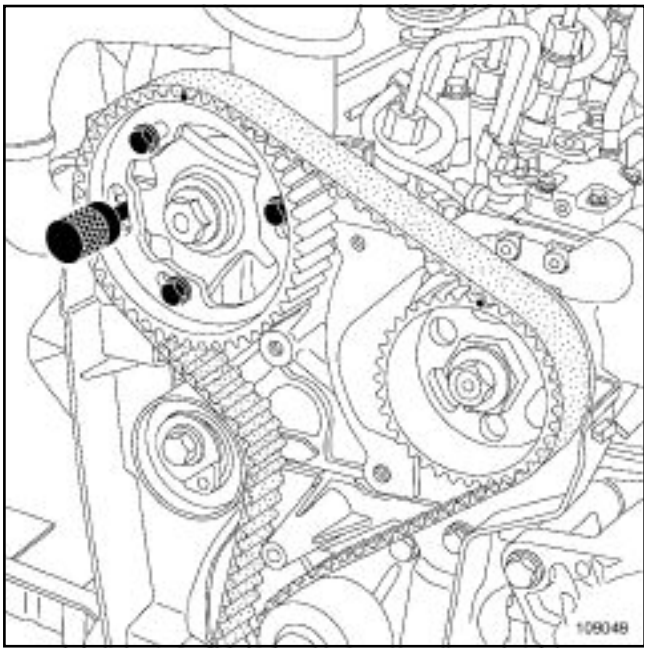


- the TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

107272

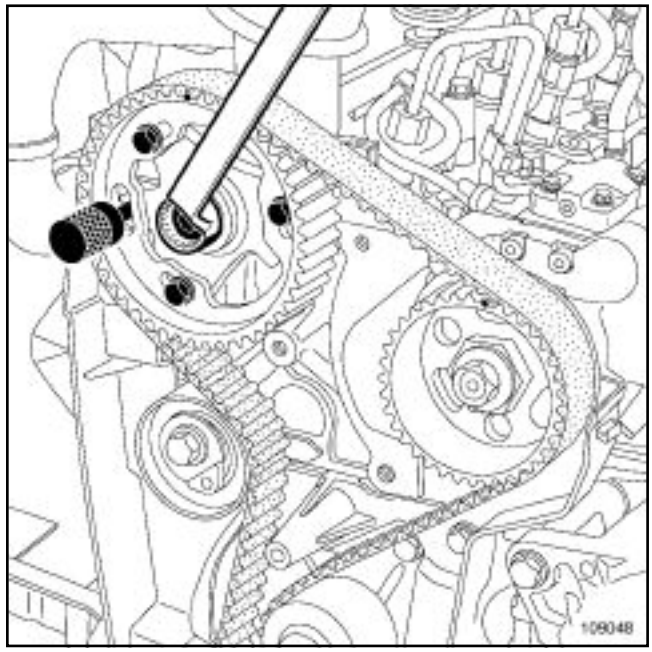
Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**8**) onto the crankshaft.

K9K, and 732 or 764



107270

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole (**9**) is opposite the cylinder head hole (**10**) .



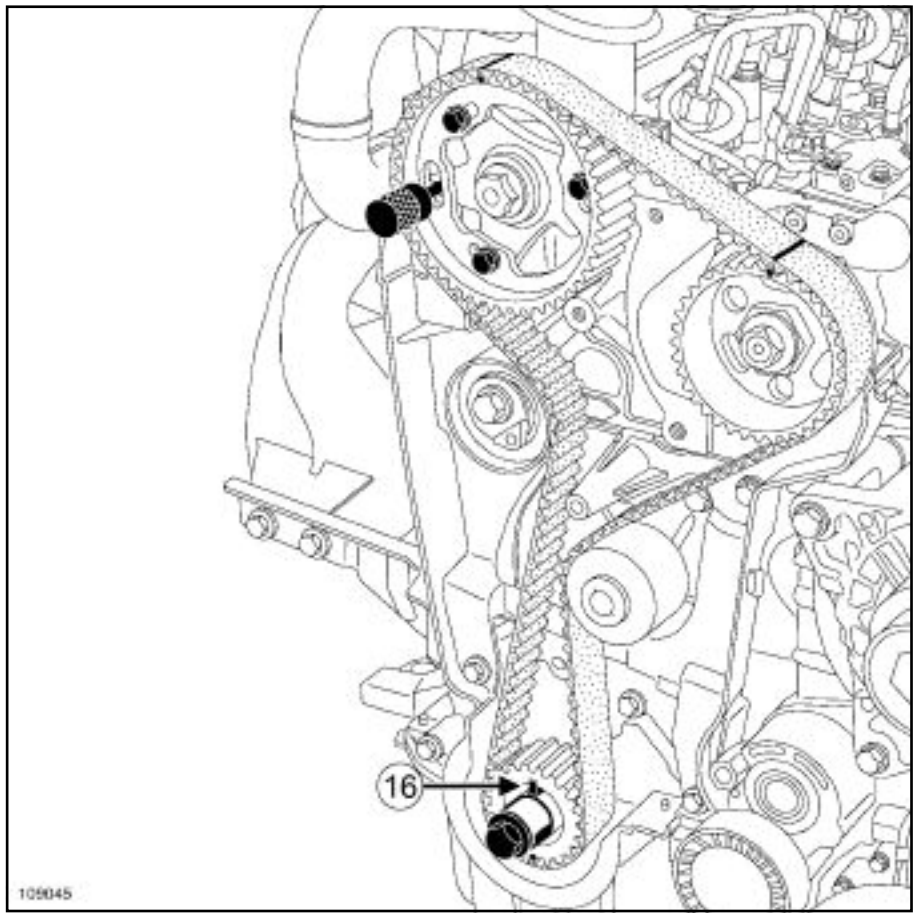
Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.

Bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

Set the camshaft pulley using the **(Mot. 1430)** .

109048



If the pin **(Mot. 1430)** does not engage:

loosen the camshaft pulley wheel bolts by one turn at most,

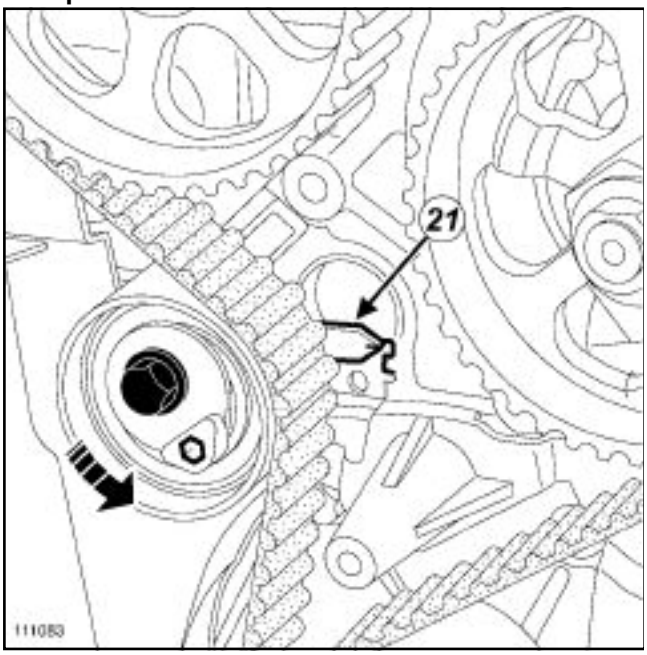
Turn the camshaft pulley hub using an **18 mm** offset wrench to set the camshaft pulley hub timing.

Do not retighten the camshaft pulley wheel bolts.

K9K, and 732 or 764

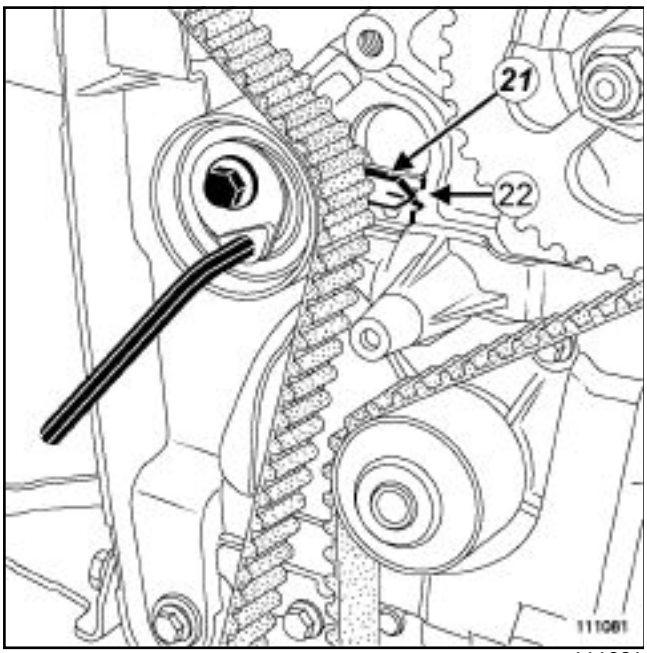
109045

Check that the crankshaft timing sprocket cotter (**16**) is positioned vertically at the top



Note:

After two turns, the tensioning roller index markers may be in two different positions.

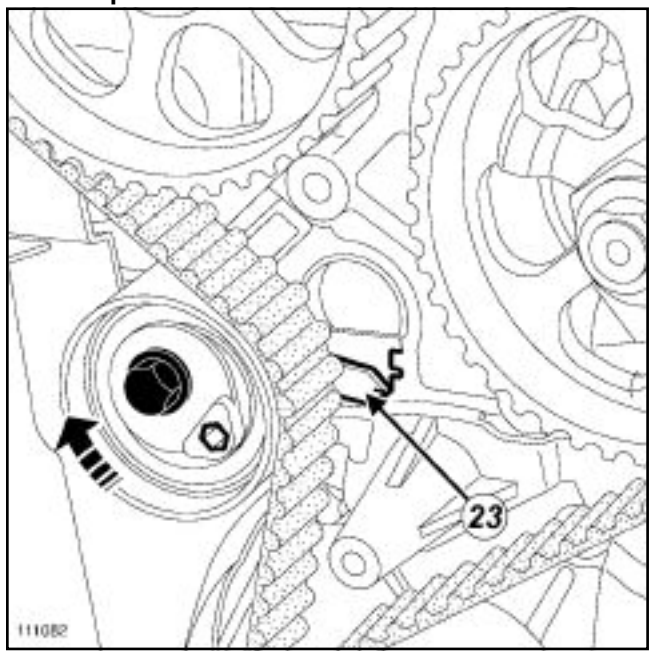


The rotation of the tensioning roller eccentric cam depends on the position.

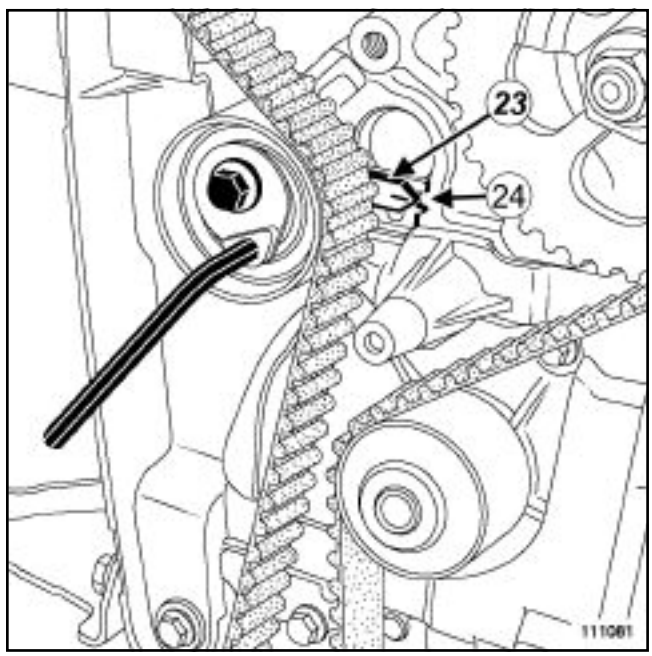
K9K, and 732 or 764

First position

111083



111081



Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

Gradually align the adjustable index (**21**) in the middle of the timing window (**22**) , turning the key anticlockwise.

Second position

111082

111081

Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

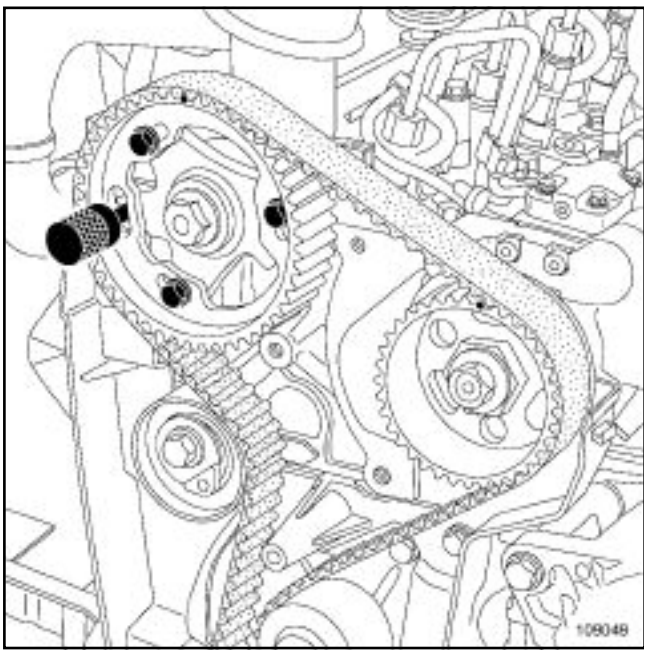
Gradually align the adjustable index (**23**) in the middle of the timing window (**24**) , turning the key clockwise.

Tighten to torque:

- **the tensioning roller bolt (27 ± 2.7 Nm)** ,
- **the camshaft pulley wheel bolts (14± 1.4 Nm)** .

Remove the following tools:

- TDC setting pin **(Mot. 1489)** ,

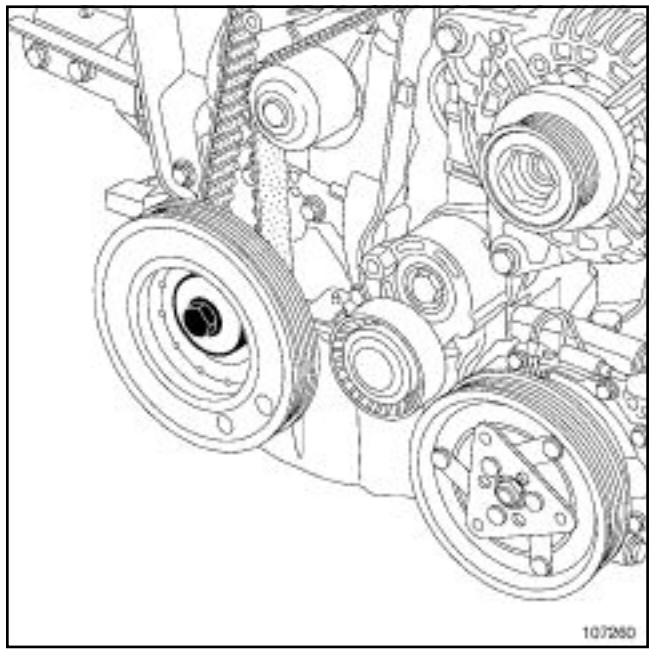


K9K, and 732 or 764

- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Rotate the crankshaft clockwise through two revolutions (timing end), before the camshaft pulley hole is opposite the cylinder head hole.

Screw the TDC setting pin **(Mot. 1489)** into the cylinder block.



Bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

Set the camshaft pulley using the **(Mot. 1430)** .

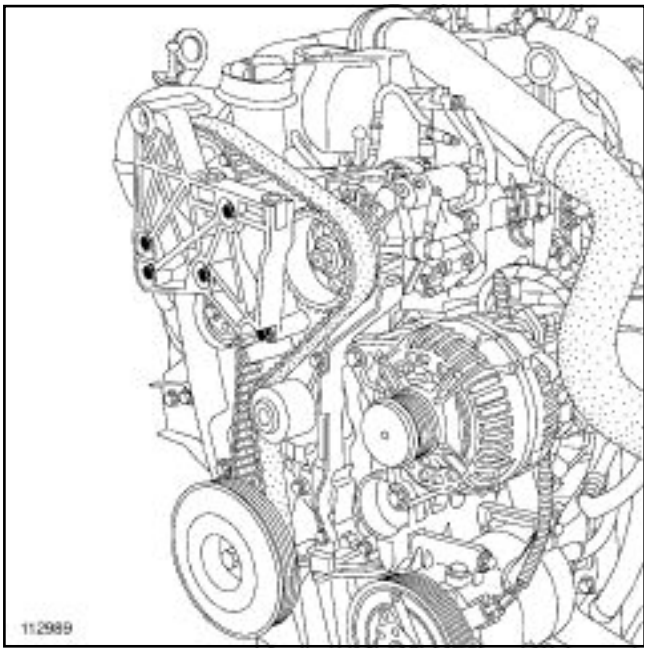
If this is not possible, repeat the timing belt refitting operation.

107260

Refit the accessories crankshaft pulley with a new bolt.

Tighten to torque and angle (crankshaft in contact with the TDC setting pin) **the crankshaft accessories pulley M14 bolt (120 ± 12 Nm + 95° ± 15°)** .

Remove the following tools:



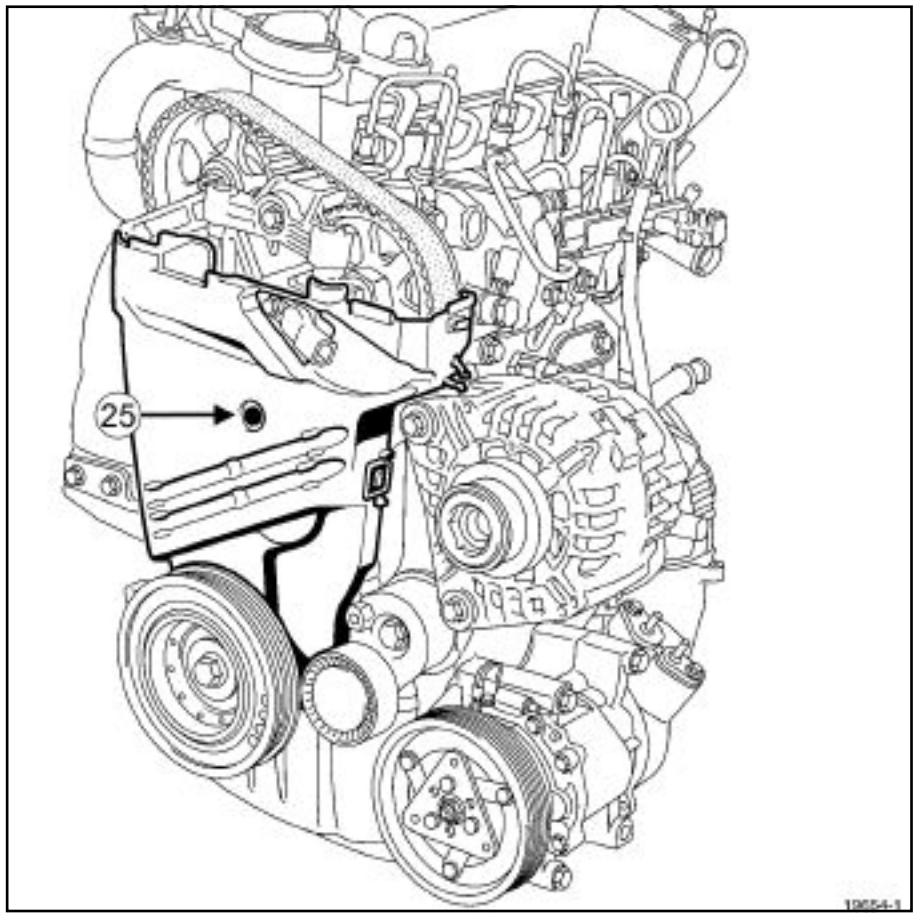
- TDC setting pin **(Mot. 1489)** ,
- the set of 5 timing pins for the camshaft and crankshaft pulleys **(Mot. 1430)** .

Refit the TDC pin plug, coating the thread with **SILICONE ADHESIVE SEALANT** .

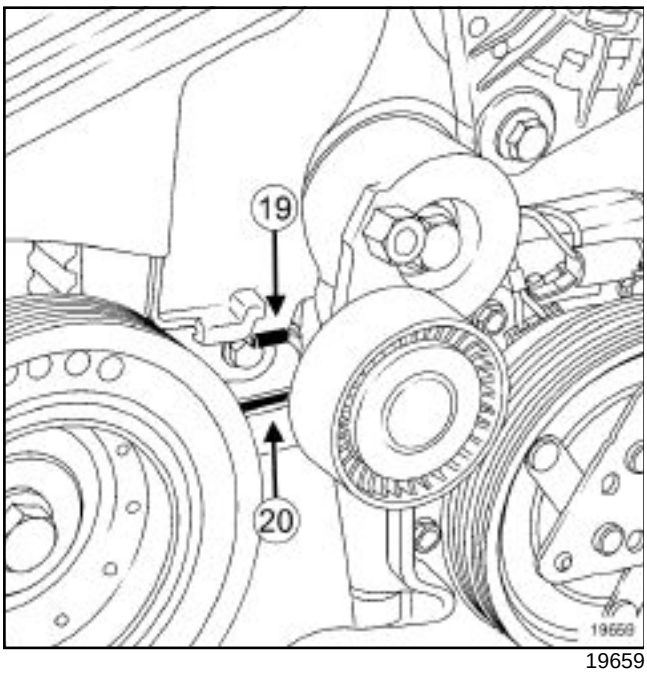
Tighten to torque the **TDC pin plug (20 ± 2 Nm)** .

K9K, and 732 or 764

K9K, and 732



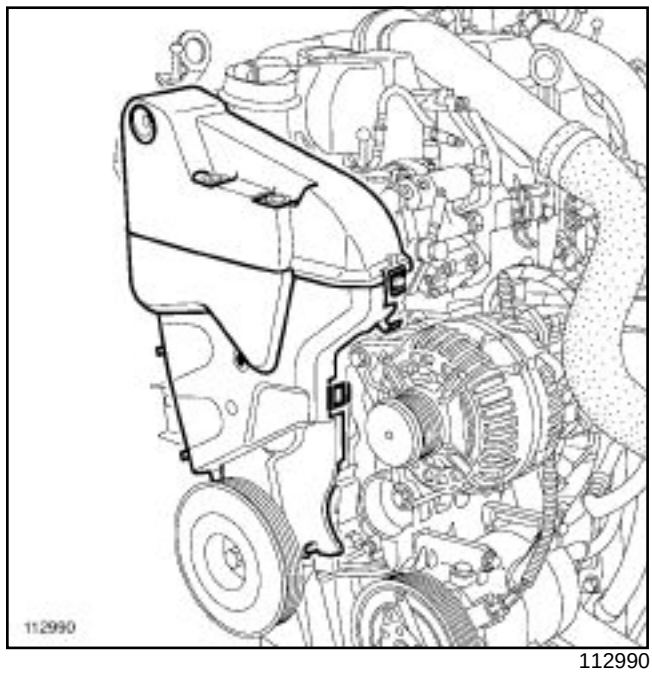
112989



Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

K9K, and 732 or 764

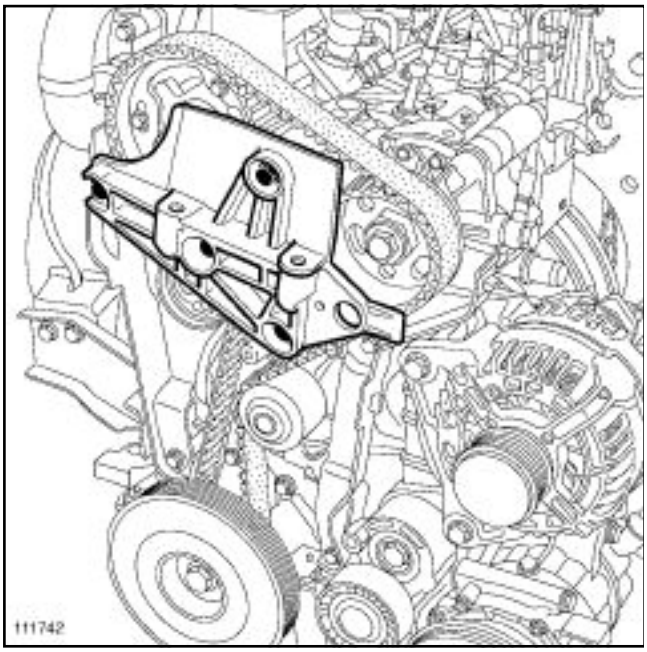


19654-1

19659

Refit:

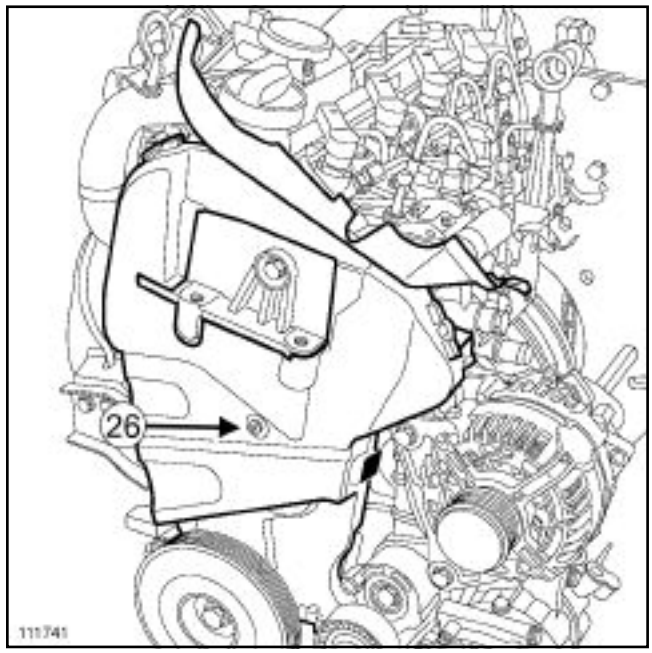
- the lower timing cover, positioning the tab (**19**) in the inner timing cover hole (**20**) ,
- the timing cover plastic bolt (**25**) .



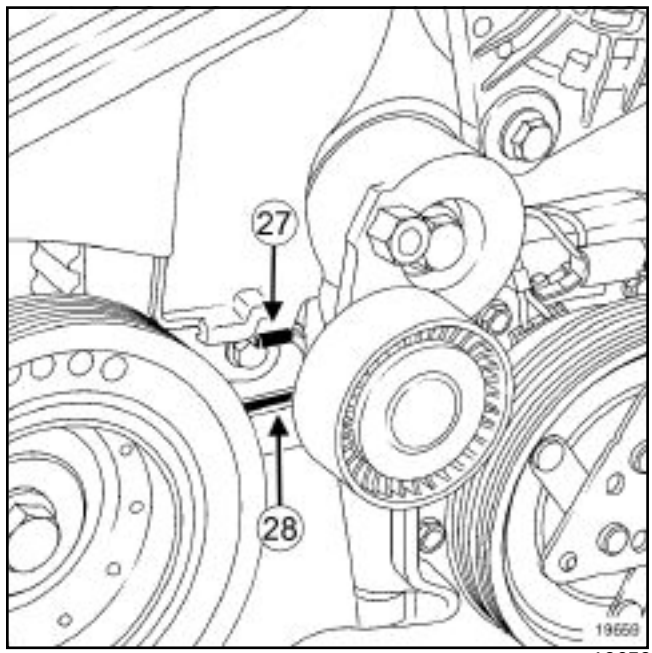
112990

Refit the upper timing cover.

K9K, and 732 or 764



K9K, and 764



111742

Refit the cylinder head suspended mounting.

Tighten to torque the **cylinder head suspended mounting bolts (21 ± 2.1 Nm)** .

111741

19659

Refit:

- the timing cover, positioning the tab (**27**) in the inner timing cover hole (**28**) ,
- the timing cover plastic bolt (**26**) .

10 ENGINE AND PERIPHERALS

Cleanness & Safety	10-1
Foreword	10-7
Engine identification	10-8
Tightening torques (in daNm or degrees)	10-10
Technical specifications	10-12
Standard exchange	10-31
Essential special tooling	10-32
Essential equipment	10-36
Engine overhaul	10-37

CLEANLINESS INSTRUCTIONS WHICH MUST BE FOLLOWED WHEN WORKING ON THE HIGH PRESSURE DIRECT INJECTION SYSTEM

Risks relating to contamination

The system is very sensitive to contamination. The risks caused by the introduction of contamination are:
– damage to or destruction of the high pressure injection system,
– seizing or leaking of a component.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) must be allowed to enter the system during dismantling or into the circuits via the fuel unions.

The cleanliness principle must be applied from the filter to the injectors.

WHAT ARE THE SOURCES OF CONTAMINATION?

Contamination is caused by:
– metal or plastic chips,
– paint,
– fibres,
  - of cardboard,
  - brushes,
  - paper,
  - clothing,
  - cloths.
– foreign bodies such as hairs,
– ambient air,
– etc.

IMPORTANT: it is forbidden to clean the engine using a high pressure washer because of the risk of damaging connections. Also the moisture may collect in the connectors and cause electrical connection problems.

INSTRUCTIONS TO BE FOLLOWED BEFORE ANY WORK IS CARRIED OUT ON THE INJECTION SYSTEM

- Ensure that you have the plugs for the unions to be opened (bag of plugs sold by the Parts Stores - Part no.: **77 01 206 804**).
  Plugs are to be used once only. After use, they must be thrown away (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be thrown away.

- Ensure that you have the resealable plastic bags for storing removed parts. There is less risk of parts stored in this way being exposed to contamination. The bags must be used only once, and after use they must be thrown away.

- Make sure that lint-free cleaning cloths are available (cleaning cloths part number **77 11 211 707**). **The use of conventional cloth or paper is prohibited.** These are not lint-free and may contaminate the fuel circuit of the system. Each lint-free cloth should only be used once.

CLEANING INSTRUCTIONS TO BE FOLLOWED BEFORE CARRYING OUT ANY WORK ON THE FUEL SYSTEM

- For each operation, use new thinner (used thinner contains impurities). Pour it into a clean receptacle.

- For each operation, use a clean brush which is in good condition (the brush must not shed its bristles).

- Use a brush and thinners to clean the connections to be opened.

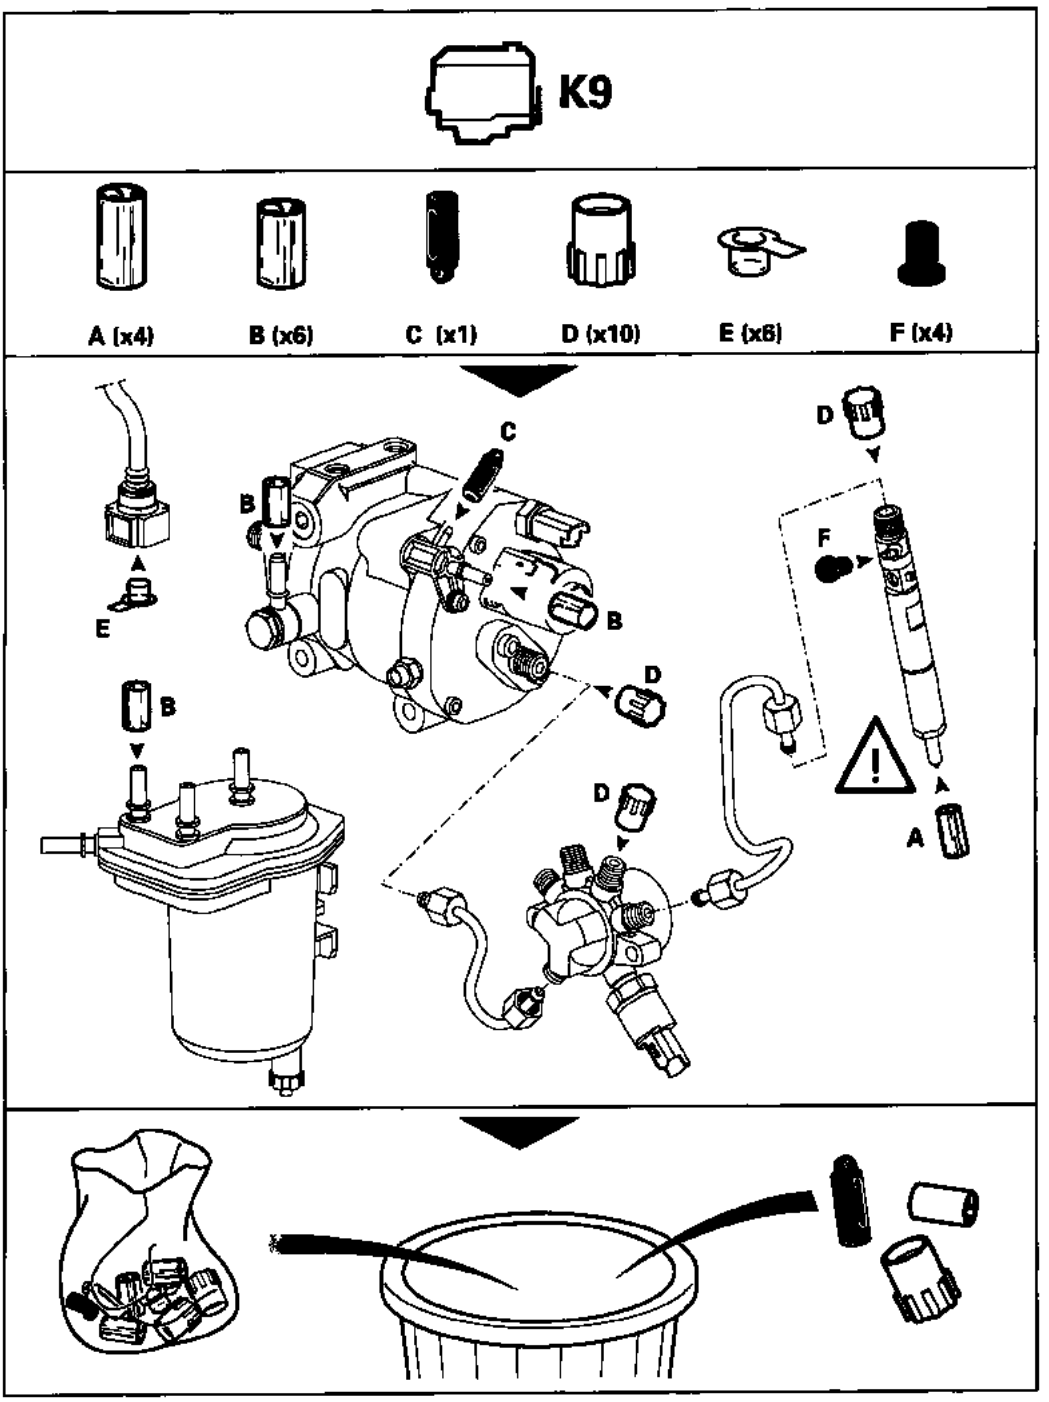
- Blow compressed air over the cleaned parts (tools, bench and parts, connections and injection system zone). Check that no bristles remain adhered.

- Wash your hands before and during the operation if necessary.

- When wearing leather protective gloves, cover these with latex gloves.

INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

- As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the **Parts Stores** (part number **77 01 206 804**). They must not, under any circumstances, be reused .



- Close the hermetically sealed bag, even if it has to be reopened shortly afterwards. Ambient air carries contamination.

- All components of the injection system that are removed must be stored in a hermetically sealed plastic bag once the plugs have been inserted.

- The use of a brush, thinner, bellows, sponge or normal cloth is strictly forbidden once the circuit has been opened. In fact, these items are likely to result in impurities entering the system.

- A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

INSTRUCTIONS FOR FITTING THE PLUGS (part number **77 01 206 804**)

20977

IMPORTANT

- **The engine must not run with:**
  - **– diesel containing more than 10% diester,**
  - **– petrol, even in very small amounts.**

- **The system can inject the diesel into the engine at a pressure of up to 1400 bars. Before carrying out any work, check that the injector rail is no longer pressurised and that the fuel temperature is not too high.**

- **You must respect the cleaning and safety advice specified in this document for any work on the high pressure injection system.**

- **Removal of the interior of the pump and injectors is prohibited. Only the flow actuator, the diesel temperature sensor and the venturi may be changed on the pump.**

- **For safety reasons, it is strictly forbidden to undo a high pressure pipe union when the engine is running.**

- **It is forbidden to remove the pressure sensor from the fuel rail because this may cause contamination problems. If the pressure sensor develops a fault, the pressure sensor, fuel rail and the five high pressure pipes must be replaced.**

- **It is strictly forbidden to remove any high pressure pump pulley bearing the part no. 070 575. The pulley must be replaced when the high pressure pump is replaced.**

- **It is forbidden to repair the wiring connecting the accelerometer and the engine speed sensor. If the wiring should fail, it has to be replaced with new wiring.**

- **Applying 12 volts directly to any component in the system is prohibited.**

- **Ultrasonic decoking and cleaning are prohibited.**

- **Never start the engine if the battery is not connected correctly.**

- **Disconnect the injection system computer when carrying out any welding work on the vehicle.**

- **All disconnected plastic air inlet hoses must be replaced.**

A 16 character code called C2I (Individual Injector Corrector) is marked on the injectors. This code, specific to each injector, takes into account any manufacturing variations and specifies the flow injected by each injector.

The code of the new injector must be programmed into the computer when injector is replaced.

The code of the four injectors must be programmed into the computer when the computer is replaced.

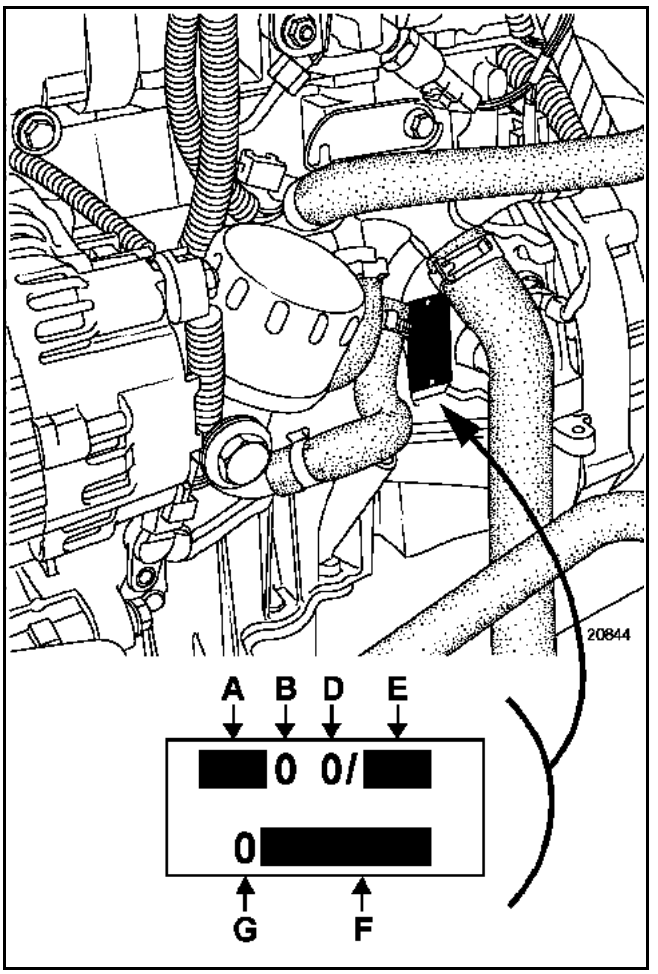
There are two possibilities:

- **If it is possible to communicate with the computer:**
  - **Upload the data from the computer into the diagnostic tool,**
  - **change the computer,**
  - **download the data from the diagnostic tool to the computer.**
  - **Using the diagnostic tool, ensure that the computer has not detected faults relating to the injector codes and check that the instrument panel warning light is off.**

- **If it is not possible to communicate with the computer:**
  - **Change the computer,**
  - **read the data on the injectors,**
  - **store the data in the computer using the diagnostic tool.**
  - **Using the diagnostic tool, ensure that the computer has not detected faults relating to the injector codes and check that the instrument panel warning light is off.**

USING THE MANUAL

There are two main sections in this manual:
– **technical specifications,**
– **overhauling the engine.**



To repair a component on the vehicle, refer to the vehicle's Workshop Repair Manual and Technical Notes.

UNITS OF MEASUREMENT

– All dimensions are expressed in millimetres **mm** (unless otherwise stated).
– Tightening torques are expressed in decanewton-metres **daNm** (reminder: **1 daNm = 1.02 kgm**).
– Pressures are expressed in bar (reminder: **1 bar = 100 000 Pa**).

TOLERANCES

Tightening torques given without a tolerance must be accurate to within:
– in **degrees (± 3º).**
– in **daNm (± 10 %).**

Identification is by means of an engraved plate on the cylinder block which carries:
– A: engine type,
– B: engine type approval letter,
– D: Renault code,
– E: engine suffix,
– F: engine fabrication number,
– G: engine assembly plant.

Engine	Suffix	Compression ratio	Bore (mm)	Stroke (mm)	Cubic capacity (cc)
K9K	700 - 702 704 - 710	18.25/1	76	80.5	1461

UPPER ENGINE

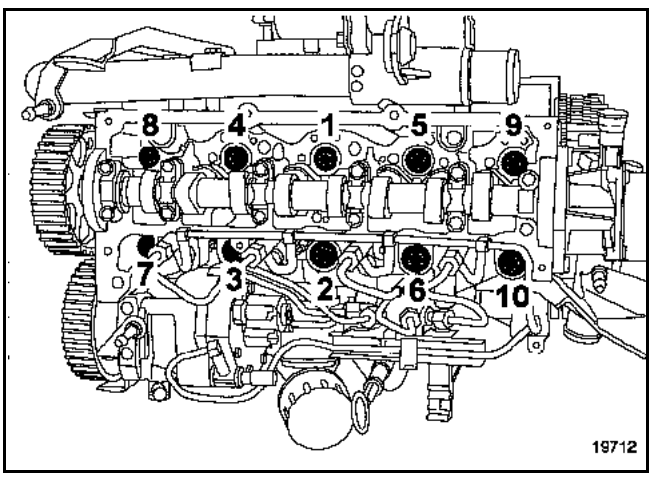
Description	Tightening torques
Cylinder head	*
Camshaft bearings	1
Camshaft pulley	3 + 84°
Vacuum pump	2.1
Cylinder head coolant outlet unit	1
Exhaust manifold	2.6
Exhaust gas recirculation valve	2.1
Pre-heater plugs	1.5
High pressure pump	2.1
Injector flanges	2.8
High pressure rail	2.8
High pressure pipe	3.8
Cylinder head cover	1
Turbo - manifold mounting	2.6
Turbo oil return pipe	0.9
Turbo oil delivery pipe	2.3
Timing tension wheel	2.5
Top dead centre cap	2
Cylinder head suspended mounting support	2.1

* See tightening procedure.

BOTTOM ENGINE:

Description	Tightening torques
Heat exchanger connector	4.5
Oil filter unit bracket	4.5
Crankshaft bearing caps	2.7 + 47° ± 5°
Con rods	2 + 45° ± 6°
Pinking sensor	2
Oil level sensor	2.2
Oil pump	2.5
Engine oil sump	*
Water pump	1.1
Flywheel	5 - 5.5
Clutch mechanism	0.8
Crankshaft accessories pulley	2 + 130° ± 15°
Water pump inlet pipe	2
Multifunction support	4
Alternator	2.1
Power steering pump	2.1
Air conditioning compressor	2.1

* See tightening procedure.



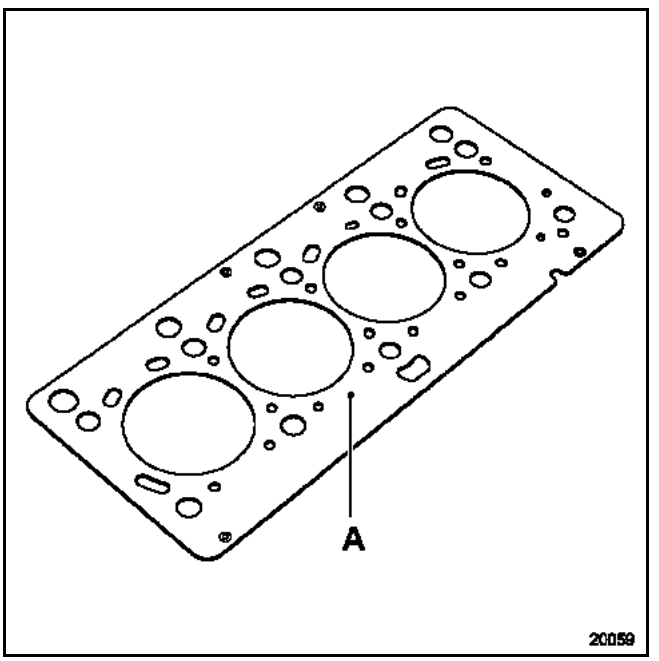
CYLINDER HEAD

Cylinder head tightening procedure

REMINDER: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to achieve correct tightening of the bolts.

All bolts must always be changed after removal. Do not oil the new bolts.

Tighten all the bolts to a torque of **2.5 daN.m**.



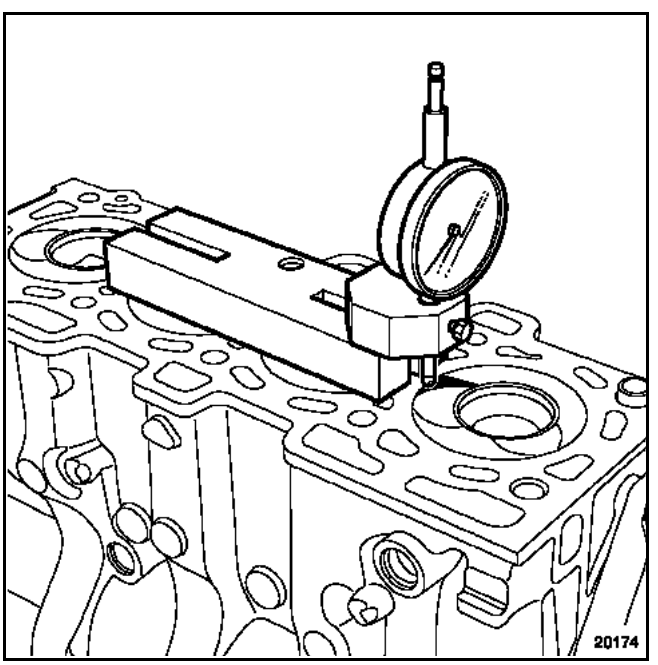
Check that all the bolts are correctly tightened to **2.5 daN.m** then tighten to an angle, **bolt by bolt**, of **255**° ± **10**°.

Do not retighten the cylinder head bolts after performing this procedure.

Thickness of the cylinder head gasket

The thickness of the cylinder head gasket is measured at (A):
– thickness of the gasket when tightened:
0.78 ± 0.3 mm.

Checking piston protrusion



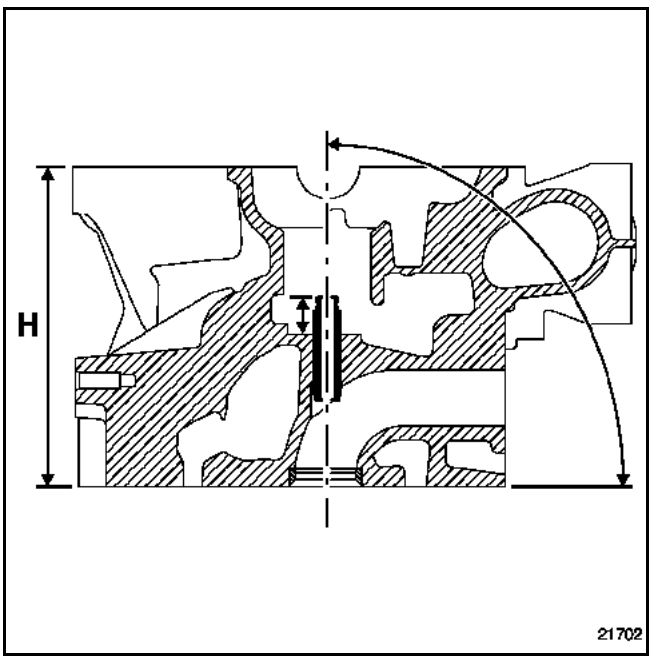
Clean the piston heads in order to eliminate any traces of deposits.

Turn the crankshaft one turn in its operating direction to bring piston no.1 close to **Top Dead Centre.**

Fit tool **Mot. 251-01** equipped with a gauge on its base plate **Mot. 252-01**, and find top dead centre of the piston.

N.B.: All measurements must be carried out along the longitudinal axis of the engine, in order to eliminate any errors due to tilting of the piston.

WARNING: the gauge follower must not be in the valve clearance.



Measure the piston protrusion.

The protrusion must be: **0.192 ± 0.093 mm.**

Height of the cylinder head (in mm)

H = 127

Gasket face bow (**in mm**):

Cylinder head	**0.05**
Cylinder block	**0.03**

NO REGRINDING IS AUTHORISED

Test the cylinder head to detect possible cracks using the cylinder head test tools (comprising a tray and a kit suited to the cylinder head, plug, sealing plate, blanking plate). The approval number of the cylinder head test container is **664 000**.

Valves

Stem diameter (in mm)

Inlet	**5.977 ± 0.008**
Exhaust	**5.963 ± 0.008**

Face angle

Inlet and exhaust:	**90º**

Head diameter (in mm)

Inlet	**33.5 ± 0.12**
Exhaust	**29 ± 0.12**

Valve length (in mm)

Inlet	**100.95 ± 0.22**
Exhaust	**100.75 ± 0.22**

Max. valve lift (in mm)

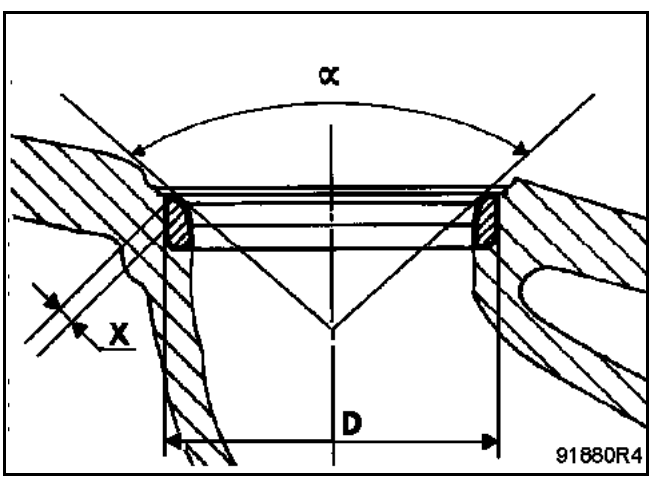
Inlet	**8.015**
Exhaust:	**8.595**

Protrusion of valves in relation to the cylinder head gasket face (in mm)

Inlet and exhaust	**0 ± 0.07**

Valve seats

Seat angle (α)



Inlet and exhaust:	**89° 30'**

Mating surface width (X) (in mm)

Inlet and exhaust:	**1.8**

Seat external diameter (D) (in mm)

Inlet	**34.542 ± 0.008**
Exhaust	**30.042 ± 0.008**

Diameter of the housing in the cylinder head (in mm)

Inlet	**34.459 ± 0.015**
Exhaust	**29.97 ± 0.015**

Valve guides

Length (in mm)

Inlet and exhaust:	**40.5 ± 0.15**

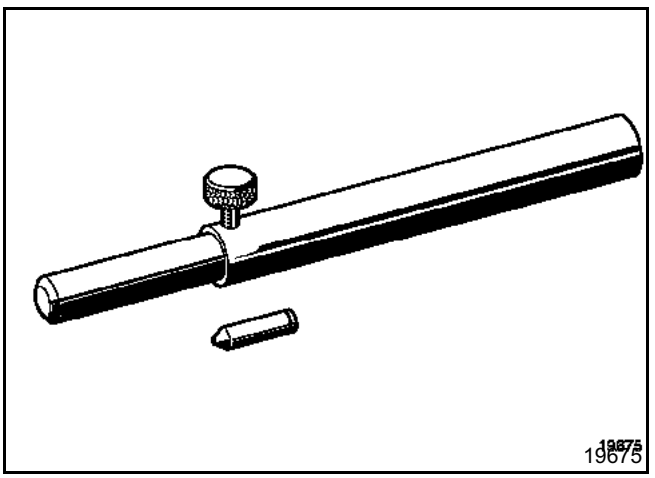
Guide external diameter (in mm)

Normal:	**11** $^{+0.062}_{+0.044}$

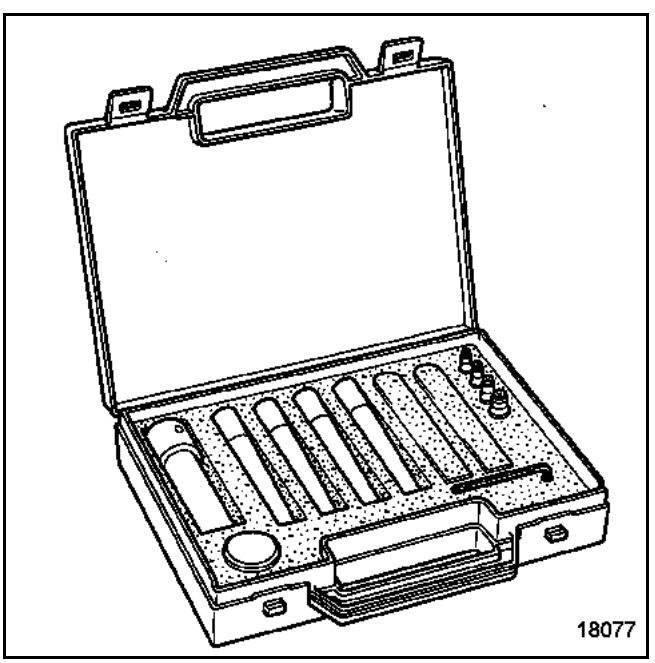
Guide internal diameter (in mm)

Inlet and exhaust

Not machined	**5.5** $^{+0.12}_{0}$
Machined*	**6.009 ± 0.009**



* This dimension is measured with the guide fitted in the cylinder head.

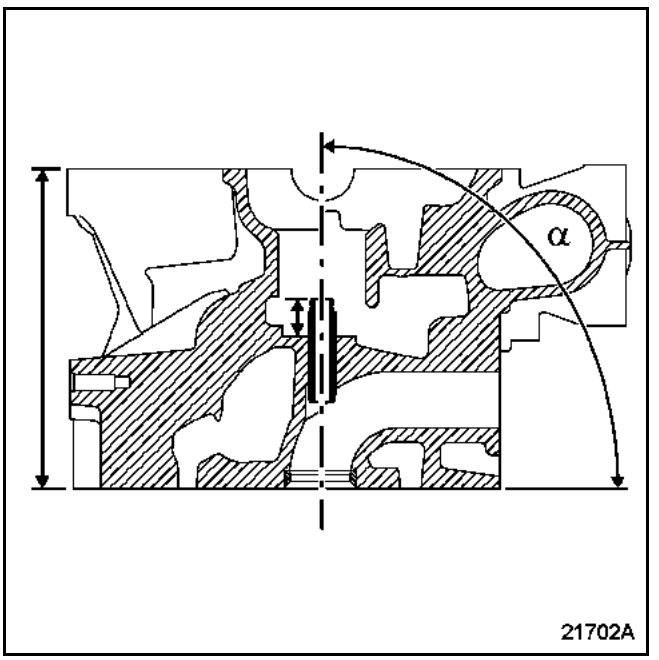


Diameter of the housing in the cylinder head (in mm)

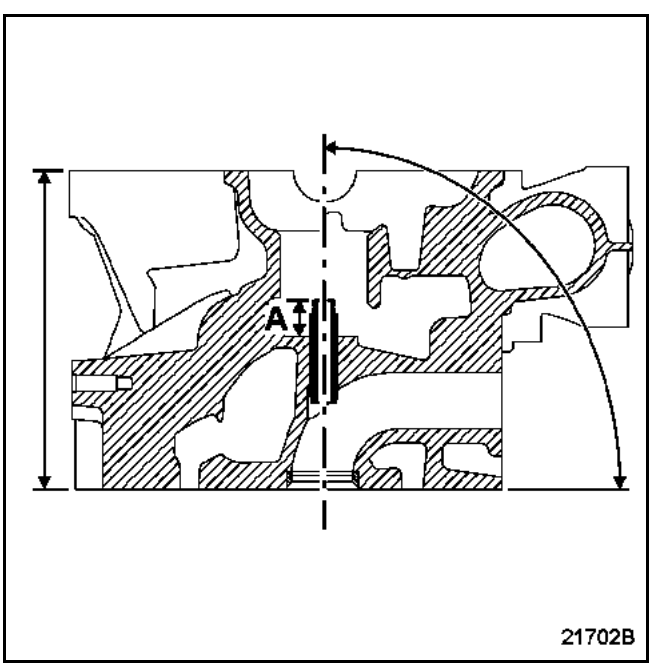
Normal	**11 ± 0.0075**

The inlet and exhaust guides have valve stem seals **which must be changed each time the valves are removed.**

It is imperative to fit the valve stem seals using tool Mot. 1511-01 or other suitable equipment.

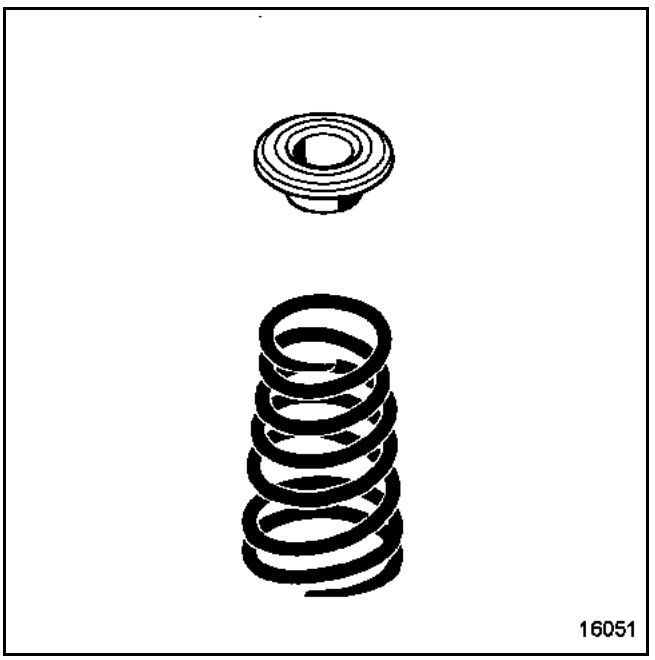


NOTE: do not lubricate the valve stem seals before fitting them.



Angle of the inlet and exhaust guides (in degrees)

Inlet and exhaust: α **= 90**



Position of the inlet and exhaust valve guides (in mm)

Inlet: **A = 14**
Exhaust **A = 14.2**

Valve springs

The valve springs are **tapered** (ensure the correct direction of fitting).

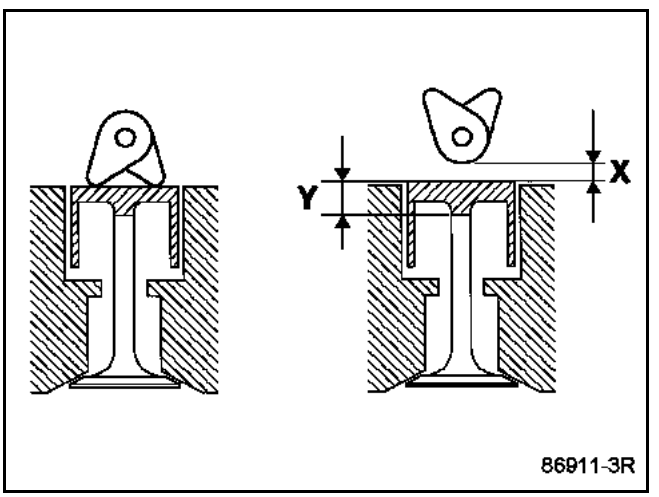
Free length (**in mm**)	**43.31**
Length under a load of (**in mm**)	
23 daN	**33.80**
50 daN	**24.80**
Joined spires (**in mm**):	**23.40**
Wire diameter (**in mm**)	**3.45**
Internal diameter (**in mm**)	
Bottom	**18.80 ± 0.2**
Top	**14.10 ± 0.2**
External diameter (**in mm**):	
Bottom	**25.70 ± 0.2**
Top	**21 ± 0.2**

WARNING: THIS ENGINE DOES NOT HAVE ANY VALVE SPRING LOWER WASHERS.

Pistons

Piston external diameter (in mm)

34.975 ± 0.01



Diameter of the housing in the cylinder head (in mm)

35.02 ± 0.02

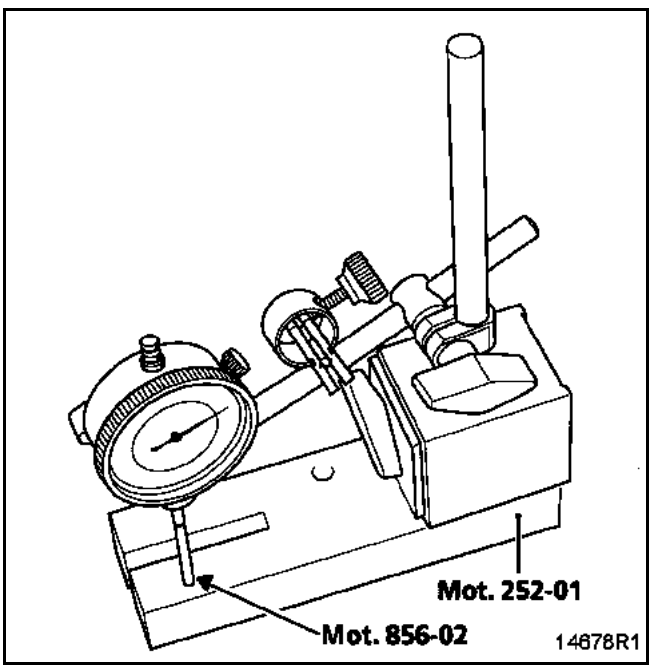
Checking the valve clearance

Place the valves of the cylinder concerned at the "end of exhaust - beginning of inlet" position and check the clearance (X).

NOTE: dimension (Y) corresponds to the tappet thickness class (there are 25 classes at the Parts Store).

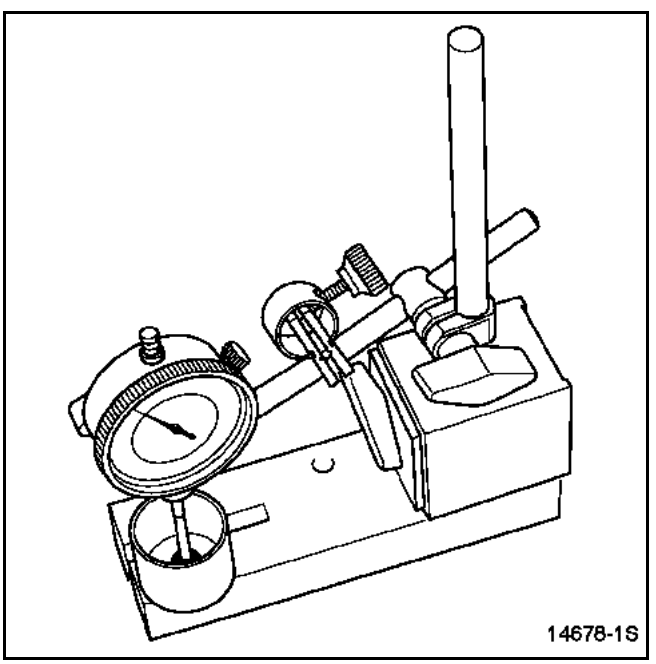
1	**4**
3	**2**
4	**1**
2	**3**

Compare the values recorded with the values specified, then replace the tappets which are not within tolerance.



Clearance (in mm), when the engine is cold:

Inlet	**0.20**	**+ 0.05 -0.075**
Exhaust:	**0.40**	**+ 0.05 -0.075**



The camshaft must be removed to replace the tappets.

Determining dimension "Y".

Set up the following assembly using **Mot. 252-01** and **Mot. 856-02,** then calibrate the gauge.

Raise the gauge extension (**without modifying the position of the magnetic support/gauge assembly**), then slide in the tappet to be measured.

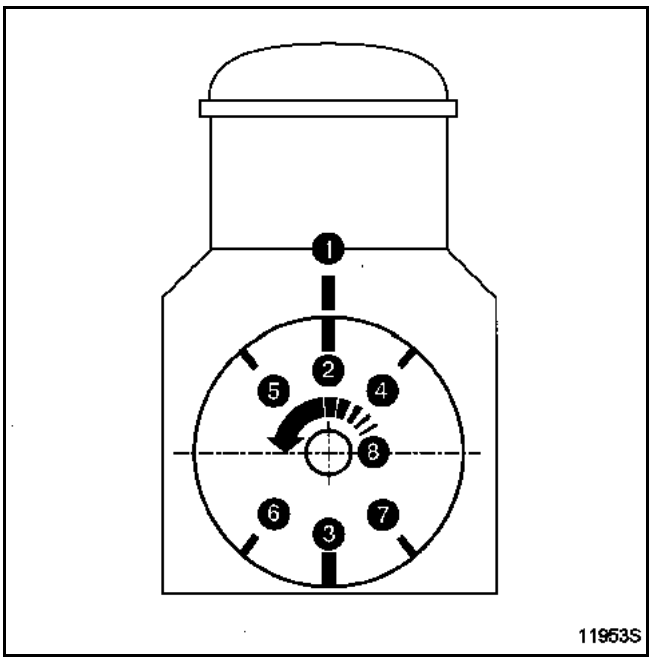
Note dimension (Y) and repeat the operation for the tappets where the valve clearance is not within tolerance.

Refer to the Replacement Parts Catalogue for the vehicle concerned to select the various thicknesses of the tappet(s) . The Parts Stores supplies 25 classes of single-piece tappets.

Camshaft

End play **(in mm)**	**0.08 to 0.178**
Number of bearings	**6**

Diameter of the camshaft bearings **(in mm)**



– on the camshaft:	
● bearings 1, 2, 3, 4, 5	**24.989 ± 0.01**
● bearing 6	**27.989 ± 0.01**
– on the cylinder head:	
● bearings 1, 2, 3, 4, 5	**25.05 ± 0.01**
● bearing 6	**28.05 ± 0.01**

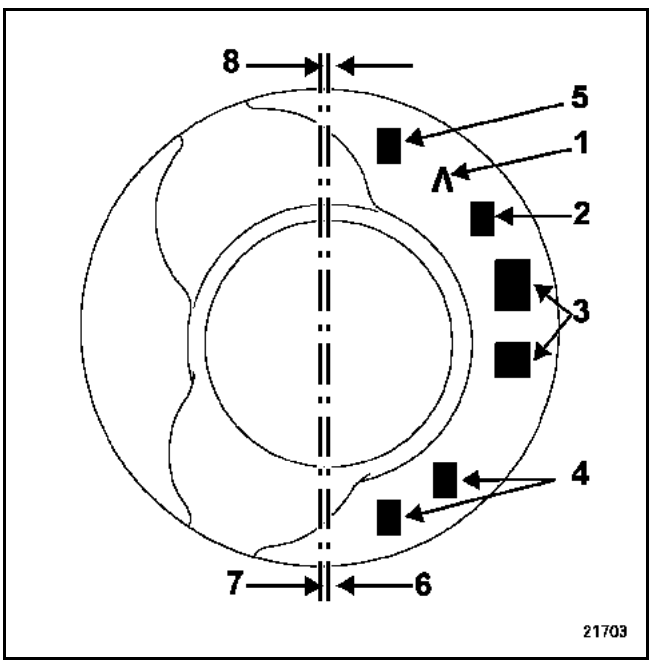
Timing diagram

– Inlet opening retard *	**-9**
– Inlet closing retard	**20**
– Exhaust opening advance	**27**
– Exhaust closing advance **	**-7**

* **As the inlet opening retard** is negative, the valve is opened after Top Dead Centre.

** **As the exhaust closing advance** is negative, the valve is closed before Top Dead Centre.

1 Cylinder block top dead centre fixed mark
2 Flywheel top dead centre moving mark
3 Flywheel bottom dead centre moving mark
4 Inlet Opening Retard
5 Exhaust Closing Advance
6 Inlet Closing Retard
7 Exhaust Opening Advance
8 Direction of engine rotation (flywheel end).



PISTONS

Fitting the gudgeon pin in the con rod and in the piston.

The gudgeon pin is retained by circlips.

These engines are fitted with **FEDERAL MOGUL pistons.**

Piston marking

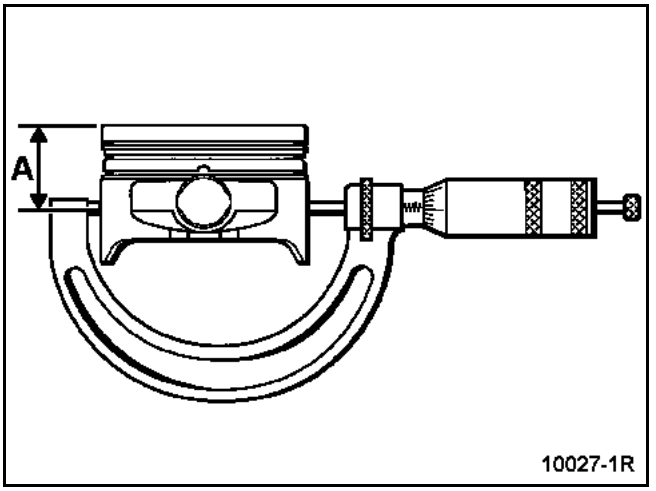
1 Direction of fitting of the piston Λ towards the flywheel
2 Height between the gudgeon pin and the top of the piston (see table below).
3 Used by the supplier only
4 Used by the supplier only
5 Used by the supplier only
6 Piston axis of symmetry
7 Gudgeon pin hole axis
8 Offset between the hole axis (7) and the piston's axis of symmetry (6) is **0.3 mm**

Table of gudgeon pin heights

* Mark on piston	Pin height (mm)
K	41.667
L	41.709
M	41.751
N	41.793
P	41.835

The tolerance on the pin heights is ± **0.02 mm**.

*** The different gudgeon pin heights are exclusively reserved for the engine assembly plant.**



The Parts Stores will only supply piston classes (height) L, M, N.

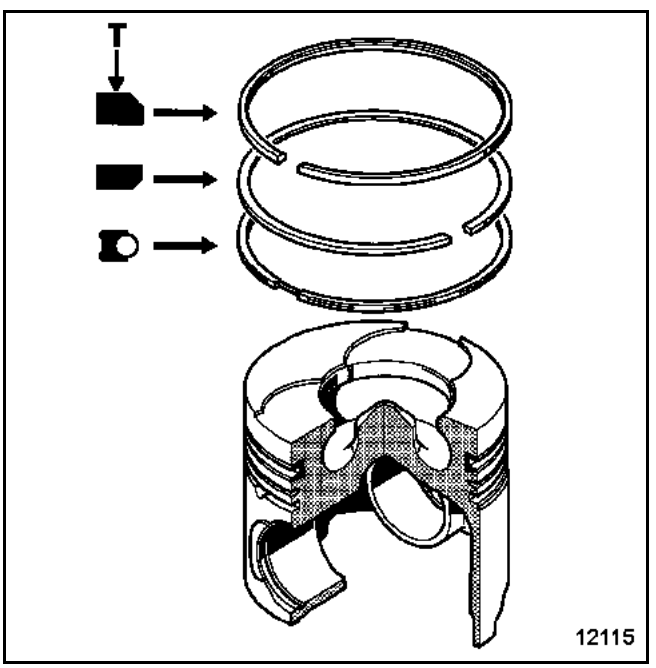
NOTE:
- **if the engine is fitted with a K class piston, an L class piston must be fitted as a replacement.**
- **if the engine is fitted with a P class piston, an N class piston must be fitted as a replacement,**

Measuring the piston diameter

The piston diameter must be measured at height **A = 56 mm**.

Piston diameter **(in mm)**: **75.94**± **0.007**

Gudgeon pin (in mm)



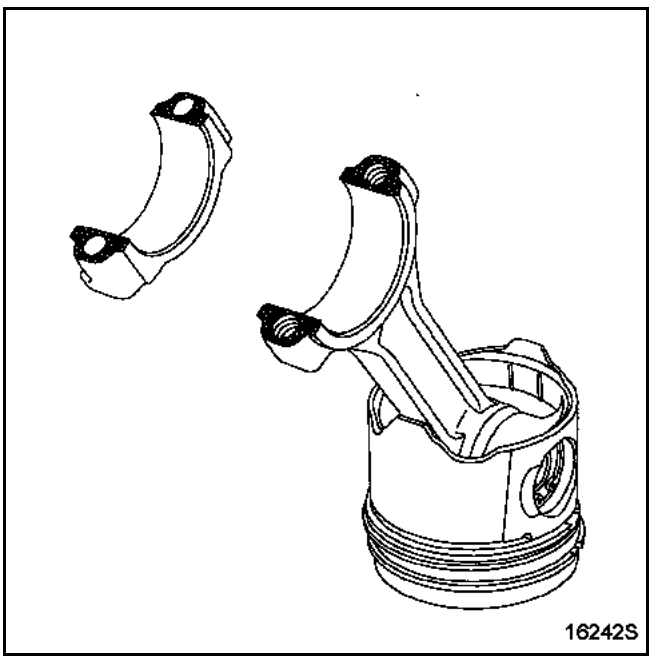
Length	**59.7** - **60.3**
External diameter	**24.8** - **25.2**
Internal diameter:	**13.55 - 13.95**

Rings

Three rings (thickness in **mm**):

Compression	**2**	**-0.01** **-0.03**
Sealing	**2**	**-0.01** **-0.03**
Scraper	**2.5**	**-0.01** **-0.03**

The rings are supplied ready adjusted.



T = Top

Clearance at the gap

Rings	Clearance at the gap (in mm)
Compression	0.2 to 0.35
Sealing	0.7 to 0.9
Scraper	0.25 to 0.5

CON RODS

The connecting rods are of the "DETACHABLE CAP" type.

WARNING:
- **The bolts must be coated with engine oil under the heads and on the threads when the con rods are fitted in the engine.**
- **The big end caps are positioned on the con rod by irregularities on the parting line.**
- **The occurrence of impacts or a foreign body between the body - cap mating surfaces will lead to rapid rupture of the con rod.**

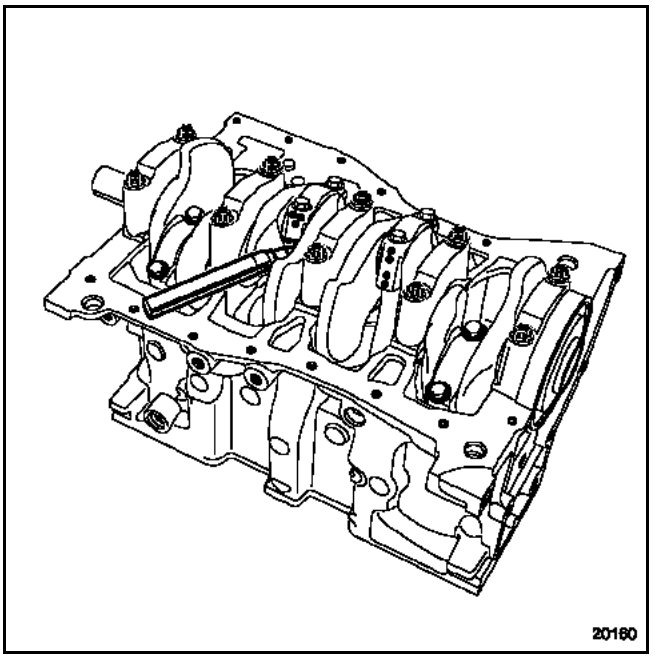
Lateral big end play **(in mm)** **0.205** to **0.467**

Diametrical big end play **(in mm)** **0.035** to **0.045**

Centre distance between the big end and small end **(in mm)** **133.75**

Diameter of the big end **(in mm)** **47.619** ± **0.009**

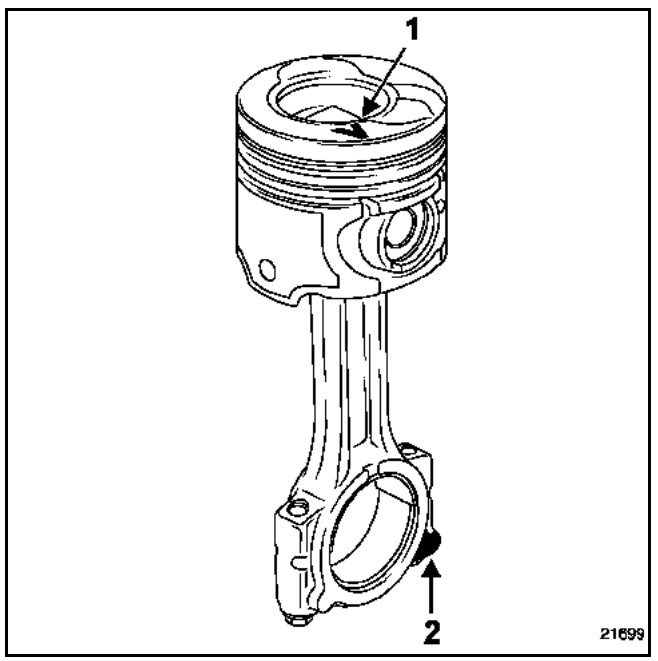
Diameter of the small end **(in mm)**
(without ring) **27.25** ± **0.010**



(with ring) **25.019** ± **0.006**

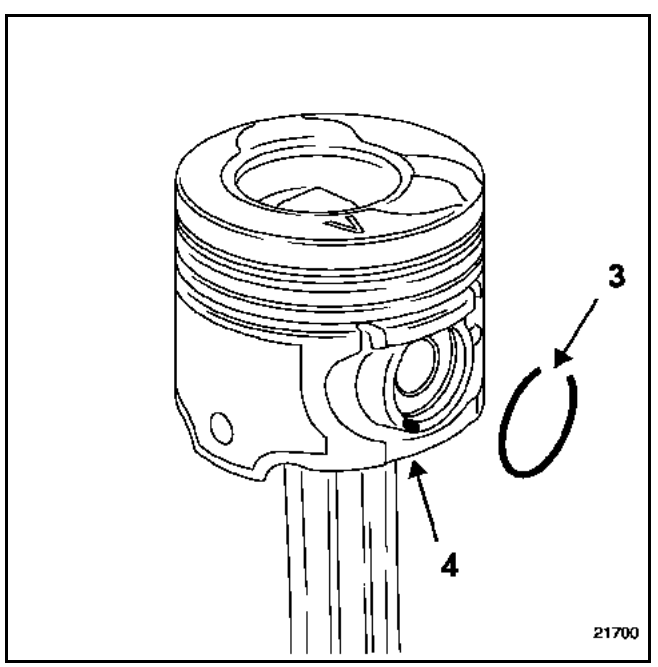
NOTE: the con rod small end rings cannot be replaced.

The maximum weight difference for the con rod, piston and gudgeon pin assemblies for the same engine must be **25 grams.**



WARNING: do not use a sharp point to mark the big end caps in relation to their con rod, to avoid initiating a crack in the rod.

Use a permanent marker pen.



Direction of fitting of the con rod in relation to the piston

Point the "Λ" (1) engraved on the top of the piston downwards and the machined flat (2) of the big end as shown on the diagram below.

Direction for fitting the circlips on the piston

Position the opening (3) of the spring rings opposite the removal and fitting channel (4).

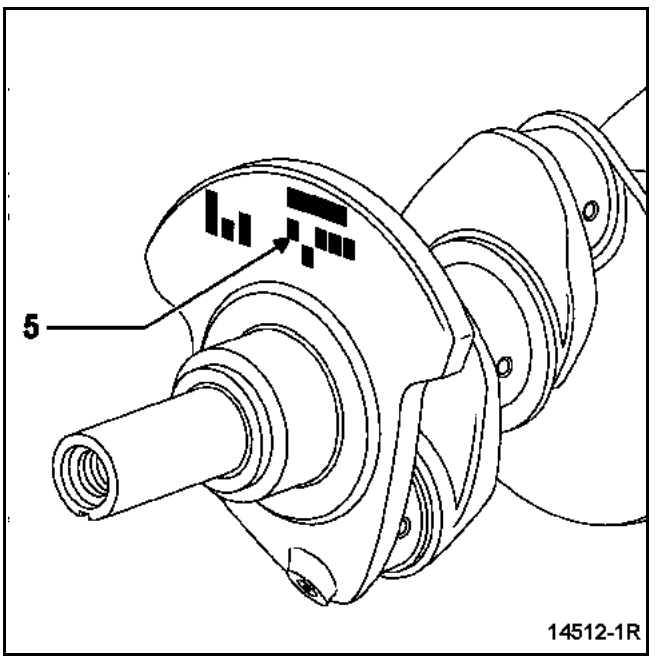
CRANKSHAFT

Number of main journals **5**

Crankshaft lateral clearance **(in mm):**
– without wear on lateral shims: **0.045 - 0.252**
– with wear on the lateral shims: **0.045 - 0.852**

Crankshaft diametrical clearance **(in mm):**
– journals **0.027 - 0.054**
– crankpins **0.035 - 0.045**

Journal diameter **(in mm)**:
48 ± 0.01



Crankpin diameter **(in mm)**:
43.97 ± 0.01

The lateral shims are located on bearing Nº 3.

NO RECTIFICATIONS ARE ALLOWED.

Working out the class of crankshaft bearing shells (Original fitment)

Marking (5) on the crankshaft

Detail of the marking (5):

Number of journals

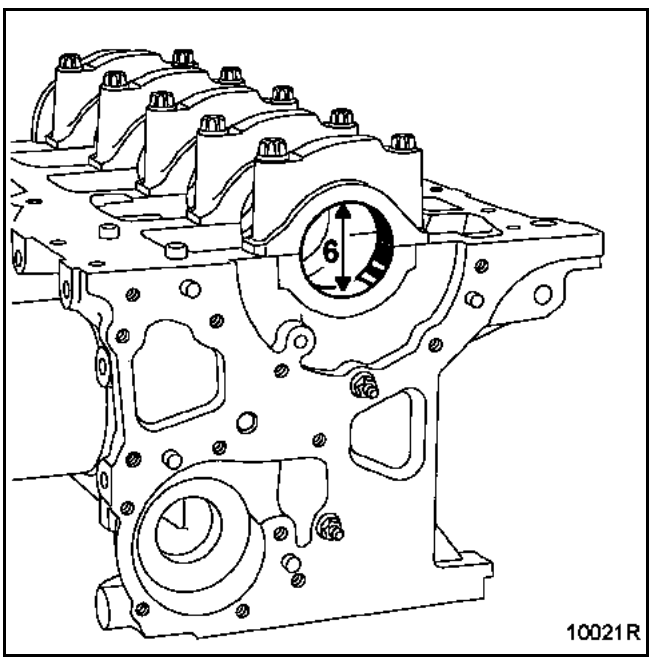
1*	2	3	4	5
B	B	C	C	B

Classes of journal diameters

A = D1

B = D2

C = D3



* Flywheel end.

Table of journal diameter classes

Journal class mark on the crankshaft	Journal diameter (in mm)
A = D1	47.990 to 47.996
B = D2	47.997 to 48.003
C = D3	48.004 to 48.010

CYLINDER BLOCK

The diameters of the bearings (6) of the cylinder block are marked by a hole on the block (7) located above the oil filter.

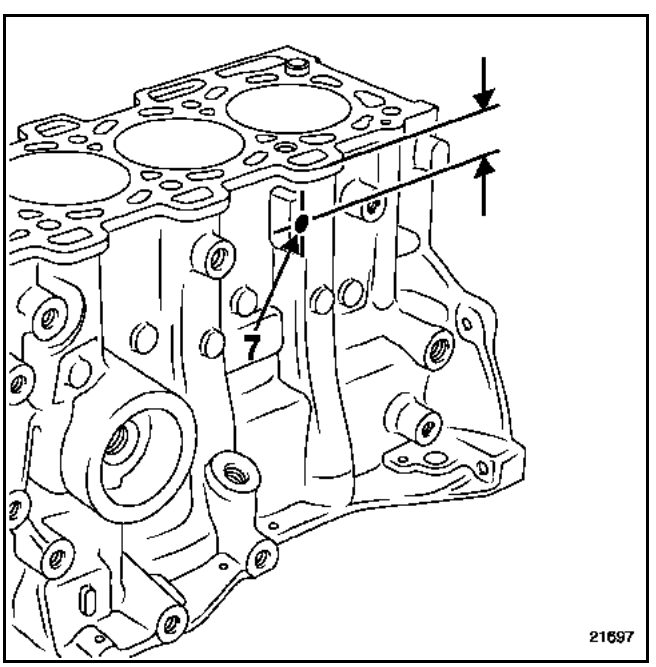


Table of cylinder block bearing diameters

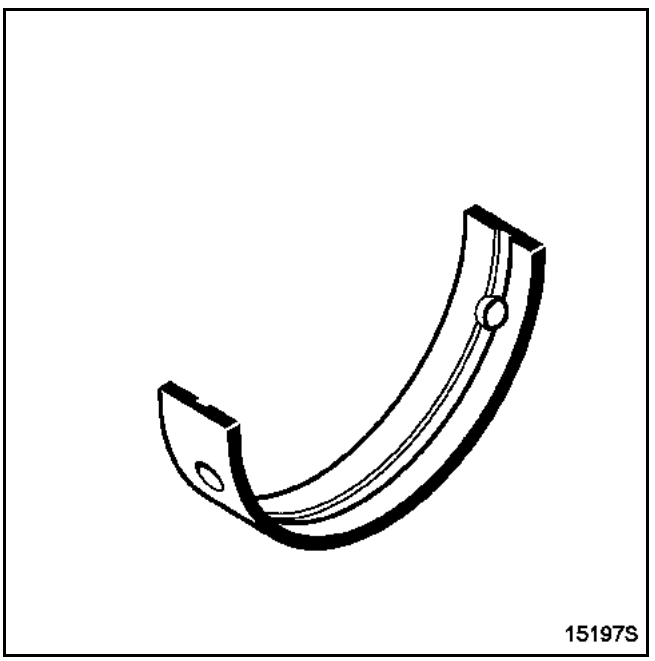
Hole position (7)	Class reference	Cylinder block bearing diameter (in mm)
A = 33 mm	1 or blue	51.936 - 51.942 exclusive
B = 43 mm	2 or red	51.942 inclusive - 51.949

NOTE: the marking zone includes:
– **A - B** gives the diameter class of bearings 1 or 2.

Matching the crankshaft bearing shells

	Journal diameter class		
	D1	**D2**	**D3**
1 *	C1 1.949 to 1.955 yellow	C2 1.946 to 1.952 blue	C3 1.943 to 1.949 black
2 *	C4 1.953 to 1.959 red	C1 1.949 to 1.955 yellow	C2 1.946 to 1.952 blue
	Bearing shell thickness and class		

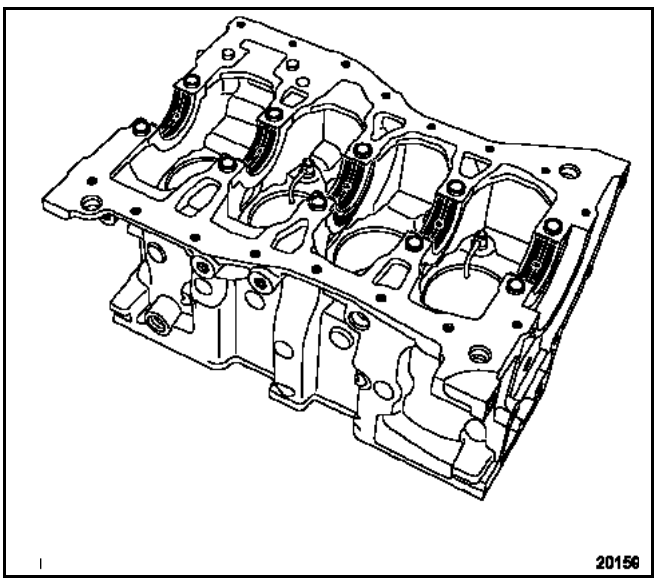


* Cylinder block crankshaft bearing diameter class.

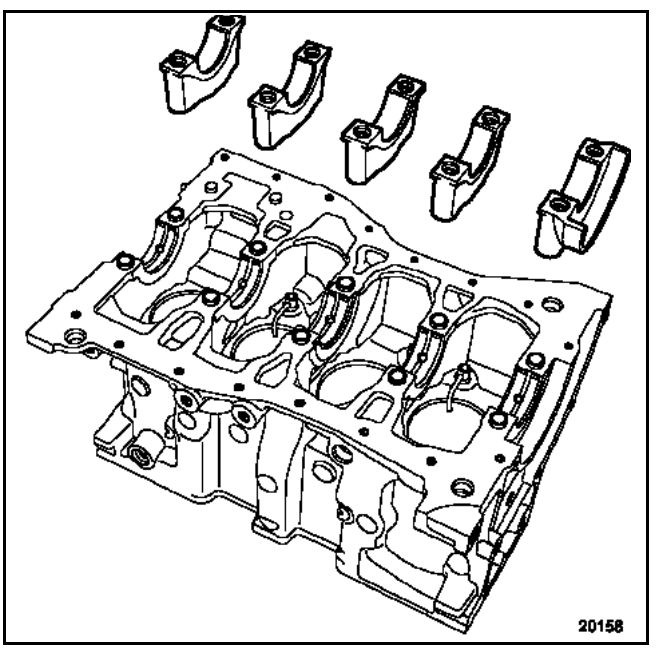
NOTE: the parts stores will only supply class **C2** (blue).

BEARING SHELLS

Crankshaft bearing shells



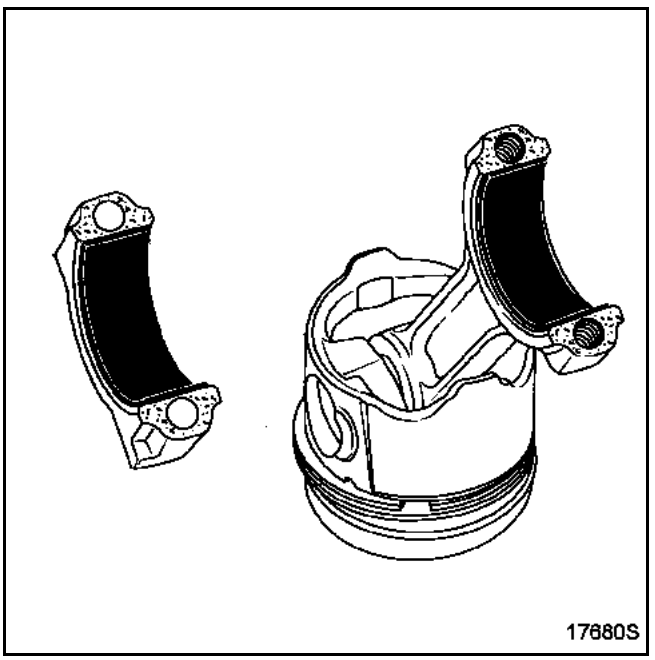
The engine is fitted with bearing shells without a locator notch.



The crankshaft bearing shells are fitted on the cylinder block and on the bearings using **Mot. 1493-01**.

Direction of fitting:

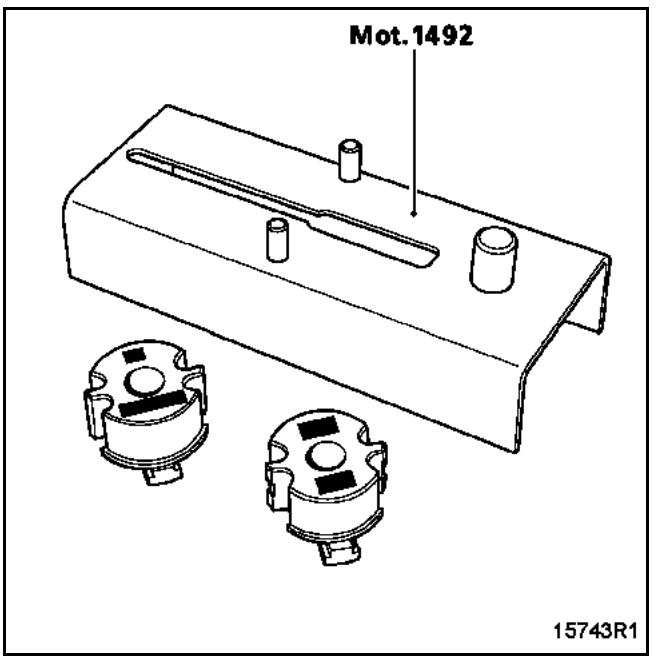
– on the **cylinder block,** fit **grooved** bearing shells on all the bearings,

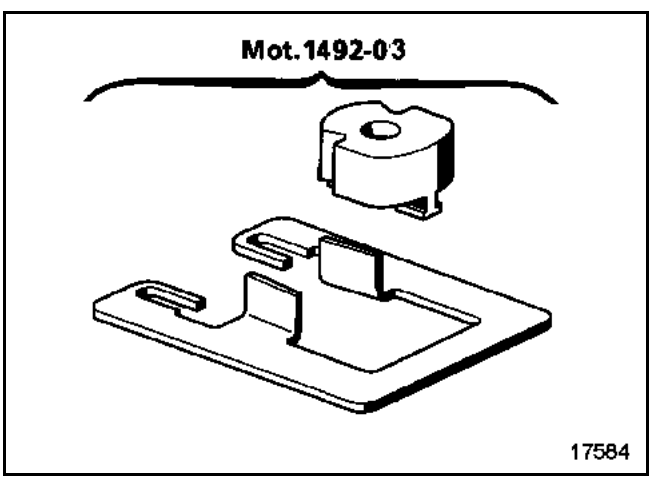


– on the **bearing caps**, fit **non grooved bearing shells.**

Con rod bearing shells

The engine is fitted with bearing shells without a locator notch.



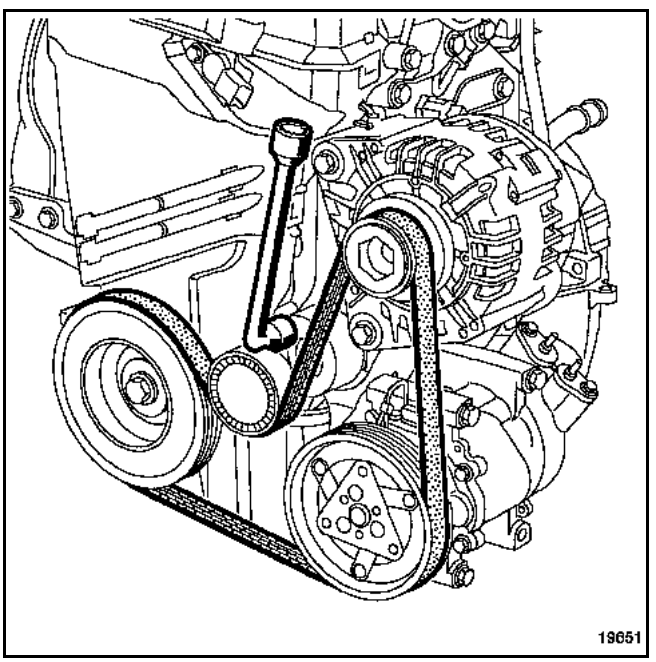


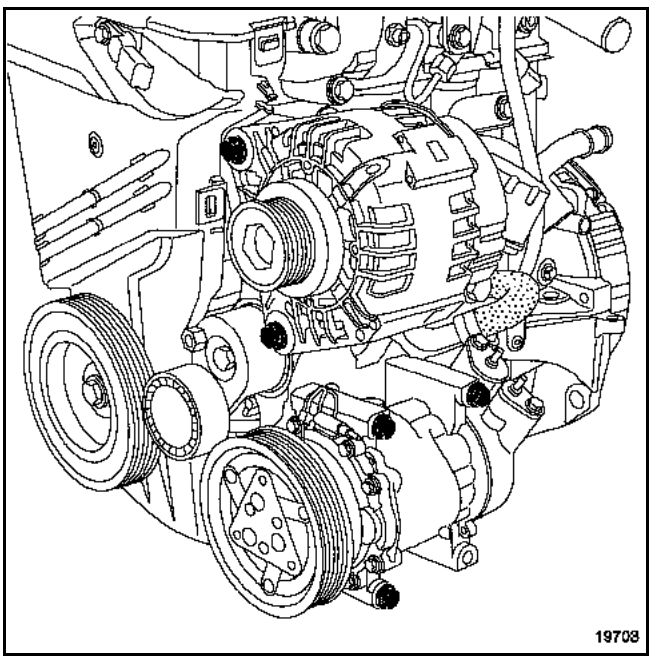
NOTE: the upper and lower con rod bearing shells are not the same width.

Bearing shell width (**in mm**):

– upper	**20.625**
– lower	**17.625**

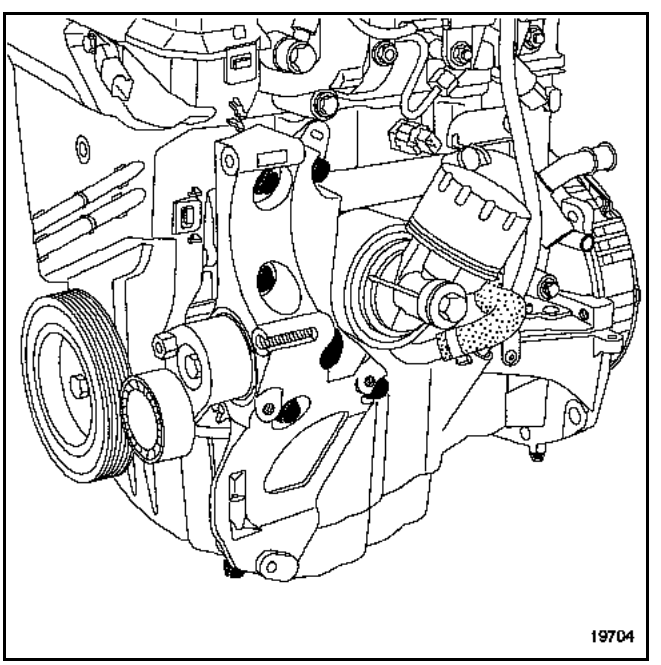
The bearing shells are fitted using **Mot. 1492** and **Mot. 1492-03**.



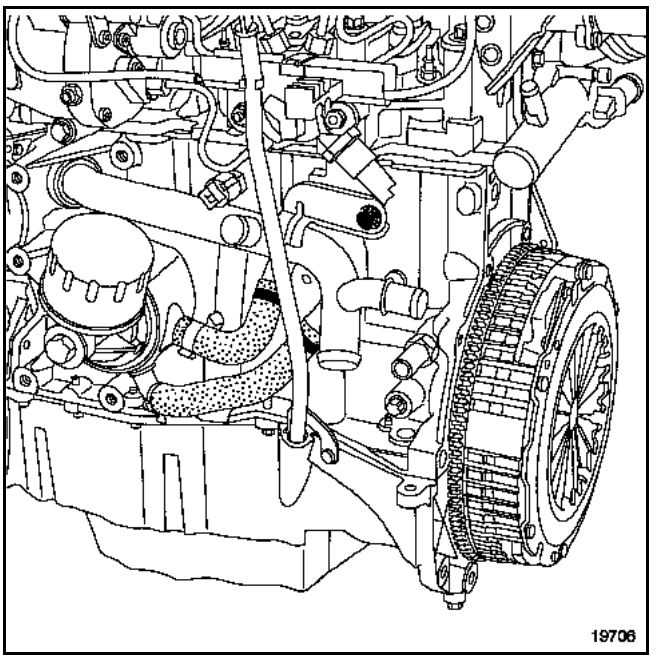


PREPARING THE ENGINE TO BE SET ON THE STAND

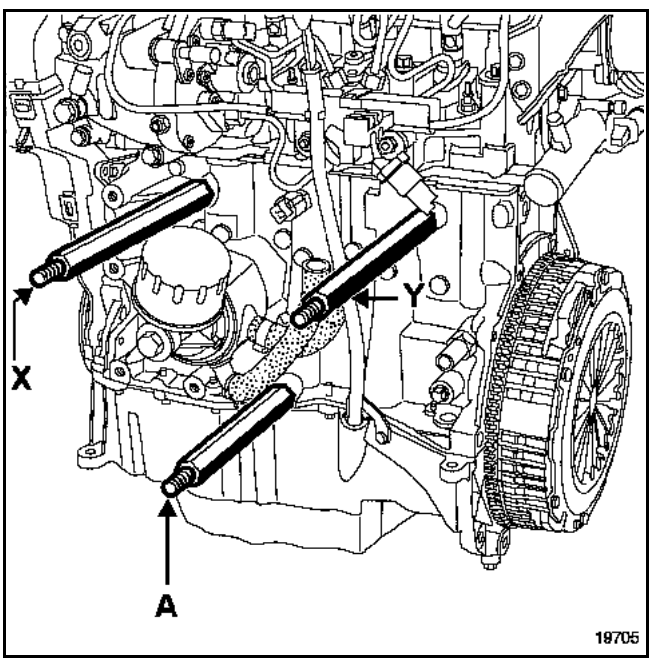
Before the engine is mounted on the stand **Mot. 792-03**, the engine's electrical harness must be removed and the engine oil drained.



Remove:
– the accessories belt,



– the alternator,
– the air conditioning compressor or the power-assisted steering pump,



– the multifunction support,

– the coolant inlet pipe on the water pump.

Place the rods (**A**), (**X**), (**Y**) of **Mot. 1378** on the cylinder block so that they fit into the holes (**20, 32, 33**) on the plate of **Mot. 792-03.**

CONSUMABLES

Type	Quantity	Component concerned	Part no.
Cleaner	-	Cleaning parts	**77 01 421 513**
DECAPJOINT	Coat	Cleaning gasket faces	**77 01 405 952**
Sealing paste	Bead	Crankshaft bearing cap Camshaft bearings Crankshaft closure plate	-
Loctite FRENETANCH	1 - 2 drops	Water pump bolts	**77 01 394 070**
RHODORSEAL 5661	Coat	Top Dead Centre pin plug	**77 00 404 452**

WARNING

WARNING: when working on the fuel supply system, the cleanliness rules described in this document must be strictly complied with.

PARTS TO BE REPLACED AFTER REMOVAL:
- All gaskets,
- Flywheel bolts,
- Crankshaft bearing bolts,
- Camshaft pulley bolt,
- Crankshaft pulley bolts,
- Big end cap bolts,
- Injector holder copper washers,
- High pressure injection pipes,
- Pipe plugs,
- Belts,
- Timing belt tension wheel,
- Piston base cooling jets,
- Turbo plastic pipes.

FITTING THREAD INSERTS

Threaded holes on all engine component parts can be repaired by using thread inserts.

PREPARING THE USED ENGINE FOR RETURN

The engine should be cleaned and drained (oil and water).

Leave on the used engine or include in the return box:
– the oil filter,
– the oil pressure switch,
– the water pump,
– the high pressure pump,
– the rail,
– the injectors
– the heater plugs,
– the dipstick,
– the vacuum pump,
– the flywheel,
– the clutch

Remember to remove:
– all coolant pipes,
– the exhaust manifold,
– the alternator,
– the power-assisted steering pump,
– the air conditioning compressor,
– the multifunction support,
– the oil level sensor,
– the cylinder head coolant outlet unit.

The used engine should be secured to the base under the same conditions as the overhauled engine:
– plastic plugs and covers fitted,
– cardboard cover over the assembly.

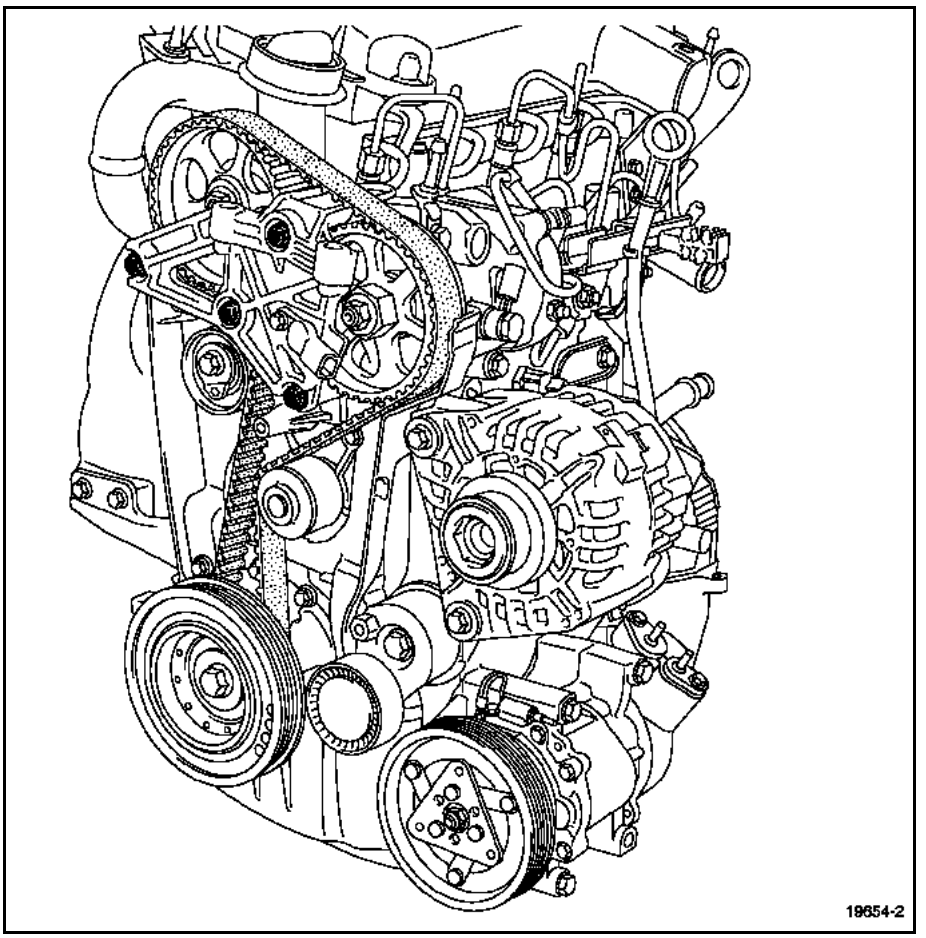
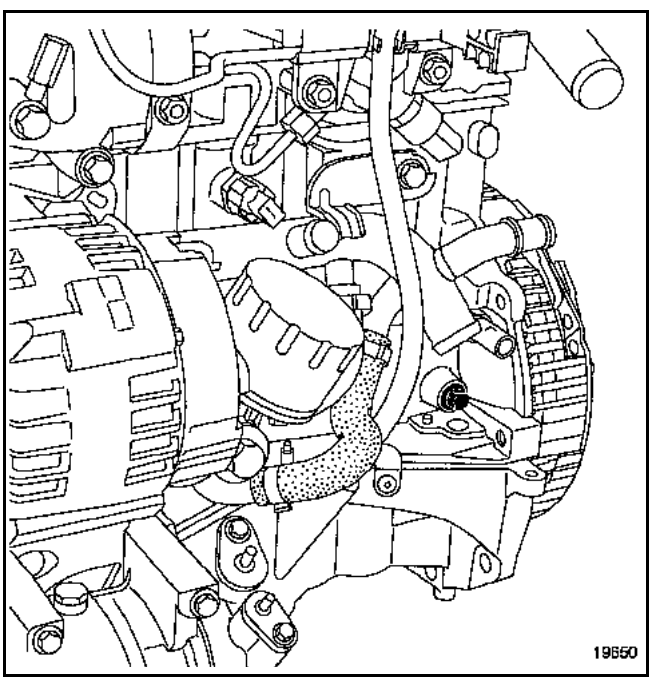
	Mot. 1632	00 00 163 200	Tool for fitting inlet camshaft seals
 21419	**Mot. 1638**	00 00 163 800	Tool for tensioning accessories belt for engines with a mechanical tension wheel
	Rou. 15-01	00 00 001 501	Internal shaft protector ∅ **16 mm**

	Description
	Ring for fitting pistons in the cylinder block
	Standard 22 mm long 1/2" (12.7 mm) square drive socket for removing the oil pressure checking gauge
 12624	Tooling for testing the cylinder head, including: a tray and the various kits suited for each model of cylinder head (plug, sealing plate, blanking plate). The approval number of the cylinder head test container is **664000**
	Standard 1/2" (12.7 mm) square drive 8/12 /14 female torx socket .
	Angular tightening tool from: – e.g. **STAHL WILLE** part number **540 100 03**, – e.g. **FACOM** part number **DM360**, – e.g. SAM part number **1 SA.**
 18077	Tool for fitting valve stem seals, e.g. FACOM part number **DM6J4**.
	Angled nippers
 19672	Wrench for removing high pressure pipes, e.g. **FACOM** part number **DM 19**
 19670	Crowfoot adapter for tightening high pressure pipe
 19668	Articulated wrench for removing and refitting the heater plugs, e.g. FACOM part number **B10R10A**.
 19669	Wrench for removing crankshaft bearings, e.g. **FACOM U49 A D5**
	Valve spring compressor

Removing the upper engine

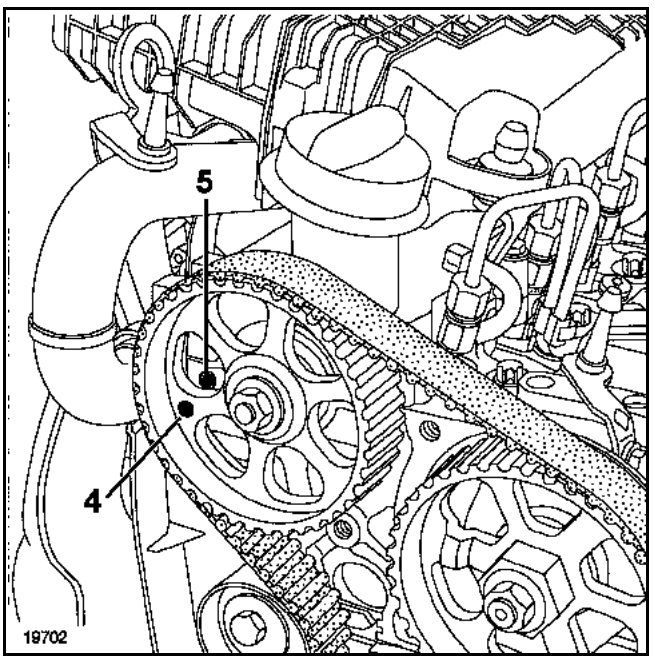


Remove:
– the upper timing cover by unclipping the two tabs (1),

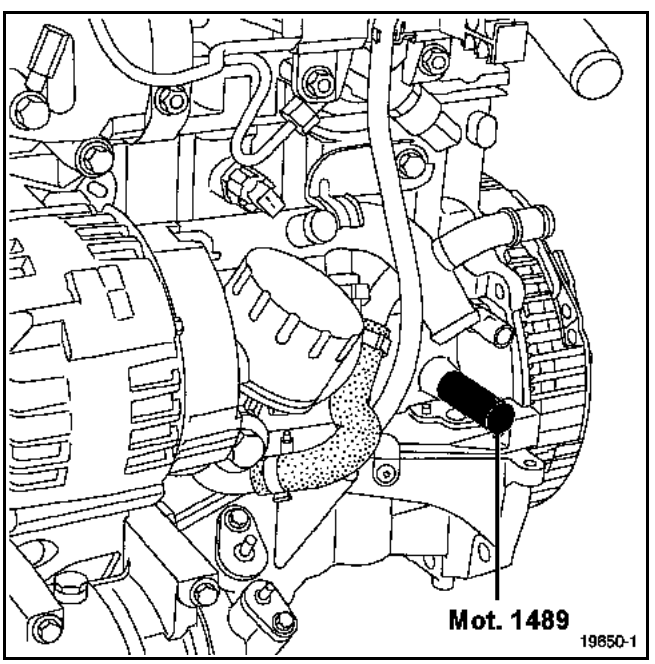


– the lower timing cover by unclipping the three tabs (2) and pulling out the plastic bolt (3),

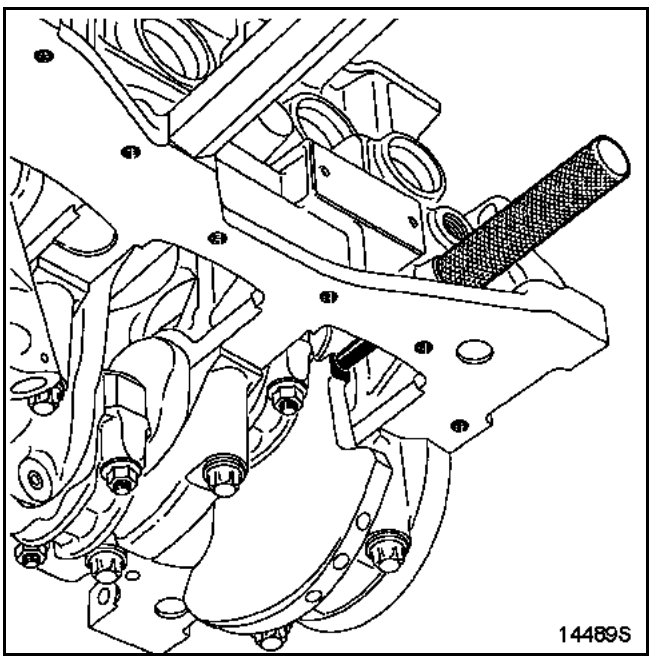
– the cylinder head suspended mounting support,



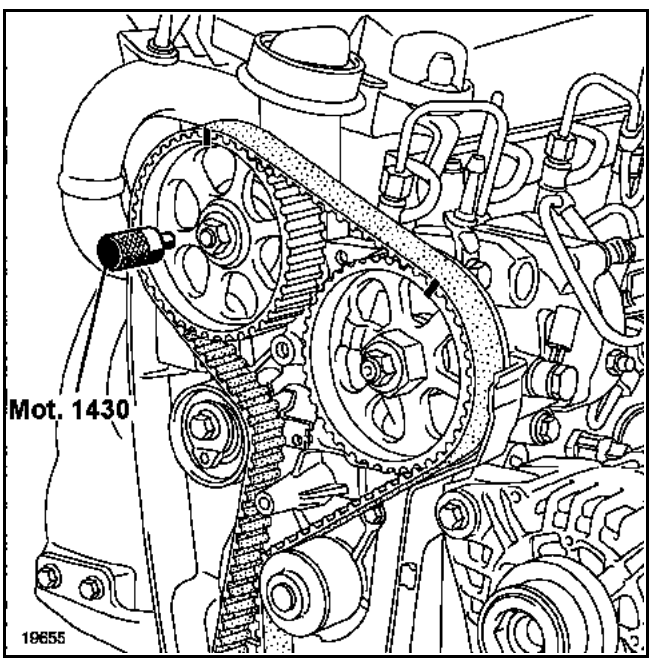
– the TDC pin cap.



Positioning the belt at the timing point

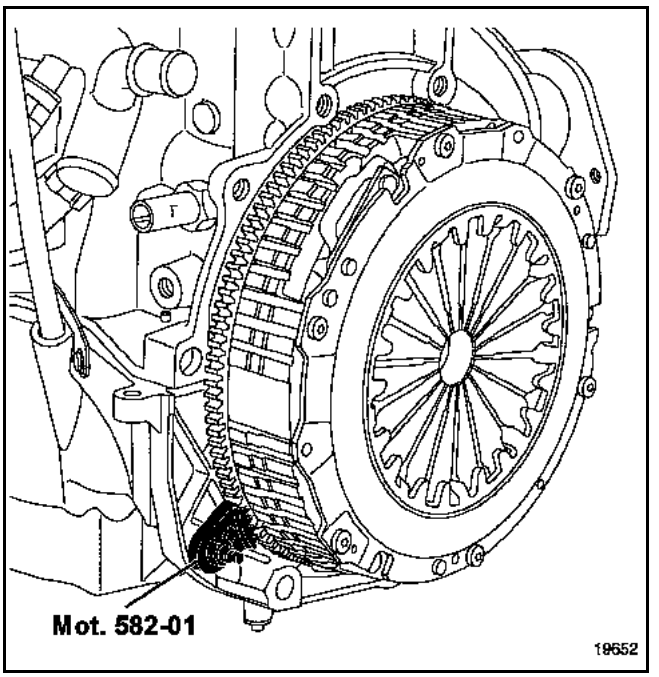


Position the hole (4) of the camshaft pulley almost opposite the hole (5) of the cylinder head.

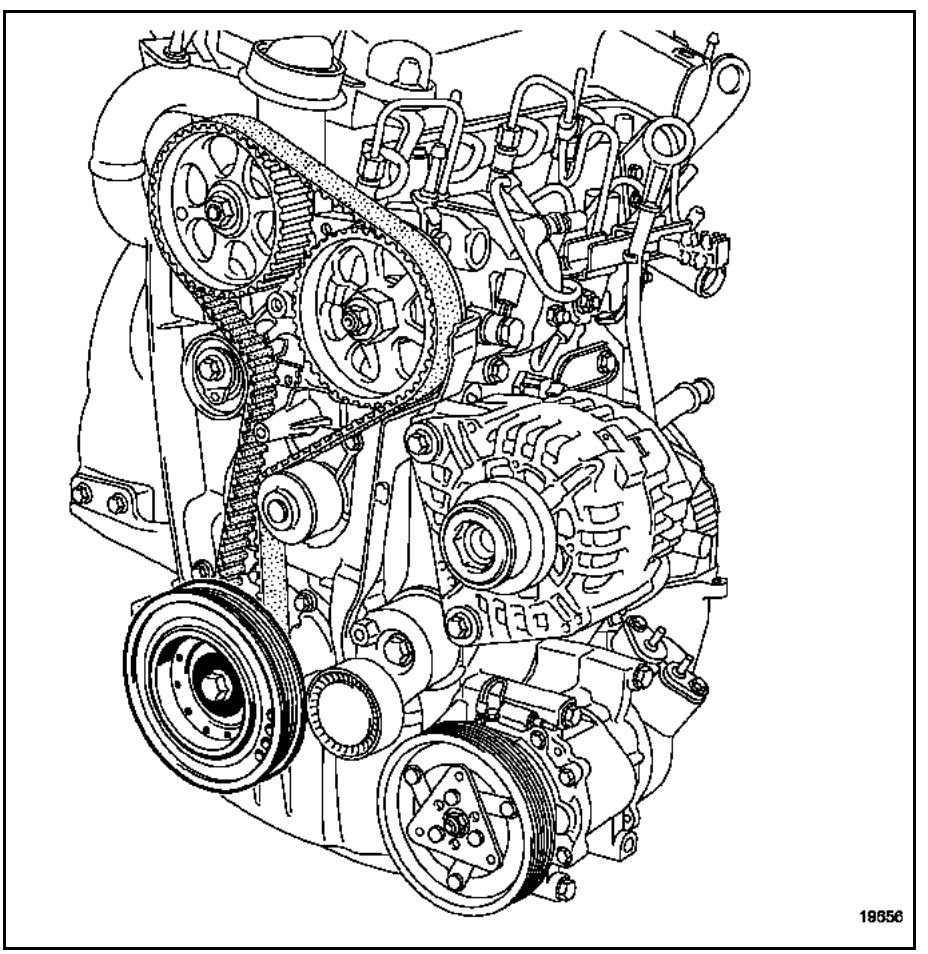


Screw in the TDC pin **Mot. 1489.**

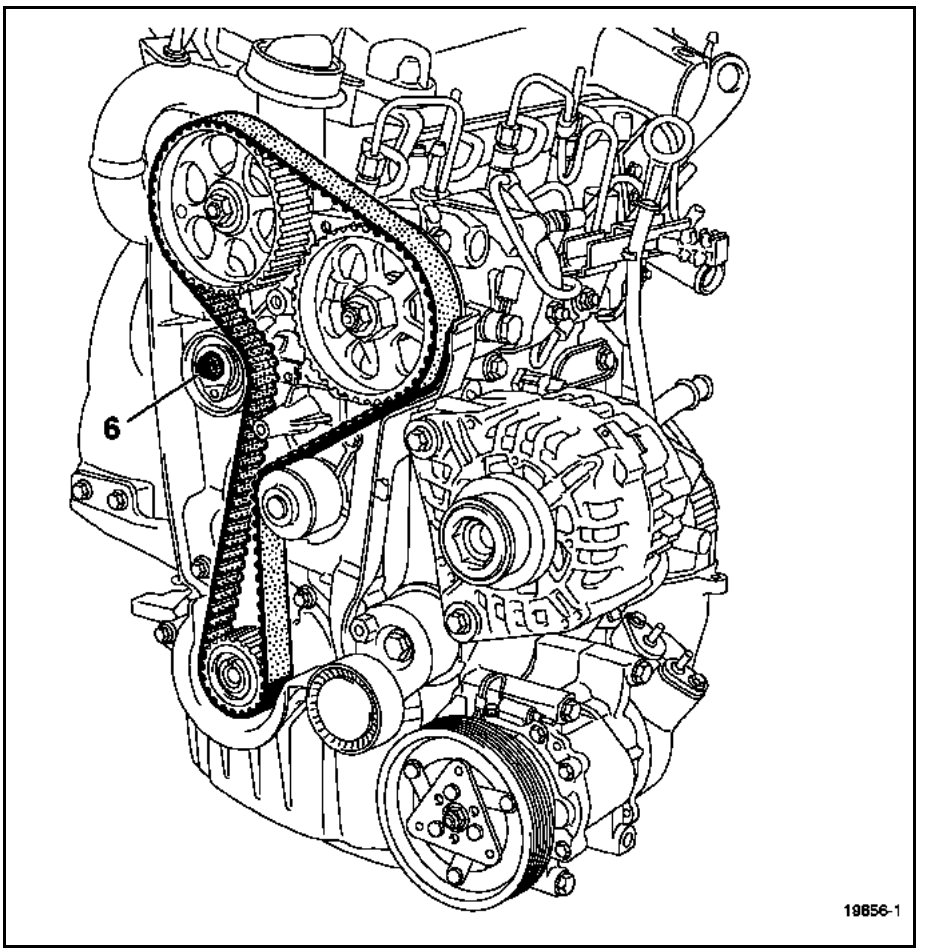
Turn the engine clockwise (timing side) until the crankshaft touches the TDC pin **Mot. 1489.**



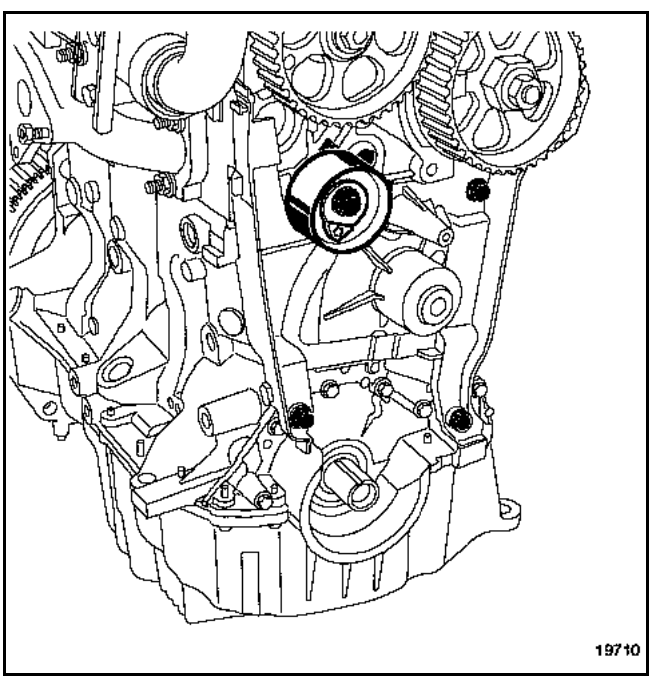
The pin **Mot. 1430** must engage in the camshaft pulley and cylinder head holes.



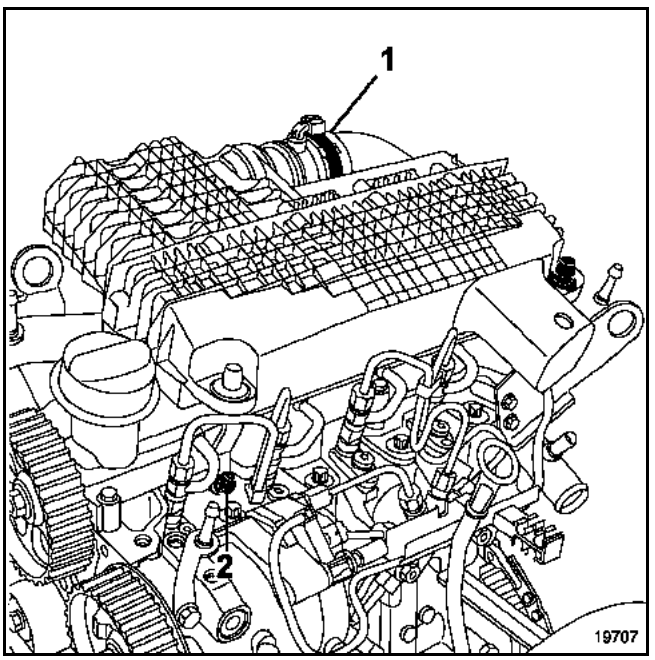
Remove **Mot. 1430** and **Mot. 1489.**



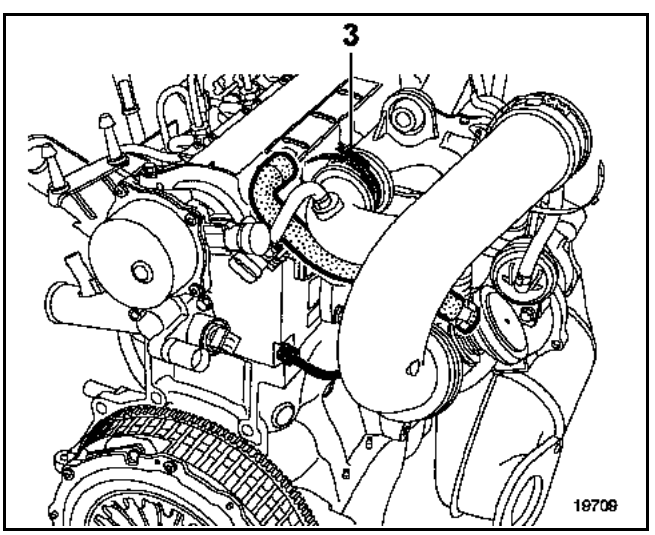
Fit flywheel block **Mot. 582-01.**



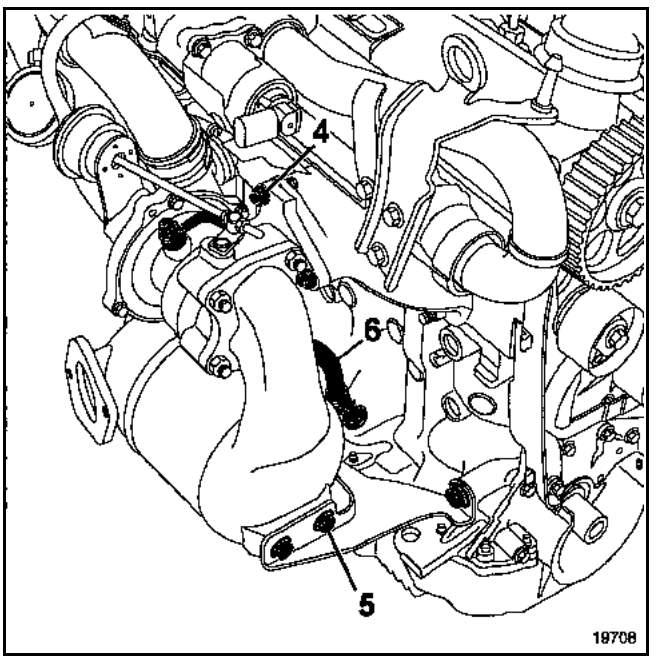
Remove the crankshaft accessories pulley.



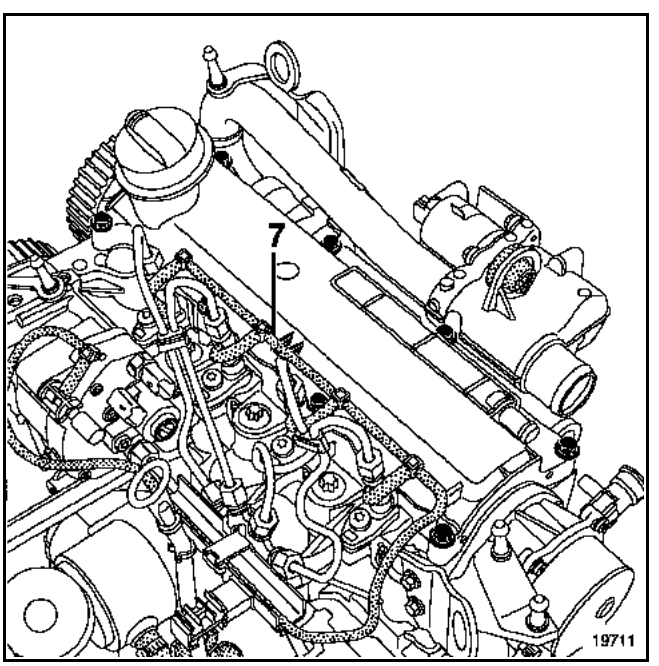
Slacken the timing belt by loosening the bolt (6) of the tension wheel, then remove the timing belt.



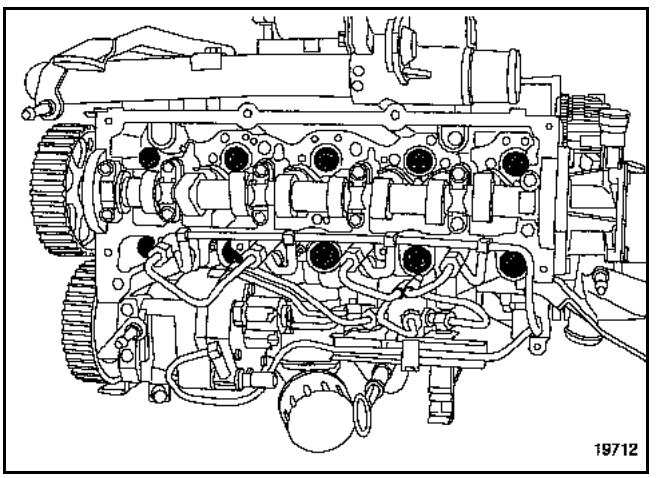
Remove:
– the timing belt tension wheel,
– the inner timing cover,



– the air filter unit, by removing the clamp (1) and the bolt (2),

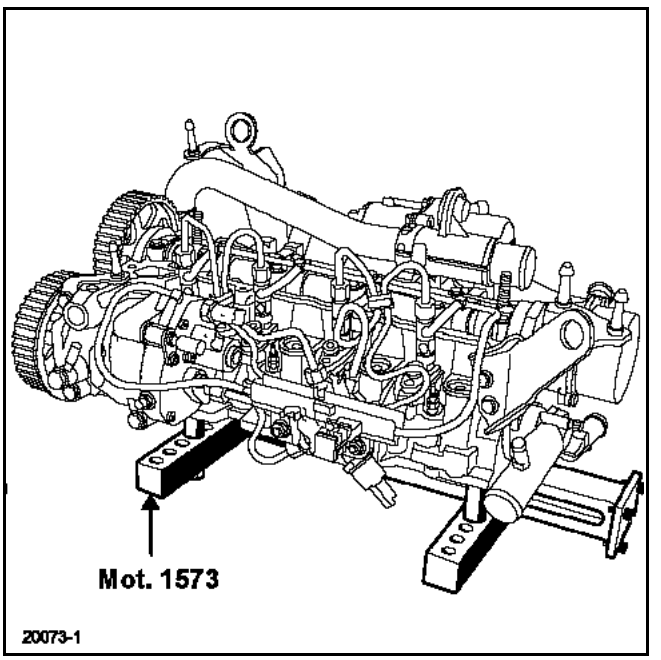


– the clamp (3),
– the oil vapour rebreathing pipe,
– the turbo oil supply pipe on the cylinder head side,

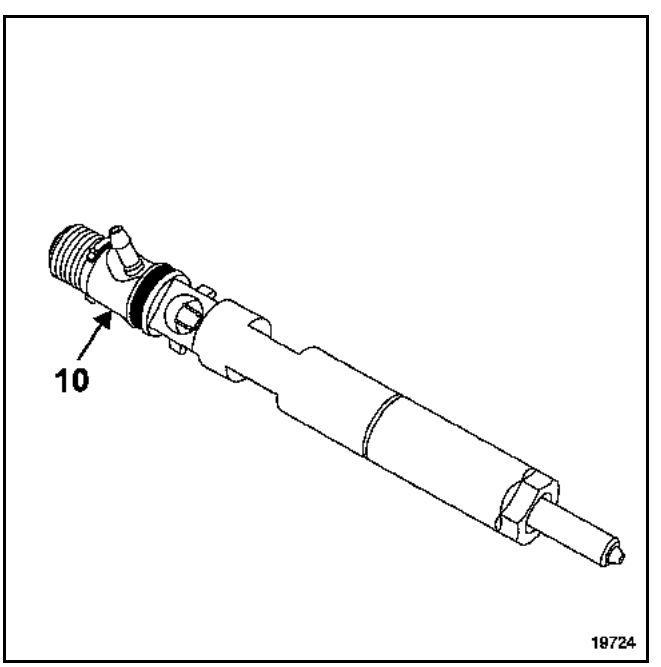


– the turbo oil supply pipe on the turbo side,
– the nuts (4) of the turbo flange,
– the bolts (5) of the catalytic converter bracket,
– the turbo oil return pipe (6).

Unclip the fuel return pipe from the cylinder head cover at (7), then remove the cylinder head cover.

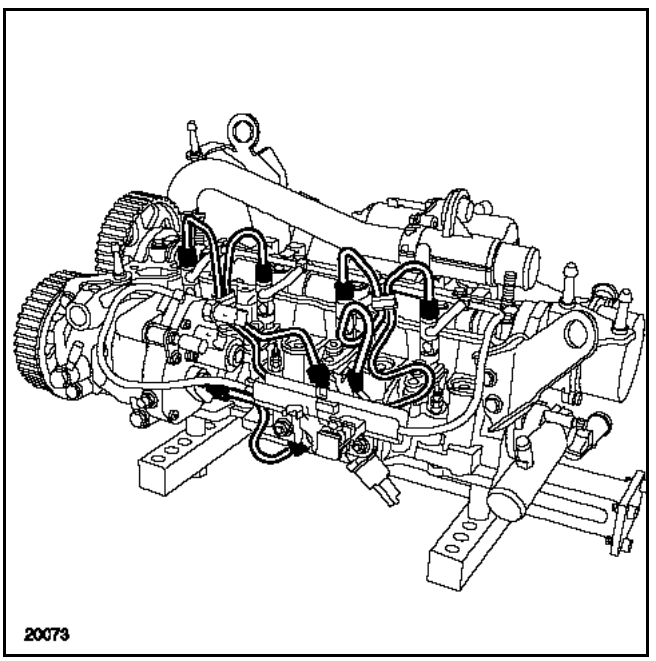


Remove:
– the dipstick guide,
– the cylinder head.



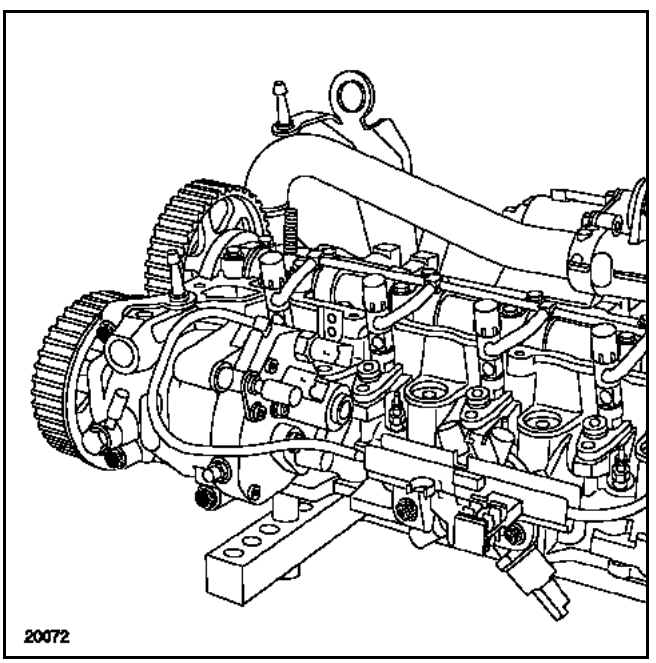
STRIPPING THE CYLINDER HEAD

Place the cylinder head on cylinder head support **Mot. 1573.**

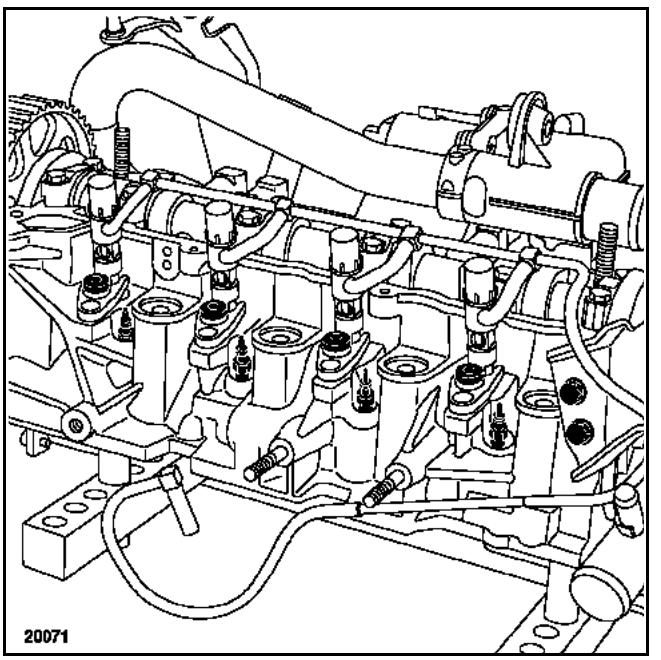


Pay strict attention to the rules regarding cleanliness (see start of document).

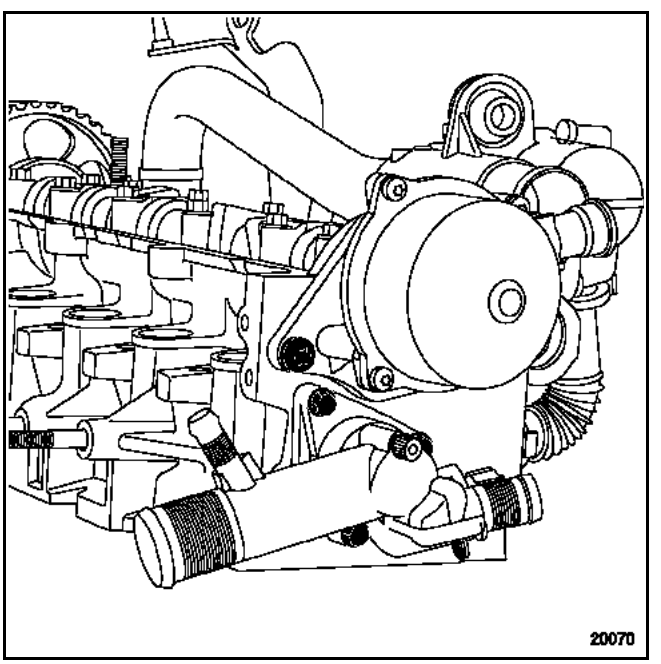
WARNING: when undoing the high pressure pipes, it is essential to secure the intermediate union (10) of the injector.



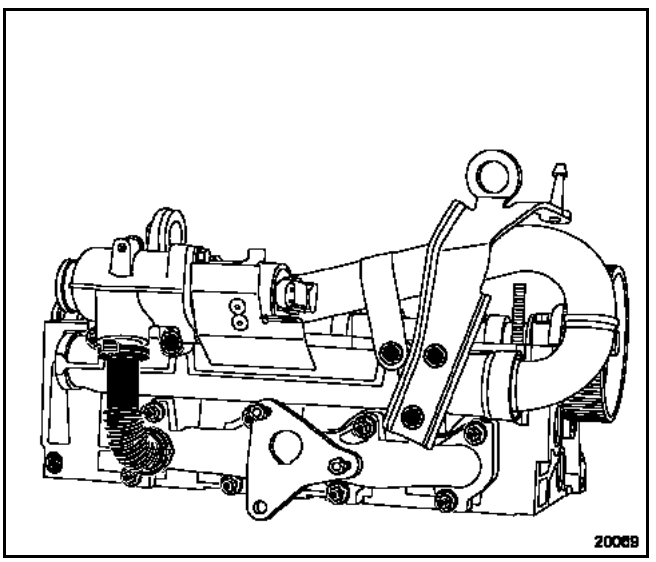
Remove:
– the high pressure pipes using **Mot. 1566** or a pipe wrench,



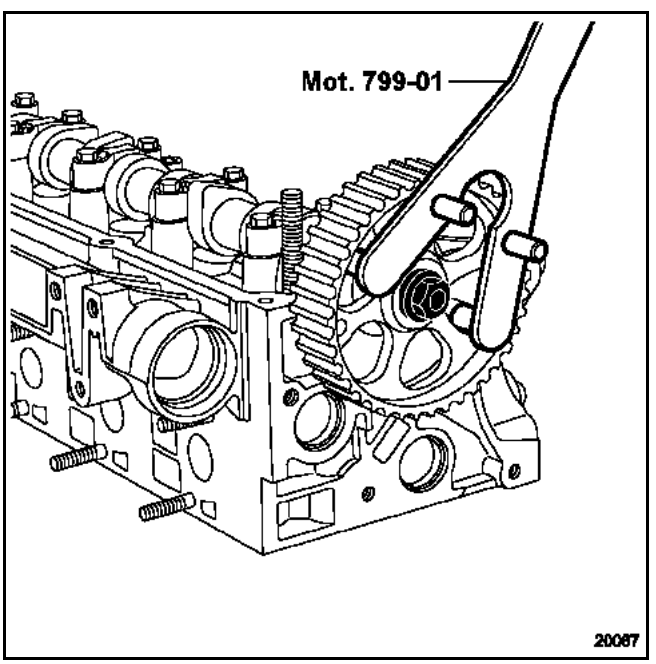
fit the protective blanking plugs to the high pressure pump, the rail and the injectors.



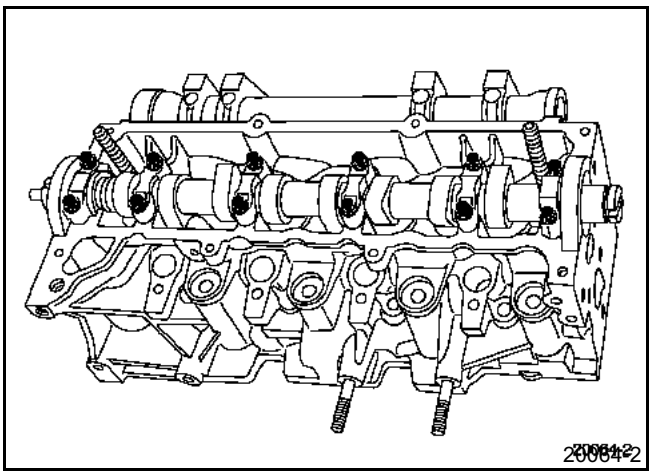
– the high pressure pump,
– the rail,



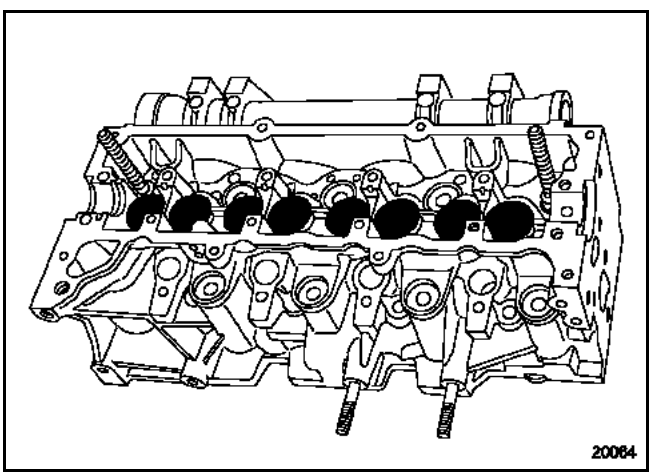
– the injectors (by marking them in relation to their cylinder),
– the pre-heater plugs using an angled spanner,
– the ring for lifting the engine (flywheel end),



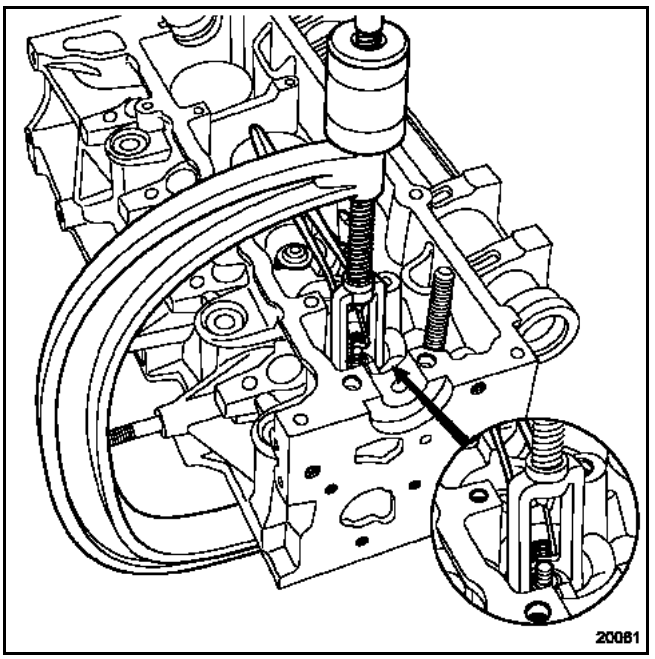
– the vacuum pump,
– the cylinder head coolant outlet unit,



– the ring for lifting the engine (timing end),
– the exhaust gas recirculation pipe,
– the inlet pipe,
– the exhaust gas recirculation valve,
– the exhaust manifold,

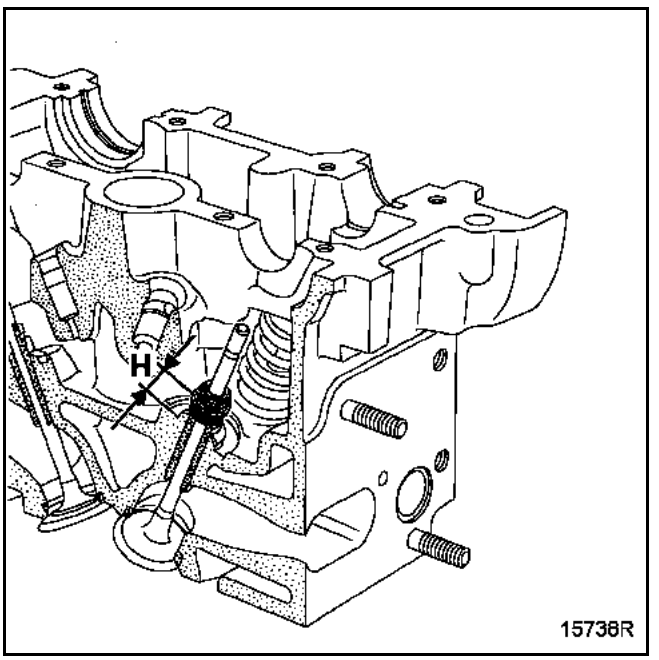


– the camshaft pulley using **Mot. 799-01**,

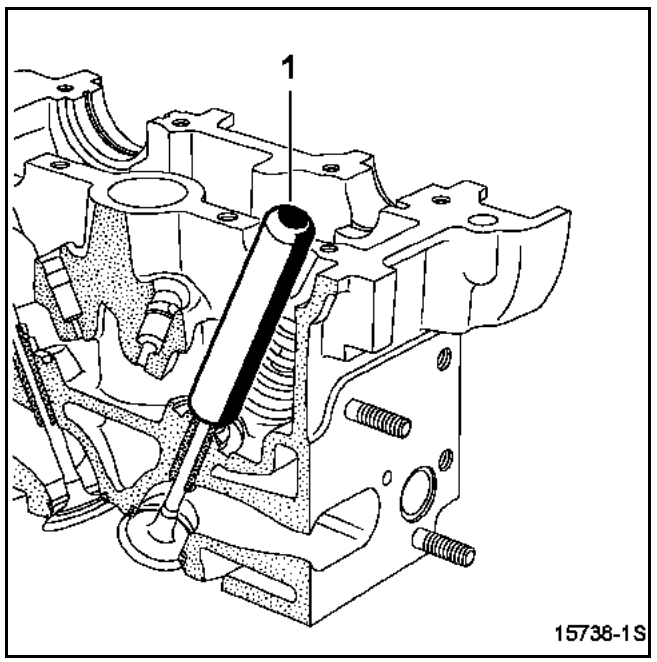


– the camshaft bearings,

– the tappets, **noting their position**.

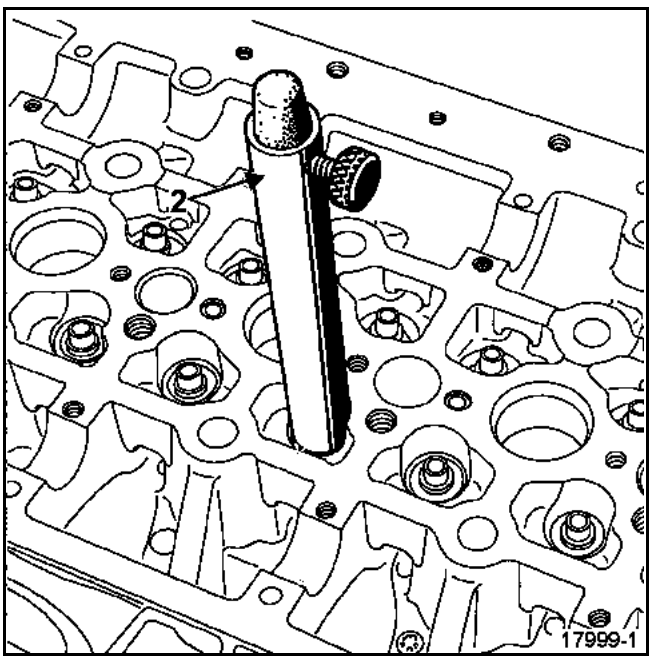


Compress the valve springs using the valve lifter.



Remove:
– the keys,
– the upper cups,
– the springs,

N.B.: before removing the valves and the valve stem seals, it is vital to measure position H of one of the old seals in relation to the cylinder head using Mot. 1511 -01 or other suitable equipment.



Fit the pushrod (1) of **Mot. 1511-01** on the valve stem seal.

NOTE: the internal diameter of the pushrod must be identical to that of the valve. In addition, the bottom of the pushrod must come into contact with the metal upper section of the valve stem seal.

Fit the guide tube (2) over the pushrod until the guide tube comes into contact with the cylinder head, locking the pushrod with the knurled wheel.

Remove the guide tube assembly plus pushrod, being **careful not to loosen the knurled wheel.**

Remove:
– the valves,
– the valve guide seals using the **Mot. 1335** pliers.

CLEANING

It is very important not to scratch the gasket faces of any aluminium components.

Use **DECAPJOINT** to dissolve any part of the seal which remains stuck to the metal surface.

Apply the product to the part to be cleaned, wait approximately 10 minutes, then remove it using a wooden spatula.

Wear gloves whilst carrying out this operation.

Do not allow this product to drip on to the paintwork.

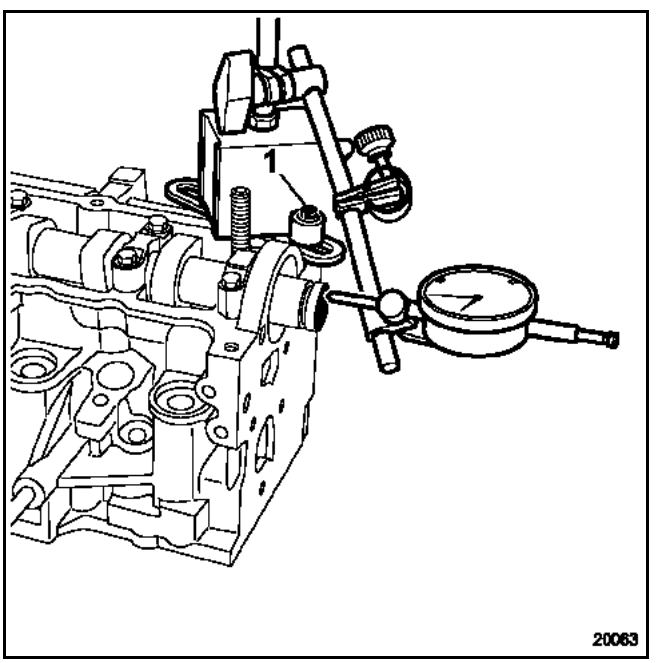
Great care should be taken when performing this operation, to prevent foreign objects entering the pipes taking oil under pressure to the camshafts (pipes in both the cylinder head and its cover) and the oil return pipes.

Failure to follow this instruction could lead to the blocking of the oilways, resulting in rapid and serious damage to the engine.

CHECKING THE GASKET FACE

Check for mating surface bow using a ruler and a set of shims.

Maximum bow **0.05 mm**



Test the cylinder head to detect possible cracks using the cylinder head test tools (comprising a tray and a kit suited to the cylinder head, plug, sealing plate, blanking plate). The approval number of the cylinder head test container is **664000**

CHECKING THE CAMSHAFT END PLAY

NOTE: to attach the magnetic gauge to the cylinder head, clamp **Mot. 588** must be used and secured using the oil filler attachment bolt (1) of the cylinder head cover and a spacer with the following dimensions:
– external diameter **18 mm**,
– diameter of bolt (1) hole **9 mm**,
– height **15 mm**.

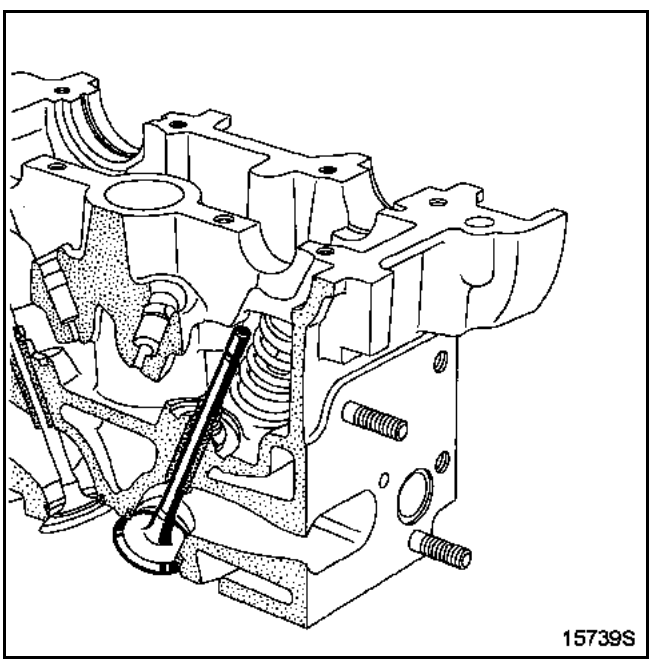
Refit:
– the camshaft,
– the camshaft bearings (positioning them correctly with bearing 1 on the flywheel end), then tighten the bolts to a torque of **1 daN.m**.

Check the end play, which must be between **0.08** and **0.178 mm.**

Remove the camshaft bearings and the camshaft.

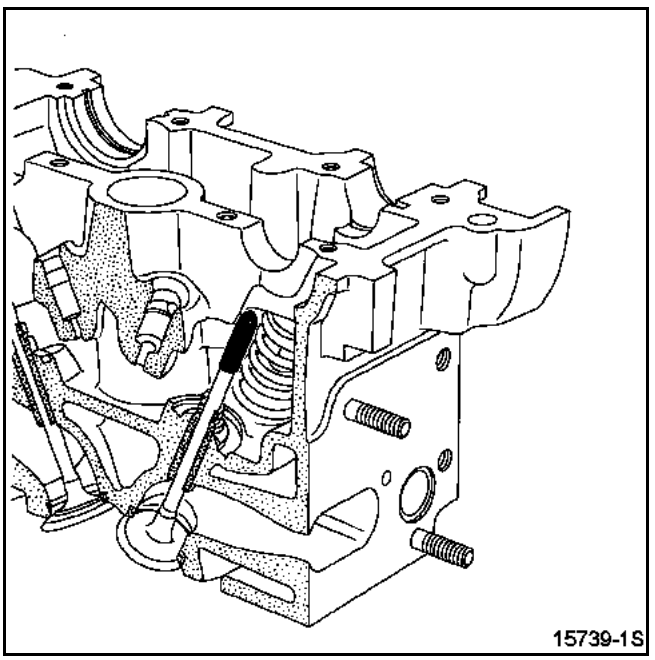
REBUILDING THE CYLINDER HEAD

Fit new valves, grind them gently into their respective seats. Clean all the parts thoroughly, mark them for identification purposes, then carry out the refitting operation.



Lubricate the inside of the valve guide.

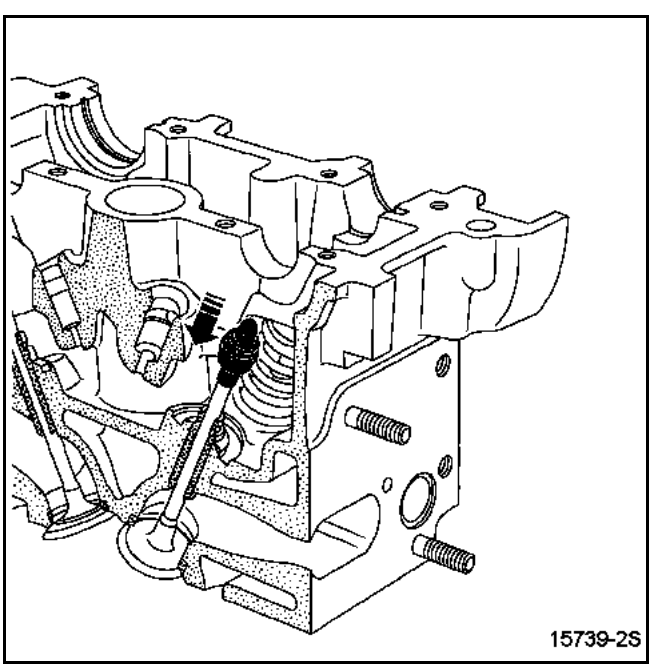
It is imperative to fit the valve stem seals using tool Mot. 1511-01 or other suitable equipment.



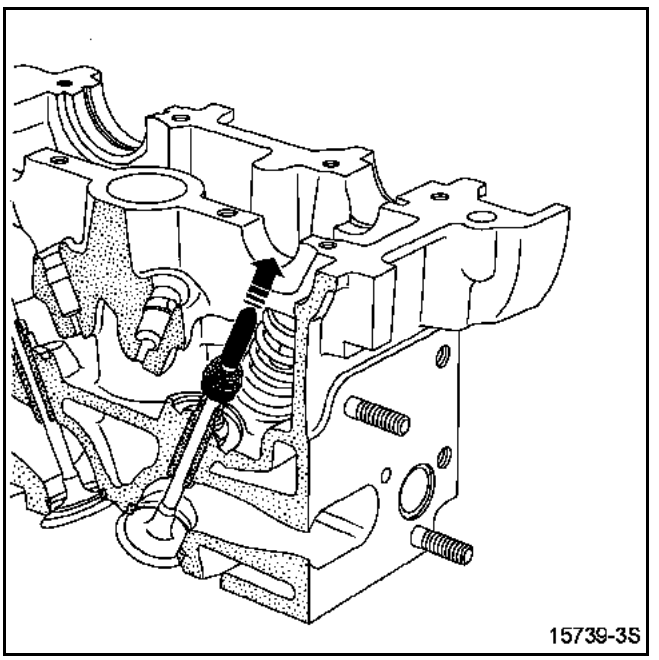
NOTE: do not lubricate the valve stem seals before fitting them.

Fitting new valve stem seals

Place the valve in the cylinder head.

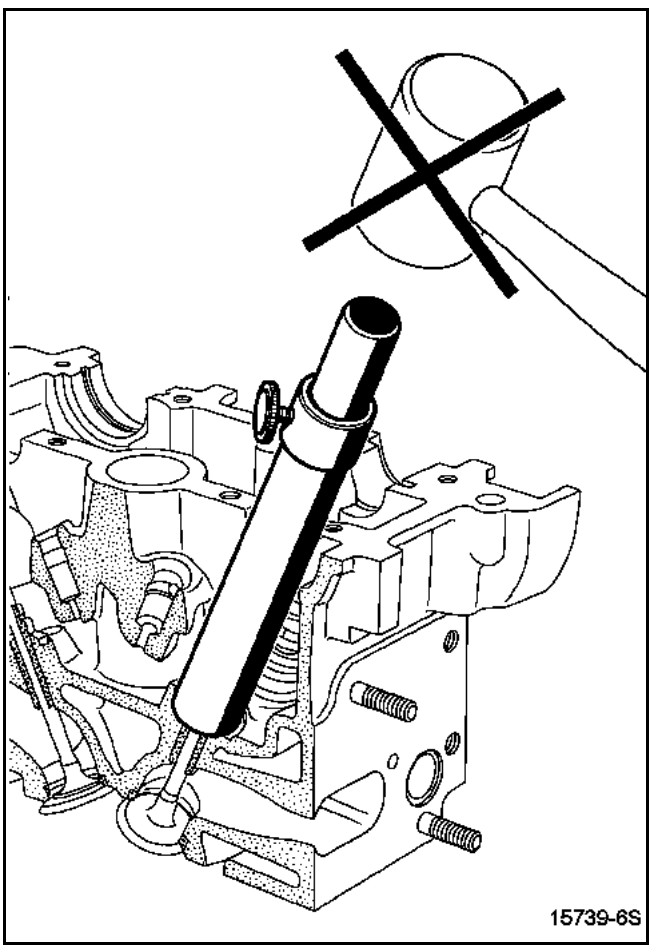


Place the barrel of tool **Mot. 1511-01** over the valve stem (the internal diameter of the barrel must be identical to the diameter of the valve stem).



Keep the valve pressed against its seat.

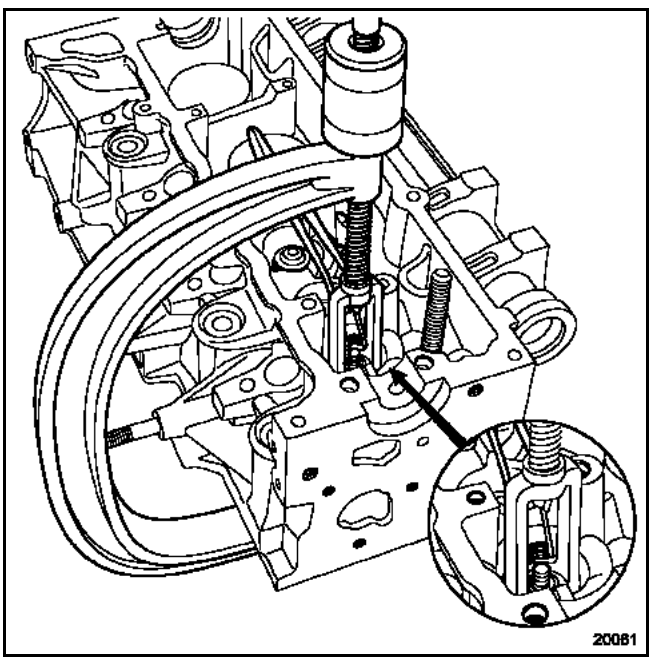
Place the valve stem seal (not lubricated) over the tool barrel.



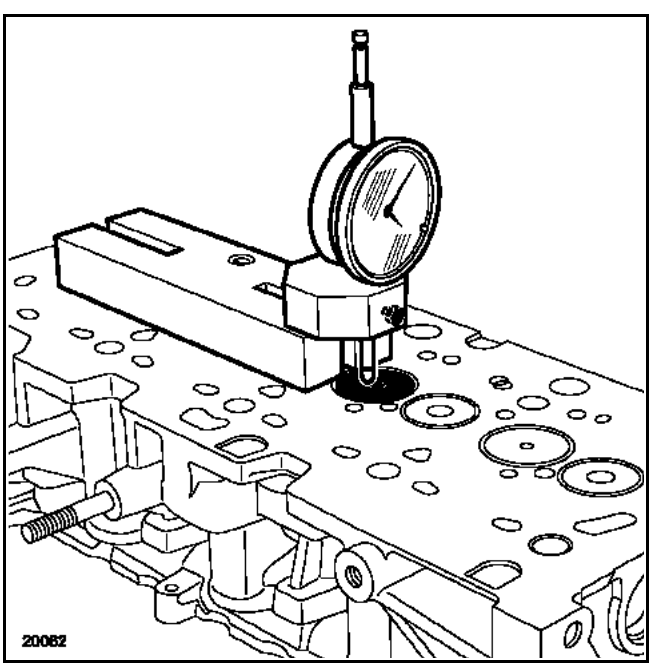
Push the valve stem seal past the tool barrel, then withdraw the barrel.

Place the guide tube plus pushrod assembly on the valve stem seal.

Push the valve stem seal down by tapping **the top of the sleeve with the palm of your hand** until the guide tube touches the cylinder head.



Repeat these operations for all the valves.

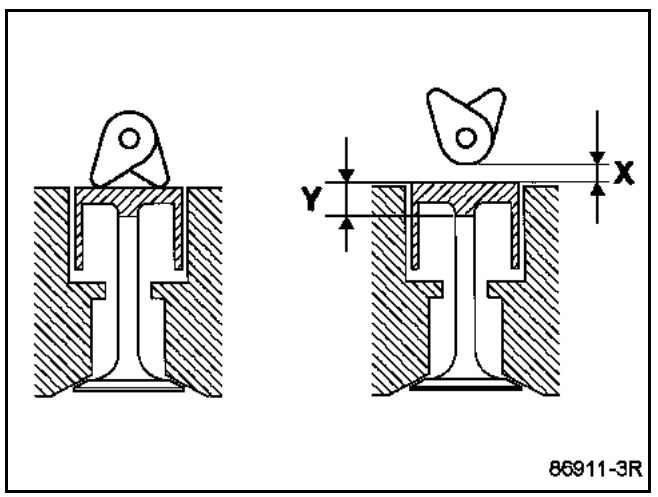


Fit:
– the springs,
– the upper cups,

Compress the springs.

Refit the keys using tweezers.

Check the valve protrusion which should be **0 ± 0.07 mm.**



CHECKING AND ADJUSTING THE VALVE CLEARANCE

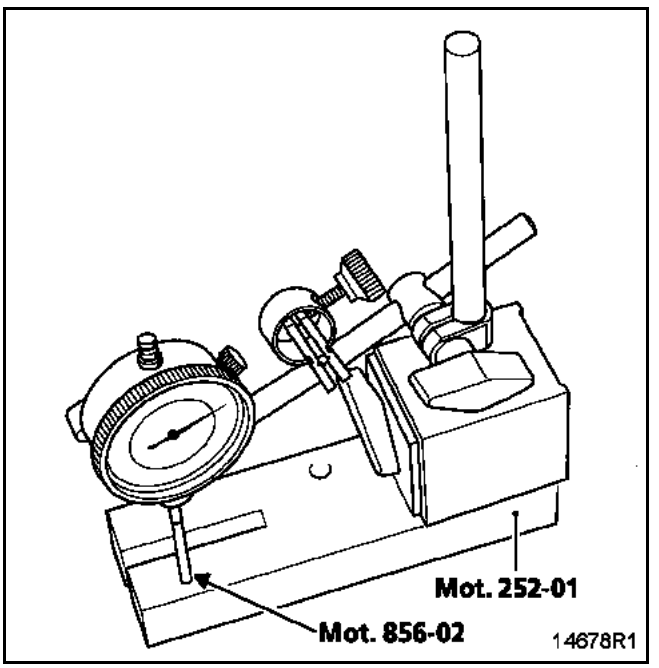
Refit:
– the tappets,
– the camshaft,
– the camshaft bearings, tightening the bolts to a torque of **1 daN.m**.

Place the valves of the cylinder concerned at the "end of exhaust - beginning of inlet" position and check the clearance (X).

NOTE: dimension (Y) corresponds to the tappet thickness class (there are 25 classes at the Parts Store).

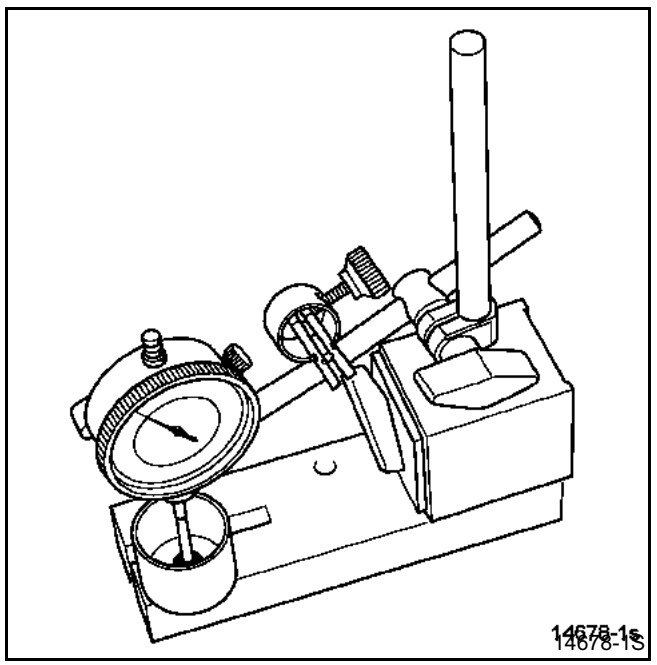
1	**4**
3	**2**
4	**1**
2	**3**

Compare the values recorded with the values specified, then replace the tappets which are not within tolerance.



Clearance, when the engine is cold, in mm:

Inlet	**0.20**	**+ 0.05 -0.075**
Exhaust:	**0.40**	**+ 0.05 -0.075**



Remove:
– the camshaft bearings,
– the camshaft,
– the tappet(s) not within tolerance.

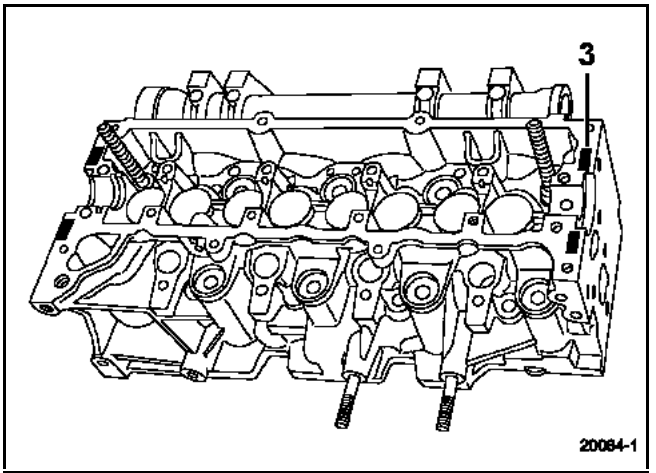
Determining dimension Y.

Set up the following assembly using **Mot. 252-01** and **Mot. 856-02,** then calibrate the gauge.

Raise the gauge extension (**without modifying the position of the magnetic support/gauge assembly**), then slide in the tappet to be measured.

Note dimension (Y) and repeat the operation for the tappets where the valve clearance is not within tolerance.

Refer to the Replacement Parts Catalogue for the vehicle concerned to select the various thicknesses of the tappet(s) .



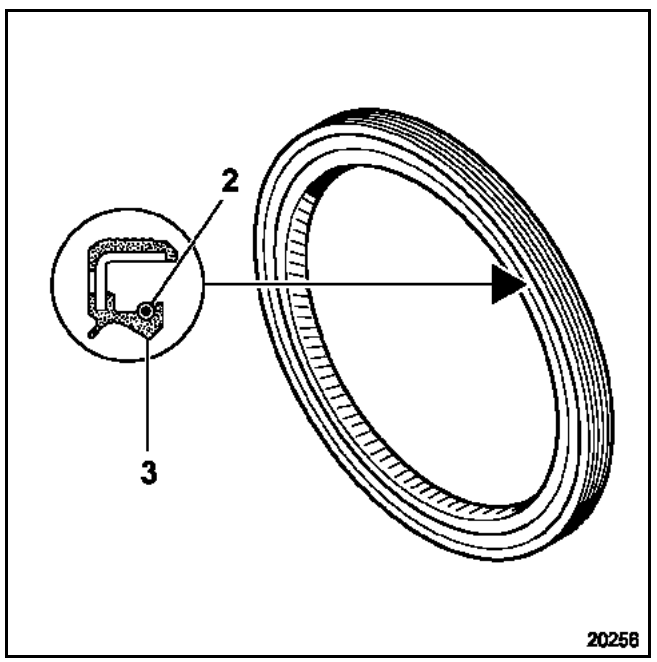
Check the valve clearance again.

Remove:
– the camshaft bearings,
– the camshaft,
– the tappet(s) not within tolerance.

Grease the underside of the tappets and the camshaft bearings.

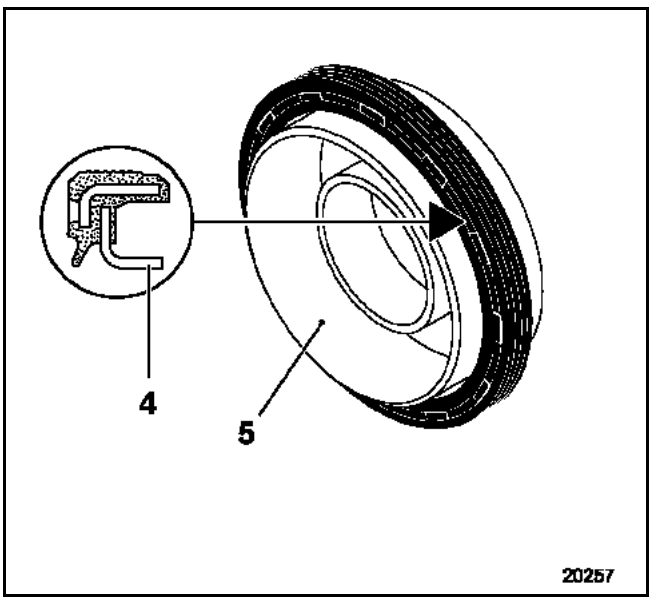
Degrease the gasket faces (of the cylinder head and bearings numbers 1 and 6). They should be clean, dry and free from grease (in particular, remove finger marks).

Lay four beads (3) of **Loctite 5181** with a width of **1 mm** on bearings 1 and 6 of the cylinder head.



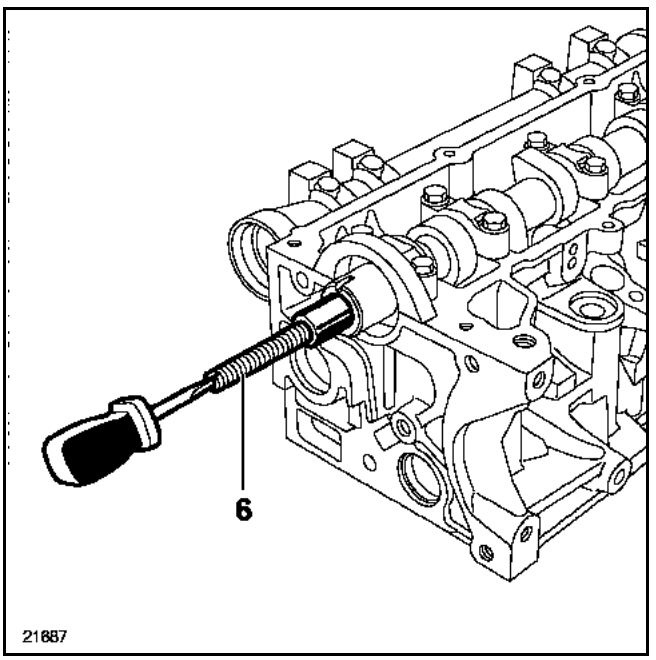
Refit:
– the camshaft,
– the camshaft bearings (these are numbered from 1 to 6 and bearing (1) should be positioned **on the flywheel end**) tightening the bolts to a torque of **1 daN.m.**

Fitting the camshaft seal



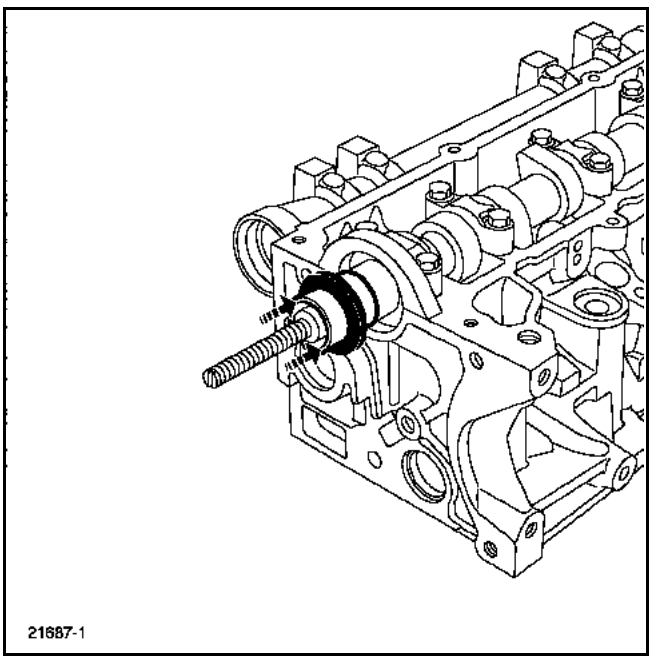
This engine can be fitted with two different types of seal.

Old and new seals are easily recognised.

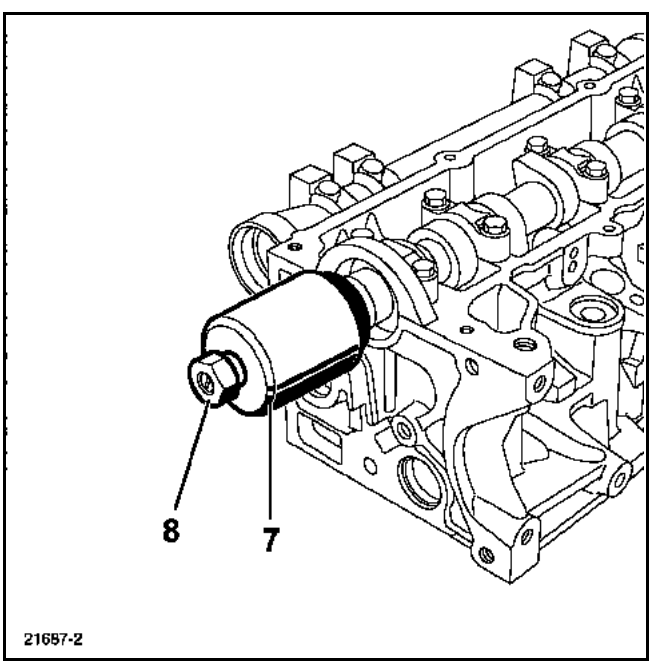


The old rubber seal is fitted with a spring (2) and has a "V"-shaped sealing lip (3).

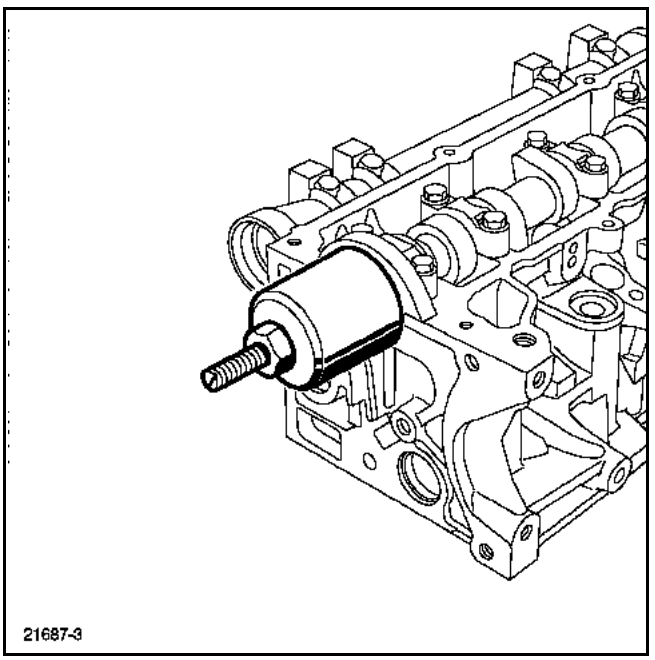
The new rubber seal has a flat sealing lip (4) and a protector (5) which also assists in fitting the seal to the engine.



Screw the shouldered rod (6) of **Mot. 1632** onto the stud of the camshaft.

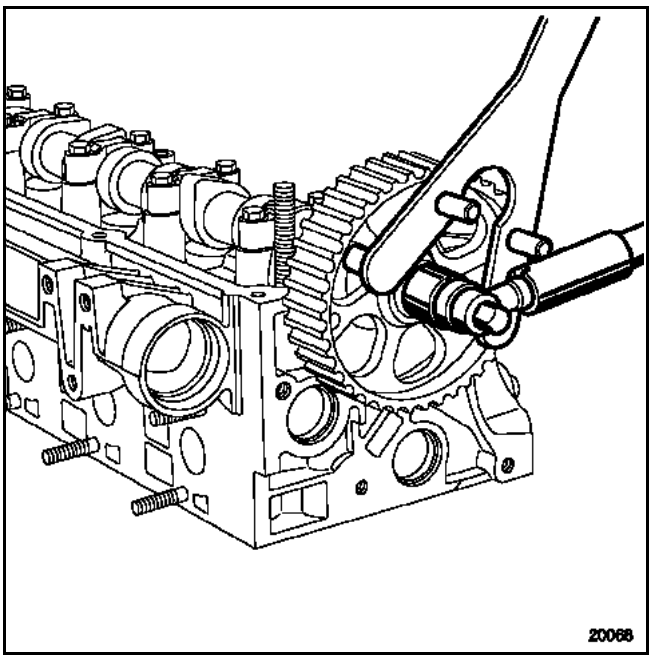


Fit the old seal on the camshaft.

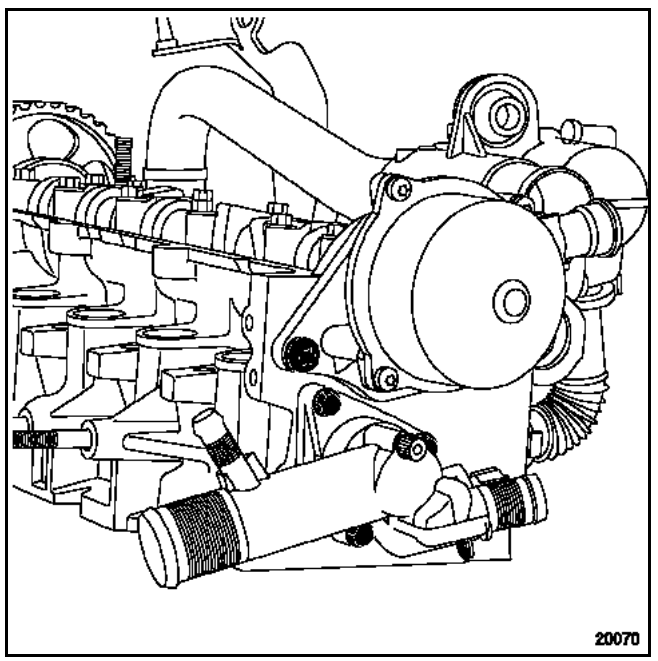


For the new seal, put the protector with the seal on the camshaft, taking care not to touch the seal.

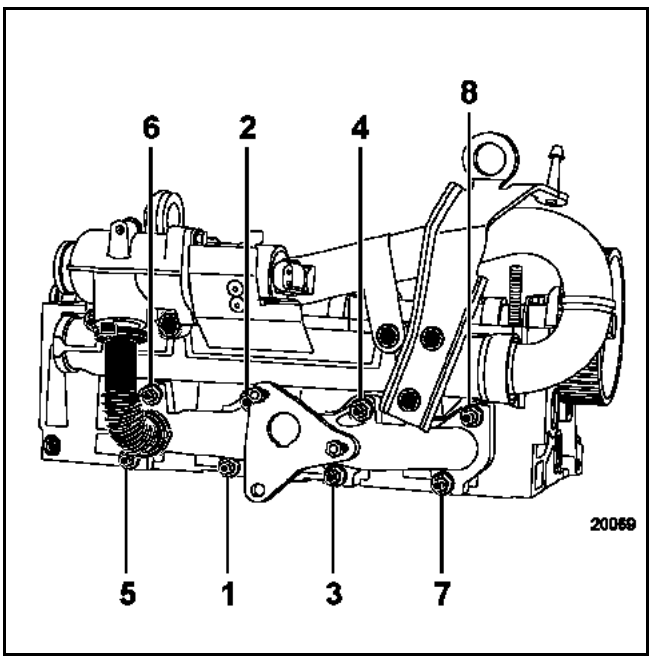
Fit the cover (7) and the collar nut (8) of **Mot. 1632.**



Screw the collar nut until the cover touches the cylinder head.



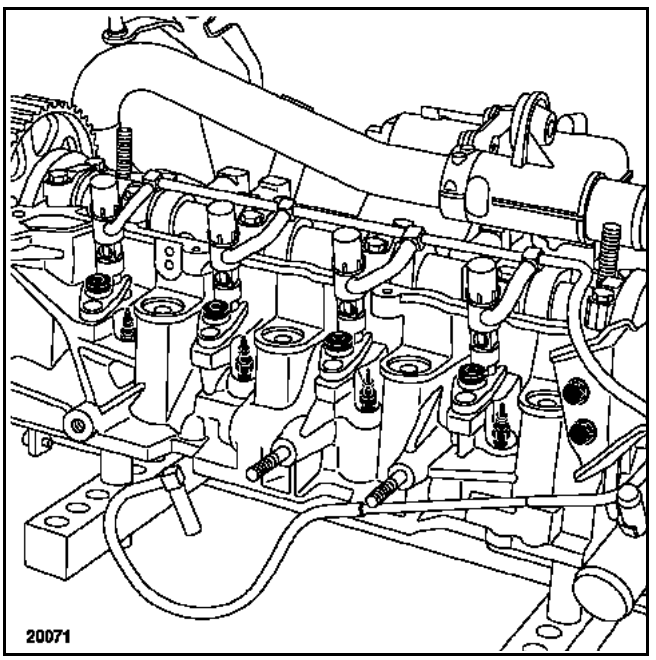
Remove the nut, the cover, the protector and the shouldered rod.



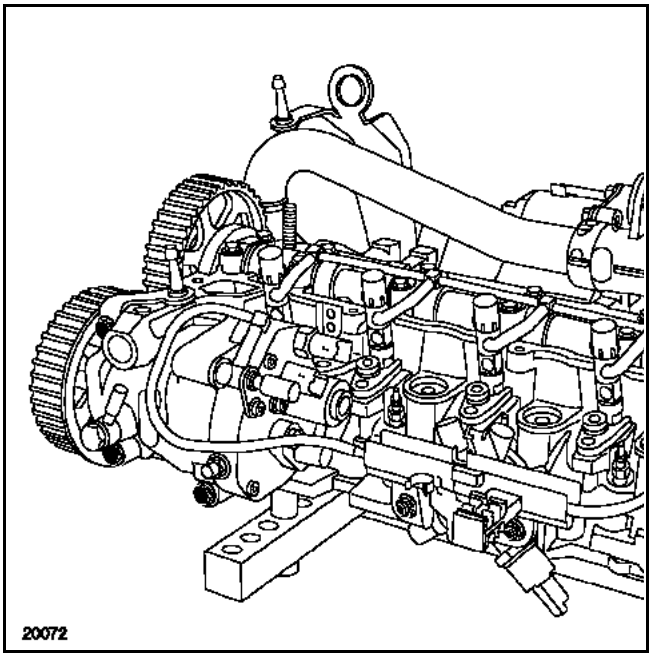
Refit the camshaft pulley, tightening the new nut to a torque of **3 daN.m plus an angle of 84°.**

Refit:
– the vacuum pump fitted with a new seal, tightening the bolts to a torque of **2.1 daNm**,
– the cylinder head coolant outlet unit fitted with a new seal, tightening the bolts to a torque of **1 daNm**,

– the exhaust manifold fitted with new seals, tightening the bolts to a torque of **2.6 daNm in the recommended order**,
– the exhaust gas recycling valve and the exhaust gas recycling pipe fitted with new clips. Tighten the mounting bolts of the valve to a torque of **2.1 daN.m**, then tighten the clips of the pipe using pliers **Mot. 1567**,
– the inlet pipe fitted with a new seal,
– the ring for lifting the engine (timing end).



Clean the injector sockets and the injector bodies, as well as their brackets using a lint-free cloth (use the wipes recommended for this purpose, part no. **77 11 211 707**) dipped in clean solvent.



Dry off using a different new wipe.

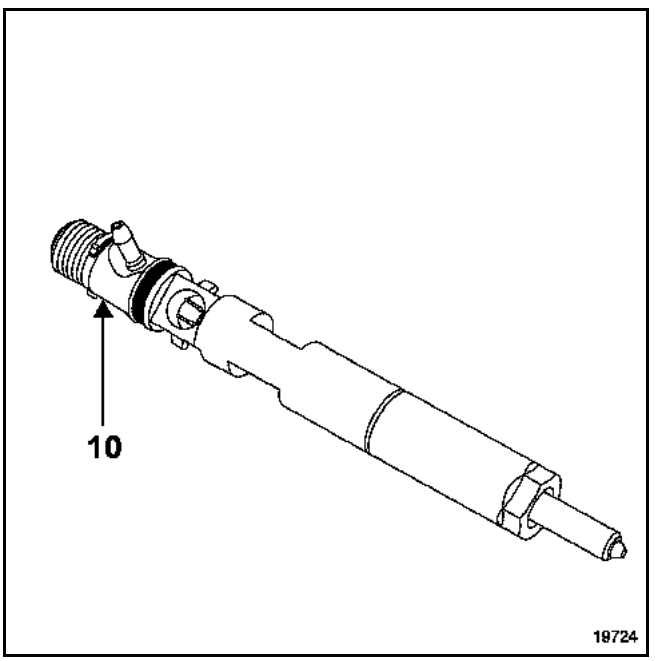
Replace the compression washer with a new washer.

Refit:
– the injectors (using the marks made during removal), tightening the mounting flanges to a torque of **2.8 daN.m**,
– the pre-heater plugs, tightening them to a torque of **1.5 daNm**,
– the ring for lifting the engine (flywheel end),

– the high pressure pump, tightening the bolts to a torque of **2.1 daNm**,
– the high pressure rail **without locking its mounting nuts.**

Method for refitting the injector pipes

WARNING: all removed high pressure pipes must be systematically replaced.



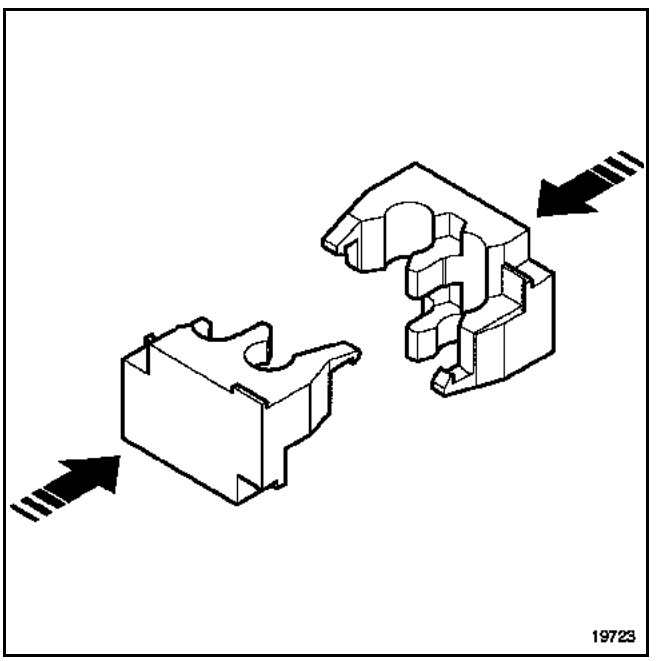
Before fitting the new high pressure pipes, lubricate the threads of the nuts with the applicator supplied with the kit of new parts.

Fit the rail-high pressure pump pipe:

– remove the protective plugs from the pump high pressure outlet and the rail high pressure inlet.
– insert the olive of the high pressure pipe into the taper of the pump high pressure outlet.
– insert the olive of the high pressure pipe into the taper of the rail high pressure inlet.
– put the high pressure pipe nuts in position by hand beginning with the one located on the rail side.

Fit the injector-high pressure rail pipe:

WARNING: when tightening the high pressure pipes, it is essential to secure the intermediate union (10) of the injector.

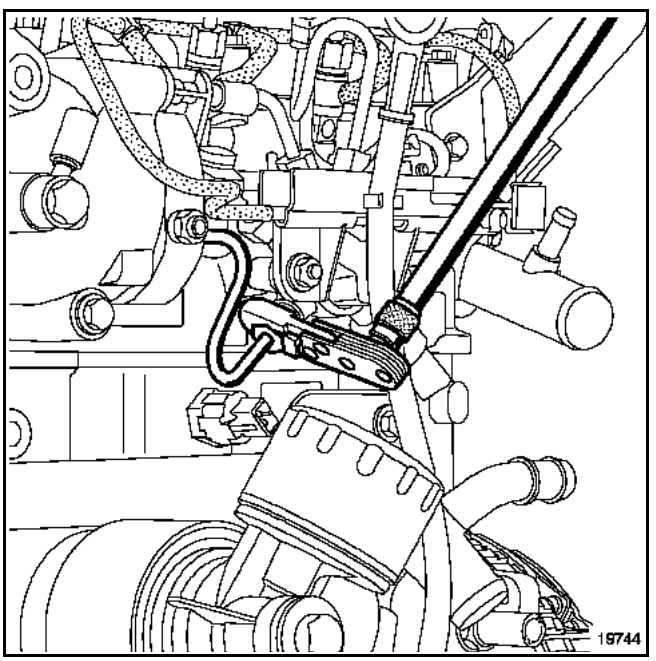


– remove the protective plugs from the rail high pressure rail outlet and the injector high pressure inlet.
– insert the olive of the high pressure pipe into the taper of the injector high pressure inlet.
– insert the olive of the high pressure pipe into the taper of the rail high pressure outlet.
– put the high pressure pipe nuts in position by hand beginning with the one located on the injector side.

Fit the remaining high pressure pipes as before.

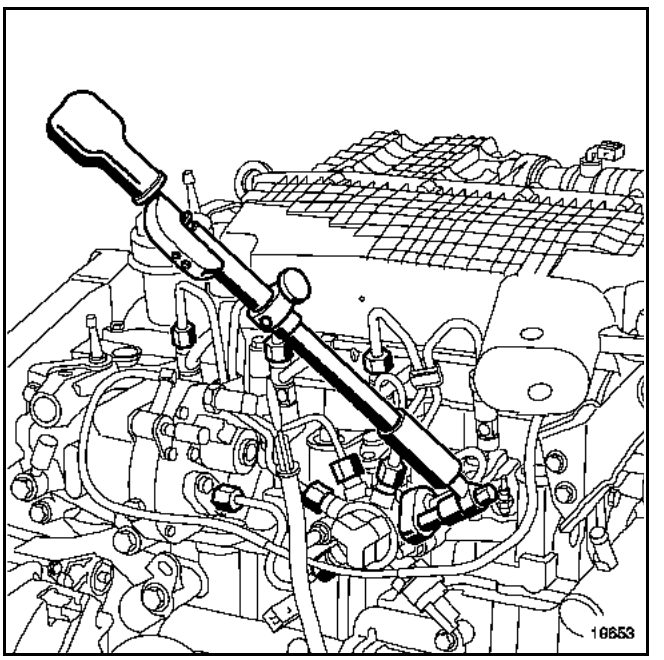
Fit the clips supplied with the new pipes onto the high pressure pipes:
– Insert the first half of the clip using adjustable pliers,
– Insert the second half of the clip using adjustable pliers.

IMPORTANT: Pay attention to the direction of fitting of the second half of the clip. The tabs located in the centre of the clip will only fit together in one position.



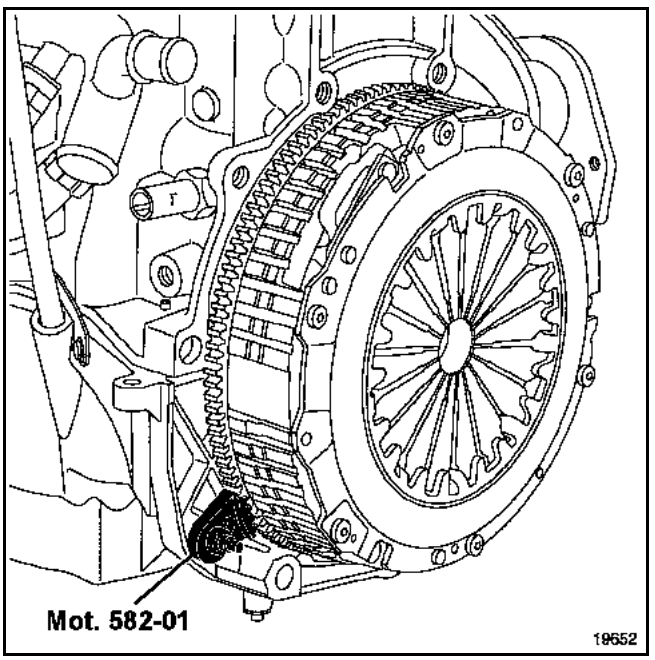
Tighten the rail nuts to a torque of **2.8 daNm**.

IMPORTANT: do not touch the pipes with the wrench when torque tightening.



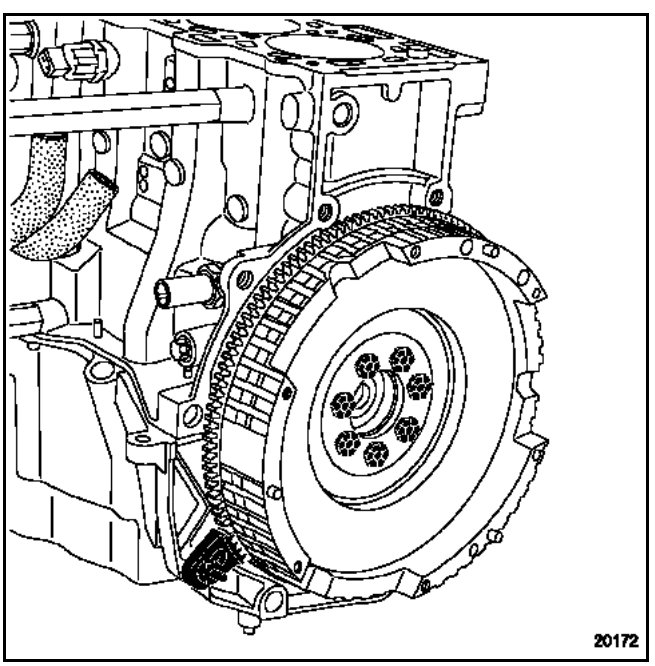
WARNING: the correct order and tightening torque must be used for the high pressure pipes.

Tighten the nuts of the pump-rail high pressure pipe using the recommended tool:
- tighten the nut on the rail side to a torque of **3.8 daN.m**,
- tighten the nut on the pump side to a torque of **3.8 daN.m**,

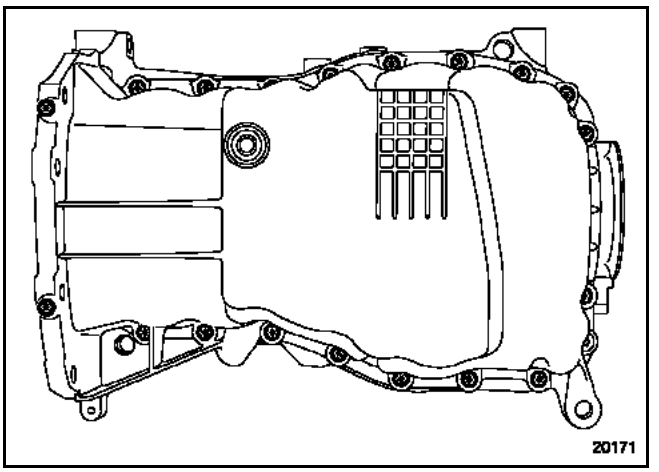


Tighten the nuts of the injector-rail high pressure pipes using the recommended tool:
- tighten the nut on the injector side to a torque of **3.8 daN.m**,
- tighten the nut on the rail side to a torque of **3.8 daN.m**,

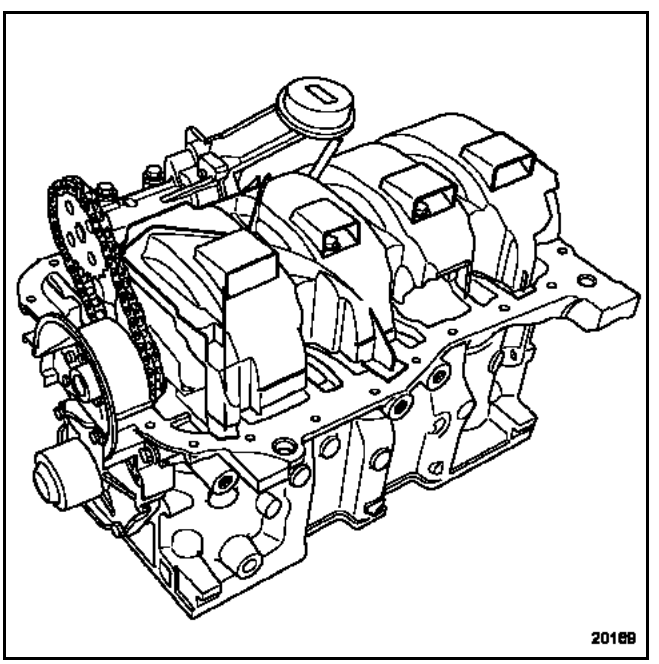
NOTE: Tighten one pipe fully before moving on to the next pipe.



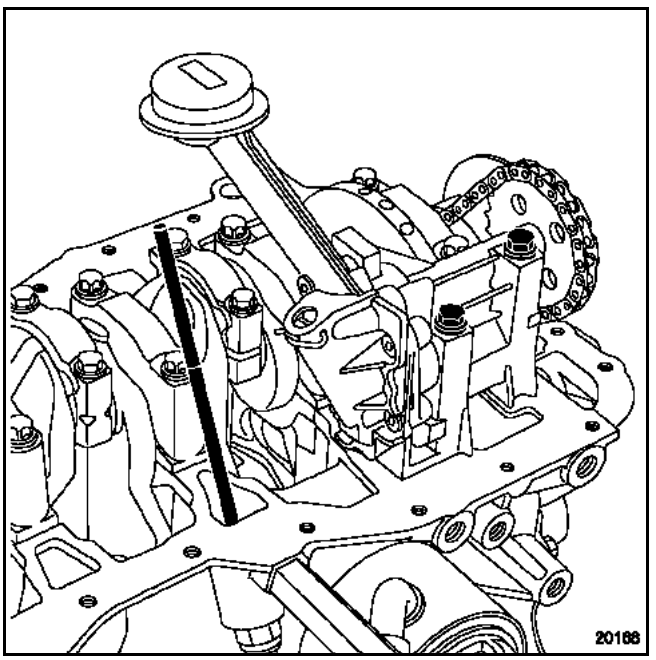
REMOVING THE BOTTOM ENGINE



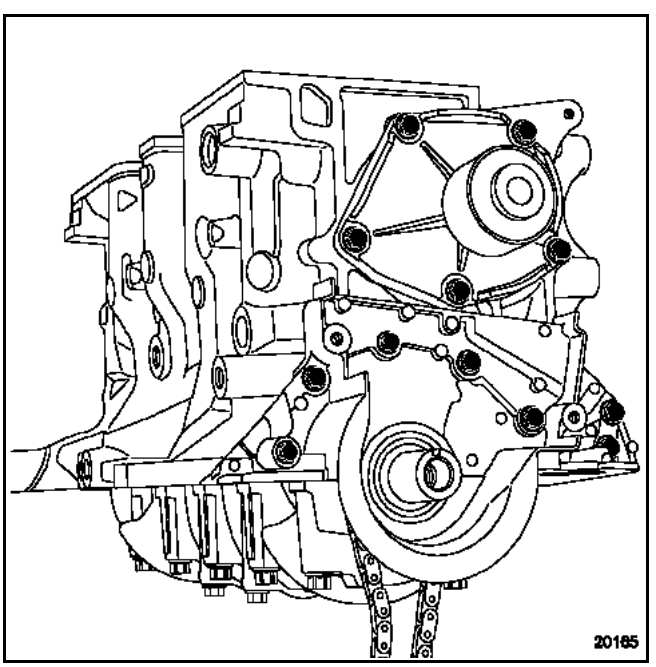
Fit flywheel block **Mot. 582-01**.



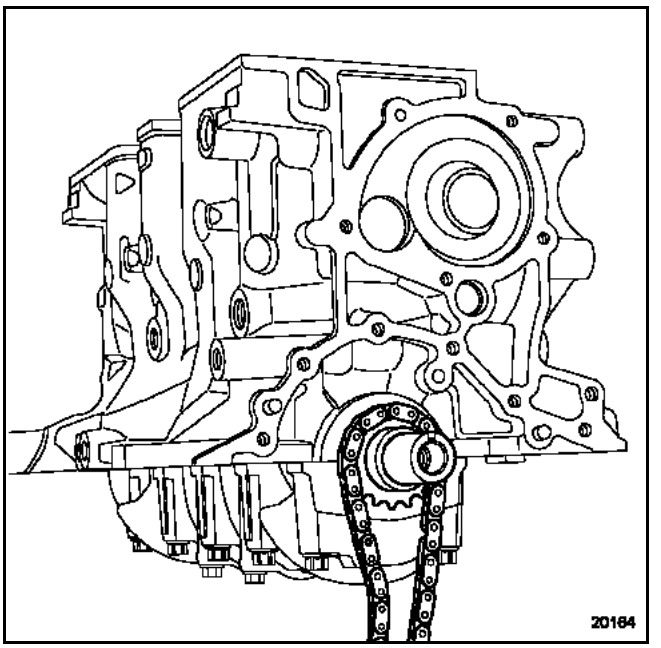
Remove:
– the clutch mechanism,
– the flywheel,



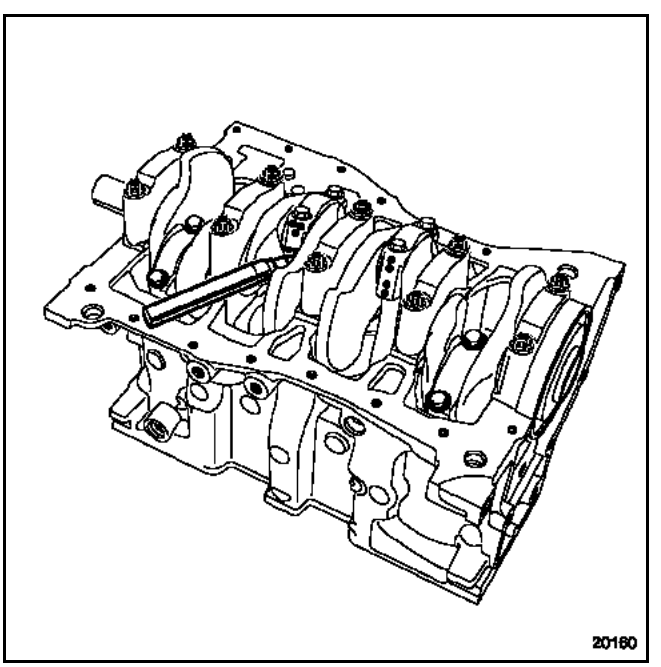
– the sump,



– the anti-emulsion plate,



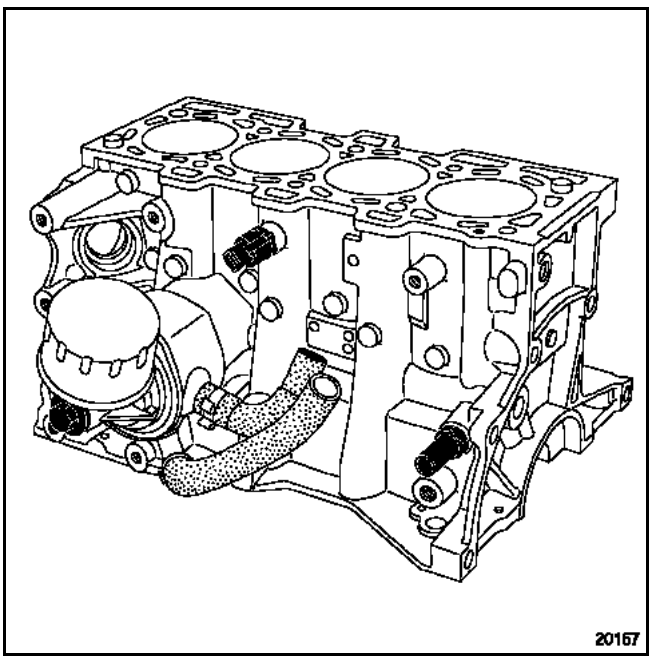
– the oil level sensor,
– the oil pump,



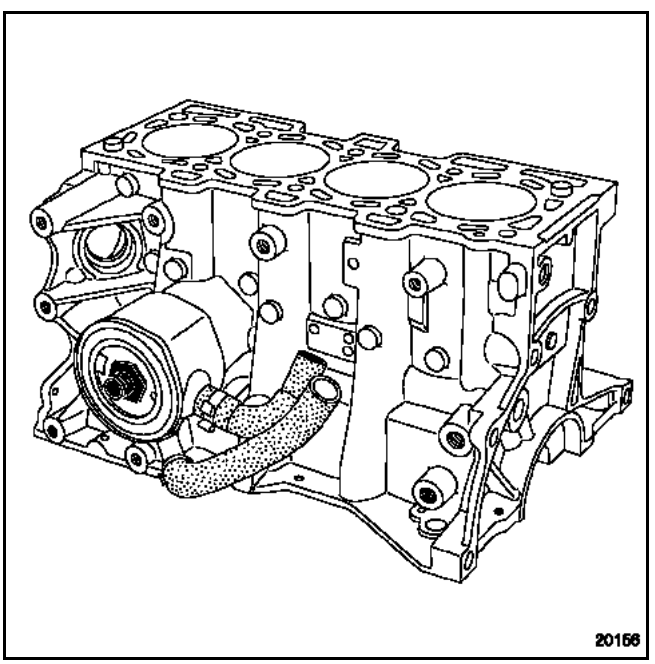
– the crankshaft closure plate,
– the water pump,

– the oil pump chain,
– the oil pump drive sprocket.

WARNING: do not use a sharp point to mark the bearing caps in relation to their con rods to avoid starting a crack in the rod. Use a permanent marker pen.



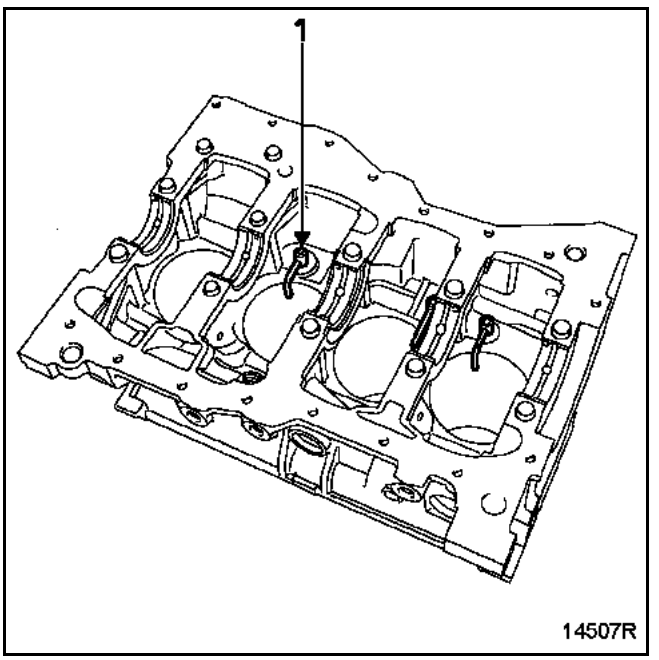
Remove the big end cap bolts and the connecting rod/piston assemblies.



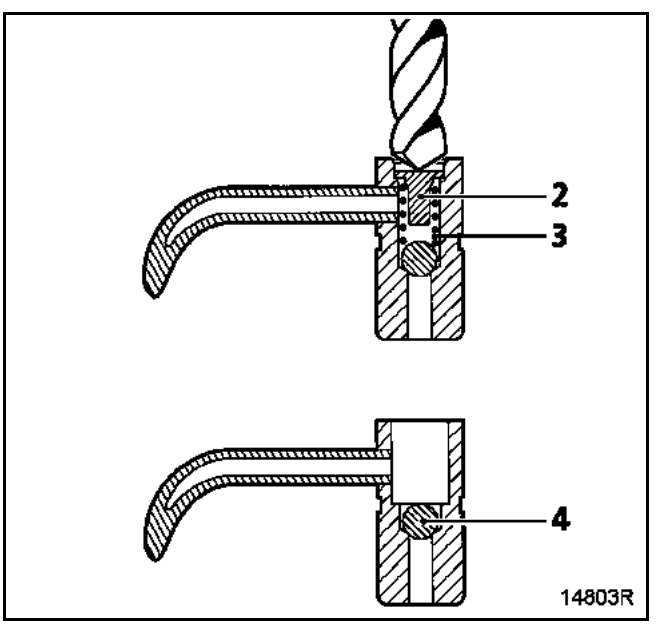
NOTE: It is essential to mark the position of the crankshaft shells, as the category may be different for each bearing.

Remove:
– the crankshaft bearing caps,
– the crankshaft.

Remove:
– the oil pressure sensor,
– the pinking sensor,
– the bolt of the oil filter unit bracket.

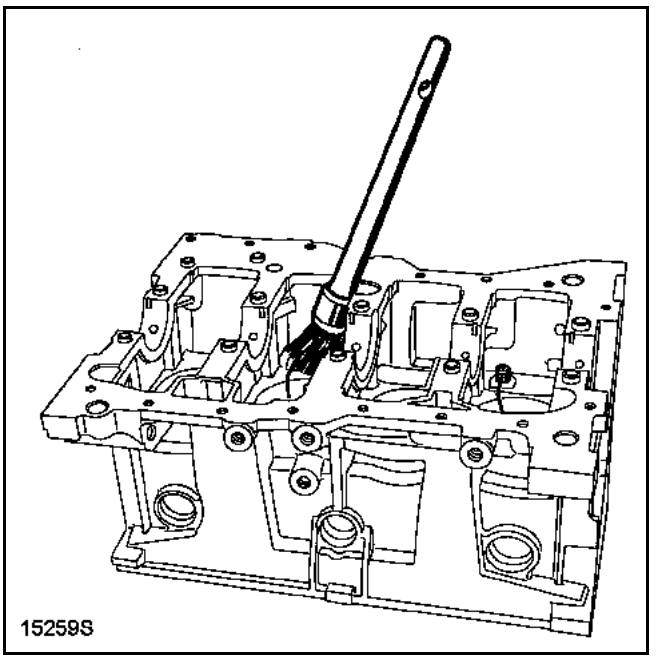


– the heat exchanger connector.

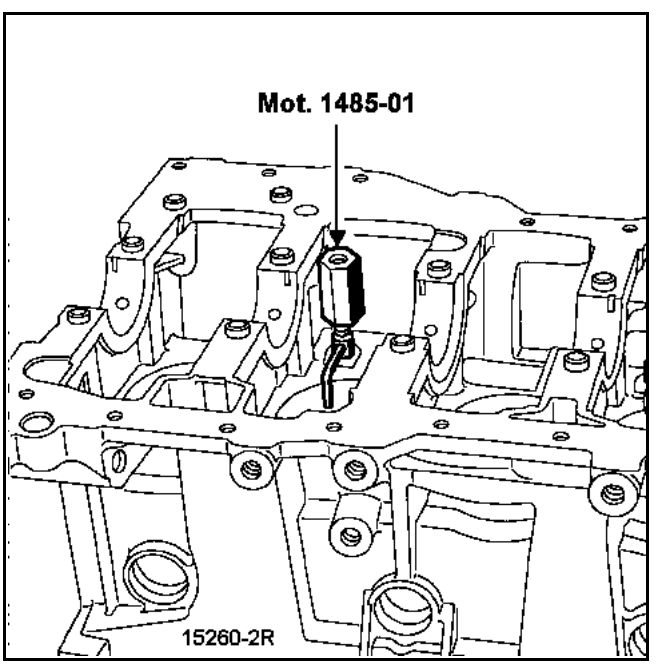


Replacement of the piston base cooling jets

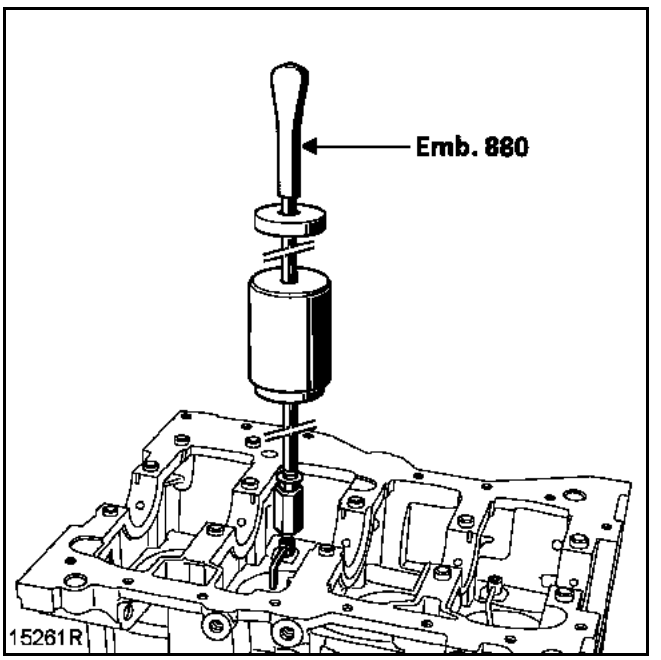
REMOVAL



To remove the piston base cooling jets (1), they must be drilled with a **7 mm** diameter drill. This is necessary in order to remove the spring stop (2) and the spring (3).



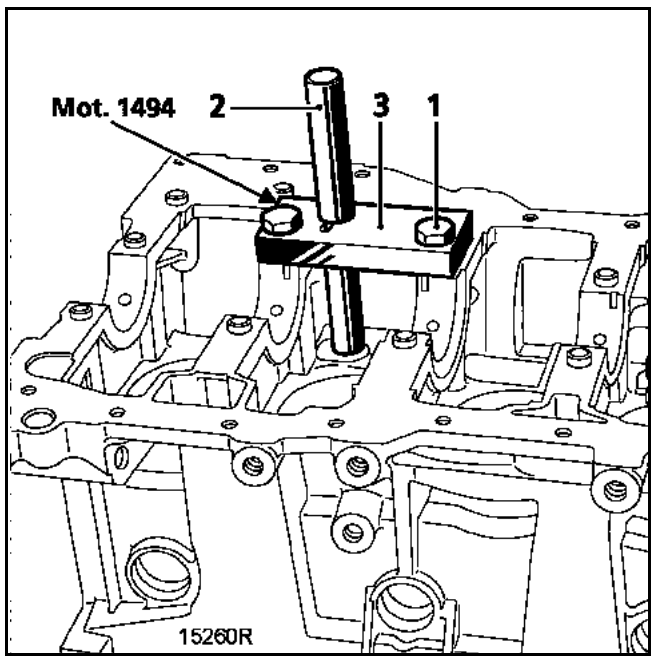
NOTE: do not remove the ball (4) to prevent swarf entering the cooling circuit.



Remove the swarf using a brush.

Screw:
– tool **Mot. 1485-01** in the drilled out jets using a **6 mm** Allen key which must slide into the tool,

– the inertia extractor **Emb. 880** onto **Mot. 1485-01** and remove the jet.

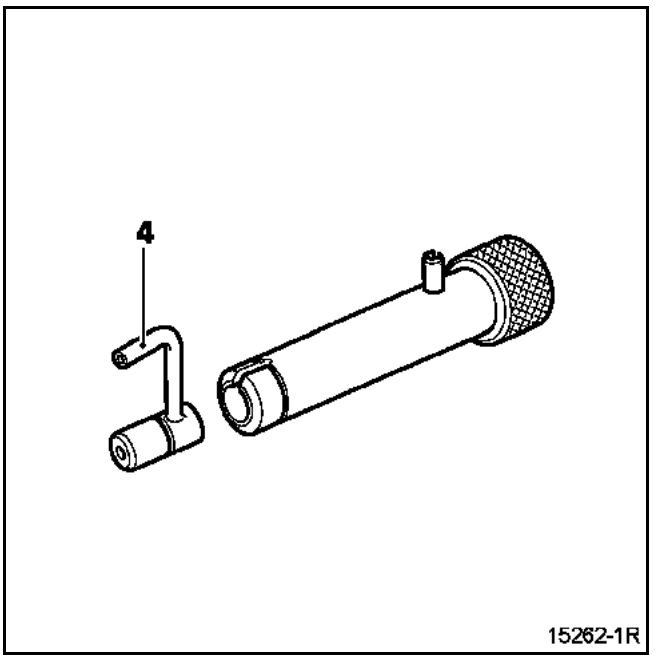


Fitting piston base cooling jets

The jets must be fitted using tool **Mot. 1494.**

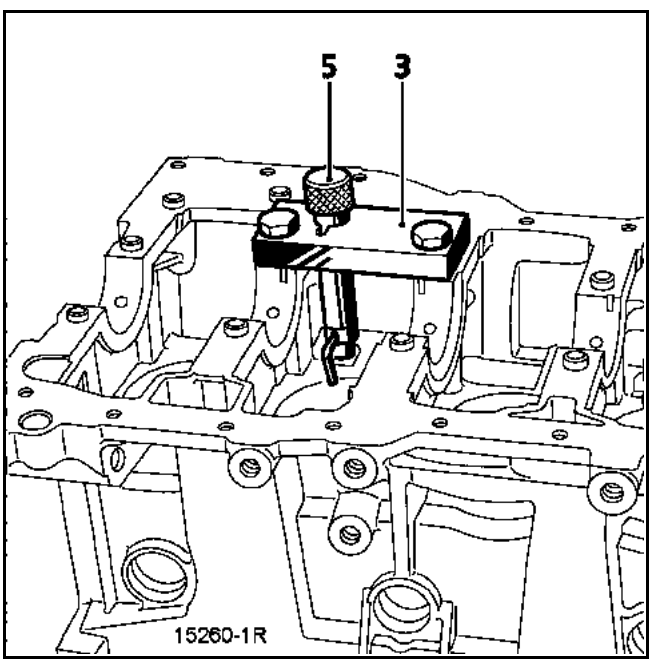
Fitting the jets for cylinders 1 and 3

Fit plate (3) of tool **Mot. 1494** onto the cylinder block (as shown on the diagram below) without tightening the two bolts (1).



Position the guide rod (2) in the plate (3) and the end of the guide rod in the hole of the jet to centre the plate (3).

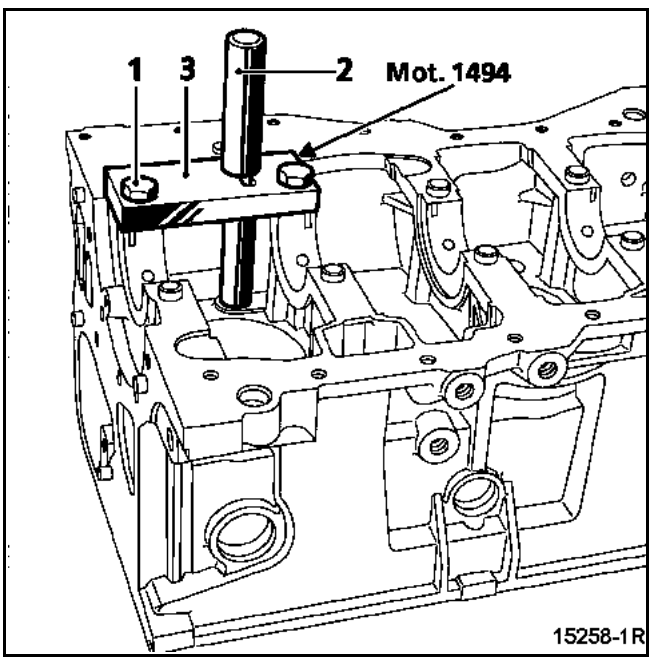
Tighten the two bolts (1).



Remove the guide rod.

Fit the pushrod instead and in place of the guide rod, then insert the jet into the pushrod.

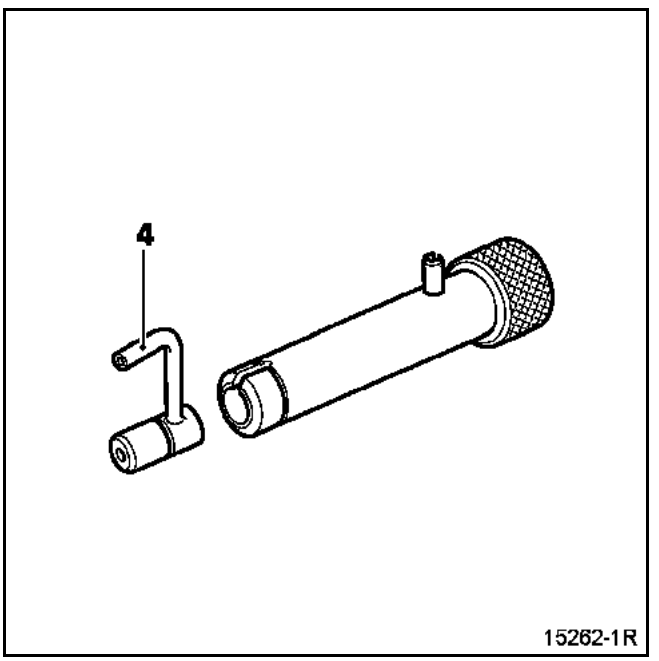
NOTE: check that the jet is correctly oriented with the end of the jet (4) directed towards the centre of the cylinder.



With a hammer, tap the pushrod until the shoulder (5) of the pushrod comes into contact with the plate (3).

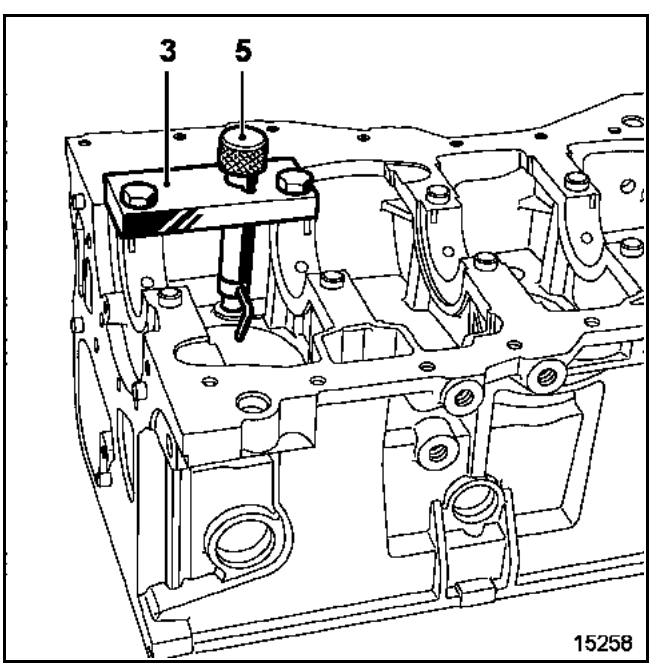
Fitting the jets for cylinders 2 and 4

Fit plate (3) of tool **Mot. 1494** onto the cylinder block (as shown on the diagram below) without tightening the two bolts (1).



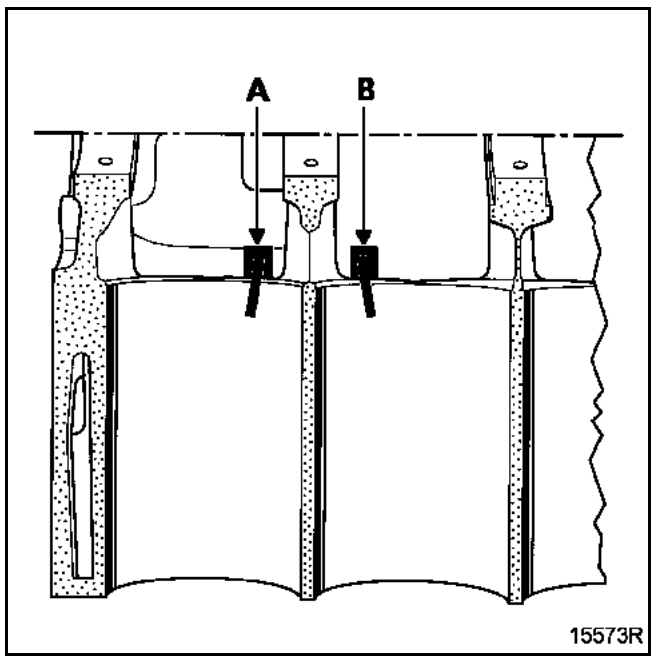
Position the guide rod (2) in the plate (3) and the end of the guide rod in the hole of the jet to centre the plate (3).

Tighten the two bolts (1).



Remove the guide rod.

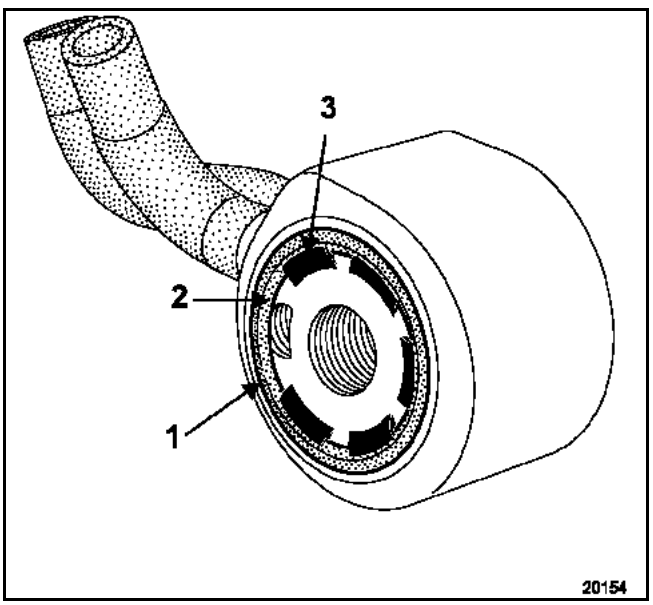
Position the pushrod instead and in place of the guide rod, then insert the jet into the pushrod.



NOTE: check that the jet is correctly oriented with the end of the jet (4) directed towards the centre of the cylinder.

With a hammer, tap the pushrod until the shoulder (5) of the pushrod comes into contact with the plate (3).

Orientation of the piston cooling jets (see diagram below).



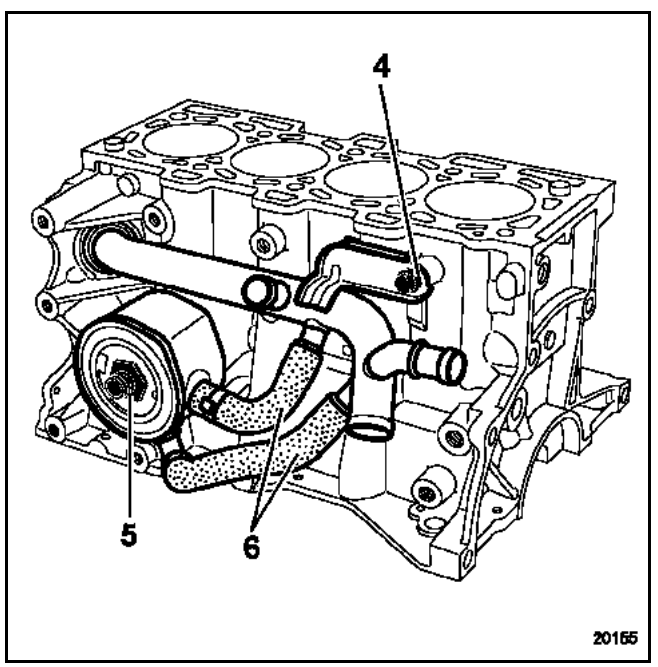
A: Orientation of the jets of cylinders 2 and 4
B: Orientation of the jets of cylinders 1 and 3

Clean:
– the cylinder block,
– the crankshaft by passing a wire through the lubrication channels.

Method for refitting the heat exchanger

Remove the cylinder block from engine stand **Mot. 792-03.**

Replace the seal (1) of the exchanger, positioning the lip (2) of the seal behind the lugs (3) of the exchanger.

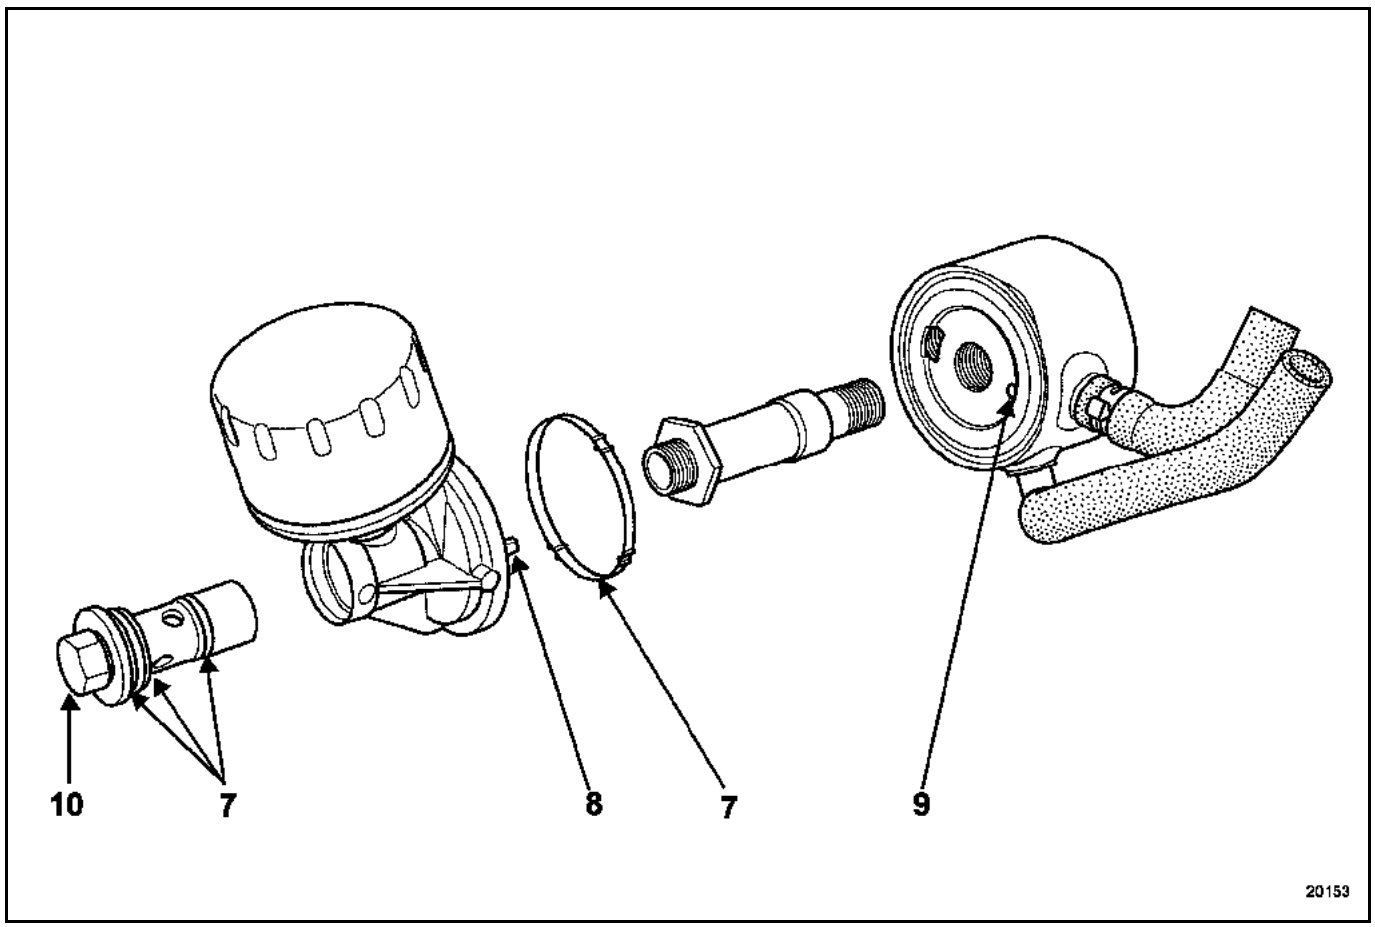


Proceed as follows to ensure the exchanger is correctly refitted.

Refit the inlet pipe of the water pump, securing using the bolt (4).

Fit the exchanger (with its coolant pipes) on the cylinder block using the connector (5) without locking the connector.

Insert the two coolant hoses (6) onto the ends of the coolant pipe.

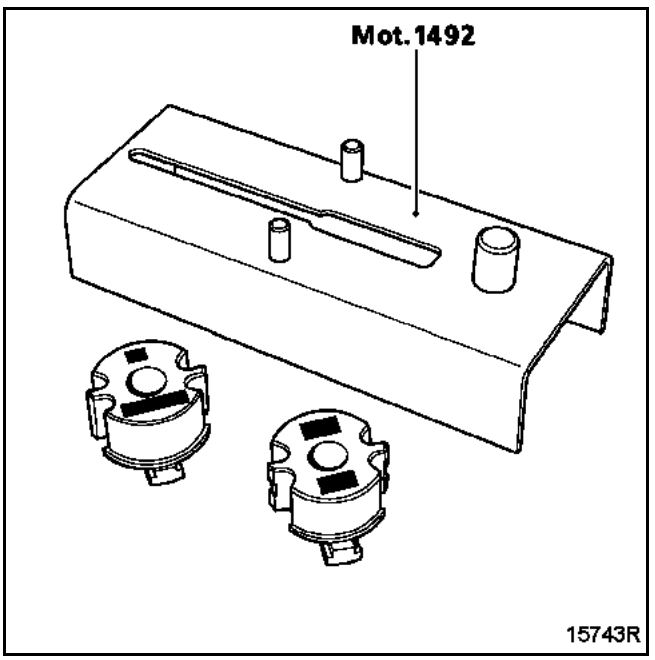


Hold the exchanger by hand whilst tightening the connector (5) to a torque of **4.5 daN.m**.

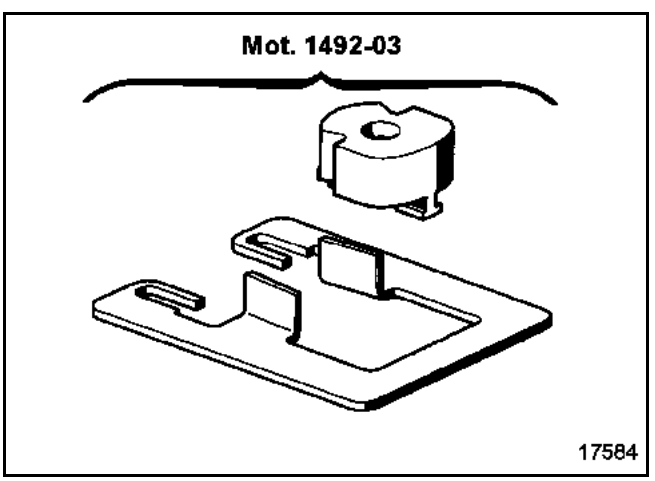
Remove the water pump inlet pipe.

Refit the cylinder block on engine stand **Mot. 792-03**.

Fit the oil filter support (complete with a new seal (7)), positioning the lug (8) in the hole (9) of the exchanger. Then tighten the bolt (10) fitted with new seals, to a torque of **4.5 daN.m**.



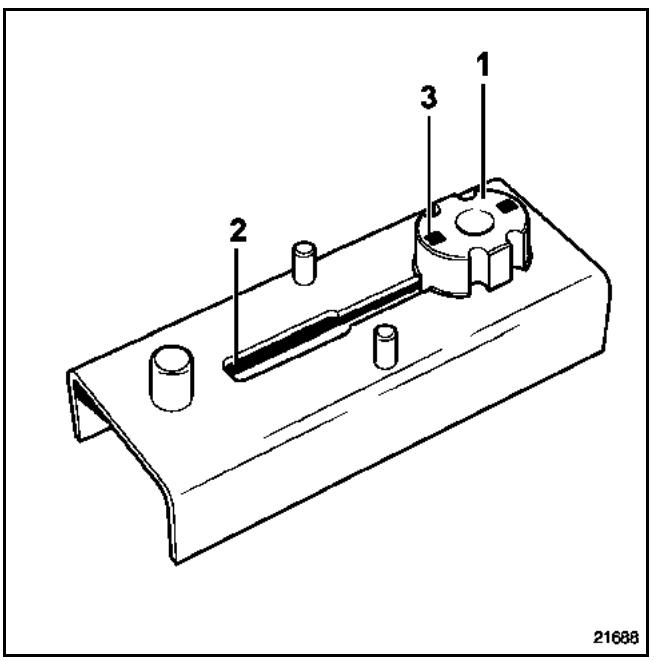
EXTRACTING THE GUDGEON PINS



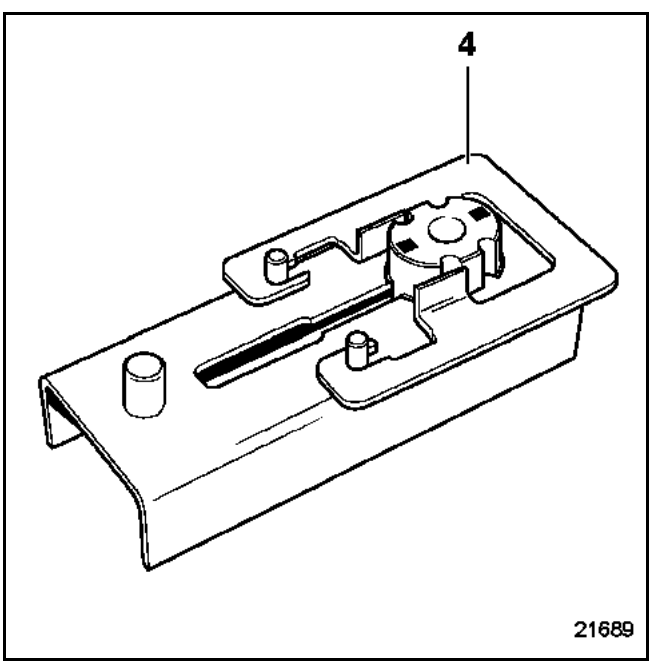
N.B.: it is imperative to mark the connecting rod to match it to its piston, because the piston height classes in the same engine may be different (see Technical Specifications section).

To extract the gudgeon pin, remove the spring ring using a screwdriver, then release the pin.

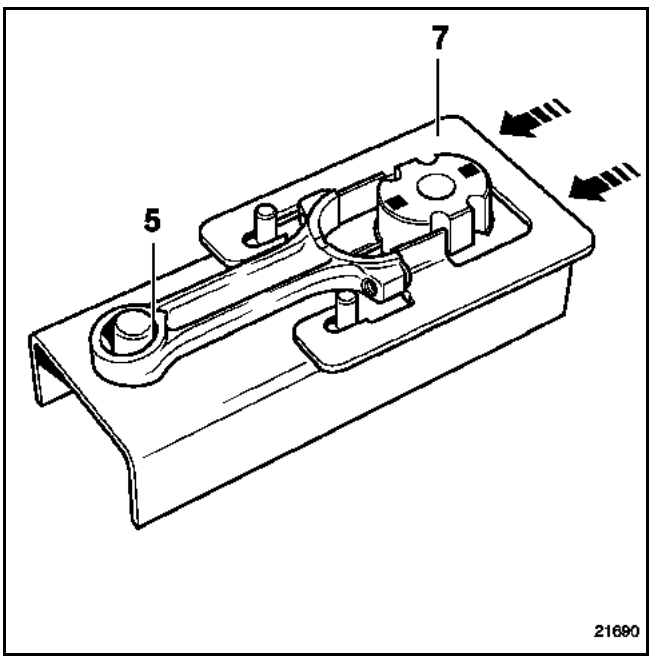
FITTING THE CON ROD BEARING SHELLS



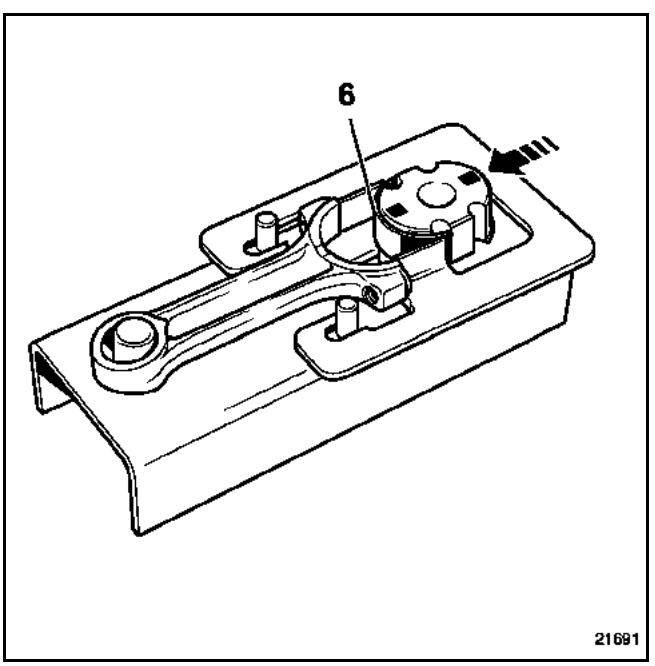
The bearing shells are fitted using **Mot. 1492** and **Mot. 1492-03**.



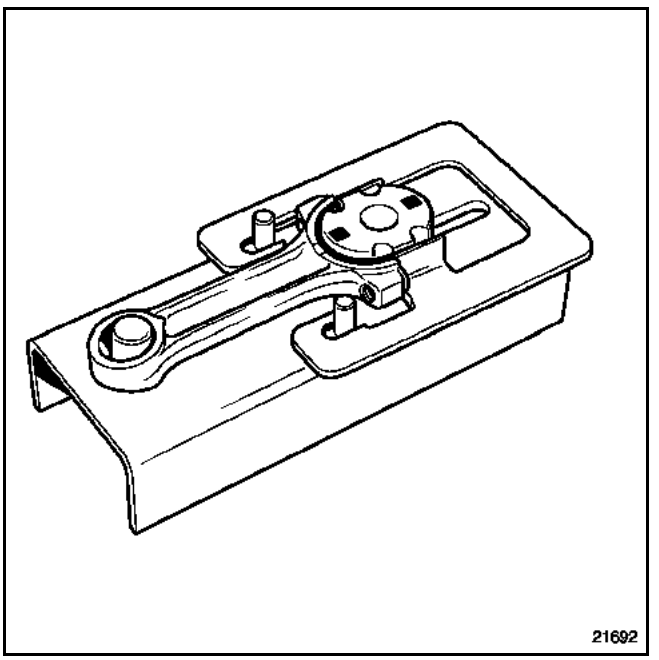
On the con rod body



Slide the bearing shell support (1) of **Mot. 1492-03 (positioning the engraved mark (3) "A" as shown on the diagram below)** into the groove (2) of the base of **Mot. 1492.**

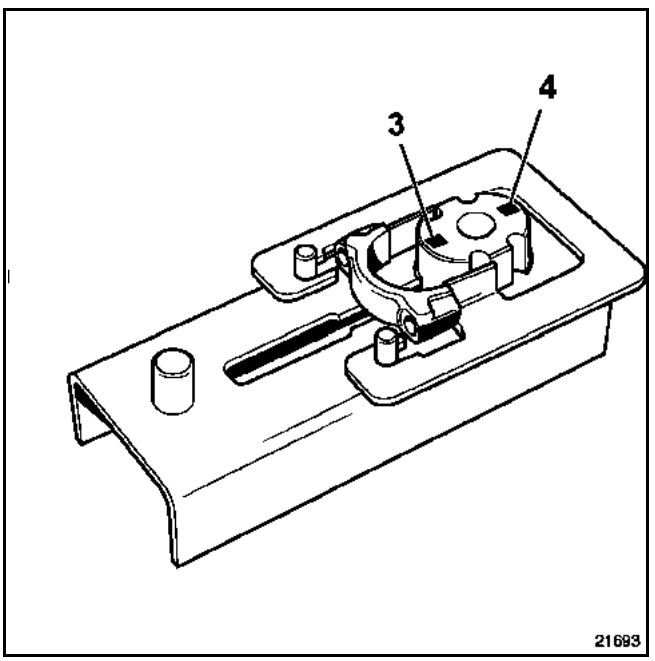


Fit the guide (4) of **Mot. 1492-03** onto the base (as shown in the diagram).

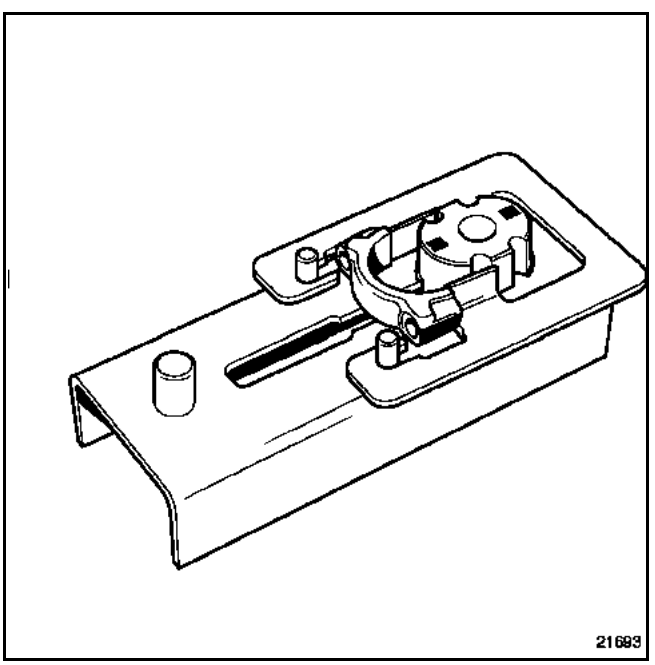


Lay the body of the con rod on the base of the tool (as shown in the diagram). Check that the lower part (5) of the small end is touching the centring pin and push the guide (7) in the direction of the arrow.

Lay the bearing shell (with a width of **20.625 mm**) (6) on the bearing shell support, then push it in the direction of the arrow (as shown on the diagram).

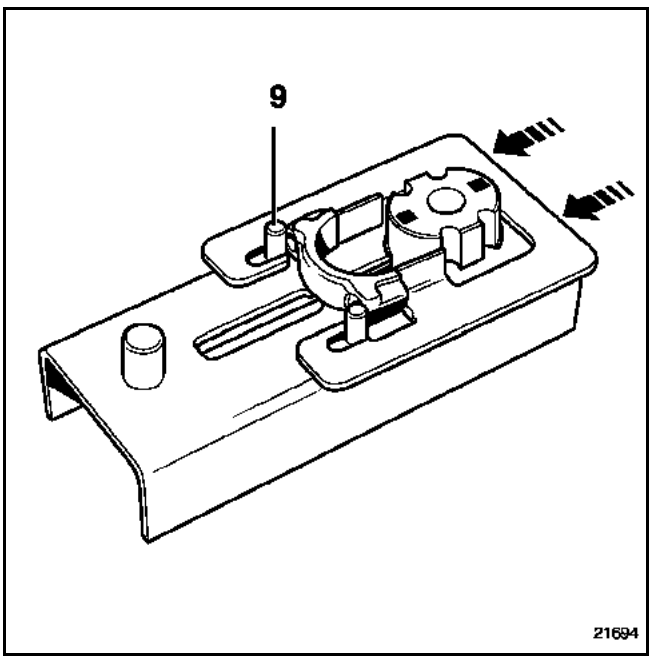


Bring the shell support up against the base of the con rod body.

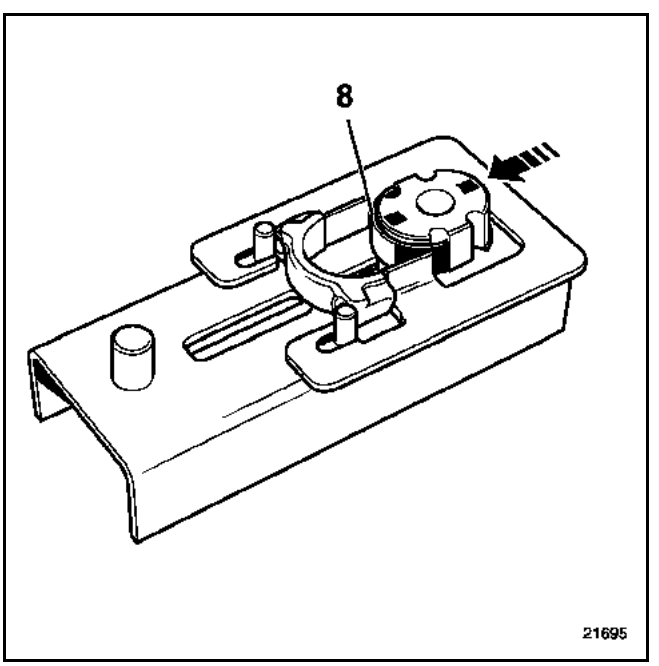


Remove the con rod body support and repeat the operation for the remaining con rod bodies.

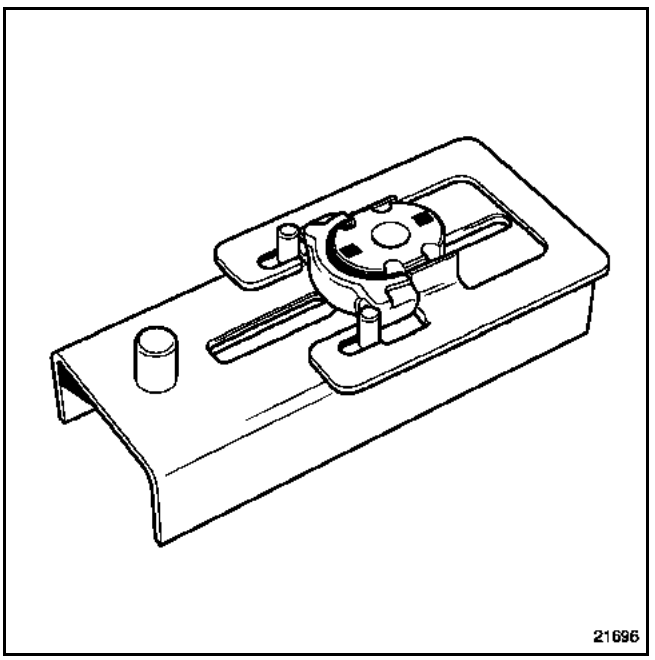
On the con rod cap



Position the bearing shell support either on:
– the engraved mark (3) "A" if the width of the bearing shell is equal to **20.625 mm**,
– the engraved mark (4) "B" if the width of the bearing shell is equal to **17.625 mm**,



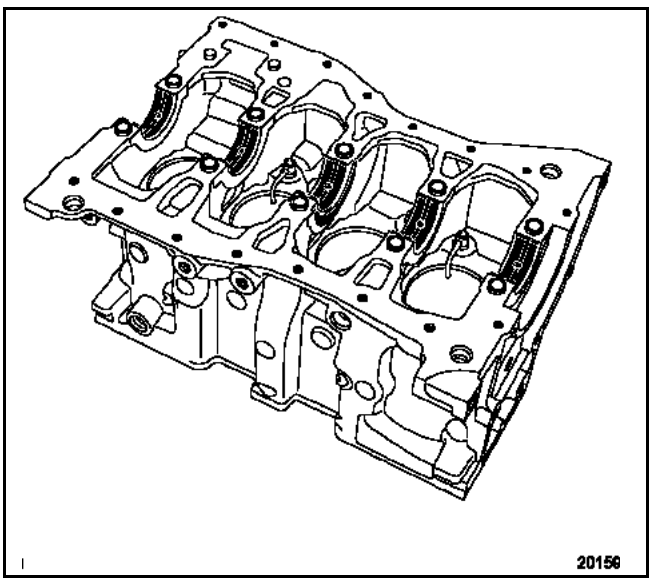
Fit the con rod cap as shown in the diagram.



Push the guide (in the direction of the arrow) until the con rod cap is in contact with the pins (9) on the base of the tool.

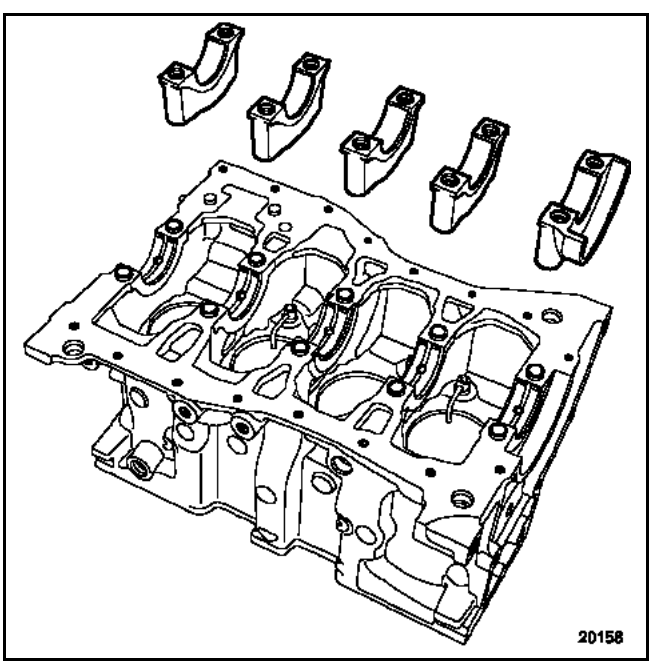
Fit the shell (8) on the shell support, then push it in the direction of the arrow (as shown in the diagram).

Bring the shell support up against the base of the con rod cap.



Remove the con rod cap support and repeat the operation for the remaining con rod caps.

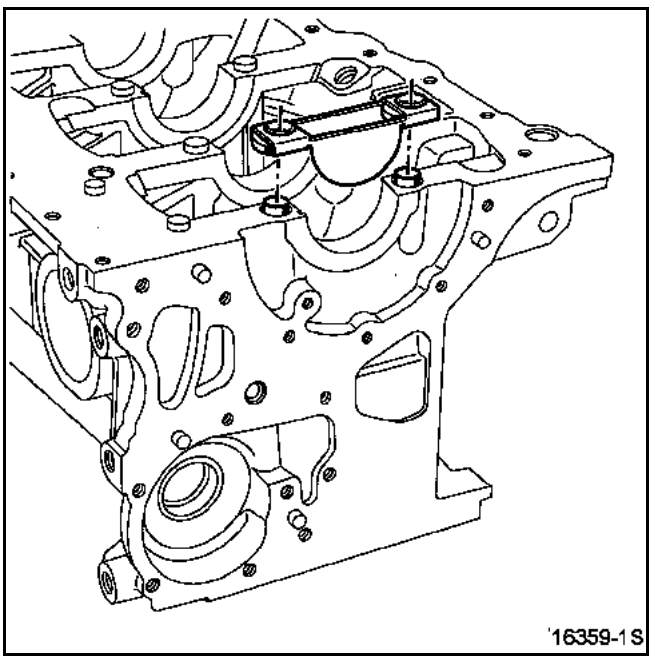
REFITTING THE BOTTOM ENGINE



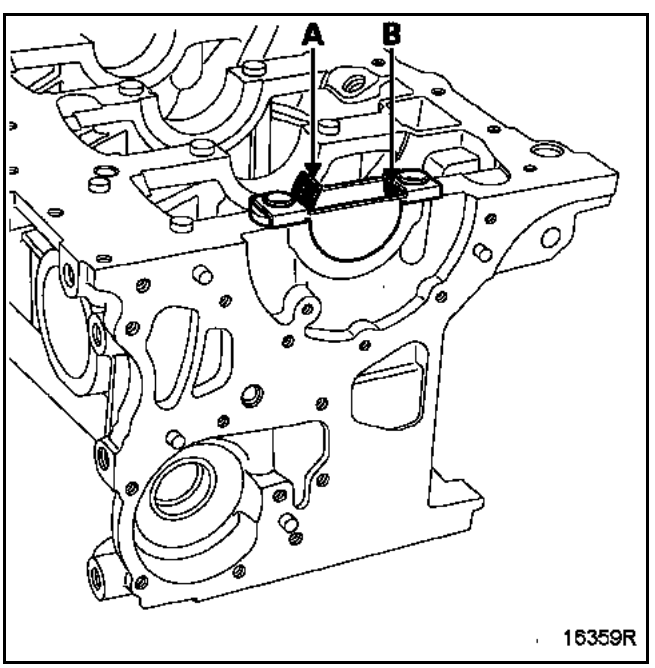
Fitting the crankshaft bearing shells

Direction of fitting.

Position the grooved bearing shells on the cylinder block.

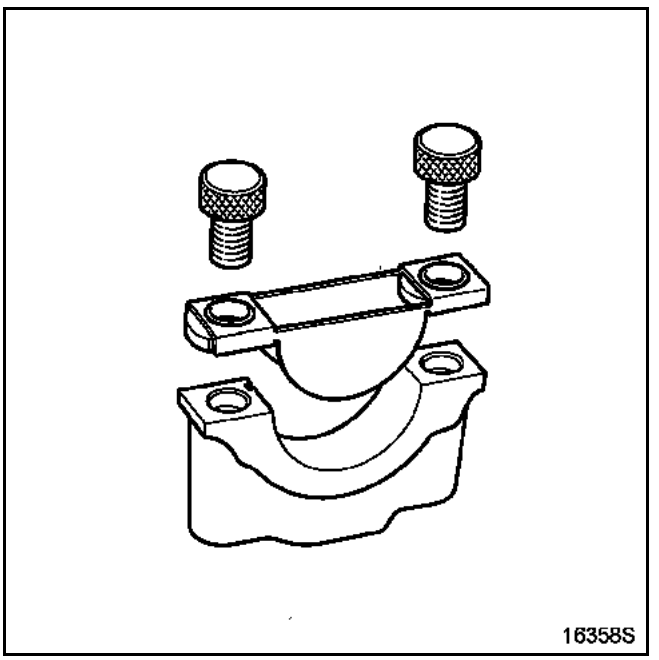


Fit the smooth bearing shells on the bearings.

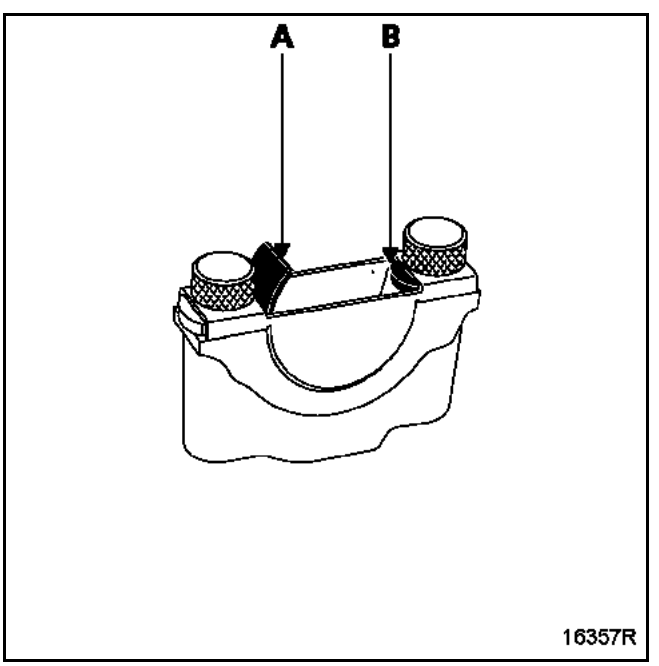


On the cylinder block

Position tool **Mot. 1493-01** on the cylinder block.

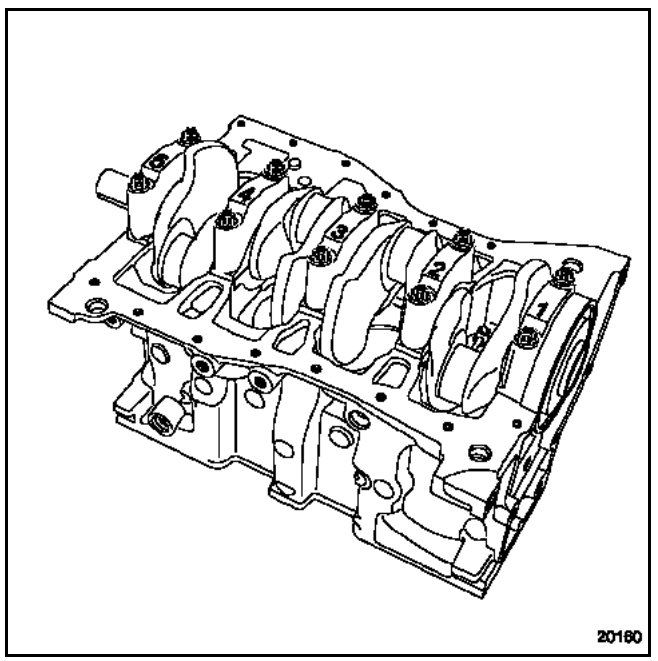


Fit the bearing shell in **Mot. 1493-01**, then press at (A) until the bearing shell is touching at (B) with **Mot. 1493-01**.

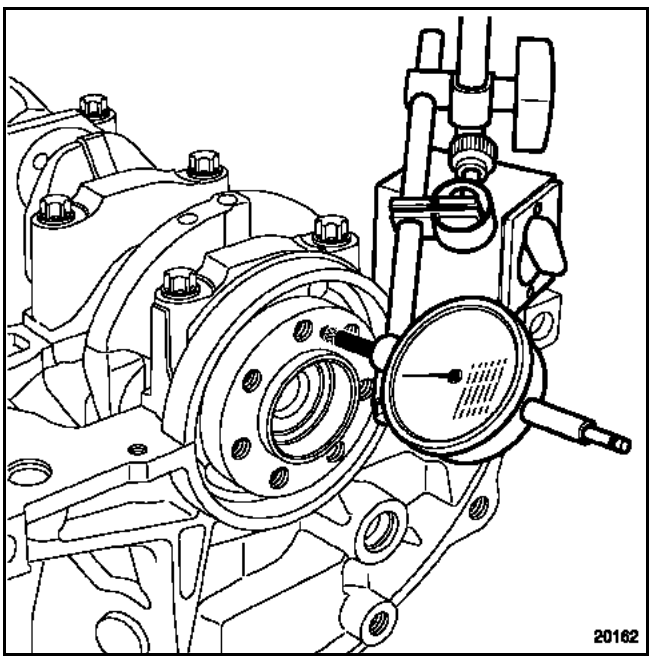


On the bearings

Position **Mot. 1493-01** on the bearing.

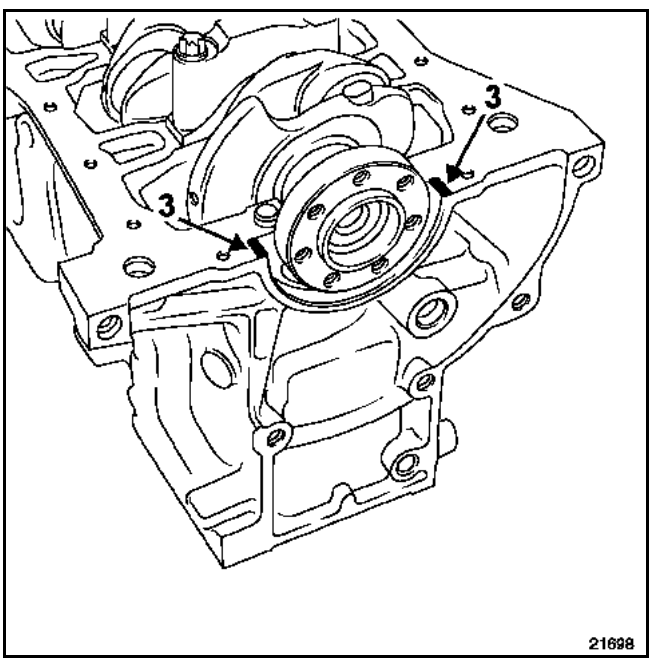


Fit the bearing shell in **Mot. 1493-01**, then press at (A) until the bearing shell is touching at (B) with **Mot. 1493-01**.



Oil the crankshaft bearing shells.

Refit:
– the crankshaft,
– the lateral shims on bearing no.3, putting the grooves on the crankshaft side,
– the crankshaft bearing caps **on bearing cap no.1** (these are numbered from 1 - 5 and these numbers should be positioned **opposite the water pump**). Then tighten the bolts to a torque of **2.7 daN.m** plus an angle of **47**° ± **5**°.



Check the lateral clearance of the crankshaft (**in mm**) which should be:
– without wear on lateral shims: **0.045** - **0.252**
– with wear on the lateral shims: **0.045** - **0.852**

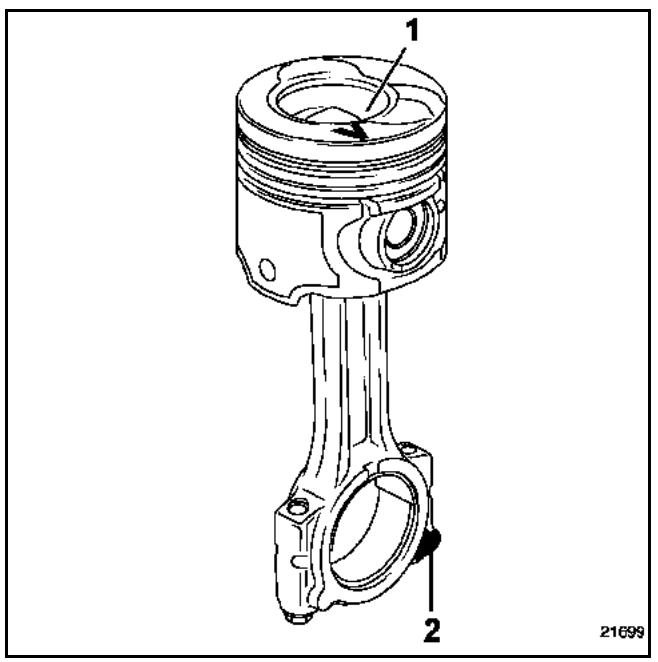
Fitting bearing number 1

Degrease the gasket faces (of the cylinder block and bearing number 1). They should be clean, dry and free from grease (in particular, remove finger marks).

Lay two beads (3) of **Threebond silicon** with a width of **1 mm** on bearing no.1 of the cylinder block.

Tighten the bolts of bearing cap no. 1 to a torque of **2.7 daN.m** plus an angle of **47**° ± **5**°**.**

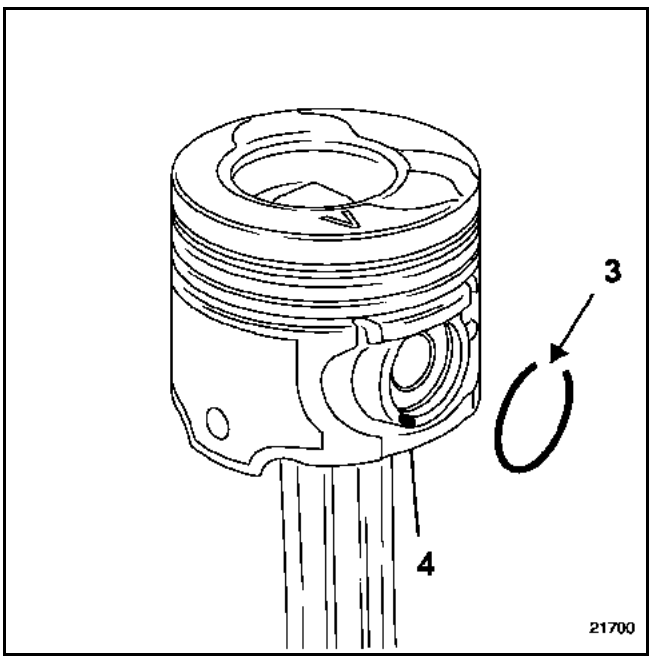
"CON RODS / PISTON" ASSEMBLY



The pistons have a "Λ" mark engraved on their heads indicating the **flywheel side.**

Oil the gudgeon pin.

Check that the gudgeon pins rotate correctly in the new piston and in the matching connecting rod.

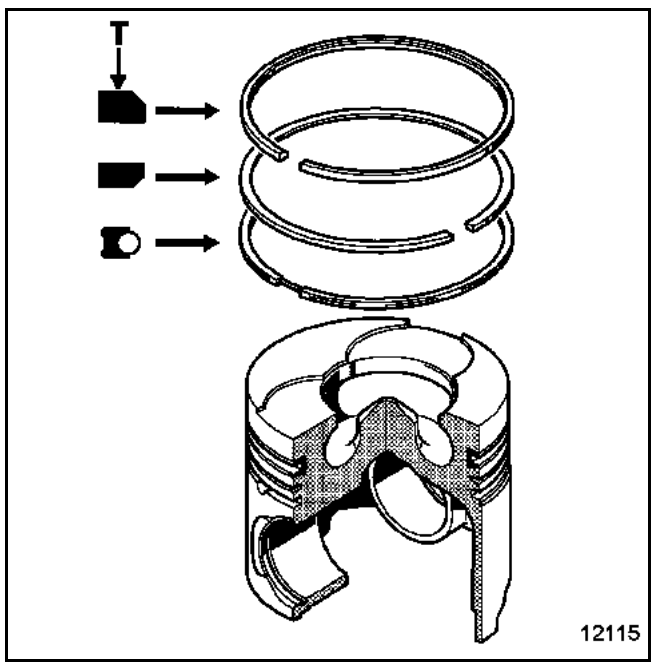


Direction of fitting of the con rod in relation to the piston

Point the "Λ" (1) engraved on the top of the piston downwards and the flat (2) of the big end as shown on the diagram below.

Direction for fitting the circlips on the piston

Position the opening (3) of the spring rings opposite the removal and fitting channel (4).



FITTING THE RINGS

Rings set to their original adjustment must be free within their channels.

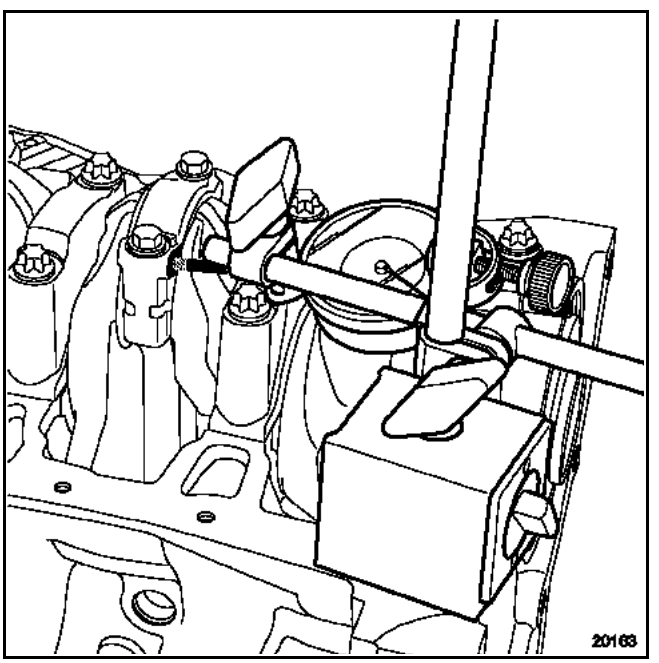
Ensure the rings are fitted the correct way round with the word **TOP** pointing upwards.

Orientation of the rings in the piston

Ensure the break in each ring is correctly oriented as shown in the diagram below.

T = Top

Oil the pistons.



Fit the con rod/piston assemblies into the cylinder block using the ring (e.g.: **FACOM 750 TB**), being careful to fit them the right way round **("Λ" towards the flywheel)**.

Fit the con rods onto the oiled crankpins of the crankshaft.

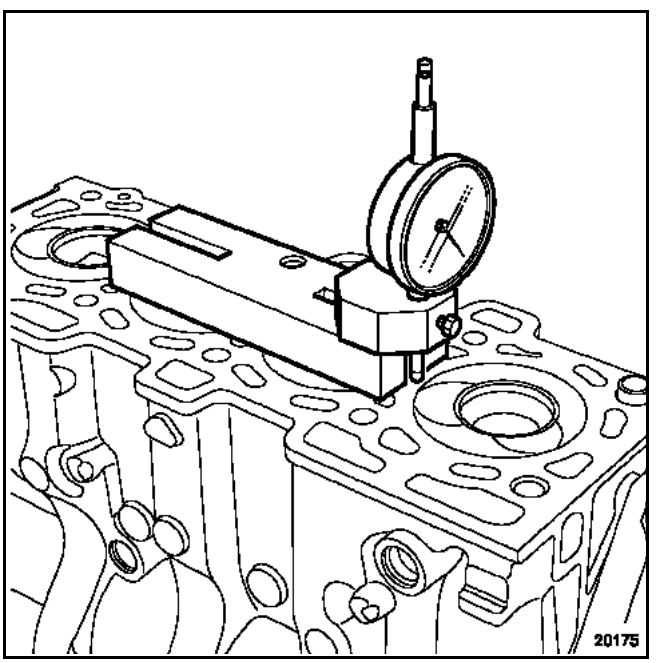
Fit the con rod caps, ensuring they are correctly matched.

Tighten the big end cap bolts to a torque of **2 daNm, plus an angle of 45° ± 6°**.

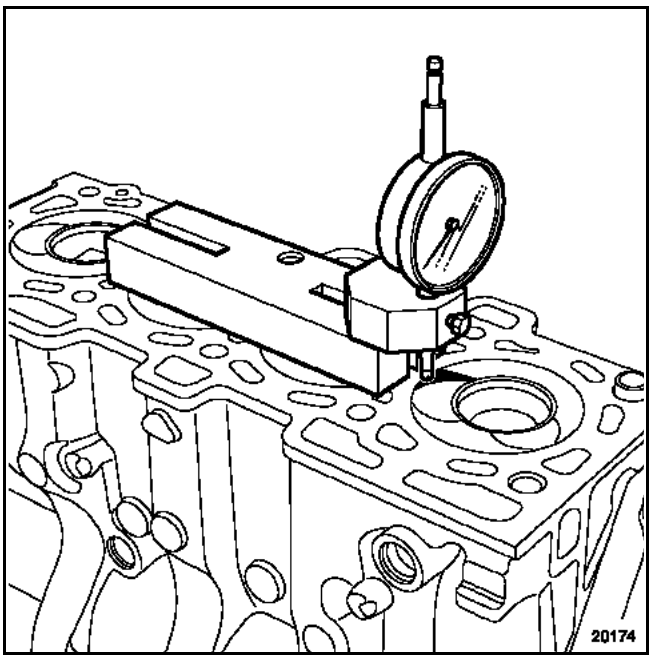
Check that the big ends have the correct lateral clearance of **0.205** to **0.467 mm**.

Checking piston protrusion

Clean the piston head.



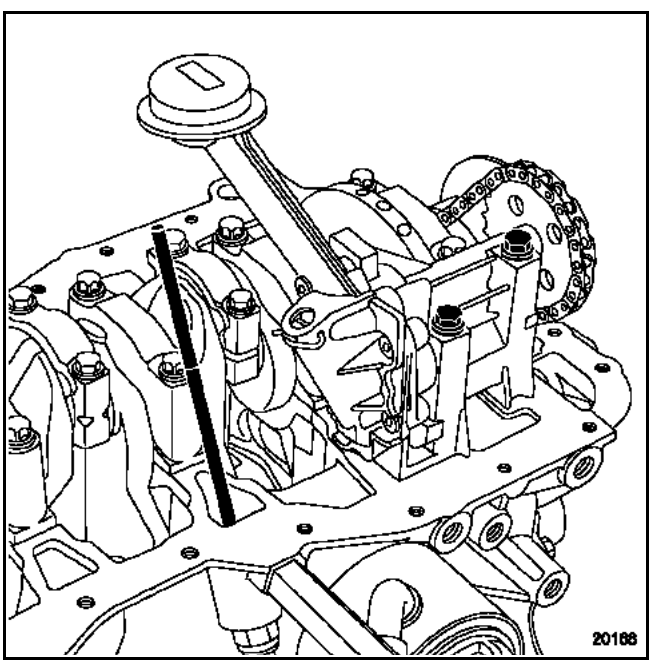
Turn the crankshaft one turn in its operating direction to bring piston no.1 close to Top Dead Centre.



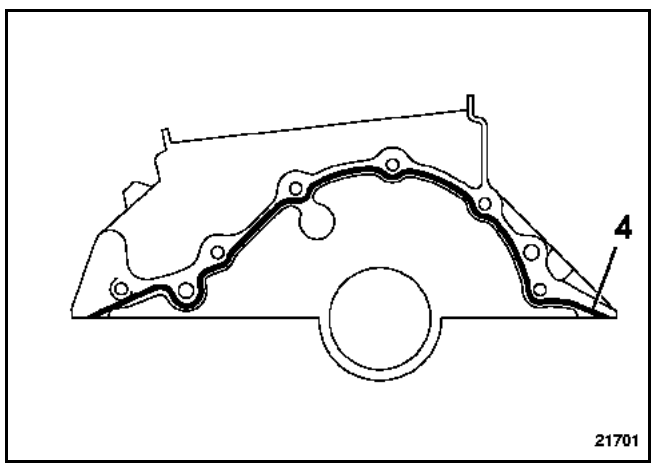
Fit tool **Mot. 252-01** on the piston.

Fit tool **Mot. 251-01** equipped with a gauge on support plate **Mot. 252-01**, and find top dead centre.

N.B.: All measurements must be carried out along the longitudinal axis of the engine, in order to eliminate any errors due to tilting of the piston.

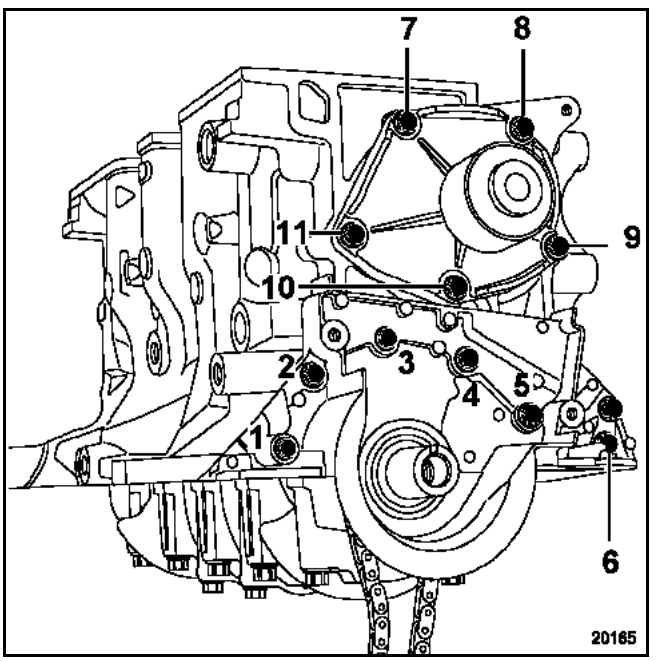


WARNING: the gauge follower must not be in the valve clearance.



Check the piston protrusion which must be **0.192 ± 0.093 mm**.

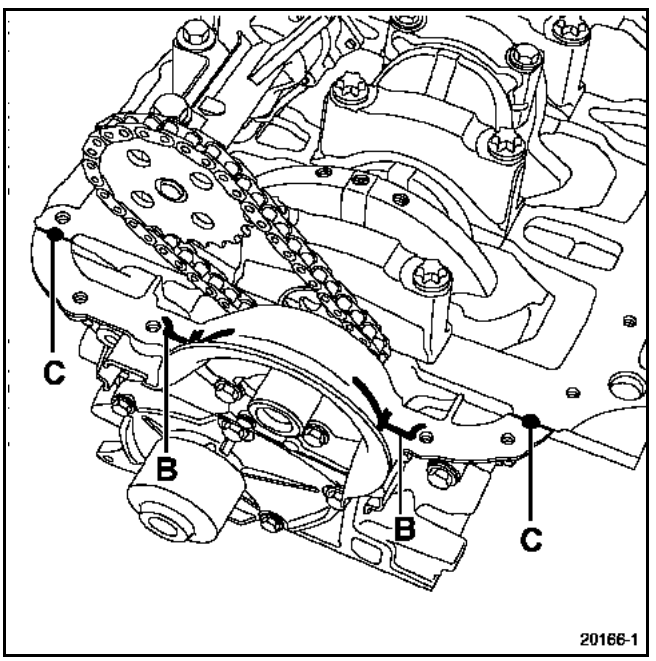
Refit:
- the pinking sensor to a torque of **2 daN.m**,
- the oil pressure sensor to a torque of **2.2 daN.m**,
- the oil pump sprocket and chain to a torque of **2.5 daN.m**.



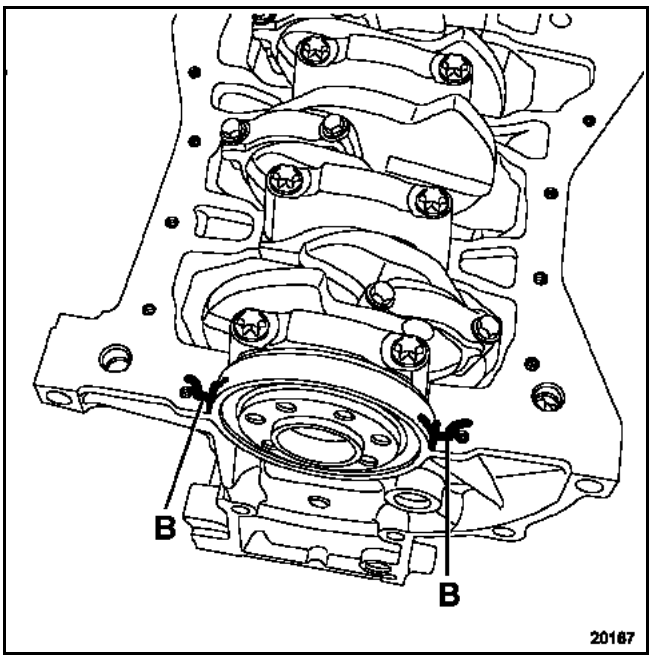
NOTE: the gasket faces (cylinder block, crankshaft closure plate and water pump) must be clean, dry and free from grease (in particular, remove finger marks).

The crankshaft closure plate is sealed with THREEBOND silicon. The bead (A) must be 1.5 - 2 mm wide and be applied in accordance with the diagram below.

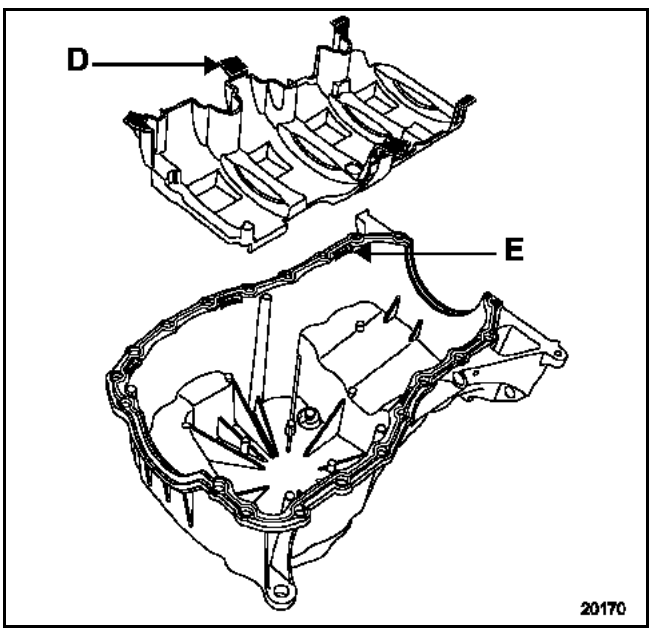
Refit:



– the crankshaft closure plate by:
  - pre-tightening bolts 1 and 6 to a torque of **0.8 daN.m**,
  - tightening bolts 2, 3, 4 and 5 to a torque of **1.2 daN.m**,
  - tightening bolts 1 and 6 to a torque of **1.2 daN.m**,

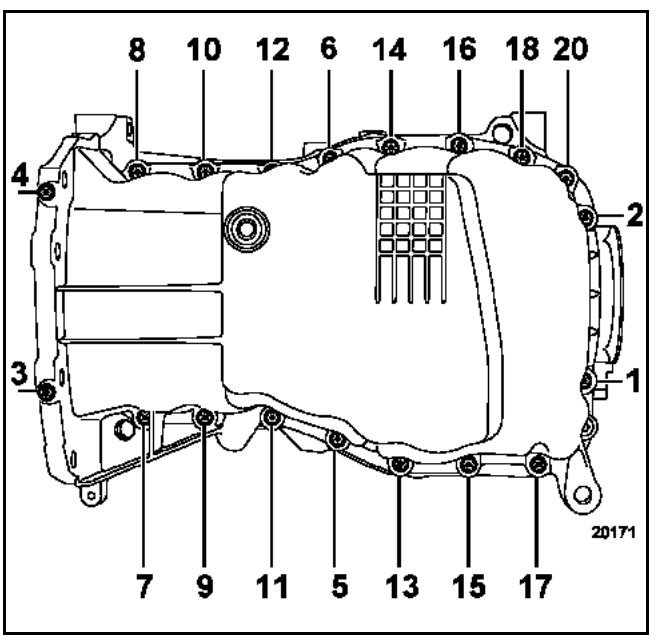


– the water pump fitted with a new seal. Put a drop of **LOCTITE FRENETANCH** on the bolts, then tighten them to a torque of **1.1 daN.m** in the recommended order.

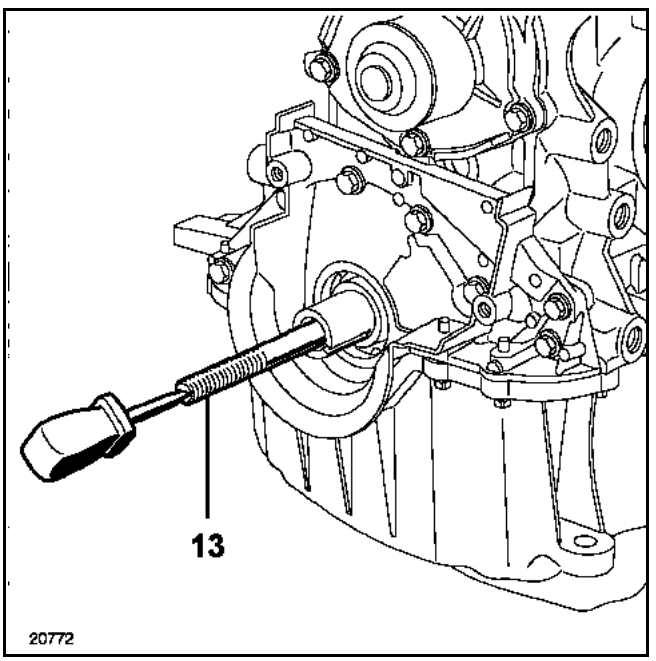


NOTE: the gasket faces (cylinder block and crankshaft closure plate) must be clean, dry and free from grease (in particular, remove finger marks).

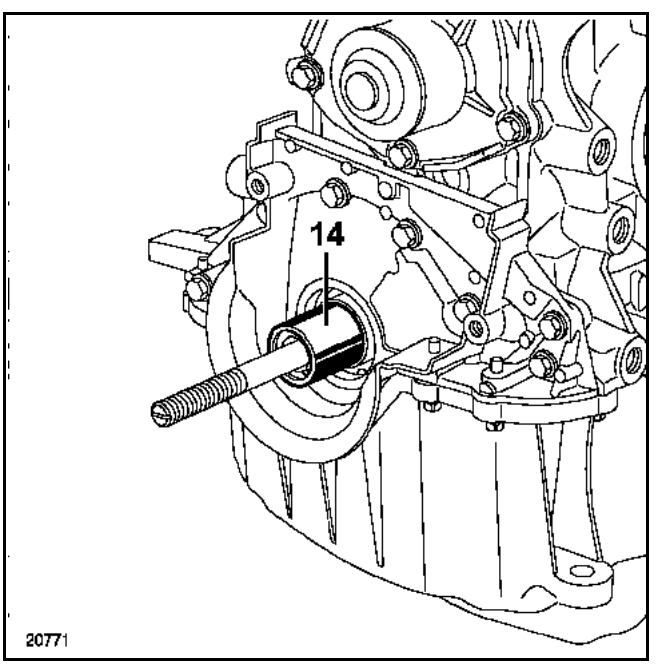
Apply:
– four beads (B) of **THREEBOND silicon,** with a diameter of **5 mm**,
– two drops (C) of **THREEBOND silicon,** with a diameter of **7 mm** at the intersection of the crankshaft closure plate and the cylinder block.



When refitting the oil sump, ensure that:
– the tabs (D) of the anti-emulsion plate are correctly positioned in the slots (E),
– the cylinder block and the oil sump are correctly aligned **on the flywheel side**, to prevent the clutch housing from being damaged when fitting the gearbox.

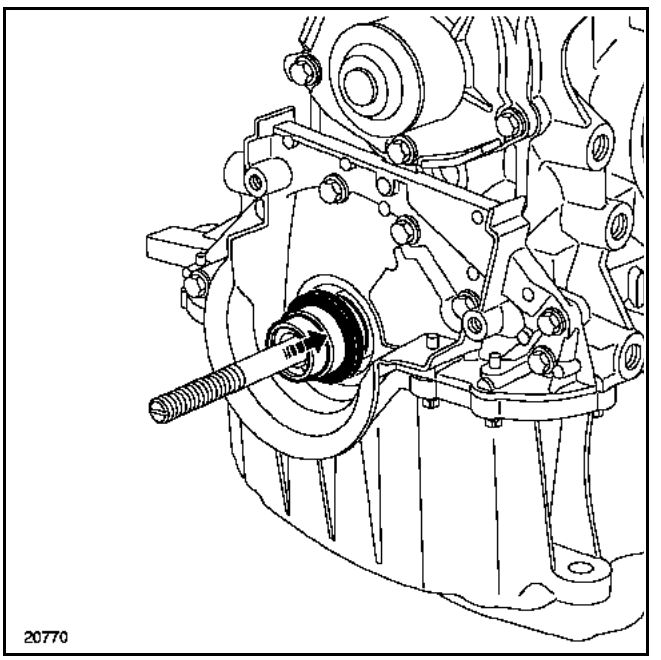


Refit:
– the anti-emulsion plate,
– the oil sump, tightening the bolts as follows:
  - pretighten the bolts in the recommended order of **1, 2, 3, 4, 5, 6, 7, 8** to a torque of **0.8 daN.m**,
  - tighten the bolts in the recommended order of **1, 2, 3, 4, 5, 6, 7, 8** to a torque of **1.5 daN.m**,
  - pretighten the bolts in the recommended order of **9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 1, 2** to a torque of **0.8 daN.m**,
  - tighten the bolts in the recommended order of **9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 1, 2** to a torque of **1.5 daN.m**,

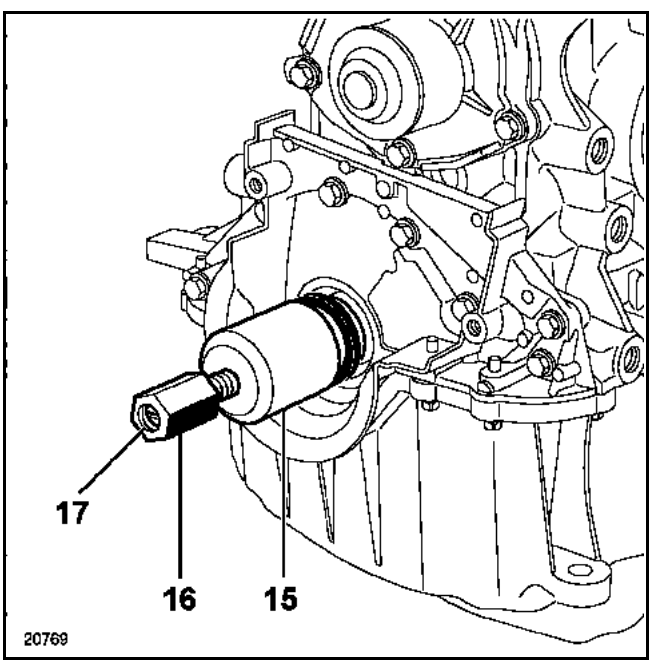


Fitting the crankshaft seal gaskets

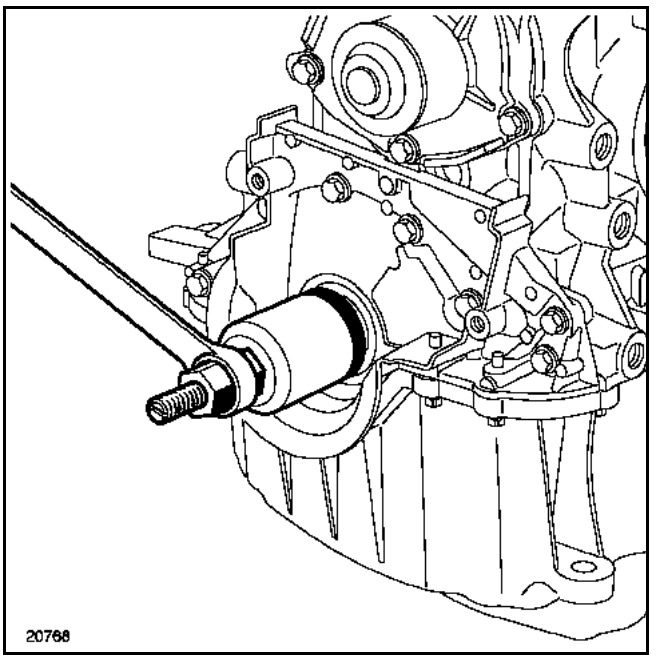
Crankshaft elastomer seal, timing side.



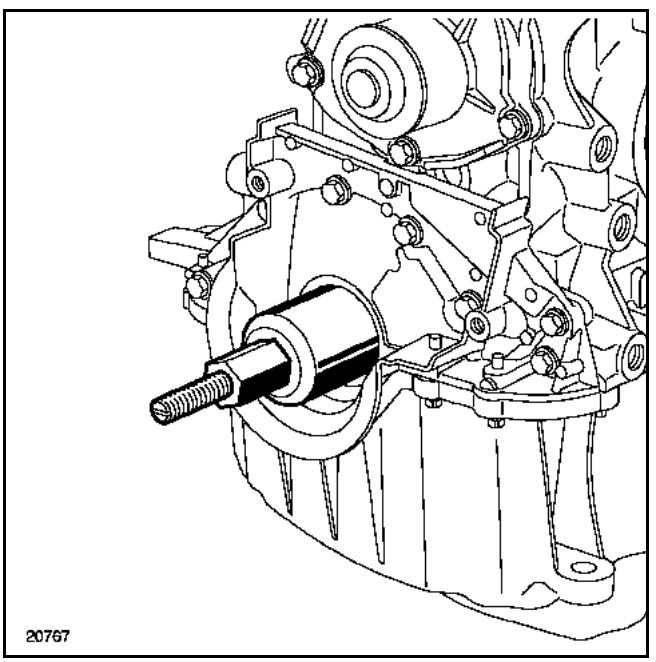
Screw the threaded rod (13) of **Mot. 1586** into the crankshaft.



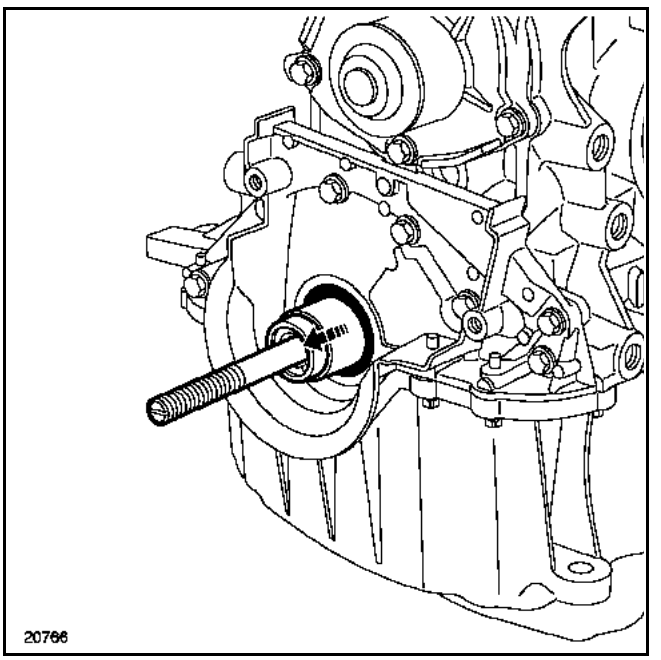
Position the spacer (14) of tool **Mot. 1586** on the crankshaft.



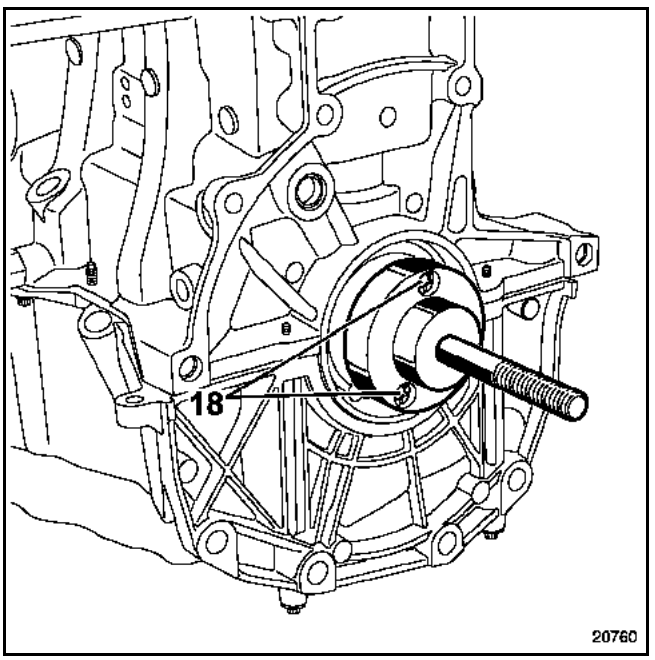
Fit the protector complete with the seal onto the spacer, taking care not to touch the seal.



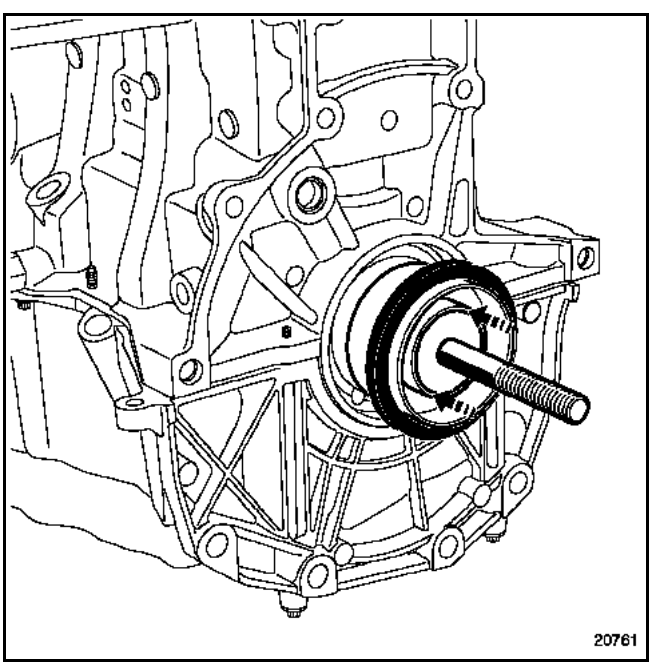
Fit the cover (15) and the nut (16) (putting the threaded part (17) of the nut on the side away from the engine) of tool **Mot. 1586**.



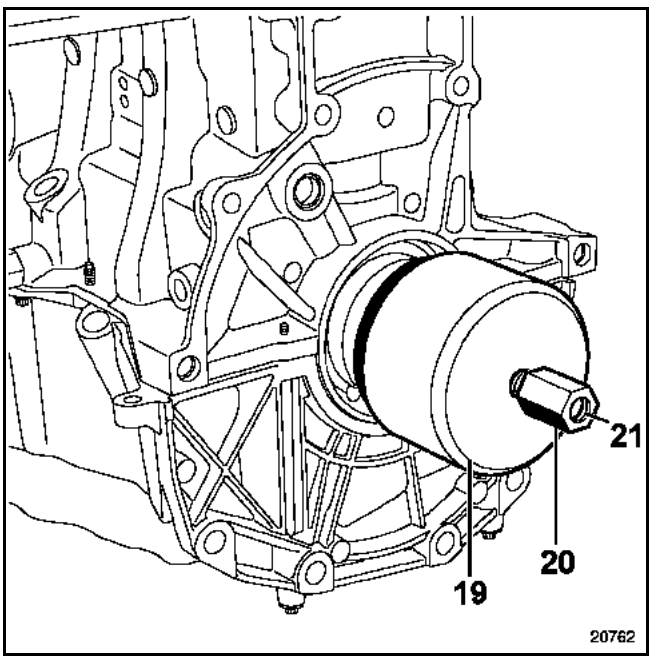
Tighten the nut until the cover touches the spacer.



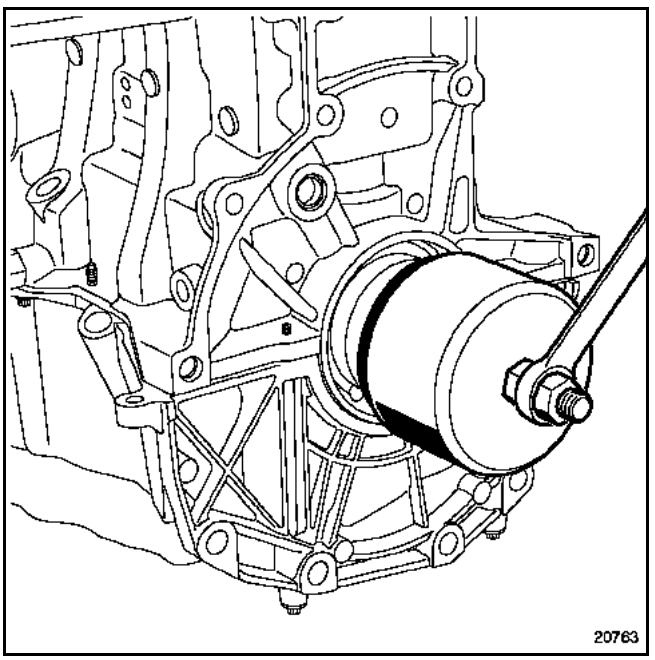
Remove the nut, the cover, the protector and the threaded rod.



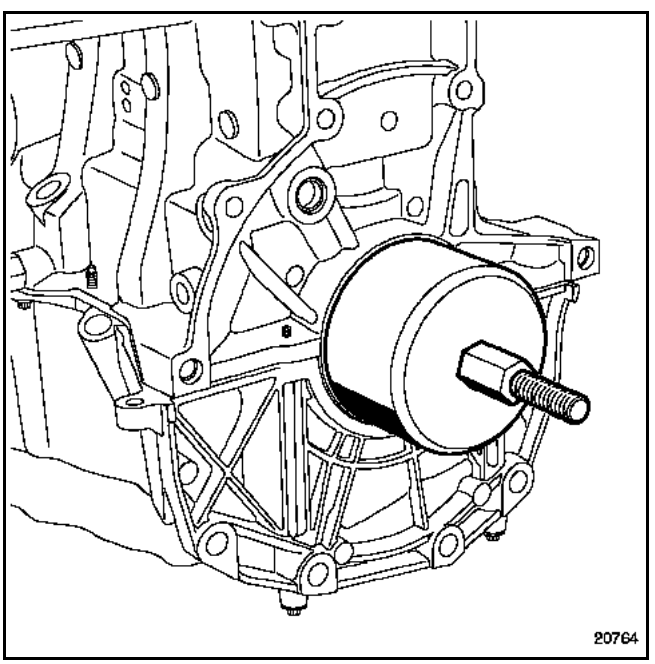
Crankshaft elastomer seal, flywheel side.



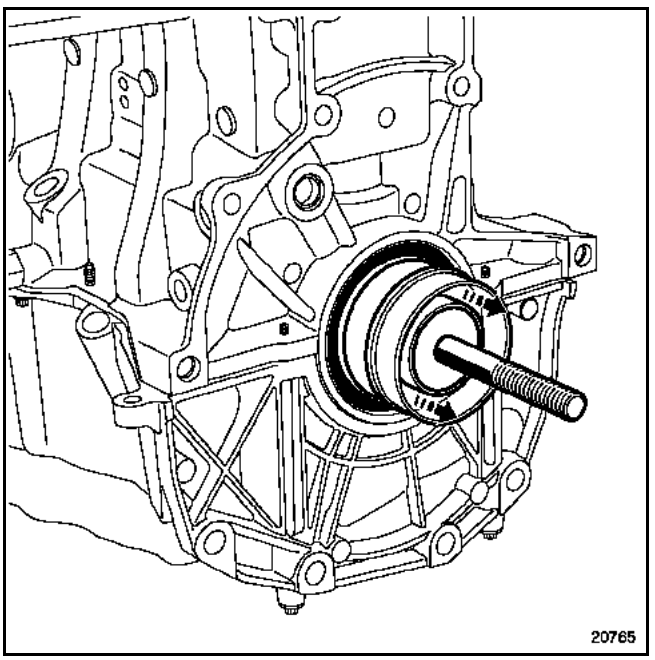
Fit tool **Mot. 1585** on the crankshaft, securing it with bolts (18).



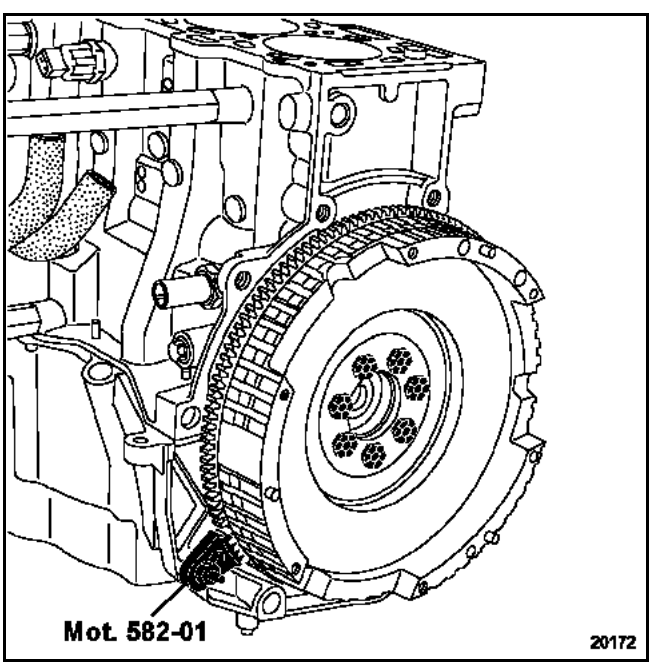
Put the protector complete with the seal on tool **Mot. 1585**, being careful not to touch the seal.

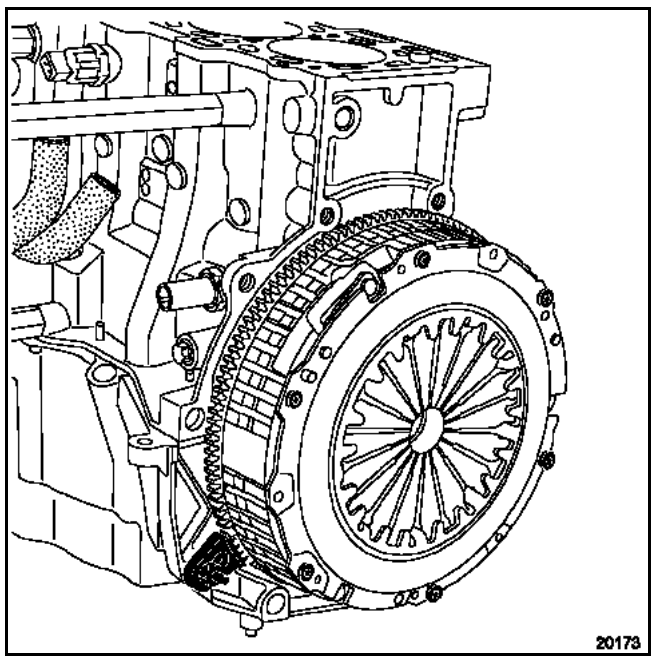


Fit the cover (19) and nut (20) (putting the threaded part (21) of the nut on the side away from the engine) of **Mot. 1585**.



Tighten the nut until the cover touches the cylinder block.





Remove the nut, the cover, the protector and the threaded rod.

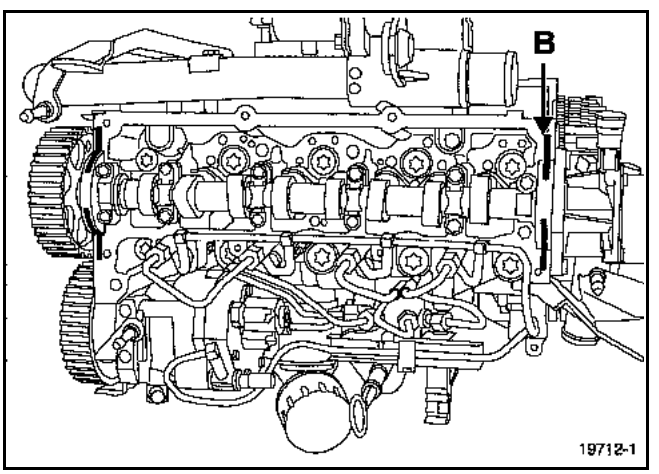
Refit:
– the flywheel, tightening the new bolts to a torque of **5 - 5.5 daN.m** (blocking the flywheel using **Mot. 582-01**),

– the clutch and mechanism, tightening the bolts to a torque of **0.8 daN.m**.

Remove flywheel block **Mot. 582-01**.

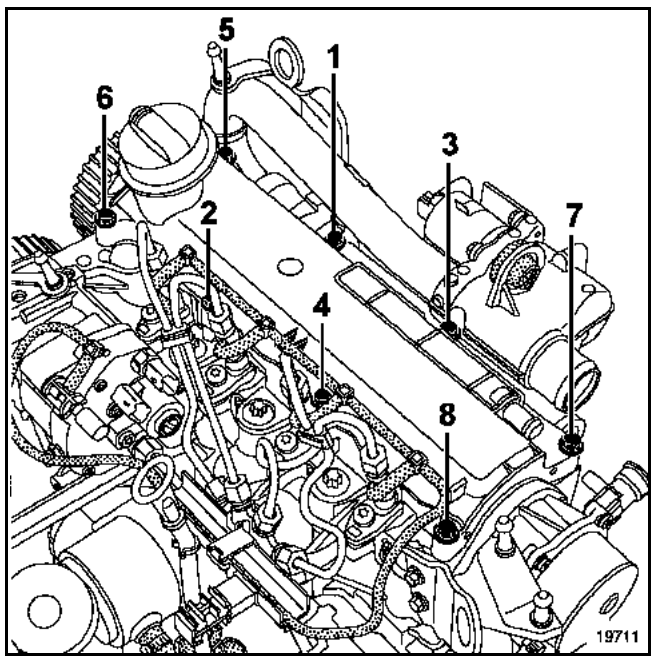
REFITTING THE UPPER ENGINE

Refitting the cylinder head



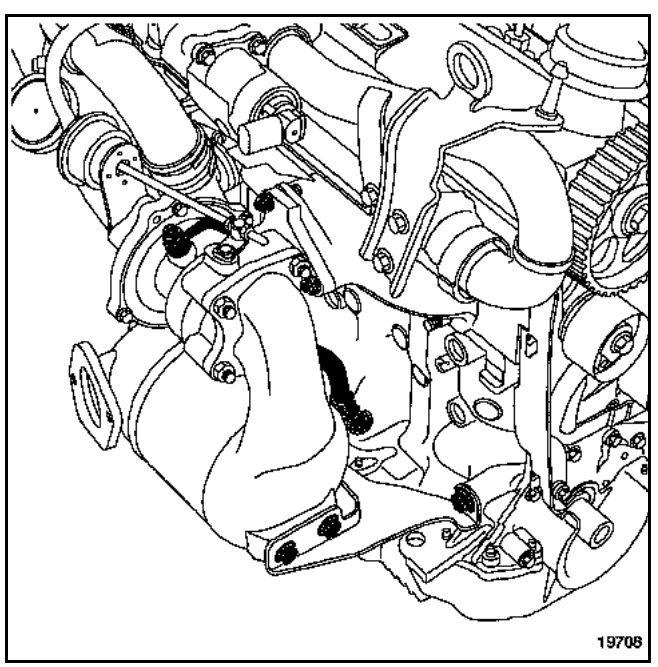
Position the pistons at mid-stroke.

Fit the cylinder head gasket using the centring dowels of the cylinder block.



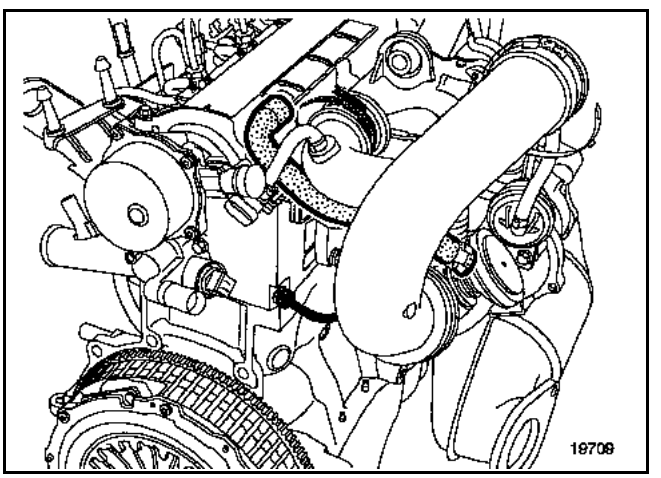
Tighten the cylinder head (see the section "**Cylinder head specifications**").

NOTE: the gasket faces (cylinder head and cylinder head cover) must be clean, dry and free from grease (in particular, remove finger marks).

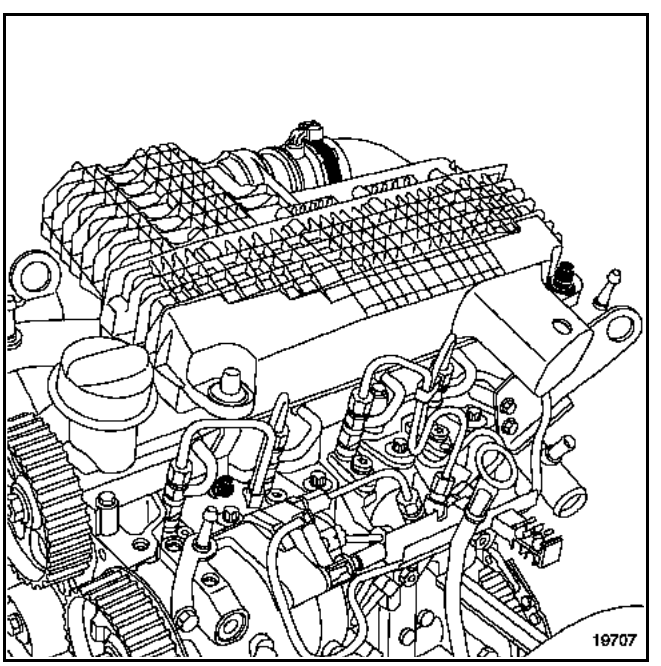


Lay four beads (B) of **THREEBOND silicon,** with a diameter of **2 mm**.

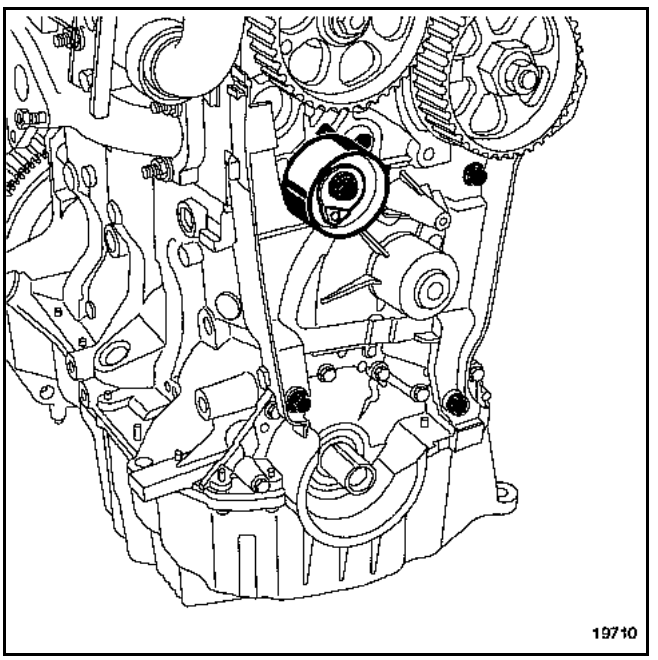
Refit:
– the cylinder head, tightening the bolts to a torque of **1 daN.m** in the recommended order,



– the turbo oil return pipe fitted with new seals,
– the turbo, tightening the nuts to a torque of **2.6 daN.m**,
– the catalytic converter bracket,
– the turbo oil supply pipe,



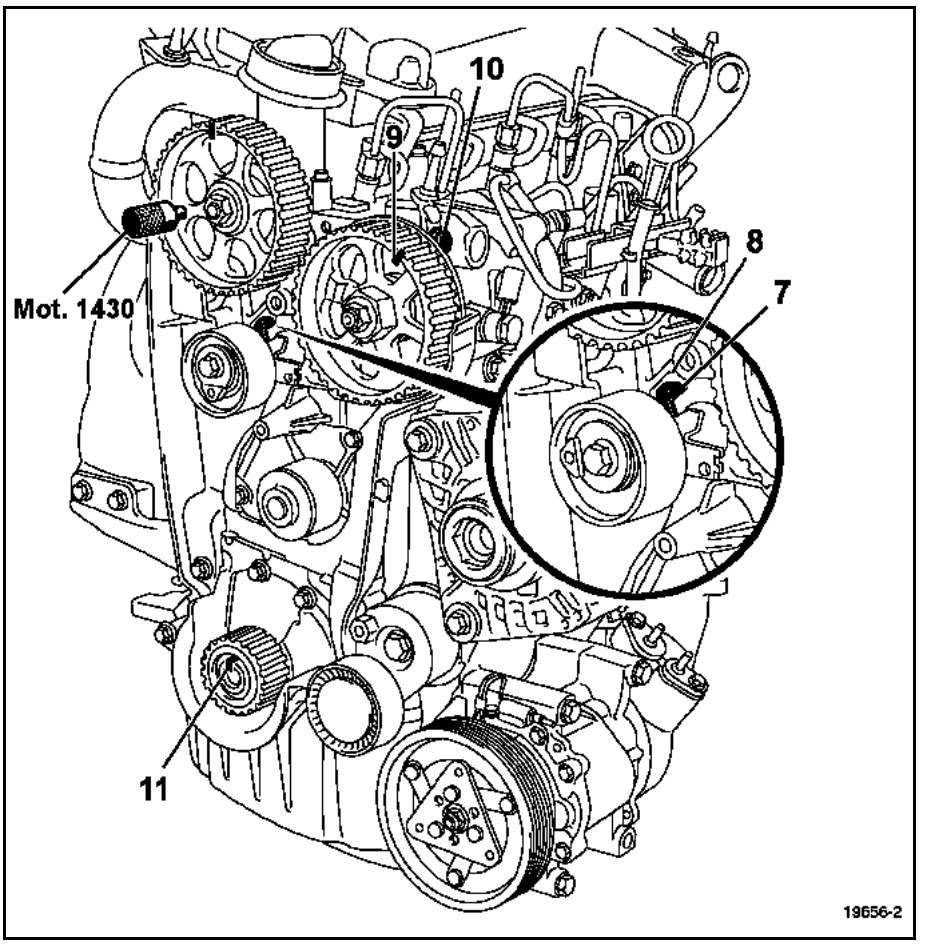
Tighten:
– the bolts of the turbo oil return pipe to a torque of **0.9 daN.m**,
– the nut and the bolt of the turbo oil supply pipe to a torque of **2.3 daN.m**.



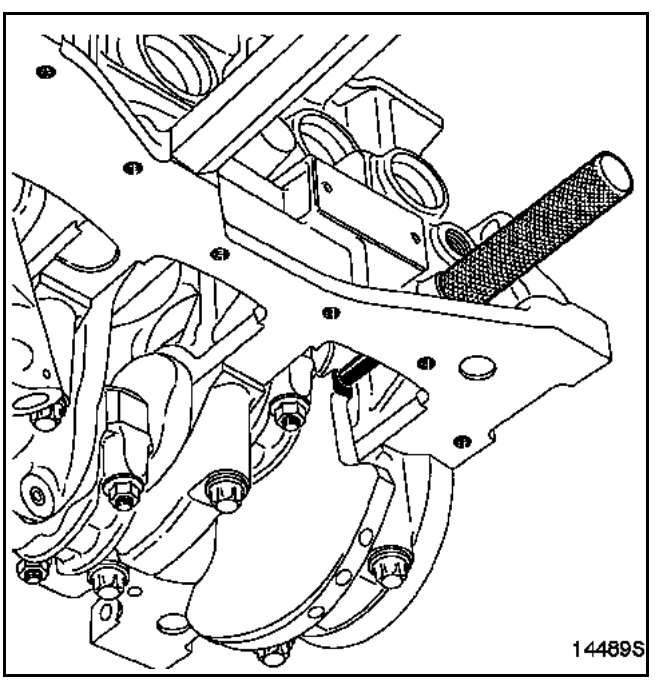
Refit:
– the oil vapour rebreathing pipe,
– the new turbo air ducts,

– the air filter unit.

Refit:
– the inner timing cover,
– the timing tension wheel.

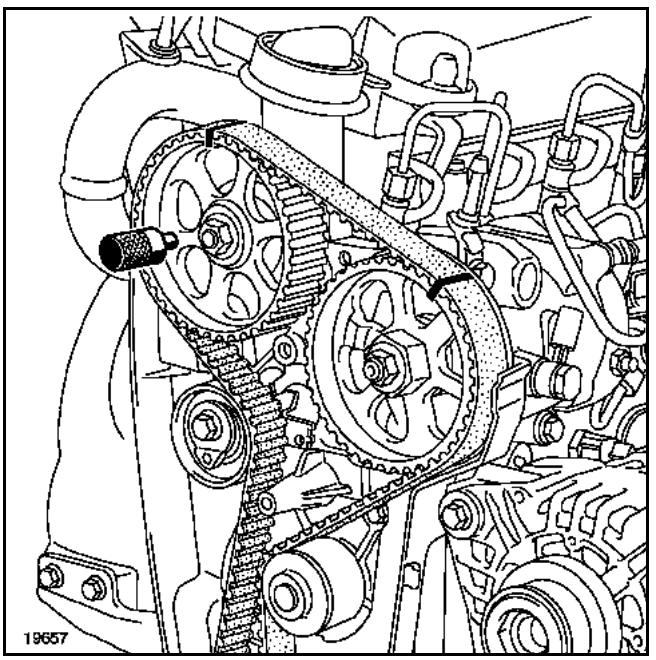


Timing adjustment



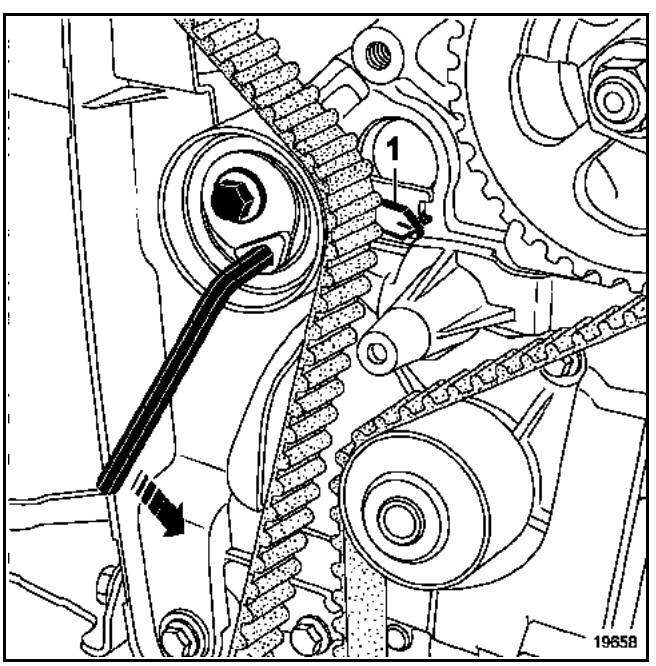
IMPORTANT: it is essential to degrease the end of the crankshaft, the bore of the crankshaft sprocket and the bearing faces of the accessories pulley to prevent any slip between the timing and the crankshaft which would risk destroying the engine.

Ensure that the peg (7) of the tension wheel is correctly positioned in the groove (8).



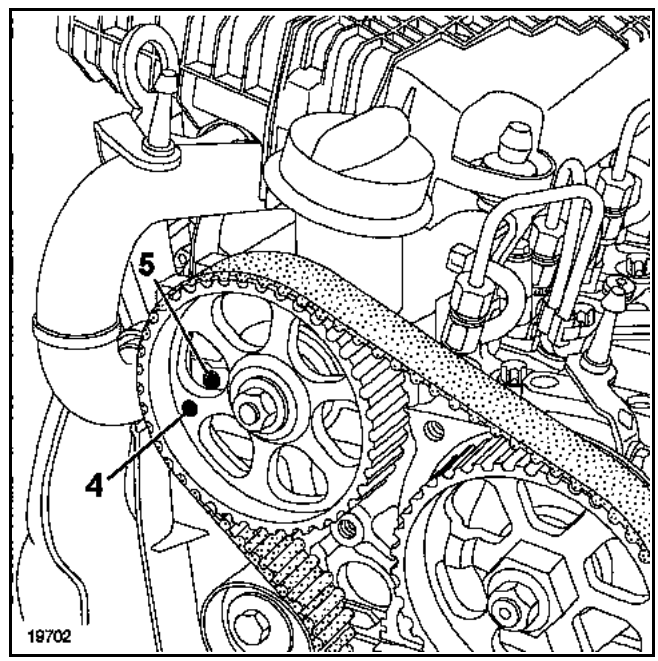
Insert pin **Mot. 1430** in the camshaft and cylinder head pulley holes.

Check that:
– the mark on the high pressure pump pulley (9) is opposite the bolt head (10),
– the crankshaft is touching the Top Dead Centre pin **Mot. 1489** (the crankshaft groove (11) must be facing upwards).

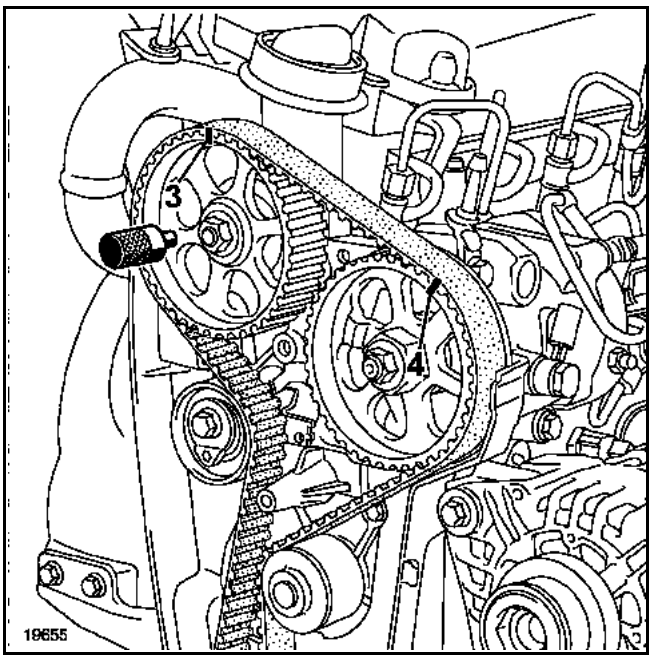


Fit the timing belt, aligning the marks on the belt with those on the camshaft and high pressure pump sprockets (**19 teeth spaces on the belt** between the marks on the camshaft and pump sprockets).

Using a **6 mm** Allen key, move the movable index (1) of the tension wheel into the position shown below, by turning the key anticlockwise.



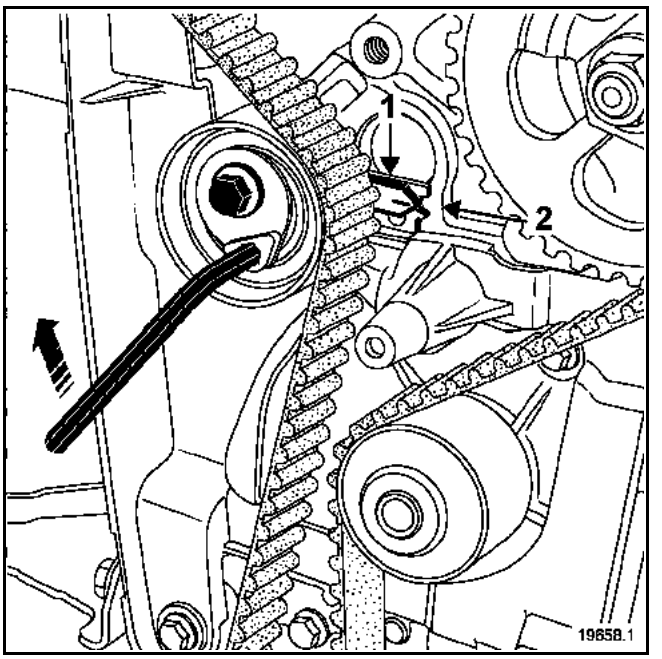
Tighten the tension wheel bolts to a torque of **2.5 daNm.**



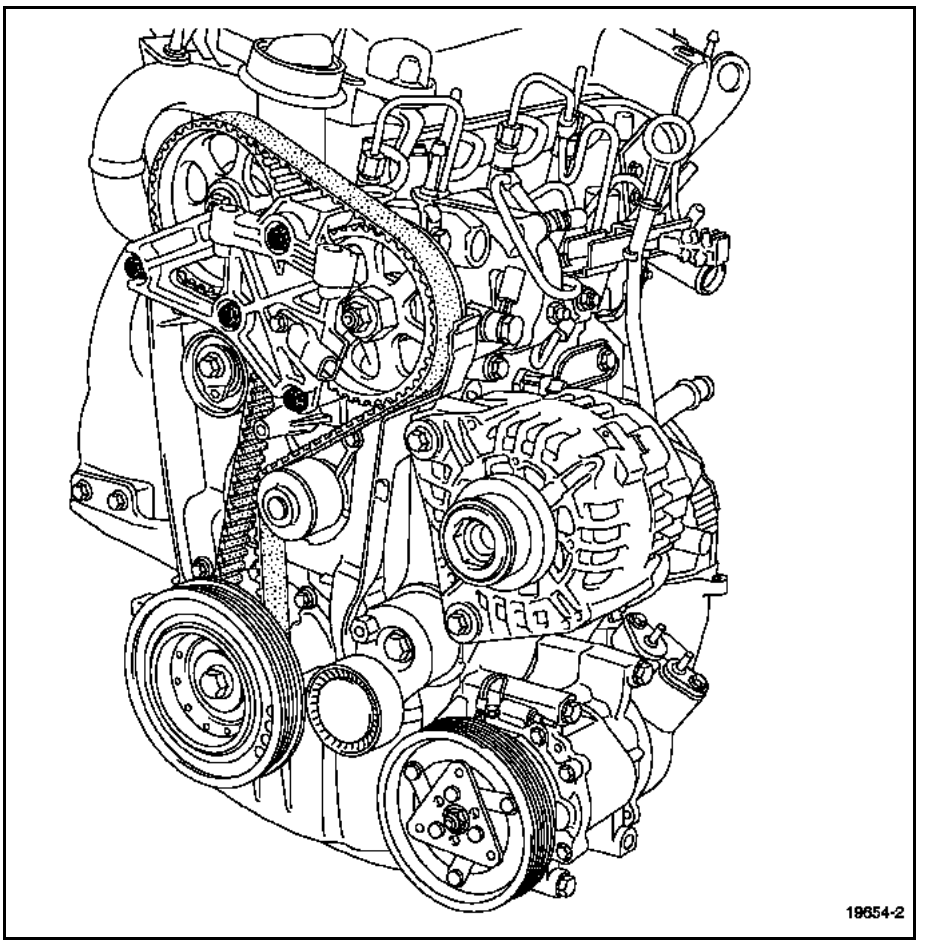
Refit the crankshaft accessories pulley, tightening the bolt to a torque of **2 daNm,** then angle tighten to **130**° ± **15**° (crankshaft touching the Top Dead Centre pin).

Remove the Top Dead Centre pin **Mot. 1489** and the camshaft pulley timing pin **Mot. 1430**.

Turn the crankshaft two full turns in a clockwise direction (timing side). Just before the hole (4) of the camshaft pulley is opposite the cylinder head hole (5), screw pin **Mot. 1489** into the cylinder block. Then move the crankshaft slowly and without jolting it until it is resting on the pin.

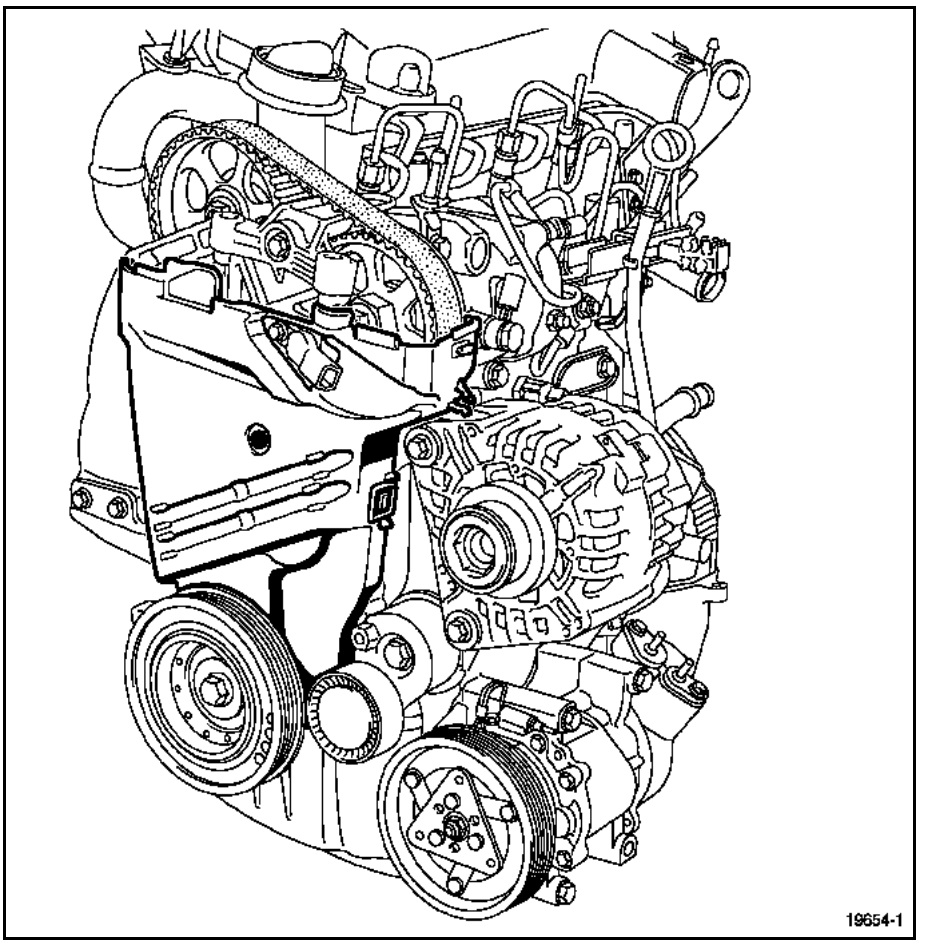


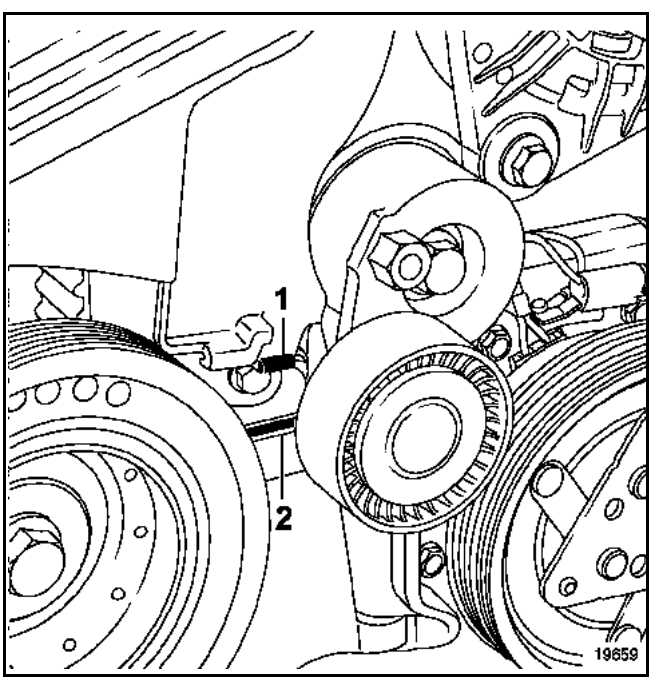
Check that pin **Mot. 1430** is correctly inserted in the holes of the camshaft and cylinder head pulleys and that there are **19 teeth spaces** between the marks on the camshaft (3) and the high pressure pump (4) sprockets.



Remove the Top Dead Centre pin **Mot. 1489** and the camshaft pulley timing pin **Mot. 1430.**

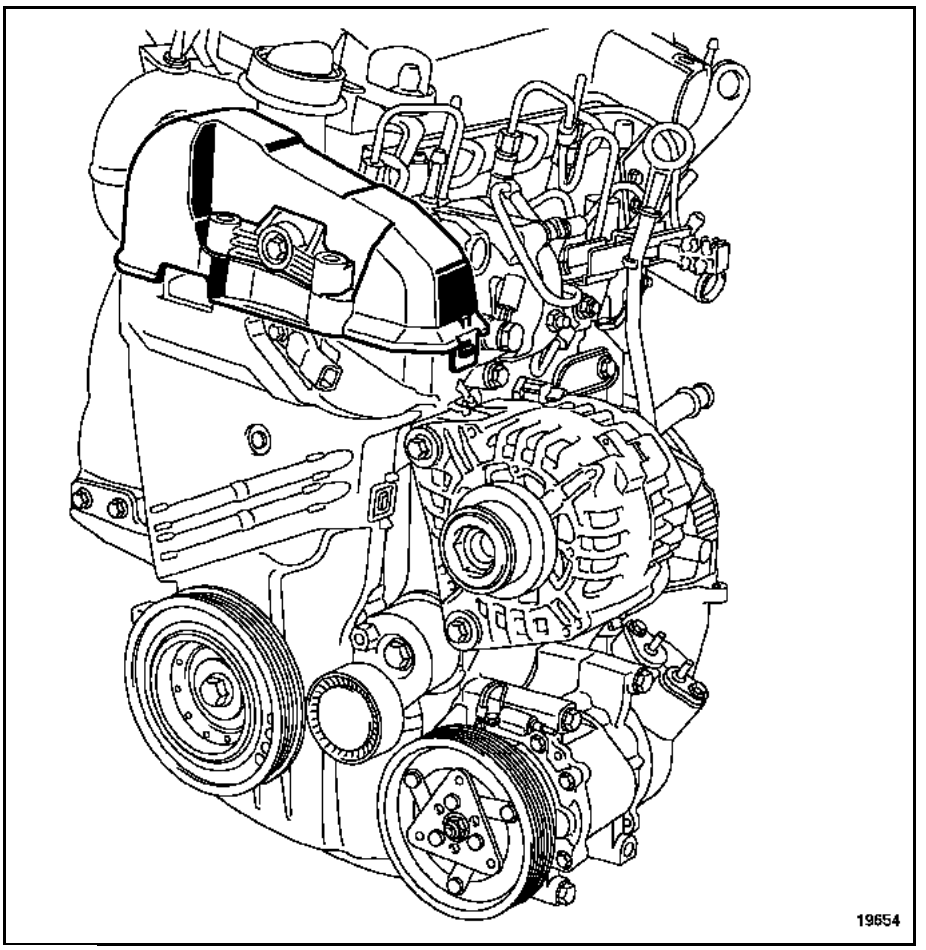
Undo the tension wheel bolt by a maximum of one turn while holding it using a **6 mm** Allen key, then gradually bring the movable index (1) (by turning the key clockwise) to the centre of the timing window (2) and tighten the nut to a torque of **2.5 daNm.**



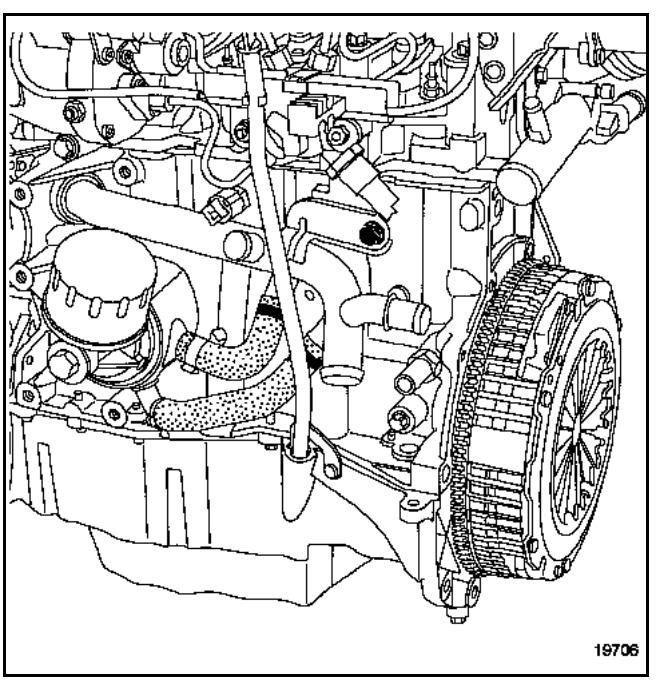


Refit the cap of the Top Dead Centre pin, applying **RHODORSEAL 5661** to the thread and tightening to a torque of **2 daNm.**

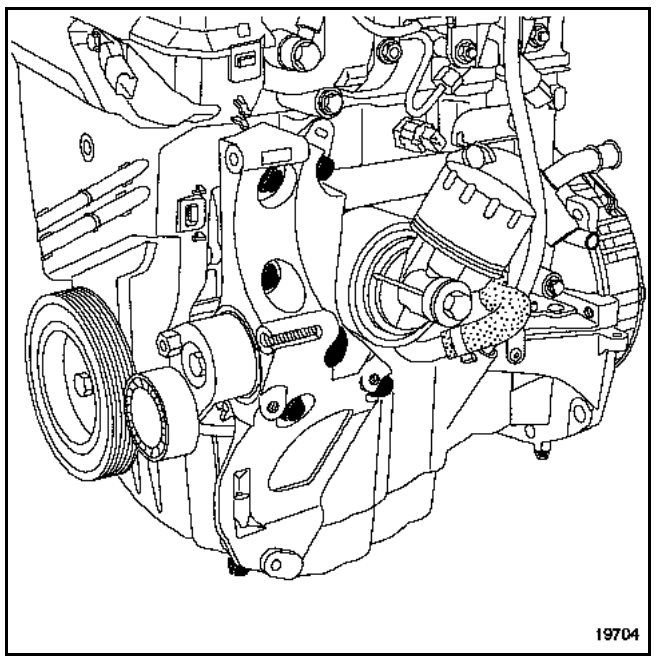
Refit:
– the cylinder head suspended mounting, tightening the bolts to a torque of **2.1 daNm**,



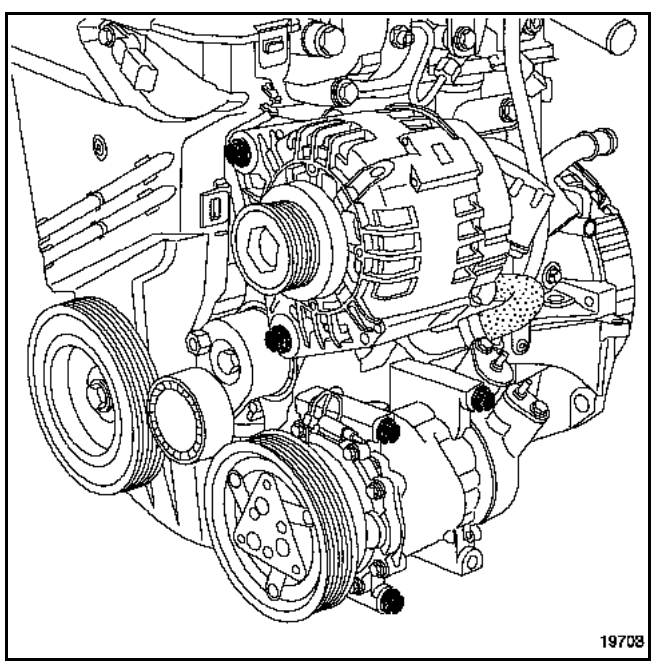
– the lower timing cover by positioning the tab (1) into the hole (2) on the inner timing cover,



– the upper timing cover.

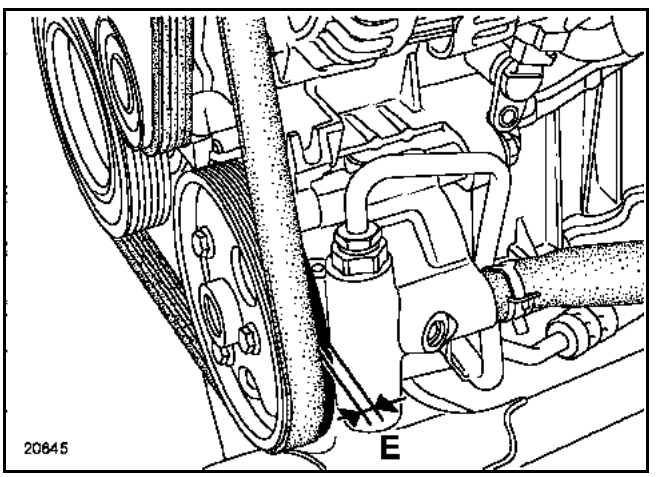


Remove the engine from the engine stand **Mot. 792-03.**

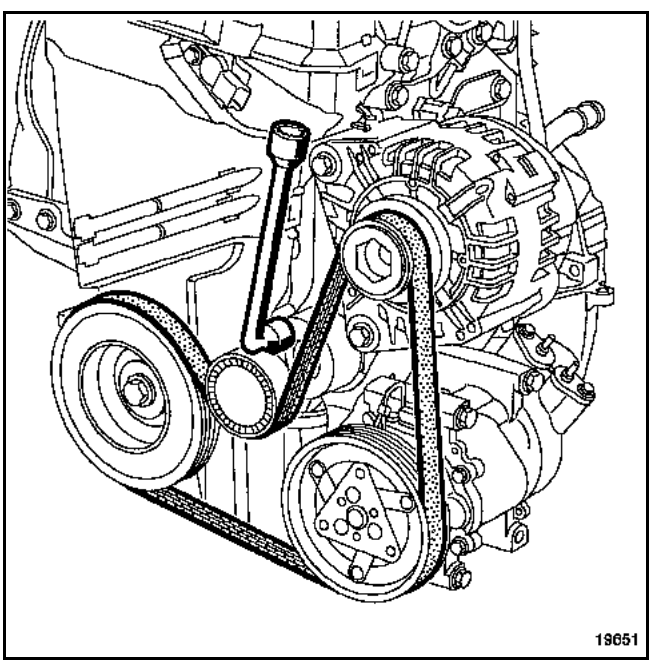


Refit:
– the coolant pipe, tightening the bolt to a torque of **2.2 daN.m**,
– the two heat exchanger pipes,

– the multifunction support, tightening the bolts to a torque of **4 daN.m**,



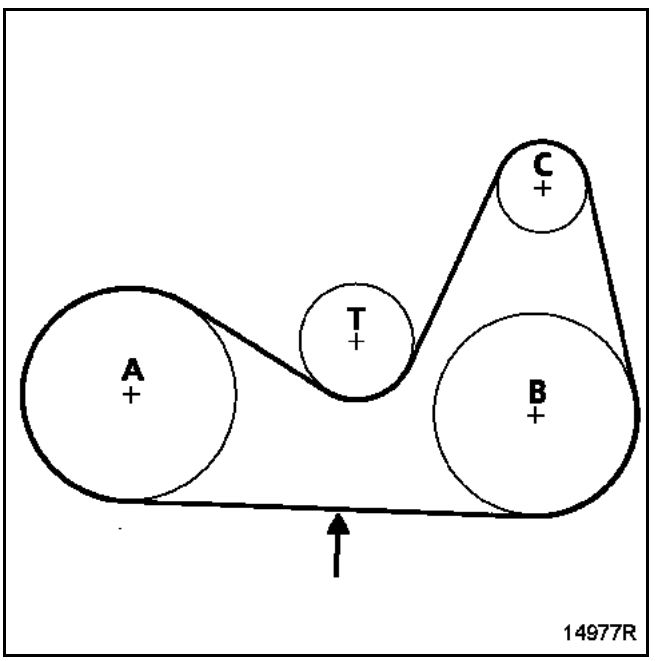
– the alternator, tightening the bolts to a torque of **2.1 daNm**,
– the air conditioning compressor, tightening the bolts to a torque of **2.1 daN.m**,
– the power-assisted steering pump or the washer which replaces the pulley (if the engine has one), tightening the bolts to a torque of **2.1 daN.m**,



– the accessories belt.

NOTE: the accessories belt has five teeth as opposed to the pulleys which have six. It is therefore essential to ensure that tooth "E" remains free when fitting the belt.

Version with air conditioning.



NOTE: the engine must be turned through two revolutions in order to position the belt correctly.

Version without air conditioning.

The belt is tensioned using tool **Mot. 1638** (with the two mounting bolts of the tensioner undone).

The tension value is **233 ± 5 Hz.**

A: Crankshaft:
B: Power-assisted steering pump
C: Alternator
T: Tension wheel:
→: Tension checking point

NOTE: the engine must be turned through two revolutions in order to position the belt correctly.

DISCLAIMER

For every problem, DTC or consideration not reported in this NT, please refer to the NT of the same vehicles with petrol version

IMPORTANT!

1. SCOPE OF THIS DOCUMENT

This document introduces the special fault finding procedure applicable to all:

Vehicle(s): **Sandero II, Logan II (B52, L52), Clio IV (B98)** For Engines: **D4F*734, D4F*744** Function concerned: **LANDI RENZO LC03**	Computer Name: **LC03** Software reference: **RE3520xxG54** Software reference: **RE3521xxG54**
Vehicle(s): **Duster II (H79Ph2), Lodgy (J92), Dokker (FK67)** For Engines: **K4M*642, K7M*828** Function concerned: **LANDI RENZO LC03**	Computer Name: **LC03** Software reference: **RE3521xxG54**
Vehicle(s): **CLIO III (X85)** For Engines: **D4F 744** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**
Vehicle(s): **SANDERO 1 (B90, FU90), LOGAN 1 (xx90)** For Engines: **K4M*642 , K7M*828** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**
Vehicle(s): **Duster (H79), Scenic (BK95), Megane (BK95)** For Engines: **K4M 616, K4M866, K4M834** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):

– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:

– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP + multiplex line sensor

Special tooling required

– A multimeter and checking bornier **Elé. 1681** Universal bornier

The present repair method **IS NOT APPLICABLE TO** Software **DR2020xxG24** or **RE2020xxG34**.

3. REMINDERS

Procedure

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition supply voltage).

With vehicles with card reader, proceed as follows:
– vehicle card in reader
– press and hold the Start button (longer than 5 seconds) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off the + after ignition supply voltage**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than 3 seconds),
– ensure that the + after ignition power supply has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

Faults

Faults are displayed as present or stored (they appeared in a certain context and have since disappeared, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + after ignition power supply is switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

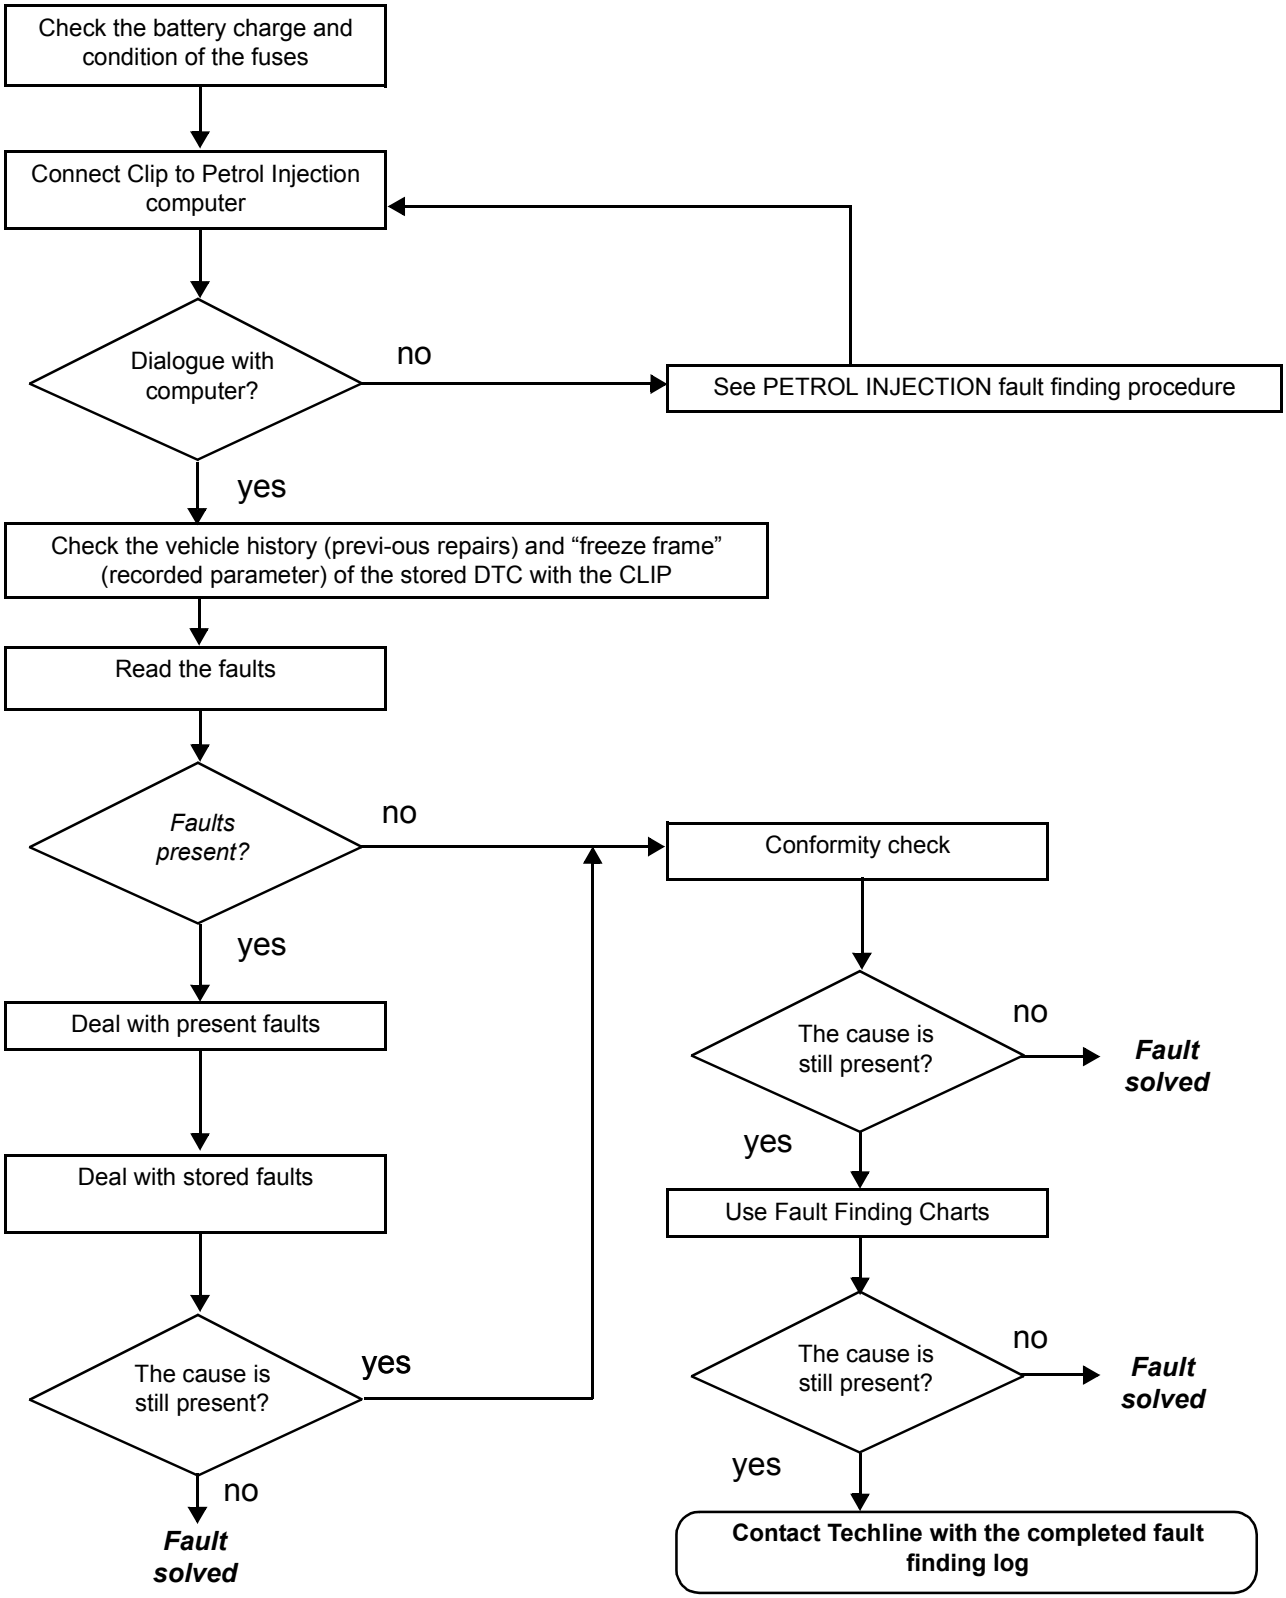
If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors for these lines (for oxidation, bent pins, etc.),
– the resistance of the component detected as faulty,
– the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool when the data is inconsistent. Therefore, this stage is used to:
– perform fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
– check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.



If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by Customer complaints.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart

4. FAULT FINDING PROCEDURE

4. FAULT FINDING PROCEDURE (continued)

Order of priority:

Electrical faults must be processed before Functional faults (**DTC2293, DTC0184, DTC1608, DTC109A, DTC0618, etc.**) and Customer Complaints.
Note that there must be no electrical failures either present or stored before dealing with Functional or Customer Complaints operational faults.
Other priorities are dealt with in the procedure for the fault in question, in the Notes section.

Wiring check:

Fault finding problems:
Disconnecting the connectors and/or manipulating the wiring may temporarily remove the cause of a fault.
Electrical measurements of the voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection:
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulation and wiring routing.
Look for signs of oxidation.

Tactile inspection:
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Check that the connectors are correctly tightened, apply light pressure to the connectors, twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs, as well as their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check:
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.
If a fault is detected, repair or replace the wiring harness.

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:
– when requesting technical assistance from Techline,
– for approval requests when replacing parts with mandatory approval, and to be enclosed when returning monitored parts on request. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

All work on components requires you to strictly follow safety rules to prevent any physical damage or human injury.
– Make sure the battery is properly charged to avoid damaging the computers with a low charge.
– Use the proper tools.

Safety instructions that must be followed before any operation is performed on the vehicle

– If a major LPG leak occurs, the vehicle must be isolated, away from buildings and any fire risks.
– The emergency services may be required to intervene if the situation cannot be controlled.
– All work on the LPG circuit must be performed by qualified and authorized personnel.
– Do not try to open the tank. Don't ever try to remove the multi-valve located at the end of the tank.
– Do not clean the engine compartment with detergent when the system is pressurized.
– Always refer to the RENAULT Workshop Repair Manual before performing any work.

Safety instructions that must be followed when any operation is performed on the vehicle

– All work must be carried out in a well-ventilated space.
– There must not be any flames, sparks, burning cigarettes or telephones near the area where work is being carried out.
– The operator must not wear acrylic clothes likely to generate static electricity.
– Disconnect the battery and leave the vehicle on the ground.
– If working on the tank, drain it by running the engine in LPG mode.
– Once it has been drained and removed, the tank can be sent to the GIAT Company, with the manual insulation valve in closed position (fully rotated clockwise) and fitted with its mounting.
– If work is to be done in the painting station, remove the tank (with its mounting).
– The tank must not be subjected to temperatures greater than 50°C.

Safety instructions that must be followed when any operation is performed on the vehicle

– After working on a LPG joint, check that it is not leaking after reassembling.
– Apply soapy water or the product distributed by SODICAM, part number 77 11 143 071 (leak detector) to the open joint(s).
– Fill the fuel tank with a few liters of LPG if it has been bled (the ignition must be switched off first).
– Crank the engine, switch in LPG mode and check again that there is no leak.
– If a leak is detected, retighten the relevant joint. If the leak persists, remake the joint.
– Fill the fuel tank (80 % of total volume). Start the engine, switch in LPG mode and check that there is no leak.

After reassembling, check that all the rubber and encased metal LPG pipes are not in contact with any parts that can be accessed by the user and may create a LPG leak.

WARNING
Before performing any work on the vehicle, drain the LPG circuit.
Only personnel who have undergone specific LPG training can work with LPG joints where liquid LPG is circulating and moving through the fuel tank from the filler neck to the expansion valve.
In addition, only personnel who have undergone specific LPG training can perform maintenance and repairs on LPG vehicles.
Workshops can only carry out work on the fuel tank if they have a degassing burner.
If the tank cannot be degassed, do not touch it and contact the:

Comité Français du Butane et du Propane
8, terrasse Bellini
92807 PUTEAUX cedex
E-Mail: contact@cfbp.fr
Tél: +33 (0)1 41 97 02 80
Fax: +33 (0)1 41 97 02 89

Maintenance operations

– No adjustment.
– Removal of internal components is not allowed, except when expressly authorized,.
– If LPG fixation clips and fittings are removed, they must be replaced.
– If LPG joints are removed, they must be replaced.

The tank must be empty before removing:

- the fuel tank,
- a component bolted onto the tank, before bleeding the LPG contained in the LPG circuit.

To remove the following, bleed all LPG contained in the LPG circuit (except the LPG in the tank):

- the filler neck,
- the pipes,
- the filter,
- The pressure reducer
- The LPG injector

7. GENERAL APPROACH TO FAULT FINDING

– Use Plus Max RE to identify the system fitted to the vehicle.

If the Software Version is in the form: RE35xxxxG54 the GCU is an LC03 adopted on vehicles compliant with EU5+ emis-sion norm.
If the Software Version is in the form: RE25xxxxG34 the GCU is an LC02 adopted on vehicles compliant with EuroV emission norm.

In the chapter "Fault Finding – Fault Interpretation" carefully follow the symbolism:

in order to ensure the correctness of the repair procedure.

1. LPG SYSTEM DESCRIPTION

1.1 Changeover from petrol to gas

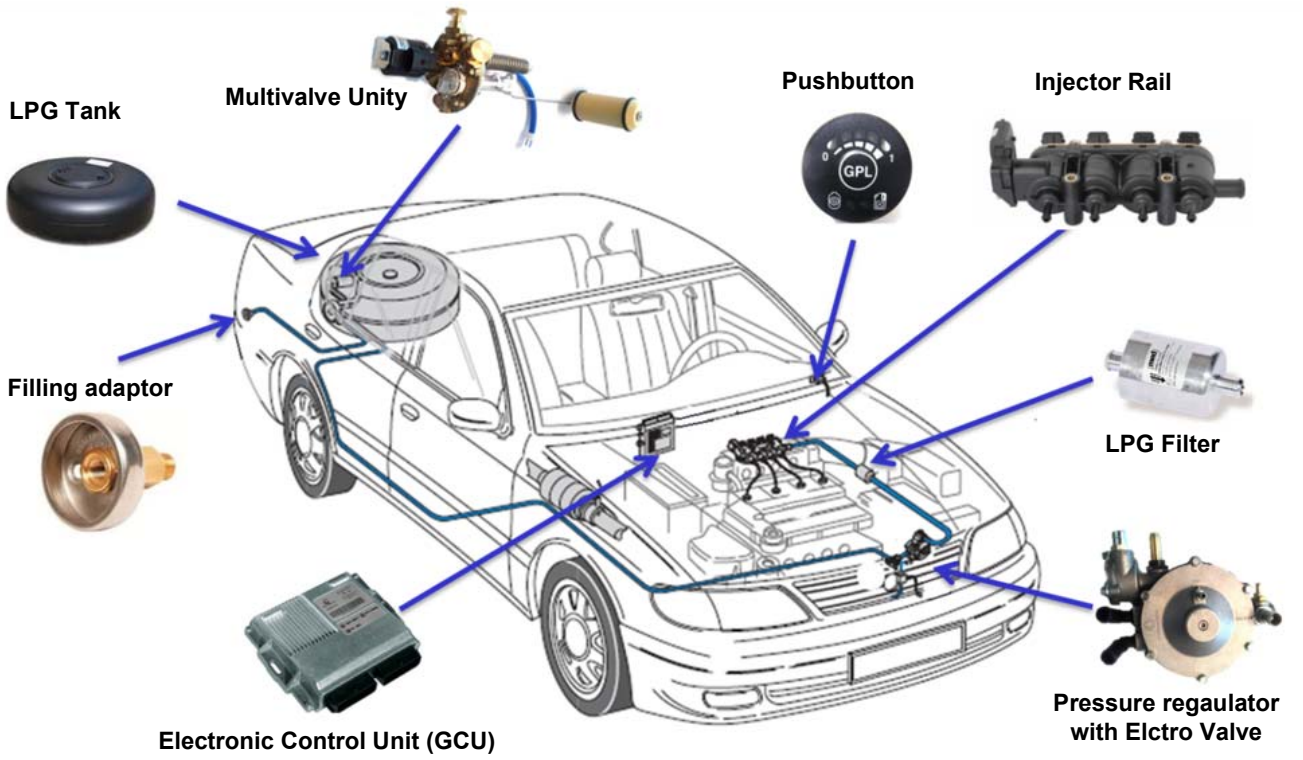
The vehicle switch to LPG when:

1) The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
2) Coolant water temperature must be higher than the tuned threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25°C.
3) A tuned delay is elapsed from the cranking; the delay depends on the temperature at the crank; usually cranking at a coolant temperature of 20°C the delay is 60s.
4) Gas Temperature must be higher than the tuned threshold usually between 2 and 5°C. Please note that with low winter temperature (for example -10°C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes
5) RPM value must be greater than the tuned RPM threshold usually between 1300 and 1800 RPM depending on engine power and vehicle gearbox ratio.
6) LPG switching isn't allowed at very high engine loads, for example in full acceleration.
7) No LPG system fault must be present.

1.2 General checks

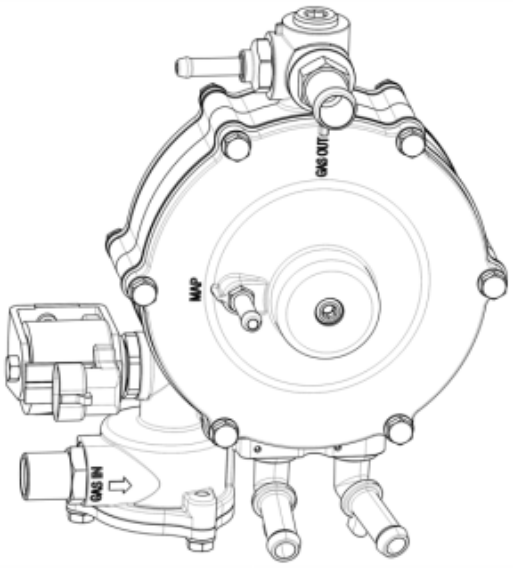
Before proceeding with repairs, verify that there are no additional faults stored in the petrol ECU.

The **operating pressure** of the LPG displayed on the DIAGNOSTIC TOOLS should be between **1.15 & 1.36 bar**, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70°C,with all auxiliary load (AC, fan,..) **switched off**.
[Usually the LPG pressure should be 0,9 - 0,95 bar over the intake manifold pressure].



The **system automatically switches** the vehicle **back to petrol** when pressure drops below a safety threshold, depending on the engine load.
This switchback to petrol can occur when the LPG tank is empty; in this case no DTC code is stored in the memory of the diagnostic system.

The **"supply voltage of LPG injectors"** influences the correct operation of the LPG system. The voltage range for a correct operation is between **9 & 16 Volts**.



1.3 Road Test

If a road test is required make a comparison between Petrol Mode and LPG mode driving.
Perform the same tests and check for a different driving behaviour of the vehicle.

GAS SYSTEM COMPONENT OVERVIEW

COMPONENT DESCRIPTION

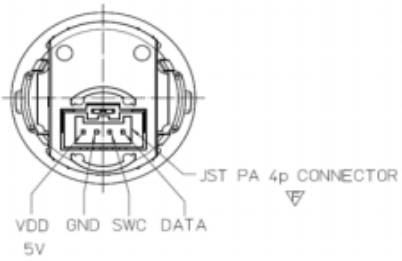
LI 10 PRESSURE REGULATOR

Aluminium body
ON-OFF solenoid safety valve
Filter incorporated in solenoid

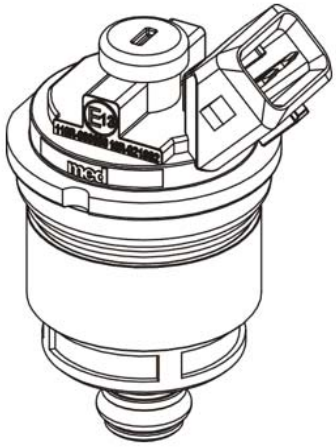
Supply pressure:	**2.5 to 30 bar**
Calibration pressure:	**0,95 bar**
Temperature range:	**-20° to 120°C**
Solenoid power supply:	**6 to 16 Volts**
Maximum flow rate:	**30 Kg/h**
Weight:	**1450 g.**
Homologation:	**ECE/ONU R67/01**

COALESCENCE LPG FILTER

Type of gas:	**LPG or Methane**
Pipe diameter IN:	**14 mm**
Pipe diameter OUT:	**14 mm**
Maximum pressure:	**2.2 bar (absolute)**
Filtering grade:	**10 micron**
Weight:	**75 g**
Homologation:	**ECE R110 - ECE R67/01**



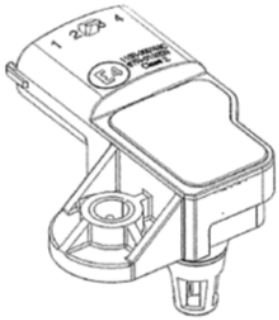
SWITCH



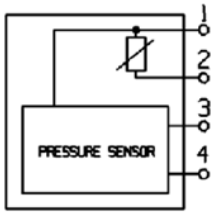
The switch shows the level of LPG and offers the driver a choice of fuels (gas/petrol).
The switch have an internal "buzzer" that work when the system switch back to petrol in case of any fault on LPG system or when the LPG tank is empty.

Pin assignment:

1) **+5V Power supply**
2) **Ground**
3) **Contact**
4) **Serial Data**

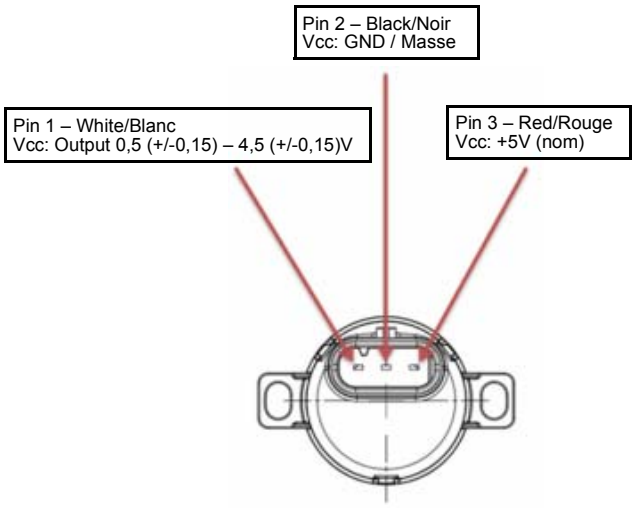


GAS INJECTOR



Current management:	**6/1.5A "Peak and hold"**
Supply voltage:	**6 to 16 Volts**
Temperature range:	**- 40 °C to +120 °C**
Nominal pressure:	**0.8 to 3 bar**
Opening time @12V:	**1.5 ms**
Dimensions:	**Ø 32 x h 73 mm**
Weight:	**120 g**
Homologation:	**ECE R 110 - ECE R 67/01**

LPG PRESSURE AND TEMPERATURE SENSOR



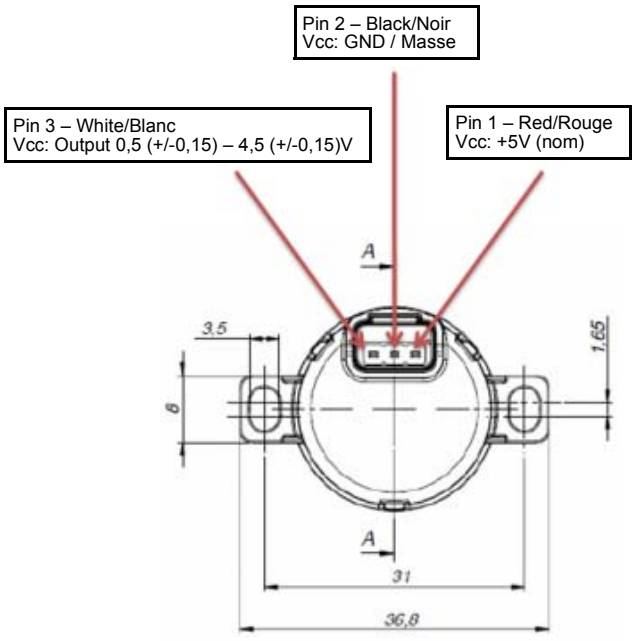
Supply voltage:	**4.5 to 5.5 Volts**
Temperature range:	**- 40 °C to +120 °C**
Nominal pressure:	**50 to 350 kPa**

Connector-Track assignment

Track 1	**Ground**
Track 2	**NTC resistor**
Track 3	**+5 V**
Track 4	**Output signal**

HALL EFFECT TANK LEVEL SENSOR (3 TERMINALS)

1) The level sensor must be supplied with 5,00 V nominal



2) Supply Voltage must be in the range 4,5 – 5,5 V. Below 4,5 V the measure isn't accurate; over 5,5 V the sensor could be damaged.

3) The Hall Effect Sensor Output Voltage is Ratiometric over the Power Supply

Level Sensor / Capteur Niveau X98, H79PH2, X92, X67 (463518000)
Clio IV, Duster 2, Lodgy, Dokker.

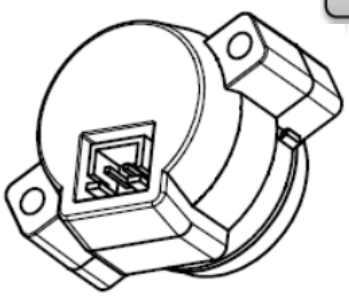
(External tank)

LC03

1) The level sensor must be supplied with 5,00 V nominal

2) Supply Voltage must be in the range 4,5 – 5,5 V. Below 4,5 V the measure isn't accurate; over 5,5 V the sensor could be damaged.

3) The Hall Effect Sensor Output Voltage is Ratiometric over the Power Supply



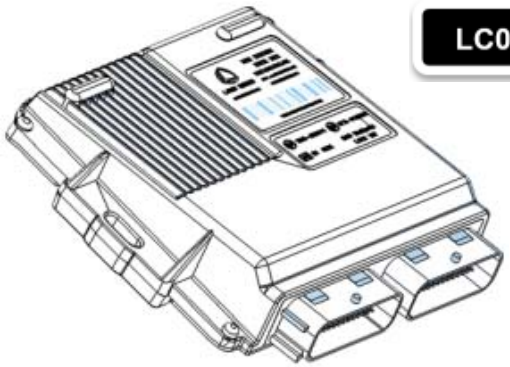
Level Sensor / Capteur Niveau X52 (616506000)
Sandero II

(Internal tank)

LC03

LC02

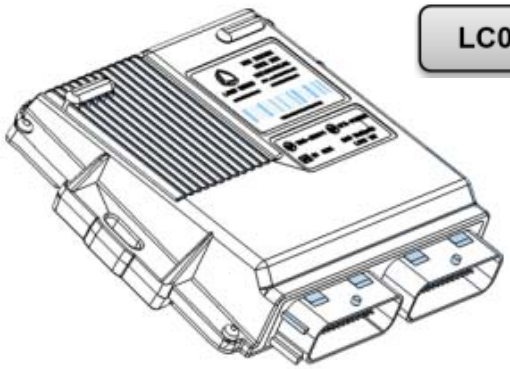
RESISTIVE TANK LEVEL SENSOR (2 TERMINALS)



Temperature range:	**- 10 °C to +85 °C**
Nominal resistance:	**from 100 to 21800 ohm**

Connector-Track assignment

Track 1	**Tank Level Voltage**
Track 2	**Ground**



GCU PINOUT

DTC2666 PRESENT OR STORED	TANK SOLENOID VALVE CIRCUIT 15: Open circuit 15: Short circuit to +12 V 11: Short circuit to ground.

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a short circuit to +12V, a short circuit to ground, a wiring interruption or solenoid coil resistance out of range, in the circuit controlling the tank electrovalve solenoid.

DTC2666 TANK SOLENOID VALVE CIRCUIT

FAILURE TYPE 15 and 11	*NOTES*	**Priority of treatment if more than one fault is present:** If the fault **DTC2294** is present at the same time, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on GCU Track 16 and 44.

Check if the tank electrovalve plug has been properly connected. Repair if necessary.

Check the tank electrovalve connections. Repair if necessary.

Check the computer connections. Repair if necessary

Remove the GCU 56 way connector.

Ensure the continuity of the connection between:

LC03	**GCU connector Track 17 → Track 2 of the EV plug**
LC03	**Track 1 of the EV plug → Ground**

LC02	**GCU connector Track 23 → Track 1 of the EV plug**
LC02	**Track 2 of the EV plug → Ground**

Measure the resistance of the coil of the tank Electrovalve

Replace the coil if the resistance is not in the range 11,0 and 13,5 ohm at ambient temperature (20°C).

If the fault persist after these check, replace the coil.

DTC2294 PRESENT OR STORED	**PRESSURE CONTROL CIRCUIT VALVE** 15: Open circuit 15: Short circuit to +12 V 11: Short circuit to ground.

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele.1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a short circuit to +12V, a short circuit to ground, a wiring interruption or solenoid coil resistance out of range, in the circuit controlling the tank electrovalve solenoid.

DTC2294 PRESSURE CONTROL CIRCUIT VALVE

FAILURE TYPE 15 and 11	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC2666** is present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on GCU Track 16 and 44.

Check if the pressure regulator electrovalve plug has been properly connected. Repair if necessary.

Check the pressure regulator electrovalve connections. Repair if necessary.

Check the computer connections. Repair if necessary

Remove the GCU 56 way connector.

LC03	**GCU connector Track 18 → Track 1 of the EV plug**
LC03	**Track 2 of the EV plug → Ground**

LC02	**GCU connector Track 23 → Track 1 of the EV plug**
LC02	**Track 2 of the EV plug → Ground**

If required, replace the faulty harness.

Measure the resistance of the coil of the electrovalve.

Replace the coil if the resistance is not in the range **11,0 and 13,5 ohm at ambient temperature (20 °C)**.

If the fault persist after these check, replace the coil.

DTC018A PRESENT OR STORED	**LPG PRESSURE SENSOR CIRCUIT** 12: Short-circuit to +5V 13: Open Circuit

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Pressure Sensor in open circuit or short circuit) in the circuit acquiring the LPG Pressure Signal.

DTC018A LPG PRESSURE SENSOR CIRCUIT

FAILURE TYPE 12 and 13	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC018A** is present at the same time, perform the current check first.

Check the LPG pressure connections. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 19 → Track 3 of the sensor plug**
LC03	**GCU connector Track 45 → Track 4 of the sensor plug**
LC03	**Track 1 of the sensor plug → Ground**

LC02	**GCU connector Track 9 → Track 3 of the sensor plug**
LC02	**GCU connector Track 8 → Track 4 of the sensor plug**
LC02	**Track 1 of the sensor plug → Ground**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Ensure the insulation against Ground of the connection between:

LC03	**GCU connector Track 19 → Track 3 of the sensor plug**
LC02	**GCU connector Track 9 → Track 3 of the sensor plug**

Repair if necessary. If required, replace the faulty harness.

Reconnect the GCU 56 way connector and check for the presence of a 5V +/-10% supply voltage on Track 3 of the sensor when in Key-On and push button LEDs are turned on.

If the fault persist after these check, carry out a road test followed by a test using the diagnostic tool and proceed to fault finding of “Unexpected switch back to petrol” Chart 1.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC2293 PRESENT OR STORED	**LPG PRESSURE** 21: Low LPG pressure 22: High LPG pressure 64: Incoherence

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This functional fault could occur when the GCU Diagnostic System detects pressure parameters out of range (LPG pressure too low or too high to guarantee a regular operation of the engine, or pressure delay due to a leakage in the rubber hoses) in the circuit controlling the LPG pressure supply to the LPG rail. The 64 recurrence could be symptomatic of a clogged hose or a leakage in a rubber hose connection or damaged hose.

DTC2293 LPG PRESSURE

FAILURE TYPE 21 and 22	***NOTES***	**Priority of treatment if more than one fault is present:** Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time. Deal with the electrical fault **DTC018A** if is present at the same time.

Ensure that there are no leaks on the inlet manifold.

Repair if necessary.

If no fault is found, then there must be a problem with the LPG fuel system and proceed to fault finding of "Unexpected switch back to petrol" Chart 1 checking:

- Fuel check
- Fuel pressure sensor check
- Multivalve electrovalve check
- Fuel supply hoses check
- Fuel pressure regulator check

Replace the defective component.

For both

AFTER REPAIR	Deal with any other possible faults. Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagno-sis tool.

DTC2293 LPG PRESSURE

FAILURE TYPE 64	*NOTES*	**Priority of treatment if more than one fault is present:** Deal with the electrical fault **DTC018A** if is present at the same time.

Ensure that there are no leaks on the inlet manifold.
Repair if necessary.

If no fault is found, then there must be a problem with the LPG fuel system and proceed to fault finding of:

Fault finding Assisted by PlusMaxRE
Chart LPG 2

FUEL SUPPLY CONFORMITY CHECK: LEAKAGE TEST
[DTC 2293-64]

FUEL SUPPLY CONFORMITY CHECK: TOO LOW PRESSURE
[DTC 2293-64]

"IMPOSSIBLE SWITCHING IN LPG MODE" Chart 3 and/or "IMPOSSIBLE TO SWITCH IN LPG MODE AND LPG SWITCH IS BUZZING" Chart 8.

For both

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC0185 PRESENT OR STORED	**LPG TEMPERATURE SENSOR CIRCUIT** 11: Open circuit 15: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Temperature Sensor in open circuit or short circuit) in the circuit acquiring the LPG Temperature Signal.

DTC0185 LPG TEMPERATURE SENSOR CIRCUIT

FAILURE TYPE 11 and 15	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC0184** is present at the same time, perform the current check first.

Check the LPG pressure connections. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 46 → Track 2 of the sensor plug**
LC03	**Track 1 of the sensor plug → Ground**

LC02	**GCU connector Track 6 → Track 2 of the sensor plug**
LC02	**Track 1 of the sensor plug → Ground**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Ensure the insulation against +12V of the connection between:

LC03	**GCU connector Track 46 → Track 3 of the sensor plug**
LC02	**GCU connector Track 6 → Track 3 of the sensor plug**

Repair if necessary. If required, replace the faulty harness.

If the fault persist after these check, carry out a road test AND proceed to fault finding of “Unexpected switch back to petrol” Chart 1.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC0184 PRESENT OR STORED	**LPG TEMPERATURE** 21: Low LPG temperature 22: High LPG temperature

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This functional fault could occur when the GCU Diagnostic System detects temperature parameters out of range (LPG temperature too low or too high to guarantee a regular combustion and operation of the engine) in the circuit controlling the LPG pressure supply to the LPG rail.

DTC0184 LPG TEMPERATURE

FAILURE TYPE 21 and 22	***NOTES***	**Priority of treatment if more than one fault is present:** Deal with the electrical fault **DTC0185** if is present at the same time.

Proceed to fault finding of “wrong gas temperature” fault finding Chart 2

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC2265 PRESENT OR STORED	**LPG TANK LEVEL SENSOR CIRCUIT** 15: Open circuit or short-circuit to +5V

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the tank level sensor (risk of destroying it).

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Level Sensor in open circuit or short circuit) in the circuit acquiring the LPG Tank Level Signal.

DTC2265 GAS TANK GAUGE VOLTAGE SIGNAL

FAILURE TYPE 15	***NOTES***	**Priority of treatment if more than one fault is present:** If faults **DTC2666** and **DTC2294** are present at the same time, perform a rear wiring harness check first.

Check the LPG Tank Level Signal. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 47 → Track 1 of the sensor plug**
LC03	**GCU connector Track 36 → Track 3 of the sensor plug**
LC03	**Track 2 of the sensor plug → Ground**

LC02	**GCU connector Track 18 → Track (1) of the sensor plug**
LC02	**GCU connector Track 21 → Track (2) of the sensor plug**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

On LC03 Systems only, ensure the continuity of the connection between:

LC03	**Track 2 of the sensor plug → Ground**

Ensure the insulation against +12V of the connection between:

LC03	**GCU connector Track 47 → Track 2 of the sensor plug**
LC02	**GCU connector Track 21 → Track (2) of the sensor plug**

GCU connector Track 47 → Track 1 of the EV plug

Repair if necessary. If required, replace the faulty harness.

If the harness is conform replace just the level sensor, not the complete MultiValve.

Reconnect the GCU 56 way connector and check for the presence of a 5 +/-10% volt supply on Track 1 of the sensor when in Key-On and push button LEDs are turned on.

If there is no supply, replace the injection computer (reprogram and configure the computer: see introduction).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1608 PRESENT OR STORED	INJECTION CONTROL COMPUTER **4B**: GCU's Over temperature

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 8 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects as an over temperature of LPG Injector drivers due to a short circuit to +12V in the wiring harness, an intermittent wiring interruption or solenoid coil resistance out of range.

DTC1608 INJECTION CONTROL COMPUTER

FAILURE TYPE 4B	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary.
Check the connection and condition of the injector connector. Change the connector if necessary.
Check the ground connection to the chassis. Repair if necessary.
With the engine running in LPG mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.
Connect the bornier in place of the computer and check the resistance value of the injector by measuring between **tracks 1 and 2 of the LPG injector**: Track 16 and 27 for an injector 1; Track 16 and 28 for an injector 2; Track 44 and 55 for an injector 3; Track 44 and 56 for an injector 4; Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).
If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC10A0 PRESENT OR STORED	CYLINDER 1 LPG INJECTOR CIRCUIT **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A0 CYLINDER 1 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection:**

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**LPG Injector 1 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 26**	→	**LPG Injector 1 Track 1**

Repair if necessary.

If there is no supply voltage, check the insulation, continuity and absence of interference resistance of the connection:

LC03 LC02	**GAS INJECTOR 1 GCU track 27**	→	**LPG Injector 1 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 1**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A1 PRESENT OR STORED	**CYLINDER 2 LPG INJECTOR CIRCUIT** **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A1 CYLINDER 2 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	***NOTES***	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignement on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**LPG Injector 2 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 26**	→	**LPG Injector 2 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 28**	→	**LPG Injector 2 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 2**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A2 PRESENT OR STORED	**CYLINDER 3 LPG INJECTOR CIRCUIT** **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A2 CYLINDER 3 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignement on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 44**	→	**LPG Injector 3 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 54**	→	**LPG Injector 3 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 55**	→	**LPG Injector 3 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 3**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A3 PRESENT OR STORED	CYLINDER 4 LPG INJECTOR CIRCUIT **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A3 CYLINDER 4 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 44**	→	**LPG Injector 4 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 54**	→	**LPG Injector 4 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 56**	→	**LPG Injector 4 Track 2**

Repair if necessary.

Check the resistance value of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 4**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC1570 PRESENT OR STORED	**LPG SWITCH STATUS** 13: Open circuit

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault reappears in the memory after the engine has been running for 5 minutes in LPG mode.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects an open circuit of the contact of the pushbutton.

DTC1570 LPG SWITCH STATUS

FAILURE TYPE 13	***NOTES***	None

Check the pushbutton electrical connections. Repair if necessary.
Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.
Ensure the continuity of the connection between:

LC03	**GCU connector Track 49 → Track 3 of the pushbutton**
LC03	**Track 2 of the pushbutton plug → Ground**

LC02	**GCU connector Track 48 → Track 3 of the pushbutton**
LC02	**Track 2 of the pushbutton plug → Ground**

Repair if necessary. If required, replace the faulty harness.

If the fault persist after these checks, change the **Pushbutton**.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1610 PRESENT OR STORED	BATTERY VOLTAGE **16**: Too Low voltage **17**: Too High voltage

NOTES	**Conditions for applying the fault finding procedure to the fault stored** The fault is declared present during Power On, after the engine has been running in LPG Mode.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a power supply voltage below 9V or over 16V for at least 3 seconds.

DTC1610 BATTERY VOLTAGE

FAILURE TYPE 16 and 17	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is in a good state of charge and, if necessary, check the charging circuit.

Connect the bornier in place of the computer and check the insulation, continuity and absence of interference resistance of the connections:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

If the fault persists after these checks, **reflash the GCU with the last released SW and Calibration**.

If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC109A PRESENT OR STORED	GCU SAFETY RELAY **64**: GCU Safety relay incoherence

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 3 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This functional fault could occur when the GCU Diagnostic System detects a failure in internal Solid State Safety Relay voltage feedback from safety relay detects an closed status when it should be open or viceversa.

DTC109A GCU SAFETY RELAY

FAILURE TYPE 64	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC2666, DTC2294,** are present, check for a wiring harness short circuit to battery on: GCU Track 16 and 17 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

With the engine running in gasoline mode and the LPG Pushbutton not selected, **check for the absence of +12 volts on the correct Track (17 or 18 for LC03 GCU and 23 or 24 for LC02 GCU) of the TANK and VAPORIZER SHUT OFF VALVE output**.

If there +12V is present when the GCU is running in gasoline mode:

1) Remove the GCU 56 way connector.
2) and **check the insulation of the connection between**:

LC03	**+ GCU connector Track 17**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC03	**+ GCU connector Track 18**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC02	**GCU connector Track 23**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC02	**GCU connector Track 24**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**

Make sure that the cable connecting the GCU and the TANK SHUT OFF VALVE or GCU and VAPORIZER SHUT OFF VALVE are in good condition.

Repair if necessary.

If the fault persists after these checks, **contact Techline**

DTC0618 PRESENT OR STORED	LPG SYSTEM **46**: GCU's Last trip data corrupted

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 8 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This functional fault could occur when the GCU Diagnostic System detects a failure in recording last trip data information; typically this occurs when the battery clamp or LPG GCU Power Supply Ground is disconnected during a "Power-latch" of the GCU.

DTC0618 LPG SYSTEM

FAILURE TYPE 46	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

If the fault persists after these checks, **reflash the GCU with the last released SW and Calibration**.

If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1316 PRESENT OR STORED	**GASOLINE PUMP RELAY** **00**: Open circuit **11**: Short circuit to ground **12**: Short circuit to +12 volts.

NOTES	**Priority for dealing with a number of faults:** First, deal with the DF46 battery voltage fault if it is present or stored.
	Conditions for applying the fault finding procedure to the fault stored: The fault is declared present 3 seconds after the switching in LPG mode.
	Special note: This fault could be present or stored on LC03 System only. LC03

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the gasoline pump relay.

DF1316 GASOLINE PUMP RELAY

FAILURE TYPE 11 and 12	***NOTES***	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DF1366, DF1367, DF1368, DF1369,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Check the **condition of the clips** on the injection relay (on the engine fuse/relay plate).

Replace the clips if necessary.

With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the Track CDE+ of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned).**

If there is no power supply **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**FUEL PUMP CUT-OFF RELAY Track CDE+**

Repair if necessary.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Connect the bornier in place of the computer and **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**Gasoline Pump Shutdown Relay Control** **GCU track 02**	→	**FUEL PUMP CUT-OFF RELAY** **Track CDE-**
LC03	**Gasoline Pump Shutdown Relay Status** **GCU track 11**	→	**FUEL PUMP CUT-OFF RELAY** **Track CDE-**

Repair if necessary.

Check the resistance value of the relay by measuring between tracks CDE+ and CDE- of the relay.
Replace the relay if the resistance is not approximately: 65 ohms Ω ± 5 Ω at 25 ºC.

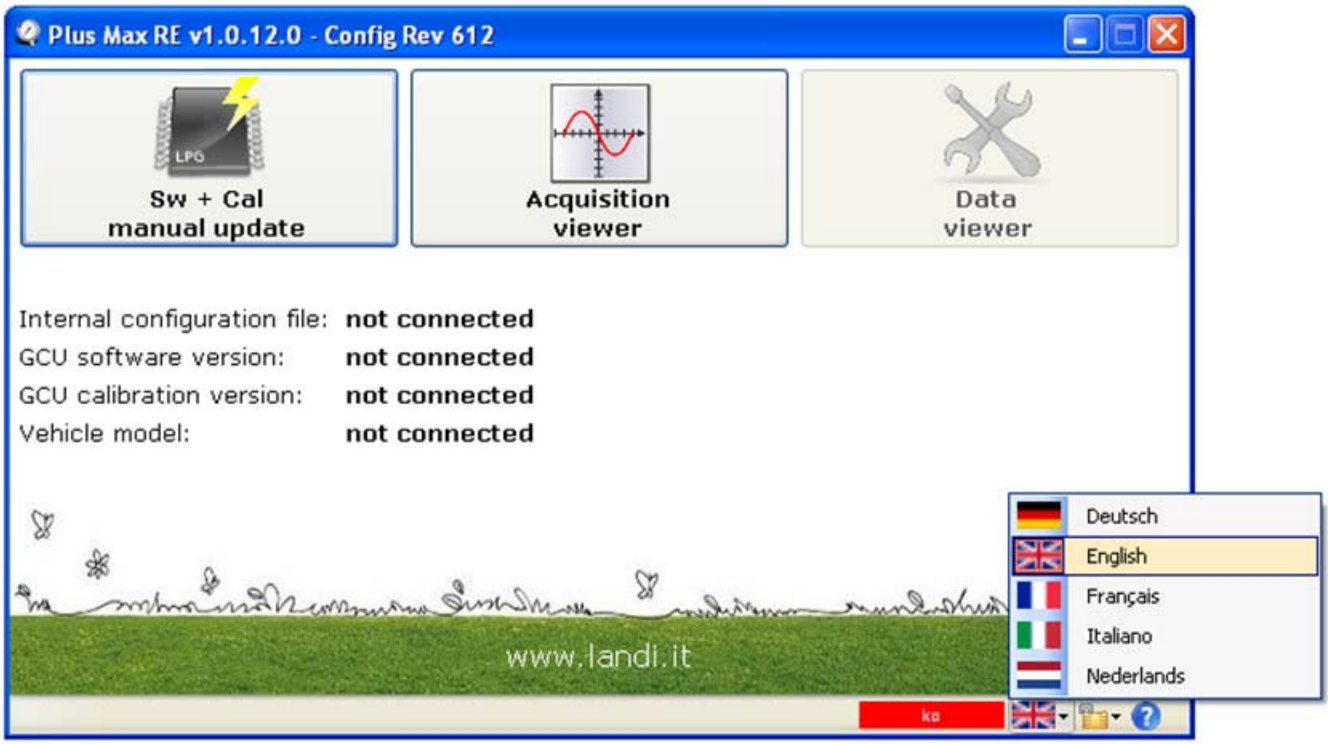
If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

1. REMINDERS

Landi Renzo diagnostic tool Plus Max Renault Version (in the following PluxMaxRe) is a diagnostic tool developed to run second level diagnostic on LPG system.

Always use the official diagnostic tool (Renault Clip) supplied by the manufacturer of the vehicle as primary diagnostic and repairing tool.



LR PlusMaxRE tools could be used in order to perform a second level diagnostic after the authorization of Renault's After Sales supervisors only.

2. PLUS MAX RE FUNCTIONS

See all the information relating the LPG System
OPERATIONS FOR REPLACING OR REPROGRAMMING THE GCU
Physical measurements
GCU test
Multimeter

PluxMaxRE can be installed on ANY PC running windows XP/VISTA/Windows 7 (32 bit only)

PlusMaxRE supports English French and Italian language.

How to select language

3. EXTRAS

3.1 Info

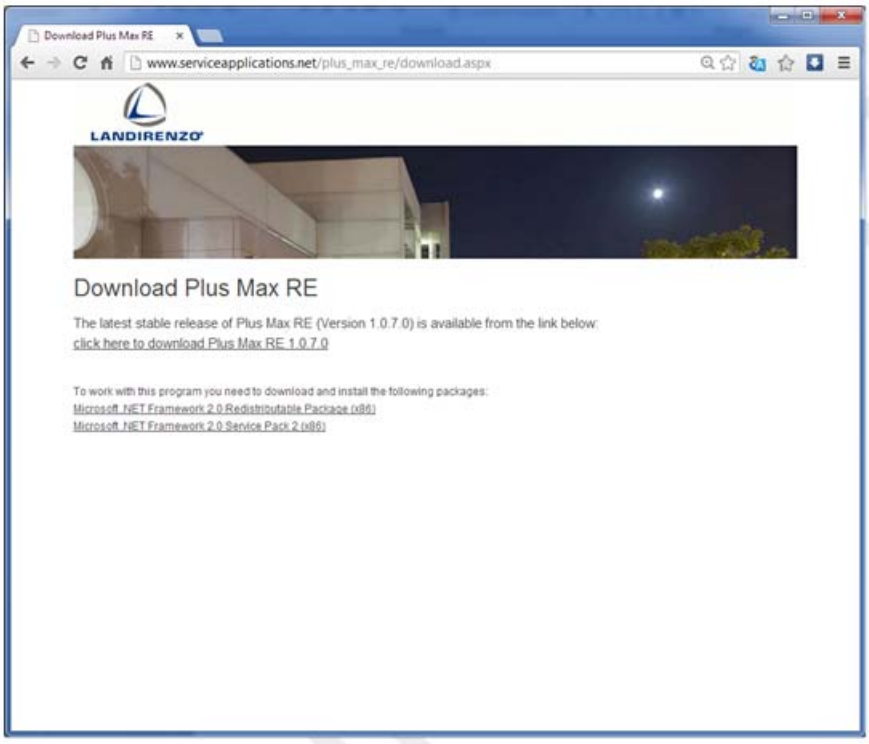
If the primary installation, follow the instructions, which is attached. If you already have an earlier version, it is recommended to uninstall and then follow the installation instructions.
It only works with original USB adapter.

3.2 Info

LR has created several versions of Diagnostic tools system named PlusMax. Just the version named Plus Max Renault Version (PluxMaxRe) must be connected to the LPG computer via Diag connector. It operates as a diagnostic interface, checking out a series of parameters as well as figuring out problems that you may then solve.

Previous version of PlusMax or other tools, as reflashing tools, or other unauthorized Tools could cause permanent damage to GCU calibration.

3.3 Info



Always keep to the instructions supplied by the vehicle manufacturer. The equipment should be used by trained personnel only.

4. PLUS MAX RE INSTALLATION GUIDE

Before installing please uninstall previous version of PlusMaxRE if you have;

Download the latest Plus Max RE diagnostic tool from Landi Renzo Aftersales Center

http://www.serviceapplications.net/plus_max_re/download.aspx

Double click the downloaded installation file (setup_1.0.x.x.exe)
Follow instructions step by step

SW Installation completed

Desktop Icon

IMPORTANT:
The Diagnostic Functions of the PlusMaxRE tools are not enabled (blocked by code); just the check and SW updating function is allowed

5. OPERATIONS FOR REPLACING OR REPROGRAMMING THE GCU

5.1 Procedure to be applied before replacement

This procedure must be applied before replacing or reprogramming the Gas Control Unit (LPG Computer)

IMPORTANT:
– Connect a battery charger and switch on the vehicle + after ignition supply voltage.
– Switch off all the electrical consumers (lights, interior lighting, air conditioning, radio, etc.).

– Connect the diagnostic tool power supply (mains or cigarette lighter supply).
– Connect the LR USB interface to the diagnostic tool:

Part Number
7711392500

Description
KIT INTERFACCIA USB PER CENTRALINE USB TYPE (LR USB interface)

– Connect the LR USB interface connecting cable to the diagnosis plug on the LPG ECU.
– Switch on vehicle + after ignition (+APC) power supply and wait until the coolant temperature is **less than 60 ºC** and the air temperature **is less than 50 ºC** and LPG injector driver temperature is **less than 40 ºC**. Consult parameter GP103 Coolant temperature and GP104 Air temperature and GP030 LPG injector driver temperature.

IMPORTANT:
It is necessary to respect these temperature values in order to carry out the computer programming or reprogramming operations.

– Apply the programming or reprogramming operations described in **Technical Note Appendix A GCU Computer (re)programming procedure**.

IMPORTANT:
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool. If the message does not appear, wait for 60 seconds.
Failure to follow this procedure may cause the computer data to be corrupted.

5.2 Procedure to be applied after repair

This procedure must be applied after replacing or reprogramming the computer.

5.3 Injection computer initialisation

– Rigorously Clear any fault code using Clip connected to Gasoline ECU. (During the reprogramming of a generic vehicle computer this cannot send messages on the CAN Network; this could generate some DTCs in the ECU).
– Crank and stop the engine to initialize the computer and wait for the loss of communication message to appear on the diagnostic tool, if the message does not appear, wait for 60 seconds.
– The computer is automatically configured according to the GCU and options present on the LPG System.
– Verify the correct configuration of the LPG System.

5.4 Procedure to be applied during the reprogramming

This procedure must be applied during the reprogramming the Gas Control Unit (LPG Computer)
The operation replaces the Software and the Calibration inside the GCU with the latest version with the help of PlusMaxRE.
Reprogramming procedure concerns GCU already assembled in the vehicle and already operational, and GCU delivered already programmed by Spare Part Centers (Magasin Pièces de Rechanges).
The reprogramming operation avoids the systematic replacement of GCUs.

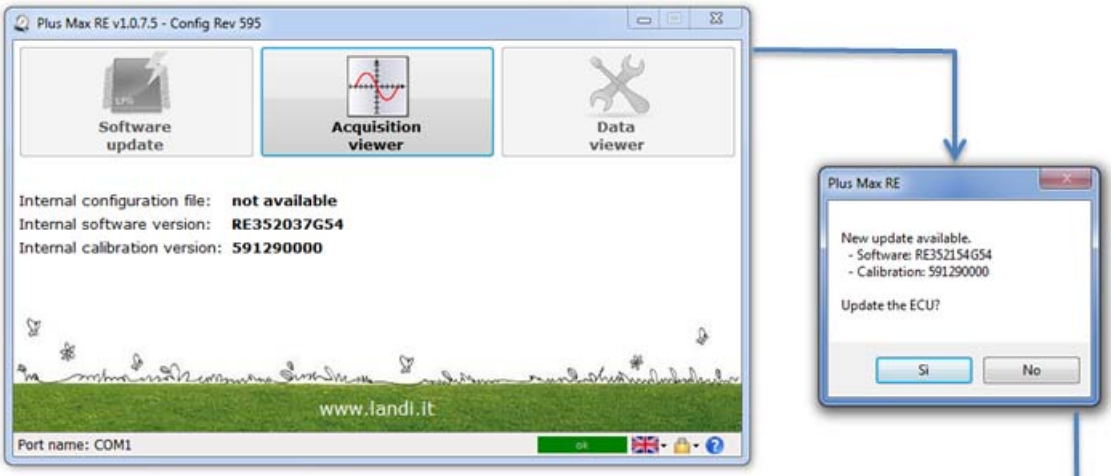
5.5 When reprogramming

The operation is done in the following sistuations:
When a well-defined Opération “Technique Spécifique” (OTS) or Note Technique Incidentielle (NTi) is put in effect in order to solve issues find in After Sales and/or an improvement of performances.
Following a RENAULT’s Techline request
Following RENAULT’s Technical Directive (Directives Techniques RENAULT)
Following a Landi Renzo’s Released Software Evolution
Following an ACTIS Solution

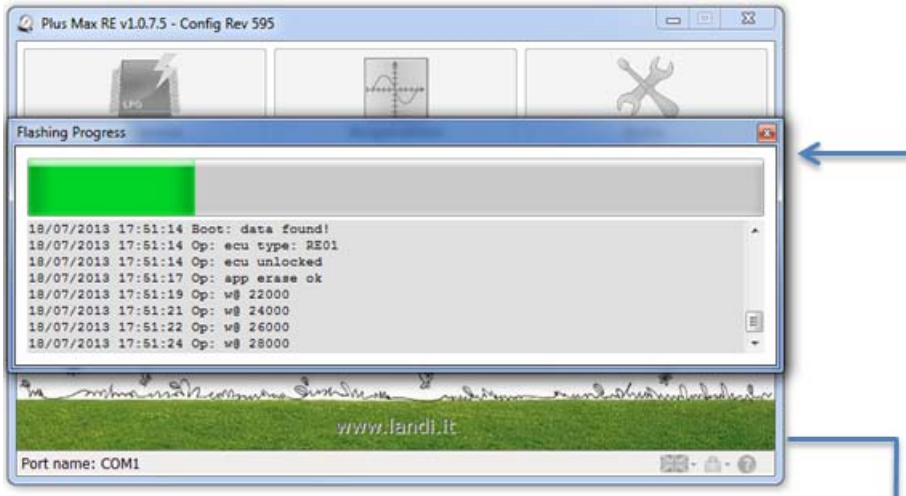
5.6 Operating Mode

The operating mode for both GCU Re-Calibration or GCU Reprogramming is strictly the same.
This operation must be done with PlusMaxRE diagnostic tools updated at the last version.

IMPORTANT:
Before any GCU Re-Calibration or GCU Reprogramming always update the tool downloading the latest Plus Max RE diagnostic tool from Landi Renzo Aftersales Center

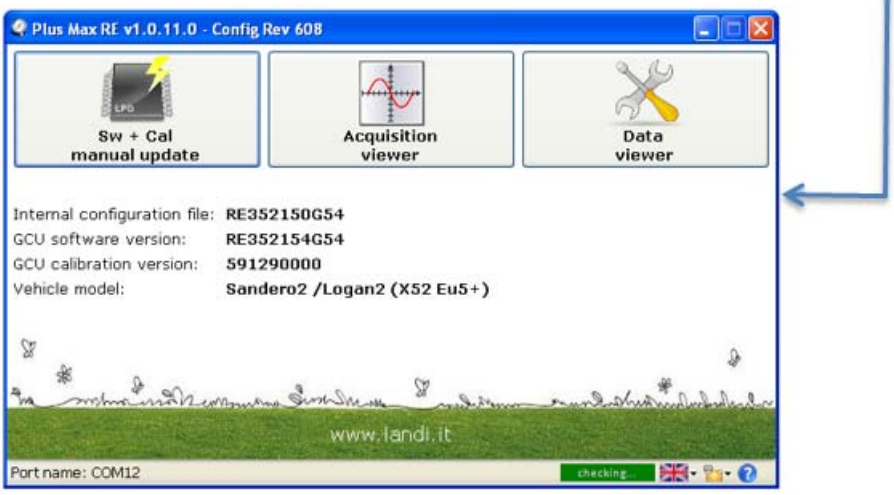


IMPORTANT:
In order to avoid any malfunctioning, outage and blockaged of the GCU, the procedures MUST be rigorously observed:
Procedure to be applied before replacement
Procedure to be applied after repair



WARNING:
DO NOT WORK ON THE VEHICLE OR ON THE DIAGNOSTIC TOOL

6. AUTOMATIC GCU RE-CALIBRATION OR GCU REPROGRAMMING



The operation replaces the Software and the Calibration inside the GCU with the latest version released for the specific vehicle.

If new update available message appears, update the GCU clicking on Si / Yes

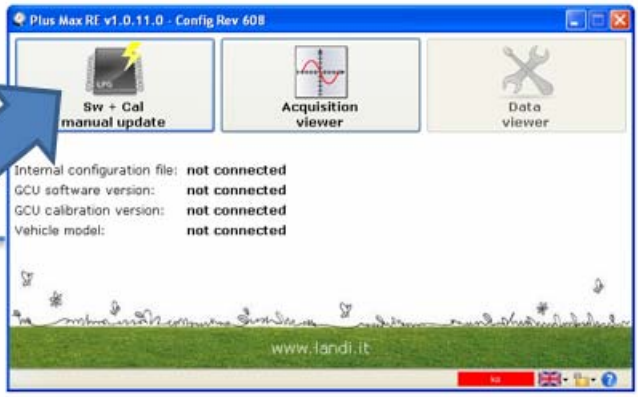
Waiting for download completion (100%)

At the end of the download it will appear the main page with new SW version.
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool, if the message does not appear, wait for 60 seconds.

7. MANUAL EMERGENCY PROCEDURE FOR GCU RE-CALIBRATION OR GCU REPROGRAMMING

This Manual Emergency Procedure must be applied when:

The operation of GCU Re-Calibration or GCU Reprogramming is interrupted by an Error Message (Example ER-ROR 110, ERROR 103, etc)
When the PlusMaxRE tool cannot automatically detects the vehicle, the original GCU Hardware Version, SW Version and Calibration version.

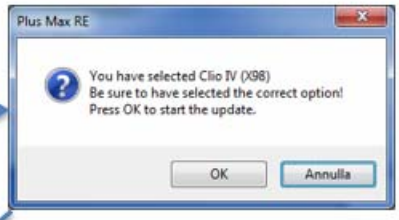


The operation replaces the Software and the Calibration inside the GCU with the latest version released for the specific vehicle.

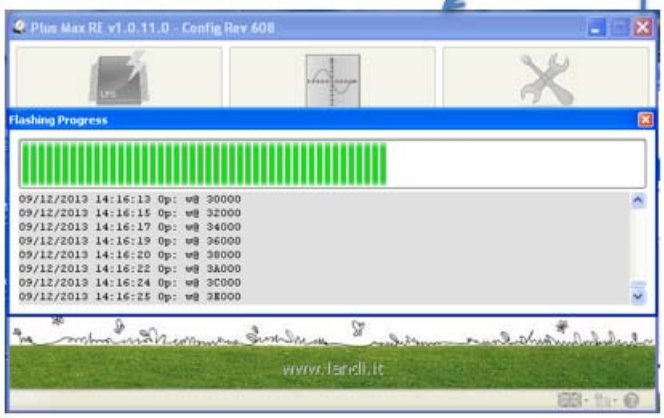
The Manual Emergency Procedure consists in the Manual Selection of the vehicle for GCU Re-Calibration or GCU Reprogramming.
The procedure must be authorized by Renault Techline and registered on FIC to report following parameters:

The VIN of the vehicle.
The fabrication number of the vehicle.
The code of error message specified in PlusMaxRE or error description
The SW and CAL number present on the label of the GCU

IMPORTANT:
The speed and relevance of the solution provided by Techline will depend on the accuracy with which this information is entered into the customer fault log.



After Techline analysis of the fault, you are authorized to apply the Manual Emergency Procedure for GCU Re-Calibration or GCU Reprogramming; depending on type of fault, this procedure can only be unlocked by a 6 character code (eg:F4A0B9).
This code is also necessary to perform all the diagnosis show in next chapter (in other word to open “parameter visualization” page)



On the main page, select SW+CAL Manual Update

Select the vehicle

Check the correct vehicle is selected and start GCU Re-Calibration or d

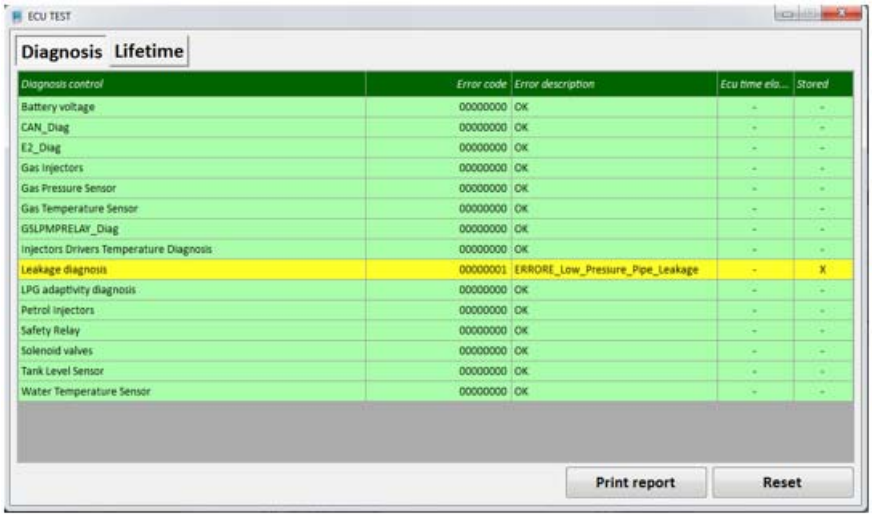
Waiting for download completion (100%)

At the end of the download it will appear the main page with new SW version.
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool, if the message does not appear, wait for 60 seconds.

8. GENERAL INFO TO FAULT FINDING USING PLUS MAX RE

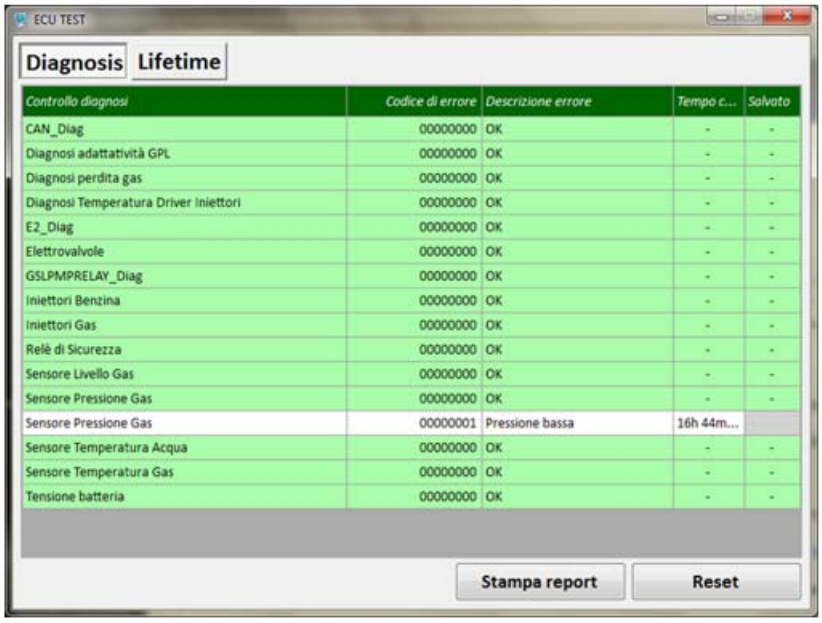
Always use the official diagnostic tool (Renault Clip) supplied by the manufacturer of the vehicle as primary diagnostic and repairing tool.
Always **clear any fault code using Clip** connected to Gasoline ECU and not using the Reset Pushbutton on the Diagnosis Page of PlusMaxRE.

9. DESCRIPTION FAULT PAGES IN PLUS MAX RE



As in Clip, faults are displayed as present or stored (they appeared in a certain context and remain present since they are fix, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + ignition power supply is switched on (without acting on the system components).



If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors for these lines (for oxidation, bent pins, etc.),
– the resistance of the component detected as faulty,
– the condition of the wires (melted or split insulation, wear).

Using PlusMaxRE to access the diagnostic page, click the "Fault List Page" link on top right of the main page. Present **faults** are **highlighted in yellow**; stored faults are **highlighted in white. Stored faults cannot be erased**. On stored faults the **"ECU time elapsed"** column indicates the GCU time elapsed from the moment when the fault appeared the last time. So a fault with an ECU time elapsed = 0h 01m appears just 1 minute before, while a fault with ECU time elapsed = 16 h 44 m appear 16 hours and 44 minutes before.

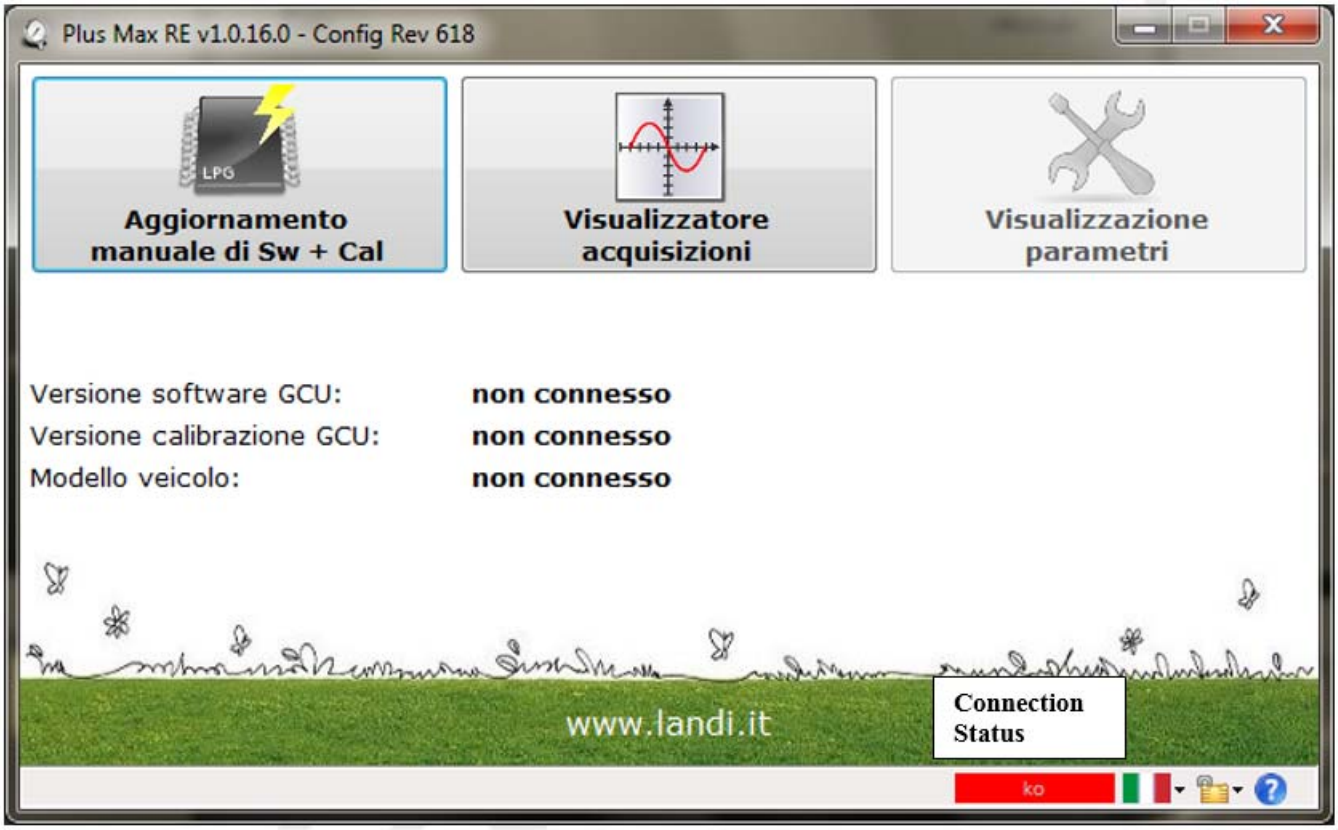
Example of present fault Highlighted in yellow

Example of stored fault Highlighted in white

10. COMPONENTS CONFORMITY CHECKS ASSISTED BY PLUSMAXRE

The aim of the conformity check is to check main LPG components in order to avoid wrong diagnostic and incorrect replacement of components.
This section gives the fault finding procedures supported by LR PlusMaxRE diagnostic Tool for behavior and parameters and the conditions for checking them.
If a behavior is not acting normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

11. CUSTOMER COMPLIANT – CONFORMITY CHECK



NOTES	Only check the Interpretation of Fault with PluxMaxRE tool after performing a complete check with the RENAULT's CLIP diagnostic tool. To open PlusMaxRE parameter page the unlock code is necessary.
	NOTE For any operation on a component of the LPG supply circuit, consult the safety instructions (see 17C).

NO DIALOGUE BETWEEN GCU AND TOOL	LPG 1
FUEL SUPPLY CONFORMITY CHECK	
LEAKAGE TEST	LPG 2
LOW PRESSURE	LPG 3
PRESSURE AND TEMPERATURE SENSOR CHECK	LPG 4
PRESSURE REGULATOR CHECK	LPG 5
INJECTORS CHECK	
MISFIRES	LPG 6
FUEL ADAPTATION	LPG 7
LPG LEVEL SENSOR CHECK	LPG 8

LPG 1	NO DIALOGUE BETWEEN GCU AND TOOL

NOTES	Use USB interface to connect your laptop to the diagnosis plug present in the GCU harness

This fault happens when the Tool isn't able to connect the diagnostic

The Area "Connection Status" must be green and parameters shown in the central part of the page.

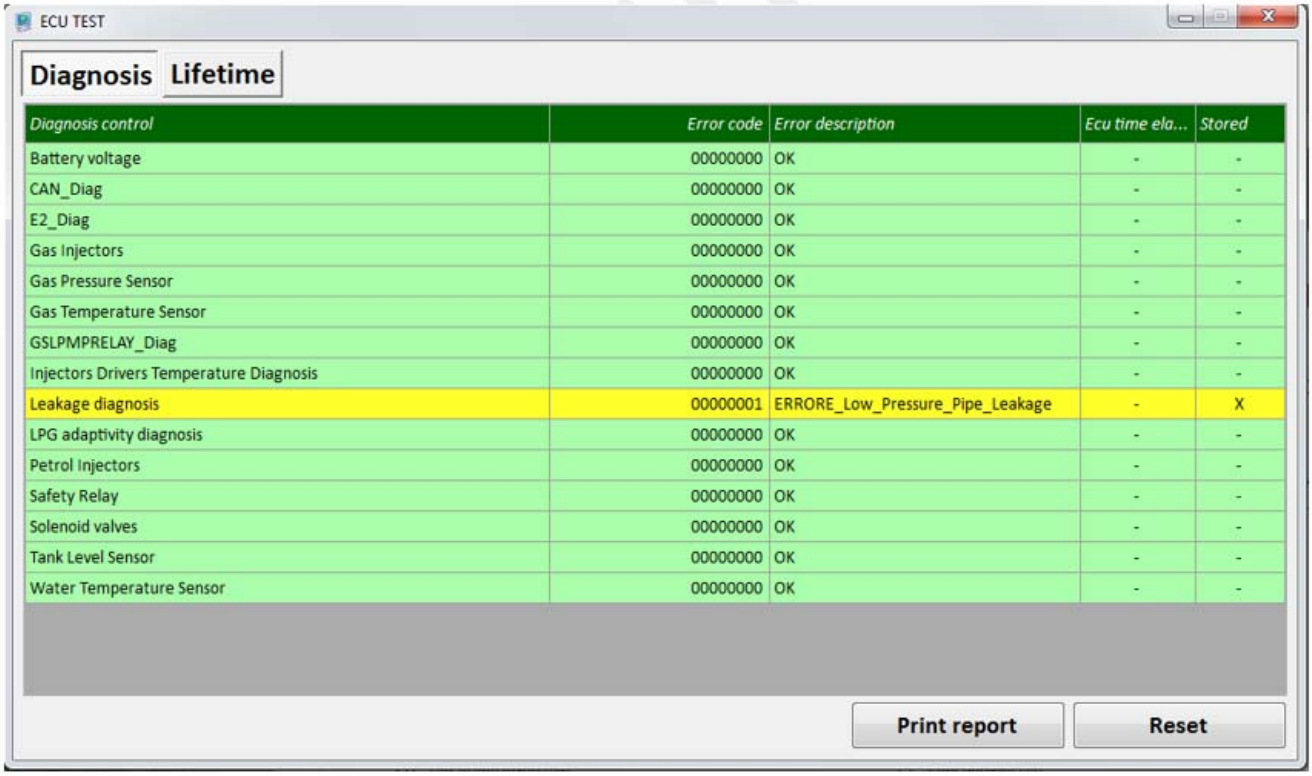
If this area is red and parameters show "not connected message" there are no connection between PC and GCU, when key is ON.

Check:
GCU Power Supply: check if the GCU is properly supplied (check if the LPG push button is ON)
USB connection: maybe the interface isn't recognized by the PC USB port; restart the PC if necessary.
Cable connection: maybe the USB interface cable is damaged or unplugged; check cable connection.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

With the engine running in gasoline mode and the LPG Pushbutton selected, **check for the presence of +12 volts on the correct Track (17 or 18 for LC03 GCU and 23 or 24 for LC02 GCU) of the TANK and VAPORIZER SHUT OFF VALVE output**.



LPG 2	*FUEL SUPPLY CONFORMITY CHECK: LEAKAGE TEST [DTC 2293-64]*

NOTES	GCU Integrates a strategy to check if the functionality of fuel supply lines are verified. In case this check isn't successful an LPG fault is generated and sent to ECU.

When test is performed:

Injector pre-heating (Antisticking function) NOT active
Tank level > 20%
At least 10 engine cranking and powersafe (60sec) after vehicle assembling or after SW reflashing.
Engine run in gasoline mode
Engine-on by at least 2 sec
Coolant water temperature at cranking > 30 °C
No other fault on Tank Level Sensor, Regulator EV, Tank EV.

Failure appears as "Leakage diagnosis" in the PlusMaxRE GCU Test page.
The fault can happen only during petrol mode.

Diagnosis control	Error code	Error description	Ecu time ela...	Stored
Battery voltage	00000000	OK	-	-
CAN_Diag	00000000	OK	-	-
E2_Diag	00000000	OK	-	-
Gas Injectors	00000000	OK	-	-
Gas Pressure Sensor	00000000	OK	-	-
Gas Temperature Sensor	00000000	OK	-	-
GSLPMPRELAY_Diag	00000000	OK	-	-
Injectors Drivers Temperature Diagnosis	00000000	OK	-	-
Leakage diagnosis	00000001	ERRORE_Low_Pressure_Pipe_Leakage	-	X
LPG adaptivity diagnosis	00000000	OK	-	-
Petrol Injectors	00000000	OK	-	-
Safety Relay	00000000	OK	-	-
Solenoid valves	00000000	OK	-	-
Tank Level Sensor	00000000	OK	-	-
Water Temperature Sensor	00000000	OK	-	-

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

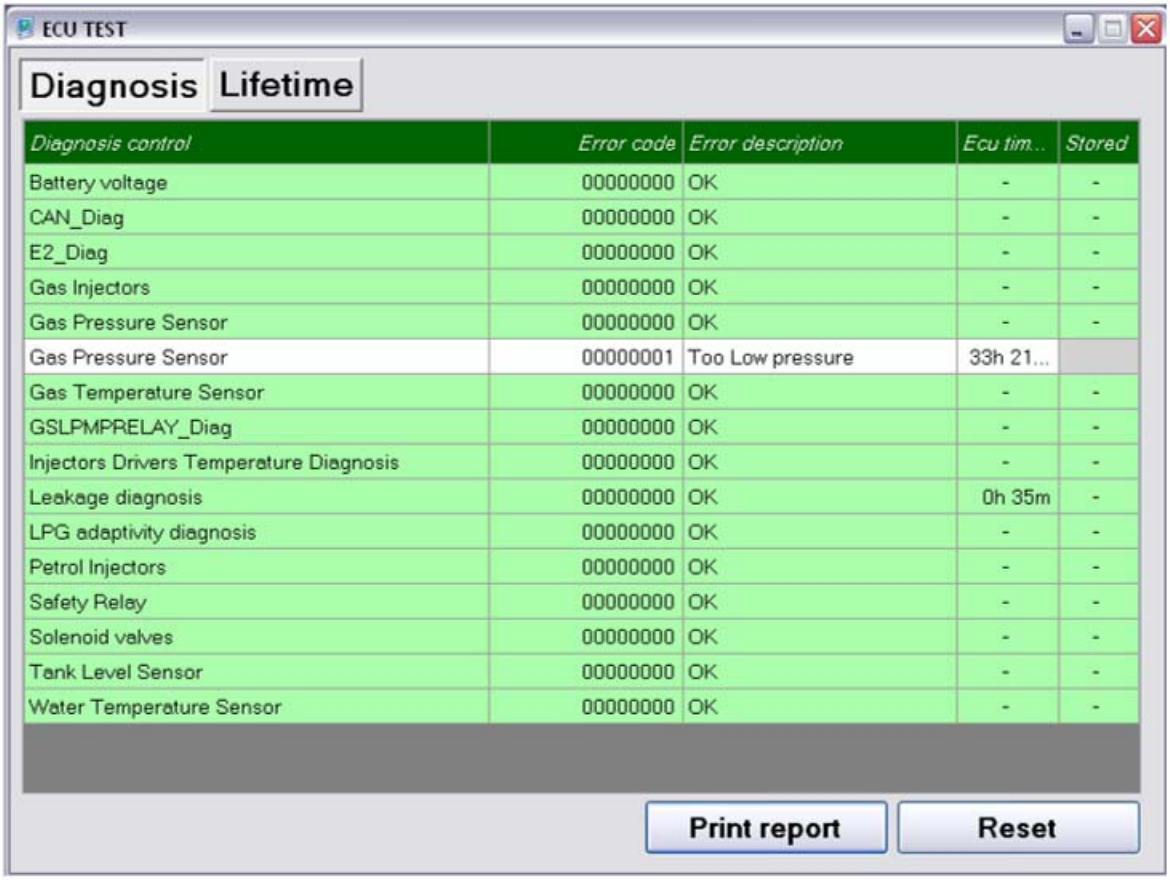
AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Test is performed in 2 different phases:
Few seconds after crank both LPG electrovalves open for 1 second (if the condition to perform the test are verified). In this phase the GCU check that the pressure reach at least 1.15 bar.
After both electrovalves closure the GCU monitor the LPG pressure for some seconds to verify if there is a pressure drop higher than a calibrated threshold.

The pressure doesn't reach 1.15 bar after EV opening:

LC03	**EV blocked:** the current supplies the coil but the EV of the regulator don't open	Replace mobile element
LC03	**Wrong level indication:** if no LPG is present in the tank but the sensor indicates more than 20% (not so common)	Fill the tank and check if the behavior is still present
LC03	**Low Pressure pipe disconnected:** a pipe is completely disconnected and LPG pressure sensor read atmospheric value	Reconnect the pipe
LC03	**Component or pipe clogged:** it can interrupt the flow of LPG inside the pipes, avoiding the rise of pressure	Not easy to detect, check if a pipe has an internal part that block it
LC03	**LPG Pressure/Temperature Sensor fault**	Check for DTC018A or DTC0185 present at the same time and deal with.

Drop of pressure during leakage test phase higher than the limit.



LC03	**Injector leakage in the manifold:** can create a drop of pressure and produce driveability issue during the test phase or during crank	Confirm the leakage from one single injector and replace it
LC03	**Hoses leakage:** Hose Clips, Double Wire Clips and Spring Band Clamps (Mubea Clamps) can be not correctly fixed	Fix correctly hoses or clamps
LC03	**Safety valve leakage:** the component not close correctly. If you remove the pipe you can smell LPG odour	Replace the regulator
LC03	**Regulator leakage:** if the membrane of the regulator is broken you can smell LPG odour from the MAP connection (after removing pipe)	Replace the regulator

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 3	*FUEL SUPPLY CONFORMITY CHECK: TOO LOW PRESSURE [DTC 2293-64]*

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

Failure appears as “Too low pressure” in the PlusMaxRE ECU Test page.
The fault can happen only in LPG mode.

Low pressure error:

LC03	**EV blocked:** Due to cranking condition, leakage test wasn’t performed in the current trip and EV don’t open when we switch to LPG	Replace mobile element
LC03	**Tank valve manually closed**	Open the valve and test again the system
LC03	**Hoses blocked:** if a pipe is clogged or bended, LPG flow can drop and decrease LPG pressure	Fix the pipes

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 4	*PRESSURE AND TEMPERATURE SENSOR CHECK*

NOTES	**Note the difference between functional and electrical error.**

DTC 2293 and DTC 0184 are related to **functional errors** and you **don't have** to replace the sensor in these cases.

"IMPOSSIBLE SWITCHING IN LPG MODE" Chart 3 and/or "IMPOSSIBLE TO SWITCH IN LPG MODE AND LPG SWITCH IS BUZZING" Chart 8.

With the vehicle stopped remove the sensor from the LPG rail
Leave the plug connected to be able to read the signals
After some minutes put the vehicle in key ON mode to supply the sensor
Check on the plus max RE the pressure and temperature value, they have to be coherent with the atmospheric value

Continuity check

LC03	Track 1 of LPG p/T sensor with ground Track 2 of LPG p/T sensor with pin 46 of the GCU Track 3 of LPG p/T sensor with pin 19 of the GCU Track 4 of LPG p/T sensor with pin 45 of the GCU
LC02	Track 1 of LPG p/T sensor with ground Track 2 of LPG p/T sensor with pin 6 of the GCU Track 3 of LPG p/T sensor with pin 9 of the GCU Track 4 of LPG p/T sensor with pin 8 of the GCU

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 5	*PRESSURE REGULATOR CHECK*

NOTES	**Note the difference between functional and electrical error.**

DTC2293-21 → Too low pressure
This error is never present on petrol ECU. When the GCU store this fault it consider the problem has a finish of LPG in the tank and didn't send any DTC to petrol ECU (if LPG level is different from 0 the error will be DTC2293-64)
DTC2293-22 → Too high pressure
DTC2293-64 → Incoherence between LPG level and pressure
This error appear when LPG pressure is too low but a normal value of pressure is attended (there is LPG inside the tank)

Regulator checks

TEST	EXPECTED PRESSURE VALUE
The **operating pressure** of the LPG displayed on the DIAGNOSTIC TOOLS should be between **1.15 & 1.36 bar**, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70°C,with all auxiliary load (AC, fan,..) **switched off**. [Usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].	**1.15 & 1.36 bar**
Idle, LPG mode, auxiliary load ON (AC, defrost, …), and when the temperature of the coolant is over 70 °C,	**1.35 & 1.55 bar**
Remove vacuum pipe, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70 °C,	**1.85 & 2.05 bar**
When the vehicle is running in LPG mode, gear in neutral position, push accelerator pedal driving	Pressure moves from **1.15 to 2 bar** according to manifold pressure
Open regulator's EV with +12V power supply (cold engine, only key ON) and check if you can immediately hear the sound of the opening	Not related with pressure value but to EV functionality

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 6	*LPG INJECTOR CHECK: MISFIRE*

NOTES	Injector issue, both electrical or functional, are always related to MIL lamp presence

If a fault code related to misfire occurs DTC030(x) (gasoline mode) or DTC130(x) (LPG mode) is stored in the petrol ECU.
Misfires can happen for different reasons, not only related to LPG injectors.

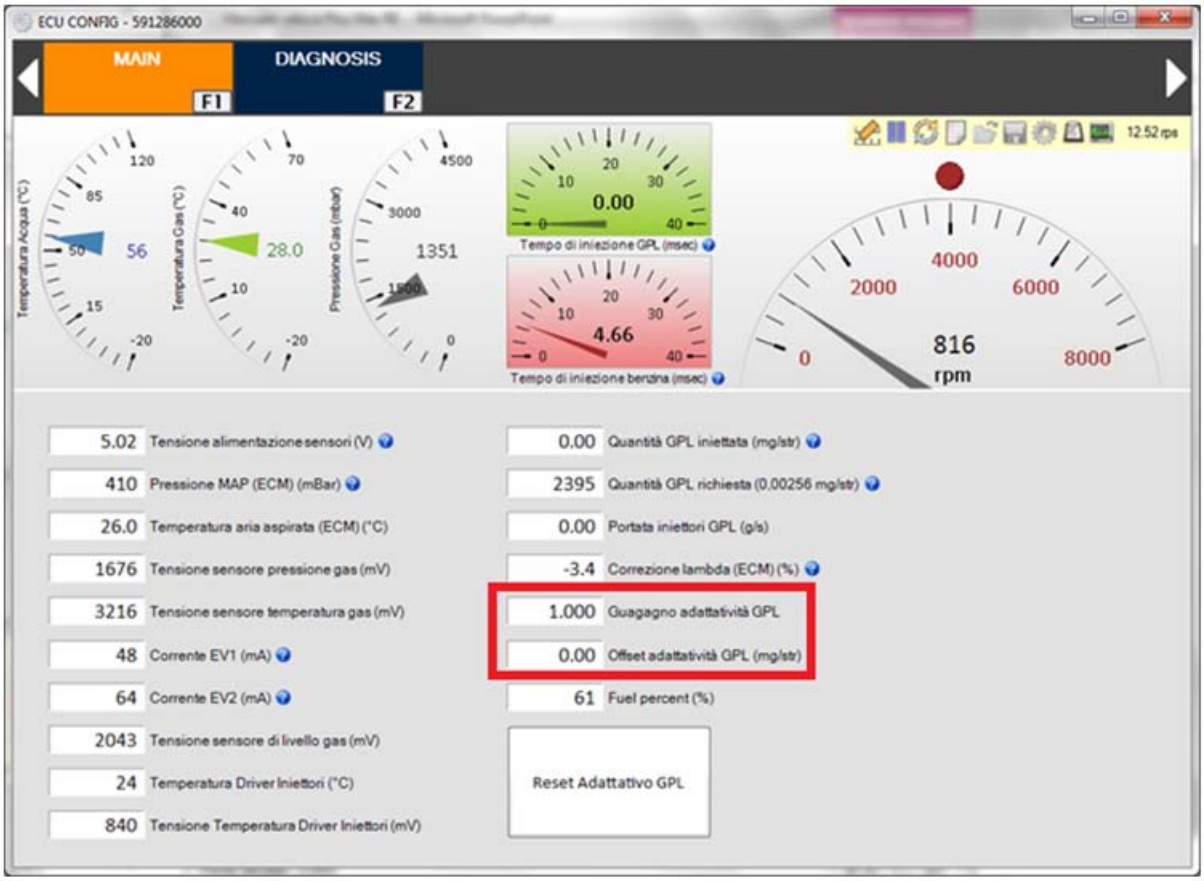
Customer Complain

Check if the issue happen during cold conditions (eg: low external temperature) and/or after few minutes from the switch to LPG.
Verify if the issue disappears when the engine is warm (coolant temperature over 70 °C).
If so a not correct vaporization of the regulator can be occurred.
In this case don't replace injector rail because they aren't responsible for the misfire.

DTC check

Check if there are other errors related to fuel combustion, for example related to lambda sensor or lean/rich combustion

Injectors check



Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.
Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 7	*LPG INJECTOR CHECK: FUEL ADAPTIVITY*

NOTES	Injector issue, both electrical or functional, are always related to MIL lamp presence

LPG system has adaptive parameters similar to petrol that correct LPG fuel mass injected.
Gain: default value is 1. For value higher than 1 mass flow rate will be increased; for values lower that 1 mass flow rate will be decreased. Expected value are between 0.8 and 1.2
Offset: default value is 0. Expected value are between -2 and +2

When adaptivity reaches its own limits an error appears.
If this happen replace the injectors.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 8	*LEVEL SENSOR AND FUEL INDICATION CHECK*

NOTES	Remember that electrical fault and bad level indication should be manage in different ways

First of all analyze the costumer complaint: if the issue is related to blocked level indication (always 3 led for example), it can be a mechanical issue of the multivalve; if the complaint is about a bad or not coherent indication the system can be conform anyway.

As described in “Fault Finding – System Description” there are 3 different level sensors:

1) “3 wires” level sensor for internal tanks (X52 – Sandero II, Logan II)
2) “3 wires” level sensor for external tanks (Clio IV, Duster II, Lodgy, Dokker)
3) “2 wires” level sensor for old Euro5 tanks (Clio III, Sandero I, Logan I, Duster I)

Check if there are errors related to electrical fault of the level sensor and, if so, check the correct connection of the wiring.

On Plus Max RE it is also showed the voltage related to the sensor.

LC03	**This sensor has a continuous output that moves from less than 200 mV to more than 4 V**
LC02	**This sensor has only 5 discrete levels that correspond to LED on the switch (on full tank the resistance between the 2 pins is 21.8 kOhm**

During the vehicle driving you can see the value that moves during long turn or during slopes: **this indicates that the leverage inside the tank isn’t blocked**. Consider that the voltage has an hysteresis inside the GCU so the plus max value moves slower that the mechanical behavior of the leverage (this means that, also if you see a fixed value on the plus max, the leverage can’t be free to move).

If the leverage isn’t blocked and no electrical fault is present the system is conform and the indication should be consider coherent.

If you think, after previous test, that the leverage is blocked remove the tank MultiValve unit from the tank and manually test it (you can again check the coherence with the position of the level sensor and the switch).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

UNEXPECTED SWITCH BACK TO PETROL	Chart 1
WRONG GAS TEMPERATURE	Chart 2
IMPOSSIBLE SWITCHING TO LPG MODE	Chart 3
IMPOSSIBLE TO CRANK THE ENGINE	Chart 4
GAS LEVEL INDICATOR: INCOHERENT WRONG LEVEL INDICATION	Chart 5
ENGINE STALL AT SWITCHING IN LPG MODE	Chart 6
MISFIRE – BAD DRIVEABILITY	Chart 7

CHART 1	*UNEXPECTED SWITCH BACK TO PETROL*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type

↓

Fuel pressure sensor check:
– Remove the sensor from the gas rail and check that the pressure value is approximately at atmospheric value with +APC (1 bar at sea level, engine temperature isn't relevant).
If the value is considerably different replace the sensor.

↓

Tank Multivalve electrovalve check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.

↓

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.

– Engine in LPG mode, running in idle and auxiliary load OFF → **gas pressure target 1.15 - 1.36 bar**.

– Switch off the engine and check the pressure is still the same after 5 minutes, to assure that no leakage is present (don't switch on engine, only +APC to give power supply to the sensor)

↓

Pressure regulator check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
– Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
– Remove vacuum pipe, idle, LPG mode → **pressure target 1.9 - 2 bar**
– In LPG mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and Manifold Pressure reference shall be approximately 0,95 bar less than LPG pressure**.

CHART 2	*WRONG GAS TEMPERATURE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

Fuel temperature sensor check:
– Park the car inside the garage, remove the sensor from the LPG pipe, but leave it electrically connected. Wait 15 minutes and check the LPG temperature using the diagnostic tool: it should be the same as ambient temperature. If the value is different replace the sensor (more than 15°C)

↓

Harness check:
– check that the plug of p/T sensor is correctly fixed
– check that wiring isn't damaged or broken.

↓

Customer complaint:
– Analyze the customer complaint: if the error occur at really low temperature (-10°C) consider the behavior has normal (at -10°C there is the diagnosys of too low temperature)

CHART 3	*IMPOSSIBLE SWITCHING TO LPG MODE: SWITCH BLINKING IN WAITING CONDITION OR LEDS SWITCHED OFF*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Important: remember that the switch to LPG isn't allowed immediately after pressing the button. The system need to reach determinate conditions before switch to LPG mode, as described in chapter 6.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.?

↓

Pushbutton check:
– Check that the LEDs on the switch are ON; if not check the harness connection of the switch.

↓

Switching condition check:
To allow LPG switch a lot of condition must be reached.
Check that
– The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
– Coolant water temperature must be higher than set threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25 °C.
– A calibrated delay is elapsed from the cranking. The delay depends on the temperature at the crank: usually cranking at a coolant temperature of 20 °C the delay is 60s.
– Gas Temperature must be higher than the tuned threshold usually between 2 and 5 °C. Please note that with low winter temperature (for example -10 °C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes.
– RPM value must be greater than the tuned RPM threshold usually around 1500 RPM.
– LPG switching isn’t allowed at very high engine loads, for example in full acceleration.

If costumer complains on delayed switch explain him that in some cases we need more than 5 minutes to reach all the conditions. It is really important that the system reach the right temperature to have a correct vaporization of the gas, even it's in the tank LPG can have really low temperature.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– Check on diagnosis page if there are any errors.

↓

LPG Fuel Trim check:
– Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
– Contact Techline with the completed fault finding log.

CHART 4	*IMPOSSIBLE TO CRANK THE ENGINE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

Battery and Fuse check:
– Make sure that **the battery is correctly charged**. If it is not, carry out fault finding on the charging circuit.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– If you experienced troubles to connect diagnostic tool, proceed with **GCU Power supply and Fuses check**.

↓

GCU Power supply and Fuses check:
Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance of the connections**:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance of the connections**:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

CHART 5	*GAS LEVEL INDICATOR: INCOHERENT WRONG LEVEL INDICATION*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– On Plus Max RE note which percentage is indicated for the LPG level
– During driving monitor the level sensor voltage (you can also record the signal on Plus Max RE) to understand if it is moving or not: if so the leverage of the multivalve isn't blocked (take into account the difference between the 2 level sensor, 2 or 3 wires)

↓

Customer complaint check:
– Analyze the costumer complaint in order to understand if there was a temporary block of the level gauge or the complaint is only due to the fluctuation of the LEDs of level indicator during the driving (uphill, downhill, roundabout); in this second case explain to the customer that the behavior is unfortunately normal and the best choice is to use the odometer to know accurately the mileage he can drive.

↓

Level indicator check:
– Drive the vehicle with PlusMaxRE connected and record Tank Level Sensor Electrical Signal; during acceleration, braking and turning, the electrical signal must change.
– Remove level indicator and check it can move freely and the position is correctly shown on the switch (wait 30 seconds for each position)
– If level sensor is "2 wires" version check the resistance is 21.8 kOhm at full level; if level sensor is "3 wires" version check the correct wiring connection (ground, +5V, signal)

↓

Multivalve check:
If the voltage of level sensor is fixed remove the multivalve from the tank to check it.
Check that
– The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
– Coolant water temperature must be higher than set threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25°C.
– A calibrated delay is elapsed from the cranking. The delay depends on the temperature at the crank: usually cranking at a coolant temperature of 20°C the delay is 60s.
– Gas Temperature must be higher than the tuned threshold usually between 2 and 5°C. Please note that with low winter temperature (for example -10°C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes.
– RPM value must be greater than the tuned RPM threshold usually around 1500 RPM.
– LPG switching isn't allowed at very high engine loads, for example in full acceleration.

CHART 6	*ENGINE STALL AT SWITCHING IN LPG MODE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Typically this issue is due to a lack of LPG in the low pressure side: during the switch pressure regulator needs few instants for fill the pipes (they should be already fill if no problem occurs)

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.

↓

Pressure in idle check:
– Check LPG pressure when:
  – Water temperature over 80°C
  – Engine is running in LPG mode in idle (≅ 750 RPM)
  – Auxiliary electrical loads OFF,

The **operating pressure** of the LPG displayed on the Diagnostic should be between **1.15 & 1.36 bar**, [usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].

↓

Tank Multivalve electrovalve check:
– Check that manual valve on the tank MultiValve unit is completely open.
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.

↓

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.
– Crank the engine monitoring:
  Gas Level (mV)
  Gas Pressure (mbar)
– Engine in LPG mode, running in idle and auxiliary load OFF → **attended pressure 1.3 bar**.
– Switch off the engine (leave key on to stay connected with the software) and check the pressure is still the same after 5 minutes, to assure that no leakage is present.

↓

Pressure regulator check:
- Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
- Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
- Remove vacuum pipe, idle, GPL mode → **pressure target 1.9 - 2 bar**
- In LPG mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and MAP reference shall be approximately 0,95 bar less than GPL pressure**

LPG Fuel Trim check:
- Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
- Contact Techline with the completed fault finding log

CHART 7	*MISFIRE – BAD DRIVEABILITY*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Priority for dealing with a number of faults: First deal with petrol faults cylinder coils control, engine speed sensor; downstream and upstream oxygen sensors, heating of upstream and downstream oxygen sensors, if they are present or stored.

Petrol fuel supply check:
- Check the petrol fuel system:
  - If requested in the petrol repairing manual, check ignition system by checking the condition of the plug and the low and high voltage contacts of the cylinder coil. Replace any faulty components.
  - If requested in the petrol repairing manual, check the compression ratio of cylinders. Repair if necessary.
  - If requested check the flywheel target (warping or cracks). Replace the flywheel if necessary.
  - Ensure that there are no leaks on the inlet manifold. Repair if necessary.

↓

If no fault is found, then there must be a problem with the LPG fuel system. Therefore check:
- the conformity of LPG fuel.
- the condition of the LPG fuel filter,
- the LPG flow and pressure
- the Tank manual valve check,
- the Tank and Regulator Electrovalves
- the Fuel supply hoses check,
- the LPG Fuel Trim check,

Replace the defective component.

↓

Conformity of LPG Fuel check:
- Check that there is LPG present (the LPG gauge may be faulty).
- Check that the LPG is of the proper type

↓

Fuel filter check:
- Check that there is LPG present (the LPG gauge may be faulty).
- Check that the LPG is of the proper type.

↓

Pressure in idle check:
– Check LPG pressure when:
  – Water temperature over 80 °C
  – Engine is running in LPG mode in idle (≅ 750 RPM)
  – Auxiliary electrical loads OFF,

The **operating pressure** of the LPG displayed on the diagnostic tool should be between **1.15 & 1.36 bar**, [usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].

Tank Manual Valve Check:
– Check that manual valve on the tank MultiValve unit is completely open.

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.

– Engine in GPL mode, running in idle and auxiliary load OFF → **attended pressure 1.3 bar**.
– Switch off the engine (leave key on to stay connected with the software) and check the pressure is still the same after 5 minutes, to assure that no leakage is present.

Pressure regulator check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
– Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
– Remove vacuum pipe, idle, GPL mode → **pressure target 1.9 - 2 bar**
– In GPL mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and MAP reference shall be approximately 0,95 bar less than GPL pressure**

LPG Fuel Trim check:
– Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
– Contact Techline with the completed fault finding log

For every problem, DTC or consideration not reported in this NT, please refer to the NT of the same vehicles with petrol version

IMPORTANT!

1. SCOPE OF THIS DOCUMENT

This document introduces the special fault finding procedure applicable to all:

Vehicle(s): **Sandero II, Logan II (B52, L52), Clio IV (B98)** For Engines: **D4F*734, D4F*744** Function concerned: **LANDI RENZO LC03**	Computer Name: **LC03** Software reference: **RE3520xxG54** Software reference: **RE3521xxG54**
Vehicle(s): **Duster II (H79Ph2), Lodgy (J92), Dokker (FK67)** For Engines: **K4M*642, K7M*828** Function concerned: **LANDI RENZO LC03**	Computer Name: **LC03** Software reference: **RE3521xxG54**
Vehicle(s): **CLIO III (X85)** For Engines: **D4F 744** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**
Vehicle(s): **SANDERO 1 (B90, FU90), LOGAN 1 (xx90)** For Engines: **K4M*642 , K7M*828** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**
Vehicle(s): **Duster (H79), Scenic (BK95), Megane (BK95)** For Engines: **K4M 616, K4M866, K4M834** Function concerned: **LANDI RENZO LC02**	Computer Name: **LC02 (OMEGAS PLUS)** Software reference: **RE2504xxG34**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):

– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:

– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP + multiplex line sensor

Special tooling required

– A multimeter and checking bornier **Elé. 1681** Universal bornier

The present repair method **IS NOT APPLICABLE TO** Software **DR2020xxG24** or **RE2020xxG34**.

3. REMINDERS

Procedure

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition supply voltage).

With vehicles with card reader, proceed as follows:
– vehicle card in reader
– press and hold the Start button (longer than 5 seconds) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off the + after ignition supply voltage**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than 3 seconds),
– ensure that the + after ignition power supply has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

Faults

Faults are displayed as present or stored (they appeared in a certain context and have since disappeared, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + after ignition power supply is switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

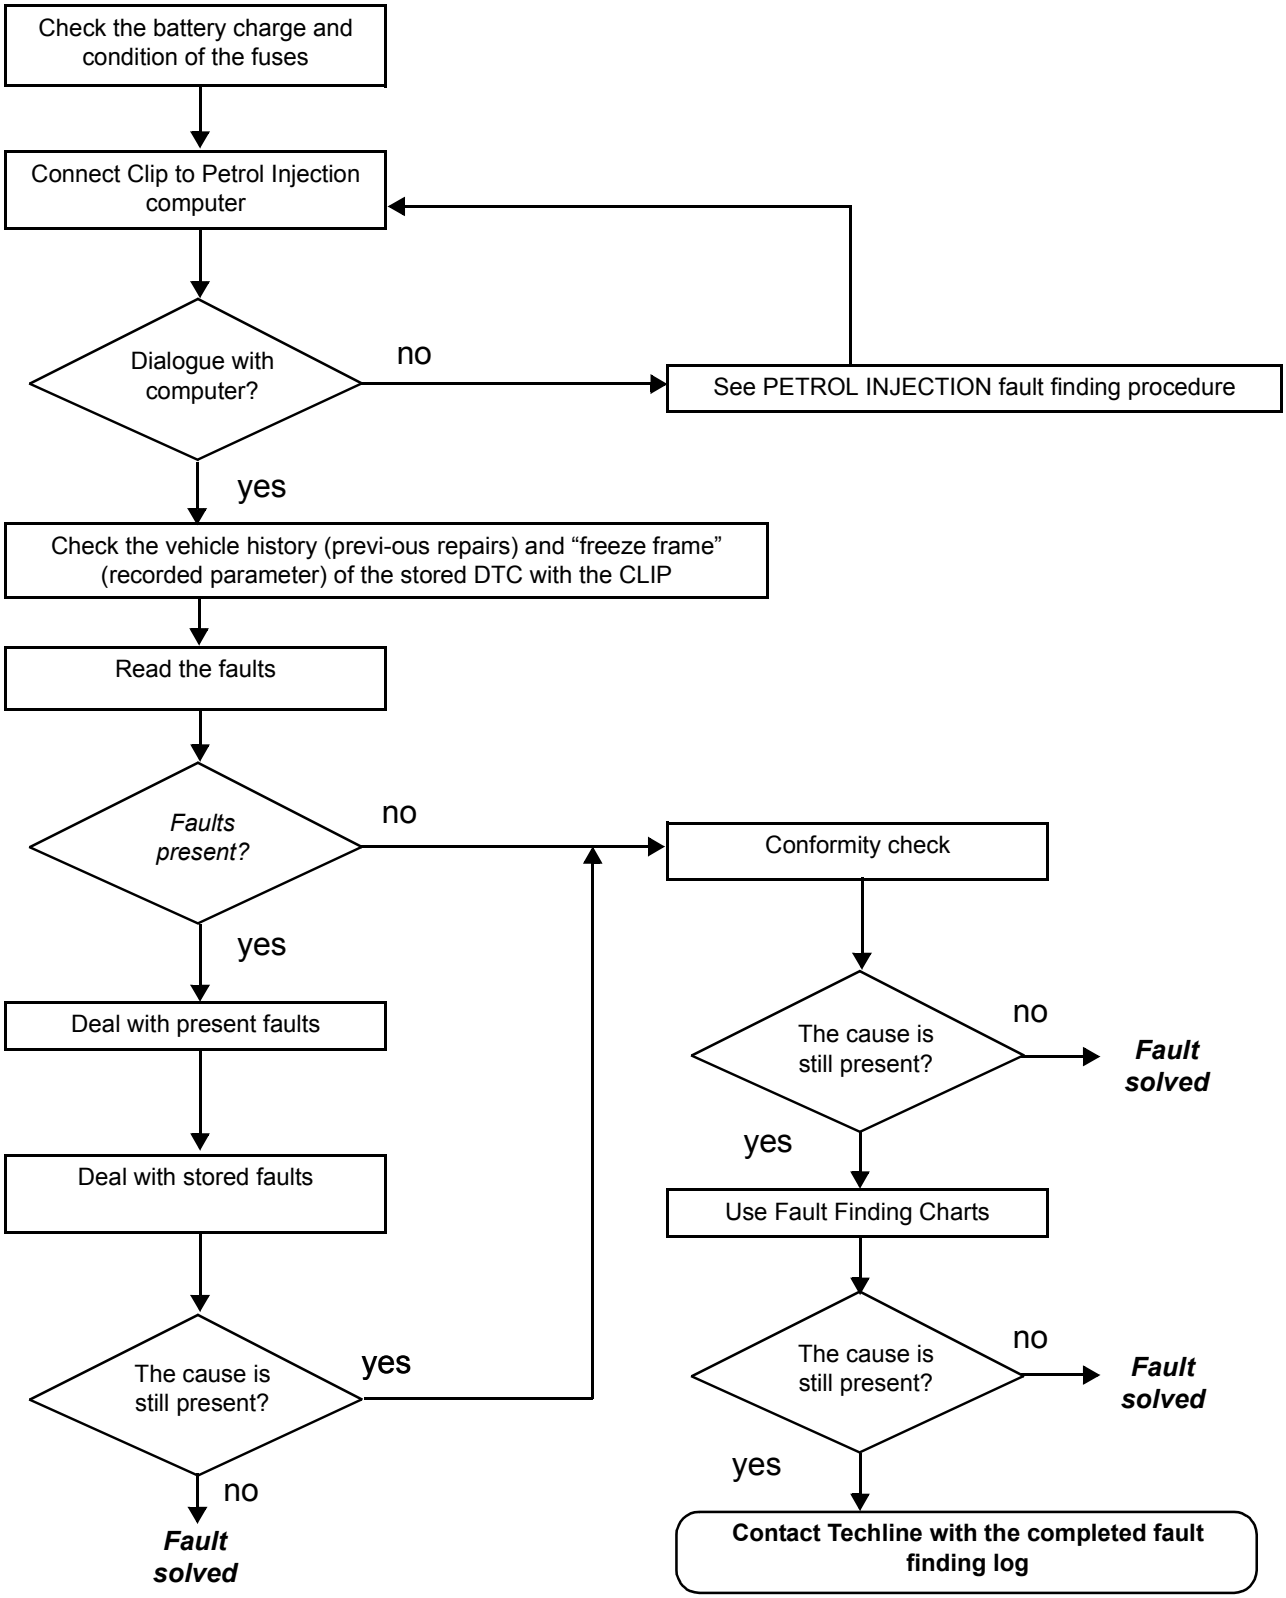
If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors for these lines (for oxidation, bent pins, etc.),
– the resistance of the component detected as faulty,
– the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool when the data is inconsistent. Therefore, this stage is used to:
– perform fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
– check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.



If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by Customer complaints.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart

4. FAULT FINDING PROCEDURE

4. FAULT FINDING PROCEDURE (continued)

Order of priority:

Electrical faults must be processed before Functional faults (**DTC2293, DTC0184, DTC1608, DTC109A, DTC0618, etc.**) and Customer Complaints.
Note that there must be no electrical failures either present or stored before dealing with Functional or Customer Complaints operational faults.
Other priorities are dealt with in the procedure for the fault in question, in the Notes section.

Wiring check:

Fault finding problems:
Disconnecting the connectors and/or manipulating the wiring may temporarily remove the cause of a fault.
Electrical measurements of the voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection:
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulation and wiring routing.
Look for signs of oxidation.

Tactile inspection:
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Check that the connectors are correctly tightened, apply light pressure to the connectors, twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs, as well as their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check:
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.
If a fault is detected, repair or replace the wiring harness.

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:
– when requesting technical assistance from Techline,
– for approval requests when replacing parts with mandatory approval, and to be enclosed when returning monitored parts on request. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

All work on components requires you to strictly follow safety rules to prevent any physical damage or human injury.
– Make sure the battery is properly charged to avoid damaging the computers with a low charge.
– Use the proper tools.

Safety instructions that must be followed before any operation is performed on the vehicle

– If a major LPG leak occurs, the vehicle must be isolated, away from buildings and any fire risks.
– The emergency services may be required to intervene if the situation cannot be controlled.
– All work on the LPG circuit must be performed by qualified and authorized personnel.
– Do not try to open the tank. Don't ever try to remove the multi-valve located at the end of the tank.
– Do not clean the engine compartment with detergent when the system is pressurized.
– Always refer to the RENAULT Workshop Repair Manual before performing any work.

Safety instructions that must be followed when any operation is performed on the vehicle

– All work must be carried out in a well-ventilated space.
– There must not be any flames, sparks, burning cigarettes or telephones near the area where work is being carried out.
– The operator must not wear acrylic clothes likely to generate static electricity.
– Disconnect the battery and leave the vehicle on the ground.
– If working on the tank, drain it by running the engine in LPG mode.
– Once it has been drained and removed, the tank can be sent to the GIAT Company, with the manual insulation valve in closed position (fully rotated clockwise) and fitted with its mounting.
– If work is to be done in the painting station, remove the tank (with its mounting).
– The tank must not be subjected to temperatures greater than 50°C.

Safety instructions that must be followed when any operation is performed on the vehicle

– After working on a LPG joint, check that it is not leaking after reassembling.
– Apply soapy water or the product distributed by SODICAM, part number 77 11 143 071 (leak detector) to the open joint(s).
– Fill the fuel tank with a few liters of LPG if it has been bled (the ignition must be switched off first).
– Crank the engine, switch in LPG mode and check again that there is no leak.
– If a leak is detected, retighten the relevant joint. If the leak persists, remake the joint.
– Fill the fuel tank (80 % of total volume). Start the engine, switch in LPG mode and check that there is no leak.

After reassembling, check that all the rubber and encased metal LPG pipes are not in contact with any parts that can be accessed by the user and may create a LPG leak.

WARNING
Before performing any work on the vehicle, drain the LPG circuit.
Only personnel who have undergone specific LPG training can work with LPG joints where liquid LPG is circulating and moving through the fuel tank from the filler neck to the expansion valve.
In addition, only personnel who have undergone specific LPG training can perform maintenance and repairs on LPG vehicles.
Workshops can only carry out work on the fuel tank if they have a degassing burner.
If the tank cannot be degassed, do not touch it and contact the:

Comité Français du Butane et du Propane
8, terrasse Bellini
92807 PUTEAUX cedex
E-Mail: contact@cfbp.fr
Tél: +33 (0)1 41 97 02 80
Fax: +33 (0)1 41 97 02 89

Maintenance operations

– No adjustment.
– Removal of internal components is not allowed, except when expressly authorized,.
– If LPG fixation clips and fittings are removed, they must be replaced.
– If LPG joints are removed, they must be replaced.

The tank must be empty before removing:

- the fuel tank,
- a component bolted onto the tank, before bleeding the LPG contained in the LPG circuit.

To remove the following, bleed all LPG contained in the LPG circuit (except the LPG in the tank):

- the filler neck,
- the pipes,
- the filter,
- The pressure reducer
- The LPG injector

7. GENERAL APPROACH TO FAULT FINDING

– Use Plus Max RE to identify the system fitted to the vehicle.

If the Software Version is in the form: RE35xxxxG54 the GCU is an LC03 adopted on vehicles compliant with EU5+ emis-sion norm.
If the Software Version is in the form: RE25xxxxG34 the GCU is an LC02 adopted on vehicles compliant with EuroV emission norm.

In the chapter "Fault Finding – Fault Interpretation" carefully follow the symbolism:

in order to ensure the correctness of the repair procedure.

1. LPG SYSTEM DESCRIPTION

1.1 Changeover from petrol to gas

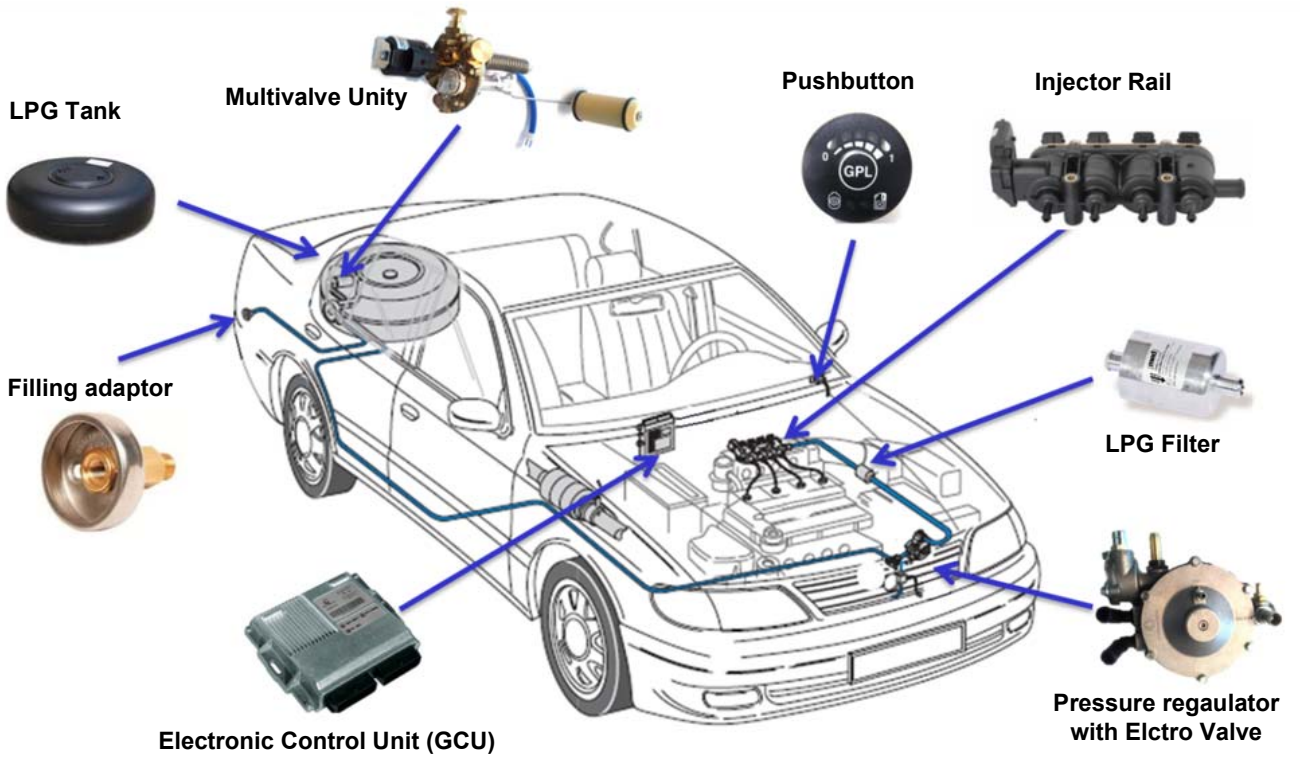
The vehicle switch to LPG when:

1) The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
2) Coolant water temperature must be higher than the tuned threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25°C.
3) A tuned delay is elapsed from the cranking; the delay depends on the temperature at the crank; usually cranking at a coolant temperature of 20°C the delay is 60s.
4) Gas Temperature must be higher than the tuned threshold usually between 2 and 5°C. Please note that with low winter temperature (for example -10°C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes
5) RPM value must be greater than the tuned RPM threshold usually between 1300 and 1800 RPM depending on engine power and vehicle gearbox ratio.
6) LPG switching isn't allowed at very high engine loads, for example in full acceleration.
7) No LPG system fault must be present.

1.2 General checks

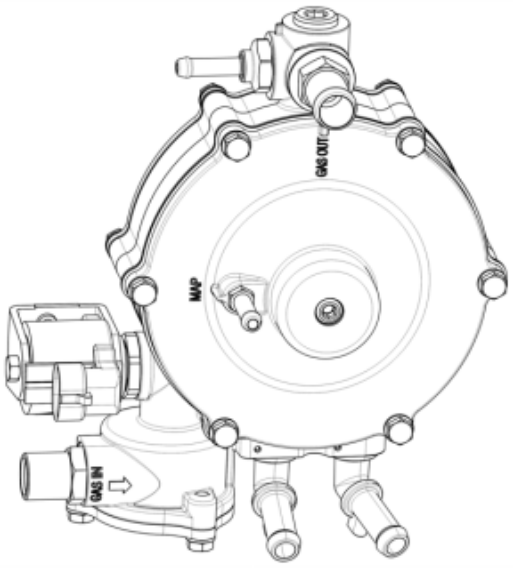
Before proceeding with repairs, verify that there are no additional faults stored in the petrol ECU.

The **operating pressure** of the LPG displayed on the DIAGNOSTIC TOOLS should be between **1.15 & 1.36 bar**, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70°C,with all auxiliary load (AC, fan,..) **switched off**.
[Usually the LPG pressure should be 0,9 - 0,95 bar over the intake manifold pressure].



The **system automatically switches** the vehicle **back to petrol** when pressure drops below a safety threshold, depending on the engine load.
This switchback to petrol can occur when the LPG tank is empty; in this case no DTC code is stored in the memory of the diagnostic system.

The **"supply voltage of LPG injectors"** influences the correct operation of the LPG system. The voltage range for a correct operation is between **9 & 16 Volts**.



1.3 Road Test

If a road test is required make a comparison between Petrol Mode and LPG mode driving.
Perform the same tests and check for a different driving behaviour of the vehicle.

GAS SYSTEM COMPONENT OVERVIEW

COMPONENT DESCRIPTION

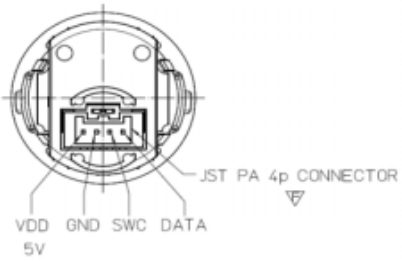
LI 10 PRESSURE REGULATOR

Aluminium body
ON-OFF solenoid safety valve
Filter incorporated in solenoid

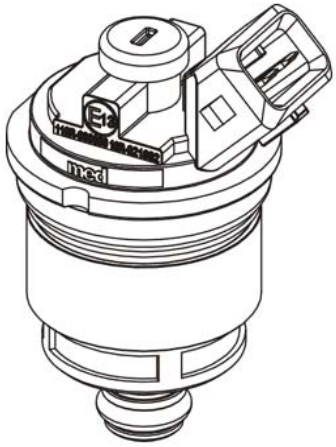
Supply pressure:	**2.5 to 30 bar**
Calibration pressure:	**0,95 bar**
Temperature range:	**-20° to 120°C**
Solenoid power supply:	**6 to 16 Volts**
Maximum flow rate:	**30 Kg/h**
Weight:	**1450 g.**
Homologation:	**ECE/ONU R67/01**

COALESCENCE LPG FILTER

Type of gas:	**LPG or Methane**
Pipe diameter IN:	**14 mm**
Pipe diameter OUT:	**14 mm**
Maximum pressure:	**2.2 bar (absolute)**
Filtering grade:	**10 micron**
Weight:	**75 g**
Homologation:	**ECE R110 - ECE R67/01**



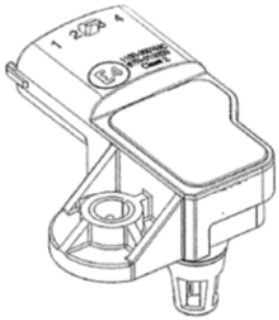
SWITCH



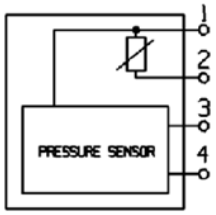
The switch shows the level of LPG and offers the driver a choice of fuels (gas/petrol).
The switch have an internal "buzzer" that work when the system switch back to petrol in case of any fault on LPG system or when the LPG tank is empty.

Pin assignment:

1) **+5V Power supply**
2) **Ground**
3) **Contact**
4) **Serial Data**

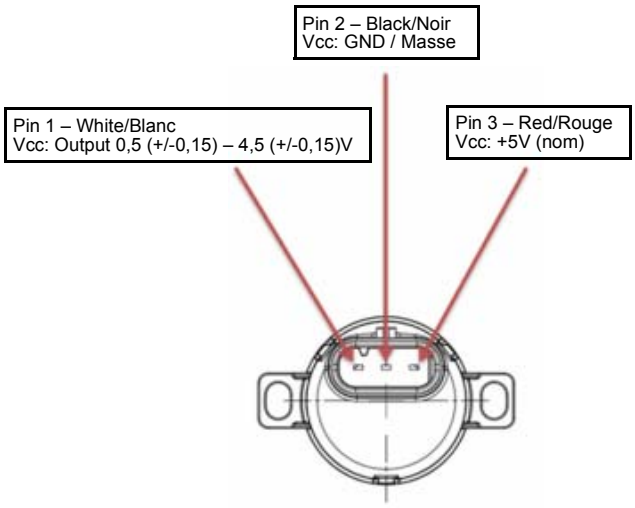


GAS INJECTOR



Current management:	**6/1.5A "Peak and hold"**
Supply voltage:	**6 to 16 Volts**
Temperature range:	**- 40 °C to +120 °C**
Nominal pressure:	**0.8 to 3 bar**
Opening time @12V:	**1.5 ms**
Dimensions:	**Ø 32 x h 73 mm**
Weight:	**120 g**
Homologation:	**ECE R 110 - ECE R 67/01**

LPG PRESSURE AND TEMPERATURE SENSOR



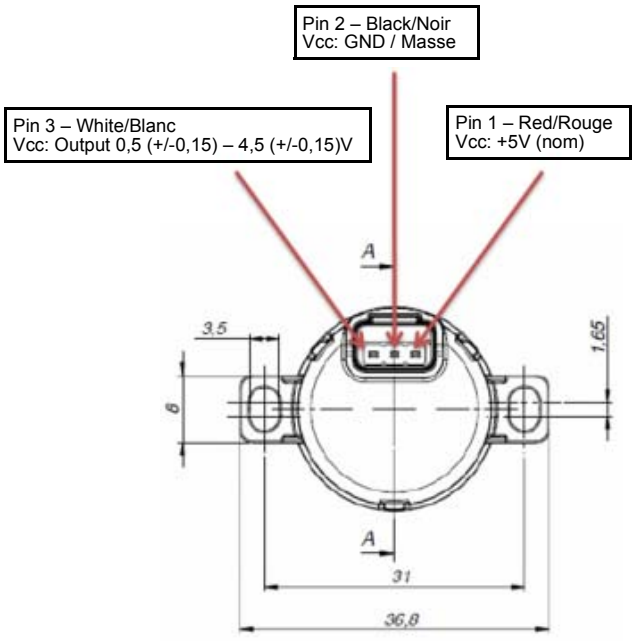
Supply voltage:	**4.5 to 5.5 Volts**
Temperature range:	**- 40 °C to +120 °C**
Nominal pressure:	**50 to 350 kPa**

Connector-Track assignment

Track 1	**Ground**
Track 2	**NTC resistor**
Track 3	**+5 V**
Track 4	**Output signal**

HALL EFFECT TANK LEVEL SENSOR (3 TERMINALS)

1) The level sensor must be supplied with 5,00 V nominal



2) Supply Voltage must be in the range 4,5 – 5,5 V. Below 4,5 V the measure isn't accurate; over 5,5 V the sensor could be damaged.

3) The Hall Effect Sensor Output Voltage is Ratiometric over the Power Supply

Level Sensor / Capteur Niveau X98, H79PH2, X92, X67 (463518000)
Clio IV, Duster 2, Lodgy, Dokker.

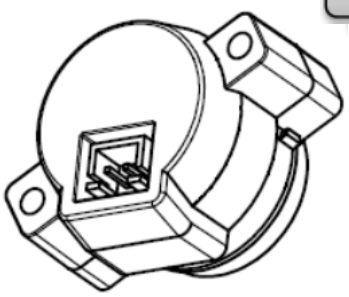
(External tank)

LC03

1) The level sensor must be supplied with 5,00 V nominal

2) Supply Voltage must be in the range 4,5 – 5,5 V. Below 4,5 V the measure isn't accurate; over 5,5 V the sensor could be damaged.

3) The Hall Effect Sensor Output Voltage is Ratiometric over the Power Supply



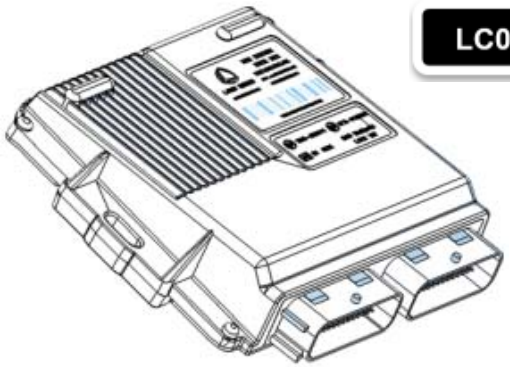
Level Sensor / Capteur Niveau X52 (616506000)
Sandero II

(Internal tank)

LC03

LC02

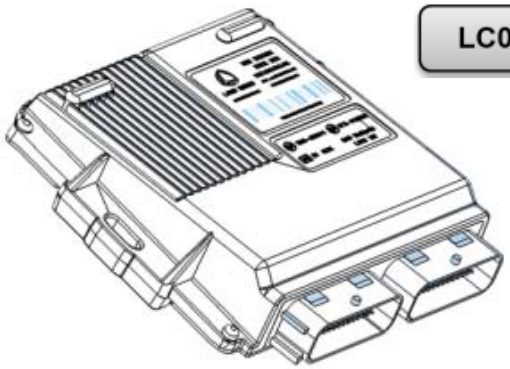
RESISTIVE TANK LEVEL SENSOR (2 TERMINALS)



Temperature range:	**- 10 °C to +85 °C**
Nominal resistance:	**from 100 to 21800 ohm**

Connector-Track assignment

Track 1	**Tank Level Voltage**
Track 2	**Ground**



GCU PINOUT

LC03 GAS CONTROL UNIT

Automotive 16 bit 40 Mhz microprocessor Manages up to 6 injectors and 2 additional relay Internal self-diagnosis for sensors and actuators Temperature range – 40° to 105°C CAN communication

RENAULT CLIP Faults (<u>not</u> managed on LC02 & LC03), see method into CLIP				CAN Message Faults	LPG System Failure Description
DF	DTC	Failure Type	Label	Label	Label
633	1170	09	LPG Fuel Trim Function	Vxx_fmc_fsys_lpg_cpt	See description into CLIP tool

DTC2666 PRESENT OR STORED	TANK SOLENOID VALVE CIRCUIT 15: Open circuit 15: Short circuit to +12 V 11: Short circuit to ground.

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a short circuit to +12V, a short circuit to ground, a wiring interruption or solenoid coil resistance out of range, in the circuit controlling the tank electrovalve solenoid.

DTC2666 TANK SOLENOID VALVE CIRCUIT

FAILURE TYPE 15 and 11	*NOTES*	**Priority of treatment if more than one fault is present:** If the fault **DTC2294** is present at the same time, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on GCU Track 16 and 44.

Check if the tank electrovalve plug has been properly connected. Repair if necessary.

Check the tank electrovalve connections. Repair if necessary.

Check the computer connections. Repair if necessary

Remove the GCU 56 way connector.

Ensure the continuity of the connection between:

LC03	**GCU connector Track 17 → Track 2 of the EV plug**
LC03	**Track 1 of the EV plug → Ground**

LC02	**GCU connector Track 23 → Track 1 of the EV plug**
LC02	**Track 2 of the EV plug → Ground**

Measure the resistance of the coil of the tank Electrovalve

Replace the coil if the resistance is not in the range 11,0 and 13,5 ohm at ambient temperature (20°C).

If the fault persist after these check, replace the coil.

DTC2294 PRESENT OR STORED	**PRESSURE CONTROL CIRCUIT VALVE** 15: Open circuit 15: Short circuit to +12 V 11: Short circuit to ground.

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele.1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a short circuit to +12V, a short circuit to ground, a wiring interruption or solenoid coil resistance out of range, in the circuit controlling the tank electrovalve solenoid.

DTC2294 PRESSURE CONTROL CIRCUIT VALVE

FAILURE TYPE 15 and 11	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC2666** is present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on GCU Track 16 and 44.

Check if the pressure regulator electrovalve plug has been properly connected. Repair if necessary.

Check the pressure regulator electrovalve connections. Repair if necessary.

Check the computer connections. Repair if necessary

Remove the GCU 56 way connector.

LC03	**GCU connector Track 18 → Track 1 of the EV plug**
LC03	**Track 2 of the EV plug → Ground**

LC02	**GCU connector Track 23 → Track 1 of the EV plug**
LC02	**Track 2 of the EV plug → Ground**

If required, replace the faulty harness.

Measure the resistance of the coil of the electrovalve.

Replace the coil if the resistance is not in the range **11,0 and 13,5 ohm at ambient temperature (20 °C)**.

If the fault persist after these check, replace the coil.

DTC018A PRESENT OR STORED	**LPG PRESSURE SENSOR CIRCUIT** 12: Short-circuit to +5V 13: Open Circuit

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Pressure Sensor in open circuit or short circuit) in the circuit acquiring the LPG Pressure Signal.

DTC018A LPG PRESSURE SENSOR CIRCUIT

FAILURE TYPE 12 and 13	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC018A** is present at the same time, perform the current check first.

Check the LPG pressure connections. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 19 → Track 3 of the sensor plug**
LC03	**GCU connector Track 45 → Track 4 of the sensor plug**
LC03	**Track 1 of the sensor plug → Ground**

LC02	**GCU connector Track 9 → Track 3 of the sensor plug**
LC02	**GCU connector Track 8 → Track 4 of the sensor plug**
LC02	**Track 1 of the sensor plug → Ground**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Ensure the insulation against Ground of the connection between:

LC03	**GCU connector Track 19 → Track 3 of the sensor plug**
LC02	**GCU connector Track 9 → Track 3 of the sensor plug**

Repair if necessary. If required, replace the faulty harness.

Reconnect the GCU 56 way connector and check for the presence of a 5V +/-10% supply voltage on Track 3 of the sensor when in Key-On and push button LEDs are turned on.

If the fault persist after these check, carry out a road test followed by a test using the diagnostic tool and proceed to fault finding of “Unexpected switch back to petrol” Chart 1.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC2293 PRESENT OR STORED	**LPG PRESSURE** 21: Low LPG pressure 22: High LPG pressure 64: Incoherence

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This functional fault could occur when the GCU Diagnostic System detects pressure parameters out of range (LPG pressure too low or too high to guarantee a regular operation of the engine, or pressure delay due to a leakage in the rubber hoses) in the circuit controlling the LPG pressure supply to the LPG rail. The 64 recurrence could be symptomatic of a clogged hose or a leakage in a rubber hose connection or damaged hose.

DTC2293 LPG PRESSURE

FAILURE TYPE 21 and 22	***NOTES***	**Priority of treatment if more than one fault is present:** Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time. Deal with the electrical fault **DTC018A** if is present at the same time.

Ensure that there are no leaks on the inlet manifold.

Repair if necessary.

If no fault is found, then there must be a problem with the LPG fuel system and proceed to fault finding of "Unexpected switch back to petrol" Chart 1 checking:

- Fuel check
- Fuel pressure sensor check
- Multivalve electrovalve check
- Fuel supply hoses check
- Fuel pressure regulator check

Replace the defective component.

For both

AFTER REPAIR	Deal with any other possible faults. Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagno-sis tool.

DTC2293 LPG PRESSURE

FAILURE TYPE 64	*NOTES*	**Priority of treatment if more than one fault is present:** Deal with the electrical fault **DTC018A** if is present at the same time.

Ensure that there are no leaks on the inlet manifold.
Repair if necessary.

If no fault is found, then there must be a problem with the LPG fuel system and proceed to fault finding of:

Fault finding Assisted by PlusMaxRE
Chart LPG 2

FUEL SUPPLY CONFORMITY CHECK: LEAKAGE TEST
[DTC 2293-64]

FUEL SUPPLY CONFORMITY CHECK: TOO LOW PRESSURE
[DTC 2293-64]

"IMPOSSIBLE SWITCHING IN LPG MODE" Chart 3 and/or "IMPOSSIBLE TO SWITCH IN LPG MODE AND LPG SWITCH IS BUZZING" Chart 8.

For both

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC0185 PRESENT OR STORED	**LPG TEMPERATURE SENSOR CIRCUIT** 11: Open circuit 15: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Temperature Sensor in open circuit or short circuit) in the circuit acquiring the LPG Temperature Signal.

DTC0185 LPG TEMPERATURE SENSOR CIRCUIT

FAILURE TYPE 11 and 15	***NOTES***	**Priority of treatment if more than one fault is present:** If the fault **DTC0184** is present at the same time, perform the current check first.

Check the LPG pressure connections. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 46 → Track 2 of the sensor plug**
LC03	**Track 1 of the sensor plug → Ground**

LC02	**GCU connector Track 6 → Track 2 of the sensor plug**
LC02	**Track 1 of the sensor plug → Ground**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Ensure the insulation against +12V of the connection between:

LC03	**GCU connector Track 46 → Track 3 of the sensor plug**
LC02	**GCU connector Track 6 → Track 3 of the sensor plug**

Repair if necessary. If required, replace the faulty harness.

If the fault persist after these check, carry out a road test AND proceed to fault finding of “Unexpected switch back to petrol” Chart 1.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC0184 PRESENT OR STORED	**LPG TEMPERATURE** 21: Low LPG temperature 22: High LPG temperature

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the pressure sensor (risk of destroying it).

This functional fault could occur when the GCU Diagnostic System detects temperature parameters out of range (LPG temperature too low or too high to guarantee a regular combustion and operation of the engine) in the circuit controlling the LPG pressure supply to the LPG rail.

DTC0184 LPG TEMPERATURE

FAILURE TYPE 21 and 22	***NOTES***	**Priority of treatment if more than one fault is present:** Deal with the electrical fault **DTC0185** if is present at the same time.

Proceed to fault finding of “wrong gas temperature” fault finding Chart 2

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC2265 PRESENT OR STORED	**LPG TANK LEVEL SENSOR CIRCUIT** 15: Open circuit or short-circuit to +5V

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 5 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer
	WARNING: It is imperative that no ohmmeter check is carried out on the tank level sensor (risk of destroying it).

This electrical fault could occur when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or LPG Level Sensor in open circuit or short circuit) in the circuit acquiring the LPG Tank Level Signal.

DTC2265 GAS TANK GAUGE VOLTAGE SIGNAL

FAILURE TYPE 15	***NOTES***	**Priority of treatment if more than one fault is present:** If faults **DTC2666** and **DTC2294** are present at the same time, perform a rear wiring harness check first.

Check the LPG Tank Level Signal. Repair if necessary

Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.

LC03	**GCU connector Track 47 → Track 1 of the sensor plug**
LC03	**GCU connector Track 36 → Track 3 of the sensor plug**
LC03	**Track 2 of the sensor plug → Ground**

LC02	**GCU connector Track 18 → Track (1) of the sensor plug**
LC02	**GCU connector Track 21 → Track (2) of the sensor plug**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

On LC03 Systems only, ensure the continuity of the connection between:

LC03	**Track 2 of the sensor plug → Ground**

Ensure the insulation against +12V of the connection between:

LC03	**GCU connector Track 47 → Track 2 of the sensor plug**
LC02	**GCU connector Track 21 → Track (2) of the sensor plug**

GCU connector Track 47 → Track 1 of the EV plug

Repair if necessary. If required, replace the faulty harness.

If the harness is conform replace just the level sensor, not the complete MultiValve.

Reconnect the GCU 56 way connector and check for the presence of a 5 +/-10% volt supply on Track 1 of the sensor when in Key-On and push button LEDs are turned on.

If there is no supply, replace the injection computer (reprogram and configure the computer: see introduction).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1608 PRESENT OR STORED	INJECTION CONTROL COMPUTER **4B**: GCU's Over temperature

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 8 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects as an over temperature of LPG Injector drivers due to a short circuit to +12V in the wiring harness, an intermittent wiring interruption or solenoid coil resistance out of range.

DTC1608 INJECTION CONTROL COMPUTER

FAILURE TYPE 4B	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary.
Check the connection and condition of the injector connector. Change the connector if necessary.
Check the ground connection to the chassis. Repair if necessary.
With the engine running in LPG mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.
Connect the bornier in place of the computer and check the resistance value of the injector by measuring between **tracks 1 and 2 of the LPG injector**: Track 16 and 27 for an injector 1; Track 16 and 28 for an injector 2; Track 44 and 55 for an injector 3; Track 44 and 56 for an injector 4; Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).
If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC10A0 PRESENT OR STORED	CYLINDER 1 LPG INJECTOR CIRCUIT **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A0 CYLINDER 1 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection:**

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**LPG Injector 1 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 26**	→	**LPG Injector 1 Track 1**

Repair if necessary.

If there is no supply voltage, check the insulation, continuity and absence of interference resistance of the connection:

LC03 LC02	**GAS INJECTOR 1 GCU track 27**	→	**LPG Injector 1 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 1**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A1 PRESENT OR STORED	**CYLINDER 2 LPG INJECTOR CIRCUIT** **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A1 CYLINDER 2 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	***NOTES***	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignement on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**LPG Injector 2 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 26**	→	**LPG Injector 2 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 28**	→	**LPG Injector 2 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 2**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A2 PRESENT OR STORED	**CYLINDER 3 LPG INJECTOR CIRCUIT** **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A2 CYLINDER 3 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignement on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 44**	→	**LPG Injector 3 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 54**	→	**LPG Injector 3 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 55**	→	**LPG Injector 3 Track 2**

Repair if necessary.

Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 3**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC10A3 PRESENT OR STORED	CYLINDER 4 LPG INJECTOR CIRCUIT **12**: Short circuit to +12 volts **14**: Open circuit **14**: Short circuit to ground

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault is declared present while: – the LPG system in pre-heating mode or while or the engine is running in LPG mode and – the LPG Injector 1 is activated for 50 time and for 50 times the GCU Diagnostic System detect the fault.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the four LPG injectors.

DTC10A3 CYLINDER 4 LPG INJECTOR CIRCUIT

FAILURE TYPE 12 and 14	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.
Check if the LPG Injectors plugs has been properly connected. Repair if necessary. Check the connection and condition of the injector connector. Change the connector if necessary. Check the ground connection to the chassis. Repair if necessary.
With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the correct Track (1 or 2) of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned)**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 44**	→	**LPG Injector 4 Track 1**
LC02	**+15 INJECTOR SUPPLY GCU track 54**	→	**LPG Injector 4 Track 1**

Repair if necessary.

If there is no supply voltage, **check the insulation, continuity and absence of interference resistance of the connection**:

LC03 LC02	**GAS INJECTOR 1 GCU track 56**	→	**LPG Injector 4 Track 2**

Repair if necessary.

Check the resistance value of the injector by measuring between **tracks 1 and 2 of the LPG injector**.

Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

If the fault persist after these check, change the **LPG injector no. 4**.

AFTER REPAIR	Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a customer road test to confirm repair using engine speed and load ranges frequently encountered during the vehicle's life, followed by a test using diagnosis tool. Deal with any other possible faults.

DTC1570 PRESENT OR STORED	**LPG SWITCH STATUS** 13: Open circuit

NOTES	**Conditions for applying the diagnostic to stored faults:** The fault reappears in the memory after the engine has been running for 5 minutes in LPG mode.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects an open circuit of the contact of the pushbutton.

DTC1570 LPG SWITCH STATUS

FAILURE TYPE 13	***NOTES***	None

Check the pushbutton electrical connections. Repair if necessary.
Check the GCU connections. Repair if necessary.

Remove the GCU 56 way connector.
Ensure the continuity of the connection between:

LC03	**GCU connector Track 49 → Track 3 of the pushbutton**
LC03	**Track 2 of the pushbutton plug → Ground**

LC02	**GCU connector Track 48 → Track 3 of the pushbutton**
LC02	**Track 2 of the pushbutton plug → Ground**

Repair if necessary. If required, replace the faulty harness.

If the fault persist after these checks, change the **Pushbutton**.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1610 PRESENT OR STORED	BATTERY VOLTAGE **16**: Too Low voltage **17**: Too High voltage

NOTES	**Conditions for applying the fault finding procedure to the fault stored** The fault is declared present during Power On, after the engine has been running in LPG Mode.
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This electrical fault could occur when the GCU Diagnostic System detects a power supply voltage below 9V or over 16V for at least 3 seconds.

DTC1610 BATTERY VOLTAGE

FAILURE TYPE 16 and 17	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is in a good state of charge and, if necessary, check the charging circuit.

Connect the bornier in place of the computer and check the insulation, continuity and absence of interference resistance of the connections:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

If the fault persists after these checks, **reflash the GCU with the last released SW and Calibration**.

If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC109A PRESENT OR STORED	GCU SAFETY RELAY **64**: GCU Safety relay incoherence

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 3 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This functional fault could occur when the GCU Diagnostic System detects a failure in internal Solid State Safety Relay voltage feedback from safety relay detects an closed status when it should be open or viceversa.

DTC109A GCU SAFETY RELAY

FAILURE TYPE 64	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC2666, DTC2294,** are present, check for a wiring harness short circuit to battery on: GCU Track 16 and 17 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

With the engine running in gasoline mode and the LPG Pushbutton not selected, **check for the absence of +12 volts on the correct Track (17 or 18 for LC03 GCU and 23 or 24 for LC02 GCU) of the TANK and VAPORIZER SHUT OFF VALVE output**.

If there +12V is present when the GCU is running in gasoline mode:

1) Remove the GCU 56 way connector.
2) and **check the insulation of the connection between**:

LC03	**+ GCU connector Track 17**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC03	**+ GCU connector Track 18**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC02	**GCU connector Track 23**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**
LC02	**GCU connector Track 24**	→	**+30_POWER SUPPLY FROM BATTERY GCU track 15**

Make sure that the cable connecting the GCU and the TANK SHUT OFF VALVE or GCU and VAPORIZER SHUT OFF VALVE are in good condition.

Repair if necessary.

If the fault persists after these checks, **contact Techline**

DTC0618 PRESENT OR STORED	LPG SYSTEM **46**: GCU's Last trip data corrupted

NOTES	**Conditions for applying the diagnostic to stored faults:** If the fault reappears in the memory after the engine has been running for 8 minutes in LPG mode
	Special notes: Use the correct bornier Ele. 1681 for all operations on the engine management computer

This functional fault could occur when the GCU Diagnostic System detects a failure in recording last trip data information; typically this occurs when the battery clamp or LPG GCU Power Supply Ground is disconnected during a "Power-latch" of the GCU.

DTC0618 LPG SYSTEM

FAILURE TYPE 46	*NOTES*	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DTC10A0, DTC10A1, DTC10A2, DTC10A3,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connections:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

If the fault persists after these checks, **reflash the GCU with the last released SW and Calibration**.

If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

DTC1316 PRESENT OR STORED	**GASOLINE PUMP RELAY** **00**: Open circuit **11**: Short circuit to ground **12**: Short circuit to +12 volts.

NOTES	**Priority for dealing with a number of faults:** First, deal with the DF46 battery voltage fault if it is present or stored.
	Conditions for applying the fault finding procedure to the fault stored: The fault is declared present 3 seconds after the switching in LPG mode.
	Special note: This fault could be present or stored on LC03 System only. LC03

These electrical faults could occur individually or in multiple messages, when the GCU Diagnostic System detects any electrical fault (short circuit, wiring interruption or solenoid coil resistance out of range) in the circuit controlling the gasoline pump relay.

DF1316 GASOLINE PUMP RELAY

FAILURE TYPE 11 and 12	***NOTES***	**Priority of treatment if more than one fault is present:** If one or more of the following faults **DF1366, DF1367, DF1368, DF1369,** are present, check the **"+15 INJECTOR SUPPLY (Safety Relay)"** Voltage on: GCU Track 16 and 44 on LC03 Systems GCU Track 26 and 54 on LC02 Systems and deal with those faults before all else.

Check the **condition of the clips** on the injection relay (on the engine fuse/relay plate).

Replace the clips if necessary.

With the engine running in gasoline mode and the LPG Pushbutton in waiting mode, **check for the presence of +12 volts on the Track CDE+ of the injector. (Check the correct track assignment on wiring diagram of the function for the vehicle concerned).**

If there is no power supply **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**+15 INJECTOR SUPPLY GCU track 16**	→	**FUEL PUMP CUT-OFF RELAY Track CDE+**

Repair if necessary.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

Connect the bornier in place of the computer and **check the insulation, continuity and absence of interference resistance of the connection**:

LC03	**Gasoline Pump Shutdown Relay Control** **GCU track 02**	→	**FUEL PUMP CUT-OFF RELAY** **Track CDE-**
LC03	**Gasoline Pump Shutdown Relay Status** **GCU track 11**	→	**FUEL PUMP CUT-OFF RELAY** **Track CDE-**

Repair if necessary.

Check the resistance value of the relay by measuring between tracks CDE+ and CDE- of the relay.
Replace the relay if the resistance is not approximately: 65 ohms Ω ± 5 Ω at 25 ºC.

If the fault persists after these checks, **contact Techline**

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

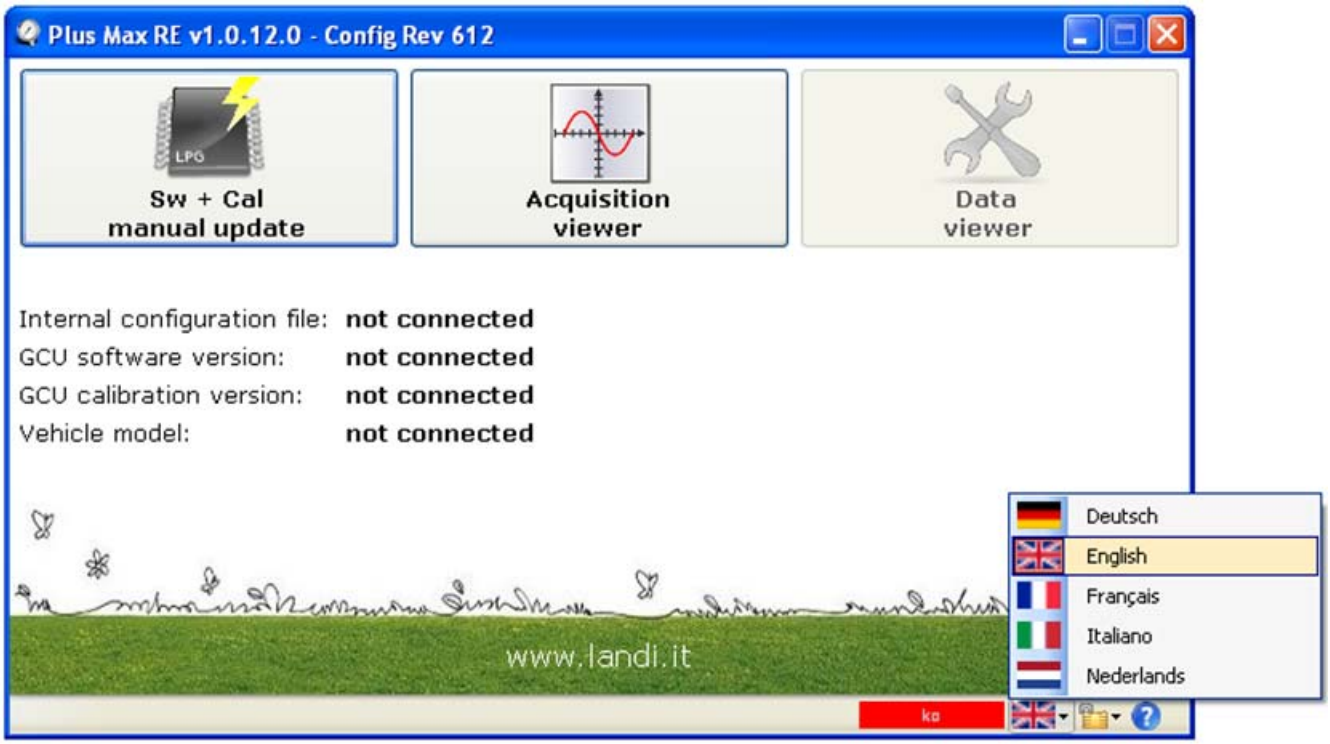
1. REMINDERS

Landi Renzo diagnostic tool Plus Max Renault Version (in the following PluxMaxRe) is a diagnostic tool developed to run second level diagnostic on LPG system.

Always use the official diagnostic tool (Renault Clip) supplied by the manufacturer of the vehicle as primary diagnostic and repairing tool.



LR PlusMaxRE tools could be used in order to perform a second level diagnostic after the authorization of Renault's After Sales supervisors only.

2. PLUS MAX RE FUNCTIONS

See all the information relating the LPG System
OPERATIONS FOR REPLACING OR REPROGRAMMING THE GCU
Physical measurements
GCU test
Multimeter

PluxMaxRE can be installed on ANY PC running windows XP/VISTA/Windows 7 (32 bit only)

PlusMaxRE supports English French and Italian language.

How to select language

3. EXTRAS

3.1 Info

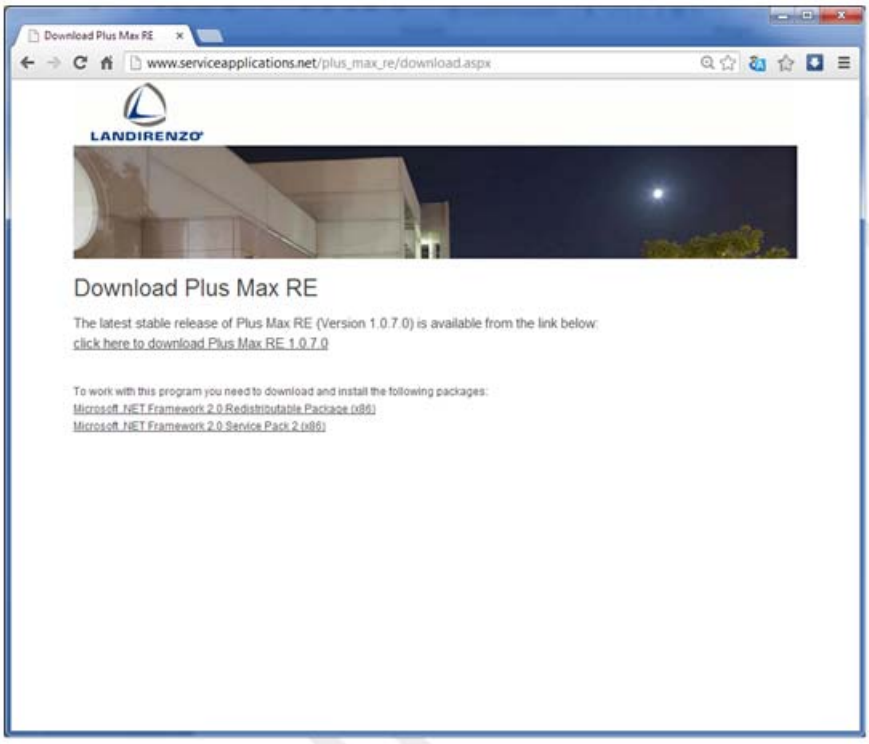
If the primary installation, follow the instructions, which is attached. If you already have an earlier version, it is recommended to uninstall and then follow the installation instructions.
It only works with original USB adapter.

3.2 Info

LR has created several versions of Diagnostic tools system named PlusMax. Just the version named Plus Max Renault Version (PluxMaxRe) must be connected to the LPG computer via Diag connector. It operates as a diagnostic interface, checking out a series of parameters as well as figuring out problems that you may then solve.

Previous version of PlusMax or other tools, as reflashing tools, or other unauthorized Tools could cause permanent damage to GCU calibration.

3.3 Info



Always keep to the instructions supplied by the vehicle manufacturer. The equipment should be used by trained personnel only.

4. PLUS MAX RE INSTALLATION GUIDE

Before installing please uninstall previous version of PlusMaxRE if you have;

Download the latest Plus Max RE diagnostic tool from Landi Renzo Aftersales Center

http://www.serviceapplications.net/plus_max_re/download.aspx

Double click the downloaded installation file (setup_1.0.x.x.exe)
Follow instructions step by step

SW Installation completed

Desktop Icon

IMPORTANT:
The Diagnostic Functions of the PlusMaxRE tools are not enabled (blocked by code); just the check and SW updating function is allowed

5. OPERATIONS FOR REPLACING OR REPROGRAMMING THE GCU

5.1 Procedure to be applied before replacement

This procedure must be applied before replacing or reprogramming the Gas Control Unit (LPG Computer)

IMPORTANT:
– Connect a battery charger and switch on the vehicle + after ignition supply voltage.
– Switch off all the electrical consumers (lights, interior lighting, air conditioning, radio, etc.).

– Connect the diagnostic tool power supply (mains or cigarette lighter supply).
– Connect the LR USB interface to the diagnostic tool:

Part Number
7711392500

Description
KIT INTERFACCIA USB PER CENTRALINE USB TYPE (LR USB interface)

– Connect the LR USB interface connecting cable to the diagnosis plug on the LPG ECU.
– Switch on vehicle + after ignition (+APC) power supply and wait until the coolant temperature is **less than 60 ºC** and the air temperature **is less than 50 ºC** and LPG injector driver temperature is **less than 40 ºC**. Consult parameter GP103 Coolant temperature and GP104 Air temperature and GP030 LPG injector driver temperature.

IMPORTANT:
It is necessary to respect these temperature values in order to carry out the computer programming or reprogramming operations.

– Apply the programming or reprogramming operations described in **Technical Note Appendix A GCU Computer (re)programming procedure**.

IMPORTANT:
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool. If the message does not appear, wait for 60 seconds.
Failure to follow this procedure may cause the computer data to be corrupted.

5.2 Procedure to be applied after repair

This procedure must be applied after replacing or reprogramming the computer.

5.3 Injection computer initialisation

– Rigorously Clear any fault code using Clip connected to Gasoline ECU. (During the reprogramming of a generic vehicle computer this cannot send messages on the CAN Network; this could generate some DTCs in the ECU).
– Crank and stop the engine to initialize the computer and wait for the loss of communication message to appear on the diagnostic tool, if the message does not appear, wait for 60 seconds.
– The computer is automatically configured according to the GCU and options present on the LPG System.
– Verify the correct configuration of the LPG System.

5.4 Procedure to be applied during the reprogramming

This procedure must be applied during the reprogramming the Gas Control Unit (LPG Computer)
The operation replaces the Software and the Calibration inside the GCU with the latest version with the help of PlusMaxRE.
Reprogramming procedure concerns GCU already assembled in the vehicle and already operational, and GCU delivered already programmed by Spare Part Centers (Magasin Pièces de Rechanges).
The reprogramming operation avoids the systematic replacement of GCUs.

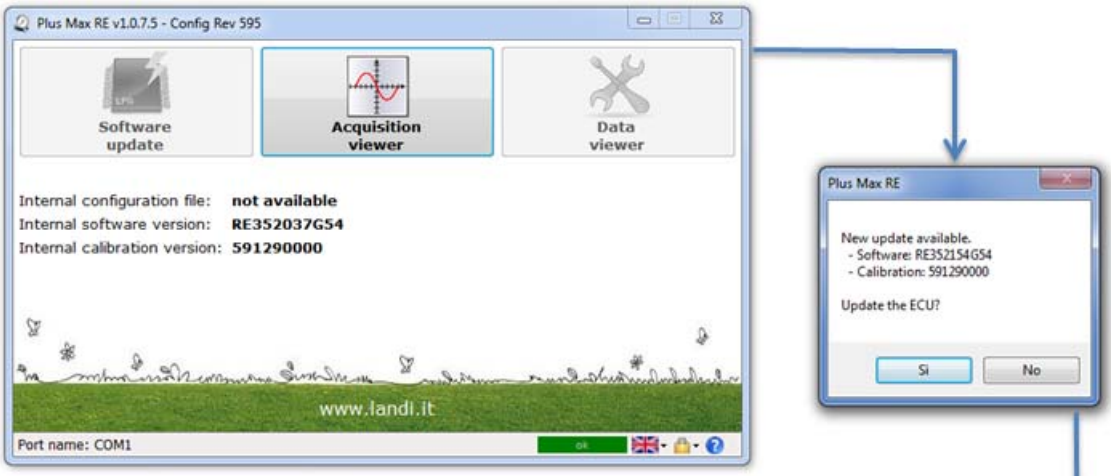
5.5 When reprogramming

The operation is done in the following sistuations:
When a well-defined Opération “Technique Spécifique” (OTS) or Note Technique Incidentielle (NTi) is put in effect in order to solve issues find in After Sales and/or an improvement of performances.
Following a RENAULT’s Techline request
Following RENAULT’s Technical Directive (Directives Techniques RENAULT)
Following a Landi Renzo’s Released Software Evolution
Following an ACTIS Solution

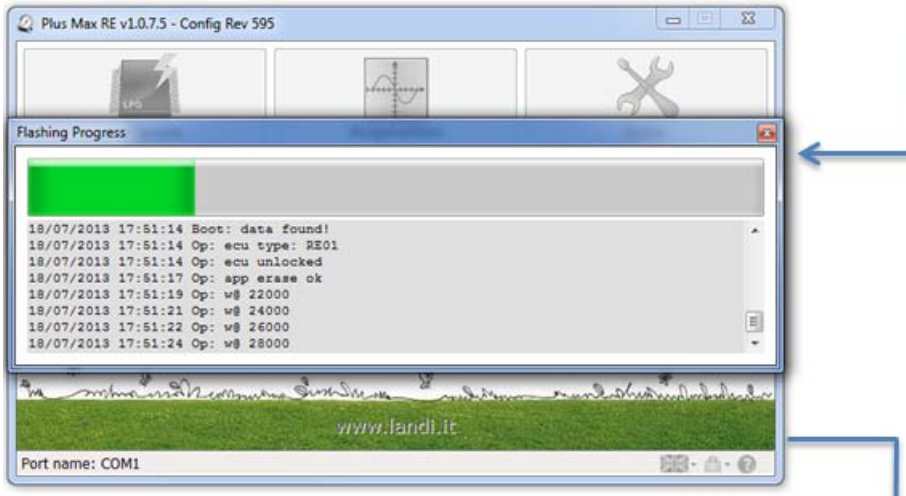
5.6 Operating Mode

The operating mode for both GCU Re-Calibration or GCU Reprogramming is strictly the same.
This operation must be done with PlusMaxRE diagnostic tools updated at the last version.

IMPORTANT:
Before any GCU Re-Calibration or GCU Reprogramming always update the tool downloading the latest Plus Max RE diagnostic tool from Landi Renzo Aftersales Center

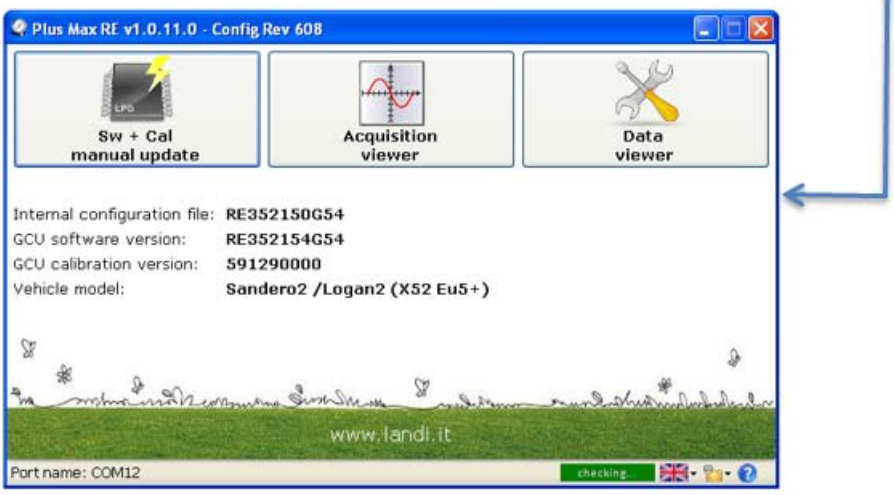


IMPORTANT:
In order to avoid any malfunctioning, outage and blockaged of the GCU, the procedures MUST be rigorously observed:
Procedure to be applied before replacement
Procedure to be applied after repair



WARNING:
DO NOT WORK ON THE VEHICLE OR ON THE DIAGNOSTIC TOOL

6. AUTOMATIC GCU RE-CALIBRATION OR GCU REPROGRAMMING



The operation replaces the Software and the Calibration inside the GCU with the latest version released for the specific vehicle.

If new update available message appears, update the GCU clicking on Si / Yes

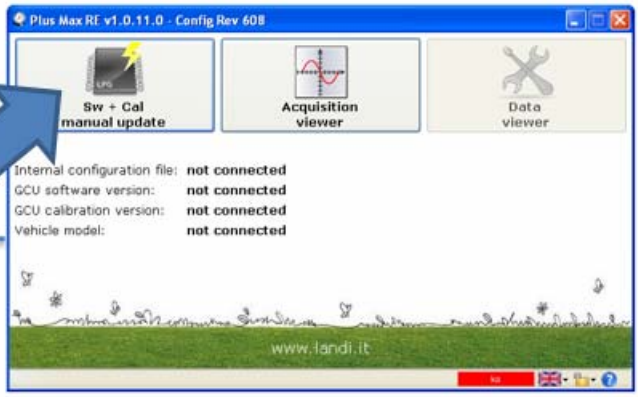
Waiting for download completion (100%)

At the end of the download it will appear the main page with new SW version.
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool, if the message does not appear, wait for 60 seconds.

7. MANUAL EMERGENCY PROCEDURE FOR GCU RE-CALIBRATION OR GCU REPROGRAMMING

This Manual Emergency Procedure must be applied when:

The operation of GCU Re-Calibration or GCU Reprogramming is interrupted by an Error Message (Example ER-ROR 110, ERROR 103, etc)
When the PlusMaxRE tool cannot automatically detects the vehicle, the original GCU Hardware Version, SW Version and Calibration version.

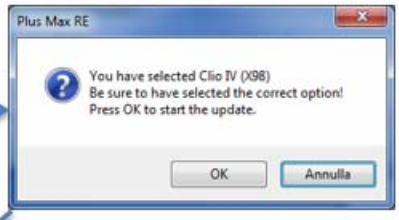


The operation replaces the Software and the Calibration inside the GCU with the latest version released for the specific vehicle.

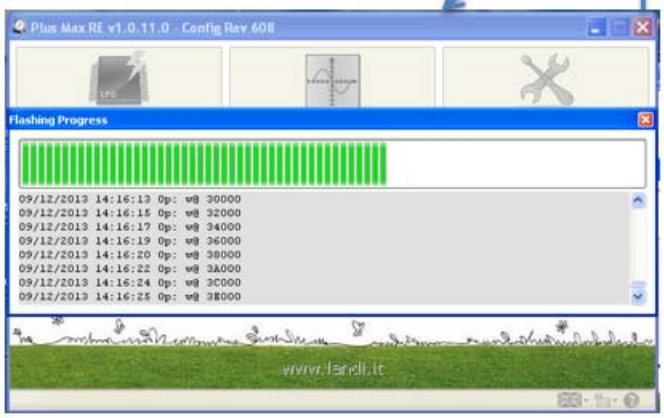
The Manual Emergency Procedure consists in the Manual Selection of the vehicle for GCU Re-Calibration or GCU Reprogramming.
The procedure must be authorized by Renault Techline and registered on FIC to report following parameters:

The VIN of the vehicle.
The fabrication number of the vehicle.
The code of error message specified in PlusMaxRE or error description
The SW and CAL number present on the label of the GCU

IMPORTANT:
The speed and relevance of the solution provided by Techline will depend on the accuracy with which this information is entered into the customer fault log.



After Techline analysis of the fault, you are authorized to apply the Manual Emergency Procedure for GCU Re-Calibration or GCU Reprogramming; depending on type of fault, this procedure can only be unlocked by a 6 character code (eg:F4A0B9).
This code is also necessary to perform all the diagnosis show in next chapter (in other word to open “parameter visualization” page)



On the main page, select SW+CAL Manual Update

Select the vehicle

Check the correct vehicle is selected and start GCU Re-Calibration or d

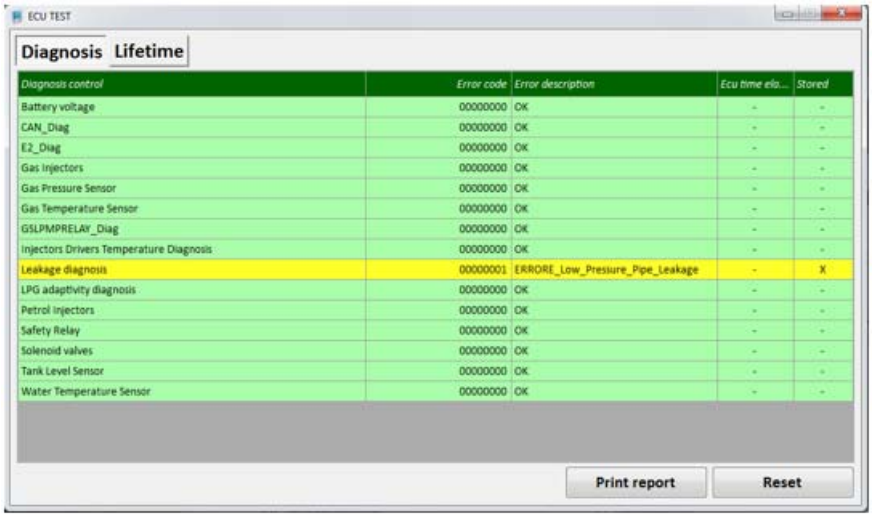
Waiting for download completion (100%)

At the end of the download it will appear the main page with new SW version.
After (re)programming the computer, switch off the + after ignition (+APC) power supply and wait for the loss of communication message to appear on the PlusMaxRE diagnostic tool, if the message does not appear, wait for 60 seconds.

8. GENERAL INFO TO FAULT FINDING USING PLUS MAX RE

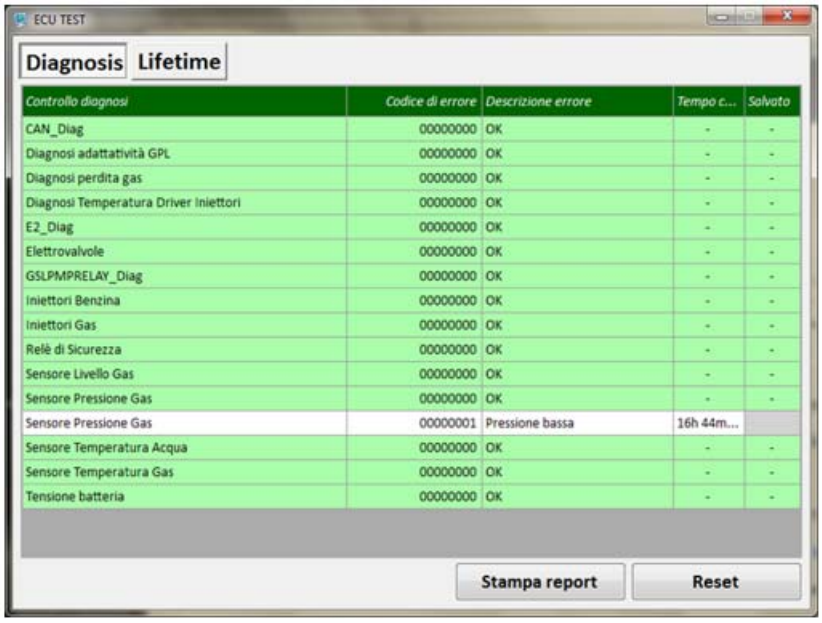
Always use the official diagnostic tool (Renault Clip) supplied by the manufacturer of the vehicle as primary diagnostic and repairing tool.
Always **clear any fault code using Clip** connected to Gasoline ECU and not using the Reset Pushbutton on the Diagnosis Page of PlusMaxRE.

9. DESCRIPTION FAULT PAGES IN PLUS MAX RE



As in Clip, faults are displayed as present or stored (they appeared in a certain context and remain present since they are fix, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + ignition power supply is switched on (without acting on the system components).



If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors for these lines (for oxidation, bent pins, etc.),
– the resistance of the component detected as faulty,
– the condition of the wires (melted or split insulation, wear).

Using PlusMaxRE to access the diagnostic page, click the "Fault List Page" link on top right of the main page. Present **faults** are **highlighted in yellow**; stored faults are **highlighted in white. Stored faults cannot be erased**. On stored faults the **"ECU time elapsed"** column indicates the GCU time elapsed from the moment when the fault appeared the last time. So a fault with an ECU time elapsed = 0h 01m appears just 1 minute before, while a fault with ECU time elapsed = 16 h 44 m appear 16 hours and 44 minutes before.

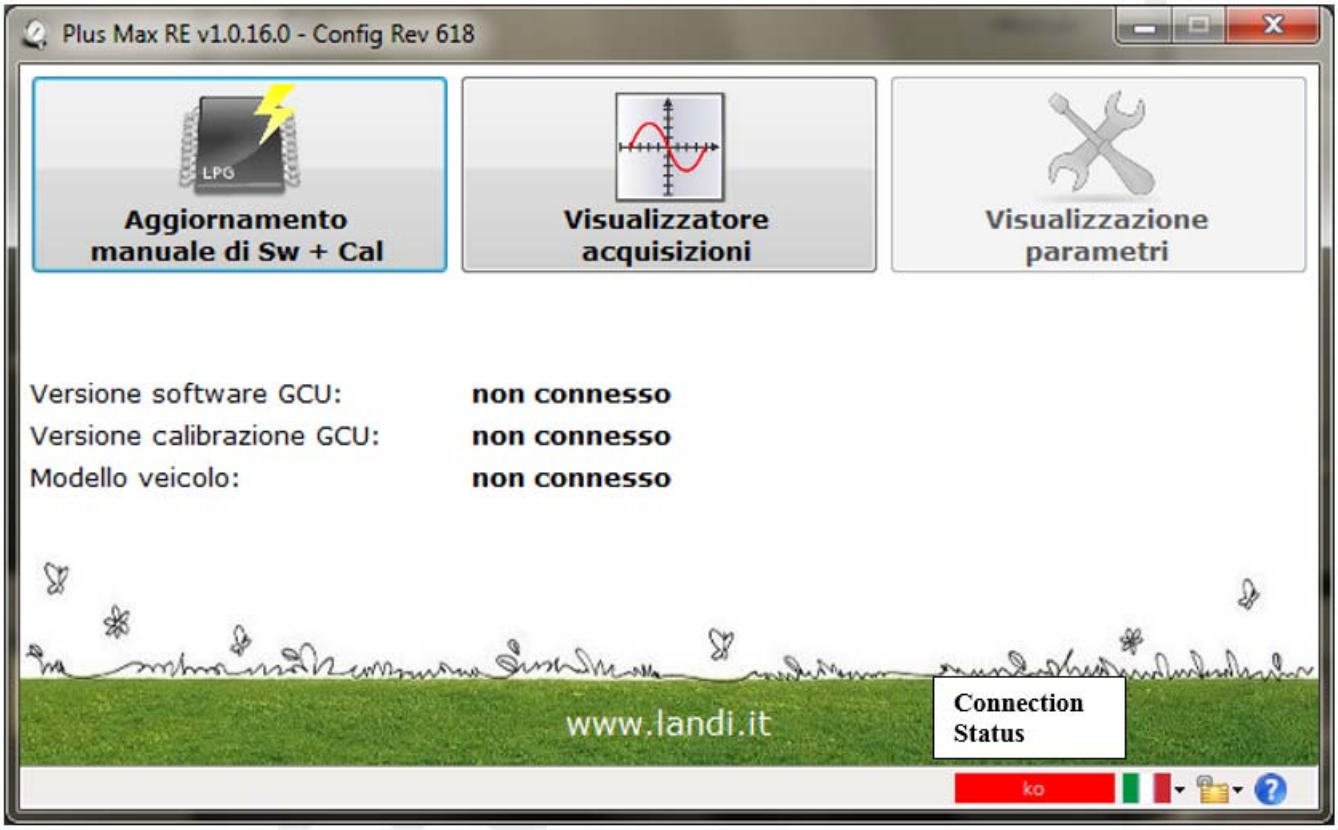
Example of present fault Highlighted in yellow

Example of stored fault Highlighted in white

10. COMPONENTS CONFORMITY CHECKS ASSISTED BY PLUSMAXRE

The aim of the conformity check is to check main LPG components in order to avoid wrong diagnostic and incorrect replacement of components.
This section gives the fault finding procedures supported by LR PlusMaxRE diagnostic Tool for behavior and parameters and the conditions for checking them.
If a behavior is not acting normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

11. CUSTOMER COMPLIANT – CONFORMITY CHECK



NOTES	Only check the Interpretation of Fault with PluxMaxRE tool after performing a complete check with the RENAULT's CLIP diagnostic tool. To open PlusMaxRE parameter page the unlock code is necessary.
	NOTE For any operation on a component of the LPG supply circuit, consult the safety instructions (see 17C).

NO DIALOGUE BETWEEN GCU AND TOOL	LPG 1
FUEL SUPPLY CONFORMITY CHECK	
LEAKAGE TEST	LPG 2
LOW PRESSURE	LPG 3
PRESSURE AND TEMPERATURE SENSOR CHECK	LPG 4
PRESSURE REGULATOR CHECK	LPG 5
INJECTORS CHECK	
MISFIRES	LPG 6
FUEL ADAPTATION	LPG 7
LPG LEVEL SENSOR CHECK	LPG 8

LPG 1	NO DIALOGUE BETWEEN GCU AND TOOL

NOTES	Use USB interface to connect your laptop to the diagnosis plug present in the GCU harness

This fault happens when the Tool isn't able to connect the diagnostic

The Area "Connection Status" must be green and parameters shown in the central part of the page.

If this area is red and parameters show "not connected message" there are no connection between PC and GCU, when key is ON.

Check:
GCU Power Supply: check if the GCU is properly supplied (check if the LPG push button is ON)
USB connection: maybe the interface isn't recognized by the PC USB port; restart the PC if necessary.
Cable connection: maybe the USB interface cable is damaged or unplugged; check cable connection.

Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

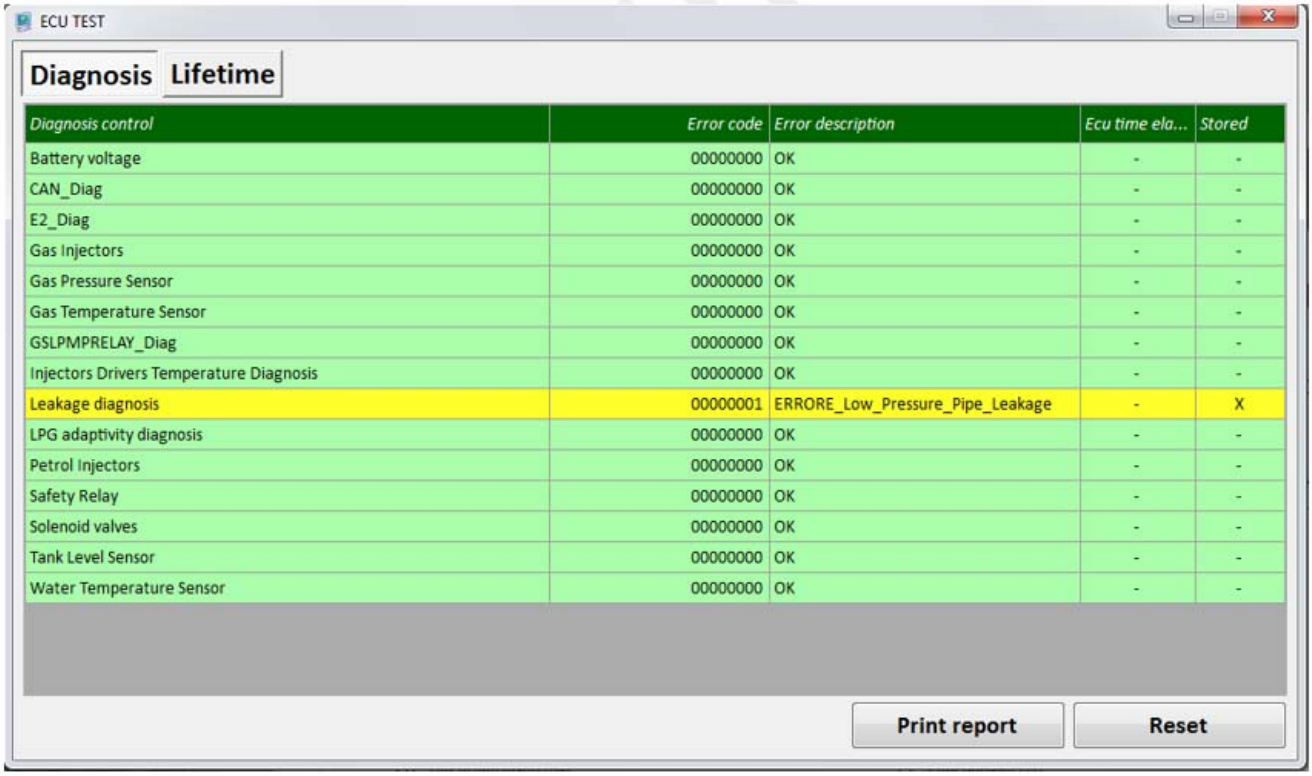
Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

With the engine running in gasoline mode and the LPG Pushbutton selected, **check for the presence of +12 volts on the correct Track (17 or 18 for LC03 GCU and 23 or 24 for LC02 GCU) of the TANK and VAPORIZER SHUT OFF VALVE output**.



LPG 2	*FUEL SUPPLY CONFORMITY CHECK: LEAKAGE TEST [DTC 2293-64]*

NOTES	GCU Integrates a strategy to check if the functionality of fuel supply lines are verified. In case this check isn't successful an LPG fault is generated and sent to ECU.

When test is performed:

Injector pre-heating (Antisticking function) NOT active
Tank level > 20%
At least 10 engine cranking and powersafe (60sec) after vehicle assembling or after SW reflashing.
Engine run in gasoline mode
Engine-on by at least 2 sec
Coolant water temperature at cranking > 30 °C
No other fault on Tank Level Sensor, Regulator EV, Tank EV.

Failure appears as "Leakage diagnosis" in the PlusMaxRE GCU Test page.
The fault can happen only during petrol mode.

Diagnosis control	Error code	Error description	Ecu time ela...	Stored
Battery voltage	00000000	OK	-	-
CAN_Diag	00000000	OK	-	-
E2_Diag	00000000	OK	-	-
Gas Injectors	00000000	OK	-	-
Gas Pressure Sensor	00000000	OK	-	-
Gas Temperature Sensor	00000000	OK	-	-
GSLPMPRELAY_Diag	00000000	OK	-	-
Injectors Drivers Temperature Diagnosis	00000000	OK	-	-
Leakage diagnosis	00000001	ERRORE_Low_Pressure_Pipe_Leakage	-	X
LPG adaptivity diagnosis	00000000	OK	-	-
Petrol Injectors	00000000	OK	-	-
Safety Relay	00000000	OK	-	-
Solenoid valves	00000000	OK	-	-
Tank Level Sensor	00000000	OK	-	-
Water Temperature Sensor	00000000	OK	-	-

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

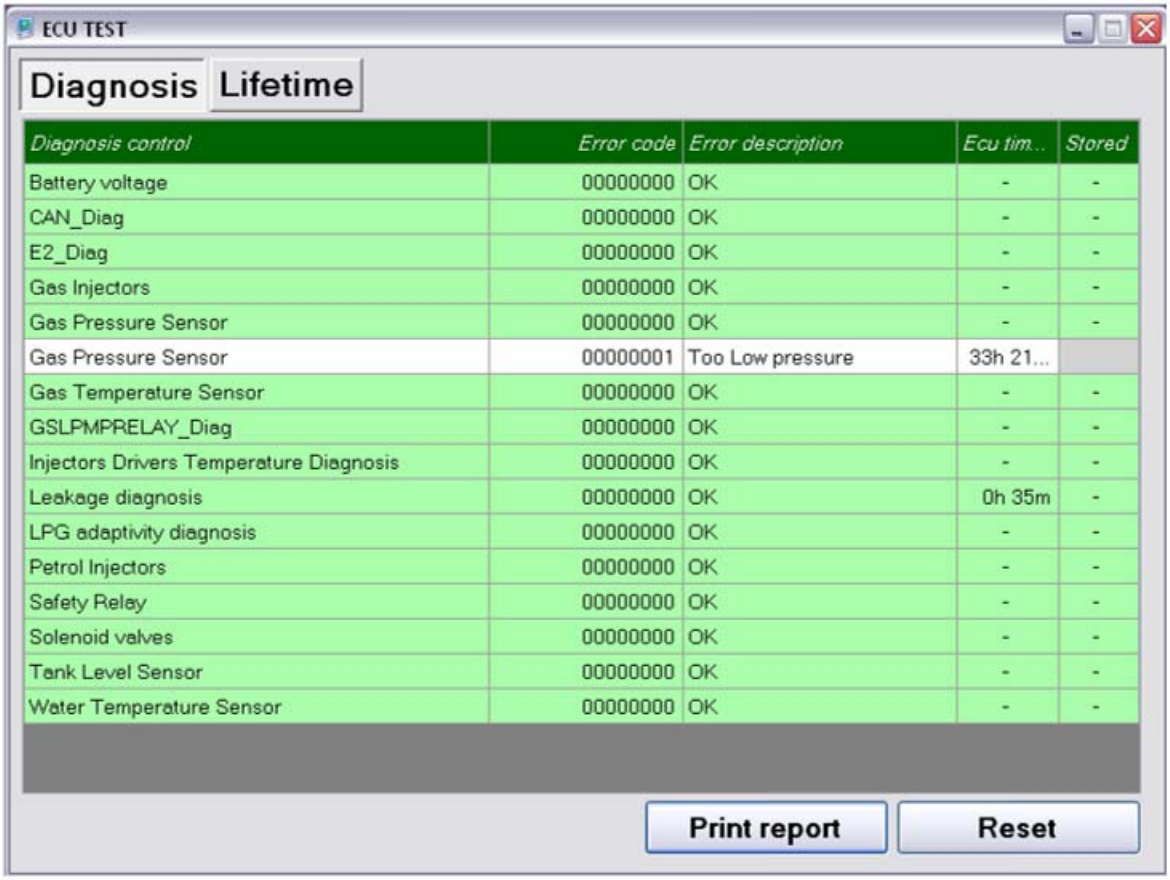
Test is performed in 2 different phases:
Few seconds after crank both LPG electrovalves open for 1 second (if the condition to perform the test are verified). In this phase the GCU check that the pressure reach at least 1.15 bar.
After both electrovalves closure the GCU monitor the LPG pressure for some seconds to verify if there is a pressure drop higher than a calibrated threshold.

The pressure doesn't reach 1.15 bar after EV opening:

LC03	**EV blocked:** the current supplies the coil but the EV of the regulator don't open	Replace mobile element
LC03	**Wrong level indication:** if no LPG is present in the tank but the sensor indicates more than 20% (not so common)	Fill the tank and check if the behavior is still present
LC03	**Low Pressure pipe disconnected:** a pipe is completely disconnected and LPG pressure sensor read atmospheric value	Reconnect the pipe
LC03	**Component or pipe clogged:** it can interrupt the flow of LPG inside the pipes, avoiding the rise of pressure	Not easy to detect, check if a pipe has an internal part that block it
LC03	**LPG Pressure/Temperature Sensor fault**	Check for DTC018A or DTC0185 present at the same time and deal with.

Drop of pressure during leakage test phase higher than the limit.



LC03	**Injector leakage in the manifold:** can create a drop of pressure and produce driveability issue during the test phase or during crank	Confirm the leakage from one single injector and replace it
LC03	**Hoses leakage:** Hose Clips, Double Wire Clips and Spring Band Clamps (Mubea Clamps) can be not correctly fixed	Fix correctly hoses or clamps
LC03	**Safety valve leakage:** the component not close correctly. If you remove the pipe you can smell LPG odour	Replace the regulator
LC03	**Regulator leakage:** if the membrane of the regulator is broken you can smell LPG odour from the MAP connection (after removing pipe)	Replace the regulator

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 3	*FUEL SUPPLY CONFORMITY CHECK: TOO LOW PRESSURE [DTC 2293-64]*

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

Failure appears as “Too low pressure” in the PlusMaxRE ECU Test page.
The fault can happen only in LPG mode.

Low pressure error:

LC03	**EV blocked:** Due to cranking condition, leakage test wasn’t performed in the current trip and EV don’t open when we switch to LPG	Replace mobile element
LC03	**Tank valve manually closed**	Open the valve and test again the system
LC03	**Hoses blocked:** if a pipe is clogged or bended, LPG flow can drop and decrease LPG pressure	Fix the pipes

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 4	*PRESSURE AND TEMPERATURE SENSOR CHECK*

NOTES	**Note the difference between functional and electrical error.**

DTC 2293 and DTC 0184 are related to **functional errors** and you **don't have** to replace the sensor in these cases.

"IMPOSSIBLE SWITCHING IN LPG MODE" Chart 3 and/or "IMPOSSIBLE TO SWITCH IN LPG MODE AND LPG SWITCH IS BUZZING" Chart 8.

With the vehicle stopped remove the sensor from the LPG rail
Leave the plug connected to be able to read the signals
After some minutes put the vehicle in key ON mode to supply the sensor
Check on the plus max RE the pressure and temperature value, they have to be coherent with the atmospheric value

Continuity check

LC03	Track 1 of LPG p/T sensor with ground Track 2 of LPG p/T sensor with pin 46 of the GCU Track 3 of LPG p/T sensor with pin 19 of the GCU Track 4 of LPG p/T sensor with pin 45 of the GCU
LC02	Track 1 of LPG p/T sensor with ground Track 2 of LPG p/T sensor with pin 6 of the GCU Track 3 of LPG p/T sensor with pin 9 of the GCU Track 4 of LPG p/T sensor with pin 8 of the GCU

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 5	*PRESSURE REGULATOR CHECK*

NOTES	**Note the difference between functional and electrical error.**

DTC2293-21 → Too low pressure
This error is never present on petrol ECU. When the GCU store this fault it consider the problem has a finish of LPG in the tank and didn't send any DTC to petrol ECU (if LPG level is different from 0 the error will be DTC2293-64)
DTC2293-22 → Too high pressure
DTC2293-64 → Incoherence between LPG level and pressure
This error appear when LPG pressure is too low but a normal value of pressure is attended (there is LPG inside the tank)

Regulator checks

TEST	EXPECTED PRESSURE VALUE
The **operating pressure** of the LPG displayed on the DIAGNOSTIC TOOLS should be between **1.15 & 1.36 bar**, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70°C,with all auxiliary load (AC, fan,..) **switched off**. [Usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].	**1.15 & 1.36 bar**
Idle, LPG mode, auxiliary load ON (AC, defrost, …), and when the temperature of the coolant is over 70 °C,	**1.35 & 1.55 bar**
Remove vacuum pipe, when the vehicle is running in LPG mode, at idle speed (750 rpm) and when the temperature of the coolant is over 70 °C,	**1.85 & 2.05 bar**
When the vehicle is running in LPG mode, gear in neutral position, push accelerator pedal driving	Pressure moves from **1.15 to 2 bar** according to manifold pressure
Open regulator's EV with +12V power supply (cold engine, only key ON) and check if you can immediately hear the sound of the opening	Not related with pressure value but to EV functionality

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 6	*LPG INJECTOR CHECK: MISFIRE*

NOTES	Injector issue, both electrical or functional, are always related to MIL lamp presence

If a fault code related to misfire occurs DTC030(x) (gasoline mode) or DTC130(x) (LPG mode) is stored in the petrol ECU.
Misfires can happen for different reasons, not only related to LPG injectors.

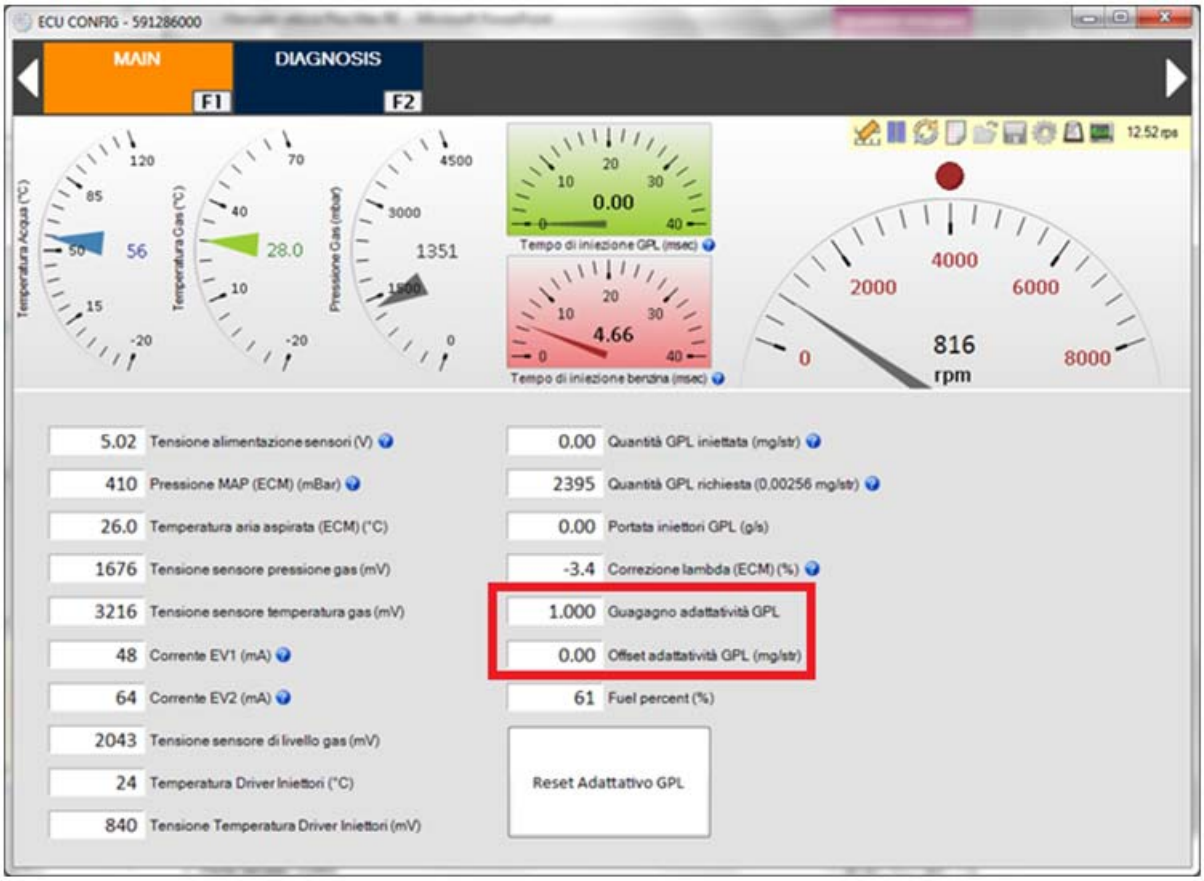
Customer Complain

Check if the issue happen during cold conditions (eg: low external temperature) and/or after few minutes from the switch to LPG.
Verify if the issue disappears when the engine is warm (coolant temperature over 70 °C).
If so a not correct vaporization of the regulator can be occurred.
In this case don't replace injector rail because they aren't responsible for the misfire.

DTC check

Check if there are other errors related to fuel combustion, for example related to lambda sensor or lean/rich combustion

Injectors check



Check the **resistance value** of the injector by measuring between **tracks 1 and 2 of the LPG injector**.
Replace the interested LPG Injector if the resistance is not approximately: **1.2 Ω ± 0.2 Ω at 25 °C**. (For more details, consult the electrical properties of the LPG injector in the Repair method).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 7	*LPG INJECTOR CHECK: FUEL ADAPTIVITY*

NOTES	Injector issue, both electrical or functional, are always related to MIL lamp presence

LPG system has adaptive parameters similar to petrol that correct LPG fuel mass injected.
Gain: default value is 1. For value higher than 1 mass flow rate will be increased; for values lower that 1 mass flow rate will be decreased. Expected value are between 0.8 and 1.2
Offset: default value is 0. Expected value are between -2 and +2

When adaptivity reaches its own limits an error appears.
If this happen replace the injectors.

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

LPG 8	*LEVEL SENSOR AND FUEL INDICATION CHECK*

NOTES	Remember that electrical fault and bad level indication should be manage in different ways

First of all analyze the costumer complaint: if the issue is related to blocked level indication (always 3 led for example), it can be a mechanical issue of the multivalve; if the complaint is about a bad or not coherent indication the system can be conform anyway.

As described in “Fault Finding – System Description” there are 3 different level sensors:

1) “3 wires” level sensor for internal tanks (X52 – Sandero II, Logan II)
2) “3 wires” level sensor for external tanks (Clio IV, Duster II, Lodgy, Dokker)
3) “2 wires” level sensor for old Euro5 tanks (Clio III, Sandero I, Logan I, Duster I)

Check if there are errors related to electrical fault of the level sensor and, if so, check the correct connection of the wiring.

On Plus Max RE it is also showed the voltage related to the sensor.

LC03	**This sensor has a continuous output that moves from less than 200 mV to more than 4 V**
LC02	**This sensor has only 5 discrete levels that correspond to LED on the switch (on full tank the resistance between the 2 pins is 21.8 kOhm**

During the vehicle driving you can see the value that moves during long turn or during slopes: **this indicates that the leverage inside the tank isn’t blocked**. Consider that the voltage has an hysteresis inside the GCU so the plus max value moves slower that the mechanical behavior of the leverage (this means that, also if you see a fixed value on the plus max, the leverage can’t be free to move).

If the leverage isn’t blocked and no electrical fault is present the system is conform and the indication should be consider coherent.

If you think, after previous test, that the leverage is blocked remove the tank MultiValve unit from the tank and manually test it (you can again check the coherence with the position of the level sensor and the switch).

AFTER REPAIR	Deal with any other possible faults. Clear the faults from the computer memory only using CLIP. Switch the ignition off and carry out a road test followed by a test using diagnosis tool.

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

UNEXPECTED SWITCH BACK TO PETROL	Chart 1
WRONG GAS TEMPERATURE	Chart 2
IMPOSSIBLE SWITCHING TO LPG MODE	Chart 3
IMPOSSIBLE TO CRANK THE ENGINE	Chart 4
GAS LEVEL INDICATOR: INCOHERENT WRONG LEVEL INDICATION	Chart 5
ENGINE STALL AT SWITCHING IN LPG MODE	Chart 6
MISFIRE – BAD DRIVEABILITY	Chart 7

CHART 1	*UNEXPECTED SWITCH BACK TO PETROL*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type

↓

Fuel pressure sensor check:
– Remove the sensor from the gas rail and check that the pressure value is approximately at atmospheric value with +APC (1 bar at sea level, engine temperature isn't relevant).
If the value is considerably different replace the sensor.

↓

Tank Multivalve electrovalve check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.

↓

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.

– Engine in LPG mode, running in idle and auxiliary load OFF → **gas pressure target 1.15 - 1.36 bar**.

– Switch off the engine and check the pressure is still the same after 5 minutes, to assure that no leakage is present (don't switch on engine, only +APC to give power supply to the sensor)

↓

Pressure regulator check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
– Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
– Remove vacuum pipe, idle, LPG mode → **pressure target 1.9 - 2 bar**
– In LPG mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and Manifold Pressure reference shall be approximately 0,95 bar less than LPG pressure**.

CHART 2	*WRONG GAS TEMPERATURE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

Fuel temperature sensor check:
– Park the car inside the garage, remove the sensor from the LPG pipe, but leave it electrically connected. Wait 15 minutes and check the LPG temperature using the diagnostic tool: it should be the same as ambient temperature. If the value is different replace the sensor (more than 15°C)

↓

Harness check:
– check that the plug of p/T sensor is correctly fixed
– check that wiring isn't damaged or broken.

↓

Customer complaint:
– Analyze the customer complaint: if the error occur at really low temperature (-10°C) consider the behavior has normal (at -10°C there is the diagnosys of too low temperature)

CHART 3	*IMPOSSIBLE SWITCHING TO LPG MODE: SWITCH BLINKING IN WAITING CONDITION OR LEDS SWITCHED OFF*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Important: remember that the switch to LPG isn't allowed immediately after pressing the button. The system need to reach determinate conditions before switch to LPG mode, as described in chapter 6.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.?

↓

Pushbutton check:
– Check that the LEDs on the switch are ON; if not check the harness connection of the switch.

↓

Switching condition check:
To allow LPG switch a lot of condition must be reached.
Check that
– The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
– Coolant water temperature must be higher than set threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25 °C.
– A calibrated delay is elapsed from the cranking. The delay depends on the temperature at the crank: usually cranking at a coolant temperature of 20 °C the delay is 60s.
– Gas Temperature must be higher than the tuned threshold usually between 2 and 5 °C. Please note that with low winter temperature (for example -10 °C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes.
– RPM value must be greater than the tuned RPM threshold usually around 1500 RPM.
– LPG switching isn’t allowed at very high engine loads, for example in full acceleration.

If costumer complains on delayed switch explain him that in some cases we need more than 5 minutes to reach all the conditions. It is really important that the system reach the right temperature to have a correct vaporization of the gas, even it's in the tank LPG can have really low temperature.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– Check on diagnosis page if there are any errors.

↓

LPG Fuel Trim check:
– Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
– Contact Techline with the completed fault finding log.

CHART 4	*IMPOSSIBLE TO CRANK THE ENGINE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

Battery and Fuse check:
– Make sure that **the battery is correctly charged**. If it is not, carry out fault finding on the charging circuit.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– If you experienced troubles to connect diagnostic tool, proceed with **GCU Power supply and Fuses check**.

↓

GCU Power supply and Fuses check:
Make sure that the cable connecting the battery to the GCU, the battery Ground cable to the chassis and the chassis grounding cable to the engine and transmission assembly are in good condition.
Repair if necessary.

Make sure that the battery is correctly charged. If it is not, carry out fault finding on the charging circuit.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance of the connections**:

LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC03	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC03	**POWER GROUND GCU track 22**	→	**CHASSIS GROUND**
LC03	**POWER GROUND GCU track 7**	→	**CHASSIS GROUND**
LC03	**LOGIC GROUND GCU track 48**	→	**CHASSIS GROUND**

Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance of the connections**:

LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 15**	→	**BATTERY FUSE**
LC02	**+30_POWER SUPPLY FROM BATTERY GCU track 43**	→	**BATTERY FUSE**
LC02	**POWER GROUND GCU track 25**	→	**CHASSIS GROUND**
LC02	**POWER GROUND GCU track 53**	→	**CHASSIS GROUND**
LC02	**LOGIC GROUND GCU track 22**	→	**CHASSIS GROUND**

Repair if necessary.

CHART 5	*GAS LEVEL INDICATOR: INCOHERENT WRONG LEVEL INDICATION*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.
– On Plus Max RE note which percentage is indicated for the LPG level
– During driving monitor the level sensor voltage (you can also record the signal on Plus Max RE) to understand if it is moving or not: if so the leverage of the multivalve isn't blocked (take into account the difference between the 2 level sensor, 2 or 3 wires)

↓

Customer complaint check:
– Analyze the costumer complaint in order to understand if there was a temporary block of the level gauge or the complaint is only due to the fluctuation of the LEDs of level indicator during the driving (uphill, downhill, roundabout); in this second case explain to the customer that the behavior is unfortunately normal and the best choice is to use the odometer to know accurately the mileage he can drive.

↓

Level indicator check:
– Drive the vehicle with PlusMaxRE connected and record Tank Level Sensor Electrical Signal; during acceleration, braking and turning, the electrical signal must change.
– Remove level indicator and check it can move freely and the position is correctly shown on the switch (wait 30 seconds for each position)
– If level sensor is "2 wires" version check the resistance is 21.8 kOhm at full level; if level sensor is "3 wires" version check the correct wiring connection (ground, +5V, signal)

↓

Multivalve check:
If the voltage of level sensor is fixed remove the multivalve from the tank to check it.
Check that
– The driver has selected the LPG fuel switch mode in the current trip or in the previous trip the engine stopped in LPG mode.
– Coolant water temperature must be higher than set threshold; this threshold depends on the temperature at the crank; usually the threshold is between 20 and 25°C.
– A calibrated delay is elapsed from the cranking. The delay depends on the temperature at the crank: usually cranking at a coolant temperature of 20°C the delay is 60s.
– Gas Temperature must be higher than the tuned threshold usually between 2 and 5°C. Please note that with low winter temperature (for example -10°C), the delay requested to the LPG temperature to reach the threshold could be long and sometimes more than 5 minutes.
– RPM value must be greater than the tuned RPM threshold usually around 1500 RPM.
– LPG switching isn't allowed at very high engine loads, for example in full acceleration.

CHART 6	*ENGINE STALL AT SWITCHING IN LPG MODE*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Typically this issue is due to a lack of LPG in the low pressure side: during the switch pressure regulator needs few instants for fill the pipes (they should be already fill if no problem occurs)

Conformity of LPG Fuel check:
– Check that there is LPG present (the LPG gauge may be faulty).
– Check that the LPG is of the proper type.

↓

GCU Status check:
– Using diagnostic tool, check on diagnosis page if there are any errors.

↓

Pressure in idle check:
– Check LPG pressure when:
  – Water temperature over 80°C
  – Engine is running in LPG mode in idle (≅ 750 RPM)
  – Auxiliary electrical loads OFF,

The **operating pressure** of the LPG displayed on the Diagnostic should be between **1.15 & 1.36 bar**, [usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].

↓

Tank Multivalve electrovalve check:
– Check that manual valve on the tank MultiValve unit is completely open.
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.

↓

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.
– Crank the engine monitoring:
  Gas Level (mV)
  Gas Pressure (mbar)
– Engine in LPG mode, running in idle and auxiliary load OFF → **attended pressure 1.3 bar**.
– Switch off the engine (leave key on to stay connected with the software) and check the pressure is still the same after 5 minutes, to assure that no leakage is present.

↓

Pressure regulator check:
- Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
- Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
- Remove vacuum pipe, idle, GPL mode → **pressure target 1.9 - 2 bar**
- In LPG mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and MAP reference shall be approximately 0,95 bar less than GPL pressure**

LPG Fuel Trim check:
- Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
- Contact Techline with the completed fault finding log

CHART 7	*MISFIRE – BAD DRIVEABILITY*

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.
	Priority for dealing with a number of faults: First deal with petrol faults cylinder coils control, engine speed sensor; downstream and upstream oxygen sensors, heating of upstream and downstream oxygen sensors, if they are present or stored.

Petrol fuel supply check:
- Check the petrol fuel system:
  - If requested in the petrol repairing manual, check ignition system by checking the condition of the plug and the low and high voltage contacts of the cylinder coil. Replace any faulty components.
  - If requested in the petrol repairing manual, check the compression ratio of cylinders. Repair if necessary.
  - If requested check the flywheel target (warping or cracks). Replace the flywheel if necessary.
  - Ensure that there are no leaks on the inlet manifold. Repair if necessary.

↓

If no fault is found, then there must be a problem with the LPG fuel system. Therefore check:
- the conformity of LPG fuel.
- the condition of the LPG fuel filter,
- the LPG flow and pressure
- the Tank manual valve check,
- the Tank and Regulator Electrovalves
- the Fuel supply hoses check,
- the LPG Fuel Trim check,

Replace the defective component.

↓

Conformity of LPG Fuel check:
- Check that there is LPG present (the LPG gauge may be faulty).
- Check that the LPG is of the proper type

↓

Fuel filter check:
- Check that there is LPG present (the LPG gauge may be faulty).
- Check that the LPG is of the proper type.

↓

Pressure in idle check:
– Check LPG pressure when:
  – Water temperature over 80 °C
  – Engine is running in LPG mode in idle (≅ 750 RPM)
  – Auxiliary electrical loads OFF,

The **operating pressure** of the LPG displayed on the diagnostic tool should be between **1.15 & 1.36 bar**, [usually the LPG pressure should be 0,9 - 0,95 bar over the manifold pressure].

Tank Manual Valve Check:
– Check that manual valve on the tank MultiValve unit is completely open.

Fuel supply hoses check:
– Check that no low pressure hoses are pinched (especially after a removal operation).
– Check that no low pressure hoses are damaged and clips or strips are correctly closed
– Check that no foreign body is inside the low pressure hoses
– Check the condition of the fuel filter; change it if necessary.

– Engine in GPL mode, running in idle and auxiliary load OFF → **attended pressure 1.3 bar**.
– Switch off the engine (leave key on to stay connected with the software) and check the pressure is still the same after 5 minutes, to assure that no leakage is present.

Pressure regulator check:
– Open EV reducer from the software or with +12V power supply (cold engine, only key ON) and check if you can immediately hear the clack noise of the opening.
– Check pressure on idle,GPL mode, AUX load OFF,warm engine → **gas pressure target 1.15 - 1.36 bar**.
– Remove vacuum pipe, idle, GPL mode → **pressure target 1.9 - 2 bar**
– In GPL mode, push accelerator and check that the pressure moves between **1.1 and 2 bar and MAP reference shall be approximately 0,95 bar less than GPL pressure**

LPG Fuel Trim check:
– Deal with the faults **DF633/DTC1170, DF635/DTC1301, DF636/DTC1302, DF637/DTC1303, DF638/DTC1304** and **DF639/DTC1300** if are present at the same time.
– Contact Techline with the completed fault finding log

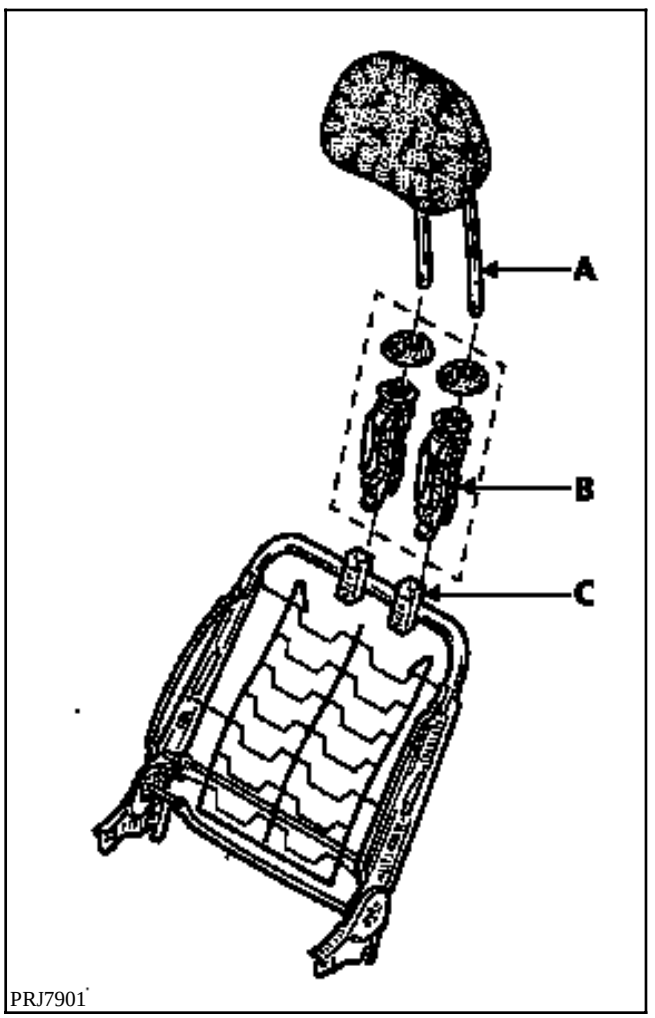
Type XXX X

S/Section 79

79 HEAD RESTRAINT FOR COMFORT AND SAFETY

INFORMATION

This note will provide you with all the information and instructions required to remove and replace the new head restraints and the special sleeves fitted on the front seatbacks.



"The repair methods given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The methods may be modified as a result of changes by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed".

All copyrights reserved by Renault.

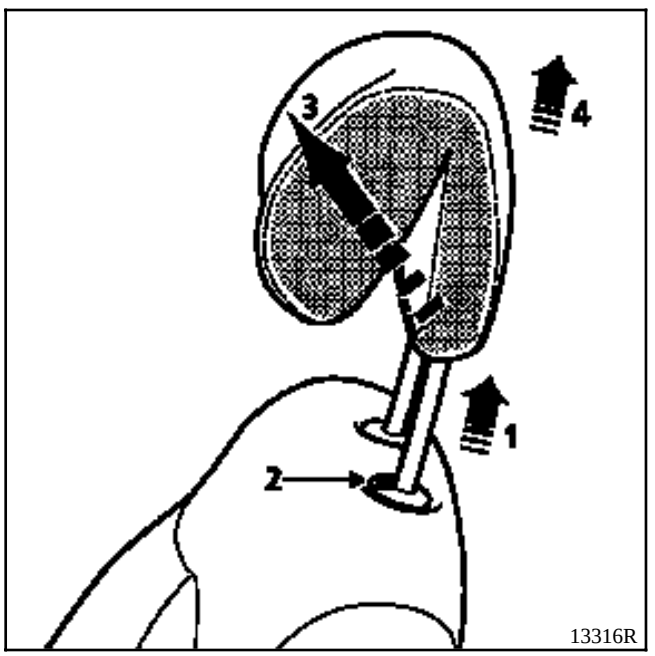
Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of RENAULT.

INTRODUCTION

This new type of head restraint will allow you:

- Height adjustment over a greater range so that it can be adjusted for passengers of all heights.

- A reduction in the distance between the head and the head restraint which will provide better support for the head if an impact occurs.



These head restraints consist of curved metal rods (A) fitted into plastic sleeves (B). These sleeves ensure that the restraint remains in place securely and that it can be adjusted.

NOTE: These sleeves must be removed and refitted with great care. This is to ensure that the head restraint retains its safety functions.

Each seat has a sleeve with a retention mechanism and a simple sleeve, mounted in dowels (C) in the seatback fittings.

IMPORTANT : In order to ensure that the sleeves are not damaged when the head restraint is removed, it is essential to follow the instructions given below.

REMOVING THE HEAD RESTRAINT

Sit on the back seat of the vehicle.

Tilt the seatback slightly.

Move the head restraint to its highest position (1), pushing it slightly towards the front.

Lift the plastic retention mechanism (2) and hold it in that position.

Raise the head restraint whilst pushing it firmly towards the front (3), in the same way as for adjusting the head restraint height.

Let go of the plastic retention mechanism (2) as soon as you feel the head restraint has been released.

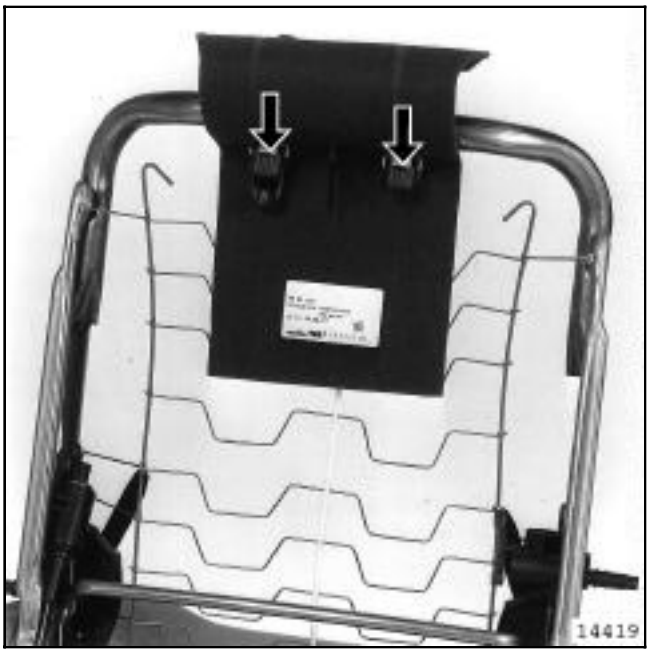
Keep lifting the head restraint (4) until the rods have been completely released.

REFITTING

Position the two head restraint rods in the movable sleeve caps.

Press down on the head restraint to insert the sleeves but do not use force.

As soon as the sleeves have locked in position (a click will be heard), lower the head restraint, still keeping it pushed towards the front.



ATTENTION

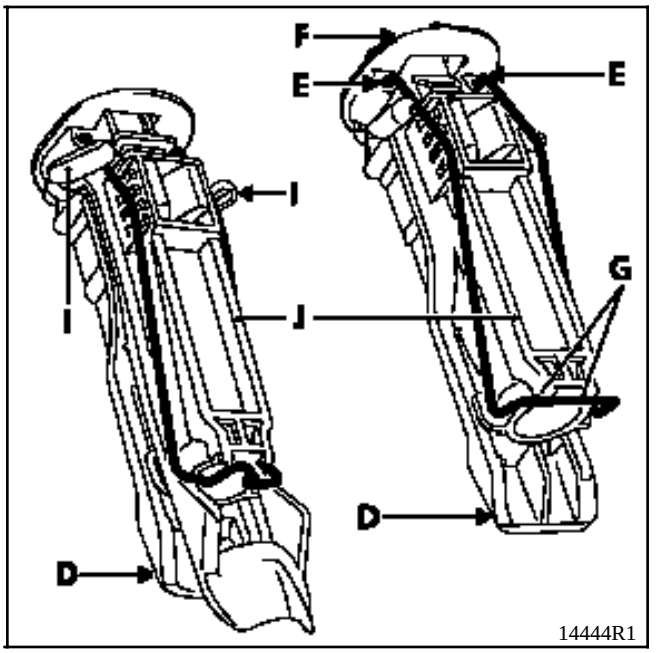
When the rods have been taken out or inserted, be very careful how they are fitted into the sleeves until they lock in position.

When the ends of the rods are inserted, the movable tops of the sleeves must be aligned with the guides secured to the seatback fittings in such as way that the rods can be extracted or inserted.

If any force is applied during these dismantling or refitting operations it may damage the sleeves irreparably .

REMOVING THE SLEEVES

Remove:
- the head restraint (as specified above),
- the seat.



Unclip the upper caps on the sleeves.

Remove the seat back trim.

Apply pressure to the two retaining lugs (D) (see illustration in next column).

Release the sleeves from the metal dowels in the seat fittings by pushing them upwards

REFITTING THE SLEEVES

First make sure that the two arms of the spring (E) are properly fitted into the inner cap (F) and clipped onto the body of the sleeve at (G).

If this is not the case, push the inner cap (F), (moving hinged section) towards the front to fit the spring at (G).

When the assembly has been fitted, push the inner cap back towards the rear.

Insert each sleeve in the relevant dowel into the seatback fittings without using any tools and without applying any force.

NOTE: Each sleeve has locating rib (J) which will ensure that no mistake can be made when fitting the sleeves in the dowels.

Apply pressure until the retaining lugs (D) have clicked into the dowel.

Each sleeve must have tabs (I) which fit each side of the dowel along its entire length .

IMPORTANT : If one of the tabs (I) is broken, the sleeve **must** be replaced.

Refit the seat trim and fit the head restraint back into position.

80A	**BATTERY**	
	Battery: General information	80A-1
	Battery: Checking	80A-2
	Battery: Advice	80A-5

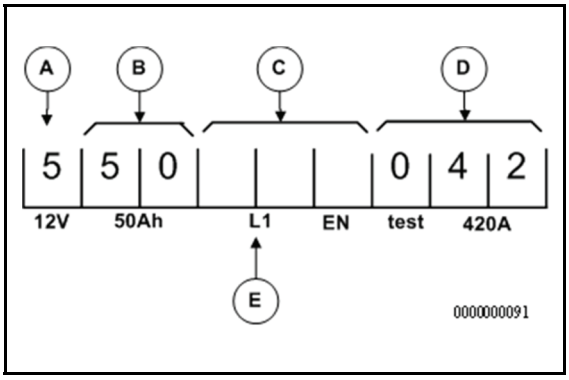
GENERAL INFORMATION

Apply this Technical Note if battery non-conformity was detected during the 1st inspection carried out by the preparation mechanic for new vehicles (see **Technical Note 3598A, Preparation of a new vehicle before it is handed over**). In this case, the Technical Note allows a more technical check of the condition of the battery to be performed when the new vehicle is prepared.

To ensure that the new vehicle is delivered with a sound battery, the inspection must be carried out as late as possible (as close as possible to the delivery of the new vehicle to the customer), allowing for any time needed for recharging or replacing the battery.

This must allow for the different cases of discharge encountered between preparation and delivery: exposure, storage, etc.

If the vehicle does not start when removed from storage, the battery must be replaced, (see **MR of corresponding vehicle, 80A, Battery, Battery: removal - refitting**).



Special notes for VRLA* batteries:

VRLA* batteries can be identified by a label affixed on the top of the battery, where the name VRLA is given.

VRLA* batteries do not have a visual indicator.

DESCRIPTION OF THE BATTERY LABEL

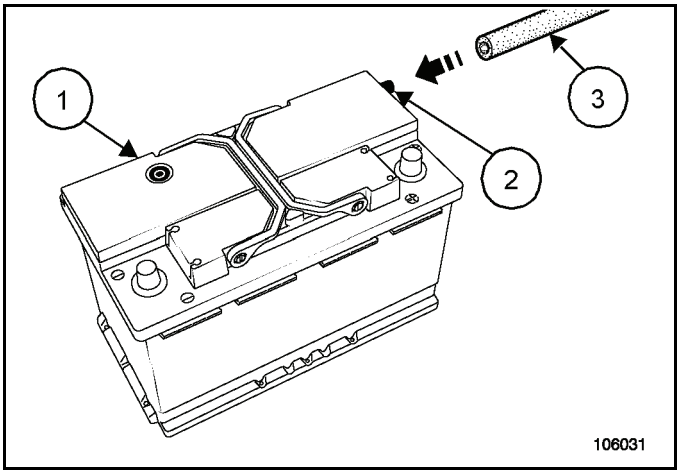
If the battery is replaced, refer to Dialogys or to the description on the label below to select the spare part.

A- + 12 V code.
B- Electrical capacity.
C- Location of terminals, size of tray, quality, performance level (if shown).
D- Maximum current when starting (e.g. 420 A, is written 042).
E- Size code (LB = low height).

The battery's date of manufacture is engraved on the cover in the format "DDMMYY".

*VRLA: Valve Regulated Liquid Acid

CHECK AROUND THE BATTERY

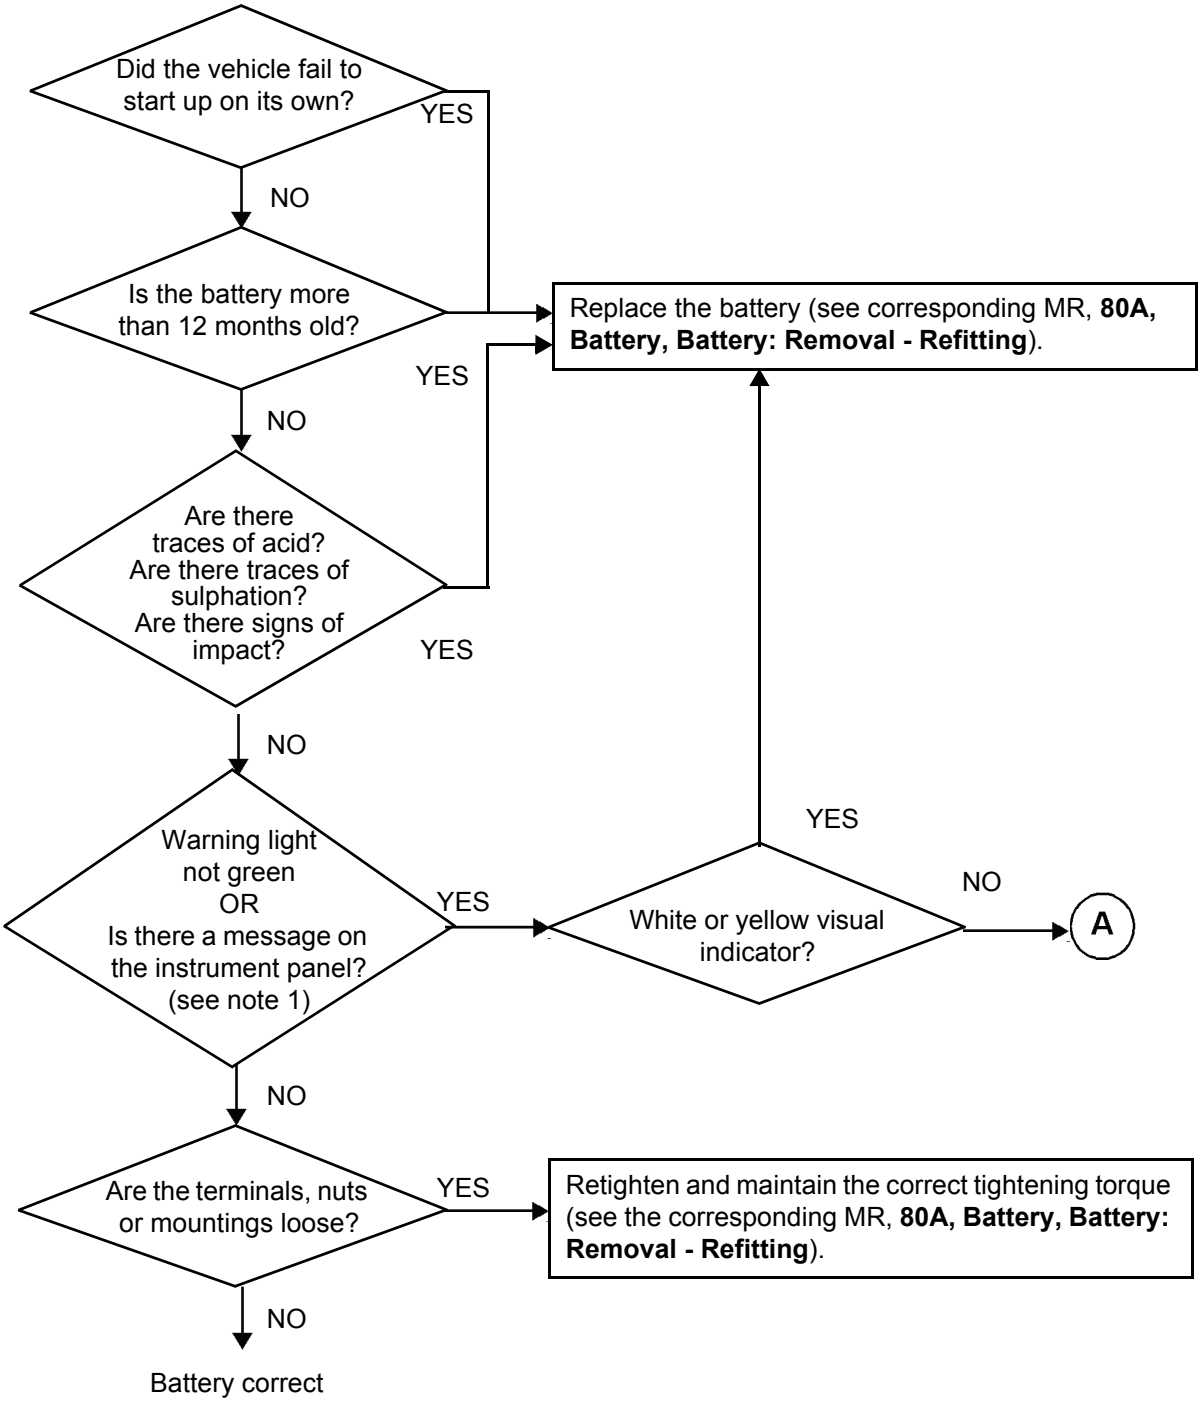


– Check the tightness of the bracket mounting bolt: it must be attached with the correct tightening torque (see **the MR for the relevant vehicle, 80A, Battery, Battery: Removal - Refitting**). Excessive tightening is not beneficial and can be dangerous, as it can damage, or even break, the battery. Conversely, insufficient tightening allows too much play, and there may be wear caused by battery movement and breakage caused by impact.

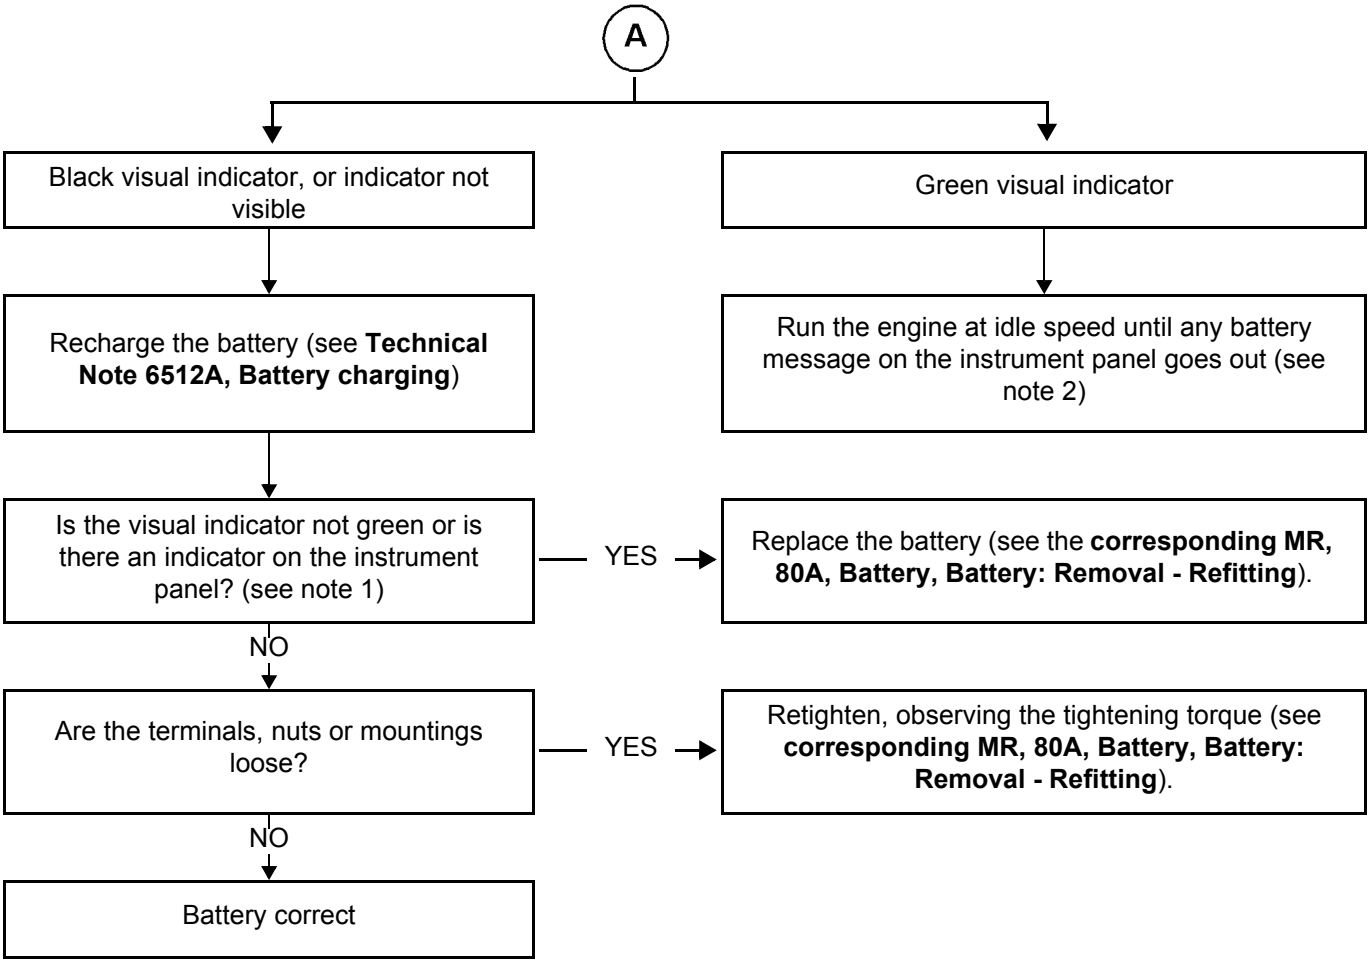
– Check the tightness of the battery terminal mountings: check that the battery terminals are correctly inserted and secure. The terminals must be attached with the correct tightening torque (see **the MR for the relevant vehicle, 80A, Battery, Battery: Removal - Refitting**).

– Check the tightness of the battery terminal stud nuts: check that the battery terminal stud nuts are correctly inserted and secure. The nuts must be tightened to the correct tightening torque (see the **MR for the corresponding vehicle, 80A, Battery, Battery: Removal - Refitting**).

CHECKING THE BATTERY



1- Replace all batteries with a date of manufacture over 1 year ago (date engraved on the cover).
2- Check that there are no cracks or breaks, traces of acid, or creepage (sulphation) on the terminals.
If any of the above are present, replace the battery and clean the surrounding area.
3- Check that the degassing pipe (depending on the version) is properly connected to the battery vent.
4- Ensure that the degassing pipe (3) is correctly positioned.
5- The battery charge status check is carried out differently depending on the presence or visibility of a visual indicator (1), known as the "Magic eye". See Flow charts opposite.



1- Visual indicator
2- Degassing vent
3- Degassing pipe

WARNING
All these vehicles are equipped with a low water consumption battery.
Opening the battery and topping up the electrolyte level are prohibited.

WARNING
The MIDTRONIC must not be used to check the batteries on new vehicles.

Note 1:
The visual indicator (also called the "magic eye") is visible depending on the equipment (VRLA, etc.).
The information on the instrument panel can be either:
– Text message: "battery needs recharging" or "battery low, start the engine"
– Flashing of the battery charge warning light.

Note 1:
The visual indicator (also called the "magic eye" "ME") is visible depending on the equipment (VRLA etc.).
The information on the instrument panel can be either:
– Text message: "battery needs recharging" or "battery low, start the engine"
– Flashing of the battery charge warning light.

Note 2:
It is normal for the message "BATTERY LOW, START THE ENGINE" to switch to "BATTERY CHARGING"; wait for any messages to disappear completely before switching the engine off.

REMINDER

Battery charge **(see Technical Note 6512A, Battery charge)**

CLAIM COMPLETION AND CODING
– Operation time:

Additional battery recharge
– Operation code: 8210
– Allocated time: 0.3 hours

Battery replacement
– Operation code: 8207
– Allocated time: **See Operation Time**

– Faulty part to be indicated: part number of battery (if replaced).
– Or Operation Time code to be indicated: battery recharge (if recharged).

RENAULT

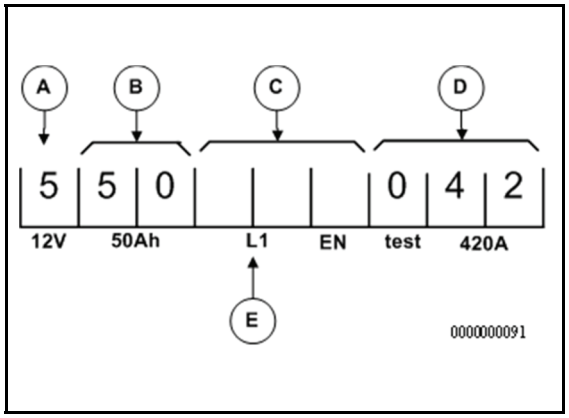
80A BATTERY

Battery: General information	80A-1
Battery: Test	80A-2
Battery: Result	80A-6
Battery: Advice	80A-7

General information
This Technical Note deals with the battery checking procedure, and the equipment to be used for preparing a used vehicle or for After-Sales.



The battery must be kept charged throughout the used vehicle's storage period, with regular checks following the procedure described in this note.

To ensure that the used vehicle is delivered with a sound battery, the battery must be checked as late as possible (as close as possible to the delivery of the used vehicle to the customer), allowing for any time needed for recharging or replacing the battery.

This should enable you to deal with the various cases of discharge encountered between preparation and delivery: display, storage, etc.

If the battery is equipped with a warning light (1), this is reserved for preparing a new vehicle and must not be used for After-Sales

Description of the battery label:
If the battery is replaced, refer to Dialogys or to the description on the label below to select the spare part.

A- + 12 V code.
B- Electrical capacity.
C- Location of terminals, size of tray, quality, performance level (if shown).
D- Maximum current when starting (e.g. 420 A, is written 042).
E- Size code (LB = low height).

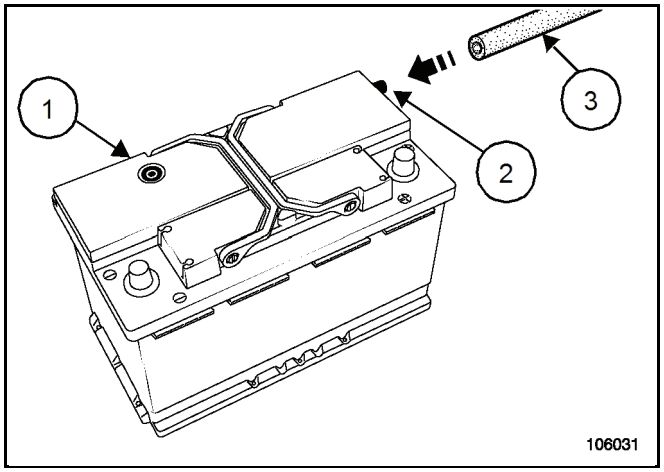
The manufacture date of the battery is engraved on the cover in DDMMYY format.

Special notes for VRLA* batteries:
VRLA* batteries can be identified by a label affixed on the top of the battery, where the name VRLA is given.

VRLA* batteries do not have a visual indicator.
*VRLA: Valve Regulated Liquid Acid

Checking around the battery:

– Check the tightness of the bracket mounting bolt: it must be attached with the correct tightening torque (see **the MR for the relevant vehicle, 80A, Battery, Battery: Removal - Refitting**).
Excessive tightening is not beneficial and can be dangerous, as it can damage, or even break, the battery.
Conversely, insufficient tightening allows too much play, and there may be wear caused by battery movement and breakage caused by impact.



– Check the tightness of the battery terminal mountings: check that the battery terminals are correctly inserted and secure.
The terminals must be attached with the correct tightening torque (see **the MR for the relevant vehicle, 80A, Battery, Battery: Removal - Refitting**).

– Check the tightness of the battery terminal stud nuts: check that the battery terminal stud nuts are correctly inserted and secure. The nuts must be attached with the correct tightening torque (see **the MR for the relevant vehicle, 80A, Battery, Battery: Removal - Refitting**).

Checking the battery

Make sure there are no cracks or breakages, traces of acid, or creepage (sulphation) on the terminals. If any of the above are present, replace the battery and clean the surrounding area.
Check that the degassing pipe (depending on the version) is properly connected to the battery vent.

Check that the degassing pipe (3) is correctly positioned.

1- Visual indicator
2- Degassing vent
3- Degassing pipe

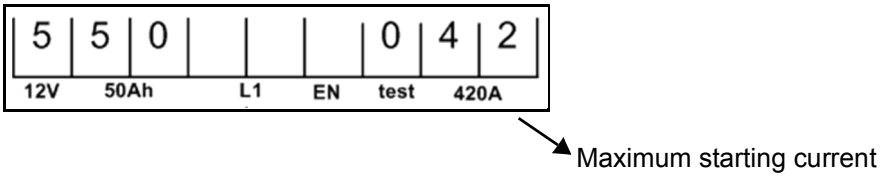
WARNING
All these vehicles are equipped with a low water consumption battery.
Opening the battery and topping up the electrolyte level are prohibited.

Test procedure using the MIDTRONICS tool

Special tooling required	
Elé. 1593	Battery tester MIDTRONICS R330

Test conditions

The measurement must be taken when the vehicle is stationary and the ignition is off.



If the engine has been run in the last hour, switch the battery status to test and carry out the following operations:
– engine switched off,
– switch on the main beam headlights for **2 minutes**.
– switch off the main beam headlights,
– wait for **2 minutes**,
– switch off the ignition.

Equipment to be used:
– Tester approved by the Service Department: MIDTRONICS MICRO R330.
– Tool available as part no.: Elé. 1593.
– Equipment available in France from the Parts Department.
– Tool available in 6 languages.
For other countries, consult your contact in your country.

WARNING
Failure to observe the procedure or poorly maintained equipment may result in incorrect measurements, which could be:
– detrimental to the customer (the battery is not sound),
– detrimental to RENAULT (unnecessary replacement of a sound or rechargeable battery),
– detrimental to the dealership (if the battery is tested as sound or rechargeable for a part return under warranty, the warranty reimbursement request will be cancelled).

Mode (test on vehicle)

– Connect the tool directly to the battery terminals, without disconnecting the vehicle battery, as close as possible to the battery terminal but ensuring it is not after the fuse (on-vehicle test) or carry out the battery test after disconnecting the two terminals (see **note**),
– check that the vehicle ignition is switched off,
– select the "battery connected to the vehicle" or "battery disconnected" test using buttons ⏶ and ⏷ . Confirm by pressing the green key ↵
– The test is carried out to the EN standard by default. Confirm with the green ↵ button.
– Select the starting power on the battery label using buttons ⏶ and ⏷.

– Confirm with the green ↵ button.
– The tool displays **TEST IN PROGRESS**.
– The MIDTRONICS tool carries out the test and gives the results of the fault finding procedure.

To set the tool language, carry out the following operations:
– before connecting the tool, simultaneously press buttons ⏶ and ⏷,
– connect the device to the battery,
– release the keys,
– scroll through the languages using buttons ⏶ and ⏷,
– confirm with the green ↵ button.

Note:
The battery must always be disconnected in the following order:
– Wait for at least **1 minute** between switching the ignition off and disconnecting the battery, to enable the computer systems to go on standby.
– Wait for the engine cooling fan to stop completely.
– Disconnect the negative terminal first.

CHECKING USING THE MIDTRONICS R330 TOOL

Has the engine been running in the last hour?

NO → TEST WITH THE MIDTRONICS R330 TOOL **(Elé. 1593)**

YES →

– Stop the engine and switch off the ignition.
– Switch on the main beam headlights for **2 minutes**.
– Switch off the main beam headlights.
– Wait for **2 minutes**.

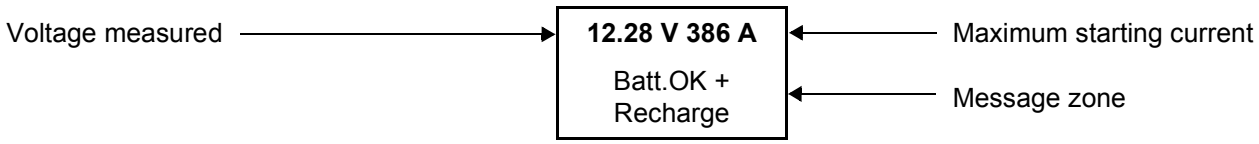
→ TEST WITH THE MIDTRONICS R330 TOOL **(Elé. 1593)**

– Switch off the ignition.
– Switch off all the electrical consumers.
– Adjust the tool **Elé. 1593** (MIDTRONICS R330).
– carry out the test.

The tool displays **"Battery OK + recharge"** or **"Charge + re-test"** → Recharge the battery **(see Technical Note 6512A, Battery charge).**

The tool displays **"Test impossible"** → Is the message appearing for the first time?

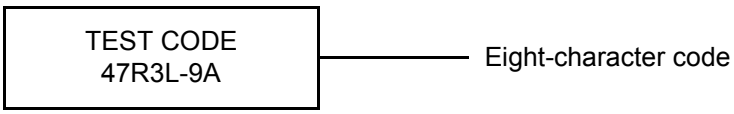
NO → Make sure that only the battery is faulty by starting the test again with the battery disconnected. If the result of the test is identical, replace the battery (see MR for the corresponding vehicle, **80 A, Battery, Battery: Removal - Refitting**).



YES → Check that the tool is correctly connected to the battery. Switch off all the electrical consumers. → TEST WITH THE MIDTRONICS R330 TOOL **(Elé. 1593)**

The tool displays
– **"Component faulty"**
– or **"Replace battery"**
– or **"Disconnect battery"** → Make sure that only the battery is faulty by starting the test again with the battery disconnected. If the result of the test is identical, replace the battery (see MR for the corresponding vehicle, **80 A, Battery, Battery: Removal - Refitting**).

The tool displays **"Battery OK"** → The battery is charged. Reconnect the degassing pipe and put the heat shield back in position, if fitted to the vehicle.



RESULTS OF MEASUREMENT

1st results screen (example):

Confirm using the green ↵ button.

2nd results screen (example):

To stop the test, disconnect the tool.

Each code issued by the MIDTRONICS R330 tool is unique and varies according to:
– the type of battery,
– and its charge status.

Reminders

Battery charge (see **Technical Note 6512A, Charging batteries**)

Reinitialisation of systems after the batteries are disconnected (see **Technical Note 3682A, Checking batteries before new vehicle delivery, Battery: Advice**)

Claim completion and coding

Relating to the preparation of used vehicles:
The used vehicle pre-delivery battery check is complete after:
– the message **Battery OK** is displayed,
– the MIDTRONICS R330 code corresponding to the**"Battery OK"** message is noted down on the used vehicle checklist.

Relating to an operation on the battery:
– If the operation is covered by the warranty, enter the code given by the MIDTRONICS R330 tool in the "Comments" field of the Warranty reimbursement request, which provides justification for recharging or replacement.

Operation time:
Additional battery recharge
– Operation code: 8210
– Allocated time: 0.3 hours

Battery replacement
– Operation code: 8207
– Time allowed: See Operation time.

Part to be indicated: part number of faulty battery (if replaced).
Or indicate OT code concerned: battery recharge (if recharged).

80A BATTERY

Battery: General information, equipment to be used 80A-1
Battery: Charging 80A-2
Battery: Advice 80A-3

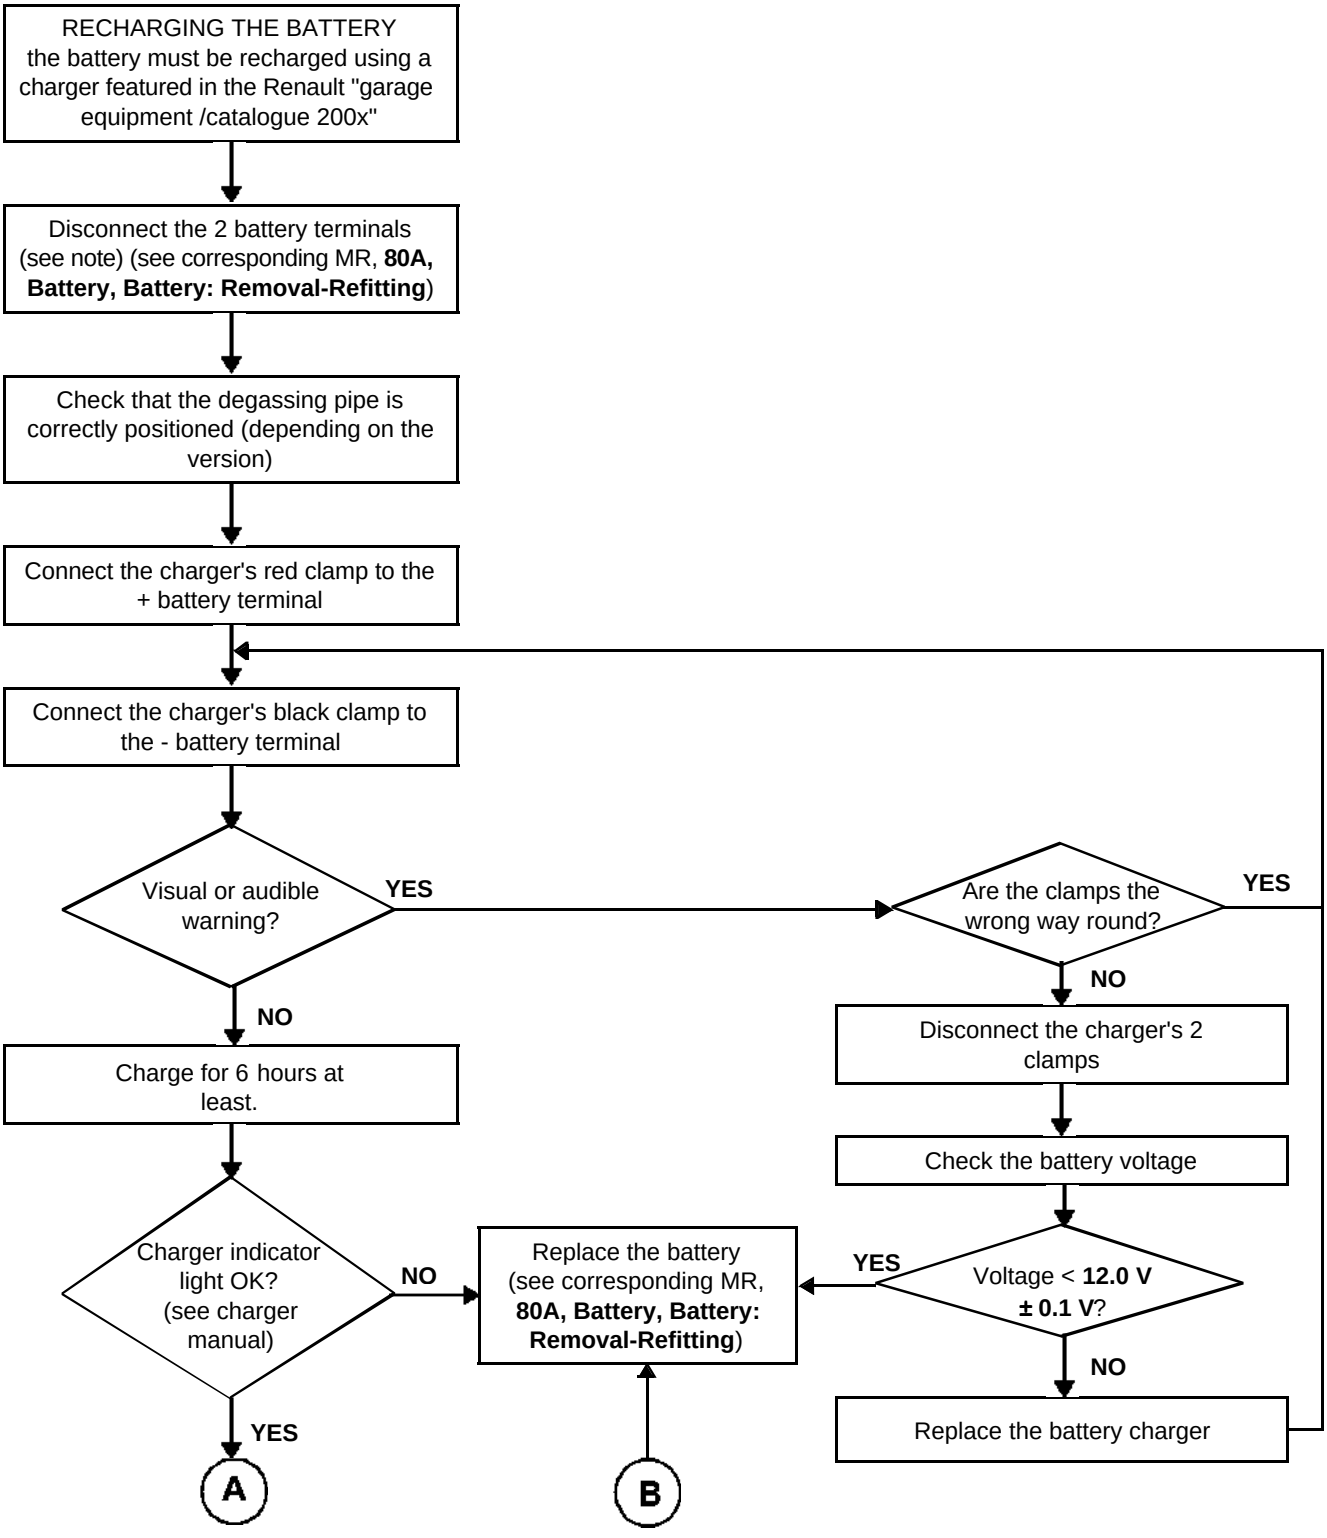
Battery: General information, equipment to be used

GENERAL INFORMATION

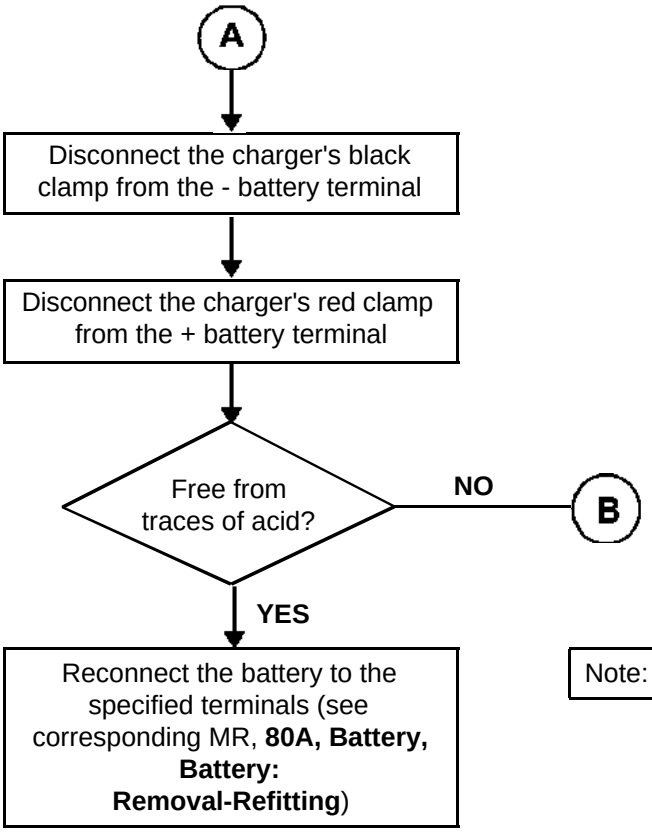
This Technical Note describes the procedure for charging the battery, as well as the equipment to use.

This note applies to all charging operations in the network.

RECHARGING EQUIPMENT TO BE USED



It is essential to use a charger from the list of special equipment selected by Renault in the catalogue **"Garage equipment / Catalogue 200x"**.



PRECAUTIONS:

The 2 battery terminals must be disconnected (see **corresponding MR, 80A, Battery, Battery: Removal-Refitting**).

Check that the degassing pipe is correctly positioned (depending on the equipment).

IMPORTANT
All these vehicles are equipped with a low water consumption battery.
Opening the battery and topping up the electrolyte level are prohibited.

RECHARGING THE BATTERY
the battery must be recharged using a charger featured in the Renault "garage equipment /catalogue 200x"
Disconnect the 2 battery terminals (see note) (see corresponding MR, 80A, Battery, Battery: Removal-Refitting)
Check that the degassing pipe is correctly positioned (depending on the version)
Connect the charger's red clamp to the + battery terminal
Connect the charger's black clamp to the - battery terminal
Visual or audible warning?
YES
NO
Are the clamps the wrong way round?
YES
NO
Disconnect the charger's 2 clamps
Check the battery voltage
Voltage < 12.0 V ± 0.1 V?
YES
NO
Replace the battery charger
Charge for 6 hours at least.
Charger indicator light OK? (see charger manual)
NO
YES
Replace the battery (see corresponding MR, 80A, Battery, Battery: Removal-Refitting)
A
B

Note: except if a "SLAT" type charger is used

CLAIM COMPLETION AND CODING

– Operation time:

Additional battery recharge
- – Operation code: 8210
- – Allocated time: 0.3 hours

Battery replacement
- – Operation code: 8207
- – Time allowed: See Operation time.

– Part to be indicated: part number of faulty battery (if replaced).
Or indicate OT code concerned: battery recharge (if recharged).

0) Introduction

Since 1st June 2005 there has been a single service available for supplying the following codes:

- Engine immobiliser
- Radio
- Video network
- Reprogramming key (NRE)

This service is Code Management (GDC) on RENAULT NET or importers' RENAULT NET.

Information required for use:

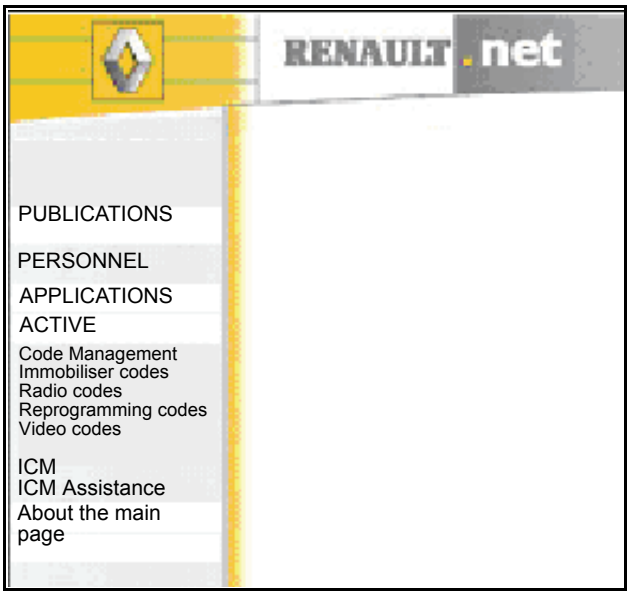
Immobiliser code:
VIN (17 characters)
number marked on the key head (old vehicles, 8 characters maximum)
Programming key supplied by diagnostic tool (new vehicles, 24 characters)

Note: The programming key is obligatory from CLIP CD65, i.e. from June 2006.

Radio code:
VIN (17 characters)
Pre-code or serial number of the radio

Radio pre-code if the first code obtained using the VIN is not correct
Pre-code = 1 letter + 3 digits
Refer to the detailed procedure §2.2.2 "Finding the radio pre-code"

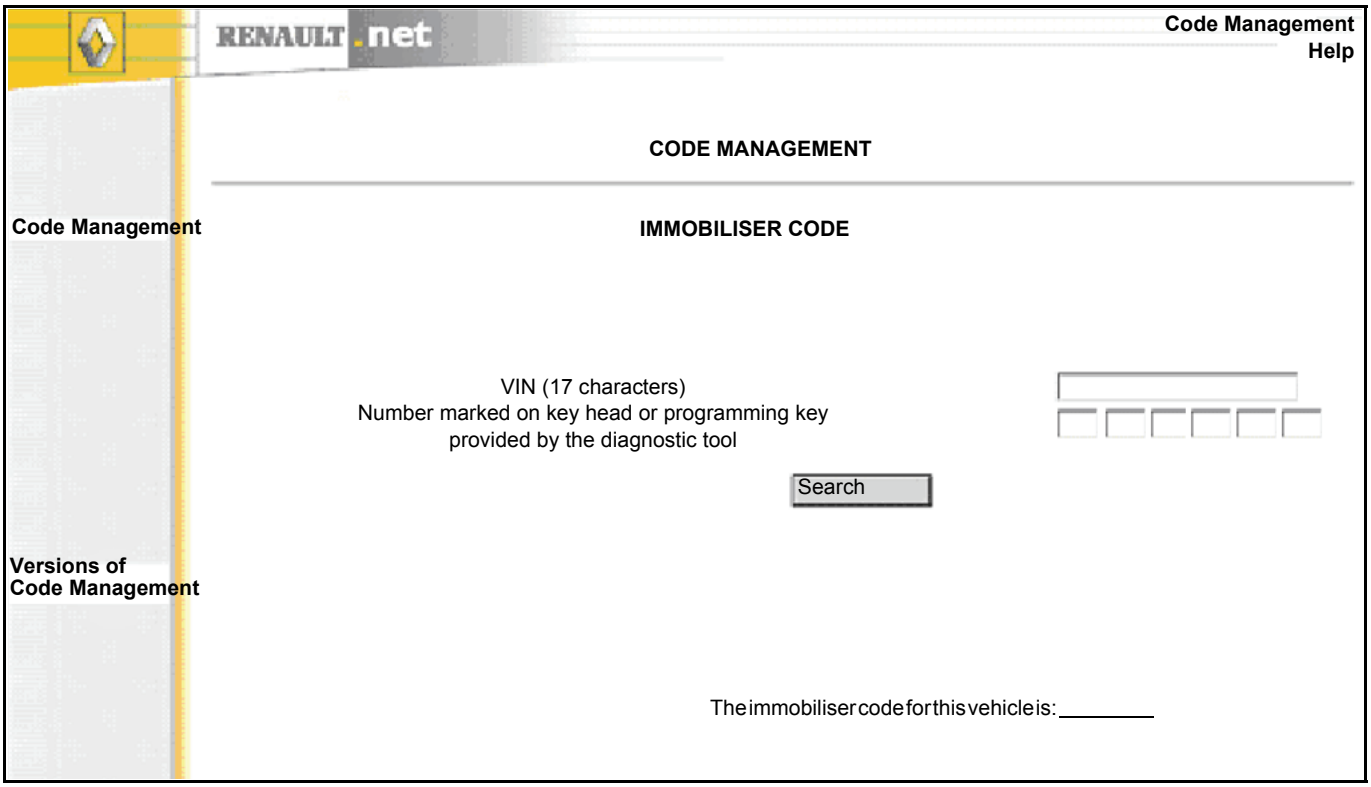
Radio without pre-code:
Radio manufacturer: Philips/Blaupunkt/Pioneer/Alpine/Becker



Video control code specific to Vel Satis:
VIN of the vehicle (17 characters)
Four-digit code supplied by the video control
Refer to the corresponding repair manual.

Reprogramming key (only in disconnected mode):
*Note: this key is an authorisation code provided by the diagnostic tool to the operator in order to obtain the reprogramming key from the code server.
VIN of the vehicle (17 characters)
Reprogramming key supplied by the diagnostic tool

WARNING
Access to the "code management" application is restricted to authorised personnel.
To use the code server, access rights are required.
These access rights (certificate) are integrated into the Tokens.
All code requests are recorded in a database. This database can be accessed by the police authorities.
Any member of personnel found to be making fraudulent use of management codes will be subject to corporate and legal proceedings.



Using the Code Management server to find codes:

1) Main menu in Renault Net, under Applications you will find Code Management:

2) Finding a code in Code Management:
2.1 Immobiliser code:

Note:
To find out whether a vehicle is governed by the old or the new procedure, just start the programming procedure using your diagnostic tool. If the tool displays a **programming key**, this vehicle is governed by the new procedure.

2.1.1 Old procedure

– Enter the VIN
– Confirm with the "Search" button
– Immobiliser code supplied in the following form:
  4 digits (old vehicles)
  8 digits (MEGANE 1 and AVANTIME only)
  12 characters (digits and letters for other vehicles)

If the immobiliser code supplied is not correct and you have the key head number, resubmit your request with the same VIN and **key head number**:

Note:
The key head number is required for old vehicles; if the four-digit code supplied by the code server does not correspond to the vehicle, the key head code is used to recalculate the new four-digit code.

– Re-enter the VIN of the vehicle
– Enter the key head number (marked on the key head) 8 characters maximum (5 figures or 7 alphanumeric characters, or even 8 alphanumeric characters)
– Confirm with the "Search" button
– The immobiliser code (4 figures) is supplied

2.1.2 New procedure:
This new procedure affects vehicles from LAGUNA II, and new vehicles.
This has been compulsory since June 2006.

In disconnected mode:
– Enter the VIN + programming key supplied by the diagnostic tool.
– Confirm with the "Search" button
– The immobiliser code is supplied in the form of programming keys of 24, 40 or 28 characters, then supplied in the form of 13, 34 or 39 characters

In connected mode:
– The immobiliser code can be searched for and supplied automatically via the diagnostic tool.

2.1.3 Error messages and procedure to follow

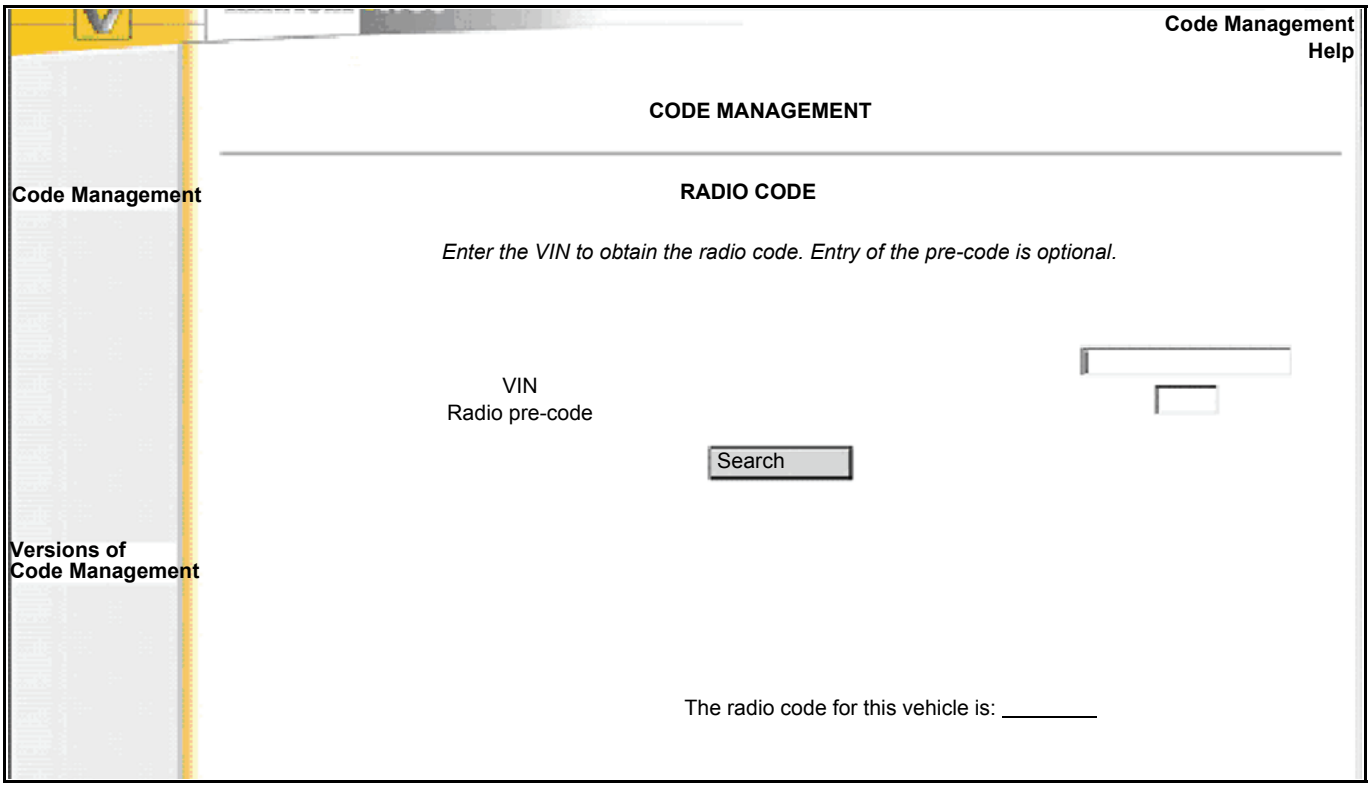
MANAGEMENT CODE ERROR MESSAGE	PROCEDURE TO FOLLOW
All vehicles	
The VIN is not found on the World Vehicle Database	Re-enter the VIN. If the fault is still present, contact the Techline.
The diagnostic tool programming key is compulsory.	The vehicle corresponding to the VIN entered is subject to the new procedure described in paragraph 2.1.2. CLIP version 65 or a more recent version is required.
A new code cannot be supplied.	contact your technical assistance network
Old procedure	
The immobiliser code cannot be obtained by entering the VIN alone. For old vehicles with a four-digit security code, you must enter the code marked on the key head in addition to the VIN. If no number is marked on the key head, contact your technical assistance network	The immobiliser code cannot be obtained from the server; the key head code is required to calculate the immobiliser code. Open the key head to obtain the key head code. If the code does not appear on the key head, check the customer documents (e.g. invoice) to find the code. If this number cannot be found, contact your technical assistance network quoting the error message.
The immobiliser code cannot be obtained with values entered. Check that the values are correct. If they are correct, contact your technical assistance network	If the key head code is incorrect, the immobiliser code cannot be calculated by the server. Check the key head code.
New procedure	
1. Check the programming key. 2. Check that the VIN from the CLIP main menu is correct.	The programming key does not correspond to the VIN entered. 1. Check the programming key (6 x 4 characters); the programming key does not contain: the letters O and Q as these may be confused with the number 0 the letter I as it may be confused with the number 1. 2. In the CLIP main menu, enter the correct VIN of the vehicle (17 characters)

2.1.3 Error messages and procedure to follow (continued)

MANAGEMENT CODE ERROR MESSAGE	PROCEDURE TO FOLLOW
New procedure (continued)	
The Renault card (or key) stored by CLIP in the "insertion" section of the programming scenario cannot be found on the server. 1. Check the programming key. 2. Check that the Renault card (or key) was ordered directly by the production workshop in France with the VIN (new procedure). 3. Check that the Renault card (or key) corresponds to the vehicle (the VIN is included on the document supplied with the part).	1. Check the programming key. 2. Renault cards and keys must be ordered according to the new procedure: from June 2006, directly from the central manufacturing workshop (in France), with the vehicle's VIN. The Renault cards and keys can only be used with the VIN for which they have been ordered. The VIN is written on the sheet attached to the packet containing the part. 3. If the fault is still present, contact the Techline.
The immobiliser code is not available on the database. follow the emergency procedure (see 2.1.4)	Check the VIN and the programming key. If the fault is still present, follow the emergency procedure (see 2.1.4).
Another immobiliser chain computer has recently been programmed on this vehicle. You are not authorised to perform this operation. Follow the emergency procedure (see 2.1.4).	1. Check the programming key. 2. Restart the procedure with CLIP. 3. If the fault is still present, follow the emergency procedure (see 2.1.4)

2.1.4 Emergency procedure

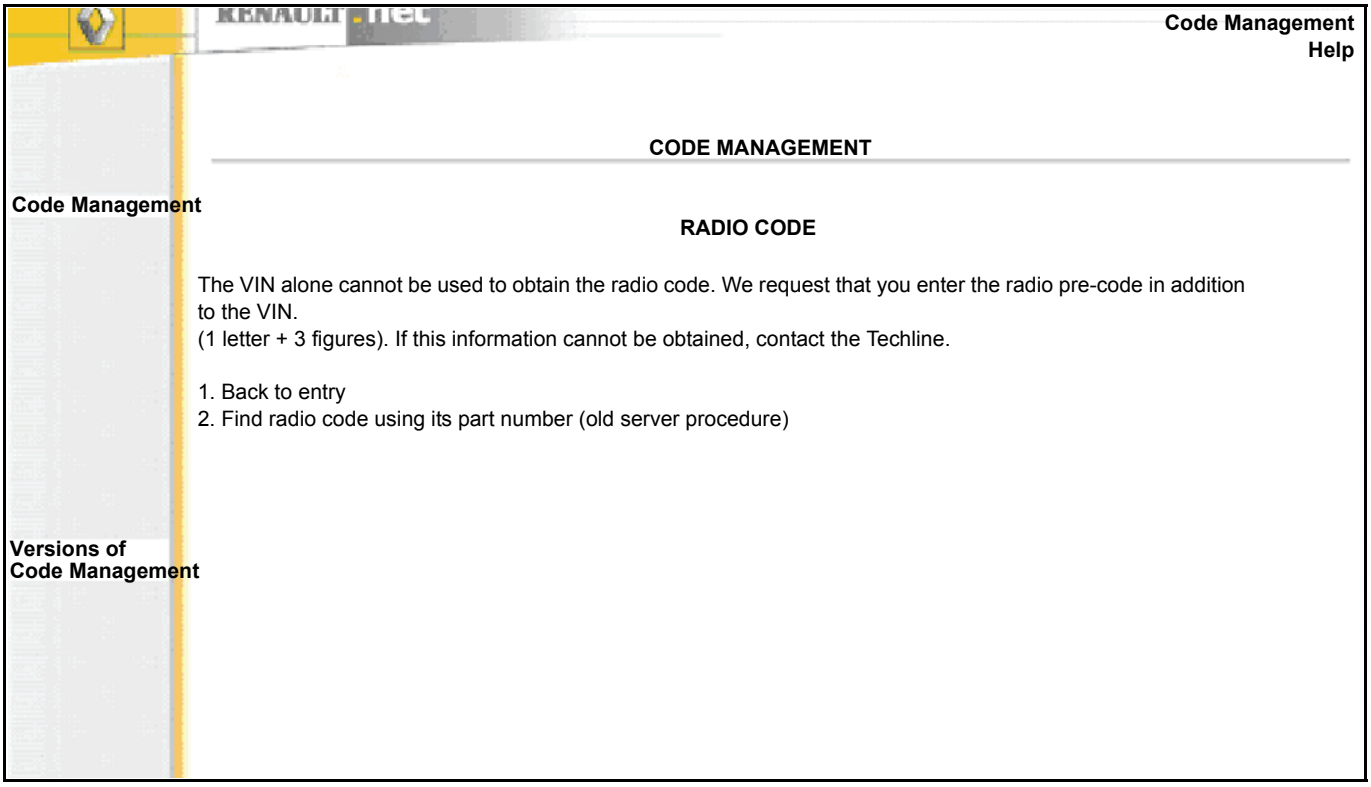
From 2007, the help mail will be replaced by a text file.
Once the code has been requested, a button will appear: "create a text file".
This creates a text file which can be saved to the hard drive or to a mobile device.



In the event of a fault, this text file contains all the information needed by the Techline :

- The VIN
- the key head code or programming key
- the message displayed

It is recommended that you use this text file to contact your technical assistance network.



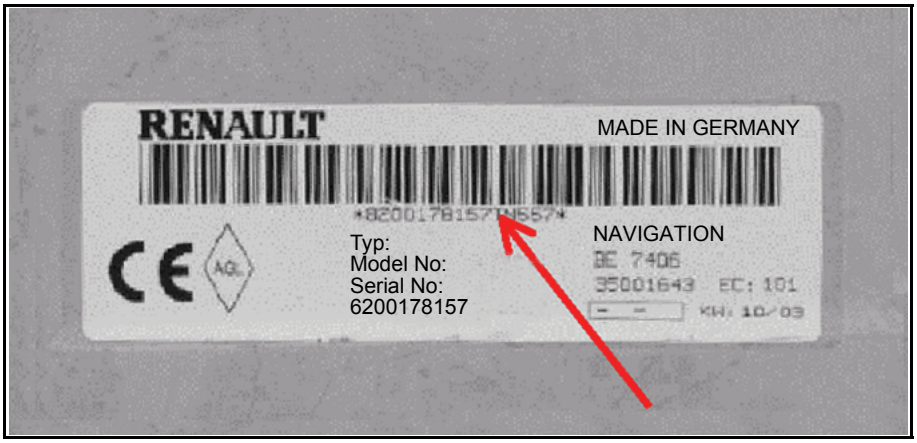
2.2 Radio code:

– Enter the VIN only
– Confirm with the "Search" button
– Radio code supplied

WARNING
It is not possible to obtain more than three radio codes for a single VIN.
The error message reads "A new code cannot be supplied".

2.2.1 "Enter pre-code" error screen

The radio code cannot be supplied by the server; the radio pre-code is required to calculate the radio code.
To find the radio pre-code, see paragraph 2.2.2.



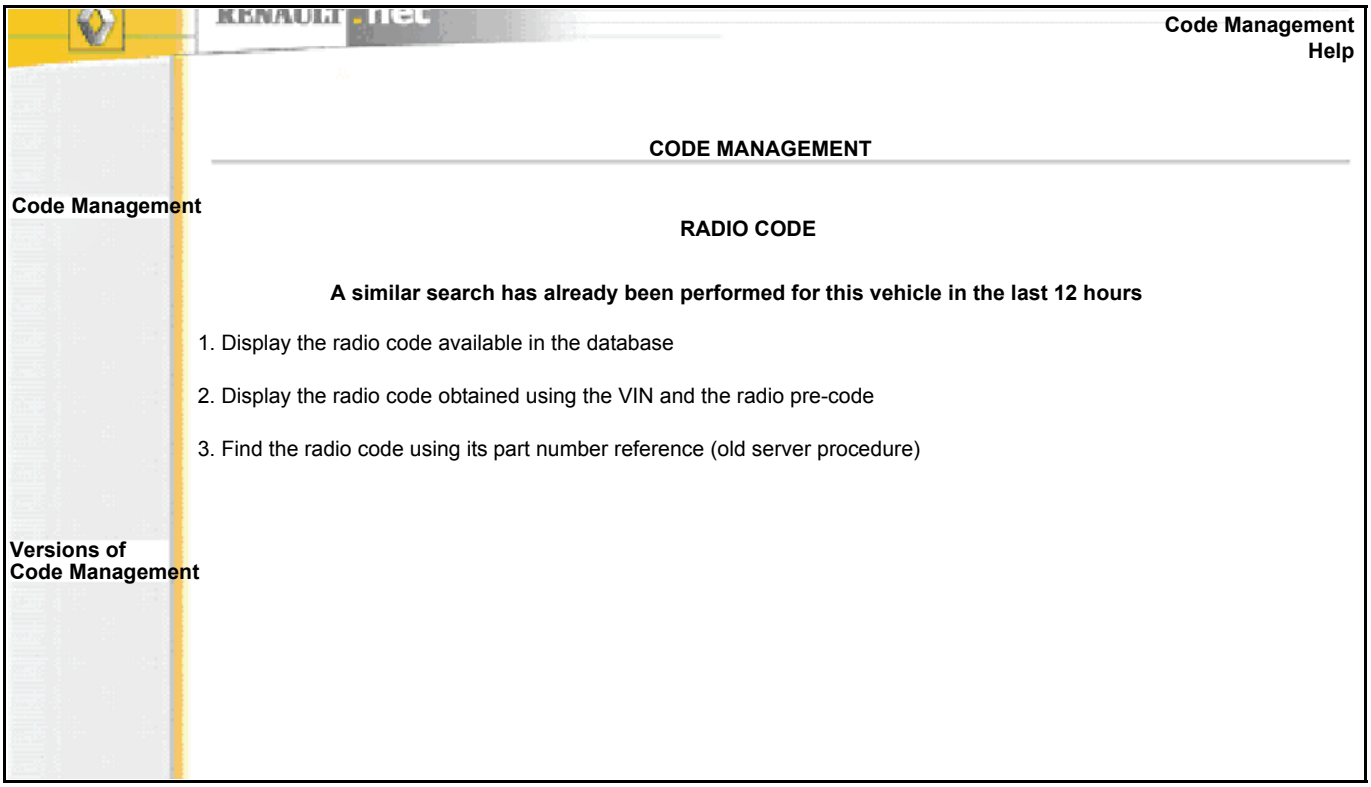
Once you have obtained the pre-code:
– Select option no. 1: "Return to entry"
– Enter the radio pre-code
– Confirm with the "Search" button
– Radio code supplied

Option no. 2, "Find radio code using its part number (old server procedure)" refers to old radios without a pre-code, see paragraph 2.2.4.

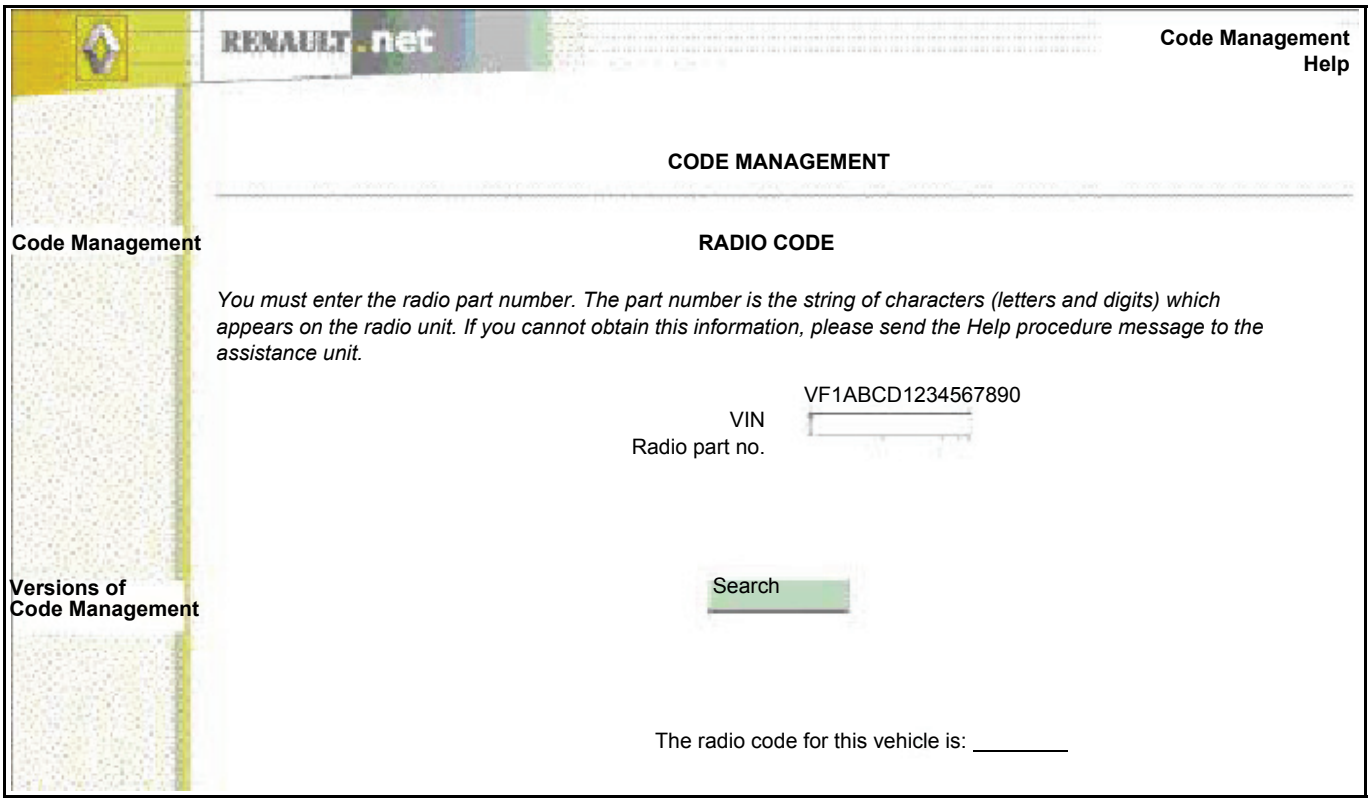
2.2.2 Finding the radio pre-code

Depending on the type of radio, recover the pre-code, either:
- from the radio display using the self-test procedure,
- by removing the radio; the pre-code is found on the label affixed to the radio.
- Vehicles with ITS Navigation: it is necessary to use the diagnostic tool obtain the pre-code

Note:
The pre-code consists of a letter and three digits (example below, N557).



The pre-code is found after the Renault part number (8200 XXX XXX or 7700 XXX XXX) and the letter T



Example above: 8200178157T**N557**

2.2.3 The code supplied is not correct

If the code supplied from the first request with the vehicle VIN alone is not accepted by the radio, resend your request with the radio pre-code (paragraph 2.2.2).
– Re-enter the VIN of the vehicle
– Enter the radio pre-code
– Confirm with the "Search" button
– New radio code supplied

2.2.4 Old radios without pre-code:
To find a radio code using the radio part number (old minitel and voice server procedures), select:
"Find radio code using its part number (old server procedure)".

– Enter the radio part number in the "Radio part number" field

Example:

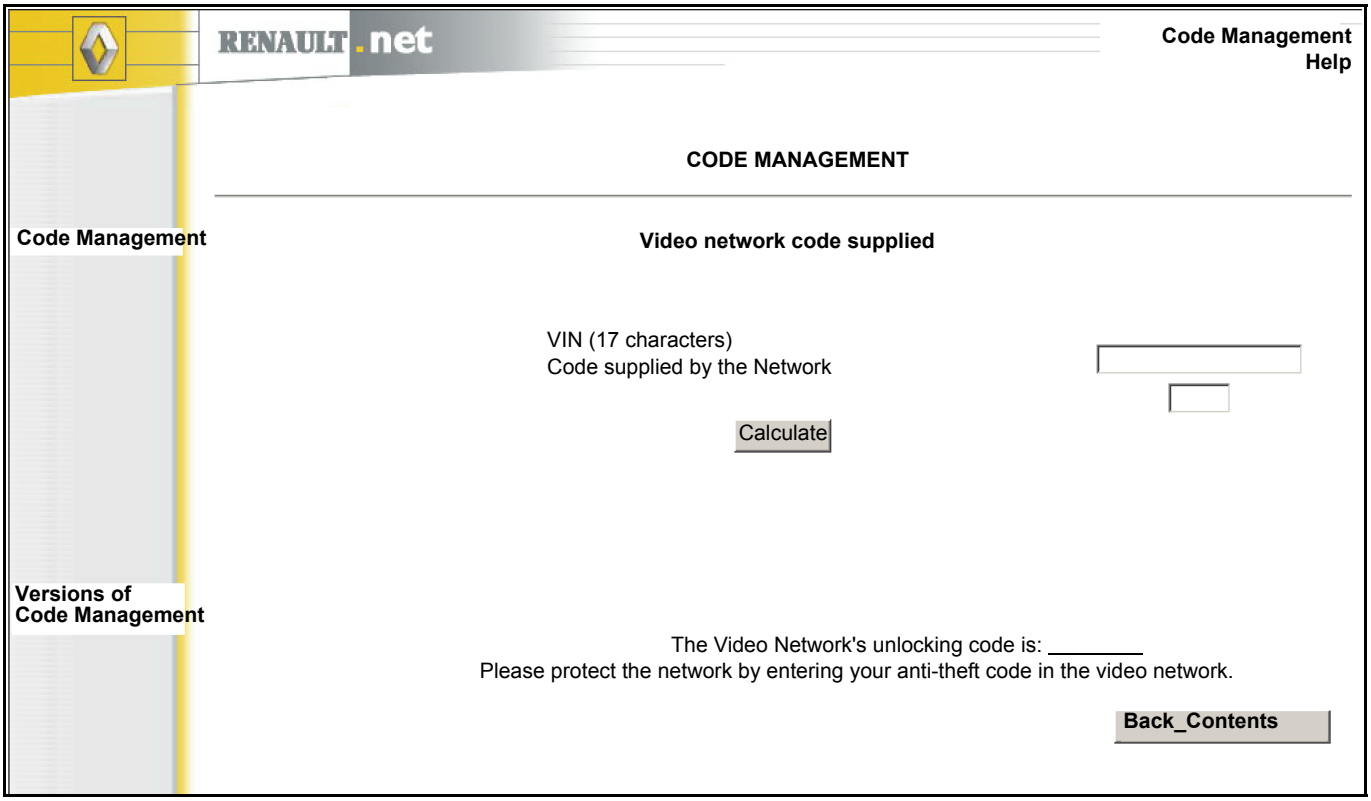
Radio part no.:

Philips = RN + 3 digits + 2 letters + 7 digits

Blaupunkt = BP + 4 digits + 1 letter + 7 digits

Pioneer = RN2006 + 1 letter + 7 digits or 1 letter + 7 digits (old models)

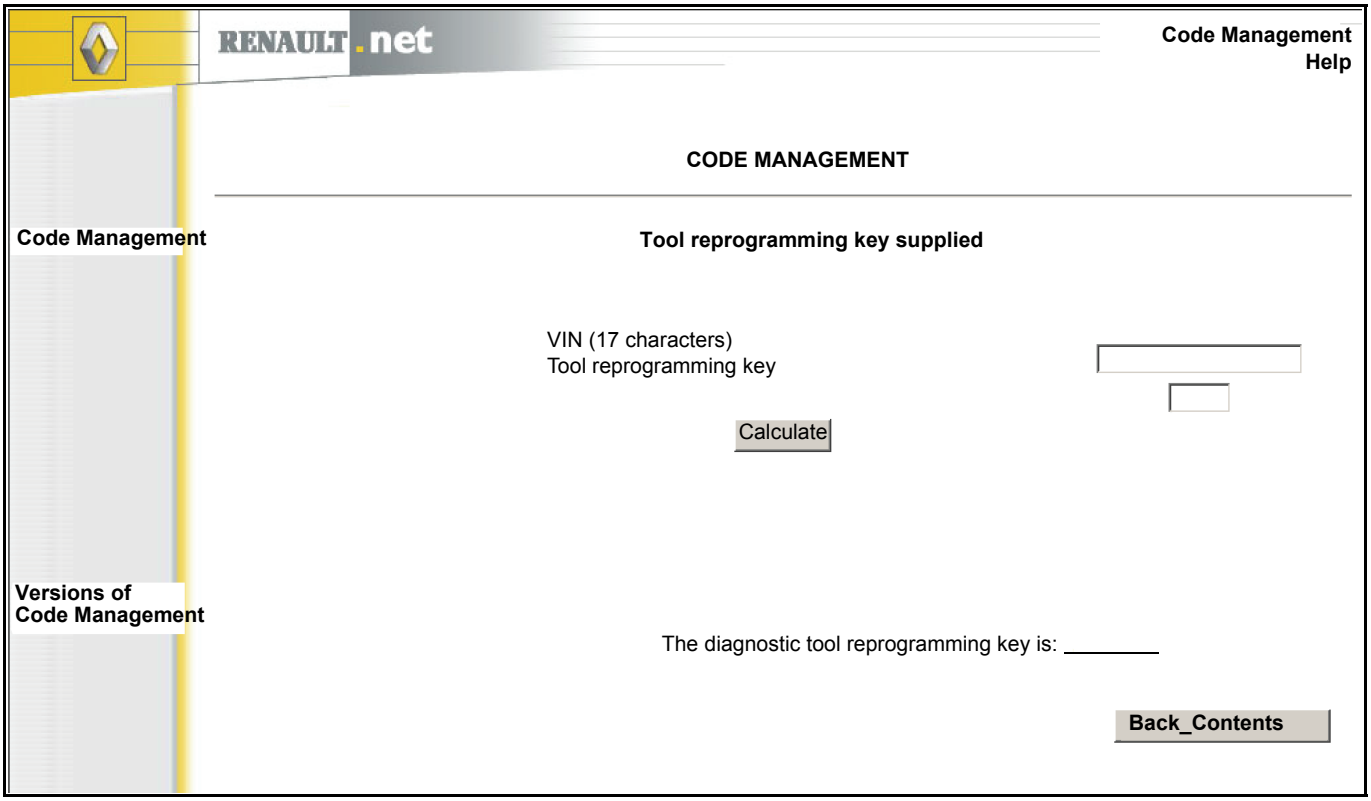
Alpine = AL + 9 digits



Becker = B or E + 7 digits

– Confirm with the "Search" button

– Radio code supplied



2.3 Video network code

– Enter the VIN of the vehicle
– Enter the four-digit code generated by the vehicle's video control
– Confirm with the "Calculate" button
– Four-digit code supplied by the code server

2.4 Tool reprogramming key:

– Enter the VIN of the vehicle
– Enter the six-digit code generated by the diagnostic tool
– Confirm with the "Calculate" button
– Six-character (letters and digits) reprogramming key supplied, to be entered in the diagnostic tool.

RENAULT

Technical Note 6015A

All types

Sub-sections concerned: 88A - 88B - 88C

ELECTRICAL WIRING REPAIR

77 11 332 302 **Edition Anglaise**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

Multiplex network: Repair 88B-1

88C

AIRBAGS AND PRETENSIONERS

Airbag and pretensioner wiring: Repair 88C-1

WARNING
This note authorises the repair of electrical wiring in very specific cases only and under certain conditions.
Check that the repair in question is authorised and that the repair conditions are respected.

1 - Result of the fault finding procedure.

Note:
During repair, check that you have the most recently updated version of the technical note.

A preliminary fault finding procedure has enabled a wiring fault to be identified. Follow the investigation procedure below.

Disconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

Remove the components necessary to access the area to be worked on. The operation area must allow the pliers and the heat gun to be used, without blocking visibility.

WARNING
If the damaged section is not sufficiently accessible, remove the wiring concerned and repair on the bench.

When the damaged section is sufficiently accessible, detach the wires to be repaired from the main wiring.

WARNING
Check if there is a sensitive line. These cases are listed in the specific procedures reference table in this section.
If there is a sensitive line, replace the defective wiring or apply the specific procedure, if one exists. These procedures are indicated in the specific procedures reference table in this section.

Check that the fault is located more than 10 cm from the connector.

WARNING
If the damaged section is located less than 10 cm from the connector, replace the defective wiring, unless a wiring-connector kit (connector with wires) exists. In this case, use the kit to replace the damaged section and the connector.

This note does not authorise operations directly on the connectors and electrical contacts. Only wiring-connector kits allow the replacement of a connector. These kits can have associated procedures.

Note:
To check whether there is a wiring-connector kit, consult DIALOGYS. These kits are generally linked to specific wiring or function diagrams.

Note:
If the fault is located at the electrical contact (in the connector) and if it is linked to a corrosion or heating fault, replace the wiring or fit the wiring-connector kit. Also check the connector complement.

Note:
In all cases, pay particular attention to supply and earth lines and their tightening (refer to the tightening torques in the MRs concerned).

After having carried out these checks (outlined in the **Summary flowchart of the operating procedure**), if the repair is authorised, and it does not require a specific procedure, carry out the generic procedure (see **Wiring: Repair**).

Note:
If you have been referred to this note by a MR, NT or removal-refitting procedure, apply the repair procedure adapted to the case in question.
Either the generic repair procedure (see **Wiring: Repair**), or a specific procedure listed in the specific procedures reference table in this section.

2 - Specific procedures reference table.

- **Guidelines for reading the tables below:**

  – If not otherwise stated, consider all components or electrical connections to have a link with the functions or equipment listed. For example: For the electric power assisted steering, the function is not specified. It is prohibited to carry out operations on any wire attached to the electric power assisted steering.

  – If one case can be found in both tables, give priority to the **Changing the wiring**, recommendations, and then to those for the specific cases:
    - Example 1: For a 22-track airbag connector where more than 10 wires are damaged, the specific cases refer you back to the airbag and pretensioner repair procedure, and the general cases recommend that the wiring is replaced (as there are more than 10 wires involved). Priority is given to **Changing the wiring**.
    - Example 2: For an operation on a pair of twisted wires (general case) for the airbag function (specific case), the specific case refers back to the repair procedure for Airbags and pretensioners, and the general cases refer back to the repair procedure for multiplex lines. Priority is given to the airbag and pretensioner repair procedure. The recommendations for the specific cases take precedent over the general cases.

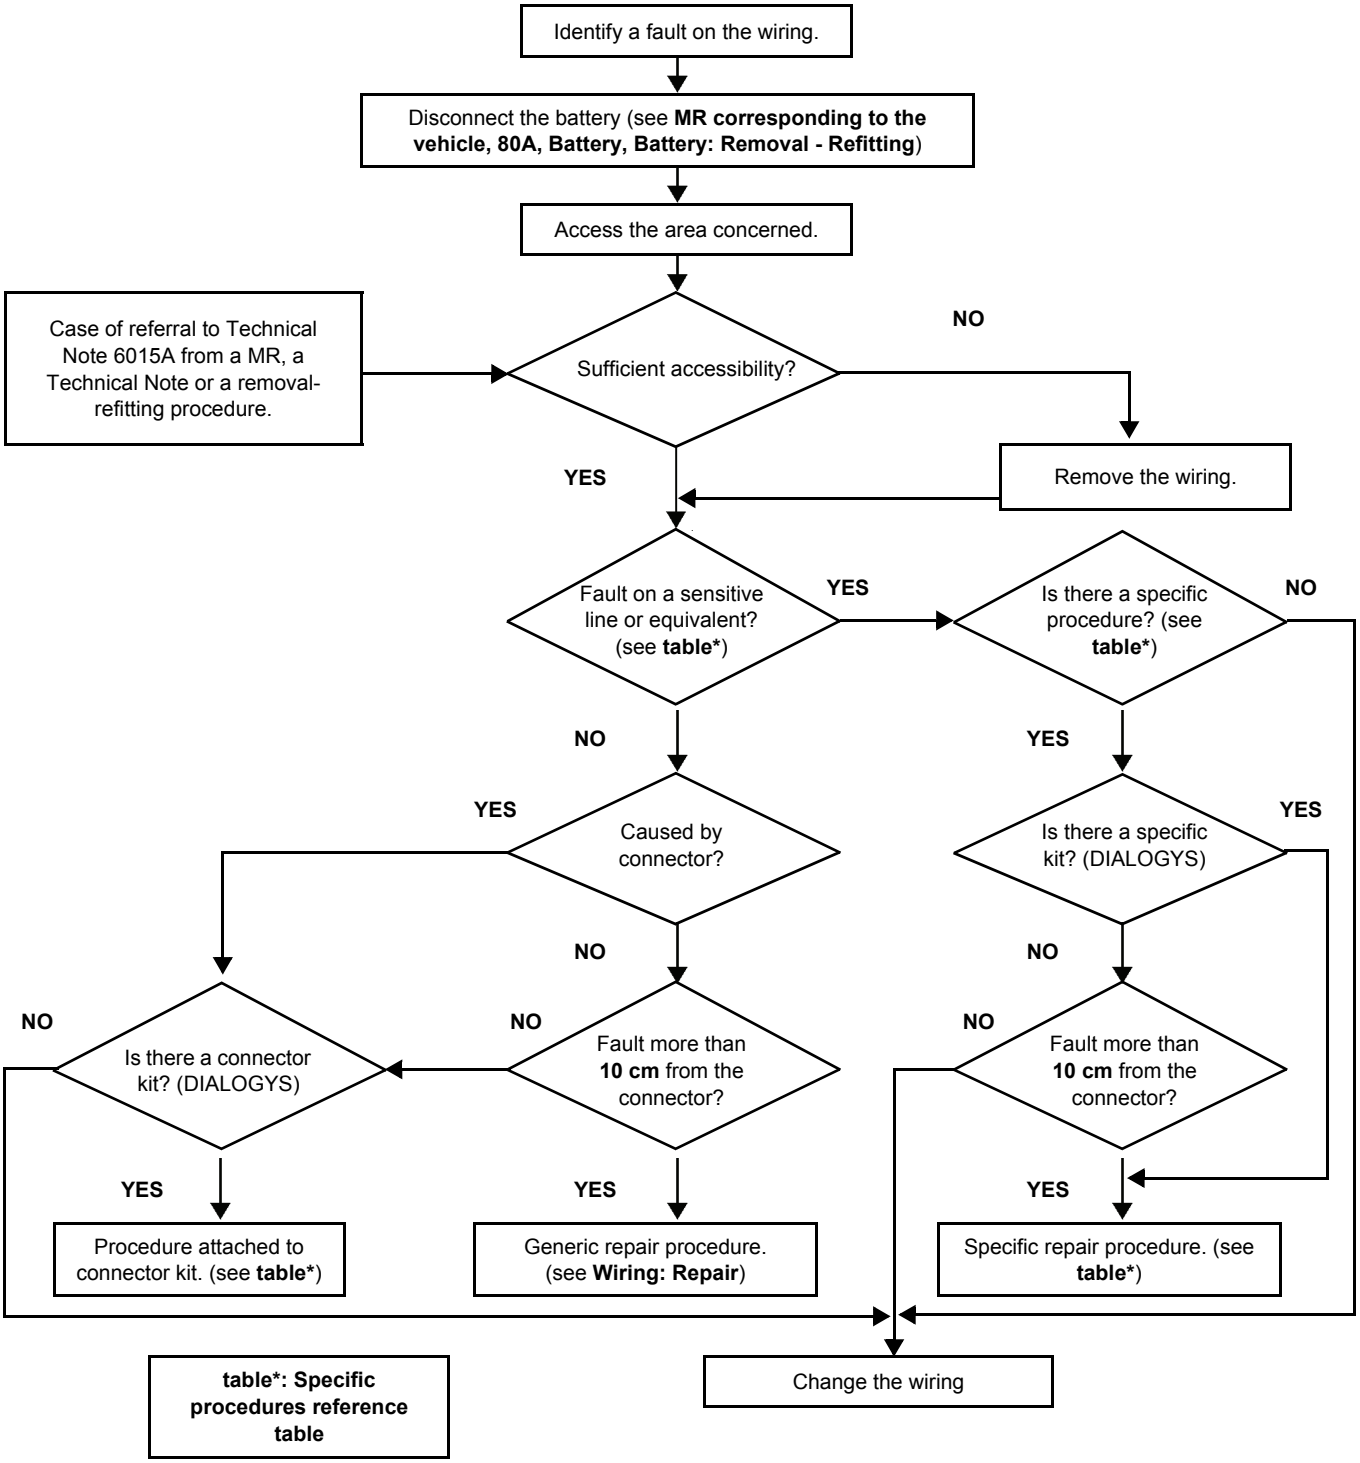
● **General cases:**

Functions or equipment	Precisions	Instructions
Wiring harness	Number of damaged wires 10 or fewer	(see **Wiring: Repair**)
	Number of damaged wires more than 10	Change the wiring
Equipment and predispositions specific to commercial vehicles and conversions	/	Change the wiring
Electric vehicles	Wiring and power connectors	Change the wiring
Connections or associated components	/	(see **Connector: Repair**)
Splices	Splice with more than 3 wires	Change the wiring
	3-wire splice which does not need sealing	(see **Wiring: Repair**)
	Splice with 3 wires or more, which needs sealing (engine and underbody areas and damp areas of the doors and boot)	Change the wiring
Wires outside the loom	Sheathed wires	Change the wiring
	Shielded wires	Change the wiring
	Twisted wires	**If the wire cross-sections are 0.5 mm^2:** (see **Multiplex network: Repair**)
	Flat cable	Change the wiring
	Wires with specific thermal protection	Change the wiring
	Copper wires with cross-section less than 0.35 mm^2	Change the wiring
	Copper wires with cross-section greater than 6 mm^2	Change the wiring
	Damaged wires less than 10 cm from the connector	(see **88A, Wiring, Connector: Repair**)

● **Specific cases:**

Lines	Device	Instructions
4-wheel steering	/	Change the wiring
ABS	Other ABS lines	Change the wiring
ABS	ABS sensor	Change the wiring
Airbag	Other airbag lines	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag sensor	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag computer connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Pretensioner (squib) connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Under seat connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag trigger connectors (pyrotechnic lines)	(see **Airbag and pretensioner wiring: Repair**)
Preheating unit (Diesel)	Heater plug	Change the wiring
Injection computer (Petrol)	Petrol vapour absorber	Change the wiring
Injection computer	Variable camshaft	Change the wiring
Injection computer	Variable inlet camshaft	Change the wiring
Injection computer	Variable exhaust camshaft	Change the wiring
Injection computer (Petrol)	Pencil coil	Change the wiring
Injection computer (Petrol and Diesel)	Motorised throttle body	Change the wiring
Injection computer	Camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Inlet camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Exhaust camshaft sensor	Change the wiring
Injection computer	Camshaft sensor, row A, B	Change the wiring
Injection computer	Variable exhaust camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Pinking sensor	Change the wiring
Injection computer (Diesel)	Turbine upstream pressure sensor	Change the wiring

● **Specific cases (cont. 1):**



Lines	Device	Instructions
Injection computer (Petrol)	Manifold pressure sensor	Change the wiring
Injection computer (Diesel)	Particle filter differential pressure sensor	Change the wiring
Injection computer (Diesel)	Rail pressure sensor	Change the wiring
Injection computer (Petrol and Diesel)	Turbocharging pressure sensor	Change the wiring
Injection computer	Accelerator pedal sensor	Change the wiring, except for the connector on KANGOO (see **Connector: Repair**)
Injection computer (Petrol and Diesel)	TDC sensor	**See OTS***
Injection computer (Diesel)	Particle filter (downstream) output sensor	Change the wiring
Injection computer (Petrol and Diesel)	Air temperature sensor	Change the wiring
Injection computer (Petrol)	Turbine upstream temperature sensor	Change the wiring
Injection computer (Diesel)	Fuel temperature sensor	Change the wiring
Injection computer (Petrol and Diesel)	Coolant temperature sensor	Change the wiring
Injection computer (Diesel)	Particle filter inlet temperature sensor (upstream)	Change the wiring
Injection computer (Diesel)	Injection air flowmeter	Change the wiring
Injection computer	Camshaft shift, row A, B	Change the wiring
Injection computer (Diesel)	Turbocharger control solenoid valve	Change the wiring
Injection computer (Diesel)	Damper solenoid valve	Change the wiring
Injection computer (Petrol and Diesel)	Injectors	Change the wiring
Injection computer (Diesel)	Diesel heater	Change the wiring
Injection computer (Diesel)	Water in diesel sensor	Change the wiring

*OTS: Special Technical Operation

● **Specific cases (cont. 2):**

Lines	Device	Instructions
Injection computer (Diesel/particle filter)	Oil level and temperature sensor	Change the wiring
Injection computer (Diesel)	Nitrogen oxide (Nox)	Change the wiring
Injection computer (Petrol and Diesel)	Upstream oxygen sensor	Change the wiring
Injection computer (Petrol and Diesel)	Downstream oxygen sensor	Change the wiring
Injection computer (Diesel)	Proportional oxygen sensor	Change the wiring
Injection computer (Diesel)	EGR valve	Change the wiring
Injection computer (Diesel)	Heater plug	Change the wiring
EPAS	/	Change the wiring
ETC (4x4 torque distributor)	/	Change the wiring
GMV	GMV	Change the wiring
Multiplex network	CAN	(See Multiplex network: Repair)
UPC (Petrol and diesel)	Air conditioning compressor	Change the wiring
UPC (Petrol)	Oil level sensor	Change the wiring

3 - Summary flowchart of the operating procedure defined in this section.

1 - Purpose and applications.

Description of the content of the Wiring repair kit case as well as the procedure and the field of application.

The kit enables wiring which is damaged or has cut electrical wires to be repaired whilst ensuring that it will be fully functional.

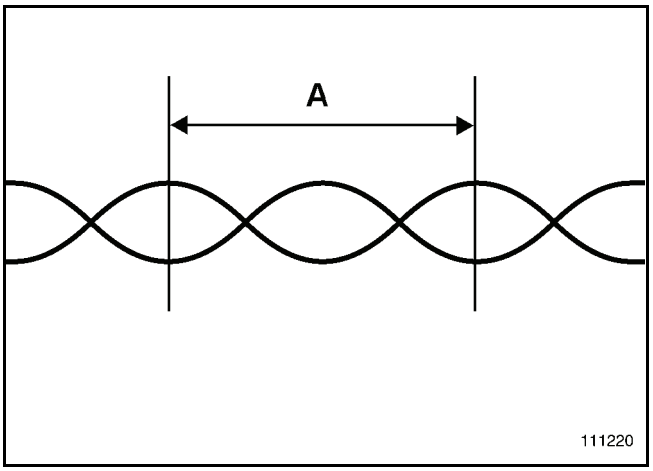
It also allows wiring-connector kits to be used.

All electrical cables and wires with cross-sections between **0.35 mm^2** and **6 mm^2** except "sensitive lines" (defined in this document), are affected.

WARNING
Repair of sensitive lines is prohibited using the generic procedure alone. It can be authorised provided that there is an additional appropriate procedure (see **Wiring: Precautions for repair**).

The technical nature and the sensitivity of this type of operation requires the adapted equipment contained and described in the Wiring repair kit case.

WARNING
Using tools or components which have not been recommended is strictly forbidden when repairing wiring.



WARNING
For sensitive lines, only automotive electricians, technician agents or cotechs (Level 2 Electricity as a minimum) can carry out the repair described in this note.

2 - Terminology.

● **Wiring-connector kit.**
Kit usually made up of a connector the cells of which are populated with crimped wires along with sleeves for joining.

● **Multiplex lines or connections.**
Principal or secondary CAN network lines link the computers together and are made up of twisted pairs of stranded wires.

● **Turns or twists.**
For twisted pairs:
One turn (twist) = (**A**)

3 - Operation time (TM).

For each vehicle, an average repair time is given in the wiring section of the TM.

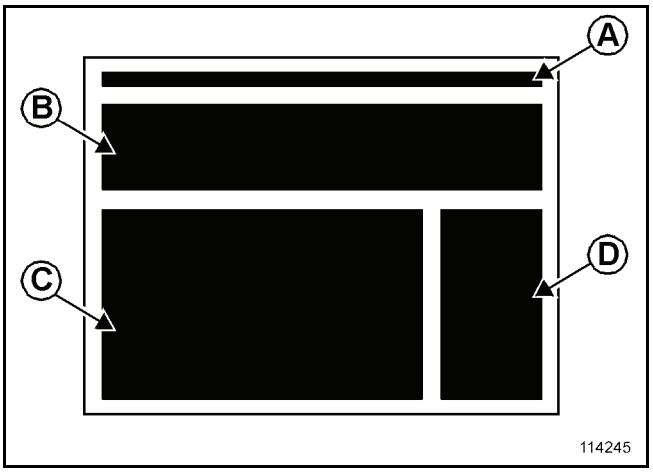
The corresponding codes are:
– **0500** for replacing a connector (using a connector kit).
– **0501** for repairing wiring.

This times do not include the time taken to access the area to be repaired. The time taken to remove and refit the wiring must be added.

1 - Case and label.

● **Case (77 11 420 544).**

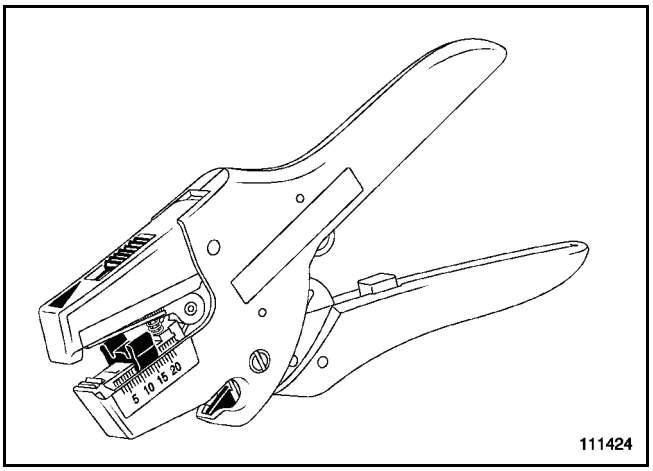
Part no. 77 11 420 544 corresponds to the new electrical repair case. It replaces case part no. 77 11 229 893.
Both part numbers are authorised for electrical repair.



The case contains all the components described in this section. A label lists their part numbers.

● **Label.**

The label affixed inside the case is made up of 4 sections in English and French.

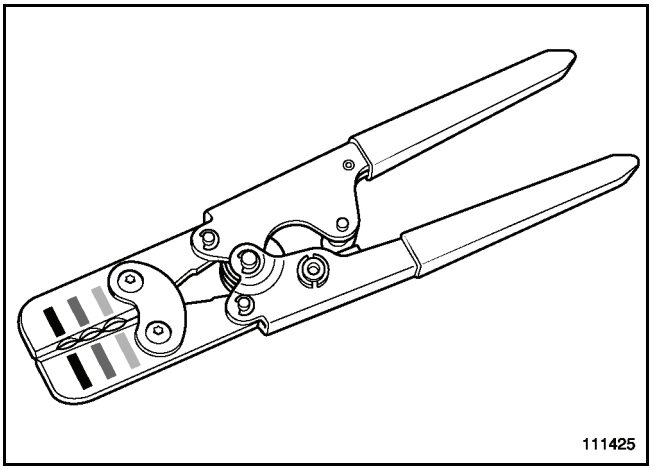


On the upper section, at (**A**) is the title and number of the note. At (**B**) are the After-Sales references (for the network) and MABEC code (for factories) which enables the kit to be restocked with consumables or new tools or a new kit to be ordered.

On the lower section, at (**C**) is a table (not exhaustive) which helps the right sleeve to be chosen, with a summary of the recommendations for each case. And at (**D**) are the recommendations for use.

2 - Tools.

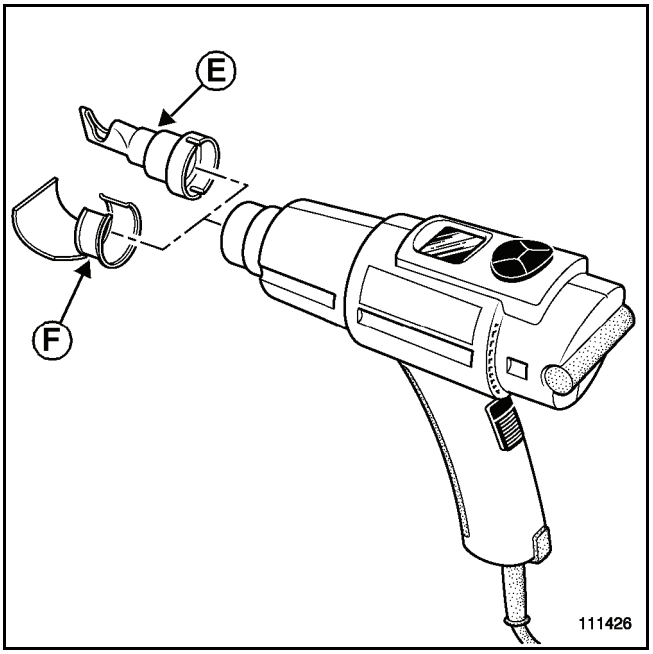
● **Stripping pliers (77 11 230 416).**



These are automatic stripping pliers which enable an electrical conductor up to a maximum cross-section of **6 mm^2** to be cut or stripped.
The length of the stripped section can be adjusted up to **20 mm**.

The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

● **Crimping pliers (77 11 421 296).**

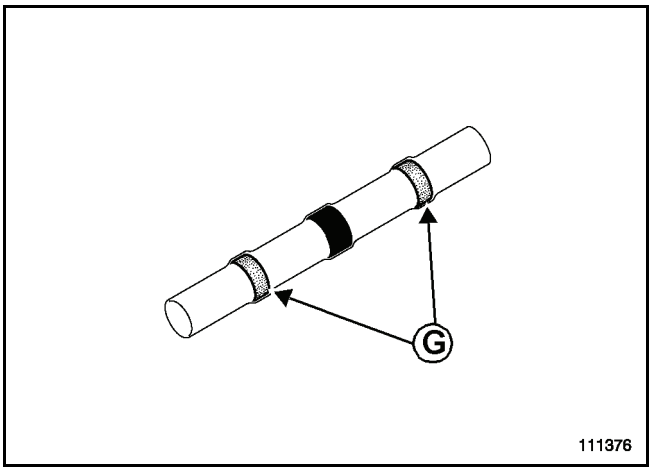


Part no. 77 11 421 296 corresponds to the new crimping pliers in the electrical repair kit. It replaces the crimping pliers with part no. 77 11 230 417.
Both part numbers are authorised for electrical repair.

The crimping pliers have three sizes of jaw (red, blue and yellow) which correspond to the crimping sleeves. These pliers are recommended for the crimping the sleeves provided in the kit.

The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

- **Heat gun (77 11 230 415).**



The heat gun is a hot air blower with 2 nozzles which enable it to be adapted for different needs:
- Concentrator nozzle **(E), (77 11 237 778)**.
- Heat shield nozzle **(F), (77 11 237 777)**.

It can be used to solder all self-solder sleeves and to contract the heat-shrinkable parts and sheaths on all sleeves
Its temperature and flow of air are adjustable and are indicated on the screen.
Temperature adjustment from **80°C** to **650°C** in increments of **5°C**.
Air flow adjustment from **200 l/min** to **550 l/min** at 5 levels displayed on the screen.

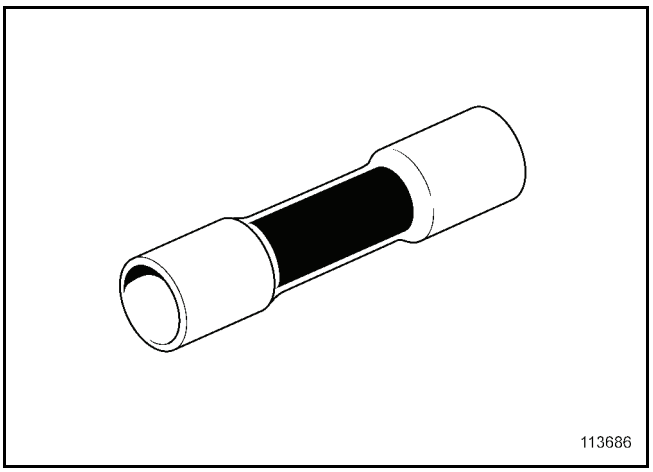
The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

3 - Consumables.

- **Self-solder sleeves.**

There are three sizes of heat shrinkable self-solder sleeve differentiated by the colour of their rings (**G**):

- **Clear,** for a total copper section (sum of the 2 wires) between **0.3** and **0.8 mm^2** (packet of 20: **77 11 229 418**).



- **Red,** for a total copper section (sum of the 2 wires) between **0.8** and **2.0 mm^2** (packet of 20: **77 11 229 419**).

- **Blue,** for a total copper section (sum of the 2 wires) between **2.0** and **4.0 mm^2**(packet of 20: **77 11 229 420**).

These are sealing sleeves. The seal is formed when the rings are tightened around the wire when heated.

These sleeves are only to be used for connecting one wire with another wire (1-to-1).

● **Crimping sleeve.**

There are three sizes of heat shrinkable crimp sleeve differentiated by the colour of their rings:

– **Red,** for a copper section between **0.5** and **1.5 mm^2** (Packet of 20: **77 11 229 410**).

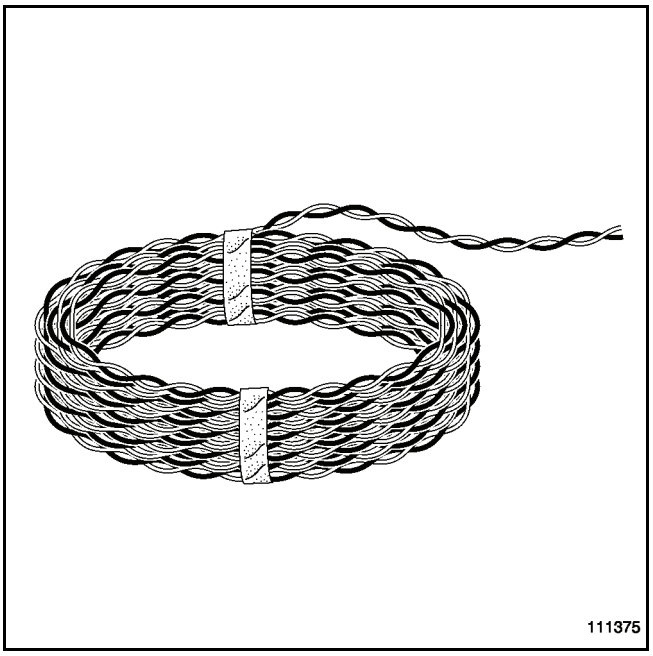
– **Blue,** for a copper section between **1.5** and **2.5 mm^2** (Packet of 20: **77 11 229 416**).

– **Yellow,** for a copper section between **3.0** and **6.0 mm^2** (Packet of 20: **77 11 229 417**).

These are sealing sleeves. The seal is formed by the inner wall which becomes adhesive when heated.

These sleeves can be used to join one wire with another wire (1-to-1) or two wires with another wire (2-to-1).

In the case where two wires are joined to one wire (2-to-1), the seal is no longer guaranteed. Do not use when a seal is required.

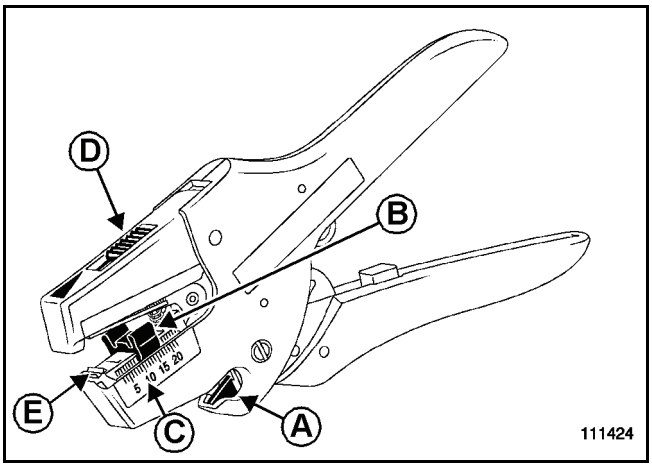


● **Thermal protection (77 11 229 424).**

The protective heat shield is a **250 mm** by **250 mm** square. It is intended to protect the surrounding area from the flow of hot air from the heat gun.

● **Adhesive PVC tape (77 11 170 331).**

Use the adhesive PVC tape for taping the wires. Do not use it to protect or insulate electrical parts.
It is a contact-adhesive high temperature tape.



● **Coil of twisted wires (77 11 229 425).**

This is a coil of a pair of twisted wires (40 turns/linear m). Ensure these wires remain twisted. The 2 wires have a **0.5 mm^2** cross-section and are of temperature class T3. It is possible to fit them in all areas of the vehicle during repairs to twisted wires of the same cross-section.

Note:
This section is an abridged version of the instructions for use of the tools in the kit.

1 - Stripping pliers.

● **Description of the stripping pliers:**

(**A**) = Wire cutter.
(**B**) = Stop for adjusting the length to be stripped.
(**C**) = Scale (millimetre divisions).
(**D**) = Pressure adjustment.
(**E**) = Stripping jaws and cutting edges.

● **Cutting a wire:**

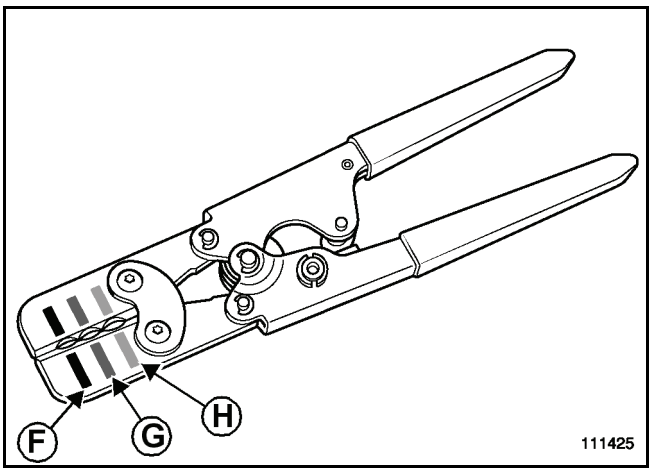
To cut electrical wires up to **6 mm^2**, insert the wire into slot **(A)** and press the handle.

● **Stripping a wire:**

This pair of stripping pliers is automatic. It does not need adjusting to the cross-section of wire to be stripped **(6 mm^2** maximum).

To strip a wire, adjust the length to be stripped by moving the stop (**B**). Press lightly on the ends to make it slide. The length to be stripped is read on the scale (**C**) in millimetres (mm).

Adjust the stripping pressure by moving the cursor (**D**). Press on the cursor to make it slide. The further forward the cursor is, the greater the force.



WARNING
If the pressure is too weak, the cutting edges will not grip the wire's insulation. If the pressure is too strong, the cutting edges can cut through the copper strands. Start with a medium setting and then adjust according to results.

Place the end of the wire against the stop (**B**) and bring it out through the jaws (**E**).

Press the handle. The jaws will grip the wire. The cutting edges will automatically adjust their position in relation to the section of wire and strip it.

WARNING
Check the quality of the stripped wire (insulation cleanly removed and no cut copper strands). Start again if necessary.

2 - Crimping pliers.

The crimping pliers are the only pliers recommended for crimping the crimp sleeves in the kit.

They are used on the 3 sizes of crimp sleeve:
- At (**F**) for crimping the **red** crimp sleeve.
- At (**G**) for crimping the **blue** crimp sleeve.
- At (**H**) for crimping the **yellow** crimp sleeve.

Before crimping a sleeve:
- choose the sleeve suitable for the cross-section of the wire (see **Wiring: Repair**),
- strip the recommended length of wire.

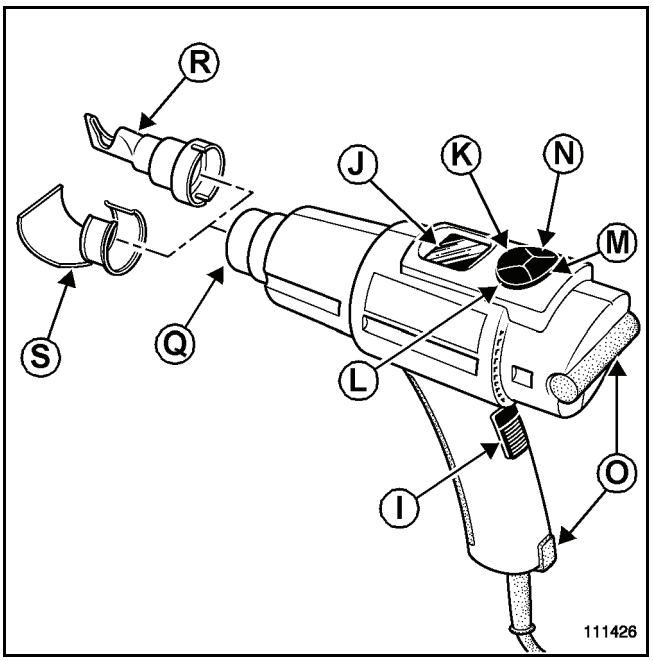
● **Crimping operation:**

Squeeze the handles fully together to unlock the pliers and open the jaws.

On the pliers, find the crimping jaws which correspond to the sleeve being used.

Insert the wire(s) into one end of the sleeve.

Position the pliers' jaws in the middle of the half of the metal shaft where the wire(s) are.



Squeeze the handles fully together to crimp the sleeve onto the wire(s). Crimping is complete once the pliers are opened again.

Check that the copper of the wire is correctly crimped and that the plastic part of the sleeve has not been cut.

Repeat the crimping operation on the other end of the sleeve.

Note:
If the wire is not correctly crimped, cut the wire at the sleeve and start the operation again with a new sleeve.

3 - Heat gun.

WARNING
Before using the gun, the user must familiarise themselves with the safety advice in the user's manual provided by the manufacturer.

● **Introduction to the gun:**

The heat gun is recommended for contracting heat shrinkable sleeves.
For other applications, the user must take the precautions and advice in the user's manual into account.

● **Description of the heat gun:**

(**I**) = On (1)/off (0) switch.
(**J**) = Display screen.
(**K**) = SELECT MENU button.
(**L**) = + button for setting parameters.
(**M**) = STANDBY button (pause/cooling).
(**N**) = - button for setting parameters.
(**O**) = Supports for resting the tool on a bench.
(**P**) = Tool air inlet.
(**Q**) = Tool air outlet.

● **Accessories:**

(**R**) = Concentrator nozzle.
(**S**) = Deflector nozzle.

Note:
The concentrator nozzle (**R**) is recommended when using the heat gun on the crimp or self-solder sleeves in the kit.

WARNING
The heat shield nozzle (S) can be used for contracting single heat shrinkable sheaths. Do not use it for contracting the crimp or self-solder sleeves in the kit.

● **General information on the setting parameters:**

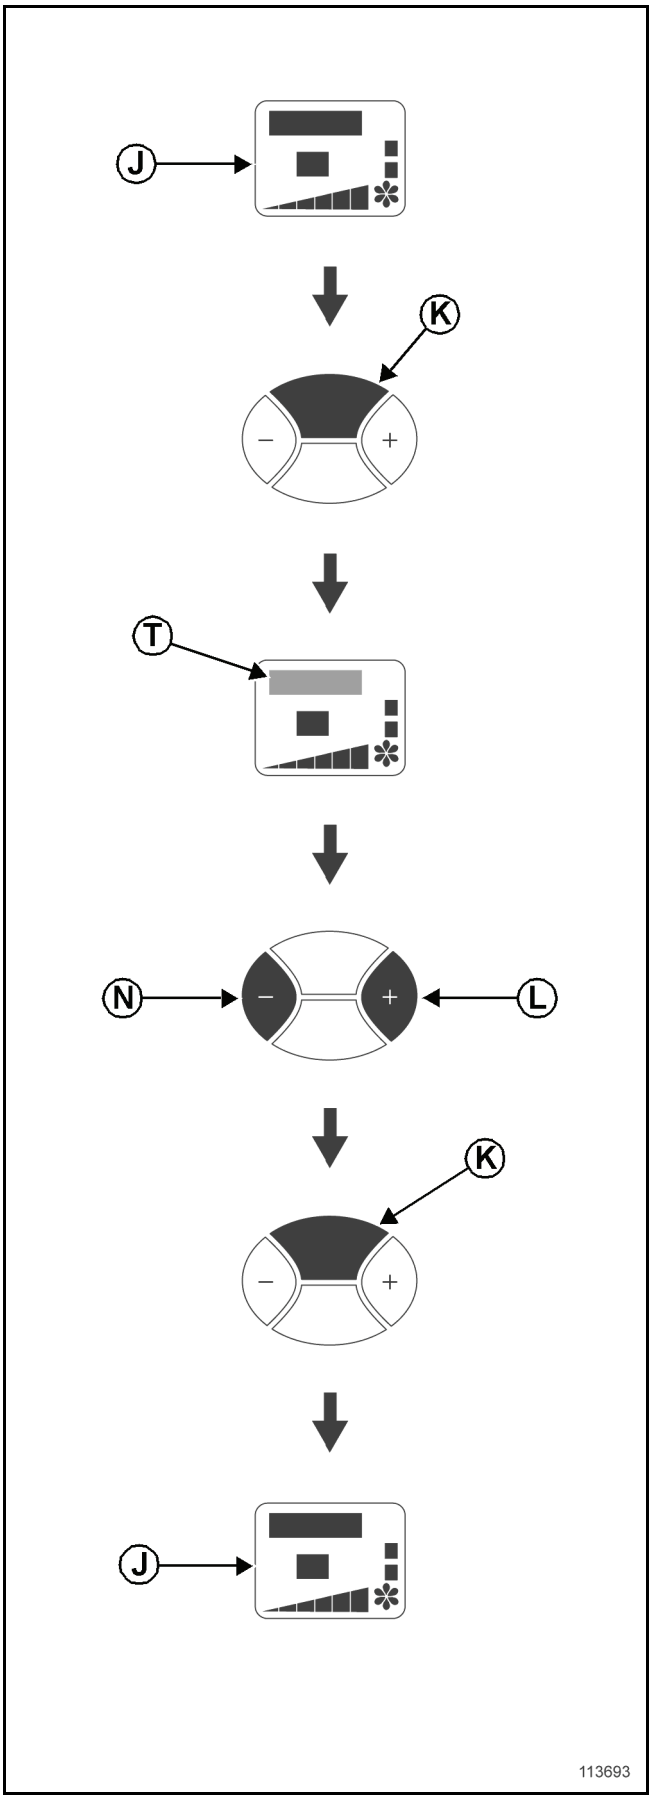
When contracting the sleeves in the kit, use the FREE program and change the settings as recommended. A memory function recalls the program and settings from the last time the gun was used.

● **Switching on the gun:**

Connect the appliance to the mains electricity supply (**230 Vac** - **50 Hz** or **60 Hz**), respecting all precautions.
Push the switch (**I**) on (1).
The appliance will come on using the programs and settings most recently used.

WARNING
The gun starts heating immediately.

WARNING
Before putting the gun away in its case or anywhere else, leave it to cool down to ambient temperature.



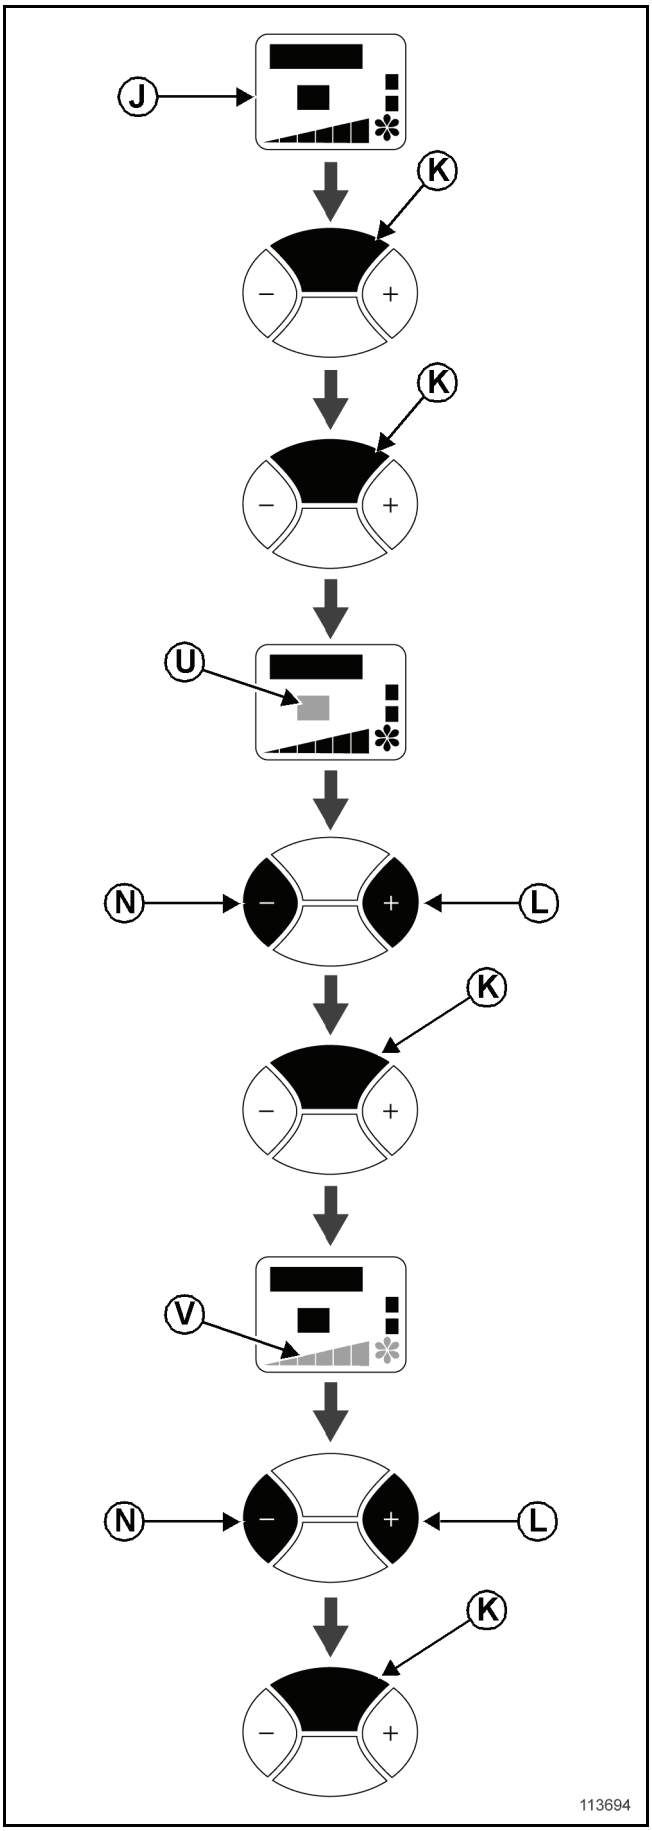
● **Operating instructions:**

The heat gun is used in two ways. It can either be held in the hand and used directly. Or it can be set down on its supports (**O**) on a clean and tidy bench. The latter has the advantage of leaving the user with both hands free.

● **Programs:**

Always work with the FREE program shown on the screen (**J**) at (**T**). If it is not shown, perform the following operation:

– press menu selection button (**K**) once,
– program field (**T**) on display field (**J**) flashes,
– select the free program using the + (**L**) or - (**N**) buttons,
– press the menu selection button (**K**) once, so that field (**T**) on display screen (**J**) stops flashing.



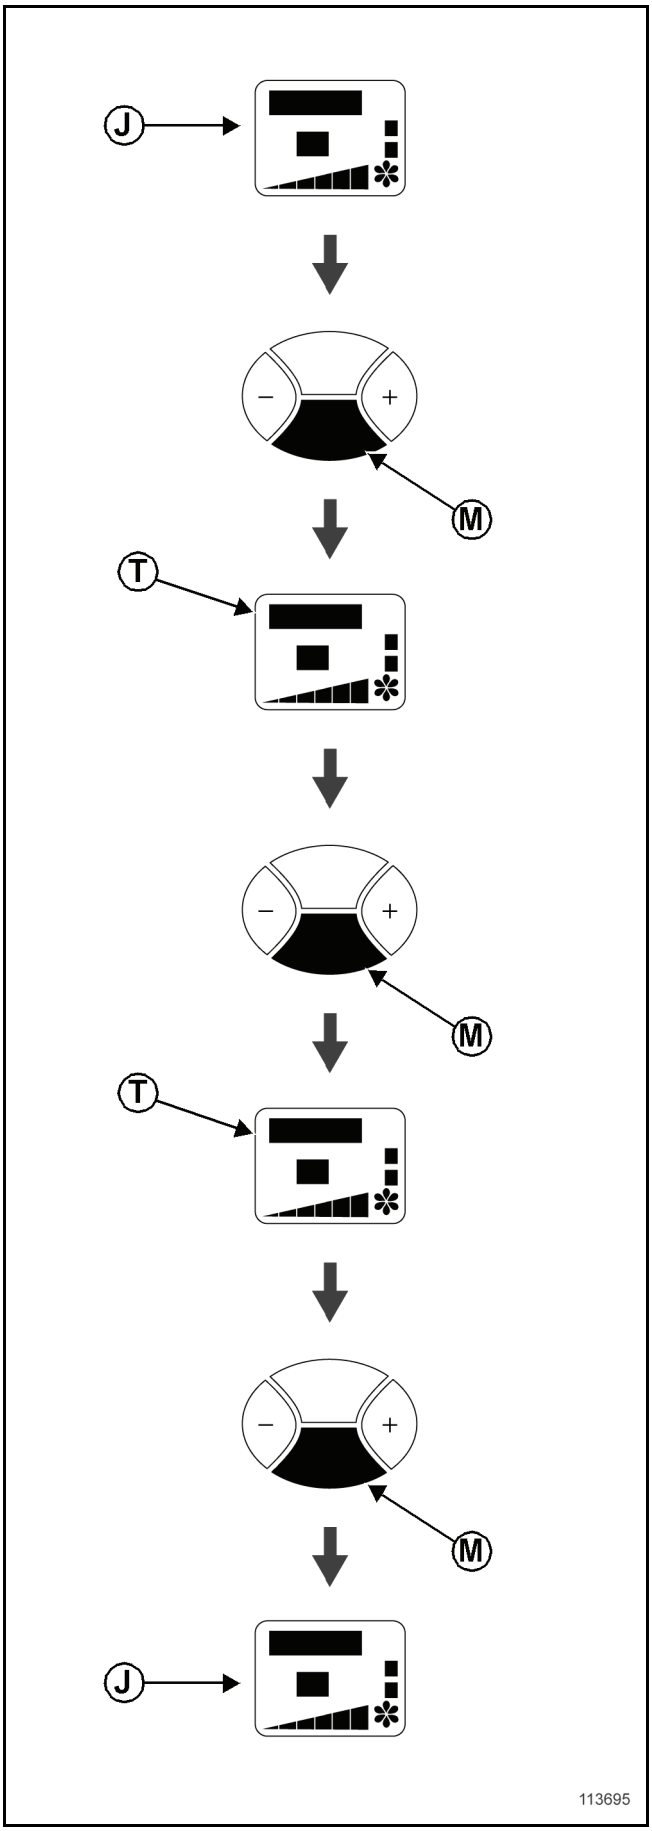
● **Temperature and air flow settings:**

To change the program settings (the FREE program is recommended), carry out the following operation:

– press menu selection button (**K**) twice,
– temperature field (**U**) on display field (**J**) flashes,
– adjust the temperature using the + (**L**) or - (**N**) buttons,
– press menu selection button (**K**) once,
– air flow field (**V**) on display field (**J**) flashes,
– adjust the air flow using the + (**L**) or - (**N**) buttons,
– press menu selection button (**K**) once, so that the fields on display screen (**J**) stop flashing.

Note:
When using the heat gun on crimp or self-solder sleeves, the air flow is always on the maximum setting, only the temperature varies.

● **Special modes (COOL/PAUSE):**



After use and before pushing switch (**A**) off (0), cool the gun. Similarly, during brief pauses or for lower power consumption, switch the gun to PAUSE mode by carrying out the following operation.

Before switching off the heat gun:

– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows COOL,
– wait until the temperature goes down to **150**°**C** and push switch (**A**) off (0).

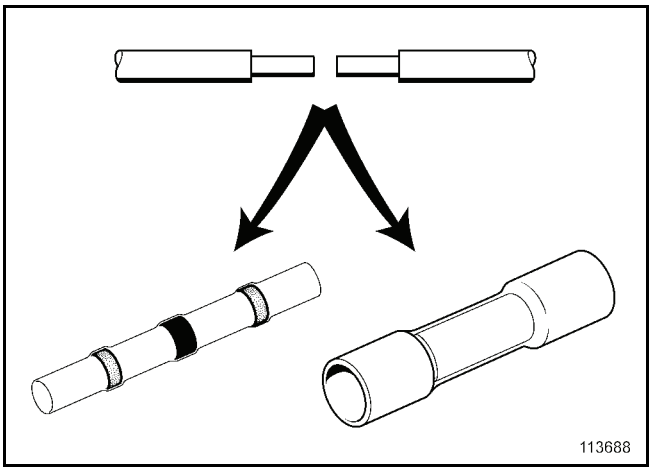
To switch to economy mode:

– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows COOL,
– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows WAIT,
– the gun is in economy mode,
– press STANDBY button (**M**) once to recover the previous settings and start heating again.

Note:
This relates to **the generic repair procedure**.

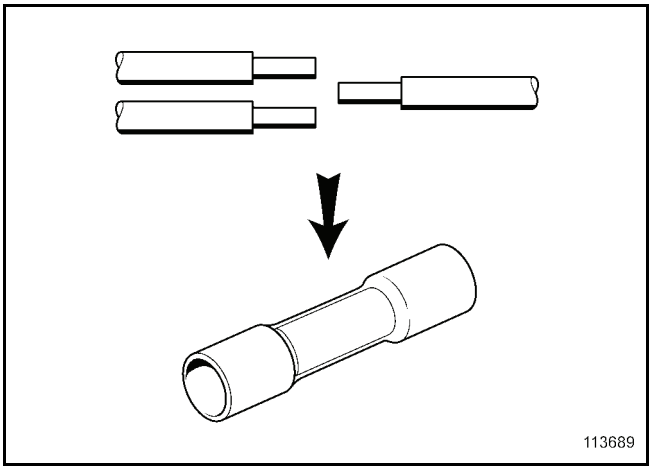
1 - Choosing the sleeve.

The are two possible techniques available:
- self-solder sleeves,
- crimp sleeves.



For each technique there are 3 sizes of sleeve.

The choice of sleeve depends on the following criteria:



- **Type of operation.**

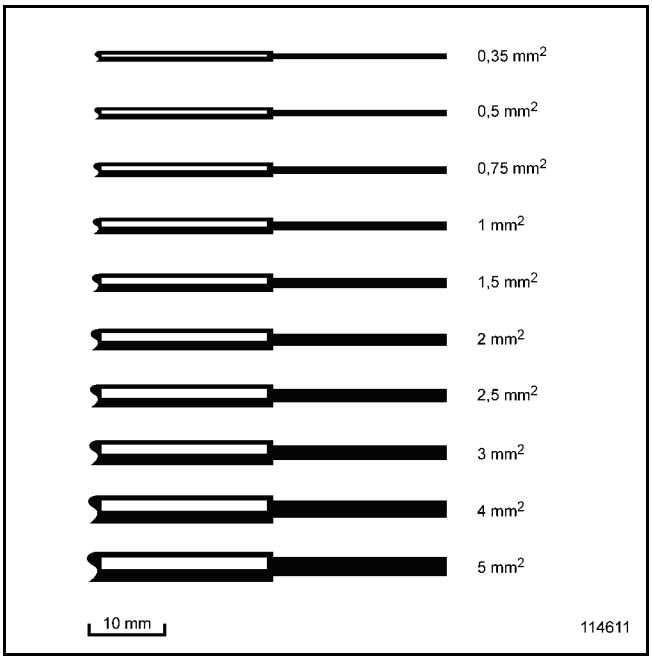
Note:
This is **stage 1** when using the label.

If wire to wire (1-to-1), use crimp sleeves or self-solder sleeves.

If 2 wires and 1 wire (2-to-1), **only** use crimp sleeves. In this case, the seal can no longer be guaranteed. Do not use this solution when a tight seal is needed (engine and underbody areas and damp areas of the doors and boot).

- **Wire cross-sections.**

Note:
This is **stage 2** when using the label.



See the sleeve choice table taken from the label.

Note:
The columns corresponding to the wire cross-sections give a representative overview of the different cases.

Identify the cross-section of the wire which is the subject of the operation. Use the diagram which shows pictures of wires which correspond to the wire cross-sections.

Check that the diagram is at scale 1.

Find the stripped section of wire.

Refer to the columns of wire cross-sections to find your case.

Note:
If the case in question is not present, refer to the special cases.

Example 1.
Joining together 2 wires, each **0.5 mm²** (1-to-1 type operation). Look at the upper section of the columns (1-to-1).
Each wire (A and C) has a **0.5 mm²** cross-section.
Refer to the line where:

- column A shows **1 x 0.5 mm²**,
- and column C shows **1 x 0.5 mm²**.

Example 2.
Joining 3 wires together (2-to-1 type operation). Look at the lower section of the columns (2-to-1).
On one side, the 2 wires (A and B) both have a **1 mm²** cross-section. On the other side, wire C has a **2 mm²** cross-section. Refer to the line where:

- columns A & B show **2 x 1 mm²**,
- and column C shows **1 x 2 mm²**.

- **Identifying the settings.**

Note:
This is **stage 3** when using the label.

After having found your case in question, follow the corresponding line to find the setting parameters.
The settings correspond to the lengths to be stripped and the temperature of the heat gun.

The column corresponding to these parameters gives the recommended sleeve.

Note:
If several sleeves are possible for the same operation, choose the one best adapted for the number of wires to be repaired, the wiring layout and the vehicle layout (thickness of the harness, available room etc.).

As relates to the previous examples.

Example 1.
2 possible sleeves:
- Either the red self-solder sleeve.
- Or the red crimp sleeve.

Example 2.
- Only the blue crimp sleeve is possible.

- **Special cases.**

If the case in question is not shown in the selection table, apply the following rules to select a sleeve.

In all cases, identify the cross-section of each wire (copper strands).

● **Case of a wire joint between 1 wire and 1 wire (most common situation).**

Conditions for self-solder sleeves:

Add together the 2 wire cross-sections (copper strands):

If **0.3 mm²** ≤ (section 1 + section 2) ≤ **0.8 mm²**, use the self-solder sleeve with **clear rings**.
Strip **10 mm** from each wire.
The temperature setting is **300°C**.

If **0.8 mm²** ≤ (section 1 + section 2) ≤ **2 mm²**, use the self-solder sleeve with **red rings**.
Strip **12 mm** from each wire.
The temperature setting is **340°C**.

If **2 mm²** ≤ (section 1 + section 2) ≤ **3 mm²**, use the self-solder sleeve with **blue rings**.
Strip **15 mm** from each wire.
The temperature setting is **400°C**.

Conditions for crimp sleeves:

Consider the section of each wire separately.

If **0.5 mm²** ≤ each section ≤ **1.5 mm²**, use the **red** crimp sleeve.
Strip **7 mm** from each wire.
The temperature setting is **280°C**.

If **1.5 mm²** ≤ each section ≤ **2.5 mm²**, use the **blue** crimp sleeve.
Strip **7 mm** from each wire.
The temperature setting is **300°C**.

If **3 mm²** ≤ each section ≤ **6 mm²**, use the **yellow** crimp sleeve.
Strip **8 mm** from each wire.
The temperature setting is **320°C**.

● **Case of a wire joint between 2 wires and 1 wire (less common situation).**

Conditions for crimp sleeves:

Add together the 2 wire cross-sections (copper strands) found on one side of the sleeve to find ***Sum side 1***.

If **0.5 mm²** ≤ ***Sum sections side 1*** ≤ **1.5 mm²**.
And if **0.5 mm²** ≤ wire cross-section side 2 only ≤ **1.5 mm²**, use the **red crimp sleeve**.
The temperature setting is **280°C**.

If **1.5 mm²** ≤ ***Sum sections side 1*** ≤ **2.5 mm²**.
And if **1.5 mm²** ≤ wire cross-section only side 2 ≤ **2.5 mm²**, use the **blue crimp sleeve**.
The temperature setting is **300°C**.

If **3 mm²** ≤ ***Sum sections side 1*** ≤ **6 mm²**.
And if **3 mm²** ≤ wire cross-section only side 2 ≤ **6 mm²**, use the **yellow crimp sleeve**.
The temperature setting is **320°C**.

For stripping the wires:

7 mm is stripped from the single wire (side 2) for red and blue crimp sleeves and **8 mm** for the yellow sleeve.

If the two wires (side 1) have the same cross-section, strip **10 mm** from them for red and blue crimp sleeves and **11 mm** for the yellow sleeve.

If the 2 wires (side 1) have different cross-sections, then:
For red and blue crimp sleeves, strip **10 mm** from the smaller cross-section and **7 mm** from the larger cross-section.
For the yellow sleeve, strip **11 mm** from the smaller cross-section and **8 mm** from the larger cross-section.

WARNING
If no sleeve corresponds to the case in question, the operator cannot repair the wiring. Replace the wiring harness.

● **Settings table (taken from the label).**

	Sleeves / Wire cross-sections		Self-solder									Crimp								
			clear			red			blue			red			blue			yellow		
			$0.3^2 \leq A+C \leq 0.8^2$			$0.8^2 \leq A+C \leq 2^2$			$2^2 \leq A+C \leq 3^2$			$0.5^2 \leq A+B \leq 1.5^2$ & $0.5^2 \leq C \leq 1.5^2$			$1.5^2 \leq A+B \leq 2.5^2$ & $1.5^2 \leq C \leq 2.5^2$			$3^2 \leq A+B \leq 6^2$ & $3^2 \leq C \leq 6^2$

In the case of a 1-to-1 type operation, wires **A** and **C** denote the wires which are found at either side of the sleeve.

In the case of an operation where 2 wires are joined to 1 (2 to 1), wires **A** and **B** denote the 2 wires which are found at the same side of the sleeve (**A** is the smaller section). **C** denotes the single wire on the other side.

2 - Preparation.

To start the preparatory stage, check that the wiring is sufficiently accessible and that the sleeves have been chosen.

– Detach the wires from the wiring.

– Check that the operating area is sufficiently spacious and that the sleeves can be fitted staggered (if there is a number of wires).

– Mark the wires to be cut, particularly if there is a number of wires the same colour.

– Cut the damaged wire(s). Stagger the cuts if a lot of wires are marked so that the sleeves are not all on top of each other. The cut must be made at a distance of no less than **50 mm** from the damaged section and in an area where the sleeve will remain straight.

– Cut the replacement wire to length(s) identical to those removed from the harness. If the self-solder sleeves are being used, add **30 mm** for the wire joints.

WARNING
The cross-section of replacement wire must not be less than the original cross-section of wire.

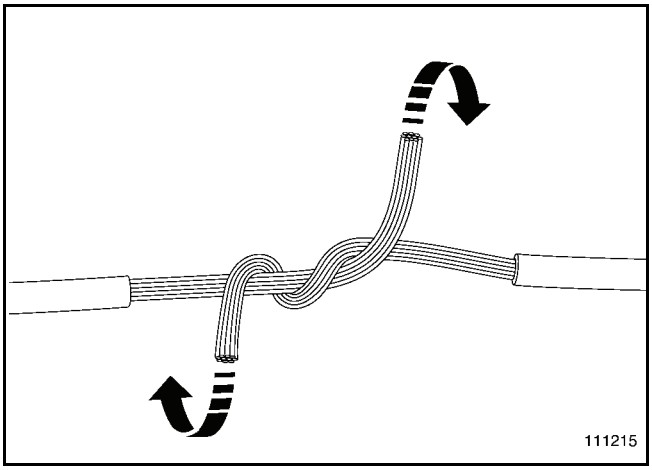
WARNING
Use a 0.5 mm^2 wire to repair a 0.35 mm^2wire.

WARNING
The temperature class of the replacement wire must be greater than or equal to class T3. For the repair, use the wires recommended by the parts department network, checking that they are suitable for your requirements.

– Strip the ends by the lengths indicated in relation to the sleeve chosen, using the stripping pliers (see **Wiring repair kit: Use**).

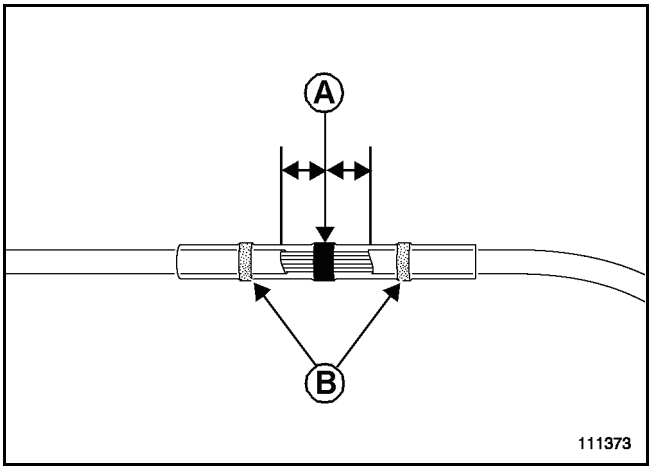
– Protect sensitive areas close to the wiring with the heat shield.

3 - Self-solder sleeves.



Note:
Fit the self-solder sleeves (connection and heating) line by line, sleeve by sleeve.

● **Connection.**



The equipment necessary and the wires are ready for the operation:

– Slip the self-solder sleeve onto one of the wires.

– Connect the wires by twisting the stripped sections around each other.

– Slide the sleeve over the stripped section. The ring of solder should end up in the centre of the stripped and twisted wires (**A**). The stripped and twisted section of the wires must be located between the 2 sealing rings (**B**).

WARNING
When twisting the wires, make sure that your hands are not greasy so that the solder adheres.

WARNING
When the sleeve is positioned, check that all the copper strands remain flat and subsequently are not at risk of perforating the sleeve. Start the operation to join the wires again if necessary.

WARNING
The sealing rings must be clearly located on the insulated section of the wires (B) and not on the copper or where the copper and the insulated section meet. Start the operation to join the wires again if necessary.

Once the wires are joined, start the heating operation.

- **Heating the self-solder sleeve.**

  – Switch on the heat gun fitted with the concentrator nozzle after familiarising yourself with the precautions for use (see **Wiring repair kit: Use**).

  – Adjust the temperature and the air flow to the values indicated (see **Wiring repair kit: Use**).

  – Check that the sensitive areas close to the sleeve and the other electrical wires are not at risk of damage.

  – Heat the sleeve starting at the centre, concentrating the heat on the ring of solder and the stripped section of the wires.

  – When the copper and the ring of solder become hot enough, the ring of solder melts and runs in between the copper strands (**C**).

  – When the solder has completely melted, move the nozzle to the ends of the sleeve to finish shrinking the sheath.

  – The sealing rings of the sleeve tighten around the insulation of the wires (**D**).

Note:
Spend the majority of the recommended time on the ring of solder and the rest of the time on the ends of the sleeve.
The heating operation takes **30 s** ± **10**. This time is a guide only. It can be reduced or increased depending on how efficient the heating is.

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

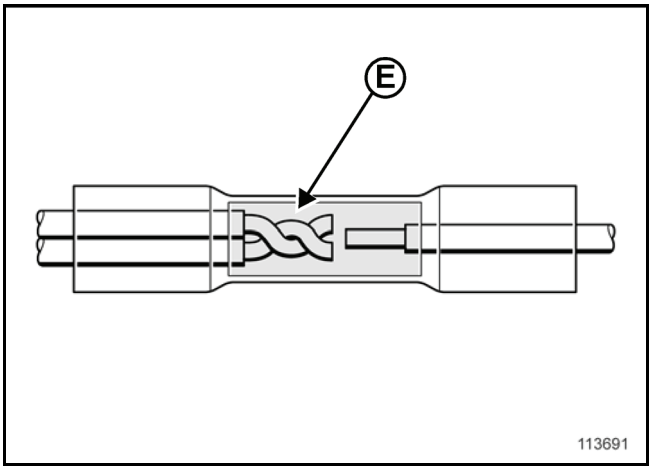
WARNING
Wait for the sleeve to cool before manipulating it to maintain the quality of the solder (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the quality of the solder or the sealing properties of the sleeve.

Note:
– Do not move during installation.
– Do not overheat the sleeve.
– Do not move the sleeve or wires until they have cooled.

If several self-solder sleeves must be positioned, repeat the operation sleeve by sleeve.

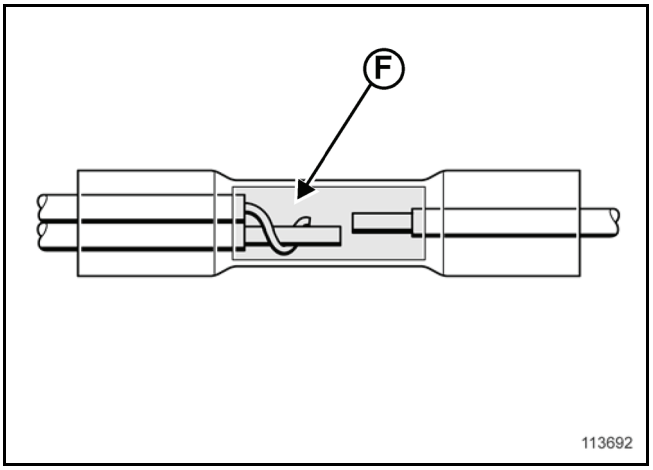
When the heating operations have finished, move on to the checking operation (see **Wiring: Check**).

4 - Crimp sleeves.



Note:
For a wire-to-wire join, go straight to the crimping operation.

● **Special notes for joining 2 wires to 1 wire.**



WARNING
Do not use if a tight seal is needed (engine and underbody areas and damp areas of the doors and boot).

When joining 2 wires to 1 wire, first connect the 2 wires from the same end in the following way:

– If the 2 wires have identical diameters, twist together the stripped section of the 2 wires (**E**), before putting them into the sleeve.

– If the 2 wires have different diameters, wind the stripped section of the smaller wire around that of the larger wire (**F**) before inserting them in the sleeve.

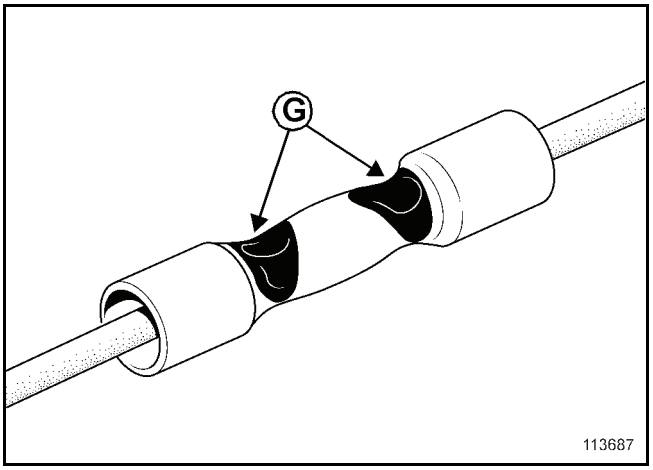
● **Crimping.**

The equipment necessary and the wires are ready for the crimping operation:

– Take the crimping pliers. Squeeze the handles fully together to unlock the pliers and open the jaws (see **Wiring repair kit: Use**).

– On the pliers, find the crimping jaws which correspond to the sleeve chosen.

– Insert the wire(s) into one end of the sleeve up to the stop located inside the metal barrel of the sleeve.



– Position the pliers' jaws around the middle of the section of the metal barrel where the wire(s) are.

– Squeeze the handles fully together to crimp the sleeve onto the wire(s). Crimping is complete once the pliers are opened again.

WARNING
Check that the copper of the wire is correctly crimped and that the plastic part of the sleeve has not been cut. If the wire has been stripped by the correct length and correctly inserted in the metal barrel, then the copper of the wire should barely jut out from the shaft.

Note:
If the wire is not correctly crimped, cut the wire before the sleeve and start the operation again with a new sleeve.

Repeat the crimping operation on the other end of the sleeve to obtain the result below.

The pliers have correctly crimped each wire on the halves of the metal barrel at (**G**) without damaging the plastic.

- **Heating the crimping sleeve.**

  – Switch on the heat gun fitted with the concentrator nozzle after familiarising yourself with the precautions for use (see **Wiring repair kit: Use**).

  – Set the temperature and the air flow to the values indicated, following the procedure in this note (see **Wiring repair kit: Use**).

  – Check that the sensitive areas close to the sleeve and the other electrical wires are not at risk of damage.

  – Heat the sleeve starting at the centre.

  – When the sheath starts to contract, move the nozzle to one of the ends.

  – The sheath continues to contract and produces a glue.

  – When the end of the sleeve has completely contracted and the glue has correctly covered the opening of the sleeve, repeat the operation on the other end to obtain the result shown at (**H**).

Note:
Spend the majority of the recommended time on the metal barrel and the rest of the time on the ends of the sleeve.
The heating operation takes **30 s** ± **10**. This time is a guide only. It can be reduced or increased depending on how efficient the heating is.

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

WARNING
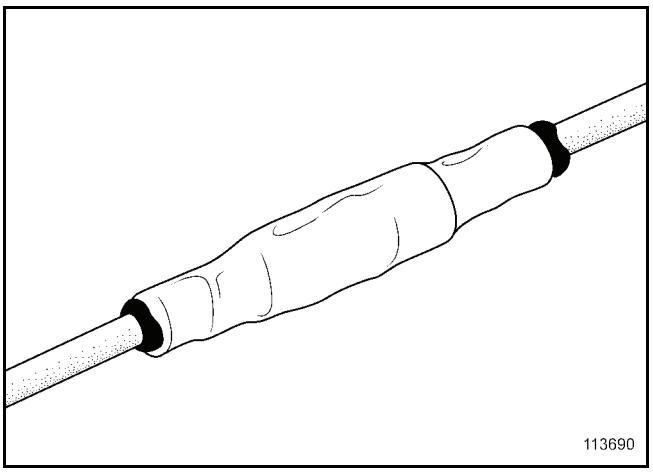
Wait for the sleeve to cool before manipulating it to ensure that the sealing properties of the sleeve are not affected (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the sealing properties of the sleeve.

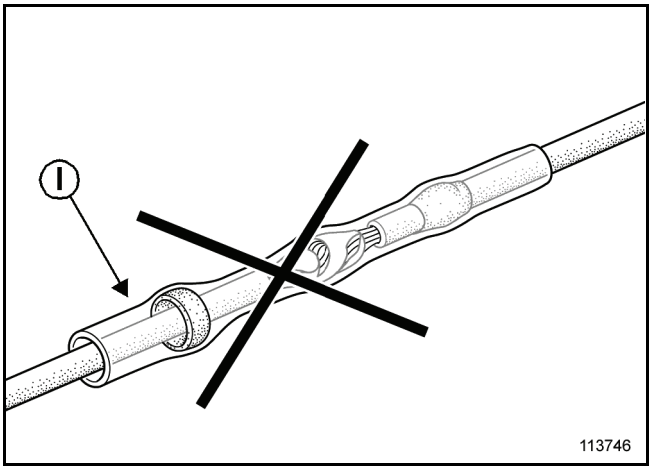
When the heating operations have finished, move on to the checking operation (see **Wiring: Check**).



1 - Visual checks.

- The insulation of the wires is within the sleeve.
- (Self-solder sleeves) The sealing rings must be clearly located on the insulated section of the wires.
- (Self-solder sleeves) The solder has completely melted.
- (Crimp sleeves) The adhesive of the crimp sleeves forms a barrier at the ends of the sleeves.
- The sleeves has completely contracted around the insulation of the wires.
- The sleeve is not cut, slit, discoloured or pierced by a copper strand.
- The insulation of the wires does not show any sign of damage caused by overheating.
- The wiring and the area surrounding it have not been damaged by the heating operation.

Result of a correctly applied self-solder sleeve.



Result of a correctly applied crimp sleeve.

WARNING
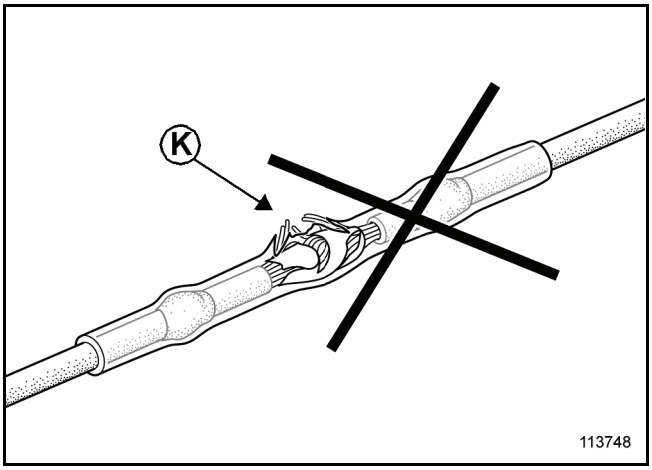
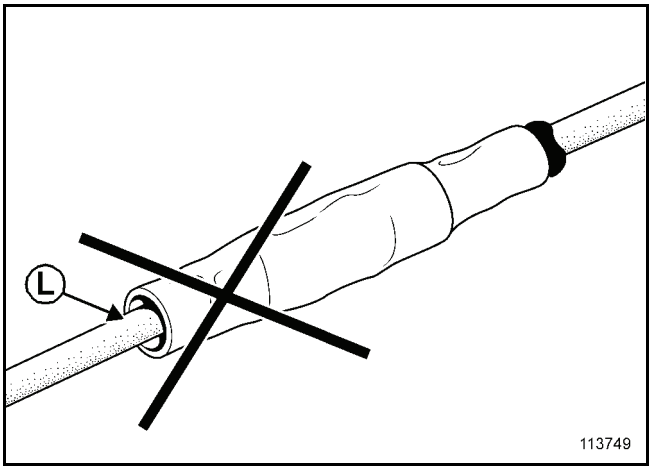
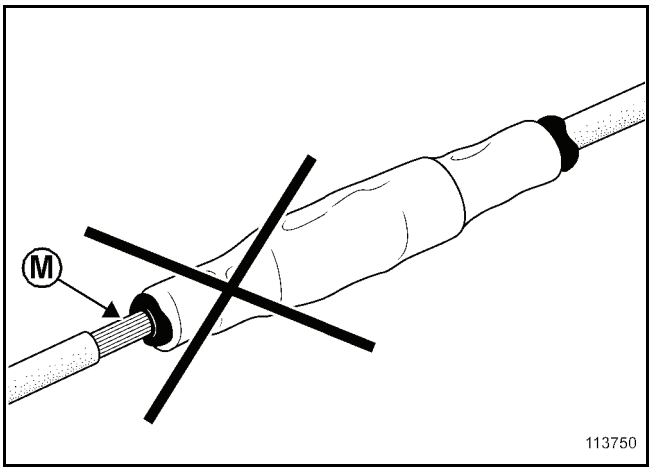
The various struck-through cases are strictly forbidden.



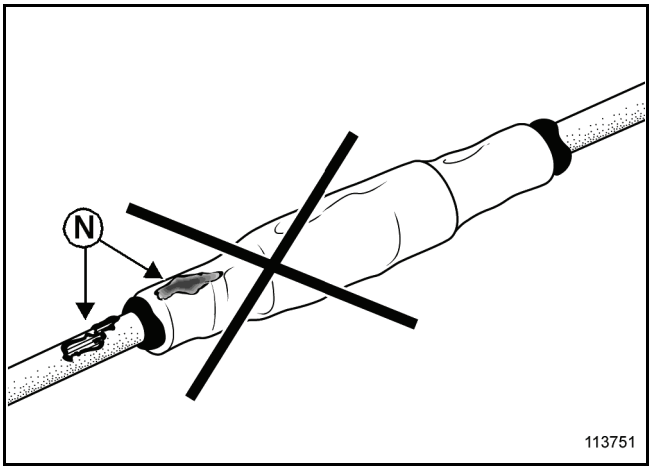
The self-solder sleeve has not been correctly shrunk. At (**I**), the sealing ring has not contracted around the insulation of the wire.



The sealing ring of the self-solder sleeve is directly on the copper of the wire at (**J**).



The protruding strands of the wire have pierced the self-solder sleeve at (**K**) during contraction.



The crimp sleeve has not been correctly shrunk. At (**L**), the adhesive does not form a barrier at the end of the sleeve.

The adhesive of the crimp sleeve is directly on the copper of the wire at (**M**).

The sleeve and the insulation of the wire show signs of damage at (**N**) cause by overheating.

Note:
Reconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

2 - Check with the diagnostic tool.

When a repaired line can be tested with the diagnostic tool, run this check.

3 - Function check.

Check that the component or the function of the repaired line is working correctly. If the case in question requires it, carry out a test drive.

Note:
Always check for faults after repair.

Refer to the fault finding procedure for the function concerned.

4 - Fitting and protections.

After the operation:

- reposition the wires concerned in the main harness,
- tape up the main harness using adhesive tape,
- protect the harness as it is was originally using equivalent (noise or anti-damage) or superior protection with the protections recommended by the Parts Store network.

The part numbers for the protections are as follows:
– **77 11 237 838** - Protective sheath for wiring, diameter **7 mm** (mechanical)
– **77 11 237 839 -** Protective sheath for wiring, diameter **18 mm** (mechanical)
– **77 11 237 840 -** Protective sheath for wiring, diameter **31 mm** (mechanical)
– **77 11 237 841** - Velour tape for wiring harness (sound insulation)

WARNING
Any repair which requires a specific heat shield for the wiring are forbidden. Replace the wiring harness.

WARNING
Check that the wiring is correctly maintained and protected to avoid any wear by rubbing and any noise disturbance.

5 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

WARNING
Apply this procedure when there is a connector - wiring kit or wire kit. Unless the kit is linked to one of the sensitive lines listed in the specific procedures reference table (see Wiring: Precautions for repair). In this case, apply the specific procedure for the sensitive line concerned.

1 - Wiring-Connector kit.

A wiring-connector kit enables repair to be carried out when the connector is faulty or when the fault is located less than **10 cm** from the connector.

A wiring-connector kit is generally made up of:

- at least 1 connector,
- crimped wires with corresponding contacts,
- sealing components if the connector is sealed,
- the self-solder or crimp sleeves necessary for the repair,
- other components specific to the function concerned (e.g. fuses).

Note:
if there is no kit, it is possible to create a wiring - connector kit if the following rules are respected:
– The connector affected by the repair must be taken from the **new wiring** provided as a spare part and intended for this repair.
– The function affected by the repair must not by covered by a special procedure.
– The connector should not be made up of more than **10 wires**.
– The wires are cut more than **10 cm** away from the connector.
– For each opening, the wires of the connector taken from the new wiring have a cross-section which is equal to or greater than that of the original connector.
– For each opening, the metal contacts of the connector taken from the new wiring are the same material (gilded or tinplated) as those of the original connector.
– The precautions set out in this note are respected (see **Wiring: Precautions for repair**).

2 - Using a wiring-connector kit.

Except in the specific outlined cases, use the wiring-connector kits as follows:

- check that the kit is complete,
- check that the conductor configuration (position of wires in the cells of the connector) corresponds to your needs,
- check that the wire cross-sections of the wiring-connector kit are equal to or larger than the cross-section of wires to be repaired,
- mark the wires to ensure that the tracks are not reversed,

WARNING
The colour of the wires cannot serve as a marker. In certain cases, wiring-connector kits can have different colours to those of the wiring to be repaired.

- Cut the connector wires to be replaced to a length greater than **100 mm** and stagger the cut wires,
- shorten the wiring-connector kit wires so as to provide wires the same lengths as those cut from the wiring to be repaired. For self-solder sleeves, add **30 mm** for the wire joints,
- apply the generic repair procedure for the joint (see **Wiring: Repair**).

3 - Wire kit.

A wire kit is used to perform a repair when the connector is not damaged.

A wire kit is generally comprised of:

- 3 crimp wires
- protection on the metal contacts.

4 - Applying a wire kit.

NOTE
Access the electric documentation for the vehicle on Infotech to obtain the part number of the wire kit required and the removal procedure for the connector.

Except in the specific outlined cases, use the wire kits as follows:

- check that the kit is complete,
- check for the presence of protection on the metal contacts,
- check that the wire cross-sections of the wire kit are equal to or larger than the cross-section of wires to be repaired,
- mark the wires to ensure that the tracks are not reversed,

WARNING
The colour of the wires cannot serve as a marker. Wiring-connector kits may be different colours to those of the wiring to be repaired.

- cut the connector wires to be replaced to a length greater than 100 mm and stagger the cut wires,
- shorten the kit wires so as to provide wires with the same lengths as those cut from the wiring to be repaired. For self-solder sleeves, add 30 mm for the splices,

Apply the generic repair procedure for the joint (see **Wiring: Repair**).

5 - Checking and fitting the repair with wiring-connector kits.

- Carry out the generic repair procedure check (see Wiring: Check) or that for the specific procedures if it is a specific case (see Wiring: Precautions for repair).
- Apply the recommendations from the generic repair procedure concerning the fitting and protection (see Wiring: Check).

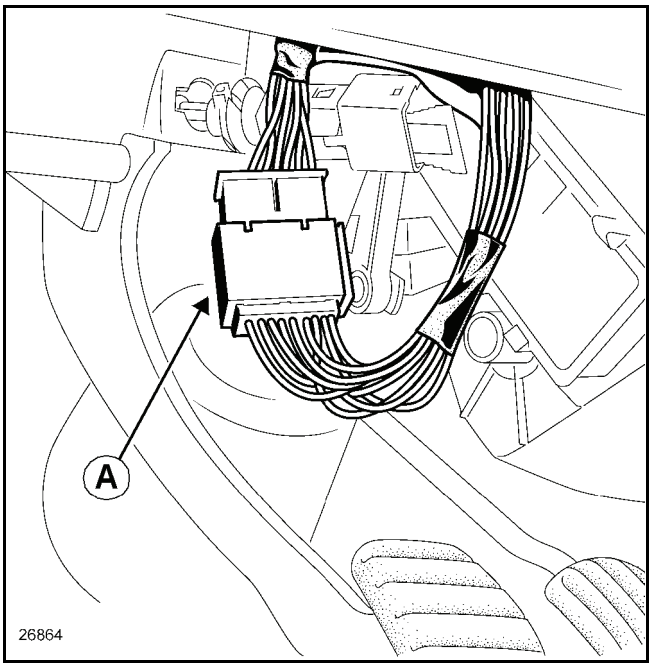
6 - Final check.

After any operation on wiring, check for the absence of faults using the diagnostic tools (Clip, etc.).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

This section deals with an electrical contact fault on the connector between the dashboard wiring and the pedal wiring on KANGOO.



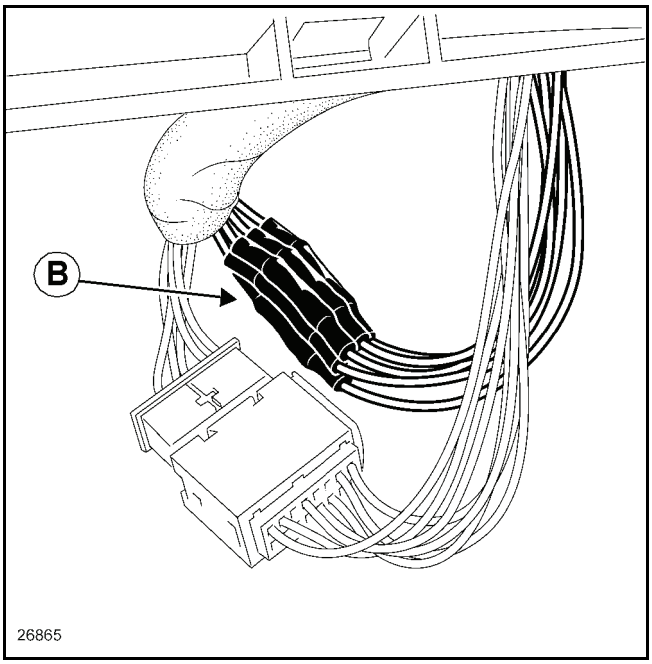
1 - Context.

Customer complaint:
Loss of engine power when driving, with the injection warning light illuminated on Kangoo vehicles with K4M, F9Q, D4F, D7F and K9K engines.

Possible cause:
Loss of contact on the 16-track **R181** connector (dashboard wiring harness and pedal connection).

2 - Description of the repair procedure.

Make the **R181** connector accessible and unclip it from its mounting (**A**).



On the **R181** connector and using the Wiring Diagrams Technical Note corresponding to the vehicle, mark the gangs related to the accelerator potentiometer.

Note:
Using the Wiring Diagrams Technical Note or applying a continuity check, check that it concerns gangs B1, B2, B3, B4, B5 and B6.

WARNING
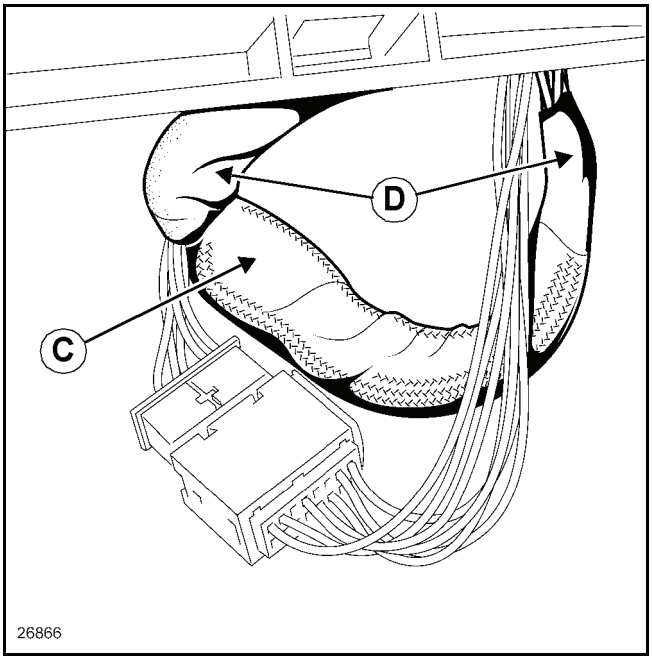
The colour of the wires is not same on either side of the R181 connector.



For each gang, proceed in the following manner:

- Cut the electrical wire either side of the connector.
- Make a wire joint with a **red self-solder sleeve** from the **wiring repair kit**, between the pedal electrical wire and the passenger compartment wiring electrical wire (**B**) (see **Wiring: Repair**).

After having shunted all of the wires concerned:

- Protect the shunted electrical wires (**C**) with wiring protective sheath with a diameter of **18 mm (77 11 237 839)**.
- Cover the ends of the protective sheath with **Adhesive PVC tape (D)**.
- Refit the **R181** connector on the mounting.
- Secure the shunted lines to the wiring using **Adhesive PVC Tape**.

3 - Repair check.

Continuity:

- Check the continuity of each of the shunted lines.

Function check:

- Clear the faults.
- Check the conformity of the pedal sensor parameters:
  - If it is a DDCR computer, see **Technical Note 3845A, Injection fault finding: DDCR VDIAG 04 - 08 - 10 - 0C - 14 - 18 - 20, Conformity check**.
  - If it is a DCM 1.2 computer, see **Technical Note 6500A, Fault finding - DCM 1.2 Injection Program 4C Vdiag 08, Conformity check**.
  - If it is a SIM 32 computer, see **Technical Note 3878A, Injection fault finding: SIM 32 SOFT D4 - Vdiag 04, Conformity check**.
  - If it is an EDC15 computer, see **Technical Note 3929A, Injection fault finding: DIESEL BOSCH EDC15C3 Vdiag 10 - 14 - 18, Conformity check** or **Technical Note 3930A, Injection fault finding: DIESEL BOSCH EDC15C3 Vdiag 0C, Conformity check** depending on the case.
  - If it is a SIRIUS 34 computer, see **Technical Note 3834A, Injection fault finding: SIRIUS 34-E932 - Vdiag 08, Conformity check**.
- Perform a road test.
- Check the status of the faults (present and stored).

Final check:

- Carry out a complete check with the **CLIP** tool and check that there are no faults.

This section explains how to insulate and immobilise an unused connector when changing the wiring.

2 cases are dealt with:
- Waterproof wiring in damp areas
- Non-waterproof wiring

Refer to the relevant section.

1 - For waterproof wiring in damp areas.

WARNING
This operation is compulsory for any wiring which is located in damp areas which needs to be waterproof (engine and underbody areas, and damp areas of the opening elements).
It applies to all of the unused connectors located on the wiring.

- **Equipment required.**

– Heat shrinkable waterproof sheath:

Part number of heat shrinkable waterproof sheath	Internal diameter (E) before contraction (mm)	Internal diameter (F) after contraction (mm)
7701 069 915	4 mm	1 mm
7701 033 055	8 mm	2 mm
7701 033 056	19 mm	4 mm

(E) < Diameter of electrical wire with insulation < **(F)**

– Adhesive **7703 397 035** (cracked cylinder of solid adhesive).
– Wiring repair kit (see **Wiring Repair Kit: Description**).

- **Description of the operation.**

Plug preparation:
– Mark the unused connector.
– Count the number of wires to be insulated and note their total diameter (copper and insulation).

Note:
The coupling of wires must be preserved.
If several wires are connected together in a connector opening, always preserve this connection.
The electric wires in the same opening will be connected together using self-solder sleeves or crimp sleeves from the wiring repair kit (See **Wiring repair kit: Description**).

– For every wire, remove **50 mm** of heat shrinkable sheath adapted to each wire diameter. The diameter of the wire must be less than the internal diameter of the sheath before contraction **(E)** and greater than the internal diameter of the sheath after contraction **(F)**.

– Heat the end **(G)** of the pre-cut sheath using the heat gun included in the wiring repair kit (See **Wiring Repair Kit: Description**) and contract it approximately 15 mm **(F)**.
The heat gun is equipped with the retraction nozzle and its temperature is adjusted to **120ºC**, with maximum air flow (See **Wiring Repair Kit: Description**).

WARNING
To avoid burns, always wear gloves during the following operation .

– When the end has been contracted, flatten it in order to bond the surfaces using the internal adhesive of the sheath **(G)**.
– Allow the sheath to cool for **1 min**.
– Check the prepared plug. The contracted length should not exceed **15 mm** and the adhesive should completely block the end at **(H)**.
Do not remove the surplus adhesive at **(H)**.

Fitting the plugs:

Note: When replacing the wiring, preferably carry out the operation before refitting the new wiring.

– Mark the unused connector.

– Mark the wire couplings on this connector (wires connected together in the same connector opening). Electric wires in the same opening will be connected together using the self-solder sleeves or crimp sleeves from the wiring repair kit (See **Wiring: Repair**).

– Cut the other wires of the connector equally.

– Fit a plug on each wire **(I)** and contract it using the heat gun included in the wiring repair kit (See **Wiring repair kit: Description**).
The heat gun is equipped with the deflector nozzle and its temperature is adjusted to **120°C**, with maximum air flow (See **Wiring repair kit: Use**).

WARNING
It is forbidden to place 2 wires of different connection codes in a single plug. There is a risk of a short circuit if the wires are live.

– Allow the assembly to cool down for **1 min**.

– Check that the sheath is sufficiently contracted on the wire **(J)**. Repeat the operation with a heat shrinkable sheath with a smaller diameter if necessary.

Note:
Do not remove the surplus adhesive.

WARNING
If there is not enough adhesive released by the heat shrinkable sheath, repeat the operation and add some adhesive (see Equipment required) inside the sheath.

– Tape all of the wires and sheaths using adhesive tape included in the wiring repair kit (See **Wiring repair kit: Description**).

– Fit a wiring protector which is equivalent or better than the original (See **Wiring: Check**).

– Secure the assembly to the main wiring using a Colson-type clip which will be fitted level with the sleeves. Use several clips if necessary.

2 - For non-waterproof wiring.

For non-waterproof wiring, only apply the immobilisation procedure.

– Mark the unused connector.

– Secure the connector on the main wiring using a Colson-type clip. Use several clips if necessary.

– Check that the assembly does not produce any interference noises, with the engine running and the vehicle moving. Fit an audible protector if necessary (See **Wiring: Check**).

This section describes how to visually inspect a connector.

Note:
Carry out each requested check visually. Do not remove a connector if it is not required.

Note:
Repeated connections and disconnections alter the functionality of the connectors and increase the risk of poor electrical contact. Limit the number of connections/disconnections as much as possible.

The check is carried out on the 2 parts of the connection. There may be two types of connections:
– Connector / Connector
– Connector / Device

1 - Visual inspection of the connection:

- Check that the connector is connected correctly and that the male and female parts of the connection are correctly coupled.

2 - Visual inspection of the area around the connection:

- Check the condition of the mounting (pin, strap, adhesive tape, etc.) if the connectors are attached to the vehicle.
- Check that there is no damage to the wiring trim (sheath, foam, adhesive tape, etc.) near the wiring.
- Check that there is no damage to the electrical wires at the connector outputs, in particular on the insulating material (wear, cuts, burns, etc.).

Disconnect the connector to continue the checks.

3 - Visual inspection of the plastic casing:

- Check that there is no mechanical damage (casing crushed, cracked, broken, etc.), in particular to the fragile components (lever, lock, openings, etc.).
- Check that there is no heat damage (casing melted, darker, deformed, etc.).
- Check that there are no stains (grease, mud, liquid, etc.).

4 - Visual inspection of the metal contacts:

- Check that there are no bent contacts (the contact is not inserted correctly and can come out of the back of the connector). If the wire is slightly stressed, the contact will come out.
- Check that there is no damage (folded tabs, clips open too wide, blackened or melted contact, etc.).
- Check that there is no oxidation on the metal contacts.

5 - Visual inspection of the sealing:
(Only for watertight connectors)

- Check for the seal on the connection (between the 2 parts of the connection).
- Check the seal at the back of the connectors:
  – For *unit* joints (1 for each wire), check that the unit joints are present on each electrical wire and that they are correctly positioned in the opening (level with the housing). Check that plugs are present on openings which are not used.
  – For a *grommet* seal (one seal which covers the entire internal surface of the connector), check that the seal is present.
  – For gel seals, check for gel in all of the openings without removing the excess or any protruding sections (it does not matter if there is gel on the contacts).
  – For *hotmelt* sealing (heat-shrink sheath with glue), check that the sheath has contracted correctly on the rear of the connectors and electrical wires, and that the hardened glue comes out of the side of the wire.
- Check that there is no damage to any of the seals (cuts, burns, significant deformation, etc.).

WARNING
This procedure is relates to the repair of the multiplex network alone (twisted wires).

1 - Locating the fault.

Use the diagnostic tool (clip) to test the multiplex network (see the fault finding procedure corresponding to the vehicle).

The diagnostic tool can detect the following short circuits on the multiplex network:

- short circuit between CAN L and **+ 12 V**,
- short circuit between CAN H and **+ 12 V**,
- short circuit between CAN H and earth,
- short circuit between CAN L and earth,
- short circuit between CAN L and CAN H,
- open circuits.

Note:
In the case of a short circuit between CAN-L and earth, communication between the different computers which make up the multiplex network is not interrupted. However, the multiplex network becomes sensitive to interference and can be the cause of an intermittent fault.

After having located the multiplex line fault, it is possible to repair it whilst applying all the necessary precautions outlined in this document.

2 - Necessary equipment.

For repairing the multiplex network, use the components of the wiring repair kit (see **Wiring repair kit: Description**).

Use the self-solder sleeves with red rings (**A**) for making the joints.

111376

3 - Repairing the multiplex line.

WARNING
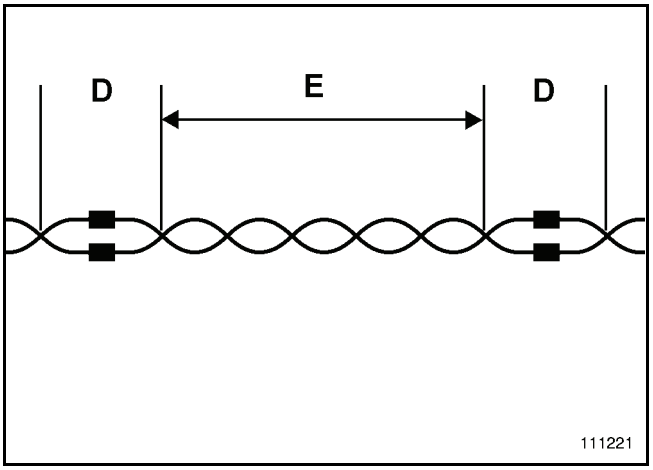
Before starting to repair a multiplex line, it is necessary that you familiarise yourself with the use of the tools relating to this repair (see **Wiring repair kit: Use**).

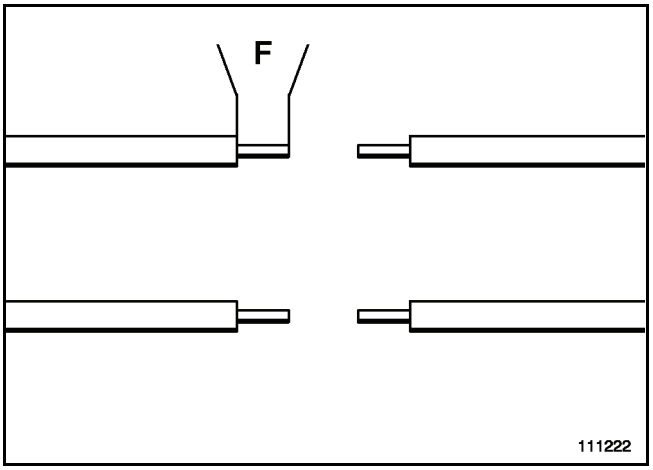
Disconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

Remove the components necessary to enable access to the wiring.



Detach the section of wire to be repaired from the main wiring.

Cut the wires at (**B**) and (**C**), **50 mm** on each side of the damage.



Take from the coil of twisted wires **(0.5 mm^2**, specific number of turns) to be used to repair the multiplexing, a length of wire the same as that removed from the harness, **plus 30 mm** for the wire joints (See **Wiring repair kit: Description**).

WARNING
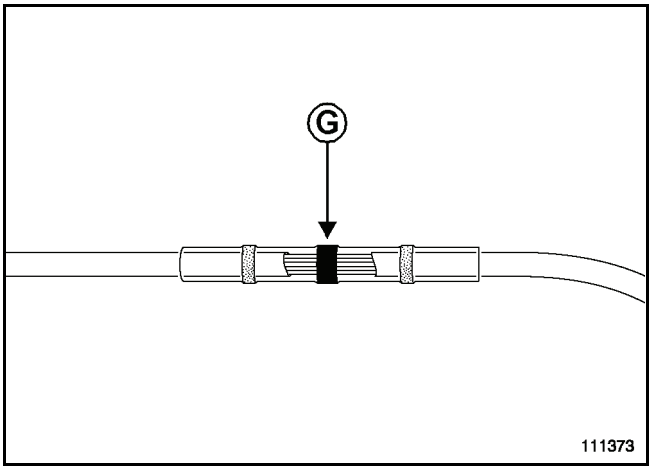
Do not untwist the harness to be repaired more than 100 mm (D). The wires at (E) must be twisted uniformly along the repaired length.

Strip each end of the wires by **10 mm (F)** at each side.



To join the wires, working wire by wire:
- slip the self-solder sleeve onto the wire,
- twist the end of the wires together.

WARNING
The colour of the wires (CAN H et CAN L) must be respected when they are being joined.

- Position the sleeve with its solder ring in the centre of the wire joint.

- Switch on the heat gun.
- Adjust the temperature of the tool to **340°C** with a ventilation speed set to maximum (See **Wiring repair kit: Use**).
- Heat the sleeve so that the solder ring melts (**G**) onto the wires until the heat shrinkable sheath contracts.

Refer to the precautions for use which relate to using self-solder sleeves (see **Wiring: Repair**).

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure that it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

Note:
For the soldering to be complete and for the sheath to contract, the heating operation should last approximately **30 s** ± **10**.
Spend the majority of the recommended time on the ring of solder and the rest of the time on the ends of the sleeve.
The recommended time is given as a guide. It can be reduced or increased depending on how efficient the heating is.

WARNING
Wait for the sleeve to cool before manipulating it to maintain the quality of the solder (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the quality of the solder or the sealing properties of the sleeve.

4 - Checking the multiplex line.

WARNING
After repairing the multiplex line, always check the multiplex network using the diagnostic tool.

Note:
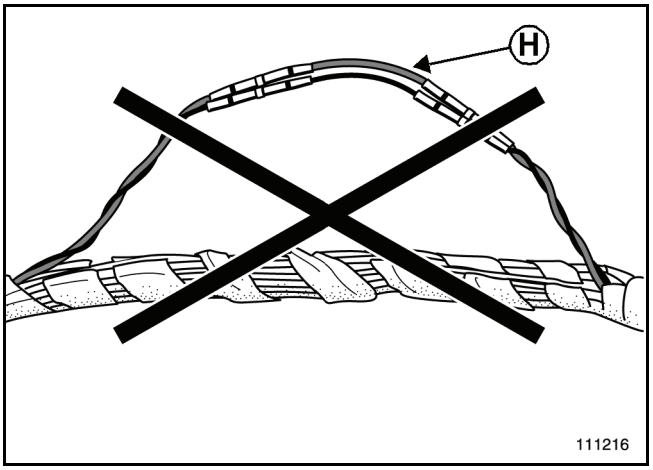
During the check with the diagnostic tool, move the lines forwards and backwards slightly. If a fault is recorded, start the operation again for the faulty line.



Refer to the fault finding procedure for the function concerned.

WARNING
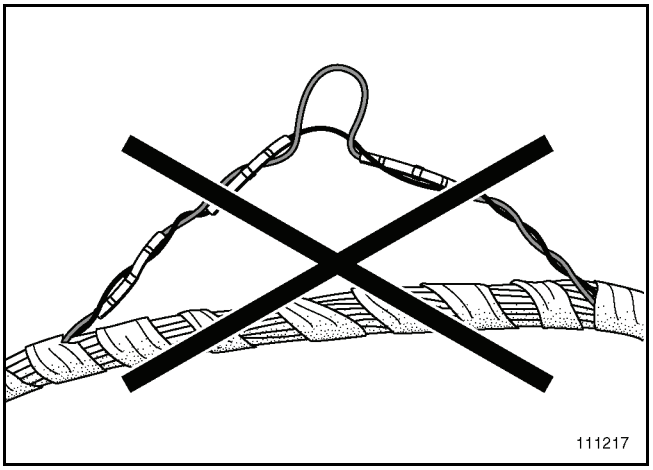
After having checked the multiplex line:
- **refit it in the main harness,**
- **tape it up with adhesive tape.**



Apply the recommendations from the generic repair procedure concerning the fitting and fuses (see **Wiring: Check**).

WARNING
The various struck-through cases are strictly forbidden.

No turns (twists) at (**H**).

The two wires added are of a different length.

5 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

WARNING
This procedure relates repairing airbag and pretensioner wiring only.

Note: Apply all the precautions and recommendations shown in the MR.

WARNING
All work on airbag and pretensioner systems must be carried out by qualified trained personnel.

WARNING
The pyrotechnic systems (pretensioners or airbags) must not be handled near to a heat source or flame; there is a risk that they may be triggered.

WARNING
Before removing an electronic control unit (ECU) or before any operation on the safety systems or around them, the airbag computer must be locked using the diagnostic tool. When this function is activated all the trigger lines are inhibited, and the airbag warning light on the instrument panel is lit continuously.

WARNING
Before any operation on a pyrotechnic component connection (connector or wiring) found faulty during fault finding, disconnect the pyrotechnic component.

1 - Identify the solution.
The case in question must figure in the table below. Otherwise, replace the wiring.

Airbag and pretensioner components	Solutions
Under seat connector (Airbag warning light on)	● If the connector has more than 10 wires, no operation can be carried out. Replace the wiring unless there is a specific procedure (OTS*). ● If not, shunt the connector. See **Under seat connector** in this section.
Connector on seat runner	No operation. Replace the wiring unless there is a specific procedure (OTS*).
Pyrotechnic component connectors (squib) (airbag triggers, pretensioner, etc.)	Replace the connector using the airbag connectors kit. See **Pyrotechnic component connectors** in this section.
Airbag computer connector	No operation. Change the wiring harness except in the following cases: ● If there is a specific procedure (OTS*), its application is authorised. ● If the connector lock is broken, replacing the lock authorised.
Airbag and pretensioner harness damage	No operation except in specific conditions. See **Airbag and Pretensioner harness damage** in this section.

*OTS: Special Technical Operation

WARNING
Any repair linked to the airbag function necessitates a specific check using the network's diagnostic tools.

2 - Under seat connector.

Note:
For a connector on a seat runner, the wiring must be replaced.

When fault finding identifies a under seat connector fault, shunt the under seat connector following the procedure below:

Cut the electrical wires either side of the connector.

Apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except the part on locating the fault, to shunt the connector.

Note:
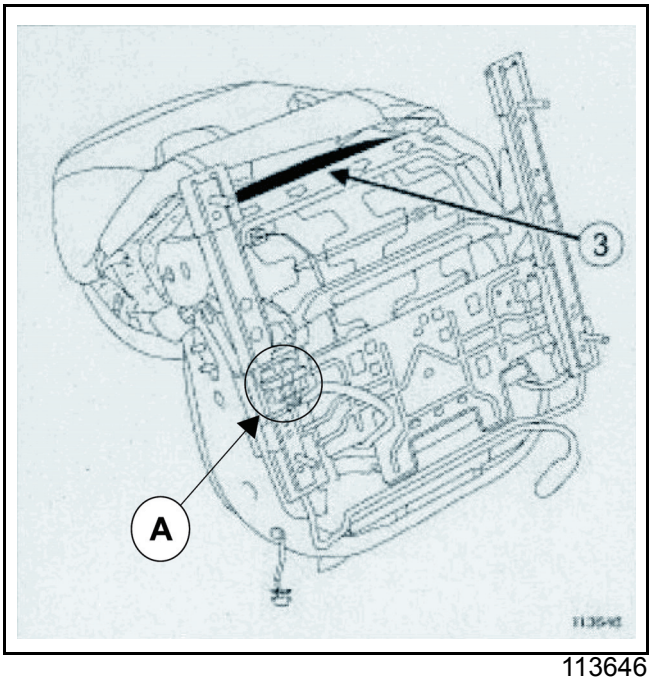
Check that the length of replacement wire is the same as that removed from the harness, **plus 30 mm** for the wire joints.



After the operation, check that the wire is not too taut or too long when the seat is furthest forward or back.

Protect the wires so that they are not damaged and this new branch is correctly maintained. Hanging loops are not allowed, regardless of the wires involved in the repair.

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

Note:
Check that the harness is correctly repositioned after the operation and that it is does not obstruct the seat adjusting mechanisms.

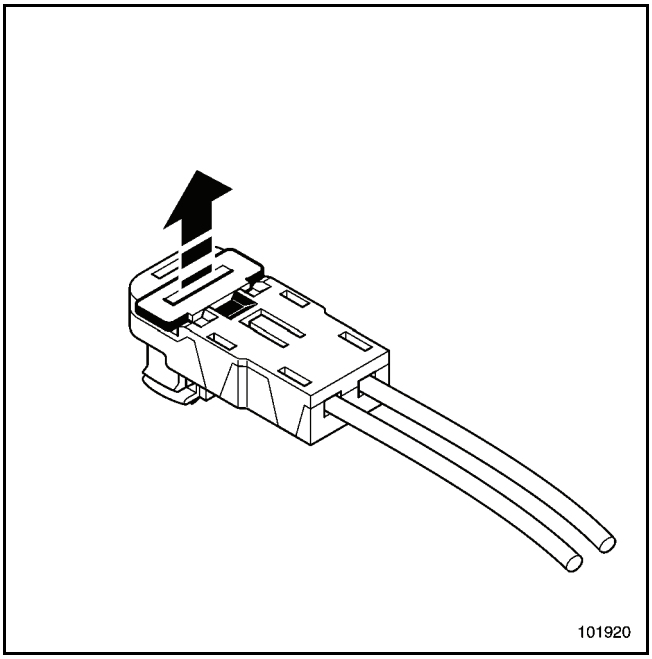
Example of a connector on a seat runner (A):

113646

3 - Pyrotechnic component connectors.

These are airbag and pretensioner trigger connectors.

Identify the connector concerned on the vehicle.



Repair is possible if it is a SQUIB connector.

Find the colour of the connector: Blue, green or orange.

Find the shape of the connector: Straight or angled.

Select the same connector (colour and shape) from the airbag connectors kit (see under DIALOGYS).

Example of an angled SQUIB connector.

Apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except the section on locating the fault, to replace the connector.

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

4 - Airbag and Pretensioner harness damage.

WARNING
No operation is authorised unless it is possible to check the repair using the diagnostic tool.

Where the repair can be checked with the diagnostic tool:

- if it is a case of twisted wires with a cross-section less than or equal to **0.5 mm^2**, apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except for the section on locating the fault, for the repair of the lines;
- if it does not concern twisted wires, apply the generic procedure for repairing the harness (see **Wiring: Check**).

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

5 - Airbag lines repair check.

Confirm the airbag line repair to ensure that the repair is correct:

- Check the quality of the operation by reading the impedance reading produced by the computer using the diagnostic tool.
- Unlock the airbag computer using the diagnostic tools.
- The warning light should no longer be on.

Note:
During the check with the diagnostic tool, move the lines forwards and backwards slightly.
The resistance measure should remain stable, if variations in resistance are noticed, start the repair operation again for the defective line.

Refer to the airbag and pretensioner function fault finding procedure for the vehicle concerned.

Apply the recommendations from the generic repair procedure concerning the fitting and fuses (see **Wiring: Check**).

6 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the fault finding procedure for the airbag and pretensioner function concerned.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

88C

AIRBAGS AND PRETENSIONERS

Airbag and pretensioner wiring: Repair 88C-1

WARNING
This note authorises the repair of electrical wiring in very specific cases only and under certain conditions.
Check that the repair in question is authorised and that the repair conditions are respected.

1 - Result of the fault finding procedure.

Note:
During repair, check that you have the most recently updated version of the technical note.

A preliminary fault finding procedure has enabled a wiring fault to be identified. Follow the investigation procedure below.

Disconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

Remove the components necessary to access the area to be worked on. The operation area must allow the pliers and the heat gun to be used, without blocking visibility.

WARNING
If the damaged section is not sufficiently accessible, remove the wiring concerned and repair on the bench.

When the damaged section is sufficiently accessible, detach the wires to be repaired from the main wiring.

WARNING
Check if there is a sensitive line. These cases are listed in the specific procedures reference table in this section.
If there is a sensitive line, replace the defective wiring or apply the specific procedure, if one exists. These procedures are indicated in the specific procedures reference table in this section.

Check that the fault is located more than 10 cm from the connector.

WARNING
If the damaged section is located less than 10 cm from the connector, replace the defective wiring, unless a wiring-connector kit (connector with wires) exists. In this case, use the kit to replace the damaged section and the connector.

This note does not authorise operations directly on the connectors and electrical contacts. Only wiring-connector kits allow the replacement of a connector. These kits can have associated procedures.

Note:
To check whether there is a wiring-connector kit, consult DIALOGYS. These kits are generally linked to specific wiring or function diagrams.

Note:
If the fault is located at the electrical contact (in the connector) and if it is linked to a corrosion or heating fault, replace the wiring or fit the wiring-connector kit. Also check the connector complement.

Note:
In all cases, pay particular attention to supply and earth lines and their tightening (refer to the tightening torques in the MRs concerned).

After having carried out these checks (outlined in the **Summary flowchart of the operating procedure**), if the repair is authorised, and it does not require a specific procedure, carry out the generic procedure (see **Wiring: Repair**).

Note:
If you have been referred to this note by a MR, NT or removal-refitting procedure, apply the repair procedure adapted to the case in question.
Either the generic repair procedure (see **Wiring: Repair**), or a specific procedure listed in the specific procedures reference table in this section.

2 - Specific procedures reference table.

- **Guidelines for reading the tables below:**

  – If not otherwise stated, consider all components or electrical connections to have a link with the functions or equipment listed. For example: For the electric power assisted steering, the function is not specified. It is prohibited to carry out operations on any wire attached to the electric power assisted steering.

  – If one case can be found in both tables, give priority to the **Changing the wiring**, recommendations, and then to those for the specific cases:
    - Example 1: For a 22-track airbag connector where more than 10 wires are damaged, the specific cases refer you back to the airbag and pretensioner repair procedure, and the general cases recommend that the wiring is replaced (as there are more than 10 wires involved). Priority is given to **Changing the wiring**.
    - Example 2: For an operation on a pair of twisted wires (general case) for the airbag function (specific case), the specific case refers back to the repair procedure for Airbags and pretensioners, and the general cases refer back to the repair procedure for multiplex lines. Priority is given to the airbag and pretensioner repair procedure. The recommendations for the specific cases take precedent over the general cases.

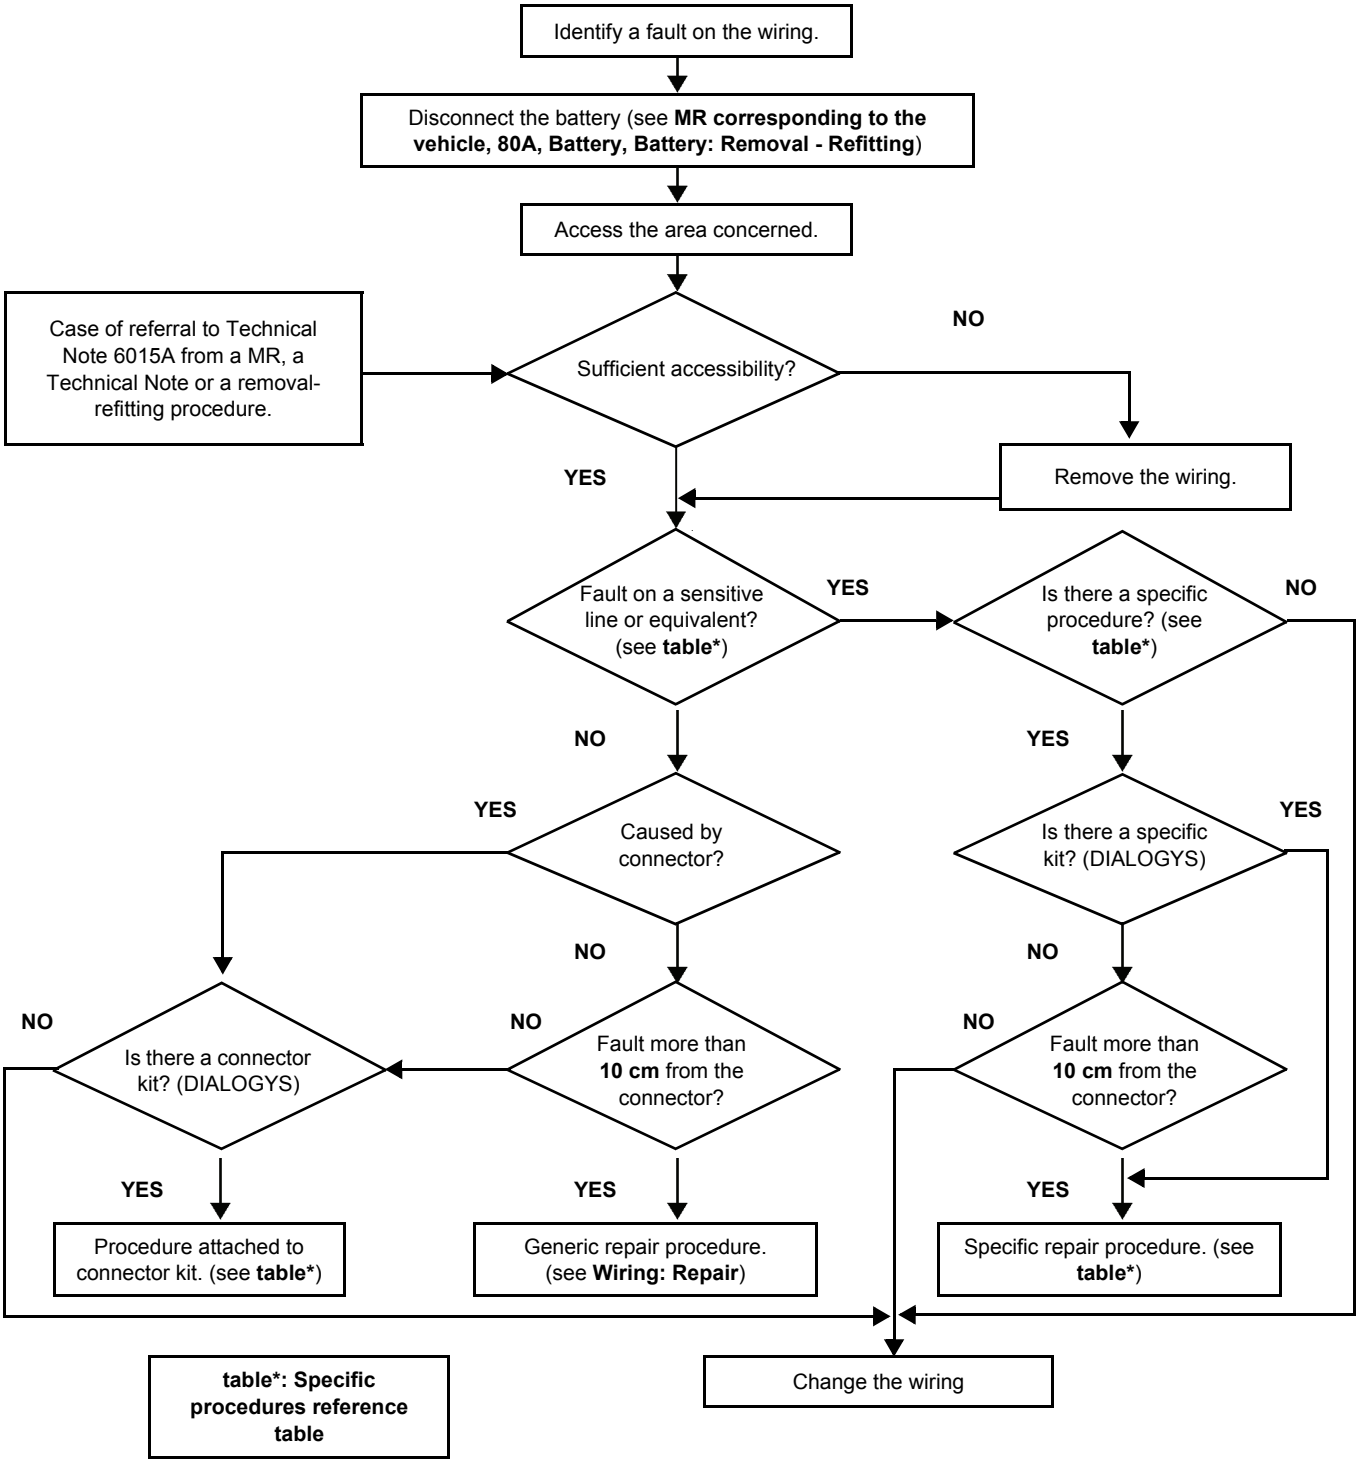
● **General cases:**

Functions or equipment	Precisions	Instructions
Wiring harness	Number of damaged wires 10 or fewer	(see **Wiring: Repair**)
	Number of damaged wires more than 10	Change the wiring
Equipment and predispositions specific to commercial vehicles and conversions	/	Change the wiring
Electric vehicles	Wiring and power connectors	Change the wiring
Connections or associated components	/	(see **Connector: Repair**)
Splices	Splice with more than 3 wires	Change the wiring
	3-wire splice which does not need sealing	(see **Wiring: Repair**)
	Splice with 3 wires or more, which needs sealing (engine and underbody areas and damp areas of the doors and boot)	Change the wiring
Wires outside the loom	Sheathed wires	Change the wiring
	Shielded wires	Change the wiring
	Twisted wires	**If the wire cross-sections are 0.5 mm^2:** (see **Multiplex network: Repair**)
	Flat cable	Change the wiring
	Wires with specific thermal protection	Change the wiring
	Copper wires with cross-section less than 0.35 mm^2	Change the wiring
	Copper wires with cross-section greater than 6 mm^2	Change the wiring
	Damaged wires less than 10 cm from the connector	(see **88A, Wiring, Connector: Repair**)

● **Specific cases:**

Lines	Device	Instructions
4-wheel steering	/	Change the wiring
ABS	Other ABS lines	Change the wiring
ABS	ABS sensor	Change the wiring
Airbag	Other airbag lines	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag sensor	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag computer connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Pretensioner (squib) connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Under seat connector	(see **Airbag and pretensioner wiring: Repair**)
Airbag	Airbag trigger connectors (pyrotechnic lines)	(see **Airbag and pretensioner wiring: Repair**)
Preheating unit (Diesel)	Heater plug	Change the wiring
Injection computer (Petrol)	Petrol vapour absorber	Change the wiring
Injection computer	Variable camshaft	Change the wiring
Injection computer	Variable inlet camshaft	Change the wiring
Injection computer	Variable exhaust camshaft	Change the wiring
Injection computer (Petrol)	Pencil coil	Change the wiring
Injection computer (Petrol and Diesel)	Motorised throttle body	Change the wiring
Injection computer	Camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Inlet camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Exhaust camshaft sensor	Change the wiring
Injection computer	Camshaft sensor, row A, B	Change the wiring
Injection computer	Variable exhaust camshaft sensor	Change the wiring
Injection computer (Petrol and Diesel)	Pinking sensor	Change the wiring
Injection computer (Diesel)	Turbine upstream pressure sensor	Change the wiring

● **Specific cases (cont. 1):**



Lines	Device	Instructions
Injection computer (Petrol)	Manifold pressure sensor	Change the wiring
Injection computer (Diesel)	Particle filter differential pressure sensor	Change the wiring
Injection computer (Diesel)	Rail pressure sensor	Change the wiring
Injection computer (Petrol and Diesel)	Turbocharging pressure sensor	Change the wiring
Injection computer	Accelerator pedal sensor	Change the wiring, except for the connector on KANGOO (see **Connector: Repair**)
Injection computer (Petrol and Diesel)	TDC sensor	**See OTS***
Injection computer (Diesel)	Particle filter (downstream) output sensor	Change the wiring
Injection computer (Petrol and Diesel)	Air temperature sensor	Change the wiring
Injection computer (Petrol)	Turbine upstream temperature sensor	Change the wiring
Injection computer (Diesel)	Fuel temperature sensor	Change the wiring
Injection computer (Petrol and Diesel)	Coolant temperature sensor	Change the wiring
Injection computer (Diesel)	Particle filter inlet temperature sensor (upstream)	Change the wiring
Injection computer (Diesel)	Injection air flowmeter	Change the wiring
Injection computer	Camshaft shift, row A, B	Change the wiring
Injection computer (Diesel)	Turbocharger control solenoid valve	Change the wiring
Injection computer (Diesel)	Damper solenoid valve	Change the wiring
Injection computer (Petrol and Diesel)	Injectors	Change the wiring
Injection computer (Diesel)	Diesel heater	Change the wiring
Injection computer (Diesel)	Water in diesel sensor	Change the wiring

*OTS: Special Technical Operation

● **Specific cases (cont. 2):**

Lines	Device	Instructions
Injection computer (Diesel/particle filter)	Oil level and temperature sensor	Change the wiring
Injection computer (Diesel)	Nitrogen oxide (Nox)	Change the wiring
Injection computer (Petrol and Diesel)	Upstream oxygen sensor	Change the wiring
Injection computer (Petrol and Diesel)	Downstream oxygen sensor	Change the wiring
Injection computer (Diesel)	Proportional oxygen sensor	Change the wiring
Injection computer (Diesel)	EGR valve	Change the wiring
Injection computer (Diesel)	Heater plug	Change the wiring
EPAS	/	Change the wiring
ETC (4x4 torque distributor)	/	Change the wiring
GMV	GMV	Change the wiring
Multiplex network	CAN	(See Multiplex network: Repair)
UPC (Petrol and diesel)	Air conditioning compressor	Change the wiring
UPC (Petrol)	Oil level sensor	Change the wiring

3 - Summary flowchart of the operating procedure defined in this section.

1 - Purpose and applications.

Description of the content of the Wiring repair kit case as well as the procedure and the field of application.

The kit enables wiring which is damaged or has cut electrical wires to be repaired whilst ensuring that it will be fully functional.

It also allows wiring-connector kits to be used.

All electrical cables and wires with cross-sections between **0.35 mm^2** and **6 mm^2** except "sensitive lines" (defined in this document), are affected.

WARNING
Repair of sensitive lines is prohibited using the generic procedure alone. It can be authorised provided that there is an additional appropriate procedure (see **Wiring: Precautions for repair**).

The technical nature and the sensitivity of this type of operation requires the adapted equipment contained and described in the Wiring repair kit case.

WARNING
Using tools or components which have not been recommended is strictly forbidden when repairing wiring.

WARNING
For sensitive lines, only automotive electricians, technician agents or cotechs (Level 2 Electricity as a minimum) can carry out the repair described in this note.

2 - Terminology.

● **Wiring-connector kit.**
Kit usually made up of a connector the cells of which are populated with crimped wires along with sleeves for joining.

● **Multiplex lines or connections.**
Principal or secondary CAN network lines link the computers together and are made up of twisted pairs of stranded wires.

● **Turns or twists.**
For twisted pairs:
One turn (twist) = (**A**)

3 - Operation time (TM).

For each vehicle, an average repair time is given in the wiring section of the TM.

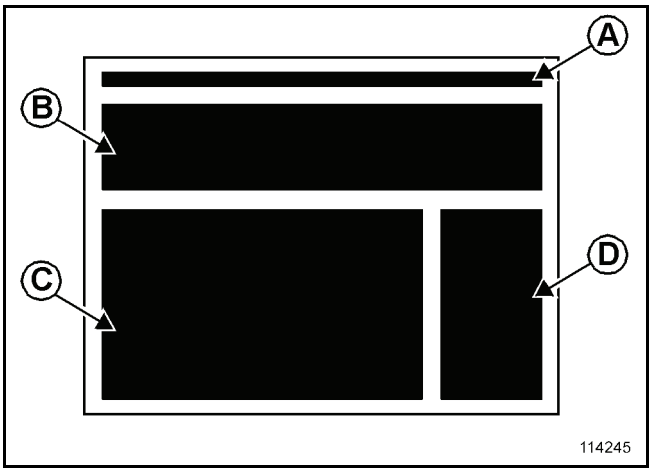
The corresponding codes are:
– **0500** for replacing a connector (using a connector kit).
– **0501** for repairing wiring.

This times do not include the time taken to access the area to be repaired. The time taken to remove and refit the wiring must be added.

1 - Case and label.

● **Case (77 11 420 544).**

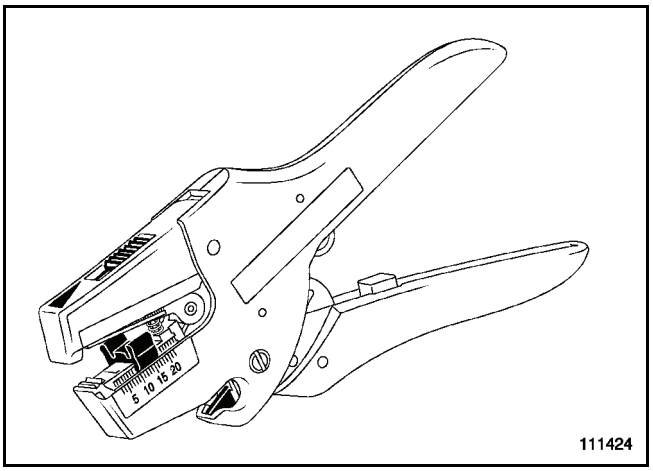
Part no. 77 11 420 544 corresponds to the new electrical repair case. It replaces case part no. 77 11 229 893.
Both part numbers are authorised for electrical repair.



The case contains all the components described in this section. A label lists their part numbers.

● **Label.**

The label affixed inside the case is made up of 4 sections in English and French.

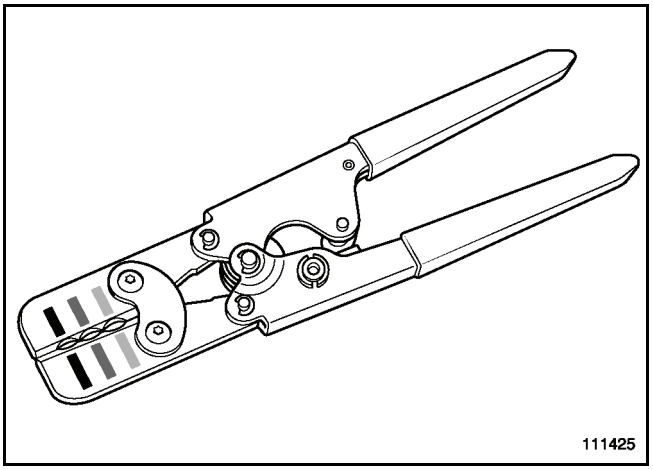


On the upper section, at (**A**) is the title and number of the note. At (**B**) are the After-Sales references (for the network) and MABEC code (for factories) which enables the kit to be restocked with consumables or new tools or a new kit to be ordered.

On the lower section, at (**C**) is a table (not exhaustive) which helps the right sleeve to be chosen, with a summary of the recommendations for each case. And at (**D**) are the recommendations for use.

2 - Tools.

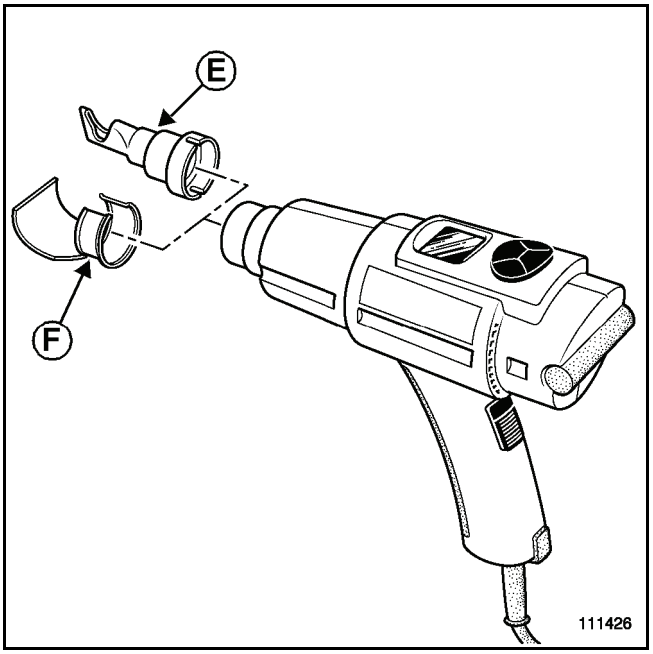
● **Stripping pliers (77 11 230 416).**



These are automatic stripping pliers which enable an electrical conductor up to a maximum cross-section of **6 mm^2** to be cut or stripped.
The length of the stripped section can be adjusted up to **20 mm**.

The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

● **Crimping pliers (77 11 421 296).**

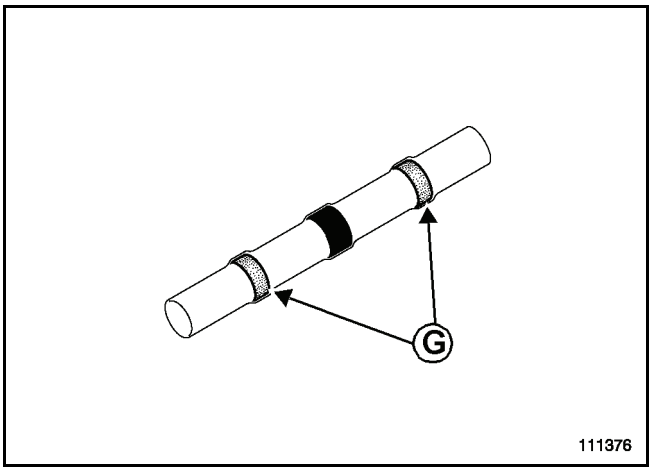


Part no. 77 11 421 296 corresponds to the new crimping pliers in the electrical repair kit. It replaces the crimping pliers with part no. 77 11 230 417.
Both part numbers are authorised for electrical repair.

The crimping pliers have three sizes of jaw (red, blue and yellow) which correspond to the crimping sleeves. These pliers are recommended for the crimping the sleeves provided in the kit.

The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

- **Heat gun (77 11 230 415).**



The heat gun is a hot air blower with 2 nozzles which enable it to be adapted for different needs:
- Concentrator nozzle **(E), (77 11 237 778)**.
- Heat shield nozzle **(F), (77 11 237 777)**.

It can be used to solder all self-solder sleeves and to contract the heat-shrinkable parts and sheaths on all sleeves
Its temperature and flow of air are adjustable and are indicated on the screen.
Temperature adjustment from **80°C** to **650°C** in increments of **5°C**.
Air flow adjustment from **200 l/min** to **550 l/min** at 5 levels displayed on the screen.

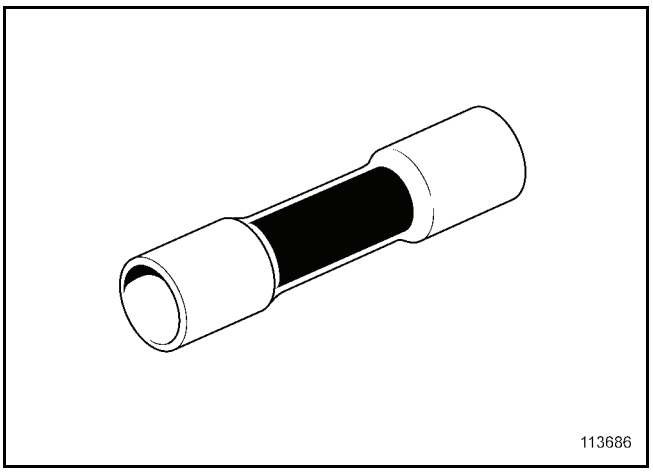
The operating instructions for this kit are described in this document (see **Wiring repair kit: Use**).

3 - Consumables.

- **Self-solder sleeves.**

There are three sizes of heat shrinkable self-solder sleeve differentiated by the colour of their rings (**G**):

- **Clear,** for a total copper section (sum of the 2 wires) between **0.3** and **0.8 mm^2** (packet of 20: **77 11 229 418**).



- **Red,** for a total copper section (sum of the 2 wires) between **0.8** and **2.0 mm^2** (packet of 20: **77 11 229 419**).

- **Blue,** for a total copper section (sum of the 2 wires) between **2.0** and **4.0 mm^2**(packet of 20: **77 11 229 420**).

These are sealing sleeves. The seal is formed when the rings are tightened around the wire when heated.

These sleeves are only to be used for connecting one wire with another wire (1-to-1).

● **Crimping sleeve.**

There are three sizes of heat shrinkable crimp sleeve differentiated by the colour of their rings:

– **Red,** for a copper section between **0.5** and **1.5 mm^2** (Packet of 20: **77 11 229 410**).

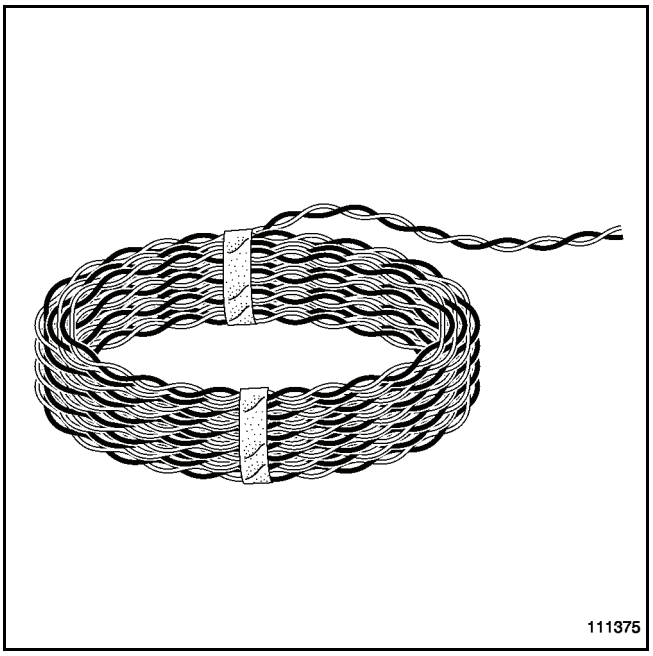
– **Blue,** for a copper section between **1.5** and **2.5 mm^2** (Packet of 20: **77 11 229 416**).

– **Yellow,** for a copper section between **3.0** and **6.0 mm^2** (Packet of 20: **77 11 229 417**).

These are sealing sleeves. The seal is formed by the inner wall which becomes adhesive when heated.

These sleeves can be used to join one wire with another wire (1-to-1) or two wires with another wire (2-to-1).

In the case where two wires are joined to one wire (2-to-1), the seal is no longer guaranteed. Do not use when a seal is required.

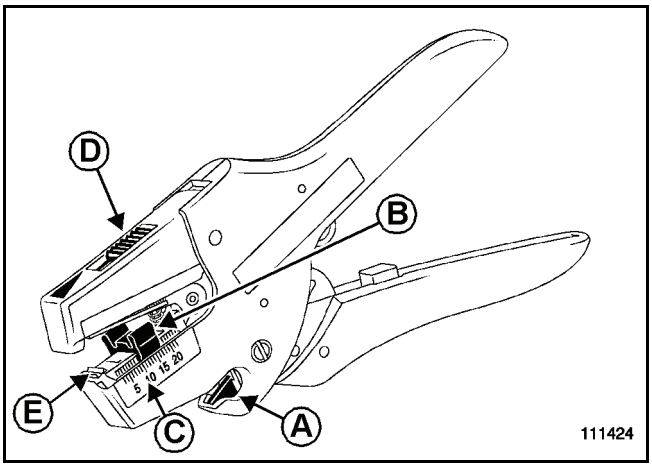


● **Thermal protection (77 11 229 424).**

The protective heat shield is a **250 mm** by **250 mm** square. It is intended to protect the surrounding area from the flow of hot air from the heat gun.

● **Adhesive PVC tape (77 11 170 331).**

Use the adhesive PVC tape for taping the wires. Do not use it to protect or insulate electrical parts.
It is a contact-adhesive high temperature tape.



● **Coil of twisted wires (77 11 229 425).**

This is a coil of a pair of twisted wires (40 turns/linear m). Ensure these wires remain twisted. The 2 wires have a **0.5 mm^2** cross-section and are of temperature class T3. It is possible to fit them in all areas of the vehicle during repairs to twisted wires of the same cross-section.

Note:
This section is an abridged version of the instructions for use of the tools in the kit.

1 - Stripping pliers.

● **Description of the stripping pliers:**

(**A**) = Wire cutter.
(**B**) = Stop for adjusting the length to be stripped.
(**C**) = Scale (millimetre divisions).
(**D**) = Pressure adjustment.
(**E**) = Stripping jaws and cutting edges.

● **Cutting a wire:**

To cut electrical wires up to **6 mm^2**, insert the wire into slot **(A)** and press the handle.

● **Stripping a wire:**

This pair of stripping pliers is automatic. It does not need adjusting to the cross-section of wire to be stripped **(6 mm^2** maximum).

To strip a wire, adjust the length to be stripped by moving the stop (**B**). Press lightly on the ends to make it slide. The length to be stripped is read on the scale (**C**) in millimetres (mm).

Adjust the stripping pressure by moving the cursor (**D**). Press on the cursor to make it slide. The further forward the cursor is, the greater the force.

WARNING
If the pressure is too weak, the cutting edges will not grip the wire's insulation. If the pressure is too strong, the cutting edges can cut through the copper strands. Start with a medium setting and then adjust according to results.

Place the end of the wire against the stop (**B**) and bring it out through the jaws (**E**).

Press the handle. The jaws will grip the wire. The cutting edges will automatically adjust their position in relation to the section of wire and strip it.

WARNING
Check the quality of the stripped wire (insulation cleanly removed and no cut copper strands). Start again if necessary.

2 - Crimping pliers.

The crimping pliers are the only pliers recommended for crimping the crimp sleeves in the kit.

They are used on the 3 sizes of crimp sleeve:
- At (**F**) for crimping the **red** crimp sleeve.
- At (**G**) for crimping the **blue** crimp sleeve.
- At (**H**) for crimping the **yellow** crimp sleeve.

Before crimping a sleeve:
- choose the sleeve suitable for the cross-section of the wire (see **Wiring: Repair**),
- strip the recommended length of wire.

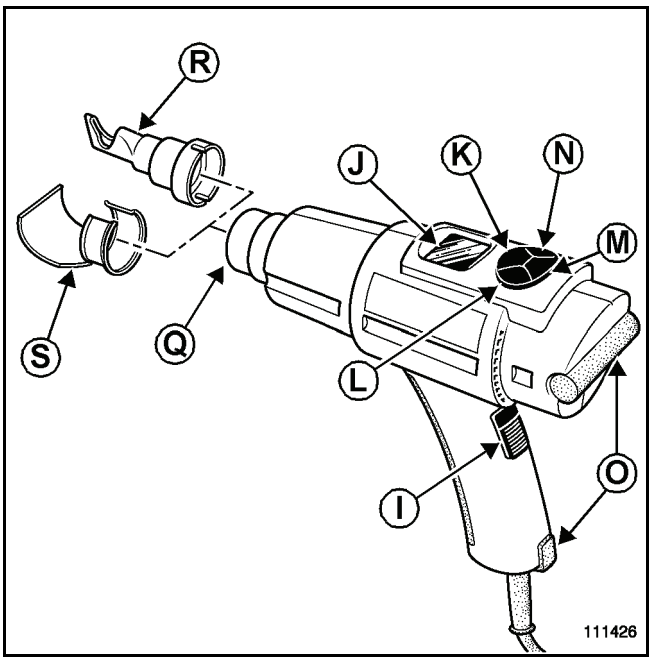
● **Crimping operation:**

Squeeze the handles fully together to unlock the pliers and open the jaws.

On the pliers, find the crimping jaws which correspond to the sleeve being used.

Insert the wire(s) into one end of the sleeve.

Position the pliers' jaws in the middle of the half of the metal shaft where the wire(s) are.



Squeeze the handles fully together to crimp the sleeve onto the wire(s). Crimping is complete once the pliers are opened again.

Check that the copper of the wire is correctly crimped and that the plastic part of the sleeve has not been cut.

Repeat the crimping operation on the other end of the sleeve.

Note:
If the wire is not correctly crimped, cut the wire at the sleeve and start the operation again with a new sleeve.

3 - Heat gun.

WARNING
Before using the gun, the user must familiarise themselves with the safety advice in the user's manual provided by the manufacturer.

● **Introduction to the gun:**

The heat gun is recommended for contracting heat shrinkable sleeves.
For other applications, the user must take the precautions and advice in the user's manual into account.

● **Description of the heat gun:**

(**I**) = On (1)/off (0) switch.
(**J**) = Display screen.
(**K**) = SELECT MENU button.
(**L**) = + button for setting parameters.
(**M**) = STANDBY button (pause/cooling).
(**N**) = - button for setting parameters.
(**O**) = Supports for resting the tool on a bench.
(**P**) = Tool air inlet.
(**Q**) = Tool air outlet.

● **Accessories:**

(**R**) = Concentrator nozzle.
(**S**) = Deflector nozzle.

Note:
The concentrator nozzle (**R**) is recommended when using the heat gun on the crimp or self-solder sleeves in the kit.

WARNING
The heat shield nozzle (S) can be used for contracting single heat shrinkable sheaths. Do not use it for contracting the crimp or self-solder sleeves in the kit.

● **General information on the setting parameters:**

When contracting the sleeves in the kit, use the FREE program and change the settings as recommended. A memory function recalls the program and settings from the last time the gun was used.

● **Switching on the gun:**

Connect the appliance to the mains electricity supply (**230 Vac** - **50 Hz** or **60 Hz**), respecting all precautions.
Push the switch (**I**) on (1).
The appliance will come on using the programs and settings most recently used.

WARNING
The gun starts heating immediately.

WARNING
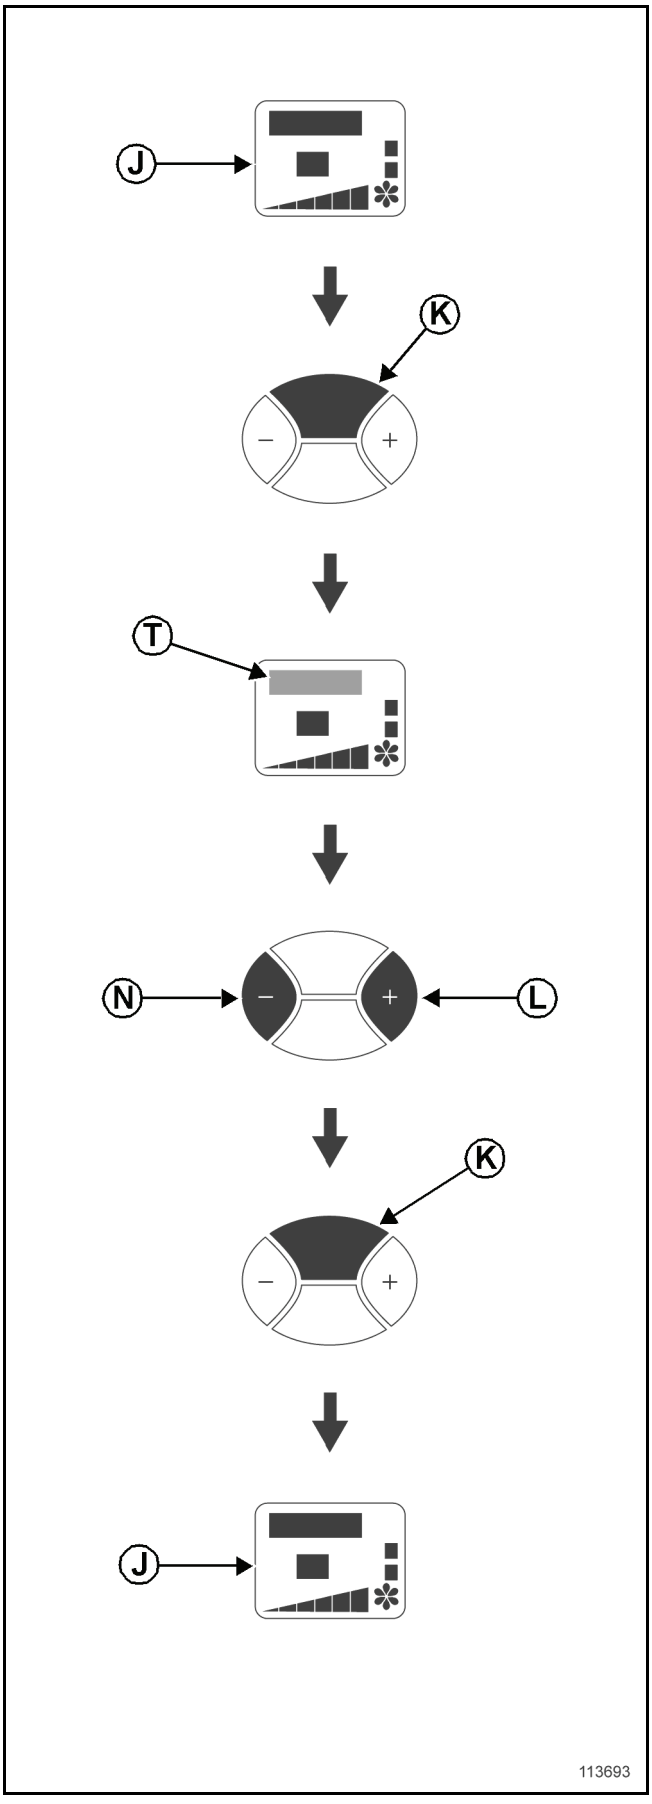
Before putting the gun away in its case or anywhere else, leave it to cool down to ambient temperature.



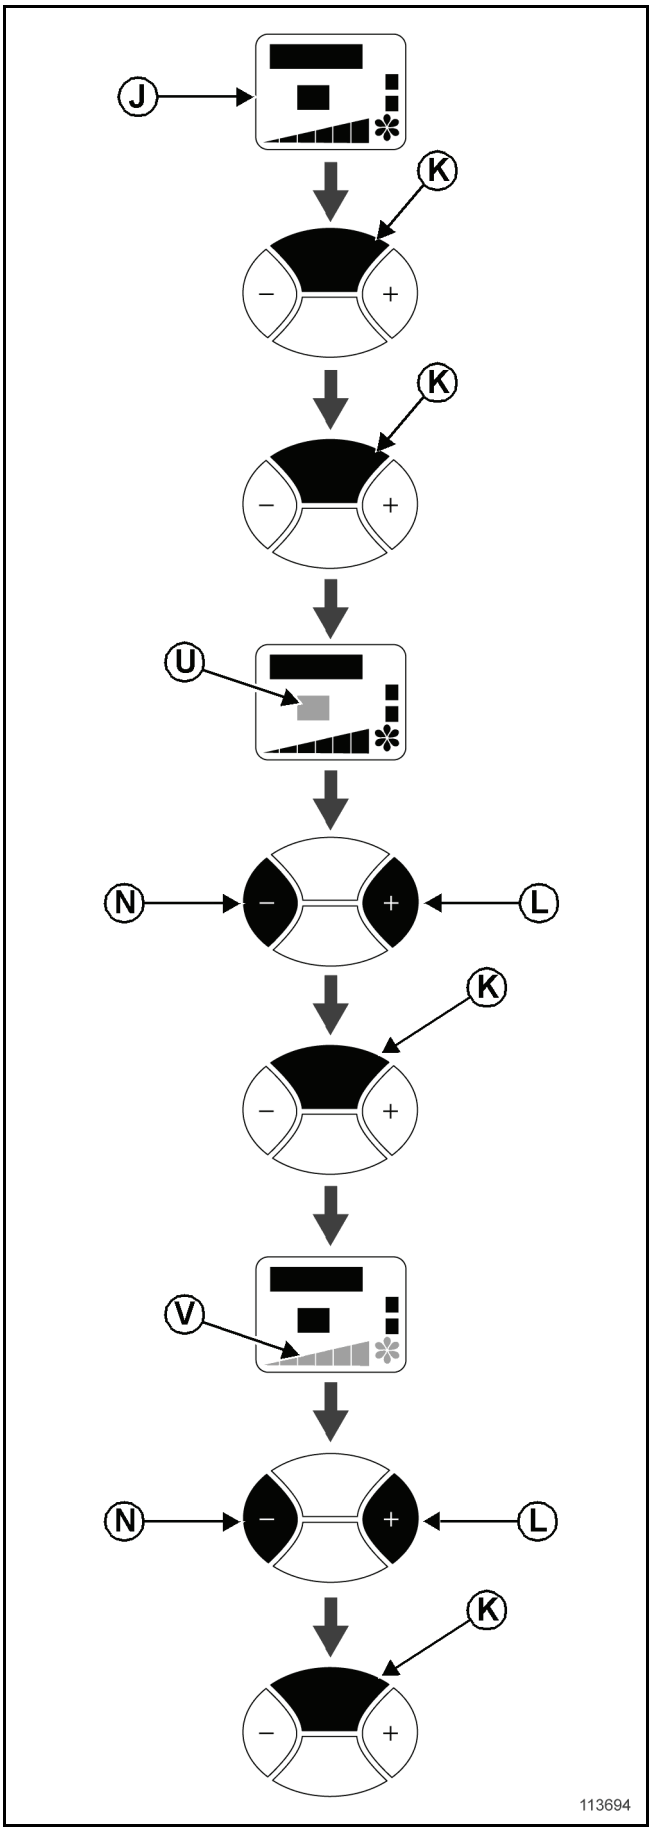
● **Operating instructions:**

The heat gun is used in two ways. It can either be held in the hand and used directly. Or it can be set down on its supports (**O**) on a clean and tidy bench. The latter has the advantage of leaving the user with both hands free.

● **Programs:**

Always work with the FREE program shown on the screen (**J**) at (**T**). If it is not shown, perform the following operation:

– press menu selection button (**K**) once,
– program field (**T**) on display field (**J**) flashes,
– select the free program using the + (**L**) or - (**N**) buttons,
– press the menu selection button (**K**) once, so that field (**T**) on display screen (**J**) stops flashing.



● **Temperature and air flow settings:**

To change the program settings (the FREE program is recommended), carry out the following operation:

– press menu selection button (**K**) twice,
– temperature field (**U**) on display field (**J**) flashes,
– adjust the temperature using the + (**L**) or - (**N**) buttons,
– press menu selection button (**K**) once,
– air flow field (**V**) on display field (**J**) flashes,
– adjust the air flow using the + (**L**) or - (**N**) buttons,
– press menu selection button (**K**) once, so that the fields on display screen (**J**) stop flashing.

Note:
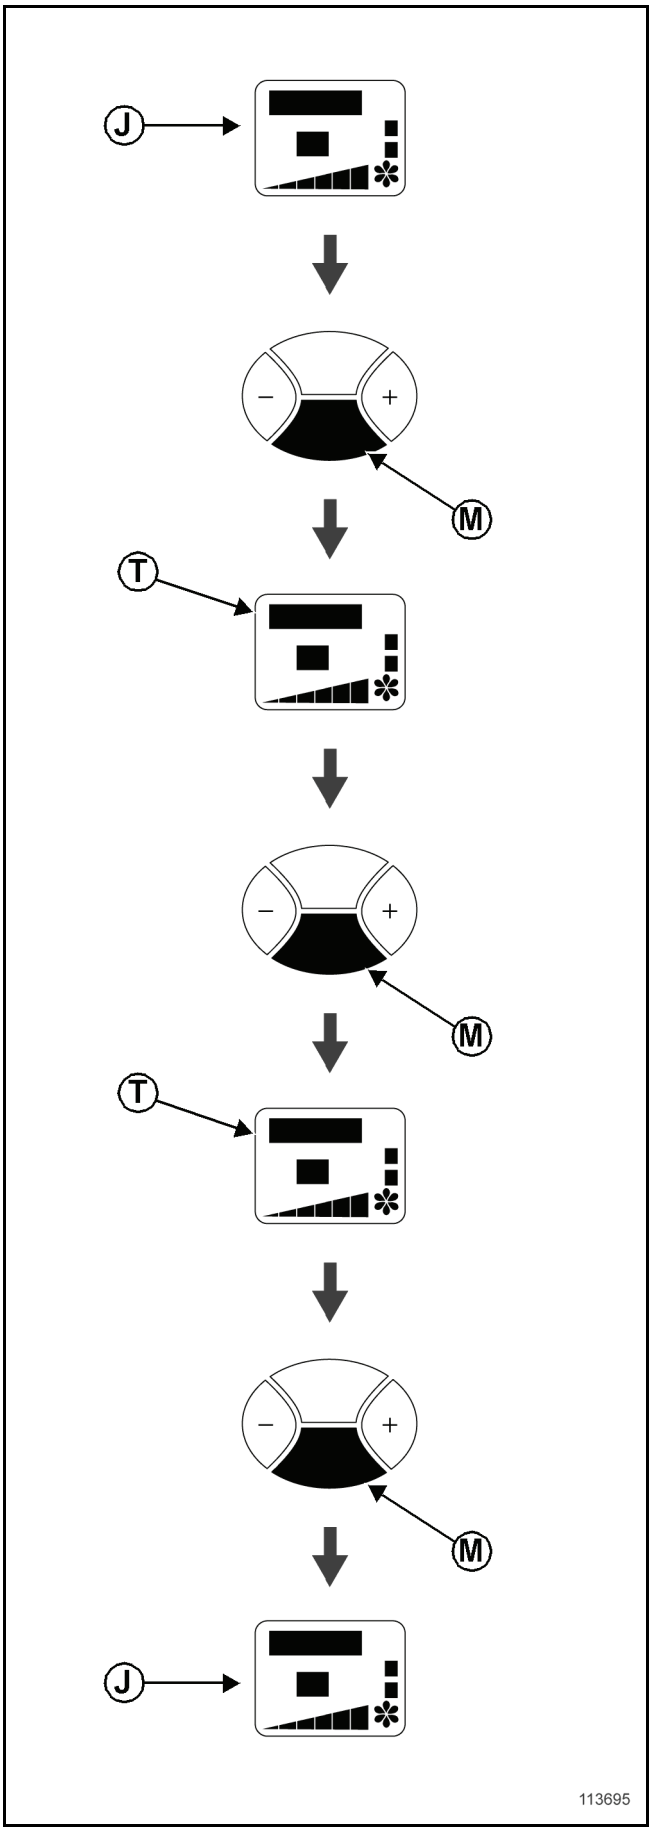
When using the heat gun on crimp or self-solder sleeves, the air flow is always on the maximum setting, only the temperature varies.

● **Special modes (COOL/PAUSE):**



After use and before pushing switch (**A**) off (0), cool the gun. Similarly, during brief pauses or for lower power consumption, switch the gun to PAUSE mode by carrying out the following operation.

Before switching off the heat gun:

– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows COOL,
– wait until the temperature goes down to **150**°**C** and push switch (**A**) off (0).

To switch to economy mode:

– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows COOL,
– press STANDBY button (**M**) once,
– program field (**T**) on display field (**J**) shows WAIT,
– the gun is in economy mode,
– press STANDBY button (**M**) once to recover the previous settings and start heating again.

Note:
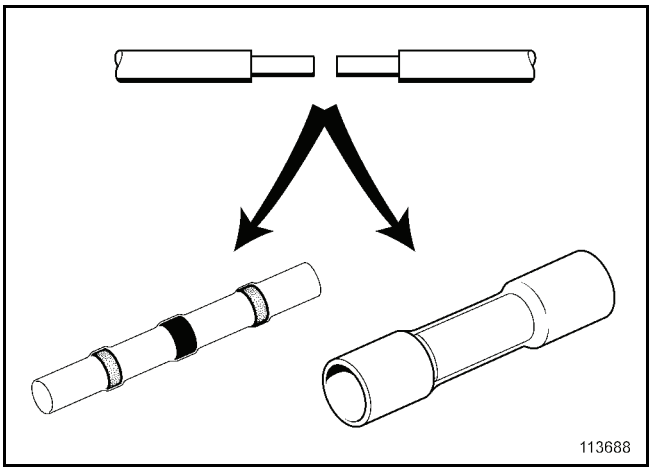
This relates to **the generic repair procedure**.

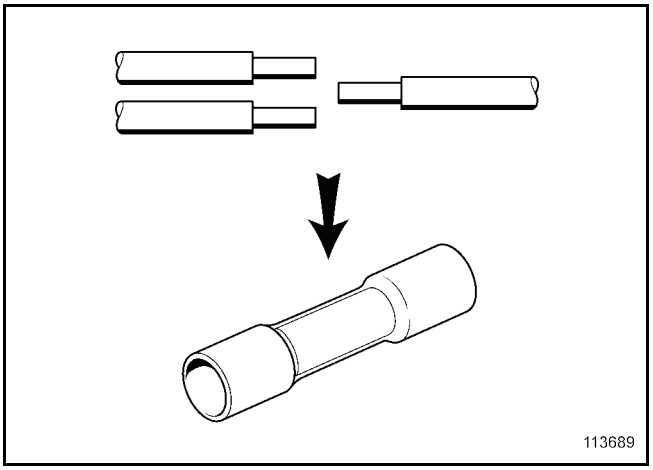
1 - Choosing the sleeve.

The are two possible techniques available:
- self-solder sleeves,
- crimp sleeves.



For each technique there are 3 sizes of sleeve.

The choice of sleeve depends on the following criteria:



- **Type of operation.**

Note:
This is **stage 1** when using the label.

If wire to wire (1-to-1), use crimp sleeves or self-solder sleeves.

If 2 wires and 1 wire (2-to-1), **only** use crimp sleeves. In this case, the seal can no longer be guaranteed. Do not use this solution when a tight seal is needed (engine and underbody areas and damp areas of the doors and boot).

- **Wire cross-sections.**

Note:
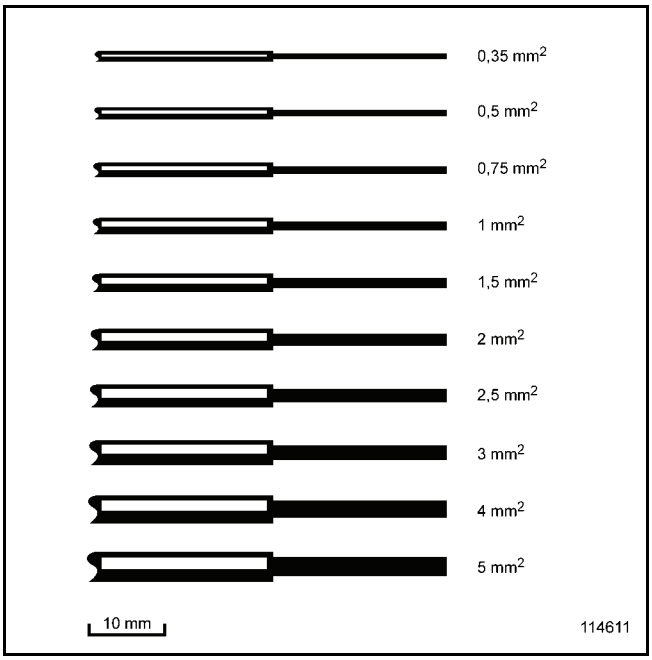
This is **stage 2** when using the label.



See the sleeve choice table taken from the label.

Note:
The columns corresponding to the wire cross-sections give a representative overview of the different cases.

Identify the cross-section of the wire which is the subject of the operation. Use the diagram which shows pictures of wires which correspond to the wire cross-sections.

Check that the diagram is at scale 1.

Find the stripped section of wire.

Refer to the columns of wire cross-sections to find your case.

Note:
If the case in question is not present, refer to the special cases.

Example 1.
Joining together 2 wires, each **0.5 mm²** (1-to-1 type operation). Look at the upper section of the columns (1-to-1).
Each wire (A and C) has a **0.5 mm²** cross-section.
Refer to the line where:

- column A shows **1 x 0.5 mm²**,
- and column C shows **1 x 0.5 mm²**.

Example 2.
Joining 3 wires together (2-to-1 type operation). Look at the lower section of the columns (2-to-1).
On one side, the 2 wires (A and B) both have a **1 mm²** cross-section. On the other side, wire C has a **2 mm²** cross-section. Refer to the line where:

- columns A & B show **2 x 1 mm²**,
- and column C shows **1 x 2 mm²**.

- **Identifying the settings.**

Note:
This is **stage 3** when using the label.

After having found your case in question, follow the corresponding line to find the setting parameters.
The settings correspond to the lengths to be stripped and the temperature of the heat gun.

The column corresponding to these parameters gives the recommended sleeve.

Note:
If several sleeves are possible for the same operation, choose the one best adapted for the number of wires to be repaired, the wiring layout and the vehicle layout (thickness of the harness, available room etc.).

As relates to the previous examples.

Example 1.
2 possible sleeves:
- Either the red self-solder sleeve.
- Or the red crimp sleeve.

Example 2.
- Only the blue crimp sleeve is possible.

- **Special cases.**

If the case in question is not shown in the selection table, apply the following rules to select a sleeve.

In all cases, identify the cross-section of each wire (copper strands).

● **Case of a wire joint between 1 wire and 1 wire (most common situation).**

Conditions for self-solder sleeves:

Add together the 2 wire cross-sections (copper strands):

If **0.3 mm²** ≤ (section 1 + section 2) ≤ **0.8 mm²**, use the self-solder sleeve with **clear rings**.
Strip **10 mm** from each wire.
The temperature setting is **300°C**.

If **0.8 mm²** ≤ (section 1 + section 2) ≤ **2 mm²**, use the self-solder sleeve with **red rings**.
Strip **12 mm** from each wire.
The temperature setting is **340°C**.

If **2 mm²** ≤ (section 1 + section 2) ≤ **3 mm²**, use the self-solder sleeve with **blue rings**.
Strip **15 mm** from each wire.
The temperature setting is **400°C**.

Conditions for crimp sleeves:

Consider the section of each wire separately.

If **0.5 mm²** ≤ each section ≤ **1.5 mm²**, use the **red** crimp sleeve.
Strip **7 mm** from each wire.
The temperature setting is **280°C**.

If **1.5 mm²** ≤ each section ≤ **2.5 mm²**, use the **blue** crimp sleeve.
Strip **7 mm** from each wire.
The temperature setting is **300°C**.

If **3 mm²** ≤ each section ≤ **6 mm²**, use the **yellow** crimp sleeve.
Strip **8 mm** from each wire.
The temperature setting is **320°C**.

● **Case of a wire joint between 2 wires and 1 wire (less common situation).**

Conditions for crimp sleeves:

Add together the 2 wire cross-sections (copper strands) found on one side of the sleeve to find ***Sum side 1***.

If **0.5 mm²** ≤ ***Sum sections side 1*** ≤ **1.5 mm²**.
And if **0.5 mm²** ≤ wire cross-section side 2 only ≤ **1.5 mm²**, use the **red crimp sleeve**.
The temperature setting is **280°C**.

If **1.5 mm²** ≤ ***Sum sections side 1*** ≤ **2.5 mm²**.
And if **1.5 mm²** ≤ wire cross-section only side 2 ≤ **2.5 mm²**, use the **blue crimp sleeve**.
The temperature setting is **300°C**.

If **3 mm²** ≤ ***Sum sections side 1*** ≤ **6 mm²**.
And if **3 mm²** ≤ wire cross-section only side 2 ≤ **6 mm²**, use the **yellow crimp sleeve**.
The temperature setting is **320°C**.

For stripping the wires:

7 mm is stripped from the single wire (side 2) for red and blue crimp sleeves and **8 mm** for the yellow sleeve.

If the two wires (side 1) have the same cross-section, strip **10 mm** from them for red and blue crimp sleeves and **11 mm** for the yellow sleeve.

If the 2 wires (side 1) have different cross-sections, then:
For red and blue crimp sleeves, strip **10 mm** from the smaller cross-section and **7 mm** from the larger cross-section.
For the yellow sleeve, strip **11 mm** from the smaller cross-section and **8 mm** from the larger cross-section.

WARNING
If no sleeve corresponds to the case in question, the operator cannot repair the wiring. Replace the wiring harness.

● **Settings table (taken from the label).**

	Sleeves / Wire cross-sections		Self-solder									Crimp								
			clear			red			blue			red			blue			yellow		
			$0.3^2 \leq A+C \leq 0.8^2$			$0.8^2 \leq A+C \leq 2^2$			$2^2 \leq A+C \leq 3^2$			$0.5^2 \leq A+B \leq 1.5^2$ & $0.5^2 \leq C \leq 1.5^2$			$1.5^2 \leq A+B \leq 2.5^2$ & $1.5^2 \leq C \leq 2.5^2$			$3^2 \leq A+B \leq 6^2$ & $3^2 \leq C \leq 6^2$

	2x1 mm²	1x2 mm²																	10	10	7	300				
	1x0.5 mm² + 1x 1.5 mm²	1x2 mm²																	10	7	7	300				
	1x0.5 mm² + 1x3 mm²	1x3 mm²																					11	8	8	320
	2x2 mm²	1x6 mm²																					11	11	8	320
Stripping/Temperature			**mm**			**°C**	**mm**			**°C**	**mm**			**°C**	**mm**			**°C**	**mm**			**°C**	**mm**			**°C**

In the case of a 1-to-1 type operation, wires **A** and **C** denote the wires which are found at either side of the sleeve.

In the case of an operation where 2 wires are joined to 1 (2 to 1), wires **A** and **B** denote the 2 wires which are found at the same side of the sleeve (**A** is the smaller section). **C** denotes the single wire on the other side.

2 - Preparation.

To start the preparatory stage, check that the wiring is sufficiently accessible and that the sleeves have been chosen.

– Detach the wires from the wiring.

– Check that the operating area is sufficiently spacious and that the sleeves can be fitted staggered (if there is a number of wires).

– Mark the wires to be cut, particularly if there is a number of wires the same colour.

– Cut the damaged wire(s). Stagger the cuts if a lot of wires are marked so that the sleeves are not all on top of each other. The cut must be made at a distance of no less than **50 mm** from the damaged section and in an area where the sleeve will remain straight.

– Cut the replacement wire to length(s) identical to those removed from the harness. If the self-solder sleeves are being used, add **30 mm** for the wire joints.

WARNING
The cross-section of replacement wire must not be less than the original cross-section of wire.

WARNING
Use a 0.5 mm^2 wire to repair a 0.35 mm^2wire.

WARNING
The temperature class of the replacement wire must be greater than or equal to class T3. For the repair, use the wires recommended by the parts department network, checking that they are suitable for your requirements.

– Strip the ends by the lengths indicated in relation to the sleeve chosen, using the stripping pliers (see **Wiring repair kit: Use**).

– Protect sensitive areas close to the wiring with the heat shield.

3 - Self-solder sleeves.

Note:
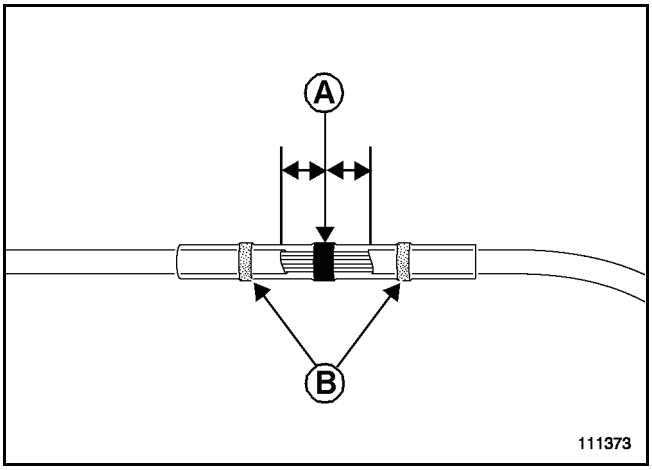
Fit the self-solder sleeves (connection and heating) line by line, sleeve by sleeve.

● **Connection.**



The equipment necessary and the wires are ready for the operation:

– Slip the self-solder sleeve onto one of the wires.

– Connect the wires by twisting the stripped sections around each other.

– Slide the sleeve over the stripped section. The ring of solder should end up in the centre of the stripped and twisted wires (**A**). The stripped and twisted section of the wires must be located between the 2 sealing rings (**B**).

WARNING
When twisting the wires, make sure that your hands are not greasy so that the solder adheres.

WARNING
When the sleeve is positioned, check that all the copper strands remain flat and subsequently are not at risk of perforating the sleeve. Start the operation to join the wires again if necessary.

WARNING
The sealing rings must be clearly located on the insulated section of the wires (B) and not on the copper or where the copper and the insulated section meet. Start the operation to join the wires again if necessary.

Once the wires are joined, start the heating operation.

- **Heating the self-solder sleeve.**

  – Switch on the heat gun fitted with the concentrator nozzle after familiarising yourself with the precautions for use (see **Wiring repair kit: Use**).

  – Adjust the temperature and the air flow to the values indicated (see **Wiring repair kit: Use**).

  – Check that the sensitive areas close to the sleeve and the other electrical wires are not at risk of damage.

  – Heat the sleeve starting at the centre, concentrating the heat on the ring of solder and the stripped section of the wires.

  – When the copper and the ring of solder become hot enough, the ring of solder melts and runs in between the copper strands (**C**).

  – When the solder has completely melted, move the nozzle to the ends of the sleeve to finish shrinking the sheath.

  – The sealing rings of the sleeve tighten around the insulation of the wires (**D**).

Note:
Spend the majority of the recommended time on the ring of solder and the rest of the time on the ends of the sleeve.
The heating operation takes **30 s** ± **10**. This time is a guide only. It can be reduced or increased depending on how efficient the heating is.

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

WARNING
Wait for the sleeve to cool before manipulating it to maintain the quality of the solder (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the quality of the solder or the sealing properties of the sleeve.

Note:
– Do not move during installation.
– Do not overheat the sleeve.
– Do not move the sleeve or wires until they have cooled.

If several self-solder sleeves must be positioned, repeat the operation sleeve by sleeve.

When the heating operations have finished, move on to the checking operation (see **Wiring: Check**).

4 - Crimp sleeves.

Note:
For a wire-to-wire join, go straight to the crimping operation.

● **Special notes for joining 2 wires to 1 wire.**

WARNING
Do not use if a tight seal is needed (engine and underbody areas and damp areas of the doors and boot).

When joining 2 wires to 1 wire, first connect the 2 wires from the same end in the following way:

– If the 2 wires have identical diameters, twist together the stripped section of the 2 wires (**E**), before putting them into the sleeve.

– If the 2 wires have different diameters, wind the stripped section of the smaller wire around that of the larger wire (**F**) before inserting them in the sleeve.

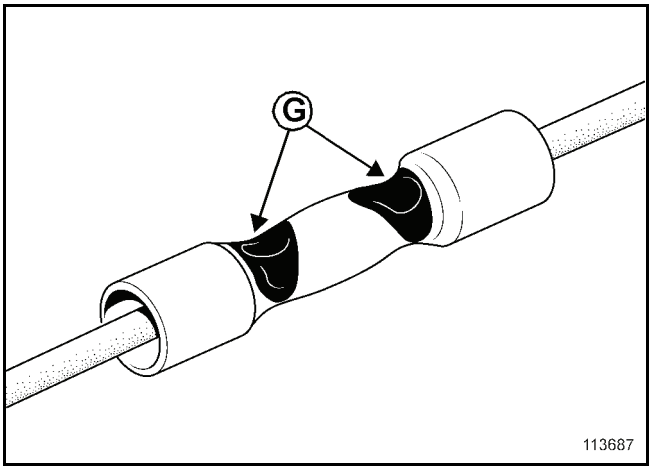
● **Crimping.**

The equipment necessary and the wires are ready for the crimping operation:

– Take the crimping pliers. Squeeze the handles fully together to unlock the pliers and open the jaws (see **Wiring repair kit: Use**).

– On the pliers, find the crimping jaws which correspond to the sleeve chosen.

– Insert the wire(s) into one end of the sleeve up to the stop located inside the metal barrel of the sleeve.



– Position the pliers' jaws around the middle of the section of the metal barrel where the wire(s) are.

– Squeeze the handles fully together to crimp the sleeve onto the wire(s). Crimping is complete once the pliers are opened again.

WARNING
Check that the copper of the wire is correctly crimped and that the plastic part of the sleeve has not been cut. If the wire has been stripped by the correct length and correctly inserted in the metal barrel, then the copper of the wire should barely jut out from the shaft.

Note:
If the wire is not correctly crimped, cut the wire before the sleeve and start the operation again with a new sleeve.

Repeat the crimping operation on the other end of the sleeve to obtain the result below.

The pliers have correctly crimped each wire on the halves of the metal barrel at (**G**) without damaging the plastic.

- **Heating the crimping sleeve.**

  – Switch on the heat gun fitted with the concentrator nozzle after familiarising yourself with the precautions for use (see **Wiring repair kit: Use**).

  – Set the temperature and the air flow to the values indicated, following the procedure in this note (see **Wiring repair kit: Use**).

  – Check that the sensitive areas close to the sleeve and the other electrical wires are not at risk of damage.

  – Heat the sleeve starting at the centre.

  – When the sheath starts to contract, move the nozzle to one of the ends.

  – The sheath continues to contract and produces a glue.

  – When the end of the sleeve has completely contracted and the glue has correctly covered the opening of the sleeve, repeat the operation on the other end to obtain the result shown at (**H**).

Note:
Spend the majority of the recommended time on the metal barrel and the rest of the time on the ends of the sleeve.
The heating operation takes **30 s** ± **10**. This time is a guide only. It can be reduced or increased depending on how efficient the heating is.

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

WARNING
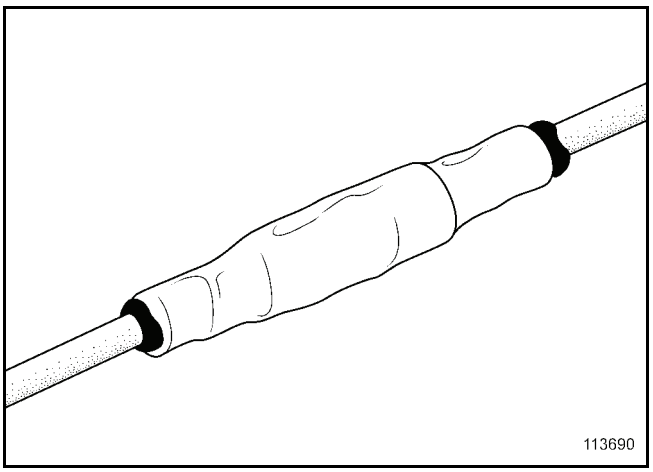
Wait for the sleeve to cool before manipulating it to ensure that the sealing properties of the sleeve are not affected (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the sealing properties of the sleeve.

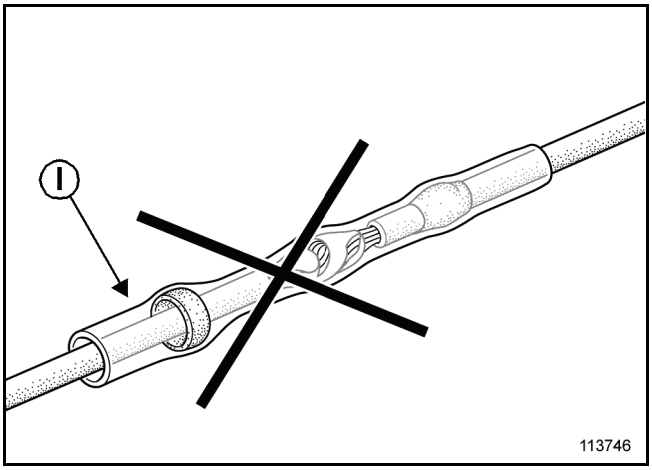
When the heating operations have finished, move on to the checking operation (see **Wiring: Check**).



1 - Visual checks.

- The insulation of the wires is within the sleeve.
- (Self-solder sleeves) The sealing rings must be clearly located on the insulated section of the wires.
- (Self-solder sleeves) The solder has completely melted.
- (Crimp sleeves) The adhesive of the crimp sleeves forms a barrier at the ends of the sleeves.
- The sleeves has completely contracted around the insulation of the wires.
- The sleeve is not cut, slit, discoloured or pierced by a copper strand.
- The insulation of the wires does not show any sign of damage caused by overheating.
- The wiring and the area surrounding it have not been damaged by the heating operation.

Result of a correctly applied self-solder sleeve.



Result of a correctly applied crimp sleeve.

WARNING
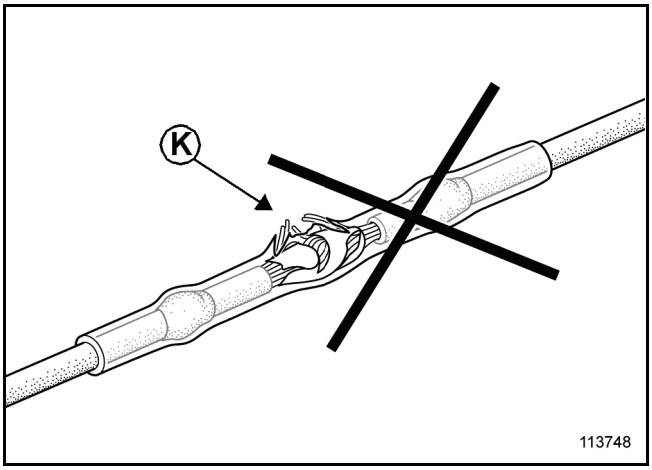
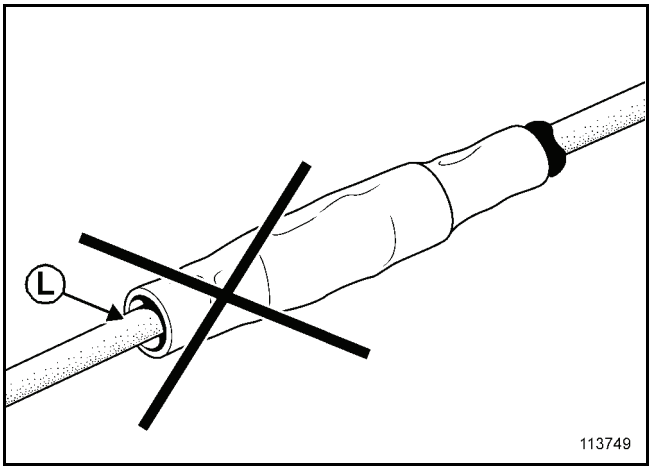
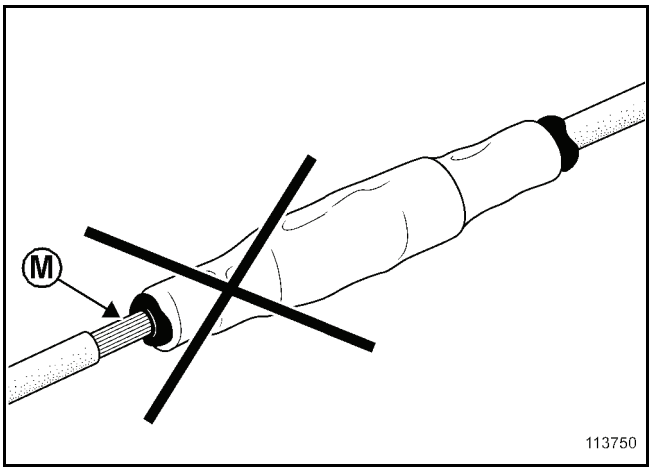
The various struck-through cases are strictly forbidden.



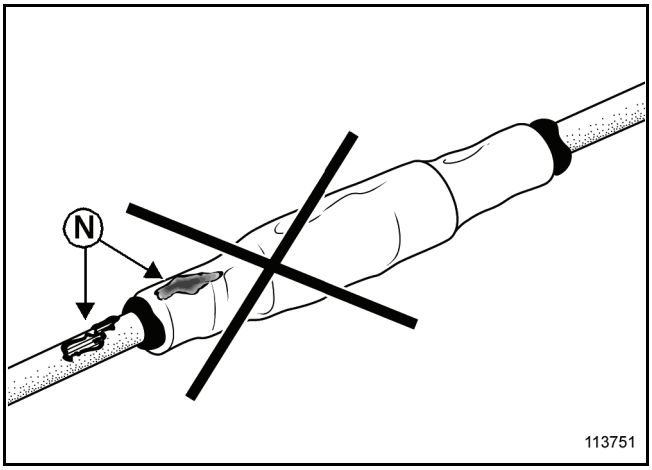
The self-solder sleeve has not been correctly shrunk. At (**I**), the sealing ring has not contracted around the insulation of the wire.



The sealing ring of the self-solder sleeve is directly on the copper of the wire at (**J**).



The protruding strands of the wire have pierced the self-solder sleeve at (**K**) during contraction.



The crimp sleeve has not been correctly shrunk. At (**L**), the adhesive does not form a barrier at the end of the sleeve.

The adhesive of the crimp sleeve is directly on the copper of the wire at (**M**).

The sleeve and the insulation of the wire show signs of damage at (**N**) cause by overheating.

Note:
Reconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

2 - Check with the diagnostic tool.

When a repaired line can be tested with the diagnostic tool, run this check.

3 - Function check.

Check that the component or the function of the repaired line is working correctly. If the case in question requires it, carry out a test drive.

Note:
Always check for faults after repair.

Refer to the fault finding procedure for the function concerned.

4 - Fitting and protections.

After the operation:

- reposition the wires concerned in the main harness,
- tape up the main harness using adhesive tape,
- protect the harness as it is was originally using equivalent (noise or anti-damage) or superior protection with the protections recommended by the Parts Store network.

The part numbers for the protections are as follows:
– **77 11 237 838** - Protective sheath for wiring, diameter **7 mm** (mechanical)
– **77 11 237 839 -** Protective sheath for wiring, diameter **18 mm** (mechanical)
– **77 11 237 840 -** Protective sheath for wiring, diameter **31 mm** (mechanical)
– **77 11 237 841** - Velour tape for wiring harness (sound insulation)

WARNING
Any repair which requires a specific heat shield for the wiring are forbidden. Replace the wiring harness.

WARNING
Check that the wiring is correctly maintained and protected to avoid any wear by rubbing and any noise disturbance.

5 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

WARNING
Apply this procedure when there is a connector - wiring kit or wire kit. Unless the kit is linked to one of the sensitive lines listed in the specific procedures reference table (see Wiring: Precautions for repair). In this case, apply the specific procedure for the sensitive line concerned.

1 - Wiring-Connector kit.

A wiring-connector kit enables repair to be carried out when the connector is faulty or when the fault is located less than **10 cm** from the connector.

A wiring-connector kit is generally made up of:

- at least 1 connector,
- crimped wires with corresponding contacts,
- sealing components if the connector is sealed,
- the self-solder or crimp sleeves necessary for the repair,
- other components specific to the function concerned (e.g. fuses).

Note:
if there is no kit, it is possible to create a wiring - connector kit if the following rules are respected:
– The connector affected by the repair must be taken from the **new wiring** provided as a spare part and intended for this repair.
– The function affected by the repair must not by covered by a special procedure.
– The connector should not be made up of more than **10 wires**.
– The wires are cut more than **10 cm** away from the connector.
– For each opening, the wires of the connector taken from the new wiring have a cross-section which is equal to or greater than that of the original connector.
– For each opening, the metal contacts of the connector taken from the new wiring are the same material (gilded or tinplated) as those of the original connector.
– The precautions set out in this note are respected (see **Wiring: Precautions for repair**).

2 - Using a wiring-connector kit.

Except in the specific outlined cases, use the wiring-connector kits as follows:

- check that the kit is complete,
- check that the conductor configuration (position of wires in the cells of the connector) corresponds to your needs,
- check that the wire cross-sections of the wiring-connector kit are equal to or larger than the cross-section of wires to be repaired,
- mark the wires to ensure that the tracks are not reversed,

WARNING
The colour of the wires cannot serve as a marker. In certain cases, wiring-connector kits can have different colours to those of the wiring to be repaired.

- Cut the connector wires to be replaced to a length greater than **100 mm** and stagger the cut wires,
- shorten the wiring-connector kit wires so as to provide wires the same lengths as those cut from the wiring to be repaired. For self-solder sleeves, add **30 mm** for the wire joints,
- apply the generic repair procedure for the joint (see **Wiring: Repair**).

3 - Wire kit.

A wire kit is used to perform a repair when the connector is not damaged.

A wire kit is generally comprised of:

- 3 crimp wires
- protection on the metal contacts.

4 - Applying a wire kit.

NOTE
Access the electric documentation for the vehicle on Infotech to obtain the part number of the wire kit required and the removal procedure for the connector.

Except in the specific outlined cases, use the wire kits as follows:

- check that the kit is complete,
- check for the presence of protection on the metal contacts,
- check that the wire cross-sections of the wire kit are equal to or larger than the cross-section of wires to be repaired,
- mark the wires to ensure that the tracks are not reversed,

WARNING
The colour of the wires cannot serve as a marker. Wiring-connector kits may be different colours to those of the wiring to be repaired.

- cut the connector wires to be replaced to a length greater than 100 mm and stagger the cut wires,
- shorten the kit wires so as to provide wires with the same lengths as those cut from the wiring to be repaired. For self-solder sleeves, add 30 mm for the splices,

Apply the generic repair procedure for the joint (see **Wiring: Repair**).

5 - Checking and fitting the repair with wiring-connector kits.

- Carry out the generic repair procedure check (see Wiring: Check) or that for the specific procedures if it is a specific case (see Wiring: Precautions for repair).
- Apply the recommendations from the generic repair procedure concerning the fitting and protection (see Wiring: Check).

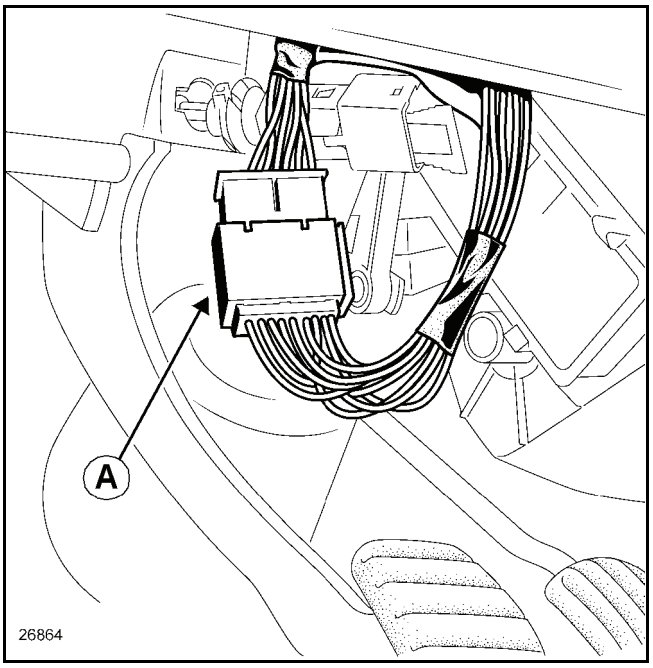
6 - Final check.

After any operation on wiring, check for the absence of faults using the diagnostic tools (Clip, etc.).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

This section deals with an electrical contact fault on the connector between the dashboard wiring and the pedal wiring on KANGOO.



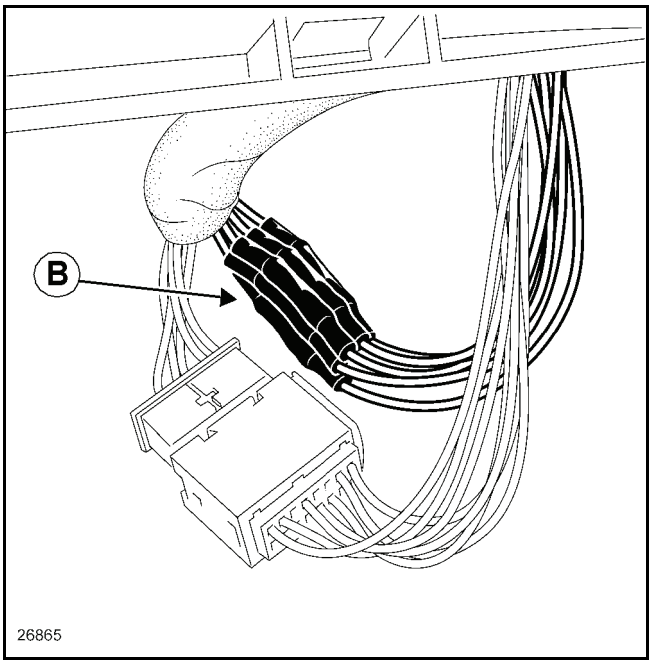
1 - Context.

Customer complaint:
Loss of engine power when driving, with the injection warning light illuminated on Kangoo vehicles with K4M, F9Q, D4F, D7F and K9K engines.

Possible cause:
Loss of contact on the 16-track **R181** connector (dashboard wiring harness and pedal connection).

2 - Description of the repair procedure.

Make the **R181** connector accessible and unclip it from its mounting (**A**).



On the **R181** connector and using the Wiring Diagrams Technical Note corresponding to the vehicle, mark the gangs related to the accelerator potentiometer.

Note:
Using the Wiring Diagrams Technical Note or applying a continuity check, check that it concerns gangs B1, B2, B3, B4, B5 and B6.

WARNING
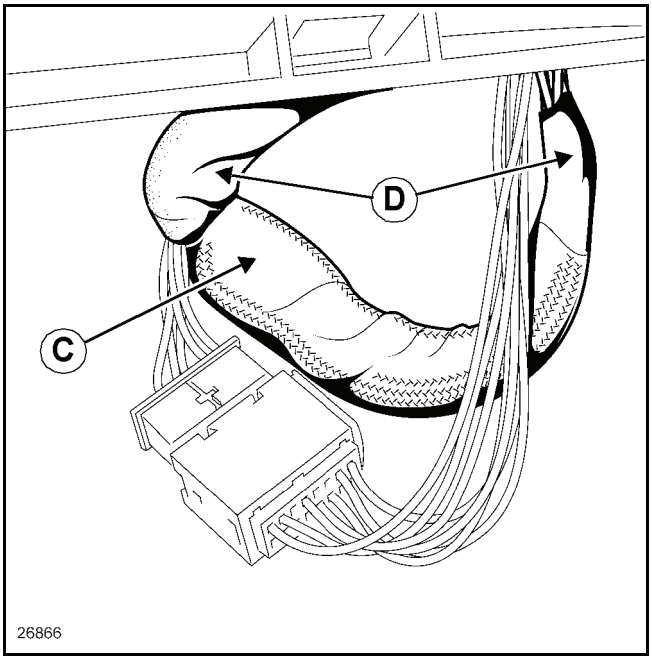
The colour of the wires is not same on either side of the R181 connector.



For each gang, proceed in the following manner:

- Cut the electrical wire either side of the connector.
- Make a wire joint with a **red self-solder sleeve** from the **wiring repair kit**, between the pedal electrical wire and the passenger compartment wiring electrical wire (**B**) (see **Wiring: Repair**).

After having shunted all of the wires concerned:

- Protect the shunted electrical wires (**C**) with wiring protective sheath with a diameter of **18 mm (77 11 237 839)**.
- Cover the ends of the protective sheath with **Adhesive PVC tape (D)**.
- Refit the **R181** connector on the mounting.
- Secure the shunted lines to the wiring using **Adhesive PVC Tape**.

3 - Repair check.

Continuity:

- Check the continuity of each of the shunted lines.

Function check:

- Clear the faults.
- Check the conformity of the pedal sensor parameters:
  - If it is a DDCR computer, see **Technical Note 3845A, Injection fault finding: DDCR VDIAG 04 - 08 - 10 - 0C - 14 - 18 - 20, Conformity check**.
  - If it is a DCM 1.2 computer, see **Technical Note 6500A, Fault finding - DCM 1.2 Injection Program 4C Vdiag 08, Conformity check**.
  - If it is a SIM 32 computer, see **Technical Note 3878A, Injection fault finding: SIM 32 SOFT D4 - Vdiag 04, Conformity check**.
  - If it is an EDC15 computer, see **Technical Note 3929A, Injection fault finding: DIESEL BOSCH EDC15C3 Vdiag 10 - 14 - 18, Conformity check** or **Technical Note 3930A, Injection fault finding: DIESEL BOSCH EDC15C3 Vdiag 0C, Conformity check** depending on the case.
  - If it is a SIRIUS 34 computer, see **Technical Note 3834A, Injection fault finding: SIRIUS 34-E932 - Vdiag 08, Conformity check**.
- Perform a road test.
- Check the status of the faults (present and stored).

Final check:

- Carry out a complete check with the **CLIP** tool and check that there are no faults.

This section explains how to insulate and immobilise an unused connector when changing the wiring.

2 cases are dealt with:
- Waterproof wiring in damp areas
- Non-waterproof wiring

Refer to the relevant section.

1 - For waterproof wiring in damp areas.

WARNING
This operation is compulsory for any wiring which is located in damp areas which needs to be waterproof (engine and underbody areas, and damp areas of the opening elements).
It applies to all of the unused connectors located on the wiring.

- **Equipment required.**

– Heat shrinkable waterproof sheath:

Part number of heat shrinkable waterproof sheath	Internal diameter (E) before contraction (mm)	Internal diameter (F) after contraction (mm)
7701 069 915	4 mm	1 mm
7701 033 055	8 mm	2 mm
7701 033 056	19 mm	4 mm

(E) < Diameter of electrical wire with insulation < **(F)**

– Adhesive **7703 397 035** (cracked cylinder of solid adhesive).
– Wiring repair kit (see **Wiring Repair Kit: Description**).

- **Description of the operation.**

Plug preparation:
– Mark the unused connector.
– Count the number of wires to be insulated and note their total diameter (copper and insulation).

Note:
The coupling of wires must be preserved.
If several wires are connected together in a connector opening, always preserve this connection.
The electric wires in the same opening will be connected together using self-solder sleeves or crimp sleeves from the wiring repair kit (See **Wiring repair kit: Description**).

– For every wire, remove **50 mm** of heat shrinkable sheath adapted to each wire diameter. The diameter of the wire must be less than the internal diameter of the sheath before contraction **(E)** and greater than the internal diameter of the sheath after contraction **(F)**.

– Heat the end **(G)** of the pre-cut sheath using the heat gun included in the wiring repair kit (See **Wiring Repair Kit: Description**) and contract it approximately 15 mm **(F)**.
The heat gun is equipped with the retraction nozzle and its temperature is adjusted to **120ºC**, with maximum air flow (See **Wiring Repair Kit: Description**).

WARNING
To avoid burns, always wear gloves during the following operation .

– When the end has been contracted, flatten it in order to bond the surfaces using the internal adhesive of the sheath **(G)**.
– Allow the sheath to cool for **1 min**.
– Check the prepared plug. The contracted length should not exceed **15 mm** and the adhesive should completely block the end at **(H)**.
Do not remove the surplus adhesive at **(H)**.

Fitting the plugs:

Note: When replacing the wiring, preferably carry out the operation before refitting the new wiring.

– Mark the unused connector.

– Mark the wire couplings on this connector (wires connected together in the same connector opening). Electric wires in the same opening will be connected together using the self-solder sleeves or crimp sleeves from the wiring repair kit (See **Wiring: Repair**).

– Cut the other wires of the connector equally.

– Fit a plug on each wire **(I)** and contract it using the heat gun included in the wiring repair kit (See **Wiring repair kit: Description**).
The heat gun is equipped with the deflector nozzle and its temperature is adjusted to **120°C**, with maximum air flow (See **Wiring repair kit: Use**).

WARNING
It is forbidden to place 2 wires of different connection codes in a single plug. There is a risk of a short circuit if the wires are live.

– Allow the assembly to cool down for **1 min**.

– Check that the sheath is sufficiently contracted on the wire **(J)**. Repeat the operation with a heat shrinkable sheath with a smaller diameter if necessary.

Note:
Do not remove the surplus adhesive.

WARNING
If there is not enough adhesive released by the heat shrinkable sheath, repeat the operation and add some adhesive (see Equipment required) inside the sheath.

– Tape all of the wires and sheaths using adhesive tape included in the wiring repair kit (See **Wiring repair kit: Description**).

– Fit a wiring protector which is equivalent or better than the original (See **Wiring: Check**).

– Secure the assembly to the main wiring using a Colson-type clip which will be fitted level with the sleeves. Use several clips if necessary.

2 - For non-waterproof wiring.

For non-waterproof wiring, only apply the immobilisation procedure.

– Mark the unused connector.

– Secure the connector on the main wiring using a Colson-type clip. Use several clips if necessary.

– Check that the assembly does not produce any interference noises, with the engine running and the vehicle moving. Fit an audible protector if necessary (See **Wiring: Check**).

This section describes how to visually inspect a connector.

Note:
Carry out each requested check visually. Do not remove a connector if it is not required.

Note:
Repeated connections and disconnections alter the functionality of the connectors and increase the risk of poor electrical contact. Limit the number of connections/disconnections as much as possible.

The check is carried out on the 2 parts of the connection. There may be two types of connections:
– Connector / Connector
– Connector / Device

1 - Visual inspection of the connection:

- Check that the connector is connected correctly and that the male and female parts of the connection are correctly coupled.

2 - Visual inspection of the area around the connection:

- Check the condition of the mounting (pin, strap, adhesive tape, etc.) if the connectors are attached to the vehicle.
- Check that there is no damage to the wiring trim (sheath, foam, adhesive tape, etc.) near the wiring.
- Check that there is no damage to the electrical wires at the connector outputs, in particular on the insulating material (wear, cuts, burns, etc.).

Disconnect the connector to continue the checks.

3 - Visual inspection of the plastic casing:

- Check that there is no mechanical damage (casing crushed, cracked, broken, etc.), in particular to the fragile components (lever, lock, openings, etc.).
- Check that there is no heat damage (casing melted, darker, deformed, etc.).
- Check that there are no stains (grease, mud, liquid, etc.).

4 - Visual inspection of the metal contacts:

- Check that there are no bent contacts (the contact is not inserted correctly and can come out of the back of the connector). If the wire is slightly stressed, the contact will come out.
- Check that there is no damage (folded tabs, clips open too wide, blackened or melted contact, etc.).
- Check that there is no oxidation on the metal contacts.

5 - Visual inspection of the sealing:
(Only for watertight connectors)

- Check for the seal on the connection (between the 2 parts of the connection).
- Check the seal at the back of the connectors:
  – For *unit* joints (1 for each wire), check that the unit joints are present on each electrical wire and that they are correctly positioned in the opening (level with the housing). Check that plugs are present on openings which are not used.
  – For a *grommet* seal (one seal which covers the entire internal surface of the connector), check that the seal is present.
  – For gel seals, check for gel in all of the openings without removing the excess or any protruding sections (it does not matter if there is gel on the contacts).
  – For *hotmelt* sealing (heat-shrink sheath with glue), check that the sheath has contracted correctly on the rear of the connectors and electrical wires, and that the hardened glue comes out of the side of the wire.
- Check that there is no damage to any of the seals (cuts, burns, significant deformation, etc.).

WARNING
This procedure is relates to the repair of the multiplex network alone (twisted wires).

1 - Locating the fault.

Use the diagnostic tool (clip) to test the multiplex network (see the fault finding procedure corresponding to the vehicle).

The diagnostic tool can detect the following short circuits on the multiplex network:

- short circuit between CAN L and **+ 12 V**,
- short circuit between CAN H and **+ 12 V**,
- short circuit between CAN H and earth,
- short circuit between CAN L and earth,
- short circuit between CAN L and CAN H,
- open circuits.

Note:
In the case of a short circuit between CAN-L and earth, communication between the different computers which make up the multiplex network is not interrupted. However, the multiplex network becomes sensitive to interference and can be the cause of an intermittent fault.

After having located the multiplex line fault, it is possible to repair it whilst applying all the necessary precautions outlined in this document.

2 - Necessary equipment.

For repairing the multiplex network, use the components of the wiring repair kit (see **Wiring repair kit: Description**).

Use the self-solder sleeves with red rings (**A**) for making the joints.

111376

3 - Repairing the multiplex line.

WARNING
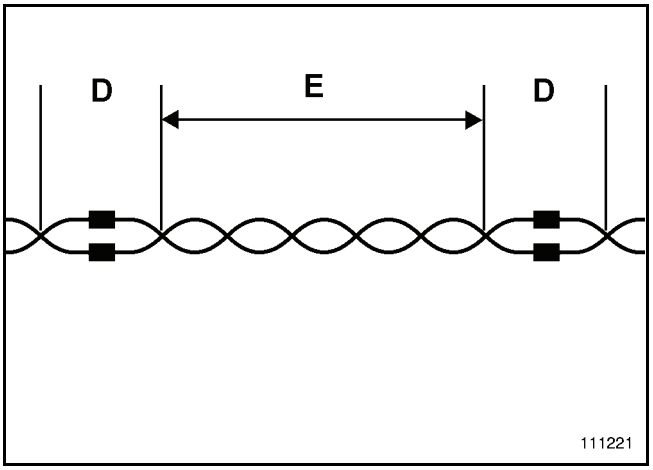
Before starting to repair a multiplex line, it is necessary that you familiarise yourself with the use of the tools relating to this repair (see **Wiring repair kit: Use**).

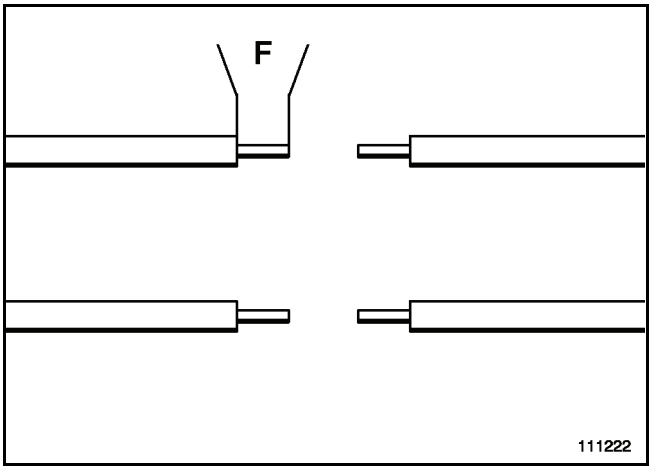
Disconnect the battery (see the **MR corresponding to the vehicle, 80A, Battery, Battery: Removal - Refitting**).

Remove the components necessary to enable access to the wiring.



Detach the section of wire to be repaired from the main wiring.

Cut the wires at (**B**) and (**C**), **50 mm** on each side of the damage.



Take from the coil of twisted wires **(0.5 mm^2**, specific number of turns) to be used to repair the multiplexing, a length of wire the same as that removed from the harness, **plus 30 mm** for the wire joints (See **Wiring repair kit: Description**).

WARNING
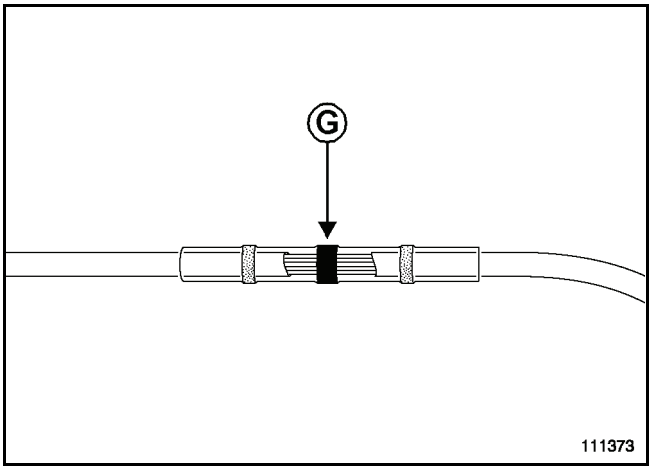
Do not untwist the harness to be repaired more than 100 mm (D). The wires at (E) must be twisted uniformly along the repaired length.

Strip each end of the wires by **10 mm (F)** at each side.



To join the wires, working wire by wire:
- slip the self-solder sleeve onto the wire,
- twist the end of the wires together.

WARNING
The colour of the wires (CAN H et CAN L) must be respected when they are being joined.

- Position the sleeve with its solder ring in the centre of the wire joint.

- Switch on the heat gun.
- Adjust the temperature of the tool to **340°C** with a ventilation speed set to maximum (See **Wiring repair kit: Use**).
- Heat the sleeve so that the solder ring melts (**G**) onto the wires until the heat shrinkable sheath contracts.

Refer to the precautions for use which relate to using self-solder sleeves (see **Wiring: Repair**).

WARNING
Do not try to heat the sheath too quickly, use a backwards and forwards motion to ensure that it does not burn.
Do not direct the flow of hot air onto the insulation of the wires so as not to burn it.

Note:
For the soldering to be complete and for the sheath to contract, the heating operation should last approximately **30 s** ± **10**.
Spend the majority of the recommended time on the ring of solder and the rest of the time on the ends of the sleeve.
The recommended time is given as a guide. It can be reduced or increased depending on how efficient the heating is.

WARNING
Wait for the sleeve to cool before manipulating it to maintain the quality of the solder (minimum waiting period: 1 minute).
Do not bend the sleeve (even when cool) so as to not damage the quality of the solder or the sealing properties of the sleeve.

4 - Checking the multiplex line.

WARNING
After repairing the multiplex line, always check the multiplex network using the diagnostic tool.

Note:
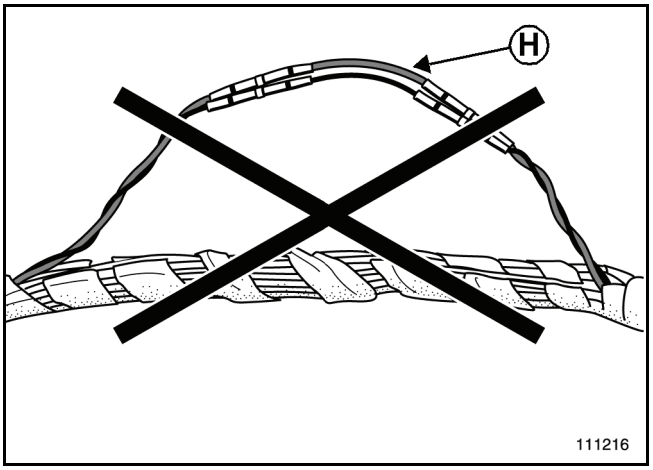
During the check with the diagnostic tool, move the lines forwards and backwards slightly. If a fault is recorded, start the operation again for the faulty line.



Refer to the fault finding procedure for the function concerned.

WARNING
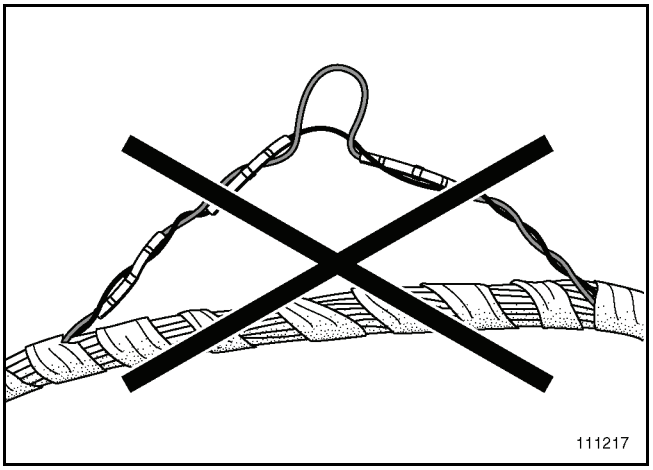
After having checked the multiplex line:
- **refit it in the main harness,**
- **tape it up with adhesive tape.**



Apply the recommendations from the generic repair procedure concerning the fitting and fuses (see **Wiring: Check**).

WARNING
The various struck-through cases are strictly forbidden.

No turns (twists) at (**H**).

The two wires added are of a different length.

5 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the corresponding fault finding procedure.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

WARNING
This procedure relates repairing airbag and pretensioner wiring only.

Note: Apply all the precautions and recommendations shown in the MR.

WARNING
All work on airbag and pretensioner systems must be carried out by qualified trained personnel.

WARNING
The pyrotechnic systems (pretensioners or airbags) must not be handled near to a heat source or flame; there is a risk that they may be triggered.

WARNING
Before removing an electronic control unit (ECU) or before any operation on the safety systems or around them, the airbag computer must be locked using the diagnostic tool. When this function is activated all the trigger lines are inhibited, and the airbag warning light on the instrument panel is lit continuously.

WARNING
Before any operation on a pyrotechnic component connection (connector or wiring) found faulty during fault finding, disconnect the pyrotechnic component.

1 - Identify the solution.
The case in question must figure in the table below. Otherwise, replace the wiring.

Airbag and pretensioner components	Solutions
Under seat connector (Airbag warning light on)	● If the connector has more than 10 wires, no operation can be carried out. Replace the wiring unless there is a specific procedure (OTS*). ● If not, shunt the connector. See **Under seat connector** in this section.
Connector on seat runner	No operation. Replace the wiring unless there is a specific procedure (OTS*).
Pyrotechnic component connectors (squib) (airbag triggers, pretensioner, etc.)	Replace the connector using the airbag connectors kit. See **Pyrotechnic component connectors** in this section.
Airbag computer connector	No operation. Change the wiring harness except in the following cases: ● If there is a specific procedure (OTS*), its application is authorised. ● If the connector lock is broken, replacing the lock authorised.
Airbag and pretensioner harness damage	No operation except in specific conditions. See **Airbag and Pretensioner harness damage** in this section.

*OTS: Special Technical Operation

WARNING
Any repair linked to the airbag function necessitates a specific check using the network's diagnostic tools.

2 - Under seat connector.

Note:
For a connector on a seat runner, the wiring must be replaced.

When fault finding identifies a under seat connector fault, shunt the under seat connector following the procedure below:

Cut the electrical wires either side of the connector.

Apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except the part on locating the fault, to shunt the connector.

Note:
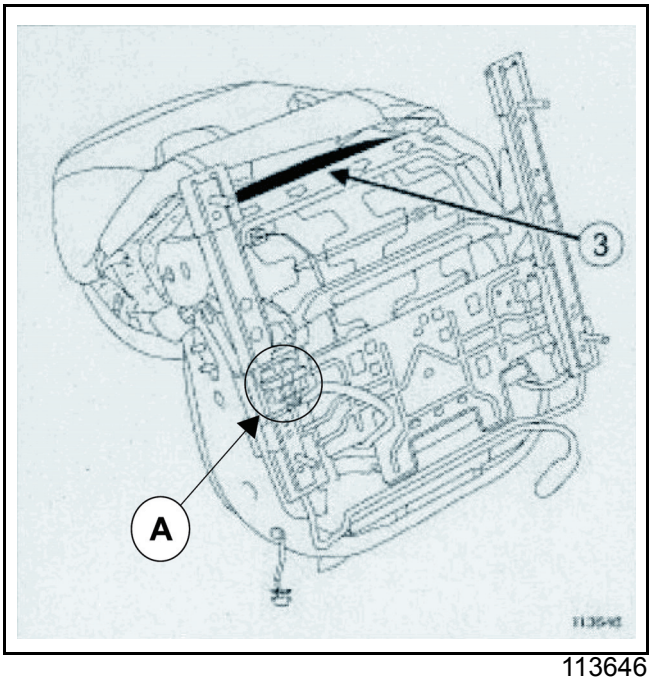
Check that the length of replacement wire is the same as that removed from the harness, **plus 30 mm** for the wire joints.



After the operation, check that the wire is not too taut or too long when the seat is furthest forward or back.

Protect the wires so that they are not damaged and this new branch is correctly maintained. Hanging loops are not allowed, regardless of the wires involved in the repair.

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

Note:
Check that the harness is correctly repositioned after the operation and that it is does not obstruct the seat adjusting mechanisms.

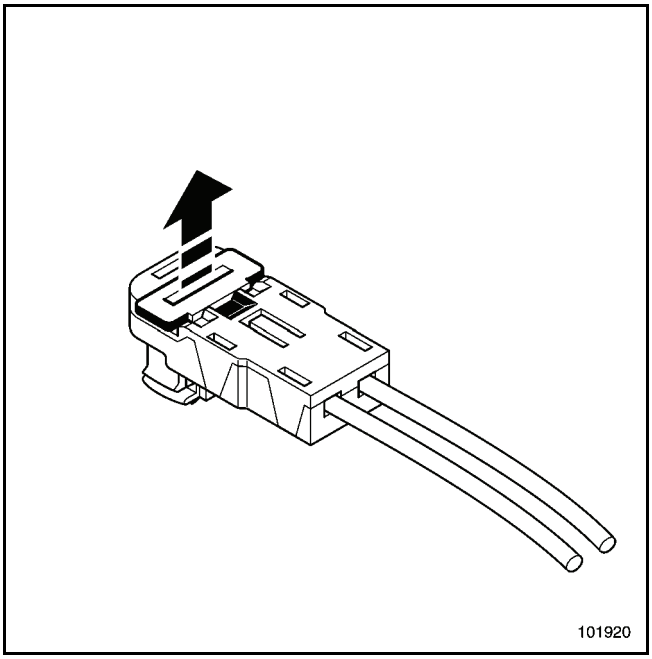
Example of a connector on a seat runner (A):

113646

3 - Pyrotechnic component connectors.

These are airbag and pretensioner trigger connectors.

Identify the connector concerned on the vehicle.



Repair is possible if it is a SQUIB connector.

Find the colour of the connector: Blue, green or orange.

Find the shape of the connector: Straight or angled.

Select the same connector (colour and shape) from the airbag connectors kit (see under DIALOGYS).

Example of an angled SQUIB connector.

Apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except the section on locating the fault, to replace the connector.

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

4 - Airbag and Pretensioner harness damage.

WARNING
No operation is authorised unless it is possible to check the repair using the diagnostic tool.

Where the repair can be checked with the diagnostic tool:

- if it is a case of twisted wires with a cross-section less than or equal to **0.5 mm^2**, apply the specific procedure for repairing multiplex lines (see **Multiplex network: Repair**), except for the section on locating the fault, for the repair of the lines;
- if it does not concern twisted wires, apply the generic procedure for repairing the harness (see **Wiring: Check**).

Carry out the specific airbag and pretensioner line repair checks. See **Airbag line repair check** and **Final check** in this section.

5 - Airbag lines repair check.

Confirm the airbag line repair to ensure that the repair is correct:

- Check the quality of the operation by reading the impedance reading produced by the computer using the diagnostic tool.
- Unlock the airbag computer using the diagnostic tools.
- The warning light should no longer be on.

Note:
During the check with the diagnostic tool, move the lines forwards and backwards slightly.
The resistance measure should remain stable, if variations in resistance are noticed, start the repair operation again for the defective line.

Refer to the airbag and pretensioner function fault finding procedure for the vehicle concerned.

Apply the recommendations from the generic repair procedure concerning the fitting and fuses (see **Wiring: Check**).

6 - Final check.

After any operation on the wiring, check that there are no faults using the diagnostic tools (Clip).

Refer to the fault finding procedure for the airbag and pretensioner function concerned.

If a fault is present, pass on the vehicle fault finding to a qualified operator: automotive electrician, technician agent or cotech (level 2 minimum).

ABS BODYWORK COMPONENT: PREPARATION AND PAINT RANGE

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

Use extra ventilation source.

Note:

Before using the products, consult the manufacturer's technical sheet.

Note:

Never apply pre-treatment primer or primer filler on this type of material.

1. PRE PRIMED PARTS

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Sand	P400 - P500dry / P400 - P800with water
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Blow / rub with the abrasive finishing pad	
7	Apply the finishing paint	

2. REPAIRED PARTS

Steps	Description	Special notes
1	Wipe / blow	
2	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
3	Sand the defect	P240 dry / orbital sander (mid speed)
4	Wipe / blow	
5	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
6	Apply and sand polyester mastic if necessary	Plastic material bodywork component: Repair (50A, General information)
7	Wipe / blow	
8	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
9	Smooth	Grey adhesive pad soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
10	Wipe / blow	
11	Degrease	Lint-free cloth soaked in antistatic thinner Vehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth

12	Apply a bi component primer	Vehicle: Parts and consumables for the repair (04B, Consumables - Products)
13	Remove solvent / dry	
14	Sand	P400 - P500dry / P400 - P800with water
15	Wipe / blow	
16	Degrease	Lint-free cloth soaked in antistatic thinnerVehicle: Parts and consumables for the repair (04B, Consumables - Products). Wipe with a dry lint-free cloth
17	Blow / rub with an adhesive pad	
18	Apply the finishing paint	

ACCESSORIES BELT - CRANKSHAFT ACCESSORIES PULLEY : REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
sliding two-claw extractor

parts always to be replaced:
Crankshaft accessories pulley bolts
Engine accessories belt
Accessories belt tensioning roller
Accessories fixed roller

WARNING

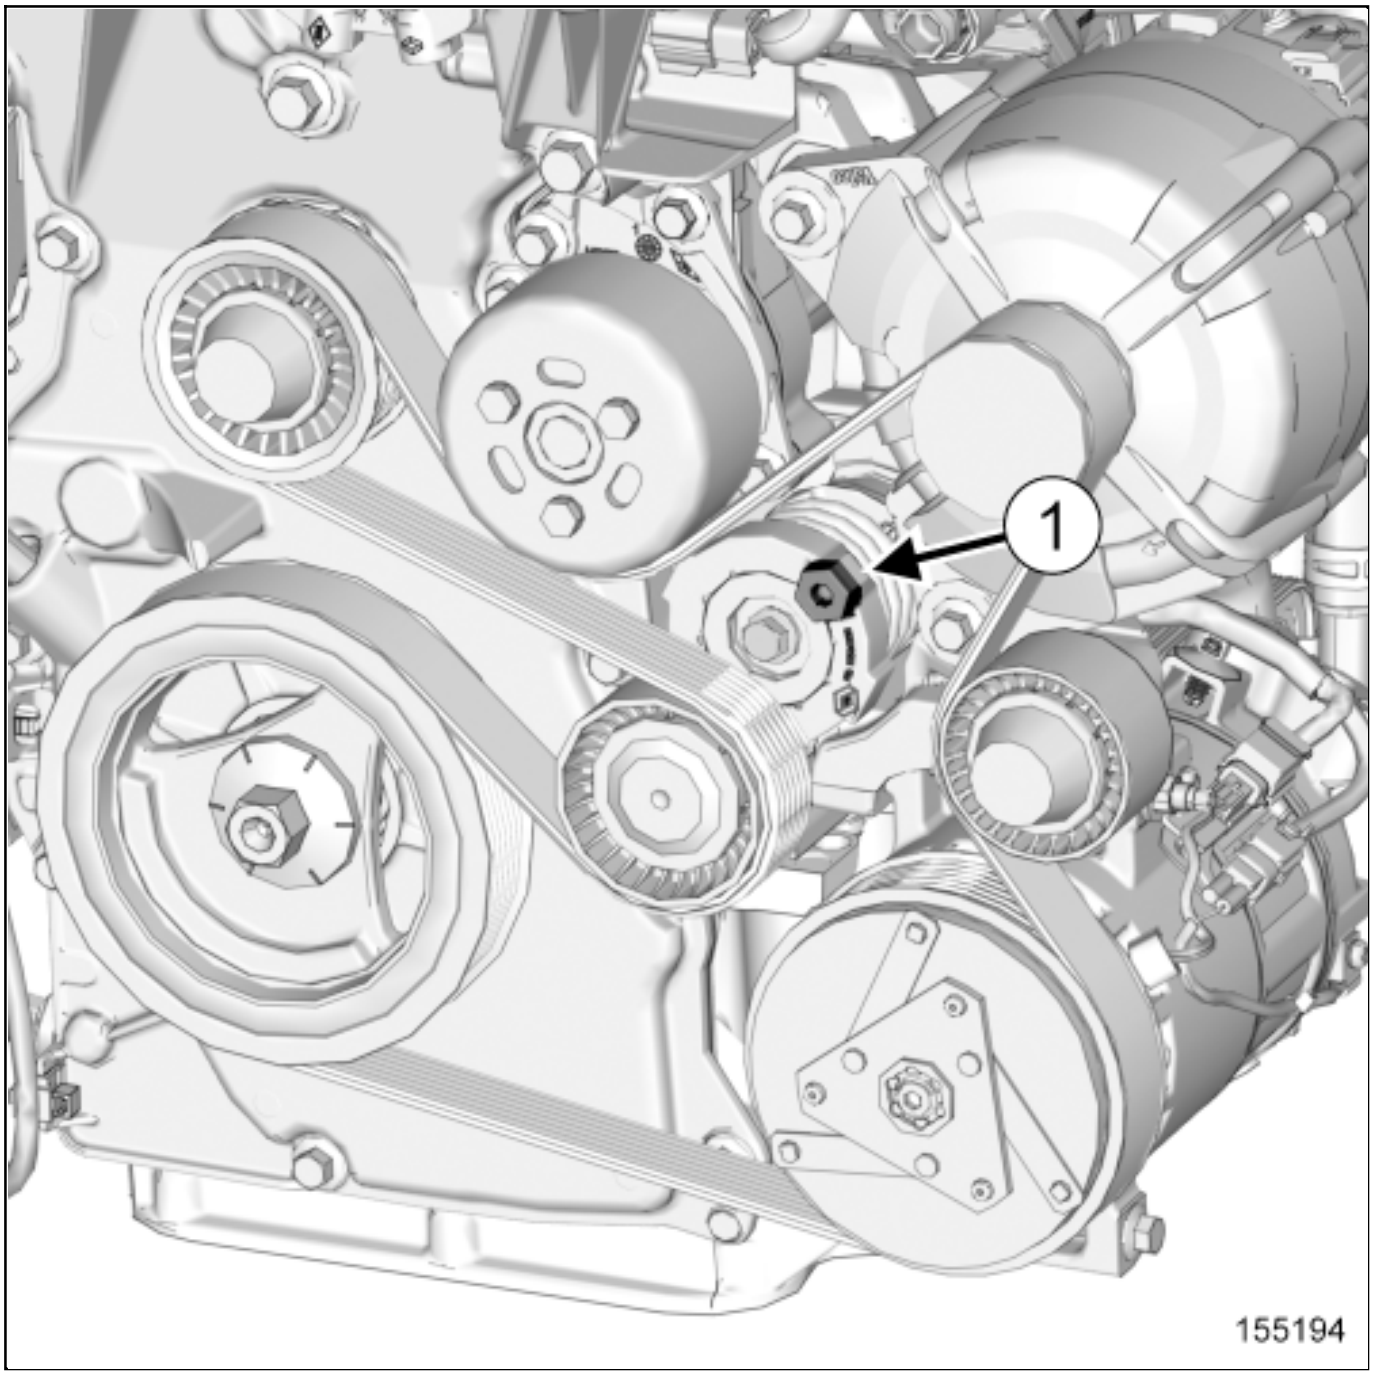
Wear cut-resistant gloves during the operation.

CAUTION

Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

REMOVAL



1. REMOVING THE ACCESSORIES BELT

1- REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift[Vehicle: Towing and lifting] .

Remove the engine undertray.

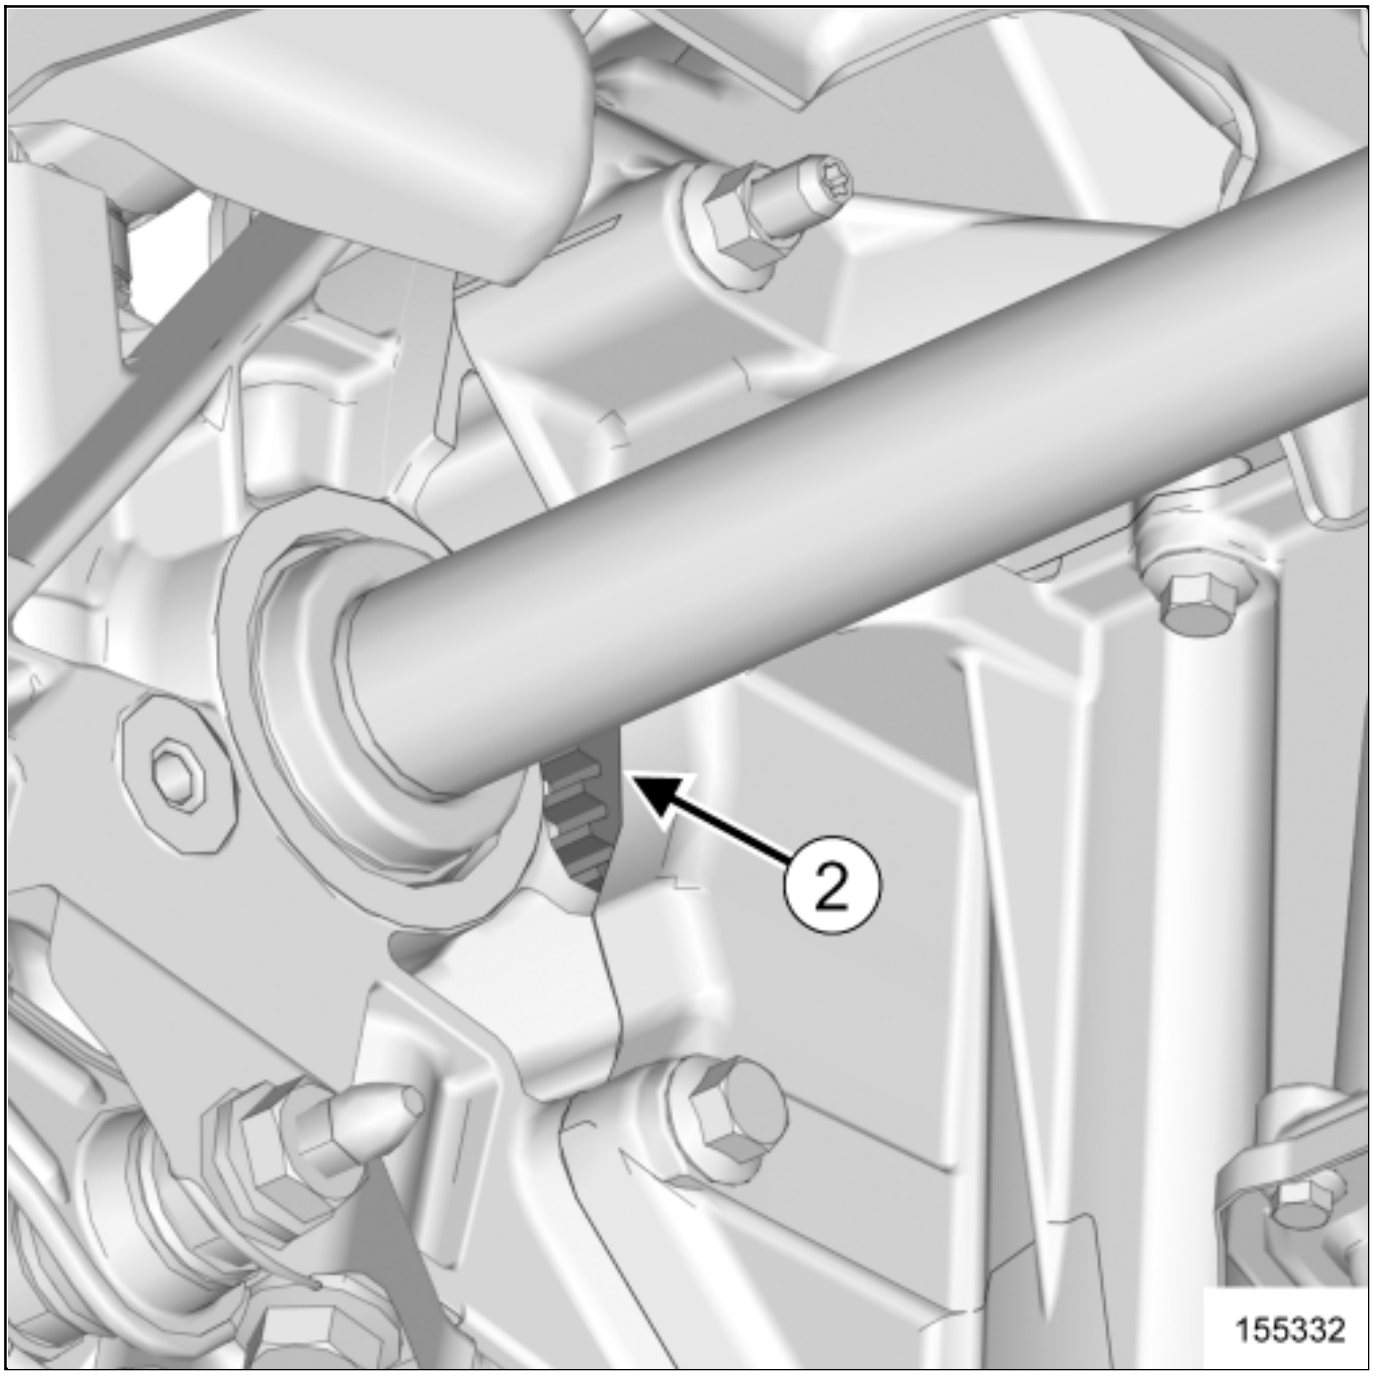
2- REMOVAL OPERATION

Rotate the automatic tensioning roller of the accessories belt clockwise(1) using a 16 mm spanner.

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the accessories belt,
- the accessories belt tensioning roller bolts.
- the accessories belt tensioning roller,
- the accessories belt fixed rollers protectors,
- the accessories belt fixed rollers bolts,
- the accessories belt fixed rollers.

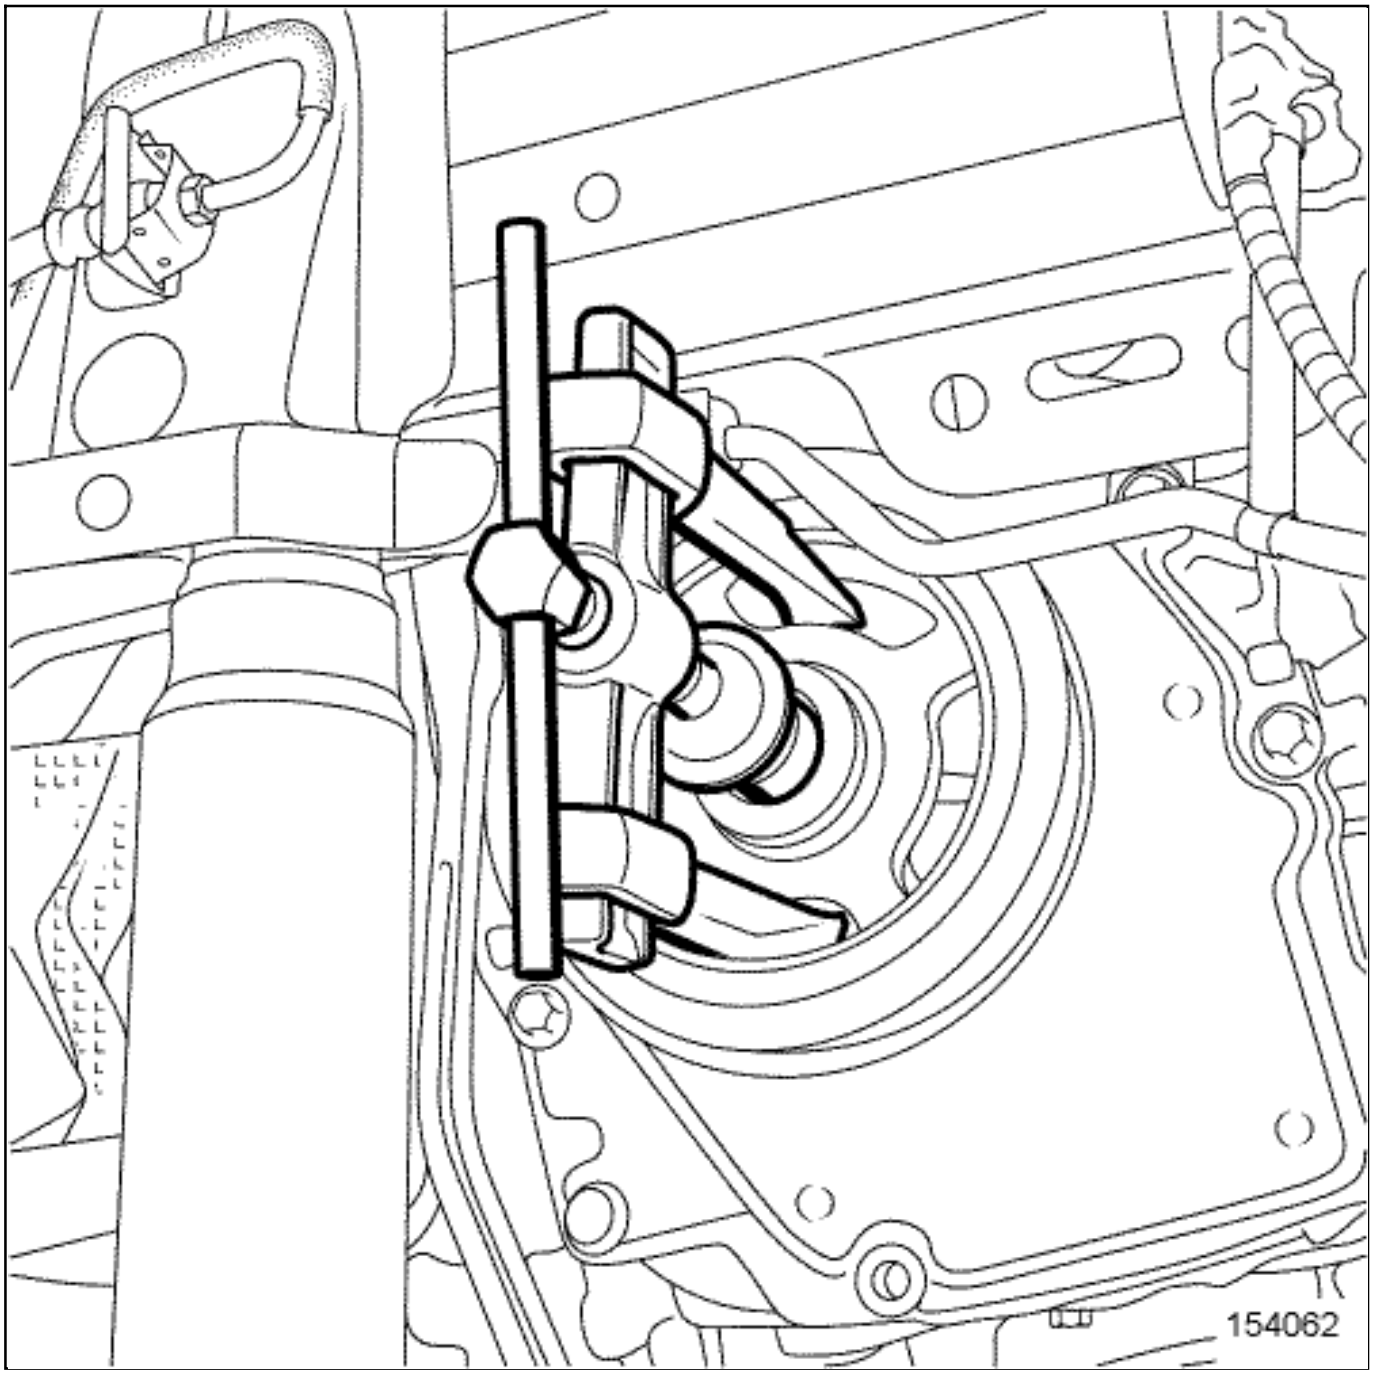
2. REMOVING THE CRANKSHAFT ACCESSORIES PULLEY



1- REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:



- the engine undertray,
- the front right-hand wheel Front hub carrier assembly: Exploded view ,
- the front section of the front right-hand wheel arch liner Exterior body front trim assembly: Exploded view ,
- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

2- REMOVAL OPERATION

- Lock the flywheel using a screwdriver at(2) .

- Loosen the crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Fit an sliding two-claw extractoron the crankshaft accessories pulley.

Detach the crankshaft accessories pulley.

Remove the sliding two-claw extractor.

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the crankshaft accessories pulley bolt,
- the crankshaft accessories pulley.

REFITTING

1. REFITTING THE CRANKSHAFT ACCESSORIES PULLEY

1- REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft accessories pulley bolts .

CAUTION

Ensure that the seals between the cooler and its two supports are correctly positioned to avoid any coolant leaks.

If reusing the crankshaft accessories pulley, clean the pulley V-grooves with a brush to eliminate any deposits.

2- REFITTING OPERATION

Refit the crankshaft accessories pulley(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Rotate the crankshaft accessories pulley on the crankshaft in order to fit the pulley onto the key groove of the crankshaft.

Refit a new crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Lock the flywheel using a screwdriver.

Torque tighten the crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Note:

Two operators are necessary.

Proceed in the reverse order to removal.

2. REFITTING THE ACCESSORIES BELT

1- REFITTING PREPARATION OPERATION

parts always to be replaced: Engine accessories belt .

parts always to be replaced: Accessories belt tensioning roller .

parts always to be replaced: Accessories fixed roller .

Using a brush, clean the v-block of the crankshaft pulley in order to remove any swarf.

2- REFITTING OPERATION

Refit the new accessories belt fixed rollers (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Torque tighten the accessories belt fixed rollers bolts (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Refit (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the accessories belt fixed rollers protector,
- a new accessories belt tensioning roller.

Torque tighten the accessories belt tensioning roller bolts (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Rotate the accessories belt tensioning roller clockwise using a 16 mmkey.

Refit a new accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Gradually unlock the tensioning roller using a 16 mmkey.

Rotate the crankshaft clockwise twice to balance the accessories belt tension on all pulleys.

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

ACCESSORIES BELT - CRANKSHAFT ACCESSORIES PULLEY : REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
sliding two-claw extractor

parts always to be replaced:
Crankshaft accessories pulley bolts
Engine accessories belt
Accessories belt tensioning roller
Accessories fixed roller

WARNING

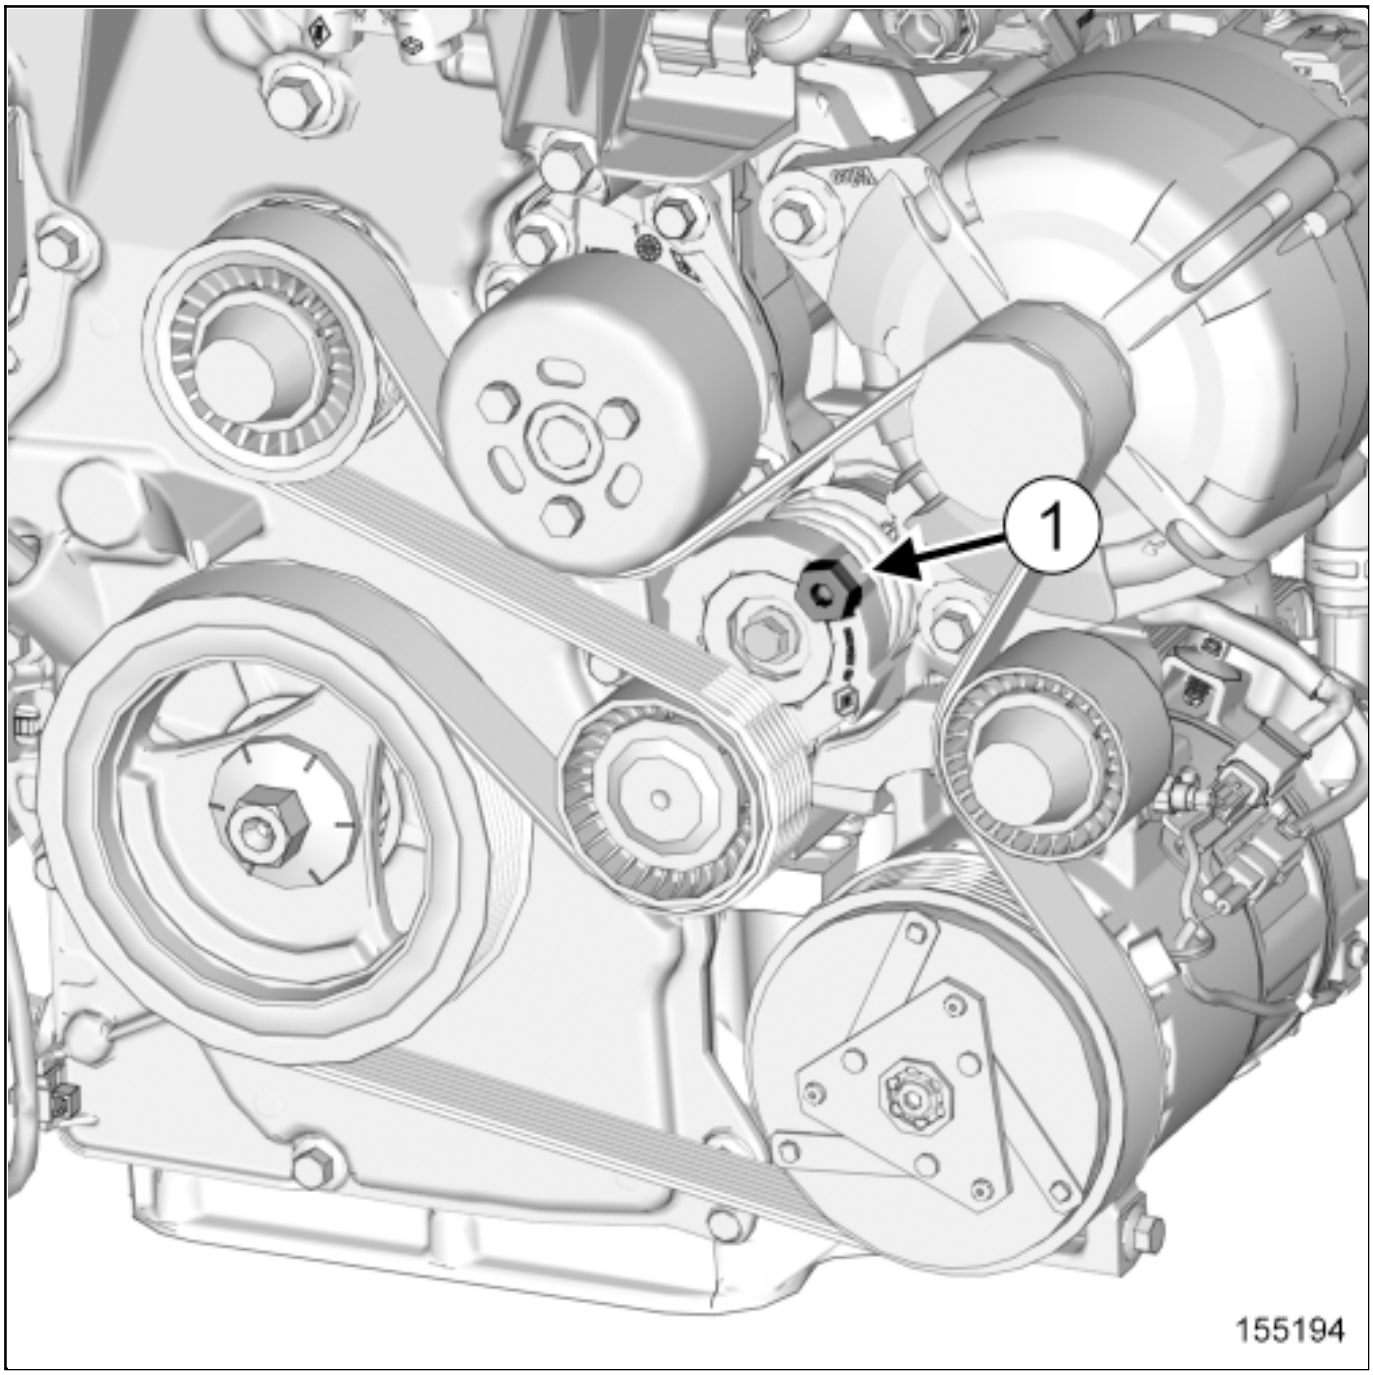
Wear cut-resistant gloves during the operation.

CAUTION

Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

REMOVAL



1. REMOVING THE ACCESSORIES BELT

1- REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift[Vehicle: Towing and lifting] .

Remove the engine undertray.

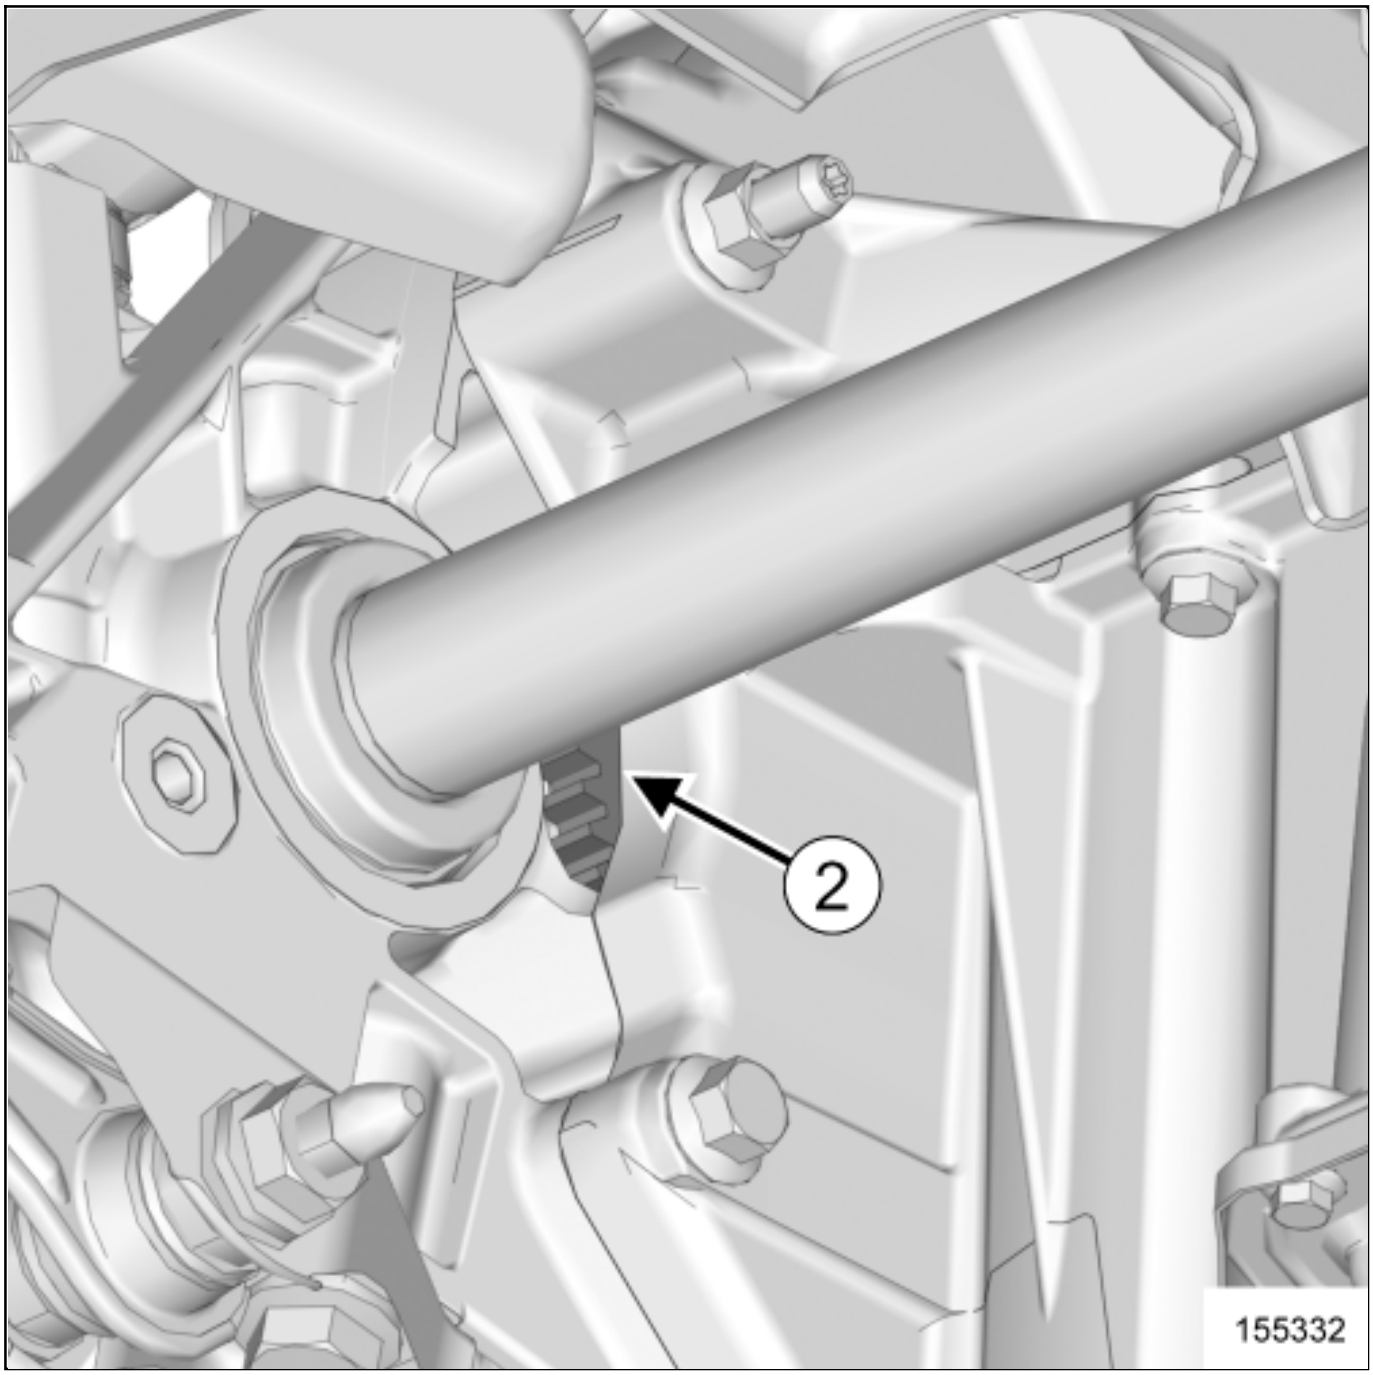
2- REMOVAL OPERATION

Rotate the automatic tensioning roller of the accessories belt clockwise(1) using a 16 mm spanner.

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the accessories belt,
- the accessories belt tensioning roller bolts.
- the accessories belt tensioning roller,
- the accessories belt fixed rollers protectors,
- the accessories belt fixed rollers bolts,
- the accessories belt fixed rollers.

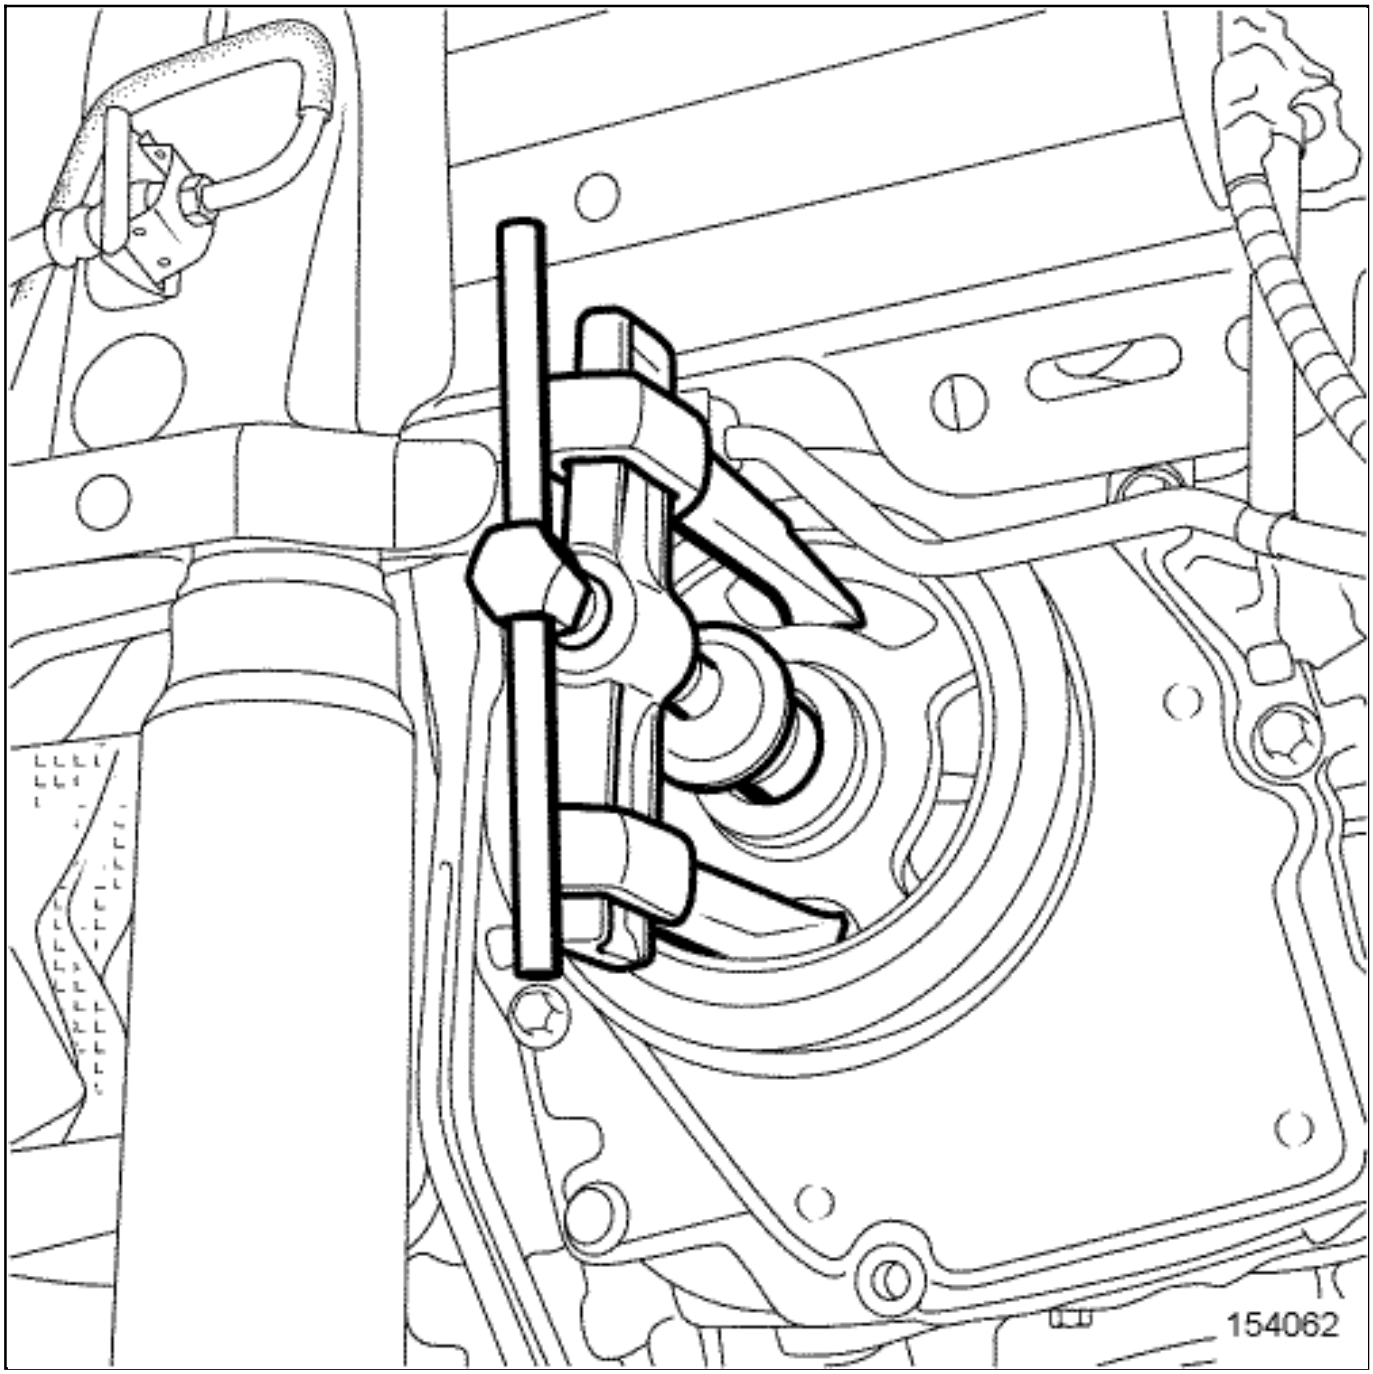
2. REMOVING THE CRANKSHAFT ACCESSORIES PULLEY



1- REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:



- the engine undertray,
- the front right-hand wheel Front hub carrier assembly: Exploded view ,
- the front section of the front right-hand wheel arch liner Exterior body front trim assembly: Exploded view ,
- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

2- REMOVAL OPERATION

- Lock the flywheel using a screwdriver at(2) .

- Loosen the crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Fit an sliding two-claw extractoron the crankshaft accessories pulley.

Detach the crankshaft accessories pulley.

Remove the sliding two-claw extractor.

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the crankshaft accessories pulley bolt,
- the crankshaft accessories pulley.

REFITTING

1. REFITTING THE CRANKSHAFT ACCESSORIES PULLEY

1- REFITTING PREPARATION OPERATION

parts always to be replaced: Crankshaft accessories pulley bolts .

CAUTION

Ensure that the seals between the cooler and its two supports are correctly positioned to avoid any coolant leaks.

If reusing the crankshaft accessories pulley, clean the pulley V-grooves with a brush to eliminate any deposits.

2- REFITTING OPERATION

Refit the crankshaft accessories pulley(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Rotate the crankshaft accessories pulley on the crankshaft in order to fit the pulley onto the key groove of the crankshaft.

Refit a new crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Lock the flywheel using a screwdriver.

Torque tighten the crankshaft accessories pulley bolt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Note:

Two operators are necessary.

Proceed in the reverse order to removal.

2. REFITTING THE ACCESSORIES BELT

1- REFITTING PREPARATION OPERATION

parts always to be replaced: Engine accessories belt .

parts always to be replaced: Accessories belt tensioning roller .

parts always to be replaced: Accessories fixed roller .

Using a brush, clean the v-block of the crankshaft pulley in order to remove any swarf.

2- REFITTING OPERATION

Refit the new accessories belt fixed rollers (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Torque tighten the accessories belt fixed rollers bolts (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Refit (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the accessories belt fixed rollers protector,
- a new accessories belt tensioning roller.

Torque tighten the accessories belt tensioning roller bolts (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Rotate the accessories belt tensioning roller clockwise using a 16 mmkey.

Refit a new accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

Gradually unlock the tensioning roller using a 16 mmkey.

Rotate the crankshaft clockwise twice to balance the accessories belt tension on all pulleys.

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

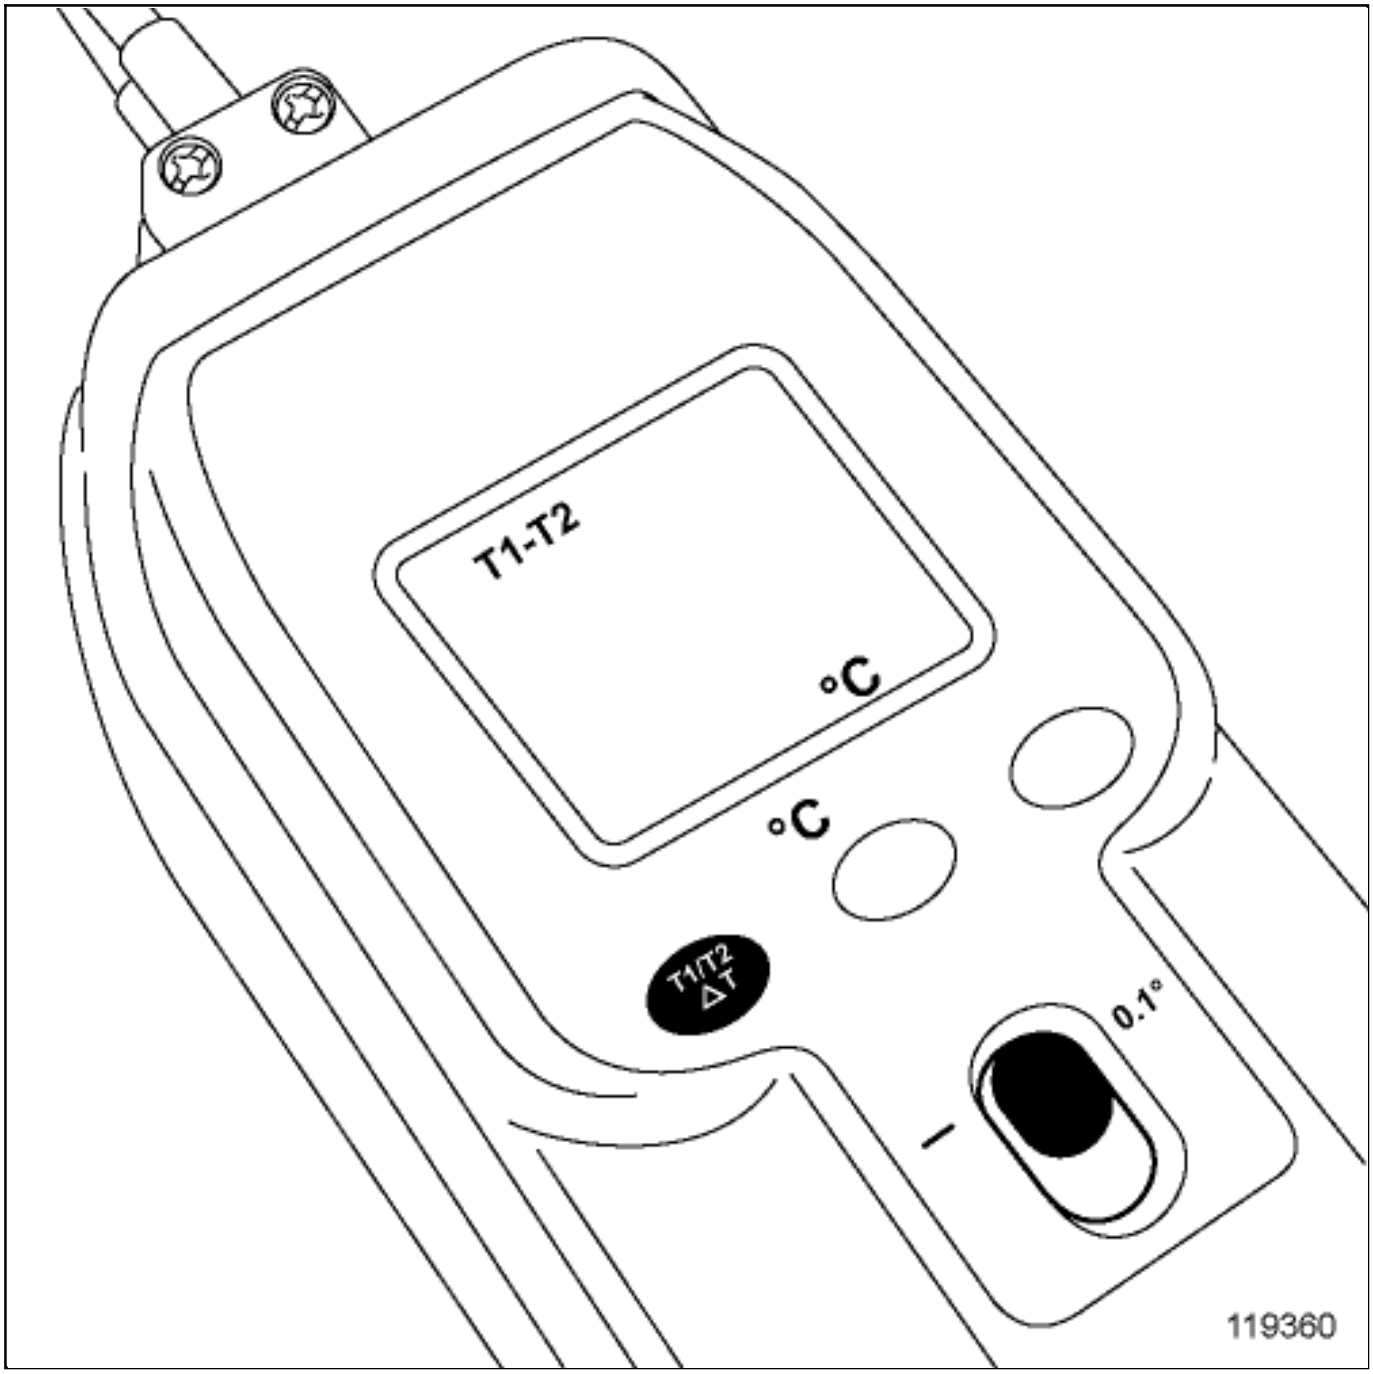
AIRCONDITIONING:CHECK

 **Note, one or more warnings are present in this procedure** 

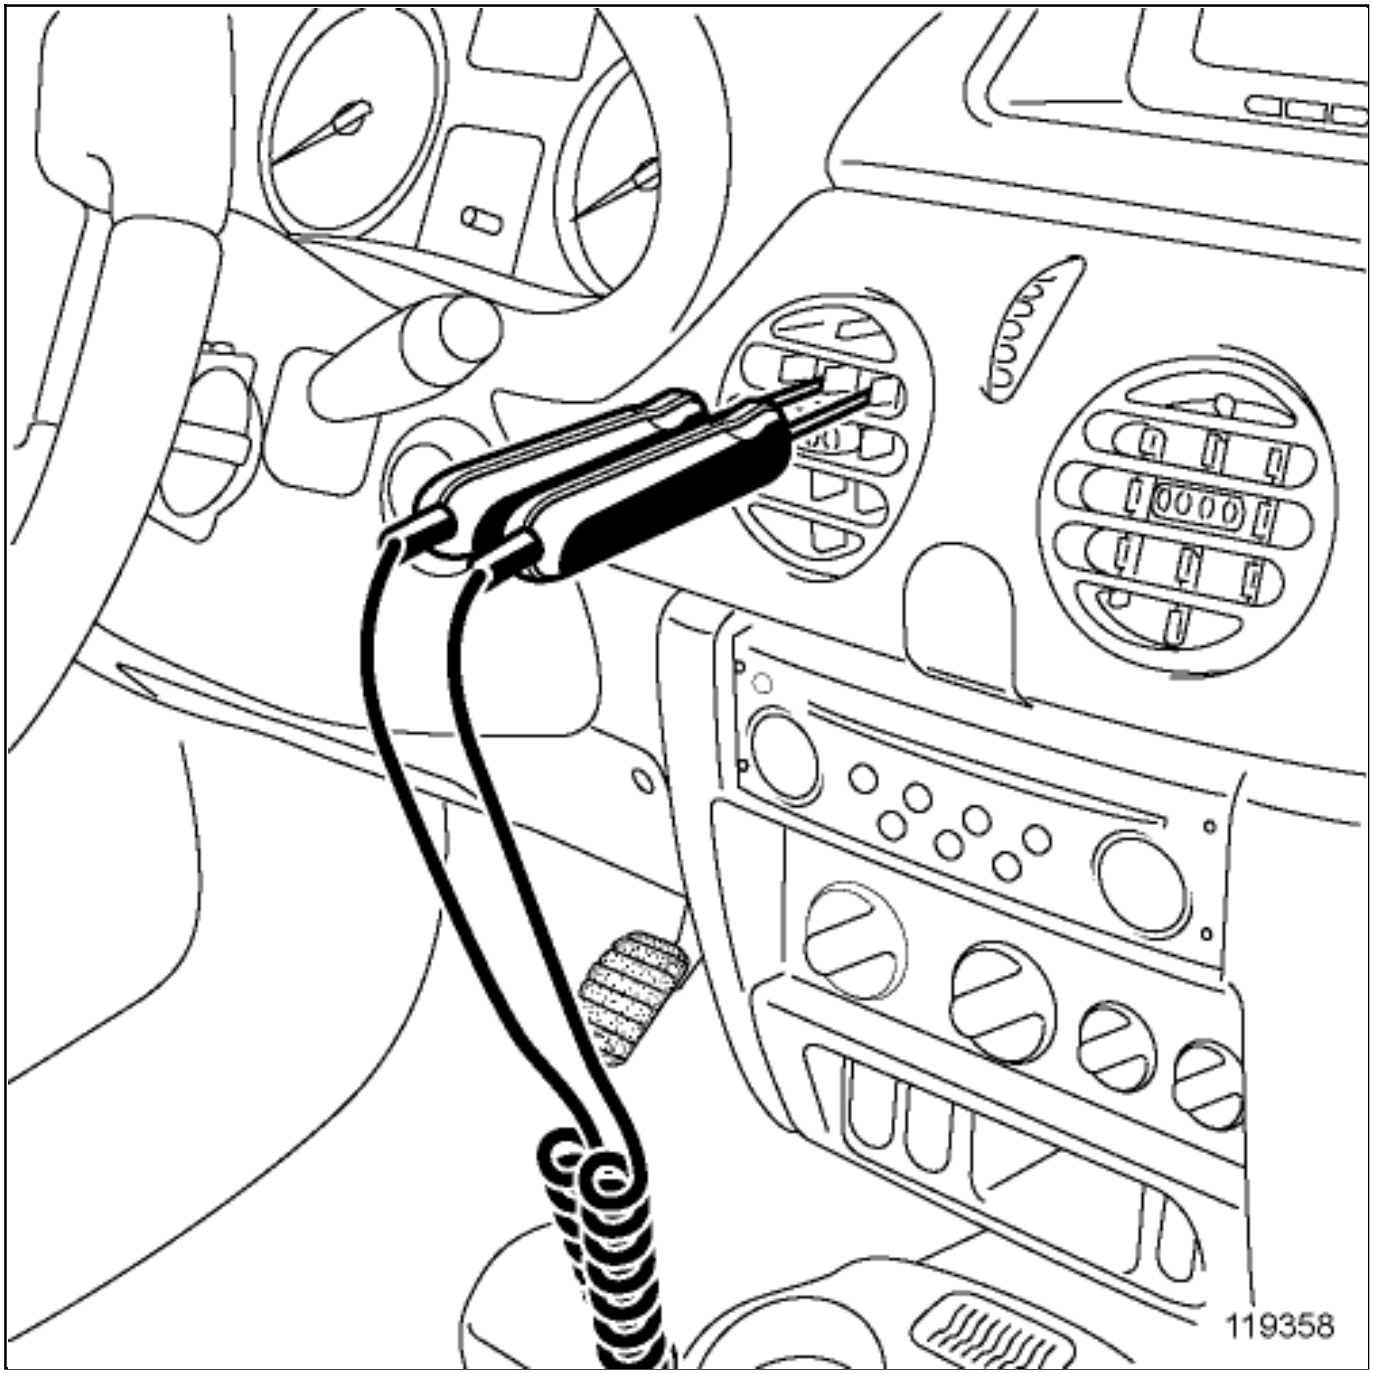
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

Equipment required
Dual-sensor temperature measuring device



Note:



When performing RENAULT maintenance, check the air conditioning system at the end of the vehicle's maintenance program so that the engine will be cold.

1. PREPARATION OPERATION FOR THE MEASUREMENT DEVICE

- Check that the measurement device functions properly (see the device's instruction manual).
- Set units to ˚C.
- Set the device's sensitivity to 0.1˚C.

Set the reading mode to (ΔT) = (T1 - T2)

Check the two sensors T1 and T2 in order to calculate the correction (Δ) to be applied to the measurement (T1 - T2). the two sensors must indicate the same measurement under the same conditions. Check the sensors by:

- bringing the ends of the 2 sensors together until they touch,
- placing the sensors in the air flow of an air vent,
- setting the passenger compartment fan assembly to top speed.

waiting for the value to become stable.

- recording the correction value (Δ).

Note:

It is not necessary to start the vehicle. The device display is in mode (ΔT) = (T1 - T2).

CAUTION

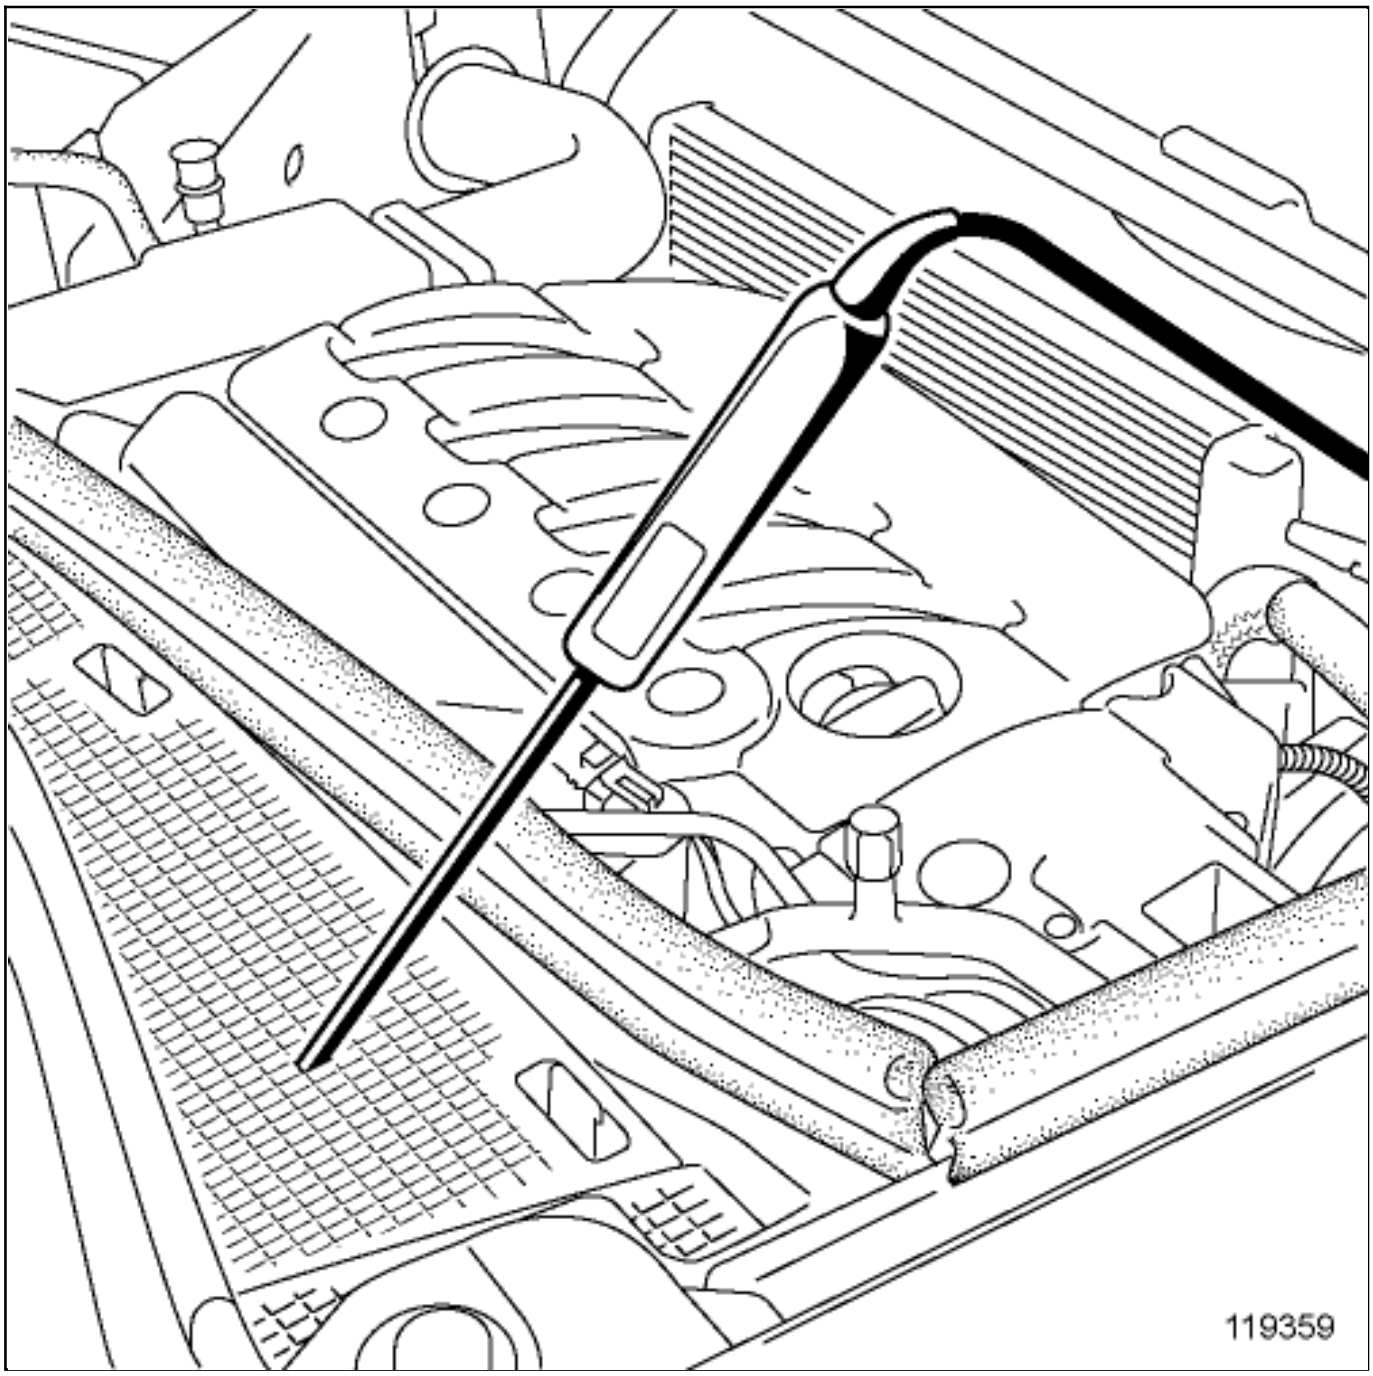
Note the difference and sign as soon as the temperature becomes stable.

Calculate the correction (Δ) = - (T1 - T2) to be applied to the measurement (ΔT).

Examples:

If (T1 - T2) = - 0.3˚C, correct the measurement (ΔT) by (Δ) = + 0.3˚C

If (T1 - T2) = + 0.3˚C, correct the measurement (ΔT) by (Δ) = - 0.3˚C

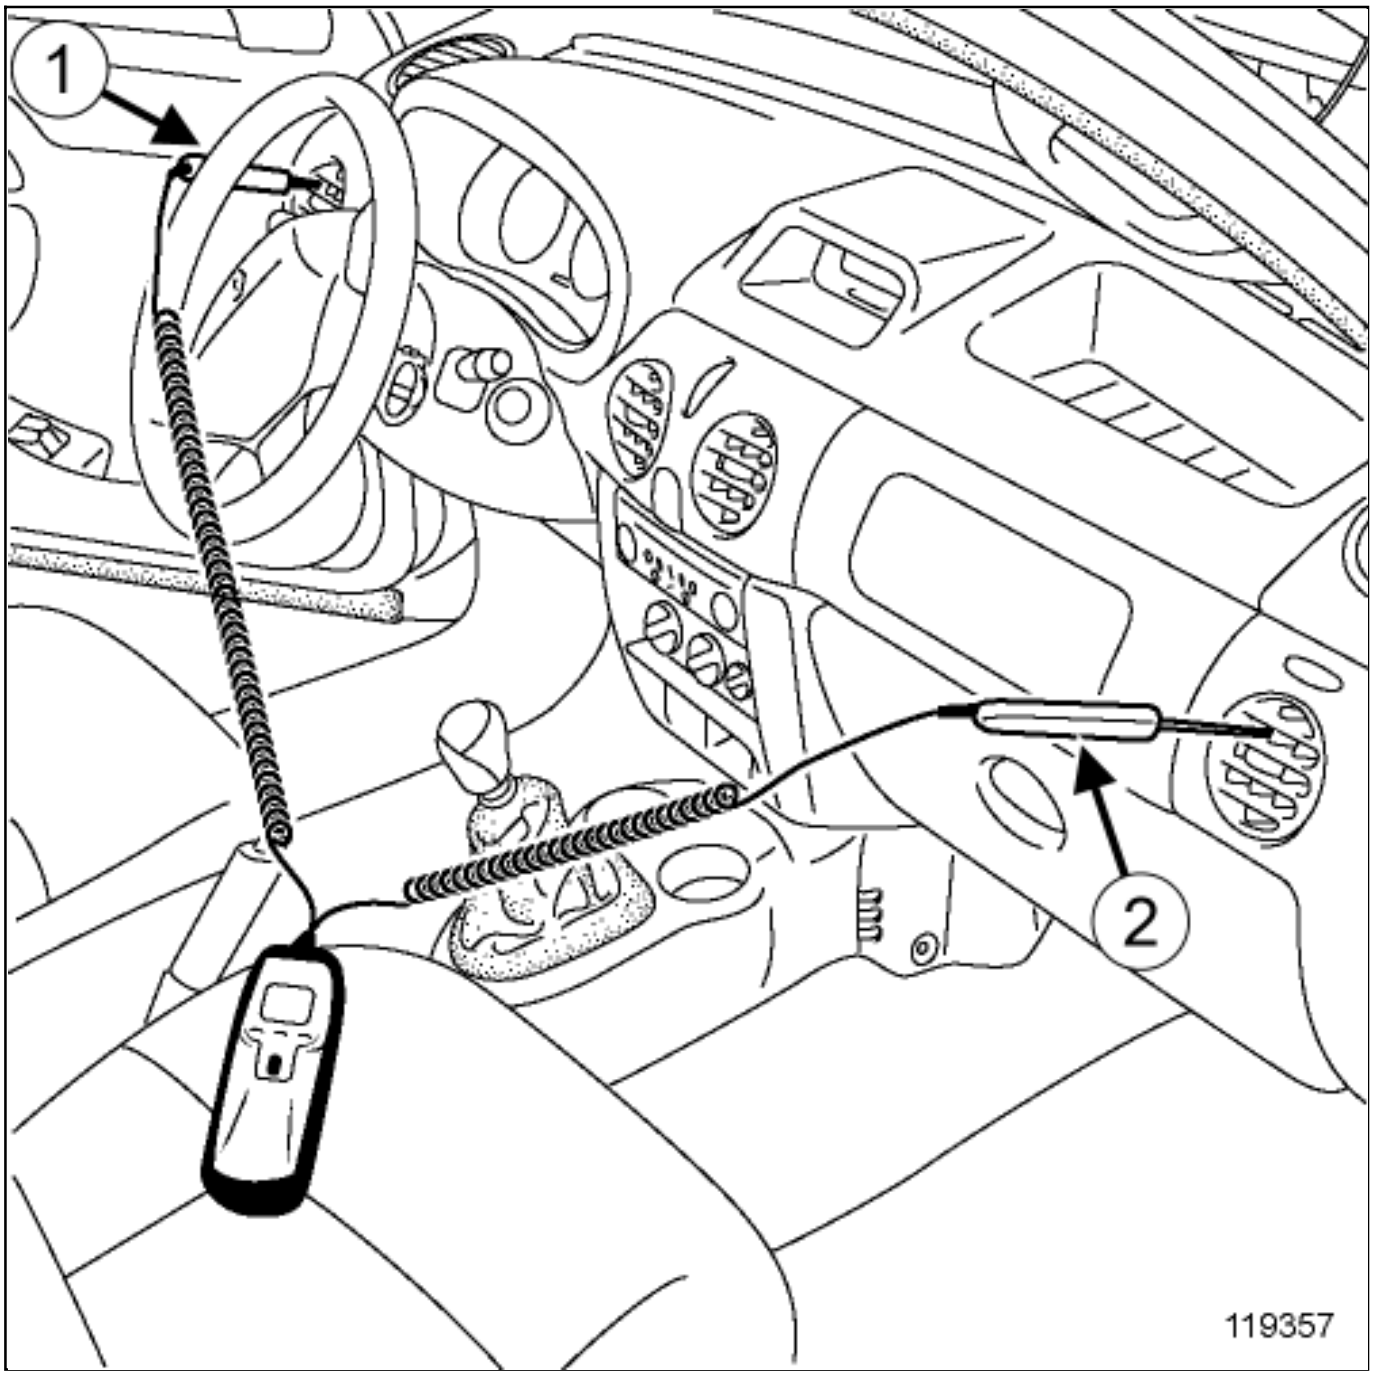


2. VEHICLE PREPARATION OPERATION

- Put the vehicle in the shade, where the temperature is greater than or equal to 15˚Cminimum.
- Close the bonnet.
- Open the front windows.
- Start the engine and let it idle.
- Set the air conditioning controls with:
  - recirculation mode in the external position,

- the ventilation distribution in "face" mode,
- the temperature control to coldest temperature setting in front (and at the back, if it exists),
- the speed of the passenger compartment fan assembly set to maximum (switch off the rear control if it exists),
- the front side and centre air vents open with the vanes in a neutral position,
- the air conditioning system must be turned on (indicator light illuminated).

Wait 5 minutes with the engine idling before taking any measurements.



3. MEASUREMENTS

Record the air temperature at the scuttle panel grille (T3).

- open the bonnet, depending on the vehicle, to access the scuttle panel grille.
- place the sensor where air is drawn through the scuttle panel grille.
- wait for the value to become stable.
- record the T3 temperature value.

close the bonnet if it was opened.

Record the air temperature at the left air vent (T1), and at the right air vent (T2).

- fit sensor T1 in the left air vent(**1**) .
- fit sensor T2 in the right air vent(**2**) .

Record the differences in temperature once the (ΔT) value has stabilised:

- between T3 and the higher of values T1 or T2, (T3 - highest value).
- record this difference in temperature.
- between T1 and T2 (read the (ΔT) value (T1-T2) display mode).
- record the difference in temperature (ΔT) according to the correction (Δ) to be applied to the measurement.

If the (ΔT)=(T1-T2) measurement is unstable, follow the procedure below:

Note:

Depending on the vehicle's air conditioning system programming, this check method may not be applicable because the engine cooling fan assembly has been activated. Its operation renders the (ΔT) value between T1 and T2 unstable. To eliminate this error, the fan assembly must be activated for the entire period over which temperature T1 and T2 measurements are recorded.

Activate the engine cooling fan assembly operation by modifying the engine speed.

- stabilise the engine speed at 2000 rpm while T1 and T2 temperature measurements are being recorded.
- check that the engine cooling fan assembly operating.
- record the temperatures by following the instructions given in the paragraph MEASUREMENTS.

4. FAULT FINDING PROCEDURE

The following two following conditions must be met:

- the difference between T3 and the higher of the two values T1 or T2, must be greater than or equal to 5°C

- the difference between T1 and T2 must be less than or equal to 2°C.

Note:

If one of these two conditions is not met, then the air conditioning system is not working properly. Should this be the case, refer to the fault finding procedure for the air conditioning system for the vehicle concerned.

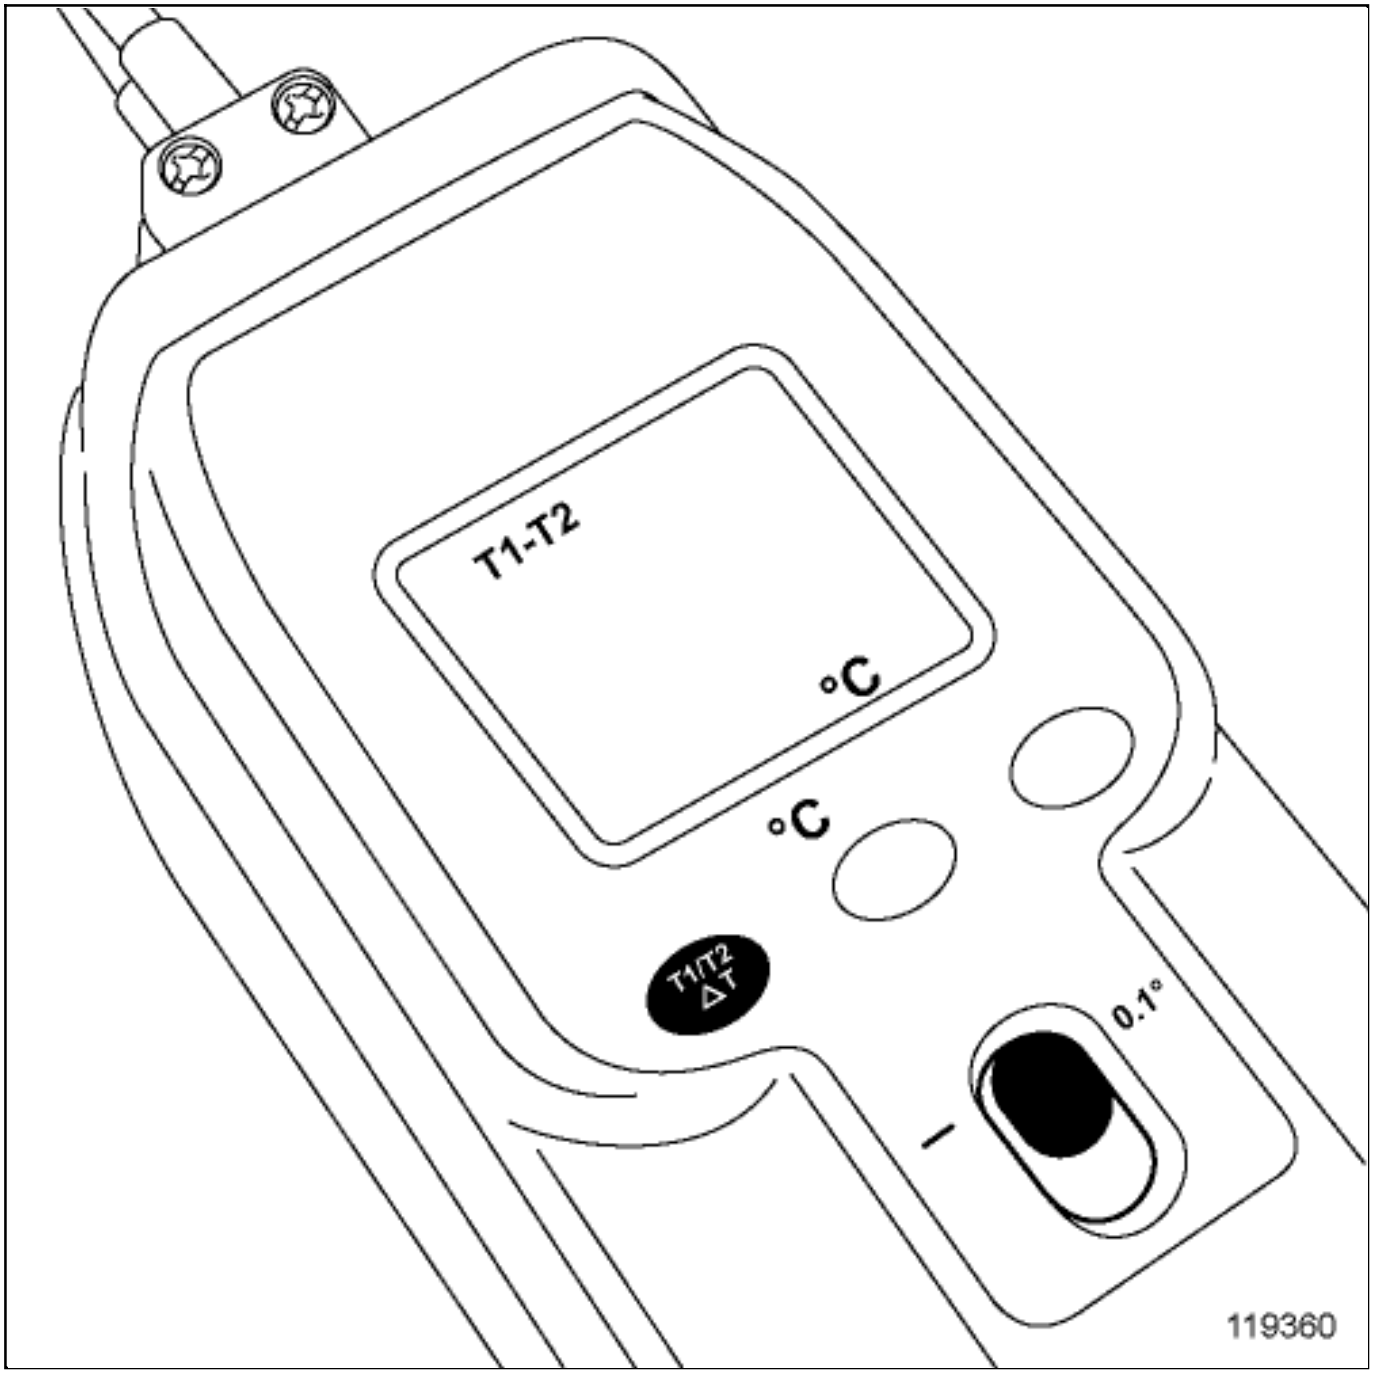
AIRCONDITIONING:CHECK

 **Note, one or more warnings are present in this procedure** 

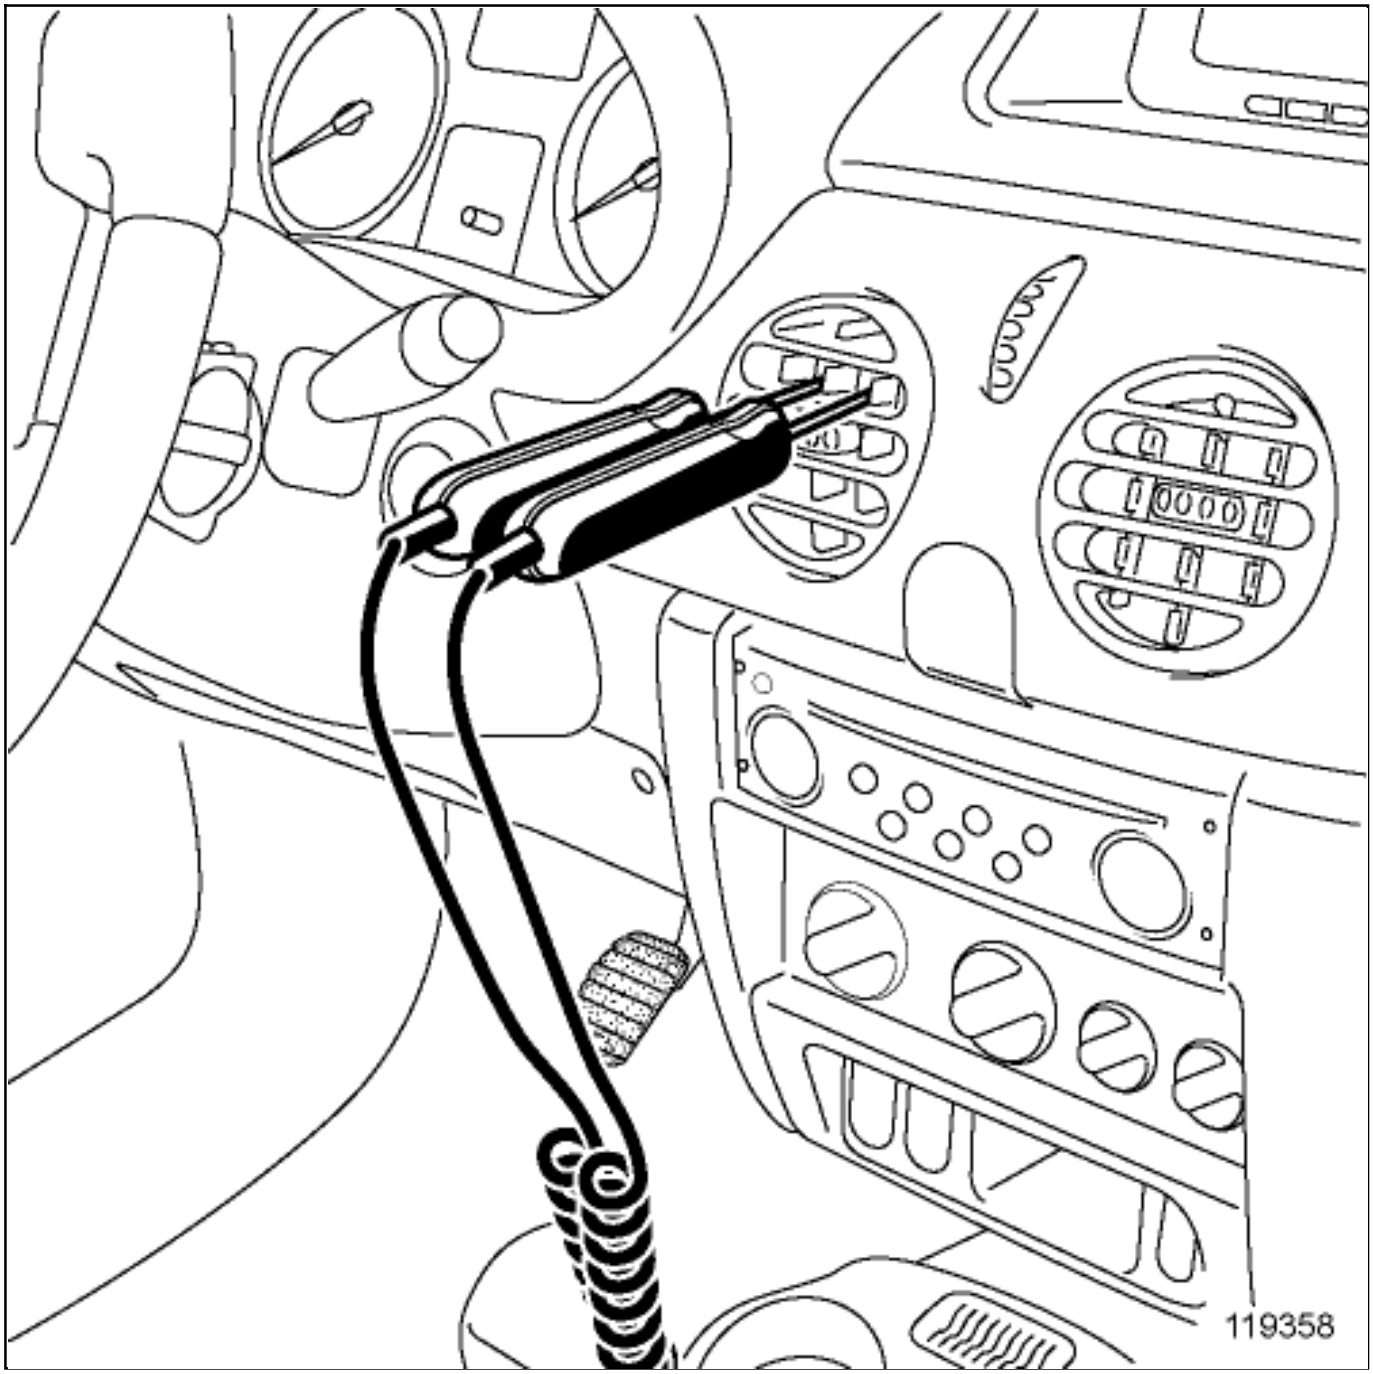
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

Equipment required
Dual-sensor temperature measuring device



Note:



When performing RENAULT maintenance, check the air conditioning system at the end of the vehicle's maintenance program so that the engine will be cold.

1. PREPARATION OPERATION FOR THE MEASUREMENT DEVICE

- Check that the measurement device functions properly (see the device's instruction manual).
- Set units to ˚C.
- Set the device's sensitivity to 0.1˚C.

Set the reading mode to (ΔT) = (T1 - T2)

Check the two sensors T1 and T2 in order to calculate the correction (Δ) to be applied to the measurement (T1 - T2). the two sensors must indicate the same measurement under the same conditions. Check the sensors by:

- bringing the ends of the 2 sensors together until they touch,
- placing the sensors in the air flow of an air vent,
- setting the passenger compartment fan assembly to top speed.

waiting for the value to become stable.

- recording the correction value (Δ).

Note:

It is not necessary to start the vehicle. The device display is in mode (ΔT) = (T1 - T2).

CAUTION

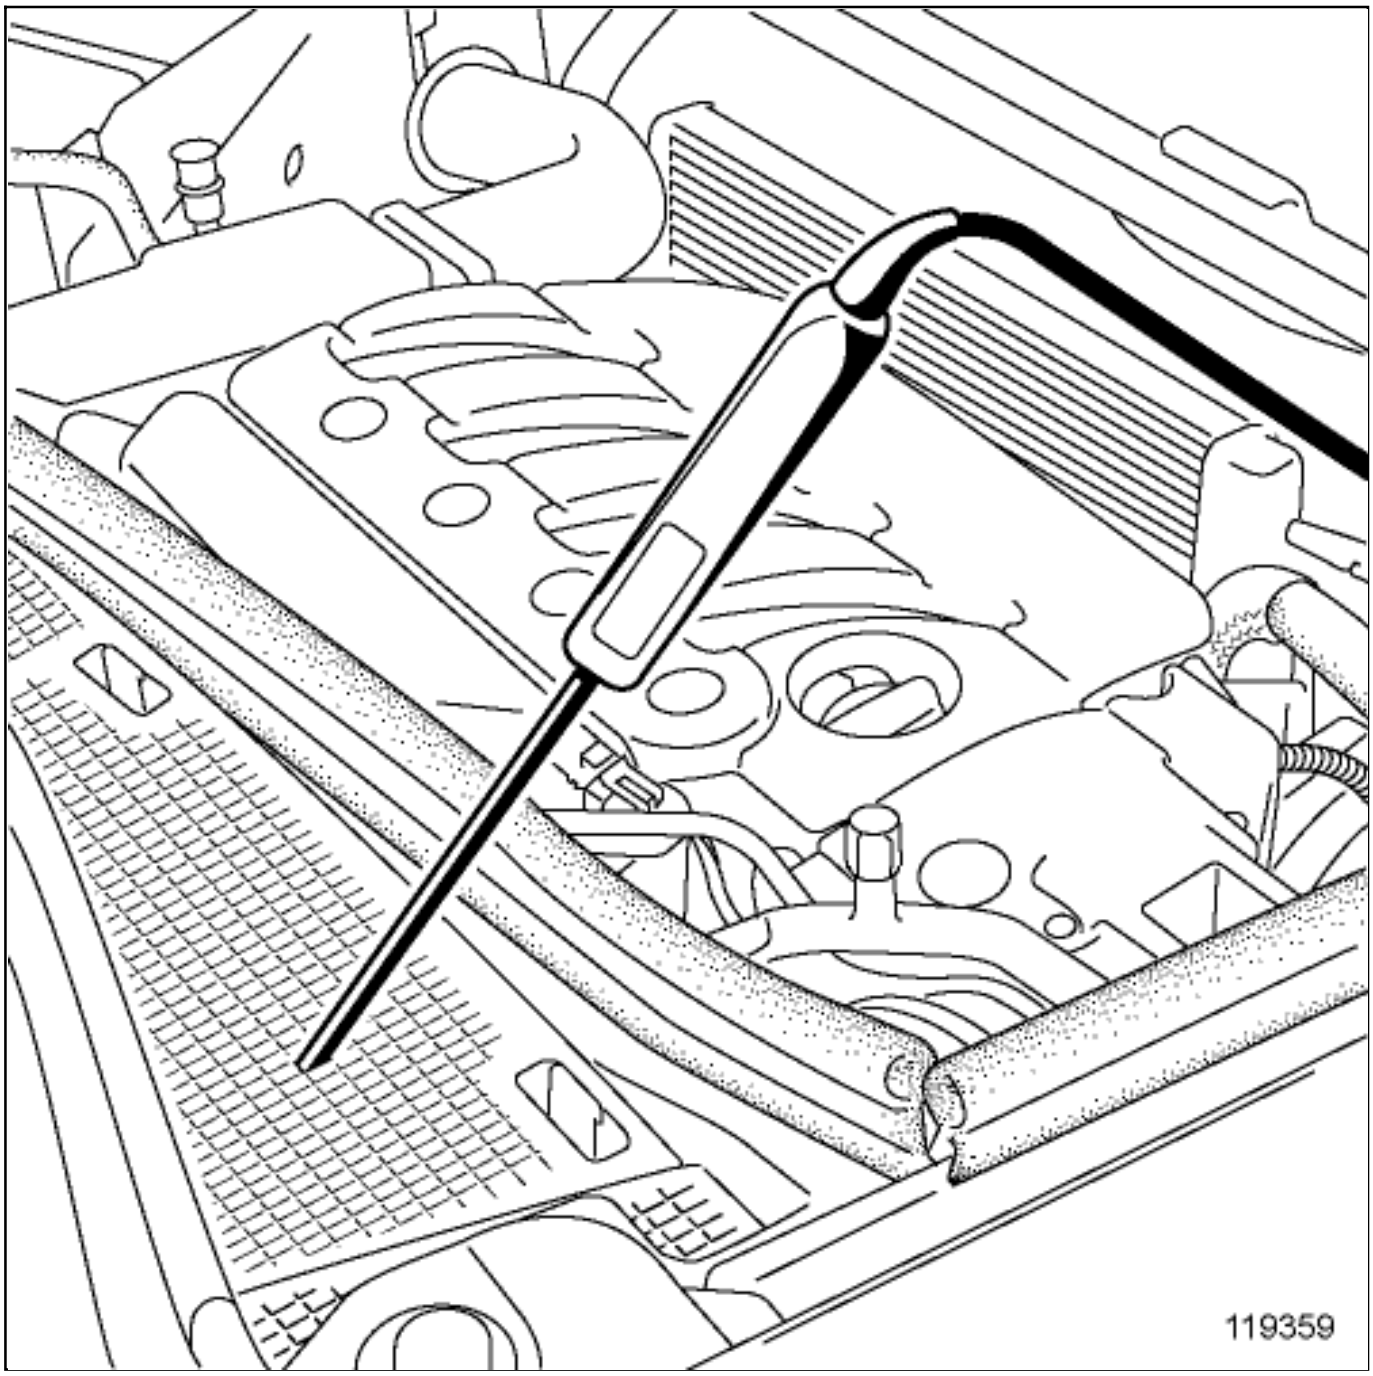
Note the difference and sign as soon as the temperature becomes stable.

Calculate the correction (Δ) = - (T1 - T2) to be applied to the measurement (ΔT).

Examples:

If (T1 - T2) = - 0.3˚C, correct the measurement (ΔT) by (Δ) = + 0.3˚C

If (T1 - T2) = + 0.3˚C, correct the measurement (ΔT) by (Δ) = - 0.3˚C



2. VEHICLE PREPARATION OPERATION

- Put the vehicle in the shade, where the temperature is greater than or equal to 15˚Cminimum.
- Close the bonnet.

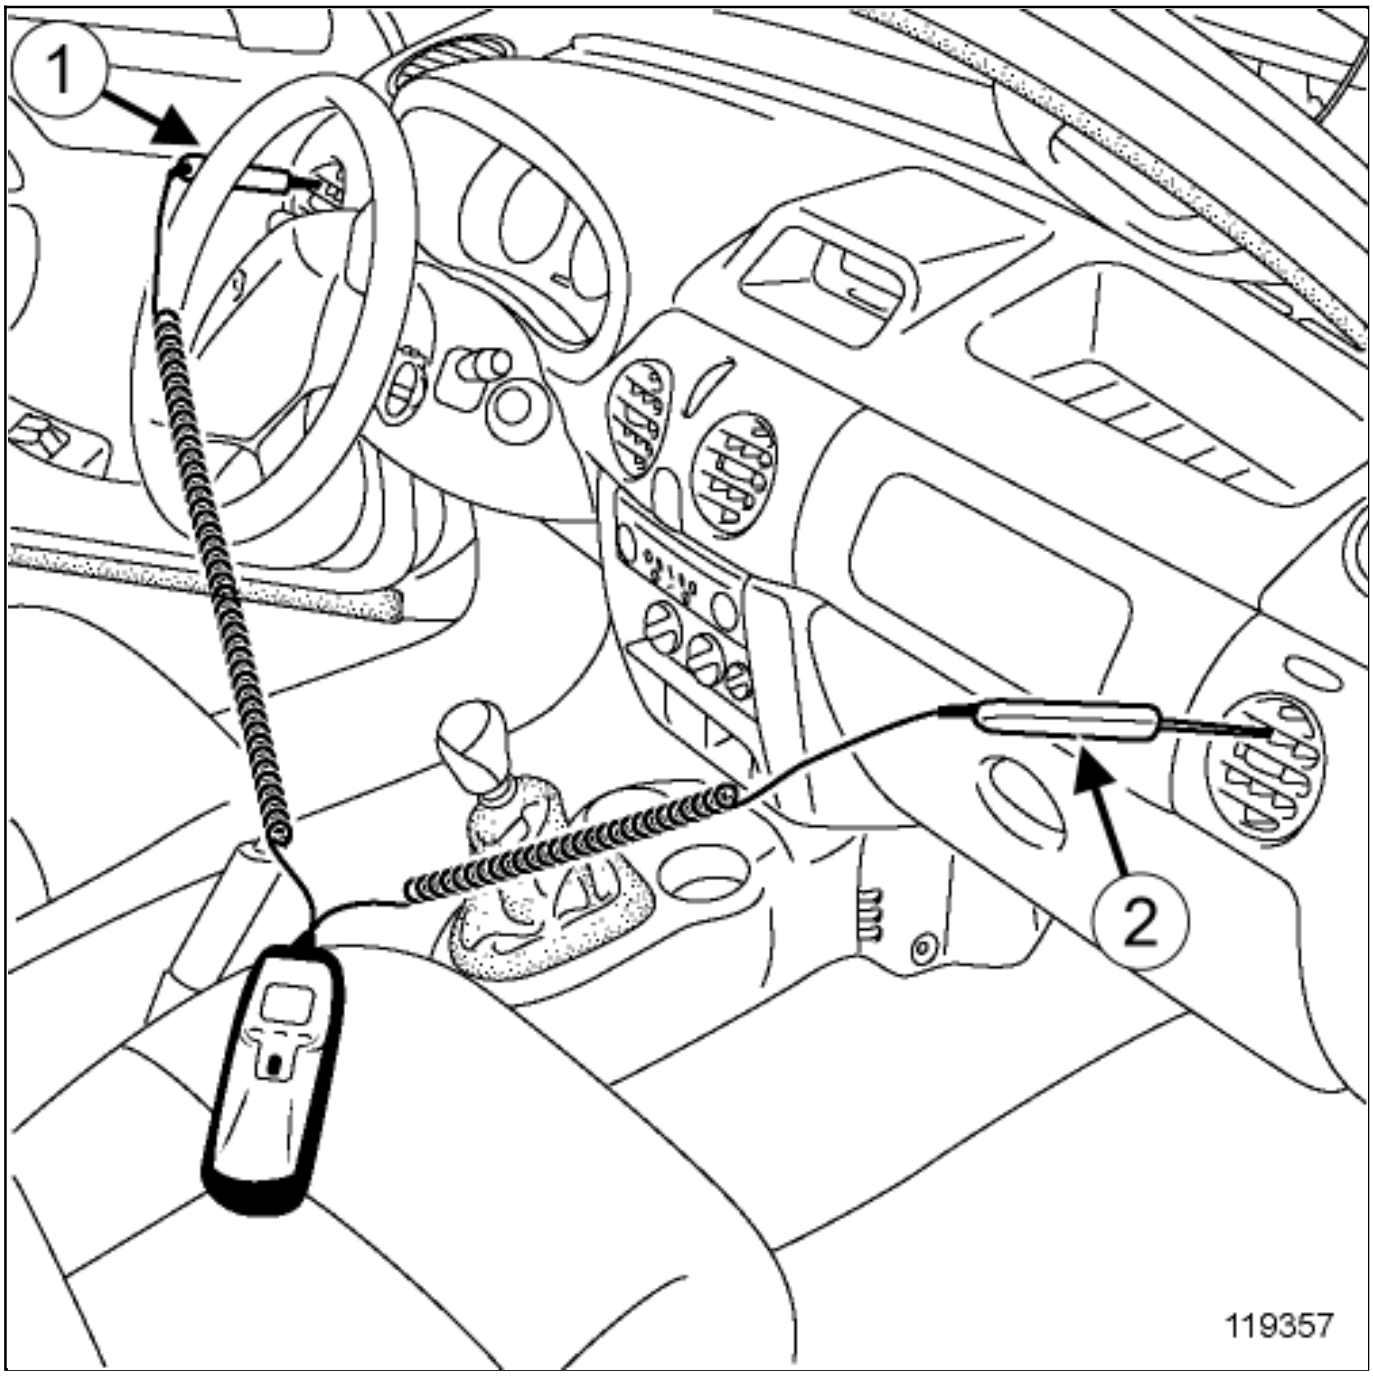
- the front side and centre air vents open with the vanes in a neutral position,
- the air conditioning system must be turned on (indicator light illuminated).

Wait 5 minutes with the engine idling before taking any measurements.



3. MEASUREMENTS

Record the air temperature at the scuttle panel grille (T3).

- open the bonnet, depending on the vehicle, to access the scuttle panel grille.
- place the sensor where air is drawn through the scuttle panel grille.
- wait for the value to become stable.
- record the T3 temperature value.

close the bonnet if it was opened.

Record the air temperature at the left air vent (T1), and at the right air vent (T2).

- fit sensor T1 in the left air vent(**1**) .
- fit sensor T2 in the right air vent(**2**) .

Record the differences in temperature once the (ΔT) value has stabilised:

- between T3 and the higher of values T1 or T2, (T3 - highest value).
- record this difference in temperature.
- between T1 and T2 (read the (ΔT) value (T1-T2) display mode).
- record the difference in temperature (ΔT) according to the correction (Δ) to be applied to the measurement.

If the (ΔT)=(T1-T2) measurement is unstable, follow the procedure below:

Note:

Depending on the vehicle's air conditioning system programming, this check method may not be applicable because the engine cooling fan assembly has been activated. Its operation renders the (ΔT) value between T1 and T2 unstable. To eliminate this error, the fan assembly must be activated for the entire period over which temperature T1 and T2 measurements are recorded.

Activate the engine cooling fan assembly operation by modifying the engine speed.

- stabilise the engine speed at 2000 rpm while T1 and T2 temperature measurements are being recorded.
- check that the engine cooling fan assembly operating.
- record the temperatures by following the instructions given in the paragraph MEASUREMENTS.

4. FAULT FINDING PROCEDURE

The following two following conditions must be met:

- the difference between T3 and the higher of the two values T1 or T2, must be greater than or equal to 5°C

- the difference between T1 and T2 must be less than or equal to 2°C.

Note:

If one of these two conditions is not met, then the air conditioning system is not working properly. Should this be the case, refer to the fault finding procedure for the air conditioning system for the vehicle concerned.

AIR CONDITIONING COMPUTER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 62A, Air conditioning, Air conditioning: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts to always be replaced, etc.)Passenger compartment heating and ventilation assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Disconnect the batteryBattery: Removal - Refitting .

Remove the gloveboxDashboard assembly: Exploded view .

2. REMOVAL OPERATION

Disconnect the connectors from the air conditioning computer.

Unclip the air conditioning computer from its support Passenger compartment heating and ventilation assembly: Exploded view .

REFITTING

1. REFITTING OPERATION

Refit the air conditioning computer Passenger compartment heating and ventilation assembly: Exploded view .

Connect the air conditioning computer connectors.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Air conditioning computer."

AIR CONDITIONING: PARTS AND CONSUMABLES FOR THE REPAIR

To find out the oil part numbersVehicle: Parts and consumables for the repair

TABLE OF VEHICLE REFRIGERANT CAPACITIES ACCORDING TO THEIR ENGINES AND VARIOUS FEATURES.

Engine	Refrigerant capacity (g)	Type of compressor	Type of oil	Quantity of oil (ml)
D4F	430 ± 35	Valeo VCS-14EC	PAG 488	120 ± 10
H4B				
H5F				
M5M				100 ± 10
K9K				

TABLE OF QUANTITIES OF OIL TO ADD WHEN REPLACING COMPONENTS:

Operation on the air conditioning circuit	Quantity of oil (ml or cc)
Circuit oil change	Measure the volume recovered and add the same quantity of new oil
Split hose or other rapid leak	100
Replacing a hose	Quantity recovered + 10
Replacement of a condenser	Quantity recovered + 30
Replacement of an evaporator	Quantity recovered + 30
Replacement of the dehydrator canister	Quantity recovered + 15
Removing and refitting a compressor	Quantity recovered
Replacing a compressor	None added
Standard replacement of a compressor	Top up as necessary
Replacement of a compressor and one or more components of the heating and air conditioning system	None added
Standard replacement of a compressor and replacement of one or more heating and air conditioning circuit components	Top up as necessary

AIR CONDITIONING: PARTS AND CONSUMABLES FOR THE REPAIR

To find out the oil part numbersVehicle: Parts and consumables for the repair

TABLE OF VEHICLE REFRIGERANT CAPACITIES ACCORDING TO THEIR ENGINES AND VARIOUS FEATURES.

Engine	Refrigerant capacity (g)	Type of compressor	Type of oil	Quantity of oil (ml)
D4F	430 ± 35	Valeo VCS-14EC	PAG 488	120 ± 10
H4B

Standard replacement of a compressor	Top up as necessary
Replacement of a compressor and one or more components of the heating and air conditioning system	None added
Standard replacement of a compressor and replacement of one or more heating and air conditioning circuit components	Top up as necessary

AIR CONDITIONING: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

1. SAFETY

WARNING

- The following must be worn when handling refrigerant:
  - gloves,
  - protective goggles (with side shields if possible).

In the event of refrigerant fluid coming into contact with the eyes, rinse well with clean water continuously for 15 minutes. If possible, have an eye rinse unit available.

If refrigerant comes into contact with your eyes, consult a doctor immediately. Inform the doctor that the burns were caused by R134Arefrigerant.

In the event of contact with other unprotected parts of the body (event though the safety advice has been observed), rinse well with clean water continuously for 15 minutes .

WARNING

Work requiring the use of refrigerant must be carried out in a well-ventilated area.

The refrigerant must not be stored in a shaft, a pit, a hermetically sealed room, etc.

Refrigerants are colourless and odourless fluids.

Refrigerant is heavier than air. As a result there is a risk of asphyxia for those working close to the ground and less than 5 maway from the working area (pit, well, air vents, etc.).

Switch on gas extraction systems.

At temperatures above 100°C, the refrigerant will decompose and produce a highly irritant gas.

WARNING

It is forbidden to smoke close to an open refrigerant circuit.

2. GENERAL RECOMMENDATIONS

CAUTION

Consult the device's operating manual to avoid incorrect use.

It is possible to place components in the drying oven after painting or to carry out work near the system if the temperature does not exceed 80°C.

WARNING

To prevent refrigerant from leaking, never repair a faulty air conditioning circuit component.

Replace all faulty components.

It is essential to follow the routing of the connecting pipes.

Ensure that the refrigerant connecting pipes are correctly fitted so that they will not come into contact with metal parts in the engine compartment.

CAUTION

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

CAUTION

To avoid damaging the surface of the air conditioning pipes when removing the seals, do not use a tool with a metallic end piece.

CAUTION

To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

Note:

Use blanking plugs for the fuel circuits with part numbers 77 01 208 229or 77 01 476 857 to plug any openings exposed to the open air. They must be clean. Do not use any plugs which have already been used to plug a fuel circuit.

CAUTION

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

CAUTION

To avoid any leaks, check that the seal and the pipe surface are in good condition. The seal and the surface must be clean and scratch free.

CAUTION

Lubricants are not mutually compatible: always observe the type and quantity of oil recommended for each compressor even when topping up as this could damage the cold loop components.

Always close the oil cans again after use to keep moisture out and never use oil contained in a can that has been open for a long time (viscous appearance).

Consumables:

To avoid the destruction of the components of the cold loop and create electric leakage on high voltage electric vehicles, observe the types and quantities of oil imposed for each compressor including making an extra.

The following lubricants are not miscible:

- Planetelf PAG 488 for internal combustion engine vehicle,
- Sanden SP 10 for internal combustion engine vehicle,
- POE ND 11 for electric vehicle.

Close systematically oil cans after each use to prevent humidity penetration.

Do not use the oil contained in a can appearance seems begun viscous.

Tool:

Use a refrigerant charging station adapted to each type of lubricant.

There are automatic refrigerant charging stations or semi-automatic (see catalog garage equipment) for the injection of lubricants without mixture.

AIR CONDITIONING: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

REFITTING

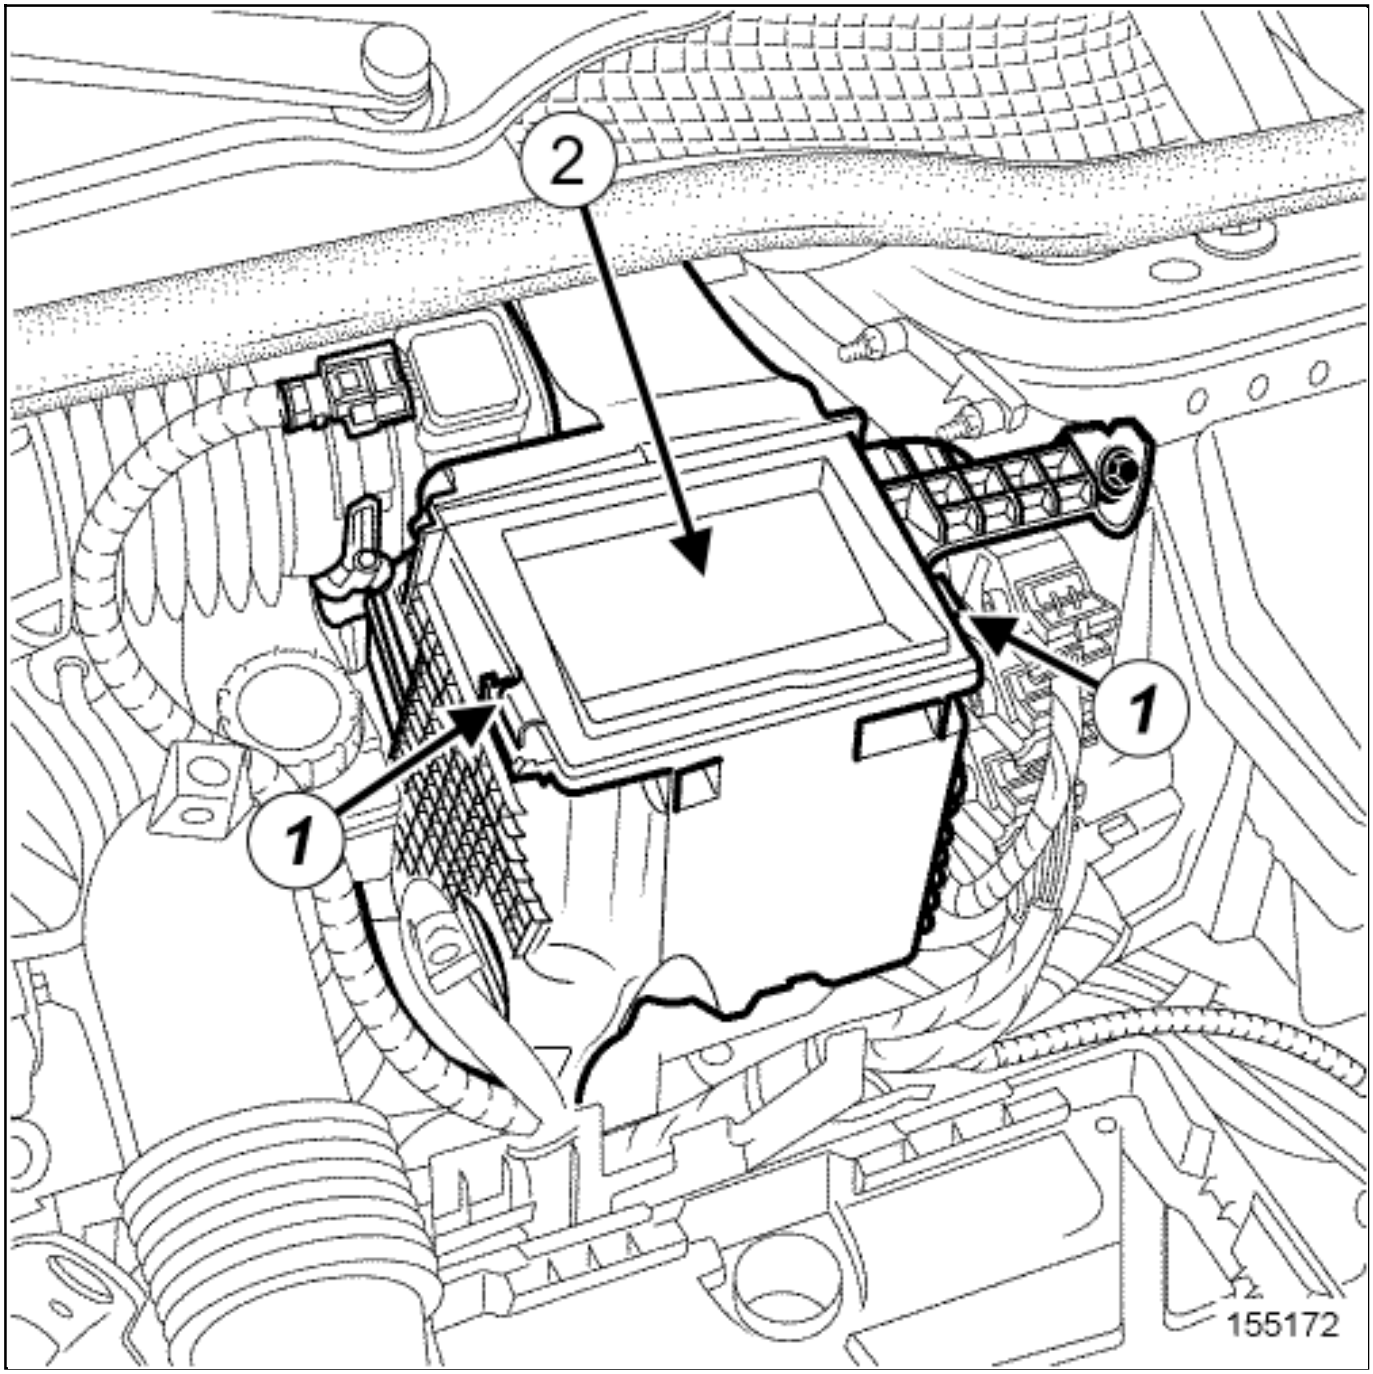
1. REFITTING PREPARATION OPERATION

Clean the air filter housing.

2. REFITTING OPERATION

CAUTION

If the air filter is fitted incorrectly in the air filter unit, unfiltered air may enter the engine.



Proceed in the reverse order to removal.

AIR FILTER UNIT: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - from the front end panel,
  - from the air filter unit.
- Remove the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Remove the batteryBattery: Removal - Refitting .

2. REMOVAL OPERATION

- Loosen the air filter unit air outlet pipe clip(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Disconnect the air filter unit air outlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the air filter unit bolt,
  - the air filter unit.

1- IN THE EVENT OF REPLACEMENT

- Remove the air filter(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

1- IN THE EVENT OF REPLACEMENT

Refit the air filter(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REFITTING OPERATION

Proceed in the reverse order to removal.

AIR FILTER UNIT: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - from the front end panel,
  - from the air filter unit.
- Remove the air filter unit air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Remove the batteryBattery: Removal - Refitting .

2. REMOVAL OPERATION

- Loosen the air filter unit air outlet pipe clip(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Disconnect the air filter unit air outlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Remove (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - the air filter unit bolt,
  - the air filter unit.

1- IN THE EVENT OF REPLACEMENT

- Remove the air filter(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

1- IN THE EVENT OF REPLACEMENT

Refit the air filter(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REFITTING OPERATION

Proceed in the reverse order to removal.

AIRBAG AND PRETENSIONERS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool

WARNING

All operations on airbag and pretensioner systems must be carried out by qualified trained personnel.

The airbags have a pyrotechnic gas generator, with an ignition module and bag which must not be separated.

The pretensioners have a pyrotechnic gas generator and an igniter which must, under no circumstances, be separated.

WARNING

Never handle the pyrotechnic systems (pretensioners or airbags) near to a source of heat or naked flame - they may be triggered.

WARNING

To avoid any splashes, do not place anything in the airbag deployment area.

WARNING

To prevent the any component from being thrown upwards, store the airbag with the inflatable cushion facing upwards.

Protect the side impact sensors (with cardboard and adhesive, for example) during an operation near these sensors (risk of damage caused by a falling tool, etc.).

Always replace any pyrotechnic system that has fallen on the ground or shows signs of impact.

Always replace any restraint system that shows deterioration (tears or damage to the strap, damaged appearance parts, cover unclipped, damaged clips or indexing brackets, etc.).

1. PROCEDURE FOR DEACTIVATING AND ACTIVATING THE SAFETY SYSTEMS

Bodywork and pyrotechnic component	Deactivation	Activation

Disconnection, wiring operation and removal:

- dashboard
- seat
- steering column switch assembly
- driver's front airbag
- passenger's front airbag
- front chest-level side airbag
- rear chest-level side airbag
- curtain side airbag
- anti-submarining airbag
- front seat lap belt pretensioner
- front side seat belt
- rear side seat belt
- pyrotechnic battery terminal

Lock the airbag computer applying the before repair procedure using the Diagnostic tool[Diagnostic tool : Use] :

-Computer concerned by the before repair procedure:

"Airbag computer"

Connect the battery[Battery: Removal - Refitting] or connect the 12V supply circuit[Vehicle: Lockout - Removal of lockout] on an electric vehicle

automatic roll-hoops

Bodywork operation

dent removal

jacking

replacing non-removable components (weld)

Upholstery operation

trim removal

Operation on a door (if the door is equipped with a side impact sensor):

adjustment with a striking tool

removal of an electric window mechanism

removal of a lock

removal of an exterior handle

removal of a window

Airbag computer

Disconnect the battery Battery: Removal - Refitting or disconnect the 12V supply circuit Vehicle: Lockout - Removal of lockout on an electric vehicle

Unlock the airbag computer applying the after repair procedure using the Diagnostic tool Diagnostic tool : Use :

-Computer concerned by the after repair procedure:

"Airbag computer"

Impact detection component	Deactivation	Activation
Disconnection, wiring operation and removal: side impact sensors airbag computer Removal of a door (if the door is equipped with a side impact sensor) Disconnection of passenger compartment/door connection (if the door is equipped with a side impact sensor)	Lock the airbag computer applying the before repair procedure using the Diagnostic tool Diagnostic tool : Use : -Computer concerned by the before repair procedure: "Airbag computer" Disconnect the battery Battery: Removal - Refitting or disconnect the 12V supply circuit Vehicle: Lockout - Removal of lockout on an electric vehicle	Connect the battery Battery: Removal - Refitting or connect the 12V supply circuit Vehicle: Lockout - Removal of lockout on an electric vehicle Unlock the airbag computer applying the after repair procedure using the Diagnostic tool Diagnostic tool : Use : -Computer concerned by the after repair procedure: "Airbag computer"

Occupant management device	Deactivation	Activation
Disconnection, wiring operation and removal: inhibitor switch seat belt buckling detection connector (if a non-pyrotechnic buckle)	Switch off the ignition	Switch on the ignition

2. TRIGGERING OF THE SAFETY SYSTEMS

Check the safety systems using the Diagnostic tool:

- after an accident,
- after theft or attempted theft of the vehicle,
- before selling a used vehicle.

After detection of an impact, the airbag computer is definitively locked and the "airbag fault" warning light illuminates on the instrument panel. The airbag computer and the side impact sensors must always be replaced.

WARNING

To eliminate the risk of any accident, do not reuse pyrotechnic components.

It is essential to destroy pretensioners or airbags before scrapping a vehicle or a part only (see 88C, Airbags and pretensioners, Airbags and pretensioners: Recycling - Destruction) .

3. DURABILITY OF THE PYROTECHNIC COMPONENTS

The precautions which recommended that pyrotechnic components (airbags and pretensioners) were replaced 10 years after the registration of the vehicle have now been lifted.

Pyrotechnic components (airbags and pretensioners) do not therefore require any maintenance.

AIRBAG AND PRETENSIONERS: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool

WARNING

All operations on airbag and pretensioner systems must be carried out by qualified trained personnel.

The airbags have a pyrotechnic gas generator, with an ignition module and bag which must not be separated.

The pretensioners have a pyrotechnic gas generator and an igniter which must, under no circumstances, be separated.

WARNING

Never handle the pyrotechnic systems (pretensioners or airbags) near to a source of heat or naked flame - they may be triggered.

WARNING

To avoid any splashes, do not place anything in the airbag deployment area.

WARNING

To prevent the any component from being thrown upwards, store the airbag with the inflatable cushion facing upwards.

Protect the side impact sensors (with cardboard and adhesive, for example) during an operation near these sensors (risk of damage caused by a falling tool, etc.).

Always replace any pyrotechnic system that has fallen on the ground or shows signs of impact.

Always replace any restraint system that shows deterioration (tears or damage to the strap, damaged appearance parts, cover unclipped, damaged clips or indexing brackets, etc.).

Pyrotechnic components (airbags and pretensioners) do not therefore require any maintenance.

AIRBAGS AND PRETENSIONERS: RECYCLING - DESTRUCTION

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for destroying airbags and pretensioners.	
Kit of 2 adapters for the airbag and pretensioner destruction tool.	
Kit of 2 adapters for the airbag and pretensioner destruction tool.	
Adapter for airbag and pretensioner destruction tool	

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) .

WARNING

To prevent any risk of an accident when destroying a pyrotechnic component, check that no-one is in the vicinity.

Note:

If triggering is not possible (faulty ignition module) return the part to Techline.

Always use the toolTool for destroying airbags and pretensioners. and three kits of adaptersKit of 2 adapters for the airbag and pretensioner destruction tool. ,Adapter for airbag and pretensioner destruction tool and Kit of 2 adapters for the airbag and pretensioner destruction tool. .

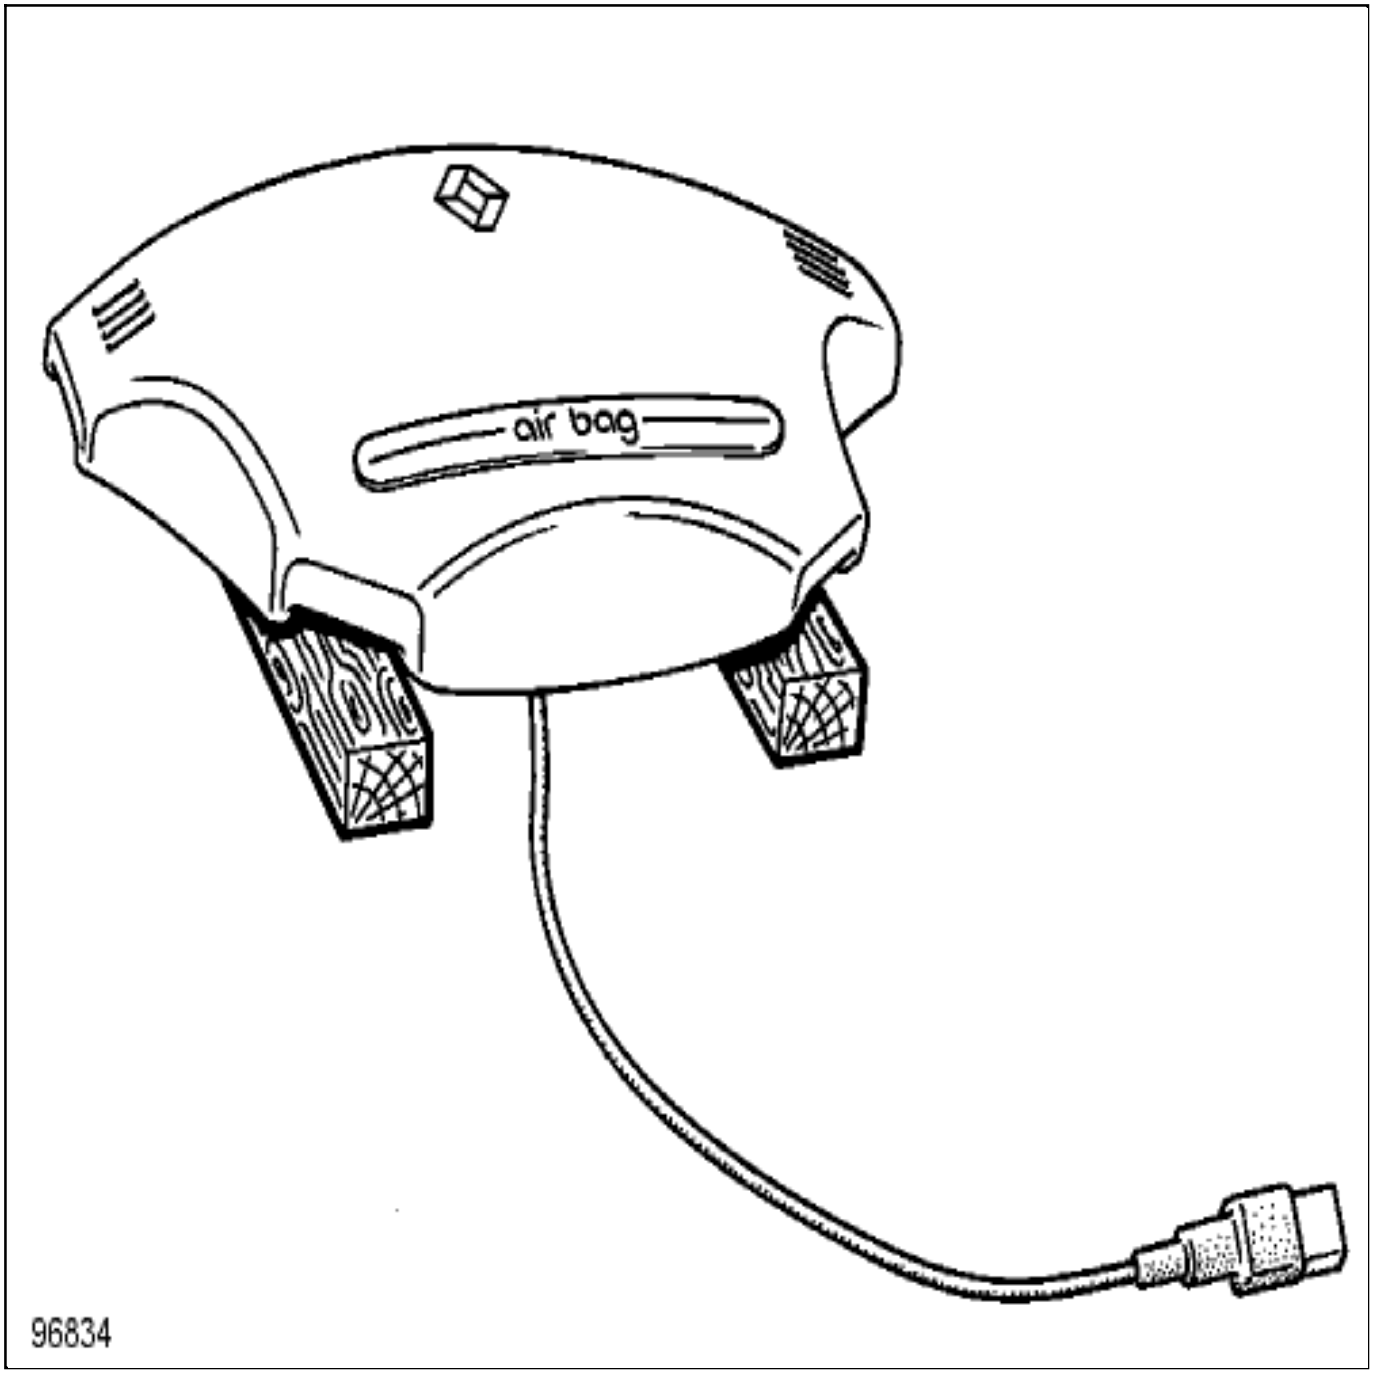
Use a wiring connector kit (Ref: 82 00 518 971).

Attach the wiring connectors (Ref: 82 00 518 971) to the adaptersKit of 2 adapters for the airbag and pretensioner destruction tool. to obtain an adapter for each colour (green, orange, blue, etc.) (see

Wiring: Repair) (Technical Note 6015A, 88A, Wiring).

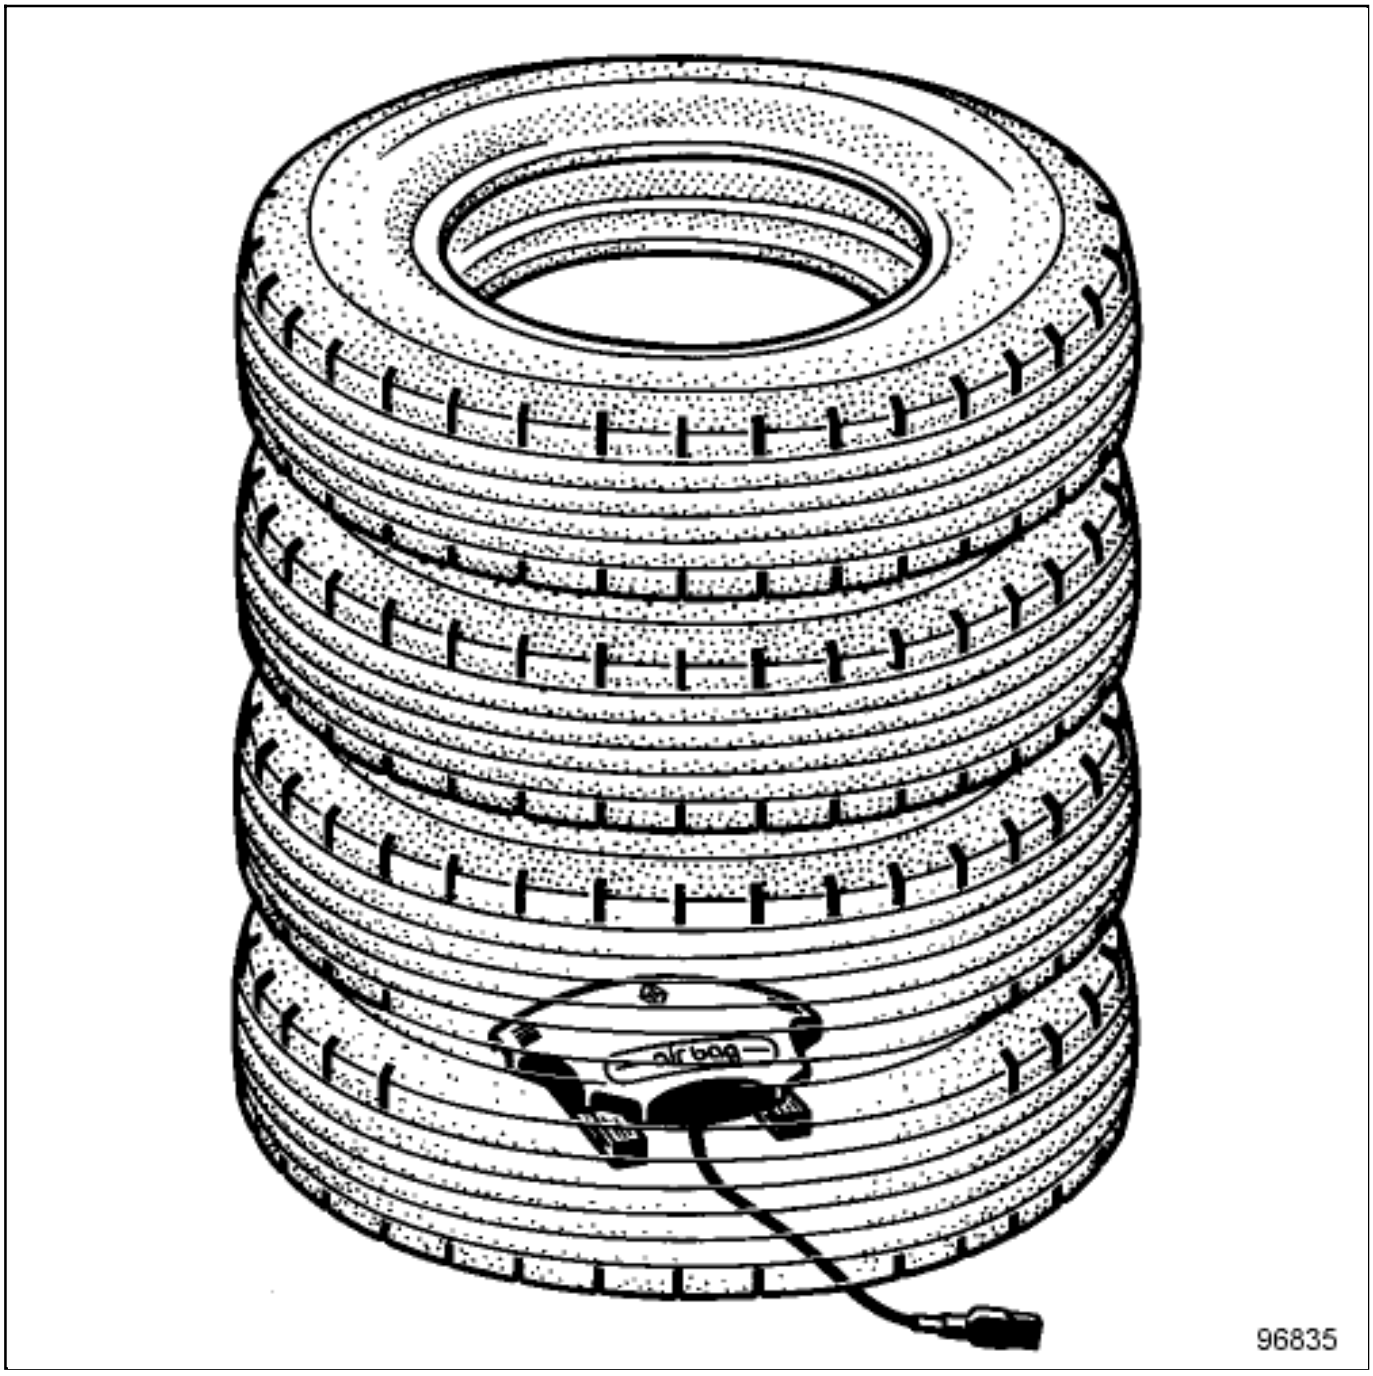
Use a battery to power the destruction tool.

1. AIRBAGS



> Note:
>
> The airbags must be destroyed outside the workshop, in an area with sufficient space.
>
> The airbags to be destroyed must be removed.

> Note:
>
> If the airbag has two levels of activation (i.e. it is fitted with two connectors), destroy both connectors.



Prepare the adapter corresponding to the airbag to be destroyed.

Connect:

- the adapter to the destruction toolTool for destroying airbags and pretensioners. ,
- the adapter to the airbag.

Put the airbag on two wooden blocks.

The destruction procedure is carried out in a stack of old tyres.

Make sure that the airbag deployment will not be hindered.

Unwind the full length of the wiring for the tool, in order to distance it as far away as possible from the pyrotechnic component to be destroyed.

Connect the two feed wires of the destruction toolTool for destroying airbags and pretensioners. to a battery.

Destroy the airbag by pressing the two push buttons on the tool simultaneously.

2. PYROTECHNIC PRETENSIONERS AND INERTIA REELS

1- DESTRUCTION OF PART FITTED ON THE VEHICLE TO BE SCRAPPED:

Move the vehicle outside the workshop.

Mark the adapter corresponding to the pyrotechnic component to be destroyed.

Connect:

- the destruction toolTool for destroying airbags and pretensioners. to the adapter,
- the adapter to the pyrotechnic component.

Unwind the tool wiring fully, so that you are far enough away from the vehicle (approximately ten metres) when the device is triggered.

Connect the two feed wires of the destruction toolTool for destroying airbags and pretensioners. to a battery.

Destroy the pyrotechnic component by pressing the two push buttons on the tool simultaneously.

2- DESTRUCTION OF PART REMOVED FROM THE VEHICLE:

Proceed in the same way as for an airbag (in a stack of old tyres).

XSL version : 3.02 du 22/07/11

1- DESTRUCTION OF PART FITTED ON THE VEHICLE TO BE SCRAPPED:

Move the vehicle outside the workshop.

Mark the adapter corresponding to the pyrotechnic component to be destroyed.

Connect:

- the destruction toolTool for destroying airbags and pretensioners.(Ele. 1287) to the adapter,
- the adapter to the pyrotechnic component.

Unwind the tool wiring fully, so that you are far enough away from the vehicle (approximately ten metres) when the device is triggered.

Connect the two feed wires of the destruction toolTool for destroying airbags and pretensioners. (Ele. 1287) to a battery.

Destroy the pyrotechnic component by pressing the two push buttons on the tool simultaneously.

2- DESTRUCTION OF PART REMOVED FROM THE VEHICLE:

Proceed in the same way as for an airbag (in a stack of old tyres).

XSL version : 3.02 du 22/07/11

AIRBAG COMPUTER: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

parts always to be replaced:
Airbag computer protector

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 88C, Airbags and pretensioners, Airbag and pretensioners: Precautions for the repair) ,

Vehicle: Precautions for the repair .

REMOVAL

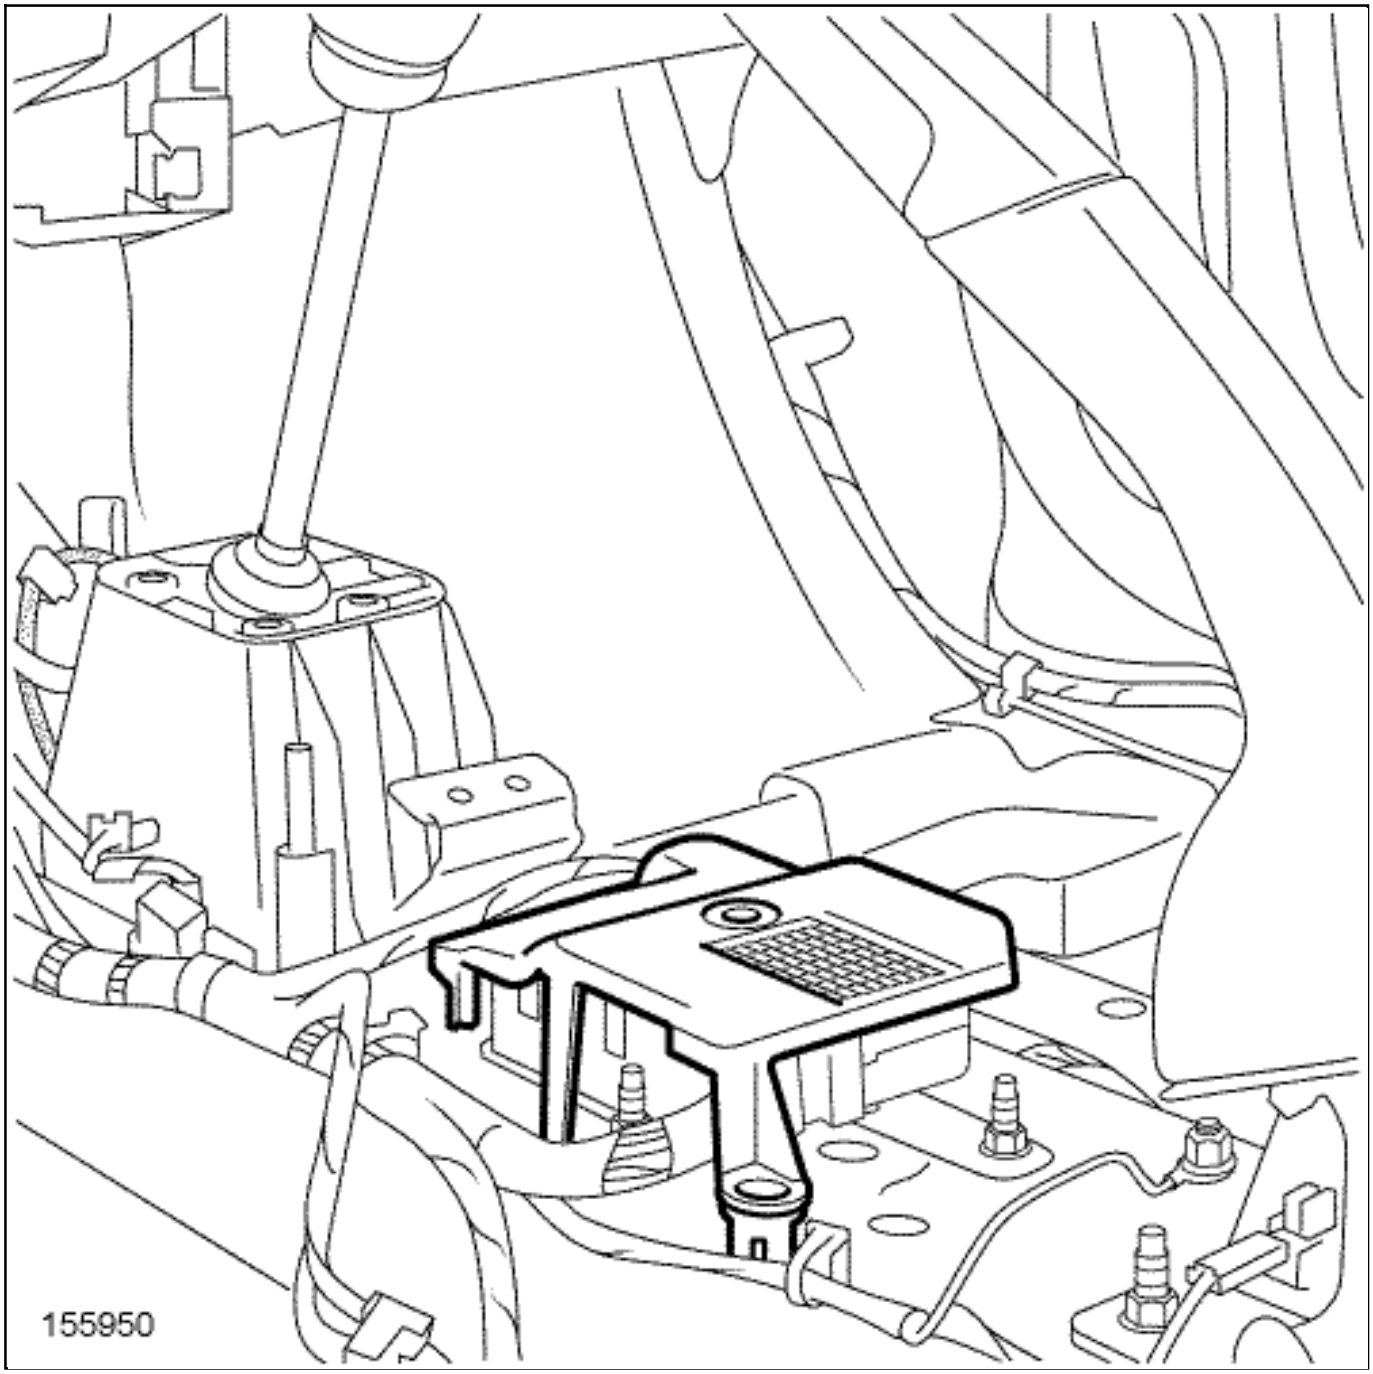
1. REMOVAL PREPARATION OPERATION

WARNING

To avoid any risk of triggering when working on or near a pyrotechnic component (airbags or pretensioners), lock the airbag computer using the diagnostic tool.

When this function is activated, all the trigger lines are inhibited and the airbag warning light on the instrument panel lights up continuously (ignition on).

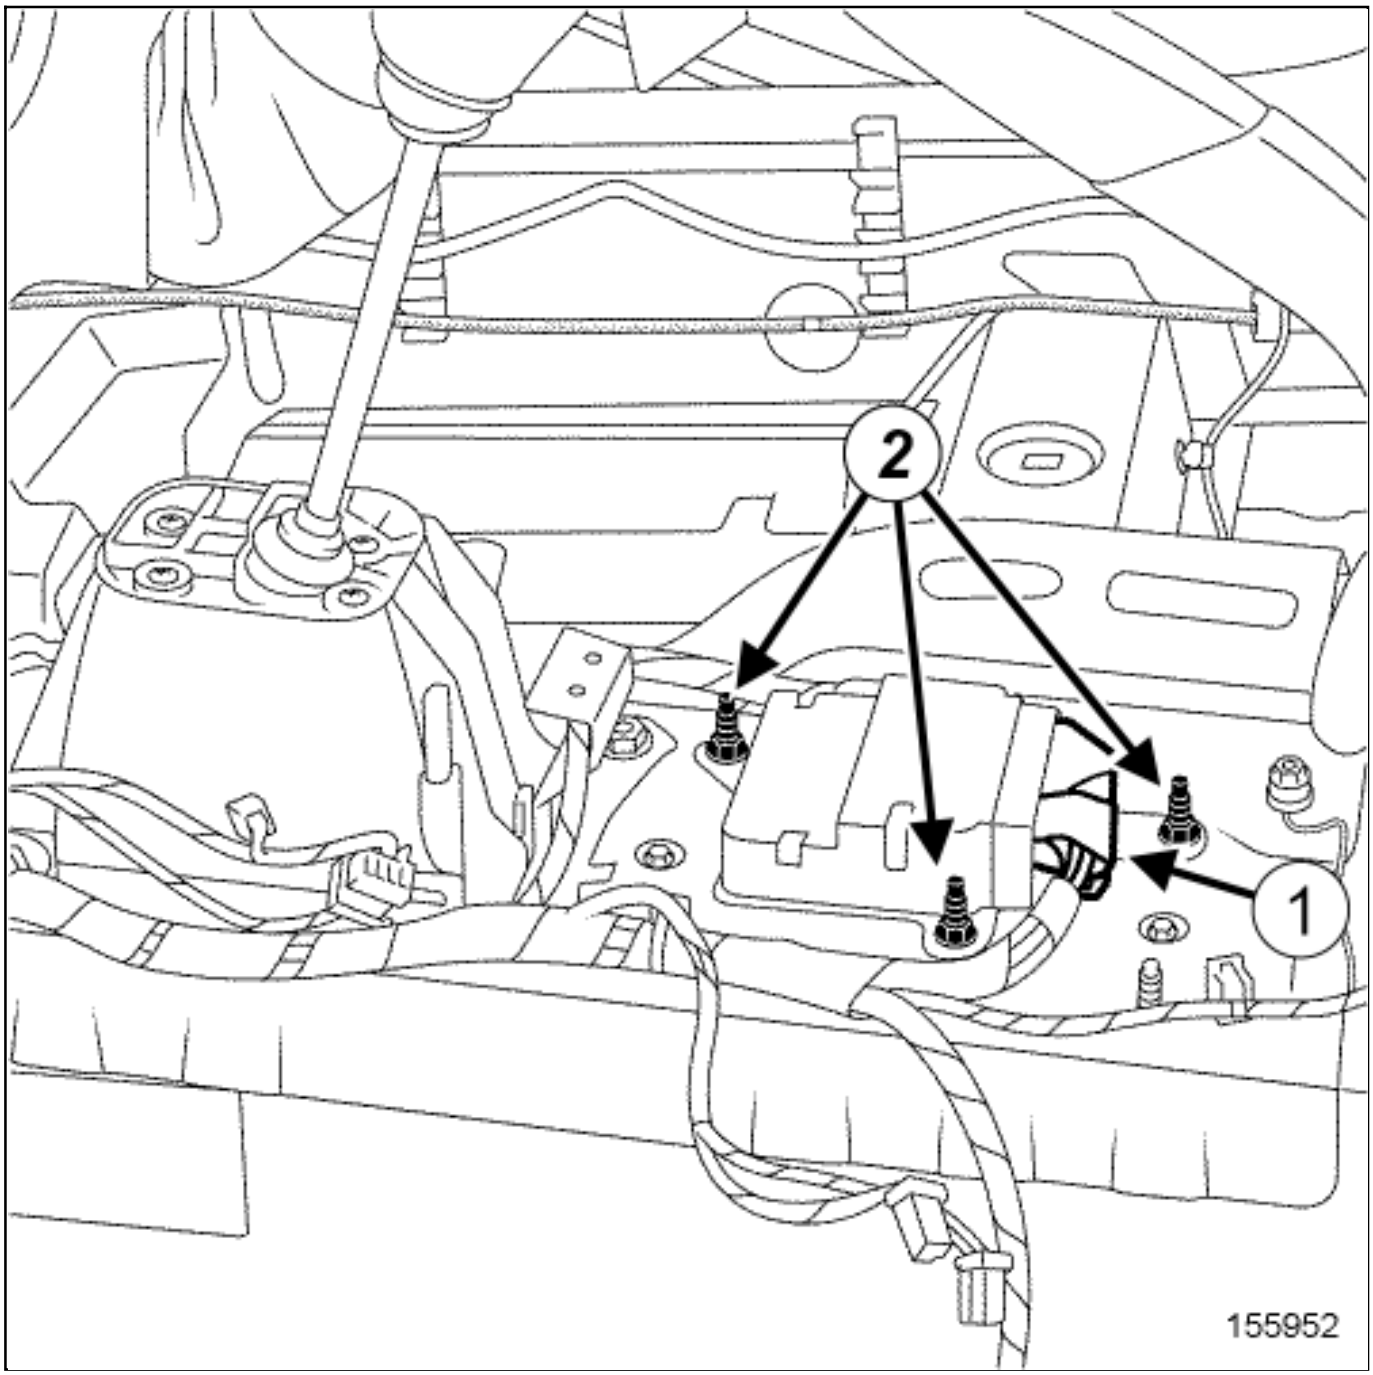
Lock the airbag computer by applying the before repair procedure using the Diagnostic toolDiagnostic tool : Use : -Computer concerned by the Before repair procedure:



"Airbag computer" .

Disconnect the batteryBattery: Removal - Refitting .

Remove the centre console(see **Centre console: Removal - Refitting**) .



Make a 20 cmcut in the carpet.

Move aside the soundproofing.

Remove the airbag computer protector.

2. REMOVAL OPERATION

Mark the wiring routing.

CAUTION

To prevent any risk of noise, premature wear, short circuits, etc. after the refitting operation, mark the wiring routing and how to connect the connectors.

Unlock the airbag computer connector.

Disconnect the airbag computer connector(1) .

Remove:

- the airbag computer nuts(2) ,
- the airbag computer.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: Airbag computer protector .

Always replace the airbag computer nuts.

2. REFITTING OPERATION

Proceed in the reverse order to removal.

CAUTION

To guarantee a good electrical connection, make sure that the wiring does not place any stress on the connectors or the surrounding components.

Check the correct routing of the wiring.

Torque tighten the airbag computer nuts8 N.m.

Clip the carpet where it was cut using clips (part number: 77 01 047 751).

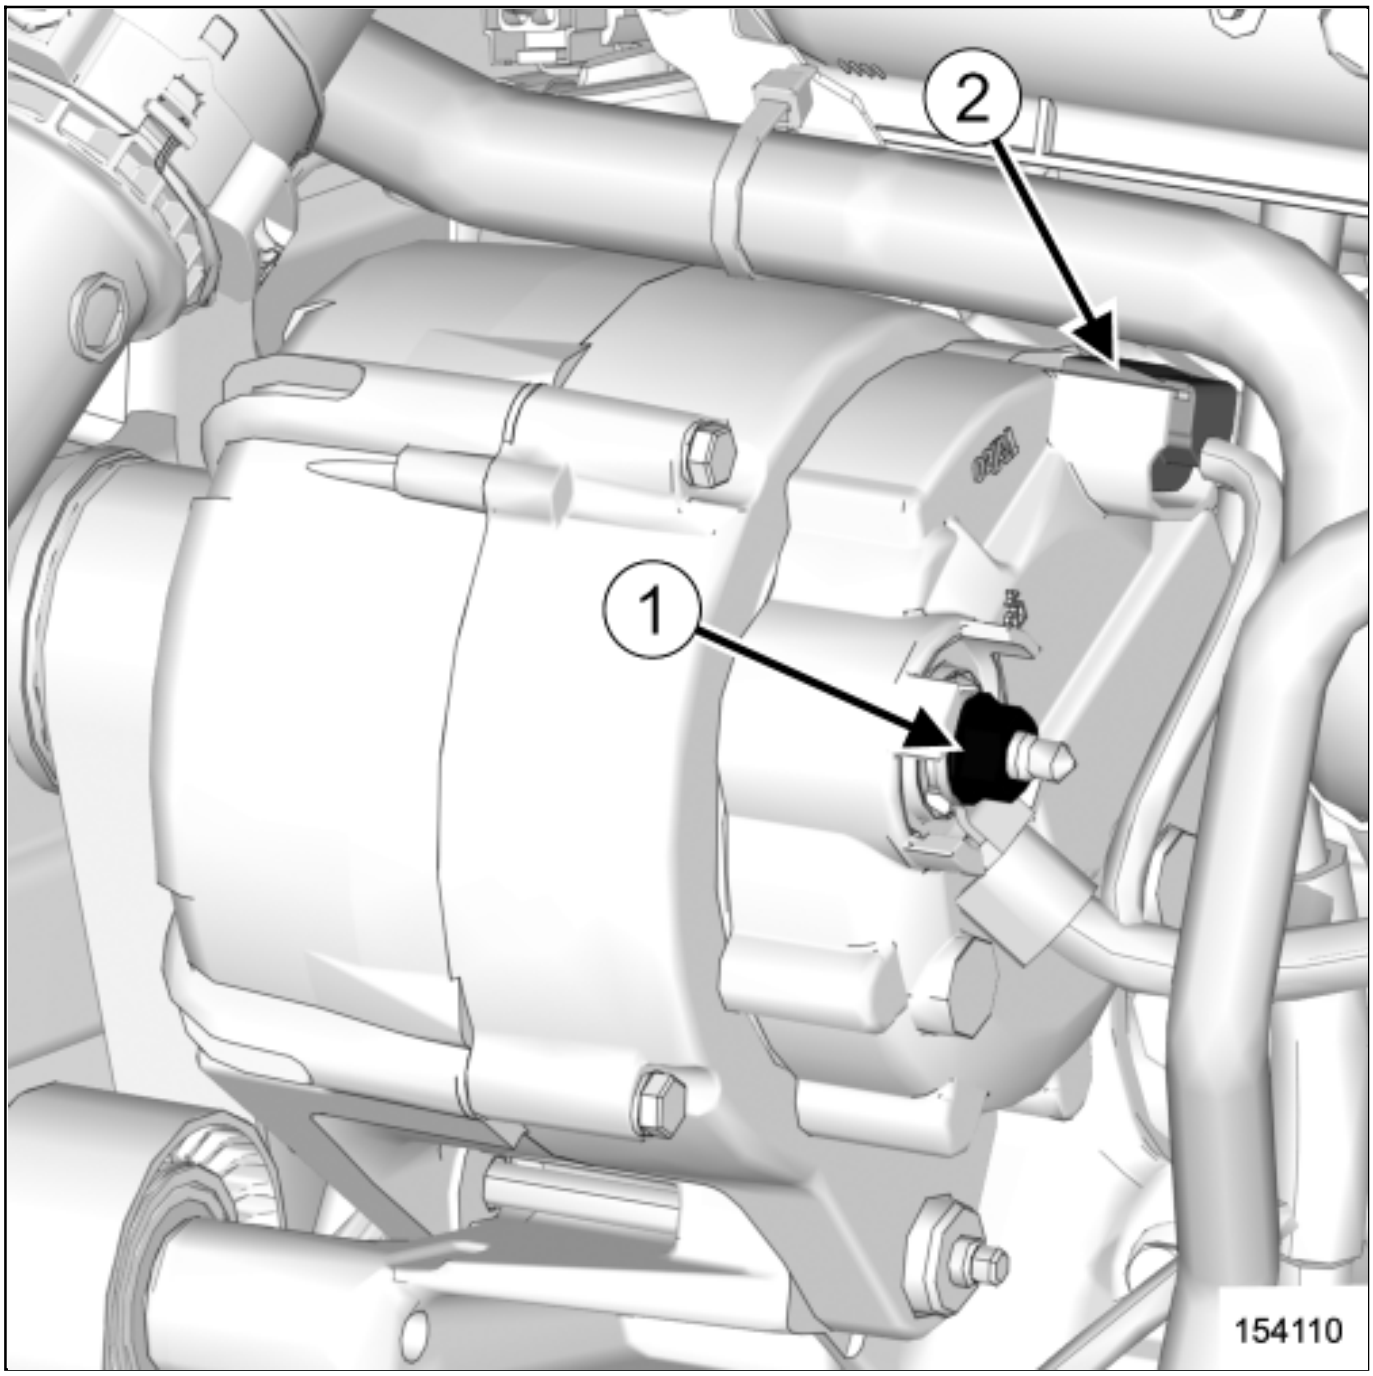
In the event of a replacement, apply the after repair procedure using the Diagnostic toolDiagnostic tool : Use :
-Calculateur concerned by the After repair procedure:

"Airbag computer" .

Unlock the airbag computer by applying the after repair procedure using the Diagnostic toolDiagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Airbag computer" .

ALTERNATOR:REMOVAL-REFITTING



Locations and specifications (tightening torques, parts always to be replaced, etc.)Engine accessories assembly: Exploded view .

REMOVAL

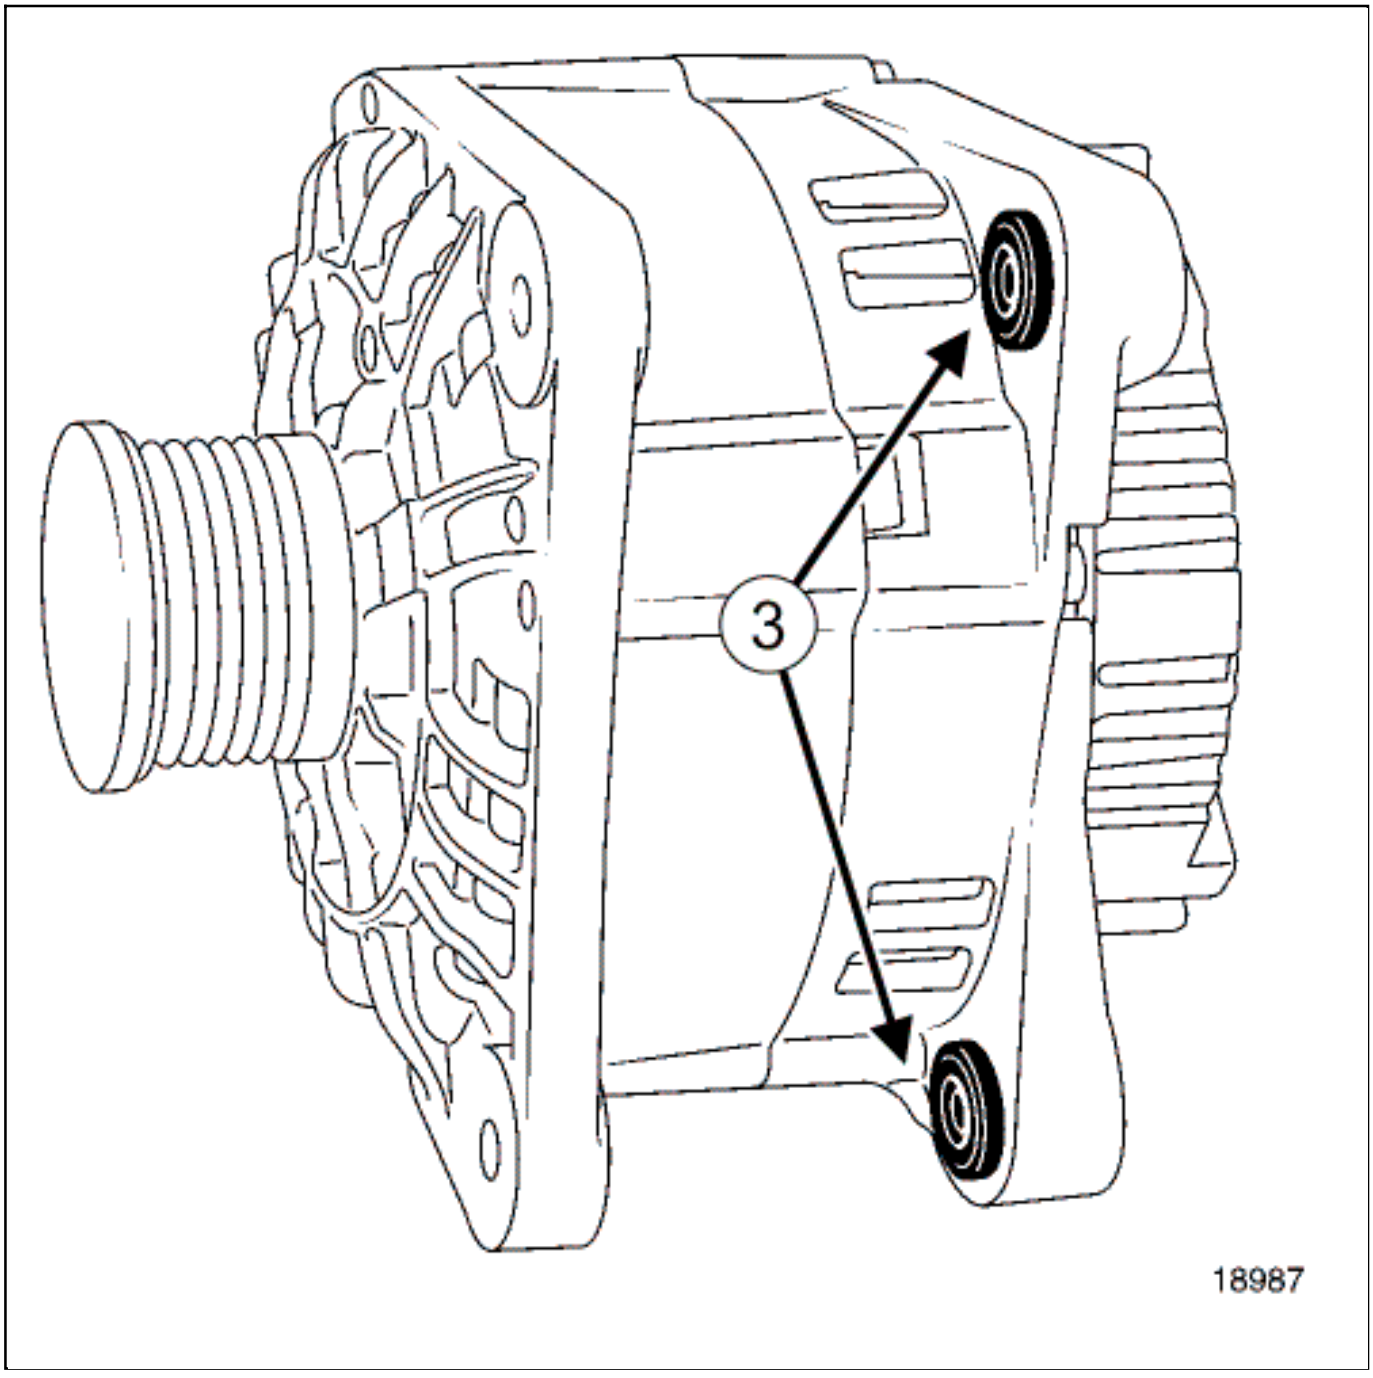
1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the front bumperFront bumper assembly: Exploded view ,
  - the air deflectors,
  - the intercooler air inlet pipeAir inlet assembly: Exploded view ,
  - the intercoolerAir inlet assembly: Exploded view
  - the accessories beltEngine accessories assembly: Exploded view .

2. REMOVAL OPERATION

Remove the nut(1) from the alternator positive terminal.

Disconnect the alternator connector(2) .



Move aside the alternator wiring.

Remove Engine accessories assembly: Exploded view :

- the alternator bolts,
- the alternator.

REFITTING

1. REFITTING PREPARATION OPERATION

Compress the alternator rings(3) using pliers or a vice to facilitate fitting.

2. REFITTING OPERATION

Refit Engine accessories assembly: Exploded view :

- the alternator,
- the alternator bolts.

Torque tighten the alternator boltsEngine accessories assembly: Exploded view .

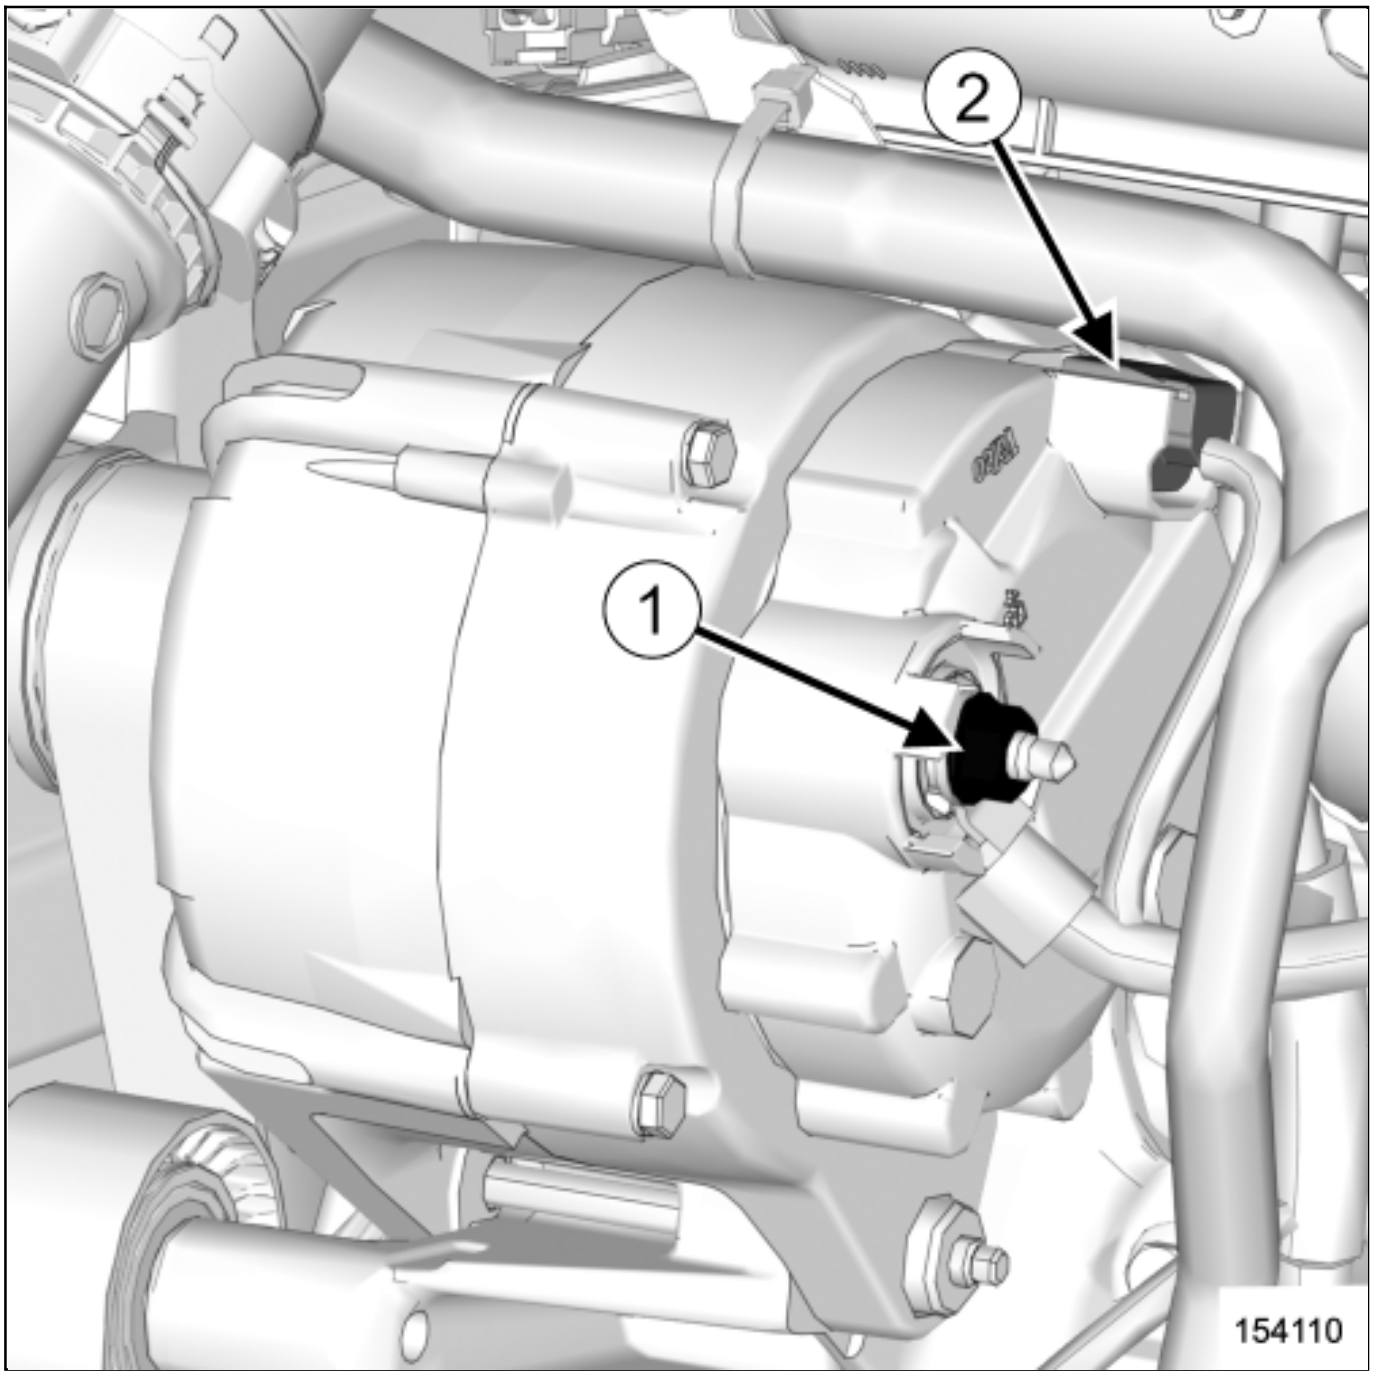
Fit the alternator electrical wiring.

Refit the alternator electrical wiring nut.

Torque tighten the alternator electrical wiring nut21 N.m.

Proceed in the reverse order to removal.

ALTERNATOR:REMOVAL-REFITTING



Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

REMOVAL

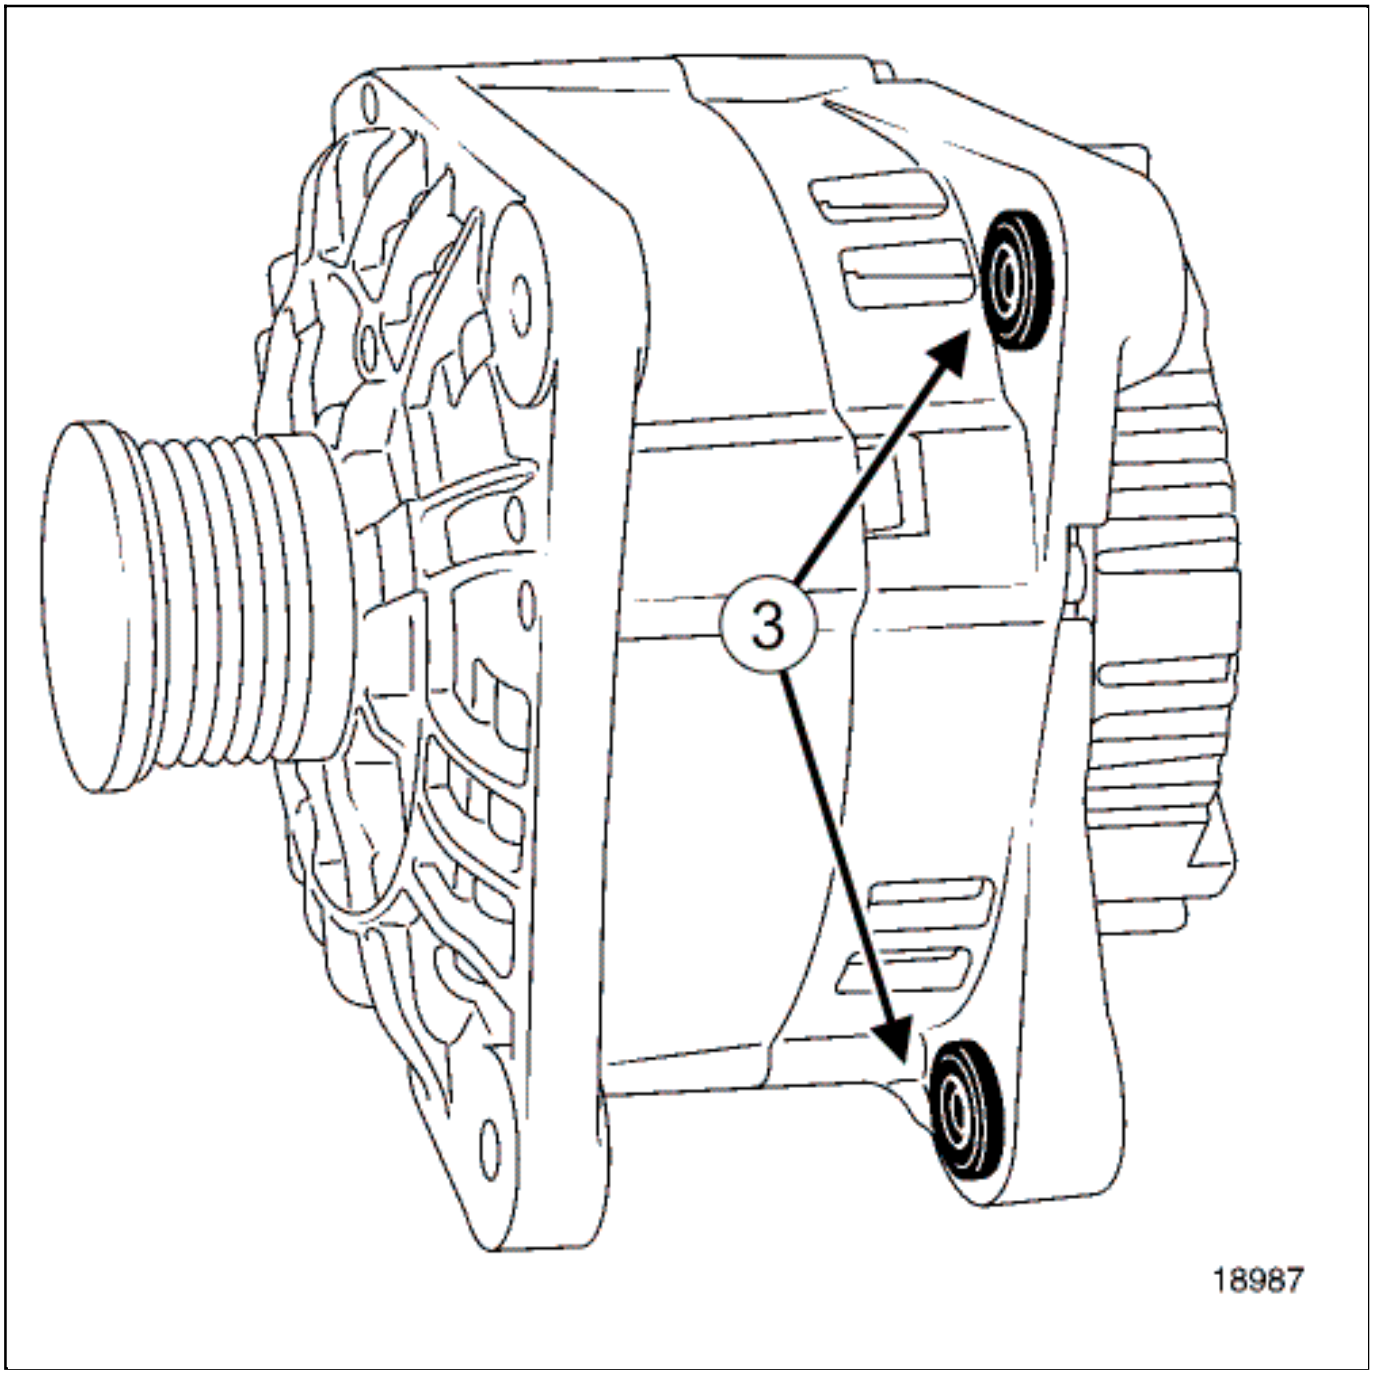
1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Disconnect the batteryBattery: Removal - Refitting .
- Remove:
  - the front bumperFront bumper assembly: Exploded view ,
  - the air deflectors,
  - the intercooler air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
  - the intercooler(see 12A, Fuel mixture, Air inlet assembly: Exploded view)
  - the accessories belt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

2. REMOVAL OPERATION

Remove the nut(1) from the alternator positive terminal.

Disconnect the alternator connector(2) .



Move aside the alternator wiring.

Remove (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the alternator bolts,
- the alternator.

REFITTING

1. REFITTING PREPARATION OPERATION

Compress the alternator rings(3) using pliers or a vice to facilitate fitting.

2. REFITTING OPERATION

Refit (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) :

- the alternator,
- the alternator bolts.

Torque tighten the alternator bolts(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) .

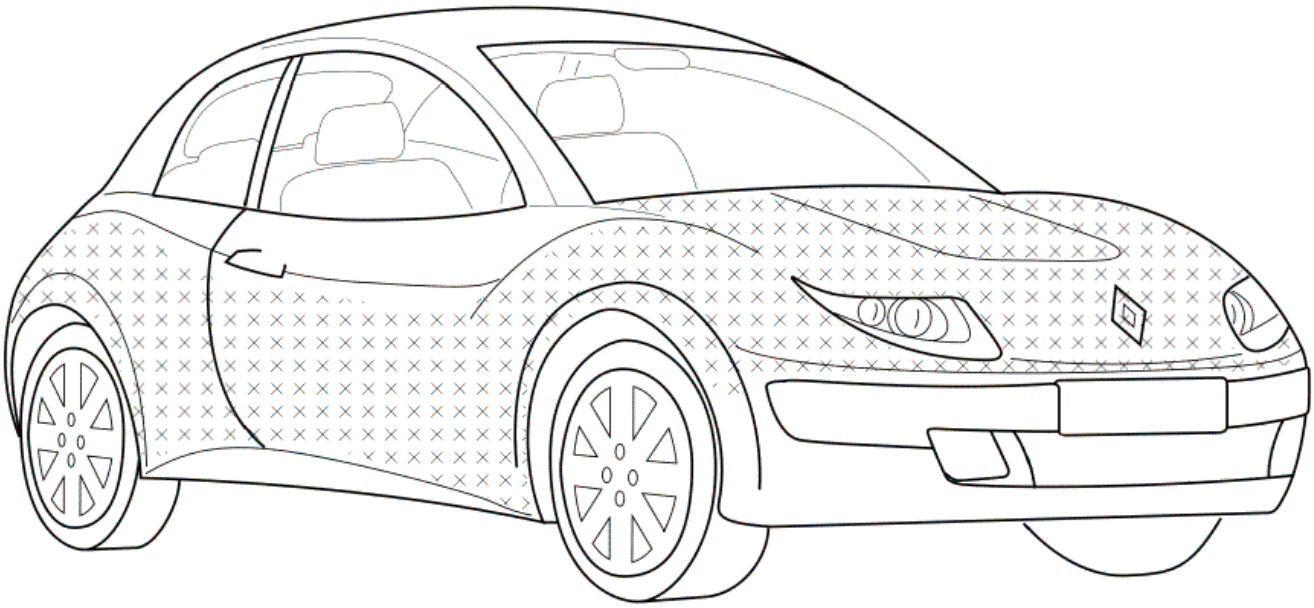
Fit the alternator electrical wiring.

Refit the alternator electrical wiring nut.

Torque tighten the alternator electrical wiring nut21 N.m.

Proceed in the reverse order to removal.

ANTI-CORROSION PROTECTION BY COLD ELECTRO ZINC PLATING: DESCRIPTION



Note, one or more warnings are present in this procedure

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

1. ELECTROGALVANISING APPLICATION AREA

ELECTROGALVANISING APPLICATION AREA

Components: Bonnet, side doors, front and rear wings.

Electro zinc plating is applied to a bare steel panel after straightening. This surface will be straightened and free of polyester mastic

2. CONTENTS OF THE CASE

Description	Quantity
8 V generator (to be connected to 220 V) with red and black cables	1
Anode holder (diameter 100mm)	1
Anode holder (diameter 13mm)	1
Anode (diameter 100mm)	1
Anode (diameter 13mm)	2
Plastic pocket	1
Goggles	1

3. CONTENTS OF THE ELECTRO ZINC PLATING KIT

The kit enables a surface of approximately 8 dm² with a thickness of 8 micrometres to be treated.

Description	Quantity
Cap (diameter 13mm)	1
Cap (diameter 100mm)	1
Pair of gloves	1
125 ml can of zinc solution	1

4. CHOICE OF ANODE

Anodes with a diameter of 100mm are to be used on flat surfaces.

Anodes with a diameter of 13mm are to be used on small surfaces. (example: panel butt welding joint).

They can be cut to the desired shape. They may be shaped with a file or an abrasive pad.

Cover all the bare surfaces using the anode with a diameter of 13 mm for areas which are difficult to access.

5. STARTING UP

Steps	Description
1	Connect the generator to 220 V
2	Connect the black cable to the (-)terminal of the generator and attach the clamp to one of the vehicle earths (unpainted). Example: door striker plate
3	Connect the red cable to the (+)terminal of the generator and the other end to the selected anode holder
4	Dampen the selected cap with water to help the zinc solution soak in
5	Screw the anode onto the anode holder
6	Position the cap on the anode
7	Place the assembly in the plastic container and pour on the zinc solution.

6. PREPARING THE SURFACE AND ELECTRO ZINC PLATING

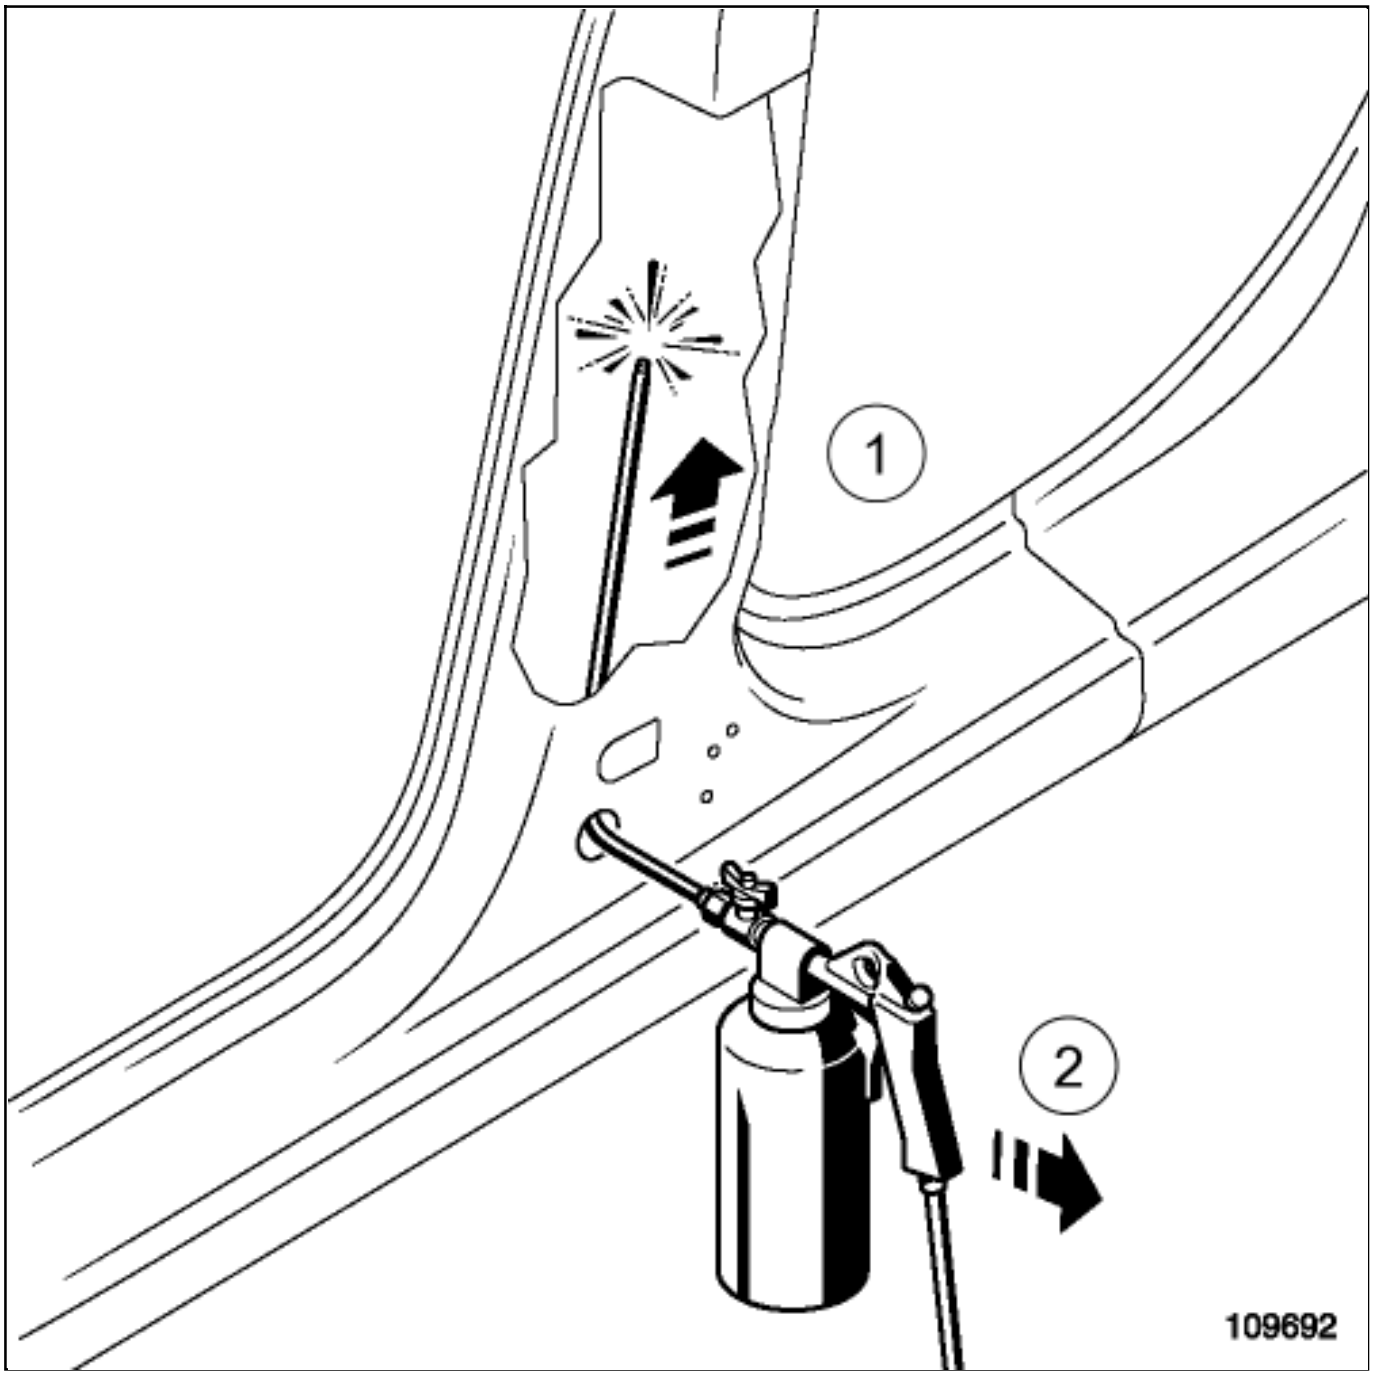
Steps	Description	Special notes
1	Degrease the surface to be treated	Lint-free cloth soaked in surface cleaner
2	Sand the area to be electro zinc plated	P280 dry - P400 slightly damp
3	Clean the surface	Damp cloth
4	Dampen the surface with the cap fixed on the anode which is impregnated with zinc solution	
5	Switch on the power supply to the generator (green indicator light on)	
6	Sweep the surface with the anode holder several times	
7	Rinse the treated surface with water	
8	Dry by wiping or using compressed air	

Note:

After use at the end of the day rinse the caps with water.

The speed of the sweeping must be approximately 25 cm/s.

The cap must always be soaked in zinc solution.



If any black patches appear on the treated area, remove them by gently sanding with a grey abrasive finishing pad.

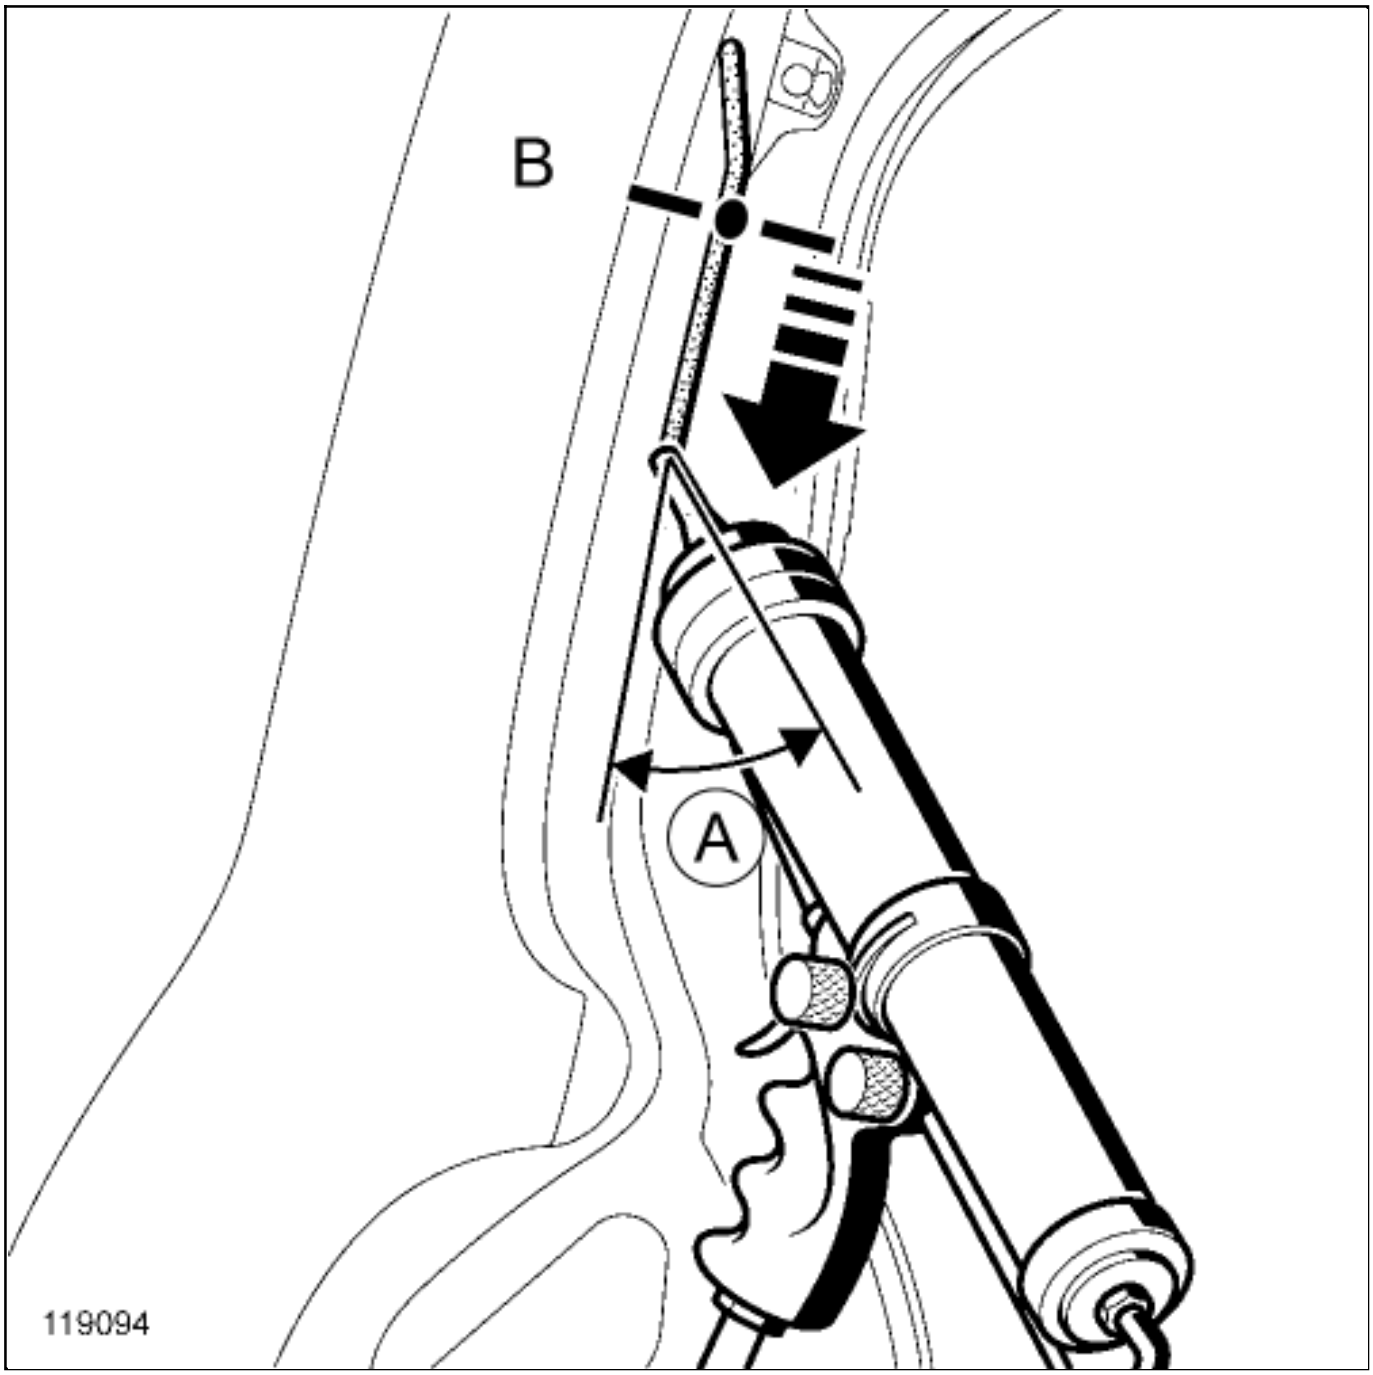
Painting (see 94A, Paint application range for panels, Steel bodywork component: Preparation and paint range) must be carried out immediately to ensure that the zinc does not oxidise.

ANTI-CORROSION PROTECTION OF JOINTS AFTER WELDING

(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

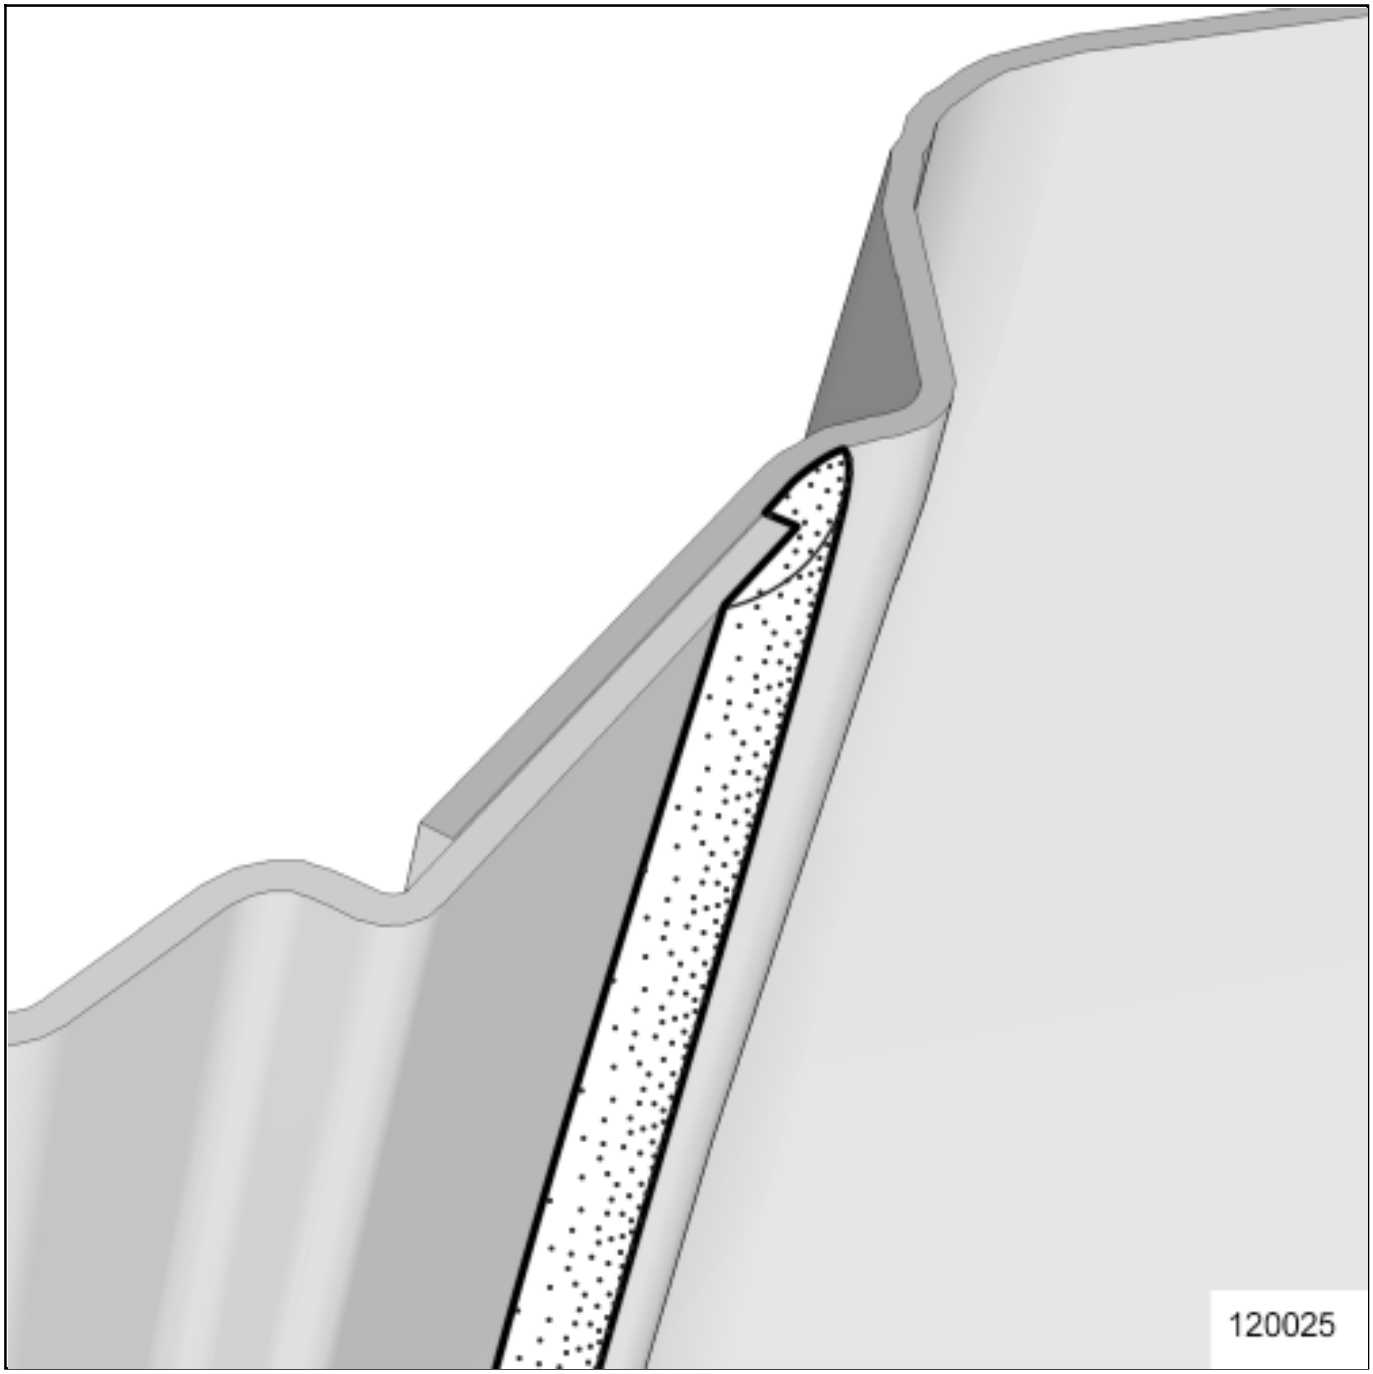
1. PROTECTION IN A HOLLOW SECTION

(1) Insert the probe as far as possible via the access hole into the hollow section.



(2) Spray the wax moving the probe slowly and regularly back towards the access hole.

2. PROTECTION ON AN EDGE OR ON A SURFACE

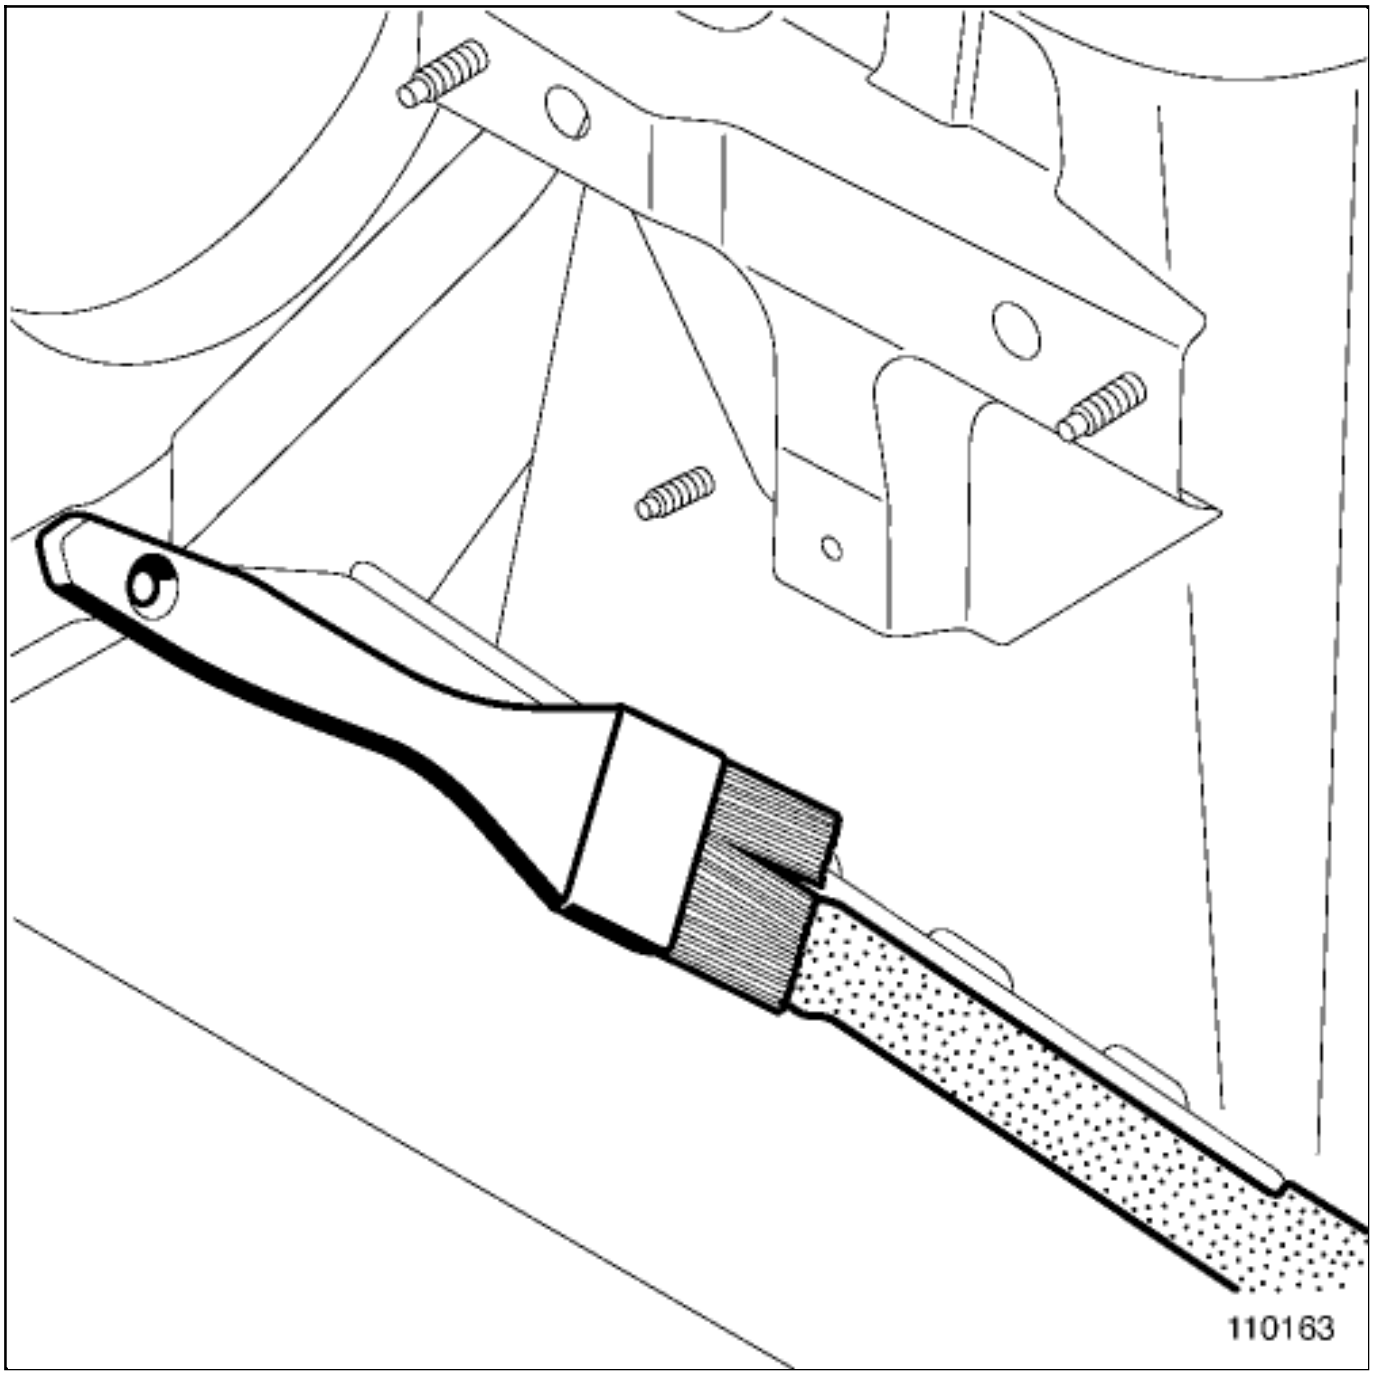


Note:

The following operations are to be carried out on machine finished surfaces which have been dry sanded to P320or scoured with a red abrasive pad.

1- EXTRUDED SEAL

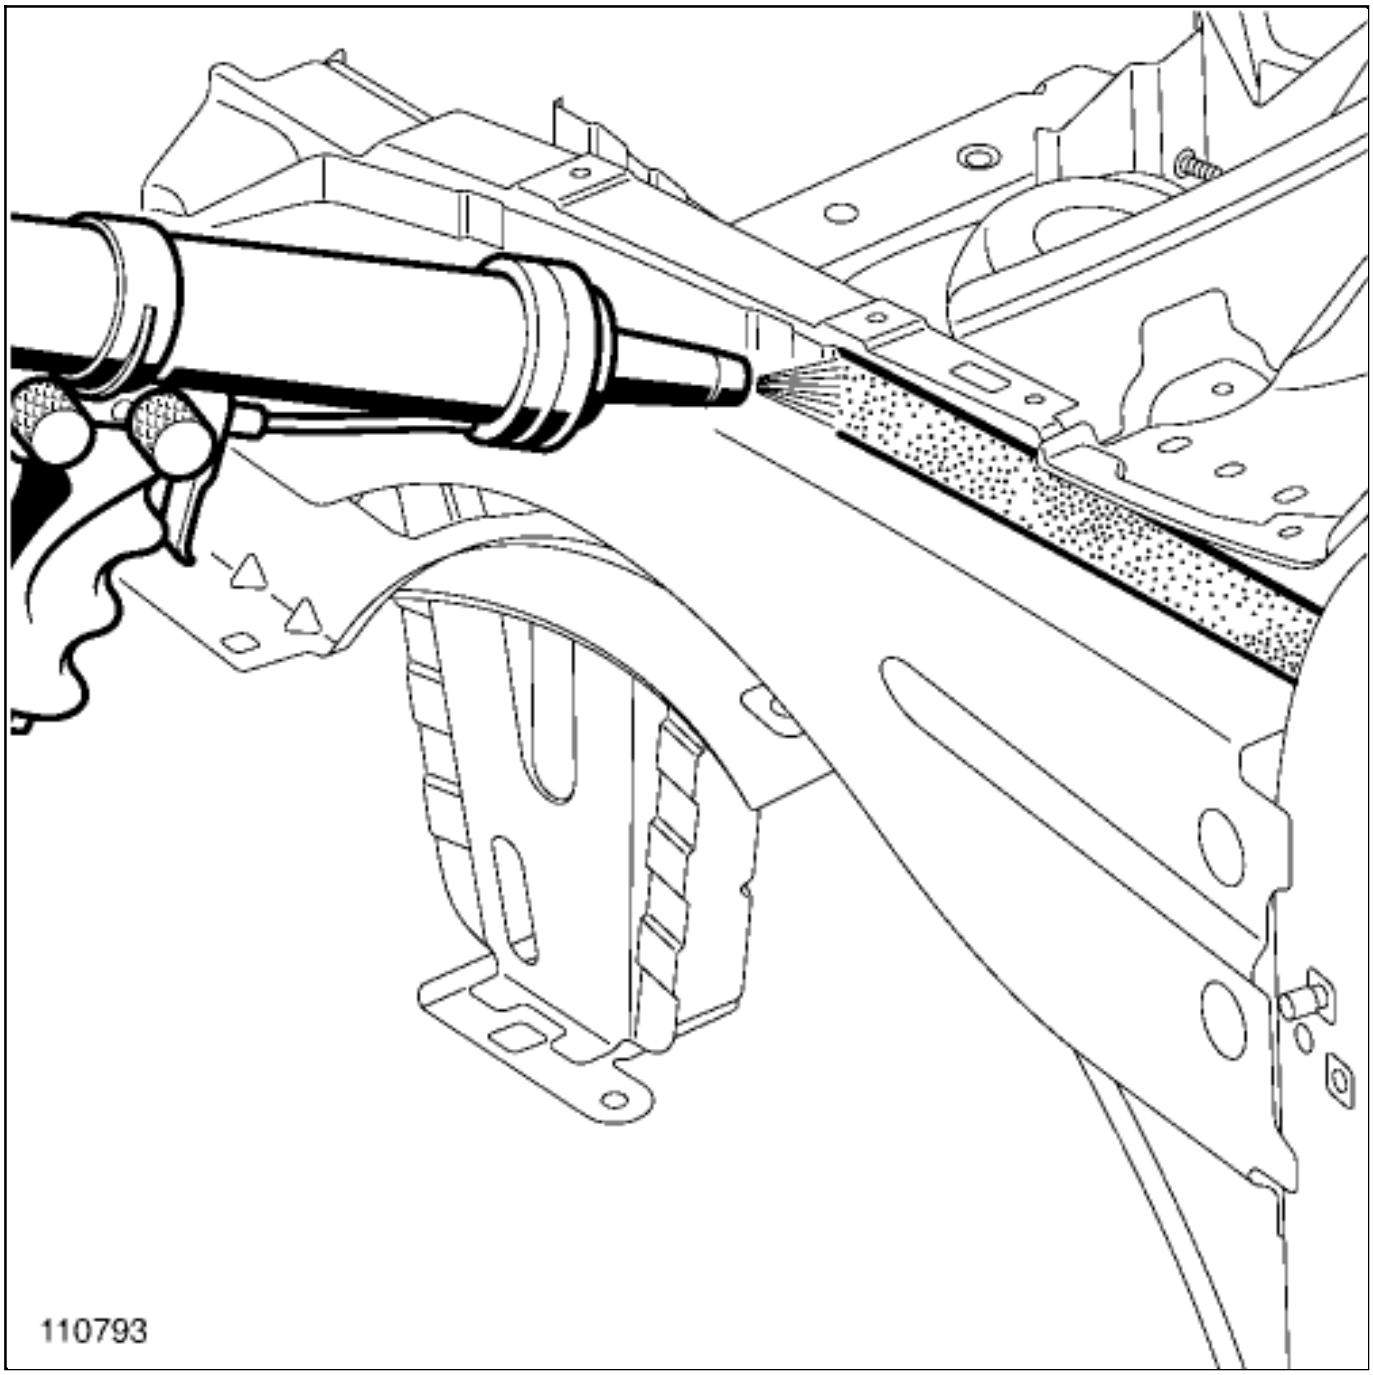
SECTION B



Position the nozzle, which has been previously cut to fit the shape and width of the desired seal, on the edge formed by the panel edge.

The appearance of the seal depends on the application speed and angle(A) of the nozzle in relation to the support.

Extrude the mastic in a uniform bead, observing the original length.



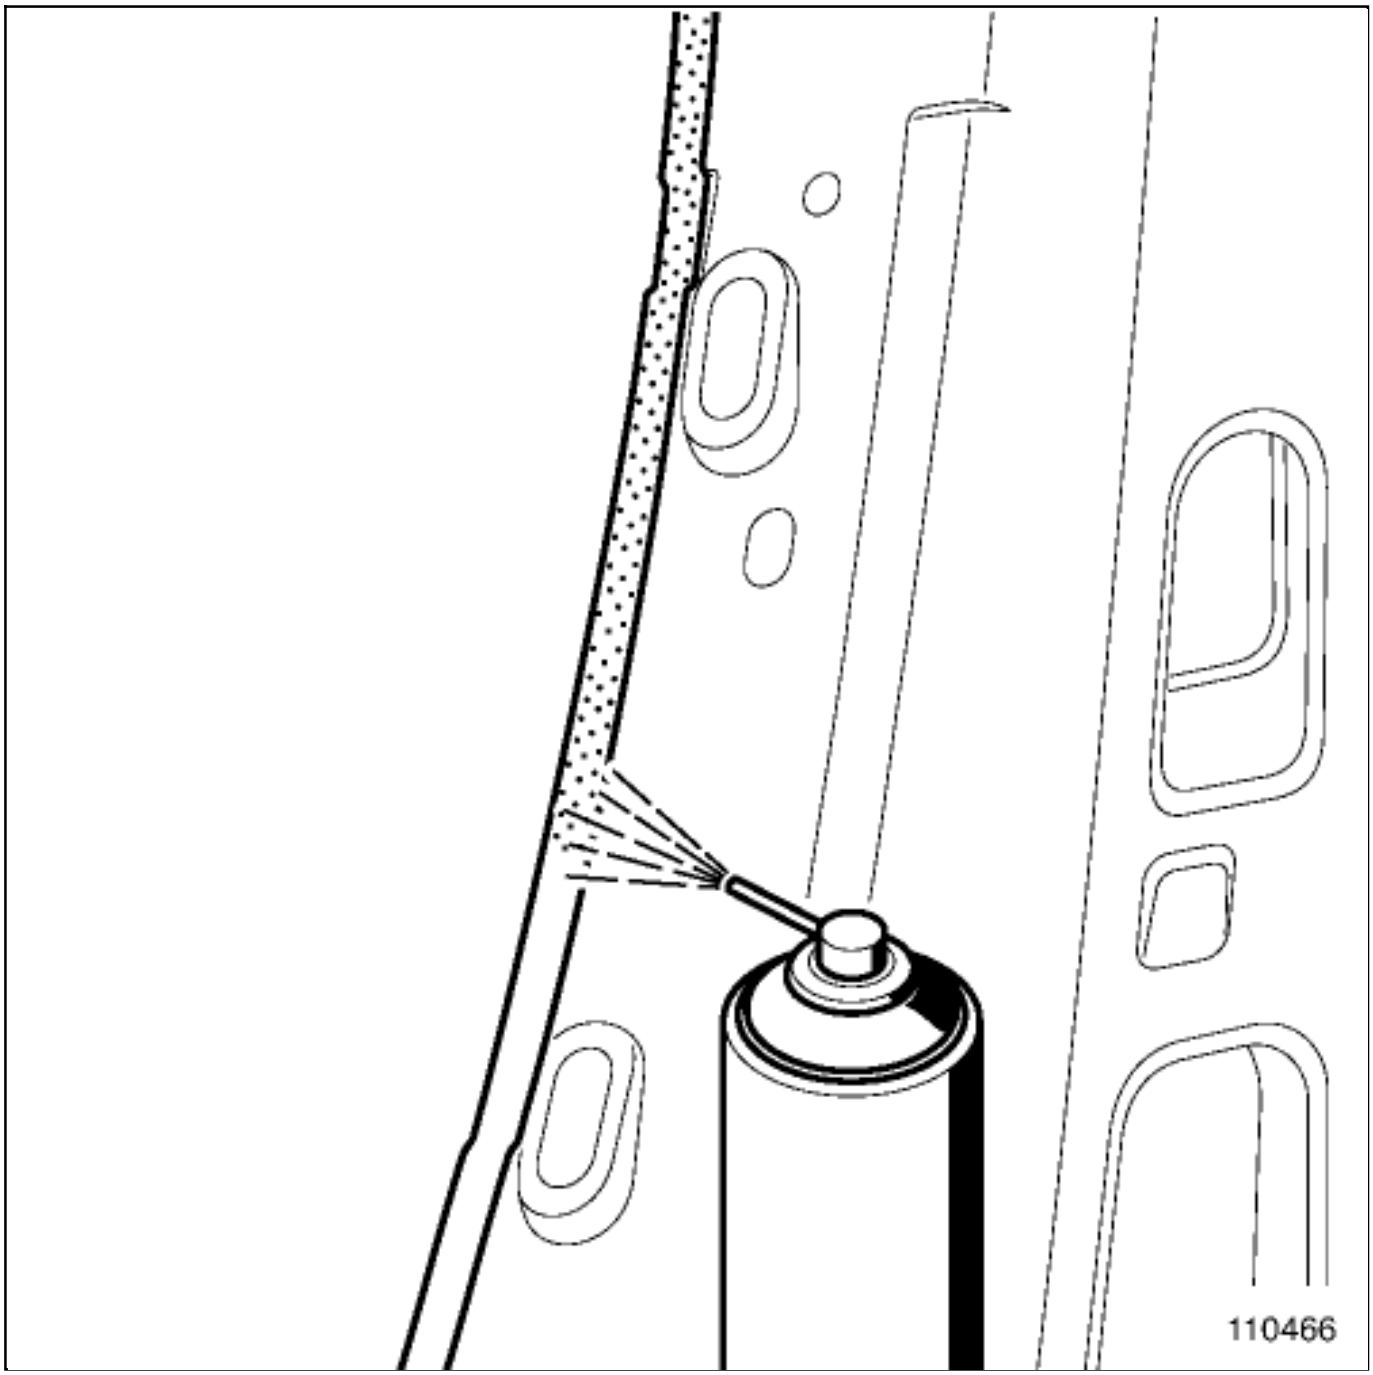
2- BRUSH SEAL

Apply an even seal thickness over the whole area to be treated.

Observing the width and look of the original seal.

3- SPRAYED SEAL

If necessary, protect the adjacent components because of product splashing.



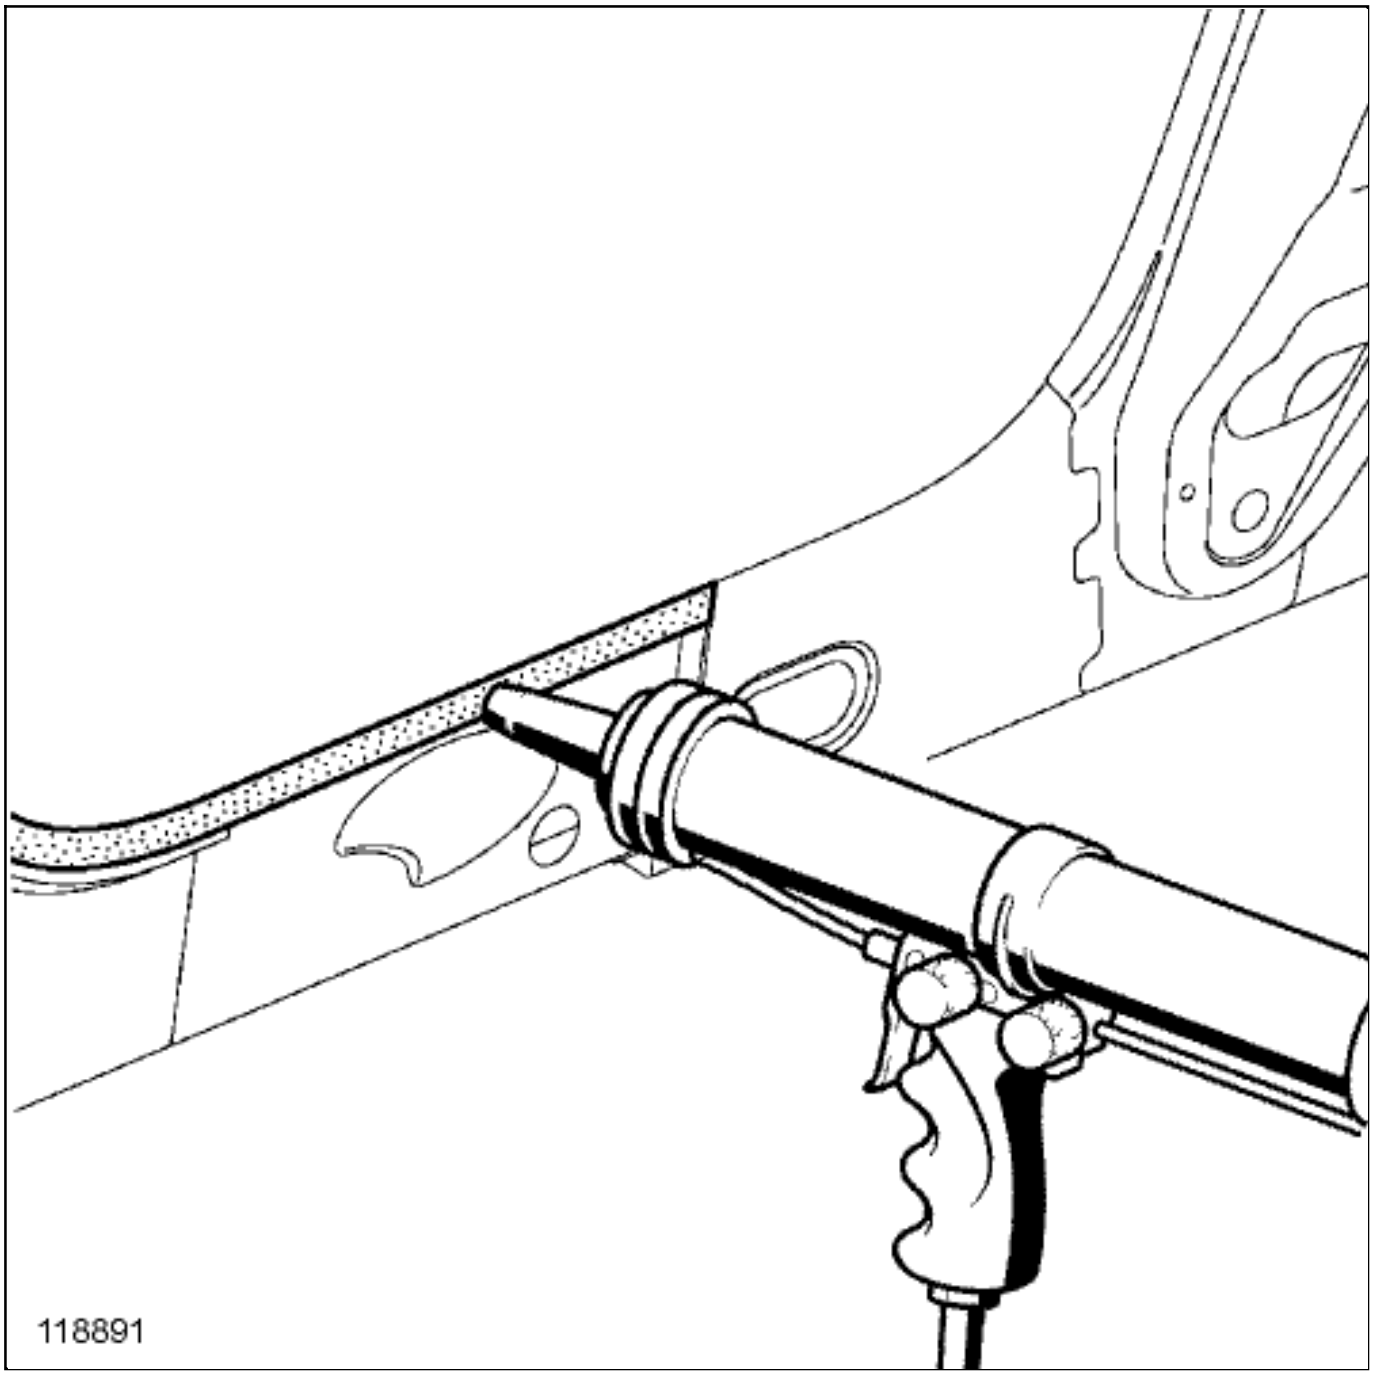
Adjust the jet beforehand to obtain the same look as the original.

Spray the seal evenly and regularly.

ANTI-CORROSION PROTECTION OF JOINTS BEFORE WELDING

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

1. ANTI-CORROSION SPRAY

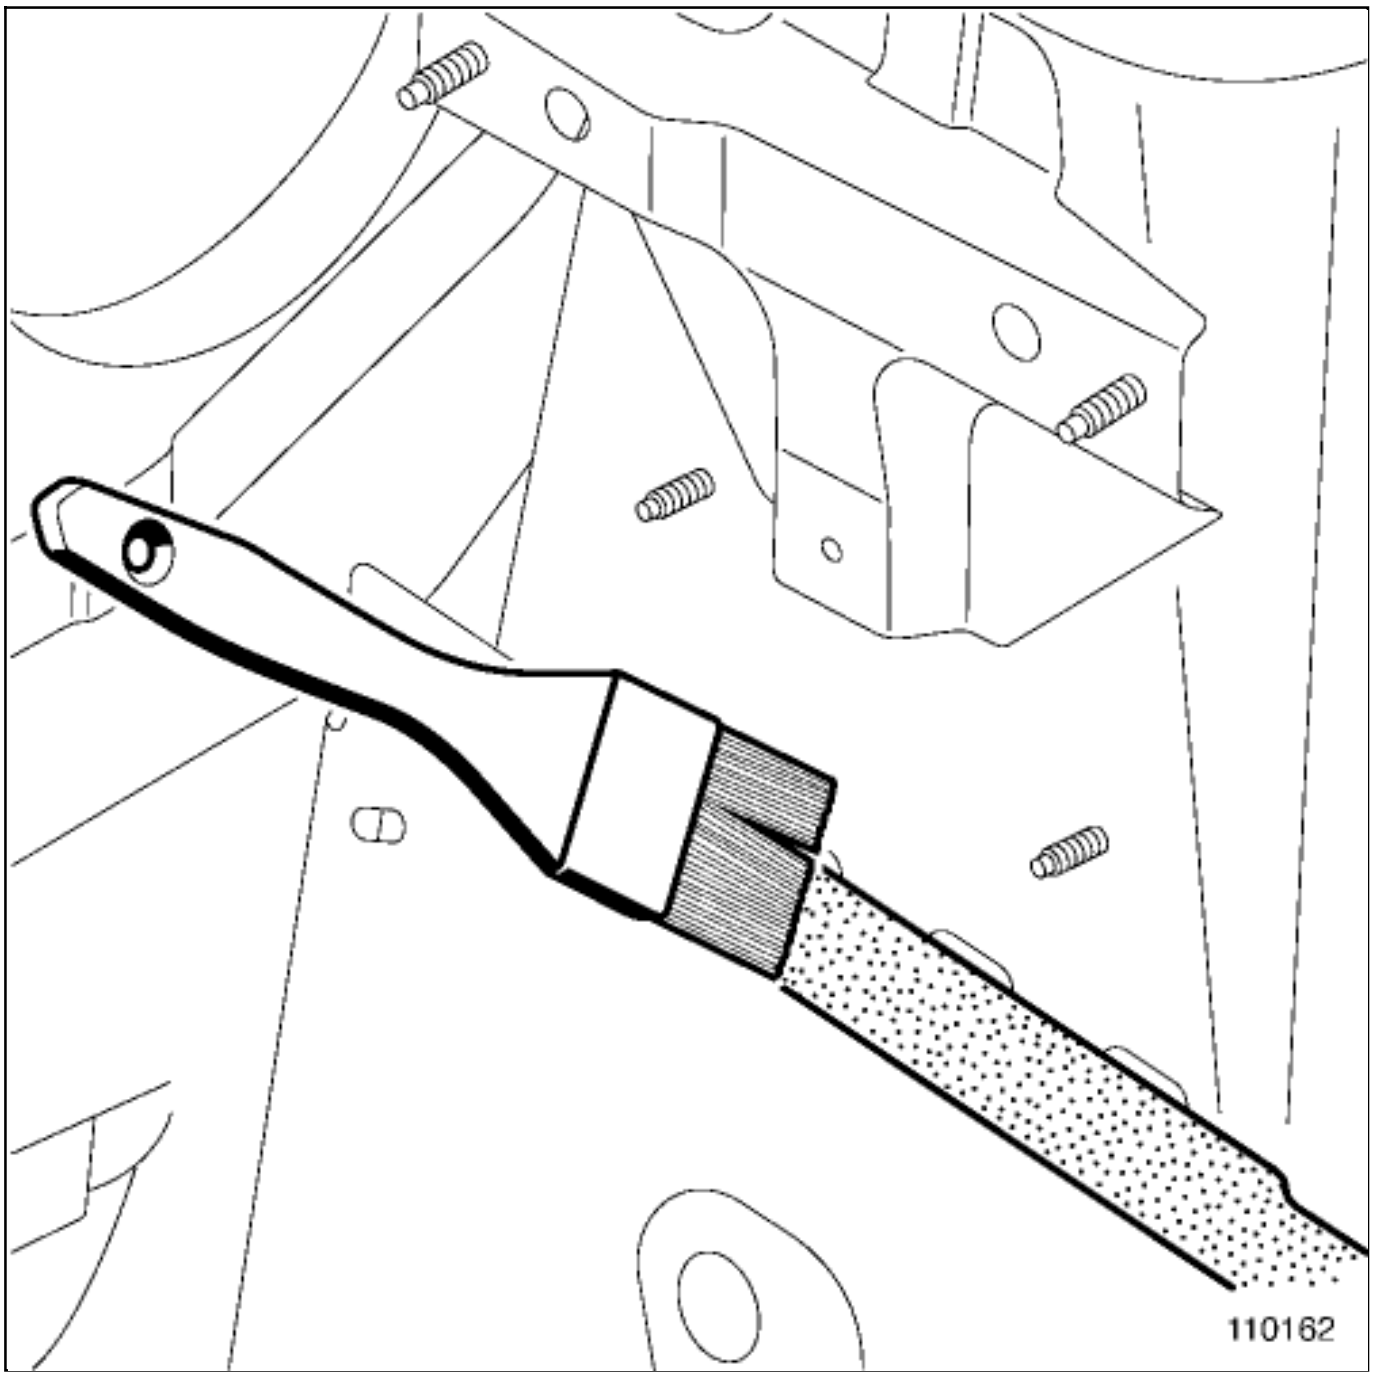


Apply the spray in a thin layer over all the internal joint faces to be treated, on the vehicle and the spare part.

Wait for the product to dissolve before assembly.

After welding, cleaning the remaining product using a cloth which has been slightly moistened with paint degreaser, ensuring that the adhesion of the paint is not affected.

2. WELDABLE MASTIC



Extrude the mastic in a uniform bead measuring ∅ 4 mmover all of the internal joint face of the vehicle.

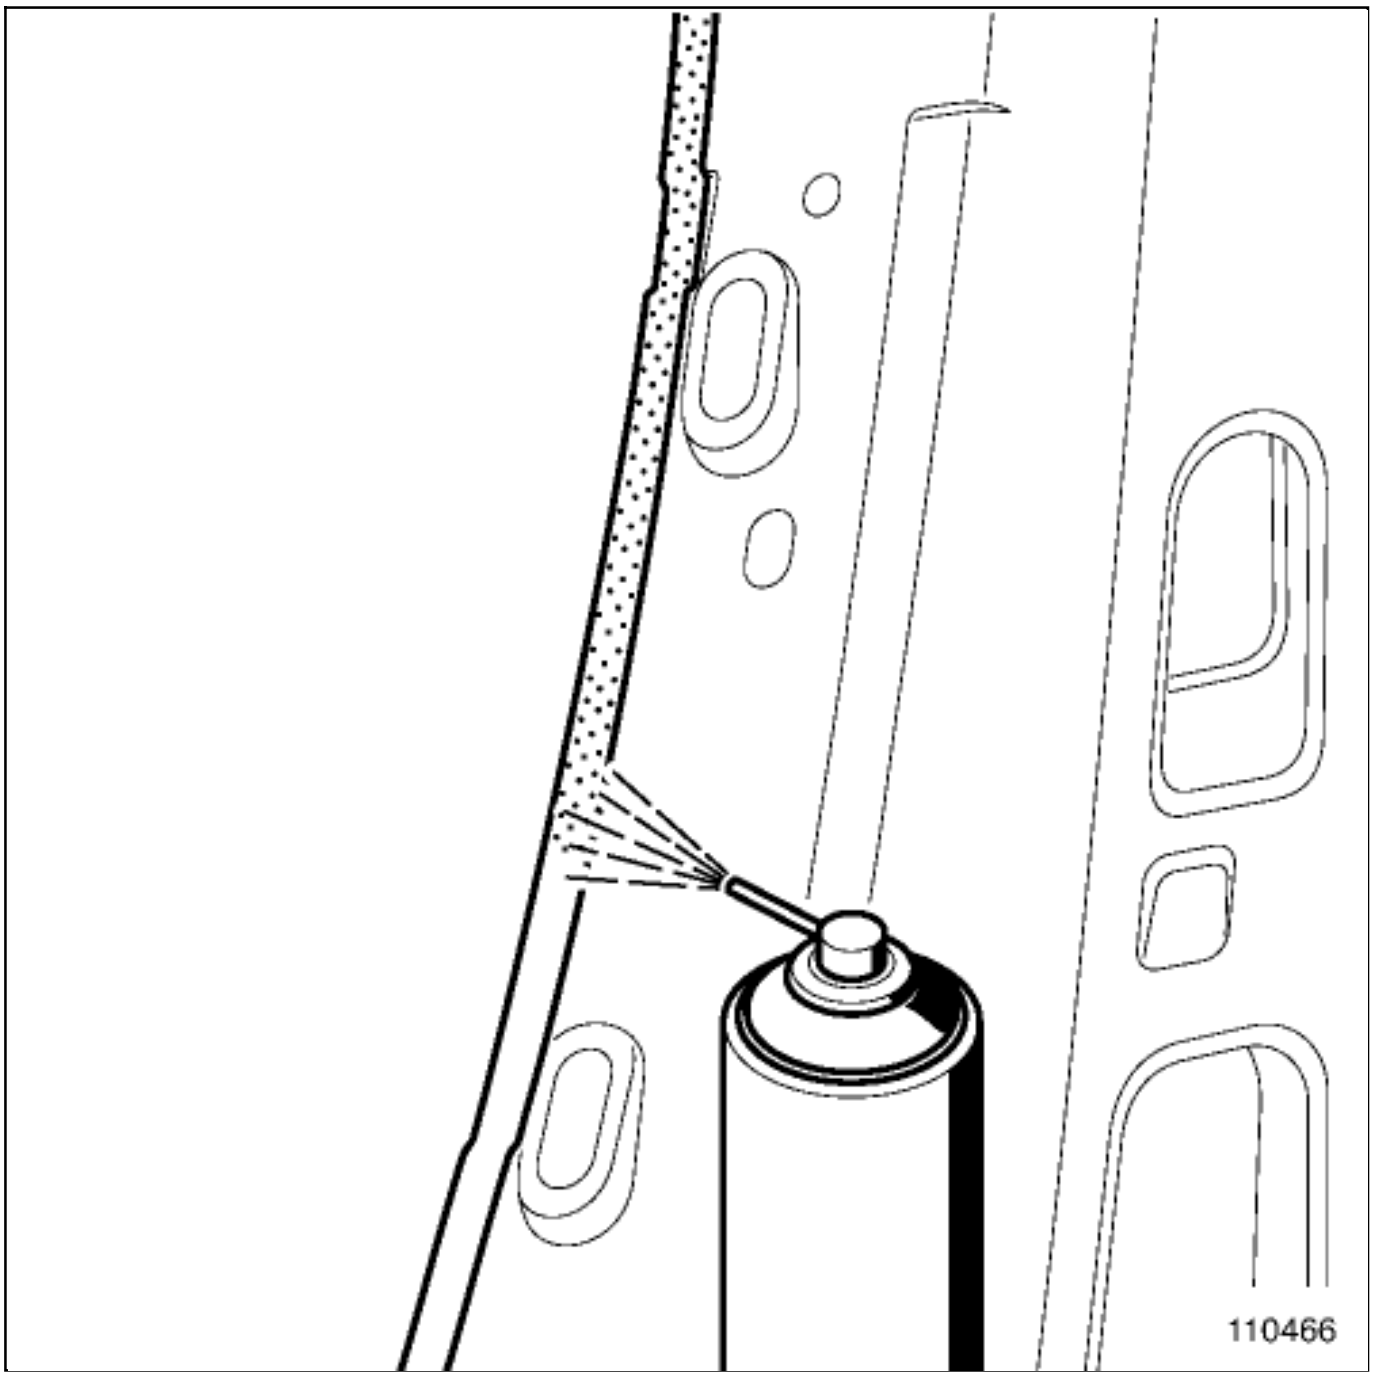
Assemble the spare part before the product dries.

Remove the excess product with paint remover before assembly.

3. BRUSH MASTIC

Apply a thick layer of mastic over the vehicle's internal joint faces.

Assemble the spare part before the product dries.



Remove the excess product with paint remover before assembly.

4. PREFORMED MASTIC

XSL version : 3.02 du 22/07/11

ANTI-CORROSIONPROTECTIONPRODUCTBEFOREASSEMBLY

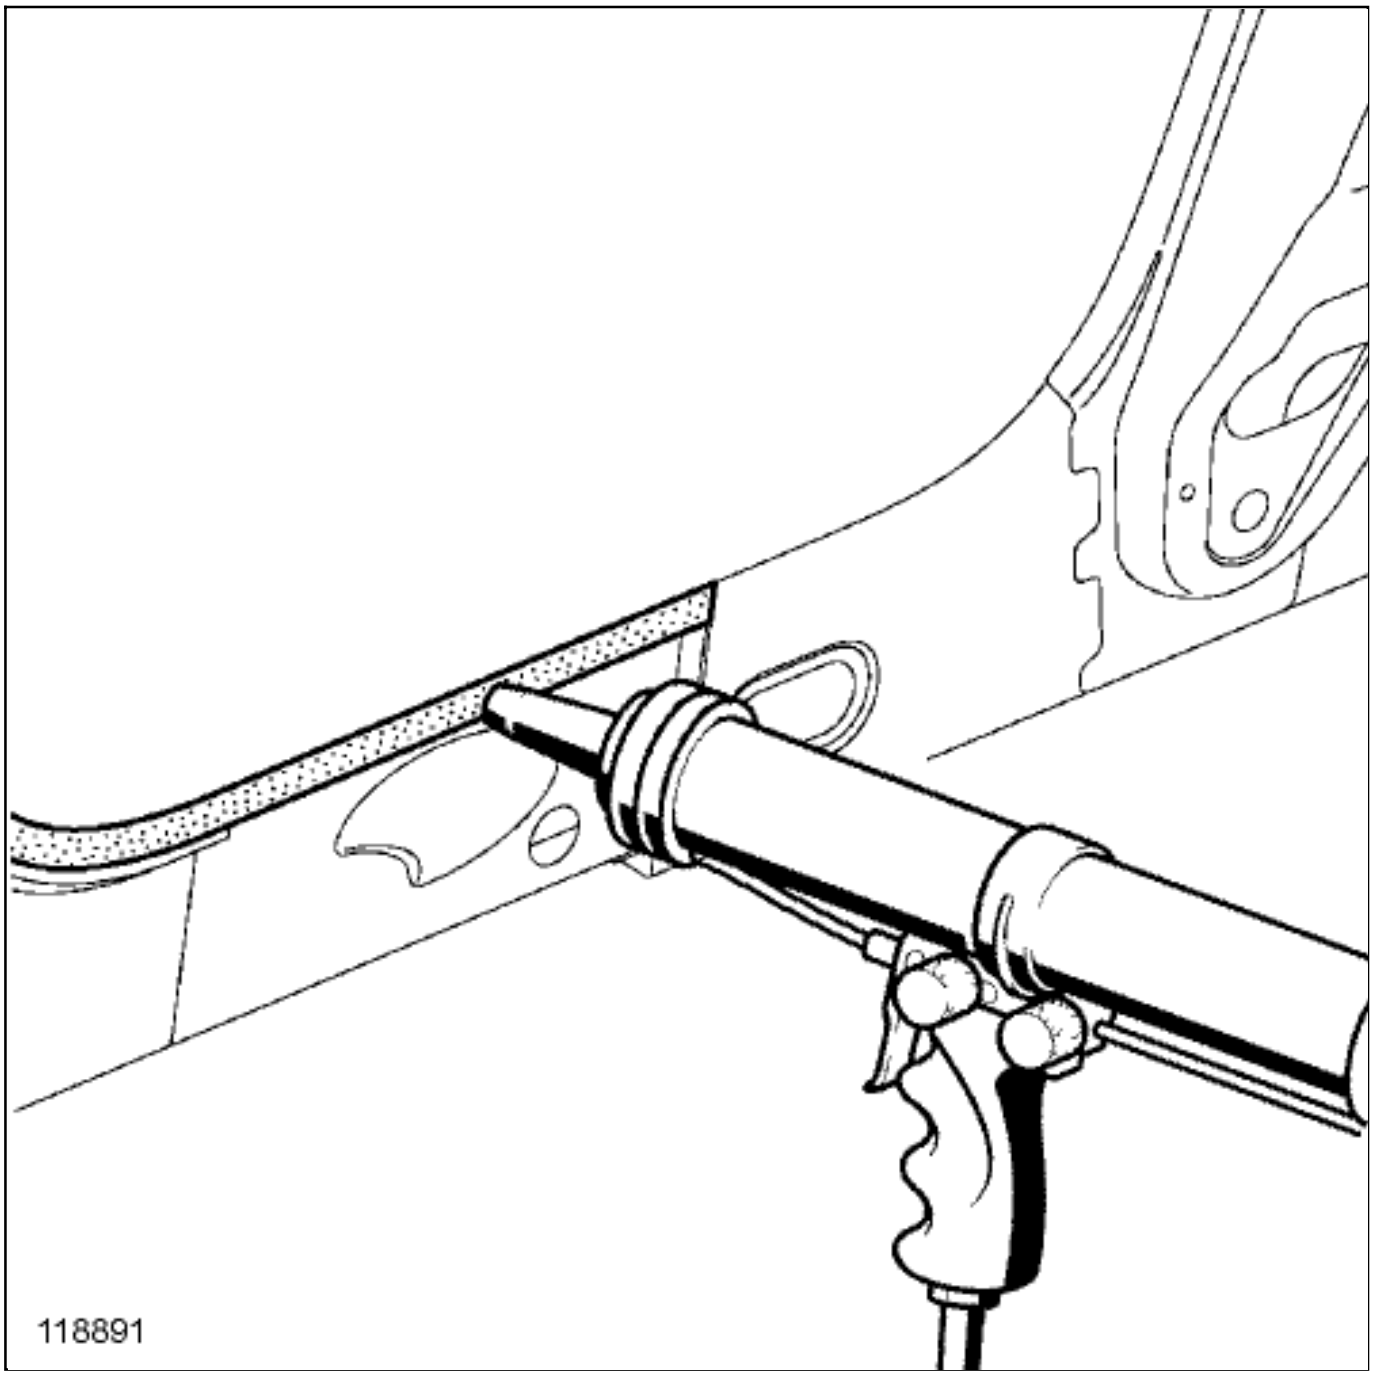
1. ANTI-CORROSION SPRAY

The spray can be applied in the inside mating surfaces for good electrical contact during welding.

Advantages:

- can be arc spot welded,
- very good adhesion on all supports,
-

makes it possible to weld using SEFG plug welds.



Disadvantage:

- residue has to be cleaned off before painting.

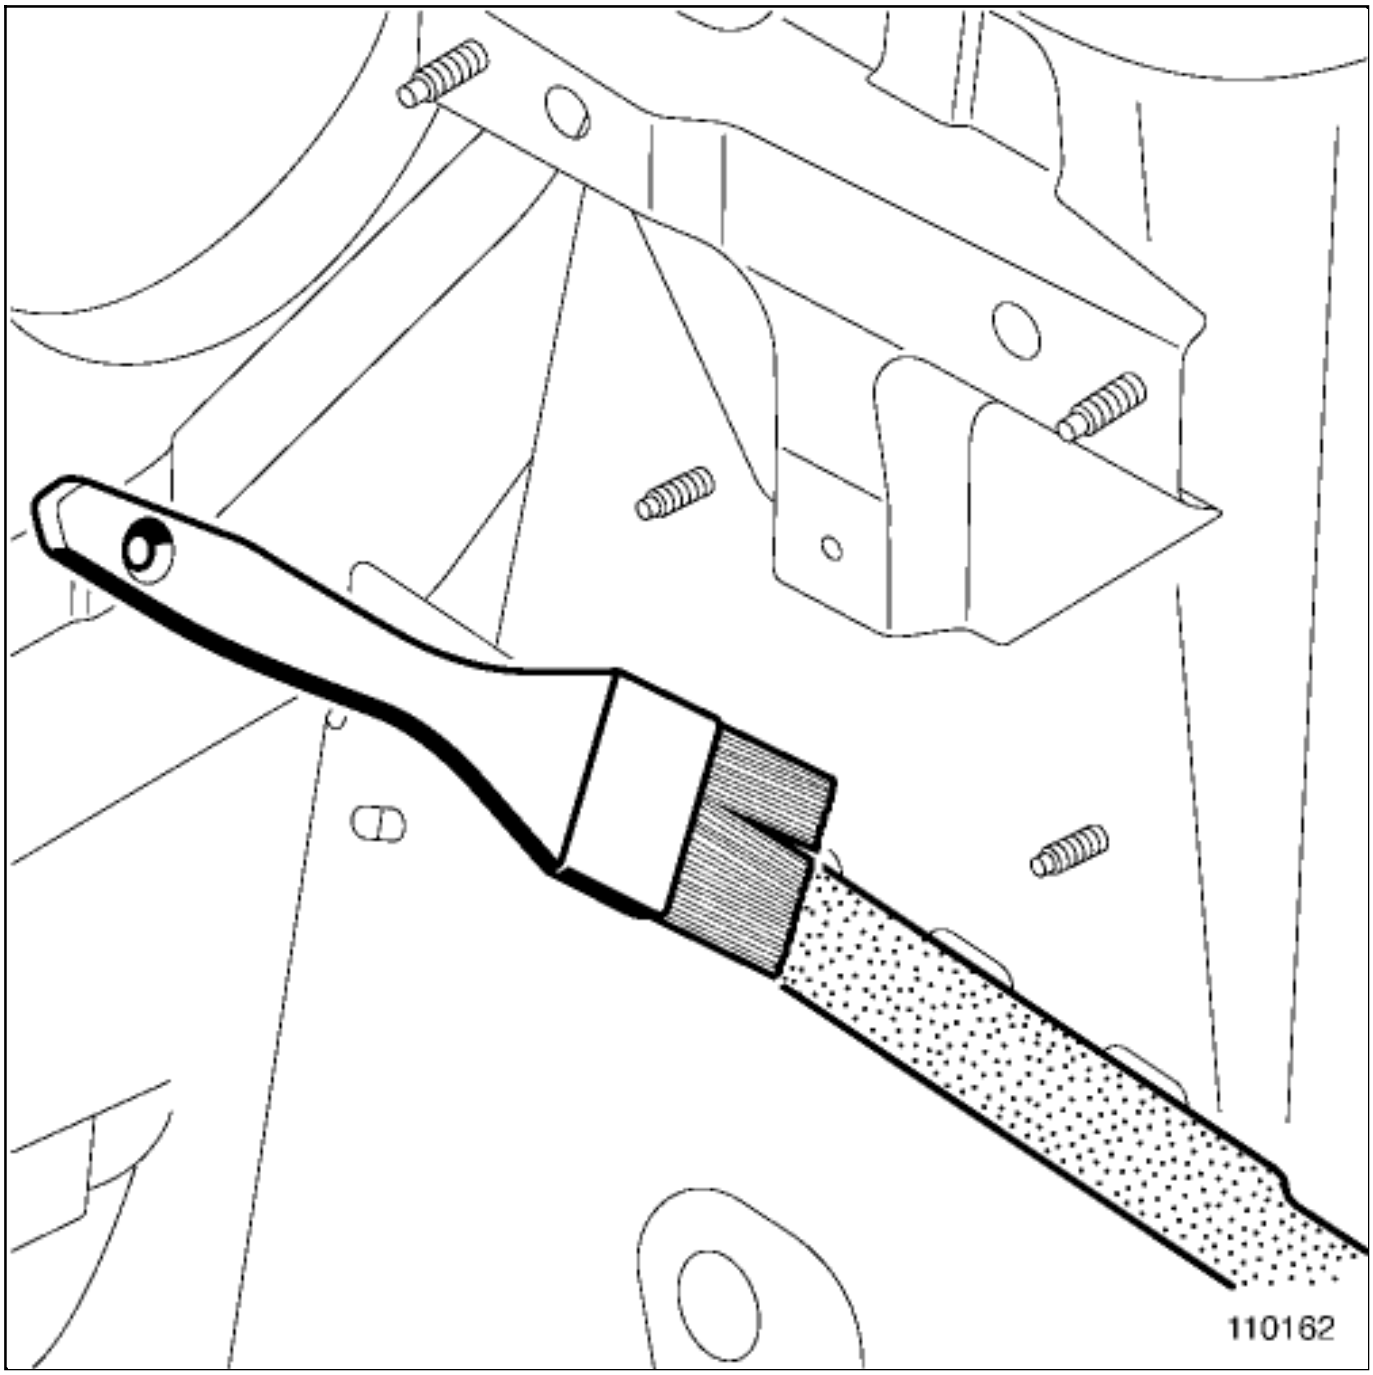
Operator protection:

- use extra ventilation source,
- obligatory hand protection.

2. EXTRUDED MASTIC

Mastic can be applied with a spray gun on the inside mating surfaces for arc weldable sealing.

Advantages:



- can be arc spot welded,
- very good adhesion on all supports,
- possibility of smoothing the bead,

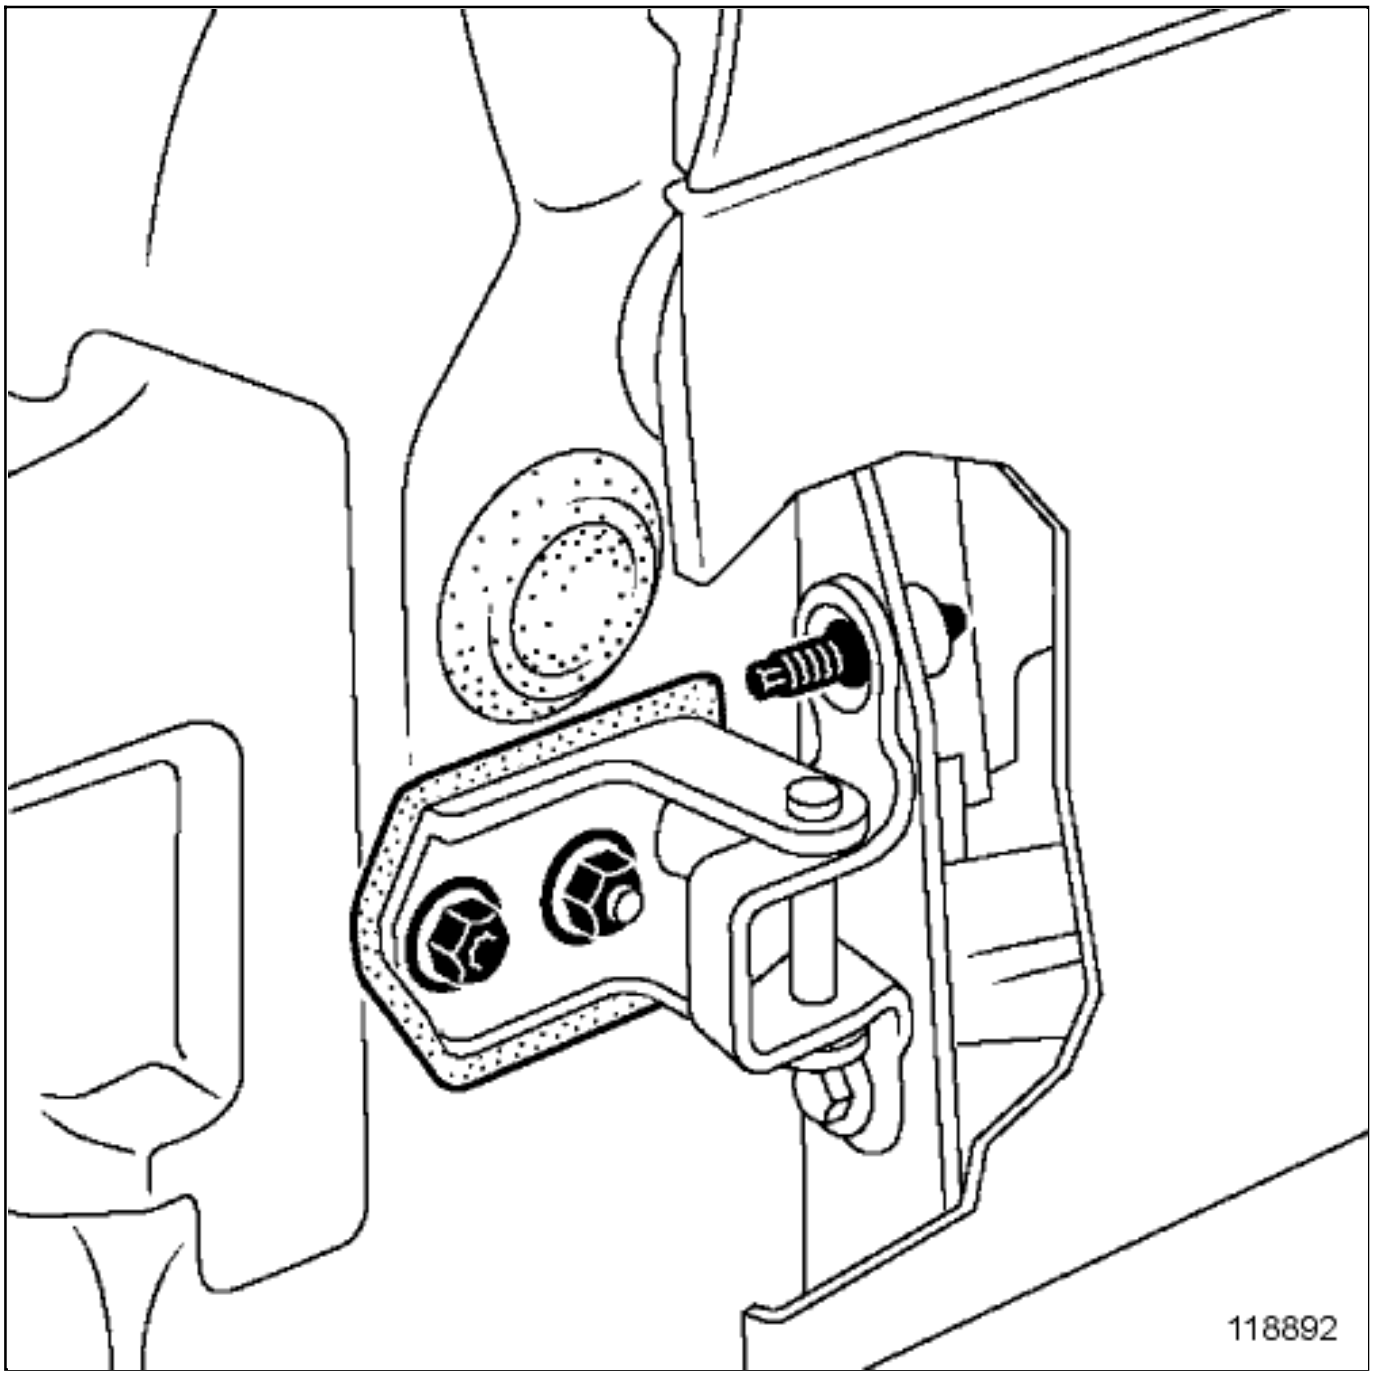
ensures seal of mating surface.

Disadvantages:

- all the components have to be welded before the joint mastic dries,
- does not allow welding using SEFG plug welds.

3. BRUSH MASTIC

The mastic can be applied with a brush. It is used in areas exposed to fuel, oil and water.



Advantages:

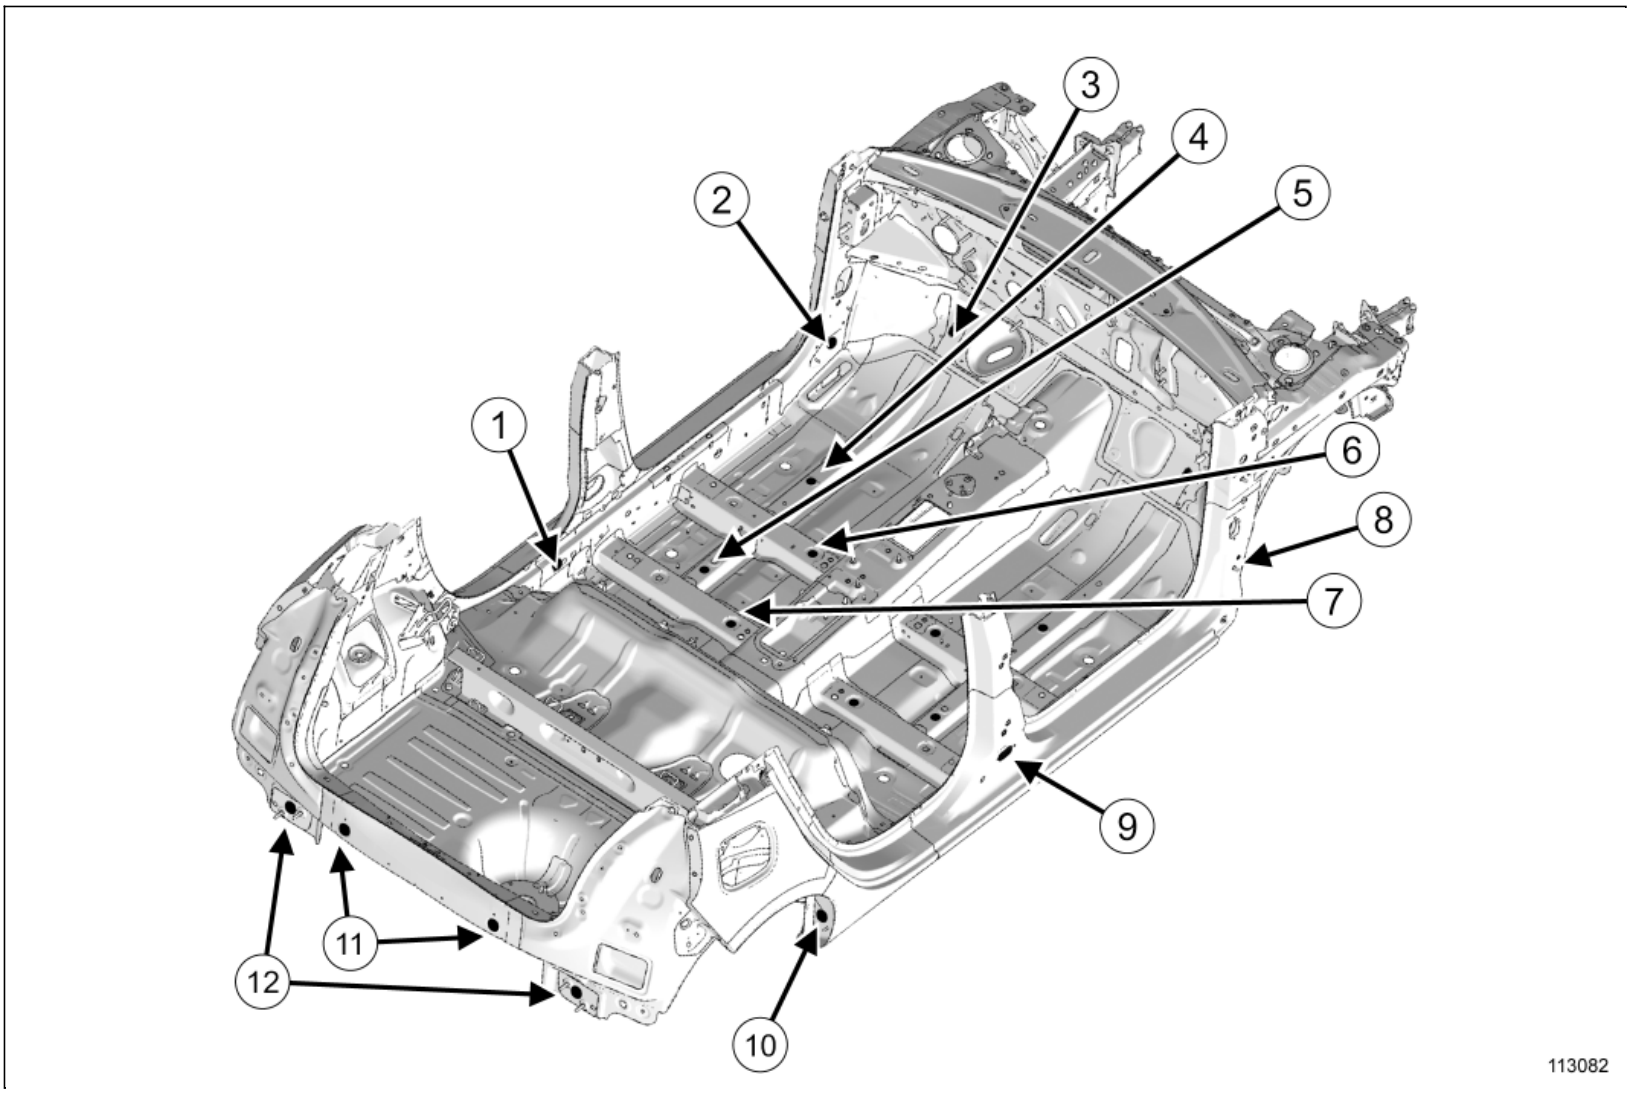
- resists water, oil and fuel,
- is compatible with all paint finishes,
- also ensures seal of mating surface.

Disadvantages:

- the welding has to be completed before the product dries,
- does not allow welding using SEFG plug welds.

4. PREFORMED MASTIC

The mastic is applied on the internal mating faces of the bolted components to seal them.



Advantages:

- simple and quick to use,
- no equipment needed for application,
- ensures sealing and bonding.

XSL version : 3.02 du 22/07/11

ANTI-CORROSIONPROTECTIONPRODUCT:DESCRIPTION

1. POINTS LOCATED INSIDE THE VEHICLE

Note:

Hollow body parts to be treated from inside the vehicle must be treated after painting and before retrimming.

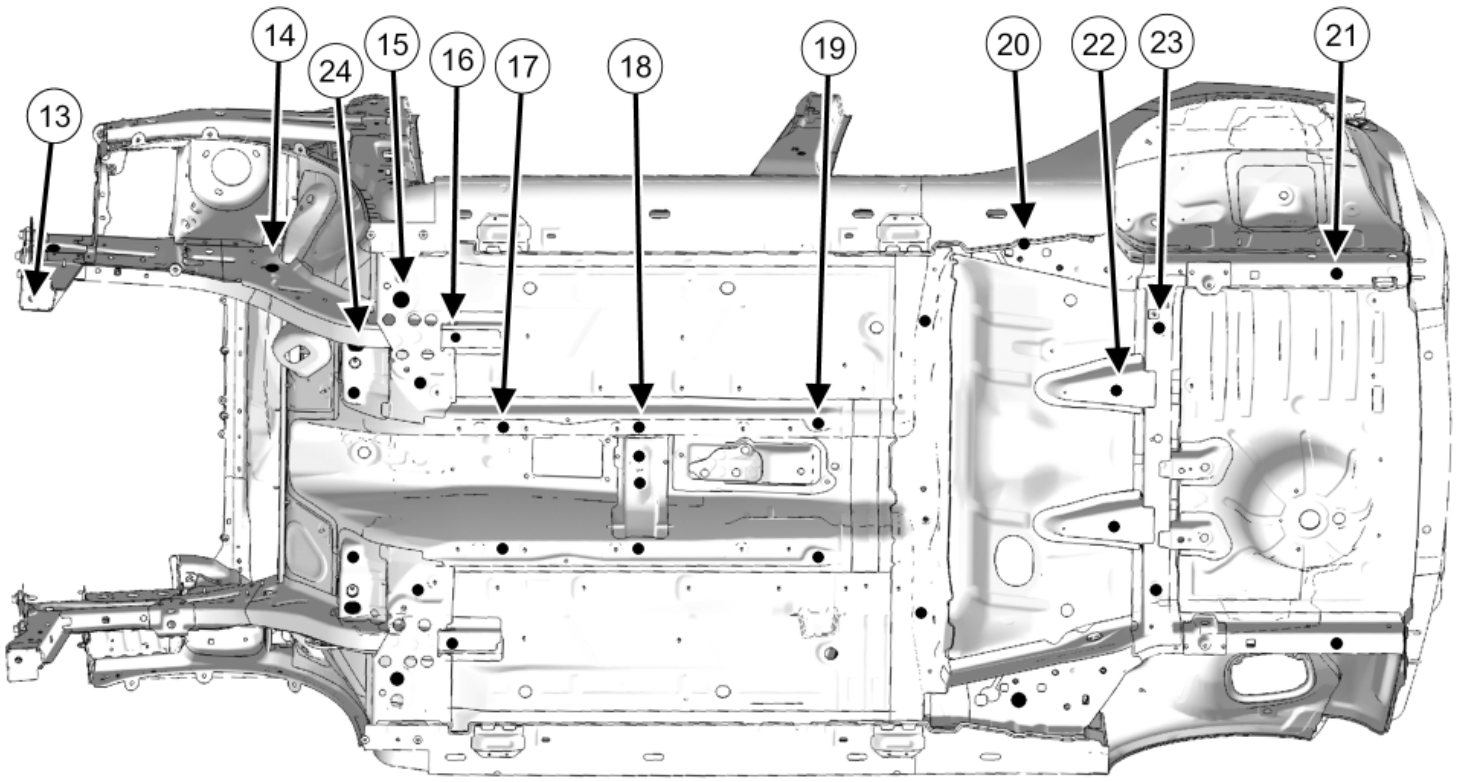
Side impact:

-Replacing or repairing the sill panel:

protection of the join between the inner sill panel and the sill panel reinforcement: wax injected into points 1 and 2,

protection of the join between the sill panel and the sill panel closure: wax injected into points 8, 9 and 10.

-Replacing the centre floor:



protection of the join between the floor and the side member reinforcement: wax injected into points 4 and 5,

protection of the join between the floor and the front seat mounting cross member: wax injected into points 6 and 7.

-Replacing the centre side member beneath the floor:

wax injected into points 17, 18 and 19.

2. POINTS BENEATH THE VEHICLE

113050

Note:

Blanking pieces are fitted to the injection points located beneath the vehicle. When any work is carried out on the vehicle, plug all the points used for injection. Replace the damaged or deformed blanking covers.

Front impact:

-Replacing or repairing the front side member, the front side member closure panel and the front sub-frame mounting unit:

wax injected into points 3, 13 and 14.

-Replacing the front side cross member or the front half unit:

wax injected into points 15, 16 and 24.

Rear impact:

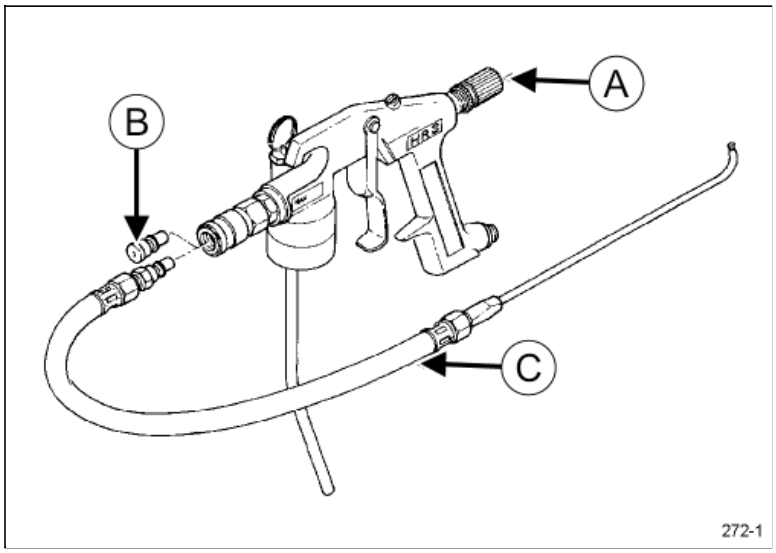
-Replacing the complete rear side member:

wax injected into points 12 and 21.

-Replacing the rear end panel:

wax injected into 11.

-Replacing the rear floor centre cross member:



wax injected into points 22 and 23.

-Replacing the front section of the rear floor:

wax injected into 20.

1- EQUIPMENT REQUIRED

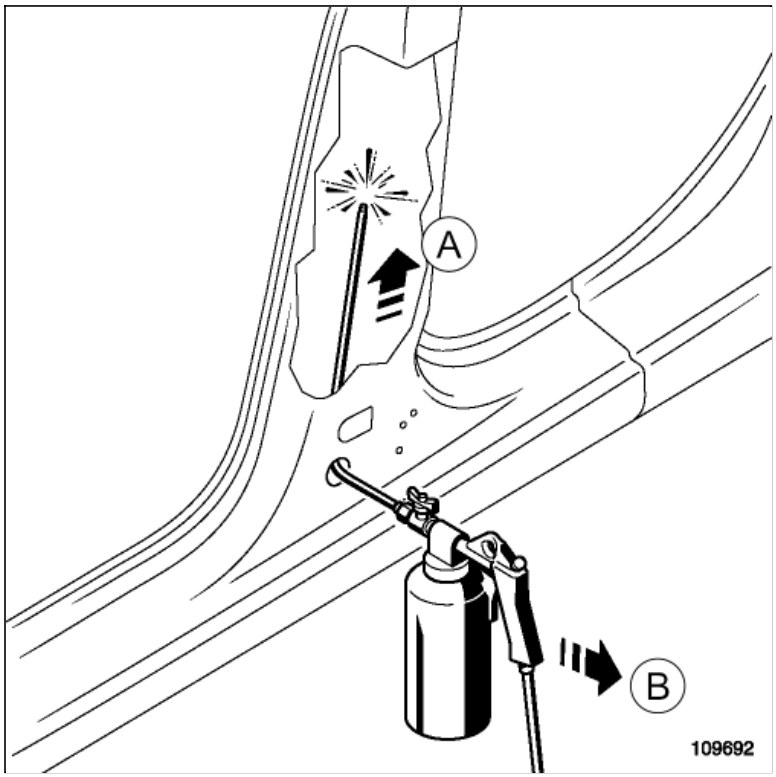
INJECTION NOZZLE

(A) Wax flow control

(B) Quick-release union end piece

(C) Interchangeable injection hose

Note:



Choose the hose most suitable for the operation.

CAN OF WAX

The subframe under the floor is protected with a special wax SPR CC(see **Vehicle: Parts and consumables for the repair**) .

2- METHOD OF USE

(A) : Insert the nozzle tip until it reaches the end of the hollow section

(B) : Inject the wax whilst retracting the nozzle tip

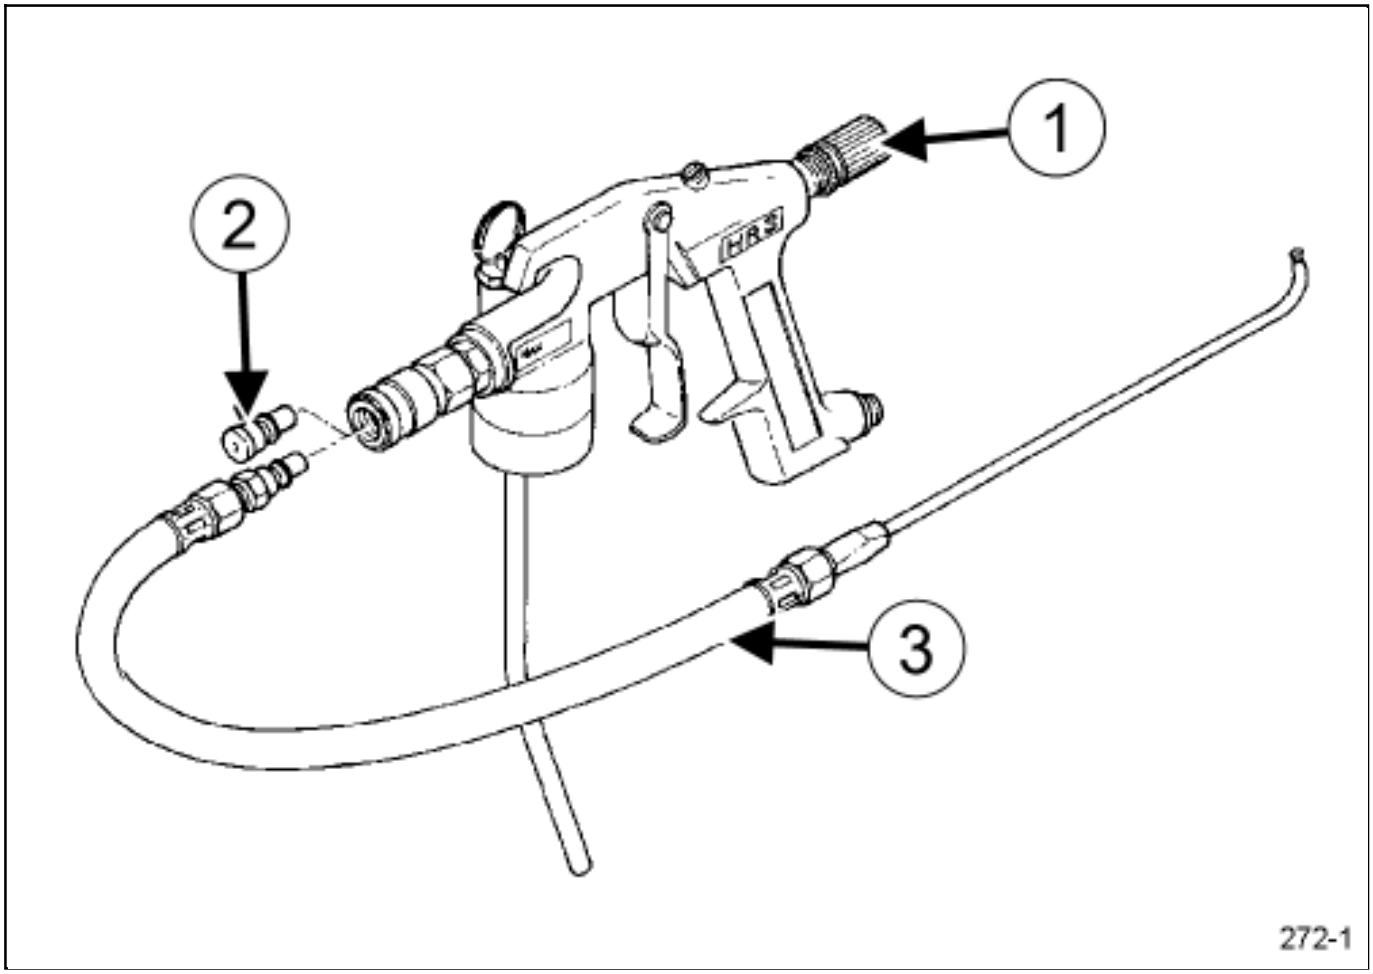
ANTI-CORROSIONPROTECTIONPRODUCT:DESCRIPTION

 **Note, one or more warnings are present in this procedure** 

WARNING

Always wear protective gear (gloves, goggles and breathing masks).

1. SPECIAL NOTES FOR INJECTING WAX



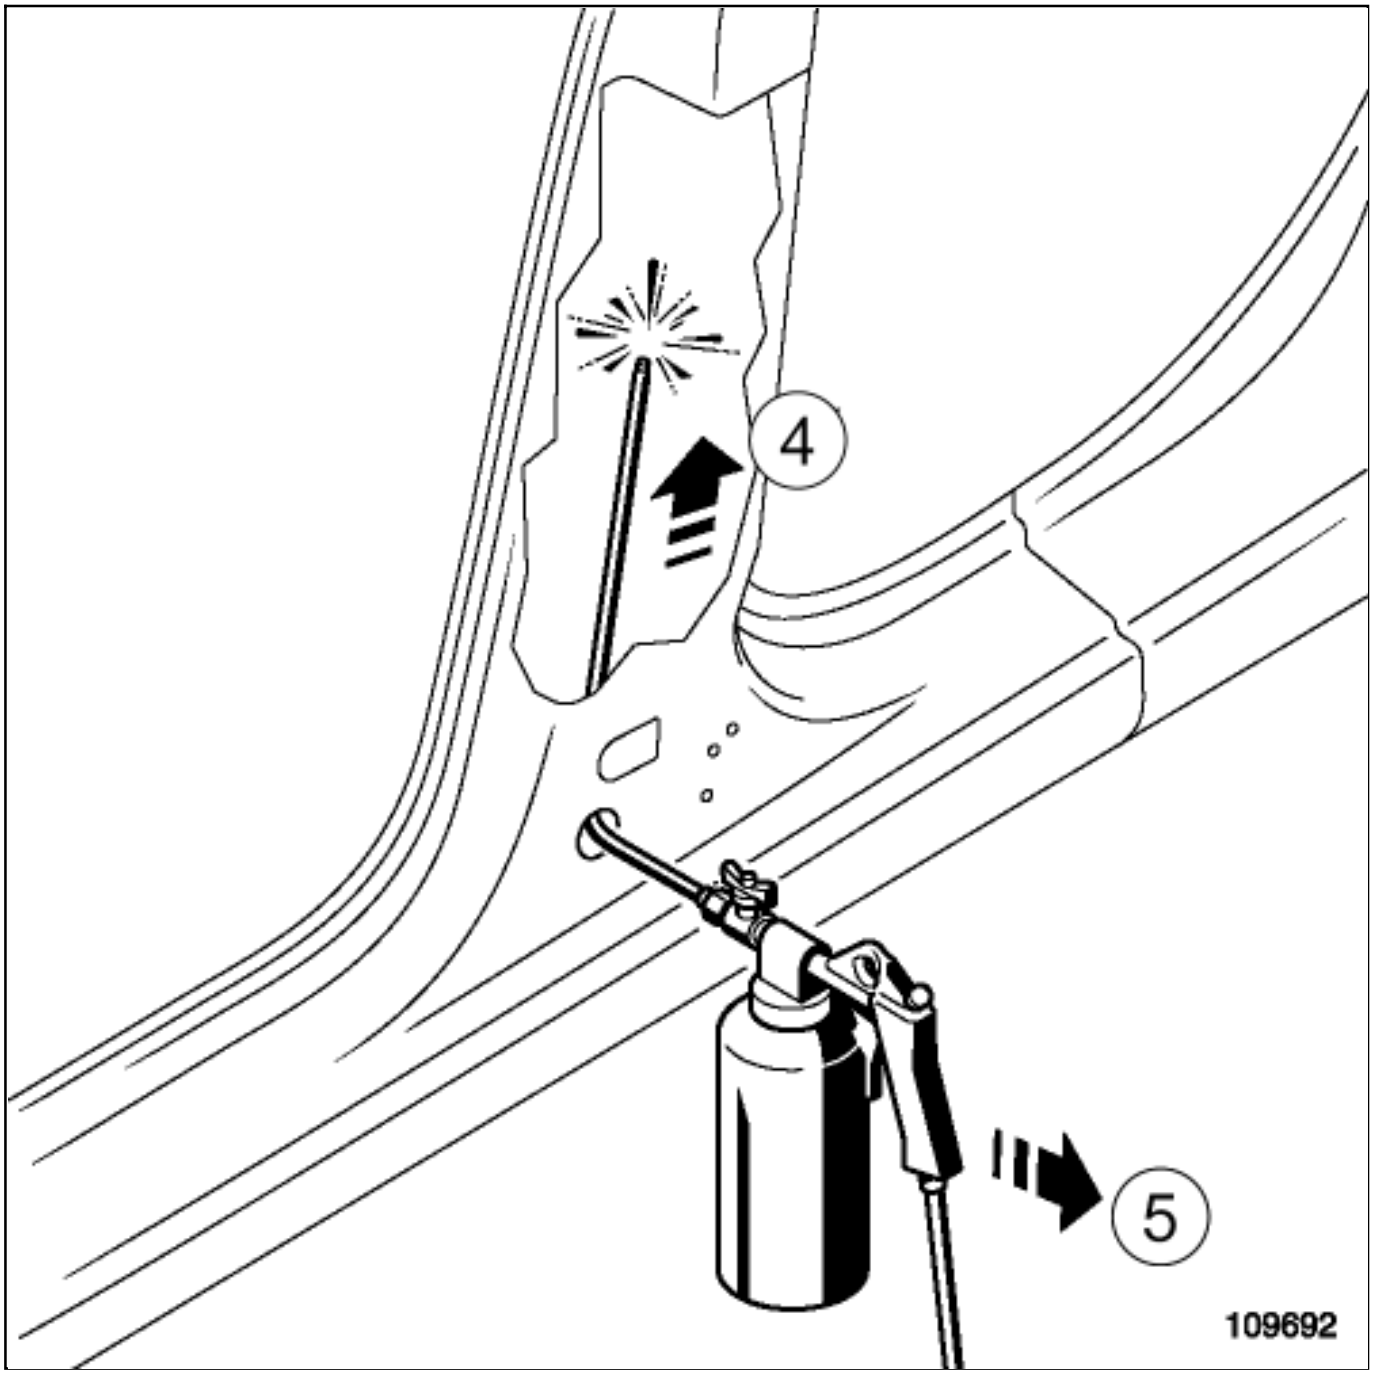
For original fittings, the areas that must be injected with wax are the following:

- hollow sections of the subframe (e.g.: side members),
- sills,
- rear wing sills,
- bonnet nose.

In After-Sales operations, wax must be injected into hollow sections after painting.

2. EQUIPMENT REQUIRED

HOLLOW SECTION NOZZLE: PART NUMBER: 77 01 421 476



No.	Description
(1)	Wax flow control
(2)	Quick-release union end piece
(3)	Interchangeable injection hose

Note:

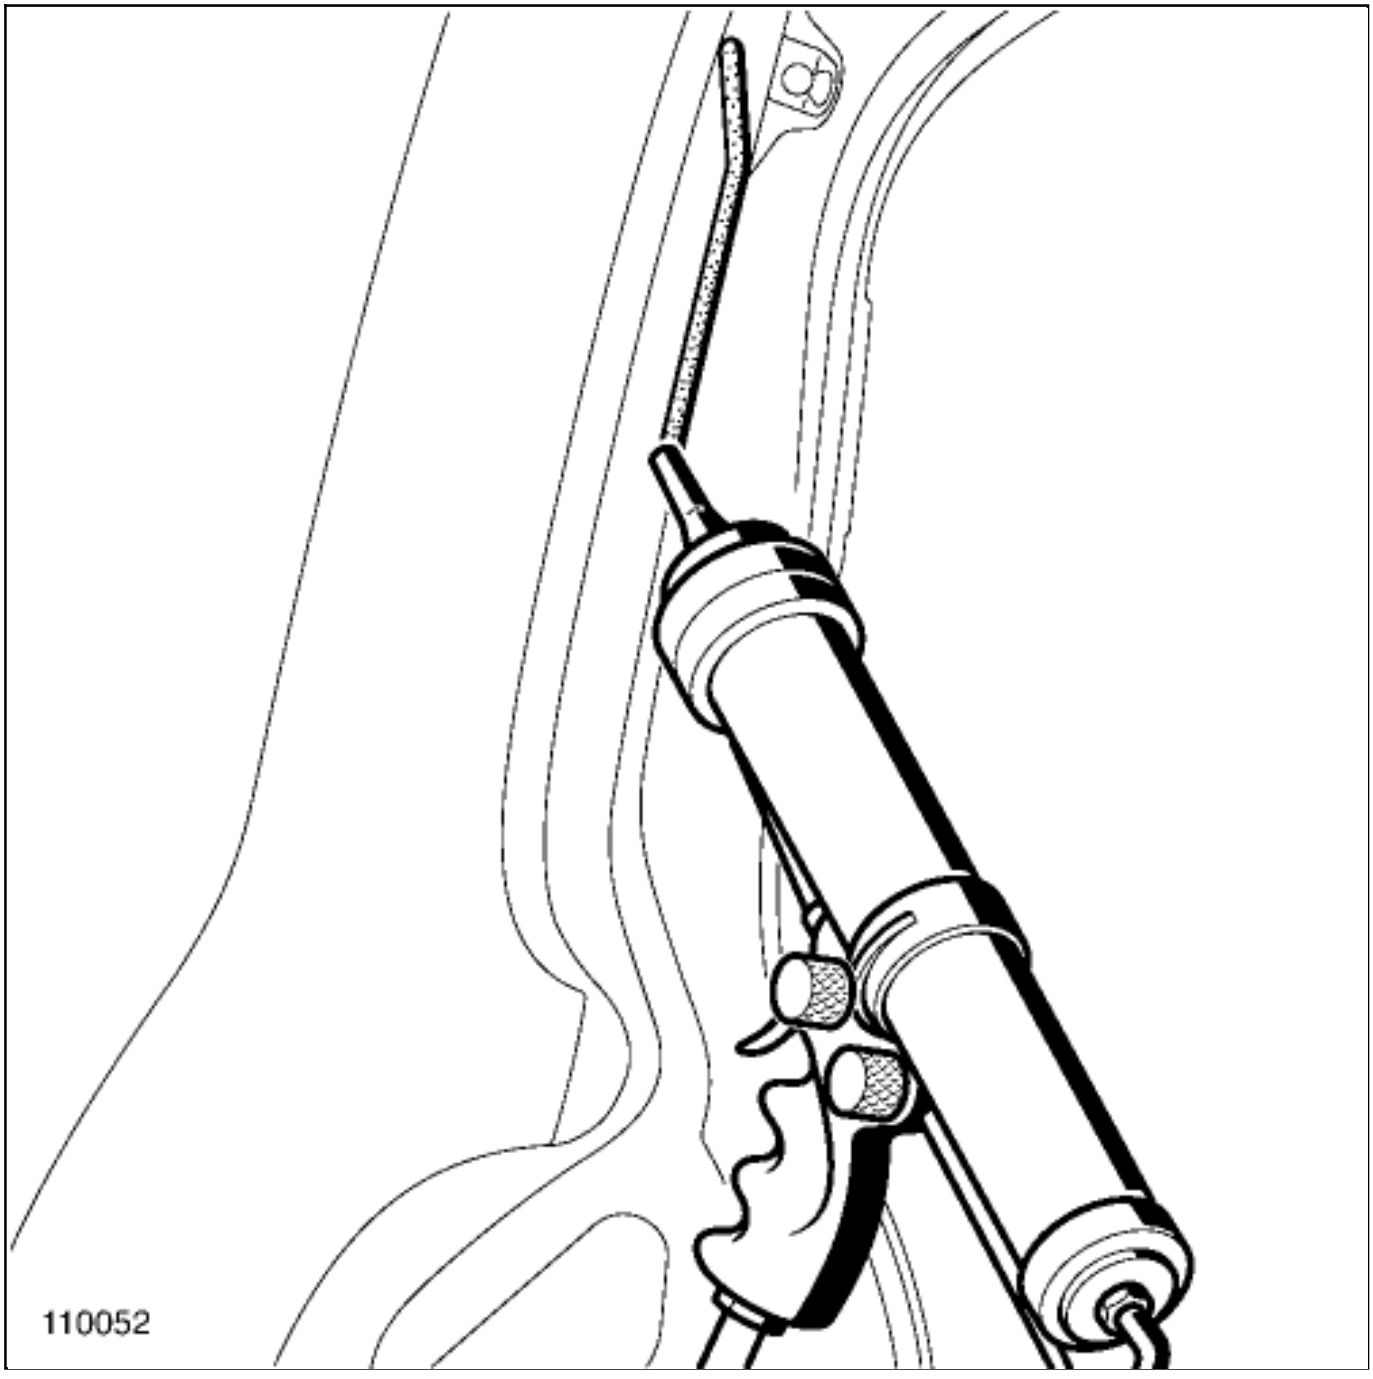
Choose the hose most suitable for the operation.

Apply wax to the hollow sections[Vehicle: Parts and consumables for the repair](#) .

3. METHOD OF USE

No.	Description
(4)	Insert the nozzle tip until it reaches the end of the hollow section
(5)	Inject the wax whilst retracting the nozzle tip

XSL version : 3.02 du 22/07/11



ANTI-CORROSIONPROTECTIONPRODUCTSAFTERASSEMBLY

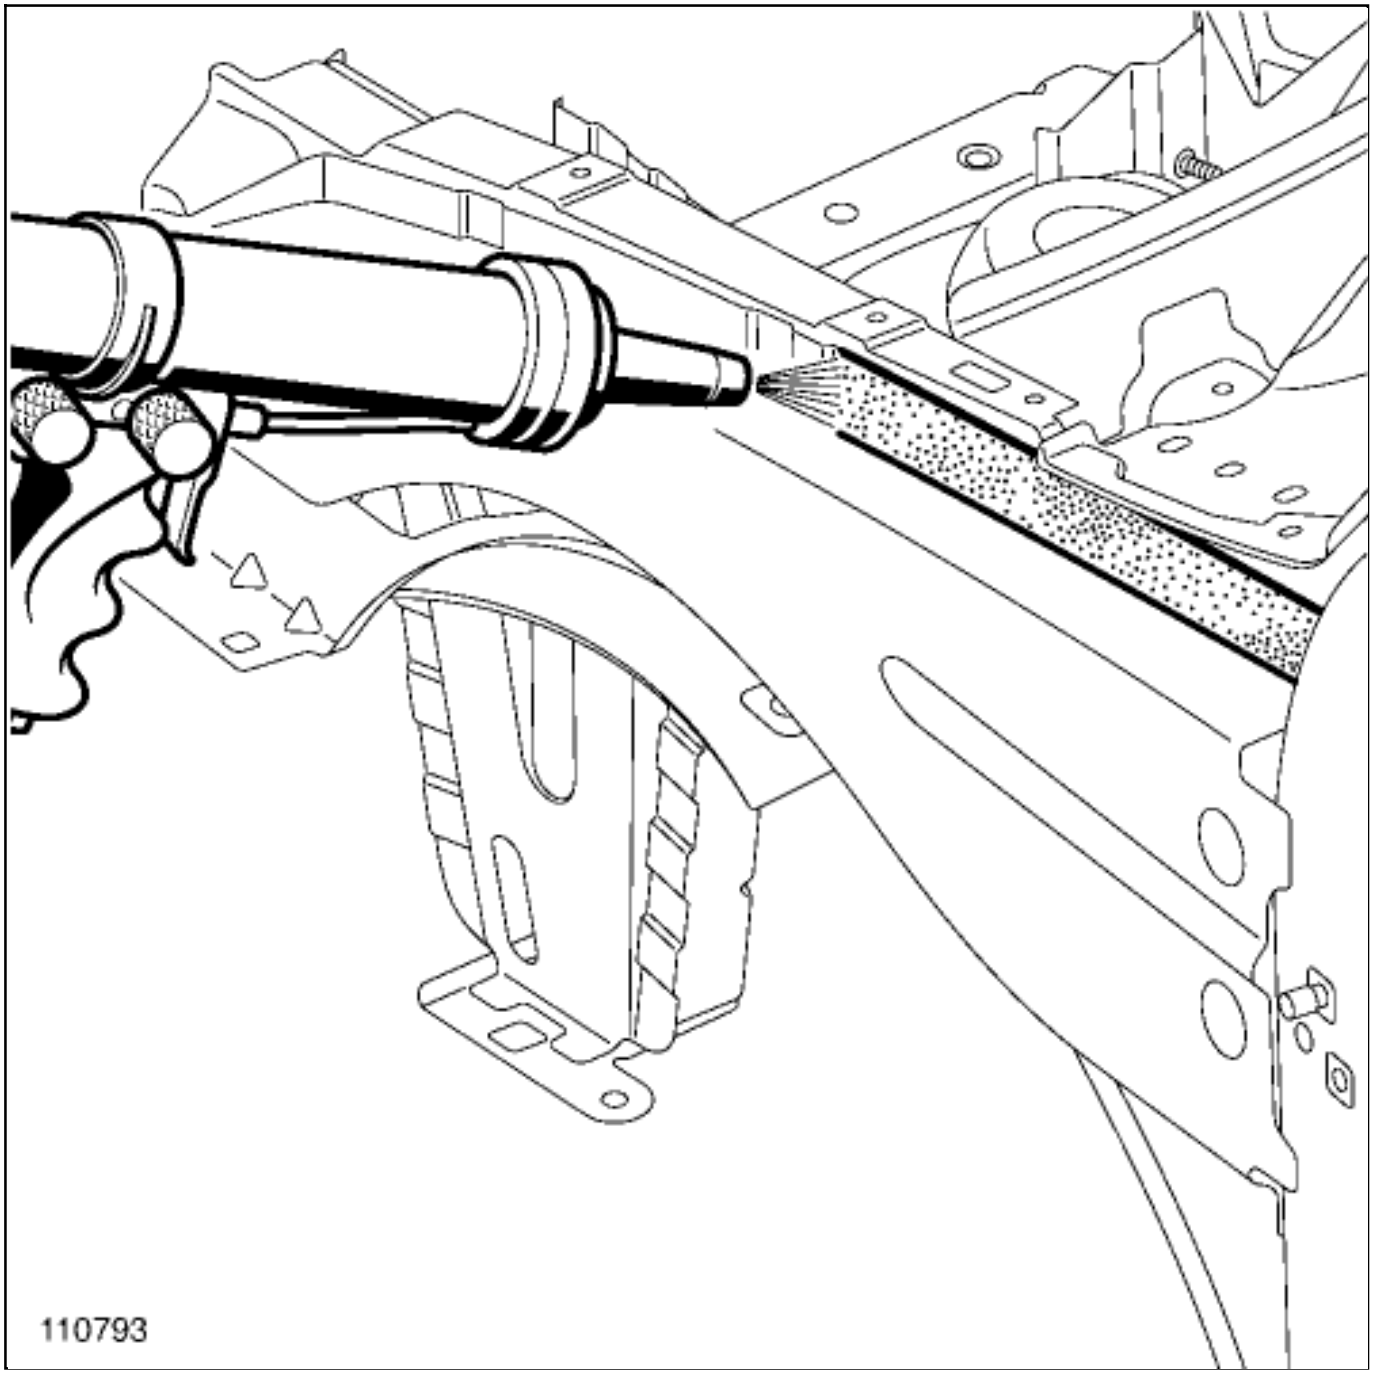
1. ELECTROGALVANIZING

See Technical Note 592A, Paint application procedure, 94A, Paint application procedure for panels, Electrogalvanizing (steel panels)

2. EXTRUDED MASTIC

Protection used in visible areas requiring a good appearance, especially for protecting crimps.

Advantages:



- Possibility of painting after drying.
- excellent adhesion on any base.
- Good edge protection (panel edge).

Disadvantage:

- Original appearance difficult to reproduce without smoothing.

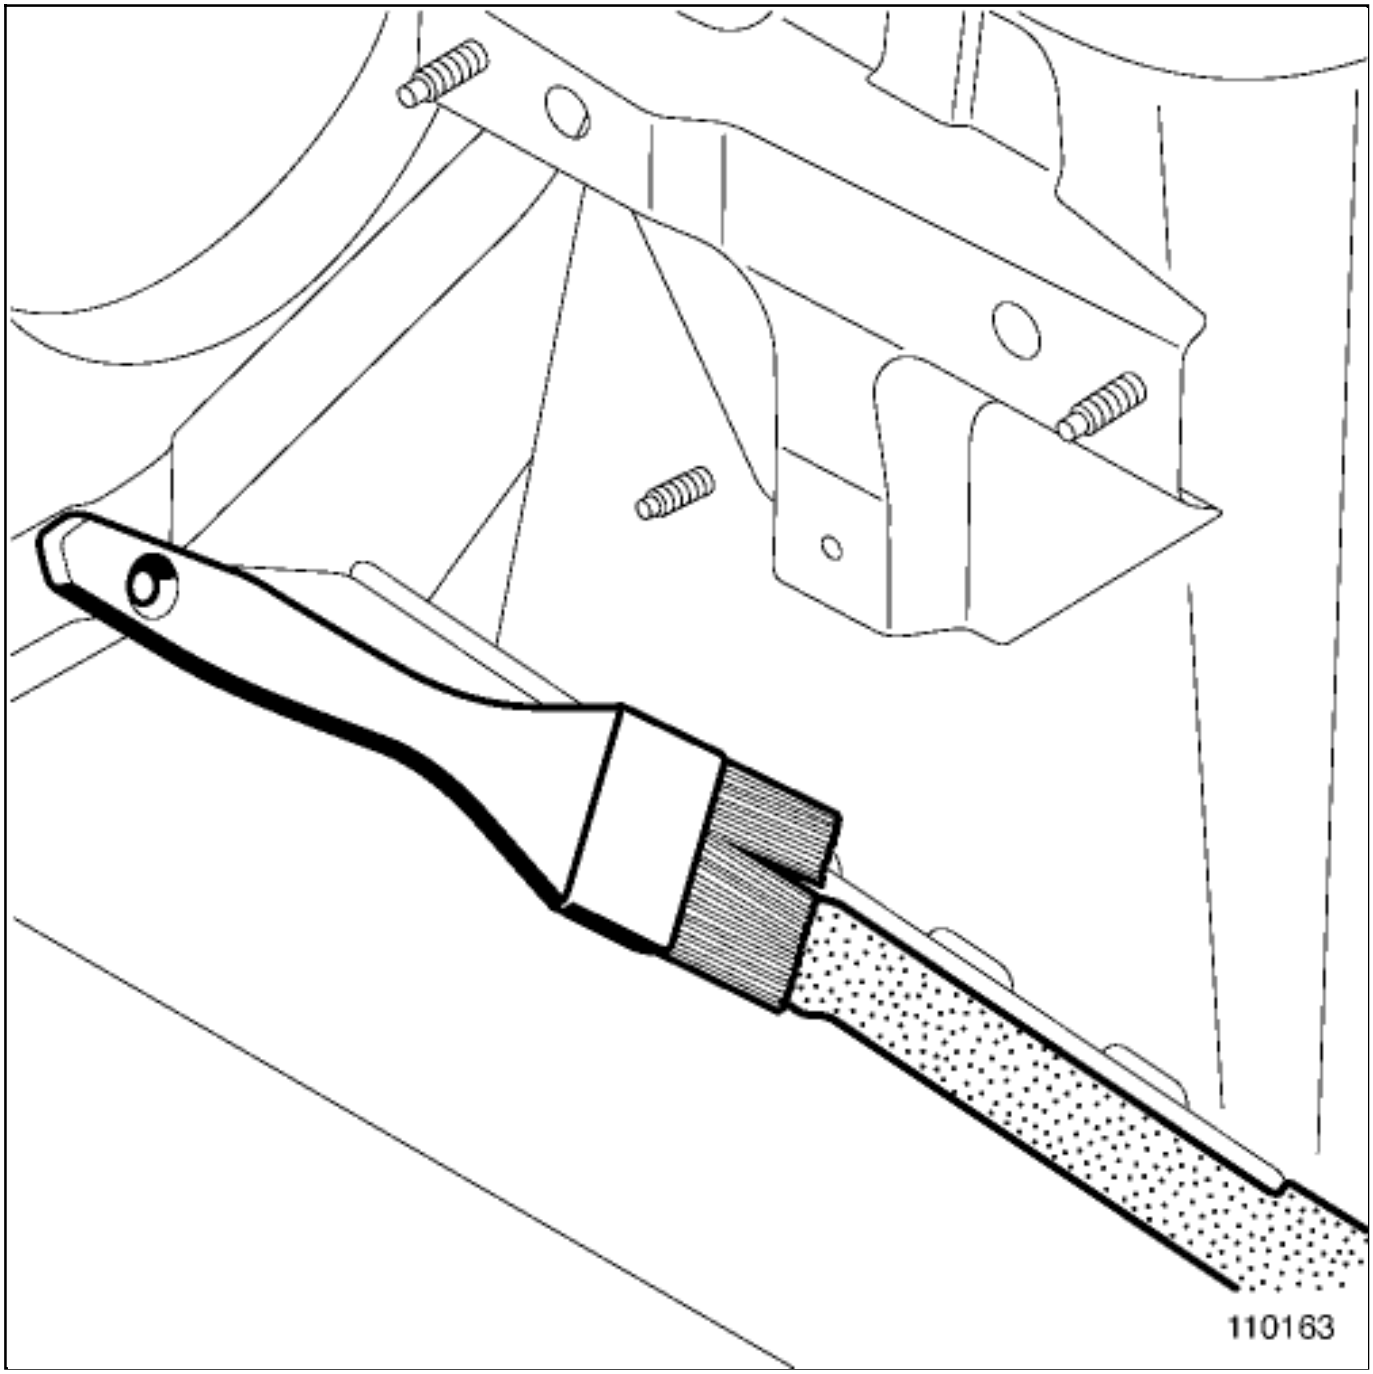
3. POWDERED MASTIC

Mastic suited for protecting the lower parts of the body (anti-grit) or powdered mating surface protection.

Advantages:

- Allows large areas to be treated.
- Modulable appearance depending on the adjustment of the gun in such a way as to reproduce the original appearance.

Disadvantage:



Possible splashing of the product.

Operator protection:

- obligatory respiratory protection,
- use extra ventilation source.

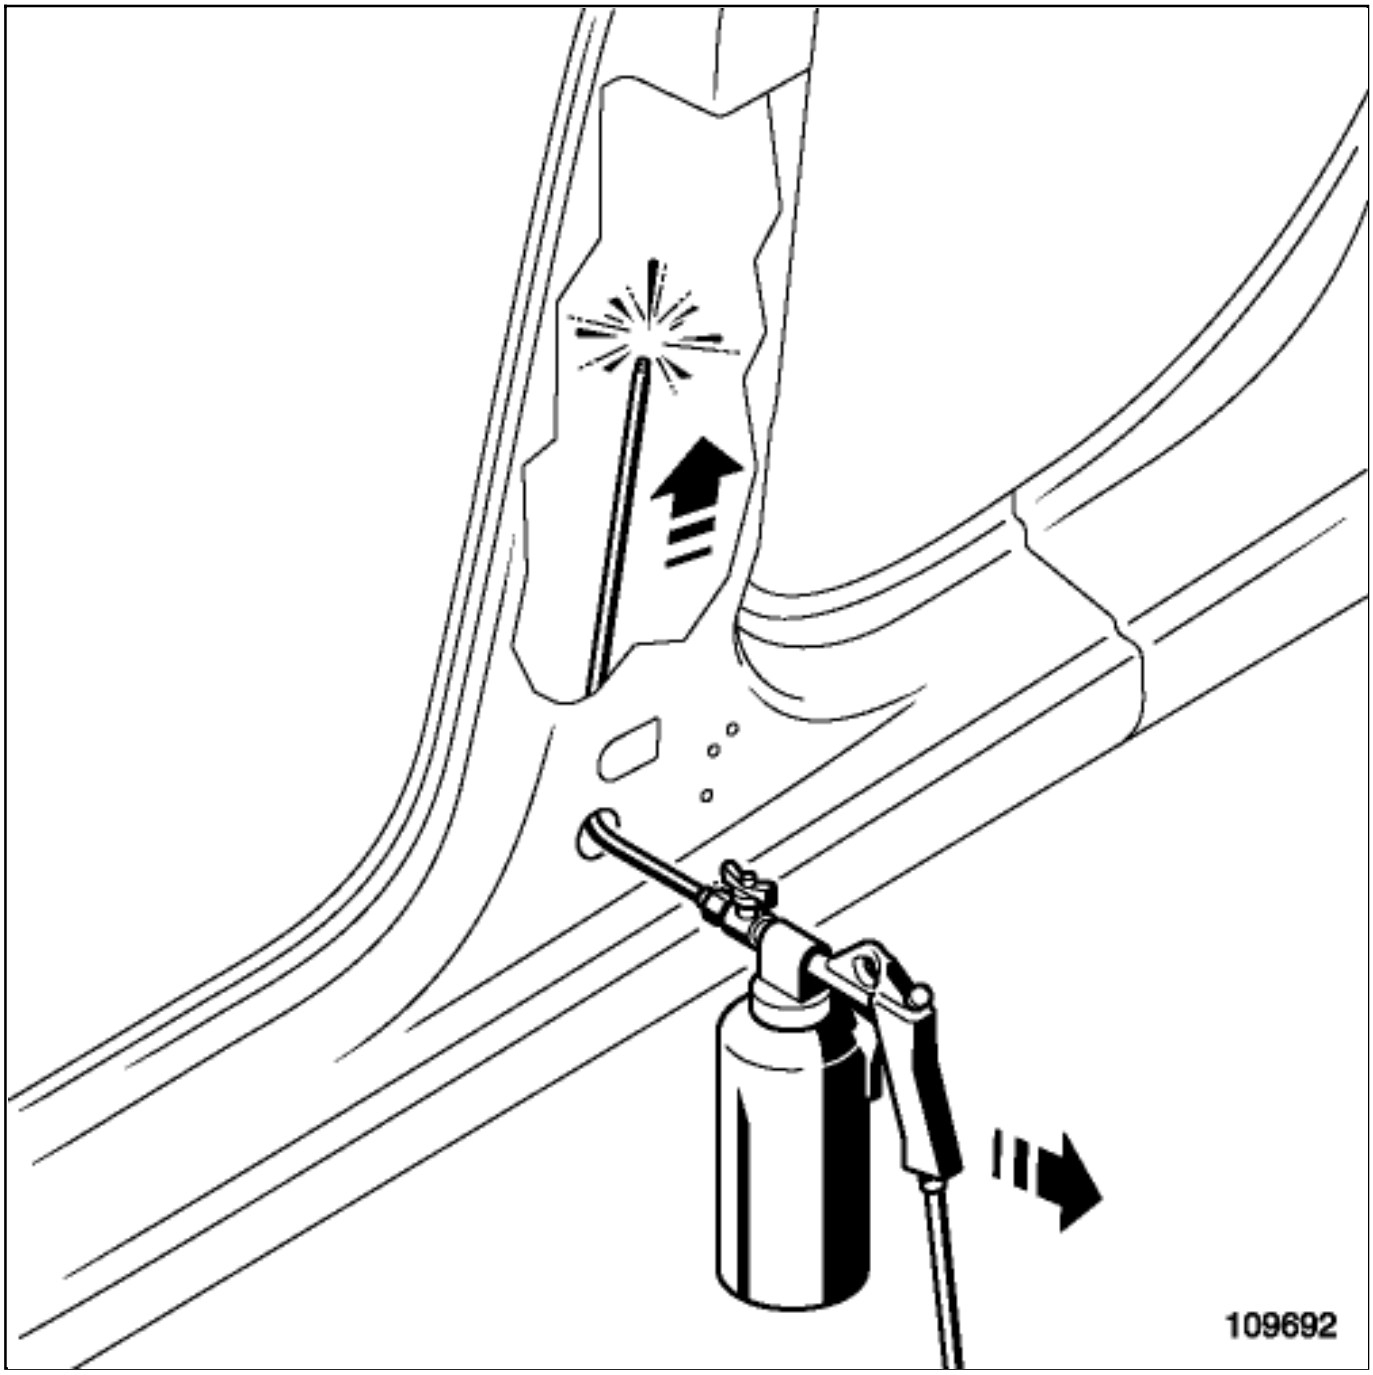
4. MASTIC FOR BRUSH APPLICATION

Mastic used in the engine compartment or highly exposed areas.

Advantages:

- Resists water, hydrocarbons and oil.
- Can be painted.

Disadvantages:



- Original appearance difficult to reproduce.

- Edge protection (panel edges).

5. WAX FOR HOLLOW SECTIONS

Wax used for treating hollow sections.

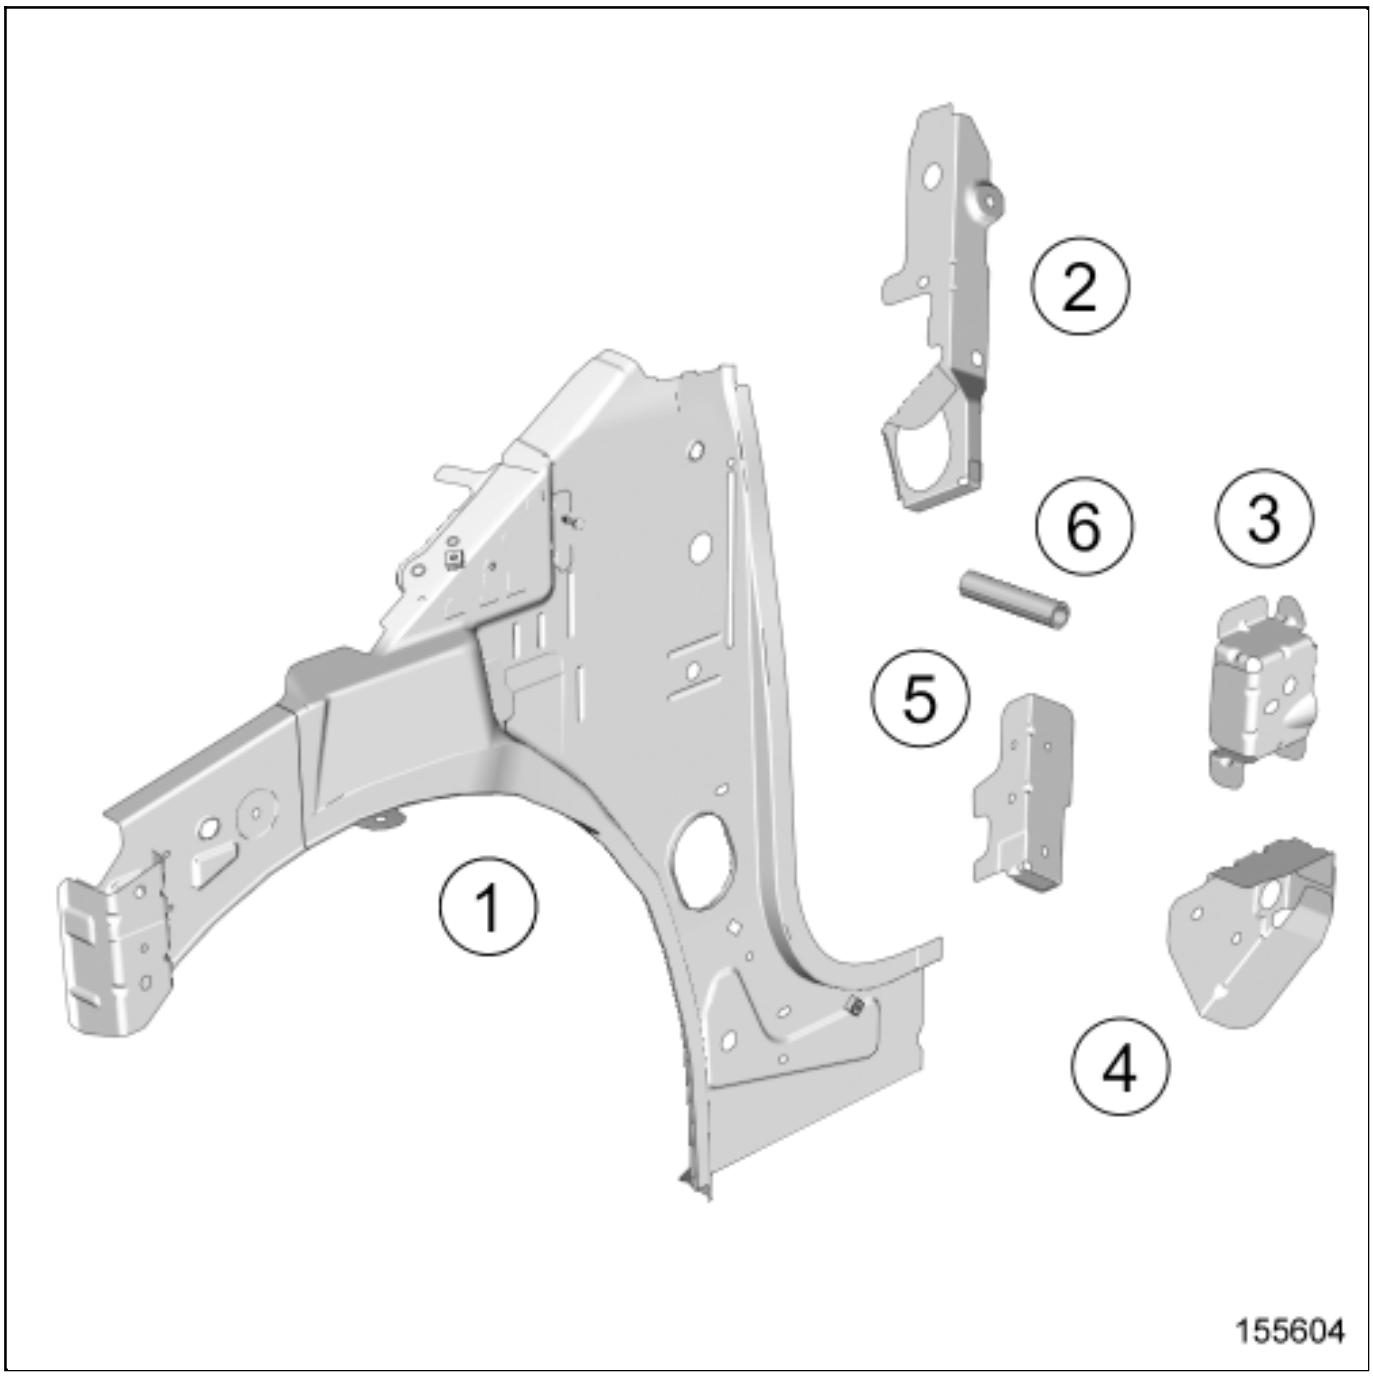
See Technical Note 592A, Paint application procedure, 94B, Protection of hollow sections.

Advantage:

- Excellent anti-corrosion protection.

Disadvantages:

- Blind application.
- Wax spillage onto floor when applied to hollow sections on the underside of the vehicle.



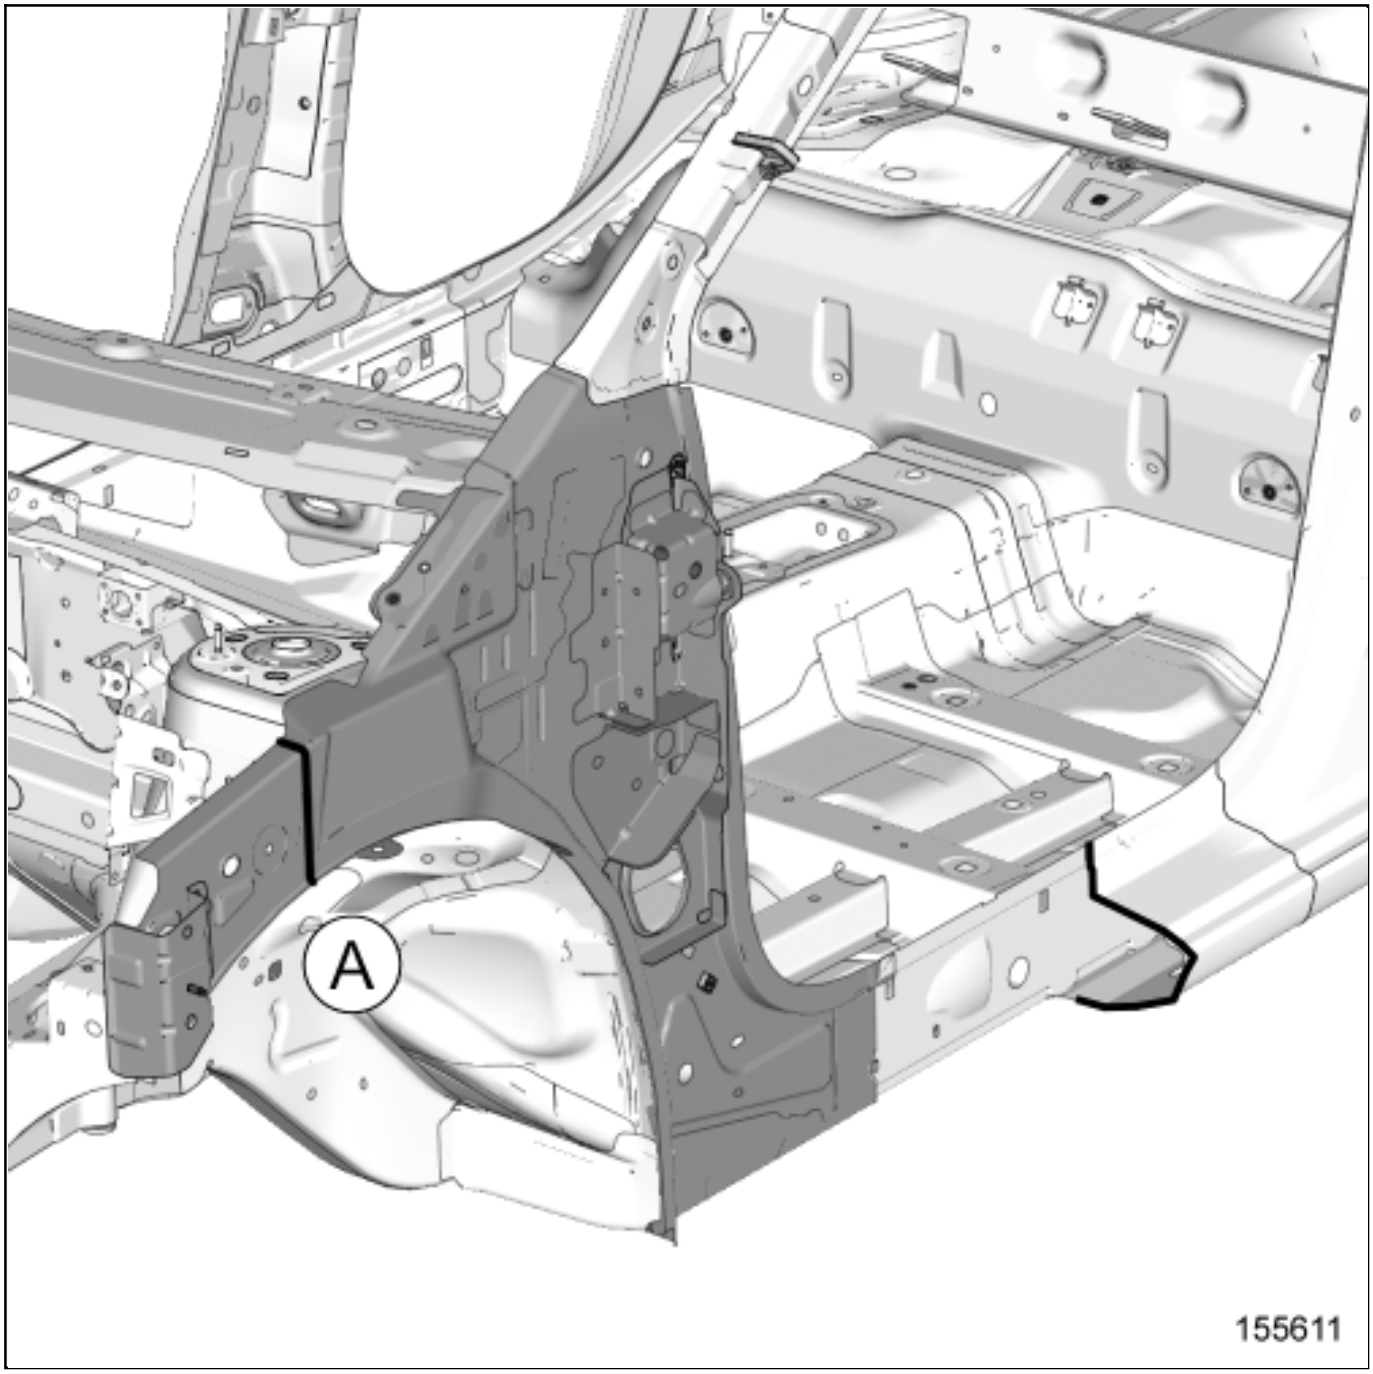
Operator protection:

- obligatory respiratory protection,
- use extra ventilation source.

A-PILLARLINING:REPLACEMENT

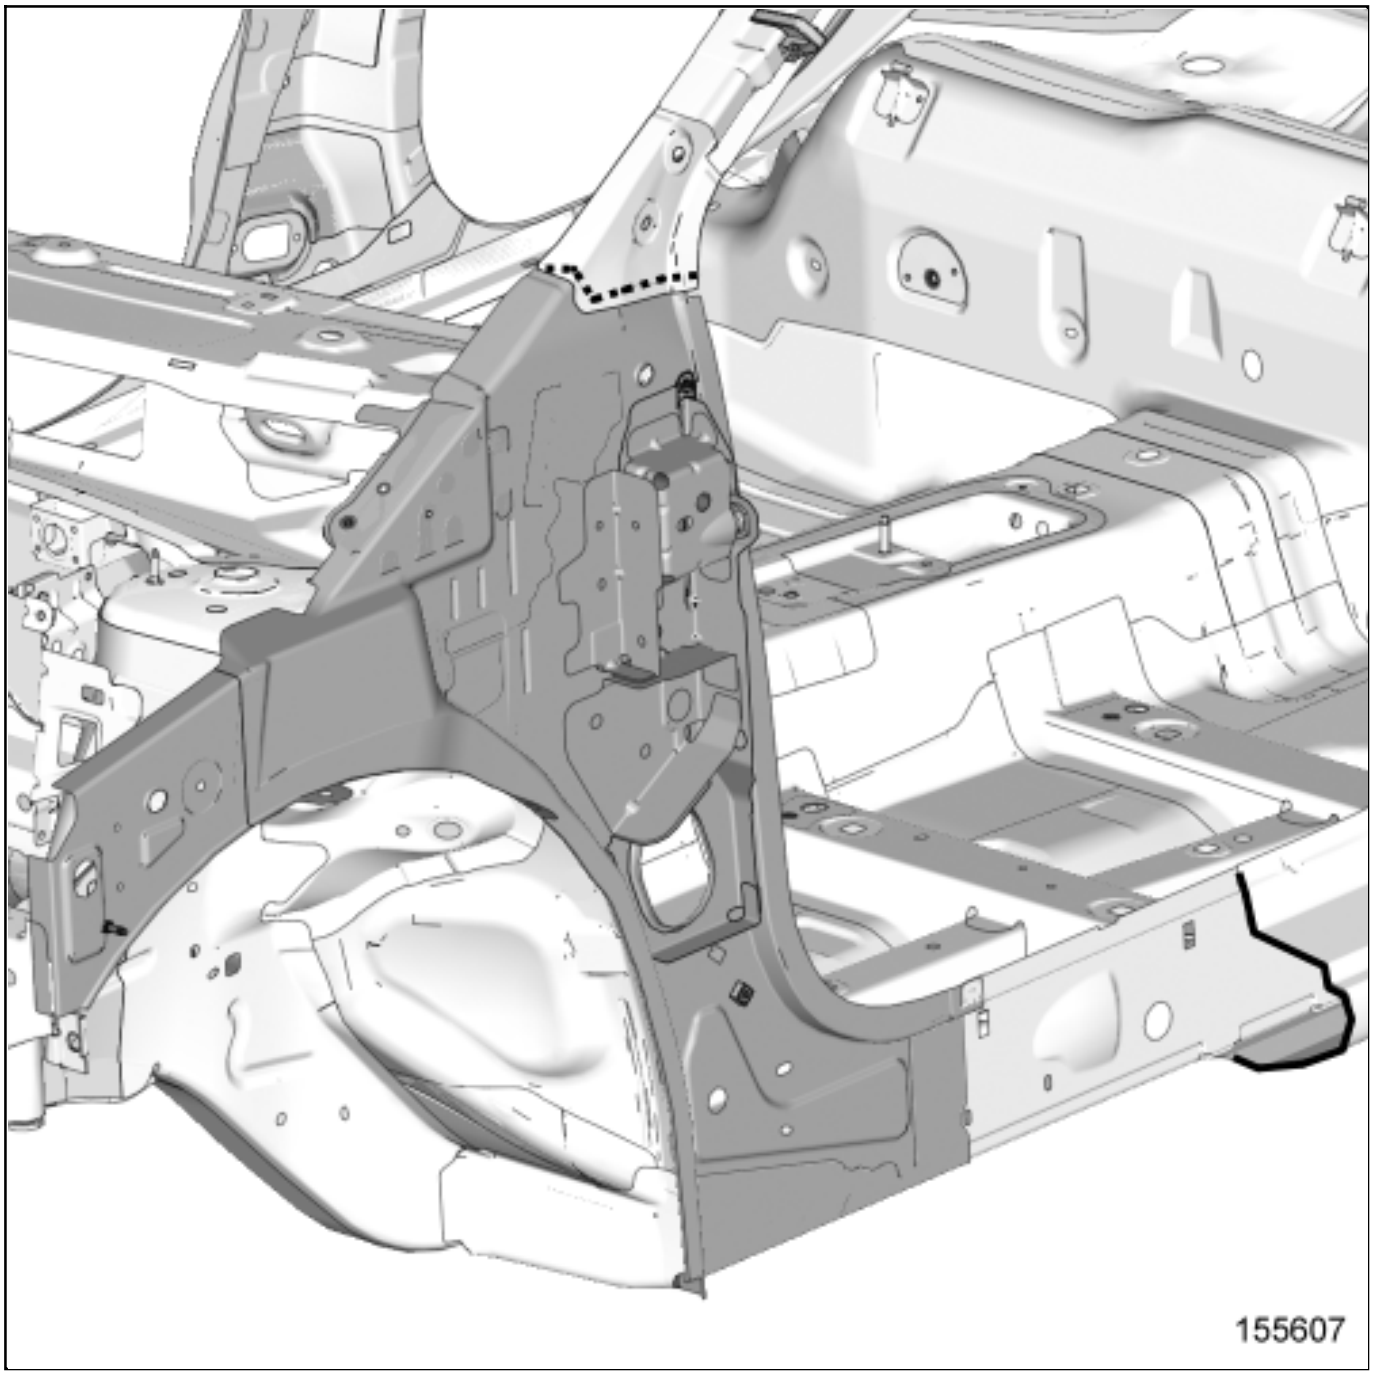
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART



No.	Description	Type	Thickness (mm)
(1)	A-pillar lining	Mild steel	0.85
(2)	A-pillar lining reinforcement	Mild steel	1.5
(3)	Upper pillar reinforcement	Mild steel	2
(4)	Lower pillar reinforcement	Mild steel	2.5
(5)	A-pillar lining connection element	Mild steel	2
(6)	Mounting spacer	Mild steel	2.5

2. IN THE EVENT OF REPLACEMENT



The option for replacing this part is as follows:

- complete replacement,
- partial replacement A.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

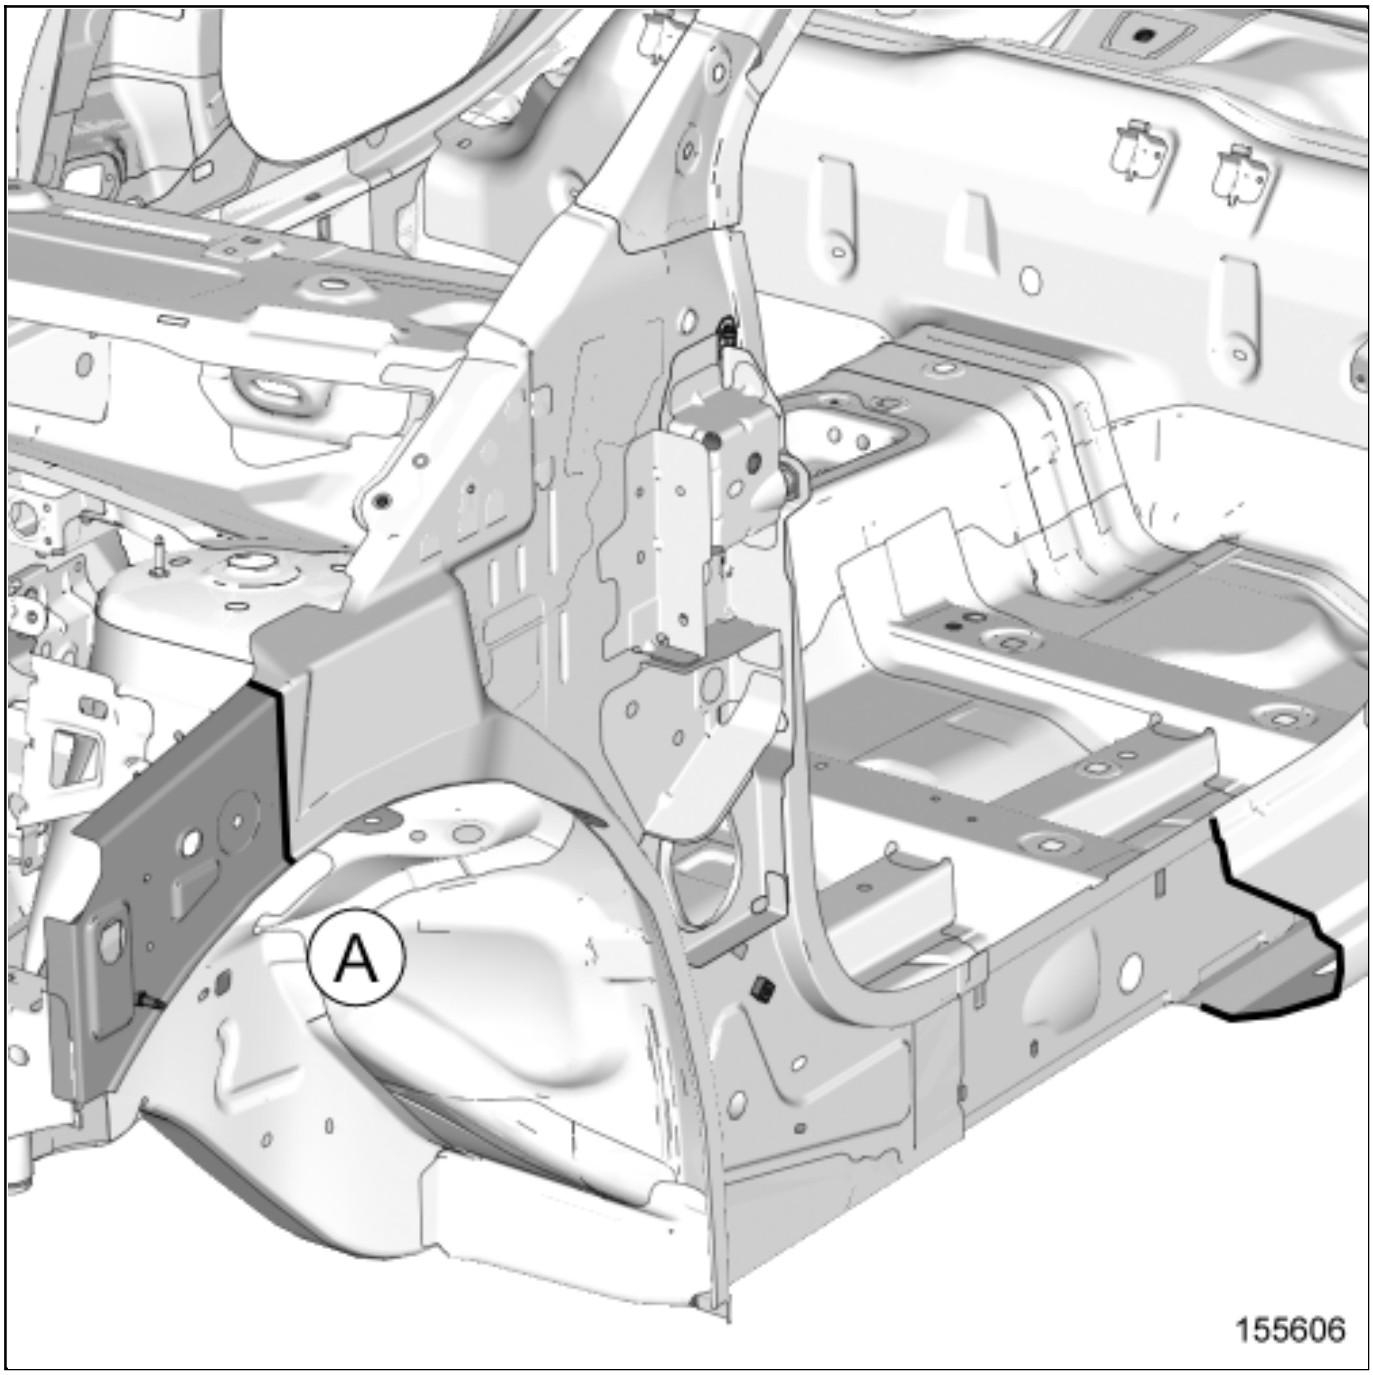
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

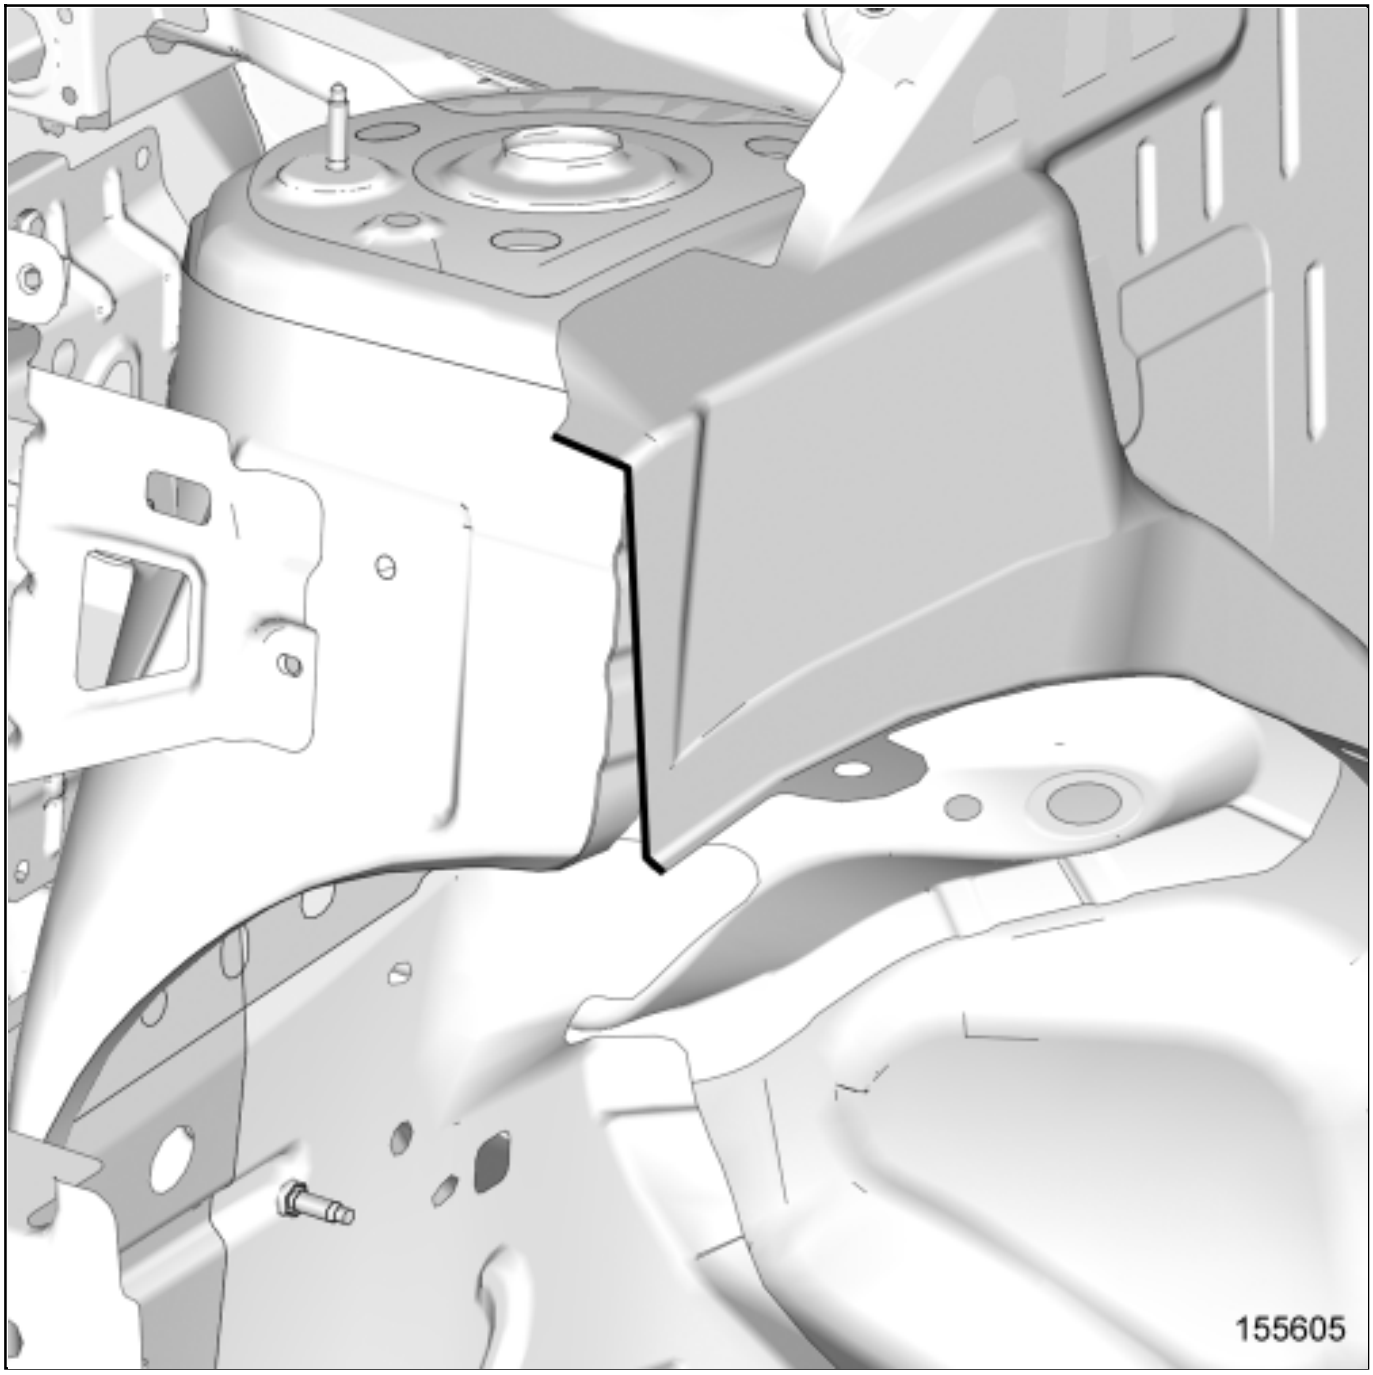
Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING



CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT A

1)PART IN POSITION

DETAILED VIEW OF CUT A

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

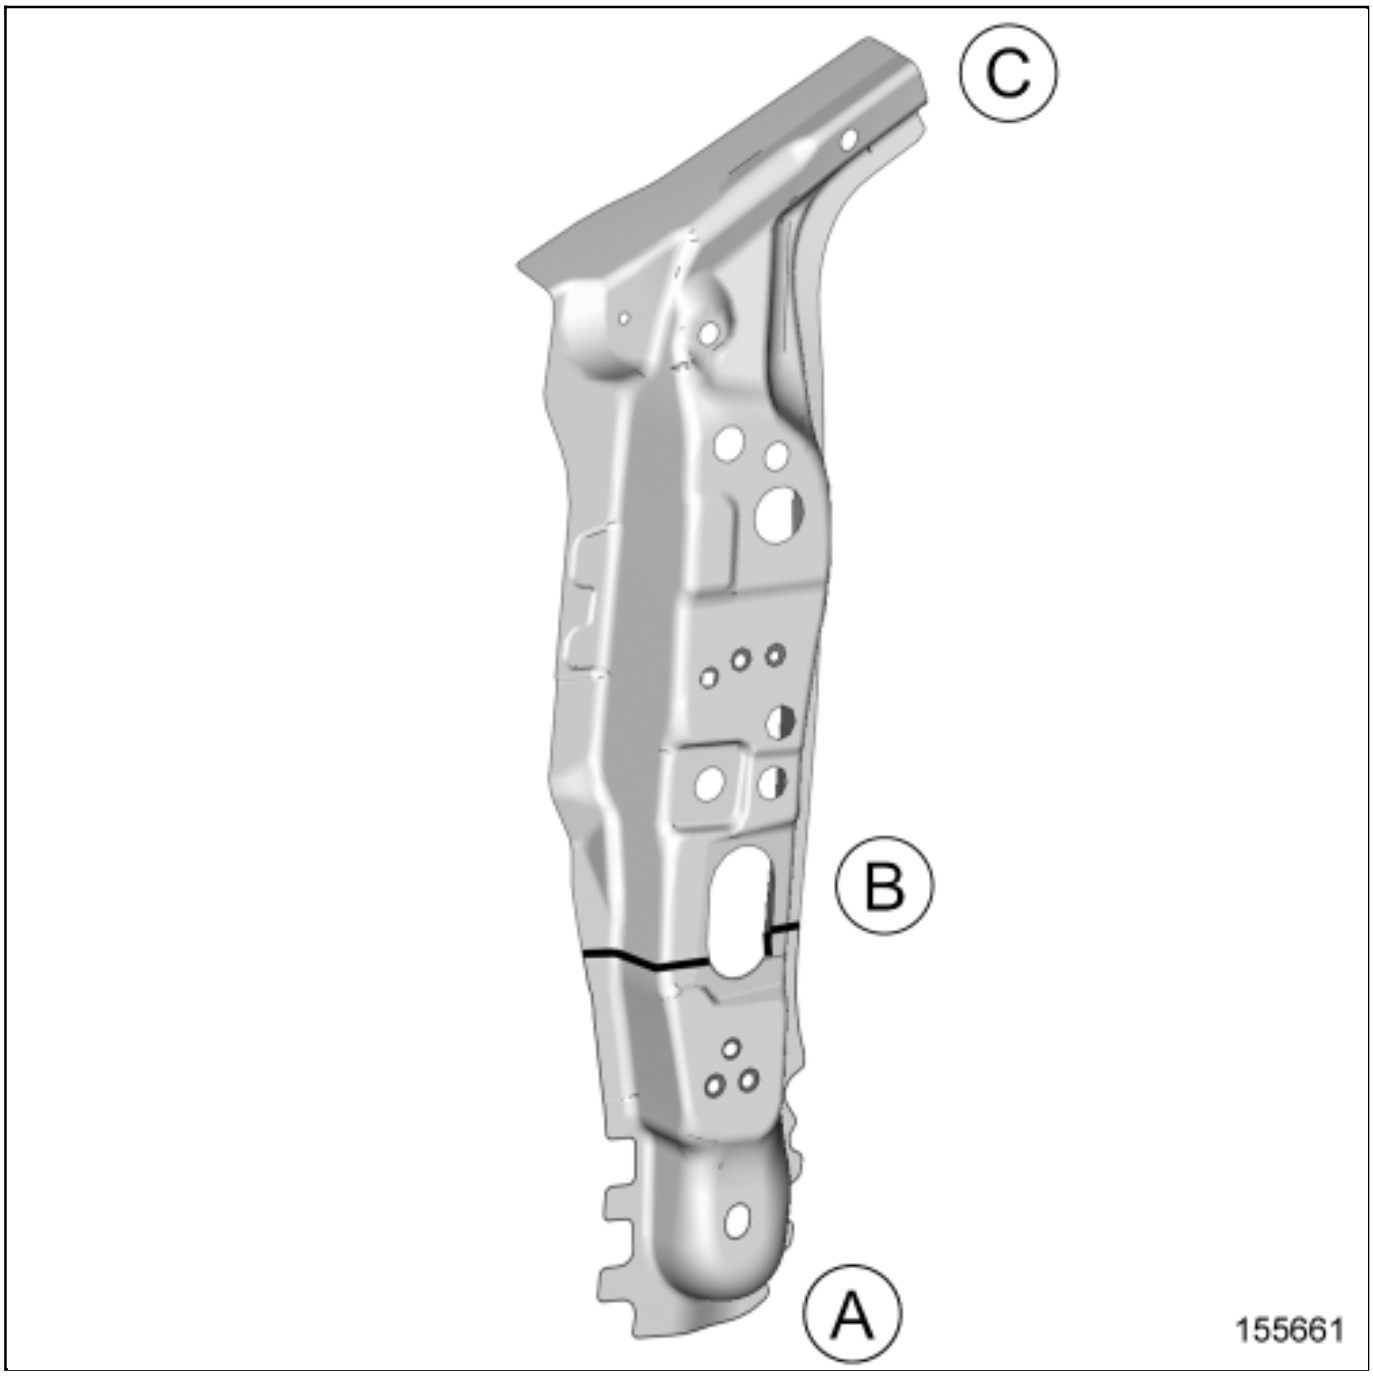
Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

A-PILLAR REINFORCEMENT : REPLACEMENT

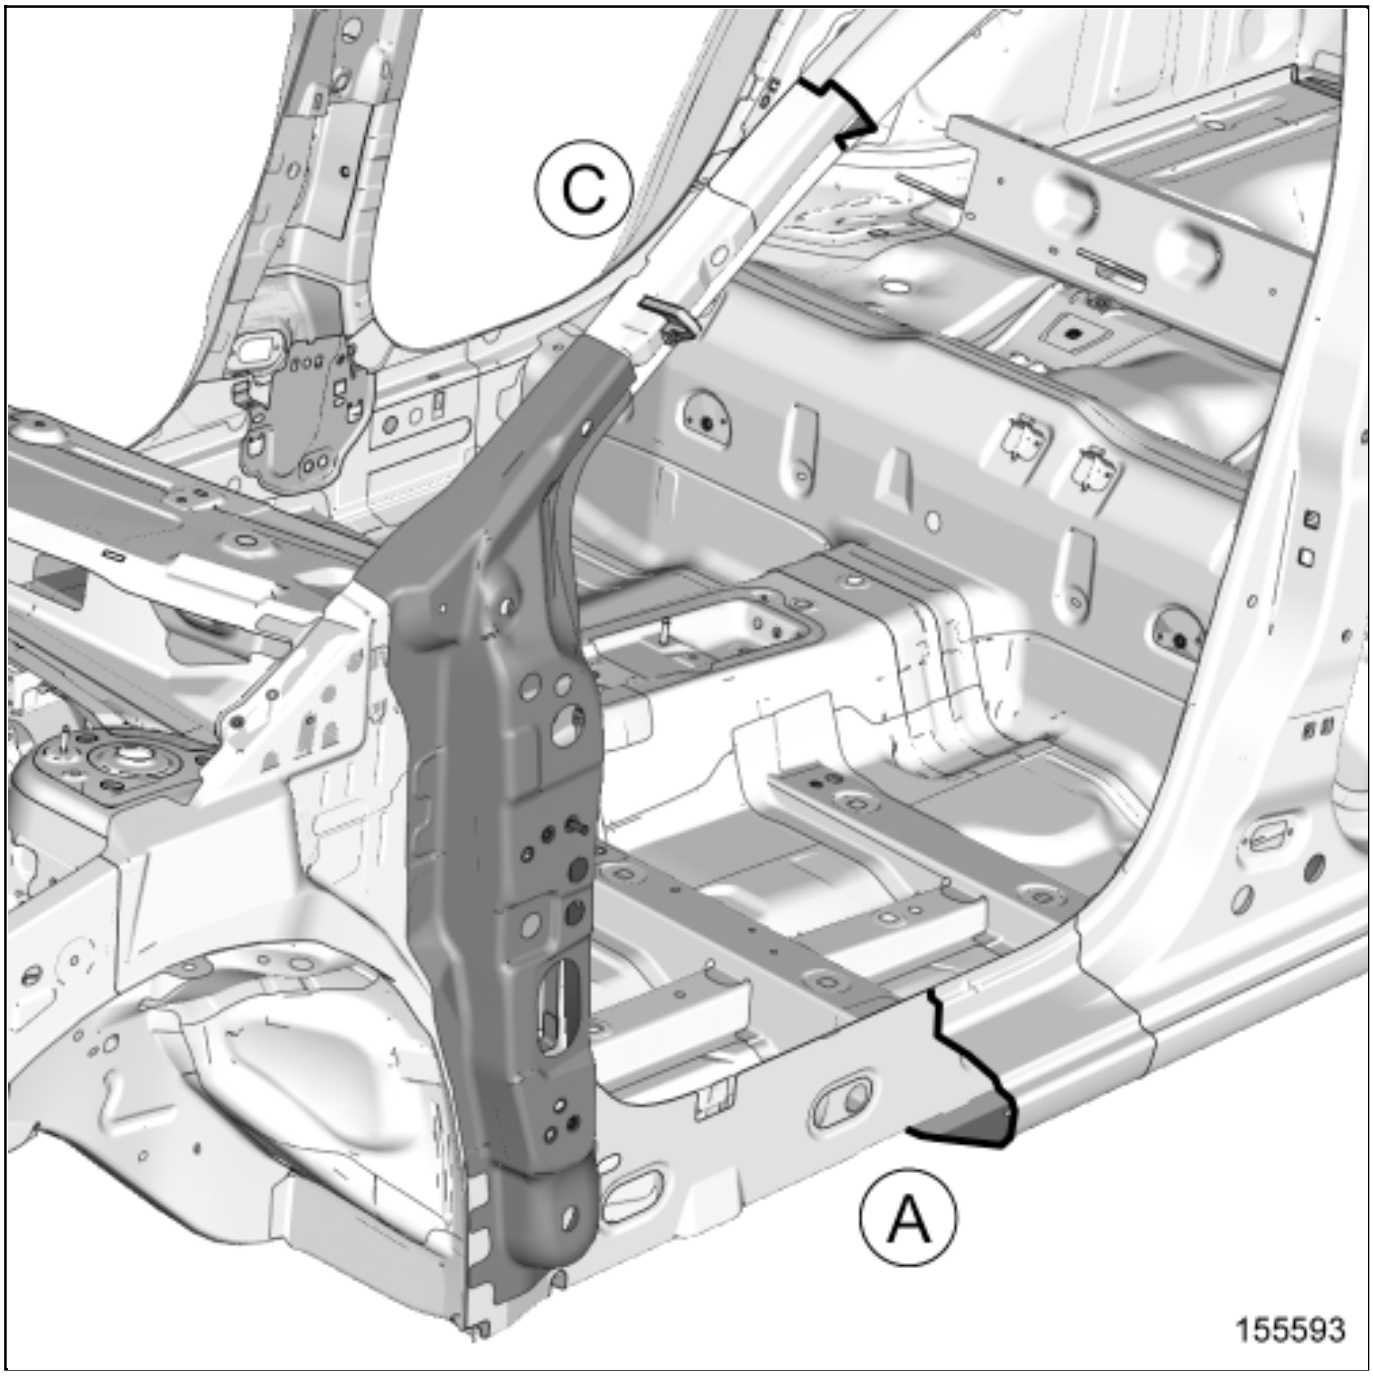


Note, one or more warnings are present in this procedure

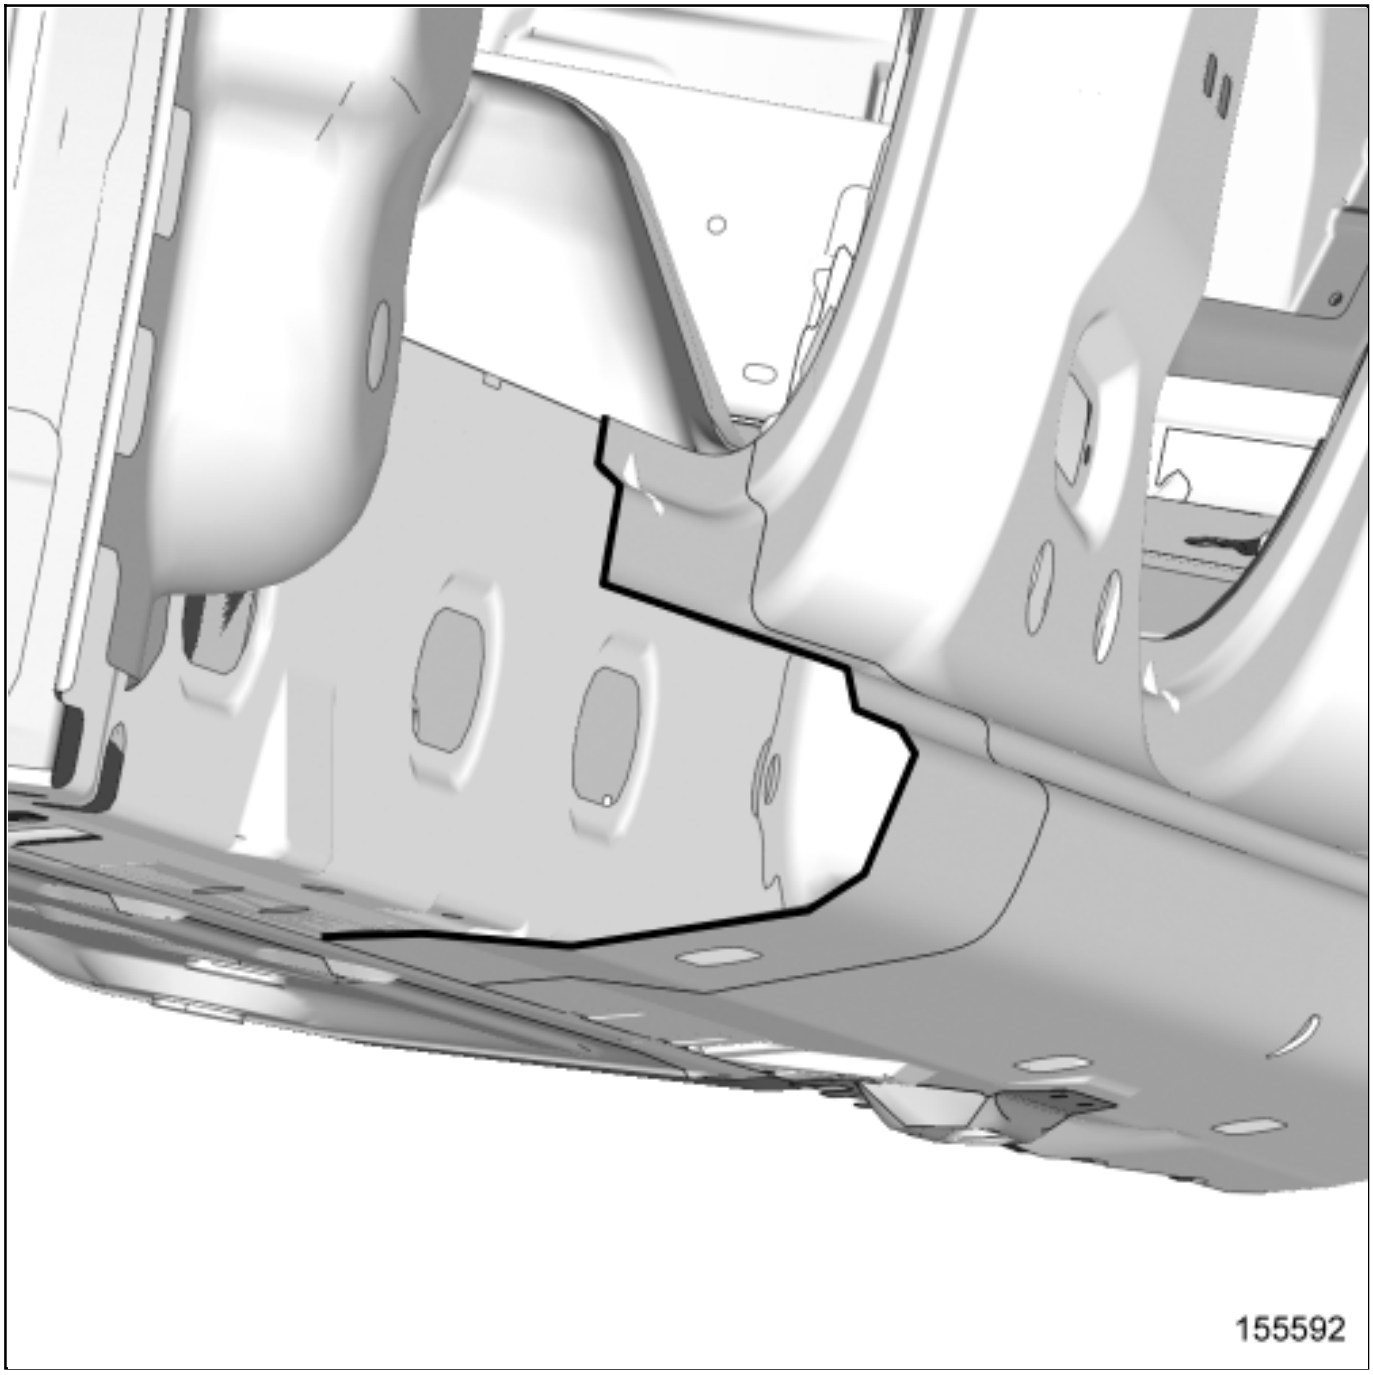
1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	A-pillar reinforcement	HLE	1.2
(2)	A-pillar upper hinge reinforcement	HLE	2
(3)	A-pillar lower hinge reinforcement	THLE	2

2. IN THE EVENT OF REPLACEMENT

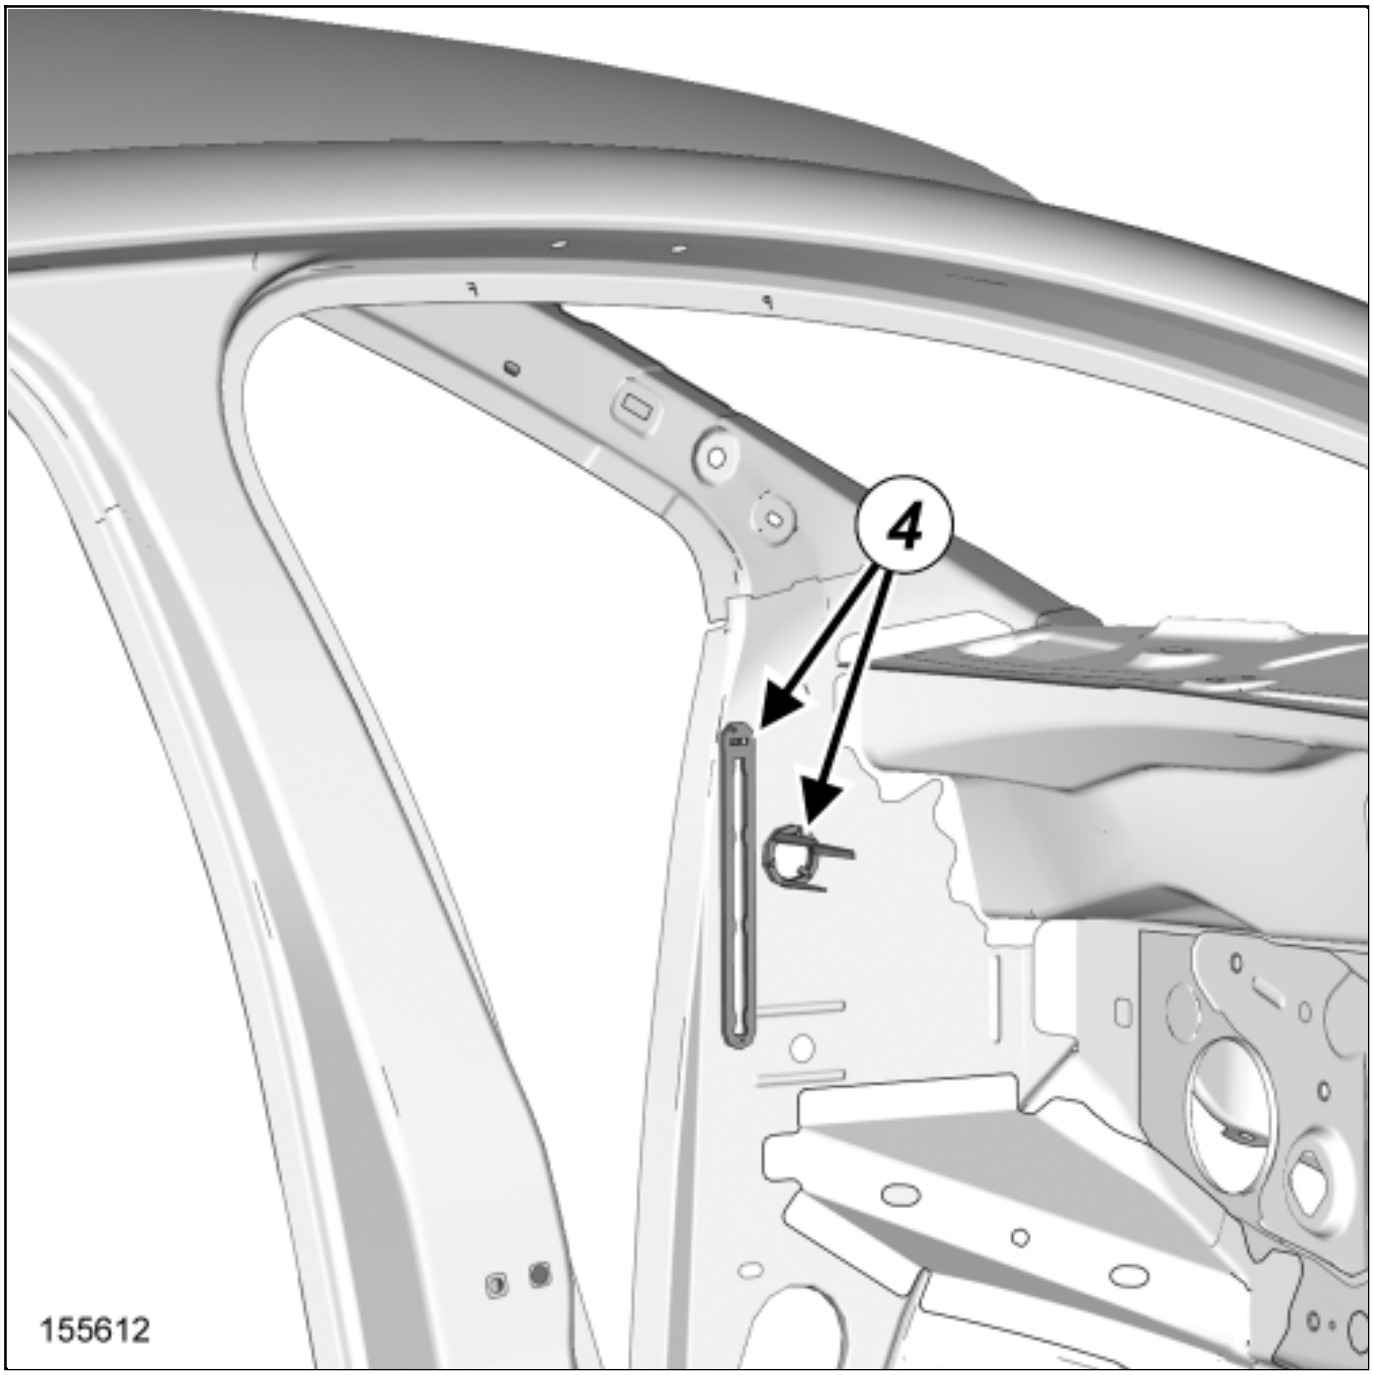


There are several ways of replacing this part:



- complete replacement A-C
- partial replacement B.

1- COMPLETE REPLACEMENT A-C



1)PART IN POSITION

DETAILED VIEW A

2)PARTS ALWAYS TO BE REPLACED

Replace the A-pillar expanding inserts(4)

3)POSITION OF ELECTRIC EARTHS

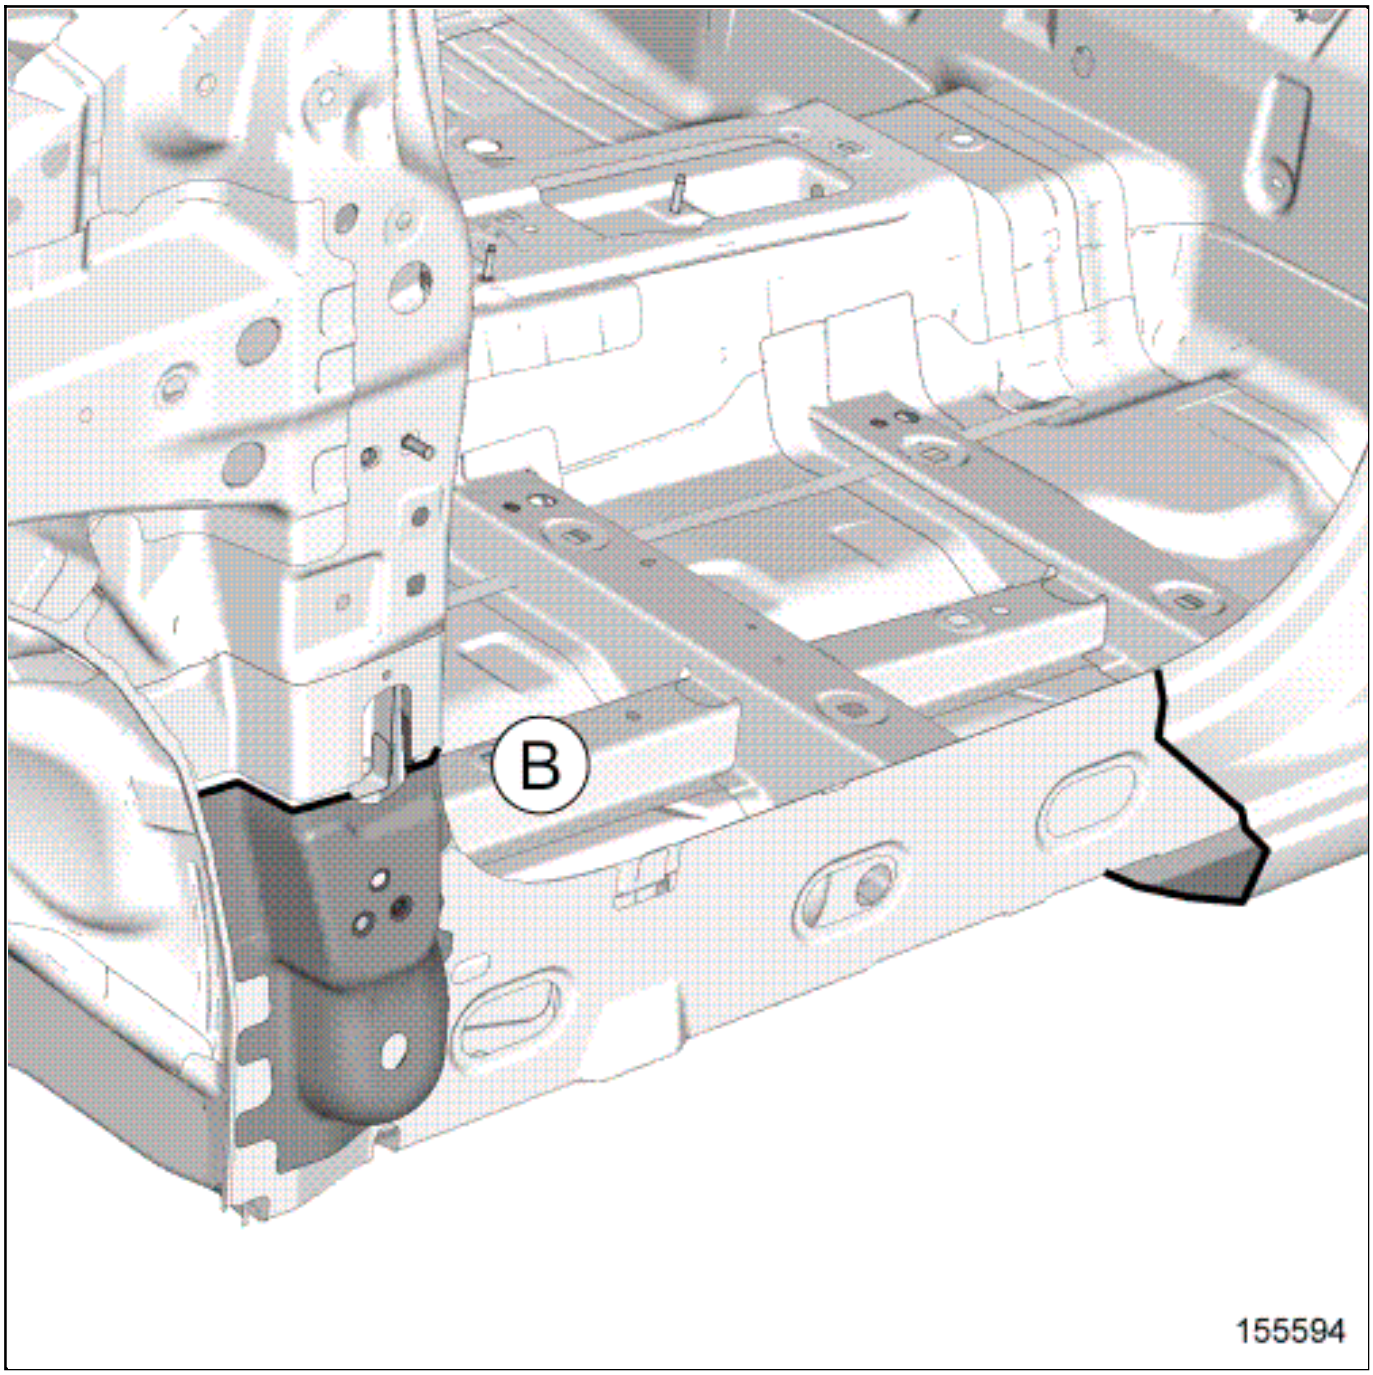
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

4)SPECIAL NOTES ON MATING



CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT B

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

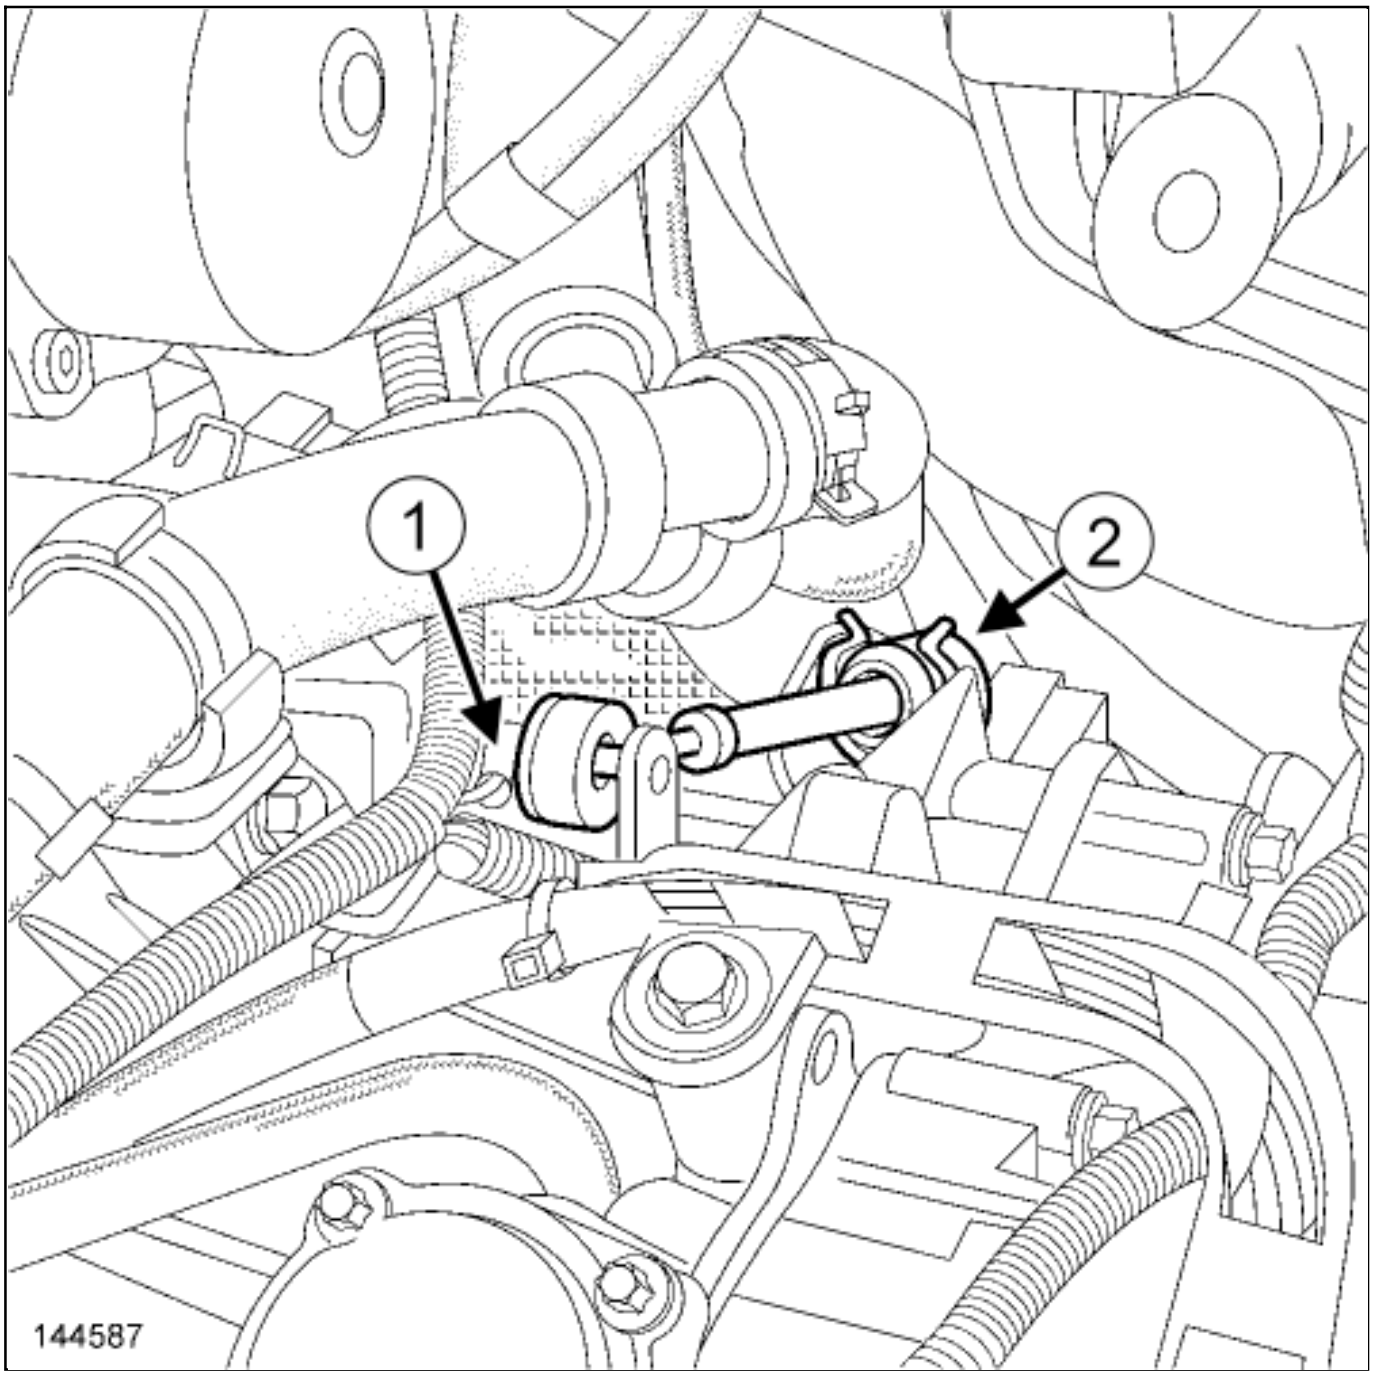
Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

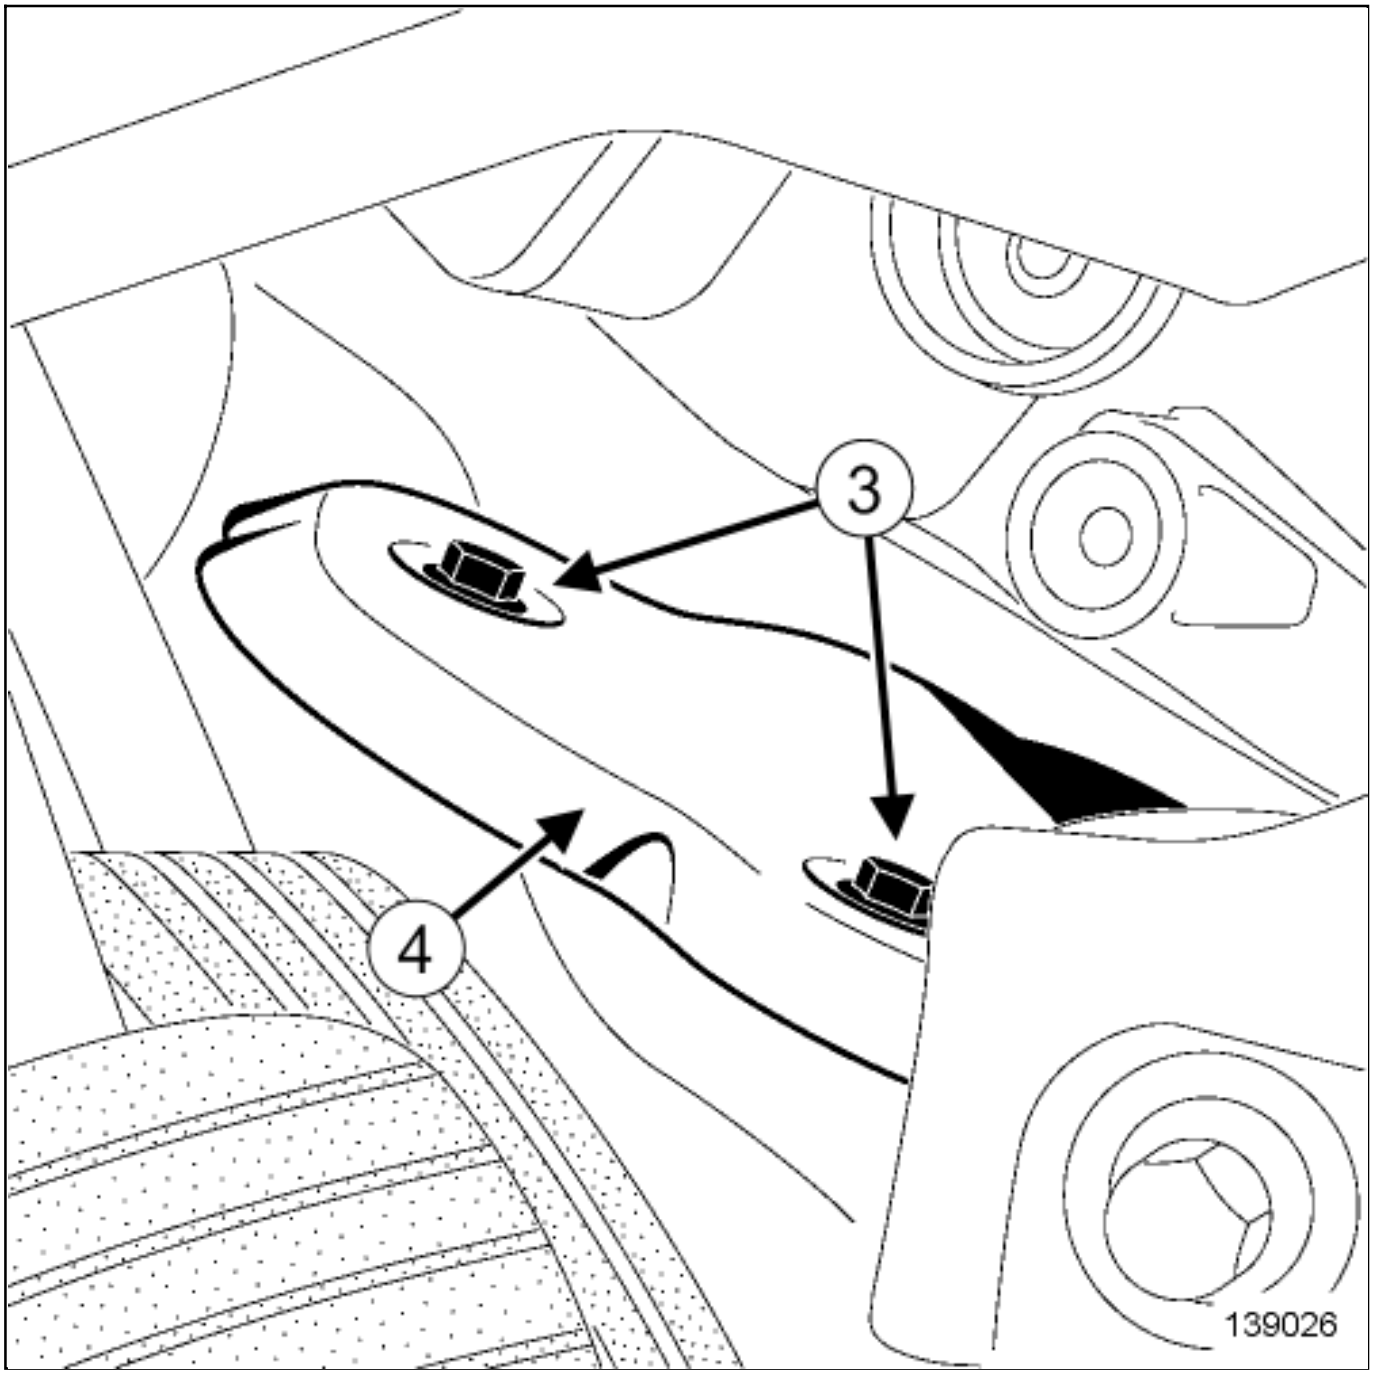
AUTOMATIC GEAR CONTROL CABLE: REMOVAL - REFITTING



REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:



- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting .
- the gear control unit (see **Manual gearbox: Removal - Refitting**) .

2. REMOVAL OPERATION

Unclip the gear control cable anchoring ball joint(1) on the gearbox using pliers.

Release the gear control cable sheath stop(2) on the gearbox.

- Remove the bulkhead seal bolts(3) .
- Move aside the bulkhead seal(4) .
- Remove the gear control cable.

REFITTING

1. REFITTING PREPARATION OPERATION

Put the external gear control unit lever and the multifunction switch on the gearbox in position D.

2. REFITTING OPERATION

Fit:

- the gear control unit control cable,
- the bulkhead seal,
- the bulkhead seal bolts.

Tighten the bulkhead seal bolts.

Lock the gear control cable sheath stop on the gearbox.

Clip the gear control cable anchoring ball joint onto the gearbox using pliers.

3. FINAL OPERATION

Proceed in the reverse order to removal.

AUTOMATICGEARBOX:CHECK

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

CHECK

1. PREPARATION OPERATION FOR CHECK

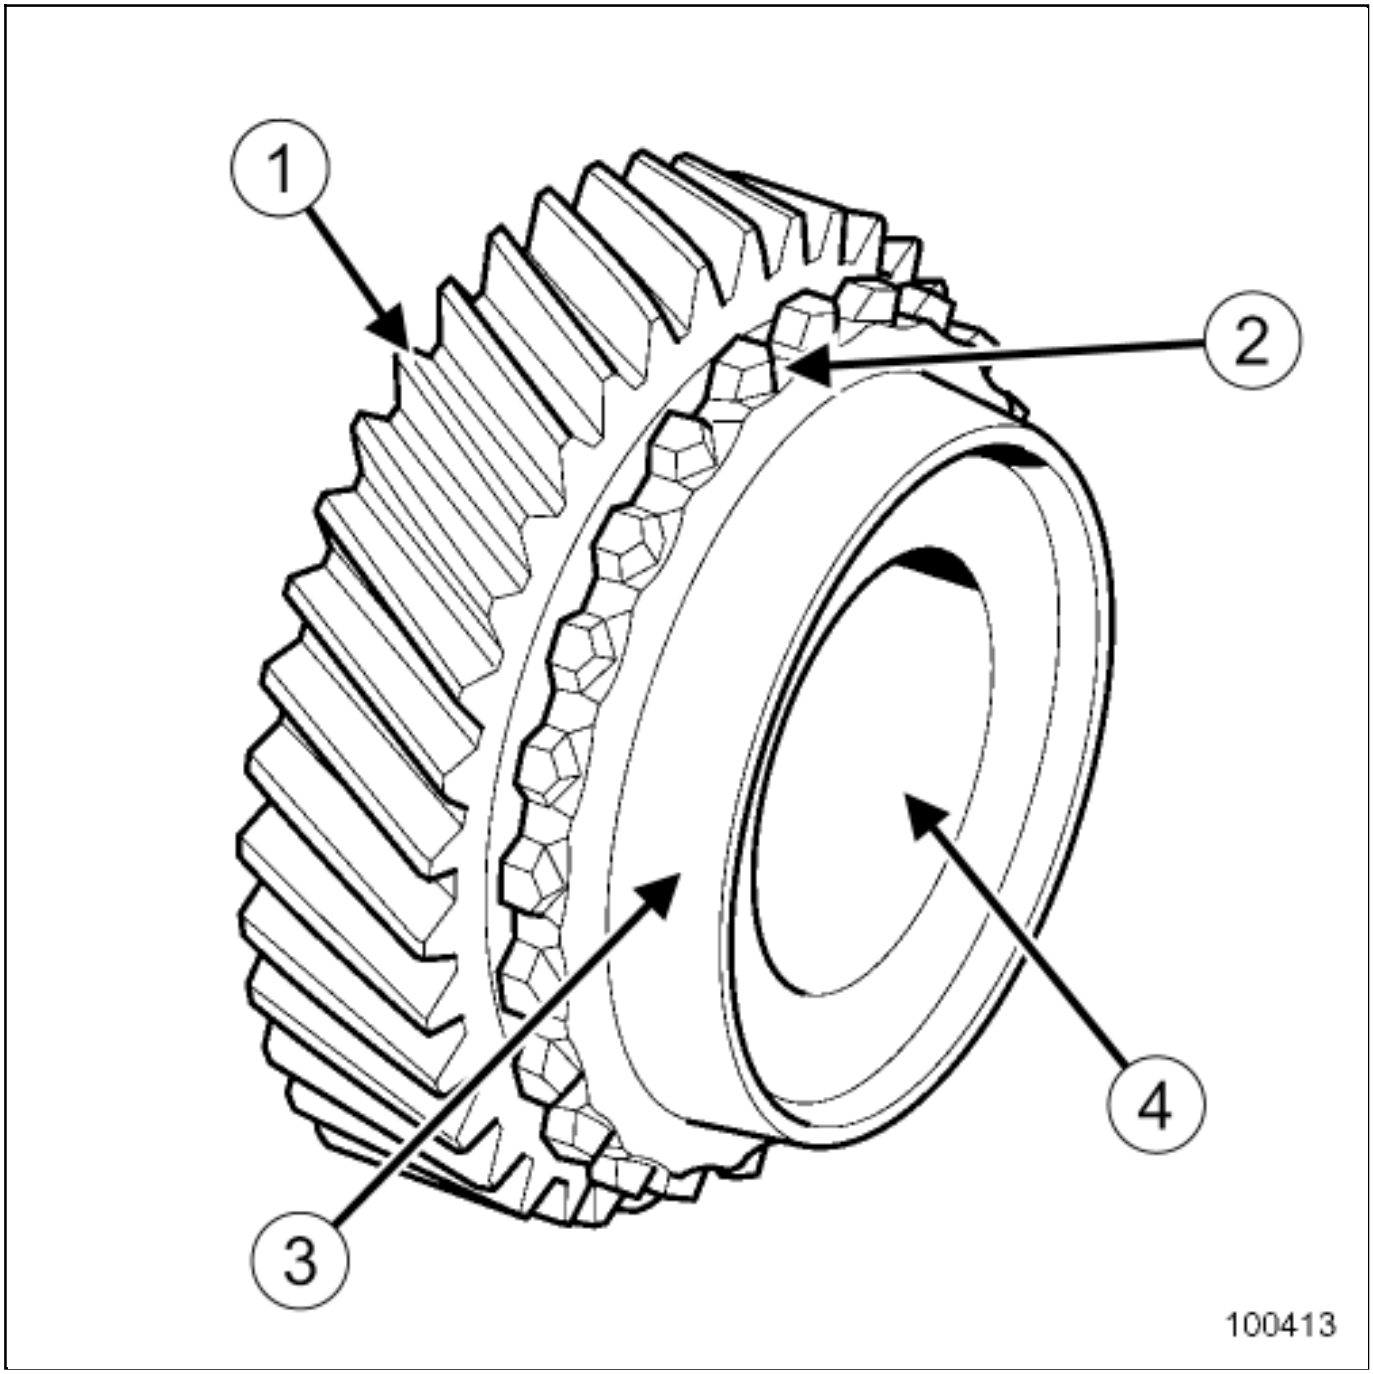
Remove:

- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,
- the gear engaged sensorGear engaged sensor: Removal - Refitting ,
- the speed sensorsSpeed sensor: Removal - Refitting ,
- the automatic transmission computerAutomatic gearbox computer : Removal - Refitting ,
- the clutch pressure plateClutch: Removal - Refitting ,
- the clutch actuator motorsClutch actuator motor: Removal - Refitting ,
- the clutch thrust bearingClutch thrust bearing: Removal - Refitting ,

- the clutch forks Clutch fork: Removal - Refitting ,
- the input shaft lip seal Input shaft lip seal: Removal - Refitting ,
- the clutch housing (see 23A, Automatic gearbox , Clutch housing: Removal - Refitting) ,
- the automatic gearbox differential (see 23A, Automatic gearbox , Automatic gearbox differential: Removal - Refitting) ,
- the gearbox control forks (see 23A, Automatic gearbox , Gear box control fork: Removal - Refitting) ,
- the gearbox shafts (see 23A, Automatic gearbox , Gearbox shaft: Removal - Refitting) ,
- the mechanism housing (see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting) ,
- the automatic gearbox differential bearings (see 23A, Automatic gearbox , Automatic gearbox differential bearing: Removal - Refitting) ,
- the mechanism housing bearings(see) ,
- the clutch housing bearings (see 23A, Automatic gearbox , Clutch housing bearing: Removal - Refitting) ,
- the fork shaft rings (see 23A, Automatic gearbox , Fork shaft ring: Removal - Refitting) .

Strip:

- the output shafts (see 23A, Automatic gearbox , Output shaft: Stripping - Rebuilding) ,
- the input shaft (see 23A, Automatic gearbox , Input shaft: Stripping - Rebuilding) .

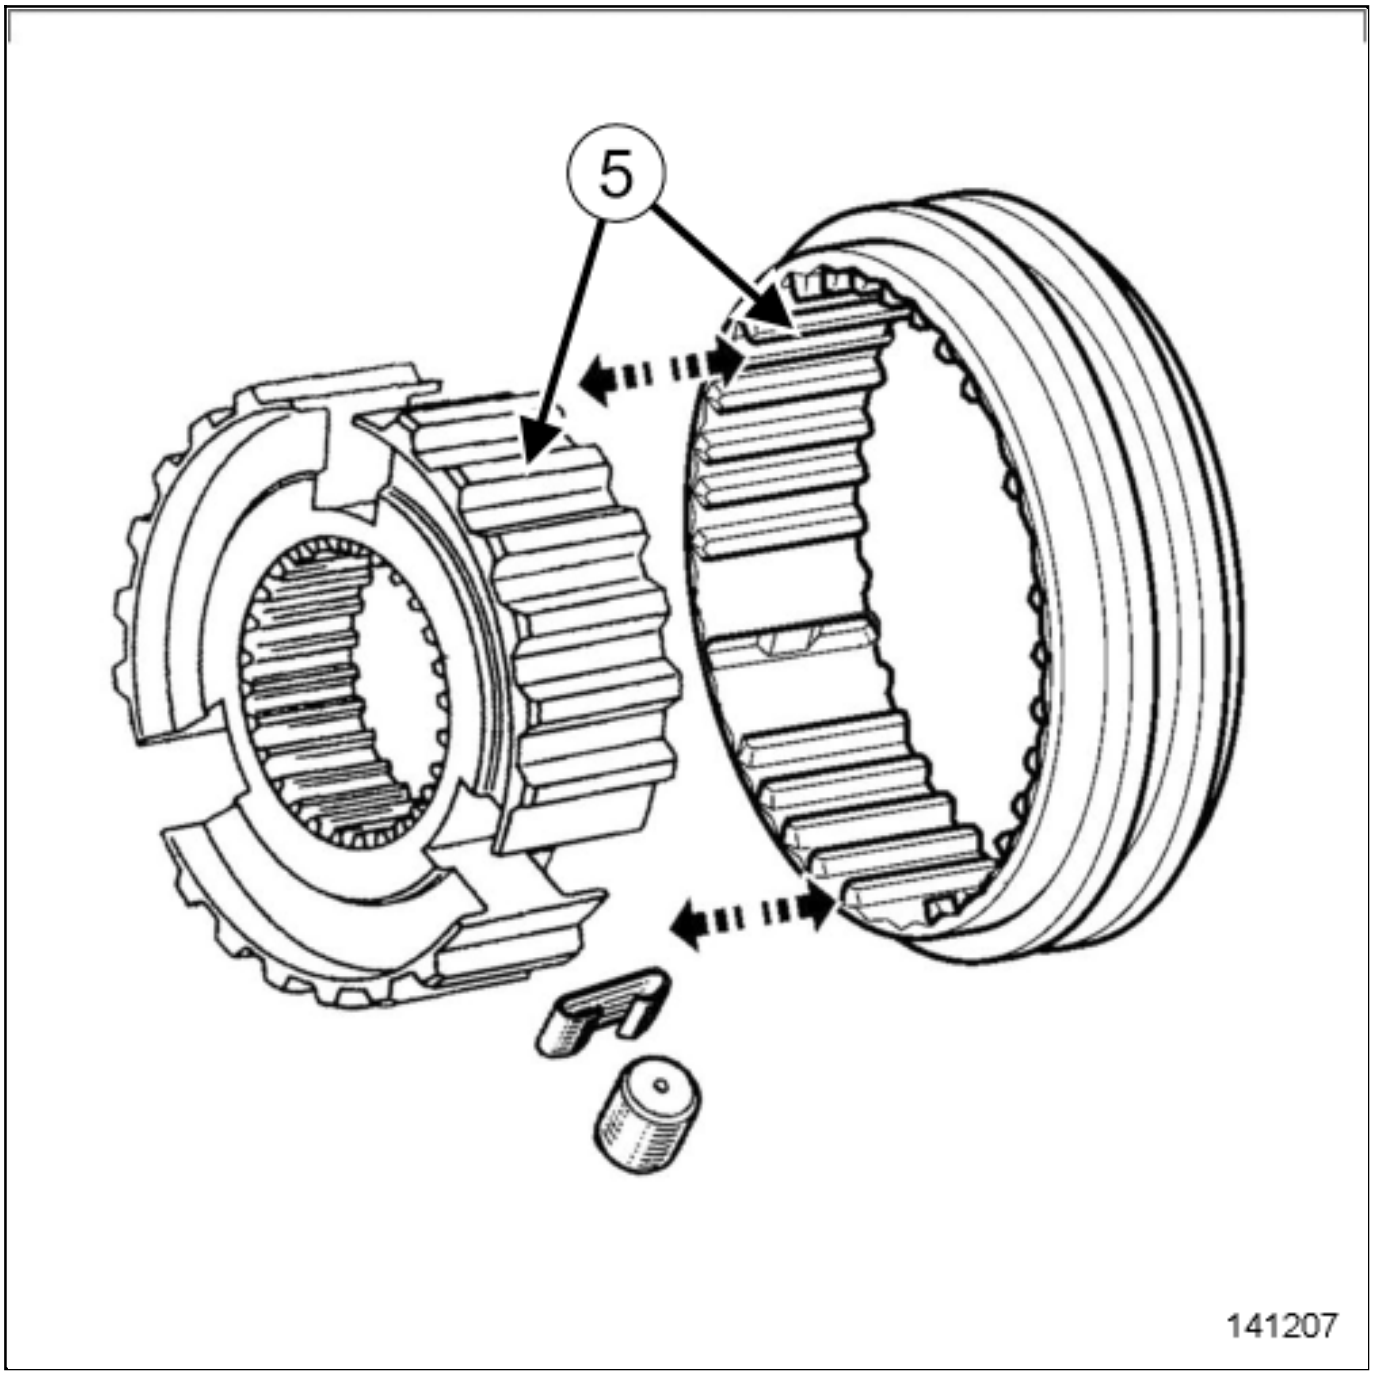


2. TEST OPERATION

Clean the parts carefully before any checks Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Note:

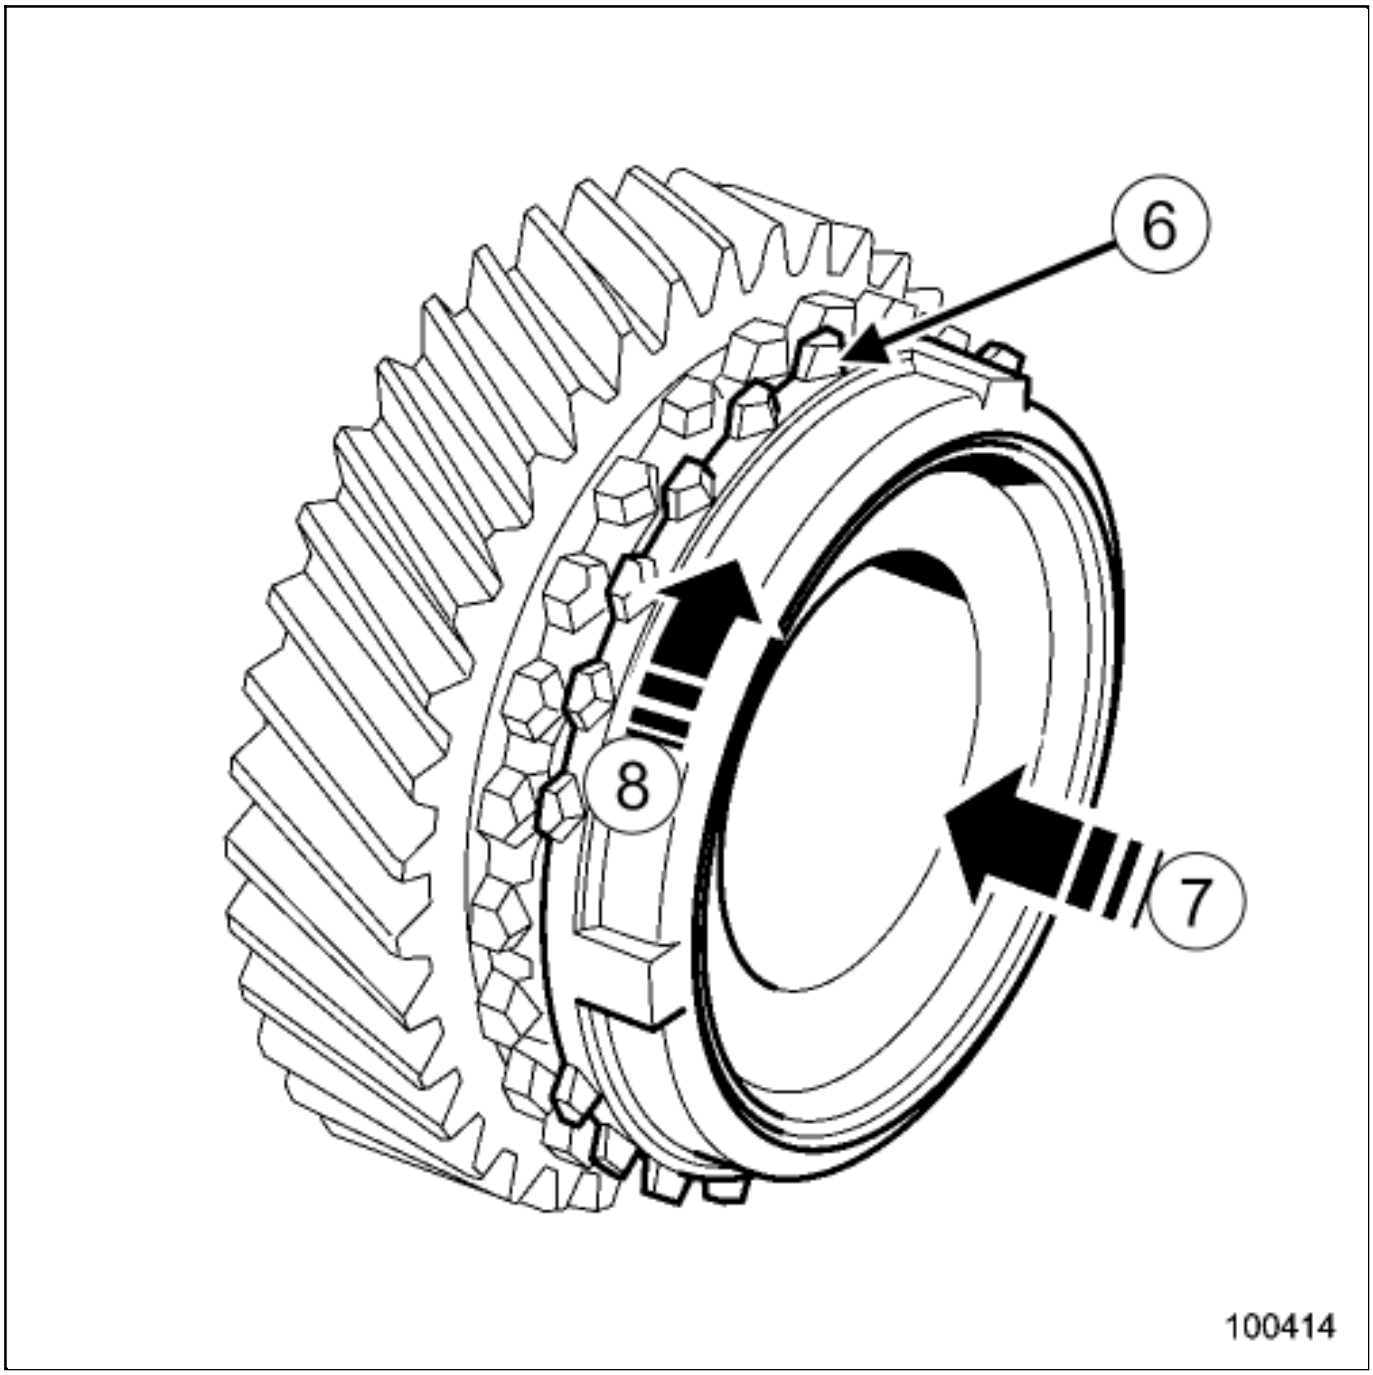
The check focuses mainly on visual appearance (wear, fracturing, cracks, scratches, hot spots, chipping, etc.).



1- PINION:

Check that:

- the teeth(1) are not chipped or broken,
- the claws(2) are not chipped or broken,
- the friction cones(3) show no sign of scratches or blue stains,
- the inner walls(4) show no sign of scratches, seizing or wear.



2- SYNCHRONISER HUB:

Check that:

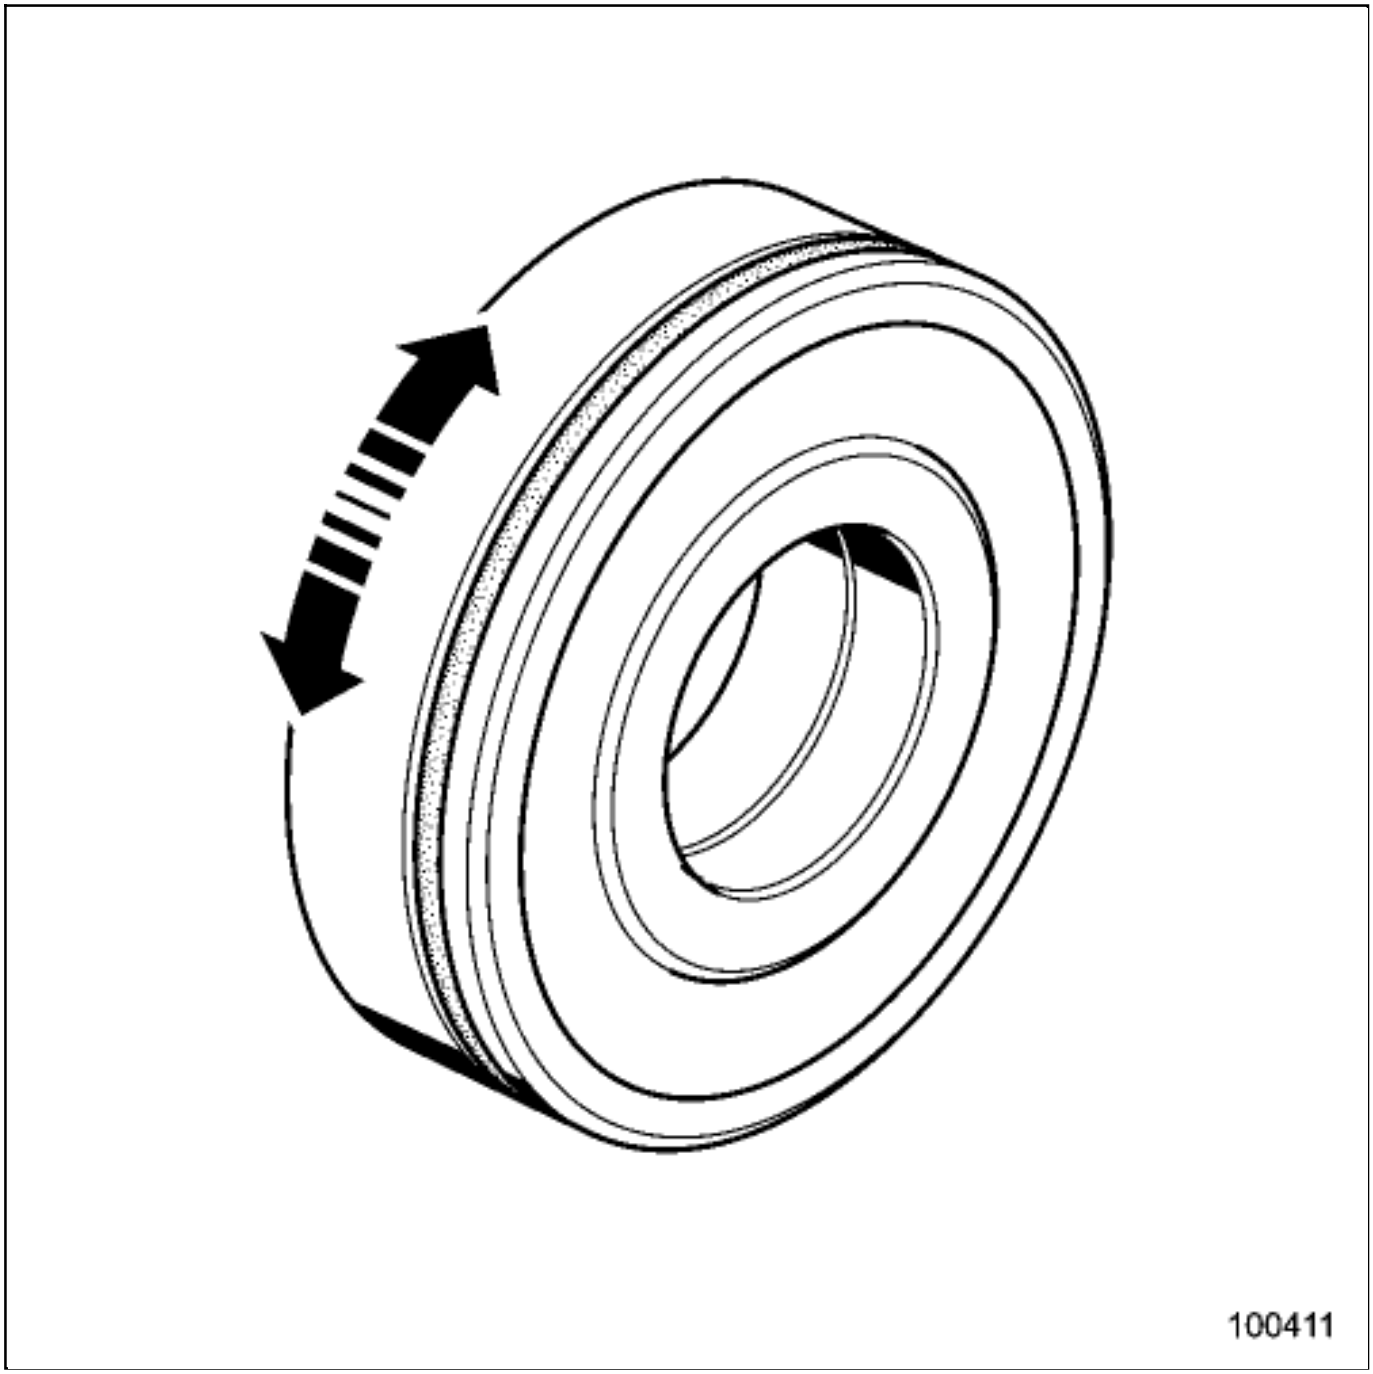
- the teeth(5) are not chipped or broken,
- both parts slide correctly,
- the locking ball.

3- SYNCHRONISING RING:

Check that:

- the teeth of the claws(**6**) are not worn, chipped or broken,
- the strip of the synchroniser ring is not worn.

Note:

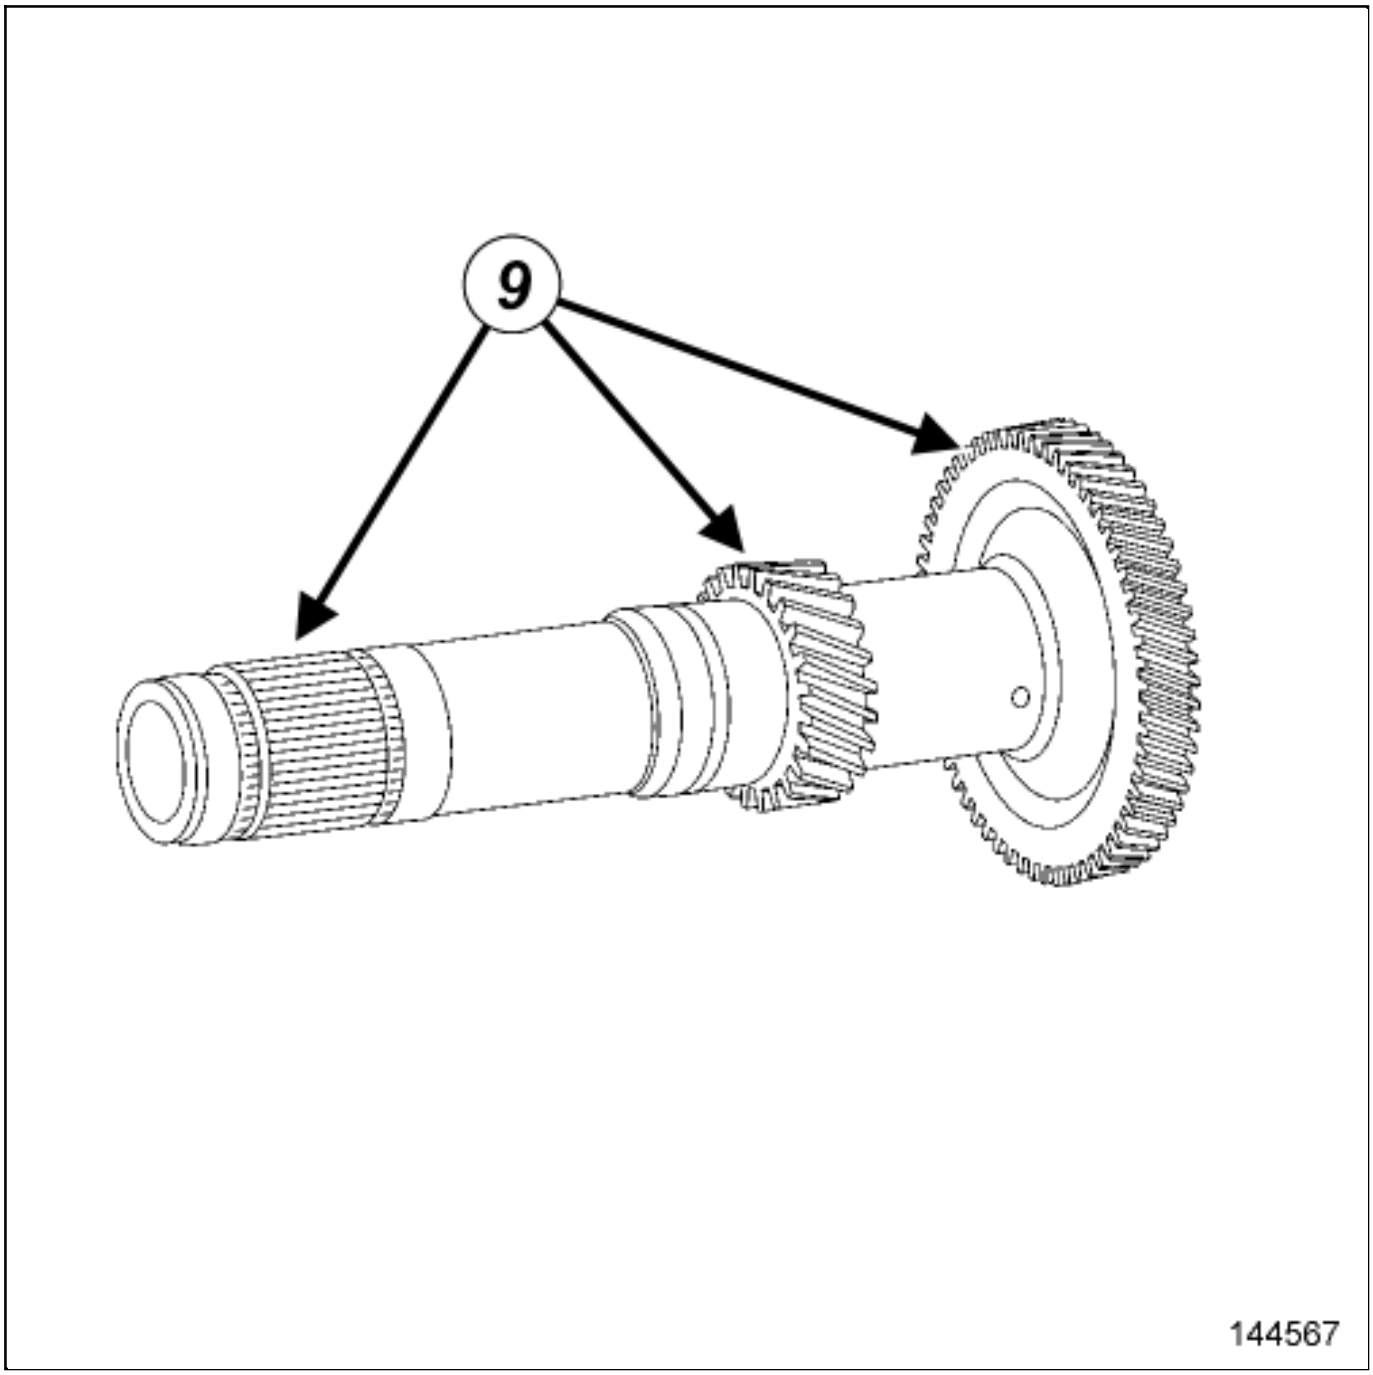


To check that the synchroniser ring is working correctly, push the ring(7) on the friction cone and rotate(8) : the ring should not turn.

Otherwise, replace the synchroniser ring.

4- BEARING:

Note:



The bearing check is only performed in the context of final fault finding confirmation as a bearing must be replaced whenever it is removed.

Check:

- that the bearing rotation is correct and does not make a noise,
- the lateral play.

5- SHAFTS

Check that:

- the teeth(9) are not worn, chipped or broken,
- the bearing mating faces do not show signs of scratches, wear or blue stains.

3. FINAL OPERATION

Proceed in the reverse order to the preparation operation for the check.

Repair-12x07x01-01x58-1-1-1.xml

XSL version : 3.02 du 22/07/11

AUTOMATIC GEARBOX COMPUTER : REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,

Vehicle: Precautions for the repair .

The DC4 gearbox has a computer which includes two actuator motors for the gear shift drums.

Note:

Do not touch the metal contacts of the computer - an electrostatic discharge can damage the shift drum actuator motors.

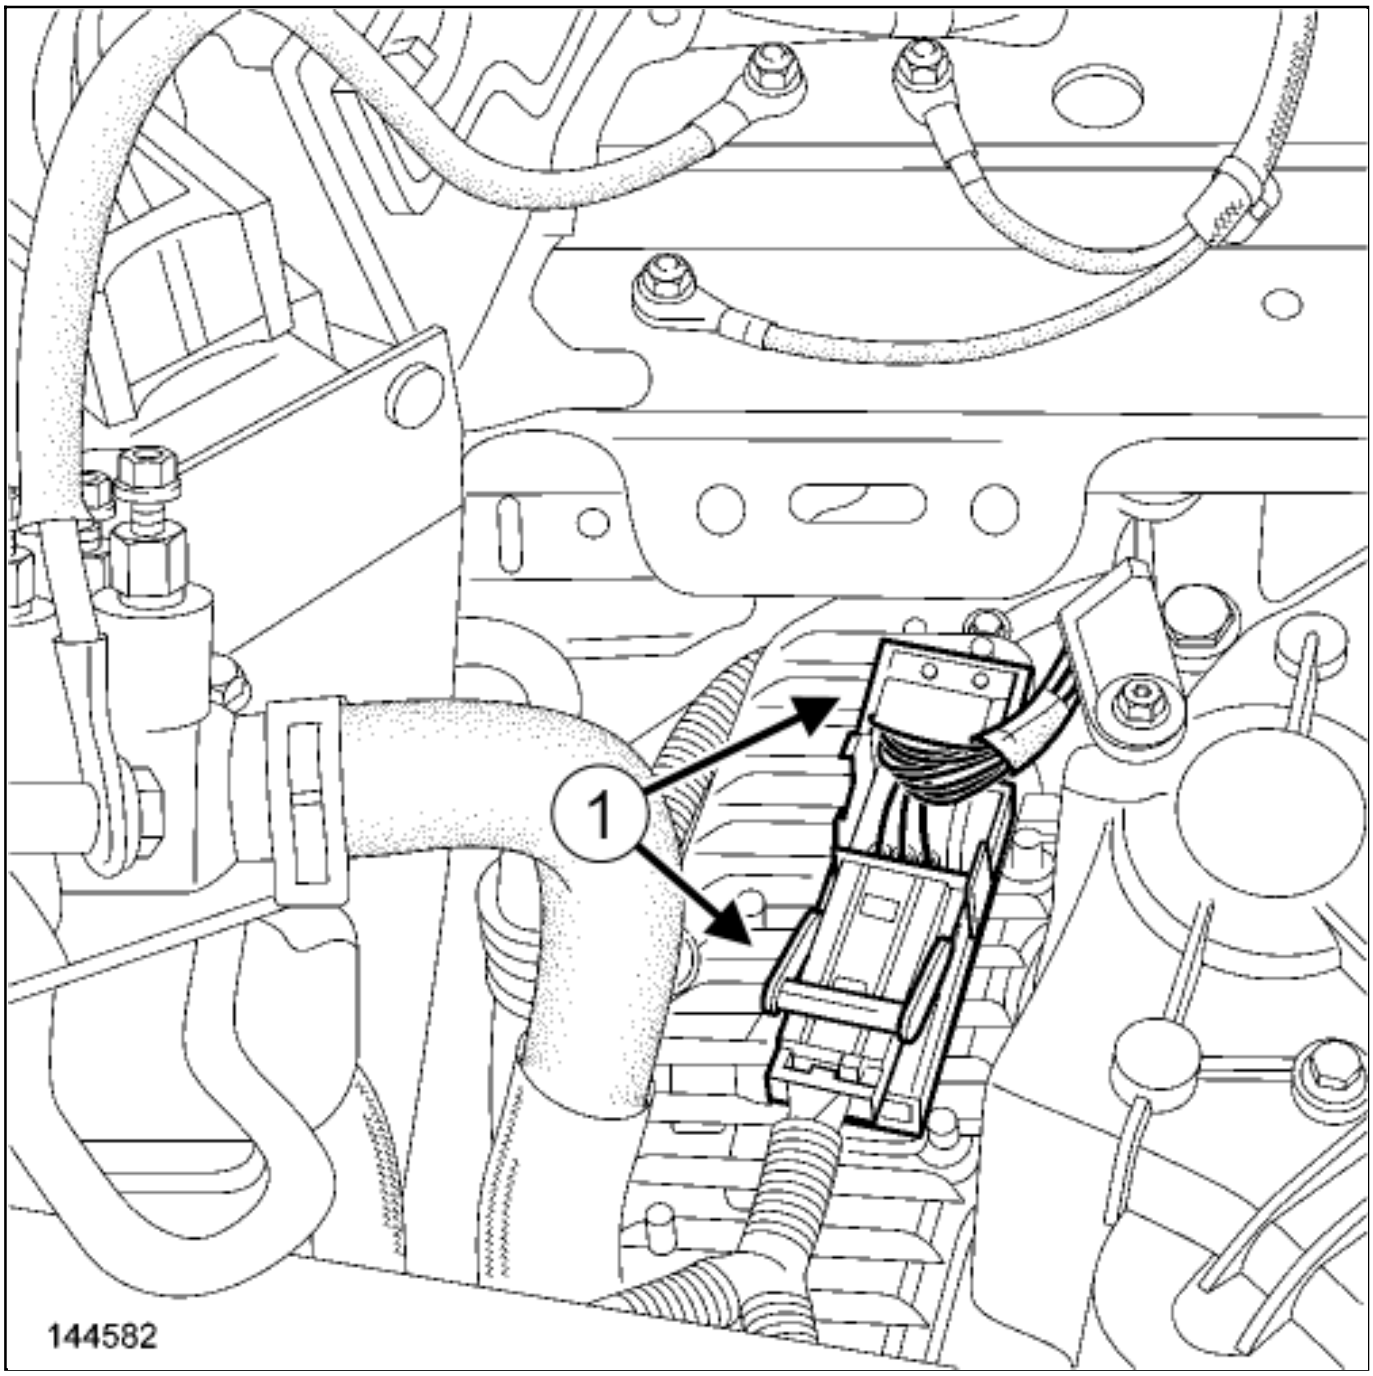
REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

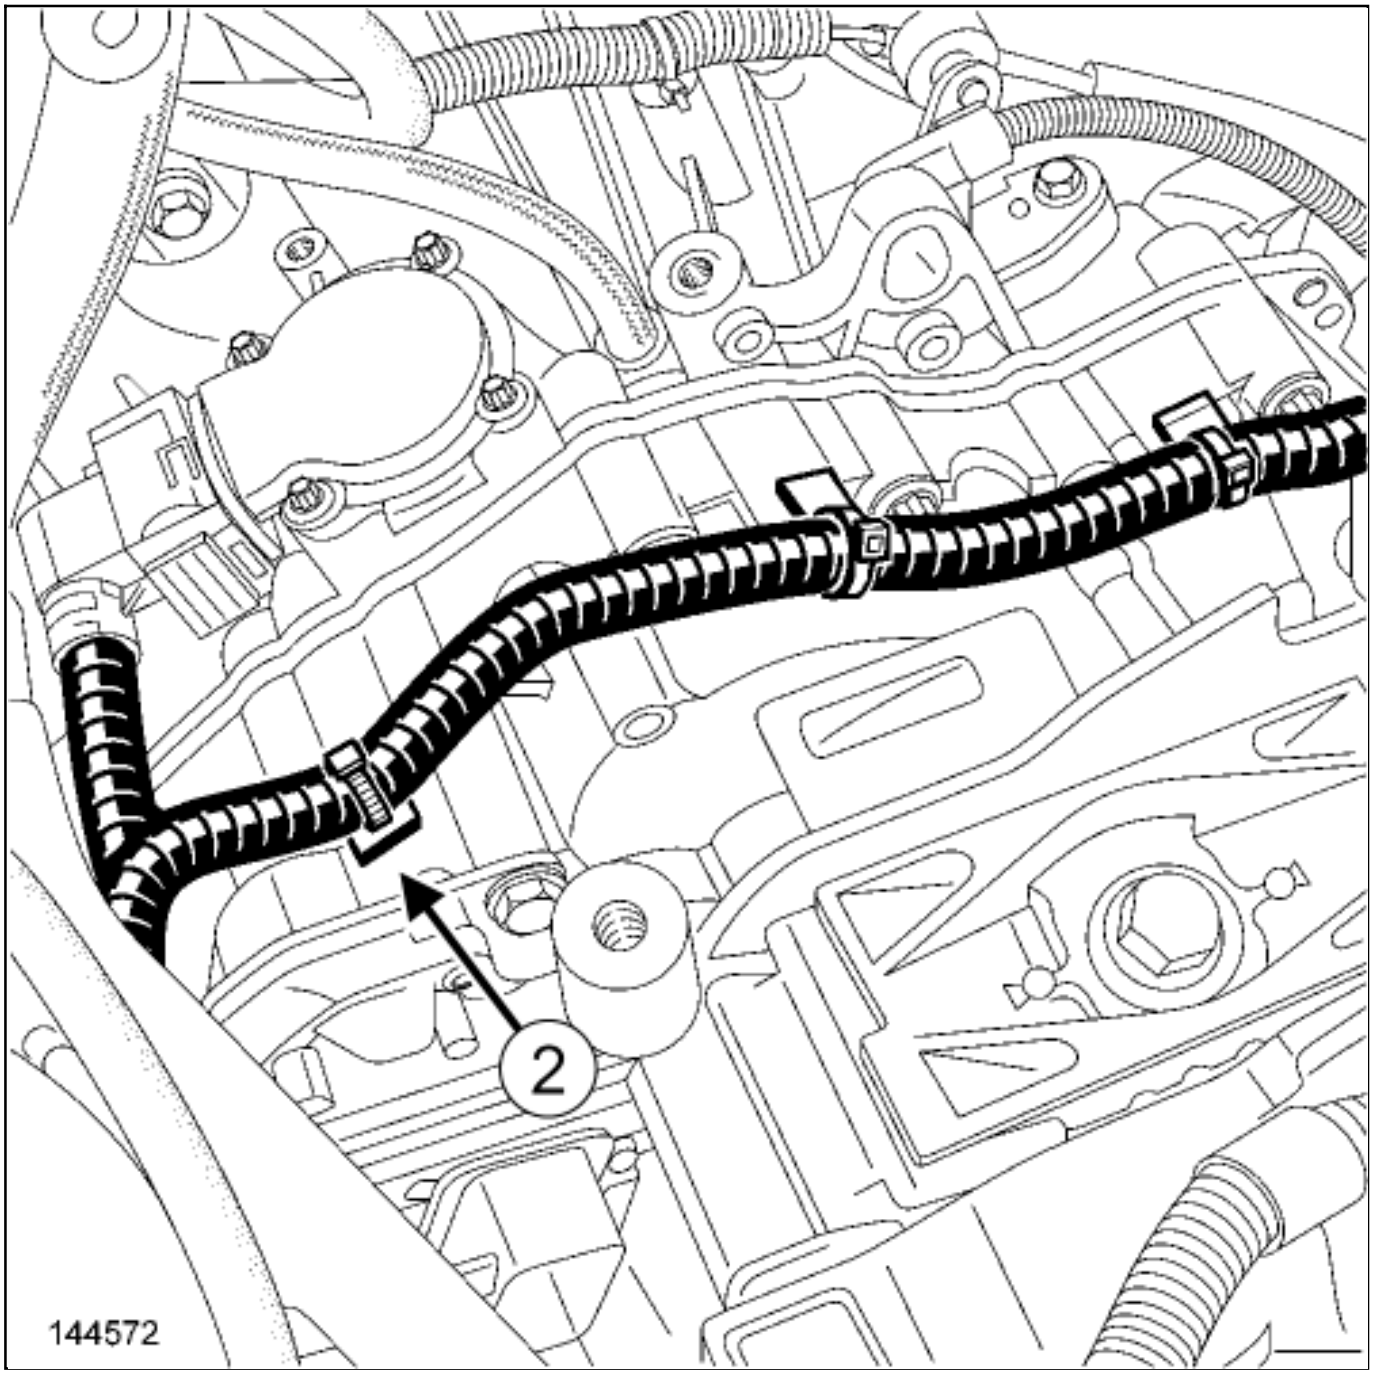
In the event of replacement, apply the Before repair procedure using the Diagnostic tool Diagnostic tool : Use :

-Computer concerned by the Before repair procedure:

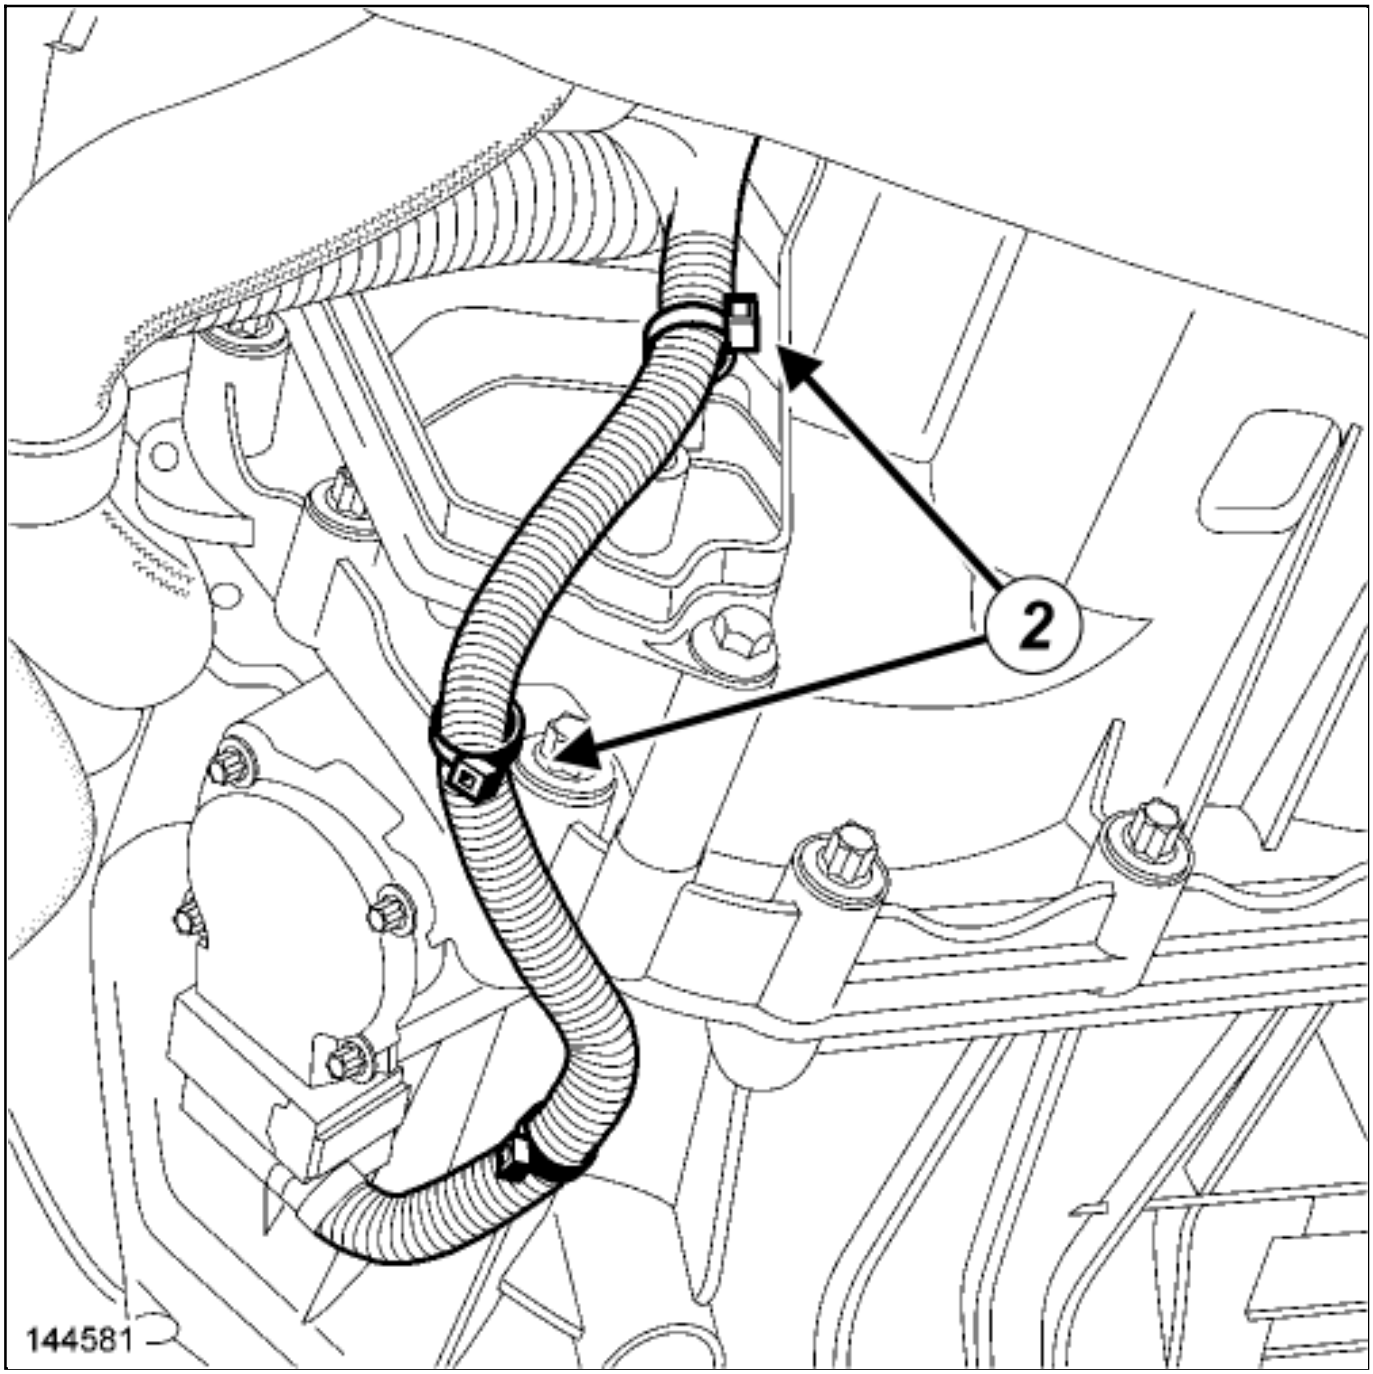


"Automatic gearbox computer" .

Disconnect the battery Battery: Removal - Refitting .

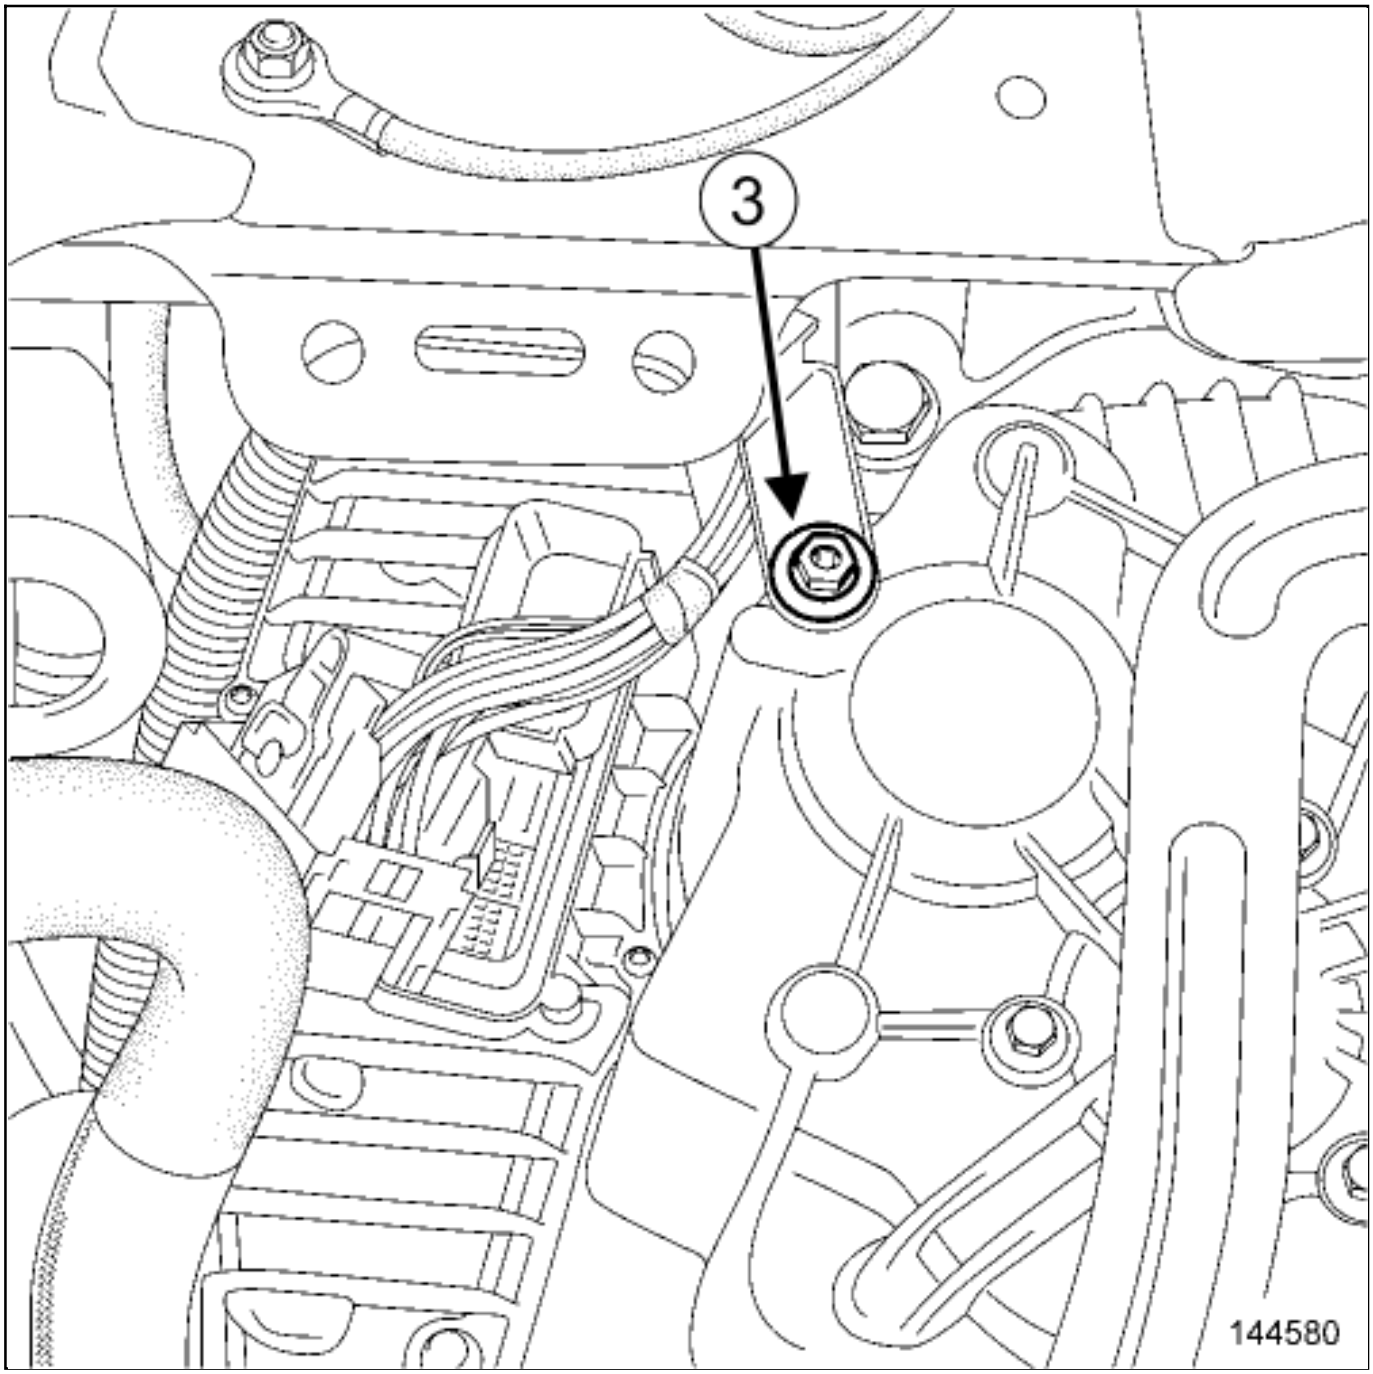


Remove:



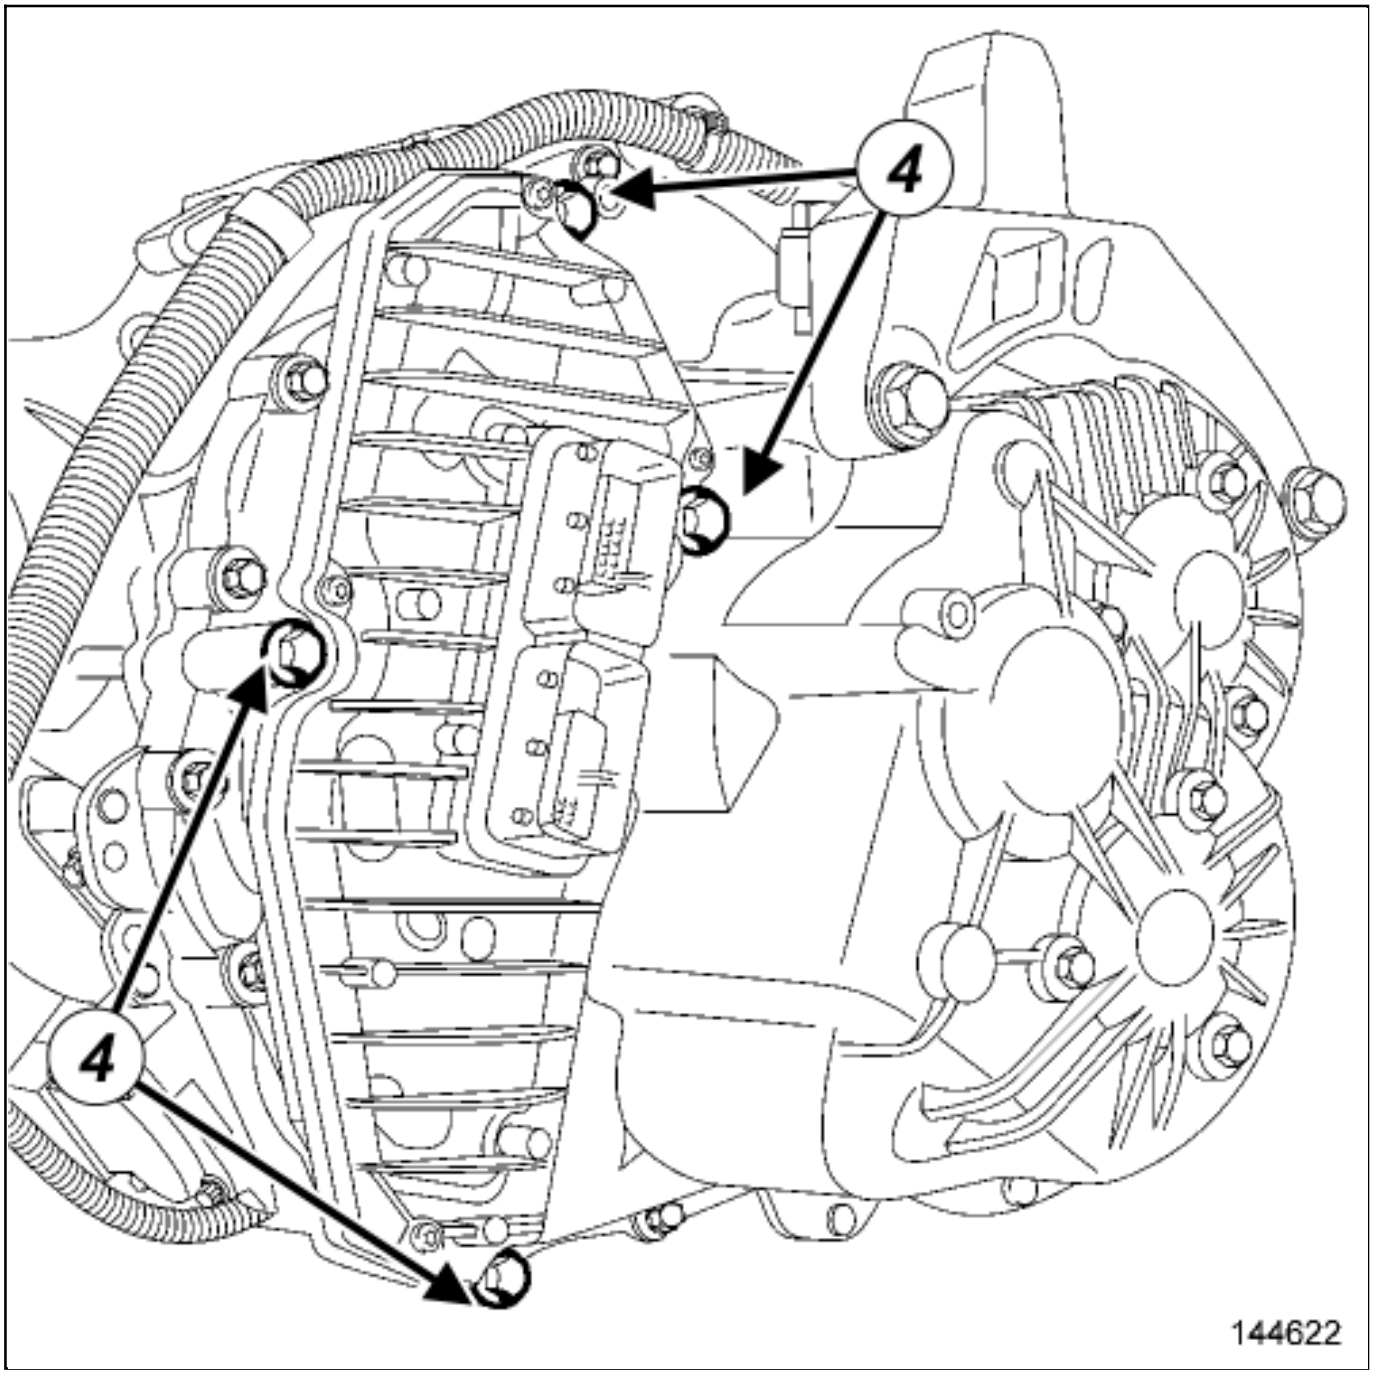
- the front left-hand wheel Front hub carrier assembly: Exploded view ,
- the front section of the front left-hand wheel arch liner Exterior body front trim assembly: Exploded view ,
- the engine undertray.

2. REMOVAL OPERATION



Disconnect the connectors(1) from the gearbox computer.

2
144572



- Unclip the gearbox wiring at(2) .

- Move aside the gearbox wiring.

- Remove the engine wiring bolt(3) .

- Move aside the engine wiring.

Remove:

- the gearbox computer bolts(4) ,
- the gearbox computer.

REFITTING

1. REFITTING PREPARATION OPERATION

Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint faces of:

- the gearbox computer,
- the gearbox casing.

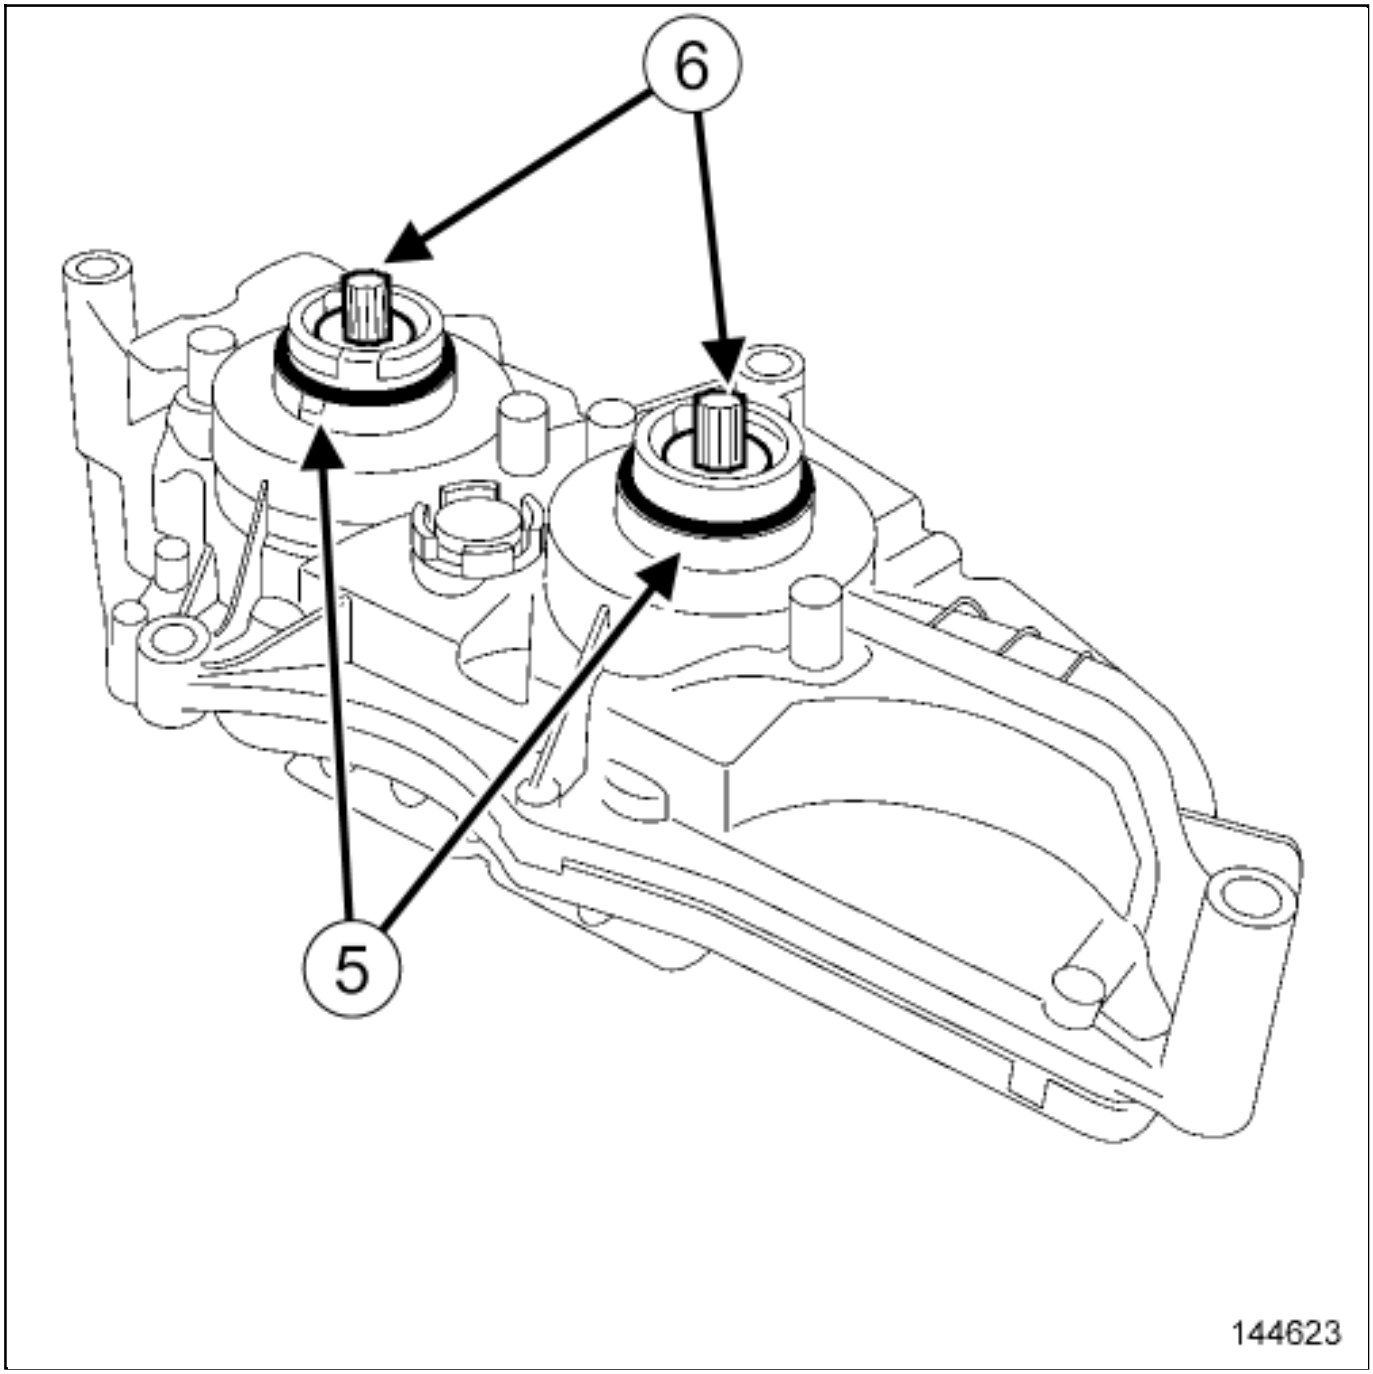
Always replace:

- the gearbox computer seals,
- the retaining clips of the gearbox wiring, if necessary.

2. REFITTING OPERATION

Note:

The computer must fit easily into its housing without forcing it.



The computer cannot be tightened unless it is exactly in position.

To facilitate refitting, it is sometimes necessary to turn the motor shafts manually so that the shaft splines match the splines of the gear shift drum pinions.

Fit the gearbox computer without its seals in order to pre-position the actuator motor splines in relation to the gear shift drums.

Turn the splines(6) if necessary in case of difficulty fitting the gearbox computer.

Remove the gearbox computer.

- Fit new seals(5) for the gearbox computer.
- Refit the gearbox computer fitted with new seals.
- Visually inspect its position before tightening.

Torque tighten the gearbox computer bolts23 N.m.

Fit the engine wiring.

Refit the engine wiring bolt.

Clip on the gearbox wiring.

Connect the connectors of the gearbox computer.

Reclip the locks of the two connectors.

Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the After repair procedure using the Diagnostic toolDiagnostic tool : Use :
-Computer concerned by the After repair procedure:

"Automatic gearbox computer" .

AUTOMATIC GEARBOX DIFFERENTIAL BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306

parts always to be replaced:

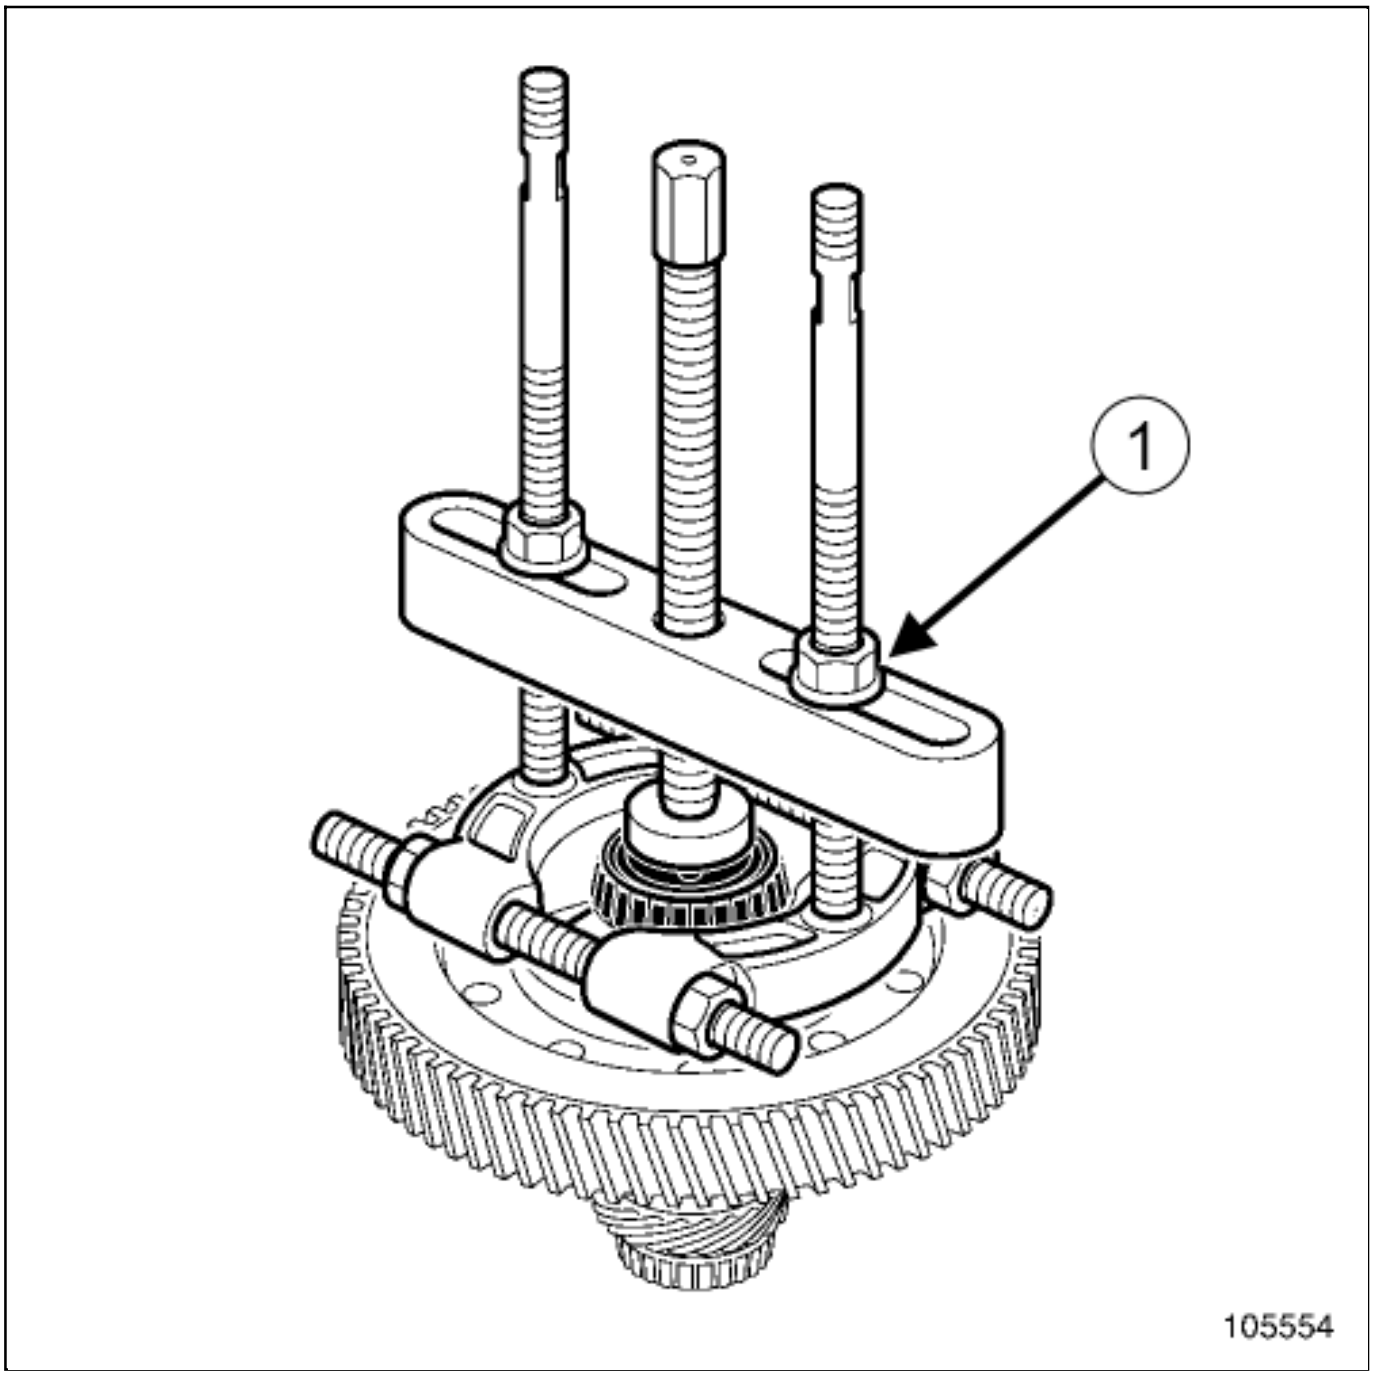
- Clutch housing bearing
- Mechanism housing bearing
- Automatic gearbox differential bearing

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

REMOVAL



1. REMOVAL PREPARATION OPERATION

Remove:

- the automatic gearbox Automatic gearbox: Removal - Refitting ,

- the automatic gearbox wiring **Automatic gearbox wiring: Removal - Refitting** ,
- the speed sensors **Speed sensor: Removal - Refitting** ,
- the gear engaged sensor **Gear engaged sensor: Removal - Refitting** ,
- the automatic transmission computer **Automatic gearbox computer : Removal - Refitting** ,
- the clutch pressure plate **Clutch: Removal - Refitting** ,
- the clutch actuator motors **Clutch actuator motor: Removal - Refitting** ,
- the clutch thrust bearing **Clutch thrust bearing: Removal - Refitting** ,
- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** .
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** ,
- the automatic gearbox differential **(see 23A, Automatic gearbox , Automatic gearbox differential: Removal - Refitting)** .

2. OPERATION FOR REMOVAL OF PART CONCERNED

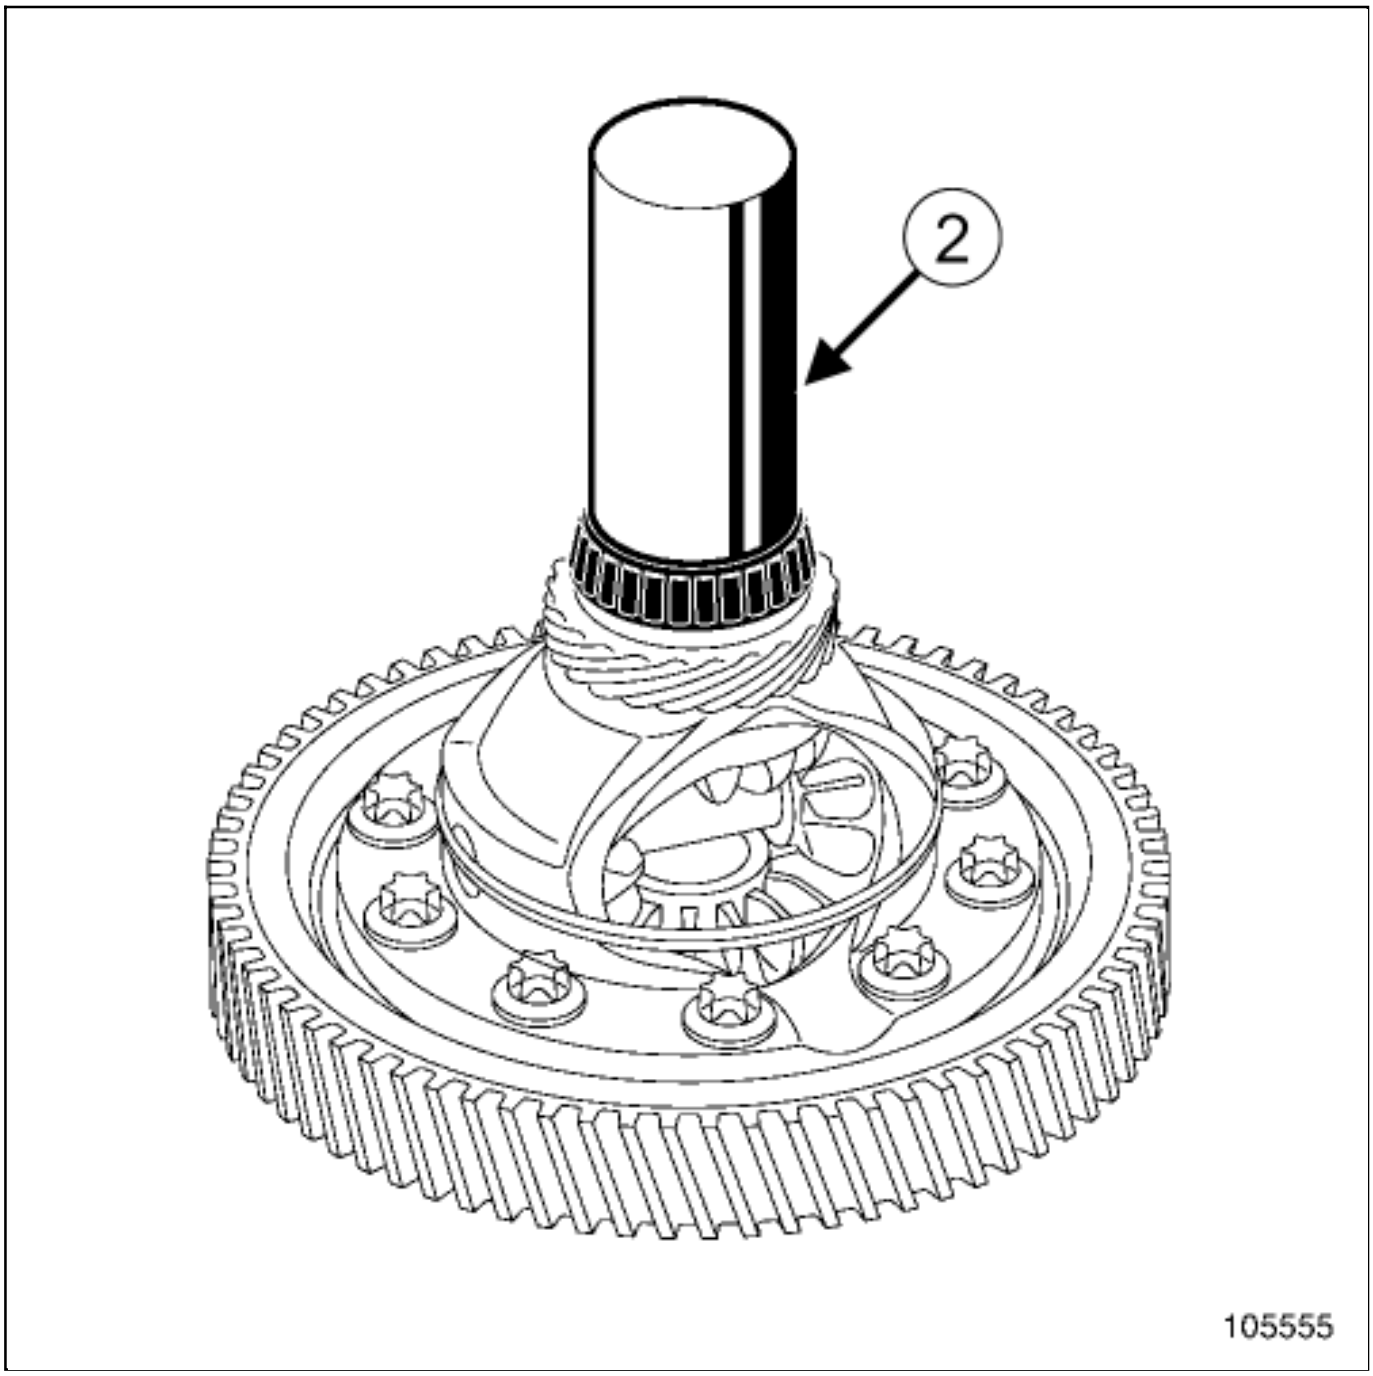
Remove the differential bearings using a bearing extractor(1) .

REFITTING

1. REFITTING PREPARATION OPERATION

Clean:

-



- all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products),
- the joint face of the automatic gearbox casings Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

parts always to be replaced: Clutch housing bearing .

parts always to be replaced: Mechanism housing bearing .

parts always to be replaced: Automatic gearbox differential bearing .

2. REFITTING OPERATION FOR PART CONCERNED

Refit the differential bearings using the toolDC4 gearbox internal renovation kit(Bvi. 1956) (2) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Repair-12x07x02x42-01x37-1-1-1.xml

XSL version : 3.02 du 22/07/11

AUTOMATICGEARBOXDIFFERENTIAL:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** .

2. REMOVAL OPERATION

Remove the differential(1) .

Note:

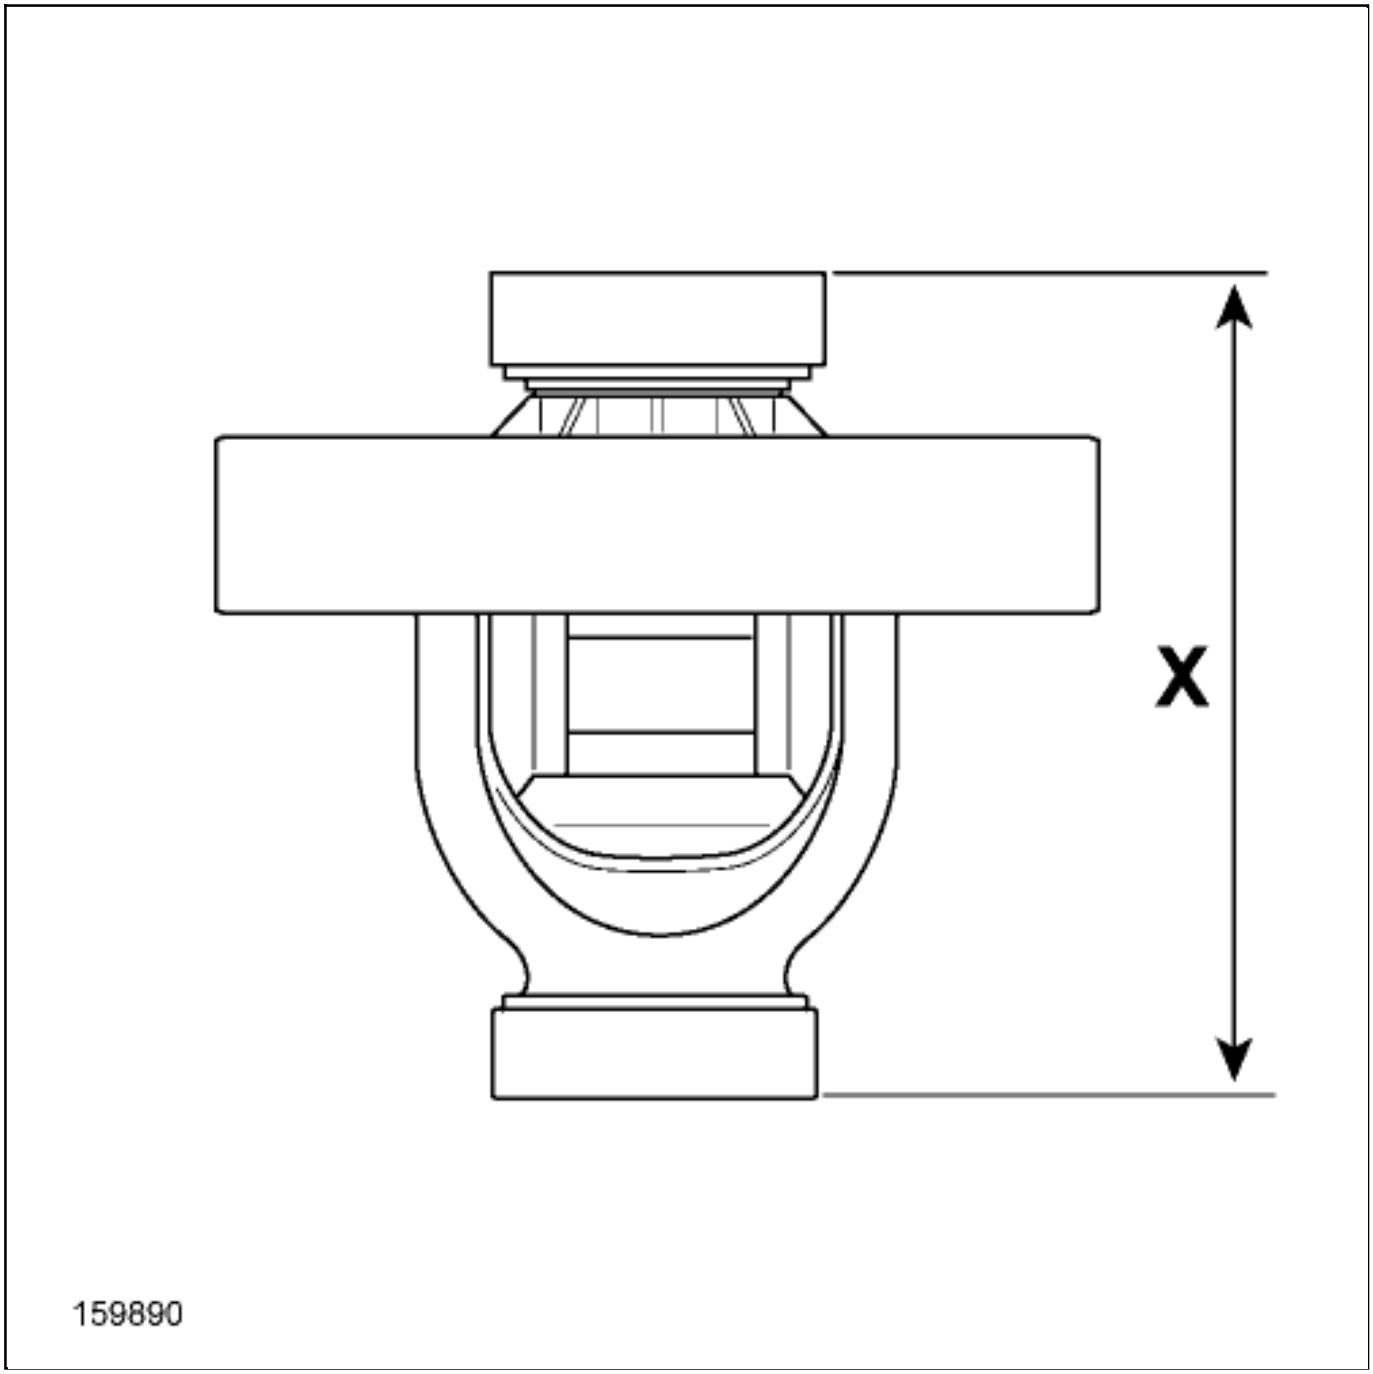
Measure the differential if it must be remplaced.

The choice blocks for new differential will by comparing dimension between the old and the new differential.

Remove the bearings side with an extractor

REFITTING

1. REFITTING PREPARATION OPERATION



Clean all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Parts always to be replaced:

- the differential bearings.

2. REFITTING OPERATION

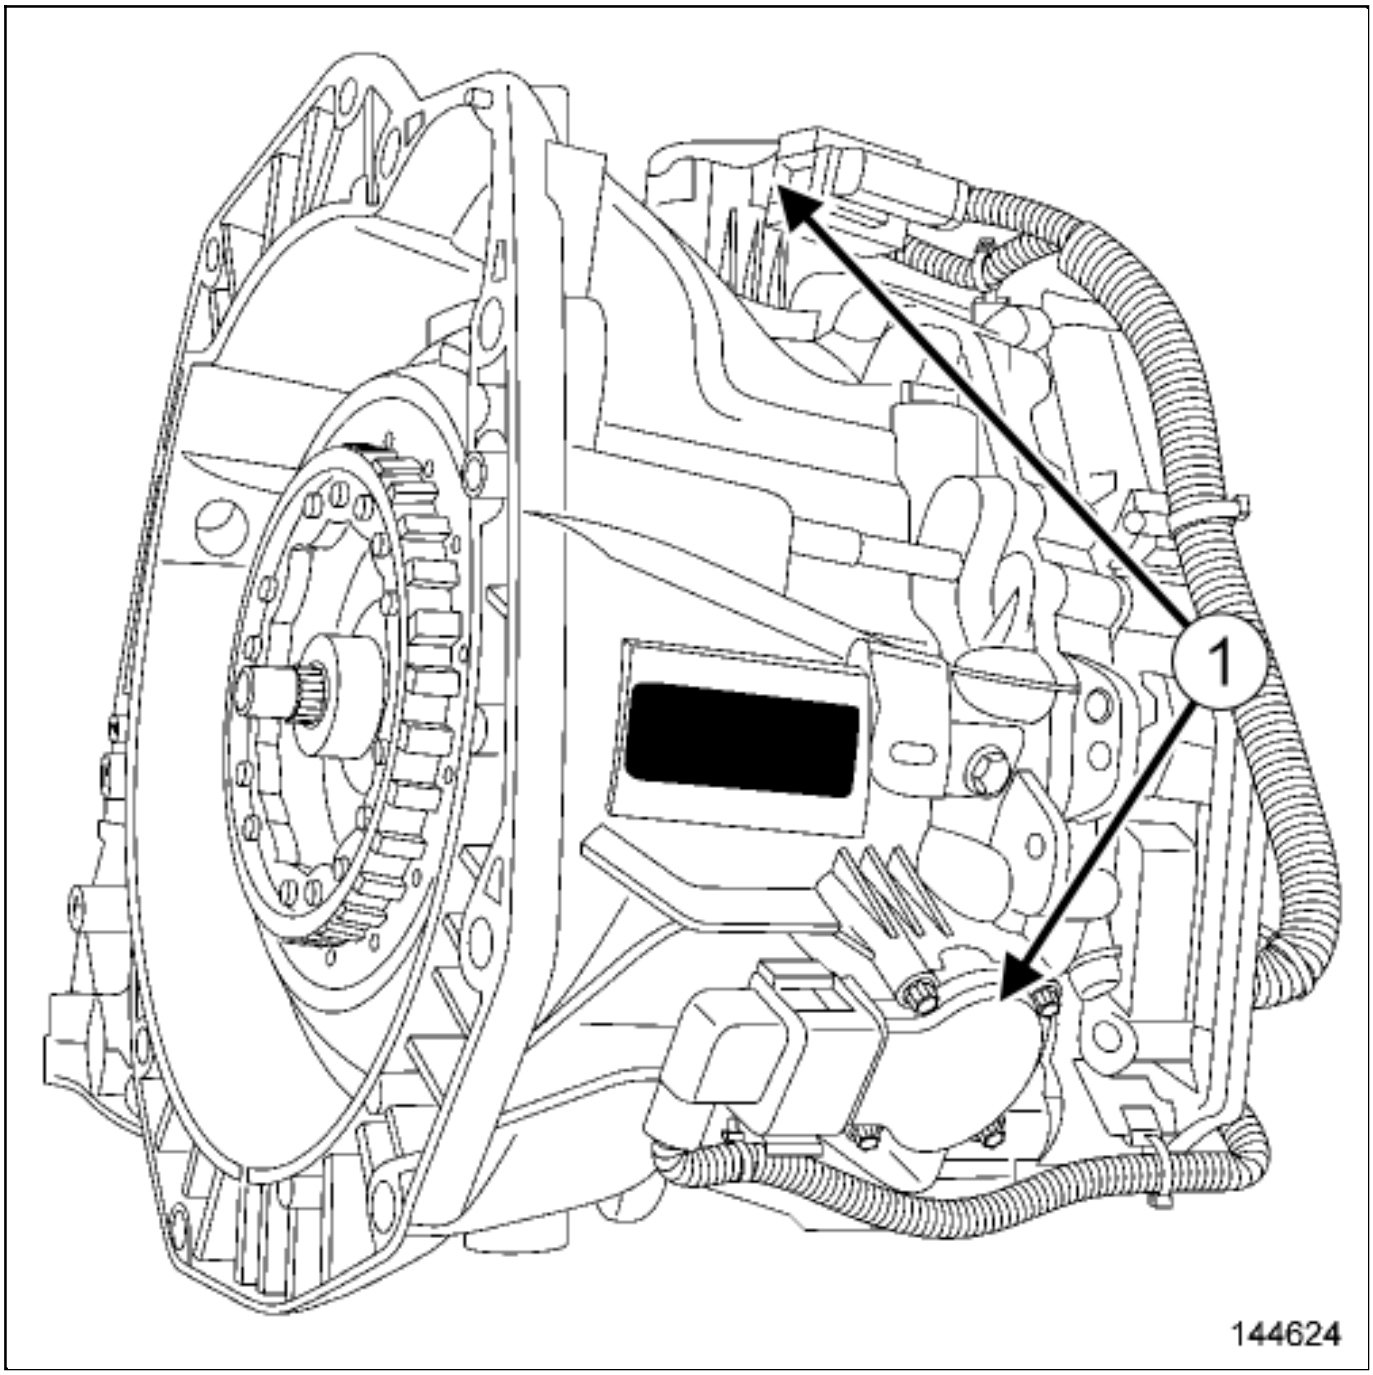
Refit the bearings with a press, applying pressure using the toolDC4 gearbox internal renovation kit (Bvi. 1956)

Measure the differential in X..

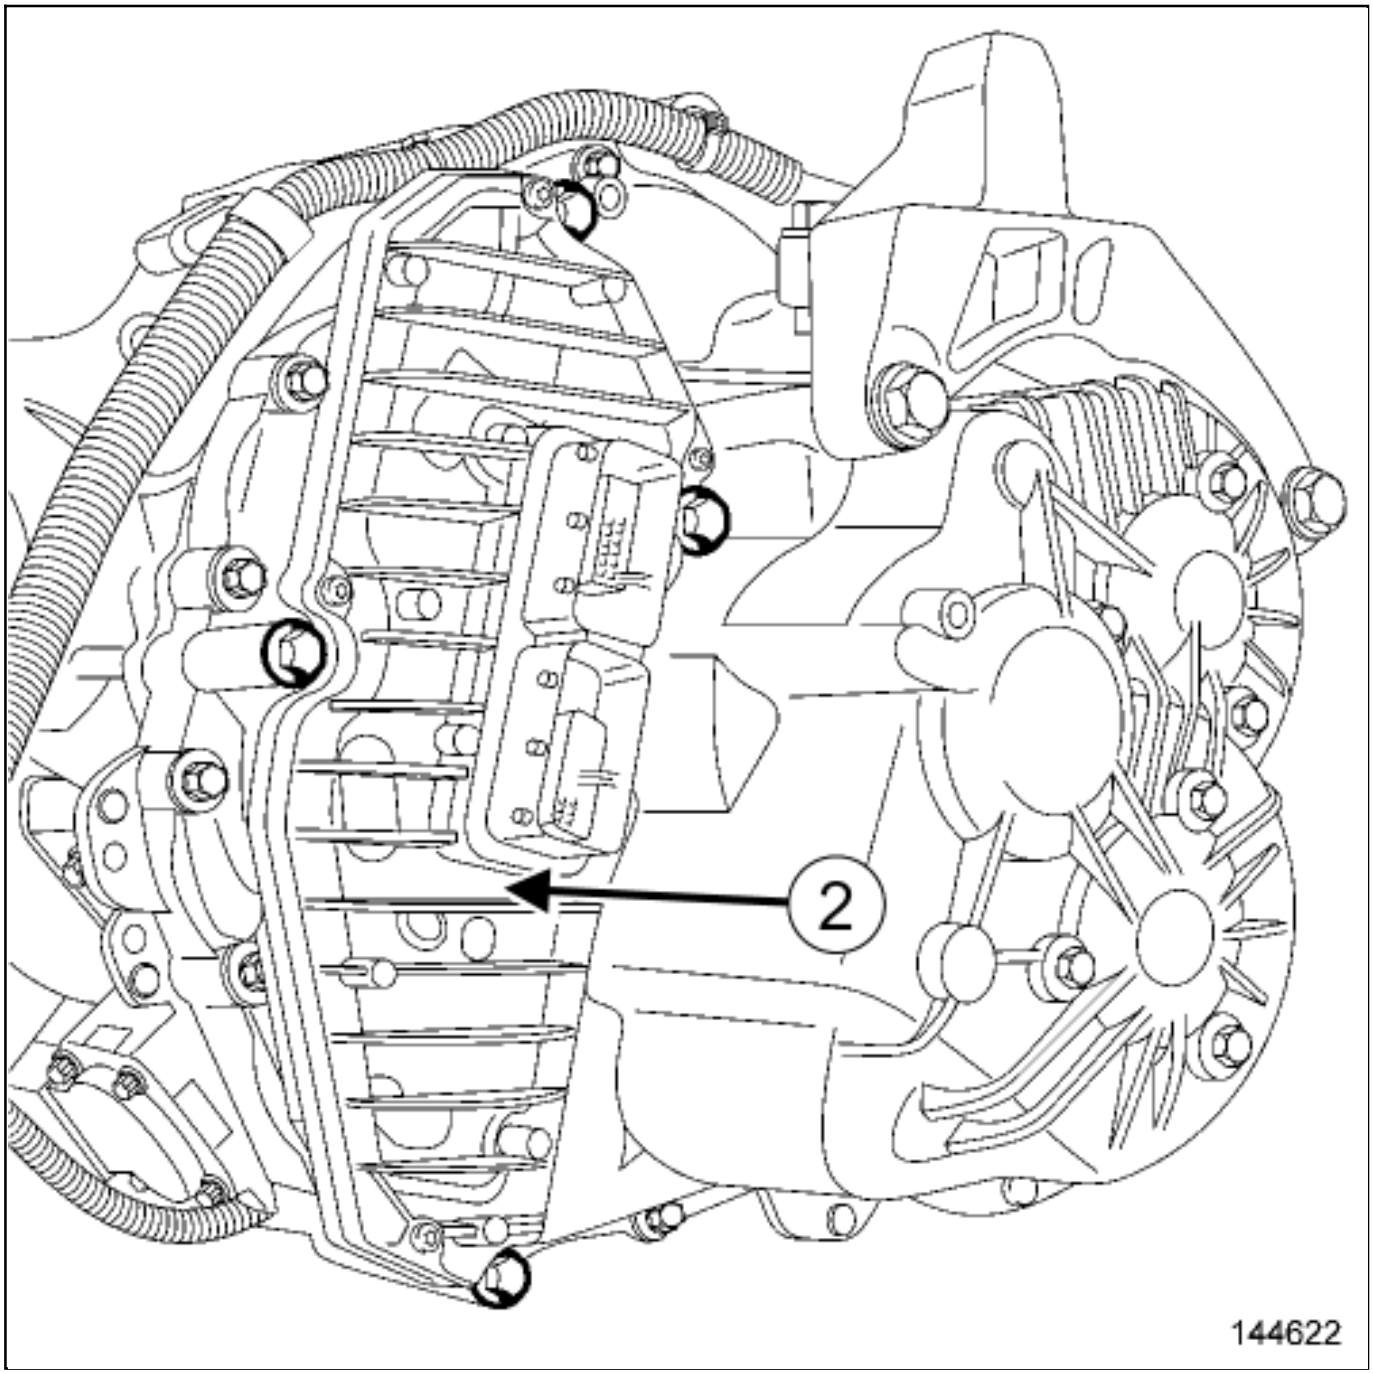
Note:

If the dimension X is the same, using the olds blocks.

If the dimension X is different, fit the blocks appropriate to recover the dimension of the old shaft.



Refit the differential.



3. FINAL OPERATION

Proceed in the reverse order to removal.

AUTOMATIC GEARBOX OIL: DRAINING - FILLING

Note, one or more warnings are present in this procedure

Equipment required
oil recovery tray

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

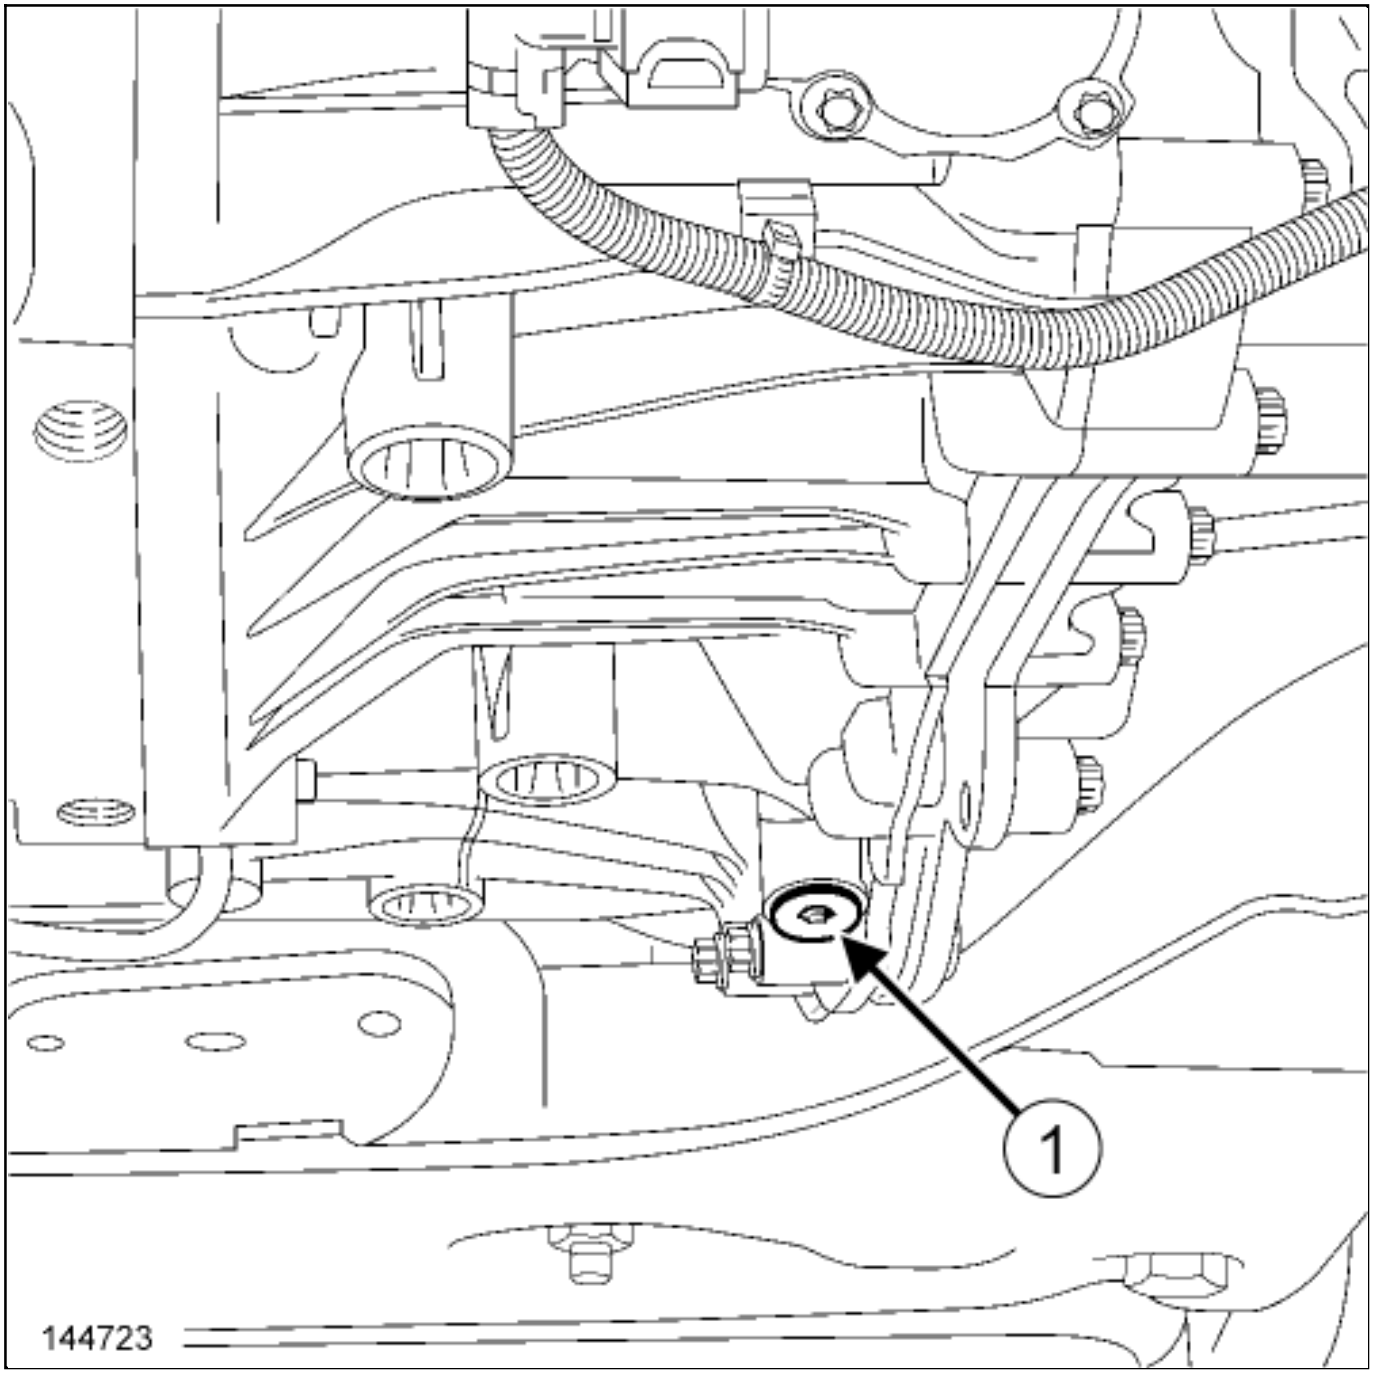
WARNING

Wear leaktight gloves (Nitrile type) for this operation.

Sequential gearbox	Capacity (L)
DC4	1.7

DRAINING

1. DRAINING PREPARATION OPERATION



Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .

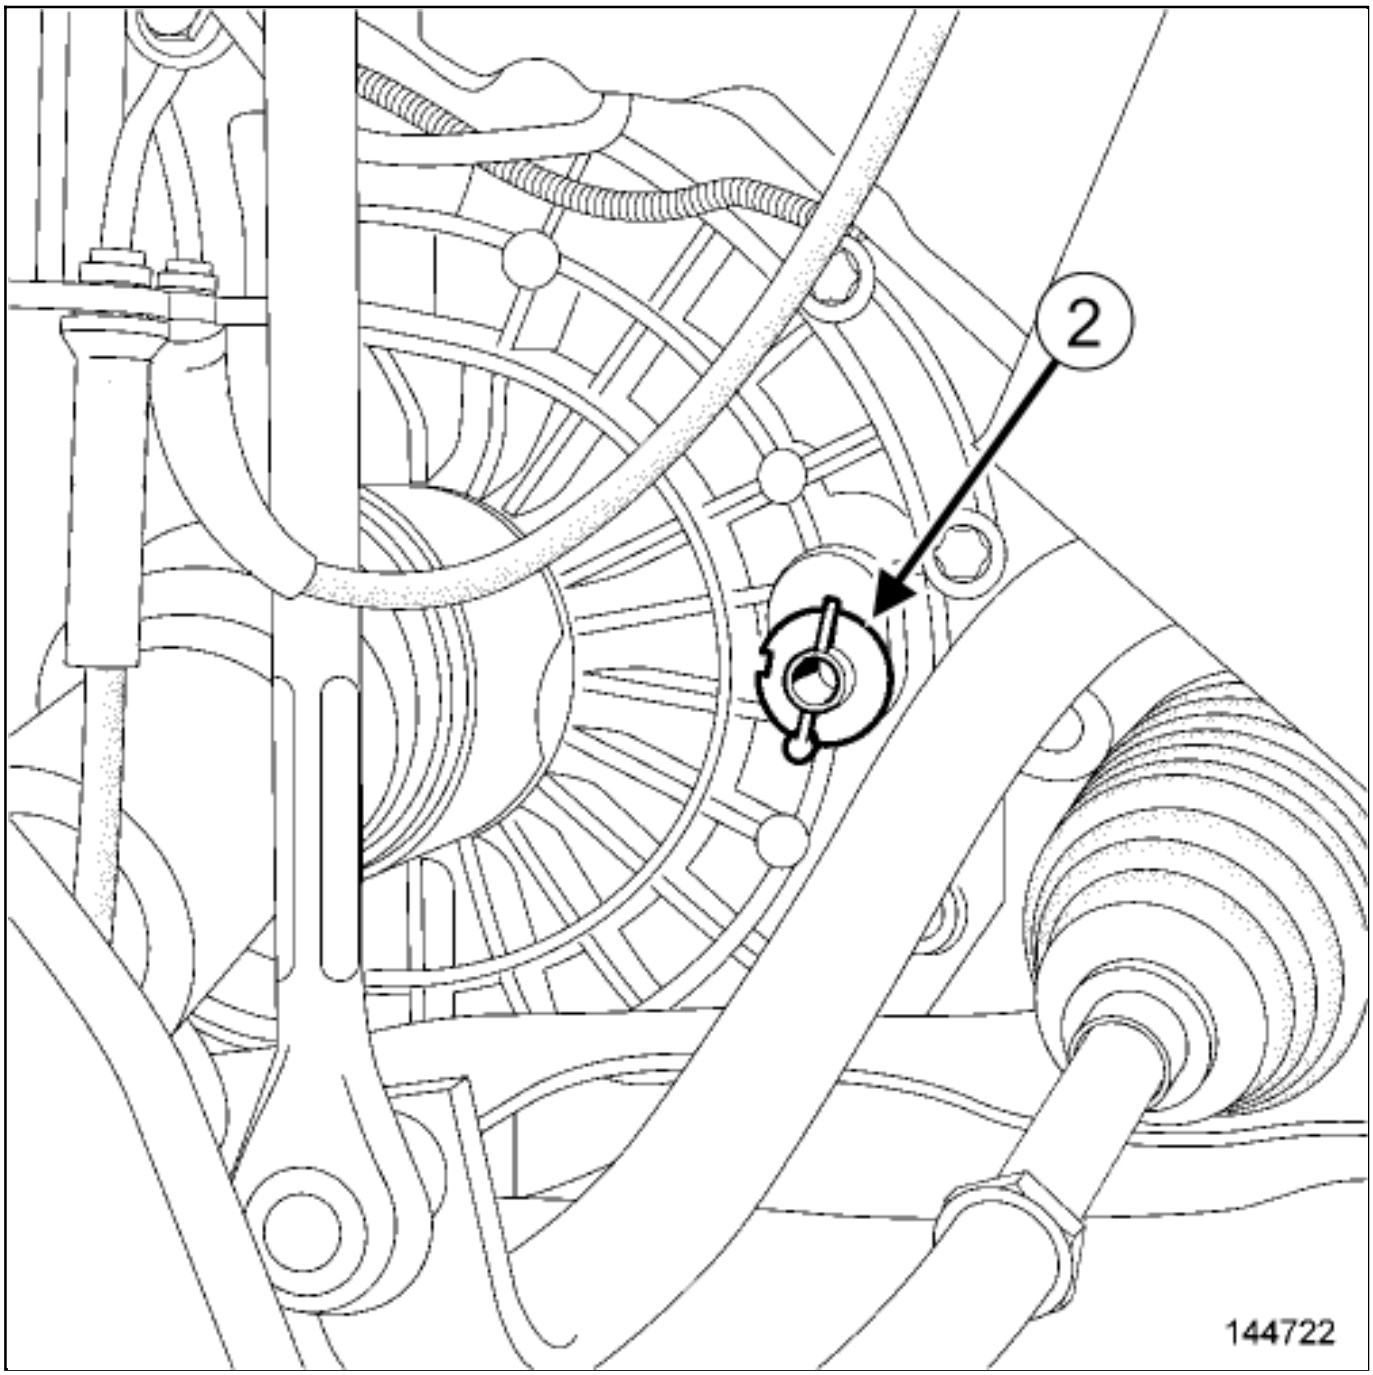
Remove:

- the front left-hand wheel**Wheel: Removal - Refitting** ,
- the engine undertray.

2. DRAINING OPERATION

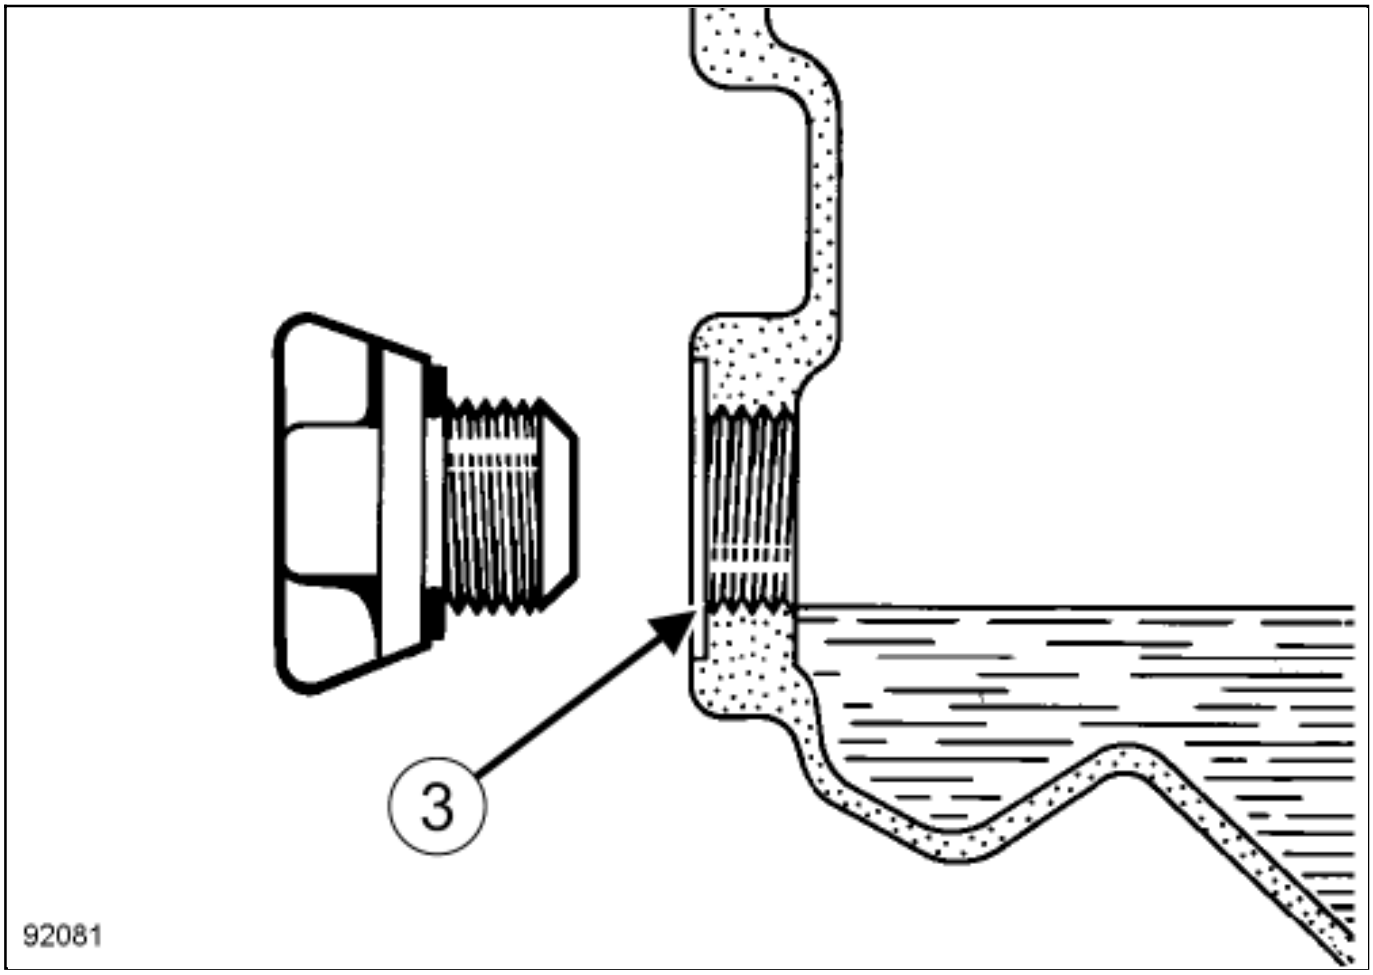
Position an oil recovery trayunder the vehicle.

- Remove the drain plug(1) .



- Let the oil flow.

FILLING



1. FILLING OPERATION

Refit the drain plug.

Torque tighten the drain plug40 N.m.

Remove the filler cap(2) .

Fill the gearbox until the oil overflows via the oil filler cap opening(3) using a syringe containing the recommended oil[Automatic gearbox oil: Specifications](Technical Note 6012A, 04A, Lubricants).

Refit the filler cap.

Wipe away any run-off.

2. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

AUTOMATICGEARBOXOIL:SPECIFICATIONS

1. GEARBOX TYPE/OIL TYPE CORRELATIONS:

GEARBOX TYPE	TYPE OF OIL FOR GEARBOX
DP0/DP2/DP8/RWX	ELF RENAULTMATIC D3 SYN
MBX/AD4/AD8/AR4	ELF RENAULTMATIC D2
LM0	ESSO ATF LT 71141
SU0/SU1/SU4	CLIP oil
AJX	ELF MATIC J6
FKX CKX DKX	ELF MATIC CVT
DCX	DC4 gearbox oil
DW6	DW6 gearbox oil
DW5	DW5 gearbox oil (pentosin FFL-5)

Component identification:

The third character X corresponds to the figure written on the identification plate and therefore covers the entire automatic gearbox range.

Note:

ELF RENAULTMATIC D3 SYN oil is not a substitute for ELF RENAULTMATIC D2.

2. STANDARDS AND PART NUMBERS OF THE VARIOUS RECOMMENDED OILS:

Designation	Standard	Part number
ELF RENAULTMATIC D2	DEXRON II D	77 01 402 037 (2 litres)
ELF RENAULTMATIC D3 SYN	DEXRON III	May be ordered from ELF
CLIP oil	-	77 11 218 368 (2 litres)
ELF MATIC J6	-	May be ordered from ELF
ELF MATIC CVT	-	May be ordered from ELF (1 litre)
ESSO ATF LT 71141	-	77 11 172 226 (2 litres)
DC4 gearbox oil	-	77 11 428 122 (1 litre)
DW6 gearbox oil	-	77 11 579 456 (1 litre)

DW5 gearbox oil (pentosin FFL-5)		77 11 579 594 (1 litre)

AUTOMATIC GEARBOX: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- GENERAL INFORMATION

This method provides information which will allow you to:

- acquire good knowledge of the component on which you will be working,
- benefit from the best repair conditions,
- obtain optimum component operation and meet customer requirements,
- optimise component repair time.

It is worth taking the time to read this method as you will gain time later on during the repairs.

1)GENERAL RECOMMENDATIONS

Observe basic principles of vehicle repair.

The quality of repair depends first and foremost on the care exercised by the person in carrying it out.

Carry out the operation on the component on a clean working area.

To ensure good repair:

- use the recommended consumables **Vehicle: Parts and consumables for the repair** (04B, Consumables - Products),
- use the recommended tools,
- observe the tightening torques,

observe the recommendations for parts that should always be replaced after removal, refitting or replacement operations,

clean and degrease the sections to be bonded, to ensure they bond correctly.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

Use professional products and apply them with care, for example do not apply too much sealing paste to the joint face to prevent damaging certain components.

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Observe the chronological order of the steps:

remove the component,

clean the component before repairing,

remove the part(s) concerned

check the part(s) removed,

replace faulty part(s) with new part(s),

perform the necessary adjustments and/or settings so that the component operates correctly,

observe the tightening torques.

Note:

Ensure sure that the parts removed match up and ensure that they are refitted in the correct order.

Note:

When refitting any component, use a brush to apply a dab of grease**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

2)SPECIAL TOOLING

Use suitable tools which are in good condition (use of "multi-purpose" tools, such as adjustable pliers, etc., should be avoided wherever possible).

For good quality repairs and for working in safe conditions, use only special tooling.

3)SAFETY

Equipment risks:

the "Note" heading used in the description of the method indicates that particular care should be taken for the operation described.

the "Important" heading used in the description of the method indicates that there is a risk of damage to the component.

Working safely:

the "Warning" heading used in the description of the method indicates that particular care should be taken

for the operation described and that there is a human risk,

- use supports and adopt a correct posture when performing heavy work or raising loads,
- check that the working area is clean and tidy during the operation,
- use personal protection (gloves, goggles, work shoes, masks, skin protection, etc.),
- do not use harmful products in unventilated rooms,
- do not ingest any chemicals (brake fluid, coolant, etc.).

Respecting the environment:

- sort waste according to its particular qualities,
- do not burn discarded products (tyres, etc.).

4)CONCLUSION

Respecting the recommended methods will guarantee the best performance and reliability of the component.

AUTOMATIC GEARBOX: PRECAUTIONS FOR THE REPAIR

4)CONCLUSION

Respecting the recommended methods will guarantee the best performance and reliability of the component.

AUTOMATICGEARBOX:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
component jack
safety strap(s)
indelible pencil

parts always to be replaced:
Differential output seal

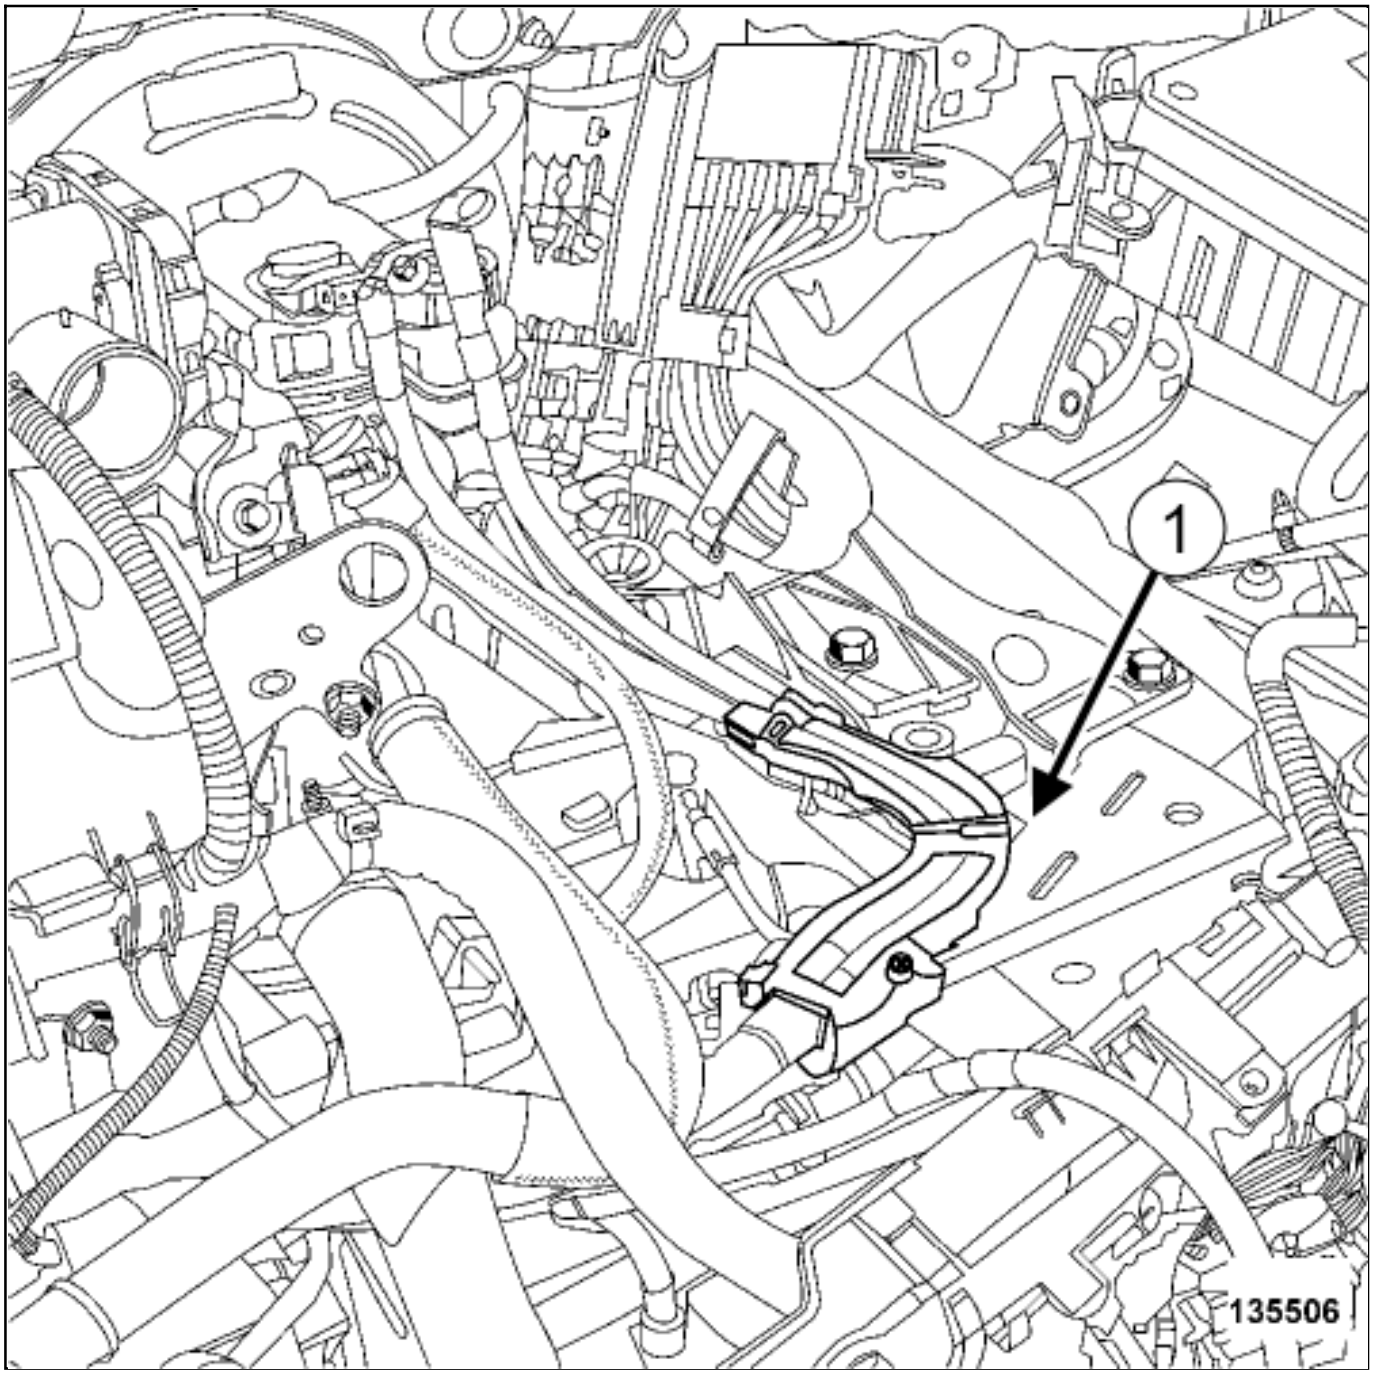
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

REMOVAL

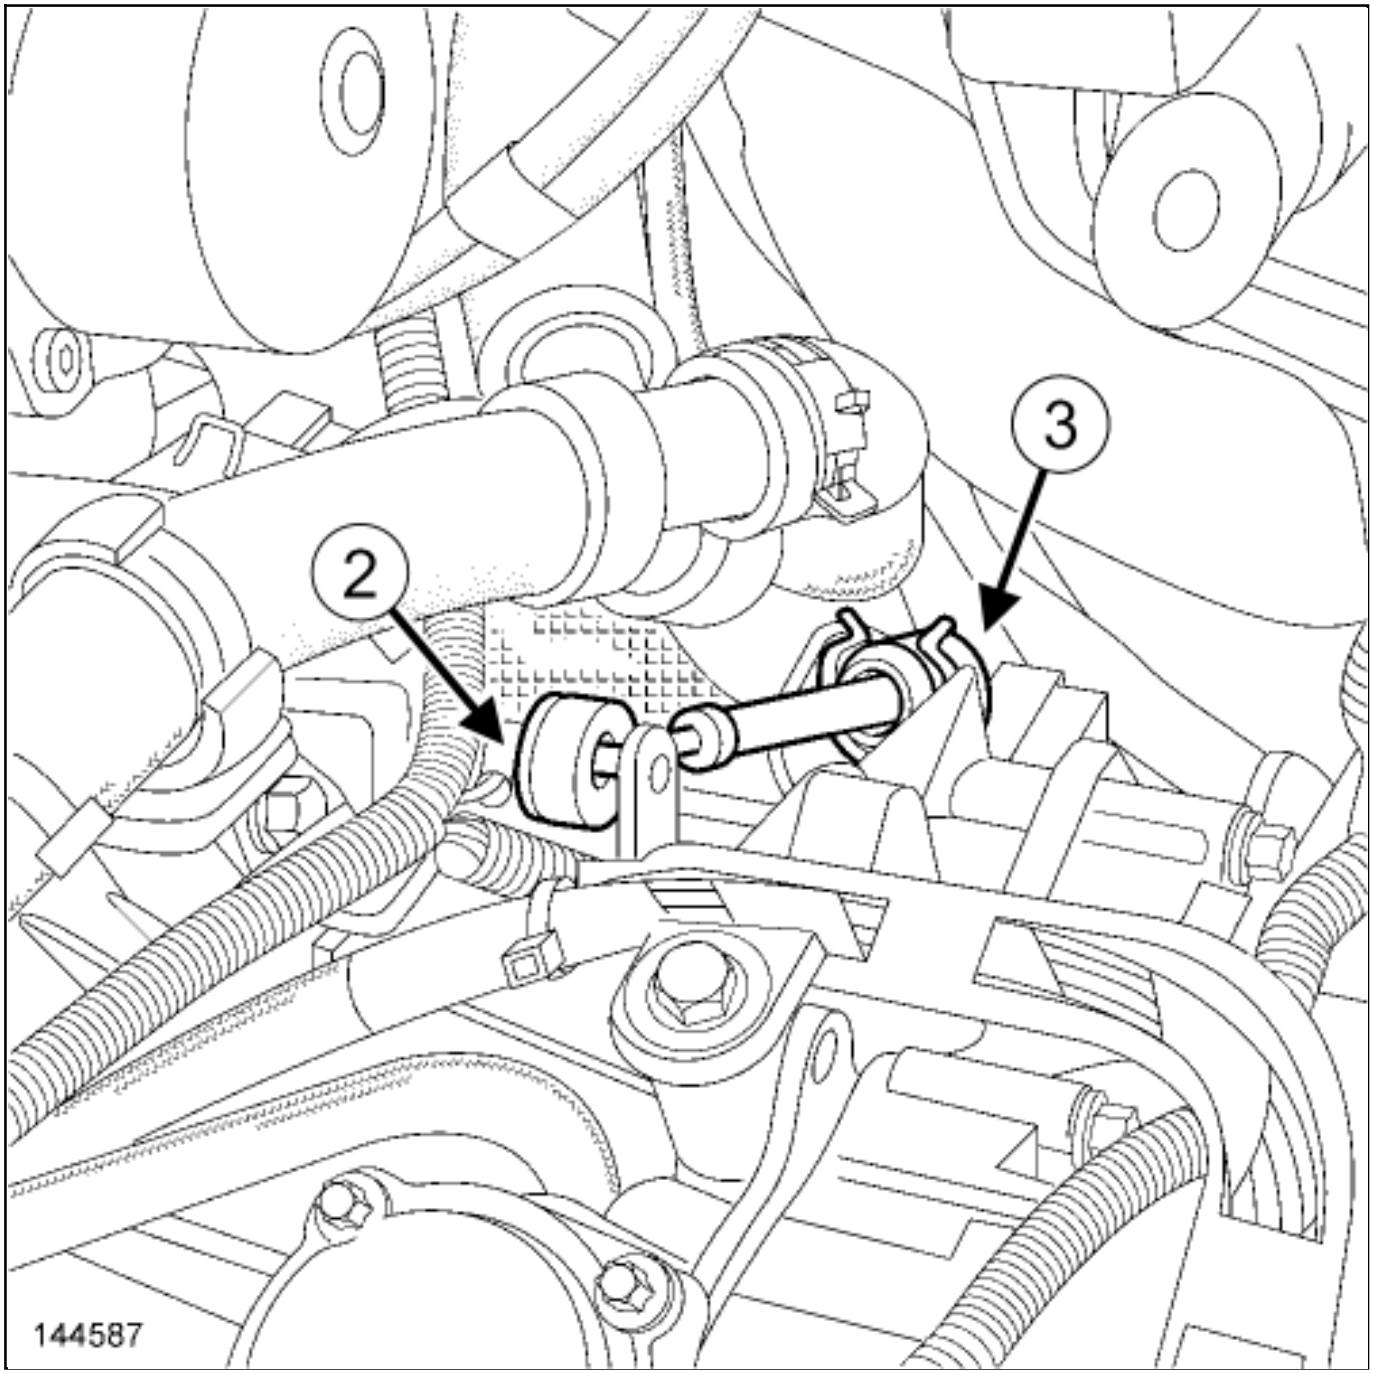
1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the engine cover,
- the battery **Battery: Removal - Refitting** ,
- the battery tray **Battery tray: Removal - Refitting** .

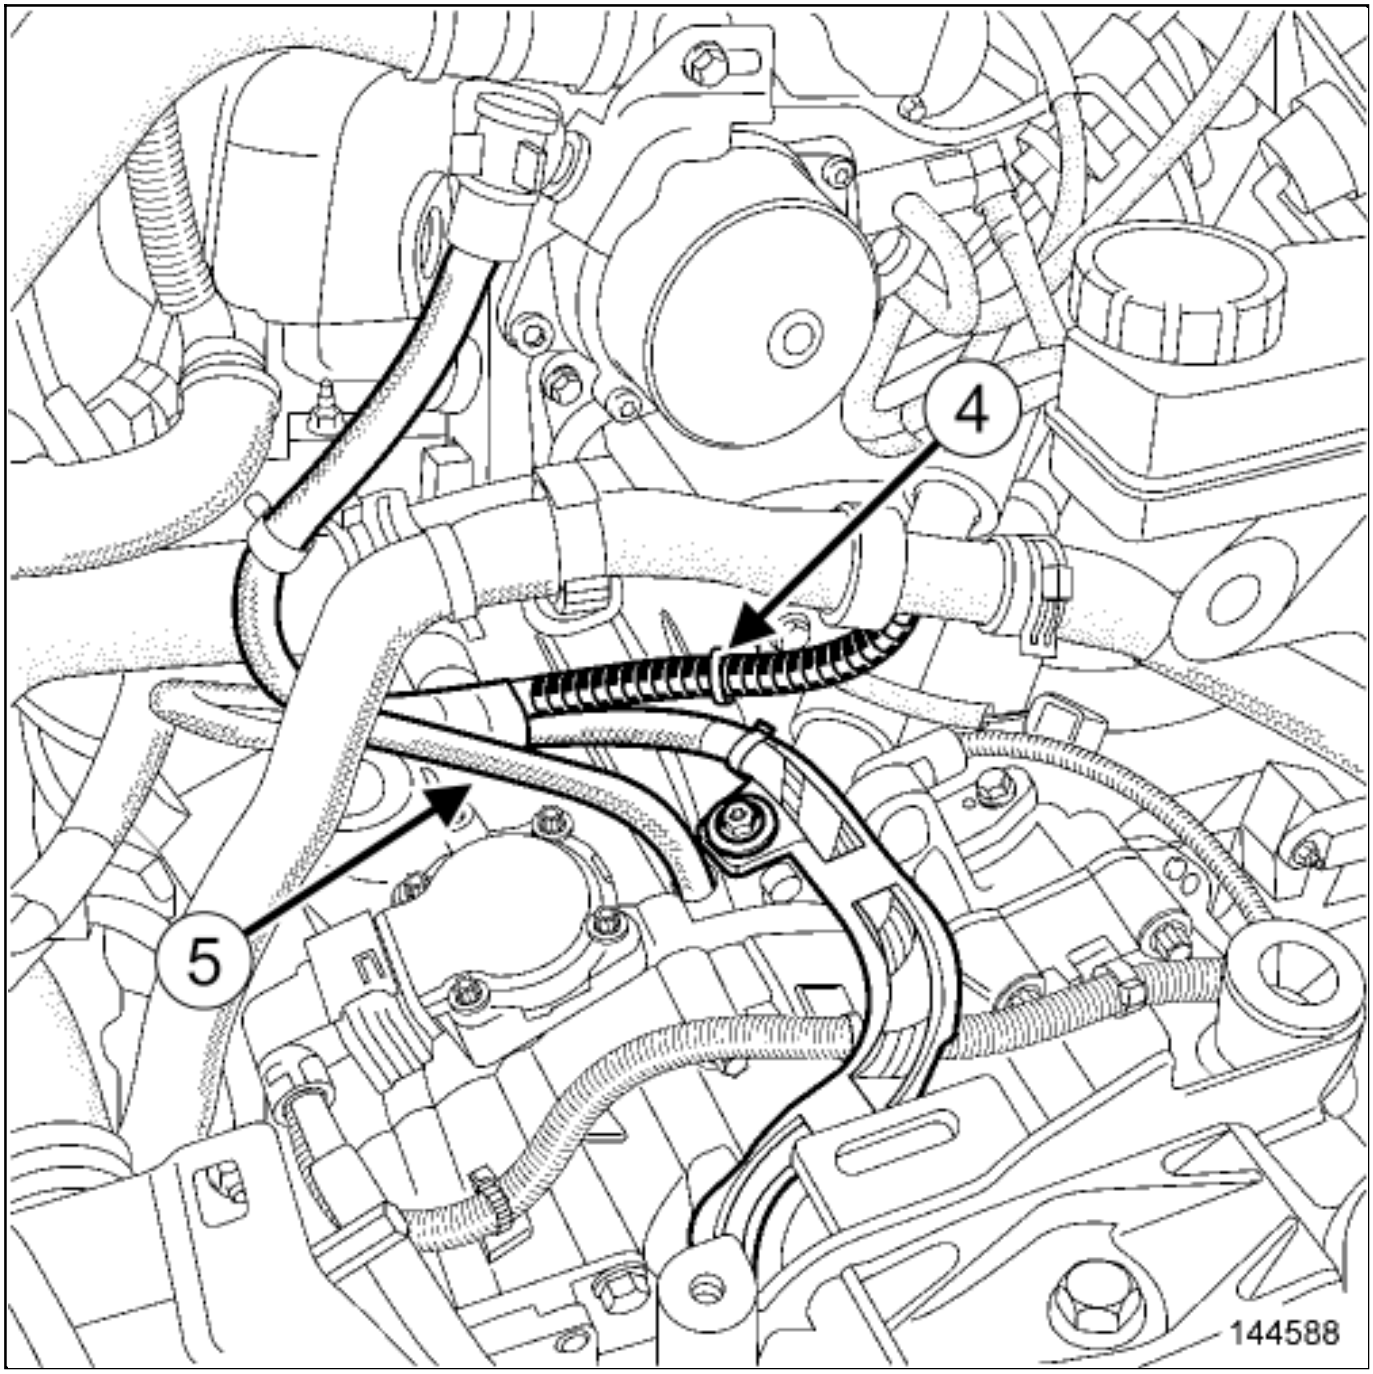


Remove **(see 12A, Fuel mixture, Air inlet assembly: Exploded view)** :

- the air filter unit air inlet pipe,
- the air filter unit.

Unclip the battery wiring channel(1) from the left-hand suspended engine mounting.

Move the battery wiring channel away from the left-hand suspended engine mounting.

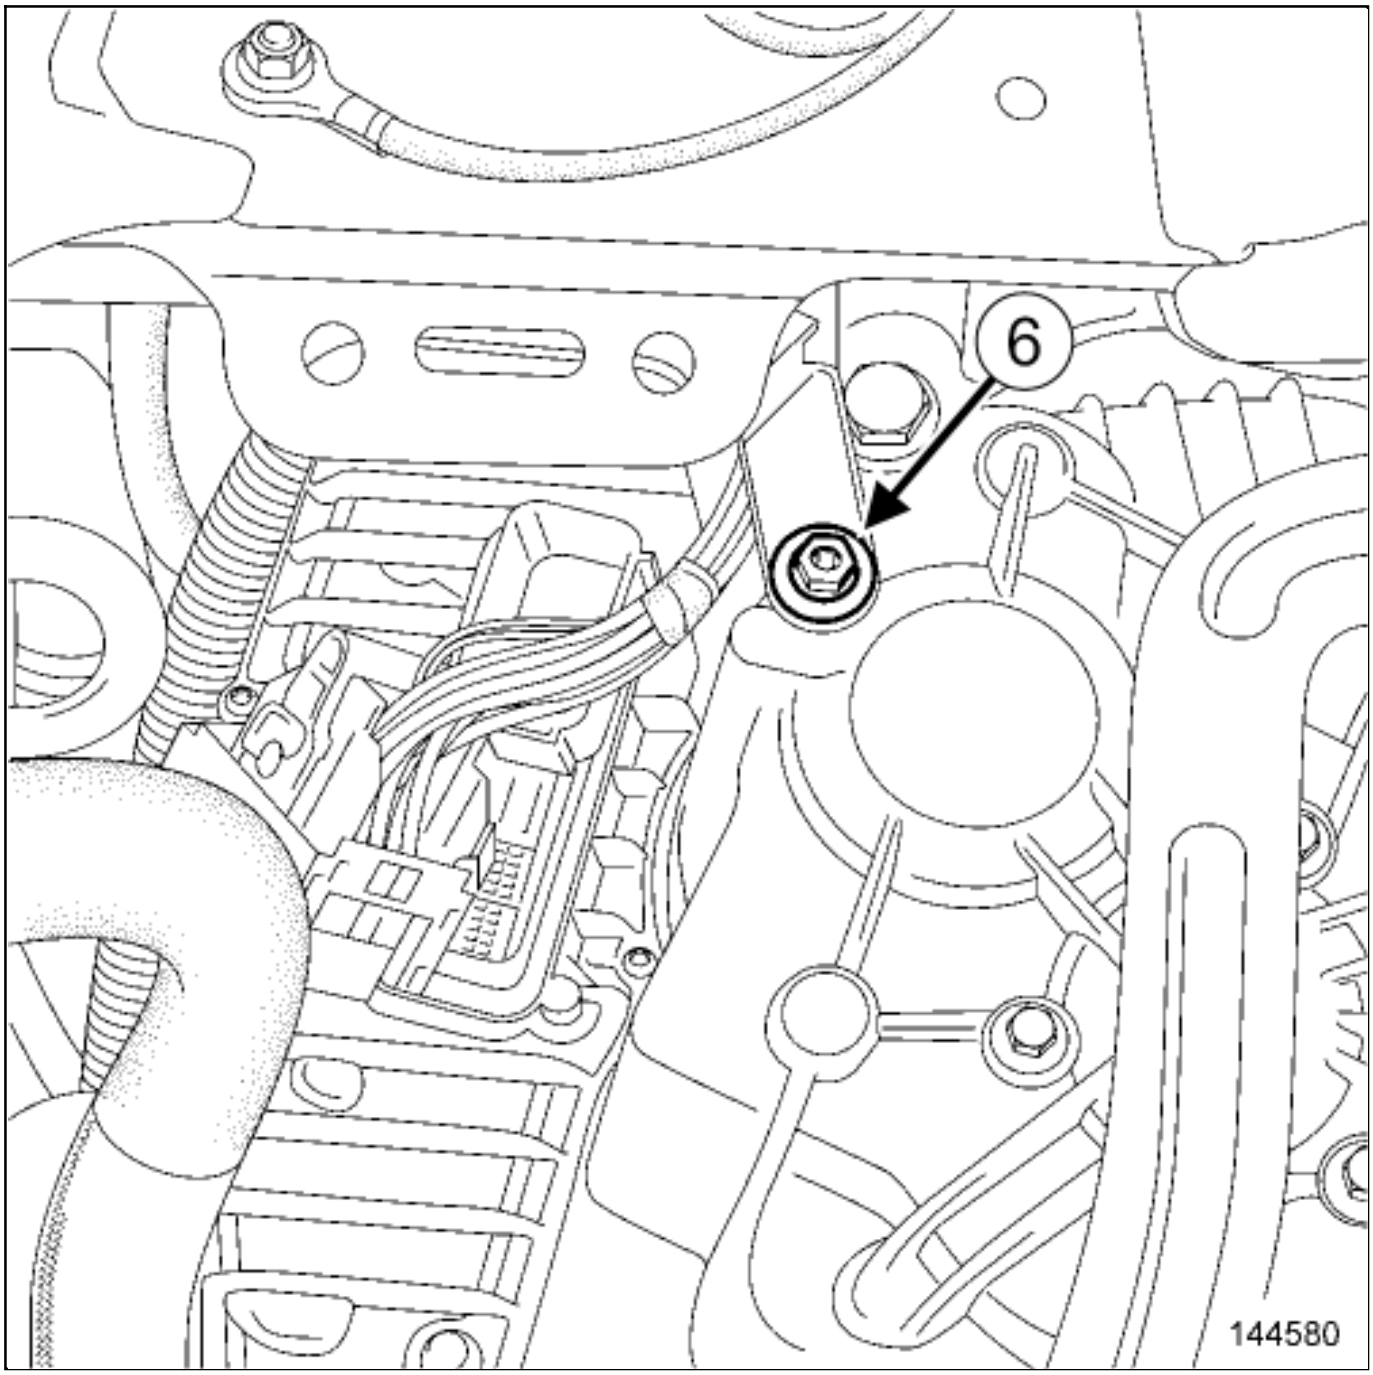


Unclip:

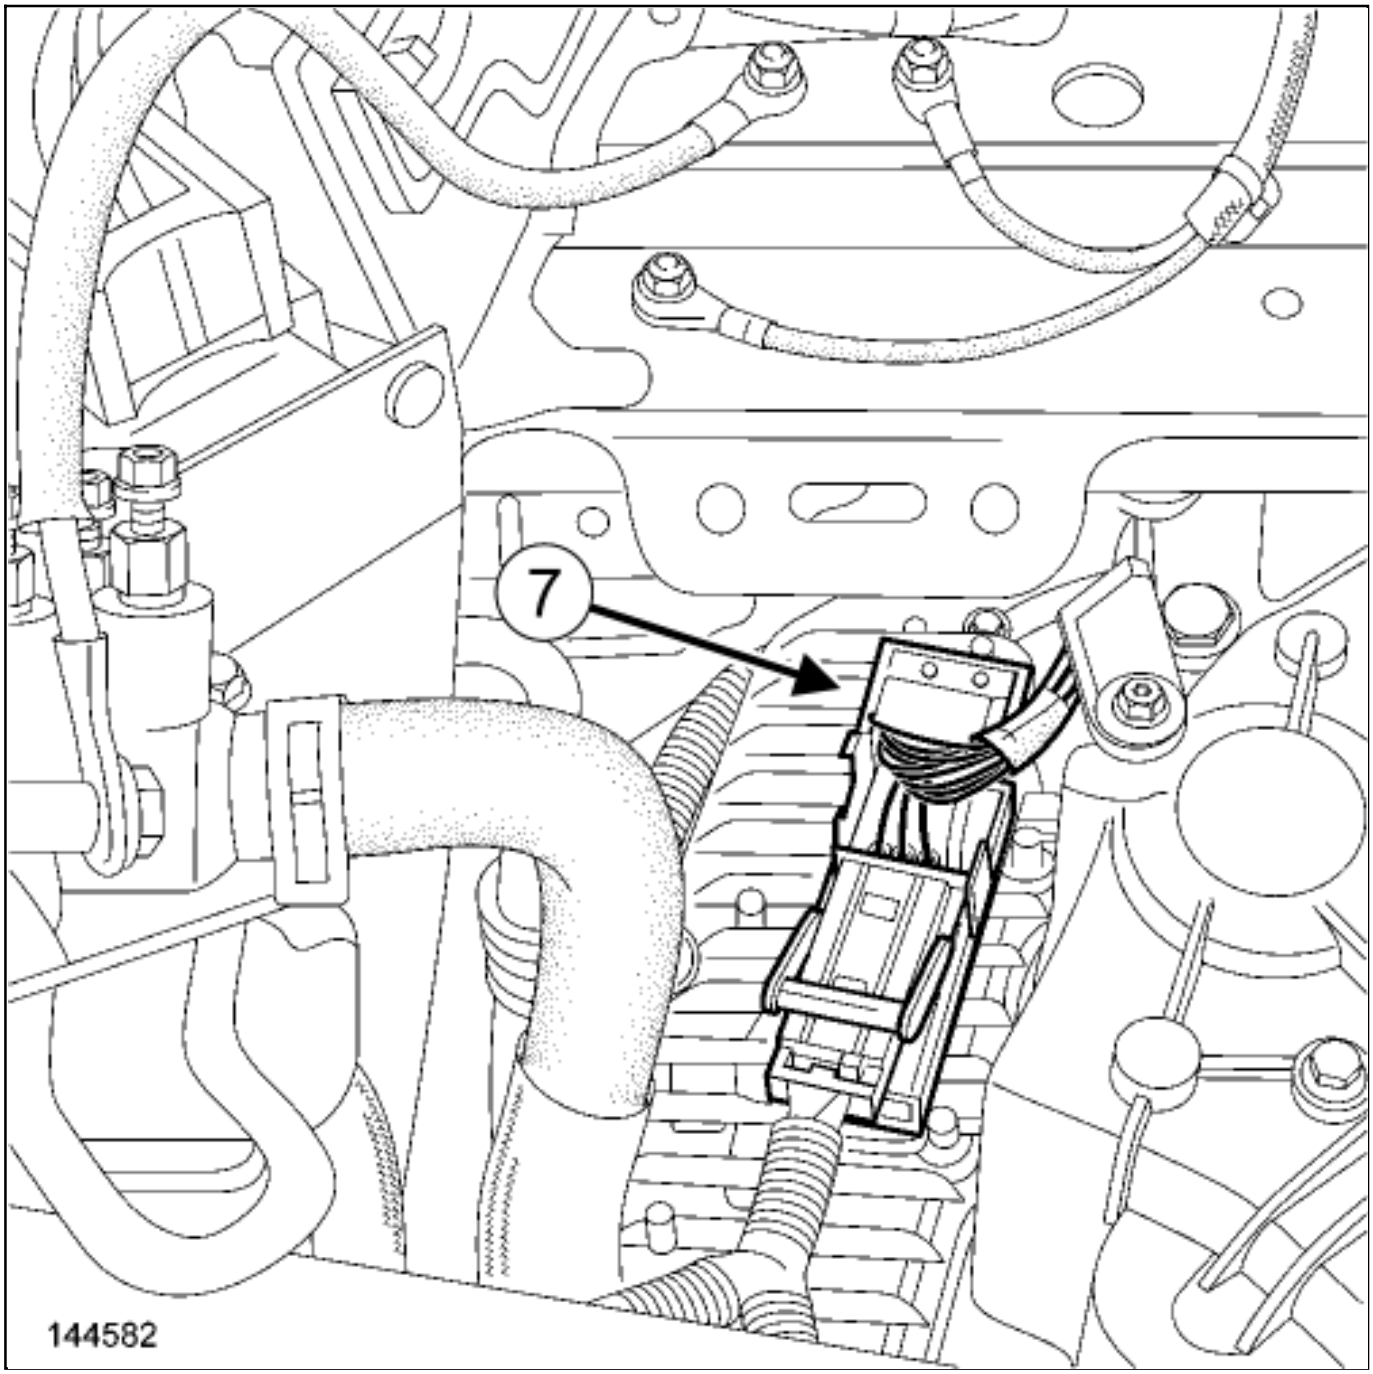
- the gear control cable(2) from the selector ball joint using an open-jawed spanner,
- the gear control cable(3) from the support.

Move the gear control cable to one side.

Remove:



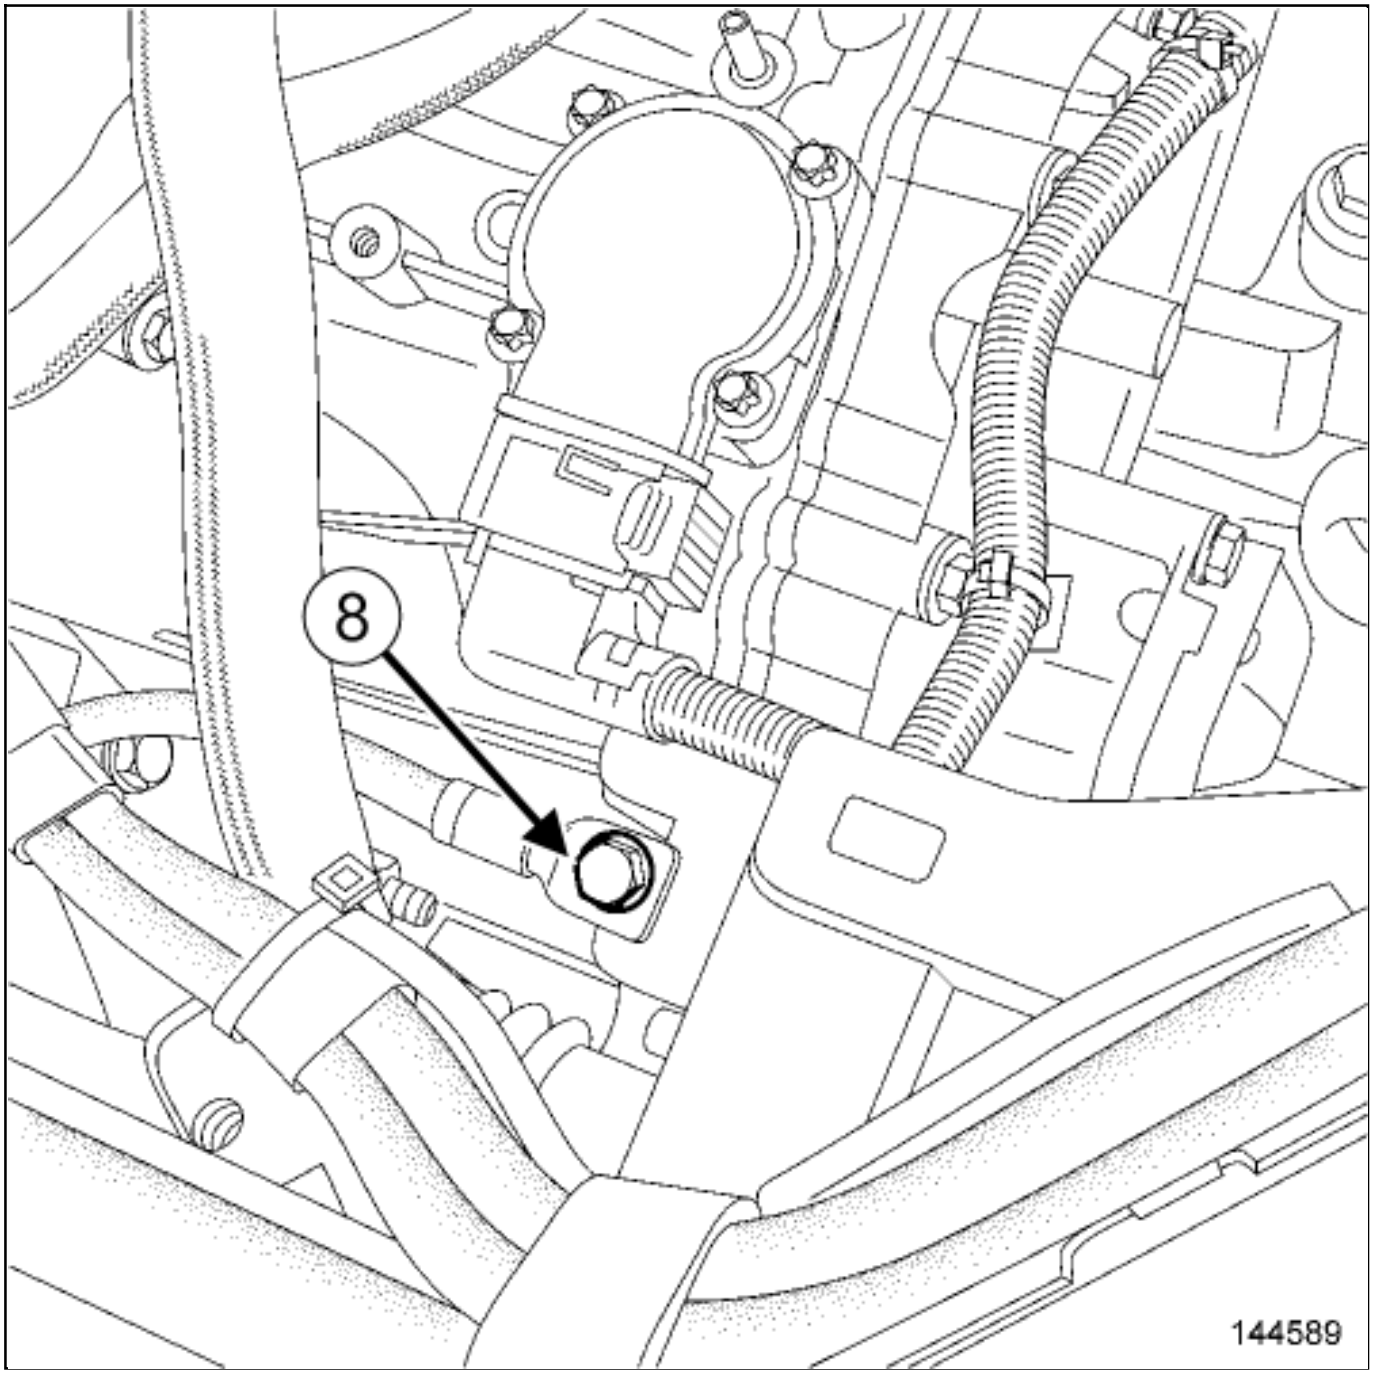
- the engine undertray,
- the crankshaft position sensor(see **Crankshaft position sensor: Removal - Refitting**) .



Unclip the following from the automatic gearbox:

- the engine wiring channel(4) ,

- the breather pipe from the gearbox(5) .



Remove the lower bolt(6) of the engine wiring.

Note:

Do not touch the metal contacts of the computer - an electrostatic discharge can damage the shift drum actuator motors.

Disconnect the connector(7) from the gearbox computer.

Move the engine wiring away from the gearbox.

Note:

Before removing the earth terminal, mark its position using an indelible pencil by drawing a line on the earth terminal and on the gearbox casing.

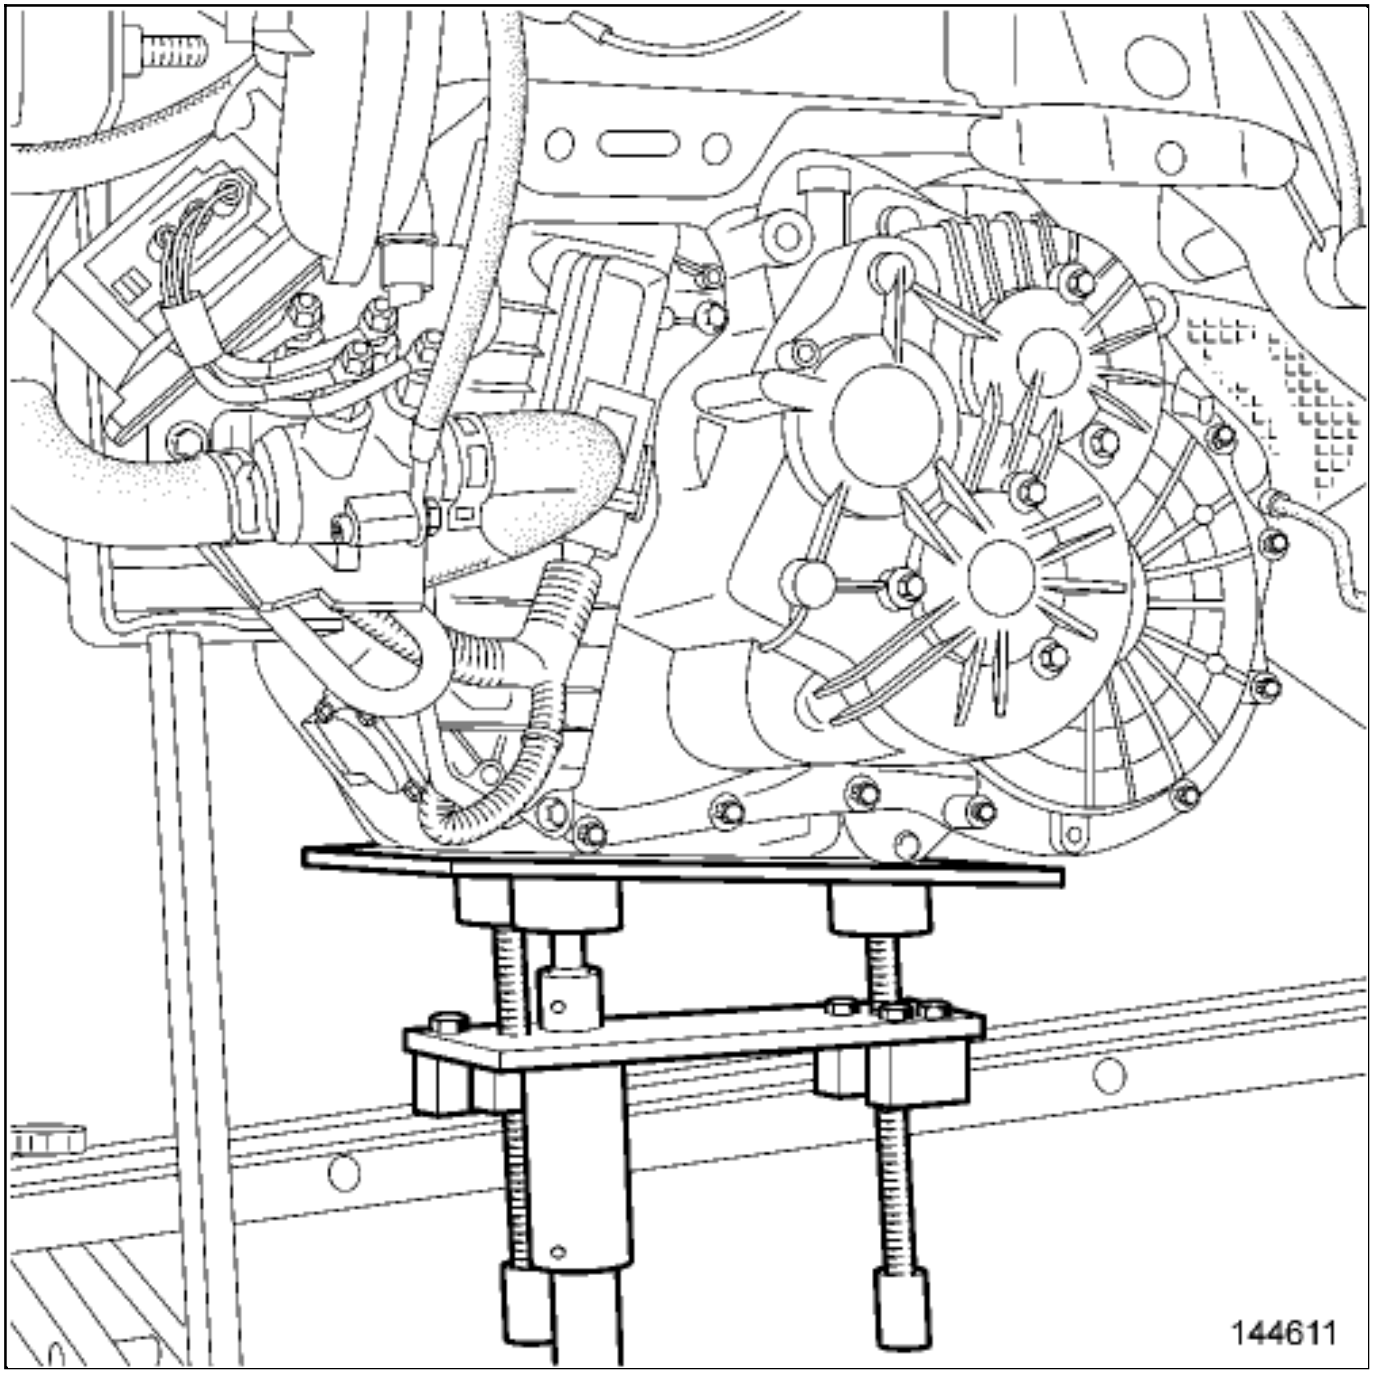
When reassembling, improper positioning of the earth terminal on the gearbox casing could result in damage to the earth terminal or earth wiring.

Remove the earth cable bolt(8) from the gearbox.

Remove:

- the front wheels Front hub carrier assembly: Exploded view ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the starter (see 16A, Starting - Charging, Starter: Removal - Refitting) .

Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .



Remove:

- the front left-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front right-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,
- the radiator mounting cross member,
- the front axle subframe Front axle assembly: Exploded view .

Remove the left-hand suspended engine mounting Engine-gearbox unit support assembly: Exploded view .

2. REMOVAL OPERATION

Remove the gearbox bell housing bolts.

Fit a component jack under the gearbox.

Note:

Correctly position the component jack under the gearbox to facilitate the removal.

Remove:

- the gearbox nuts,
- the gearbox studs.

Using a safety strap(s), strap the gearbox on the component jack.

Remove the gearbox.

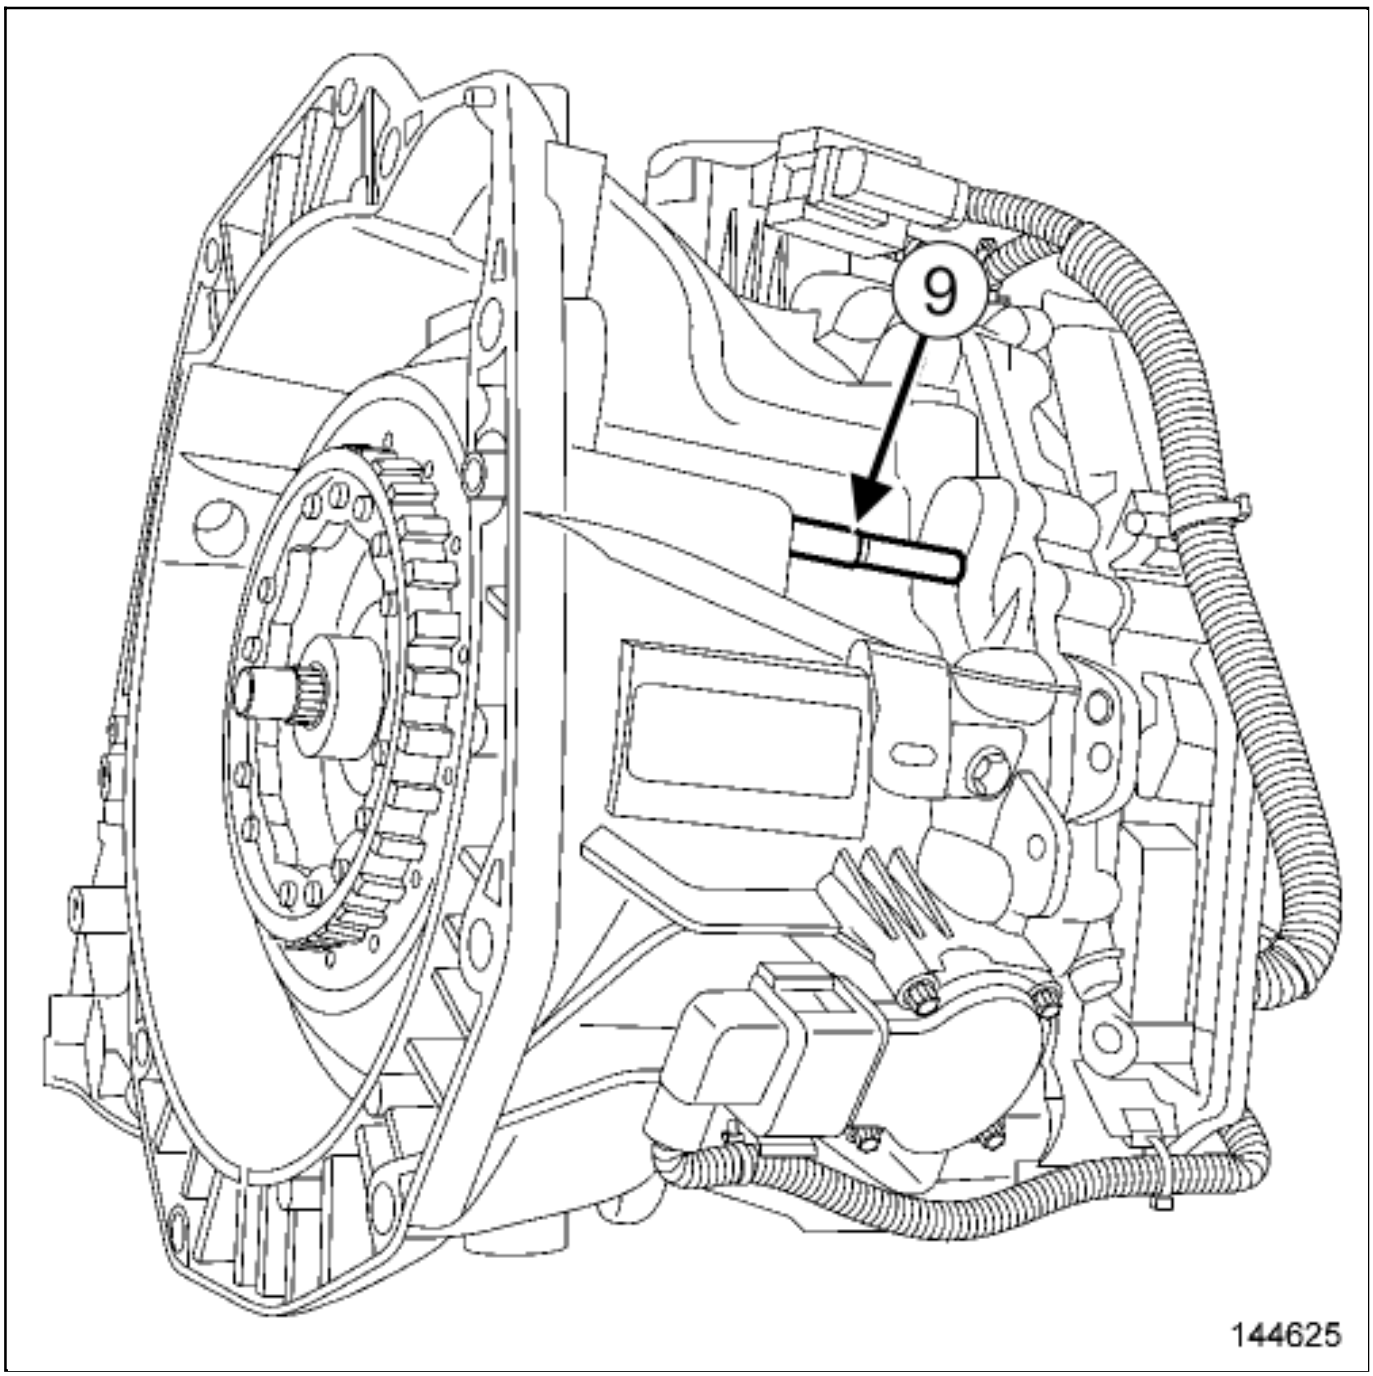
Note:

This operation requires two people due to the weight of the gearbox.

REFITTING

1. REFITTING PREPARATION OPERATION

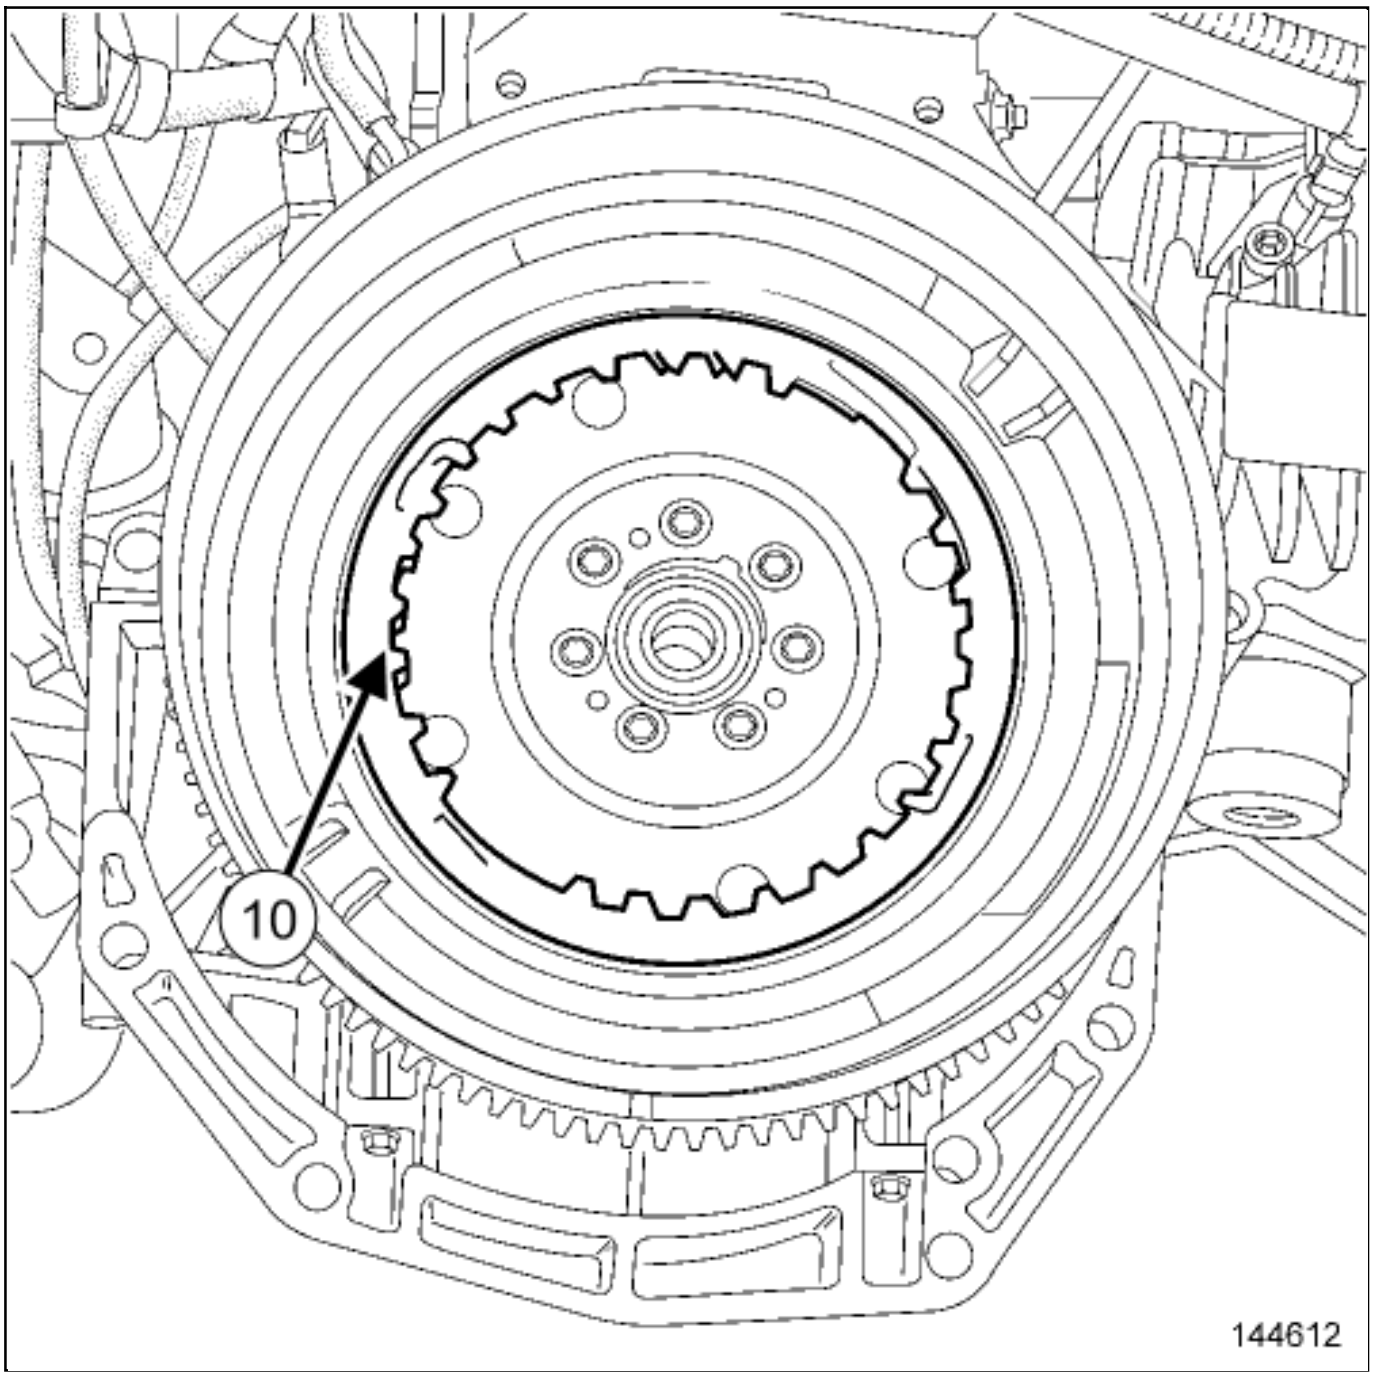
Clean:



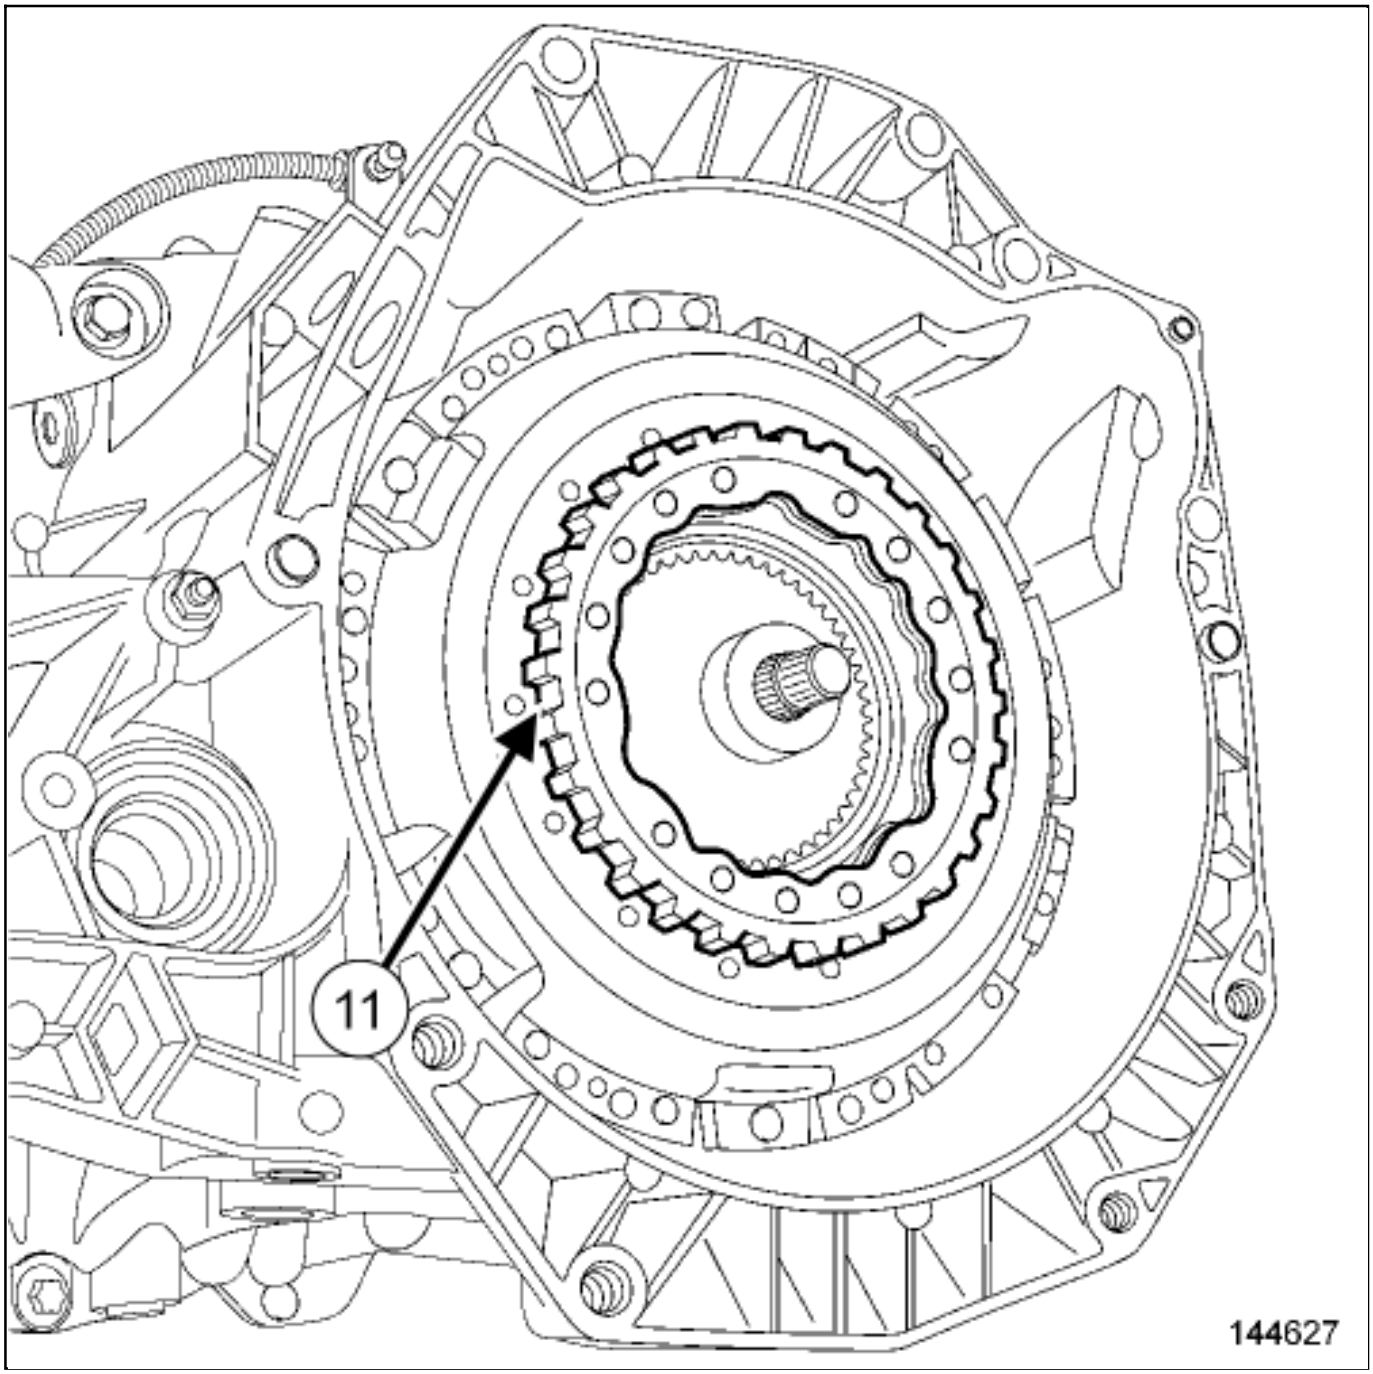
- all the removed parts Vehicle: Parts and consumables for the repair ,
- the joint face of the automatic gearbox and engine casings Vehicle: Parts and consumables for the repair .

parts always to be replaced: Differential output seal .

CAUTION



Failure to observe the following procedure may damage the system connecting the clutch to the flywheel of the automatic gearbox.



Check for the presence of centring dowels on the gearbox casing.

Position the stud (9) on the gearbox.

Correctly position the gearbox on the component jack.

Move aside the engine wiring.

Note:

Correctly position the gearbox using a component jackso that the gearbox bearing face is exactly parallel to the engine bearing face, and the flywheel splines(10) and the clutch pressure plate splines(11) are aligned.

2. REFITTING OPERATION

Refit the gearbox using a component jack.

Note:

This operation requires two people due to the weight of the gearbox.

Note:

If the flywheel splines and the clutch pressure plate splines do not fit together, turn the clutch pressure plate or the flywheel slightly.

Note:

Check for perfect contact between the bearing face of the gearbox and the engine.

Torque tighten:

- the gearbox studs 7 N.m,
- the gearbox nuts 44 N.m,
- the gearbox bolts 44 N.m.

Remove the safety strap(s) from the gearbox.

3. FINAL OPERATION

Refit the left-hand suspended engine mounting Engine-gearbox unit support assembly: Exploded view .

Clip the rail protector drain pipe onto the gearbox.

Refit:

- the front axle subframe Front axle assembly: Exploded view ,
- the radiator mounting cross member,
- the front bumper Front bumper assembly: Exploded view ,
- new differential output seals Differential output seal: Removal - Refitting ,
- the front right-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front left-hand driveshaft Front hub carrier assembly: Exploded view .

Fill the automatic gearbox Automatic gearbox oil: Draining - Filling .

Refit:

- the starter (see 16A, Starting - Charging, Starter: Removal - Refitting) ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front wheels Front hub carrier assembly: Exploded view .

Note:

Refit the earth terminal at the mark made by the indelible marker on the gearbox casing.

When reassembling, improper positioning of the earth terminal on the gearbox casing could result in damage to the earth terminal or earth wiring

Torque tighten the gearbox earth cable bolt24 N.m.

Position the engine wiring on the gearbox.

Connect the gearbox computer connector.

Refit the engine wiring bolts onto the gearbox.

Clip the following onto the gearbox:

- the breather pipe on the gearbox,
- the engine harness channel.

Refit:

- the crankshaft position sensor(see **Crankshaft position sensor: Removal - Refitting**) ,
- the engine undertray.

Fit the gear control cable.

Clip:

- the gear control cable on the support,
- the gear control cable on the selector ball joint,
- the battery wiring channel on the left-hand suspended engine mounting.

Adjust the gear control unit.Gear control unit: Adjustment

Refit the air filter unit(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

Refit:

- the battery trayBattery tray: Removal - Refitting ,
- the batteryBattery: Removal - Refitting ,
- the engine cover.

Apply the After repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Automatic gearbox computer" .

Repair-12x07x01-01x37-1-57-1.xml

AUTOMATIC GEARBOX: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool
component jack
safety strap(s)
indelible pencil

parts always to be replaced:
Differential output seal

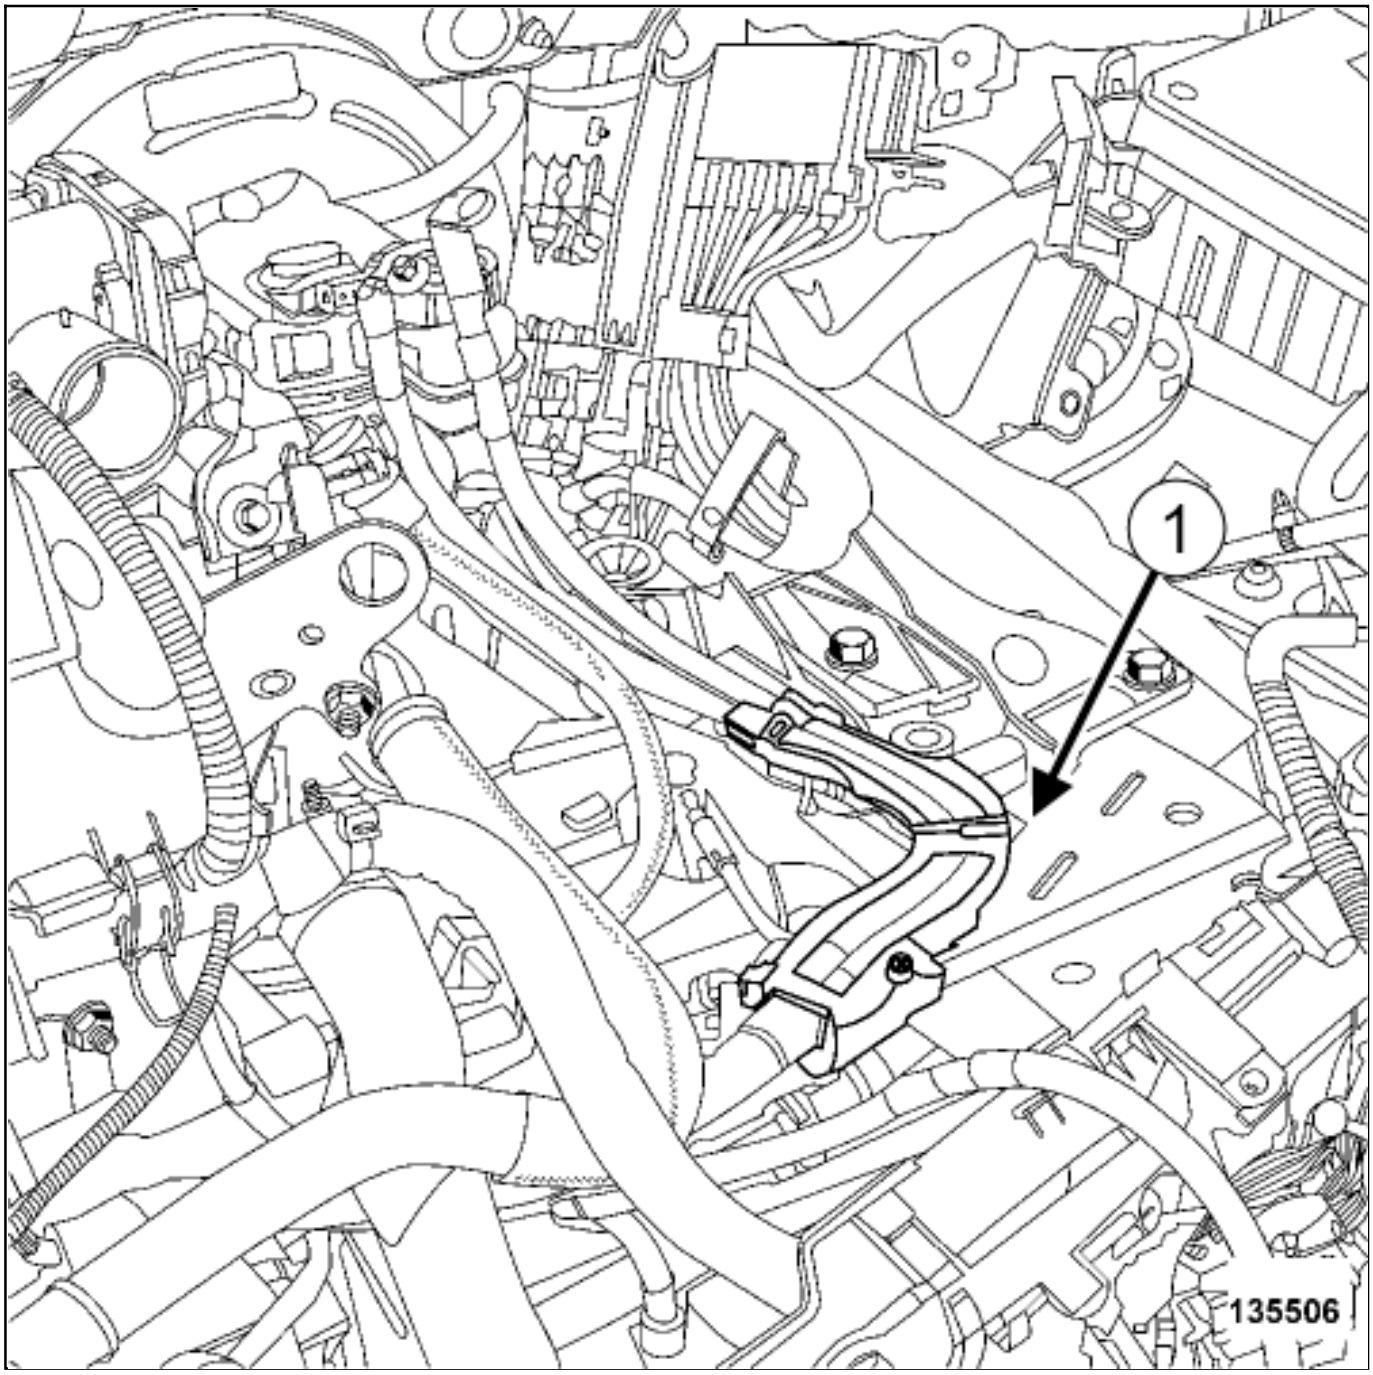
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

REMOVAL

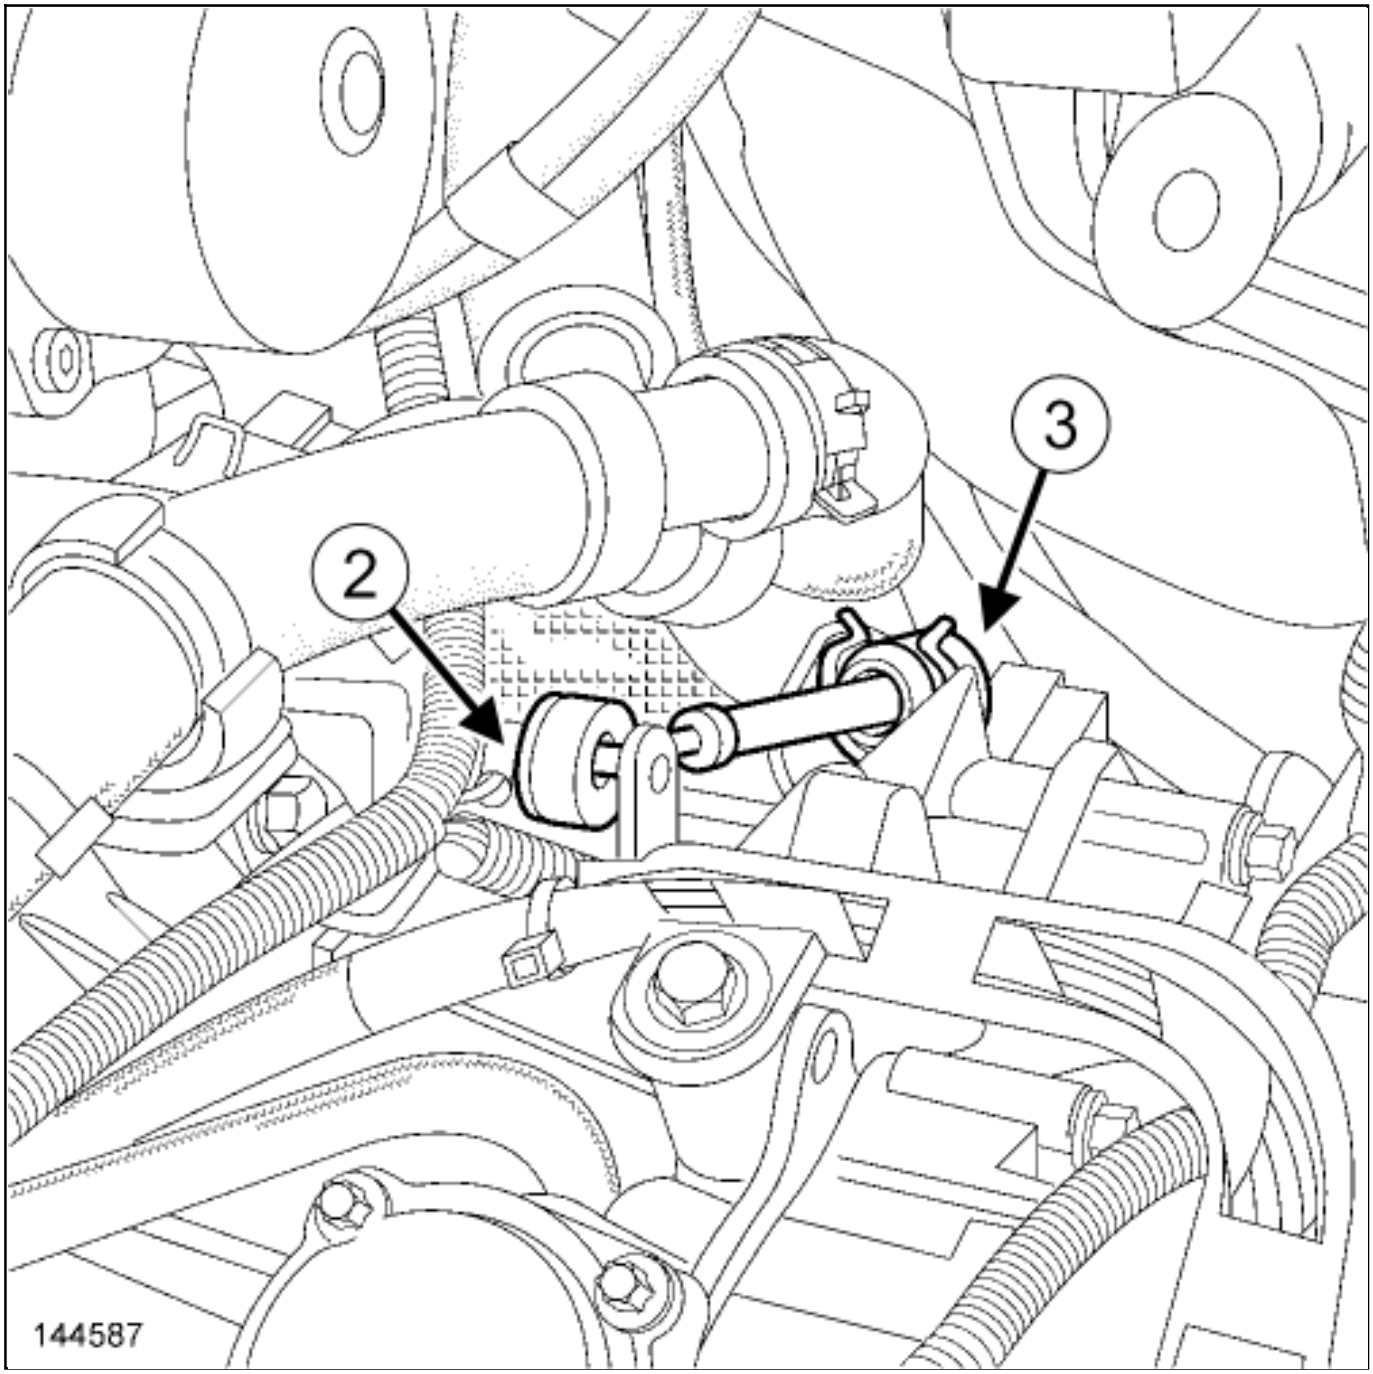
1. REMOVAL PREPARATION OPERATION



Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

- the engine cover,
- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting .

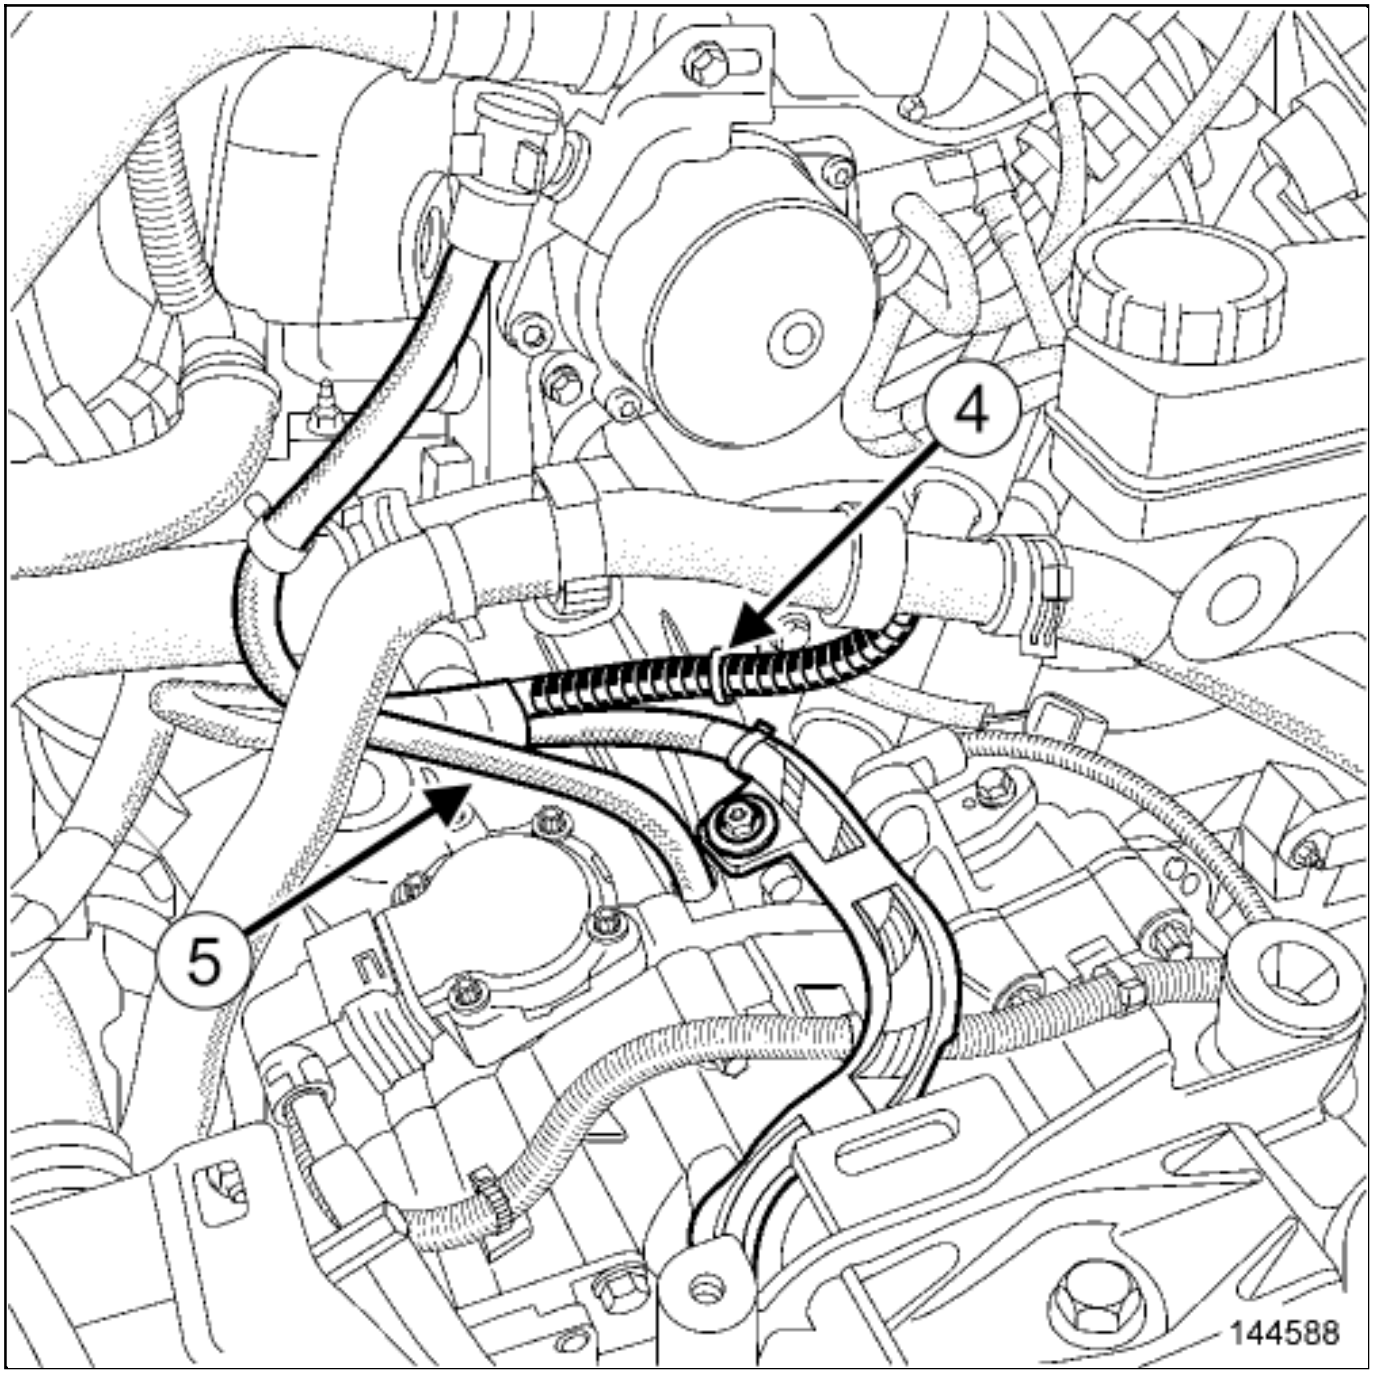


Remove Air inlet assembly: Exploded view :

- the air filter unit air inlet pipe,
- the air filter unit.

Unclip the battery wiring channel(1) from the left-hand suspended engine mounting.

Move the battery wiring channel away from the left-hand suspended engine mounting.

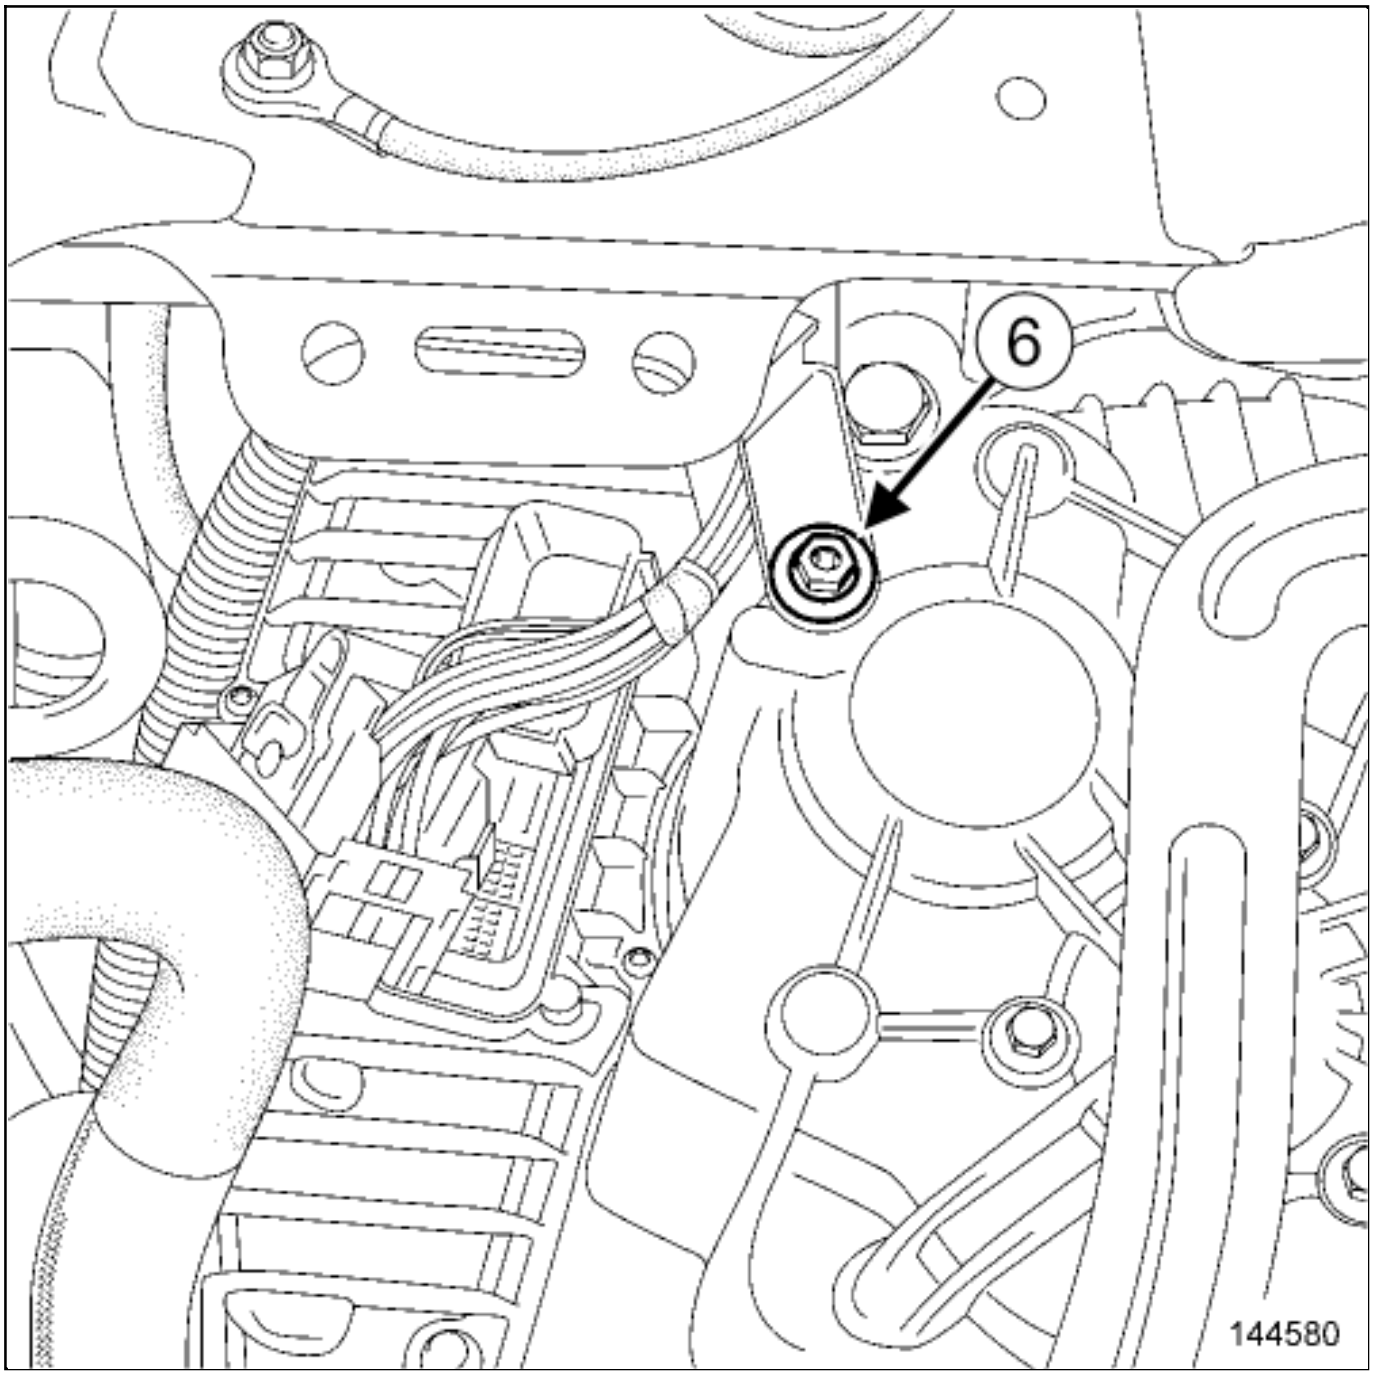


Unclip:

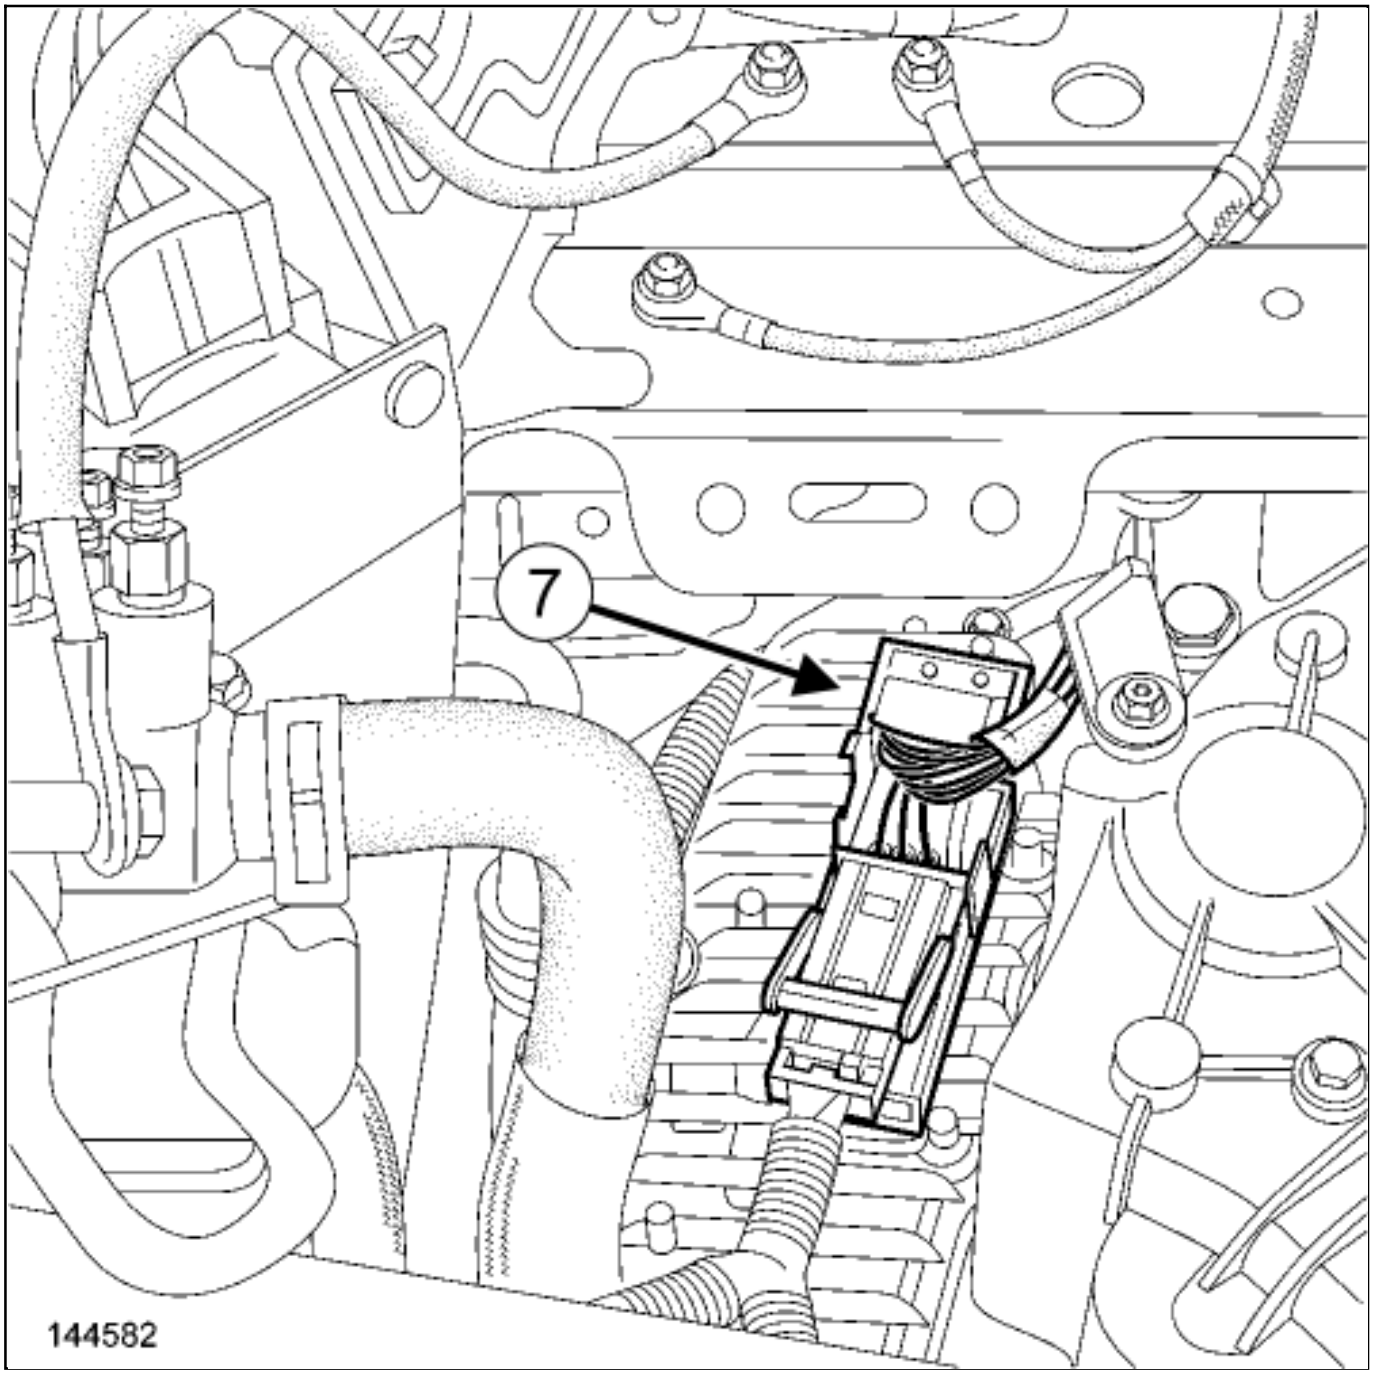
- the gear control cable(2) from the selector ball joint using an open-jawed spanner,
- the gear control cable(3) from the support.

Move the gear control cable to one side.

Remove:



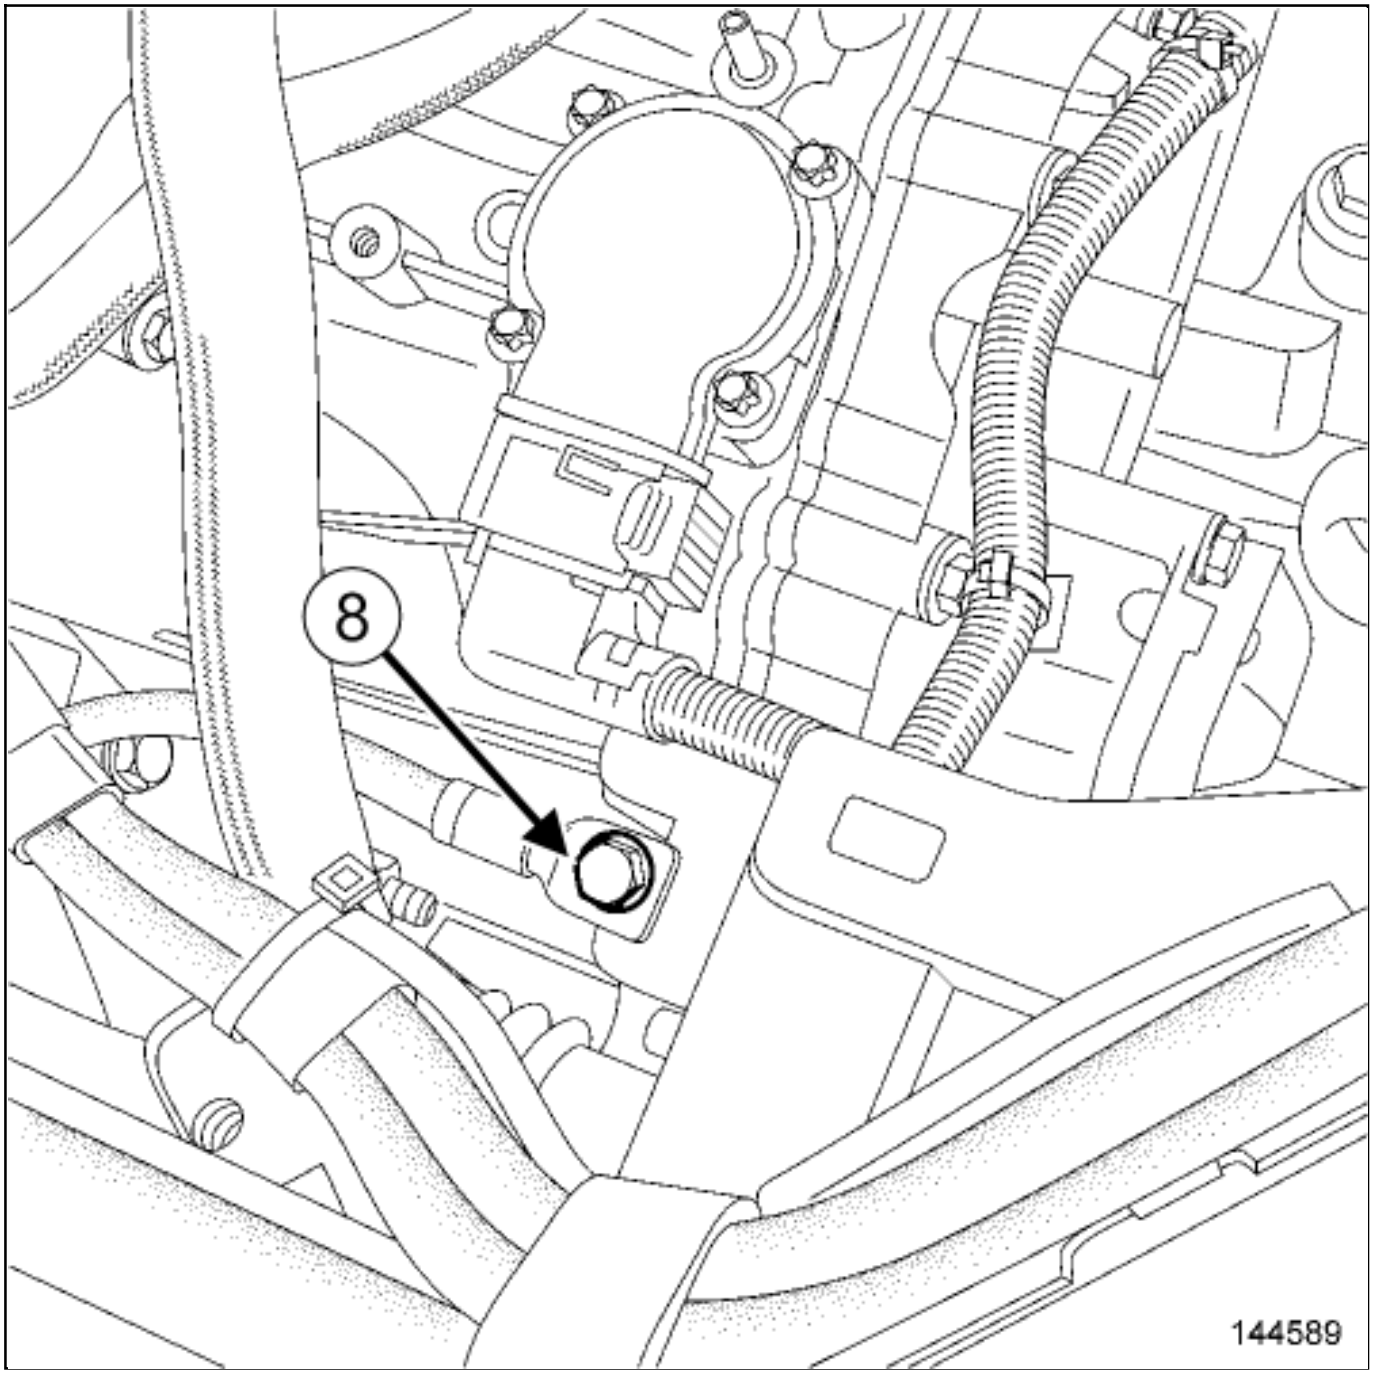
- the engine undertray,
- the crankshaft position sensor(see **Crankshaft position sensor: Removal - Refitting**) .



Unclip the following from the automatic gearbox:

- the engine wiring channel(4) ,

- the breather pipe from the gearbox(5) .



Remove the lower bolt(6) of the engine wiring.

Note:

Do not touch the metal contacts of the computer - an electrostatic discharge can damage the shift drum actuator motors.

Disconnect the connector(7) from the gearbox computer.

Move the engine wiring away from the gearbox.

Note:

Before removing the earth terminal, mark its position using an indelible pencil by drawing a line on the earth terminal and on the gearbox casing.

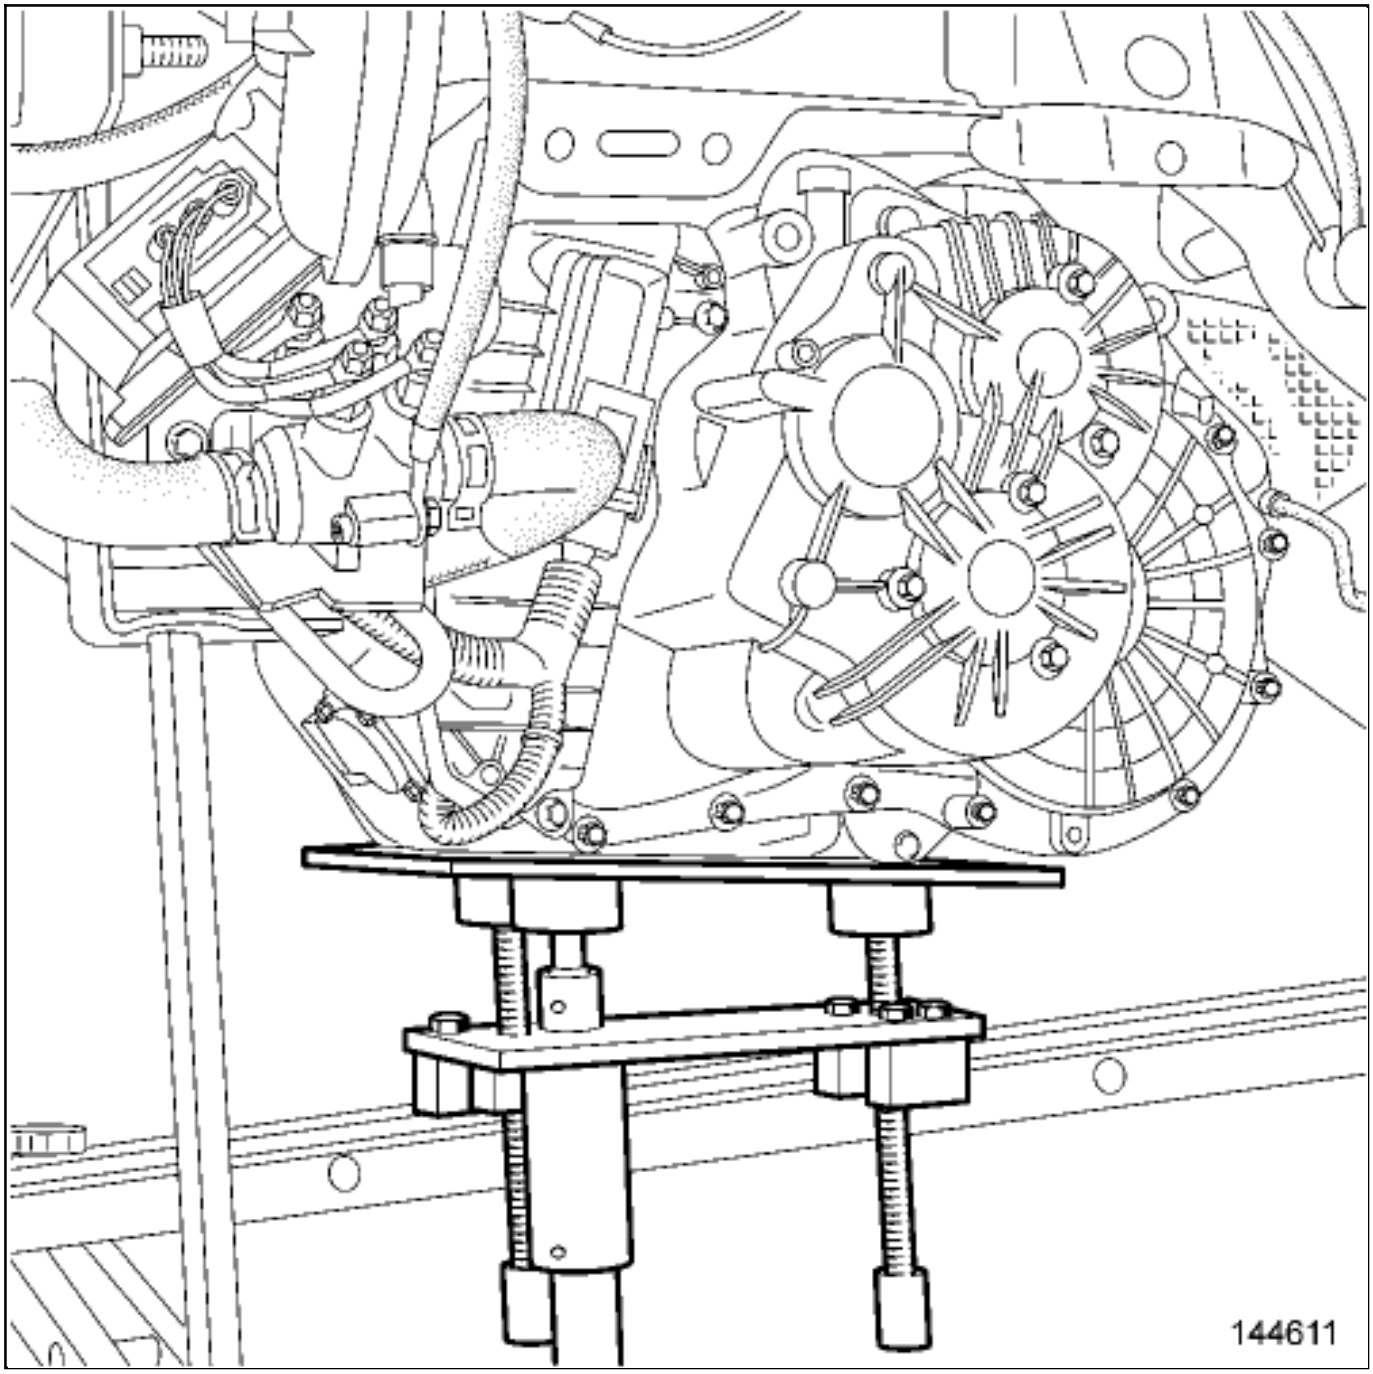
When reassembling, improper positioning of the earth terminal on the gearbox casing could result in damage to the earth terminal or earth wiring.

Remove the earth cable bolt(8) from the gearbox.

Remove:

- the front wheels Front hub carrier assembly: Exploded view ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the starter Starter: Removal - Refitting .

Drain the automatic gearbox oil (see 23A, Automatic gearbox , Automatic gearbox oil: Draining - Filling) .



Remove:

- the front left-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front right-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front bumper Front bumper assembly: Exploded view ,
- the radiator mounting cross member,
- the front axle subframe Front axle assembly: Exploded view .

Remove the left-hand suspended engine mounting Engine-gearbox unit support assembly: Exploded view .

2. REMOVAL OPERATION

Remove the gearbox bell housing bolts.

Fit a component jack under the gearbox.

Note:

Correctly position the component jack under the gearbox to facilitate the removal.

Remove:

- the gearbox nuts,
- the gearbox studs.

Using a safety strap(s), strap the gearbox on the component jack.

Remove the gearbox.

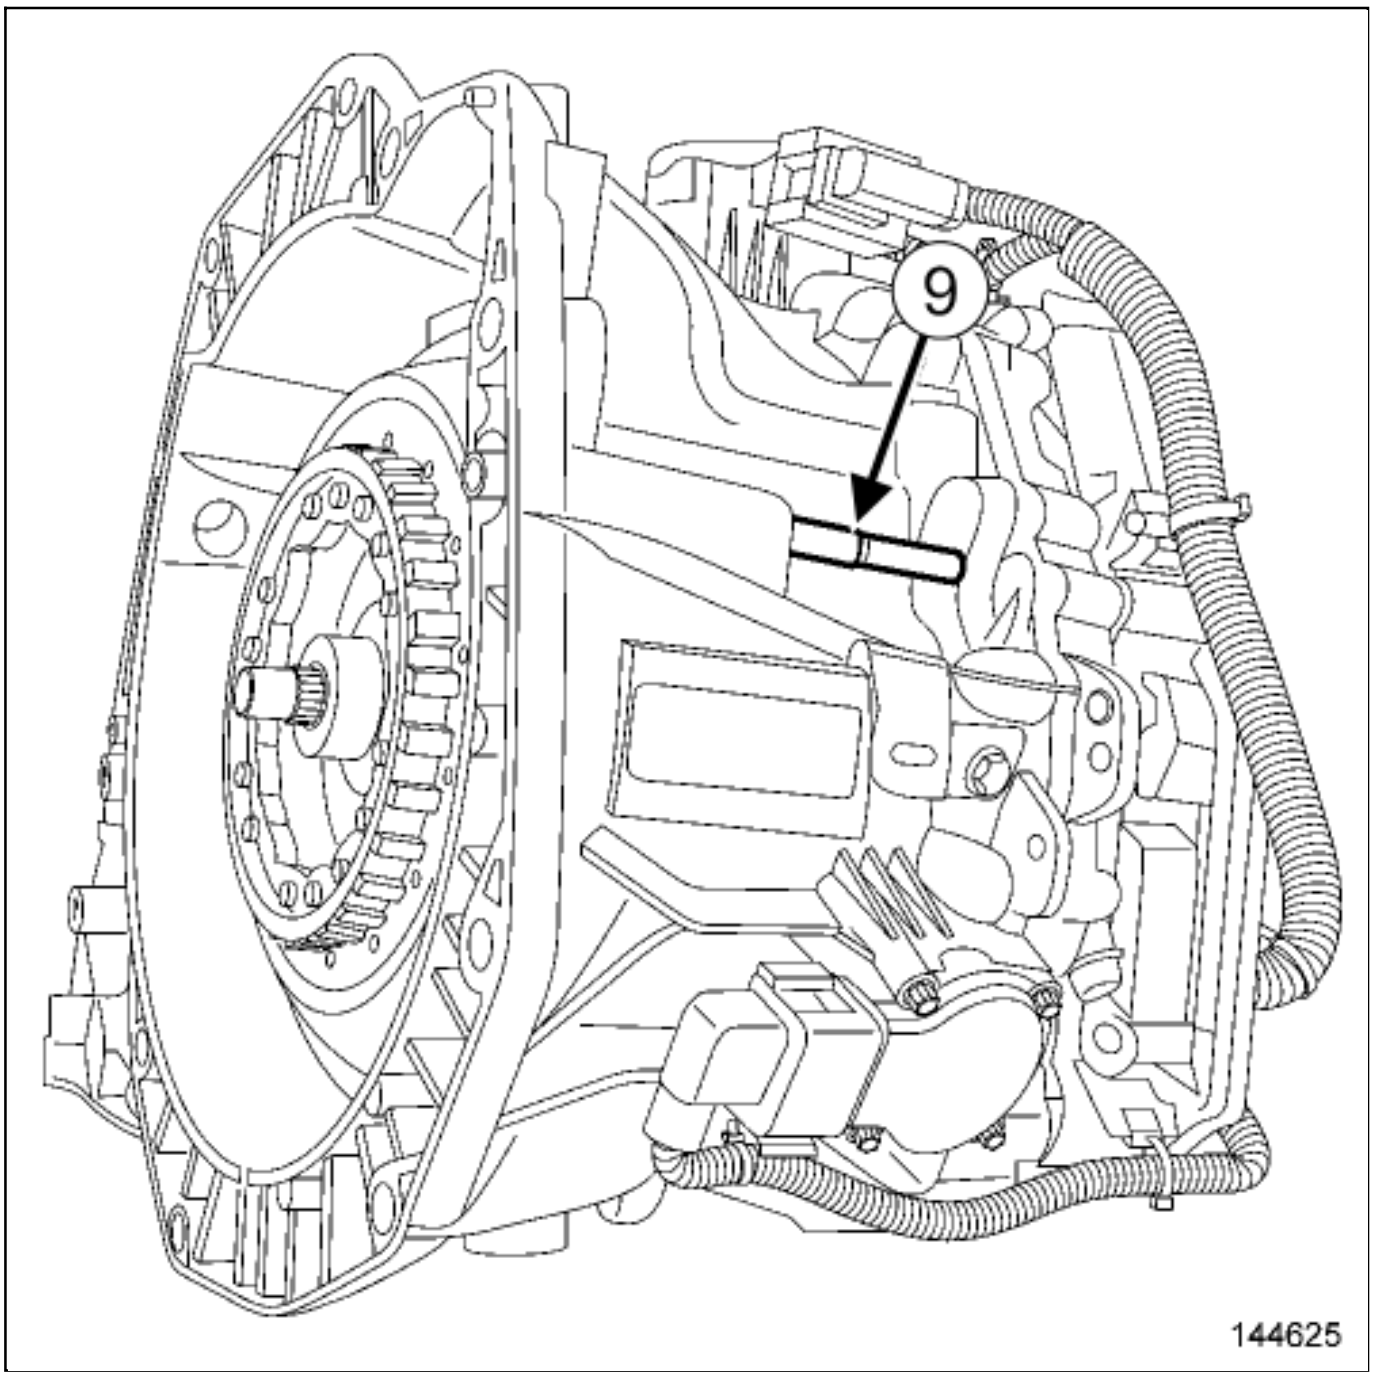
Note:

This operation requires two people due to the weight of the gearbox.

REFITTING

1. REFITTING PREPARATION OPERATION

Clean:



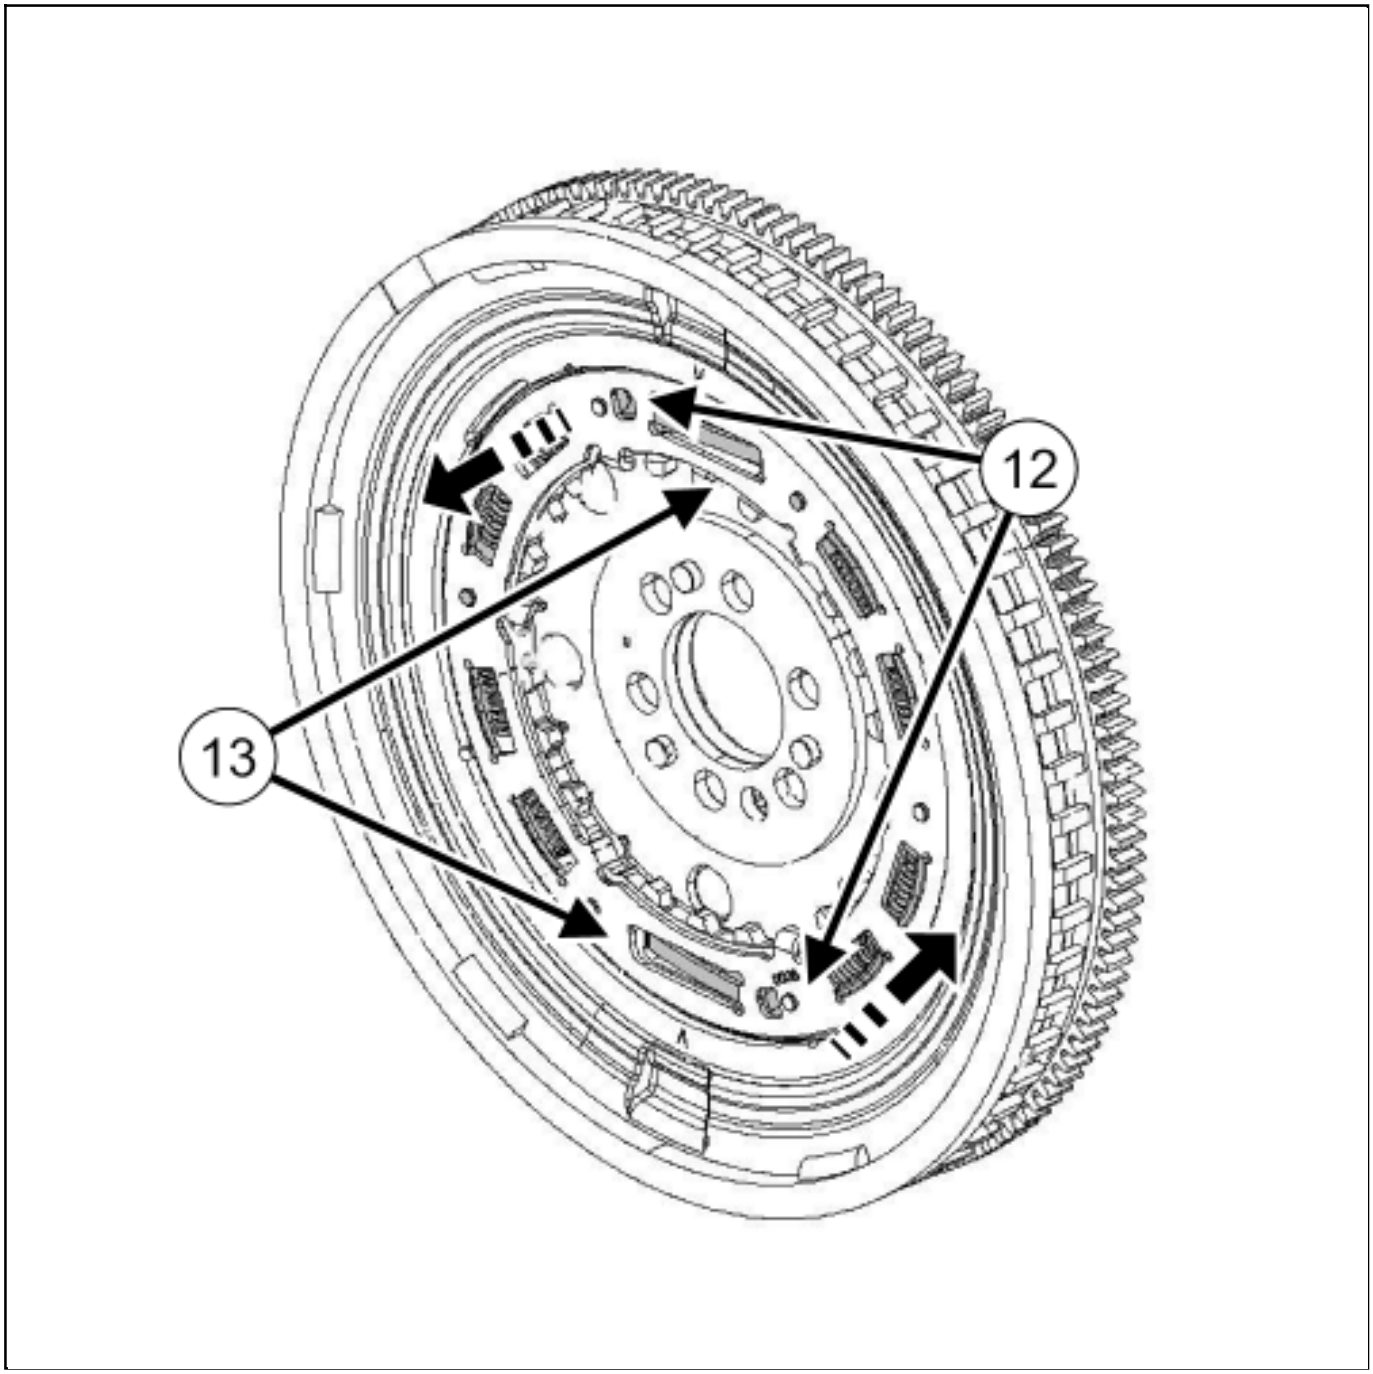
- all the removed parts Vehicle: Parts and consumables for the repair ,
- the joint face of the automatic gearbox and engine casings Vehicle: Parts and consumables for the repair .

parts always to be replaced: Differential output seal .

CAUTION

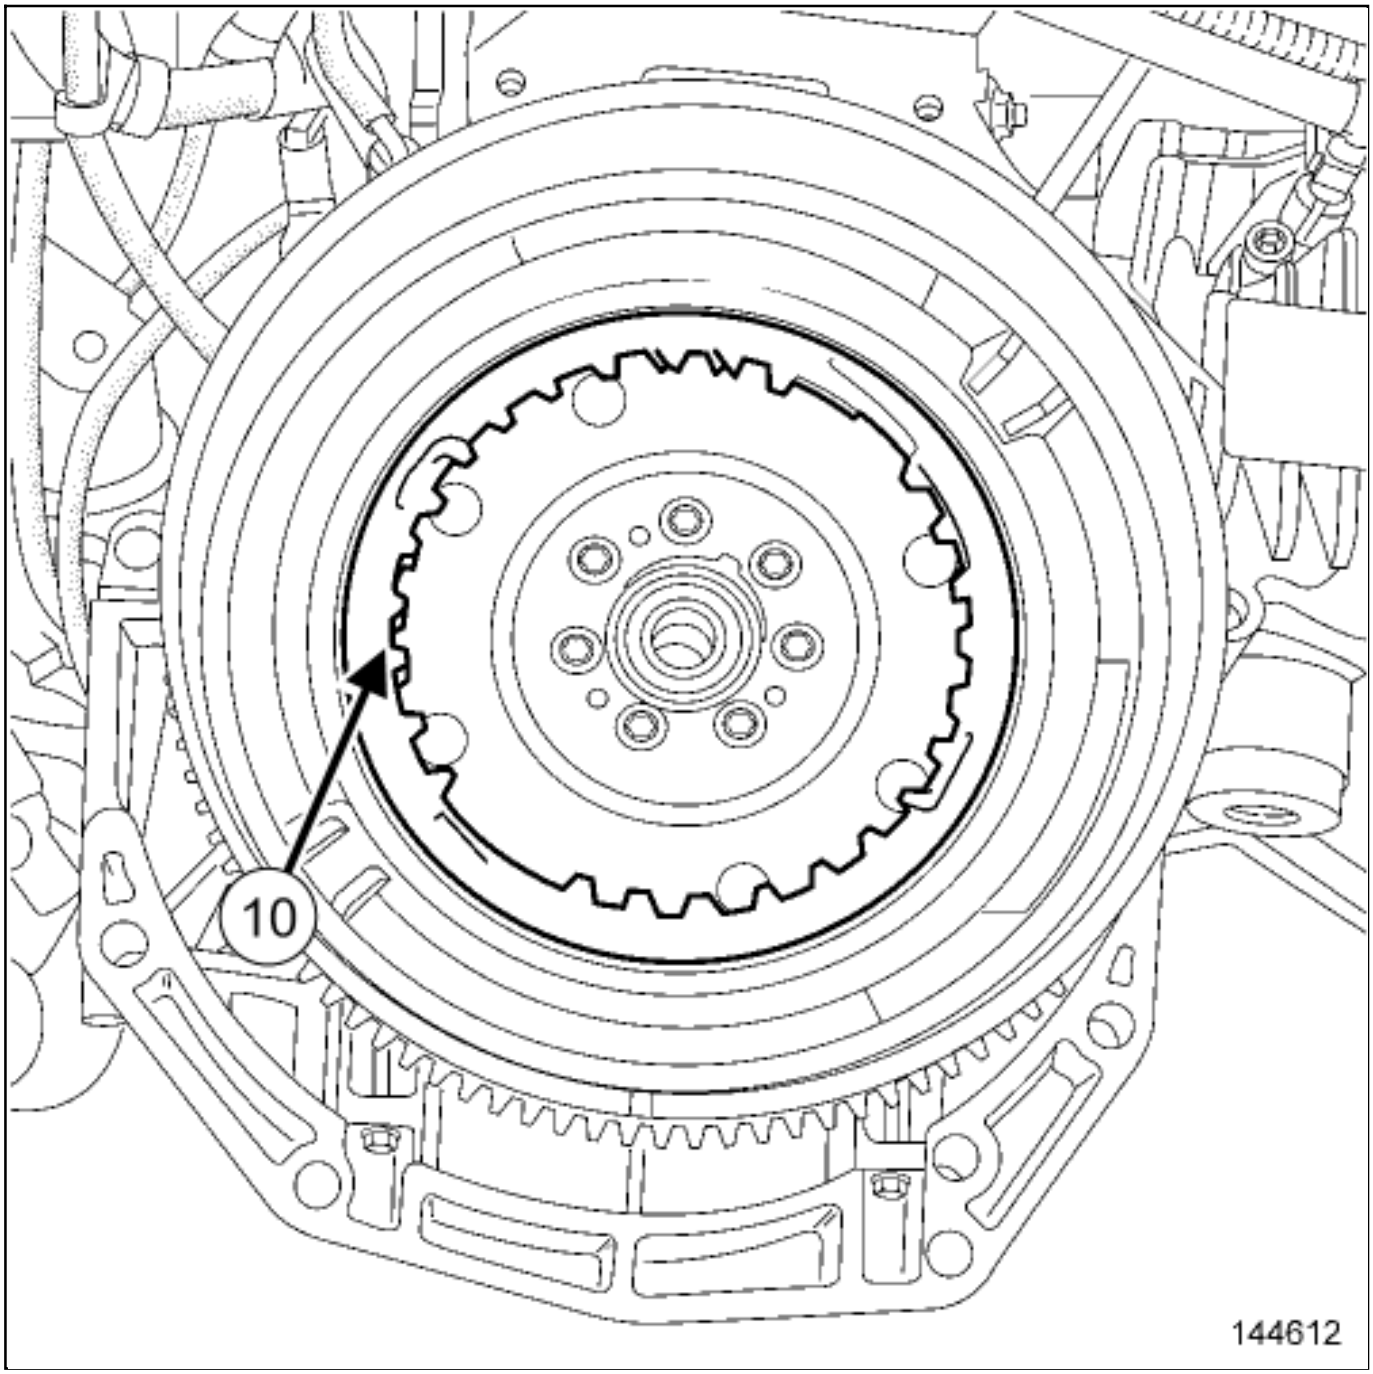
Failure to observe the following procedure may damage the system connecting the clutch to the flywheel of the automatic gearbox.

Check for the presence of centring dowels on the gearbox casing.

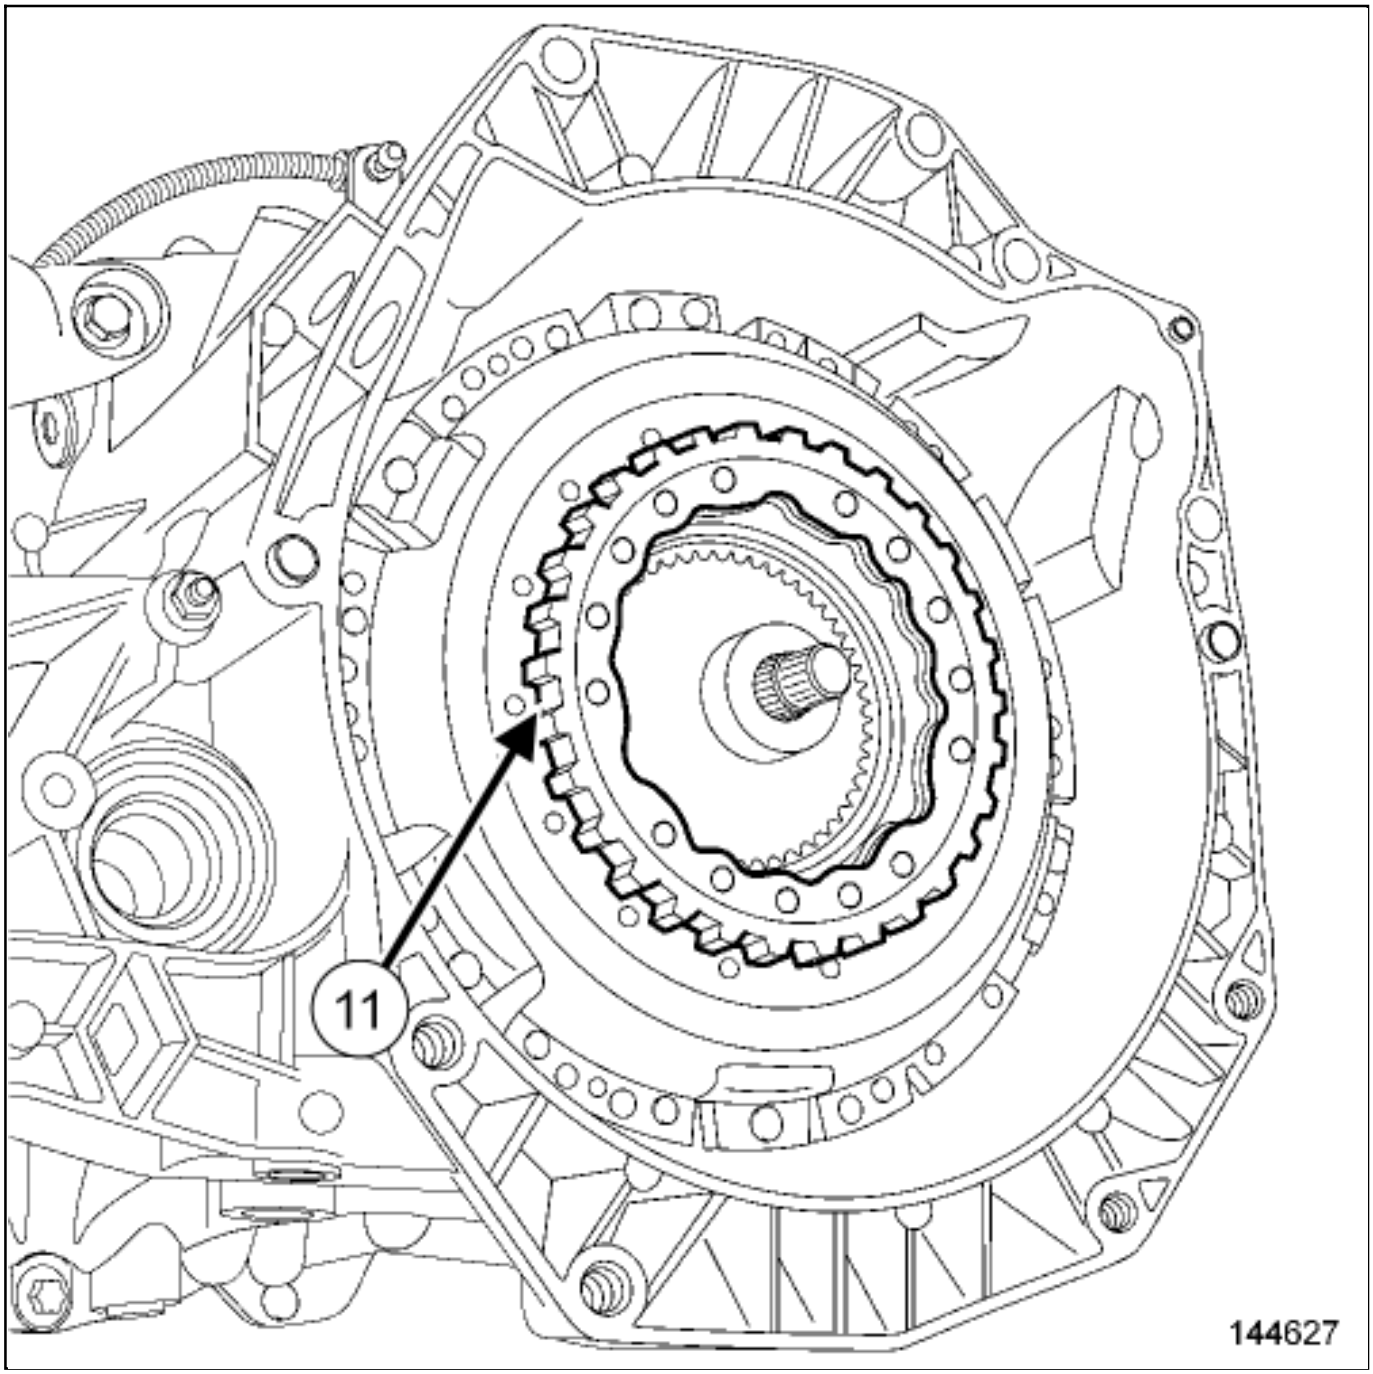


- Position the stud (9) on the gearbox.

- Correctly position the gearbox on the component jack.



Note:



Failure to observe the following procedure may result the flywheel destruction .

- Insert screwdriver in these holes(12) and applied an effort following the arrows.

- Lock the tabs(13) .

10
144612

Move aside the engine wiring.

Note:

Correctly position the gearbox using a component jackso that the gearbox bearing face is exactly parallel to the engine bearing face, and the flywheel splines(10) and the clutch pressure plate splines(11) are aligned.

2. REFITTING OPERATION

Refit the gearbox using a component jack.

Note:

This operation requires two people due to the weight of the gearbox.

Note:

If the flywheel splines and the clutch pressure plate splines do not fit together, turn the clutch pressure plate or the flywheel slightly.

Note:

Check for perfect contact between the bearing face of the gearbox and the engine.

Torque tighten:

- the gearbox studs 7 N.m,
- the gearbox nuts 44 N.m,
- the gearbox bolts 44 N.m.

Remove the safety strap(s) from the gearbox.

3. FINAL OPERATION

Refit the left-hand suspended engine mounting Engine-gearbox unit support assembly: Exploded view .

Clip the rail protector drain pipe onto the gearbox.

Refit:

- the front axle subframe Front axle assembly: Exploded view ,
- the radiator mounting cross member,
- the front bumper Front bumper assembly: Exploded view ,
- new differential output seals (see 23A, Automatic gearbox , Differential output seal: Removal - Refitting) ,
- the front right-hand driveshaft Front hub carrier assembly: Exploded view ,
- the front left-hand driveshaft Front hub carrier assembly: Exploded view .

Fill the automatic gearbox (see 23A, Automatic gearbox , Automatic gearbox oil: Draining - Filling) .

Refit:

- the starter Starter: Removal - Refitting ,
- the front section of the front wheel arch liners Exterior body front trim assembly: Exploded view ,
- the front wheels Front hub carrier assembly: Exploded view .

Note:

Refit the earth terminal at the mark made by the indelible marker on the gearbox casing.

When reassembling, improper positioning of the earth terminal on the gearbox casing could result in damage to the earth terminal or earth wiring

Torque tighten the gearbox earth cable bolt24 N.m.

Position the engine wiring on the gearbox.

Connect the gearbox computer connector.

Refit the engine wiring bolts onto the gearbox.

Clip the following onto the gearbox:

- the breather pipe on the gearbox,
- the engine harness channel.

Refit:

- the crankshaft position sensor(see **Crankshaft position sensor: Removal - Refitting**) ,
- the engine undertray.

Fit the gear control cable.

Clip:

- the gear control cable on the support,
- the gear control cable on the selector ball joint,
- the battery wiring channel on the left-hand suspended engine mounting.

Adjust the gear control unit.Gear control unit: Adjustment

Refit the air filter unitAir inlet assembly: Exploded view .

Refit:

- the battery trayBattery tray: Removal - Refitting ,
- the batteryBattery: Removal - Refitting ,
- the engine cover.

Apply the After repair procedure using the Diagnostic toolDiagnostic tool : Use :
-Computer concerned by the After repair procedure:

- "Automatic gearbox computer" .

XSL version : 3.02 du 22/07/11

AUTOMATICGEARBOX:REPAIR

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

REMOVAL

1. REPAIR PREPARATION OPERATION

Remove:

- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,
- the gear engaged sensorGear engaged sensor: Removal - Refitting ,
- the speed sensorsSpeed sensor: Removal - Refitting ,
- the automatic transmission computerAutomatic gearbox computer : Removal - Refitting ,
- the clutch pressure plateClutch: Removal - Refitting ,
- the clutch actuator motorsClutch actuator motor: Removal - Refitting ,
- the clutch thrust bearingClutch thrust bearing: Removal - Refitting ,

- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** ,
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** ,
- the automatic gearbox differential **(see 23A, Automatic gearbox , Automatic gearbox differential: Removal - Refitting)** .
- the gearbox control forks **(see 23A, Automatic gearbox , Gear box control fork: Removal - Refitting)** ,
- the gearbox shafts **(see 23A, Automatic gearbox , Gearbox shaft: Removal - Refitting)** ,
- the mechanism housing **(see 23A, Automatic gearbox , Mechanism housing: Removal - Refitting)** ,

2. REPAIR OPERATION

Strip:

- the output shafts **(see 23A, Automatic gearbox , Output shaft: Stripping - Rebuilding)** ,
- the input shaft **(see 23A, Automatic gearbox , Input shaft: Stripping - Rebuilding)** .

Check the automatic gearbox **(see 23A, Automatic gearbox , Automatic gearbox: Check)** .

Remove:

- the automatic gearbox differential bearings **(see 23A, Automatic gearbox , Automatic gearbox differential bearing: Removal - Refitting)** ,
- the mechanism housing bearings(see) ,
- the fork shaft rings **(see 23A, Automatic gearbox , Fork shaft ring: Removal - Refitting)** .

REFITTING

1. REFITTING PREPARATION OPERATION

Replace worn or damaged parts.

Clean all the removed parts**Vehicle: Parts and consumables for the repair** (04B, Consumables - Products).

Always replace:

- the lip seals,
- the O-rings,
- the shaft bearing lock rings,
- the removed bearings,
- the magnet.

Refit:

- new fork shaft rings**(see 23A, Automatic gearbox , Fork shaft ring: Removal - Refitting)** ,
- new mechanism housing bearings(see) ,
- new automatic gearbox differential bearings**(see 23A, Automatic gearbox , Automatic gearbox differential bearing: Removal - Refitting)** .

Rebuild:

- the input shaft**(see 23A, Automatic gearbox , Input shaft: Stripping - Rebuilding)** ,

the output shafts(see 23A, Automatic gearbox , Output shaft: Stripping - Rebuilding) .

2. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

AUTOMATIC GEARBOX WIRING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Note:

Do not touch the metal contacts of the computer - an electrostatic discharge can damage the shift drum actuator motors.

REMOVAL

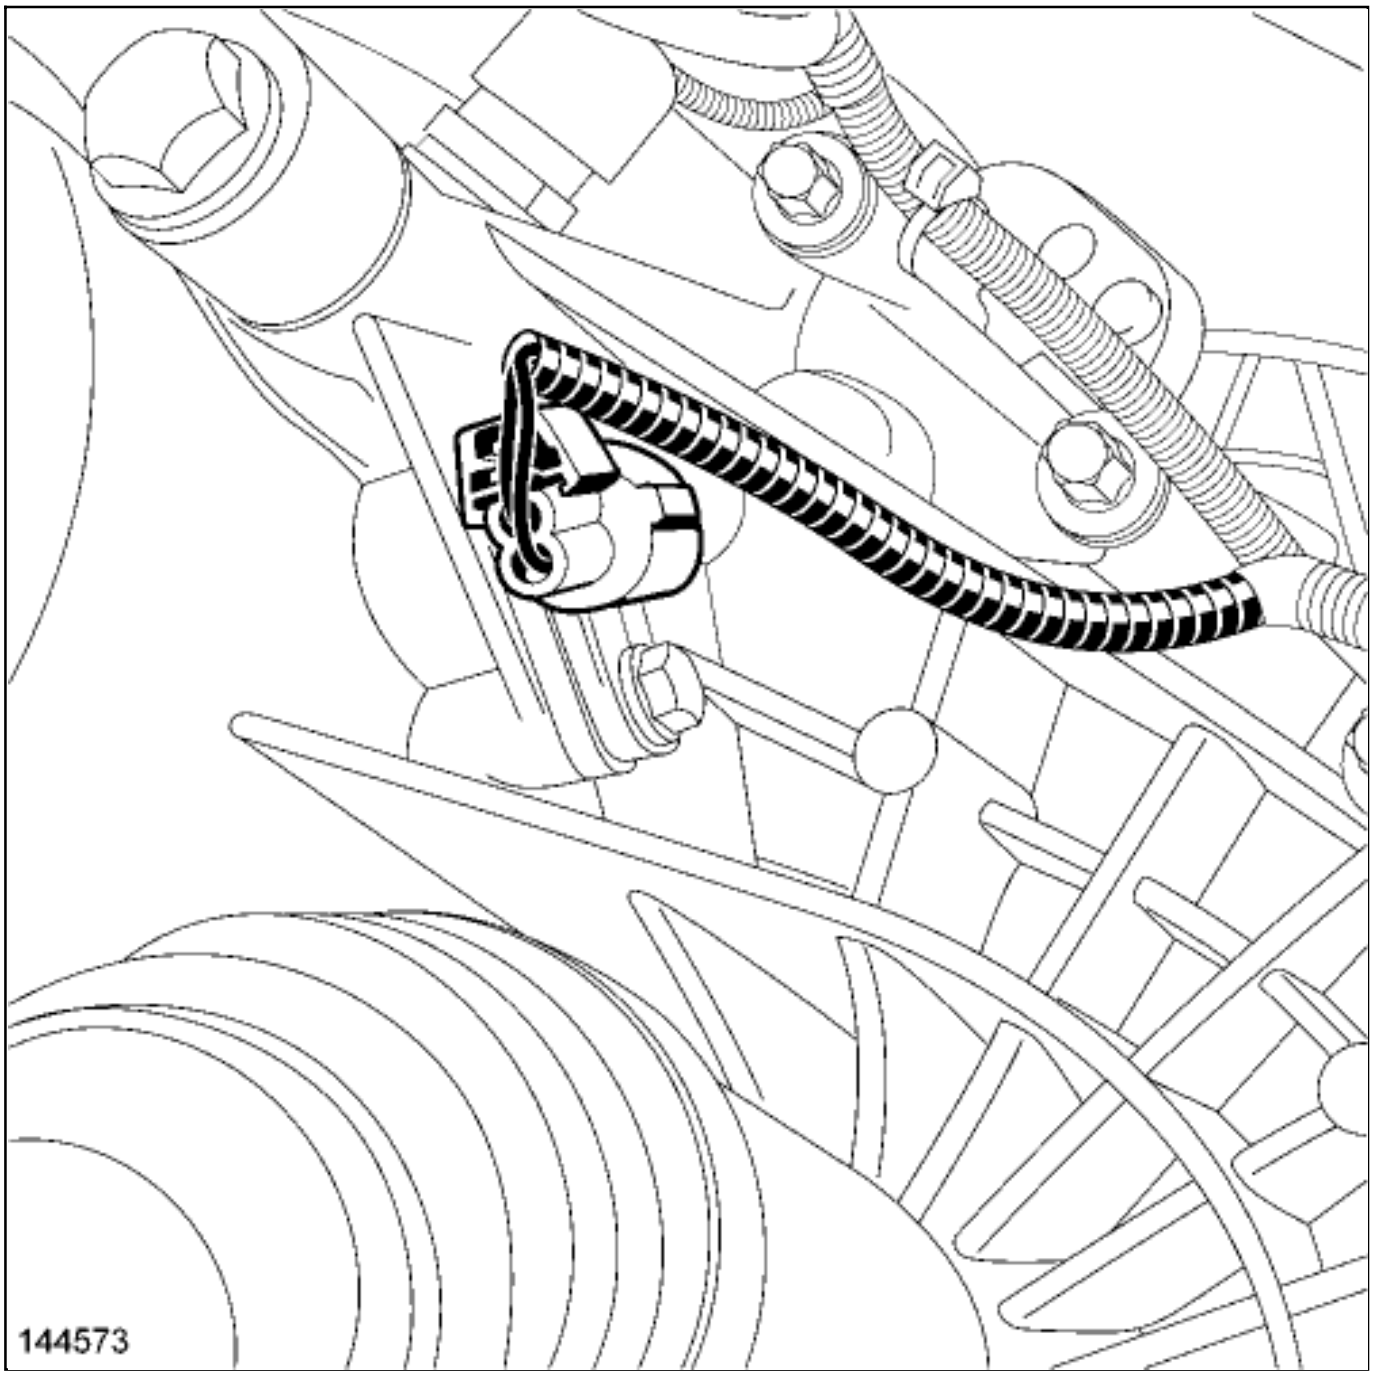
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post lift Vehicle: Towing and lifting .

Remove:

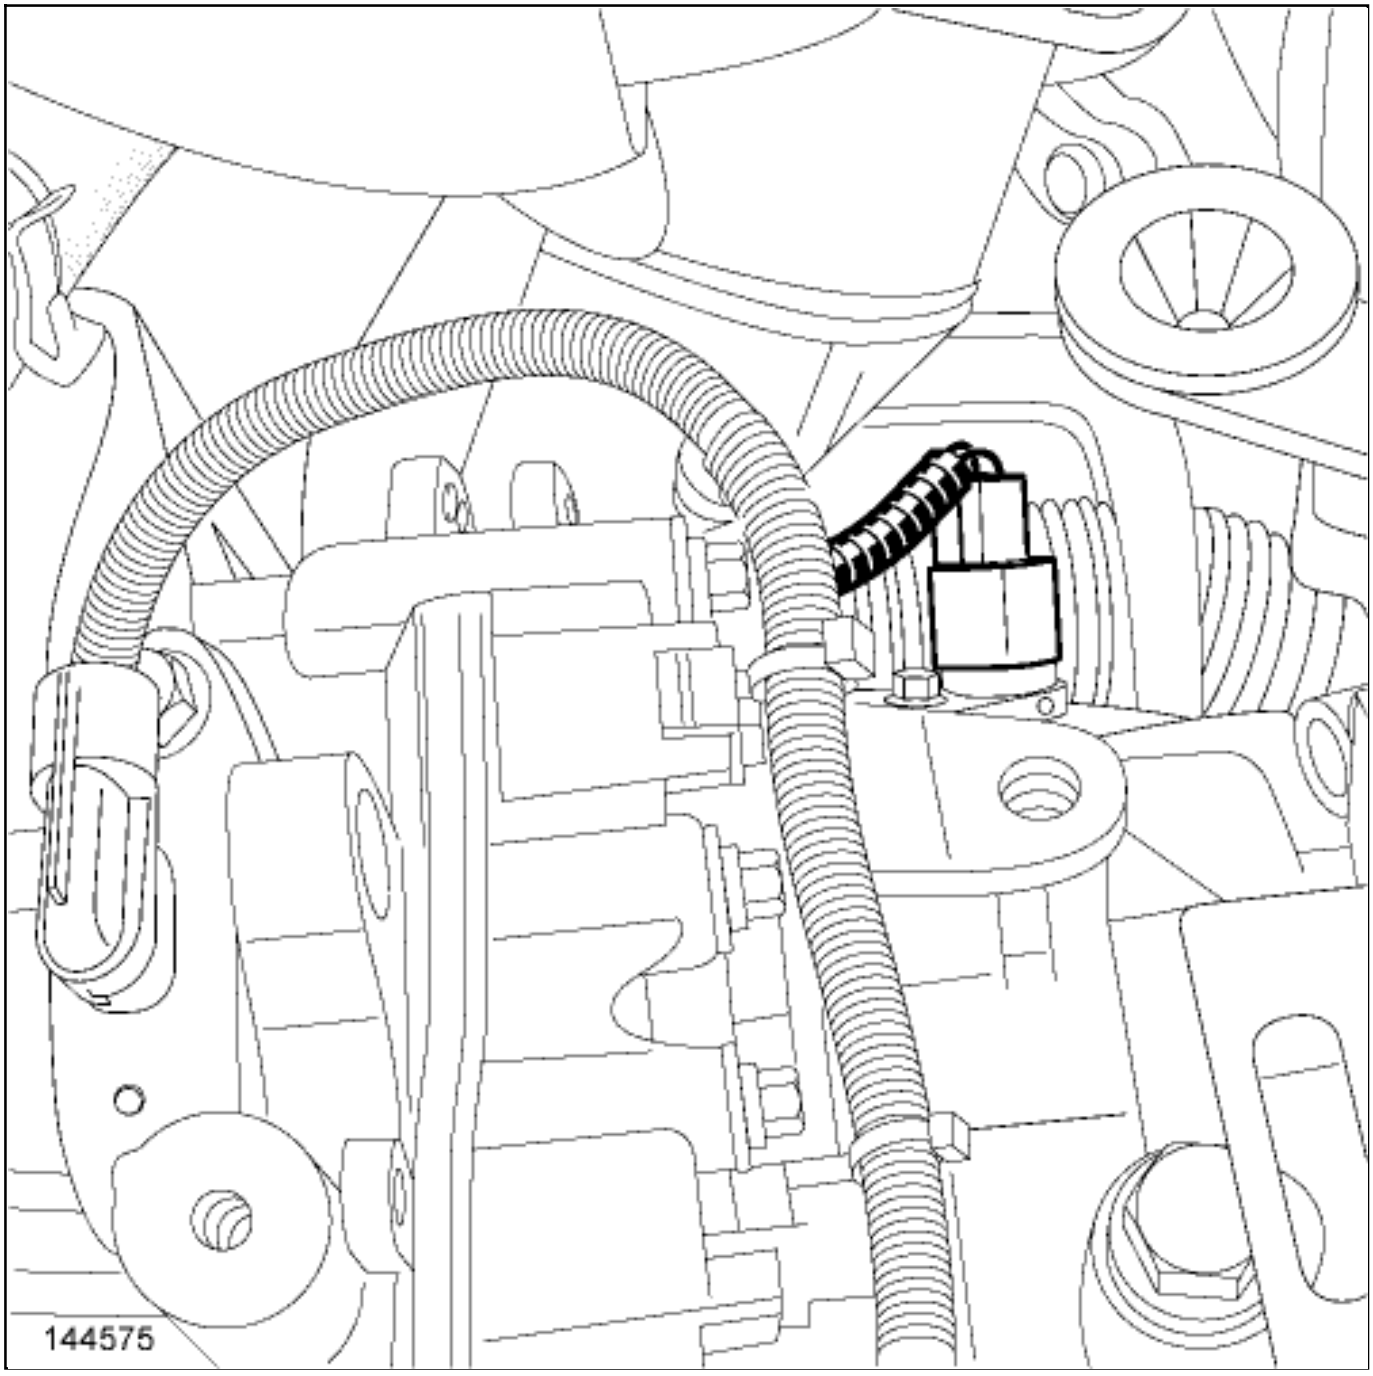
- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting ,
- the front left-hand wheel Wheel: Removal - Refitting ,
- the front section of the front left-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) ,
- the engine undertray.

2. REMOVAL OPERATION

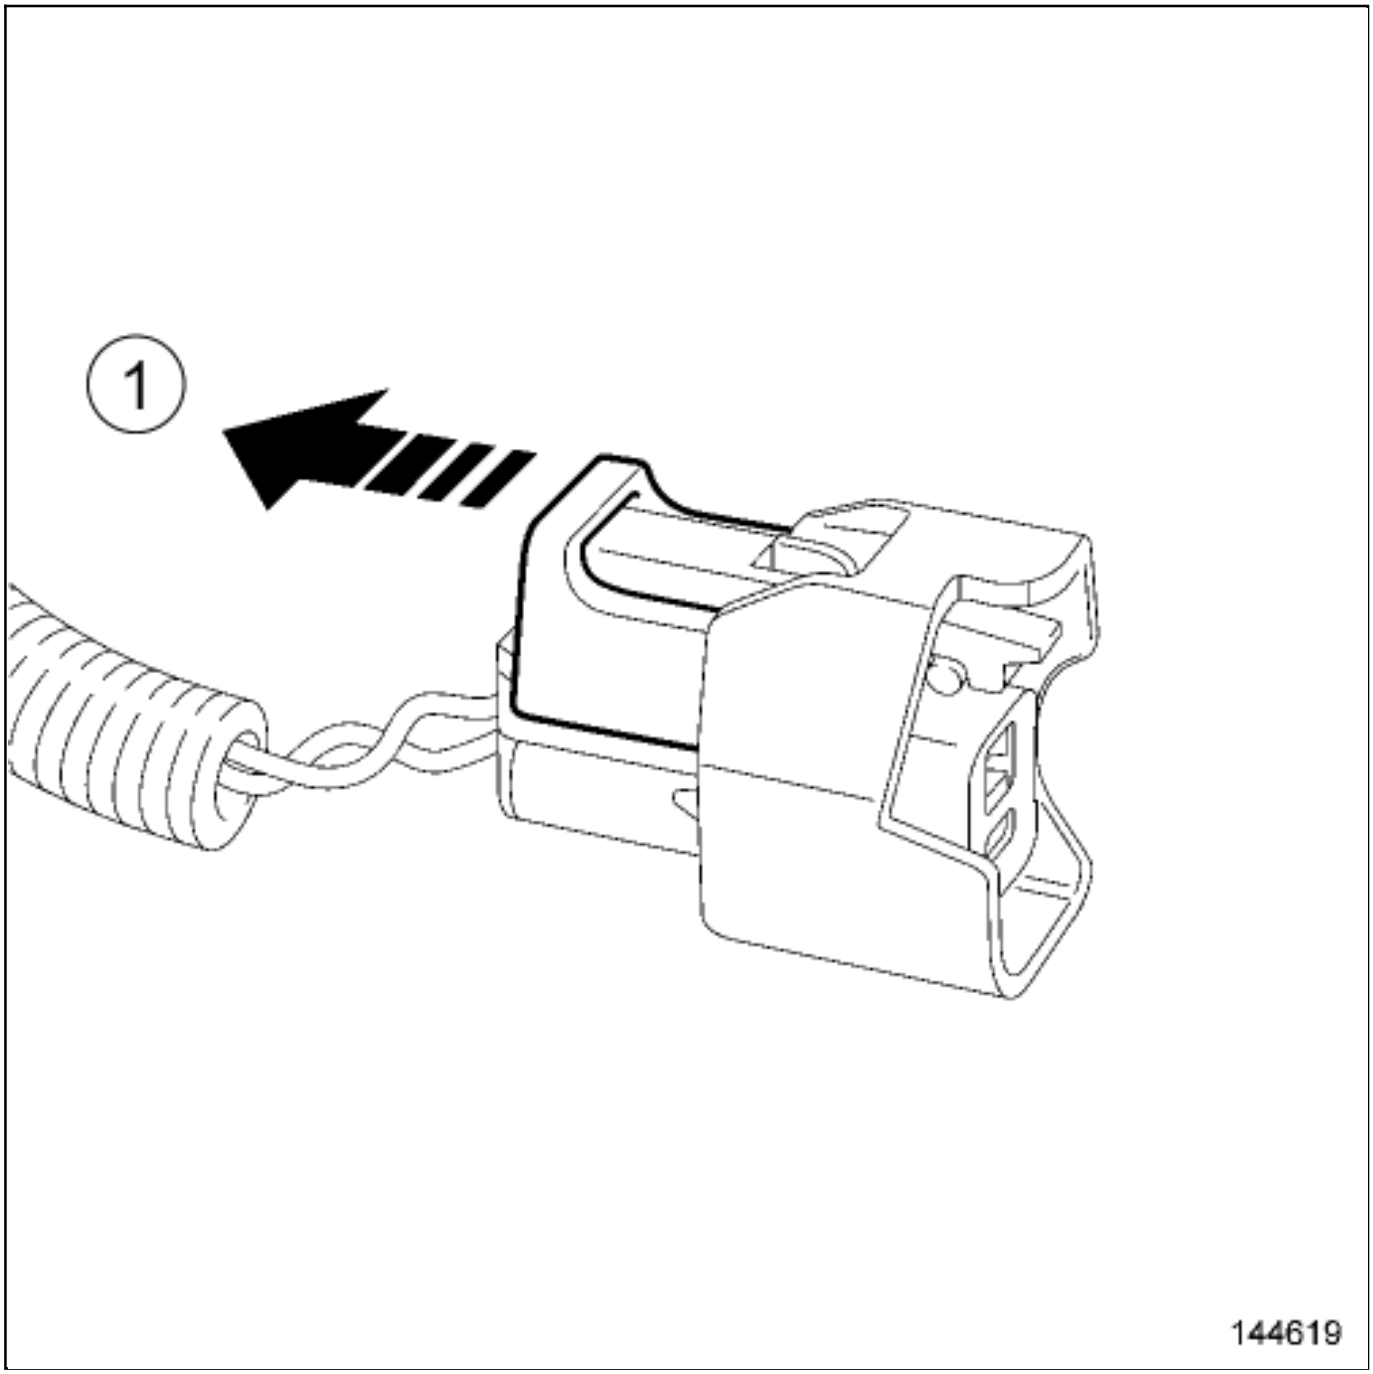


Note:

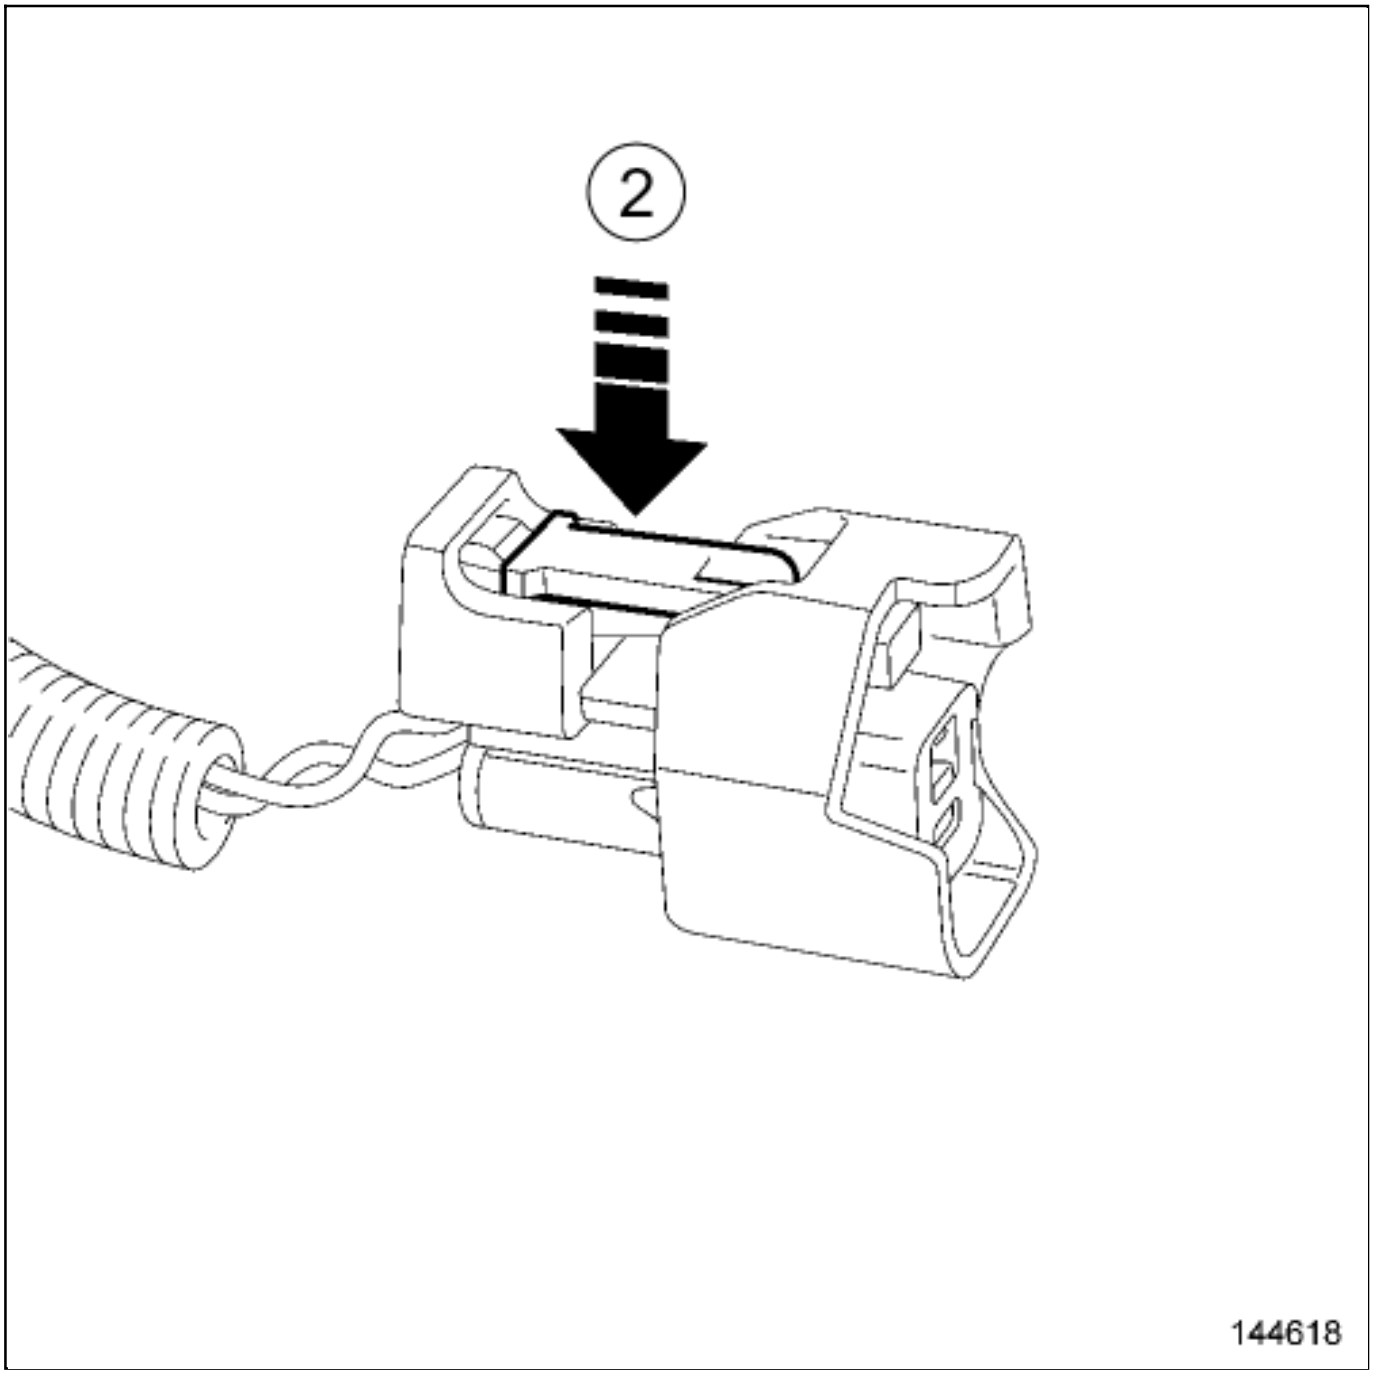
The connectors have a locking system.



CAUTION

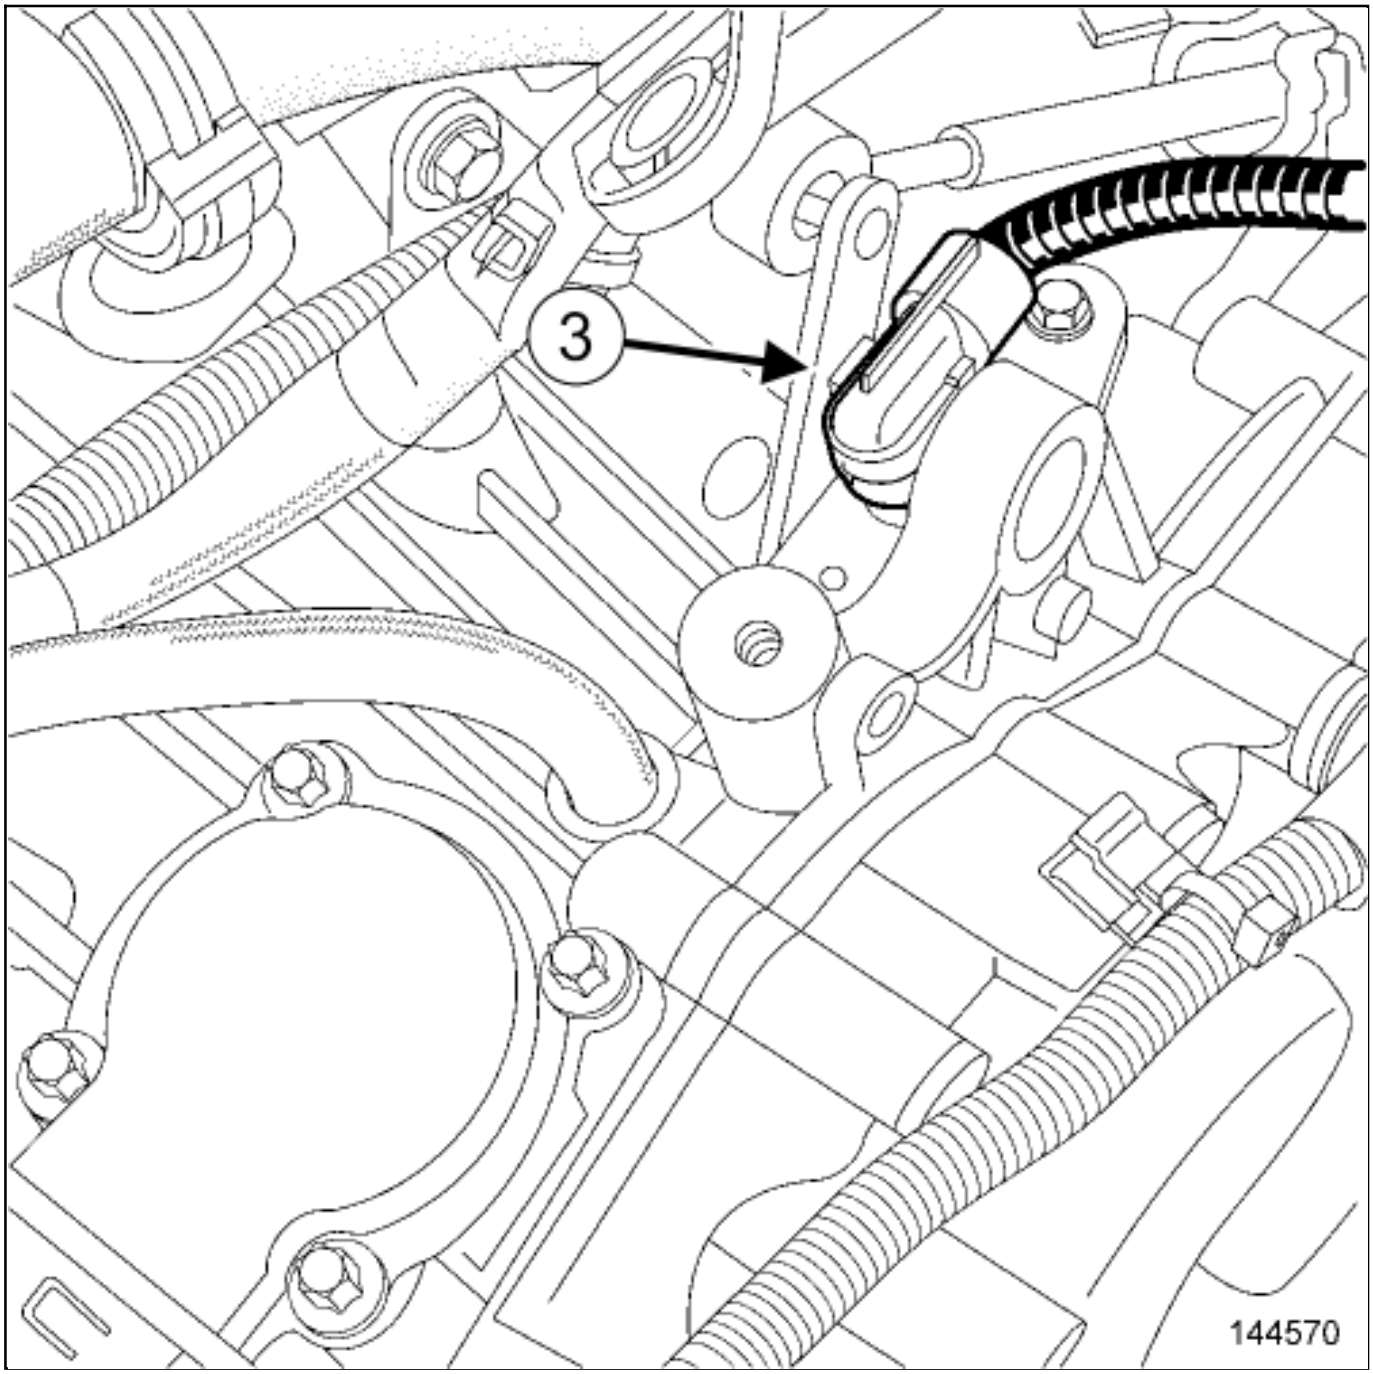


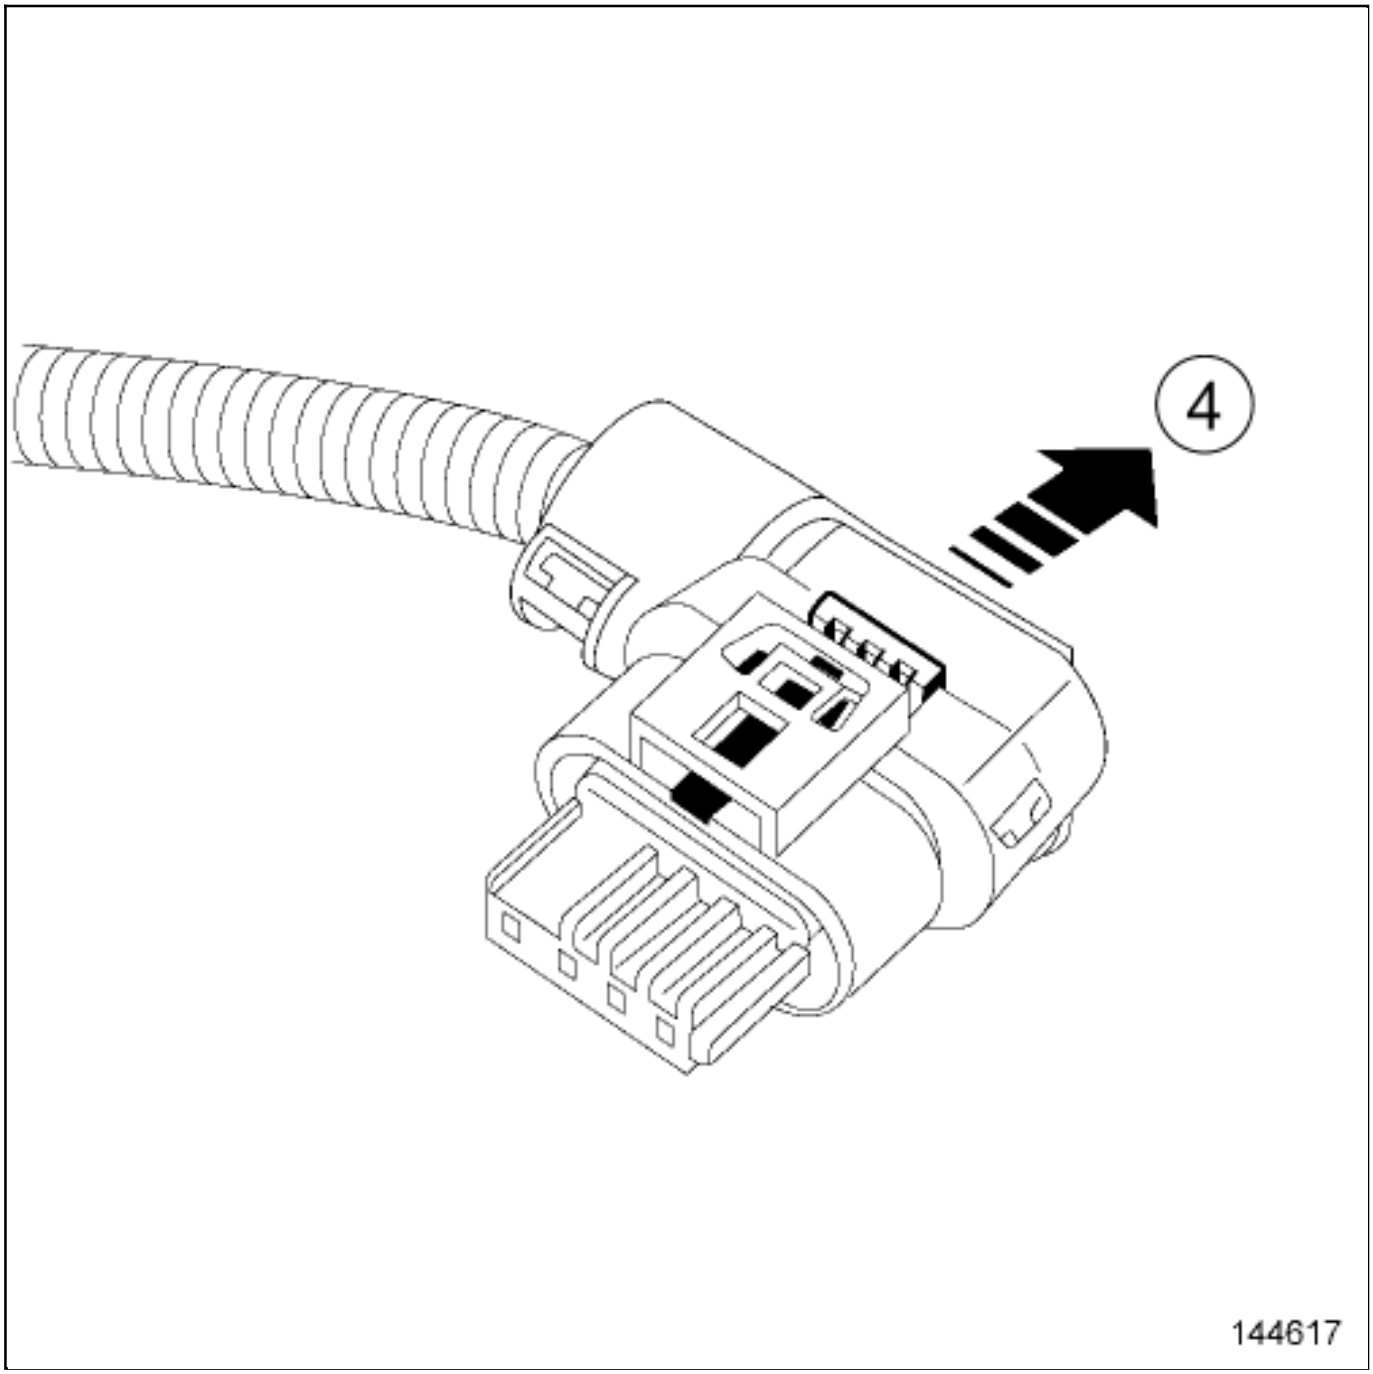
Failure to observe the following procedure could damage the connector.



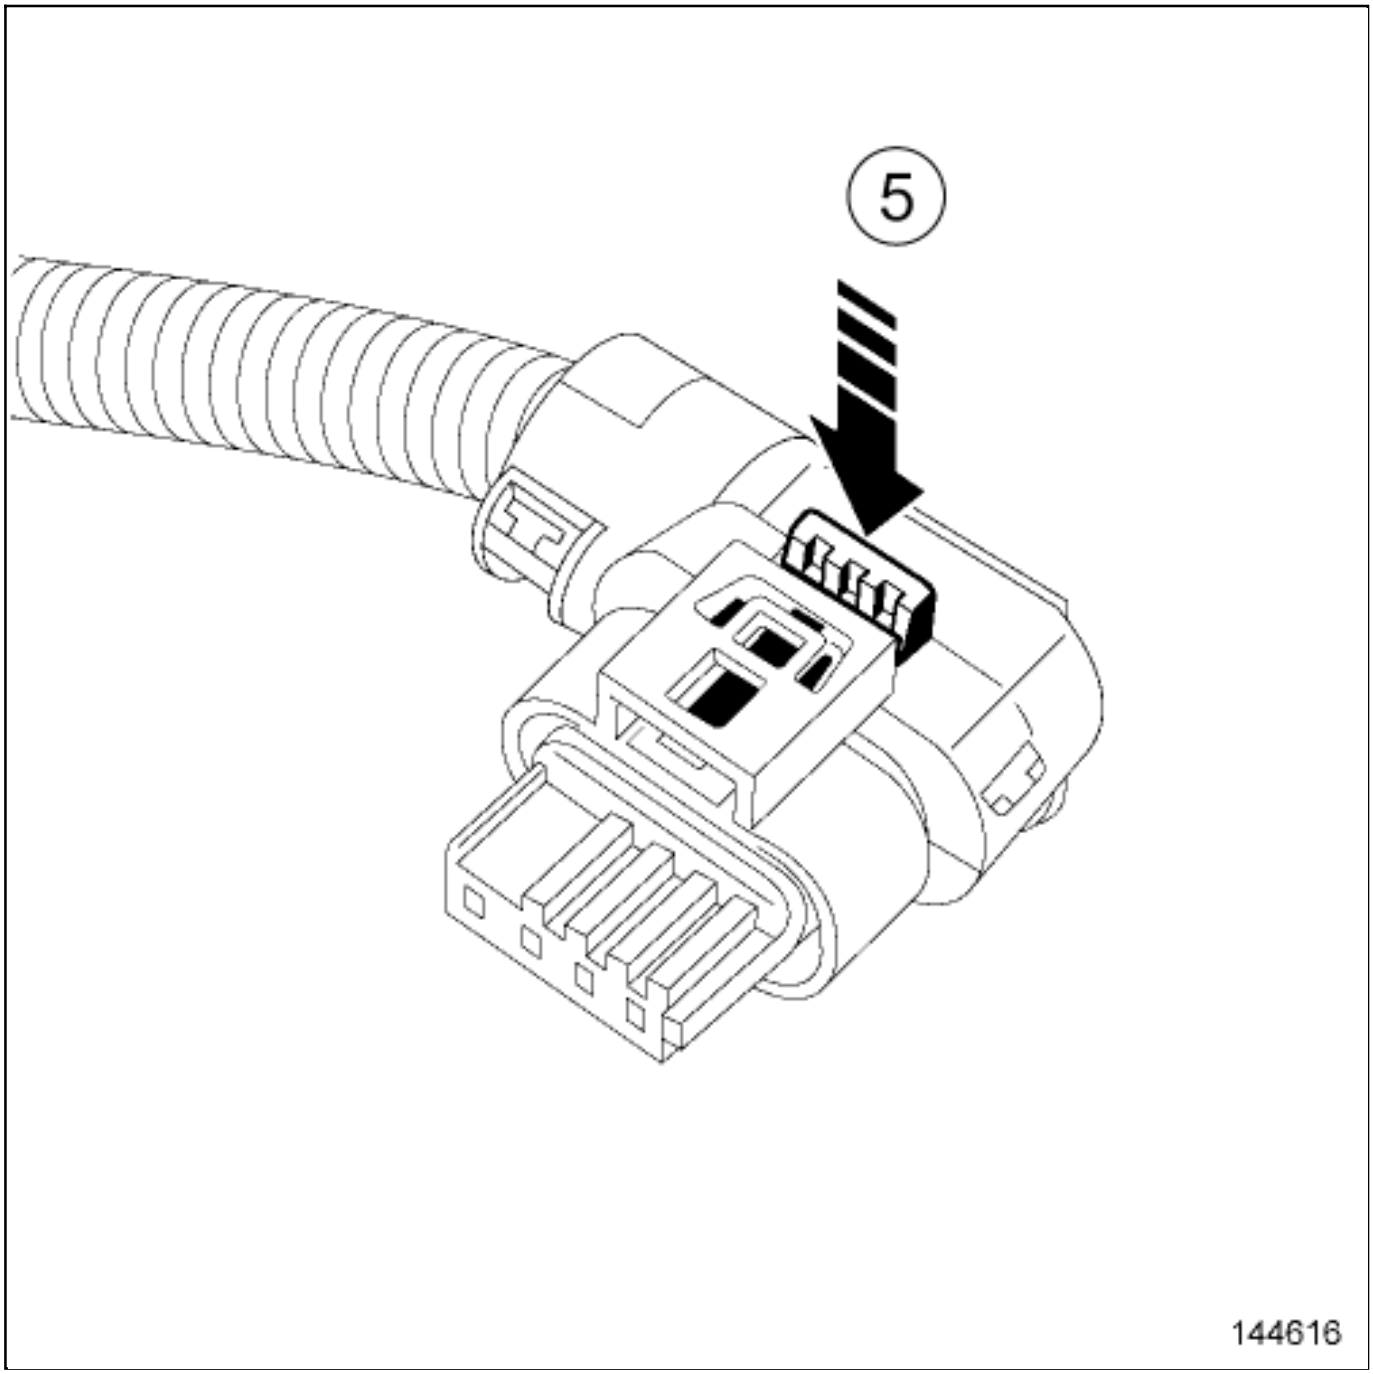
THIRD GEAR CONNECTOR

FOURTH GEAR CONNECTOR





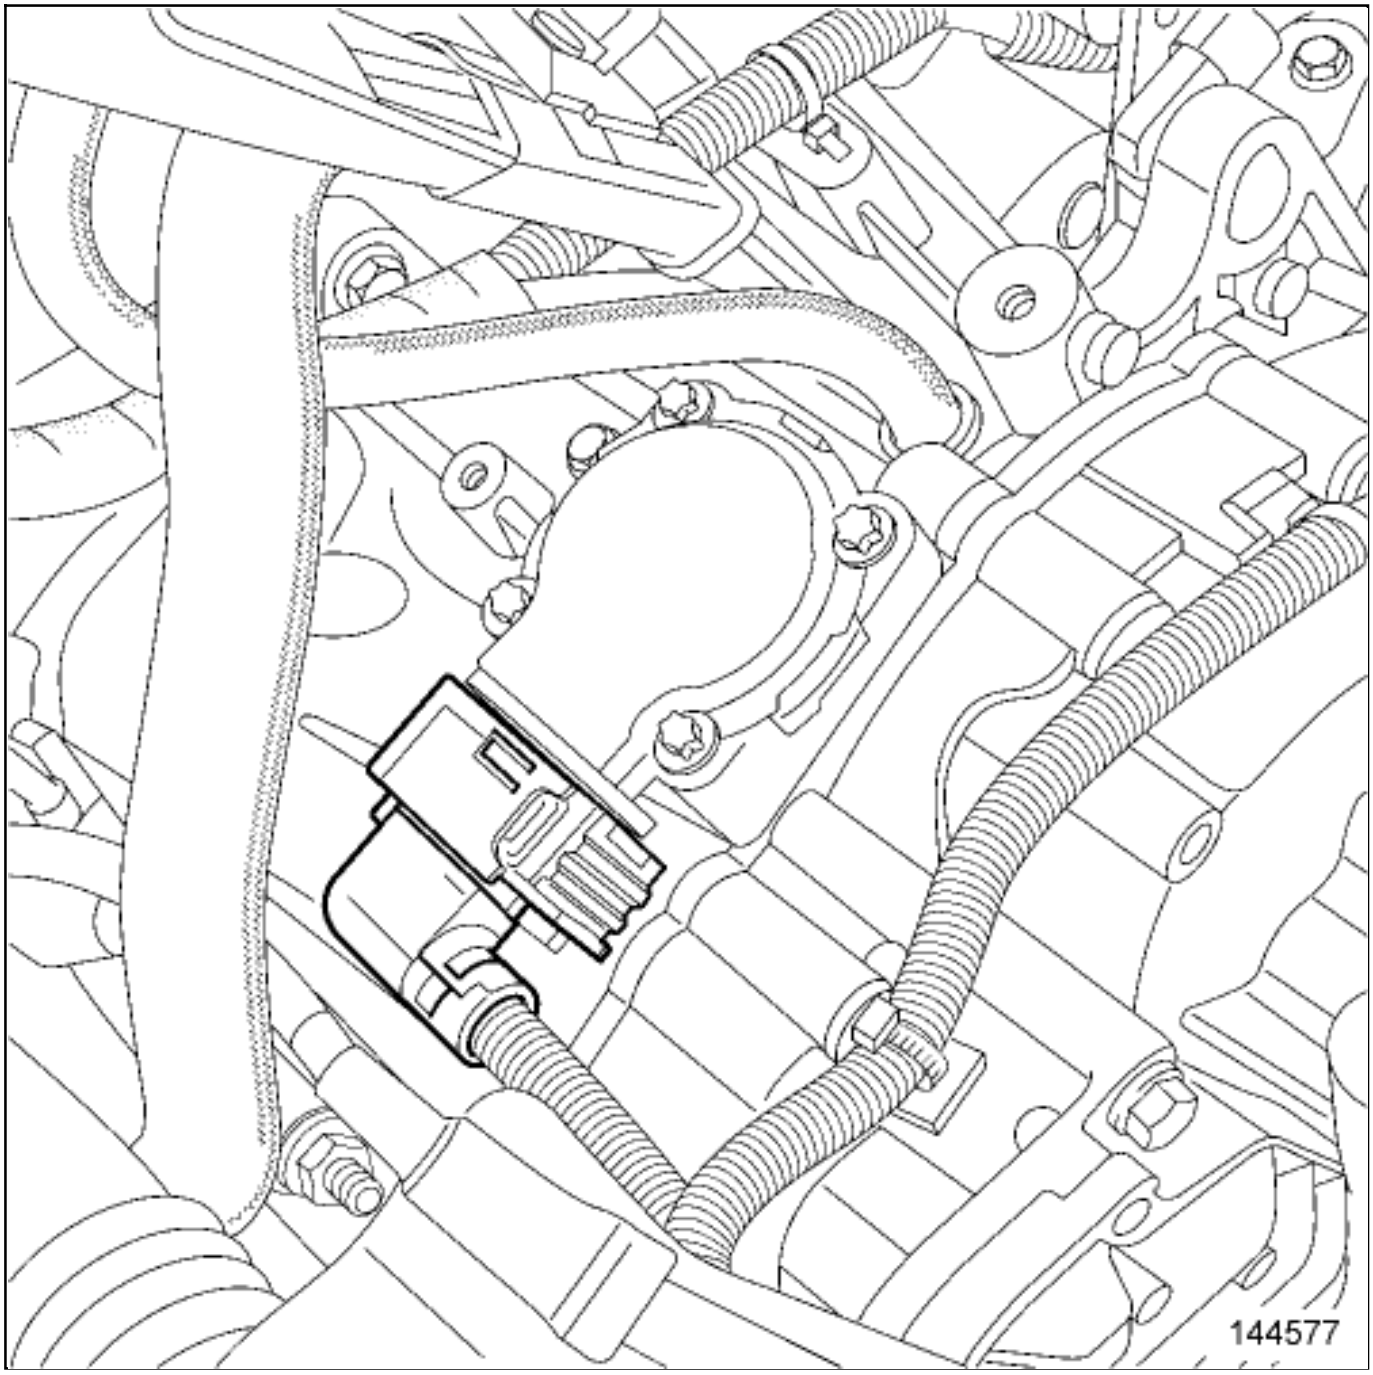
1
144619



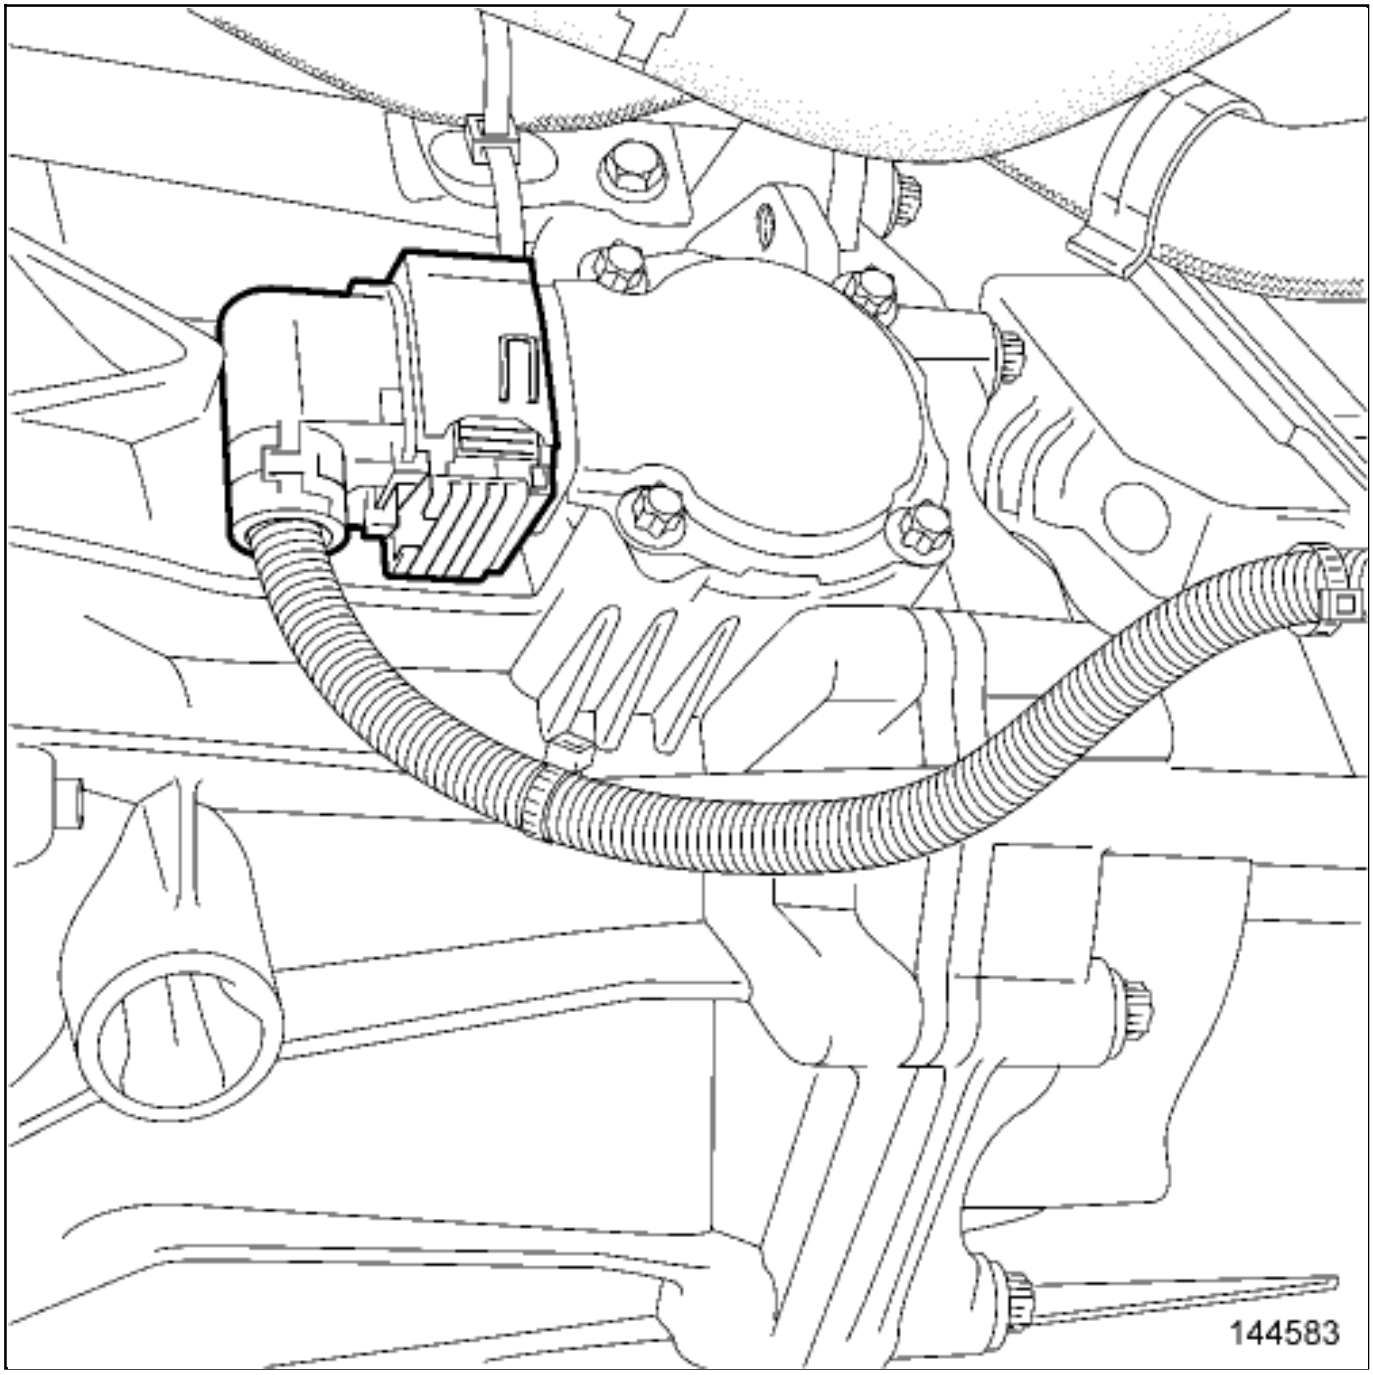
Disconnect the connectors of the engine speed sensor of third gear and fourth gear by:

- unlocking the connector locking system(1) ,
- pressing the tab(2) and pulling the connector.

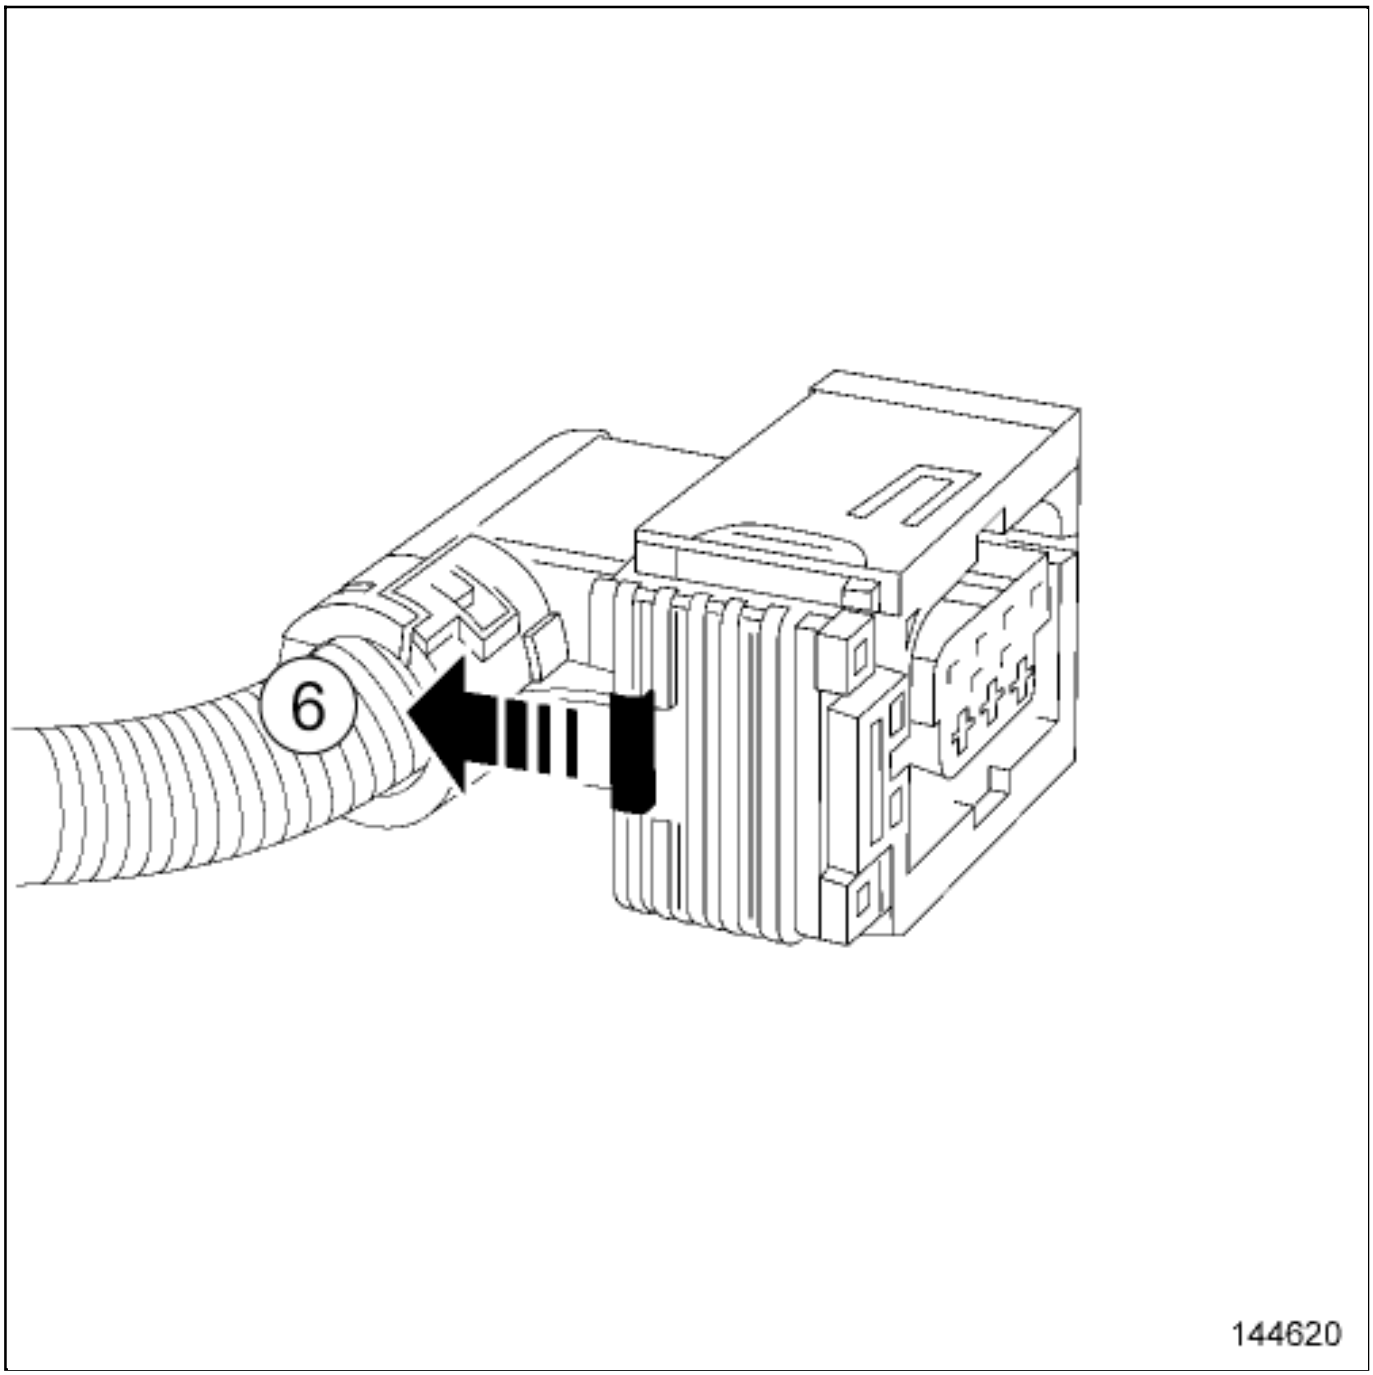
3
144570



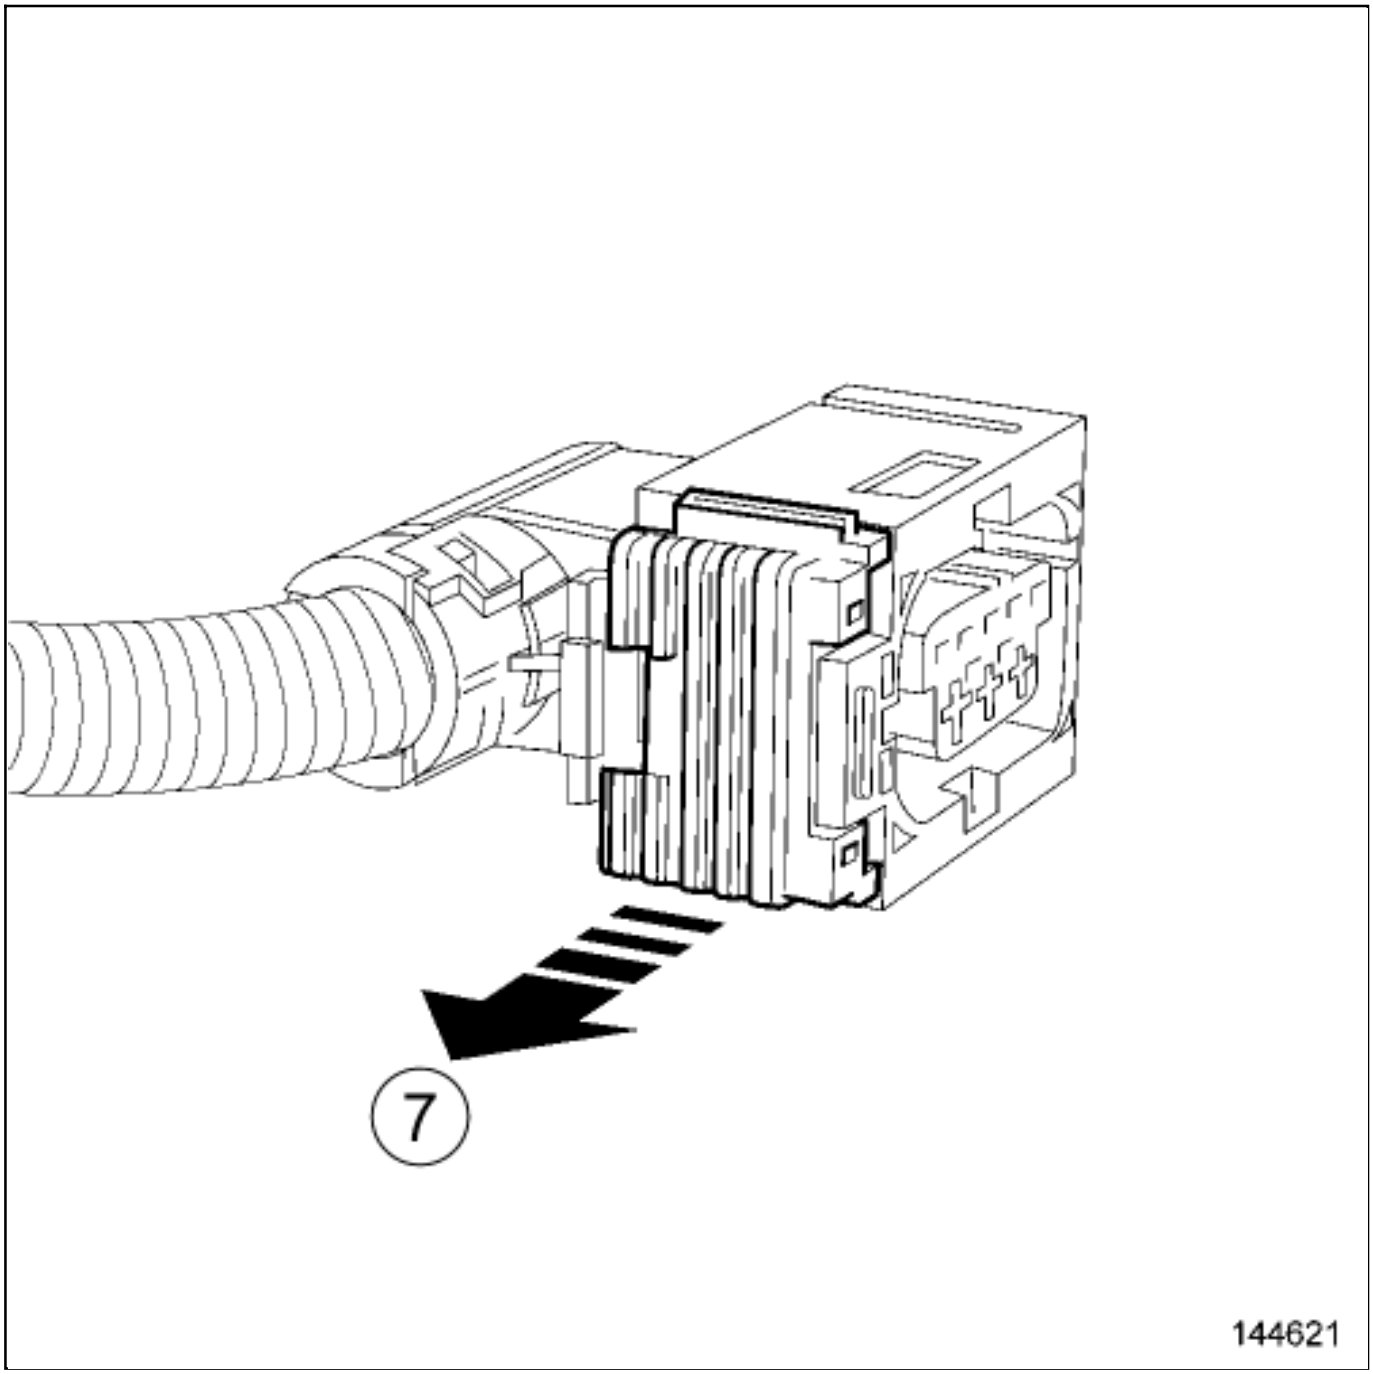
4
144617



Disconnect the gear engaged sensor connector(3) :

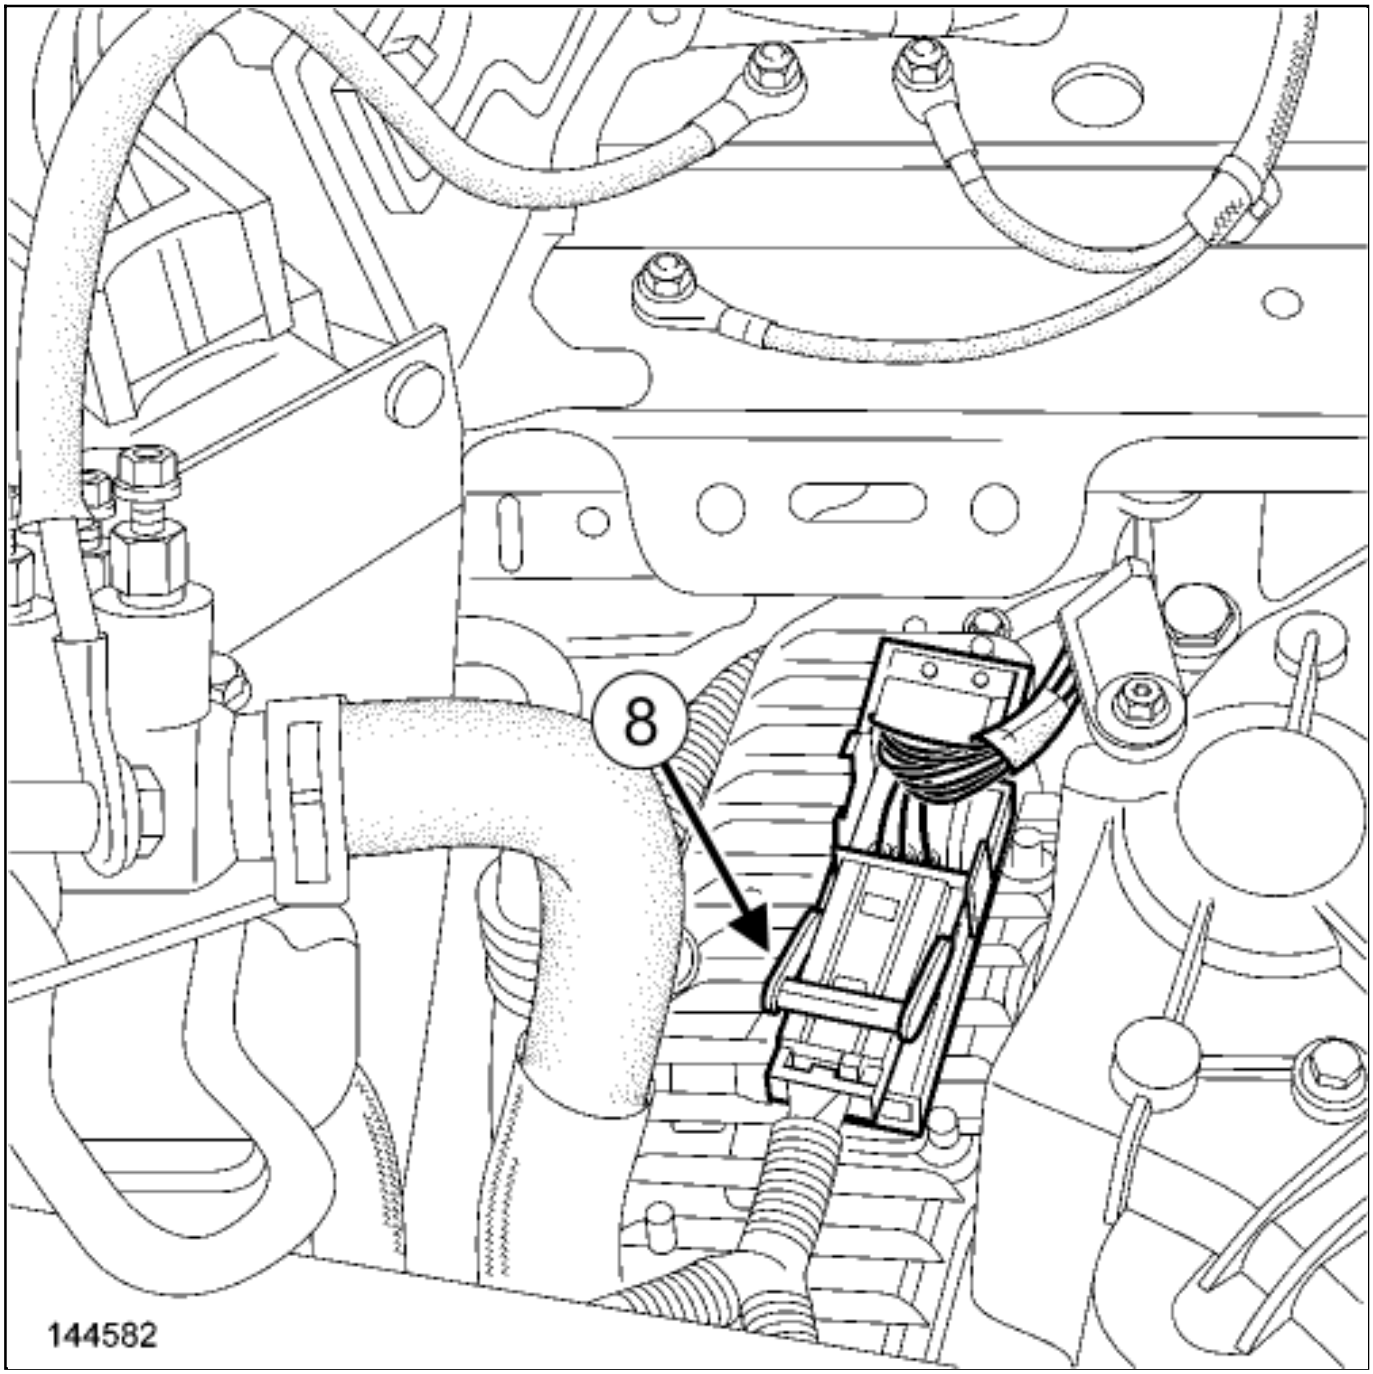


- by unlocking the connector locking system(4) ,
- pressing the tab(5) and pulling the connector.



CONNECTOR OF THE UPPER CLUTCH ACTUATOR MOTOR

CONNECTOR OF THE LOWER CLUTCH ACTUATOR MOTOR



144583

6
144620

Disconnect the connector of the upper clutch actuator motor and the connector of the lower clutch actuator motor by:

- unlocking the connector locking system(**6**) ,
- pulling the tab(**7**) .

- Disconnect the connectors(8) from the gearbox computer.
- Unclip the automatic gearbox wiring.
- Remove the automatic gearbox wiring.

REFITTING

1. REFITTING PREPARATION OPERATION

Always replace any damaged clips.

2. REFITTING OPERATION

Note:

Observe the correct sequence of steps in order not to swap the connectors.

Connect the following connectors:

- the lower clutch actuator motor,
- the upper clutch actuator motor,
- the gear engaged sensor,
- the engine speed sensors of the automatic gearbox,
- the automatic gearbox computer.

Note:

Position the automatic gearbox wiring, taking care to place the clips on their mounting points.

3. FINAL OPERATION

Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

AUTOMATIC GEARBOX WIRING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,

Vehicle: Precautions for the repair .

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair .

Note:

Do not touch the metal contacts of the computer - an electrostatic discharge can damage the shift drum actuator motors.

REMOVAL

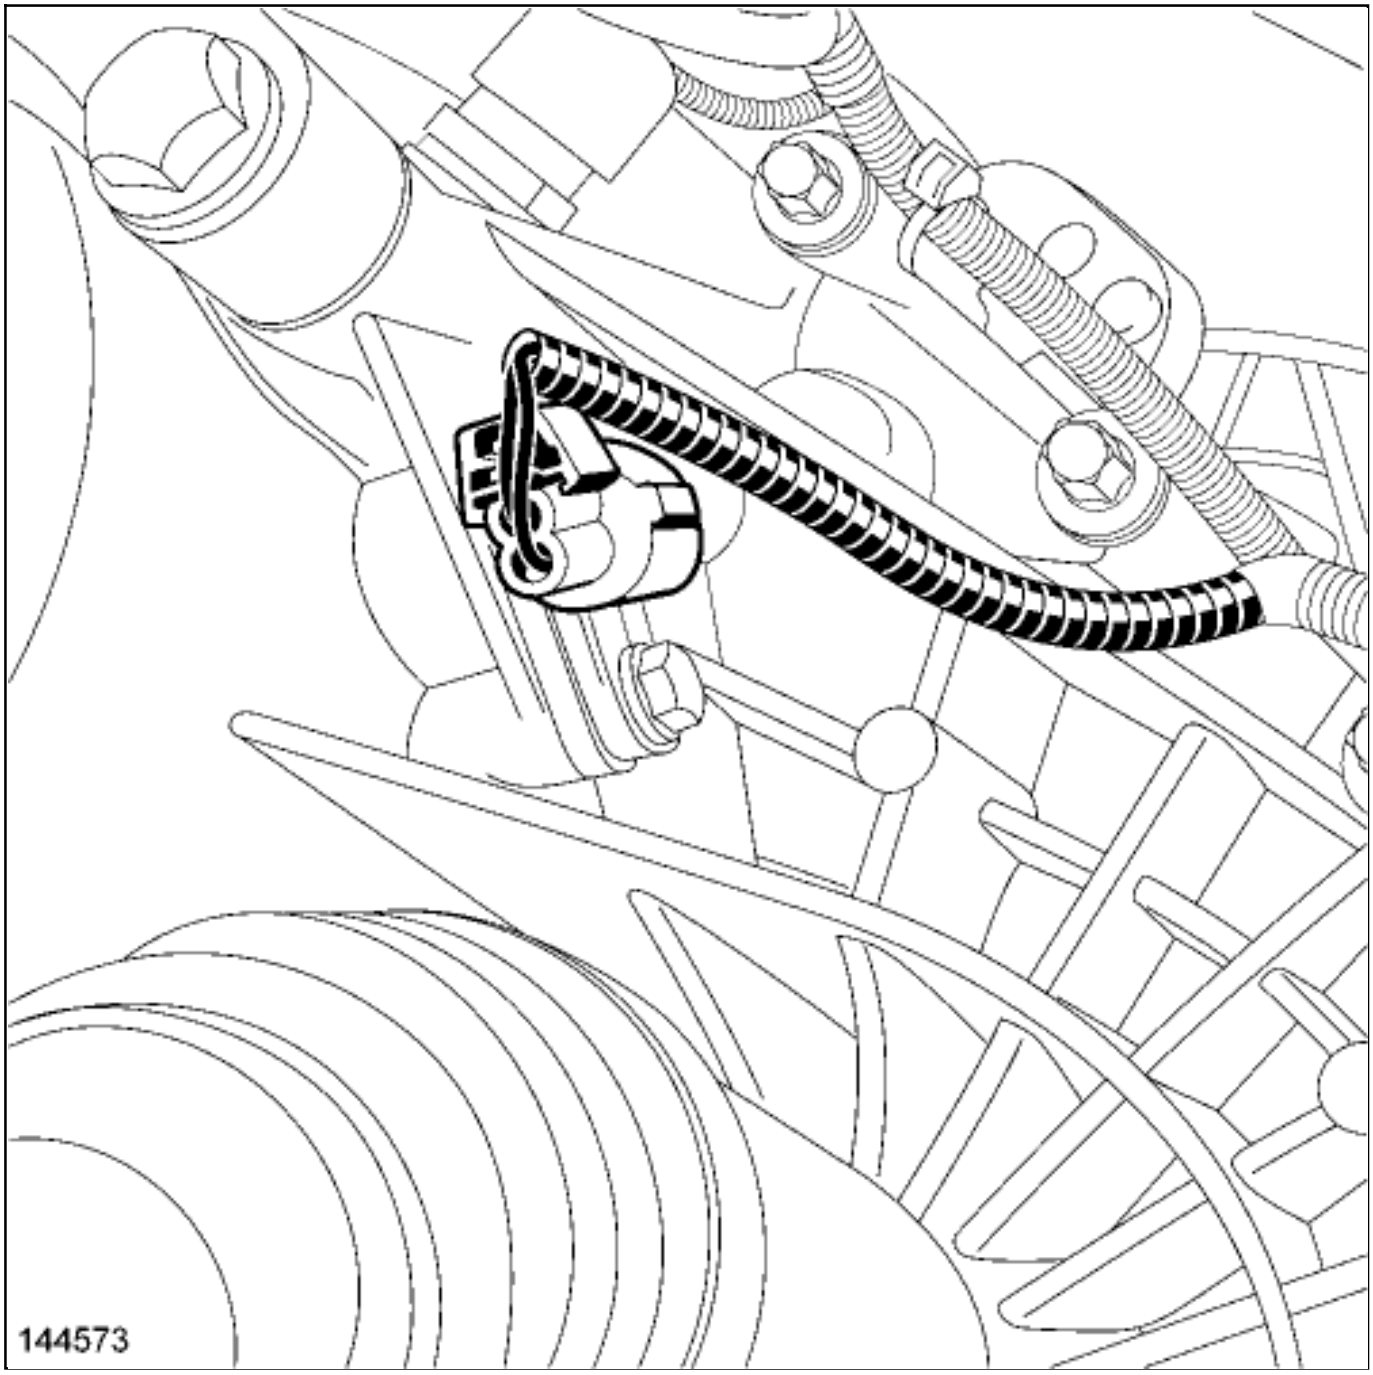
1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove:

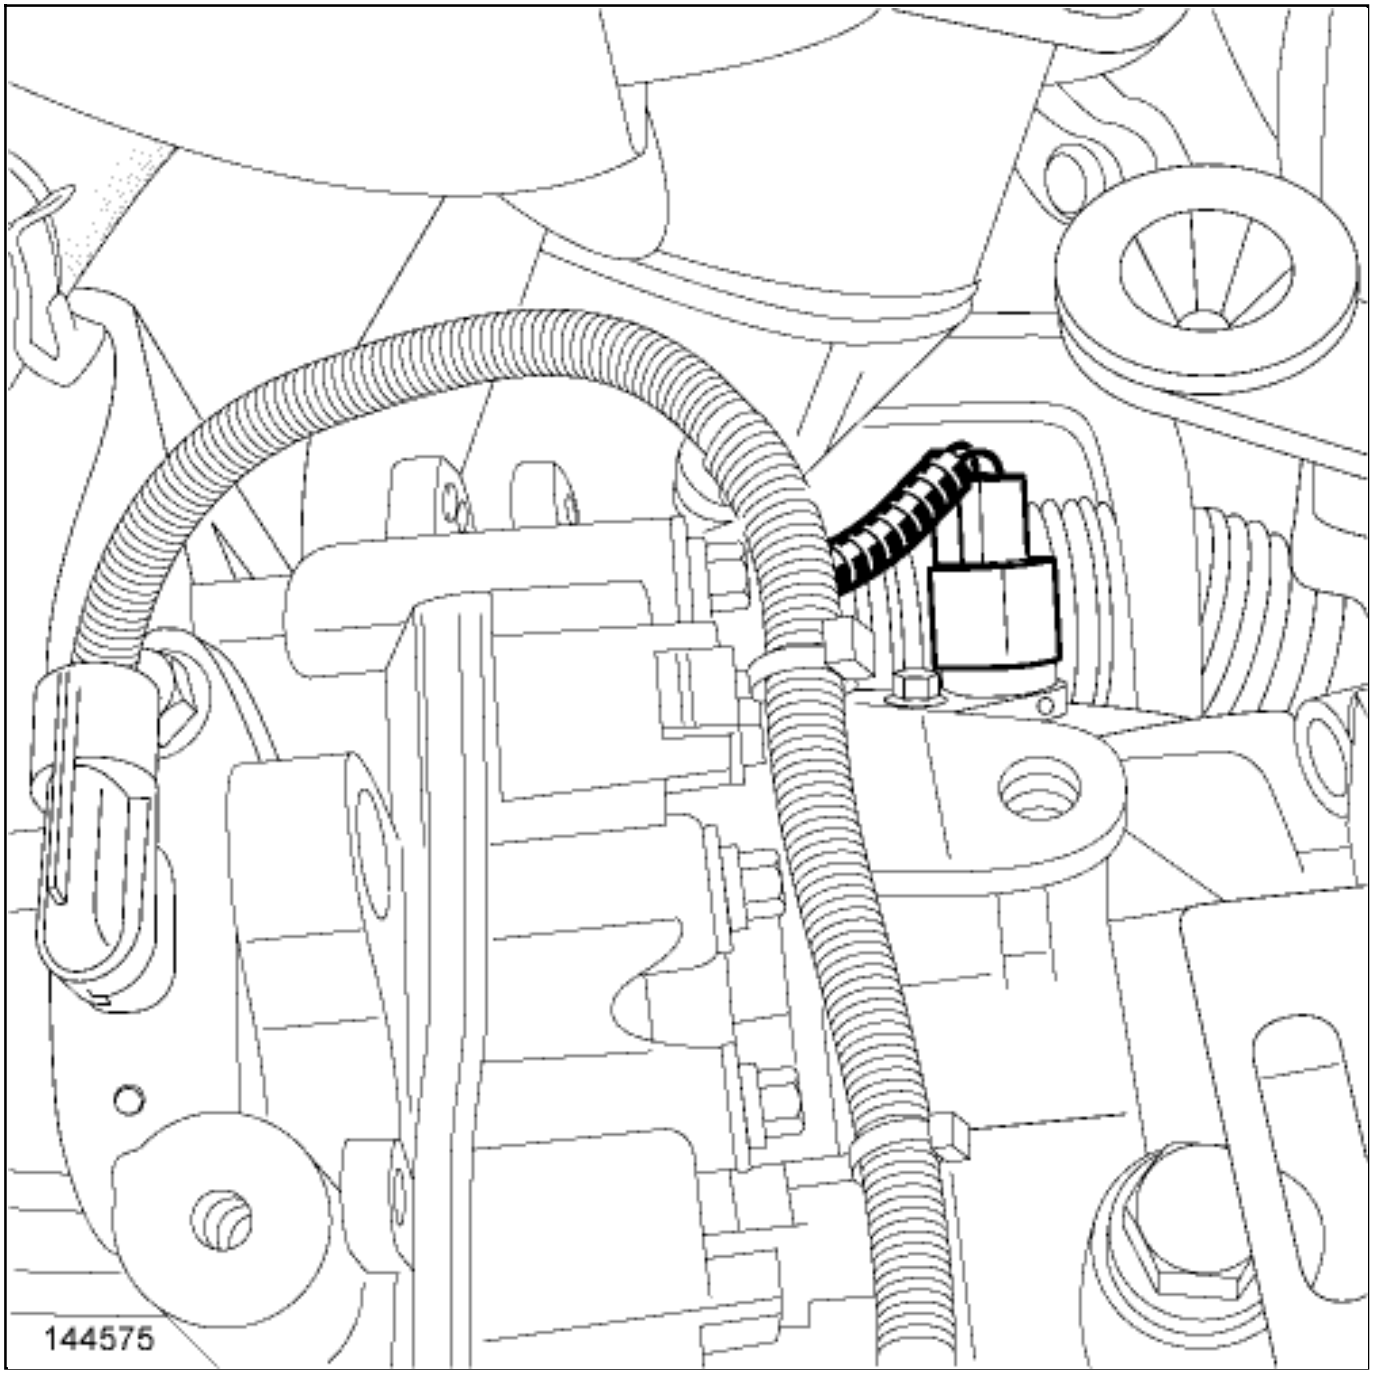
- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting ,
- the front left-hand wheel Wheel: Removal - Refitting ,
- the front section of the front left-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) ,
- the engine undertray.

2. REMOVAL OPERATION

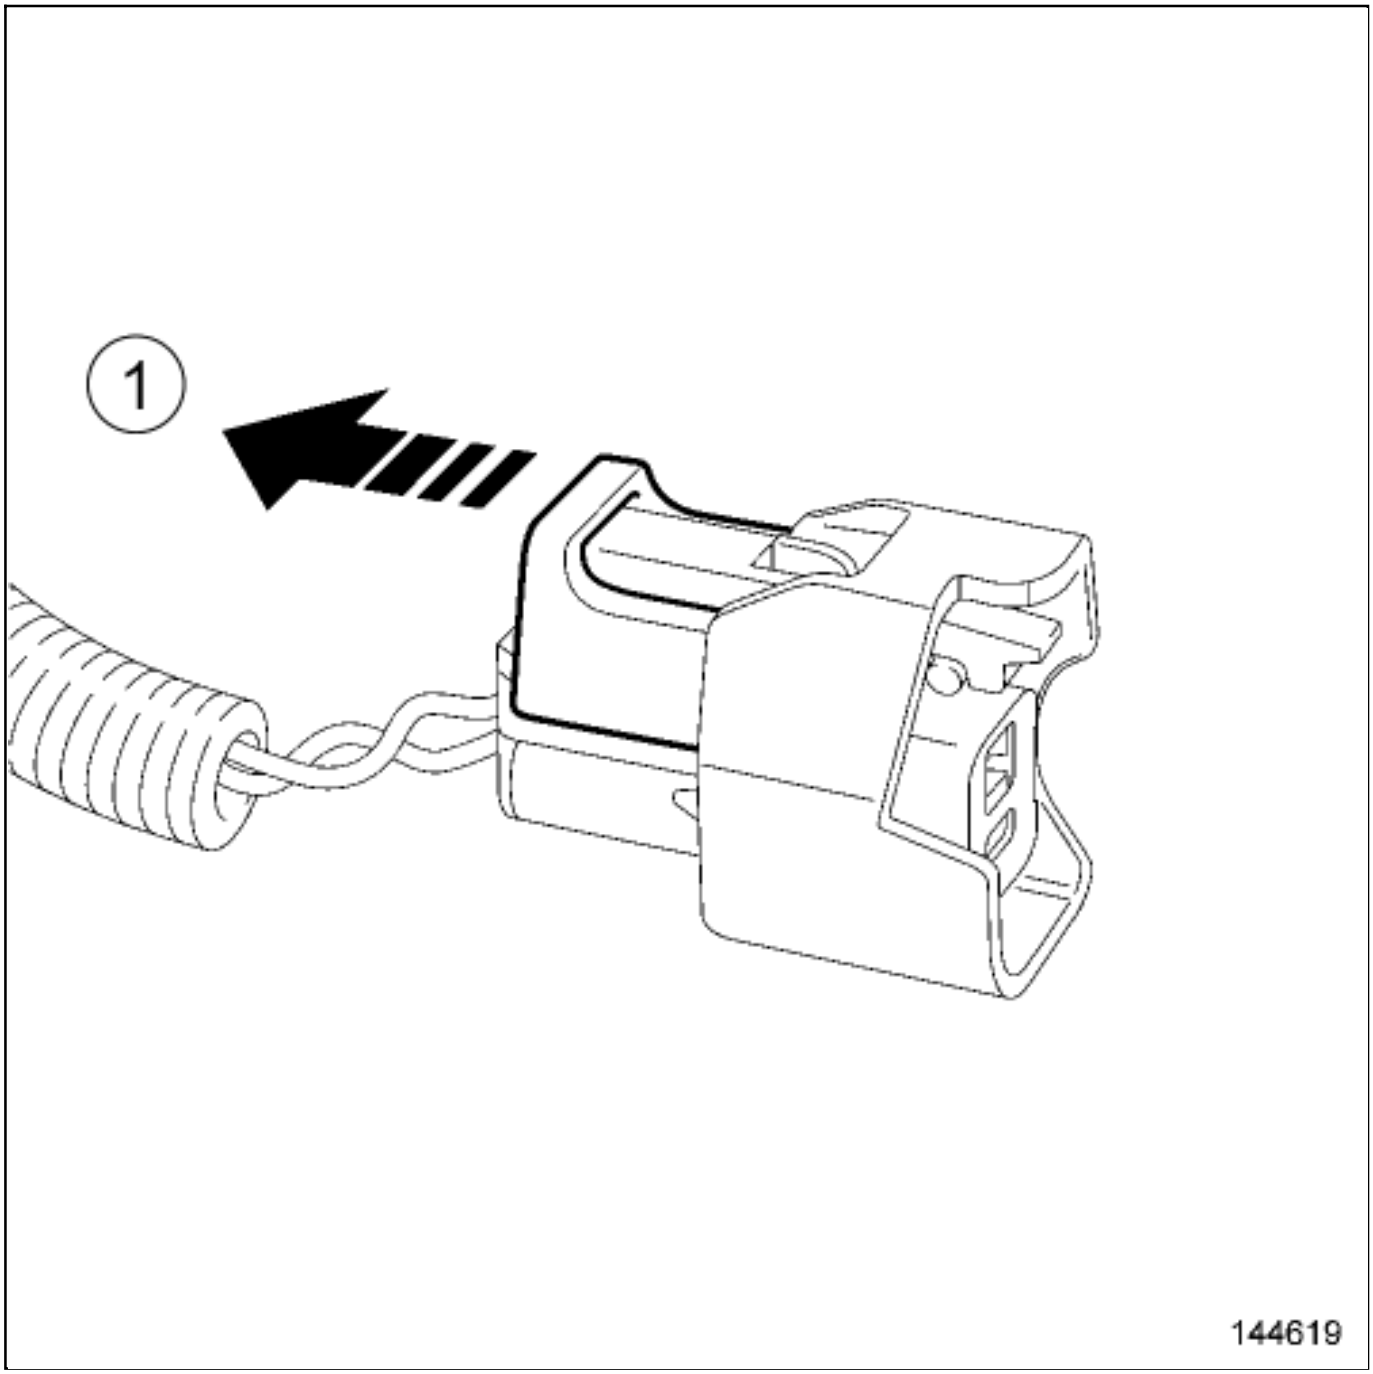


Note:

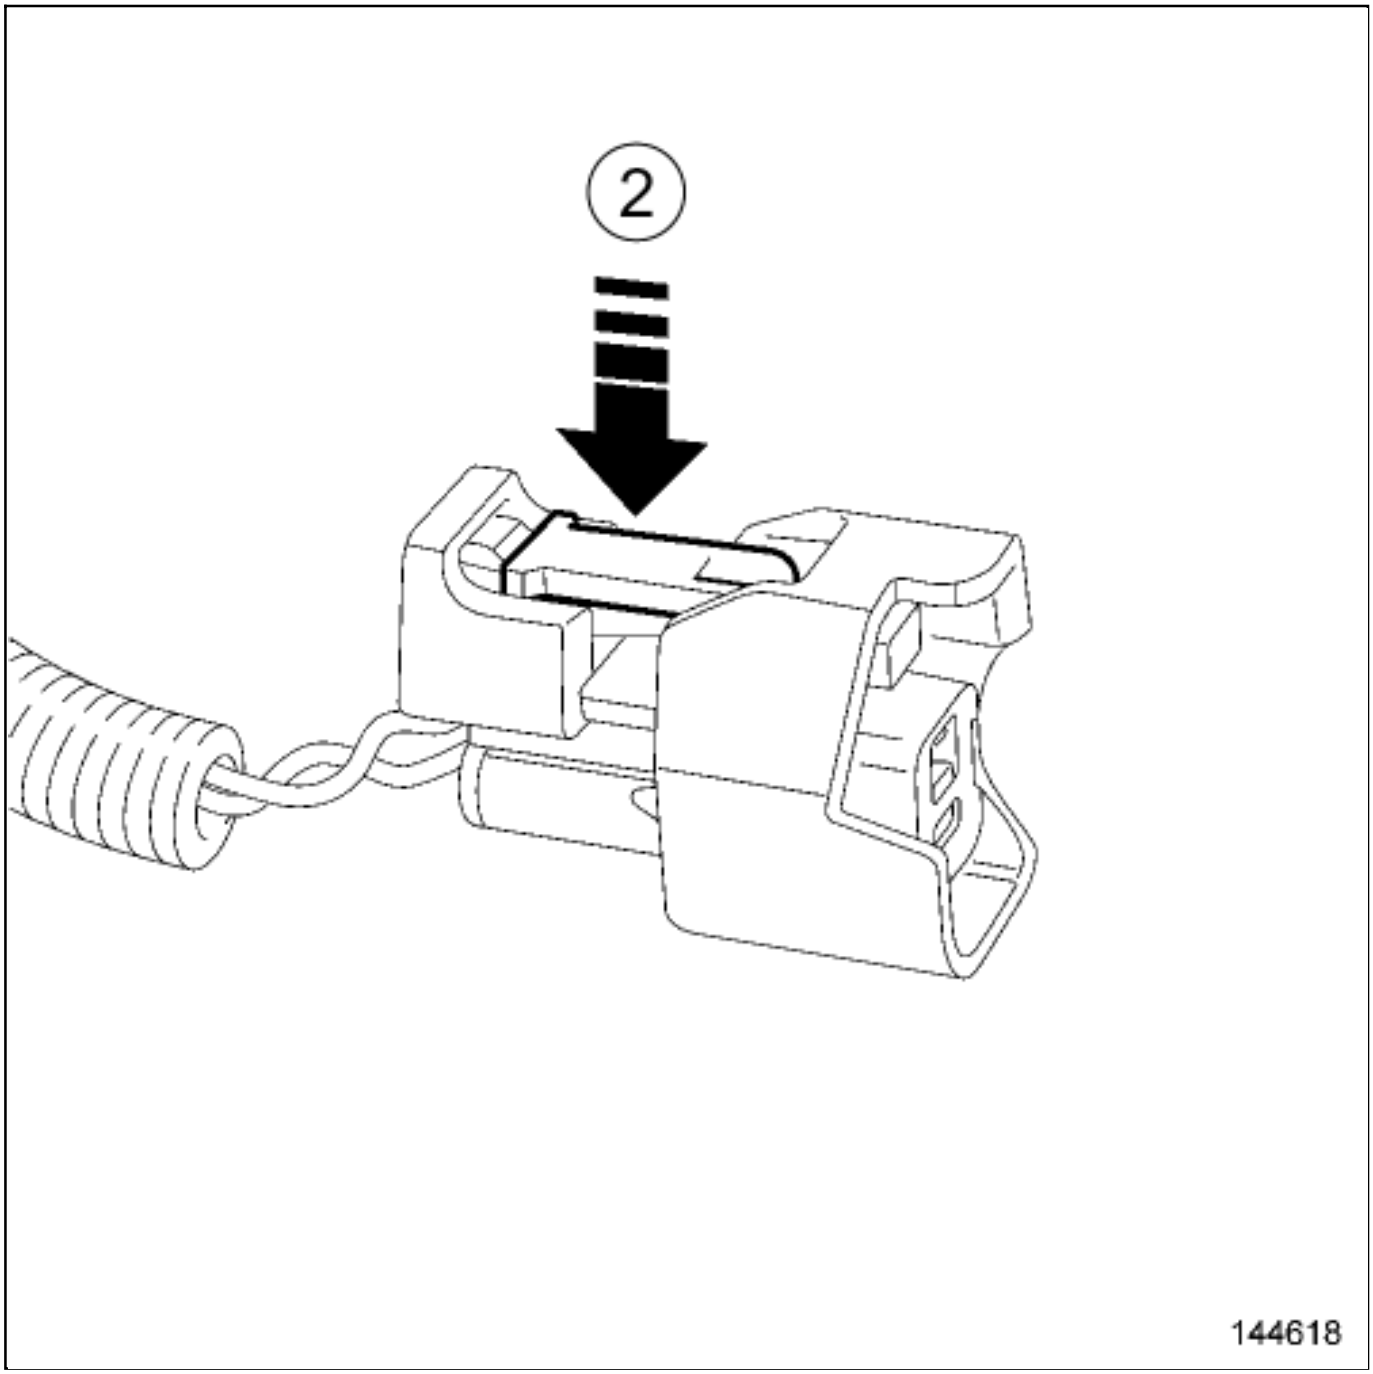
The connectors have a locking system.



CAUTION

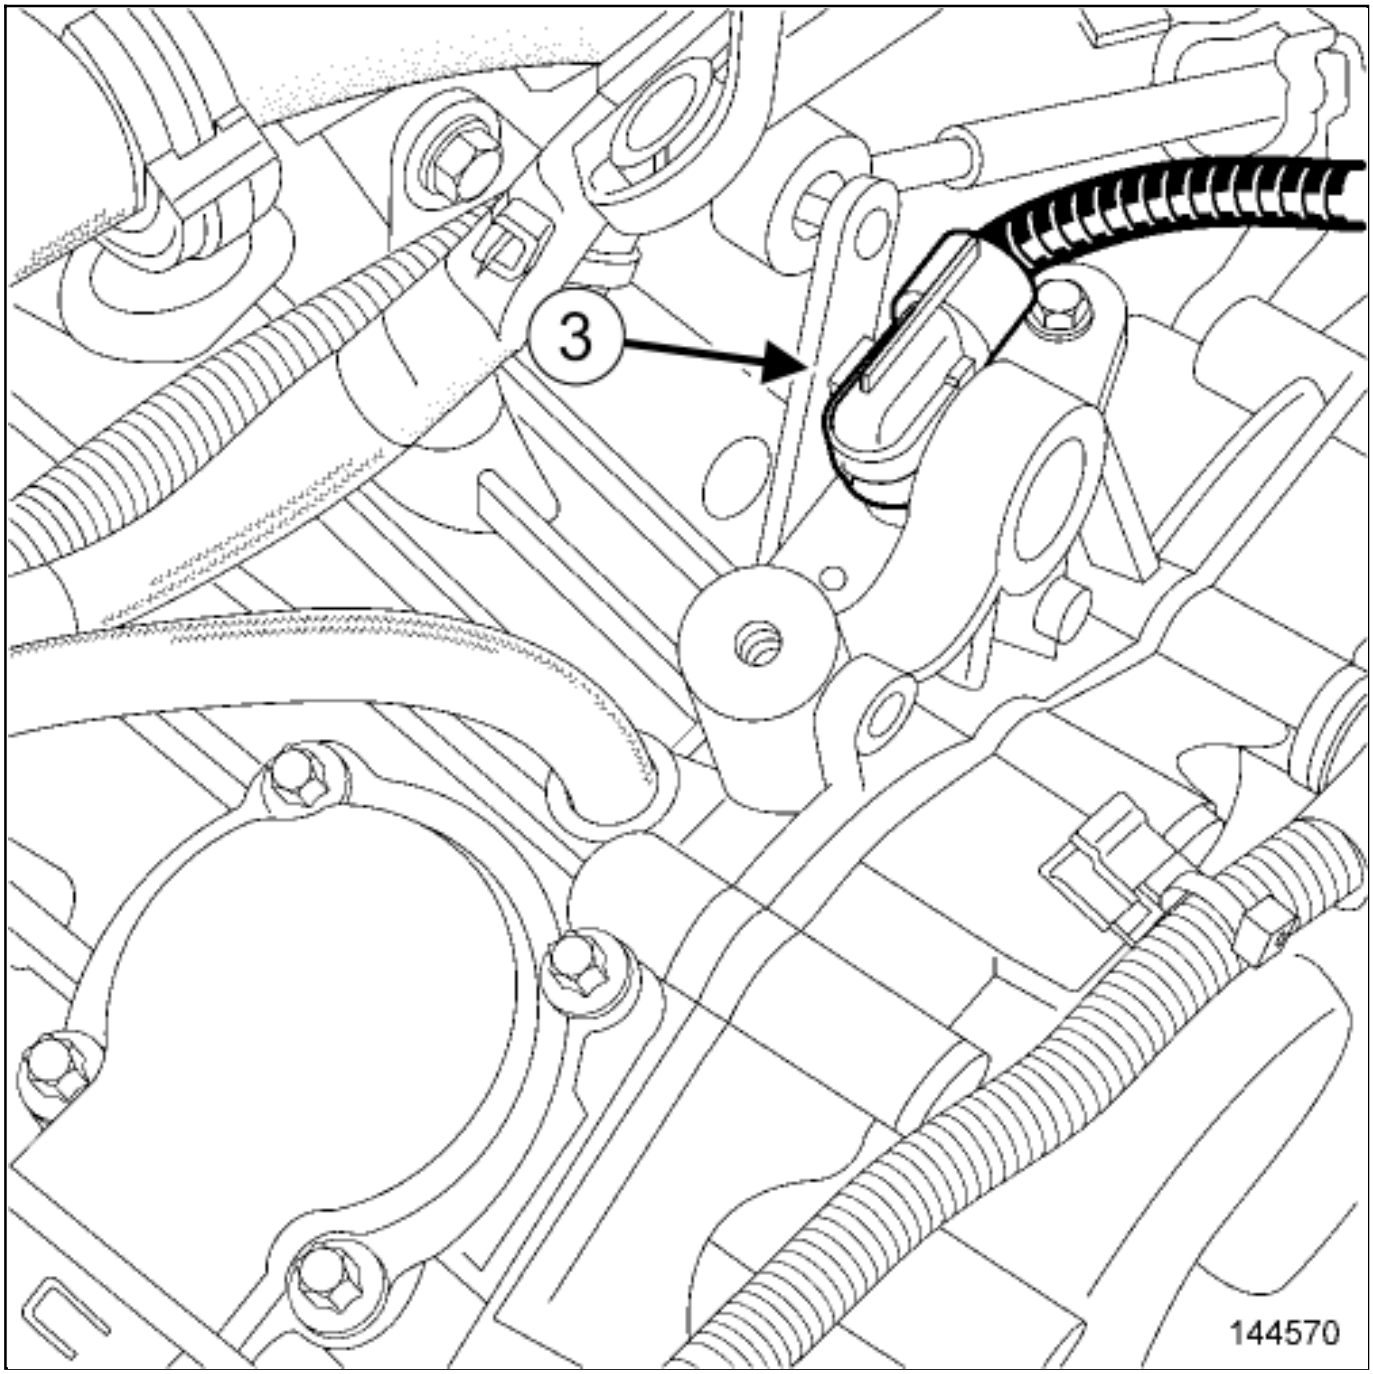


Failure to observe the following procedure could damage the connector.

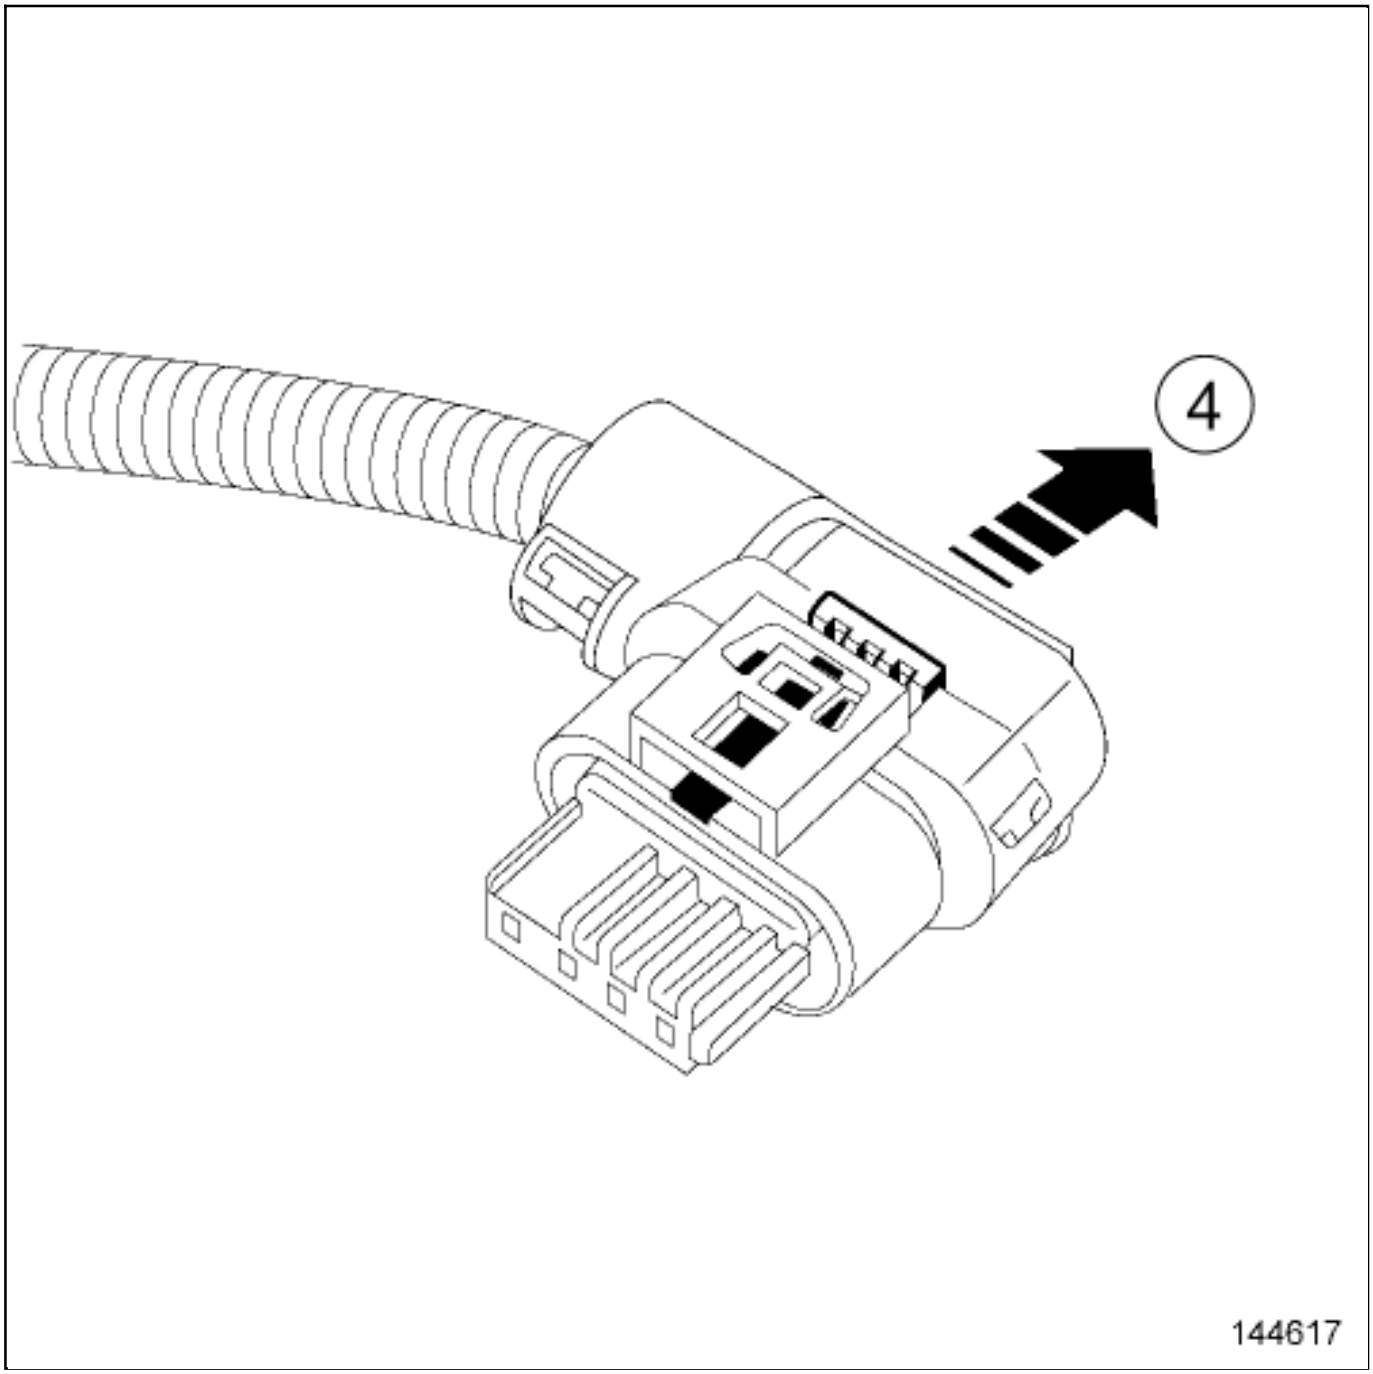


THIRD GEAR CONNECTOR

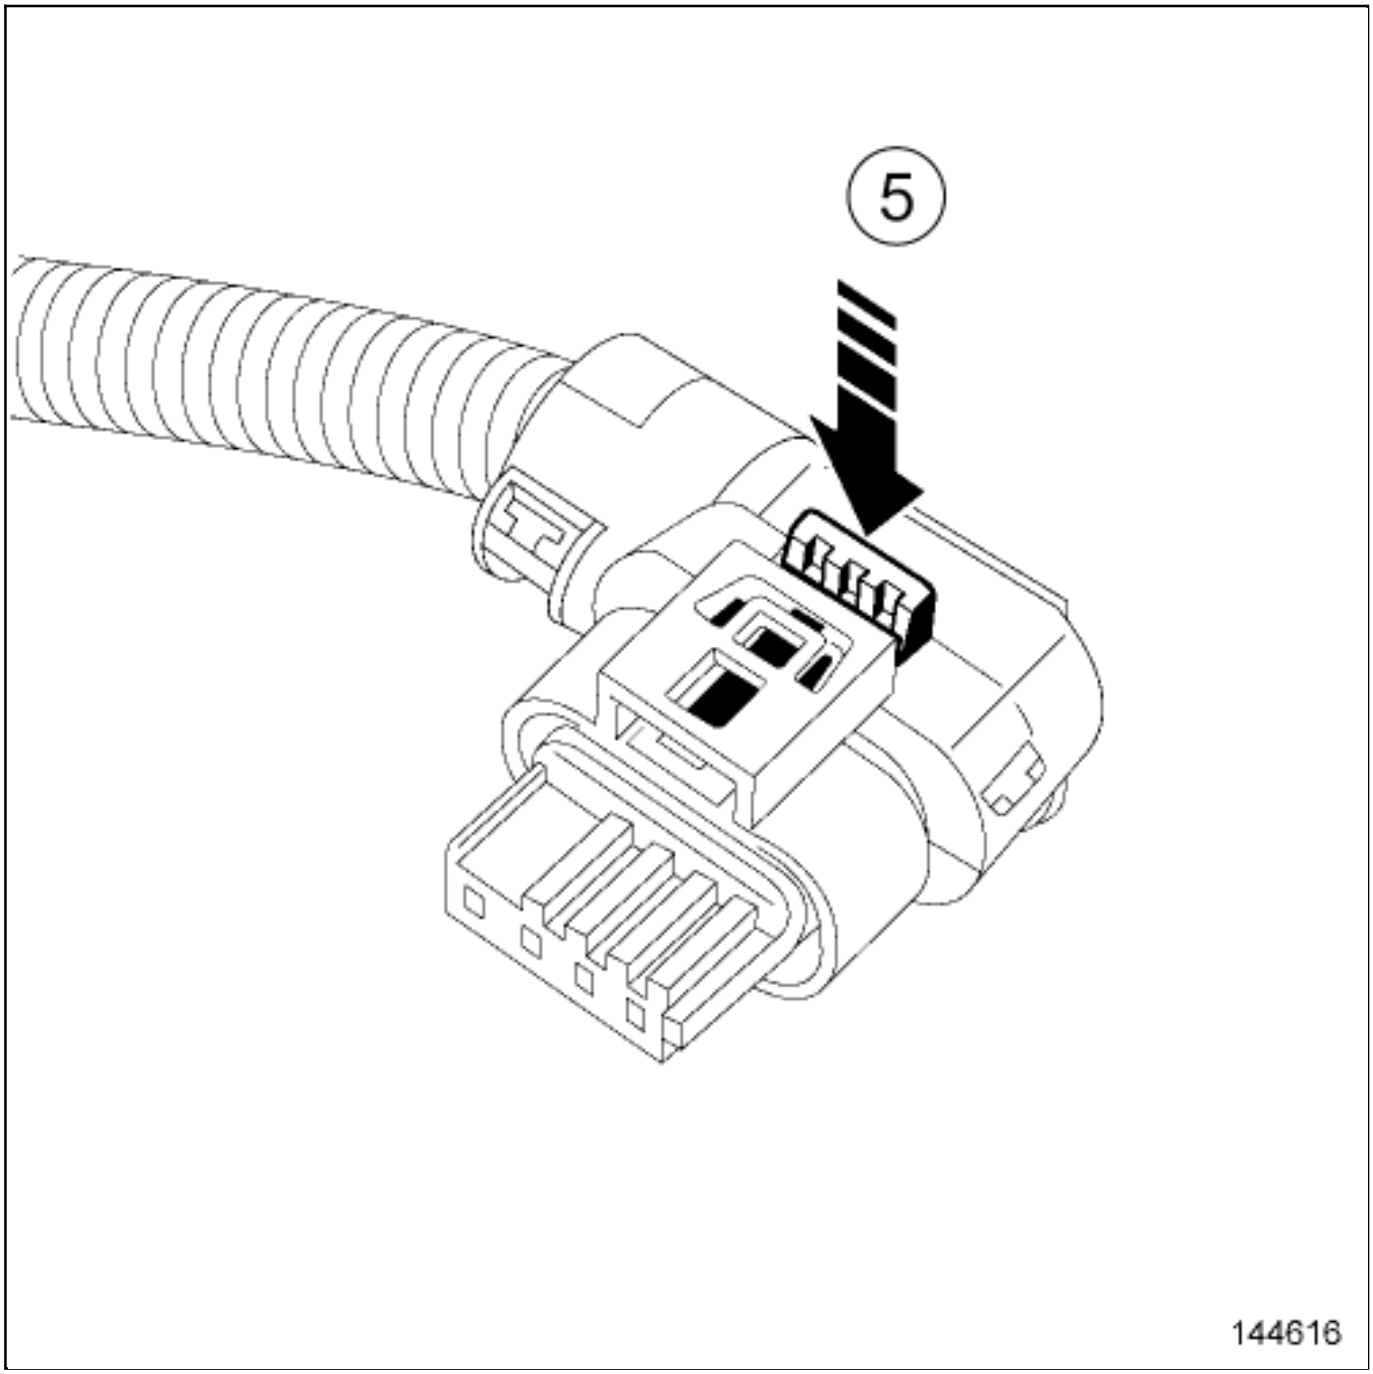
FOURTH GEAR CONNECTOR



144575



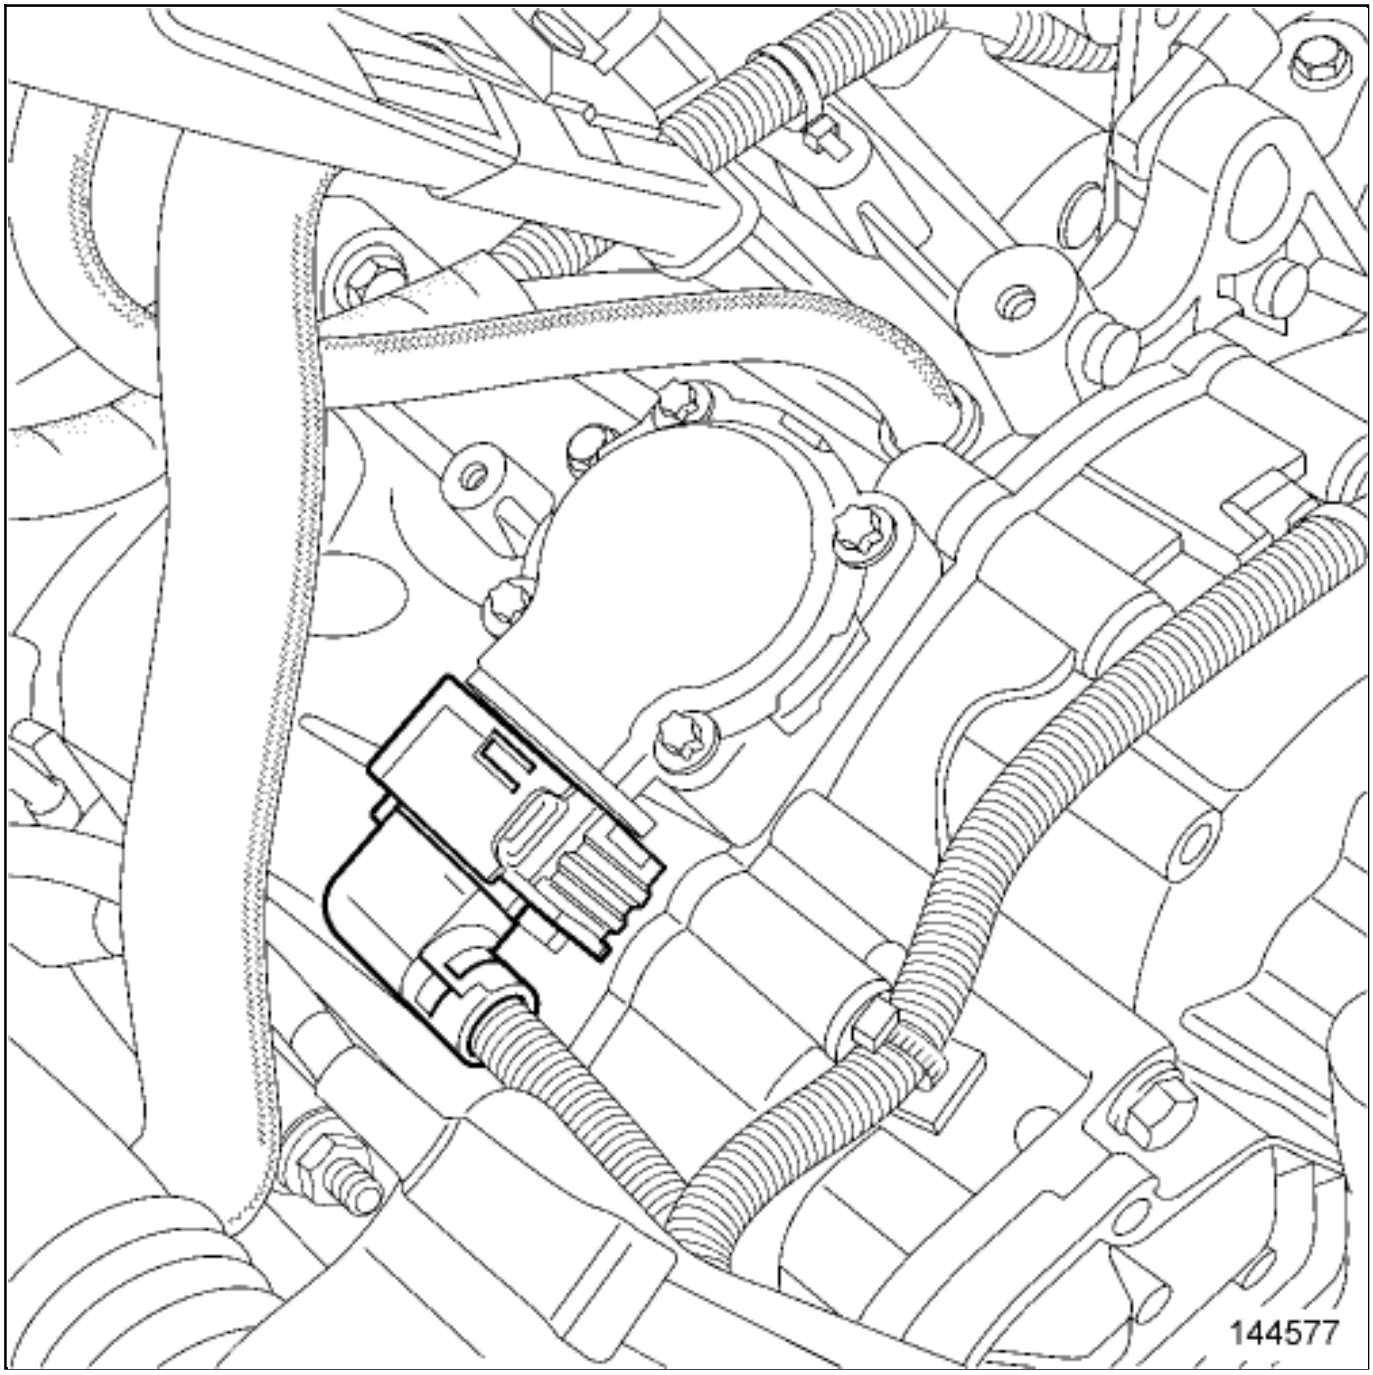
1
144619



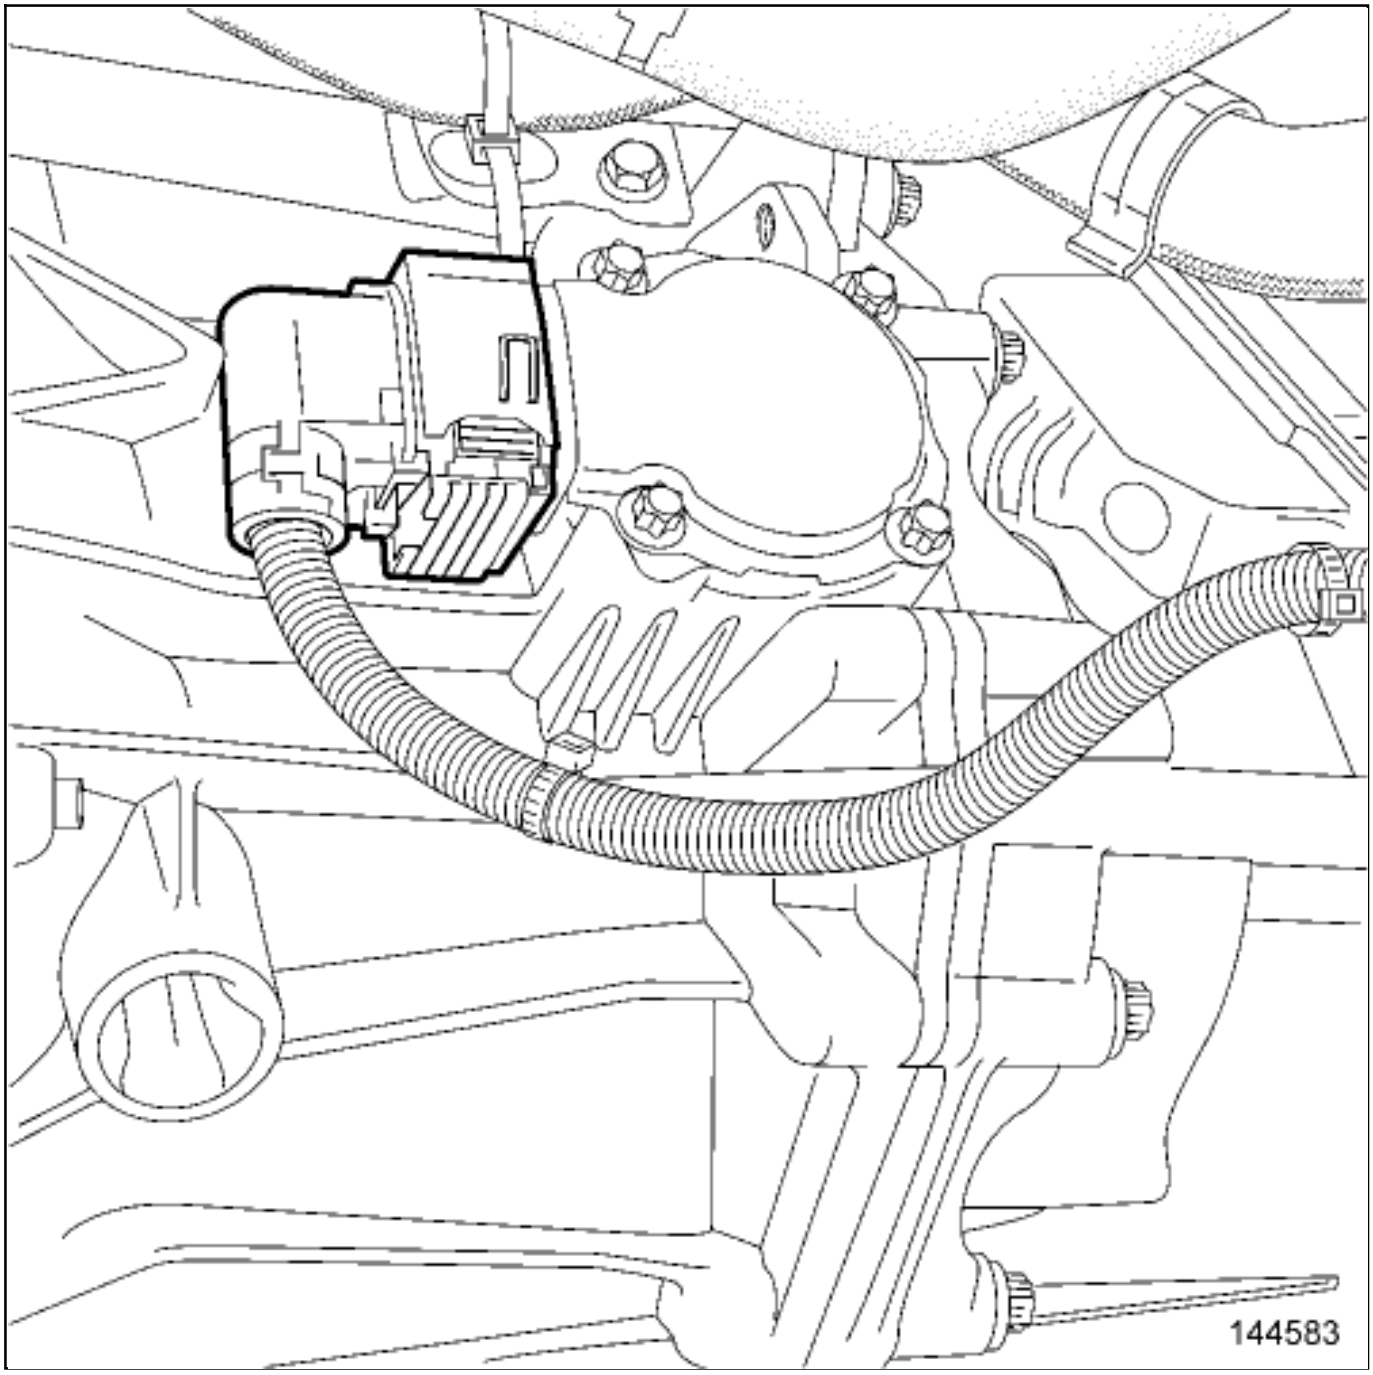
Disconnect the connectors of the engine speed sensor of third gear and fourth gear by:

- unlocking the connector locking system(1) ,
- pressing the tab(2) and pulling the connector.

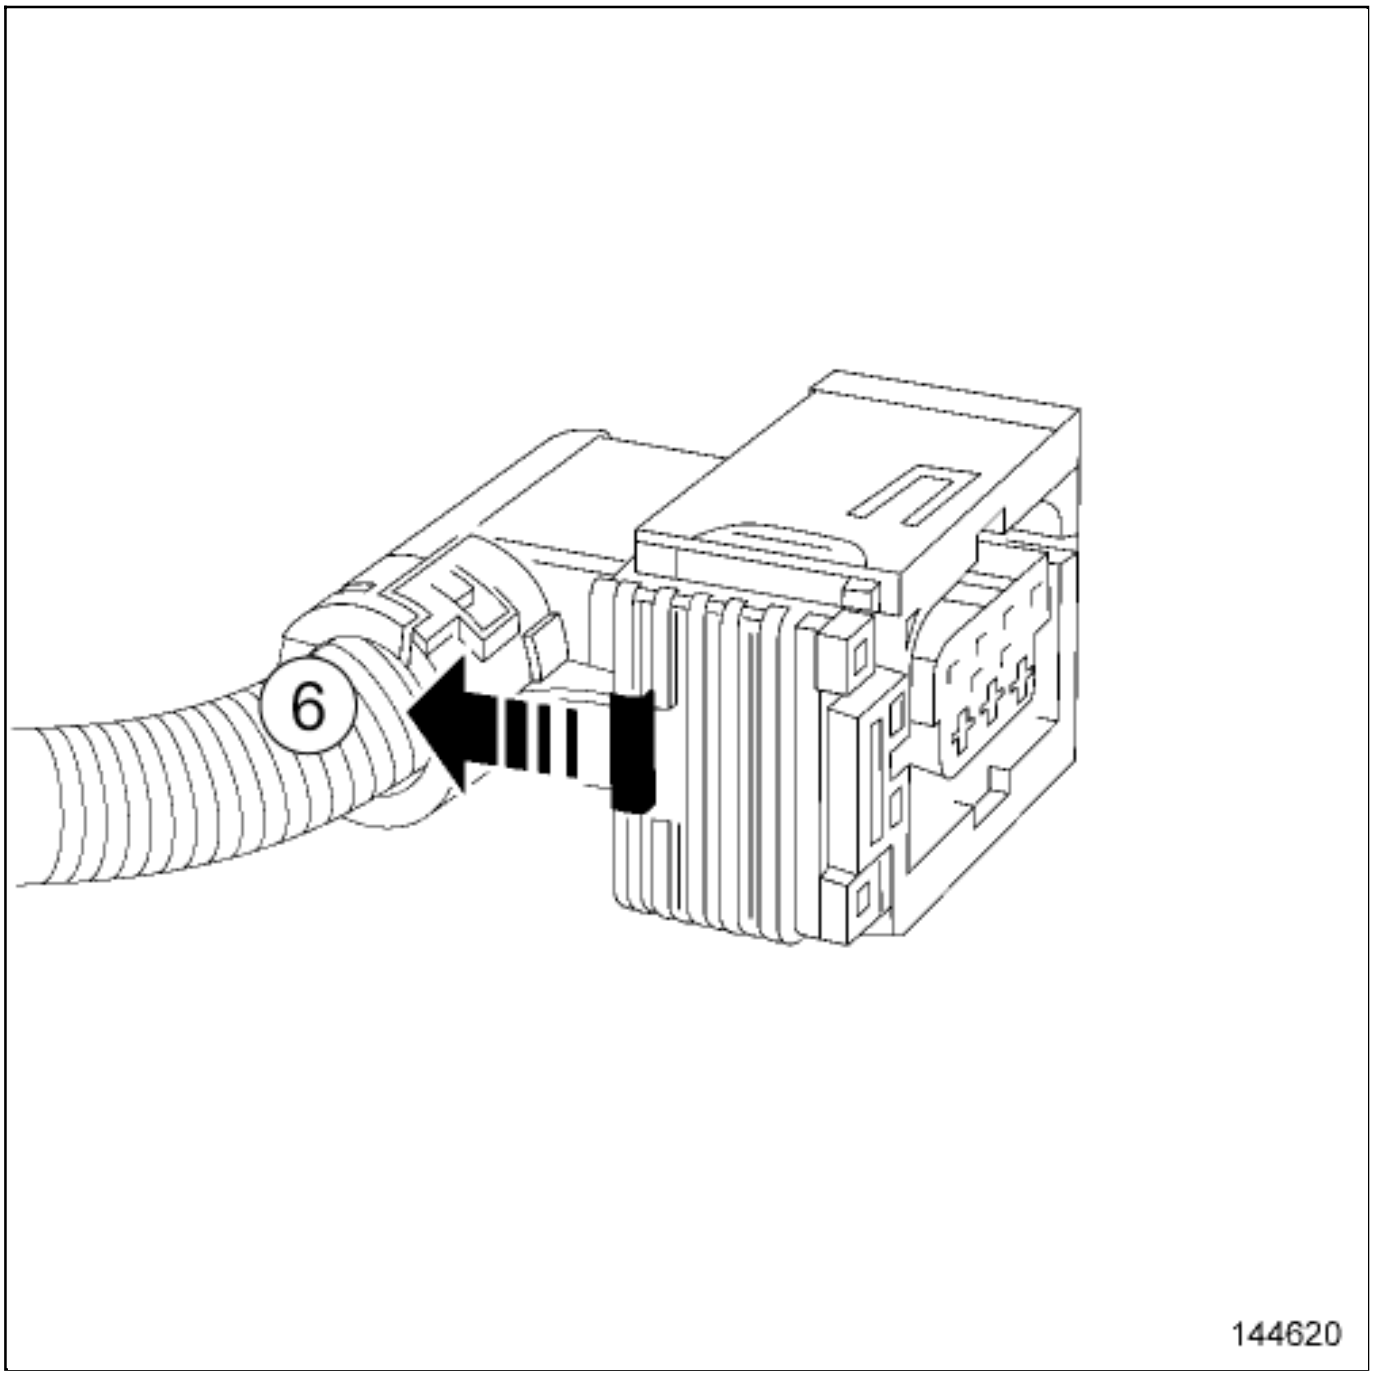
3
144570



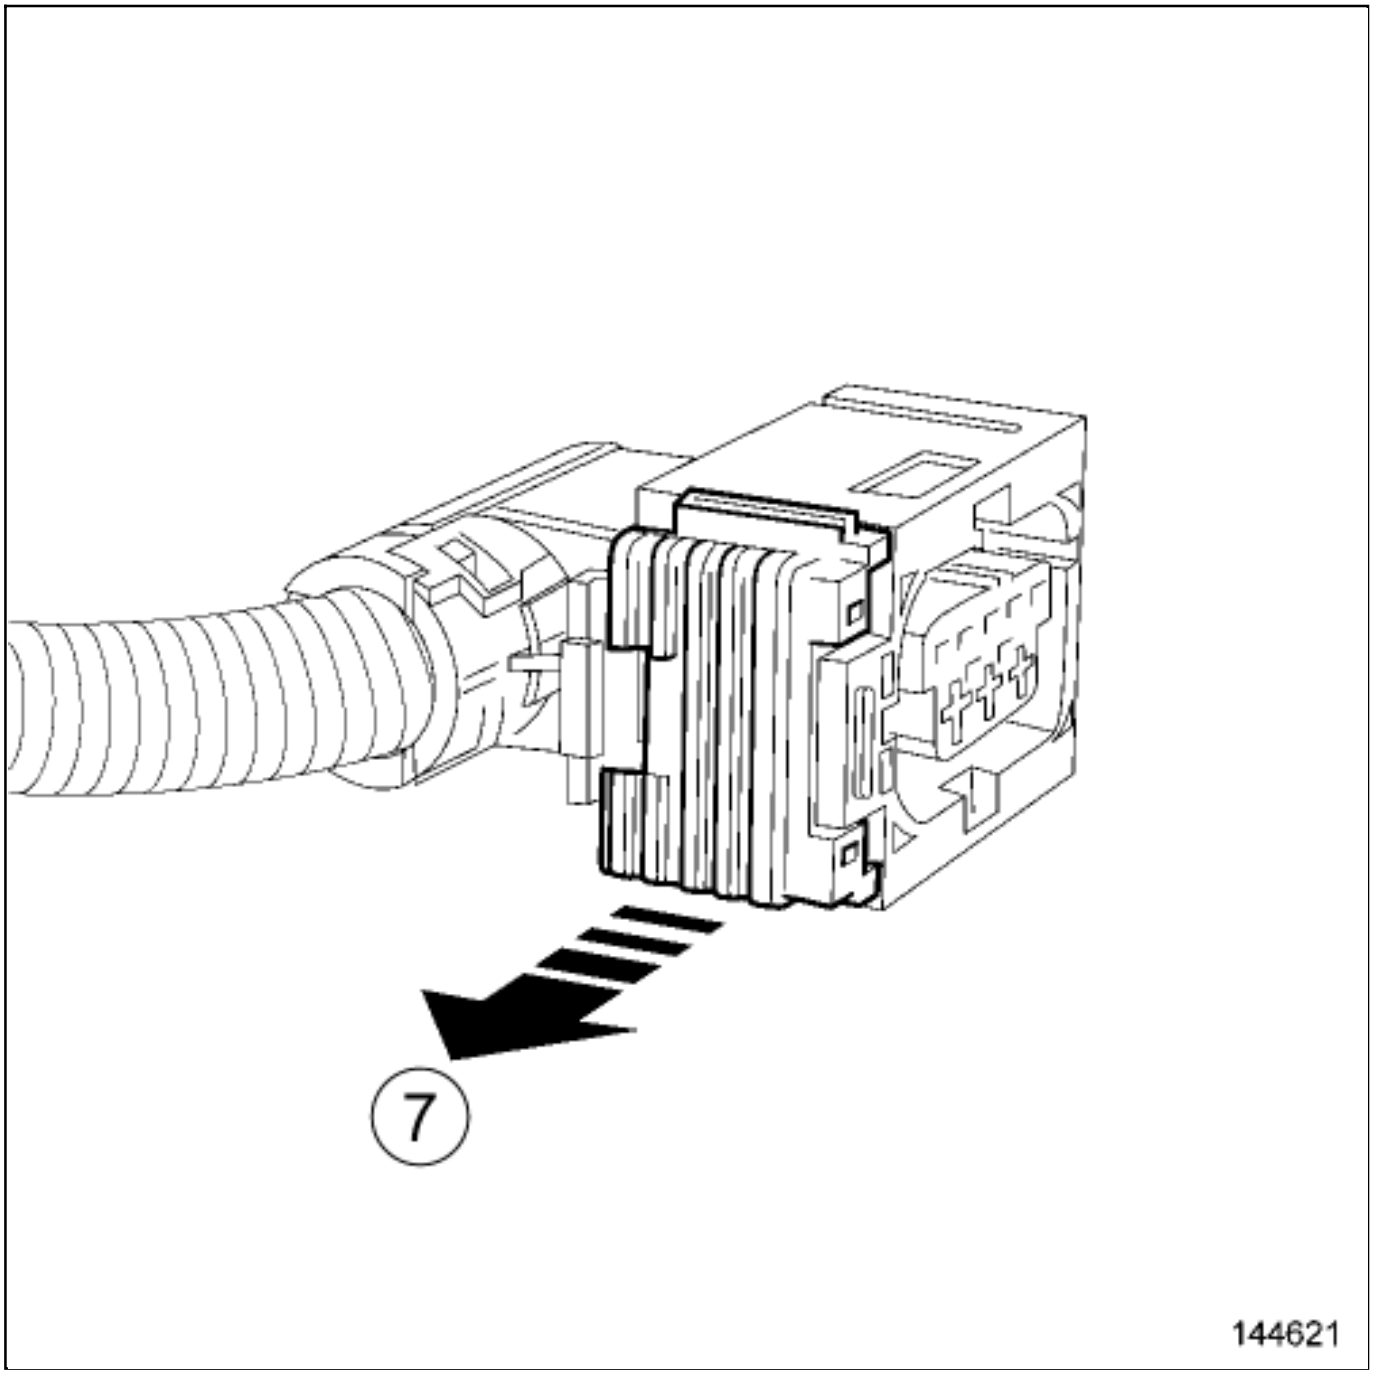
4
144617



Disconnect the gear engaged sensor connector(3) :

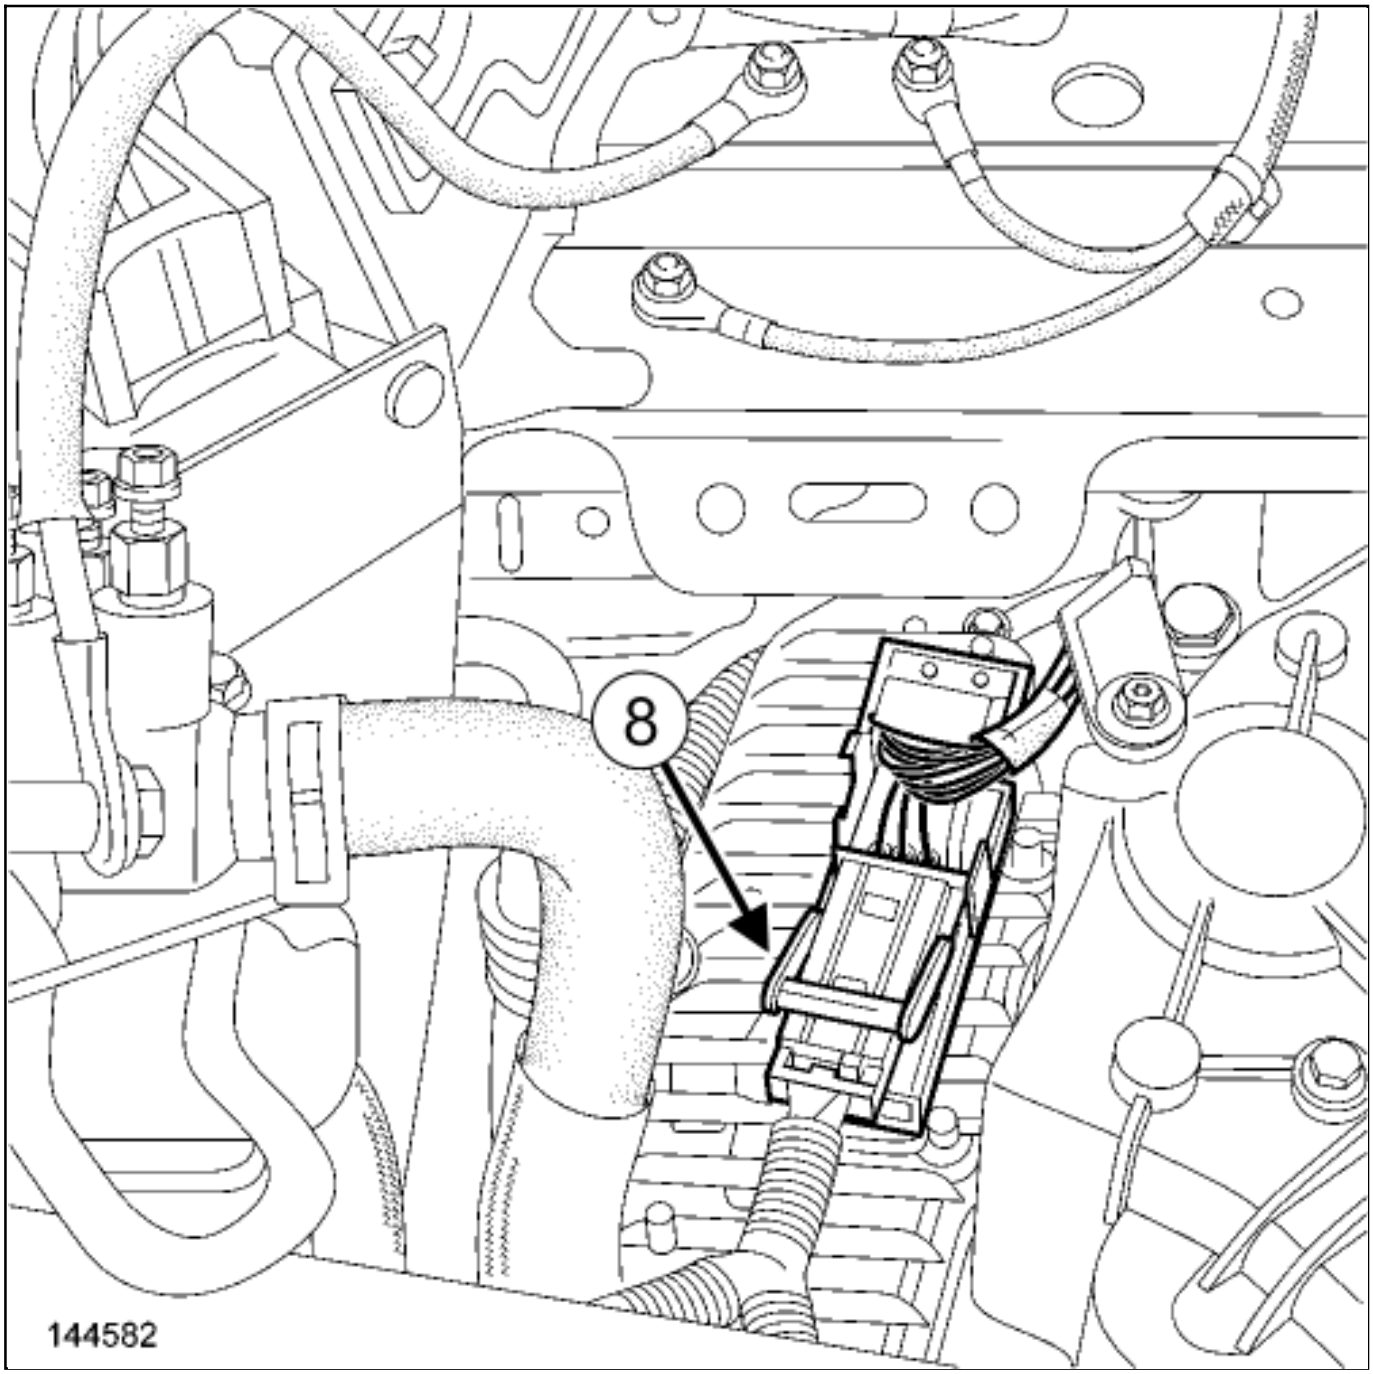


- by unlocking the connector locking system(4) ,
- pressing the tab(5) and pulling the connector.



CONNECTOR OF THE UPPER CLUTCH ACTUATOR MOTOR

CONNECTOR OF THE LOWER CLUTCH ACTUATOR MOTOR



144583

6
144620

Disconnect the connector of the upper clutch actuator motor and the connector of the lower clutch actuator motor by:

- unlocking the connector locking system(**6**) ,
- pulling the tab(**7**) .

- Disconnect the connectors(8) from the gearbox computer.
- Unclip the automatic gearbox wiring.
- Remove the automatic gearbox wiring.

REFITTING

1. REFITTING PREPARATION OPERATION

Always replace any damaged clips.

2. REFITTING OPERATION

Note:

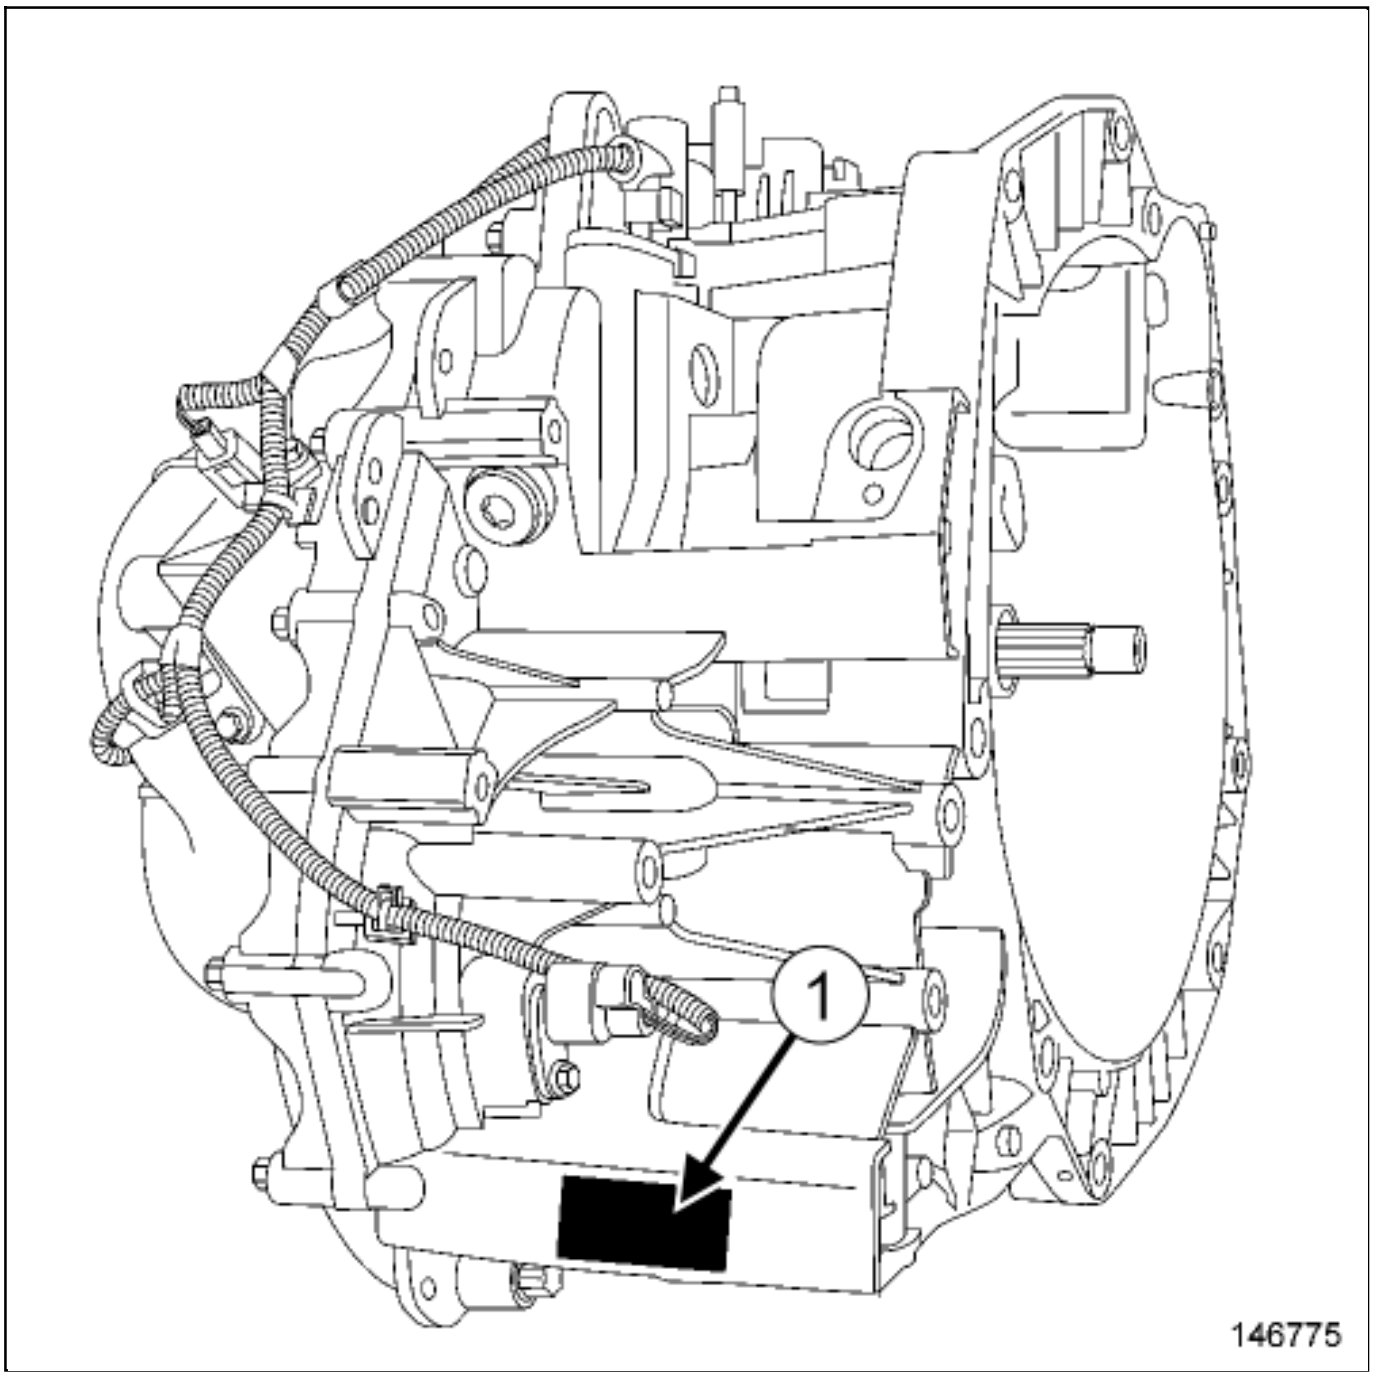
Observe the correct sequence of steps in order not to swap the connectors.

Connect the following connectors:

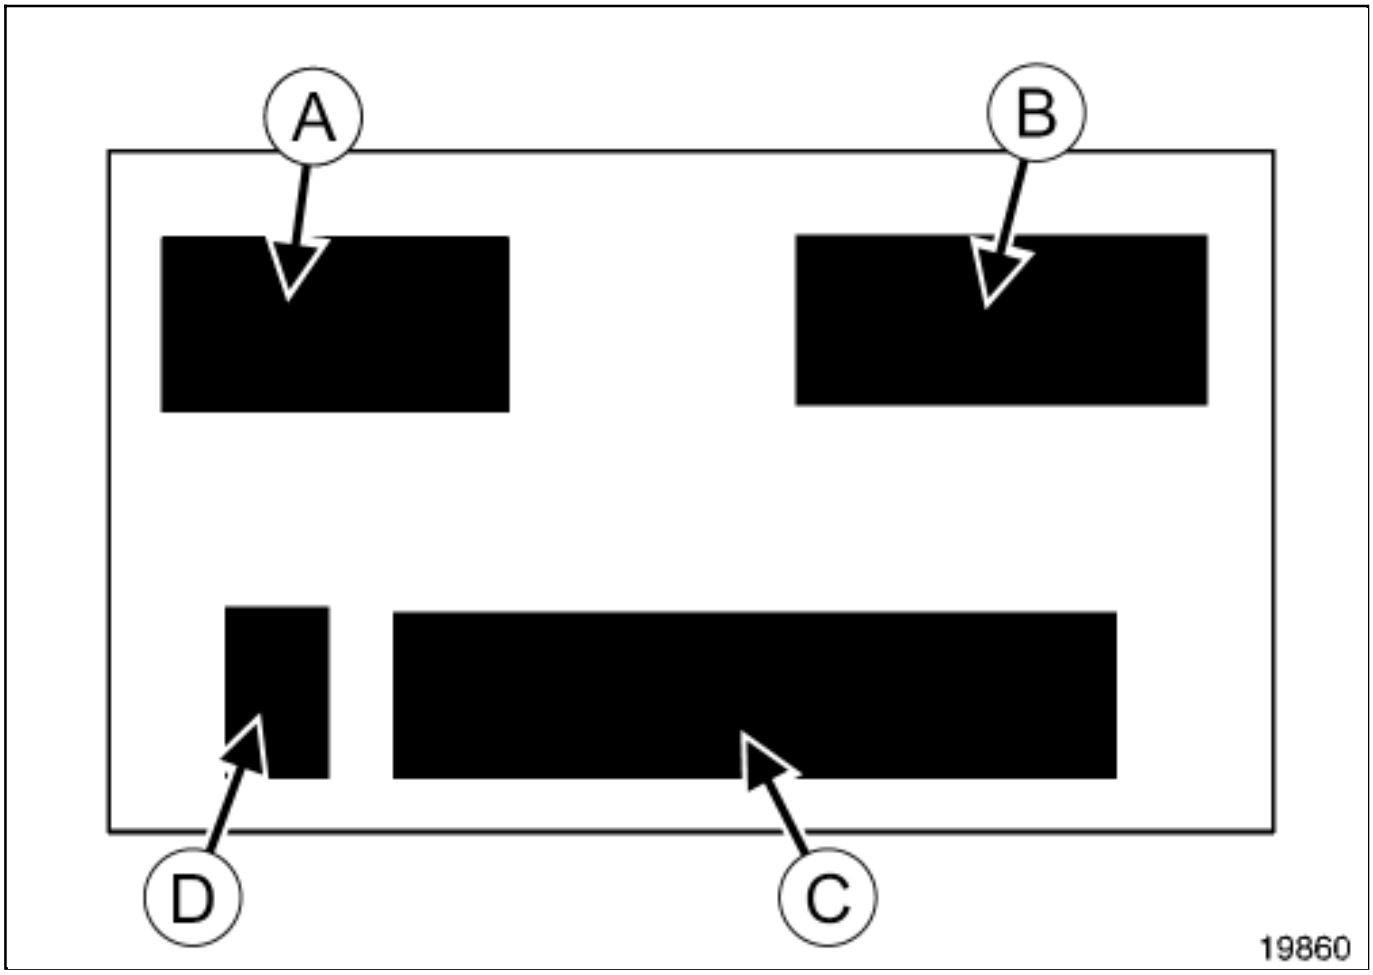
- the lower clutch actuator motor,
- the upper clutch actuator motor,
- the gear engaged sensor,
- the engine speed sensors of the automatic gearbox,
- the automatic gearbox computer.

Note:

Position the automatic gearbox wiring, taking care to place the clips on their mounting points.



3. FINAL OPERATION



Proceed in the reverse order to removal.

XSL version : 3.02 du 22/07/11

AUTOMATIC GEARBOX

1. IDENTIFICATION

A marking(1) on the gearbox casing indicates:

- (A) Gearbox type
- (B) Gearbox suffix
- (C) Production number
- (D) Factory of manufacture

AXIAL BALL JOINT LINKAGE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Special tooling required	
Tool for removal - refitting of the axial ball joint (diameter 35 mm to 41 mm).	
Steering rack locking tool (TRW).	Dir. 1306-01

WARNING

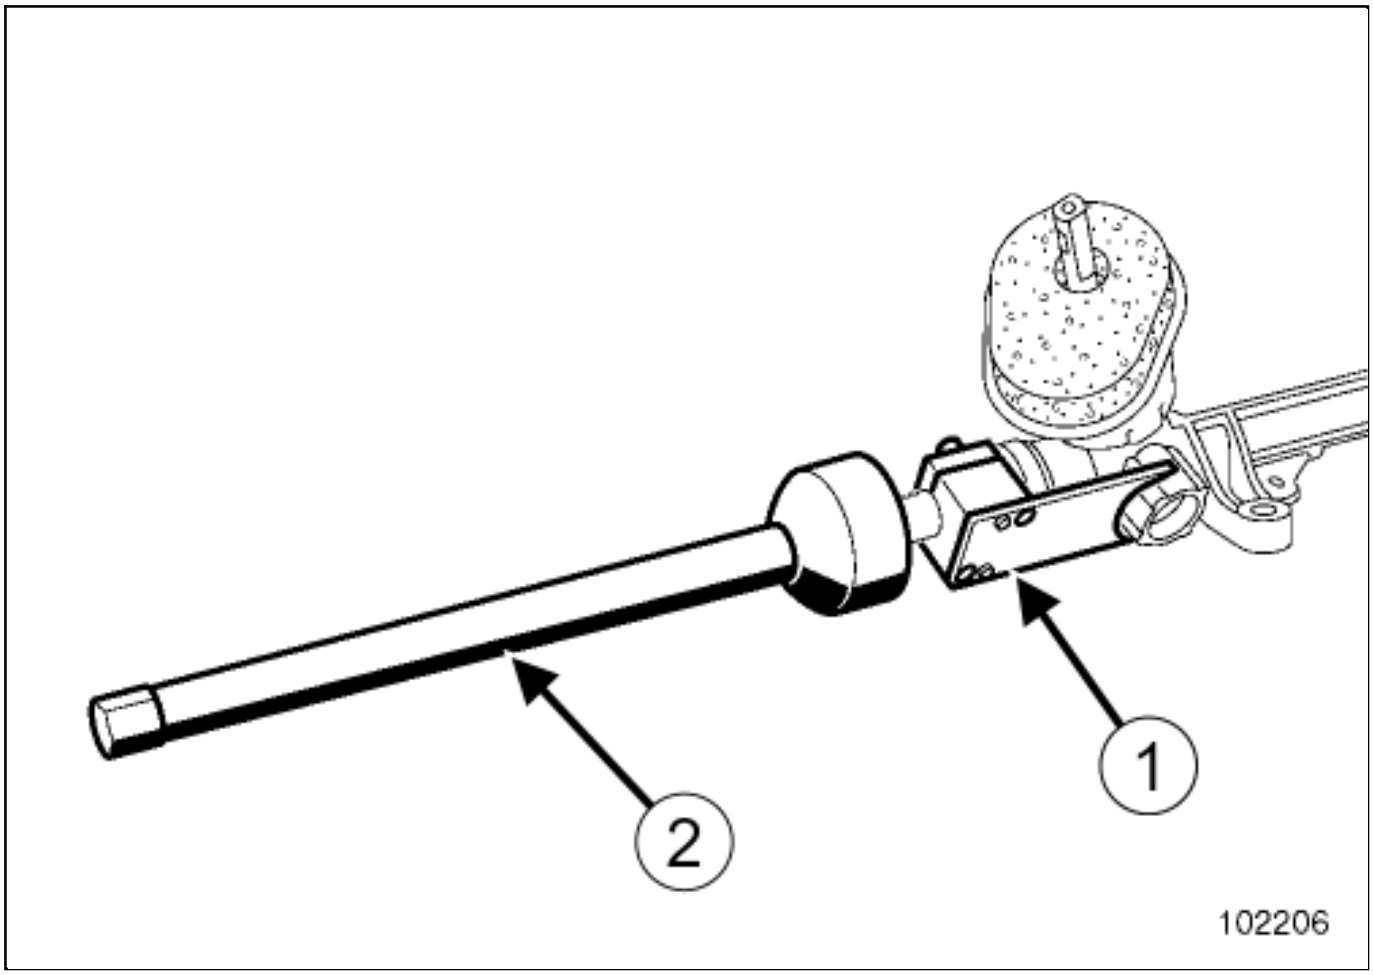
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 36A, Steering assembly , Steering: Precautions for the repair) ,
- Vehicle: Precautions for the repair .

Location and specifications (tightening torques, parts always to be replaced)(see 36A, Steering assembly , Steering assembly: Exploded view) .

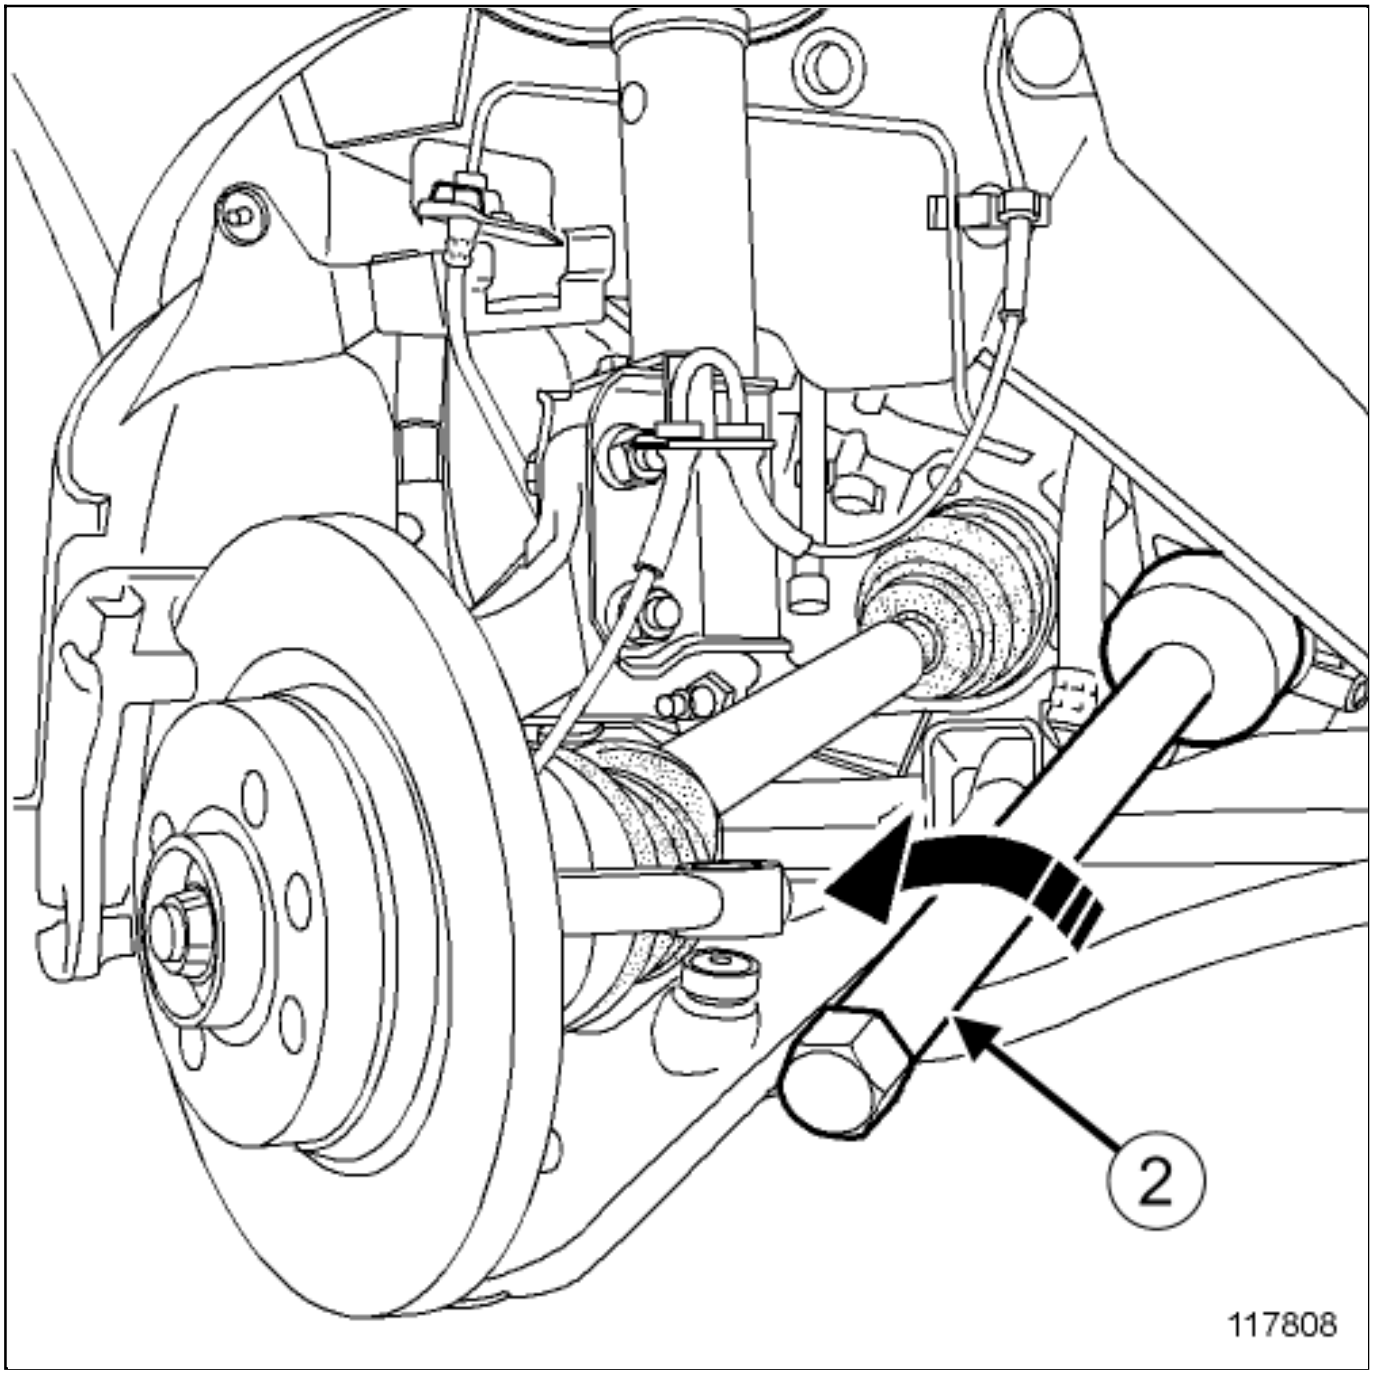
REMOVAL

1. REMOVAL OPERATION PREPARATION



Position the vehicle on a two post liftVehicle: Towing and lifting .

Remove:



- the front wheelFront hub carrier assembly: Exploded view ,
- the track rod(see 36A, Steering assembly , Steering assembly: Exploded view) ,
- the steering box gaiter(see 36A, Steering assembly , Steering assembly: Exploded view) .

Unlock the steering column.

2. REMOVAL OPERATION

Set up theSteering rack locking tool (TRW).(Dir. 1306-01) (1) on the steering rack, at the pinion end.

Unlock the axial ball joint using the toolTool for removal - refitting of the axial ball joint (diameter 35 mm to 41 mm). .

Remove the axial ball joint linkage.

REFITTING

Proceed in the reverse ordre to removal.

Coat the threading of the axial ball joint with HIGH STRENGTH THREAD LOCK**Vehicle: Parts and consumables for the repair** .

Coat the following with SILICONE GREASE**Vehicle: Parts and consumables for the repair** :

- the steering box,
- the axial ball joint.

Check the front axle geometry values**Front axle assembly: Adjustment values** .

Adjust the front axle if necessary**Front axle system: Adjustment** .

AXLEASSEMBLIES:CHECK

Lock the slip plates of the lift.

Position the vehicle on a lift(see **Vehicle: Towing and lifting**) .

Check the condition of the following components:

- track rods,
- axial ball joint linkages,
- subframe,
- lower arm rubber bushes,
- lower arm ball joints(see **Front driveshaft lower arm ball joint: Check**) ,
- shock absorbers,
- tyres.

Check:

- the tyre size(see **Tyres: Identification**) ,
- the tyre inflation pressure(see **Tyre pressure: Identification**) .

Put the vehicle in the VODM position (vehicle in running order)**(see 30A, General information, Underbody heights: Adjustment value)** :

- tank full,

- vehicle empty (without luggage, etc.).

Consult:

- the front axle geometry values **(see 30A, General information, Front axle assembly: Adjustment values)** ,
- the rear axle geometry values **(see 30A, General information, Rear axle assembly: Adjustment values)** .

Refer to the user manual for the geometry tester.

Check the geometry using the geometry tester.

If there is an inconsistency between the manufacturer's values and the measured values:

Adjust the front axle **(see 30A, General information, Front axle system: Adjustment)** .

BALL-JOINT UNCOUPLING TOOL : USE

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see **Front axle components: Precautions for the repair**) ,

(see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

Note:

If the lower ball joint is stuck in the stub axle carrier and it will not come out, this document explains how to extract the lower ball joint.

BELT TENSION CHECKING TOOL: USE

Note, one or more warnings are present in this procedure

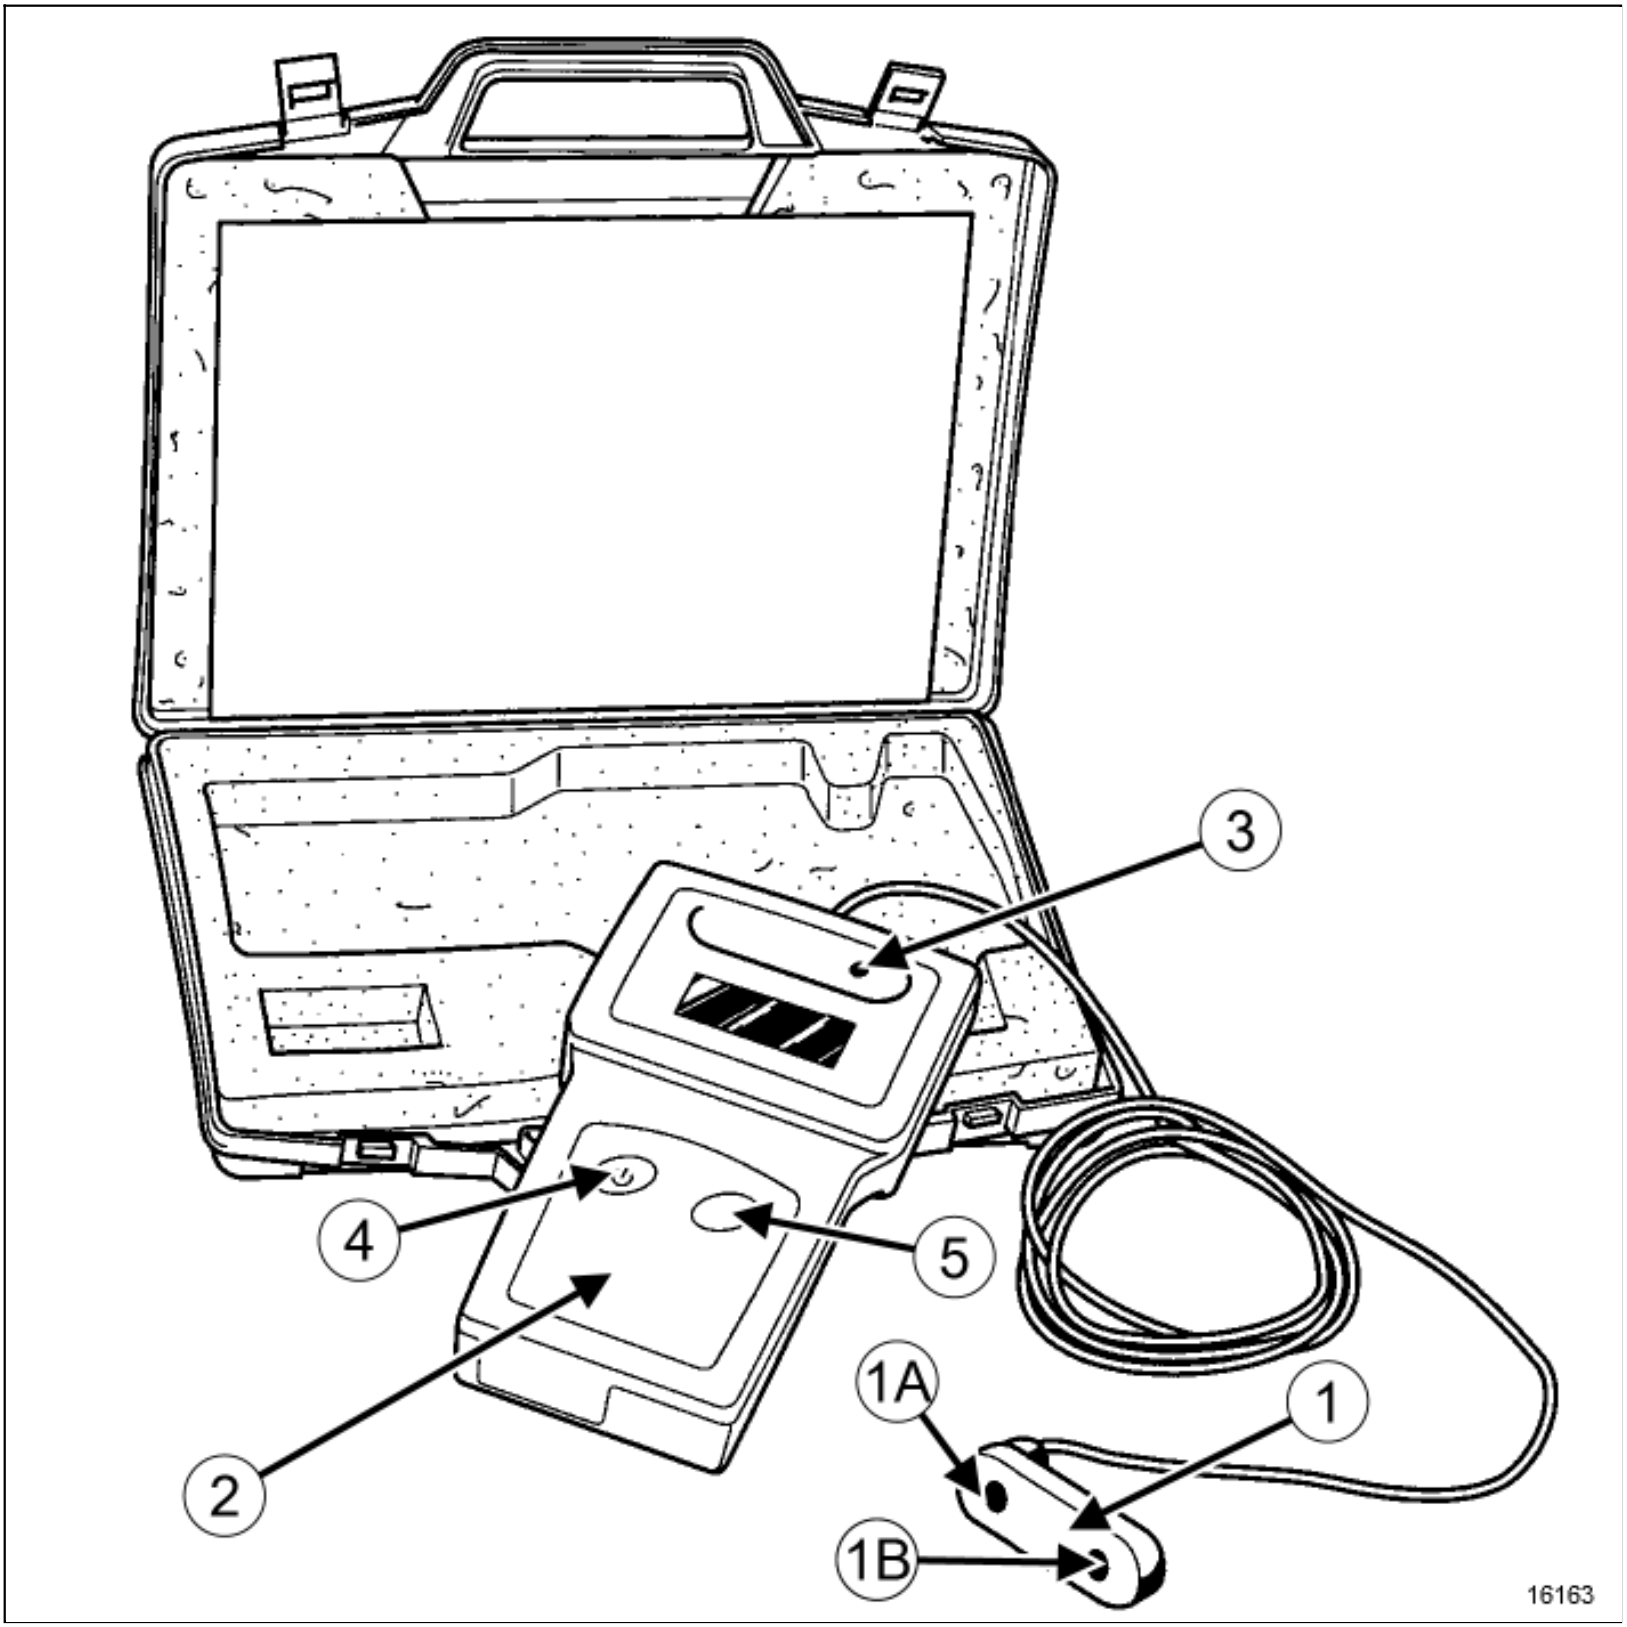
Special tooling required	
Belt tension setting tool (frequency meter)	Mot. 1505
Belt tension checking tool (frequency indicator).	Mot. 1715

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair

1.INTRODUCTION

Frequency meters Belt tension setting tool (frequency meter)(Mot. 1505) or Belt tension checking tool (frequency indicator). (Mot. 1715) allow the tension of the timing and accessories belts to be checked during a fault finding procedure or when a belt is refitted.



This note describes the use of these tools as an addition to the replacement and checking procedures for belts given in the vehicle repair methods.

The procedures and tension values recommended by the manufacturer must always be adhered to as they affect the service life of the drive systems.

An incorrect belt tension may cause noise, loss of power, engine cut-outs or even irreparable damage to the engine.

2. TOOL MOT.1505

1- DESCRIPTION

The tool is comprised of:

- a reading head(**1**) including two sensors(**1A**) and (**1B**) ,
- a display unit(**2**) ,

- a calibrated frequency generator(3) (512 ± 1 Hz) integrated into the display unit(2) ,
- a power switch(4) ,
- a tester switch(5) for checking the calibration of the equipment.

2- CALIBRATING

> Note:
>
> The tool must be calibrated every month

The calibrated frequency generator(3) integrated into the display unit(2) allows the calibration of the tool to be checked.

- Switch the tool on by pressing switch(4) .
- Position the sensor(1A) on the calibrated frequency generator(3) .
- Press on the tester switch(5) .
- Read the value shown on the display.
- Reapply the procedure to check sensor(1B) .

If the value read on the display is not 512 ± 1 Hz, for both sensors, return the tool to the address below:

ONE TOO

1 ZAC de Saint Esteve

06640 Saint-Jeannet les Plans

Tel: +33 (0)4 92 12 04 80

Fax: +33 (0)4 92 12 04 66.

3- OPERATION

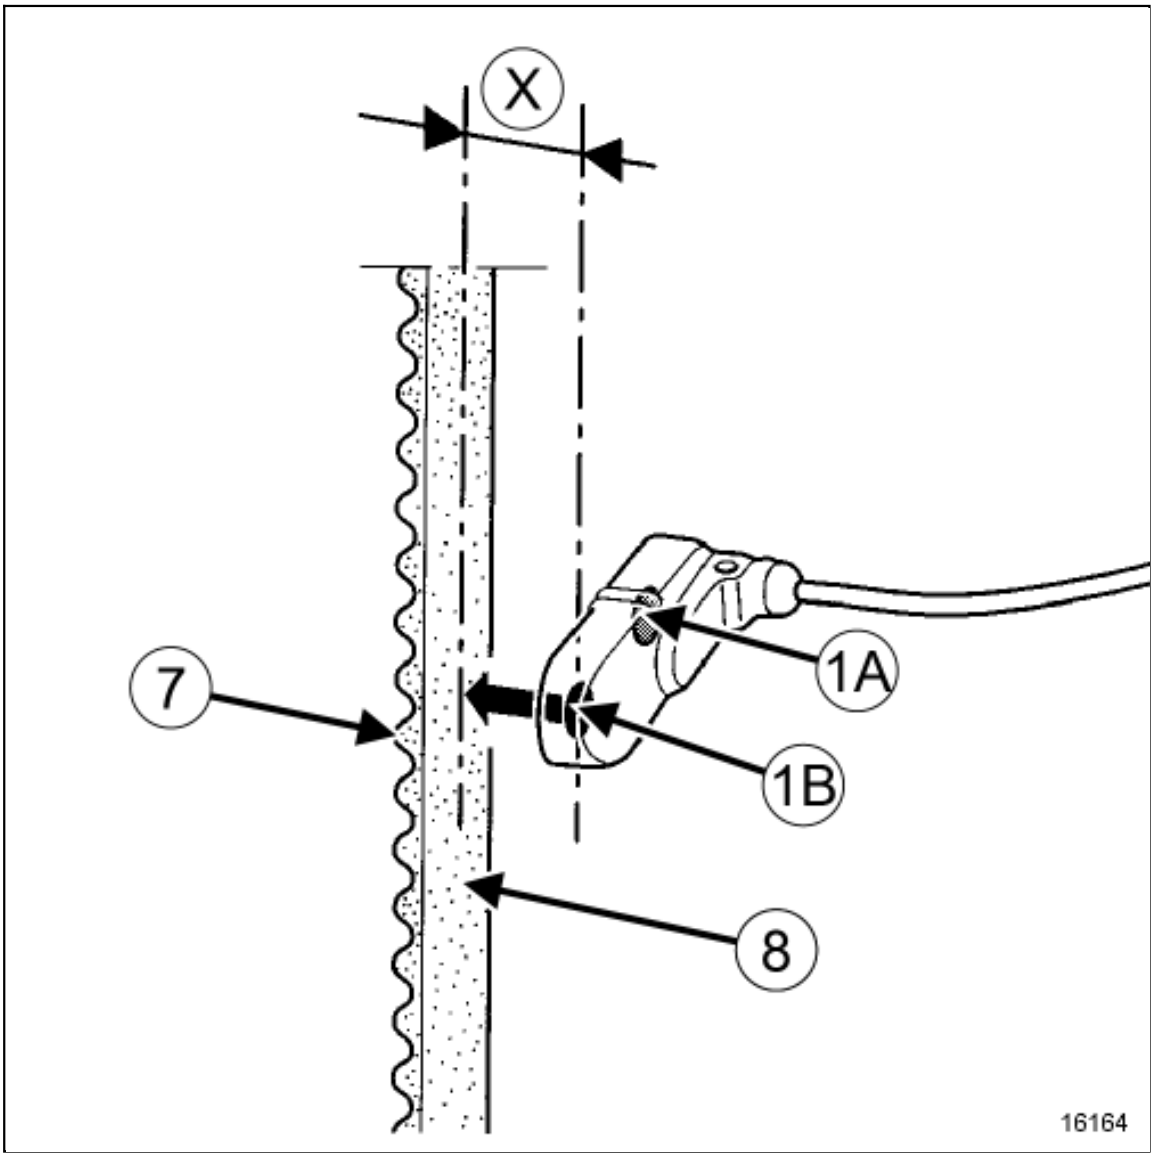
1)PRINCIPLE

This device measures the frequency of the belt to be checked in Hertz (Hz).

Frequency is a physical unit which here reflects the belt tension level very accurately.

The measurement must not be made with just one sensor, the other is used as a reference, and should be outside the measurement field.

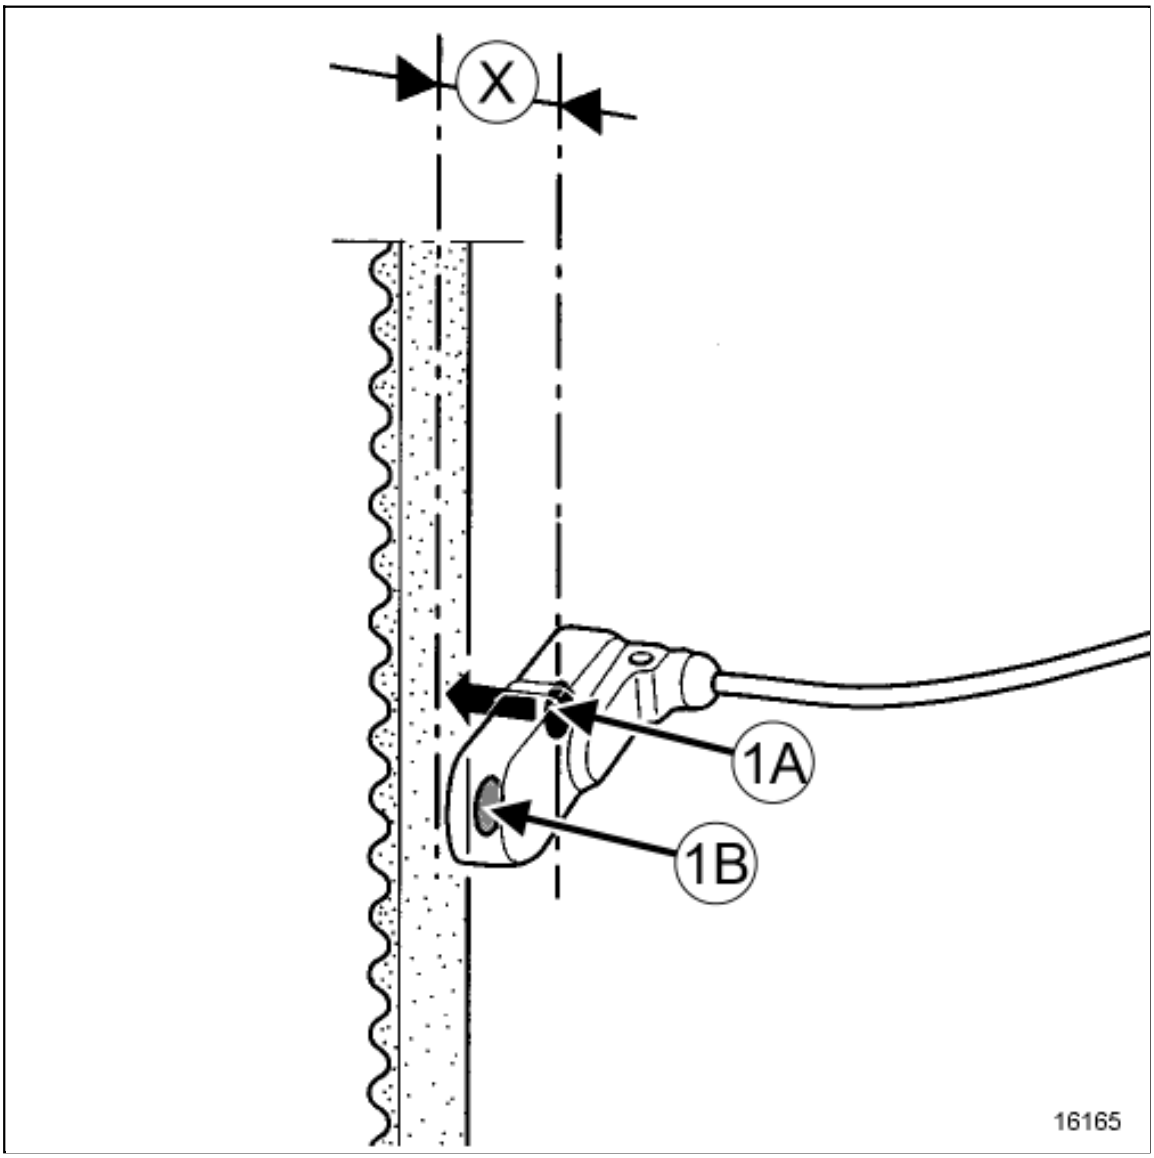
Both of these sensors can be used either as a measuring sensor or as a reference sensor.



Measuring range: 30 to 520 Hz.

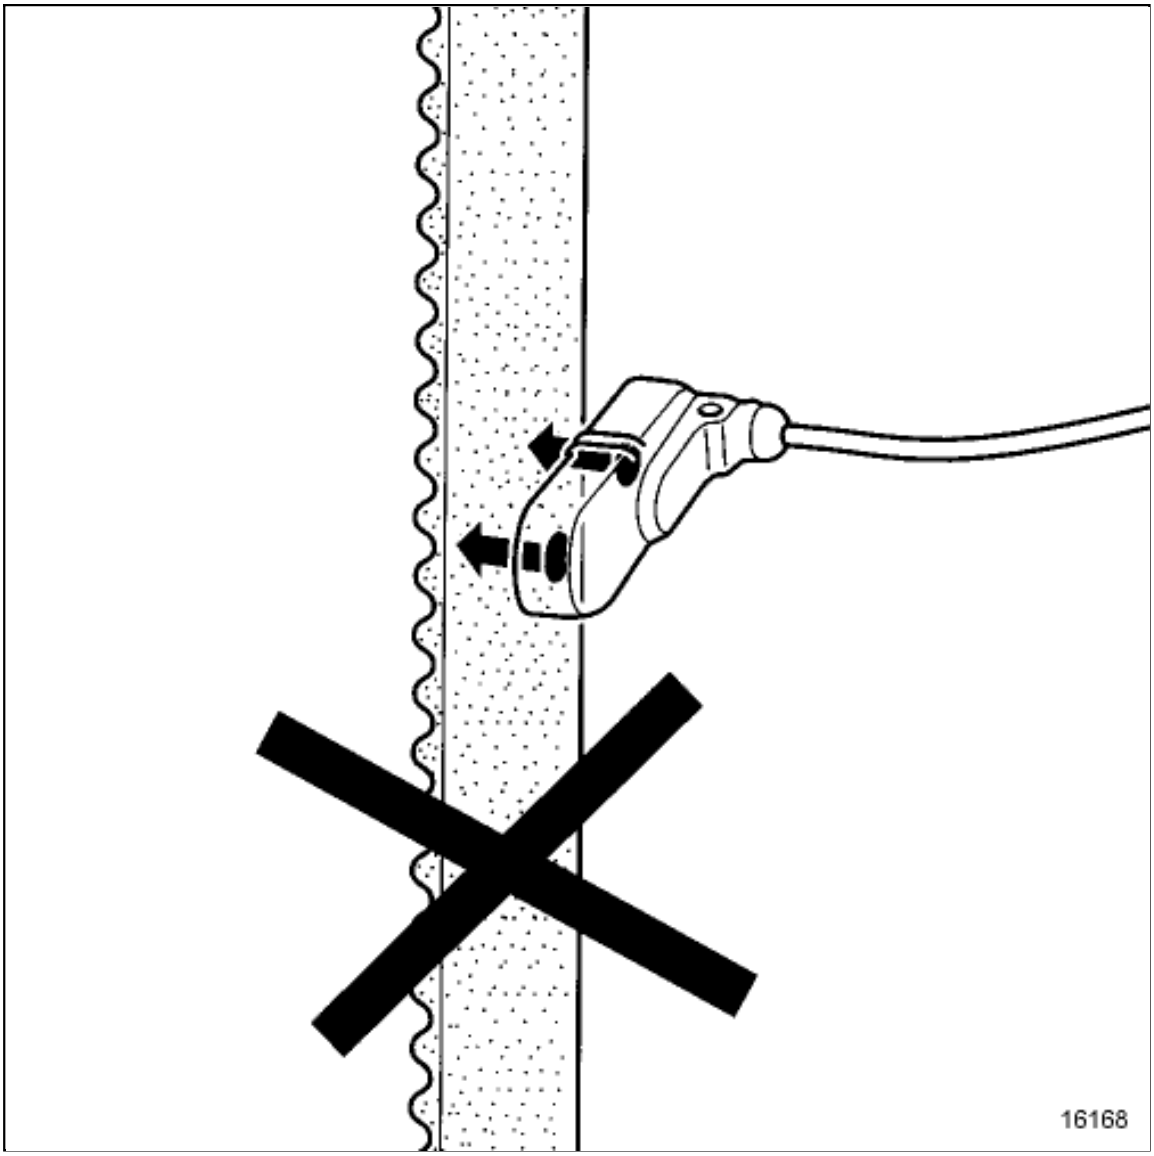
Uncertainty: ± 1 Hz < 100 Hzand 1% > 100 Hz.

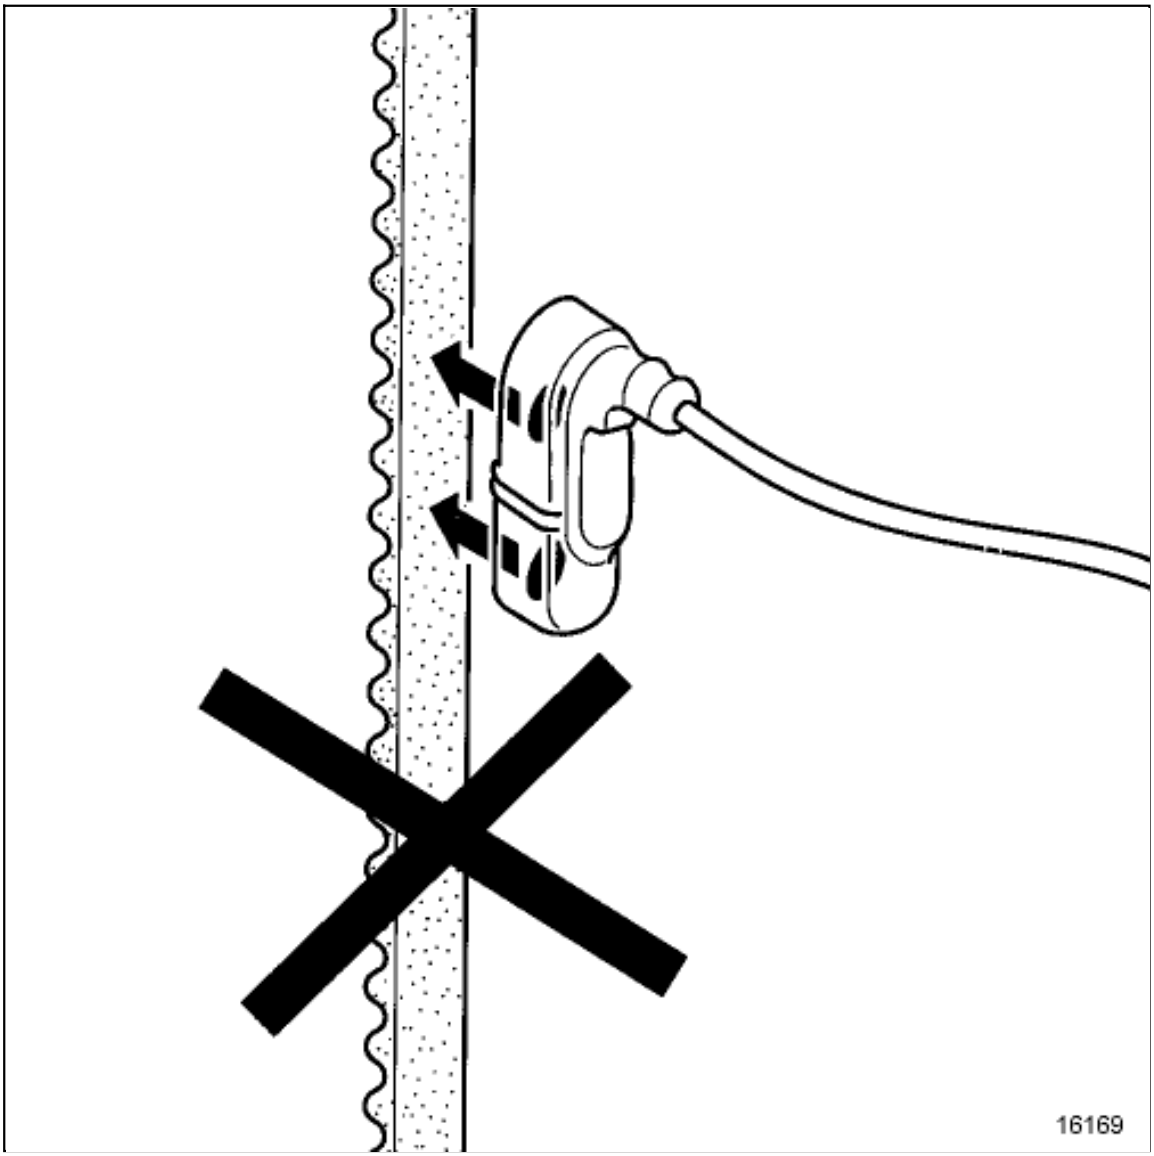
2)USE



Switch the tool on using switch(4) .

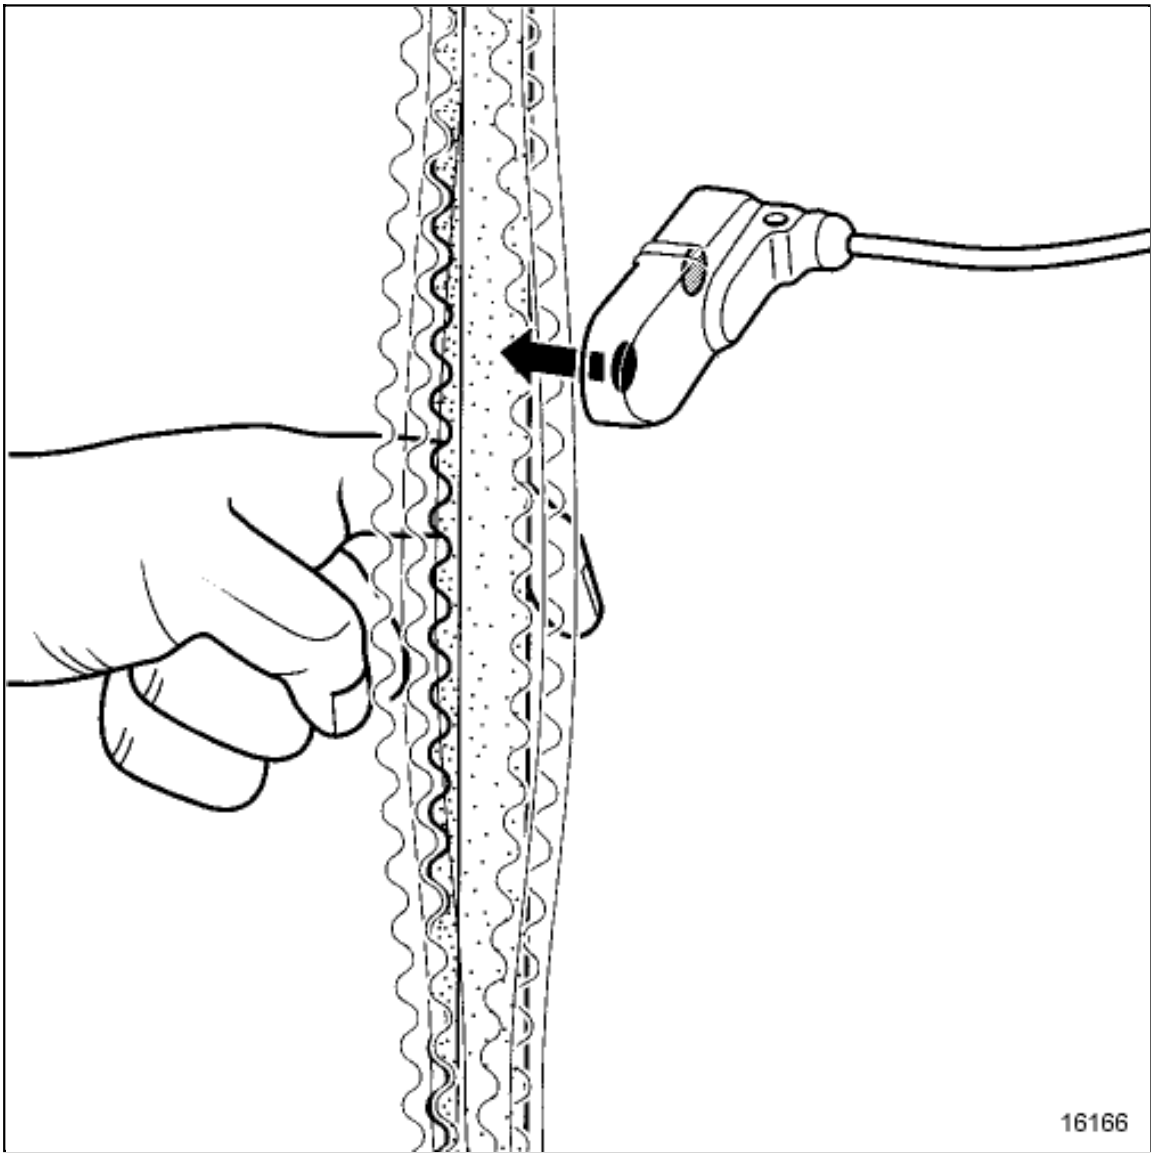
Bring the reading head(1) up to the belt section to be measured.

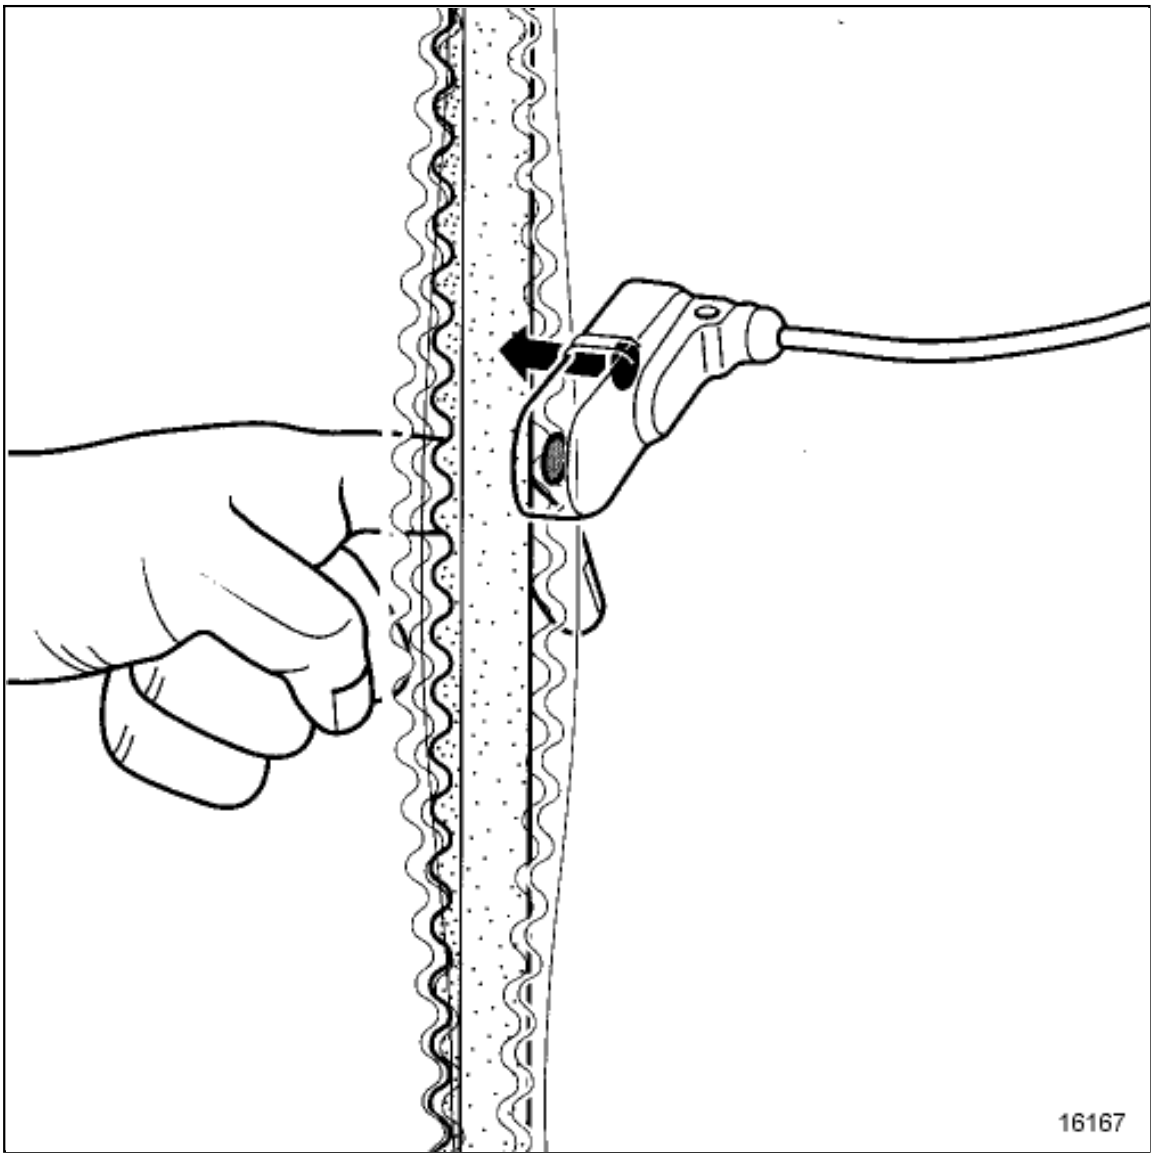




Position the reading head(1) at a distance (x) between approximately 5and 10 mminclusive from the belt.

The measurement can be made on either face(7) or (8) of the belt, according to the dimensions.



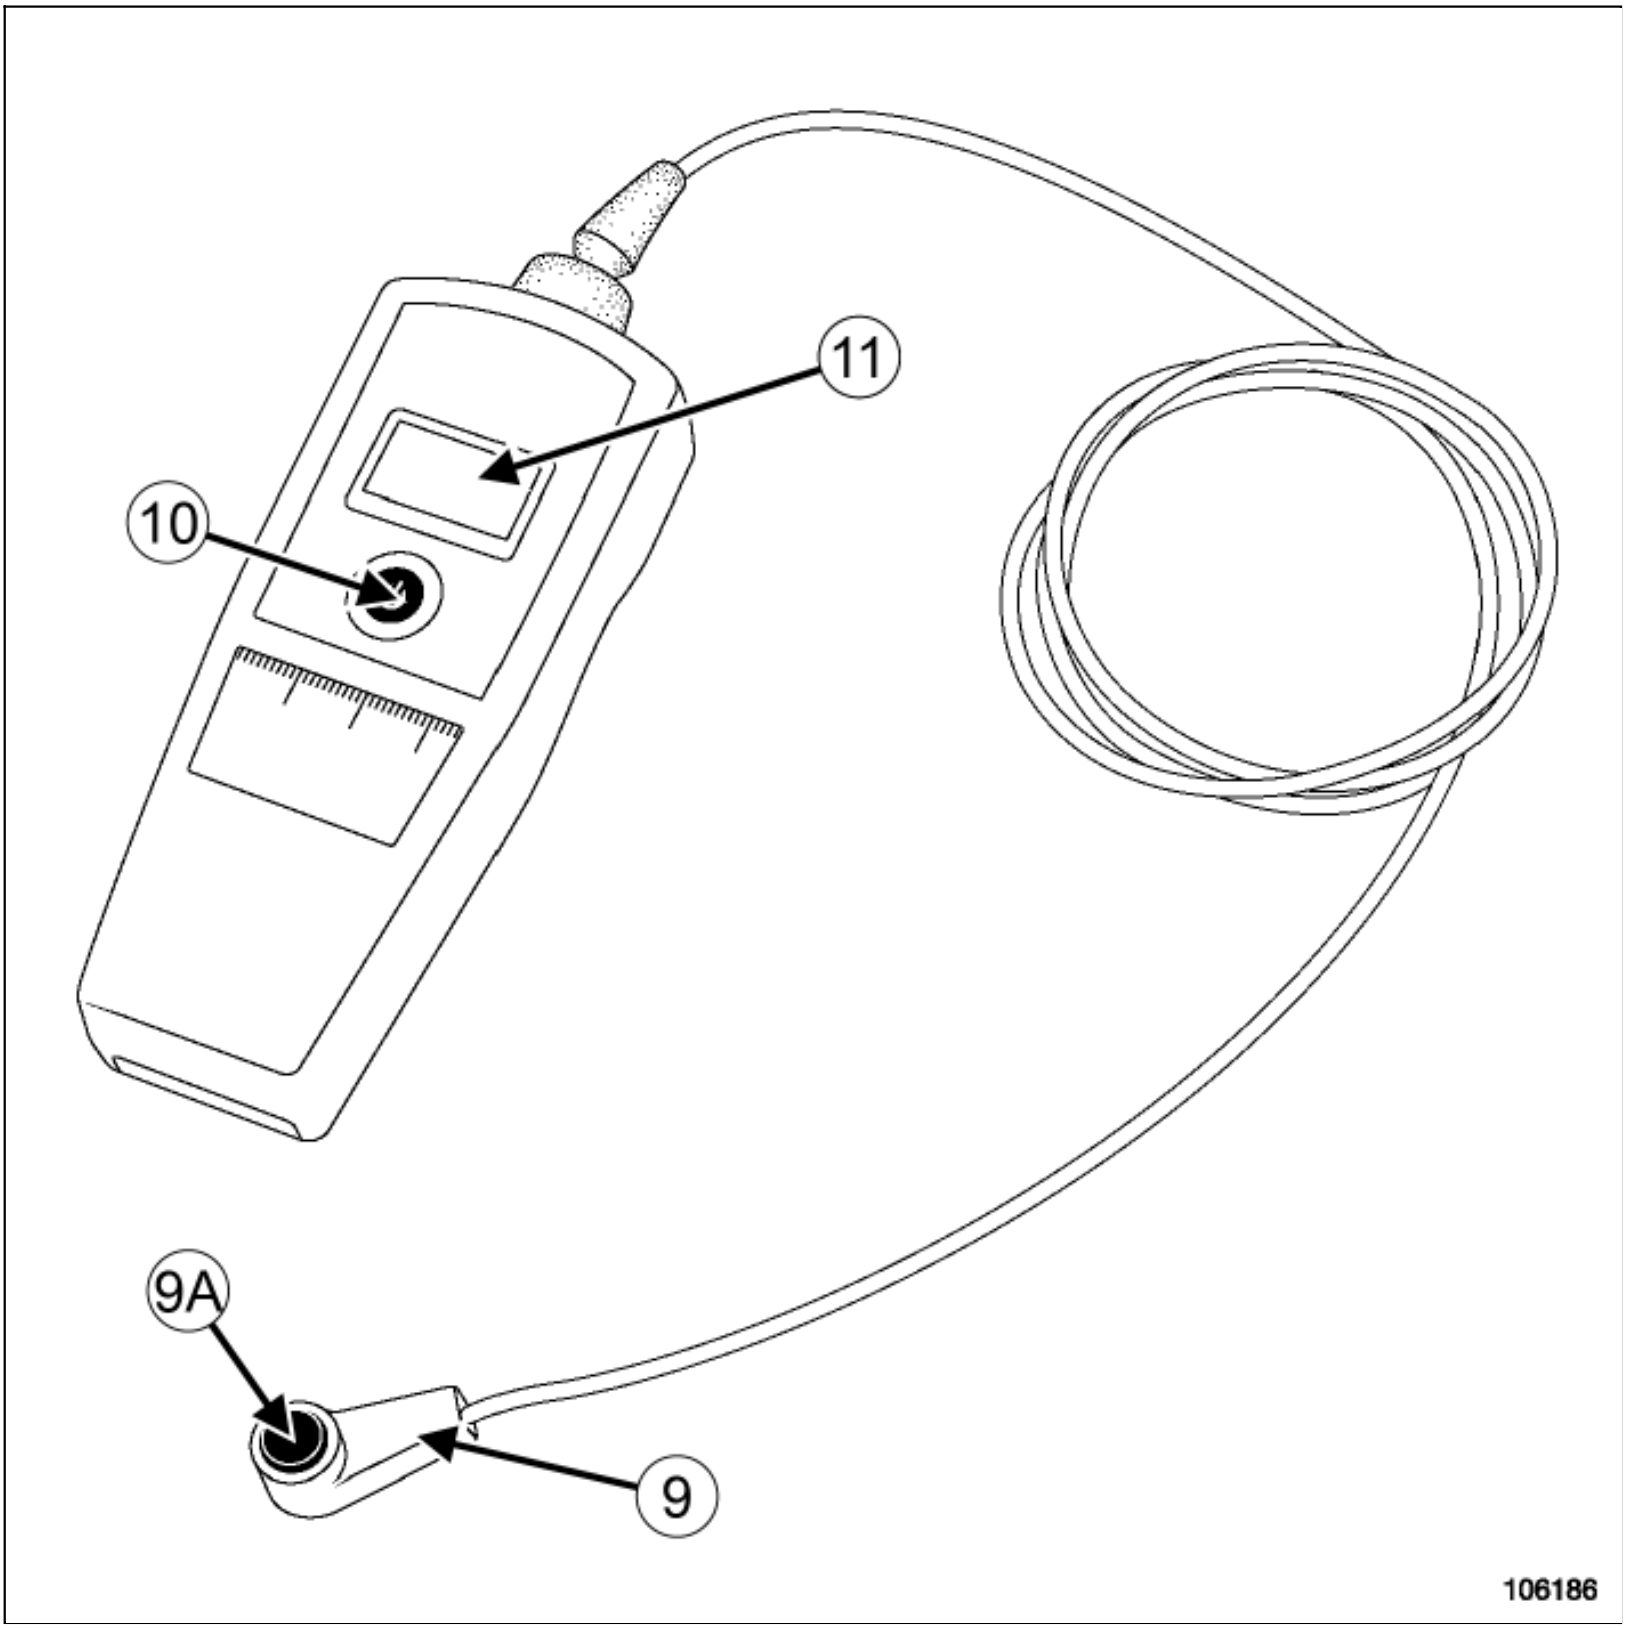


Either sensor (1A) or (1B) can be used, as long as the sensor used for reference is outside the measurement field.

16168

Under no circumstances should the two sensors be facing the belt simultaneously during measurement.

16166

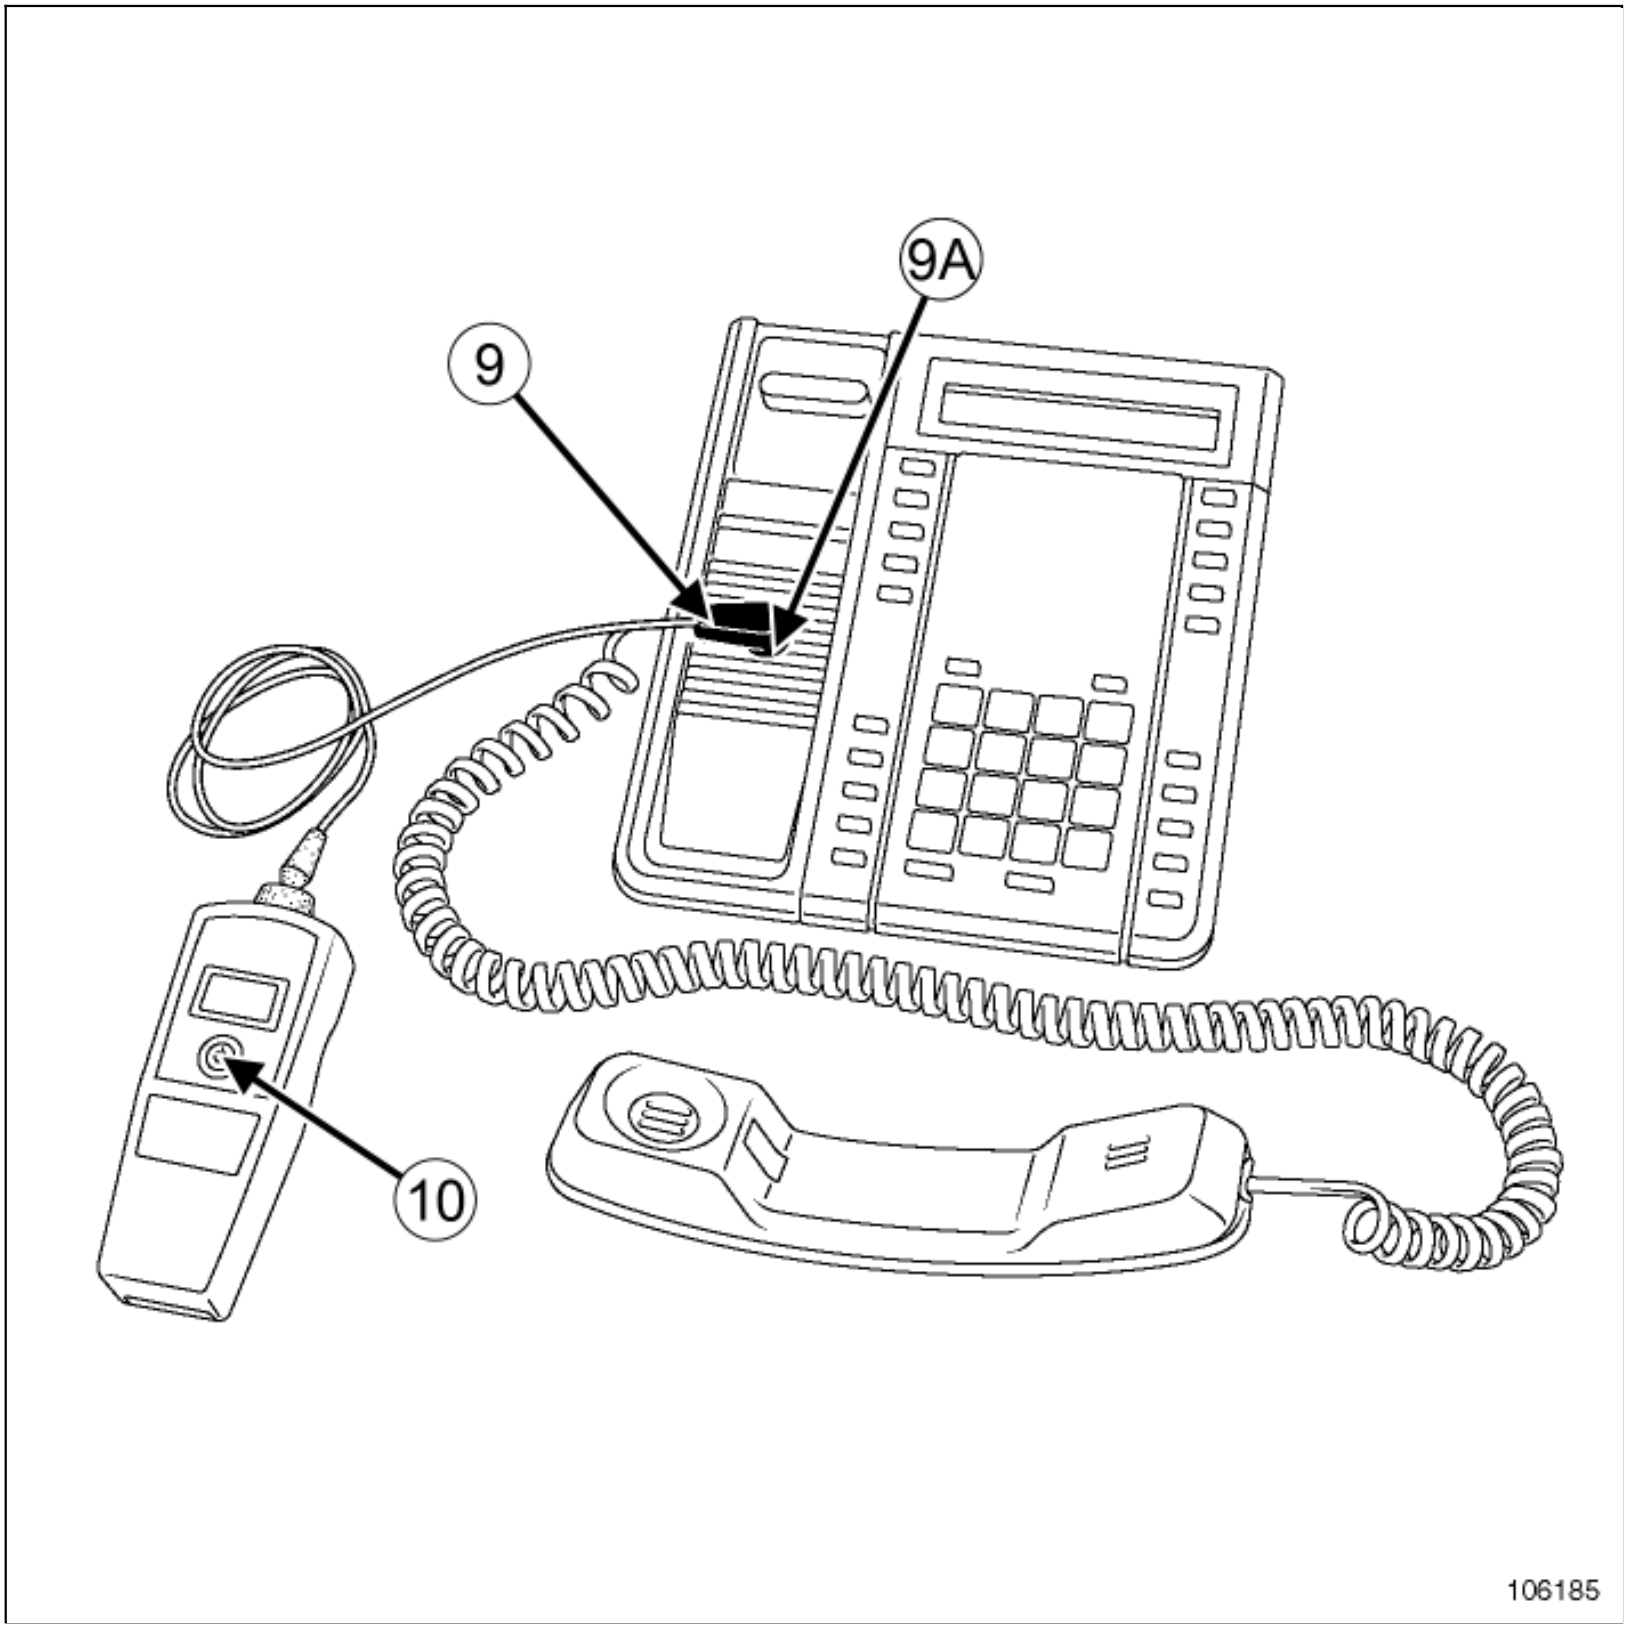


Make the measurement after setting the belt vibrating with a finger.

The measurement is validated by a bleep.

3. TOOL MOT.1715

1- DESCRIPTION



The tool is comprised of:

- a reading head(**9**) including one sensor(**9A**) ,
- a power switch(**10**) ,

a display(11) .

2- CALIBRATION

Note:

The tool must be calibrated every month.

This operation allows the calibration of the tool to be checked using a telephone.

- Switch the tool on by pressing on switch(10) .
- Take the telephone receiver off the hook.
- Dial +33 (0)4 92 12 06 54(this number is free to call).

Do not hang up the call.

- Turn up the volume to maximum.
- Position the sensor(9A) on the speaker.
- Read the value shown on the display.

If the value read on the display is not 440 ± 2 Hz, return the tool to the address below:

ONE TOO

1 ZAC de Saint Esteve

06640 Saint-Jeannet les Plans

Tel: +33 (0)4 92 12 04 80

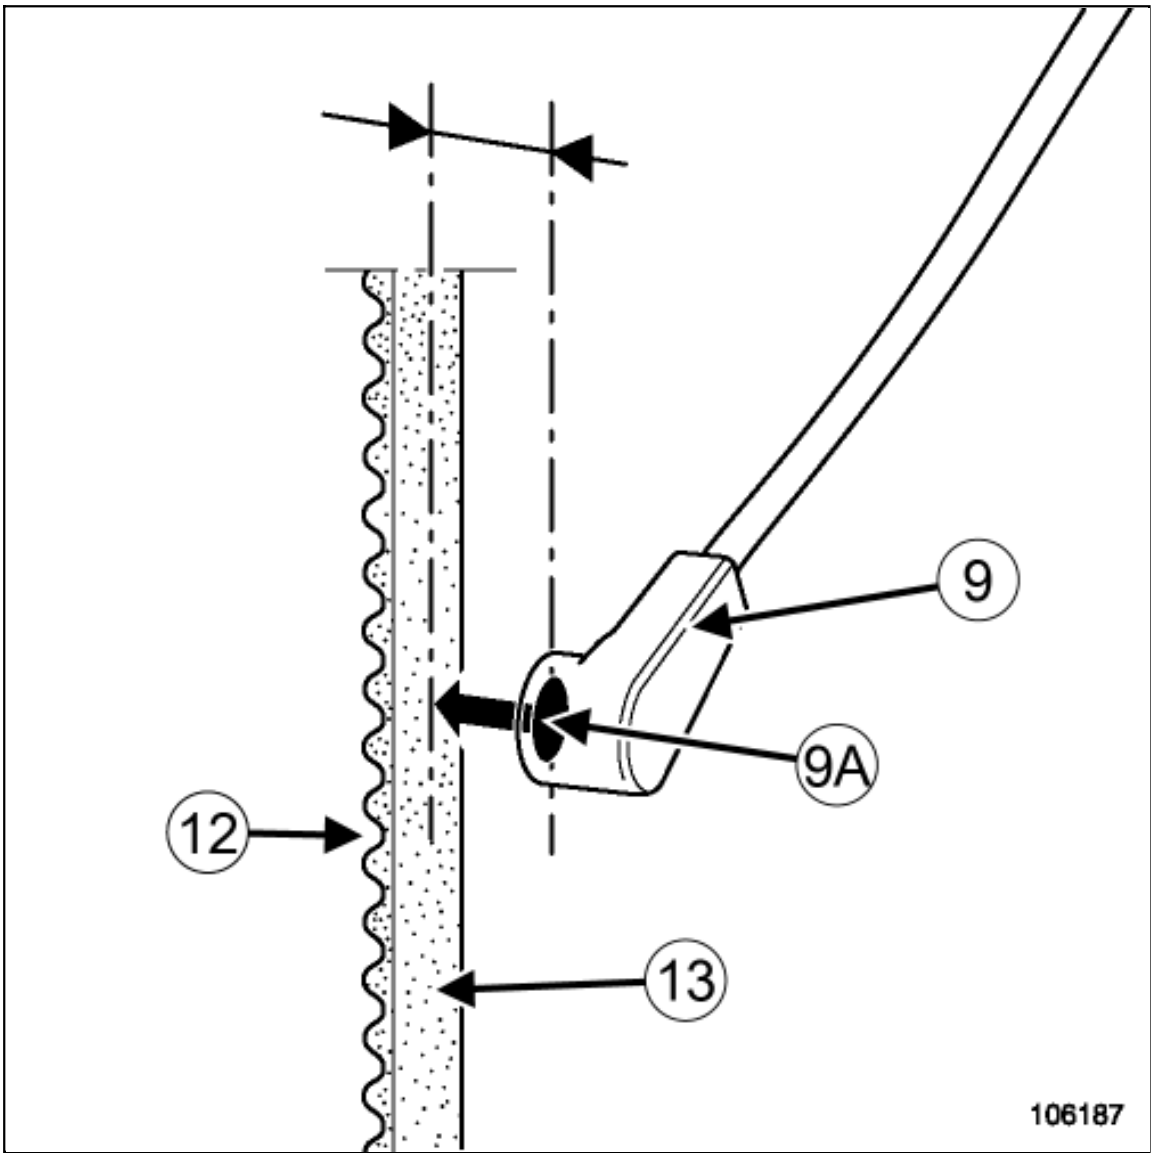
Fax: +33 (0)4 92 12 04 66.

3- OPERATION

1)PRINCIPLE

- This tool measures the frequency of the belt to be checked in Hertz (Hz).

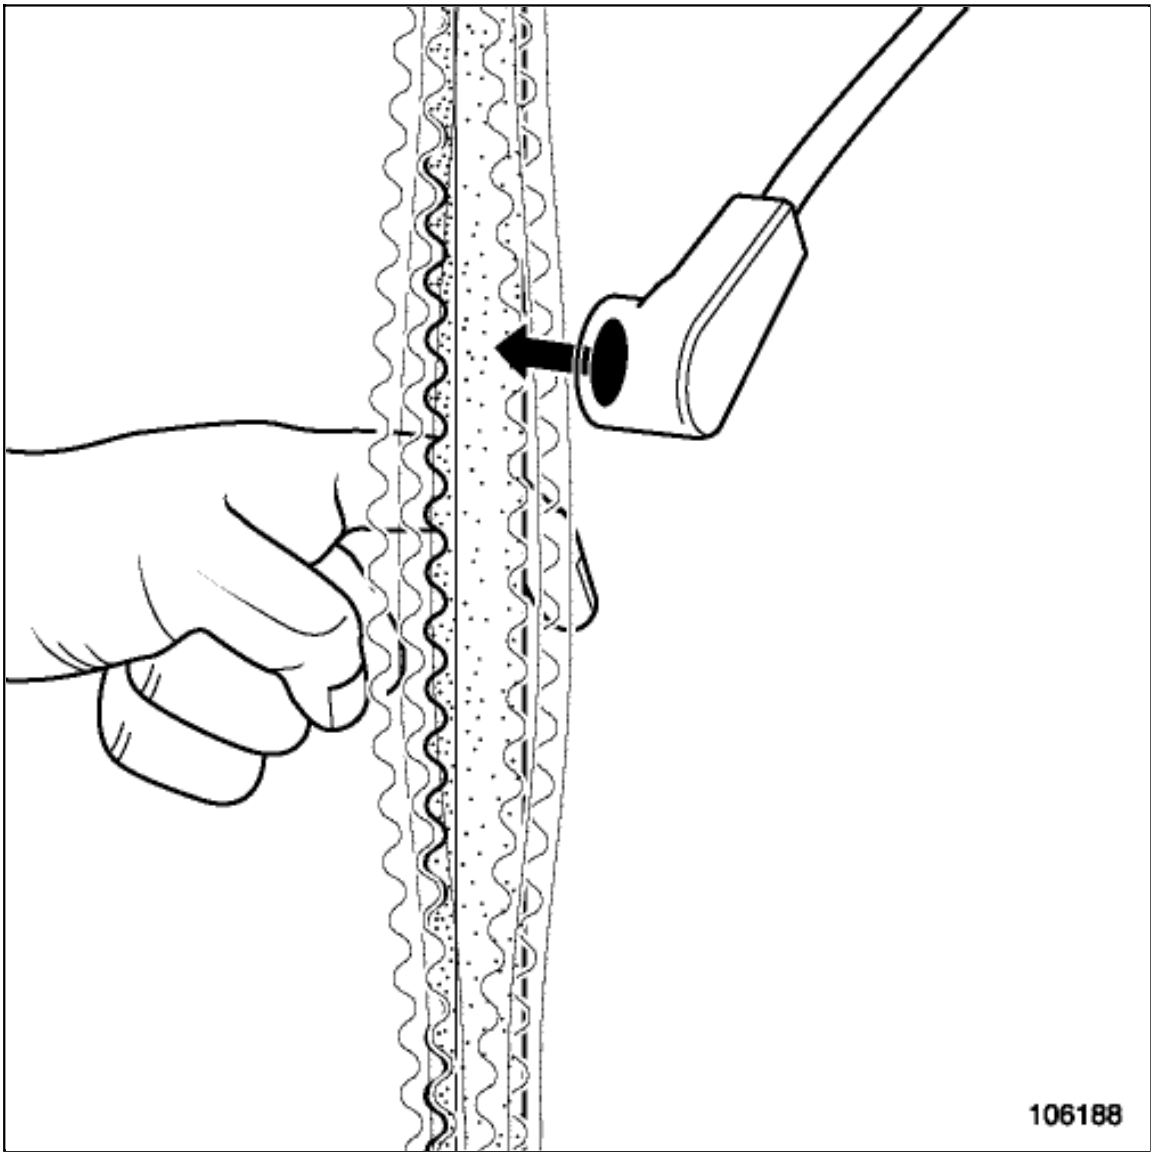
Frequency is a physical unit which here reflects the belt tension level very accurately.



Measuring range: 30 to 520 Hz.

Uncertainty: ± 1 Hz < 100 Hzand 1% > 100 Hz.

2)USE



Switch the tool on by pressing on switch(10) .

Bring the reading head(9) up to the belt section to be measured.

Position the reading head(9) at a distance (x) between approximately 5and 10 mminclusive from the belt.

The measurement can be made on either face(12) or (13) of the belt, according to the dimensions.

Make the measurement after setting the belt vibrating with a finger.

BELT TENSION CHECKING TOOL: USE

Note, one or more warnings are present in this procedure

Special tooling required	
Belt tension setting tool (frequency meter)

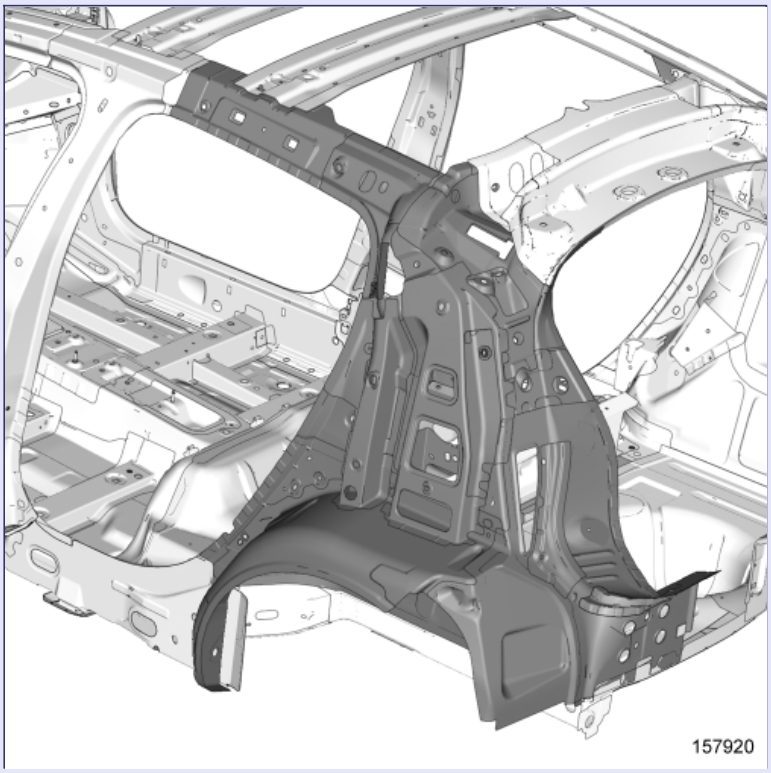
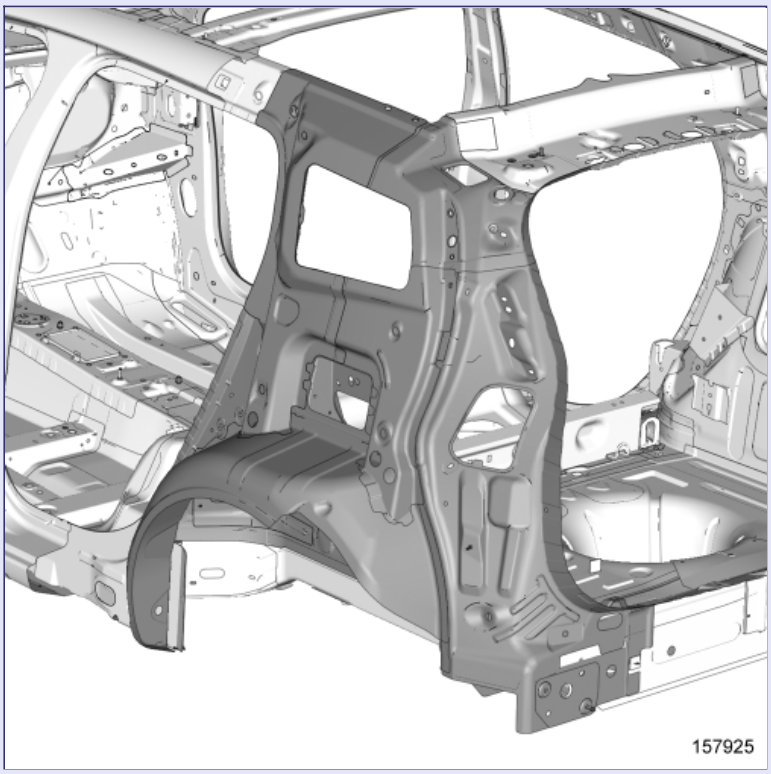
2. IN THE EVENT OF REPLACEMENT



There is only one way of replacing this part:

- complete replacement.



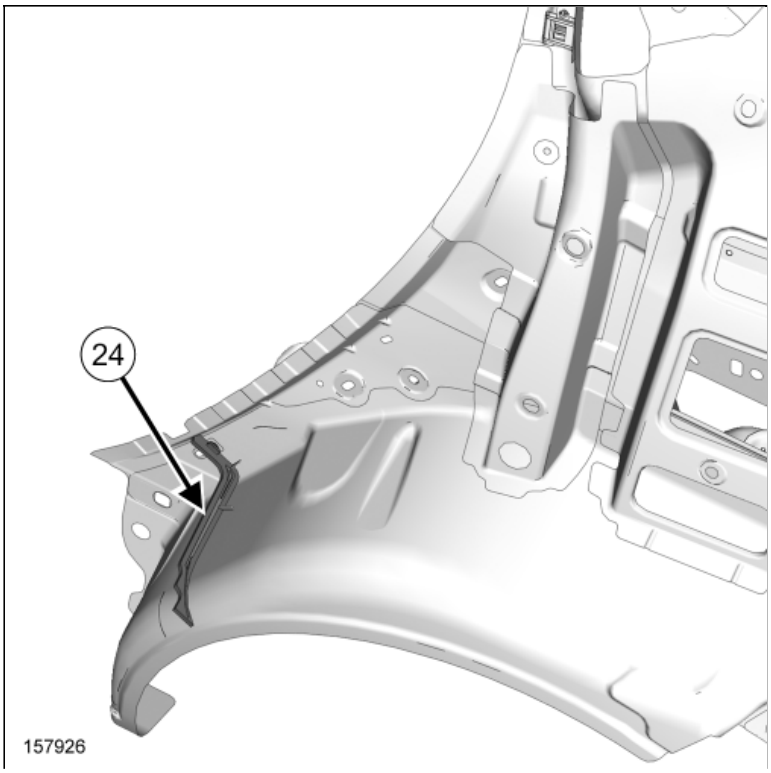
1- COMPLETE REPLACEMENT

1)PART IN POSITION

B98(B98)

K98(K98)

2)POSITION OF ELECTRIC EARTHS



CAUTION

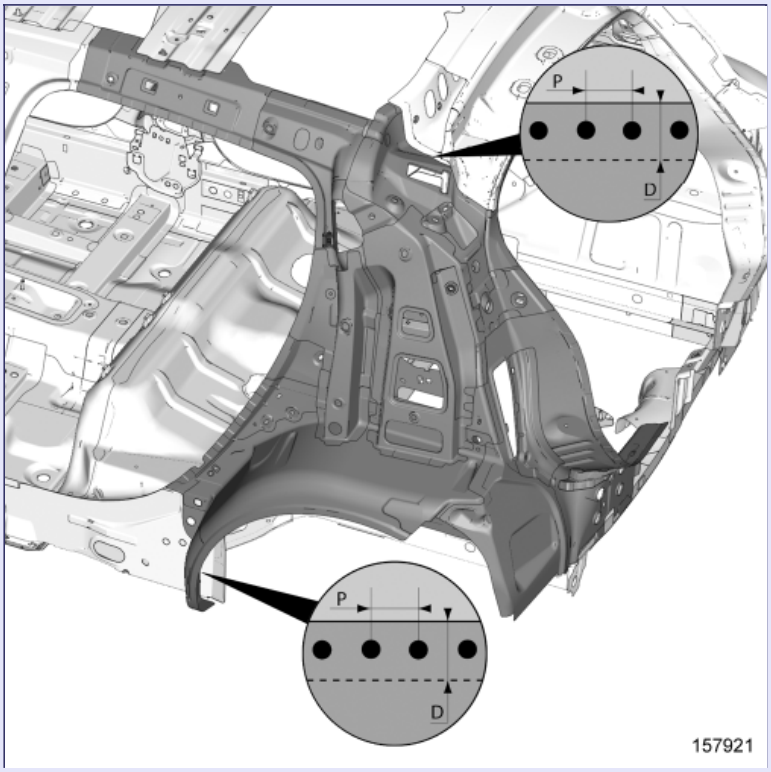
To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

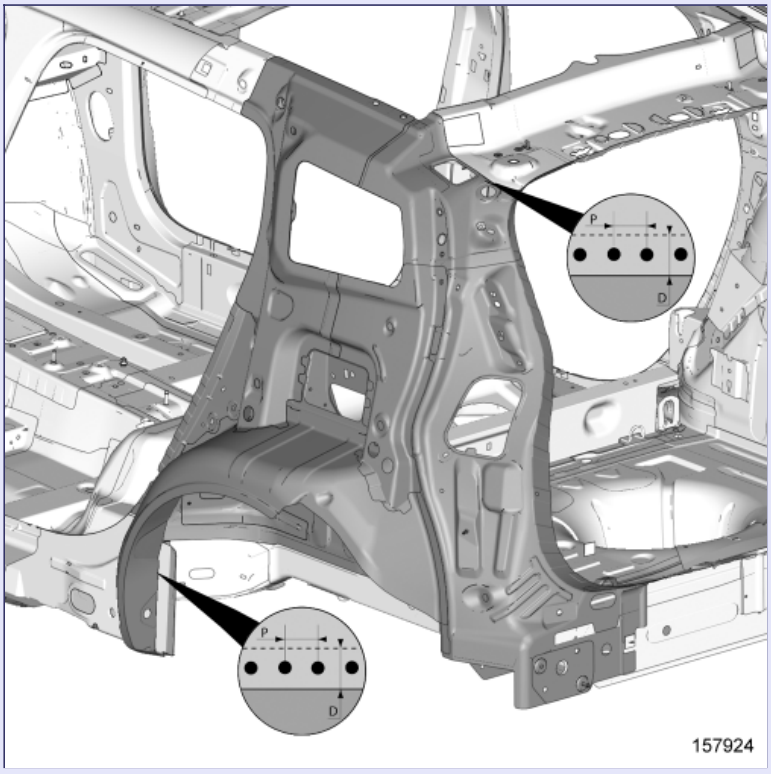
3)PARTS ALWAYS TO BE REPLACED

Replace the hollow section inserts(24) .



4)IRREMOVABLE BODYWORK COMPONENTS - STRUCTURES TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

Remove:



the roof**Roof: Replacement** .

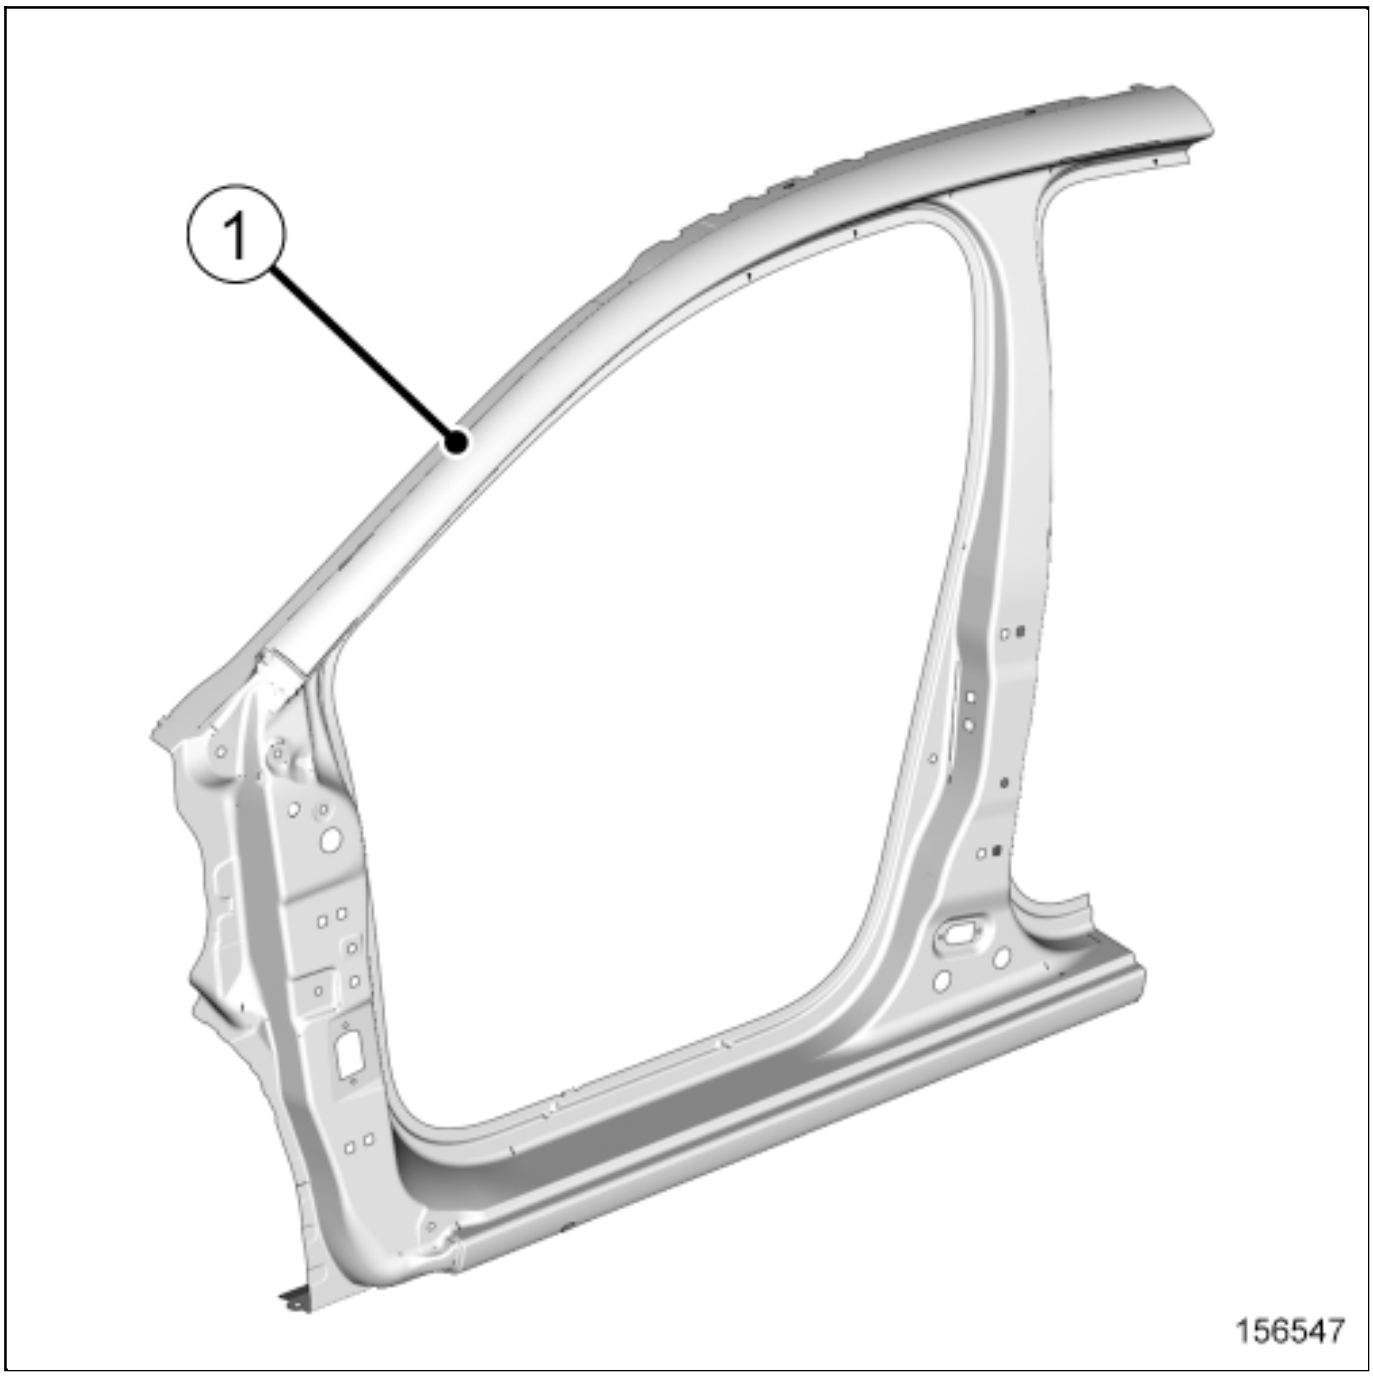
5)SPECIAL NOTES ON MATING

B98(B98)

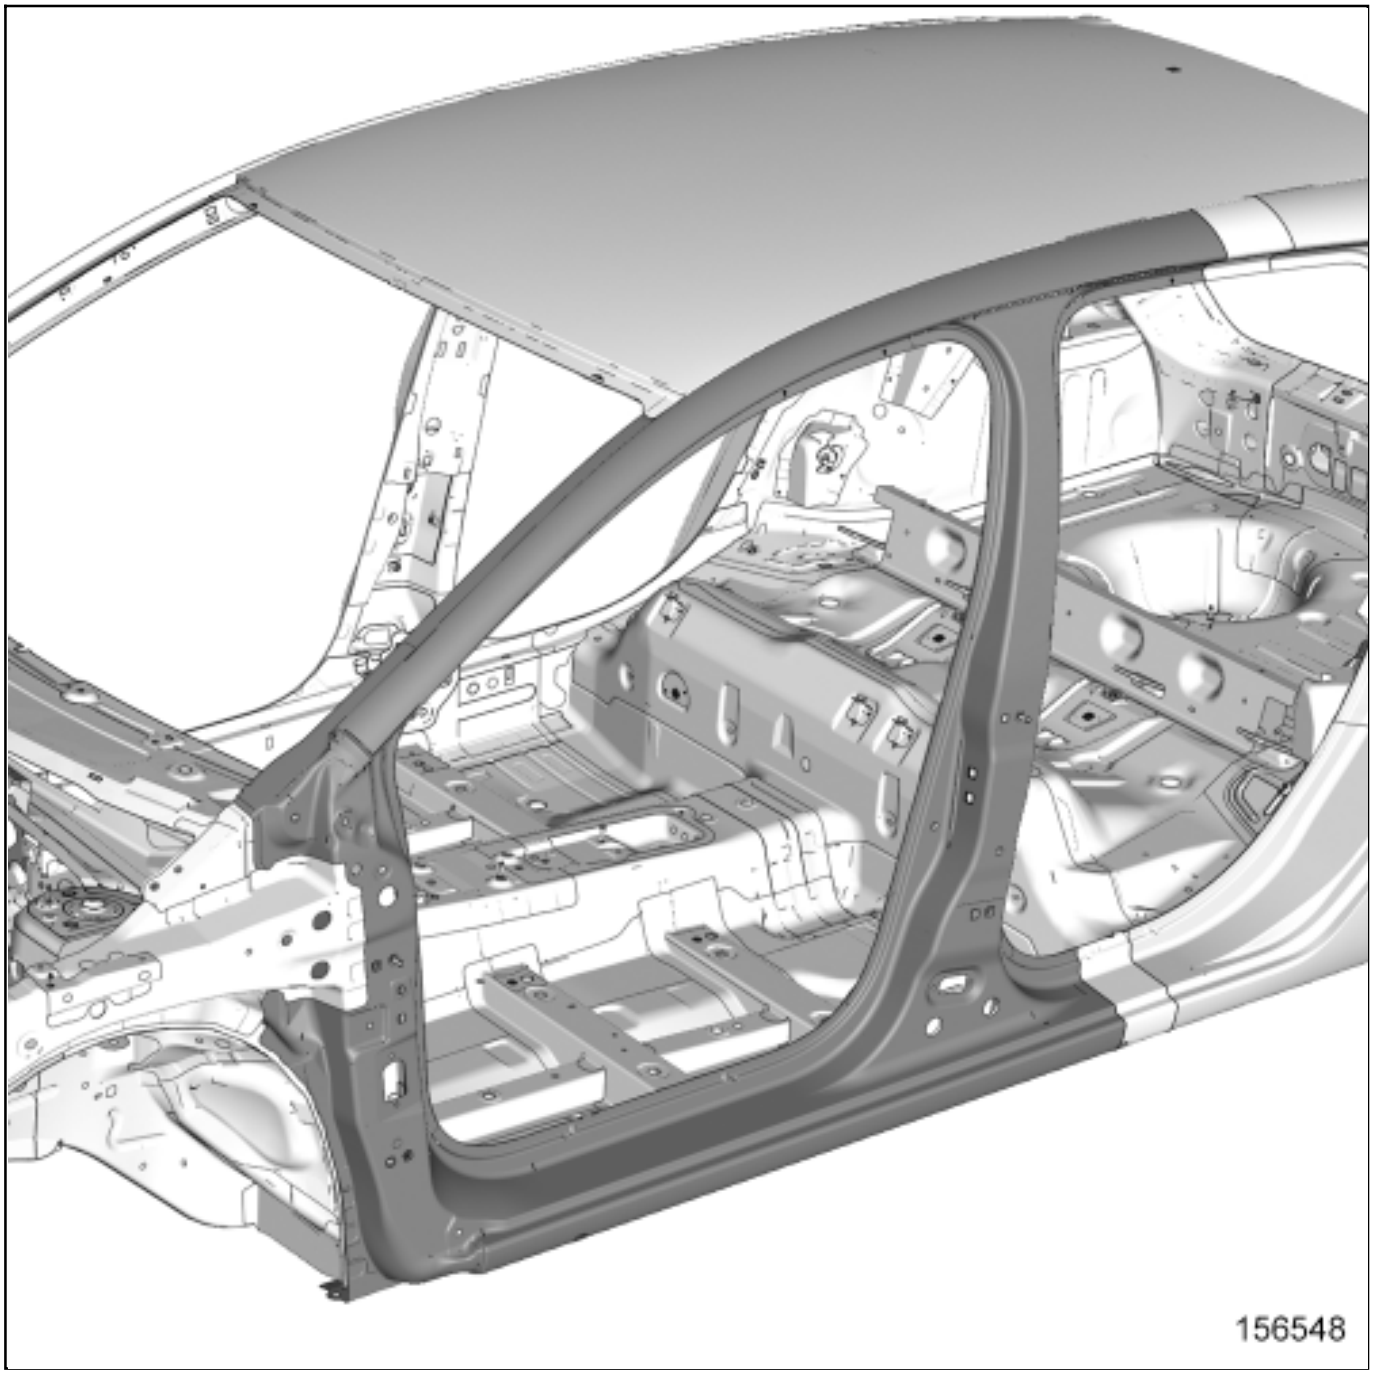
K98(K98)

Make a superimposed connection at[Partial replacement connections by overlapping: Description](#) (MR 400, 40E, Partial replacement connections).

CAUTION



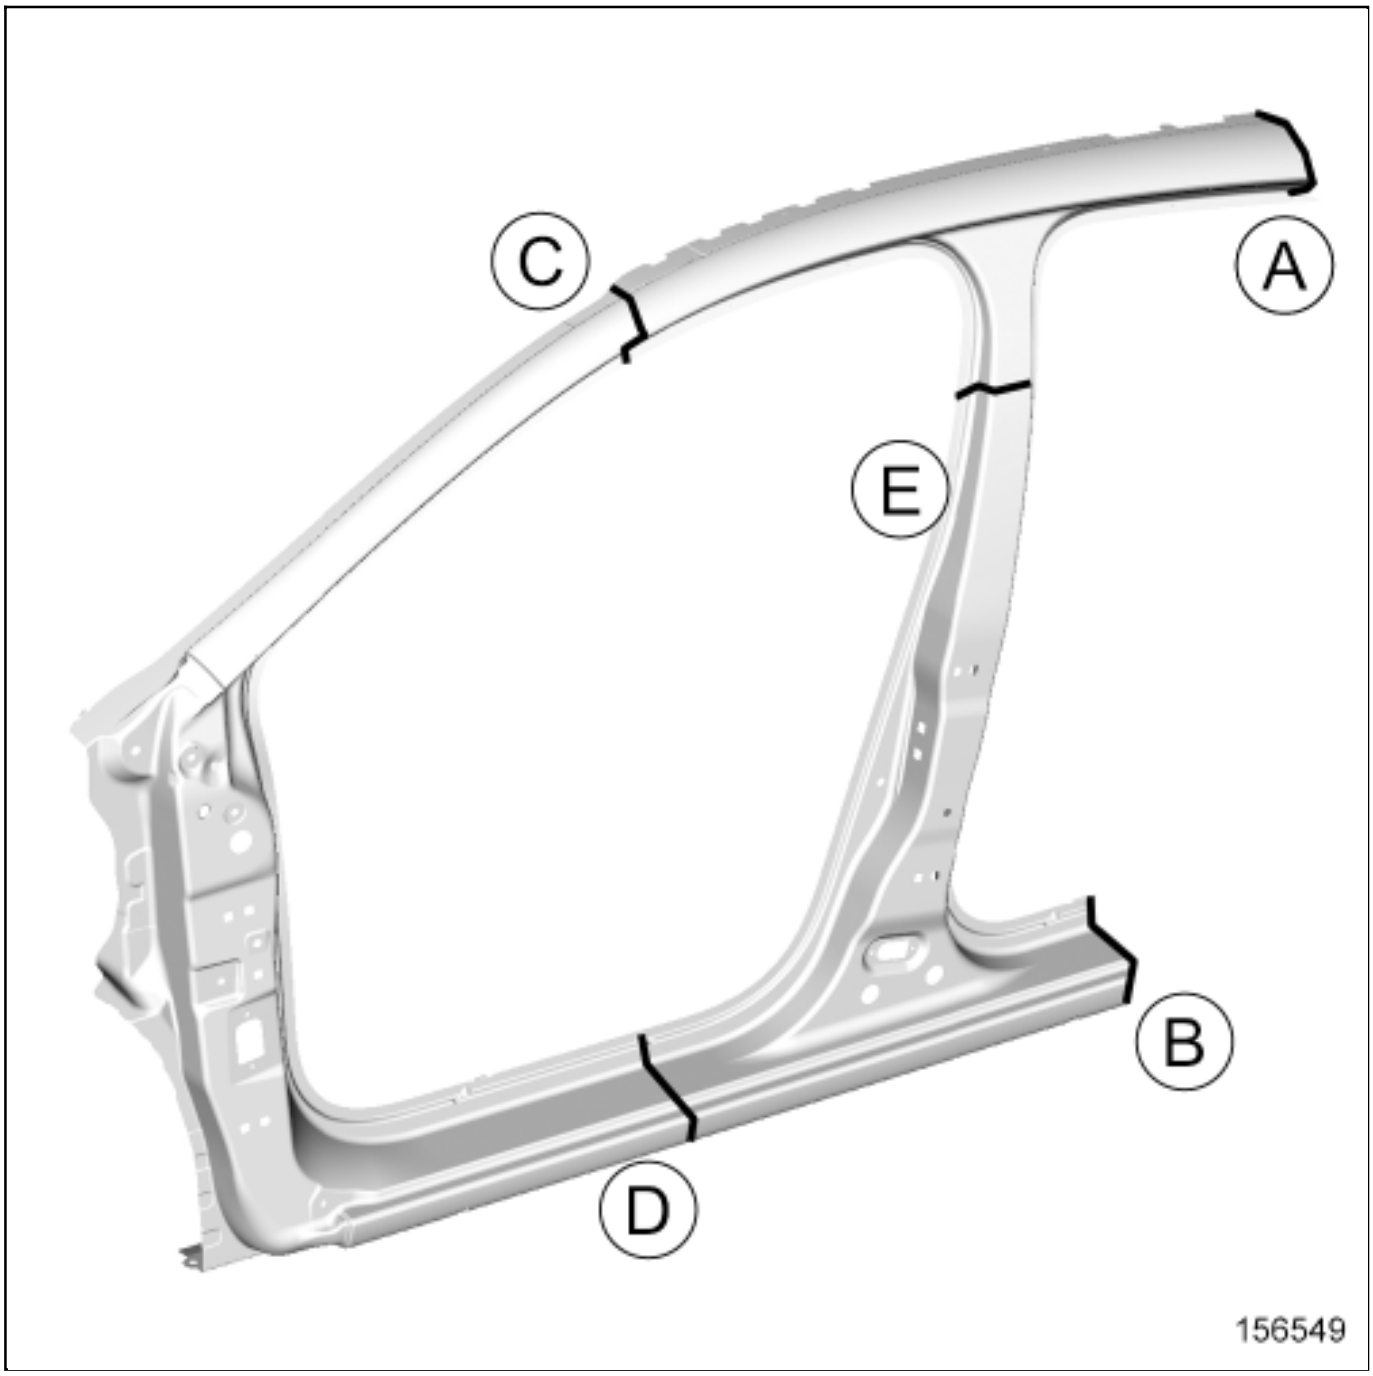
If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld[Connections by arc welding under shielding gas: Description](#) (MR 400, 40C, Gas metal arc welded connections (GMAW)).



XSL version : 3.02 du 22/07/11

BODY SIDE, FRONT SECTION: REPLACEMENT

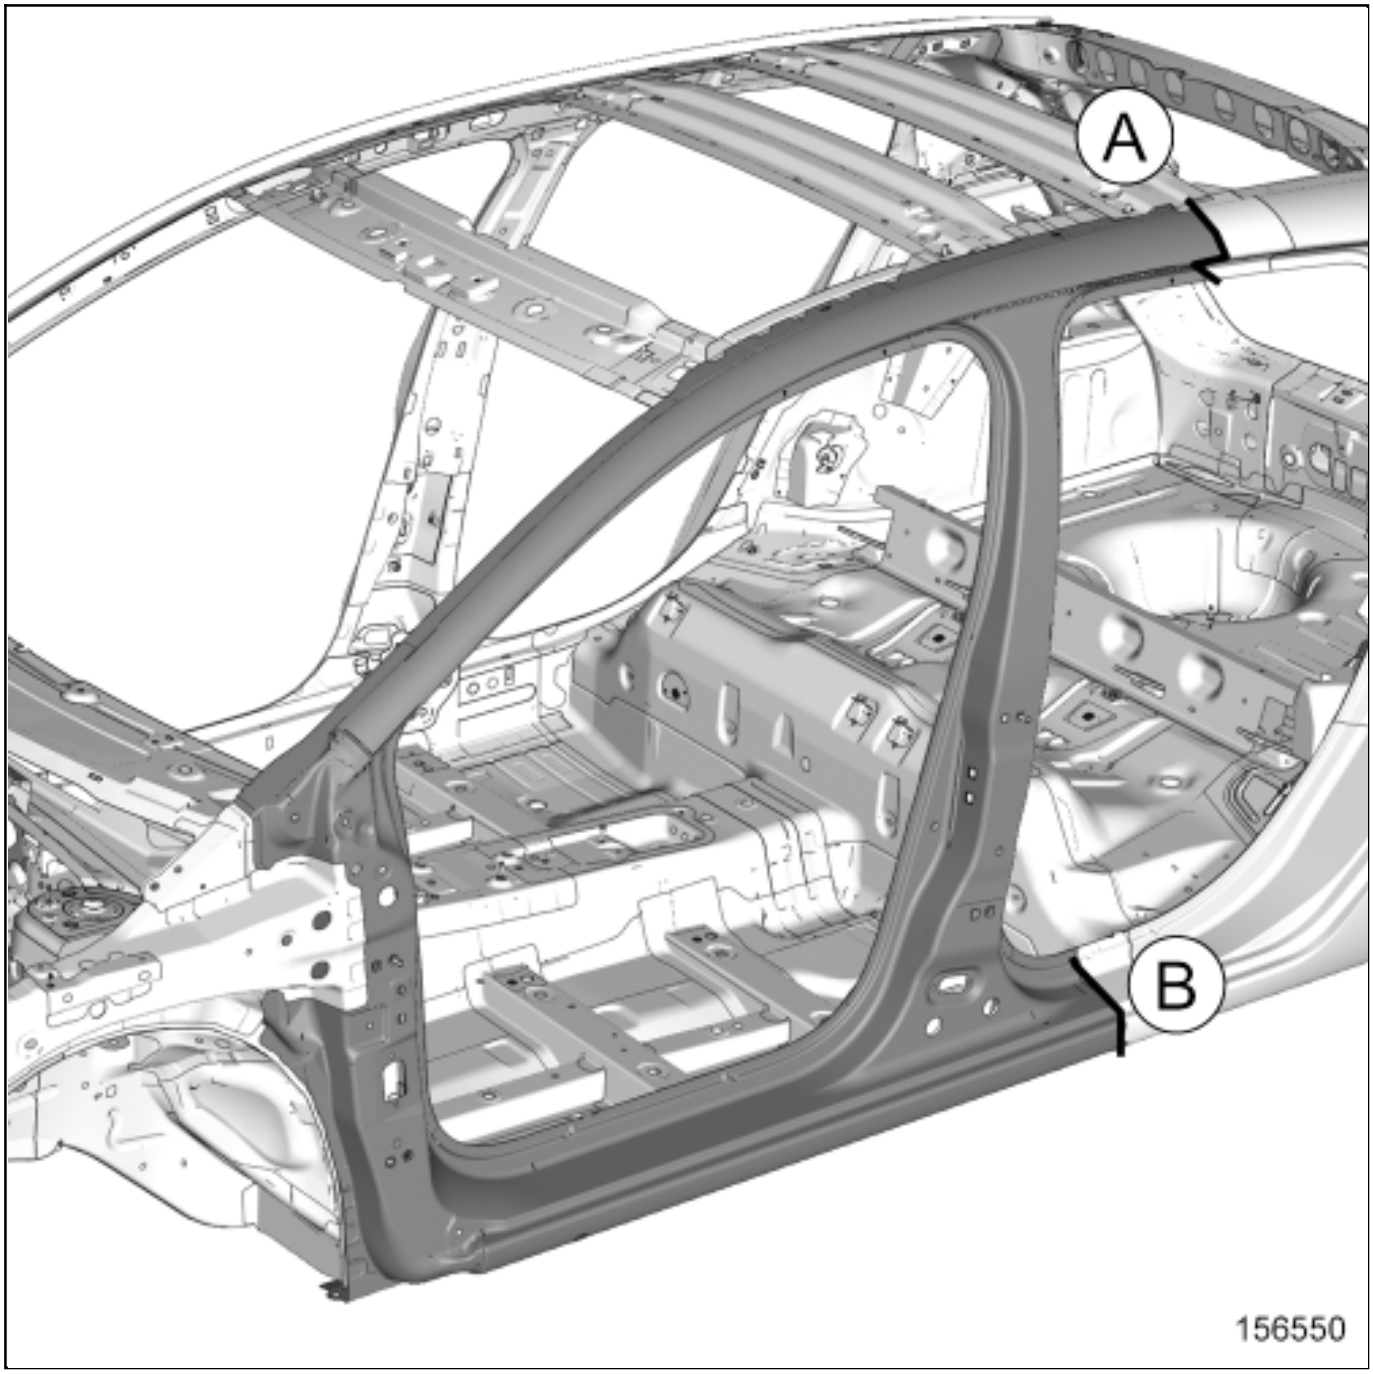
Note, one or more warnings are present in this procedure

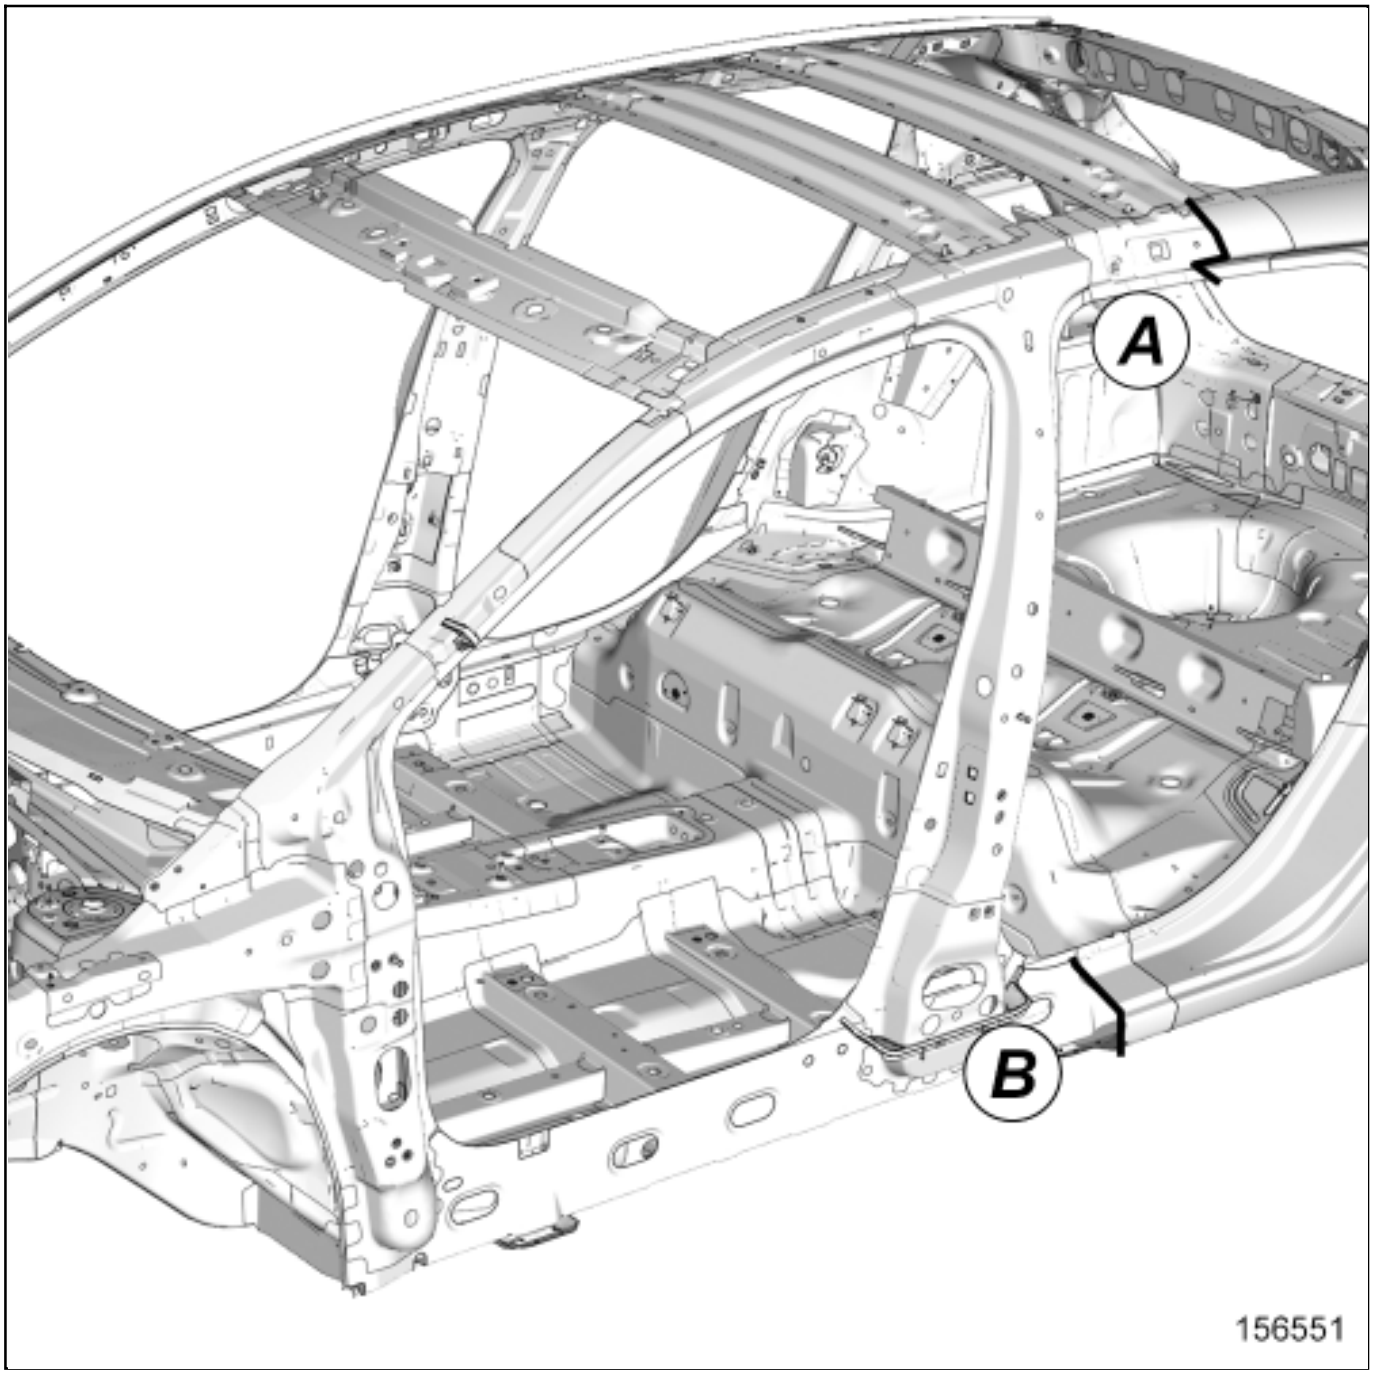


1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Body side	Mild steel	0.7

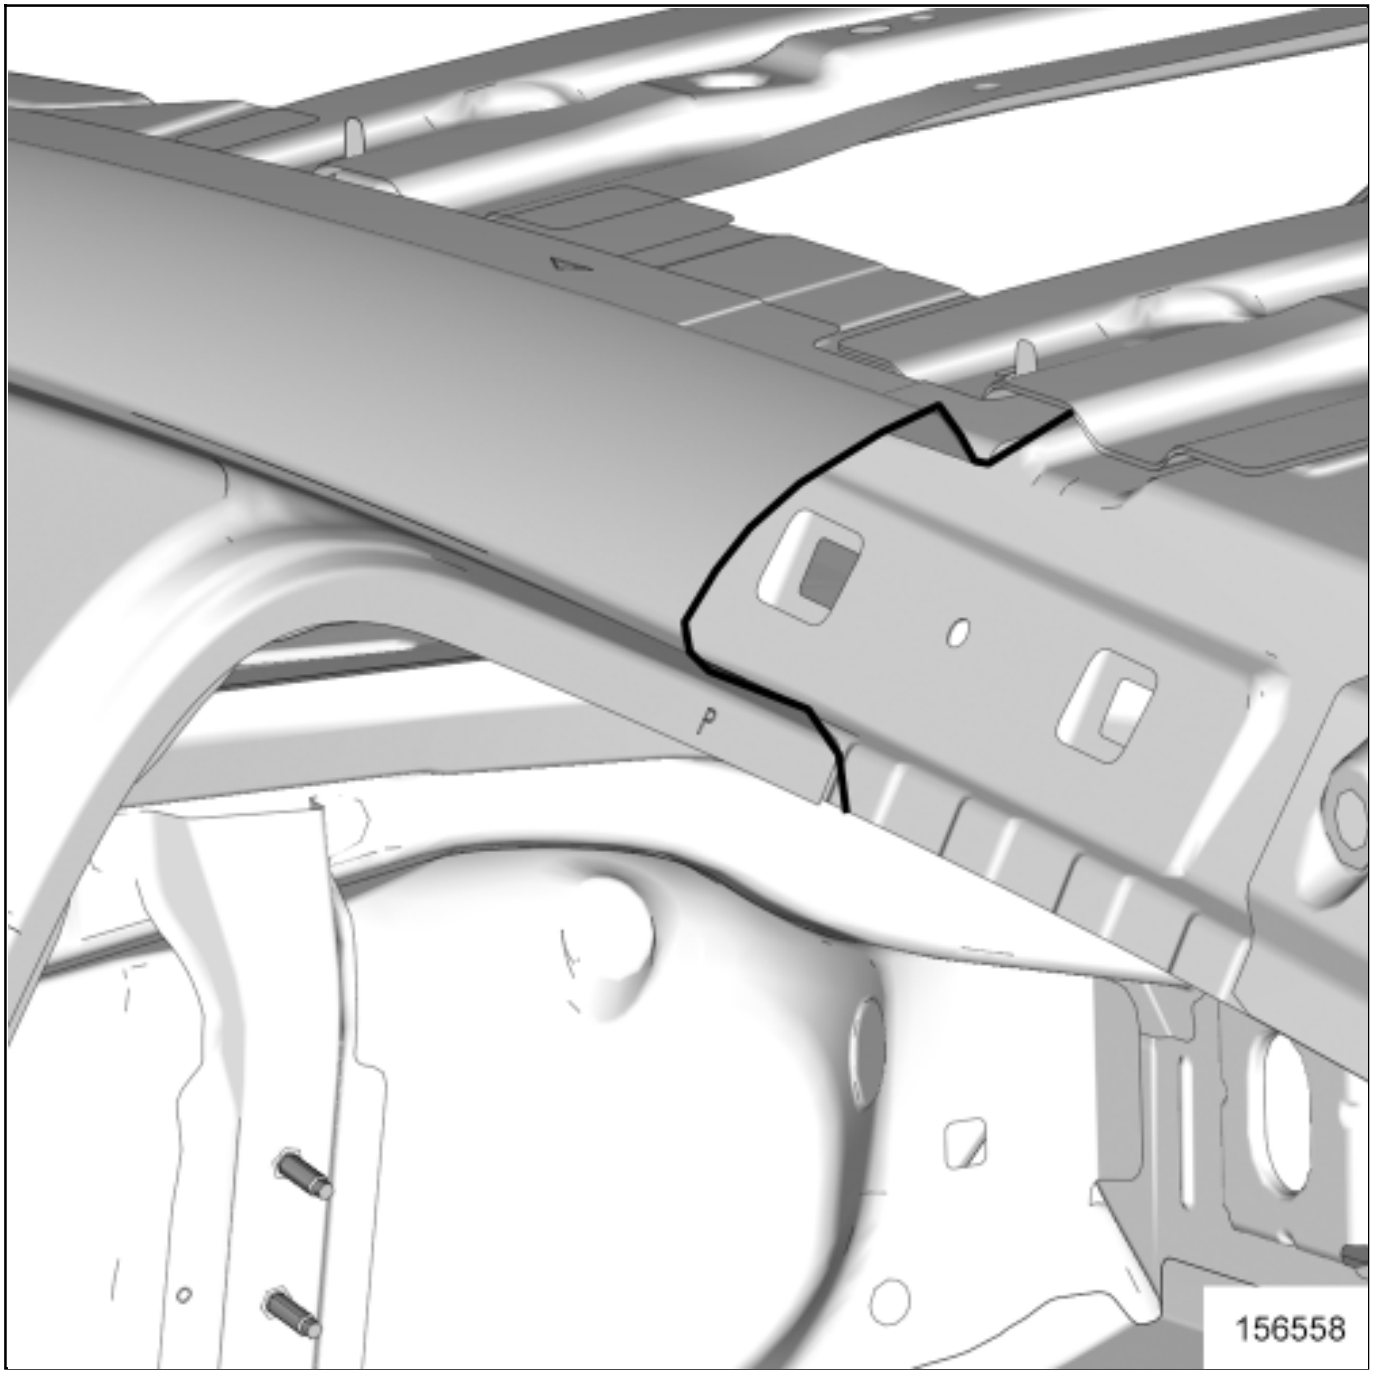
2. IN THE EVENT OF REPLACEMENT





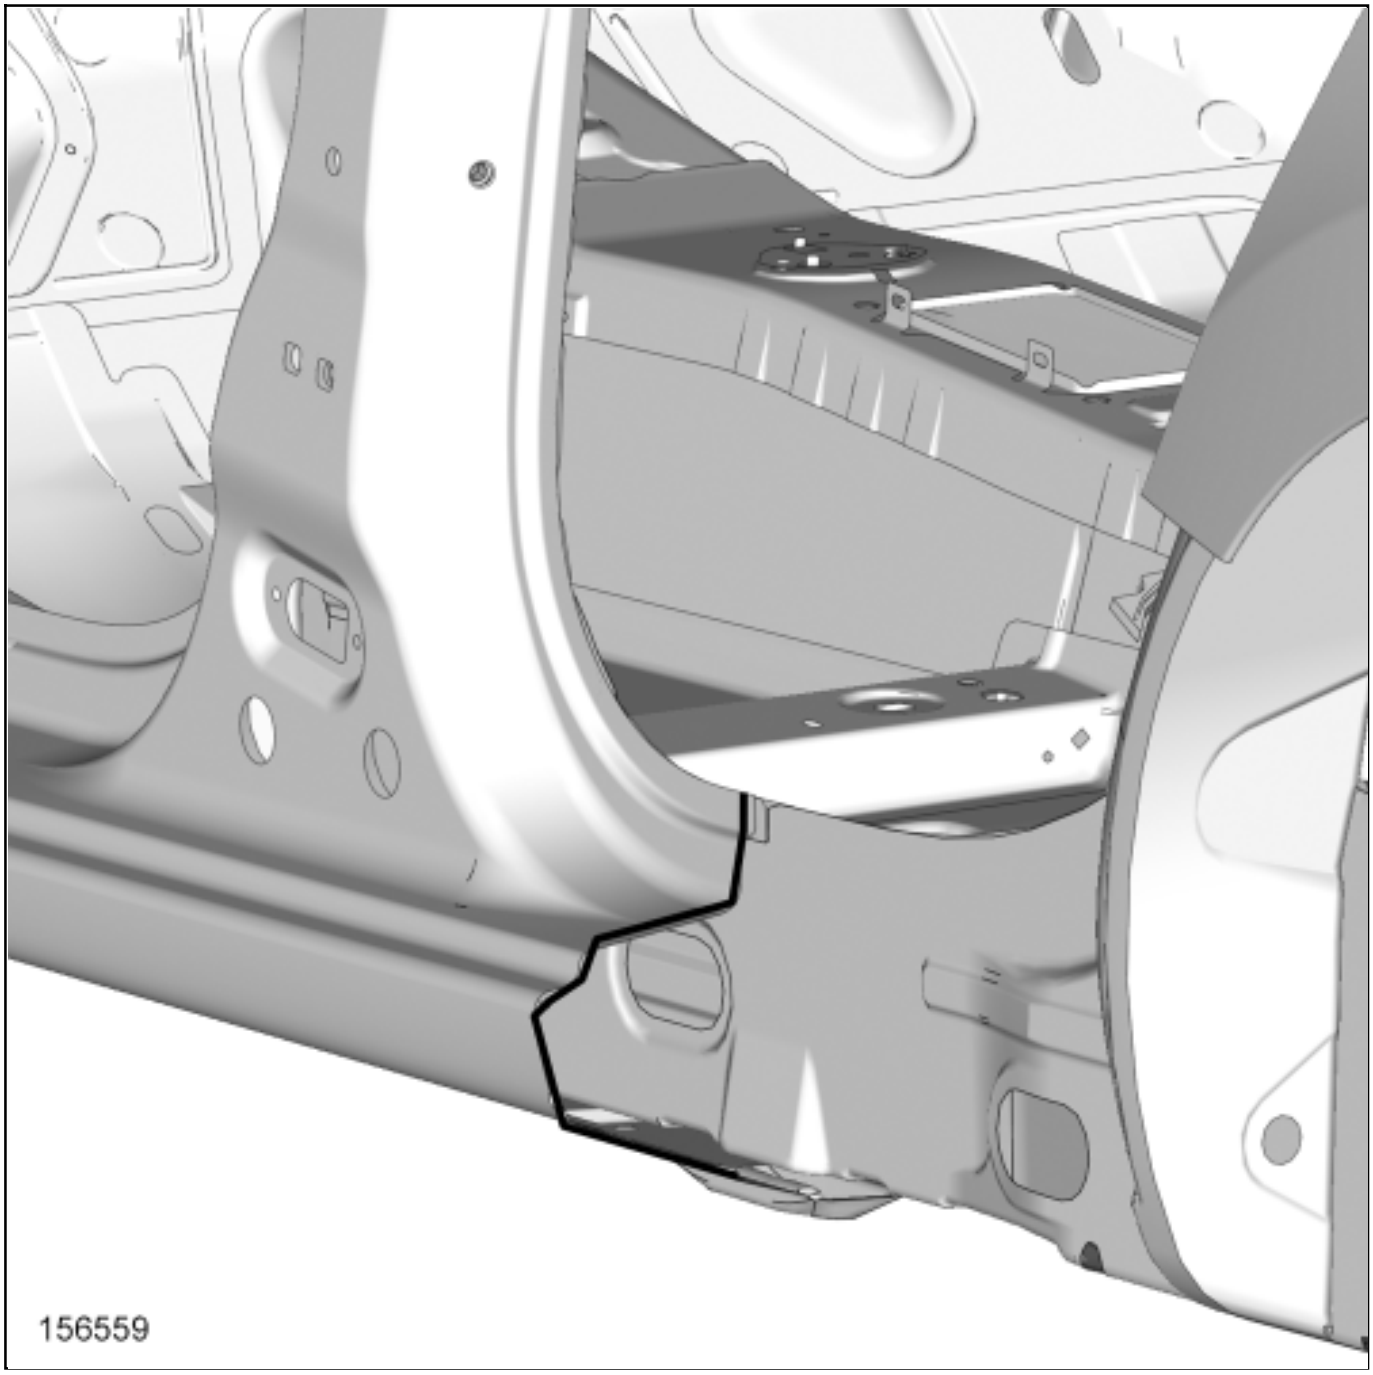
The options for replacing this part are as follows:

- complete replacement A-B,
- partial replacement A-C-E,
- partial replacement B-D-E,
- partial replacement C-D.



1- COMPLETE REPLACEMENT A-B

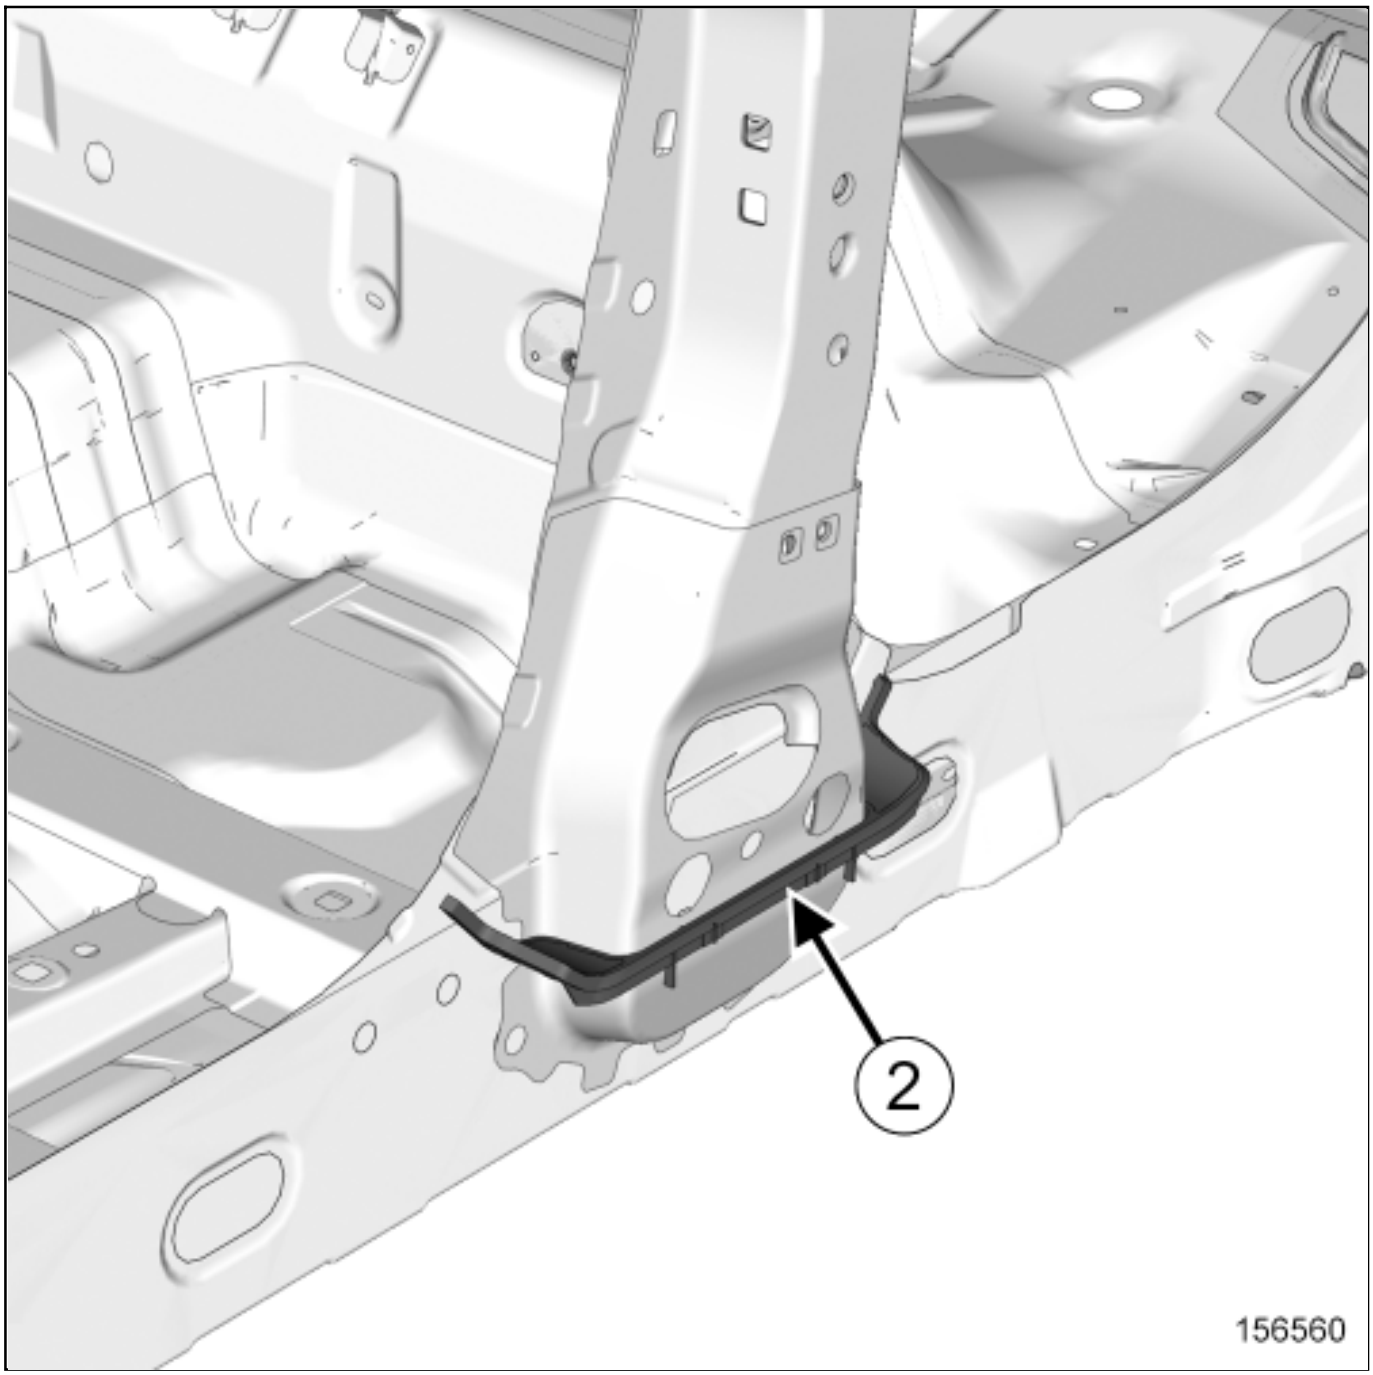
1)PART IN POSITION



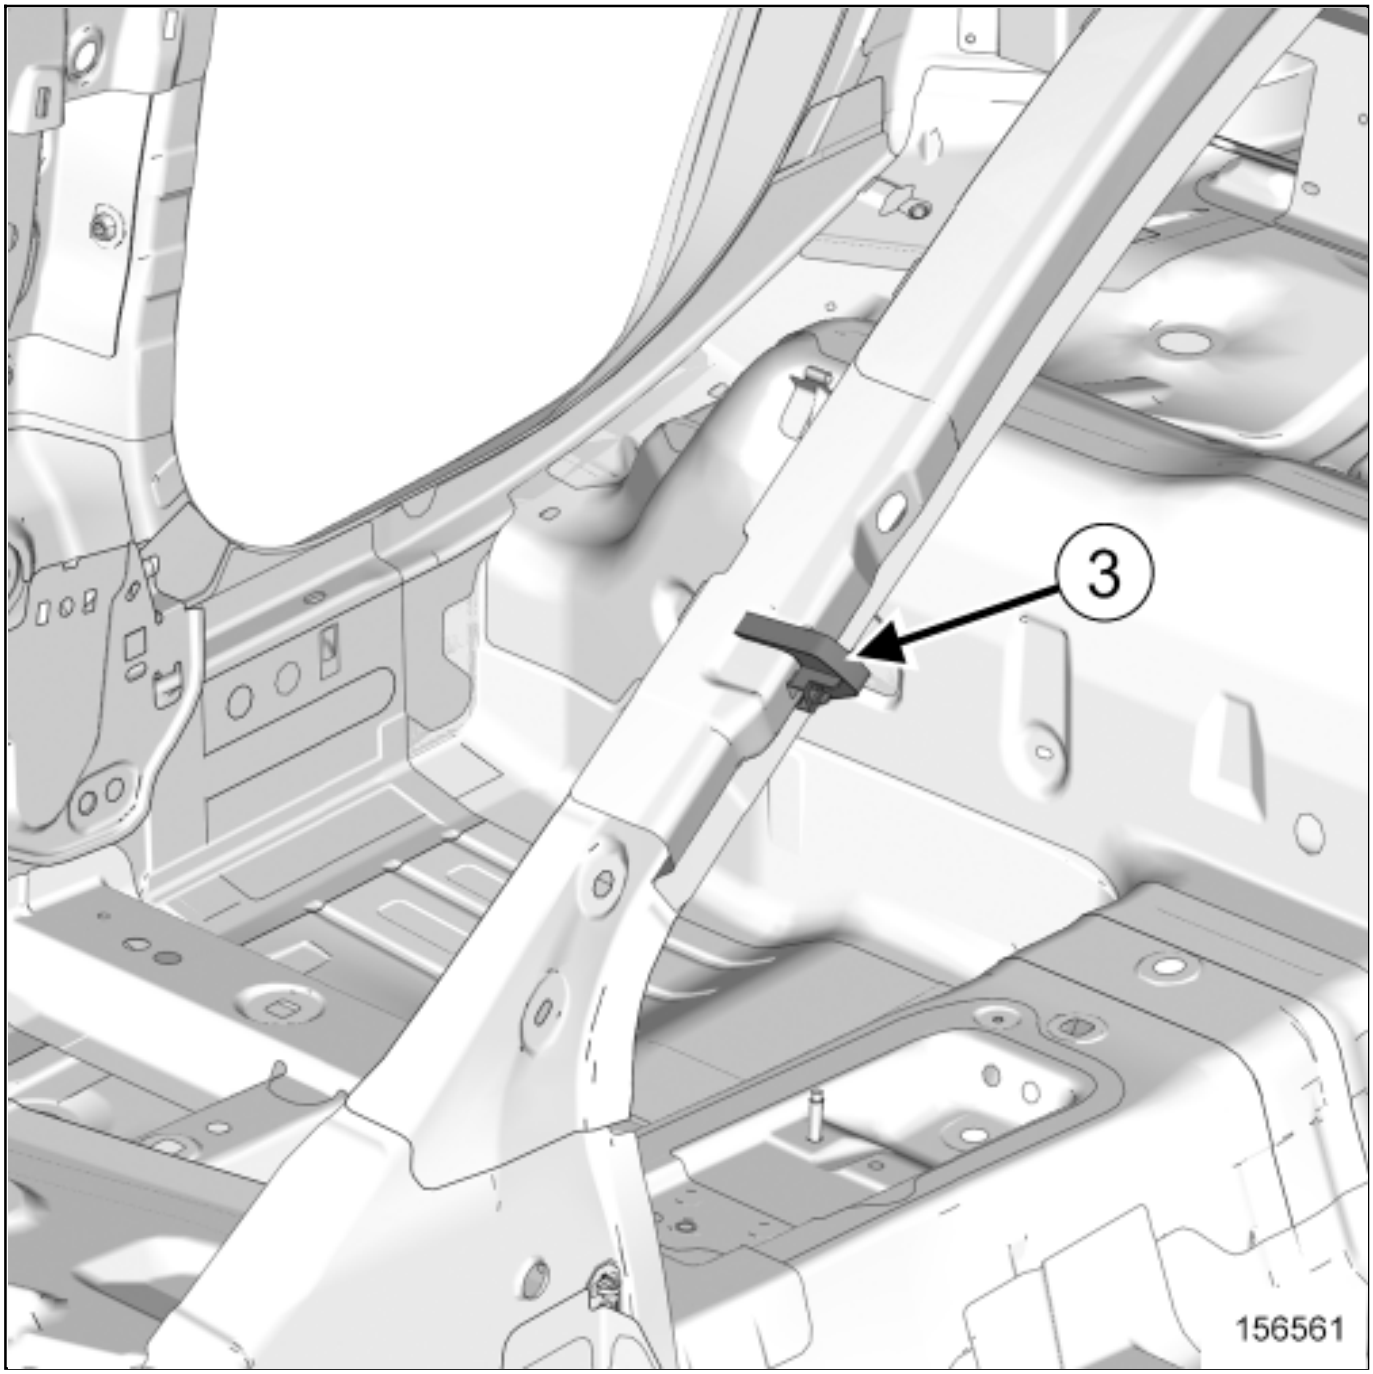
DETAILED VIEW A

DETAILED VIEW B

2)POSITION OF ELECTRIC EARTHS



CAUTION



To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area[Earths on body: List and location of components] .

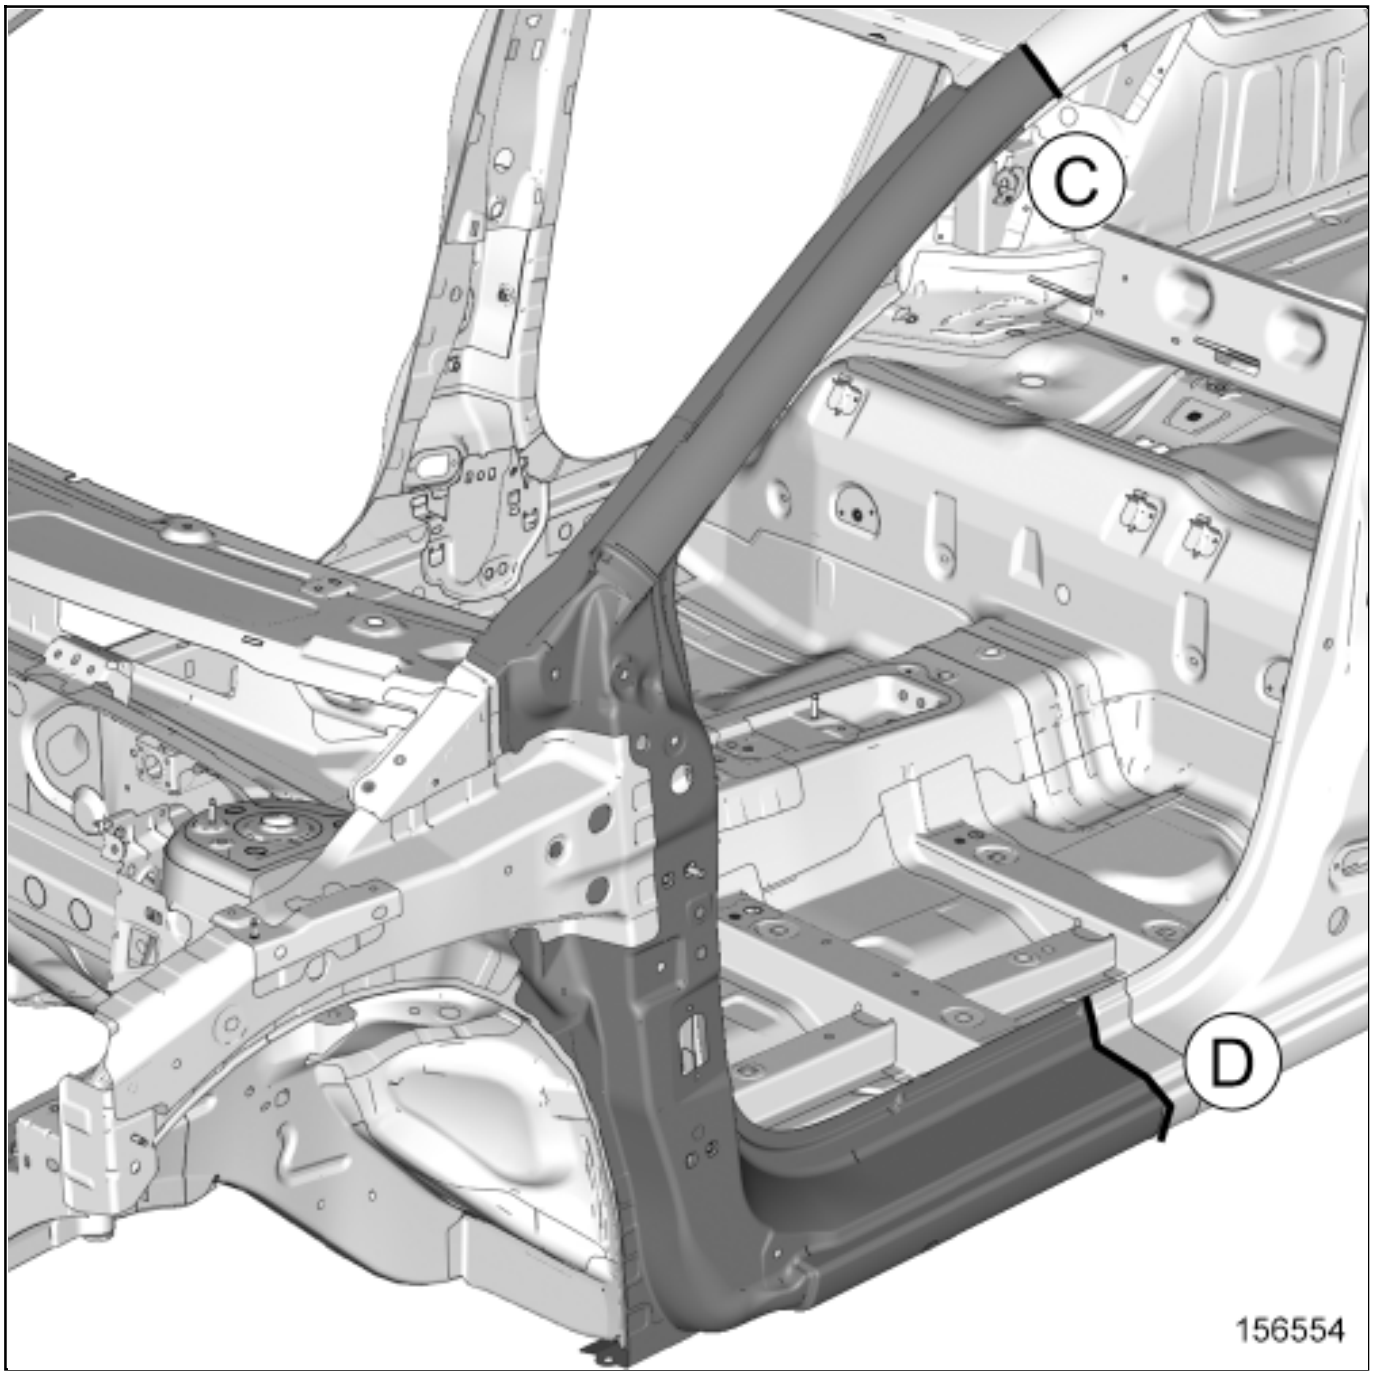
3)PARTS ALWAYS TO BE REPLACED

Replace:

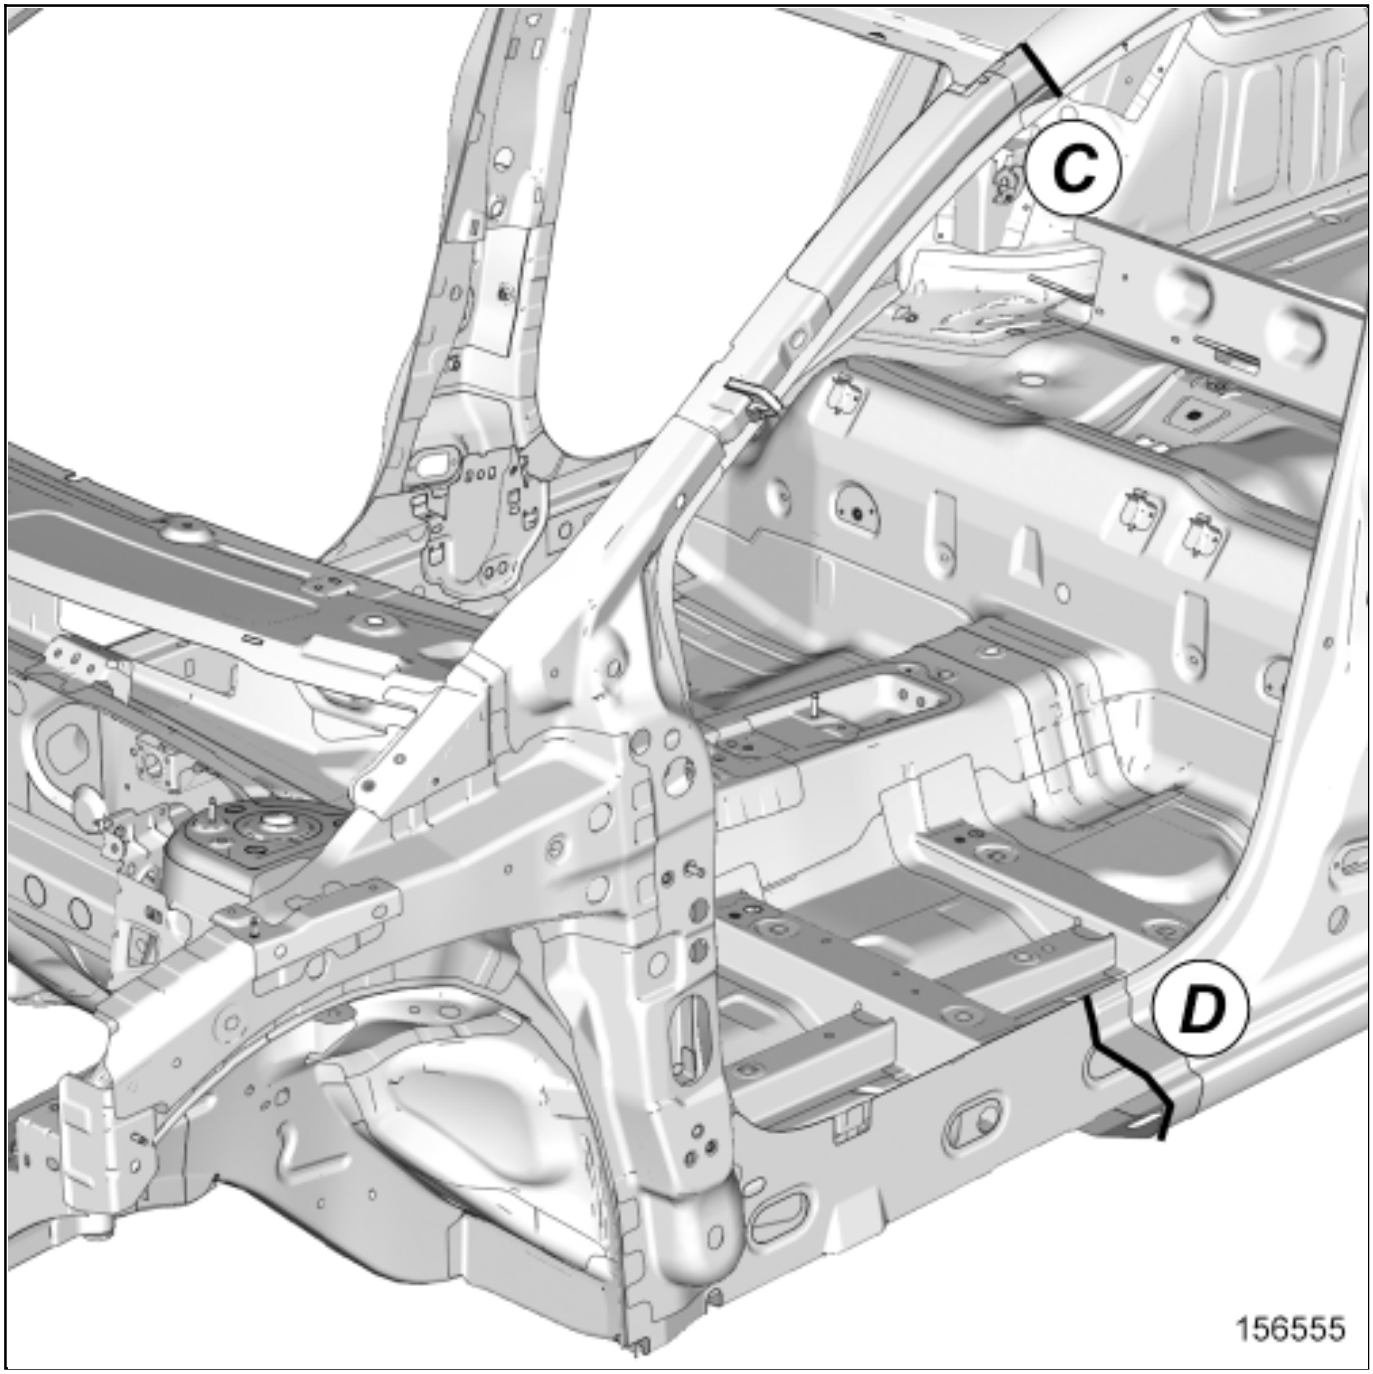
the inserts for the hollow parts of the B-pillar(2) ,and A-pillar(3) .

4)IRREMOVABLE BODYWORK COMPONENTS - STRUCTURAL COMPONENTS TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

Remove the roof Roof: Replacement .



5)SPECIAL NOTES ON MATING



CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weldConnections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT C-D

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

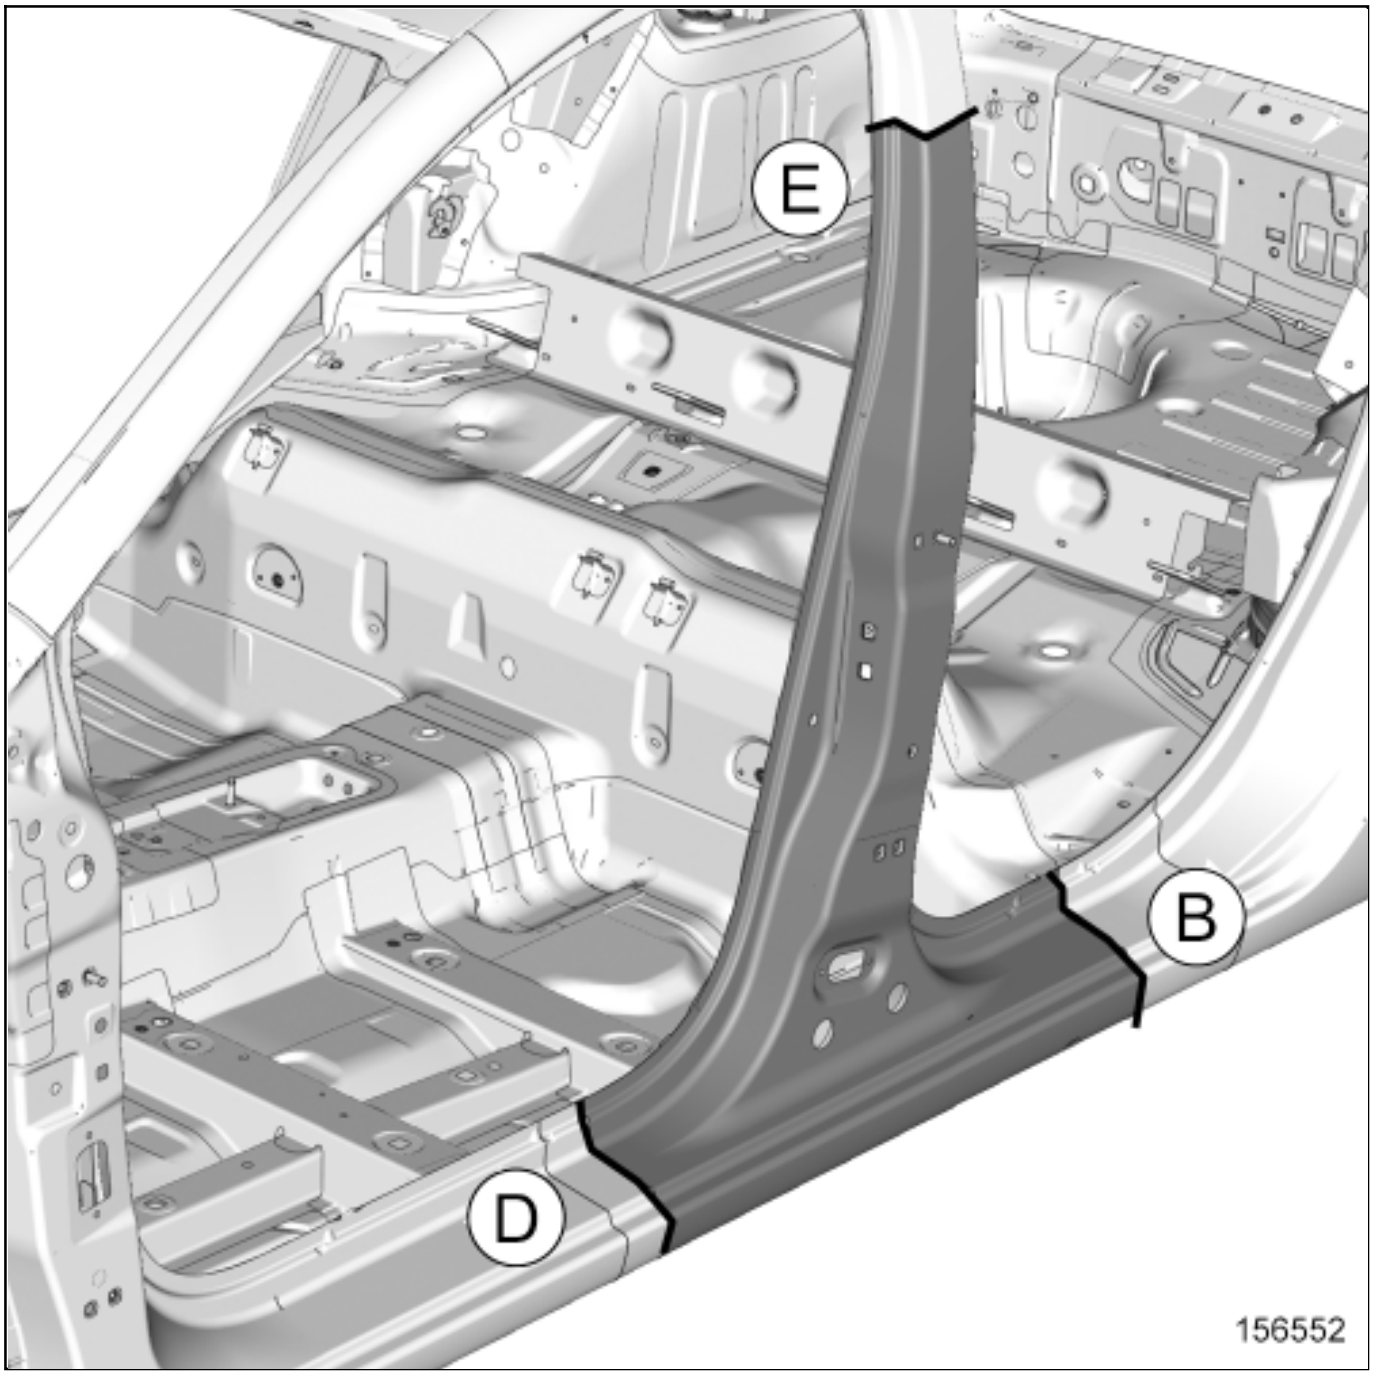
Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

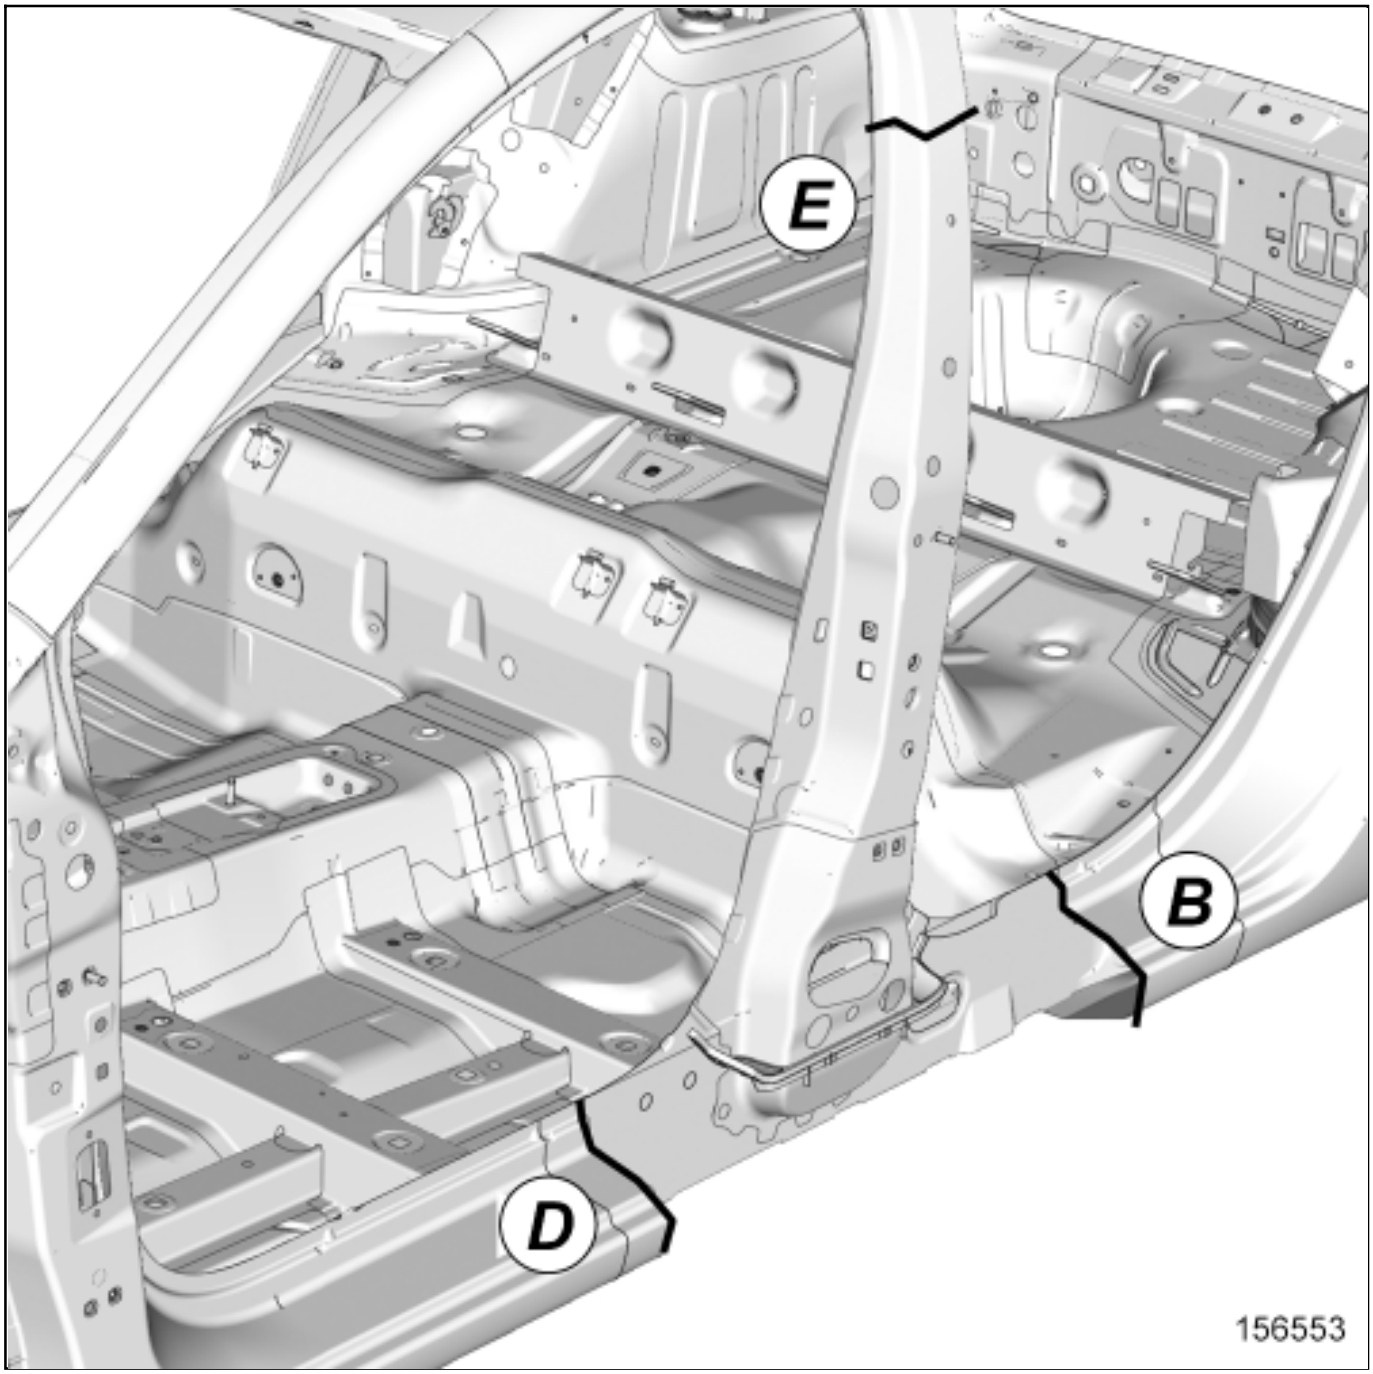
3)PARTS ALWAYS TO BE REPLACED

Replace:

the inserts for the hollow parts of the A-pillar.



4)SPECIAL NOTES ON MATING



CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

BODYWORK: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. INTRODUCTION

All the operations described in the repair methods guarantee conformity of the mechanical contents and release the repairer from his responsibilities.

The timings necessary to calculate time for coded operations are carried out according to these methods and with the tools contained in the ranges.

2. GENERAL RULES

As far as possible, reproduce the vehicle's original quality features: regarding impact, endurance, corrosion, acoustics and appearance.

If for feasibility reasons in the repair, the original connection or appearance cannot be reproduced, replacement solutions validated by the "Repair Method Engineering" department are indicated either in the MR of the vehicle concerned, or in the general and fundamental methods(see 40A, General information, Structural bodywork documentation: Description) .

For all operations that necessitate beating the bodywork of the vehicle (e.g.: hammer or "nail puller"): lock the airbag computer and disconnect the battery.

For all welding operations (e.g.: Resistance welding, Electric welding with shielding gas or "nail welding"): lock the airbag computer, disconnect the battery and the vehicle's electrical circuit earths located near the area to be welded(see **General information**) .

WARNING

DANGER: HIGH VOLTAGE VEHICLE.

Risks of serious burns or electric shock that may prove fatal.

Before carrying out any work on the vehicle, it is essential that you adhere to the instructions regarding vehicle voltage cut-off. This work must be carried out by an employee who is qualified and authorized to work on a high-voltage onboard network Vehicle: Precautions for the repair .

Before carrying out bodywork operations on an electric vehicle, disconnect the vehicleVehicle: Lockout - Removal of lockout .

3. REPAIRING THE VEHICLE

Fault finding:(see 40A, General information, Impact fault finding: Description) .

Straightening: (see 40A, General information, Straightening a component: Description) .

Replacing components:(see 40A, General information, Replacing a non-removable component: Description) .

For a significant impact, it can be necessary to carry out preliminary jacking to release the electric wiring harnesses, certain mechanical components or simply to access detaching of strategic connections. In some cases, it will be necessary to carry out preliminary cutting on the part damaged by the impact.

4. SAFETY INSTRUCTIONS FOR REPAIRING BODYWORK STRUCTURES

SYMBOL KEY :

(1) Obligatory ears protection

(2) Obligatory eye protection

(3) Obligatory respiratory protection

(4) Obligatory eye and face protection

(5) Fire risk danger

(6) Obligatory hand protection

(7) Use extra ventilation source

(8) Protection of interior fittings

(9) Protection of internal and external window faces

(10) External bodywork protection

BODYWORKSEALINGPRODUCTS

1. BODYWORK SEALING PRODUCTS

1- PRODUCTS TO ASSIST THE SEARCH FOR WATER INGRESS

- bodywork cleaning shampoo(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

2- PRODUCTS FOR REPAIRING THE SEALING OF BONDED WINDOWS

- monopac evolution adhesive kit(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- additional monopac evolution cartridge + nozzle(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- S-P adhesive kit(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- additional S-P kit cartridge + nozzle(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- bipac evolution adhesive kit(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

3- PRODUCTS FOR REPAIRING THE SEALING OF FITTED WINDOWS

- window sealing mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

4- PRODUCTS FOR REPAIRING THE SEALING OF OPENING ELEMENT TRIMS

- bead of preformed sealing mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

5- PRODUCTS FOR REPAIRING THE SEALING OF THE MATING SURFACES OF PANELWORK

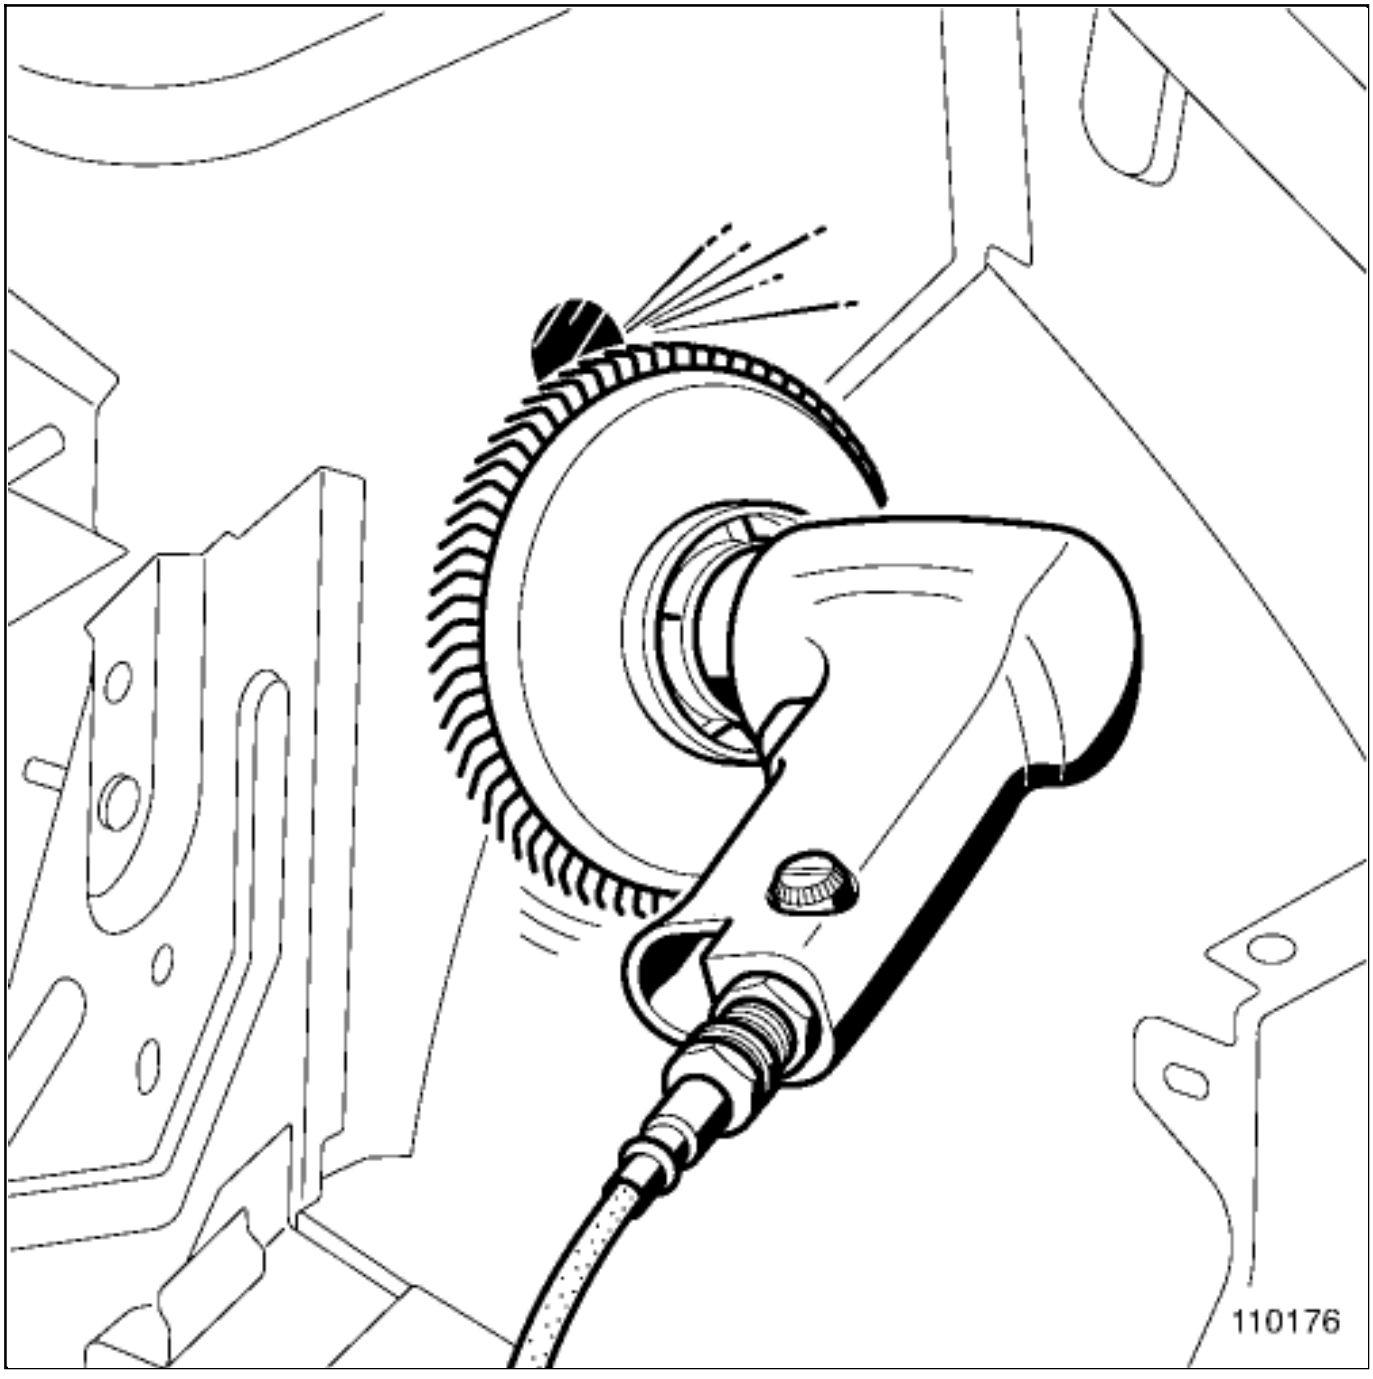
- mastic for brush application(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- white or black extruded mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

6- PRODUCTS FOR REPAIRING THE SEALING OF THE MATING SURFACES OF REMOVABLE PANELWORK COMPONENTS

- filler mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

7- FINISHING PRODUCTS FOR REPAIRING THE SEALING

- anti-gravel mastic(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).



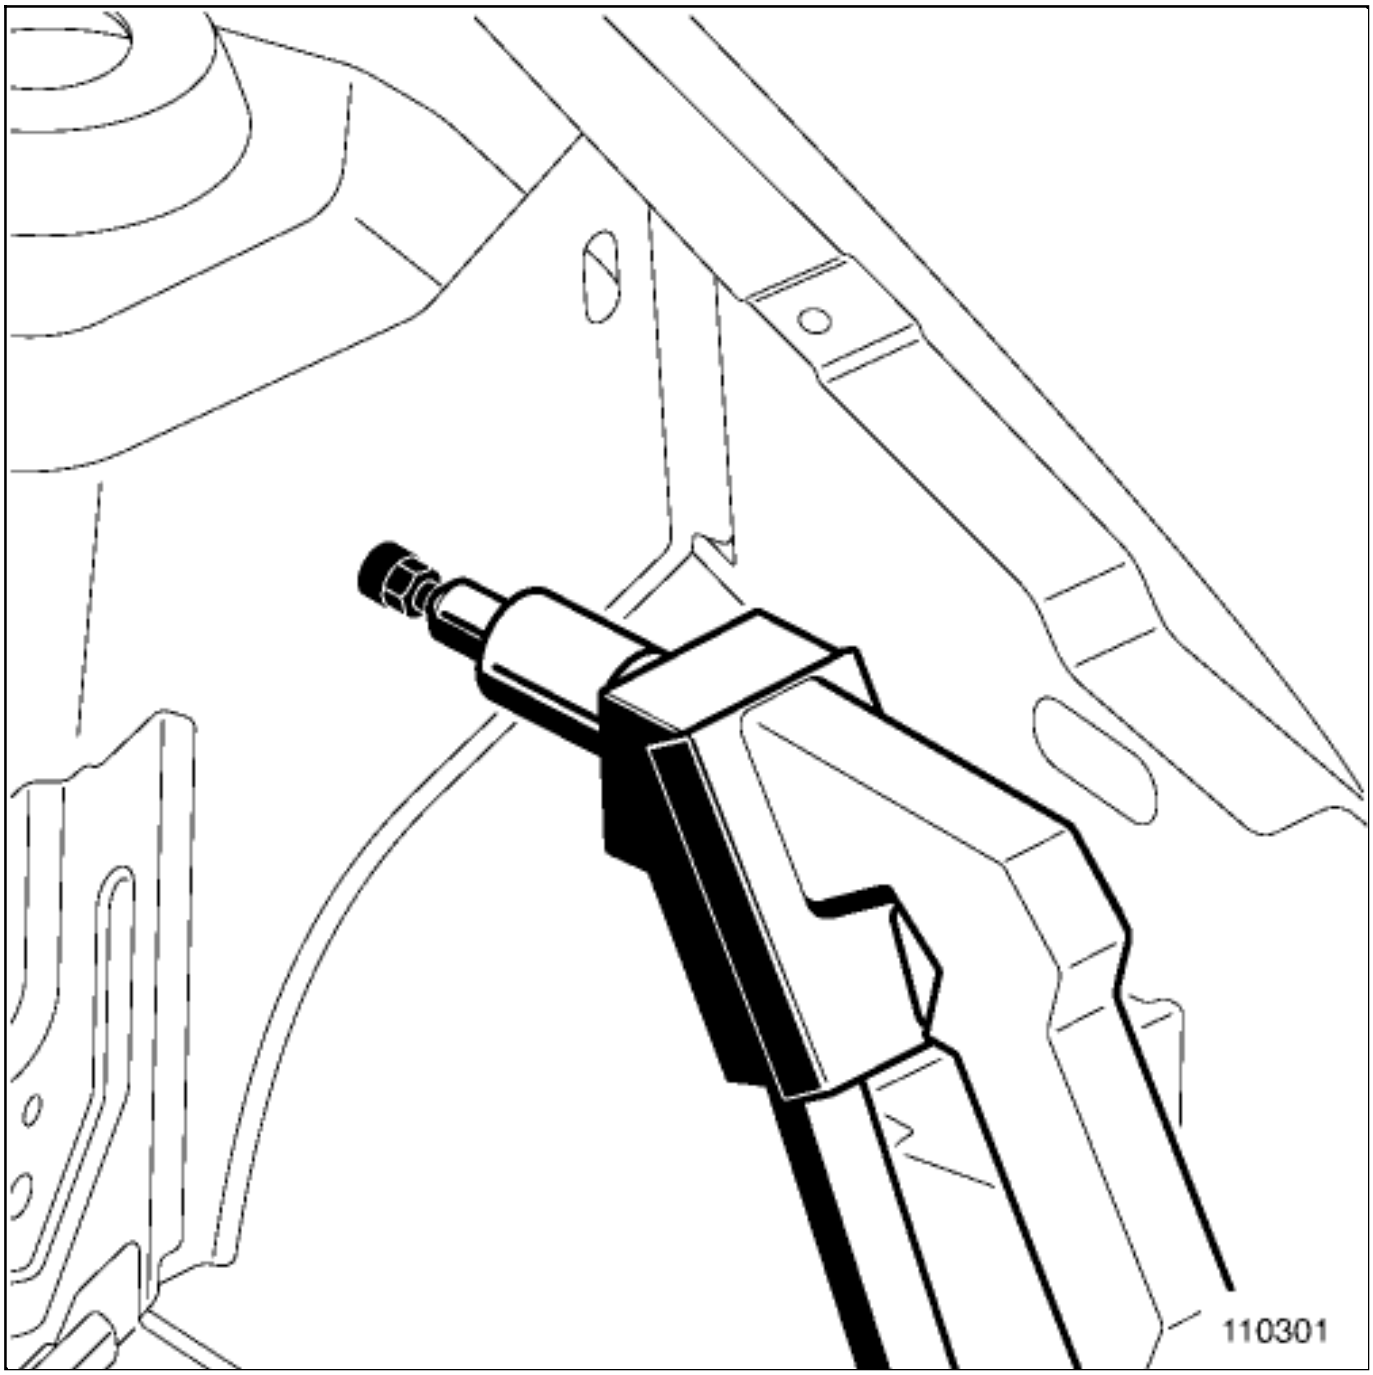
BOLTED CONNECTION FOR EARTH

Fitting the electrical earth stud can be done following two possible procedures:

- by resistance welding,
- by fitting of crimped stud.

1. ASSEMBLY BY RESISTANCE WELDING

1- PREPARATION OF THE JOINT



Scour the external face of the part at the location of the earth stud:

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use) ,

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use) .

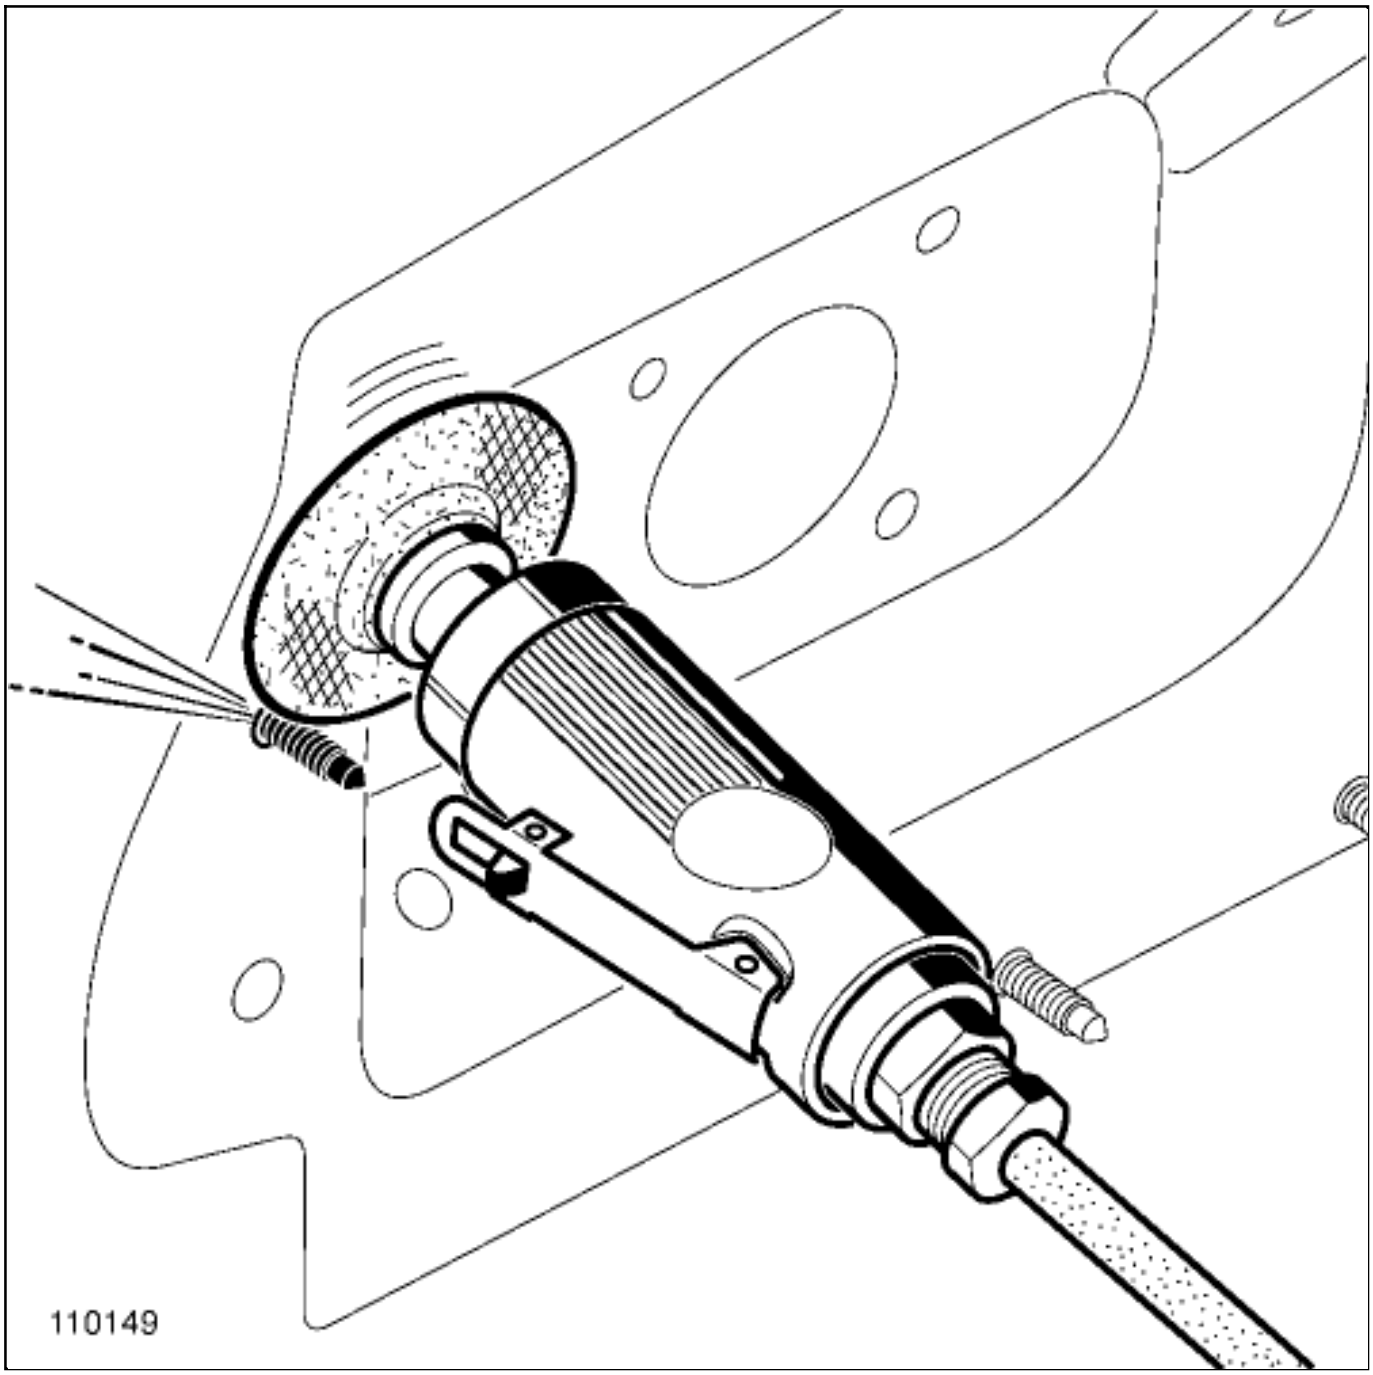
2- WELDING

Weld the stud using a resistance welding equipped with the adapted nozzle, using the studs supplied with the welding device.

Manually control the hold of the stud(see 40H, Bolted connections, Bolted connections: Precautions for the repair) .

Repair-40x01x34x12-02x21-2-1-1.xml

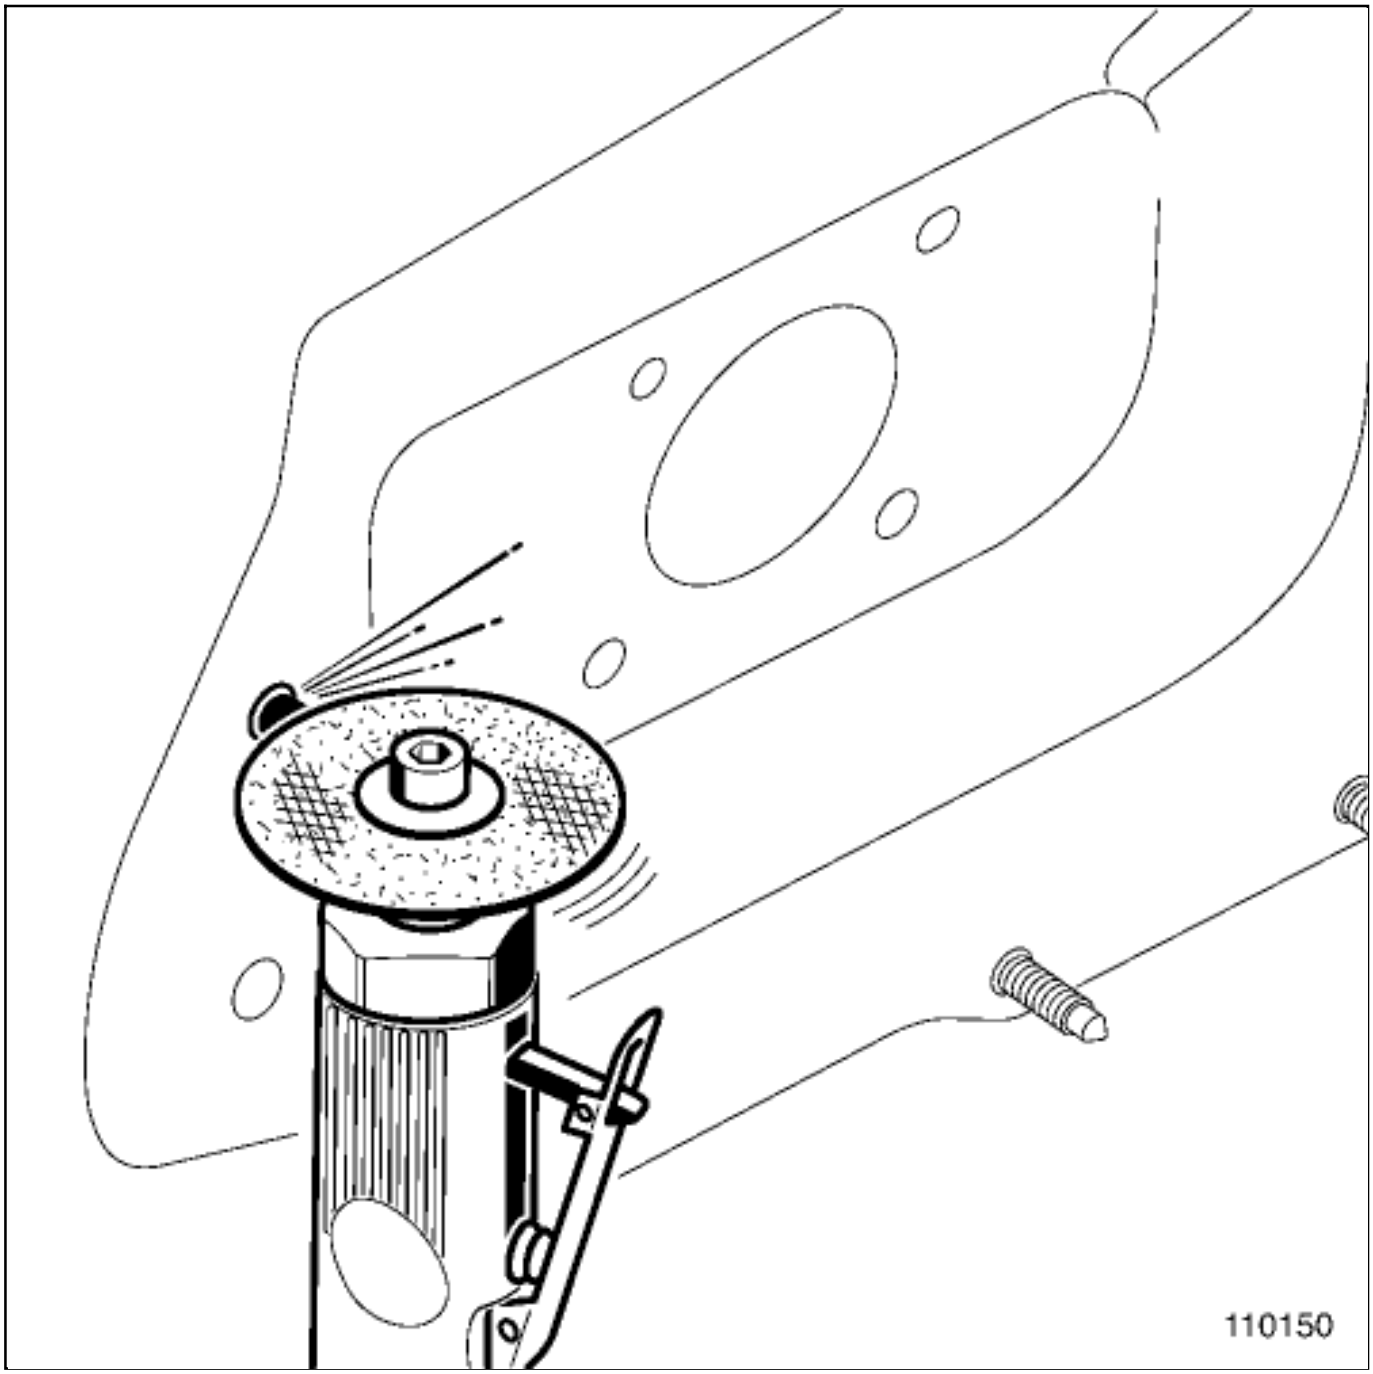
XSL version : 3.02 du 22/07/11



BOLTED CONNECTION WITH CRIMPED MOUNTING: REPAIR

Special tooling required	
Tool for fitting crimped nuts.	Car. 1504

Repairing a crimped fixing is done by replacement. Fitting is carried out using theTool for fitting crimped nuts. (Car. 1504) .

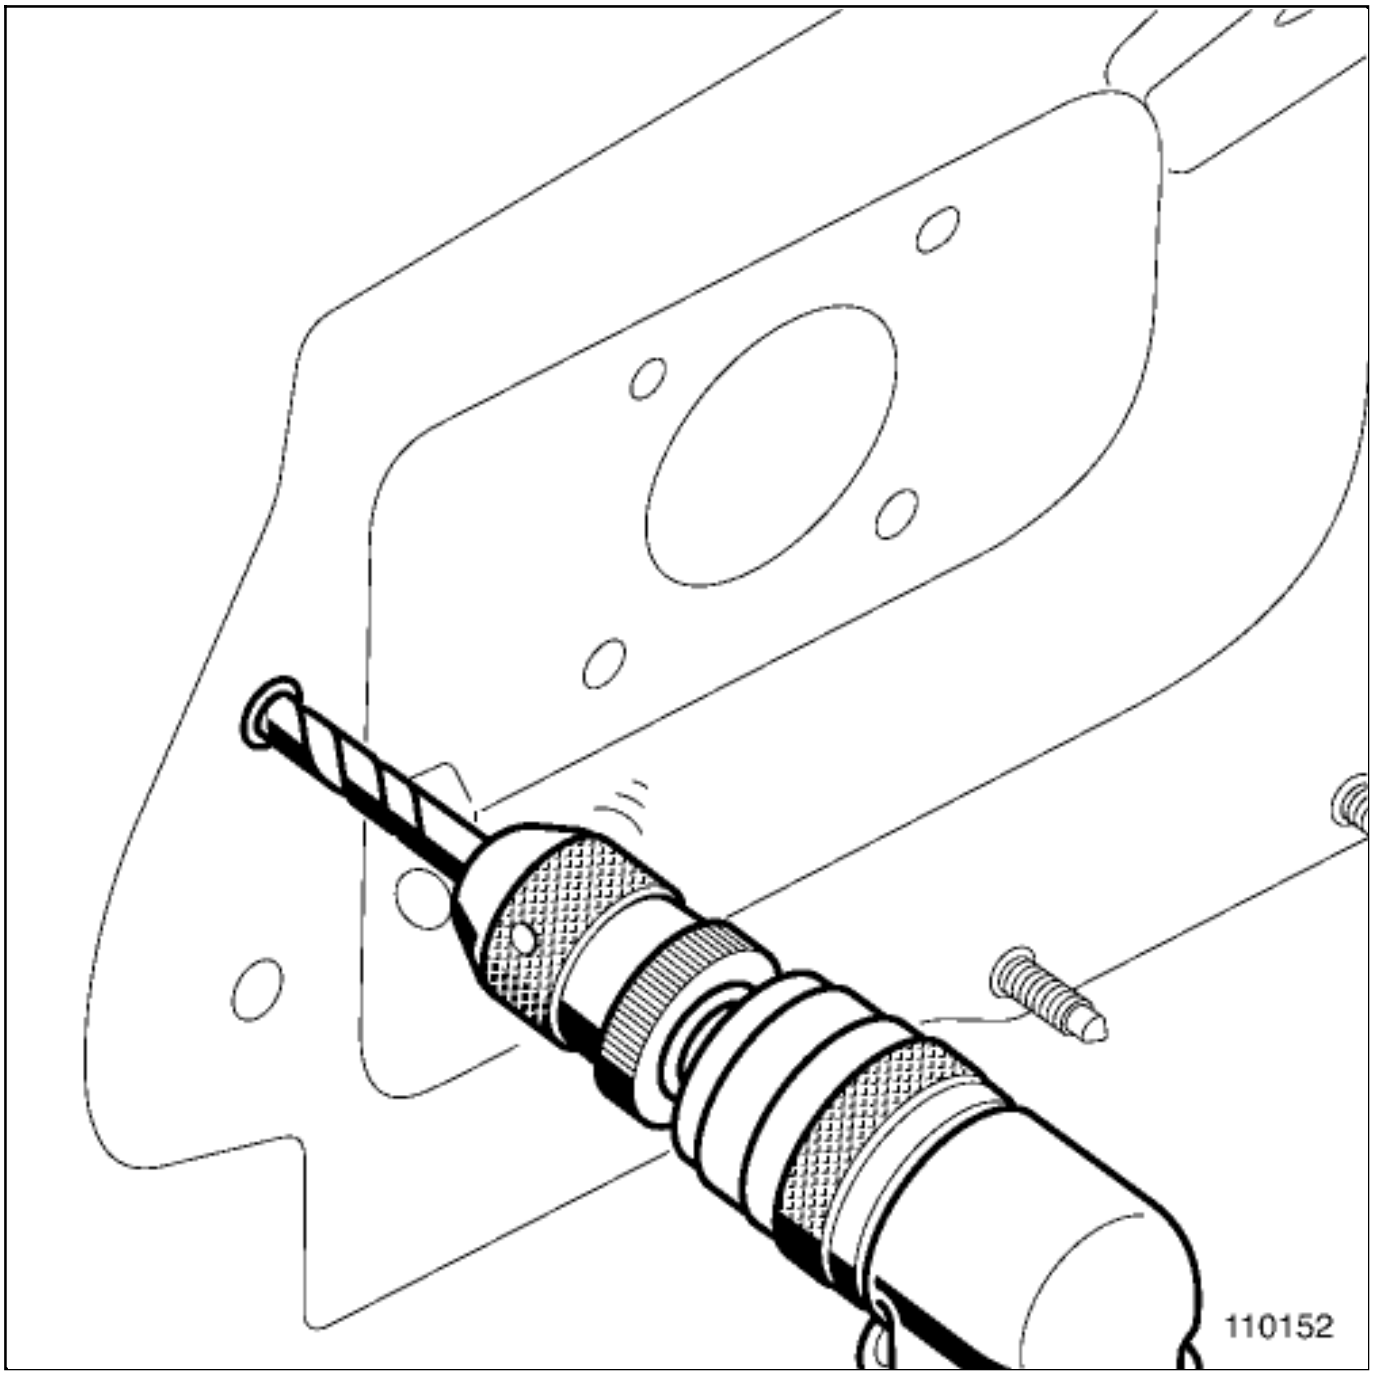


1. DISASSEMBLY

1- DISASSEMBLY OF A CRIMPED STUD

- Cut the stud around the flange, if it is still present.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)



- Shave the flange.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

- Remove the rest of the stud.

2- DISASSEMBLY OF A CAPTIVE NUT

Drill the nut using a drill bit which is slightly bigger than the internal diameter of the flange.

Note:

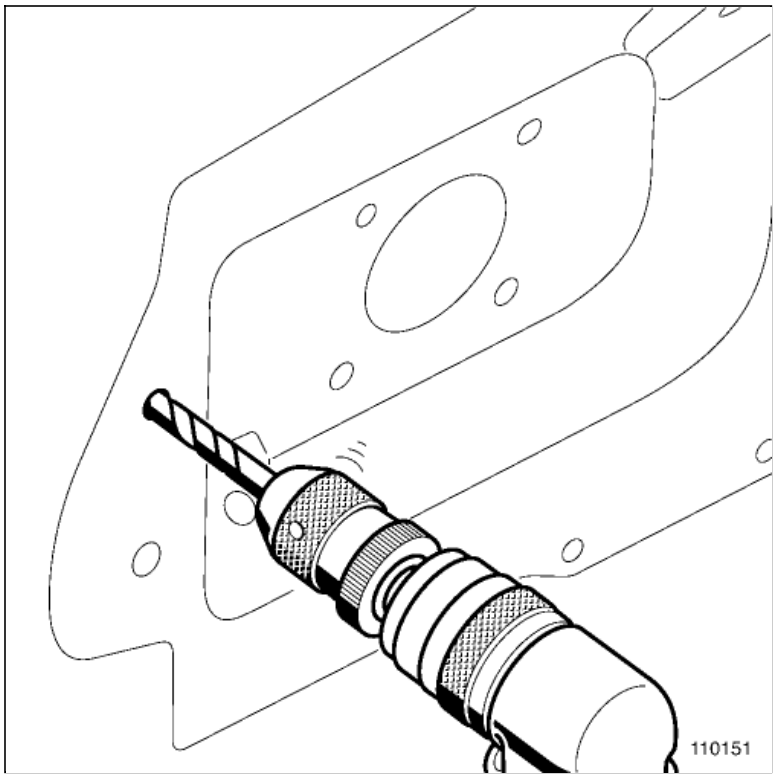
Do not damage the support during the drilling operation as this could make the hole larger and prevent the nut from holding.

Note:

If the crimped fixing falls into a hollow section when removed, inject wax to immobilise the residual fixing in the hollow section.

2. ASSEMBLY

(see 40H, Bolted connections, Screw connection with crimped mounting: Description)



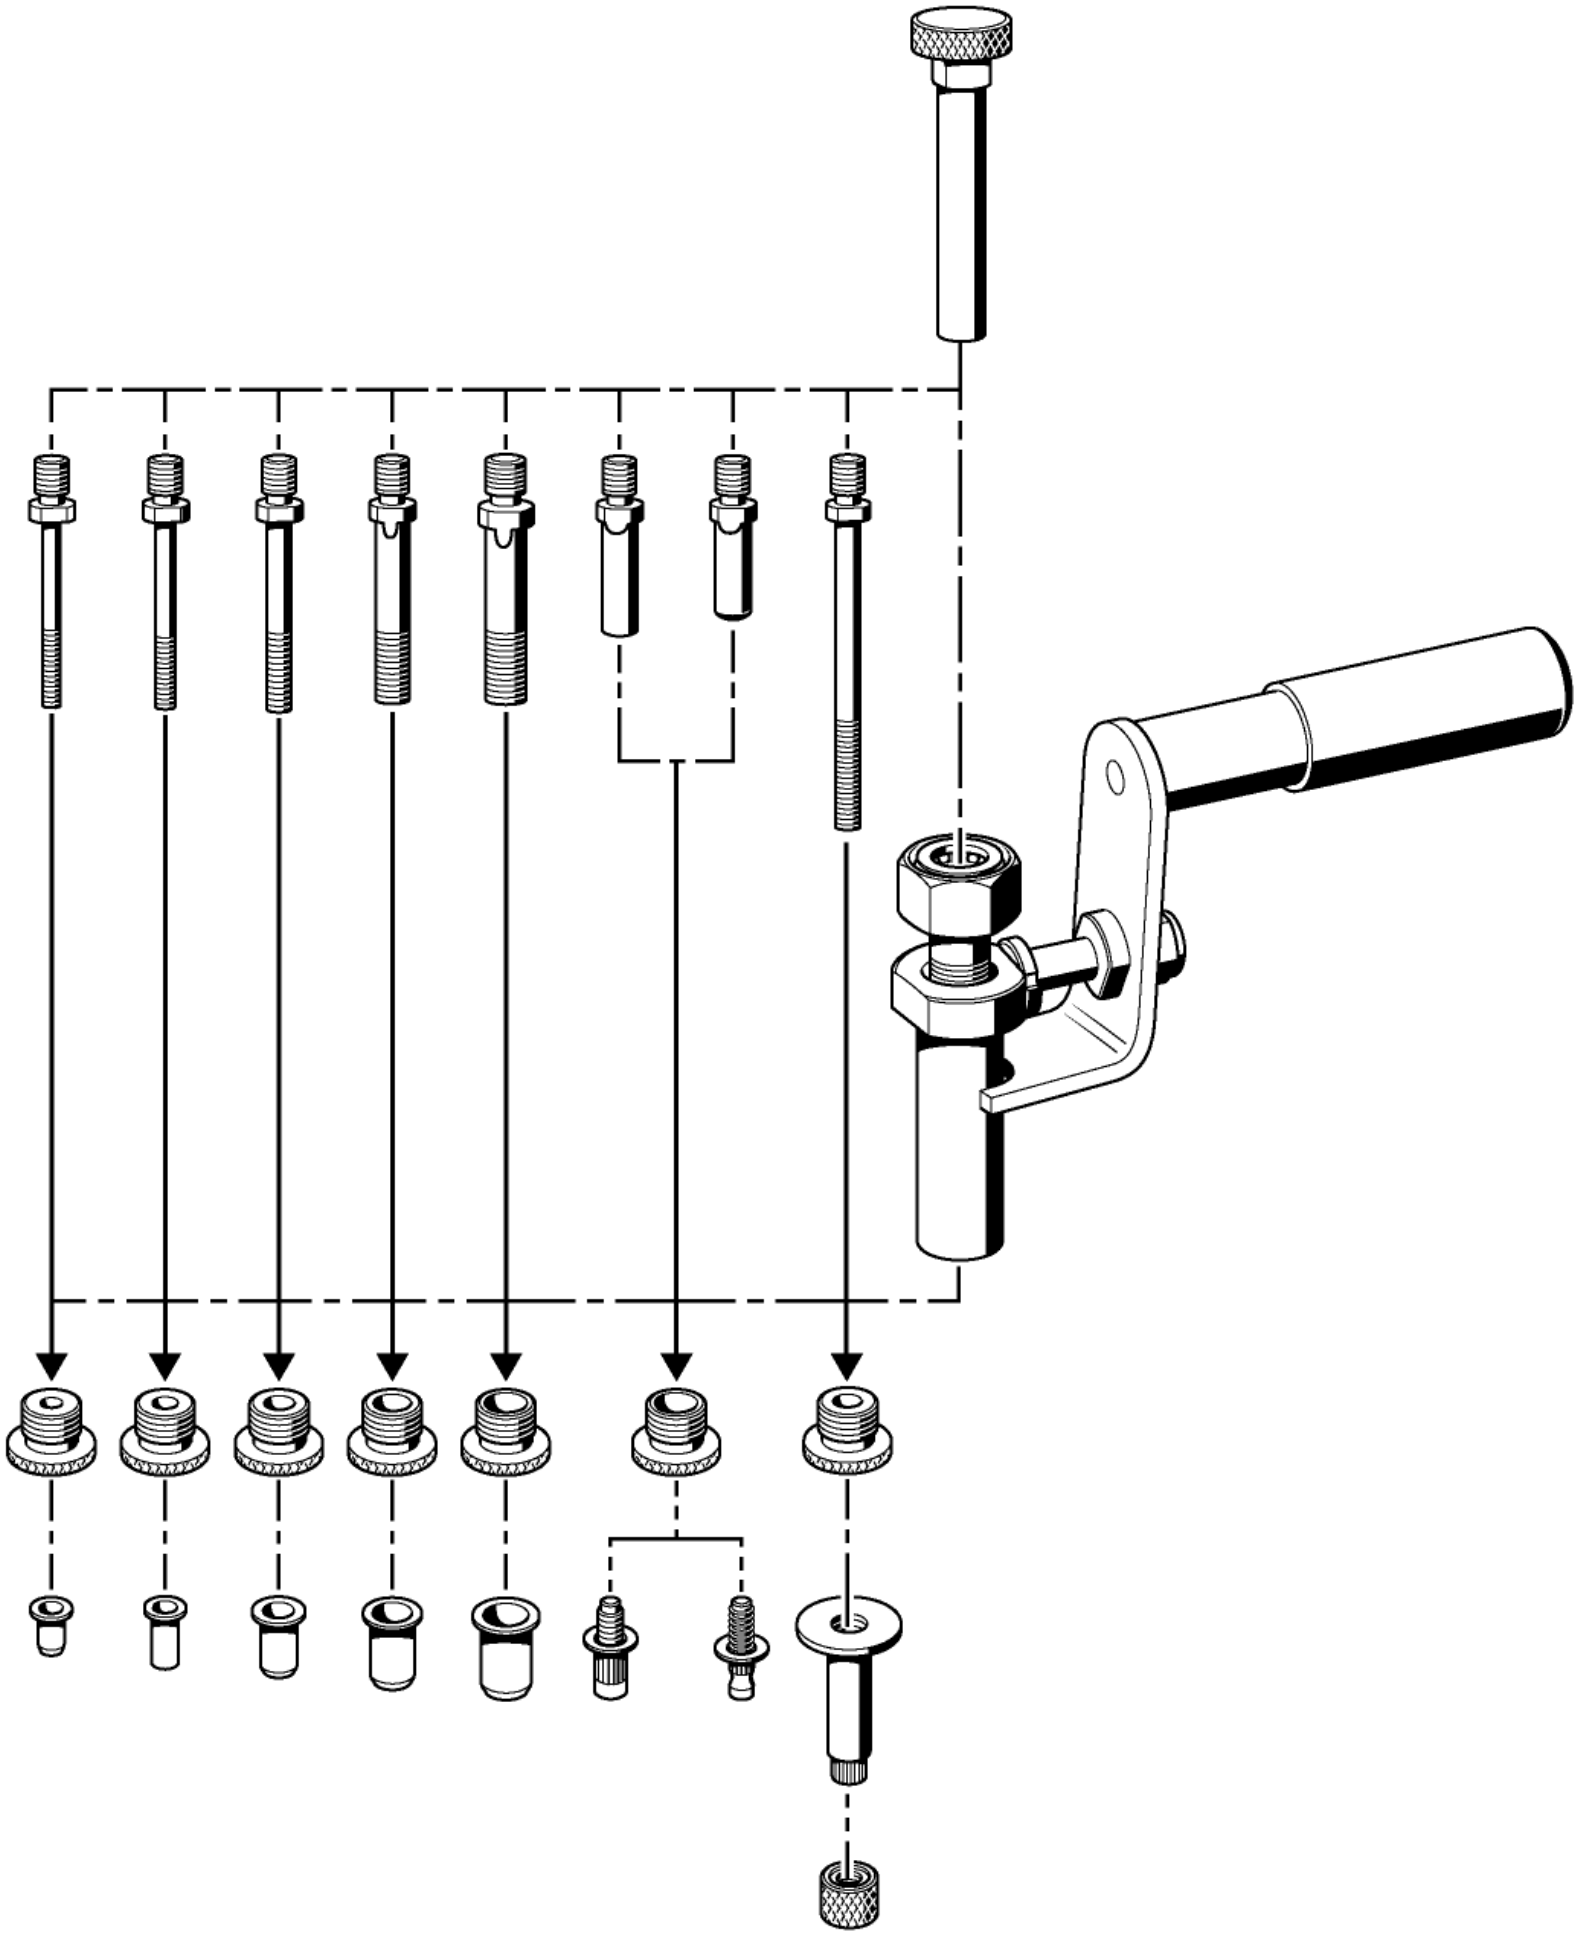
BOLTED CONNECTION WITH CRIMPED MOUNTING

Special tooling required	
Tool for fitting crimped nuts.	Car. 1504

Note:

This operation cannot be carried out for an earth mounting; it does not guarantee the current will be properly conducted from the contact with the structure.

1. PREPARATION

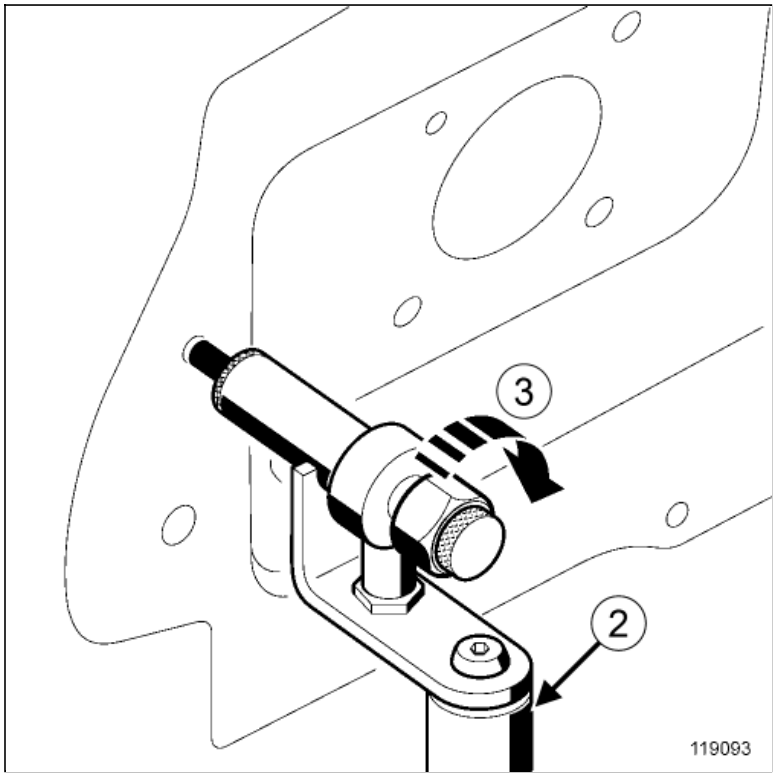


Drill the support panel using a drill bit which is adapted to the nominal diameter of the mounting, see table below.

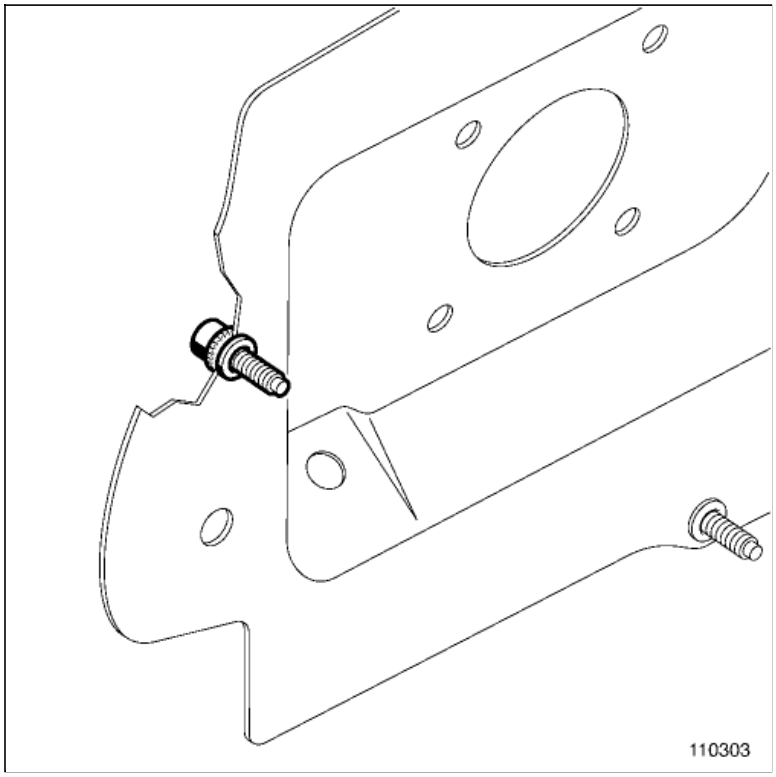
	Ø nominal	Ø drilling hole (mm)
nuts	M6 x 100	10.2
	M8 x 125	13.5
	M10 x 150	15.5
studs	Fc5	8.2
	M6	10.2

If it is a hollow section, insert wax to stabilise the shavings.(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

Fit the pull rod and the guide rod adapted to the fixation type to be crimped.



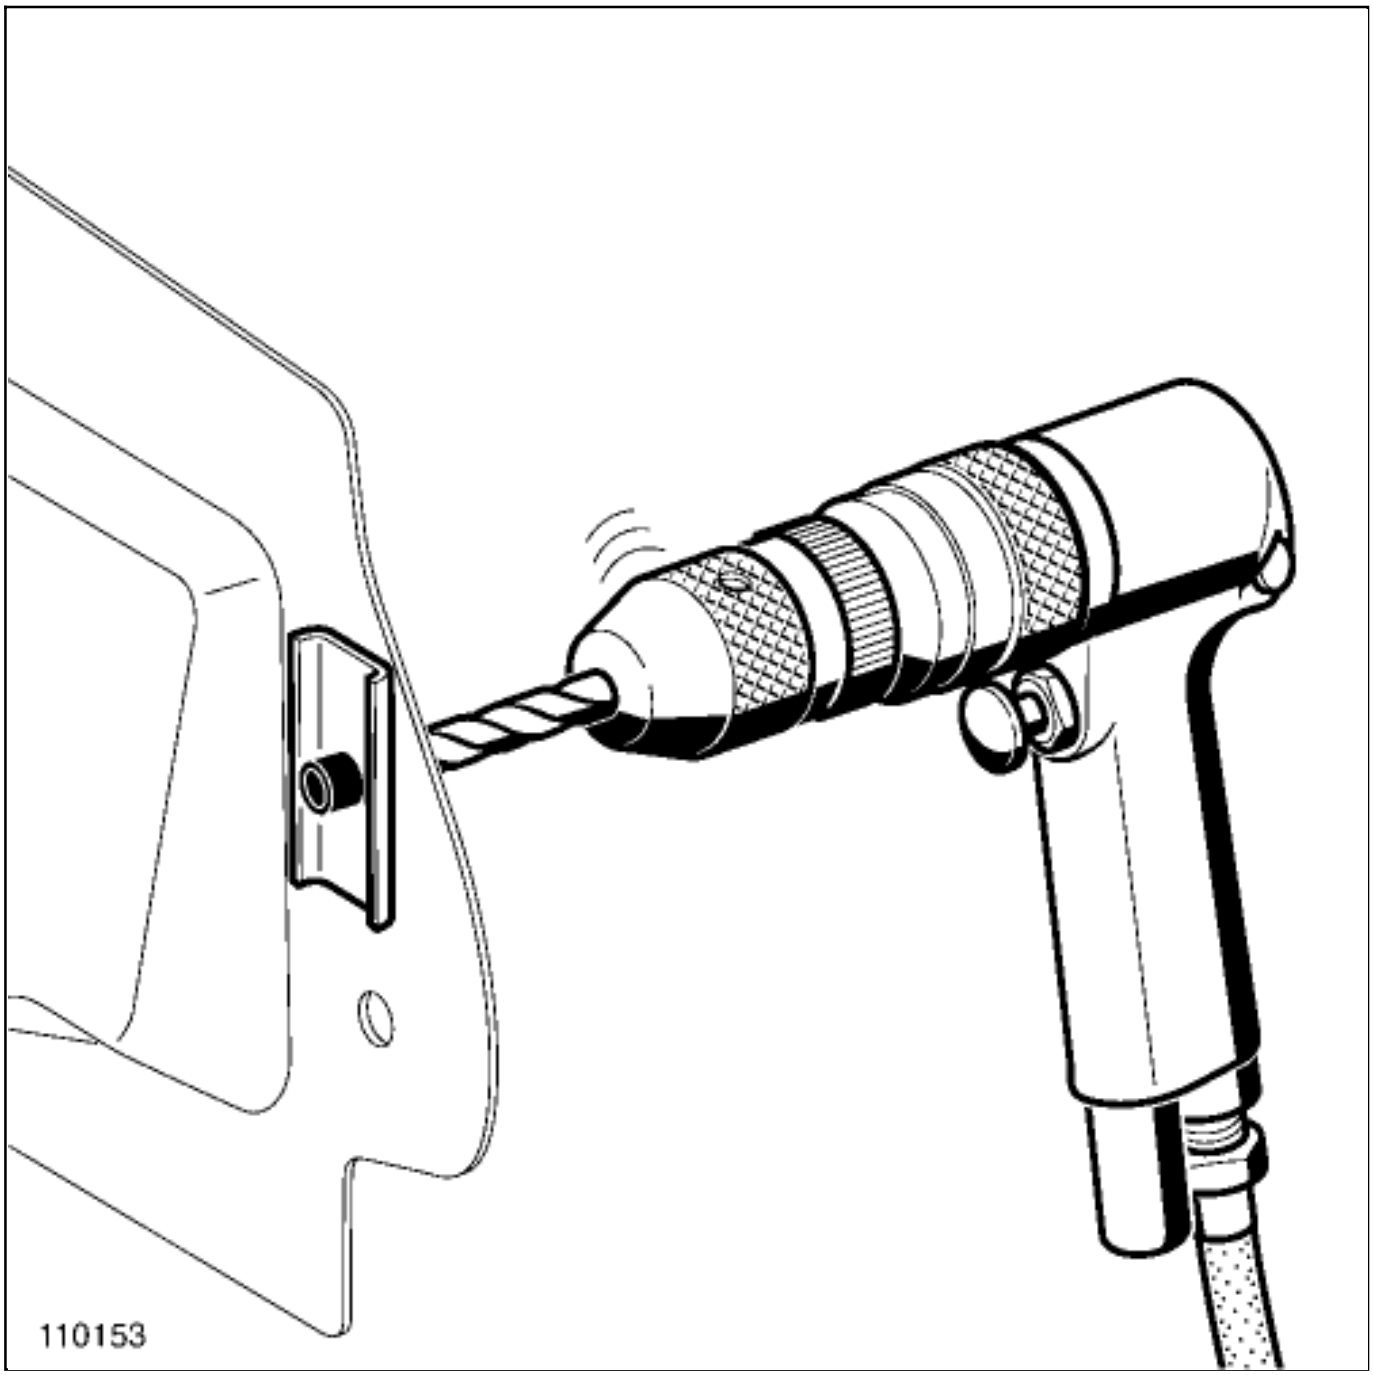
2. FITTING THE CRIMPED MOUNTING USING TOOL CAR. 1504



Screw the crimped nut or stud onto theTool for fitting crimped nuts.(Car. 1504) .

Place anti-corrosive sealing mastic(1) around the insert shaft.

Position and crimp the fixing, manually steadying the tool using the handle(2) and turning the nut(3) of the tool in the direction of the arrow.



Check that the mounting is perpendicular before the end of the crimping operation.

BOLTED CONNECTION WITH FLOWDRILLED NUT

Special tooling required	
Tool for fitting crimped nuts.	Car. 1504

Fluo tapped threading is repaired by fitting of captive nut(see 40H, Bolted connections, Screw connection with crimped mounting: Description) and using theTool for fitting crimped nuts.(Car. 1504) .

1. PREPARATION

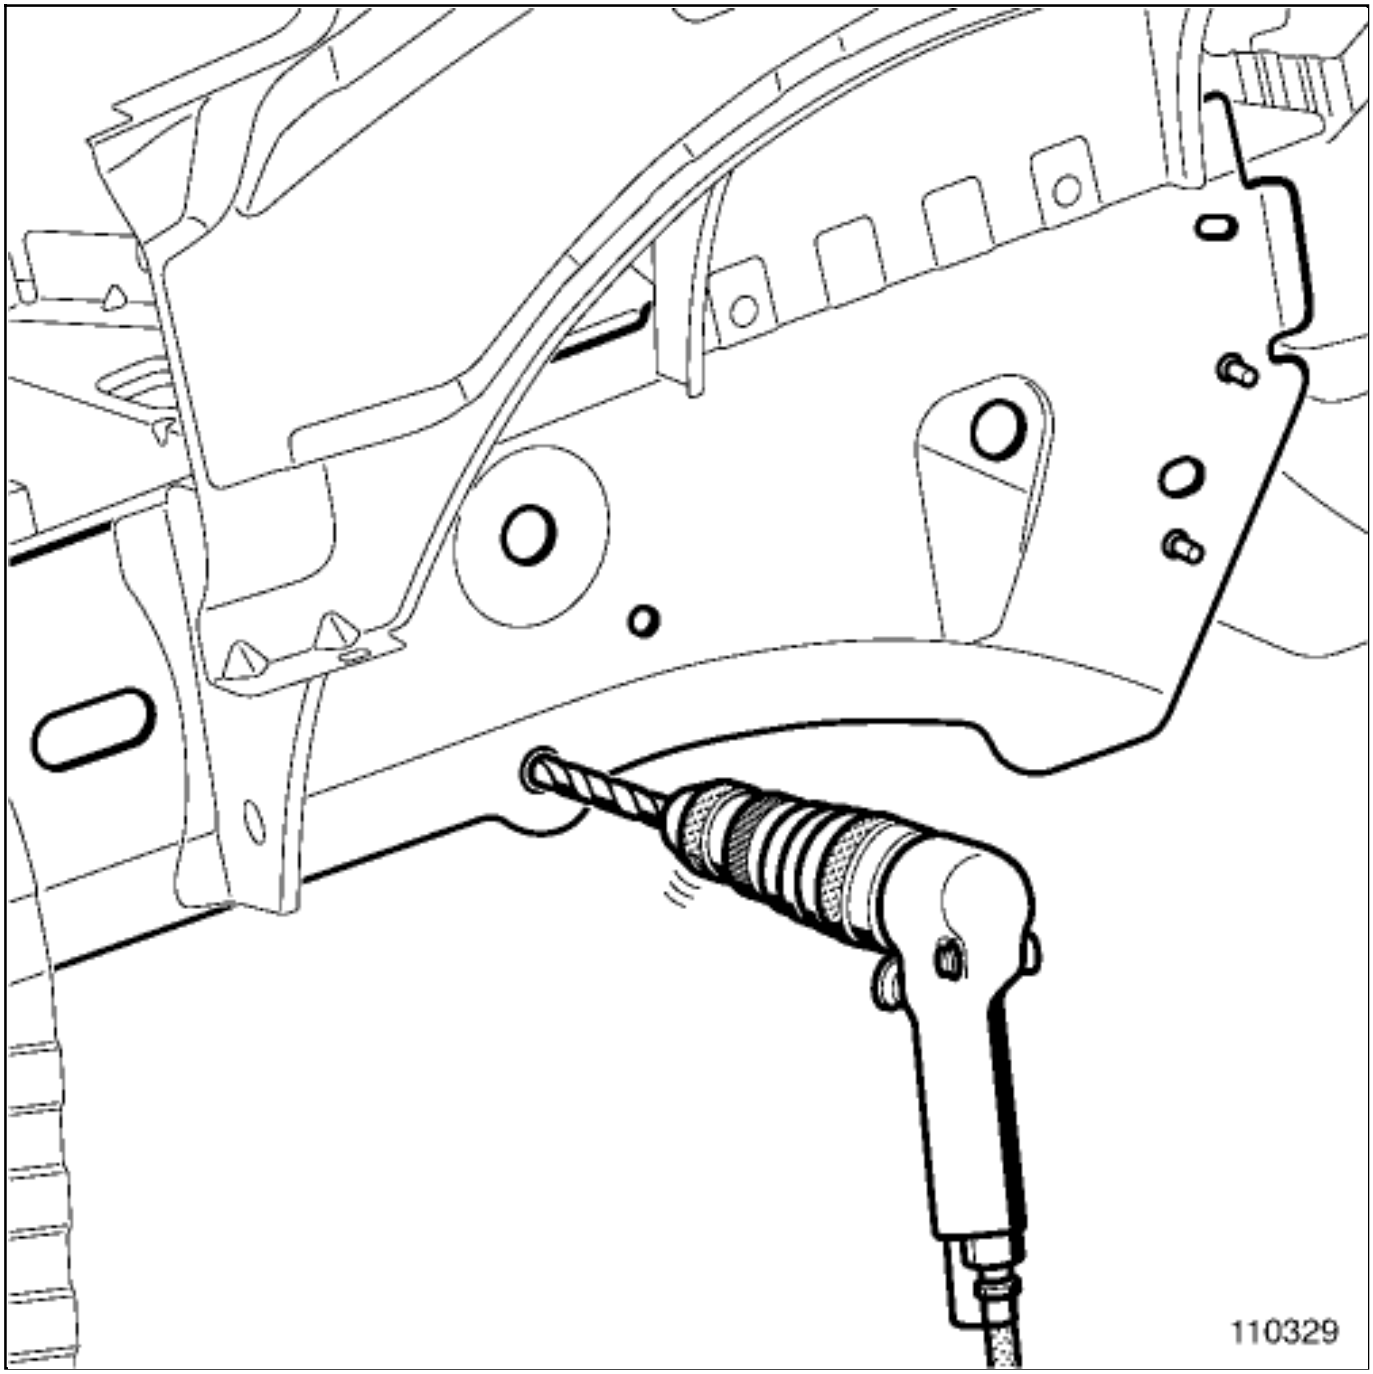
Drill the fluo tapped nut, observing the nominal diameter of the insert, see table.

∅ nominal	∅ drilling hole (mm)
M6 x 100	10.2
M8 x 125	13.5
M10 x 150	15.5

2. ANTI-CORROSION PROTECTION

If it is a hollow section, inject wax to stabilise the swarf and protect the parts which have been bared during the drilling operation.

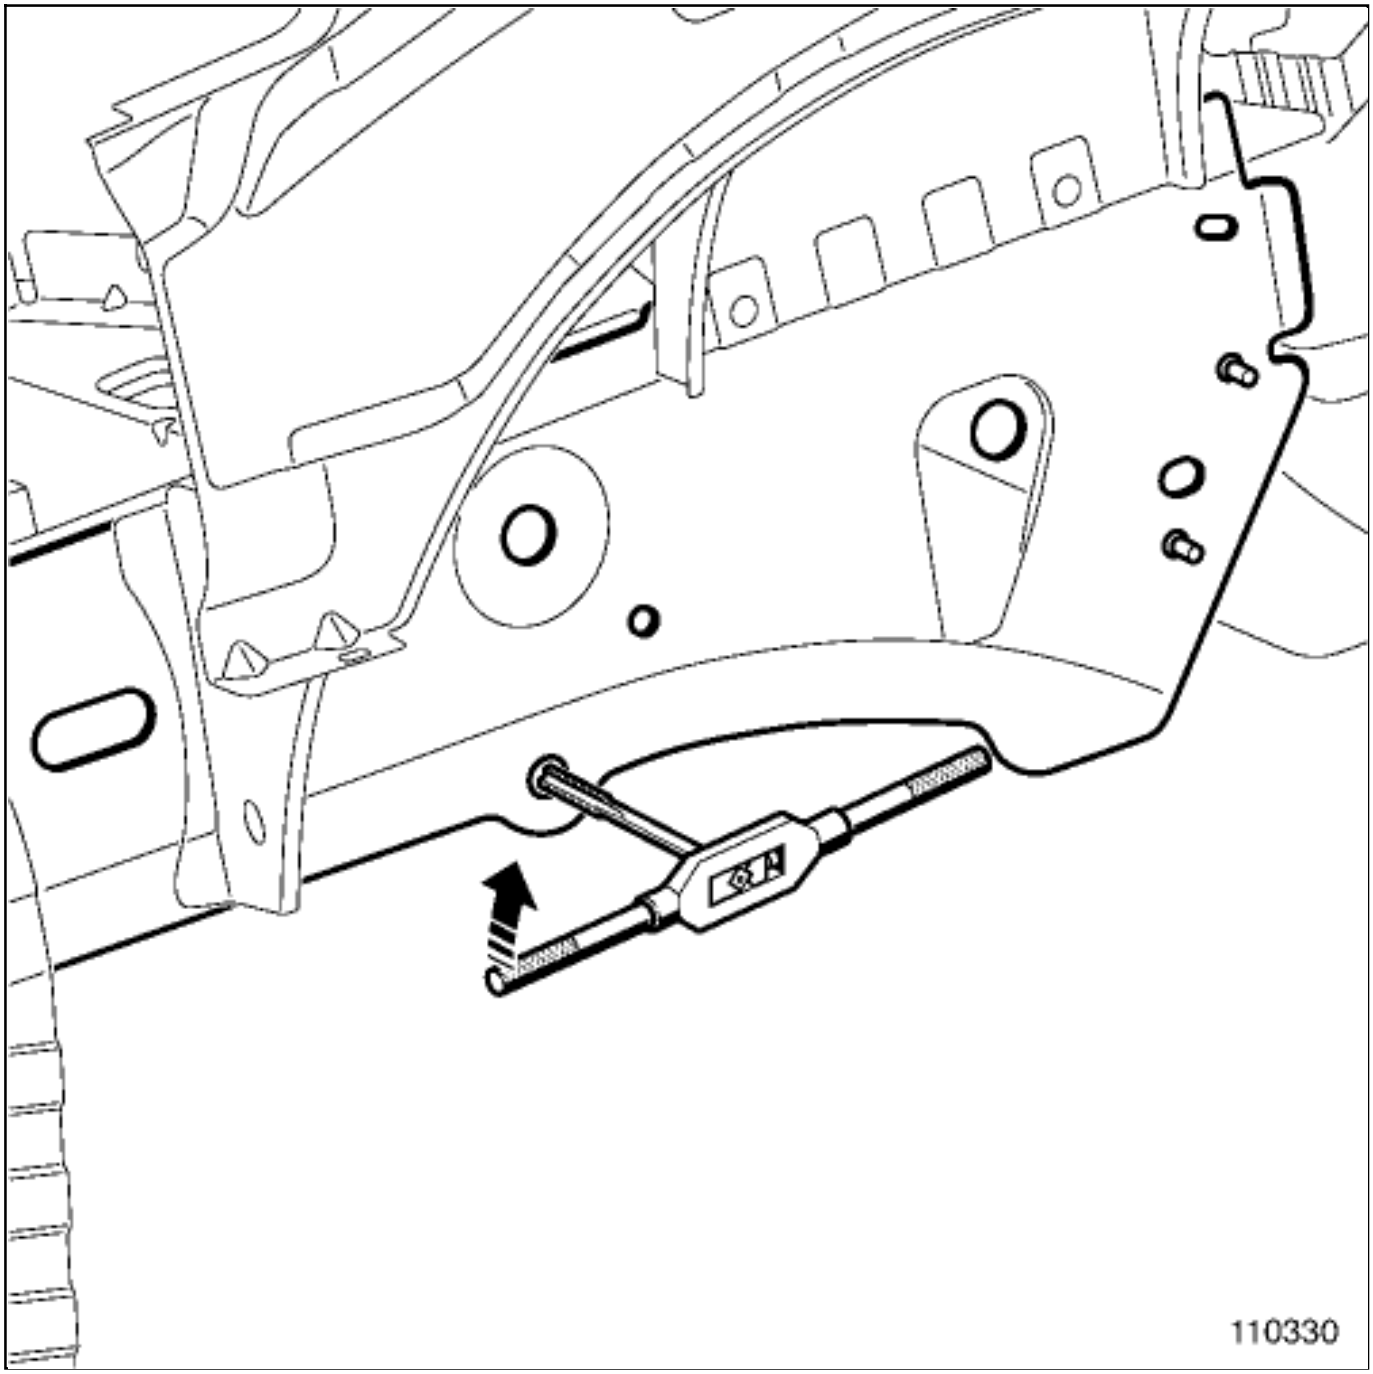
(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)



3. FITTING THE CAPTIVE NUT

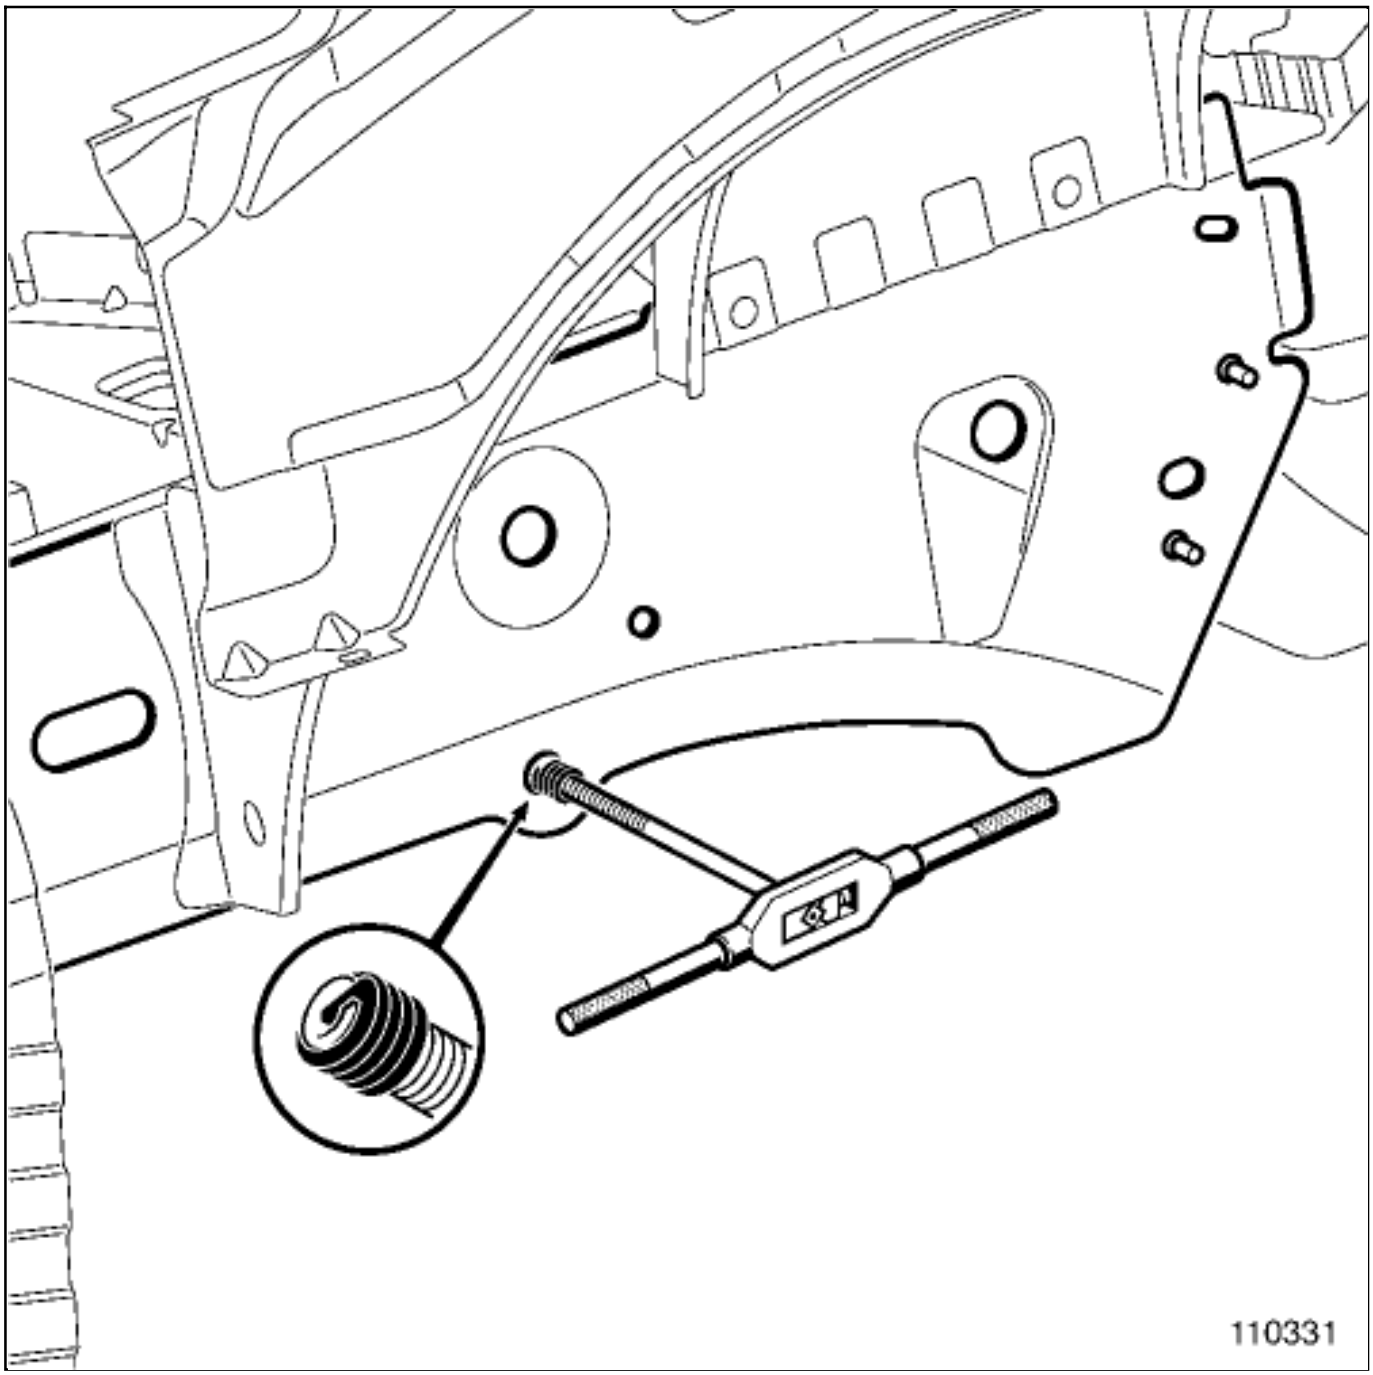
Fitting the captive nut**(see 40H, Bolted connections, Screw connection with crimped mounting: Description)** .

BOLTED CONNECTION WITH WELDED NUT



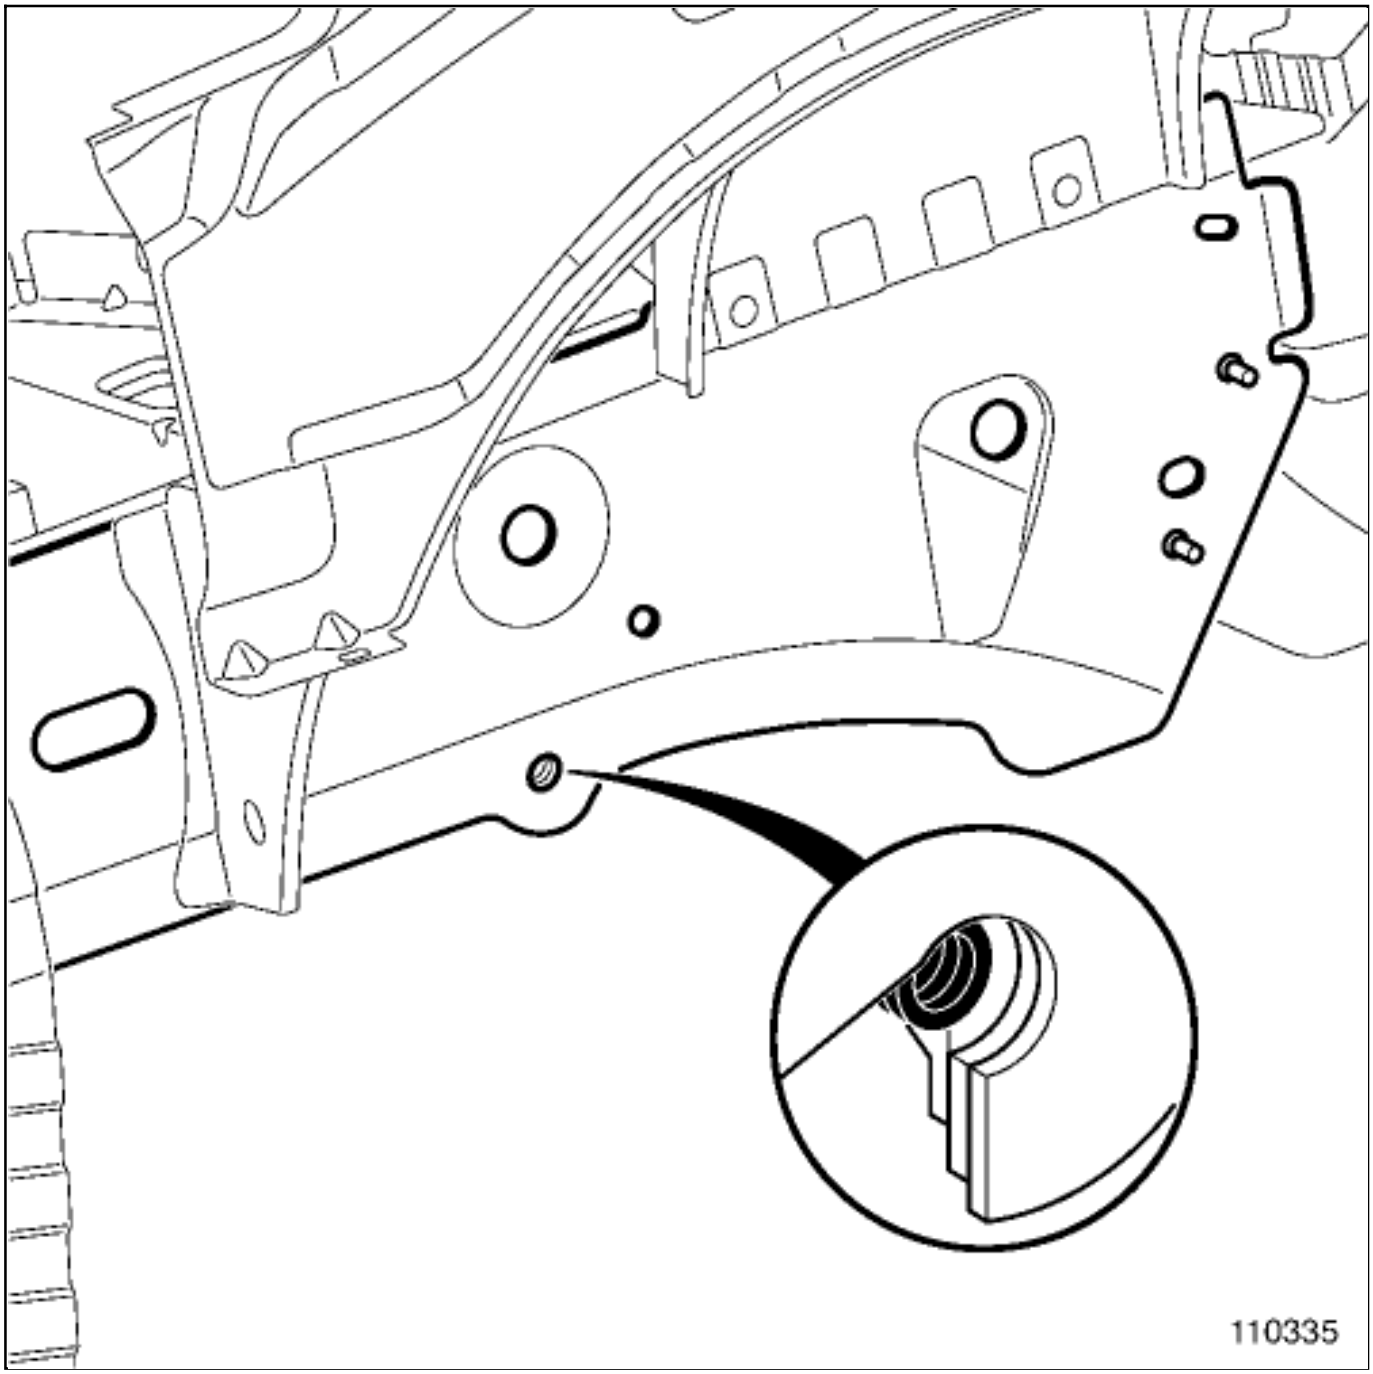
Repairing a welded nut is done using a helical thread insert from "helicoil" type, to be ordered at a supplier's as well as the appropriate material.

1. PREPARATION



Drill a front hole according to the nominal diameter of the thread, see table below.

∅ nominal	∅ drill bit (mm)
M4	4.2
M5	5.2
M6	6.3
M8	8.4
M10	10.5
M12	12.5
M14	12.5

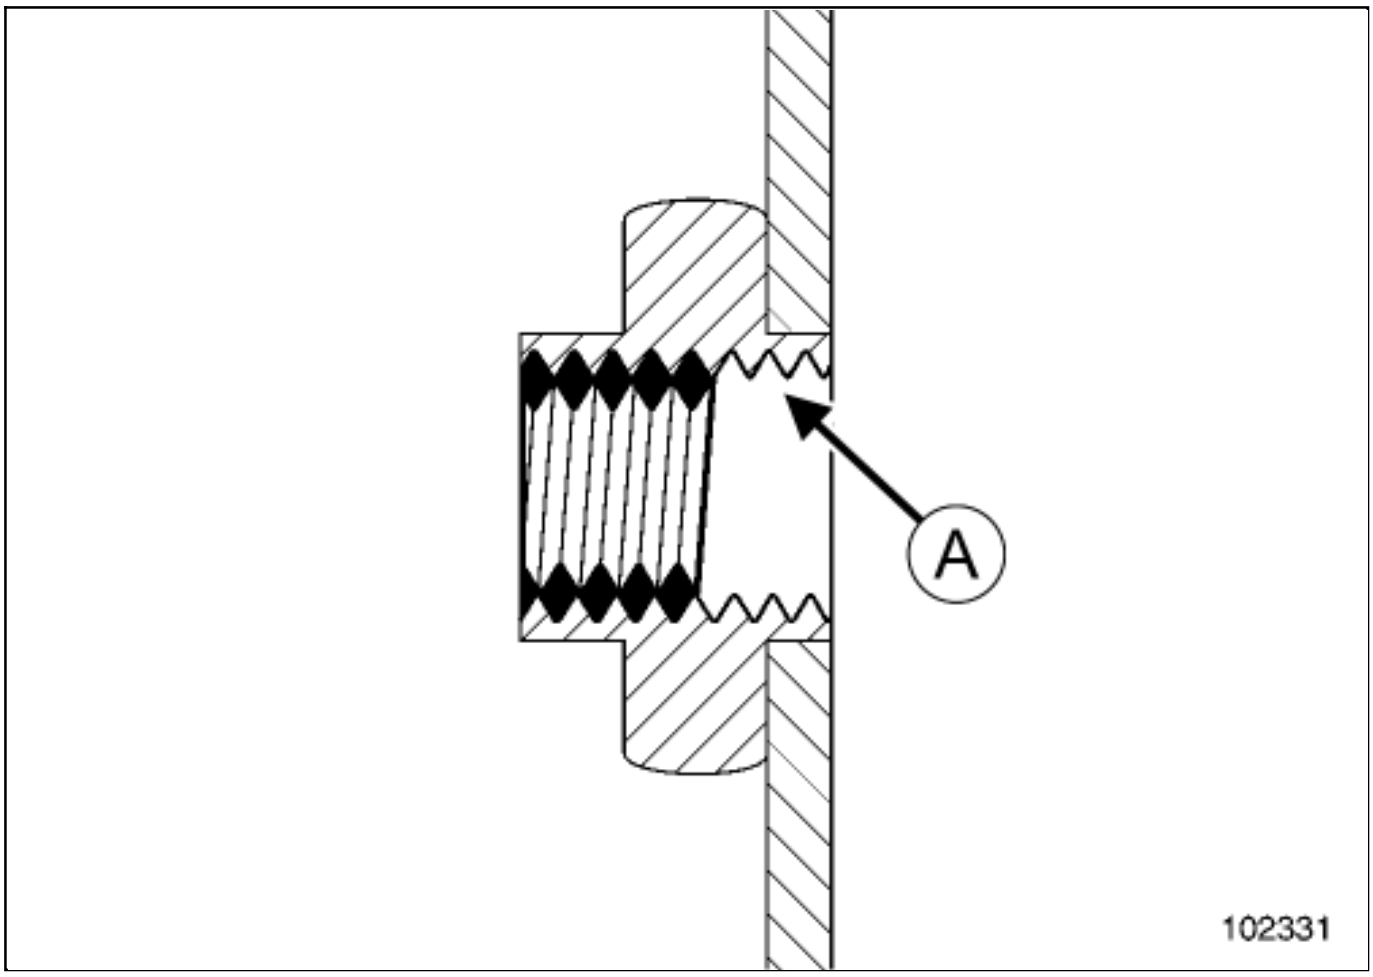


Tap the drilling hole using the tap provided with the helical thread inserts, do not forget to lubricate during the operation to evacuate the shavings.

2. FITTING THE HELICAL THREAD INSERT

Insert the helical thread insert on to the adapted pin by placing the driving plate pin in the neck provided.

Turn the pin in the drilling hole.



Note:

For perfect insertion of the helical thread insert at 0.25pitch below the surface of the part.

Break the driving plate pin using a jet.

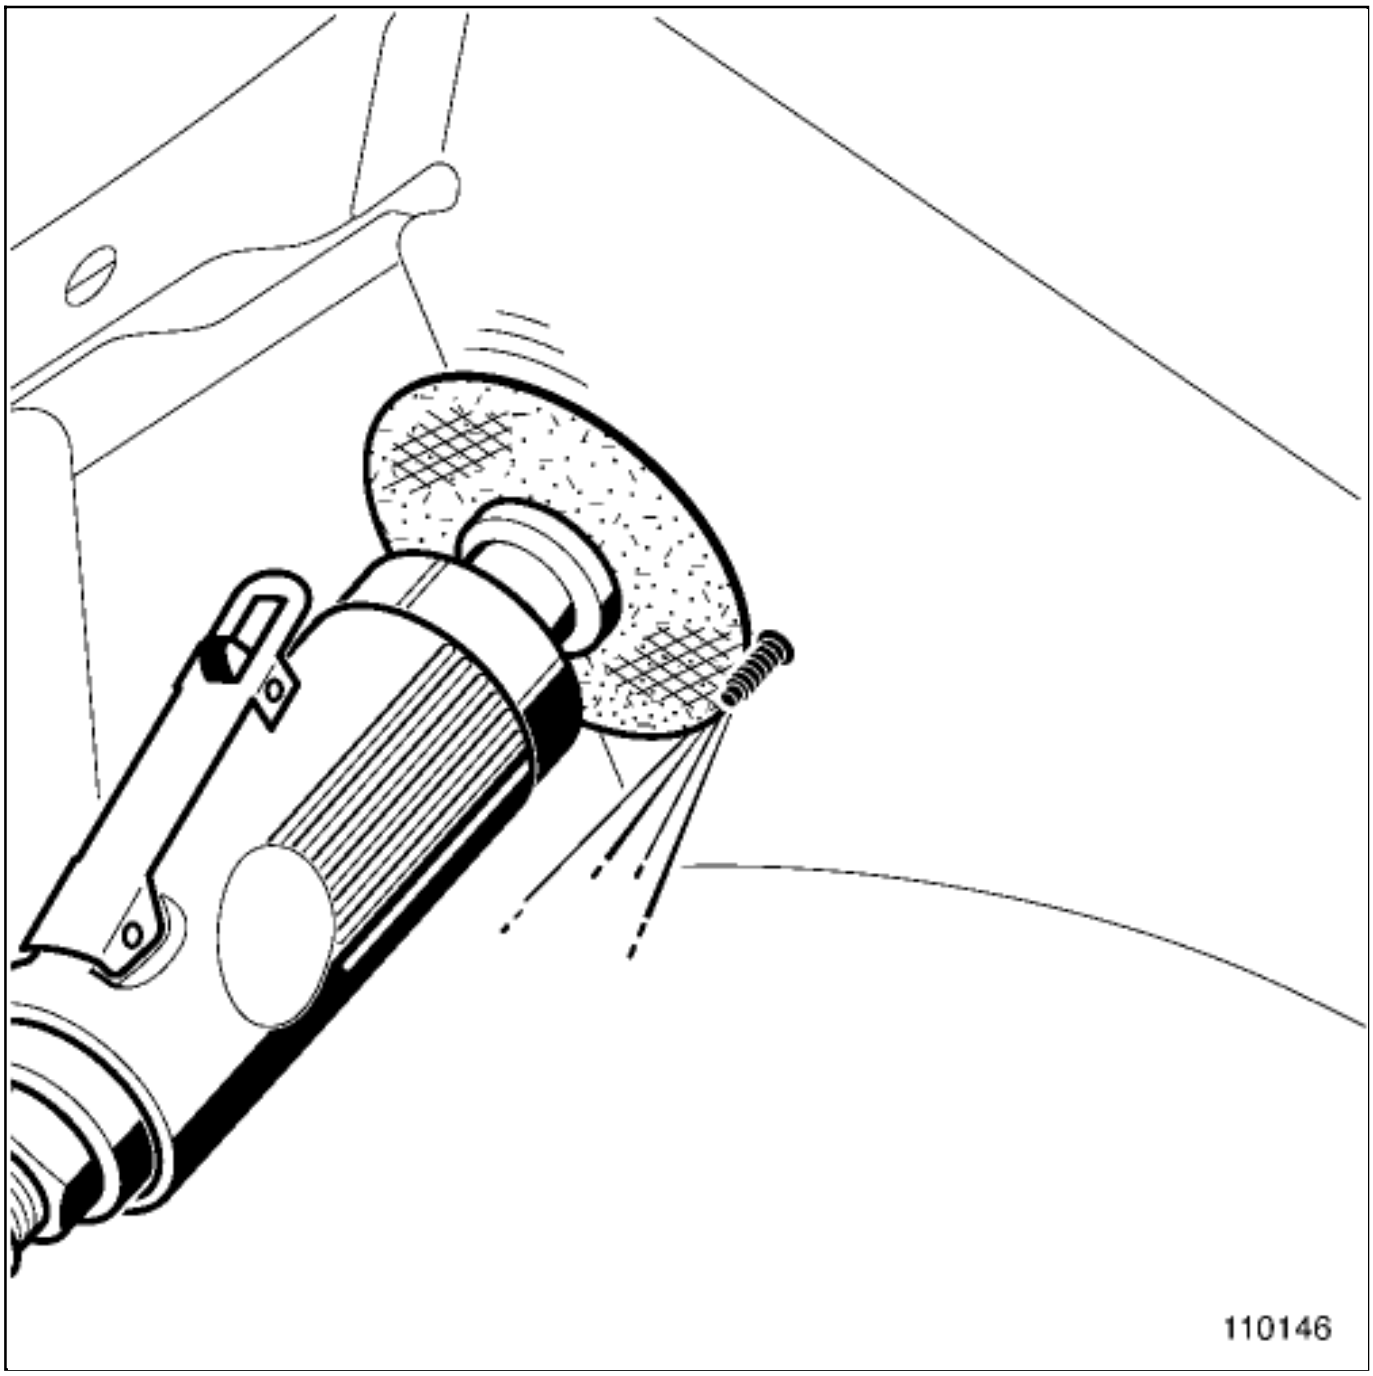
3. ANTI-CORROSION PROTECTION

After fitting the helical thread insert, apply anti-corrosion protection to the section(A) of the insert which has been re-tapped. To do this, inject some protective wax for hollow sections in the captive nut before refitting the bolt.

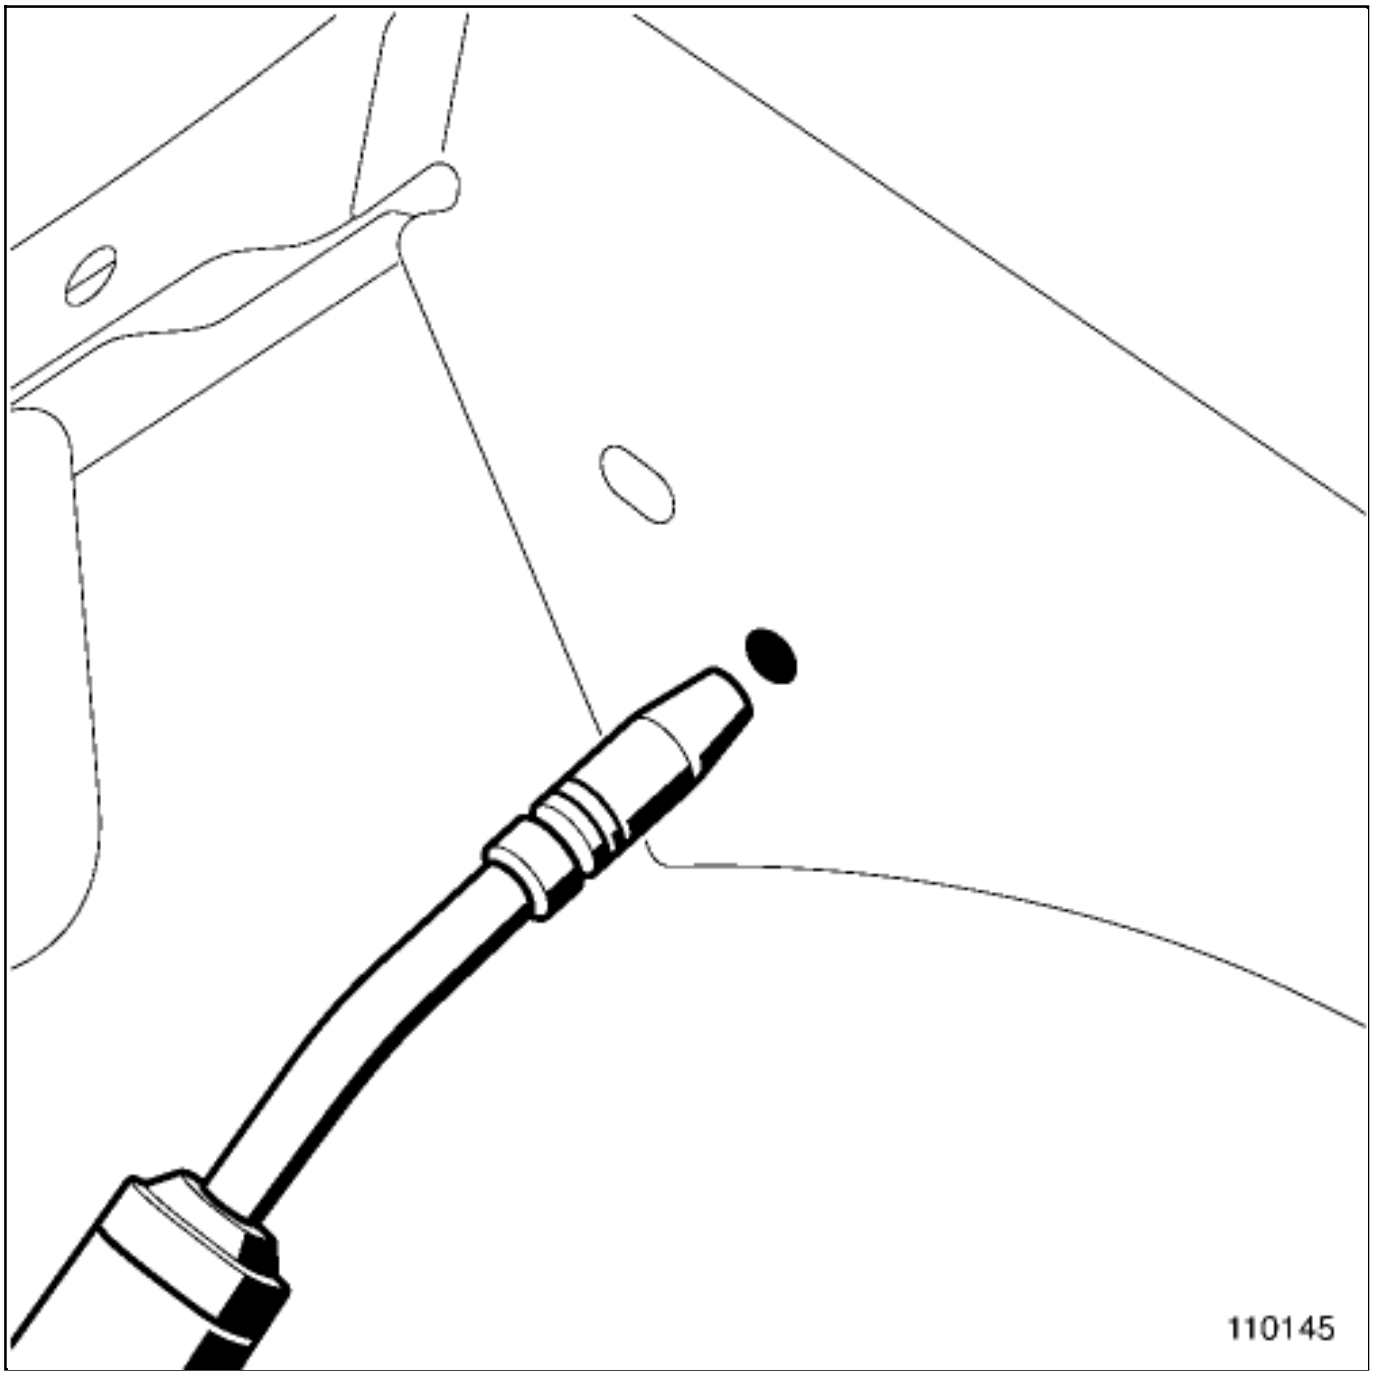
(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

BOLTED CONNECTION WITH WELDED STUD

Repairing a welded stud is done according three possibilities:

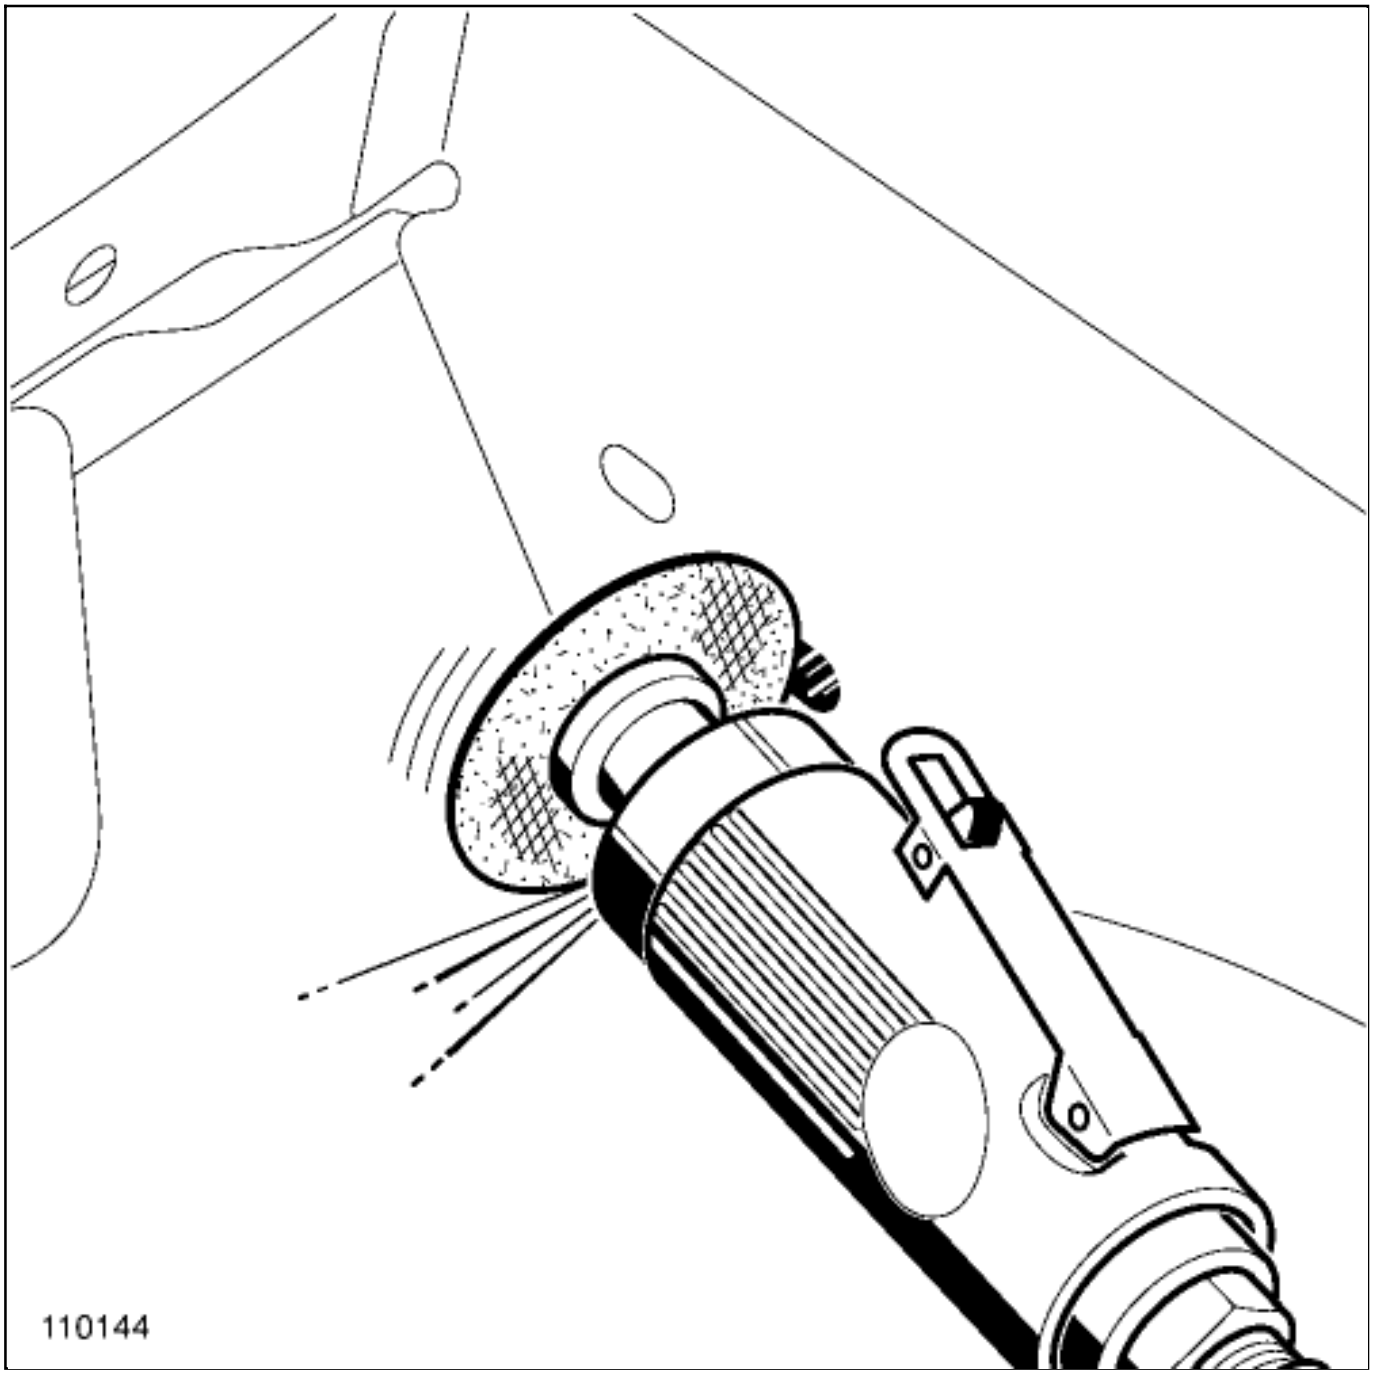


- by identical to the origin welding of a welded stud, if the operator is equipped with a resistance welding device with a specific nozzle by using studs supplied with the material,
- by fitting of a crimped stud**(see 40H, Bolted connections, Screw connection with crimped mounting: Description)** .



Note:

If it is about a D5 stud at "lying thread", it is possible to fit a riveted stud.

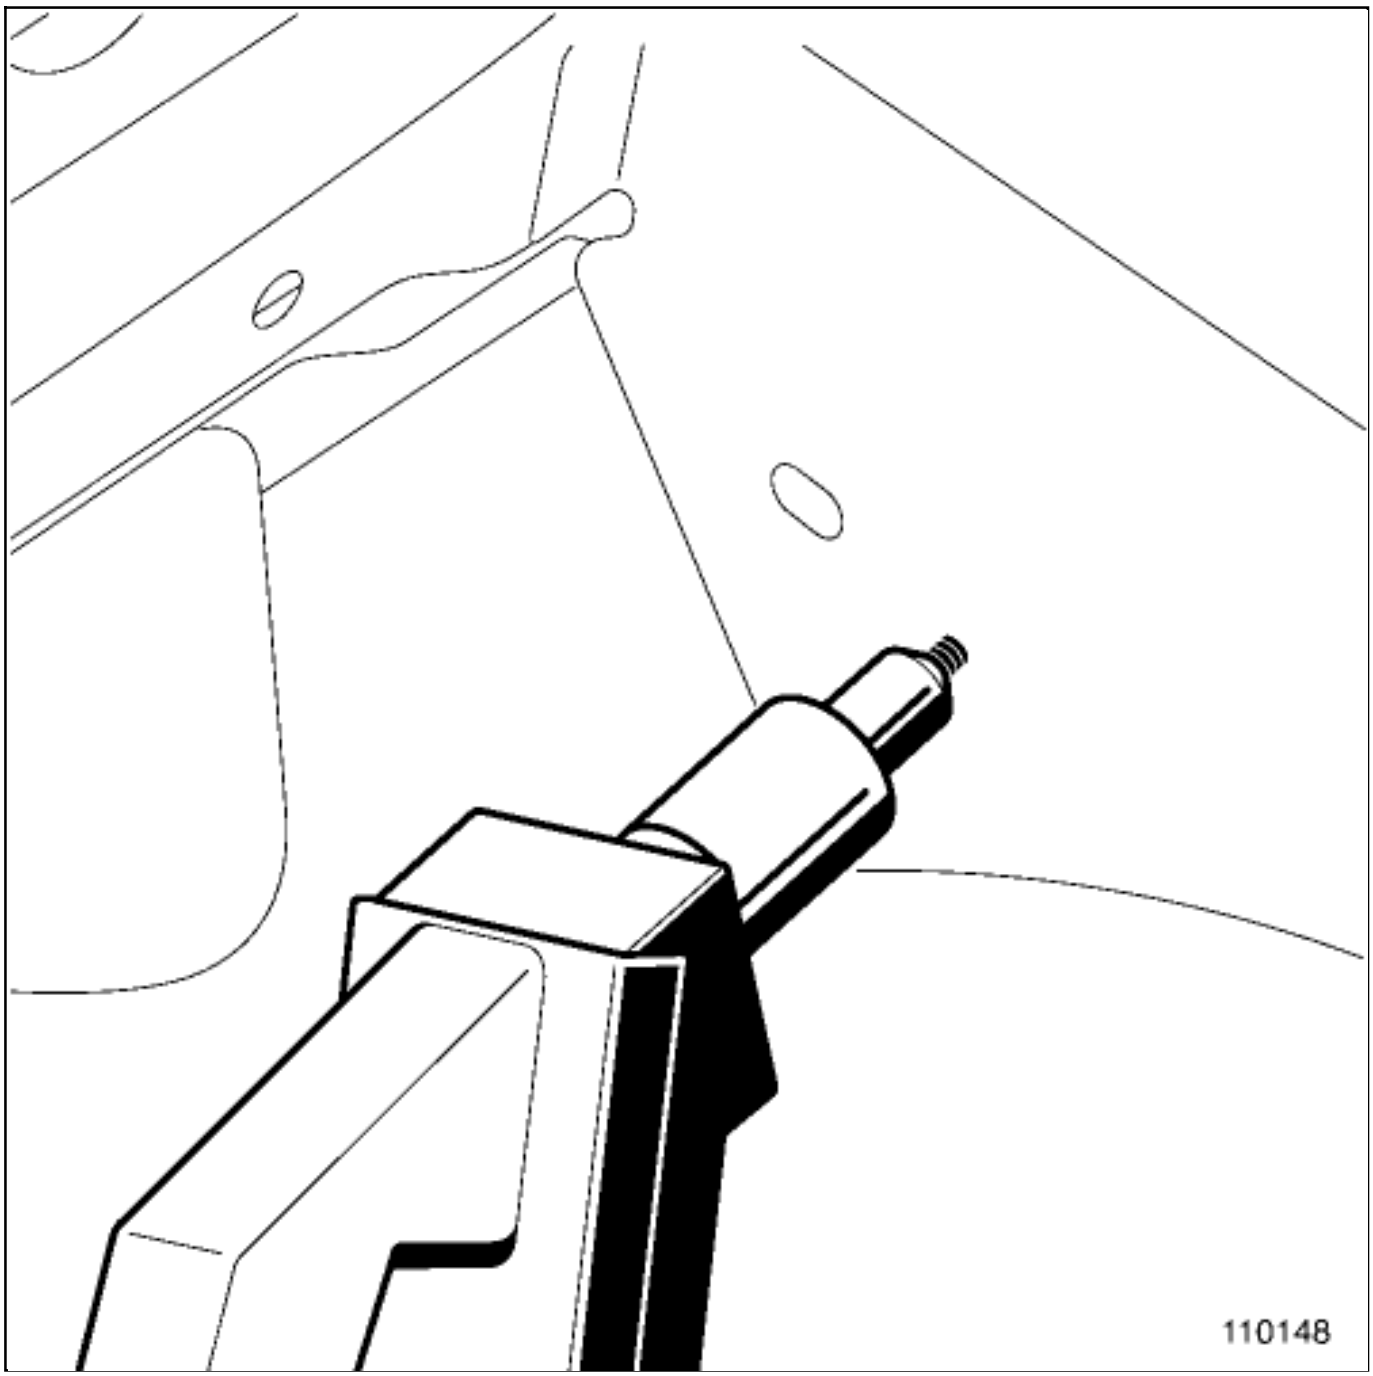


1. DISASSEMBLY

Cut the stud close to the panel mounting(see 05B, Equipment and Tools, Tools for cutting a structural component: Use) .

If the panel tears when the stud ruptures, use an electric welding process with shielding gas(see **Products and equipment for welded assembly: Use**) .

Level off the residual stud or weld(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use) .



Note:

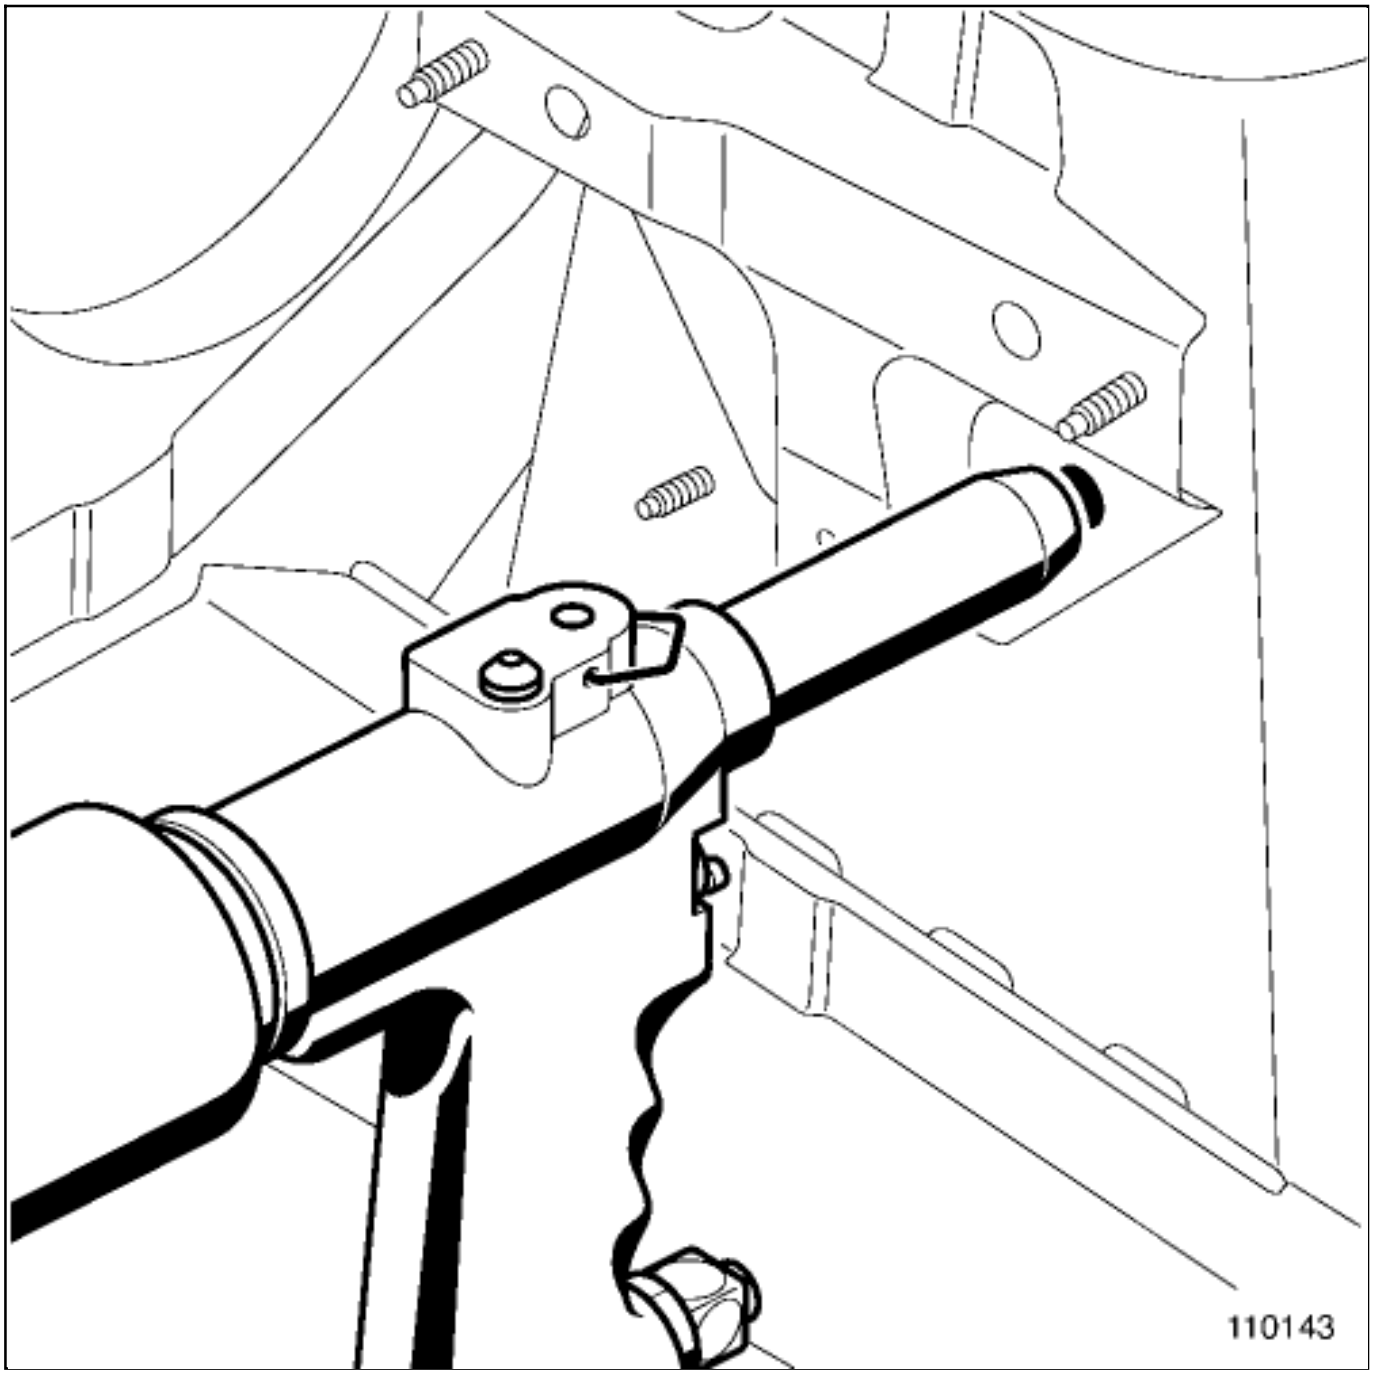
Do not strike or damage the panel.

2. FITTING A WELDED STUD IDENTICAL TO THE ORIGIN

The following procedure is used:

- before painting the part,
- on a component which is at risk from water infiltration (e.g.: floor).

Weld the stud using a resistance welder equipped with an adapted nozzle, use the studs to be welded given by the supplier of the welding equipment.



3. FITTING A CRIMPED STUD

(see 40H, Bolted connections, Screw connection with crimped mounting: Description) .

4. FITTING A RIVETED STUD

The following procedure is used:

- after painting the part,
- if there is a hollow section.

Rivet the stud using a pneumatic rivet squeezer(see 04F, Bodywork products and mountings, Products and equipment for bolted assembly: Use) .

BOLTED CONNECTIONS: PRECAUTIONS FOR THE REPAIR

1. SAFETY COMPONENT MOUNTINGS

The body mountings of the following safety components must not be redone if they have deteriorated:

- Seat belts,
- Seat belt buckles,
- Seats with safety belts board.

If the mounting is damaged, the component on which it is mounted must be replaced.

2. TIGHTNESS OF THE MOUNTING

1- CRIMPED MOUNTINGS

After fitting the crimped mounting, check the crimping by performing a tightening test on the mounting before fitting the component on the mounting.

In the event of incorrect crimping, remove the mounting and refit a new one.

2- WELDED MOUNTINGS

After fitting the welded mounting, check the weld by performing a tightening test on the mounting before fitting the component on the mounting.

In the event of an incorrect weld, redo the connection or remove the mounting and refit a new one.

3- REPAIRING BY HELICAL THREAD INSERT

After fitting the helical thread insert, check the position of the helical thread insert by performing a tightening test on the mounting before fitting the component on the mounting.

If the helical thread insert is incorrectly positioned, remove the helical thread insert and refit a new one.

In case of an insert thread breakdown, proceed to the replacement of the original fastening item.

3. ANTI-CORROSION PROTECTION

Before fitting a crimped mounting, apply anti-corrosion protection to the drilling hole, as well as around the shaft of the crimped mounting.

XSL version : 3.02 du 22/07/11

BONDINGSUNROOFOPERATINGMECHANISMS:DESCRIPTION

1. PREPARATION AND BONDING PROCEDURE

Special notes on the preparation and bonding operation for sunroof mechanisms.

For cutting operations (see the MR for the vehicle concerned).

On sunroof mechanism	
New sunroof mechanism(Parts Department)	Procedure 1
Removed sunroof mechanism(with residual beading)	Procedure 2

2. PROCEDURE 1: ON NEW SUNROOF MECHANISM (PARTS DEPARTMENT)

Clean the bonding area carefully with heptaneVehicle: Parts and consumables for the repair (04B, Consumables - Products).

Wipe the bonding area using a lint-free clothVehicle: Parts and consumables for the repair (04B, Consumables - Products).

Place indexing guides and positioning shims onto the sunroof mechanism.

Carry out a test assembly of the sunroof mechanism on the vehicle.

Apply the primer (green and red marking) with a single, uniform stroke onto the entire bonding area.

Let it dry for a minimum of 10 minutes.

Apply the cement bead.

Bond the sunroof mechanism immediately.

3. PROCEDURE 2: ON REMOVED SUNROOF MECHANISM (WITH RESIDUAL BEADING)

Carefully clean the bonding area with heptaneVehicle: Parts and consumables for the repair (04B, Consumables - Products), avoiding the cement bead.

Wipe the bonding area using a lint-free cloth[Vehicle: Parts and consumables for the repair](#) (04B, Consumables - Products).

Level the residual beading (leave a thickness of 1 to 2 mmof beading).

Place indexing guides and positioning shims onto the sunroof mechanism.

Carry out a test assembly of the sunroof mechanism on the vehicle.

Note:

If there is an area without residual beading on the sunroof mechanism (e.g.: difficulty in adhering):

- apply the glass cleaner/activator using a pre-soaked wipe along the bonding line,
- wipe with a dry cloth.

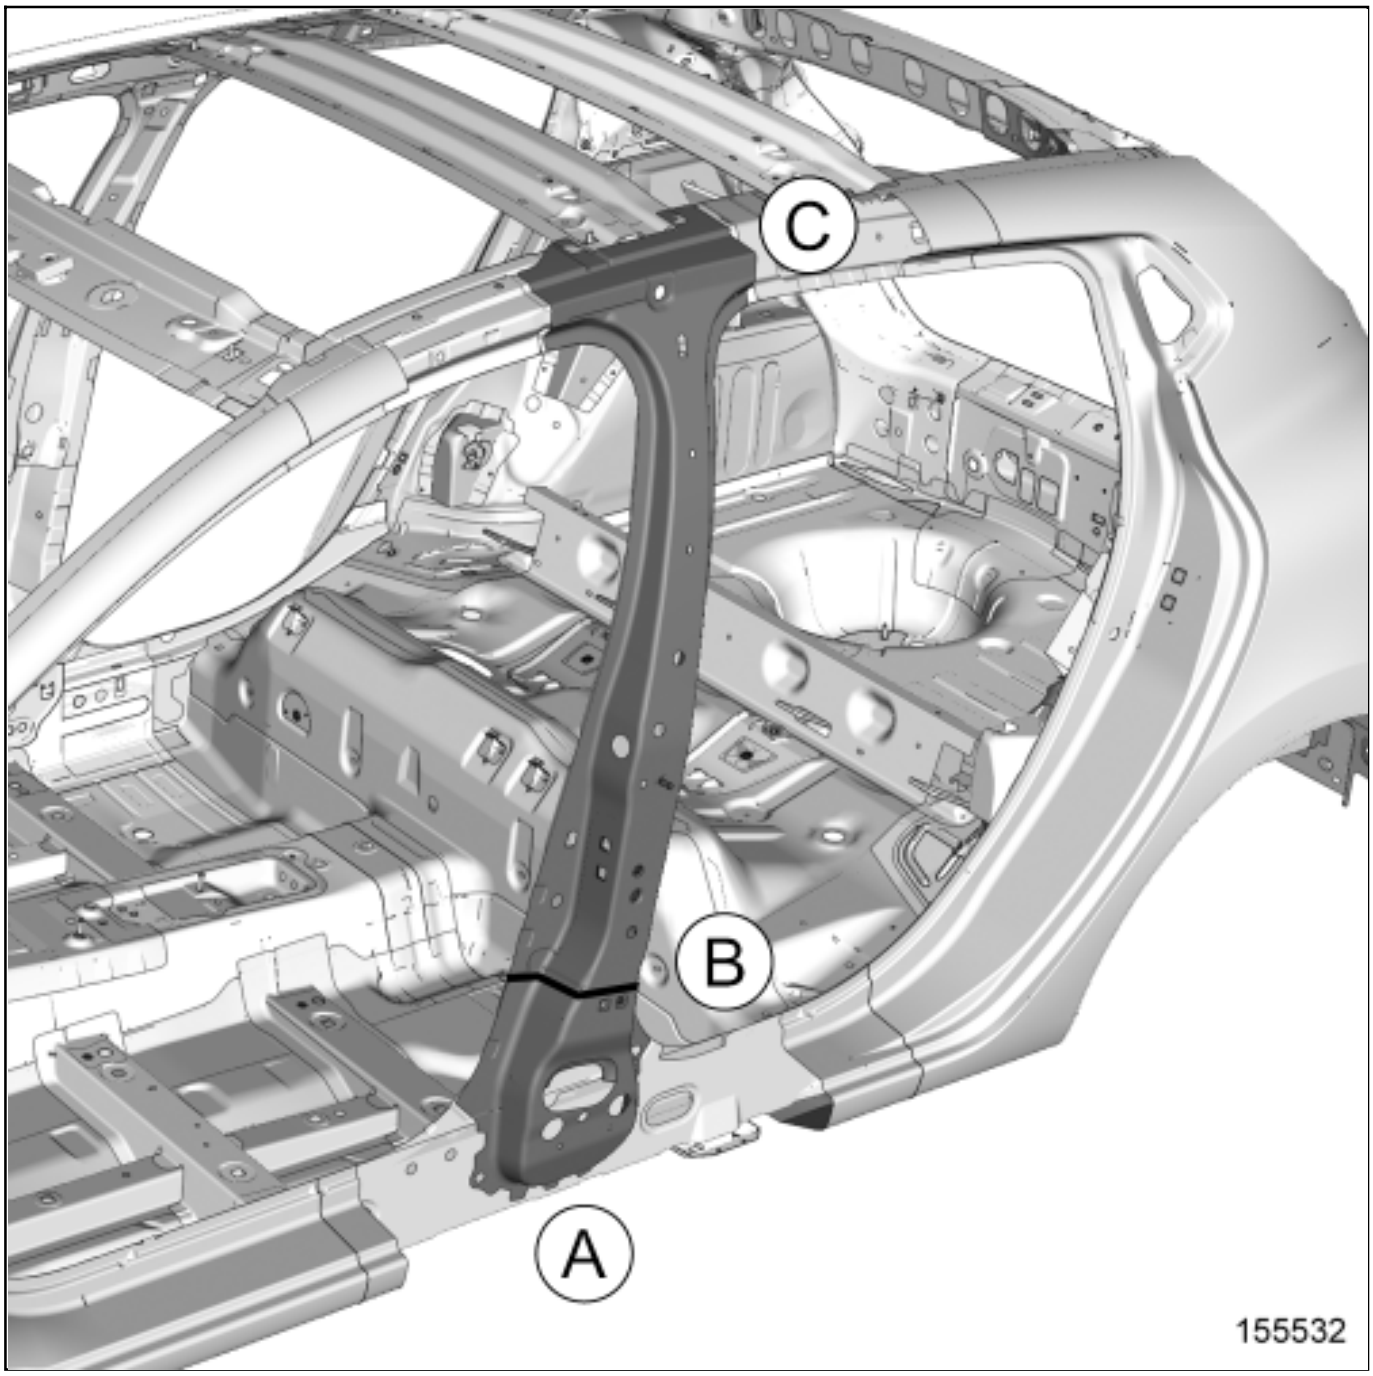
Apply the primer (green and red marking) with a single, uniform stroke onto the entire bonding area.

Let it dry for a minimum of 10 minutes.

Apply the cement bead.

Bond the sunroof mechanism immediately.

B-PILLAR REINFORCEMENT: REPLACEMENT

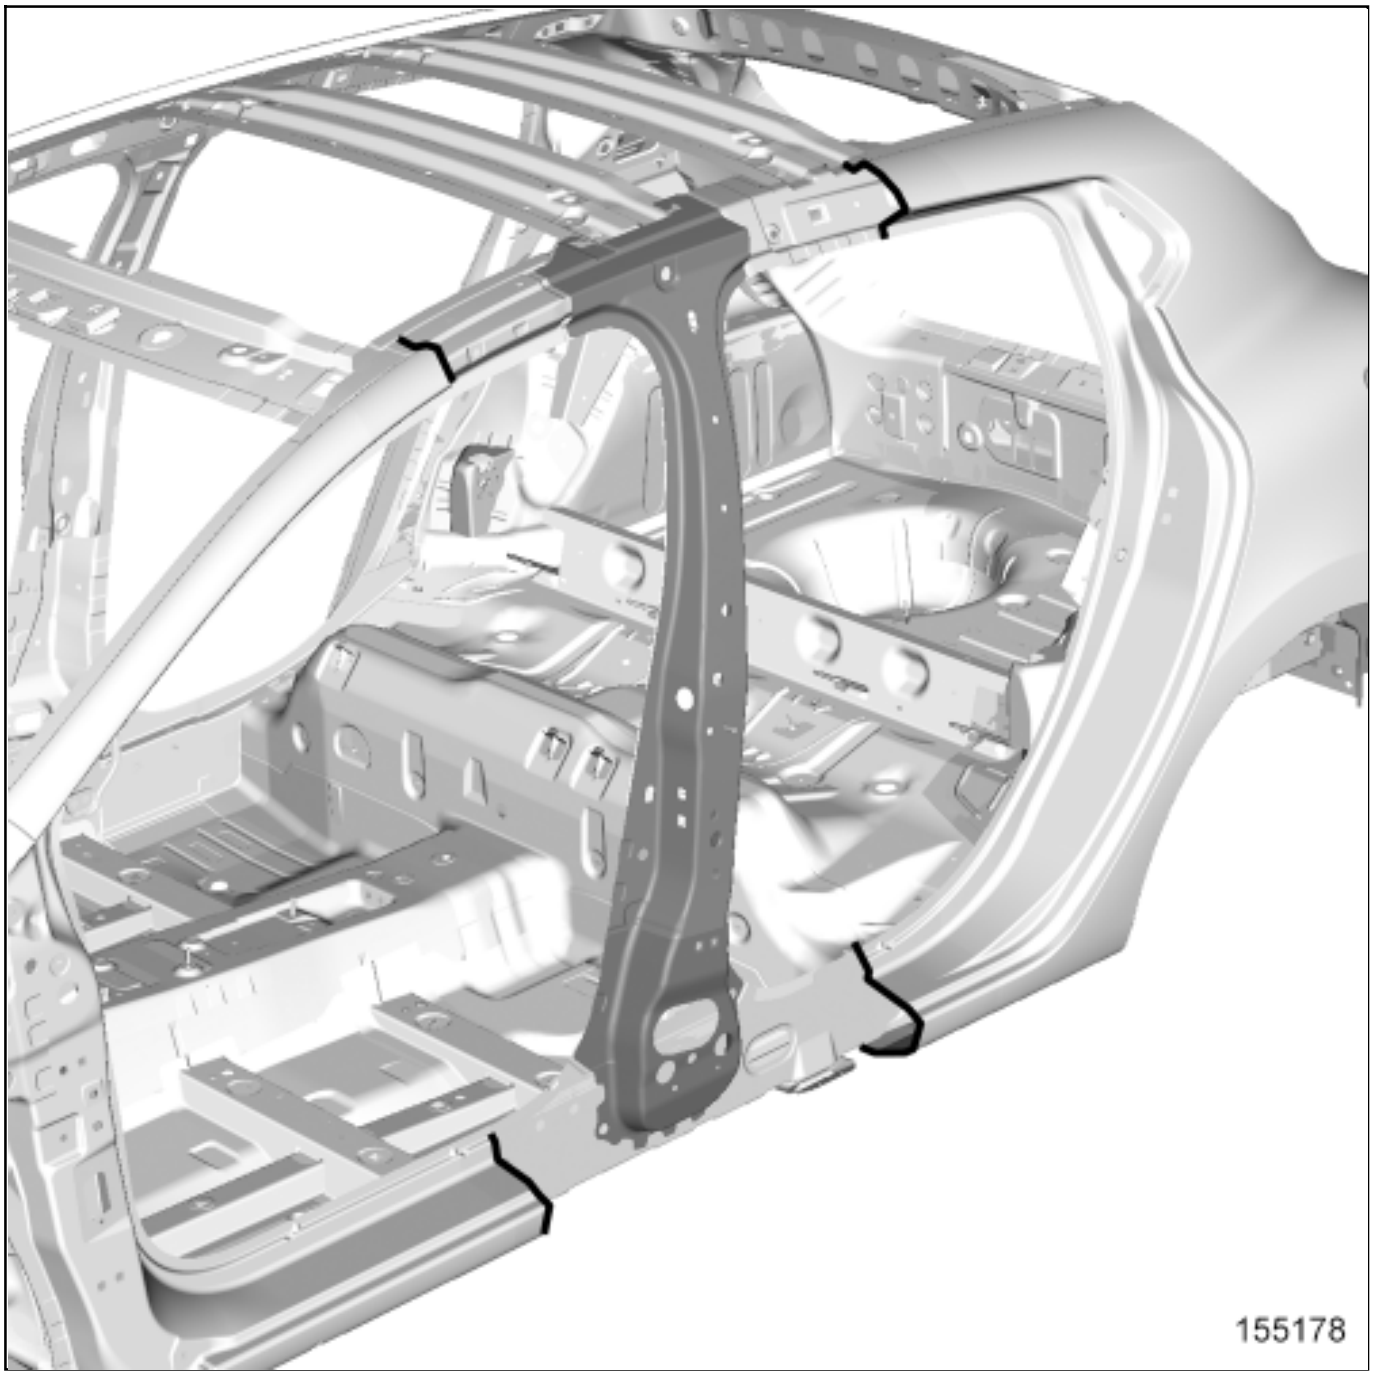


Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	B-pillar upper reinforcement	UHLE	1.7
(2)	B-pillar lower reinforcement	HLE	1.9
(3)	Mounting bridge piece	Mild steel	1.8

2. IN THE EVENT OF REPLACEMENT



There are several ways of replacing this part:

- complete replacement A-C,
- partial replacement A-B (lower reinforcement).

1- COMPLETE REPLACEMENT A-C

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

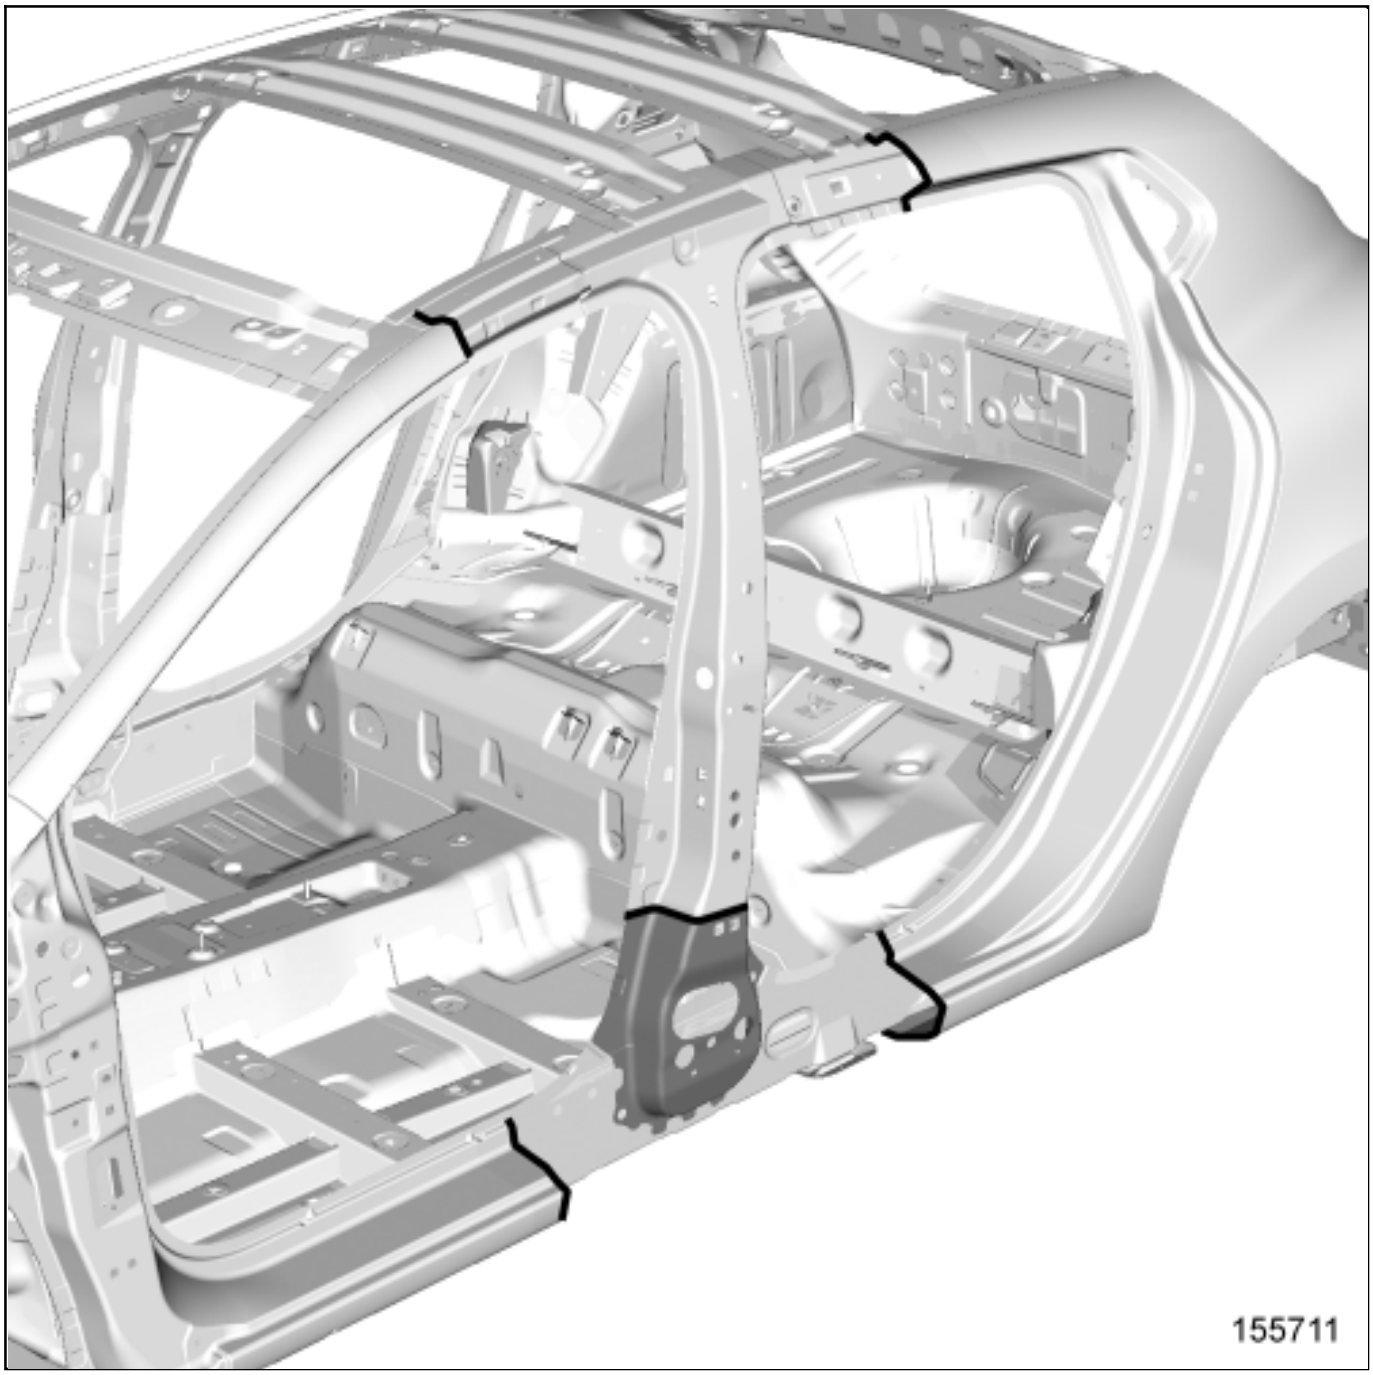
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

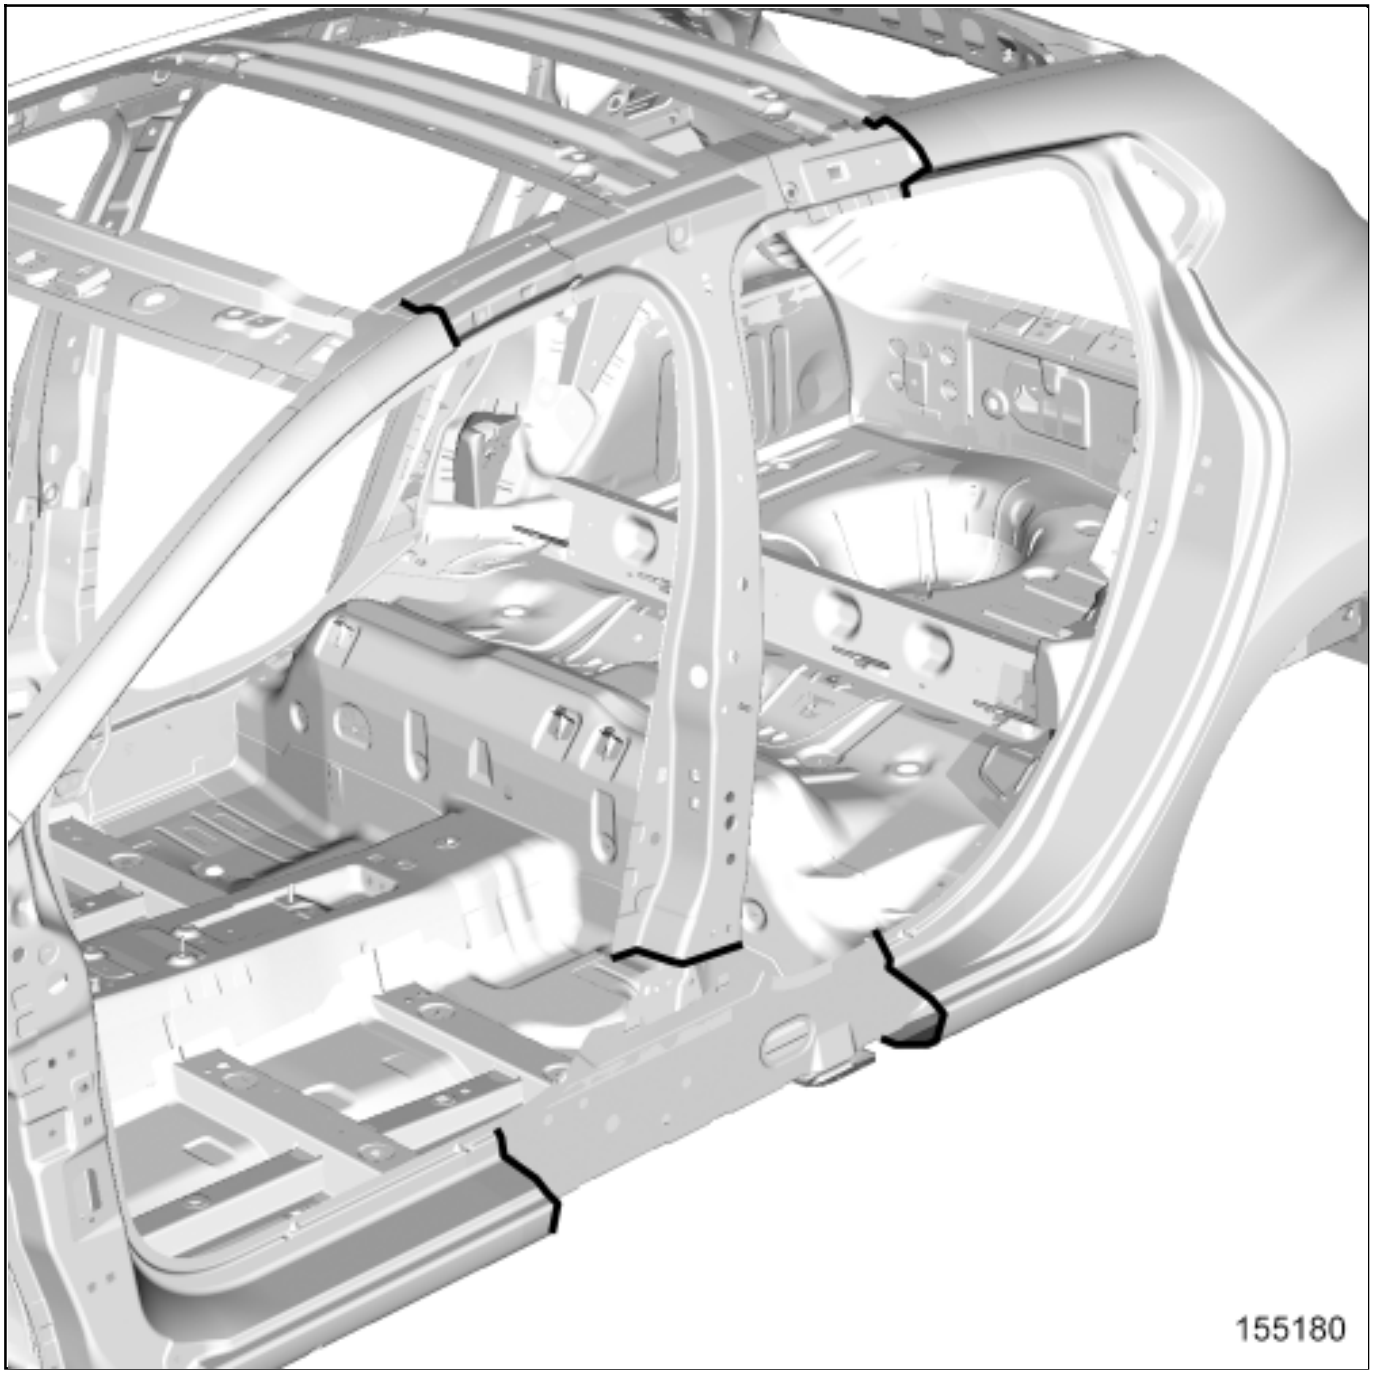
Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area Earths on body: List and location of components .

3)SPECIAL NOTES ON MATING



CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- PARTIAL REPLACEMENT A-B (LOWER REINFORCEMENT)

1)PART IN POSITION

VIEW WITHOUT PART

2)POSITION OF ELECTRIC EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING

CAUTION

If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld**Connections by arc welding under shielding gas: Description** (MR 400, 40C, Gas metal arc welded connections (GMAW)).

BRAKE CIRCUIT: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice(see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

The brake regulation circuit must be free of all hydraulic and electrical faults.

In case of incorrect handling, the brake fluid can cause serious injury and damage. Follow the manufacturer's instructions for brake fluid.

To prevent dust from entering the master cylinder reservoir and the brake circuit, the plug must be removed just before filling and closed immediately afterwards,

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Do not press on the brake pedal during work on the brake system.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

Brake fluid is highly corrosive. Ensure any brake fluid spilt on parts of the vehicle is cleaned off.

Use brake fluids that comply with the Renault standard(see **Vehicle: Parts and consumables for the repair**) .

Check the brake fluid levels in the braking circuit and the bleeding device.

Check that the pressure of the bleeding device is between 1.5 bar and 2 bar.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Fit blanking plugs recommended for the Siemens K9K injection system at the end of each pipe and in all the openings of the disconnected components of the brake circuit.

Clean around the braking system with brake cleaner(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Do not allow friction materials to come into contact with grease, oil or other lubricants and cleaning products which are mineral oil based.

3. GENERAL RECOMMENDATIONS

When replacing brake pads, always replace the pads on the other side as well.

When replacing a disc, always replace the disc on the opposite side.

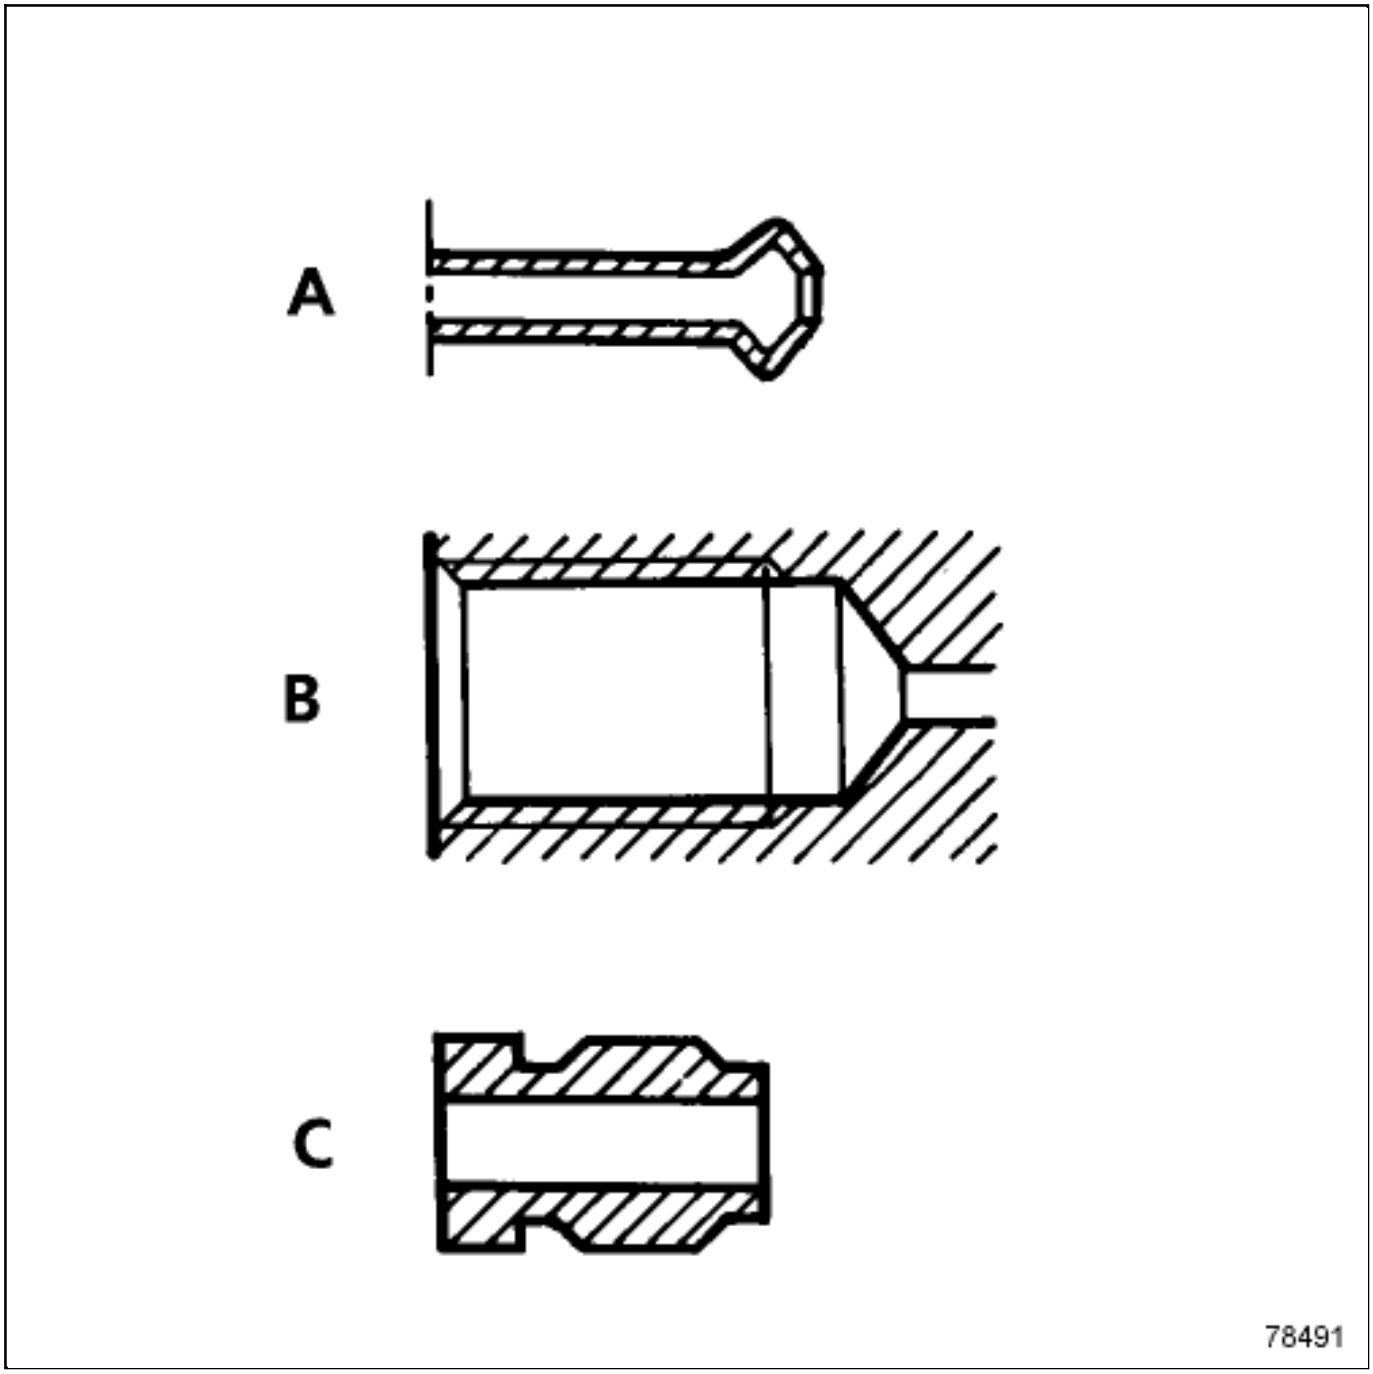
When replacing brake discs, you must replace the brake pads.

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components, regardless of the position of the wheels.

WARNING



To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

Always replace the rigid brake pipe clips.

Reminder:

The pipes between the master cylinder, callipers and the hydraulic assembly are connected using threaded unions with a metric thread.

Therefore, only parts specified in the Parts Catalogue for this vehicle should be used.

Parts identification:

- shape of steel or copper pipe end piece (A),
- shape of connecting points on components (B),
- shape of unions (C): 11 mm hexagonal.

Precautions to be taken before and during the brake circuit bleeding operation:

- use brake fluid which conforms to the Renault standard(see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- check the brake fluid levels in the brake circuit and the bleeding device,
- the braking regulation circuit must be free from all hydraulic and electrical faults,
- check that the pressure of the bleeding device is between 1.5 bars and 2 bars.

- the braking regulation circuit must be free from all hydraulic and electrical faults,
- check that the pressure of the bleeding device is between 1.5 bars and 2 bars.

XSL version : 3.02 du 22/07/11

BRAKEFLUID:SPECIFICATIONS

1. BRAKE FLUID REPLACEMENT INTERVAL

Our braking technology, and in particular the disc brakes (hollow pistons which conduct little heat, have a low volume of fluid in the cylinder, sliding callipers avoiding the need for a fluid reserve in the least cooled area of the wheel), has allowed us to prevent the risk of "vapour lock" as far as possible, even with heavy braking (mountainous area). However, current brake fluids are subject to minor deterioration during the first months of use due to slight humidity intake. This is why it is recommended that you change the brake fluid: see maintenance booklet for the vehicle.

1- TOPPING UP THE LEVEL

Wear of the brake pads will result in a gradual drop in the fluid level in the reservoir.

Do not top up the fluid, as the level will rise again when the pads are next changed. The brake fluid level must not fall below the minimum mark.

2- APPROVED BRAKE FLUID

Using a mixture of two incompatible brake fluids in the brake circuit may give rise to:

- significant risk of leaks mainly due deterioration of the cups,
- impaired operation of the ESP system.

To avoid such risks, it is essential to only use RENAULT standard approved brake fluids(see **Vehicle: Parts and consumables for the repair**) .

BRAKE MECHANISM: PRECAUTIONS FOR THE REPAIR

 **Note, one or more warnings are present in this procedure** 

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

- Using a mixture of two incompatible brake fluids in the brake circuit may give rise to:
  - serious risk of leakage due mainly to deterioration of the cups,
  - degradation of the ESP system.

To avoid such risks, only ever use brake fluids which comply with the RENAULT standard Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Switch off the vehicle ignition so as not to activate the hydraulic unit solenoid valves when bleeding the brake circuit.

- Reminder:
  - The pipes between the master cylinder, the callipers, and the hydraulic unit are connected using threaded unions with a metric thread.
  - Therefore, only parts specified in the Parts Catalogue for this vehicle should be used.

WARNING

To ensure that the ABS and ESP systems operate correctly, check that the underbody brake pipes are clipped in place and are not crossed.

WARNING

To avoid any accident, bring the pistons, brake pads and brake discs into contact by depressing the brake pad several times.

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

To avoid contaminating the brake circuit, do not allow the brake circuit components to drop on the ground.

Clean around the braking system with brake cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

3. GENERAL RECOMMENDATIONS

1- MASTER CYLINDER - BRAKE SERVO

Always replace the master cylinder seals.

Check that the brake servo seal is in place. Replace the seal if it is damaged.

Always replace the master cylinder - brake servo assembly when the master cylinder leaks into the brake servo. The brake servo becomes unusable when the rubber diaphragm is contaminated with brake fluid.

WARNING

To avoid breaking the connection between the brake servo pushrod and the brake pedal, check that the safety clevis pin is locked onto the brake servo pushrod by tilting it from the top downwards.

2- BRAKE HOSE

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

BRAKE MECHANISM: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

1. SAFETY

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

For an operation requiring the use of a lift, follow the safety advice Vehicle: Towing and lifting (02A, Lifting equipment).

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Using a mixture of two incompatible brake fluids in the brake circuit may give rise to:

- serious risk of leakage due mainly to deterioration of the cups,
- degradation of the ESP system.

To avoid such risks, only ever use brake fluids which comply with the RENAULT standard Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Switch off the vehicle ignition so as not to activate the hydraulic unit solenoid valves when bleeding the brake circuit.

Reminder:

- The pipes between the master cylinder, the callipers, and the hydraulic unit are connected using threaded unions with a metric thread.
- Therefore, only parts specified in the Parts Catalogue for this vehicle should be used.

WARNING

To ensure that the ABS and ESP systems operate correctly, check that the underbody brake pipes are clipped in place and are not crossed.

WARNING

If, during work on the brake system, any damage on any part is observed, it must be repaired before driving the vehicle again.

2. CLEANLINESS

1- ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

Protect any bodywork components that risk being damaged by brake fluid with a cover.

2- INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

To avoid contaminating the brake circuit, do not allow the brake circuit components to drop on the ground.

Clean around the braking system with brake cleanerVehicle: Parts and consumables for the repair (04B, Consumables - Products).

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

3. GENERAL RECOMMENDATIONS

1- MASTER CYLINDER - BRAKE SERVO

Always replace the master cylinder seals.

Check that the brake servo seal is in place. Replace the seal if it is damaged.

Always replace the master cylinder - brake servo assembly when the master cylinder leaks into the brake servo. The brake servo becomes unusable when the rubber diaphragm is contaminated with brake fluid.

WARNING

To avoid breaking the connection between the brake servo pushrod and the brake pedal, check that the safety clevis pin is locked onto the brake servo pushrod by tilting it from the top downwards.

2- BRAKE HOSE

CAUTION

In order not to damage the brake hose:

- do not tension the hose,
- do not twist the hose,
- check that there is no contact with the surrounding components.

BRAKE PEDAL: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

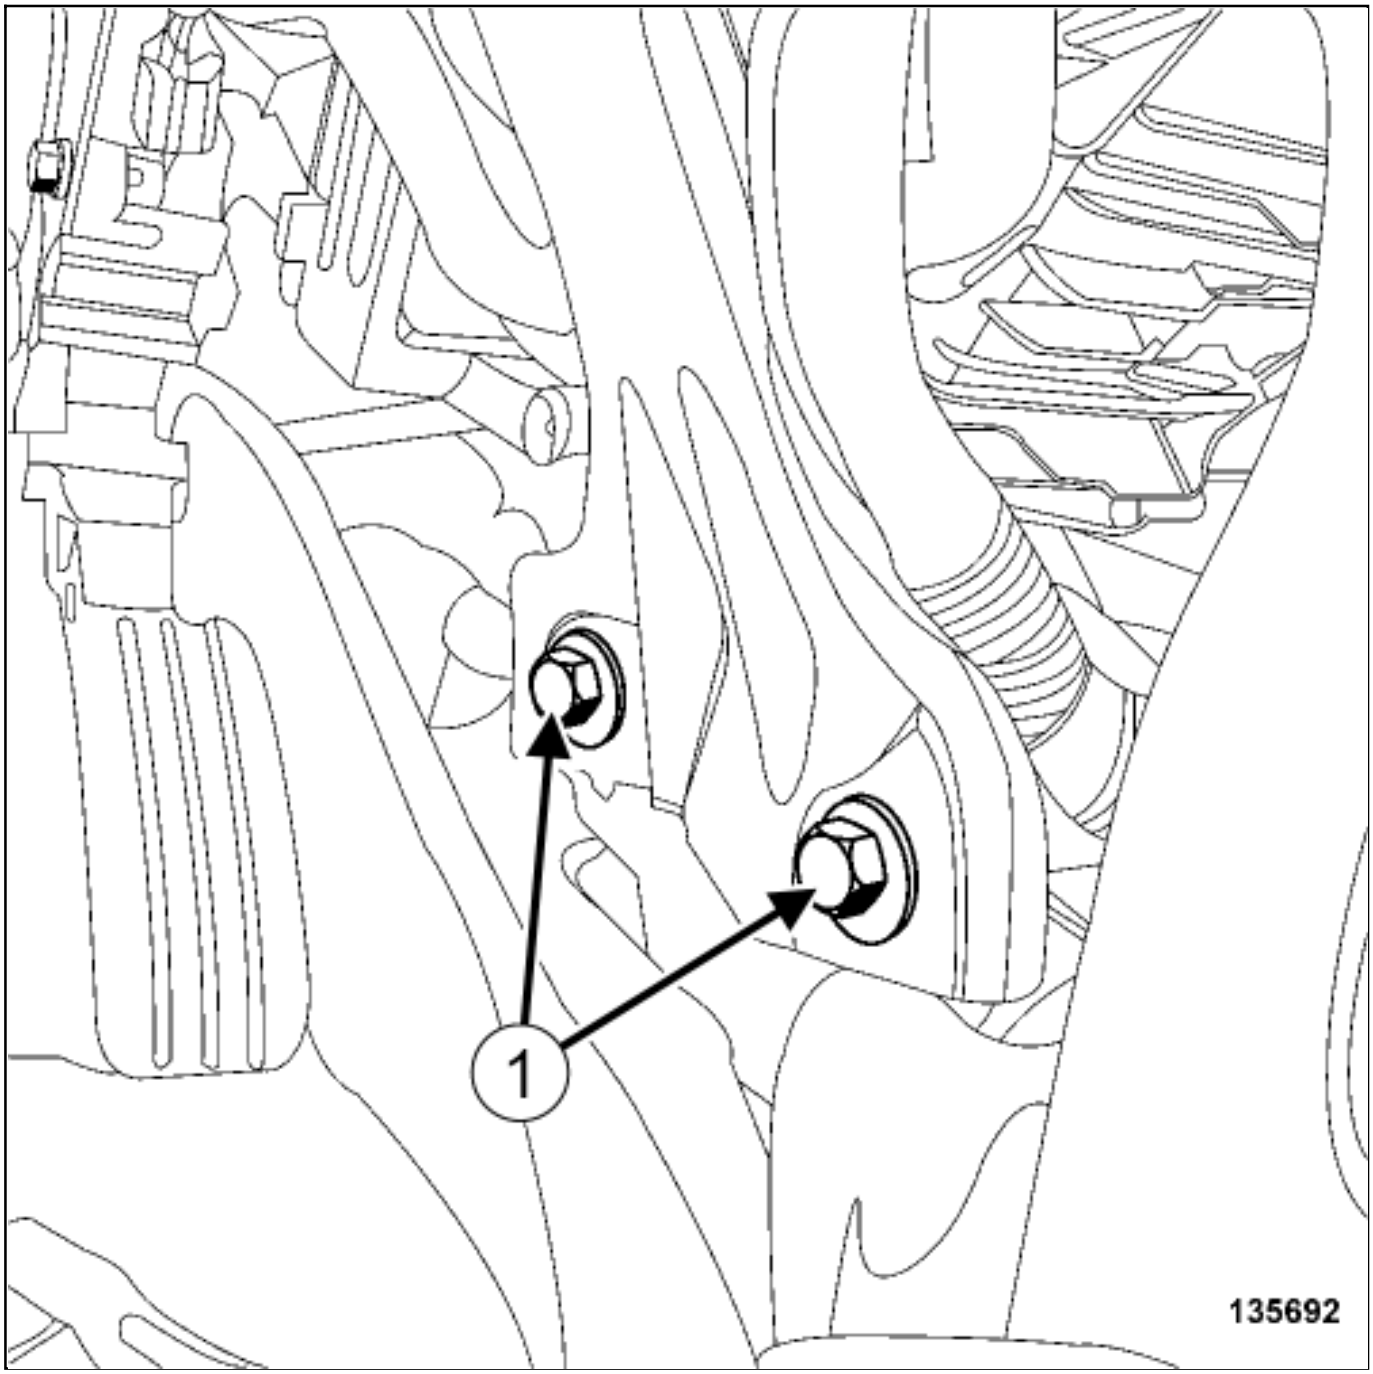
Location and specifications (tightening torques, parts always to be replaced, etc.)(see 37A, Mechanical component controls, Pedal assembly: Exploded view) and(see 37A, Mechanical component controls, Braking control assembly: Exploded view) .

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

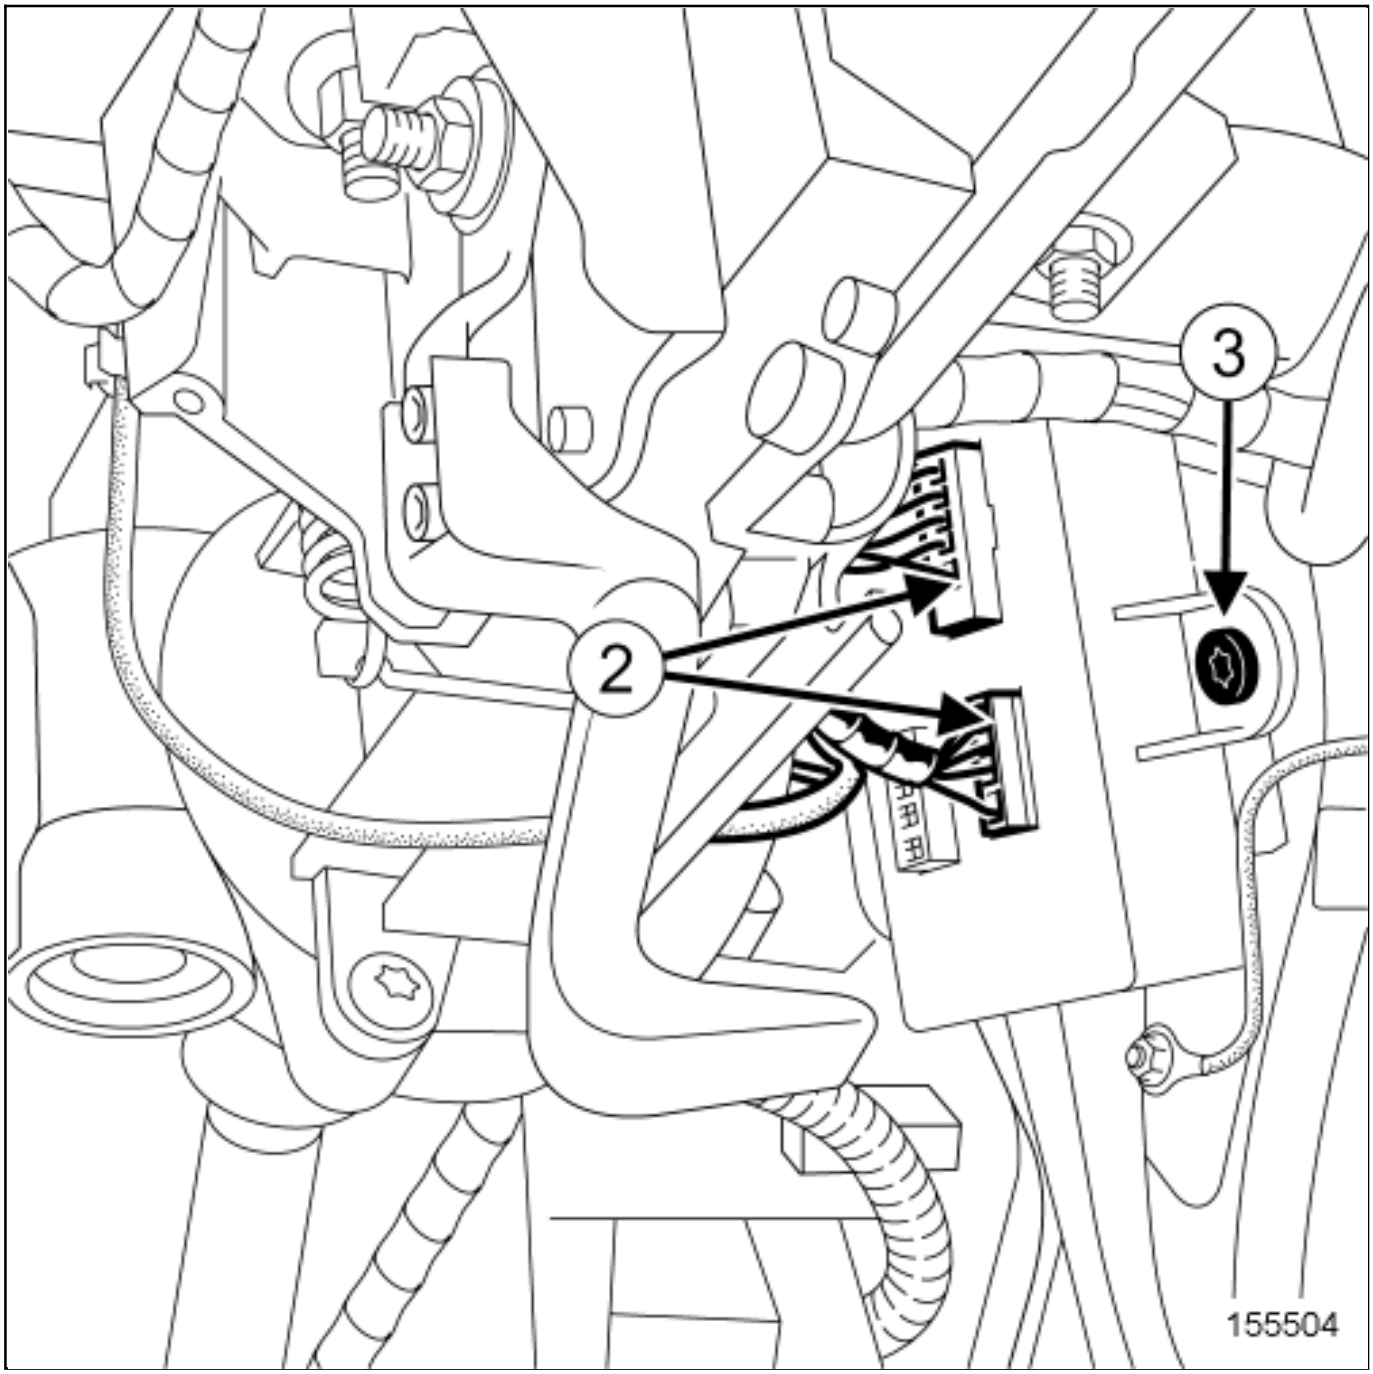
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:



(see 37A, Mechanical component controls, Pedal assembly mechanism: Precautions for the repair)

Vehicle: Precautions for the repair

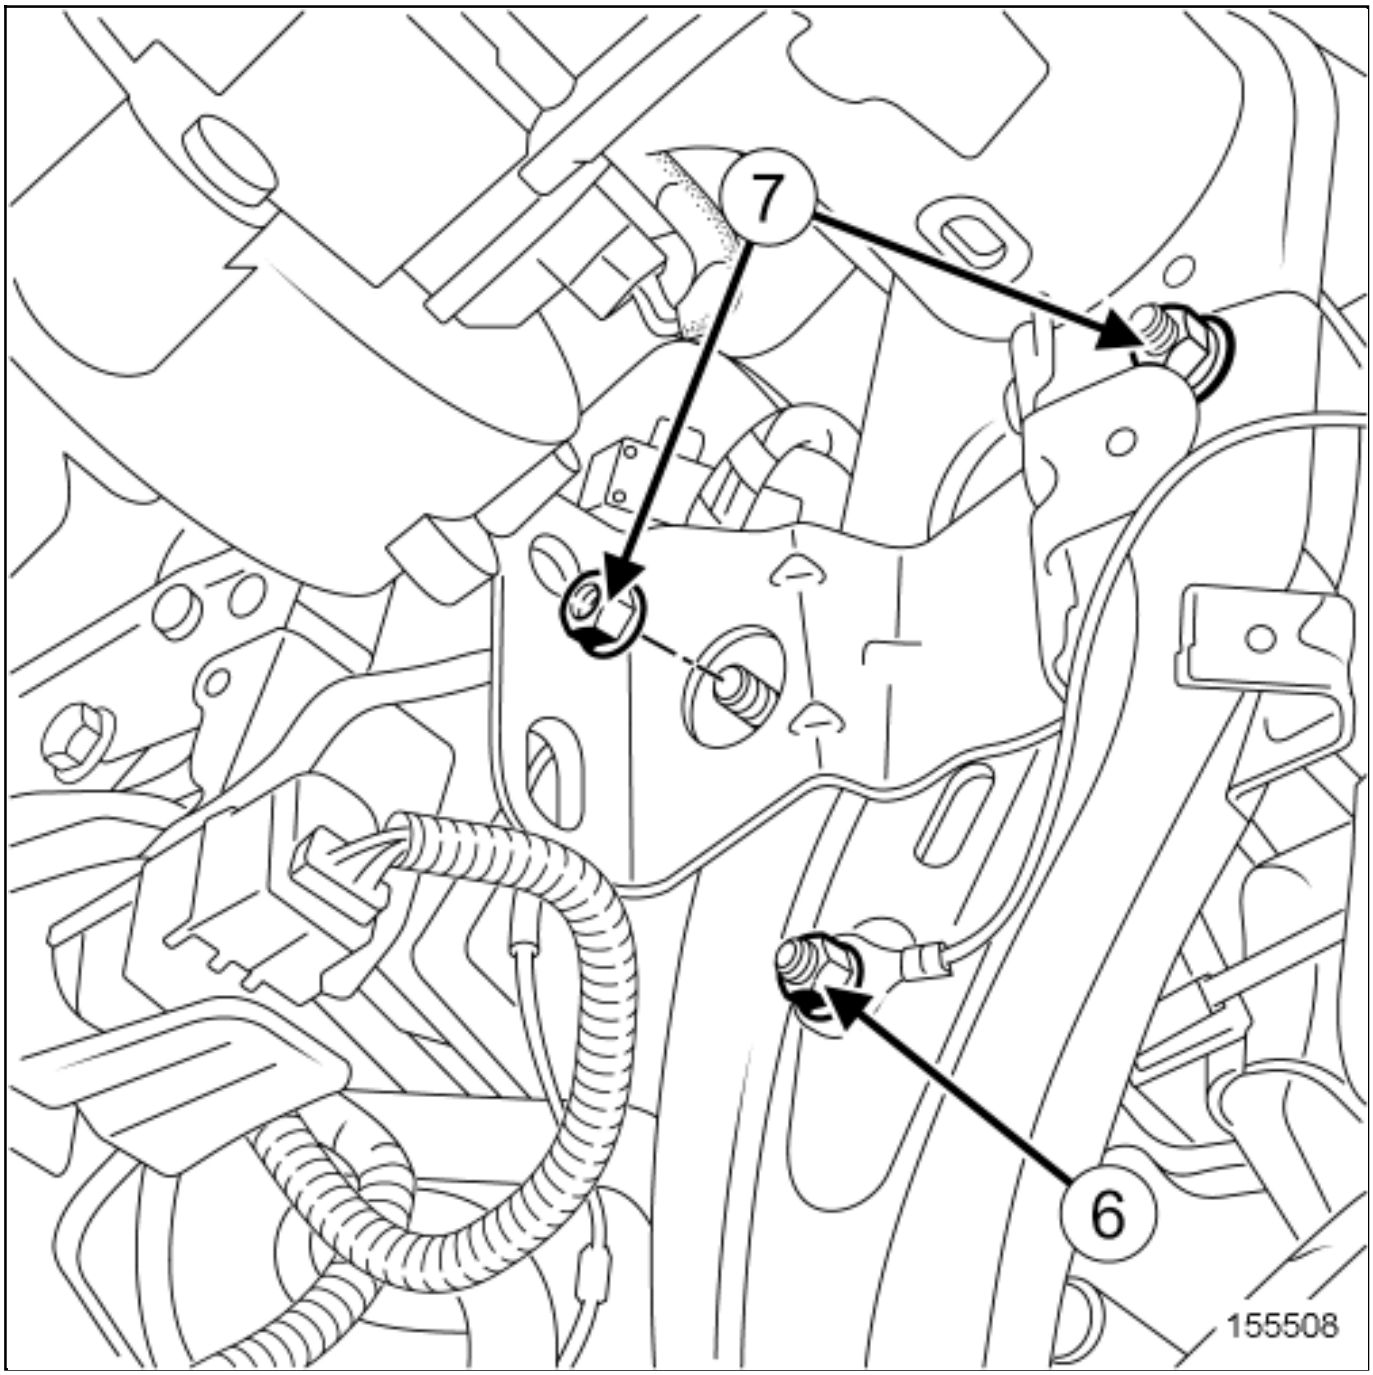


REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the dashboard lower trimDashboard assembly: Exploded view .

Remove the lower bolts(1) from the dashboard cross member reinforcement.

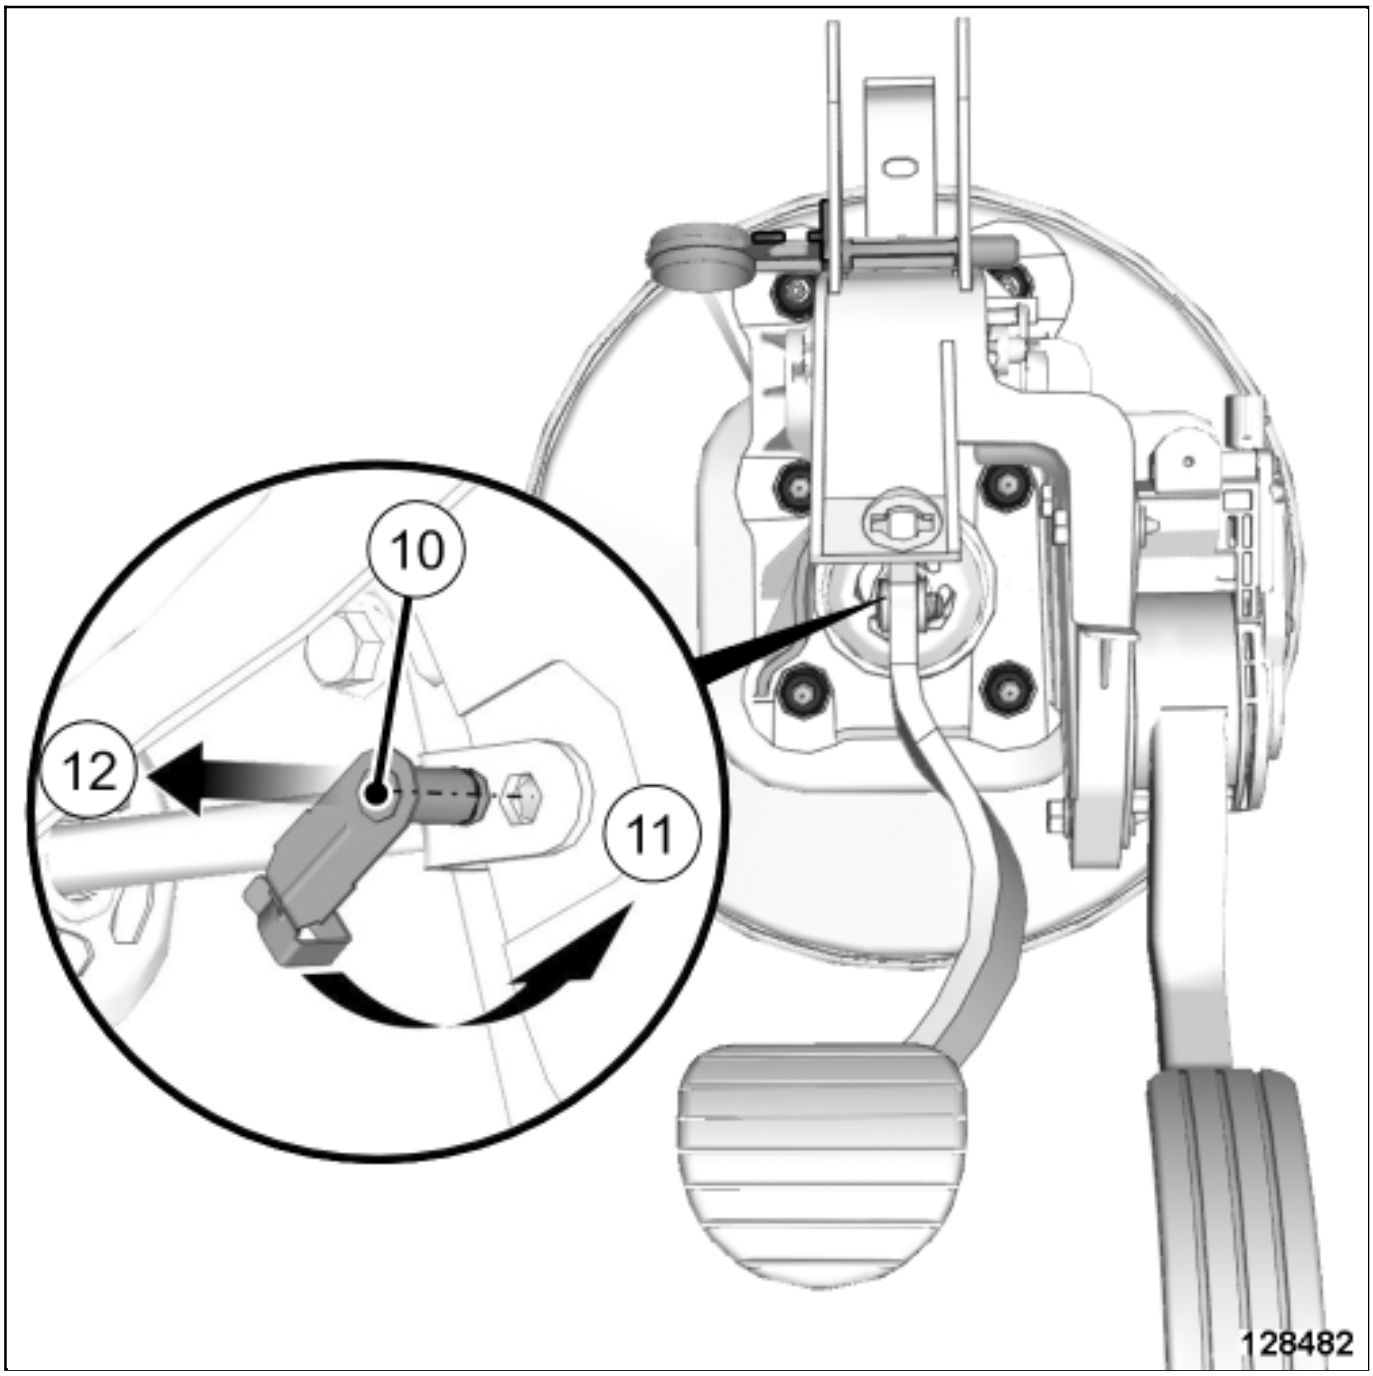


Disconnect the Protection and Switching Unit connectors(2) .

Remove:

- the Protection and Switching Unit screw(3) ,

the Protection and Switching Unit.



Remove:

- the earth nut(6) from the dashboard cross member reinforcement,

- the upper nuts(7) from the dashboard cross member reinforcement,
- the dashboard cross member reinforcement.

- Disconnect the connector from the brake pedal switch.
- Remove the brake pedal switch by turning it a quarter of a turn anti-clockwise.
- Disconnect the accelerator pedal connector.
- Remove the accelerator pedal(see 37A, Mechanical component controls, Pedal assembly: Exploded view)
.

2. REMOVAL OPERATION

Remove the connecting shaft(10) between the brake pedal and the brake servo pushrod:

- unlock the shaft in accordance with(11) ,
- extract the shaft in accordance with(12) .

Remove (see 37A, Mechanical component controls, Pedal assembly: Exploded view) :

- the brake pedal shaft,
- the brake pedal.

REFITTING

1. REFITTING PREPARATION OPERATION

Check the condition of the parts.

Replace any faulty parts.

Coat the shaft with multipurpose grease Vehicle: Parts and consumables for the repair .

2. REFITTING OPERATION

Proceed in the reverse order to removal.

Tighten to torque:

- the dashboard cross member reinforcement upper nuts 21 N.m,
- the dashboard cross member reinforcement lower bolts 21 N.m,
- the earth nut on the dashboard cross member reinforcement 8 N.m.

Adjust the brake pedal switch (see 37A, Mechanical component controls, Pedal switches: Adjustment) .

XSL version : 3.02 du 22/07/11

BRAKES SPECIFICATIONS

Front brakes (mm)		
Disc diameter	258	
Disc thickness	22	
Minimum disc thickness (1)	19,8	
Piston diameter	48	
Maximum disc run-out	0.6	
Brake lining thickness (including backplate)	18,2	
Minimum brake pad thickness (including backplate)	8	
Rear brakes (mm)		
Slave cylinder diameter	17,5	19
Drum diameter	203.2	227.6
Maximum diameter of drum wear	204.45	229.5
Drum pad thickness	4.75	4.85
Minimum drum lining thickness	1.5	

(1) Brake discs cannot be reworked. If they are excessively worn or scratched they must be replaced.

XSL version : 3.02 du 22/07/11

BRAKING CIRCUIT: BLEED

Note, one or more warnings are present in this procedure

Equipment required
brake circuit bleeding device
pedal press

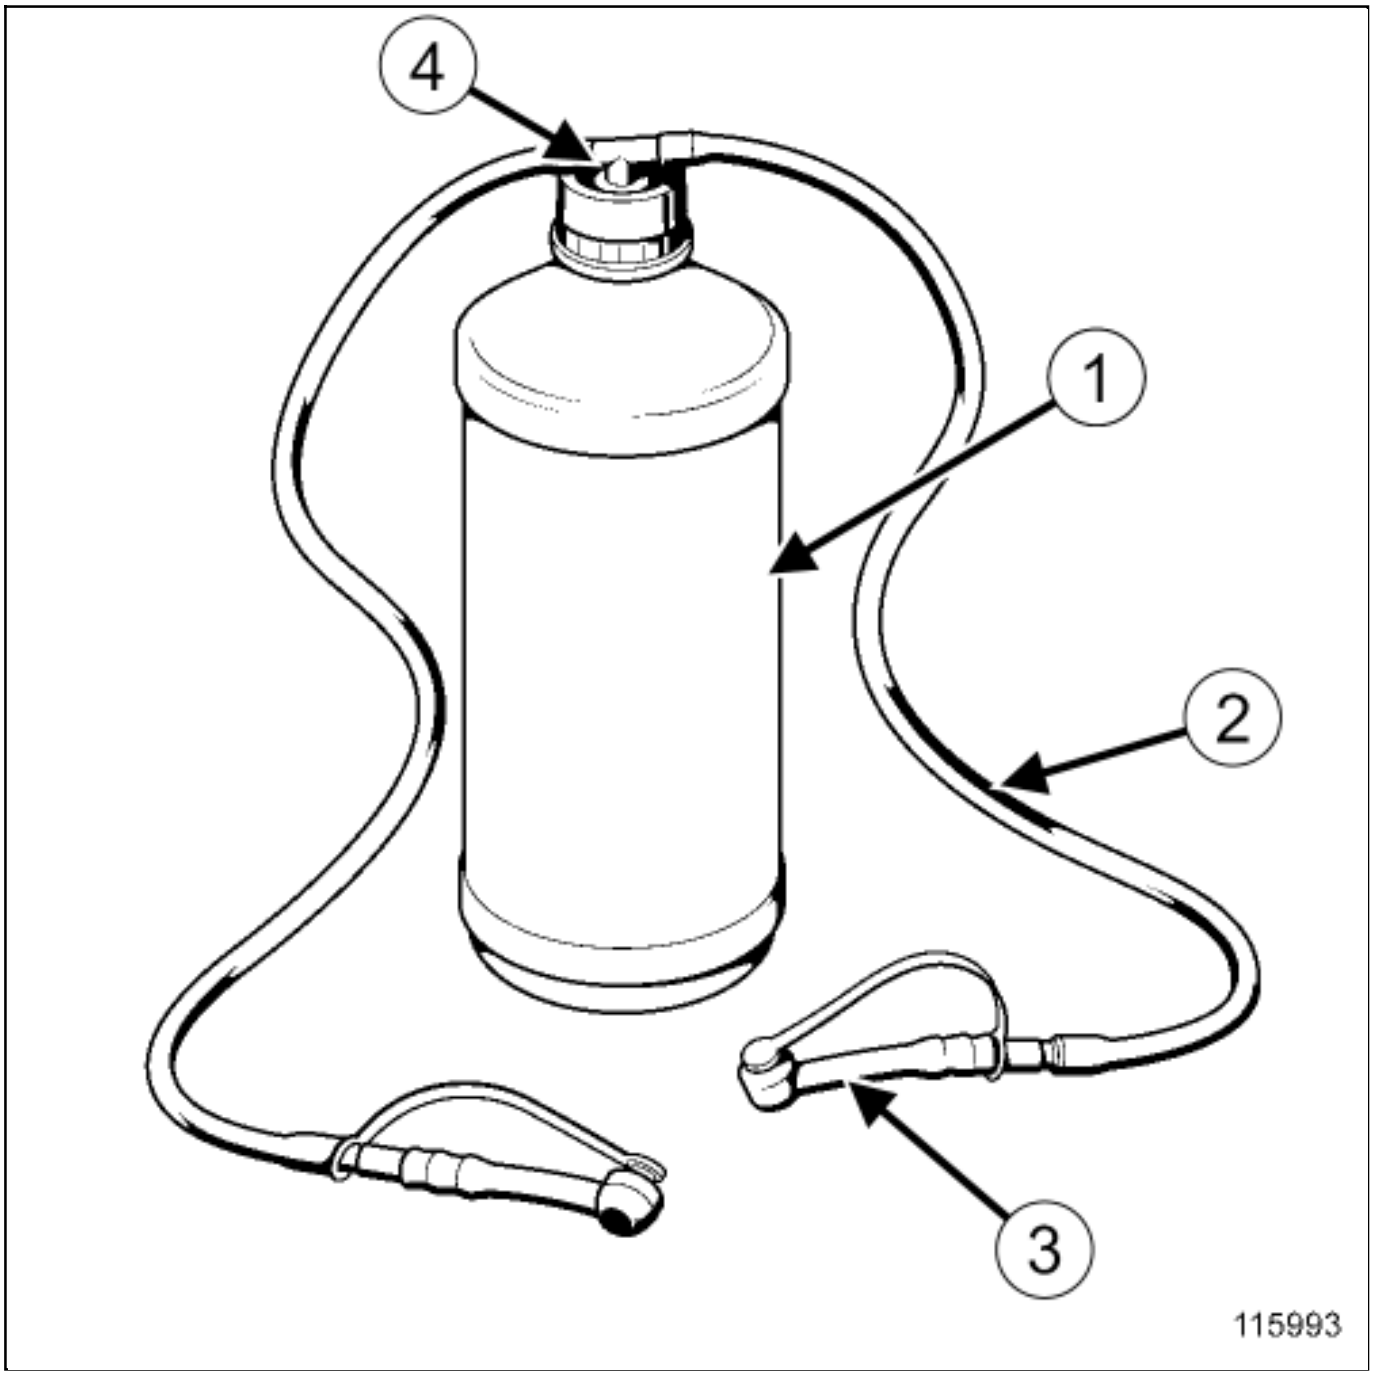
WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see 30A, General information, Brake circuit: Precautions for the repair) .

CAUTION

To avoid residual air being present in the brake circuit, the parking brake must be released before starting the bleeding process.

This procedure must be applied after one of the following components has been removed or replaced:



- the master cylinder,
- the brake fluid,
- the hydraulic unit,
- a rigid pipe,
- a hose,
- the reservoir,
- a calliper.

CAUTION

Switch off the vehicle ignition so as not to activate the hydraulic unit solenoid valves when bleeding the brake circuit.

CAUTION

The level must be between the "MIN" and "MAX" markings on the reservoir.

Use locally produced containers to collect the used brake fluid.

Front and rear callipers:

- 2 washer fluid containers(1) (1 litre),
- 4 mm diameter transparent pipes(2) ,
- 4 pipettes(3) ,
- 2 T-unions(4) .

Note:

The new hydraulic unit is pre-filled.

When working on one of the following components, position a pedal press to limit the outflow of brake fluid and prevent any air from entering the master cylinder and the circuits downstream of the master cylinder:

- hydraulic unit,
- pipes between the hydraulic unit and brake callipers,
- brake hoses,
- brake calliper.

Remove the pedal press before carrying out the braking system bleeding procedure.

Position the vehicle on a two-post lift(see **Vehicle: Towing and lifting**) .

Switch off the vehicle ignition.

Connect the brake circuit bleeding device(after having received Renault approval) to the master cylinder reservoir (see the instructions for the equipment).

Pressurise the brake circuit.

Adjust the pressure to between 1.5 bar< P < 2 barfor 3 minutesto stabilise it in the braking circuit.

Close the circuit between the bleed screw and brake fluid reservoir without dumping the pressure.

Note:

The circuit between the bleed screw and brake fluid reservoir is closed in different ways depending on the type of equipment used:

- valve,
- switch.

Fit the bleed containers to the six bleed screws of the callipers.

Note:

Some callipers are equipped with several bleed screws. In this case, turn the bolts one after another to perform the brake circuit bleed.

Undo the calliper bleed screws:

- front left-hand,
- front right-hand,
- rear left-hand,

rear right-hand.

Open the circuit between the bleed screw and brake fluid reservoir and allow the liquid to run until all the air bubbles have been released.

Tighten the bleed screws in the following order:

- front left-hand,
- front right-hand,
- rear left-hand,
- rear right-hand.

Undo the calliper bleed screw:

- front left-hand,
- allow the fluid to run until all the air bubbles have been released,
- tighten the bleed screw on the calliper.

Carry out the previous operation on the callipers:

- front right-hand,
- rear left-hand,
- rear right-hand.

Close the bleed screw to dump the pressure in the brake circuit.

Remove the brake circuit bleeding devicefrom the master cylinder reservoir.

Check pedal travel and resistance. If it is not correct, finish bleeding the brake circuit with the help of a second operator. Start the bleed operation by bleeding the calliper that is the furthest away from the master cylinder:

- hold down the brake pedal,
- open the circuit bleed screw to release the air from the brake circuit,
- close the circuit bleed screw,
- release the brake pedal.

Top up the brake fluid level in the reservoir, if necessary. Check the sealing of the front and rear bleed screws and ensure that the sealing covers are in place(see **Front brake calliper assembly: Exploded view**) and (see **Rear drum brake assembly**) **.**

During a road test, trigger braking regulation to confirm that the brake pedal travel is correct.

Clean off any traces of brake fluid on the vehicle using brake cleaning product(see **Vehicle: Parts and consumables for the repair**) **.**

1. BLEEDING THE BRAKING ASSISTANCE CIRCUIT

BRAKING CIRCUIT: BLEED

Note, one or more warnings are present in this procedure

Equipment required
brake circuit bleeding device
Diagnostic tool
pedal press

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see 30A, General information, Brake circuit: Precautions for the repair) .

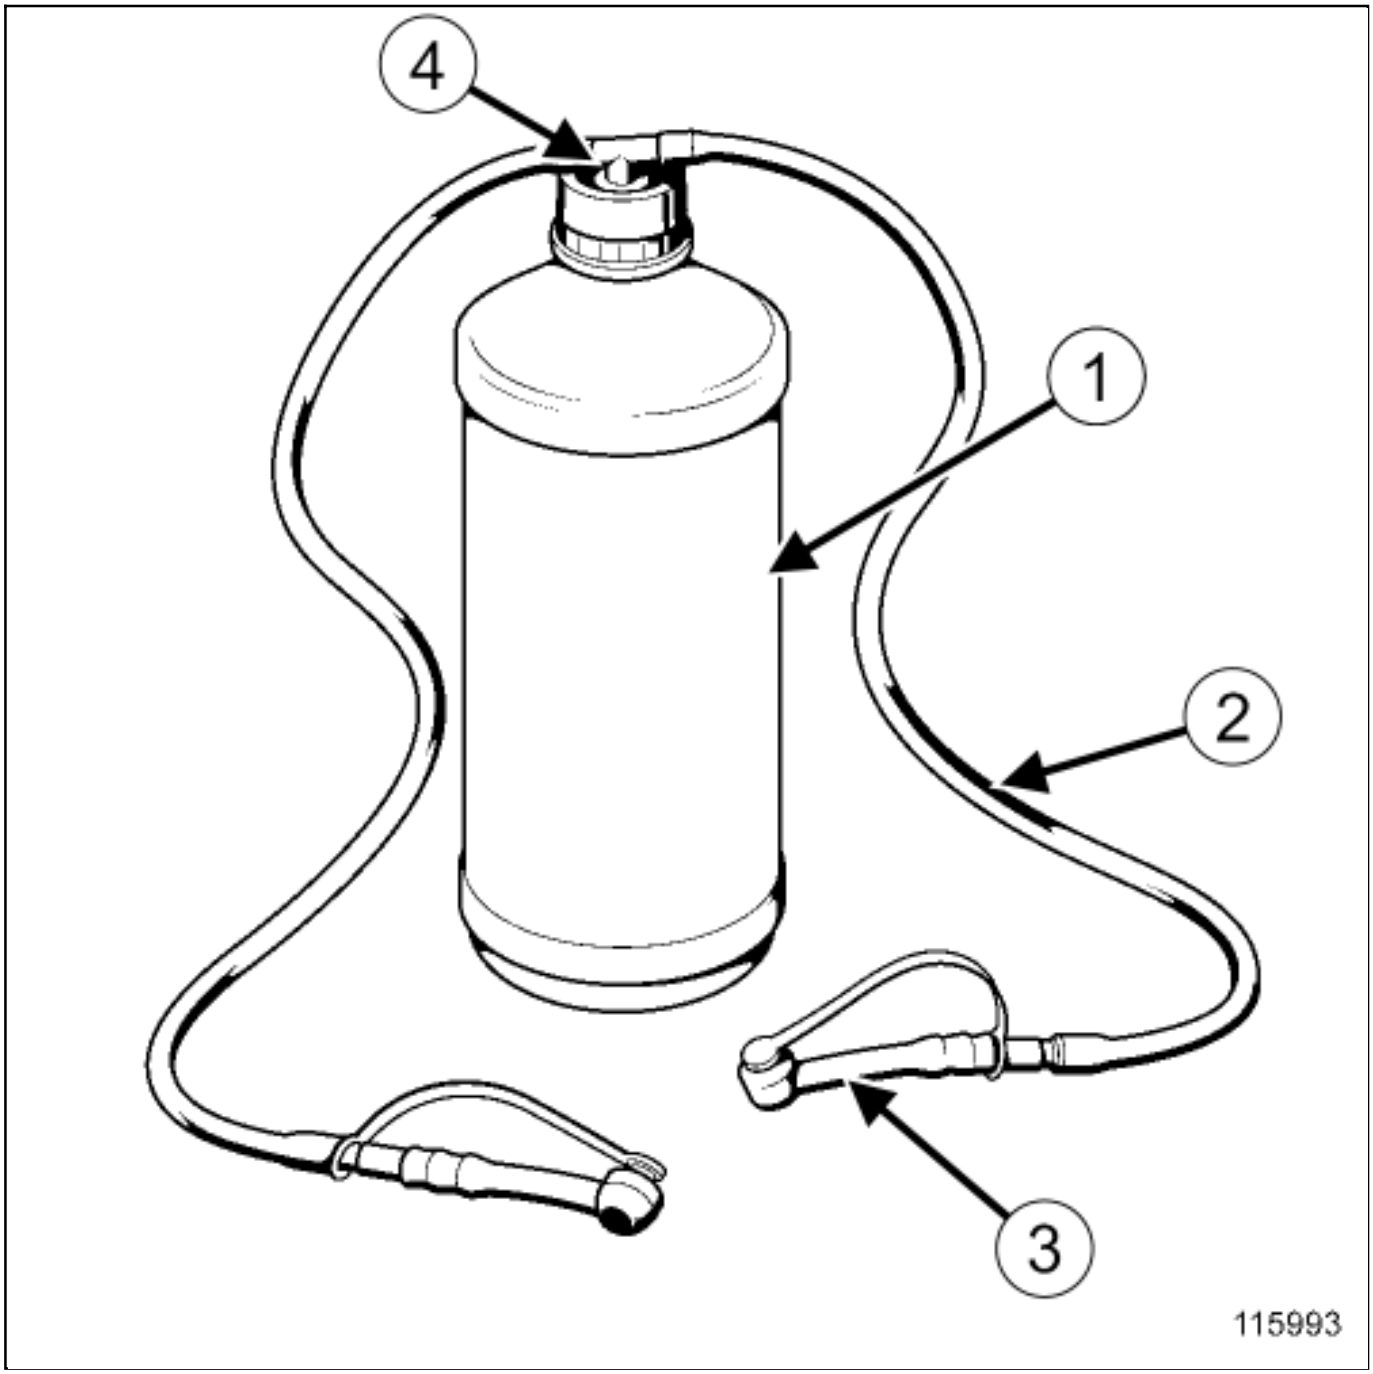
CAUTION

To avoid residual air being present in the brake circuit, the parking brake must be released before starting the bleeding process.

This procedure must be applied after one of the following components has been removed or replaced:

- the master cylinder,
- the brake fluid,
- the hydraulic unit,
- a rigid pipe,
- a hose,

- the reservoir,
- a calliper.



CAUTION

Switch off the vehicle ignition so as not to activate the hydraulic unit solenoid valves when bleeding the brake circuit.

CAUTION

The level must be between the "MIN" and "MAX" markings on the reservoir.

Use locally produced containers to collect the used brake fluid.

Front and rear callipers:

- 2 washer fluid containers(1) (1 litre),
- 4 mmdiameter transparent pipes(2) ,

- 4 pipettes(3) ,
- 2 T-unions(4) .

Note:

The new hydraulic unit is pre-filled.

When working on one of the following components, position a pedal pressto limit the outflow of brake fluid and prevent any air from entering the master cylinder and the circuits downstream of the master cylinder:

- hydraulic unit,
- pipes between the hydraulic unit and brake callipers,
- brake hoses,
- brake calliper.

Remove the pedal pressbefore carrying out the braking system bleeding procedure.

Position the vehicle on a two-post lift**Vehicle: Towing and lifting** .

Switch off the vehicle ignition.

Connect the brake circuit bleeding device(after having received Renault approval) to the master cylinder reservoir (see the instructions for the equipment).

Pressurise the brake circuit.

Adjust the pressure to between 1.5 bar< P < 2 barfor 3 minutesto stabilise it in the braking circuit.

Close the circuit between the bleed screw and brake fluid reservoir without dumping the pressure.

Note:

The circuit between the bleed screw and brake fluid reservoir is closed in different ways depending on the type of equipment used:

- valve,
- switch.

Fit the bleed containers to the six bleed screws of the callipers.

Note:

Some callipers are equipped with several bleed screws. In this case, turn the bolts one after another to perform the brake circuit bleed.

Undo the calliper bleed screws:

- front left-hand,
- front right-hand,
- rear left-hand,
- rear right-hand.

Open the circuit between the bleed screw and brake fluid reservoir and allow the liquid to run until all the air bubbles have been released.

Tighten the bleed screws in the following order:

- front left-hand,
- front right-hand,
- rear left-hand,
- rear right-hand.

Undo the calliper bleed screw:

- front left-hand,
- allow the fluid to run until all the air bubbles have been released,
- tighten the bleed screw on the calliper.

Carry out the previous operation on the callipers:

- front right-hand,
- rear left-hand,
- rear right-hand.

Close the bleed screw to dump the pressure in the brake circuit.

Remove the brake circuit bleeding devicefrom the master cylinder reservoir.

Check pedal travel and resistance. If it is not correct, finish bleeding the brake circuit with the help of a second operator. Start the bleed operation by bleeding the calliper that is the furthest away from the master cylinder:

- hold down the brake pedal,

- open the circuit bleed screw to release the air from the brake circuit,
- close the circuit bleed screw,
- release the brake pedal.

Top up the brake fluid level in the reservoir, if necessary. Check the sealing of the front and rear bleed screws and ensure that the sealing covers are in place **Front brake calliper assembly: Exploded view** and **Rear drum brake assembly : Exploded view** .

During a road test, trigger braking regulation to confirm that the brake pedal travel is correct.

Clean off any traces of brake fluid on the vehicle using brake cleaning product **Vehicle: Parts and consumables for the repair** .

1. BLEEDING THE BRAKING ASSISTANCE CIRCUIT

CABIN FILTER: REMOVAL - REFITTING

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Note:

There are 2 possibilities:

- the passenger compartment filter flap is bolted onto the air distribution unit,

- the passenger compartment filter flap is clipped onto the air distribution unit.

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Remove the gloveboxDashboard assembly: Exploded view .

2. REMOVAL OPERATION

- Remove the cabin filter access flap bolts(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view)

-

Unclip the cabin filter access flap(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

Note:

Foreign bodies (leaves, insects, etc.) are likely to accumulate in the cabin filter.
Remove the filter with care so as to prevent foreign bodies getting into the evaporator.

-

Mark the cabin filter fitting direction.

-

Remove the cabin filter(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Check there are no foreign bodies in the passenger compartment filter housing and clean thoroughly if necessary.

2. REFITTING OPERATION

Refit (see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) :

- the cabin filter in accordance with the mark,
- the cabin filter access flap.

Proceed in the reverse order to removal.

CAMSHAFTDEPHASER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support
compressed air nozzle

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts to always be replaced, etc.) (see 11A, Top and front of engine, Timing assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly(see 10A, Engine and cylinder block assembly, Engine - gearbox assembly: Removal - Refitting) .

Separate the automatic gearbox from the engine(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

Position the engine on the component supportEngine support equipment: Use .

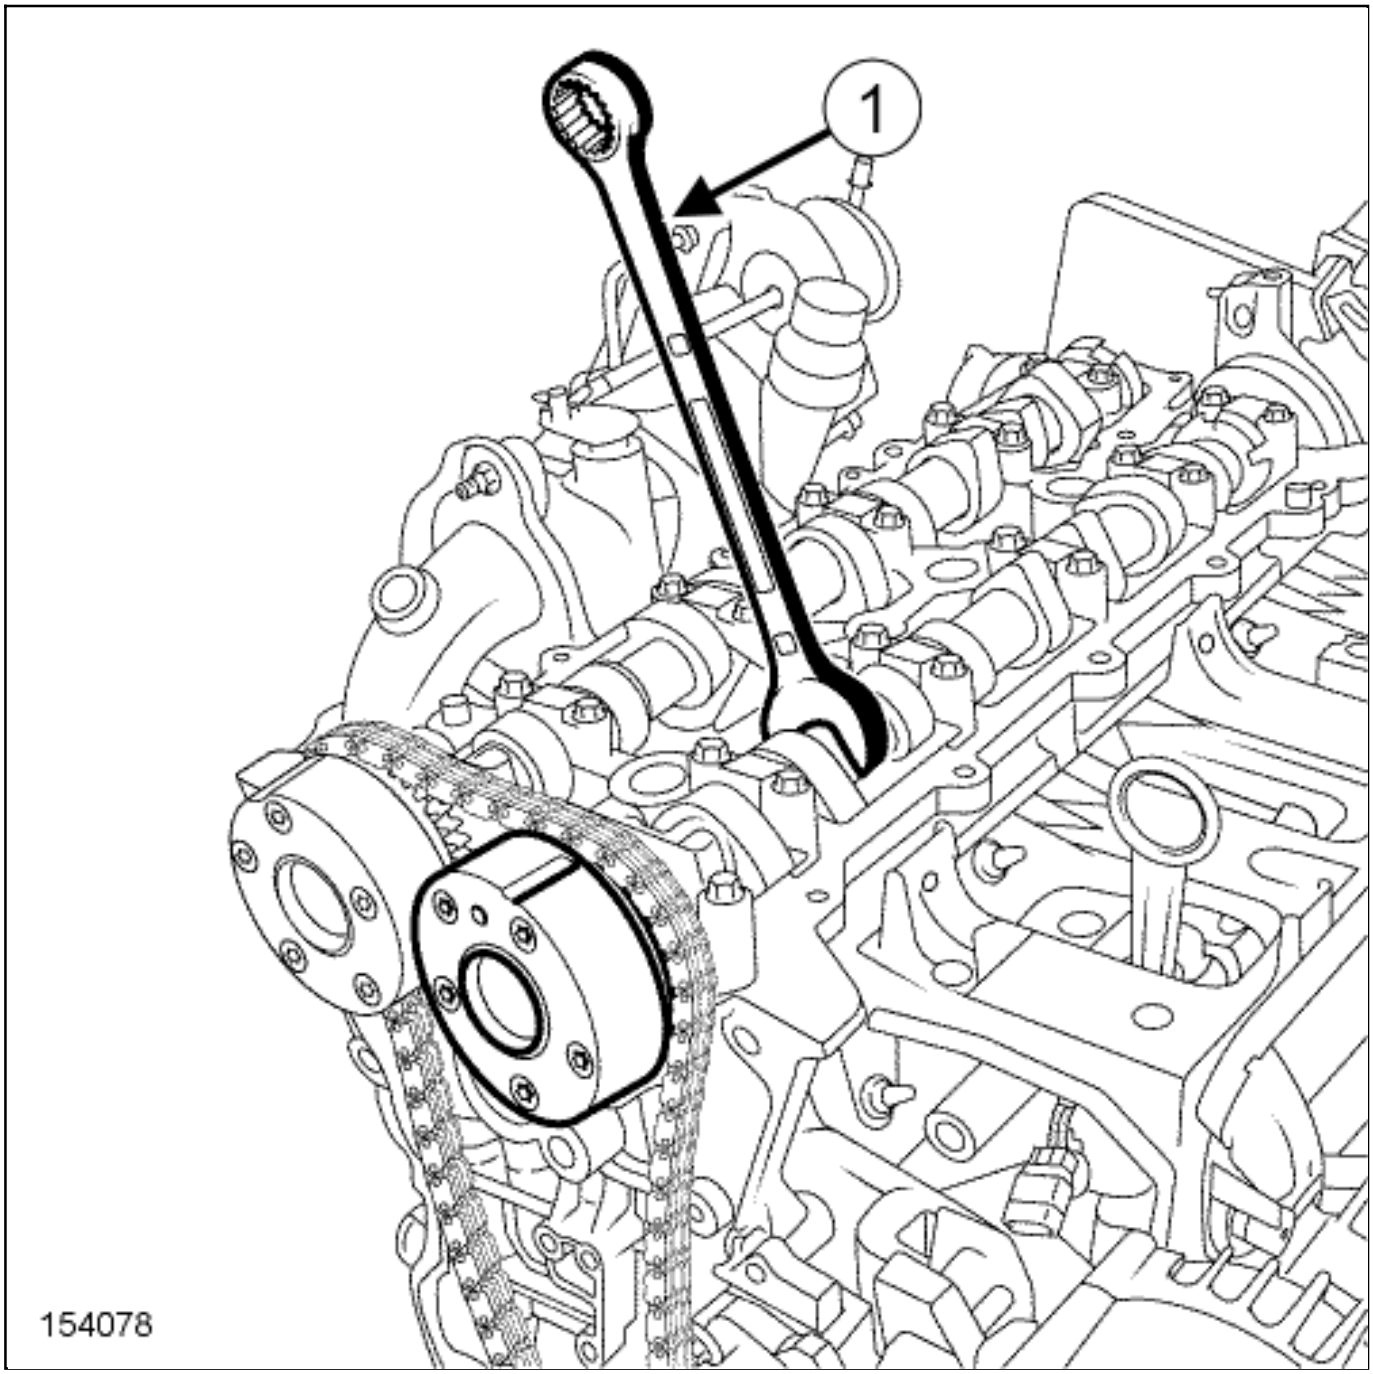
Drain the engine(see 10A, Engine and cylinder block assembly, Engine oil - Oil filter : Draining - Filling) .

Remove:

- the accessories belt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,

- the crankshaft accessories pulley (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the crankshaft seal on timing end (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the timing chain (see 11A, Top and front of engine, Timing assembly: Exploded view) .

2. REMOVAL OPERATION



1- REMOVING THE INLET CAMSHAFT DEPHASER

Note:

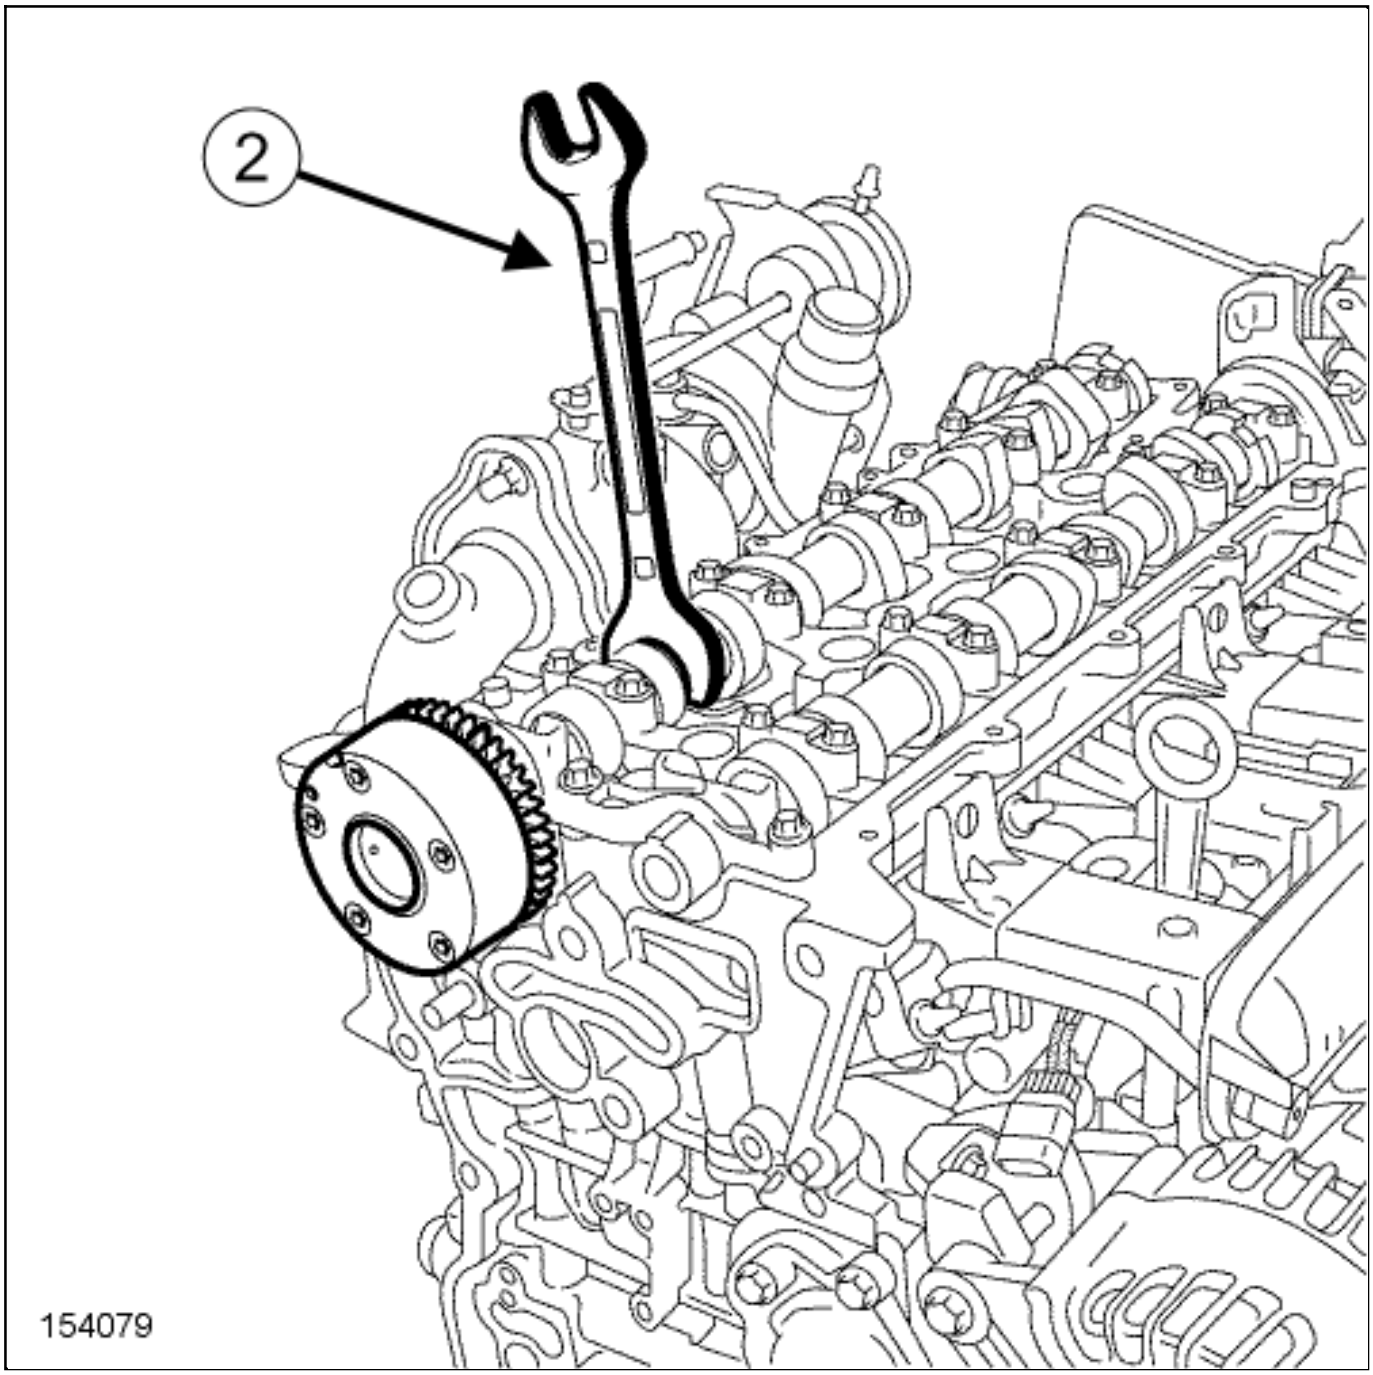
This operation requires two people.

WARNING

Wear protective gloves during the operation.

Remove:

- the inlet camshaft dephaser bolt (see 11A, Top and front of engine, Timing assembly: Exploded view) while holding the inlet camshaft in place using an open-jawed spanner (1),
- the inlet camshaft dephaser (see 11A, Top and front of engine, Timing assembly: Exploded view).



2- REMOVING THE EXHAUST CAMSHAFT DEPHASER

Note:

This operation requires two people.

WARNING

Wear protective gloves during the operation.

Remove:

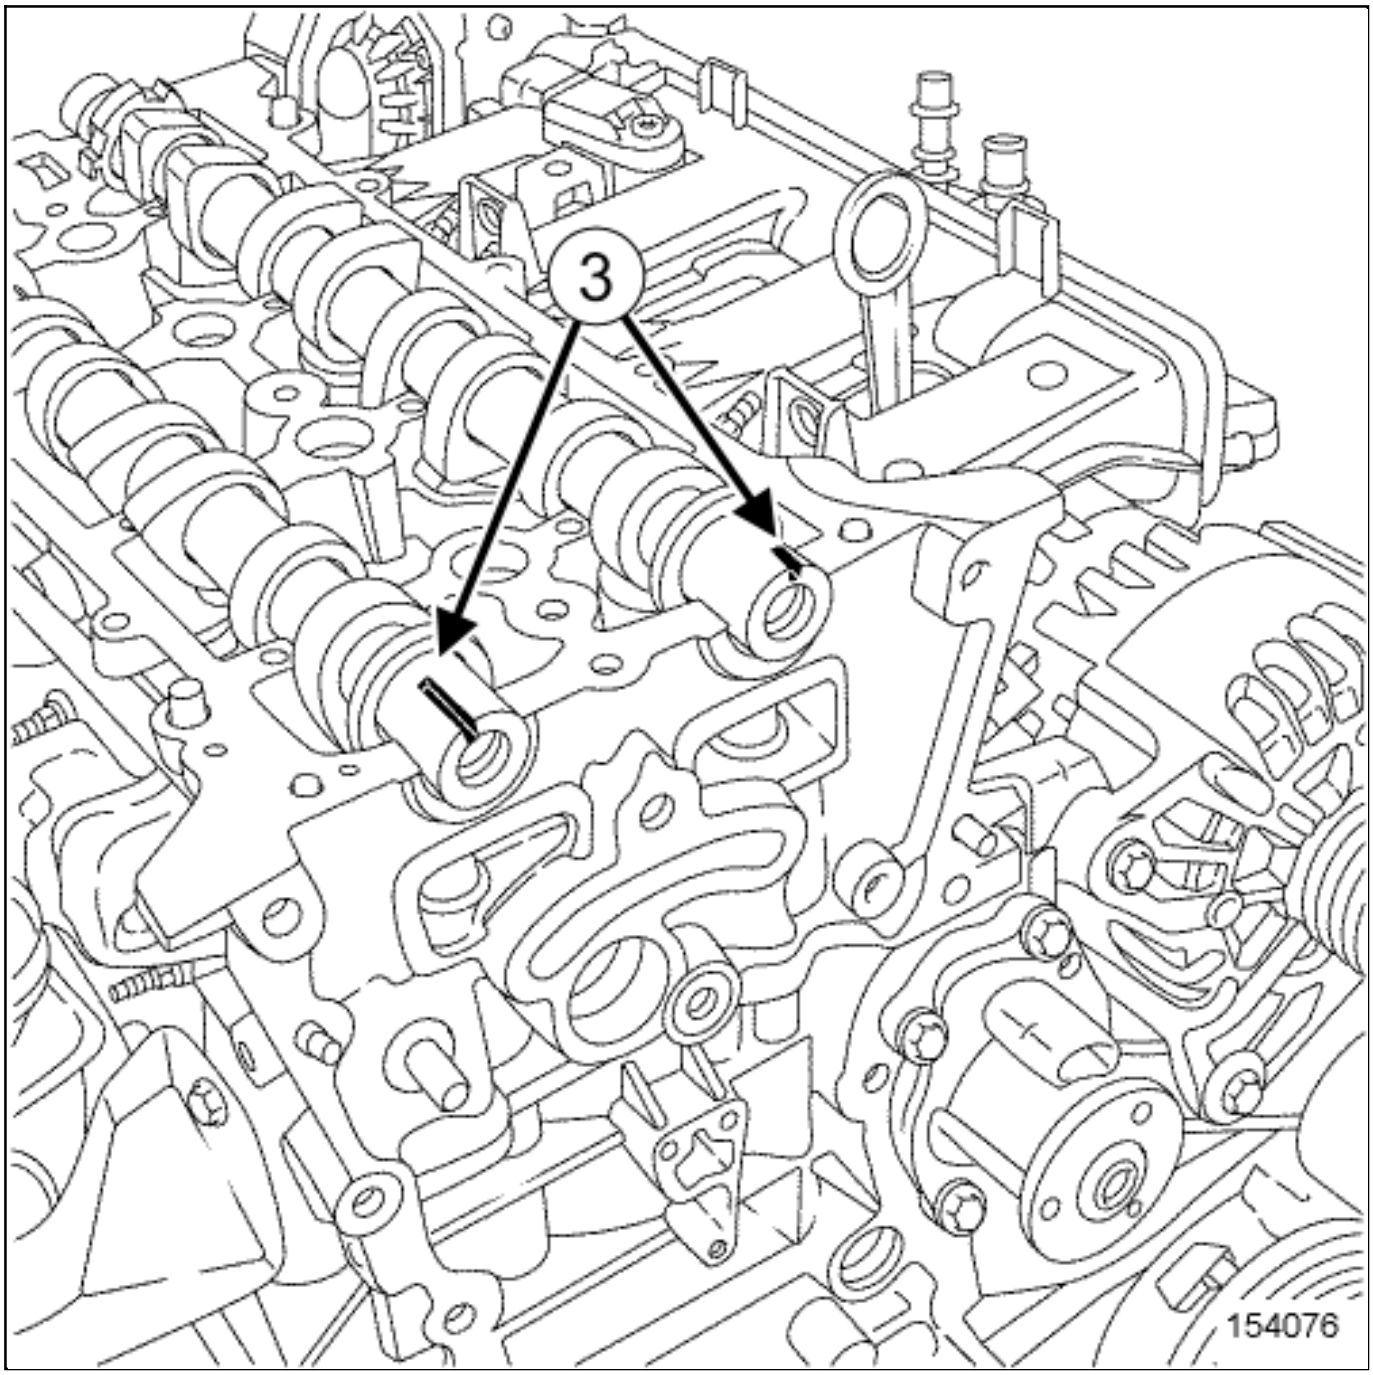
- the exhaust camshaft timing sprocket bolt (see 11A, Top and front of engine, Timing assembly: Exploded view) while holding the exhaust camshaft in place using an open-jawed spanner(2) ,
- the exhaust camshaft timing sprocket (see 11A, Top and front of engine, Timing assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the camshaft dephaser using surface cleaner Vehicle: Parts and consumables for the repair .

WARNING

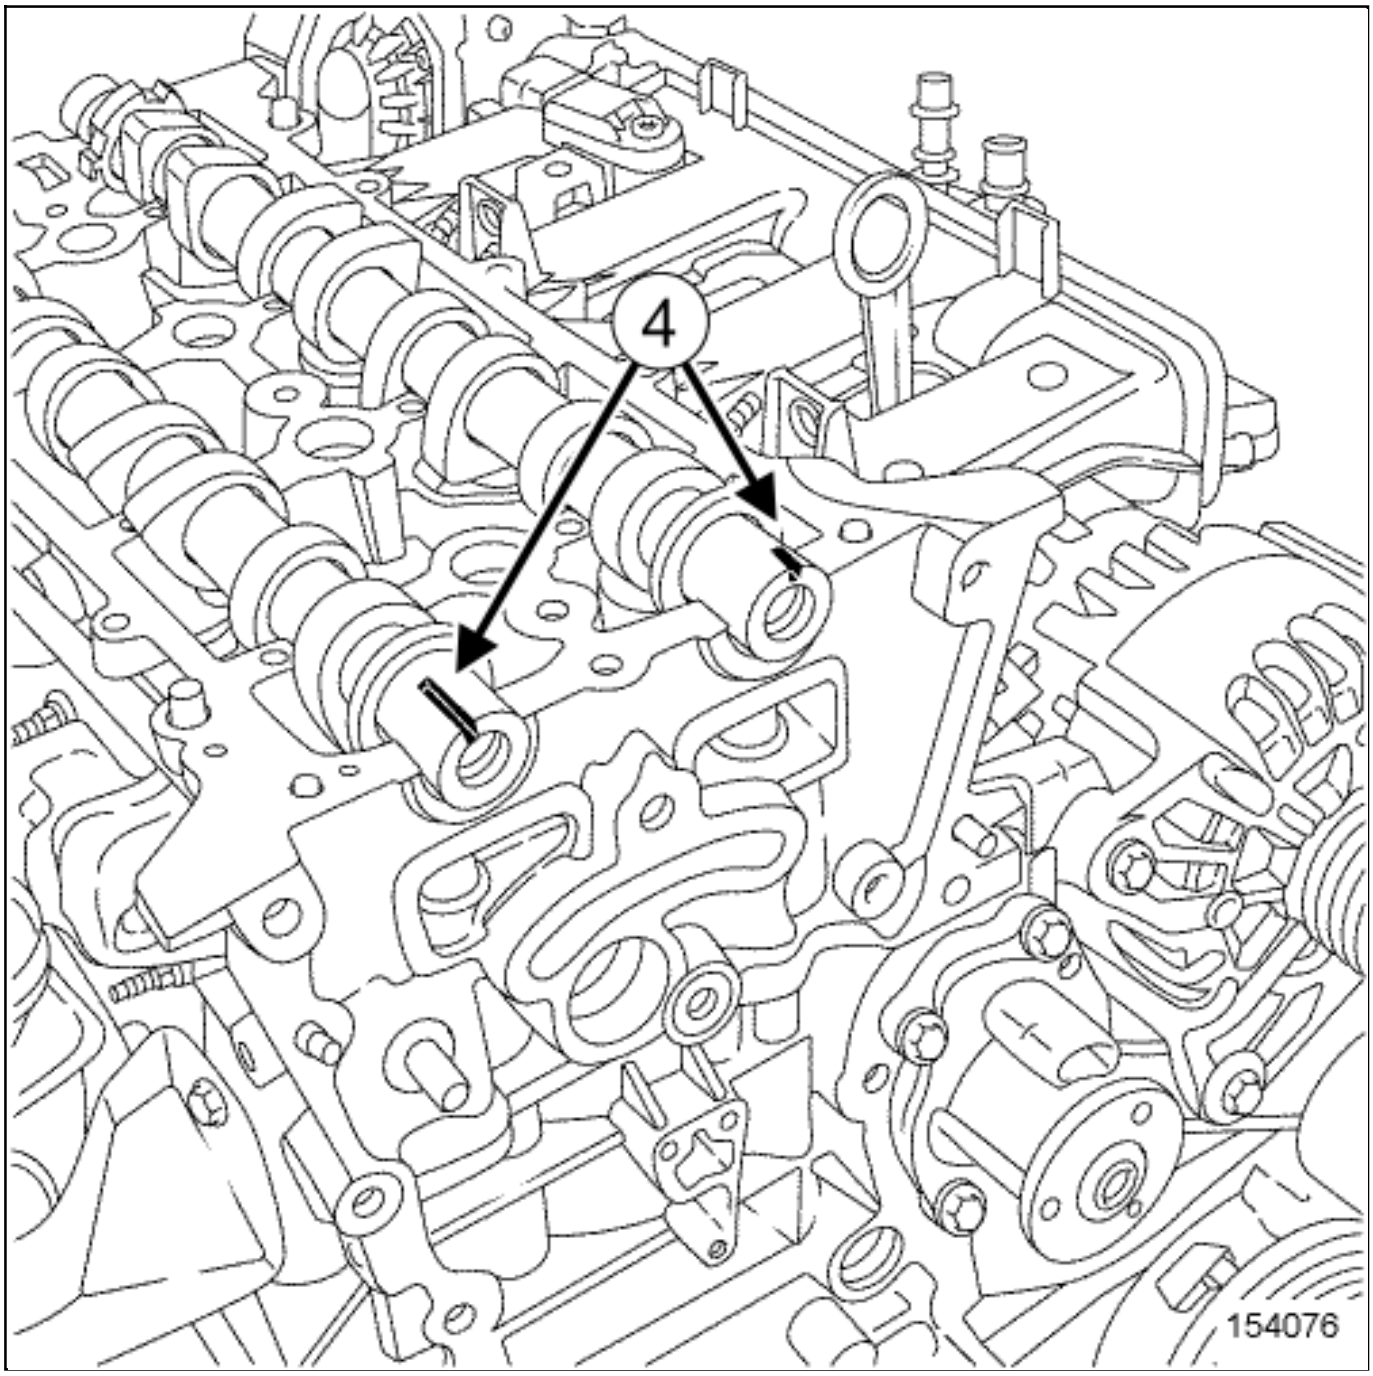


Wear goggles with side protectors for this operation.

Dry the camshaft dephaser using a compressed air nozzle.

Check that the teeth of the camshaft dephaser are not broken, chipped or scratched.

2. REFITTING OPERATION



1- REFITTING THE INLET CAMSHAFT DEPHASER

Check that the camshaft lugs(3) are in the same position as shown in the illustration.

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the inlet camshat timing sprocket,
- the inlet camshaft timing sprocket bolt.

Check that the camshaft lugs(4) are in the same position as shown in the illustration.

Fit the exhaust camshaft timing sprocket by placing the exhaust camshaft pin in the opening of the exhaust camshaft timing sprocket.

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the exhaust camshat timing sprocket,
- the exhaust camshaft timing sprocket bolt.

3. FINAL OPERATION

Proceed in the reverse order to removal.

CAMSHAFTDEPHASER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support
compressed air nozzle

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

Locations and specifications (tightening torques, parts to always be replaced, etc.) (see 11A, Top and front of engine, Timing assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly Engine - gearbox assembly: Removal - Refitting .

Separate the automatic gearbox from the engine Automatic gearbox: Removal - Refitting .

Position the engine on the component support Engine support equipment: Use .

Drain the engine Engine oil - Oil filter : Draining - Filling .

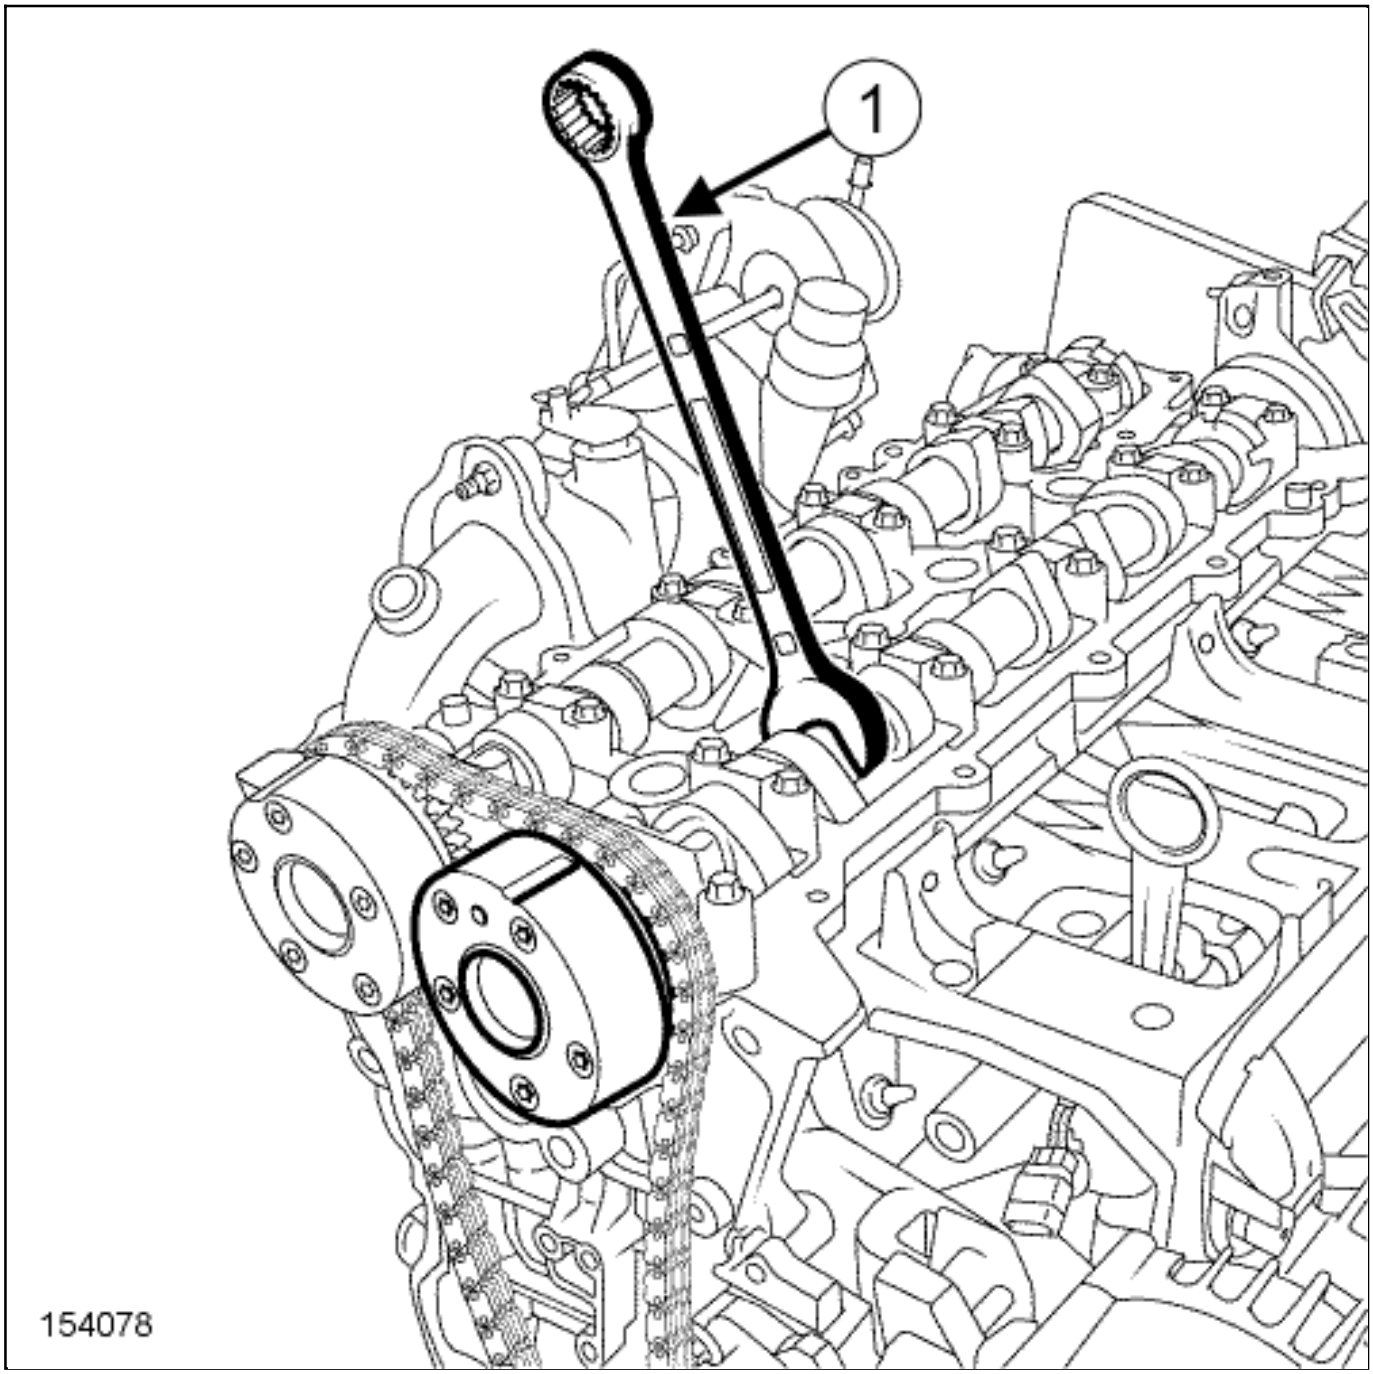
Remove:

- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the crankshaft accessories pulley (see 11A, Top and front of engine, Engine accessories assembly:

Exploded view) ,

- the crankshaft seal on timing end (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the timing chain (see 11A, Top and front of engine, Timing assembly: Exploded view) .

2. REMOVAL OPERATION



1- REMOVING THE INLET CAMSHAFT DEPHASER

Note:

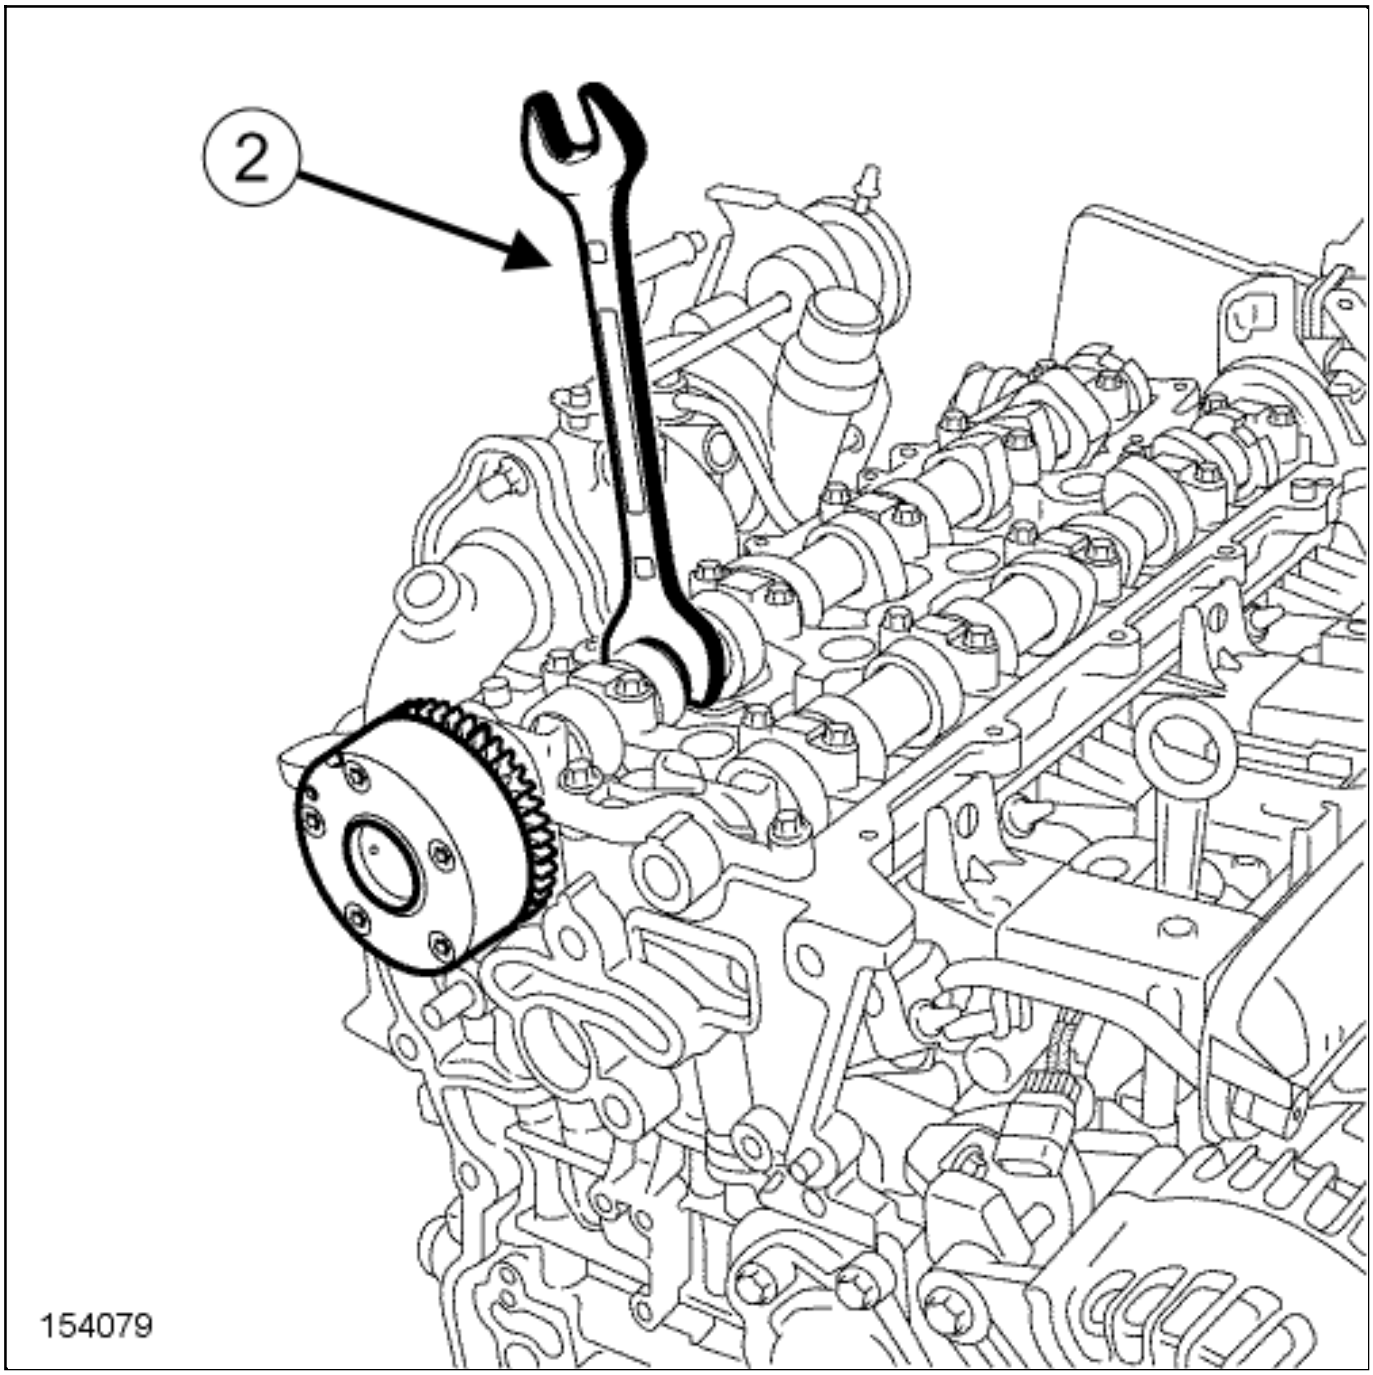
This operation requires two people.

WARNING

Wear protective gloves during the operation.

Remove:

- the inlet camshaft dephaser bolt (see 11A, Top and front of engine, Timing assembly: Exploded view) while holding the inlet camshaft in place using an open-jawed spanner (1),
- the inlet camshaft dephaser (see 11A, Top and front of engine, Timing assembly: Exploded view).



2- REMOVING THE EXHAUST CAMSHAFT DEPHASER

Note:

This operation requires two people.

WARNING

Wear protective gloves during the operation.

Remove:

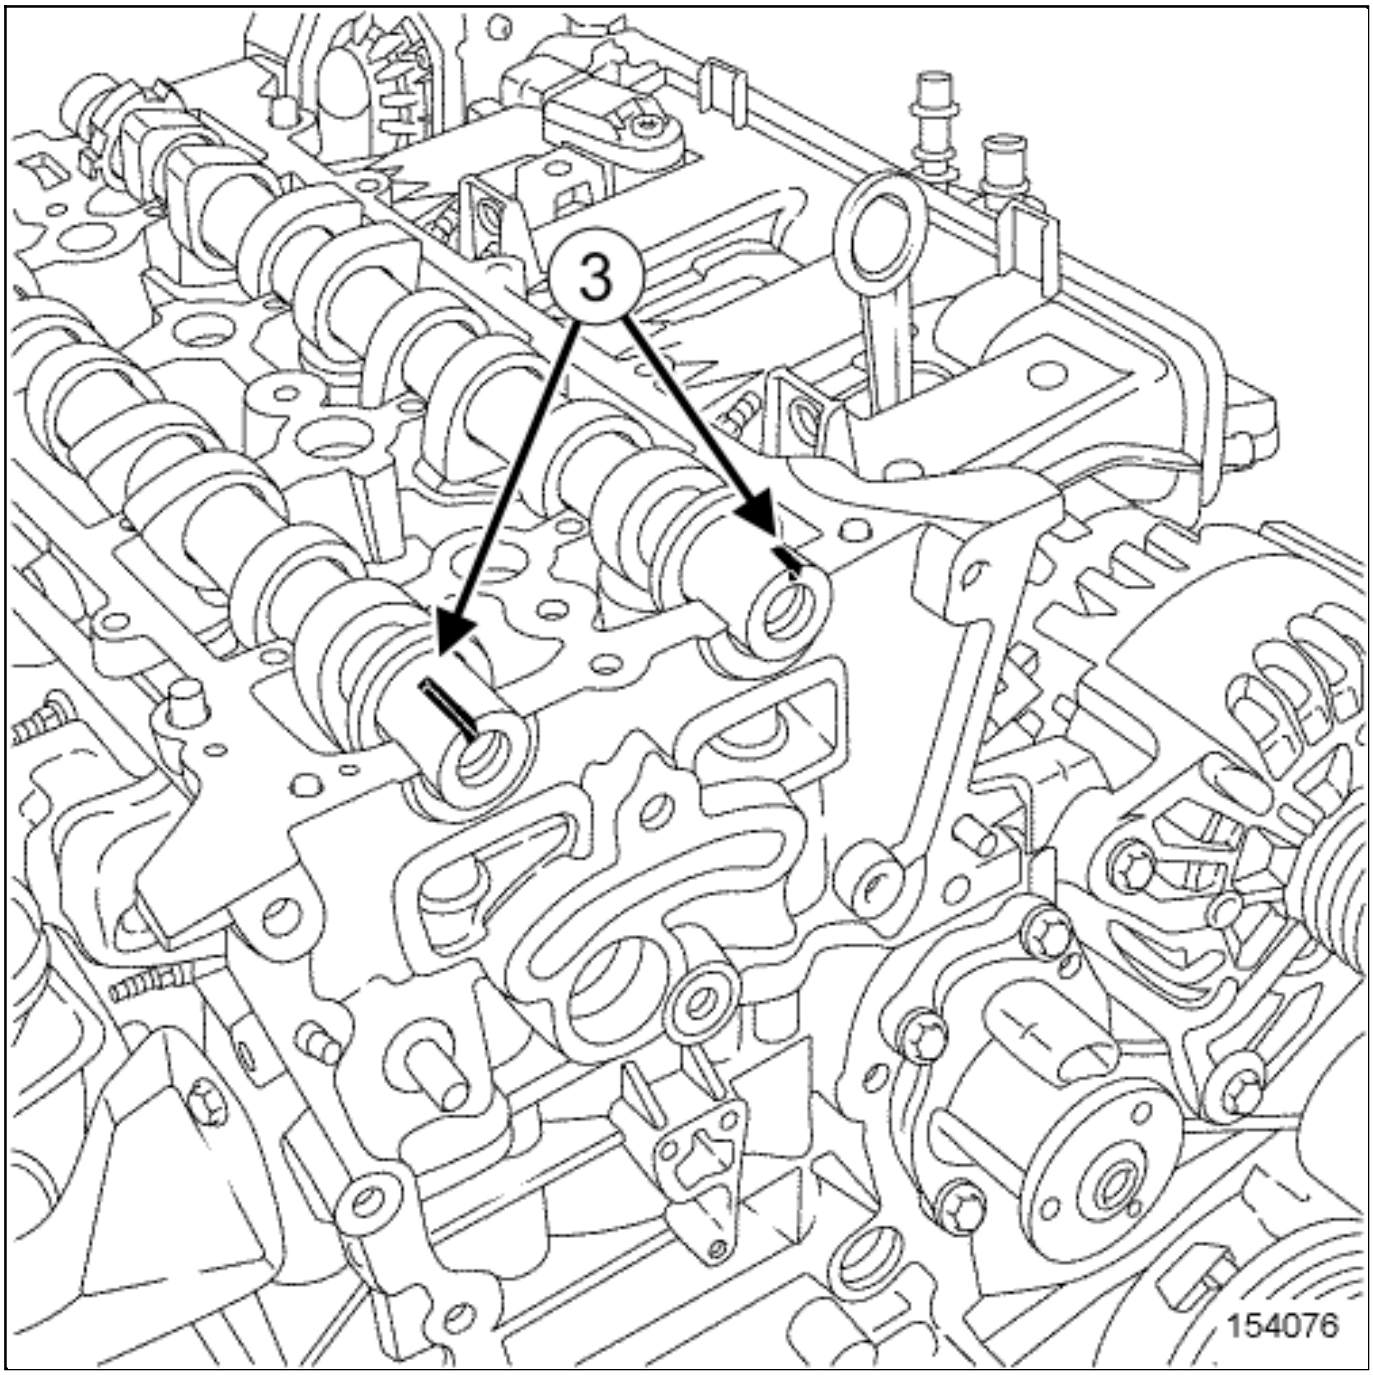
- the exhaust camshaft timing sprocket bolt (see 11A, Top and front of engine, Timing assembly: Exploded view) while holding the exhaust camshaft in place using an open-jawed spanner(2) ,
- the exhaust camshaft timing sprocket (see 11A, Top and front of engine, Timing assembly: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Clean the camshaft dephaser using surface cleaner Vehicle: Parts and consumables for the repair .

WARNING

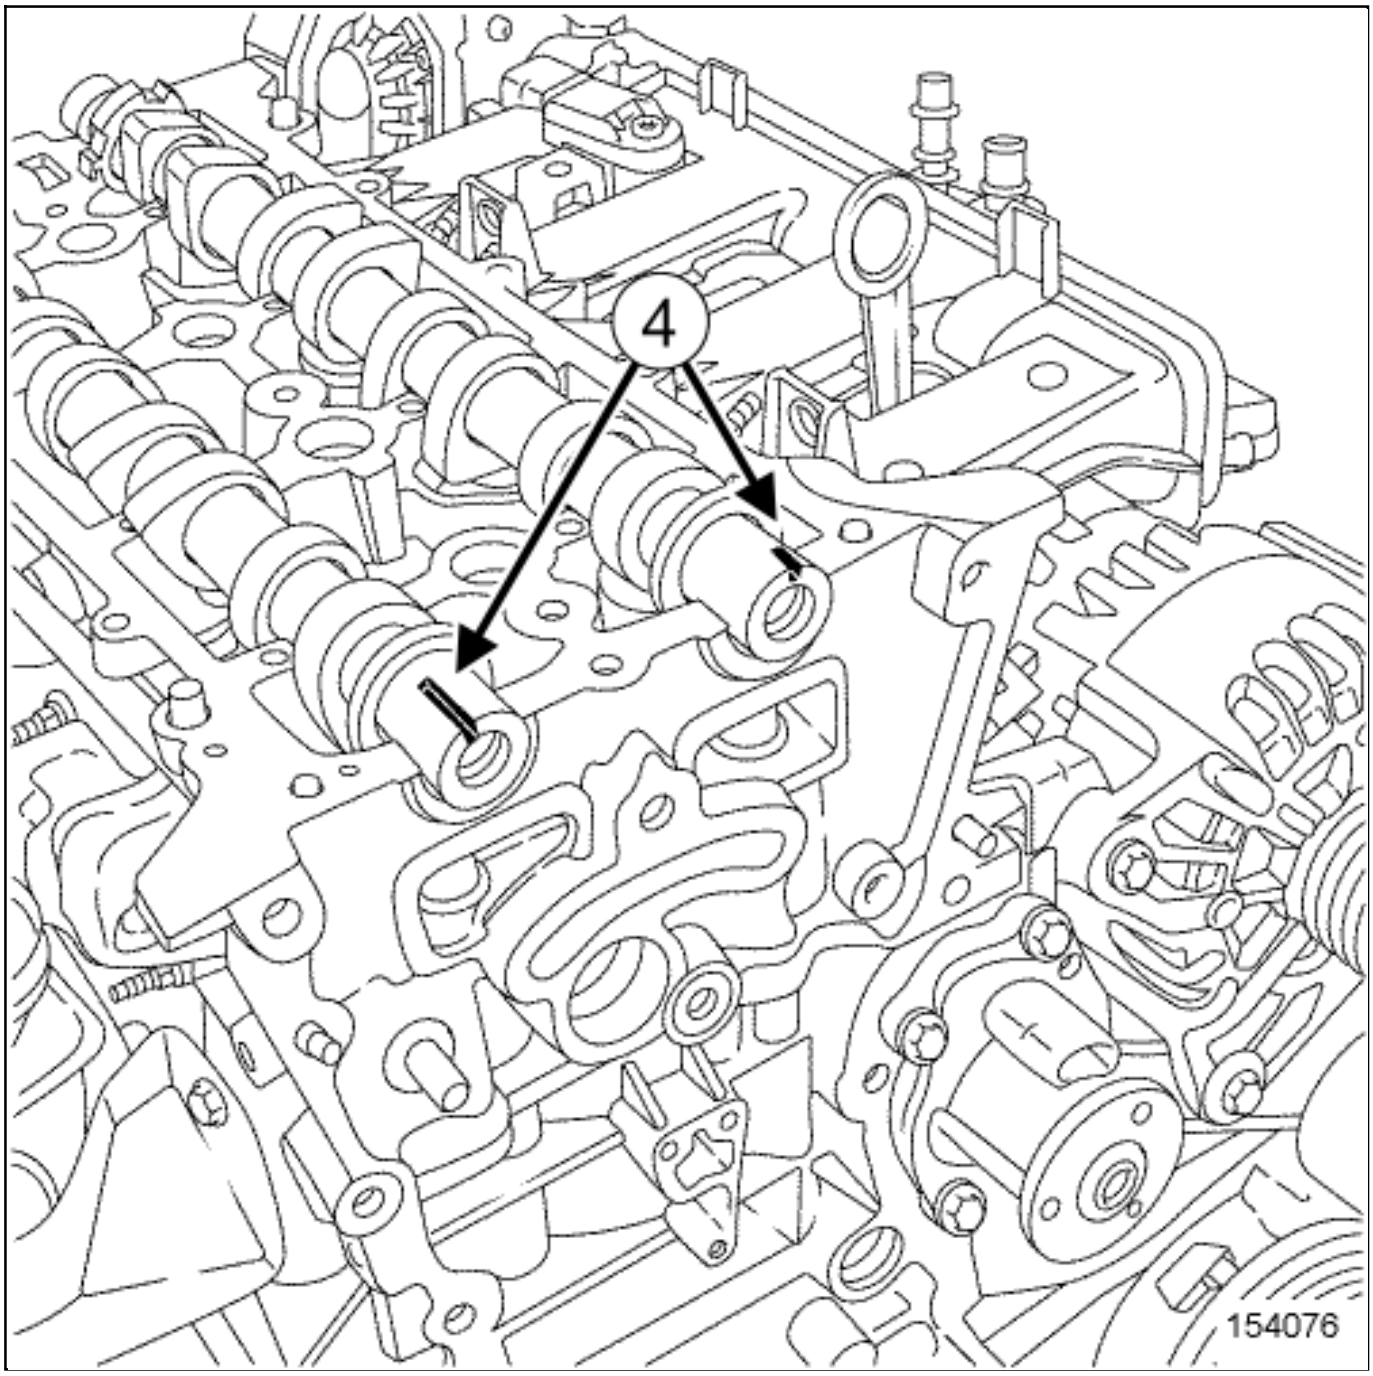


Wear goggles with side protectors for this operation.

Dry the camshaft dephaser using a compressed air nozzle.

Check that the teeth of the camshaft dephaser are not broken, chipped or scratched.

2. REFITTING OPERATION



1- REFITTING THE INLET CAMSHAFT DEPHASER

Check that the camshaft lugs(3) are in the same position as shown in the illustration.

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the inlet camshat timing sprocket,
- the inlet camshaft timing sprocket bolt.

Check that the camshaft lugs(4) are in the same position as shown in the illustration.

Fit the exhaust camshaft timing sprocket by placing the exhaust camshaft pin in the opening of the exhaust camshaft timing sprocket.

Refit (see 11A, Top and front of engine, Timing assembly: Exploded view) :

- the exhaust camshat timing sprocket,
- the exhaust camshaft timing sprocket bolt.

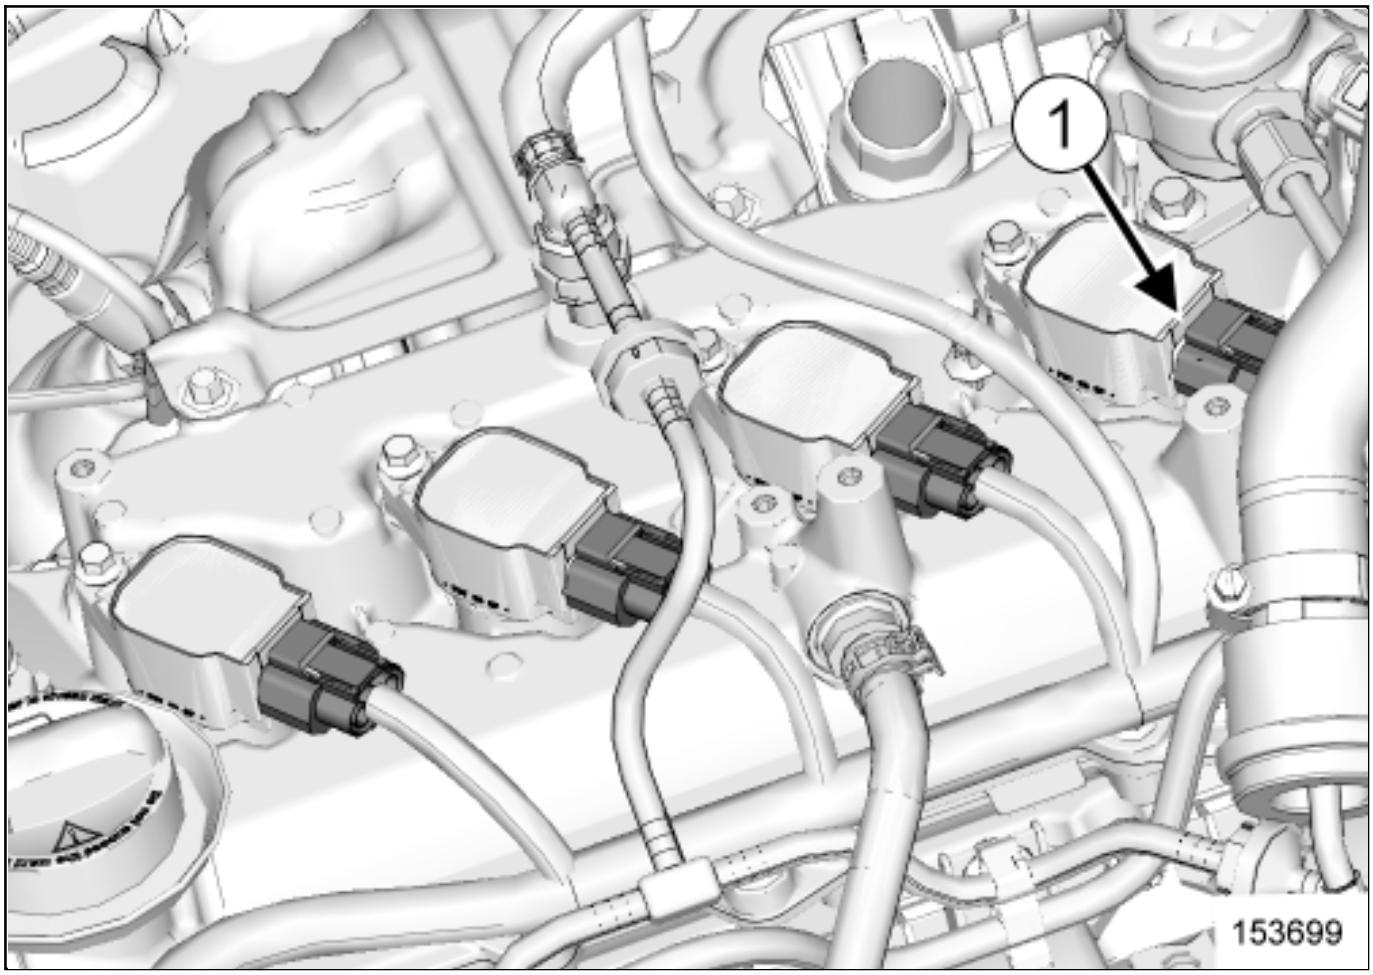
3. FINAL OPERATION

Proceed in the reverse order to removal.

CAMSHAFT POSITION SENSOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts always to be replaced etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

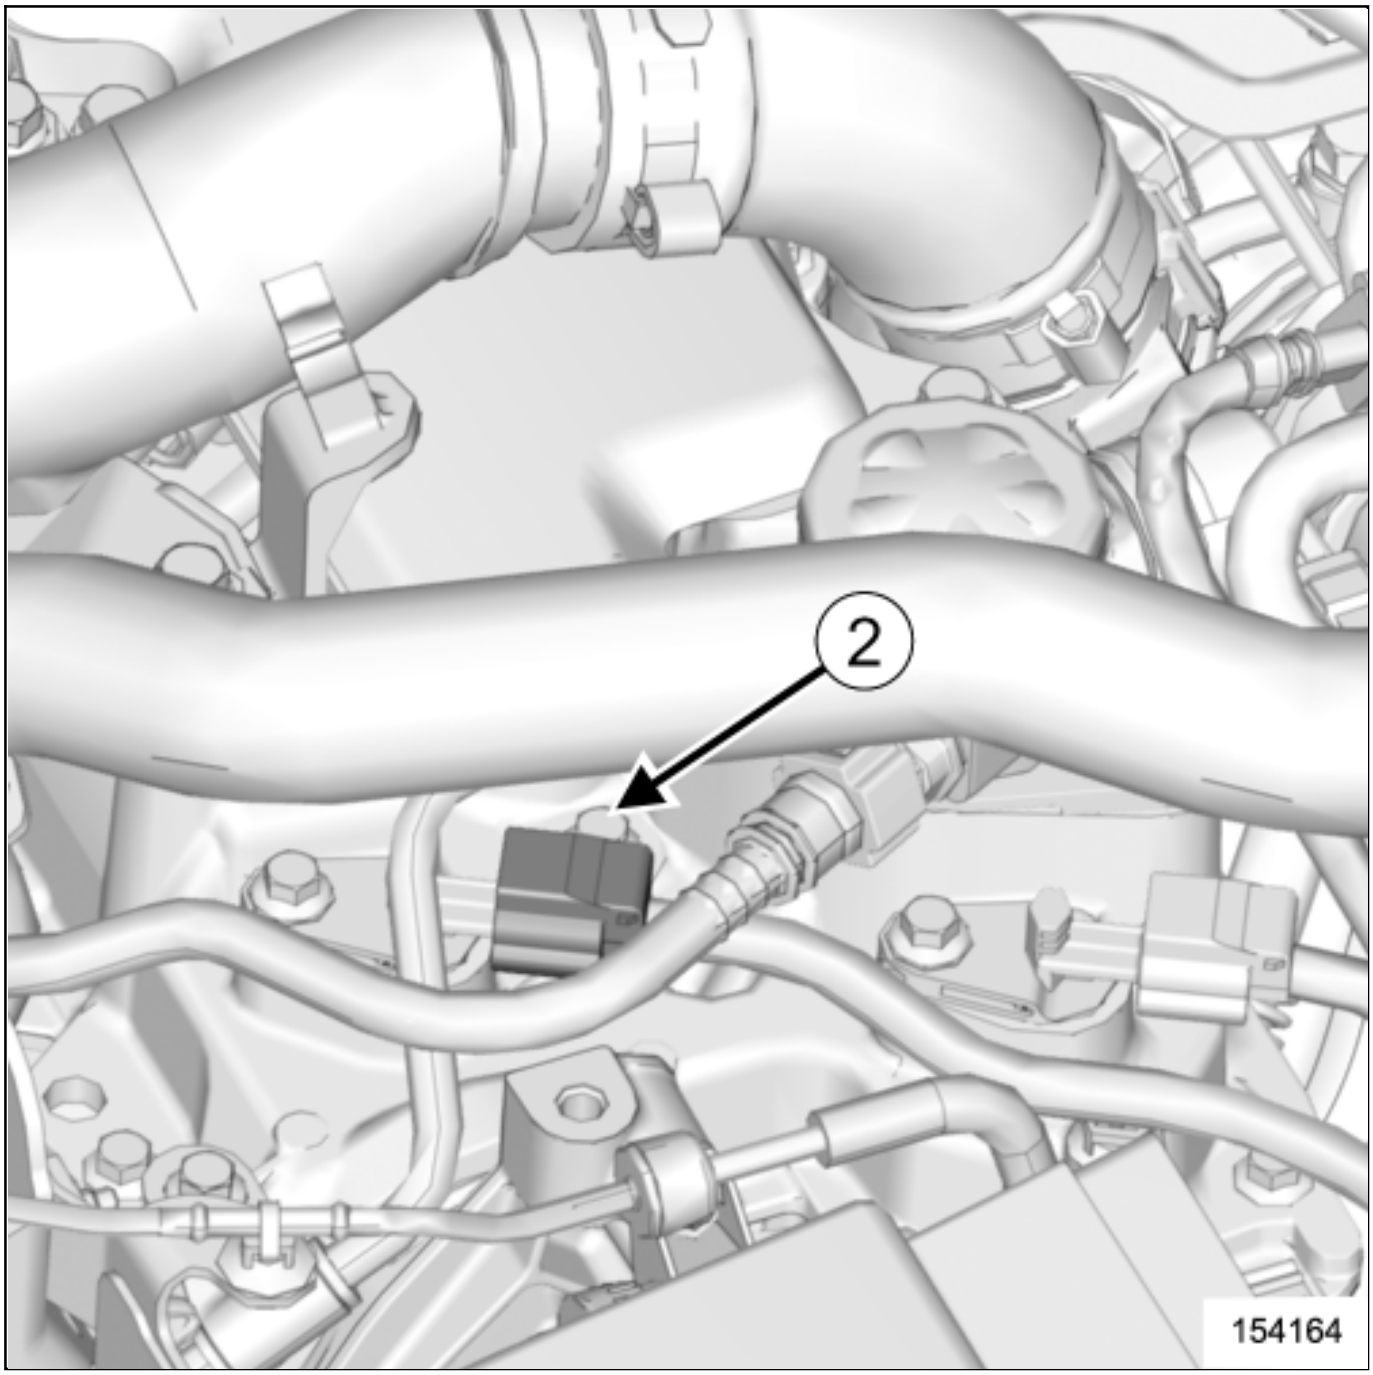


Note:

This procedure deals with removing and refitting the inlet camshaft position sensor and the exhaust camshaft position sensor.

REMOVAL

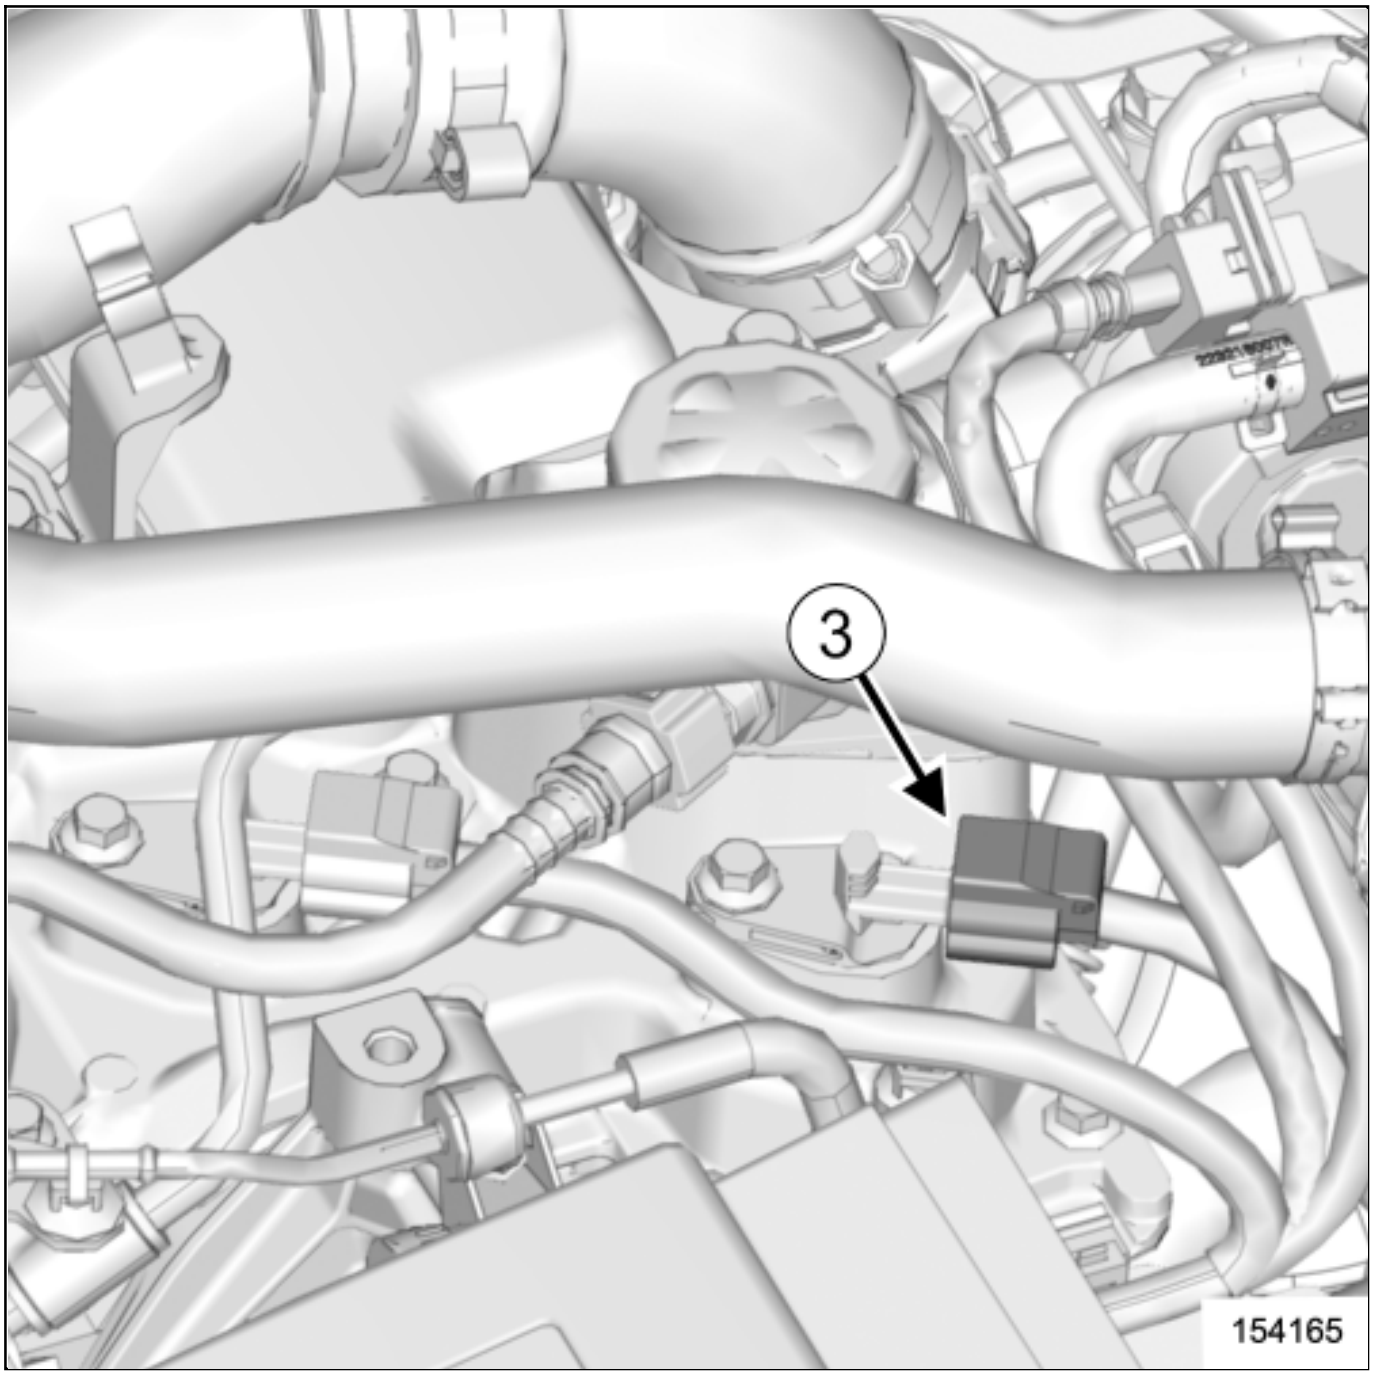
1. REMOVAL PREPARATION OPERATION



1- REMOVING THE INLET CAMSHAFT POSITION SENSOR

- Disconnect the ignition coil connector(1) .

2. REMOVAL OPERATION



1- REMOVING THE INLET CAMSHAFT POSITION SENSOR

- Disconnect the inlet camshaft position sensor connector(2) .

- Remove:
  - the inlet camshaft position sensor bolt,
  - the inlet camshaft position sensor,
  - the inlet camshaft position sensor seal.

2- REMOVING THE EXHAUST CAMSHAFT POSITION SENSOR

Disconnect the exhaust camshaft position sensor connector(3) .

Remove:

- the exhaust camshaft position sensor bolt,
- the exhaust camshaft position sensor,
- the exhaust camshaft position sensor seal.

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replaced:

- the inlet and exhaust camshaft position sensor seal.

Lubricate the inlet and exhaust camshaft position sensor housing.

2. REFITTING OPERATION

Refit:

- the new inlet and exhaust camshaft position sensor seal,
- the inlet and exhaust camshaft position sensor,
- the inlet and exhaust camshaft position sensor bolt.

Torque tighten the inlet and exhaust camshaft position sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) .

Proceed in the reverse order to removal.

Apply the After repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component controlled by this computer concerned by the After repair procedure:

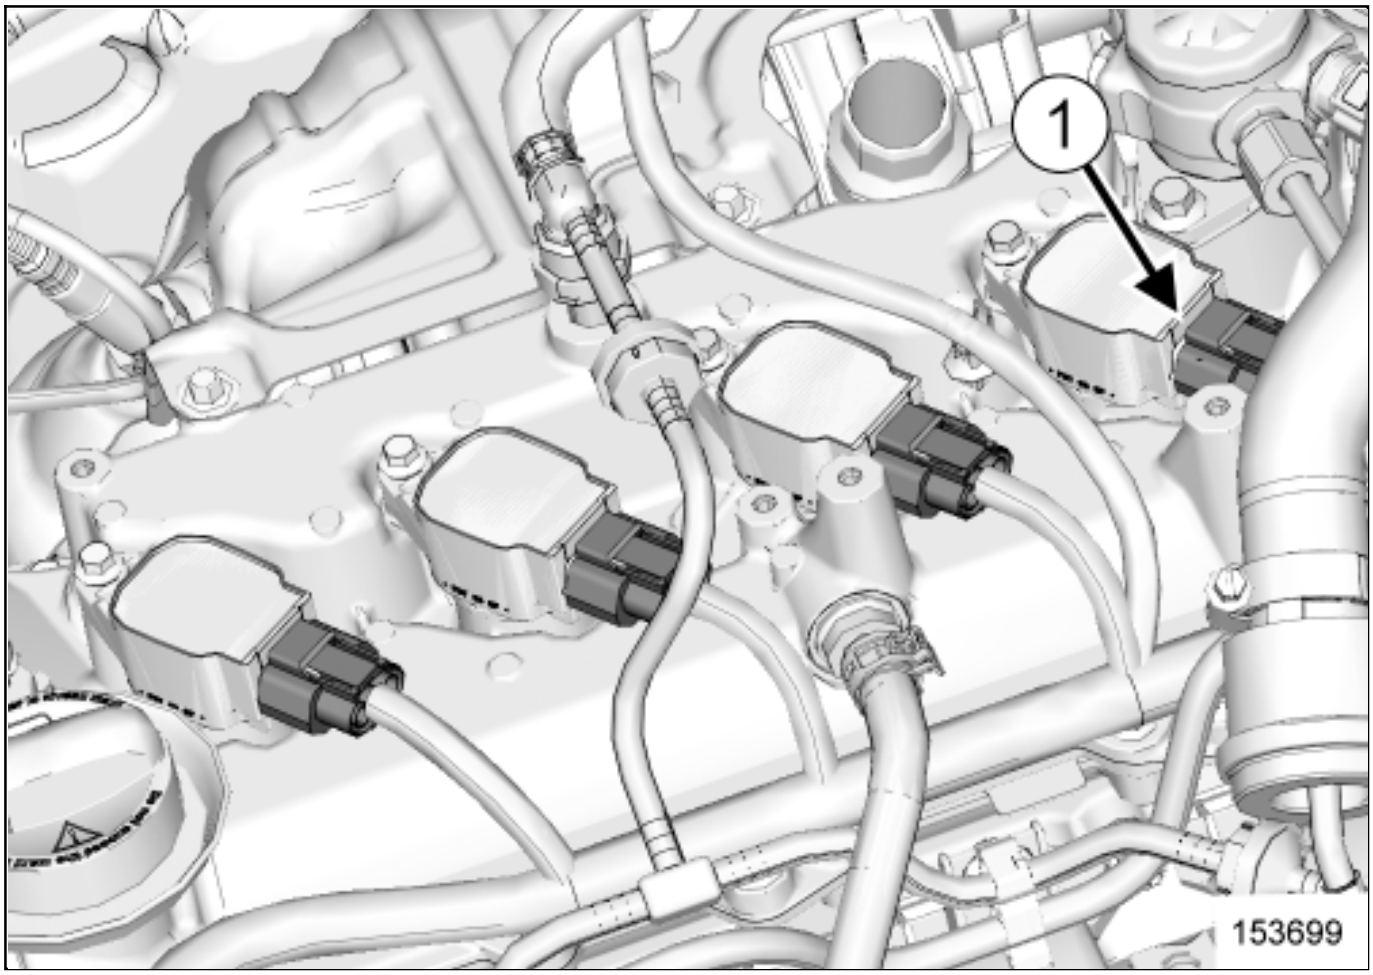
"Camshaft sensor" .

XSL version : 3.02 du 22/07/11

CAMSHAFT POSITION SENSOR: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts always to be replaced etc.)(see **Engine and transmission assembly sensors: List and location of components**) .

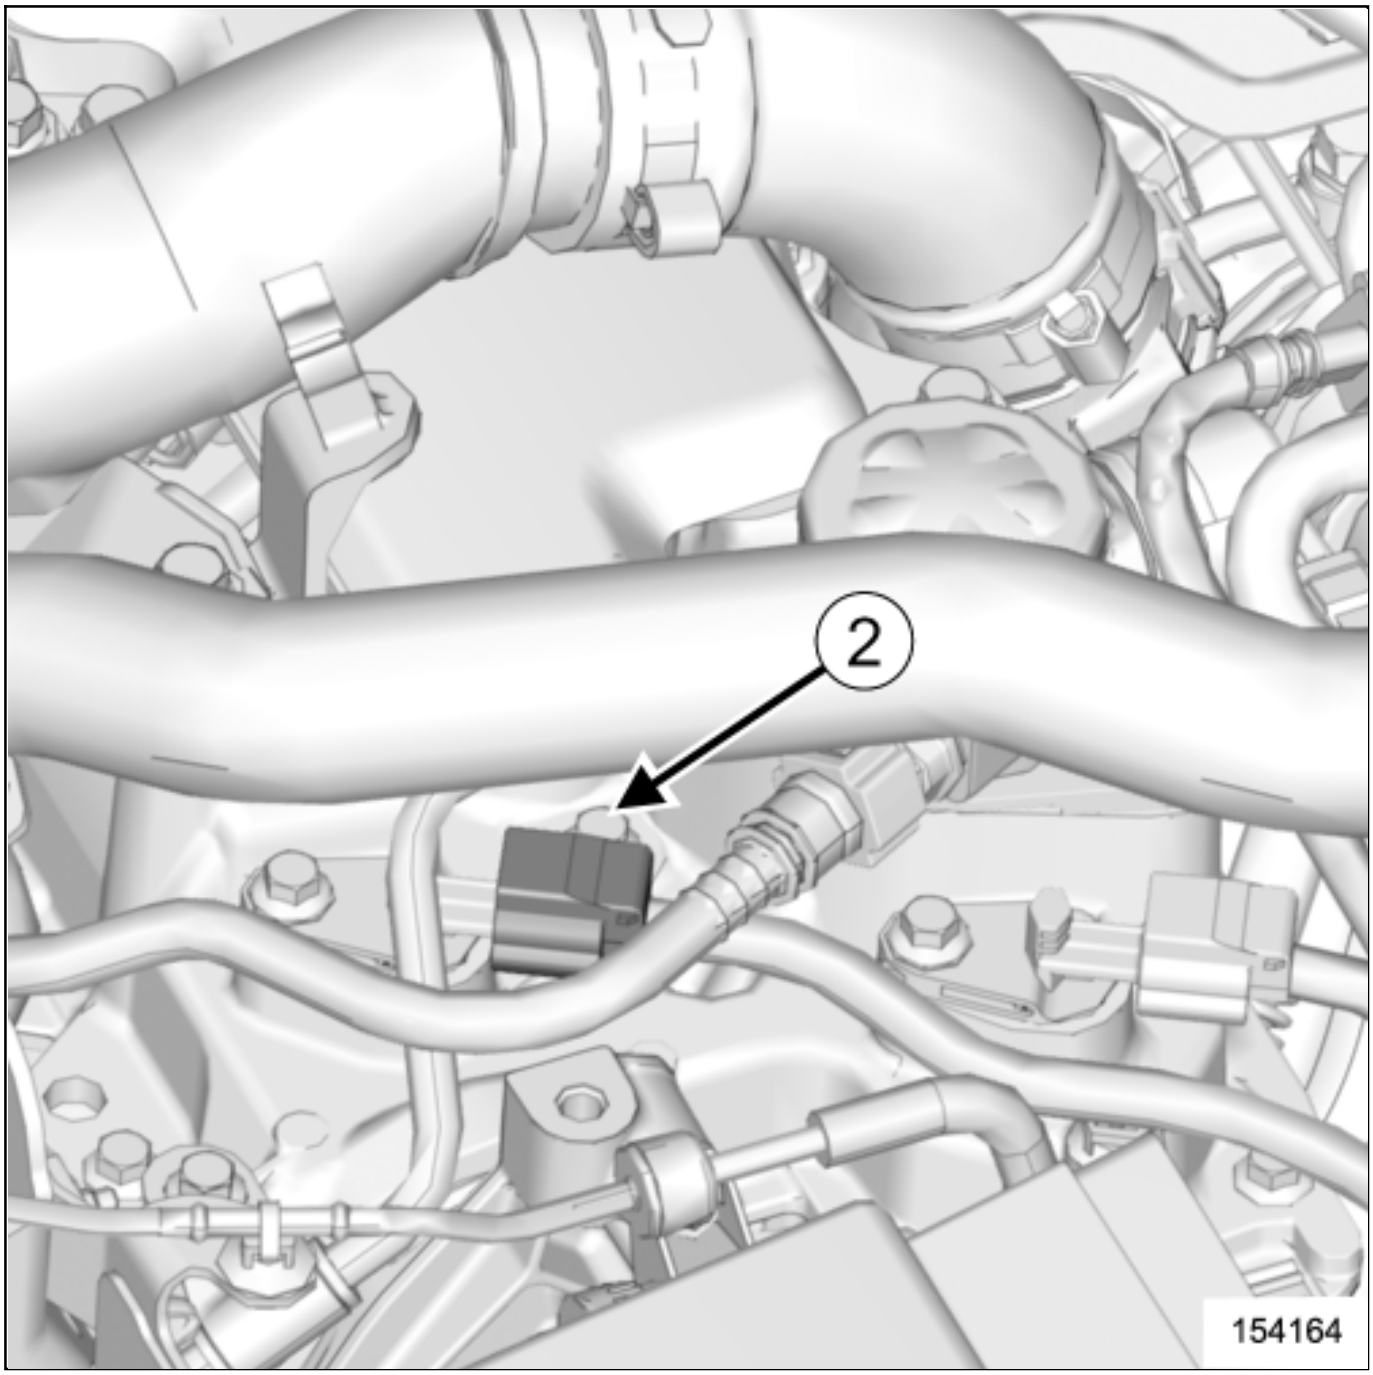


Note:

This procedure deals with removing and refitting the inlet camshaft position sensor and the exhaust camshaft position sensor.

REMOVAL

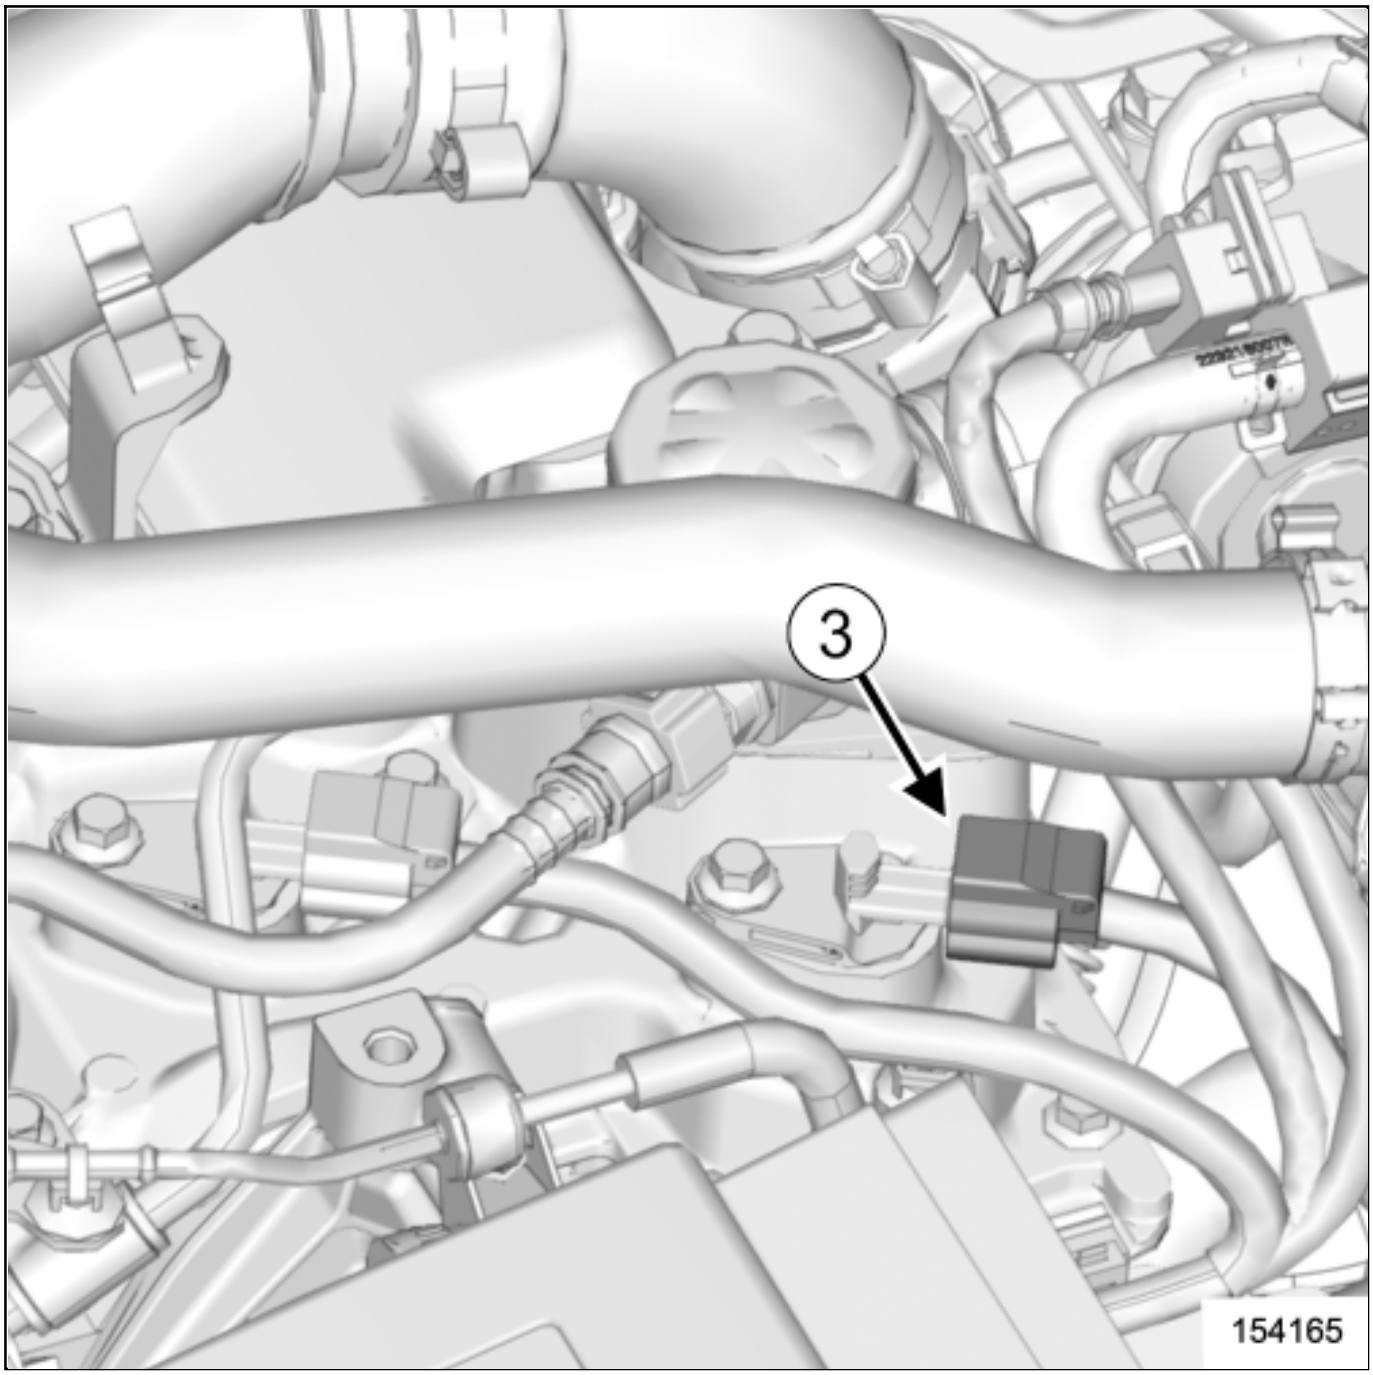
1. REMOVAL PREPARATION OPERATION



1- REMOVING THE INLET CAMSHAFT POSITION SENSOR

- Disconnect the ignition coil connector(1) .

2. REMOVAL OPERATION



1- REMOVING THE INLET CAMSHAFT POSITION SENSOR

- Disconnect the inlet camshaft position sensor connector(2) .

- Remove:
  - the inlet camshaft position sensor bolt,
  - the inlet camshaft position sensor,
  - the inlet camshaft position sensor seal.

2- REMOVING THE EXHAUST CAMSHAFT POSITION SENSOR

- Disconnect the exhaust camshaft position sensor connector(3) .

- Remove:
  - the exhaust camshaft position sensor bolt,
  - the exhaust camshaft position sensor,
  - the exhaust camshaft position sensor seal.

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replaced:

- the inlet and exhaust camshaft position sensor seal.

Lubricate the inlet and exhaust camshaft position sensor housing.

2. REFITTING OPERATION

Refit:

- the new inlet and exhaust camshaft position sensor seal,
- the inlet and exhaust camshaft position sensor,
- the inlet and exhaust camshaft position sensor bolt.

Torque tighten the inlet and exhaust camshaft position sensor bolt(see **Engine and transmission assembly sensors: List and location of components**) .

Proceed in the reverse order to removal.

Apply the After repair procedure using the Diagnostic toolDiagnostic tool : Use :

-Computer concerned by the After repair procedure:

- "Injection computer" ,

-Component controlled by this computer concerned by the After repair procedure:

- "Camshaft sensor" .

CAMSHAFT:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Engine: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

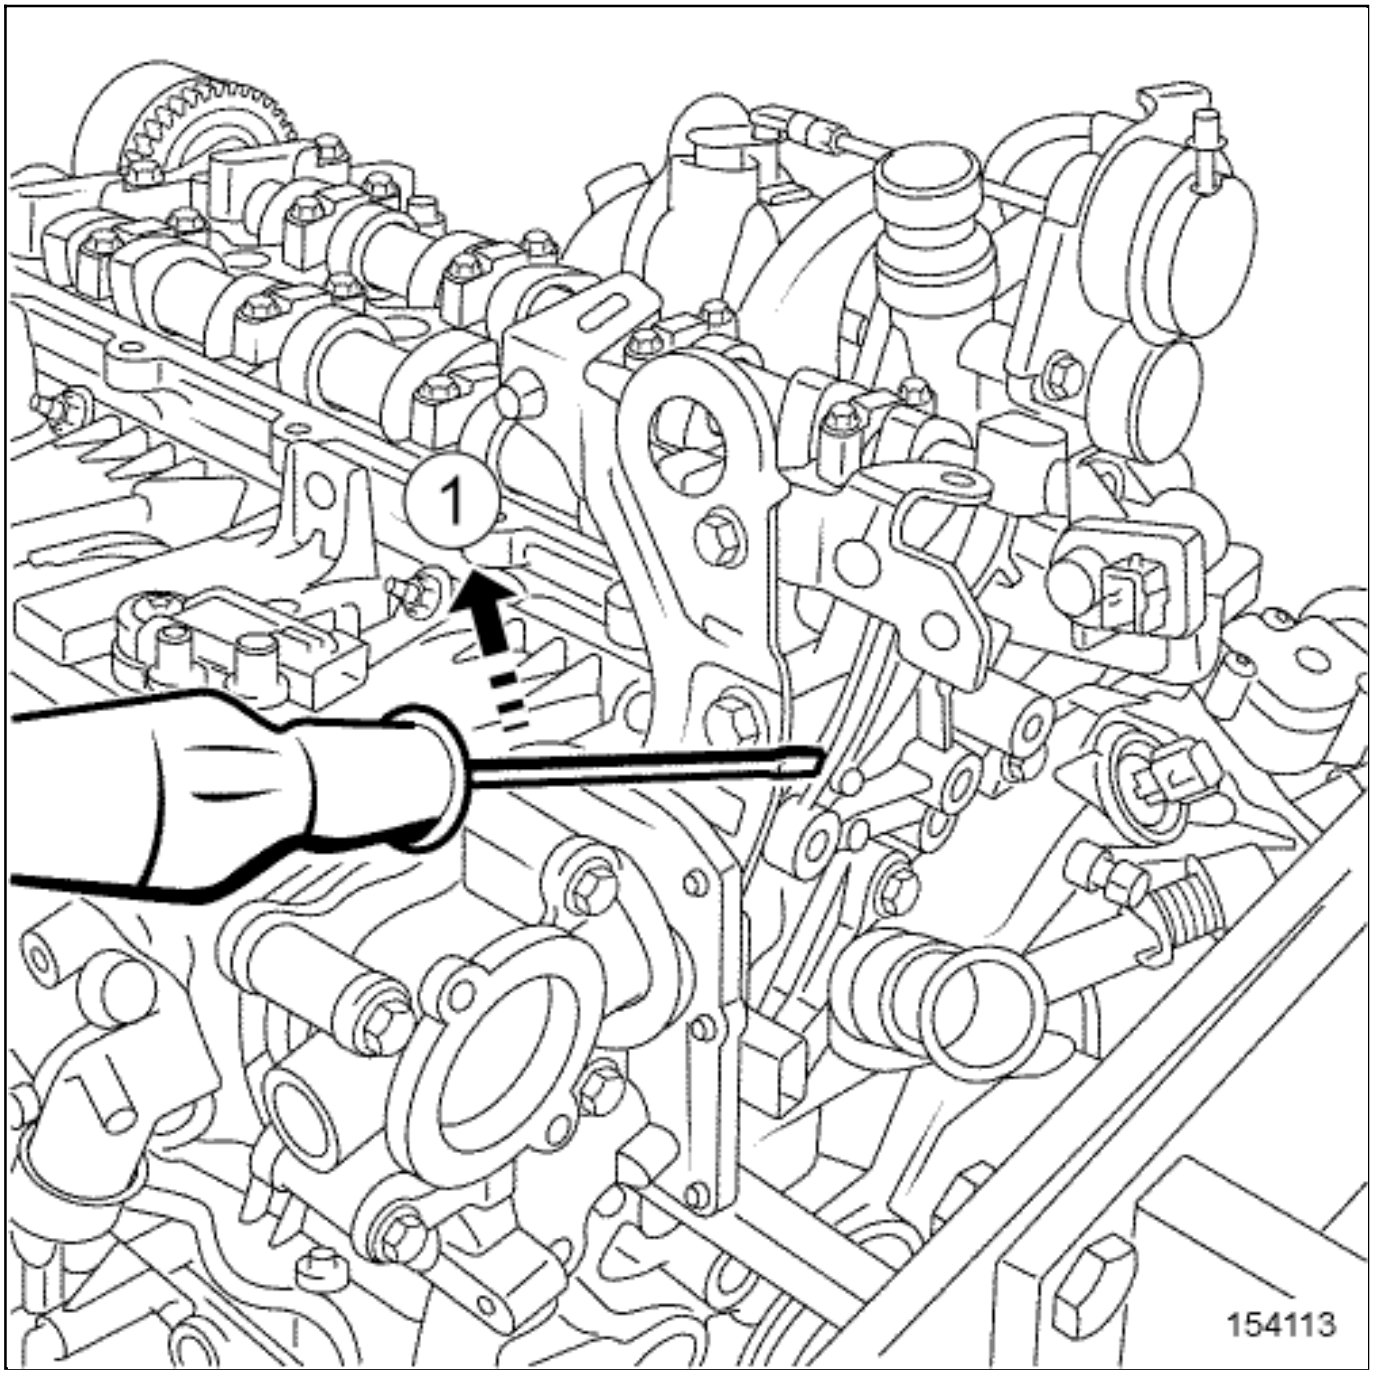
CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly(see 10A, Engine and cylinder block assembly, Engine - gearbox assembly: Removal - Refitting) .

Separate the manual gearbox from the engine(see **Manual gearbox: Removal - Refitting**) .



Position the engine on the component supportEngine support equipment: Use .

Drain the engine(see **Engine oil: Draining - Refilling**) .

Remove:

- the accessories belt(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the crankshaft accessories pulley(see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the crankshaft seal on timing end(see 11A, Top and front of engine, Timing assembly: Exploded view) ,

- the timing chain (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the camshaft timing sprockets (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the cylinder head closing plate bolts (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

Very carefuly separate the cylinder head closing plate using a flatblade screwdriver(1) .

Remove the cylinder head closing plate (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

2. REMOVAL OPERATION

Identify the camshafts Camshaft: Check .

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the camshaft bearing cap bolts, timing side,
- the inlet camshaft bearing cap bolts,
- the exhaust camshaft bearing cap bolts,
- the camshaft bearing cap bolts,
- the camshaft bearing cap, timing side,
- the exhaust camshaft bearing cap,
- the inlet camshaft bearing cap,
- the camshaft bearing cap,
- the inlet camshaft,
- the exhaust camshaft.

REFITTING

1. REFITTING PREPARATION OPERATION

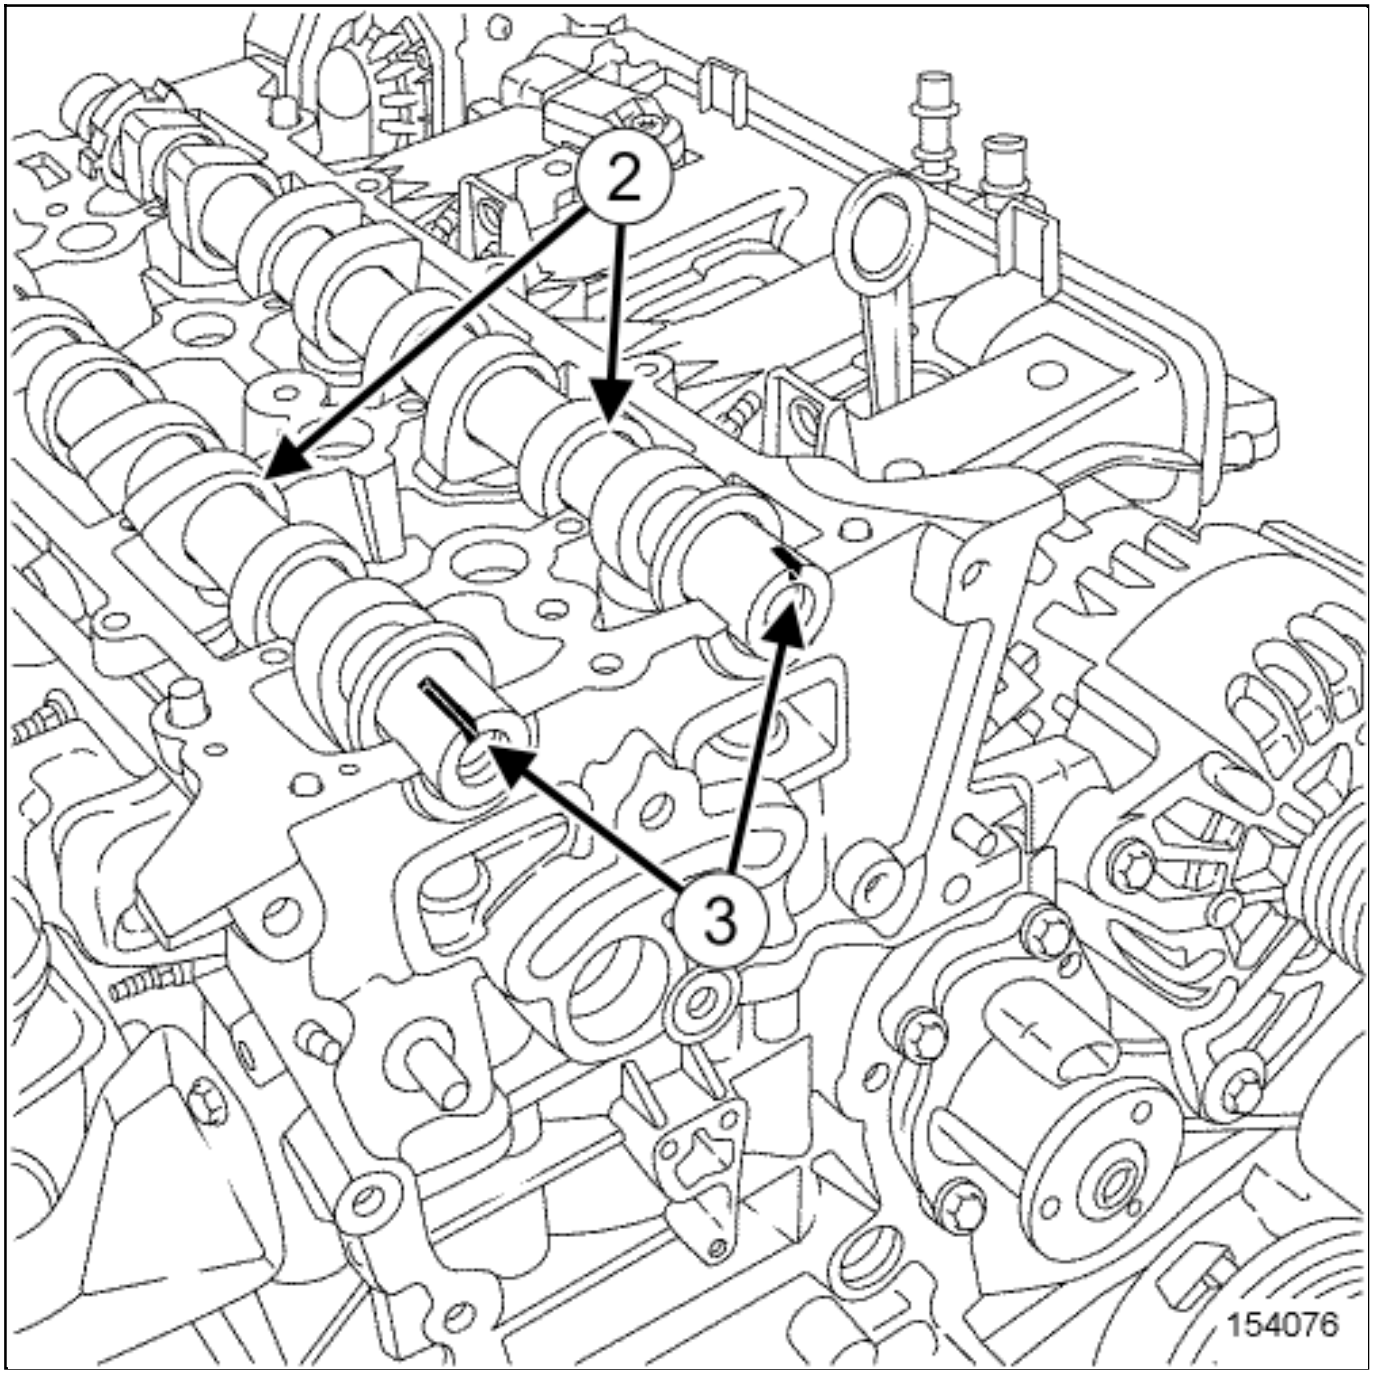
Clean the joint faces of the cylinder head cover and the cylinder head closing plate with SUPER CLEANING AGENT FOR JOINT FACES Vehicle: Parts and consumables for the repair .

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

Remove the residue using a plastic spatula.

Finish cleaning the joint faces using a GREY ABRASIVE PAD Vehicle: Parts and consumables for the repair .



CAUTION

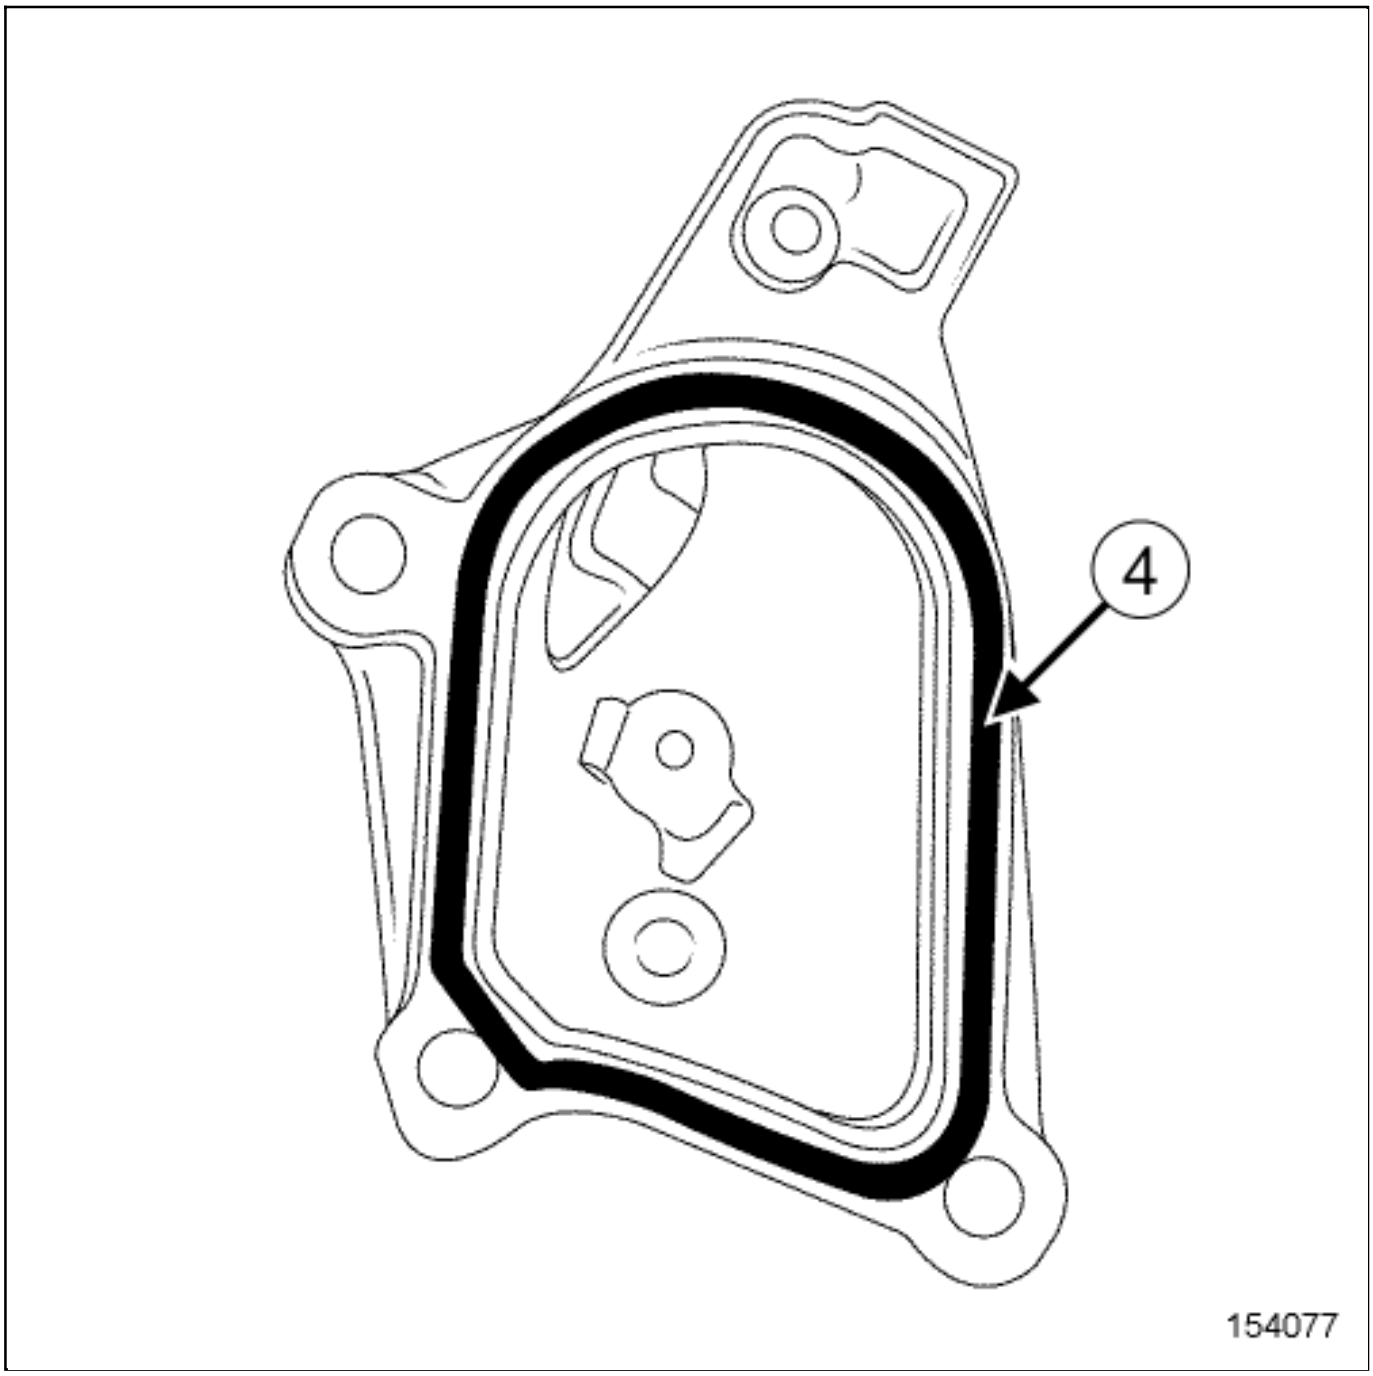
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

Use SURFACE CLEANER Vehicle: Parts and consumables for the repair to clean:

- the camshaft bearing cap, timing side,
- the exhaust camshaft bearing cap,
- the inlet camshaft bearing cap,
- the camshaft bearing cap,
- the inlet camshaft,
- the exhaust camshaft.

2. REFITTING OPERATION

Lubricate the camshaft bearings on the cylinder head with engine oil.



Refit (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the camshafts(2) , by fitting the lugs(3) in the same position as shown in the illustration,
- the camshaft bearing caps,

- the exhaust camshaft bearing cap,
- the inlet camshaft bearing cap,
- the camshaft bearing cap timing side,
- the camshaft bearing cap bolts,
- the exhaust camshaft bearing cap bolts,
- the inlet camshaft bearing cap bolts,

the camshaft bearing cap bolts, timing side.

3. FINAL OPERATION

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Apply beads of SILICONE ADHESIVE SEALANT Vehicle: Parts and consumables for the repair at(4) with a diameter of 3 to 4 mmon the joint face of the timing cover placed at a distance of 1 to 2 mm from the inside edge of the timing cover.

Remove any excess of SILICONE ADHESIVE SEALANTusing a plastic spatula.

Refit **(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)** :

- the cylinder head closing plate,
- the cylinder head closing plate bolts.

Proceed in the reverse order to removal.

CAMSHAFT:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component support

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructionsVehicle: Precautions for the repair

Locations and specifications (tightening torques, parts to always be replaced, etc.)(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

Engine: Precautions for the repair , Vehicle: Precautions for the repair .

WARNING

Wear goggles with side protectors for this operation.

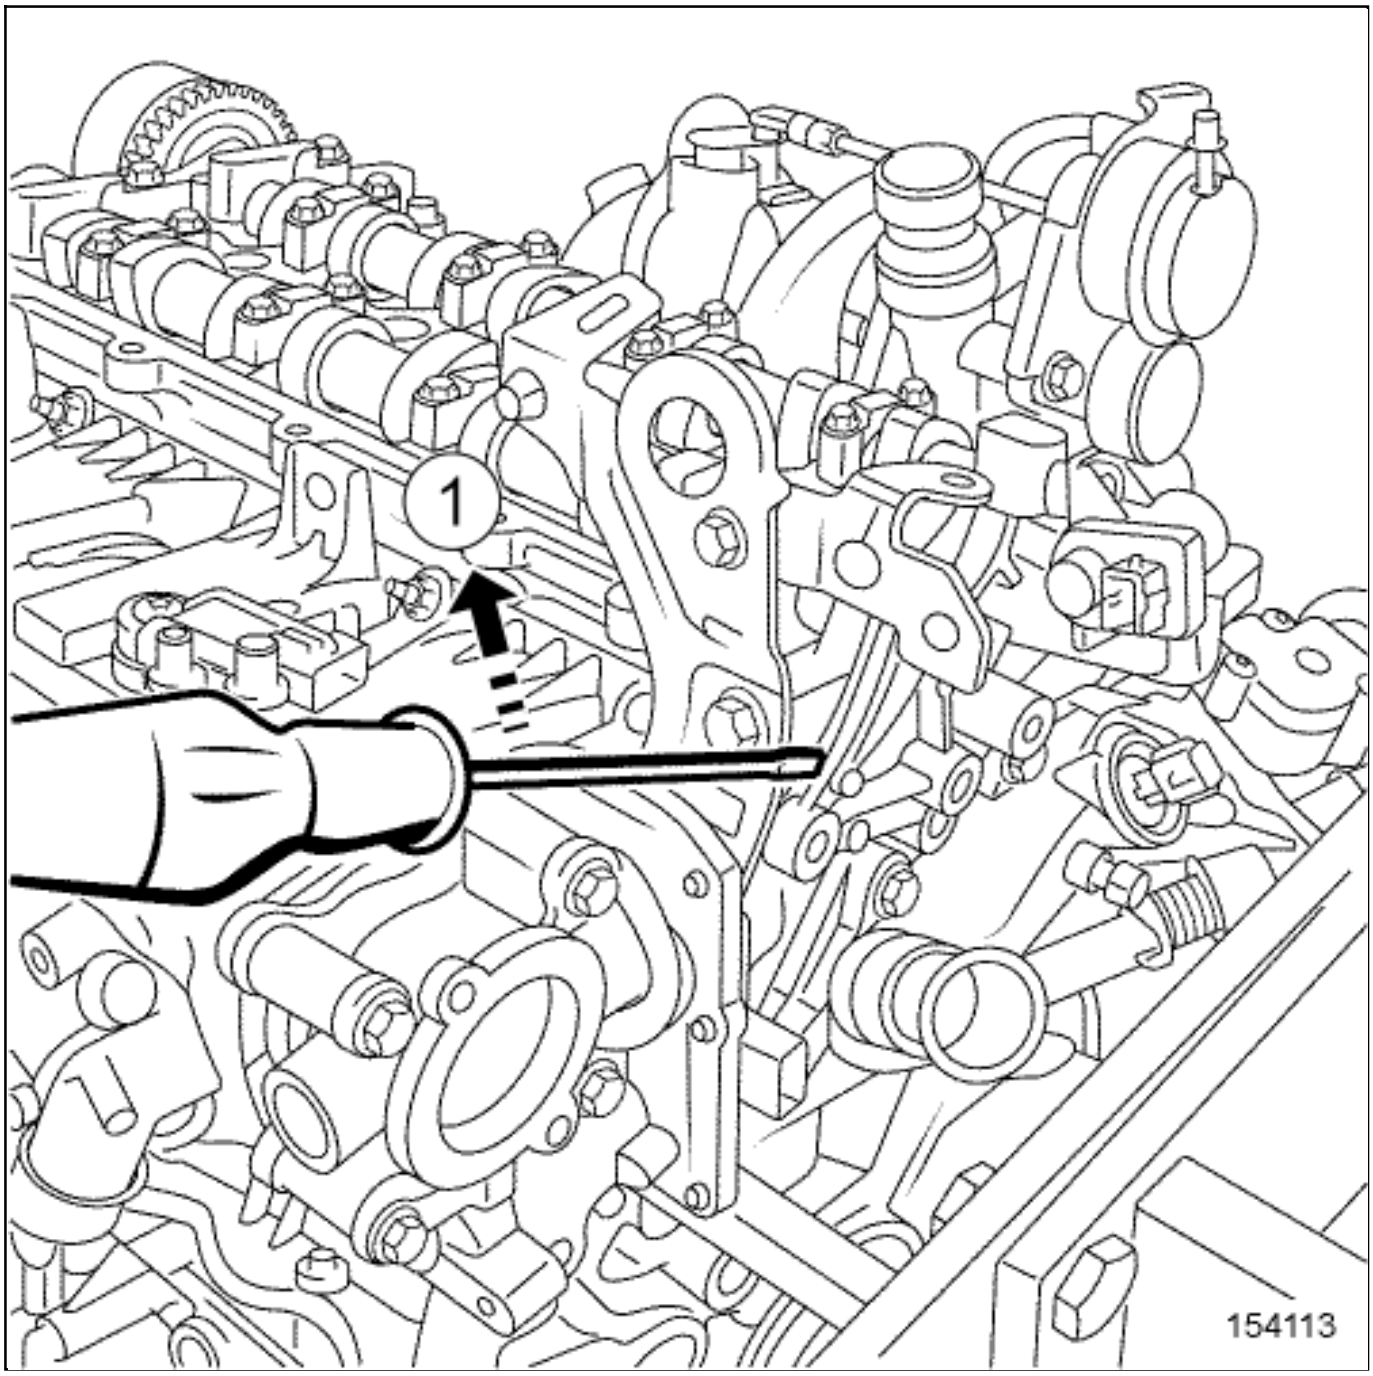
CAUTION

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

Remove the "engine and gearbox" assembly Engine - gearbox assembly: Removal - Refitting .

Separate the manual gearbox from the engine (see **Manual gearbox: Removal - Refitting**) .



Position the engine on the component support Engine support equipment: Use .

Drain the engine (see **Engine oil: Draining - Refilling**) .

Remove:

- the accessories belt (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the ignition coils (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the cylinder head cover (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) ,
- the crankshaft accessories pulley (see 11A, Top and front of engine, Engine accessories assembly: Exploded view) ,
- the crankshaft seal on timing end (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the timing chain (see 11A, Top and front of engine, Timing assembly: Exploded view) ,

- the camshaft timing sprockets (see 11A, Top and front of engine, Timing assembly: Exploded view) ,
- the cylinder head closing plate bolts (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

Very carefuly separate the cylinder head closing plate using a flatblade screwdriver(1) .

Remove the cylinder head closing plate (see 11A, Top and front of engine, Cylinder head assembly:

Exploded view) .

2. REMOVAL OPERATION

Identify the camshafts Camshaft: Check .

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the camshaft bearing cap bolts, timing side,
- the inlet camshaft bearing cap bolts,
- the exhaust camshaft bearing cap bolts,
- the camshaft bearing cap bolts,
- the camshaft bearing cap, timing side,
- the exhaust camshaft bearing cap,
- the inlet camshaft bearing cap,
- the camshaft bearing cap,
- the inlet camshaft,
- the exhaust camshaft.

REFITTING

1. REFITTING PREPARATION OPERATION

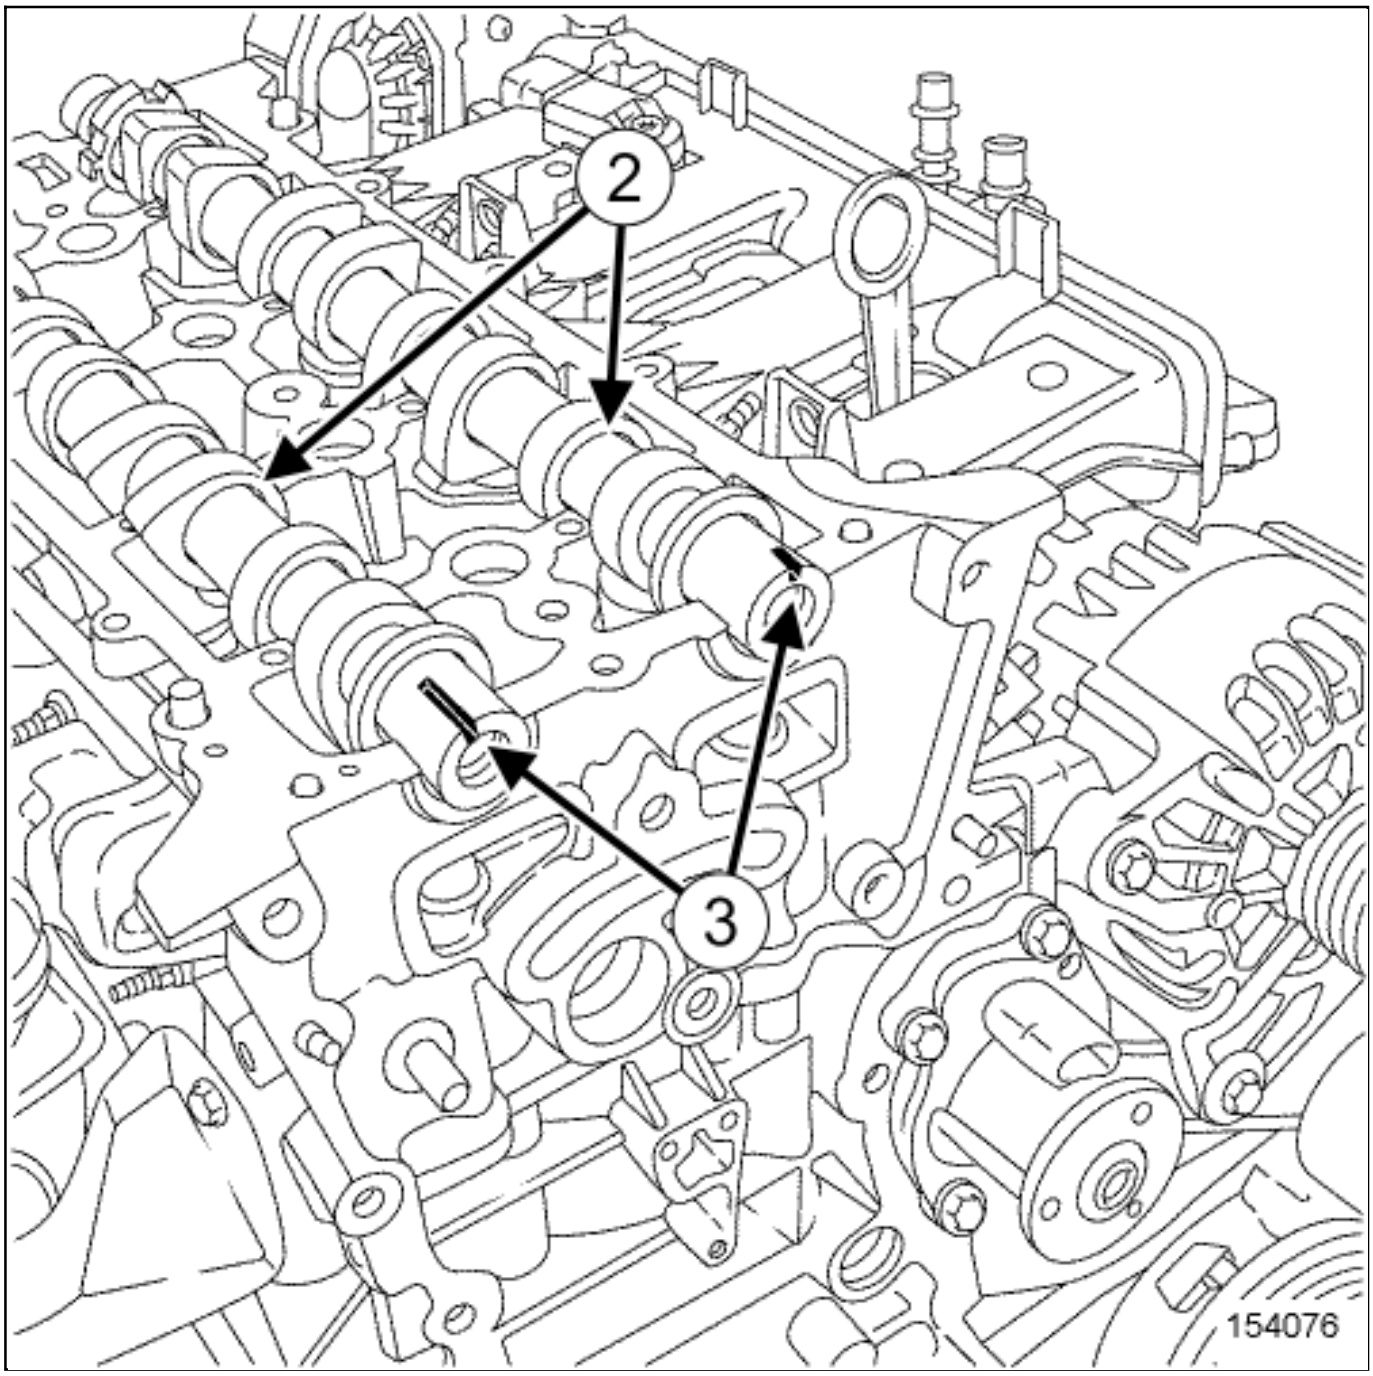
Clean the joint faces of the cylinder head cover and the cylinder head closing plate with SUPER CLEANING AGENT FOR JOINT FACES Vehicle: Parts and consumables for the repair .

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

Remove the residue using a plastic spatula.

Finish cleaning the joint faces using a GREY ABRASIVE PAD Vehicle: Parts and consumables for the repair .



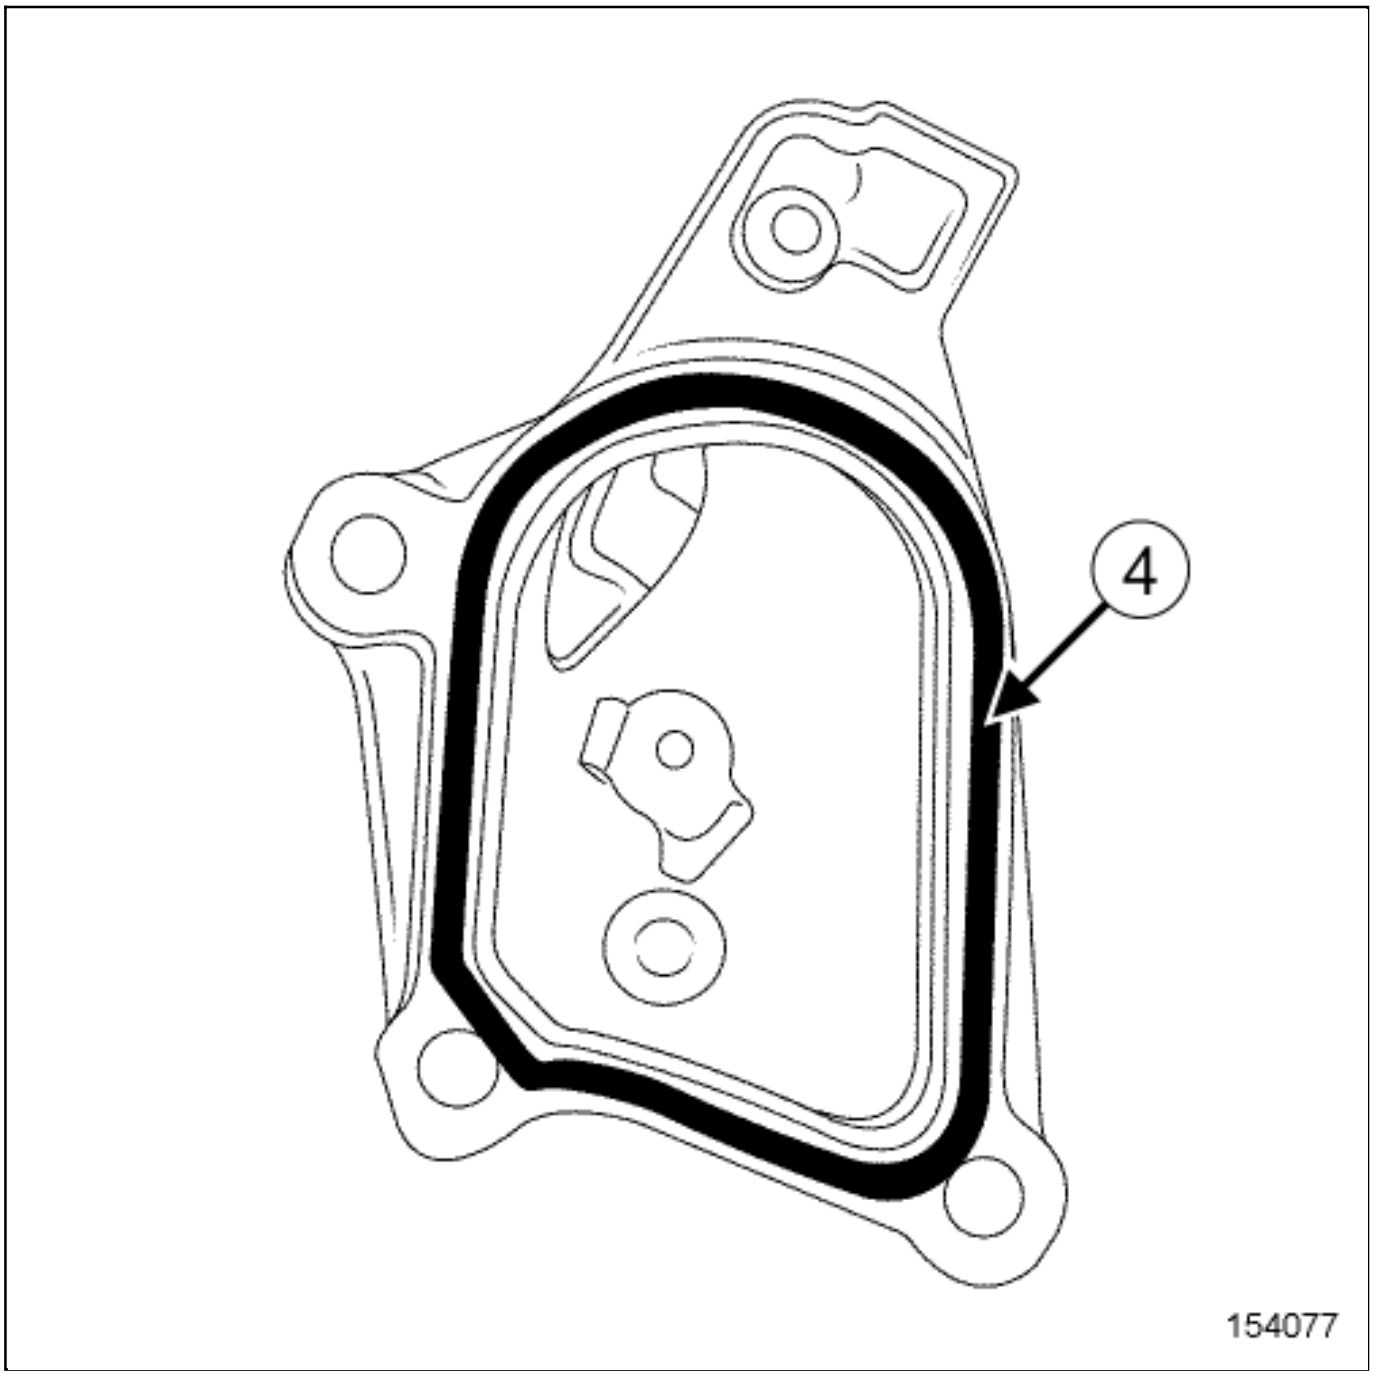
CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

Use SURFACE CLEANER Vehicle: Parts and consumables for the repair to clean:

- the camshaft bearing cap, timing side,
- the exhaust camshaft bearing cap,
- the inlet camshaft bearing cap,
- the camshaft bearing cap,
- the inlet camshaft,
- the exhaust camshaft.

2. REFITTING OPERATION



Lubricate the camshaft bearings on the cylinder head with engine oil.

Refit (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the camshafts(2) , by fitting the lugs(3) in the same position as shown in the illustration,
- the camshaft bearing caps,
- the exhaust camshaft bearing cap,

- the inlet camshaft bearing cap,
- the camshaft bearing cap timing side,
- the camshaft bearing cap bolts,
- the exhaust camshaft bearing cap bolts,
- the inlet camshaft bearing cap bolts,
- the camshaft bearing cap bolts, timing side.

3. FINAL OPERATION

CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

Apply beads of SILICONE ADHESIVE SEALANT Vehicle: Parts and consumables for the repair at(4) with a diameter of 3 to 4 mmon the joint face of the timing cover placed at a distance of 1 to 2 mm from the inside edge of the timing cover.

Remove any excess of SILICONE ADHESIVE SEALANTusing a plastic spatula.

Refit **(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)** :

- the cylinder head closing plate,
- the cylinder head closing plate bolts.

Proceed in the reverse order to removal.

CATALYTICPRE-CONVERTER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Exhaust: Precautions for the repair ,
- Vehicle: Precautions for the repair .

WARNING

Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

WARNING

Wear cut-resistant gloves during the operation.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust , Exhaust assembly in engine compartment: Exploded view) .

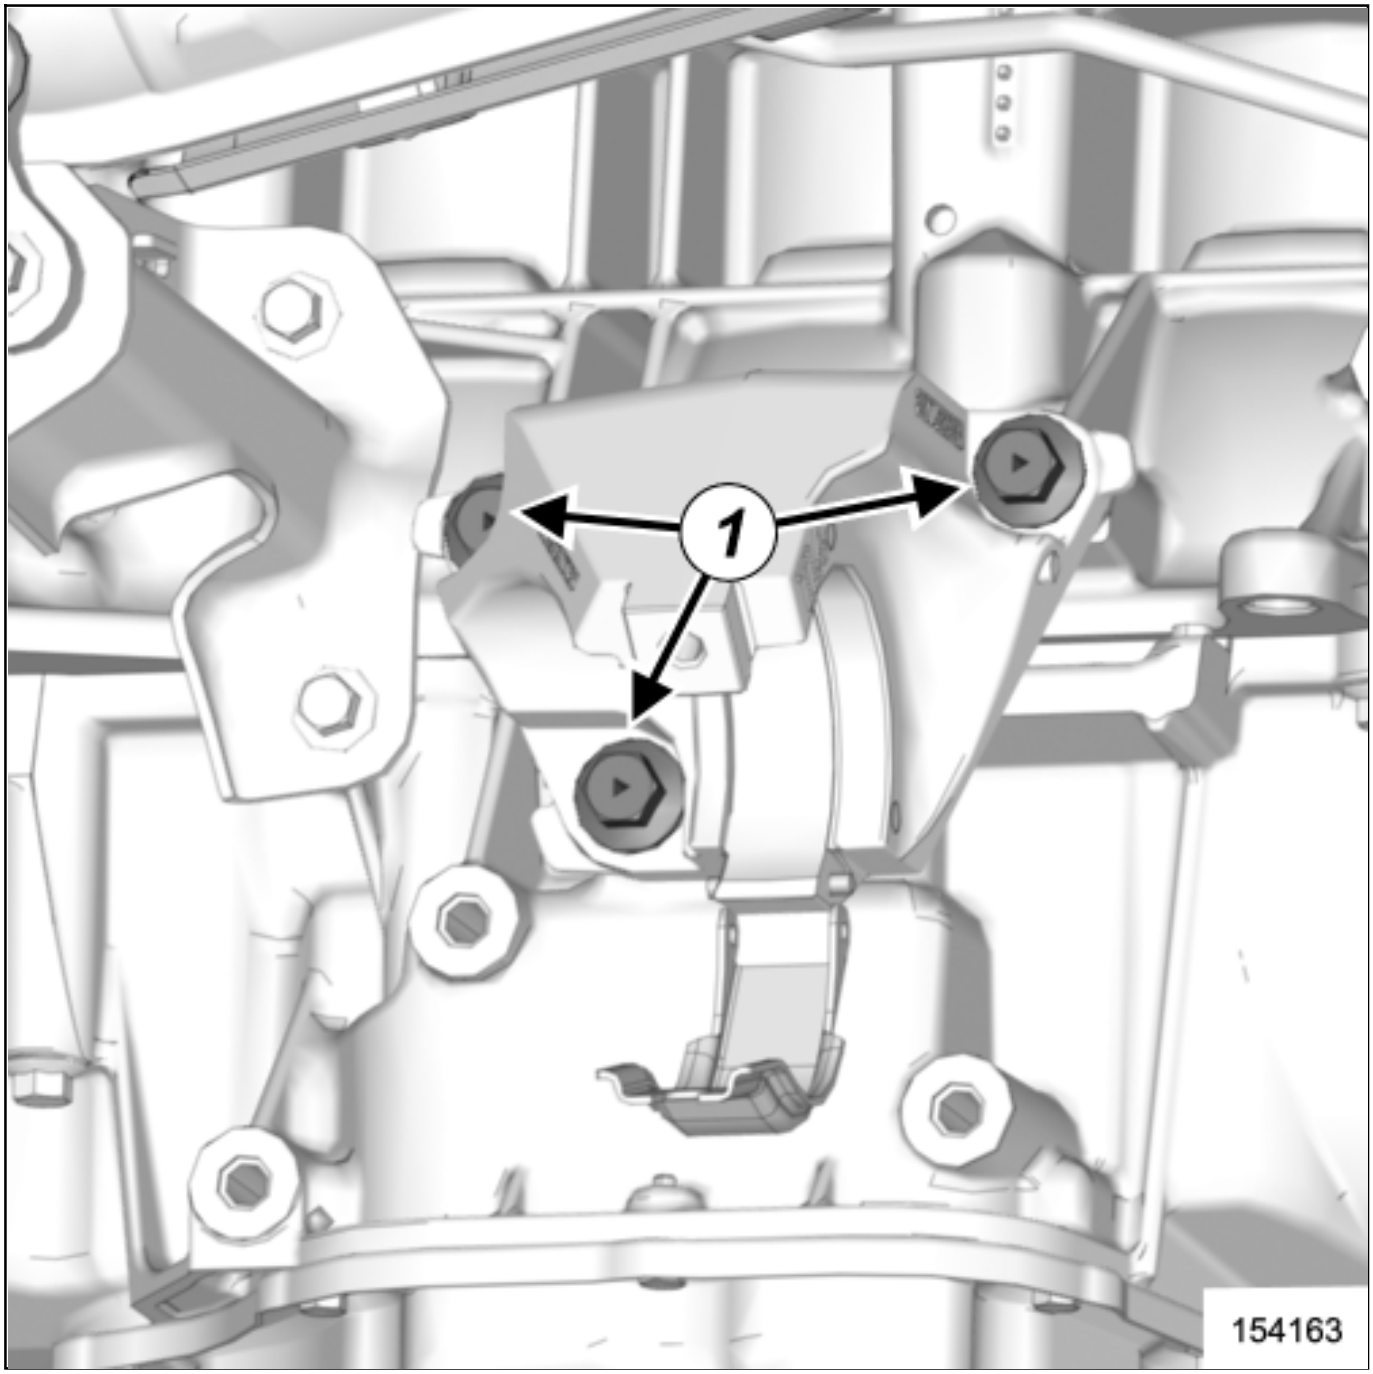
REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove:

- the batteryBattery: Removal - Refitting ,



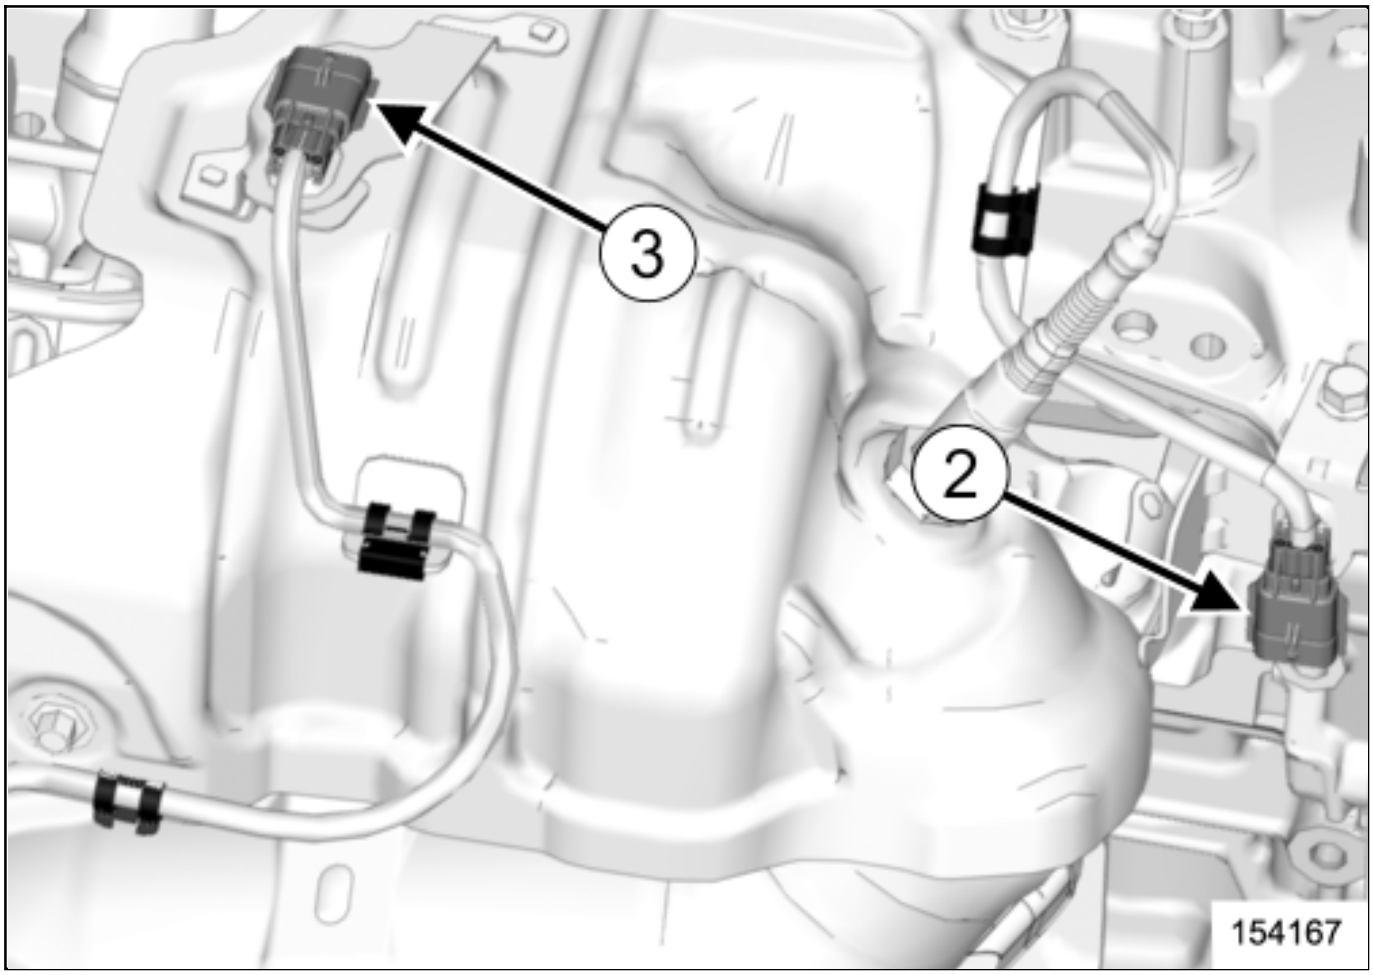
- the air filter unit (see 12A, Fuel mixture, Air inlet assembly: Exploded view) ,
- the front right-hand wheel Front hub carrier assembly: Exploded view .

Remove the engine undertray.

Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

Remove the front right-hand wheel driveshaft Front hub carrier assembly: Exploded view .

Remove the lower engine tie-bar Engine-gearbox unit support assembly: Exploded view



Remove:

- the bolts(1) from the front right-hand driveshaft relay bearing,
- the front right-hand driveshaft relay bearing.

Remove Exhaust assembly under body: Exploded view :

- the exhaust flange nuts,
- the exhaust flange seal,
- the flexible pipe support bolts.

Move the exhaust pipe to one side.

Disconnect:

- the upstream oxygen sensor connector(2) ,
- the downstream oxygen sensor connector(3) .

Unclip

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector,
- the oxygen sensor wiring from the upper turbo-manifold heat shield.

Remove the upstream oxygen sensor(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REMOVAL OPERATION

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upper turbo-manifold heat shield bolts,
- the upper turbo-manifold heat shield,
- the catalytic pre-converter strut bolts from the catalytic pre-converter.

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the lower catalytic pre-converter strut bolts from the engine, gearbox side using an universal joint,
- the upper catalytic pre-converter strut bolts from the engine, gearbox side by the exhaust tunnel.

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the catalytic pre-converter strut bolts from the engine,
- the catalytic pre-converter on engine bracket bolts from the catalytic pre-converter,
- the catalytic pre-converter on engine bracket bolt from the engine,

- the catalytic pre-converter on engine bracket,
- the catalytic pre-converter from the turbo-manifold nuts,
- the catalytic pre-converter strut,
- the catalytic pre-converter,
- the catalytic pre-converter seal.

1- IF REPLACING THE CATALYTIC PRE-CONVERTER

Remove the downstream oxygen sensor(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replaced:

- the catalytic pre-converter seal,
- the exhaust flange seal.

Use a grey abrasive padVehicle: Parts and consumables for the repair to clean the joint faces of:

- the catalytic pre-converter,
- the exhaust flange.

Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint faces of:

- the catalytic pre-converter,

- the exhaust flange.

Note:

If a stud becomes loose during the removal, replace it with a new stud and coat it with high strength thread lock Vehicle: Parts and consumables for the repair .

1- IF REPLACING THE CATALYTIC PRE-CONVERTER

Refit the downstream oxygen sensor (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REFITTING OPERATION

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the new catalytic pre-converter seal,
- the catalytic pre-converter,
- the catalytic pre-converter strut,
- the catalytic pre-converter on the turbo-manifold nuts,
- the catalytic pre-converter on engine bracket,
- the catalytic pre-converter on engine bracket bolt on the engine,
- the catalytic pre-converter on engine bracket bolts on the catalytic pre-converter,
- the catalytic pre-converter strut bolts on the engine,
- the catalytic pre-converter strut bolts on the catalytic pre-converter.

Torque tighten (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view):

- the catalytic pre-converter on the turbo-manifold nuts,
- the catalytic pre-converter on engine bracket bolt on the engine,
- the catalytic pre-converter on engine bracket bolts on the catalytic pre-converter,
- the catalytic pre-converter strut bolts on the engine,
- the catalytic pre-converter strut bolts on the catalytic pre-converter.

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view):

- the upper turbo-manifold heat shield,
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield bolts (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view).

3. FINAL OPERATION

Refit the upstream oxygen sensor (see **Engine and transmission assembly sensors: List and location of components**).

Clip:

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector,
- the oxygen sensor wiring onto the upper turbo-manifold heat shield.

Connect:

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector.

Fit the exhaust pipe to one side.

Refit **Exhaust assembly under body: Exploded view** :

- the flexible pipe support bolts,
- the new exhaust flange seal,
- the exhaust flange nuts.

Torque tighten**Exhaust assembly under body: Exploded view** :

- the flexible pipe support bolts,
- the exhaust flange nuts.

Proceed in the reverse order to removal.

CATALYTICPRE-CONVERTER:REMOVAL-REFITTING

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 19B, Exhaust, Exhaust: Precautions for the repair) ,

Vehicle: Precautions for the repair .

WARNING

Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

WARNING

Wear cut-resistant gloves during the operation.

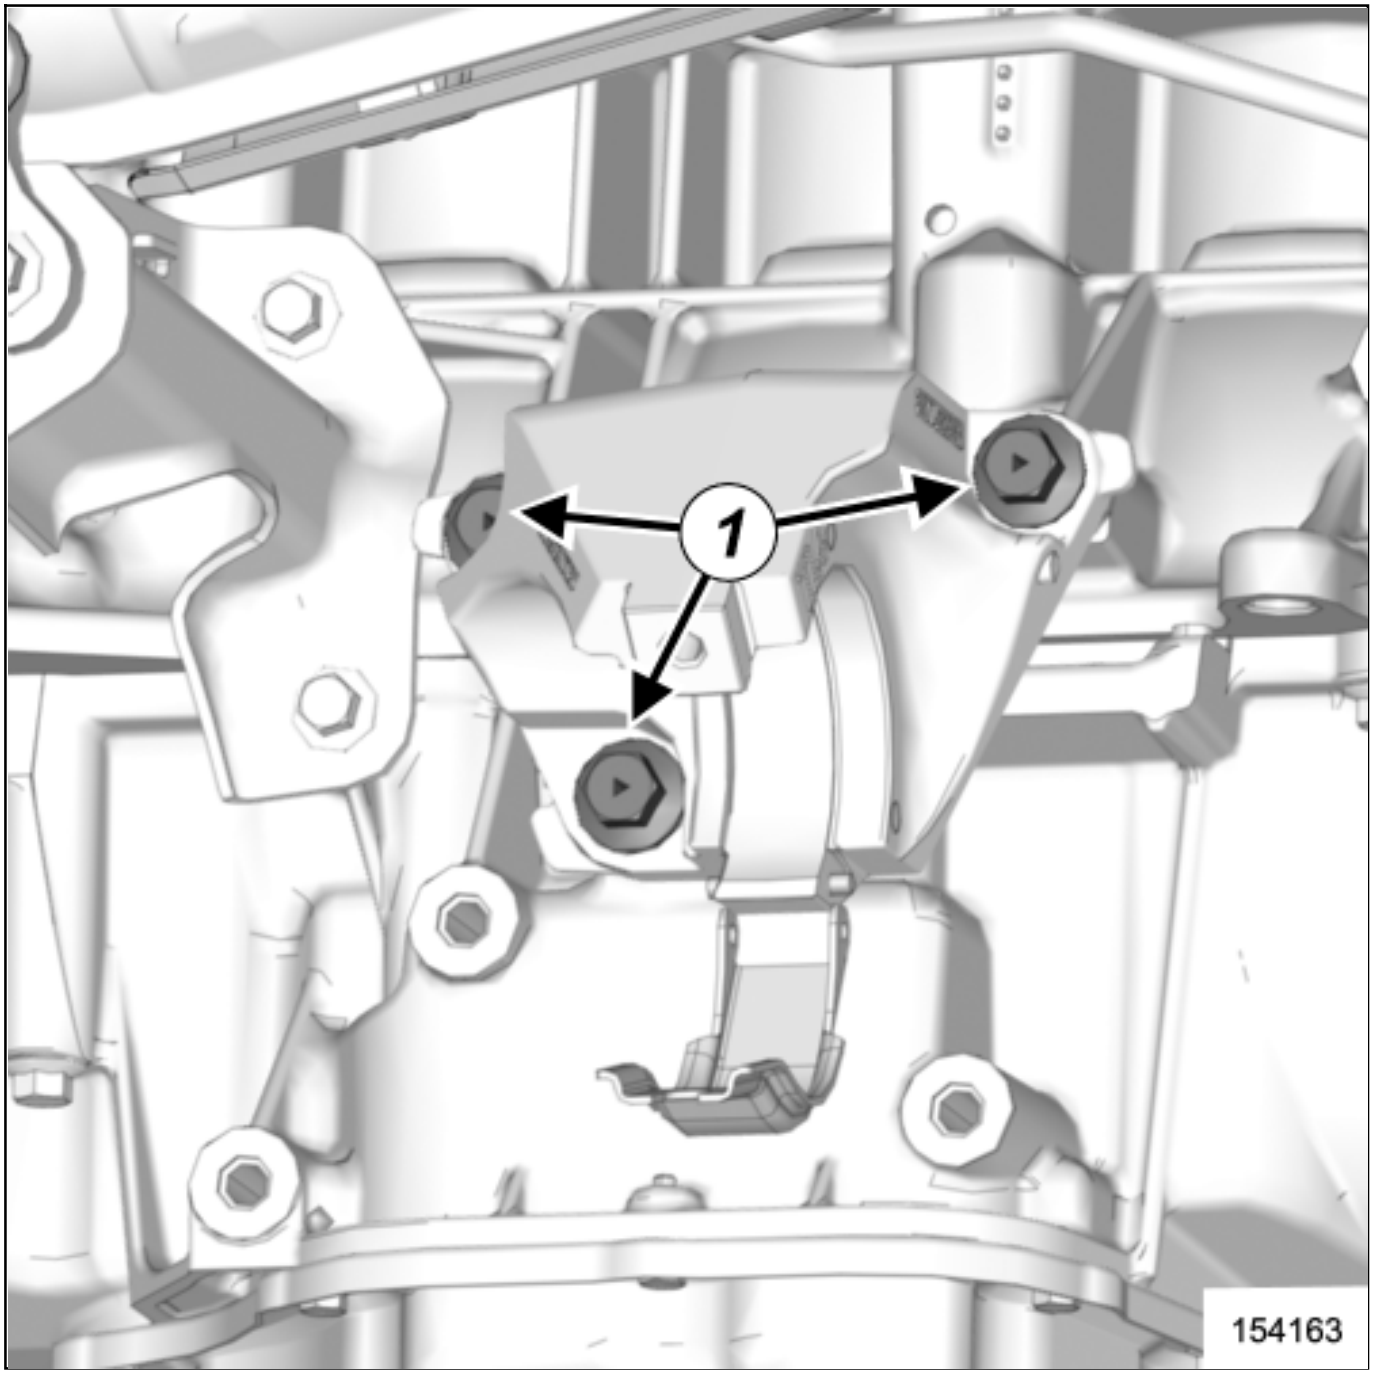
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Position the vehicle on a two-post liftVehicle: Towing and lifting .

Remove:



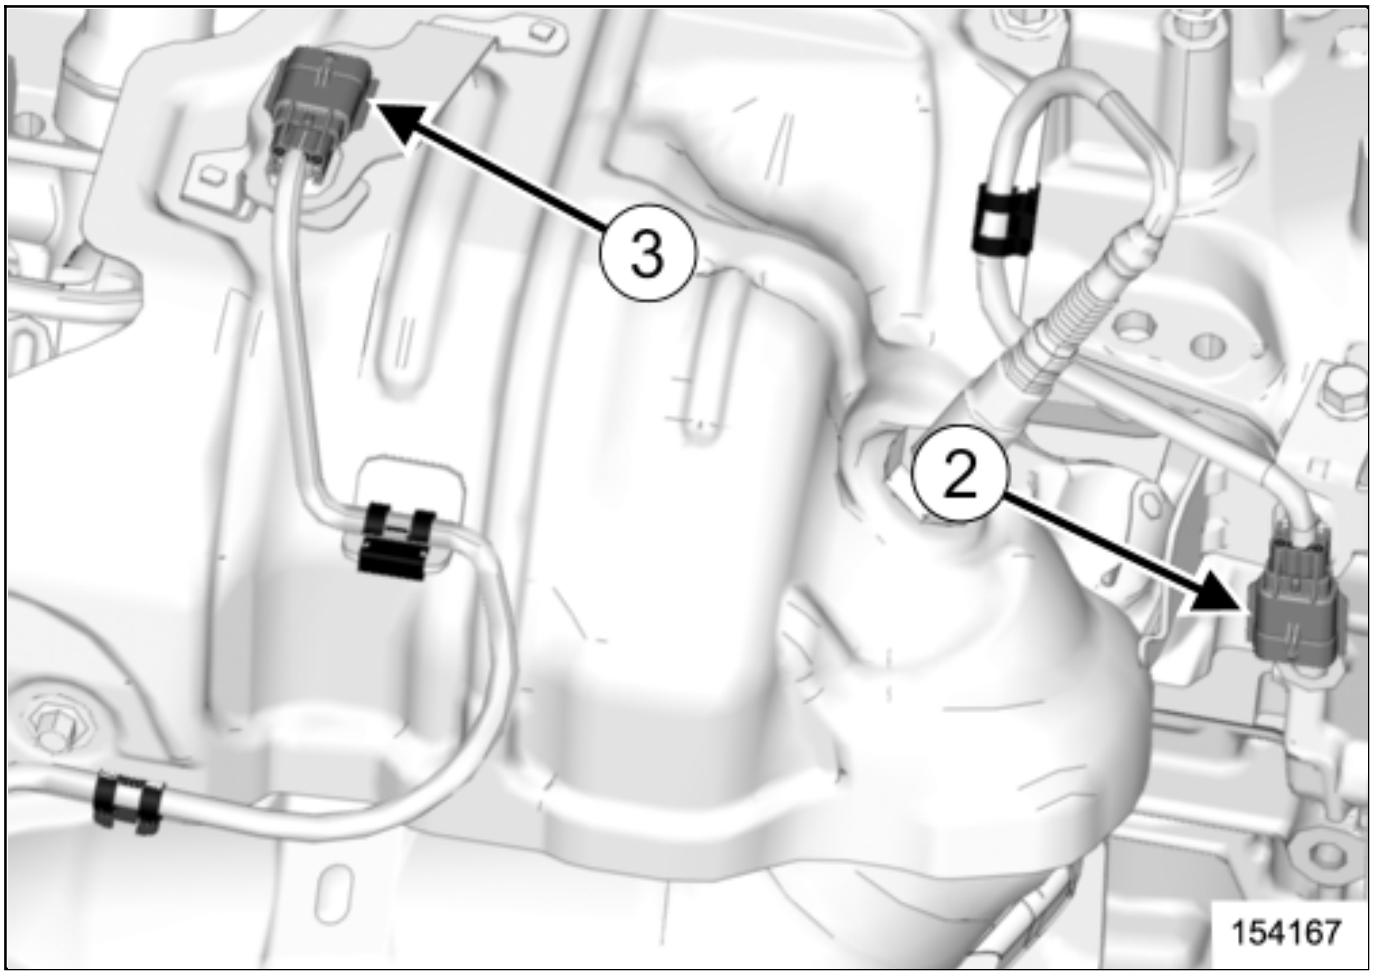
- the battery Battery: Removal - Refitting ,
- the air filter unit Air inlet assembly: Exploded view ,
- the front right-hand wheel Front hub carrier assembly: Exploded view .

Remove the engine undertray.

Drain the automatic gearbox oil Automatic gearbox oil: Draining - Filling .

Remove the front right-hand wheel driveshaft Front hub carrier assembly: Exploded view .

Remove the lower engine tie-bar Engine-gearbox unit support assembly: Exploded view



Remove:

- the bolts(1) from the front right-hand driveshaft relay bearing,
- the front right-hand driveshaft relay bearing.

Remove (see 19B, Exhaust, Exhaust assembly under body: Exploded view) :

- the exhaust flange nuts,
- the exhaust flange seal,
- the flexible pipe support bolts.

Move the exhaust pipe to one side.

Disconnect:

- the upstream oxygen sensor connector(2) ,
- the downstream oxygen sensor connector(3) .

Unclip

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector,
- the oxygen sensor wiring from the upper turbo-manifold heat shield.

Remove the upstream oxygen sensor(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REMOVAL OPERATION

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the upper turbo-manifold heat shield bolts,
- the upper turbo-manifold heat shield,
- the catalytic pre-converter strut bolts from the catalytic pre-converter.

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the lower catalytic pre-converter strut bolts from the engine, gearbox side using an universal joint,
- the upper catalytic pre-converter strut bolts from the engine, gearbox side by the exhaust tunnel.

Remove (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the catalytic pre-converter strut bolts from the engine,
- the catalytic pre-converter on engine bracket bolts from the catalytic pre-converter,
- the catalytic pre-converter on engine bracket bolt from the engine,

- the catalytic pre-converter on engine bracket,
- the catalytic pre-converter from the turbo-manifold nuts,
- the catalytic pre-converter strut,
- the catalytic pre-converter,
- the catalytic pre-converter seal.

1- IF REPLACING THE CATALYTIC PRE-CONVERTER

Remove the downstream oxygen sensor(see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

REFITTING

1. REFITTING PREPARATION OPERATION

Part always to be replaced:

- the catalytic pre-converter seal,
- the exhaust flange seal.

Use a grey abrasive padVehicle: Parts and consumables for the repair to clean the joint faces of:

- the catalytic pre-converter,
- the exhaust flange.

Use surface cleanerVehicle: Parts and consumables for the repair to clean the joint faces of:

- the catalytic pre-converter,

- the exhaust flange.

Note:

If a stud becomes loose during the removal, replace it with a new stud and coat it with high strength thread lock Vehicle: Parts and consumables for the repair .

1- IF REPLACING THE CATALYTIC PRE-CONVERTER

Refit the downstream oxygen sensor (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) .

2. REFITTING OPERATION

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view) :

- the new catalytic pre-converter seal,
- the catalytic pre-converter,
- the catalytic pre-converter strut,
- the catalytic pre-converter on the turbo-manifold nuts,
- the catalytic pre-converter on engine bracket,
- the catalytic pre-converter on engine bracket bolt on the engine,
- the catalytic pre-converter on engine bracket bolts on the catalytic pre-converter,
- the catalytic pre-converter strut bolts on the engine,
- the catalytic pre-converter strut bolts on the catalytic pre-converter.

Torque tighten (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view):

- the catalytic pre-converter on the turbo-manifold nuts,
- the catalytic pre-converter on engine bracket bolt on the engine,
- the catalytic pre-converter on engine bracket bolts on the catalytic pre-converter,
- the catalytic pre-converter strut bolts on the engine,
- the catalytic pre-converter strut bolts on the catalytic pre-converter.

Refit (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view):

- the upper turbo-manifold heat shield,
- the upper turbo-manifold heat shield bolts.

Torque tighten the upper turbo-manifold heat shield bolts (see 19B, Exhaust, Exhaust assembly in engine compartment: Exploded view).

3. FINAL OPERATION

Refit the upstream oxygen sensor (see **Engine and transmission assembly sensors: List and location of components**).

Clip:

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector,
- the oxygen sensor wiring onto the upper turbo-manifold heat shield.

Connect:

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector.

Fit the exhaust pipe to one side.

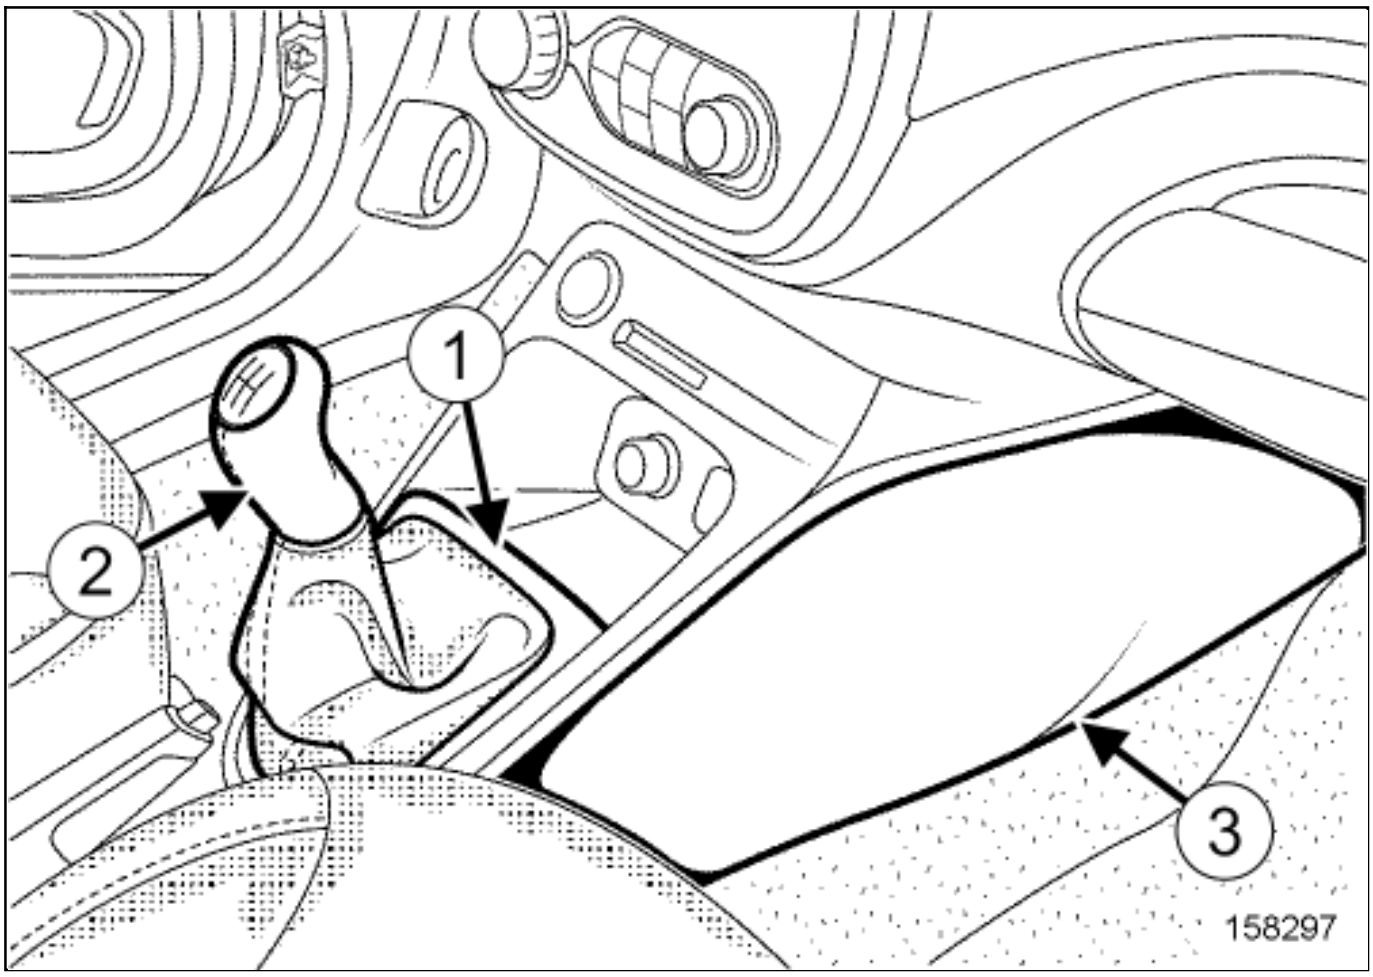
Refit (see 19B, Exhaust, Exhaust assembly under body: Exploded view) :

- the flexible pipe support bolts,
- the new exhaust flange seal,
- the exhaust flange nuts.

Torque tighten(see 19B, Exhaust, Exhaust assembly under body: Exploded view) :

- the flexible pipe support bolts,
- the exhaust flange nuts.

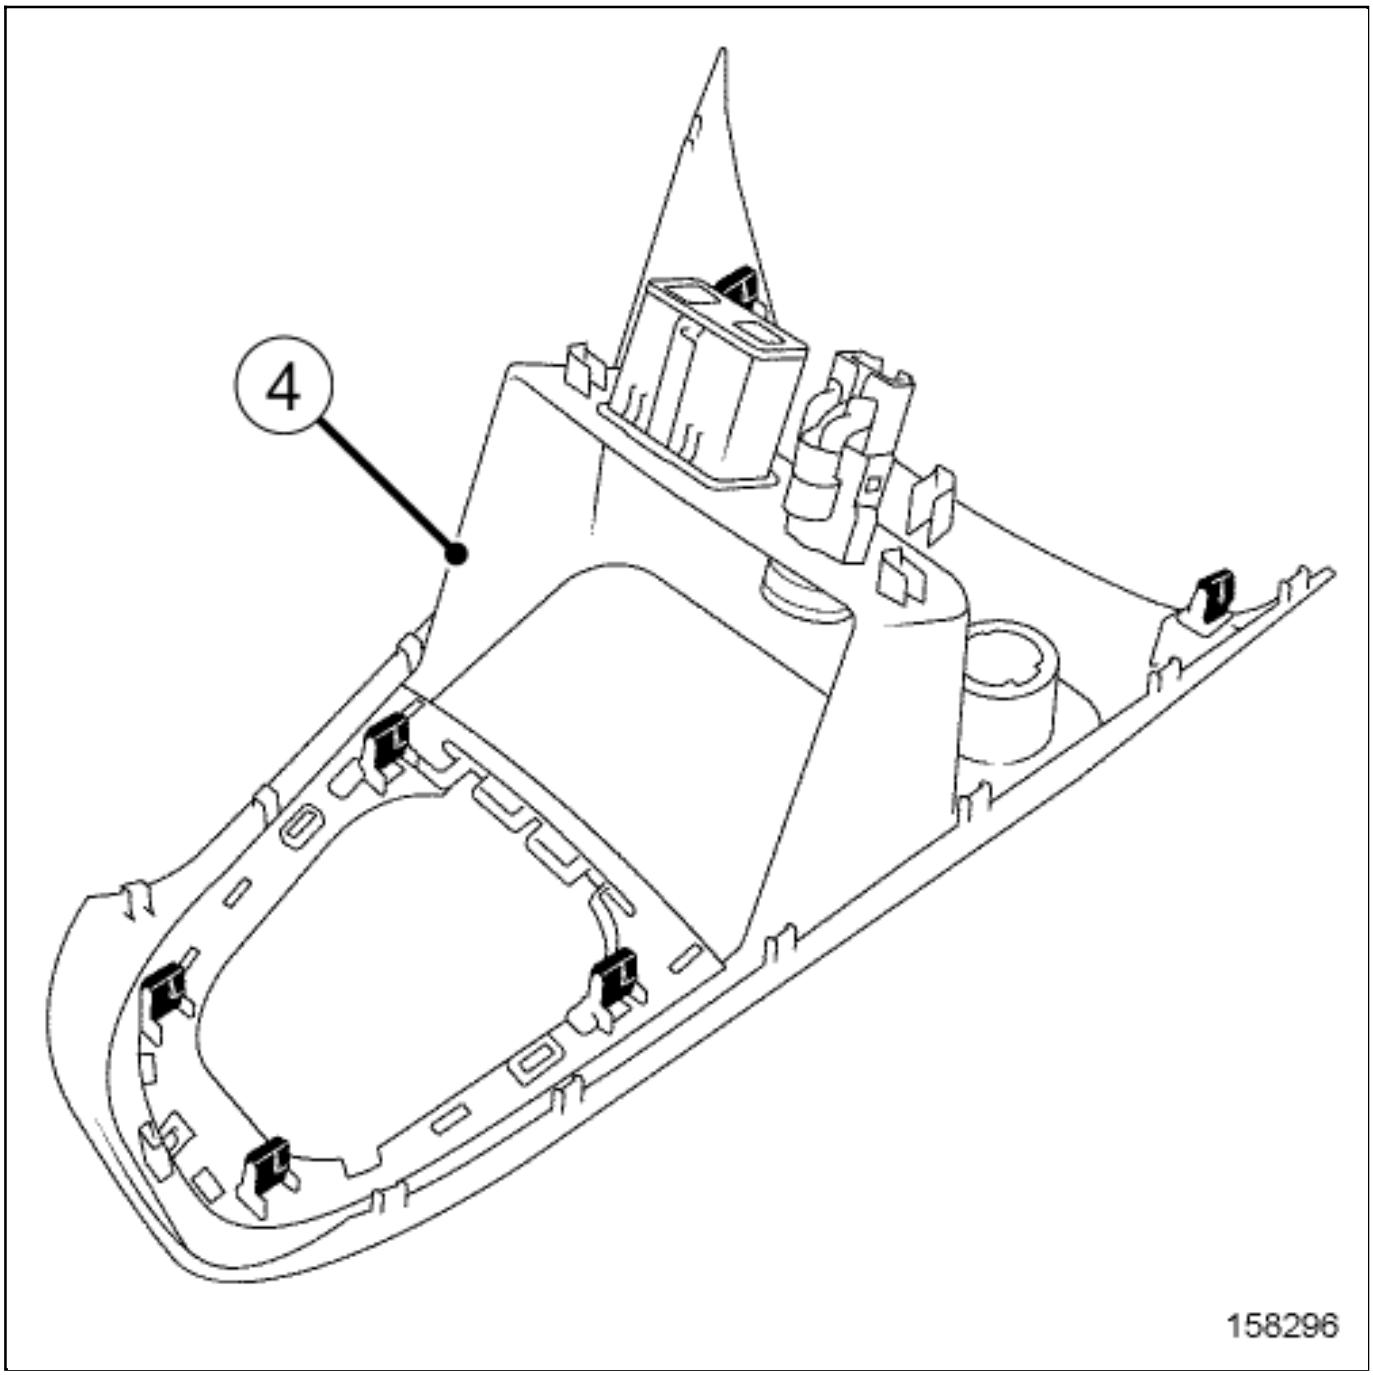
Proceed in the reverse order to removal.



CENTRE CONSOLE: REMOVAL - REFITTING

Special tooling required	
Set of trim removal levers.	Car. 1363

REMOVAL

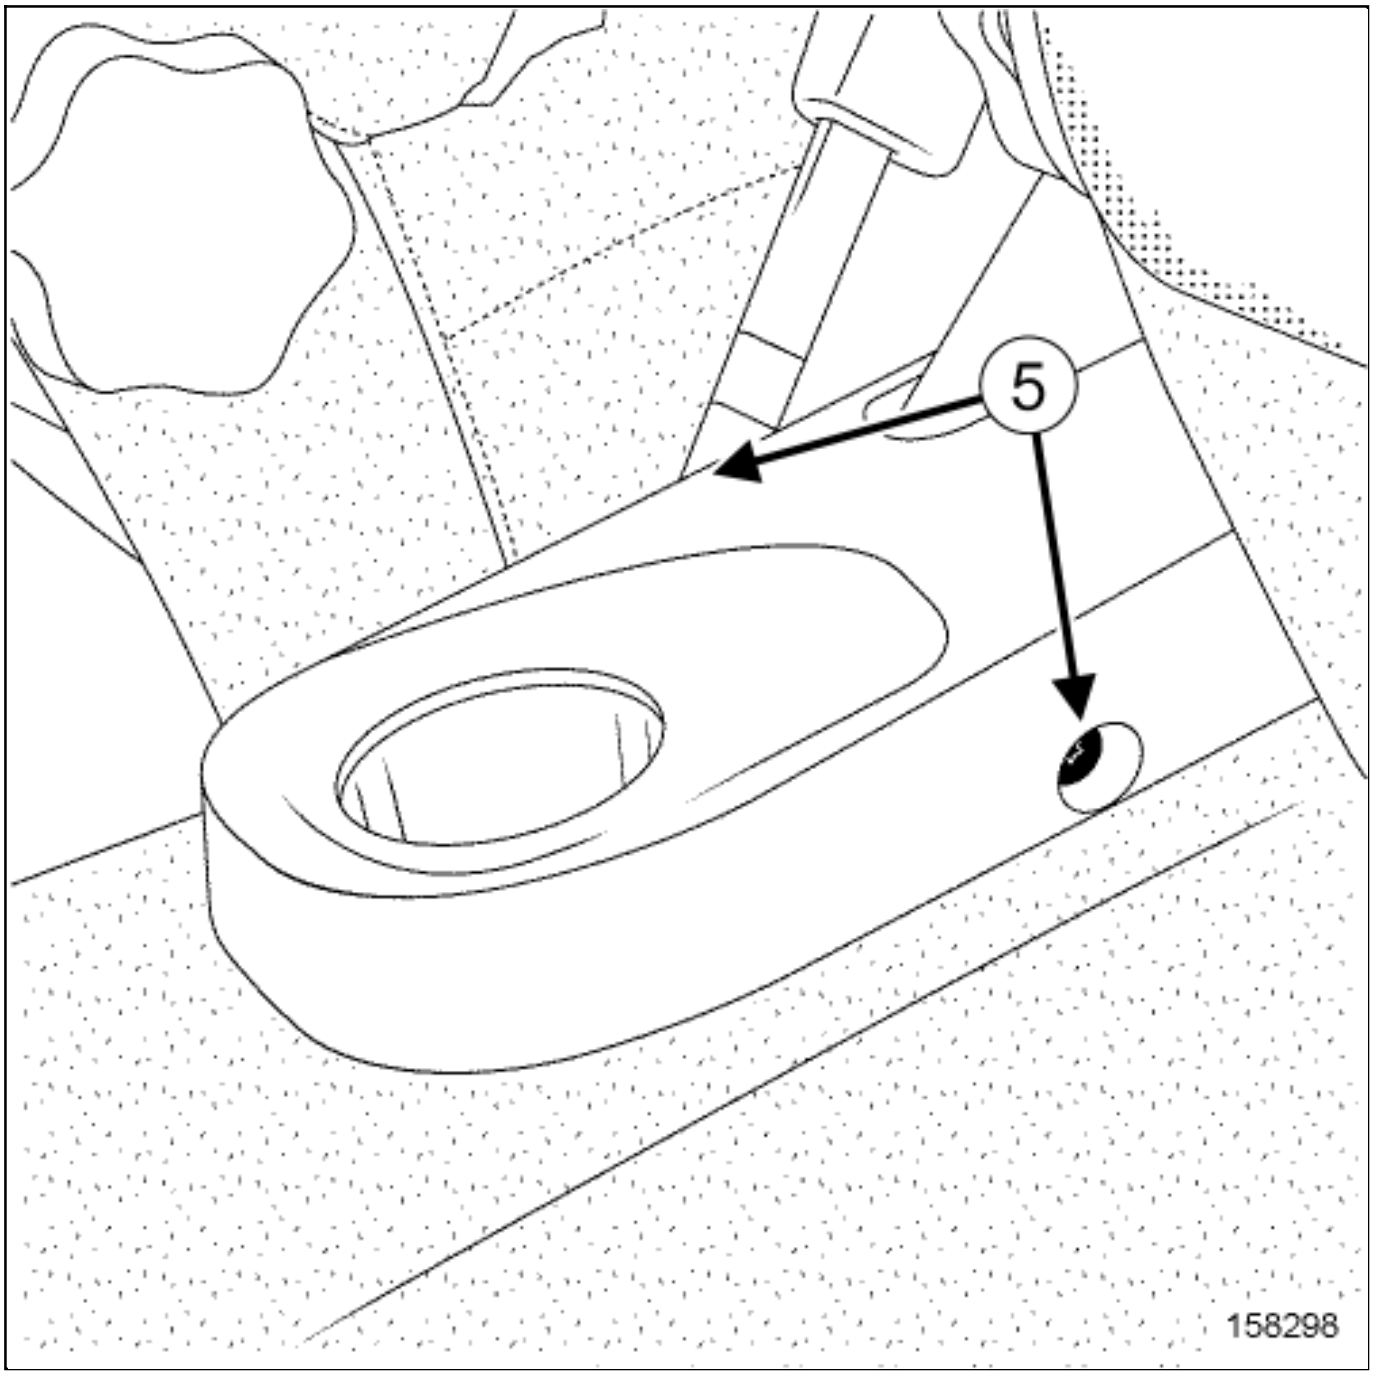


1. REMOVAL OPERATION

- Switch off the ignition.

- Unclip the gear lever gaiter trim(1) .
- Remove:
  - the gear lever knob(2) ,

the gear lever gaiter.



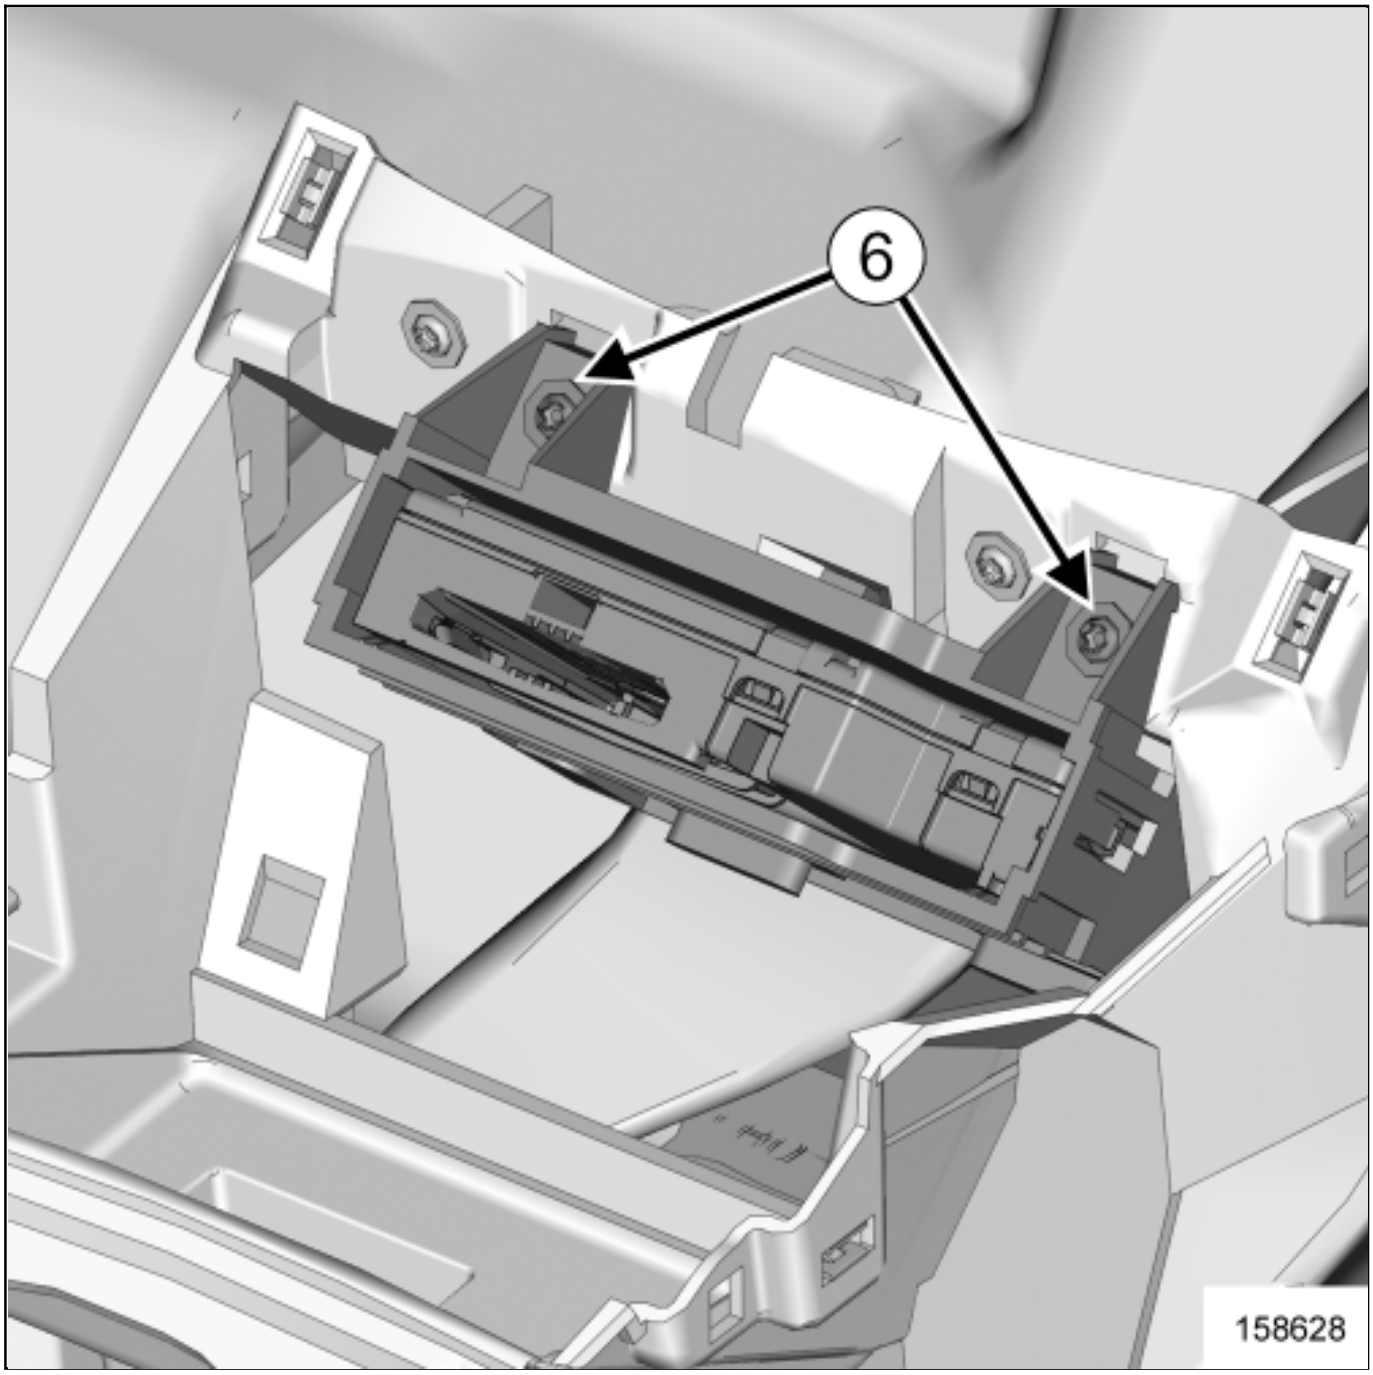
Unclip:

- the upper section of the centre console(4) ,
- the centre console side panels(3) using the toolSet of trim removal levers.(Car. 1363) .

Disconnect the connector of:

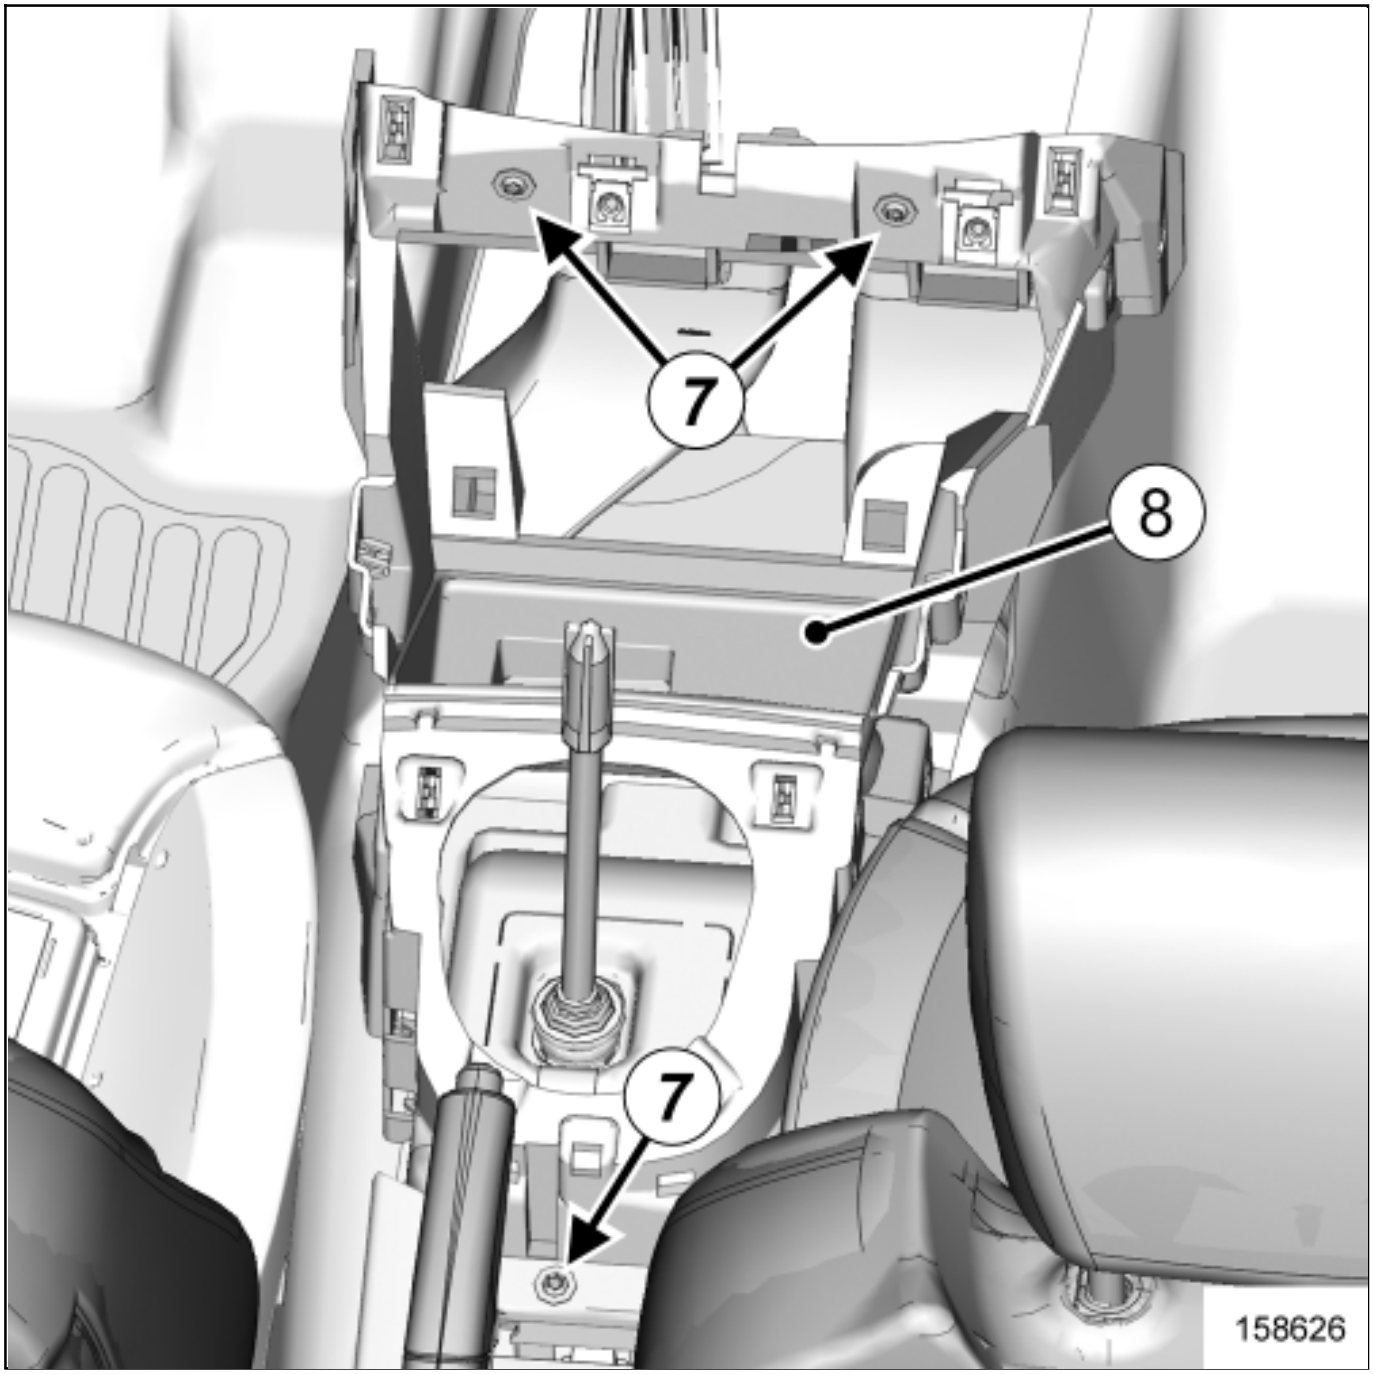
- the offset multimedia socket,
- the cigarette lighter,
- the start button.

Unclip the parking brake cover.

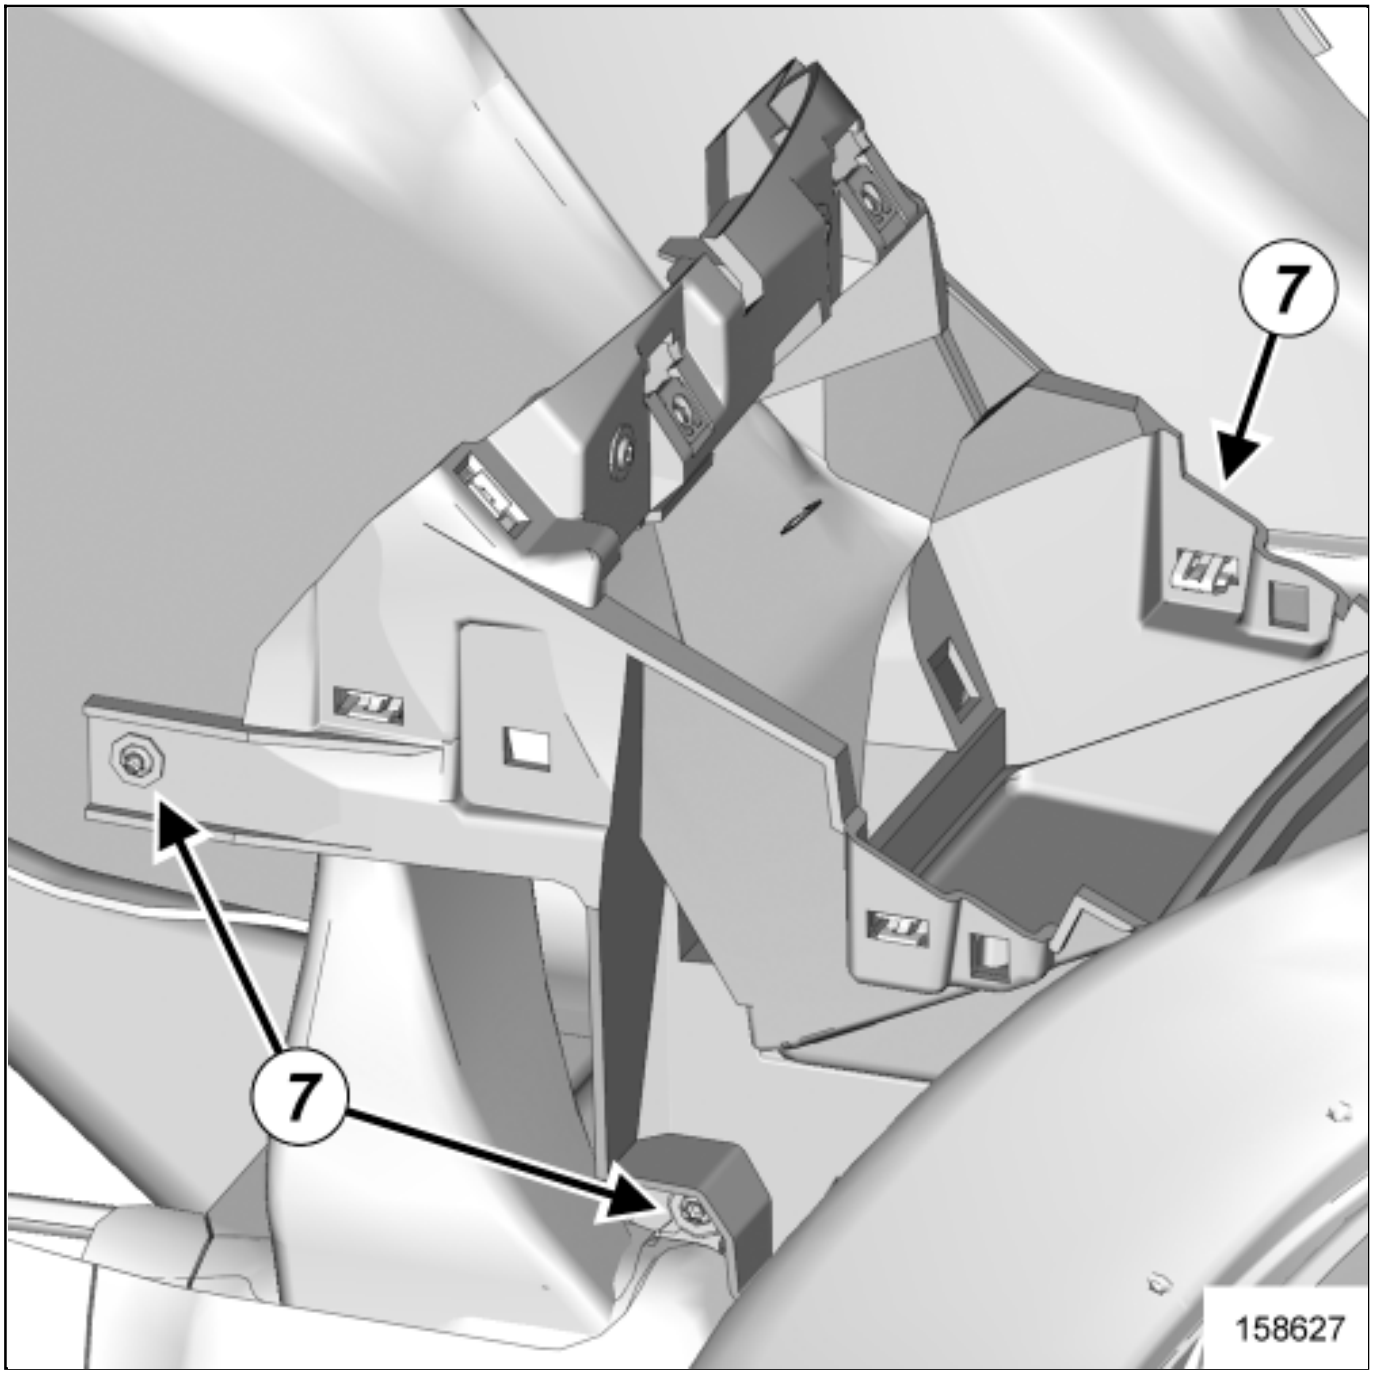


Remove on each side the screws(5) .

Unclip the lower section of the centre console.



Disconnect:



- the "Driving mode" switch,
- the cruise control-speed limiter switch.

Remove the lower section of the centre console.

- Remove the card reader support bolts(6) .
- Disconnect the card reader connector.
- Remove the "card reader - support" assembly.

7
8
7
158626

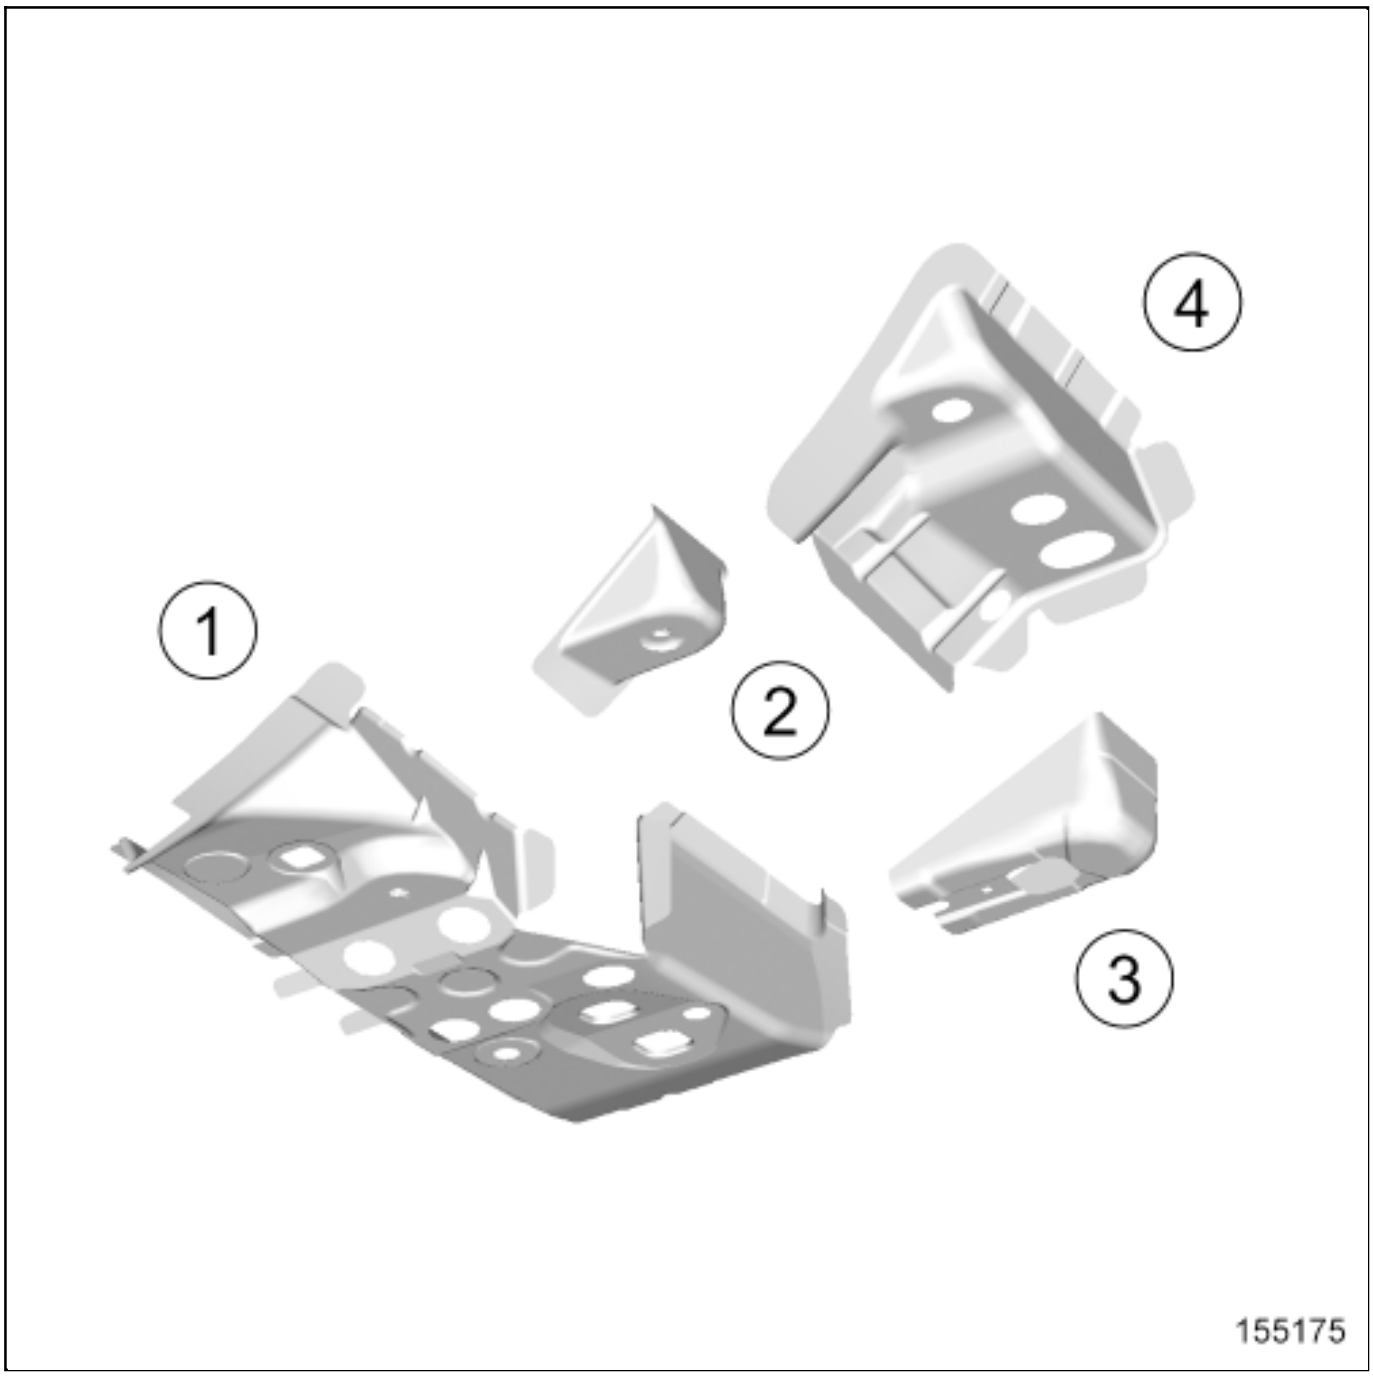
Remove:

- the centre console mounting bolts(7) ,
- the centre console mounting(8) .

REFITTING

Proceed in reverse order to removal.

Repair-50x08x04x02-01x37-1-27-1.xml



XSL version : 3.02 du 22/07/11

CENTRE FLOOR FRONT SIDE CROSS MEMBER: REPLACEMENT

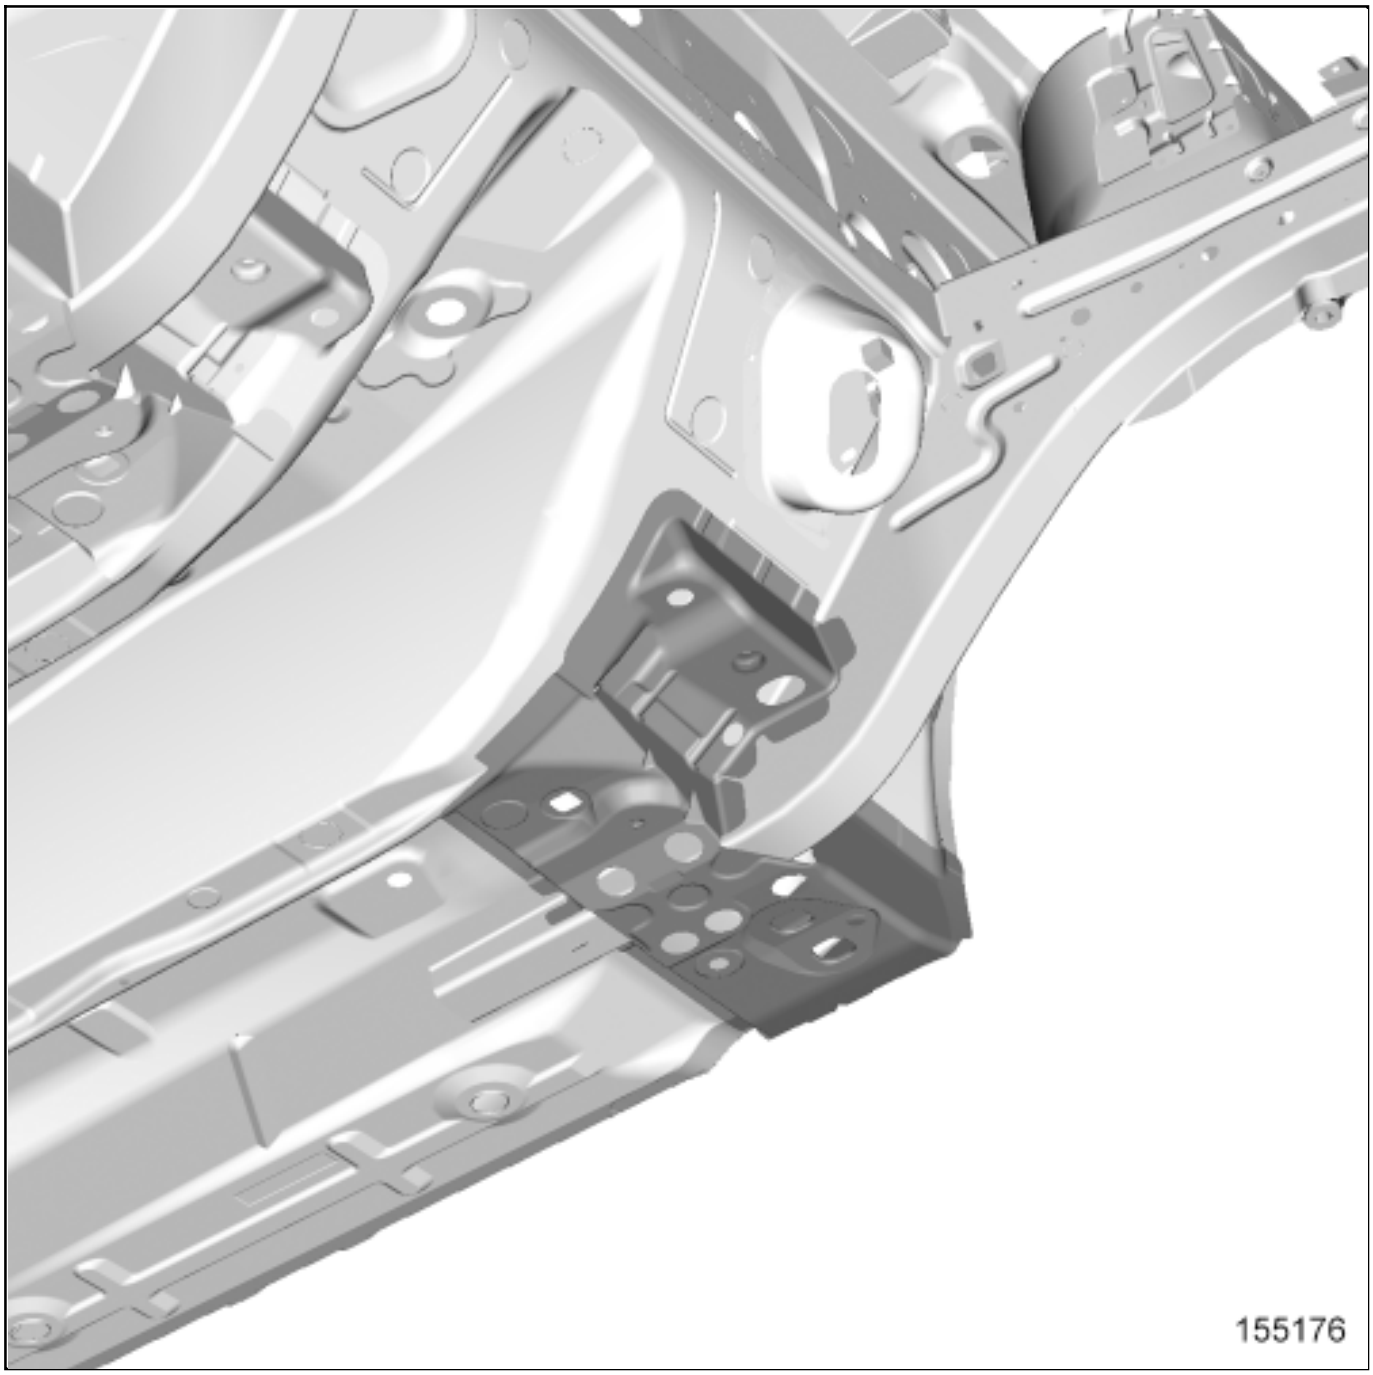
Note, one or more warnings are present in this procedure

1. COMPOSITION OF THE SPARE PART

No.	Description	Thickness (mm)
(1)	Centre floor front side cross member	1
(2)	Front side cross member reinforcement	2.6
(3)	Front subframe rear mounting reinforcement	1.5
(4)	Rear mounting unit of front subframe	2

2. IN THE EVENT OF REPLACEMENT

There is only one way of replacing this part:



complete replacement.

WARNING

Use a repair bench to ensure the positioning of the points and the geometry of the axle assemblies.

1- COMPLETE REPLACEMENT

1)PART IN POSITION

2)POSITION OF ELECTRIC EARTHS

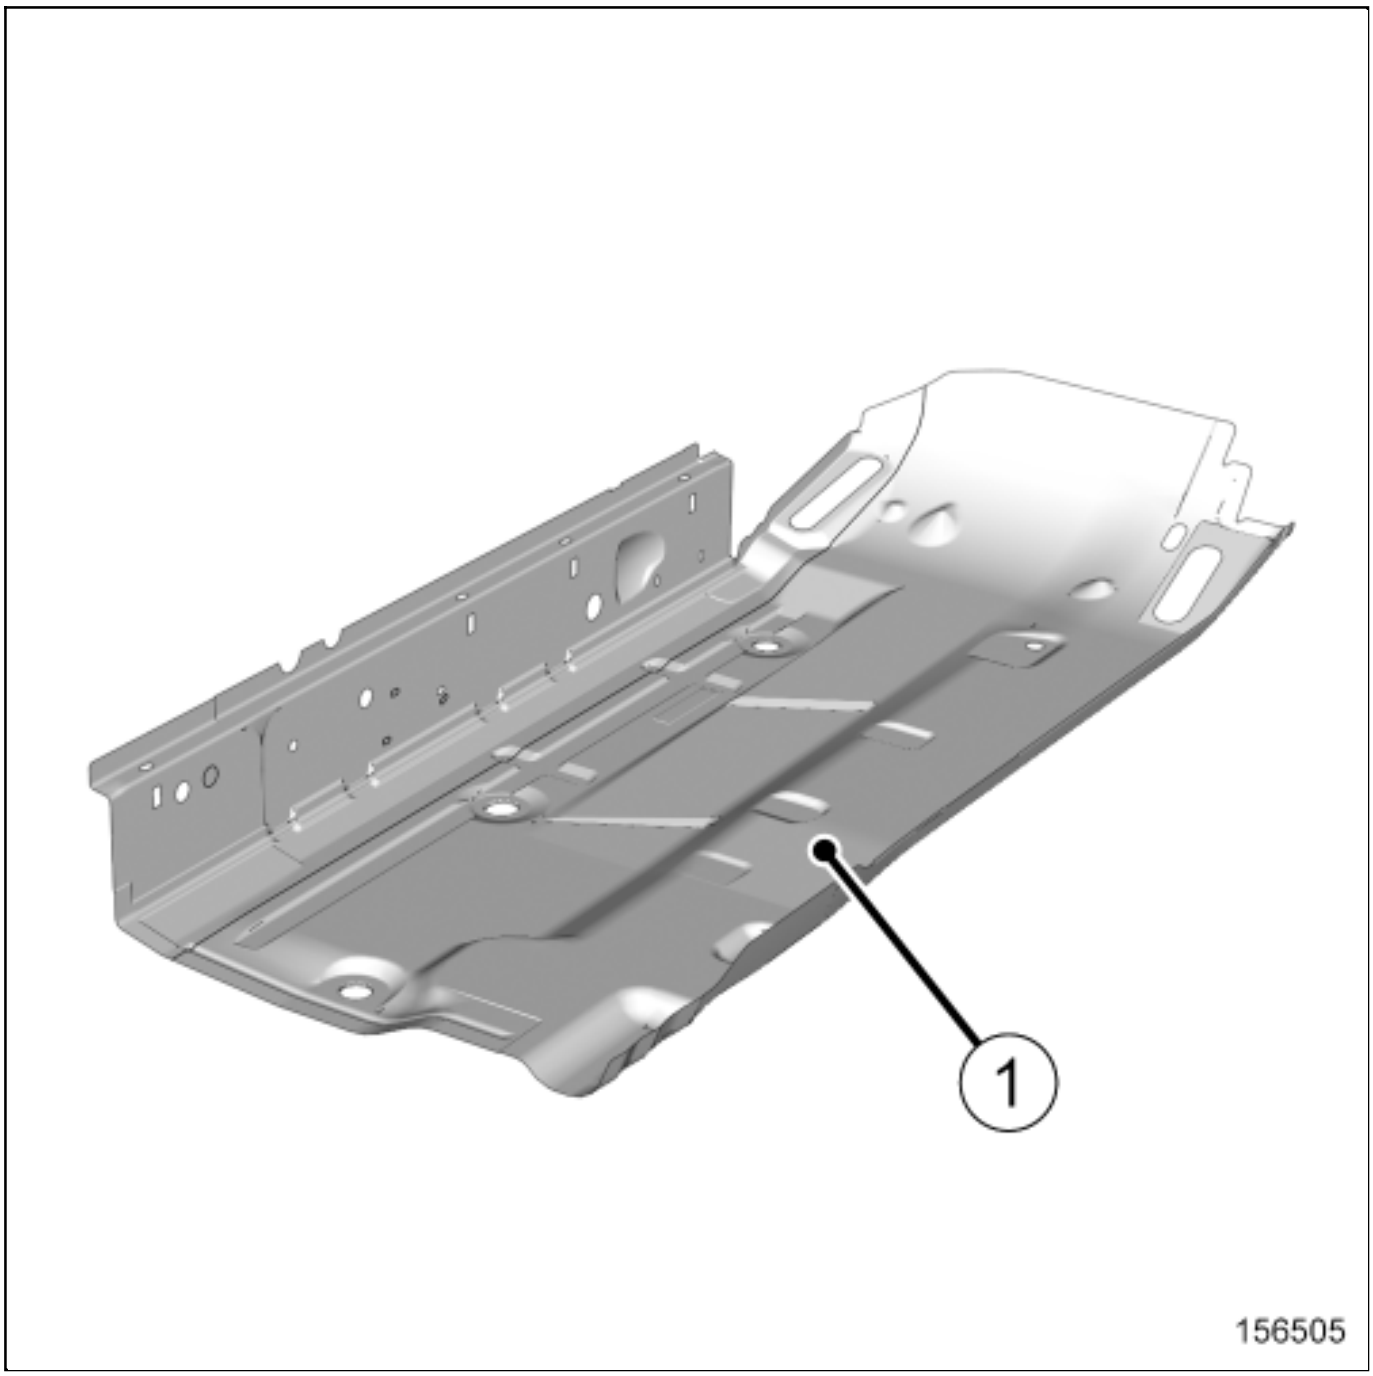
CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area(see **Bolted connection for earth: Fitting**) (MR 400, 40H, Bolted connections).

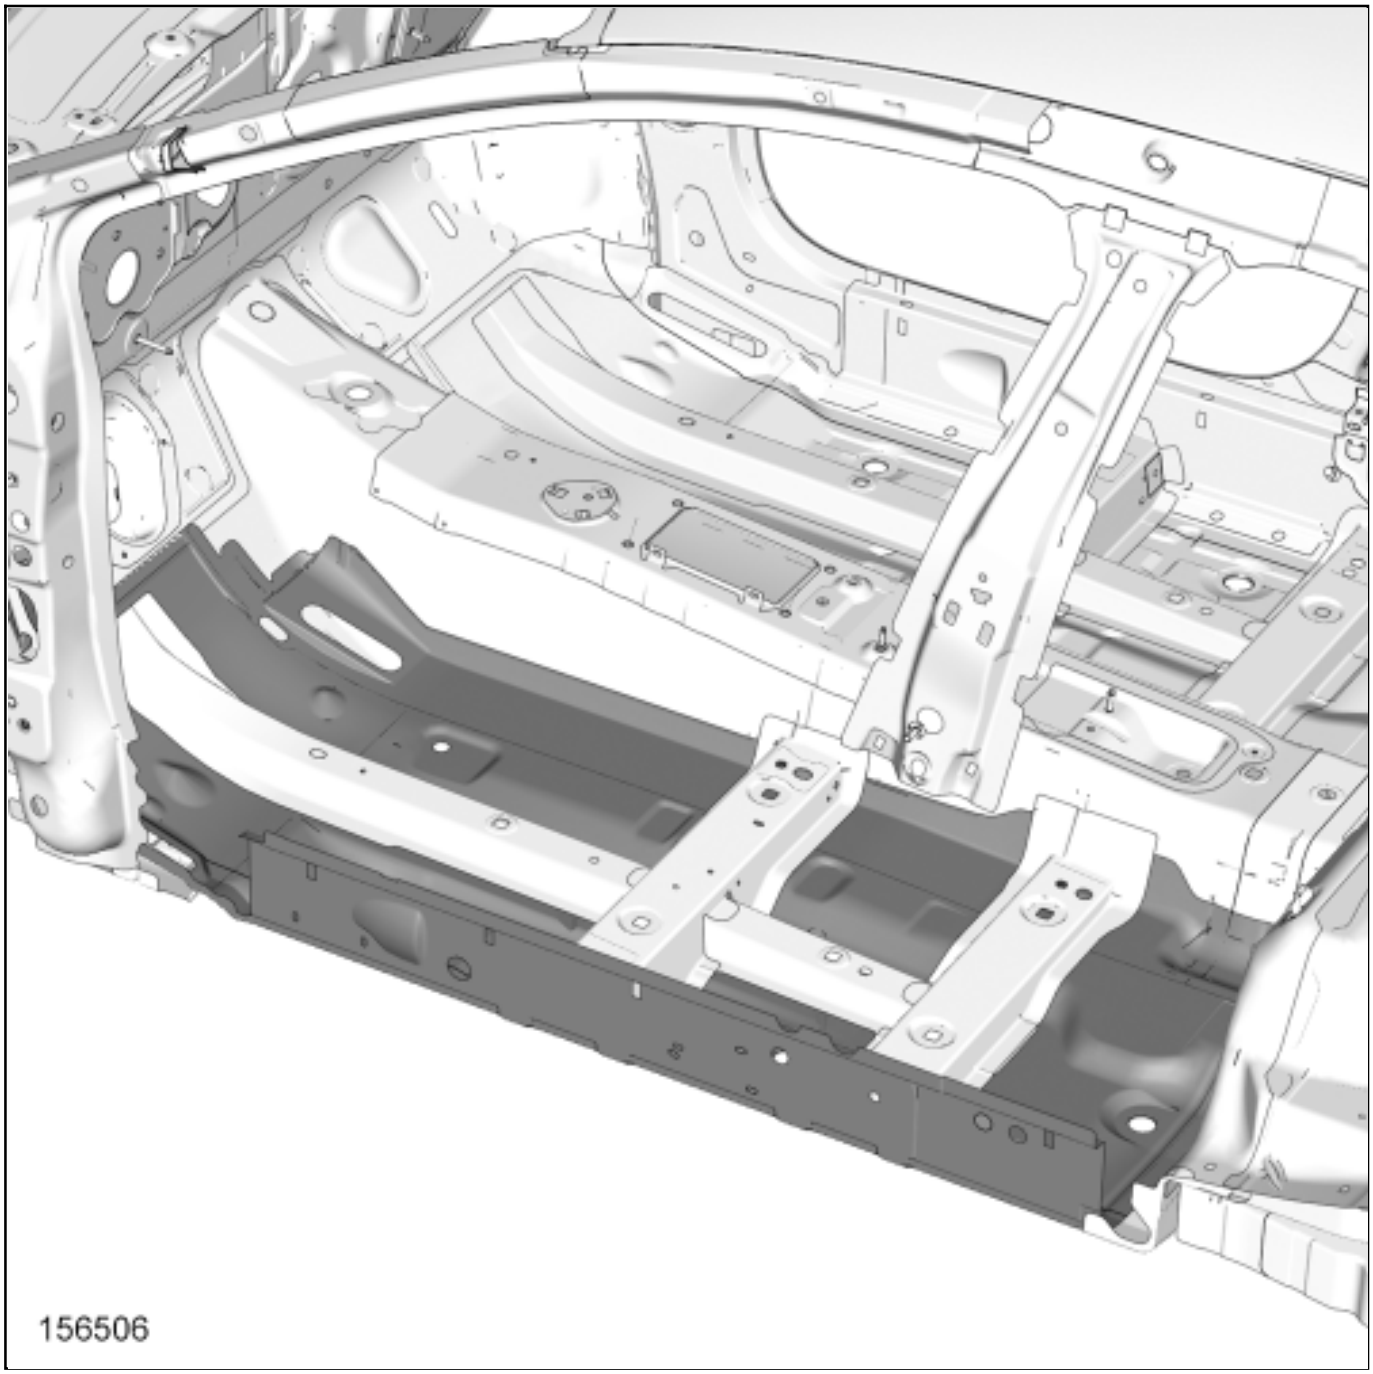
Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)SPECIAL NOTES ON MATING



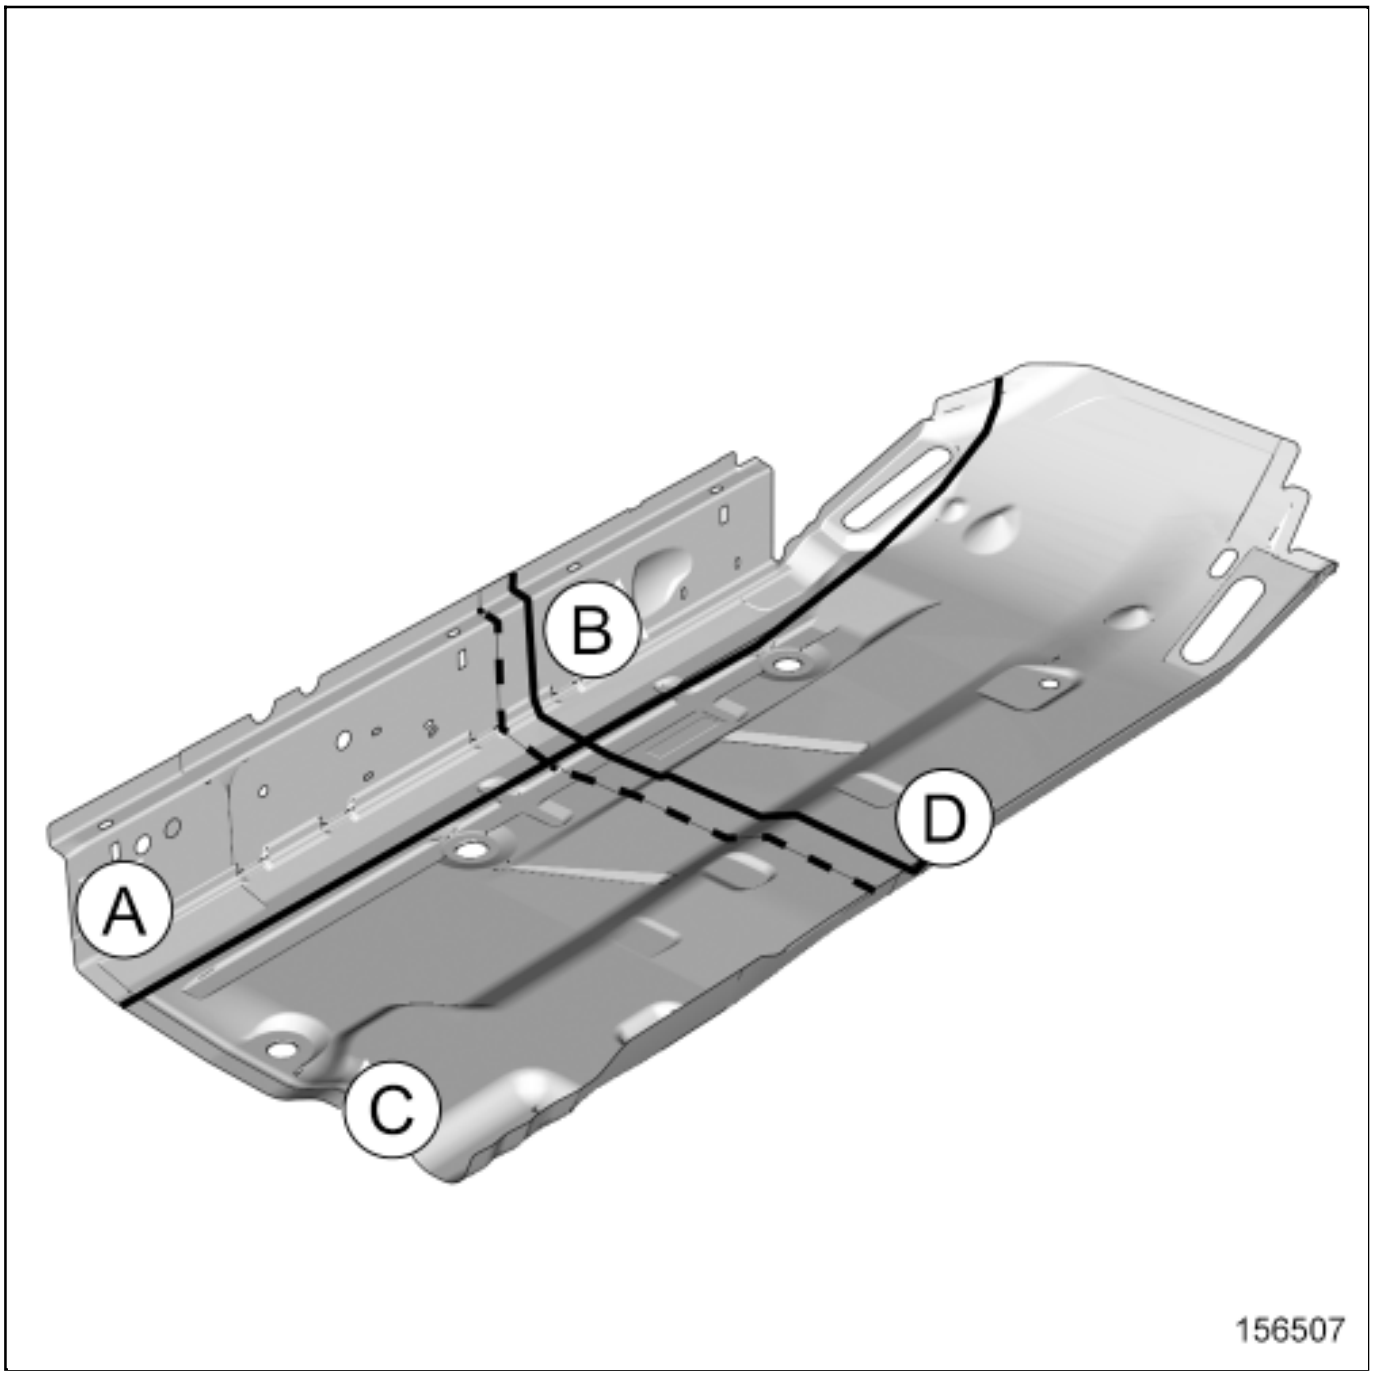
CAUTION

If the mating faces of the parts to be welded are not accessible, make EGW plug welds to replace the original resistance welds (see MR 400).



CENTRE FLOOR, SIDE SECTION: REPLACEMENT

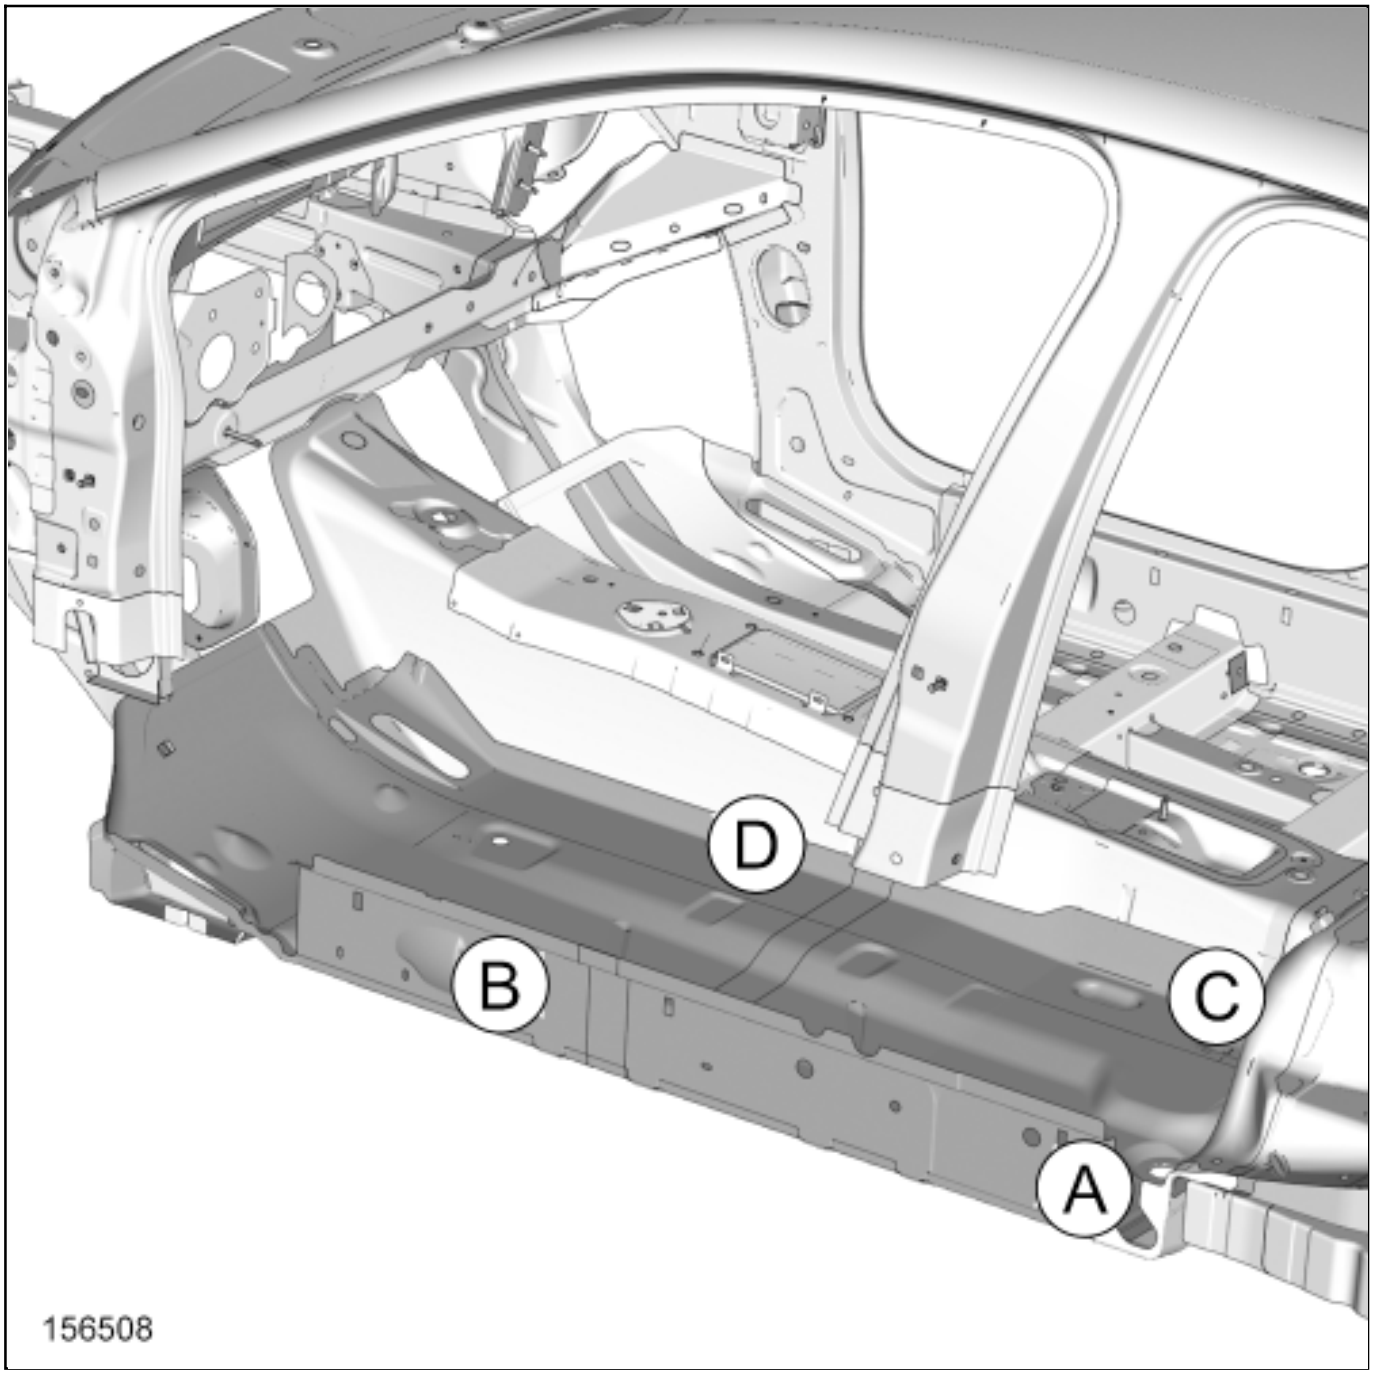
Note, one or more warnings are present in this procedure



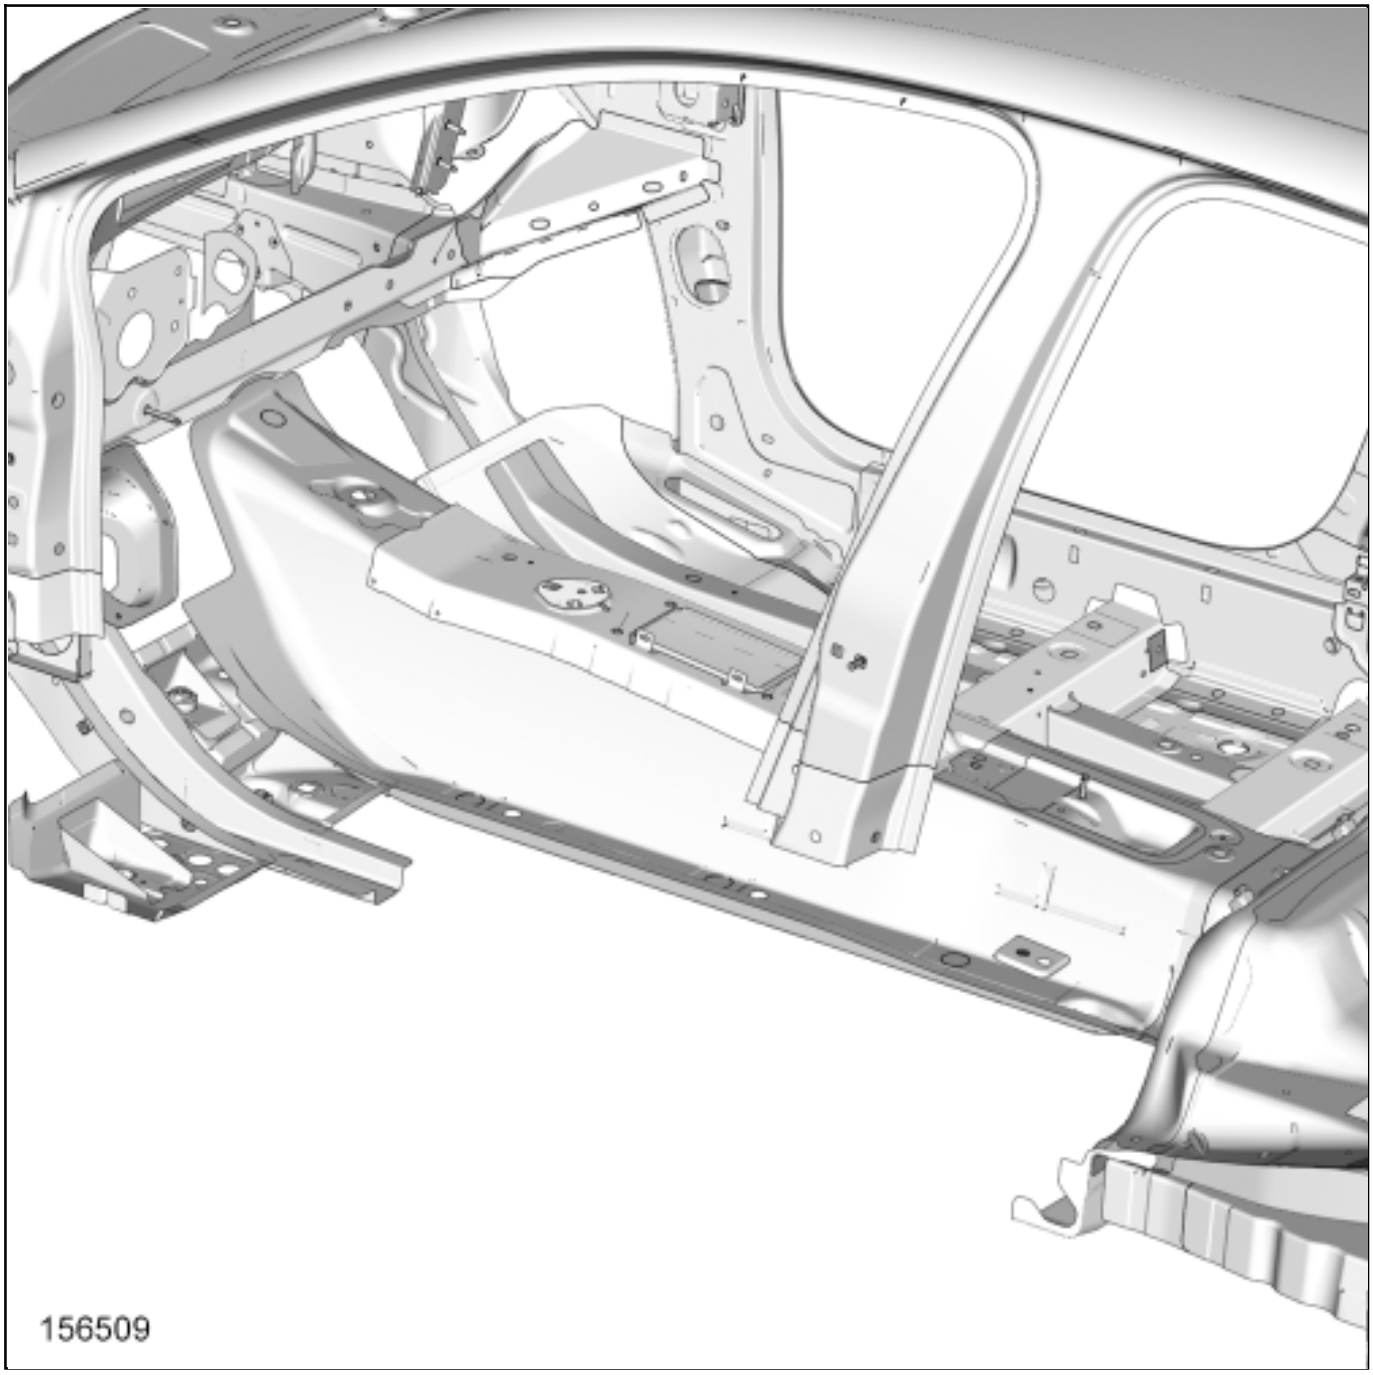
1. COMPOSITION OF THE SPARE PART

No.	Description	Type	Thickness (mm)
(1)	Centre floor, side section	Mild steel	0.65/1.2

2. IN THE EVENT OF REPLACEMENT



The options for replacing this part are as follows:



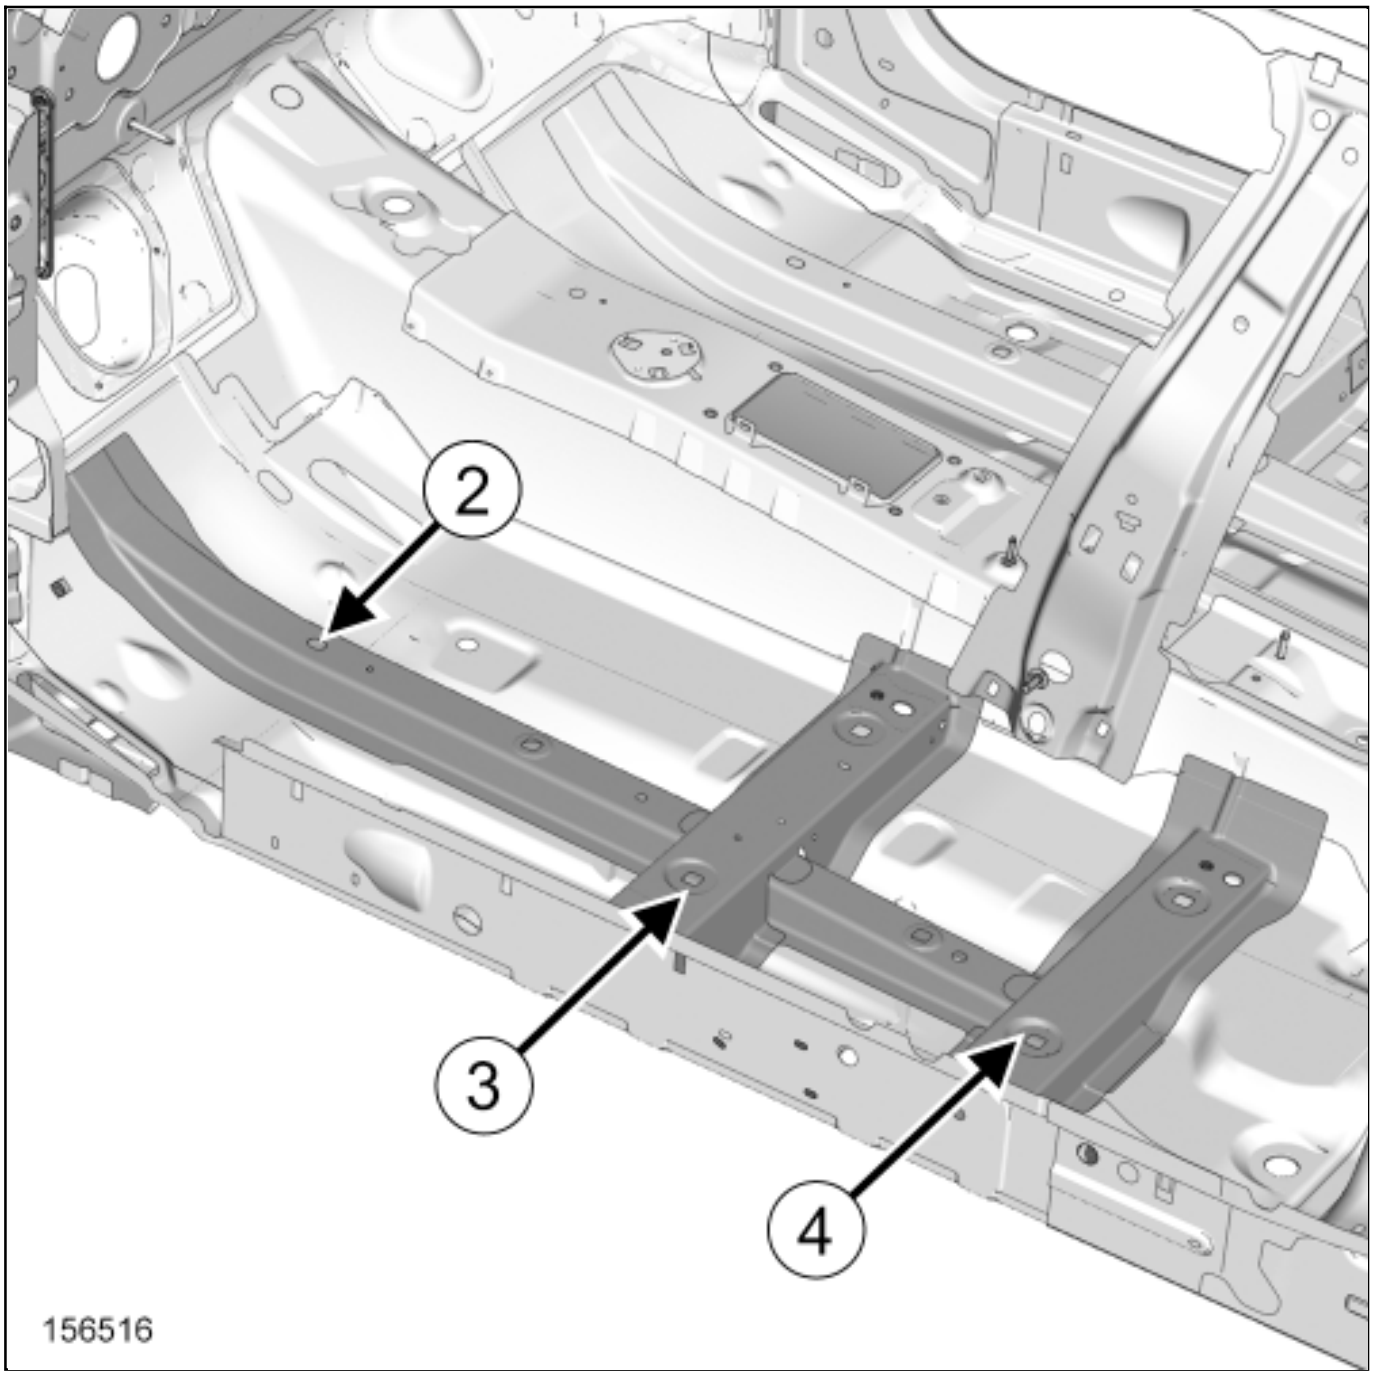
- complete replacement A-B-C-D,
- front partial replacement B-D,
- partial replacement A-B.

1- COMPLETE REPLACEMENT A-B-C-D

1)PART IN POSITION

VIEW WITHOUT PART

2)POSITION OF ELECTRIC EARTHS



CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).

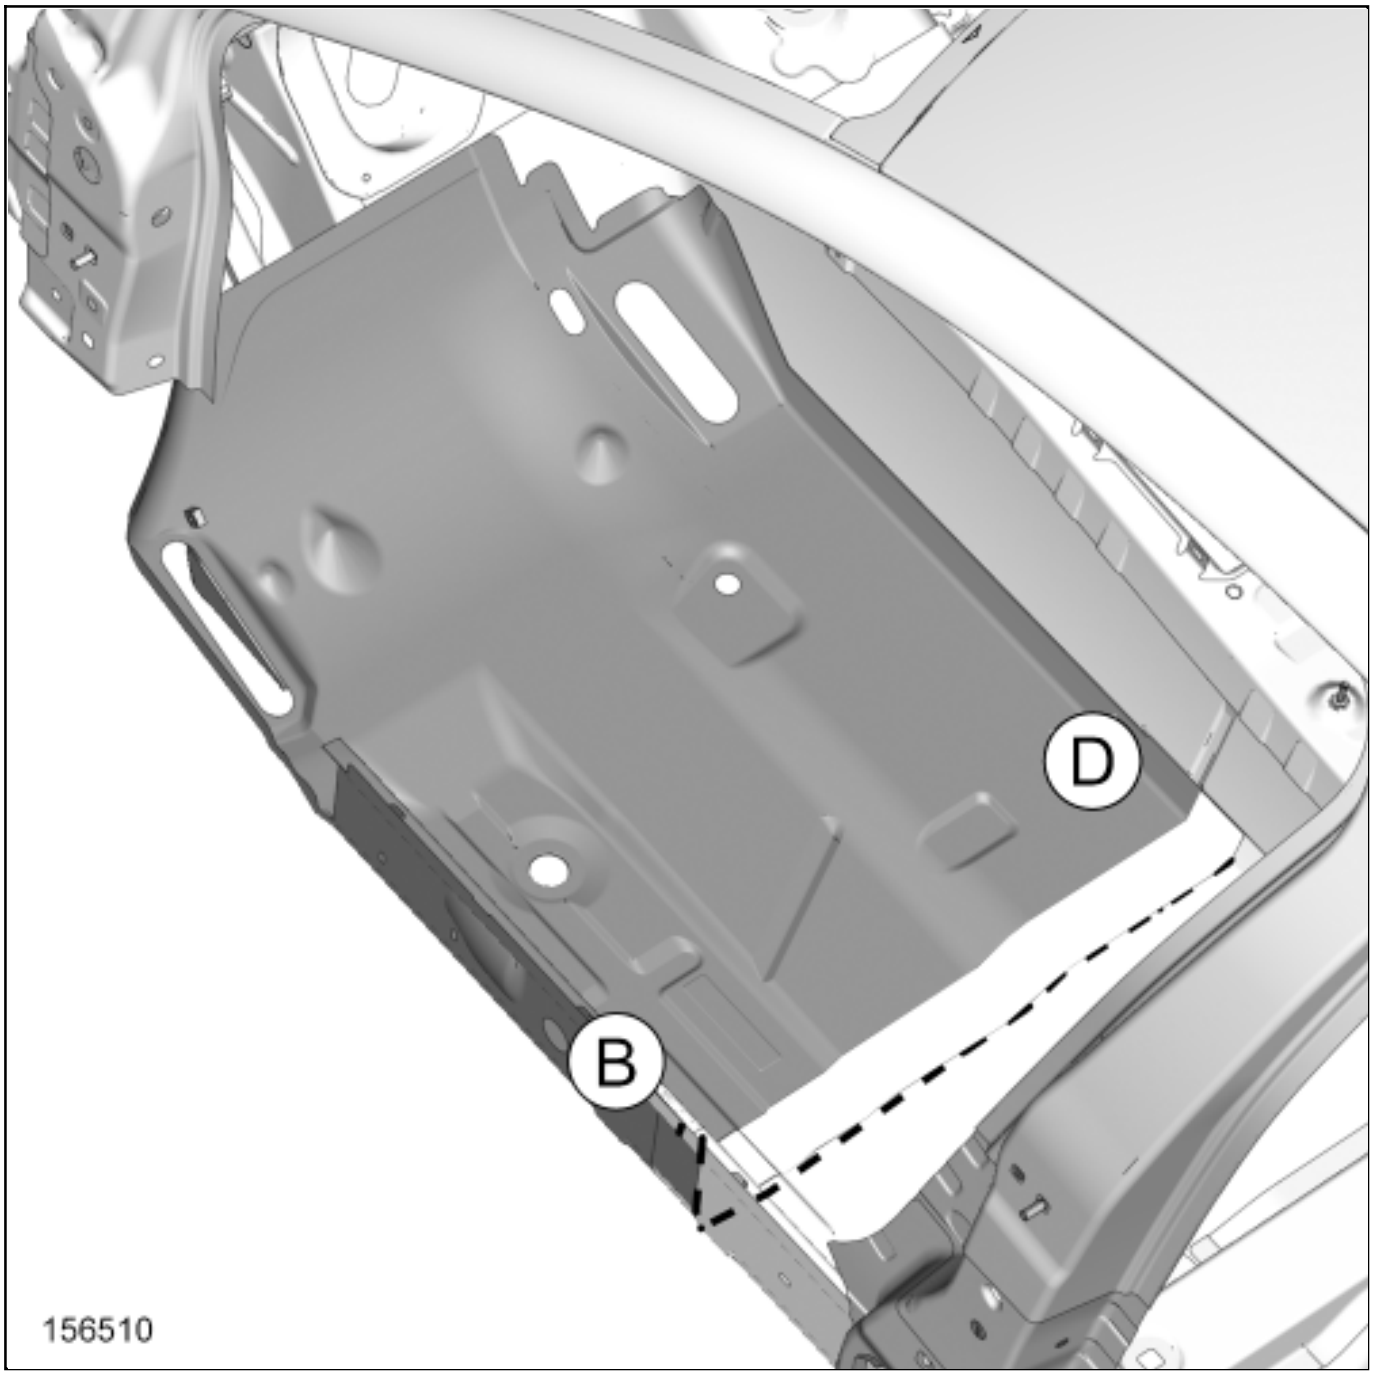
Locate the earths located near to the weld area Earths on body: List and location of components .

3)IRREMOVABLE BODYWORK COMPONENTS - STRUCTURE TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

Remove:

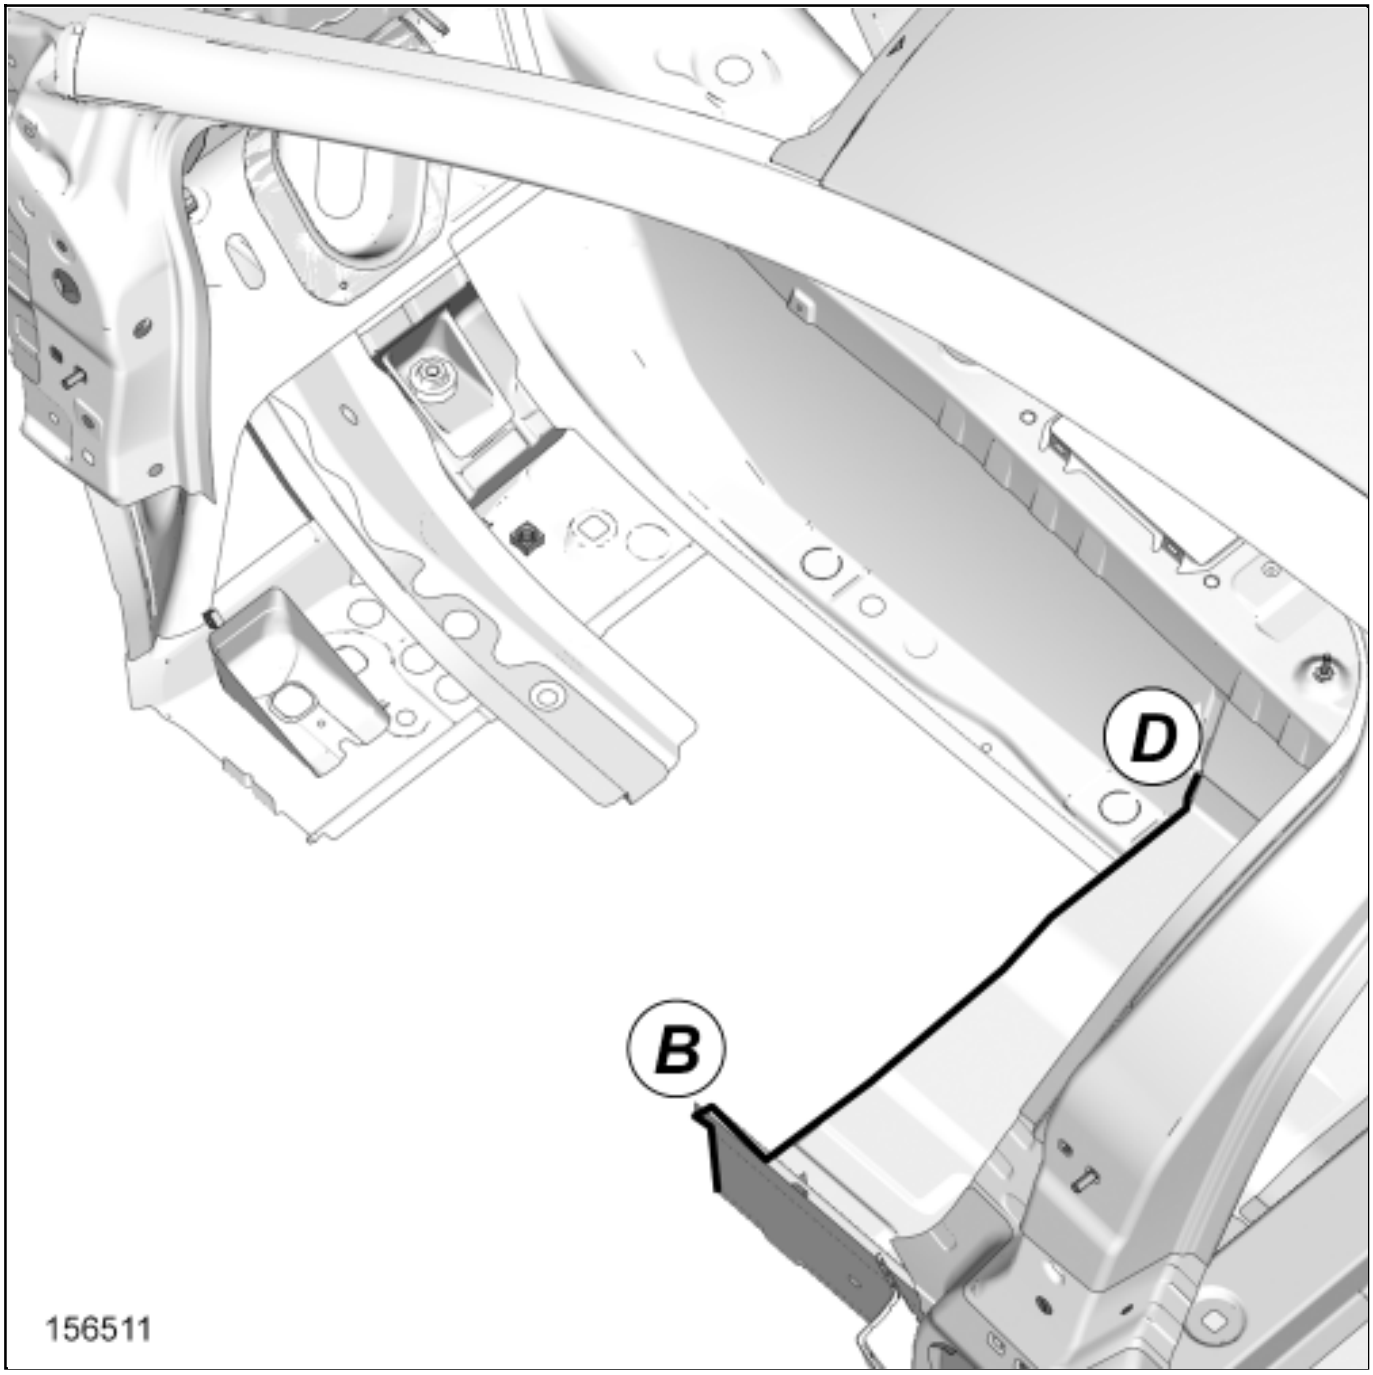
- the sill panel Sill panel: Replacement ,
- the sill panel closure panel Sill panel closure panel: Replacement ,

- the sill panel reinforcement, rear section Sill panel rear reinforcement: Replacement .
- the centre side member(2) ,
- the front cross member under front seat(3) ,
- the rear cross member under front seat(4) .



4)SPECIAL NOTES ON THE MATING FACES

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

2- FRONT PARTIAL REPLACEMENT B-D

1)PART IN POSITION

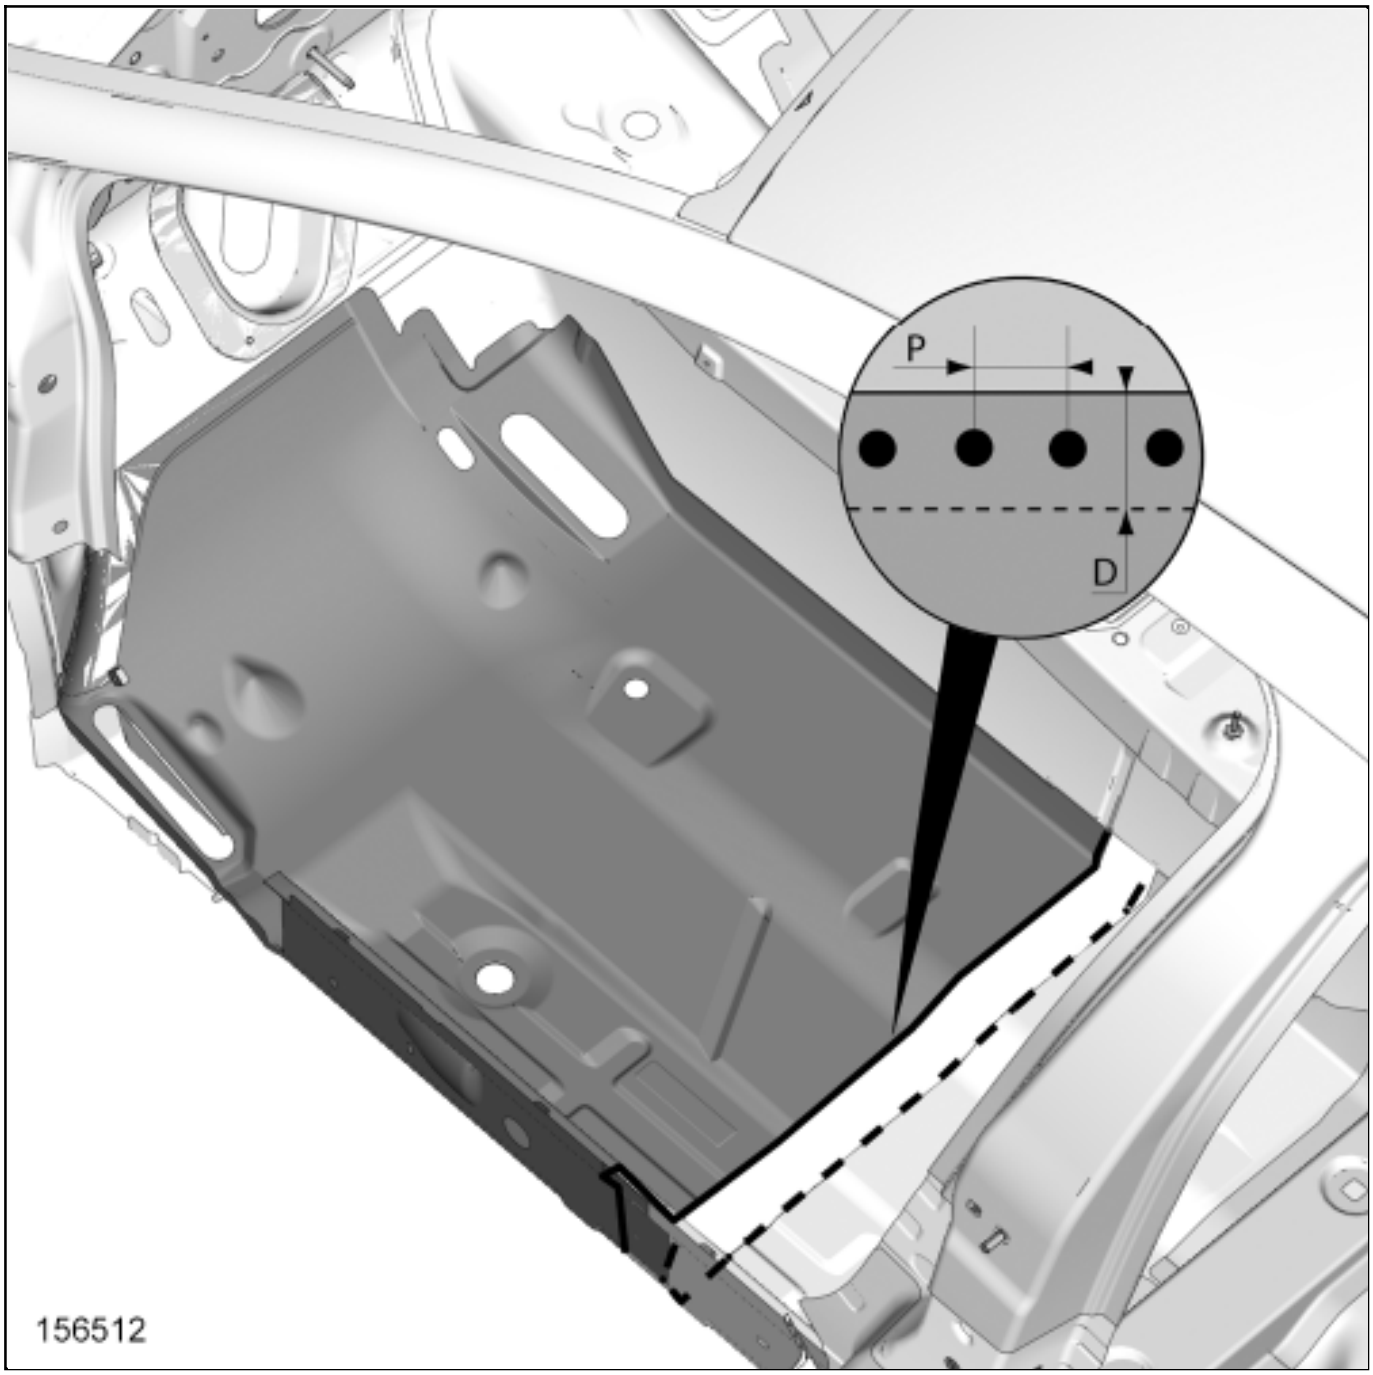
VIEW WITHOUT PART

2)POSITIONING OF ELECTRICAL EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).



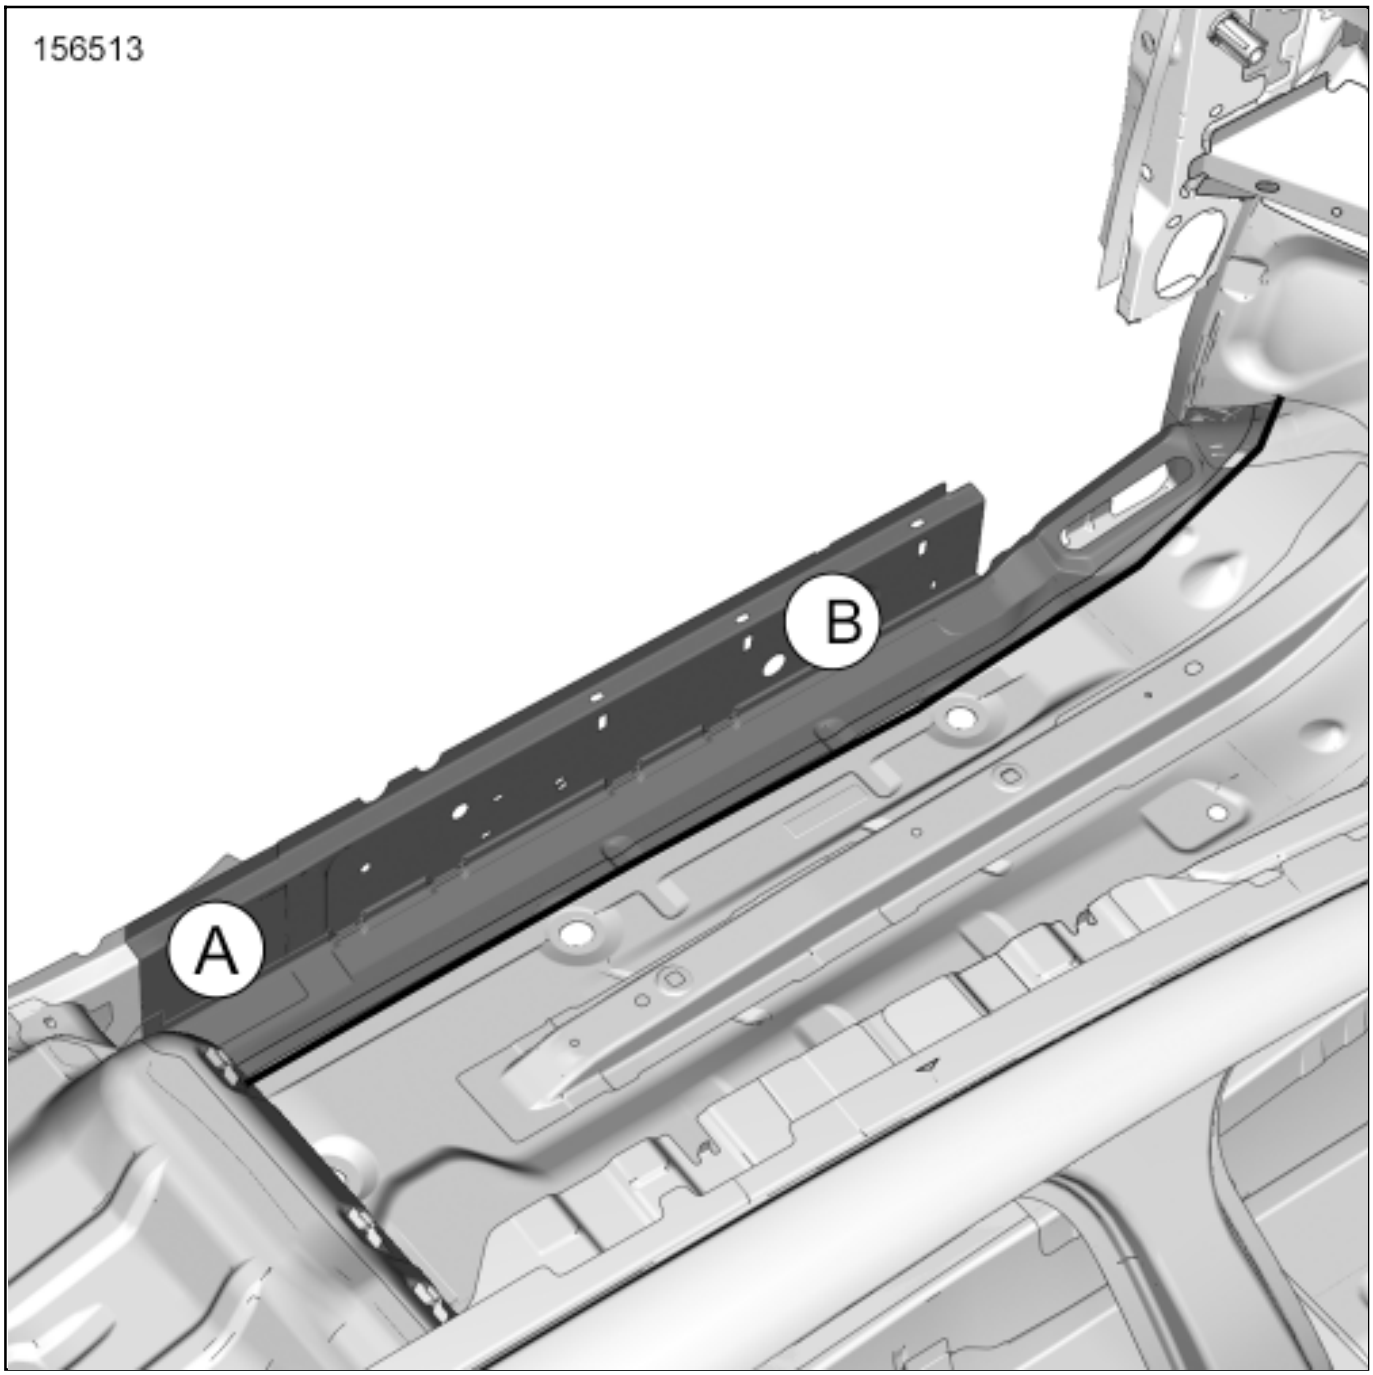
Locate the earths located near to the weld area**Earths on body: List and location of components** .

3)IRREMOVABLE BODYWORK COMPONENTS - STRUCTURE TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

Remove:

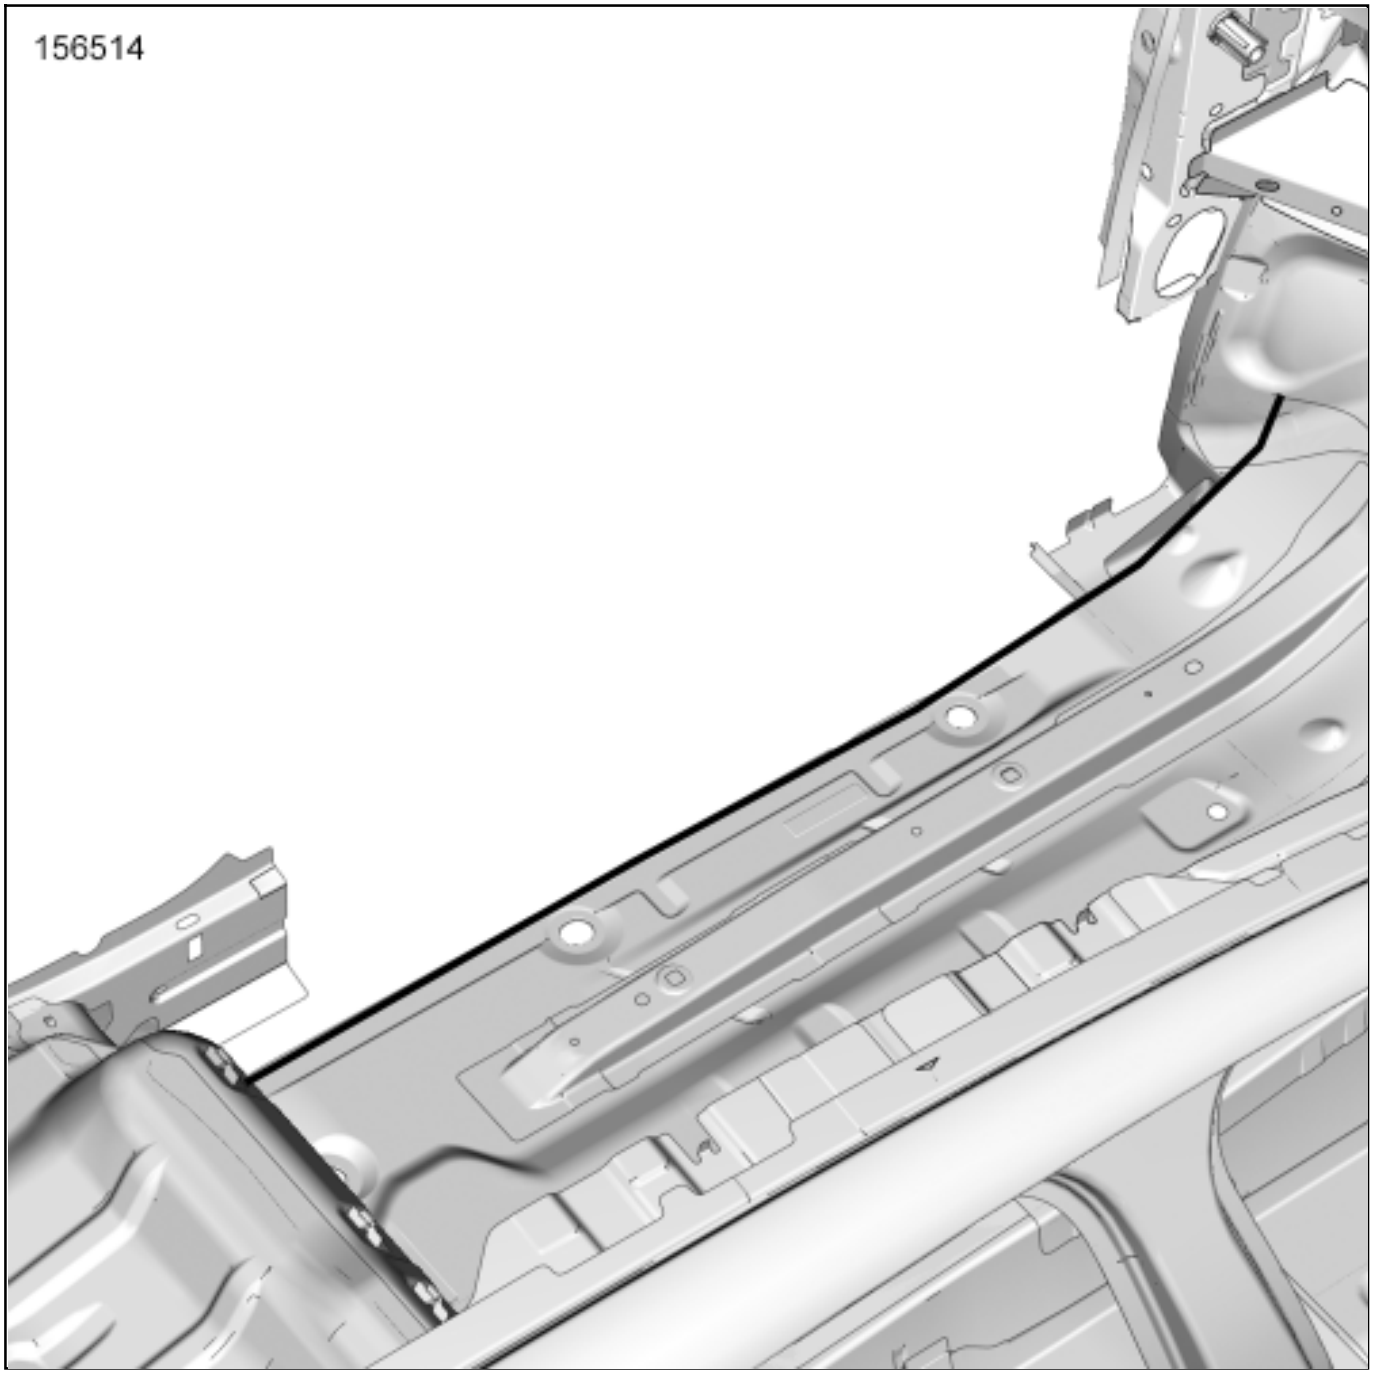
- the sill panel**Sill panel: Replacement** ,
- the sill panel closure panel**Sill panel closure panel: Replacement** ,
- the sill panel reinforcement, rear section**Sill panel rear reinforcement: Replacement** (see **Sill panel reinforcement, front section: Replacement**) .
- the front cross member under front seat(**3**) ,
- the centre side member(**2**) .

4)SPECIAL NOTES ON THE MATING FACES



Make a superimposed connection Partial replacement connections by overlapping: Description (MR 400, 40E, Partial replacement connections).

CAUTION



If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld Connections by arc welding under shielding gas: Description (MR 400, 40C, Gas metal arc welded connections (GMAW)).

3- PARTIAL REPLACEMENT A-B

1)PART IN POSITION

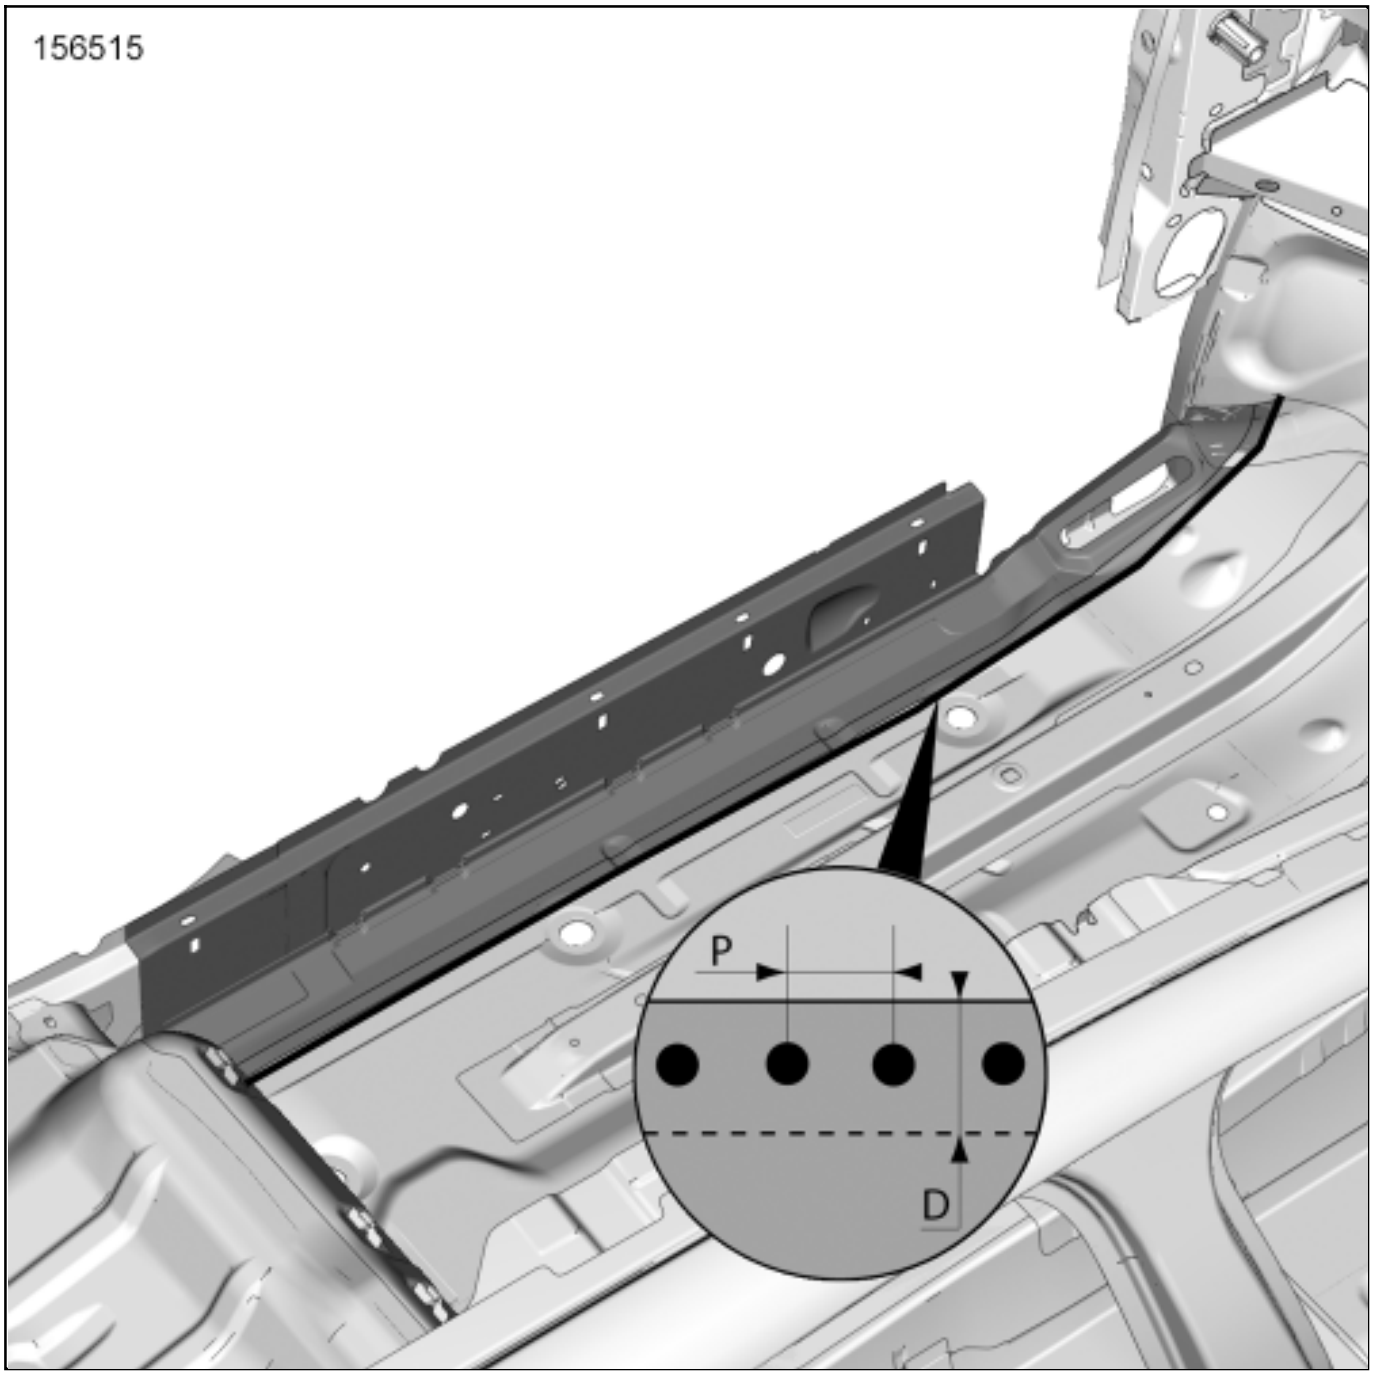
VIEW WITHOUT PART

2)POSITIONING OF ELECTRICAL EARTHS

CAUTION

To avoid damaging the vehicles electric and electronic components, the earths of any wiring harness near the weld area must be disconnected.

Position the earth of the welding machine as close as possible to the weld area Earth screw connection: Description (MR 400, 40H, Bolted connections).



Locate the earths located near to the weld area Earths on body: List and location of components .

3)IRREMOVABLE BODYWORK COMPONENTS - STRUCTURE TO BE REMOVED IN ORDER TO CARRY OUT THE REPLACEMENT OPERATION

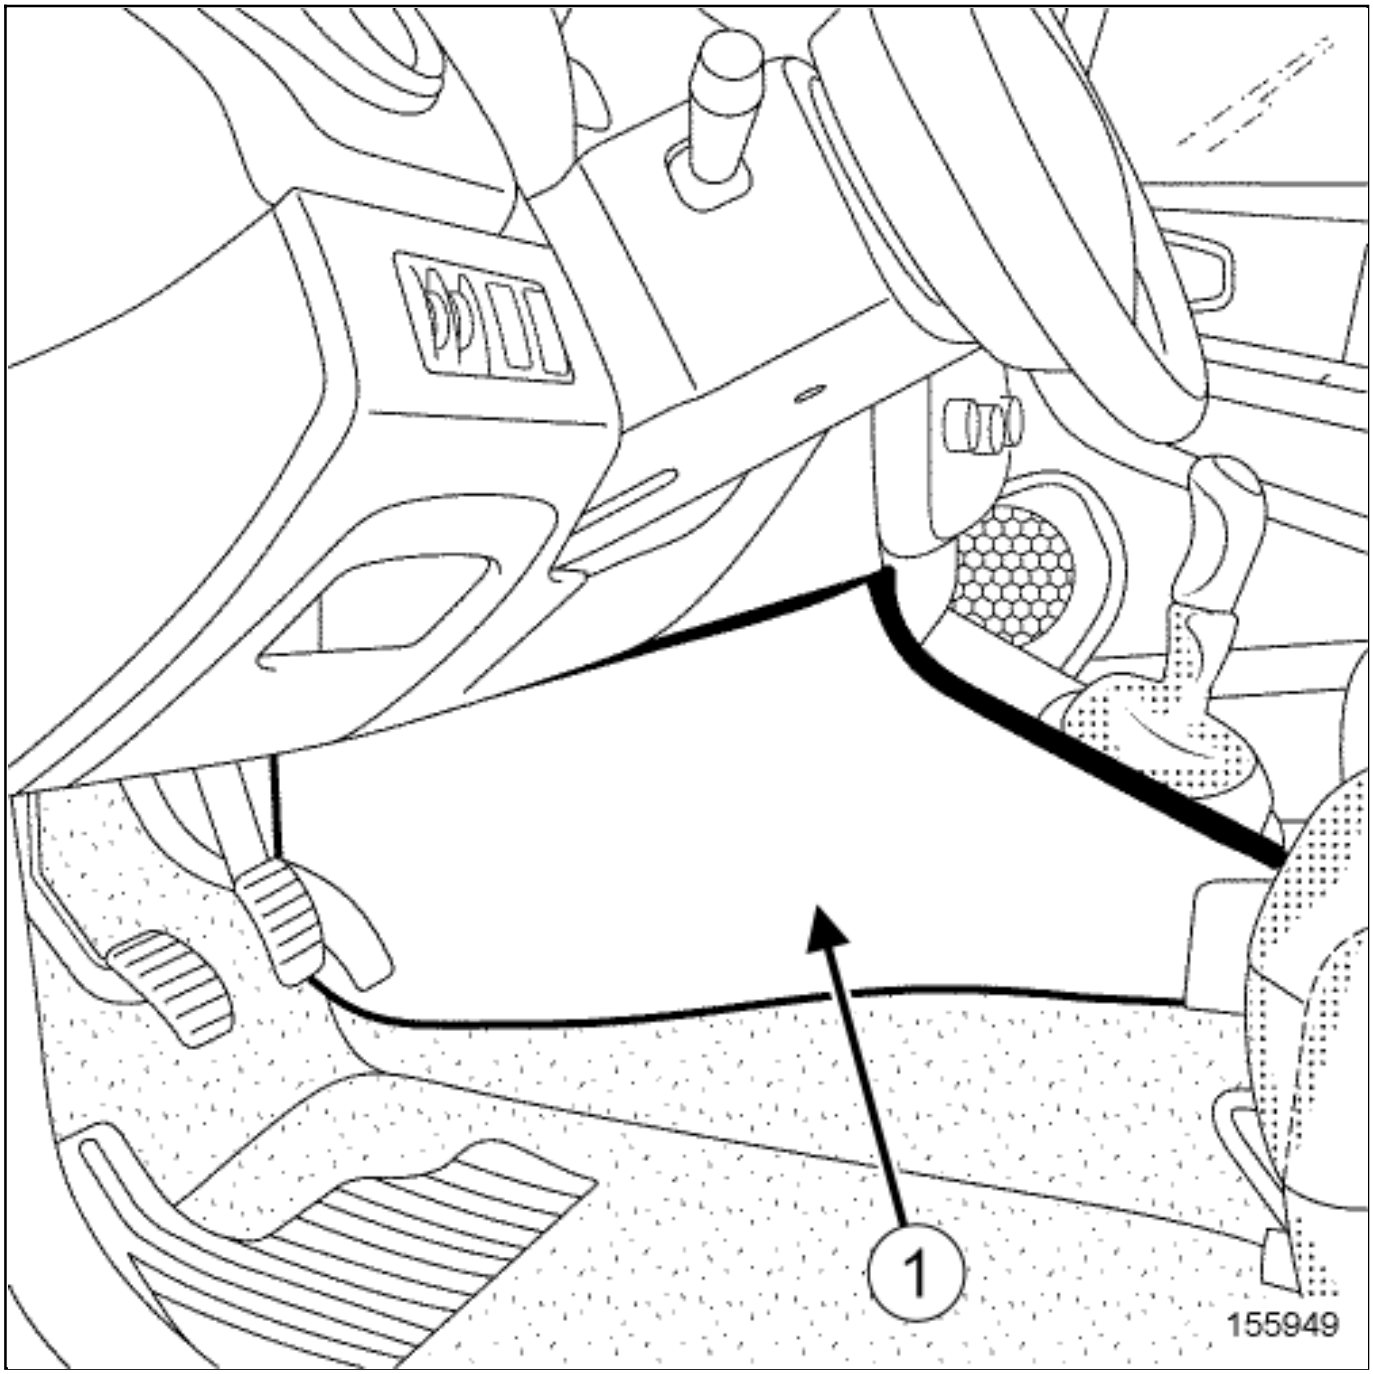
Remove:

- the sill panel Sill panel: Replacement ,
- the sill panel closure panel Sill panel closure panel: Replacement ,
- the sill panel reinforcement, rear section Sill panel rear reinforcement: Replacement .
- the front cross member under front seat(3) ,
- the rear cross member under front seat(4) .

4)SPECIAL NOTES ON THE MATING FACES

Make a superimposed connection[Partial replacement connections by overlapping: Description] (MR 400, 40E, Partial replacement connections).

CAUTION



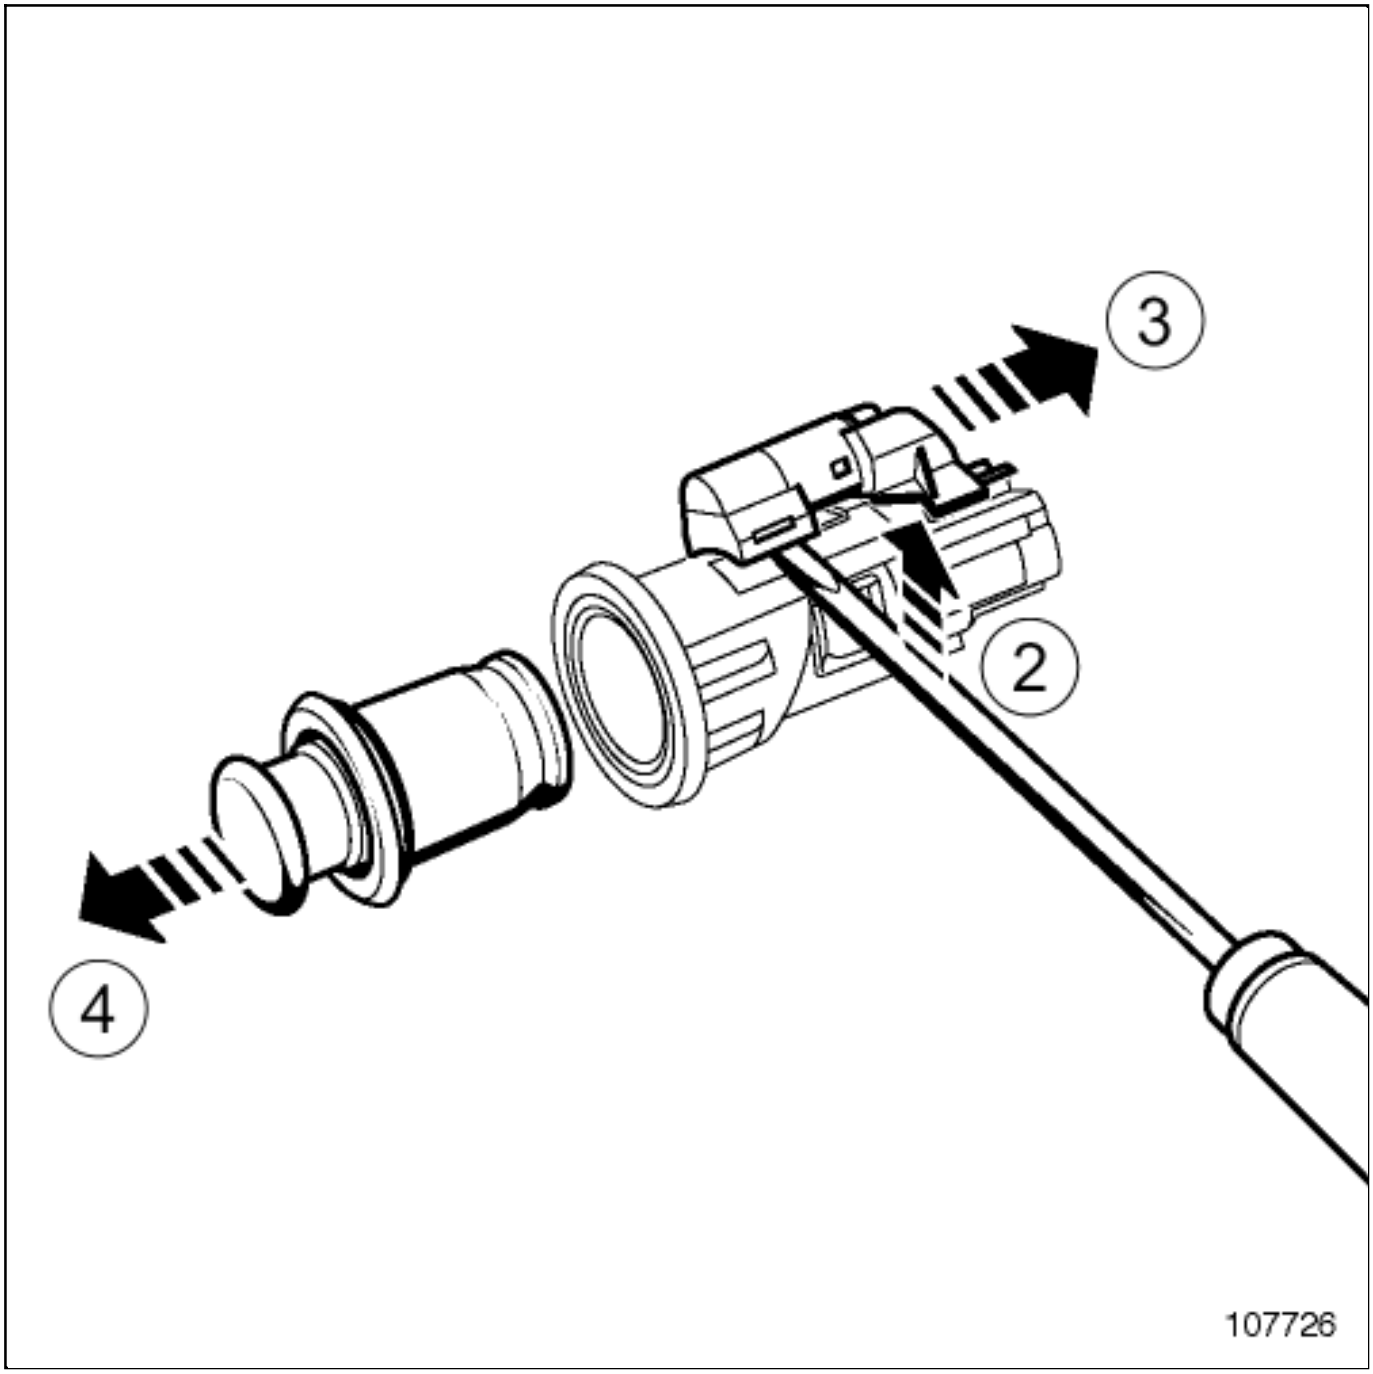
If the mating faces of the parts to be welded are not accessible, use a GMAW plug weld in place of the original electrical resistance weld[Connections by arc welding under shielding gas: Description] (MR 400, 40C, Gas metal arc welded connections (GMAW)).

CIGARETTE LIGHTER: REMOVAL - REFITTING

REMOVAL

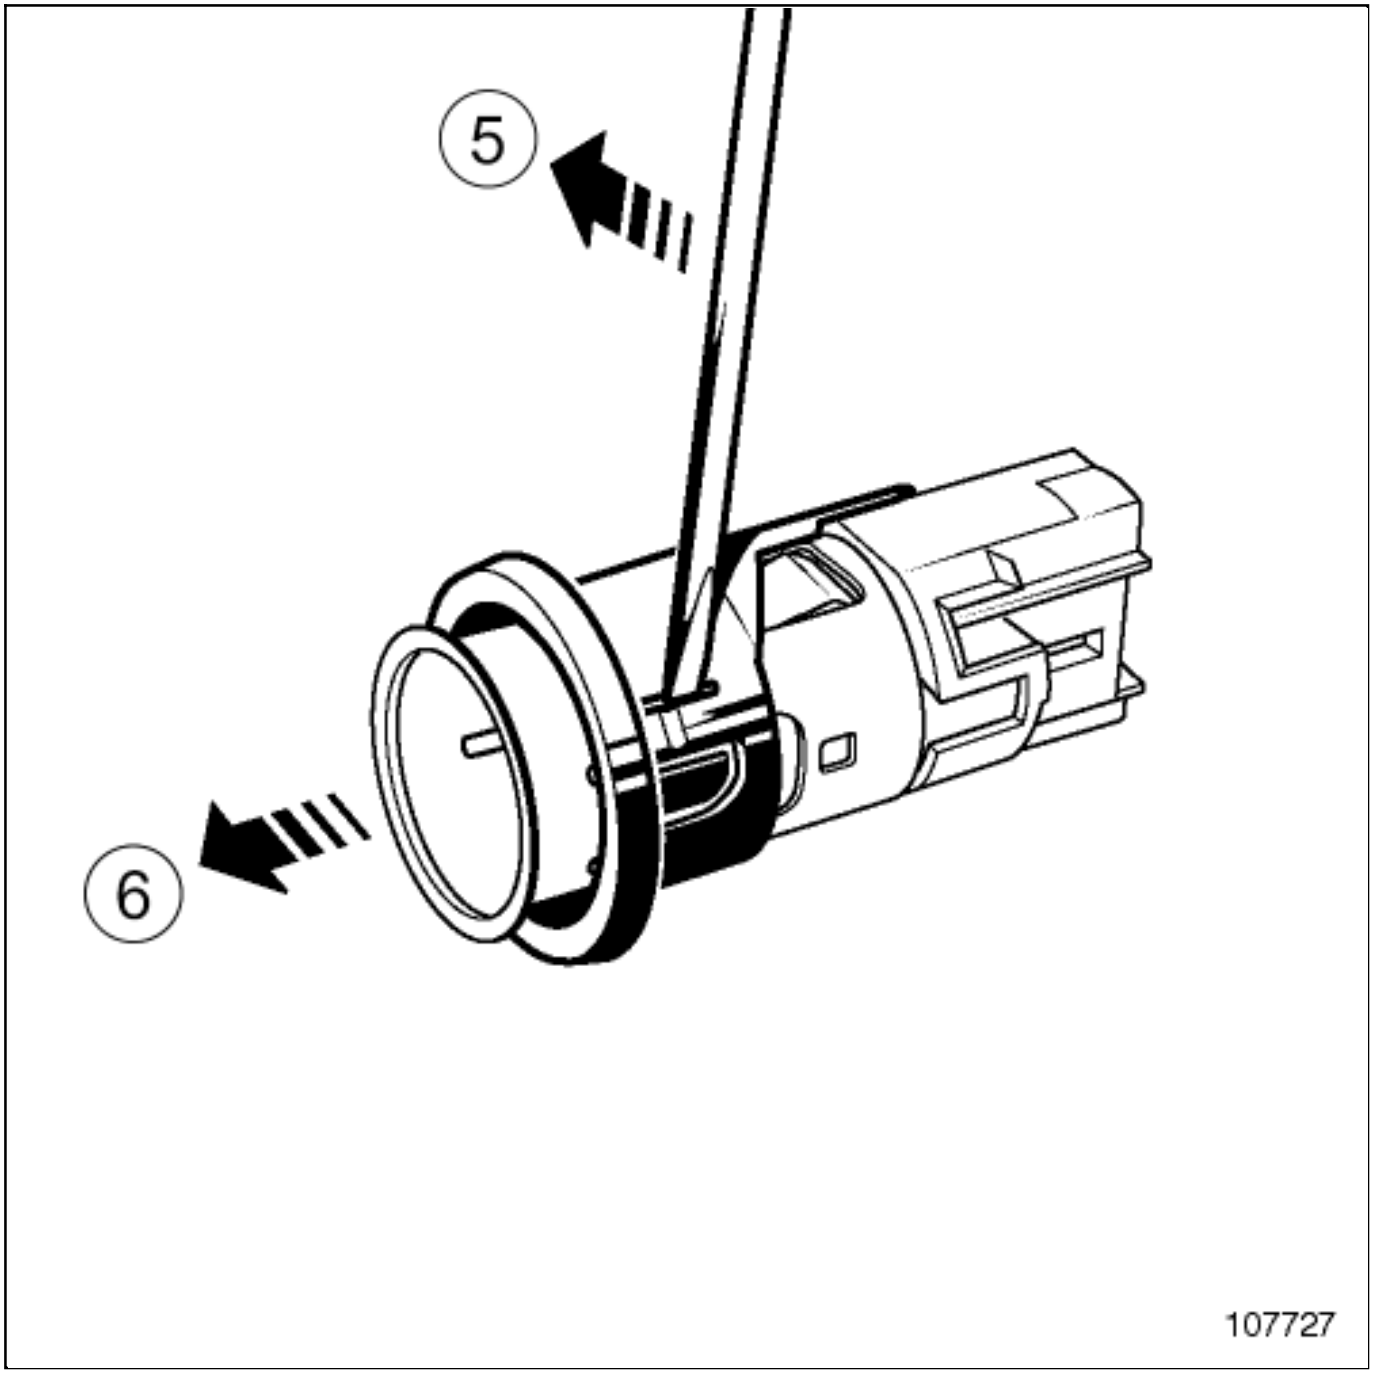
1. REMOVAL PREPARATION OPERATION

- Switch off the ignition.



-

Unclip the left-hand centre console trim(1) .



Disconnect the cigarette lighter connector.

2. REMOVAL OPERATION

Unclip the bulb mounting from the cigarette lighter using a flat-blade screwdriver at(2) and (3) .

Remove the cigarette lighter(4) .

Keep the plastic support unlocked at(5) .

Pull the cigarette lighter support at(6) .

Unclip the plastic support from the centre console upper panel.

REFITTING

1. REFITTING OPERATION

- Clip the plastic support onto the centre console upper panel.
- Refit the cigarette lighter support.
- Clip the bulb support onto the cigarette lighter.
- Refit the cigarette lighter.

2. FINAL OPERATION

- Proceed in the reverse order to removal.

CLUTCH ACTUATOR MOTOR: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Equipment required
Diagnostic tool

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

Note:

Do not touch the metal contacts of the clutch actuator motor - an electrostatic discharge can damage the clutch actuator motor.

The DC4 gearbox has two clutch actuator motors.

REMOVAL

1. REMOVAL PREPARATION OPERATION

1- REMOVAL OF THE UPPER CLUTCH ACTUATOR MOTOR

Remove:

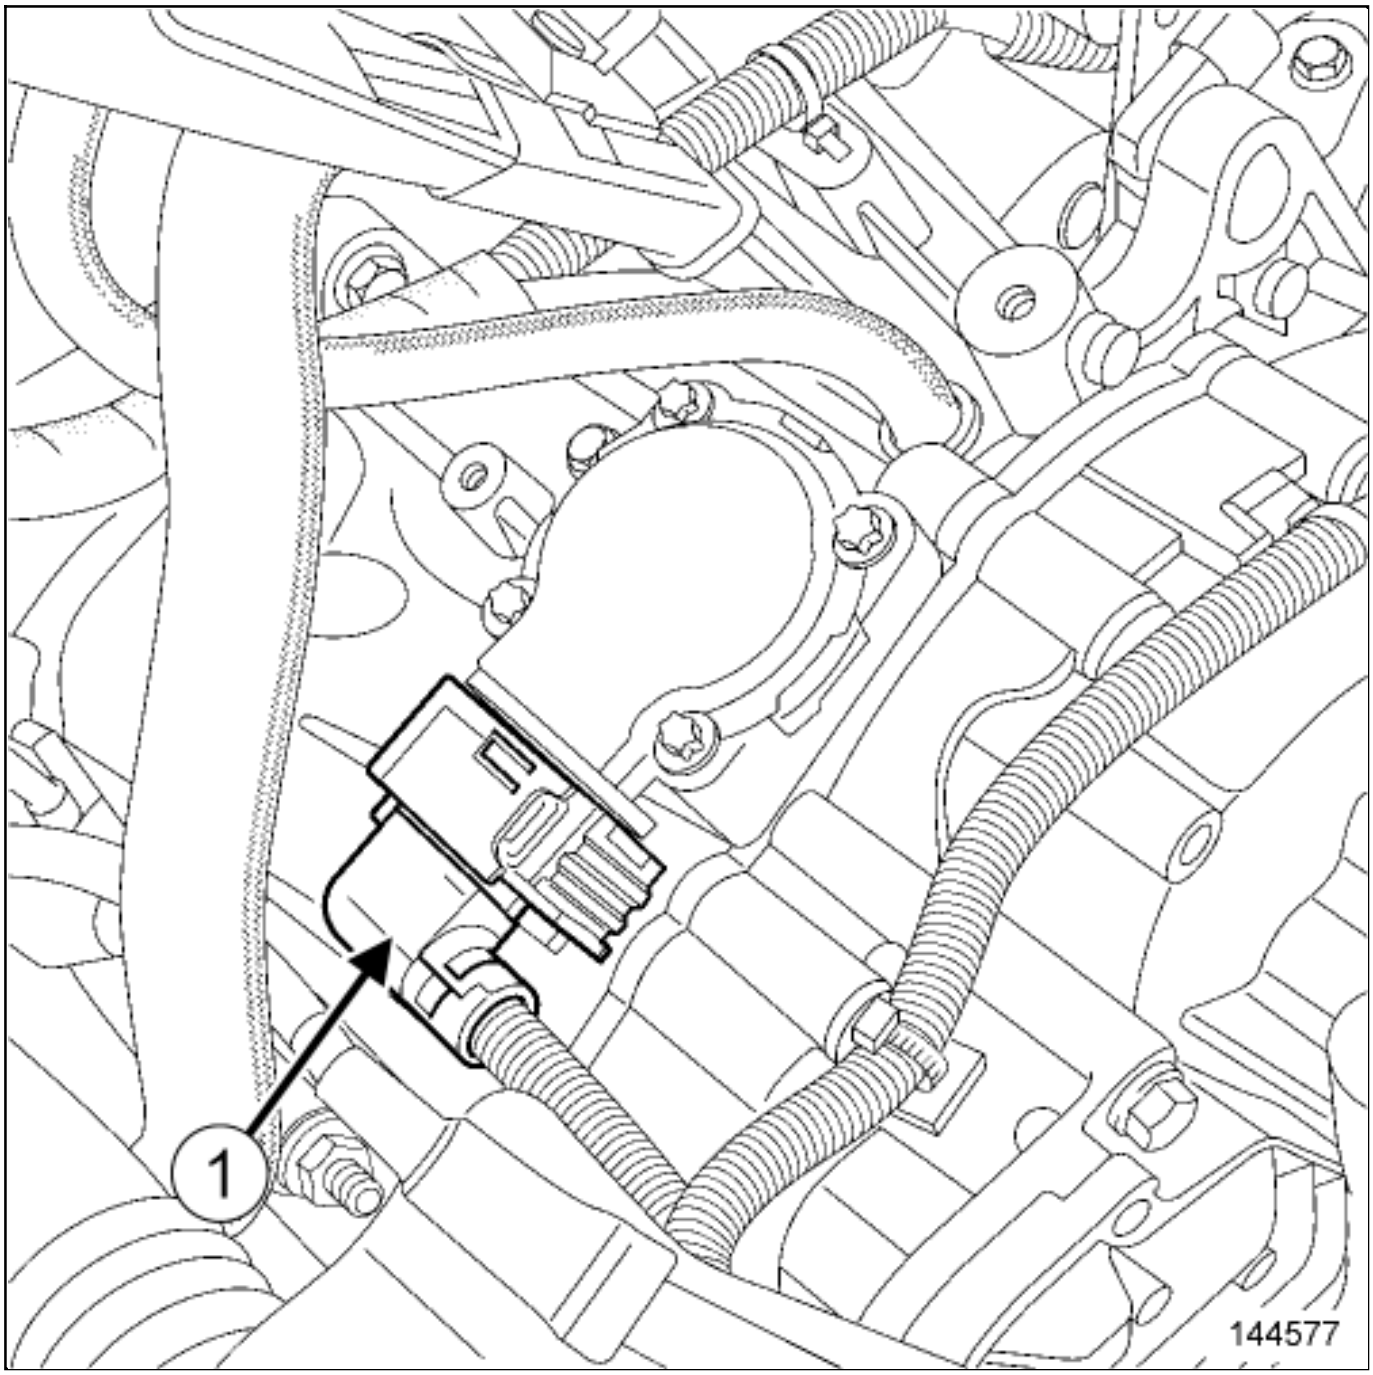
- the battery Battery: Removal - Refitting ,
- the battery tray Battery tray: Removal - Refitting .

2- REMOVAL OF THE LOWER CLUTCH ACTUATOR MOTOR

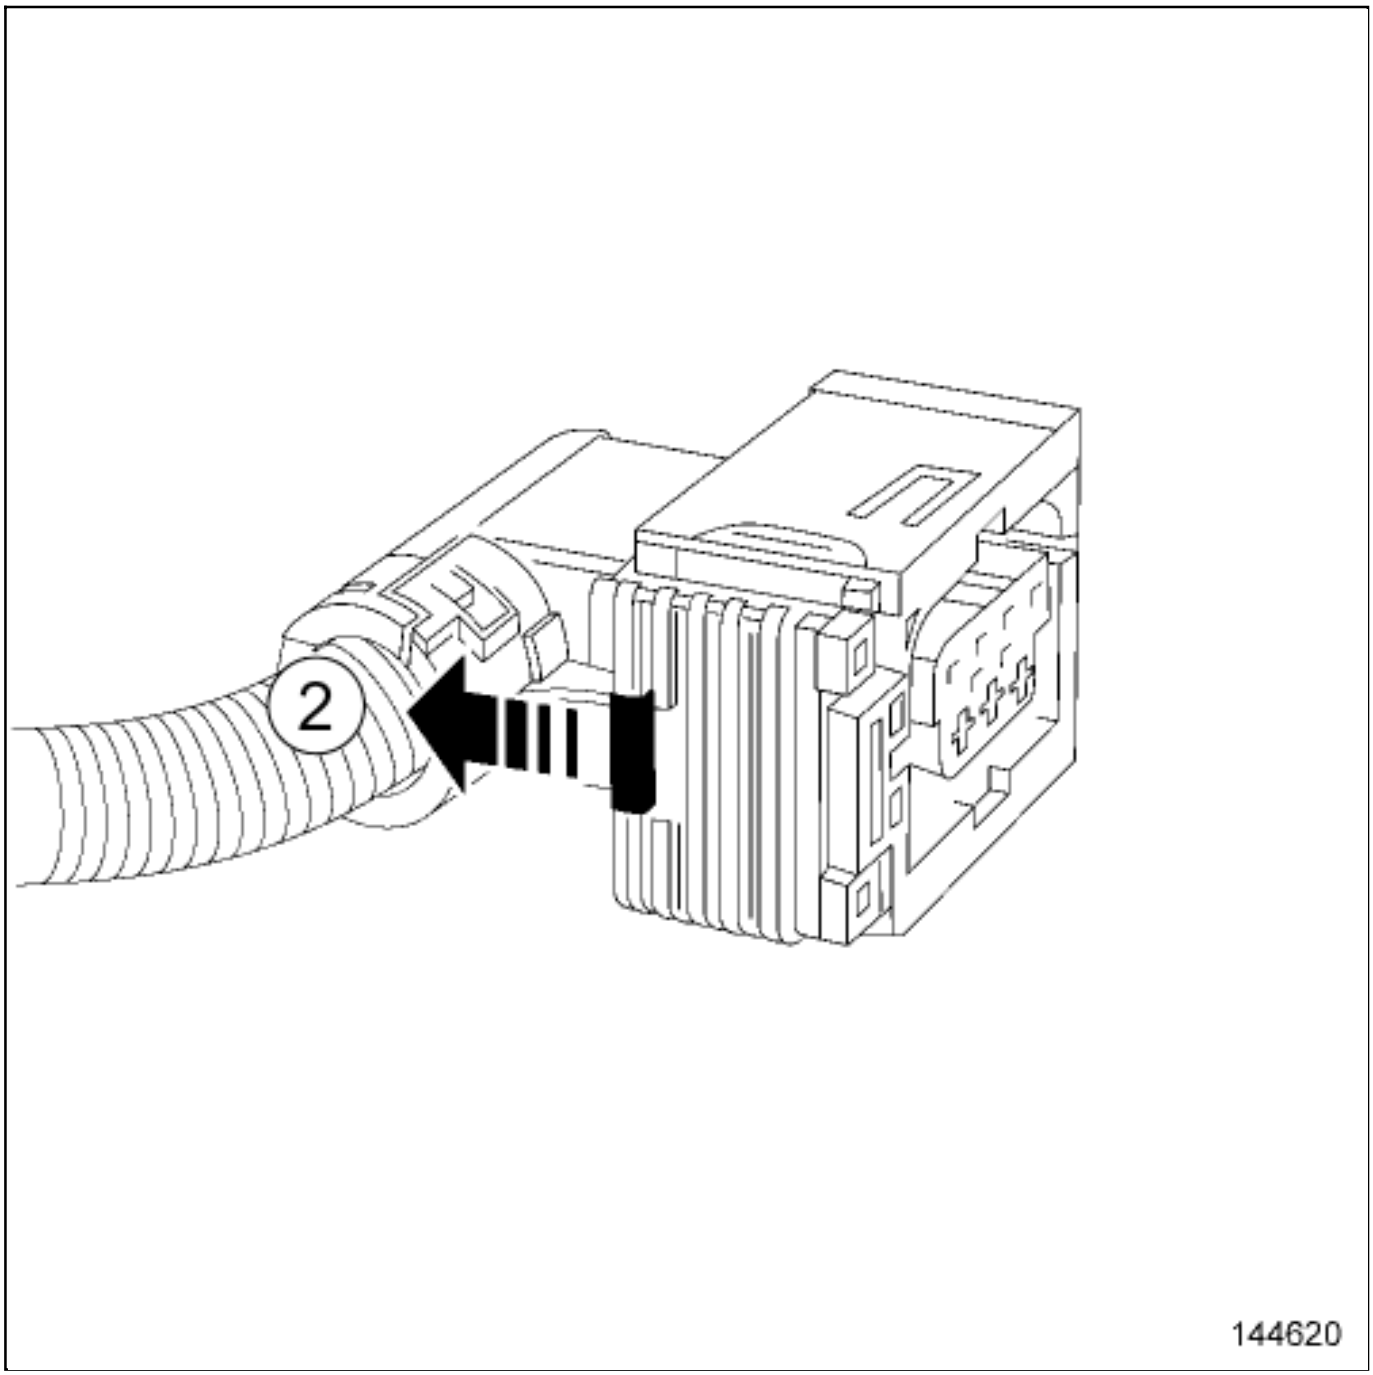
Position the vehicle on the two-post lift Vehicle: Towing and lifting .

Remove the engine undertray.

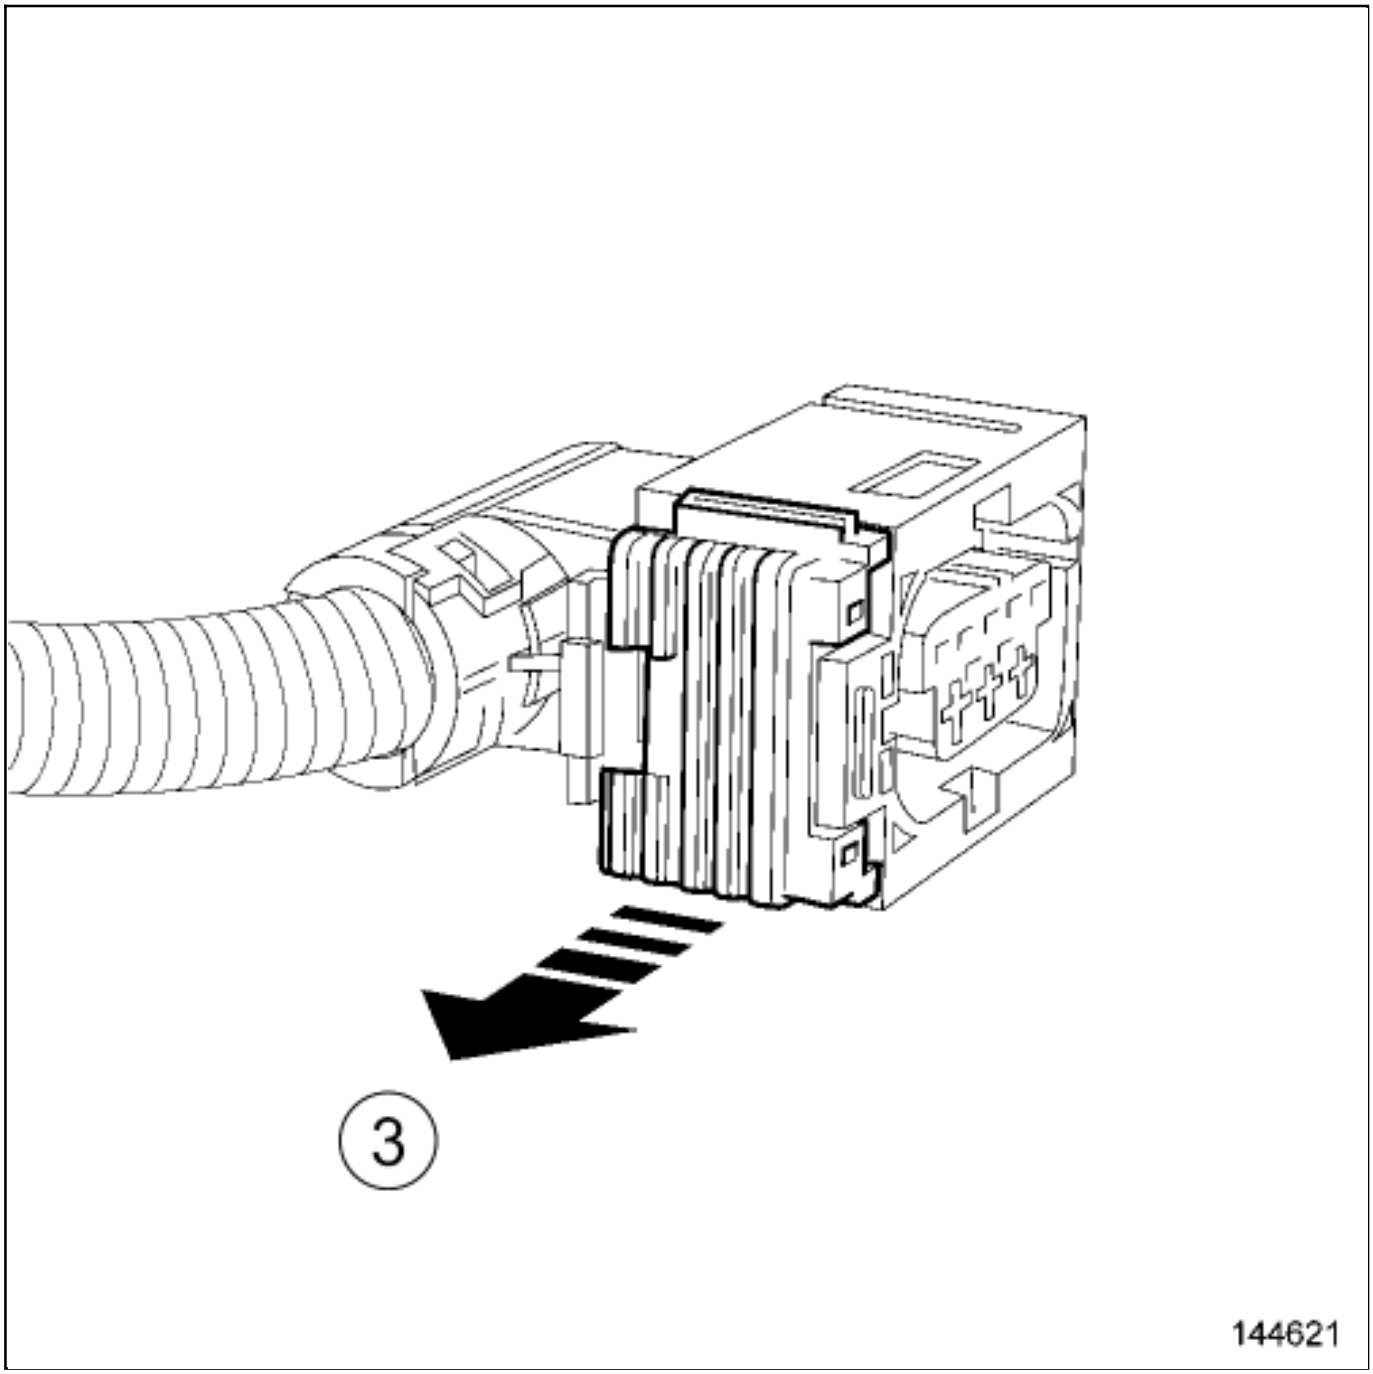
2. REMOVAL OPERATION



Note:



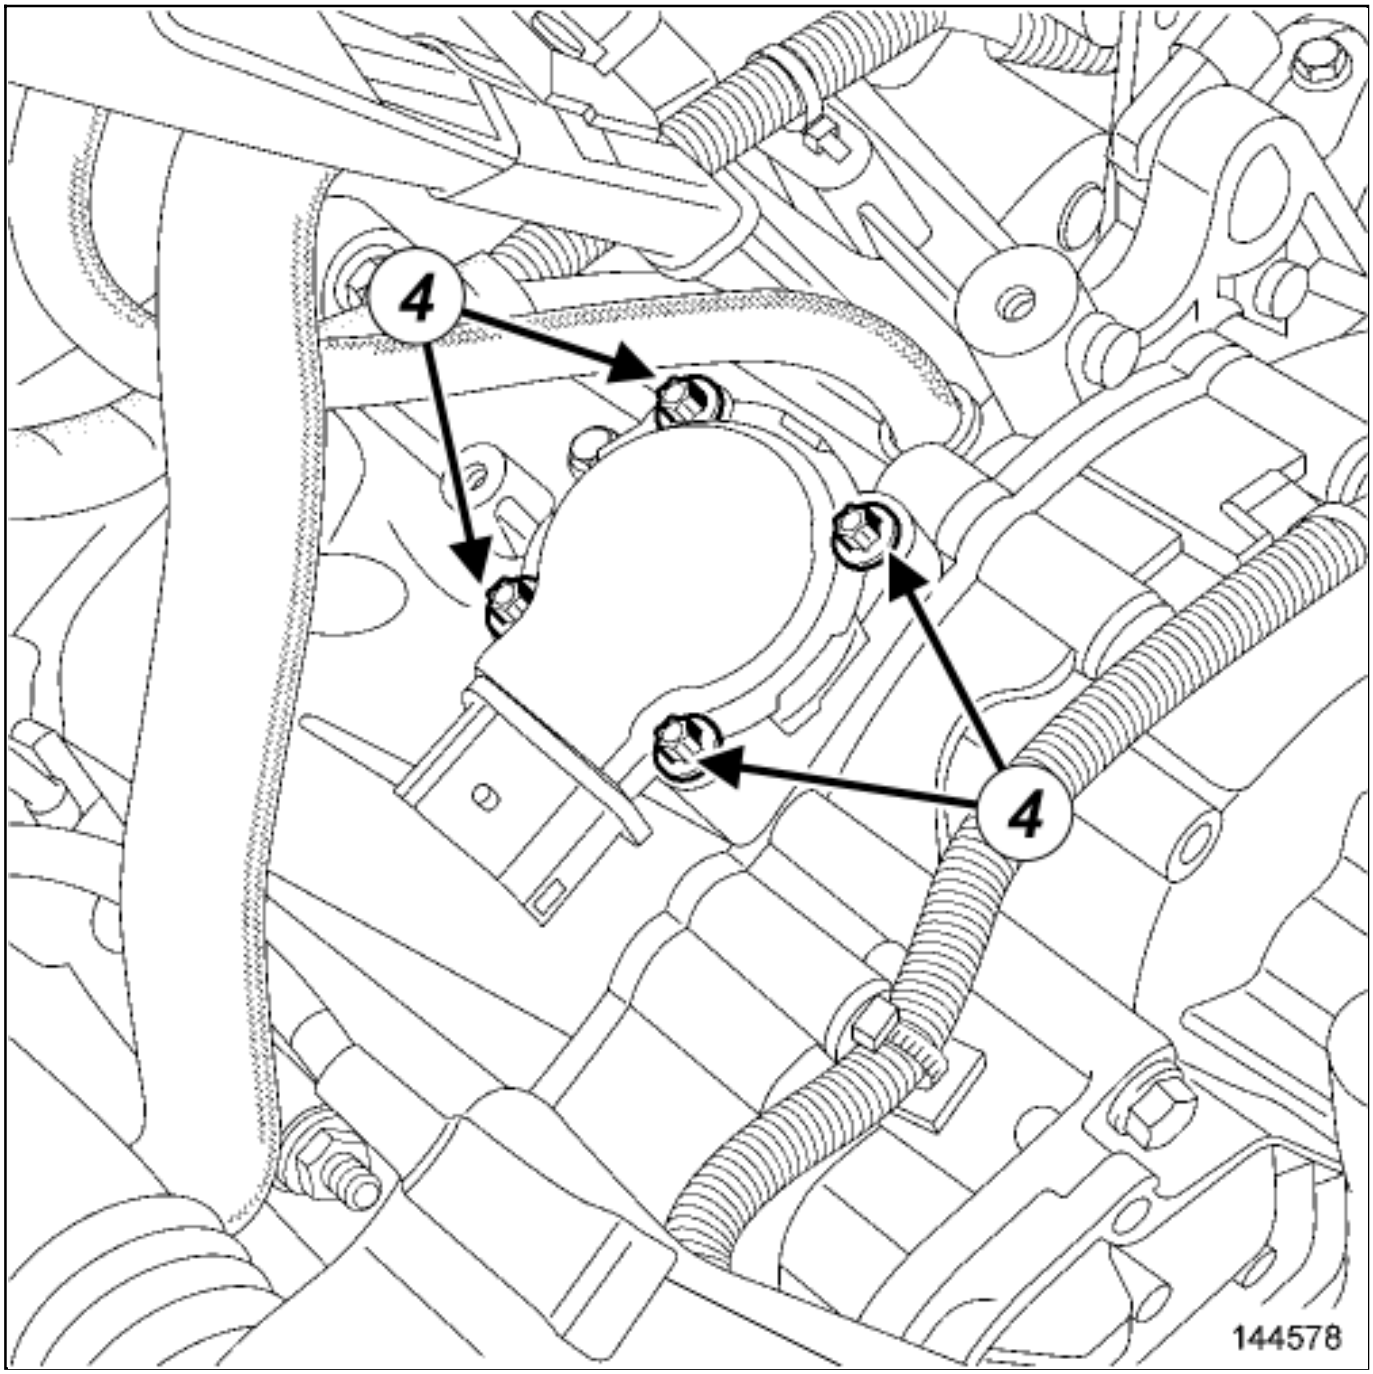
The connector has a locking system.



CAUTION

Failure to observe the following procedure could damage the connector.

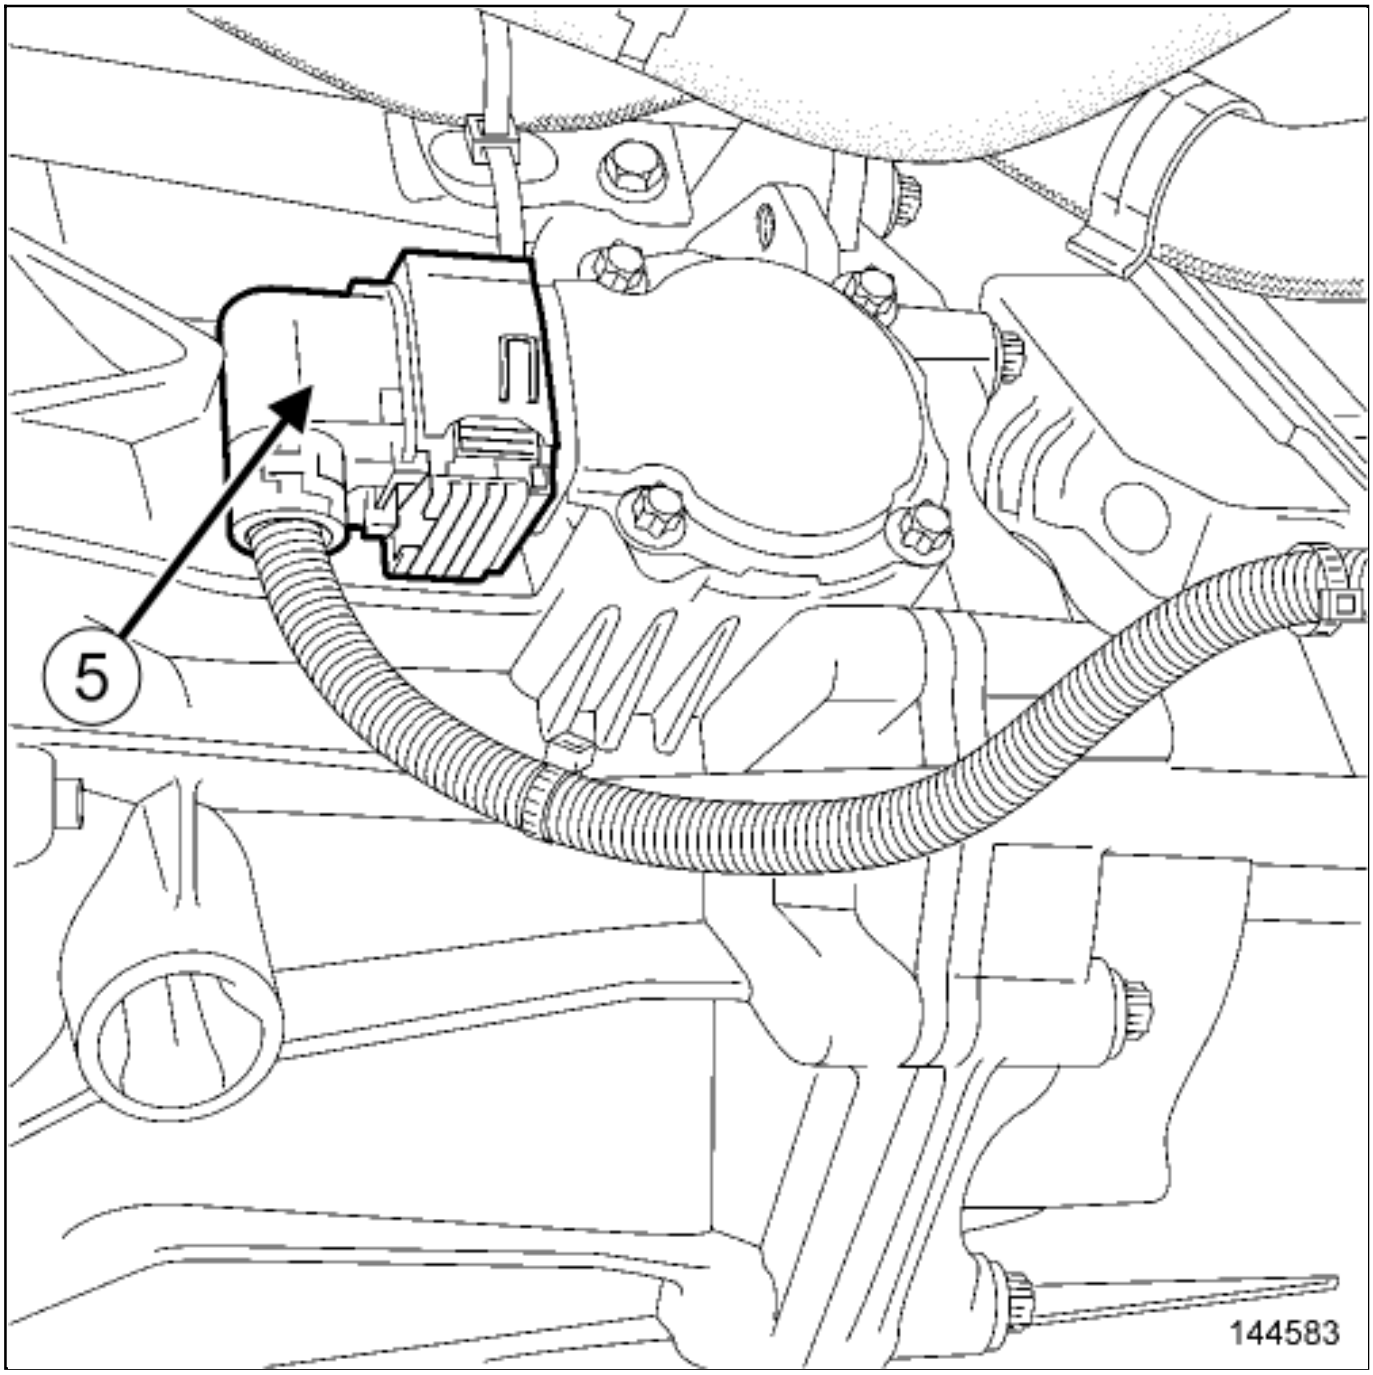
1- REMOVAL OF THE UPPER CLUTCH ACTUATOR MOTOR



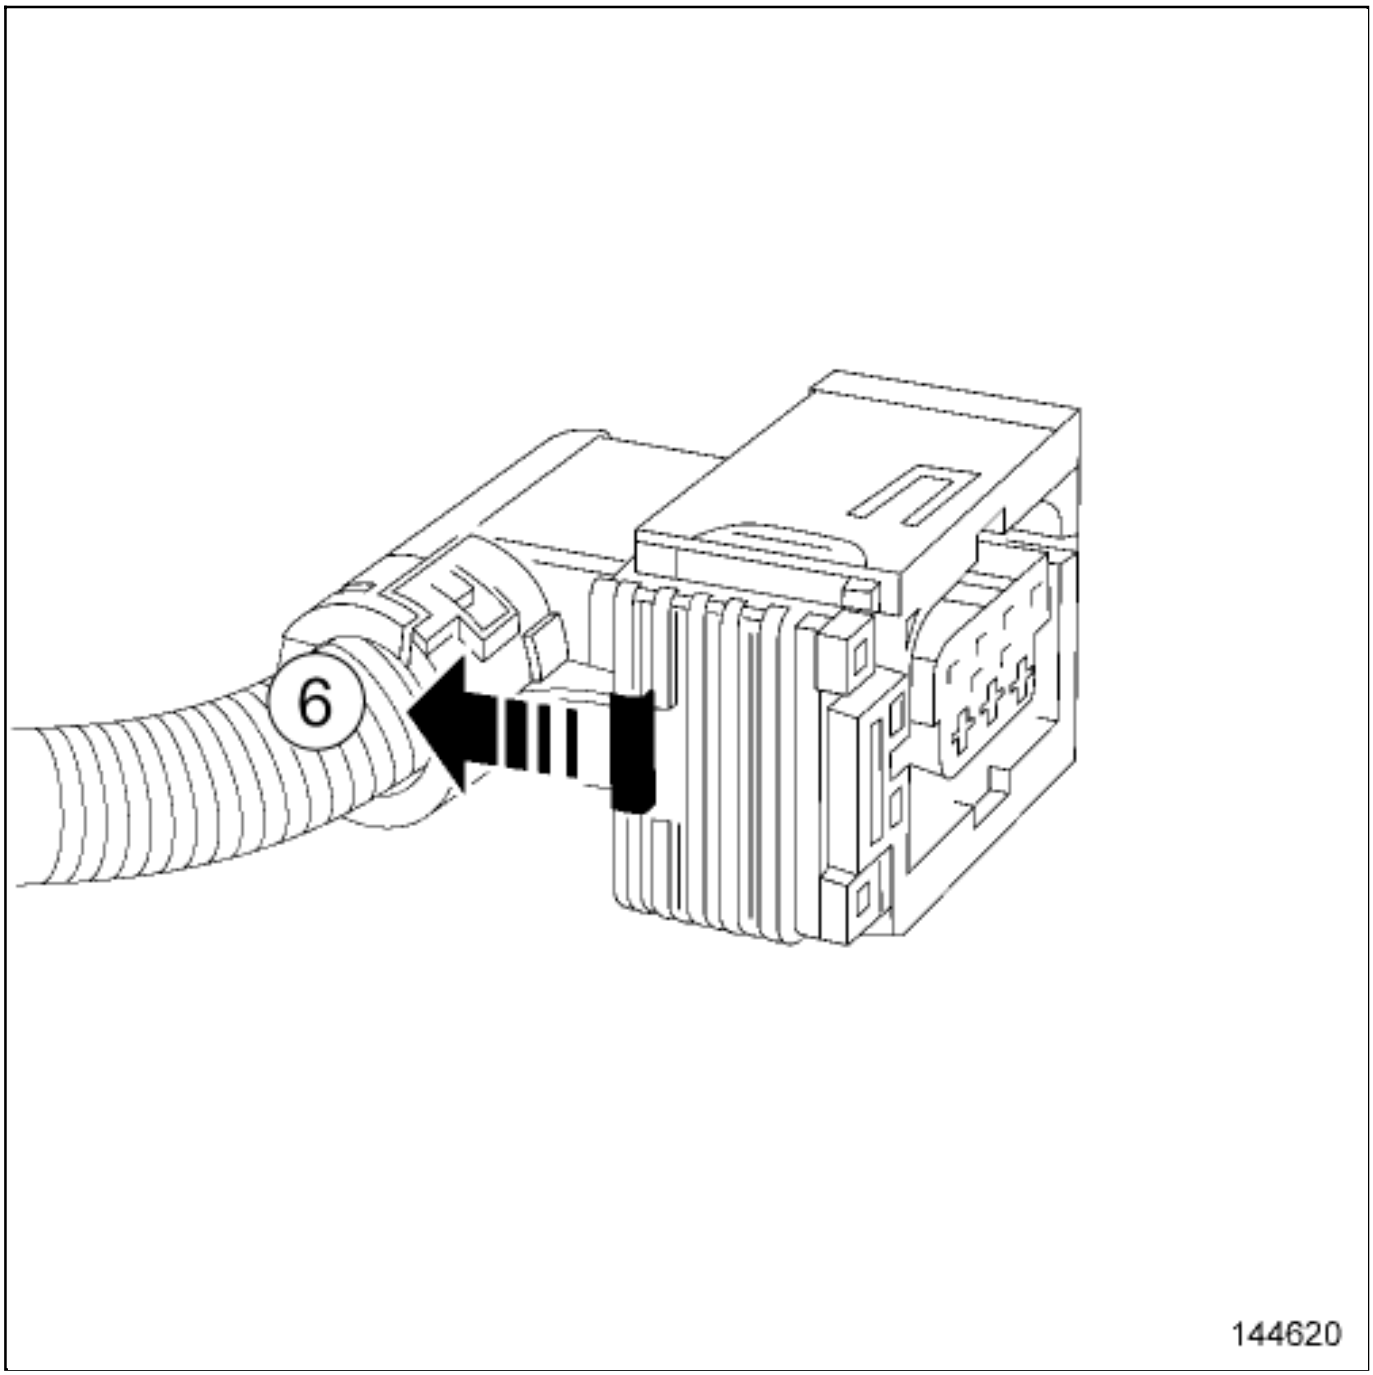
1
144577

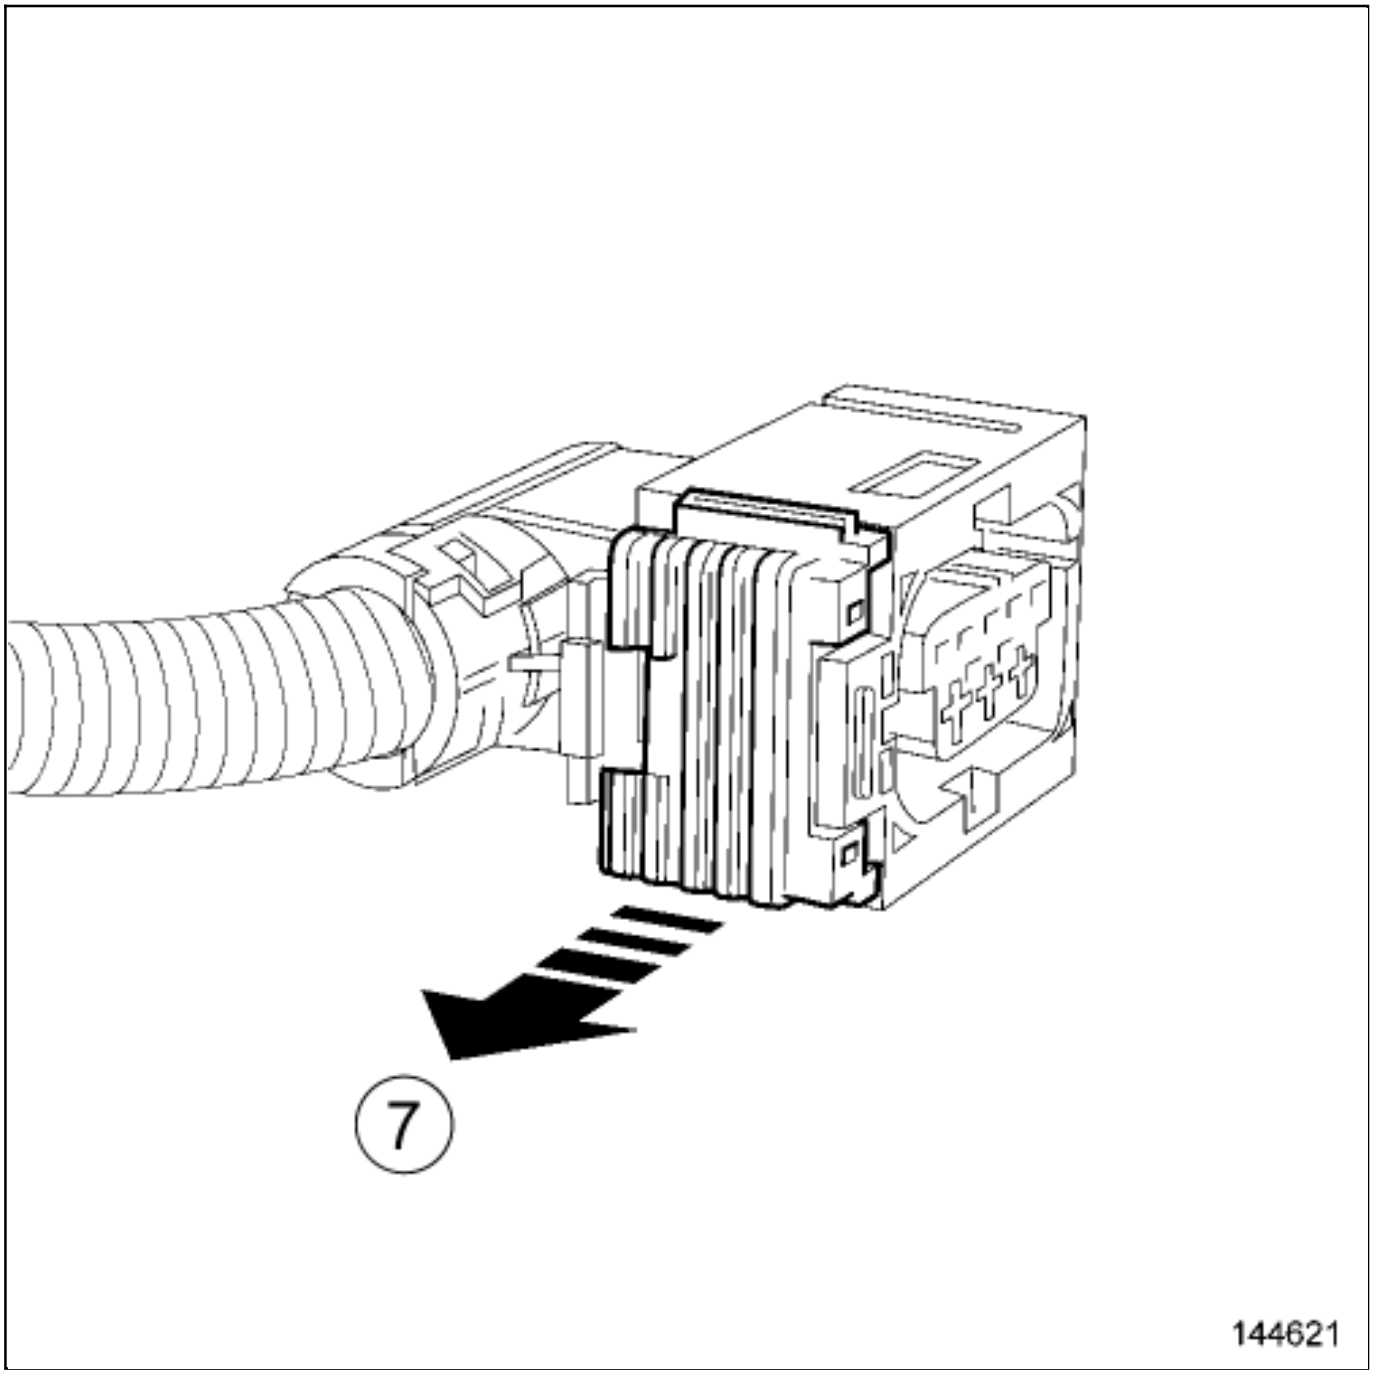
2
144620

Disconnect the connector(1) by:



- unlocking the connector locking system(2) ,
- pressing the tab(3) .

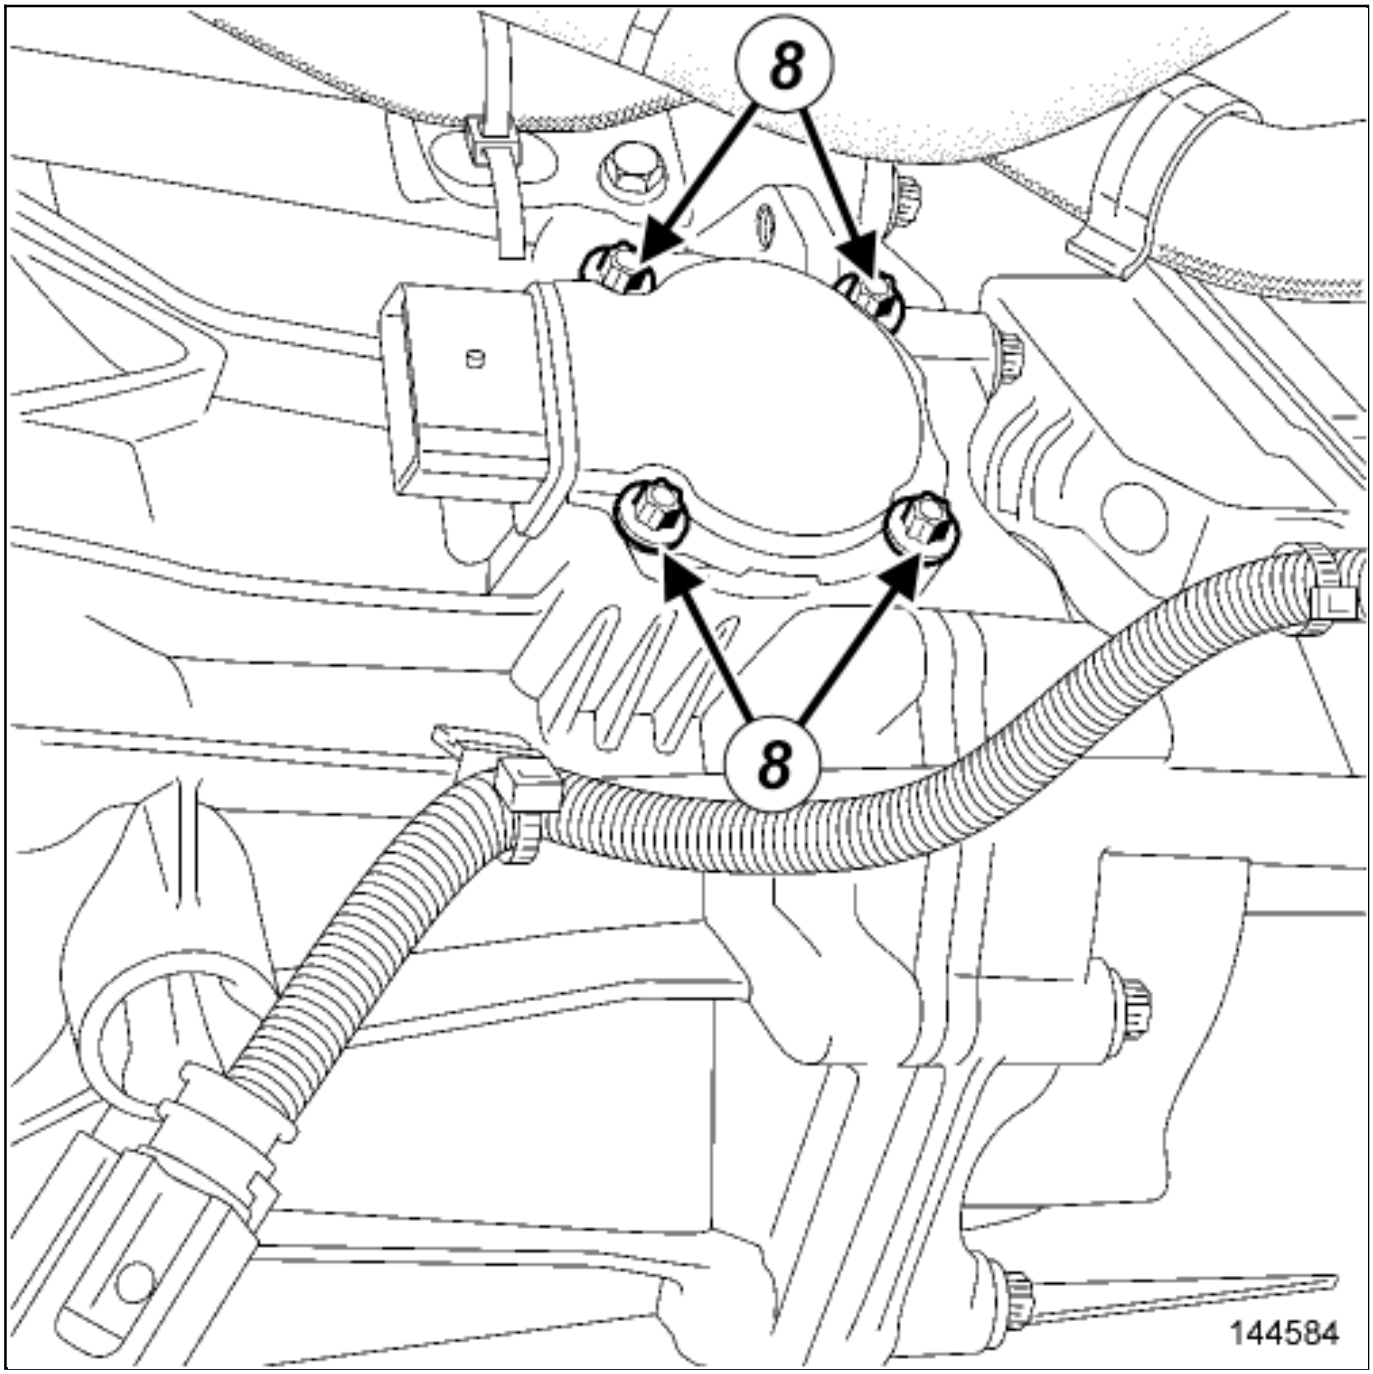




Remove:

- the bolts(4) of the clutch actuator motor,
- the clutch actuator motor.

2- REMOVAL OF THE LOWER CLUTCH ACTUATOR MOTOR



5
144583

6
144620

Disconnect the connector(5) by:

- unlocking the connector locking system(6) ,
- pressing the tab(7) .

Remove:

- the bolts(8) of the clutch actuator motor,
- the clutch actuator motor.

REFITTING

1. REFITTING PREPARATION OPERATION

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the joint faces of:
  - the clutch actuator motors,
  - the gearbox casings.

2. REFITTING OPERATION

CAUTION

Failure to observe the following procedure could damage the clutch actuator motor and the clutch fork.

Note:

Ensure that the splines of the actuator motor control shaft are engaged in the clutch fork splines before tightening the clutch actuator motor.

- Refit the clutch actuator motor.
- Visually check its position before tightening.
- Torque tighten the clutch actuator motor bolts 5.5 N.m .
- Connect the connector of the clutch actuator motor.
-

Clip the connector lock.

Confirm that it is locked by the sound of the "clip" .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Apply the After repair procedure using the Diagnostic tool**Diagnostic tool : Use** :

-Computer concerned by the After repair procedure:

"Automatic gearbox computer" ,

-Component controlled by this computer concerned by the After repair procedure:

"Clutch actuator motor" .

CLUTCH FORK: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

Differential output seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

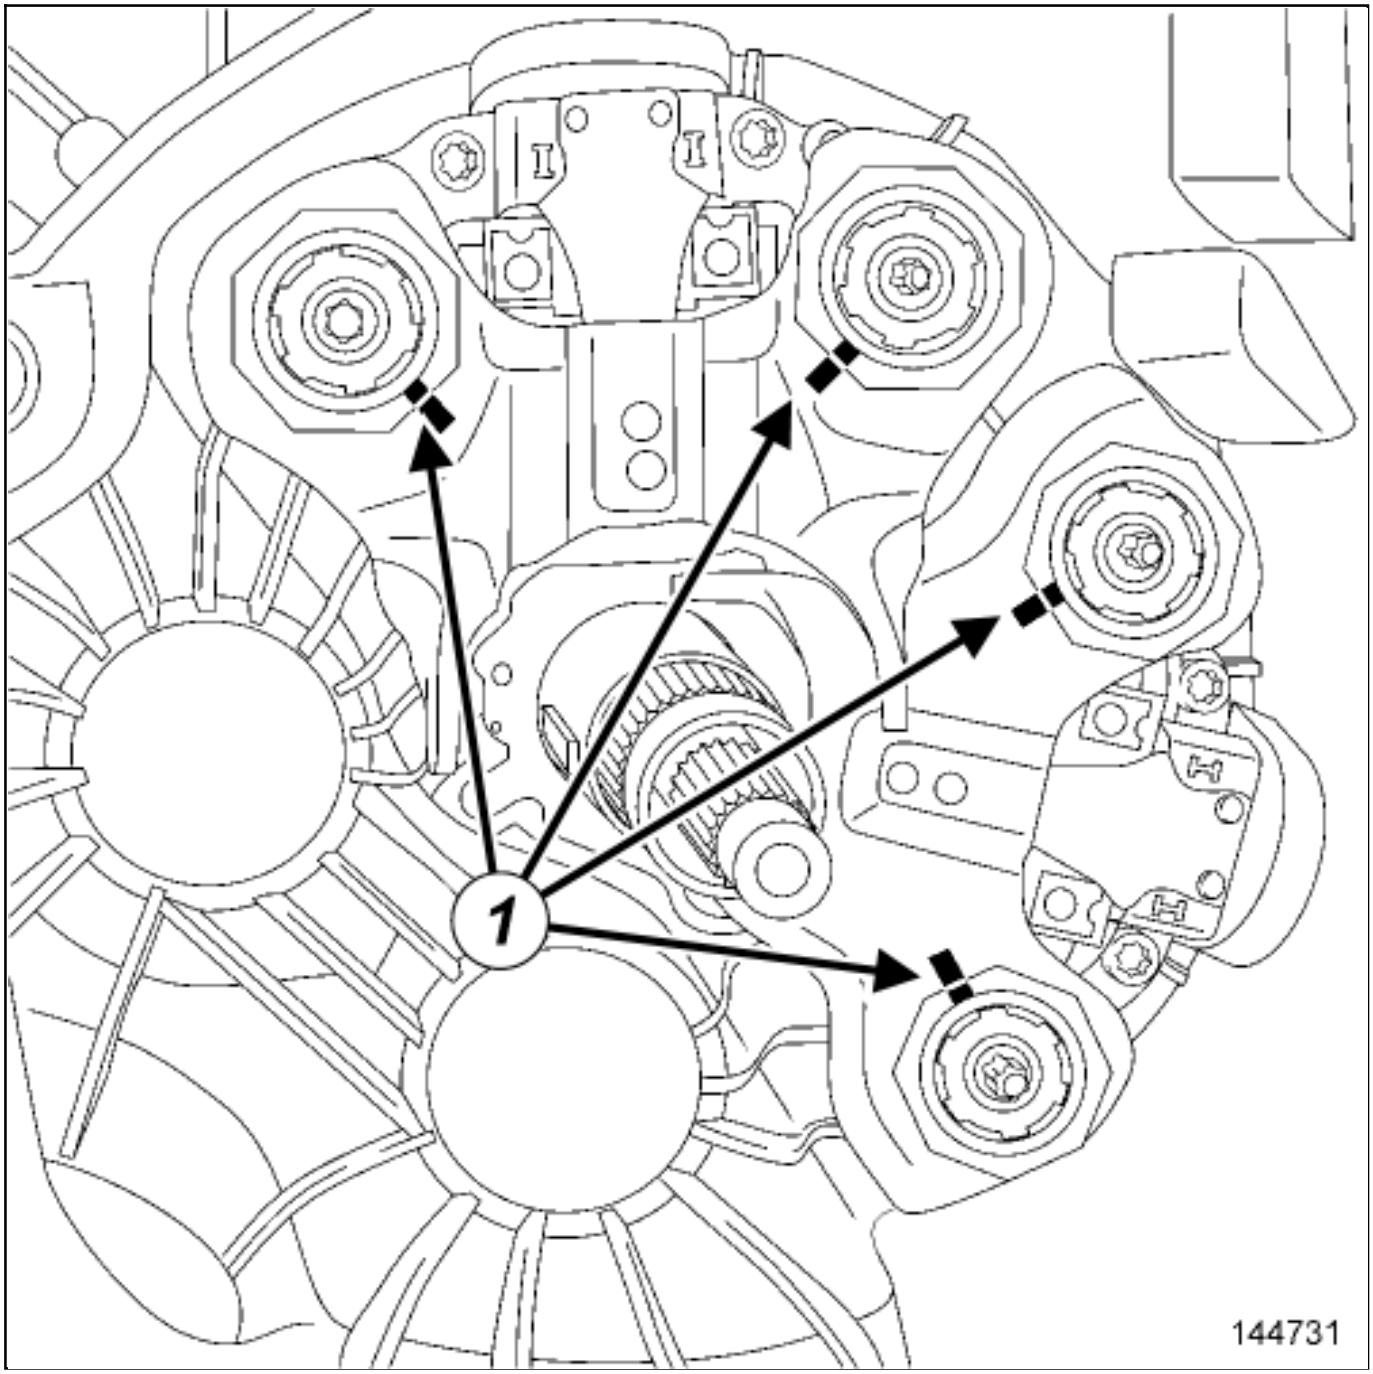
REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:

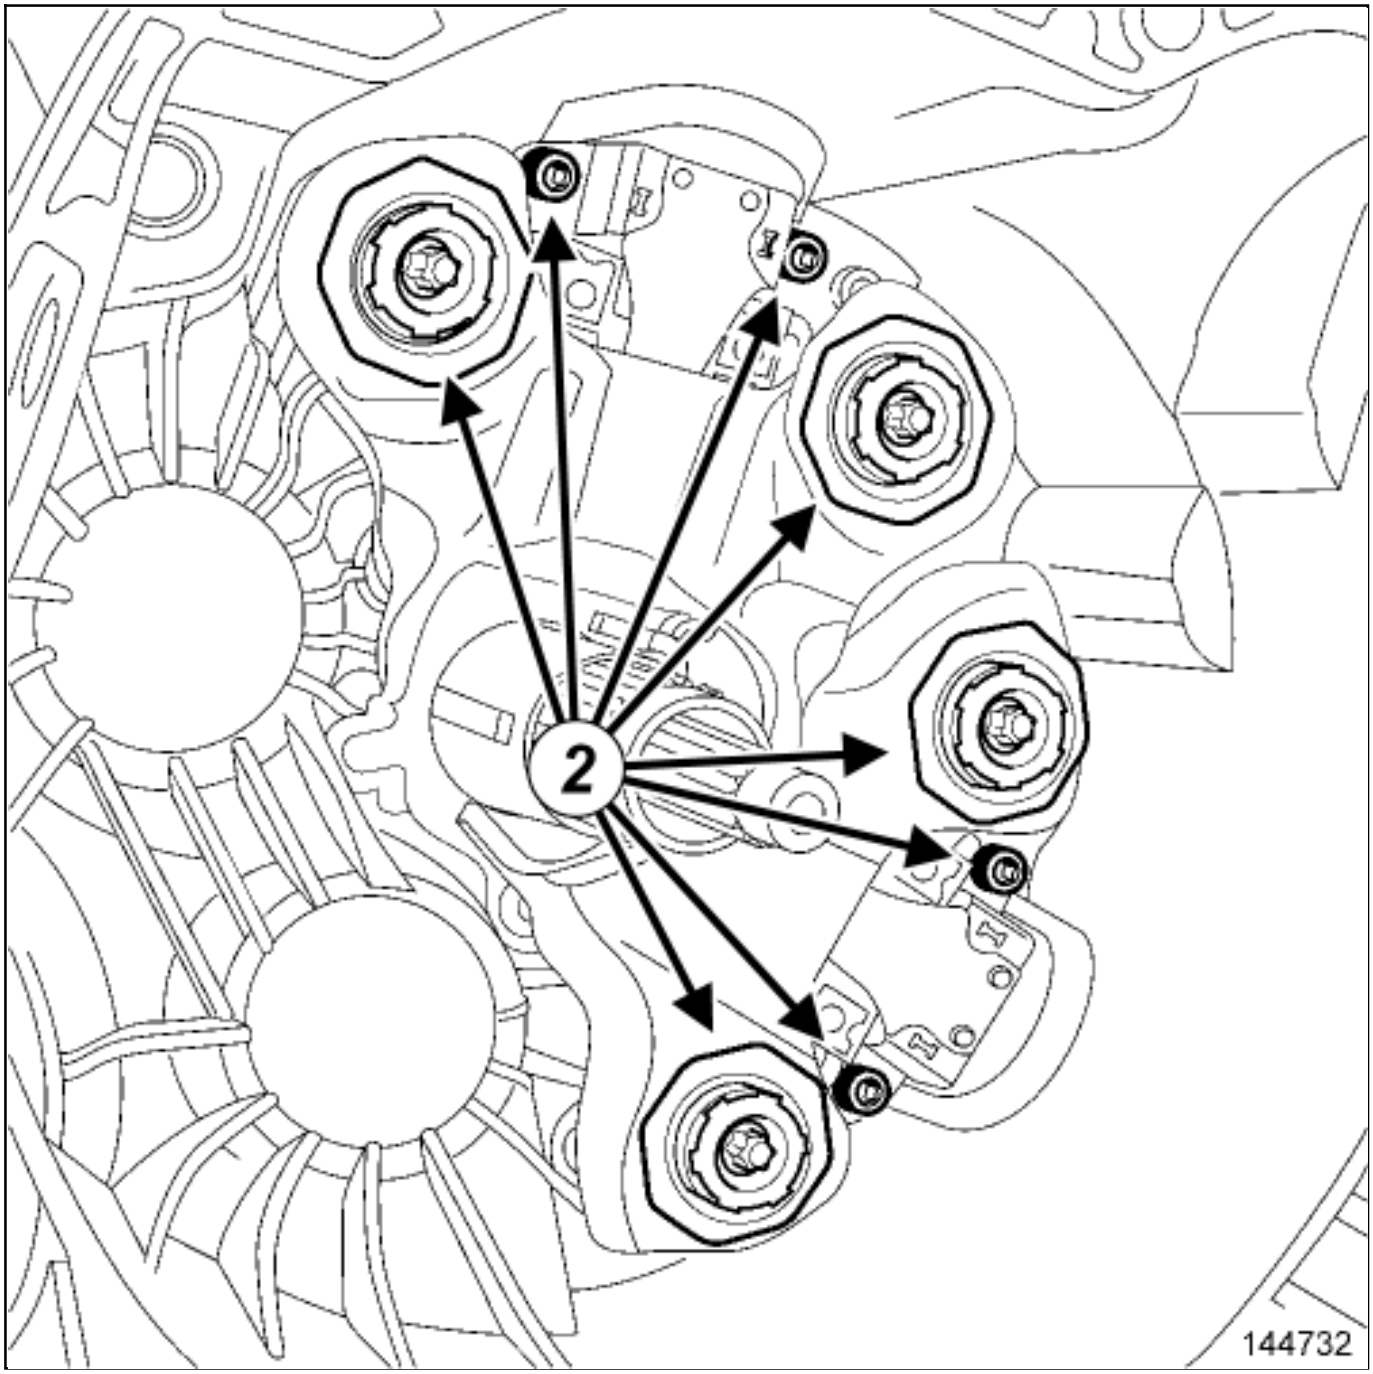
- the gearbox Automatic gearbox: Removal - Refitting ,
- the clutch (see 20A, Clutch, Clutch: Removal - Refitting) ,
- the clutch actuator motors (see 20A, Clutch, Clutch actuator motor: Removal - Refitting) ,
- the clutch thrust bearing (see 20A, Clutch, Clutch thrust bearing: Removal - Refitting) .

2. REMOVAL OPERATION



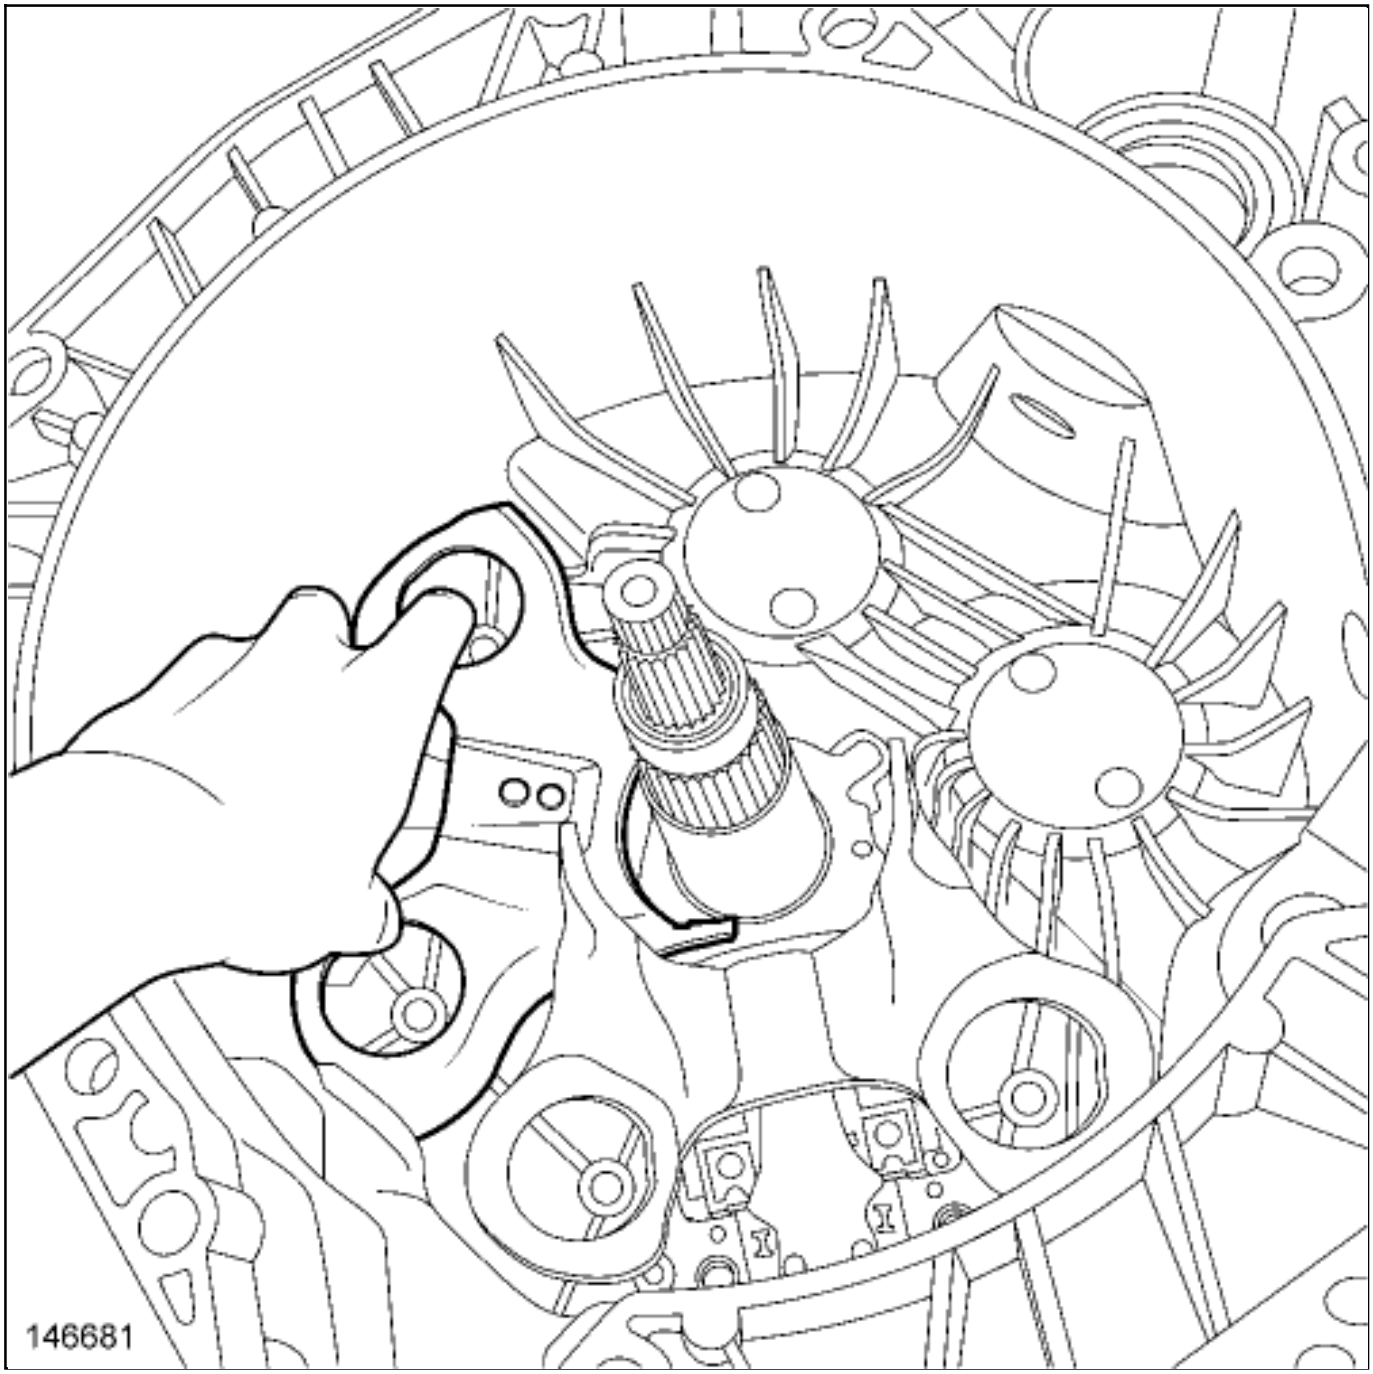
CAUTION

Failure to observe the following procedure could damage the clutch pressure plate assembly.

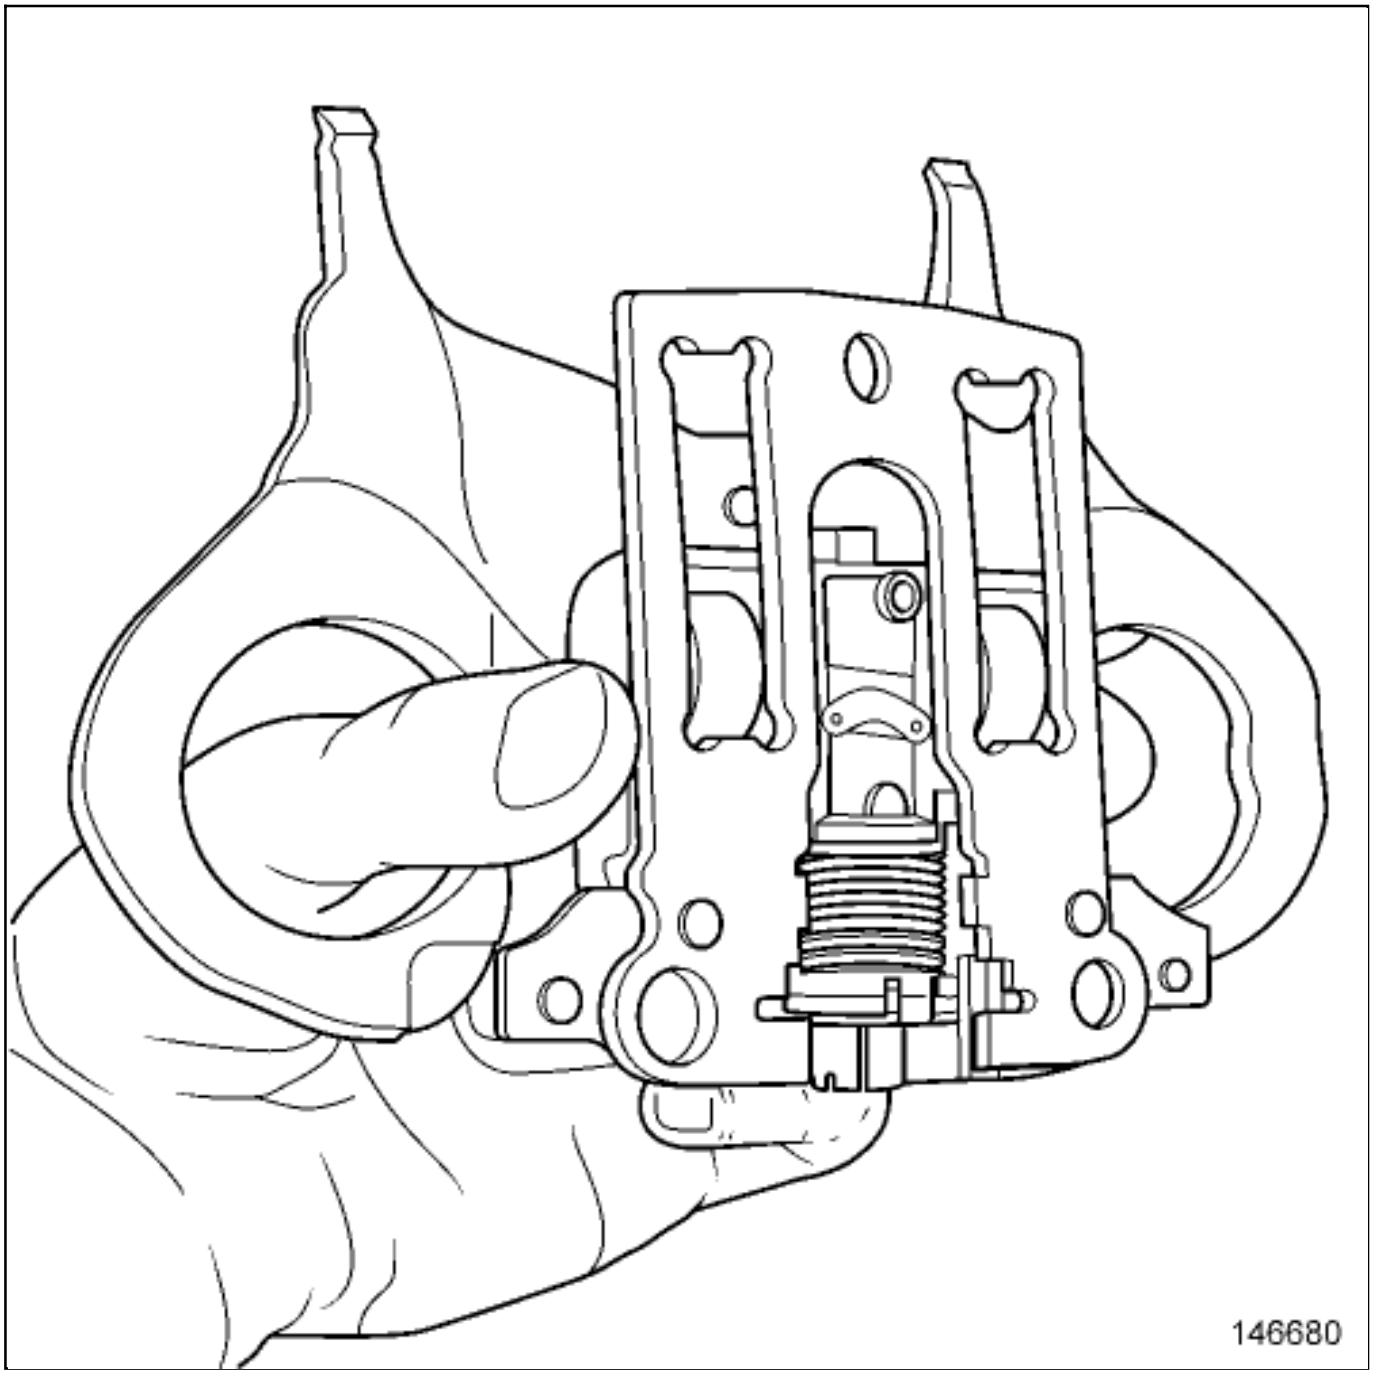


Note:

Each fork is secured by four bolts, two of which have a spring.



In order not to swap the bolts with a spring, match each bolt with a spring to its location and with its respective fork.



Match the bolts with a spring in relation to the fork before dismantling it(1) .

Remove the bolts(2) from the clutch forks.

146681

Note:

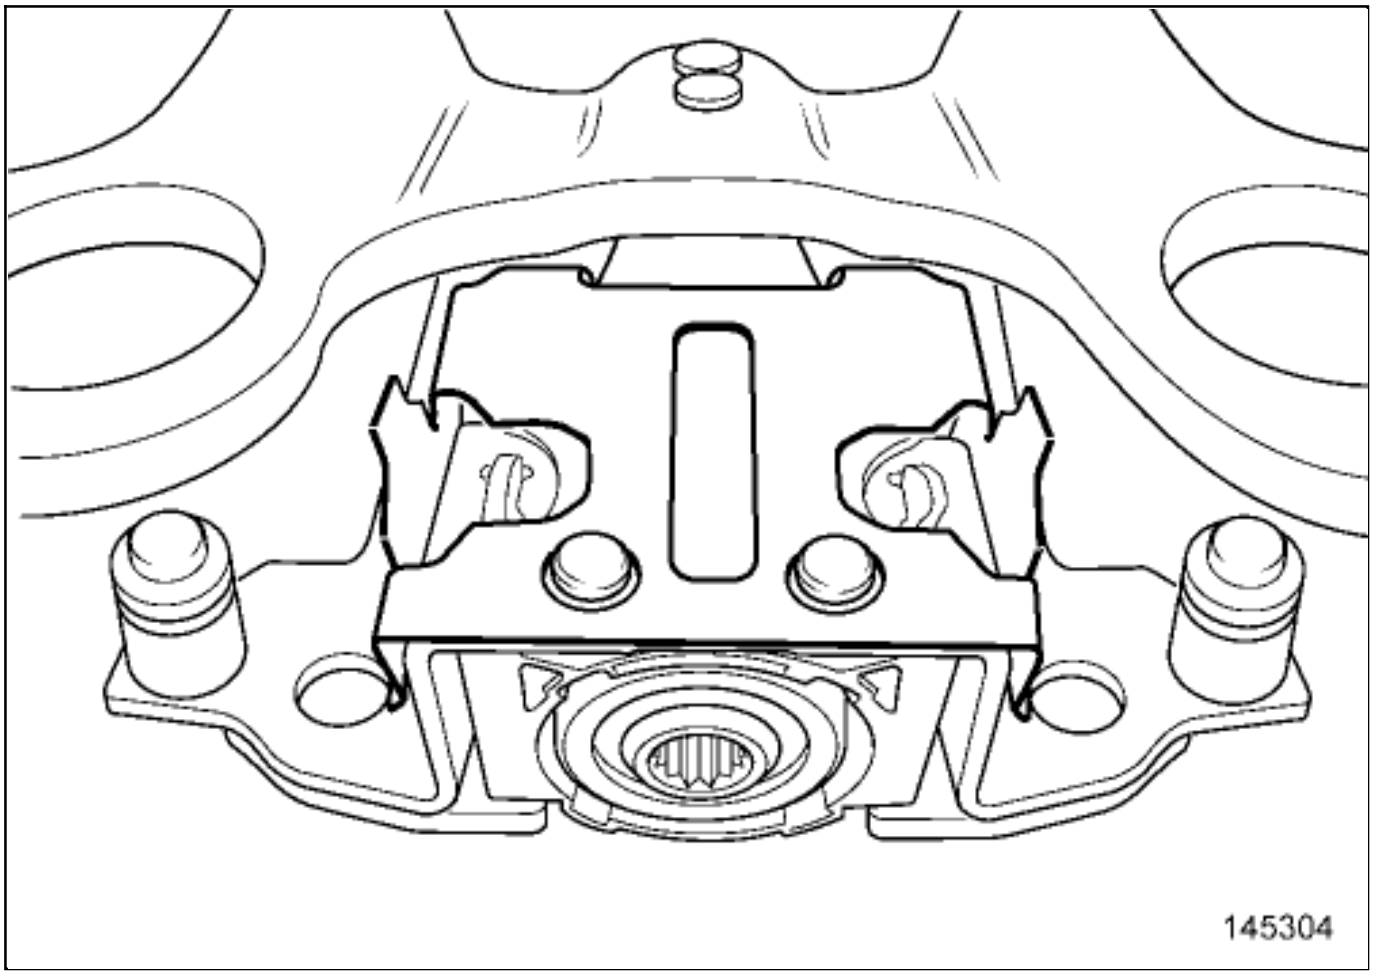
The clutch fork must be handled carefully in order not to damage its leaf spring.

It is imperative to grip the clutch fork by its body.

Remove the clutch forks, gripping them by the body.

REFITTING

1. REFITTING PREPARATION OPERATION

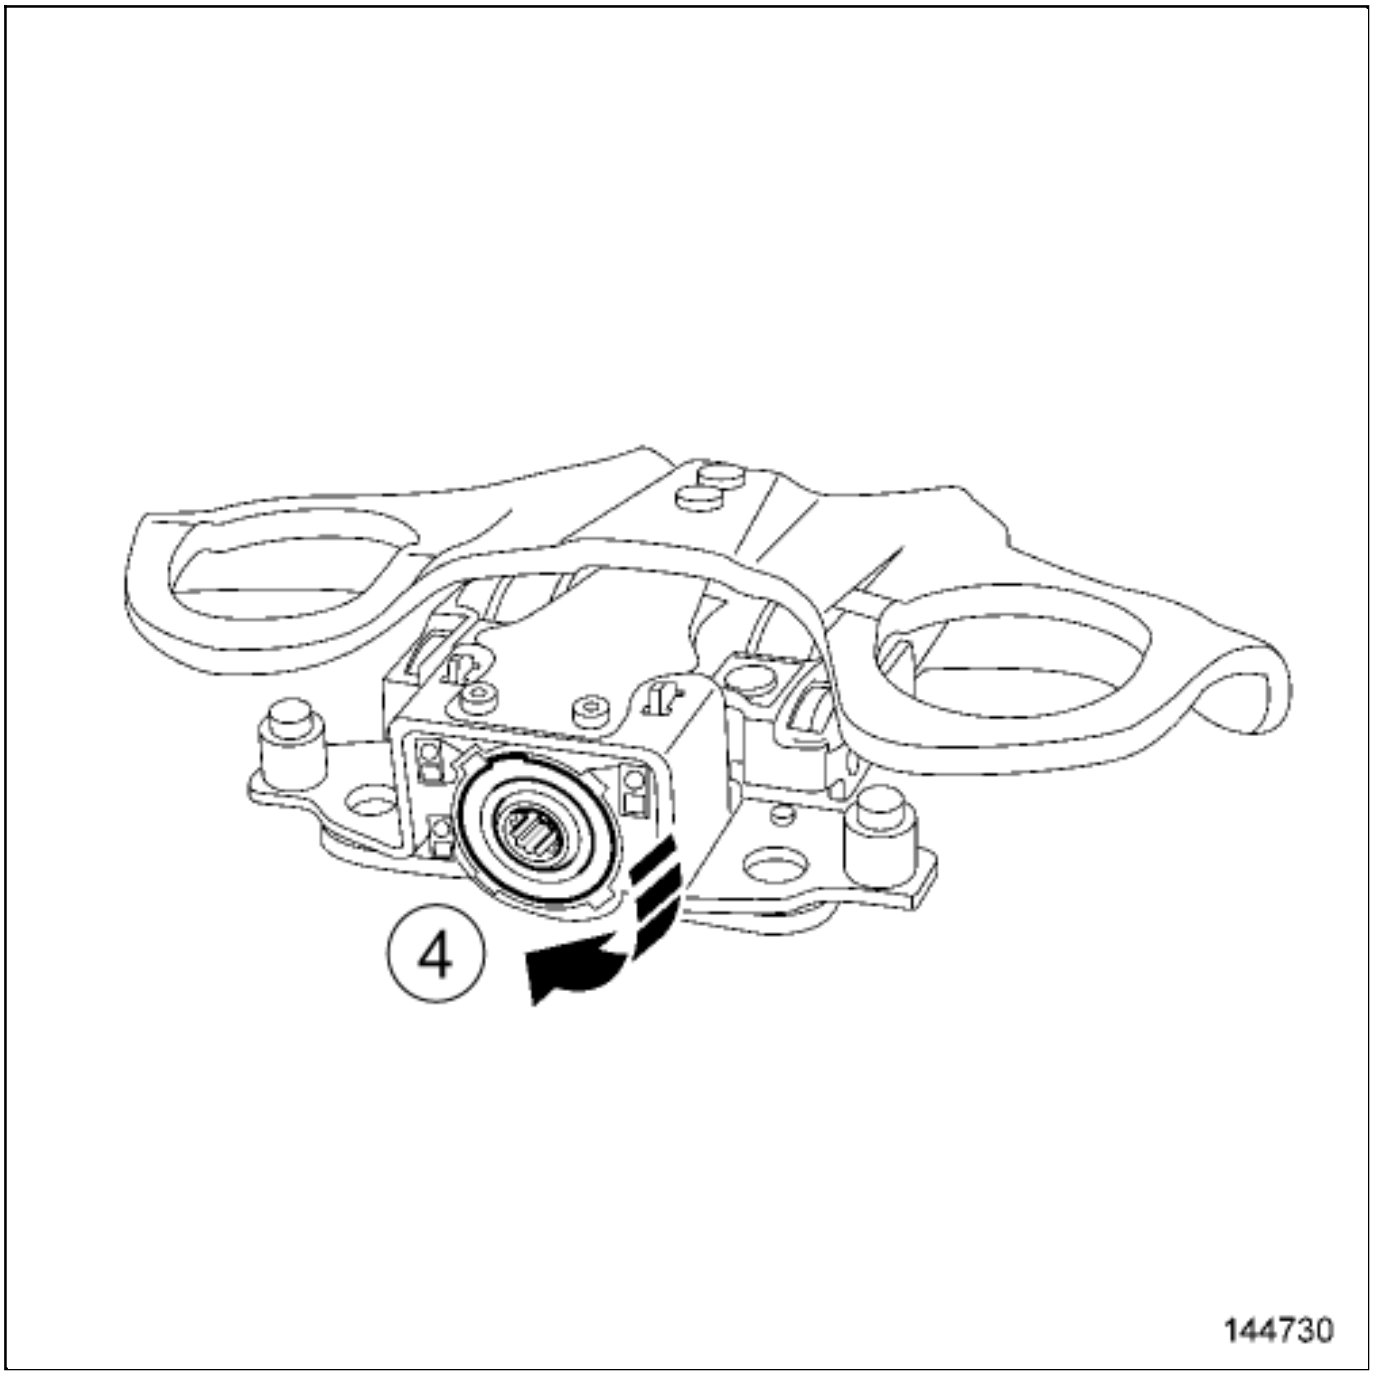


- Use surface cleaner Vehicle: Parts and consumables for the repair to clean the contact faces of:
  - the clutch forks,
  - the gearbox casing.
- Always replace the clutch clips.
- parts always to be replaced: Differential output seal .

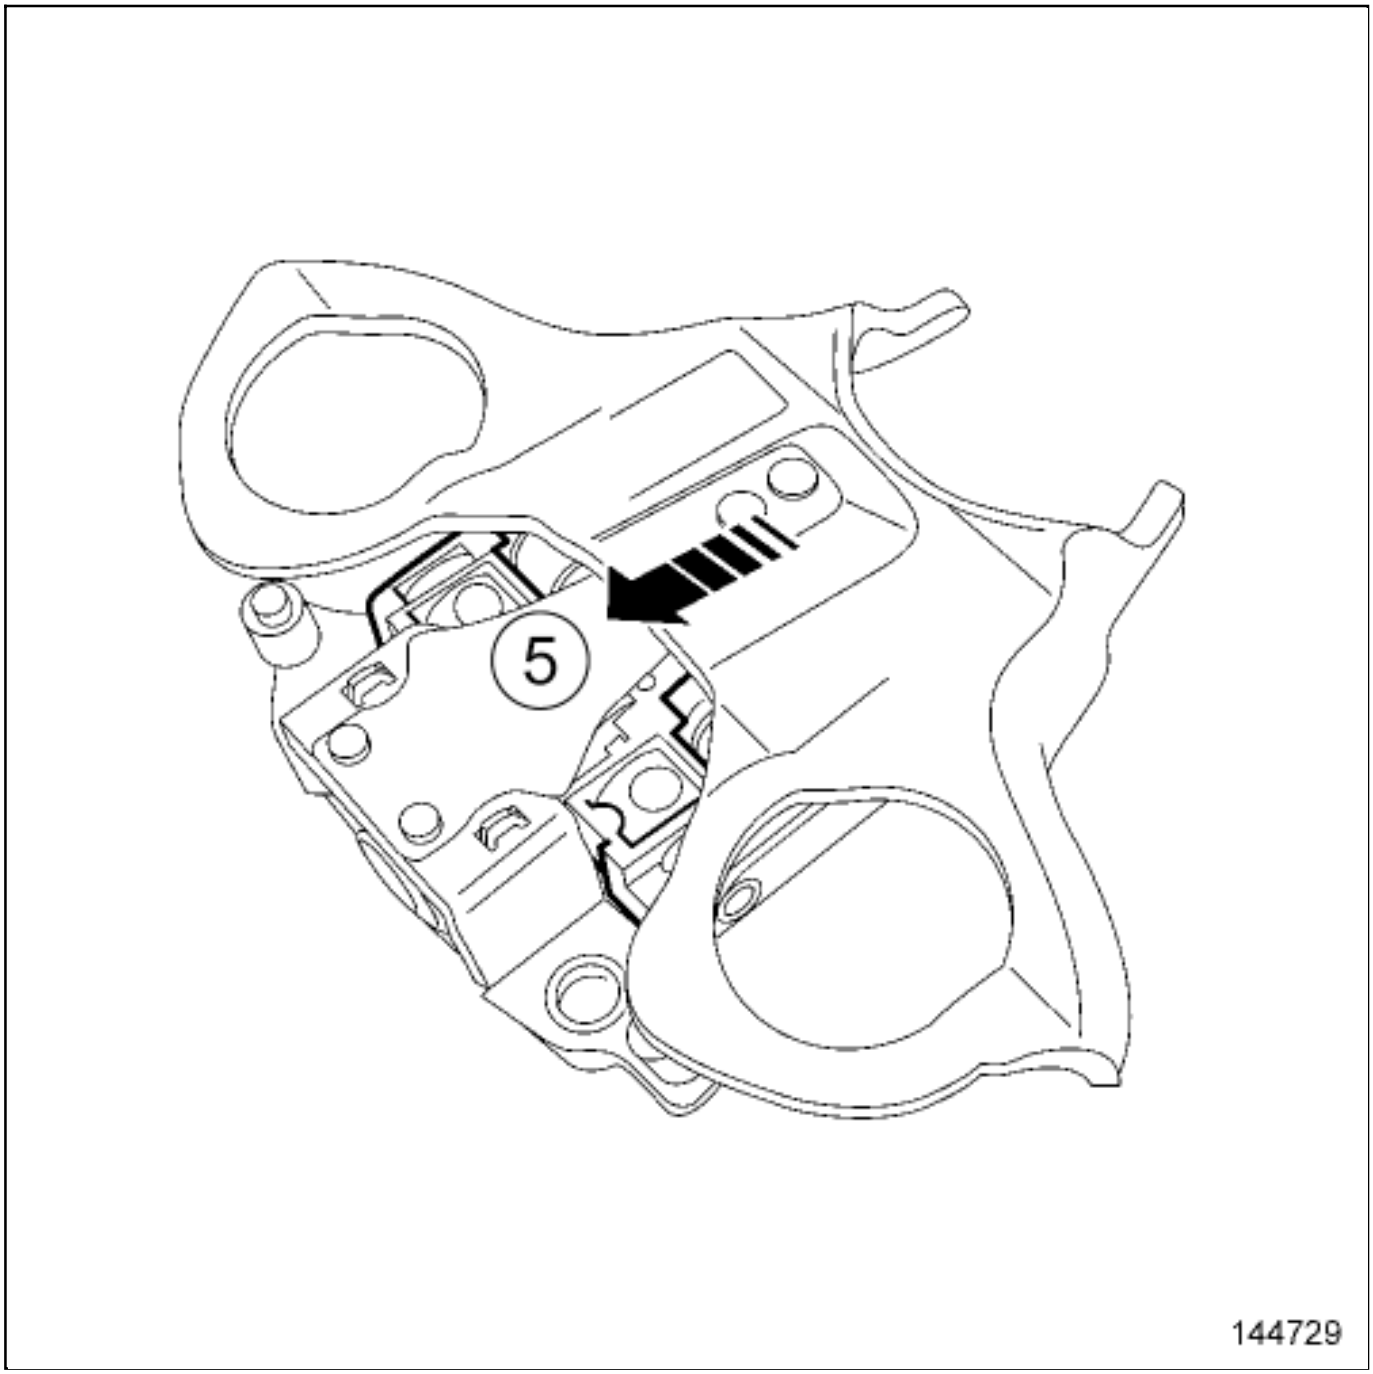
2. REFITTING OPERATION

CAUTION

Failure to observe the following procedure could damage the dual clutch.



1- FITTING THE NEW CLUTCH FORK



Note:

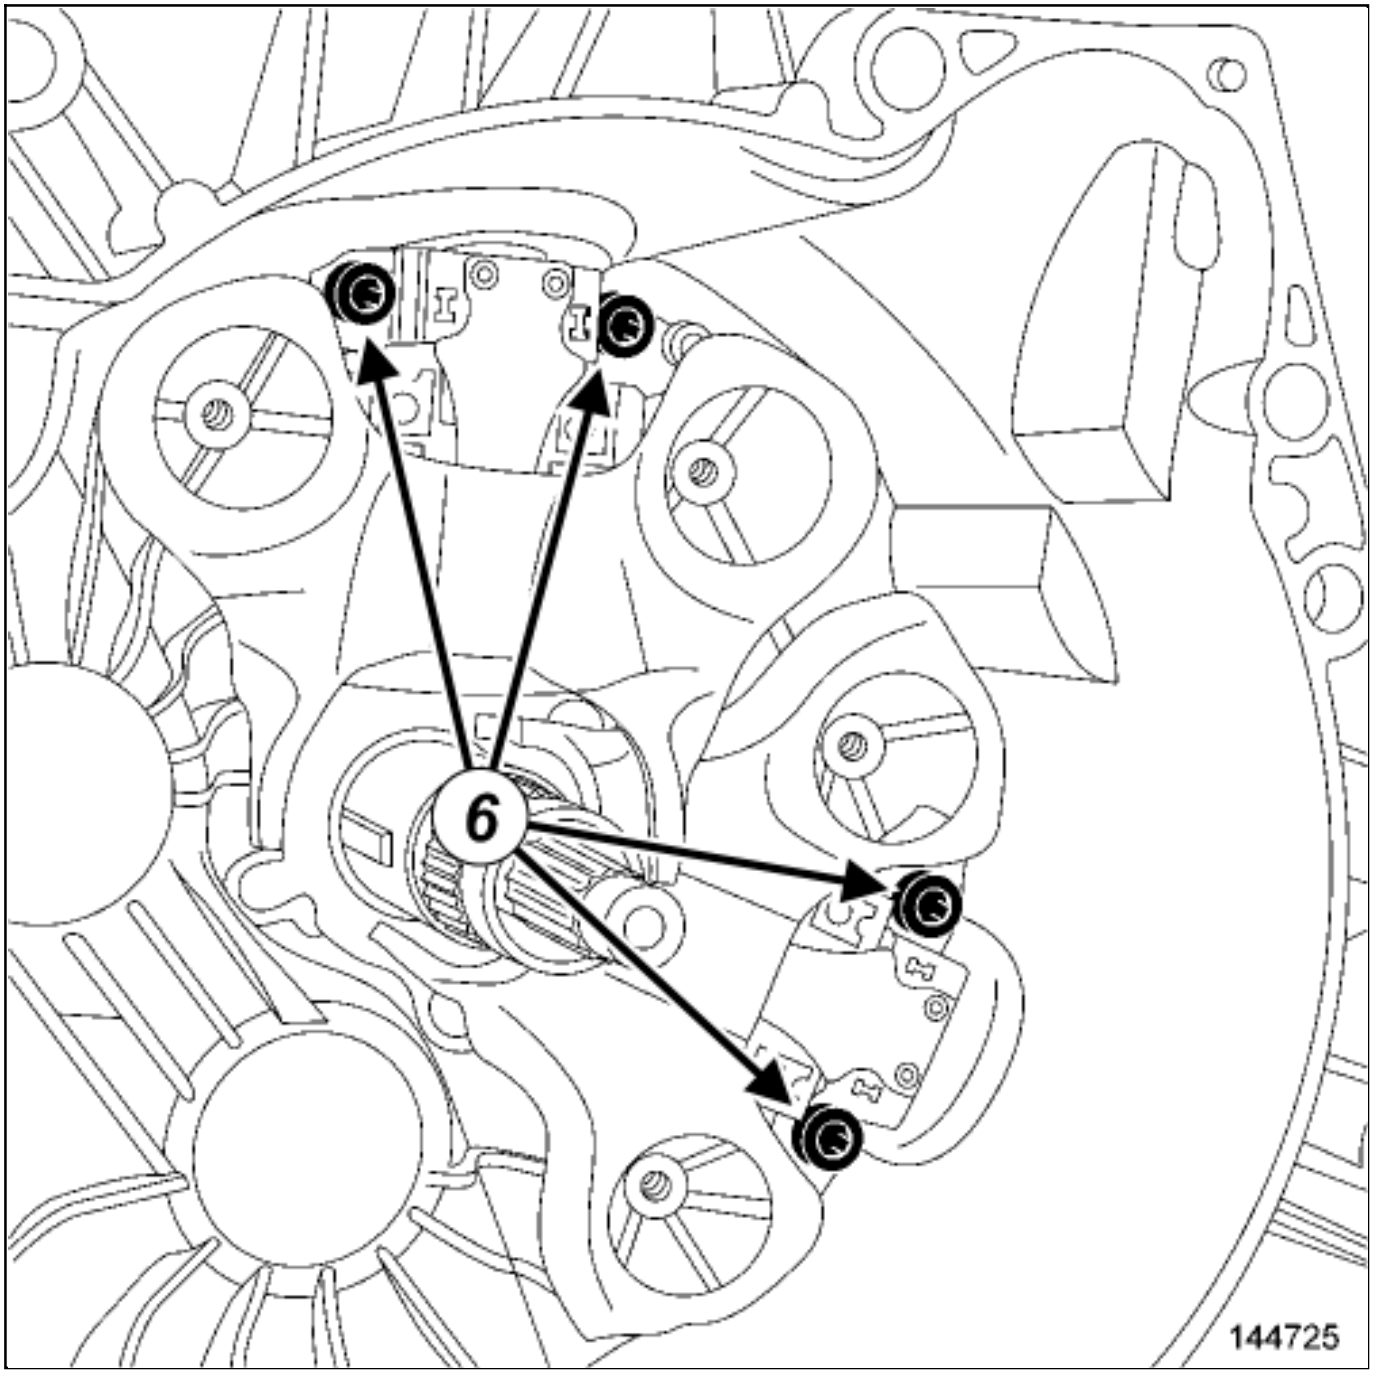
The fork is delivered with a locking tab, which is removed only after the clutch fork has been fitted, positioned, and torque tightened.

2- FITTING THE OLD CLUTCH FORK

4
144730

- Turn the shaft(4) with your fingers until the plate is against the stop at(5) .

- Refit the clutch forks without tightening them.

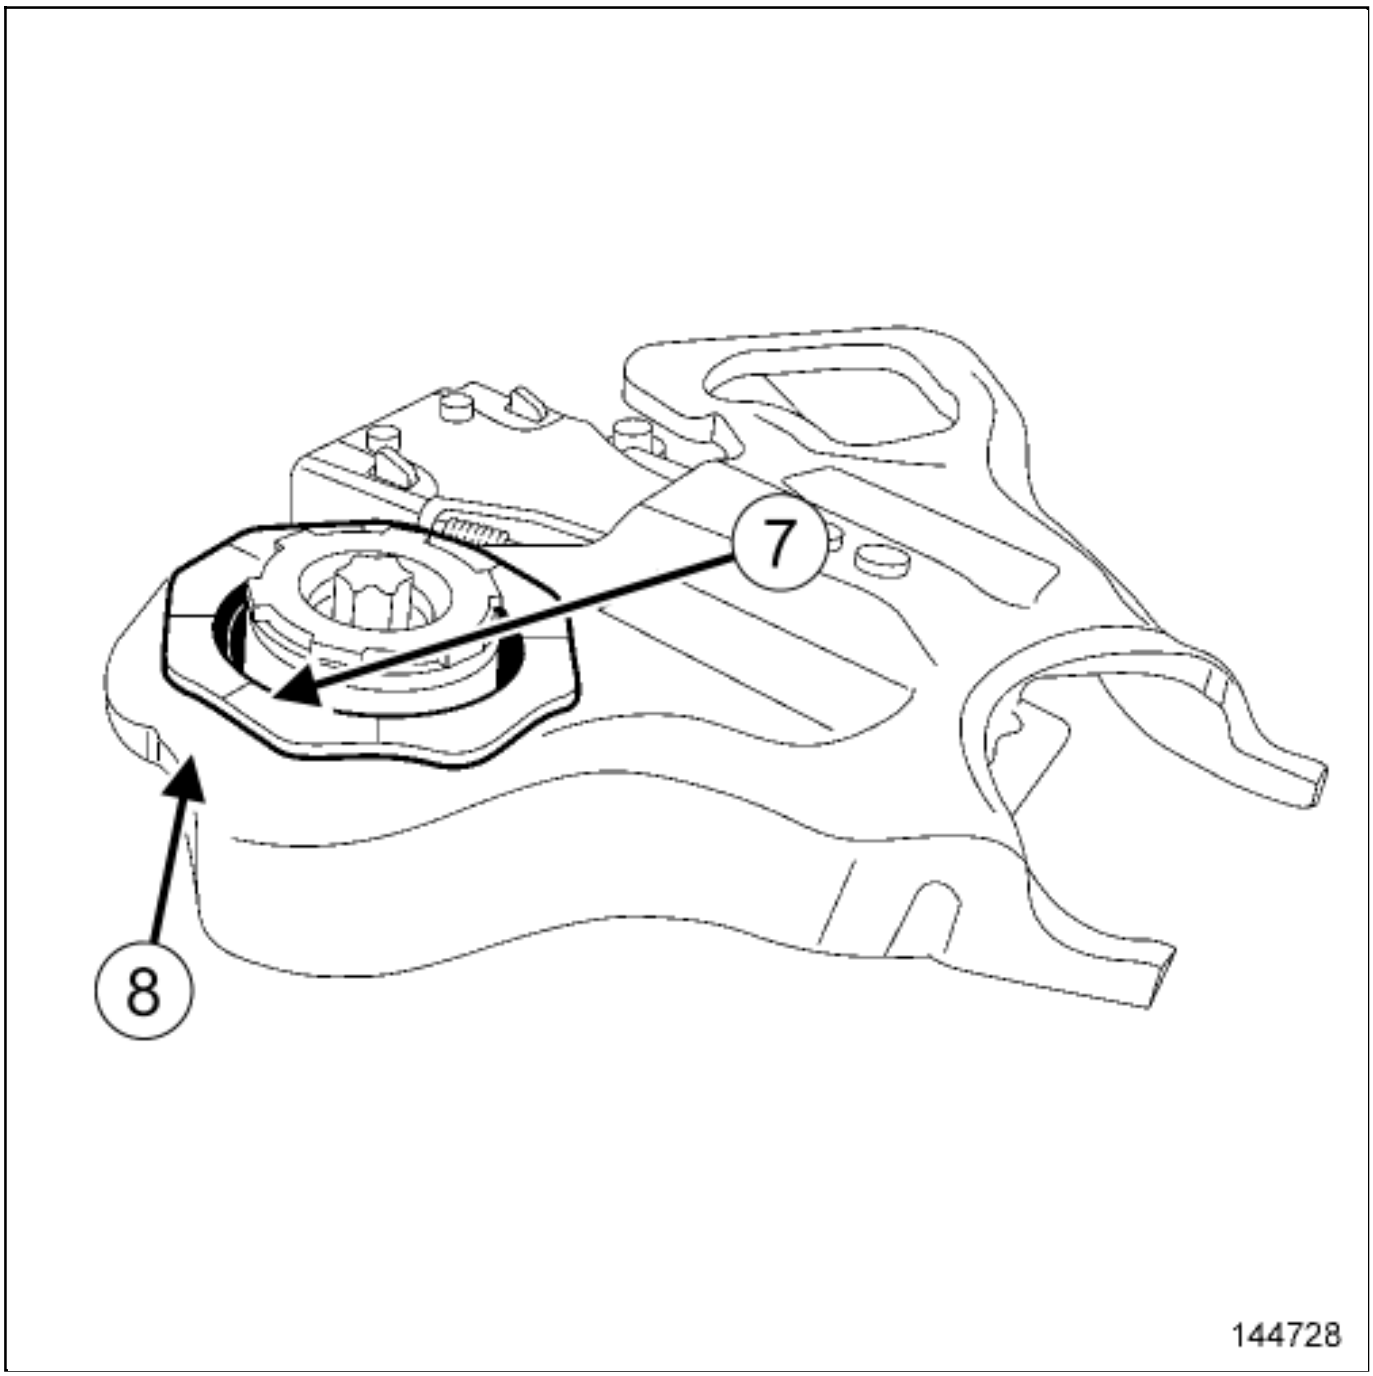


- Refit the clutch actuator motors in order to confirm the positioning of the forks(see 20A, Clutch,

Clutch actuator motor: Removal - Refitting) .

Note:

Do not force the clutch actuator motors when refitting them.



In some cases, it is necessary to turn the motor splines manually in order to engage them with the fork splines.

Refit the clutch fork bolts with no spring(6) .

Torque tighten the clutch fork bolts with no spring19 N.m.

Refit without tightening the clutch fork bolts with a spring.

Ensure that the clutch fork bolts with a spring are correctly positioned in relation to the clutch fork.

Note:

The convex part of the fork(8) must correspond with the concave part(7) of the bolt with a spring.

Torque tighten the clutch fork bolts with a spring26 N.m.

3. FINAL OPERATION

Proceed in the reverse order to removal.

CLUTCH HOUSING BEARING: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Adjustable support for fitting bearings.	Bvi. 1418
DC4 gearbox internal renovation kit	Bvi. 1956
DC4 gearbox internal renovation	RSM. 9306
Gearbox Supporter	RSM. 9308
Installation tool of bearing	Bvi. 2029

Equipment required
roll pin punch

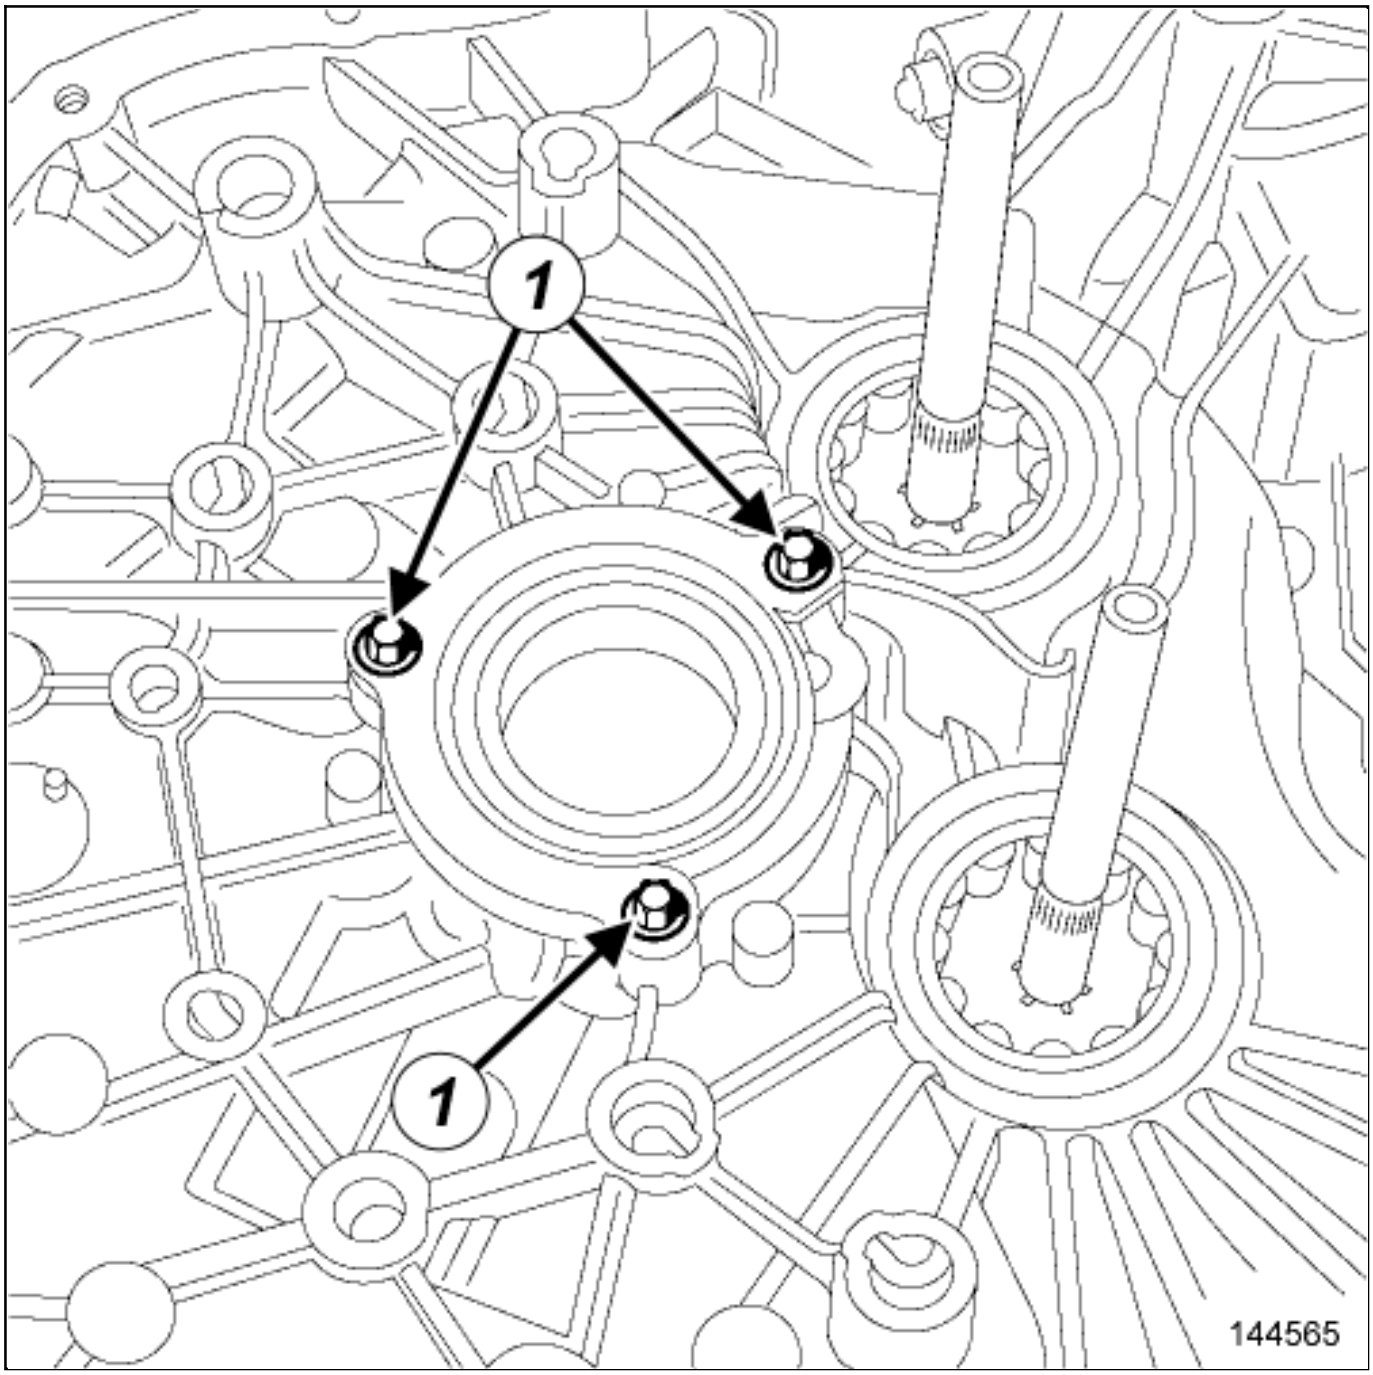
parts always to be replaced:
Clutch housing bearing
Automatic gearbox differential bearing

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).

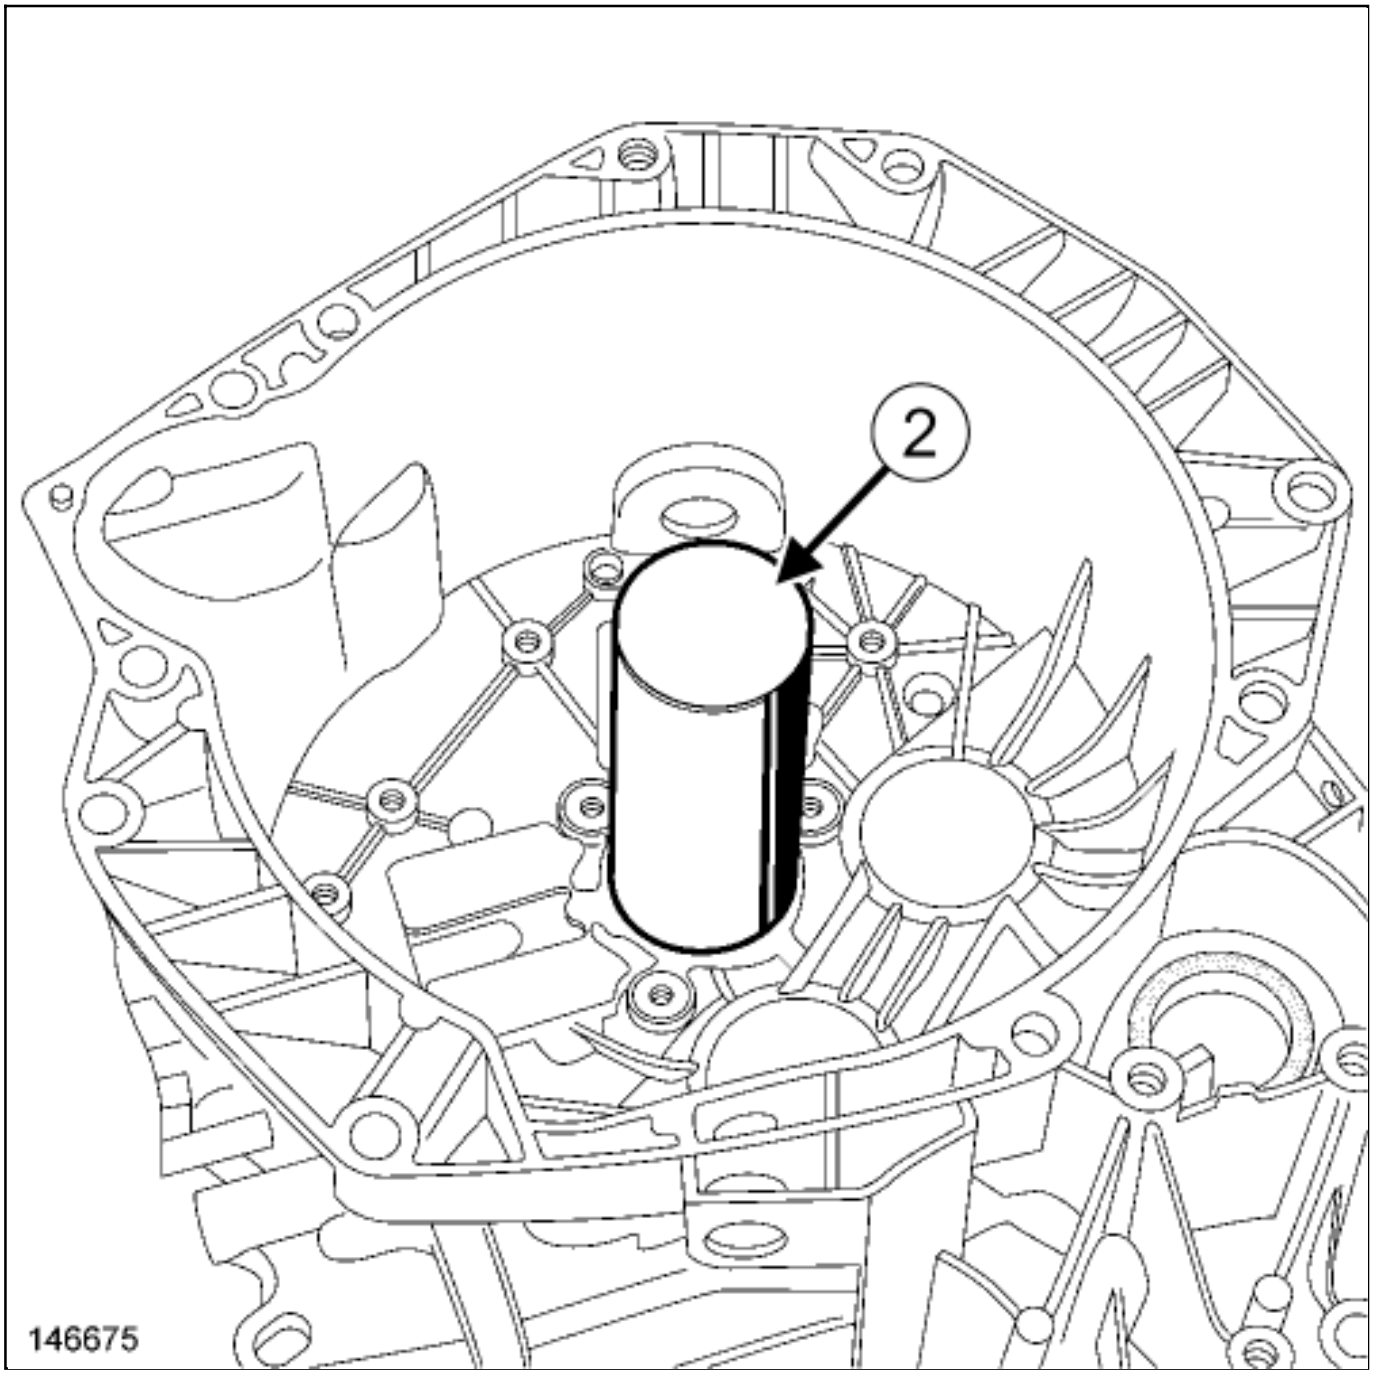
REMOVAL



1. REMOVAL PREPARATION OPERATION

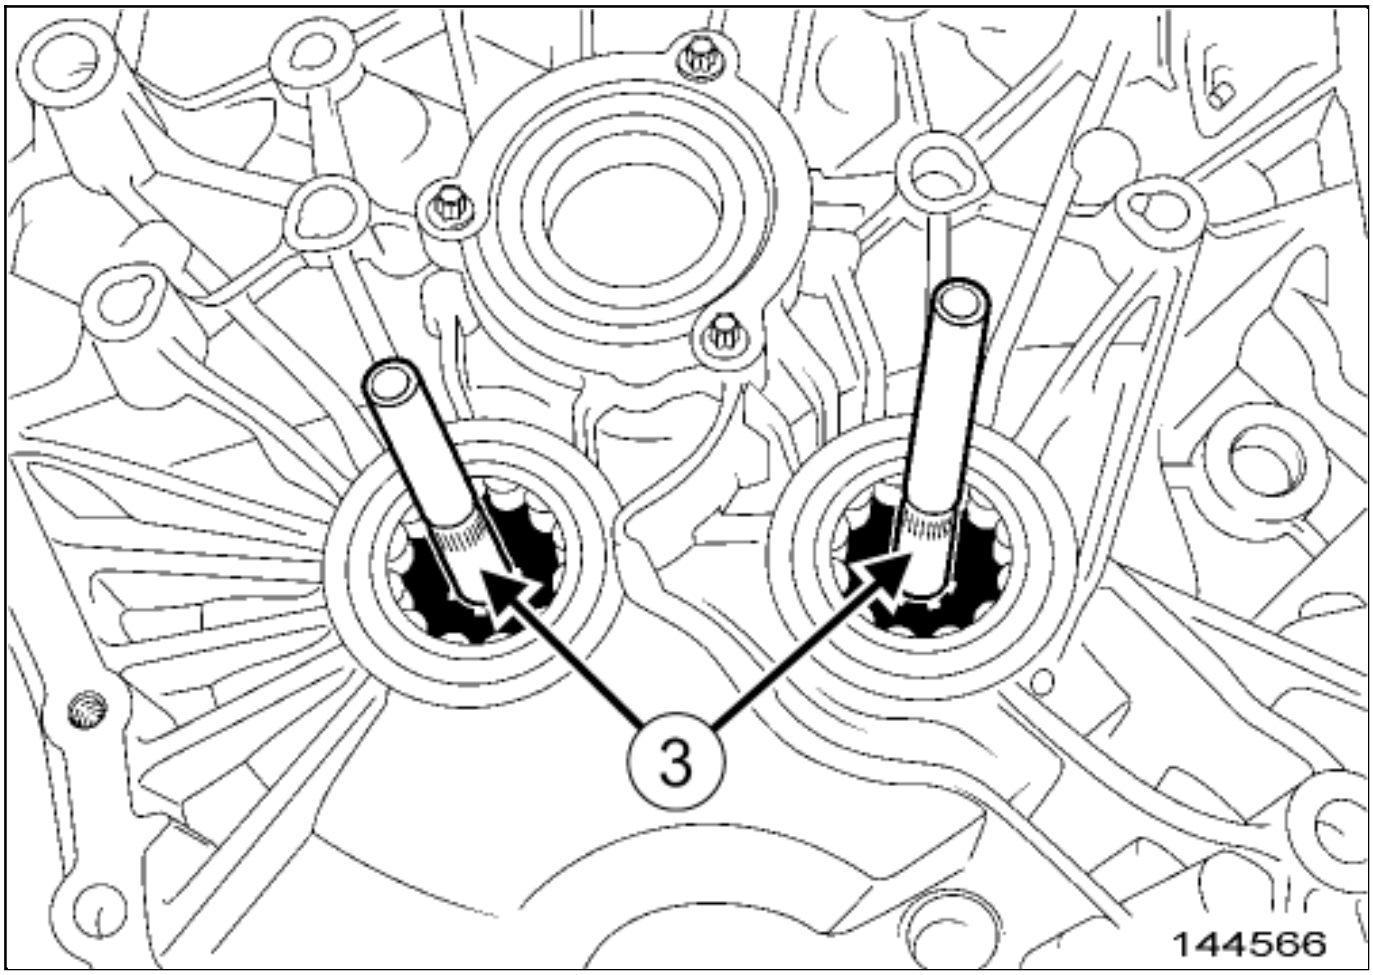
Remove:

- the automatic gearbox **Automatic gearbox: Removal - Refitting** ,
- the automatic gearbox wiring **Automatic gearbox wiring: Removal - Refitting** ,
- the speed sensors **Speed sensor: Removal - Refitting** ,
- the gear engaged sensor **Gear engaged sensor: Removal - Refitting** ,
- the automatic transmission computer **Automatic gearbox computer : Removal - Refitting** ,
- the clutch pressure plate **Clutch: Removal - Refitting** ,
- the clutch actuator motors **Clutch actuator motor: Removal - Refitting** ,
- the clutch thrust bearing **Clutch thrust bearing: Removal - Refitting** ,
- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** ,
- the clutch housing **(see 23A, Automatic gearbox , Clutch housing: Removal - Refitting)** .



2. OPERATION FOR REMOVAL OF PART CONCERNED

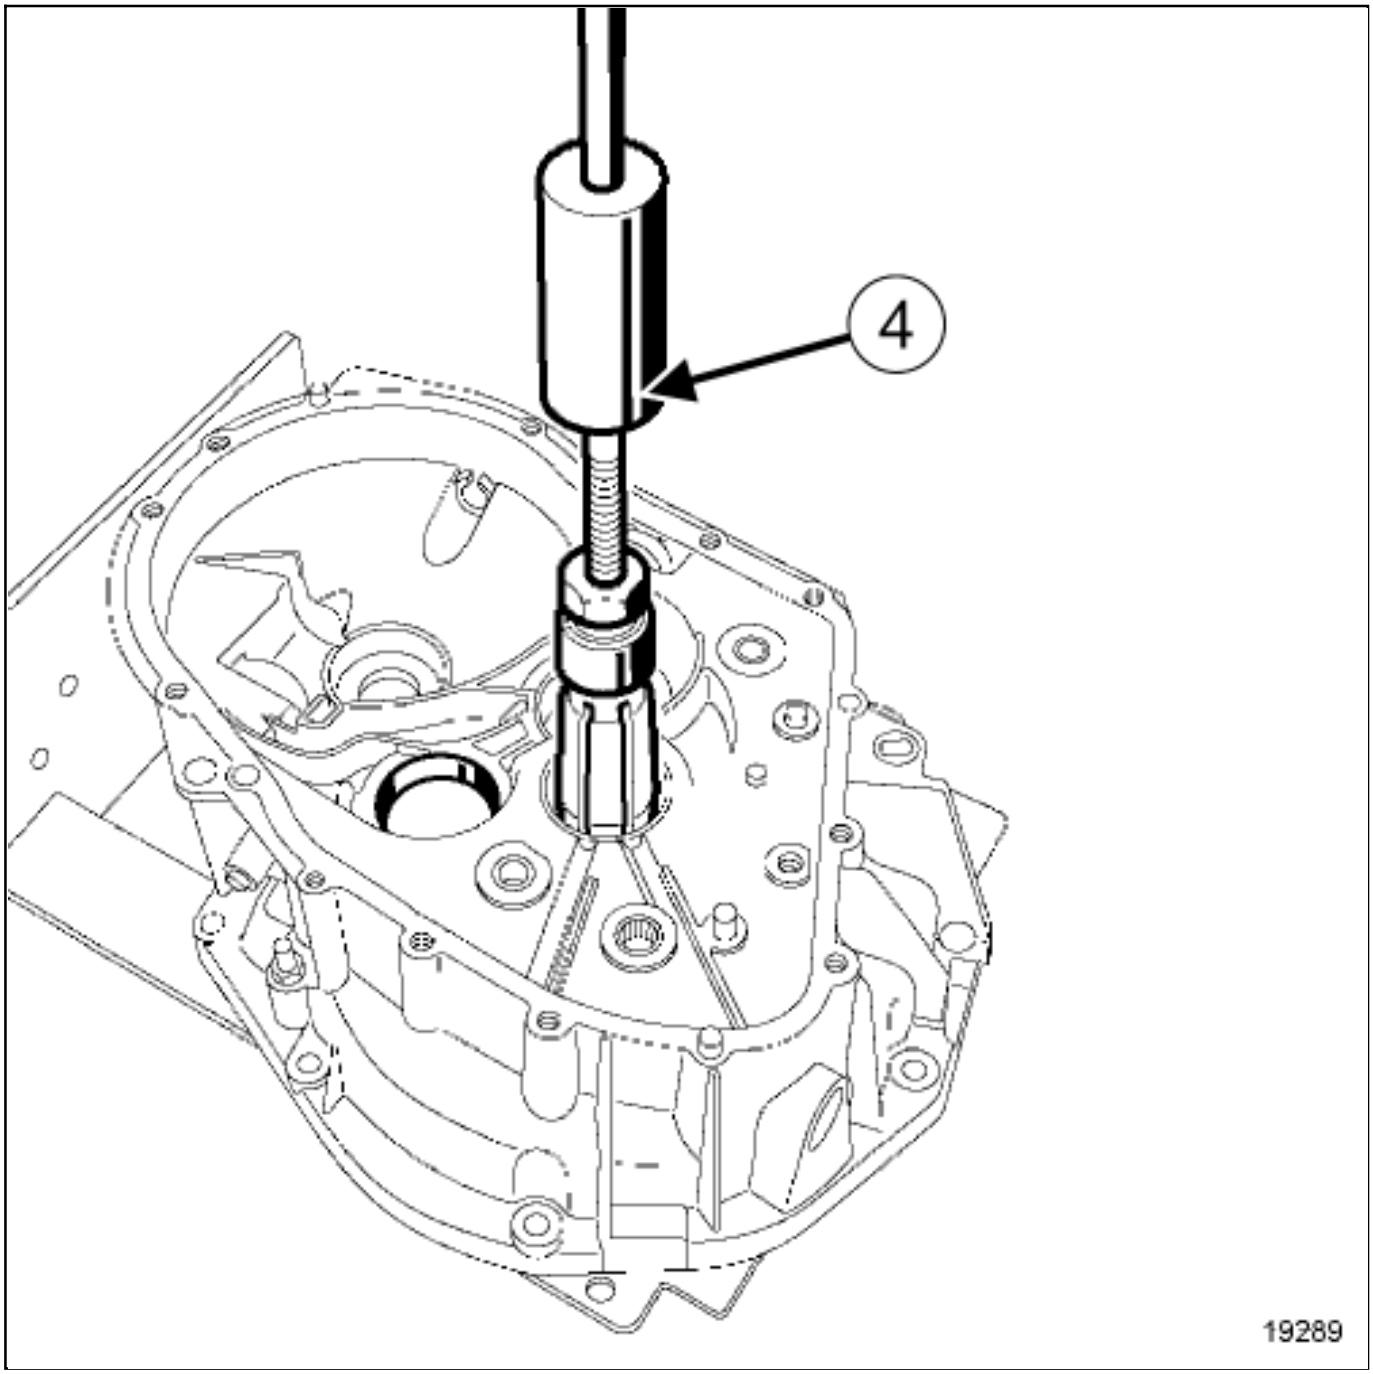
1- REMOVING THE INPUT SHAFT BEARING:



Remove:

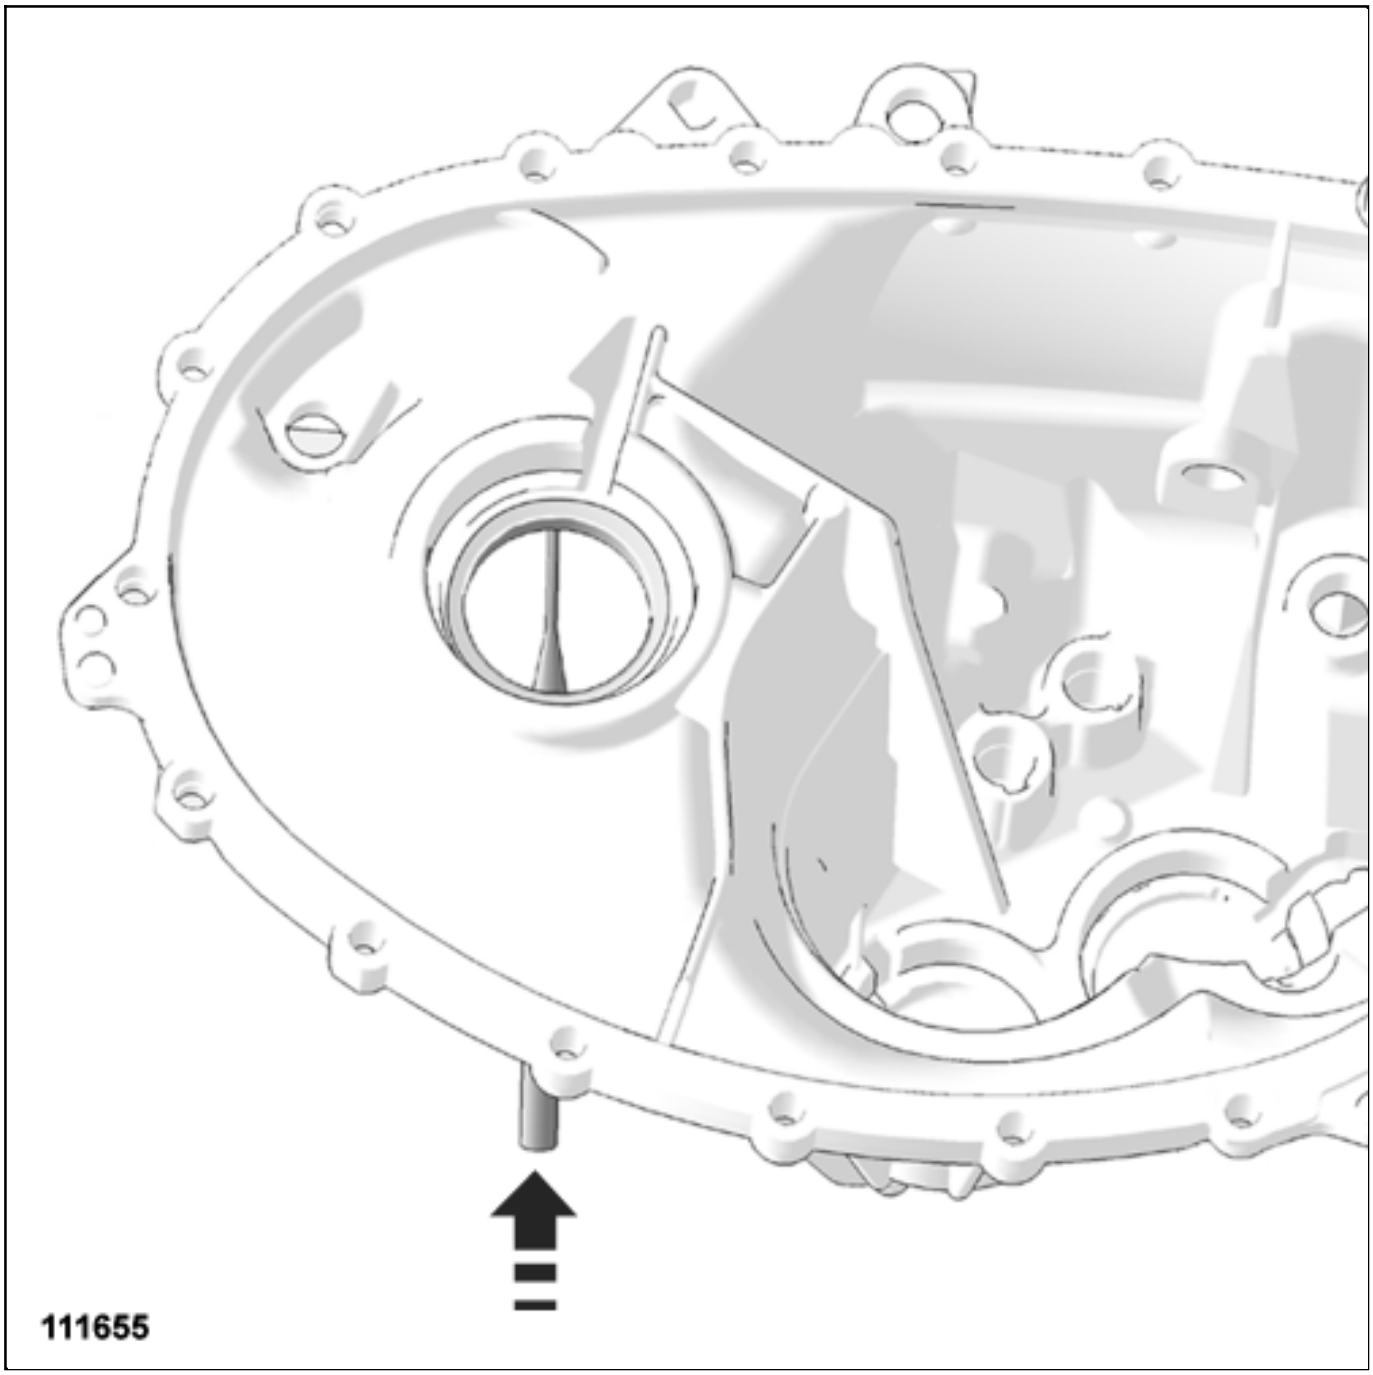
- the three bolts(1) from the retaining bracket of the input shaft bearing,
- the retaining bracket of the input shaft bearing.

Remove the input shaft bearing using the toolDC4 gearbox internal renovation kit(Bvi. 1956) A (2) .



2- REMOVING THE OUTPUT SHAFT BEARING:

Break:



- the lubrication channels(3) ,
- The plastic retaining ring of the output shaft bearing rollers.

Remove the rollers from the output shaft bearing.

Remove the output shaft bearing using an inertia extractor(4) .

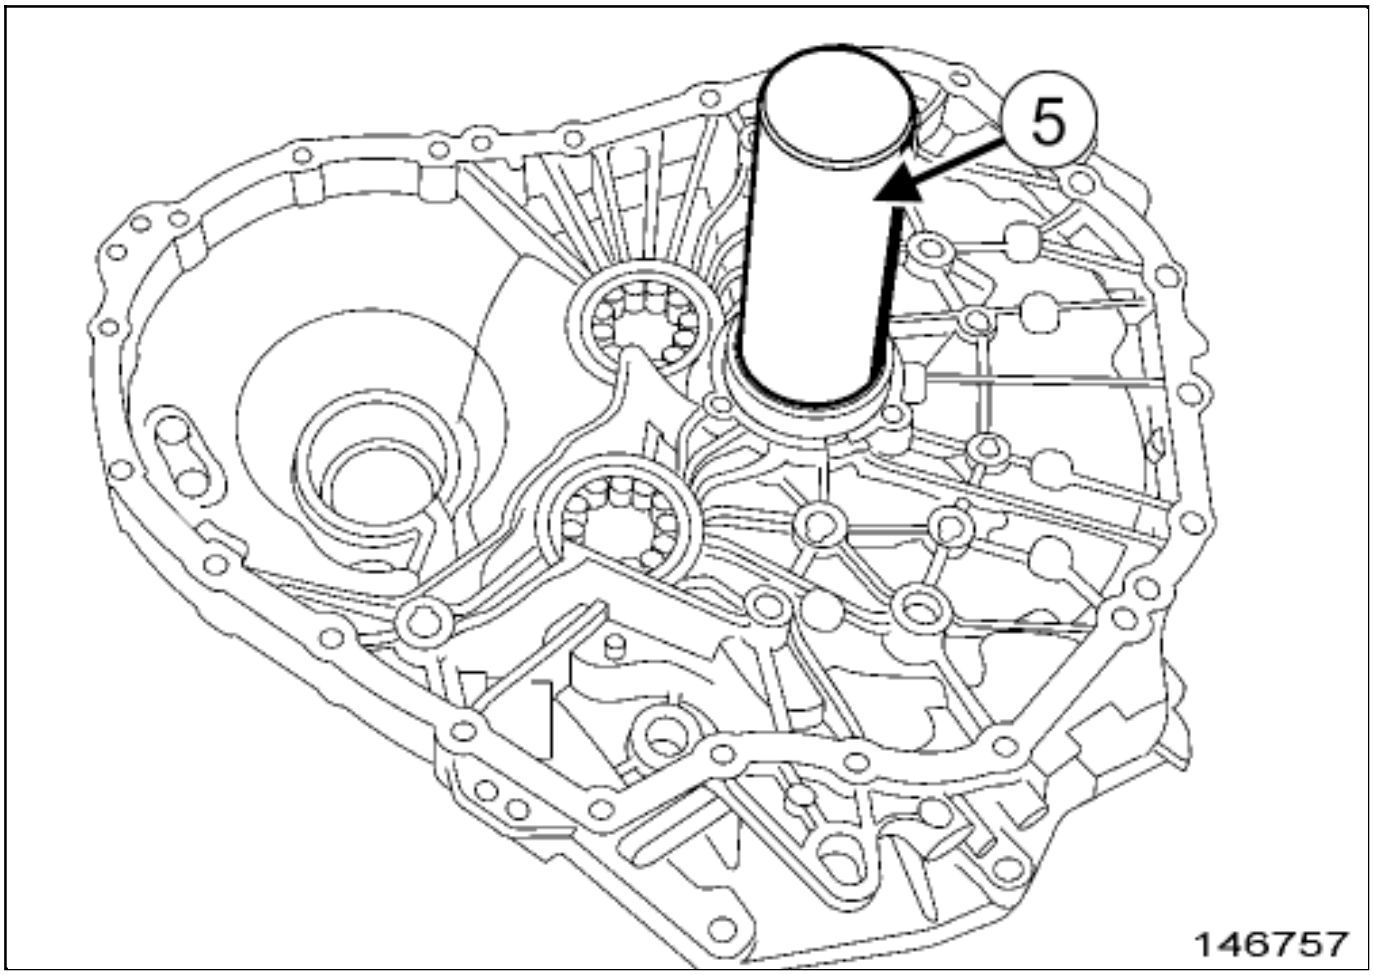
3- REMOVING THE DIFFERENTIAL BEARING:

Remove the differential bearing using a roll pin punch.

REFITTING

1. REMOVAL PREPARATION OPERATION

Clean all the removed parts[Vehicle: Parts and consumables for the repair] (04B, Consumables - Products).



- parts always to be replaced: Clutch housing bearing
- parts always to be replaced: Automatic gearbox differential bearing
- Always replace the lubrication channels.

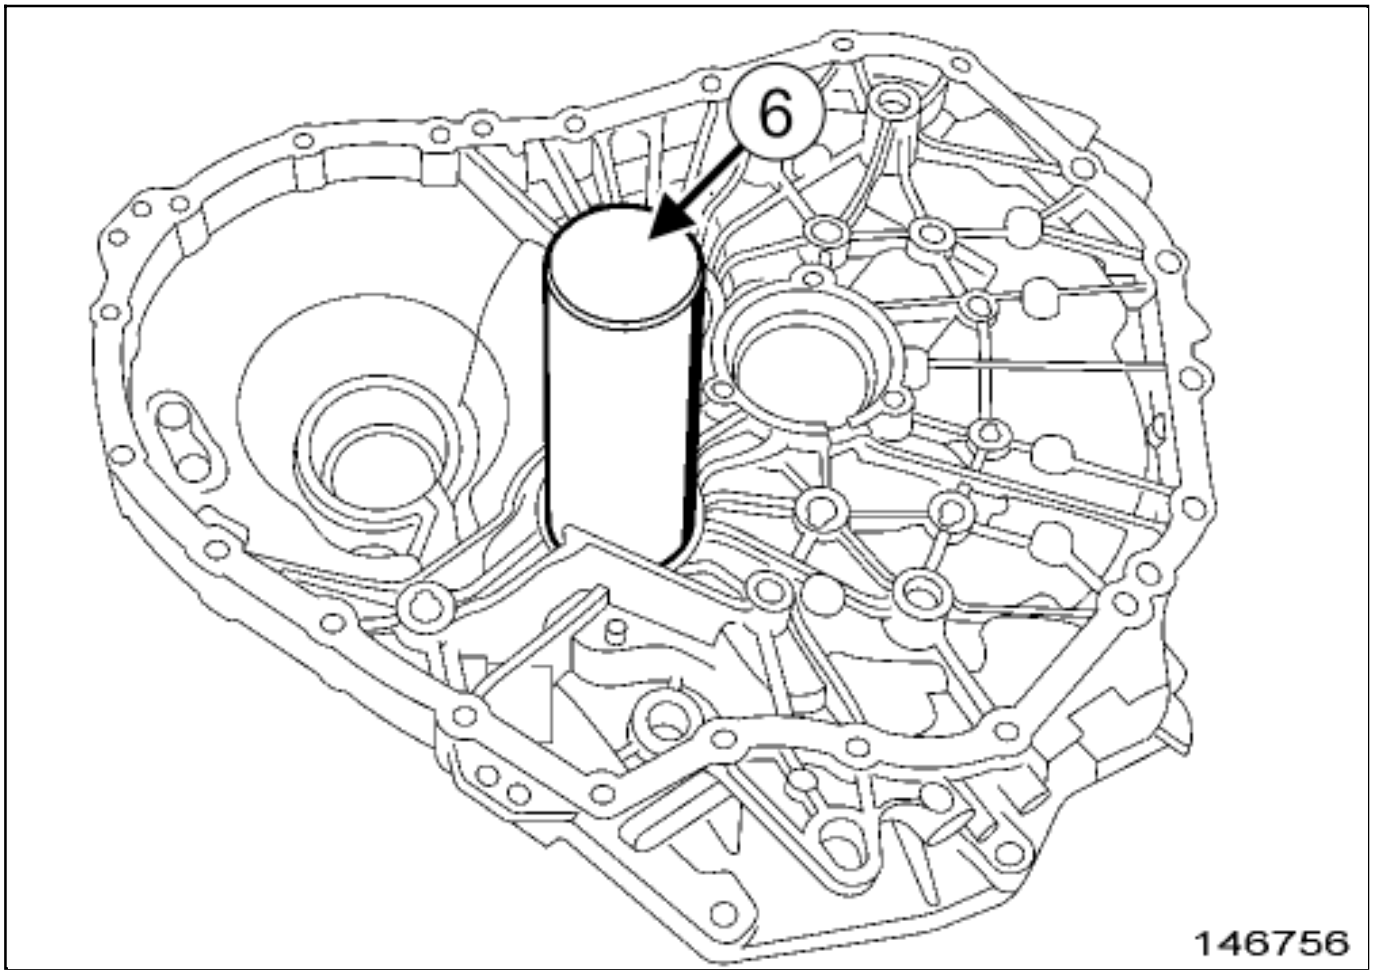
2. REFITTING OPERATION FOR PART CONCERNED

CAUTION

Failure to observe the following procedure could cause irreparable damage to the automatic gearbox clutch housing.

1- REFITTING THE INPUT SHAFT BEARING:

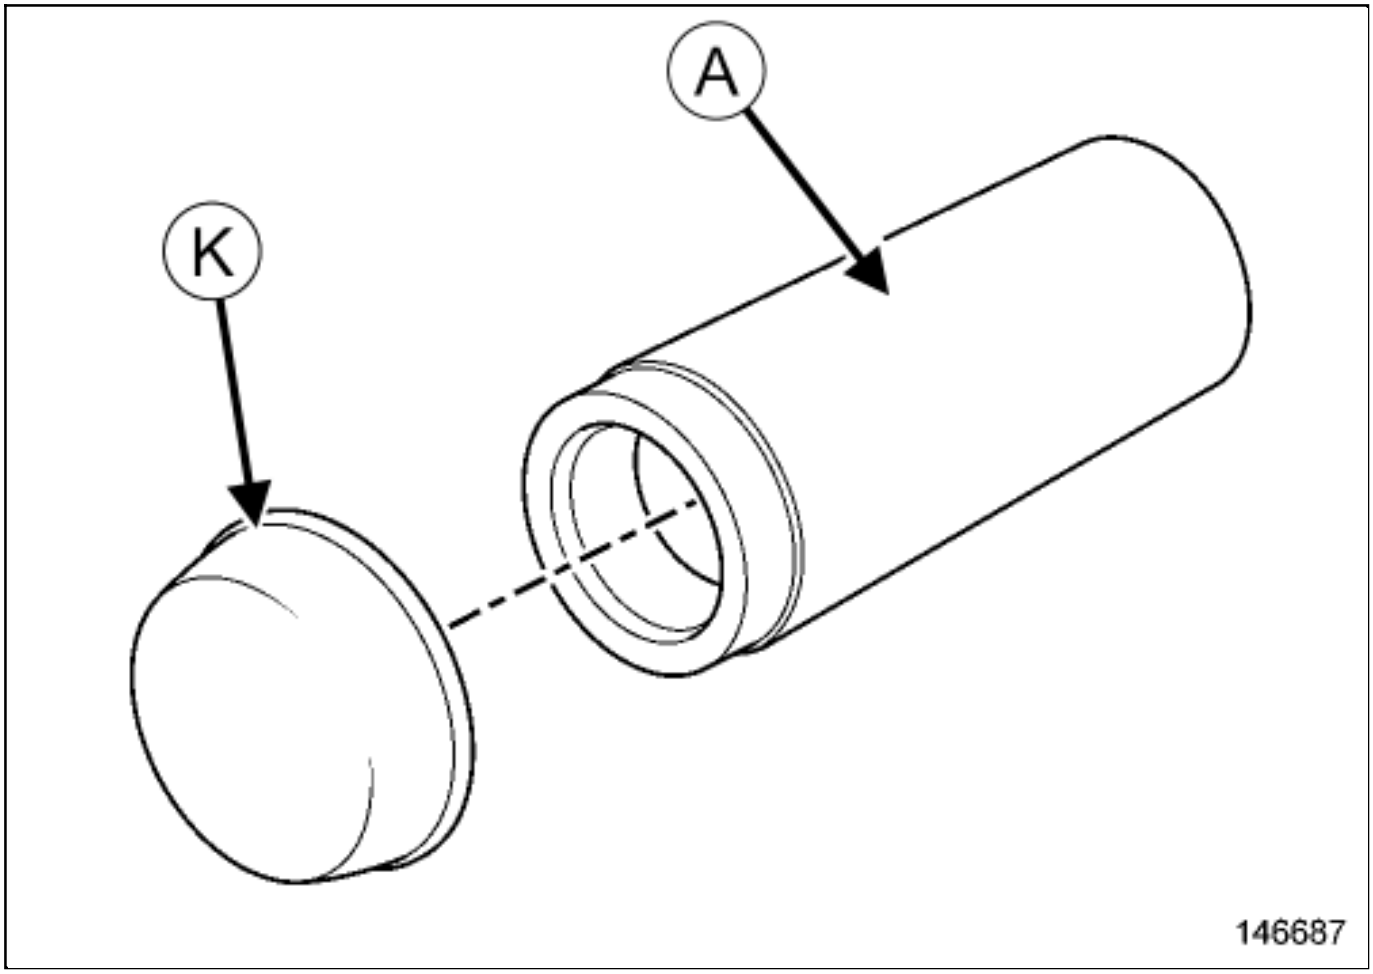
Torque tighten the bolts of the input shaft bearing retaining bracket8 N.m.



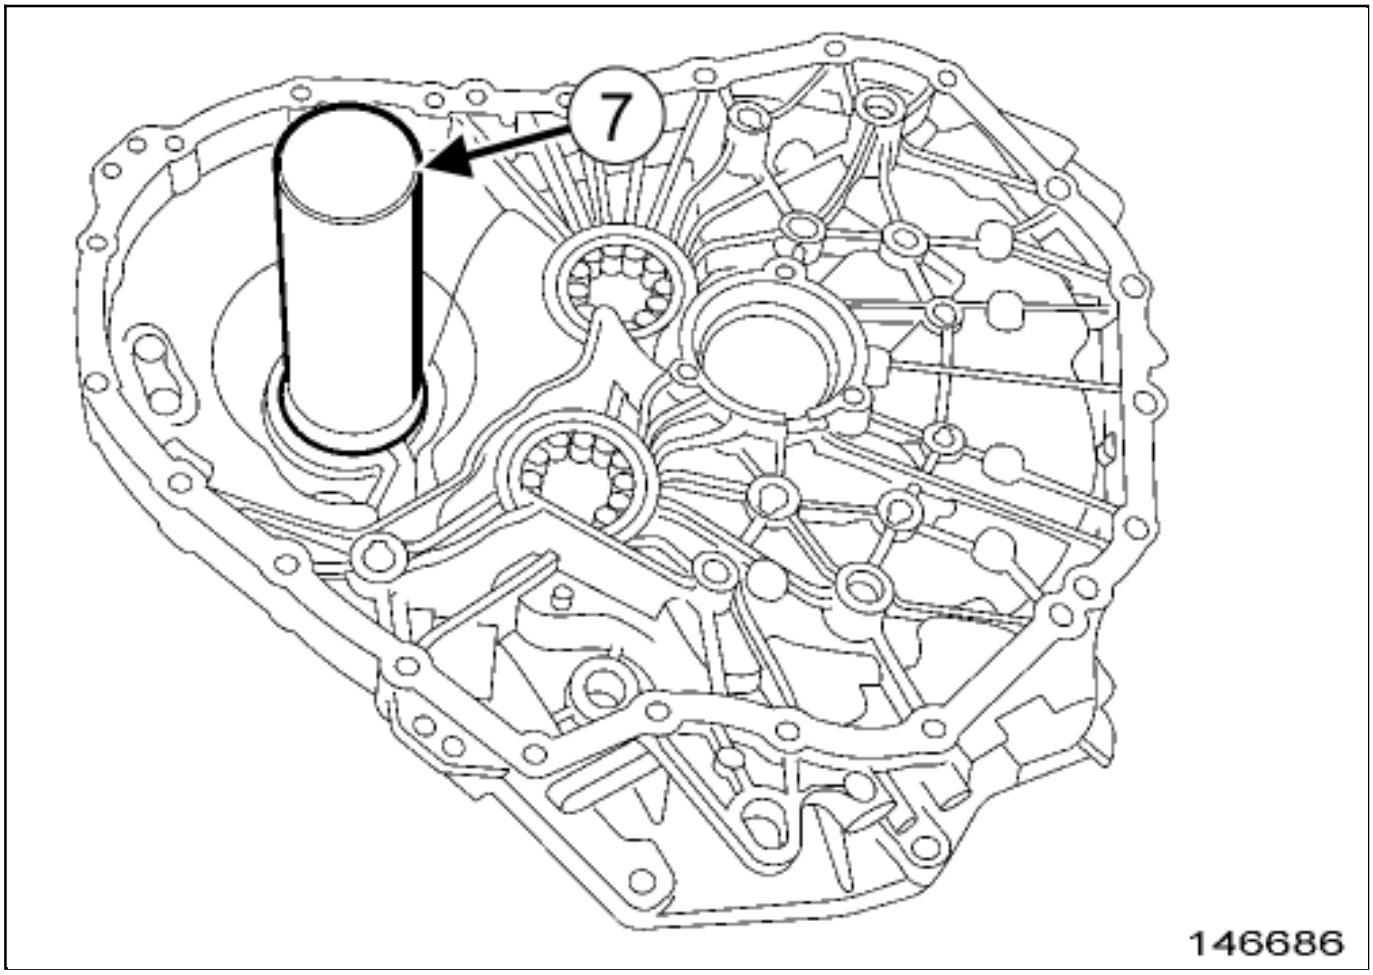
2- REFITTING THE OUTPUT SHAFT BEARING:

Refit new lubrication channels.

Note:



The flat side of the bearings must be positioned on the clutch housing side.



When refitting the bearing with the press, check that the lubrication channel is in the correct position before the bearing is fully inserted in its housing (approximately 2mm before the stop).

Refit a new output shaft bearing using a press and the toolDC4 gearbox internal renovation kit (Bvi. 1956) A and C(6) .

3- REFITTING THE DIFFERENTIAL BEARING:

A
K
146687

Fit:

- the permanent shim under the differential bearing housing,
- the toolAdjustable support for fitting bearings.(**Bvi. 1418**) on the universal joint side.

Refit a new differential bearing using a press and the toolDC4 gearbox internal renovation kit(**Bvi. 1956**) (**A**) and (**K**) (**7**) .

3. FINAL OPERATION

Proceed in the reverse order to removal.

Repair-12x07x02x40-01x37-1-1-1.xml

XSL version : 3.02 du 22/07/11

CLUTCH HOUSING: REMOVAL - REFITTING

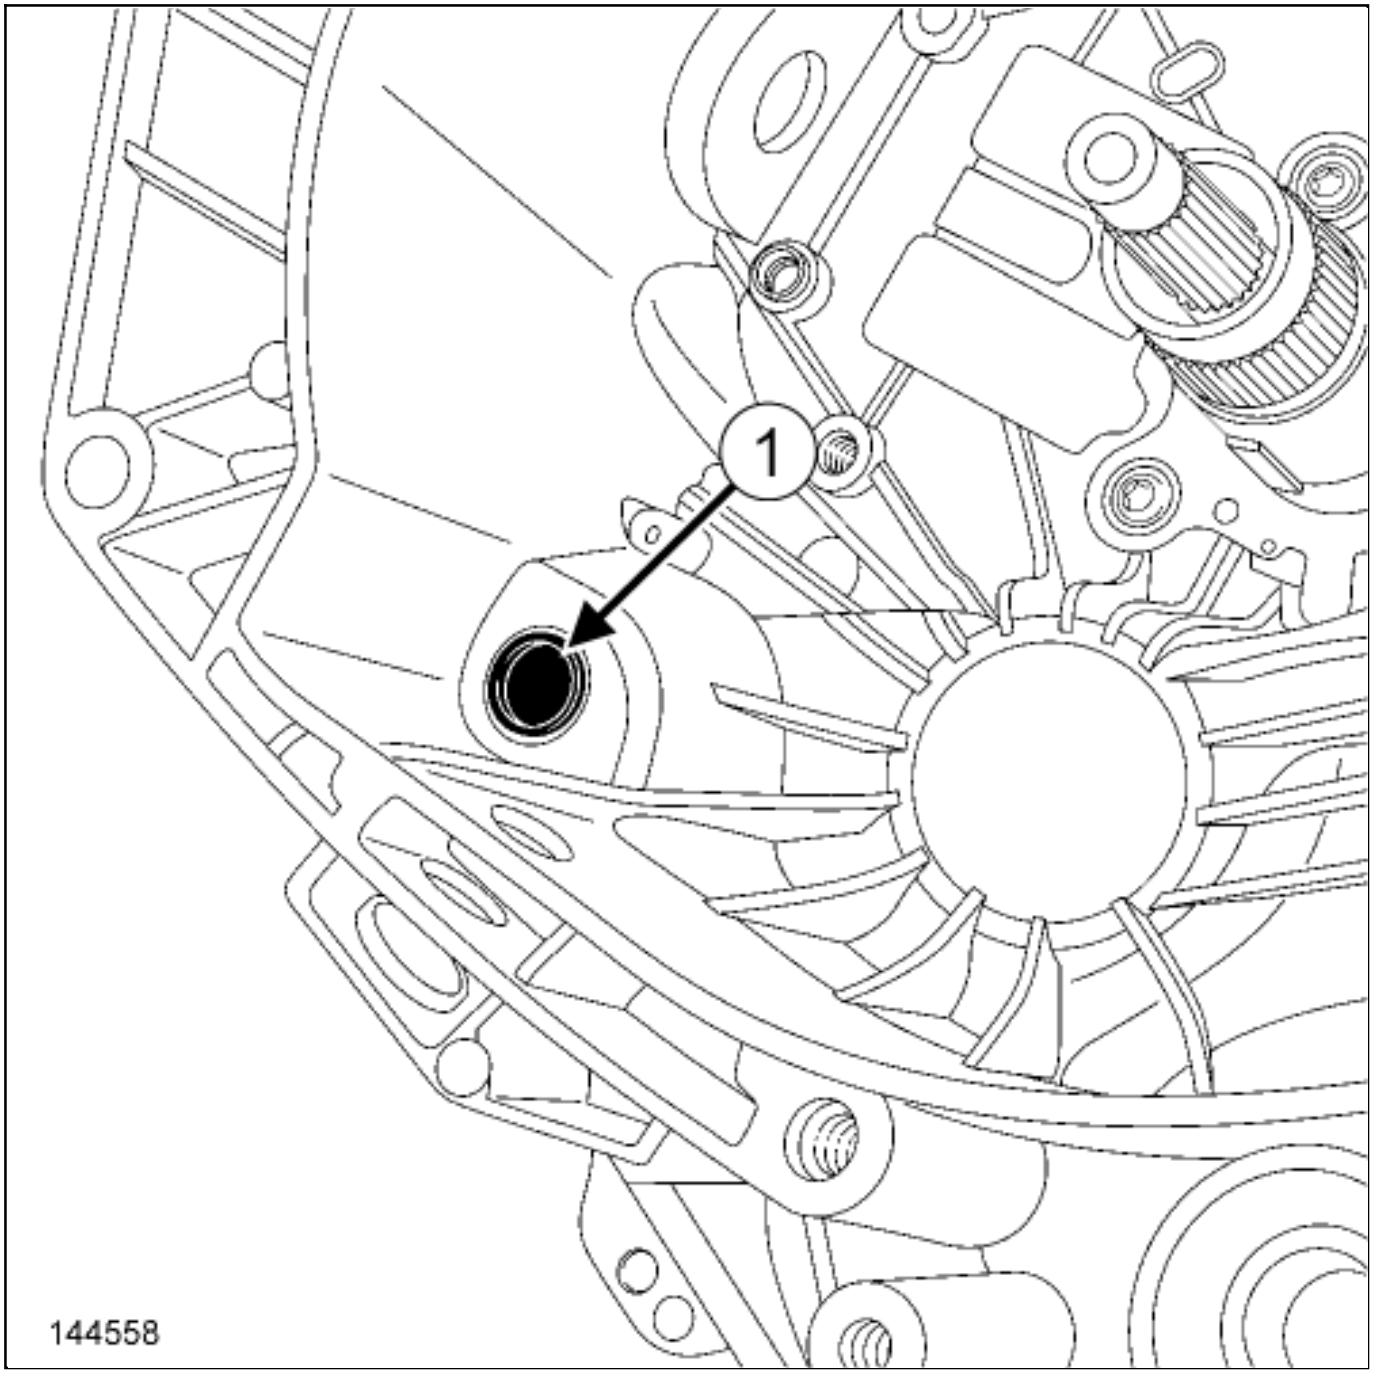
Note, one or more warnings are present in this procedure

Special tooling required	
Inertia seal extractor	Bvi. 1948
Tool for removal - refitting of clutch pressure plate and housing	Emb. 1952
Extractor	RSM. 9303
Tool for removal - refitting of clutch pressure plate and housing	RSM. 9307
Clamp for clutch housing	Emb. 2027
Clamp for clutch housing	Emb. 2028
Tool for removal-refitting of clutch pressure plate and housing(k9k)	RSM. 9320

WARNING

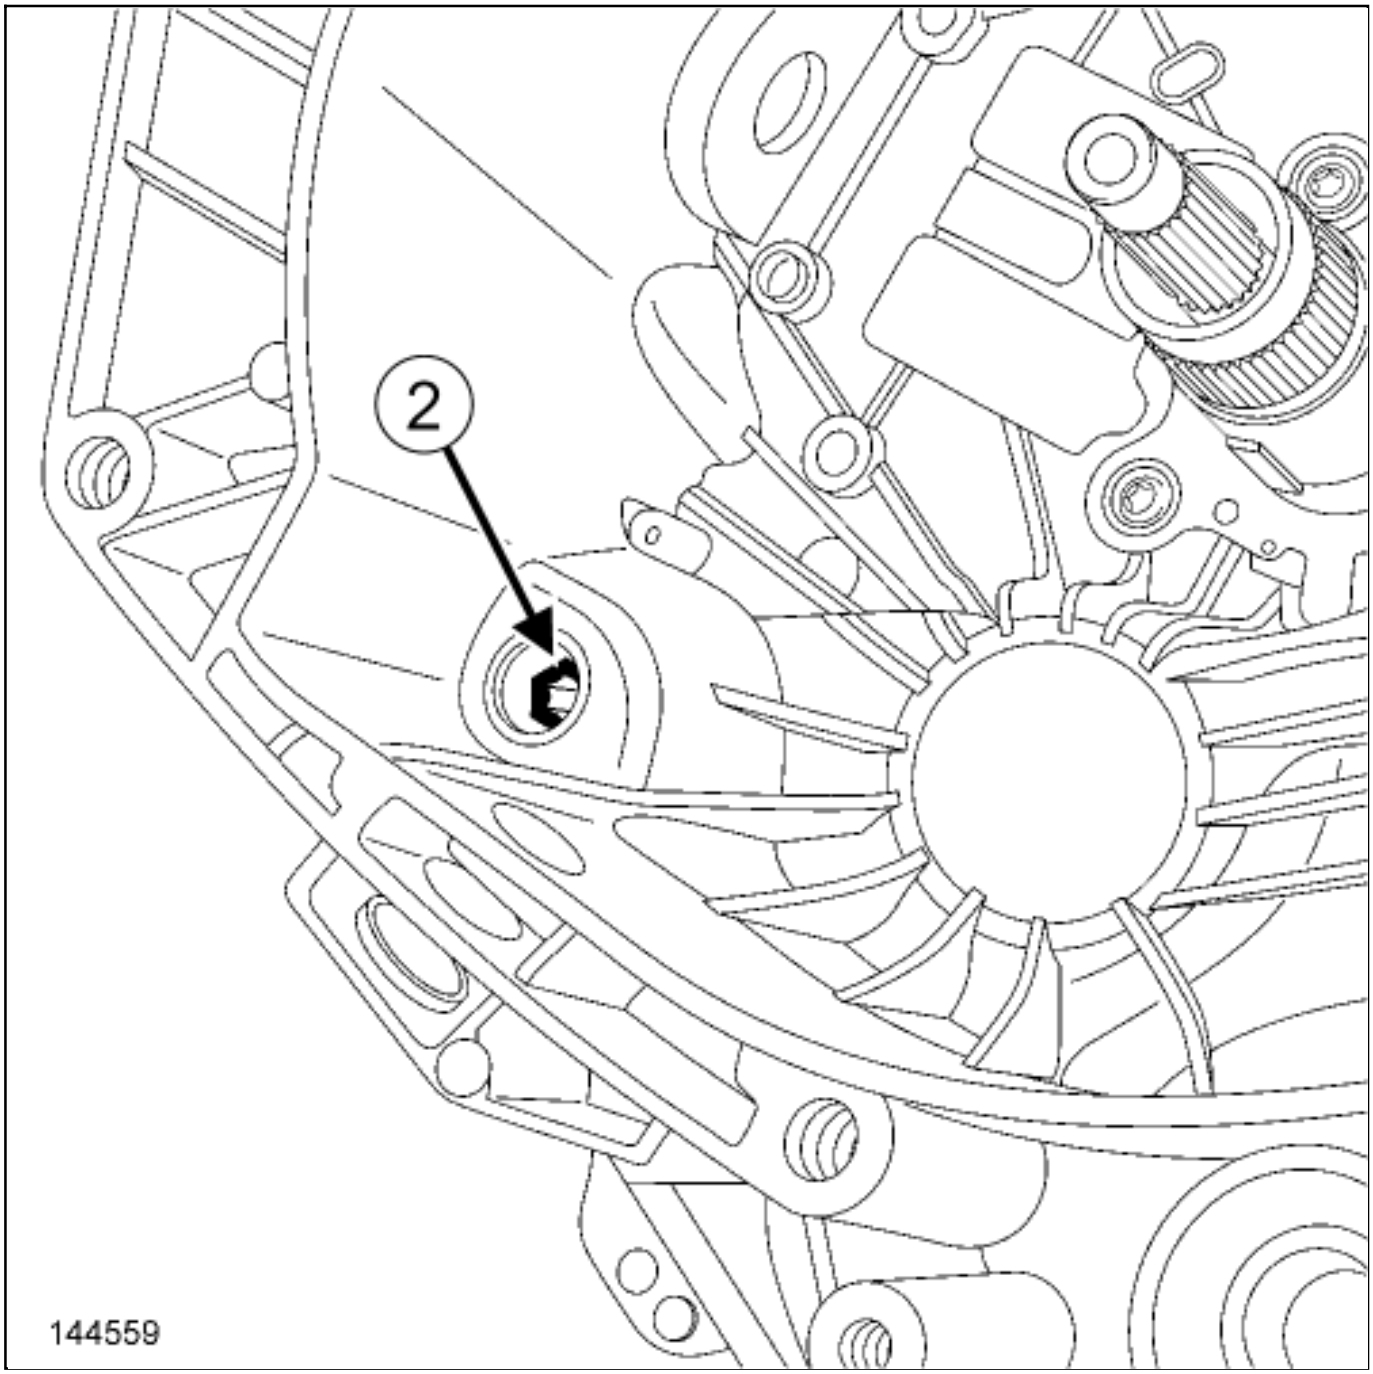
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see 23A, Automatic gearbox , Automatic gearbox: Precautions for the repair) ,
- Vehicle: Precautions for the repair (01D, Mechanical introduction).



REMOVAL

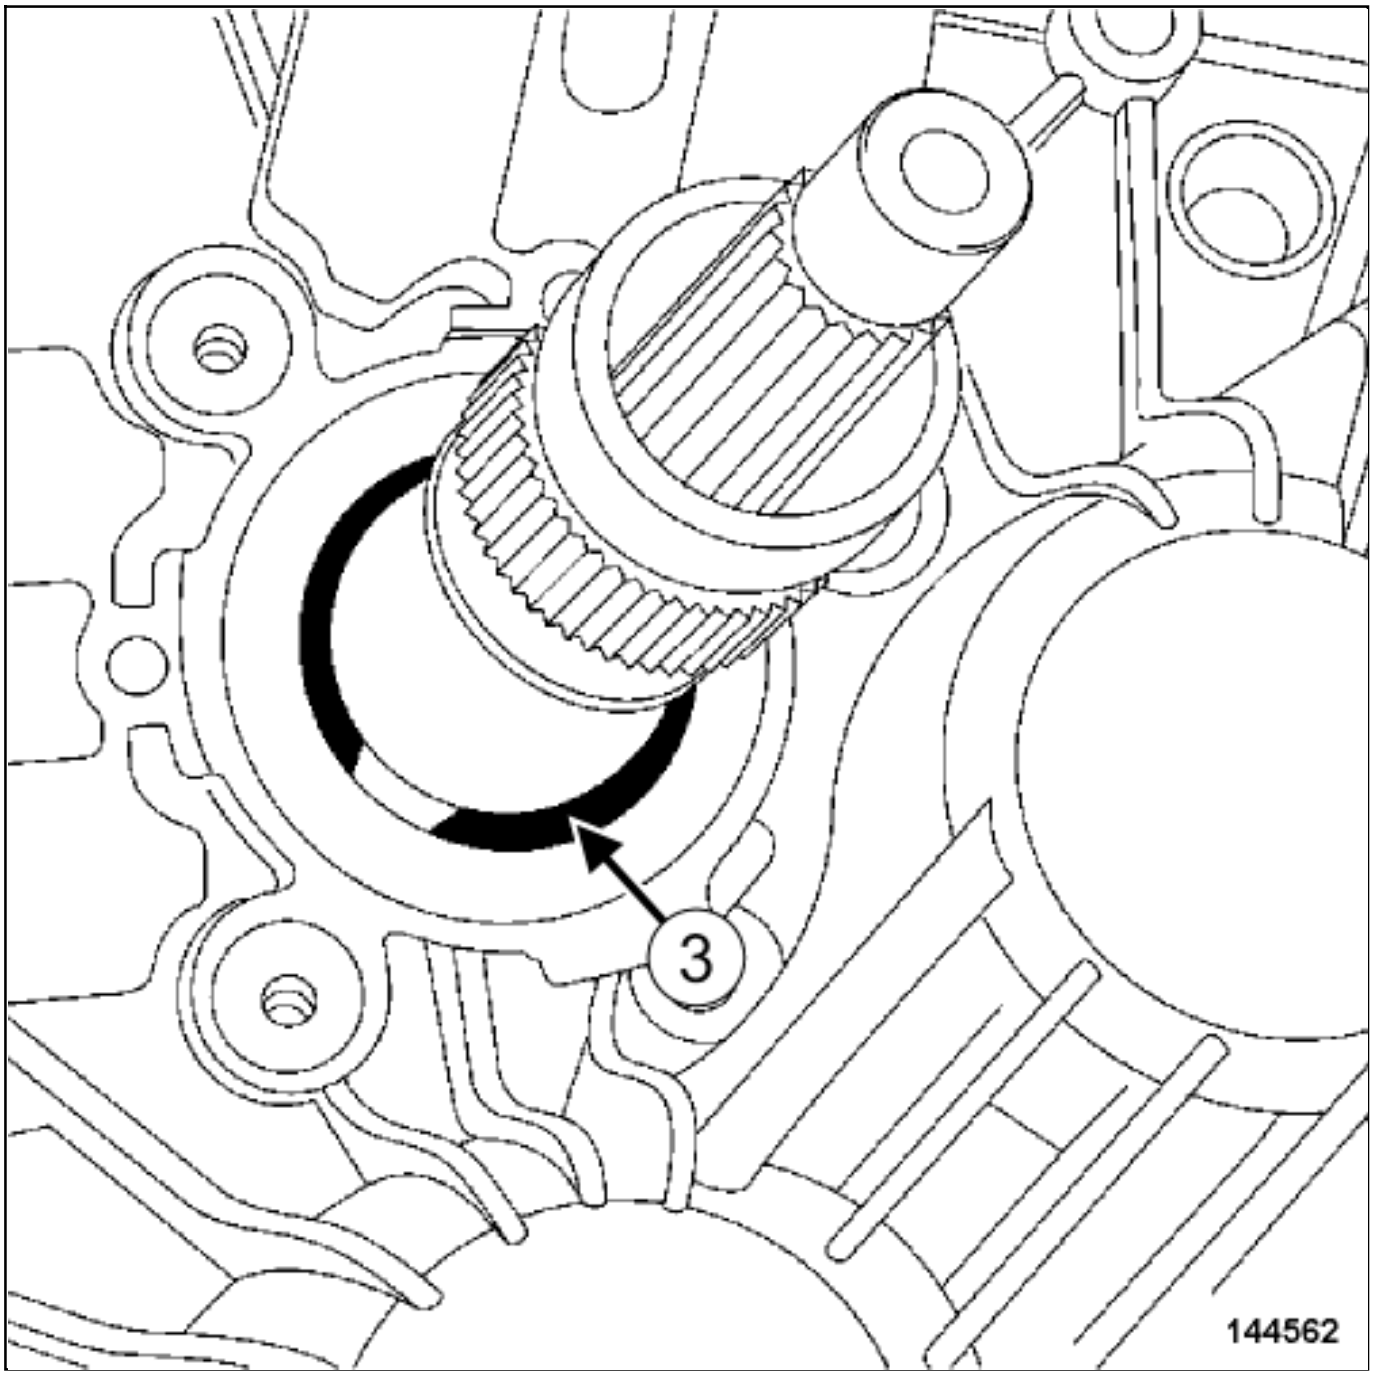
1. REMOVAL PREPARATION OPERATION



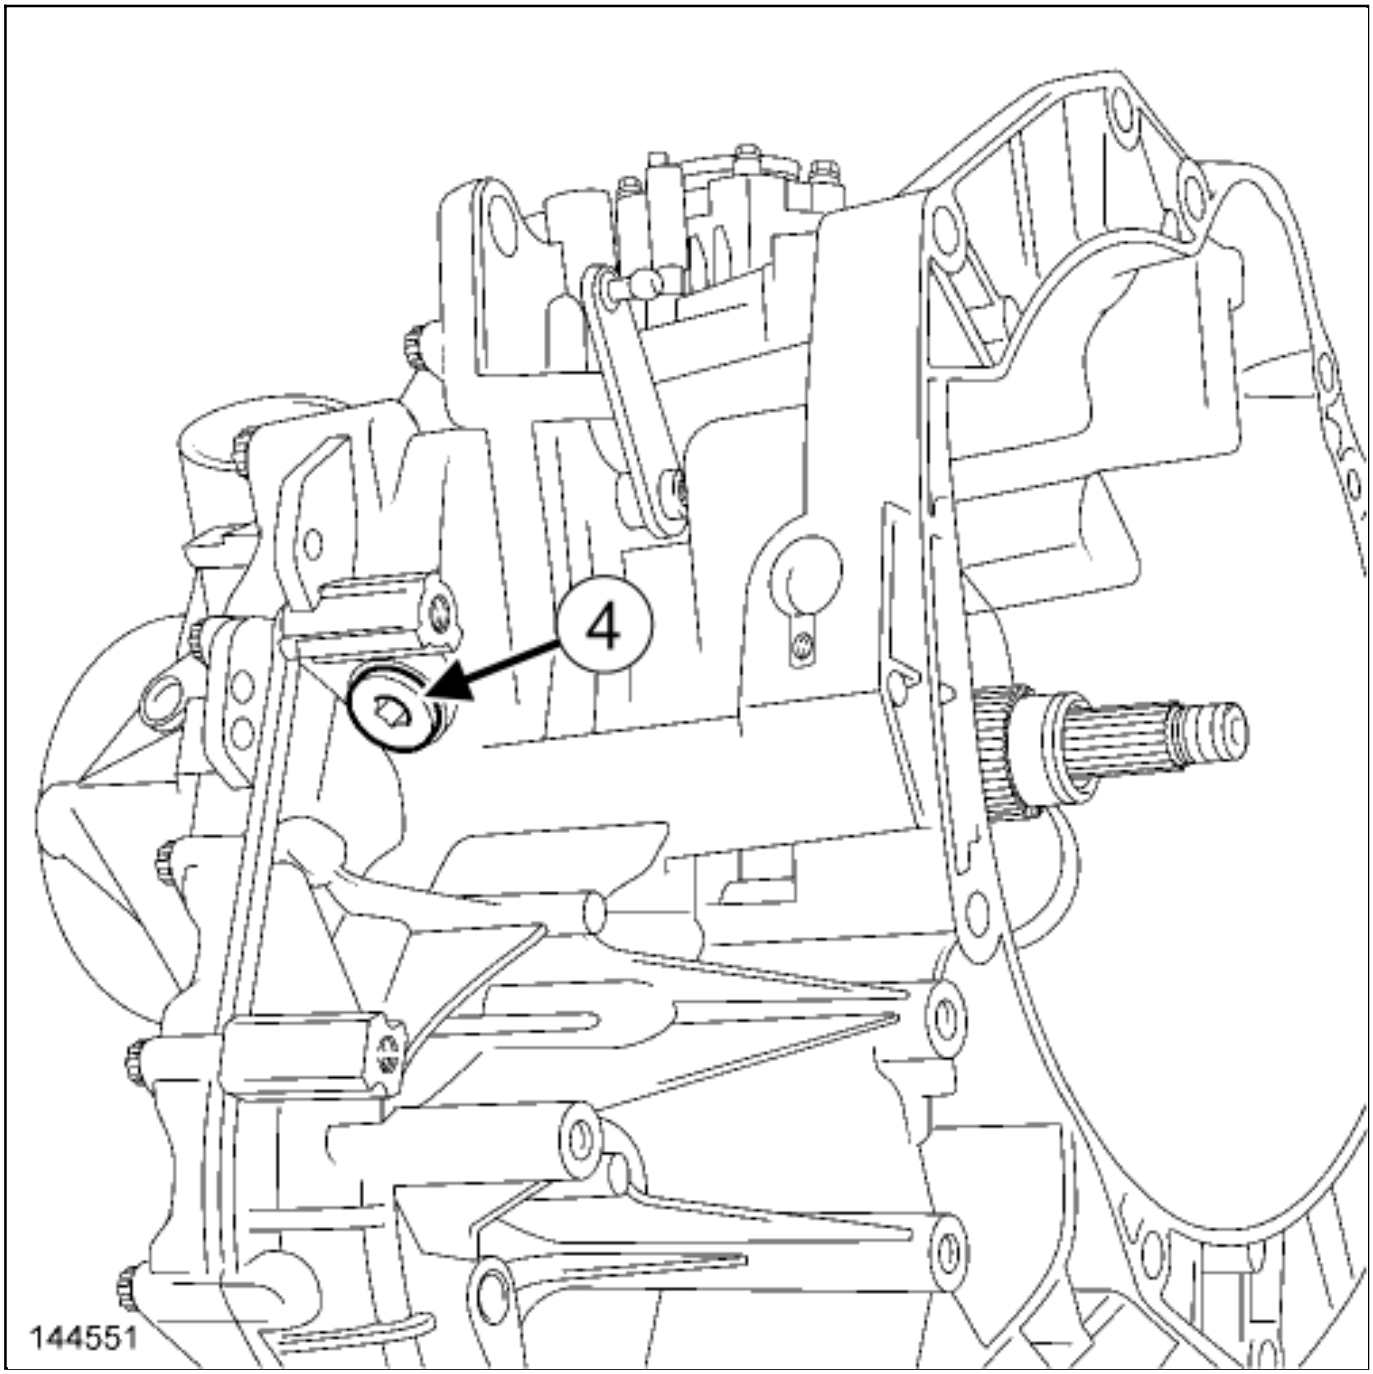
Remove:

- the automatic gearboxAutomatic gearbox: Removal - Refitting ,
- the automatic gearbox wiringAutomatic gearbox wiring: Removal - Refitting ,

- the speed sensors **Speed sensor: Removal - Refitting** ,
- the gear engaged sensor **Gear engaged sensor: Removal - Refitting** ,
- the automatic transmission computer **Automatic gearbox computer : Removal - Refitting** ,
- the clutch pressure plate **Clutch: Removal - Refitting** ,
- the clutch actuator motors **Clutch actuator motor: Removal - Refitting** ,
- the clutch thrust bearing **Clutch thrust bearing: Removal - Refitting** ,
- the clutch forks **Clutch fork: Removal - Refitting** ,
- the input shaft lip seal **Input shaft lip seal: Removal - Refitting** .

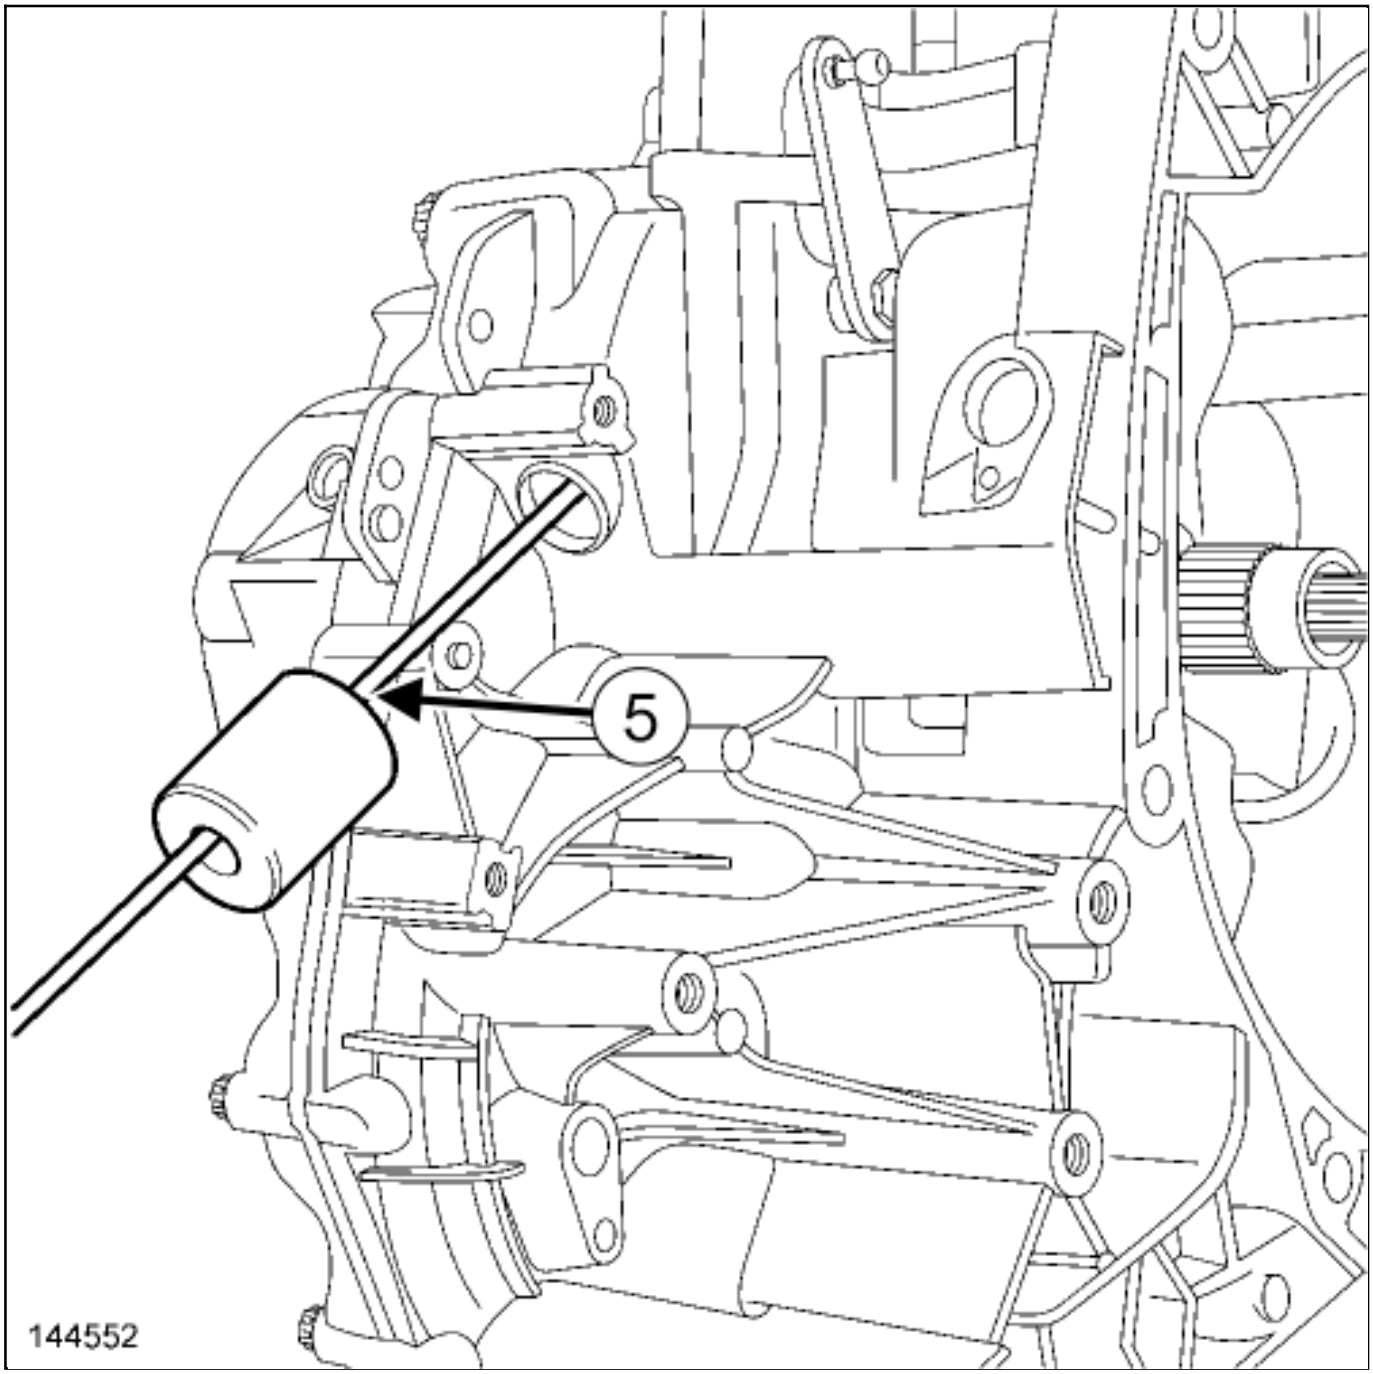


Remove the blocking shim(1) from the engagement sensor lever bolt.

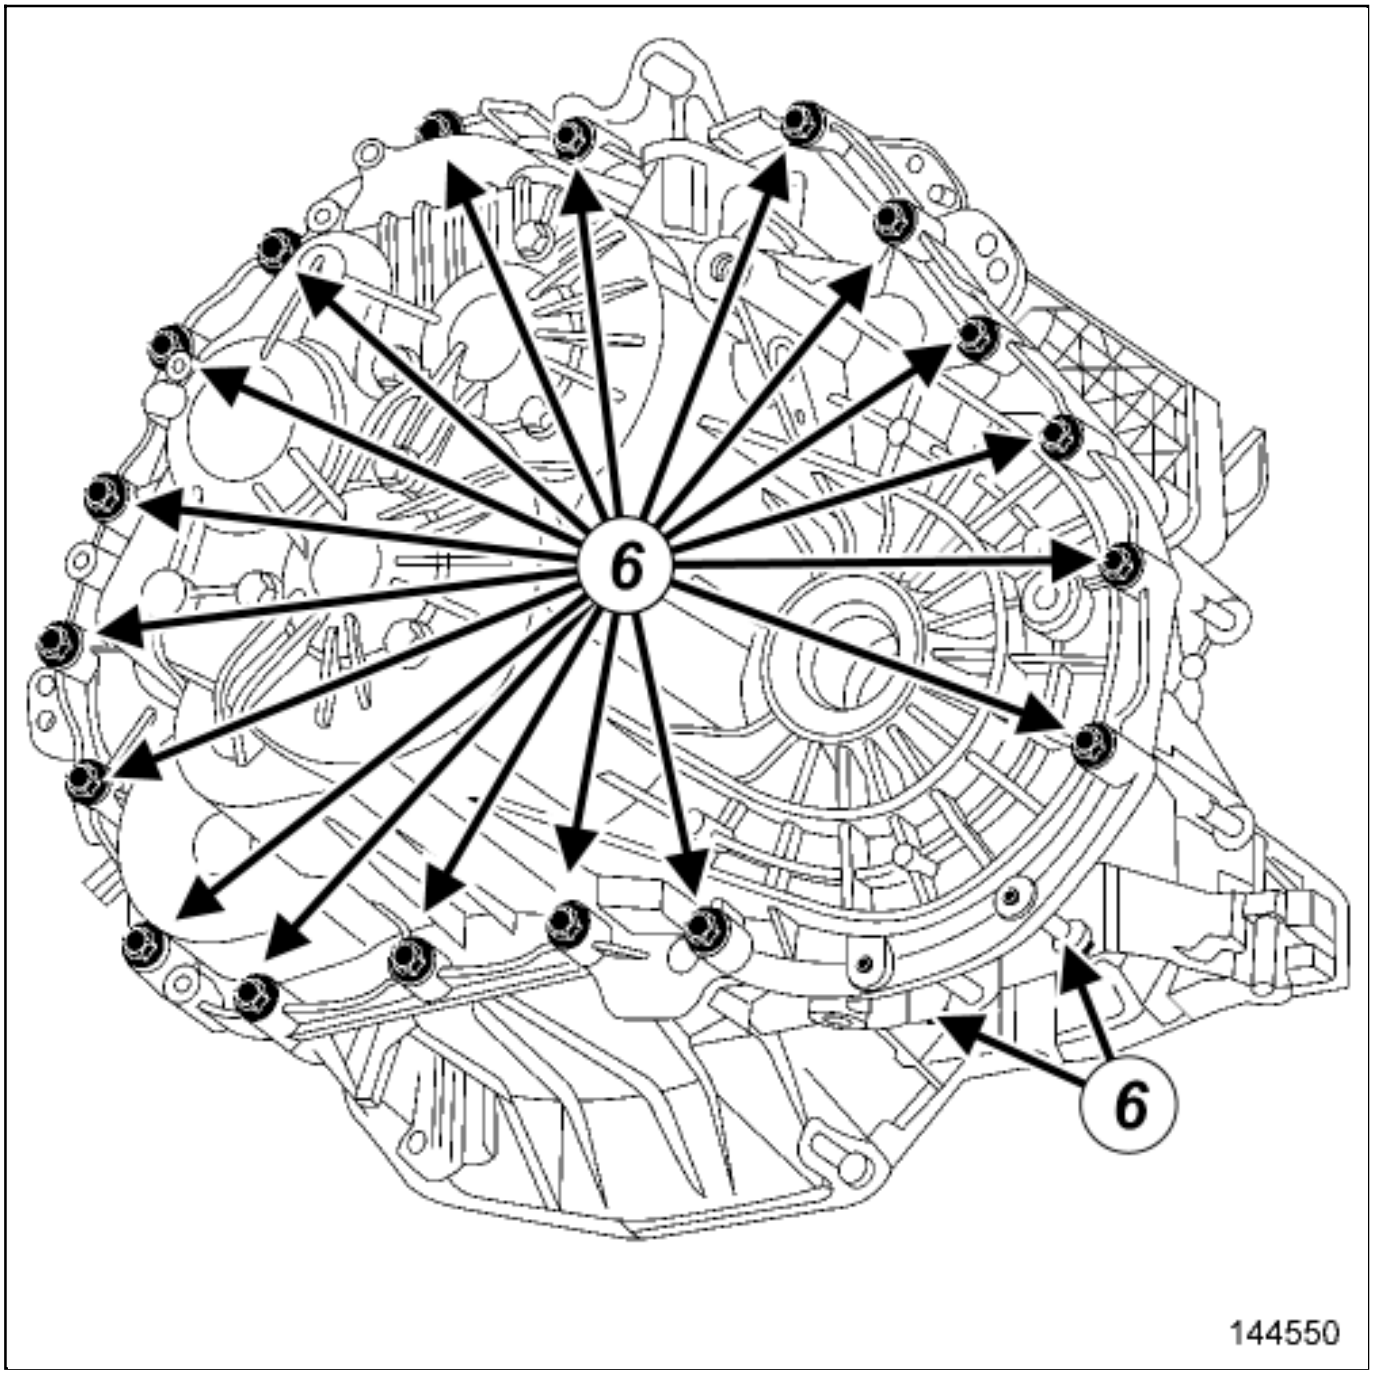


Remove:

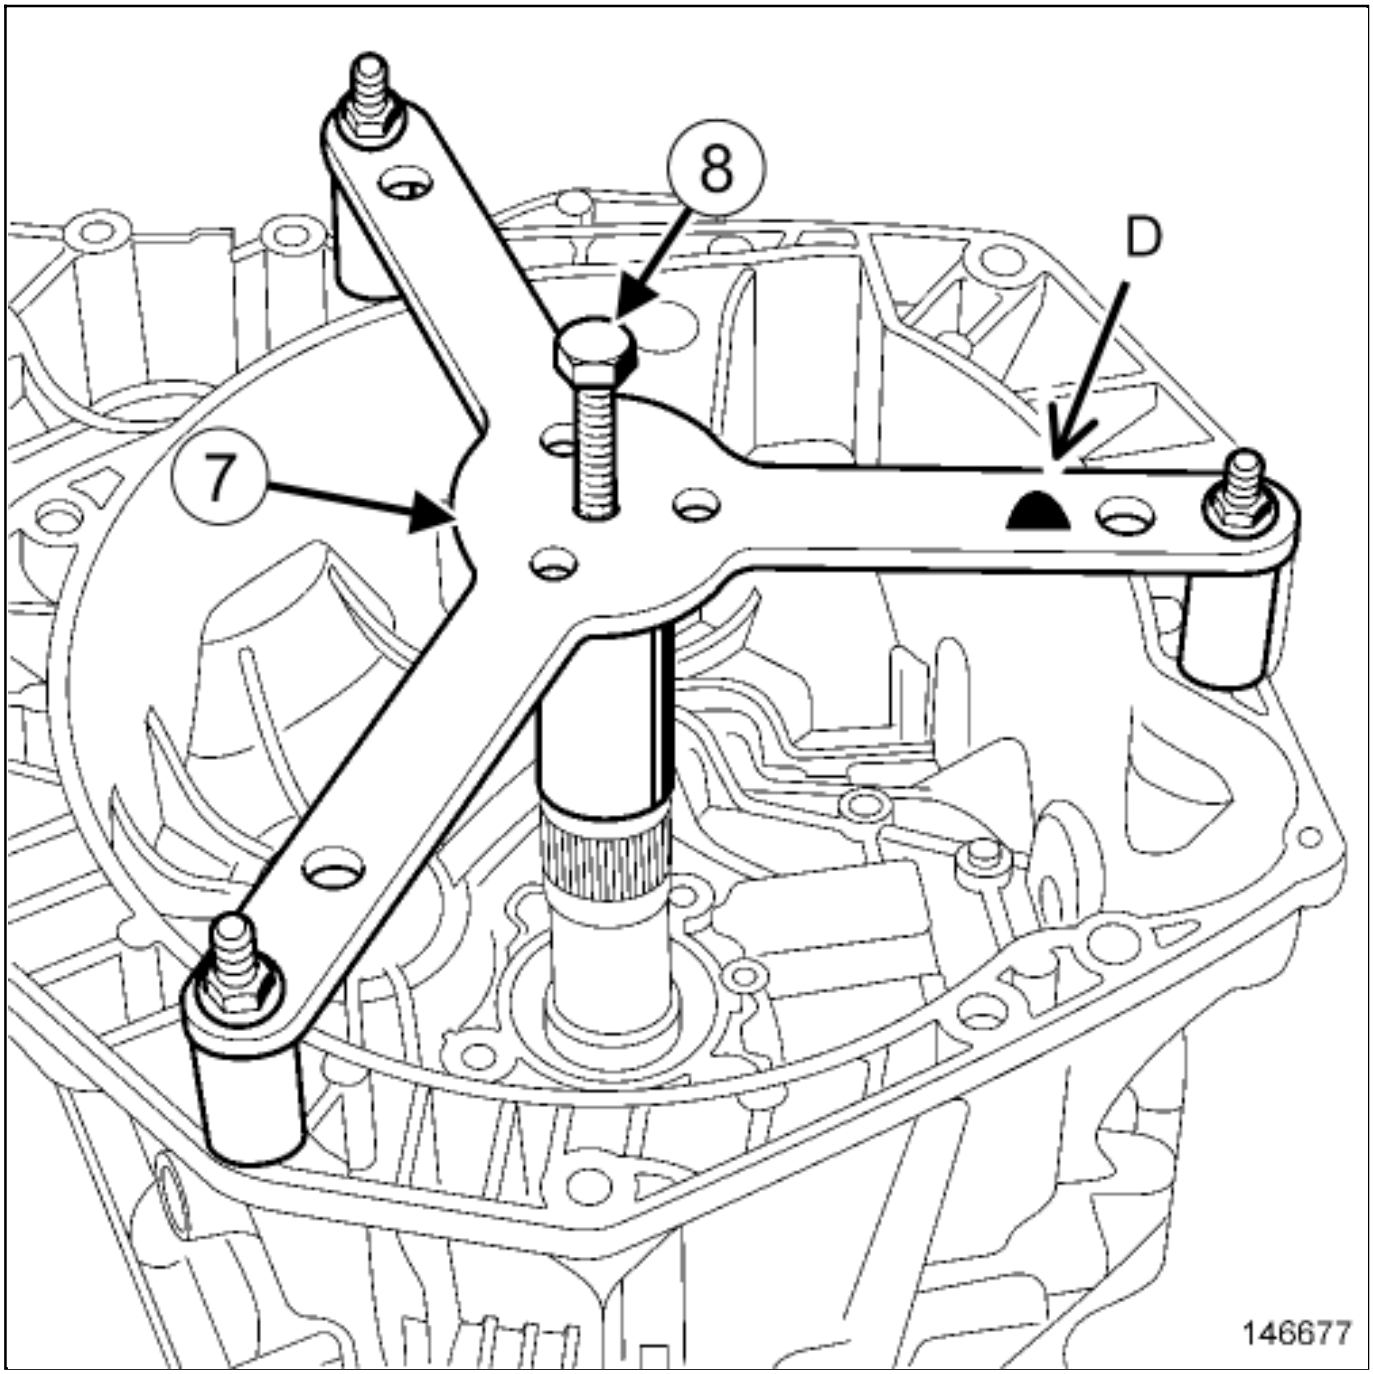
- the bolt(2) from the engagement sensor lever,
- the engagement sensor lever.



2. OPERATION FOR REMOVAL OF PART CONCERNED



Remove the clip(3) from the input shaft.



Remove the plug(4) from the parking shaft locating ball cartridge.

Remove the locating ball cartridge using the toolInertia seal extractor(Bvi. 1948) (5) .

Remove the bolts from the mechanism housing(6) .

Note:

The mark Don the one of the tool arms is positioned next to the boss of the starter.

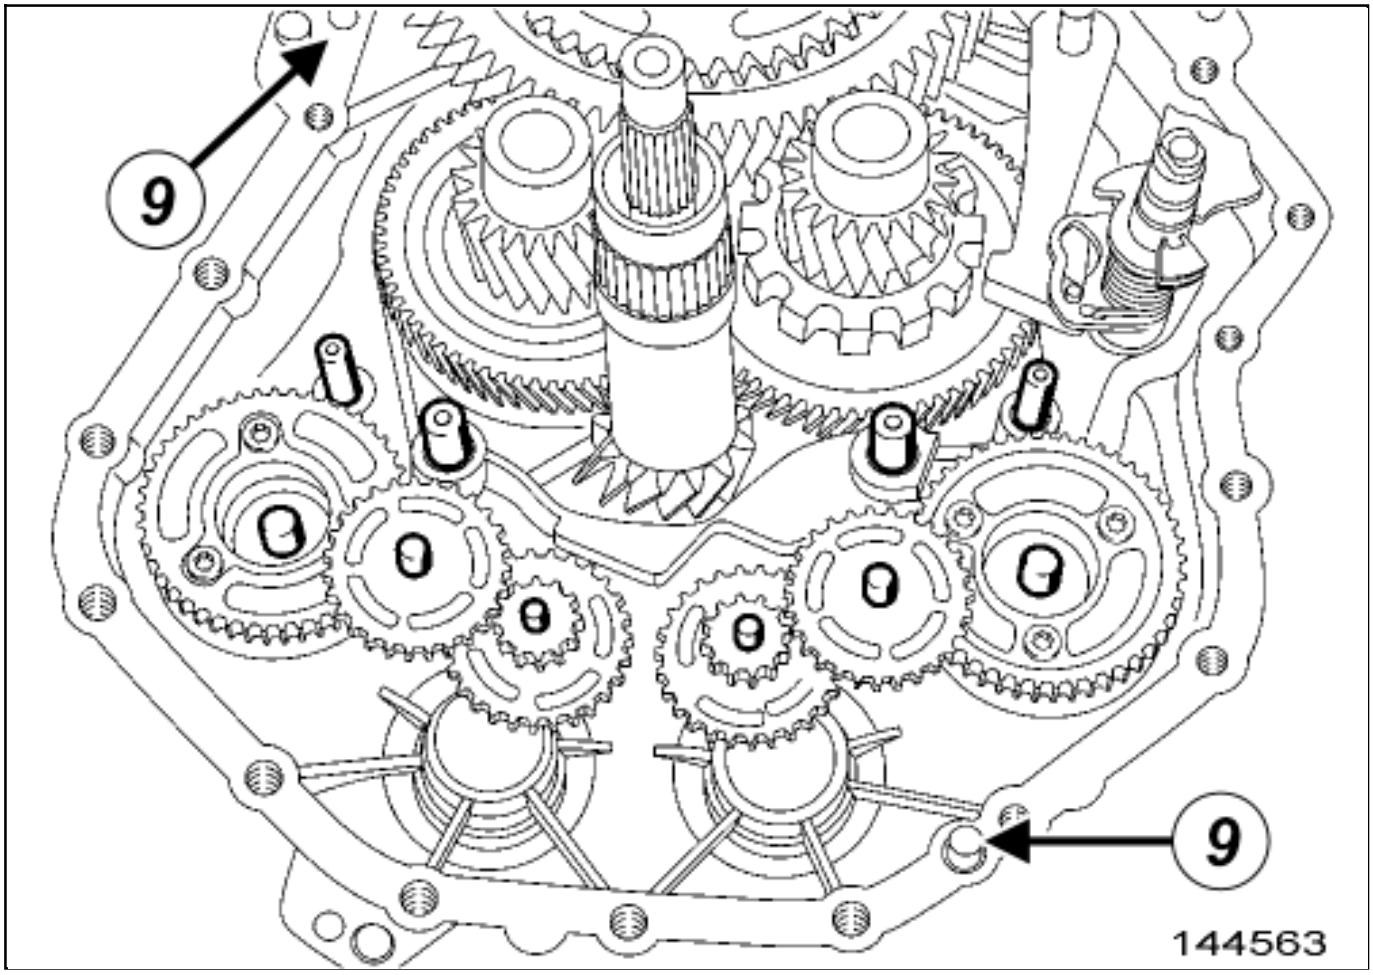
Position the tool Tool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (7) use the added toolClamp for clutch housing(Emb. 2028) .

Tighten the central bolt(8) .

Remove the clutch housing.

REFITTING

1. REFITTING PREPARATION OPERATION



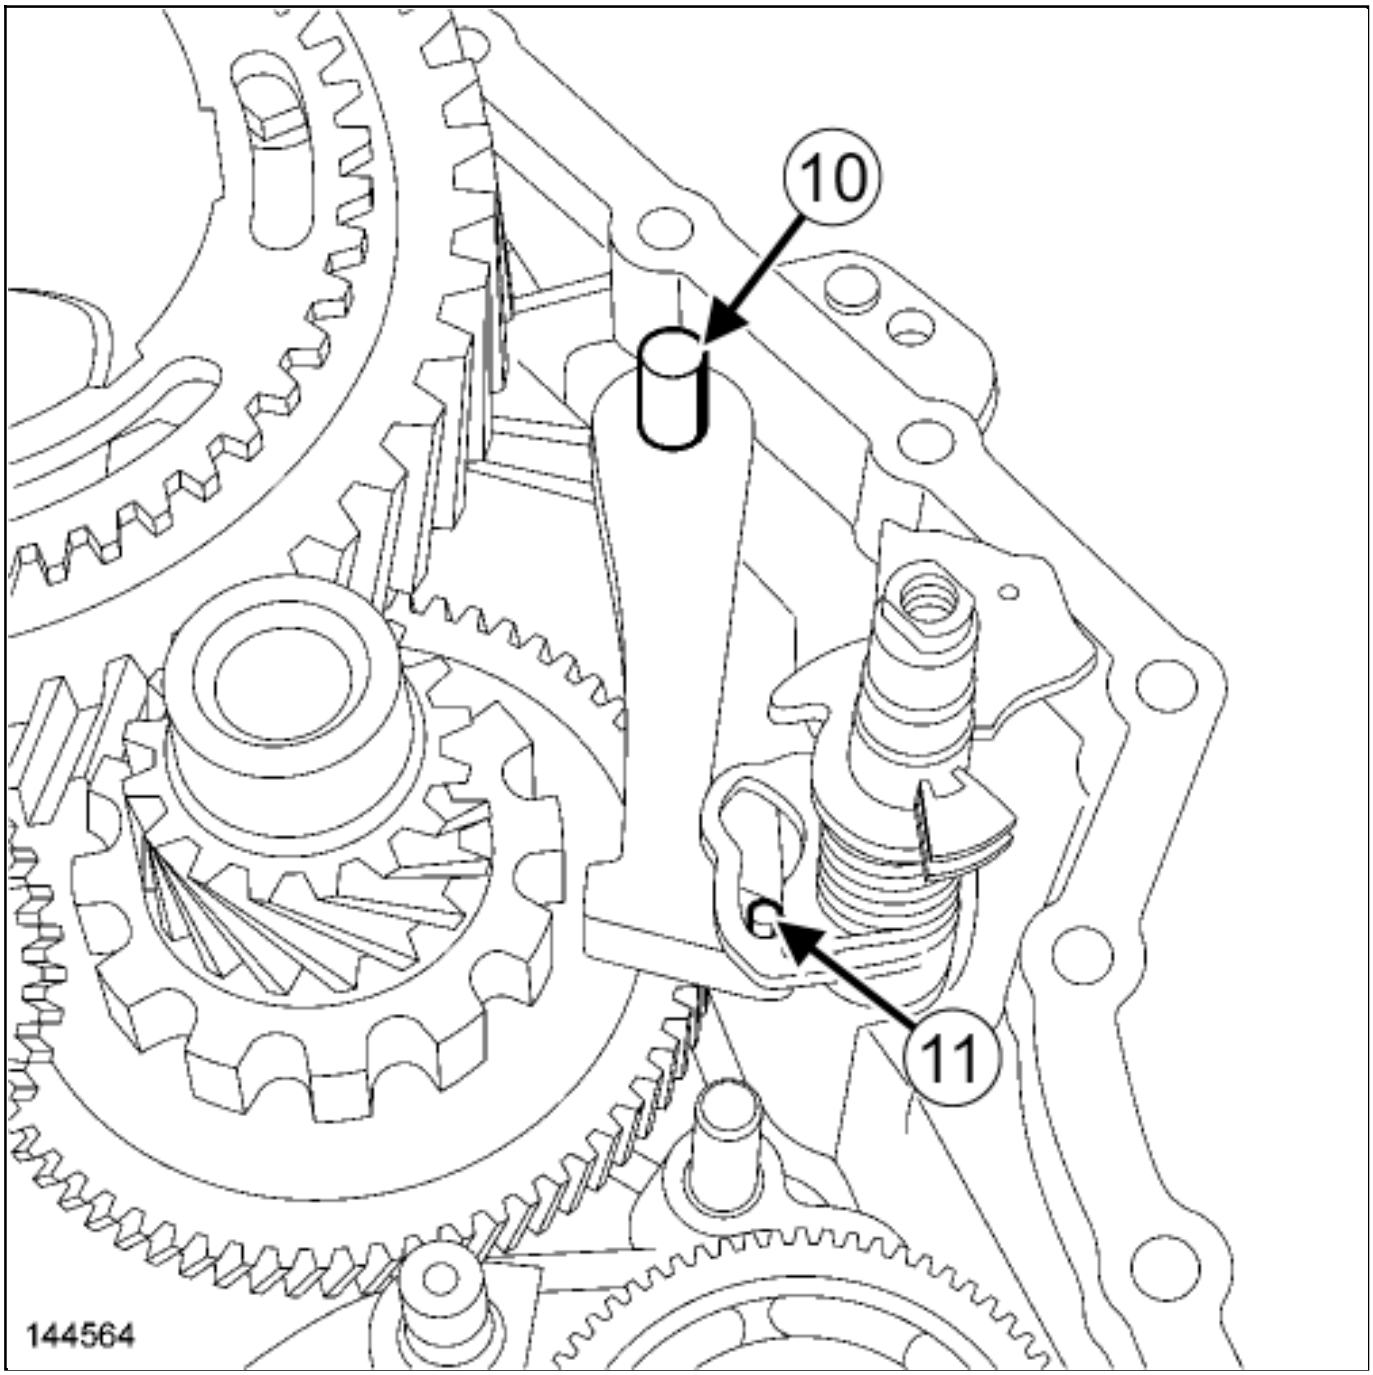
Clean:

- all the removed parts Vehicle: Parts and consumables for the repair (04B, Consumables - Products),
- the joint face of the automatic gearbox casings Vehicle: Parts and consumables for the repair (04B, Consumables - Products).

Always replace the seal of the gearbox casings.

CAUTION

Failure to observe the following procedure could cause irreparable damage to the automatic gearbox casings.



Check:

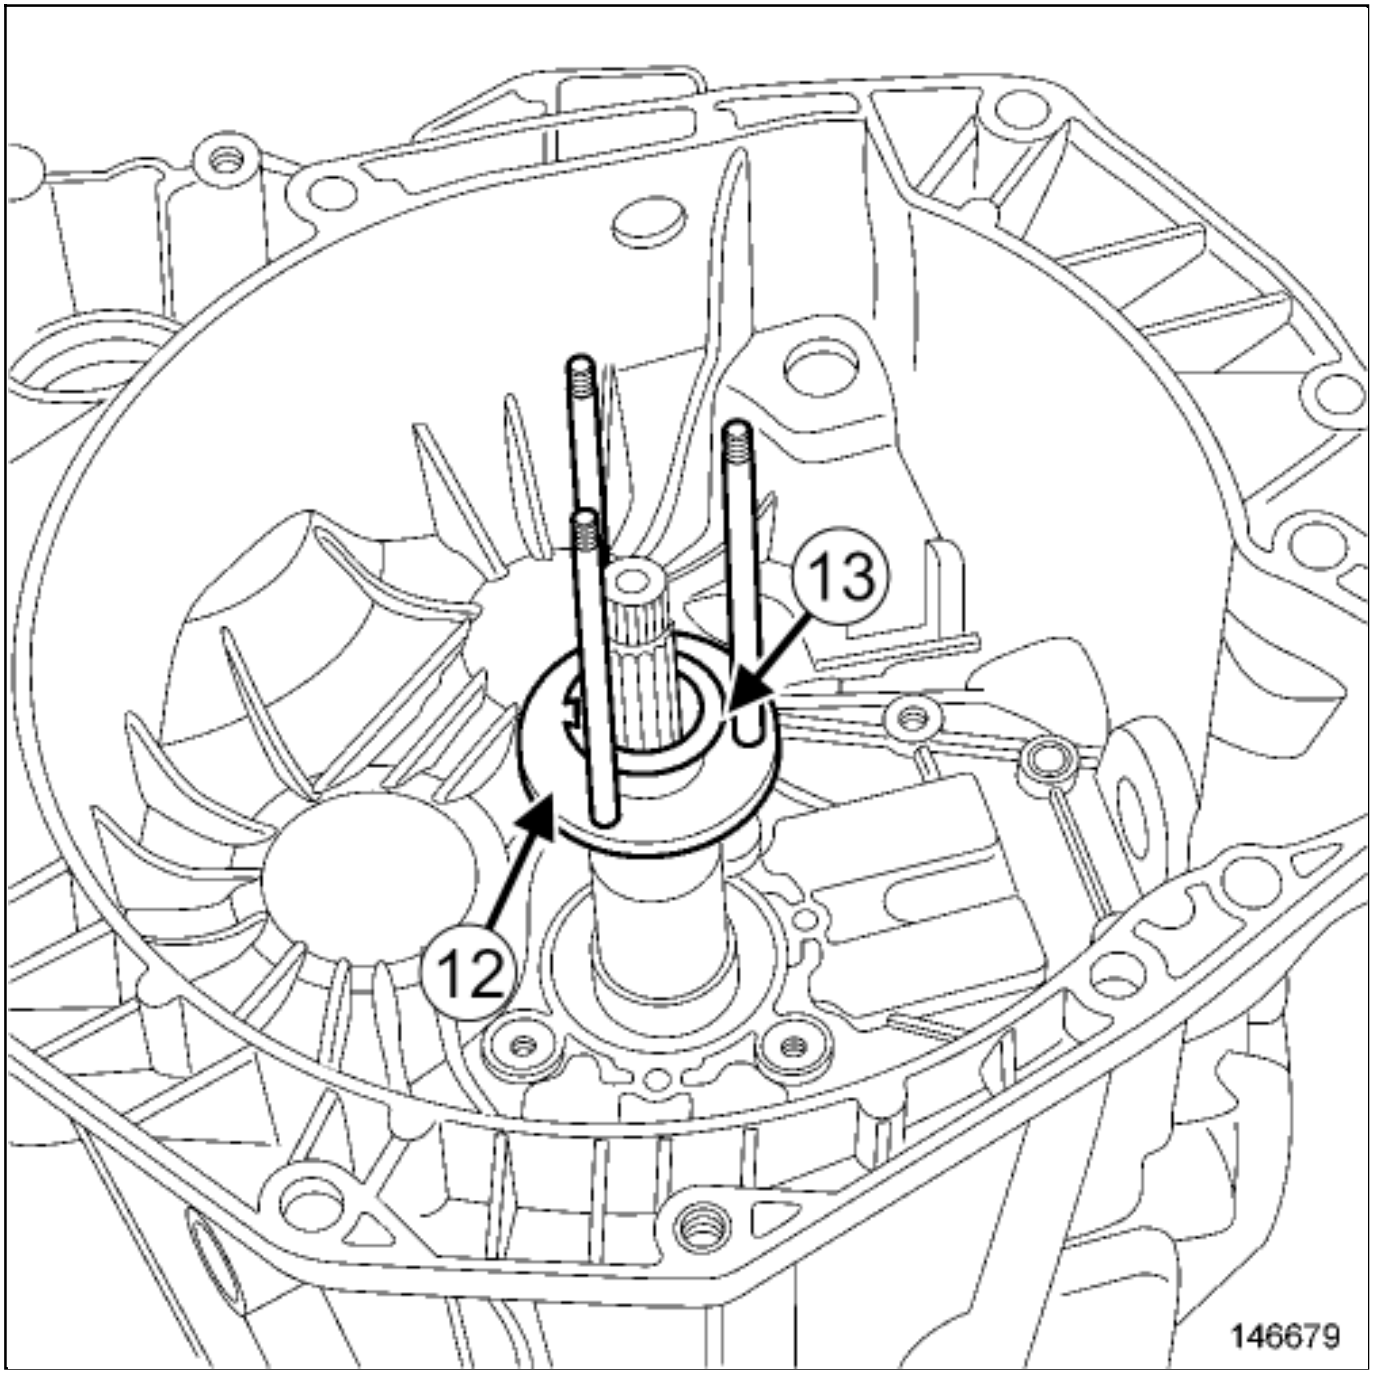
- the presence and correct position of all the control shafts on the mechanism housing and the gear shift drums,
- the presence of the centring dowels of the mechanism housing(**9**) .

CAUTION

Failure to observe the following procedure could damage the parking mechanism.

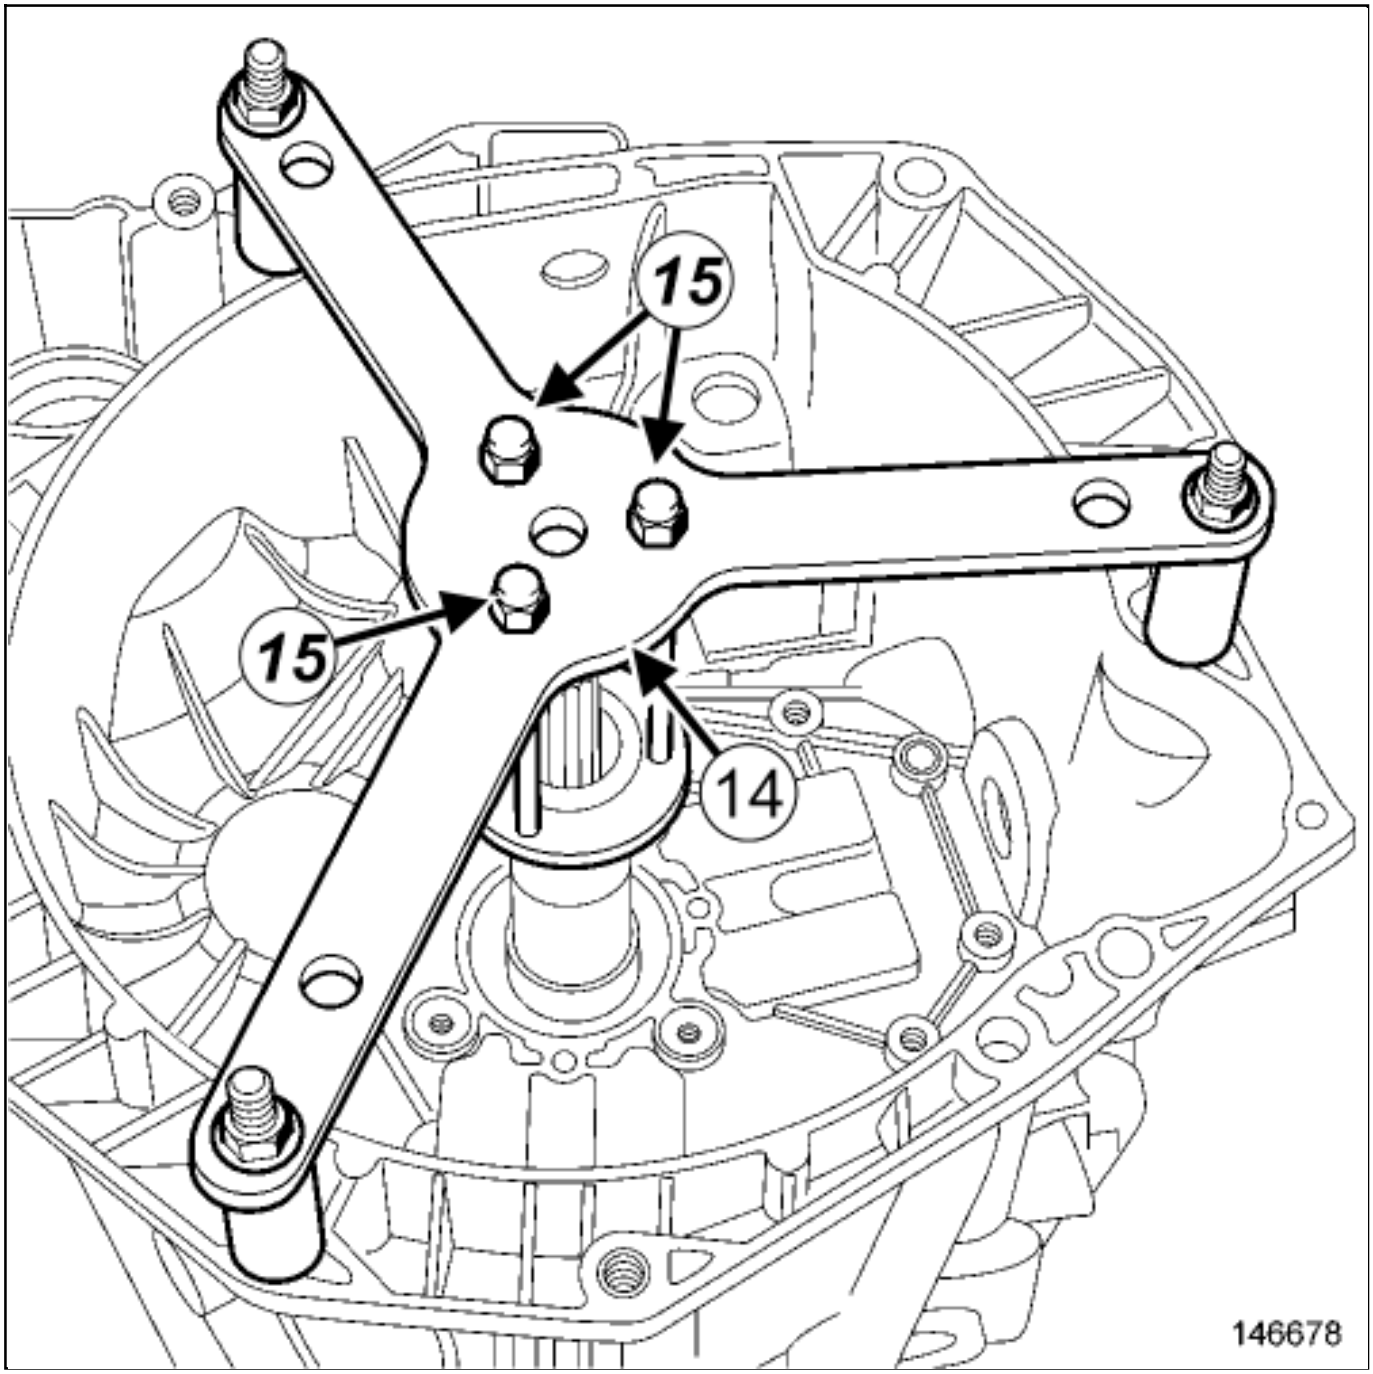
Check the presence and correct position of the parking finger shaft(10) as well as the parking finger pin which must be in the opening of the parking lever shaft(11) .

2. REFITTING OPERATION FOR PART CONCERNED



CAUTION

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).



- Add a bead of Sealing resin Vehicle: Parts and consumables for the repair (04B, Consumables - Products) to the joint face of the clutch housing.

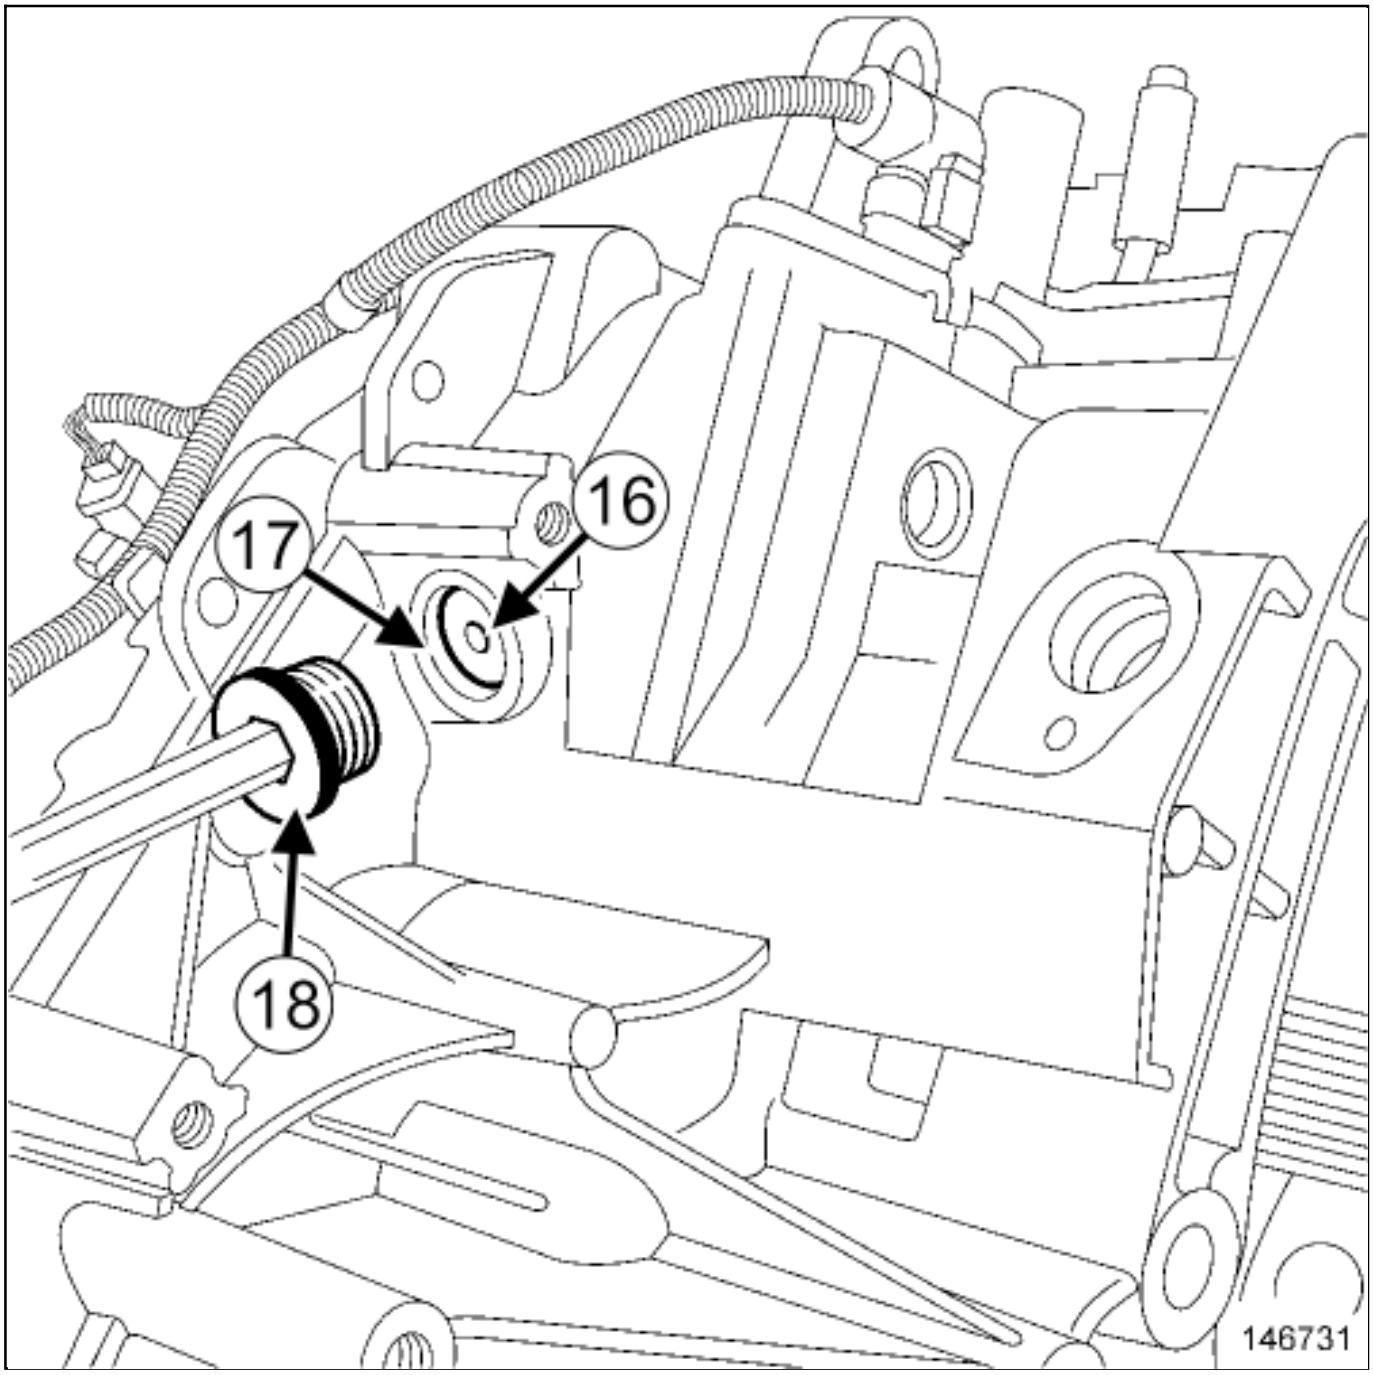
- Fit the clutch housing.

- Position the tool Tool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (12) .

- Refit the large diameter clip(13) on the input shaft using snap ring pliers.

- Position the tool Tool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (14) .
- Progressively tighten the nuts(15) of the tool(14) one by one.
-

Position the tool Tool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (14) use the added toolClamp for clutch housing(Emb. 2028)



- Progressively tighten the nuts(15) of the tool(14) one by one.

- Check the alignment of the automatic gearbox casings with the centring pins.

- Refit the clutch housing bolts.

- Torque tighten the clutch housing bolts27 N.m.

- Remove the tool

Fit the parking shaft locating ball cartridge(16) until 4 threadsare showing in the threaded plug hole on the clutch housing(17) .

Refit the plug of the parking shaft locating ball cartridge(18) .

Note:

The tightening of the parking shaft locating ball cartridge plug allows the correct positioning of the parking shaft locating ball cartridge in its housing.

Torque tighten the parking shaft locating ball cartridge plug46 N.m.

Refit:

- the engagement lever,
- the engagement lever bolt.

Torque tighten the engagement sensor lever bolt27 N.m.

Refit the blocking shim of the engagement sensor lever bolt.

Refit the clip of the input shaft.

3. FINAL OPERATION

Proceed in the reverse order to removal.

CLUTCH PEDAL: REMOVAL - REFITTING

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 37A, Mechanical component controls, Pedal assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

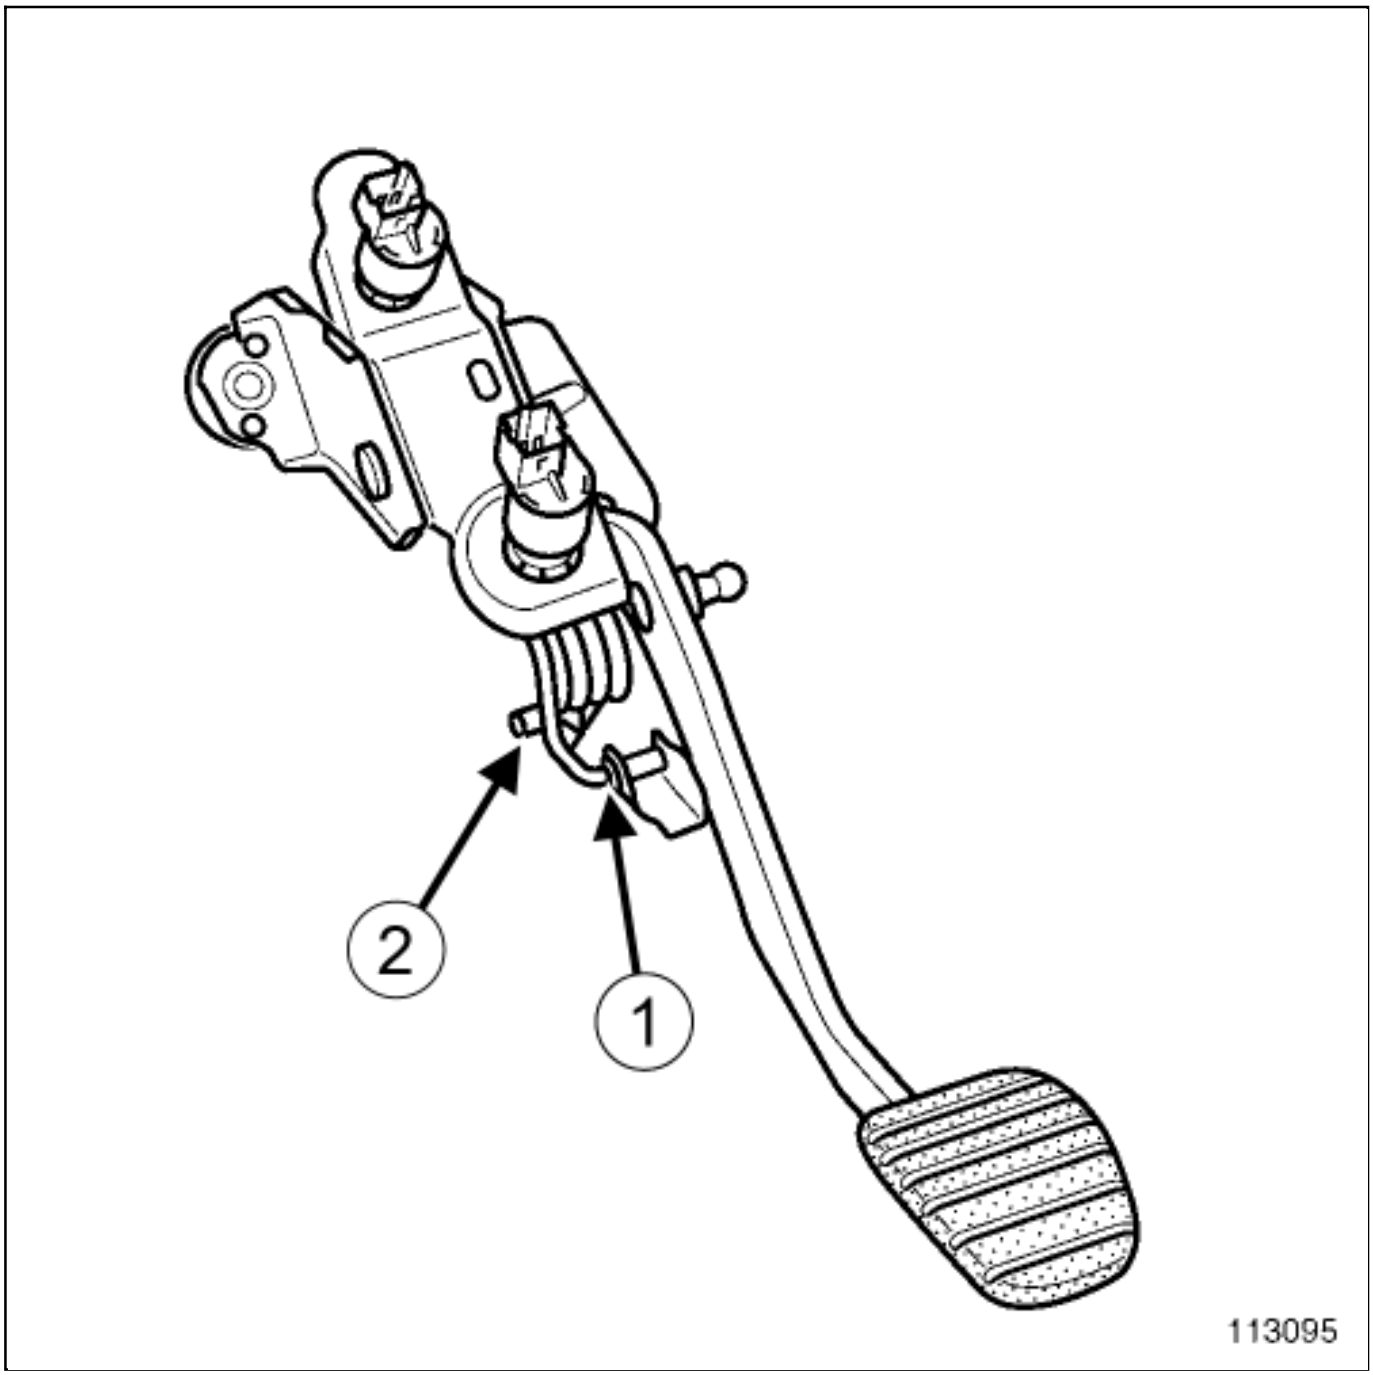
- Disconnect the batteryBattery: Removal - Refitting .
- Remove the dashboard lower trimDashboard assembly: Exploded view .
- Remove the UCHUCH: Removal - Refitting .

2. REMOVAL OPERATION

- Disconnect the connectors from the clutch pedal(see 37A, Mechanical component controls, Pedal assembly: Exploded view) .
- Remove the clutch pedal switches(see 37A, Mechanical component controls, Pedal assembly: Exploded view) .
- Remove the clutch pedal(see 37A, Mechanical component controls, Pedal assembly: Exploded view) .

REFITTING

- Proceed in the reverse order to removal.



XSL version : 3.02 du 22/07/11

CLUTCH PEDAL SPRING: REMOVAL - REFITTING

Equipment required
pedal press

REMOVAL

1. REMOVAL OPERATION

Remove the clutch pedal spring at(1) using a flat-blade screwdriver.

Fit the pedal presson the clutch pedal.

Remove the spring from its mounting at(2) using a flat-blade screwdriver.

REFITTING

1. REFITTING OPERATION

Refit the spring onto its mounting.

Remove the pedal press.

Refit the spring onto the clutch pedal.

Repair-30x03x01x05-01x37-1-1-1.xml

XSL version : 3.02 du 22/07/11

CLUTCH: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

Special tooling required	
Set of clutch plate centring mandrels.	

Before removing the clutch, check:

- the direction of fitting for the clutch plate.

Before refitting the clutch, check:

- the flywheel friction track (no scratches or blue stains),
- the crankshaft bearing (no sticking),
- the engine and gearbox seals (replace if necessary),
- the sliding action of the clutch plate on the output shaft,
- the guide of the thrust bearing and clutch fork (no wear or scratches).

CAUTION

To prevent the clutch from juddering or slipping, do not grease the output shaft or the clutch plate hub.

During refitting:

Check the direction of the clutch plate.

Centre the clutch plate using theSet of clutch plate centring mandrels. .

Gradually torque tighten the clutch pressure plate bolts.

After refitting, check:

- the clutch play (for a cable operated vehicle),
- bleeding of the hydraulic circuit (for vehicles with hydraulic controls).

XSL version : 3.02 du 22/07/11

CLUTCH: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Clutch compression tool for rearming the compensation system.	Emb. 1604
Clutch pressure plate rearming tools	Emb. 1951
Tool for removal - refitting of clutch pressure plate and housing	Emb. 1952
Clamp for clutch housing	Emb. 2027
Clamp for clutch housing	Emb. 2028

Equipment required
roll pin punch

parts always to be replaced:
Differential output seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

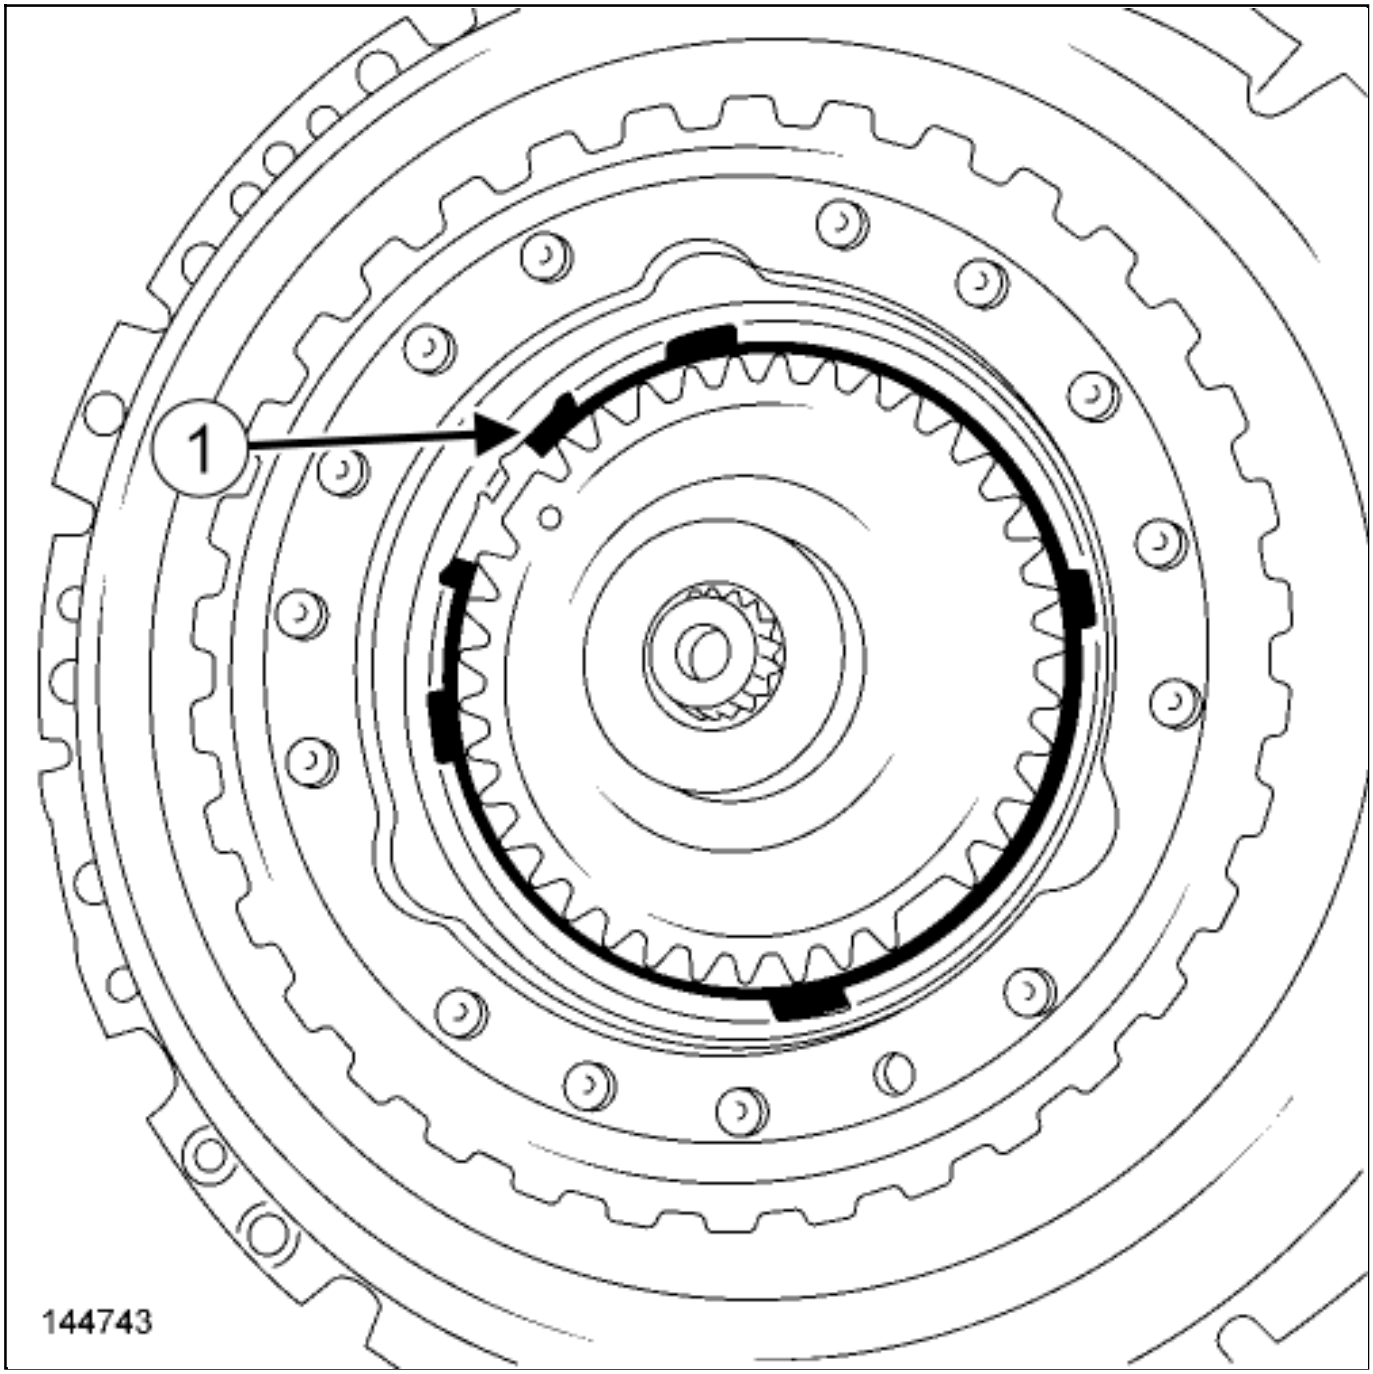
- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the automatic gearbox Automatic gearbox: Removal - Refitting .

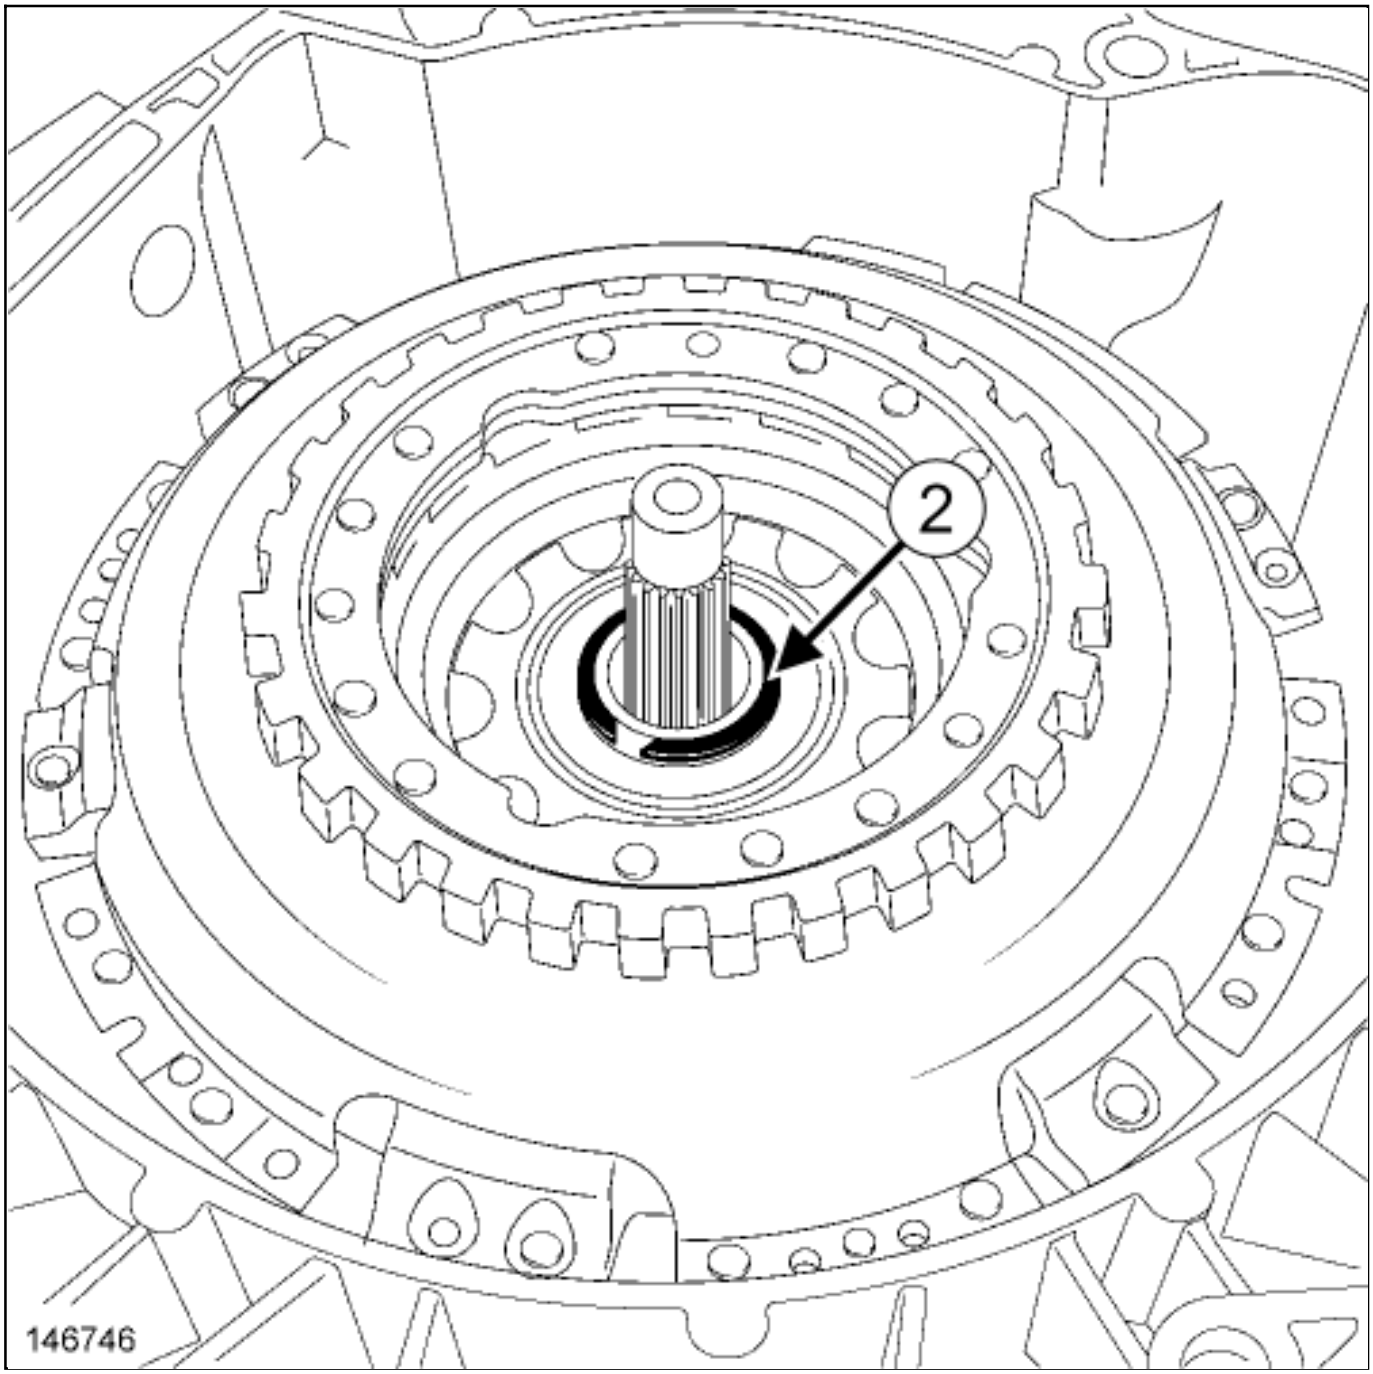
2. REMOVAL OPERATION



CAUTION

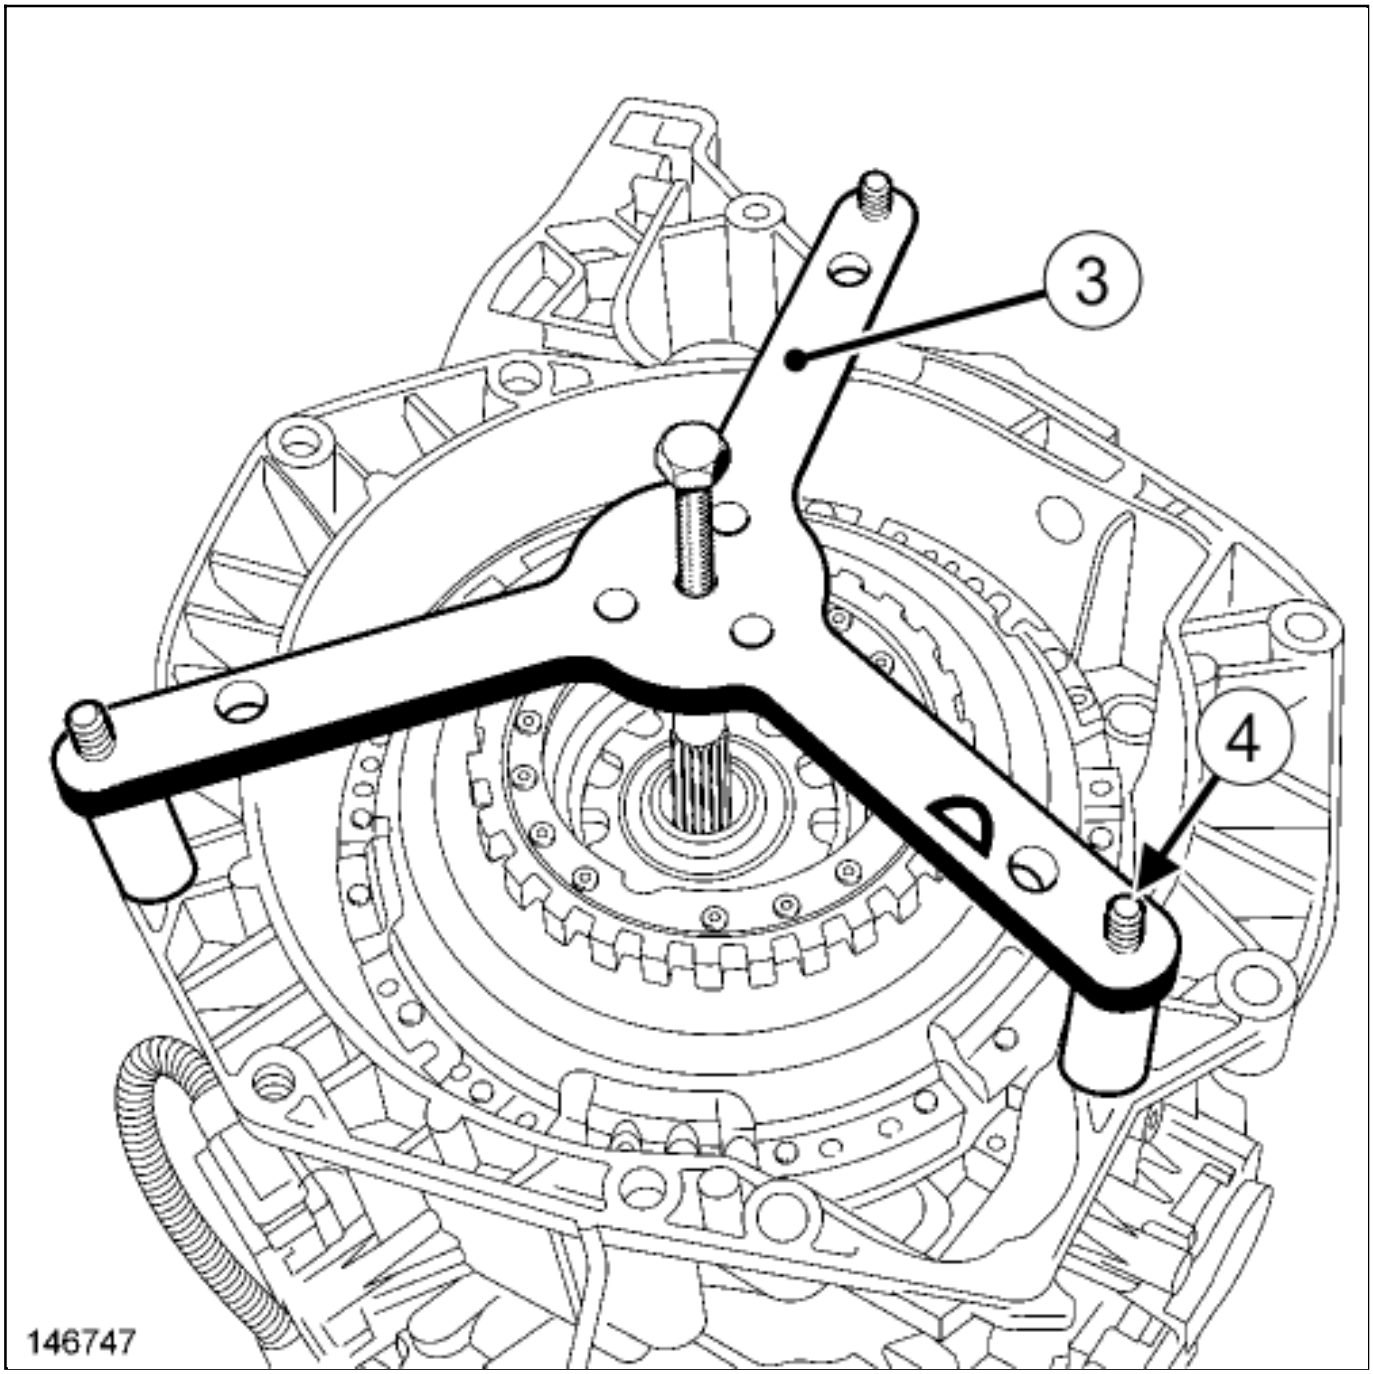
Failure to observe the following procedure could damage the clutch pressure plate assembly.

Note:

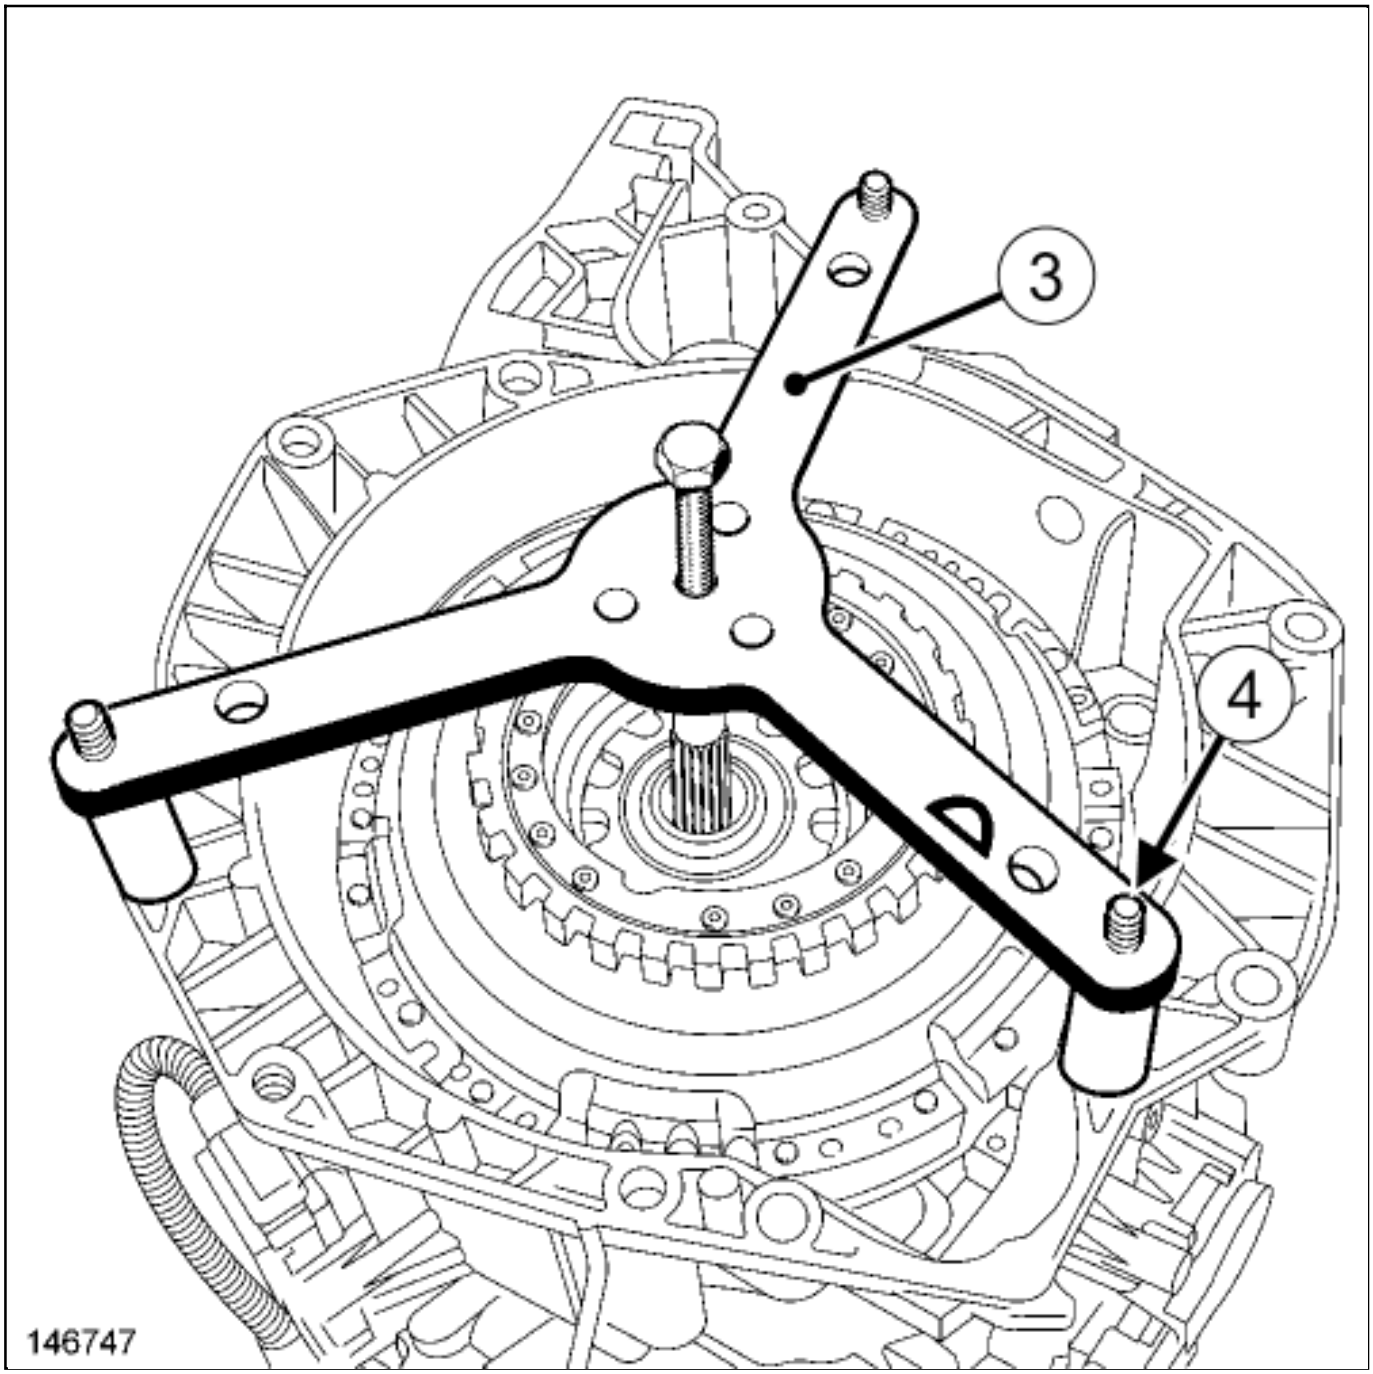


Never place the clutch on the diaphragm face - this could damage the face.

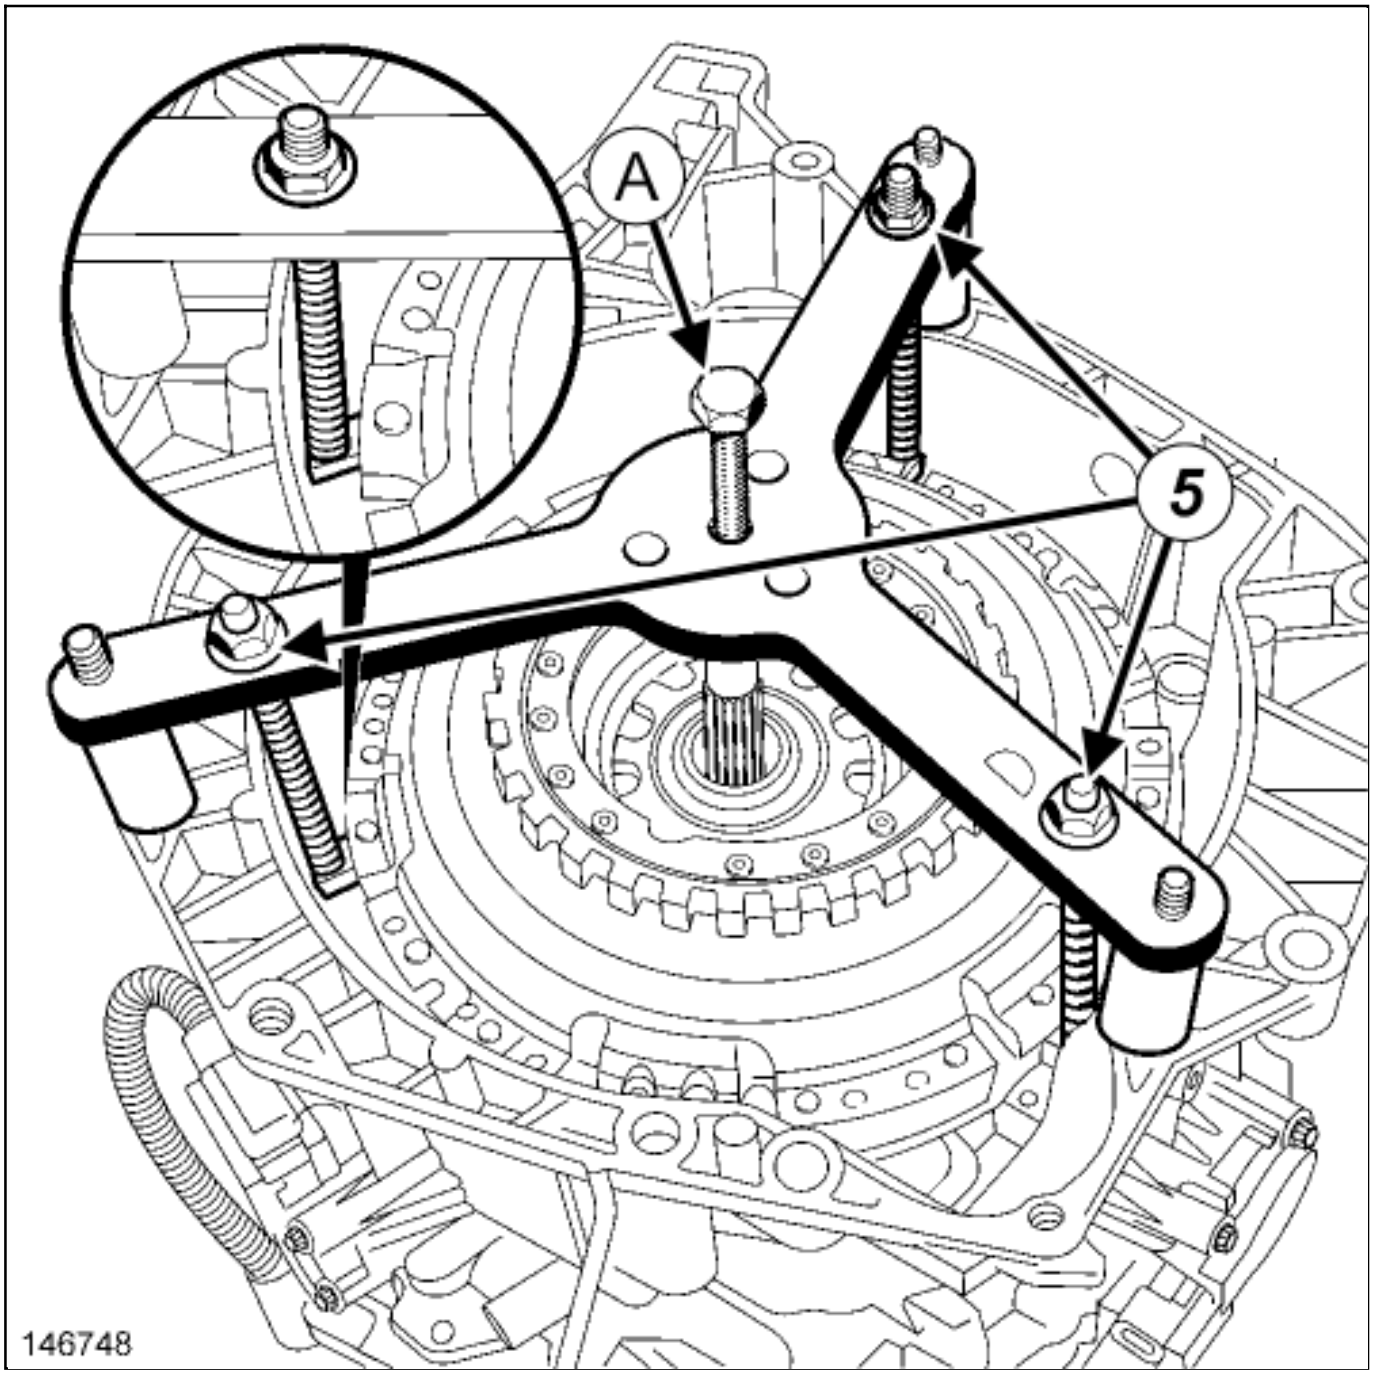
If necessary, be sure to place it on a sufficiently thick cloth.



Remove:



- the large diameter clip(1) using snap ring pliers,
- the part connecting with the clutch plate and the small diameter input shaft.



Remove the small diameter clip(2) using snap ring pliers.

Fit the toolTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (3) , but do not fit the locking nuts of the tool(4) .

Fit the toolClamp for clutch housing(Emb. 2028) (3) , with the tool's componentsTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) but do not fit the locking nuts of the tool(4) .

- Fit the extraction claws for the dual clutch(5) .
- Position the extraction claws on a non-working section of the clutch pressure plate.
- Adjust the extraction claws using the nuts.

Tighten the extraction bolt(A) of the dual clutch.

Remove the dual clutch.

REFITTING

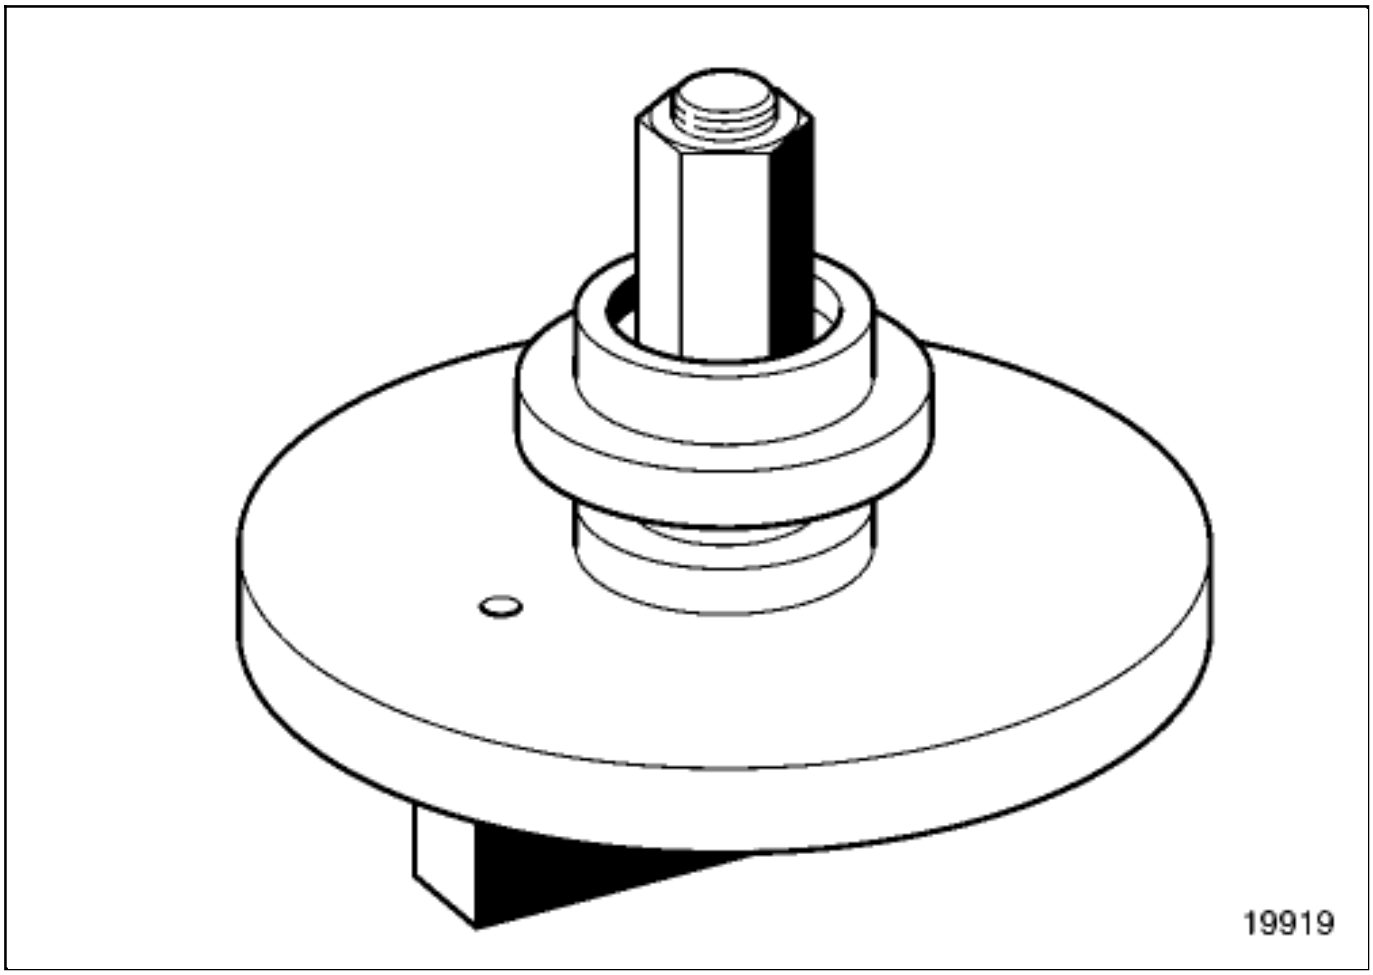
1. REFITTING PREPARATION OPERATION

Use surface cleaner Vehicle: Parts and consumables for the repair to clean all of the removed parts.

parts always to be replaced: Differential output seal .

Parts always to be replaced: Input shaft clips.

CAUTION

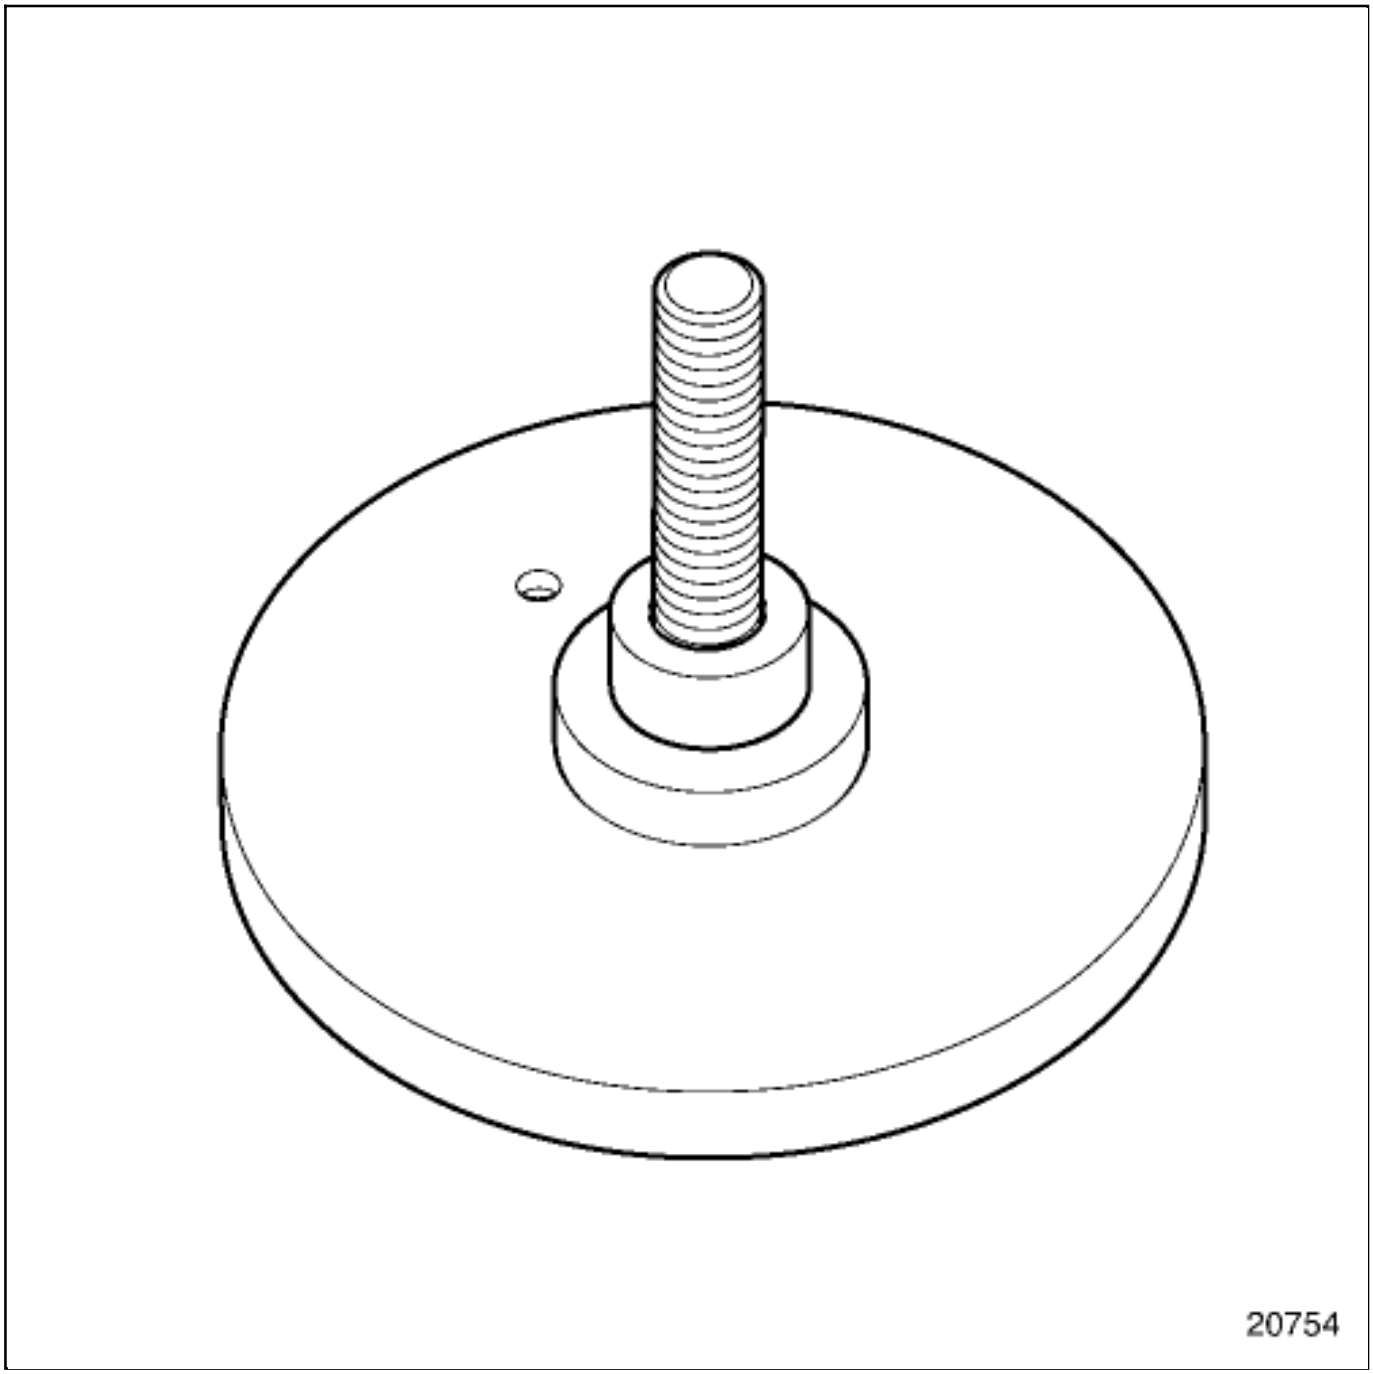


Failure to observe the following procedure could damage the clutch pressure plate assembly.

Note:

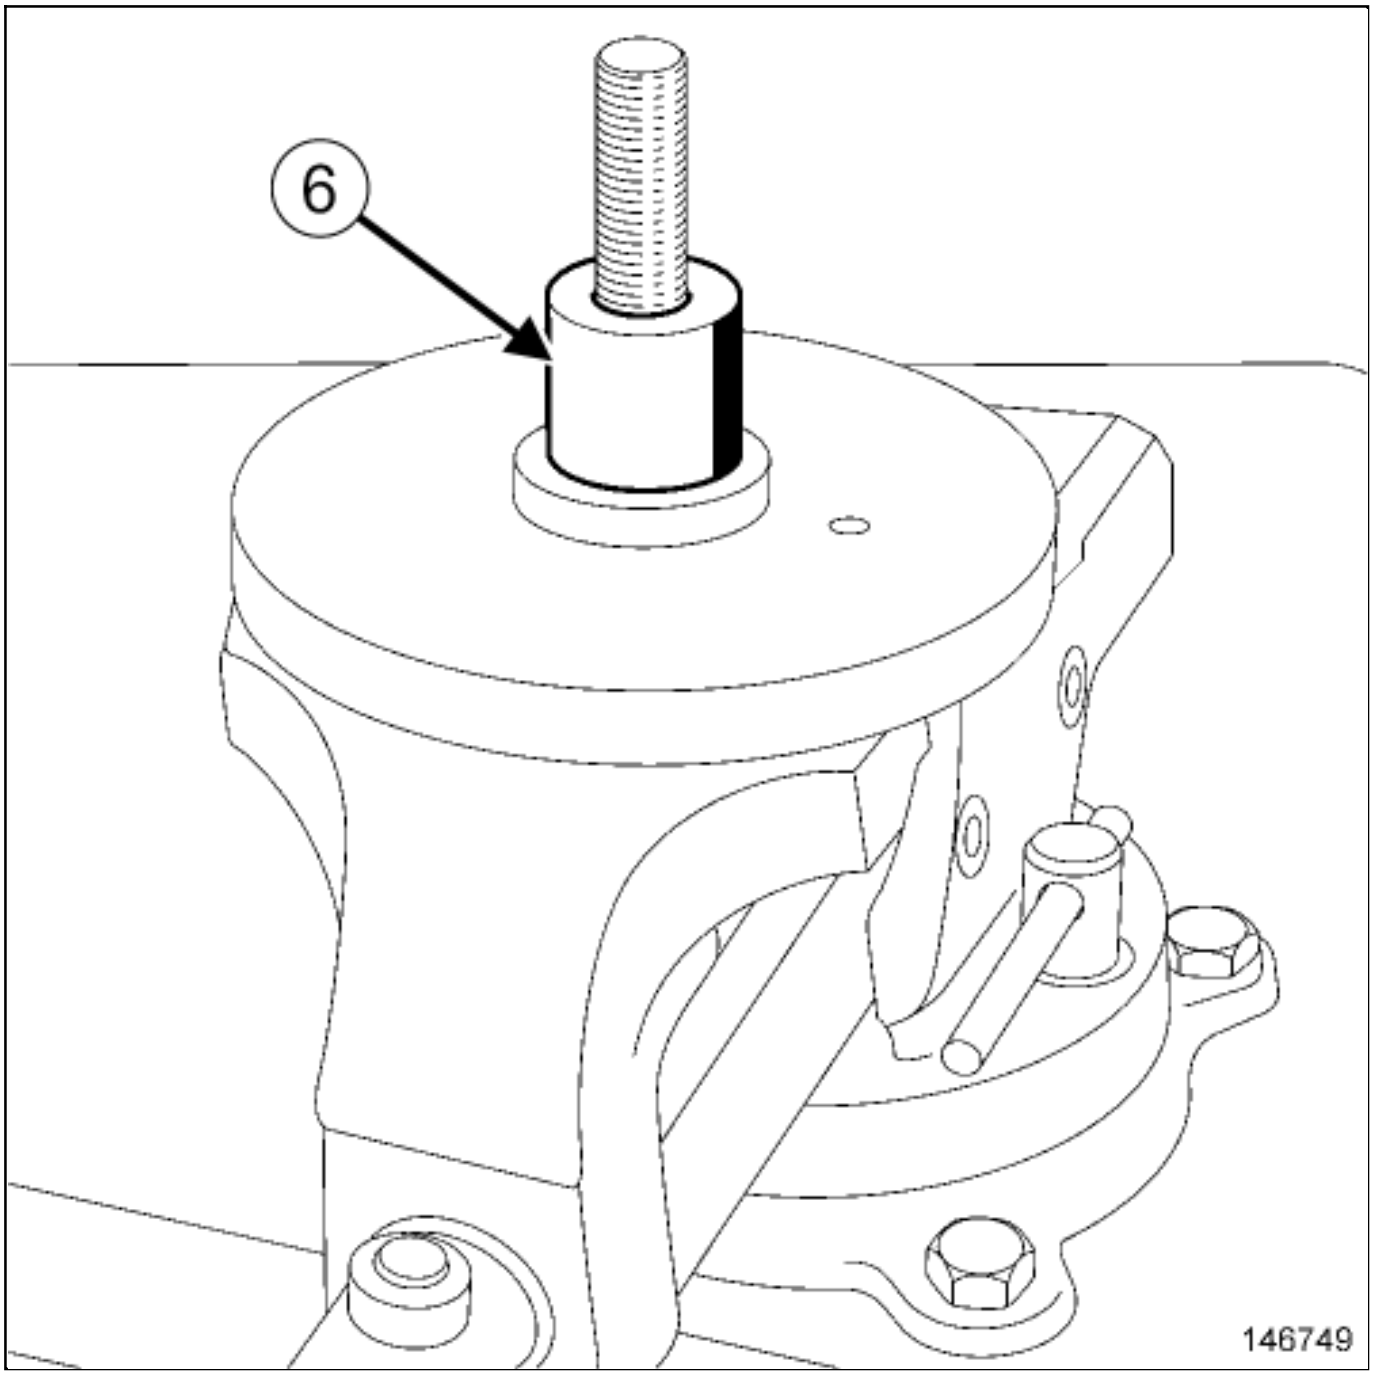
The following procedure is to be used only if refitting the old dual clutch.

The purpose is to reposition the automatic take-ups at their starting point.



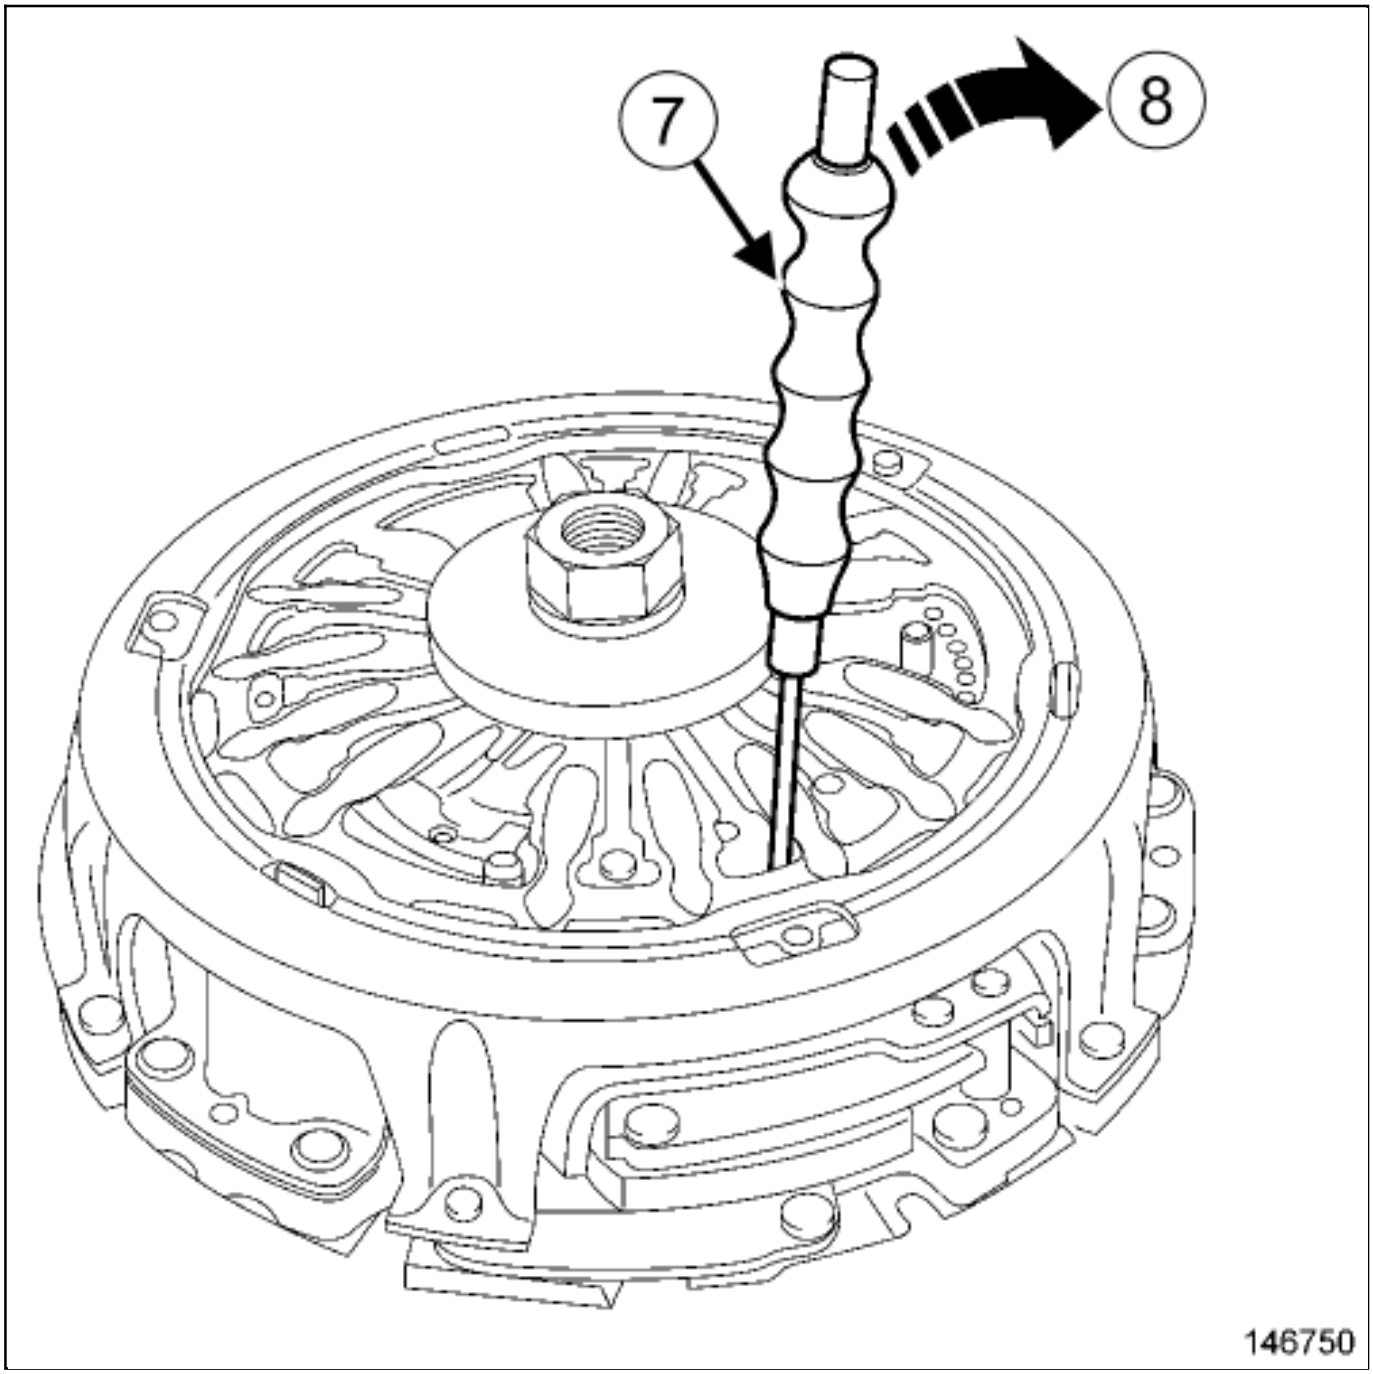
1- IF REFITTING THE OLD DUAL CLUTCH, APPLY THE FOLLOWING PROCEDURE:

Note:



To reposition the automatic take-up and lock the mechanisms, use the toolClutch compression tool for rearming the compensation system.(Emb. 1604) with

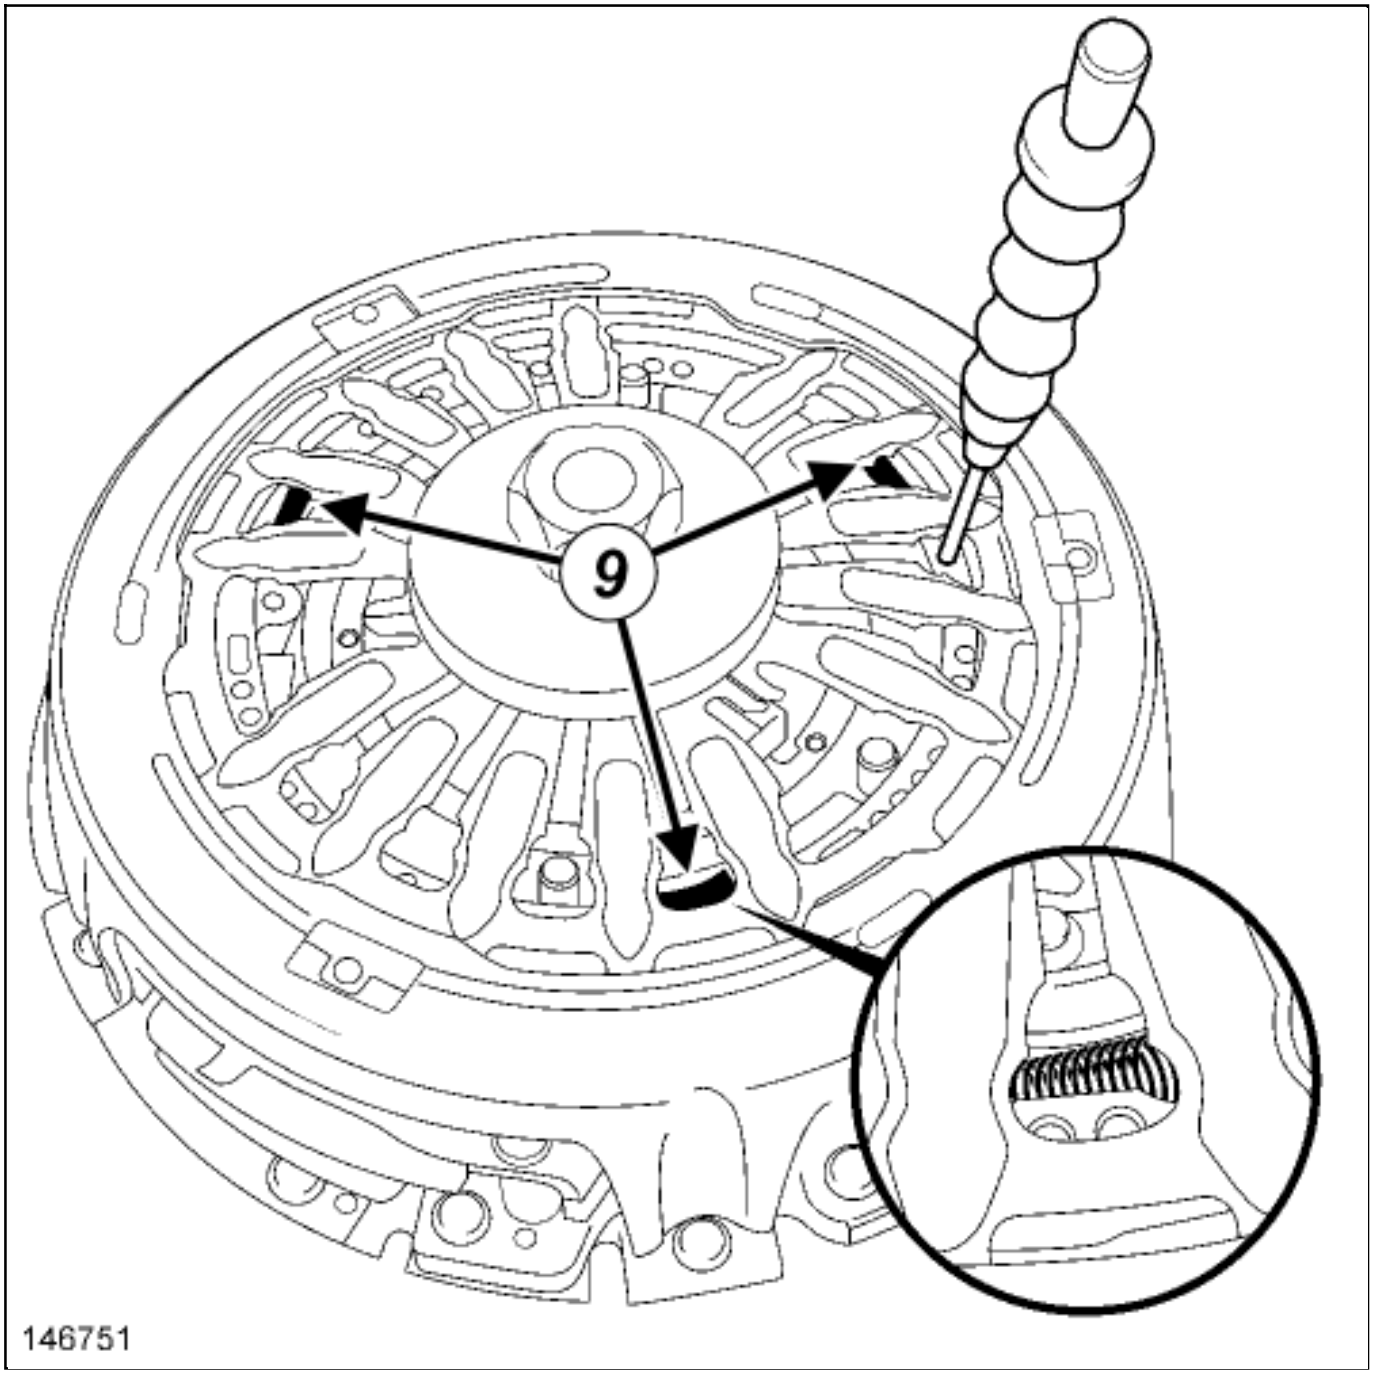
Clutch pressure plate rearming tools(Emb. 1951) .



Place the base of toolClutch compression tool for rearming the compensation system.(Emb. 1604) in a vice.

1)REPRIMING THE LARGE DIAMETER DIAPHRAGM

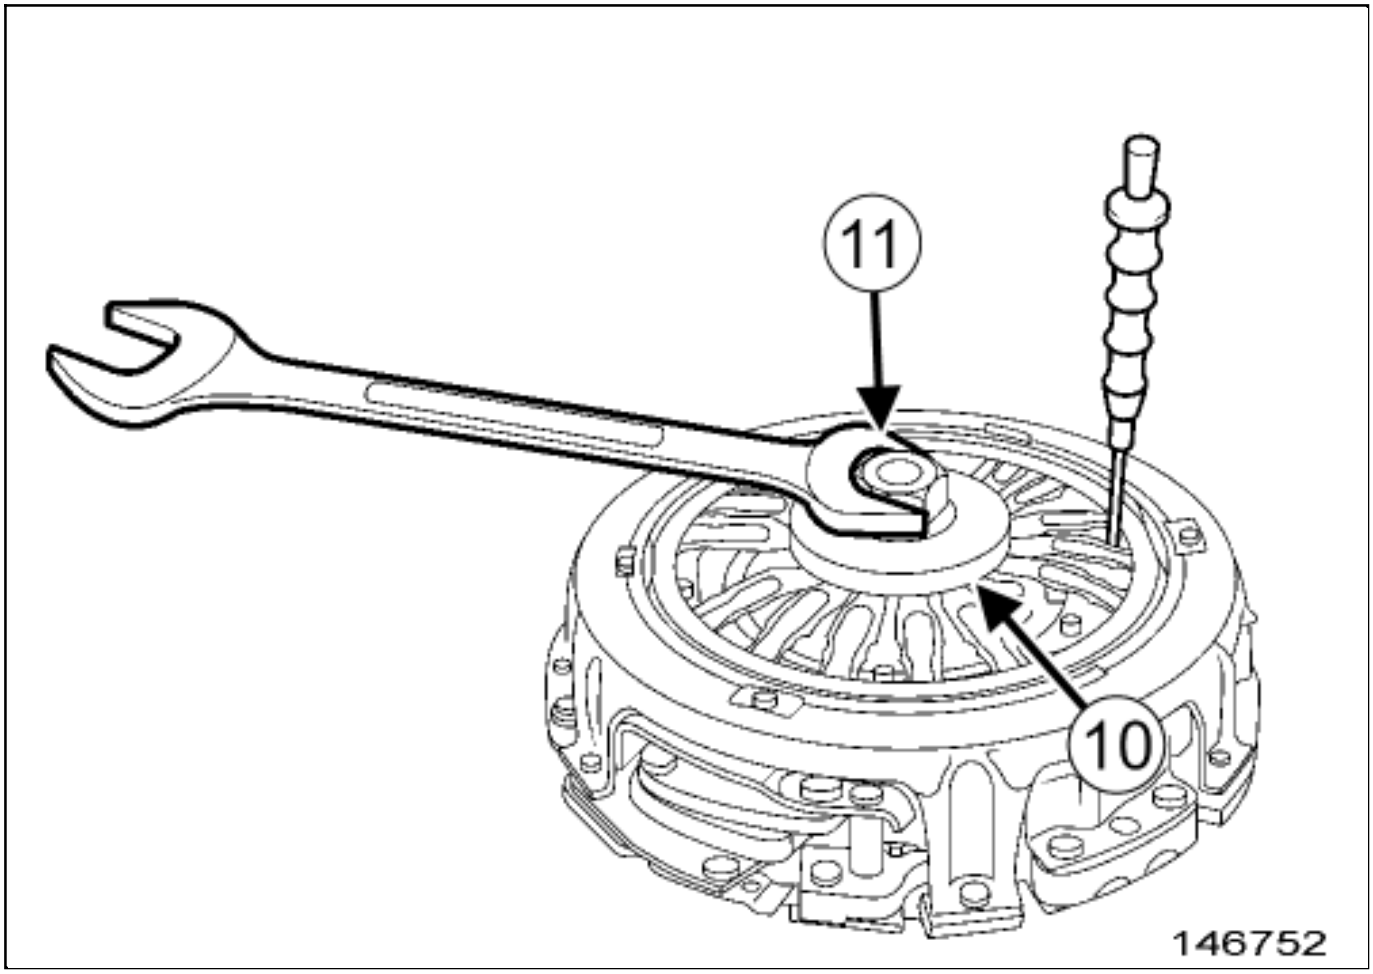
- Position the dual clutch on the base.
- Position the clutch plate centring device(6) .



Note:

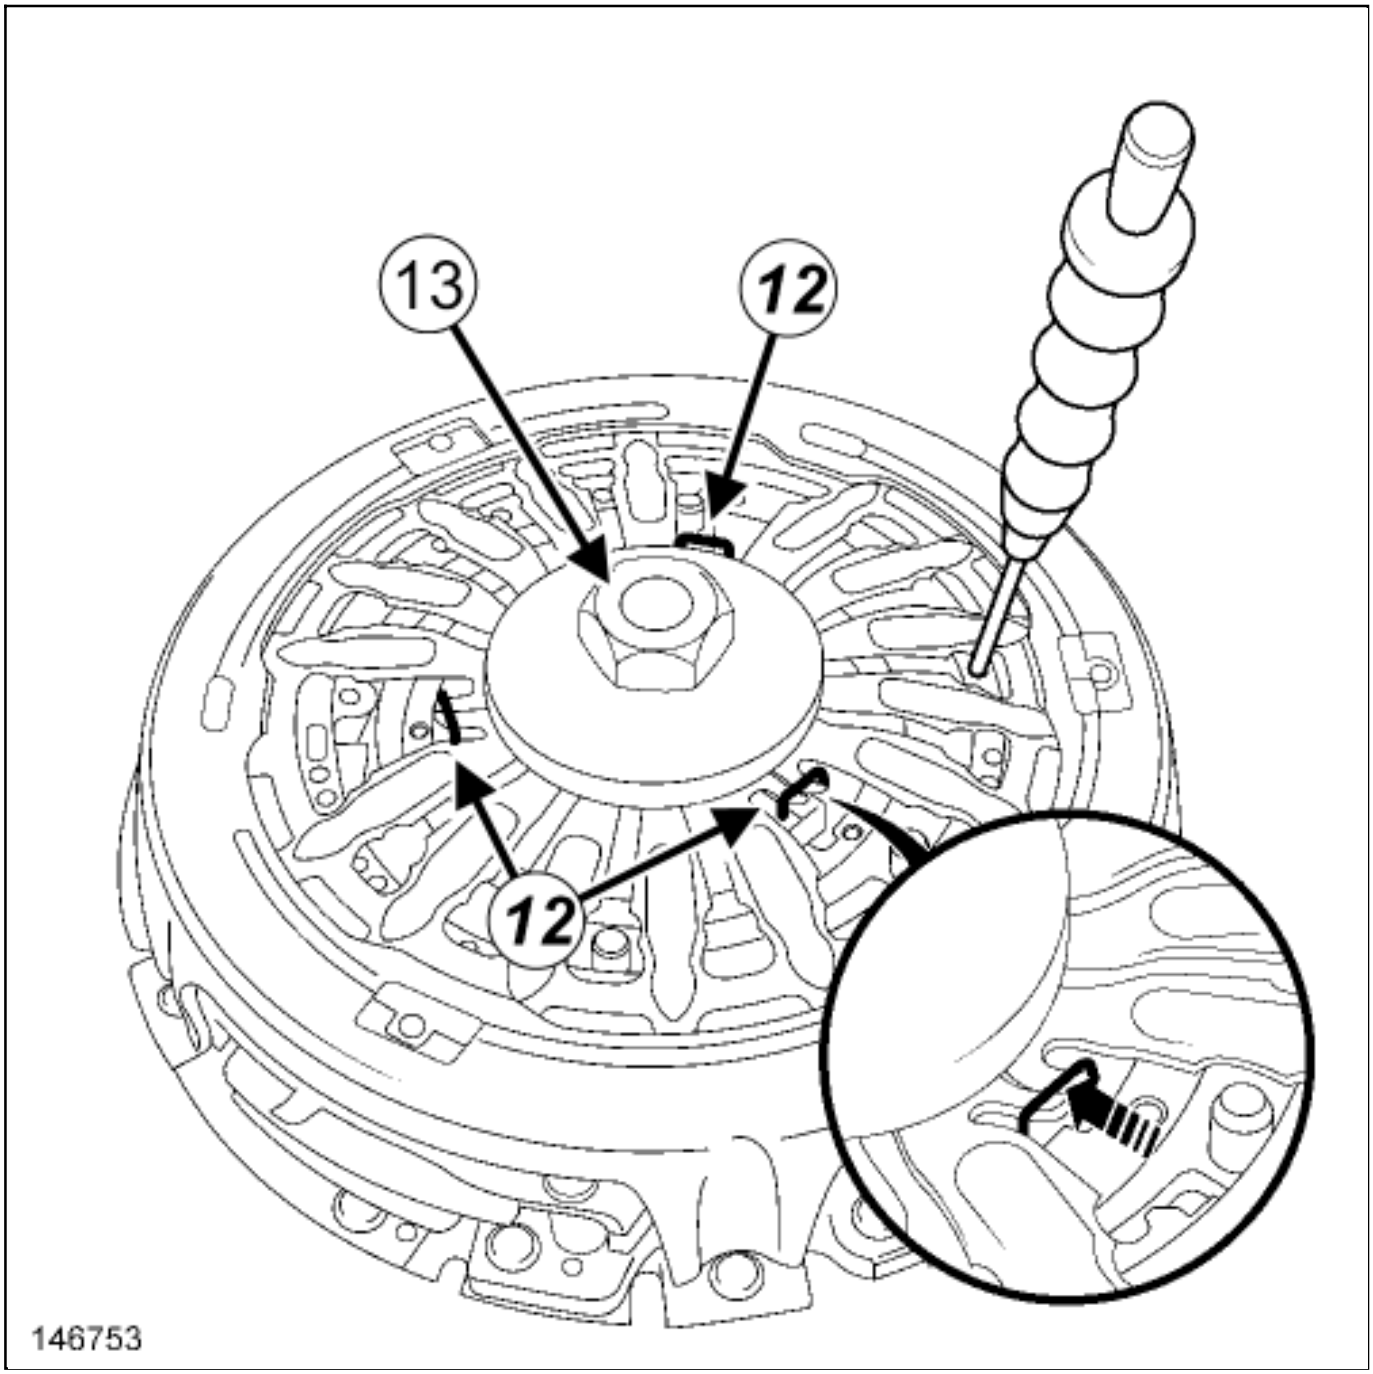
In some cases, the automatic take-up is tightly locked.

It is advised to use two people for this operation.



Reset the automatic take-up of the large diameter diaphragm using a roll pin punch(7) .

Turn the back-plate of the automatic take-up of the large diameter diaphragm by(8) .

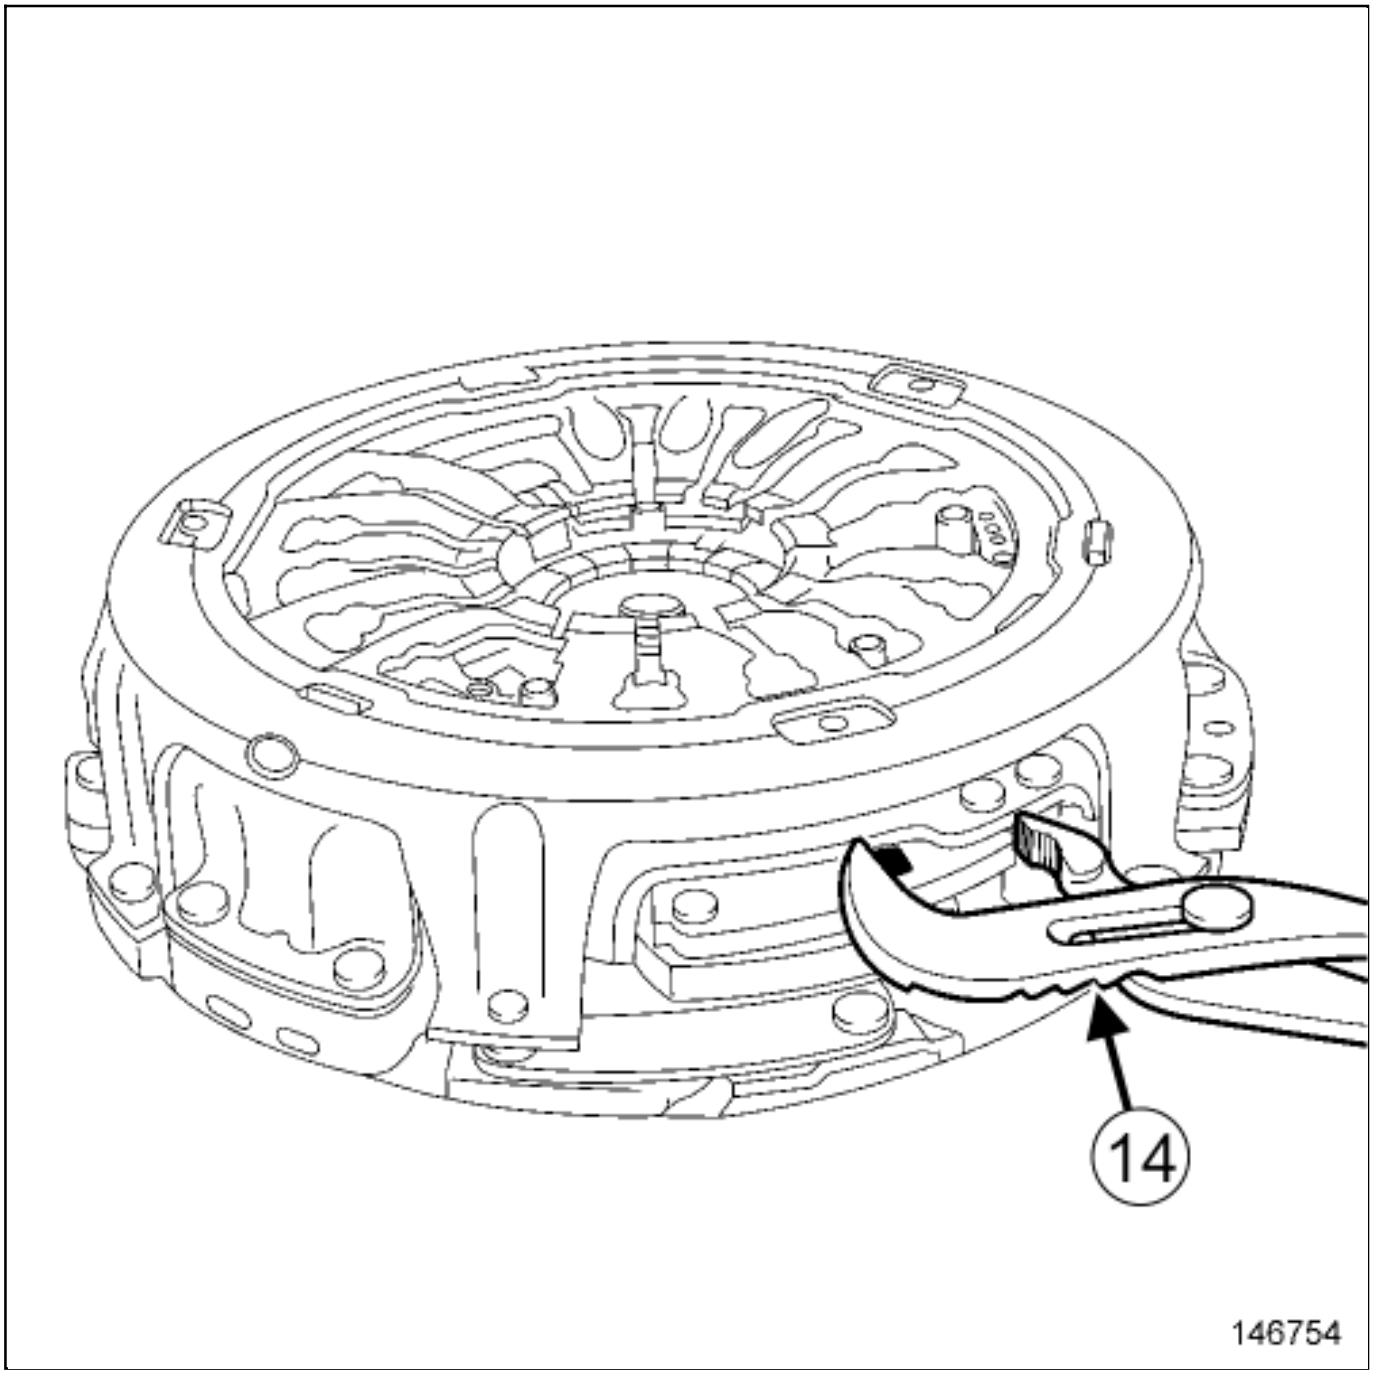


Compress the springs of the automatic take-up of the large diameter diaphragm(9) .

Keep the back-plate of the automatic take-up of the large diameter diaphragm rearmed using the roll pin punch.

- Position the Clutch pressure plate rearming tools(Emb. 1951) (10) .

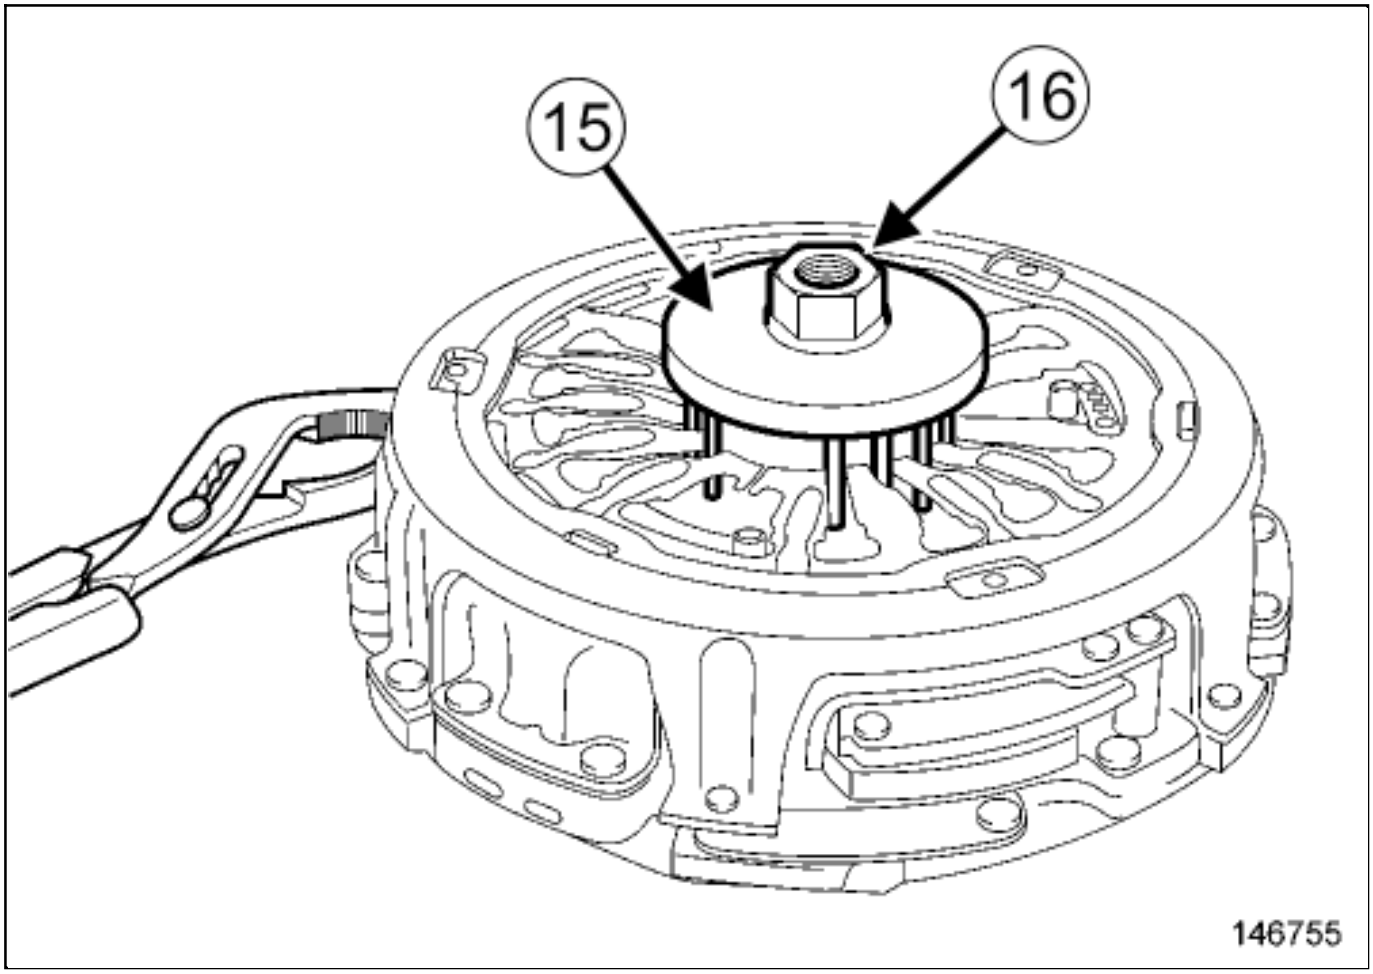
- Tighten the nut (11) until the pressure plate is compressed.



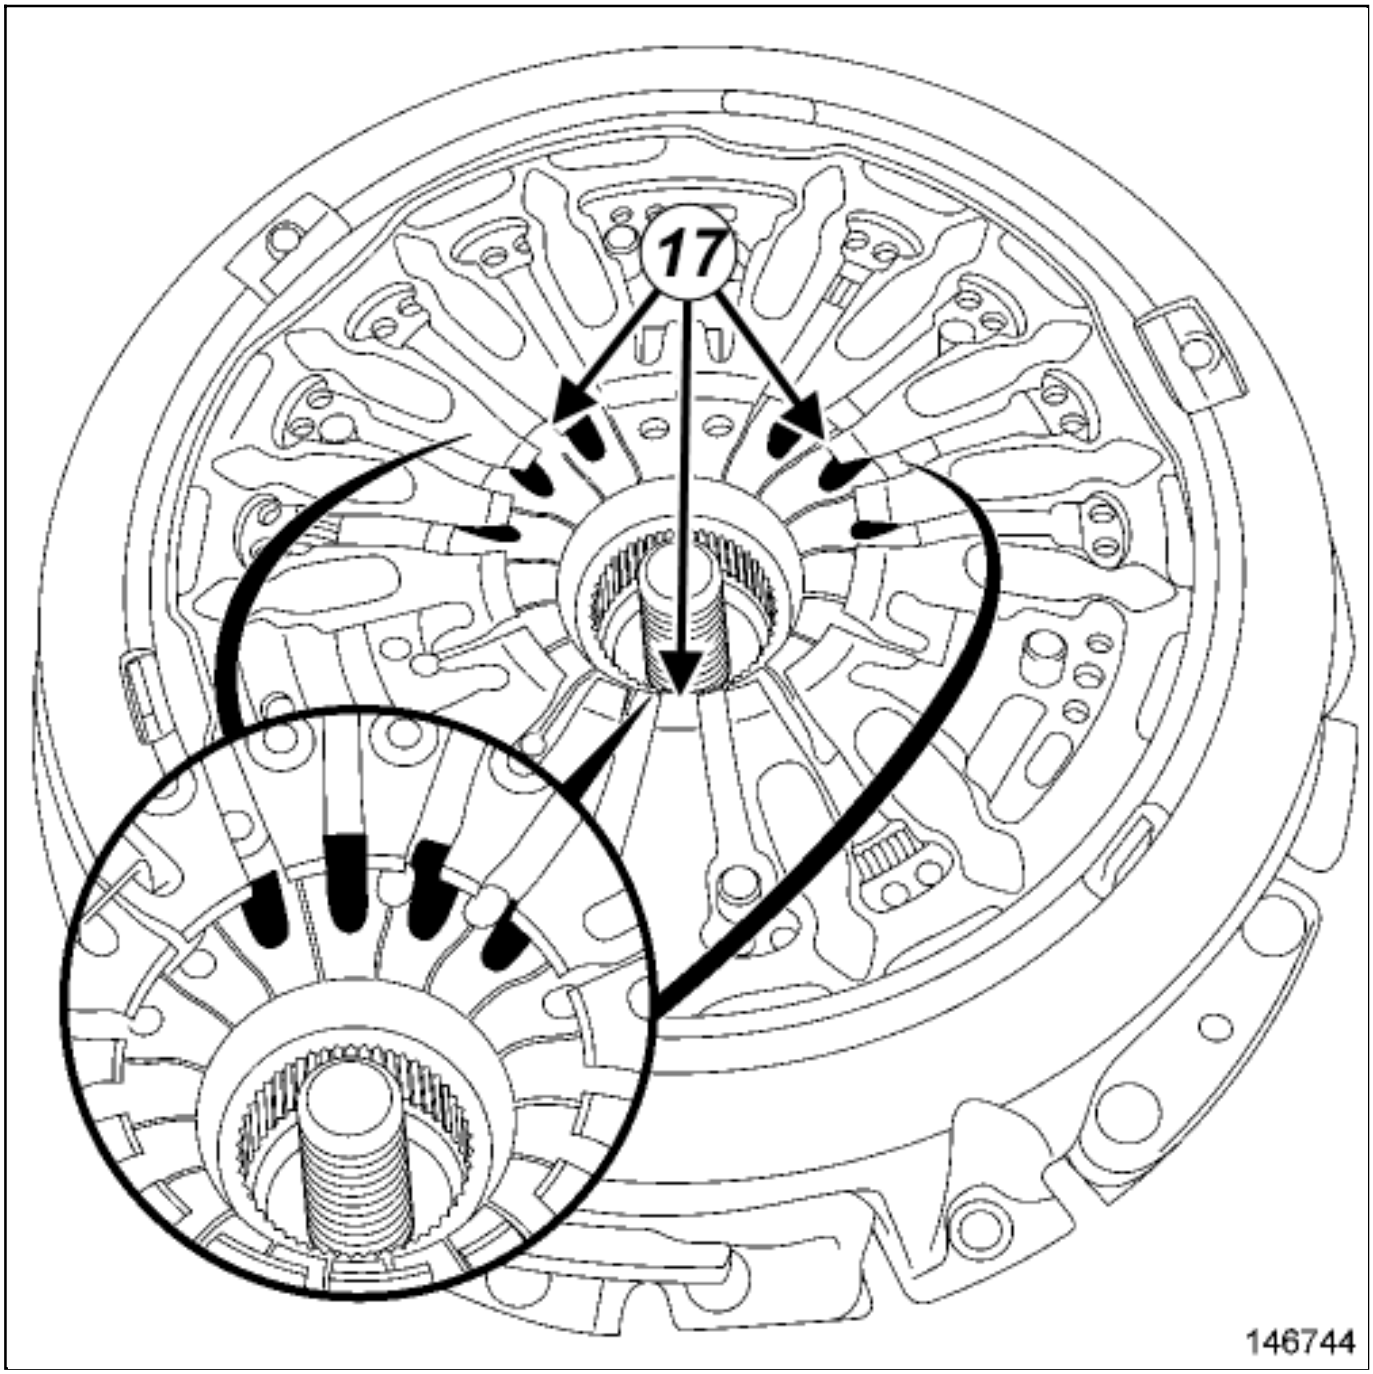
- Engage the three clips(12).
- Loosen the nut(13) while keeping the clips in place.
- Remove the toolClutch pressure plate rearming tools(Emb. 1951).

Note:

In some cases, the automatic take-up is tightly locked.



It is advised to use two people for this operation.



Reset the automatic take-up of the small diameter diaphragm using combination pliers(14) .

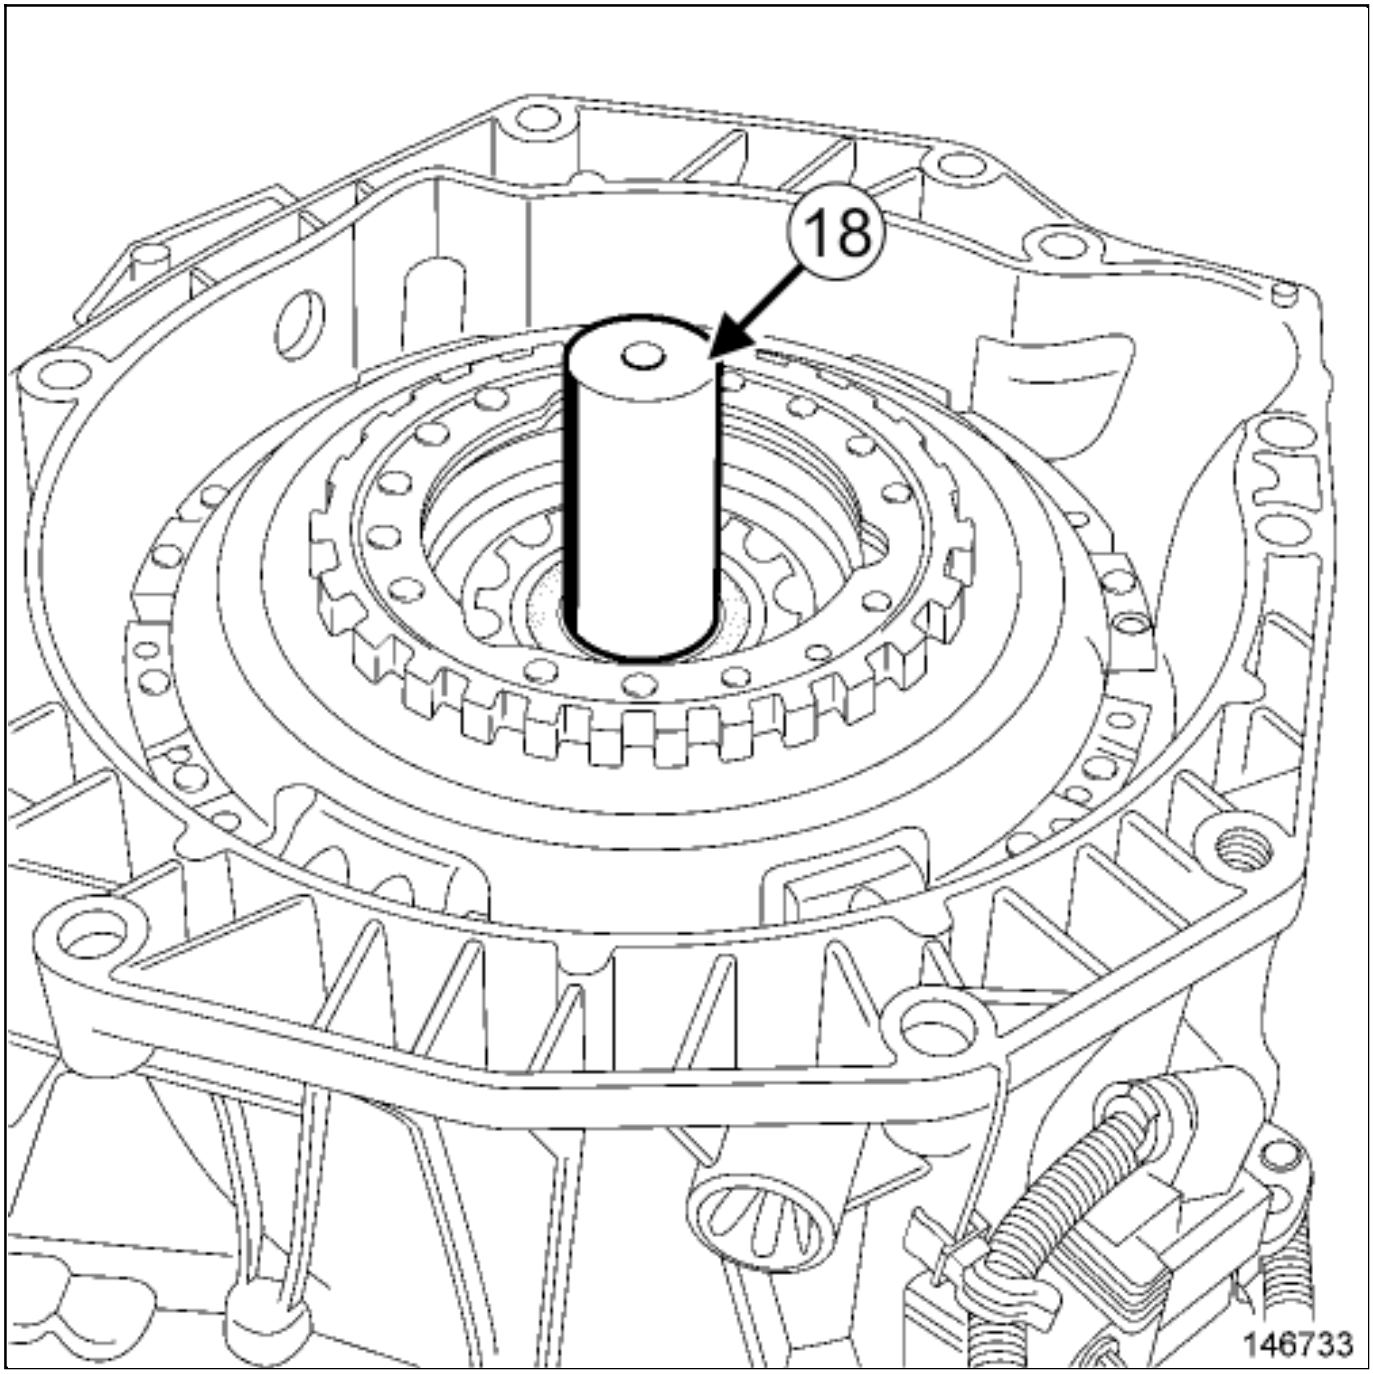
Note:

Hold the automatic take-up of the small diameter diaphragm using the combination pliers during the entire operation.

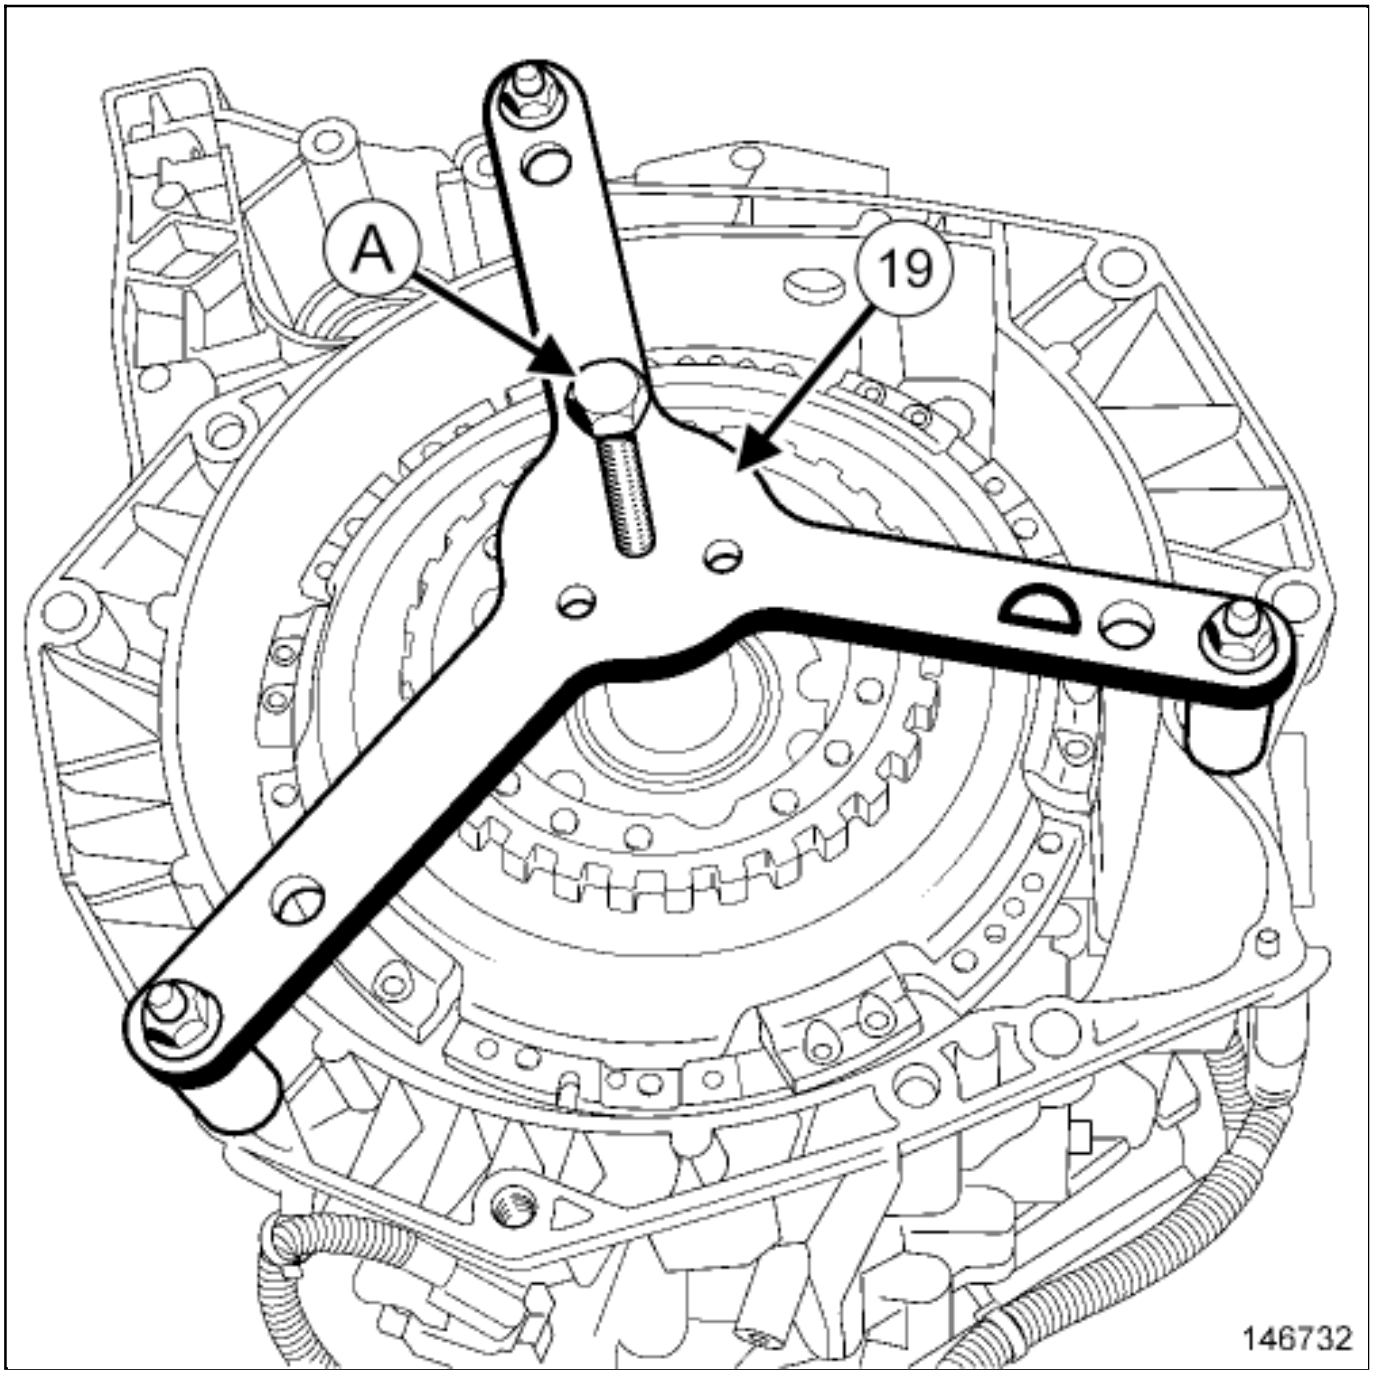
- Position the Clutch pressure plate rearming tools(Emb. 1951) (15) .
- Tighten the bolt(16) until spring finger(17) in the small diameter diaphragm is locked.
- Check that all the spring fingers(17) are engaged in the holes of the small diameter diaphragm.
- Loosen the bolt(16) .

Remove the toolClutch pressure plate rearming tools(Emb. 1951) .

2- IF REFITTING A NEW DUAL CLUTCH, APPLY THE FOLLOWING PROCEDURE:



Note:

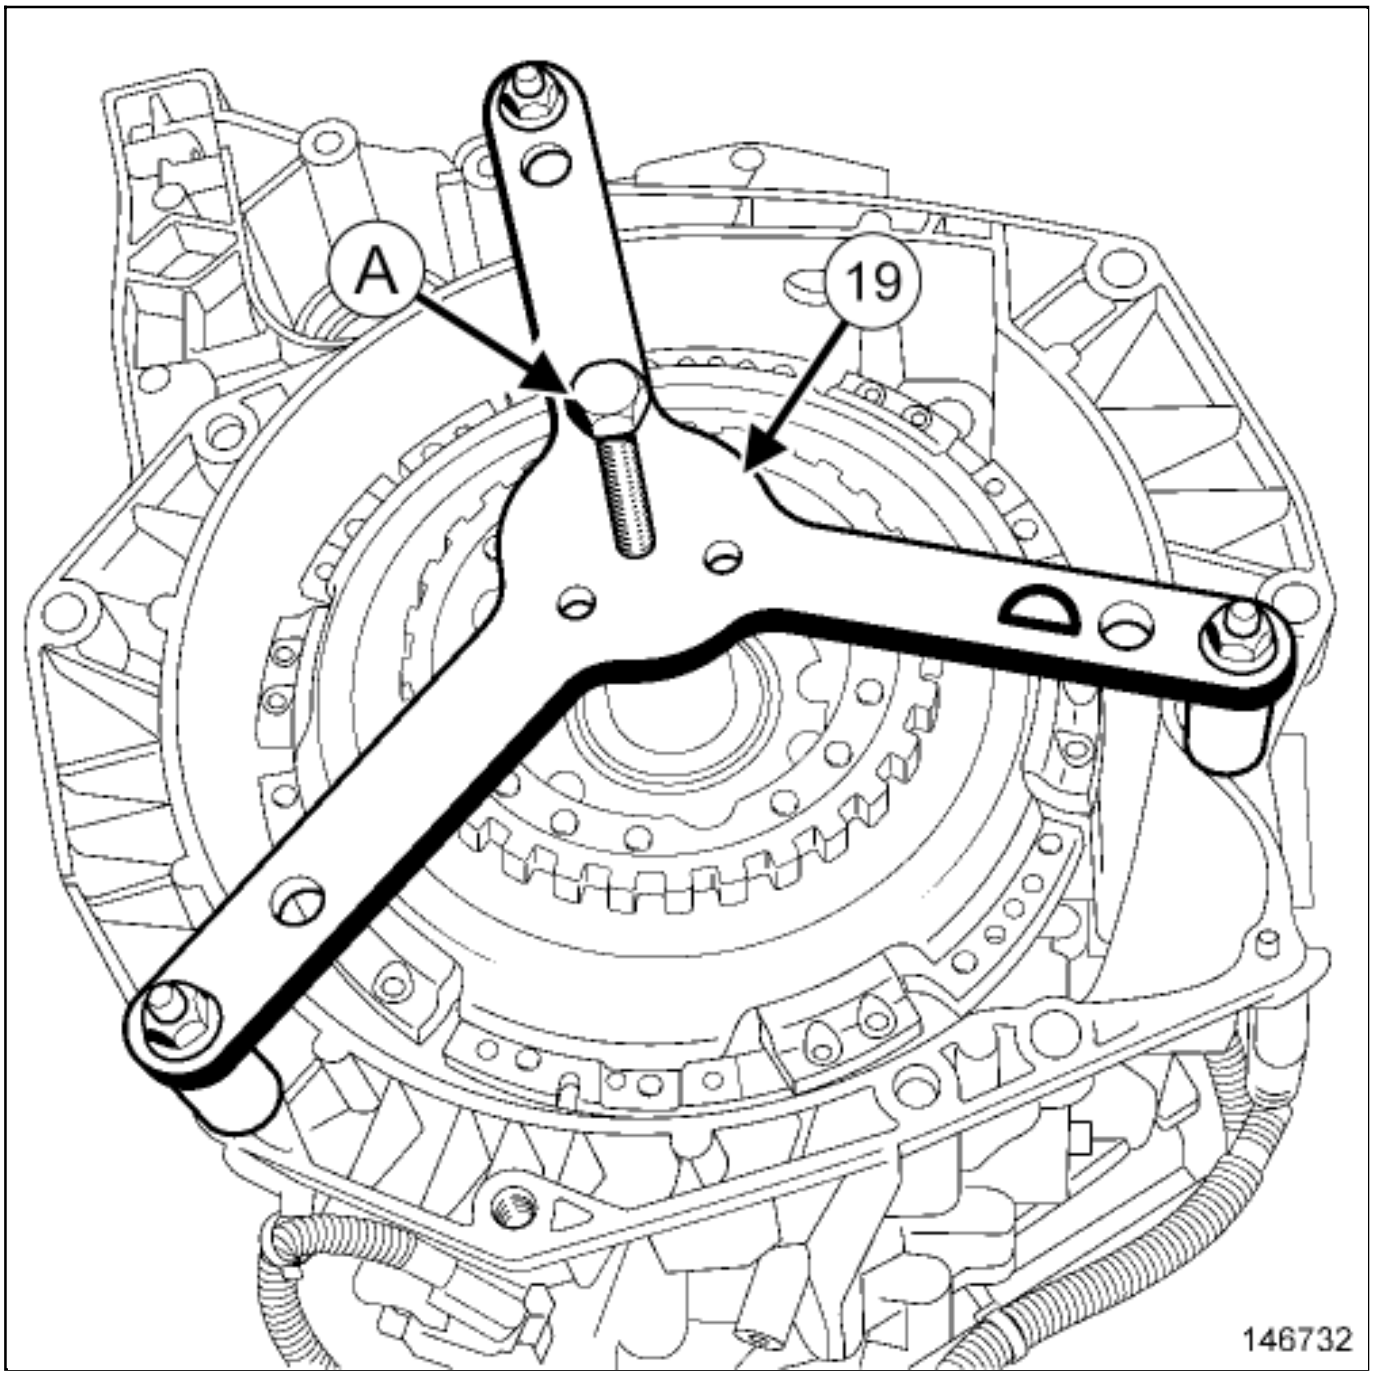


The dual clutch is supplied with the diaphragms already compressed.

2. REFITTING OPERATION

Grease the mating faces of the input shafts before refitting the clutchVehicle: Parts and consumables for the repair .

Fit the dual clutch insertion socket(18) .

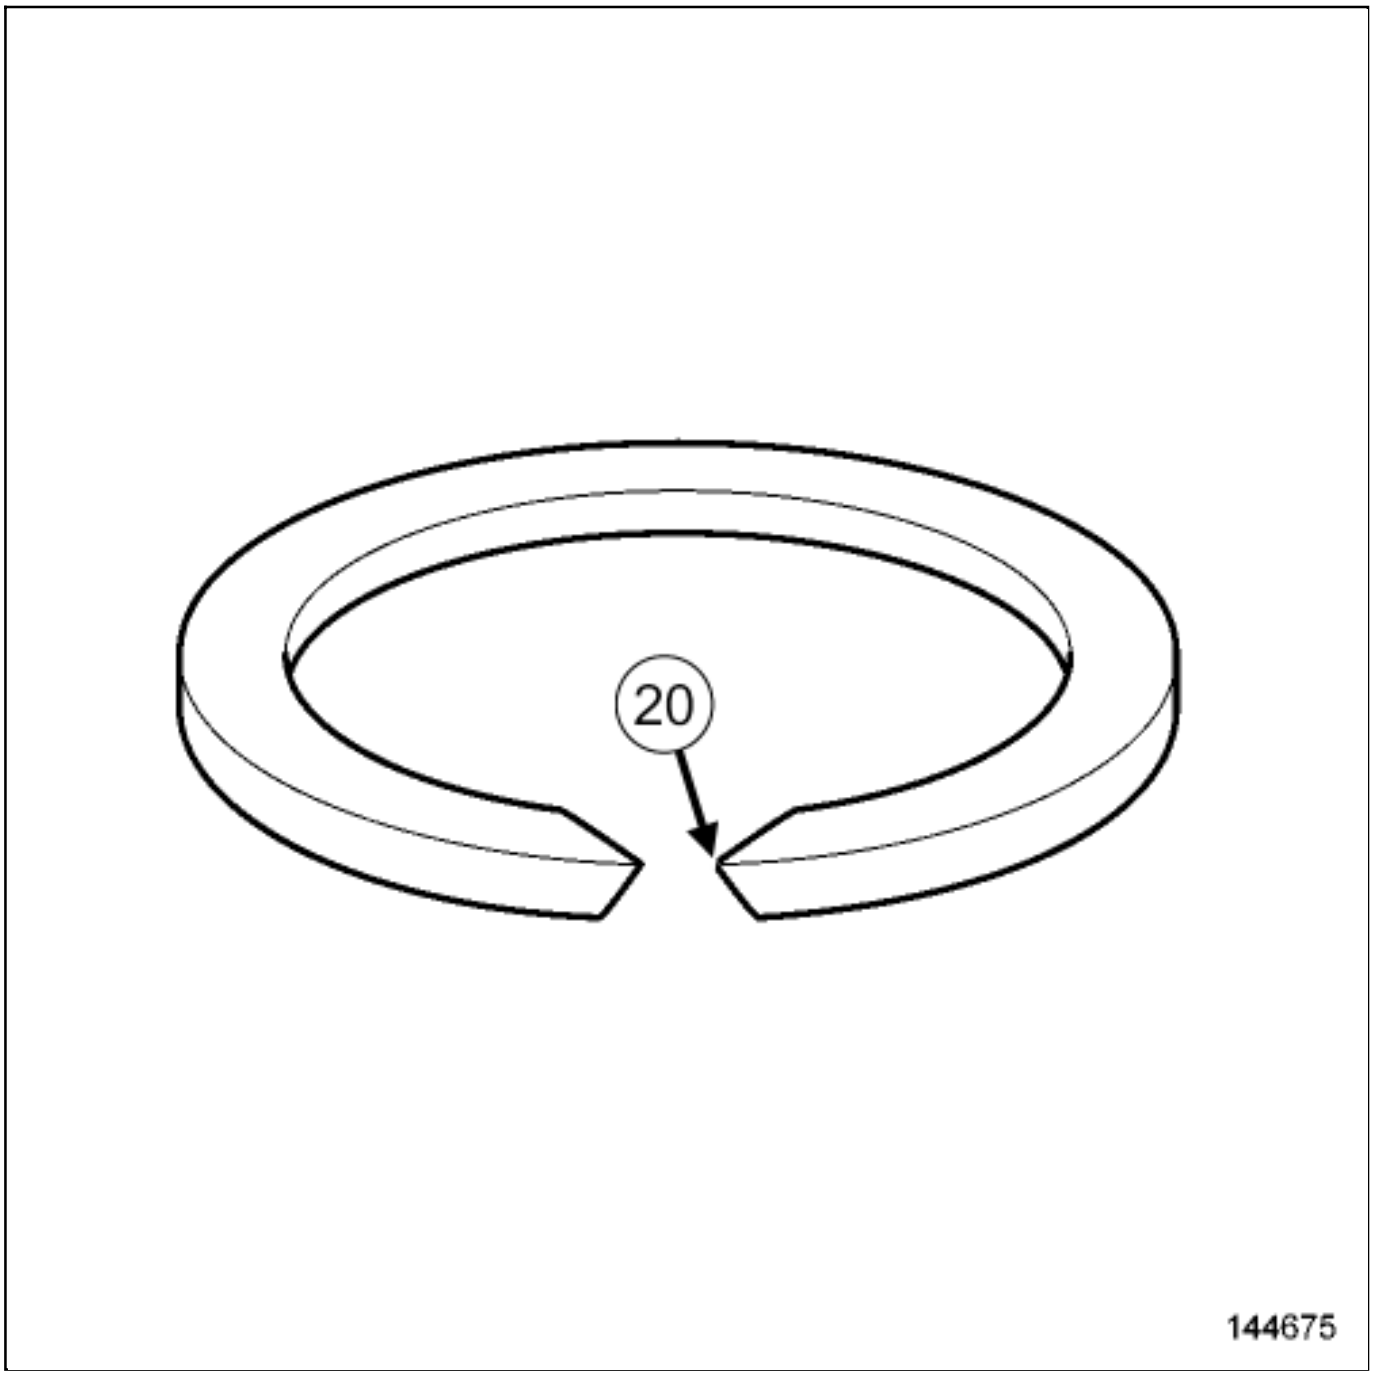


Fit the toolTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) (19) fitted with the dual clutch insertion socket.

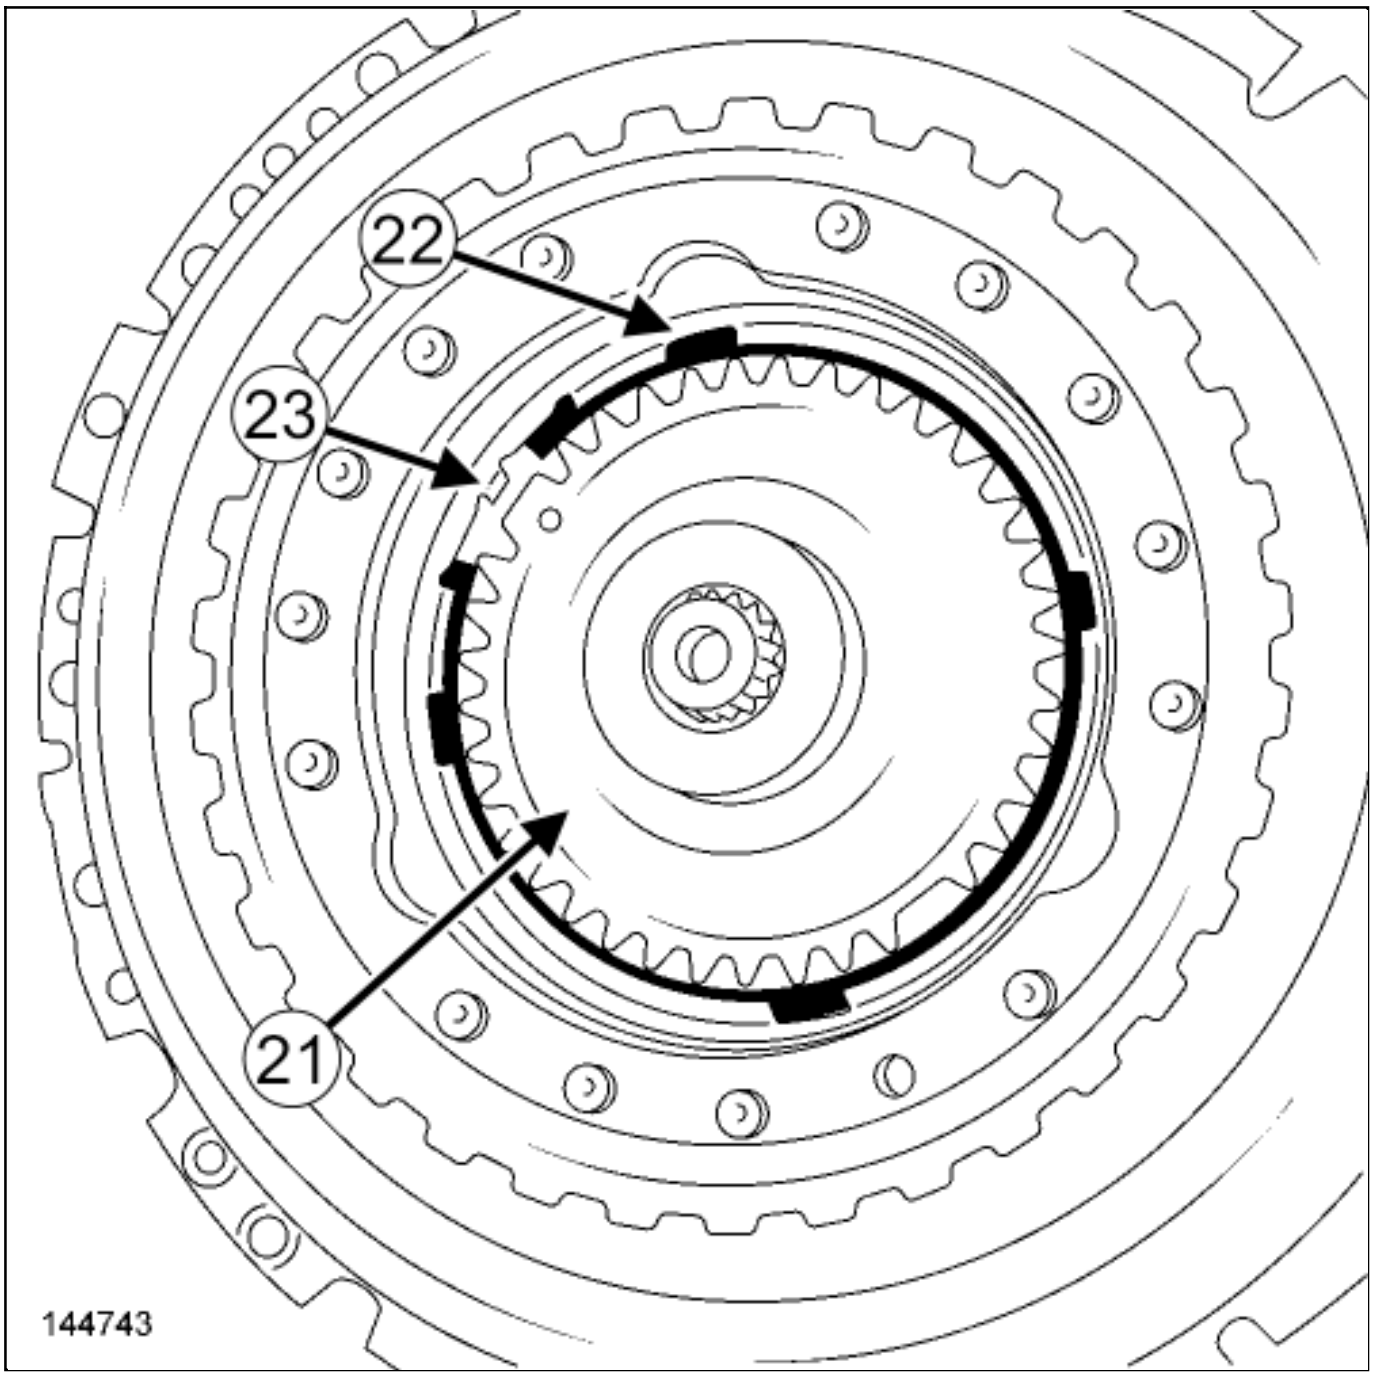
Tighten the bolt(A) of the dual clutch insertion socket until the groove of the clip is visible.

Remove:

- the toolTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) ,
- the dual clutch insertion socket.



Fit the toolClamp for clutch housing(Emb. 2028) (19) , with the tool's componentsTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) fitted with the dual clutch insertion socket.



Tighten the bolt(A) of the dual clutch insertion socket until the groove of the clip is visible.

Remove:

- the toolTool for removal - refitting of clutch pressure plate and housing(**Emb. 1952**) and Clamp for clutch housing (**Emb. 2028**) ,
- the dual clutch insertion socket.

Refit a new small diameter clip using snap ring pliers, taking care to position the pointed part of the clip(20) upwards.

Refit:

- the part connecting with the clutch plate and the small diameter input shaft(21) , taking care with the foolproofing,

the large diameter clip(22) , taking care to position it correctly in relation to the lug(23) .

3. FINAL OPERATION

Refit the automatic gearbox**Automatic gearbox: Removal - Refitting** .

CLUTCH: REMOVAL - REFITTING

 **Note, one or more warnings are present in this procedure** 

Special tooling required	
Clutch compression tool for rearming the compensation system.	Emb. 1604
Clutch pressure plate rearming tools	Emb. 1951
Tool for removal - refitting of clutch pressure plate and housing	Emb. 1952
Clamp for clutch housing	Emb. 2027
Clamp for clutch housing	Emb. 2028

Equipment required
roll pin punch

parts always to be replaced:
Differential output seal

WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

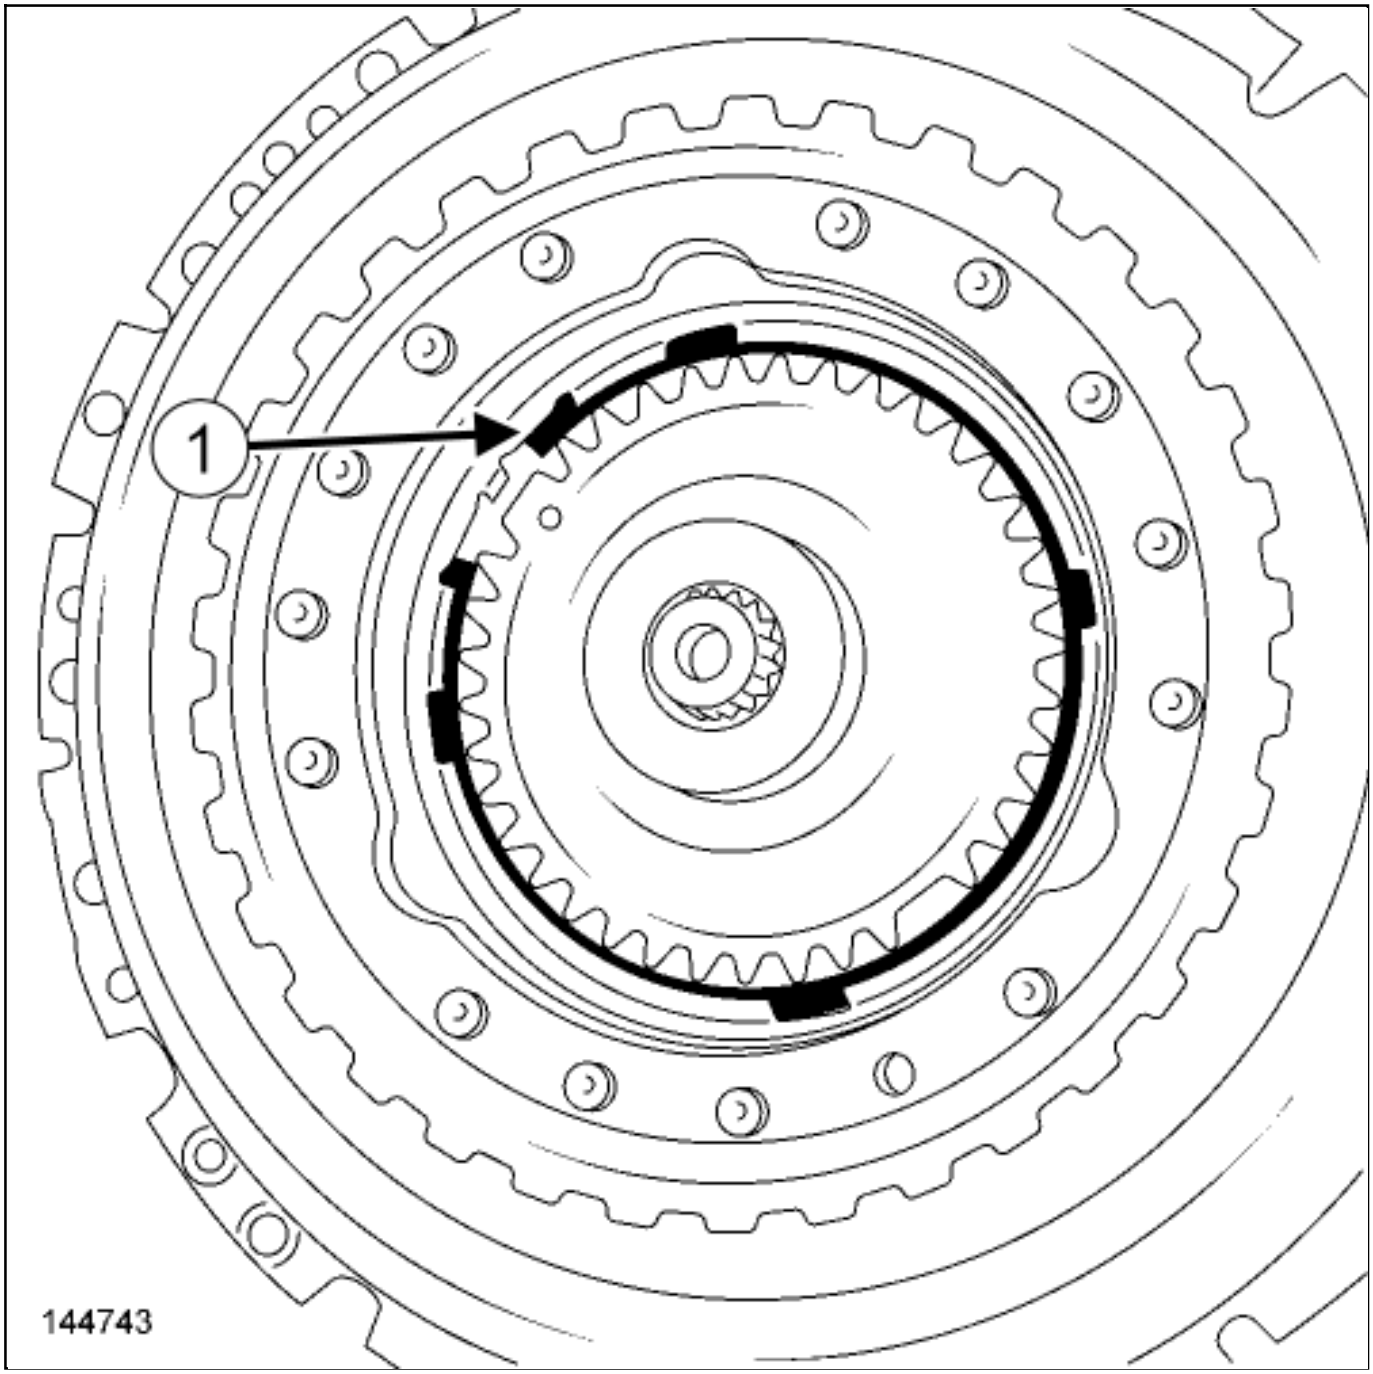
- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .

REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove the automatic gearbox (see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

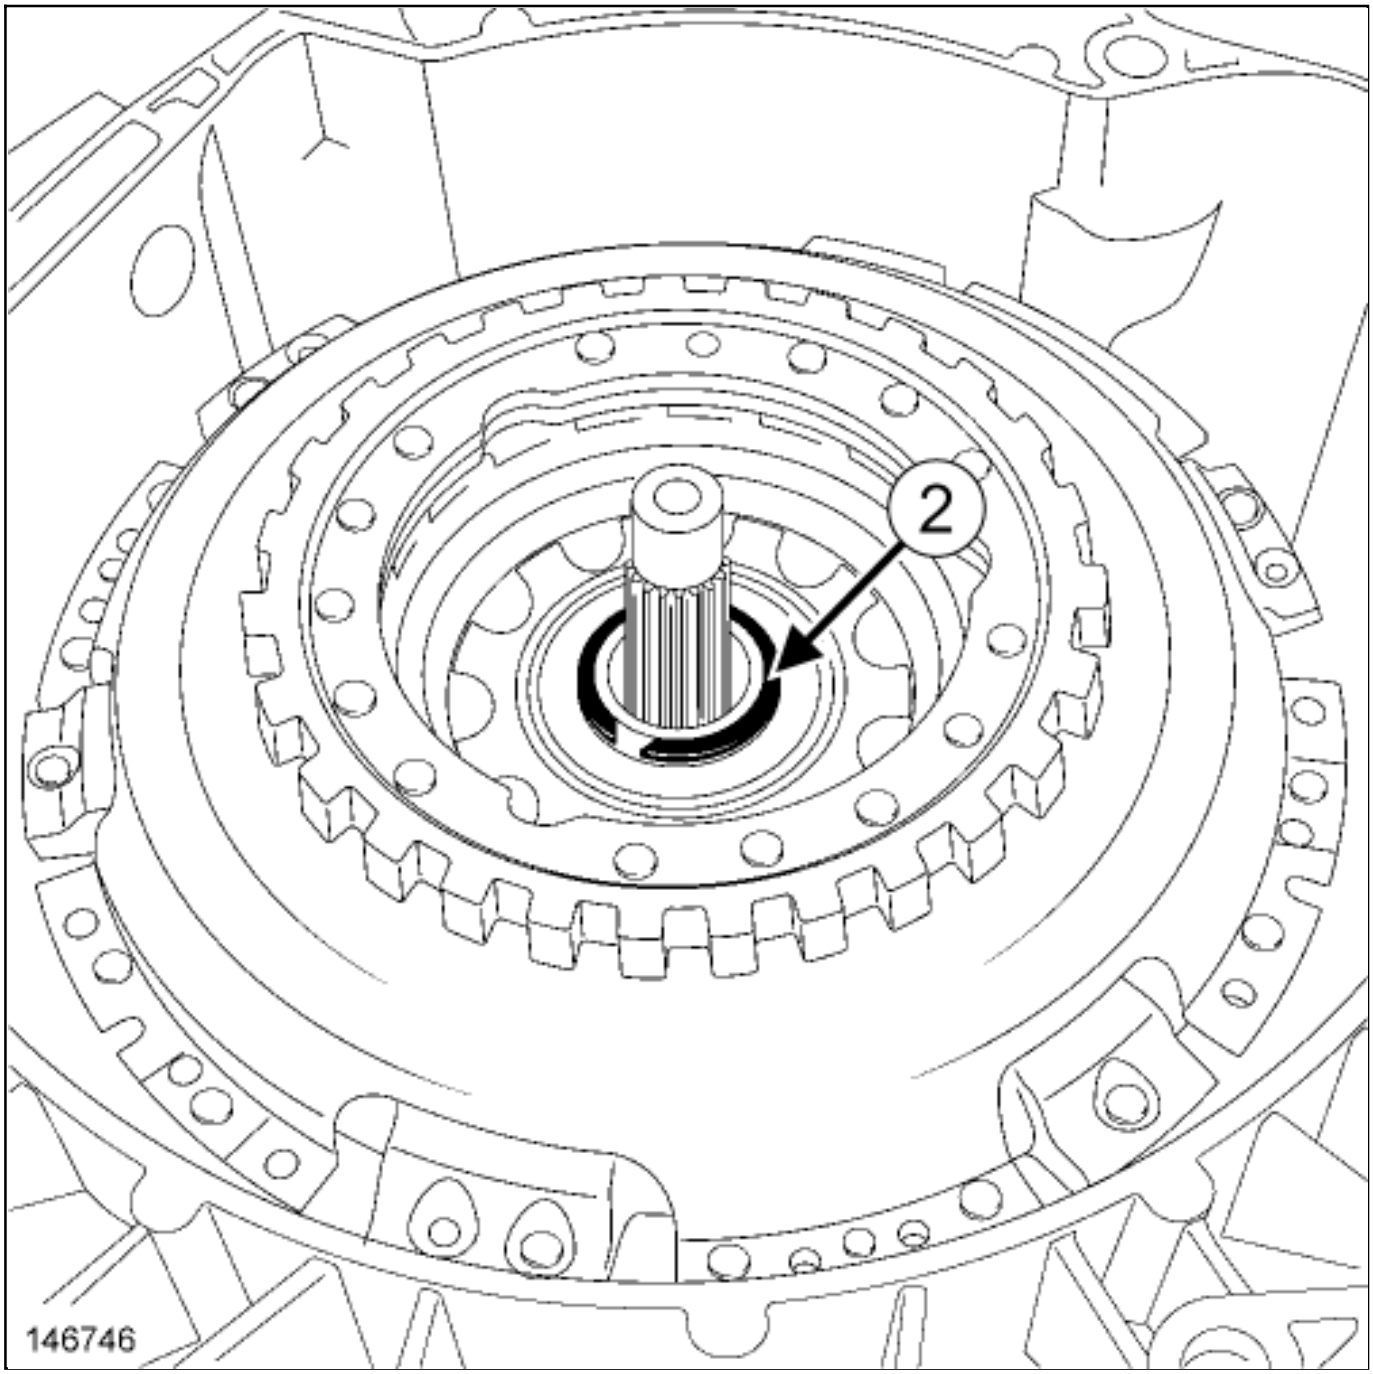
2. REMOVAL OPERATION



CAUTION

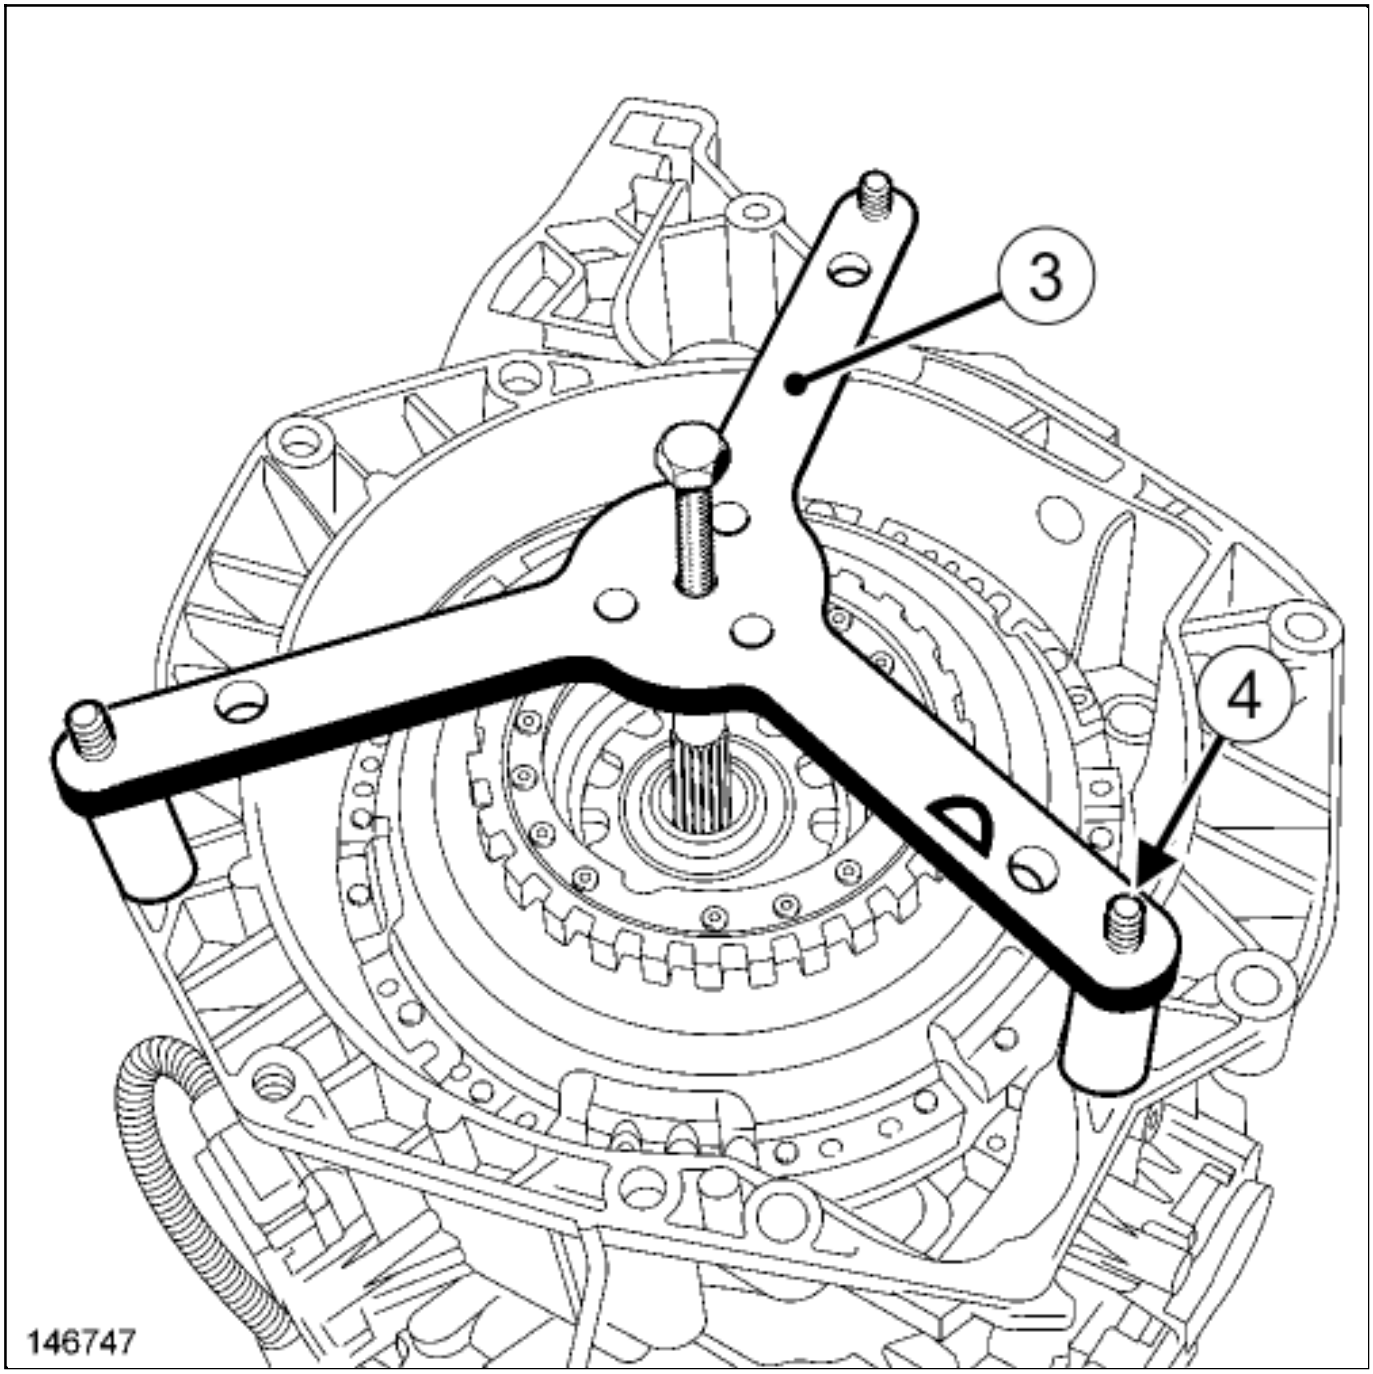
Failure to observe the following procedure could damage the clutch pressure plate assembly.

Note:

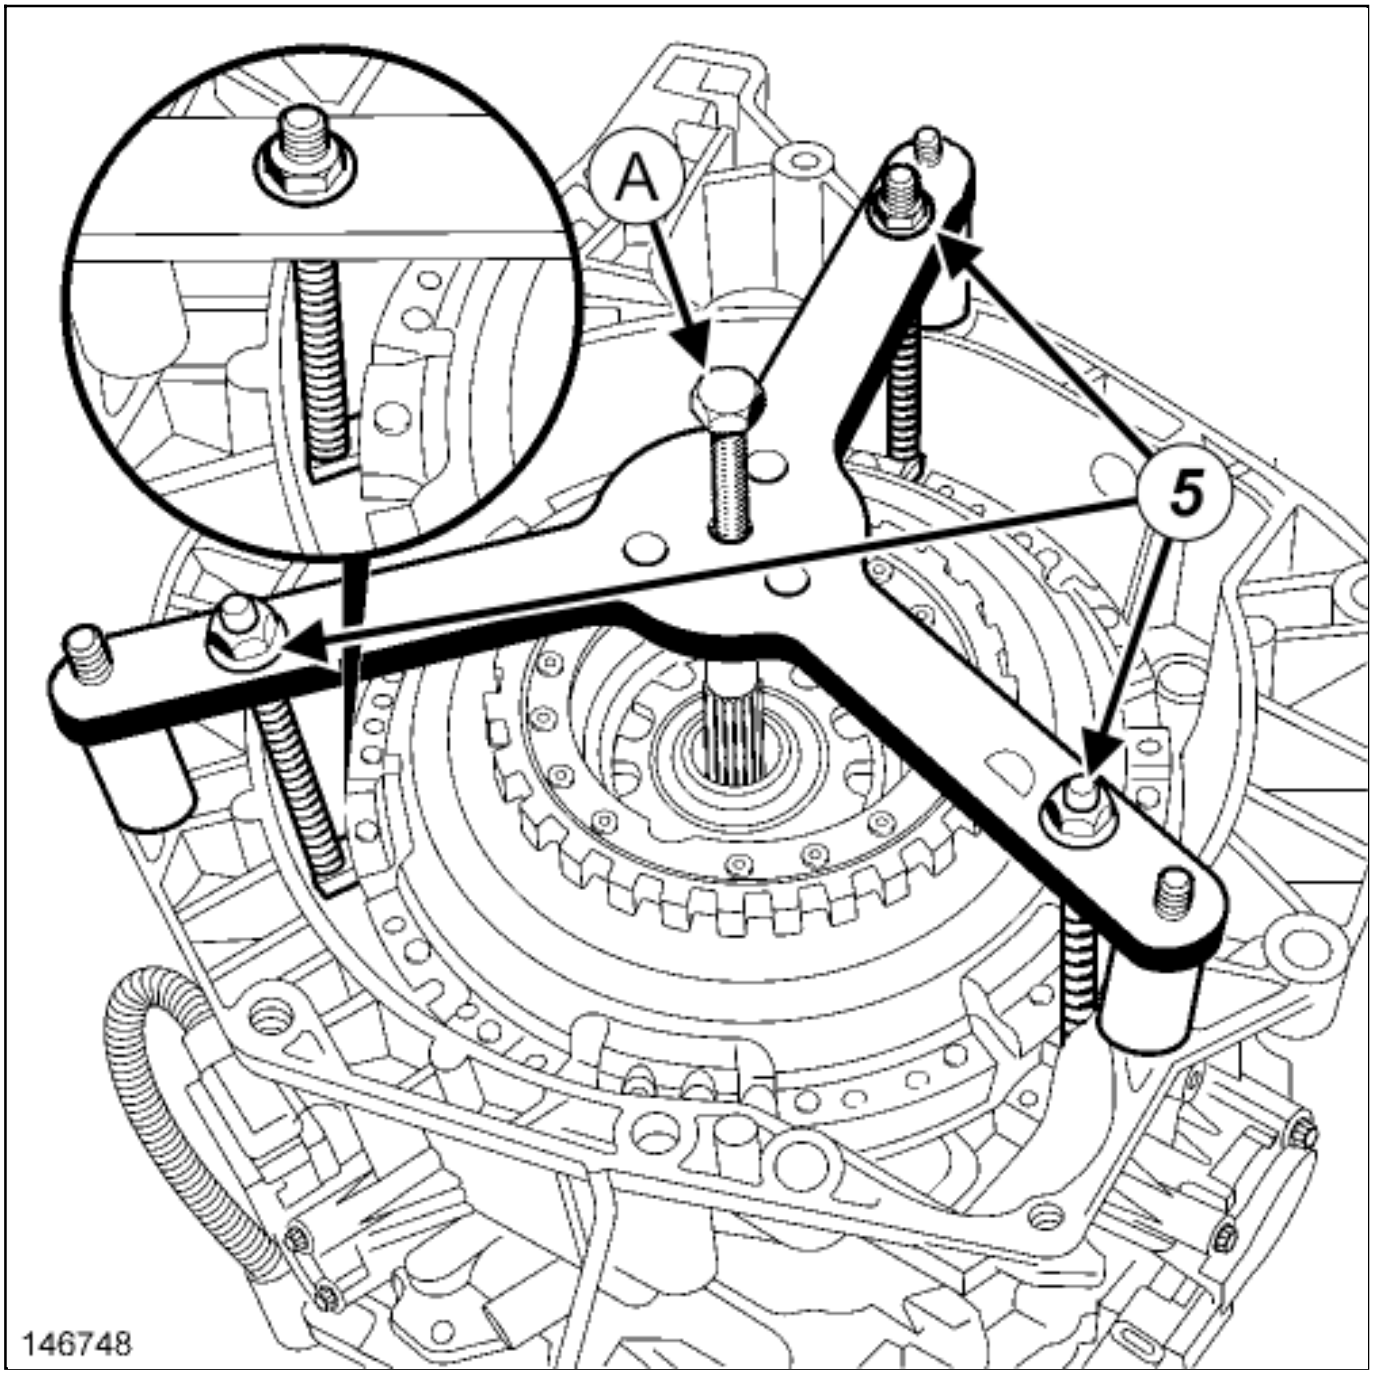


Never place the clutch on the diaphragm face - this could damage the face.

If necessary, be sure to place it on a sufficiently thick cloth.



Remove:



- the large diameter clip(1) using snap ring pliers,
- the part connecting with the clutch plate and the small diameter input shaft.

Remove the small diameter clip(2) using snap ring pliers.

Fit the toolClamp for clutch housing(Emb. 2028) (3) , with the tool's componentsTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) but do not fit the locking nuts of the tool(4) .

- Fit the extraction claws for the dual clutch(5) .
- Position the extraction claws on a non-working section of the clutch pressure plate.
- Adjust the extraction claws using the nuts.

Tighten the extraction bolt(A) of the dual clutch.

Remove the dual clutch.

REFITTING

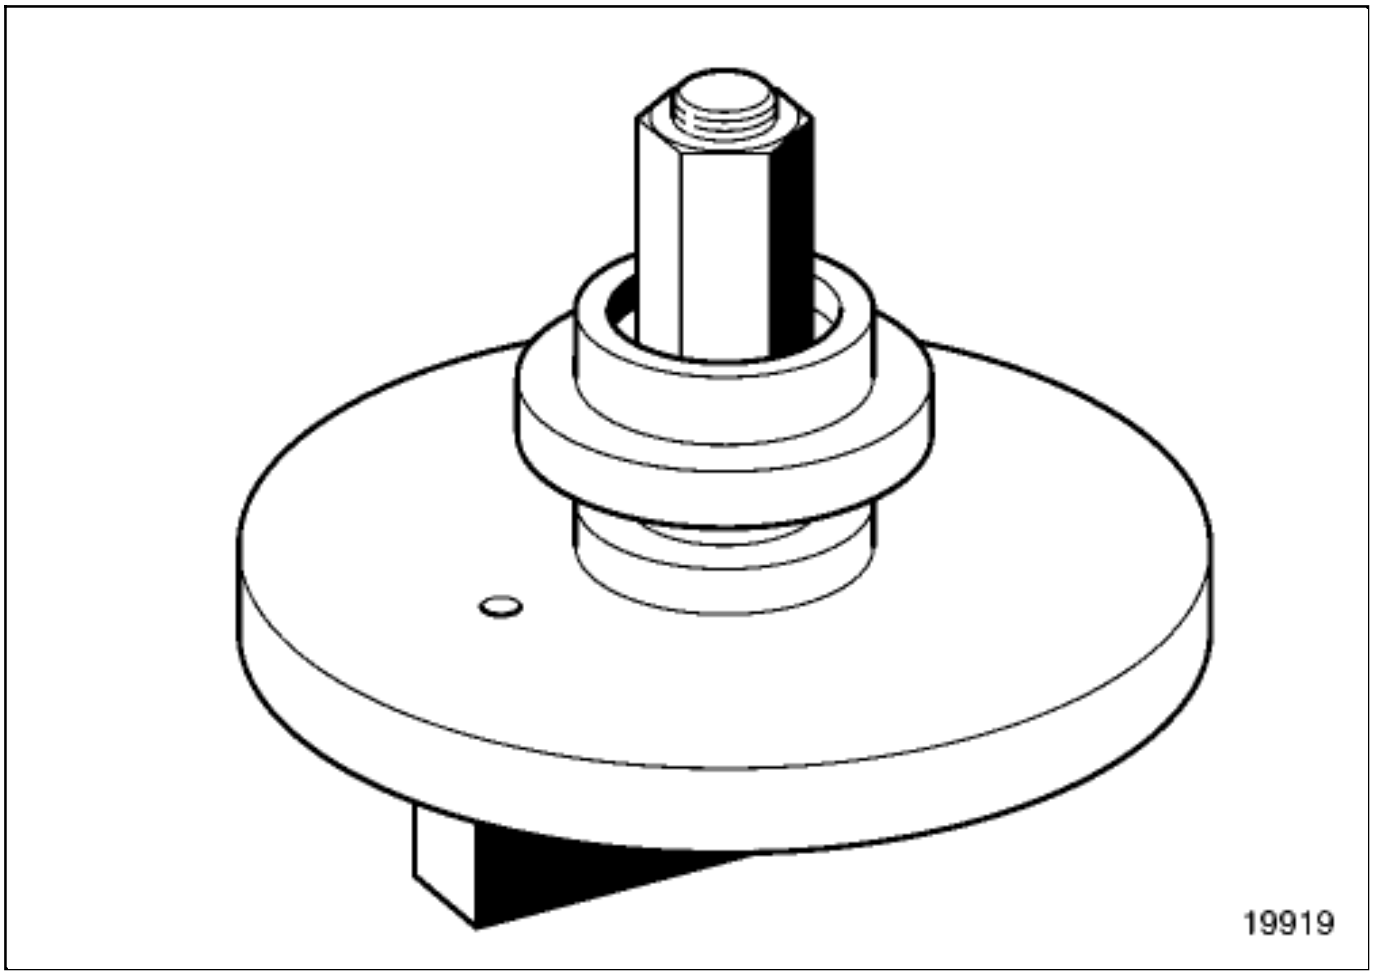
1. REFITTING PREPARATION OPERATION

Use surface cleaner Vehicle: Parts and consumables for the repair to clean all of the removed parts.

parts always to be replaced: Differential output seal .

Parts always to be replaced: Input shaft clips.

CAUTION

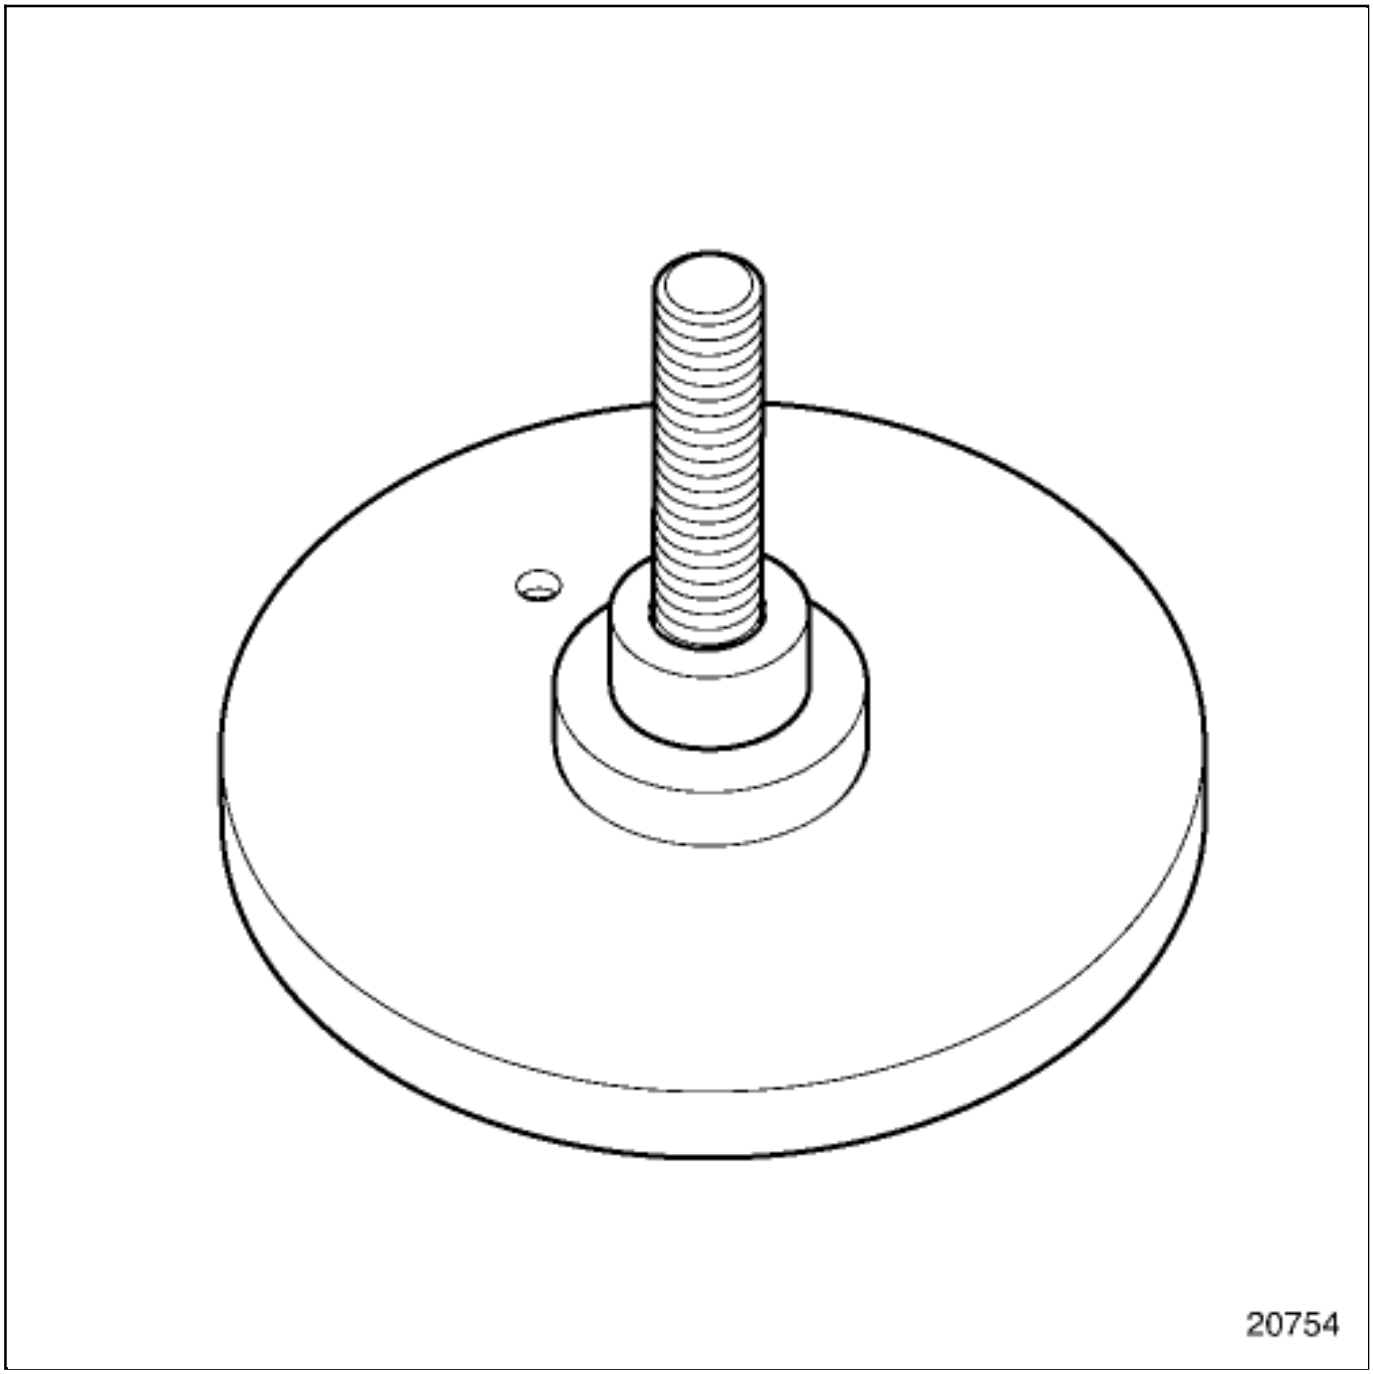


Failure to observe the following procedure could damage the clutch pressure plate assembly.

Note:

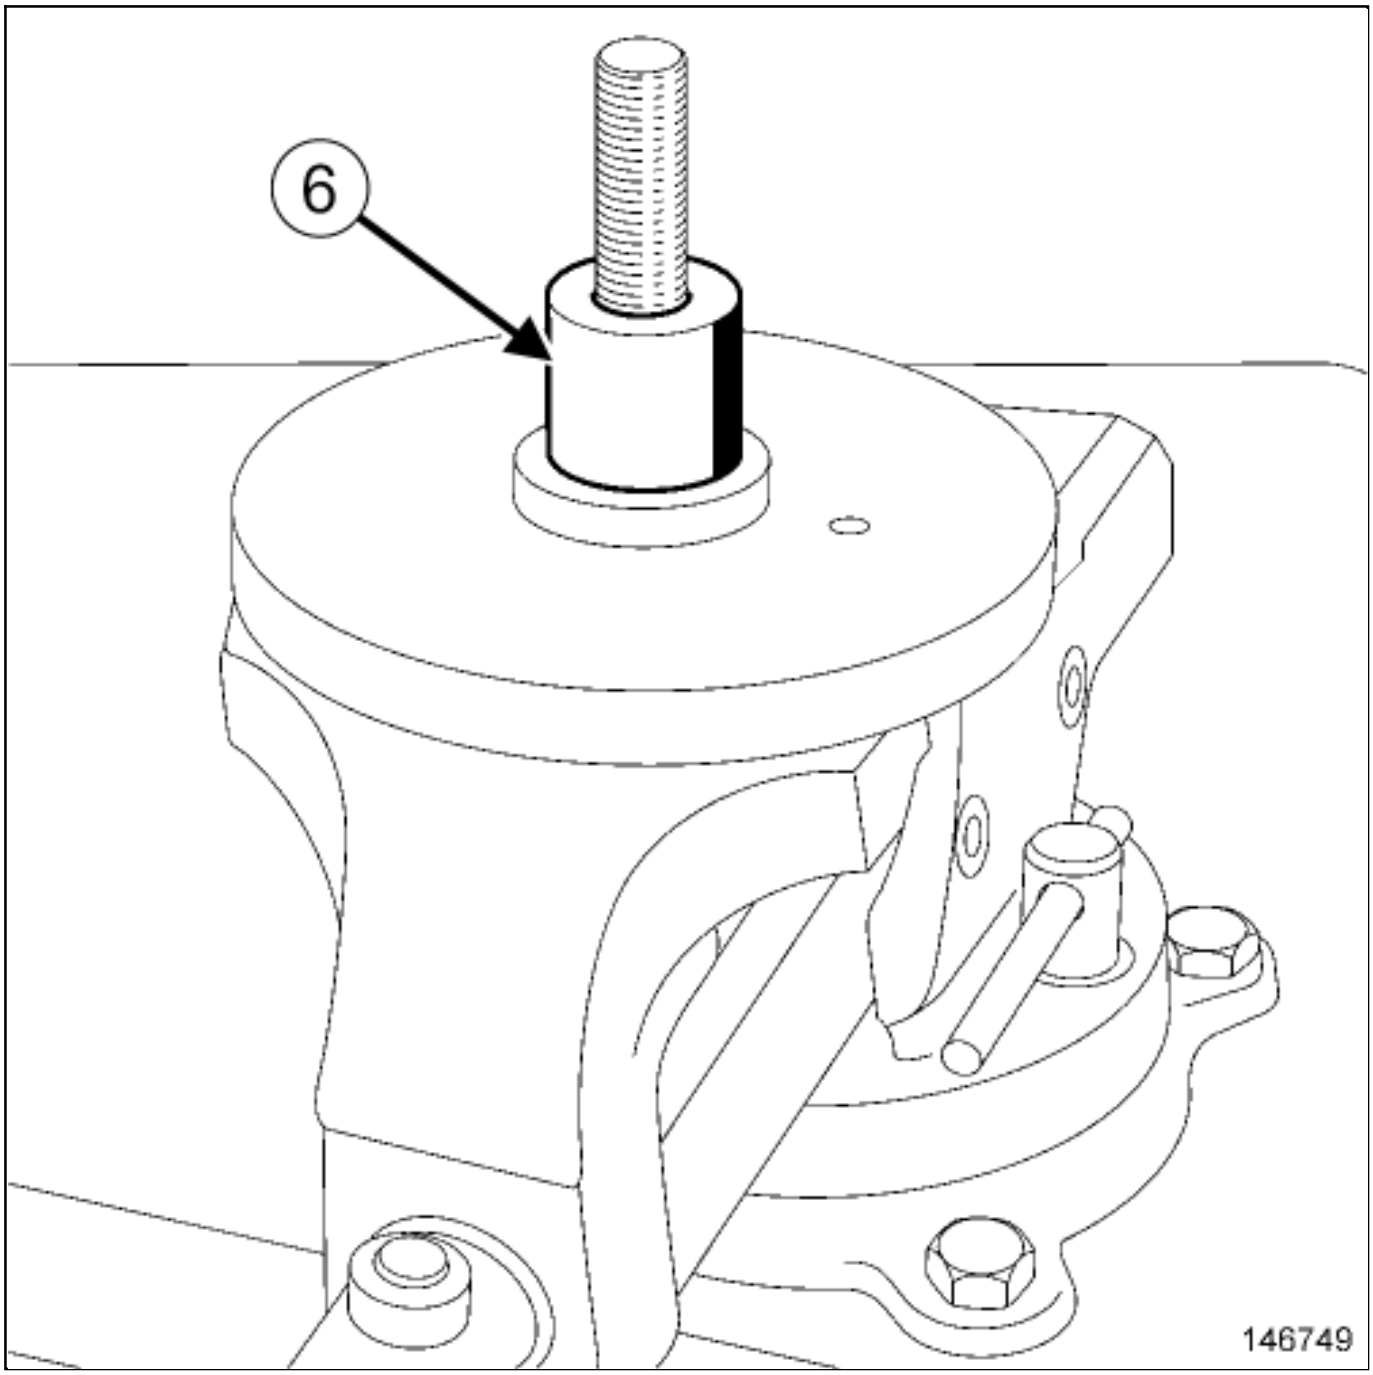
The following procedure is to be used only if refitting the old dual clutch.

The purpose is to reposition the automatic take-ups at their starting point.



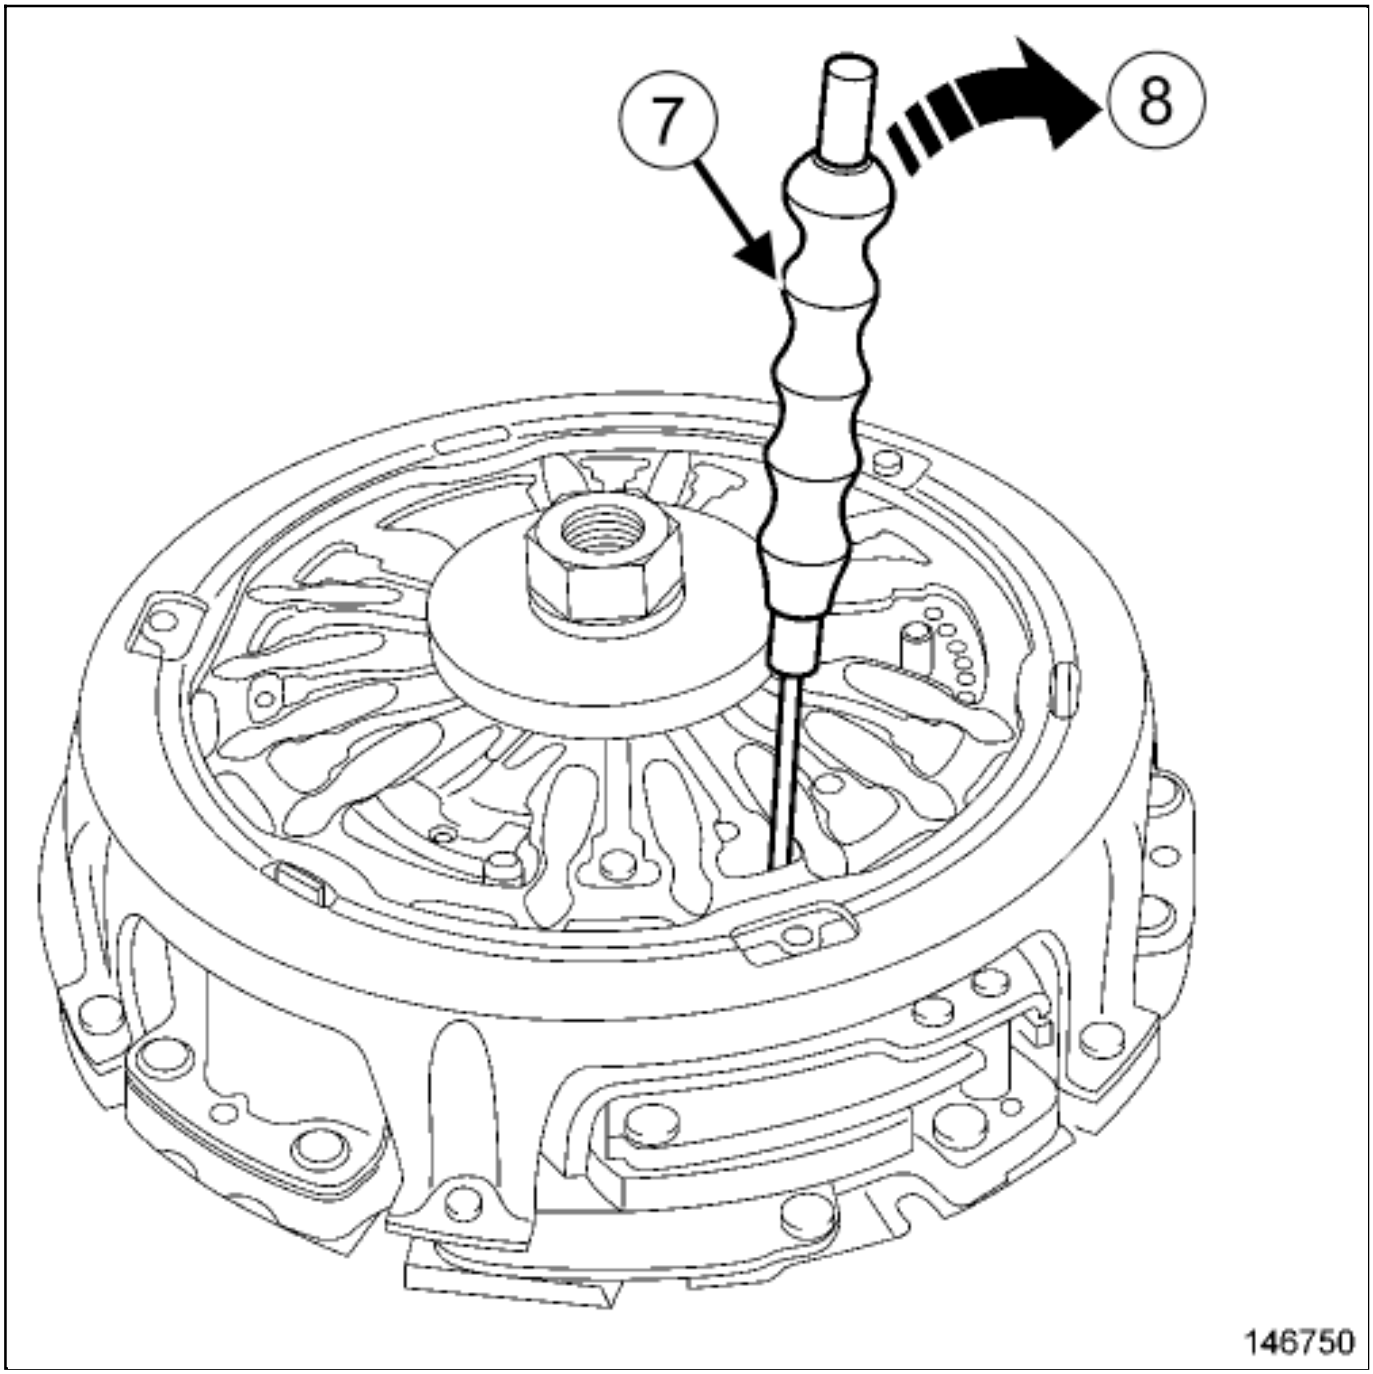
1- IF REFITTING THE OLD DUAL CLUTCH, APPLY THE FOLLOWING PROCEDURE:

Note:



To reposition the automatic take-up and lock the mechanisms, use the toolClutch compression tool for rearming the compensation system.(Emb. 1604) with

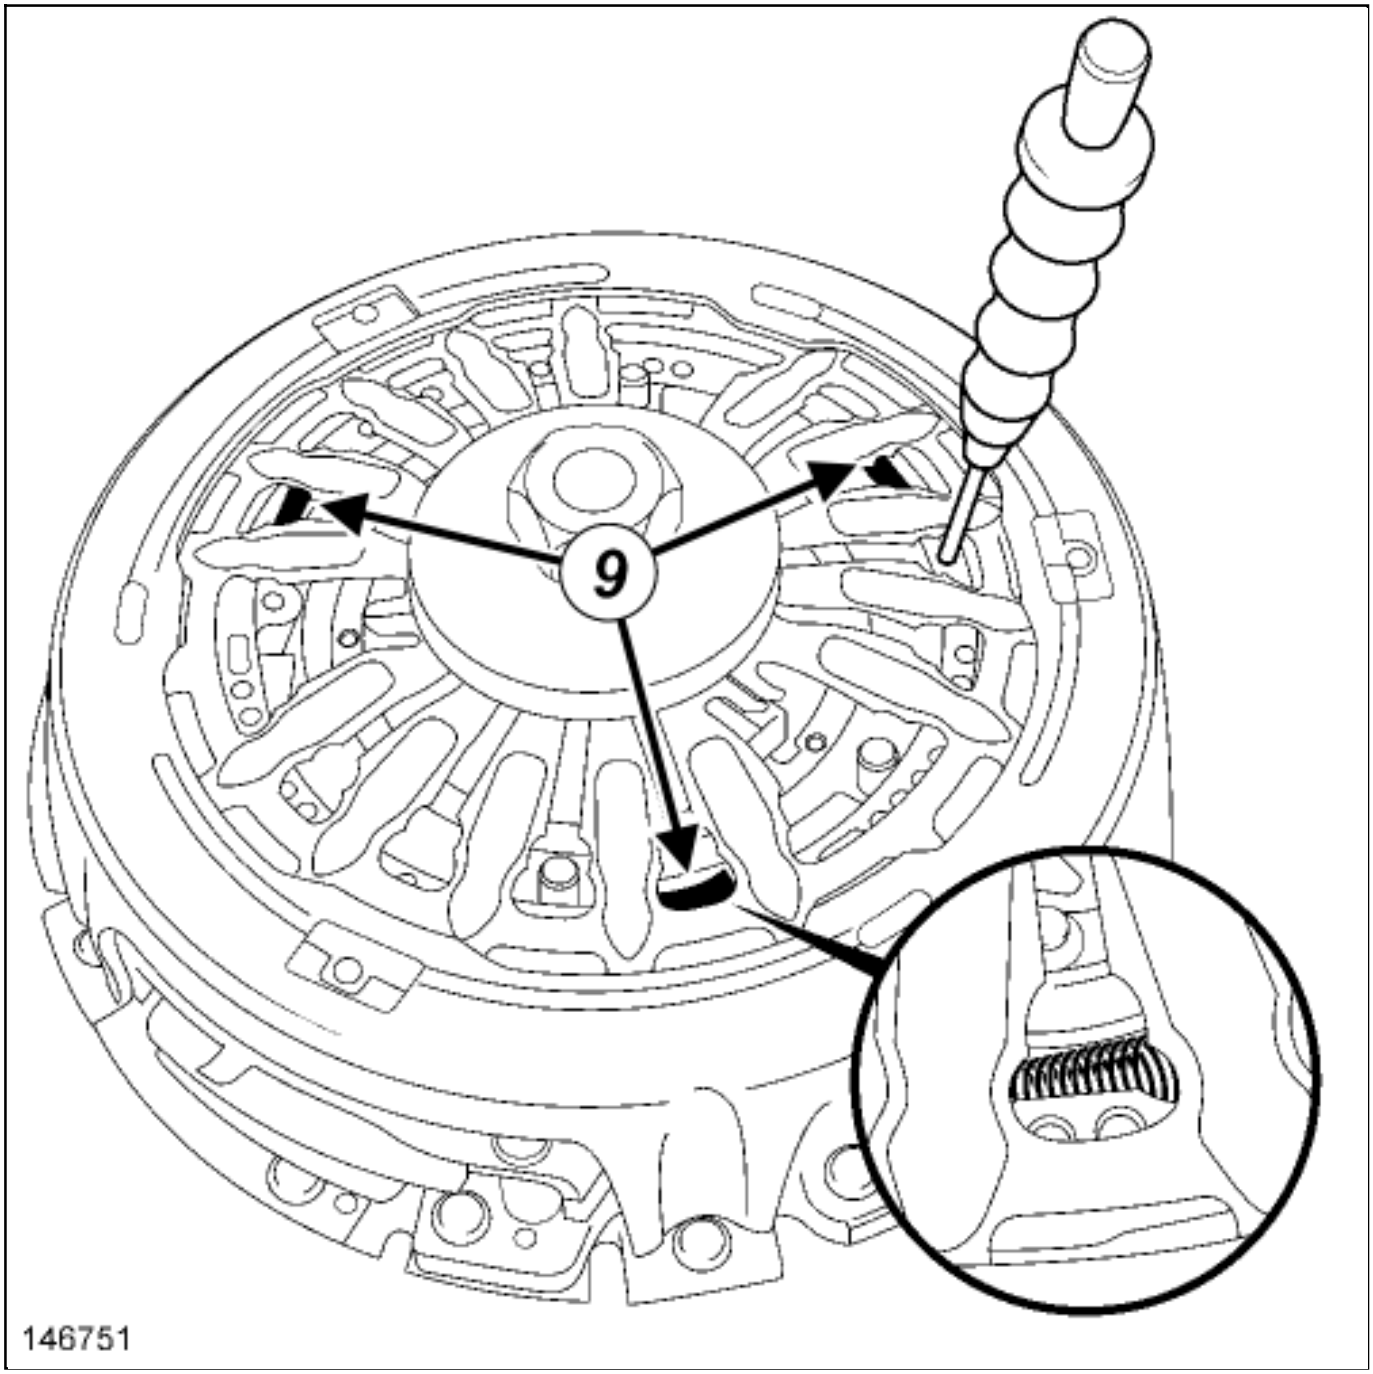
Clutch pressure plate rearming tools(Emb. 1951) .



Place the base of toolClutch compression tool for rearming the compensation system.(Emb. 1604) in a vice.

1)REPRIMING THE LARGE DIAMETER DIAPHRAGM

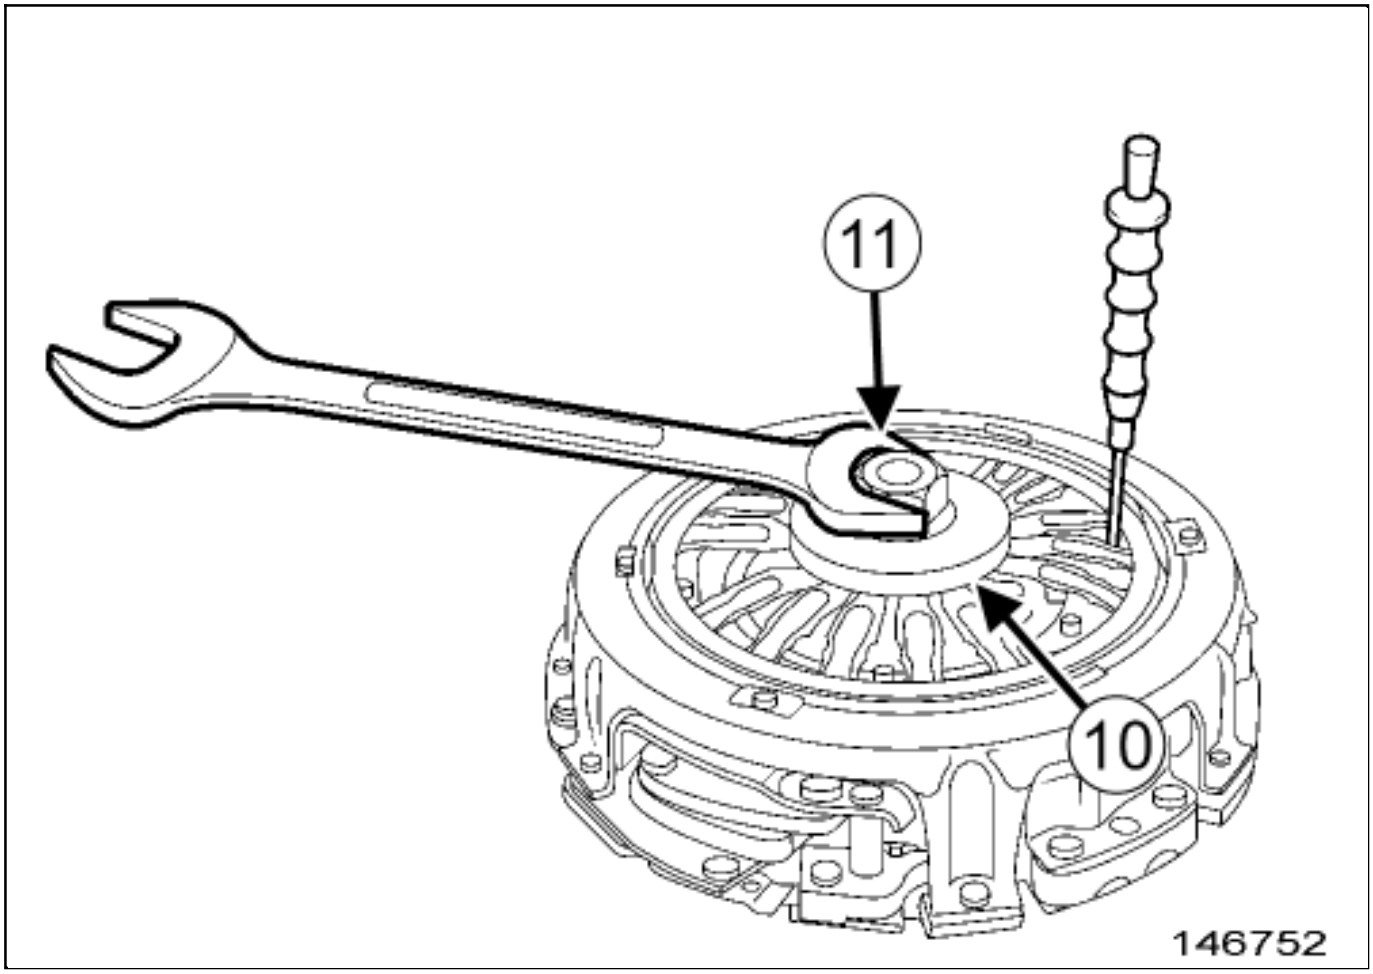
- Position the dual clutch on the base.
- Position the clutch plate centring device(6) .



Note:

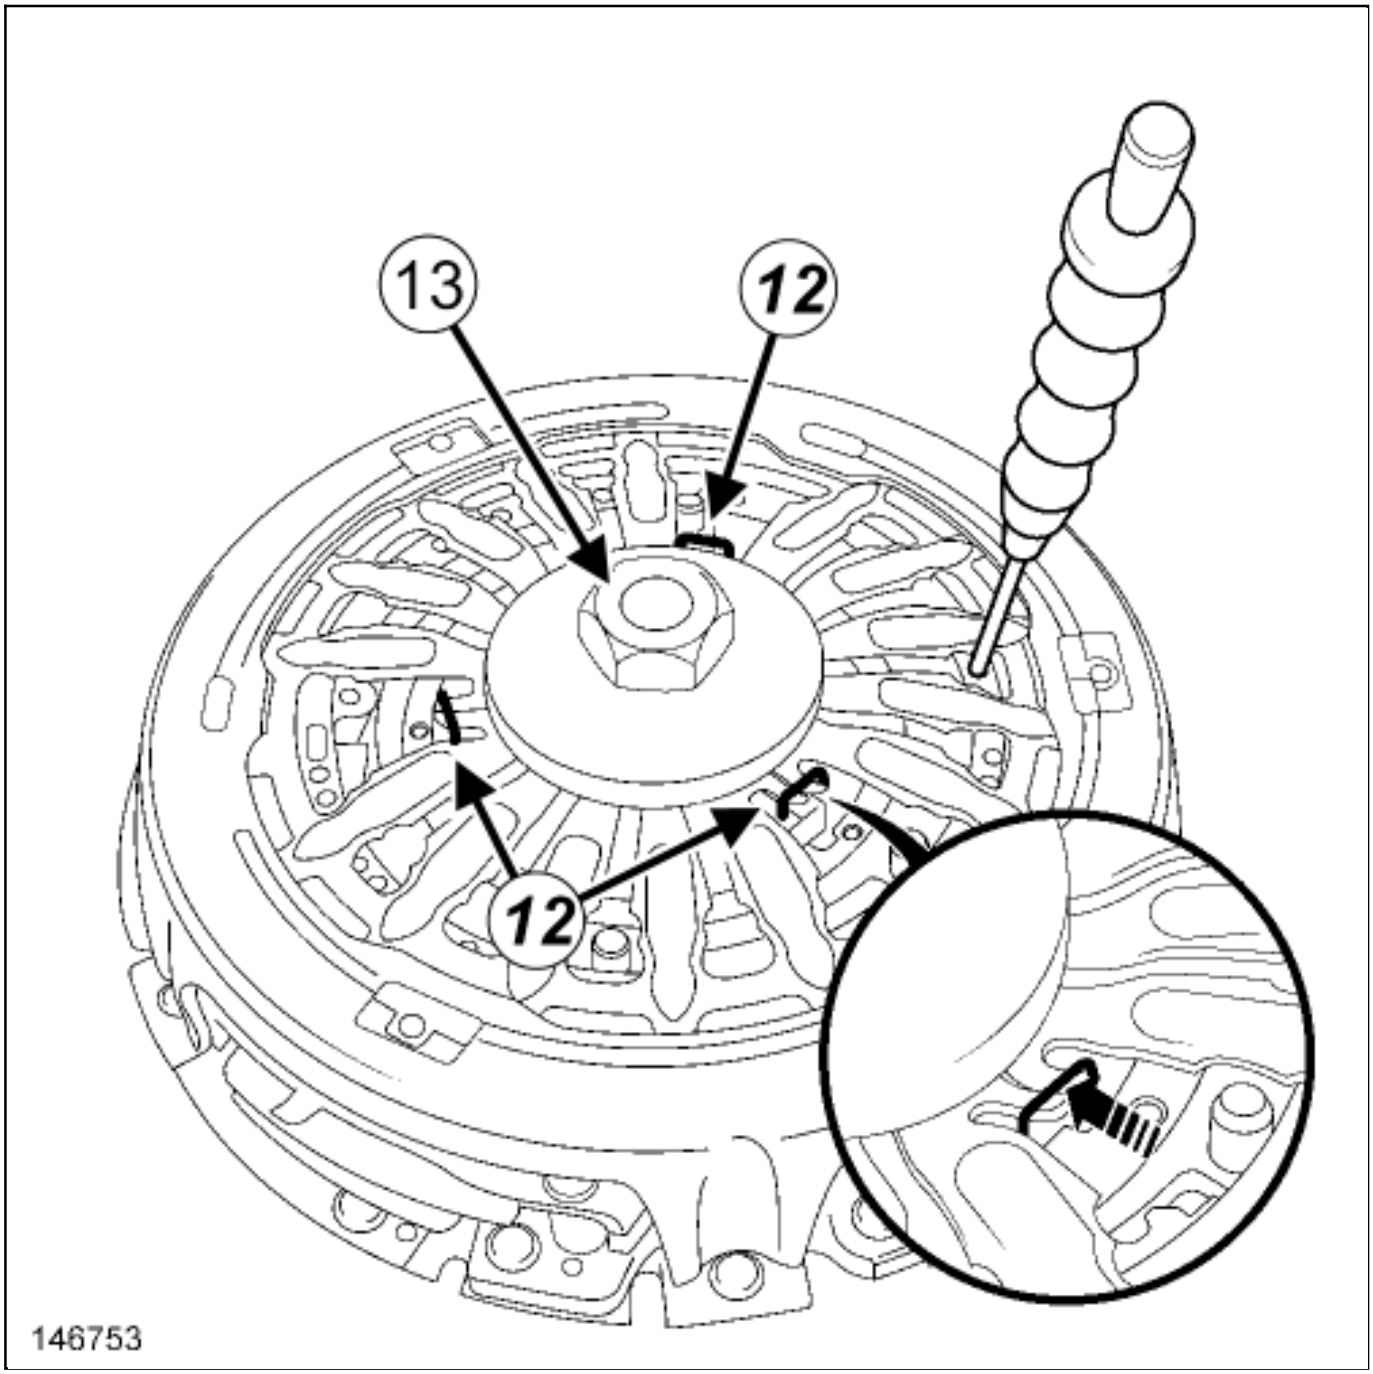
In some cases, the automatic take-up is tightly locked.

It is advised to use two people for this operation.



Reset the automatic take-up of the large diameter diaphragm using a roll pin punch(7) .

Turn the back-plate of the automatic take-up of the large diameter diaphragm by(8) .

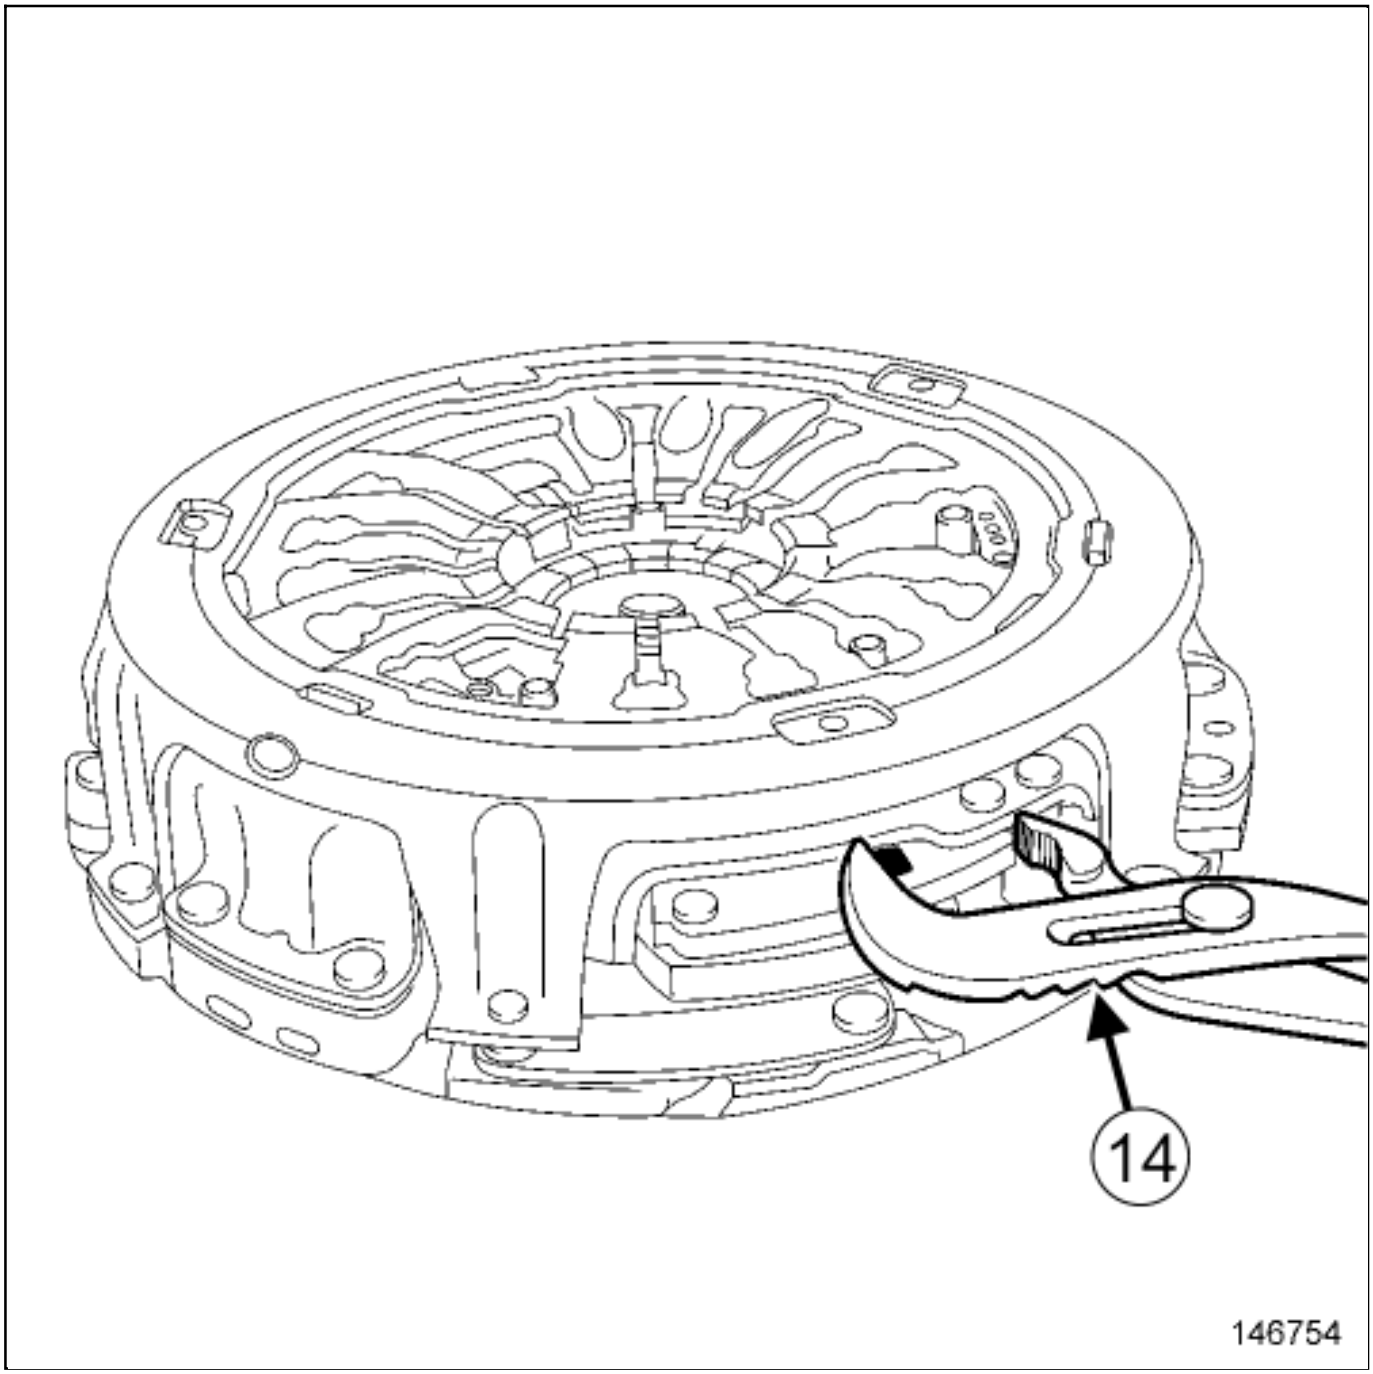


Compress the springs of the automatic take-up of the large diameter diaphragm(9) .

Keep the back-plate of the automatic take-up of the large diameter diaphragm rearmed using the roll pin punch.

- Position the Clutch pressure plate rearming tools(Emb. 1951) (10) .

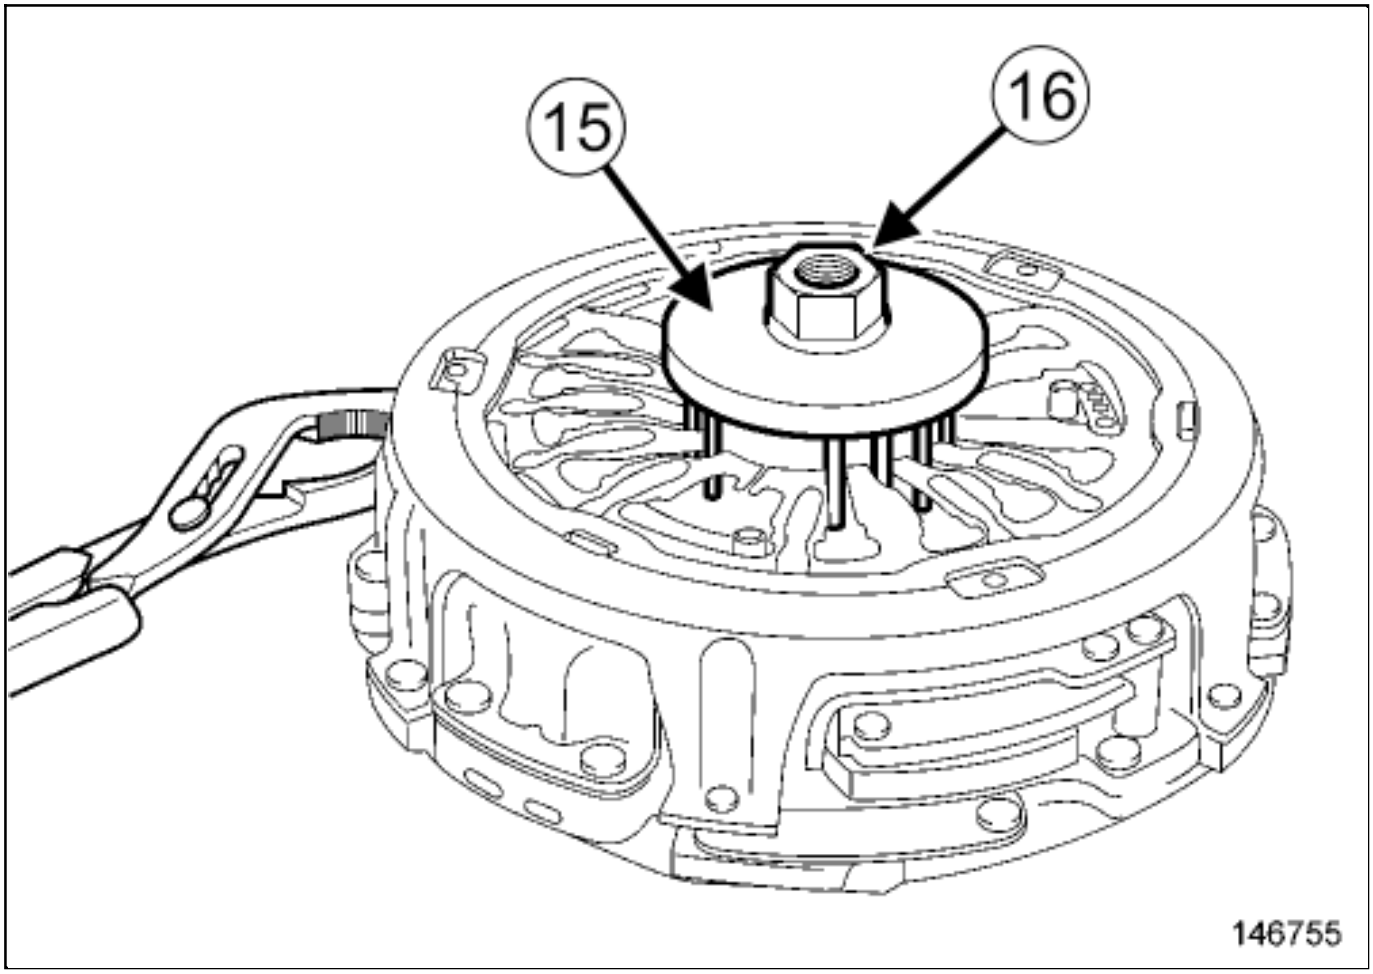
- Tighten the nut (11) until the pressure plate is compressed.



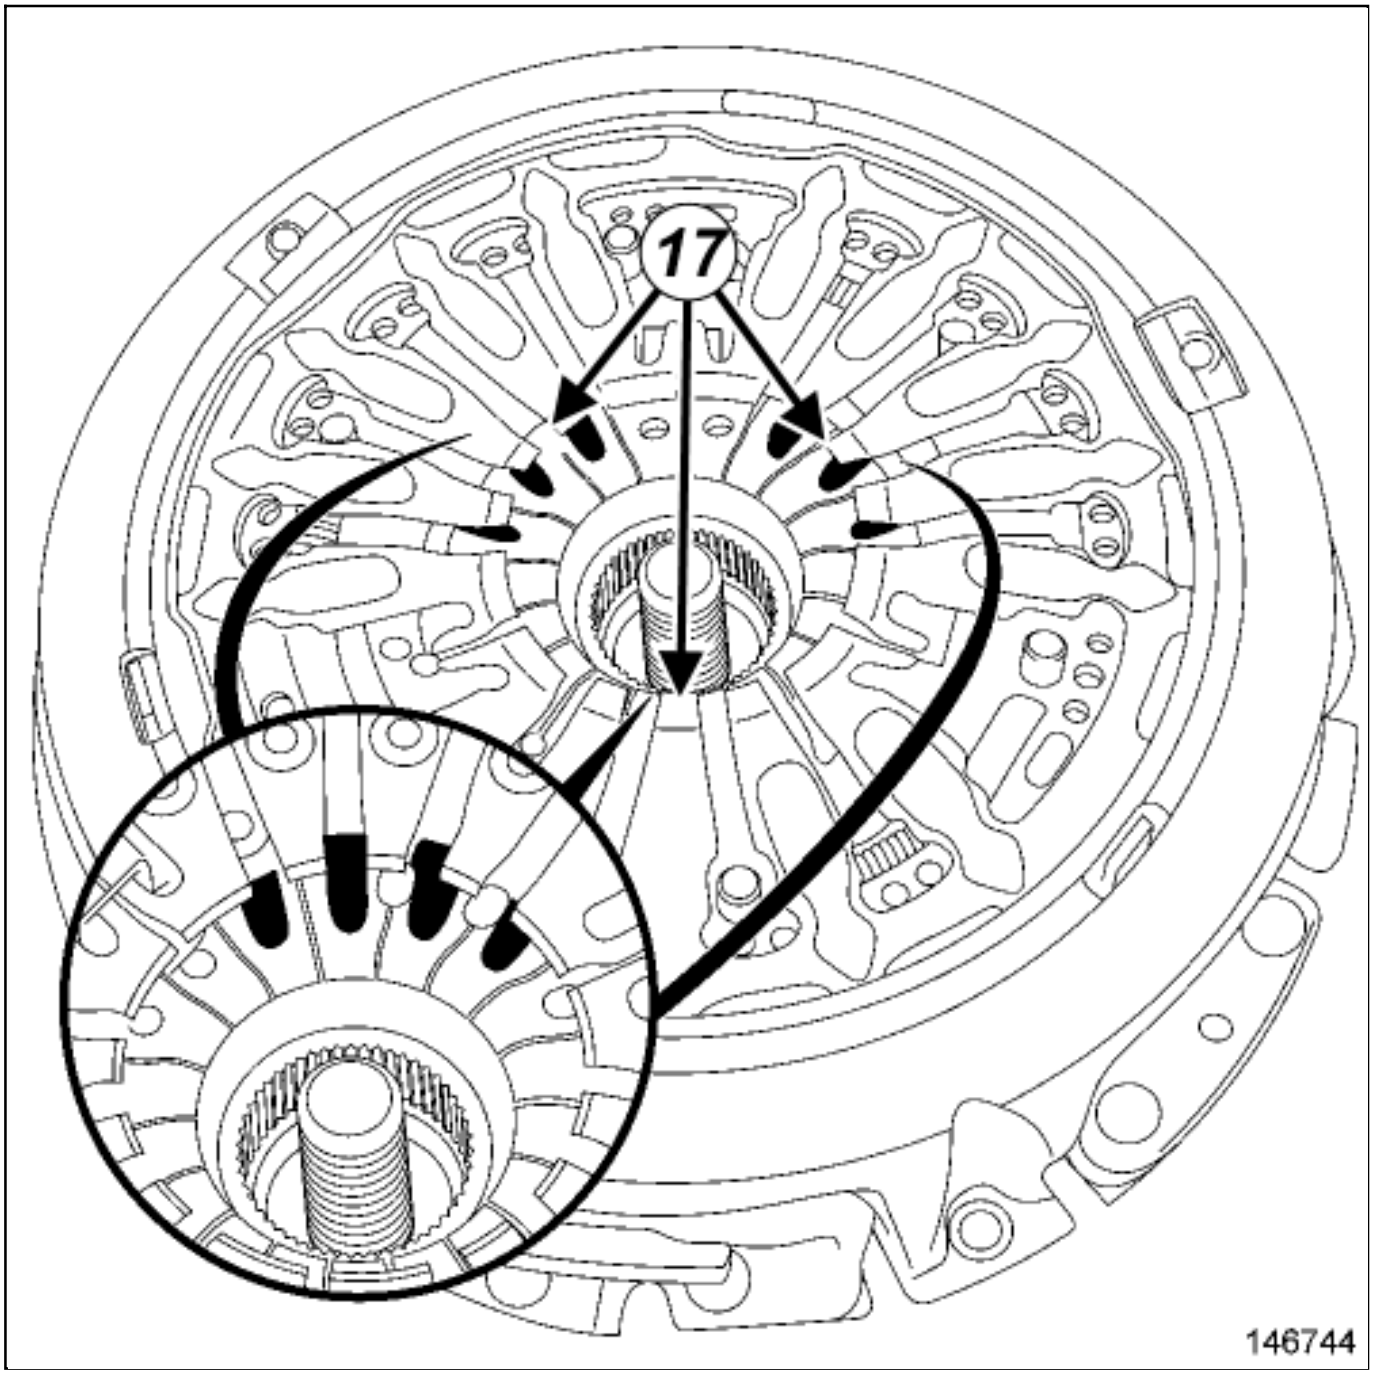
- Engage the three clips(12).
- Loosen the nut(13) while keeping the clips in place.
- Remove the toolClutch pressure plate rearming tools(Emb. 1951).

Note:

In some cases, the automatic take-up is tightly locked.



It is advised to use two people for this operation.



Reset the automatic take-up of the small diameter diaphragm using combination pliers(14) .

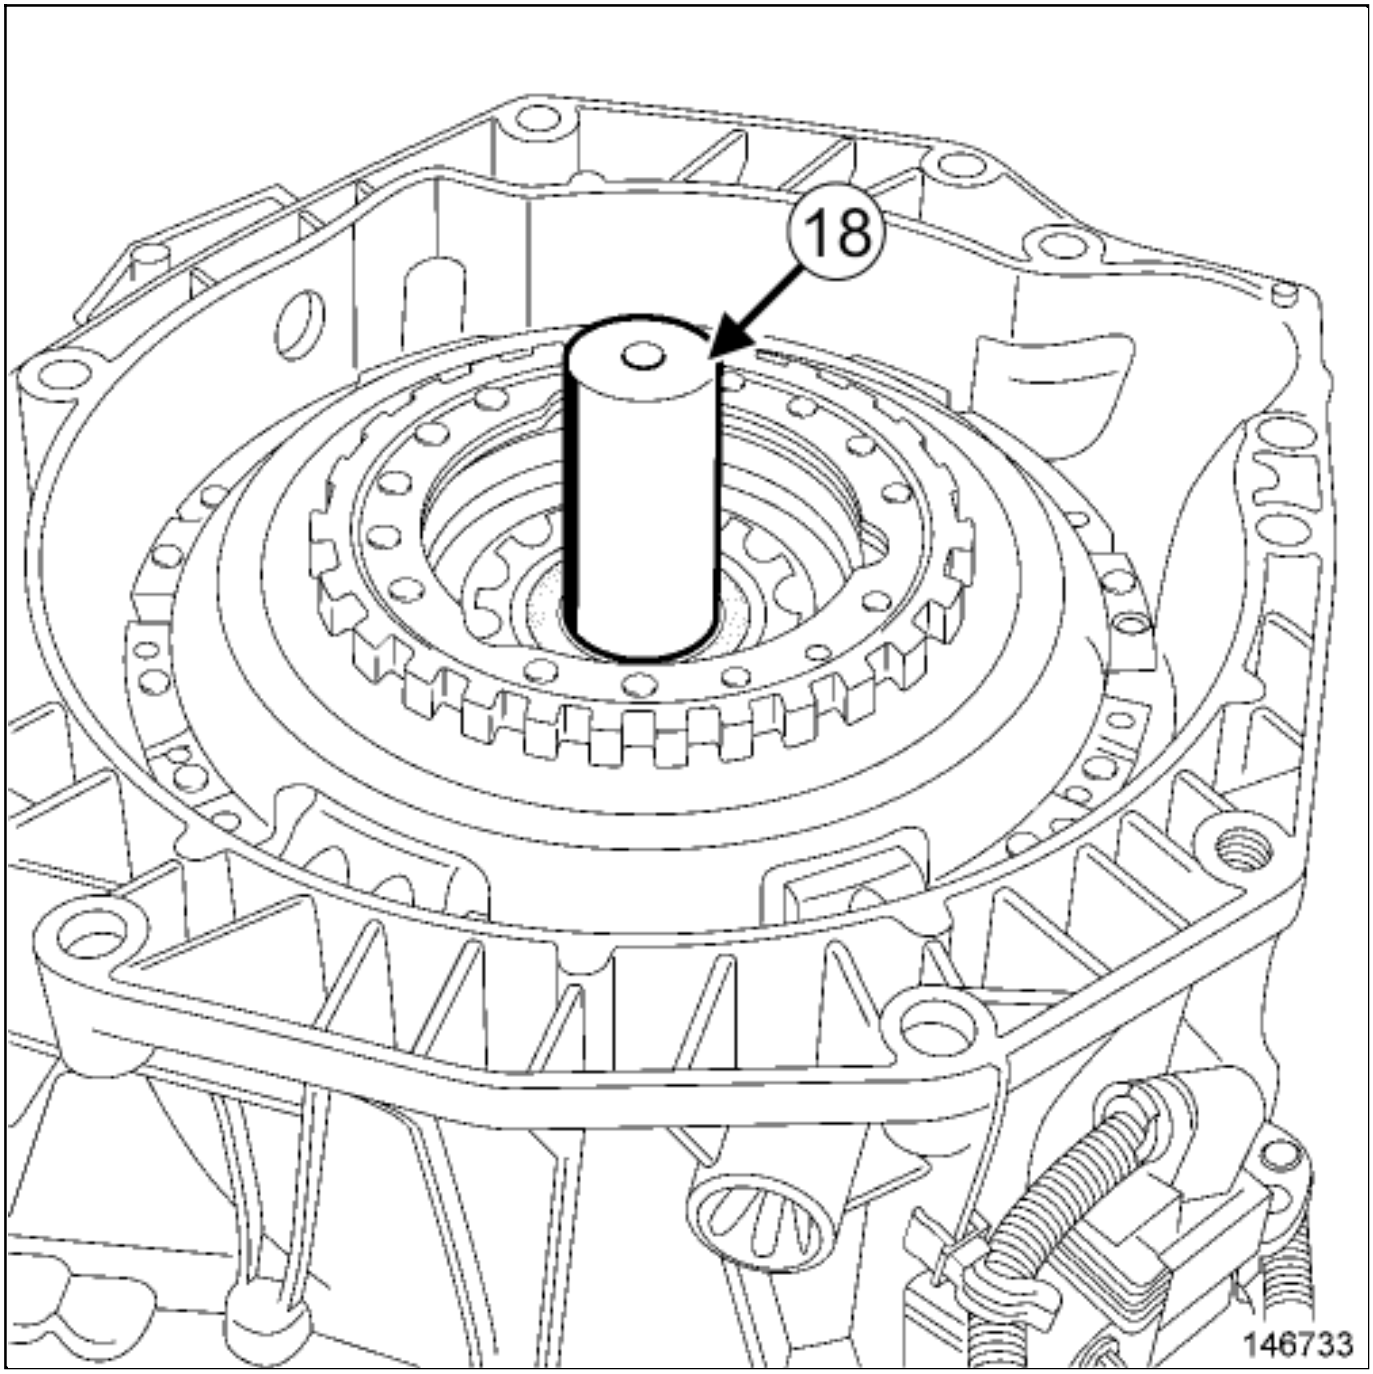
Note:

Hold the automatic take-up of the small diameter diaphragm using the combination pliers during the entire operation.

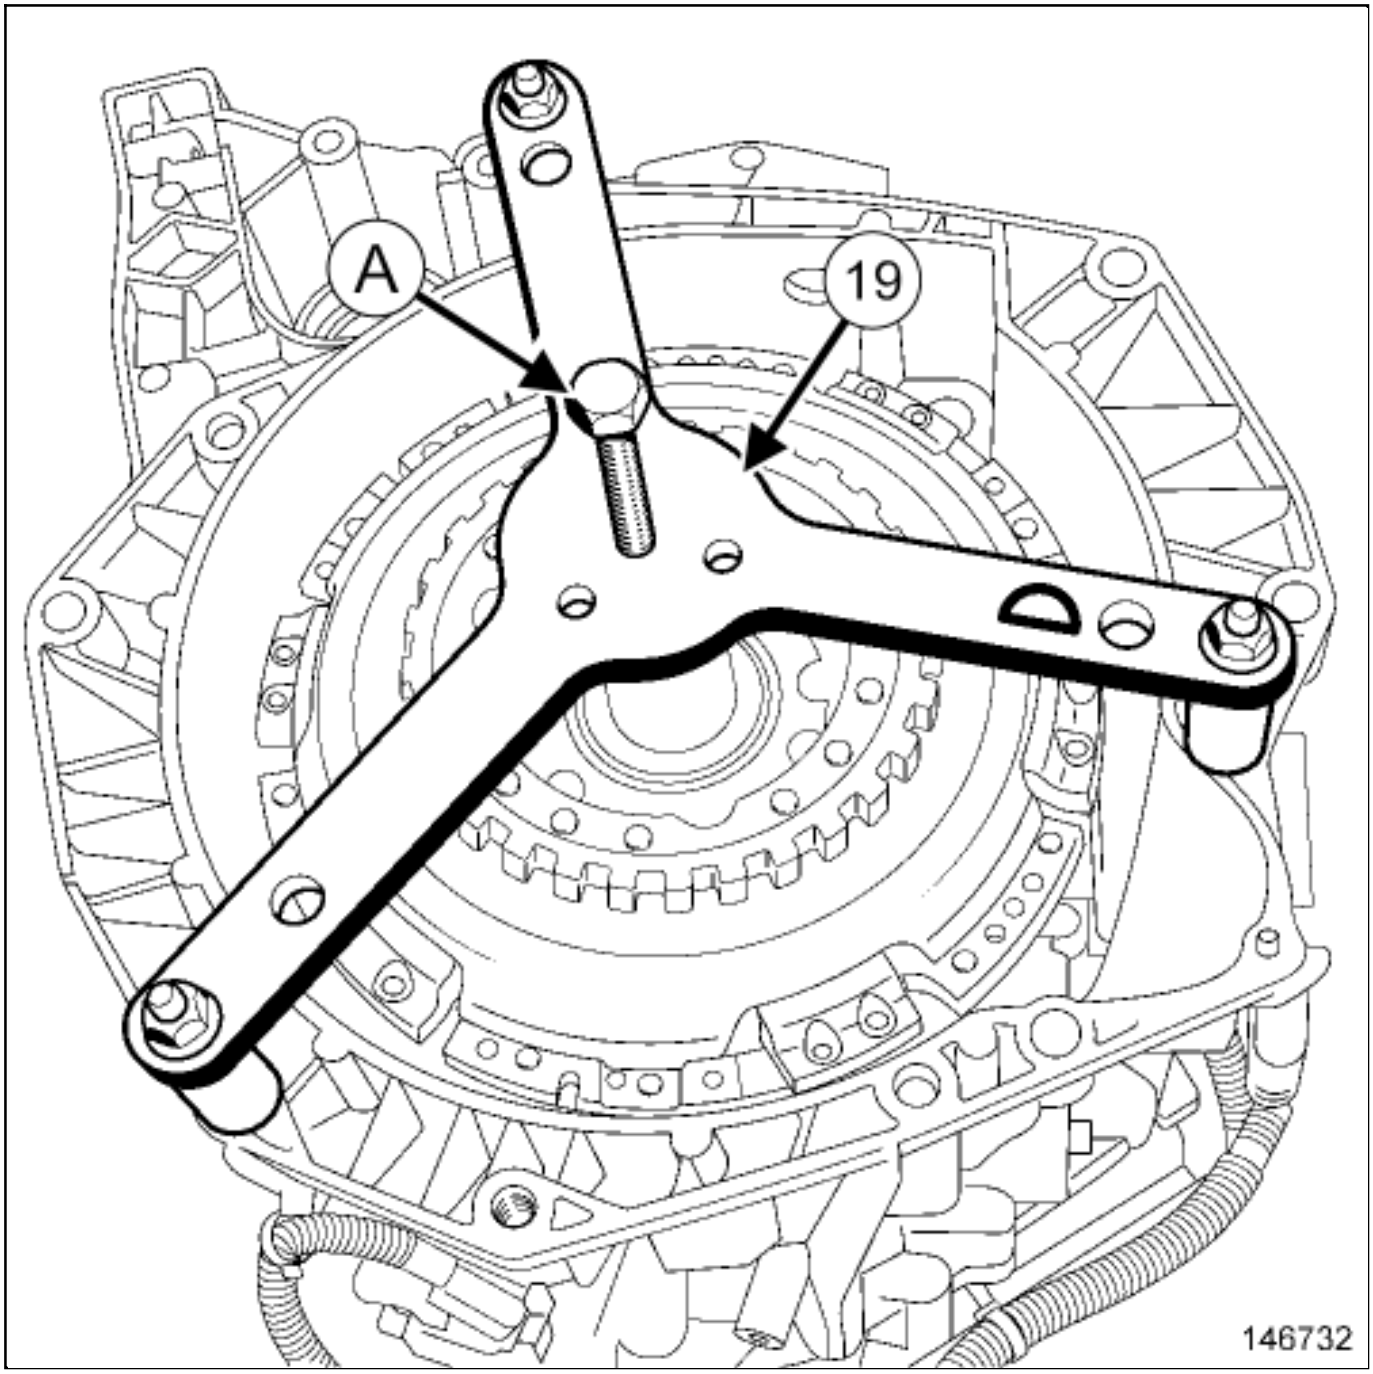
- Position the Clutch pressure plate rearming tools(Emb. 1951) (15) .
- Tighten the bolt(16) until spring finger(17) in the small diameter diaphragm is locked.
- Check that all the spring fingers(17) are engaged in the holes of the small diameter diaphragm.
- Loosen the bolt(16) .

Remove the toolClutch pressure plate rearming tools(Emb. 1951) .

2- IF REFITTING A NEW DUAL CLUTCH, APPLY THE FOLLOWING PROCEDURE:



Note:

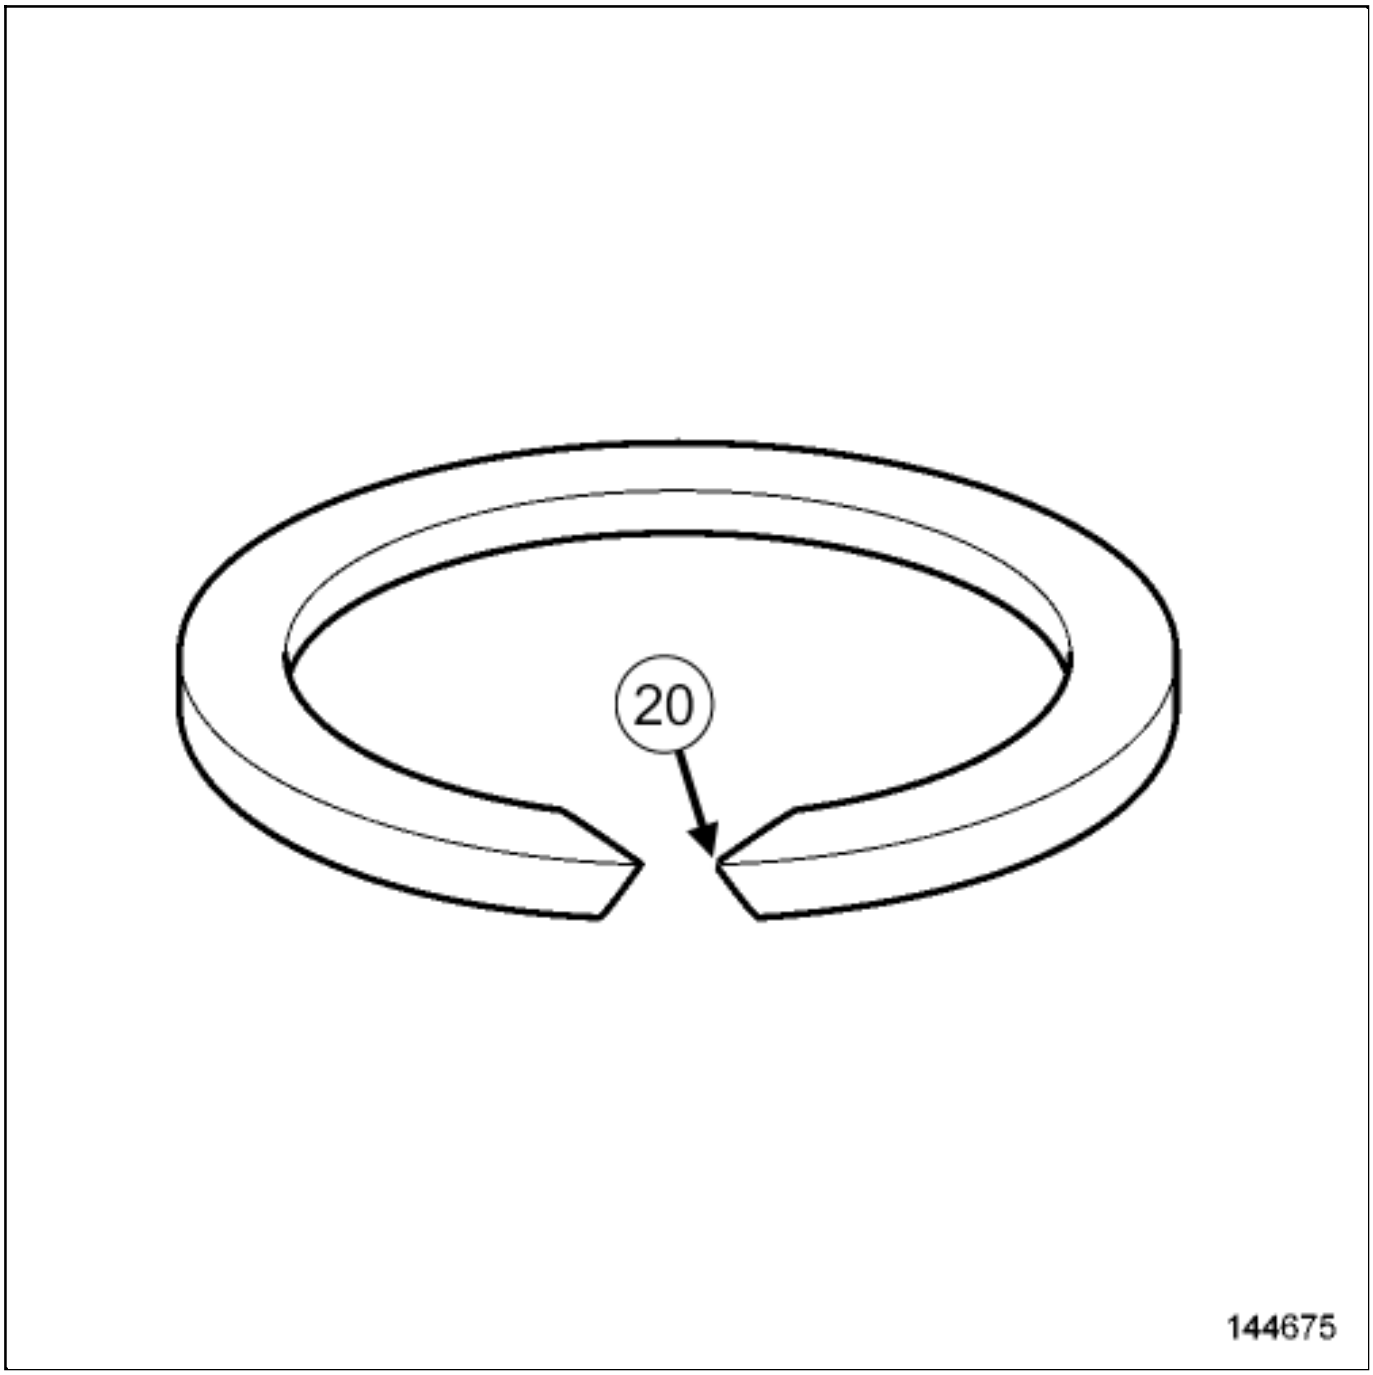


The dual clutch is supplied with the diaphragms already compressed.

2. REFITTING OPERATION

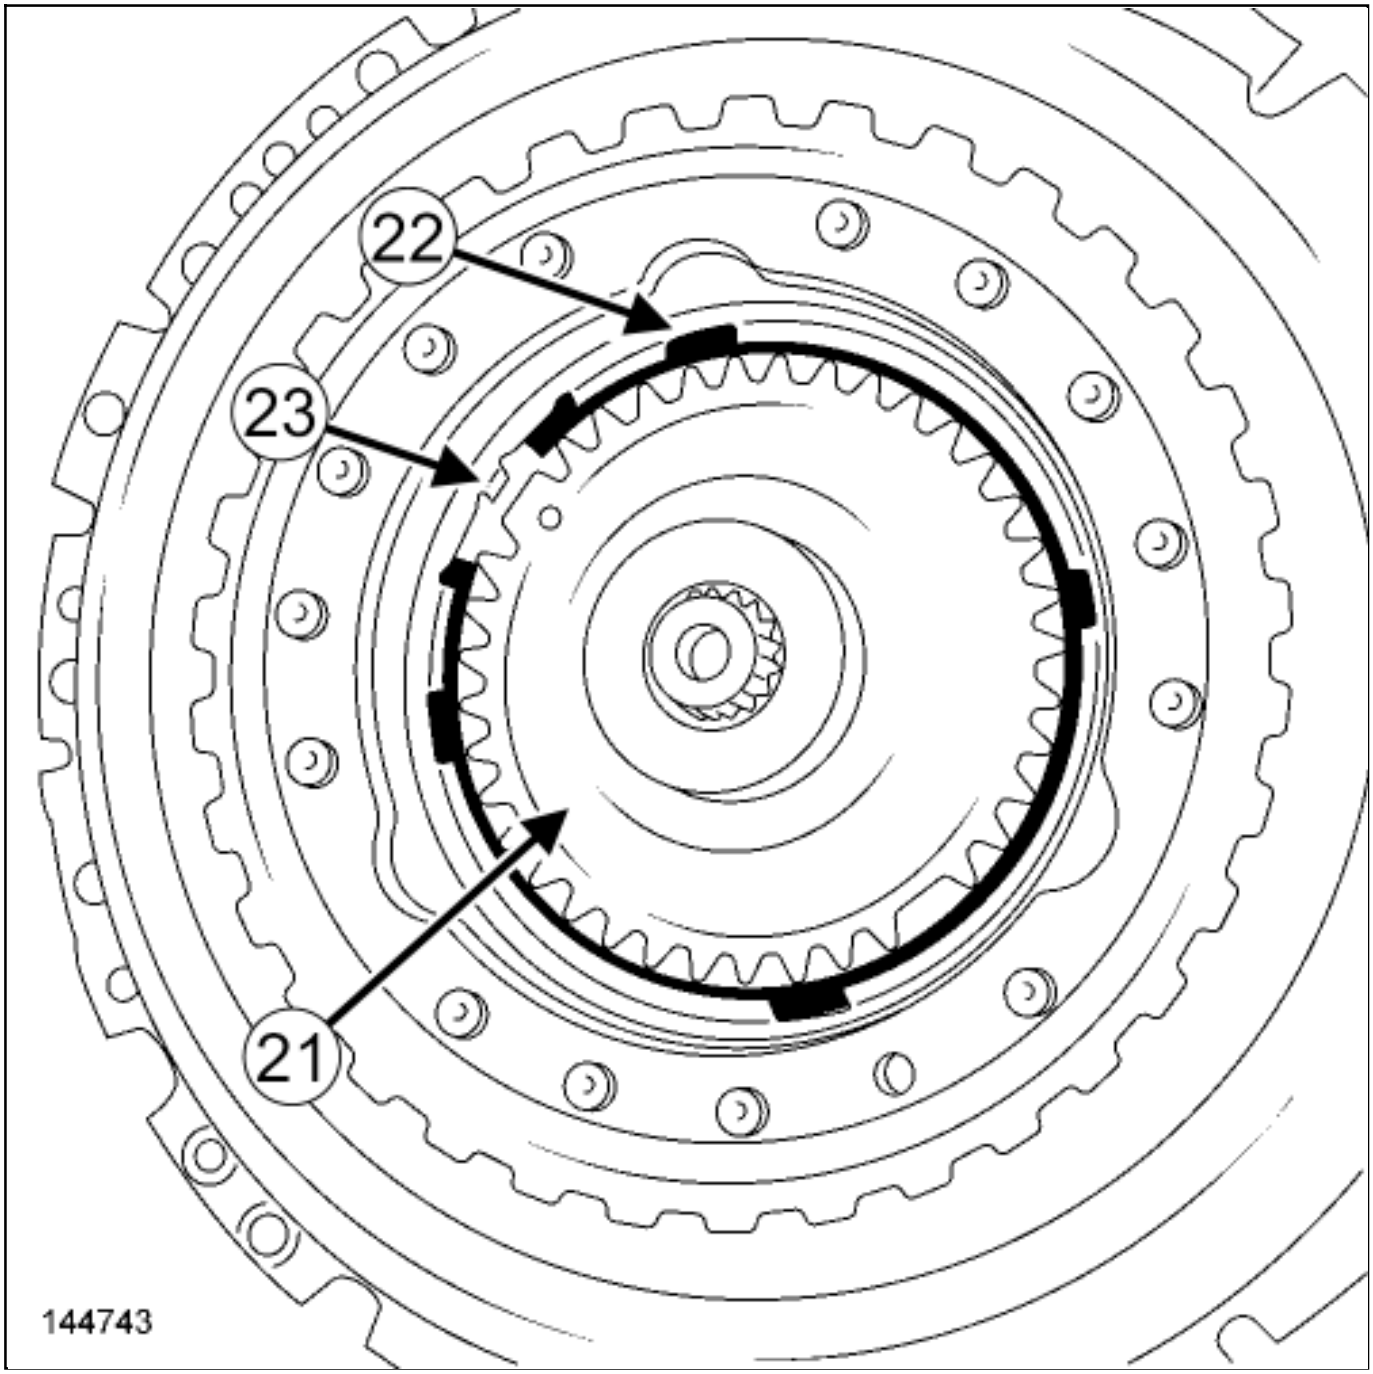
Grease the mating faces of the input shafts before refitting the clutchVehicle: Parts and consumables for the repair .

Fit the dual clutch insertion socket(18) .



Fit the toolClamp for clutch housing(Emb. 2028) (19) , with the tool's componentsTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) fitted with the dual clutch insertion socket.

Tighten the bolt(A) of the dual clutch insertion socket until the groove of the clip is visible.



Remove:

the toolTool for removal - refitting of clutch pressure plate and housing(Emb. 1952) and Clamp for clutch housing (Emb. 2028) ,

the dual clutch insertion socket.

Refit a new small diameter clip using snap ring pliers, taking care to position the pointed part of the clip(20) upwards.

Refit:

- the part connecting with the clutch plate and the small diameter input shaft(**21**) , taking care with the foolproofing,
- the large diameter clip(**22**) , taking care to position it correctly in relation to the lug(**23**) .

3. FINAL OPERATION

Refit the automatic gearbox(see 23A, Automatic gearbox , Automatic gearbox: Removal - Refitting) .

CLUTCH THRUST BEARING: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

Differential output seal

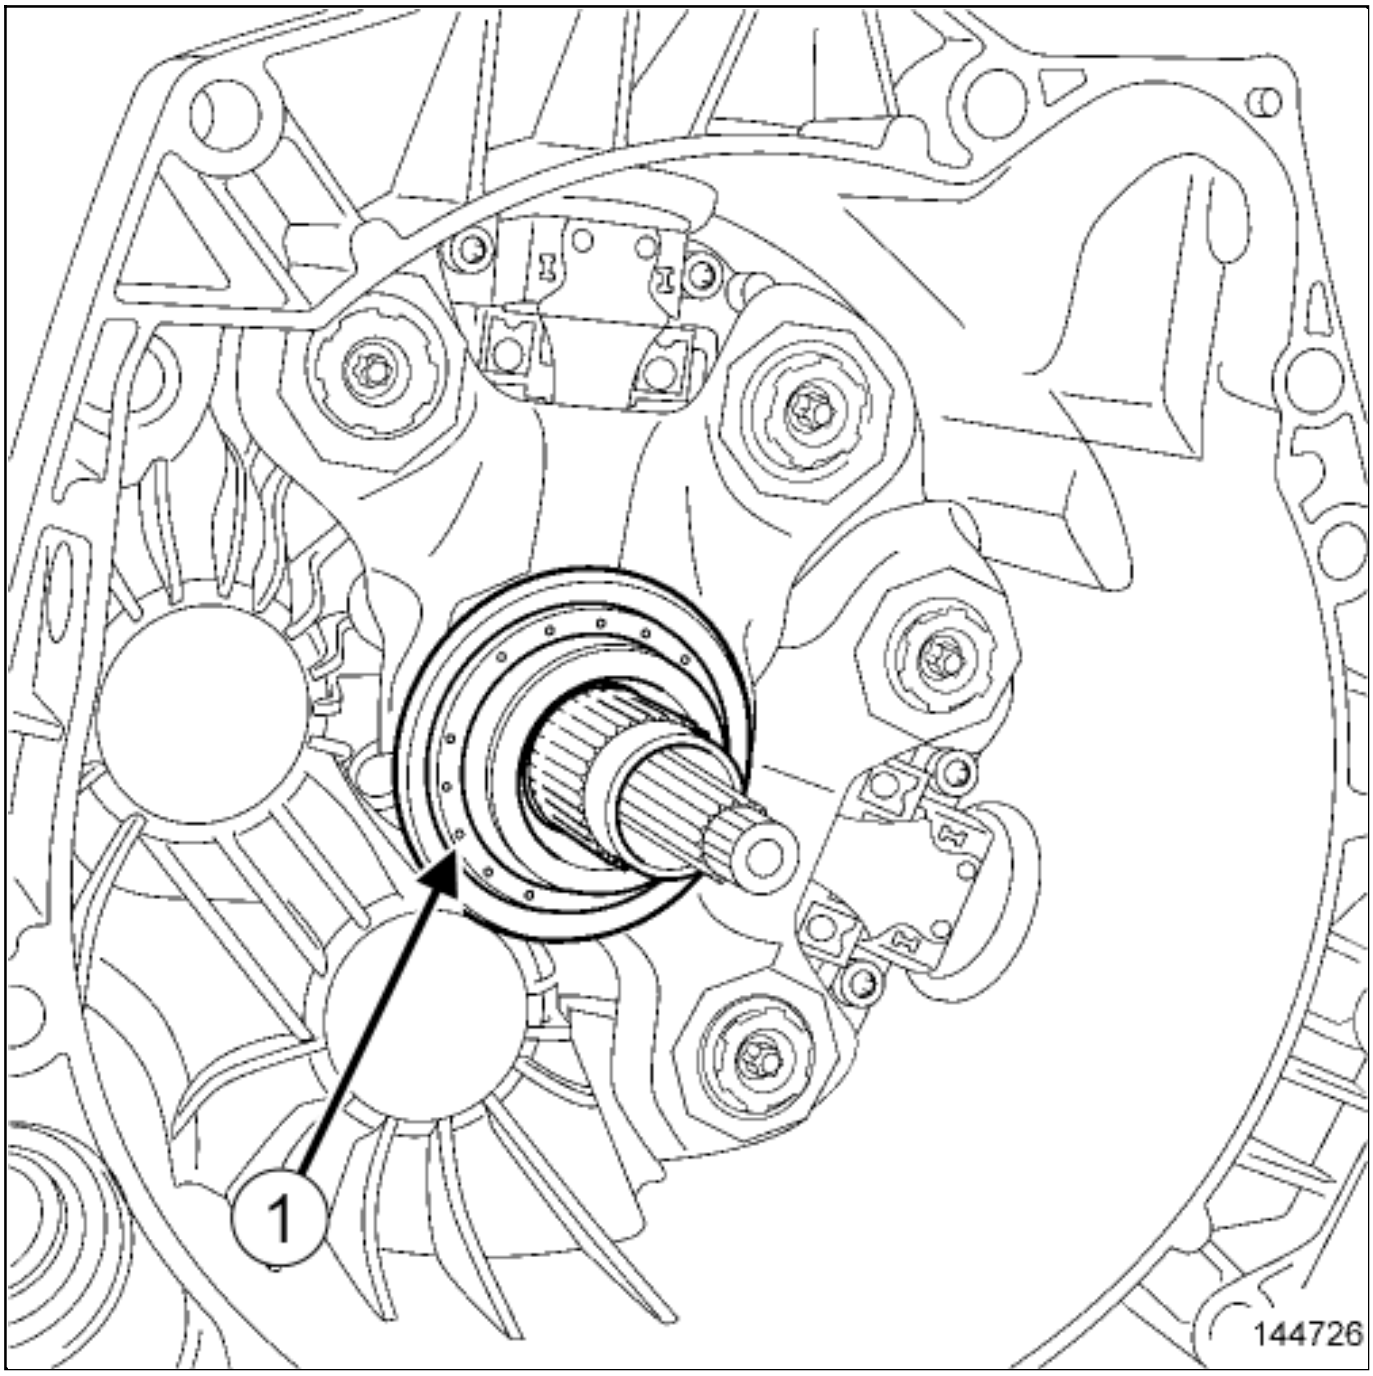
WARNING

Before carrying out any operation on a vehicle fitted with the Stop & Start system, always follow the safety instructions Vehicle: Precautions for the repair .

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

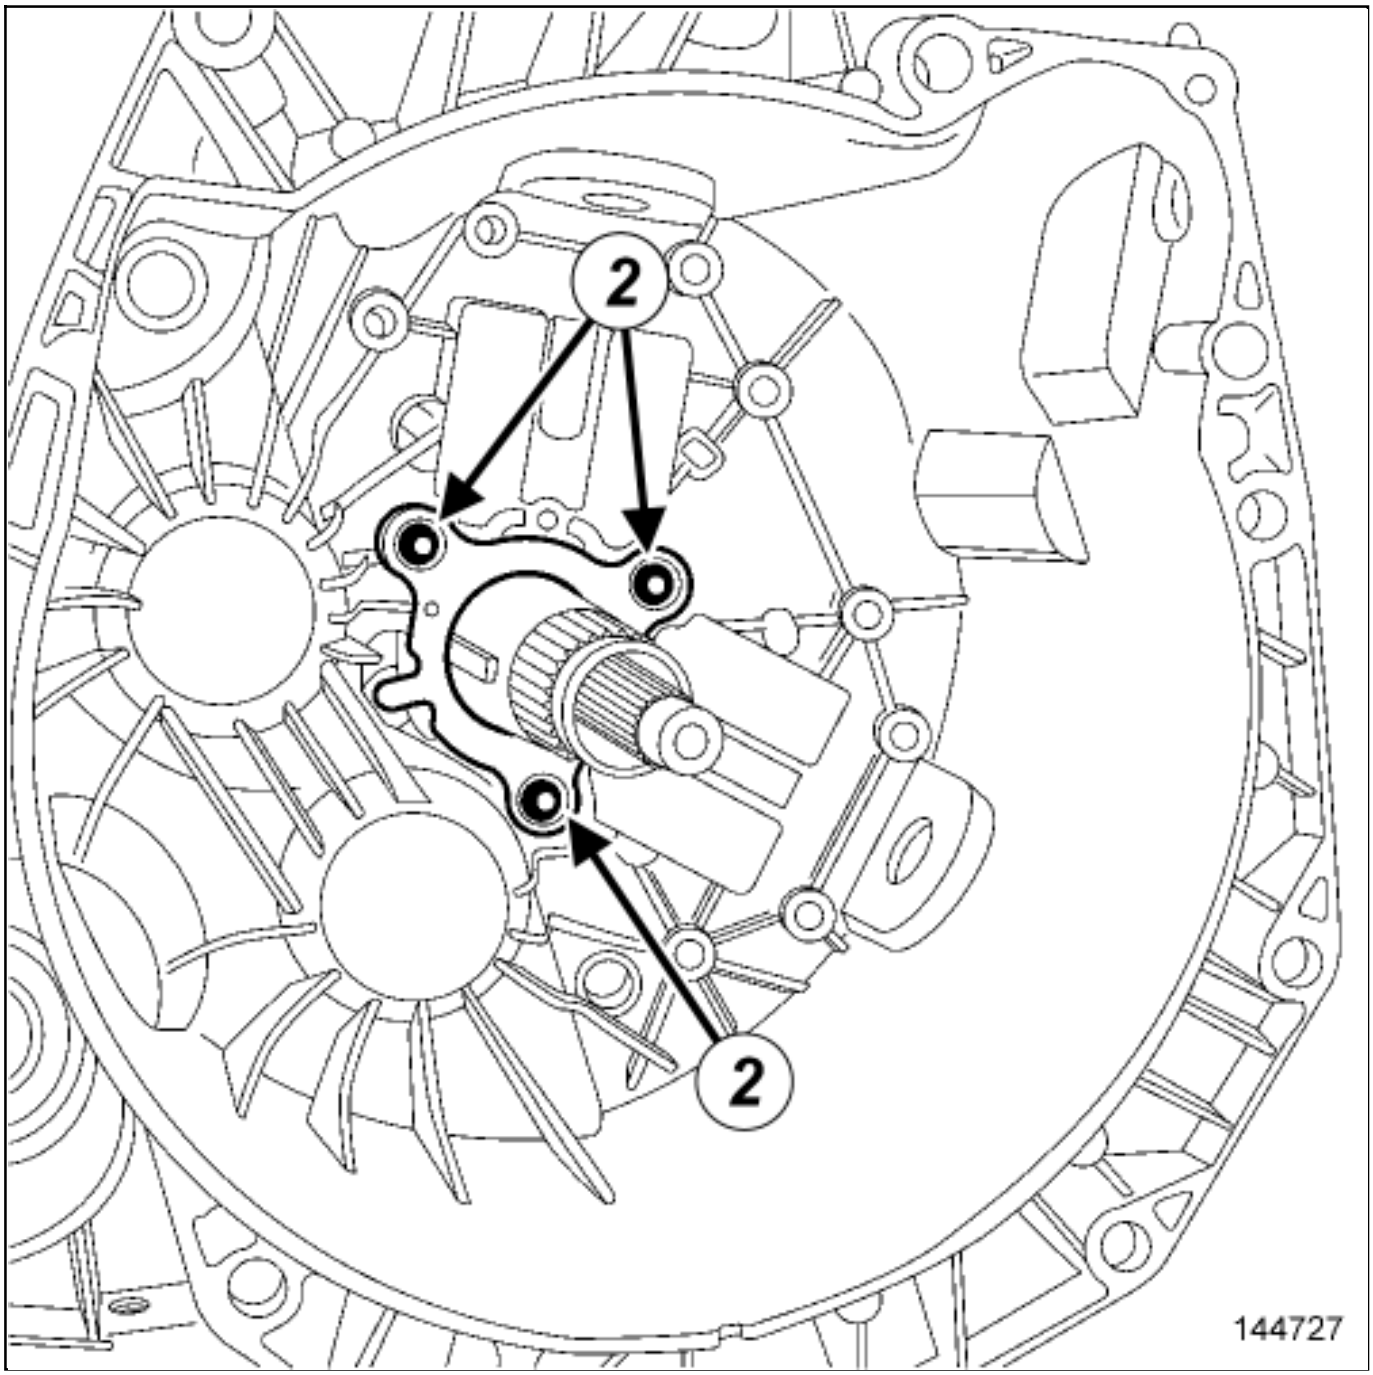
- Automatic gearbox: Precautions for the repair ,
- Vehicle: Precautions for the repair .



REMOVAL

1. REMOVAL PREPARATION OPERATION

Remove:



- the gearbox Automatic gearbox: Removal - Refitting ,
- the clutch (see 20A, Clutch, Clutch: Removal - Refitting) .

2. REMOVAL OPERATION

Remove:

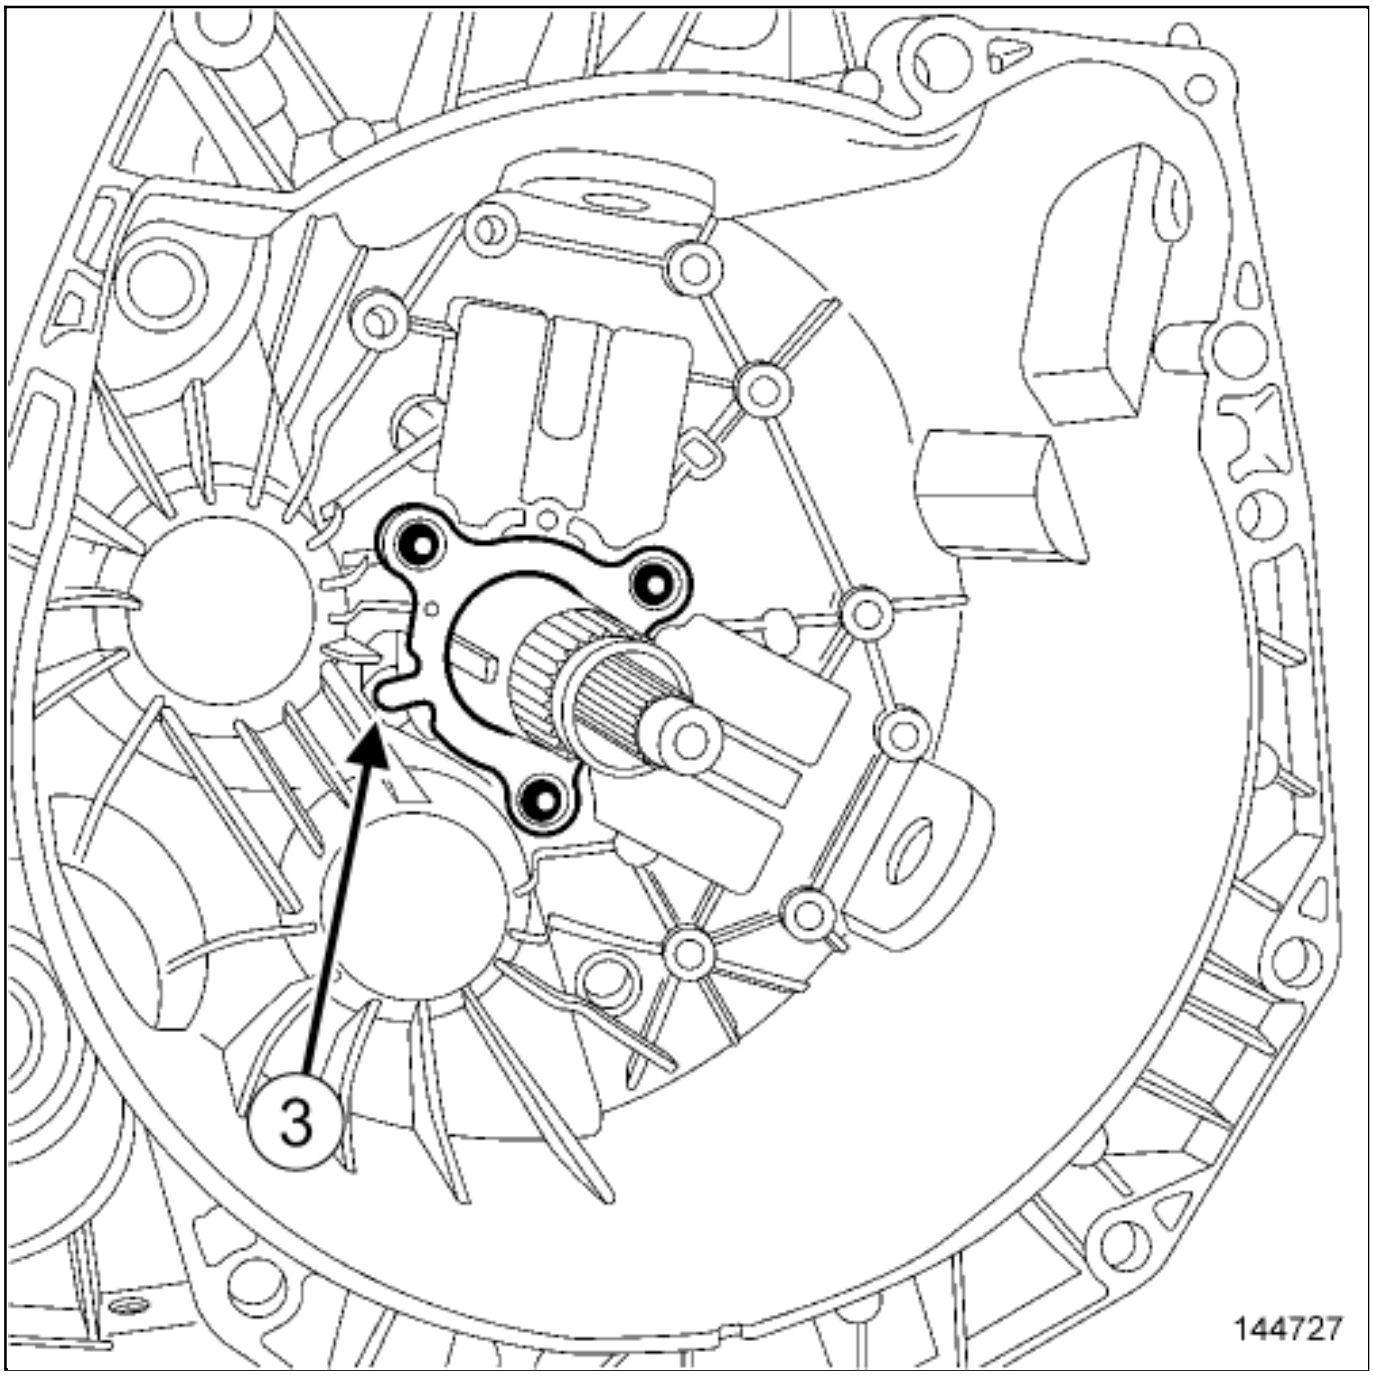
- the clutch thrust bearing(1) ,
- the clutch actuator motors(see 20A, Clutch, Clutch actuator motor: Removal - Refitting) ,
- the clutch forks(see 20A, Clutch, Clutch fork: Removal - Refitting) .

Remove:

- the bolts(2) of the clutch thrust bearing guide tube,
- the clutch thrust bearing guide tube.

REFITTING

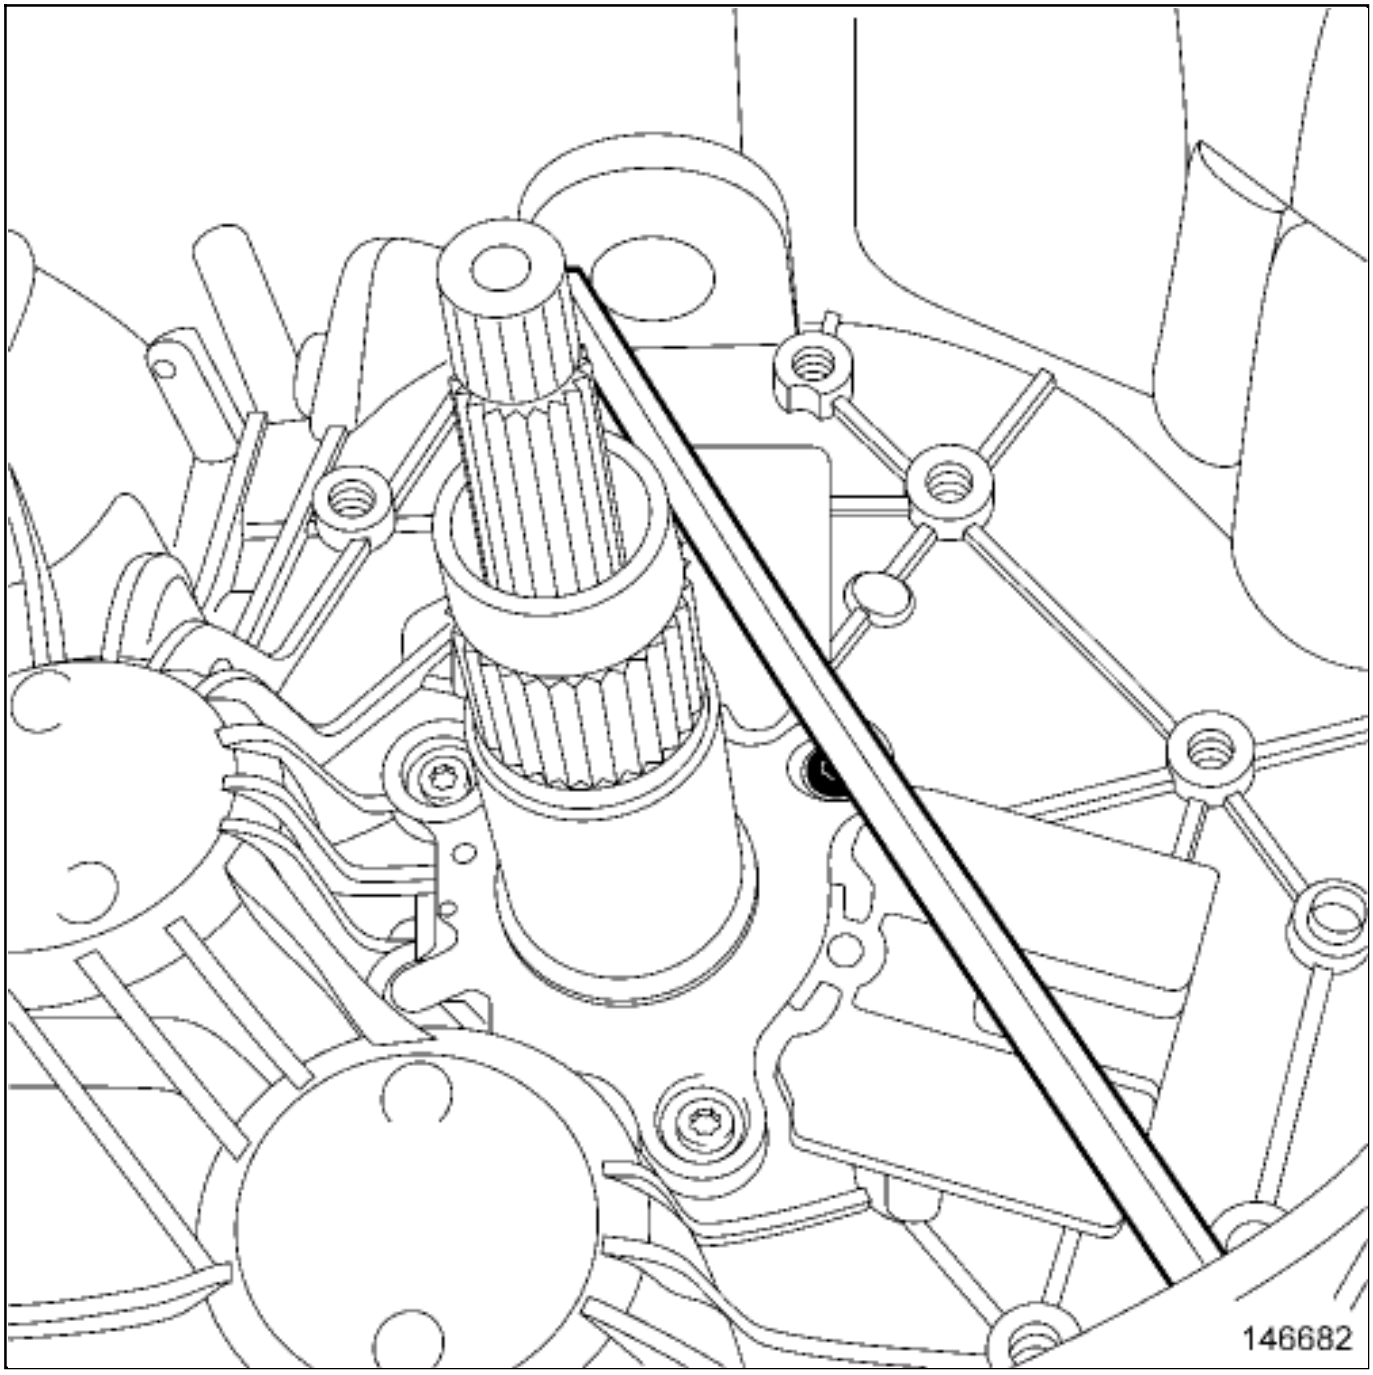
1. REFITTING PREPARATION OPERATION



Always replace the clutch clips.

parts always to be replaced: Differential output seal .

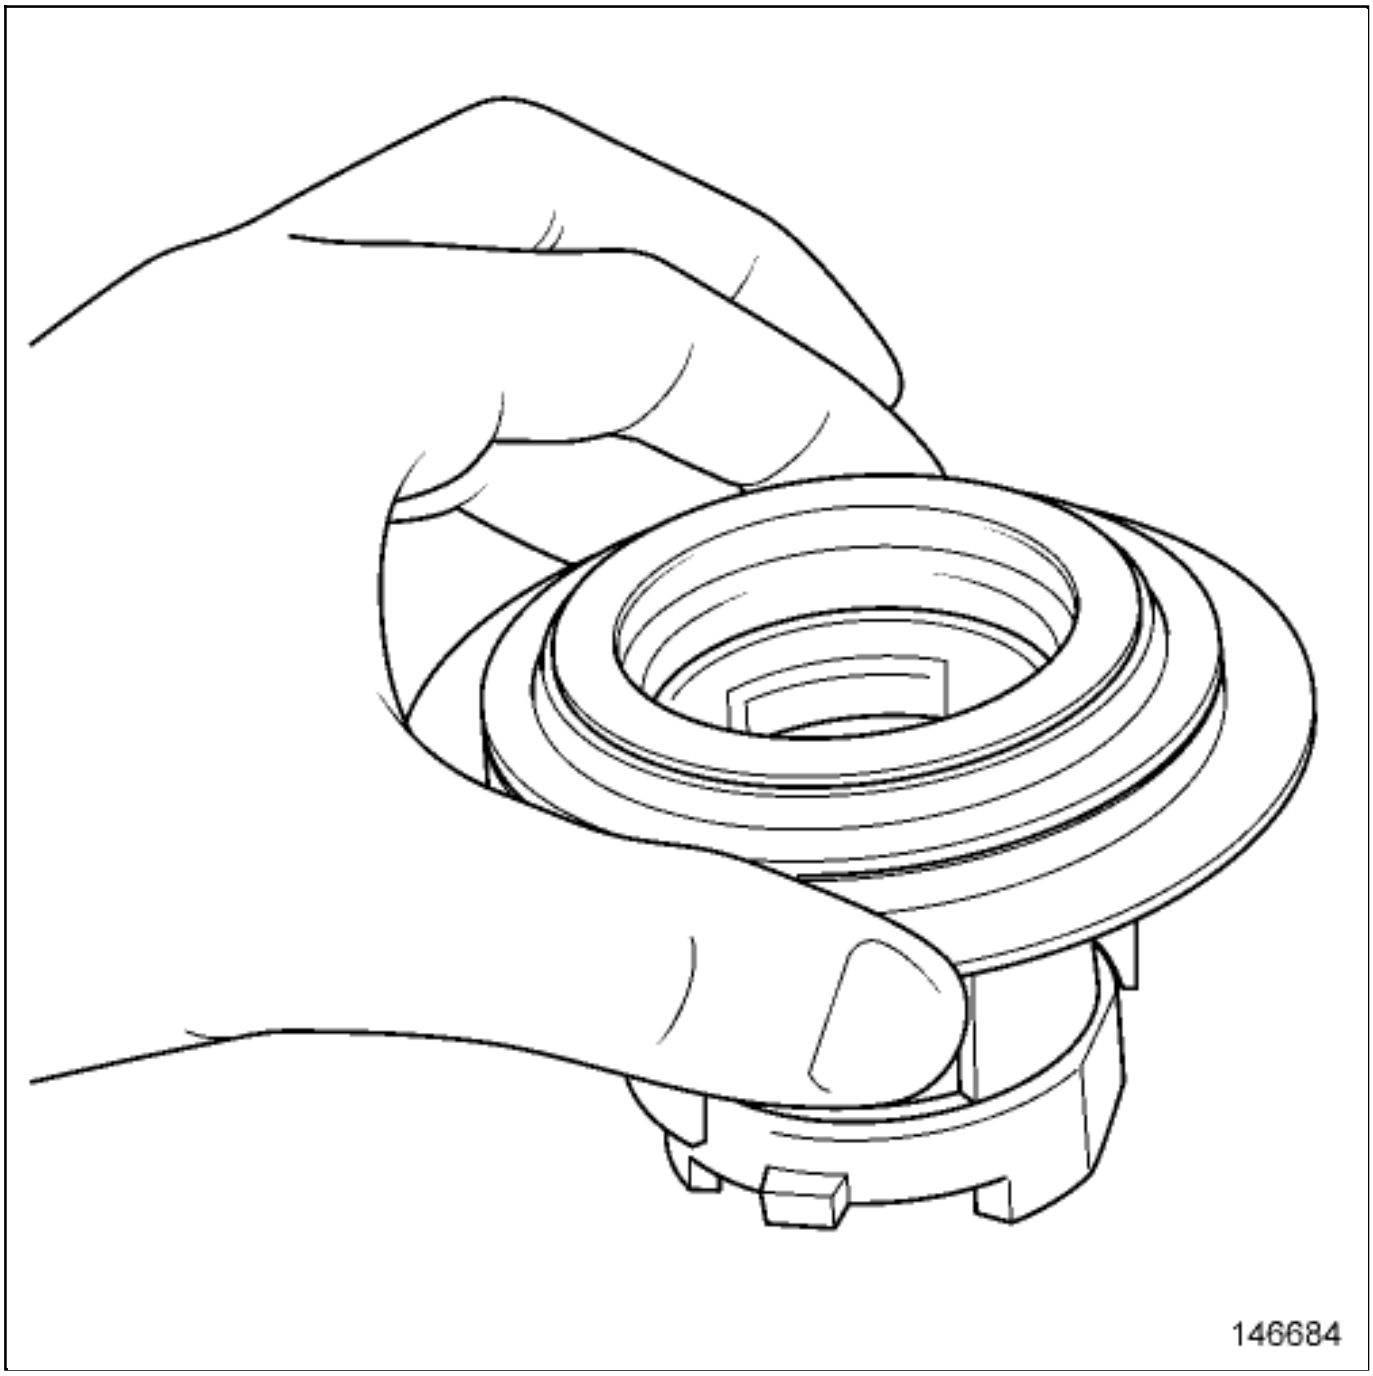
Use surface cleaner Vehicle: Parts and consumables for the repair to clean:



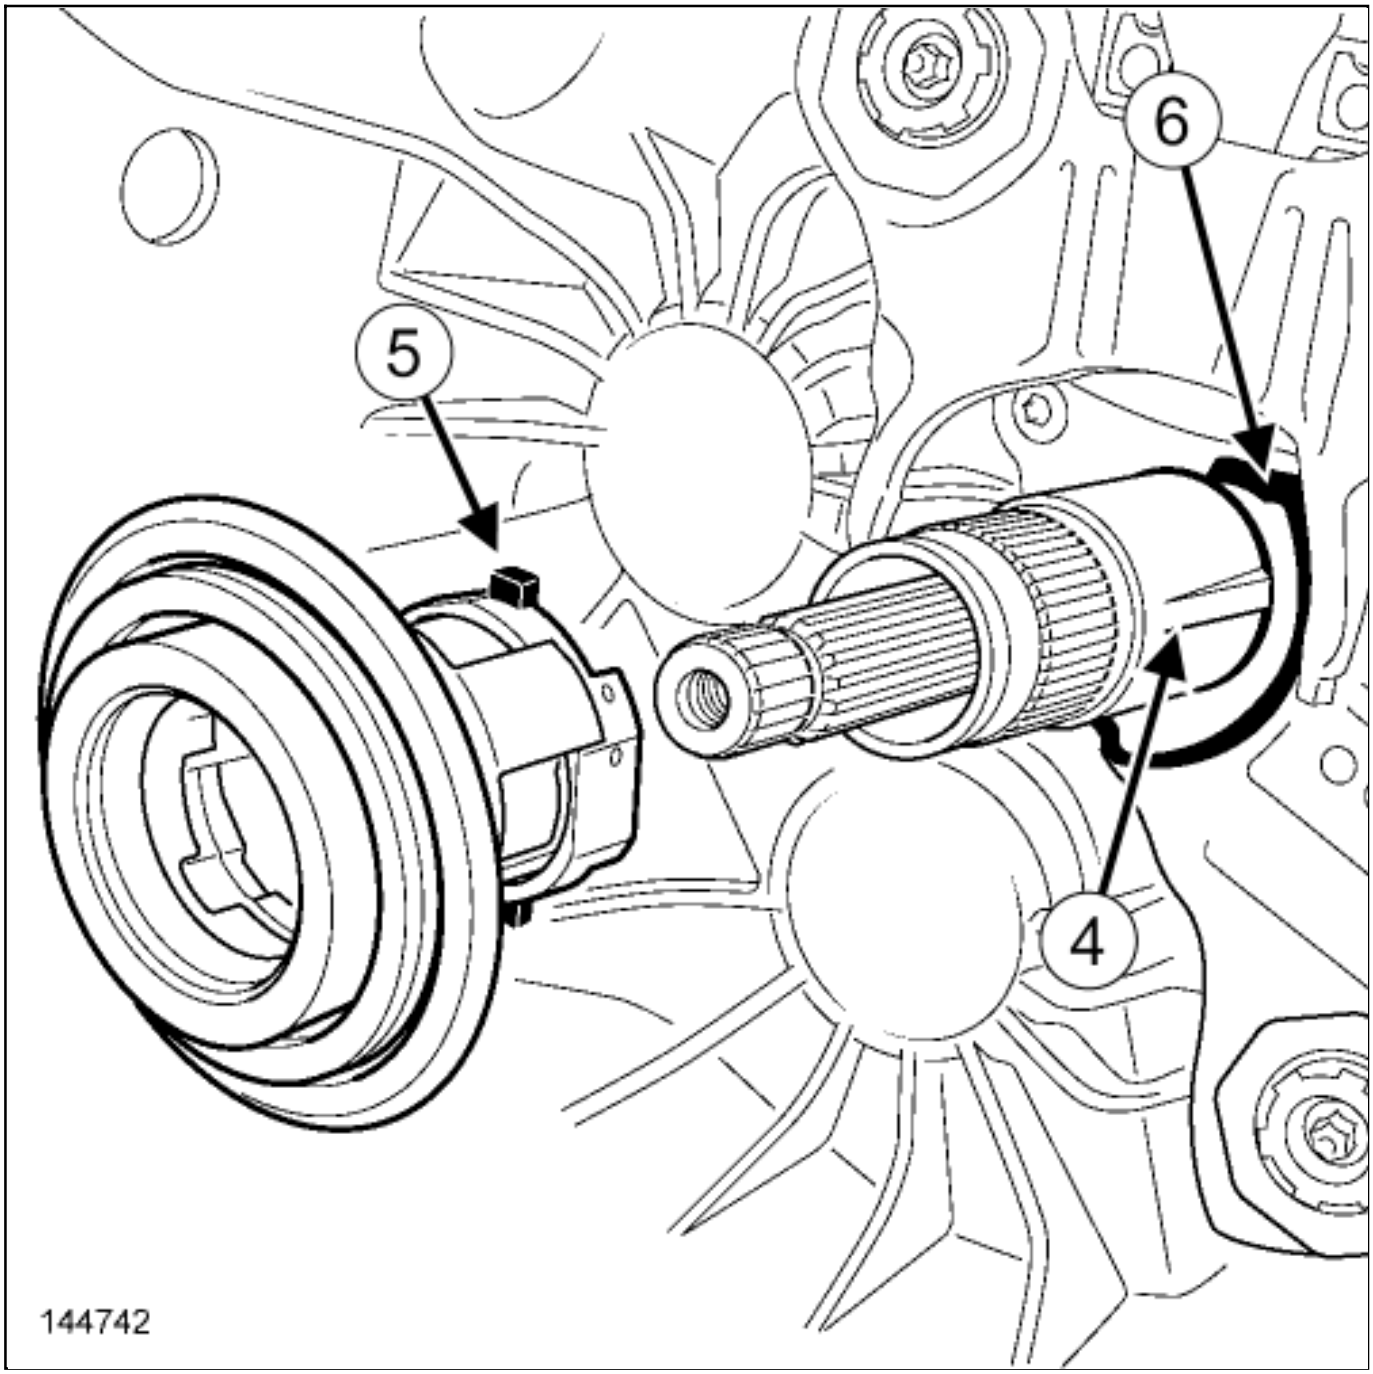
- the clutch thrust bearing guide tube,
- the gearbox casing.

2. REFITTING OPERATION

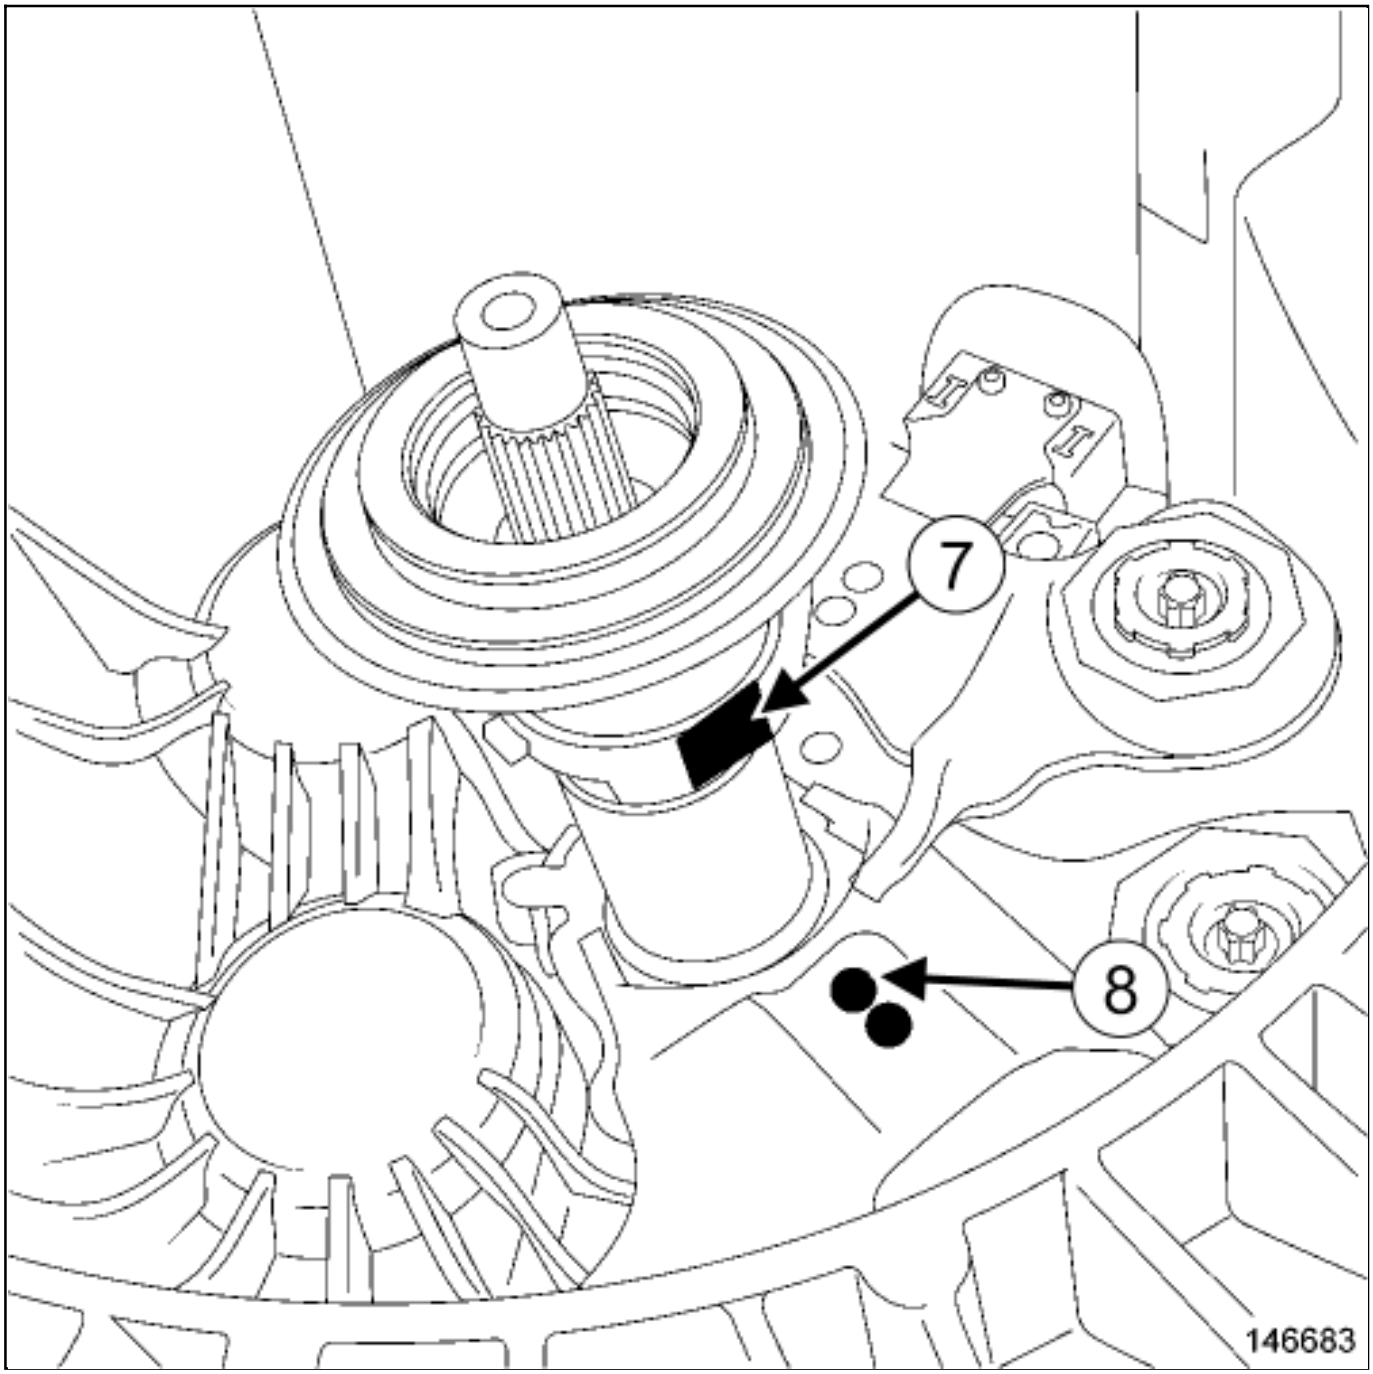
Refit the clutch guide tube, positioning the centring device(3) in its housing.



Torque tighten the clutch guide tube bolts8 N.m.



Using a ruler, check that the bolt heads do not protrude from the recess of the clutch guide tube.



Refit:

- the clutch actuator motors **(see 20A, Clutch, Clutch actuator motor: Removal - Refitting)** ,
- the clutch forks **(see 20A, Clutch, Clutch fork: Removal - Refitting)** .

Hold the thrust bearing under the large diameter bearing to keep the small diameter bearing in place.

6
5
4
144742

Note:

The thrust bearing must fit without effort.

The clutch thrust bearing guide tube has two alignment grooves to ensure that the clutch thrust bearing is correctly positioned.

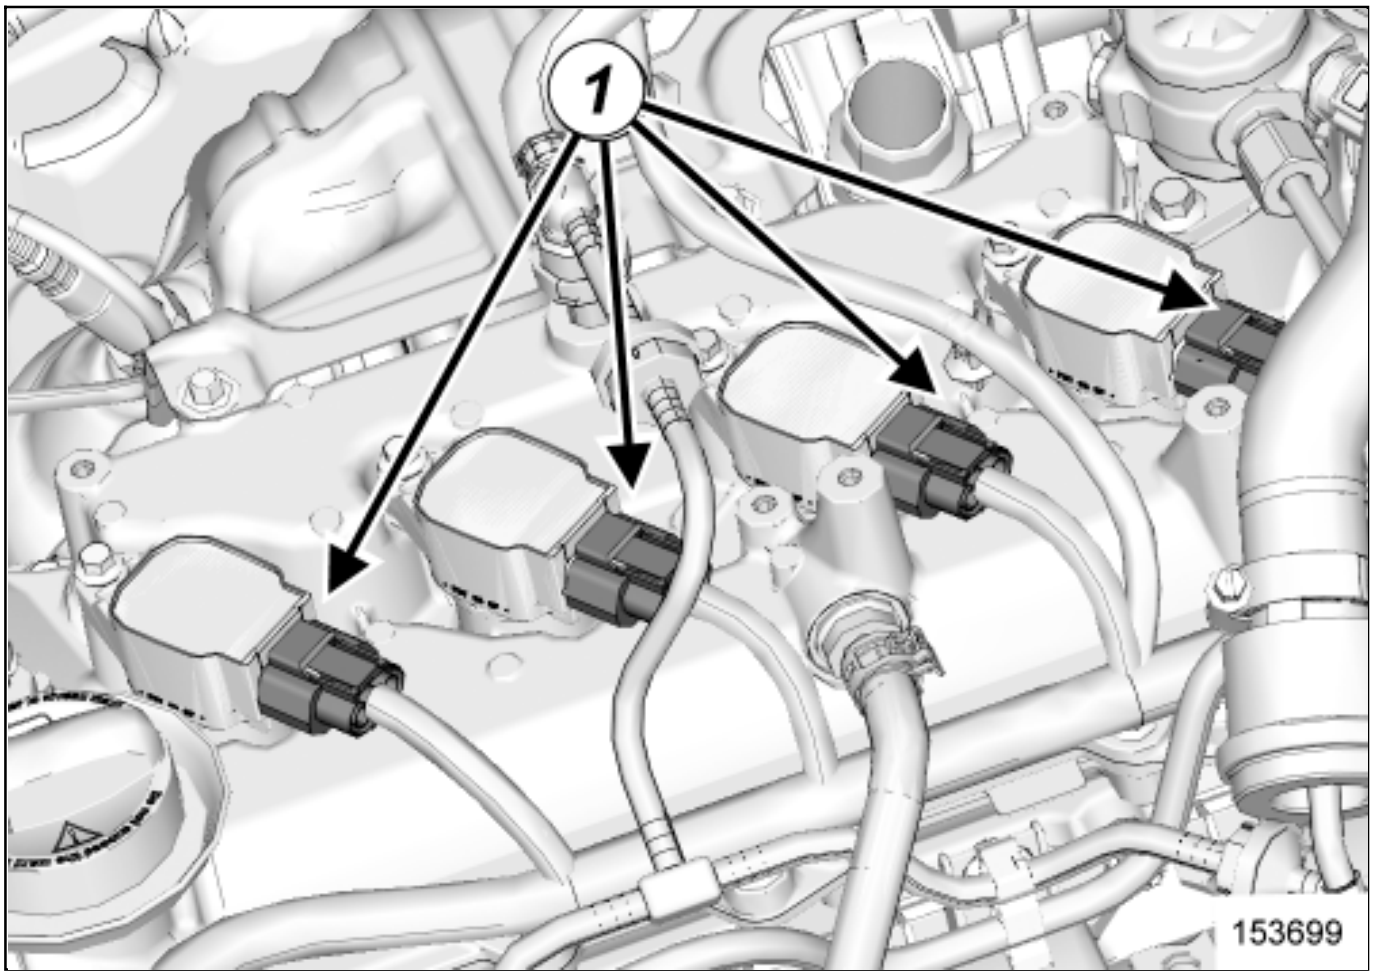
Refit the clutch thrust bearing correctly with the foolproofing(4) .

Check that the clutch thrust bearing(5) is correctly positioned in relation to the fork by operating the small diameter thrust bearing(6) . The groove(7) must be aligned with the fork(8) that operates the large diameter thrust bearing.

3. FINAL OPERATION

Proceed in the reverse order to removal.

COILS: REMOVAL - REFITTING



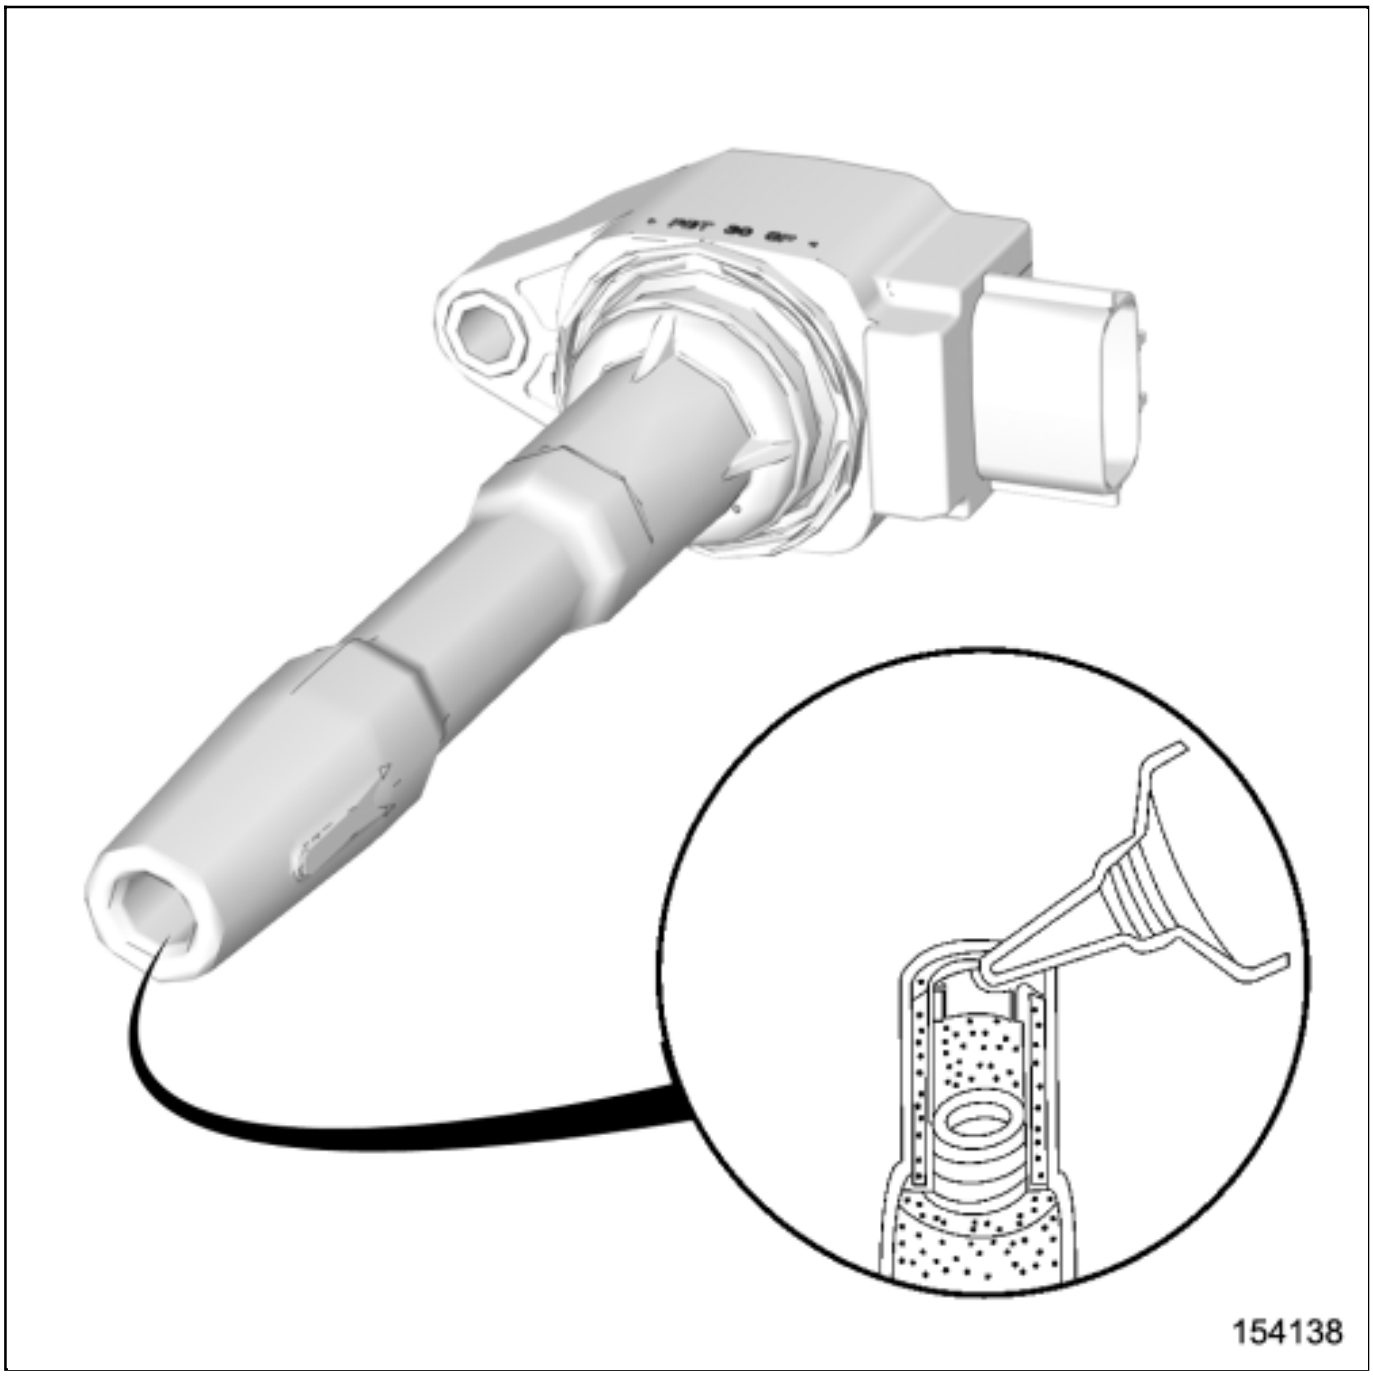
Locations and specifications (tightening torques, parts always to be replaced, etc.)Cylinder head assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Move the intercooler air inlet pipeAir inlet assembly: Exploded view .
- Disconnect the petrol vapour rebreathing pipe from:
  - the rocker cover,
  - the turbo-manifold air inlet pipe.
- Move the petrol vapour rebreathing pipe.
- Remove Cylinder head assembly: Exploded view :
  - the design cover bolts,
  - the design cover.

2. REMOVAL OPERATION



Disconnect the ignition coil connector(1) .

Remove Cylinder head assembly: Exploded view :

- the ignition coil bolts,
- the ignition coil.

REFITTING

1. REFFITING PREPARATION OPERATION

Apply a bead of fluostar 2lgrease[Vehicle: Parts and consumables for the repair] 2 mmin diameter on the internal perimeter of the high tension cap on the four coils.

2. REFITTING OPERATION

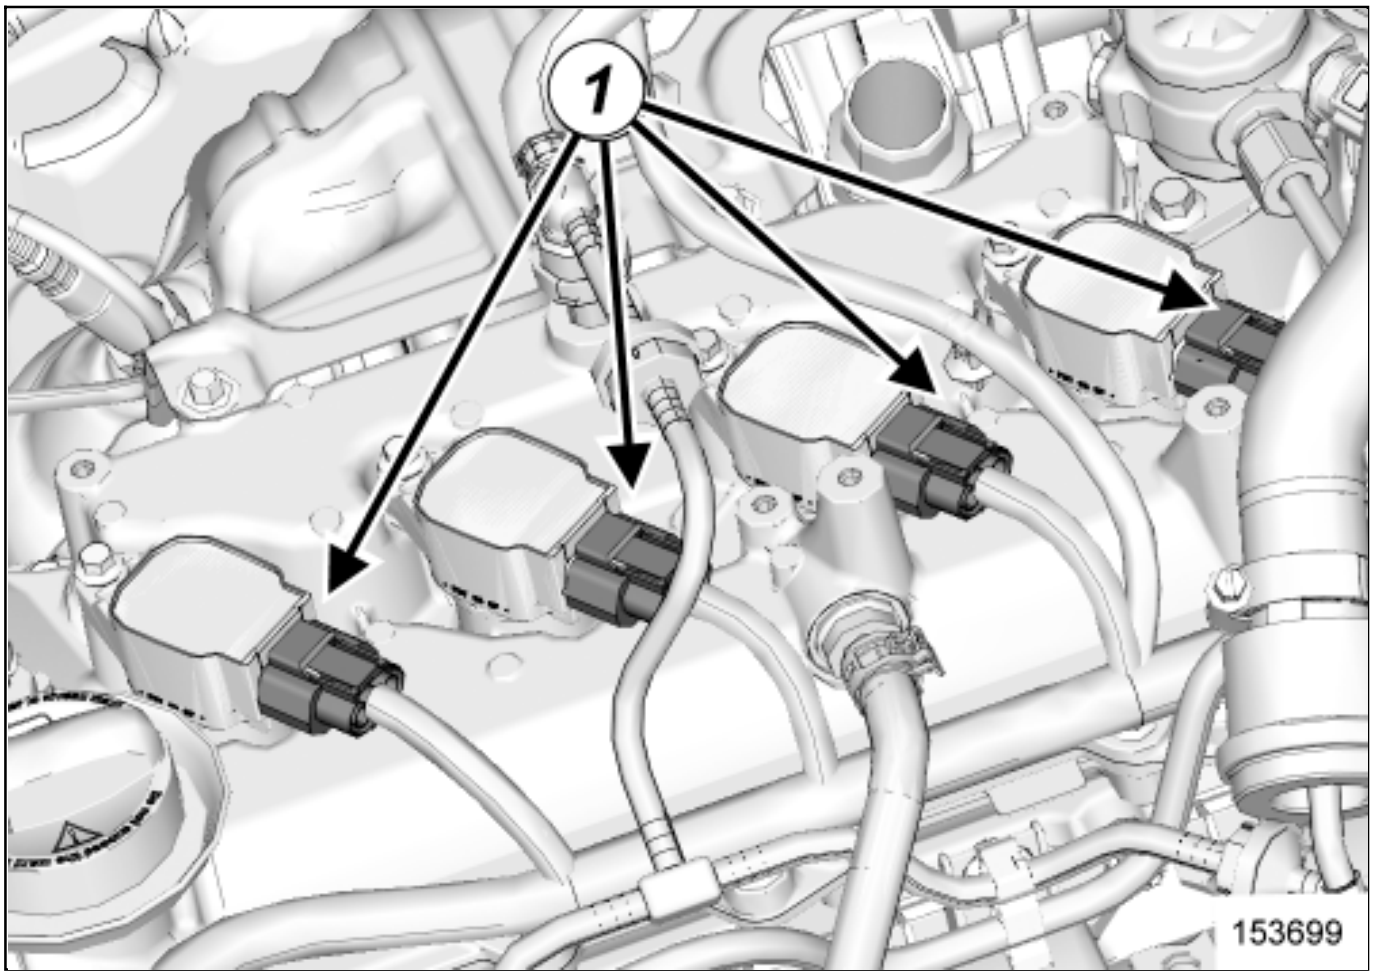
Refit [Cylinder head assembly: Exploded view] :

- the ignition coil,
- the ignition coil bolts.

Torque tighten the ignition coil bolts **Cylinder head assembly: Exploded view** .

Proceed in the reverse order to removal.

COILS: REMOVAL - REFITTING



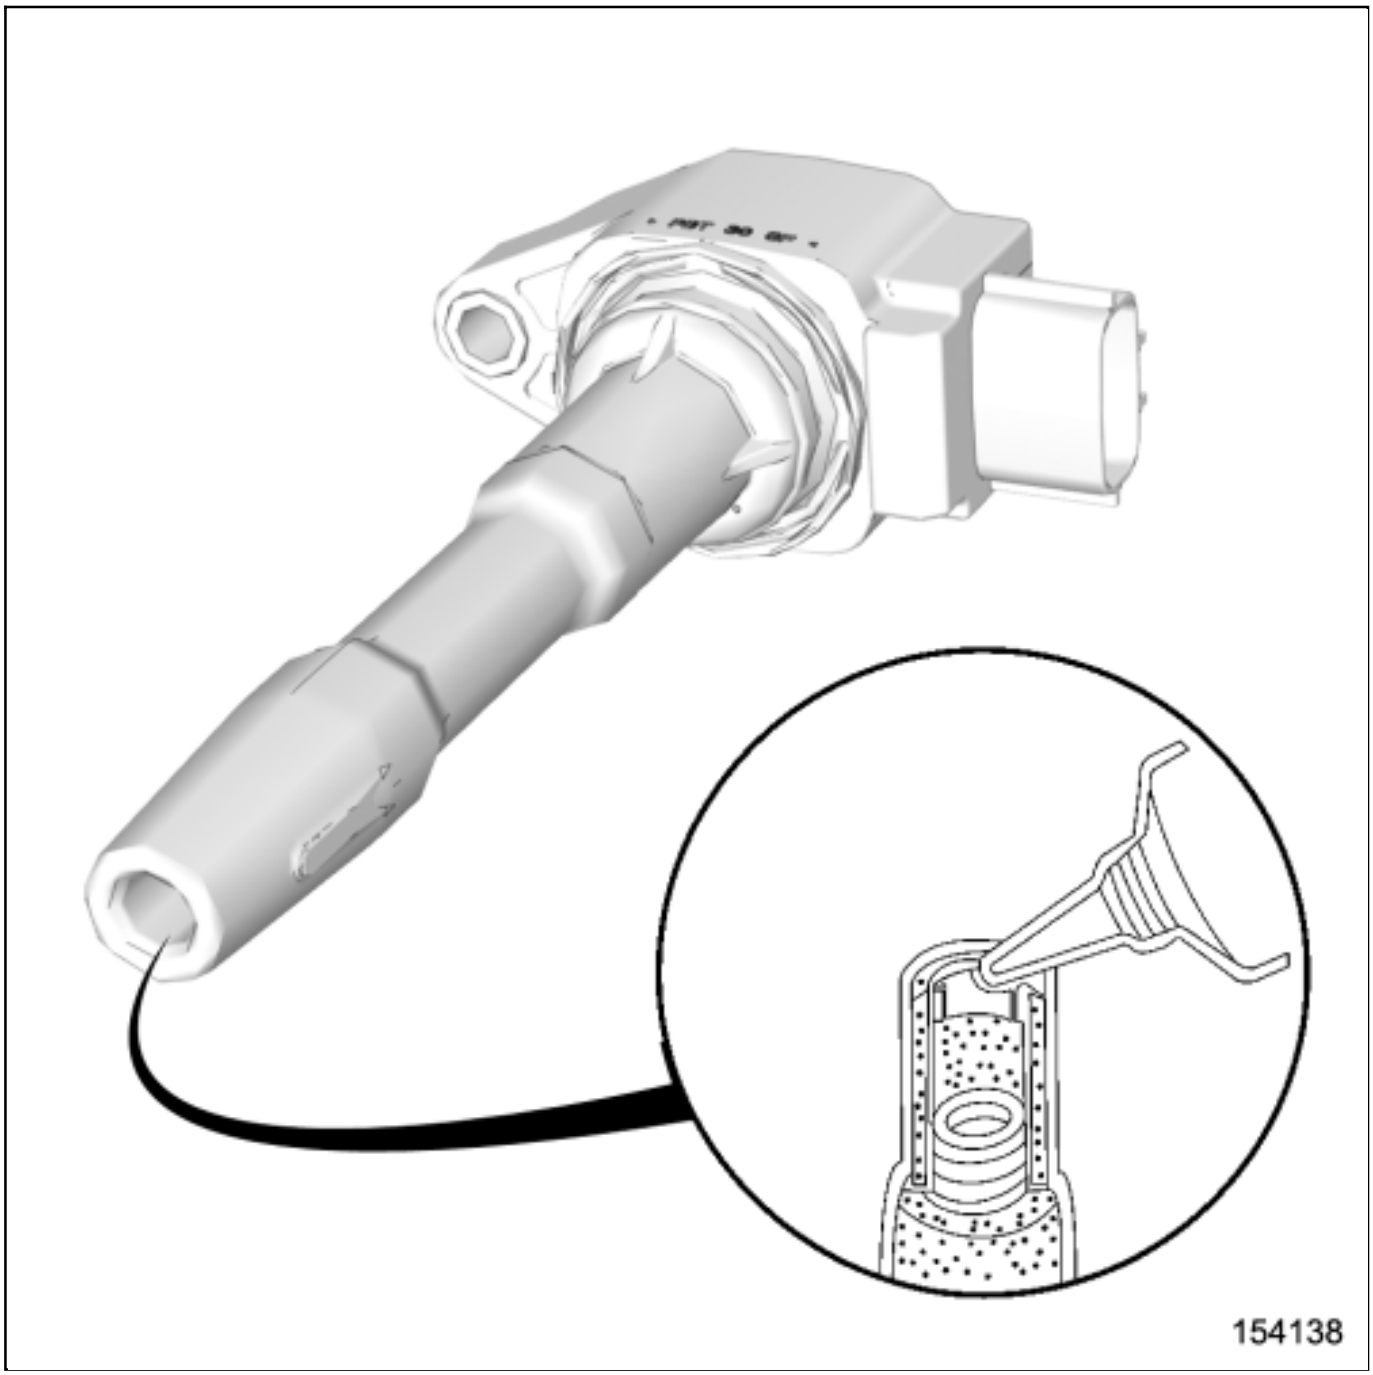
Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Move aside the intercooler air inlet pipe(see 12A, Fuel mixture, Air inlet assembly: Exploded view) .
- Disconnect the petrol vapour rebreathing pipe from:
  - the rocker cover,
  - the turbo-manifold air inlet pipe.
- Move the petrol vapour rebreathing pipe aside.
- Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :
  - the design cover bolts,
  - the design cover.

2. REMOVAL OPERATION



Disconnect the ignition coil connector(1) .

Remove (see 11A, Top and front of engine, Cylinder head assembly: Exploded view) :

- the ignition coil bolts,
- the ignition coil.

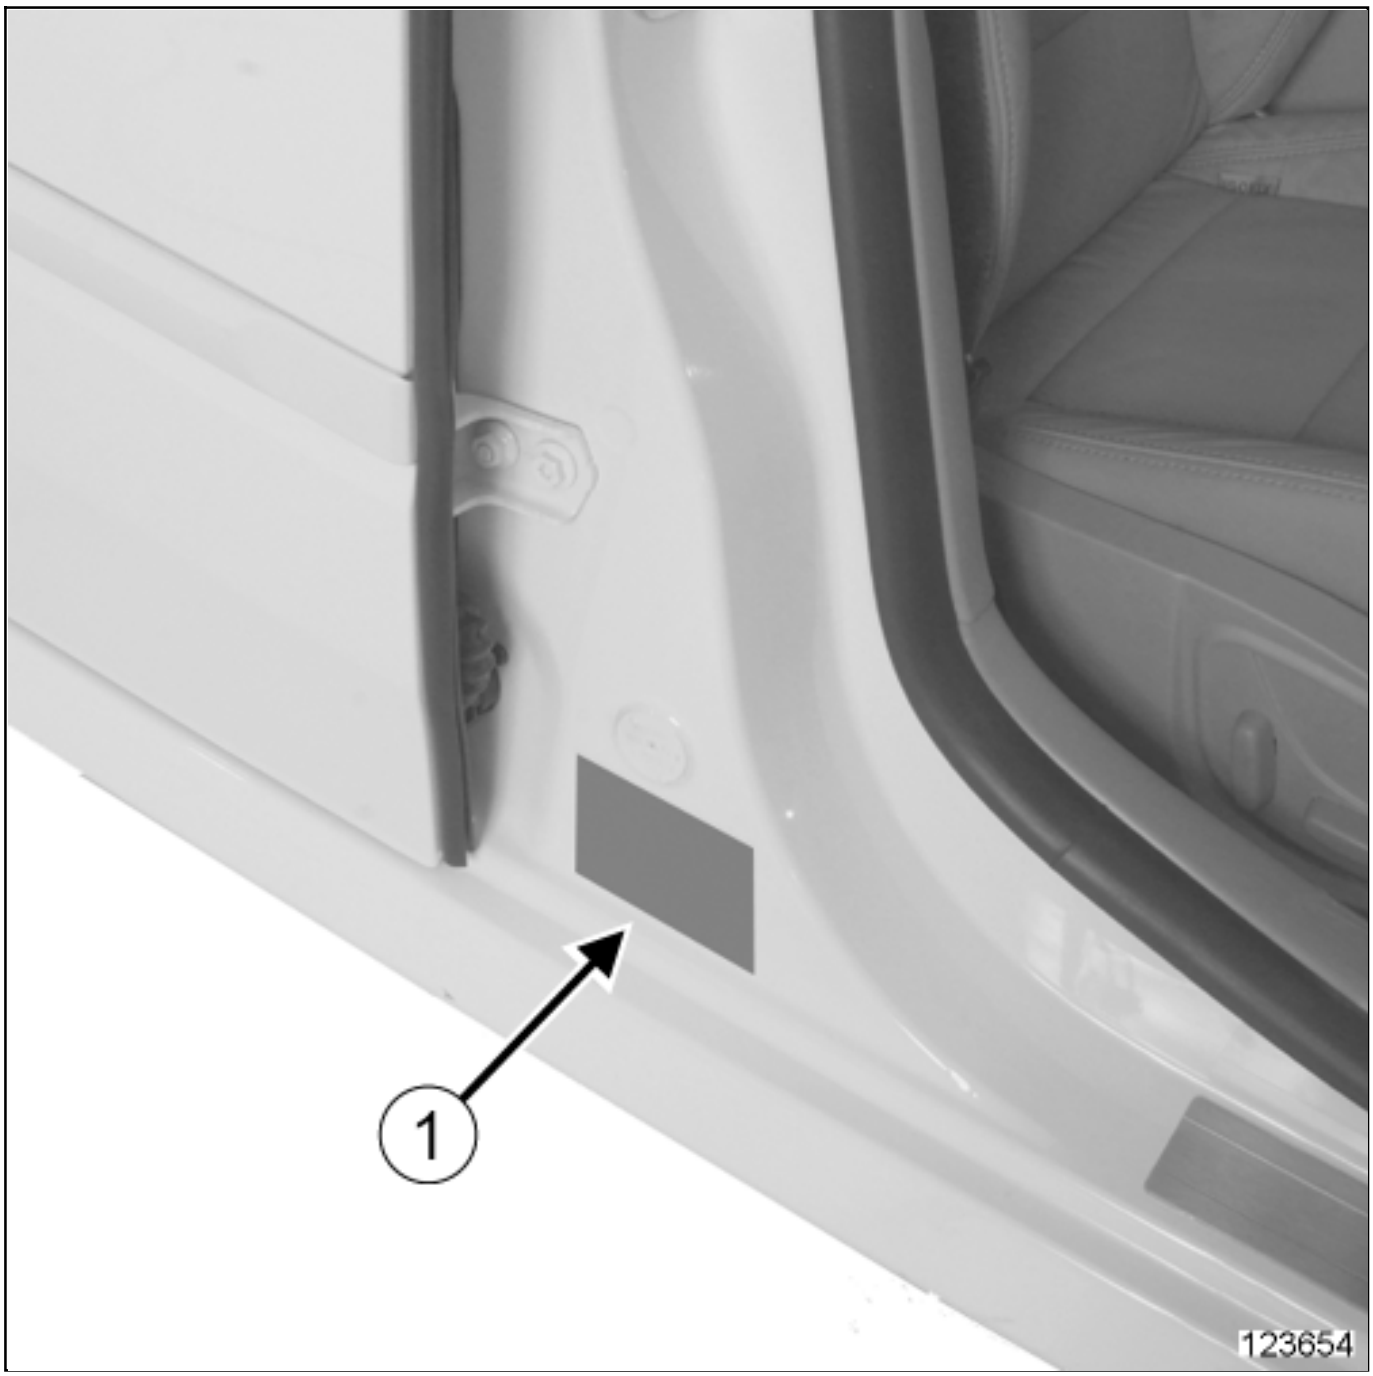
REFITTING

1. REFFITING PREPARATION OPERATION

Apply a bead of fluostar 2lgrease[Vehicle: Parts and consumables for the repair] 2 mmin diameter on the internal perimeter of the high tension cap on the four coils.

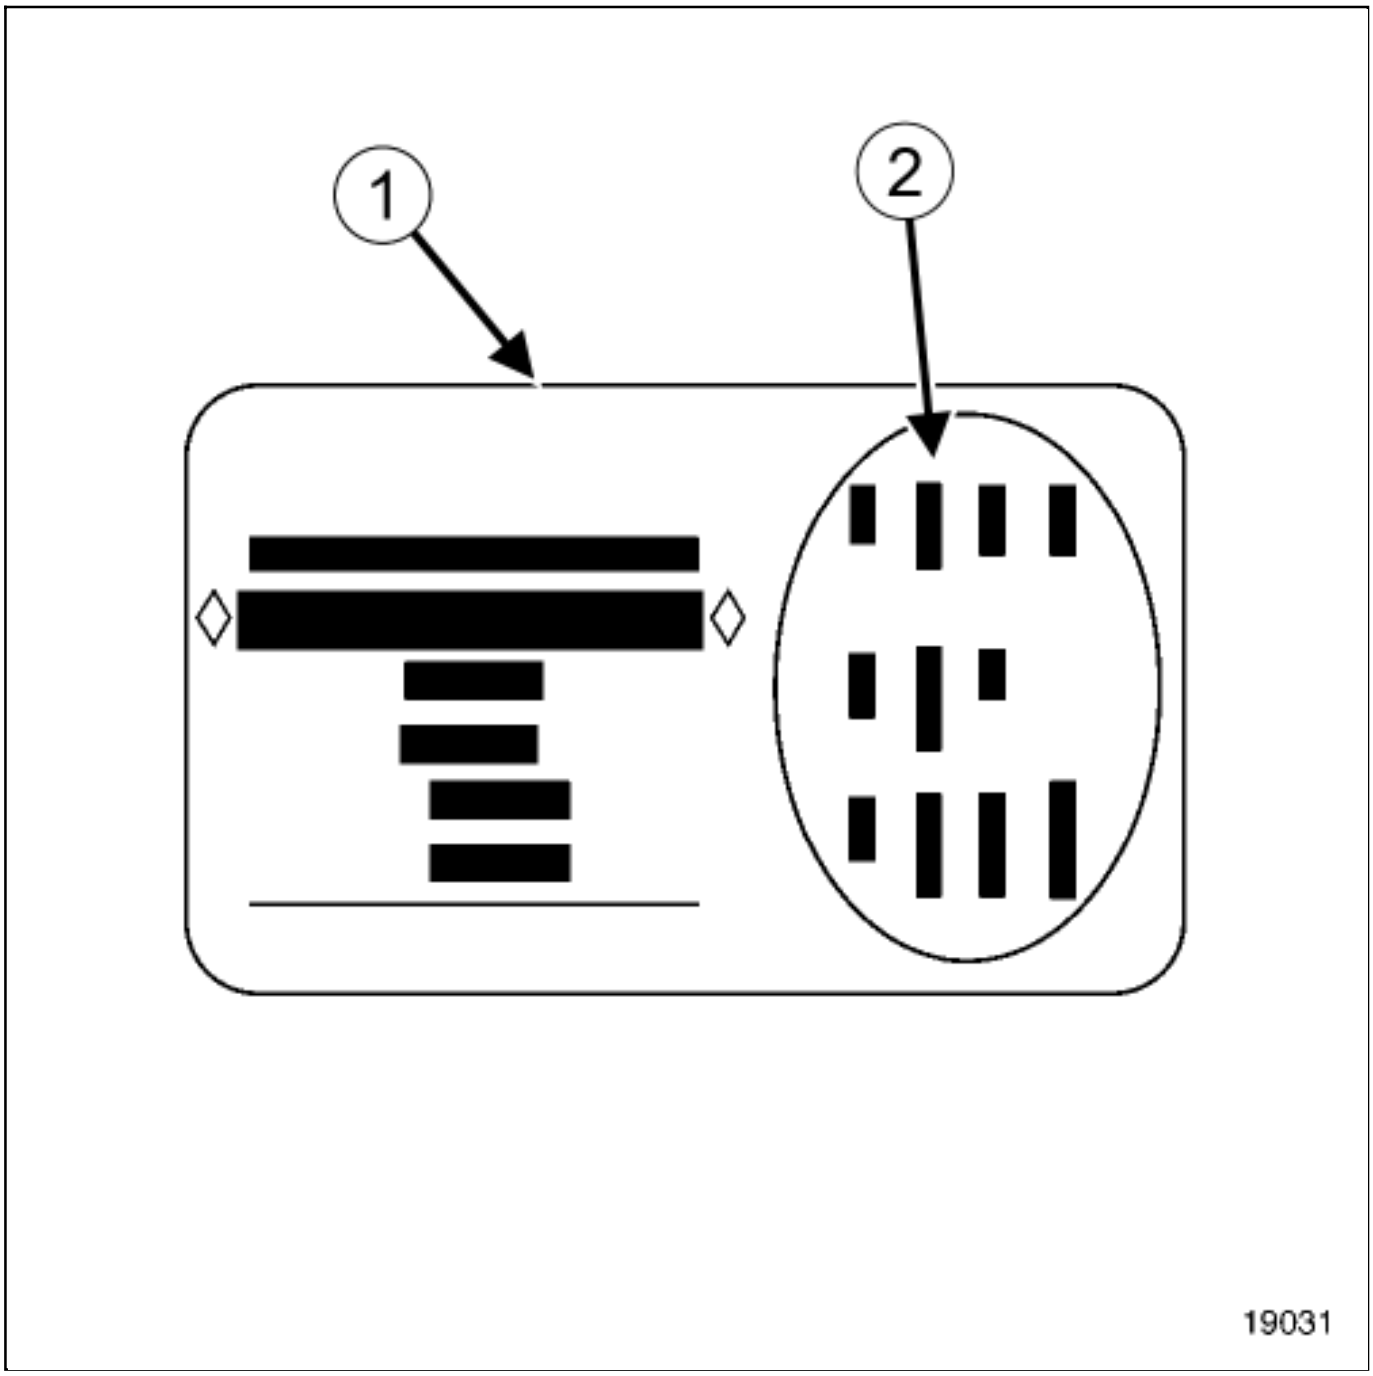
2. REFITTING OPERATION

Refit [(see 11A, Top and front of engine, Cylinder head assembly: Exploded view)] :



- the ignition coil,
- the ignition coil bolts.

Torque tighten the ignition coil bolts(see 11A, Top and front of engine, Cylinder head assembly: Exploded view) .



Proceed in the reverse order to removal.

COLOURCODE:IDENTIFICATION

1. EXAMPLE LOCATION OF THE VEHICLE IDENTIFICATION PLATE

2. EXAMPLE DETAIL OF THE VEHICLE IDENTIFICATION PLATE

(1) Vehicle identification plate

(2) Paintwork reference number

Note:

For all additional information concerning vehicle identification, see the MR of the vehicle concerned , (01C, Vehicle: Identification).

XSL version : 3.02 du 22/07/11

CONNECTING HOSE: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

Equipment required
component jack

parts always to be replaced:
seal between catalytic converter and exhaust downpipe hose

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

(see 19B, Exhaust, Exhaust: Precautions for the repair) ,

Vehicle: Precautions for the repair .

WARNING

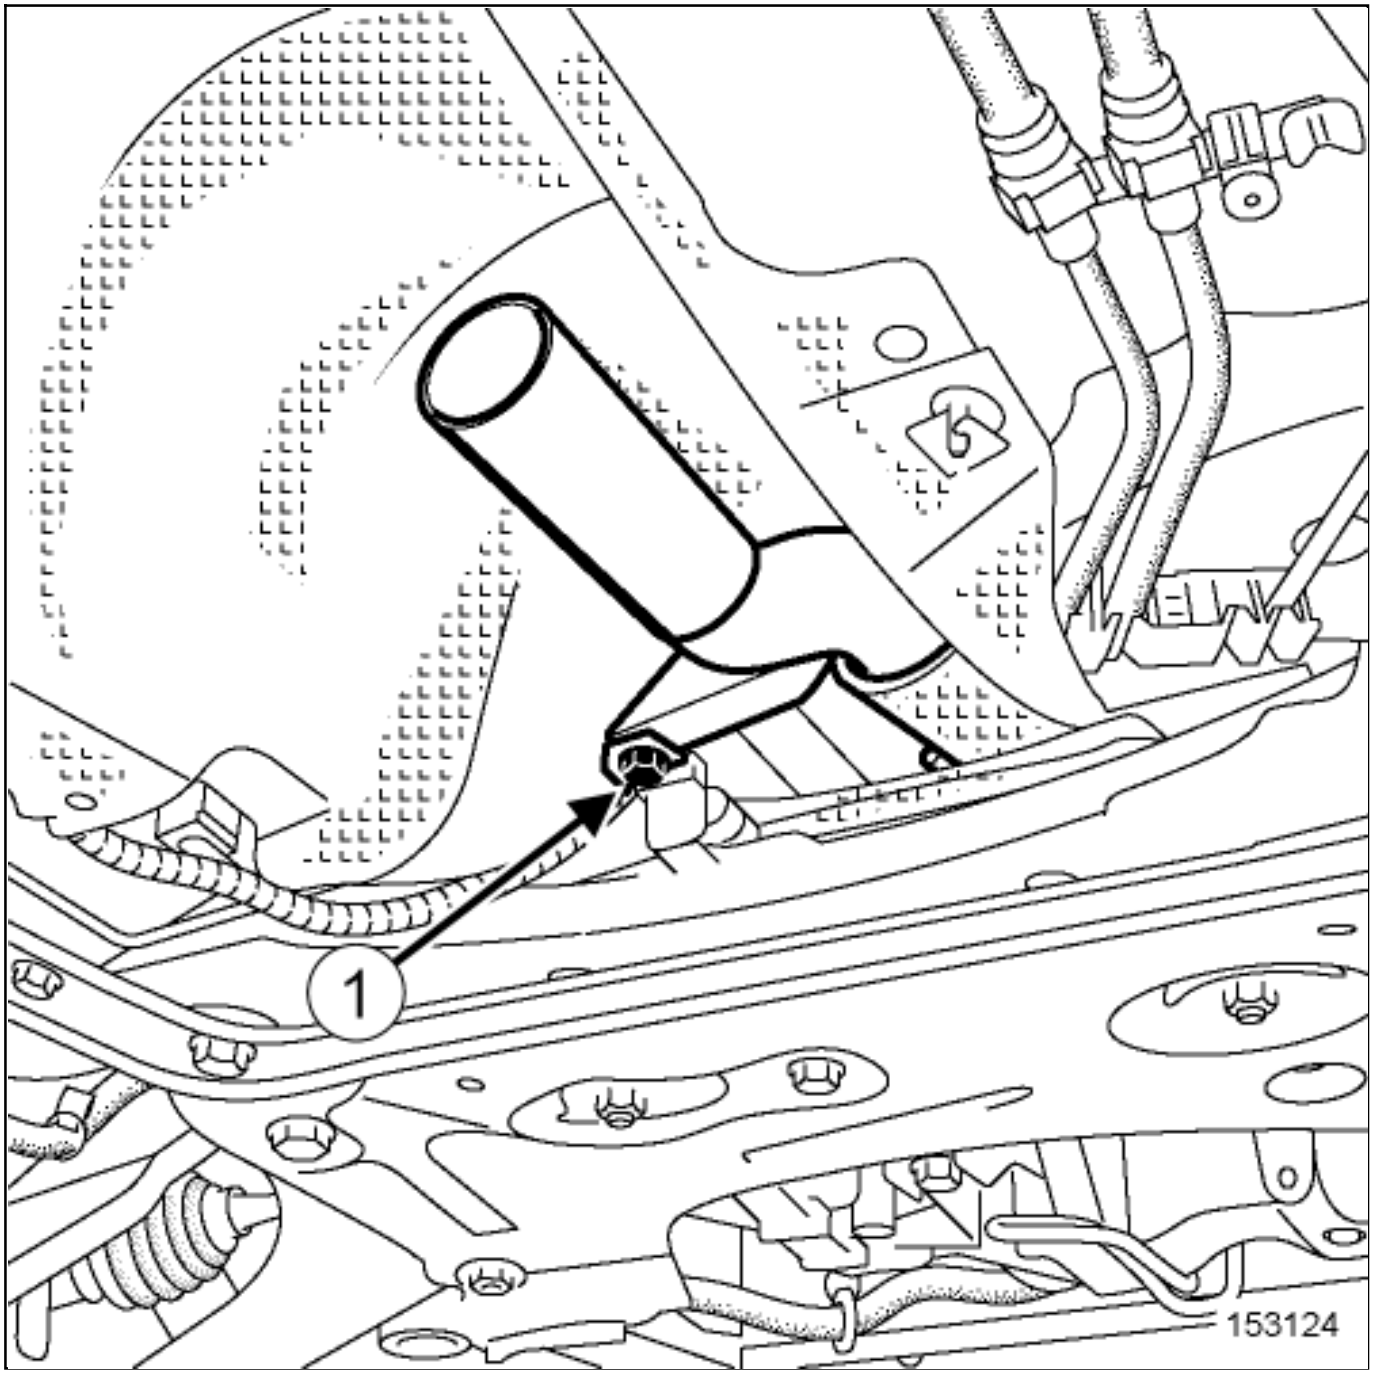
Wear heat protective gloves during the operation.

CAUTION

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

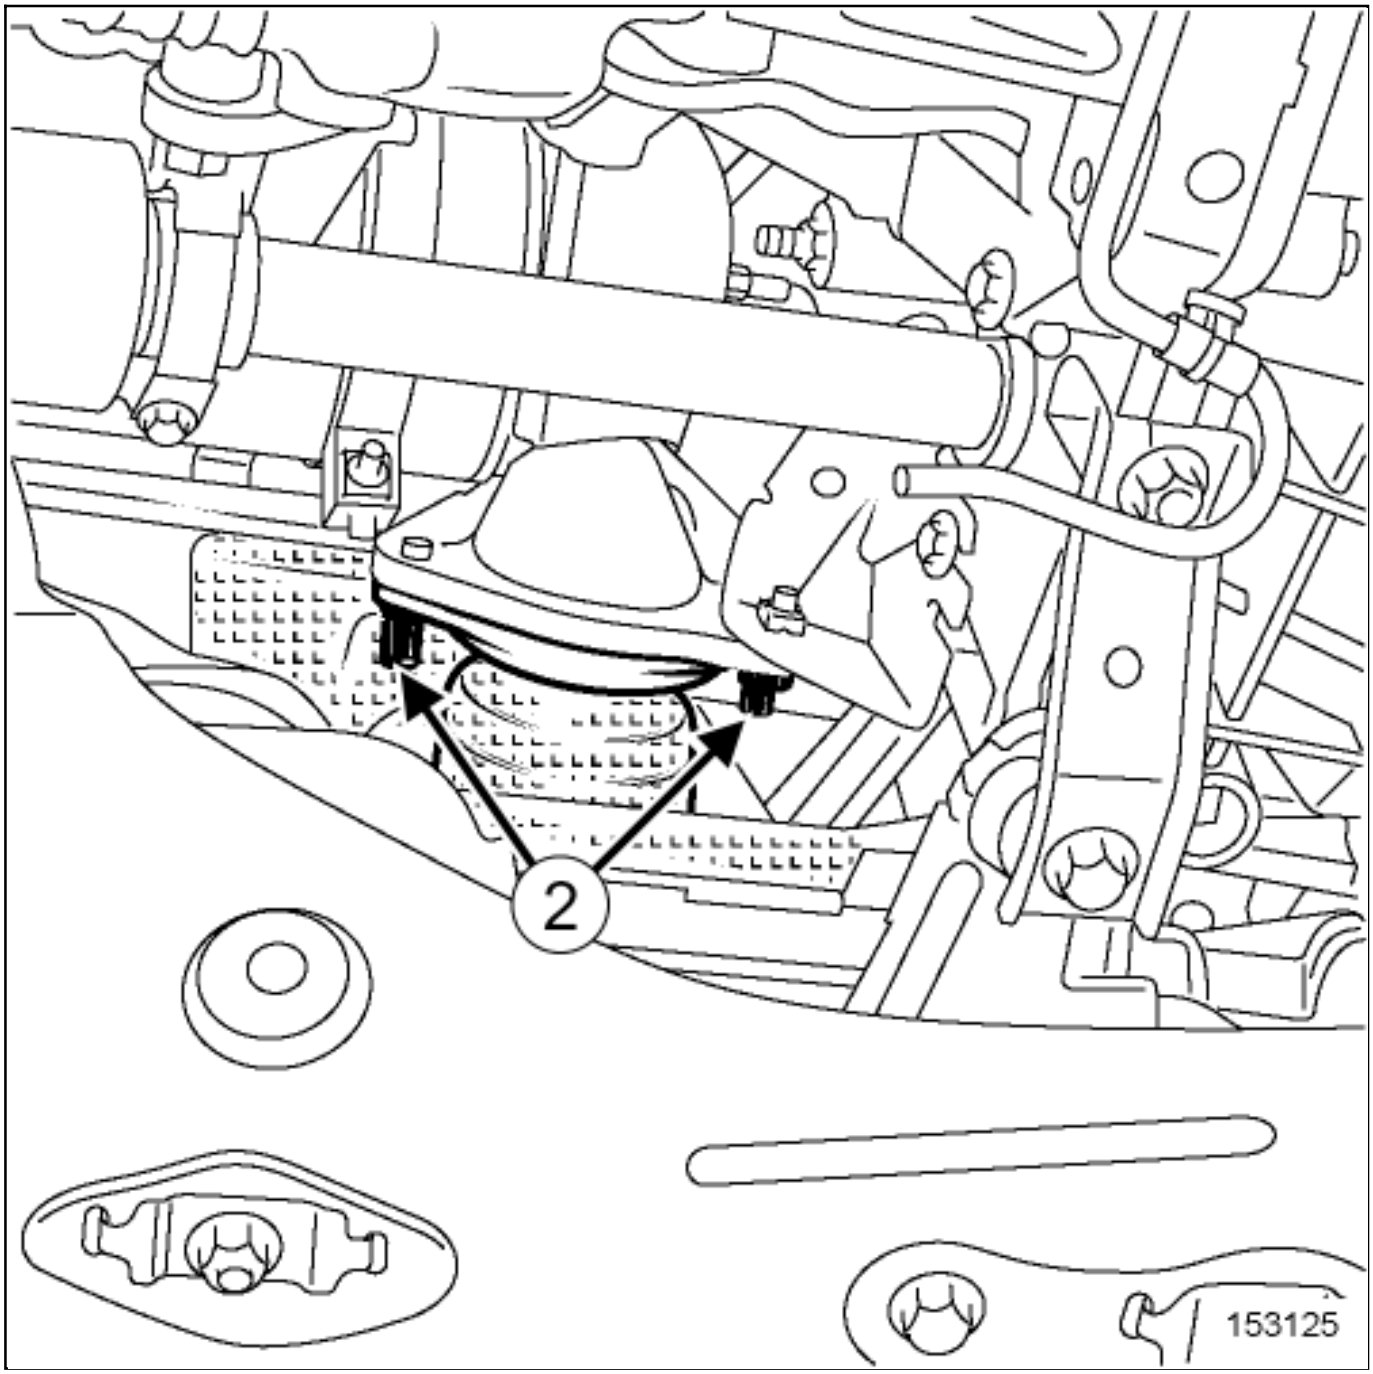
Any damaged heat shields must be replaced.

Location and specifications (tightening torques, parts always to be replaced, etc.)(see 19B, Exhaust, Exhaust assembly under body: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION



- Position the vehicle on a two-post liftVehicle: Towing and lifting .
- Remove the engine undertray.

2. REMOVAL OPERATION

- Place a component jackunder the exhaust pipe.
- Cut the exhaust pipe(see 19B, Exhaust, Exhaust: Precautions for the repair) between the intermediate pipe and the connecting hose in the designated area to be cut(see 19B, Exhaust, Exhaust assembly under body: Exploded view) .

Remove the bolt(1) of the rubber mounting bush of the exhaust connecting hose.

Remove (see 19B, Exhaust, Exhaust assembly under body: Exploded view) :

- the exhaust connecting hose nuts(2) ,
- the exhaust connecting hose,
- the exhaust connecting hose seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: seal between catalytic converter and exhaust downpipe

hose .

Use Surface cleaner Vehicle: Parts and consumables for the repair to clean the bearing faces of the catalytic converter and the exhaust connecting hose.

2. REFITTING OPERATION

Refit (see 19B, Exhaust, Exhaust assembly under body: Exploded view) :

- a new seal on the exhaust connecting hose,
- the exhaust connecting hose,
- the exhaust connecting hose nuts,
- the bolt of the rubber mounting bush of the exhaust connecting hose.

Fit a new After-Sales sleeve between the intermediate pipe and the connecting hose (see 19B, Exhaust, Exhaust: Precautions for the repair) .

WARNING

Position the "nut and bolt securing the sleeve" assembly so that the assembly cannot come into contact with the underbody.

Tighten the sleeve while supporting the exhaust pipe to ensure they are aligned.

3. FINAL OPERATION

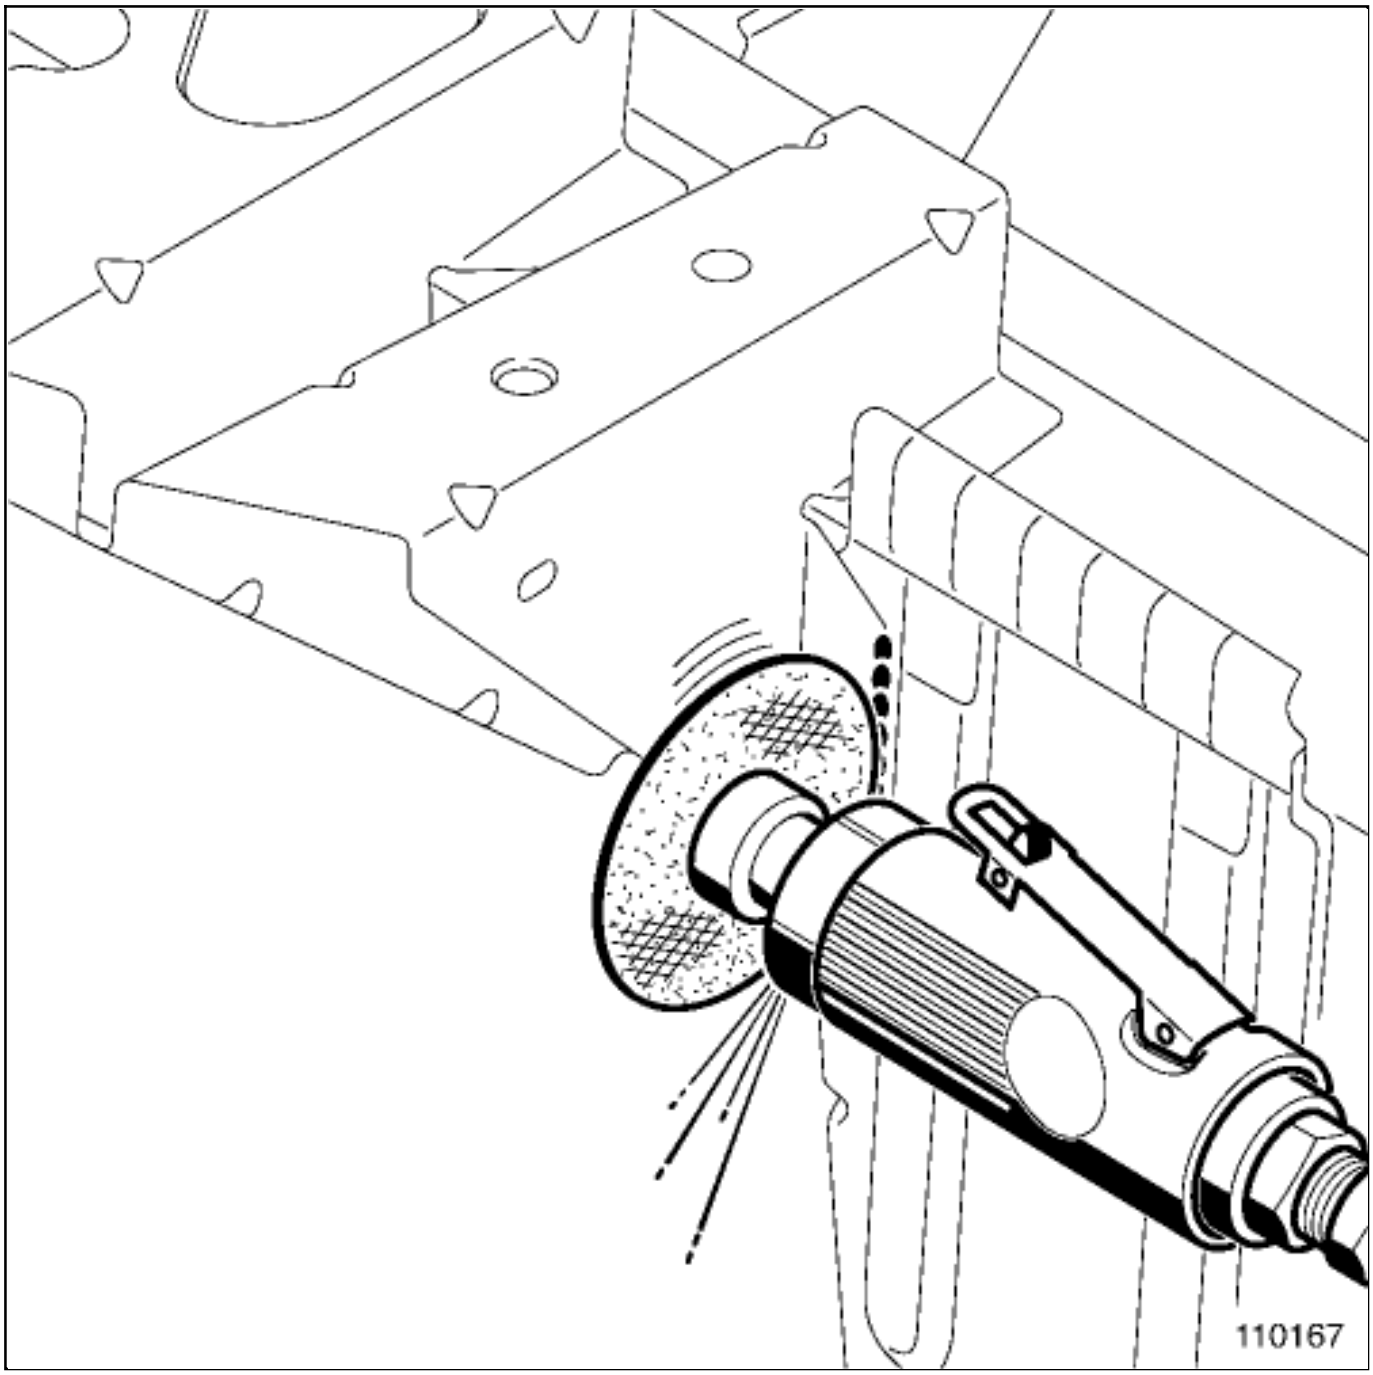
Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody,
- that there are no leaks.

Refit the engine undertray.

CONNECTIONS BY ARC WELDING UNDER SHIELDING GAS: DESCRIPTION

1. DISASSEMBLY



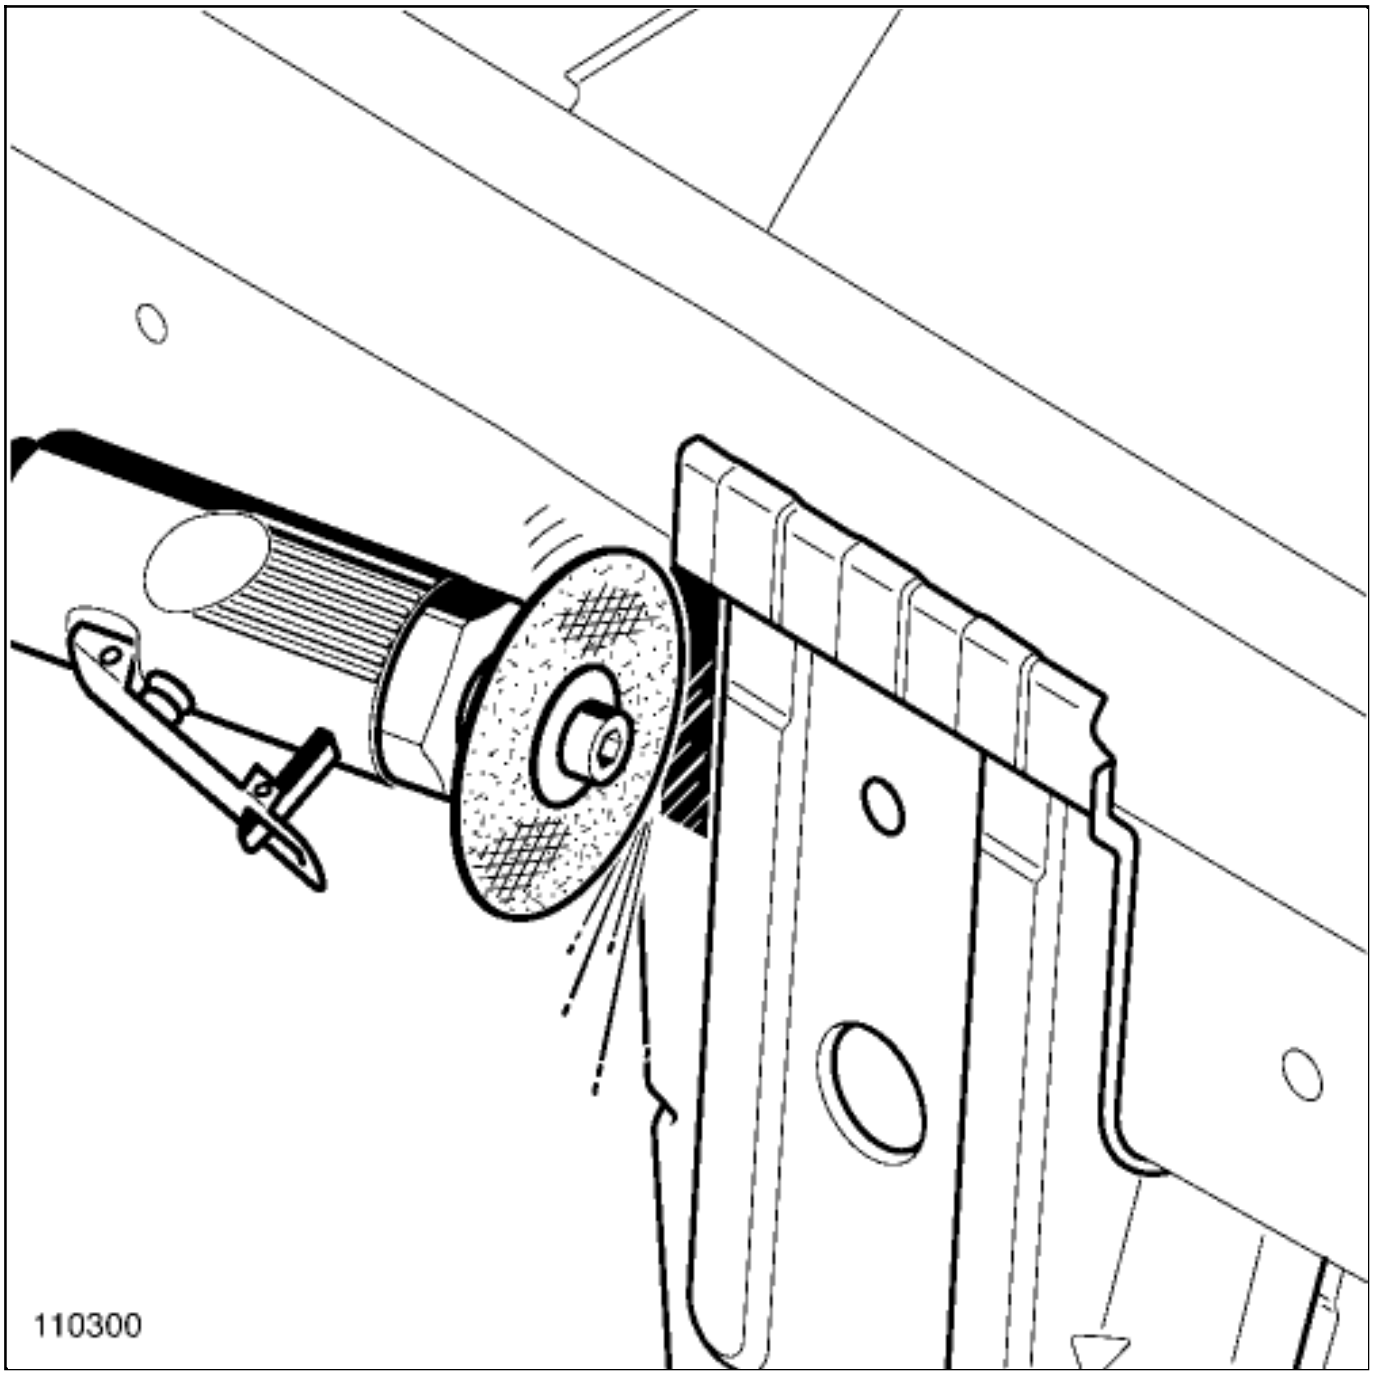
1- SCOURING

If necessary, scour the joint line to bring out the weld bead:

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- UNPICKING



Unpick the weld bead.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

3- GRINDING

Grind the welding residue.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the mating face.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

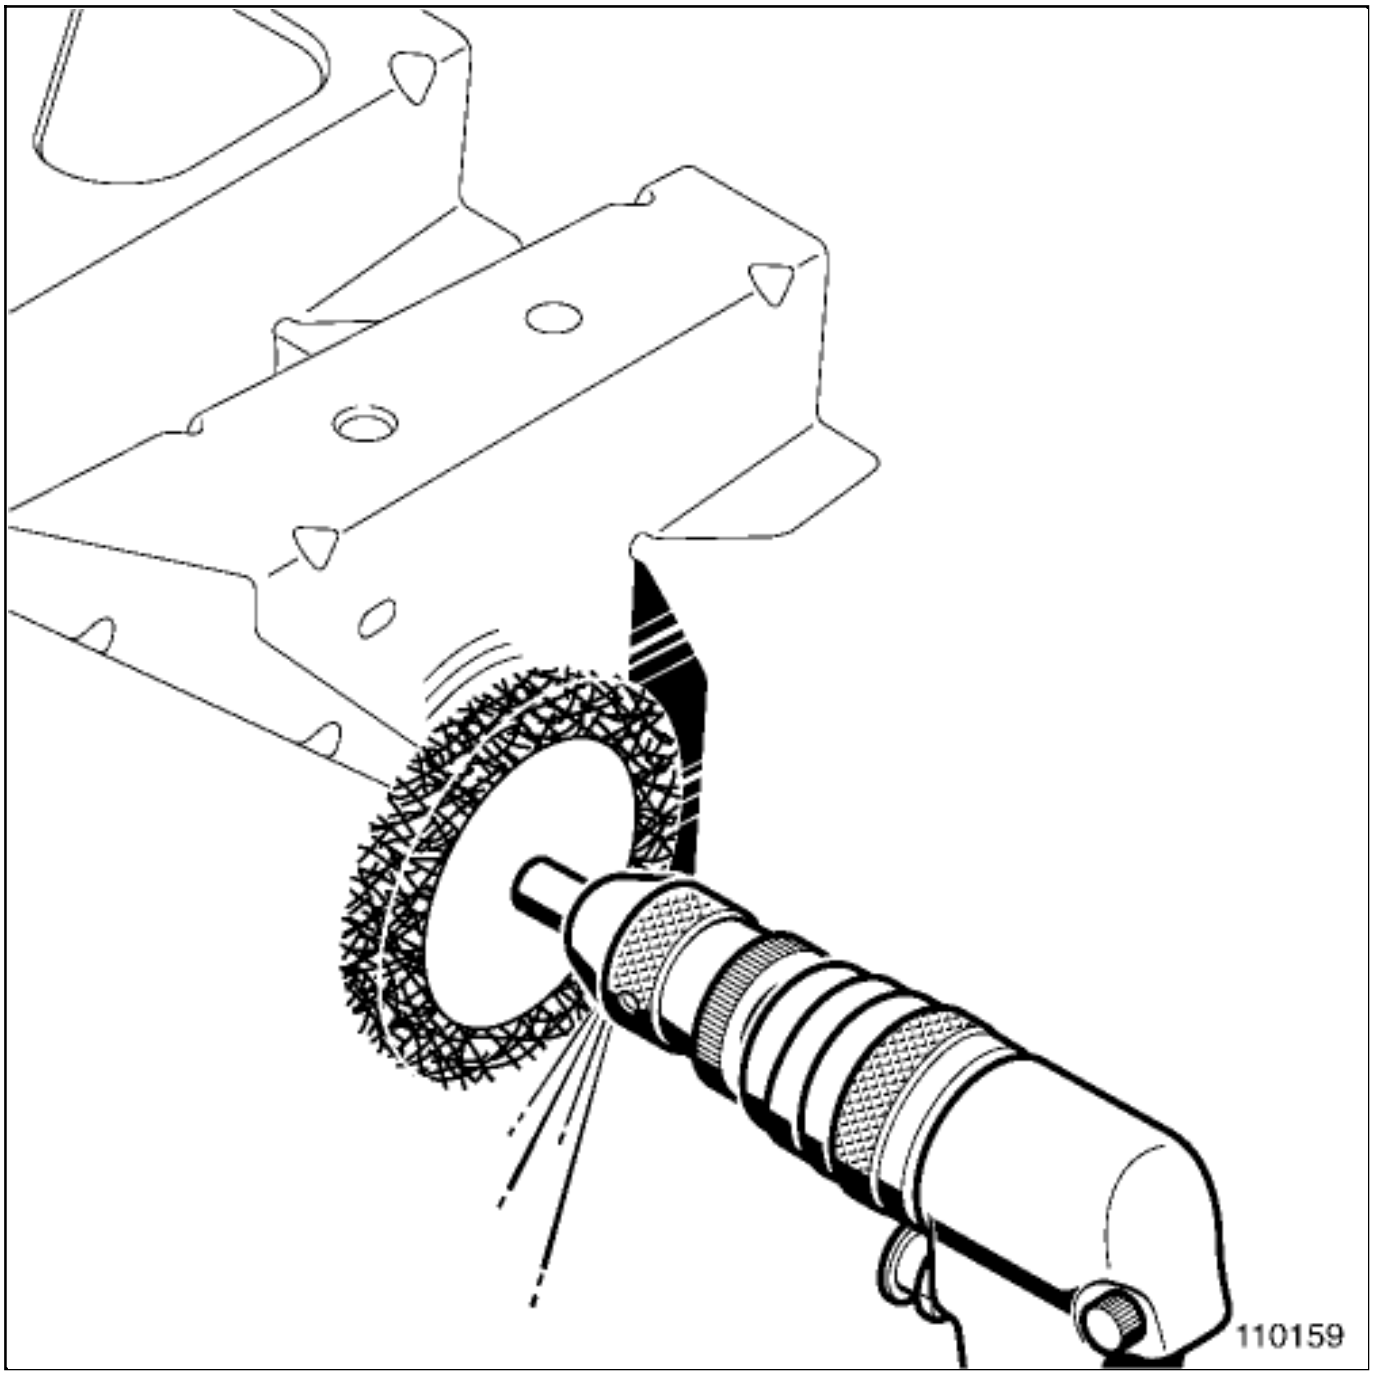
Do not strike or damage the panel.

2. PREPARATION BEFORE ASSEMBLY

1- POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint zones.

Remove the replacement part.

3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Scour the external mating face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal joint mating faces.

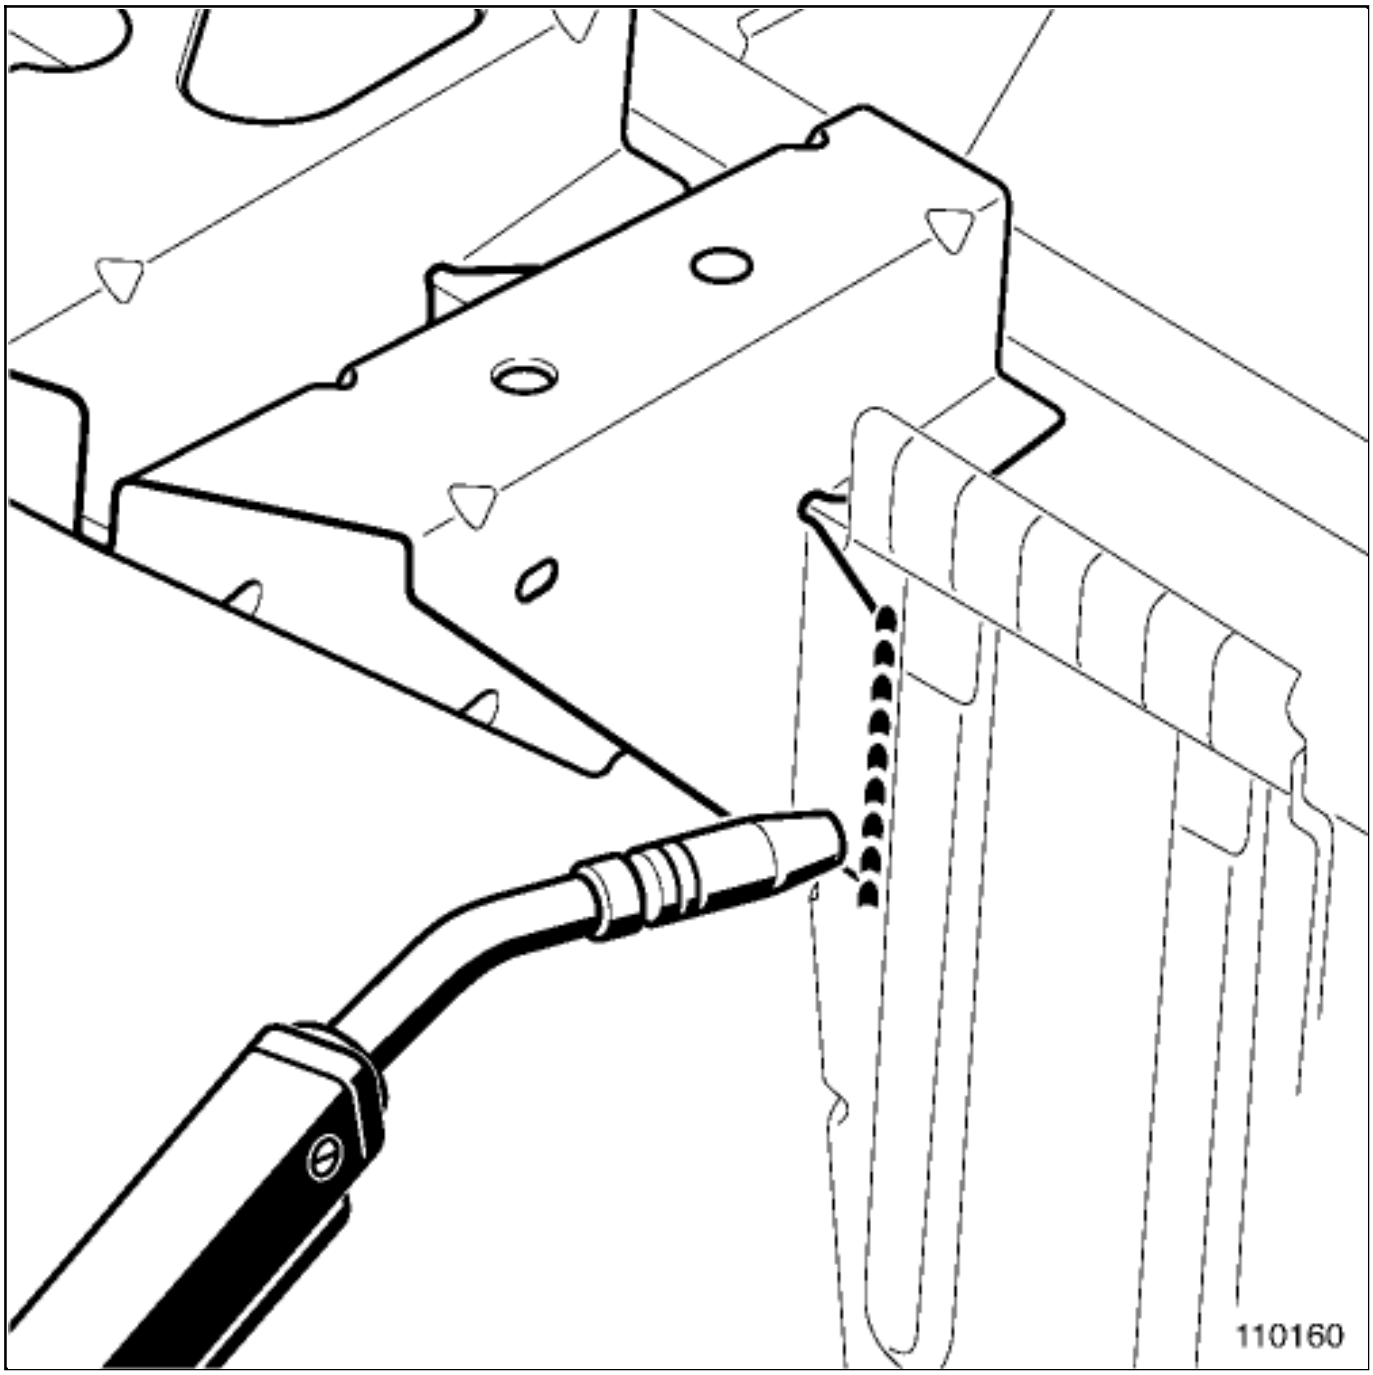
(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3. ASSEMBLY

1- POSITIONING AND ADJUSTING THE REPLACEMENT PART

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- ADJUSTING THE WELDER

Before working on the vehicle, follow the procedure below:

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

3- WELDING

Make the weld bead, the same length and in exactly the same position as the original.

4- FINISHING

No finishing is required on this type of weld; the appearance should be identical to the original.

CONNECTIONS BY ARC WELDING UNDER SHIELDING GAS: PRECAUTIONS FOR THE REPAIR

Note, one or more warnings are present in this procedure

Special tooling required	
Kit for checking weld seams.	Car. 1779
Set of replacement test pieces for tool Car. 1779	Car. 1800

1. INTRODUCTION

1-PURPOSE

The purpose of this document is to provide the information necessary for making quality GMAW welds by describing the procedure to apply to define the correct resistance weld parameters, for three types of joint:

- fillet weld,
- butt weld,
- plug weld.

These tests alone validate the weld parameters and guarantee the result in terms of repair quality.

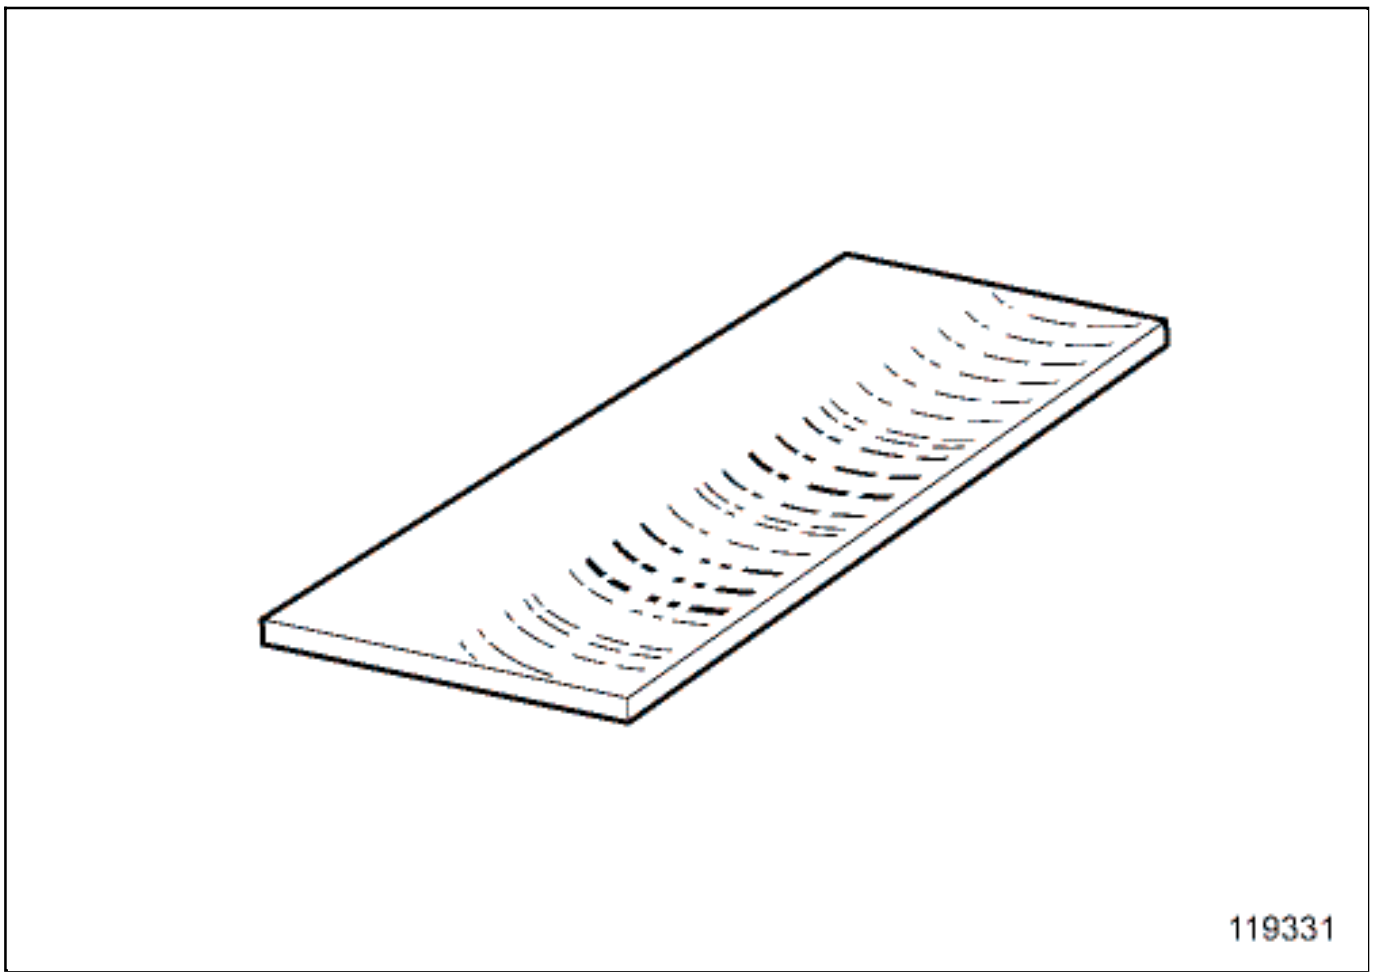
Note:

These procedures should be applied before each welding operation, according to the joint and/or stack.

2- PROCEDURE

- Consult the vehicle MR,
- Carry out the weld test,
- Interpret the results,

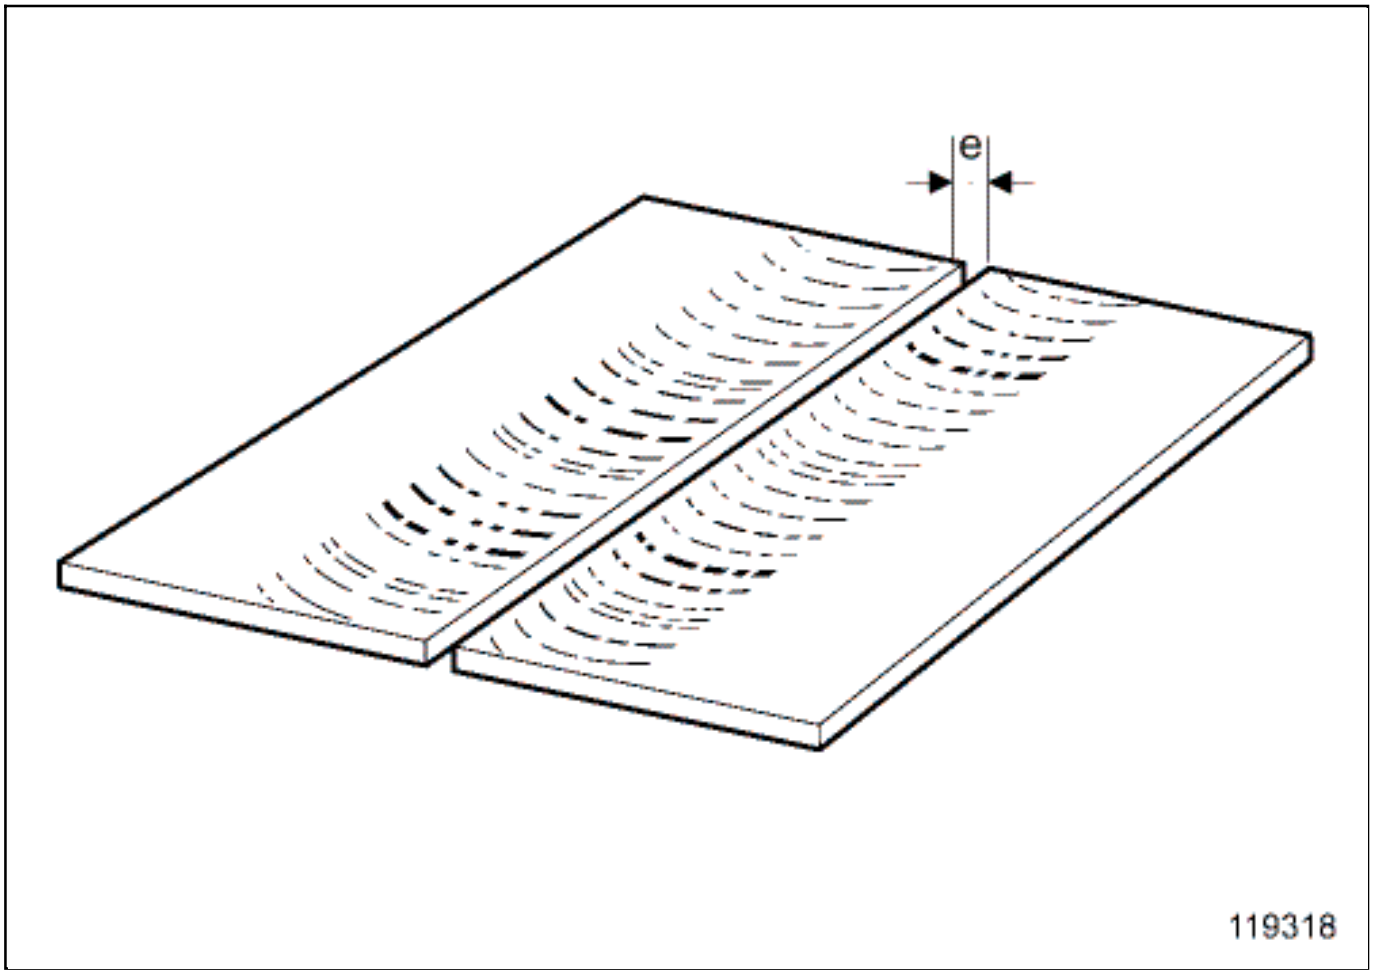
Use the remedial measures if necessary.



3- TEST PERFORMANCE CONDITIONS

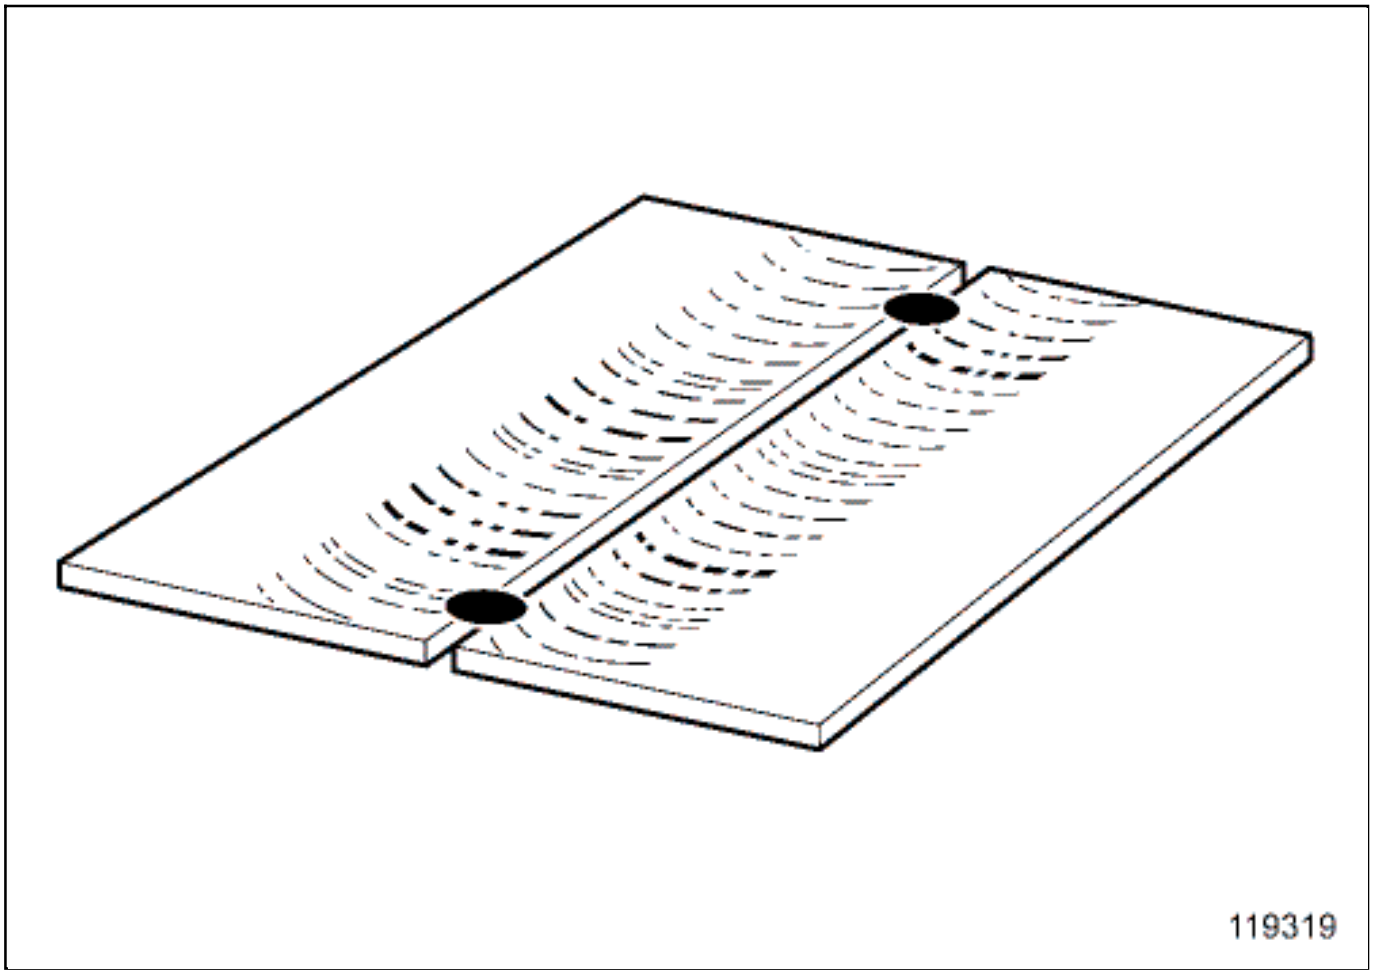
All tests should be performed using the weld validation kitKit for checking weld seams.(Car. 1779), and the set of replacement part test specimensSet of replacement test pieces for tool Car. 1779(Car. 1800).

2. BUTT WELDING TEST PROCEDURE



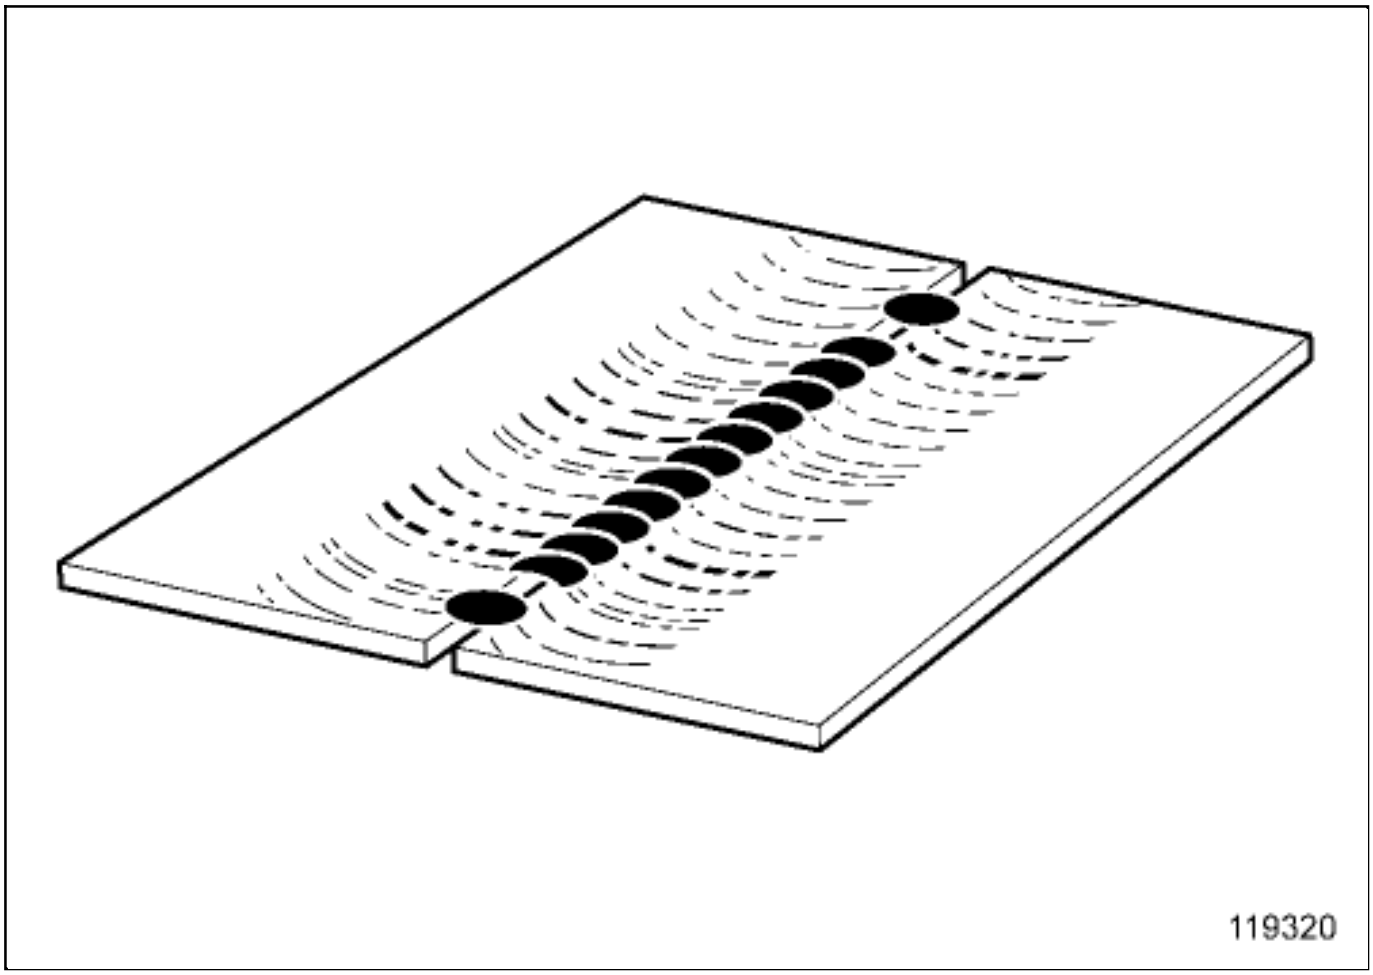
1- PREPARATION BEFORE ASSEMBLY

Select test specimens that are representative of the assembly being tested.



Prepare the test specimens in the same way as the vehicle.

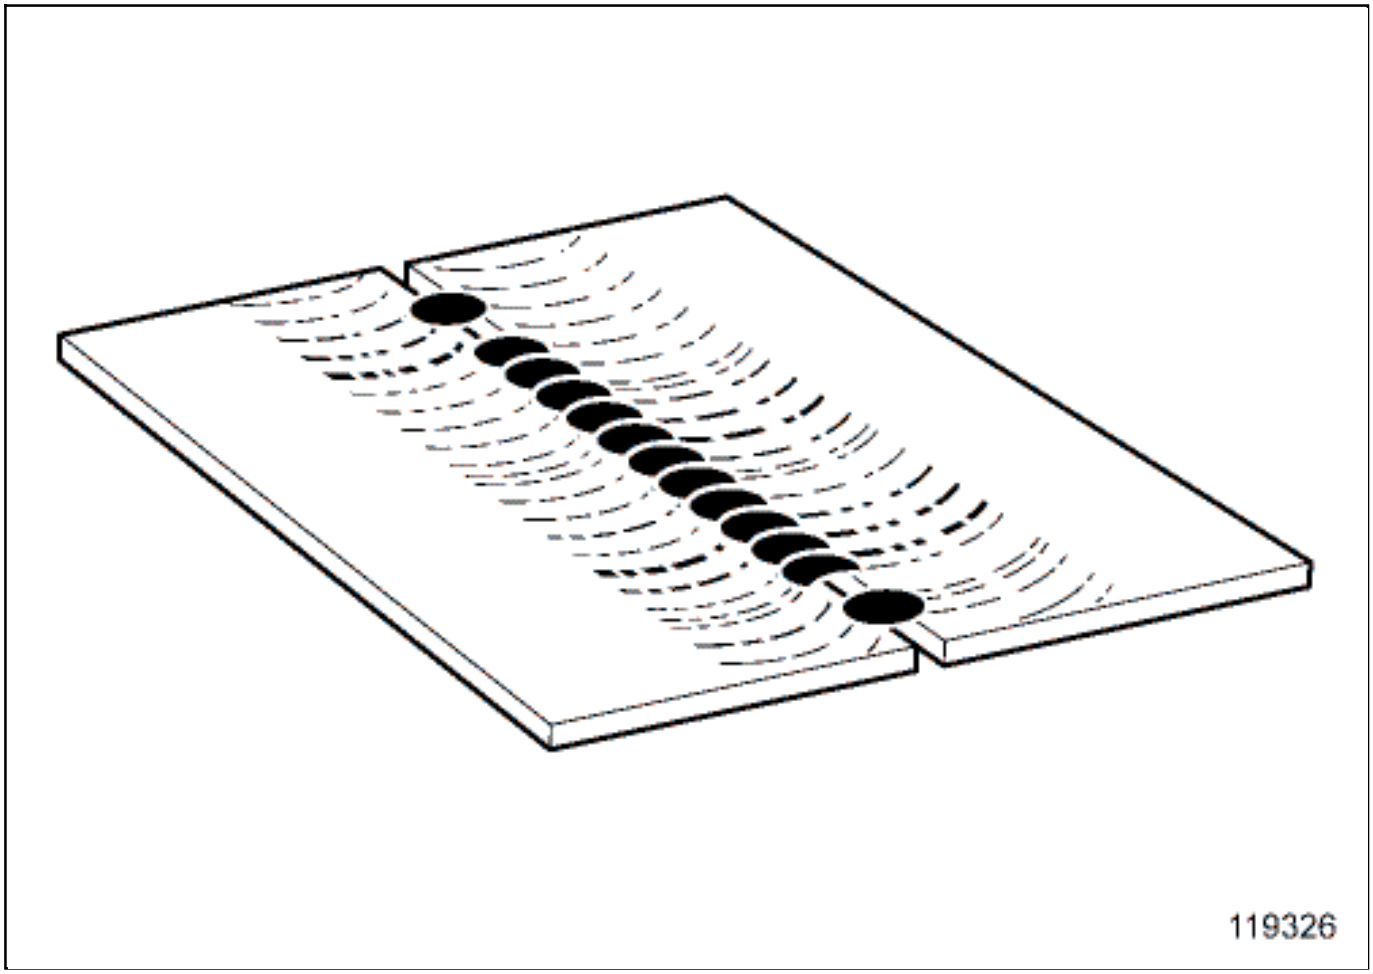
(see 40E, Partial replacement connections, Connections for edge to edge partial replacements: Description)



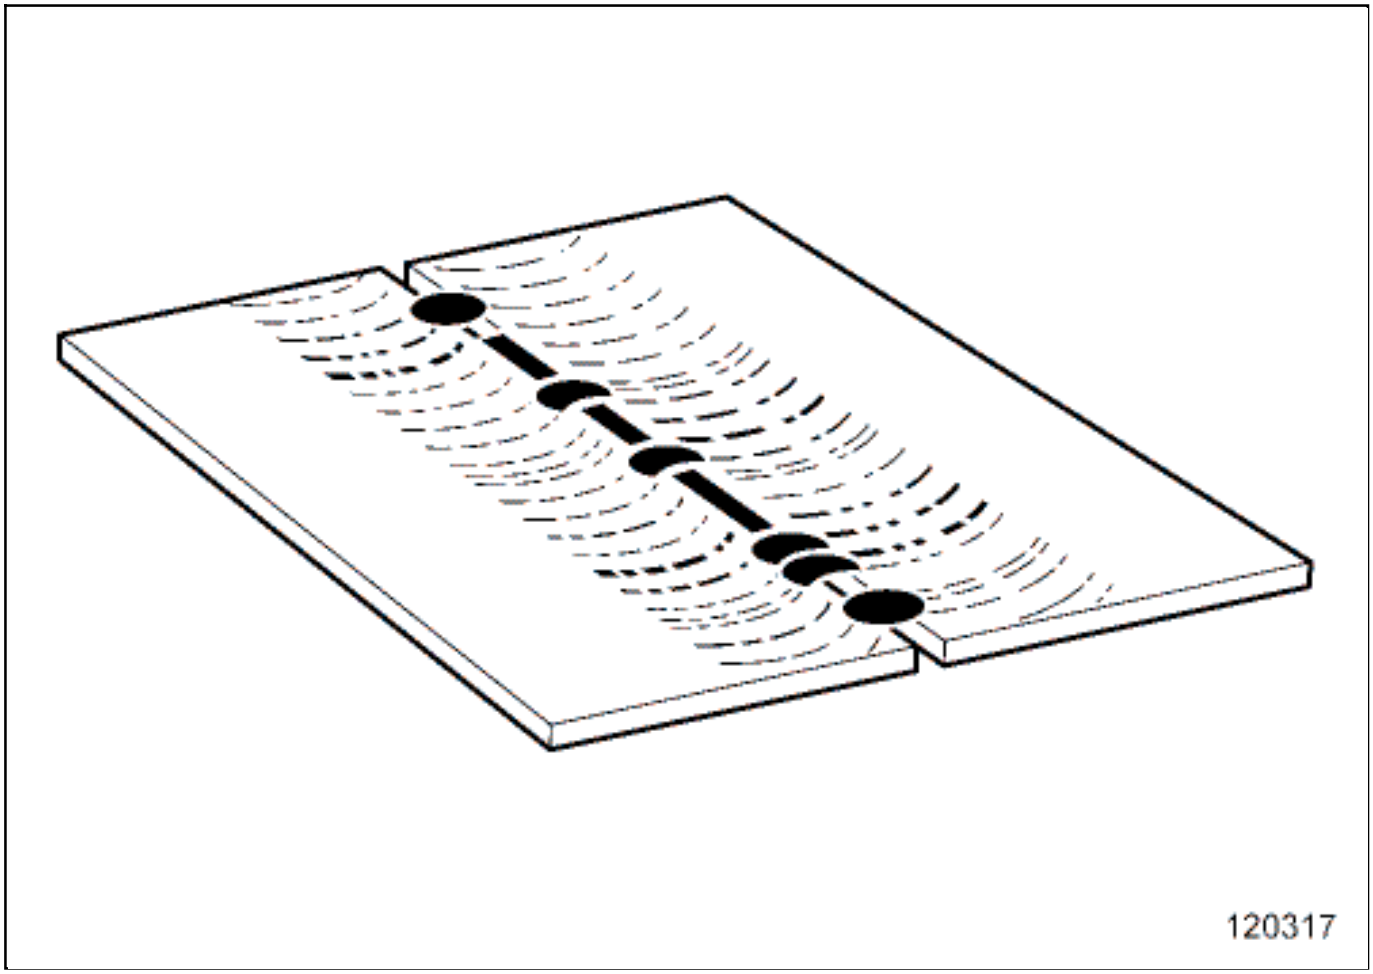
Adjust and secure the test specimens, leaving a clearance(e) equal to the thinnest measurement.

Make two holding spots at each end.

2- ASSEMBLY



Make an 80 mmlong bead of chain weld.



3- CHECK

Check that the bead of chain weld has penetrated the internal face of the assembly.

ACCEPTABLE CHAIN WELD BEAD - CONTINUOUS PENETRATION

UNACCEPTABLE CHAIN WELD BEAD - INCOMPLETE PENETRATION

Penetration should be continuous along the length of the weld.

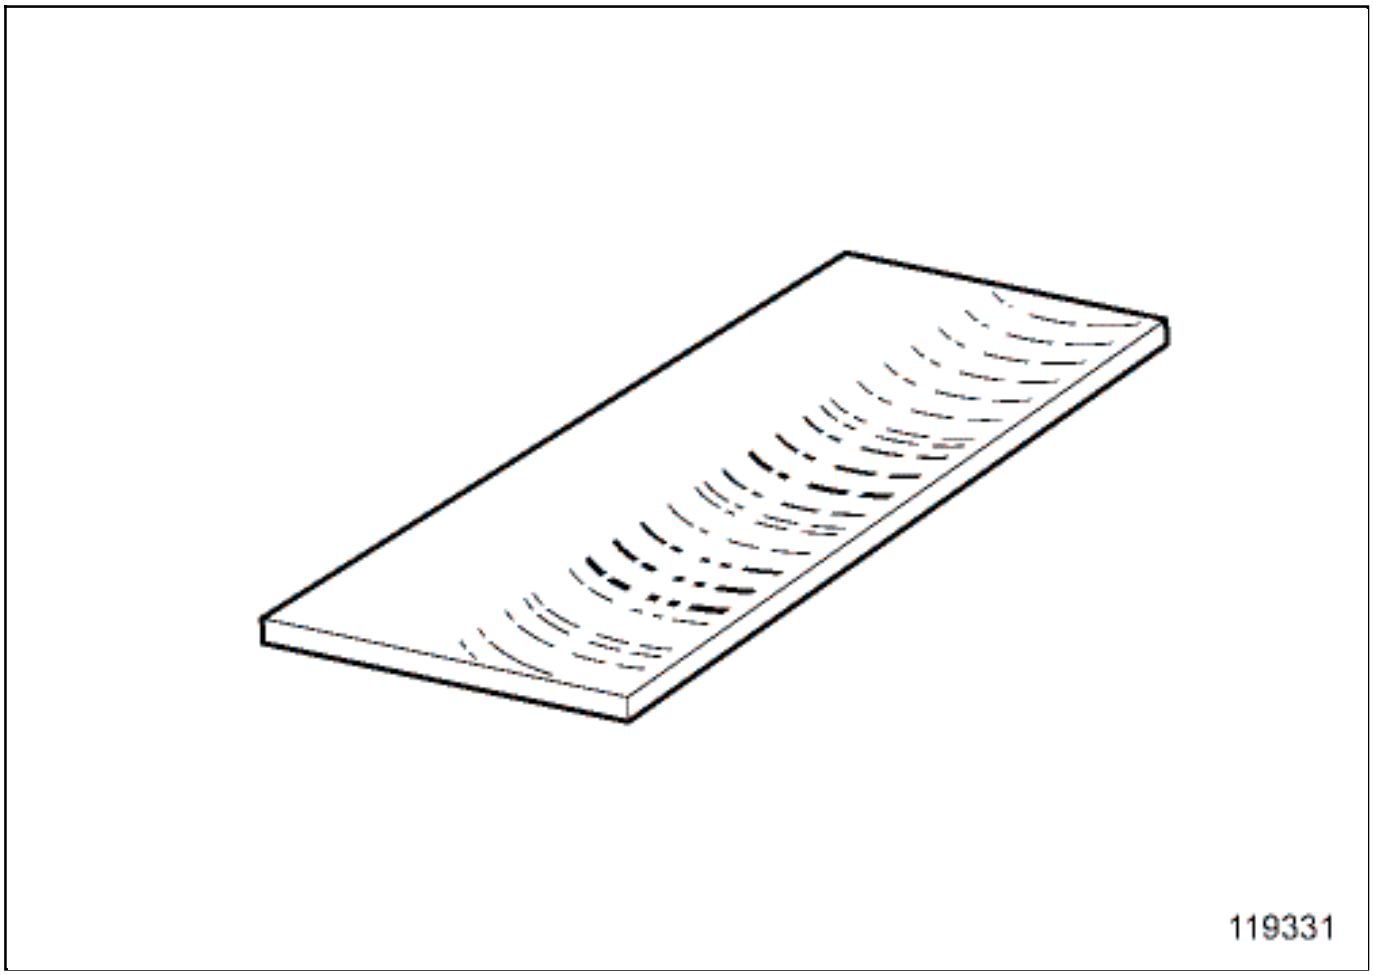
The bead of chain weld should be as wide on the internal face as on the external face.

4- SOLUTIONS

If there is incomplete or no penetration:

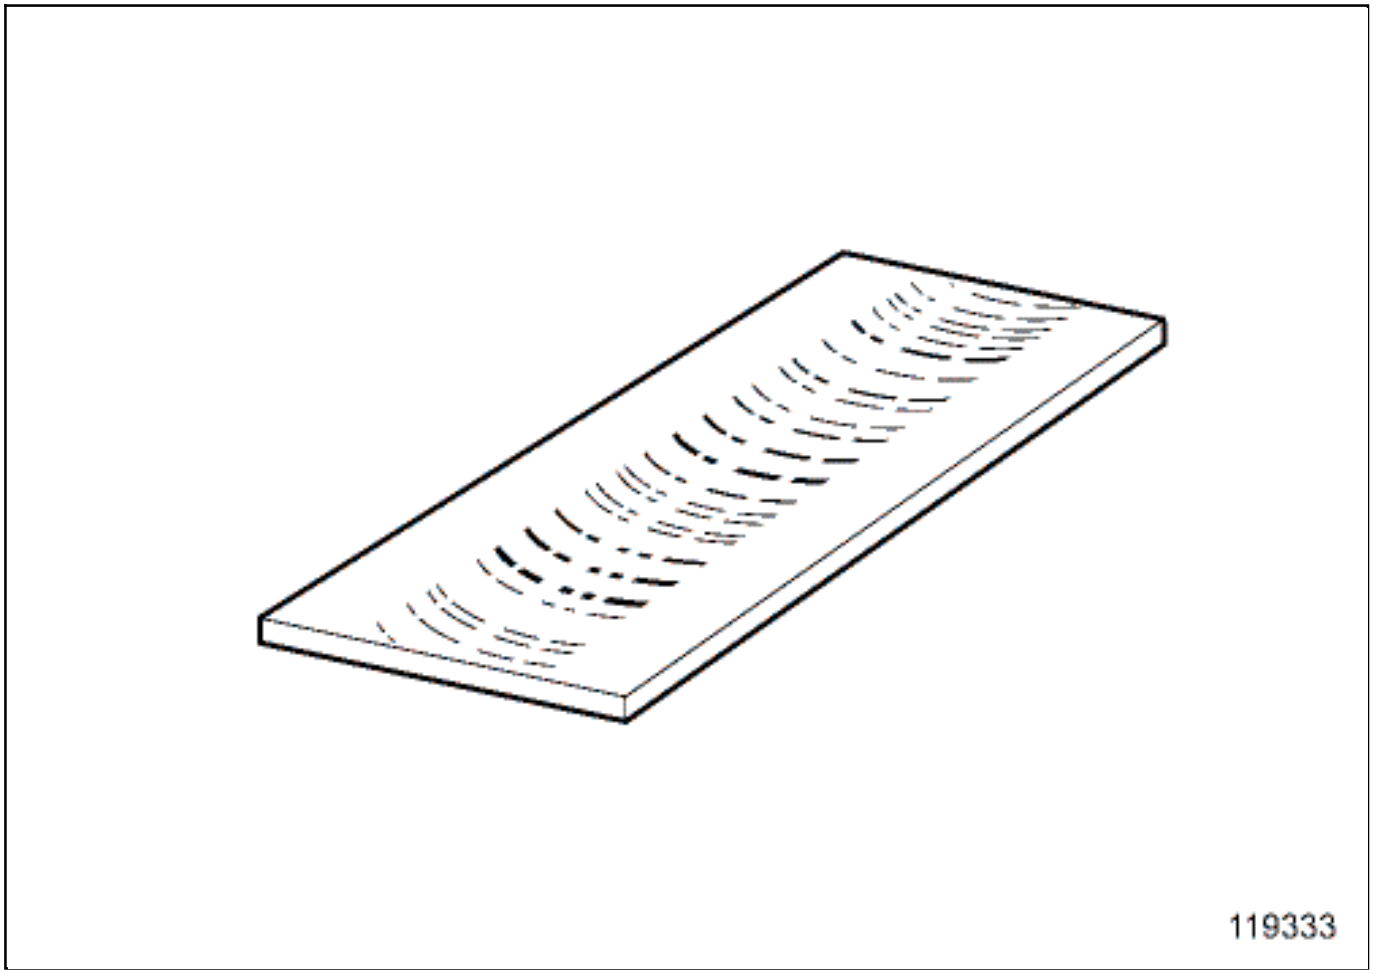
- Increase the weld current to improve its penetration,
- If the current is already at maximum, increase the gap between the panels and the weld time.

Note:



A new weld check must be carried out if any settings are adjusted.

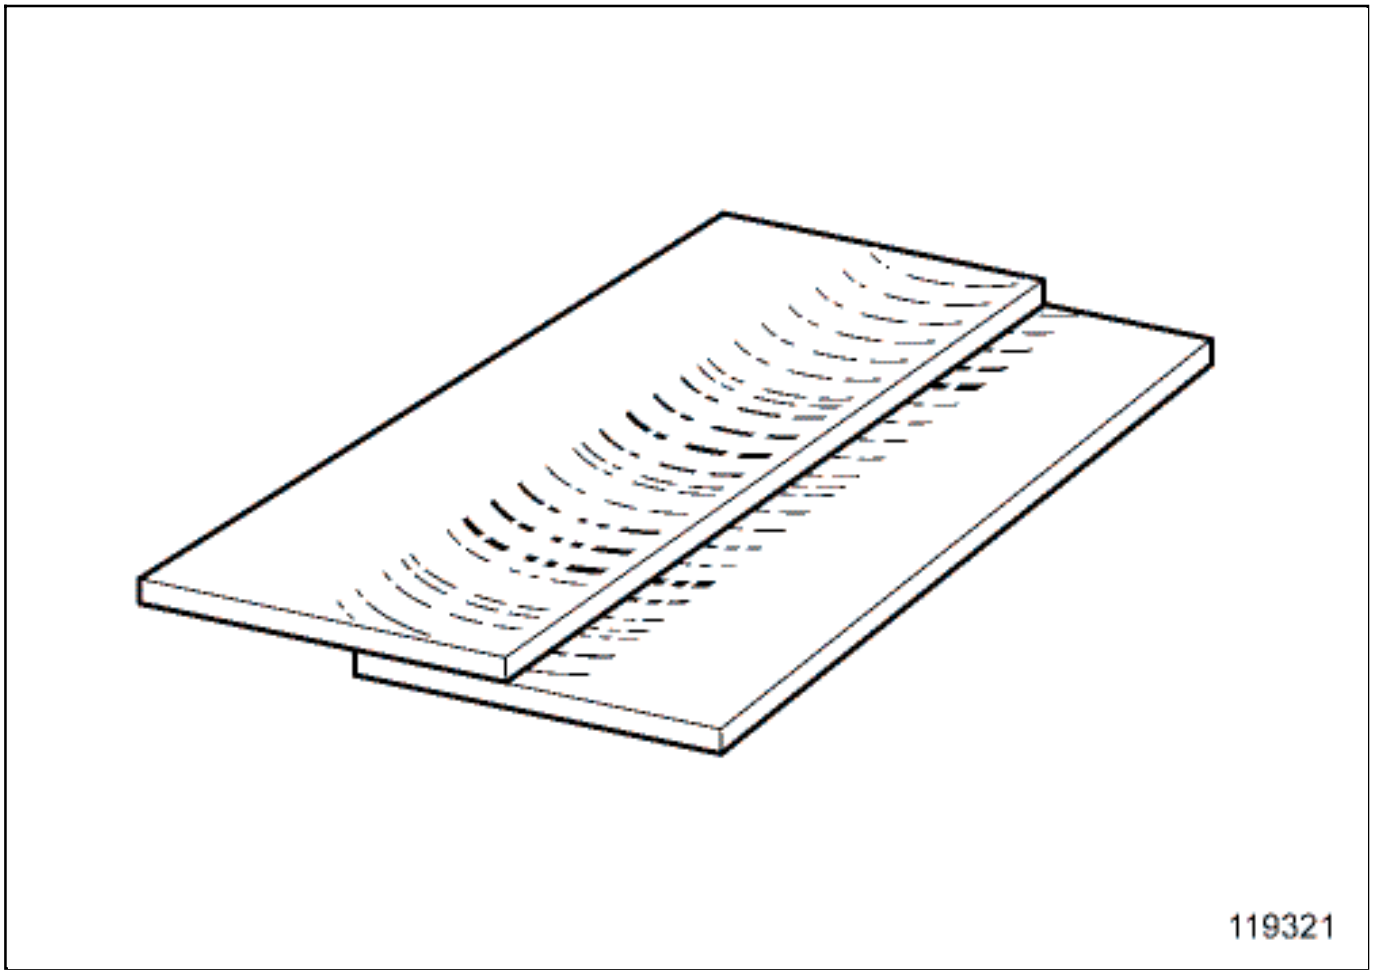
3. FILLET WELD TEST PROCEDURE



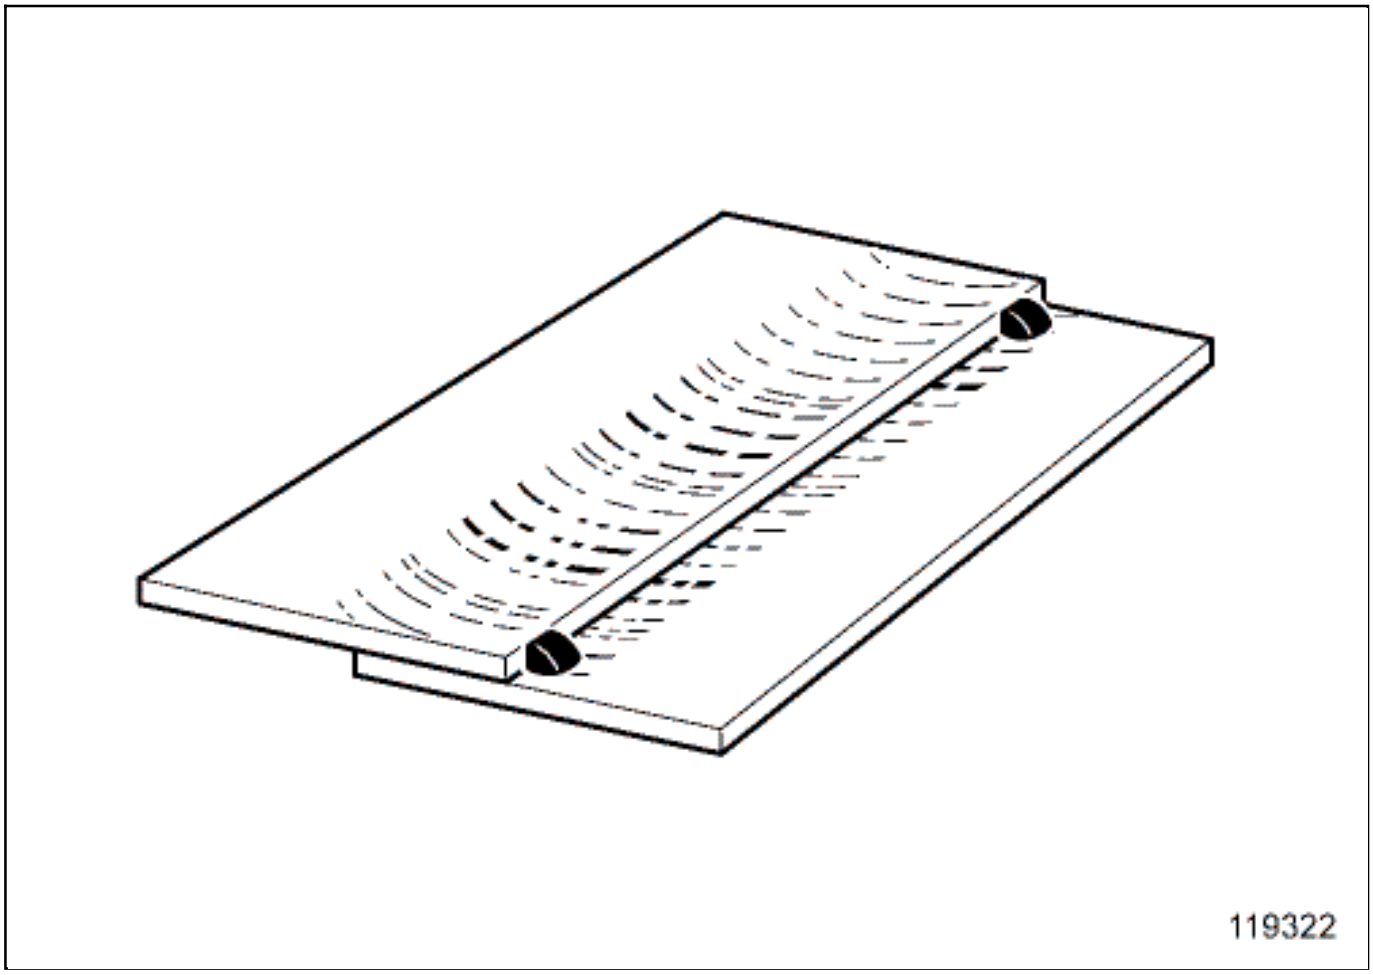
1- PREPARATION BEFORE ASSEMBLY

Select test specimens that are representative of the assembly being tested.

UPPER TEST SPECIMEN

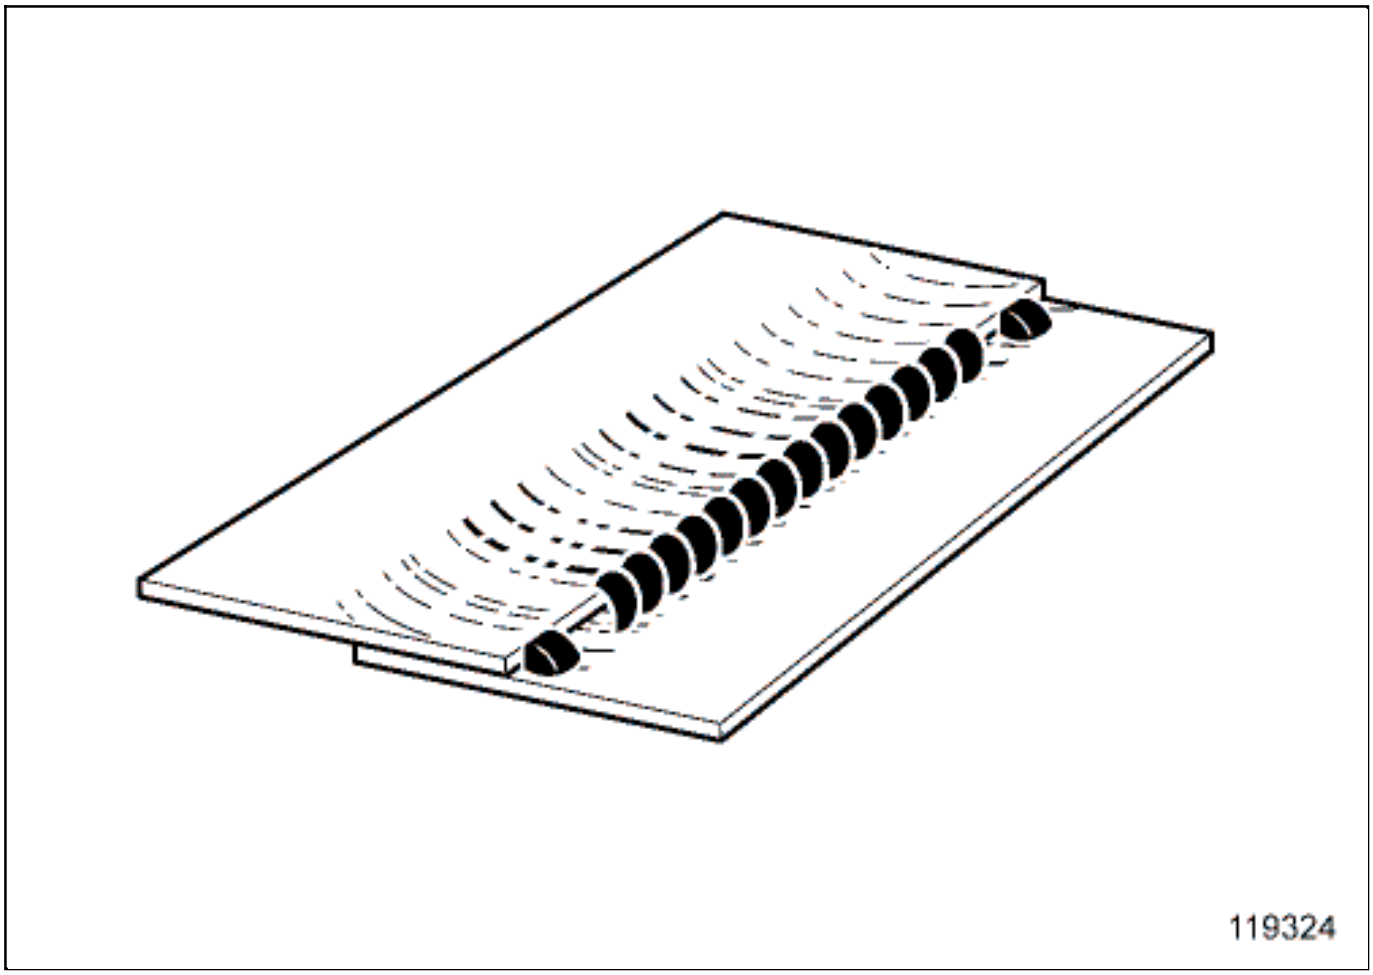


LOWER TEST SPECIMEN

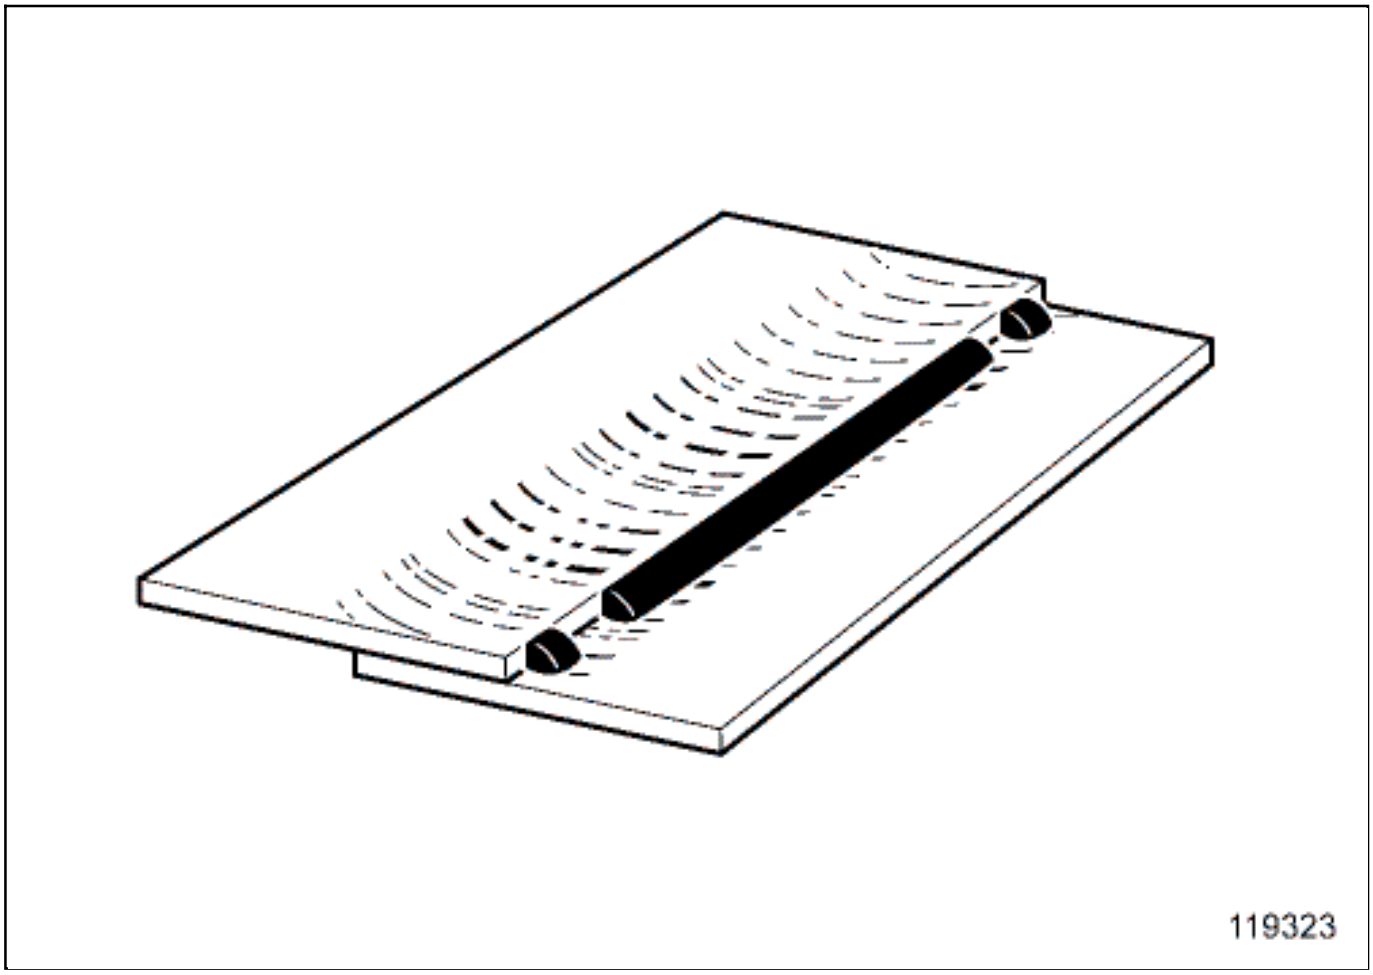


Prepare the test specimens in the same way as the vehicle.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

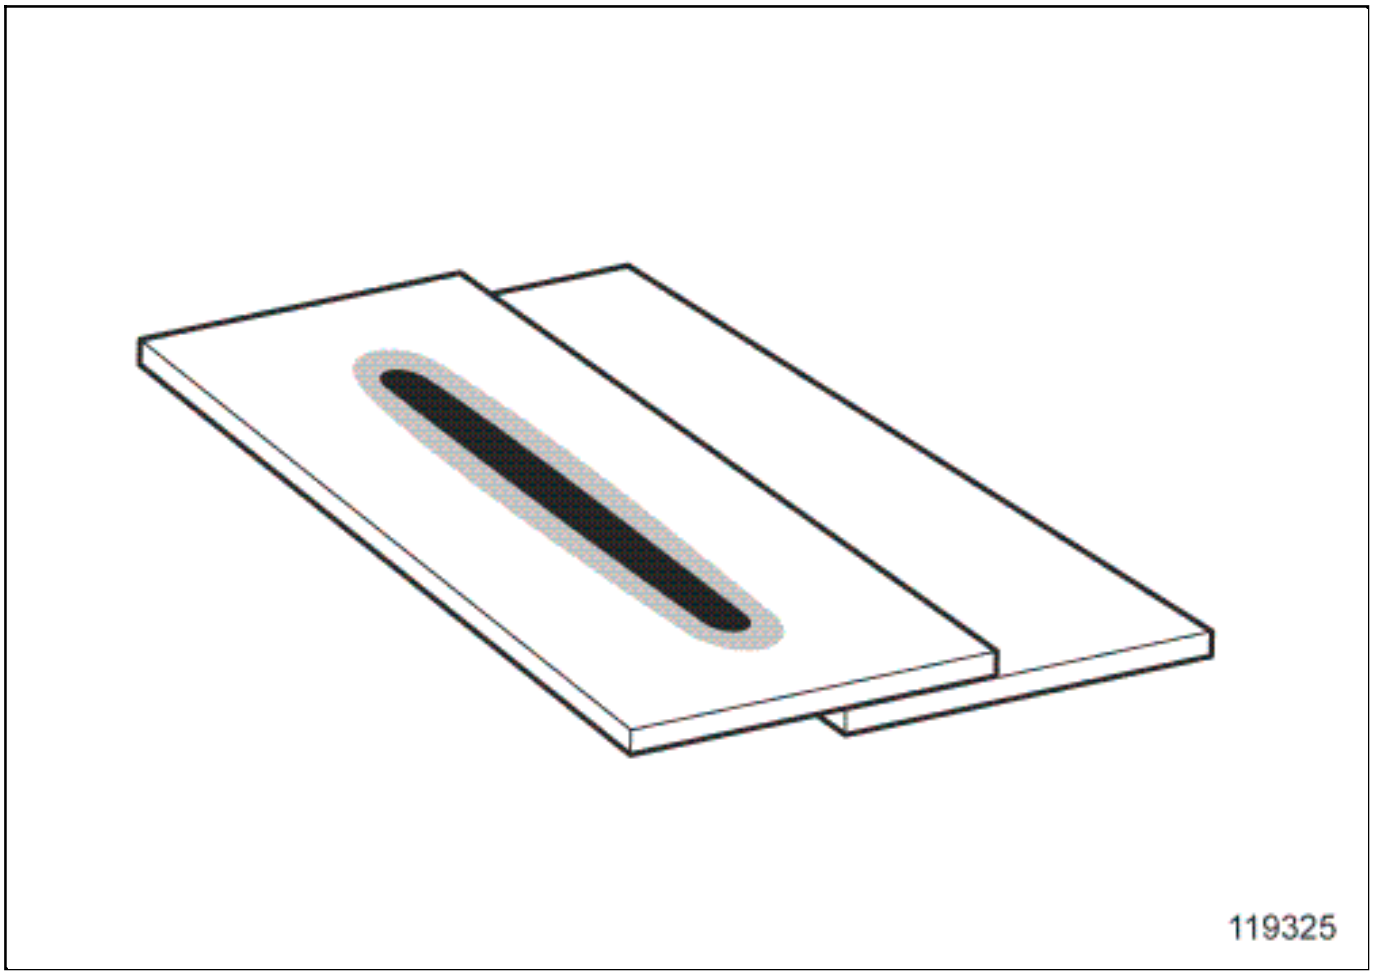


Adjust and secure the test specimens, half overlapping them.

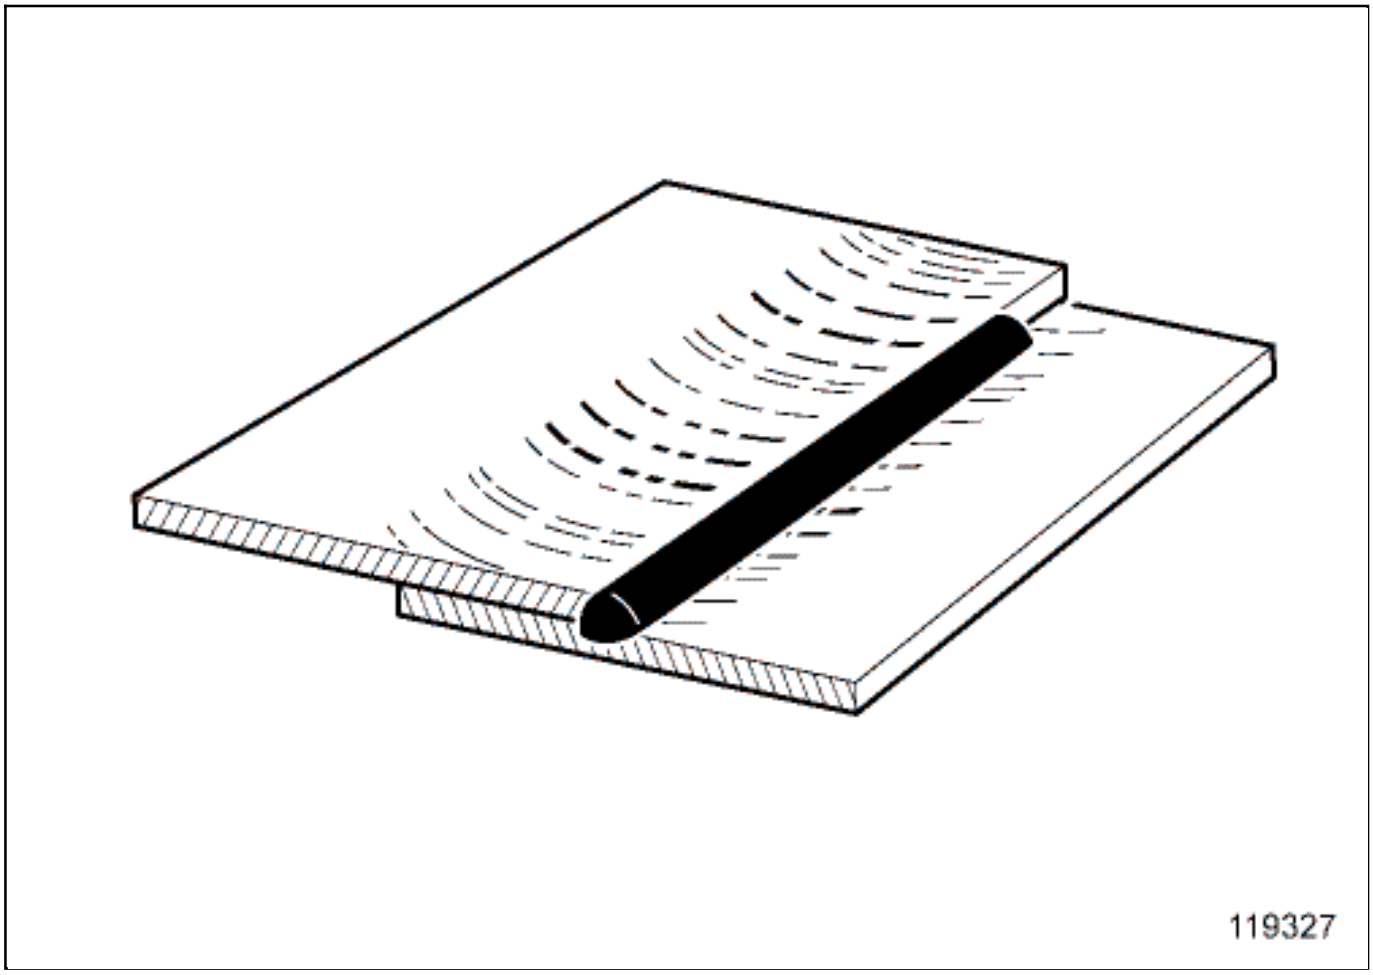


Make two holding spots at each end.

2- ASSEMBLY



Make an 80 mmlong bead of chain weld, for thin assemblies= "less than 1.5 mm".



Make an 80 mm long continuous weld bead, for thick assemblies= "greater than 1.5 mm"

3- CHECK

Check that the bead has penetrated the internal face of the assembly.

Penetration should be continuous along the length of the weld.

Note:

For thick assemblies, penetration is not always visible on the internal face.

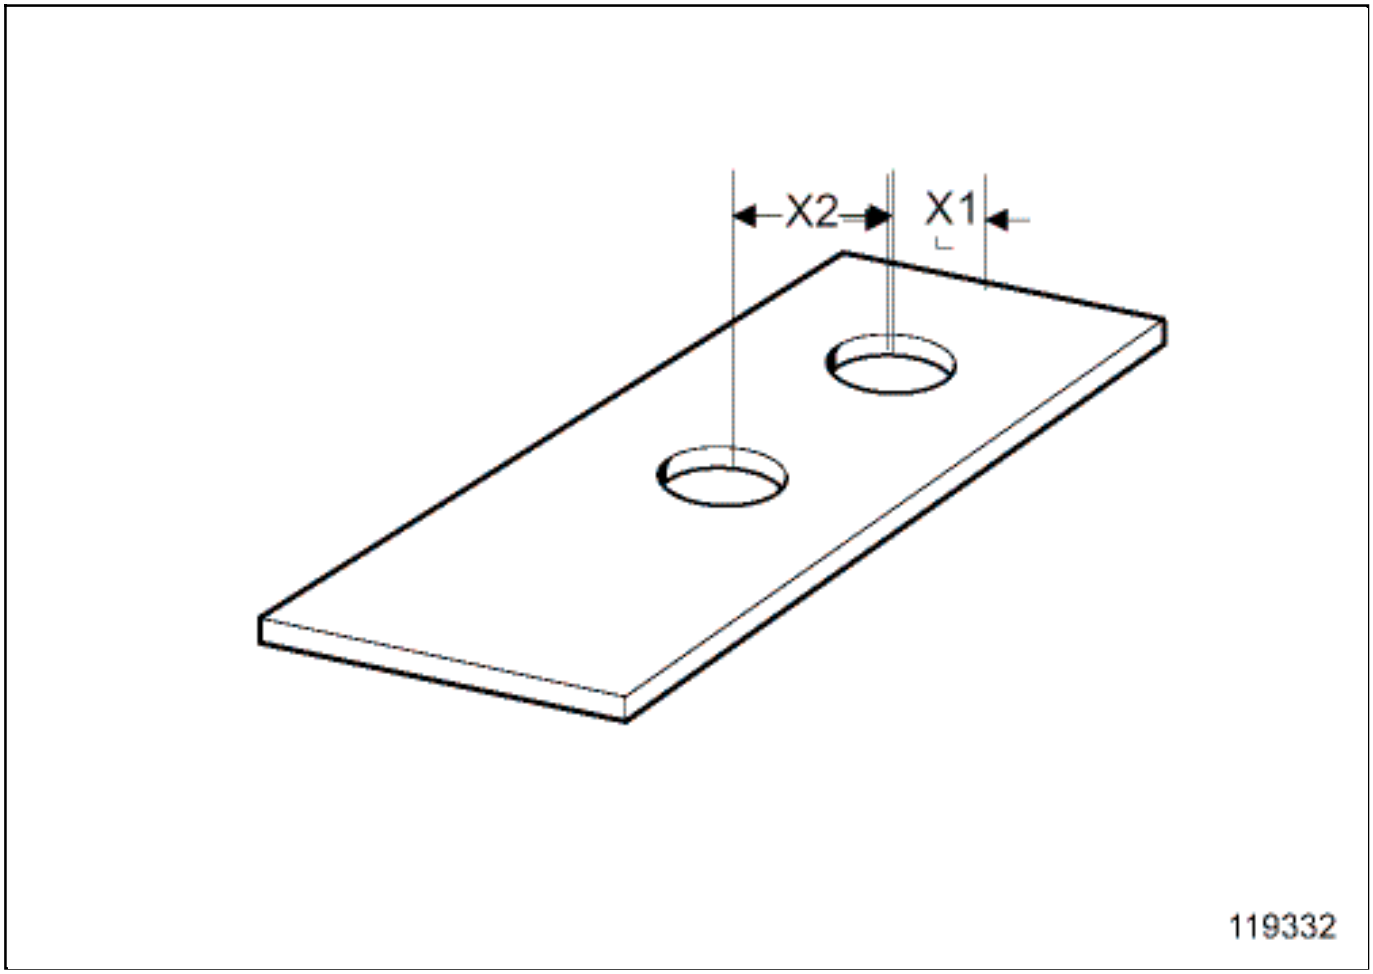
Cut the assembly in the middle.

Check that the bead has penetrated.

4- SOLUTIONS

If there is incomplete or no penetration:

- Increase the weld current to improve its penetration,
- If the current is already at maximum, increase the welding time.



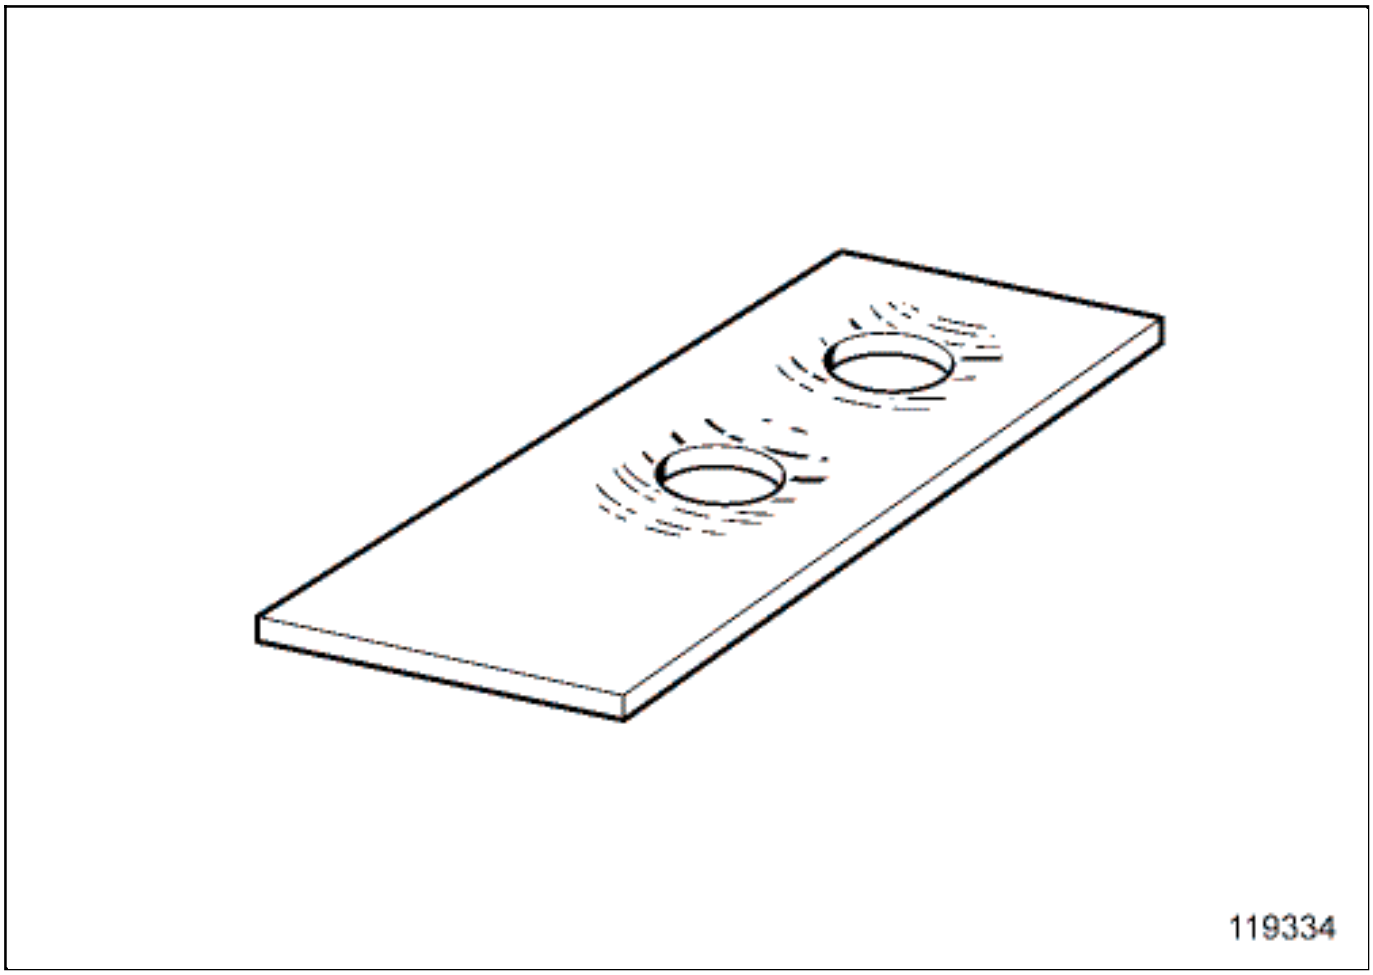
Note:

A new weld check must be carried out if any settings are adjusted.

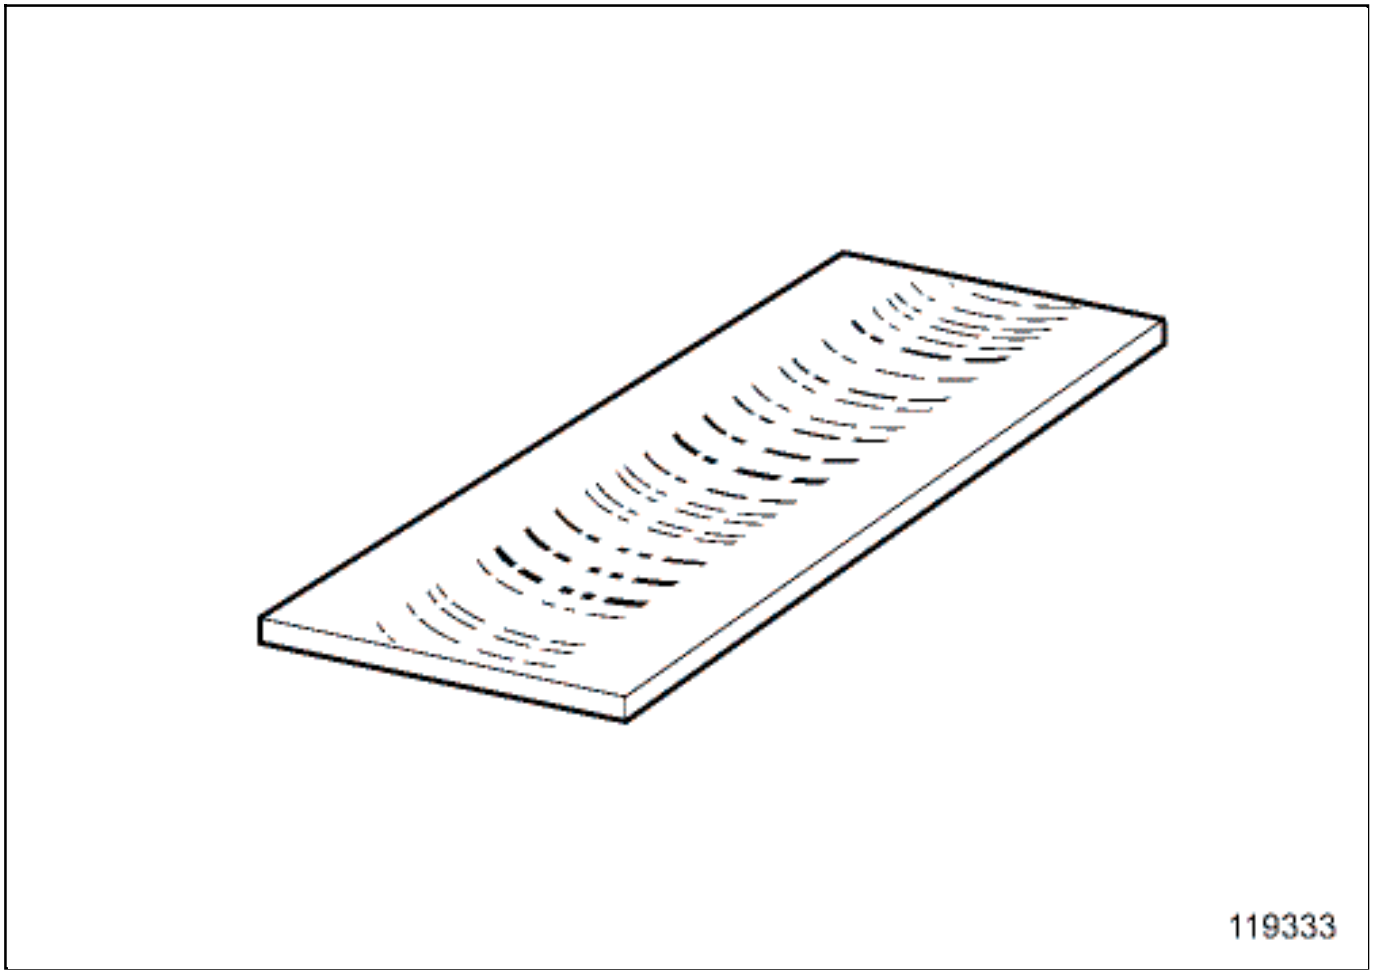
4. PLUG WELD TEST PROCEDURE

1- PREPARATION BEFORE ASSEMBLY

Select test specimens that are representative of the assembly being tested.

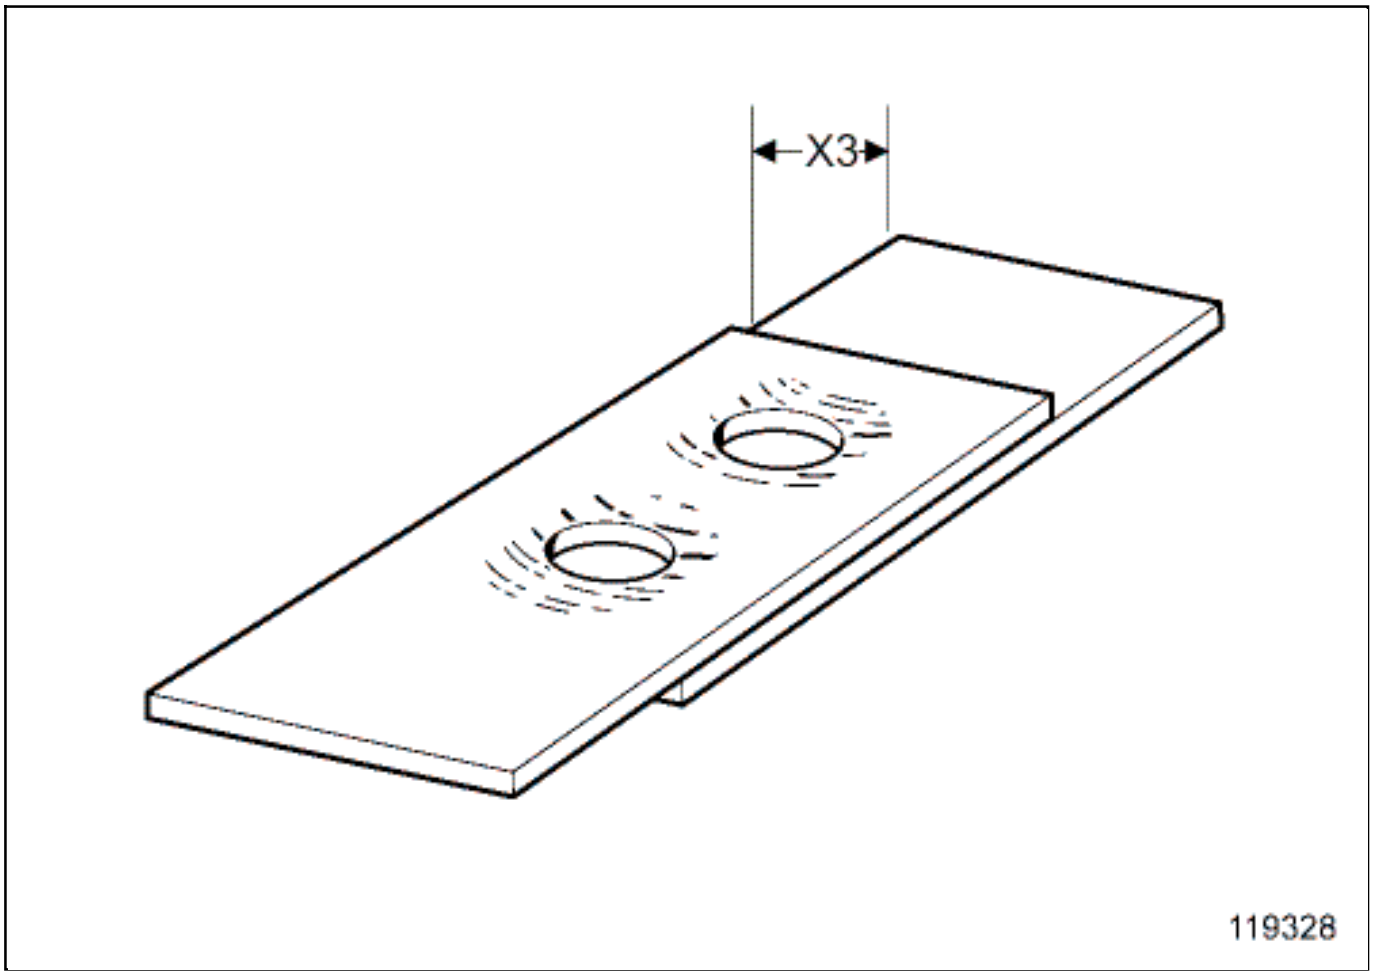


Drill the test specimen, respecting the positioning values, and the following table for the drilling diameters:



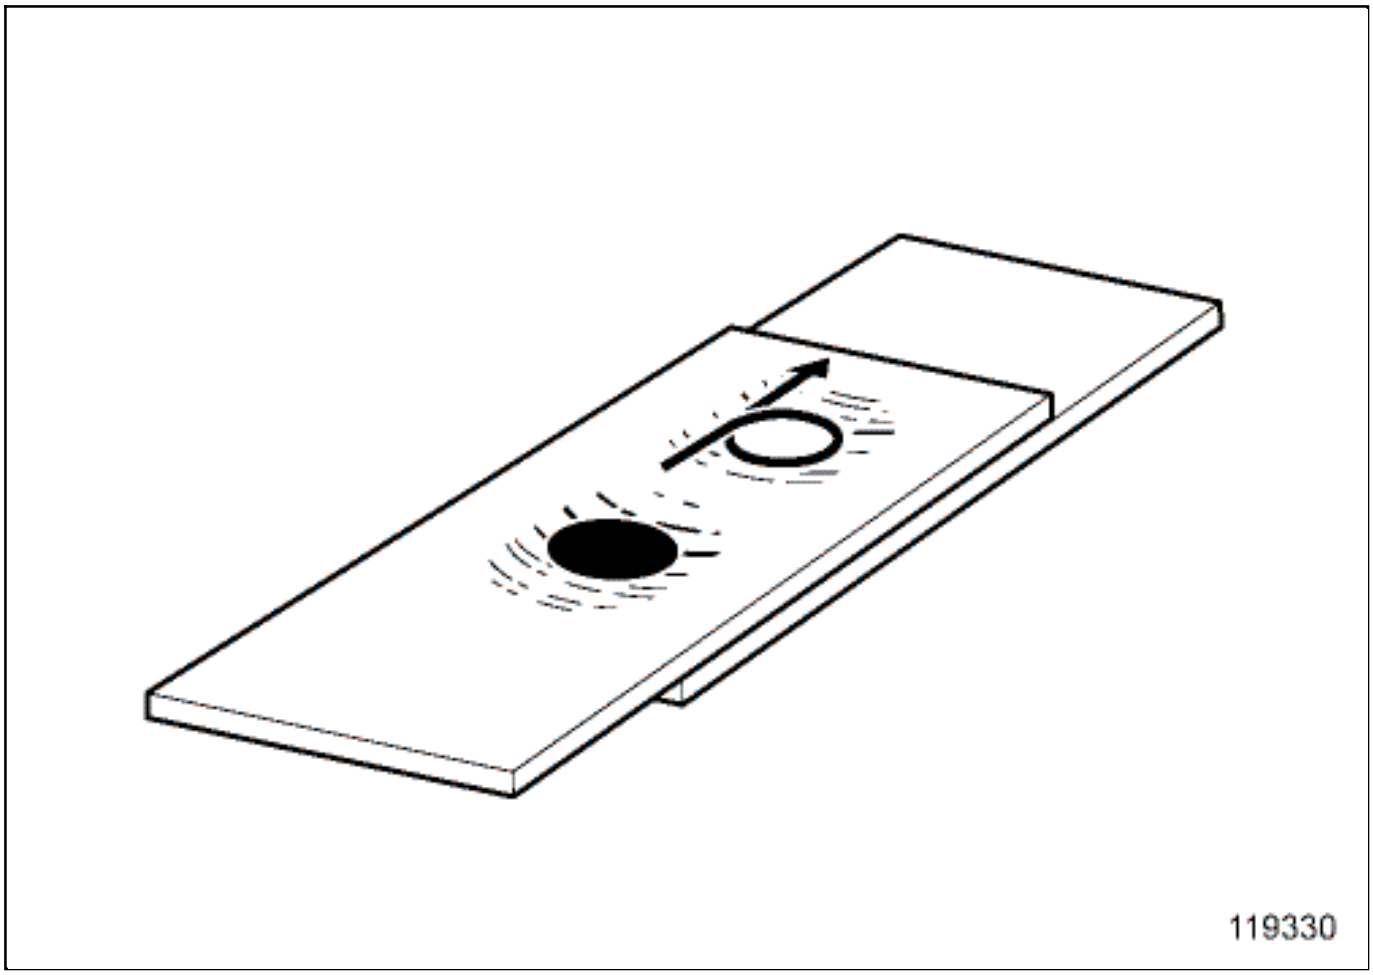
- (X1) = 20 mm
- (X2) = 40 mm

Thickness (mm)	Drill bit diameter (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10



UPPER TEST SPECIMEN

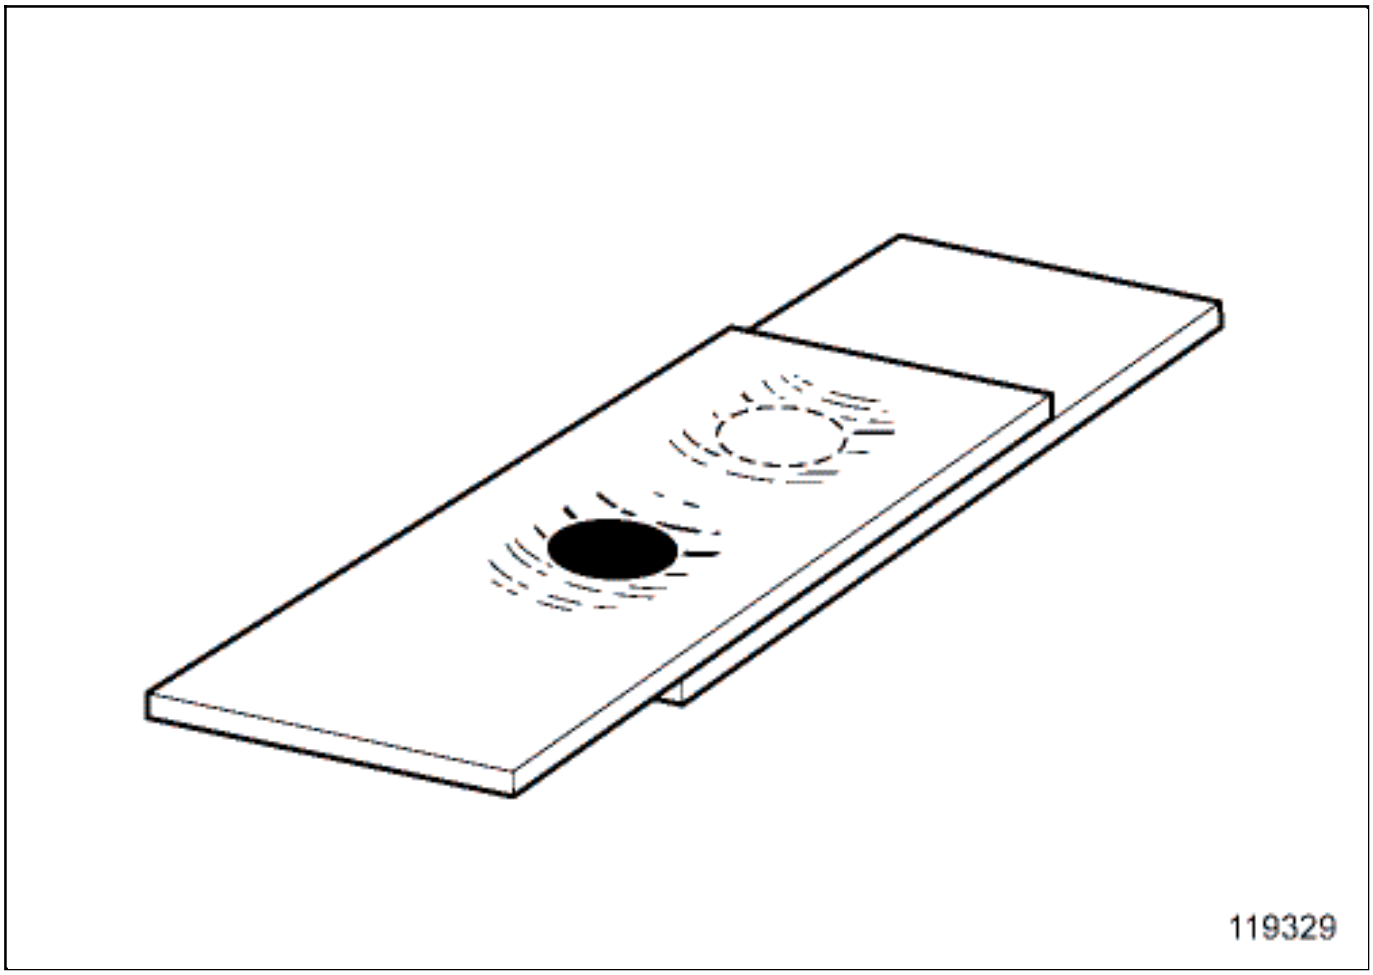
LOWER TEST SPECIMEN



Prepare the test specimens in the same way as the vehicle.

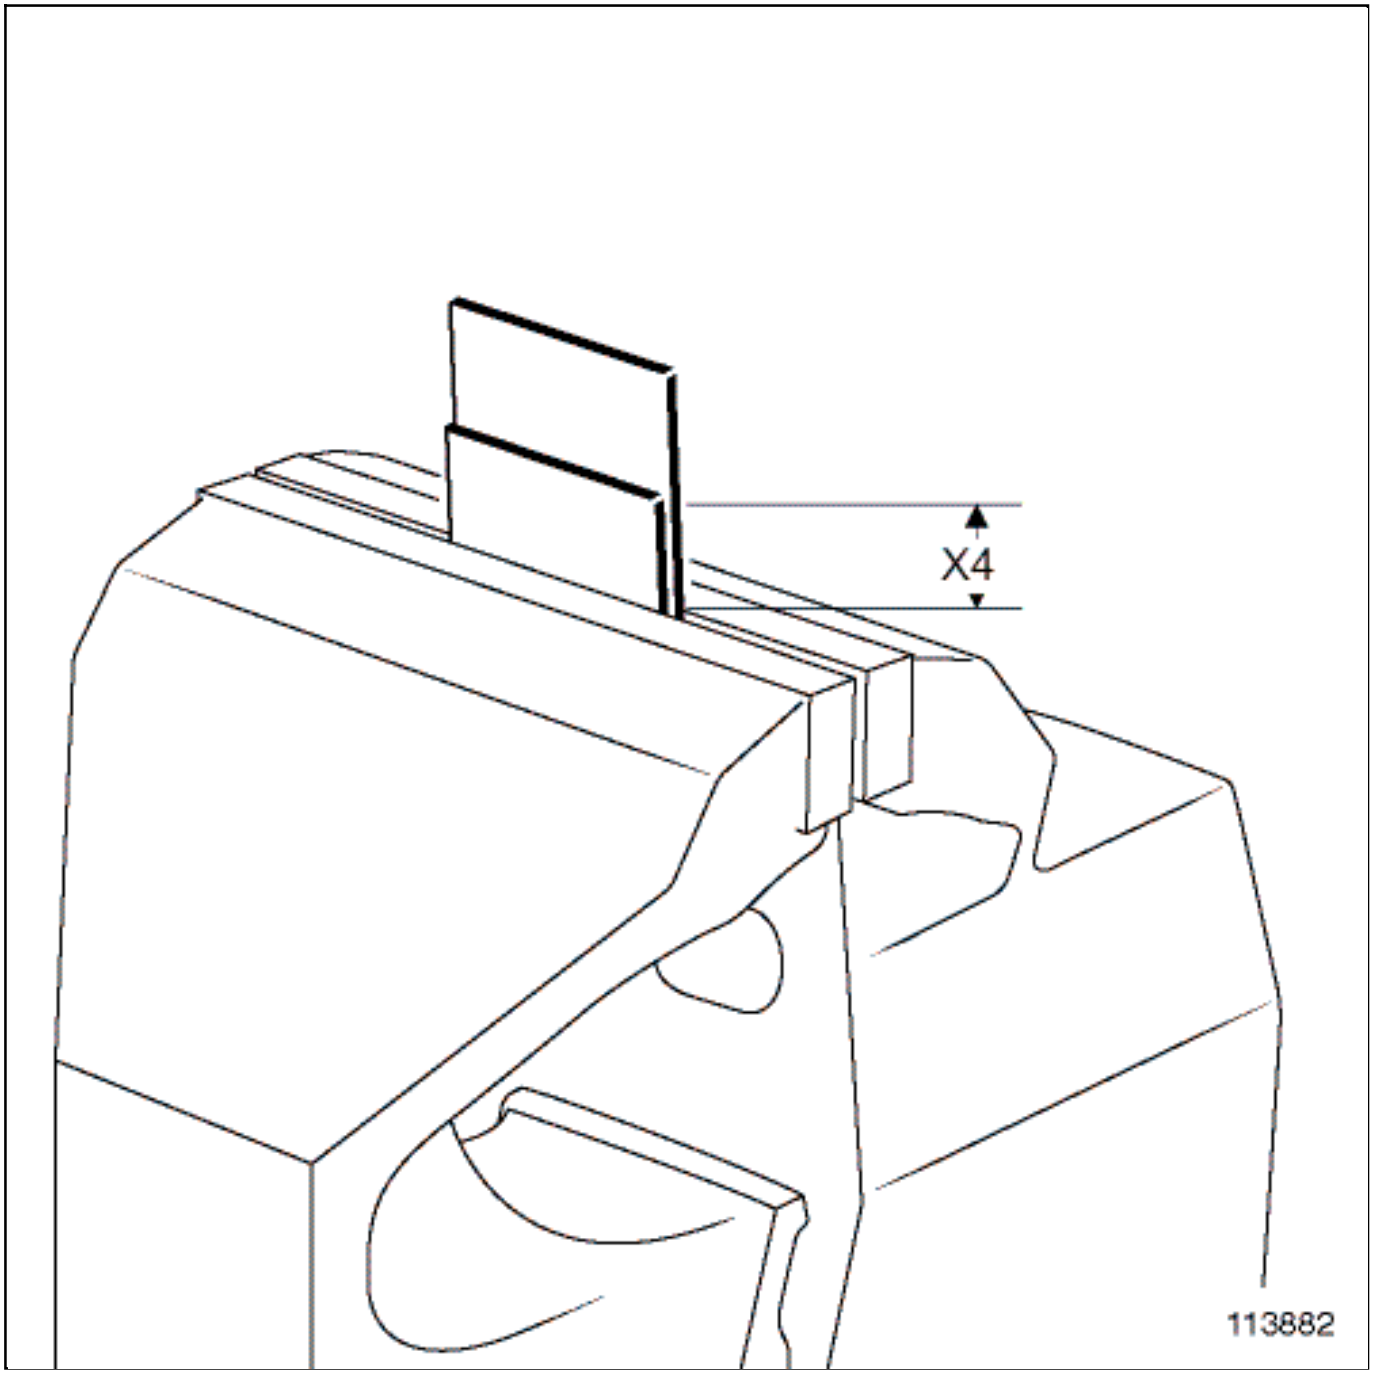
Adjust and secure the test specimens, offsetting them by(X3) = 20 mm.

2- ASSEMBLY



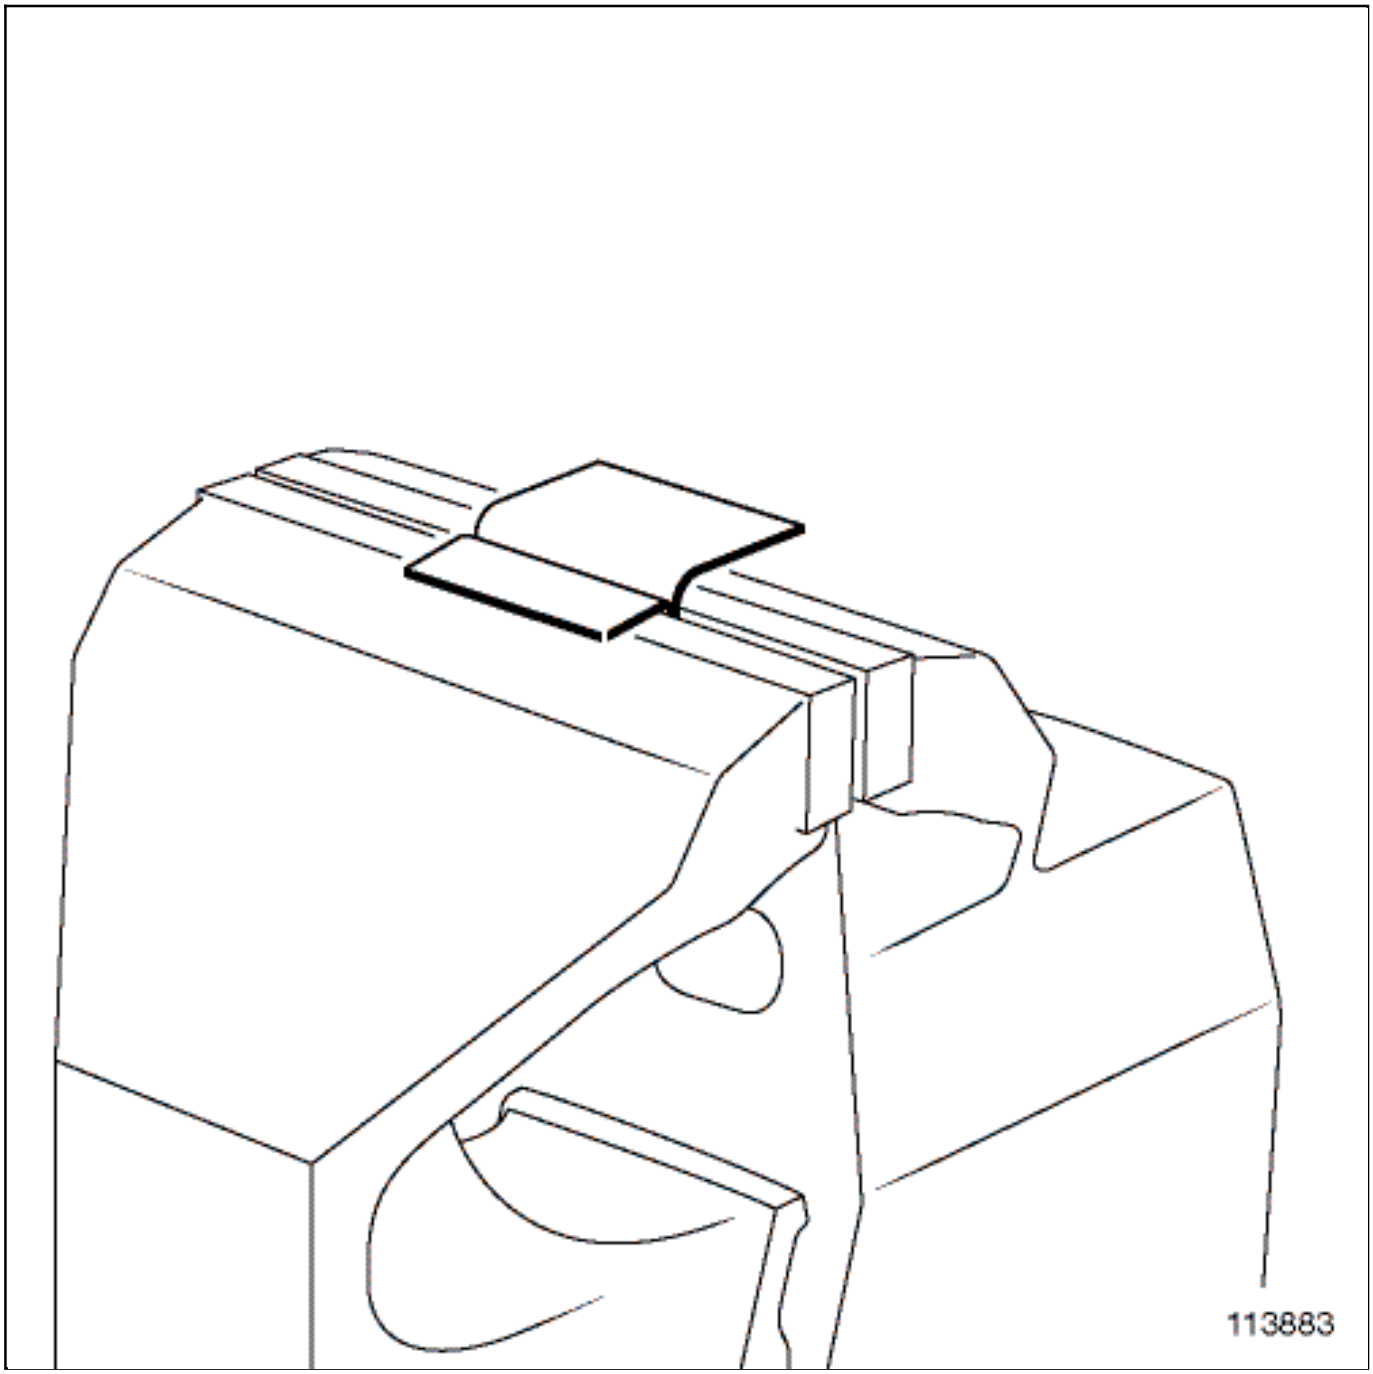
Do the plug welds.

Note:

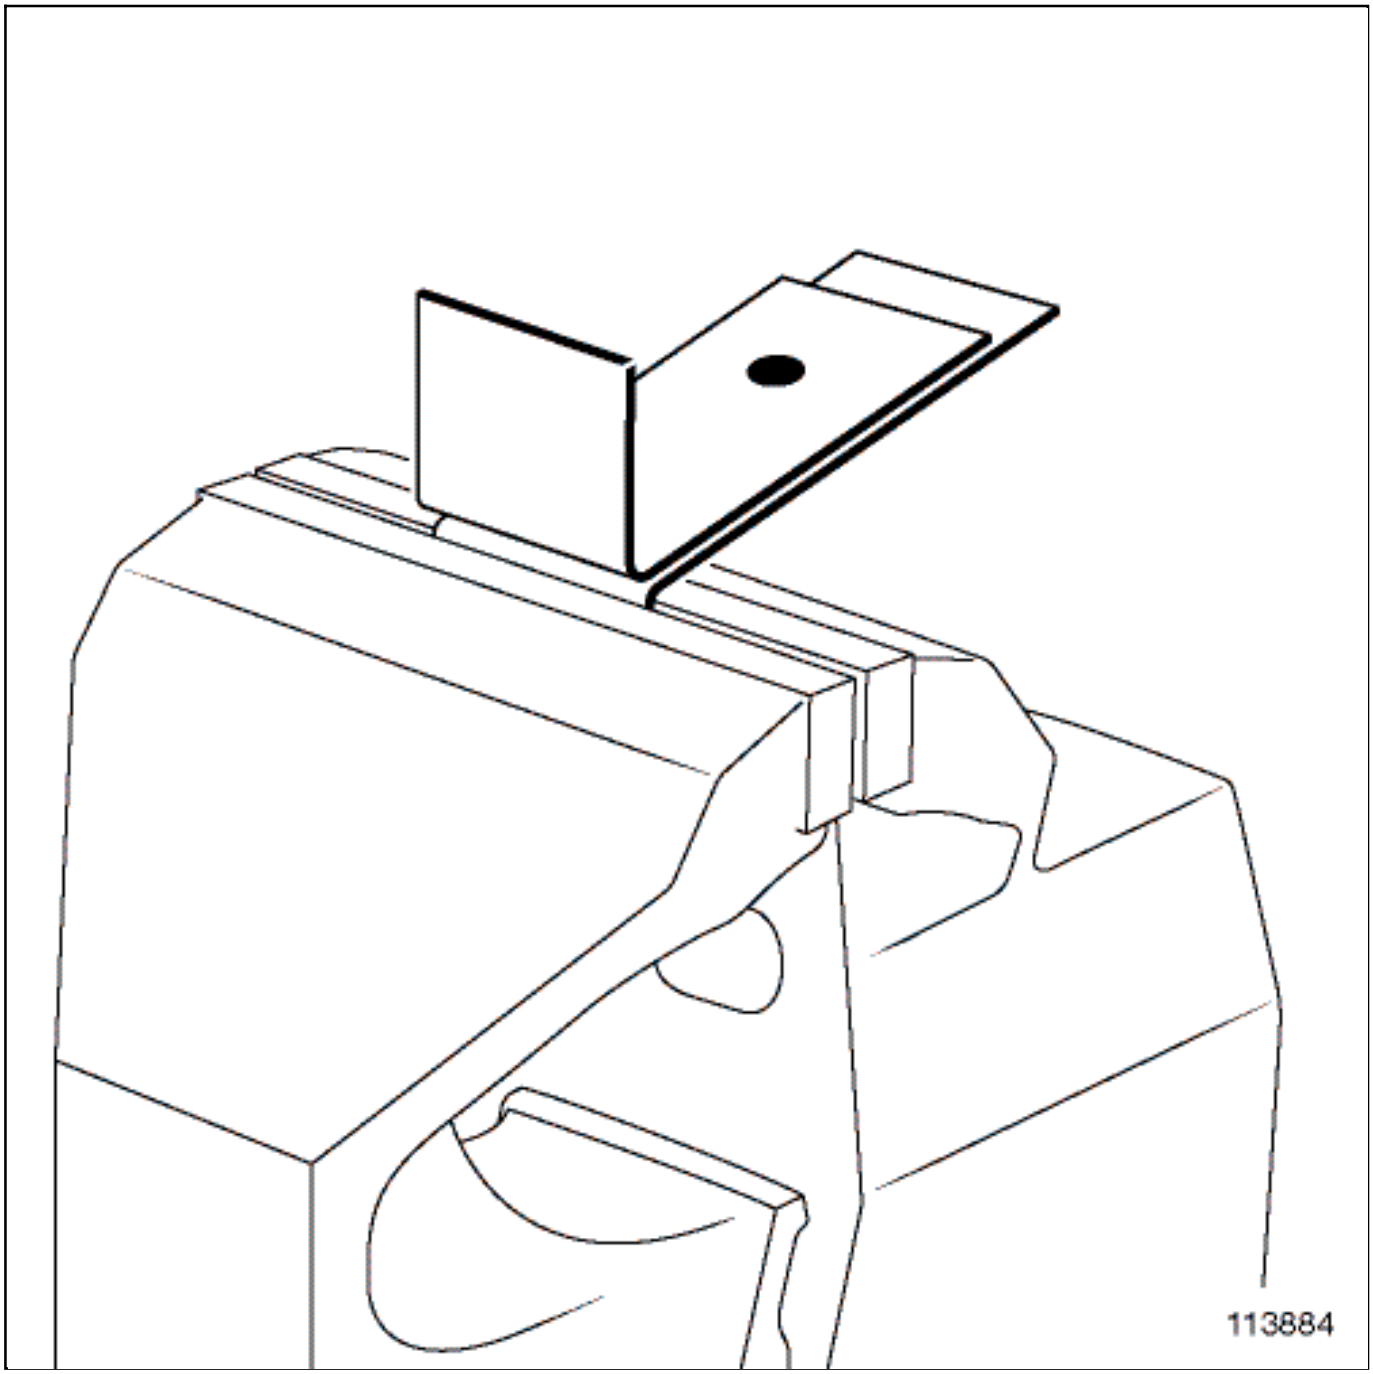


The illustration shows a loop type welding method.

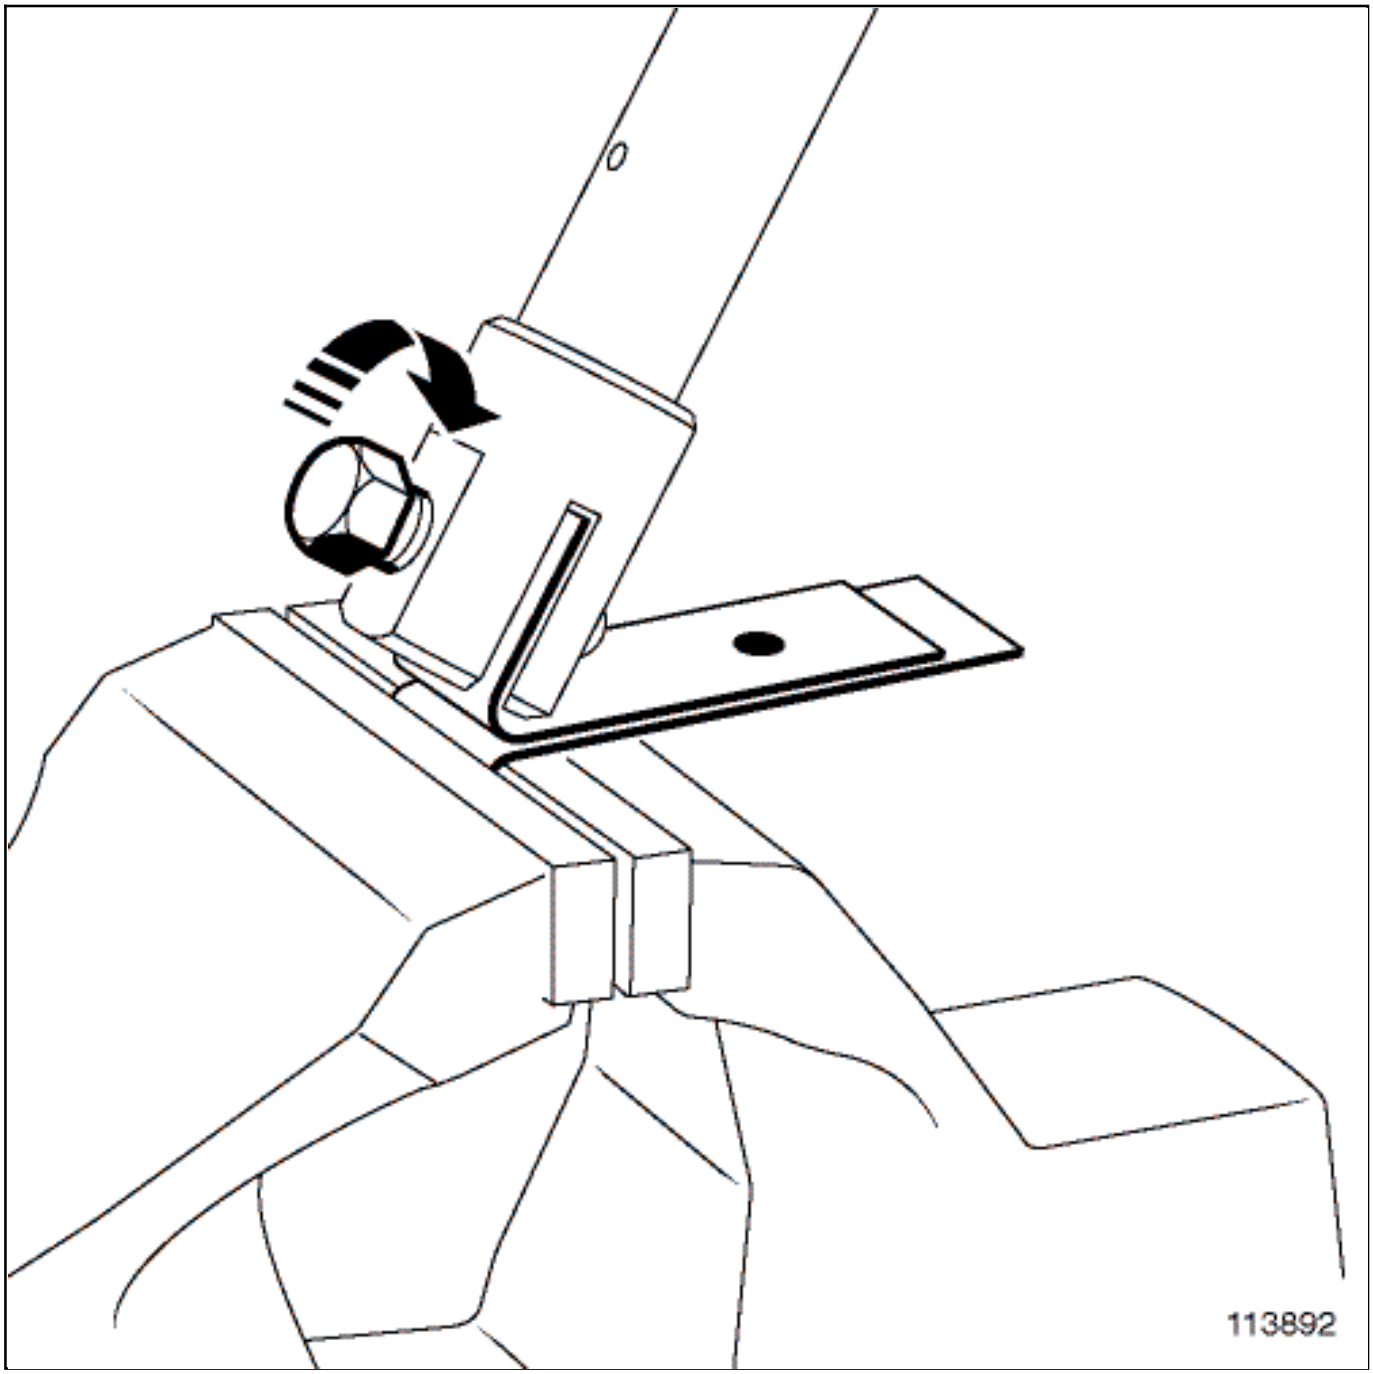
3- CHECK



If necessary, level off the plug weld to be tested, to reproduce it as it will appear on the vehicle.

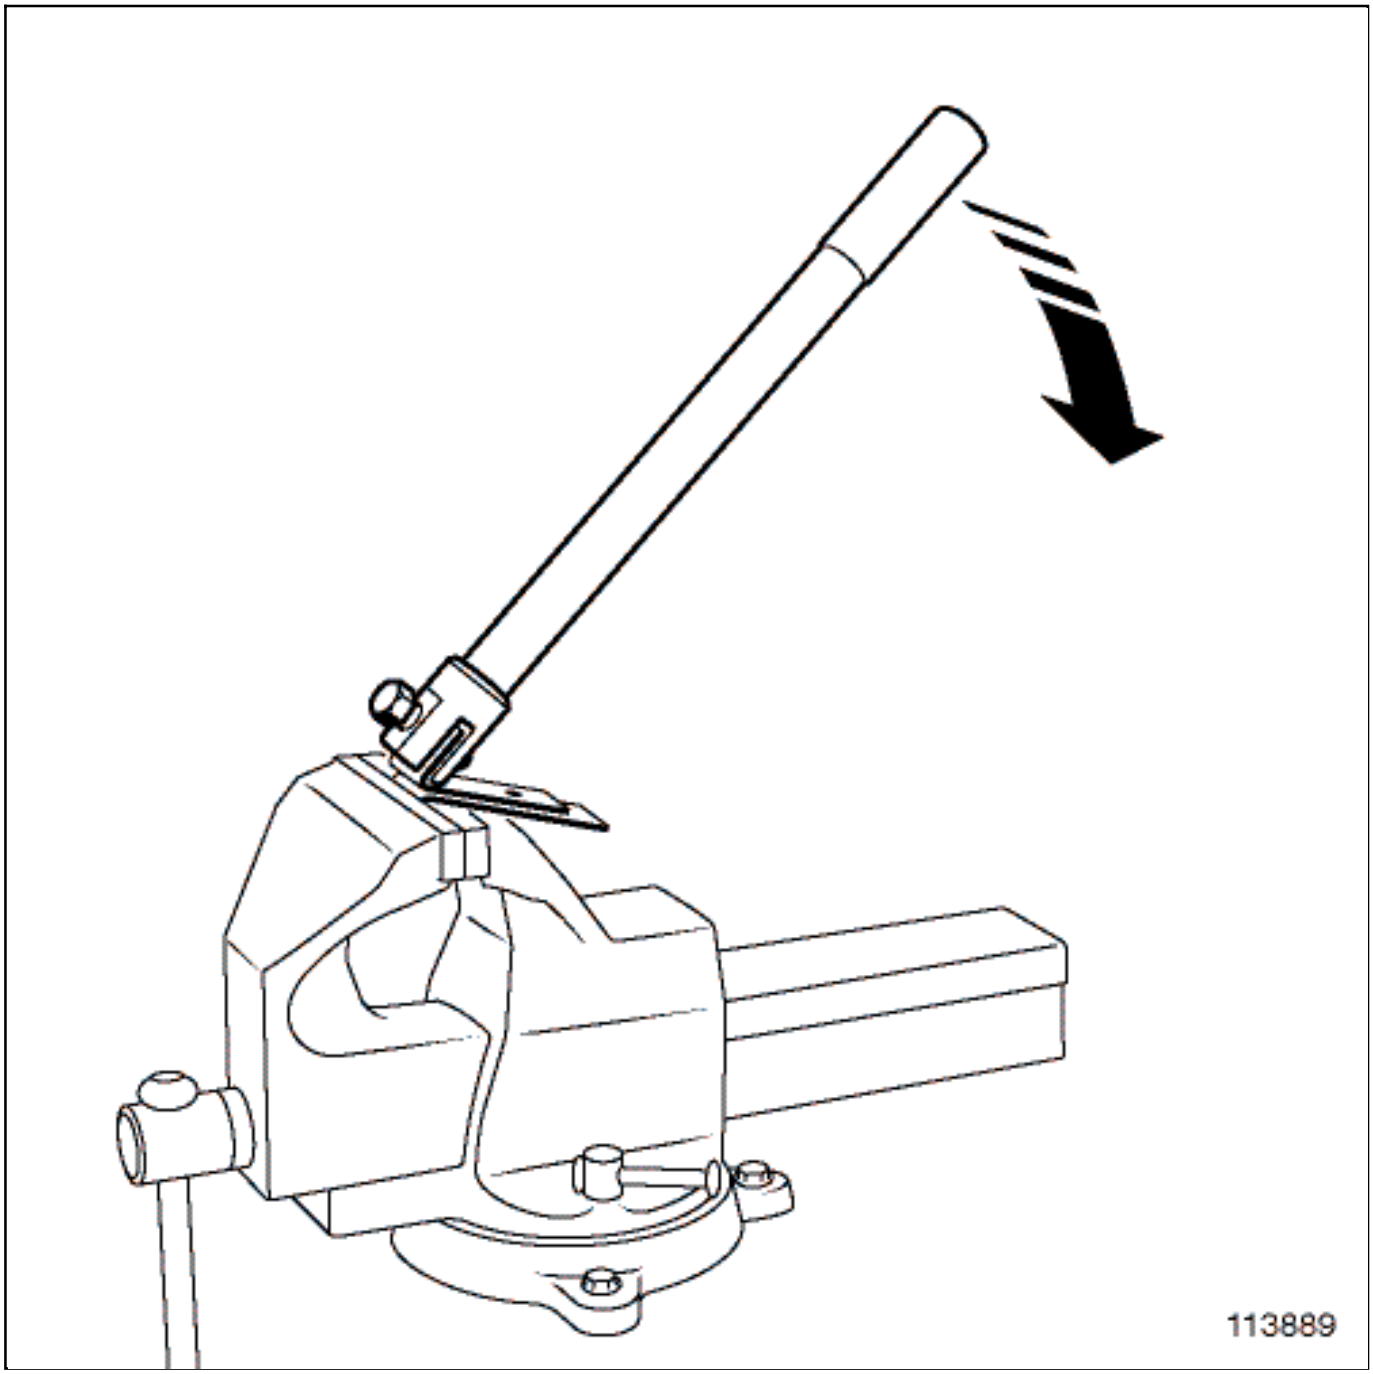


(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)



Secure the test specimens in the vice(x_4) = 15 mmto avoid damaging the plug weld during the following stage.

Fold down the test specimens, as shown in the illustration.

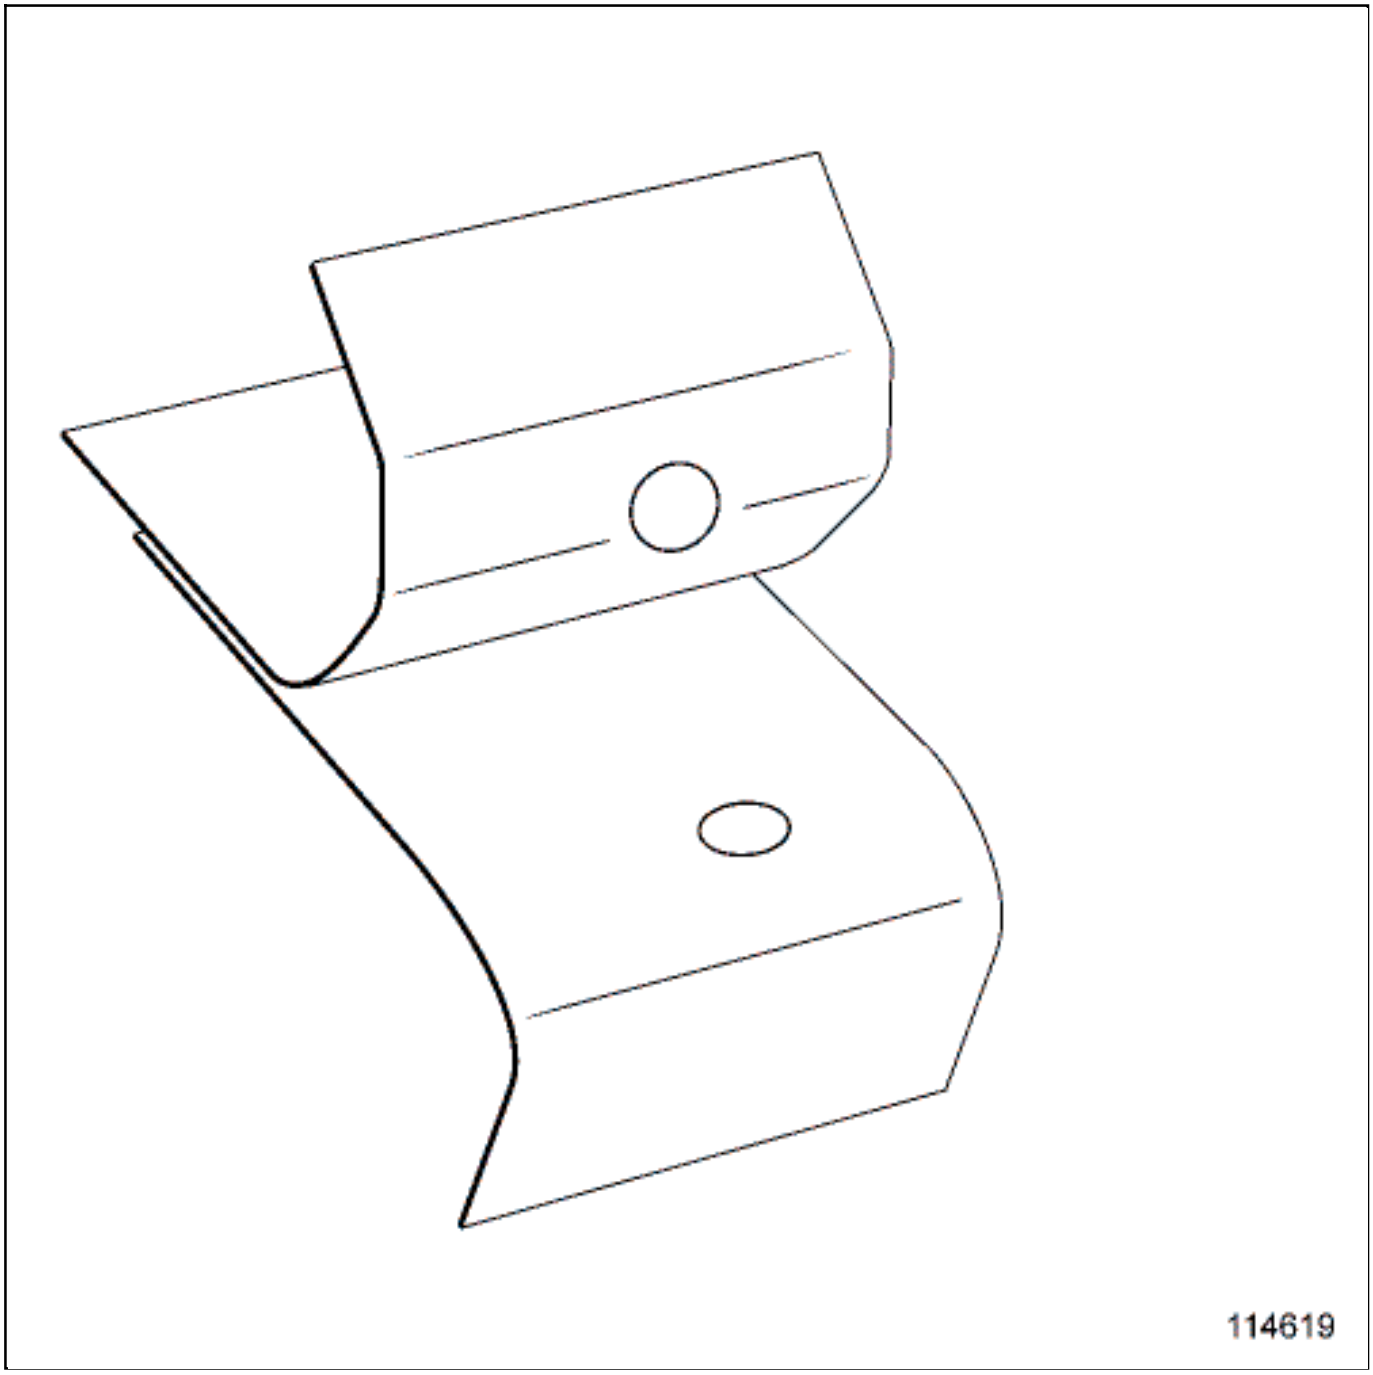


Re-secure the test specimens in the vice.

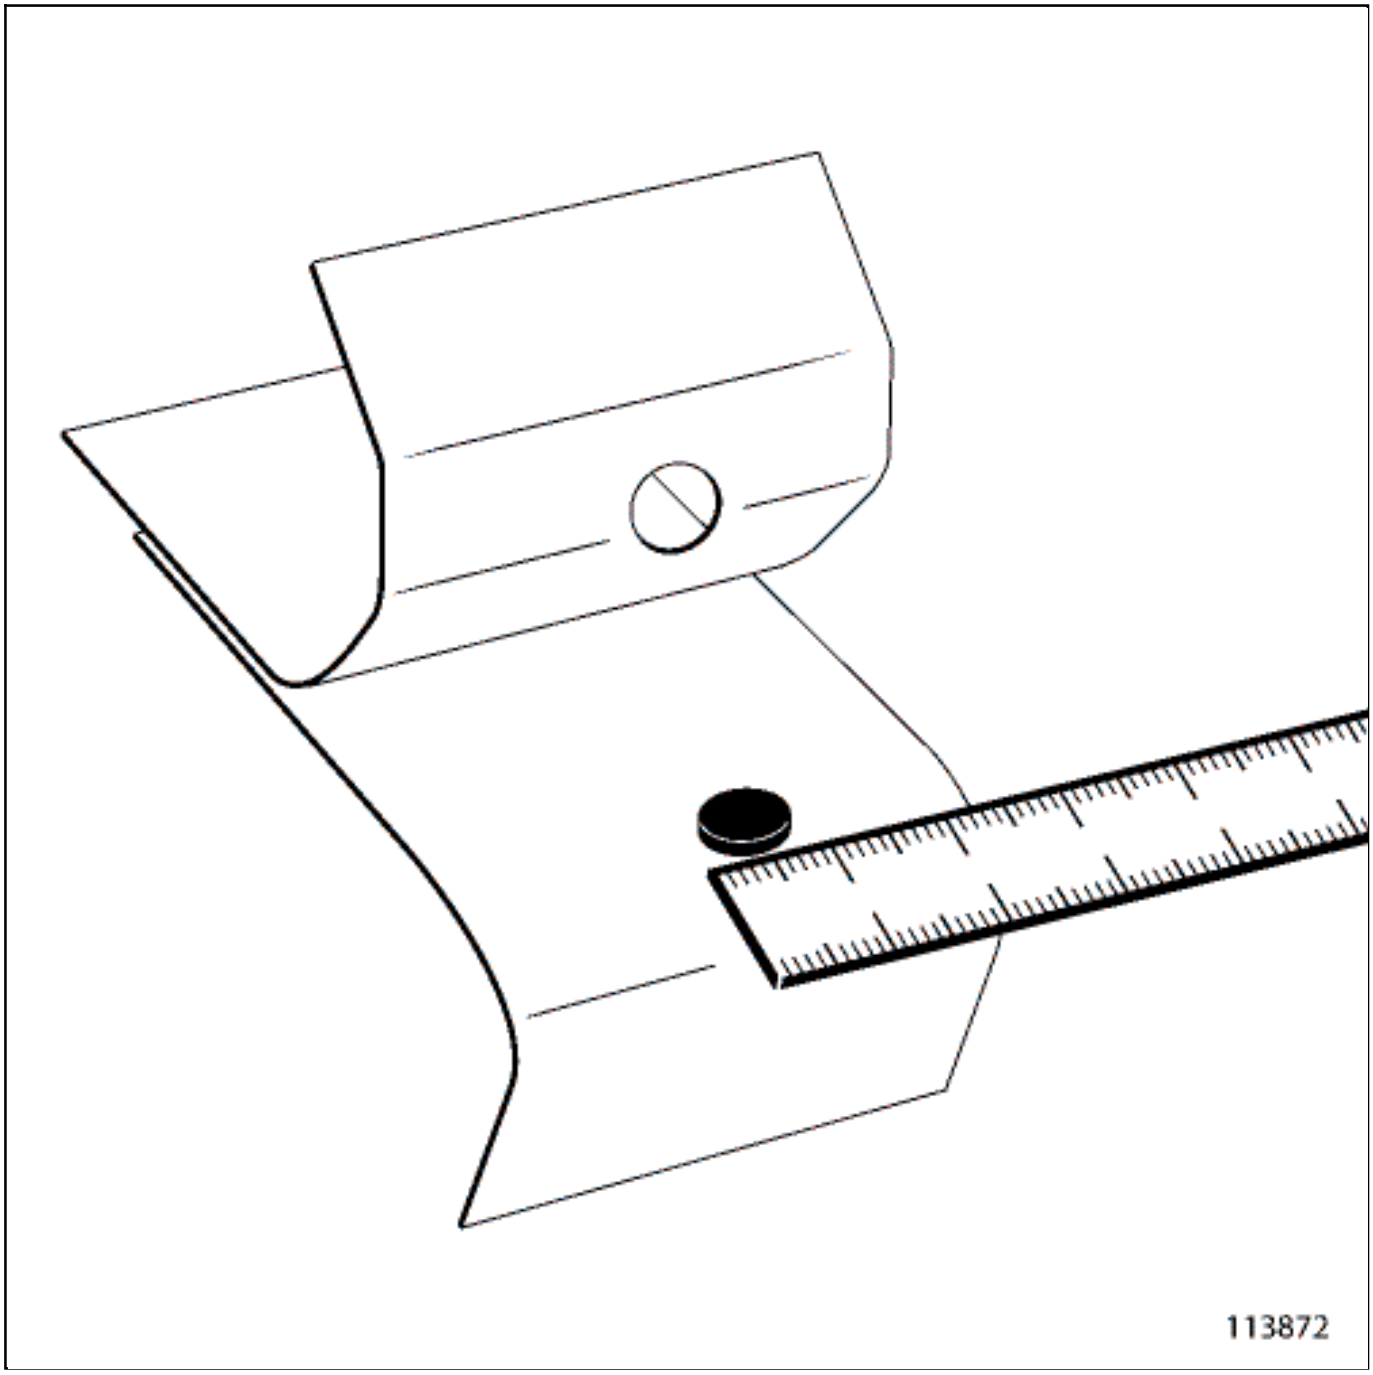
Secure the jaw of the peeling tool.

WARNING

To avoid any accidents, tighten the jaw of the tool to prevent slipping during peeling.

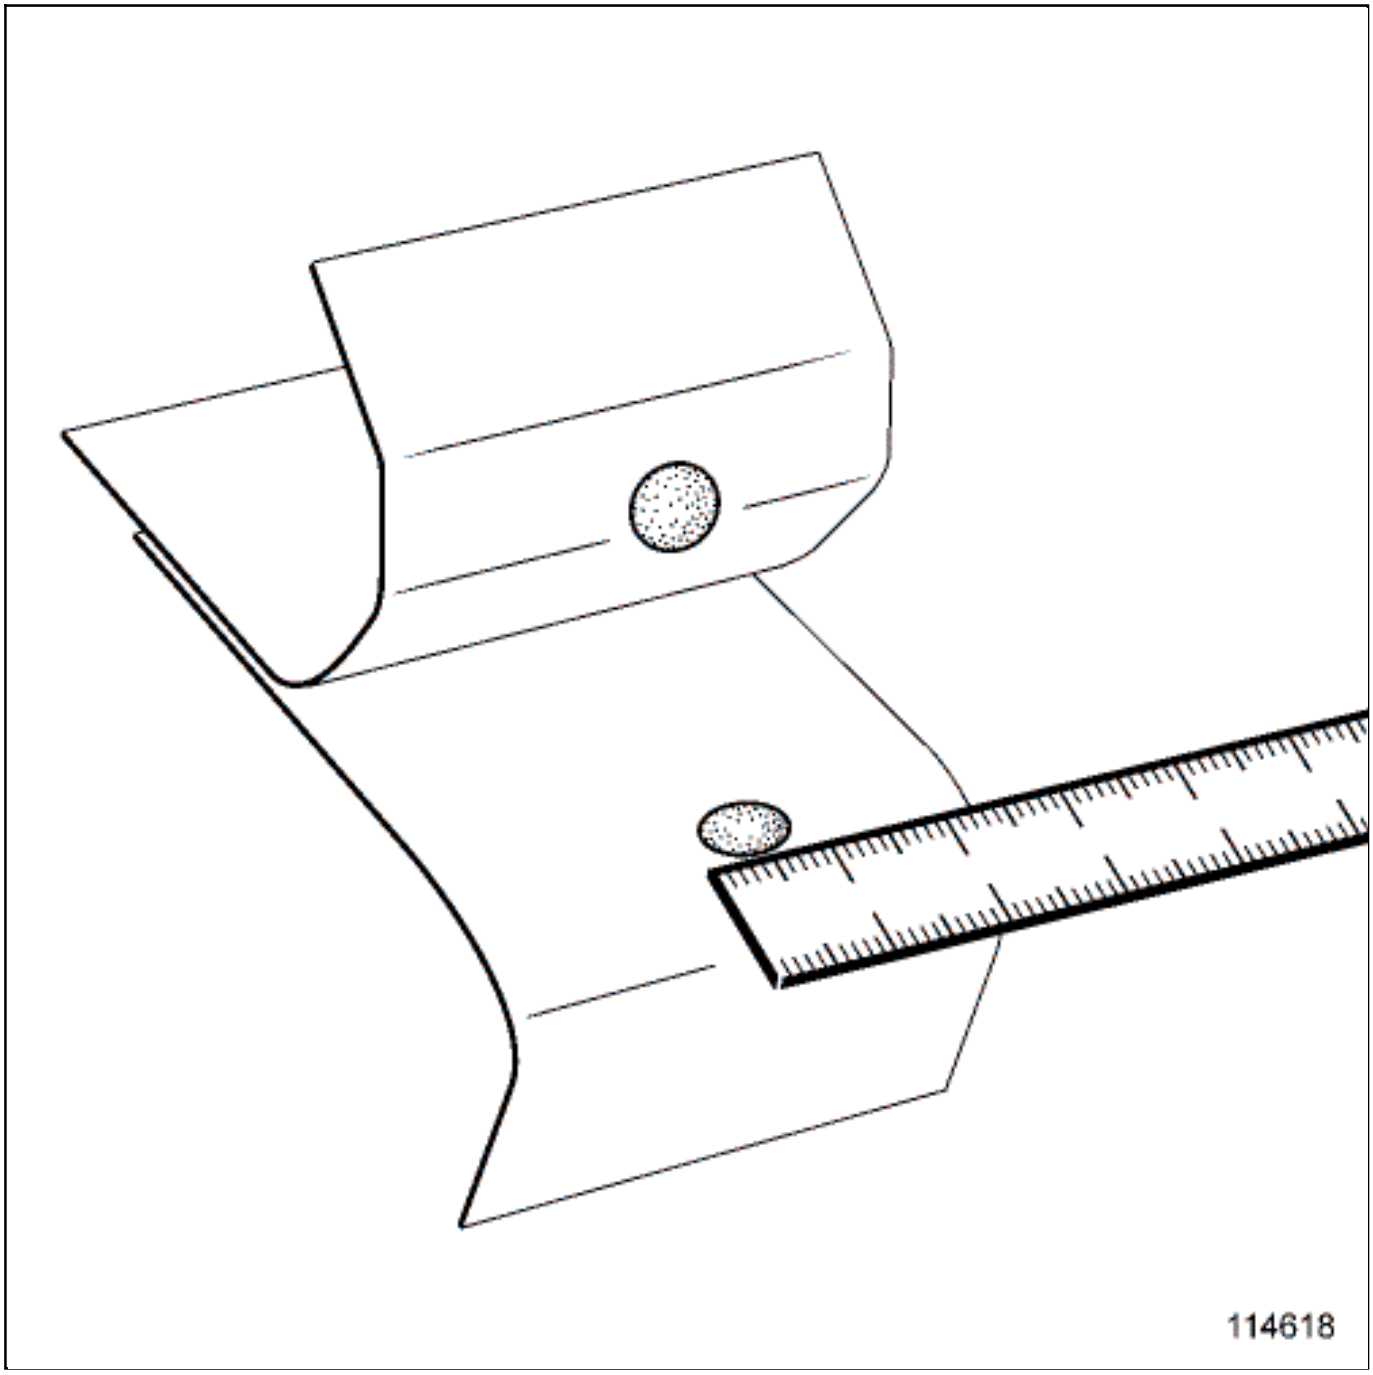


Peel the assembly, applying continuous pressure.



4- RESULTS: INTERPRETATION

this test is based on the presence or absence of a material rivet after peeling of the plug weld.



CEMENTED SPOT: UNACCEPTABLE

SPOT WITH MATERIAL RIVET: ACCEPTABLE IF DIAMETER SUFFICIENT

SPOT WITH MATERIAL PULLING OFF: ACCEPTABLE IF DIAMETER SUFFICIENT

Check that the diameter of the material rivet meets the criteria in the following table, with regard to the reference thickness.

thickness (mm)	material rivet diameter (mm)
0.6 to 1.2	4
1.2 to 2	6
2 and more	8

5- SOLUTIONS

If the material rivet is absent or too small:

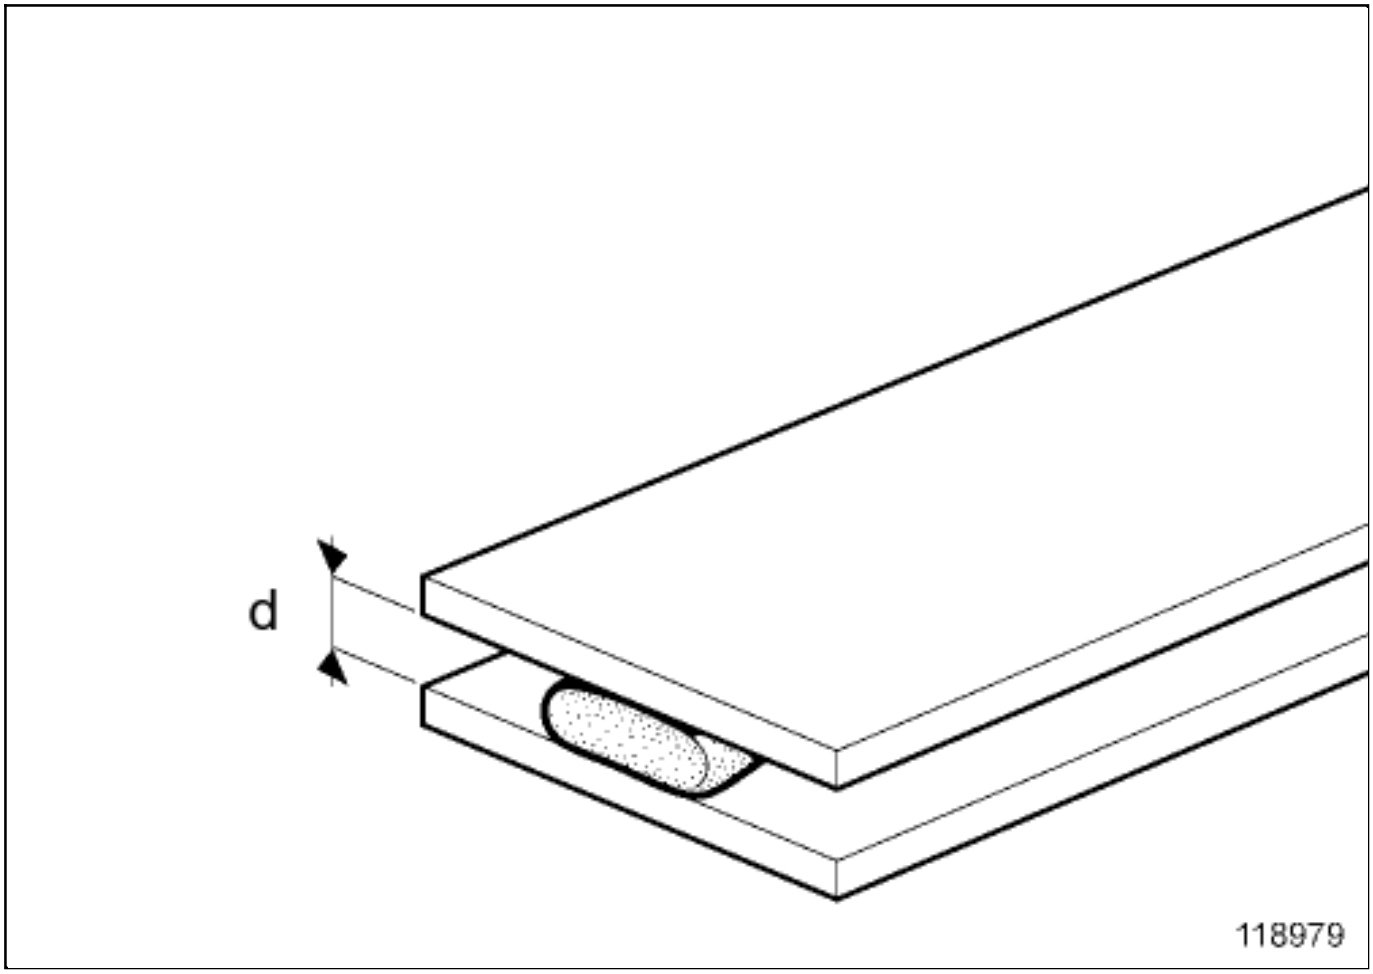
- Increase the weld current to improve its penetration,

If the current is already at maximum, increase the drilling diameter and the weld time.

Note:

A new peeling test must be performed if any settings or drilling parameters are modified.

CONNECTIONS BY BONDING: PRECAUTIONS FOR THE REPAIR



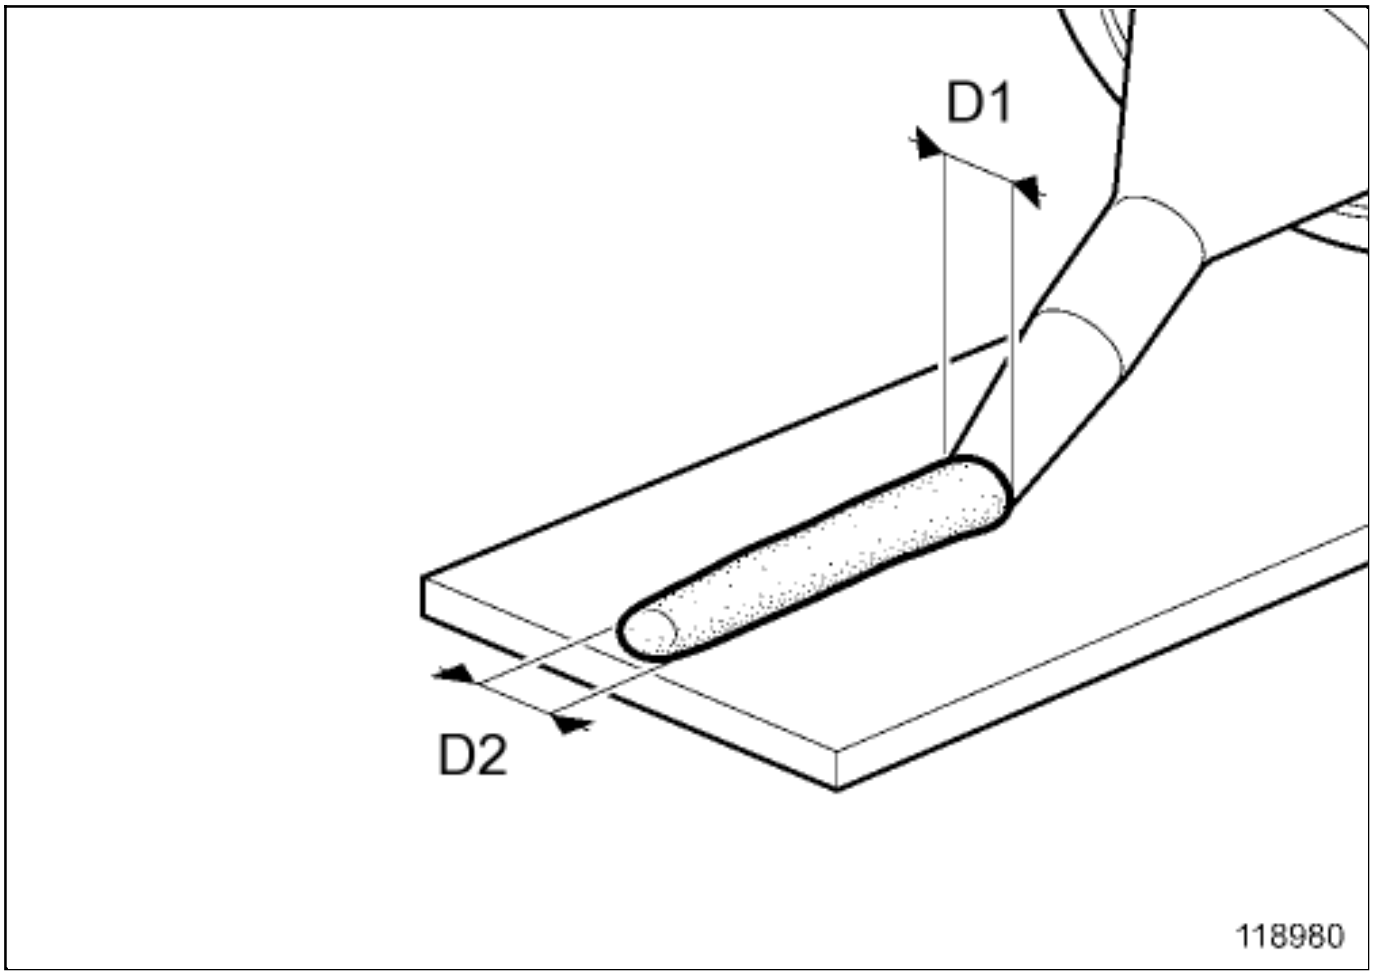
1. INTRODUCTION

The purpose of this document is to provide the information necessary for making a high quality bonded joint.

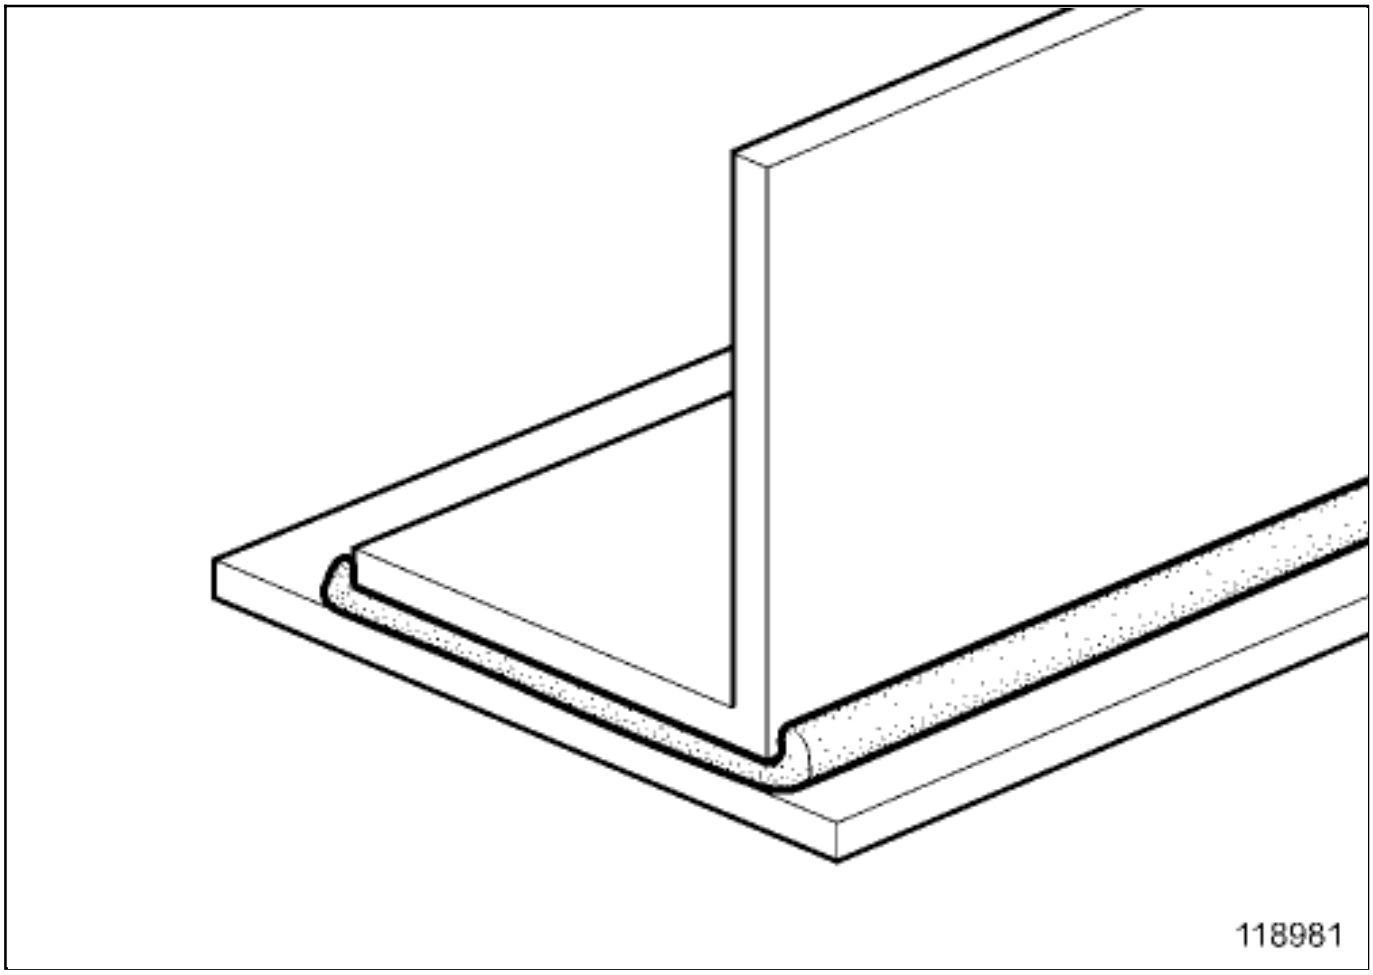
The main requirement is good preparation of the surfaces to be bonded; the mating faces must be clean, and free from any contamination which could prevent the cement from holding (e.g.: grease or dust).
(see 40F, Bonded connections, Connections by rigid bonding: Description)

2. PRELIMINARY TESTS AND OPERATIONS

1- VALIDATING THE BEAD DIAMETER



Depending on the gap between the parts to be assembled, adjust the diameter of the cement bead, cutting the end of the cartridge nozzle accordingly. To do this, after adjusting the part to be assembled, use a set of feeler gauges to measure the joint gap:



- for rigid bonding, d should be between 0 and 2 mm,
- for elastic bonding, d should be between 2 and 4 mm.

Select the required diameter of the extruded bead according to the following table.

Distance d measured between panels (mm)	Diameter D2 extruded bead average (mm)
Up to 2	4
3	6
4	8

Cut the end of the nozzle to a diameter D1, 1 mmsmaller than the required diameter of the bead D2 after extrusion.

If the joint between the two parts to be bonded is limited to the width of the mating face, check that the cement overlaps the two sides of the bonding zone.

2- VALIDATING THE PRODUCT MIXTURE FOR DUAL COMPONENT BONDING CEMENT

When testing the bead diameter, check that the dual component mixture has a uniform colour.

1)REMINDER:

If the bonded joint is associated with a plug welded joint, the cement bead should be broken 1 cmeither side of each weld point so that the cement does not alter the weld point.

XSL version : 3.02 du 22/07/11

CONNECTIONSBYBRAZING:CONNECTIONSBYBRAZING

To replace an original braze connection, apply a GMAW weld bead.

1. DISASSEMBLY

1- SCOURING

If necessary, scour the joint line to bring out the weld bead:

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

2- UNPICKING

Unpick the braze bead.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

3- GRINDING

Grind the brazing residues.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface finish the mating face.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Remove all brazing residue, in order not to contaminate the GMAW bead joint.

Note:

Do not strike or damage the support panel.

2. PREPARATION BEFORE ASSEMBLY

1- POSITIONING AND ADJUSTMENT

Position the replacement part, adjust it and fix it.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the replacement part.

3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Scour the external mating face.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- APPLY THE PROTECTION BEFORE ASSEMBLY

Apply the anti-corrosion protection to the internal joint mating faces.

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

3. ASSEMBLY

1- POSITIONING THE REPLACEMENT PART

Position the replacement part, adjust it and fix it.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2- ADJUSTING THE WELDER

Before working on the vehicle, follow the procedure below:

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

3- CARRYING OUT THE WELDING

Make the weld bead, the same length and in exactly the same position as the original.

4- FINISHING

Reproduce the original appearance of the connection by brazing.

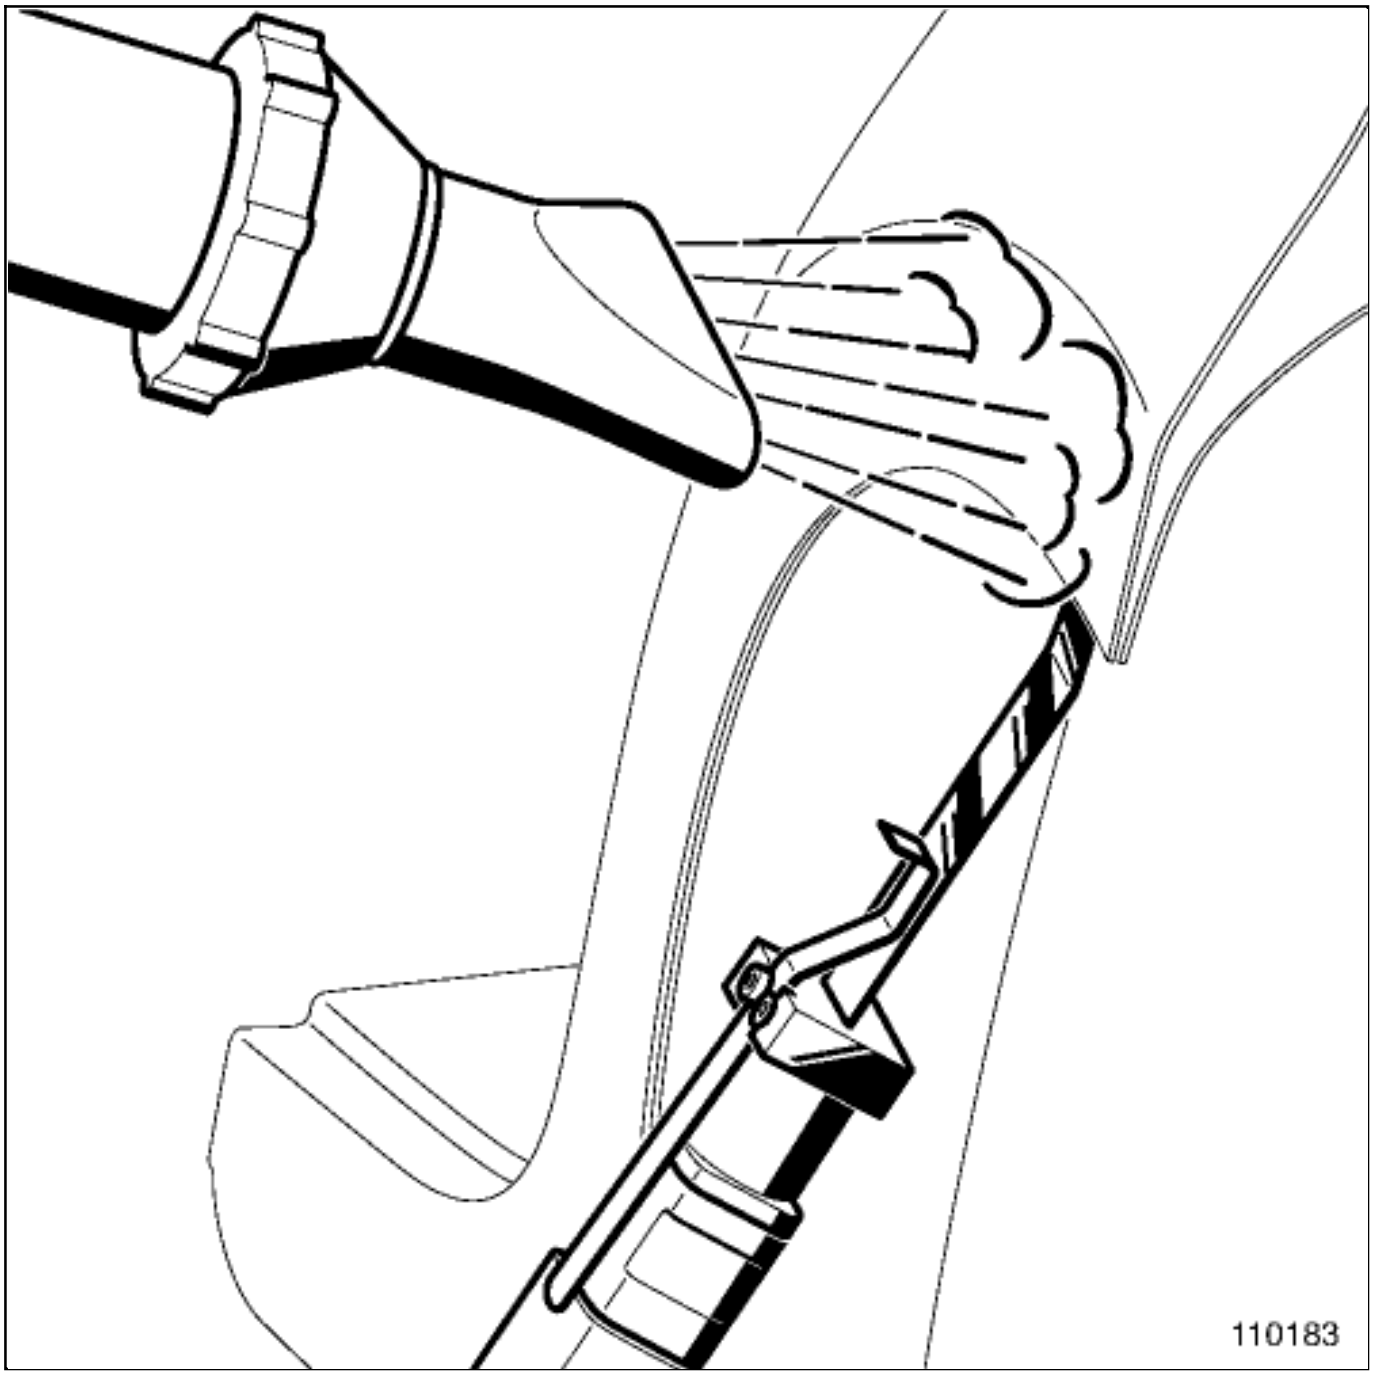
Repair-40x01x29-02x21-1-1-1.xml

XSL version : 3.02 du 22/07/11

CONNECTIONS BY RIGID BONDING: DESCRIPTION

Special tooling required	
Levelling tool for bodywork seal	Car. 1786

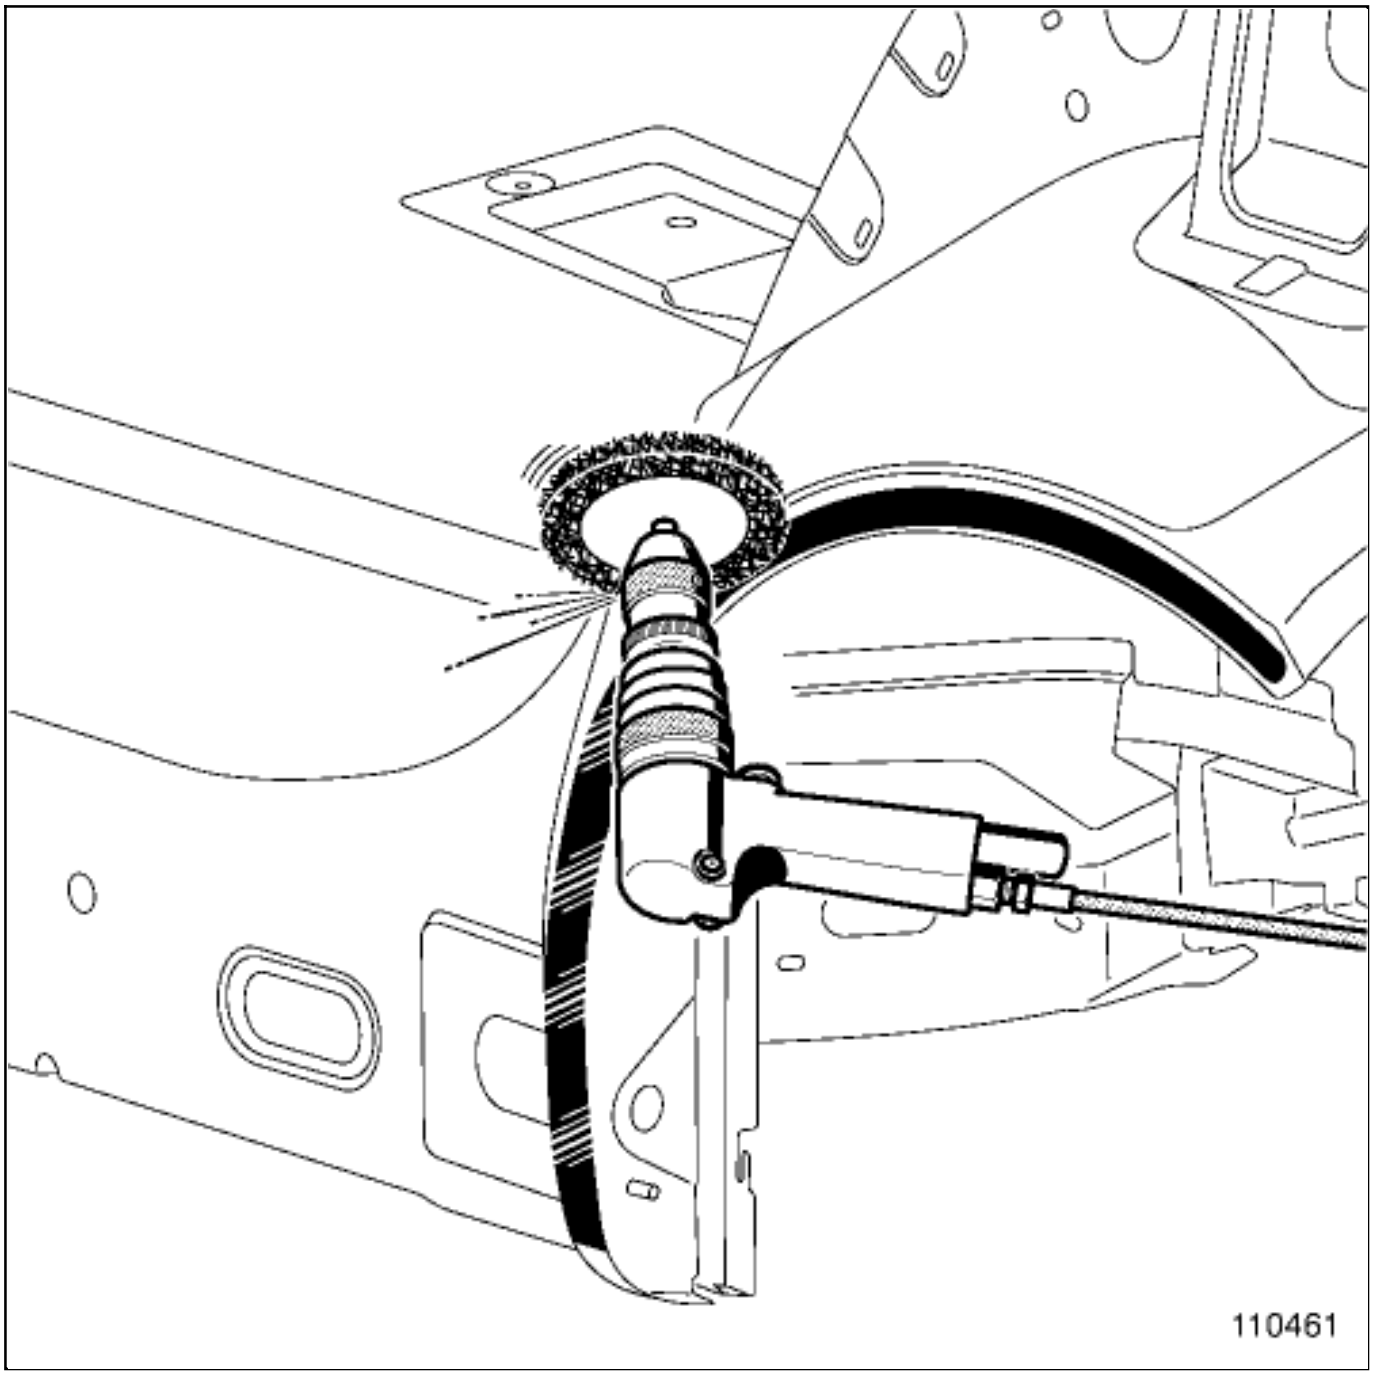
Equipment required
safety strap(s)



1. DISASSEMBLY

A rigid bonded joint can be associated with a variety of joints:

- crimped,
- resistance welded,
- riveted,
- bolted.



Disassemble these joints to allow access to the cement bead (see documentation corresponding to the relevant associated joint).

1- UNSTICKING

Remove the damaged part, by simultaneously heating with a heat stripper to destroy the bonding.

2- SCOURING

Scour the cement residue left on the vehicle(see **Tools for stripping hard mastics and paint: Use**) .

2. PREPARATION BEFORE ASSEMBLY

1- ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.**(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)**

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Remove the replacement part.

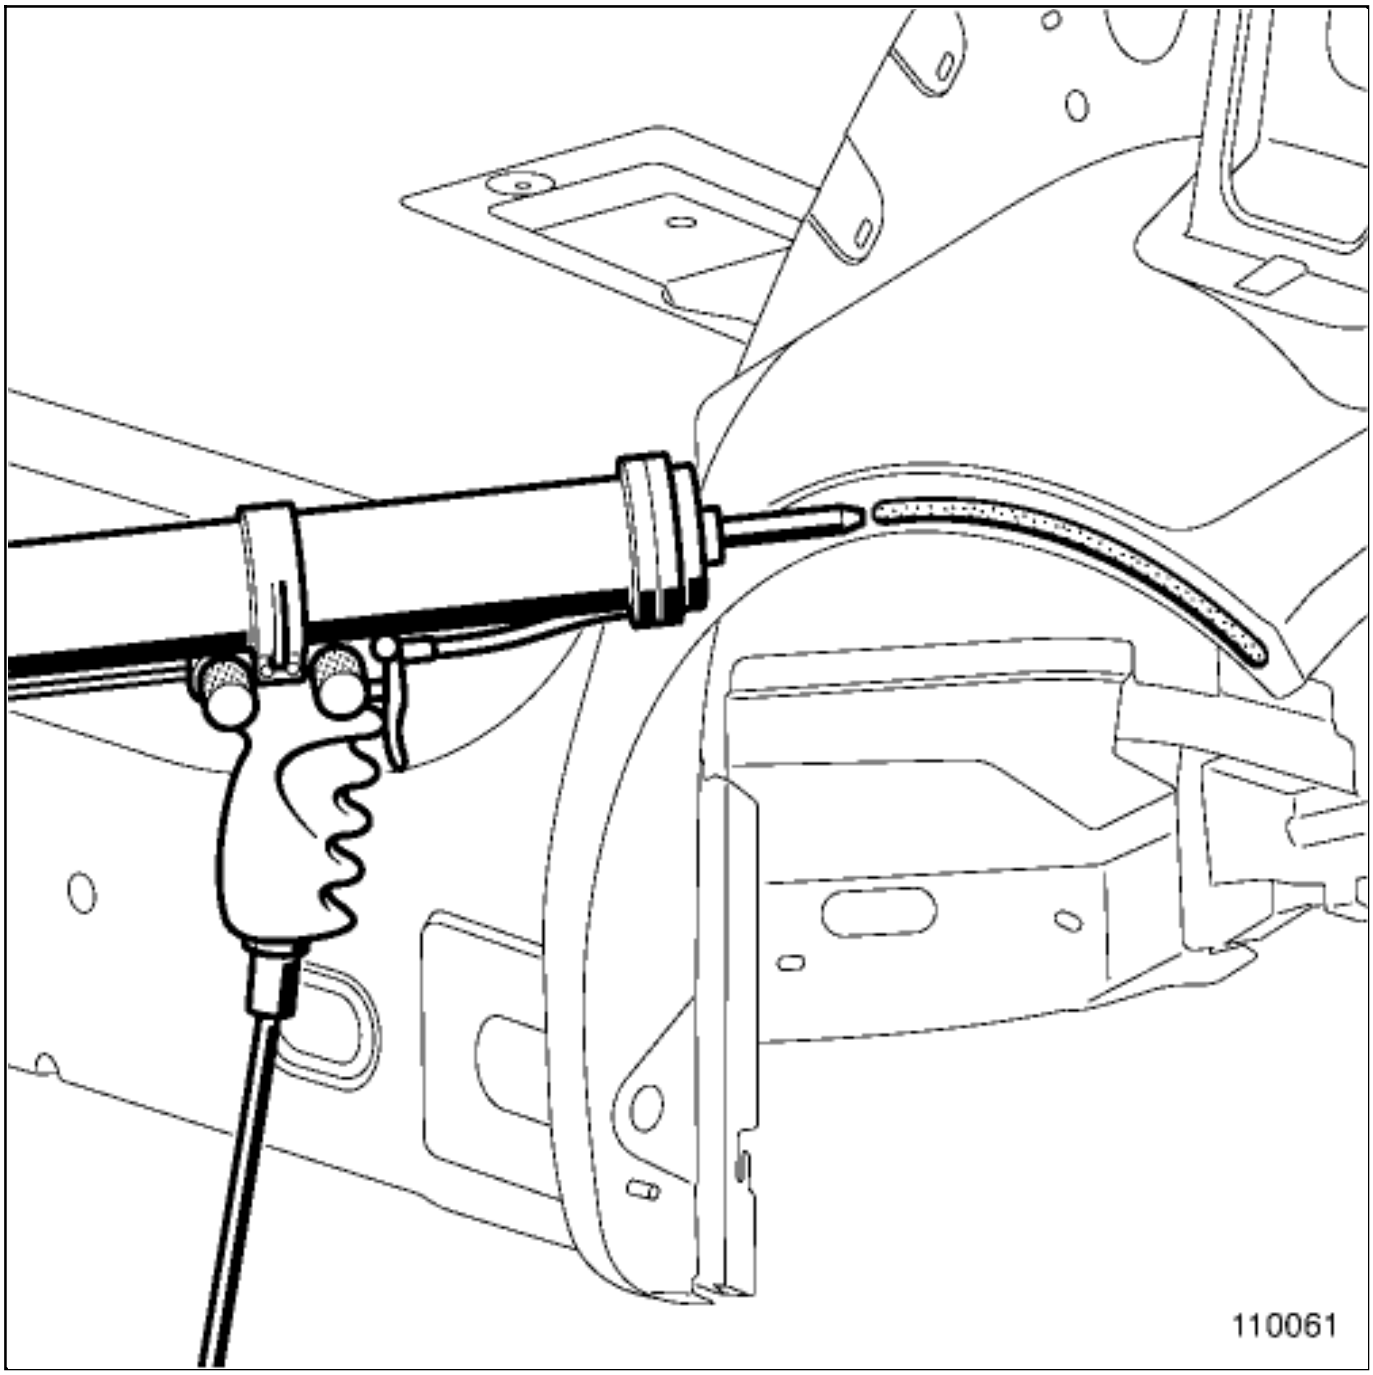
3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Sand using P320dry sand paper or a red abrasive pad, without removing the protection.

Clean the internal joint face with surface cleaner.

4- PREPARATION OF THE JOINTS ON THE VEHICLE

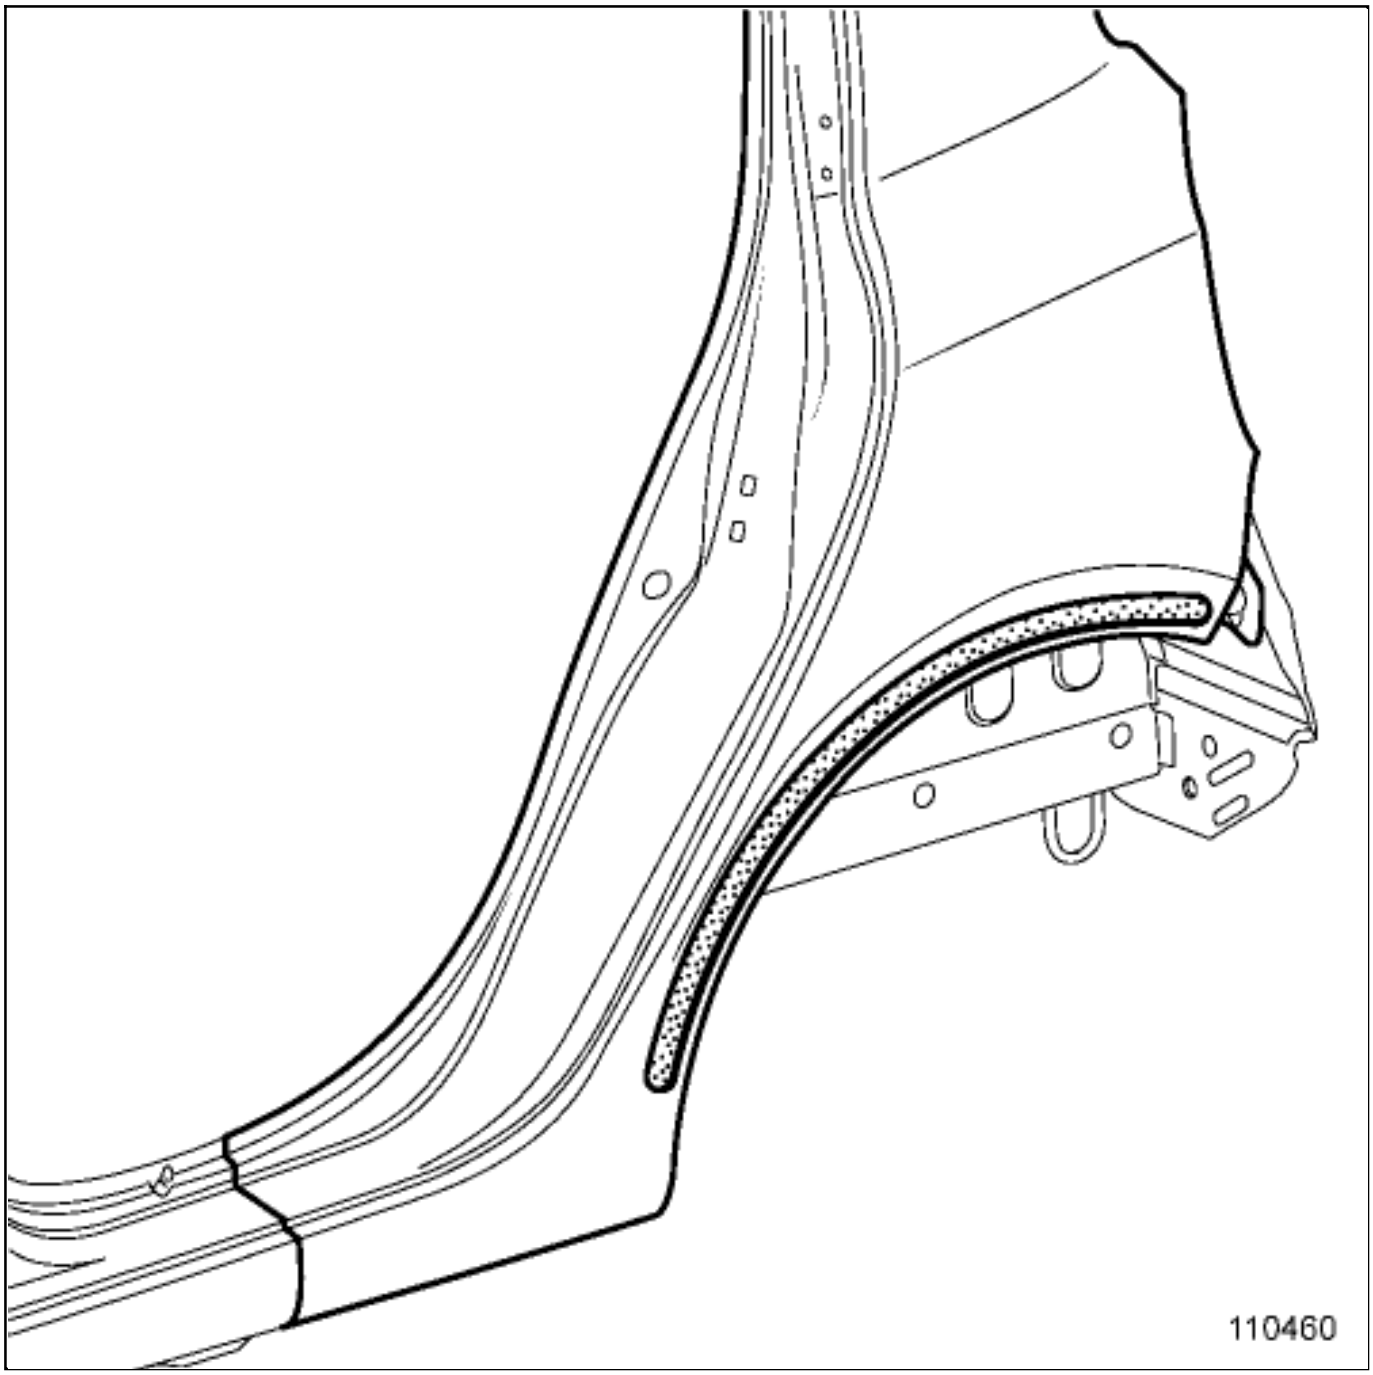
Clean the internal joint face with surface cleaner.



5- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)



3. ASSEMBLY

1- APPLICATION OF THE BONDING PRODUCT

Apply the relevant bonding product for the type of joint concerned(see 40F, Bonded connections, Connections by bonding: Precautions for the repair) (see 04F, Bodywork products and mountings, Products and equipment for bonded assembly: Use)

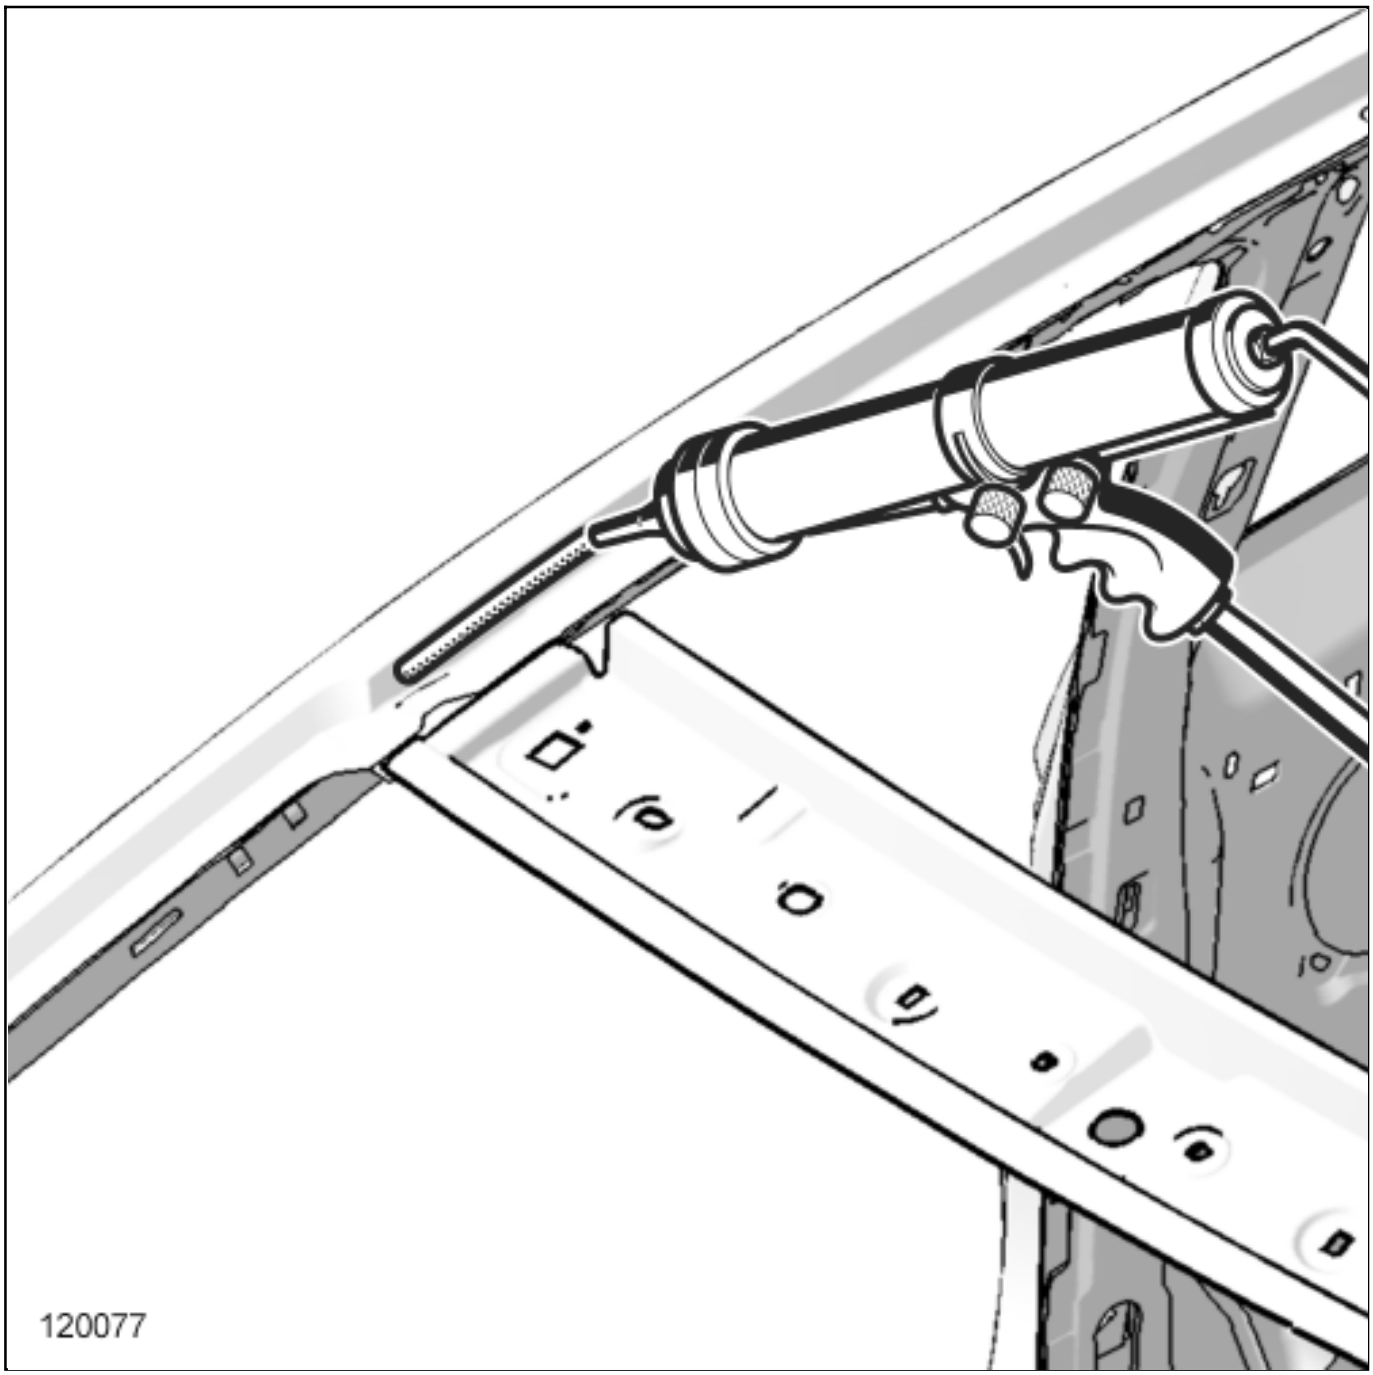
2- FITTING AND ADJUSTING THE REPLACED PARTS

Position the part on the vehicle.

Tighten the joint using C-clamps to flatten the seal and ensure bonding.

Insert the plastic protector shims between the C-clamps and the part so that it is not marked.

3- FINISHING

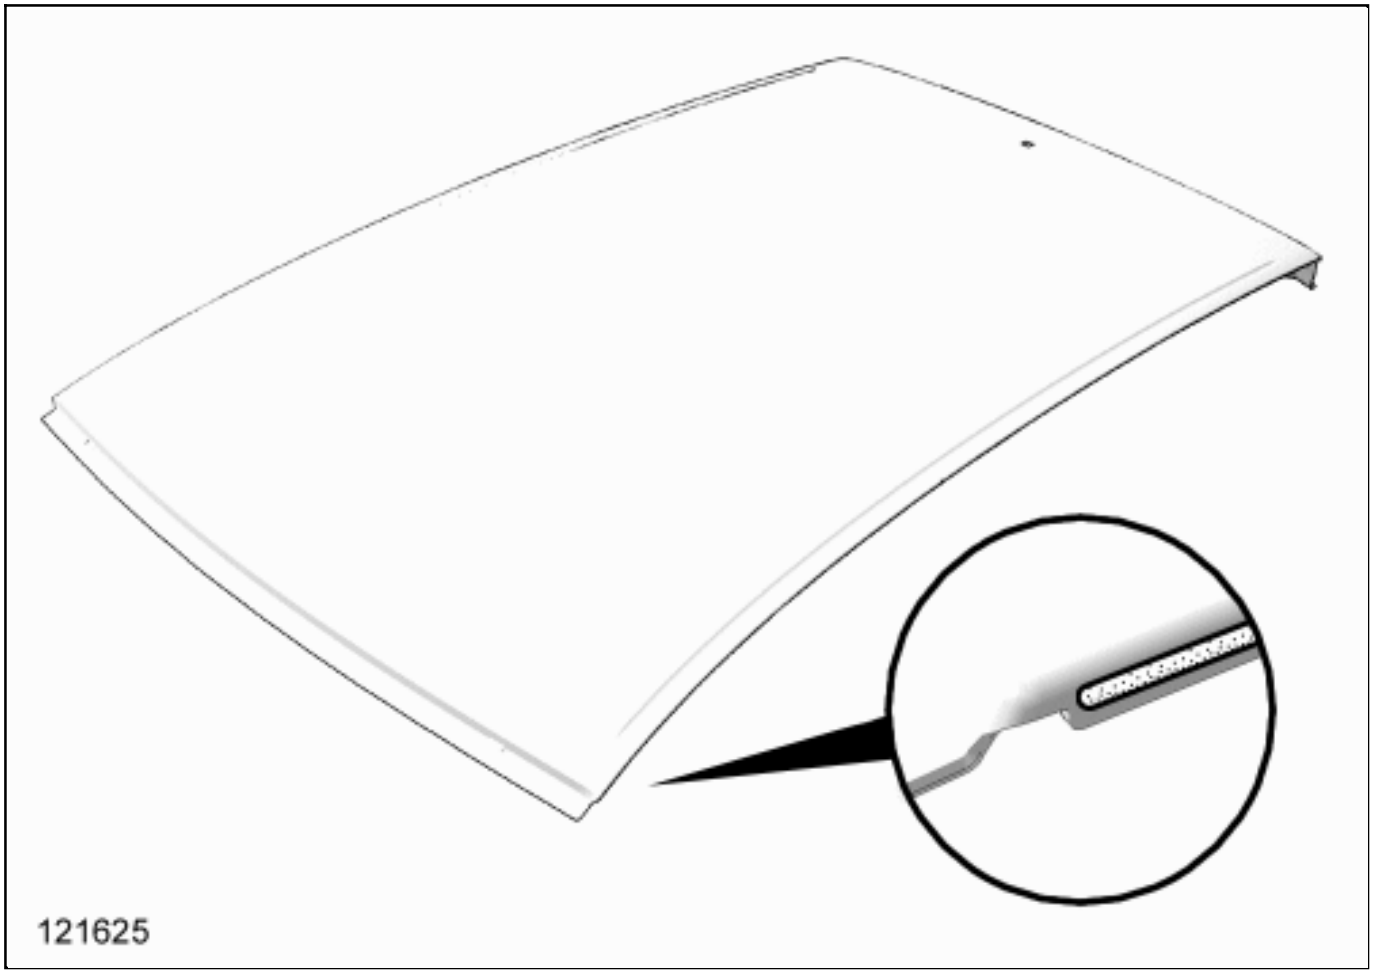


Remove the excess cement with thinner before drying.

Make the original associated joint (see procedure corresponding to the relevant associated joint).

Note:

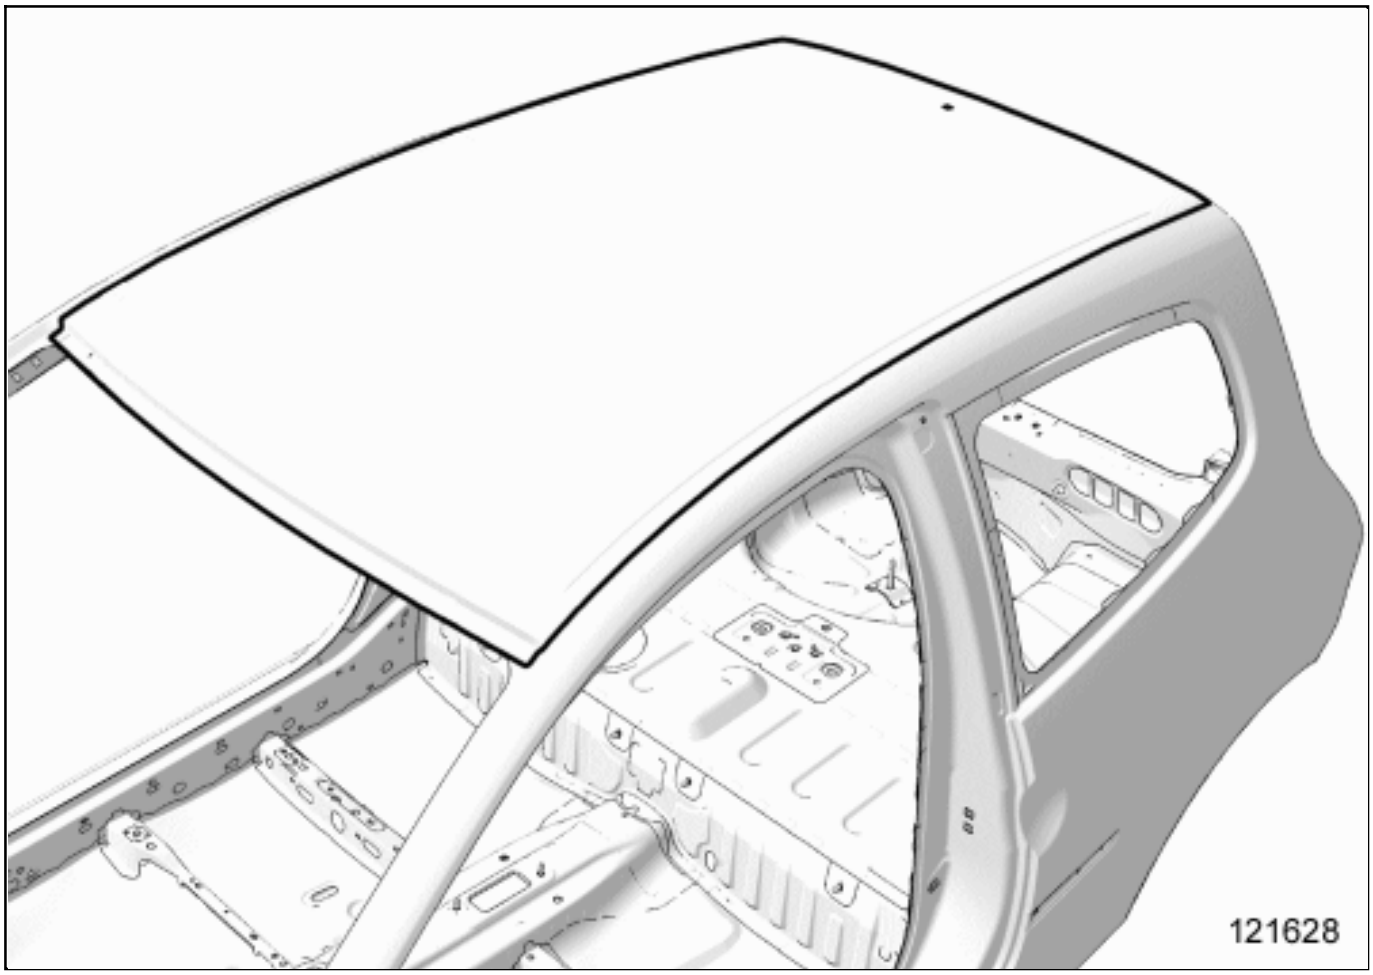
If the bonded joint is associated with a resistance welded joint, the joint face is not accessible using the spot welder and the spot welds are replaced by plug welds, the cement bead must be broken at the plug welds so as not to alter the spot quality.



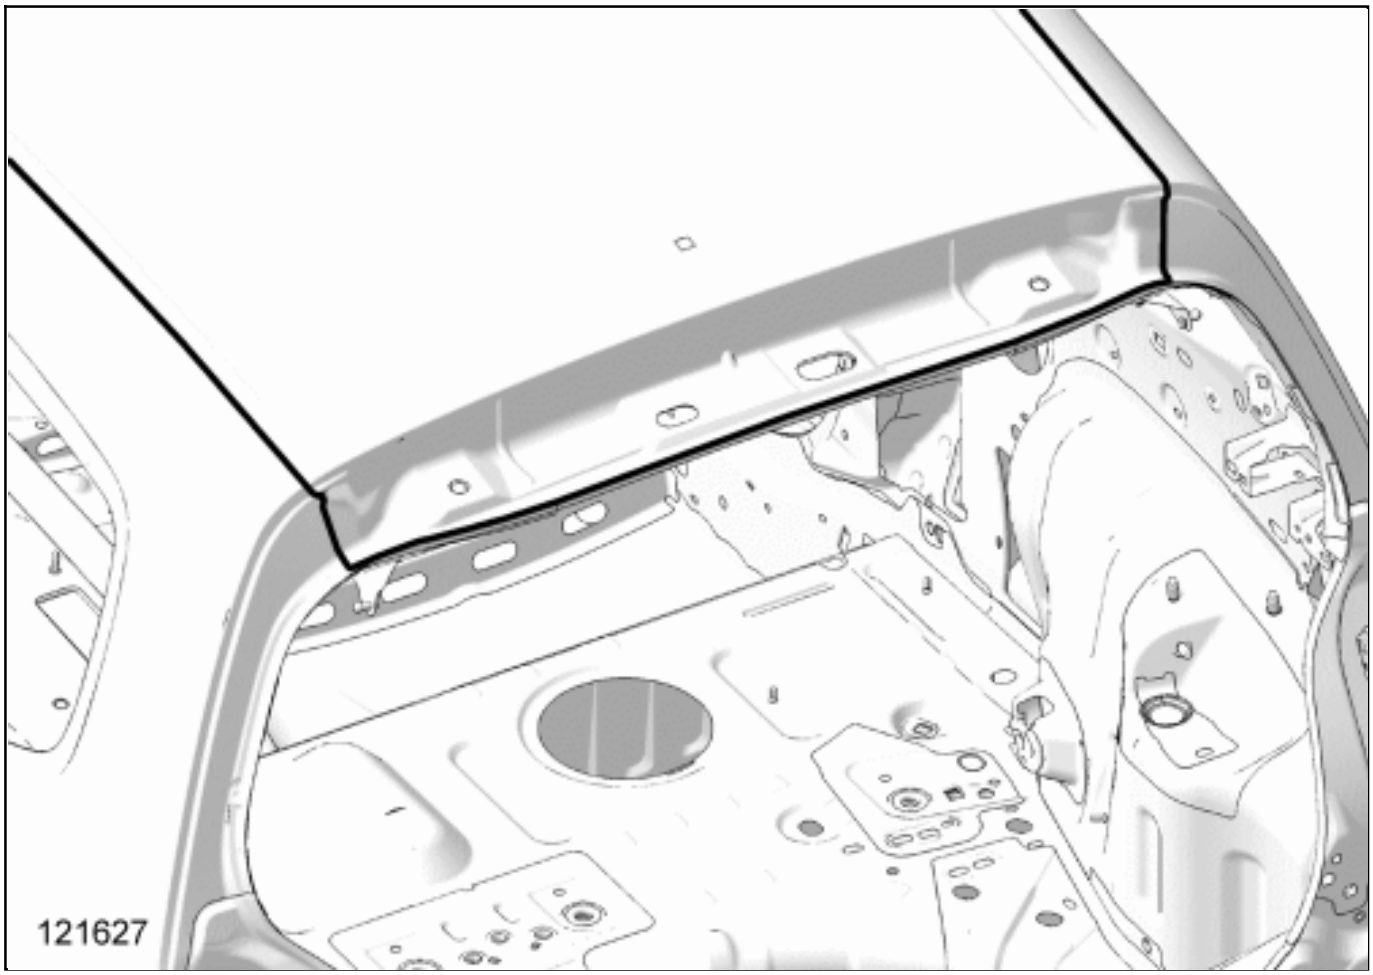
4. SPECIAL NOTES ON ROOF ASSEMBLY: DESCRIPTION

Apply a cement bead to the roof cross members.

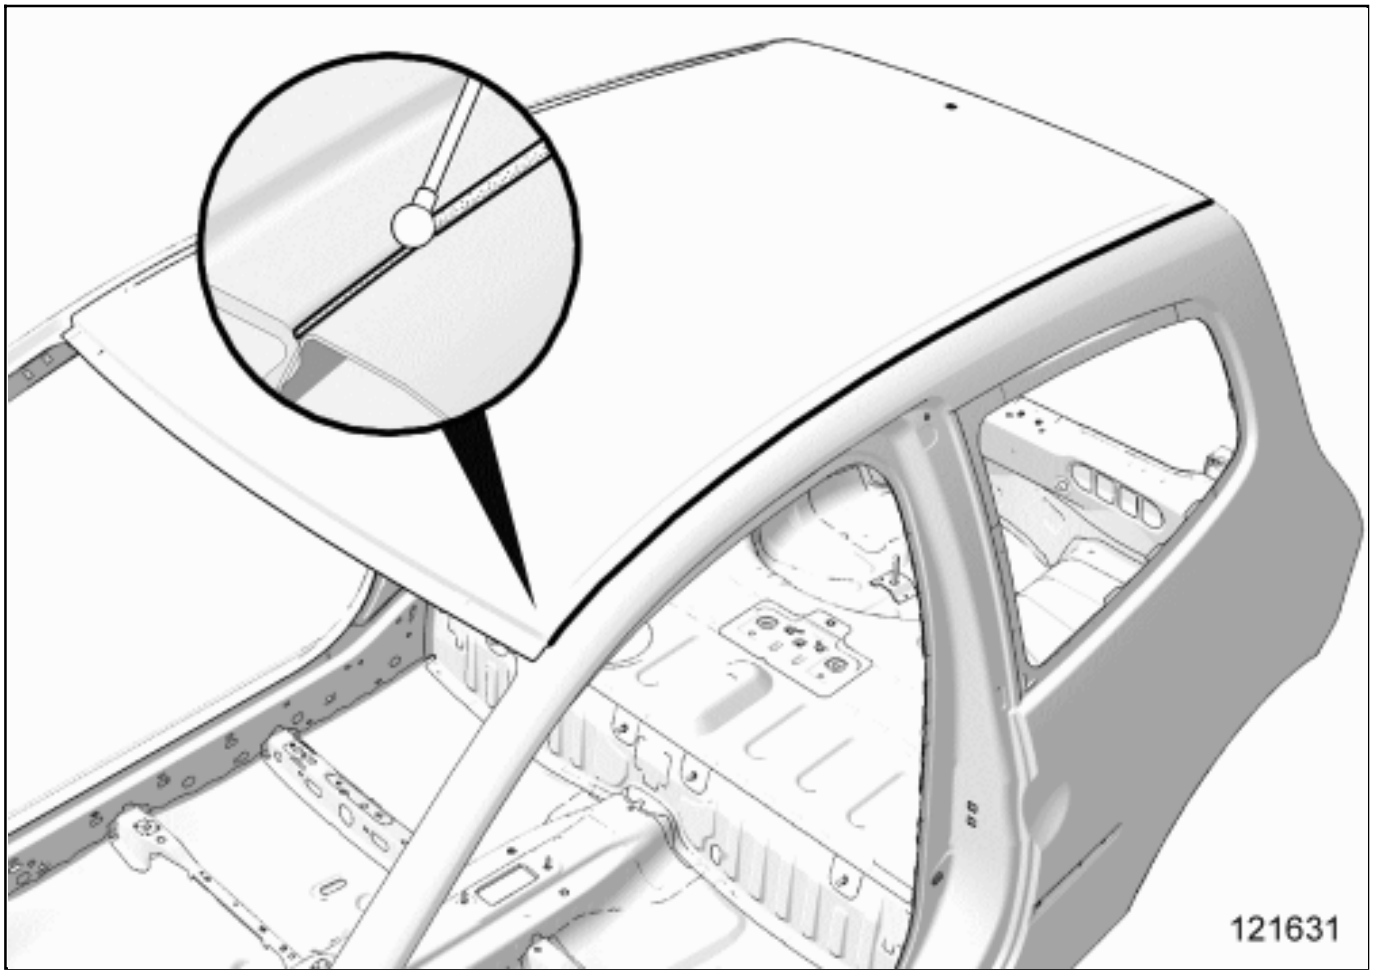
Apply a bead of high performance structural adhesiveover the whole internal joint face on the body side (see 40F, Bonded connections, Connections by rigid bonding: Description) (MR400, 40F, Bonded connections).



Smooth the high performance structural adhesiveusing a small brush.

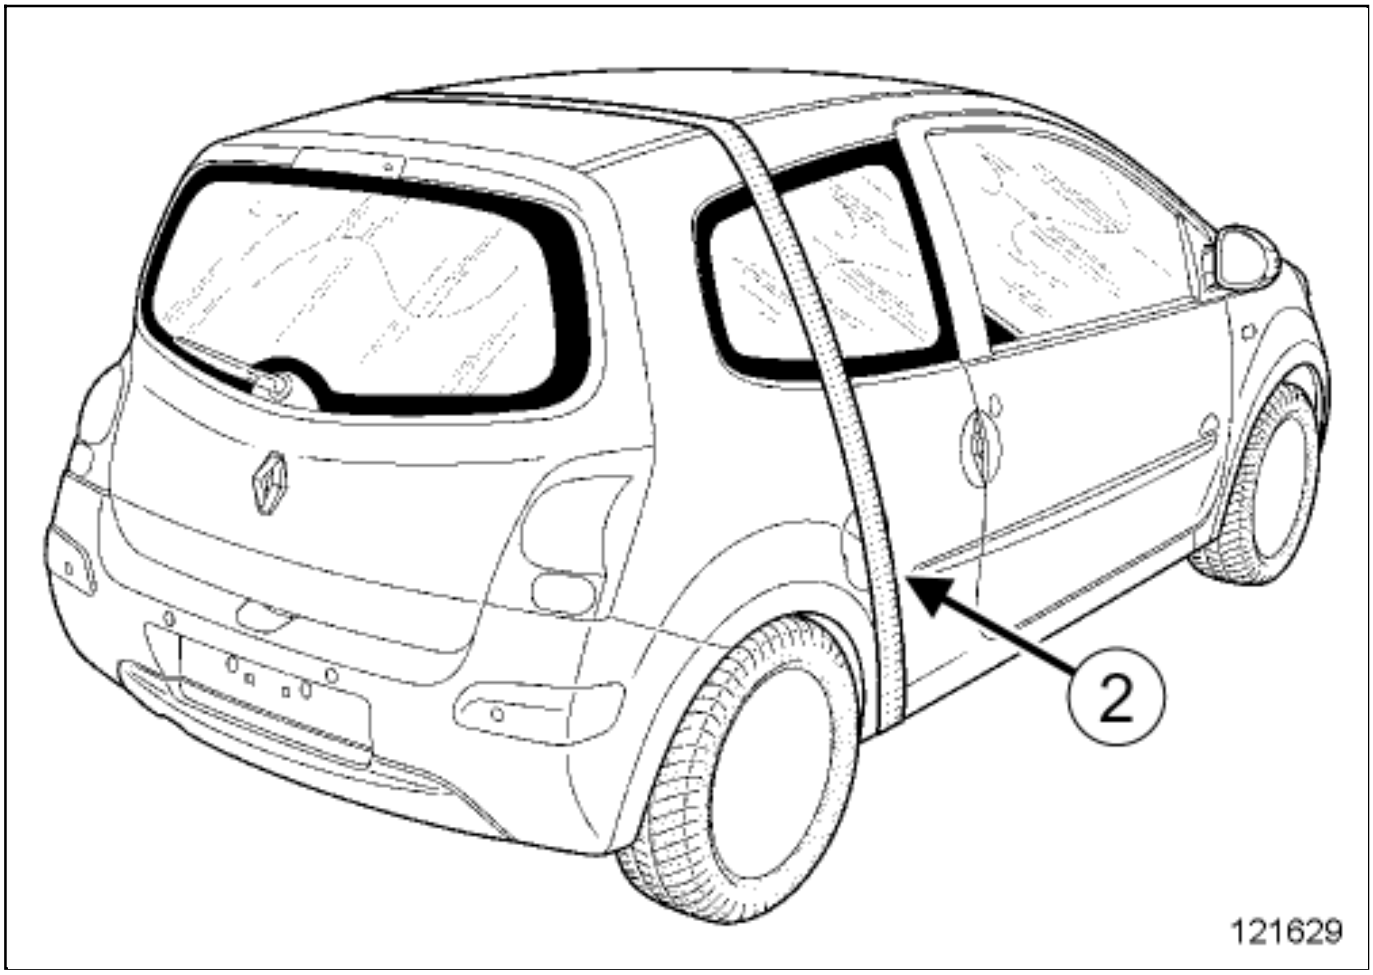


Apply a bead of high performance structural adhesiveto the spare part.

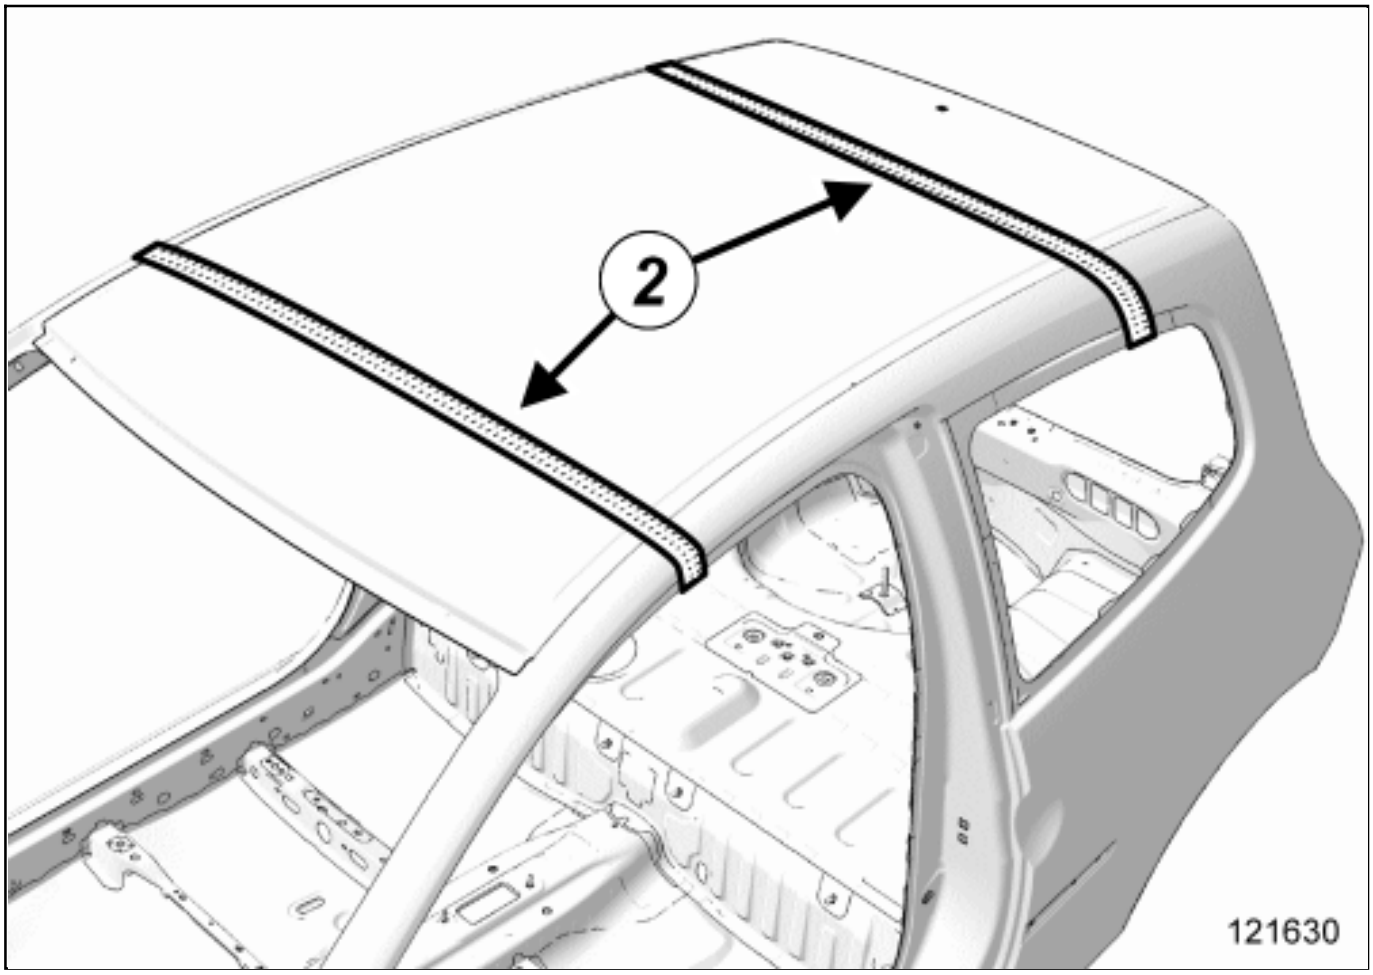


1-

1)FITTING AND ADJUSTING THE REPLACED PARTS



121628



Position the replacement part on the vehicle.

Scrape off the surplus adhesive before it dries using theLevelling tool for bodywork seal(Car. 1786) .

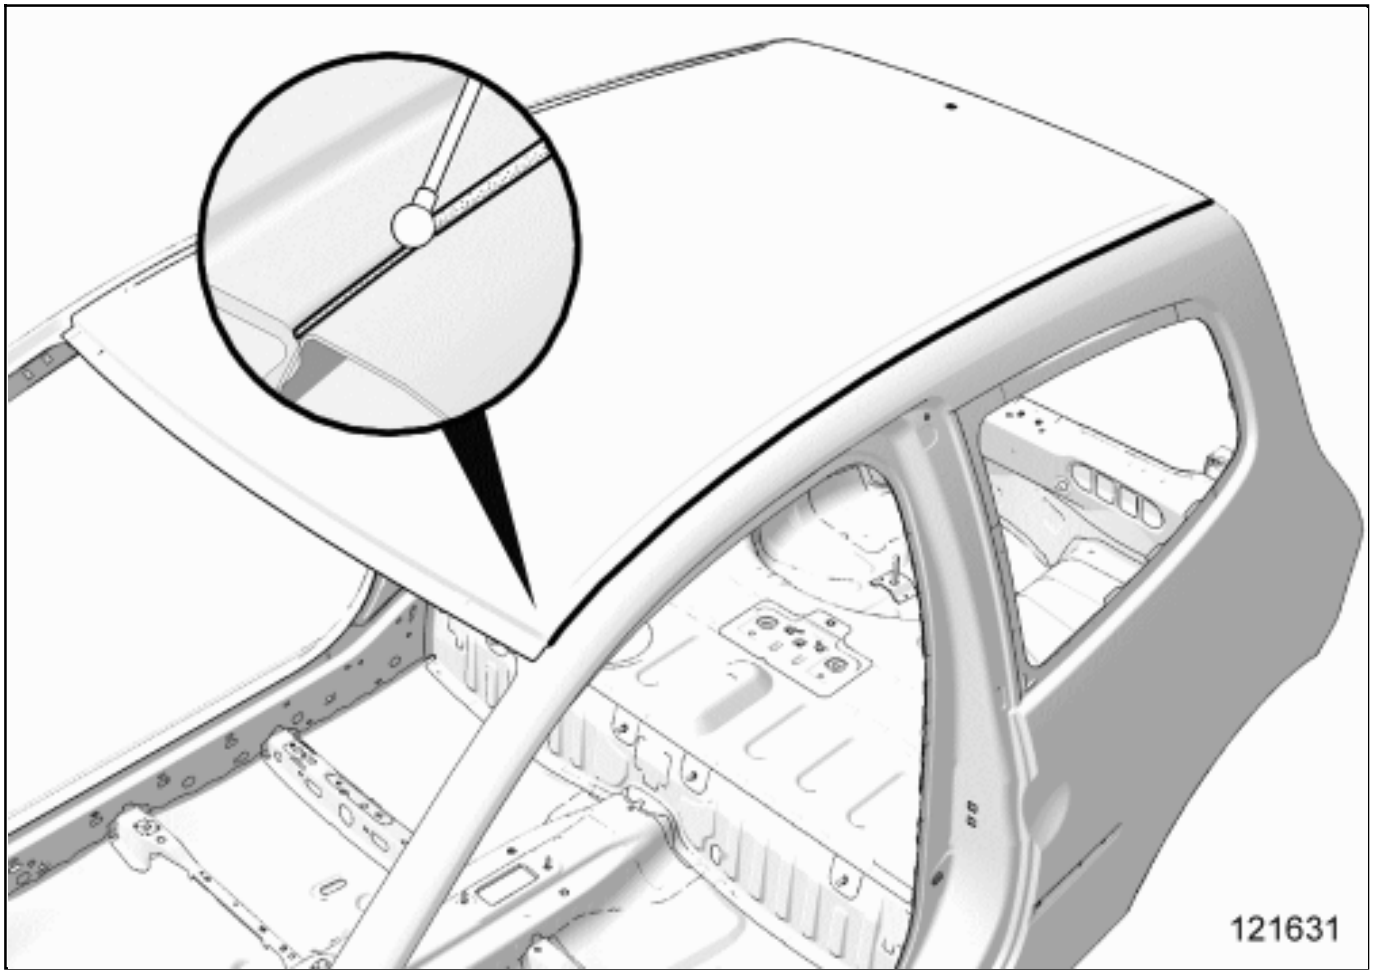
2
121629

Hold the replacement part with the locking pliers (at the front and rear cross members) and the safety strap (s)to position it securely according to the markings made earlier(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use) (MR400, 05B, Bodywork equipment and tooling).

Note:

To fit the safety straps without removing the quarter panel windows, use 3safety straps.

Let the adhesive dry for 10 hoursat an ambient temperature or for 2 hoursat 60˚C.



2)MAKING THE OTHER JOINTS

Make the rest of the replacement part joints.

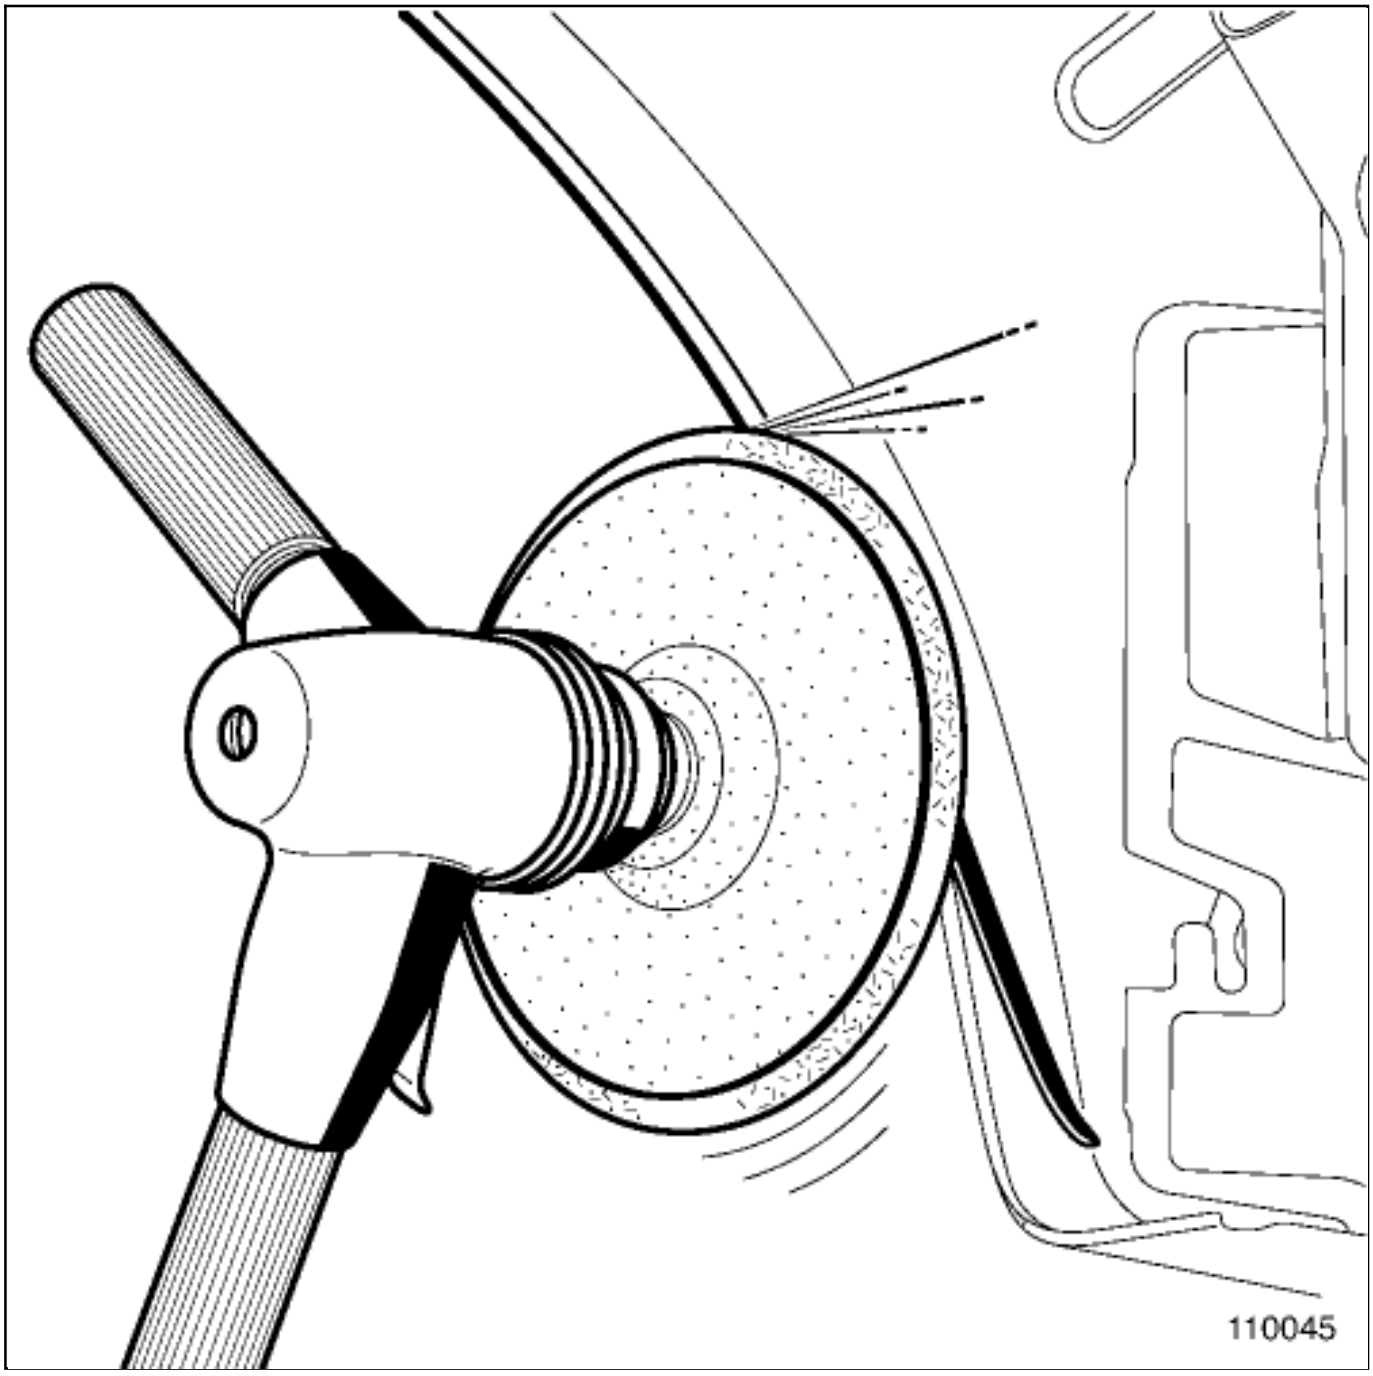
2- FINISHING AFTER ASSEMBLY

1)APPLYING FINISHING PRODUCT

Prime the side bonding areas.

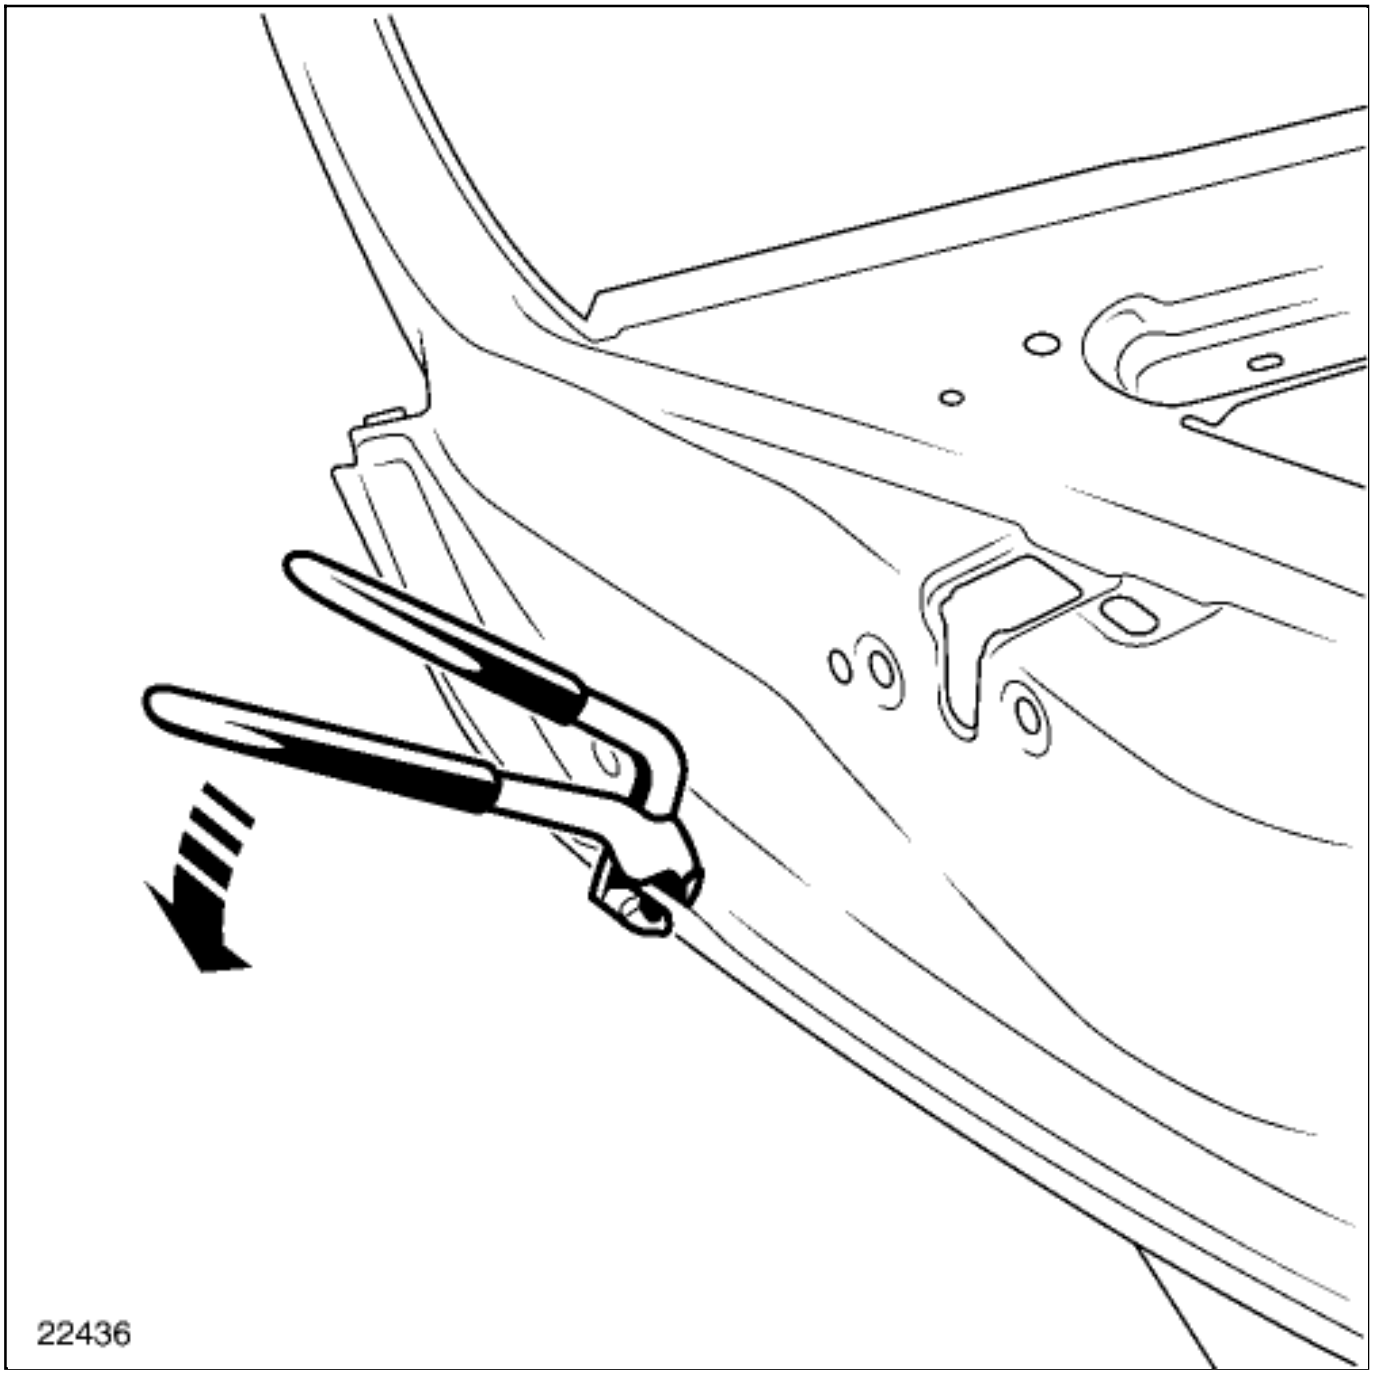
Apply a finishing seal, to the side bonding areas.

Scrape off the surplus adhesive before it dries using theLevelling tool for bodywork seal(Car. 1786) .



CONNECTIONS BY RIGID BONDING WITH CRIMPING: DESCRIPTION

Special tooling required	
Pliers for uncrimping door panels.	Car. 1657

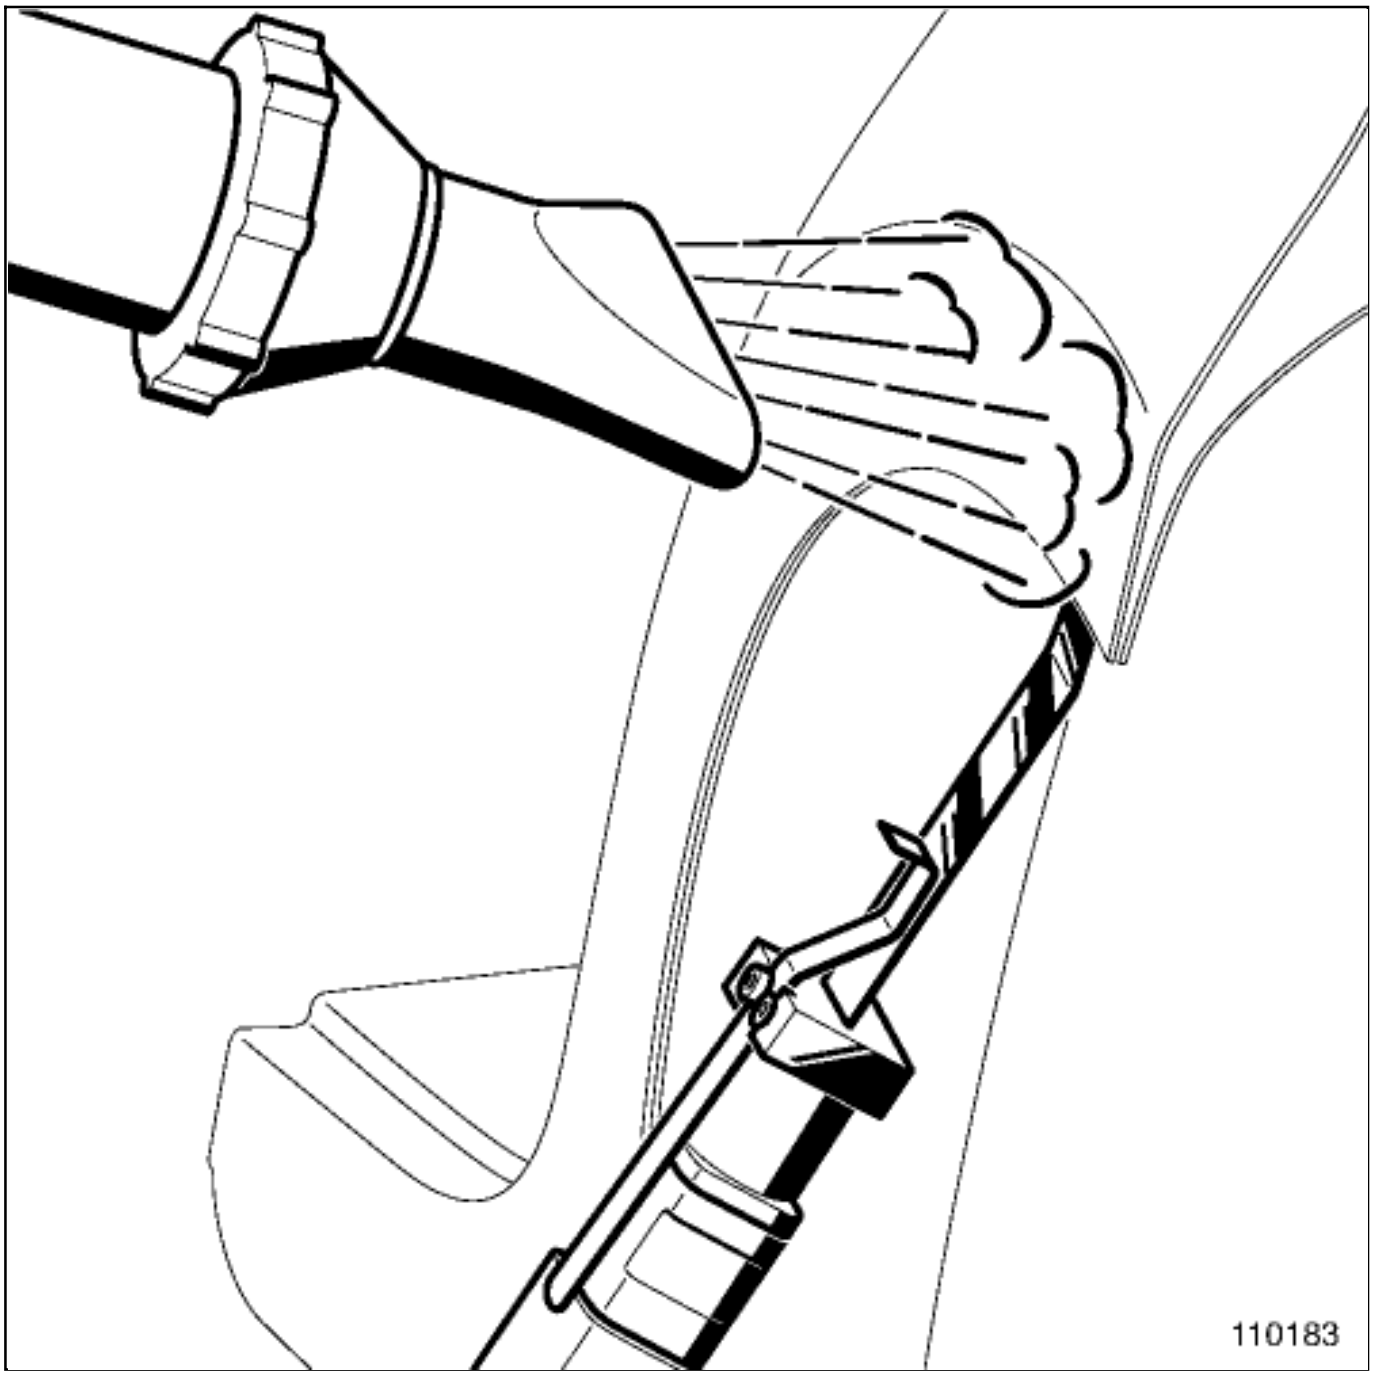


1. DISASSEMBLY

1- DECRIMPING

There are two methods for decrimping a component.

Grind down the folded edge of the component crimp.

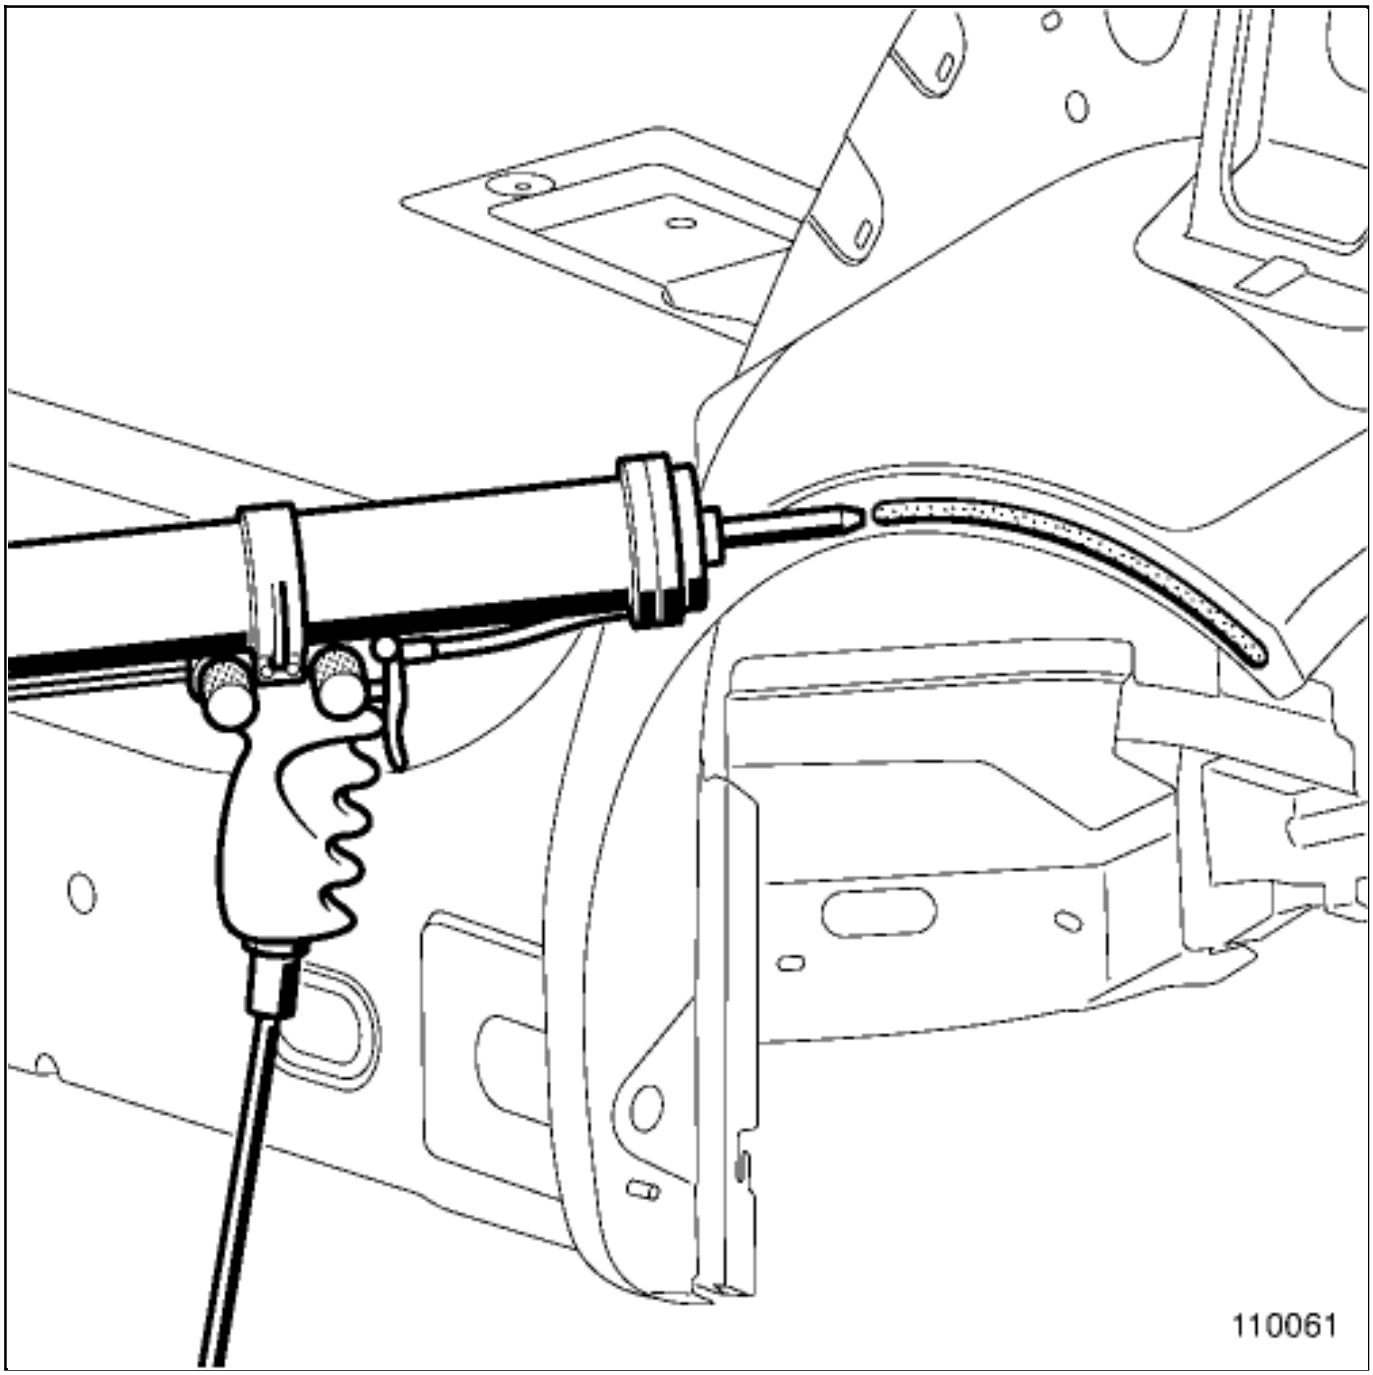


Remove the component using thePliers for uncrimping door panels.(Car. 1657) .

Note:

It is forbidden to use the grinder on aluminium components when there is no extraction and filtration system specifically for aluminium.

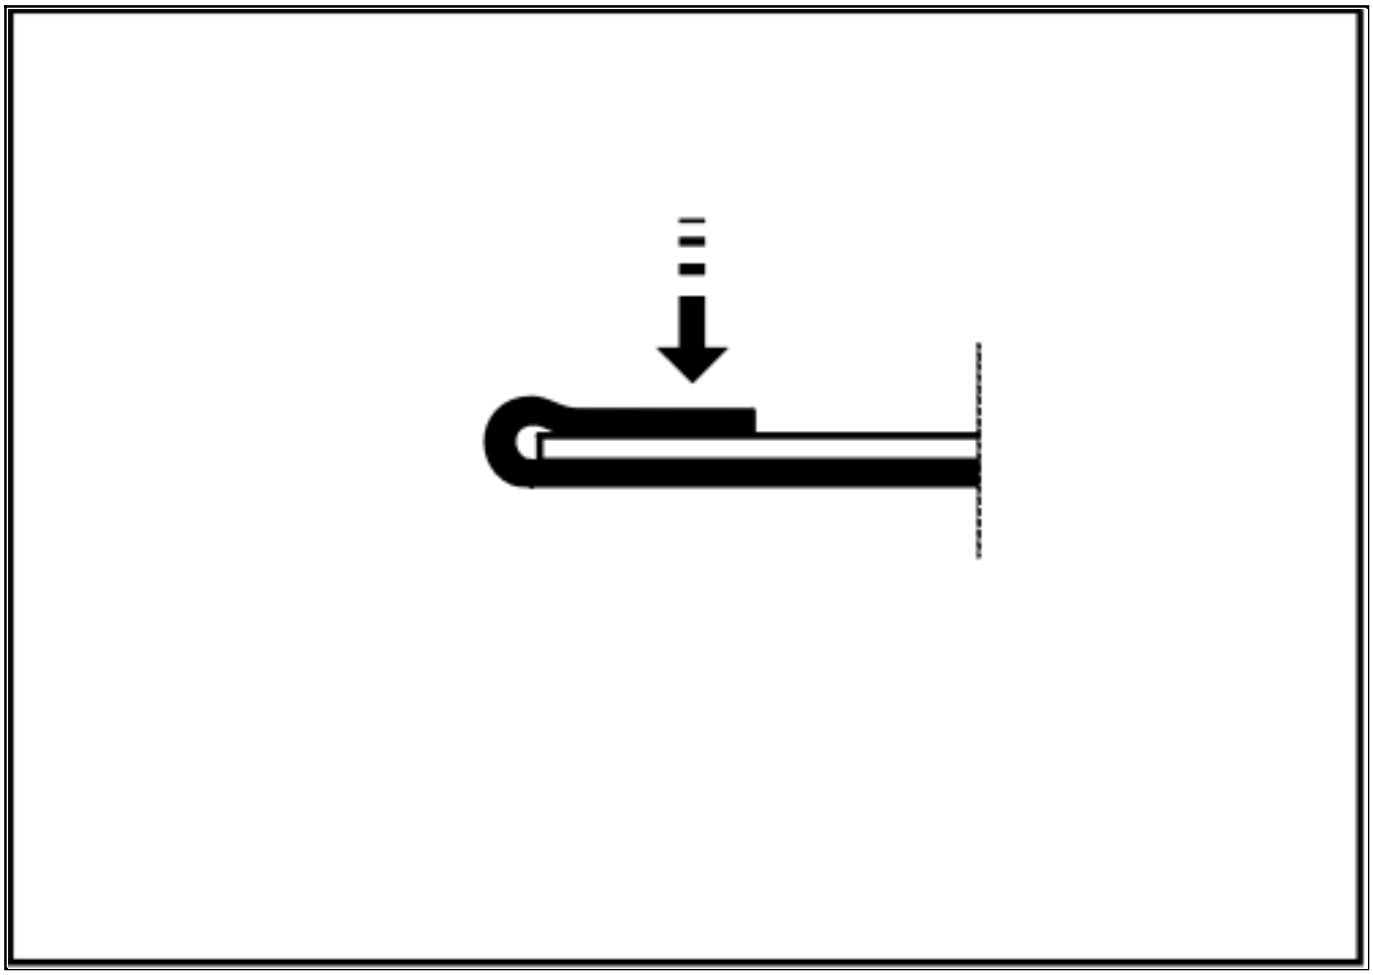
2- REMOVING



Detach whilst simultaneously heating using a heat stripper.

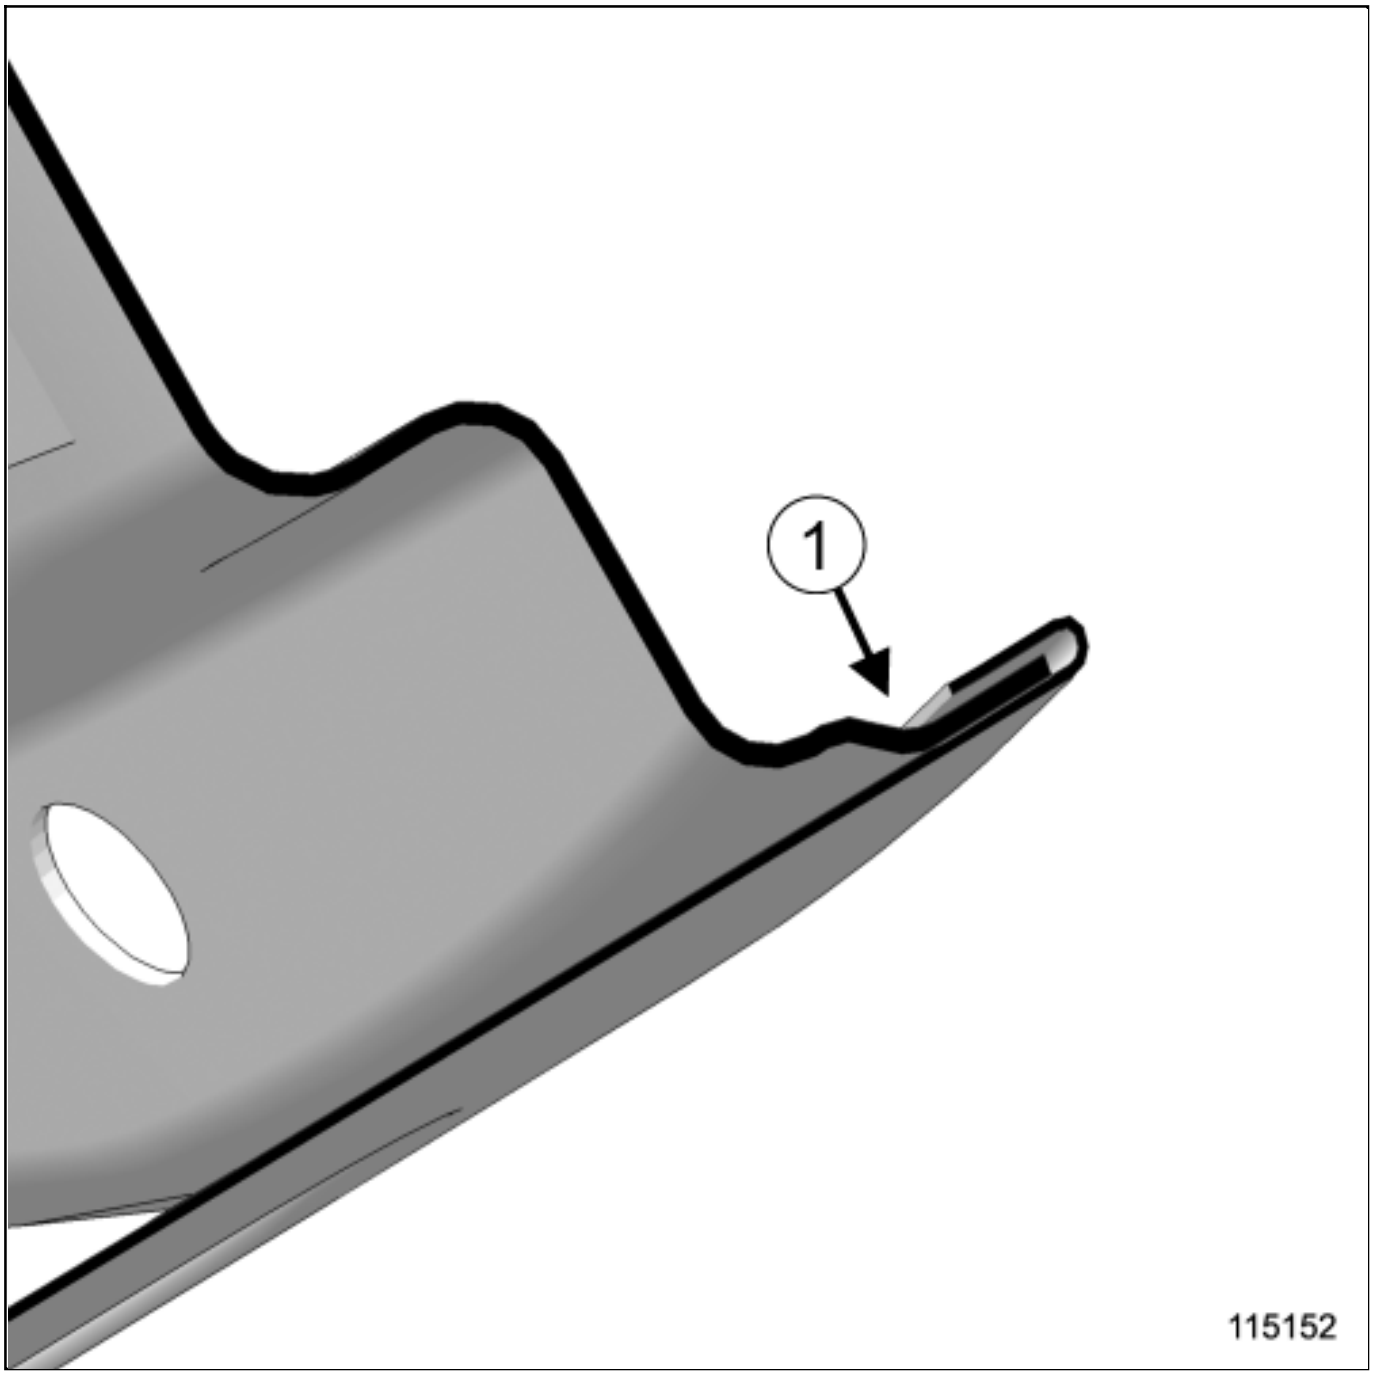
3- SCOURING

Scour the adhesive residue on the component.(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use) .



2. ASSEMBLY

1- BONDING

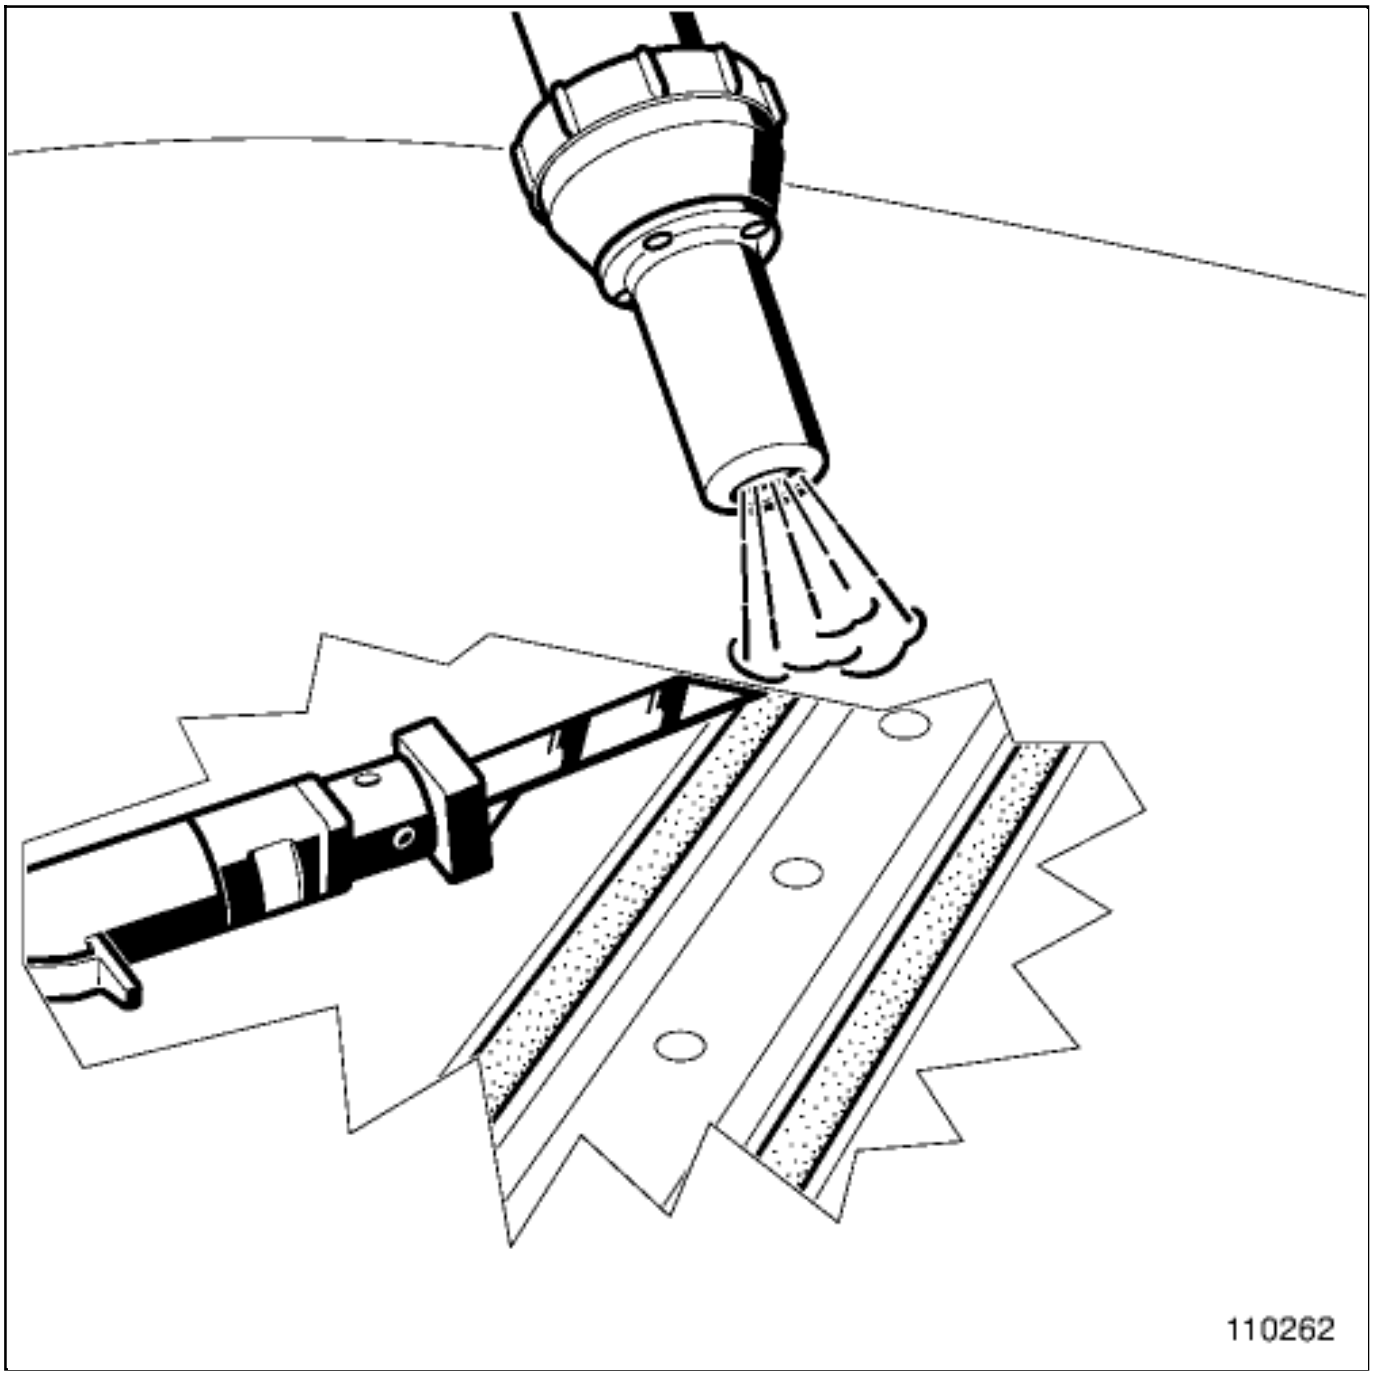


Apply the cement bead(see 40F, Bonded connections, Connections by rigid bonding: Description) .

2- CRIMPING

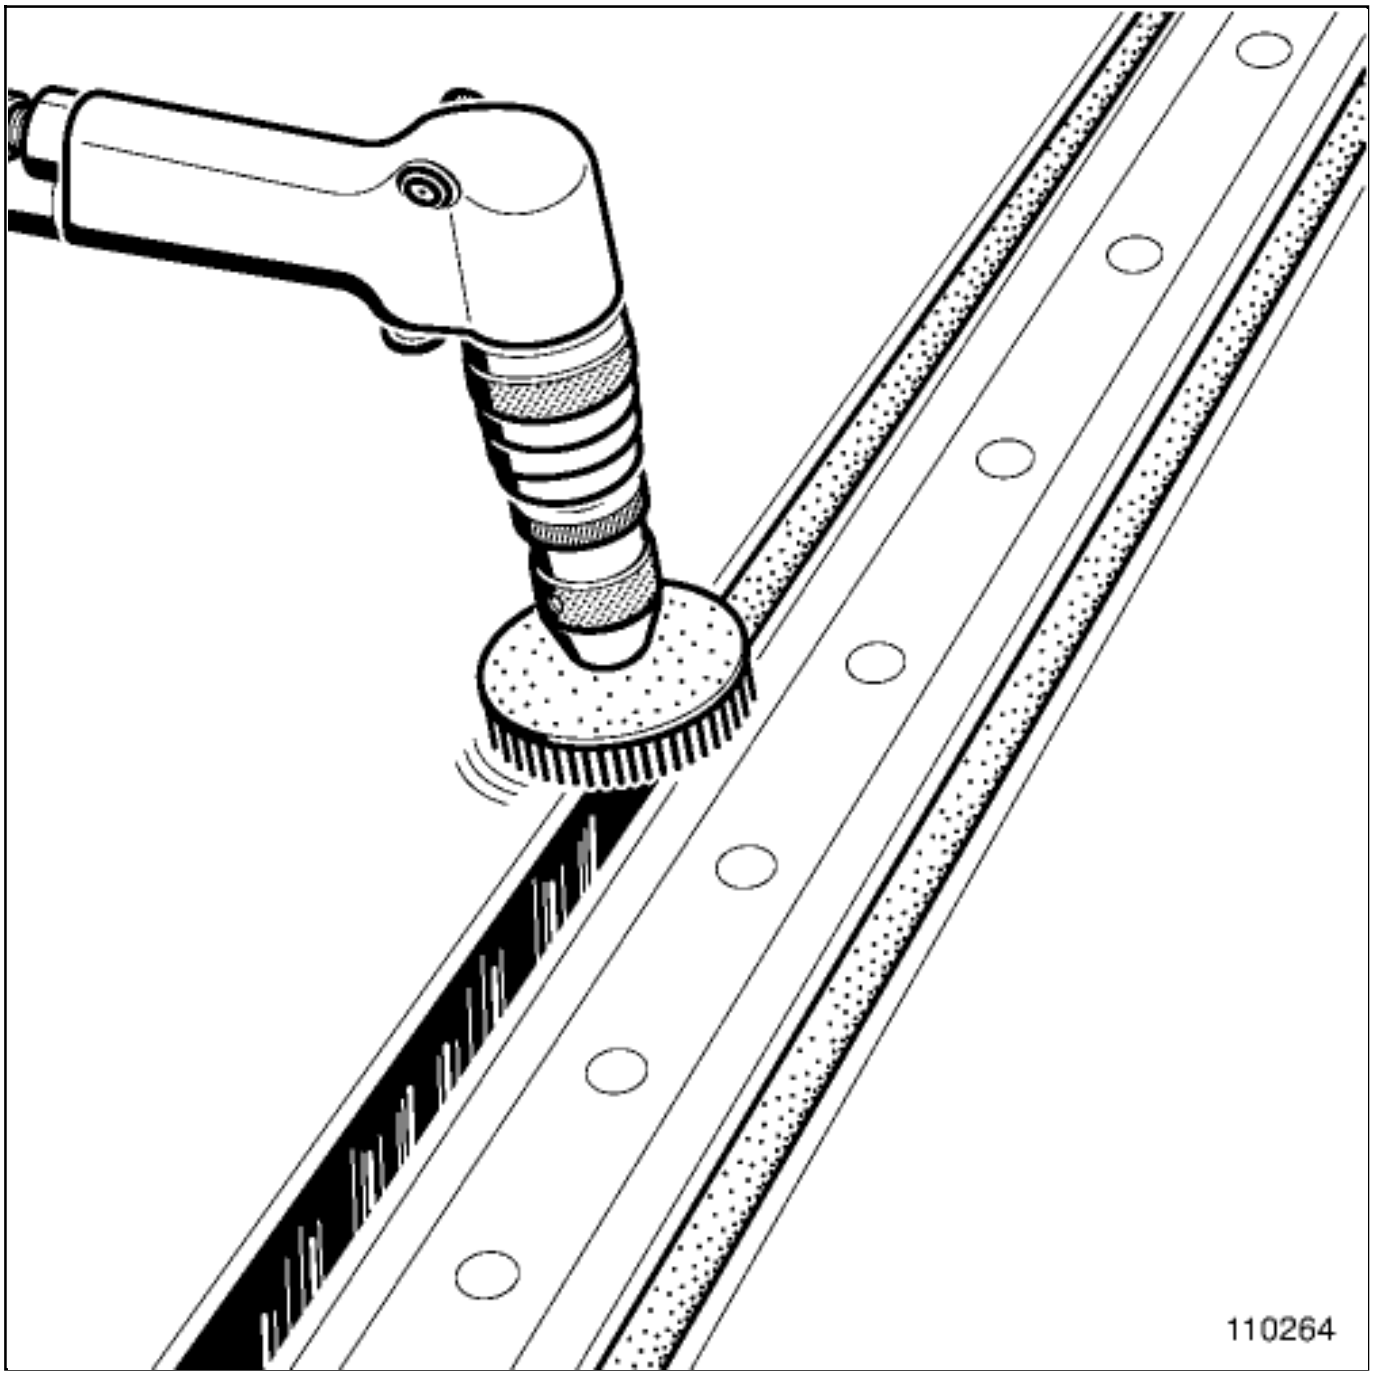
Crimp the component into the shape of a water drop, taking care not to crush the folded edge.

3- FINISHING



Apply an extruded seal at(1) **(see 40J, Protective devices , Anti-corrosion protection of joints after welding: Description)** .

CONNECTIONS BY SOFT BONDING: DESCRIPTION



1. DISASSEMBLY

1- CUTTING, SCOURING

Detach the damaged part, by simultaneously heating with a heat stripper to destroy the cement.

2- SCOURING

Using the most suitable tool(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use) , scour the excess cement left on the vehicle.

2. PREPARATION BEFORE ASSEMBLY

1- ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use) .

2- MARKING AND IDENTIFYING THE JOINTS

Mark the joint areas.

Measure the distance between the panels at the location of the joint.

Remove the replacement part.

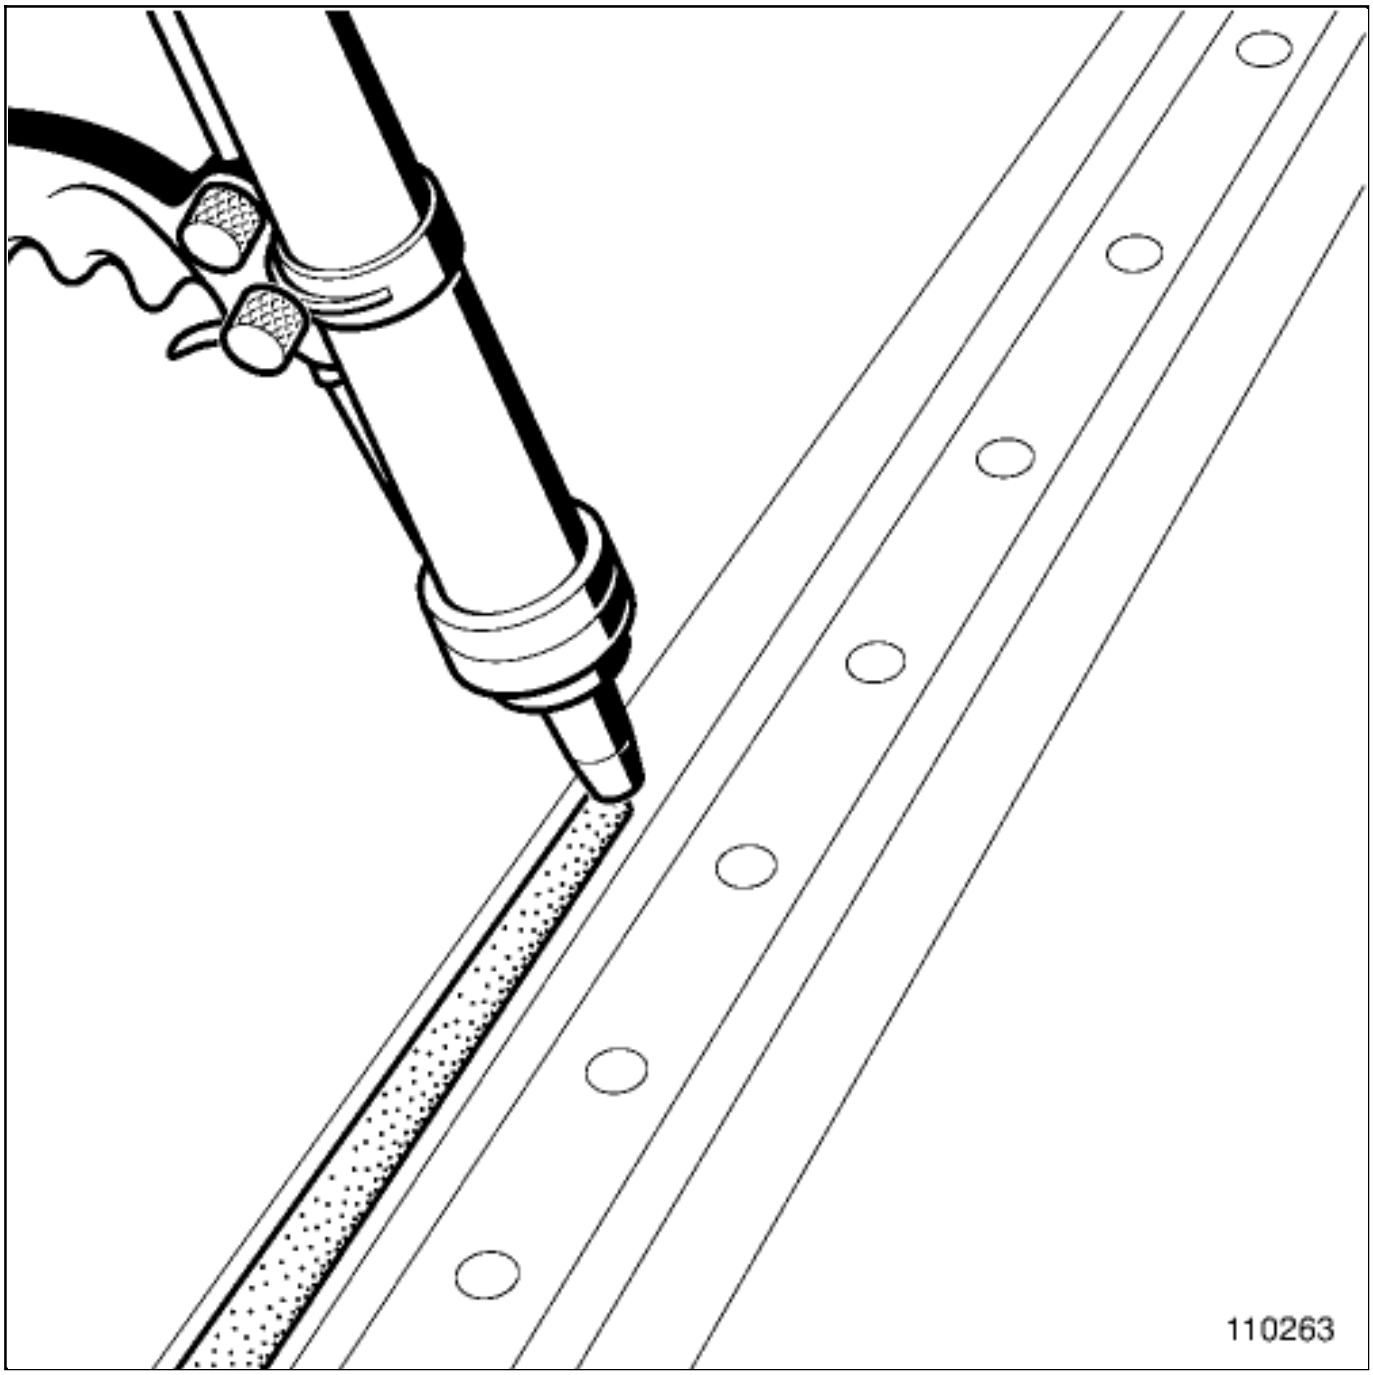
3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Sand using P320dry sand paper or a red abrasive pad, without removing the cataphoretic protection.

Clean the joint face with surface cleaner.

4- PREPARATION OF THE JOINTS ON THE VEHICLE

Clean the joint face with surface cleaner.



5- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

3. ASSEMBLY

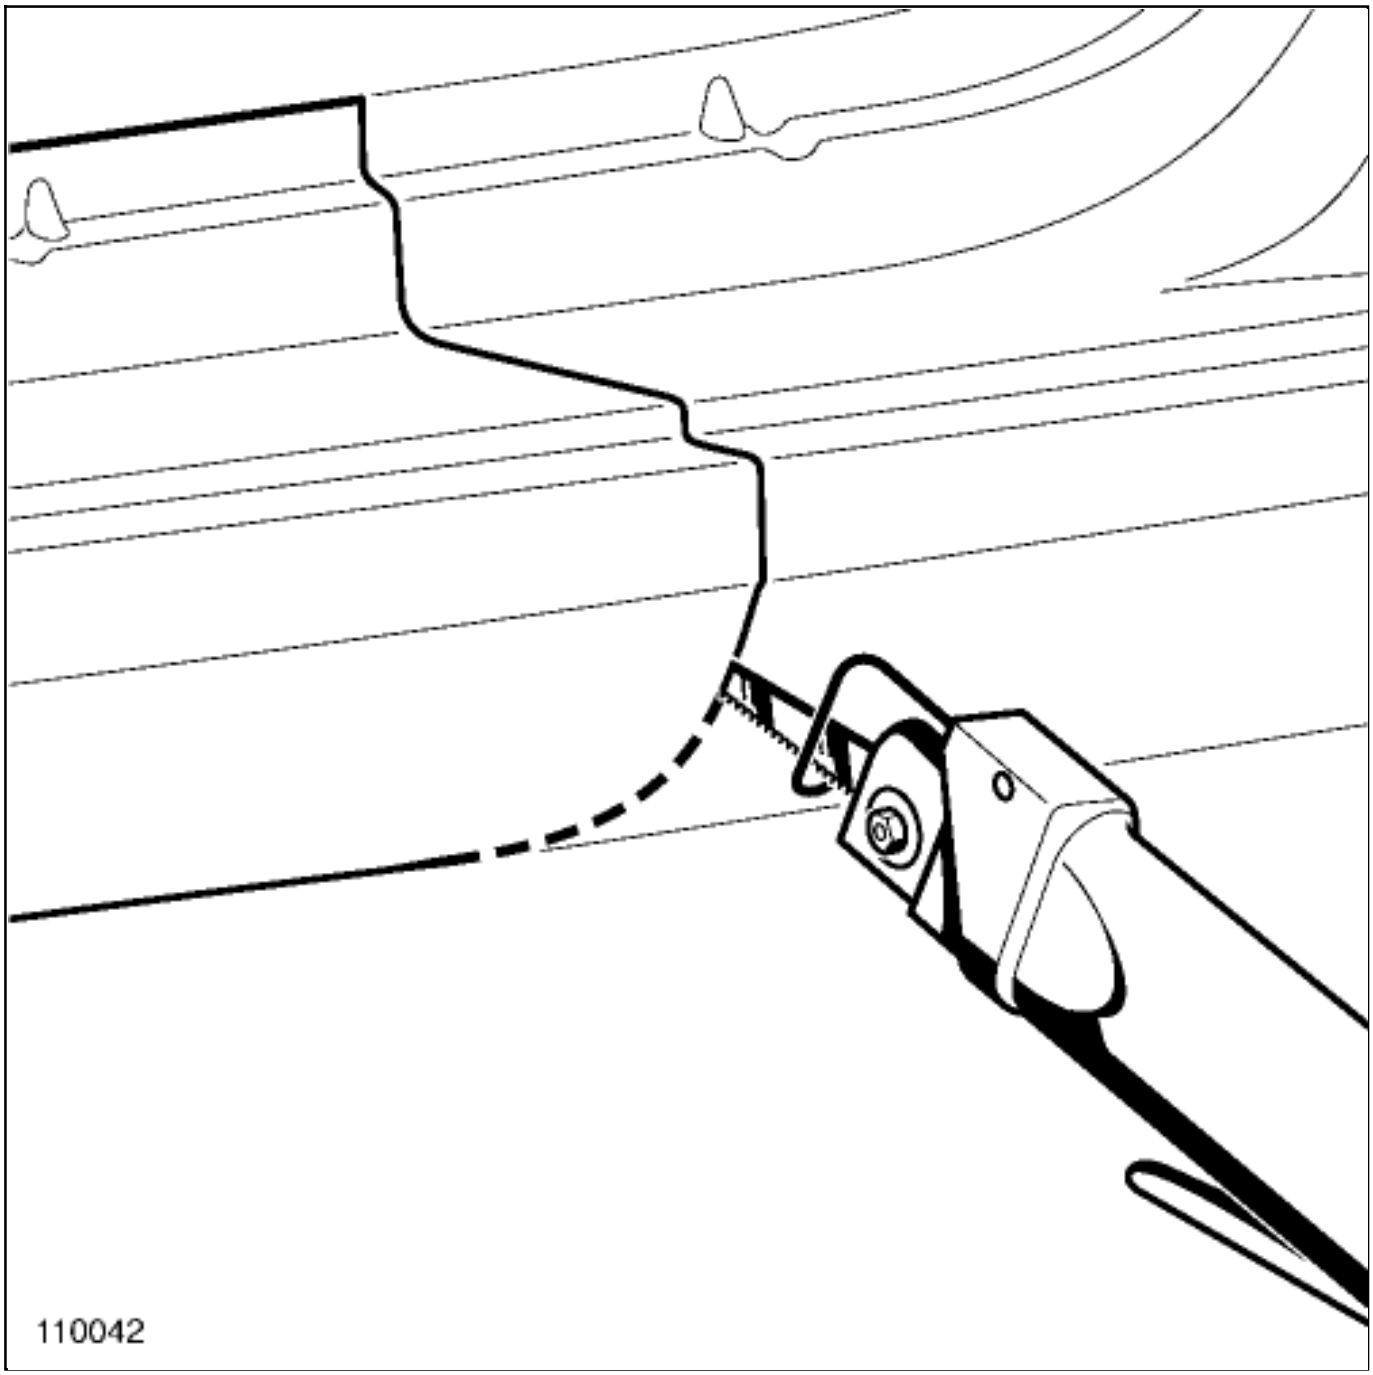
1- APPLICATION OF THE BONDING PRODUCTS

On the vehicle mating face apply an even cement bead with a diameter of 4 to 10 mmdepending on the distance between the panels measured during the adjustment.

The width of the bead after squeezing depends on the application diameter of the extruded product and on the distance between the panels(see 40F, Bonded connections, Connections by bonding: Precautions for the repair) (see 04F, Bodywork products and mountings, Products and equipment for bonded assembly: Use) .

2- FITTING AND ADJUSTING THE REPLACED PARTS

Position the part on the vehicle.

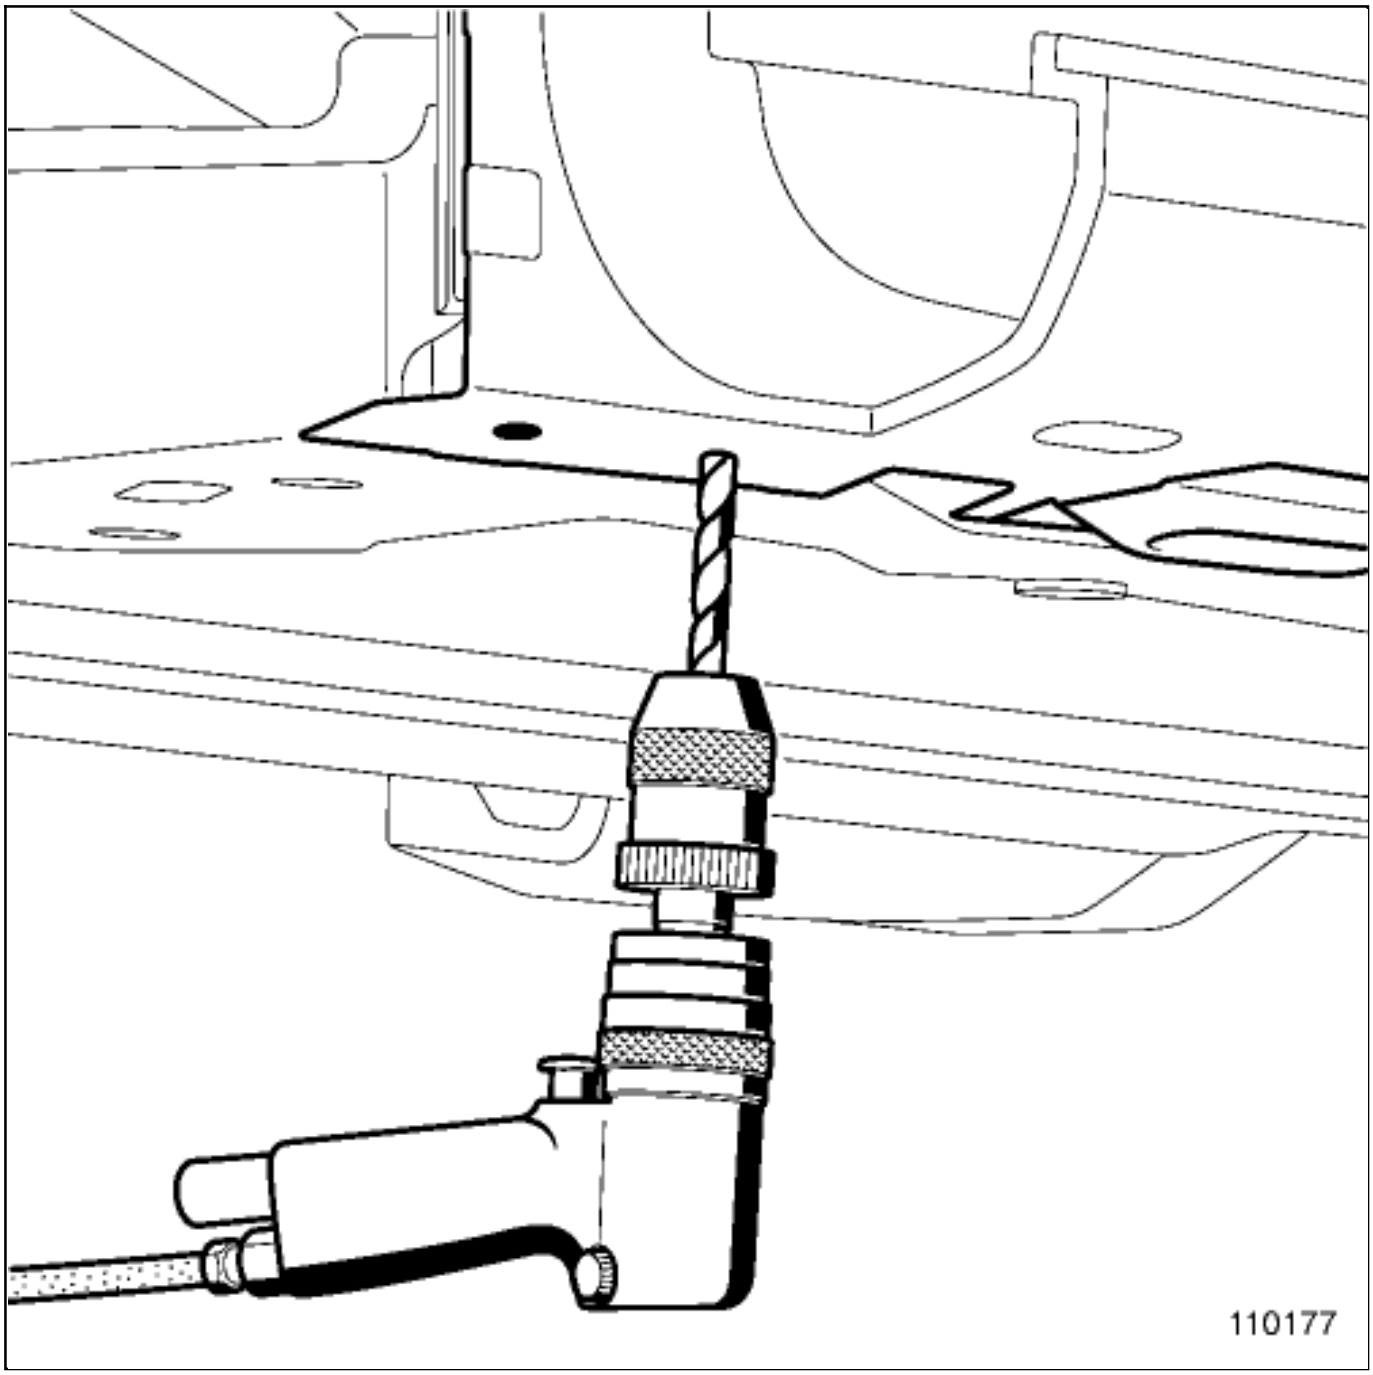


3- FINISHING

Wipe the excess product away using a cloth lightly soaked in surface cleaner.

CONNECTIONS FOR EDGE TO EDGE PARTIAL REPLACEMENTS

1. DISASSEMBLY

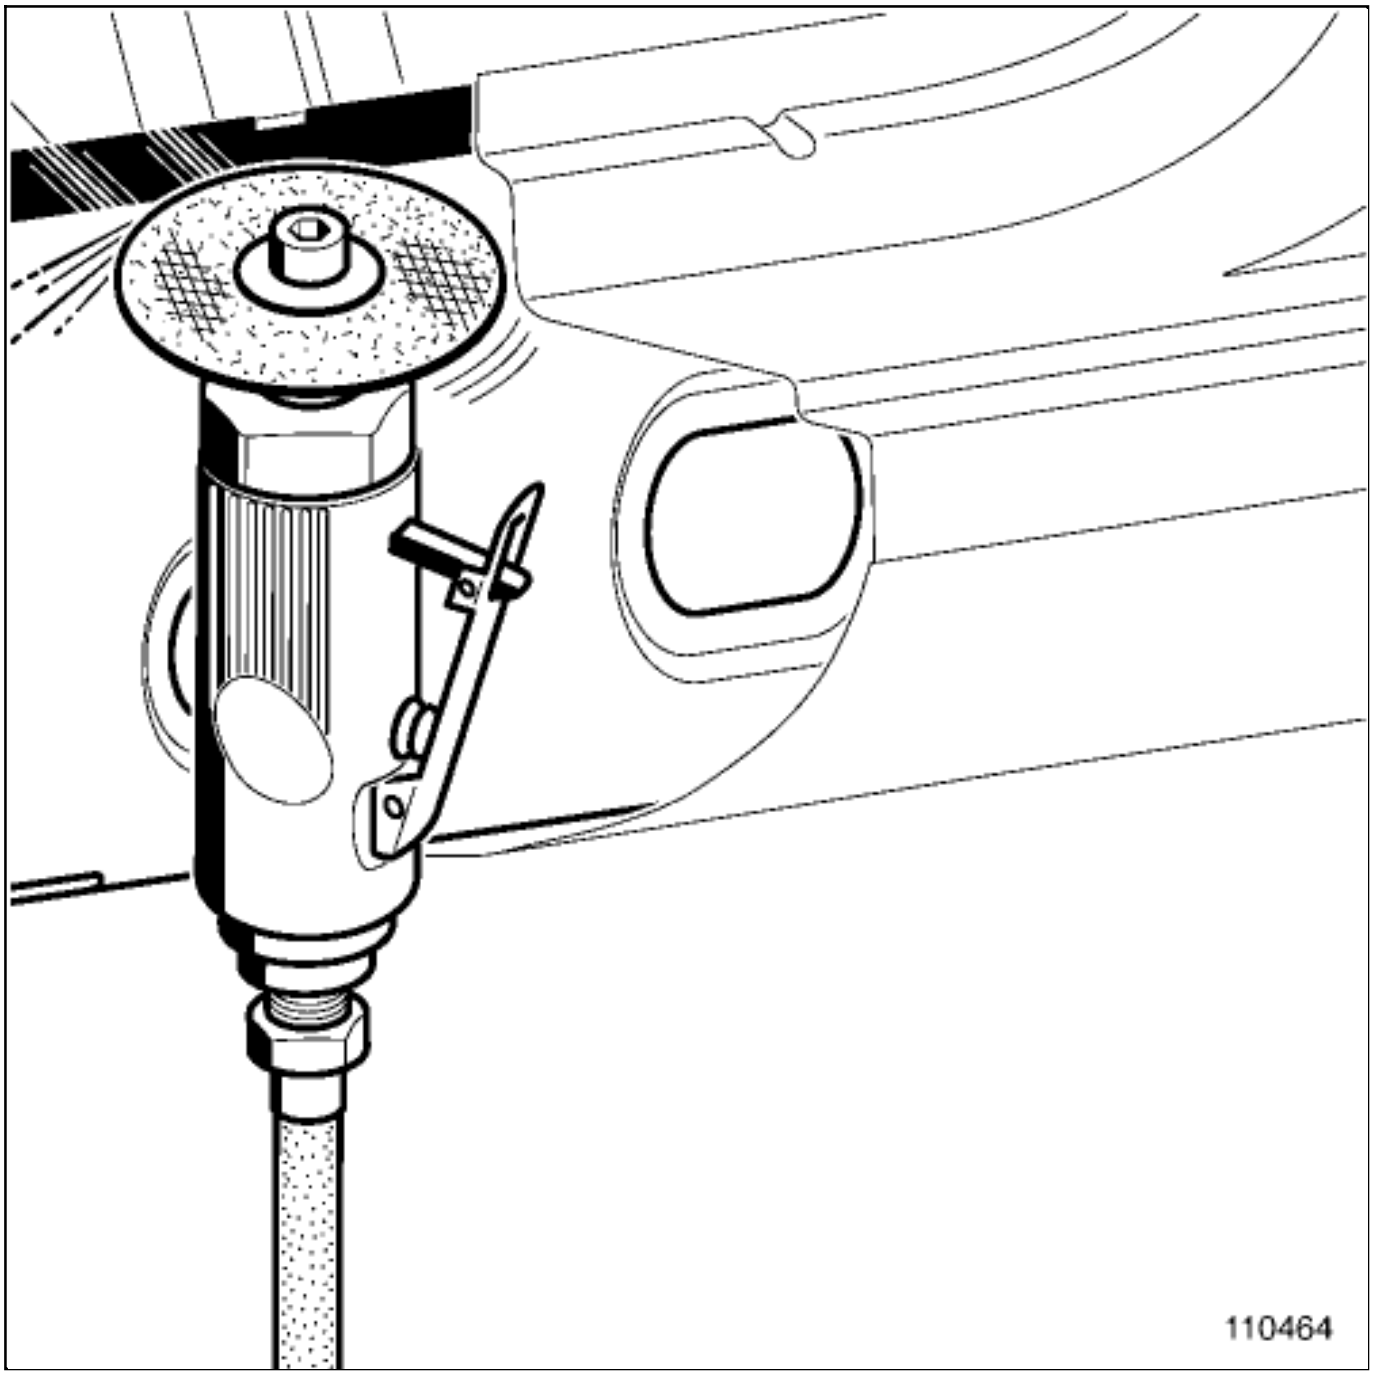


1- CUTTING

Cut the damaged part approximately 25 mmabove the cut defined in the MR of the vehicle concerned.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

2- UNPICKING



Unpick the part's welded connections.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

3- GRINDING

Level off all the welding residue as well as that left by the cutting.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Put the support faces flat so as not to penalise the joint.

Surface the internal mating faces.

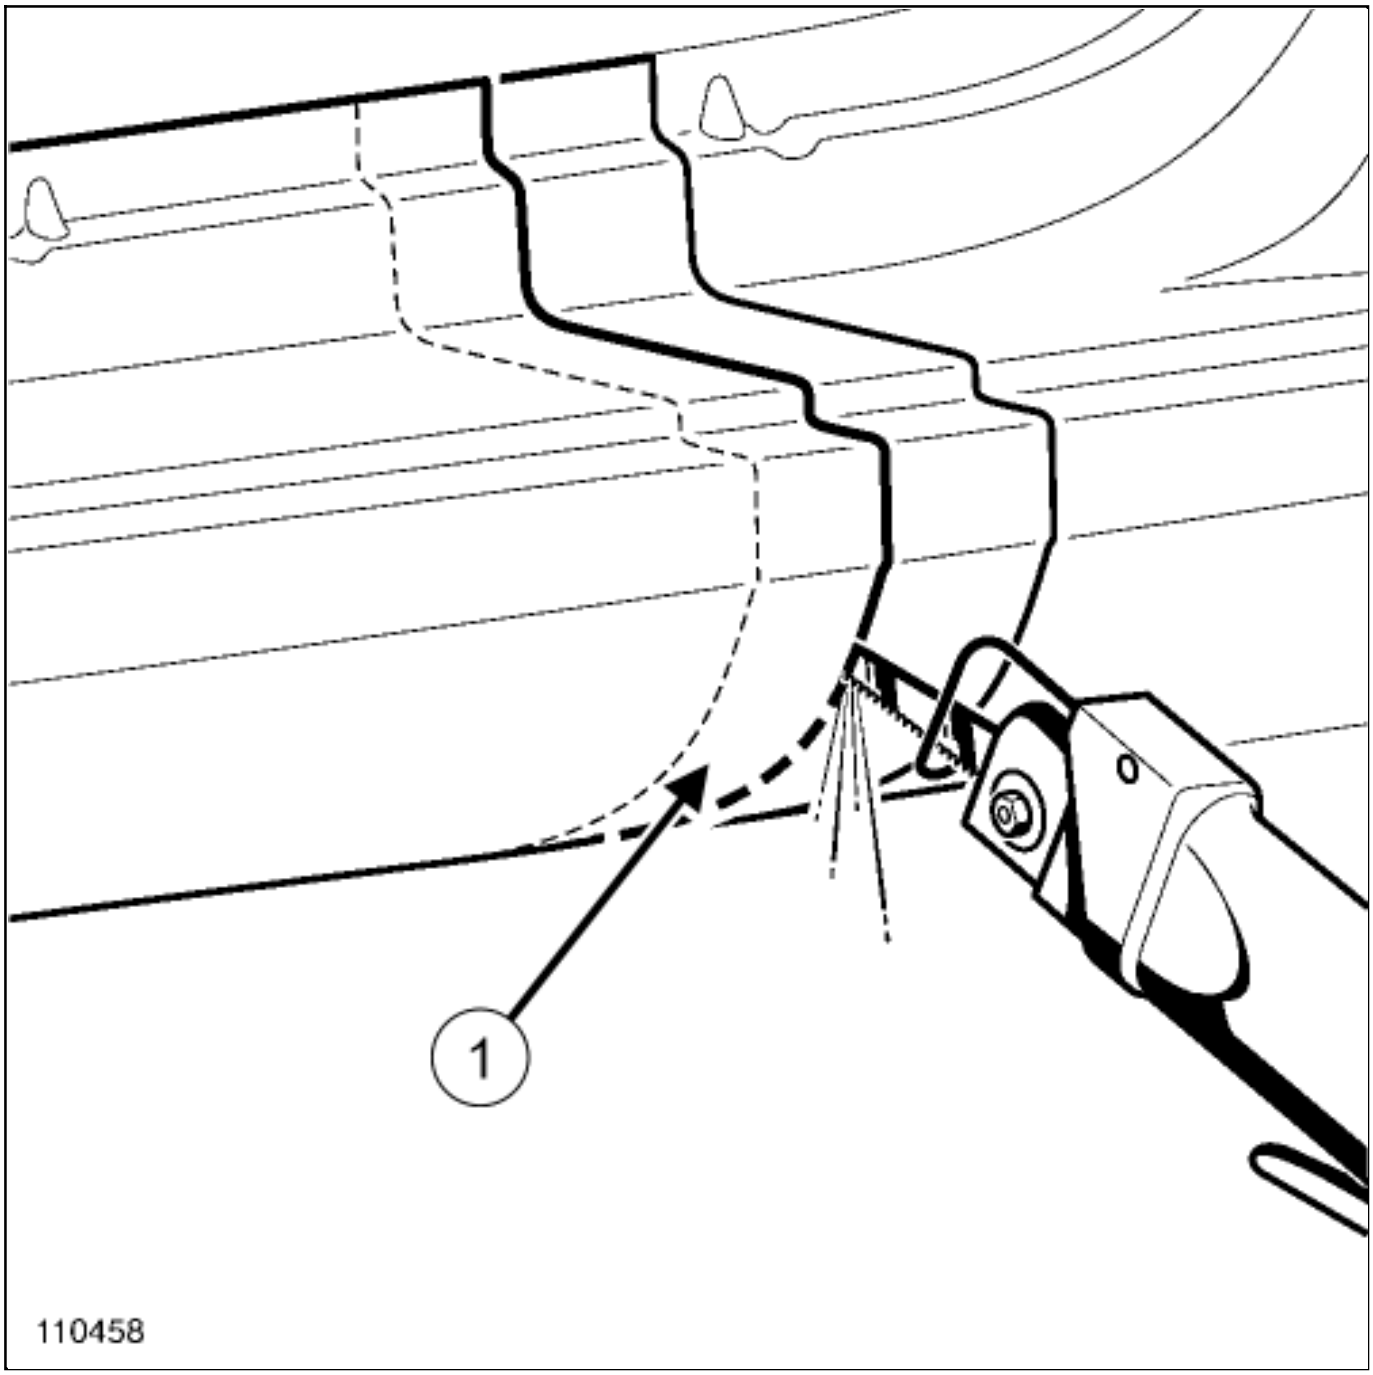
(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

2. PREPARATION BEFORE ASSEMBLY

1- ADJUSTMENT FOR SUPERIMPOSITION CUTTING



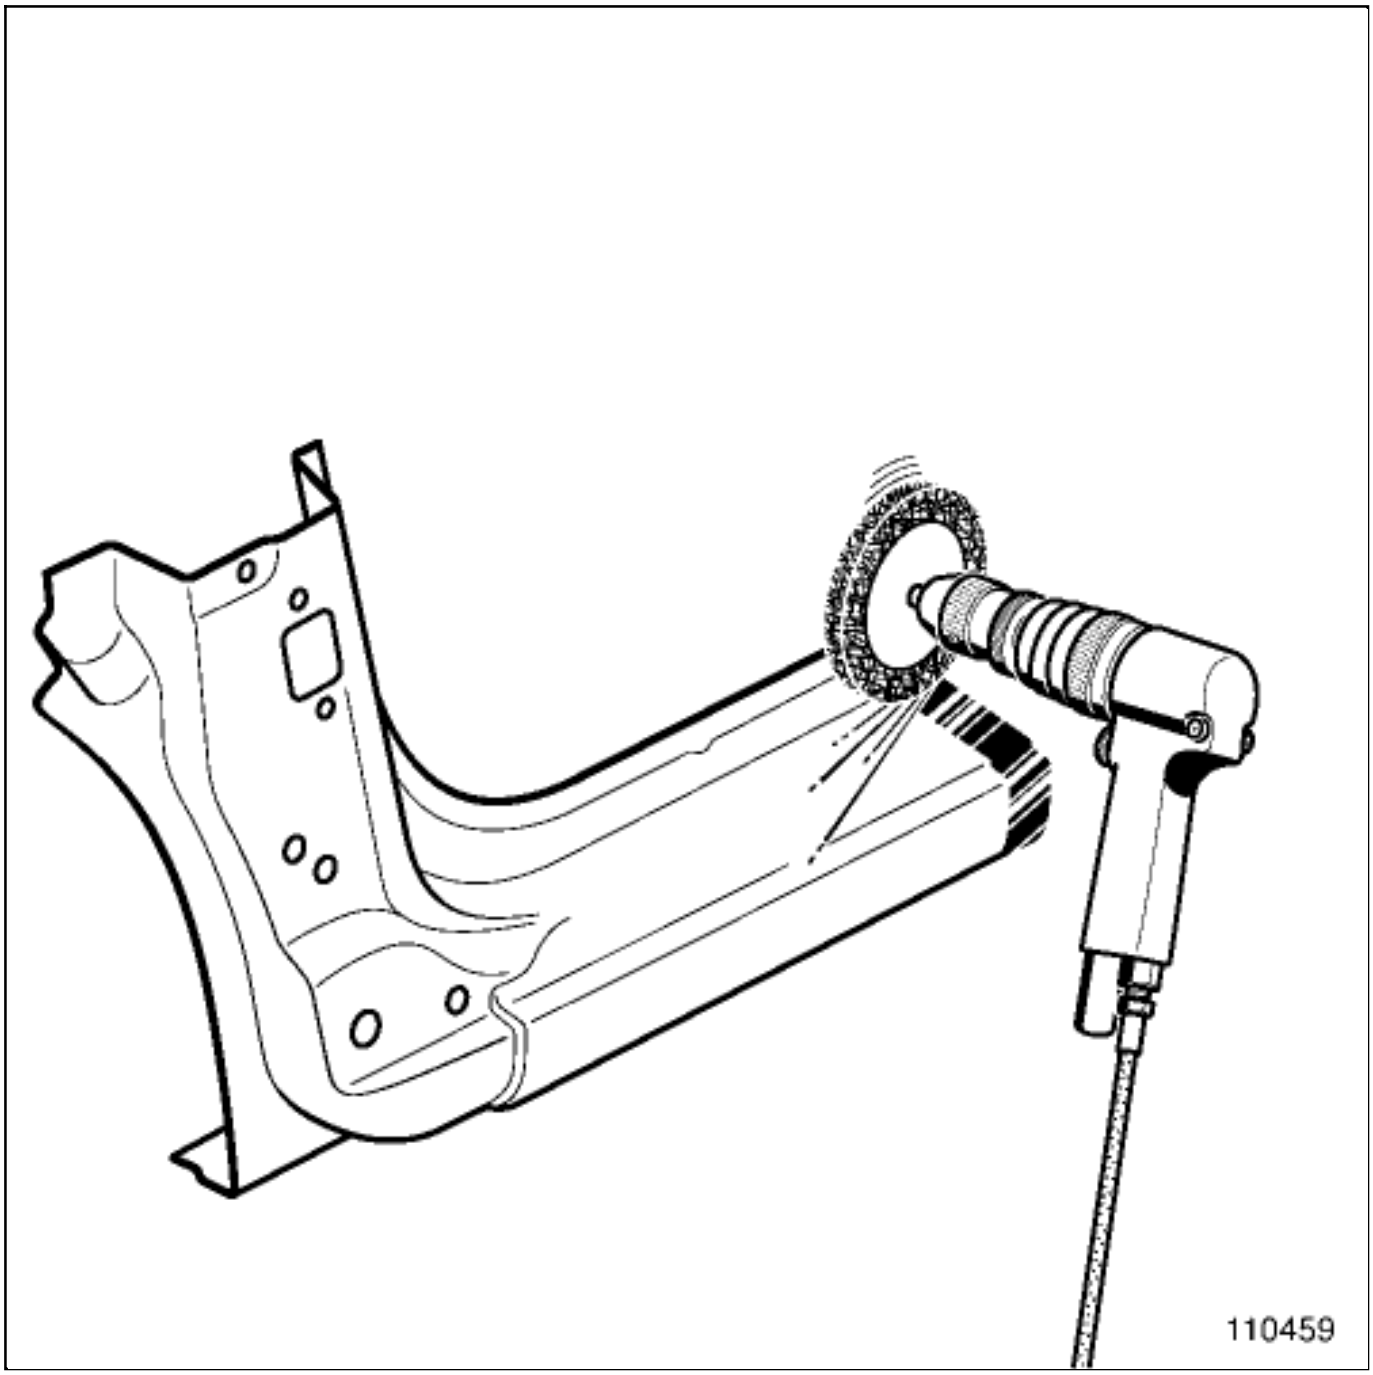
Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Mark the mating zones.

2- OVERLAPPING CUT



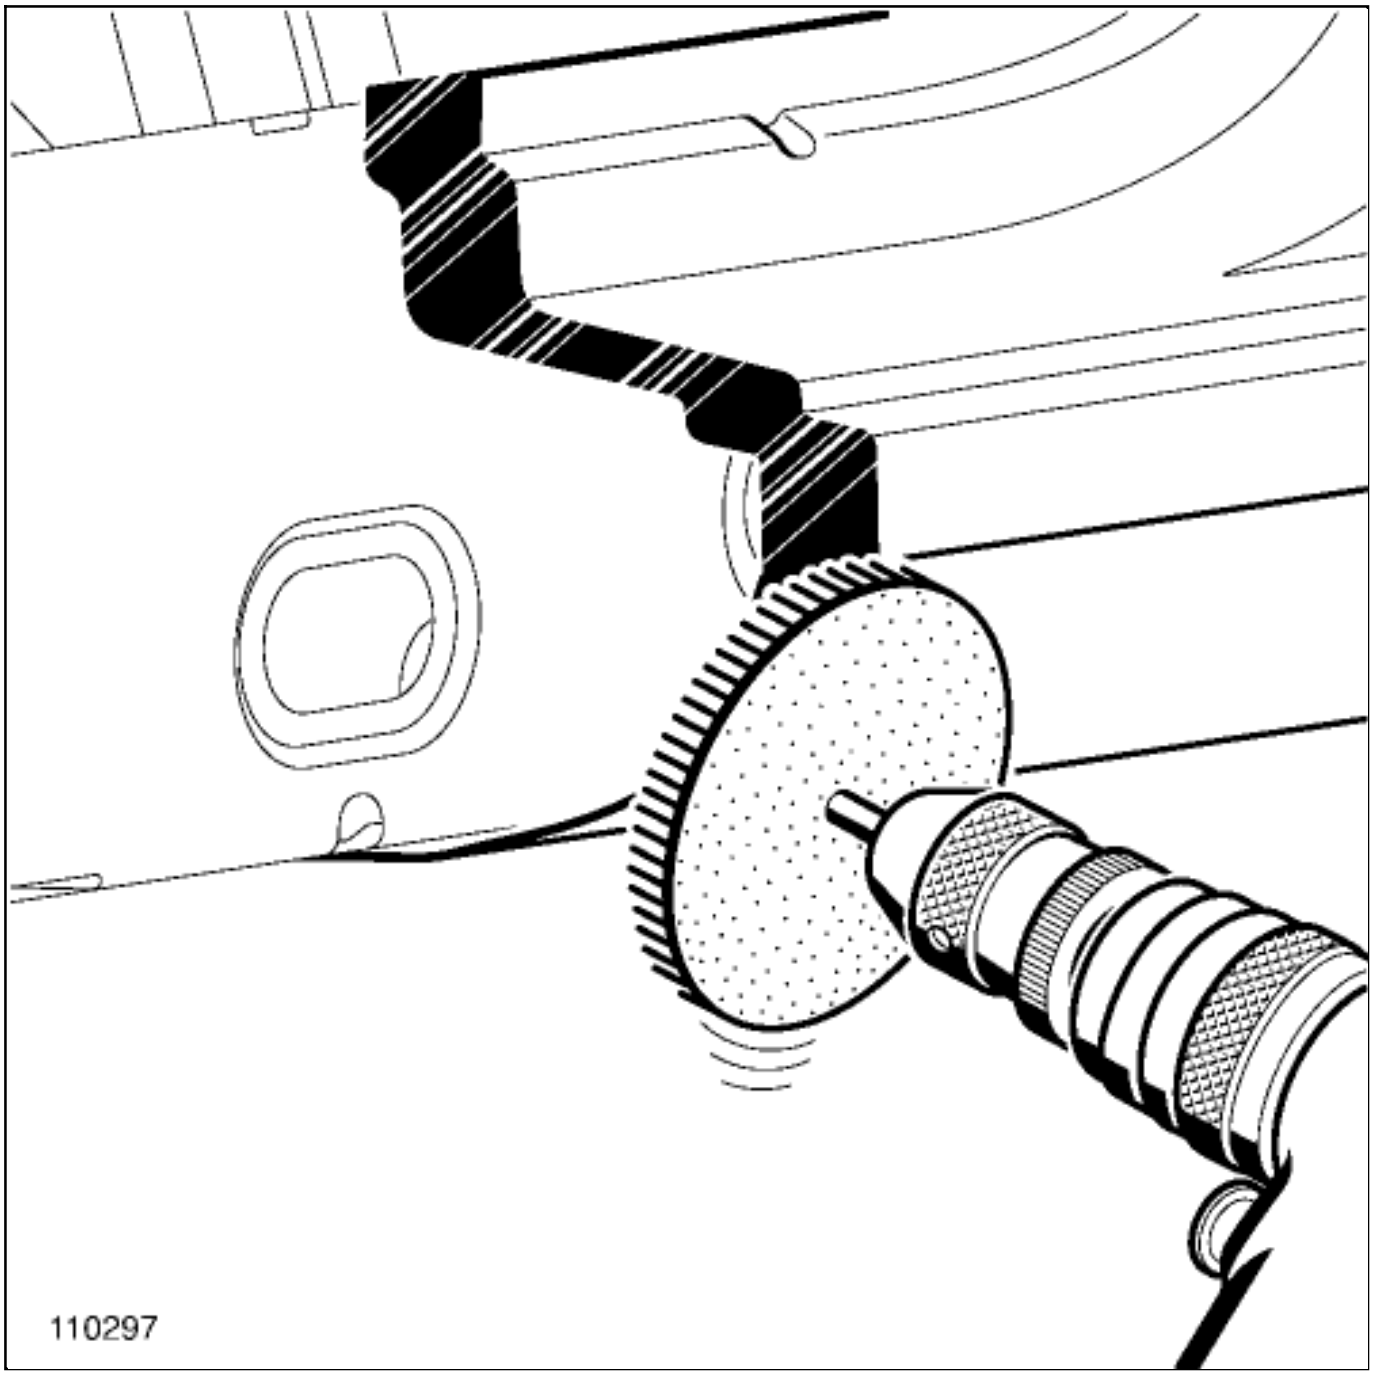
Cut the two parts simultaneously, approximately 25 mmfrom the cut made on the vehicle.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

Remove the part and detach the panel cut off(1) on the vehicle.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

3- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART



Scour the external face around the edge to edge cutting.

(see **Tools for stripping hard mastics and paint: Use**)

Prepare the rest of the replacement part, according to the chosen joint types and the available access to the mating faces.

4- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the external face around the edge to edge cutting.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see **Tools for stripping hard mastics and paint: Use**)

Prepare the rest of the vehicle, according the chosen joint types and the available access to the mating faces.

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

(see 40J, Protective devices , Structural acoustic protection: Description)

Apply the joint anti-corrosion protection according to the type of weld.

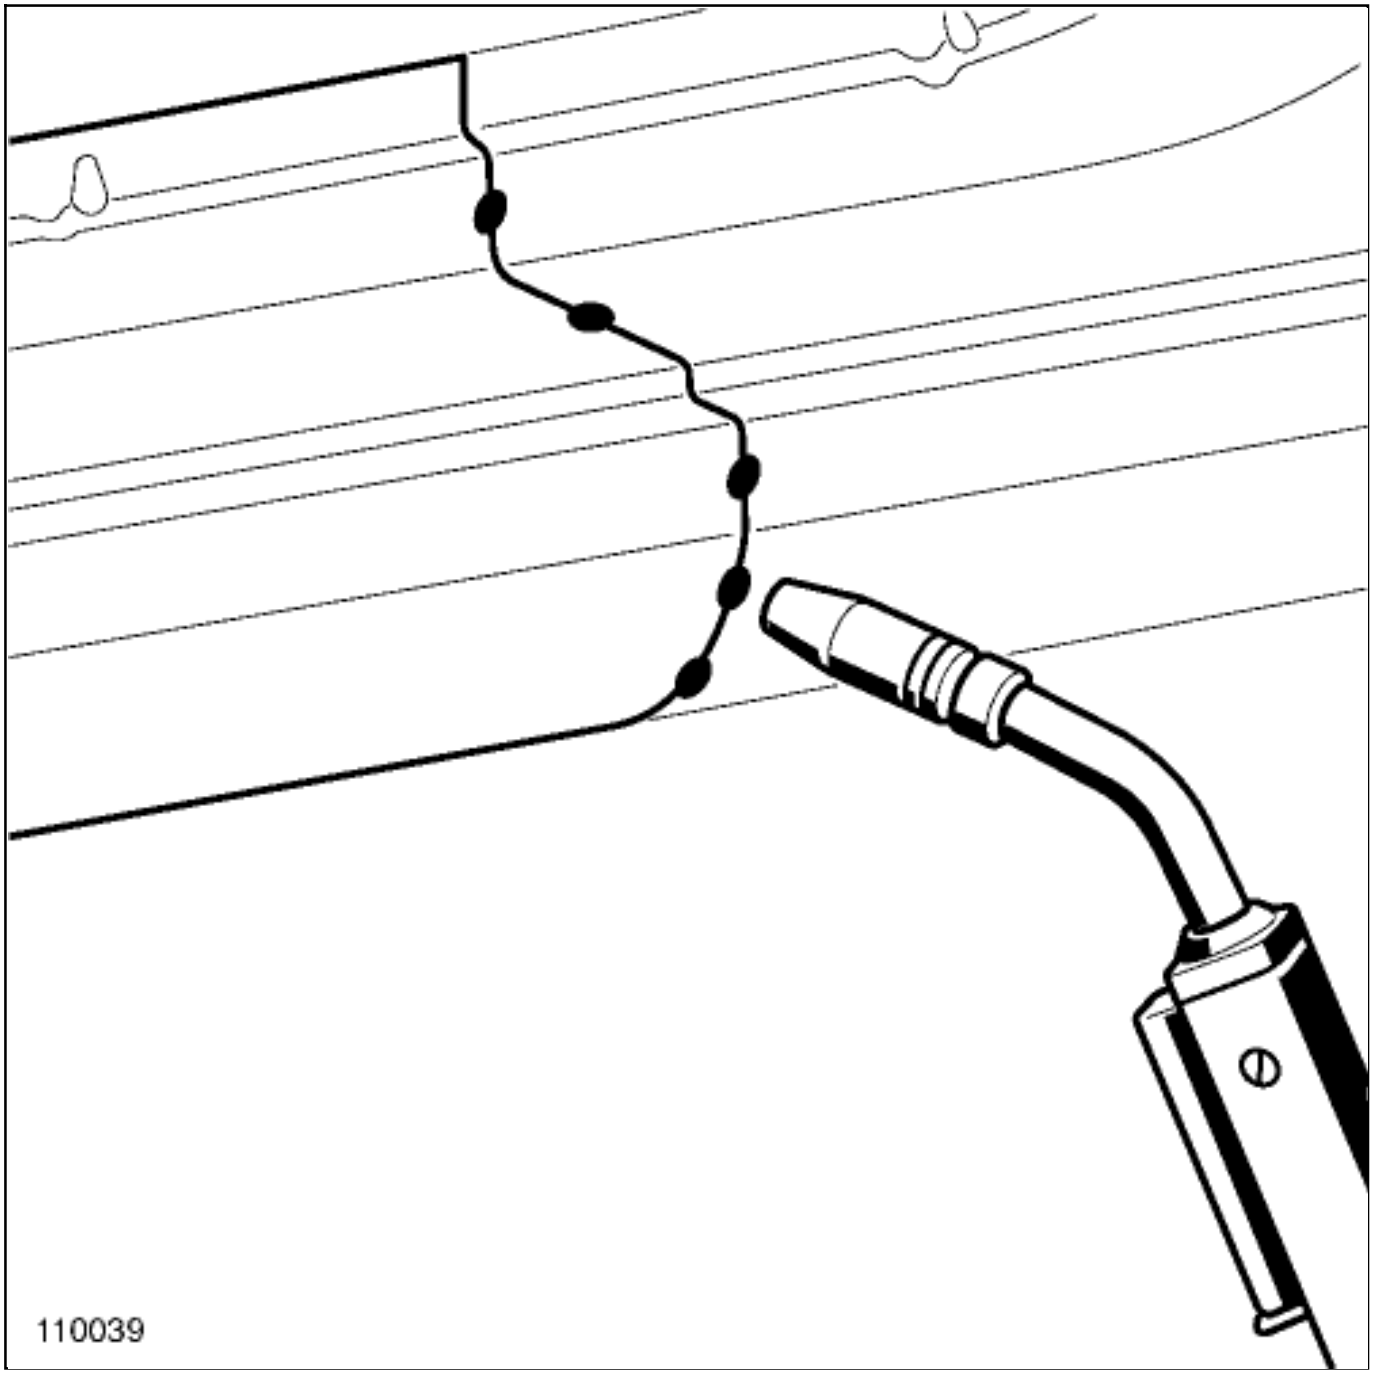
(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

(see 40J, Protective devices , Anti-corrosion protection of joints before welding: Description)

3. ASSEMBLY

1- ADJUSTING THE WELDERS.

Butt welding is by GMAW weld bead.

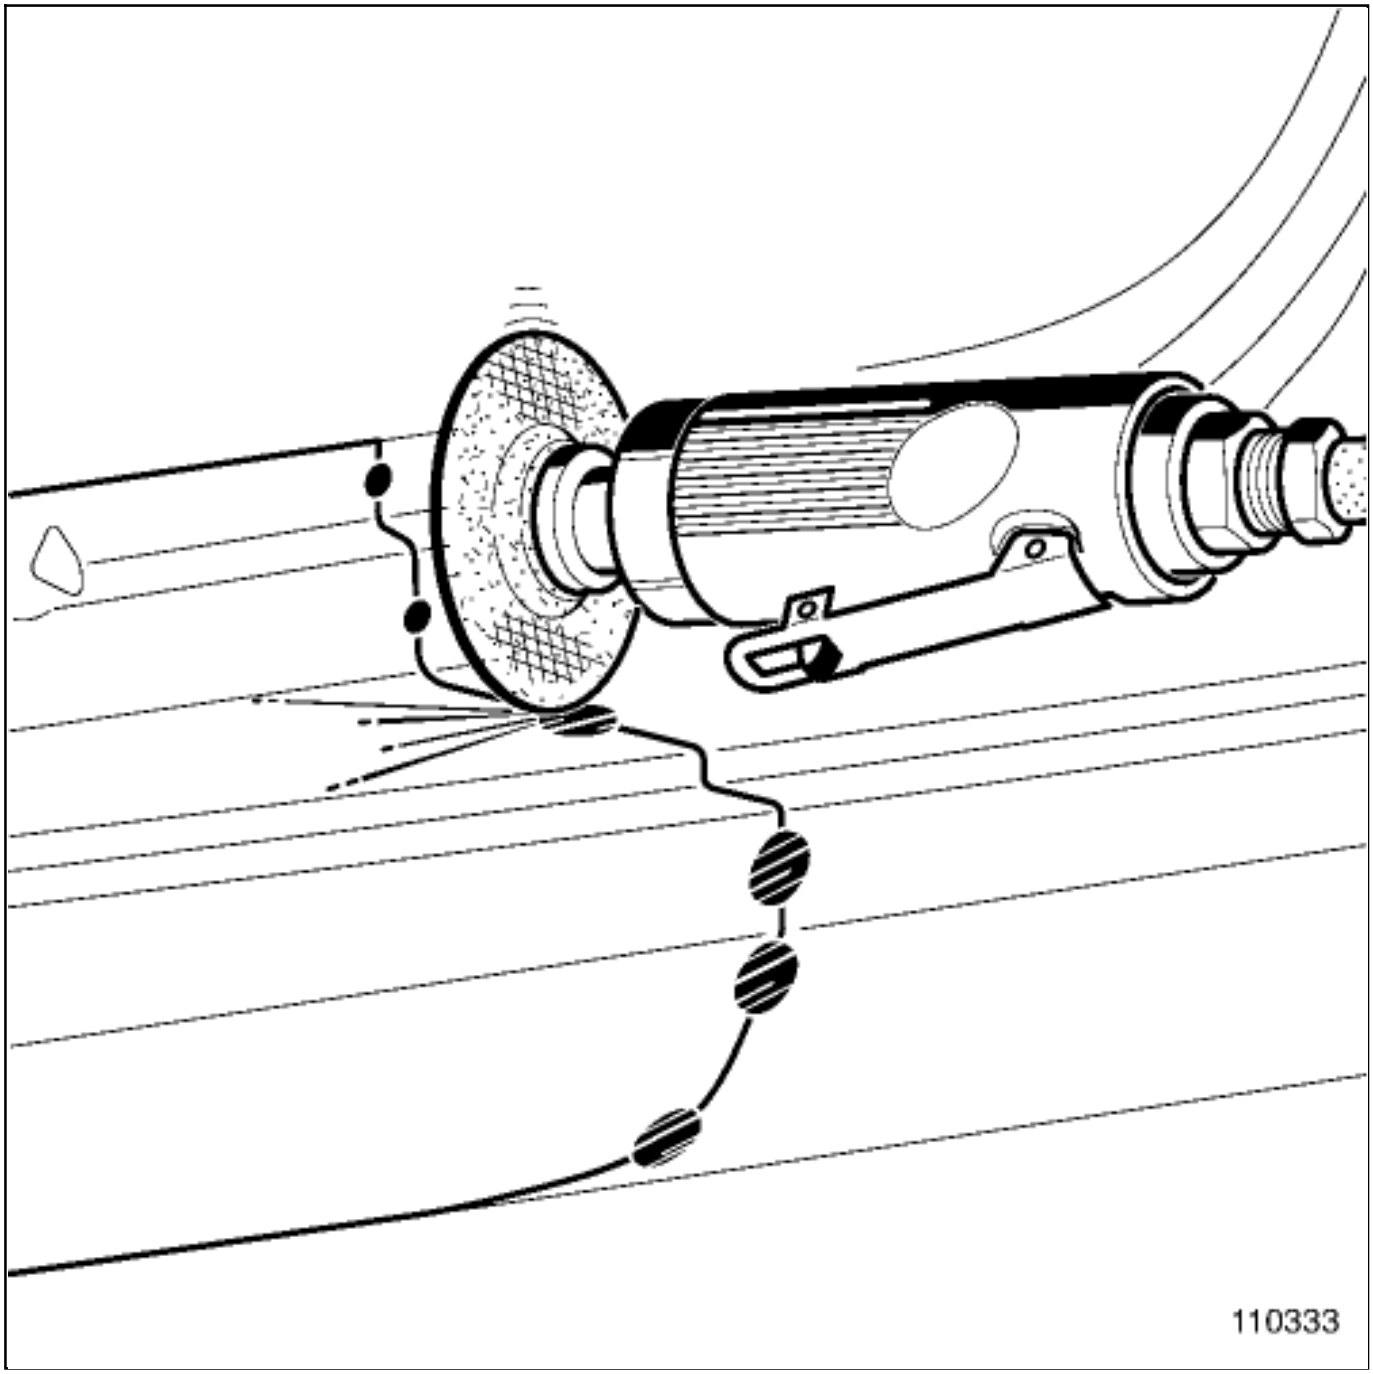


(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

2- FITTING AND ADJUSTING THE REPLACED PARTS

Reassemble, adjust and fix the part in place; if necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

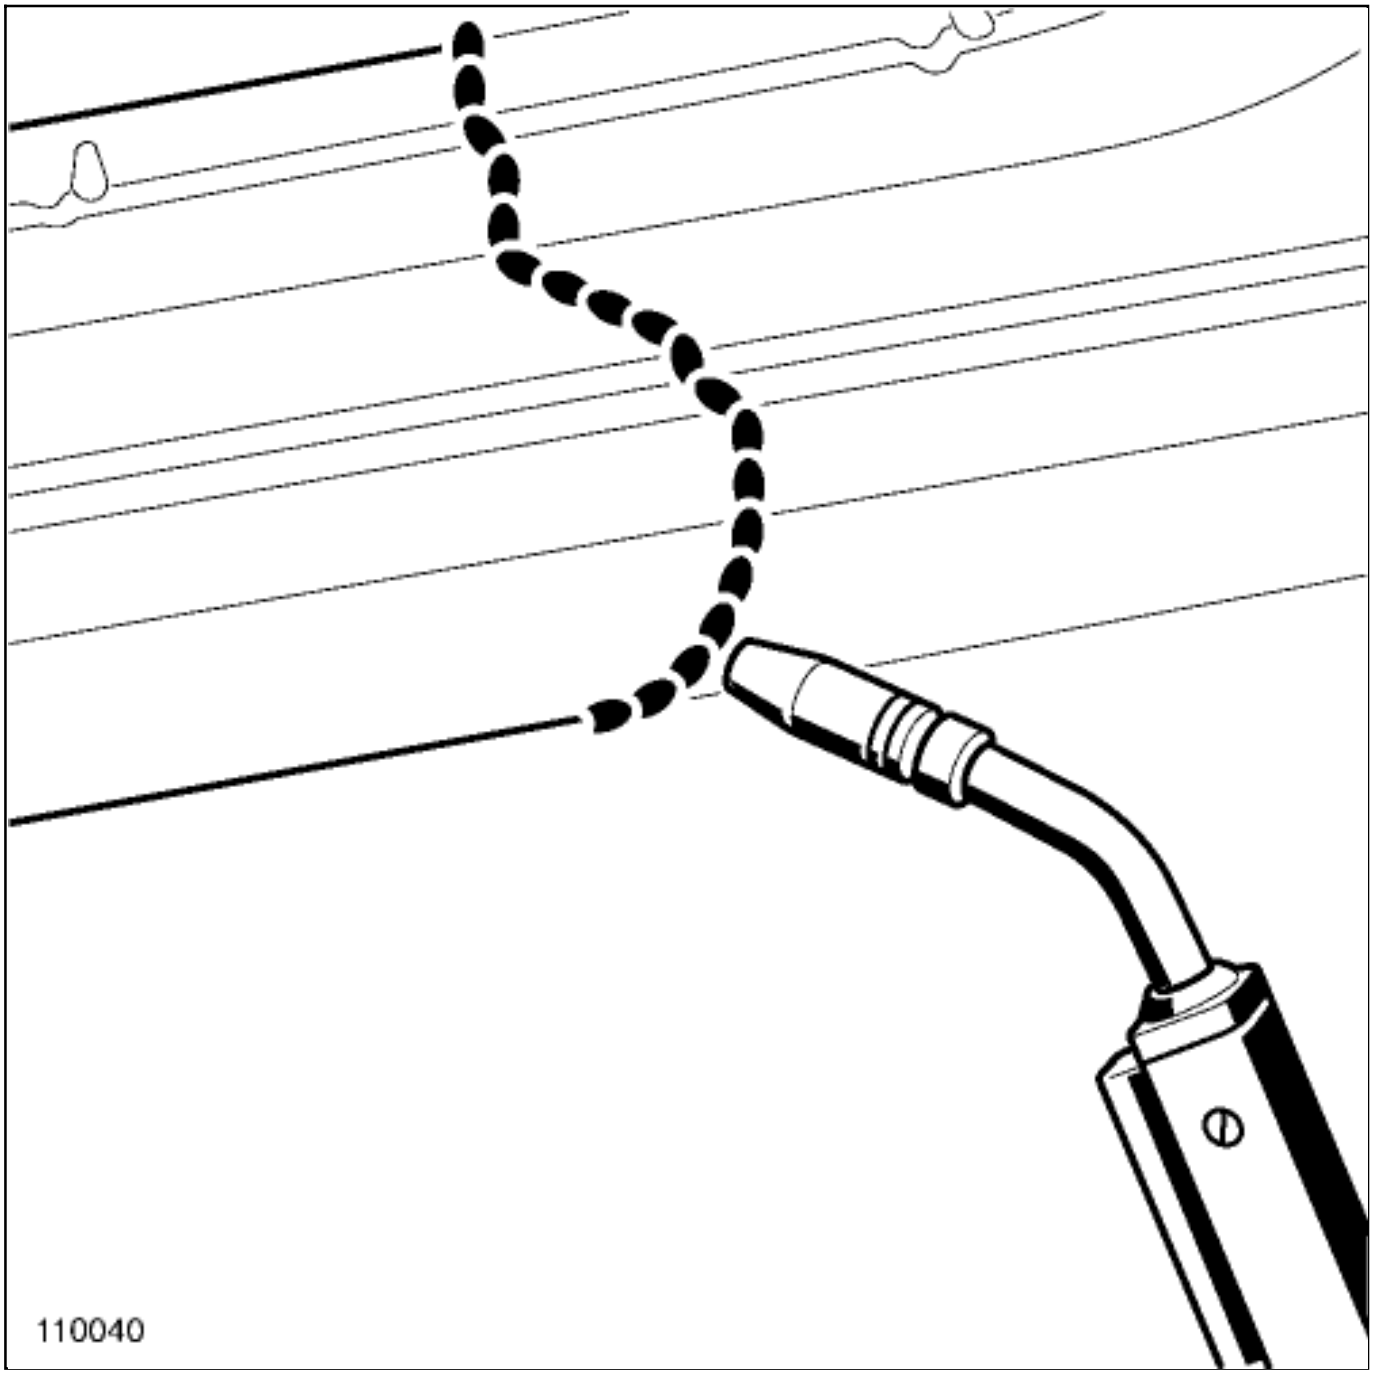


The distance between the two panels at the continuous butt welding locations must be equal to the thickness of the thinnest panel.

Tack the panels with spots 20 mmapart, avoiding edges and square corners.

Tack the parts starting from the middle, then make a spot on each side of it alternately.

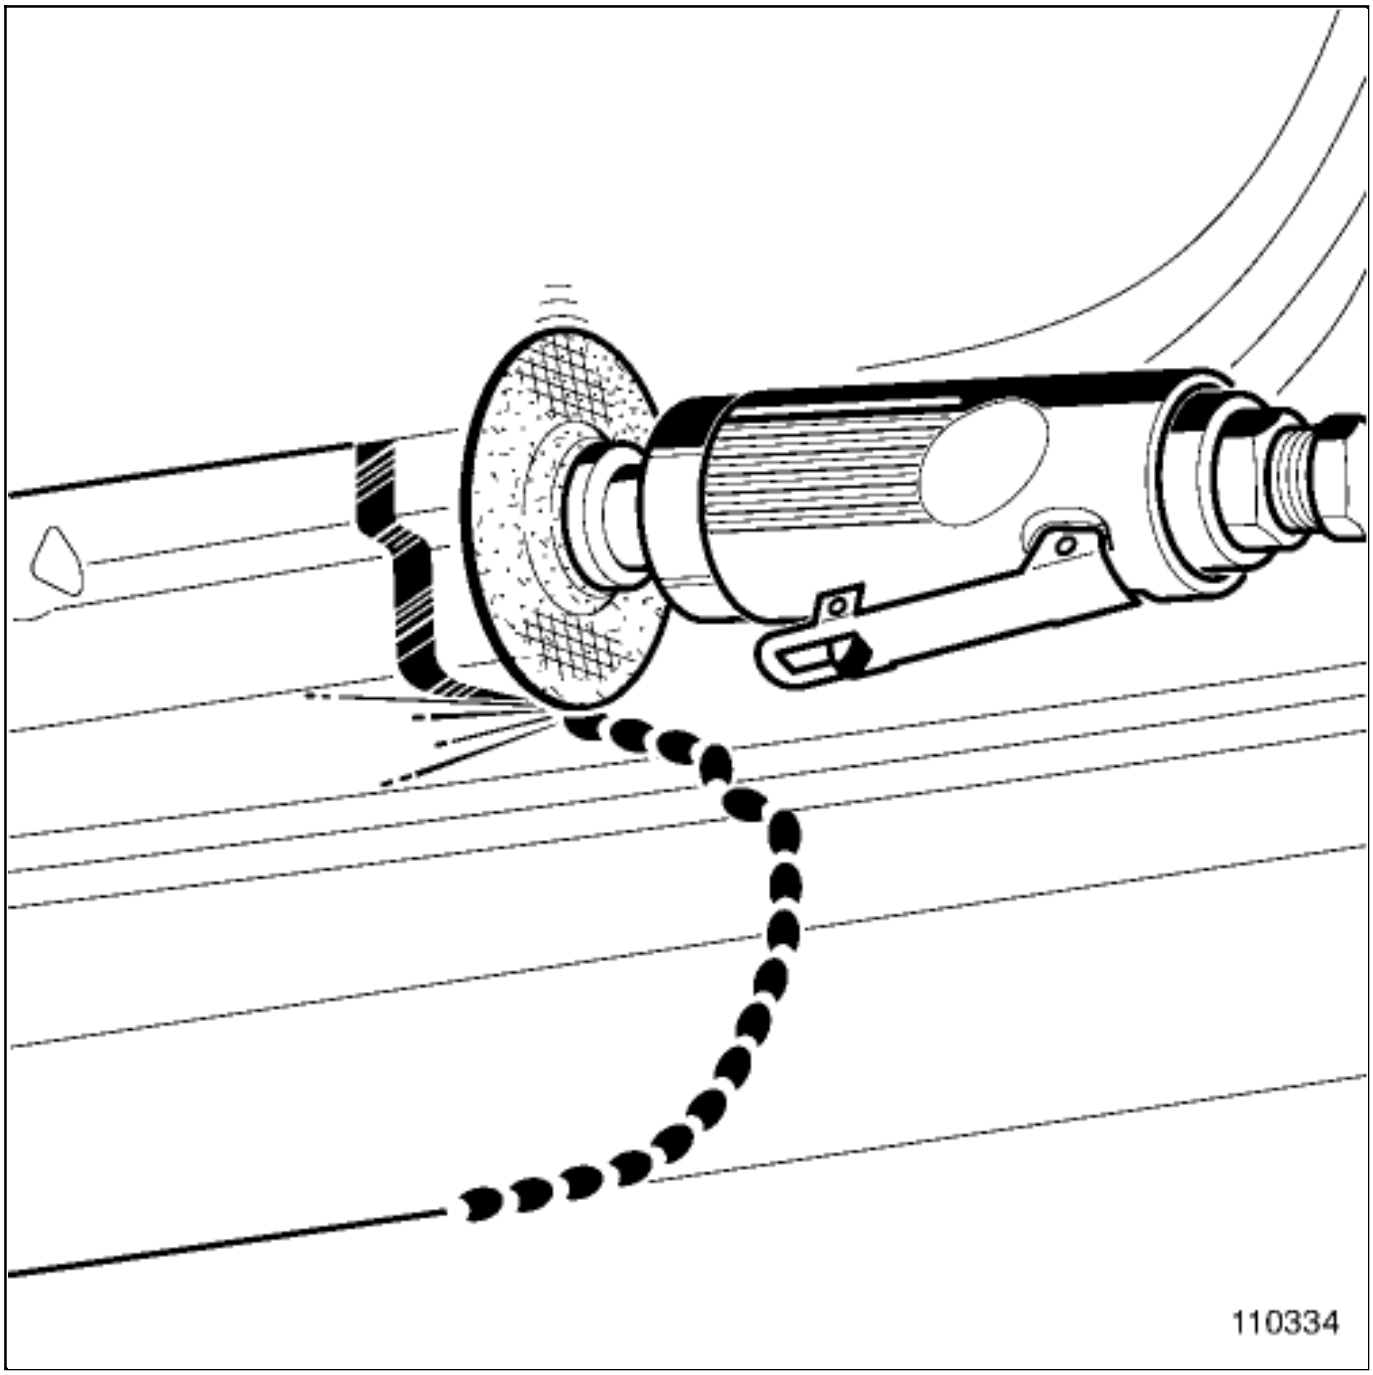
(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



Grind the maintenance points, after checking for good exposure.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

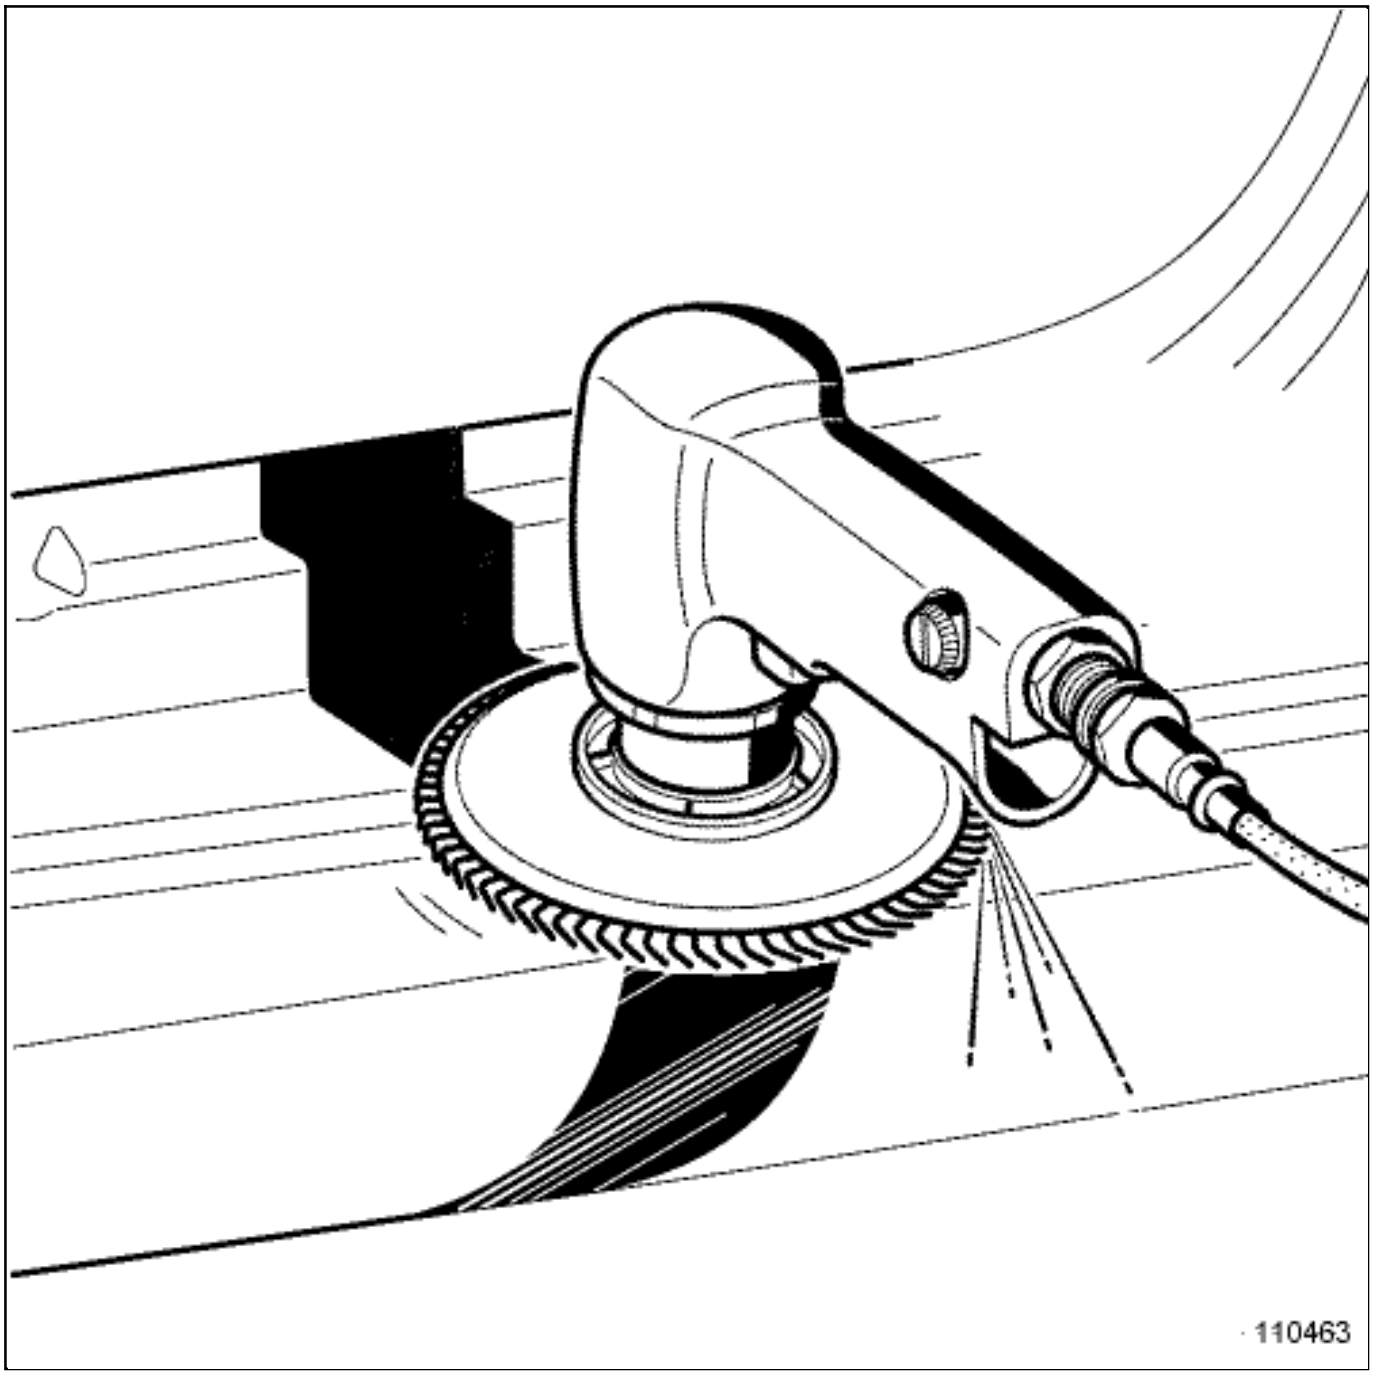
3- CARRYING OUT THE WELDING



Carry out the different connections of the part.

Carry out the continuous weld, by small sections, if the weld is very long.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)



4- GRINDING THE WELDS

Grind the continuous weld.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

5- FINISHING AND SHAPING

Surface the assembly area.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

If necessary, surface finish the visible parts.

(see 04F, Bodywork products and mountings, Panelwork finishing products: Use) (see 05B, Equipment and Tools, Tools for sanding a structural component: Use)

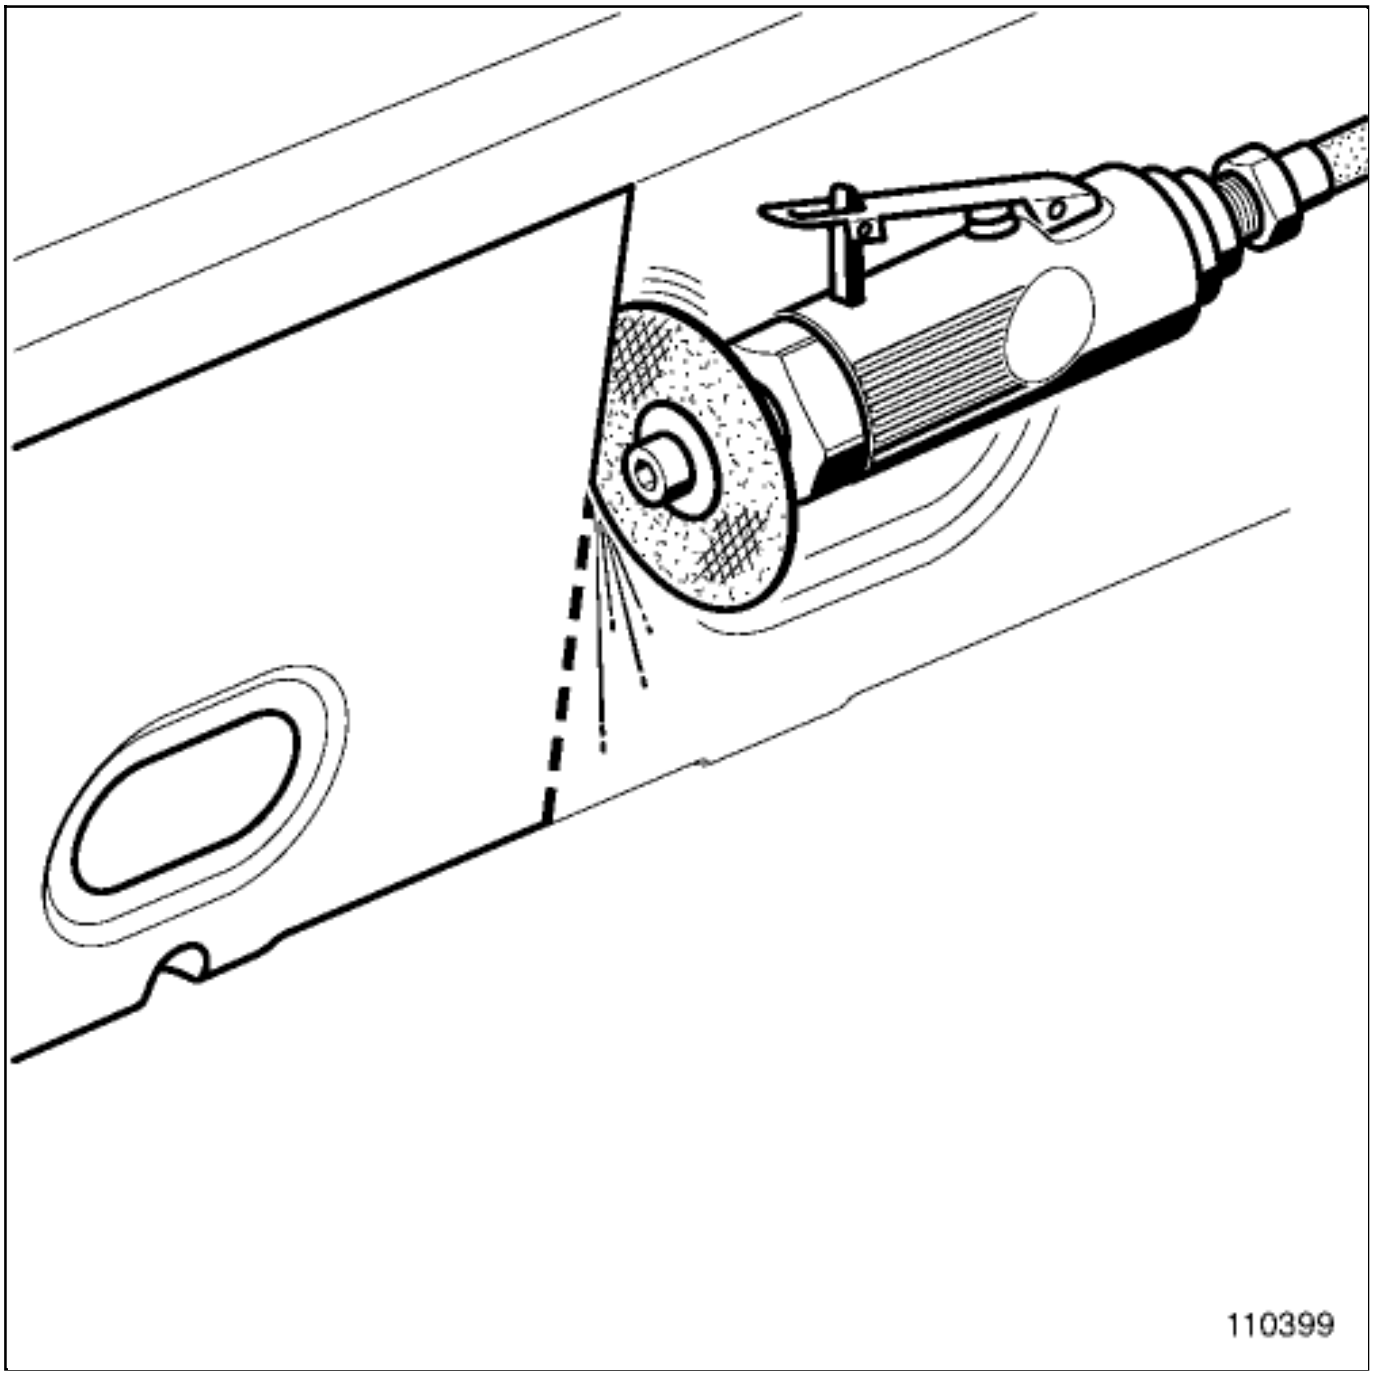
6- FITTING PROTECTION AFTER ASSEMBLY

Apply the anti-corrosion protection.

(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

(see 40J, Protective devices , Anti-corrosion protection of joints after welding: Description)

Fit the soundproofing.

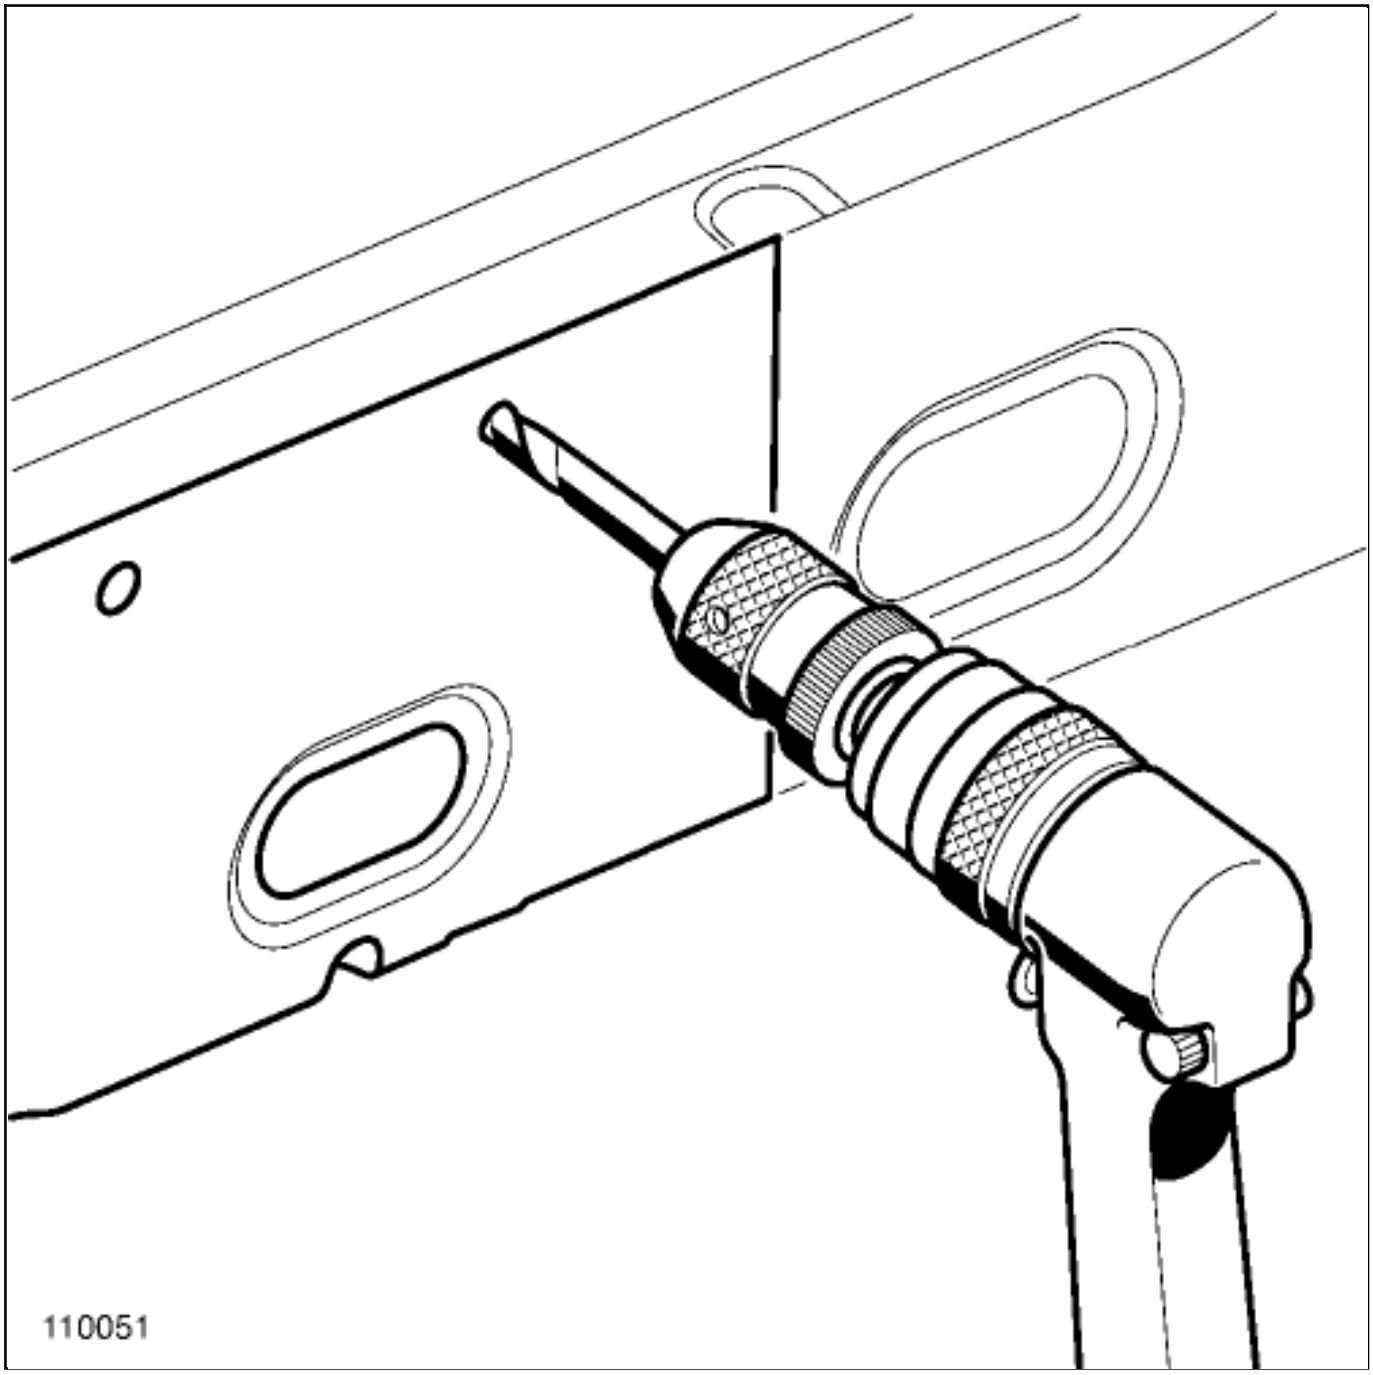


(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

(see 40J, Protective devices , Structural acoustic protection: Description)

CONNECTIONS FOR PARTIAL REPLACEMENT BY JOGGLING

1. DISASSEMBLY

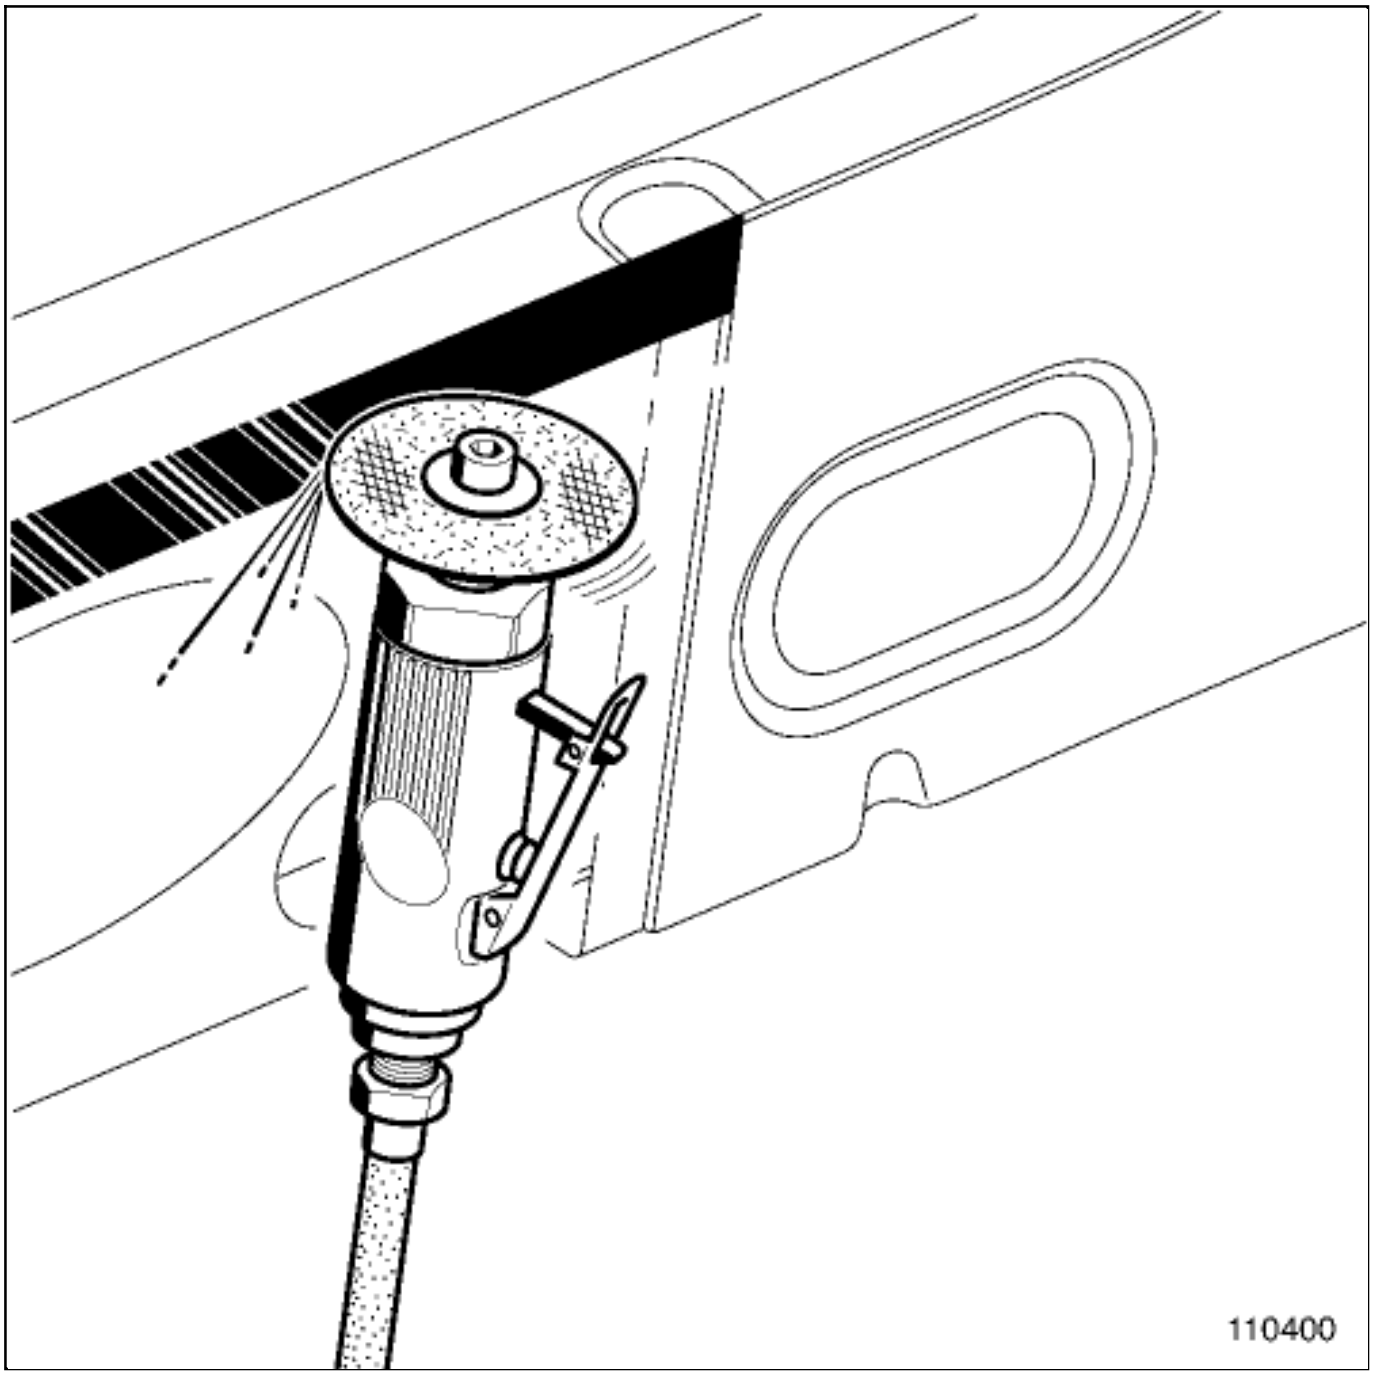


1- CUTTING

Cut the damaged part, adhering to the area defined in the MR of the vehicle concerned.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

2- UNPICKING



Unpick the retaining points of the damaged part.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

3- GRINDING

Level off the welding residue, as well as that from the cut.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface finish the mating faces.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

2. ASSEMBLY METHOD

The step drilling joint can be made in two ways, depending on the available access to the mating faces:

- Two face access, resistance spot welding (RSW).
- Single face access, gas metal arc plug welding (GMAW).

In both cases, refer to the indications given in the vehicle MR to find out the weld points.

For visible areas, apply a bead of chain weld (GMAW).

3. TWO FACE ACCESS

1- PREPARATION BEFORE ASSEMBLY

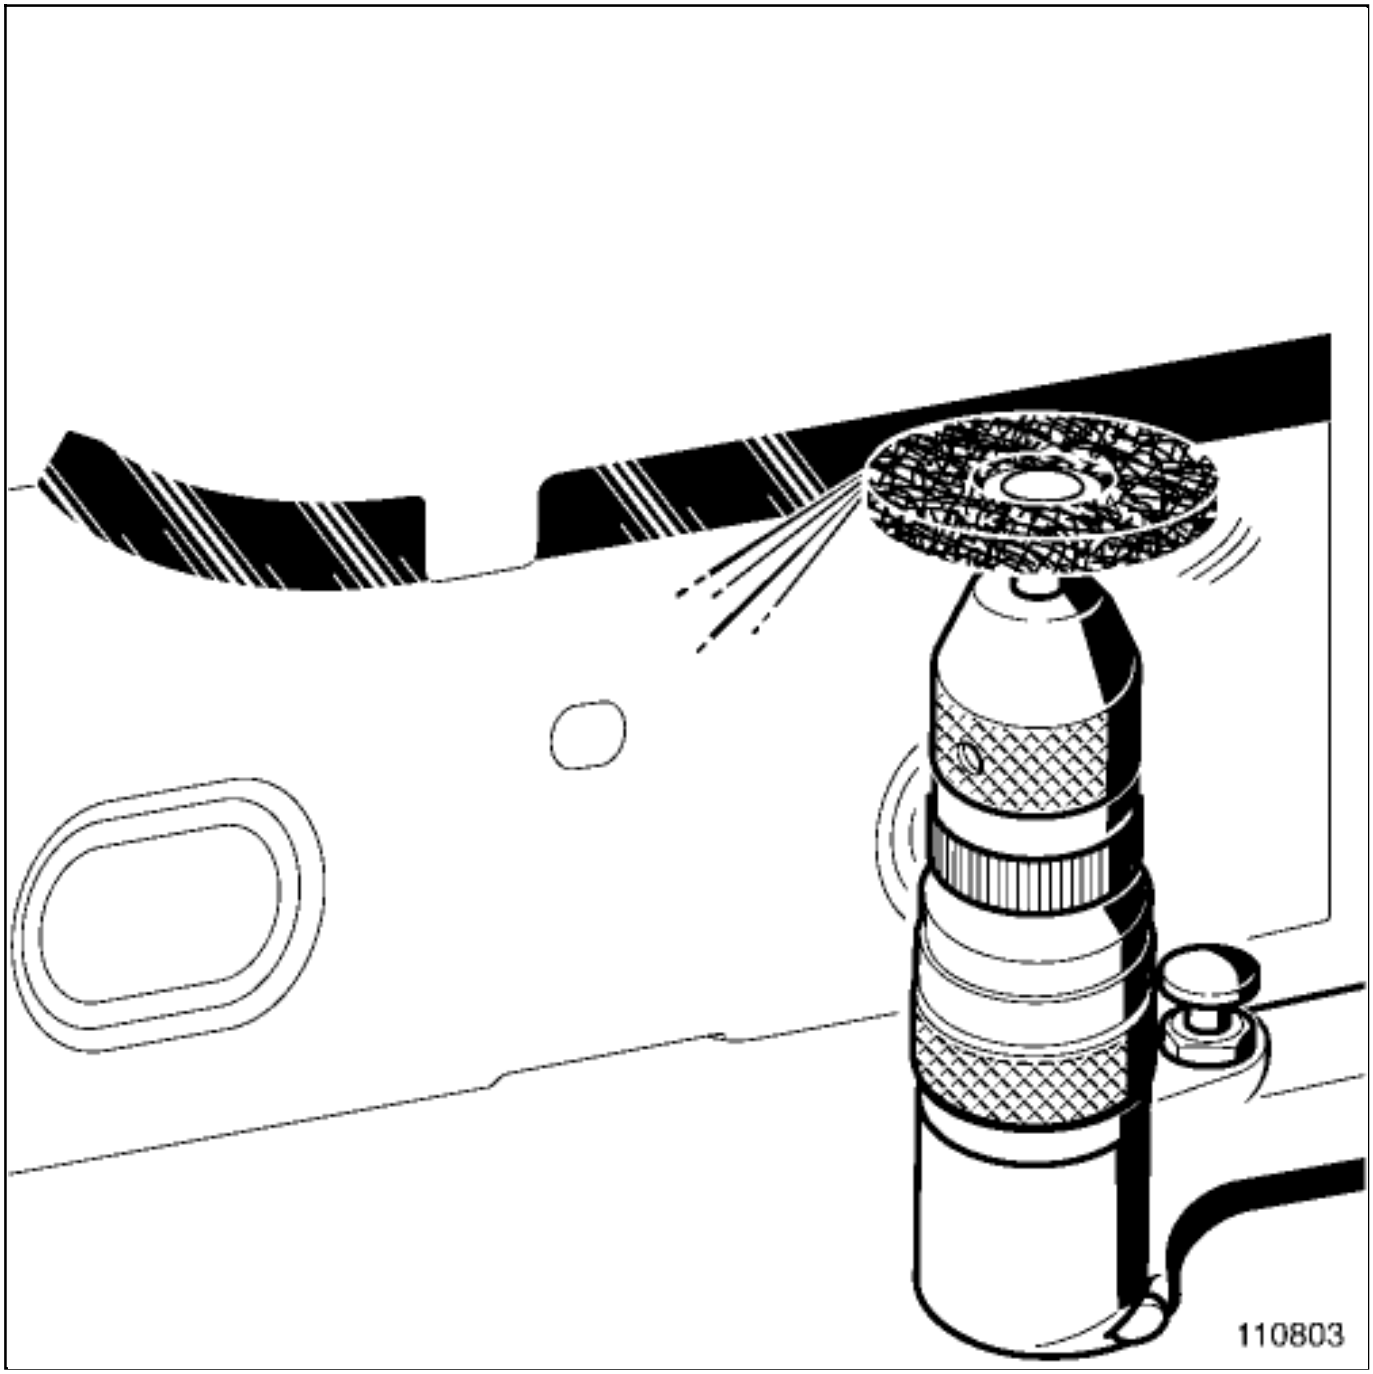
1)ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

2)MARKING AND IDENTIFYING THE JOINTS



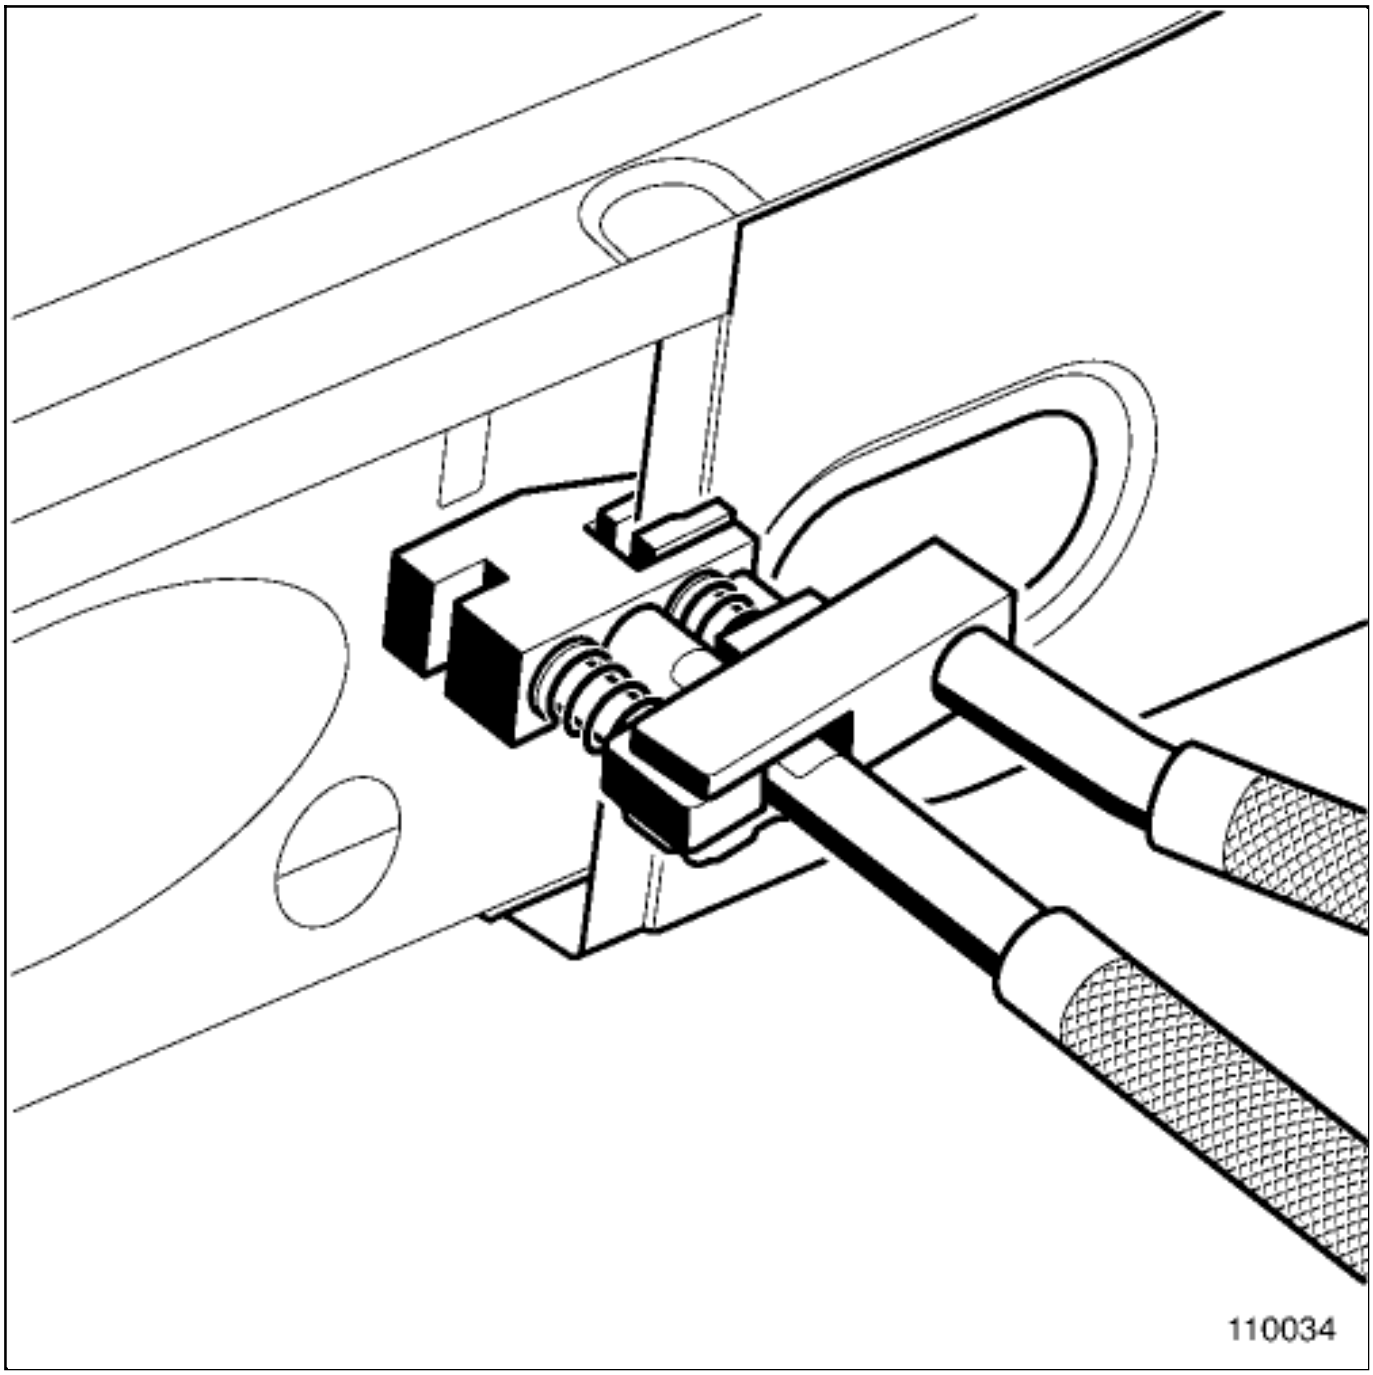
Mark the joint and cut zones.

Remove the replacement part.

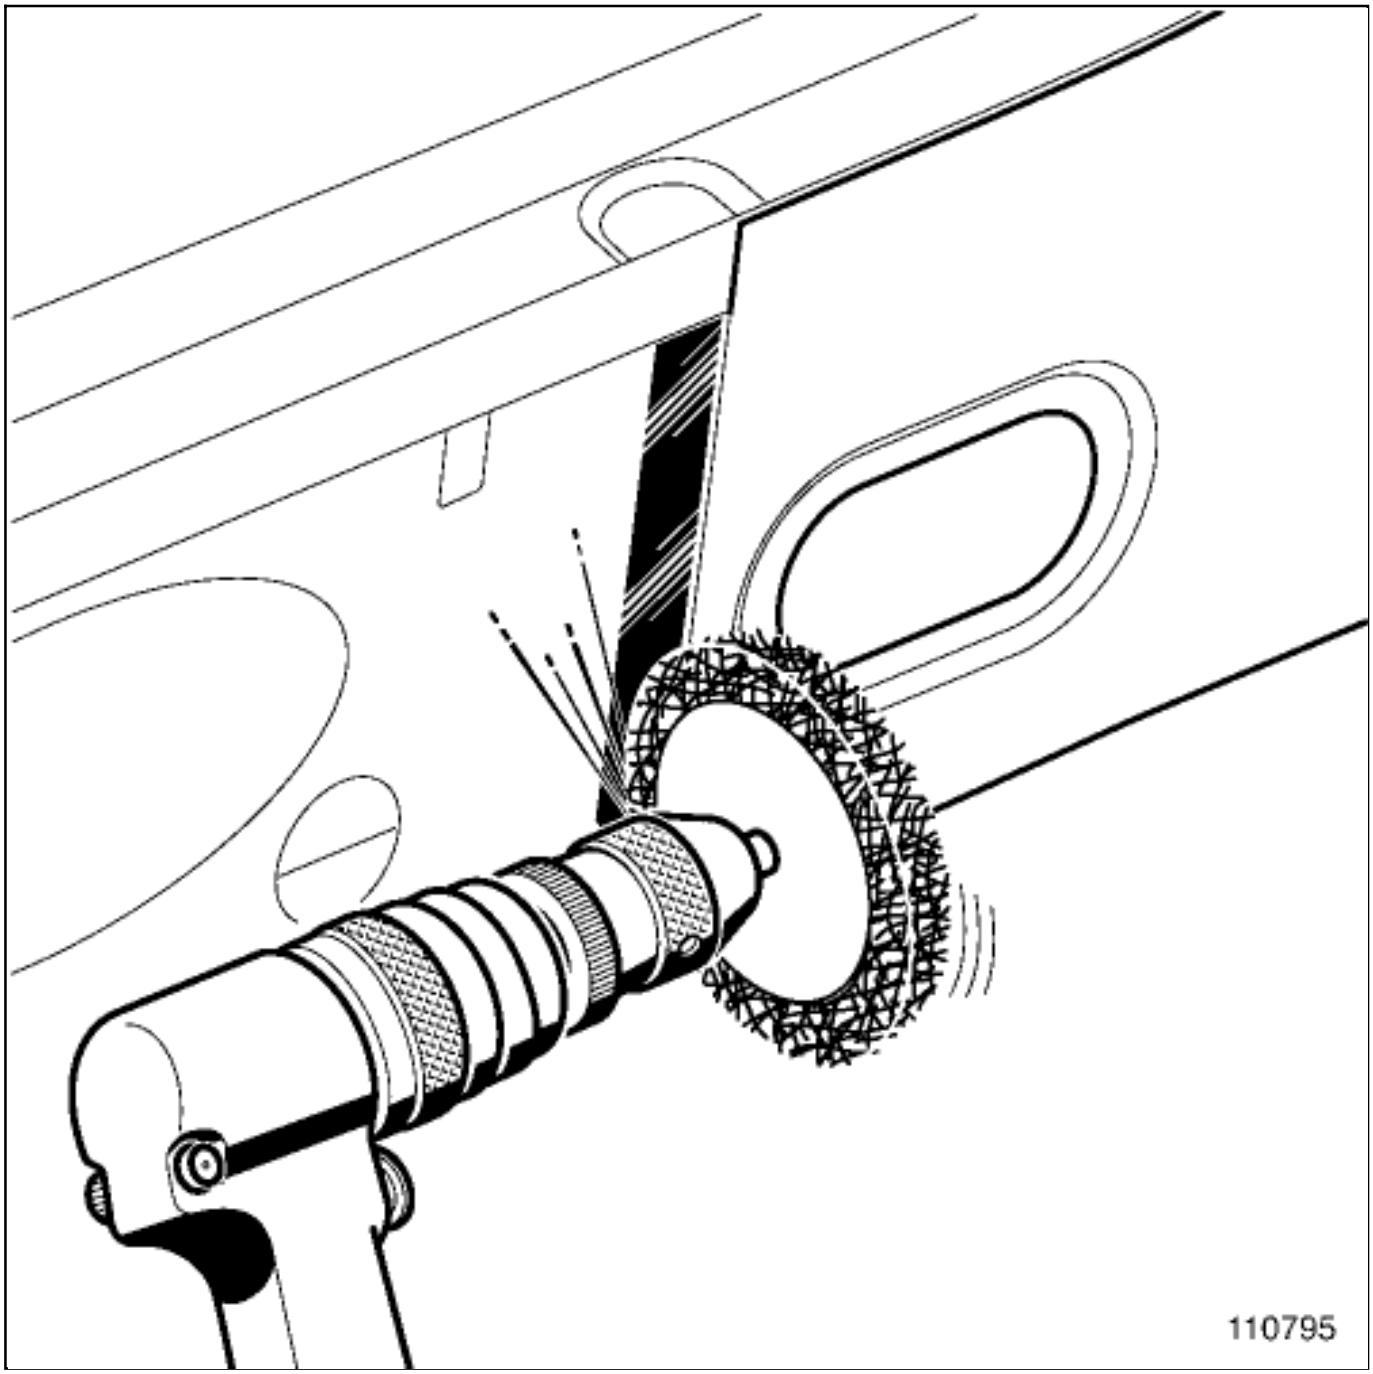
3)PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Cut the replacement part according to the marks.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)



Scour the internal and external mating faces at the drilling location.



(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

Prepare the rest of the replacement part according to the chosen joint types, in accordance with the available joint face access.

4)PREPARATION OF THE JOINTS ON THE VEHICLE

Carry out the drilling, at the cutting location.

Scour the internal and external mating faces at the drilling location.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

Prepare the rest of the vehicle, according to the chosen joint types.

5)APPLYING PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal joint faces.

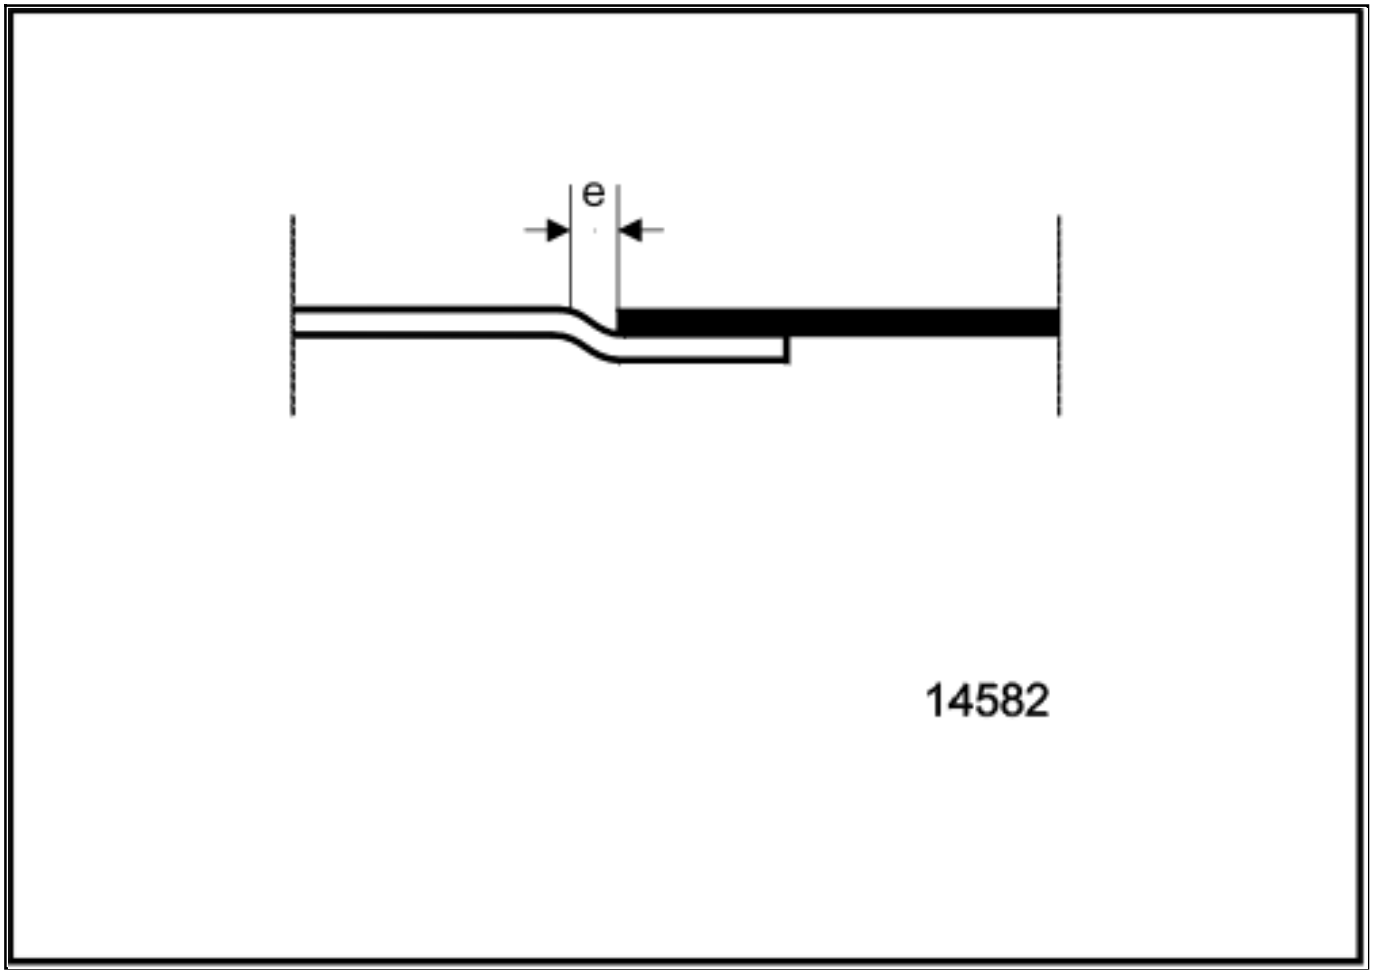
(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

2- ASSEMBLY

1)FITTING AND ADJUSTING THE REPLACED PARTS

Reposition the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

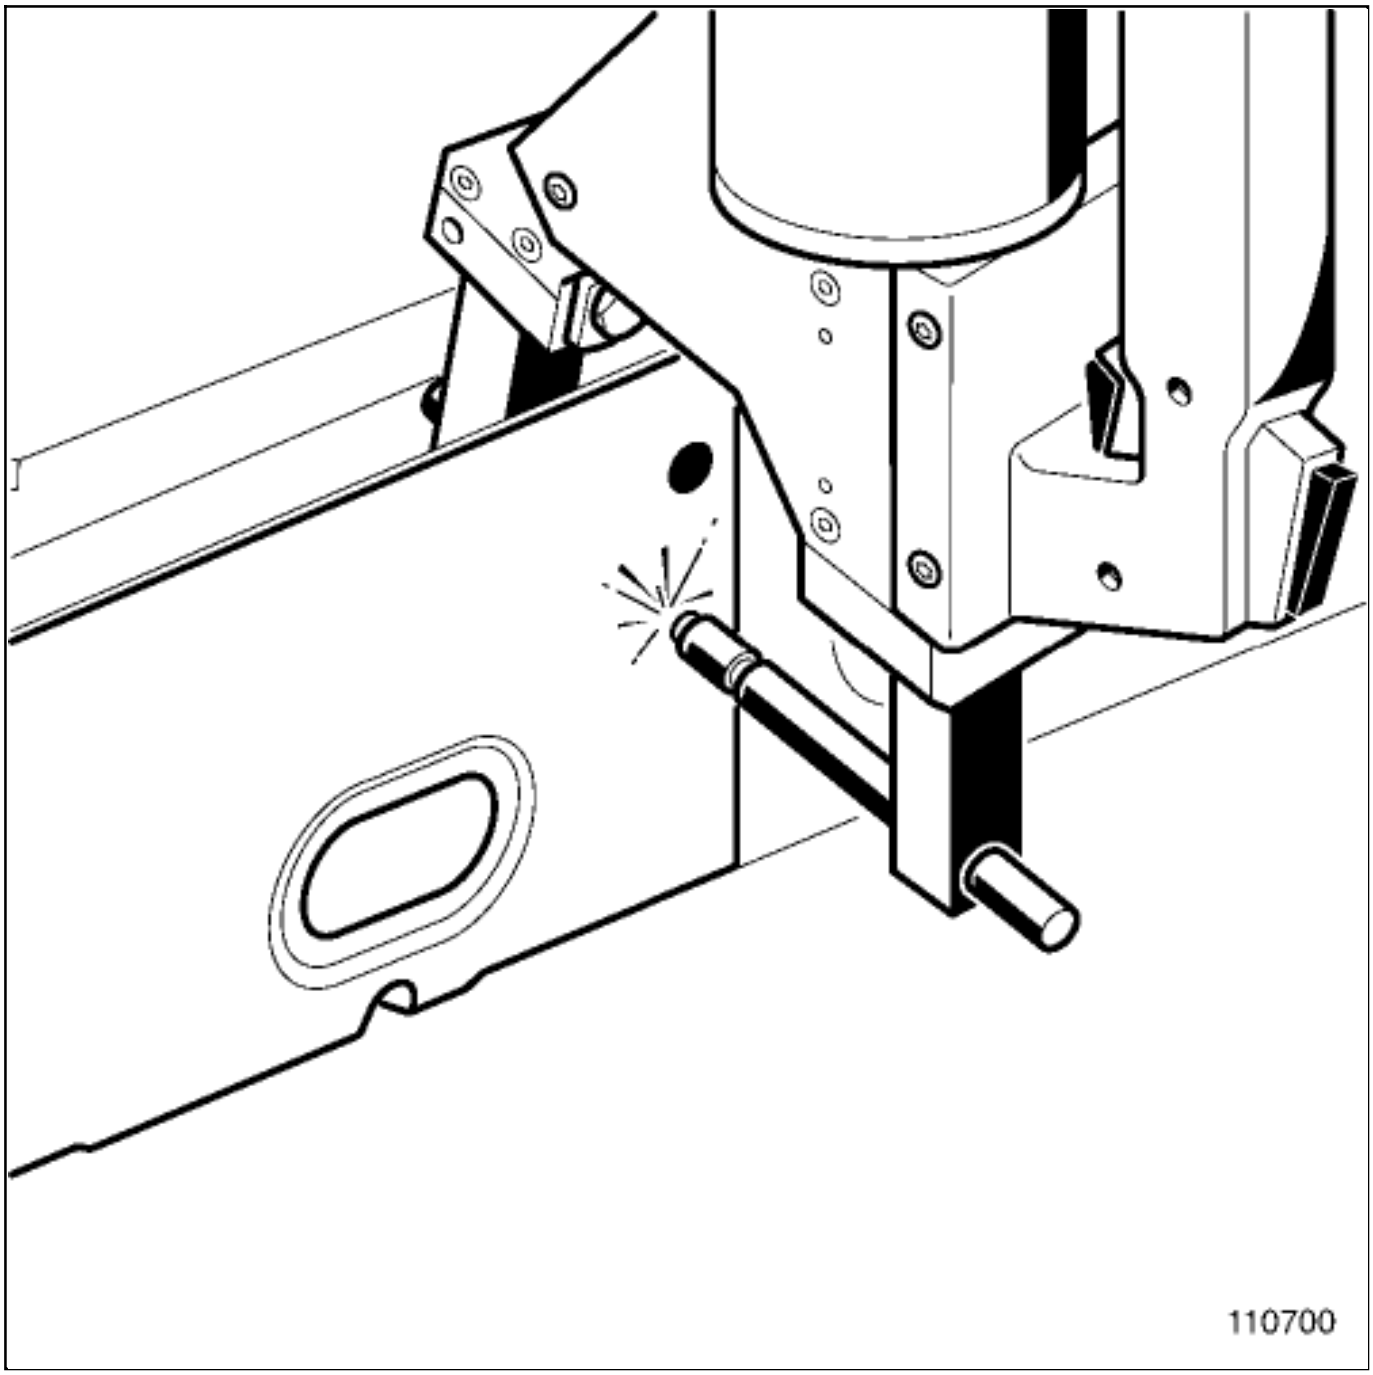
Note:

Leave a clearance(e) between the cut and the step drilling angle.

The clearance should be equal to the panel thickness.

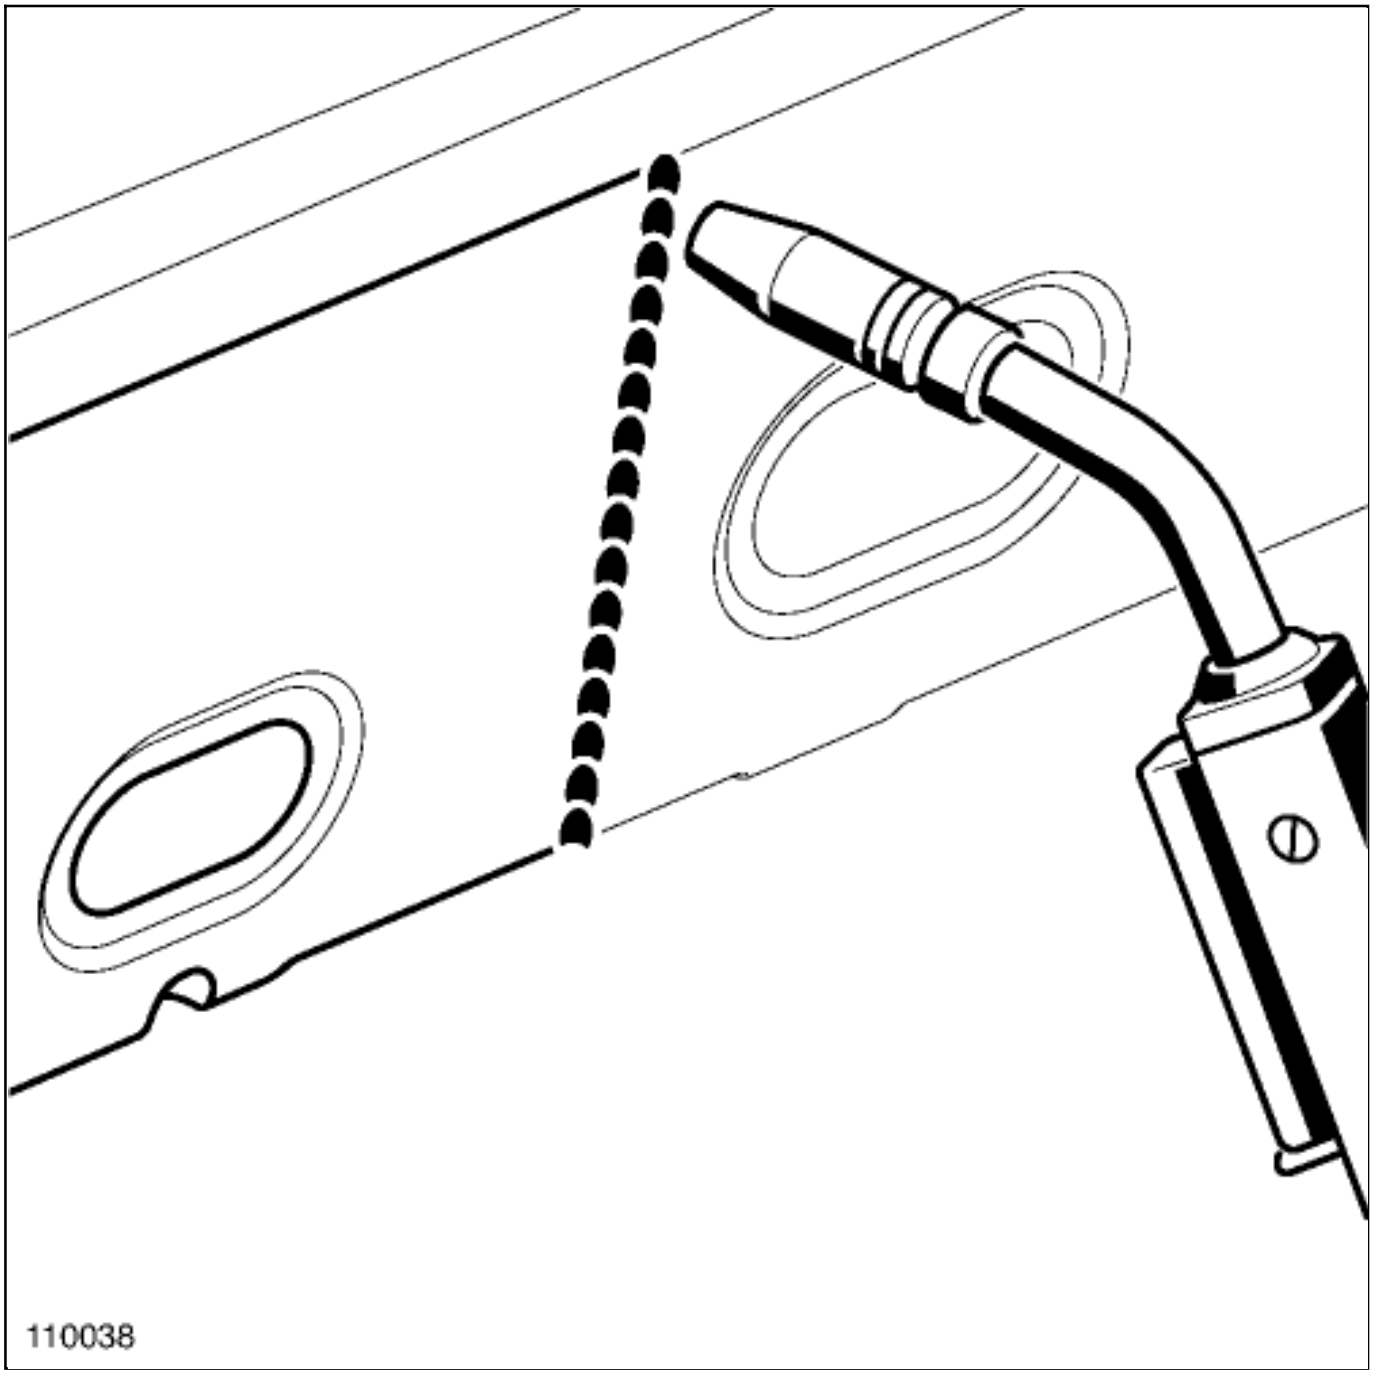
2)ADJUSTING THE WELDERS

Before making the joints on the vehicle, carry out the tests required for adjusting the welders.



Resistance welding joint.

(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection: Precautions for the repair)



GMAW joint, if necessary with a bead of chain weld in the visible area.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

3)CARRYING OUT THE WELDING

Weld the replacement part.

Apply a bead of chain weld along the whole cut.

4. SINGLE FACE ACCESS

1- PREPARATION BEFORE ASSEMBLY

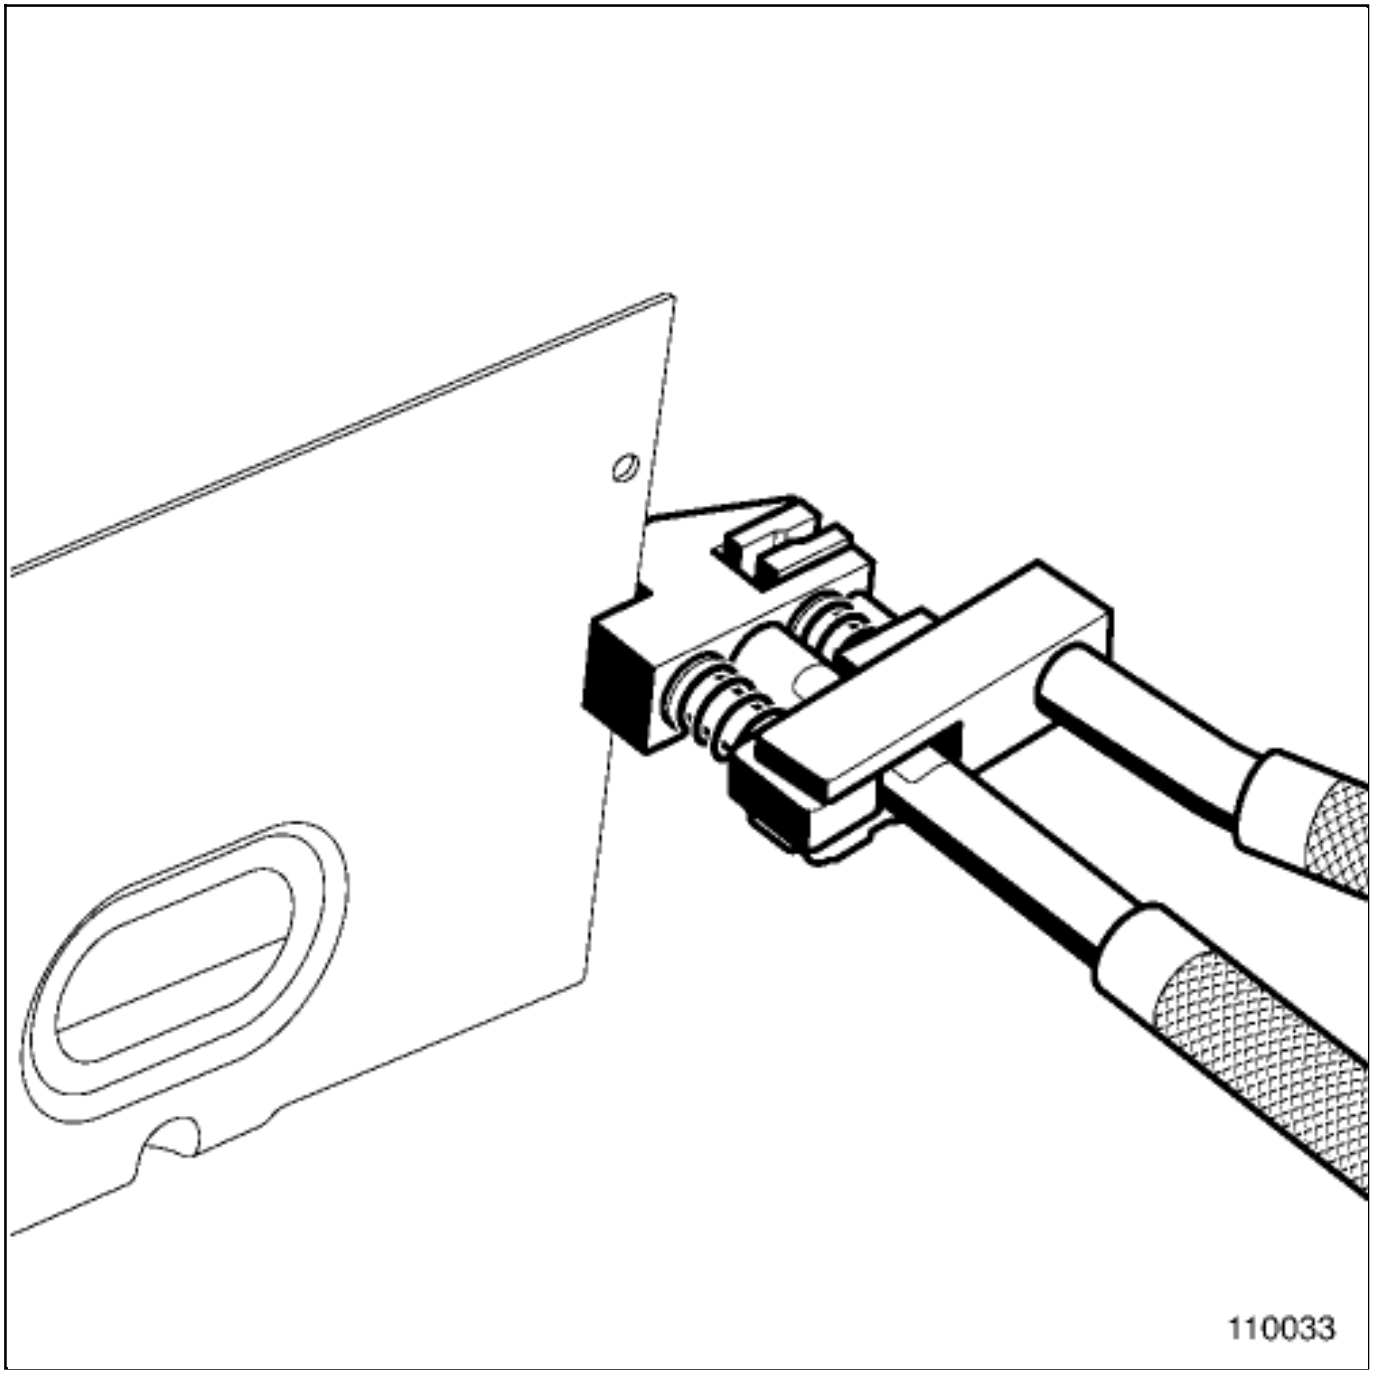
1)ADJUSTMENT BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

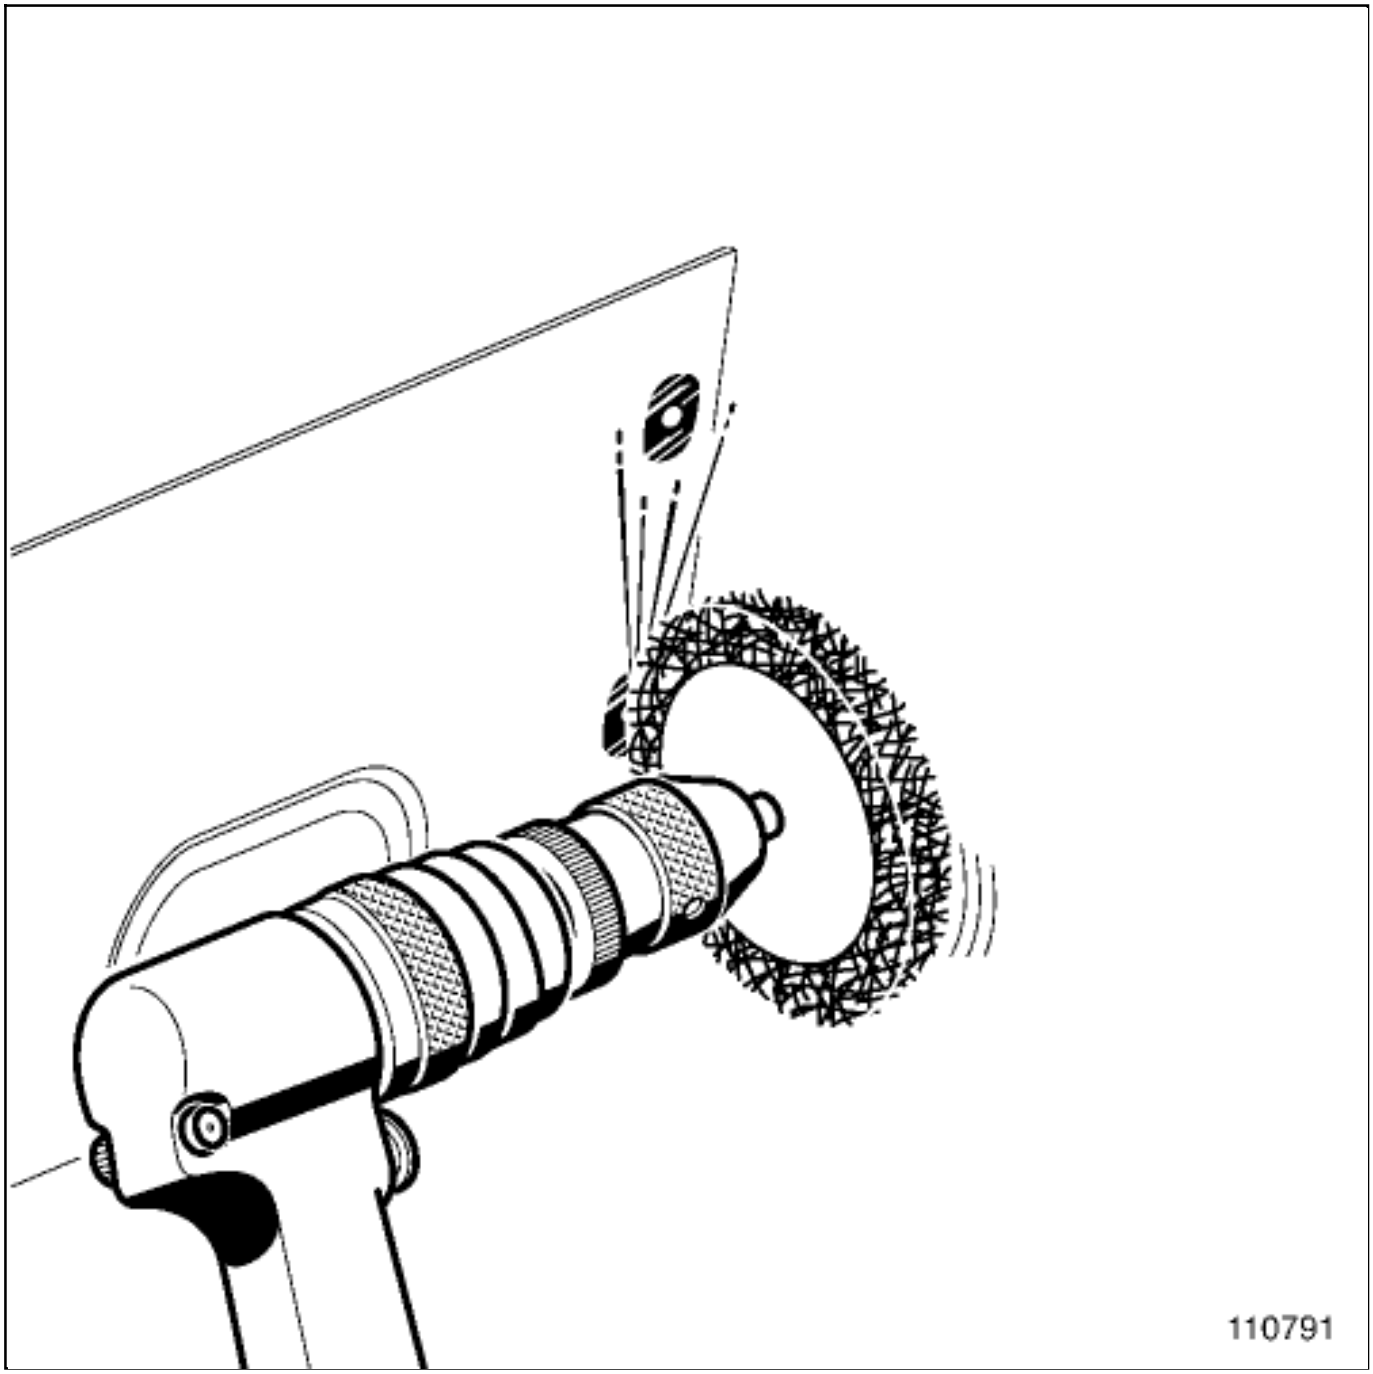
2)MARKING AND IDENTIFYING THE JOINTS



Mark the joint and cut zones.

Remove the replacement part.

3)PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

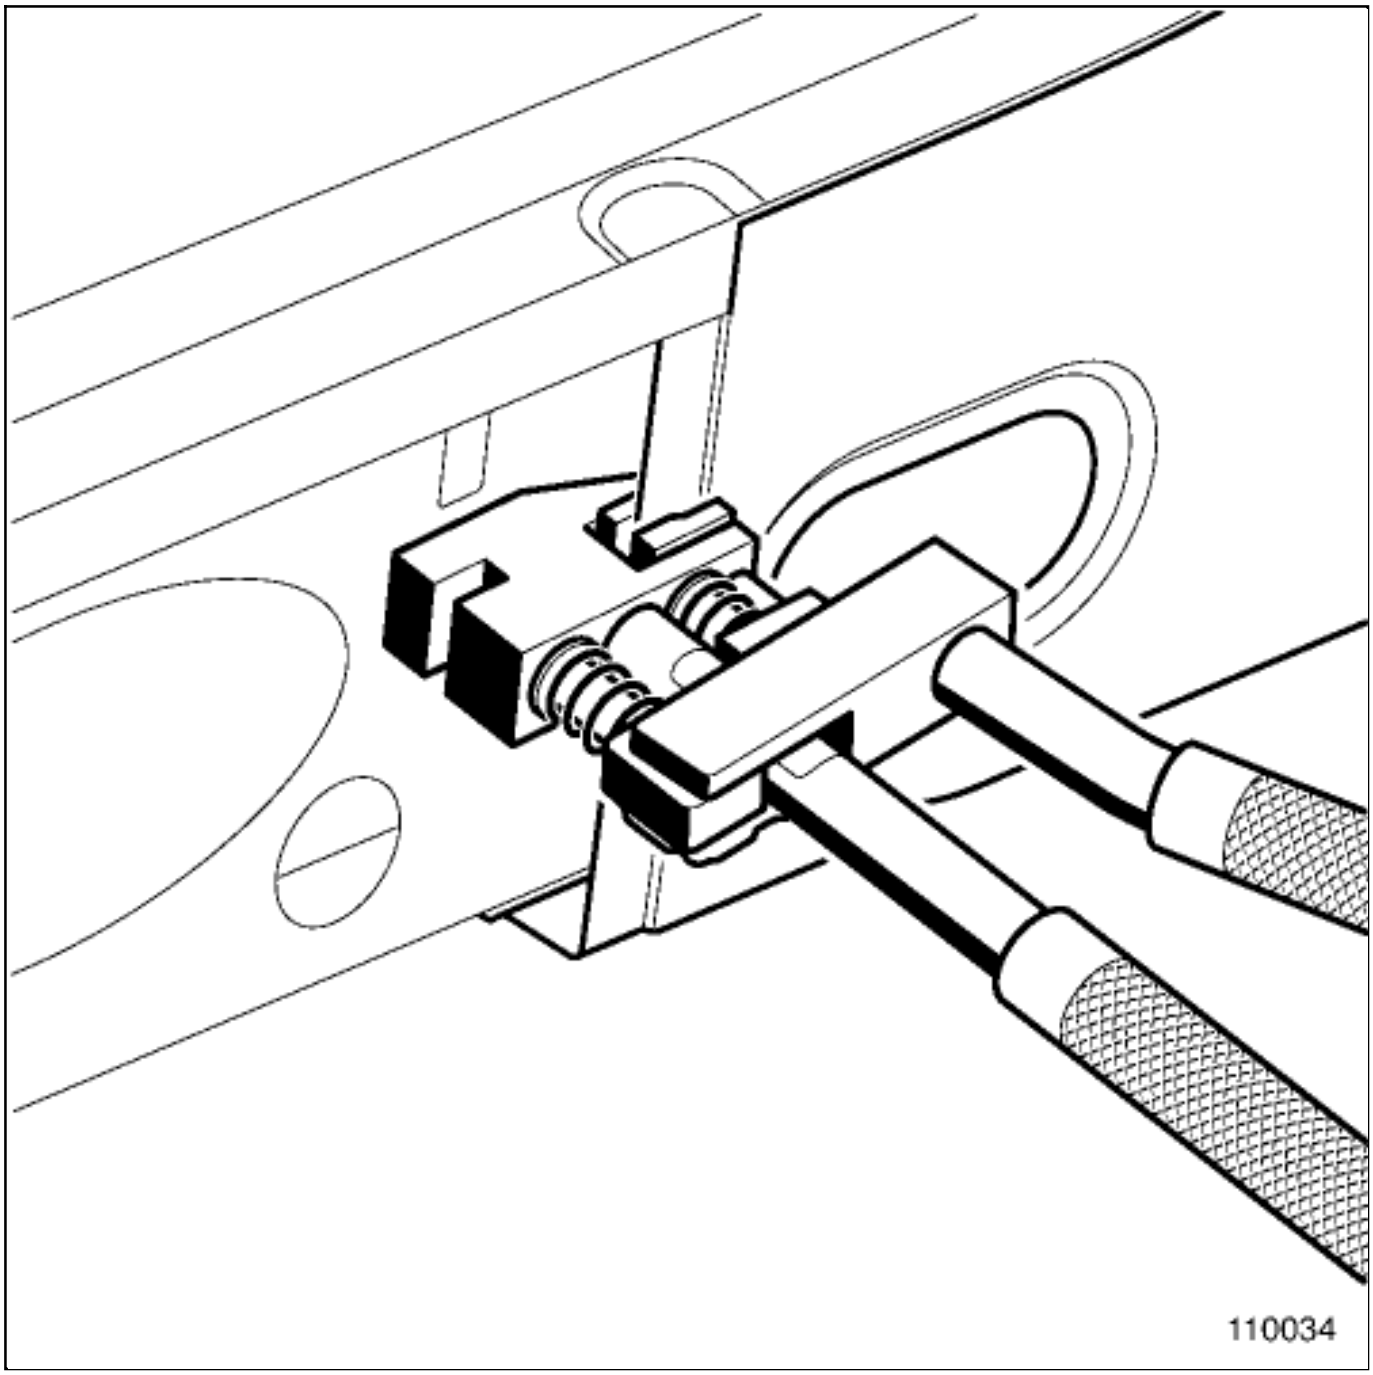


Cut the replacement part according to the marks.

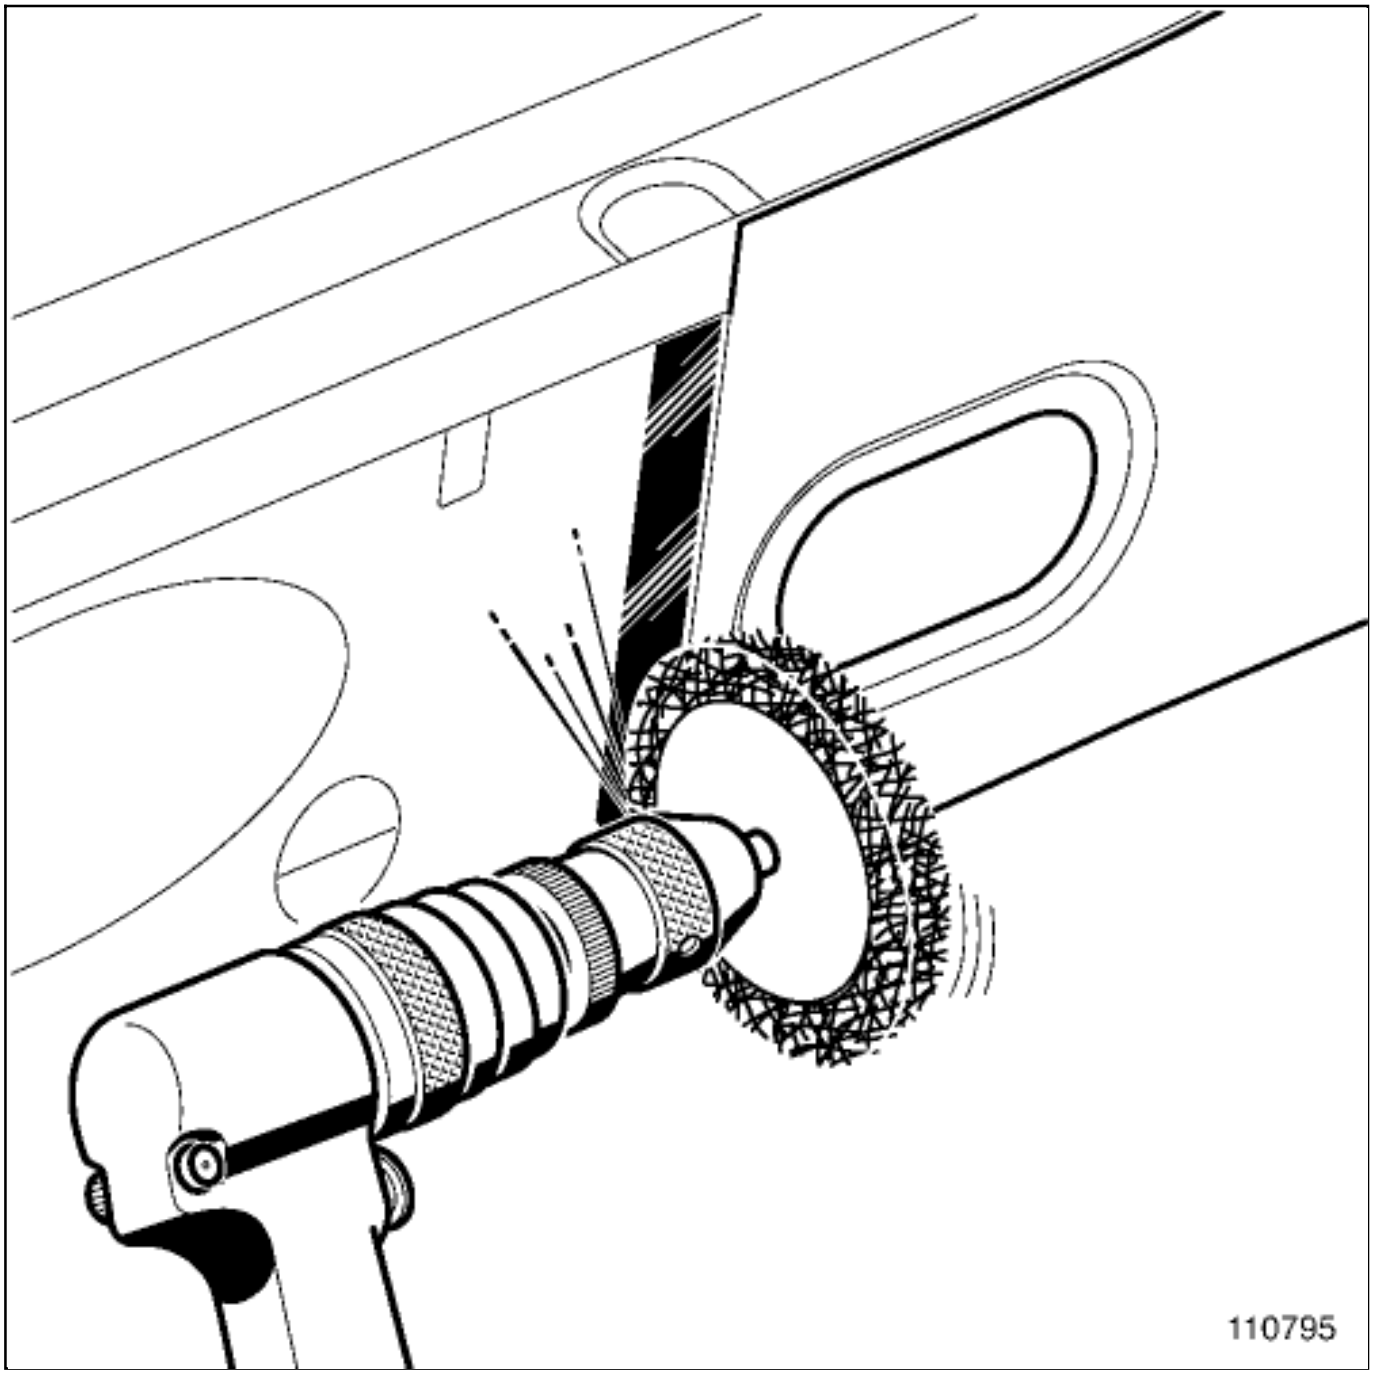
(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

Drill or pierce via the internal face at the drilling position, see table below.

Panel thickness (mm)	Drill bit diameter (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10



Scour the edges of the drilling holes and the external joint face along the length of the cut.



(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

Prepare the rest of the replacement part according to the chosen joint types, in accordance with the available joint face access.

4)PREPARATION OF THE JOINTS ON THE VEHICLE

Carry out the drilling, at the cutting location.

Scour the internal mating face at the step drilling location.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

Prepare the rest of the vehicle, according to the chosen joint types.

5)APPLYING PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

Apply the anti-corrosion protection to the internal joint faces.

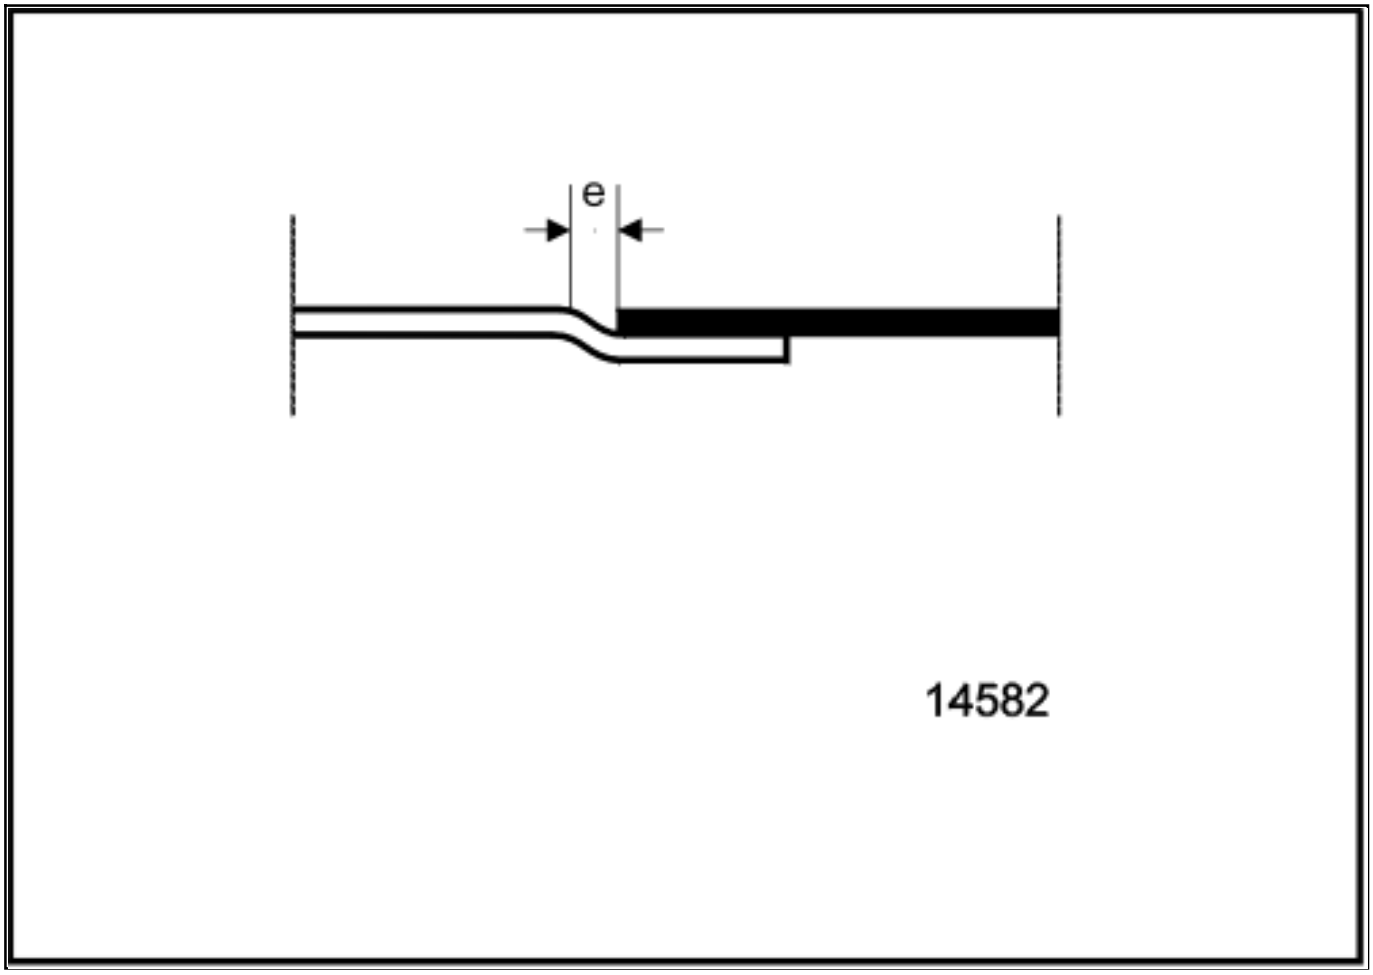
(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

2- ASSEMBLY

1)FITTING AND ADJUSTING THE REPLACED PARTS

Reposition the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

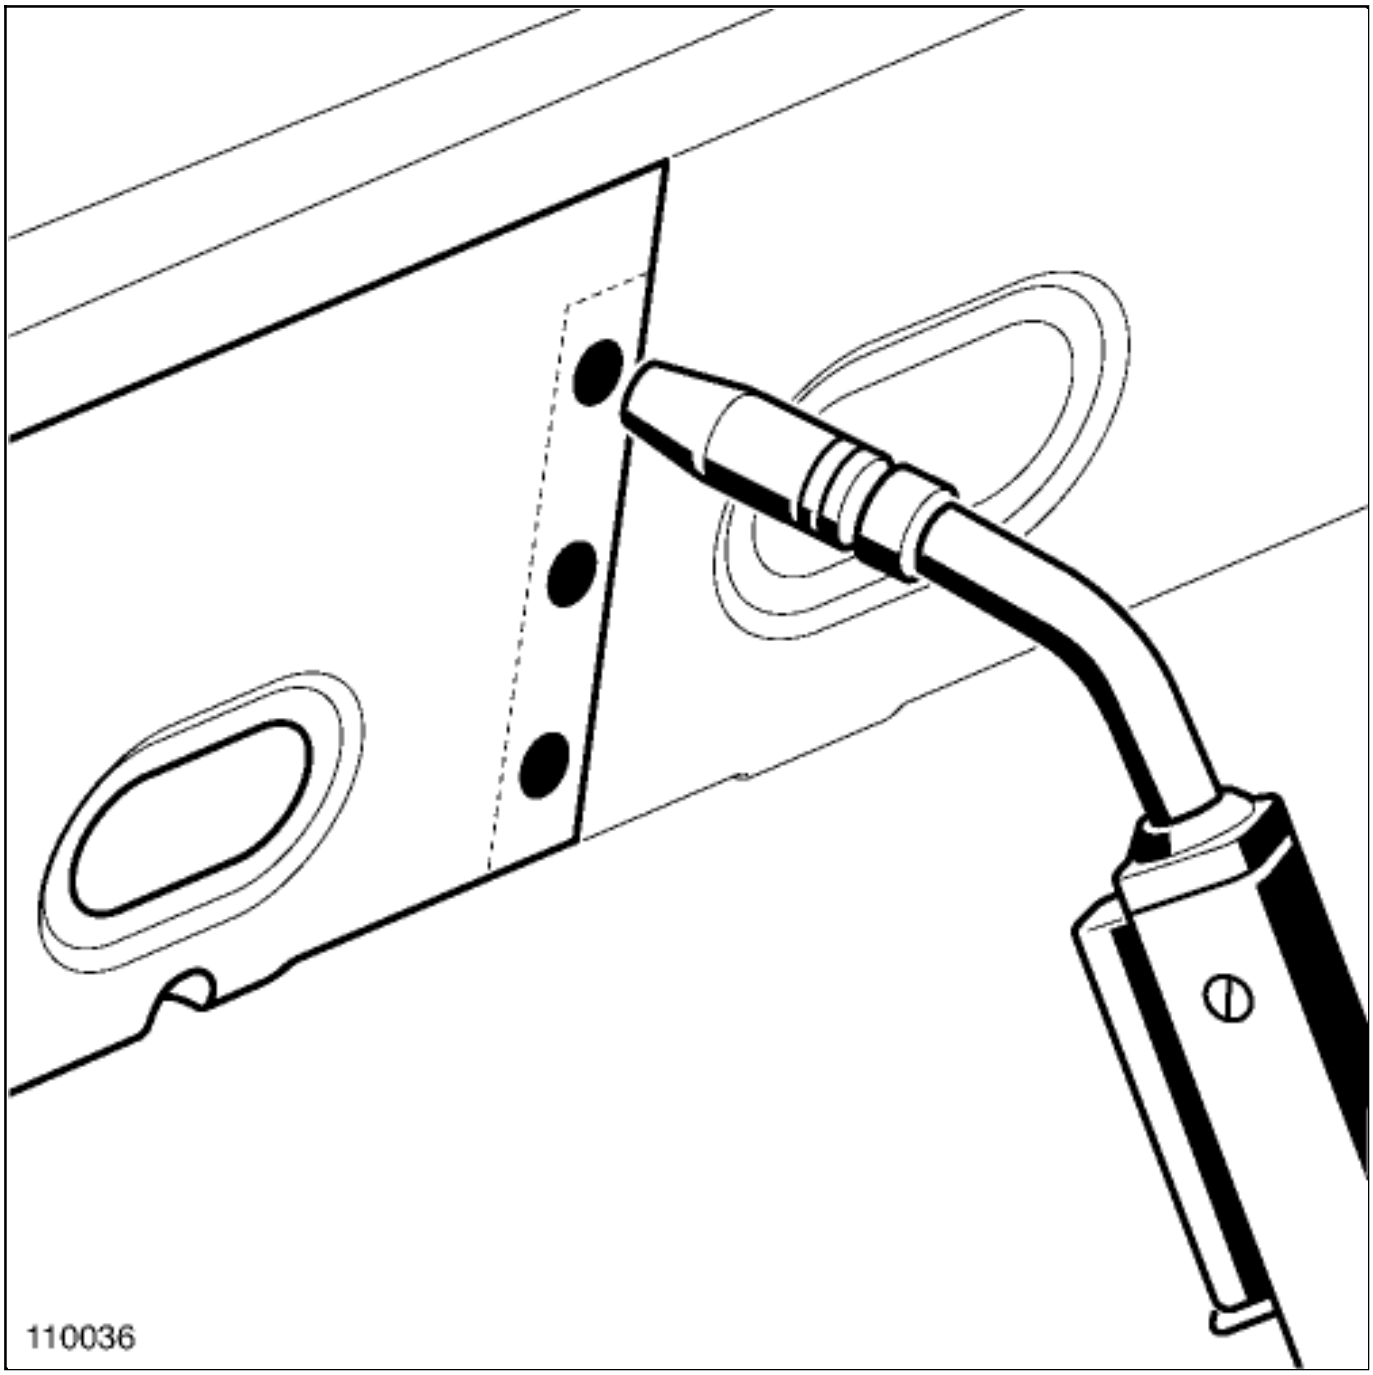


(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Note:

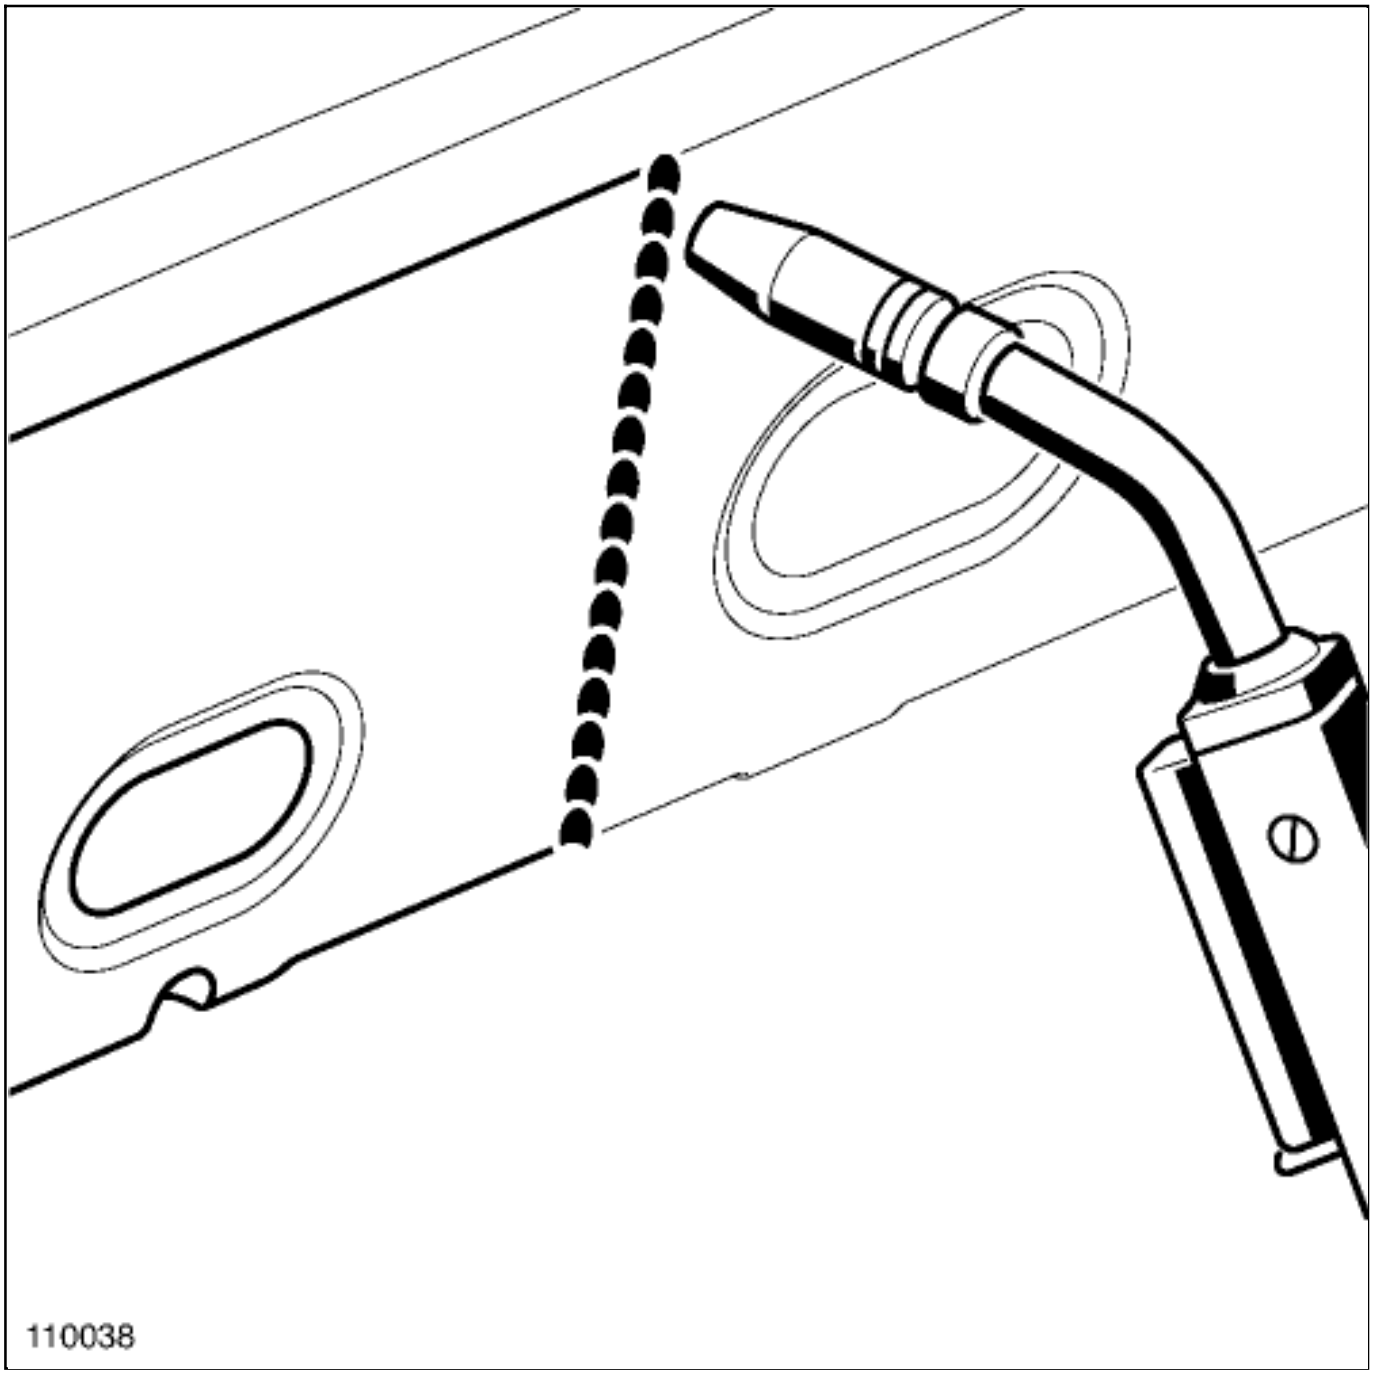
Leave a clearance(e) between the cut and the step drilling angle.

The clearance should be equal to the panel thickness.



2)ADJUSTING THE WELDERS

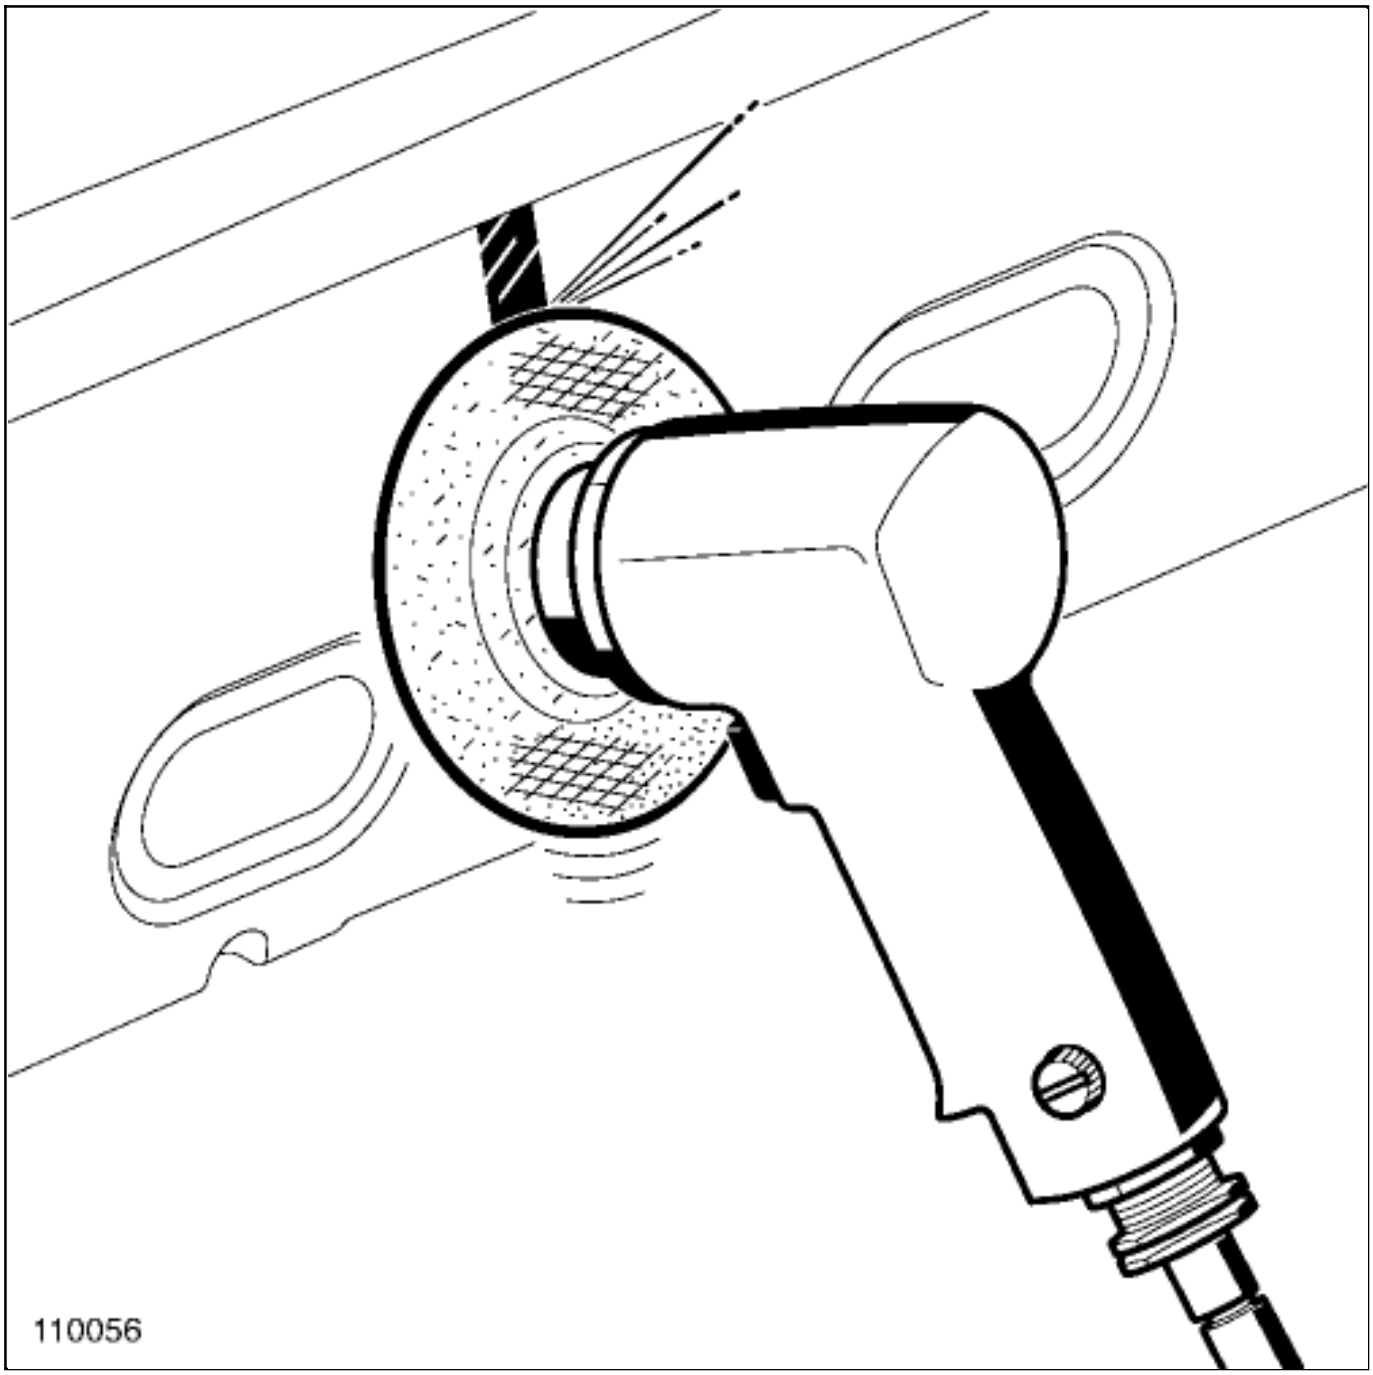
Before making the joints on the vehicle, carry out the tests required for adjusting the welders.



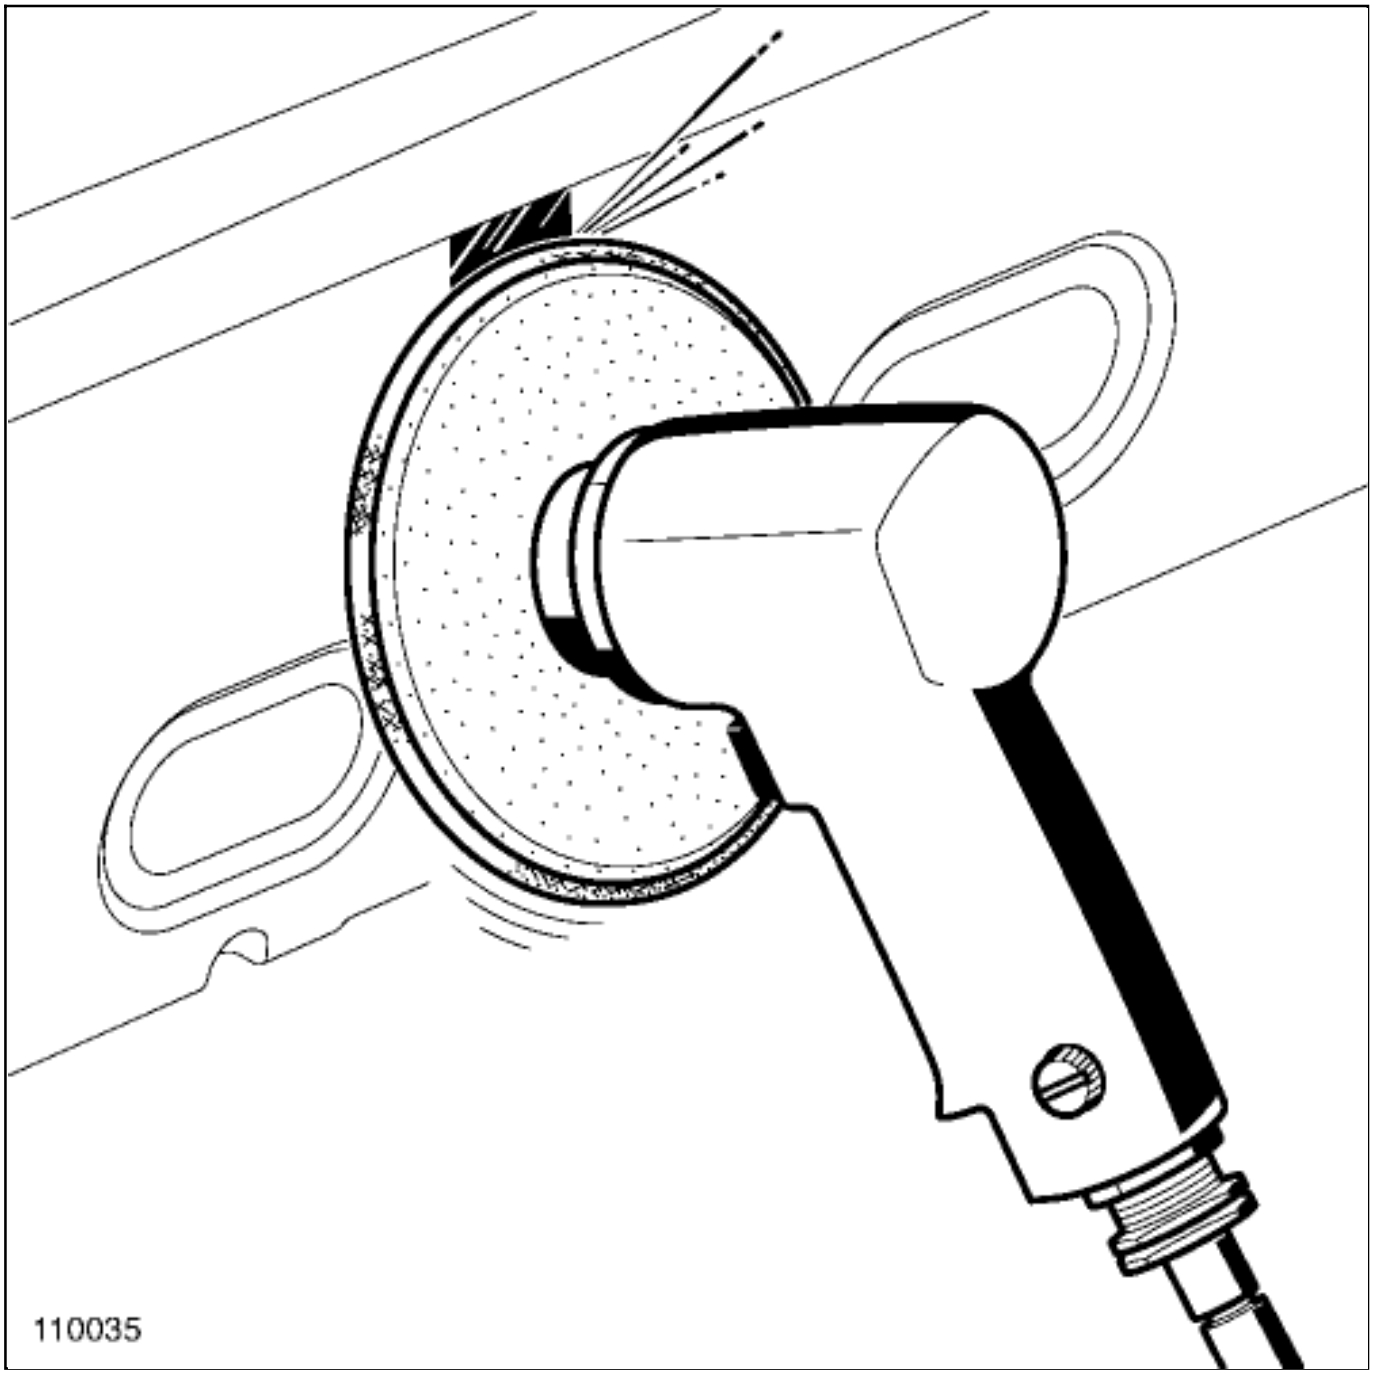
GMAW joint.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Precautions for the repair)

3)CARRYING OUT THE WELDING



Do the plug welds.



Apply a bead of chain weld along the whole cut.

3- FINISHING

Grind the continuous weld and the plug welds.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the assembly area.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

If necessary, carry out surface finishing.

(see 04F, Bodywork products and mountings, Panelwork finishing products: Use)

1)FITTING PROTECTION AFTER ASSEMBLY

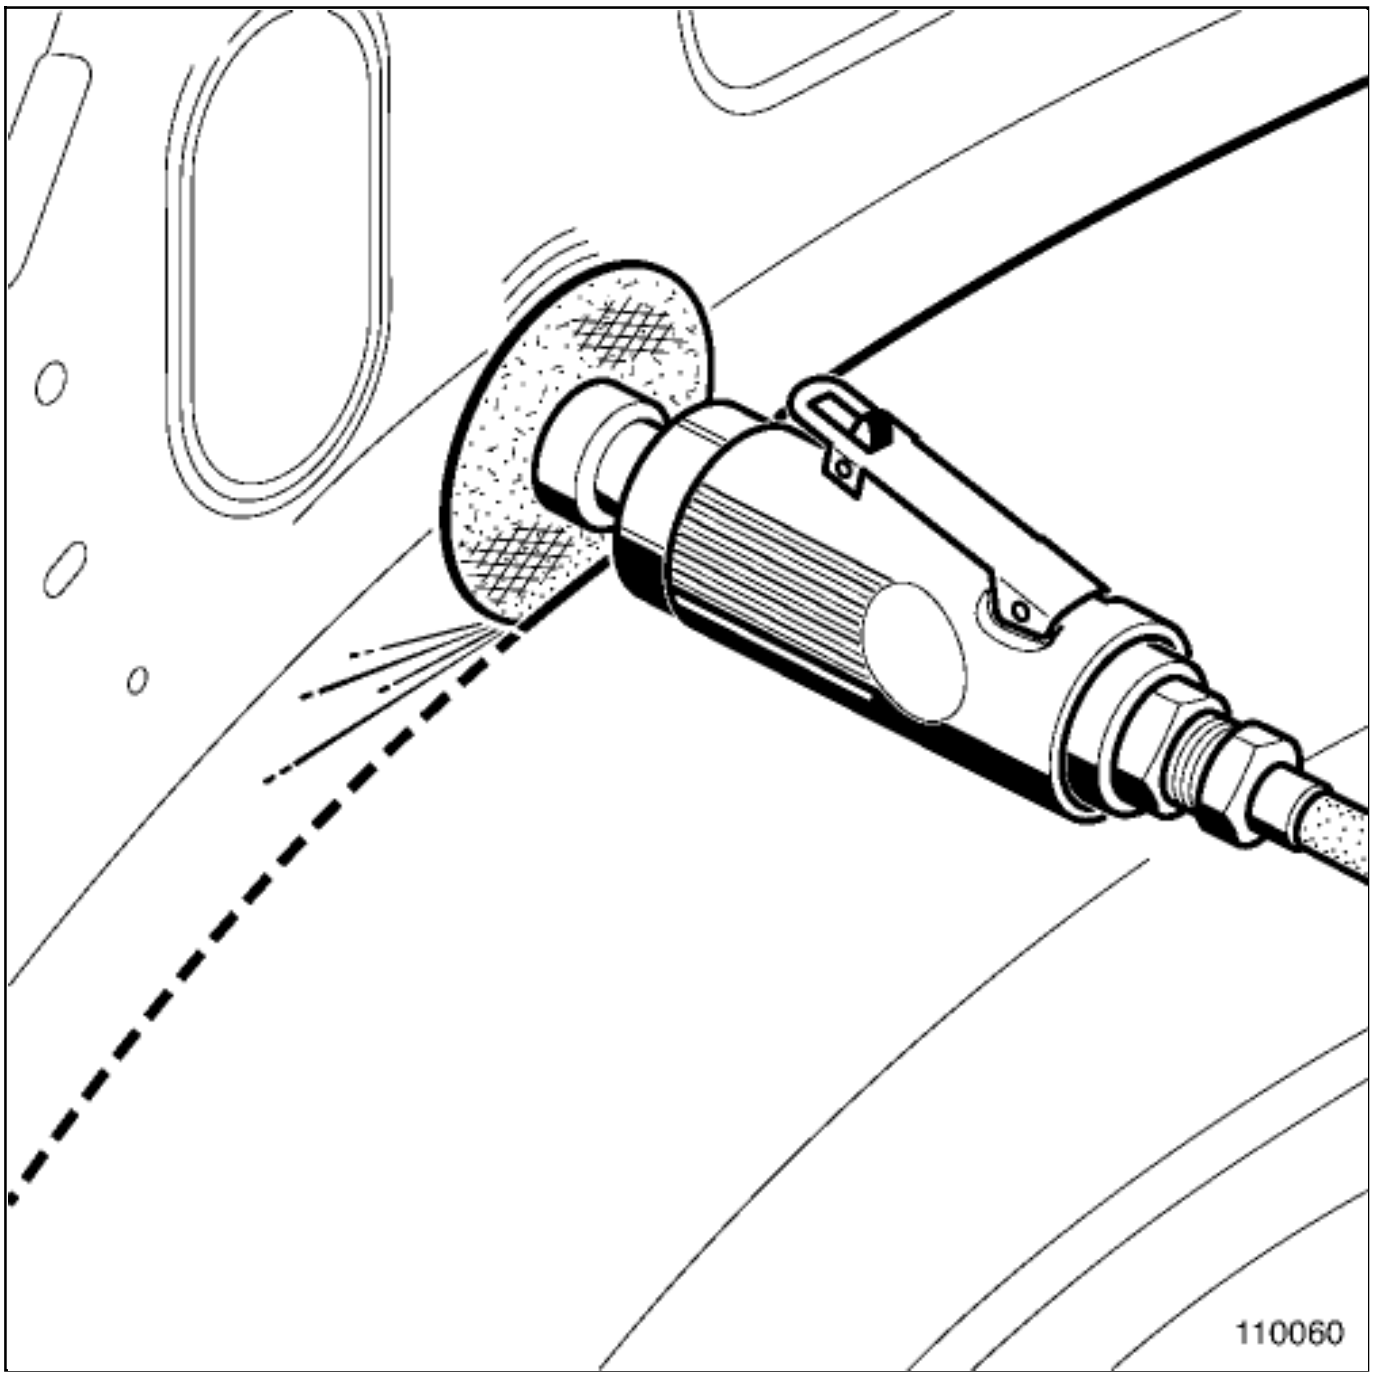
Fit the soundproofing.

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

Apply the anti-corrosion protection.

(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

CONNECTIONSFORPARTIALREPLACEMENTBYOVERLAPPING

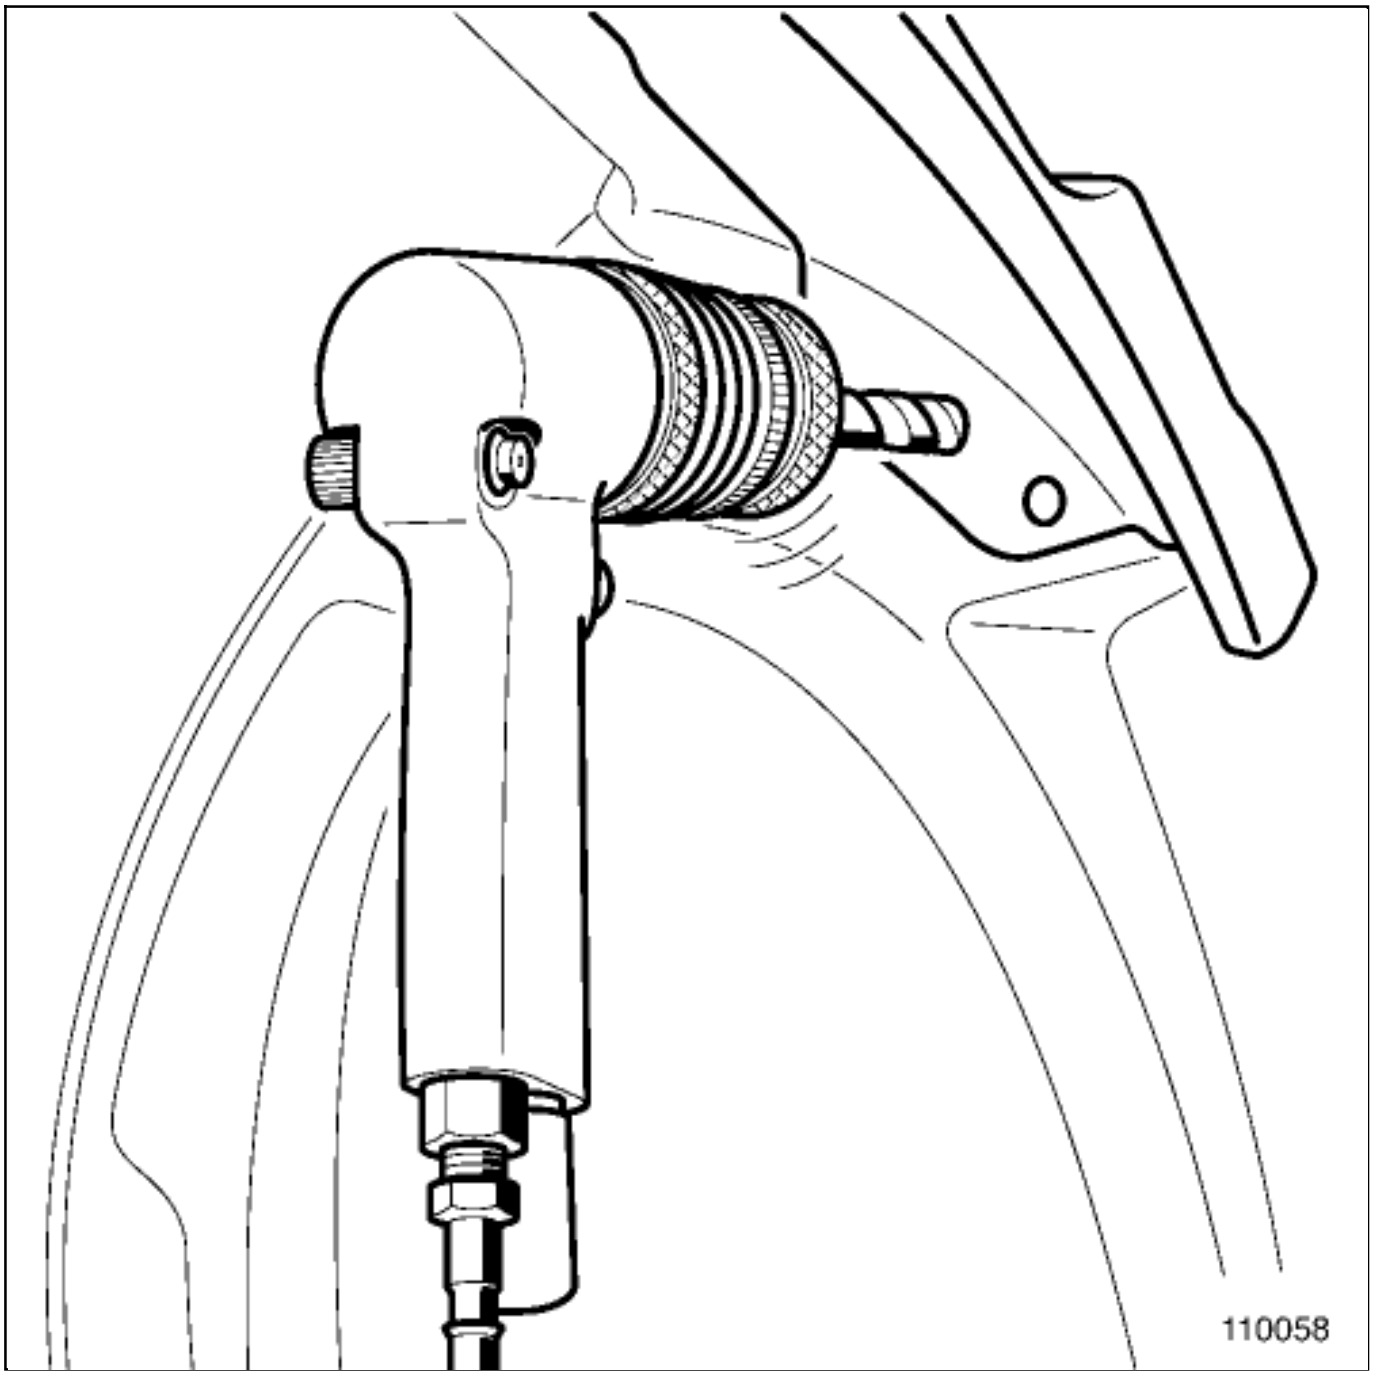


1. DISASSEMBLY

1- SCOURING

If necessary, scour the joint areas.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)



2- CUTTING

Cut the damaged part; refer to the MR for the vehicle concerned.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

3- UNPICKING

Unpick the part's welded connections.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

Note:

Do not strike or damage the panel.

4- GRINDING

Grind the unpicking and cutting residue.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the internal mating face.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

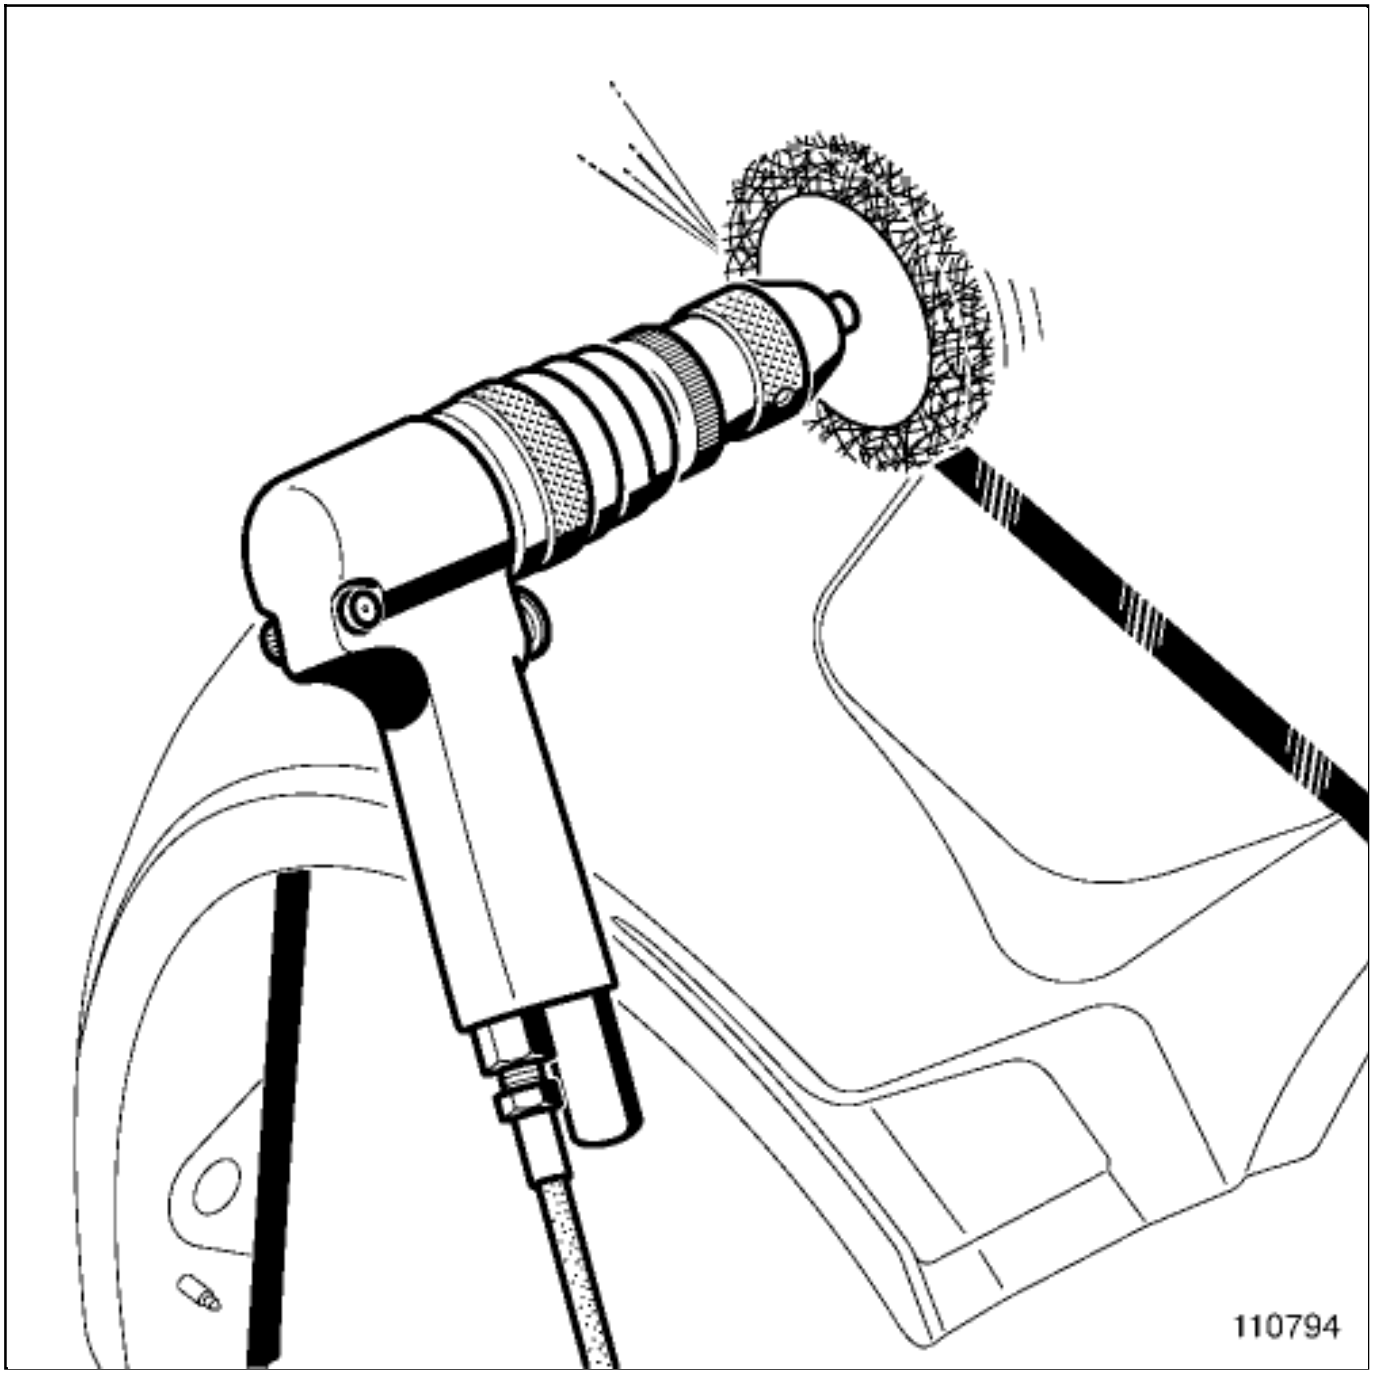
2. TWO FACE ACCESS

1- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

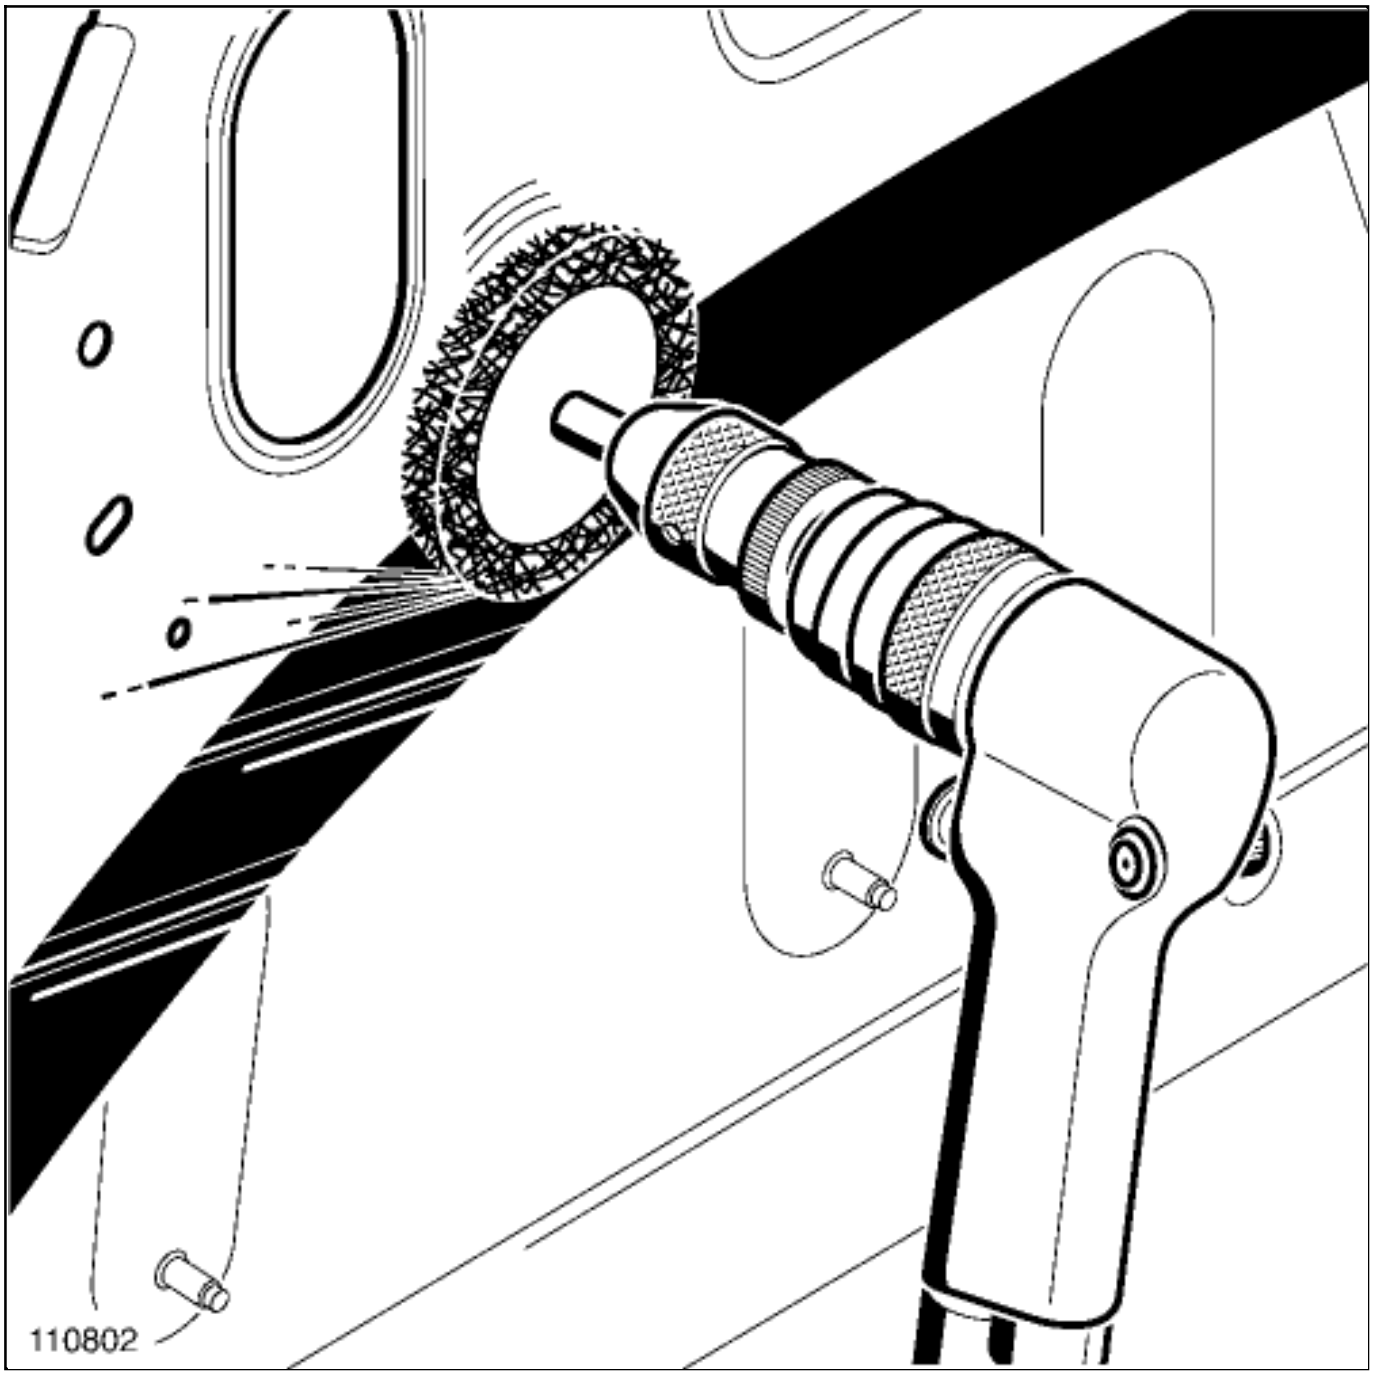


Mark the joint faces; refer to the MR for the vehicle concerned.

Disassemble the replacement part.

2- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART

Cut the replacement part according to the marking.



(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

Scour the internal and external joint faces around the cut.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the internal and external joint faces.

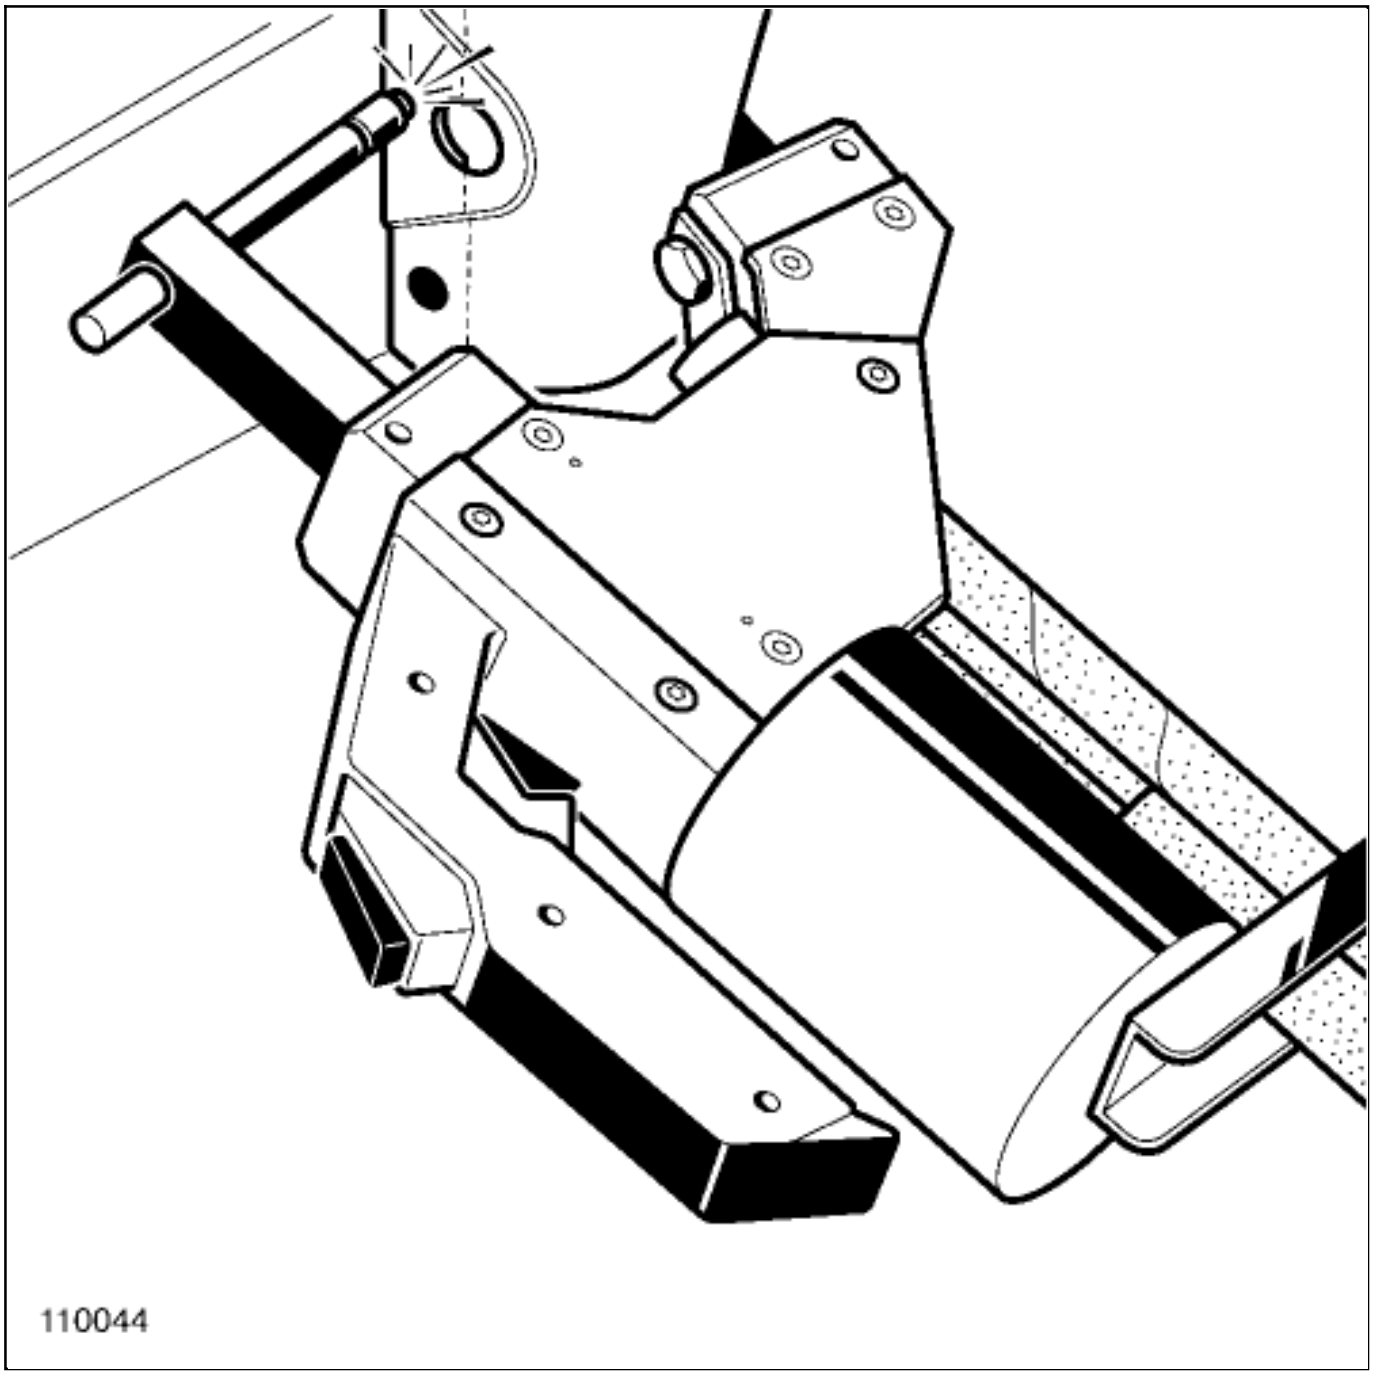
(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- APPLY THE PROTECTION BEFORE ASSEMBLY

Position the acoustic inserts in the hollow sections, if necessary.

Apply the anti-corrosion protection to the internal faces.



(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)

5- CARRYING OUT THE WELDING

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Weld the part checking for good part jointing.

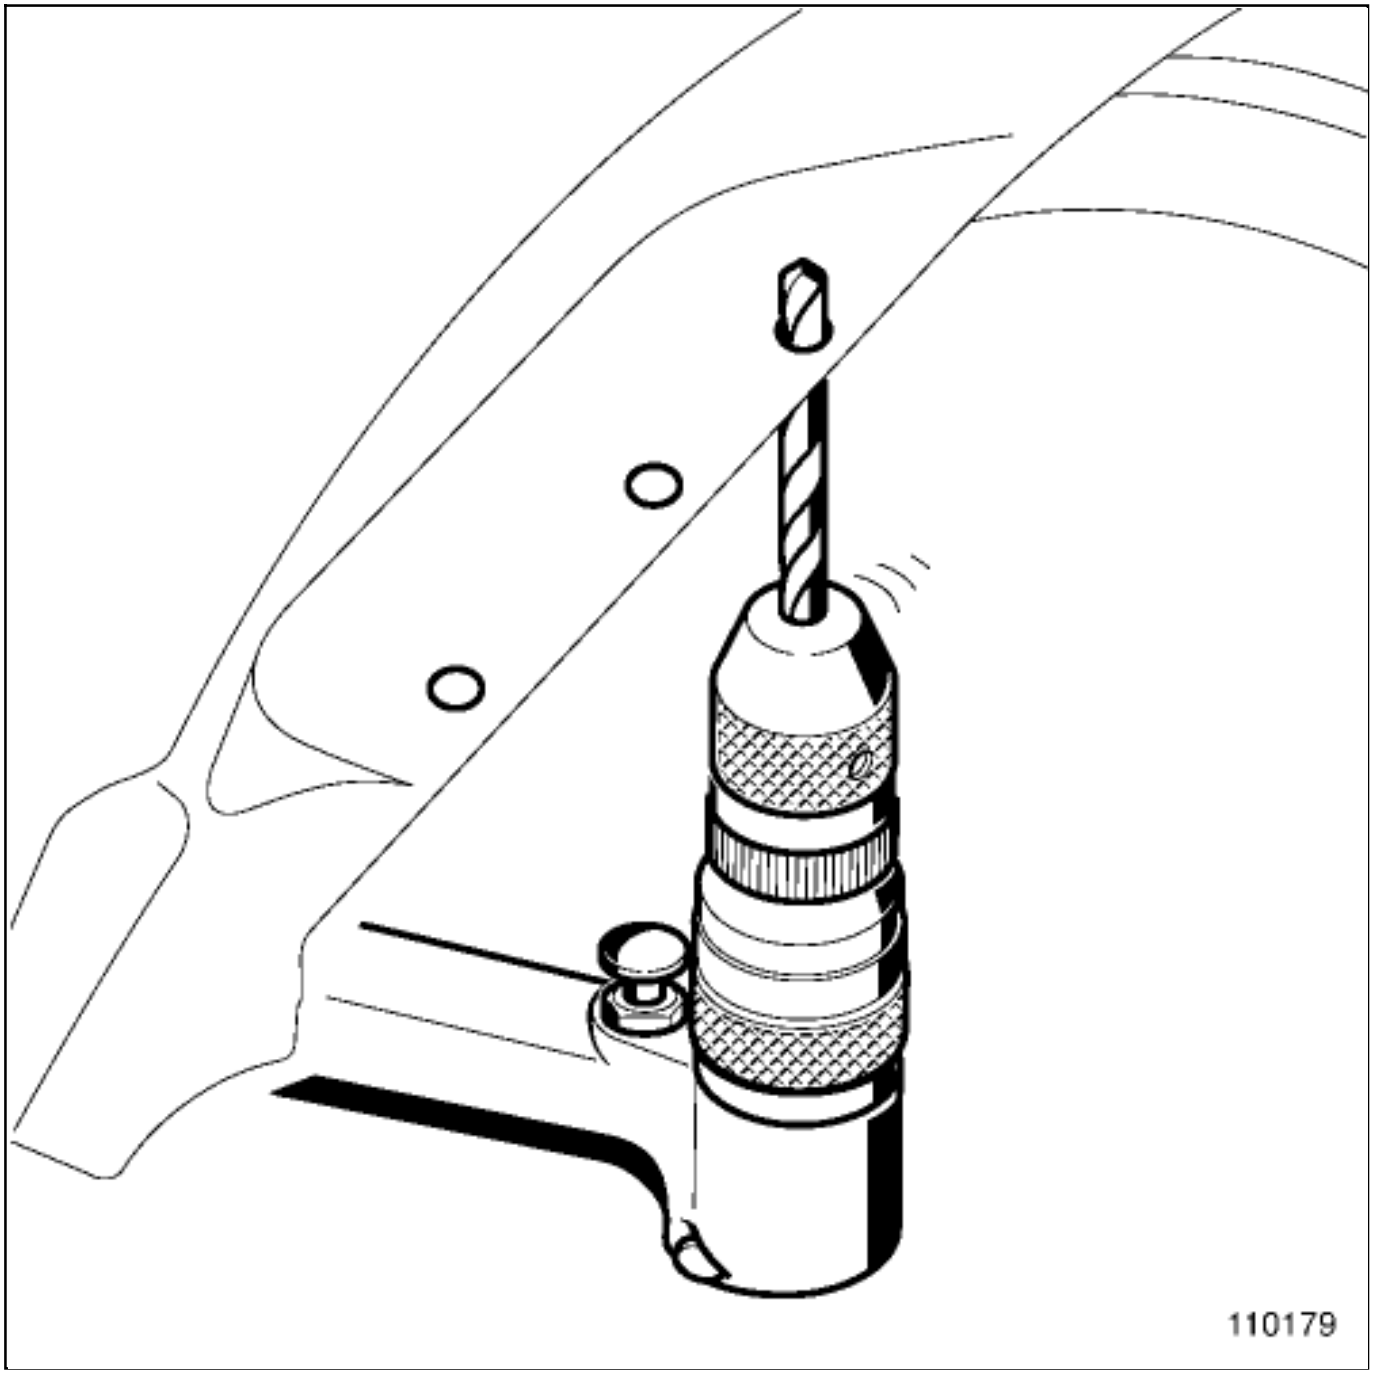
3. SINGLE FACE ACCESS

1- PREPARATION BEFORE ASSEMBLY

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

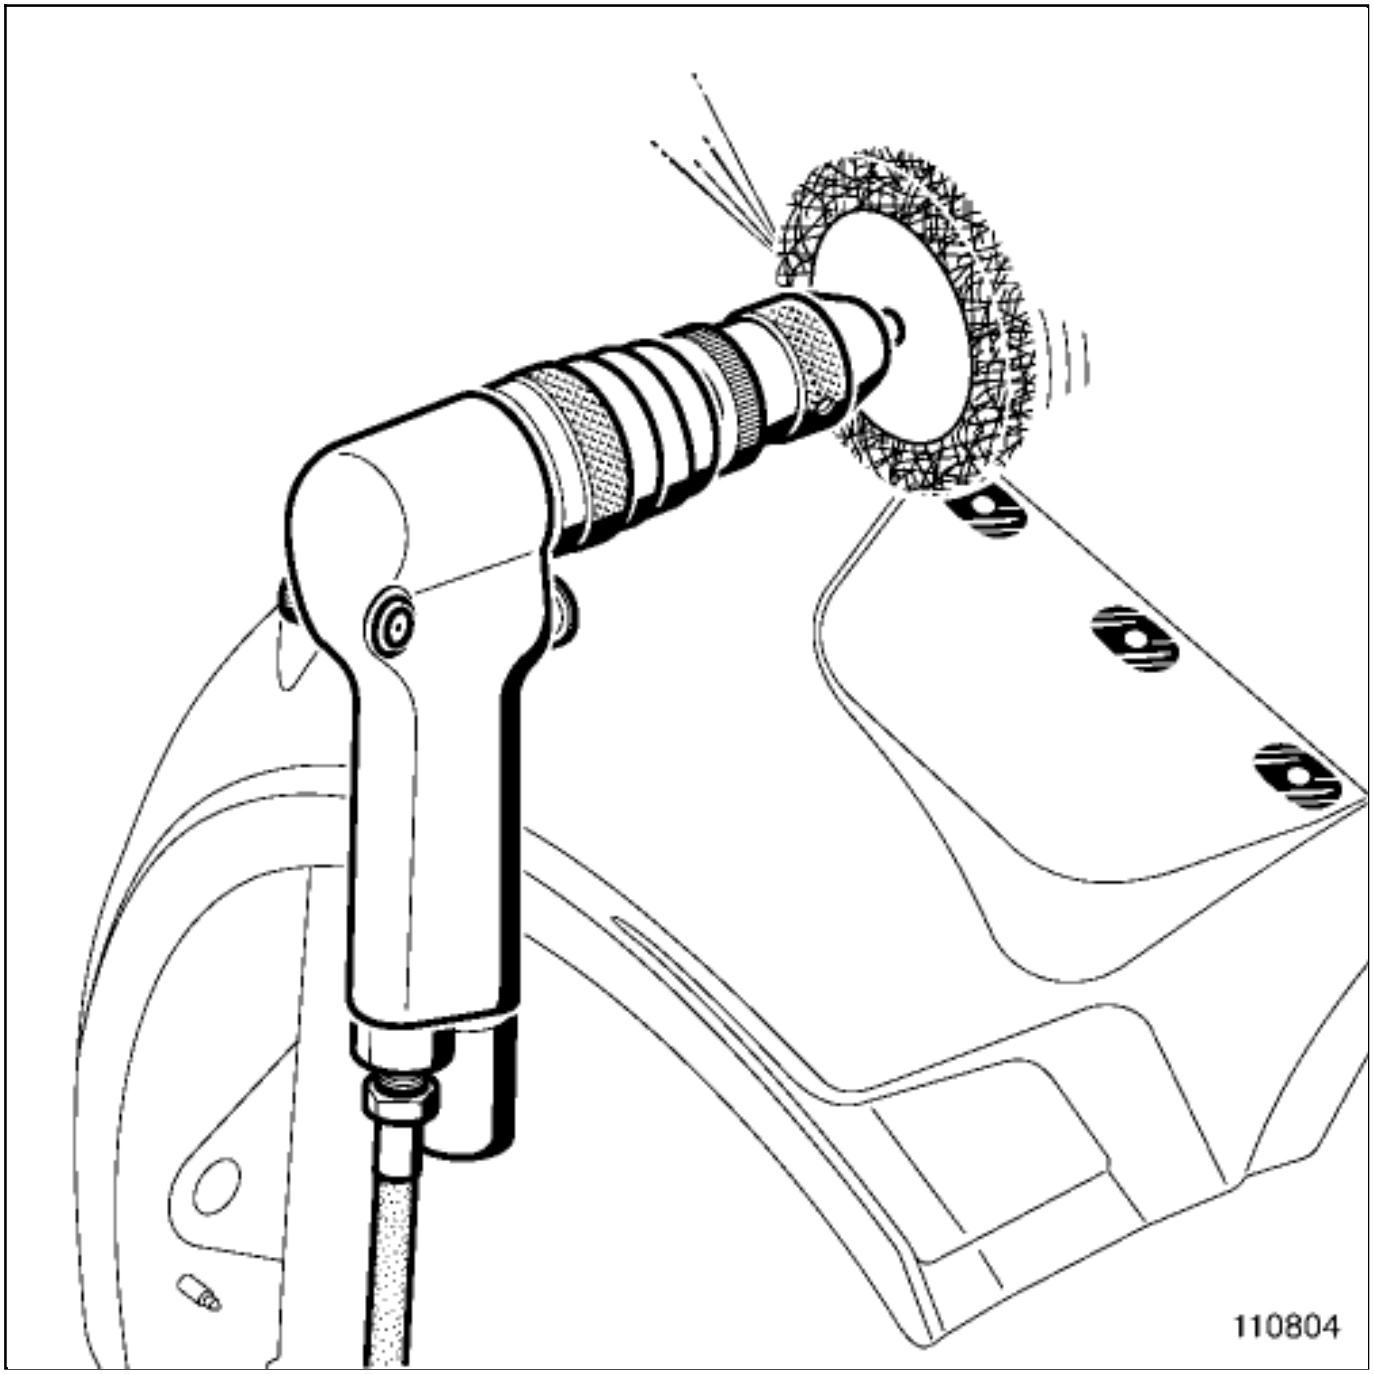
(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)



Mark the joint faces; refer to the MR for the vehicle concerned.

Remove the replacement part.

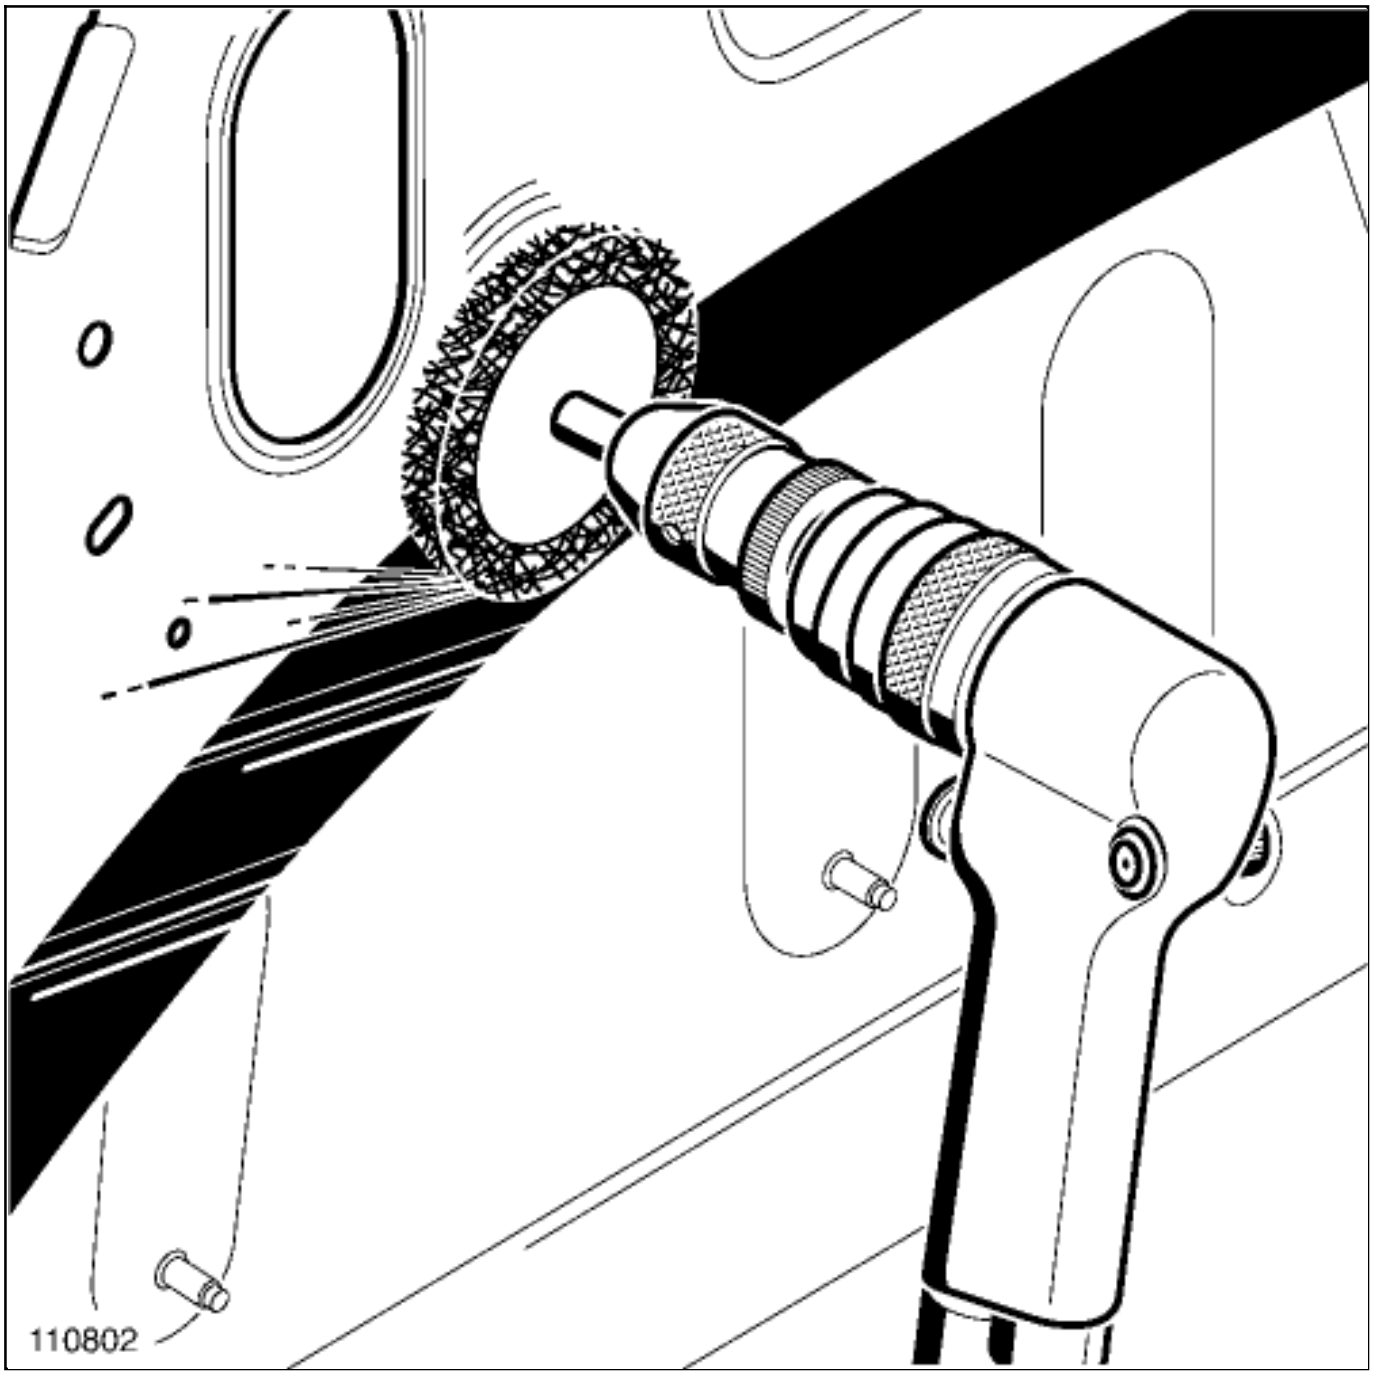
2- PREPARATION OF THE JOINTS ON THE REPLACEMENT PART



Cut the replacement part according to the marking.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

Drill or pierce the holes for the plug welds via the internal face, following the table below.



Panel thickness (mm)	Drill bit diameter (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

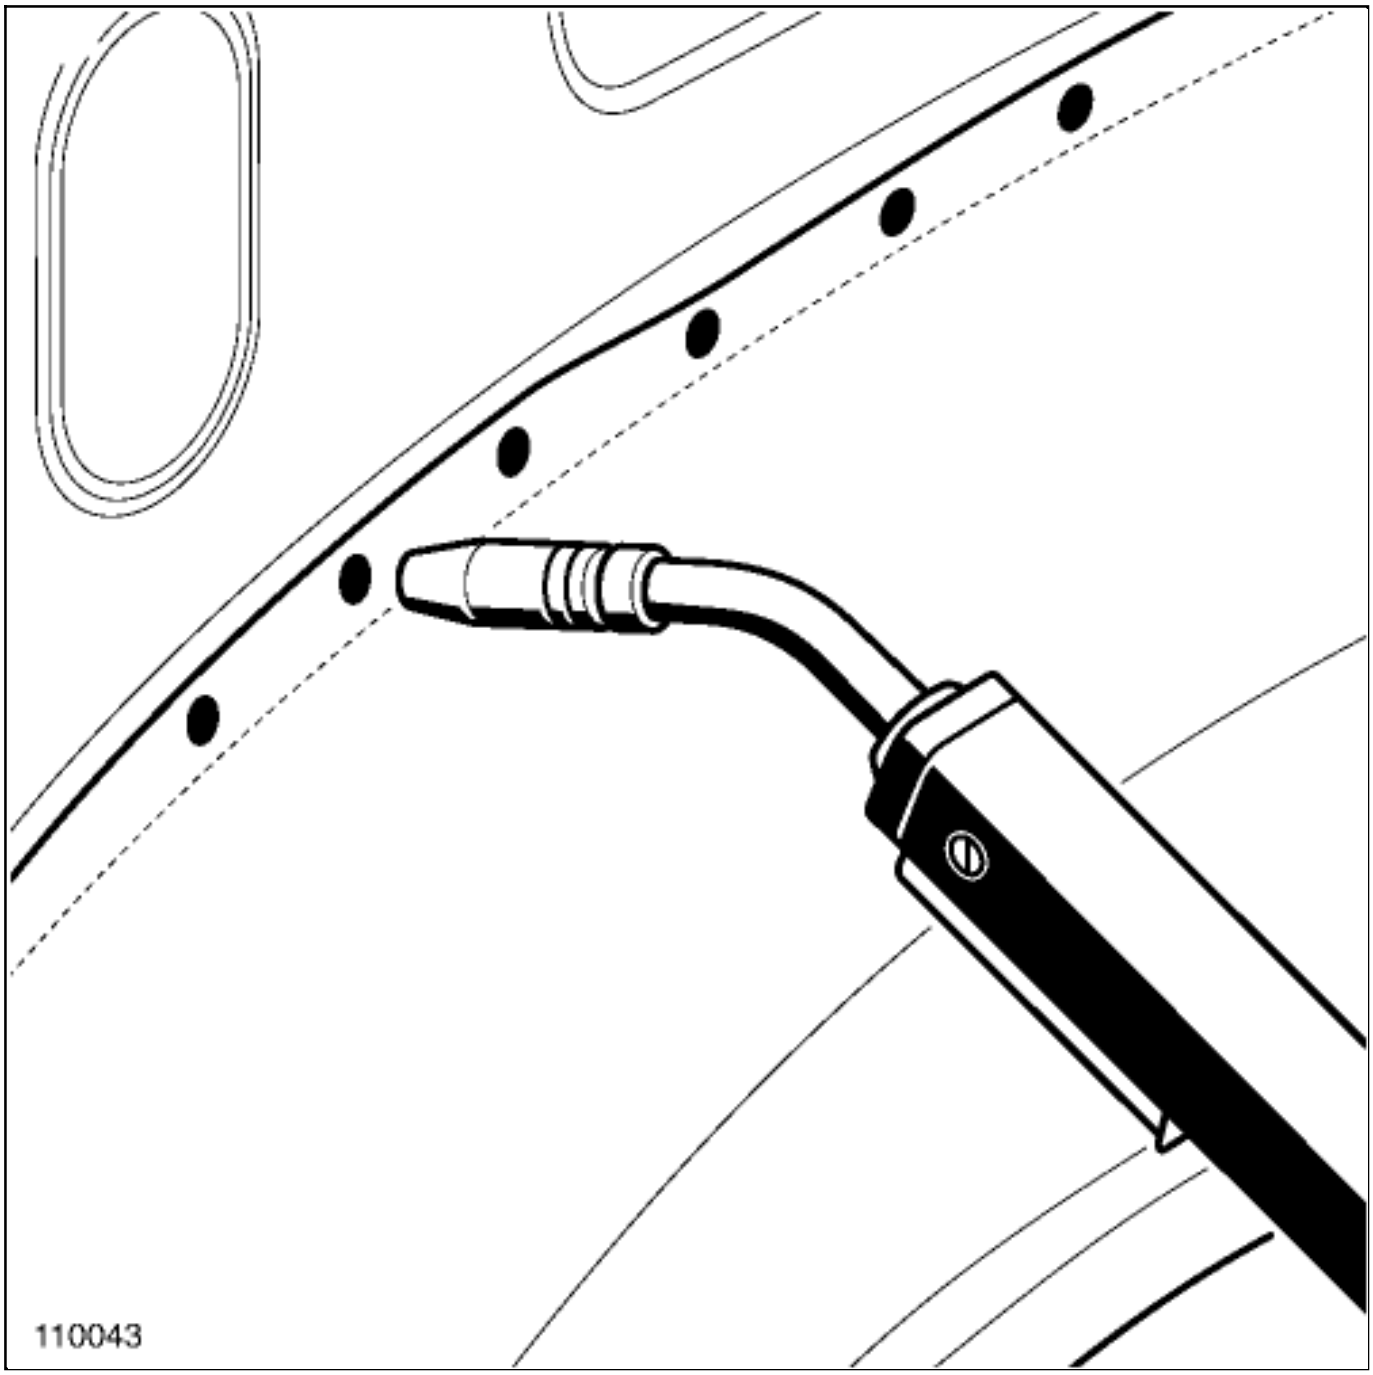
Scour the edges of the holes on the external joint faces.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

3- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the internal mating faces.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

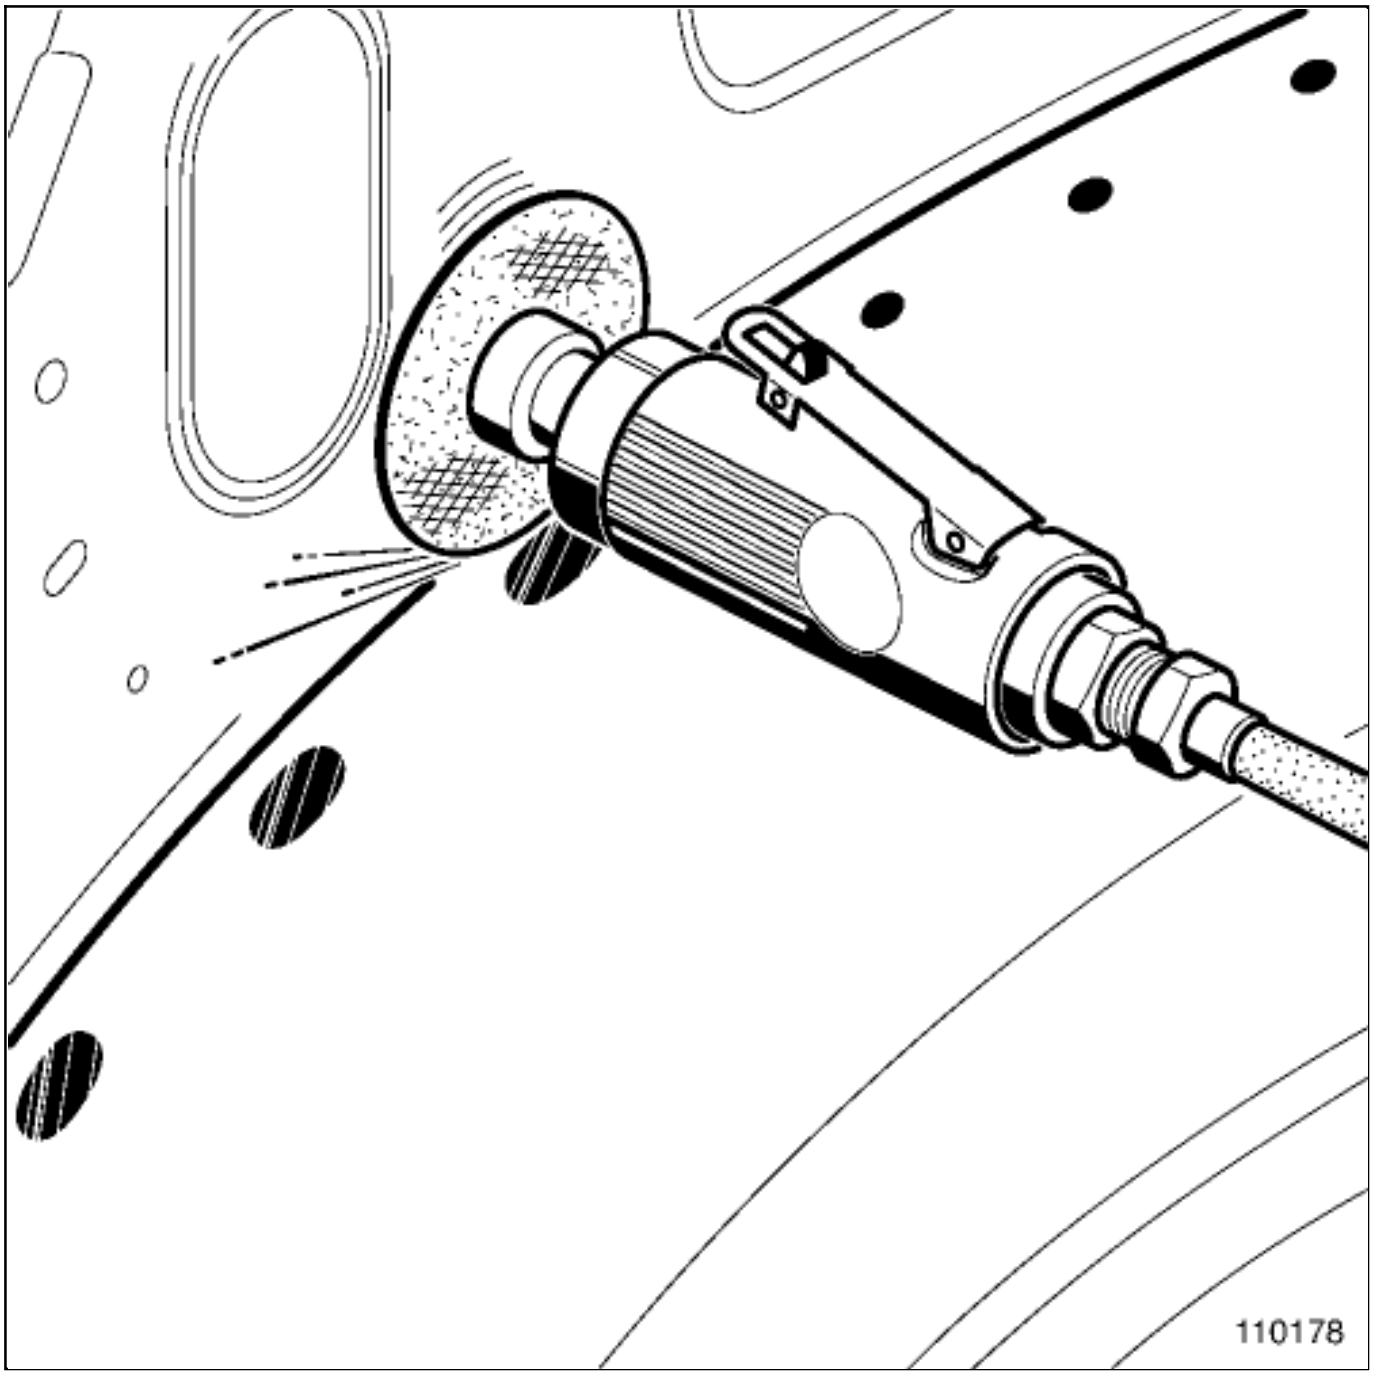


(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

4- CARRYING OUT THE WELDING

Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.



(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

Do the plug welds.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

5- FINISHING

Grind the plug welds.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

Surface the joint areas.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Note:

Do not strike or damage the panel.

Note:

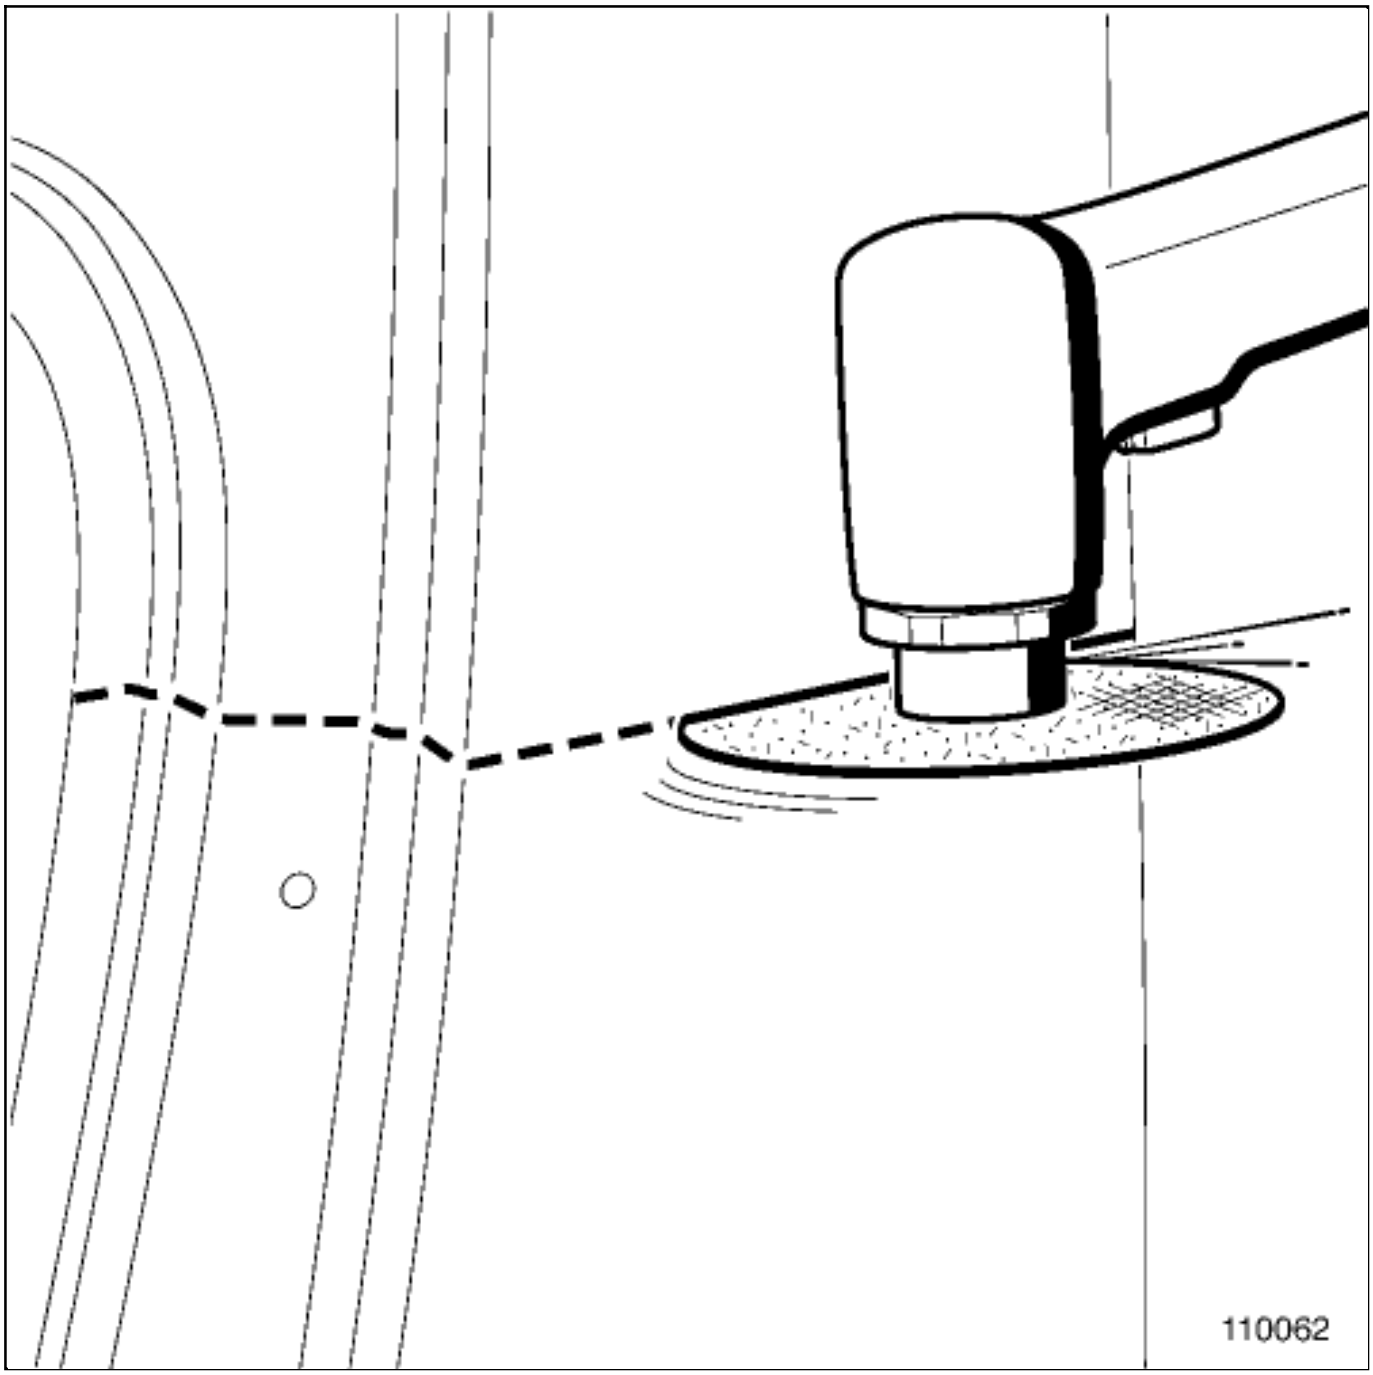
In the previous example, apply a bead of paint sealing mastic between the replaced part and the support on the vehicle before refitting the wing panel.

Repair-40x01x28x08-02x21-1-1-1.xml

XSL version : 3.02 du 22/07/11

CONNECTIONS FOR PARTIAL REPLACEMENT BY PATCH DRILLING

1. DISASSEMBLY

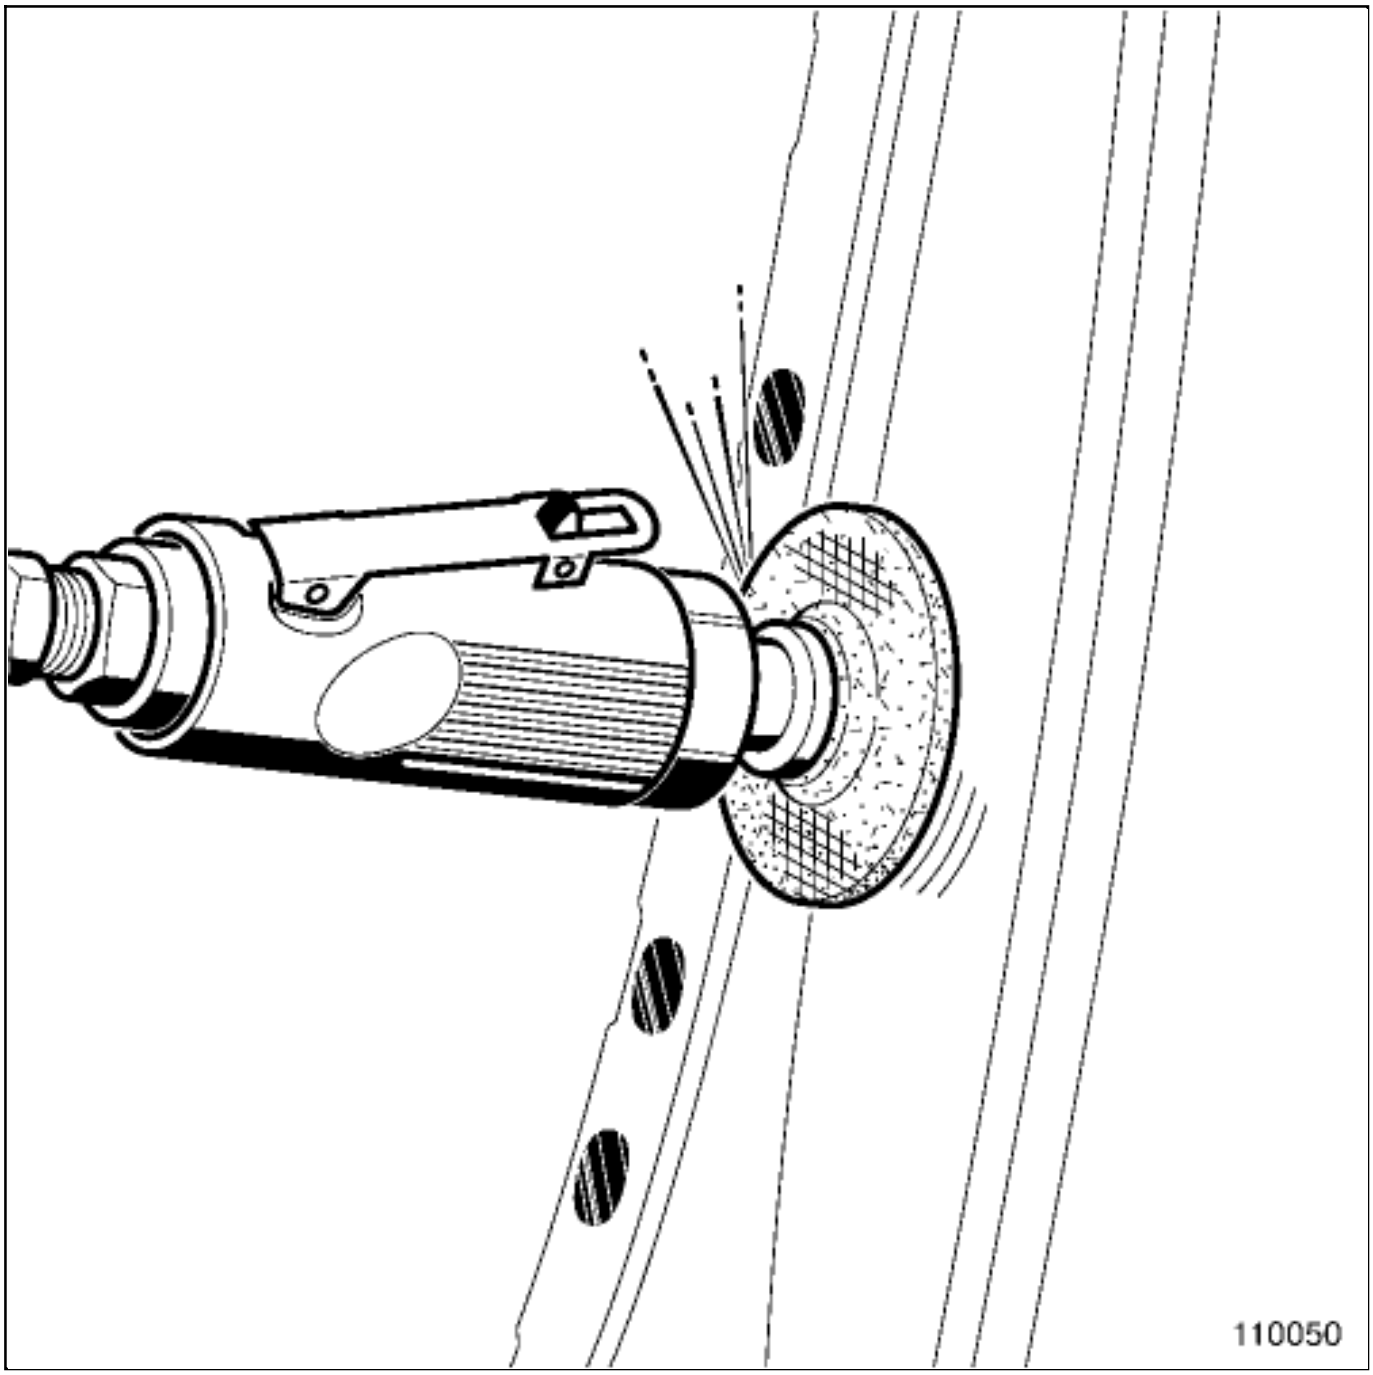


1- SCOURING

If necessary, scour the area where the partial cut will be made.

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)



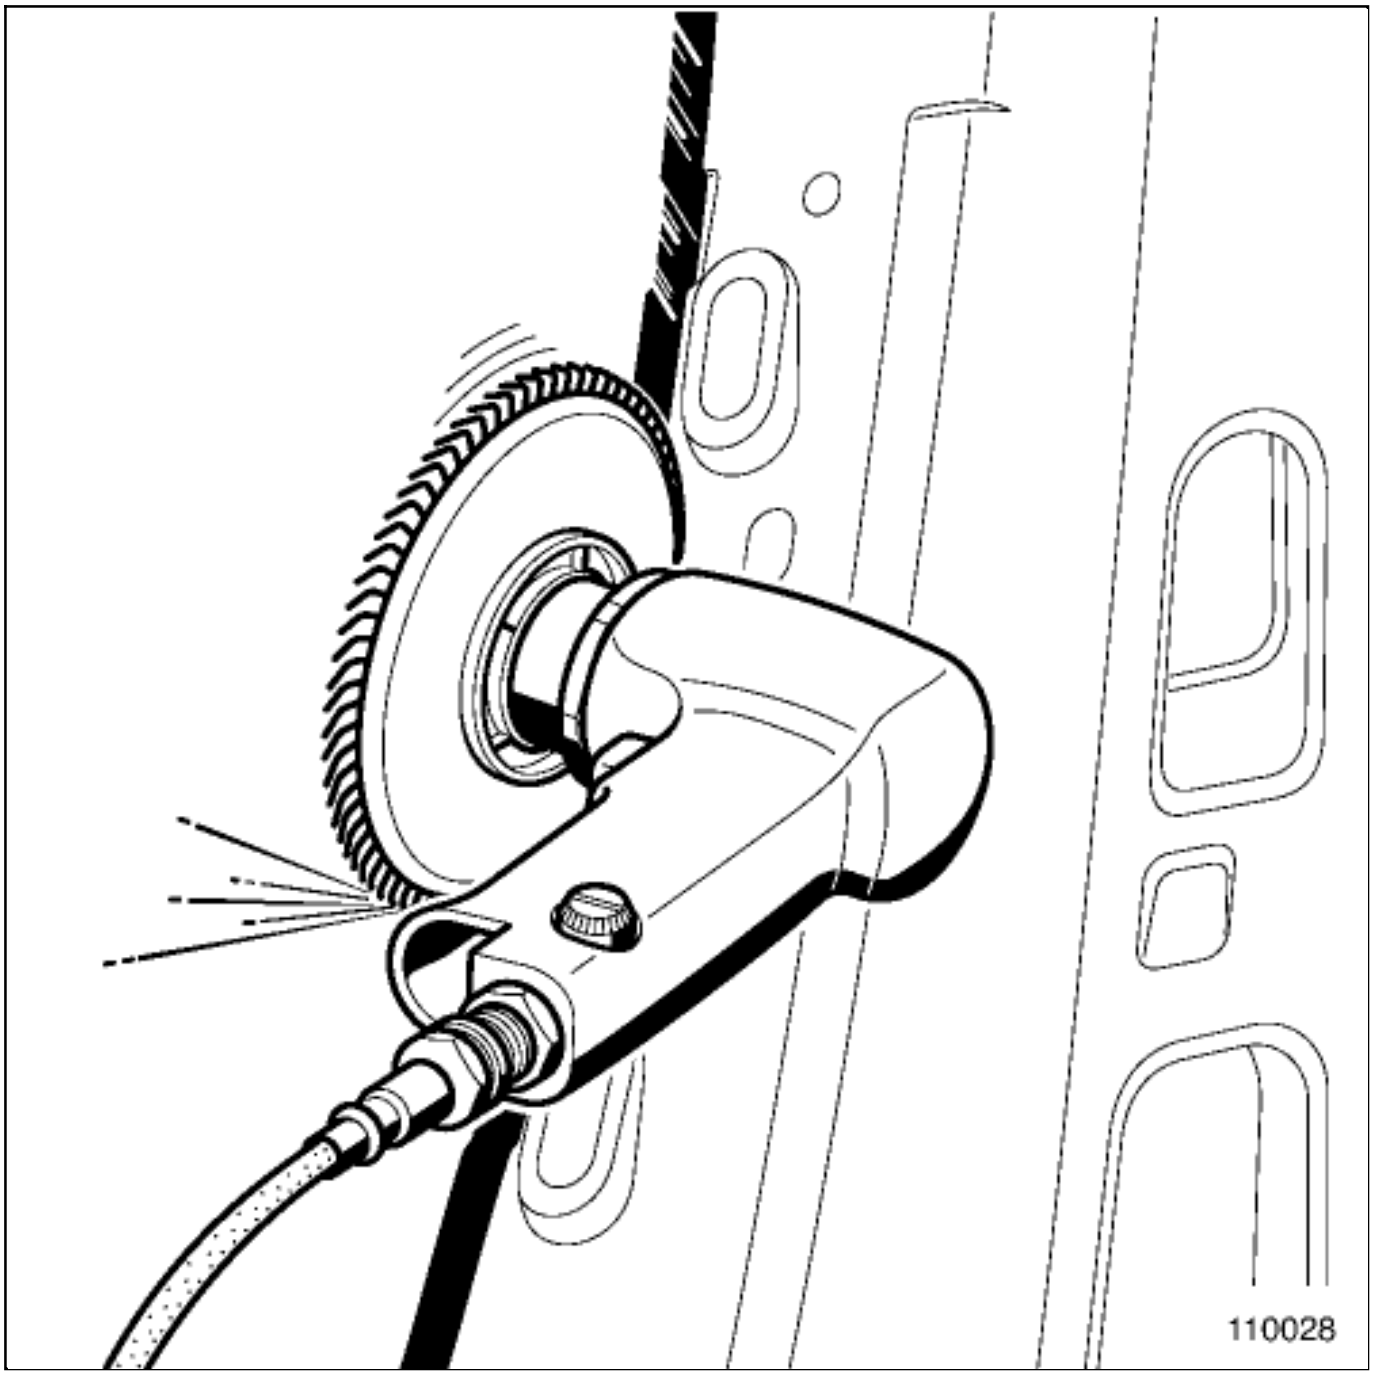
2- CUTTING

Cut the damaged part on the vehicle approximately 40 mmfrom the definitive cut; refer to the MR for the vehicle concerned.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

3- UNPICKING

Unpick the spots holding the part on the vehicle.



(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)

Remove the damaged part.

Note:

Do not strike or damage the panel.

4- GRINDING

Level off all the welding residue as well as that left by the cutting.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)

2. PREPARATION BEFORE ASSEMBLY

1- LOCATION OF THE WELDS AND NUMBER OF POINTS.

The step drilling patch joint can be made in two ways:

Resistance spot welding:

(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection with direct access: Description)

Gas metal arc spot welding (GMAW):

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

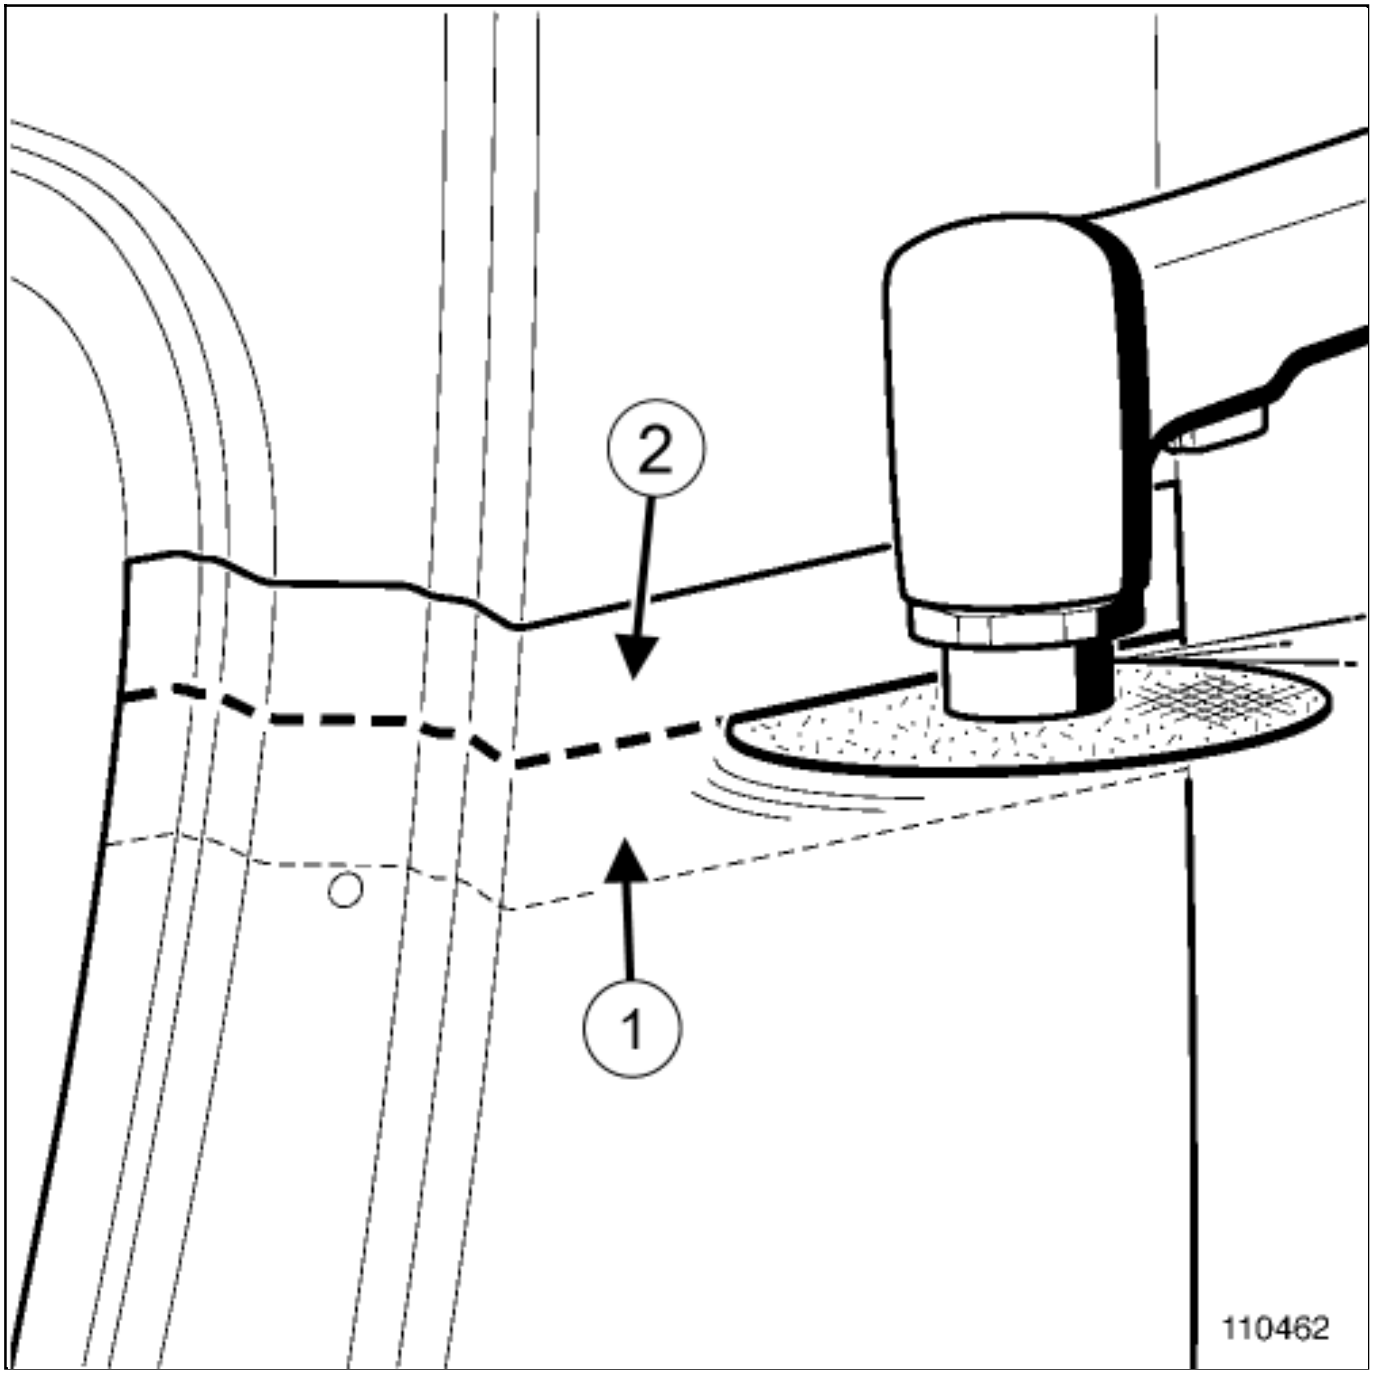
In both cases, refer to the indications given in the vehicle's MR to find out the weld locations.

Apply a bead of chain weld in visible areas.

(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

Cut the replacement part 80 mmlarger than the section removed from the damaged part to ensure coverage.

2- ADJUSTMENT BEFORE ASSEMBLY



Position the replacement part, adjust it and fix it using the locking pliers.

If necessary, reassemble the adjacent components and check the panel gaps.

(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)

3- MARKING AND IDENTIFYING THE JOINTS

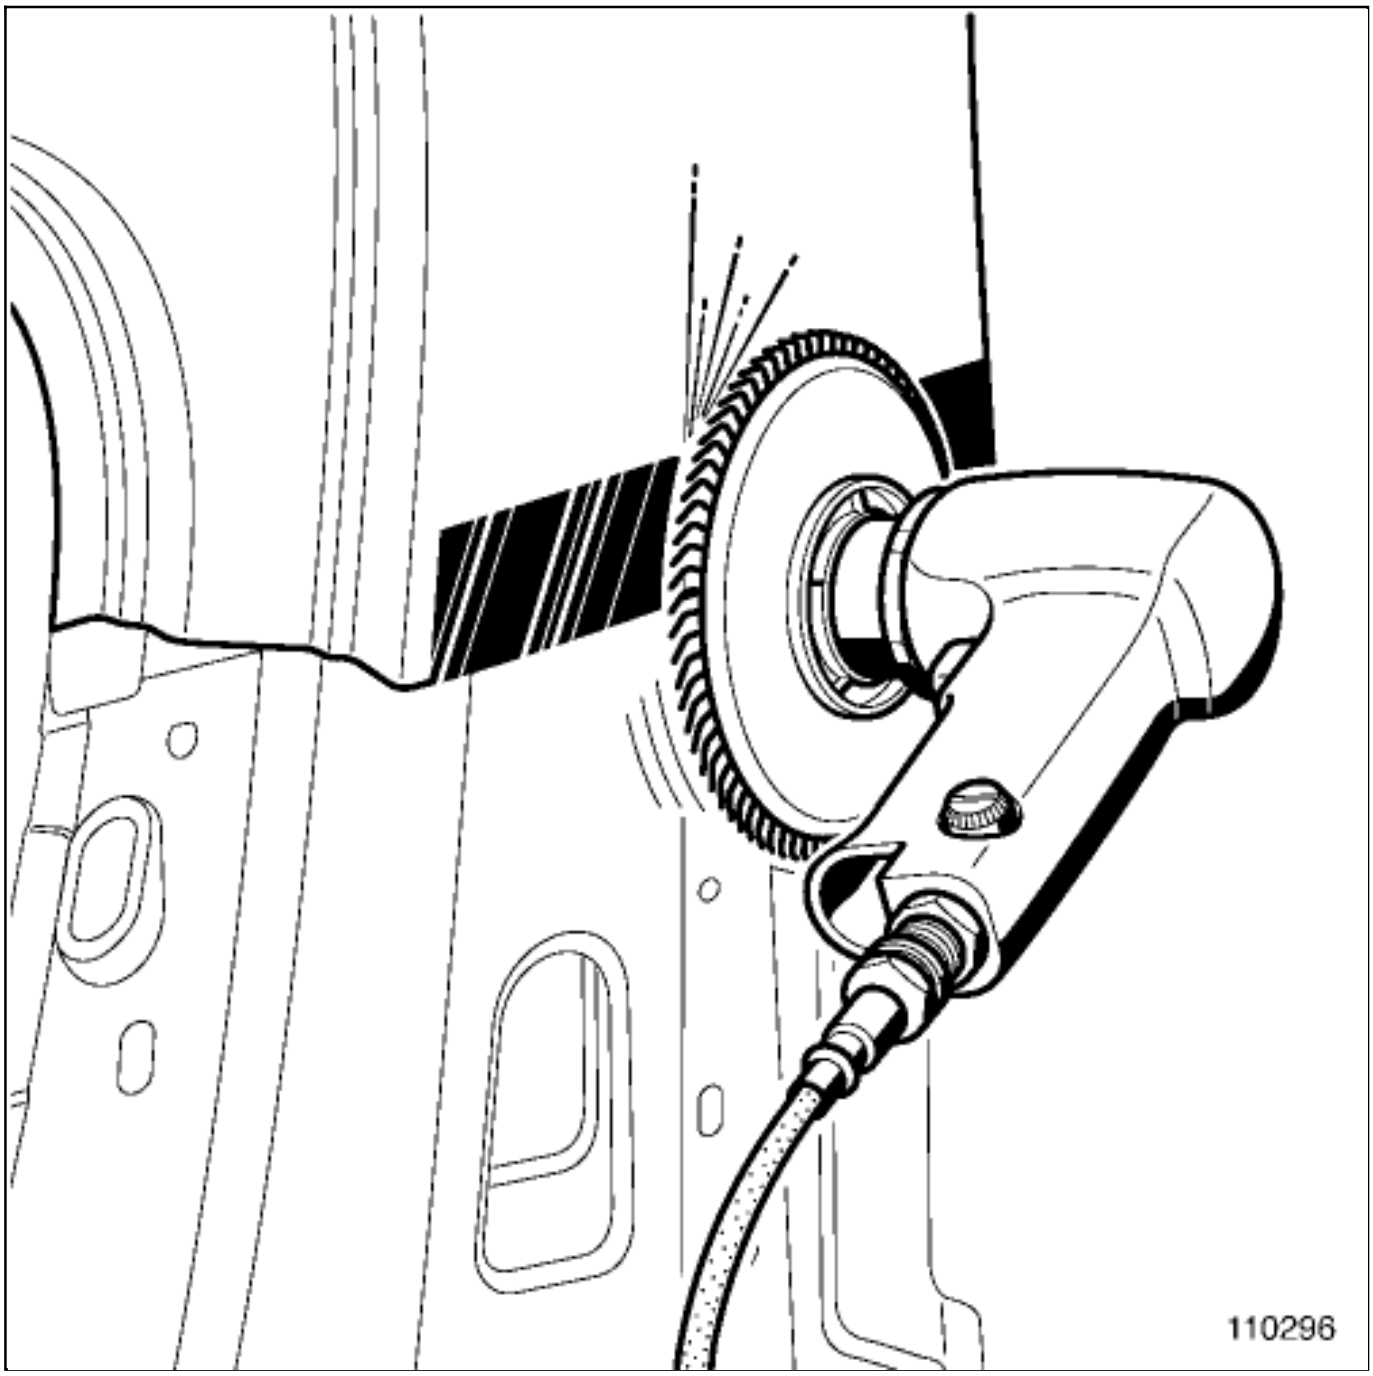
Mark the areas to be scoured in accordance with each type of joint.

Cut the two components simultaneously approximately 40 mmfrom the cut previously made.

(see 05B, Equipment and Tools, Tools for cutting a structural component: Use)

Remove the part and unpick the remaining metal strip(1) on the vehicle.

(see 05B, Equipment and Tools, Tools for unpicking a structural component: Use)



Recover the cut off(2) from the replacement part.

From the cut off section of the replacement part, take a strip of metal approximately 40 mmwide, adapted to the length of the step drilling area.

Scour both faces of the strip.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

5- PREPARATION OF THE JOINTS ON THE VEHICLE

Scour the internal and external mating faces of the cut at the patch location.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

(see 05B, Equipment and Tools, Tools for stripping very thick soft mastic: Use)

6- APPLY THE PROTECTION BEFORE ASSEMBLY

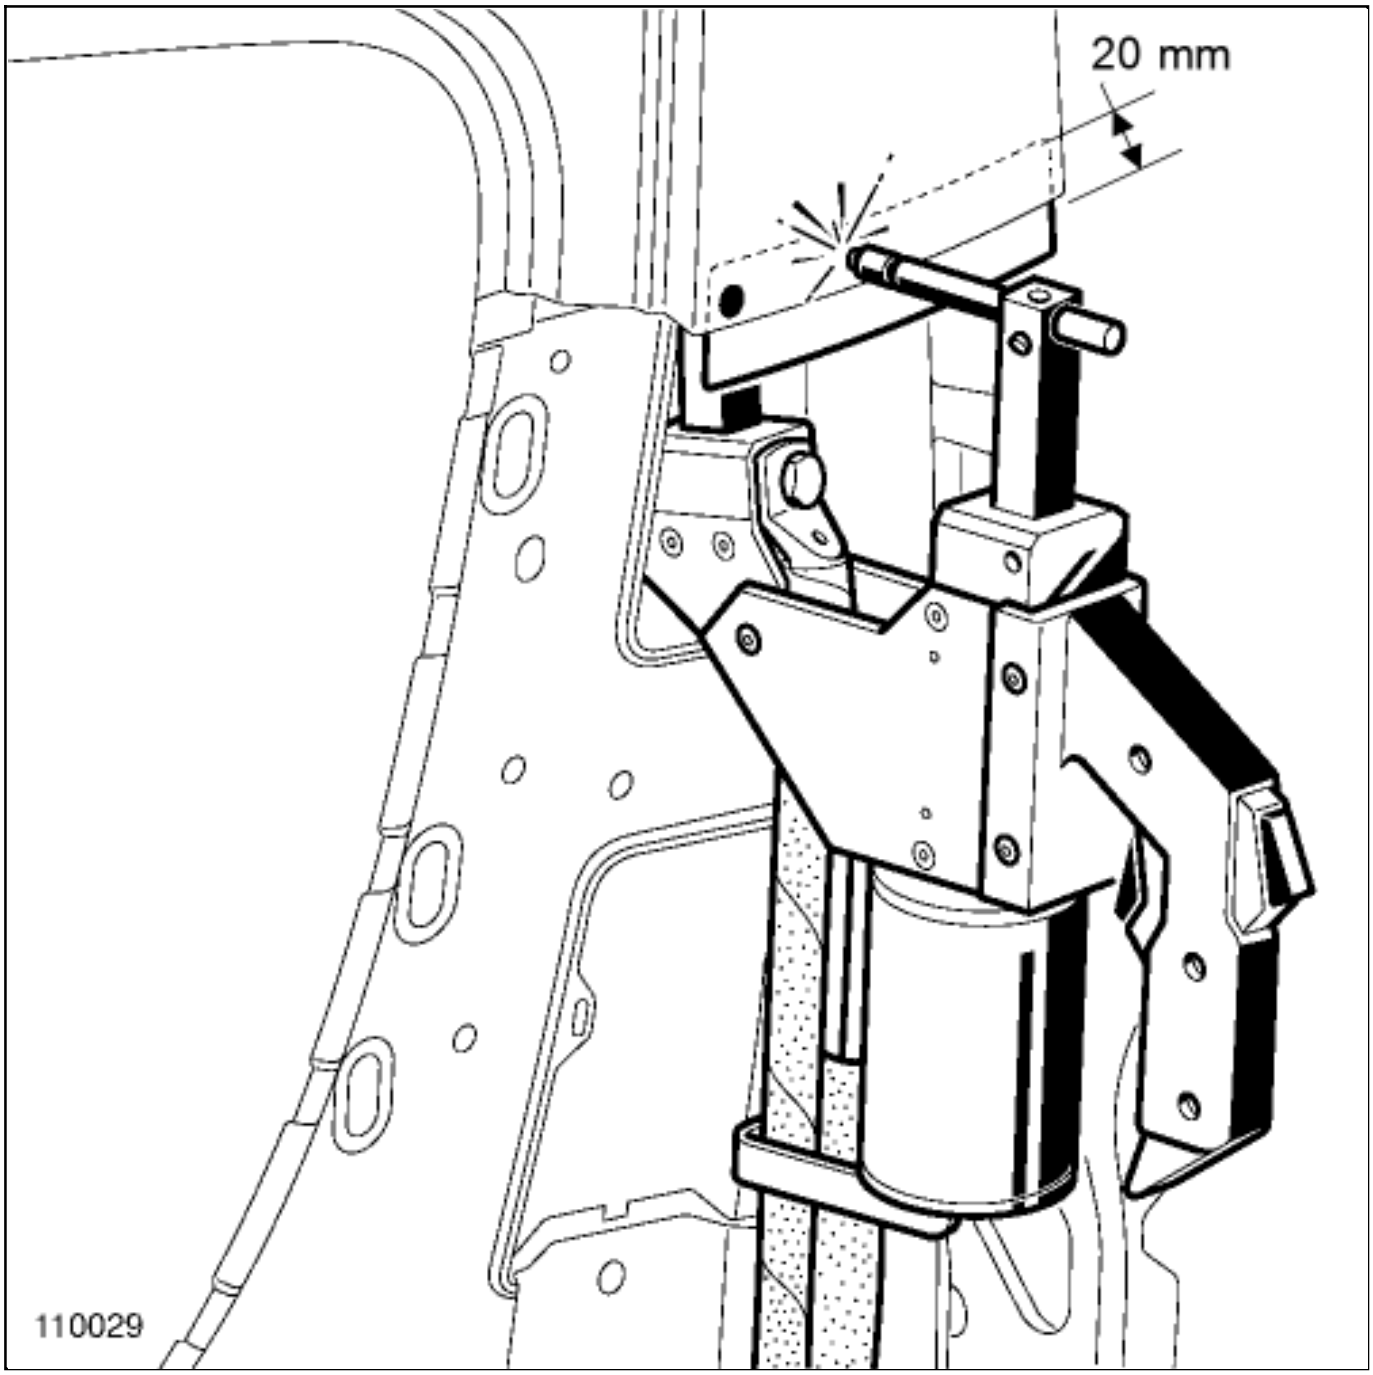
Position the acoustic inserts in the hollow sections, if necessary.

(see 04F, Bodywork products and mountings, Soundproofing products before assembly: Use)

(see 40J, Protective devices , Structural acoustic protection: Description)

Apply the anti-corrosion protection to the internal mating faces according to the type of weld.

(see 04F, Bodywork products and mountings, Anti-corrosion protection product before assembly: Use)



(see 40J, Protective devices , Anti-corrosion protection of joints before welding: Description)

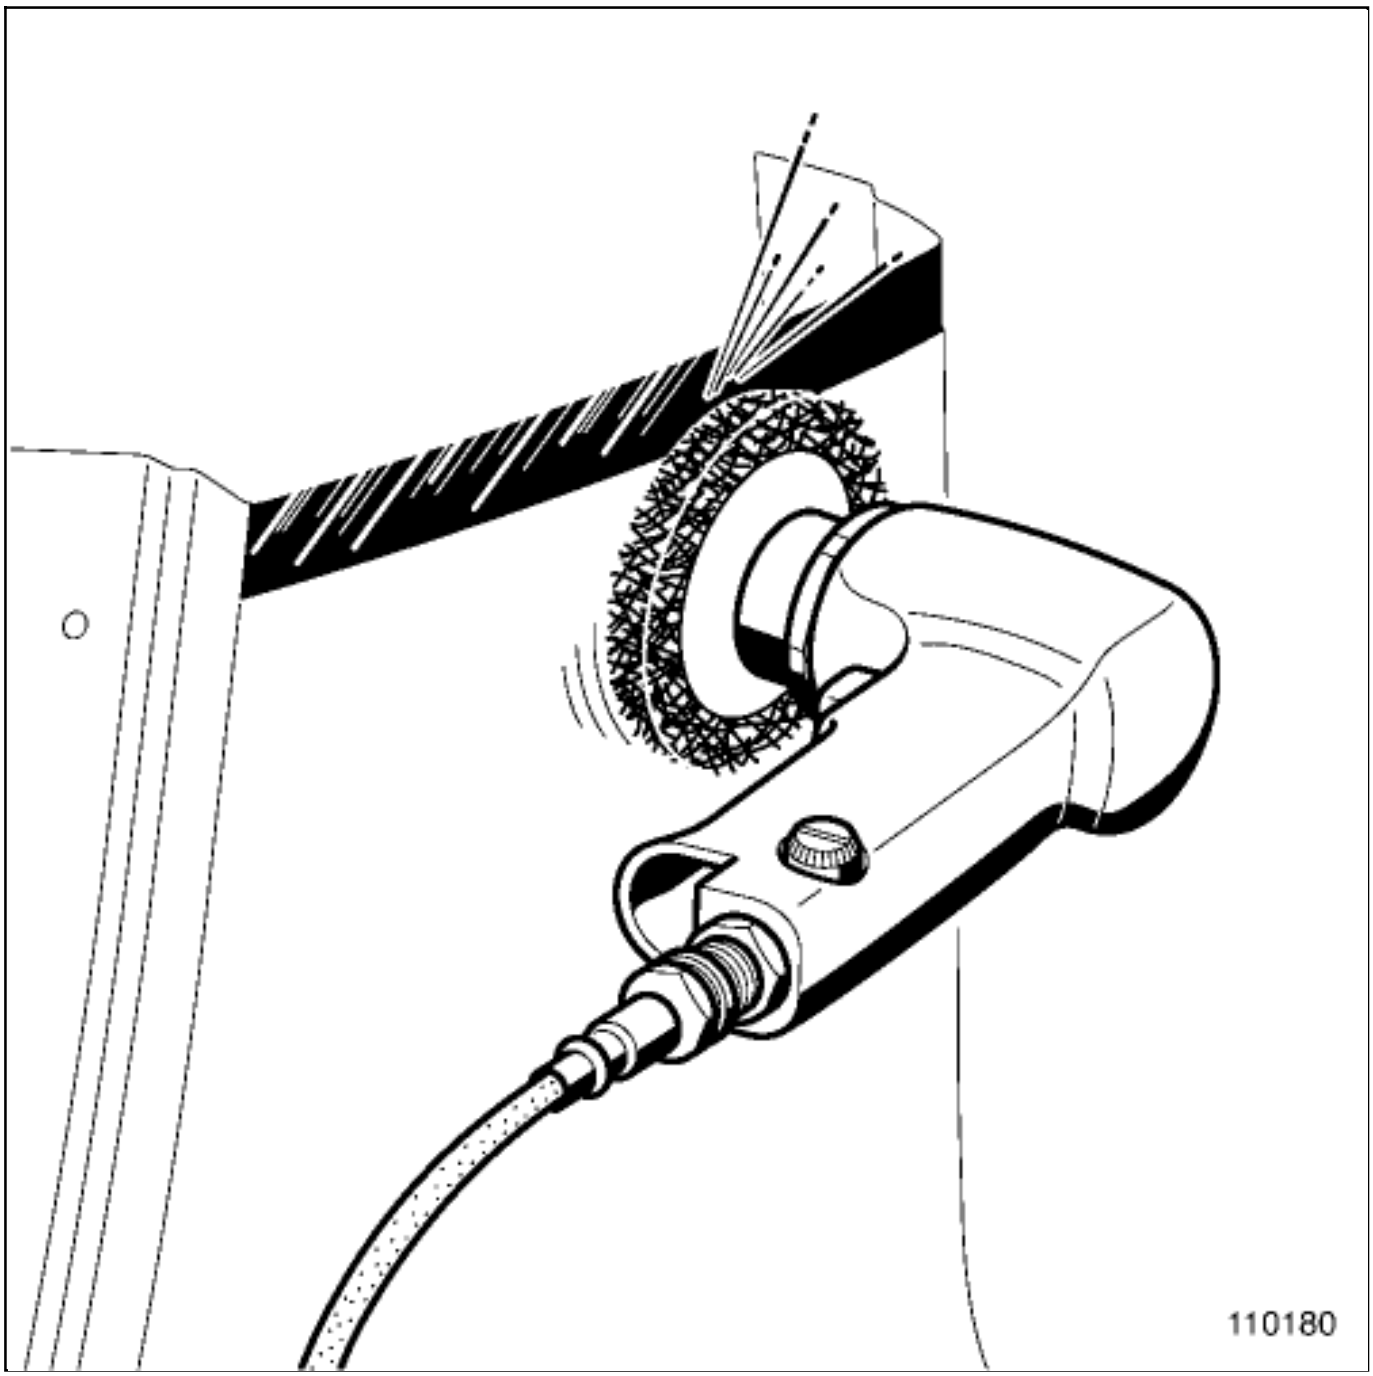
7- ADJUSTING THE WELDERS.

Before making the joints on the vehicle, carry out the tests required for adjusting the welders.

(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection: Precautions for the repair)

8- WELDING THE PATCH

Weld the patch with resistance spot welds, respecting the spacing indicated in the vehicle's MR.

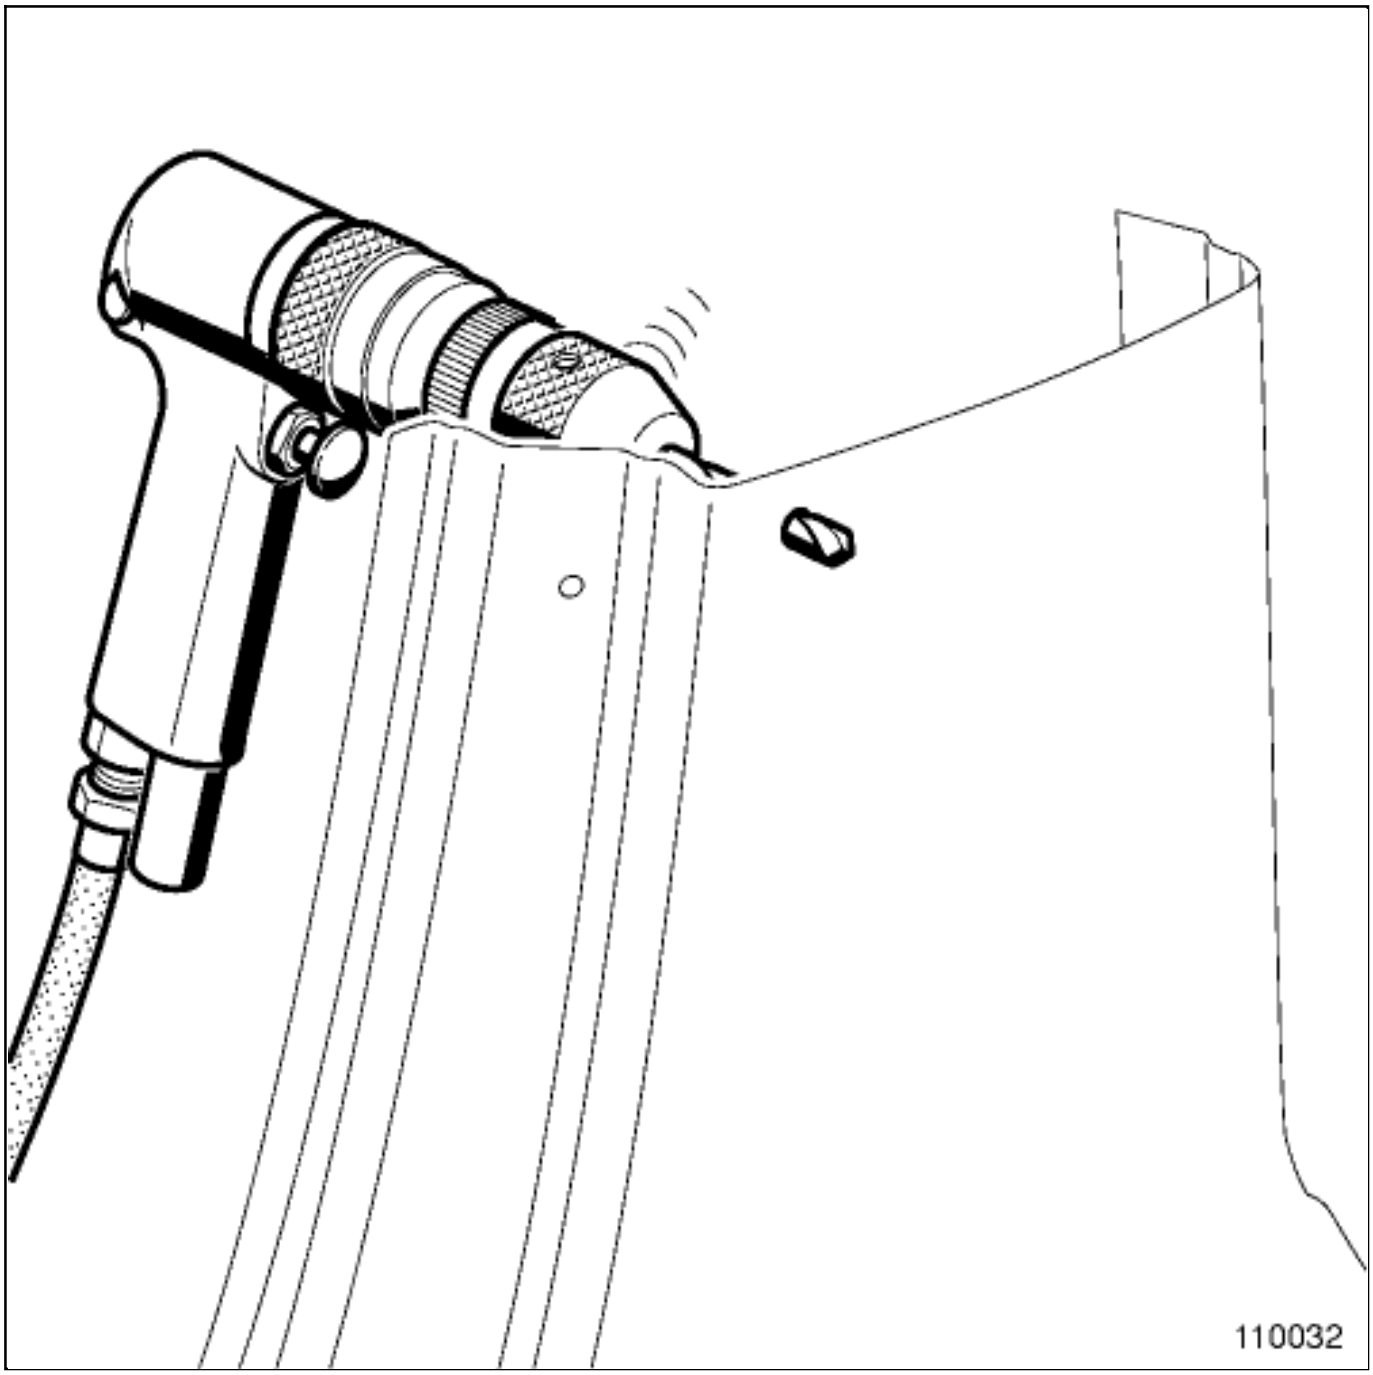


(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection with direct access: Description)

9- FITTING AND ADJUSTING THE REPLACED PARTS

Position the patch, adjust it and fix it using locking pliers; the two panels overlap by approximately 20 mm .

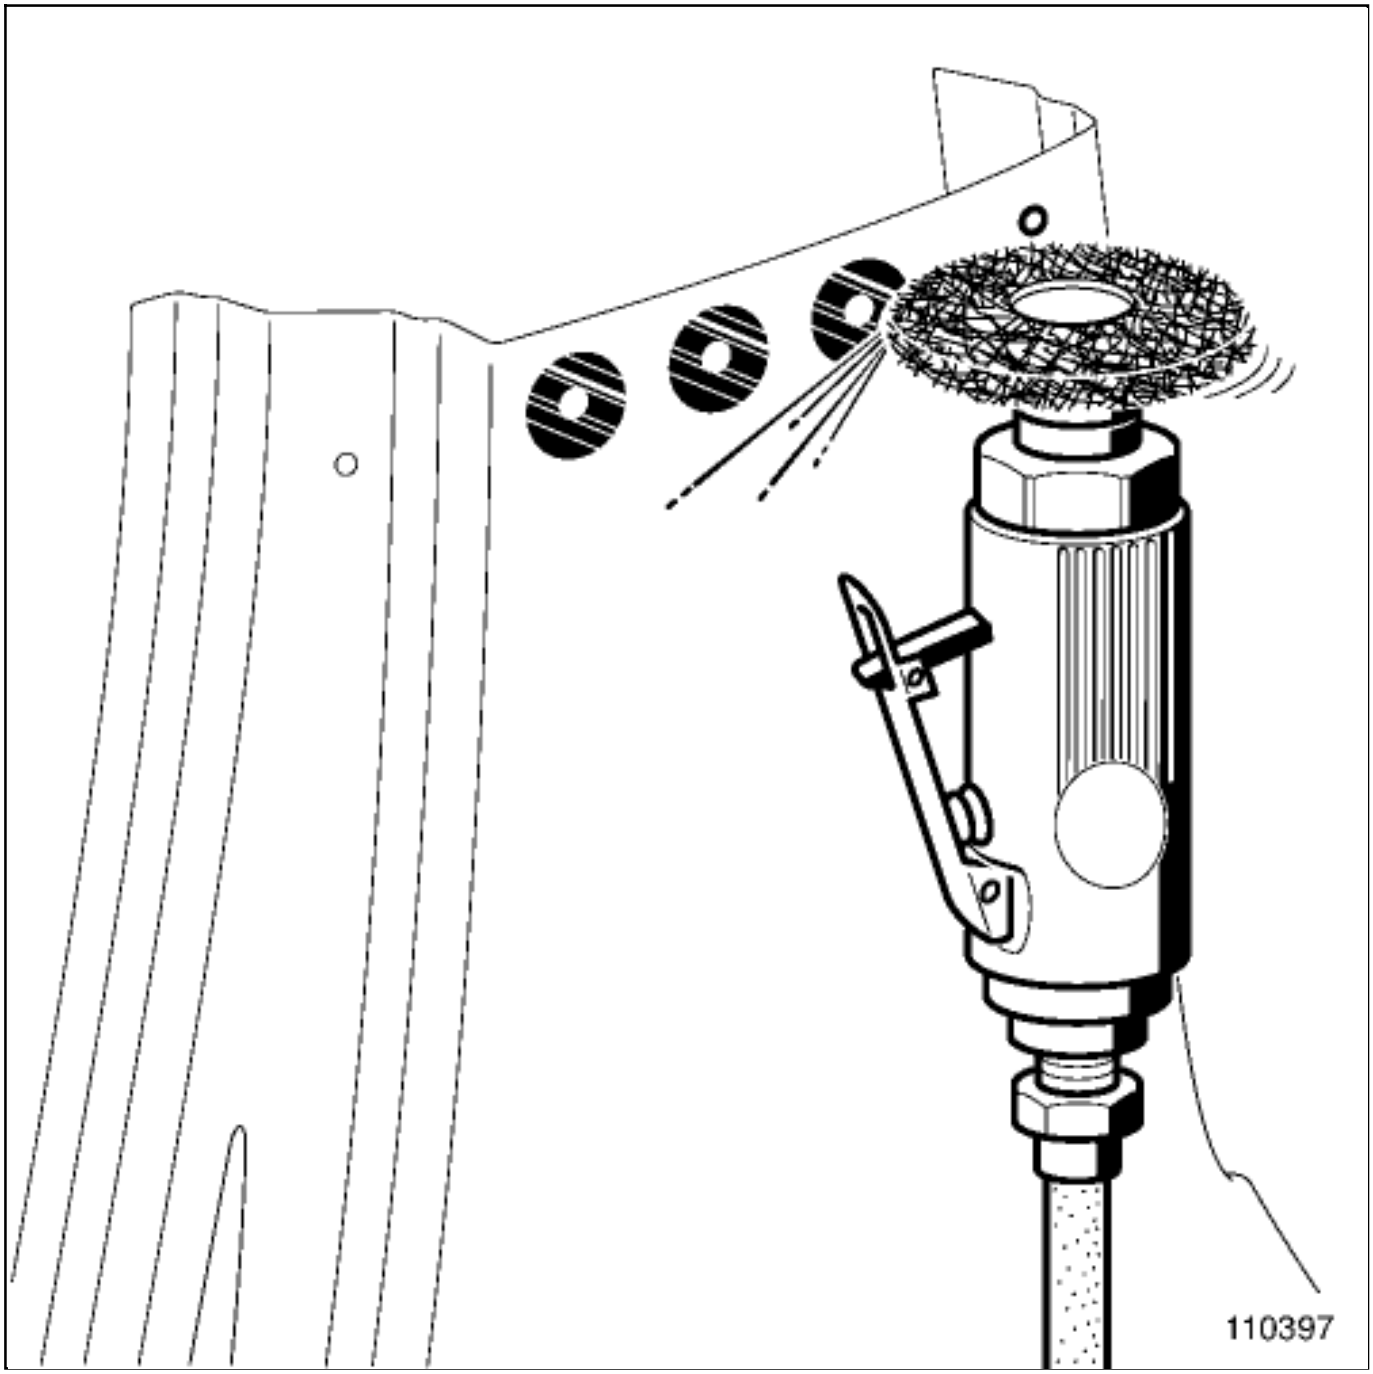
(see 05B, Equipment and Tools, Tools for adjusting and supporting a structural component: Use)



10- PREPARING THE JOINT FACES OF THE REPLACEMENT PART WITH TWO FACE ACCESS

Scour the internal and external mating faces of the cut at the patch location.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

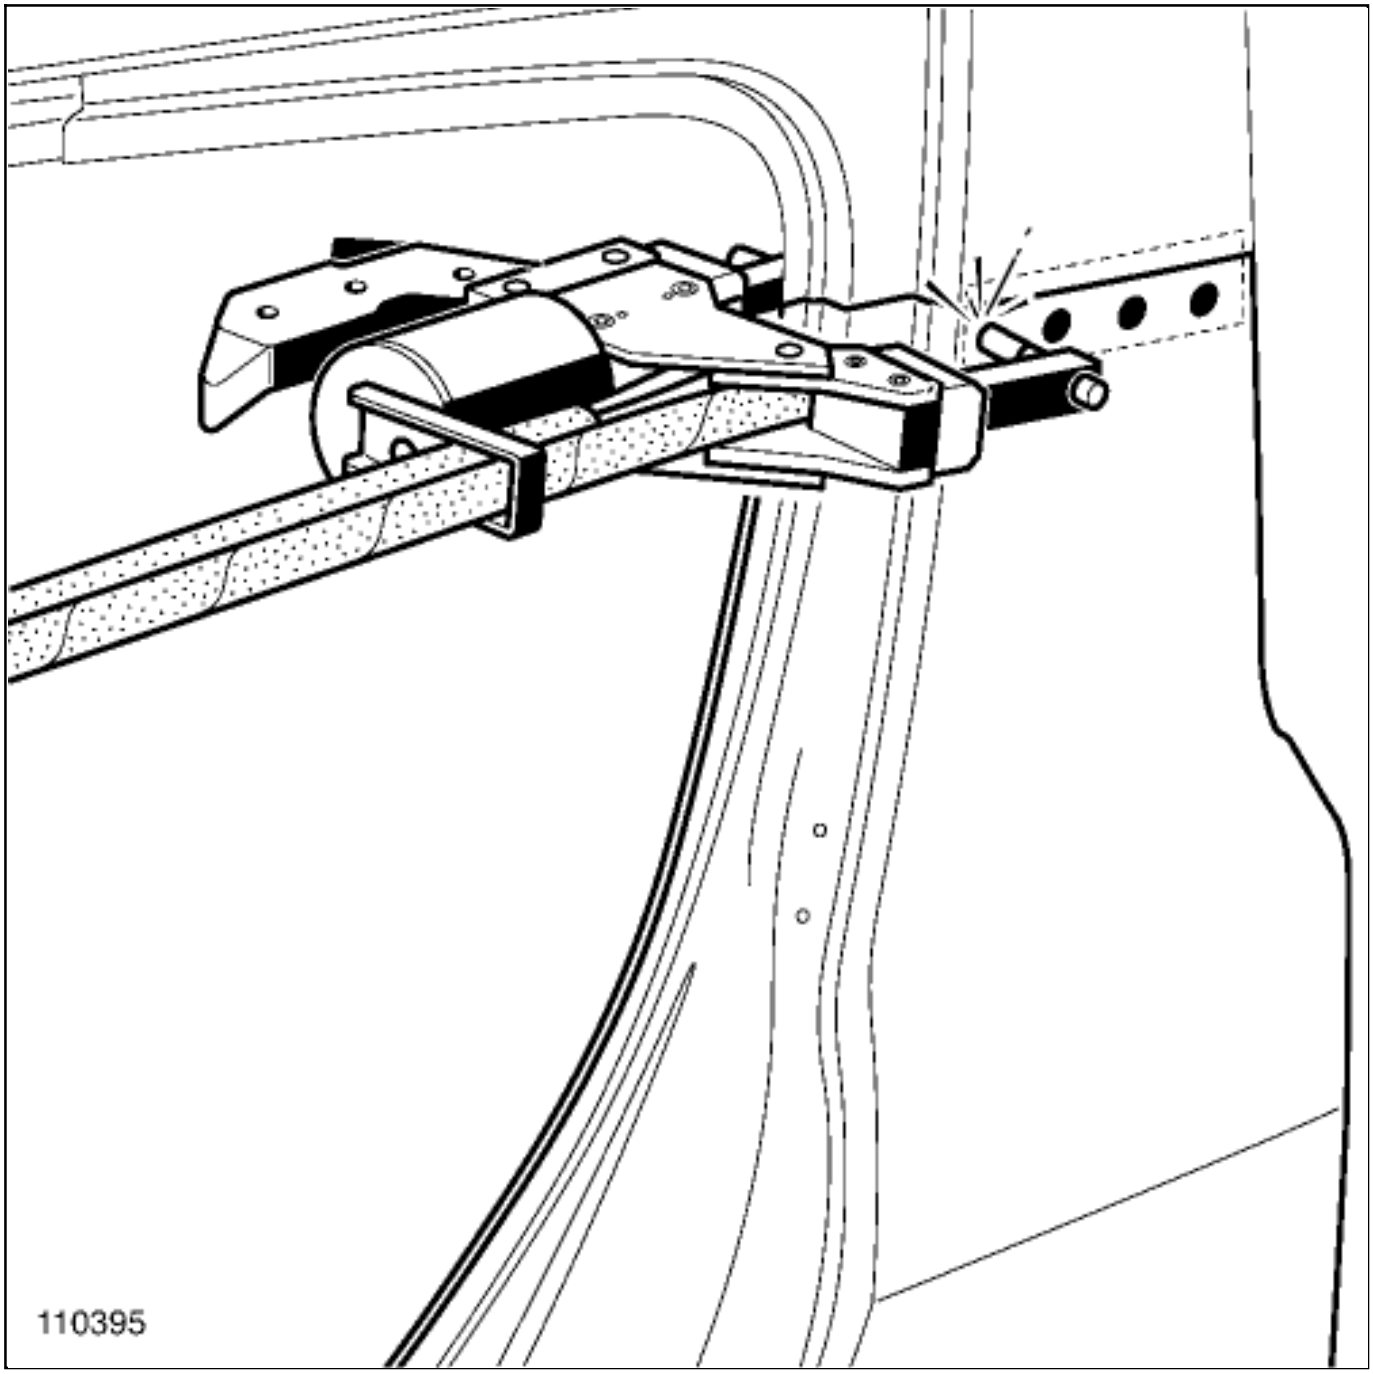


11- PREPARING THE JOINT FACES OF THE REPLACEMENT PART WITH SINGLE FACE ACCESS

Drill or pierce the replacement part from the inside at the location of the patch, respecting the spacing indicated in the vehicle's MR.

See following table:

Panel thickness (mm)	Drill bit diameter (mm)
0.6 to 1	6
1 to 1.5	7
1.5 to 2	8
2 and more	10

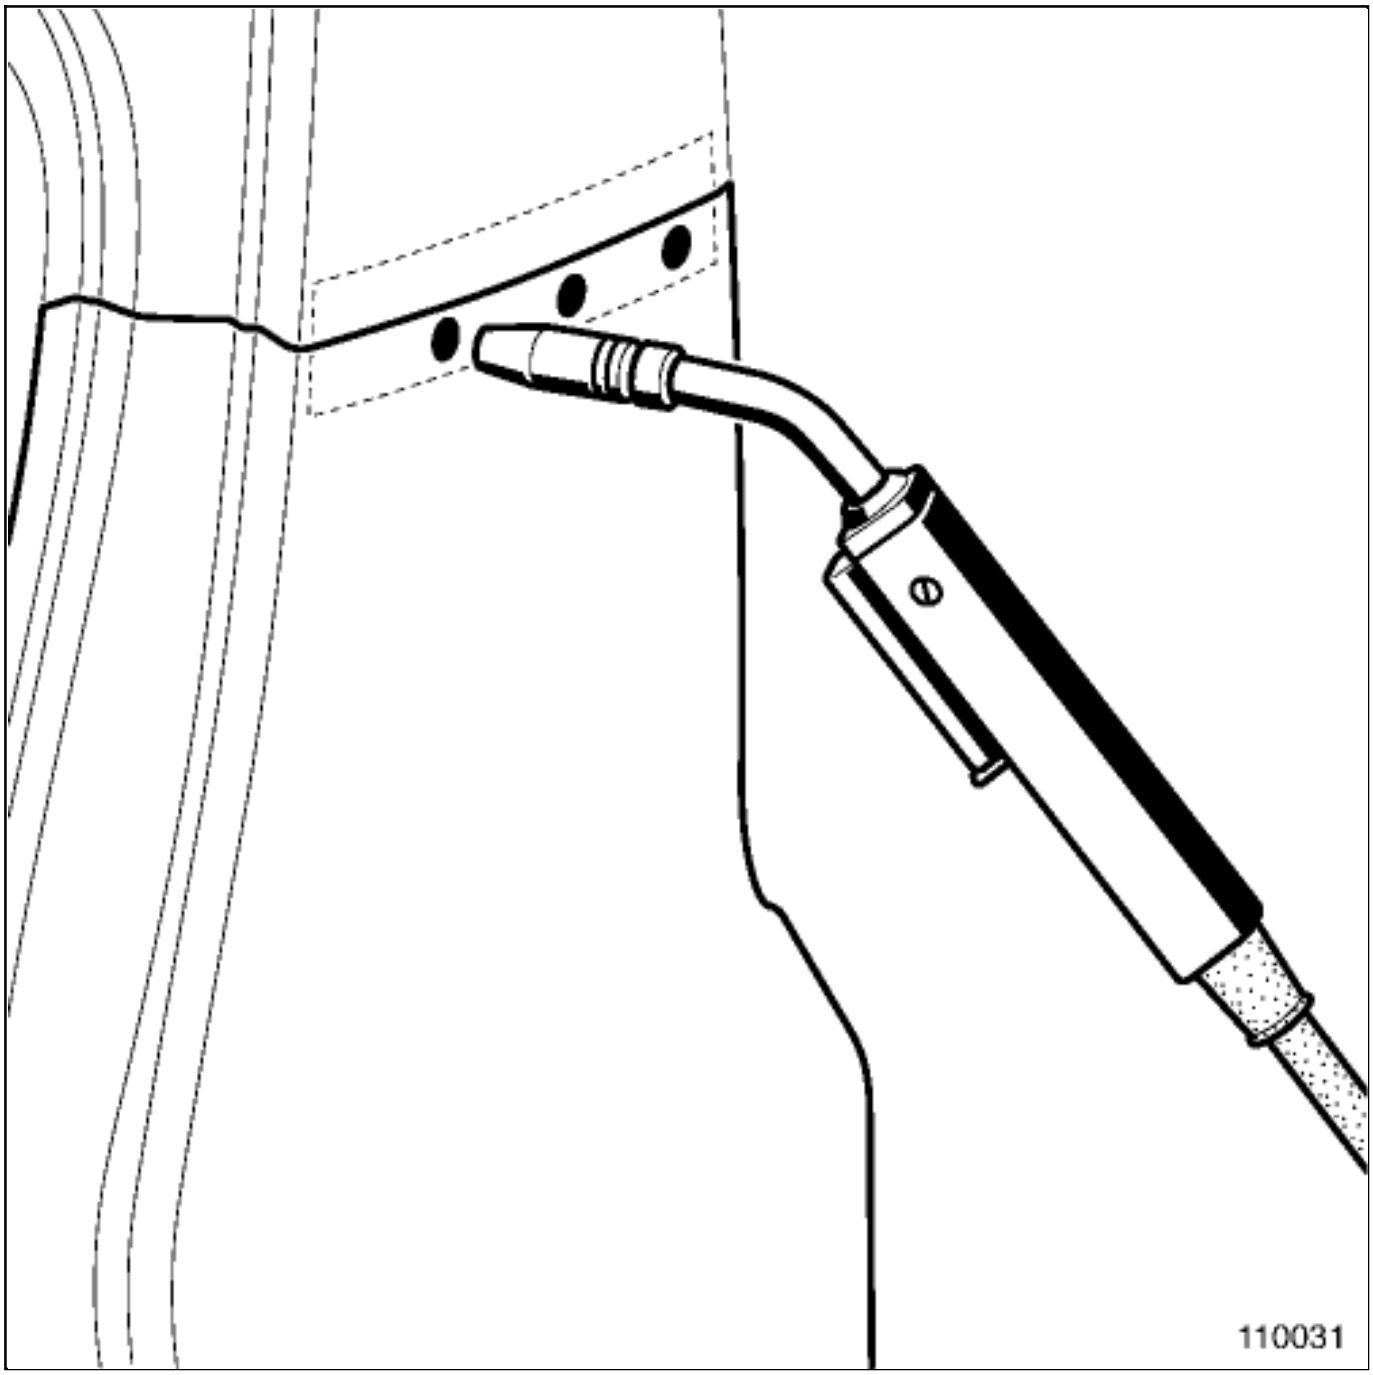


Scour the external mating face along the cut and the edges of the holes.

(see 05B, Equipment and Tools, Tools for scraping rigid adhesives and paint: Use)

Prepare the rest of the replacement part according to the different connections.

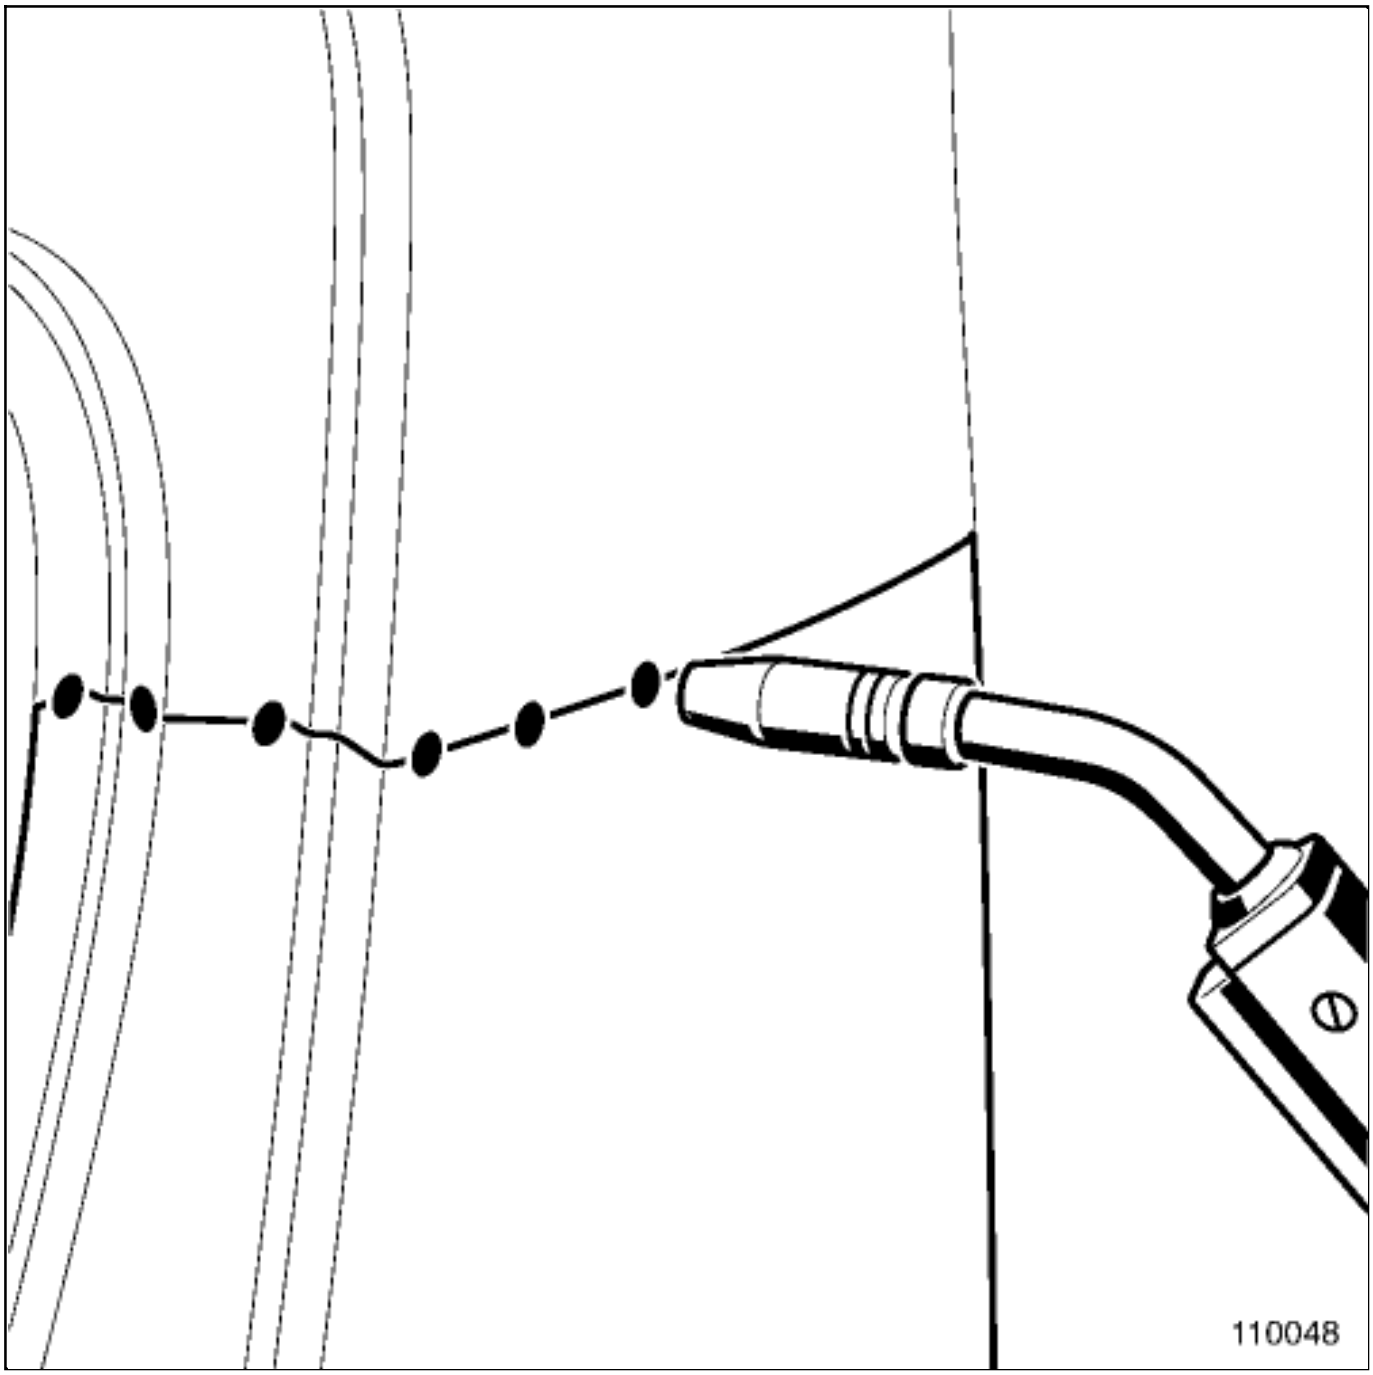
3. ASSEMBLIES



1- WELDING AND ASSEMBLING THE NEW PART WITH TWO FACE ACCESS

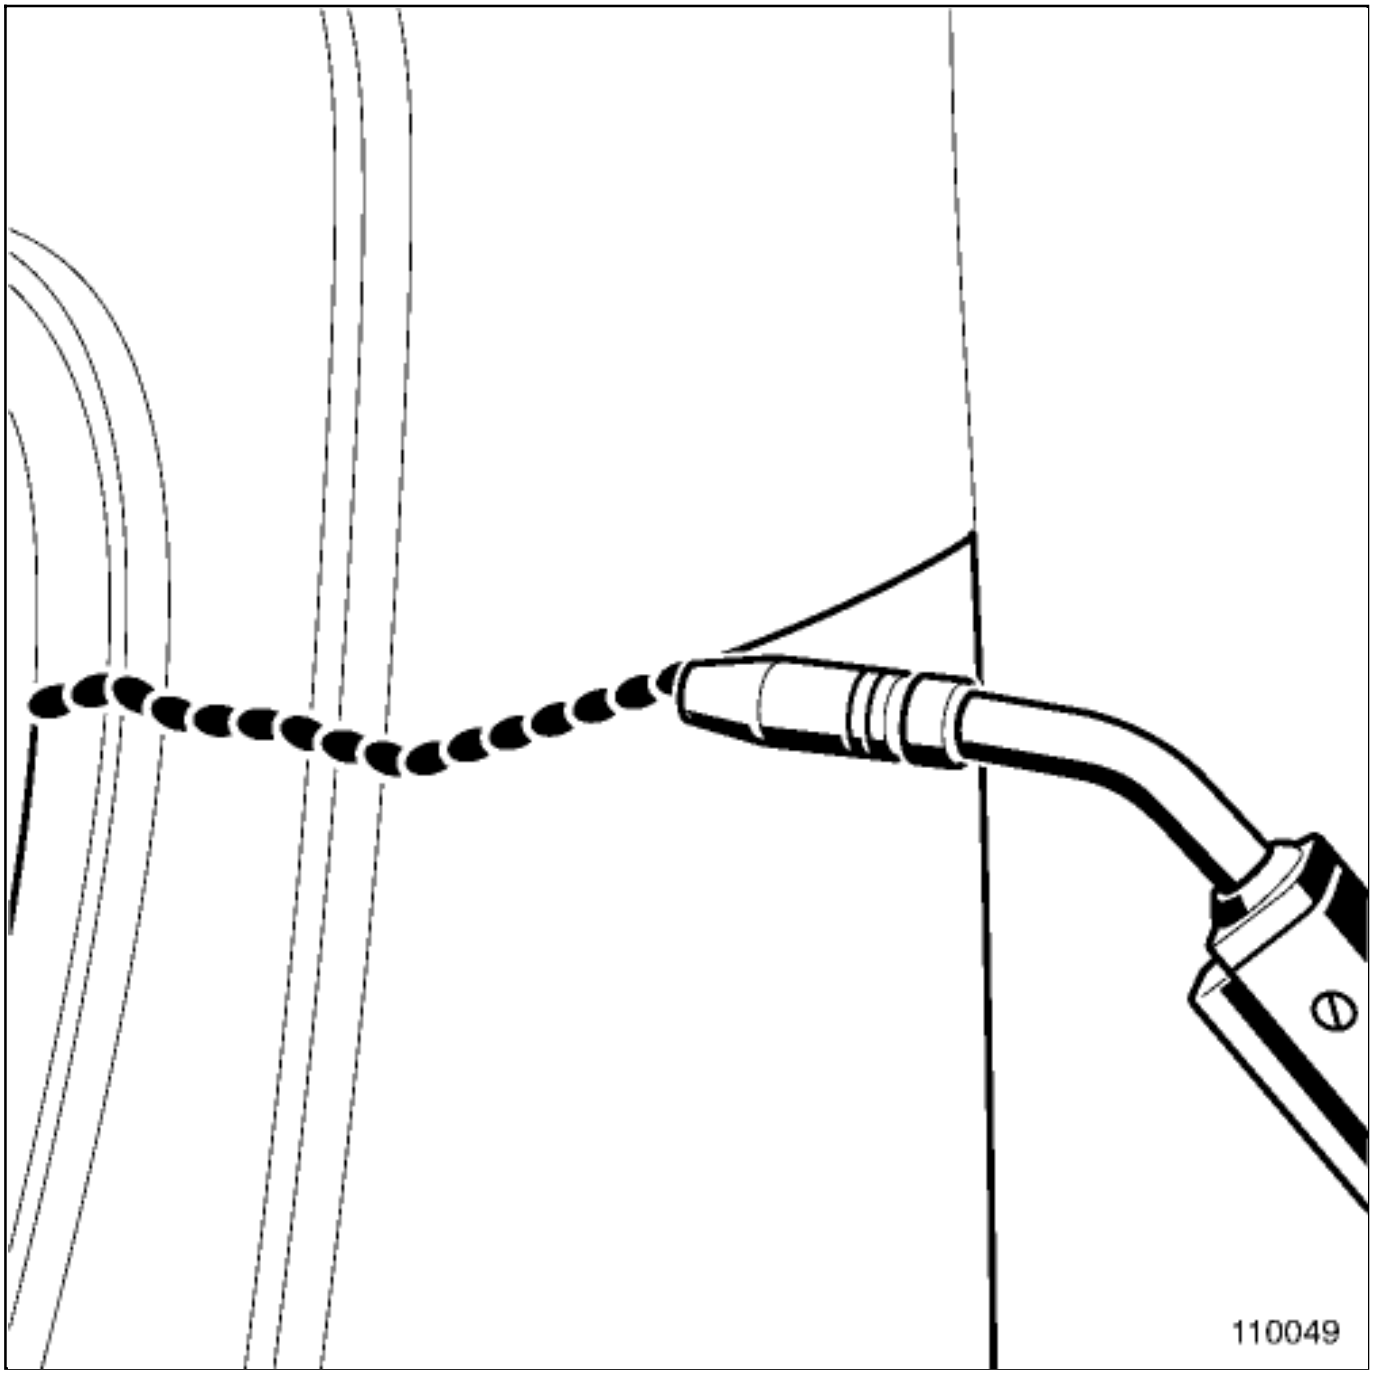
Weld the replacement part with resistance spot welds, respecting the spacing indicated in the vehicle's MR.

(see 40B, Electrical resistance welded connections, Electrical resistance spot welding connection with direct access: Description)



2- CARRYING OUT WELDING, ASSEMBLY WITH ONE FACE ACCESS

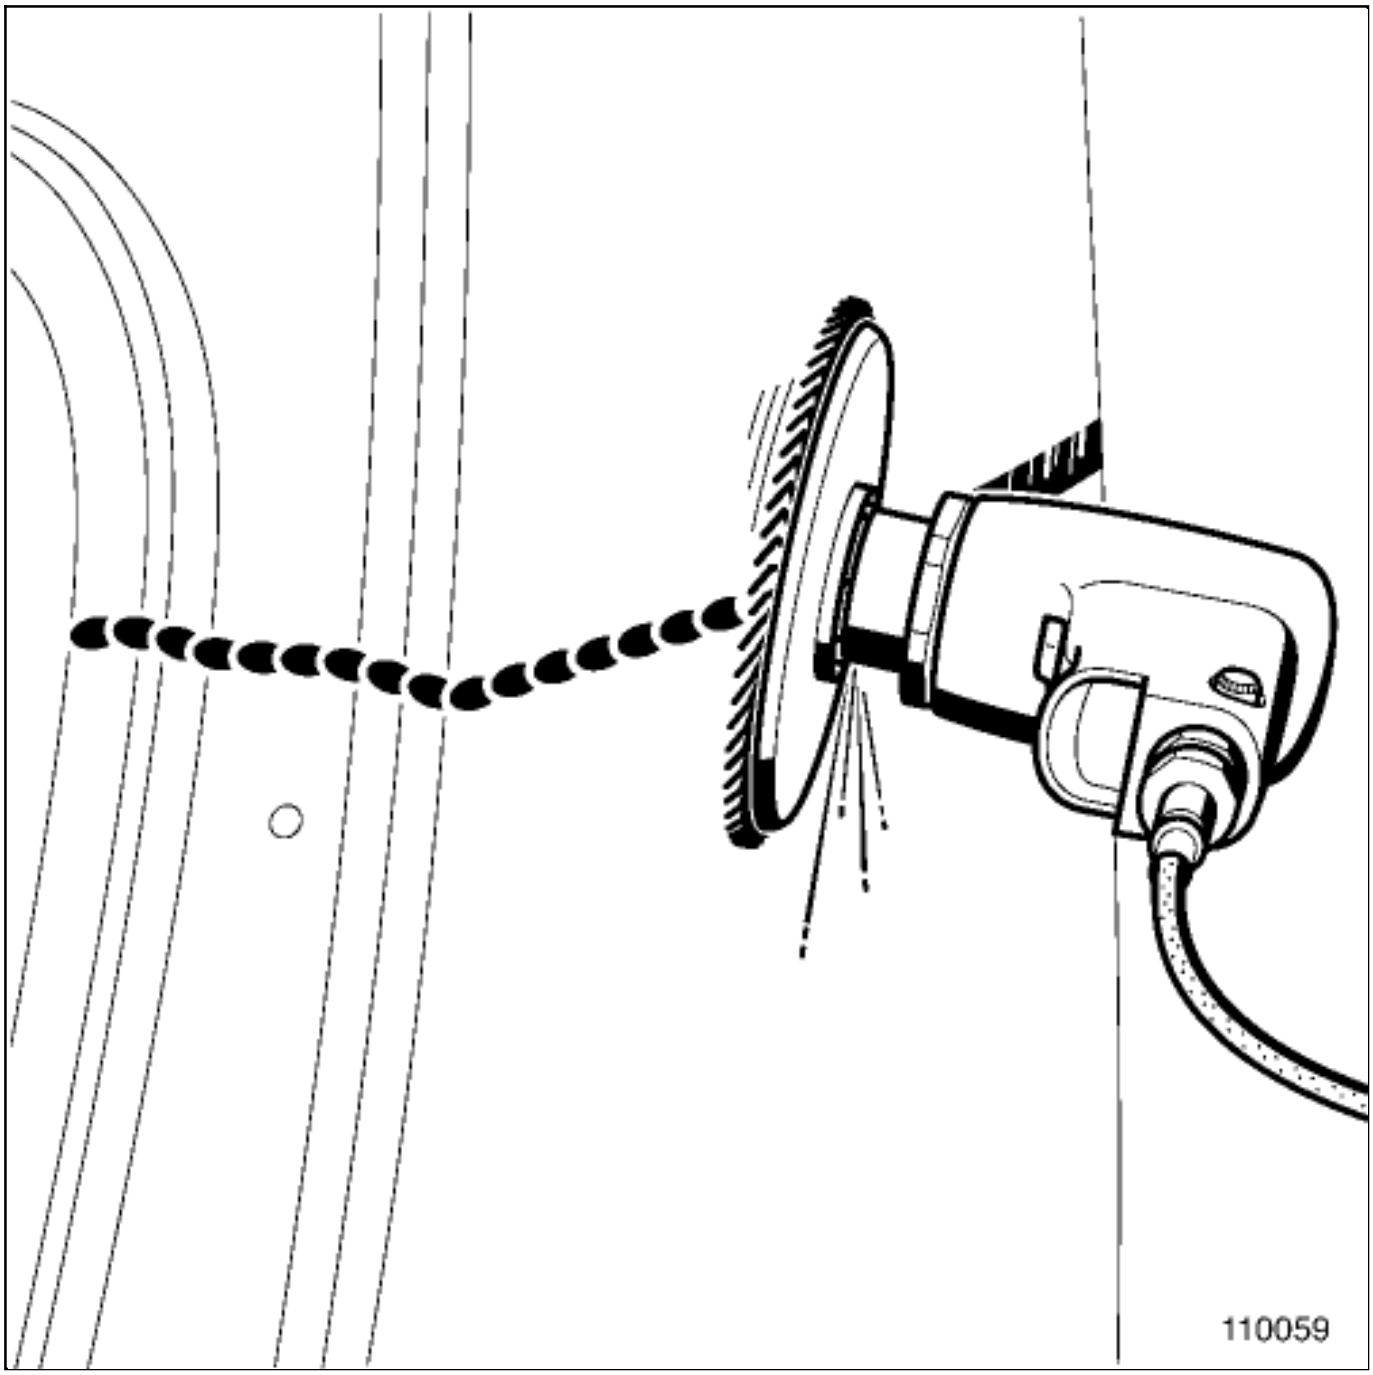
Weld the replacement part with GMAW plug welds



(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

3- SPECIAL FEATURES OF REINFORCING AN ASSEMBLY BY PATCH DRILLING

Make the anchoring points on the partial cut lines.

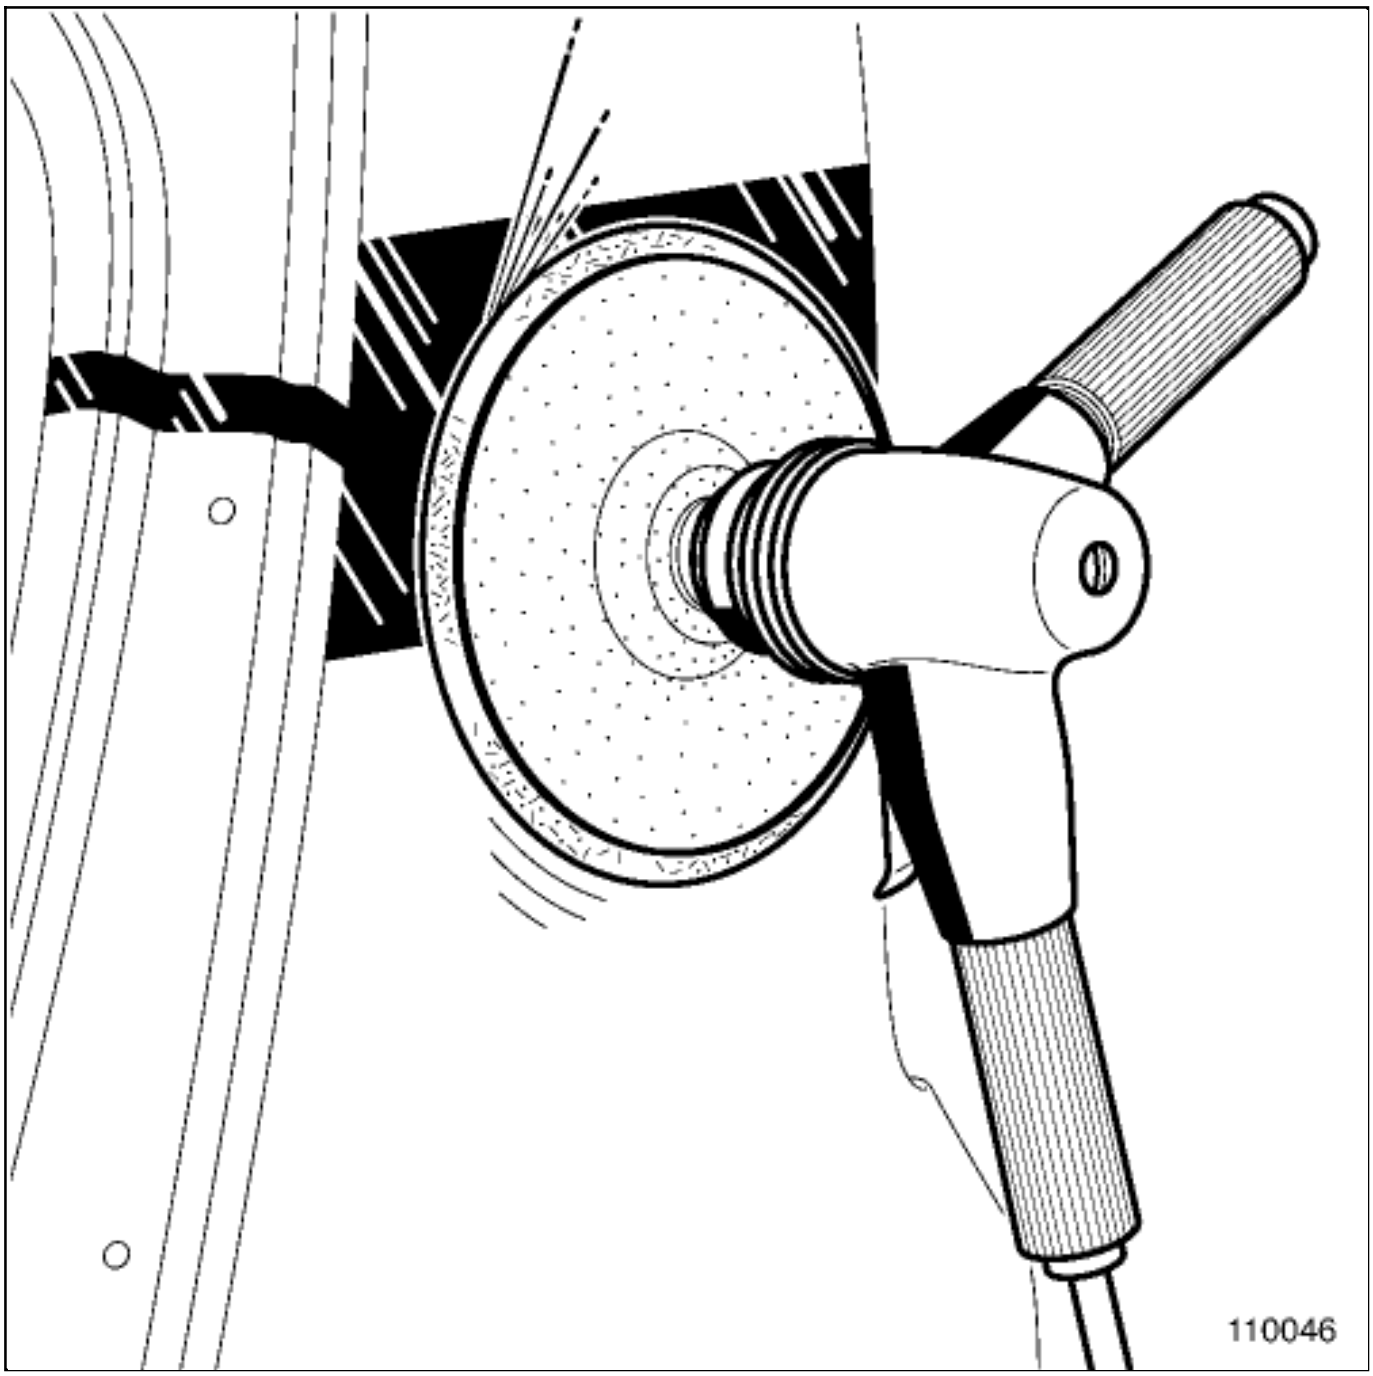


(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

Carry out the continuous weld along the whole cut.

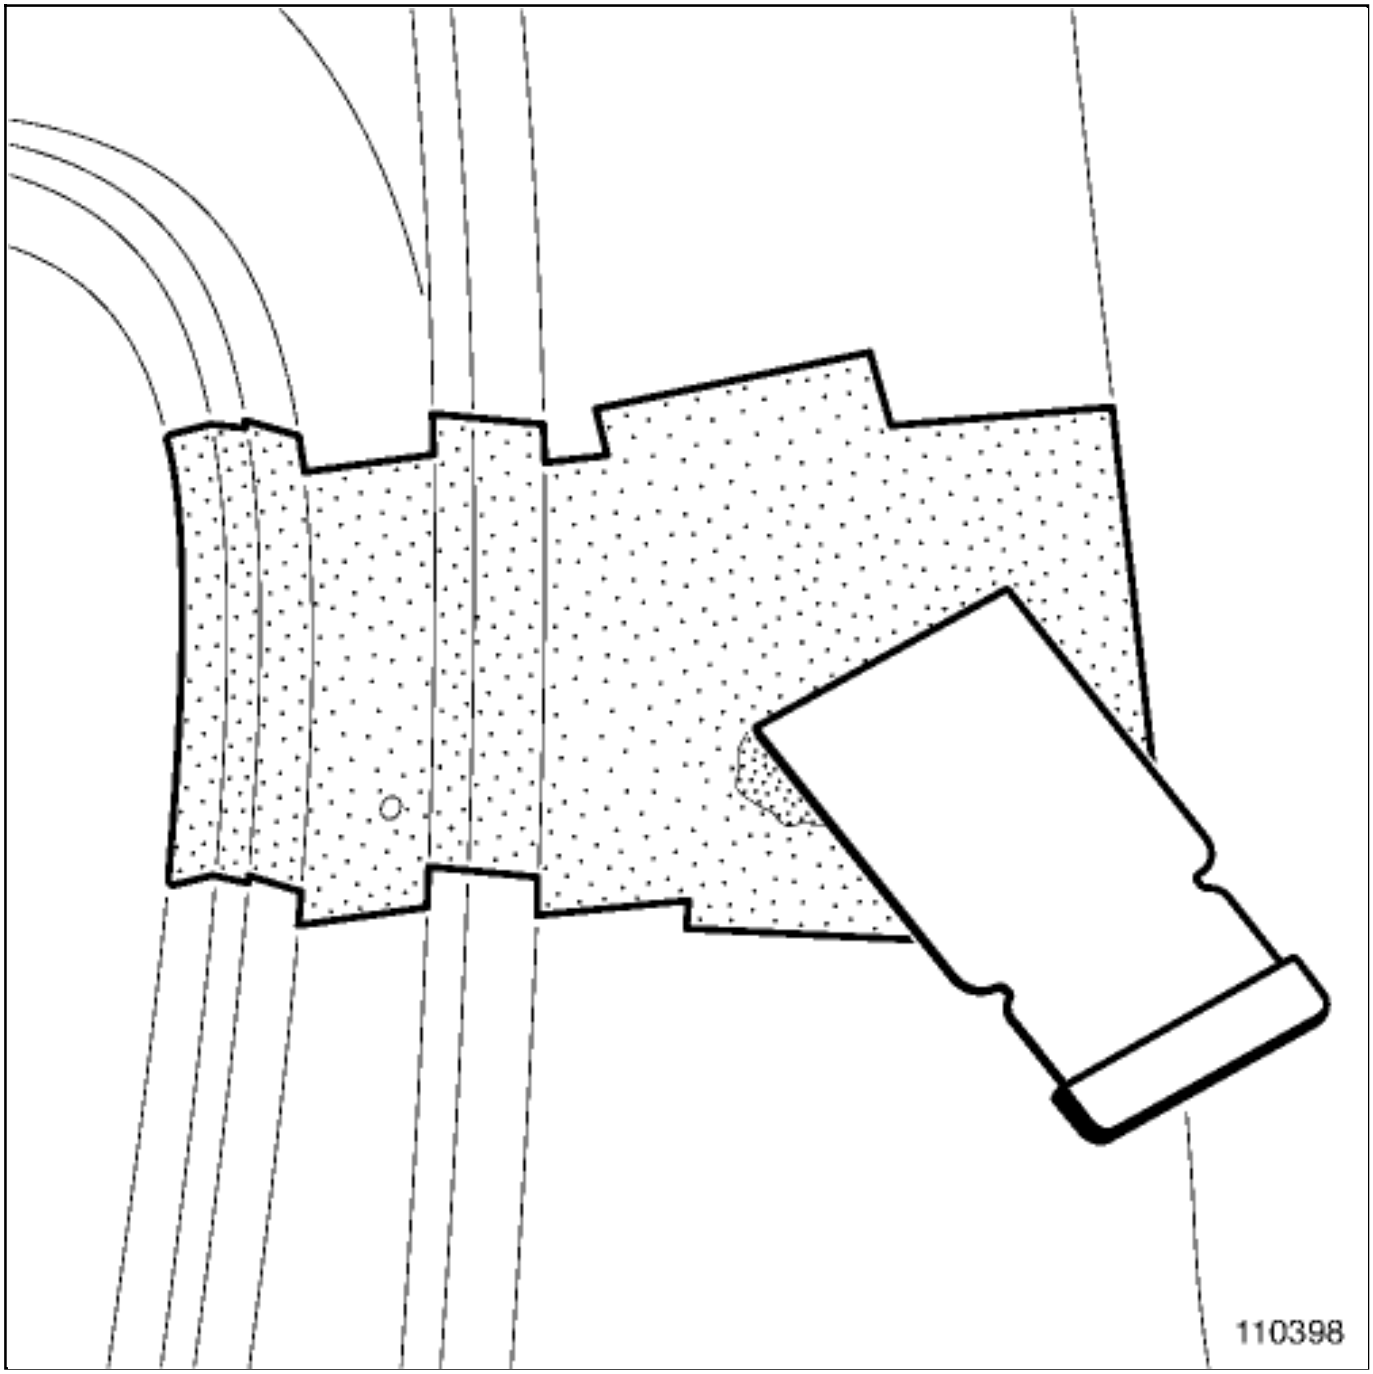
(see 40C, Gas metal arc welded connections, Connections by arc welding under shielding gas: Description)

4- GRINDING THE WELDS



Grind the continuous weld.

(see 05B, Equipment and Tools, Tool for levelling off weld residue: Use)



Note:

Do not strike or damage the panel.

Surface the assembly area.

(see 05B, Equipment and Tools, Tool for surfacing mating faces: Use)

Apply a surface finish to the visible parts.

(see 04F, Bodywork products and mountings, Panelwork finishing products: Use)

(see 05B, Equipment and Tools, Tools for sanding a structural component: Use)

6- FITTING PROTECTION AFTER ASSEMBLY

Apply the anti-corrosion protection after assembly.

(see 04F, Bodywork products and mountings, Anti-corrosion protection products after assembly: Use)

(see 40J, Protective devices , Anti-corrosion protection of joints after welding: Description)

Fit the soundproofing after assembly

(see 04F, Bodywork products and mountings, Soundproofing products after assembly: Use)

(see 40J, Protective devices , Structural acoustic protection: Description)

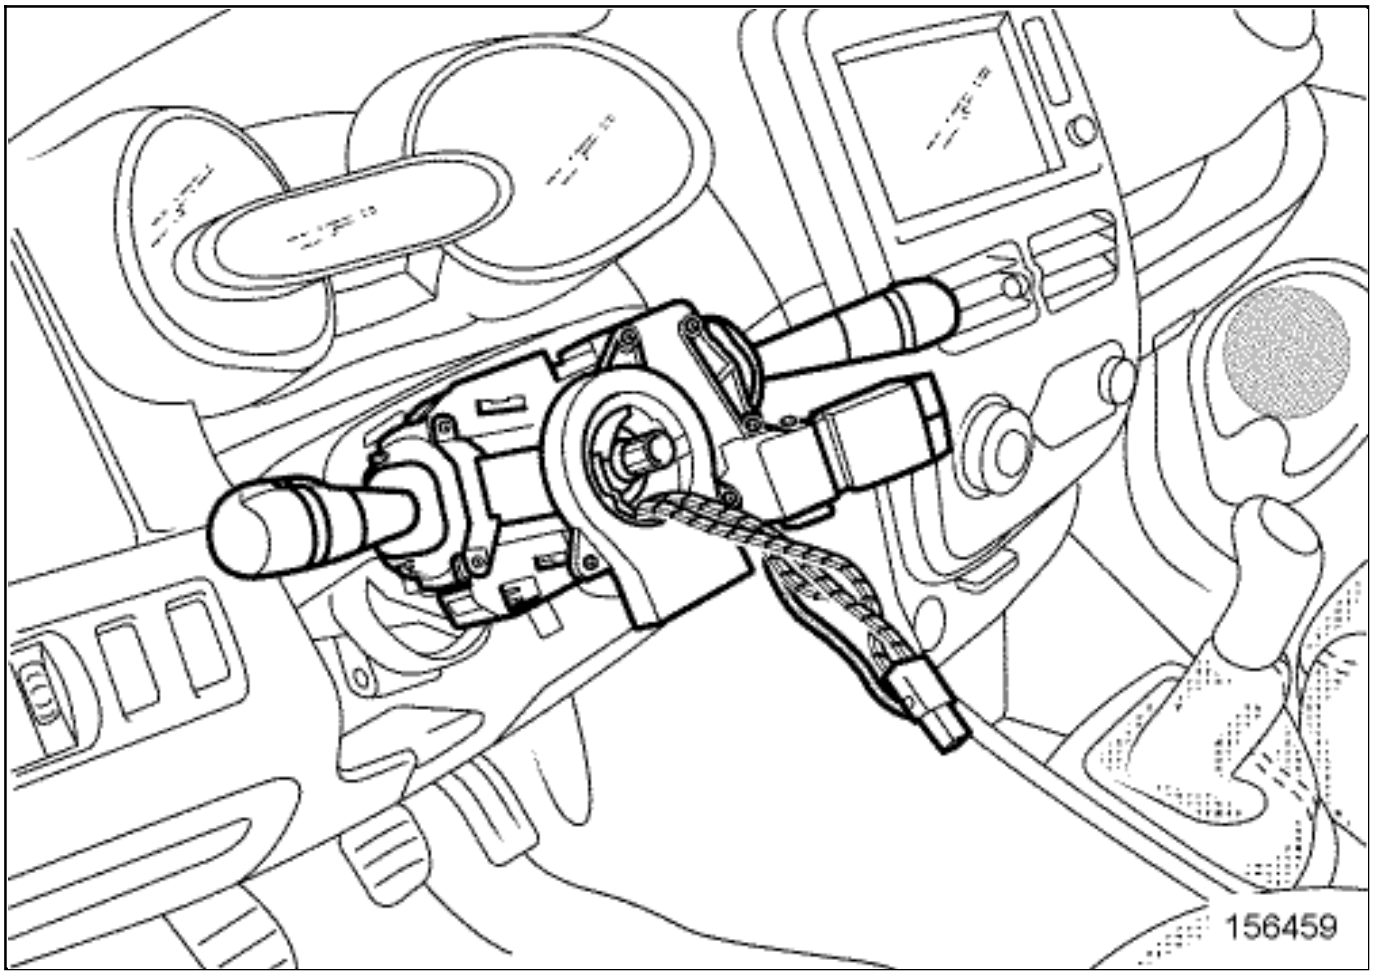
CONTROL - SIGNALS: LIST AND LOCATION OF COMPONENTS

Note, one or more warnings are present in this procedure

Equipment required
Diagnostic tool

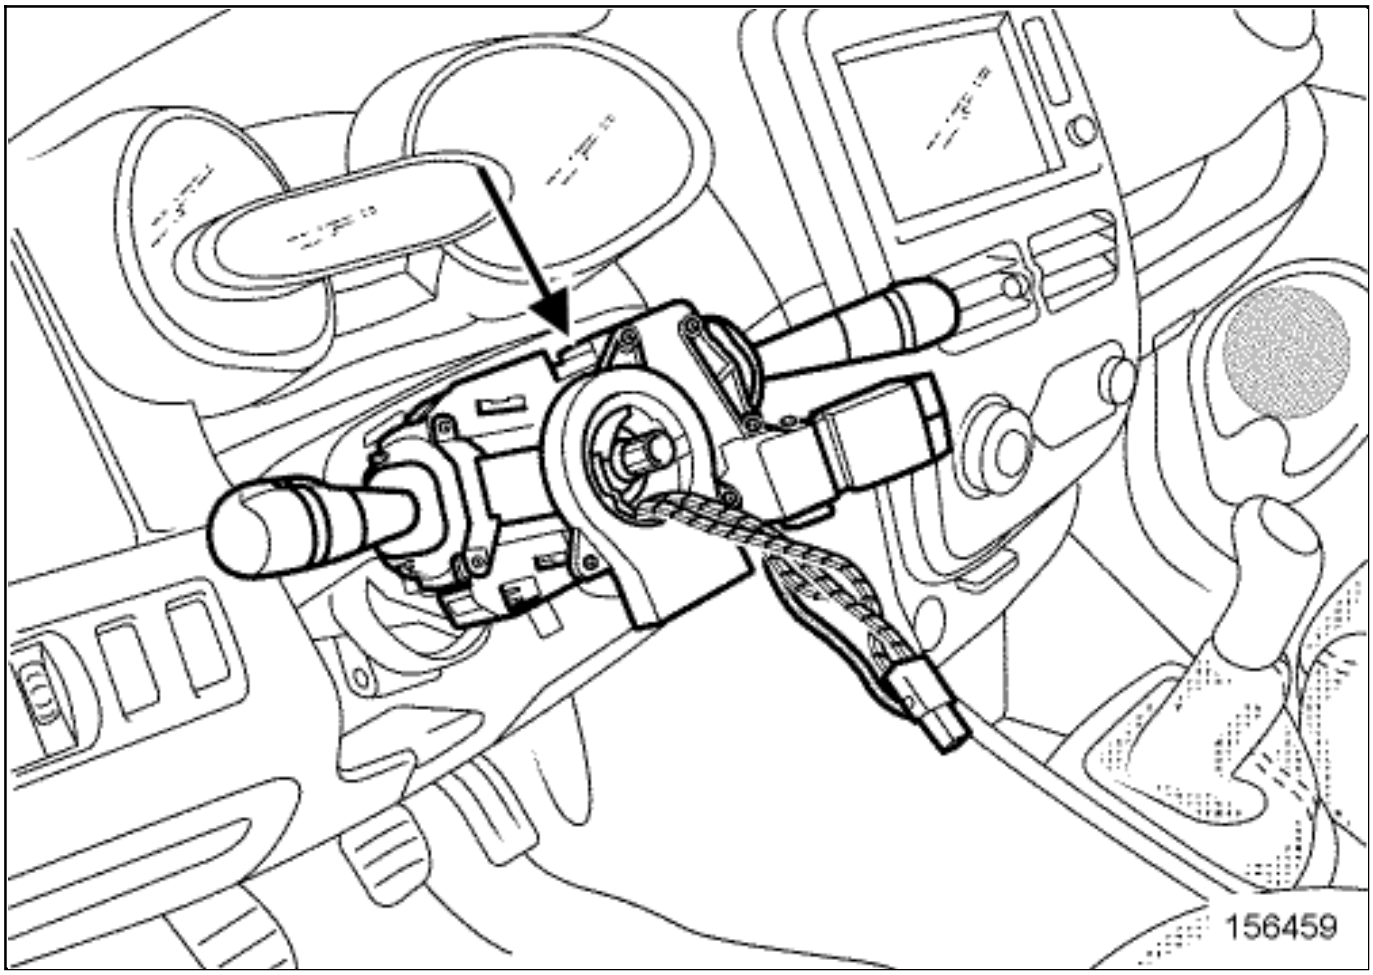
1. LIST OF COMPONENTS

1- THE CONTROL - SIGNALLING ASSEMBLY CONSISTS OF:



- a steering wheel control assembly
- a rotary switch
- a windscreen wiper switch
- a signalling light switch
- a central door locking and hazard warning lights control (see 84A, Control - Signals, Hazard warning lights and central door control: Removal - Refitting)

WITH STOP AND START (STOSTA)



- a "Stop and start" system activation control

2. LOCATION OF COMPONENTS

1- STEERING WHEEL CONTROL ASSEMBLY

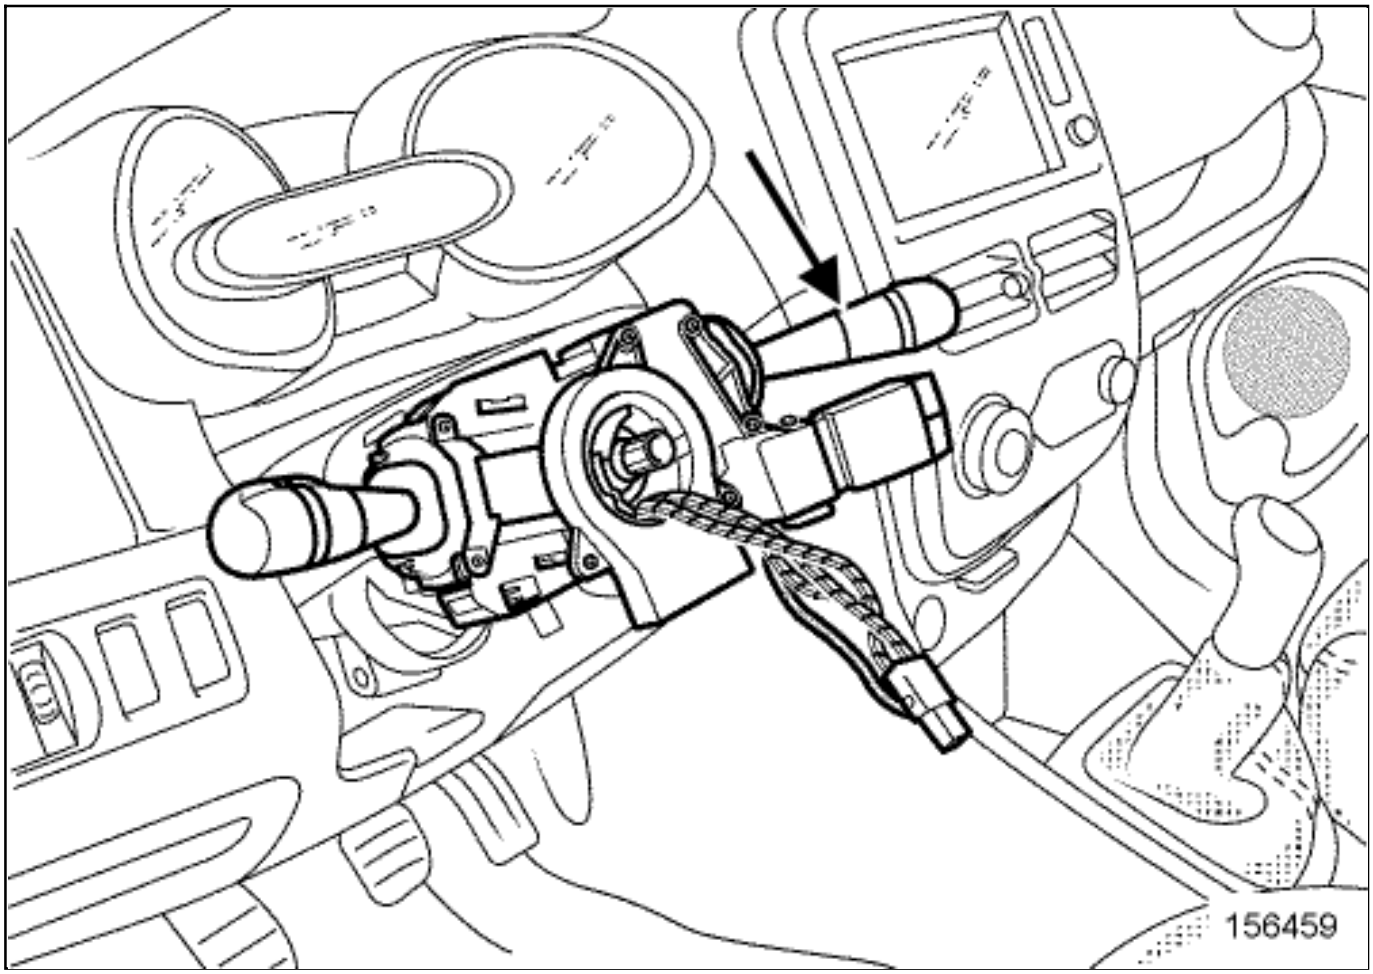
2- ROTARY SWITCH

CAUTION

Incorrect wheel alignment may damage the rotary switch.

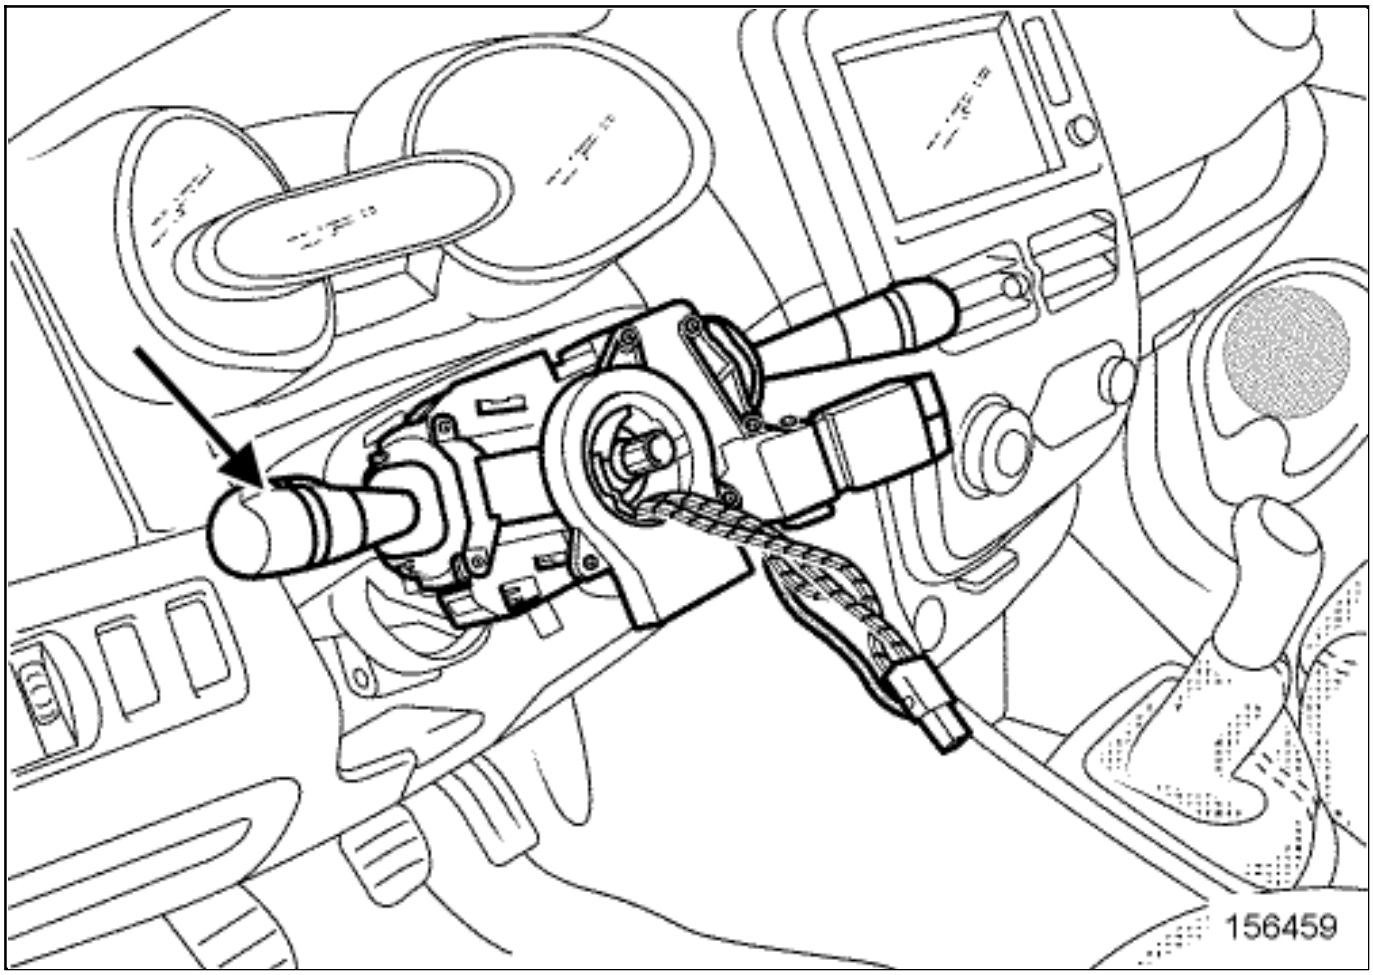
CAUTION

To prevent damaging the rotary switch, do not turn the mobile section of the rotary switch.



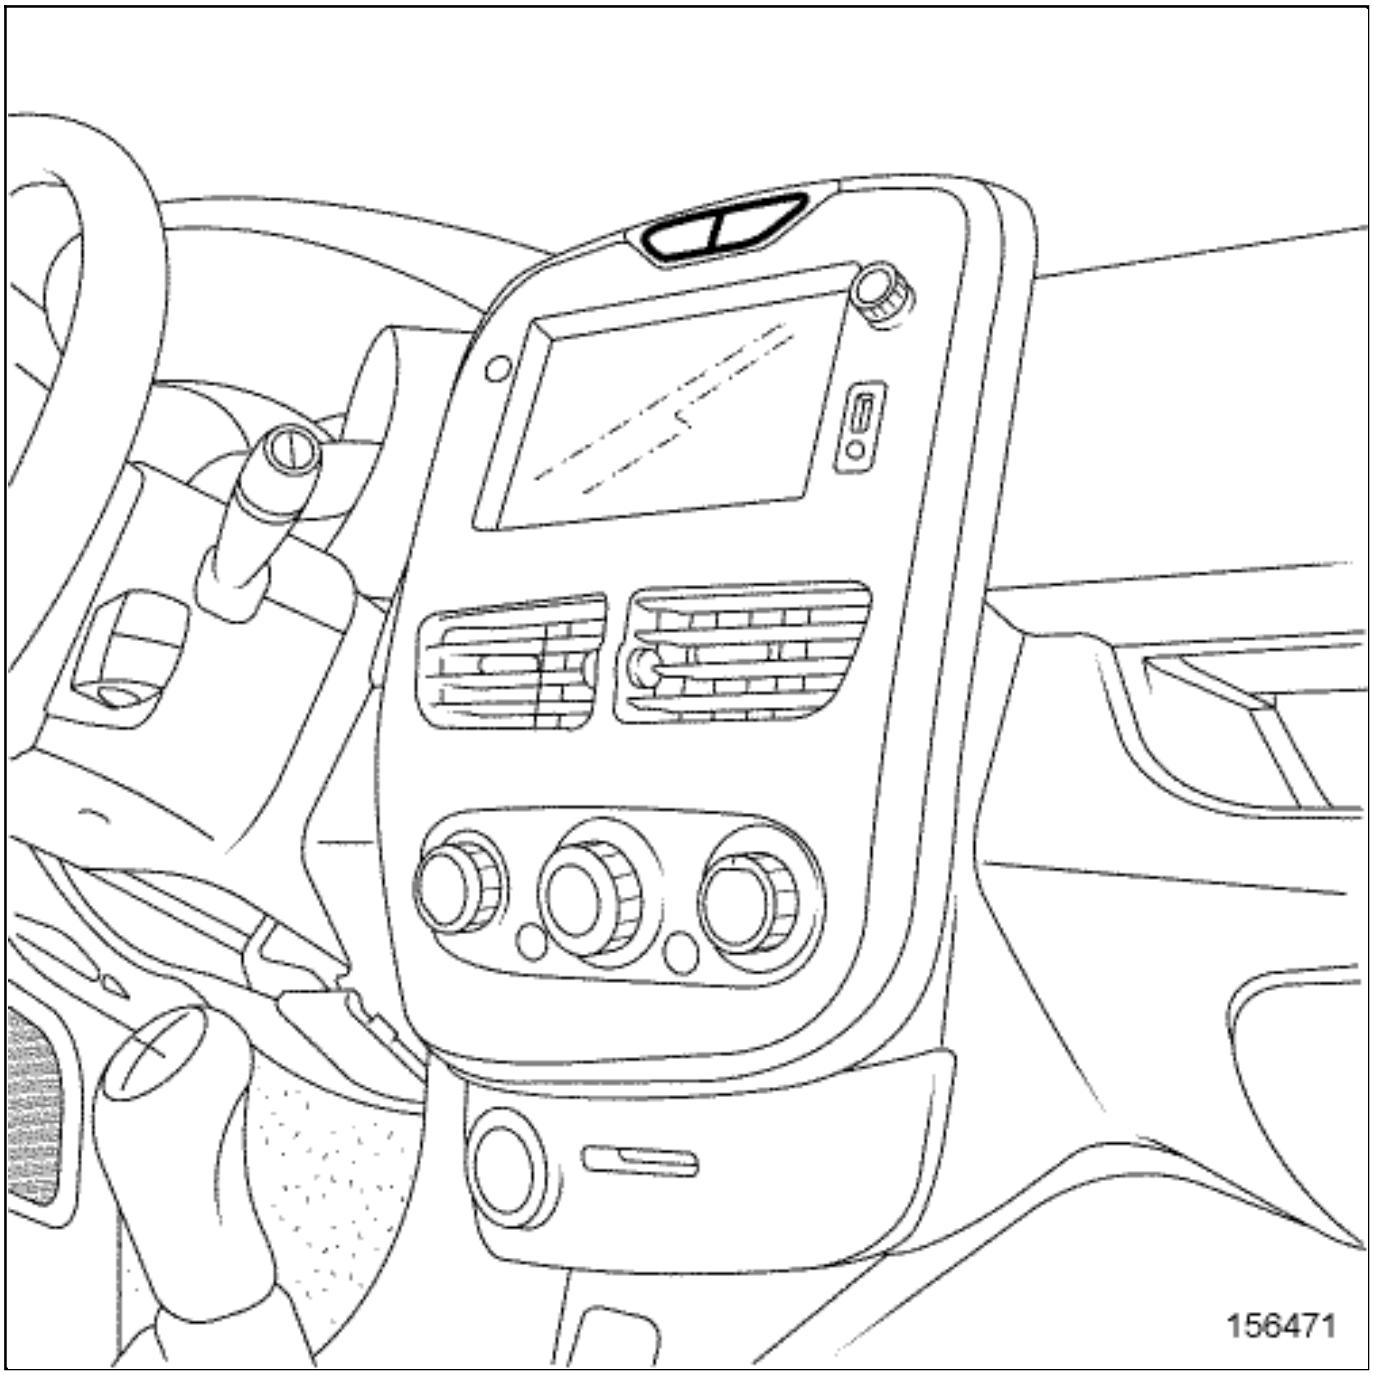
Note:

Always keep the rotary switch immobilised throughout the removal operation.



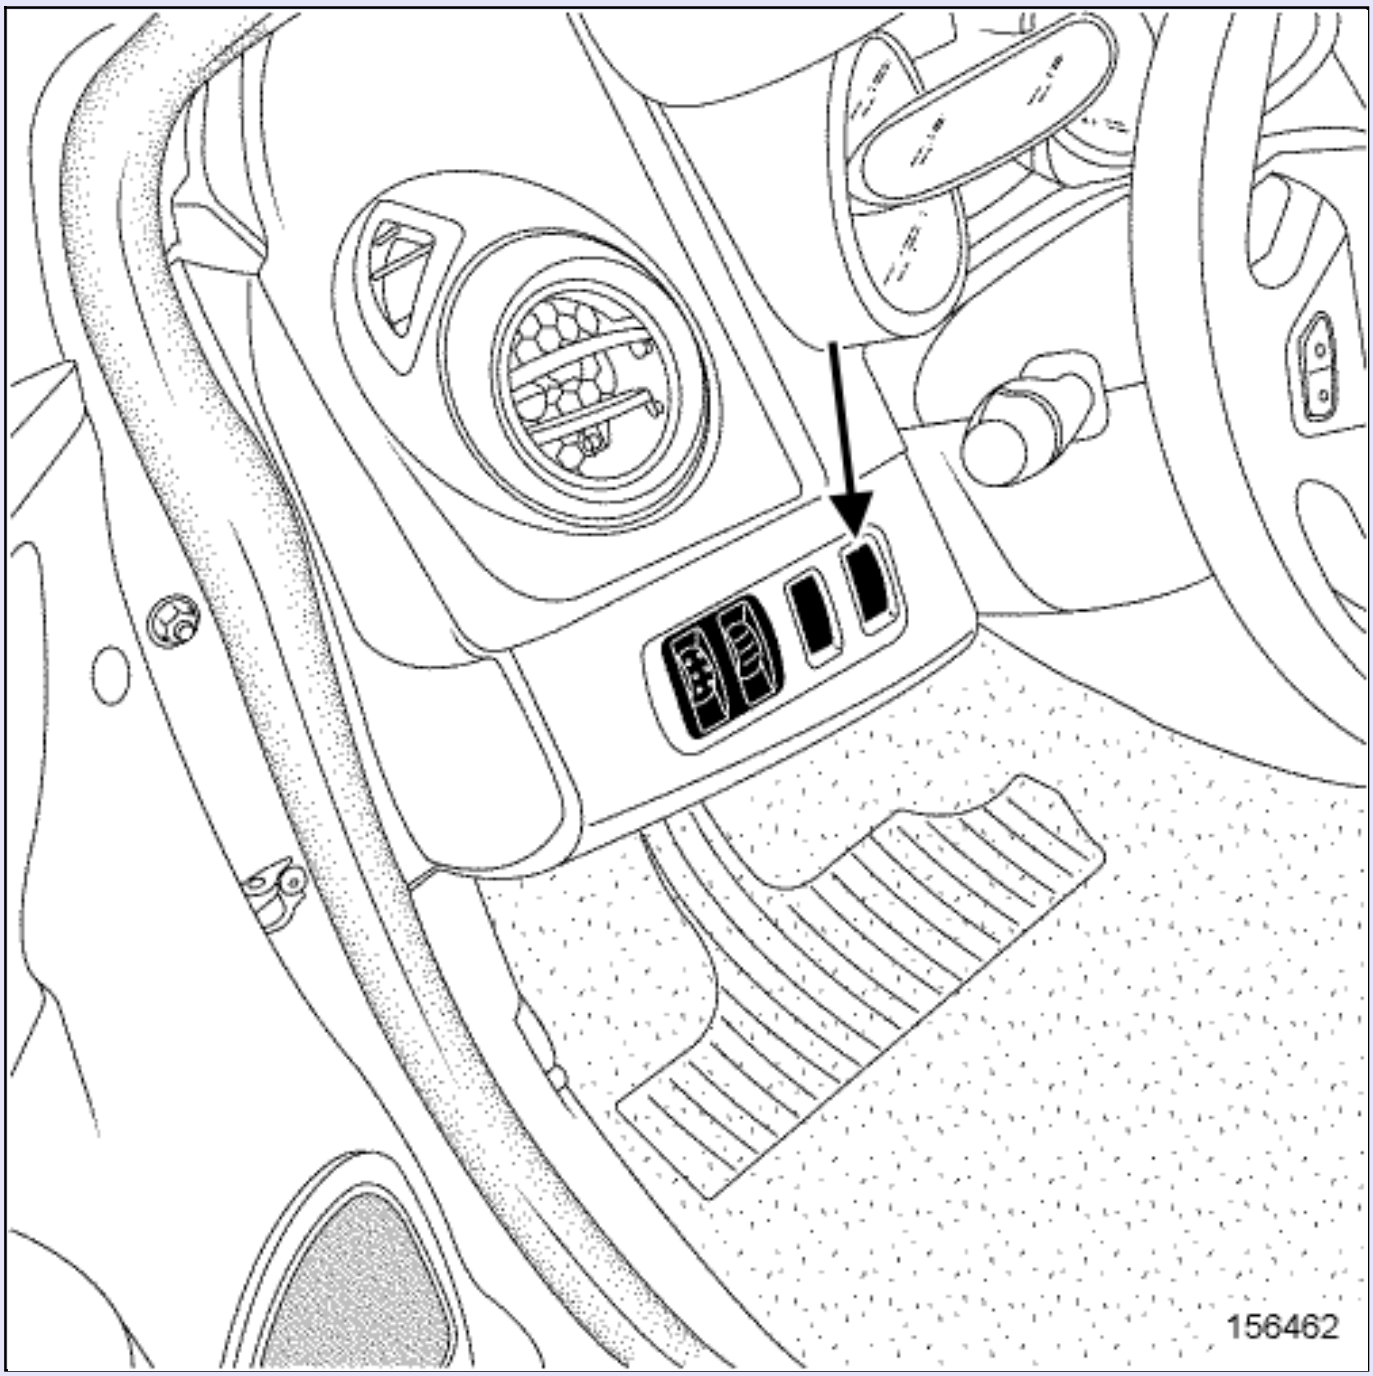
After refitting, check the operation of the rotary switch:

- turn the steering wheel to the left until it stops,
- turn the steering wheel to the right until it stops,
- bring the steering wheel back to the central position,
- check that there are no faults on the instrument panel.



3- WINDSCREEN WIPER SWITCH

4- SIGNALLING LIGHT SWITCH



5- CENTRAL DOOR LOCKING AND HAZARD WARNING LIGHTS CONTROL

156471

WITH STOP AND START (STOSTA)

1- "STOP AND START" SYSTEM ACTIVATION CONTROL

Apply the after repair procedure using the Diagnostic tool Diagnostic tool : Use :

-Computer concerned by the After repair procedure:

"USM" ,

-Component controlled by this computer concerned by the After repair procedure:

- "Stop&Start management module" .

Repair-30x04x03x40-02x51-1-4-1.xml

XSL version : 3.02 du 22/07/11

CONTROL - SIGNALS: PRECAUTIONS FOR REPAIR

Note, one or more warnings are present in this procedure

1. ROTARY SWITCH

CAUTION

Incorrect wheel alignment may damage the rotary switch.

During an operation on the steering column switch assembly, the wheels of the vehicle must be set straight ahead.

CAUTION

In order not to damage the rotary switch, do not turn the movable part of the rotary switch (except if adjusting).

To avoid damage, the rotary switch must be in the neutral position when refitting the steering wheel.

CAUTION

To ensure that the electronic systems operate correctly, do not damage the locking systems of the connectors.

In order not to damage the wiring harness, observe the original routing when refitting the steering column switch assembly.

CONTROL - SIGNALS: PRECAUTIONS FOR REPAIR

Note, one or more warnings are present in this procedure

1. ROTARY SWITCH

CAUTION

Incorrect wheel alignment may damage the rotary switch.

During an operation on the steering column switch assembly, the wheels of the vehicle must be set straight ahead.

CAUTION

In order not to damage the rotary switch, do not turn the movable part of the rotary switch (except if adjusting).

To avoid damage, the rotary switch must be in the neutral position when refitting the steering wheel.

CAUTION

To ensure that the electronic systems operate correctly, do not damage the locking systems of the connectors.

In order not to damage the wiring harness, observe the original routing when refitting the steering column switch assembly.

CONTROL PANEL: REMOVAL - REFITTING

Equipment required
Diagnostic tool

Locations and specifications (tightening torques, parts to always be replaced, etc.).(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Unclip the centre front panel trim.

- Place:
  - the air mixing control to the hottest position,
  - the air distribution control to the air vent position,
  - the air recirculation switch to the air recirculation position.

2. REMOVAL OPERATION

- Remove the control panel bolts from the centre front panel trim(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view)

- Move the control panel(see 61A, Heating, Passenger compartment heating and ventilation assembly: Exploded view) .

- Disconnect the control panel connectors.

REFITTING

Proceed in the reverse order to removal.

Check that the controls can be moved to their fullest extent.

COOLANT CIRCUIT ASSEMBLY: EXPLODED VIEW

Note, one or more warnings are present in this procedure

WARNING

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- Vehicle: Precautions for the repair .

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

- protection down to -25˚C 2for cold and temperate countries,
- protection down to -40˚C 2for very cold countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

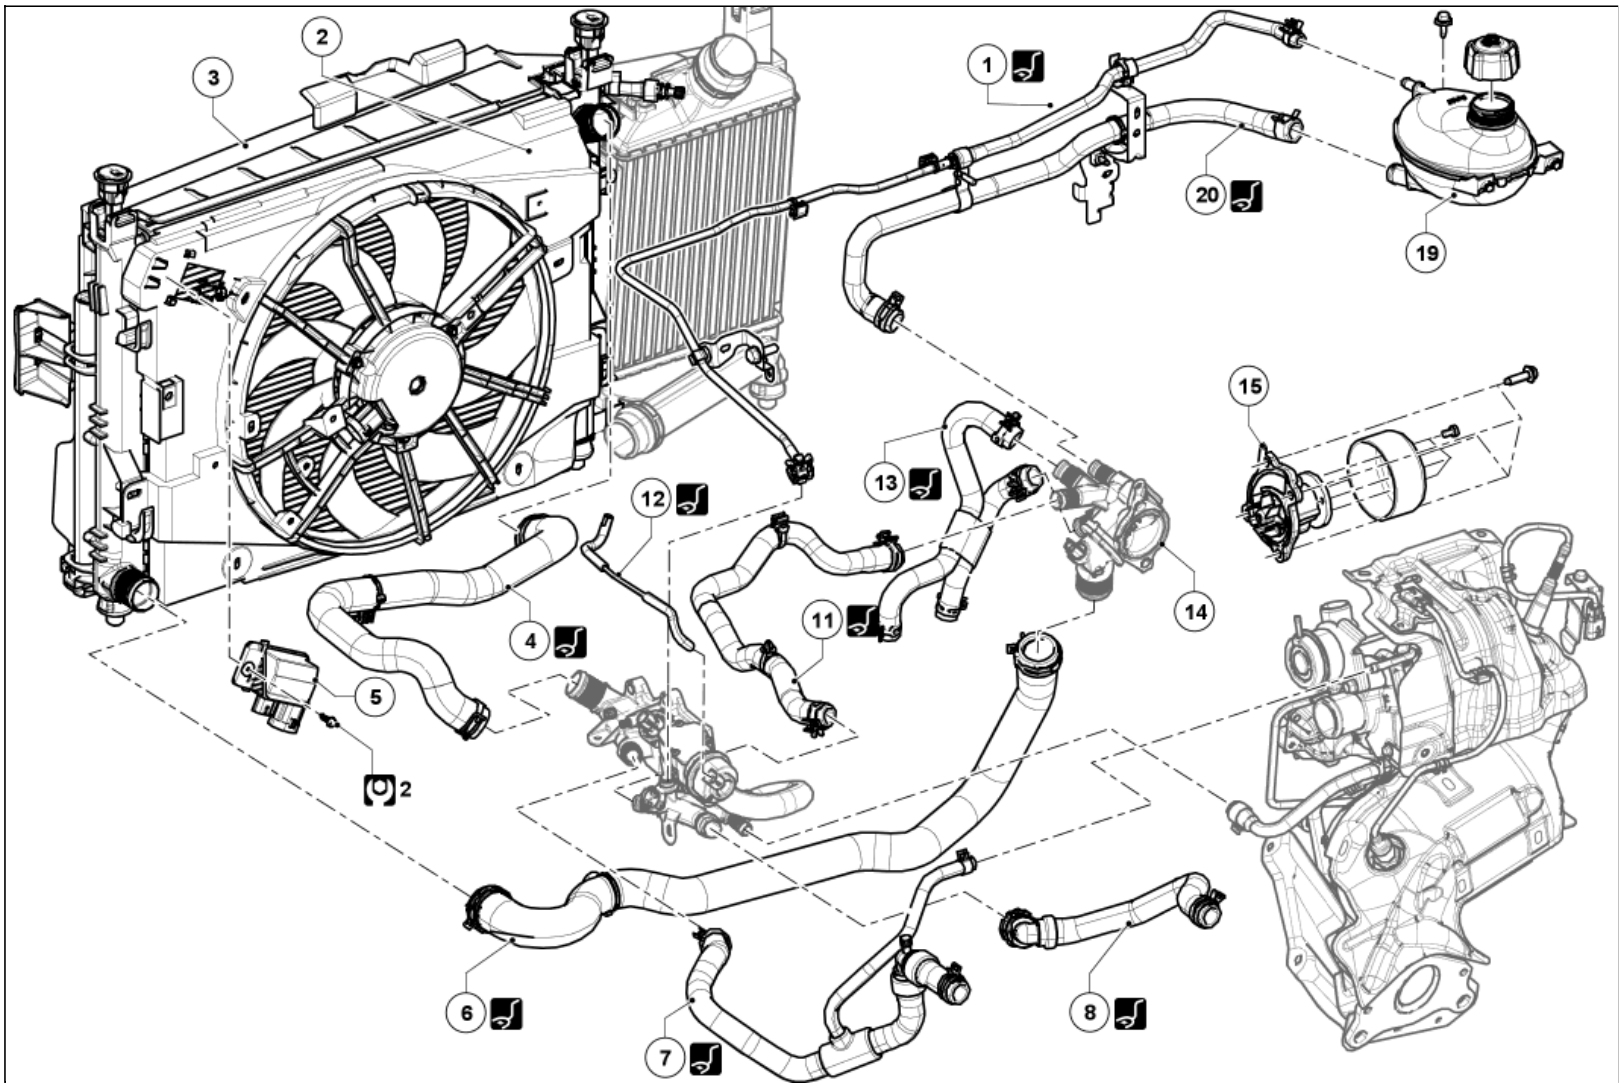


Illustration key: Description .

For fastenings with no specified tightening torque values, refer to the Table of Standard TorquesTightening torques: General information .

COOLANT PUMP: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

coolant pump seal

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C ± 2 for cold and temperate countries,
  - protection down to -40°C ± 2 for "extreme cold" countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Locations and specifications (tightening torques, parts always to be replaced, etc.) Cylinder block assembly: Exploded view .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove the engine undertray.
- Remove:
  - the front right-hand wheel Front hub carrier assembly: Exploded view ,

the front section of the front wheel arch linersExterior body front trim assembly: Exploded view .

Remove the front bumperFront bumper assembly: Exploded view .

Drain the cooling system(see 19A, Cooling, Cooling system: Draining - Refilling) .

Remove the accessories beltEngine accessories assembly: Exploded view .

Loosen the bolts of the coolant pump pulley, locking the coolant pump pulley using a screwdriver Cylinder block assembly: Exploded view .

Remove the water pump pulley boltsCylinder block assembly: Exploded view .

Move the water pump pulley.

2. REMOVAL OPERATION

Remove Cylinder block assembly: Exploded view :

- the coolant pump bolts,
- the coolant pump with its pulley,
- the coolant pump seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: coolant pump seal .

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

Use surface cleanerVehicle: Parts and consumables for the repair to clean and degrease:

- the coolant pump sealing face if it is to be reused,
- the cylinder block gasket face.

2. REFITTING OPERATION

Refit Cylinder block assembly: Exploded view :

- the new coolant pump seal,
- the coolant pump with its pulley,
- the coolant pump bolts.

Torque tighten in order the coolant pump bolts Cylinder block assembly: Exploded view .

3. FINAL OPERATION

Fit the water pump pulley.

Refit the water pump pulley bolts Cylinder block assembly: Exploded view .

Torque tighten the bolts of the coolant pump pulley, locking the coolant pump pulley using a screwdriver Cylinder block assembly: Exploded view .

Proceed in the reverse order to removal.

COOLANT PUMP: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

coolant pump seal

WARNING

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

CAUTION

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

- The criteria to be met are:
  - protection down to -25°C ± 2 for cold and temperate countries,
  - protection down to -40°C ± 2 for "extreme cold" countries.

CAUTION

Prepare for the flow of fluid, and protect the surrounding components.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

REMOVAL

1. REMOVAL PREPARATION OPERATION

- Position the vehicle on a two-post lift Vehicle: Towing and lifting .
- Disconnect the battery Battery: Removal - Refitting .
- Remove the engine undertray.
- Remove:
  - the front right-hand wheel Front hub carrier assembly: Exploded view ,

the front section of the front wheel arch liners**Exterior body front trim assembly: Exploded view** .

Remove the front bumper**Front bumper assembly: Exploded view** .

Drain the cooling system**(see 19A, Cooling, Cooling system: Draining - Refilling)** .

Remove the accessories belt**(see 11A, Top and front of engine, Engine accessories assembly: Exploded view)** .

Loosen the bolts of the coolant pump pulley, locking the coolant pump pulley using a screwdriver **(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view)** .

Remove the water pump pulley bolts**(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view)** .

Move the water pump pulley.

2. REMOVAL OPERATION

Remove **(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view)** :

- the coolant pump bolts,
- the coolant pump with its pulley,
- the coolant pump seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: coolant pump seal .

CAUTION

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

CAUTION

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING

Wear goggles with side protectors for this operation.

WARNING

Wear leaktight gloves (Nitrile type) for this operation.

- Use surface cleaner Vehicle: Parts and consumables for the repair to clean and degrease:
  - the coolant pump sealing face if it is to be reused,
  - the cylinder block gasket face.

2. REFITTING OPERATION

- Refit (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) :

- the new coolant pump seal,
- the coolant pump with its pulley,
- the coolant pump bolts.

Torque tighten in order the coolant pump bolts(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

3. FINAL OPERATION

Fit the water pump pulley.

Refit the water pump pulley bolts(see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Torque tighten the bolts of the coolant pump pulley, locking the coolant pump pulley using a screwdriver (see 10A, Engine and cylinder block assembly, Cylinder block assembly: Exploded view) .

Proceed in the reverse order to removal.

COOLANT TEMPERATURE SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

coolant temperature sensor seal

WARNING

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

CAUTION

Before the operation, protect the electrical accessories to prevent any risk of short circuiting and protect the belts to avoid damaging them.

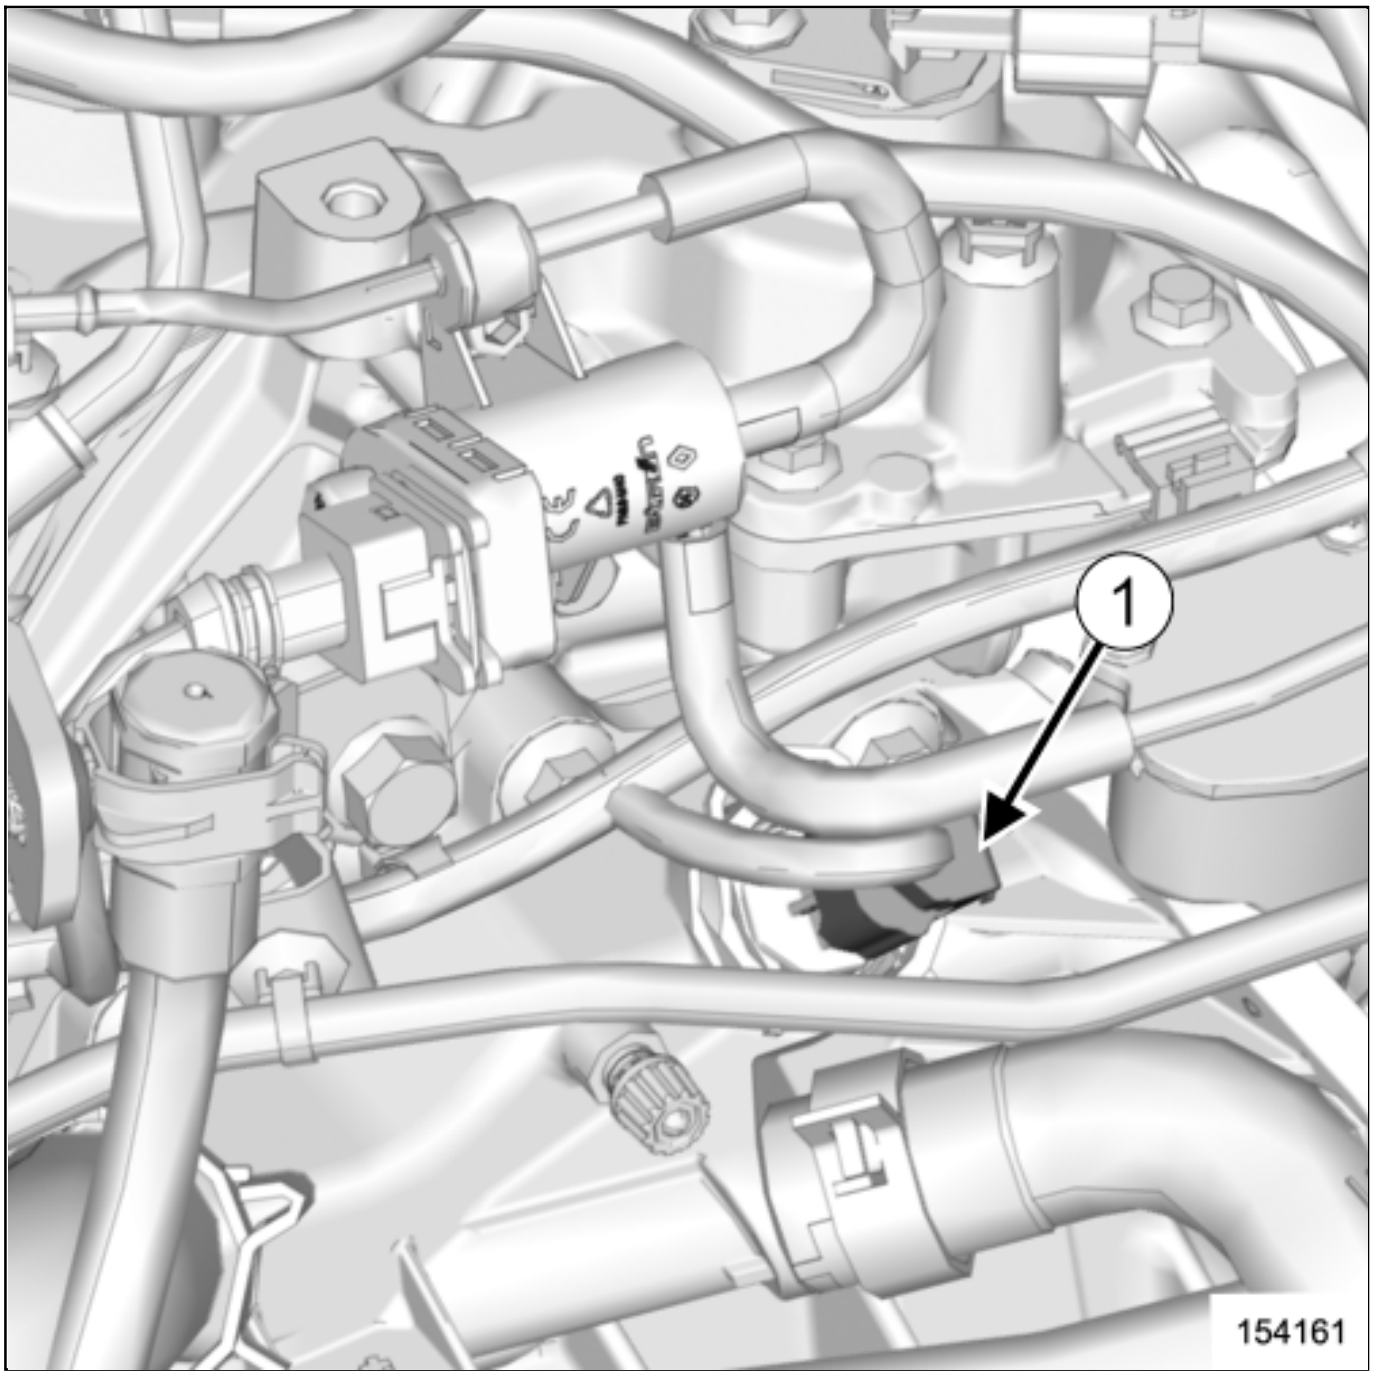
CAUTION

The coolant helps to keep the engine running properly (heat exchange).

The system does not operate using pure water.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .

REMOVAL



1. REMOVAL PREPARATION OPERATION

Disconnect the air filter unit air inlet pipe Air inlet assembly: Exploded view :

- from the front end panel,
- from the air filter unit.

Remove the air filter unit air inlet pipe Air inlet assembly: Exploded view .

2. REMOVAL OPERATION

Disconnect the coolant temperature sensor connector(1) .

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the clip from the coolant temperature sensor,
- the coolant temperature sensor,

the coolant temperature sensor seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: coolant temperature sensor seal .

Use SURFACE CLEANER(see **Vehicle: Parts and consumables for the repair**) to clean and degrease:

- the seal housing in the water chamber,
- the seal mating face of the coolant temperature sensor if reused.

1. REFITTING OPERATION

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the coolant temperature sensor fitted with a new seal,
- the coolant temperature sensor clip.

Connect the coolant temperature sensor connector.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Perform the following operations:

- top up the coolant level,
- bleed the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) .

Repair-10x06x01x03-01x37-1-91-1.xml

XSL version : 3.02 du 22/07/11

COOLANT TEMPERATURE SENSOR: REMOVAL - REFITTING

Note, one or more warnings are present in this procedure

parts always to be replaced:

coolant temperature sensor seal

WARNING

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

CAUTION

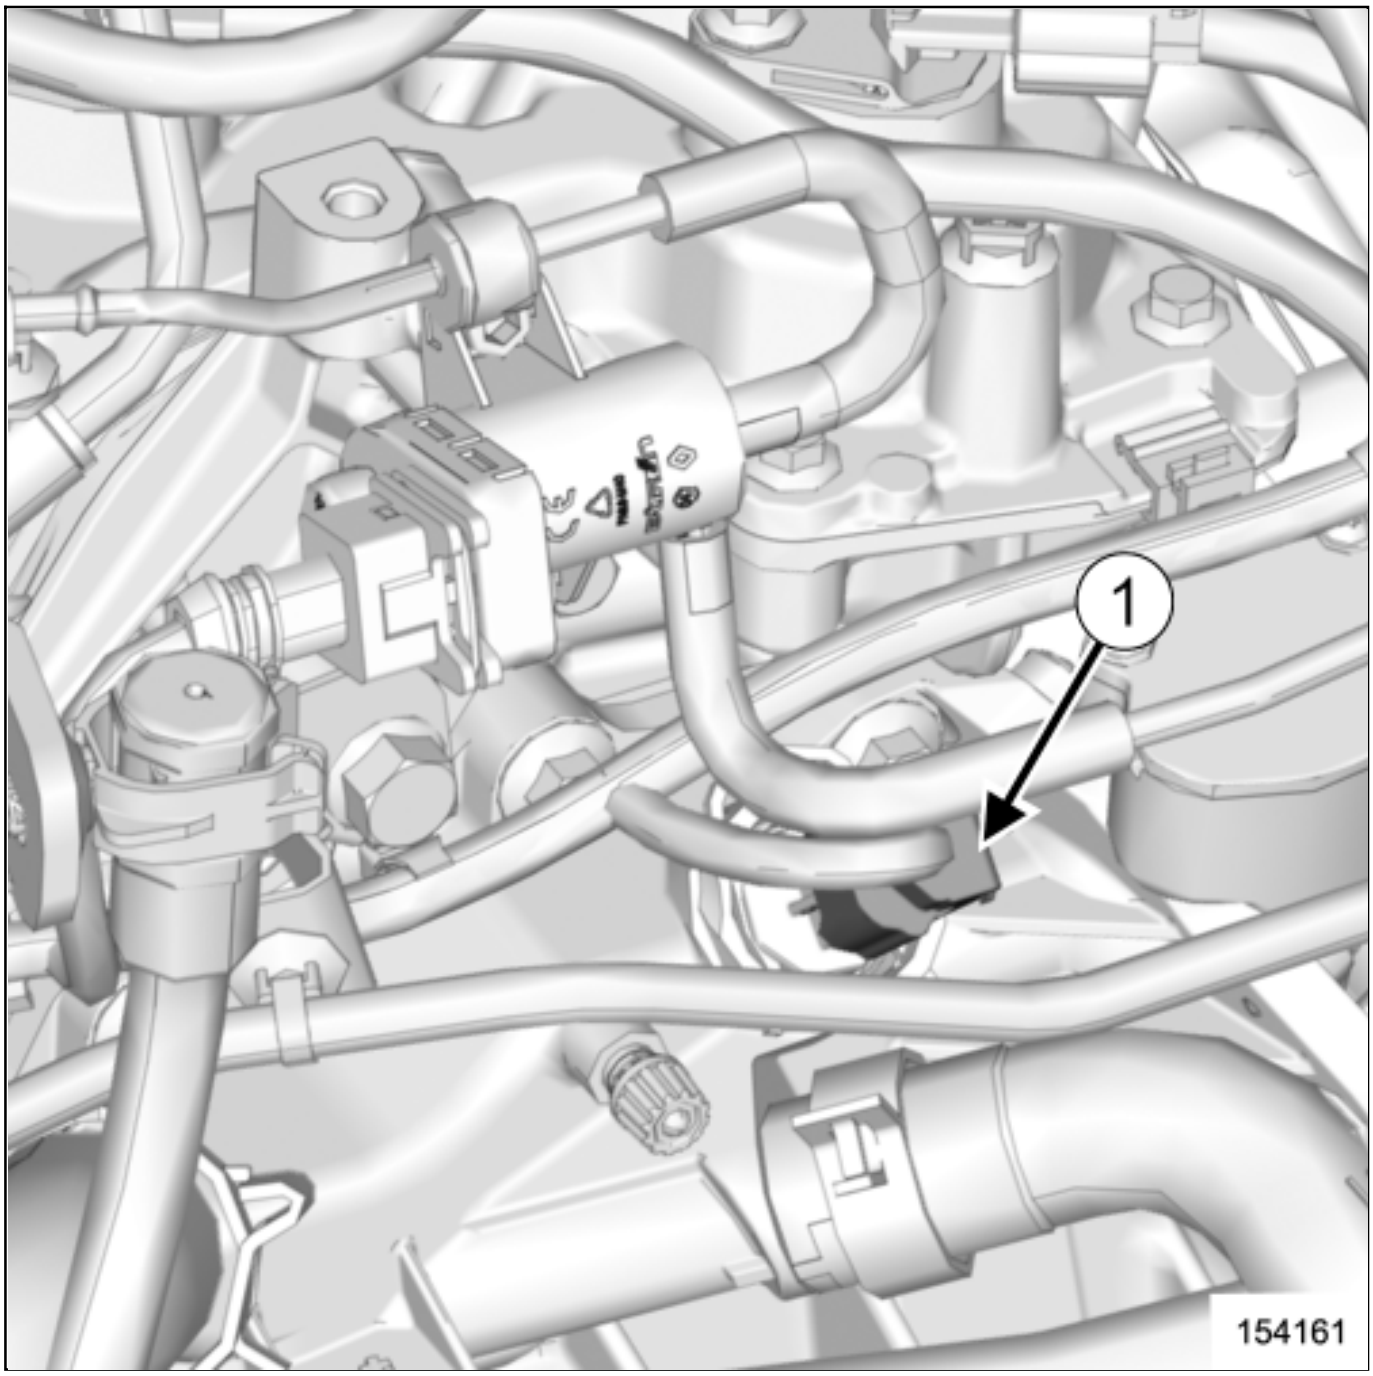
Before the operation, protect the electrical accessories to prevent any risk of short circuiting and protect the belts to avoid damaging them.

CAUTION

The coolant helps to keep the engine running properly (heat exchange).

The system does not operate using pure water.

Locations and specifications (tightening torques, parts always to be replaced, etc.)(see 19A, Cooling, Coolant circuit assembly: Exploded view) .



REMOVAL

1. REMOVAL PREPARATION OPERATION

- Disconnect the air filter unit air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) :
  - from the front end panel,
  - from the air filter unit.

- Remove the air filter unit air inlet pipe (see 12A, Fuel mixture, Air inlet assembly: Exploded view) .

2. REMOVAL OPERATION

Disconnect the coolant temperature sensor connector(1) .

Remove (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the clip from the coolant temperature sensor,
- the coolant temperature sensor,

the coolant temperature sensor seal.

REFITTING

1. REFITTING PREPARATION OPERATION

parts always to be replaced: coolant temperature sensor seal .

Use SURFACE CLEANER(see **Vehicle: Parts and consumables for the repair**) to clean and degrease:

- the seal housing in the water chamber,
- the seal mating face of the coolant temperature sensor if reused.

1. REFITTING OPERATION

Refit (see 19A, Cooling, Coolant circuit assembly: Exploded view) :

- the coolant temperature sensor fitted with a new seal,
- the coolant temperature sensor clip.

Connect the coolant temperature sensor connector.

2. FINAL OPERATION

Proceed in the reverse order to removal.

Perform the following operations:

- top up the coolant level,
- bleed the cooling system (see 19A, Cooling, Cooling system: Draining - Refilling) .

Repair-10x06x01x03-01x37-1-91-1.xml
