RENAULT

RENAULT CLIO IV WORKSHOP MANUAL 2013-2017

RENAULT

Technical Note 3585A

ALL TYPES

Subsection concerned: 01B

COMPUTER REPROGRAMMING AND CALIBRATION PROCEDURE

This Technical Note relates to onboard computer Reprogramming and Calibration operations using a RENAULT.NET connection or a Reprogramming CD (Part No.: 77 11 298 859).

77 11 338 820 **EDITION ANGLAISE**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The methods may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All copyrights reserved by Renault.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault.

Creating the trace file 19
Recovering the trace file after programming - reprogramming 19

GENERAL INFORMATION

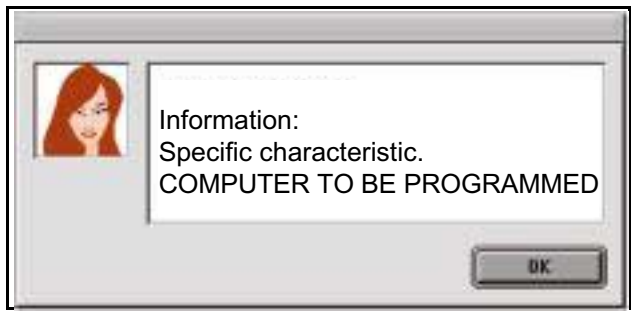
Two types of operation can be carried out in after-sales, either *programming or reprogramming* of the computer. These operations apply to all vehicles and all types of (re)programmable computer (e.g: Injection, Gearbox, Air conditioning, Instrument panel, Parking brake, UCH).

The two types of operation are carried out with the RENAULT CLIP diagnostic tool using either RENAULT.NET, or the Calibration - Reprogramming CD Part No. 77 11 298 859.

The reprogramming data available via RENAULT.NET is always more up to date than that available on the CD (Part no. 77 11 298 859).

The CD is edited and distributed every month in the same way as the diagnostic tools update.
Each CD cancels and replaces the previous one.

Tooling required:
- CLIP with the most recent update.
- 1 connection to RENAULT.NET (requires a CLIP with a RF kit and a RENAULT.NET certificate)
  or
  1 reprogramming CD, Part No. 77 11 298 859 from the current month.
- 1 RENAULT approved battery charger.
- The FAULT FINDING REPAIR MANUAL relevant to the vehicle and the system to be (re)programmed.
- 1 RENAULT.NET connection to the NRE reprogramming codes server for each calibration - reprogramming with a reprogramming CD (See **CODE SERVER PROCEDURE**).



Computer
The operation consists of downloading the calibration using the RENAULT CLIP **diagnostic tool**.

It affects computers supplied as *non operational* (also known as blank) by the Parts Department for all vehicles in the RENAULT range, but only for certain types of computer.

The types of computers which are delivered blank and to be calibrated are, to date, engine management (Petrol, Diesel and GPL injection), automatic and sequential gearboxes and ABS/ESP computers.

When To Program:

The operation is carried out as part of a computer replacement operation.
The *non operational* status of the computer, as delivered by the Parts Department, is specified in DIALOGYS by the message:

Reprogramming
The operation consists of exchanging the software and/or calibration for the most recent version using the RENAULT CLIP diagnostic tool.

This relates to computers already fitted to the vehicle as well as computers supplied as *operational* (also called "full". E.g: Air conditioning) by the Parts Department, for the entire RENAULT range.

It enables systematic replacement of the computer to be avoided.

After having entered the VIN in the main menu, the types of (re)programmable computer are displayed in the RENAULT CLIP diagnostic tool REPROGRAMMING menu.

When To Reprogram:

The operation is carried out within the framework of:

- an OTS or a Technical Note arising from a fault resulting from an After-Sales problem, or a functional improvement.
- RENAULT Technical Directives or following a request from the Techline.

OPERATING PROCEDURE (Programming and reprogramming a computer)

The operating procedure for Calibration and Reprogramming operations is strictly identical.

The operation is carried out using the RENAULT CLIP diagnostic tool, either connected to RENAULT.NETor with the reprogramming CD.

WARNING
To prevent any computer malfunctioning or locking, the following operations **must be carried out** before (re)programming.

Preparing the RENAULT CLIP diagnostic tool
- Always use the latest available version of the CLIP update.
- Always use the RENAULT.NET connection if available, in preference to the CD.

The reprogramming data available via RENAULT.NET is always more up to date than that available on the CD.

- Whenever the CD mode is being used for calibration - reprogramming, always use the latest available version of the CD.

- **Connect CLIP to the mains.**

- Set the Windows screen saver time for the RENAULT CLIP diagnostic tool to NONE or 60 minutes minimum.

  Setting the RENAULT CLIP diagnostic tool Windows monitor screen locking delay:
  In the RENAULT CLIP diagnostic tool Windows system:
  - Right click on the mouse and select **Properties**.
  - In the new **Display Properties window**, select the **Screen Saver tab**.
    Then set the screen saver to **(None)** or set the **Wait** time delay to a minimum of 60 minutes.
  - Confirm and close the display windows.

Preparing the vehicle

- **Connect an approved battery charger** to the vehicle.

- Switch off all the vehicle's electrical consumers (Lights, Interior lighting, Air conditioning, CD Radio, etc).

- Switch on the ignition (+ forced + after ignition, See Procedure).

Programming - reprogramming phase

- **Enter the exact VIN of the vehicle** in the RENAULT CLIP **diagnostic tool** main menu.

WARNING
Using a VIN which is not allocated to the vehicle risks compromising the correct running of the programming - reprogramming operation, as well as the conformity of the vehicle

Apply the correct pre-reprogramming Procedure for the vehicle and for the system to be reprogrammed.
- For example, in the case of a diesel injection: Backup the computer data if the command is available.
- For example, in the case of an Automatic Transmission: Put the gear lever in the P position.

- Find the Parts Department reference number for the computer to be reprogrammed (see **CONSULTING THE COMPUTER IDENTIFICATION FRAME**), which is necessary in the event of an **EMERGENCY PROCEDURE**.

- During any calibration and reprogramming:

WARNING
DO NOT WORK ON THE VEHICLE OR OPERATE THE DIAGNOSTIC TOOL.

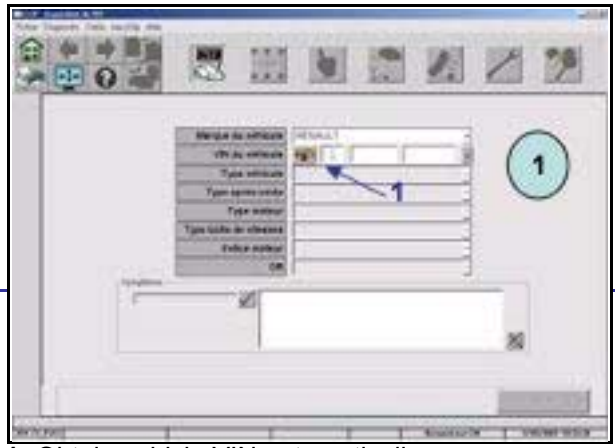
In the CD mode only, enter a reprogramming code: see **CODE SERVER PROCEDURE**.

- At the end of calibration and reprogramming, observe the following instructions:
- Proceed to the WARRANTY SCREEN by pressing the NEXT button.

Apply the pre-reprogramming procedure to the vehicle and to the system to be reprogrammed.
- For example, in the case of a diesel injection: Write the saved computer data if the command is available.
- **Enter the VIN** into the computer.

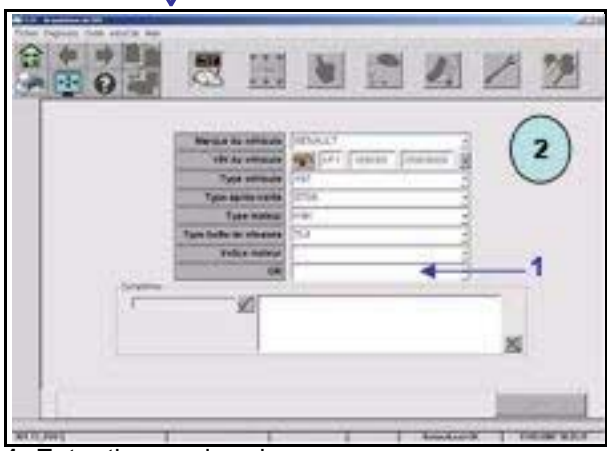
Always deal with faults in all computers (when a computer is being reprogrammed, it cannot transmit data to the multiplex network. As a result, faults will be generated in other computers connected to the multiplex network).

Note the CODECAL and the SUPPLIER CODE and transfer them to the Repair Order.
If the CODECAL and the SUPPLIER CODE are lost, they can be recovered: see **CONSULTING THE TOOL LOG**.



Returning the vehicle
- Test all the computers and **deal with any faults present**.

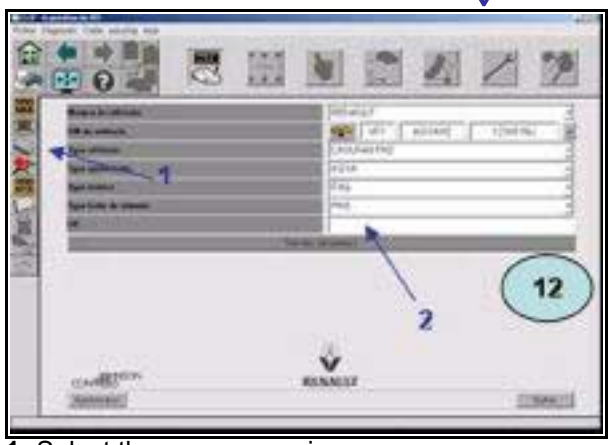
- Check that all the vehicle's current systems are correctly configured.



CLIP screens depending on programming – reprogramming step

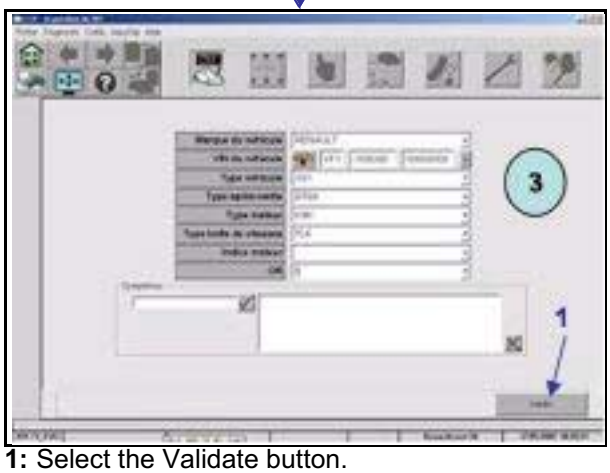
Screen	Step		Commentary
02 **12**	CLIP home		CLIP determines, via the VIN, the Technical Specification of the vehicle. **Warning:** To ensure that reprogramming is carried out effectively, enter the correct VIN for the vehicle (17 characters).
02 **12**	Reprog home		Select REPROGRAMMING and the system to (re)program.
15	Choice of computer		
16	Connecting		CLIP identifies the computer concerned and recovers the technical data necessary for the (re)programming operation.
17	Entering and confirming repair order/ Entering Vehicle Technical Specification		Enter the After-Sales information necessary for the warranty. **Note:** Enter the repair order if it has not been written in the main menu. The "*Vehicle Technical Specification*" field is to be filled in at the request of Techline or if required in a reprogramming Technical Note.
18	Pre-reprogramming Message		Description of the environment to be set up before any reprogramming. **Warning:** Follow the instructions which can differ from one computer and vehicle to the next.
19	Checking battery voltage		CLIP automatically checks the voltage level necessary for the correct running of the re-programming operation.
20	Select the reprogramming mode		Choose the technical resource: either RENAULT.NET or CD.
21	Finding the file(s)	**RENAULT.NET**	CLIP finds the technical data to download to the computer. In RENAULT.NET mode, a password is needed for authentication.
22		**CD**	
23	File selection		Confirm the operation by selecting the *Software reference* to be downloaded.
24	Enter the reprogramming code in CD mode. See **CODES SERVER PROCEDURE**		**In CD mode only:** • CLIP provides a *reprogramming code*. • Provide the code management server with the *reprogramming code* and the VIN. • The server issues an "*After-Sales reprogramming code*". • Enter this code in CLIP.
25	File downloading		CLIP downloads the technical data to the computer.
26	Post-reprogramming Message		Description of the actions to carry out to finish the reprogramming operation and return the conforming vehicle. **Warning:** Follow the instructions which can differ from one computer and vehicle to the next.
27	Warranty screen		CLIP provides the warranty screen describing the operation performed and the CODECAL necessary for the Warranty procedure.

Order of the screens



1: Obtain vehicle VIN automatically.

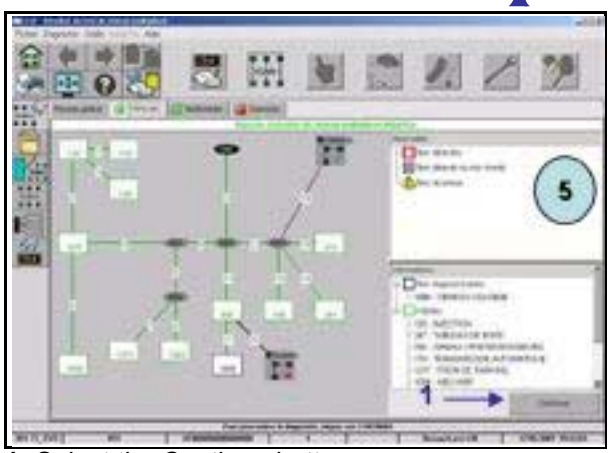
1: Enter the repair order.



See New Interface

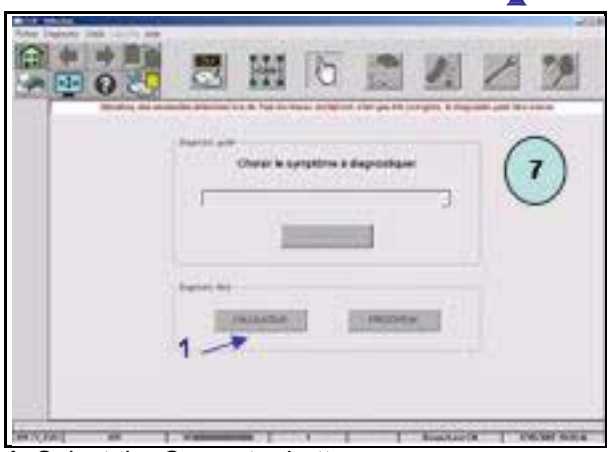
1: Select the reprogramming page.
2: Enter the repair order.

See Interface 2

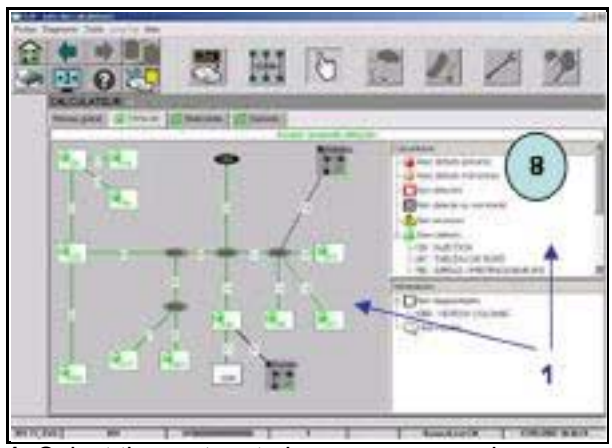


New Interface (2)

1: Select the Validate button.

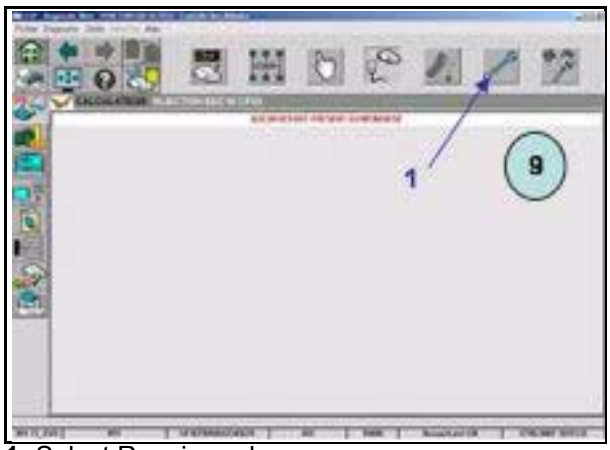


Multiplex network test.



1: Select the Continue button.

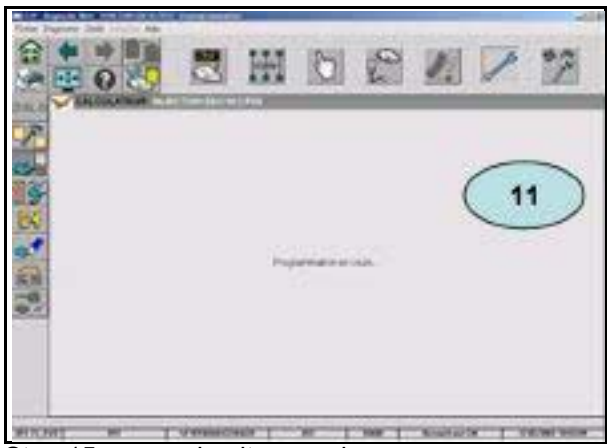
Analyse data and Read faults.



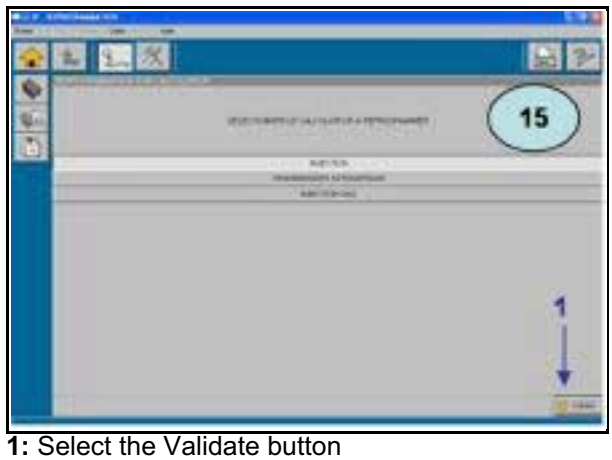
1: Select the Computer button.

1: Select the system to be reprogrammed.

(9)



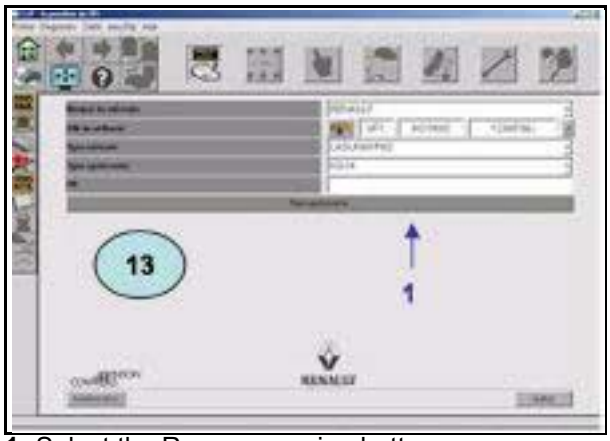
8



1: Select Repair mode.

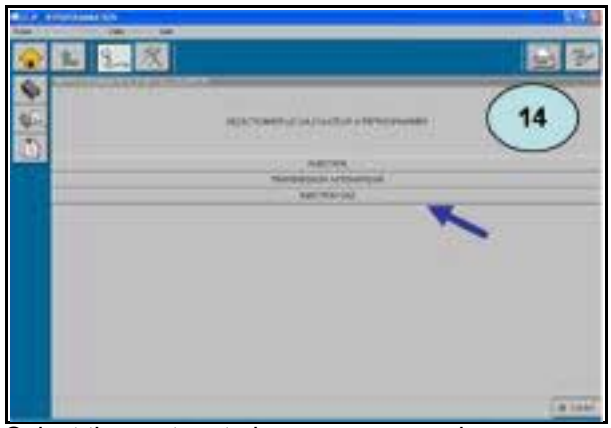
1: Select the Reprogramming page.

Step 15 opens simultaneously.



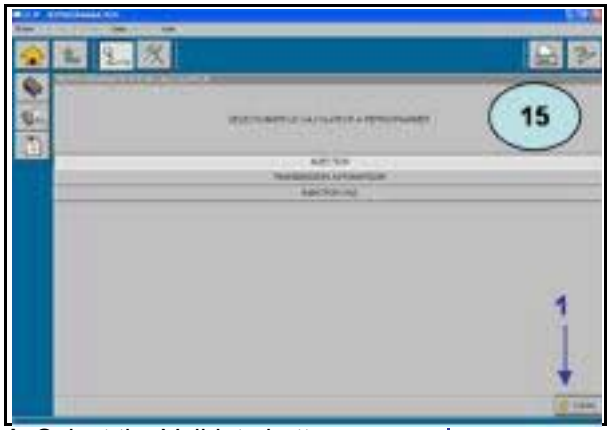
1: Select the Validate button

16



See reprogramming interface

Interface 2



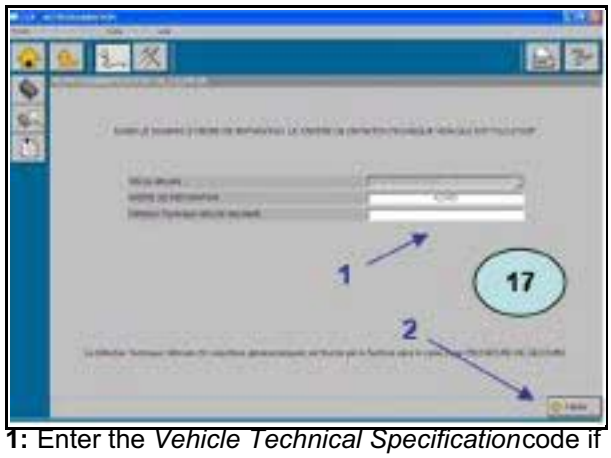
12

1: Select the Reprogramming button.

Select the system to be reprogrammed.

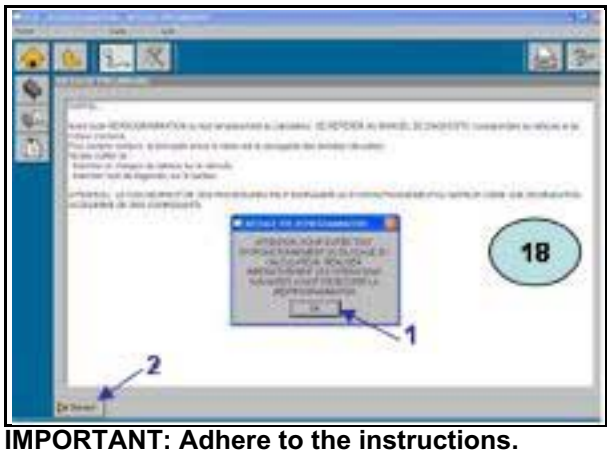
1: Select the Validate button.

16



See reprogramming interface

Interface Reprogramming



15

Identification of computer data.

1: Enter the *Vehicle Technical Specification*code if requested.
2: Select the Validate button.

IMPORTANT: Adhere to the instructions.
1: Select the OK button.
2: Select the next button.

Automatic battery voltage check.

Select the reprogramming mode.

RENAULT.NET

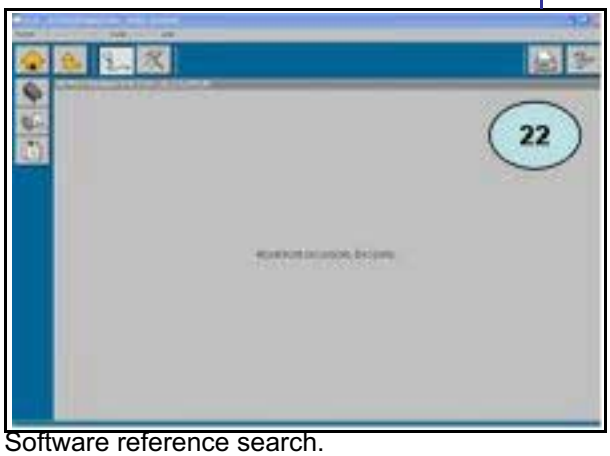
Enter the Renault.Net password.

CD-ROM

22

RENAULT.NET

23



20

CD-ROM

CD-ROM

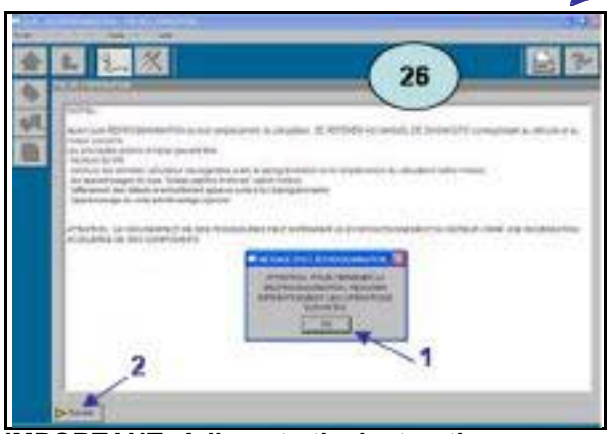
21

RENAULT.NET

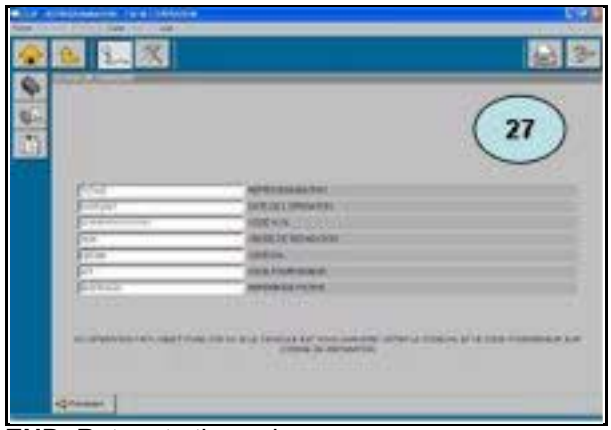
Software reference search.

1: Select the software reference.
2: Select the Validate button.

CD-ROM



RENAULT.NET



1: Enter the reprogramming code.

Downloading of the file. **(CODE SERVER PROCEDURE)**
2: Select the Validate button

IMPORTANT: Adhere to the instructions.
1: Select the OK button.
2: Select the next button.

END. Return to the welcome screen.

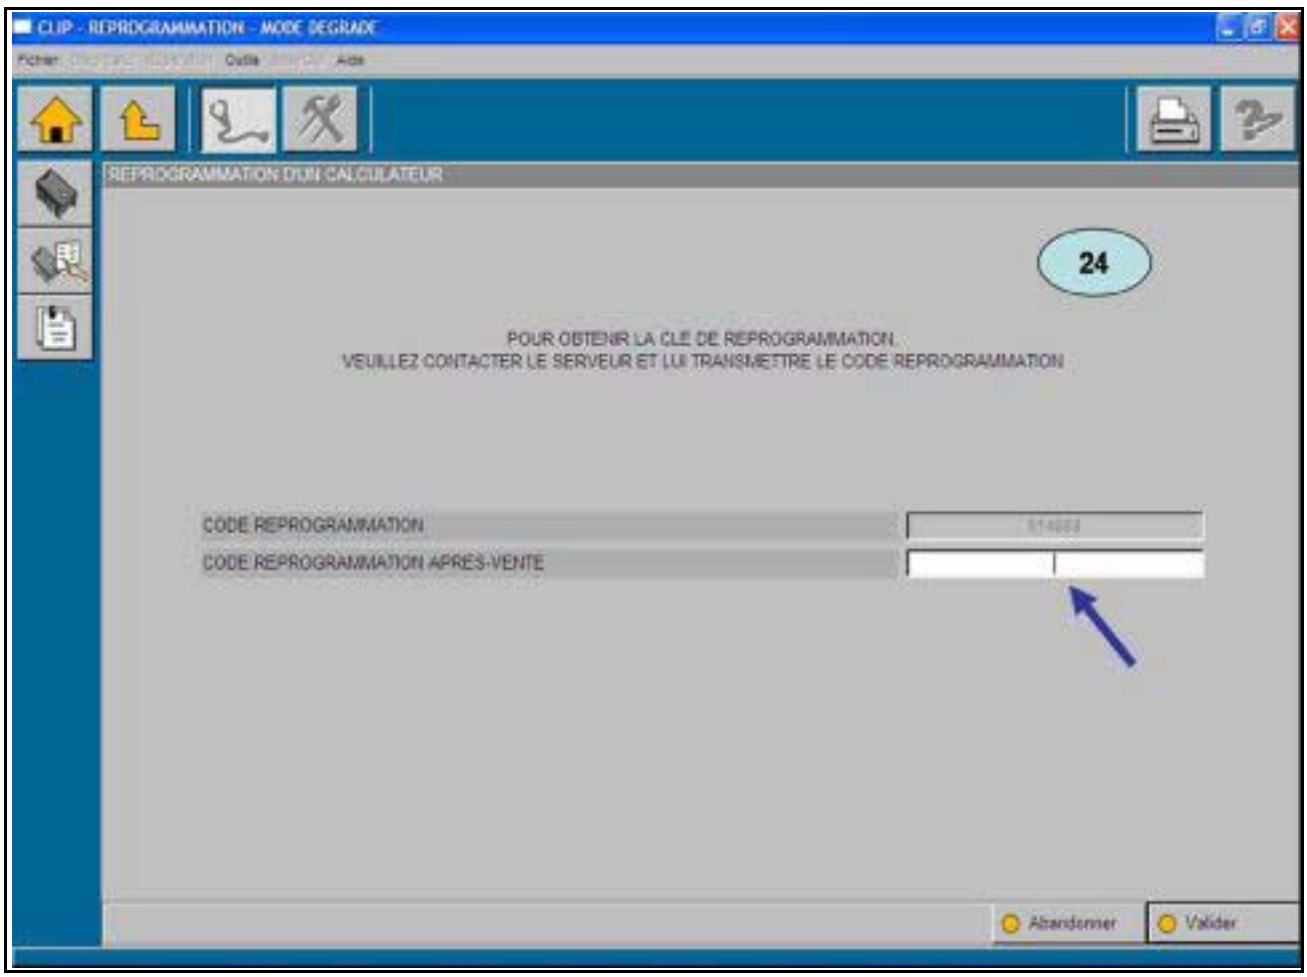
CLIP SCREEN ERROR MESSAGES AND PROCEDURE TO FOLLOW

SCREE	CLIP ERROR MESSAGE	ORIGIN	PROCEDURE TO FOLLOW
01	**THE VEHICLE CANNOT BE IDENTIFIED WITH THIS VIN…**	After the VIN has been entered into the main menu	• Re-enter the VIN. *Note:* the VIN does not contain: – the letter O as it can be confused with the number 0. – the letter I as it can be confused with the number 1.
01	**The AUTOMATIC IDENTIFICATION HAS FAILED…**	After the VIN automatic search button has been pressed	• Check the sensor/PC and vehicle/sensor connections. *Note:* Ensure that the 4 green and red sensor LEDs are illuminated. • If the fault is still present, contact the CLIP After-Sales service.
15	**CLIP INTEGRITY PROBLEM…**	After the reprogramming button has been pressed	• Reinstall CLIP with the latest available version. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
15	**THIS VEHICLE HAS NO REPROGRAMMABLE COMPUTERS**	After the reprogramming button has been pressed	• CLIP integrity error: Reinstall CLIP with the latest available version. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
16	**CANNOT COMMUNICATE WITH THE COMPUTER…**	Following selection of the computer to reprogram	• Check the connections. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
16	**OPERATION INTERRUPTED: CANNOT ACQUIRE NECESSARY DATA…**	Following selection of the computer to reprogram	• Restart operation. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
16	**IMPORTANT: THE VIN READ IN THE COMPUTER TO BE REPROGRAMMED DOES NOT CORRESPOND…**	Following selection of the computer to reprogram	• As a default, use the VIN of the computer (not that from the main menu).
17	**THE REPAIR ORDER NUMBER MUST NOT EXCEED 6 CHARACTERS**	After a repair order number has been entered	• Check that the order number entered is correct (6 alphanumerical characters).
17	**THE TECHNICAL SPECIFICATION CRITERION MUST BE COMPOSED OF 10 CHARACTERS**	After the Vehicle Technical Specification has been entered at the request of Techline or as described in a Technical Note.	• Check that the Vehicle Technical Specification contains 10 alphanumerical characters. E.g: 0000CR347B • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
19	**BATTERY VOLTAGE TOO LOW or TOO HIGH**	At any point in the reprogramming procedure	• Connect an approved battery charger to the vehicle.
20	**TO CARRY OUT REPROGRAMMING VIA RENAULT.NET …**	After the battery voltage has been checked	• Check that the wireless connection device is working. • If the fault is still present, contact the CLIP After-Sales service, • or use the latest version of the reprogramming CD.

SCREE	CLIP ERROR MESSAGE	ORIGIN	PROCEDURE TO FOLLOW
20	**NO CD-ROM IN THE READER…**	When the reprogramming mode is being selected	• Insert the latest available version of the reprogramming CD. • If the fault is still present, contact the CLIP After-Sales service.
20	**THE REPROGRAMMING CD-ROM IN USE IS TOO OLD…**	When the reprogramming mode is being selected	• Insert the latest available version of the reprogramming CD. • If the fault is still present, contact the CLIP After-Sales service.
20	**THE CD-ROM TO INSERT IS THE REPROGRAMMING CD-ROM**	When the reprogramming mode is being selected	• Check that the CD being used is a reprogramming CD. • If the fault is still present, contact Techline or the CLIP After-Sales Service.
20	**THE CD-ROM READER IS NOT FUNCTIONING CORRECTLY…**	When the reprogramming mode is being selected	• Follow the on-screen instructions. • If the fault is still present, contact the CLIP After-Sales service.
	After-Sales Service ERROR 650 **After-Sales Service ERROR 651**	After having selected the Renault. Net mode	• CLIP integrity error in RENAULT.NET mode. • Restart the reprogramming procedure. • If the fault is still present, contact your IT representative or the CLIP After-Sales Service.
	After-Sales Service ERROR 652 **After-Sales Service ERROR 653** **After-Sales Service ERROR 654** **After-Sales Service ERROR 655** **After-Sales Service ERROR 656**	After selecting the reprogramming method	• CLIP integrity error (in RENAULT.NET mode) or reprogramming CD error (in CD mode). • In mode RENAULT.NET mode, reinstall CLIP • In CD mode, restart with another reprogramming CD (previous version if necessary). • If the fault is still present, contact the After-Sales Service or carry out the **EMERGENCY PROCEDURE**.
21	**TRANSMISSION PROBLEM…**	During authentication on Renault. Net	• Check the Renault.Net connection. • If the fault is still present, contact your IT representative or the CLIP After-Sales Service.
21	**TRANSMISSION PROBLEM…**	Whilst searching Renault. Net for the file to download	• Restart the reprogramming procedure. • If the fault is still present, contact your IT representative or the CLIP After-Sales Service.
22	**DEFECTIVE DATABASE, …**	Whilst finding the file to download	• Check faults linked to the CD (operation, presence or version of the CD). • Try with another CD (same or previous version). • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
22	**VEHICLE TECHNICAL SPECIFICATION NOT RECOGNISED IN RENAULT DATABASE…**	Whilst finding the file to download	• Enter the Vehicle Technical Specification, checking it is correct (10 alphanumerical characters). E.g: 0000CD347B • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
22	**ERROR 10X: … (X = 1 to 9), EMERGENCY PROCEDURE**	Whilst finding a file	• Carry out the **EMERGENCY PROCEDURE**.

SCREE	CLIP ERROR MESSAGE	ORIGIN	PROCEDURE TO FOLLOW
22	**COMPUTER ALREADY REPROGRAMMED, CANNOT PERFORM OPERATION…**	Whilst finding a file	• RENAULT.NET mode: the computer does not need to be reprogrammed. • CD mode: Restart the operation using the latest available version of the CD. If the message remains, the computer does not need to be reprogrammed.
22	**VIN NOT RECOGNISED IN RENAULT DATABASE…**	Whilst finding a file	• Restart the reprogramming procedure, checking that the VIN corresponds to that of the vehicle. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**. • *Note:* In CD mode, it is possible that CLIP will not recognise the VIN if the vehicle has been recently manufactured.
24	**THE AFTER-SALES REPROGRAMMING KEY ENTERED IS INCORRECT**	After the After-Sales reprogramming code has been entered	• Re-enter the reprogramming code. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
25	**CANNOT COMMUNICATE WITH THE COMPUTER…**	Whilst downloading a file	• Follow the on-screen instructions.
25	**COMPUTER FAULT: CANNOT UNLOCK…**	Whilst downloading a file	• Check that the pre-reprogramming instructions have been followed: see [01B-4]. • Restart the programming - reprogramming operation. • If the fault is still present, print the computer identification screen and the history and carry out the **EMERGENCY PROCEDURE**.
25	**COMPUTER FAULT: CANNOT DELETE…**	Whilst downloading a file	• Check that the pre-reprogramming instructions have been followed: see [01B-4]. • Restart the programming - reprogramming operation. • If the fault is still present, print the computer identification screen and the history and carry out the **EMERGENCY PROCEDURE**.
25	**COMPUTER FAULT: DOWNLOAD INTERRUPTED…**	Whilst downloading a file	• Check the connections and the battery voltage and restart the operation. • If the fault is still present, carry out the **EMERGENCY PROCEDURE**.
25	**NON LOCKING ERROR OCCURRED DURING WRITING…**	At the end of downloading a file	• The computer's history is full. This is not a critical error and it will not affect the reprogramming of the vehicle.
25	**THE COMPUTER HAS NOT RESPONDED TO THE LAST REQUEST…**	At the end of downloading a file	• Try to re-establish dialogue with the computer. • If the vehicle no longer starts, carry out the **EMERGENCY PROCEDURE**.

CODE SERVER PROCEDURE (in CD mode only)



When Calibrating - reprogramming with the reprogramming CD Part No. **77 11 298 859**, enter an *After-Sales reprogramming code* to be able to carry out the operation.

This code is provided by the code management server on RENAULT.NETafter having entered the VIN and the reprogramming code displayed on screen **24** of the RENAULT CLIP diagnostic tool.

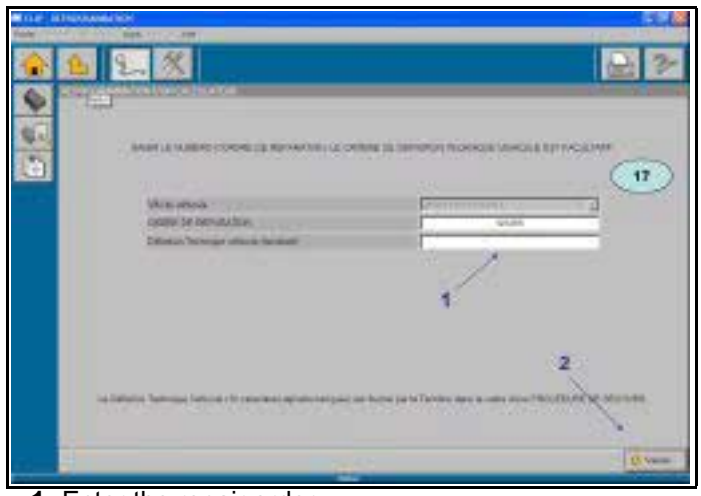
Refer to the **Technical Note CODE DELIVERY PROCEDURE**,section **Tool reprogramming key** for more details.

Steps:

1. CLIP provides a *reprogramming code*.
2. Provide the code management server with the *reprogramming code* and the VIN of the vehicle.
3. The server issues an *After-Sales reprogramming code*.
4. Enter this code in CLIP.

EMERGENCY PROCEDURE

The EMERGENCY PROCEDURE must be carried out when Calibration - reprogramming is interrupted by a message advising you to contact Techline.



Example: **ERROR 10X** (X = 1 to 9)
EMERGENCY PROCEDURE, PLEASE CONTACT YOUR TECHLINE

The EMERGENCY PROCEDURE consists of using ACTIS or a Fax to produce a customer fault log, to be sent to Techline, containing the following information:

- The VIN of the vehicle.
- The fabrication number of the vehicle.
- The code or error message specified in CLIP (e.g: ERROR 105).
- The type of computer (INJECTION, AIR CONDITIONING, etc).
- The Parts Department reference number for the computer read using the tool in the COMPUTER identification fault finding screen: see **CONSULTING THE IDENTIFICATION FRAME**.
- The Hardware Part No. for the computer read using the tool in the COMPUTER identification fault finding screen: see **CONSULTING THE IDENTIFICATION FRAME**

The speed and relevance of the solution provided by Techline will depend on the accuracy with which this information is entered into the customer fault log.

Following Techline's analysis of the fault, a **10 character code** (e.g: 0000CD347B) should be sent back to you. Repeat the Calibration - reprogramming procedure and enter the *Vehicle Technical Definition* code in screen **17** of the RENAULT CLIP diagnostic tool.

1: Enter the repair order.
2: Enter the *Vehicle Technical Definition*code.

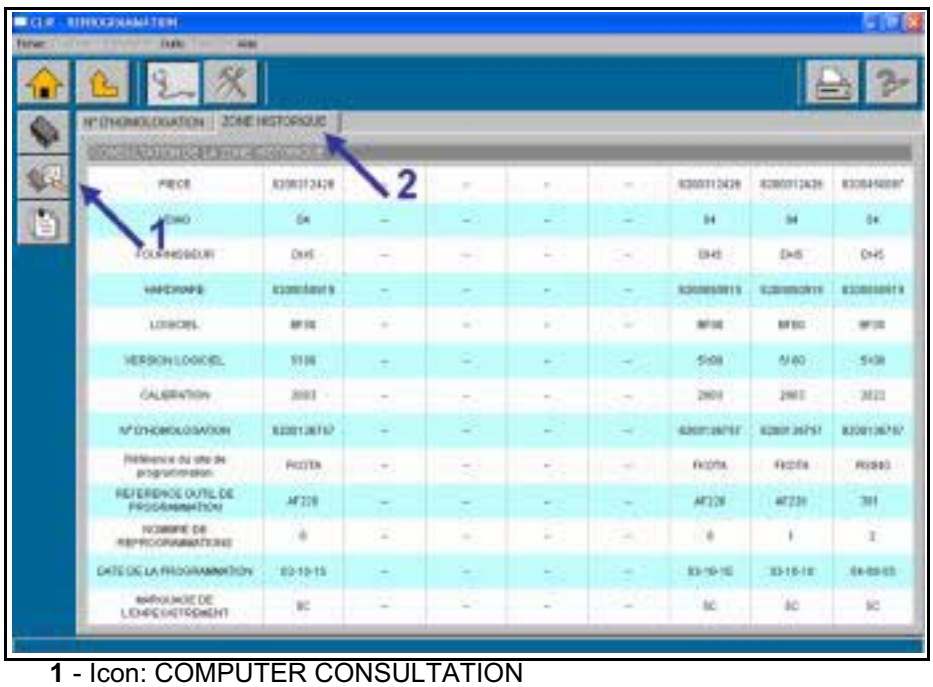
If necessary, an unconventional error could lead Techline to demand:
- the computer IDENTIFICATION FRAME: see **CONSULTING THE IDENTIFICATION FRAME**
- the HISTORY: see **CONSULTING THE HISTORY**
- the consultation of the TOOL LOG: see **CONSULTING THE TOOL LOG**
- the creation of a trace file: see **TRACE FILE**

CONSULTING THE COMPUTER IDENTIFICATION FRAME

Consulting the computer identification frame can help a problem to be better understood during an **EMERGENCY PROCEDURE**.

It allows the current (dummy) component Part No. of the computer to be consulted and to confirm that the (re)programming has been correctly carried out.

On the request of Techline, print this information screen and send it to Techline:



- Access the identification frame screen:
  MULTIPLEX NETWORK TEST/COMPUTER FAULT FINDING/IDENTIFICATION FRAME
- Press the button Print screen Syst on the top right of the keypad of the RENAULT CLIP diagnostic tool.
- Open WORDPAD(**Start → Programs→Accessories→WordPad**),
  in the **Edit** menu, **Paste** the print screen,
  then: print the document to send by fax to Techline,
  or copy it onto a disk to send by mail to Techline,
  or register the document to add it as an attachment in ACTIS.

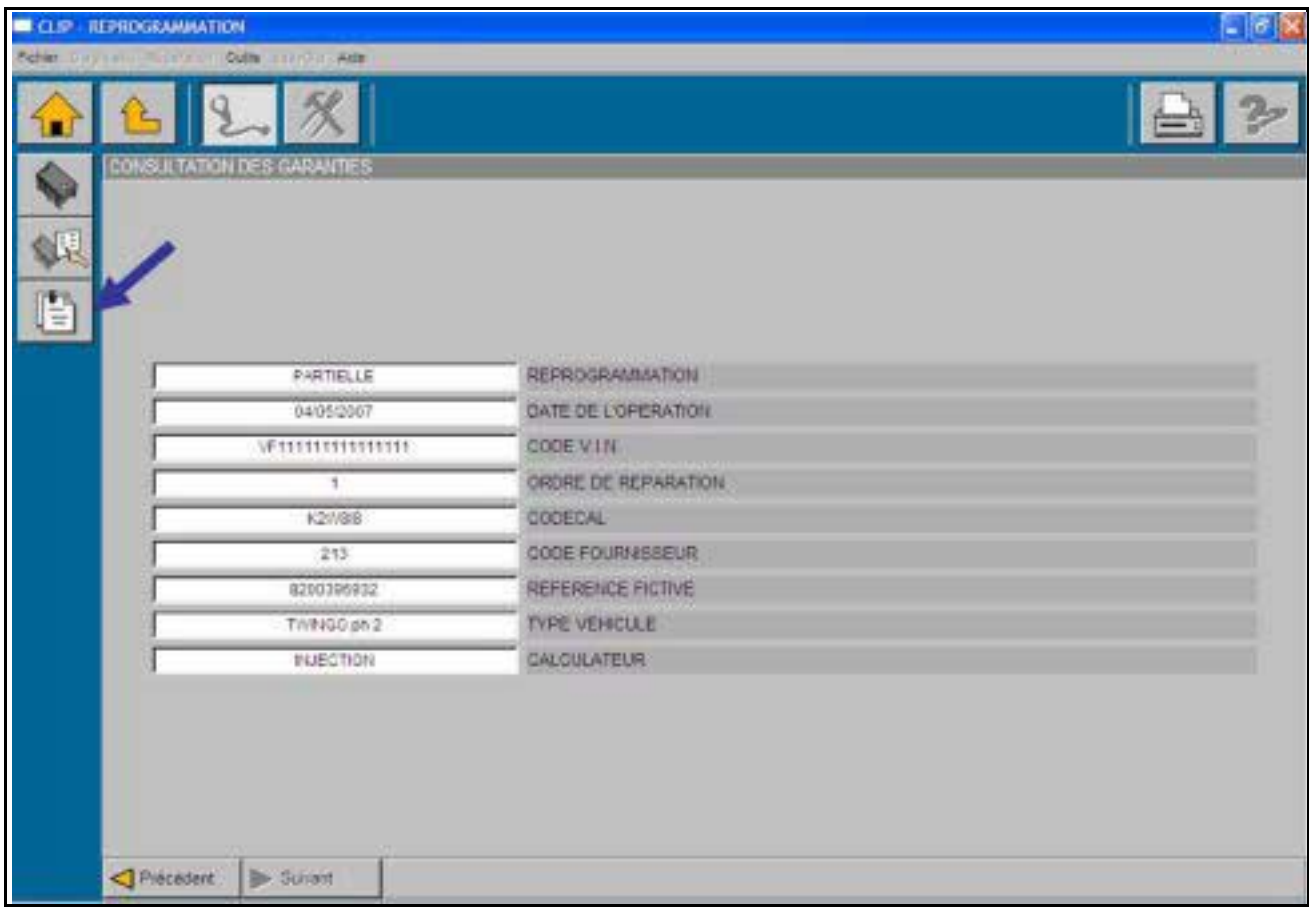
CONSULTING THE COMPUTER HISTORY

Consulting the computer's history can help a problem to be better understood during an **EMERGENCY PROCEDURE**.

It allows the last 8 reprogramming operations stored in the computer to be consulted and displays, among others, the different (dummy) component part numbers of the computer by (re)programming date.

On the request of Techline, print this screen of information and fax it to them.
See **CONSULTING THE COMPUTER IDENTIFICATION FRAME** for how to print a screen.

1 - Icon: COMPUTER CONSULTATION
2 - Tab: HISTORY

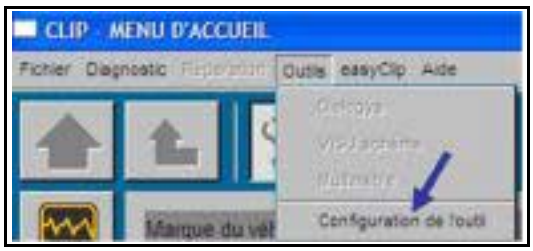


CONSULTING THE DIAGNOSTIC TOOL LOG

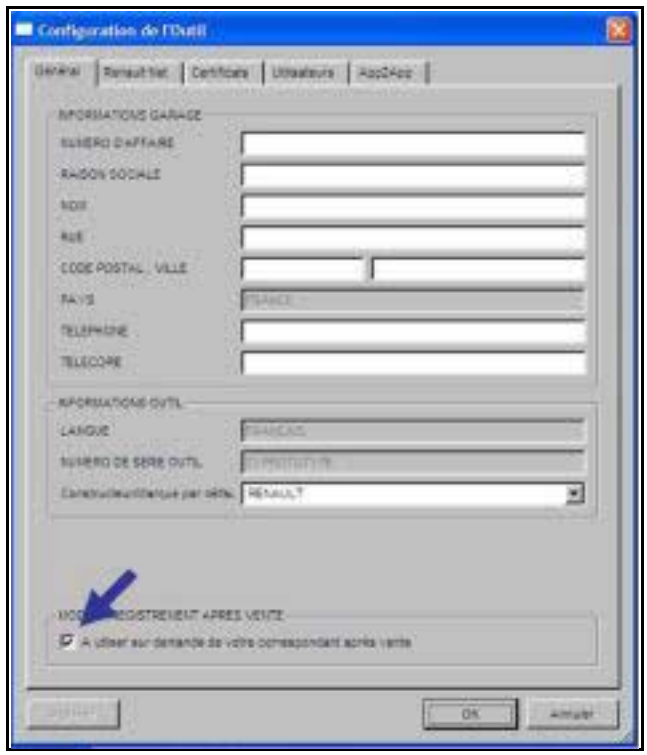
Consulting the RENAULT CLIP diagnostic tool log can aid:
- understanding of a fault during an **EMERGENCY PROCEDURE**.
- the recovery of CODECAL from the last reprogramming operations carried out.

This log enables the last 50 reprogramming operations stored in the RENAULT CLIP diagnostic tool to be consulted, displayed in chronological order with the most recent first.

This screen will provide, amongst other information:
- The vehicle's VIN.
- The Repair Order.
- The programming - reprogramming CODECAL.
- The new (dummy) Part No. for the computer in addition to that read in the **CONSULTING THE COMPUTER IDENTIFICATION FRAME**.



Upon the request of Techline, print the screen containing this information and fax it to them.
See **CONSULTING THE COMPUTER IDENTIFICATION FRAME** for how to print a screen.



TRACE FILE (upon the request of Techline)

Creating the trace file

- After starting up the **CLIP** software, click on the **Tools** tab, then on **Tool configuration**.

- In the **Tool configuration** window.

  Tick the **AFTER-SALES SAVE MODE** box, then confirm with **OK**.

- Carry out the Calibration - reprogramming until the error message is displayed.

Recovering the trace file after programming - reprogramming

- Close the CLIP application (Return to the CLIP home page then EXIT).
- In the Windows **Start** menu (bottom left-hand corner of the Windows screen), select **My Computer**.
  Then select (double left click) the following: **Local disc (C:) / CLIP / DATA/ USER / LOGS**.

Send this file to your Techline by e-mail.

Note:
For all RENAULT CLIP diagnostic tools under **Windows XP**, compress the file "clip.log":

- Select the **clip.log** trace file.
- Right click the on the **clip.log** file, and select **Properties**.
- Then **send_to Compressed (zipped) folder**.

01E FAULT FINDING INTRODUCTION

Fault finding – Introduction 01E-3
Fault finding – Customer complaints 01E-20
Fault finding – Fault finding charts 01E-37
Noise diagnostic tool – Use 01E-101

1. SCOPE OF THIS DOCUMENT

This document covers the following topics:

- Noise from the drive train,
- Noise when changing gear,
- Air inlet noises,
- Noise from the turbocharger,
- Noise from the exhaust
- Interference noise (suspension, steering, etc.)
- Noise from the dashboard,
- Noise from the upholstery,
- Noise from the sunroof,
- Noise from the window winders,
- Noise from the speakers.

This document presents the fault finding procedure applicable to all vehicles with the following specifications:

- Vehicles with 2 drive wheels for the drive train,
- Manual gearboxes (for drive train noises)
- Original sliding/tilting sunroof.

2. PRE-REQUISITES FOR FAULT FINDING

Documentation type

- Fault finding procedure (this document):
- Repair Manual for the vehicle concerned

Type of diagnostic tools

- CLIP to lock the airbags (if necessary)
- Noise diagnostic tool (see **01E GENERAL VEHICLE INFORMATION, Noise diagnostic tool - Use**)

3. FAULT FINDING PROCEDURE

1st time
complete the fault finding log
with the customer (with or without a test)

↓

2nd time
Use the Customer Complaint classification chart to identify the cause of the noise and
the corresponding ALP based on the conditions under which the noise appears

↓

3rd time
Apply the corresponding **F**ault **F**inding **C**hart (ALP).
Identify the origin of the fault

Rules for dealing with a noise-related customer complaint when the vehicle is received or in the workshop:

Rule no. 1: When the customer complaint is registered.

When the appointment is made by telephone, ask if the customer would be able to reproduce the noise in the workshop (enable the cotech to hear the noise with the customer present so that the fault finding procedure is more efficient).

If the customer cannot, preferably offer a date when they are not busy in order to deal with the noise.

Rule no. 2: Take information in a methodical manner.

The fault finding log must be completed to accurately describe the customer complaint in addition to the Order of repair.

4. FAULT FINDING LOG

IMPORTANT!

WARNING
All problems involving a complex system call for thorough diagnostics with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential item when discussing the fault with the manufacturer.

It is therefore mandatory to fill out a fault finding log for each fault finding procedure.

You will always be asked for this log:

- when requesting technical assistance from the Techline,
- for approval requests before replacing parts for which approval is compulsory
- which must be attached to monitored parts for which reimbursement is requested. It is therefore used to decide whether a reimbursement will be made under warranty and leads to improved analysis of the removed parts.

A blank log is available on the following pages

Customer complaint

	520	Abnormal noise, vibrations

Other — Your comments:

Conditions under which the customer complaint occurs

		In forwards gear (whilst driving)			Whilst reversing			When starting (increased engine speed in 1st)
		Whilst parking			When stationary (engine running)			When stationary (engine not running)
		Switching the engine on/off						

– Engine

	Engine fitted with a turbocharger		Petrol		Diesel

– Vehicle speed

	between 0 and 30 mph (0-50 km/h)		between 30 and 54 mph (50-90 km/h)		between 54 and 78 mph (90-130 km/h)
	constant		variable		

FAULT FINDING LOG

– Engine speed

	at idle speed (neutral)		at low engine speed Diesel and Petrol < 1500 rpm		at medium engine speed 1500 < Diesel < 3000 rpm 1500 < Petrol < 4000 rpm
	at high speed Diesel > 3000 rpm Petrol > 4000 rpm		stabilised		variable
	under speed		over speed		increasing engine speed (no load)
	lessens when engine speed increases				

– Engine temperature

	When cold		When warm		Quieter when hot
	Worse when hot				

– Driving conditions

	In neutral		When decelerating		Heavy acceleration
	On a hill		Pedal released suddenly after it is fully depressed		

– Vehicle speed

	Stabilised: vehicle speed or engine speed constant.		Accelerating

– Driver's action on the accelerator (acceleration or deceleration)

	no pressure		foot resting on or lightly depressing the accelerator pedal		Accelerator pedal moderately depressed and held (neither slightly nor fully depressed)
	pedal held fully depressed		pedal fully depressed suddenly (on-off)		Accelerator pedal gradually released
	Accelerator pedal suddenly released		disappears when pedal released without braking		

FAULT FINDING LOG

– Driver's action on the gear lever (gearbox)

	when changing gear (one or more)		gets worse when changing gear quickly		only appears when engaging the gear.
	Always appears when engaging AND disengaging gear.		worse when downshifting		

– Driver's action on the clutch

	the customer complaint disappears when declutching and reappears when engaging the clutch		the customer complaint disappears when changing gear, disengaged.		the customer complaint lessens when changing gear, disengaged. (test type handling in a motor show)

– Driver's action on the steering wheel

	Little movement (pressure change, cornering)		Significant movement (roundabout, manoeuvres)

– Driver's action on a vehicle fitting

	Upholstery (adjustments)		Sunroof (opening/closing)		Sunblind (opening/closing the sunblind)
	Dashboard (glovebox, air conditioning controls, etc.)		Speaker (switching on)		whilst opening/closing the window
	whilst opening or closing the window fully		when closing the door (window half-open)		

FAULT FINDING LOG

– Weather conditions

	cold weather (frost)		hot weather (sun)		humid conditions
	dry conditions				

– Main beam

	smooth		cobbled		grooved
	in poor condition: unmade, road seams, drain cover, pot hole, etc.		When driving over a speed bump		Mounting/dismounting the pavement
	Corner (to the left or right)		parallel parking		

5. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

The road tests referred to in this document should be carried out in accordance with Road Traffic Regulations (speed limits must be obeyed).

During the tests performed with the engine running, observe the safety advice. Pay particular attention to the accessories, moving parts or parts which heat up (fan assembly activation, increase in temperature of the air pipe at the turbocharger outlet, etc.)

WARNING
When carrying out road tests, obey Road Traffic Regulations, especially speed limits.

Within the framework of a fault finding test, two people are required to carry out the research and specific identification of the source of the noise.

6.1. DEFINITIONS OF CAUSES:

This document deals with the following causes of noise:

Drive train:

TEST PROTOCOL FOR CLASSIFICATION OF THE CUSTOMER COMPLAINT

A. If the customer complaint appears when driving
- Perform **gradual** accelerations and decelerations [1] [2] on each gear to determine which gear(s) display the customer complaint (on an even straight line with a good surface, warm engine and after having checked that the oil and coolant levels are correct). Note the vehicle speed, gear ratio and engine speed.
- **Disengage / re-engage**: if the customer complaint disappears when disengaging and reappears when re-engaging the gear and the engine speed is stabilised, there is a whining noise and/or growling.
- **Change pressure**: if the noise level is more pronounced or decreases when pressure is applied (when overtaking, cornering, on a roundabout, moving steering wheel to the left/right), this is not a drive train fault (check the wheel bearings).

B. If the customer complaint appears particularly during a parking manoeuvre (steering greater than one steering wheel revolution, in 1st or 2nd gear)
If a noise appears when accelerating and disappears when decelerating, there is a murmuring noise from the differential.

C. If the customer complaint appears when stationary
In neutral and disengaged, increase the engine speed **very** gradually [2].
If the noise identified when driving is still present at the same engine speed, it is not a drive chain fault.

[1]: The speed range under which the customer complaint appears may be restricted. It is necessary to slowly increase and decrease the engine speed for each gear.
[2]: Increased engine speed: as long as the noise can be heard.
- up to approximately 4500 rpm (petrol engine),
- up to approximately 3000 rpm (diesel engine).

Never go into the red zone.

Whining noise (drive train)
Definition: high-pitched noise caused by teeth engaging when driving.
Note: this customer complaint can be noticed from 0 miles. It is more noticeable on long journeys on a constant road type (motorway). Not to be confused with aerodynamic noise.

Test to identify the whining noise from the engaging teeth: during a road test, hold the gear lever to dampen the gearbox control driveshaft chain. If the noise is quieter or disappears, check the gear lever first and, if the gear lever is correct, consult ALP 13 - Whining noise from the drive train.

Murmuring (differential - relay bearings)
Definition: modulated noise which is similar to the cooing of a pigeon.
Note: this customer complaint can occur at any point in the vehicle's lifetime.

Test to identify the murmuring noise from a driveshaft: during a road test, if there is significant noise when driving in a straight line and when cornering, study the right-hand driveshaft relay bearing. If there is only significant noise when cornering, there is a fault in the gearbox, mainly with the differential.

Growling noise (drive train)
Definition: continuous noise which is similar to the noise when shaking a bag of nuts.
Note: appears particularly when hot and can be easily heard when the windows are open when passing alongside a wall. It is quite noticeable at low speed.

Test to identify the growling noise: during a road test, perform gentle accelerations in 1st and 2nd gear. If the noise dies down or disappears whilst holding the gear lever, study the control instead.

Noise from neutral (drive train)
Definition: sewing machine noise.
Note: disappears when accelerating and declutching.

Exhaust

Crackling from the pipe or ball joint.
Definition:
– For the pipe: noise like a bag of marbles shaken energetically. Very high frequency (very high-pitched).
– The ball joint may grate when fitted to the spring.
Note: can be heard easily from the outside or when the window is open (car park exit, when passing alongside a wall). The noise becomes more pronounced very quickly if no repair work is carried out on the vehicle. It can be reproduced when stationary by shaking the exhaust pipe.

Warning
The crackling may spread and get worse along the exhaust system, despite the cause being very localised at the beginning of the system (connecting hose or ball joint bracket). It may appear that the entire pipe is concerned but this is not the case.

Noise from underbody contact.
Definition: dull or bright metallic noise (fist banging on a table).
Note: it can be reproduced when stationary by shaking the exhaust pipe.

Exhaust leak noise.
Definition: none.
Note: it depends on the engine speed and can be heard according to the extent and location of the leak.

Turbocharger

Meowing noise from the turbocharger.
Definition: single frequency continuous noise, **sub-synchronous to the speed of the turbocharger**.
Note: the meowing noise from the turbocharger is quieter when hot.

Whistling noise from the turbocharger.
Definition: high-pitched whistling which follows the turbocharger rotation speed, **either synchronous to the turbocharger speed, or super-synchronous to this speed (vane number x turbocharger speed)**.
Notes:
– the whistling noise from the turbocharger is worse when hot.
– Any of the fittings installed, poor bonding of the windscreen or cable routing through the bulkhead may be the cause of the detected noise.

Blowing noise from the turbocharger.
Definition: noise similar to the noise made by a ventilation fan (passenger compartment ventilation, engine cooling system)
Note: the blowing noise from the turbocharger is even louder when the turbocharger air flow is higher.

Sighing noise from the turbocharger (Diesel terminology).
Definition: noise similar to a volume of pressurised air being released **suddenly**.
Note: the sighing noise from the turbocharger is even greater when the turbocharging pressure is greater as the pedal is released.

Releasing noise from the turbocharger: (petrol terminology).
Definition: noise similar to a volume of pressurised air being released **very suddenly** (activation of the turbocharger recirculation valve).
Note: the releasing noise from the turbocharger is even greater when the turbocharging pressure is greater as the pedal is released.

Air intake

Air inlet whistling.
Definition: high-pitched noise similar to whistling.

Test protocol.
Carry out at test in the workshop with the vehicle stationary and the bonnet open:
Warm engine: increased engine speed (neutral) to average speed (4000 rpm for a petrol engine; 3000 rpm for a diesel engine).

Warning.
The air inlet whistling noise must be distinguished from the turbocharger whistling noise. It is directly related to the engine speed and not to the speed of the turbocharger.

Air inlet humming.
Definition: dull noise which is similar to the noise of a bumblebee in flight.
Note: noise sensitive to engine load (petrol).
Noise not sensitive to engine load (diesel).

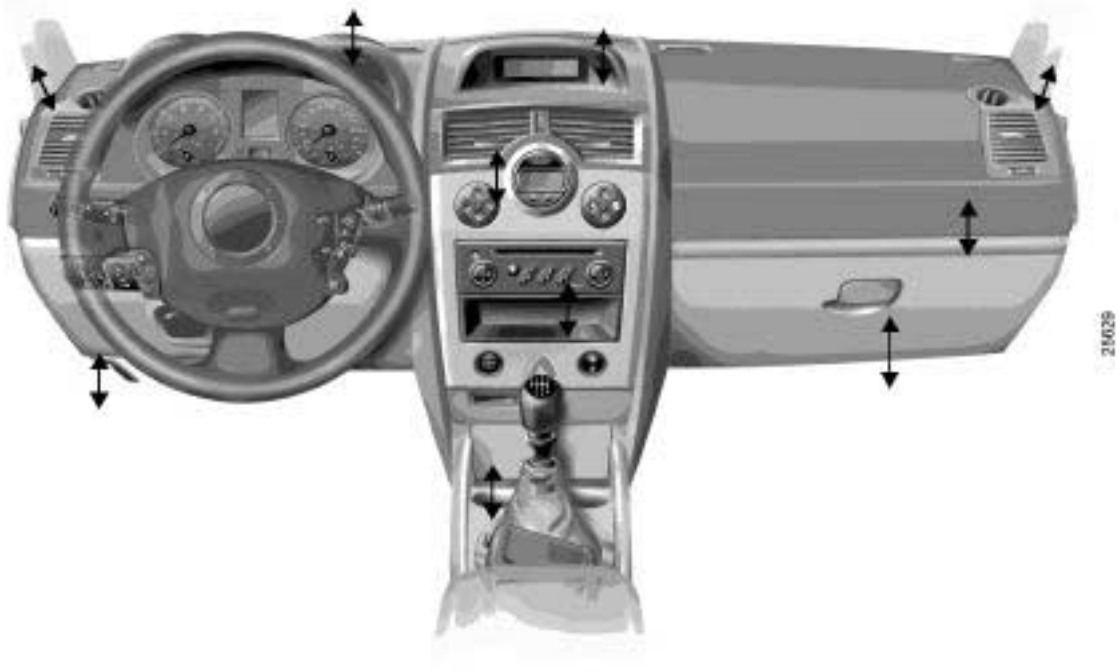
Noise when changing gear

Noise when engaging and disengaging gear.
Definition: more or less marked dull clicking (short thud).
Note:
– engine stopped, when static, if the same gears are engaged one after another (e.g. neutral- first), the first gear change is always the noisiest. On the other hand, if the gear is changed from neutral - 1st - 2nd then neutral - 1st, there will be as much noise during the first gear change in the first series as in the second.
– depending on the clutch "performance" (ability to separate the engine from the gearbox quickly) the noises when engaging/disengaging may be more pronounced.

Creaking:
Definition: onomatopoeia of a dry noise heard whilst engaging a gear (partially or completely). A malfunctioning gearbox can potentially be accompanied by successive shocks in the gear knob which may prevent gear engagement. Sporadic noise which is similar to a rattle.
Note: for basic range vehicles, it may be normal to notice creaking noises in reverse gear.

Banging during power take-up:
Definition: banging whilst changing gear or during torque inversion (successive acceleration or deceleration).
Note: mainly in the lower gears (1st, 2nd, 3rd).

Interference noise



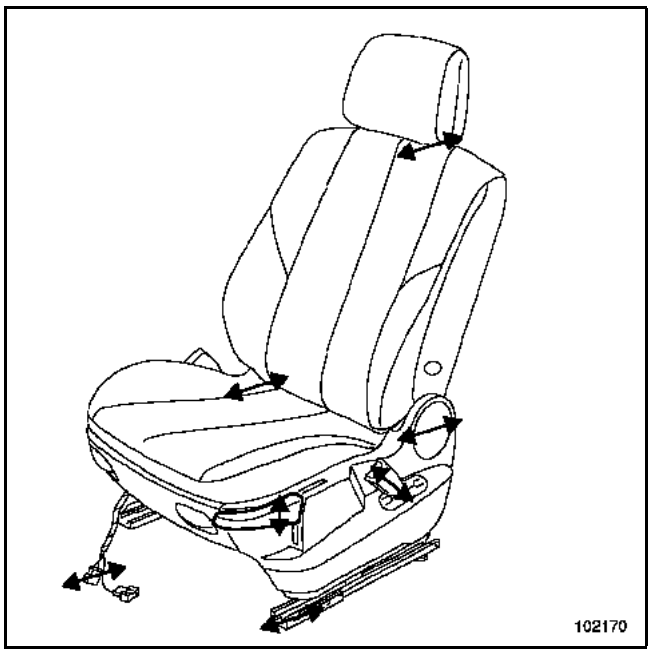
Definition: noise which is difficult to locate, due to a fault in the chassis, steering, engine and transmission assembly suspensions, underbody area, rotating components or front end panel.

Dashboard

There are three types of dashboard noise:

- **rubbing noises**: two components or sections rub against each other which produces a creaking or grating noise.
- **banging noises**: two components or sections knock together which produces a crackling or rattling noise.
- **vibration**: too much play between two components or sections

These noises are mainly related to contact between two components (cover or front panel and dashboard casing) or related to a component which moves with another component.

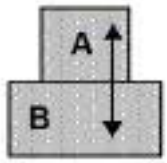


↔: Area likely to produce a noise

Noise from the upholstery

There are three types of seat noise:

- **rubbing noises:** two components or sections rub against each other which produces a squeaking or grating noise (e.g. adjustment lever)
- **banging noises**: two components or sections knock together which produces a crackling noise (e.g. cover) or a rattling noise (e.g. wiring)
- **vibration**: too much play between two components or sections



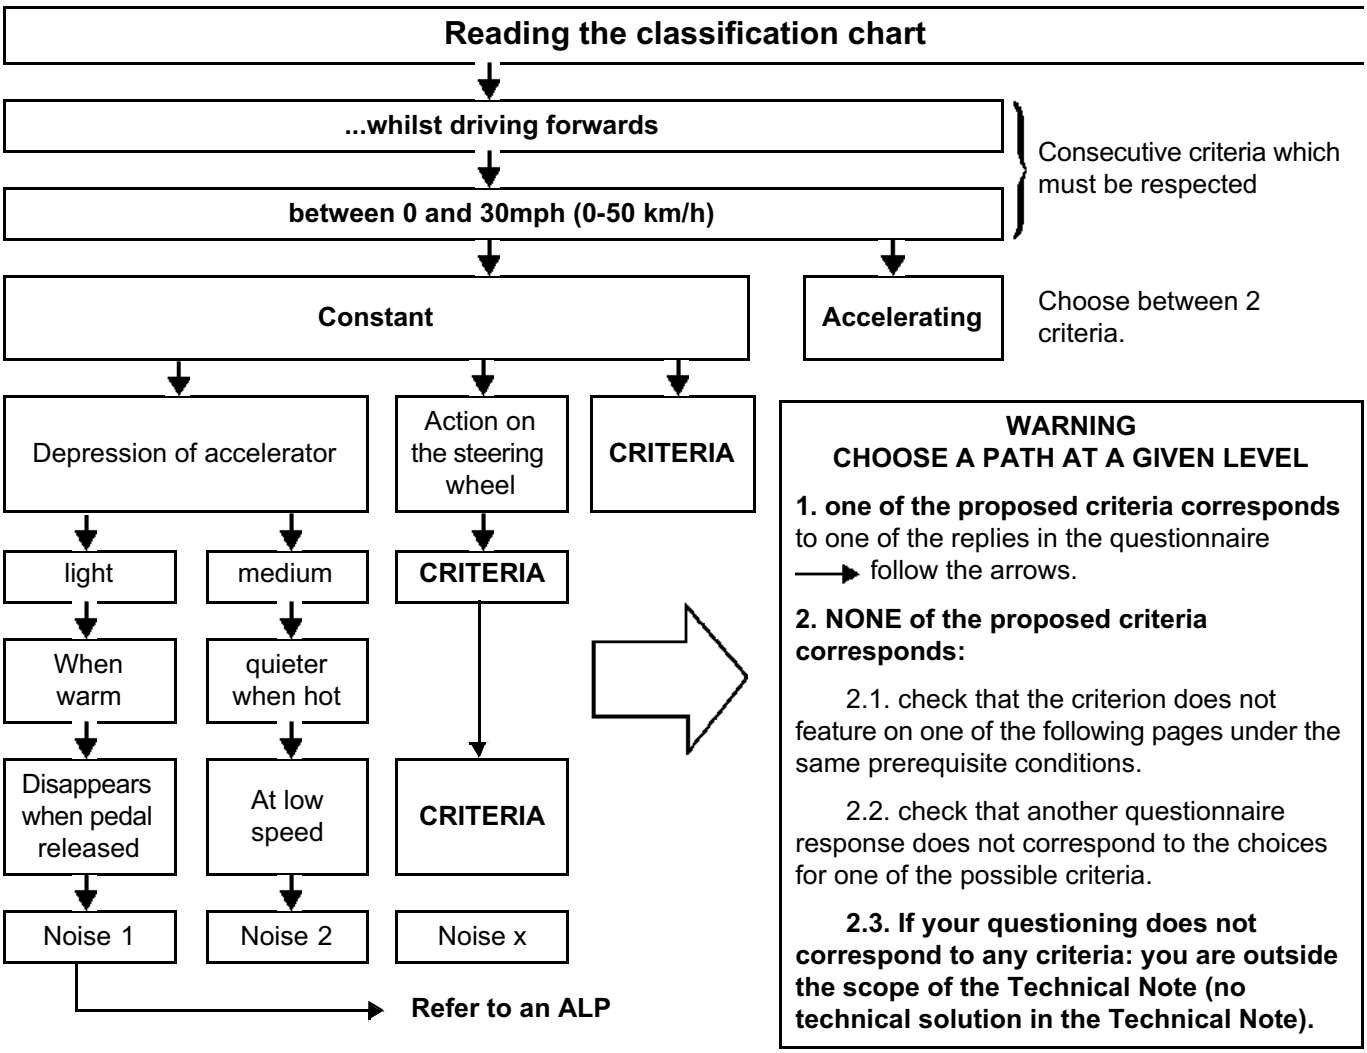
These noises are mainly related to contact between two components (e.g. cover and dashboard casing) or related to a component which moves against another component (e.g. runners)

↔: Area likely to produce a noise

Crackling from the speaker

Definition:

Crackling: quick alternating impact between two components.



Sunroof:

Sunroof chattering: jerky movement of mobile panel when opening/closing (vertical movement of the panel while moving longitudinally)

6.2. CAUSE OF NOISE CLASSIFICATION CHART

WARNING
The Customer Complaint Classification Chart is used to identify the cause of a noise which has been detected by the customer. A Classification Chart is selected using a questionnaire which lists the different conditions under which the noise appears.

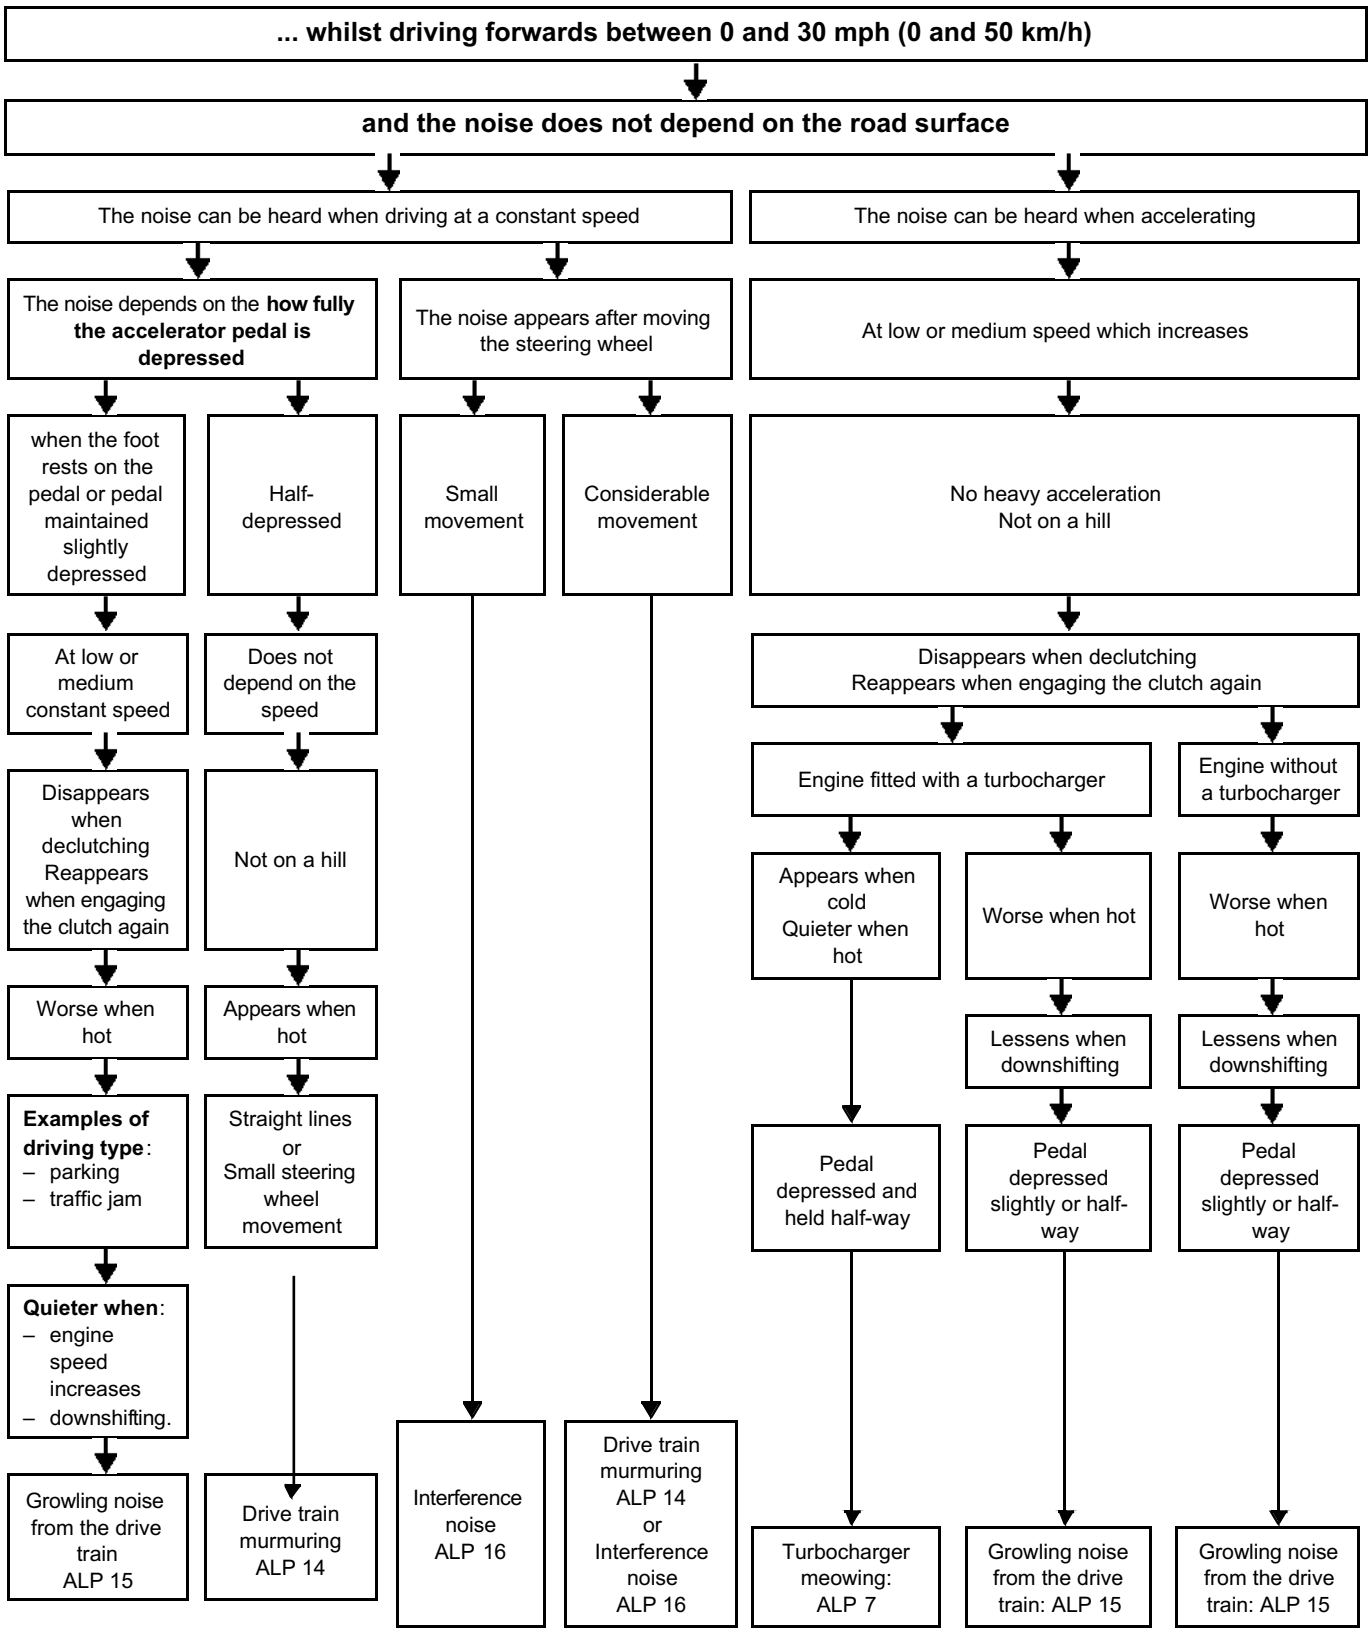
Only the **most common conditions** under which the noise occurs are listed in the classification chart. It is important to correctly identify with the customer **the main condition** under which the noise appears.

CONDITIONS UNDER WHICH THE NOISE APPEARS

The noise is detected:		
	whilst driving forwards between 0 and 30 mph (0-50 km/h) and the noise depends on the road surface	conditions under which the noise appears no. 1
	whilst driving forwards between 0 and 30 mph (0-50 km/h) and the noise does not depend on the road surface	conditions under which the noise appears no. 2
	whilst driving forwards between 30 and 54 mph (50 and 90 km/h)	conditions under which the noise appears no. 3
	whilst driving forwards between 54 and 78 mph (90 and 130 km/h)	conditions under which the noise appears no. 4
	whilst driving forwards in a particular engine speed range	conditions under which the noise appears no. 5
	whilst driving forwards when the accelerator is depressed in a particular manner	conditions under which the noise appears no. 6
	whilst driving forwards when the gear lever is manipulated in a particular manner	conditions under which the noise appears no. 7
	whilst driving forwards	conditions under which the noise appears no. 8
	Whilst reversing	conditions under which the noise appears no. 9
	starting	conditions under which the noise appears no. 10
	whilst parking	conditions under which the noise appears no. 11
	when stationary, engine running	conditions under which the noise appears no. 12
	when stationary, engine may or may not be running	conditions under which the noise appears no. 13
	vehicle stationary, engine not running or switching ignition on/off	conditions under which the noise appears no. 14

Conditions under which the noise appears no. 1

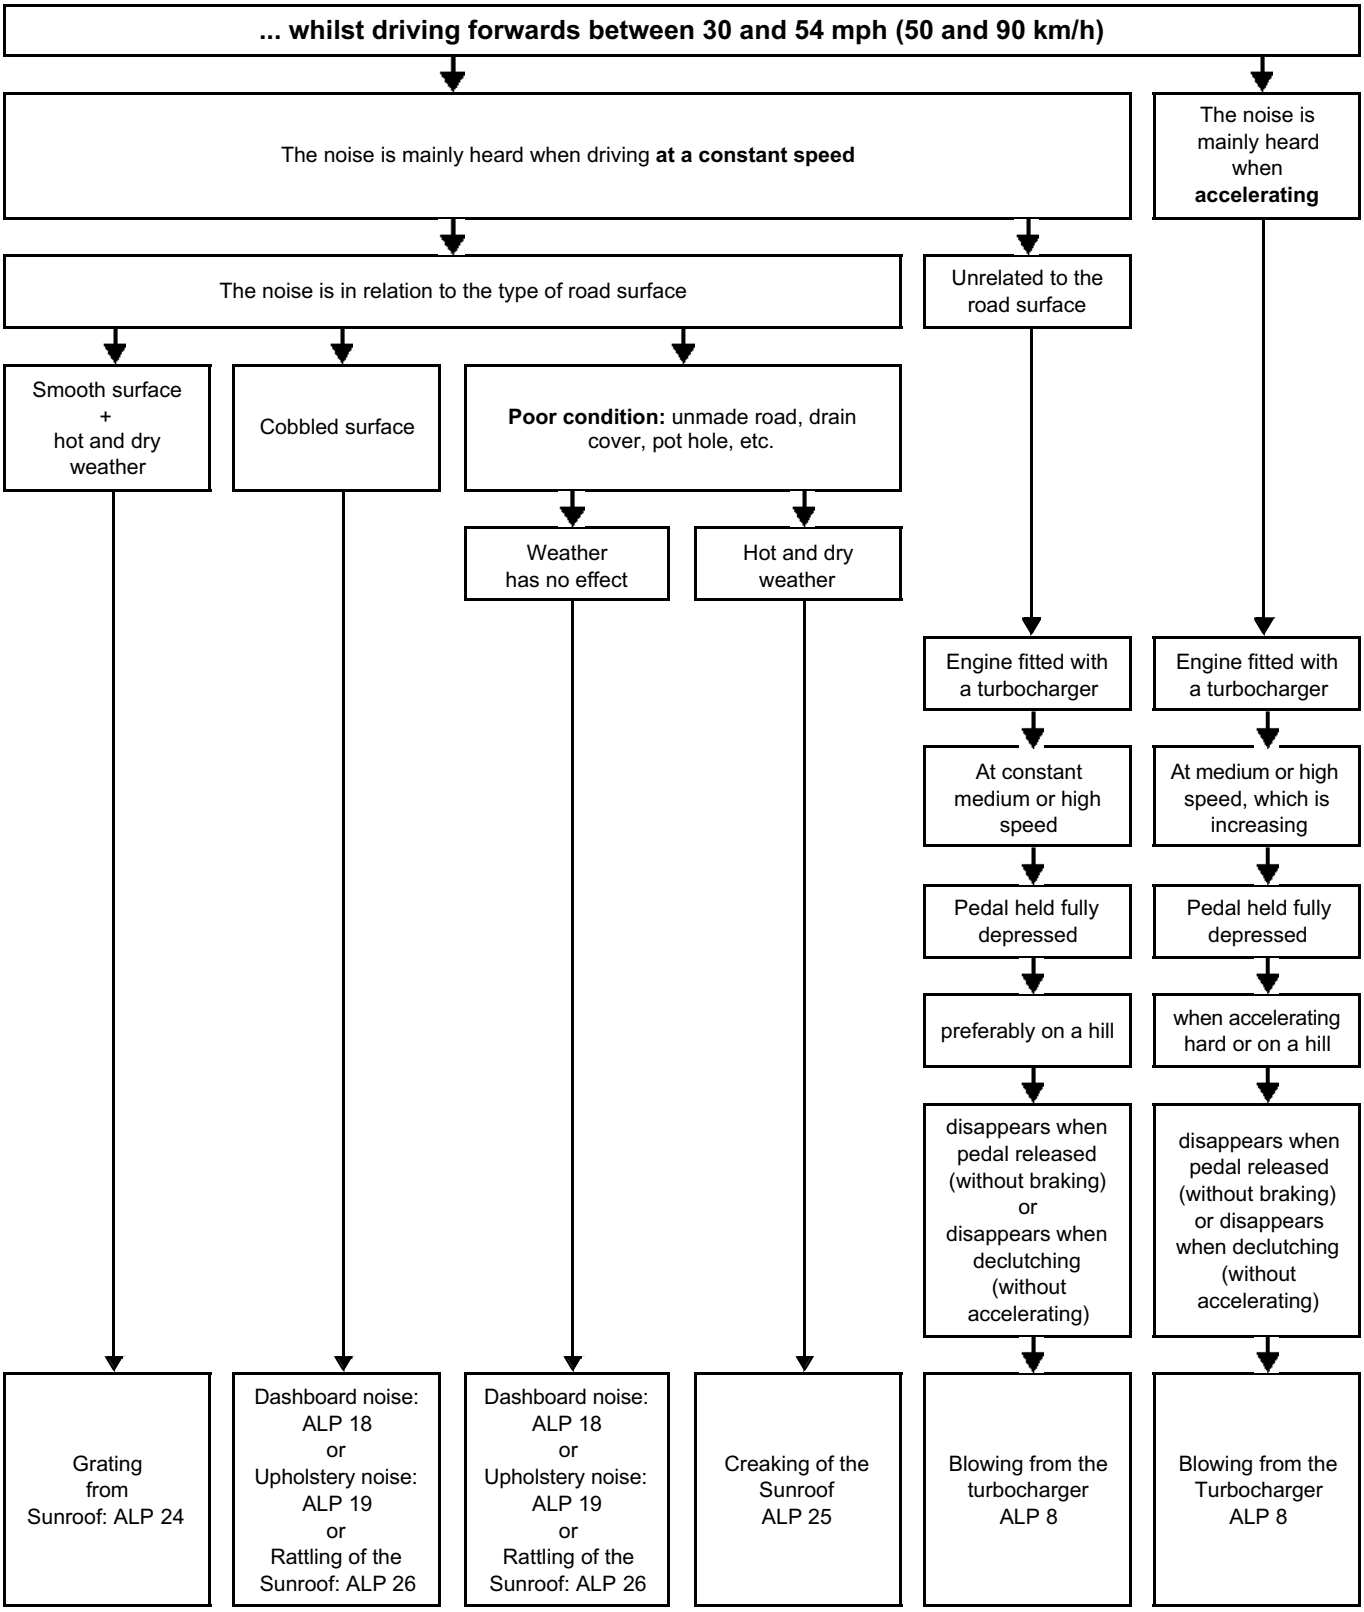
The noise is detected...



... whilst driving forwards between 0 and 30 mph (0 and 50 km/h)

and the noise depends on the road surface

- Smooth surface + Hot and dry weather → Sunroof creaking: ALP 24
- Cobbled surface → **It may be related to:** 1. Interference noise: ALP 16 2. Dashboard noise: ALP 18 3. Upholstery noise: ALP 19 4. Sunroof rattling: ALP 26 5. Underbody contact noise (exhaust): ALP 4
- Grooved surface → Interference noise: ALP 16
- Poor condition: unmade road, road seams, drain cover, pot hole, etc.
  - Weather has no effect → **It may be related to:** 1. Interference noise: ALP 16 2. Dashboard noise: ALP 18 3. Upholstery noise: ALP 19 4. Sunroof rattling: ALP 26 5. Underbody contact noise (exhaust): ALP 4
  - in hot and dry weather → Sunroof creaking: ALP 24
- On a speed bump → **It may be related to:**
  - Interference noise: ALP 16
  - Sunroof rattling: ALP 26



Conditions under which the noise appears no. 2

The noise is detected...

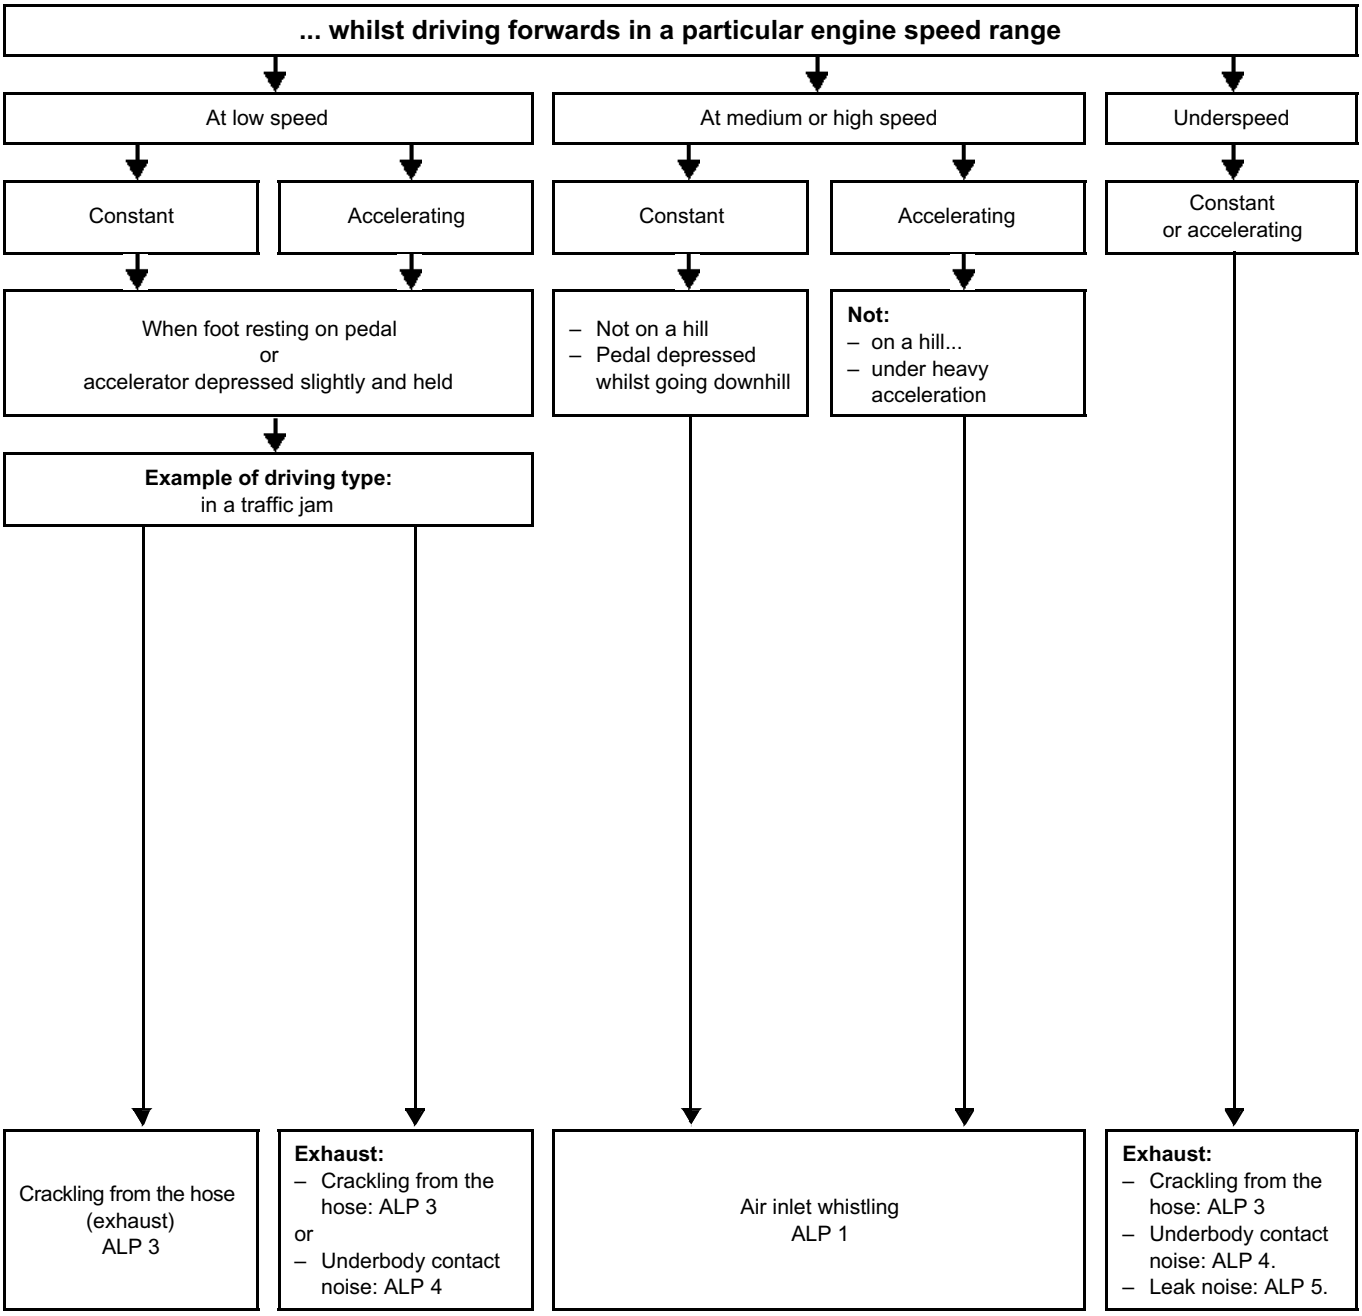
The noise is detected...



Conditions under which the noise appears no. 4

The noise is detected...

Conditions under which the noise appears no. 5

The noise is detected...

Conditions under which the noise appears no. 6

The noise is detected...

... whilst driving forwards when the accelerator is depressed in a particular manner

Noise present:
from foot resting on pedal...
to pedal held depressed half-way (not lightly nor fully).

With or without turbocharger

constant or accelerating

Appears at any vehicle speed

– Not on a hill.
– No heavy acceleration.

Disappears **instantly** when declutching
Reappears when engaging the clutch again

Does not appear when speed increased unladen (workshop)

Whining noise from the drive train
ALP 13

Noise absent:
– when foot resting on pedal,
– when pedal maintained slightly depressed.

Noise present:
– when pedal maintained depressed half-way (neither slightly nor fully).

Engine fitted with a turbocharger

Accelerating

Appears at any engine speed

Worse when hot

Fades then disappears when declutching
Reappears when engaging the clutch again

The noise fades when pedal is released then disappears (without braking)

Whistling noise from the turbocharger
ALP 6

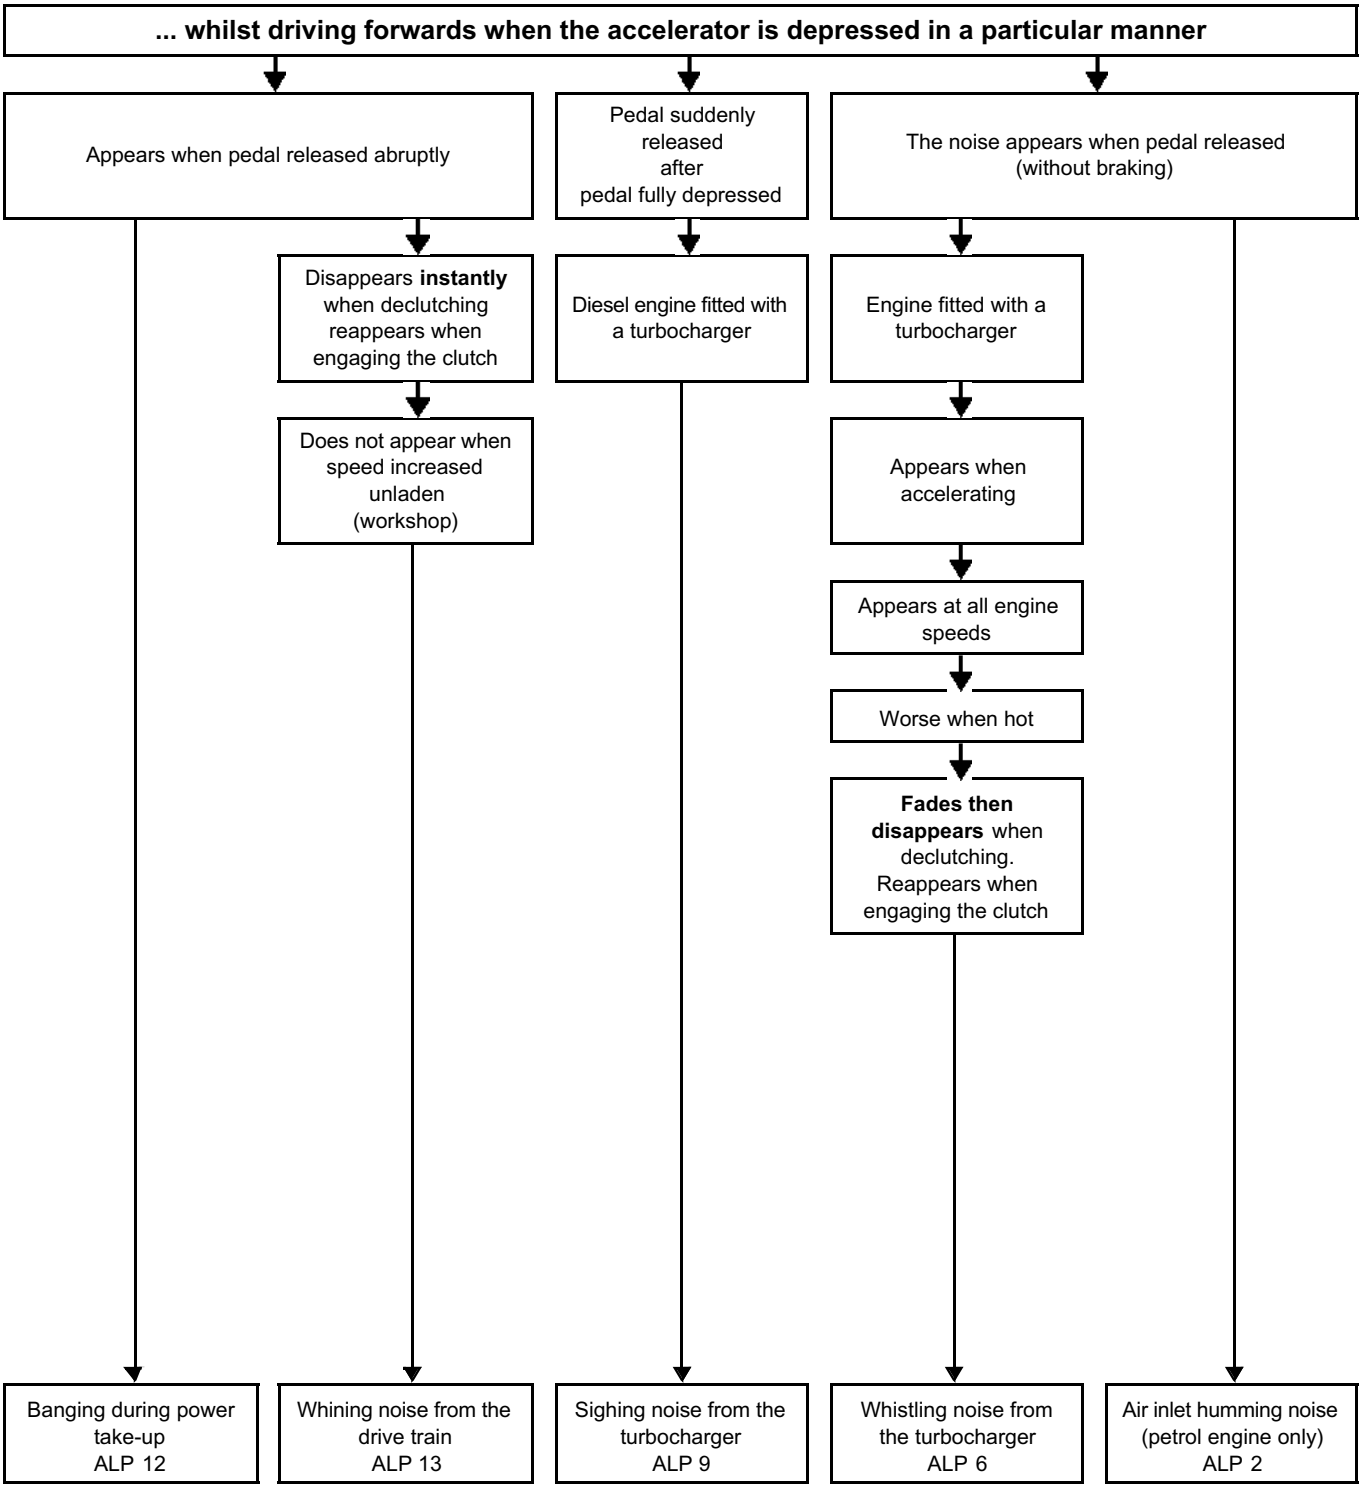
Pedal fully depressed suddenly
(on-off)

Banging during power take-up
ALP 12

Appears
when pedal released gradually

With or without turbocharger

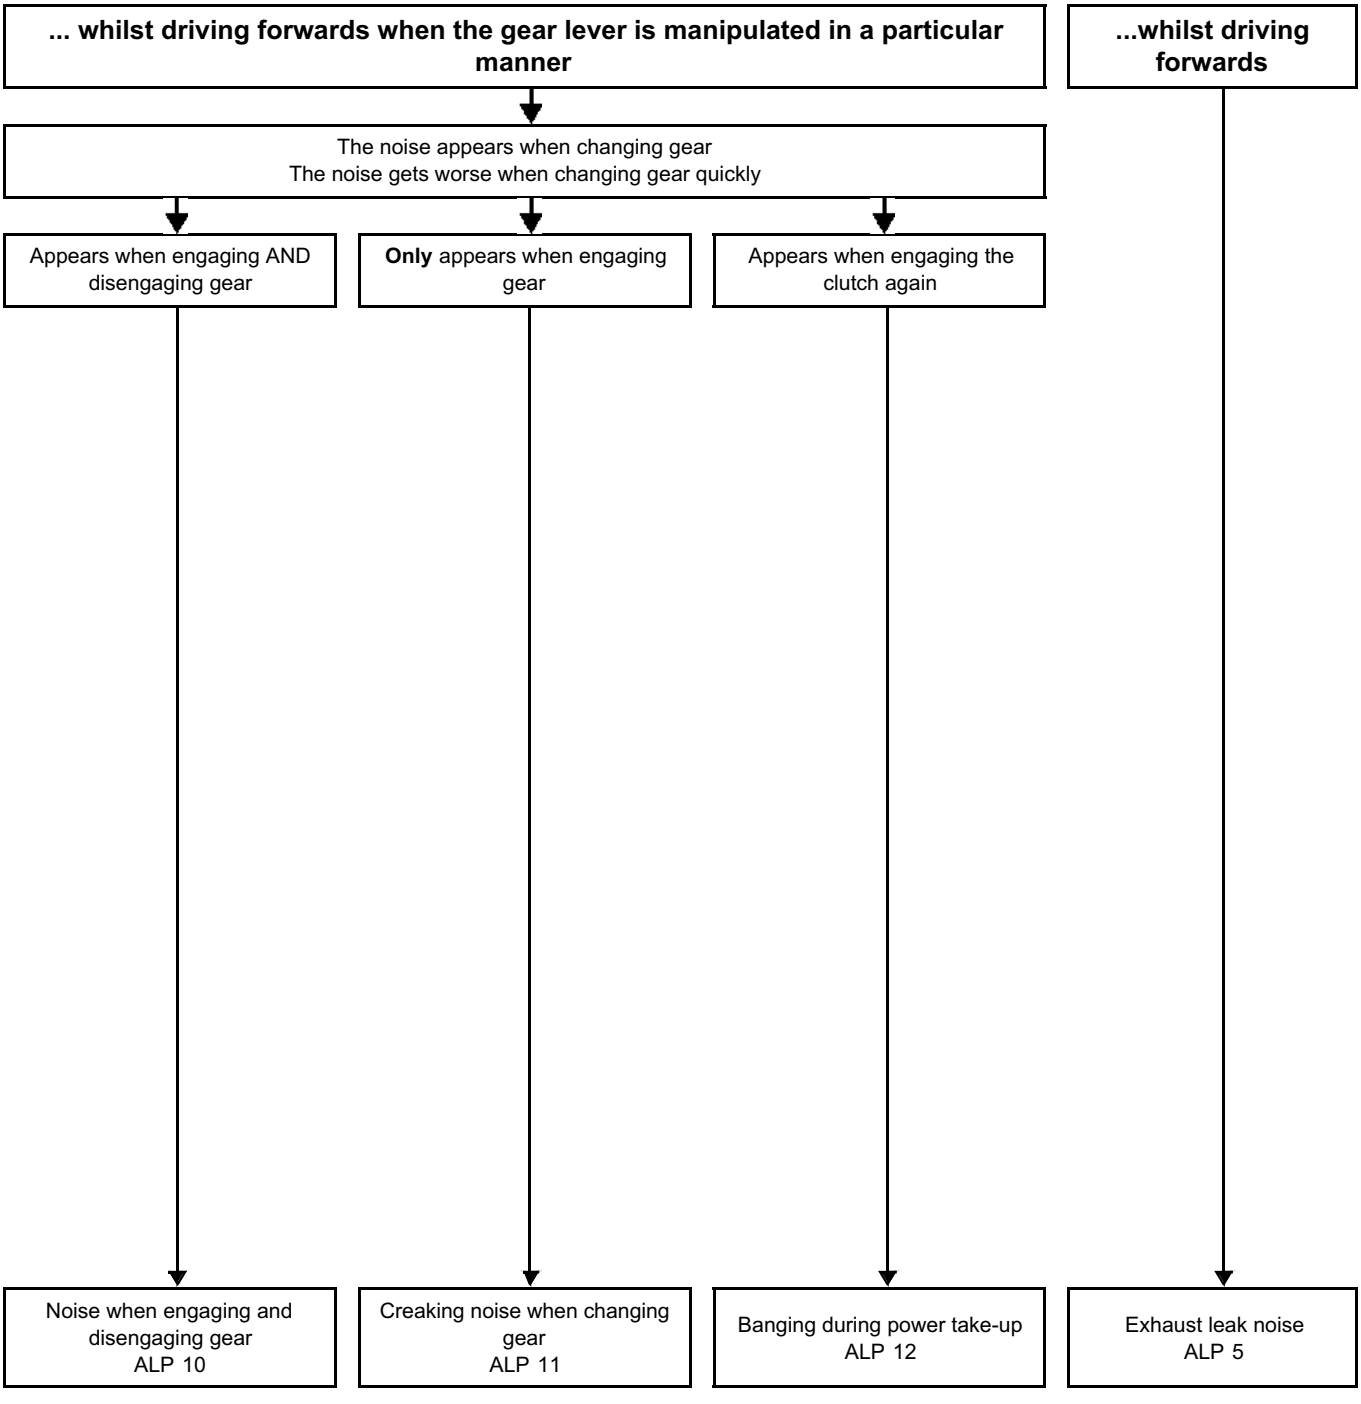
Deceleration controlled by the engine



Disappears **instantly** when declutching
Reappears when engaging the clutch again

Does not appear when speed increased unladen (workshop)

Whining noise from the drive train
ALP 13



Conditions under which the noise appears no. 6 (continued)

NOISE FROM THE UPHOLSTERY	ALP 19
NOISE WHEN WINDOW IS OPERATED (SQUEAKING/CREAKING)	ALP 20
NOISE WHEN WINDOW IS OPERATED (SCRATCHING)	ALP 21
NOISE FROM THE WINDOW WHEN CLOSING THE DOOR (RATTLING)	ALP 22
SUNROOF CHATTERING: JERKY MOVEMENT WHEN OPENING/CLOSING SUNROOF MOBILE PANEL	ALP 23
SUNROOF CREAKING	ALP 24
GRATING NOISE FROM THE SUNBLIND	ALP 25
SUNROOF RATTLING	ALP 26

ALP 1	Air inlet whistling noises

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Preliminary step: determine the area concerned (if accessible).
With the engine running, reproduce the whistling noise and detect the cause by placing a hand (part by part) or using the noise diagnostic tool (see **Noise diagnostic tool - Use**) on components which may be causing the noise and examining the entire circuit.
Two possible scenarios can arise:
– scenario no. 1 - The area is identified: only apply the ALP to the suspect area.
– scenario no. 2 - The area is not identified: follow the ALP, applying it to the entire air circuit.

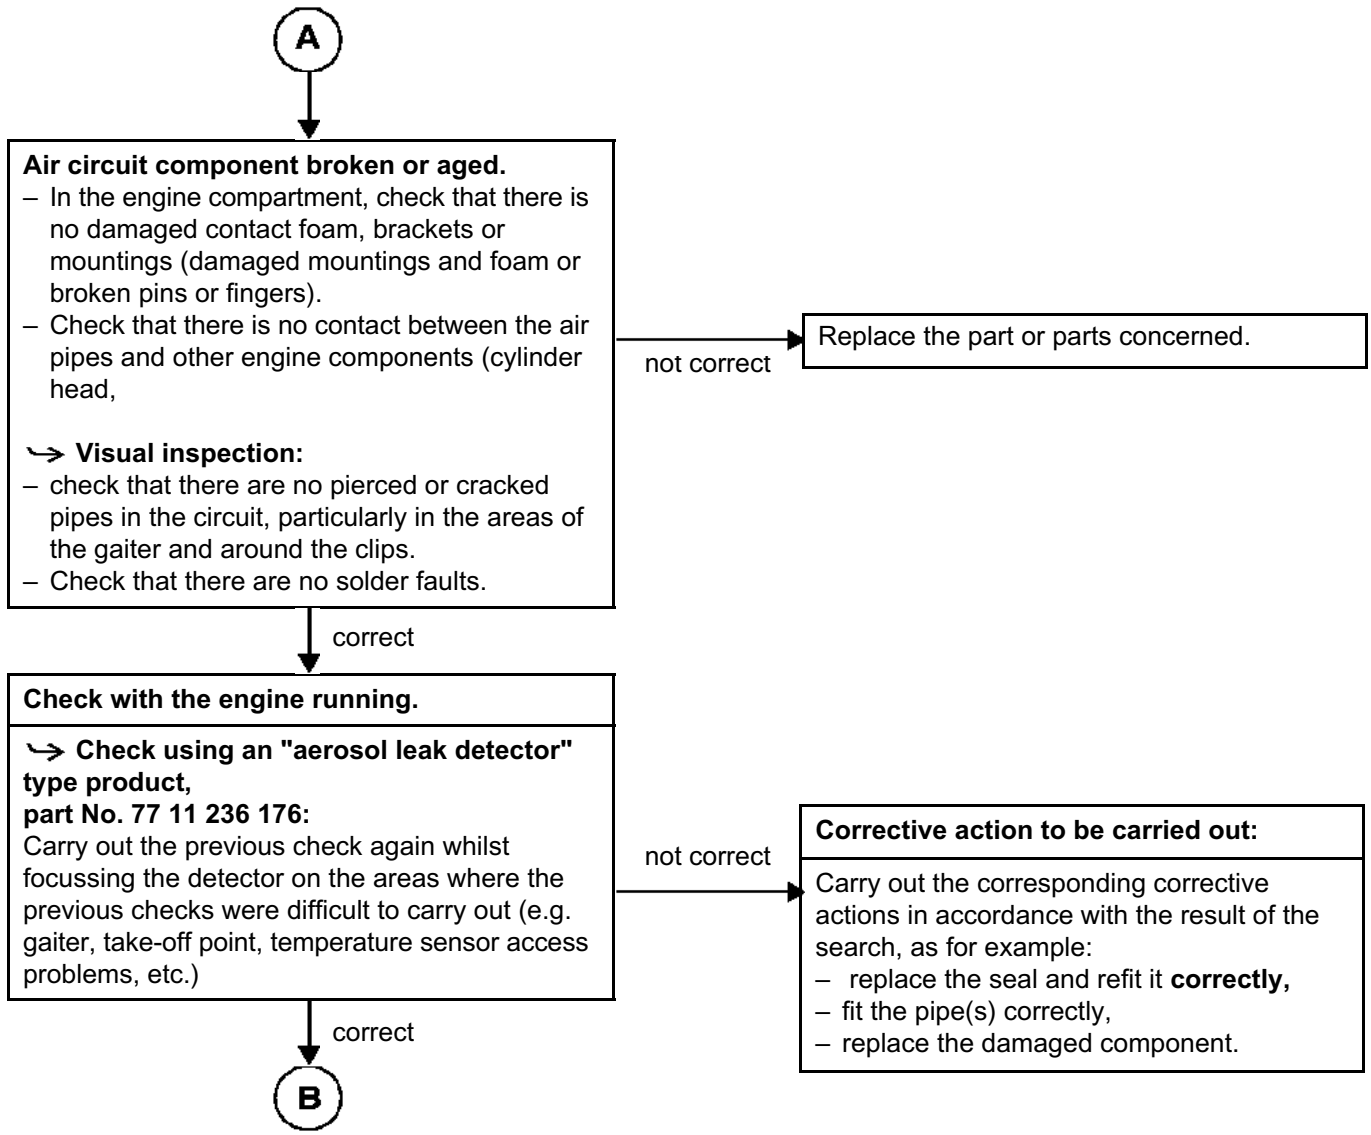
↓

Check with the engine not running.

Condition of the air circuit assembly
The noise may be caused by:
- a damaged seal,
- a poorly fitted pipe,
- a damaged component.

– Check that all of the pipes are correctly clipped and/or fitted to each other, from one end of the circuit to the other.
– Check that the air filter unit, air resonators, air pipes and turbocharging air cooler are secured correctly.
– Check that the clips are tight enough.

not correct →



Corrective action to be carried out:

In all cases, repair the air circuit, by fitting the pipes correctly and checking that the clips are correctly torque tightened using a release torque wrench preset to the recommended tightening torque.

correct ↓

(A)

ALP 1 CONTINUED 1	Air inlet whistling noises

ALP 1 CONTINUED 2	Air inlet whistling noises

Checking the internal air circuit passages, with the air pipes removed
Check the internal air circuit passages, and in particular: ↪ **Air filter:** – air filter seal on the unit or its slide, – air filter not damaged, – air filter conformity (compare manufacturer's recommendations with the filter part number) ↪ **Other internal passage or part:** – resonator not blocked, – air pipe not blocked.

not correct →

Corrective action to be carried out:
Replace the part or parts concerned.

ALP 2	Air inlet humming noises

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Preliminary step: determine the area concerned (if accessible).
With the engine running, recreate the humming noise and locate the source by placing a hand (part by part) on the components which may be the cause and examining the entire circuit.
Two possible scenarios can arise:
– scenario no. 1 - The area is identified: only apply the ALP to the suspect area.
– scenario no. 2 - The area is not identified: follow the ALP, applying it to the entire air circuit.

Check with the engine not running.

Condition of the air circuit assembly
The noise may be caused by:
– a damaged seal,
– a poorly fitted pipe,
– a damaged component.
– Check that all of the pipes are correctly clipped and/or fitted to each other, from one end of the circuit to the other.
– Check that the air filter unit, air resonators, air pipes and turbocharging air cooler are secured correctly.
– Check that the clips are tight enough.

not correct →

Corrective action to be carried out:

In all cases, repair the air circuit, by fitting the pipes correctly and checking that the clips are correctly torque tightened using a release torque wrench preset to the recommended tightening torque.

Air circuit component broken or aged.
– Check that there is not too much clearance in the air circuit created by the old component.
– In the engine compartment, check that there is no damaged contact foam, brackets or mountings (damaged mountings and foam or broken pins or fingers).

↪ **Visual inspection:**
– check that there are no pierced or cracked pipes in the circuit, particularly in the areas of the gaiter and around the clips.
– Check that there are no solder faults.

not correct → Replace the part or parts concerned.

correct ↓

(A)

ALP 2 CONTINUED	Air inlet humming noises

Checking the internal air circuit passages, with the air pipes removed
Check the internal air circuit passages, and in particular: ↪ **Air filter:** – air filter seal on the unit or its slide, – air filter not damaged, – air filter conformity (compare manufacturer's recommendations with the filter part number) ↪ **Other internal passage or part:** – resonator not blocked, – air pipe not blocked.

not correct →

Corrective action to be carried out:
Replace the part or parts concerned.

ALP 3	Crackling noises from the connecting hose or ball joint bracket (depending on version) (exhaust)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Preliminary step:
visually determine if the exhaust system has a ball joint bracket or a connecting hose (see vehicle MR, **19B EXHAUST**).

↓

Check the tightening torques

With the vehicle raised on a lift, check that the torque wrench, which is preset to the recommended tightening torque, is released at the recommended tightening torque of the bracket (flat or ball joint) at the start of the exhaust system (see MR for vehicle, **19B EXHAUST, Catalytic converter: Removal - Refitting**).

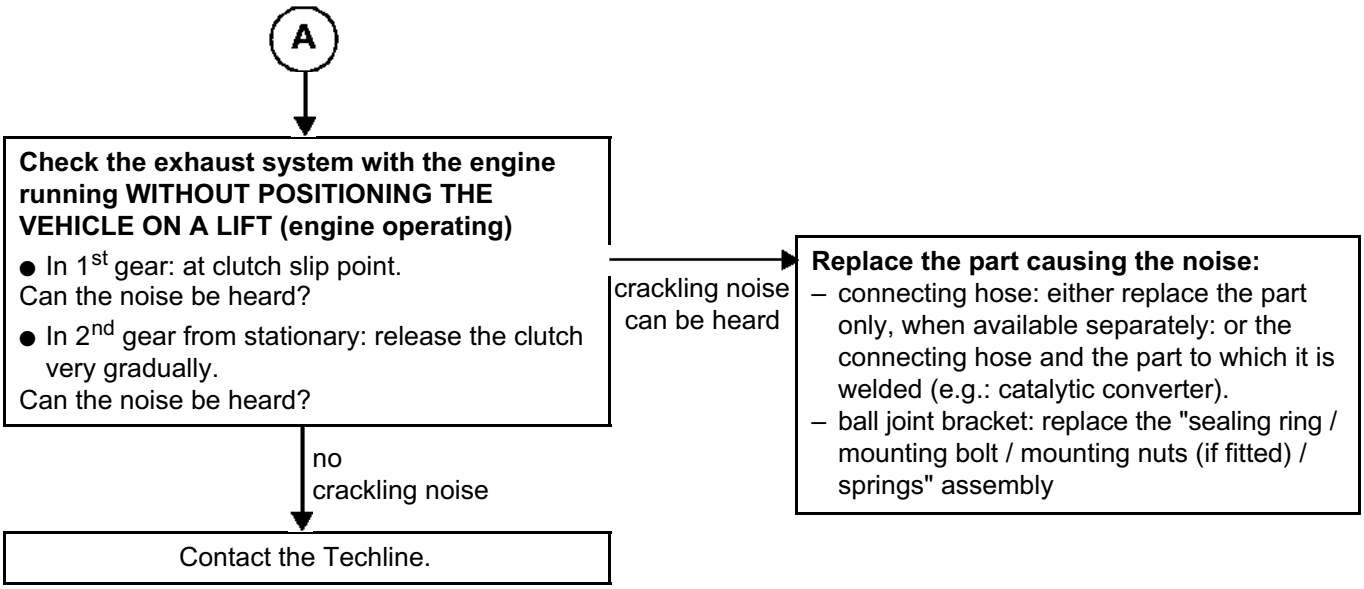
→ **Corrective action to be carried out:**

Tighten to the recommended torque (see MR for vehicle, **19B EXHAUST, Catalytic converter: Removal - Refitting**).

↓

Check the exhaust system manually ON A VEHICLE LIFT (engine stopped)

With the exhaust system cold, lightly knock the exhaust system by hand in several places (especially on the front axle subframe), without reaching its stops.
Note:
If the exhaust system is suspended from the subframe, remove the suspension mounting(s) in order to knock the pipe.



→ crackling noise can be heard

Replace the part causing the noise:
- **connecting hose:** either replace the part only, when sold separately; or the connecting hose and the part to which it is welded (e.g. catalytic converter).
- **ball joint bracket:** replace the "sealing ring / mounting bolt / mounting nuts (if fitted) / springs" assembly

↓ no crackling noise

ALP 3 CONTINUED	Crackling noises from the connecting hose or ball joint bracket (depending on version) (exhaust)

ALP 4	Underbody contact noise (exhaust)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check the tightening torques

With the vehicle raised on a lift, check that the torque wrench, which is preset to the recommended tightening torque, is released at the recommended tightening torque of the bracket (flat or ball joint) at the start of the exhaust system (see MR for vehicle, **19B EXHAUST, Catalytic converter: Removal - Refitting**).

→ **Corrective action to be carried out:**

Tighten to the recommended torque (see MR for vehicle, **19B EXHAUST, Catalytic converter: Removal - Refitting**).

↓

Visually and manually check the exhaust system

Knock the exhaust system with force in several places (cold pipe) to accurately identify the areas of the exhaust system in contact with:
– heat shields,
– suspension bolt(s) or rubber mounting bush(es),
– exhaust pipe anchorage point(s) on the body,
– suspension bracket,
– exhaust sleeve.

→ contact noises noticeable

Corrective action to be carried out:

Perform one or more of the following operations:
- Replace or manually correct the heat shield
- Check the heat shield mountings.
- Replace the suspension bolt(s).
- Replace the component on which the anchorage points or brackets may be broken or damaged.
- Reposition the exhaust pipe, by moving the sleeve or the exhaust pipe clamp (see MR for vehicle, **19B EXHAUST, Exhaust: Precautions for repair)**

↓ no contact noise

Consult ALP 16: Interference noise

These noises may be similar to exhaust system contact noises.

ALP 5	Exhaust leak noise

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

DO NOT BLOCK the exhaust pipe output.
Remove the engine undertray.

Safety
Rules which MUST be respected when the engine is operating:
– heat-protective gloves must be worn when handling the hot exhaust
– connect an exhaust gas extractor

↓

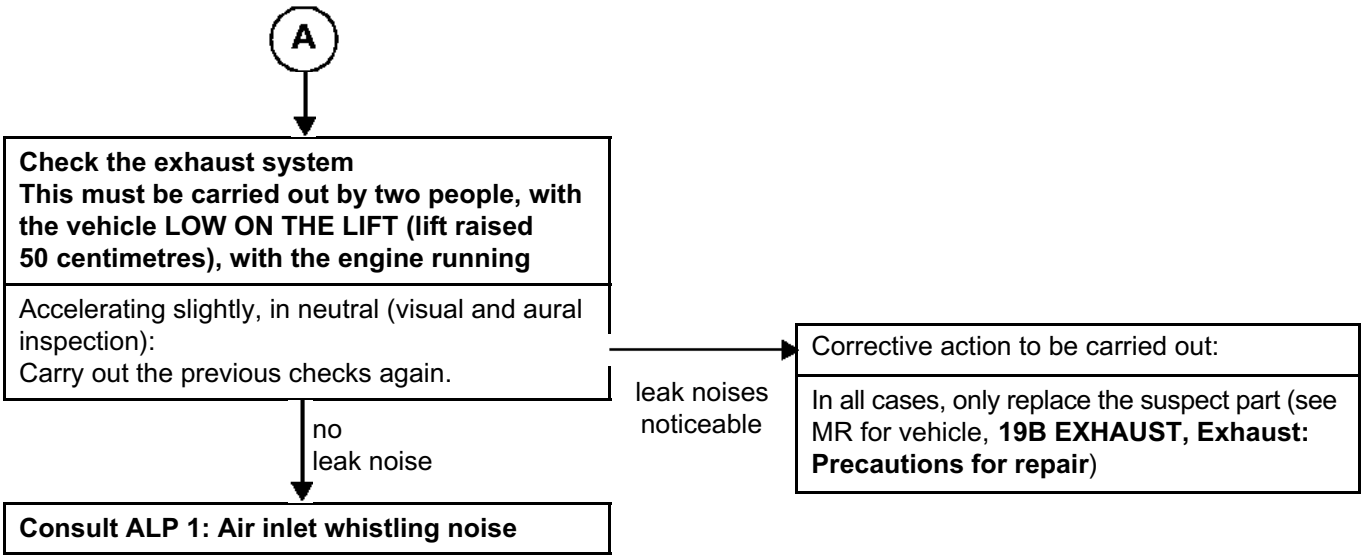
Check the exhaust system, which must only be carried out with the vehicle ON A LIFT, and the engine running

At idle speed (visual, aural and tactile inspection):
Wearing a heat-resistant glove, use one hand to lightly touch the exhaust system from the exhaust manifold to the exhaust tailpipe end.

More specifically, check:
– the seal on the exhaust manifold,
– the condition of the welds on the entire exhaust system,
– the exterior appearance of the exhaust system (impact, corrosion, cracks, welds, holes),
– the condition of the removable connections on the exhaust system (sleeves, clips and brackets)
– the presence of condensed water under the vehicle.

In certain cases and whenever possible in order to determine the leak, check the area in question using an "aerosol leak detector" type product, part no.77 11 236 176.

leak noises noticeable →



Corrective action to be carried out:

In all cases, only replace the suspect part (see MR for vehicle, **19B EXHAUST, Exhaust: Precautions for repair**)

↓ no leak noise

ALP 5 CONTINUED	Exhaust leak noise

ALP 6	Whistling noise from the turbocharger

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Checking the engine oil level

Check the oil level.

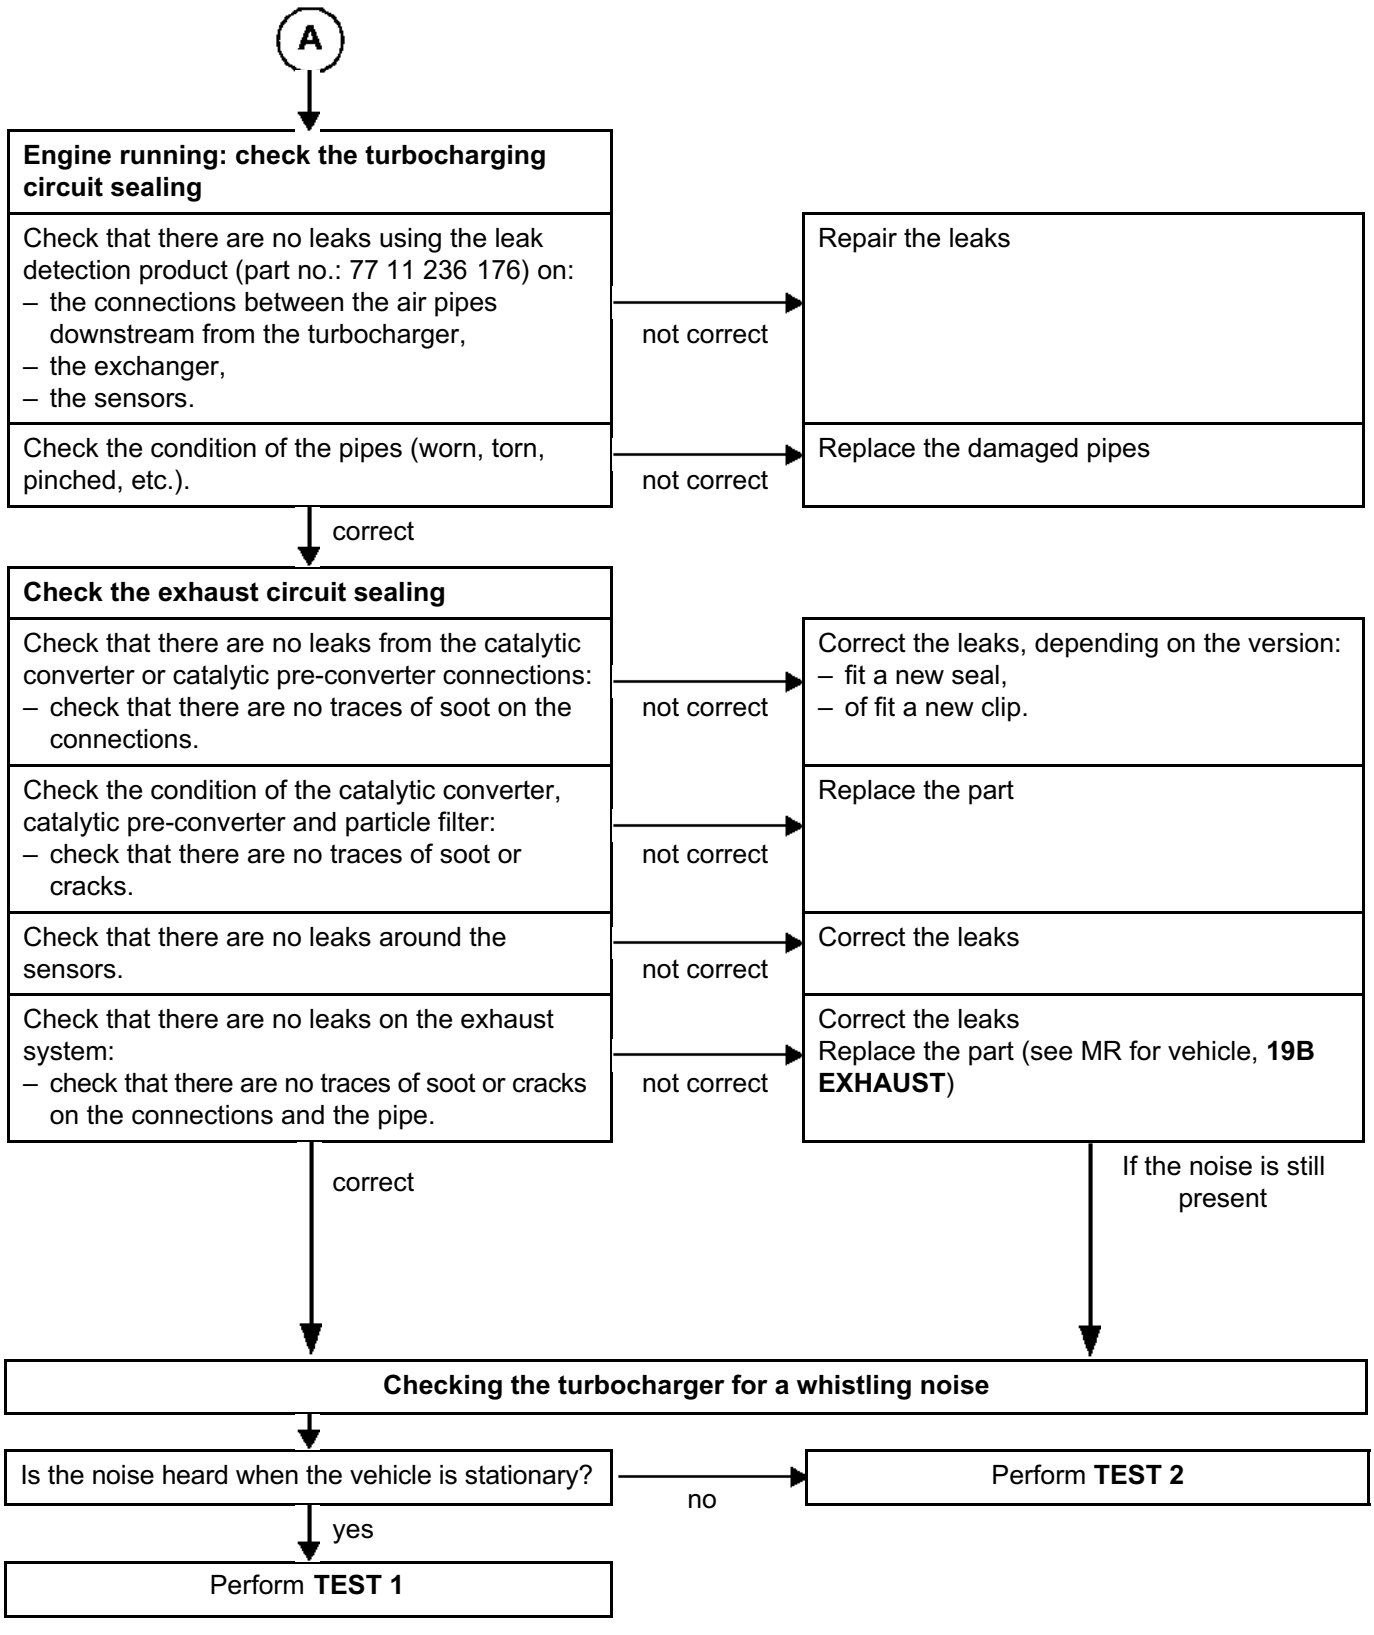
→ not correct → Adjust the level (not excessively) using the manual dipstick (do not exceed the maximum level)

Checking the engine oil grade

1. By checking the Maintenance Booklet.

→ if the oil service interval has passed or is close → Change the oil.
Drive so that the engine cooling fan is triggered. (to homogenise the viscosity of the engine oil).
If the noise disappears: end of turbocharger fault finding.

2. By checking if the noise appears when the engine starts from cold.
If this is the case, the oil is the cause (excessive thickening)



→ if noise when cold → Change the oil.
Drive so that the engine cooling fan is triggered. (to homogenise the viscosity of the engine oil).
If the noise disappears: end of turbocharger fault finding.

Oil service interval correct and no noise when cold → (A)

If the noise is still present → **Is the noise more pronounced?**

- no → Continue the ALP → (A)
- yes → Replace the turbocharger (see MR for vehicle, **12B TURBOCHARGING, Turbocharger: Removal - Refitting**)

ALP 6 CONTINUED 1	Whistling noise from the turbocharger

ALP 6 CONTINUED 2	Whistling noise from the turbocharger

TEST 1

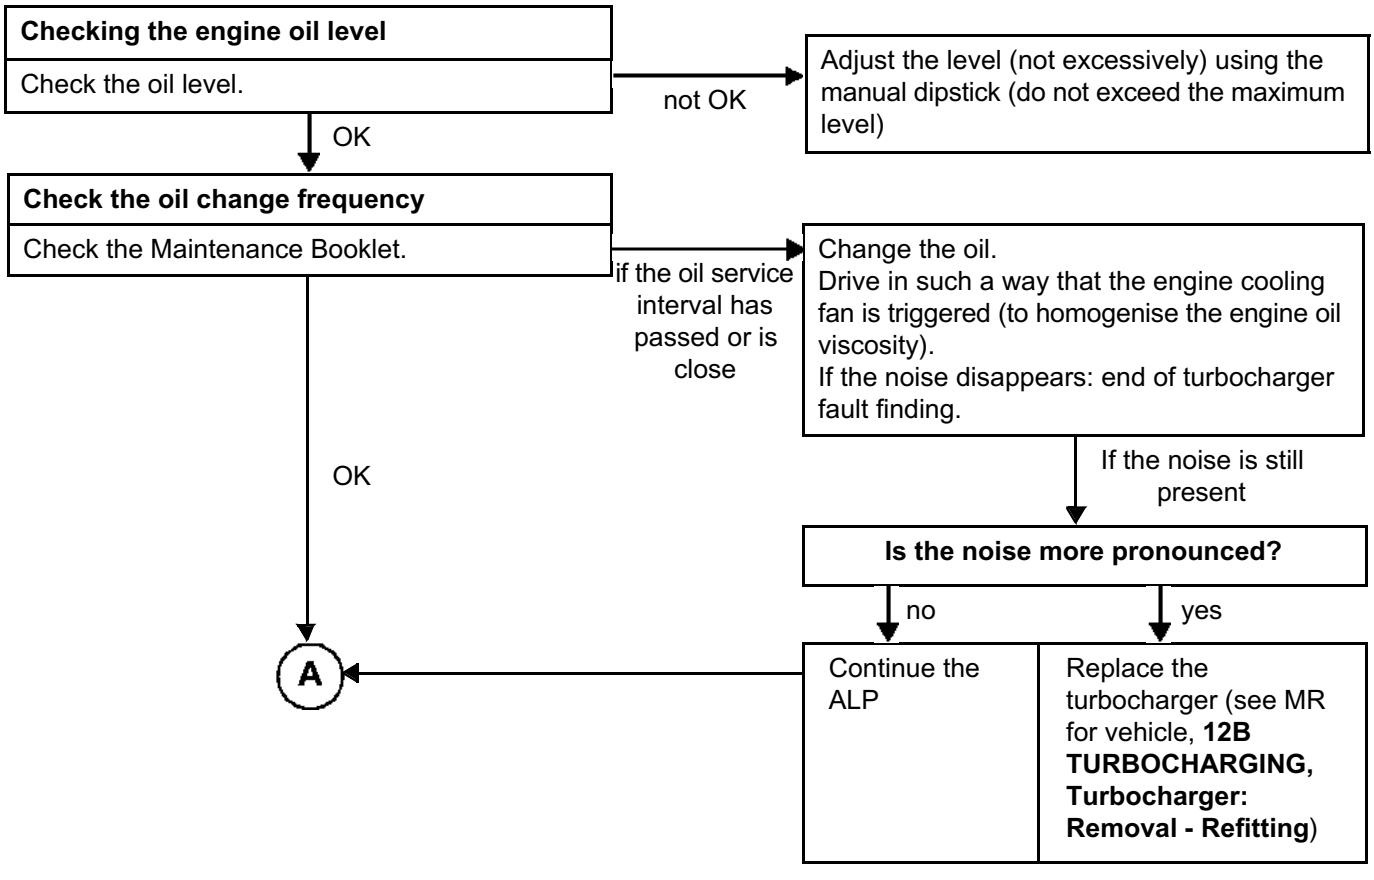
Configurations: vehicle stationary, **disengaged**, engine running and warm
Before the test, clearly identify the speed conditions under which the noise appears
A) For a vacuum-controlled turbocharger:
– Disconnect the pneumatic control on the turbocharger regulator.
– Clamp the pipe (e.g. using a set of hose clamps).
– Only for a turbocharger on G9T 710* engine: create a vacuum to control the regulator using a pressure-vacuum pump at a vacuum value of 0.6 bar (opening the pressure regulation valve).
B) For a pressure-controlled turbocharger:
– Disconnect the pneumatic control on the turbocharger regulator.
– Clamp the pipe (e.g. using a set of hose clamps).
– Create pressure to control the regulator using a pressure-vacuum pump at a maximum pressure value of 1.4 bar (opening the turbocharger by-pass valve).
These operations aim to lower the speed of the turbocharger which changes the conditions under which the noise appears.
** On the G9T 710 engine, the turbocharger controls are inverted.*

If the noise changes → **Replace the turbocharger** (see MR for vehicle, **12B TURBOCHARGING, Turbocharger: Removal - Refitting**)

If the noise does not change → The turbocharger is not the cause of the noise (end of turbocharger whistling fault finding)

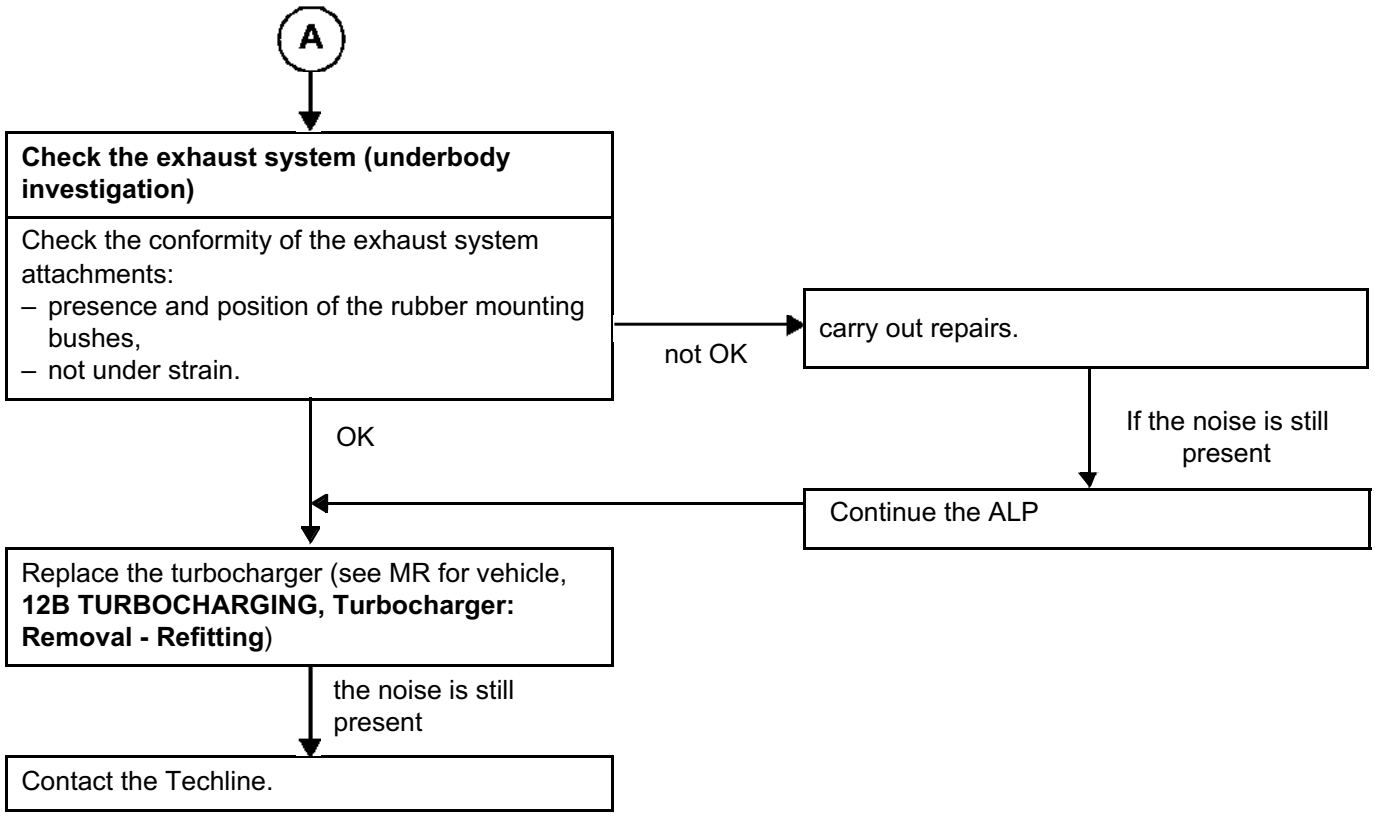
TEST 2

Configurations: vehicle driving when warm
Before the test, clearly identify the speed conditions under which the noise appears
A) For a vacuum-controlled turbocharger:
– Disconnect the pneumatic control on the turbocharger regulator.
– Clamp the pipe (e.g. using a set of hose clamps).
– Only for a turbocharger on G9T 710* engine: create a vacuum to control the regulator using a pressure-vacuum pump at a vacuum value of 0.6 bar (opening the pressure regulation valve).
B) For a pressure-controlled turbocharger:
– Disconnect the pneumatic control on the turbocharger regulator.
– Clamp the pipe (e.g. using a set of hose clamps).
– Create pressure to control the regulator using a pressure-vacuum pump at a maximum pressure value of 1.4 bar (opening the turbocharger by-pass valve).
These operations aim to lower the speed of the turbocharger which changes the conditions under which the noise appears.
** On the G9T 710 engine, the turbocharger controls are inverted.*



If the noise changes → **Replace the turbocharger** (see MR for vehicle, **12B TURBOCHARGING, Turbocharger: Removal - Refitting**)

If the noise does not change → The turbocharger is not the cause of the fault (end of turbocharger whistling noise fault finding) **Consult the ALP: Whining noise in the drive train**



ALP 7	Meowing noise from the turbocharger

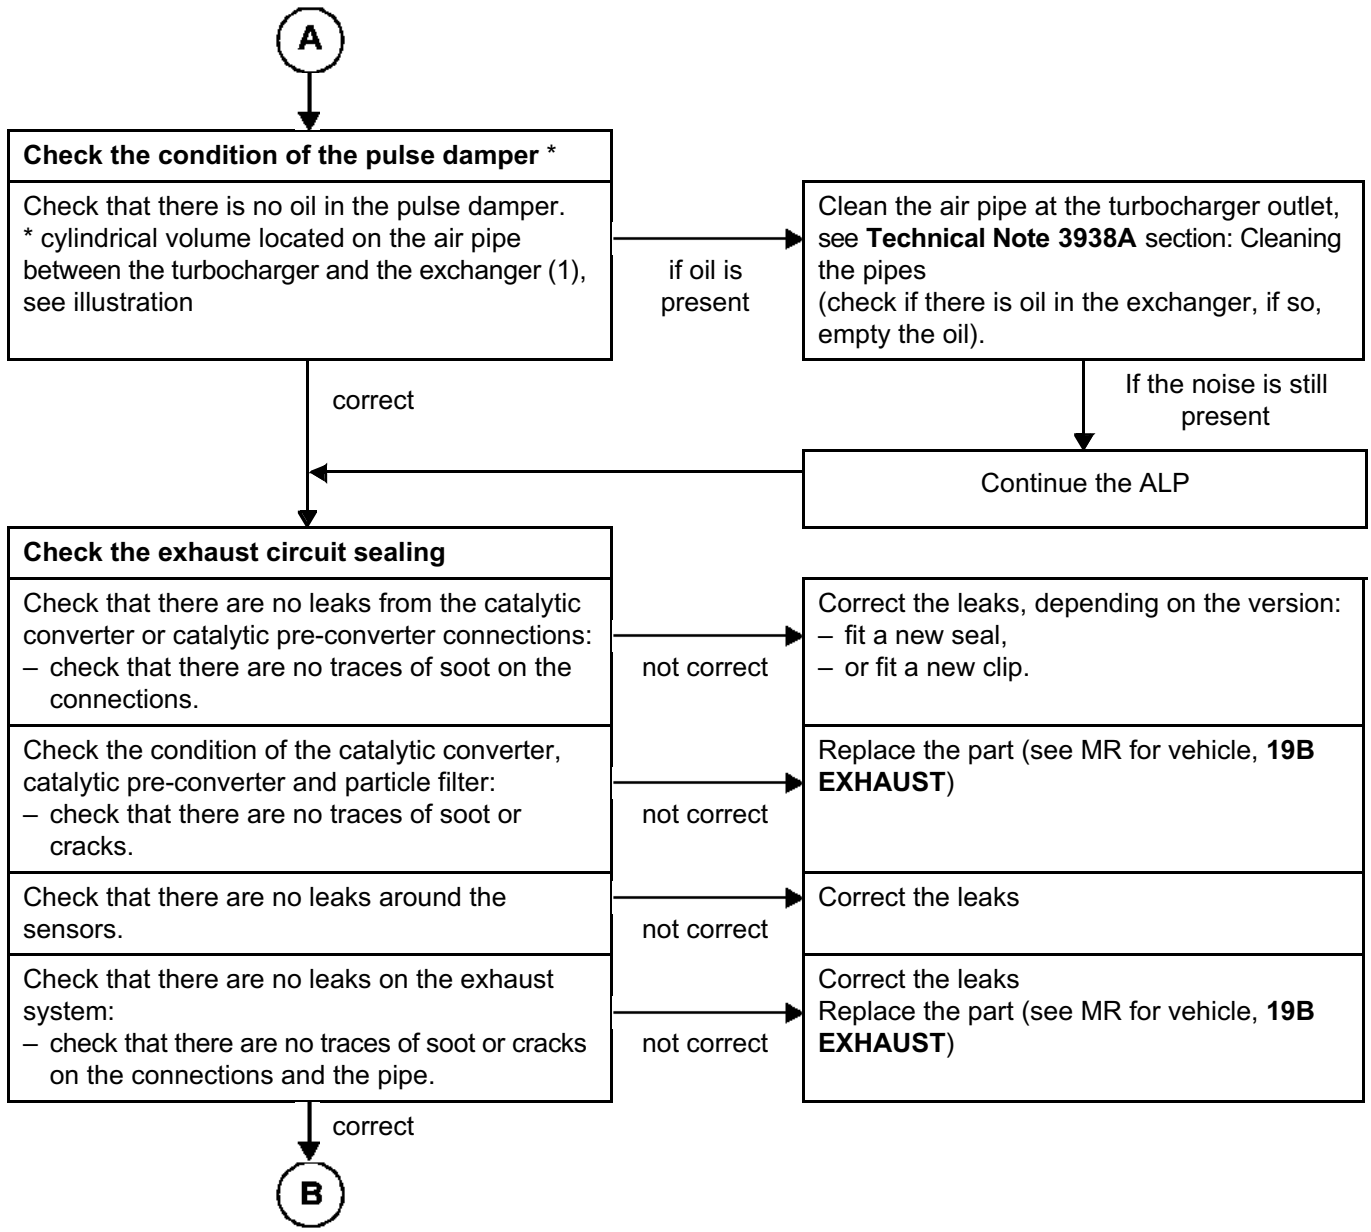
NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

IMPORTANT:
Consult the vehicle's history in the ICM database and check that the exhaust system has not been replaced (even partially) and that no work has been undertaken on the high pressure air circuit.
If this is the case, check that the operation was carried out correctly.

ALP 7 CONTINUED	Meowing noise from the turbocharger

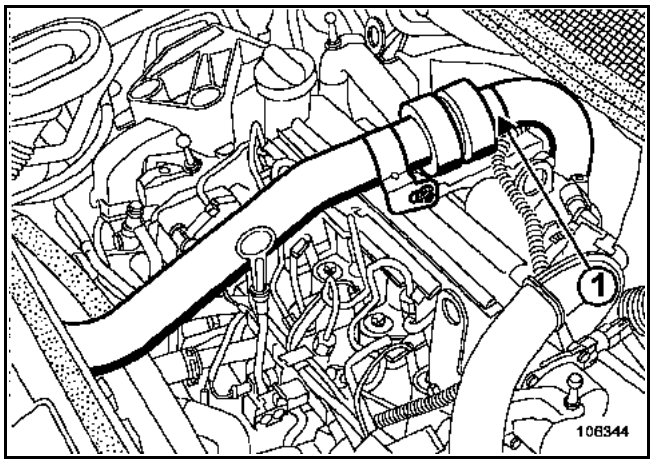
ALP 8	Blowing noise from the turbocharger

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.



IMPORTANT:
Consult the vehicle's history in the ICM database and check that the exhaust system has not been replaced (even partially) and that no work has been undertaken on the high pressure air circuit.
If this is the case, check that the operation was carried out correctly.

Check the turbocharging circuit sealing		
Check that there are no leaks on the connections between the air pipes downstream from the turbocharger and on the exchanger: – use the leak detection product (part no.: 77 11 236 176)	not correct →	Repair the leaks
Check that there are no leaks around the sensors: – use the leak detection product (part no.: 77 11 236 176)	not correct →	Repair the leaks
Check the condition of the pipes (worn, torn, pinched, etc.).	not correct →	Replace the part (see MR for vehicle, **19B EXHAUST**)
Check that the ducts are correctly fitted and check that the clips are correctly positioned on the cylindrical part of the end pieces.	not correct →	Repair



correct ↓

A

ALP 8 CONTINUED 1	Blowing noise from the turbocharger

ALP 8 CONTINUED 2	Blowing noise from the turbocharger

B

Check the operation of the EGR solenoid valve

See Fault Finding MR for the vehicle, **13B DIESEL INJECTION, Fault finding - Conformity check**

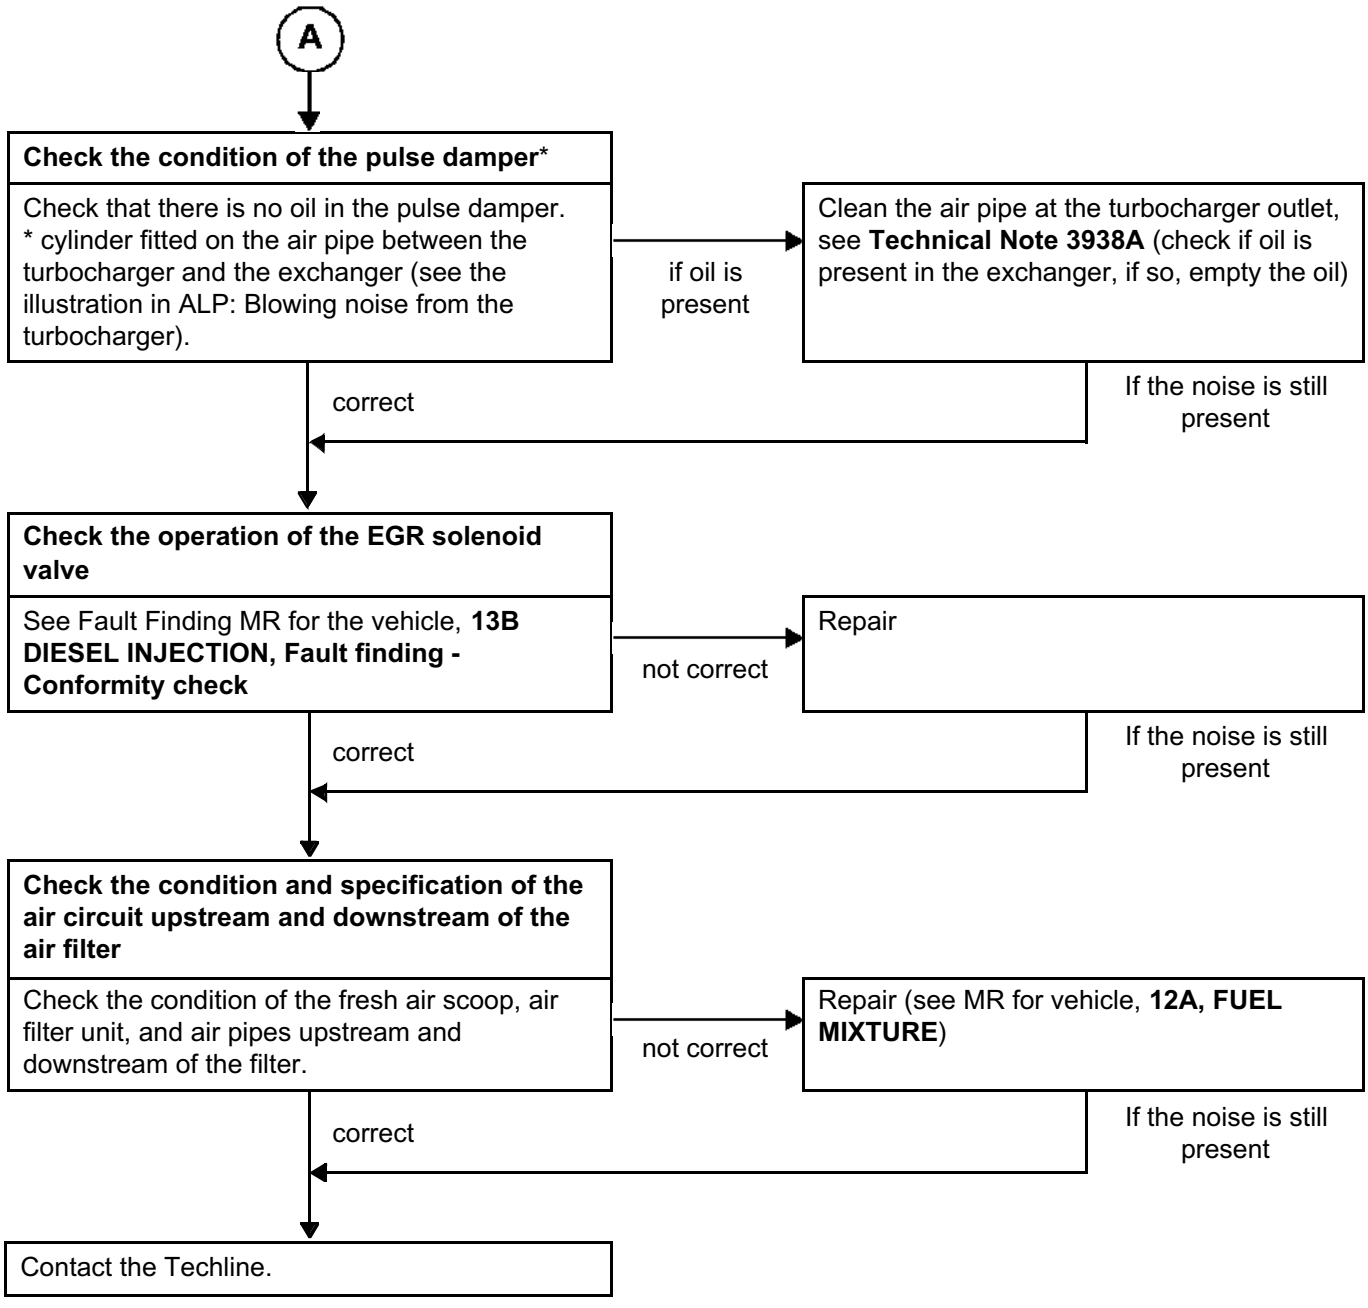
not OK → Carry out repairs

If the noise is still present → Continue the ALP

OK → The vehicle is correct

ALP 9	Sighing noise from the turbocharger (diesel engine)

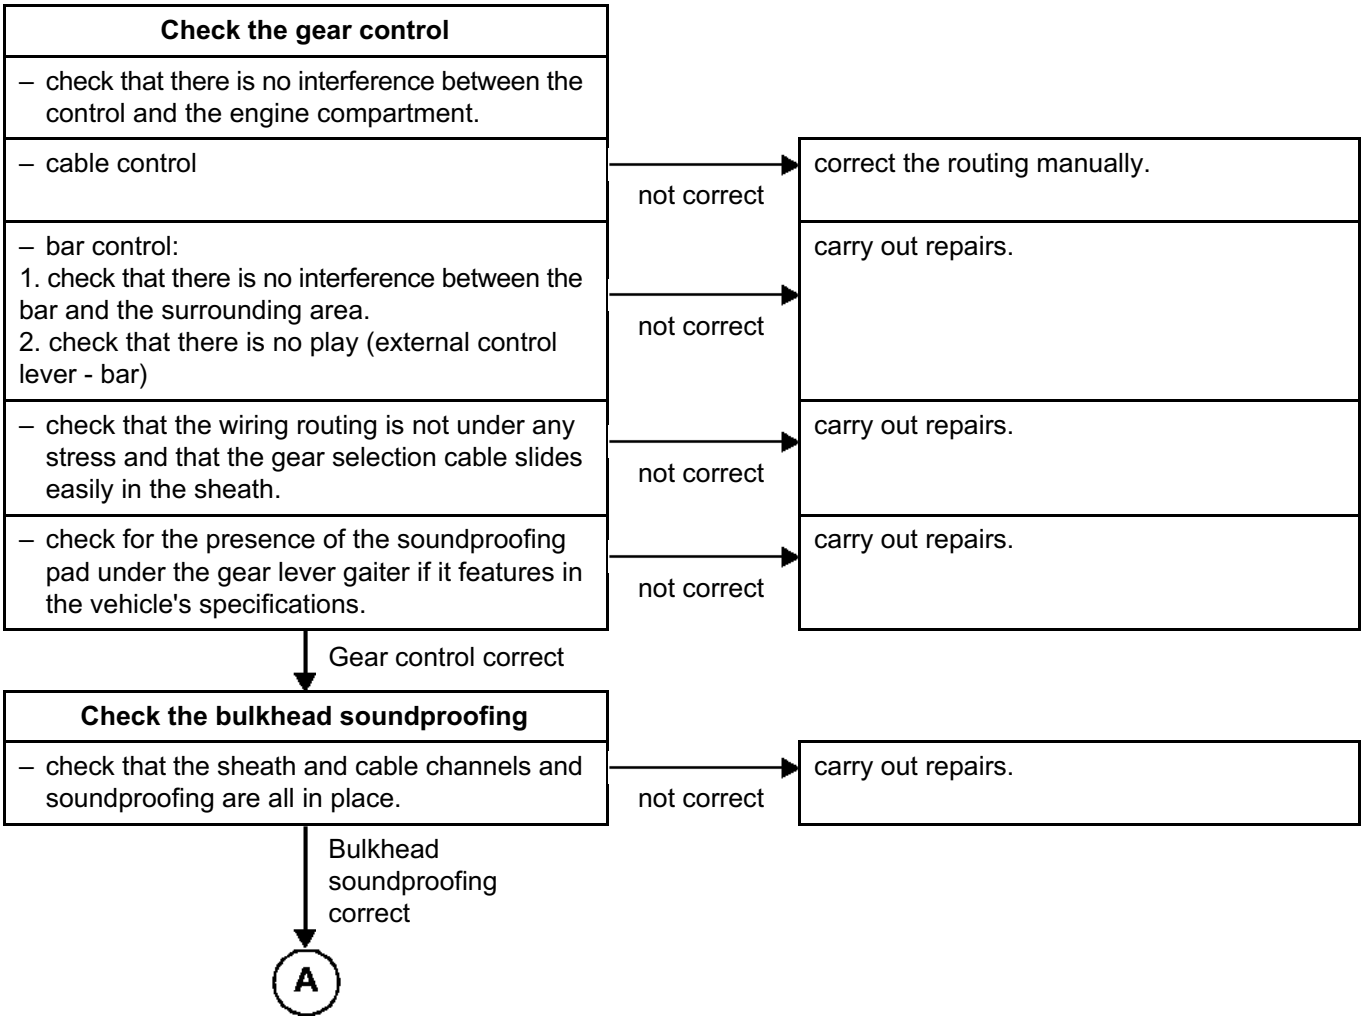
NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.



IMPORTANT: Consult the vehicle's history in the ICM database and check that the exhaust system has not been replaced (even partially) and that no work has been undertaken on the high pressure air circuit.
If this is the case, check that the operation was carried out correctly.

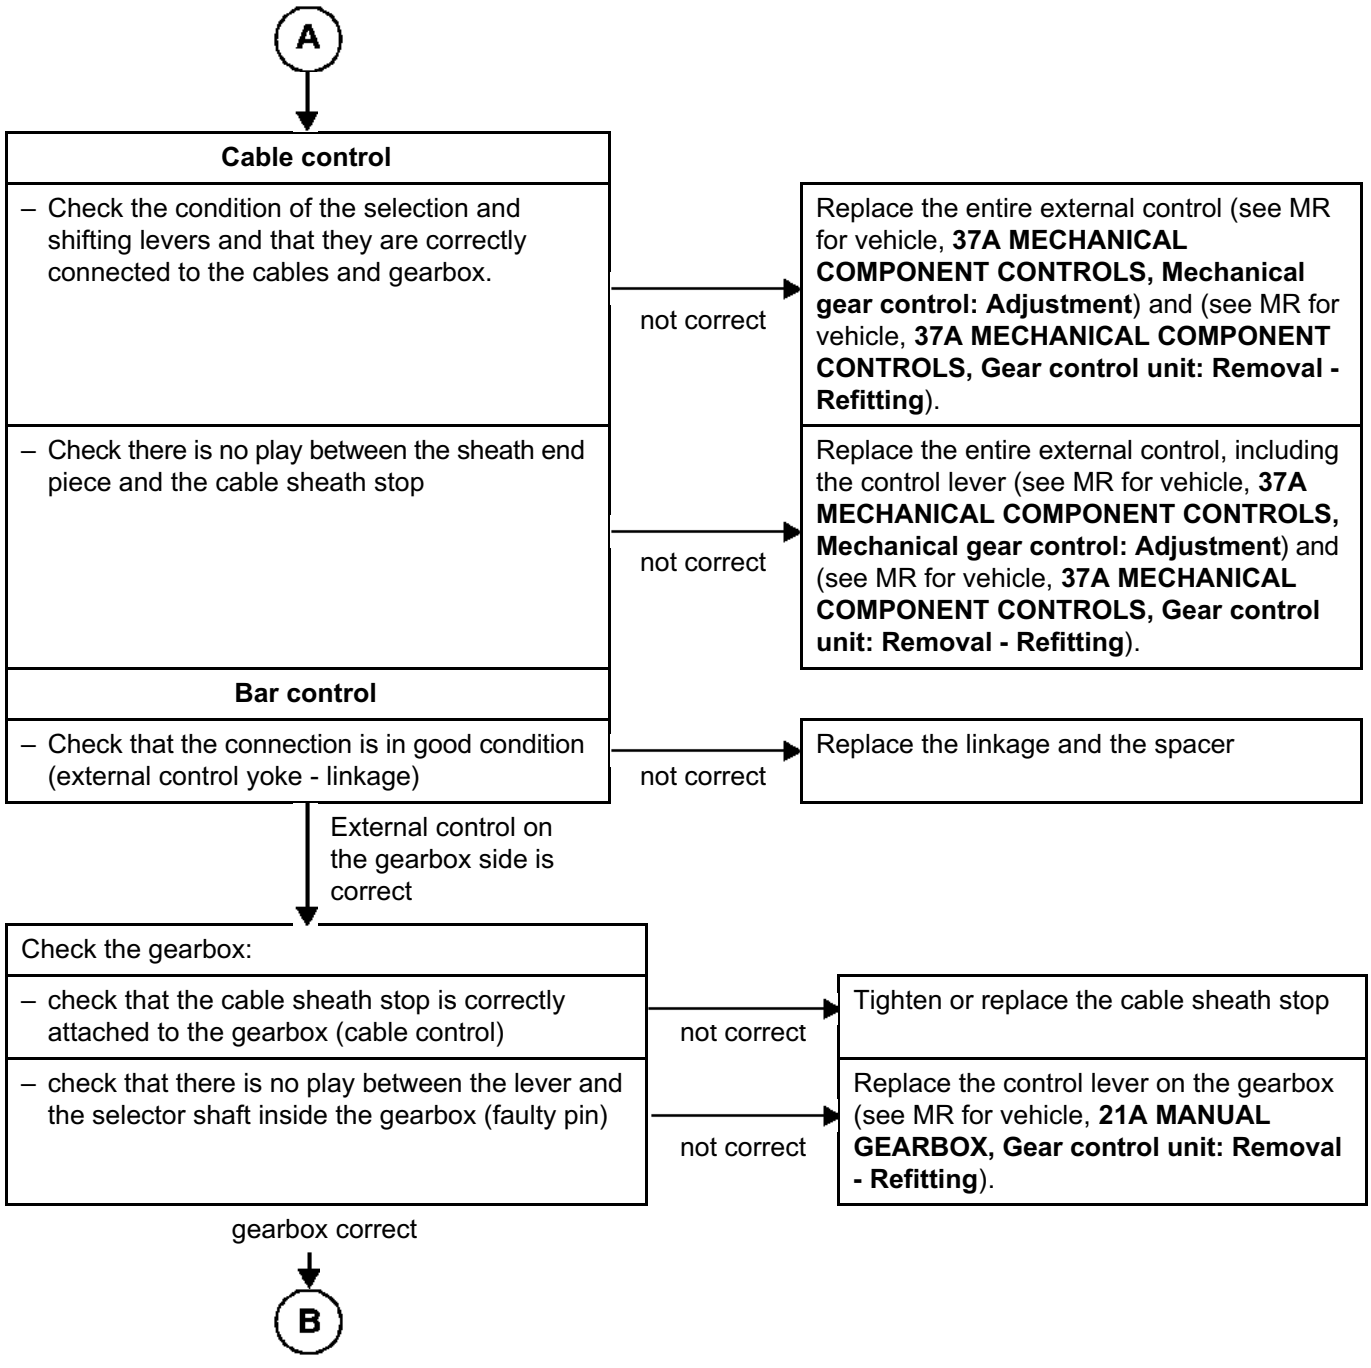
Check the turbocharging circuit sealing **IMPORTANT***:* *Under no circumstances must the sealing test be performed by plugging the exhaust system (risk of damaging the shaft line seals)*		
Check the condition of the air pipes (worn, torn, pinched, etc.).	not correct	Replace the defective part
Check that the ducts are correctly fitted and check that the clips are correctly positioned on the cylindrical part of the end pieces.	not correct	Repair the ducts
Check that there are no leaks on the connections between the air pipes downstream from the turbocharger and on the intercooler; use leak detection product (part no.: 77 11 236 176)	not correct	Repair the leaks
Check that there are no leaks around the sensors: – use the leak detection product (part no.: 77 11 236 176)	not correct	Repair the leaks

correct



A

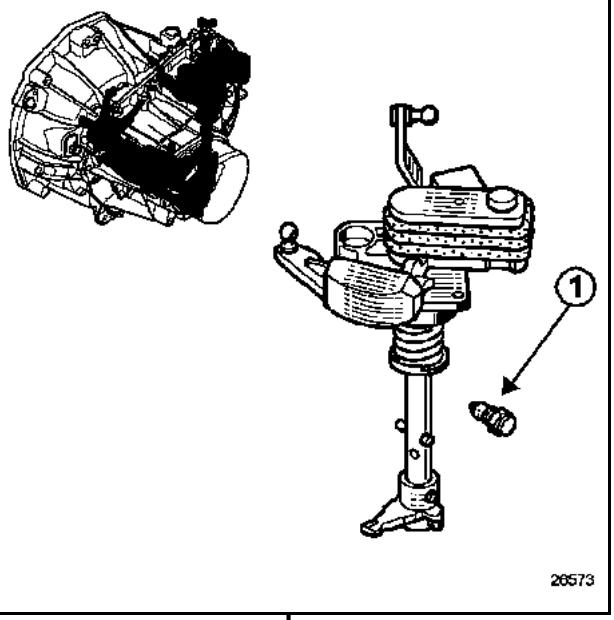
ALP 9 CONTINUED	Sighing noise from the turbocharger (diesel engine)



ALP 10	Noise when engaging/disengaging gear

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

ALP 10 CONTINUED 1	Noise when engaging/disengaging gear



ALP 10 CONTINUED 2	Noise when engaging/disengaging gear

B

Only for JH JR gearboxes

Replace the locating ball unit (1)

gearbox correct

If the noise is still present, contact the Techline

*

Gearbox	Technical Note No.

ND0	Technical Note 6034A

ALP 11	Creaking noise when changing gear

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check that no vehicle mat is preventing the clutch from operating when changing gear.
Check that the gear control setting is correct (see MR for vehicle, **21A MANUAL GEARBOX, Manual gear control: Adjustment**).
WARNING
If creaking can be heard:
– **On EVERY gear ratio:** the customer may have complained previously about hard spots when selecting gear (cable clutches). Therefore it is ONLY the clutch which is concerned (see Technical Note 3451A)
– **When changing from Neutral / 1st or Neutral / Reverse:** start by checking the clutch and follow the ALP if the clutch is correct.
– **Other gears:** start DIRECTLY by checking the gearbox WITHOUT checking the clutch

Check the clutch		
– Check that the clutch release point is correct.		
– For mechanical clutch controls: Check the fork travel (see **Technical Note 3451A**)	not correct →	Adjust the travel if manual adjustment (e.g. Logan). (see MR for vehicle, **37A MECHANICAL COMPONENT CONTROLS, Clutch control: Adjustment**).
– For hydraulic clutch controls: Only check the release point (it must be possible to change gear with the pedal depressed 3/4 of its total travel)	not correct →	Bleed the hydraulic circuit (see MR for vehicle, **37A MECHANICAL COMPONENT CONTROLS, Clutch circuit: Bleeding**).

Clutch release point correct

ALP 11 CONTINUED 1	Creaking noise when changing gear

Check the gearbox before removing it		Corrective action to be carried out:
– check that there are no leaks on the driveshaft side and/or joint face and/or gear control module (JB, JC gearbox).	not correct	Repair either: – By replacing the driveshaft seals if the leaks originate from the driveshafts (see MR for vehicle, **21A MANUAL GEARBOX, Differential output seal: Removal - Refitting**) – By repairing the gearbox joint face sealing (see Technical Note for the gearbox*) – By replacing: the gearbox seal and selector shaft if the module is leaking (see Technical Note for JB-JC)
– check the gearbox oil level.	not correct	Adjust the oil level (using oil specified by the manufacturer).
– check the appearance of the oil Oil which is dark in colour is not a fault. Oil which smells burnt is caused by a hot gearbox (insufficient oil level or hard use). The presence of bronze-coloured rings is not a fault. The presence of particles of an aluminium colour is an indication that the gearbox is seriously damaged internally.	not correct	– Perform an oil change (using oil specified by the manufacturer). – If aluminium colour particles are present, replace the gearbox (see MR for vehicle, **21A MANUAL GEARBOX, Manual gearbox: Removal - Refitting**)

ALP 11 CONTINUED 2	Creaking noise when changing gear

B

Remove the gearbox		Corrective action to be carried out:
– Check the clutch wear.	not correct →	Replace the whole clutch system. *Important: the synchronisation must be checked as this might have been damaged following clutch damage.*
Open the gearbox		**Corrective action to be carried out:**
– Check the condition of the synchronisation, synchronisation springs, idle gear and synchroniser ring and the selector rod for the gear(s) concerned. (See MR for vehicle, **21A MANUAL GEARBOX, Manual gearbox: Check**)	not correct →	Replace all of the components of the damaged gear(s) (pinion, hub, selector rod, synchroniser ring and synchronisation spring) (see Technical Note for the gearbox*)

*

ND0	Technical Note 6034A

ALP 12	Banging during power take-up or torque inversion

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

VERY IMPORTANT - Preliminary checks:	
– **Engine and transmission assembly suspension points:** Check the tightness and positioning of all of the engine and transmission assembly suspension points (engine tie-bar, engine and/or gearbox hydro-elastic rubber pads) using the centring tool mentioned in the MR concerned (if it exists).	– apply the tightening torques (see MR for vehicle, **19D ENGINE MOUNTING, Suspended engine mounting: Tightening torque**) – recentre (loosen and retighten all of the rubber pads)
– **Axle components:** Check, by comparison, the conformity of the axle components and that they are correctly tightened, in particular: the lower wishbone, anti-roll system, suspension and associated rubber mounting bushes.	– apply the recommended tightening torques (see MR for vehicle, **30A GENERAL INFORMATION, Front axle: Tightening torque**).
– **Subframe/steering rack:** Check the tightness and condition of the subframe and steering rack rubber pads.	– apply the recommended tightening torques (see MR for vehicle, **31A FRONT AXLE COMPONENTS, Front axle subframe: Removal - Refitting**). – only replace the rubber pads if they are extremely worn
– **Stub-axle (Hub-carriers):** Check the tightness of the stub-axles.	– apply the recommended tightening torques (see MR for vehicle, **31A FRONT AXLE COMPONENTS, Front driveshaft hub-carrier: Removal - Refitting) (Important: risk of driveshaft damage**).
– **Wheels:** check the tightness of the wheels.	– apply the tightening torques (see MR for vehicle, **35A WHEELS AND TYRES, Wheel: Removal - Refitting**)

correct

ALP 12 CONTINUED	Banging during power take-up or torque inversion

(A)

Check the driveshafts:

– Check the condition of the gaiters and the presence of grease on the gaiter exterior.

→ – replace the gaiters if they are damaged and/or replace the driveshaft if the gaiters are not sold separately or if there is play on the driveshaft connections (see MR for vehicle, **29A DRIVESHAFTS, Driveshaft: Removal - Refitting**)

– **Removing/refitting the right-hand driveshaft:** Check the wear of the coupling sleeve grooves on the relay bearing driveshaft (right-hand driveshaft - sunwheel) by removing/refitting the component (see MR for vehicle, **29A DRIVESHAFTS, Front right-hand driveshaft: Removal - Refitting**).

→ – It is essential to follow Infotech No. 4645.

Driveshafts correct

Check the clutch:

– check the progressiveness of the clutch by checking the clutch clearance, if it exists (see MR for the vehicle, **37A MECHANICAL COMPONENT CONTROLS, Clutch control: Adjustment**) or the automatic pedal adjustment system.

→ 1. Adjust the clearance (if it exists).
2. Replace the automatic adjustment system (see MR for vehicle, **37A MECHANICAL COMPONENT CONTROLS, Clutch control: Removal - Refitting**)
3. If the clutch clearance or the mechanical adjustment system is correct and the clutch progressiveness is still not correct, replace the clutch kit (see MR for the vehicle, **20A CLUTCH, Pressure plate - Disc: Removal - Refitting**)

– Depending on the clutch version, remove the gearbox to:
1) Check that there are no traces of oil.
OR
2) Check that the dual-mass flywheel springs are not damaged.

→ – Depending on the version, if it is in poor condition:
1) If there are traces of oil, look for the source of the leaks and repair.
OR
2) Replace the dual-mass flywheel (see MR for vehicle, **20A CLUTCH, Flywheel: Removal - Refitting**)

Clutch correct

– Contact the Techline:
Gearbox concerned - request for approval.

ALP 13	Siren (drive train)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check the oil level and grade in the gearbox (see MR for vehicle concerned, **21A MANUAL GEARBOX, Manual gearbox oil: Oil change**):

– if the oil level is low → Top up the level of oil in the gearbox

– check the appearance of the oil
Oil which is dark in colour is not a fault.
Oil which smells burnt is caused by a hot gearbox (insufficient oil level or hard use).
The presence of bronze-coloured rings is not a fault.
The presence of particles of an aluminium colour is an indication that the gearbox is seriously damaged internally

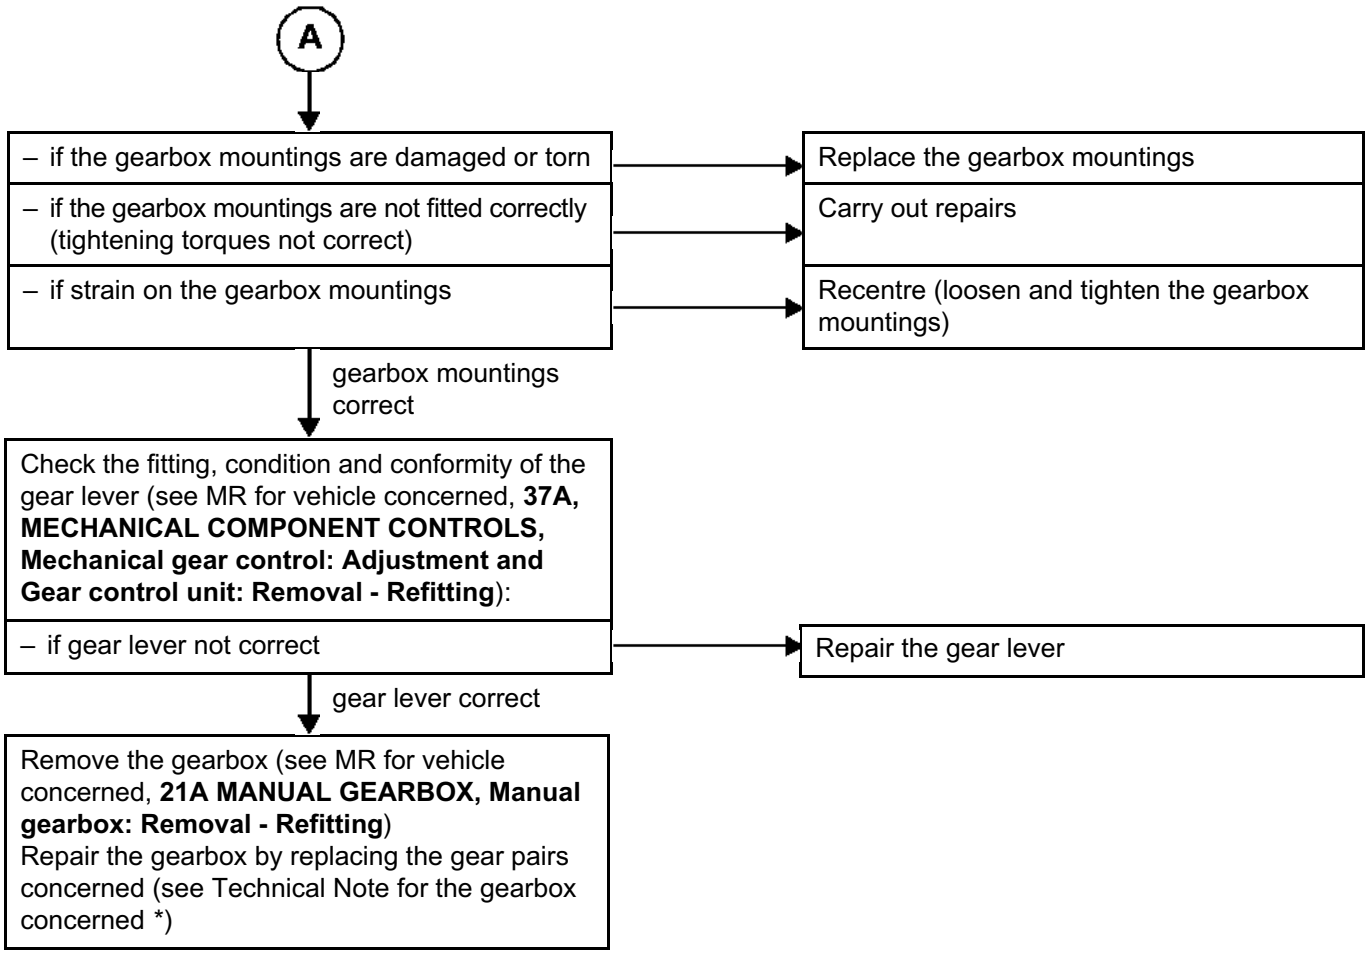
not correct → – Perform an oil change (using oil specified by the manufacturer).
– If aluminium colour particles are present, replace the gearbox (see MR for vehicle, **21A MANUAL GEARBOX, Manual gearbox: Removal - Refitting**)

oil level and grade correct ↓

Check that all components under the cover are in good condition:

– if there is unwanted gearbox / cable or sheath contact → Correct the unwanted contact

– if the grommets and other bulkhead through-routes are incorrectly fitted → Carry out repairs



under-cover components correct ↓

Check the condition, fitting and conformity of the gearbox mountings (see MR for vehicle concerned, **21A MANUAL GEARBOX, Manual gearbox: Removal - Refitting**):

↓

ALP 15	Growling / noise in neutral (drive train)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check the engine idle speed

idle speed not correct → Perform fault finding on an incorrect idle speed (see Fault Finding Manual for the vehicle concerned, **13B, DIESEL INJECTION, Fault finding - Conformity check** or **17B, PETROL INJECTION, Fault finding - Conformity check**)

idle speed correct

Check that all components under the cover are in good condition:

- if there is unwanted gearbox / cable or sheath contact → Correct the unwanted contact
- if the grommets and other bulkhead through-routes are incorrectly fitted → Carry out repairs
- if there is interference between the engine and transmission assembly and body components (engine mountings, gearbox mountings, suspended engine mountings, acoustic filters, etc.) → Eliminate the interference by replacing the faulty components

under-cover components correct

If the clutch plate has a shock absorber component, replace the clutch plate (see MR for vehicle concerned, **20A, CLUTCH, Pressure plate - clutch plate: Removal - Refitting**)

ALP 16	Interference noise

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Identification of the noise identified by the customer

↓

Is the origin of the noise known (dealt with by Infotech) or easily identifiable?

yes → Proceed directly to the repair operation

↓ no

Connect the noise diagnostic tool - Part no. **77 11 421 103** - (see **Noise diagnostic tool - Use**) to:
– the steering column,
– the universal joint
Does the noise come from this area?

yes → See ALP 16.1. "Steering column area"

↓ no

Connect the tool to the engine and transmission assembly suspensions
Does the noise come from this area?

yes → See ALP 16.2. "Engine area"

↓ no

Connect the tool to:
– the front shock absorber bump stop
– the front suspension spring
– the front shock absorber
Does the noise come from this area?

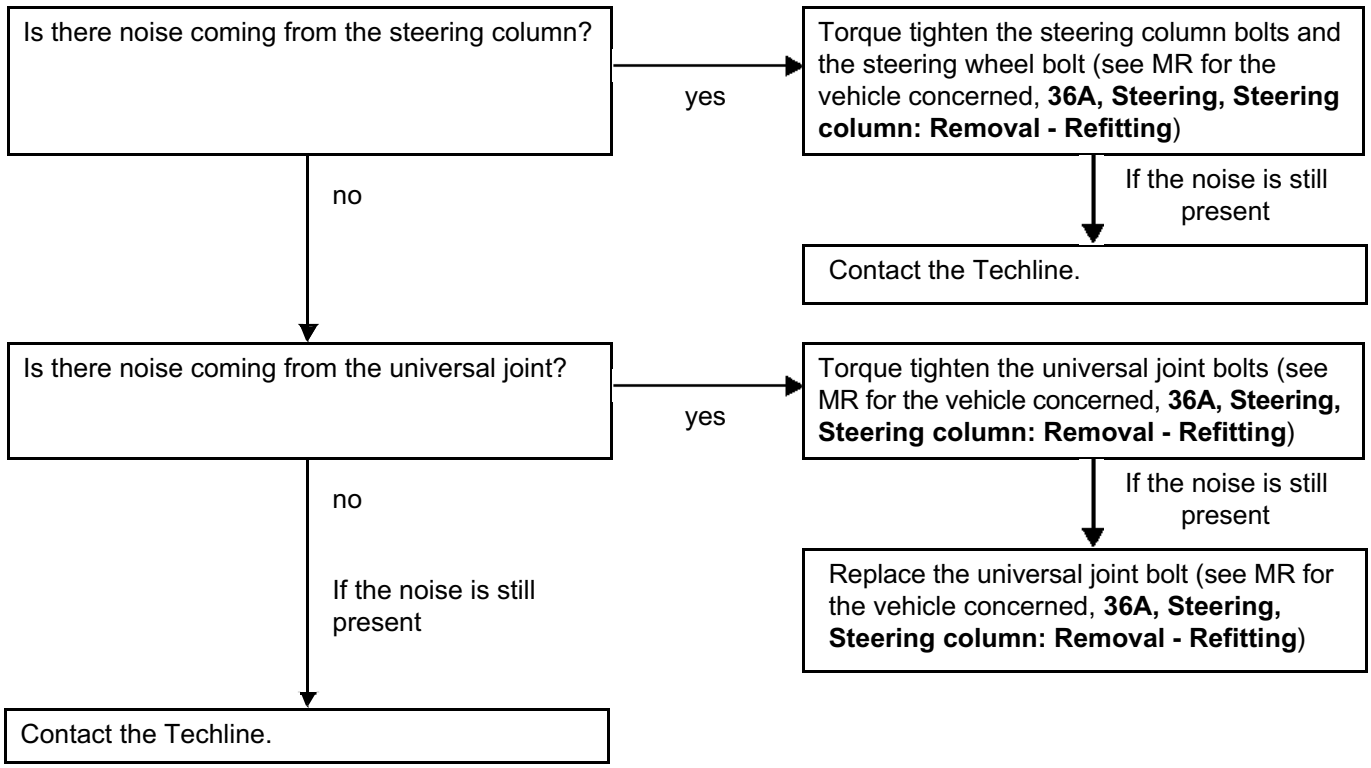
yes → See ALP 16.3. "Suspension area"

↓ no

Connect the tool to:
– the steering box
– the track rod end
– the front lower wishbone
– the anti-roll bar tie rod
– the subframe
Does the noise come from this area?

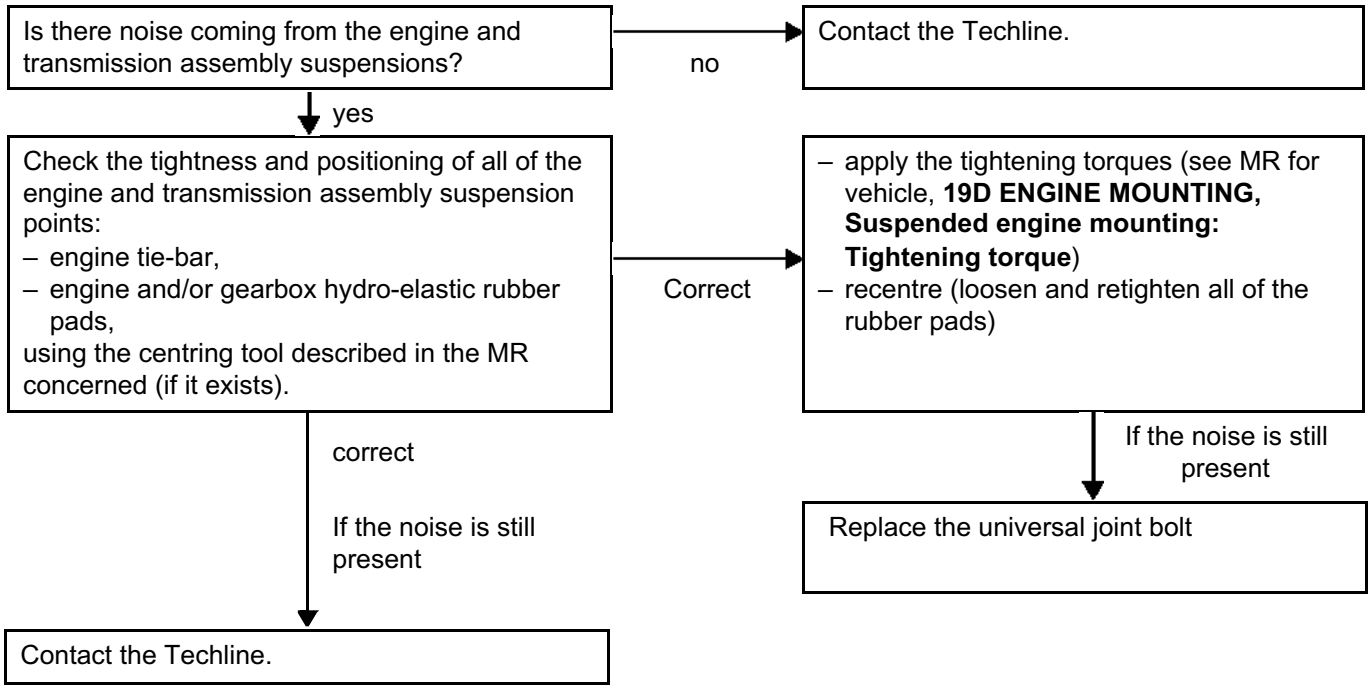
yes → See ALP 16.4. "Subframe area"

↓ no



Is the noise still present?

yes → Contact the Techline.



↓ no

End of fault finding procedure

ALP 16.1	**Interference noise** Noise in the "steering column area"

ALP 16.2	**Interference noise** Noise in the "engine area"

ALP 16.3	**Interference noise** Noise in the "suspension area"

Is there noise coming from the front shock absorber bump stop?

yes → Torque tighten front shock absorber bump stop bolts

If the noise is still present → Replace the filter assembly (see MR for the vehicle concerned, **31A, Front axle component, Filter assembly: Removal - Refitting**)

no

Is there noise coming from the front suspension spring?

yes → Lubricate the shock absorber cups

If the noise is still present → Contact the Techline

no

Is there noise coming from the front shock absorber?

yes → Torque tighten the front shock absorber bolts (see MR for the vehicle concerned, **31A, Front axle components, Front shock absorber and spring: Removal - Refitting**)

If the noise is still present → Replace the shock absorber (see MR for the vehicle concerned, **31A, Front axle components, Front shock absorber and spring: Removal - Refitting**)

no

If the noise is still present

Contact the Techline.

ALP 16.4	**Interference noise** Noise in the "subframe area"

Is there noise coming from the steering box?
yes → Replace the steering box (see MR for the vehicle concerned, **36A, Steering, Steering box: Removal - Refitting**)
no

Is there noise coming from the track rod end?
yes → Replace the track rod end (see MR for the vehicle concerned, **36A, Steering, Track rod: Removal - Refitting**)
no

Is there noise coming from the front suspension wishbone?
yes → Check the suspension lower ball joint (see MR for the vehicle concerned, **31A, Front axle components, Front driveshaft lower arm ball joint: Check**)
If the noise is still present → Torque tighten the front suspension wishbone bolts (see MR for the vehicle concerned, **31A, Front axle components, Front driveshaft lower arm: Removal - Refitting)**
If the noise is still present → Replace the front suspension wishbone (see MR for the vehicle concerned, **31A, Front axle components, Front driveshaft lower arm: Removal - Refitting**)
no

Is there noise coming from a front anti-roll bar tie rod?
yes → Torque tighten the anti-roll bar tie rod bolts (see MR for the vehicle concerned, **31A, Front axle components, Front anti-roll bar: Removal - Refitting**)
If the noise is still present → Replace the anti-roll bar tie rod (see MR for the vehicle concerned, **31A, Front axle components, Front anti-roll bar: Removal - Refitting**)
no

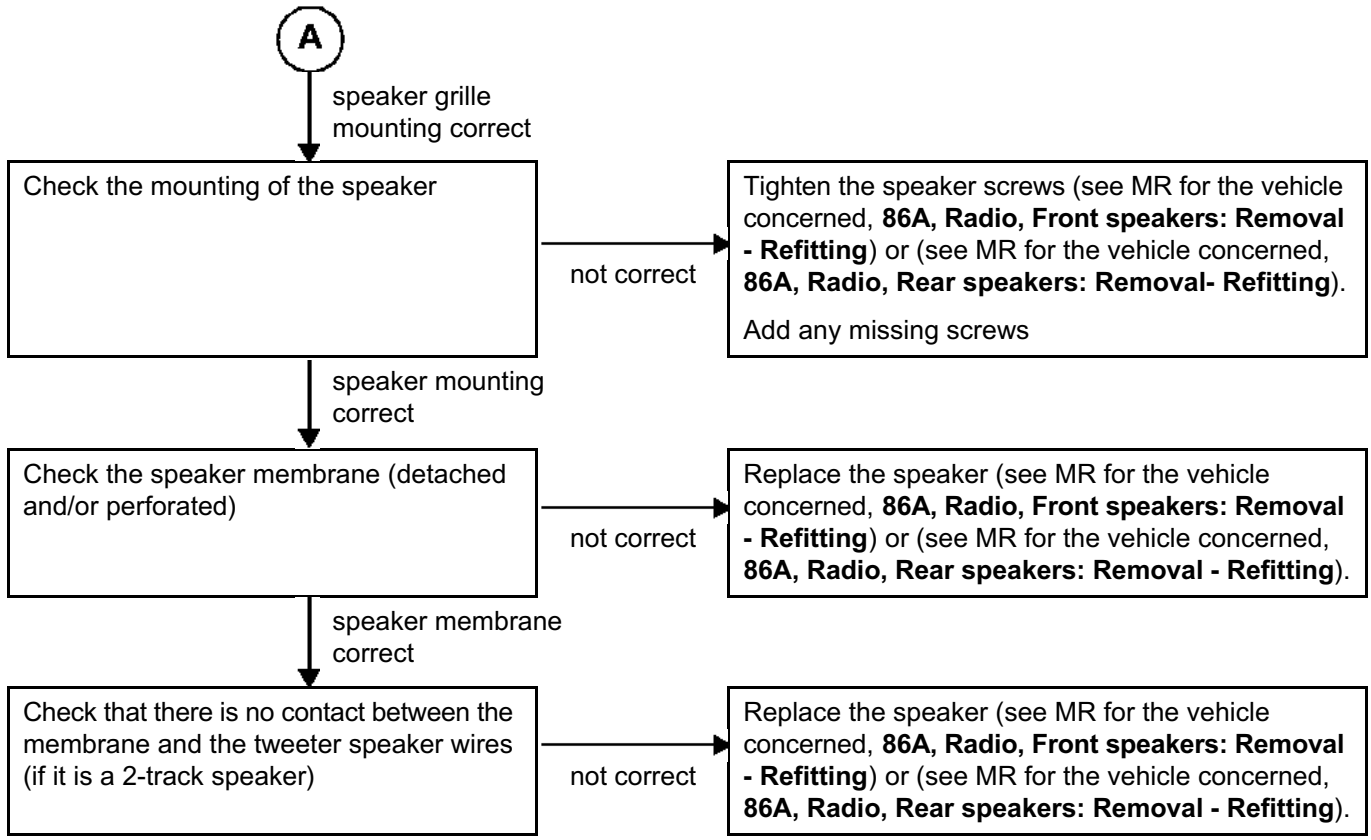
Is there noise coming from the subframe?
yes → Torque tighten all of the components fixed to the subframe (see MR for the vehicle concerned, **31A, Front axle components, front axle subframe: Removal - Refitting**)
no

If the noise is still present

Contact the Techline.

ALP 17	Crackling from the speakers

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.



Ensure that there are no foreign bodies present in the passenger compartment.
Check that no parts are broken.
Switch on the sound system and adjust it as follows:
– volume slightly raised
– bass level set at MEDIUM
– treble level set at MEDIUM
Insert a CD or audio cassette which has strong bass tones.

Check the mounting of the speaker grille:		
if the grille is clipped onto the speaker	not correct	Clip the grille onto the speaker Replace the speaker grille if the clip is broken*
if the grille is screwed onto the speaker	not correct	Tighten the speaker grille screws* Add any missing screws*
if the grille is clipped onto the trim	not correct	Clip the grille onto the trim Replace the grille if the clip is broken*
if the grille is bonded onto the trim	not correct	Bond the grille onto the trim*

*: See MR for the vehicle concerned, **72A, Side opening element trim, Front side door trim: Removal - Refitting**) or (see MR for the vehicle concerned, **72A, Side opening element trim, Rear side door trim: Removal - Refitting**)

A

ALP 17 CONTINUED	Crackling from the speakers

ALP 18	Noise from the dashboard

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Start by checking the following points:

● **When stationary, engine not running.**

– Empty all of the storage compartments in the dashboard and doors.
– Ensure that there are no foreign bodies present in the passenger compartment.
– Check that no parts are broken
– Test all of the storage compartment covers and flaps and air vent grilles (catches, hinges, play, etc.)
– Check all of the dashboard trims, visors and clipped front panels (tactile inspection that the parts are secure).
– Visually check for the presence of the bolts

? It is essential to replace all of the faulty components (fasteners, clips, air vent grilles).

● **When stationary, engine running.**

– Accelerate slightly to detect any vibration of the trims and front panels clipped onto the dashboard.
– Test the heating distribution at different speeds to detect any foreign bodies in the heating ducts (air vent vanes, dead leaves, etc.).

? It is essential to replace any faulty component (fasteners, clips, air vent grilles, etc.).

● **Operational or road test in accordance with the customer complaint.**
(Different speeds, cobbled surface, with or without ventilation or heating system, etc.).

⇓

When all of these checks have been carried out and the fault is still present, proceed to the following step

ALP 18 CONTINUED 1	Noise from the dashboard

Check that no parts are broken.
It is essential to consult the Repair Manual for the vehicle concerned in order to observe the safety advice and recommended tightening torques.
After each operation, carry out a vehicle test to check that the vehicle has been repaired.

Check the operation of the storage flaps and covers.
Visually and manually inspect the joint play.

not correct → Replace any faulty parts (see MR for vehicle concerned, **57A, INTERIOR EQUIPMENT**)

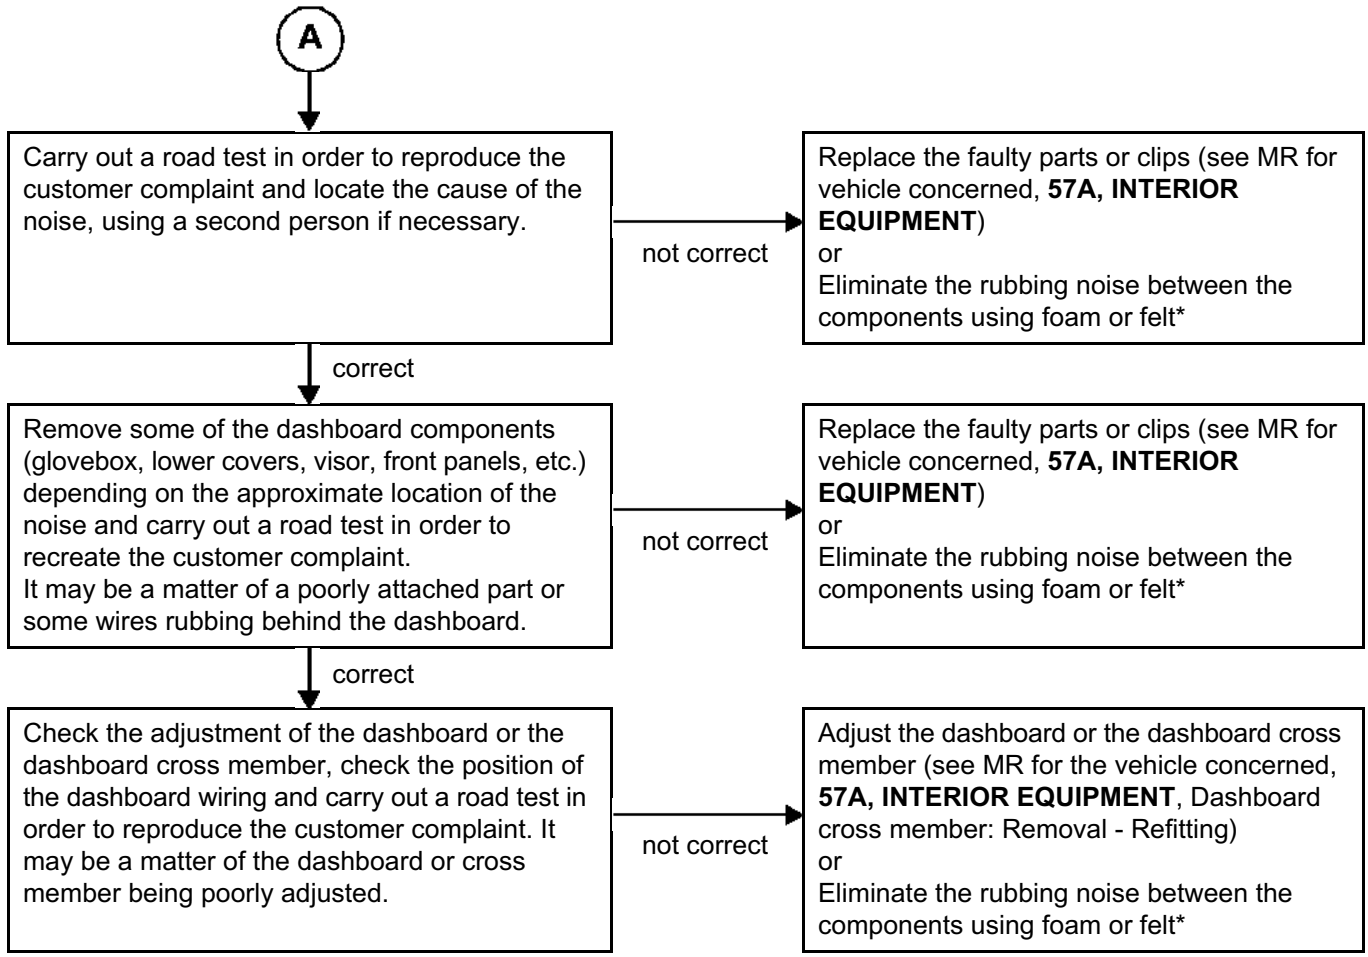
correct ↓

Check the centre and side air vent grilles.
Visually inspect if any components are missing and the clearance between the air vent vanes.

not correct → Replace the faulty parts (see MR for vehicle concerned, **57A, INTERIOR EQUIPMENT**)

correct ↓

Check that the covers, front panels, trim pieces and A-pillar trims are clipped on correctly.
Visually and manually inspect if any components are missing (bolts, clips, etc.) and check the clearance between the components.



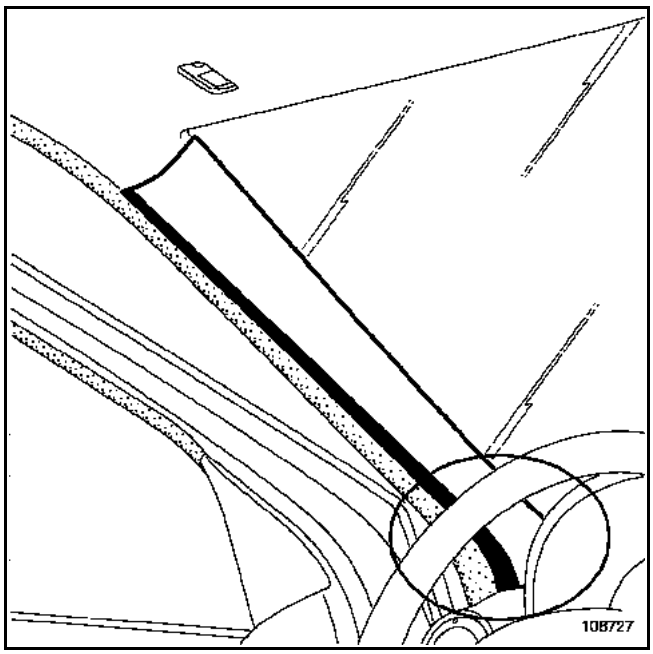
not correct → Replace the faulty parts or clips (see MR for vehicle concerned, **57A, INTERIOR EQUIPMENT**)
or
Eliminate the rubbing noise between the components using foam or felt*

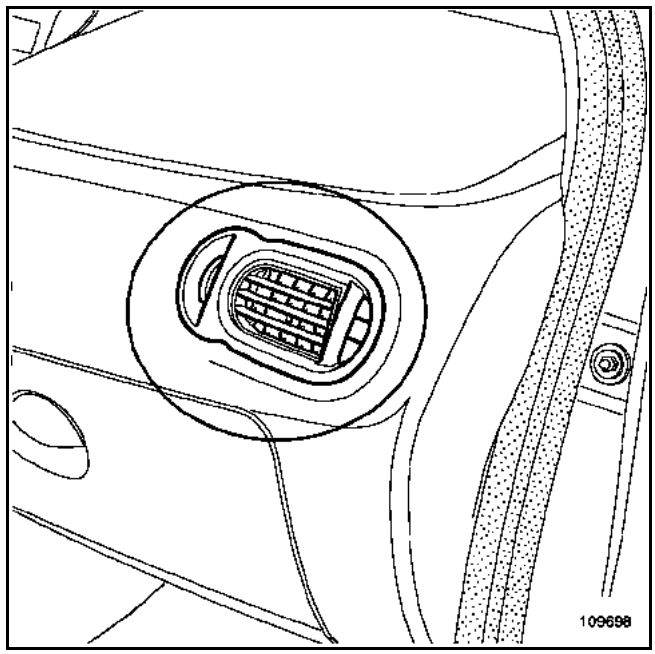
correct ↓

(A)

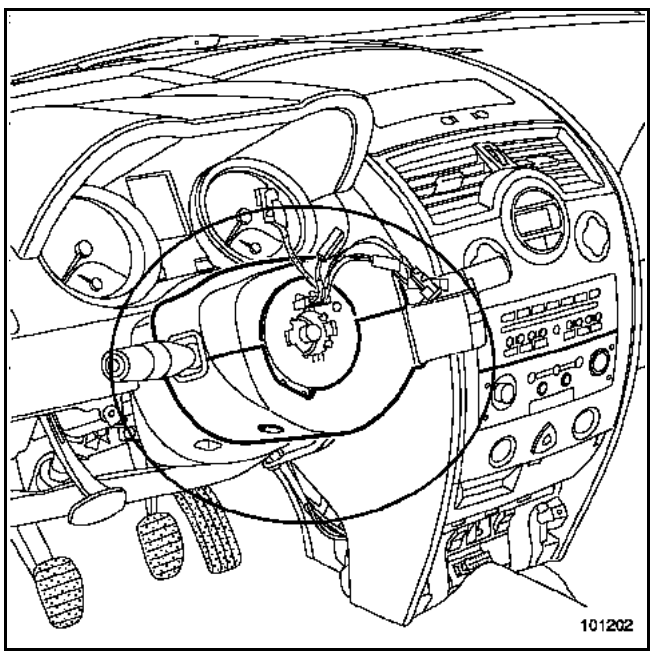
- *adhesive foam: **77 05 042 163**
- *adhesive foam: **77 05 042 122**
- *adhesive felt: **82 00 281 967**

ALP 18 CONTINUED 2	Noise from the dashboard

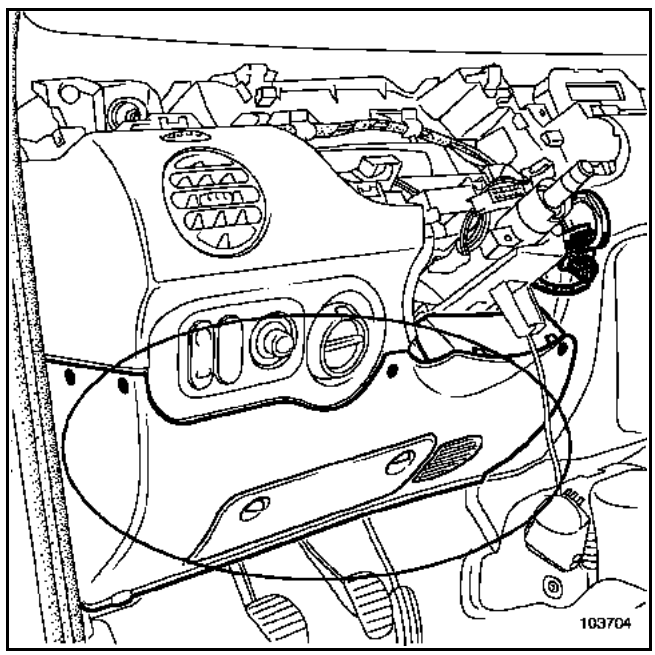




- *adhesive foam: **77 05 042 163**
- *adhesive foam: **77 05 042 122**
- *adhesive felt: **82 00 281 967**

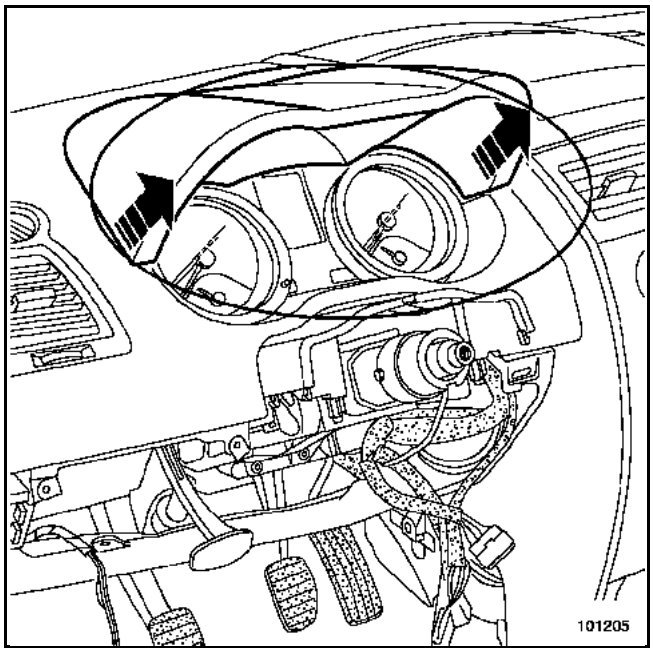


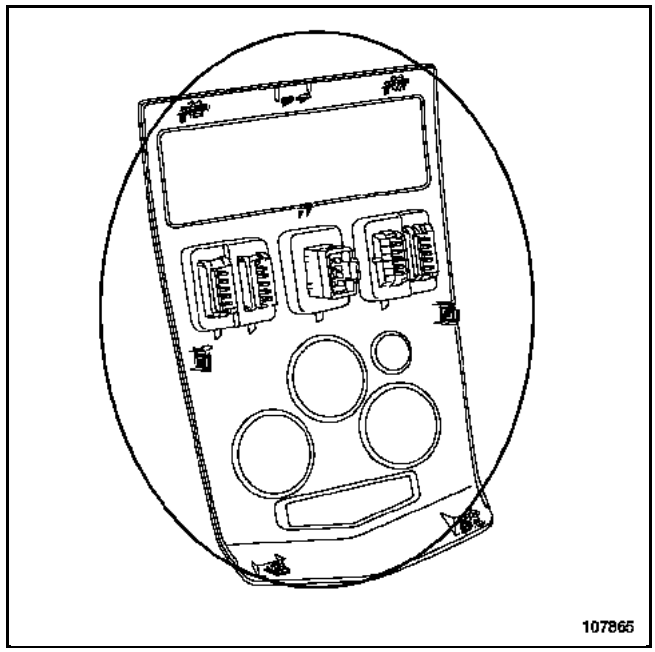
ALP 18 CONTINUED 3	Noise from the dashboard

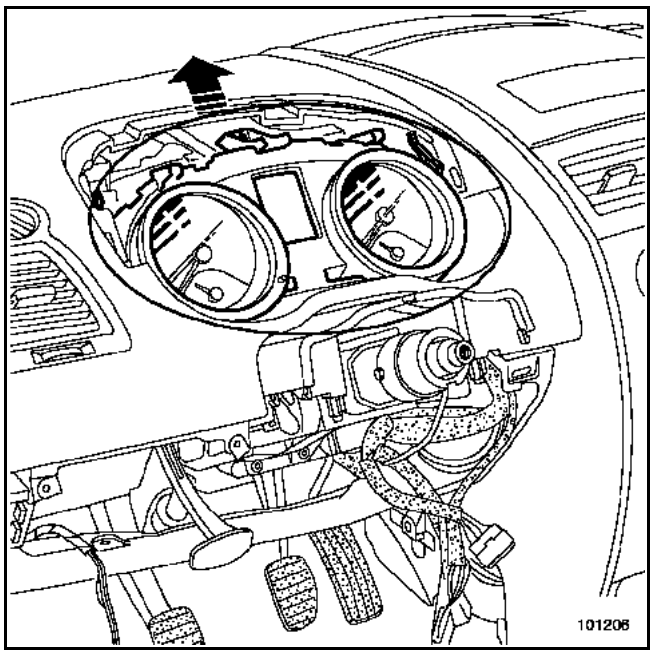


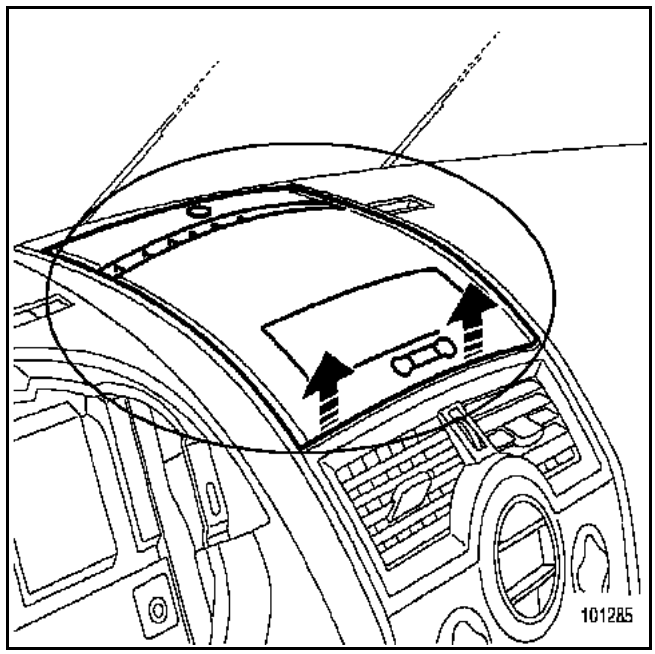
IMPORTANT:
It is essential to consult the MR for the vehicles concerned in order to observe the safety advice related to airbag locking.

Any parts connected to the dashboard body, (clipped, fitted and screwed parts) could potentially create noise (see parts below).

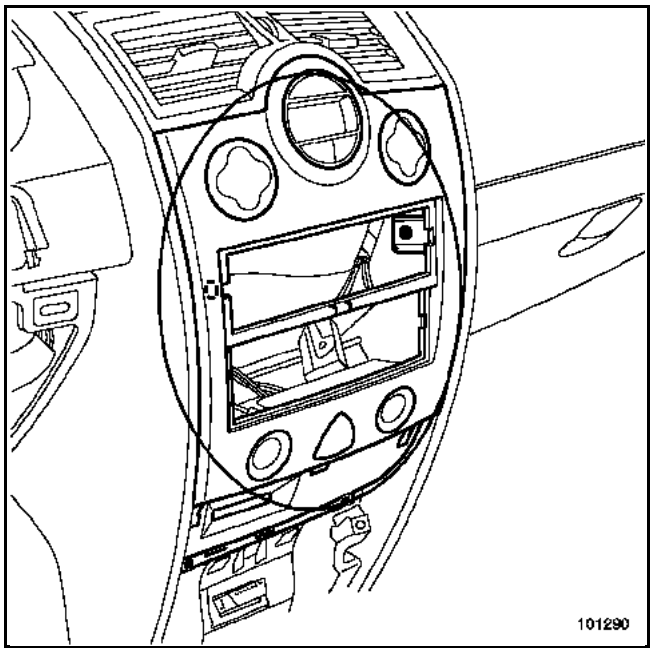


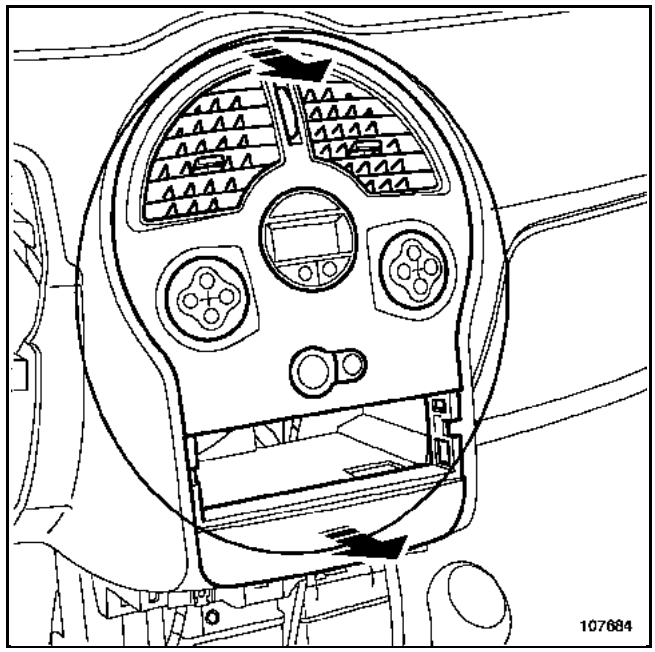


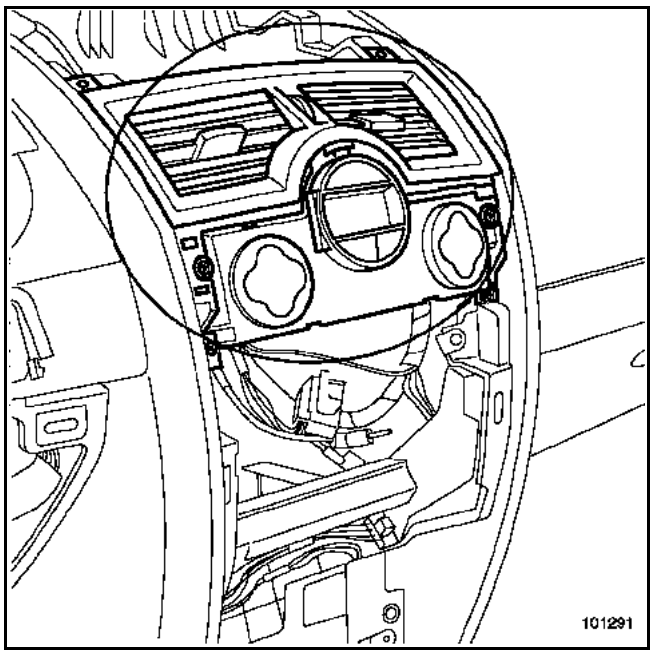


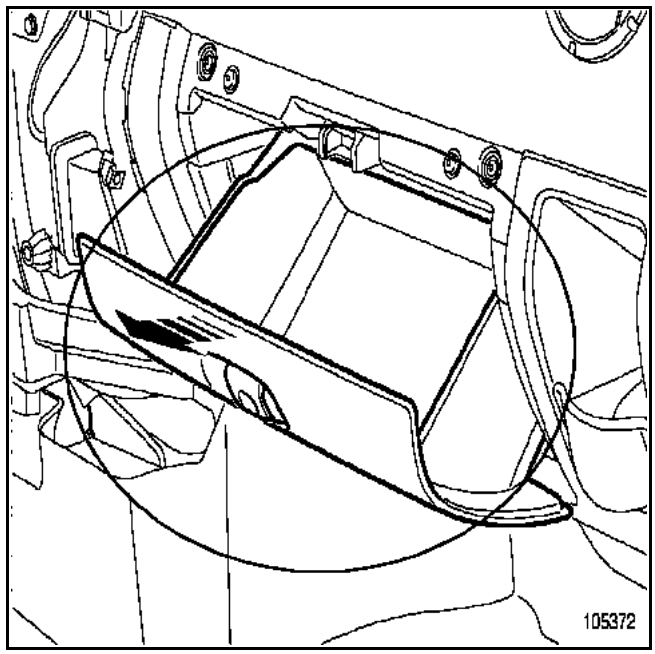


ALP 18 CONTINUED 4	Noise from the dashboard

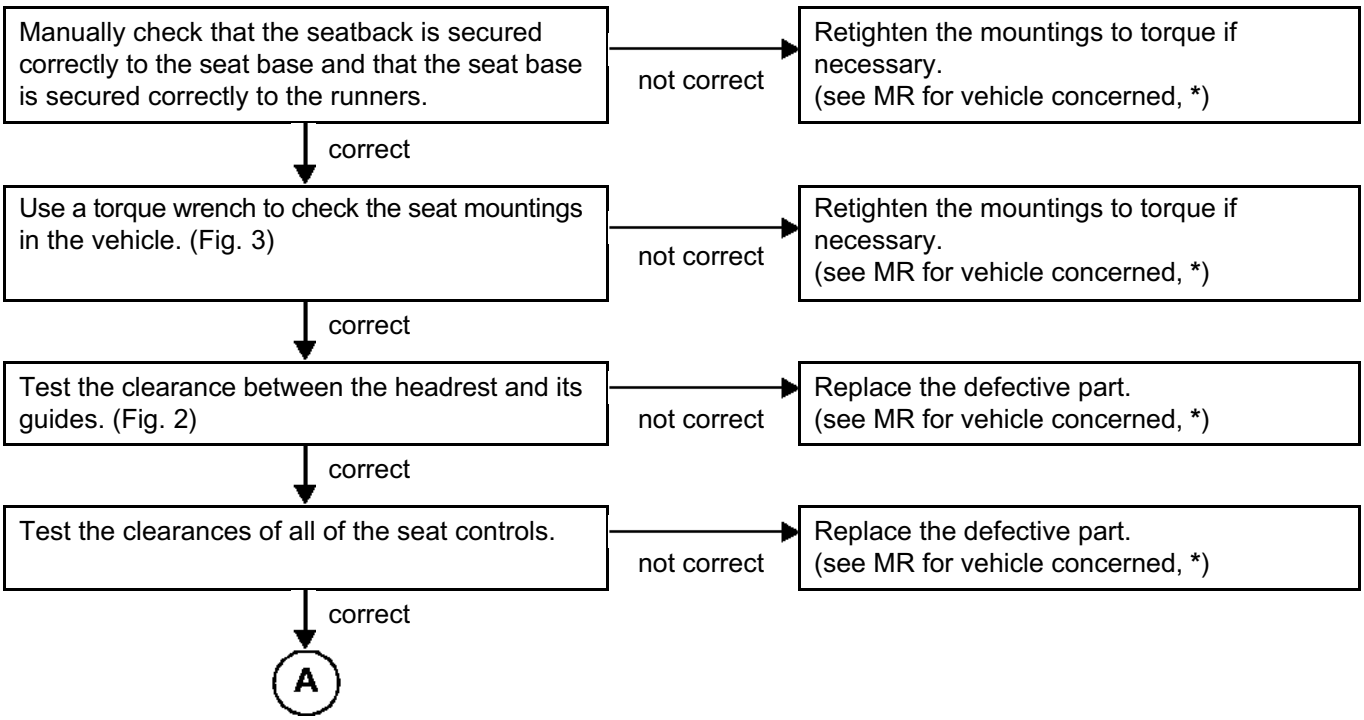




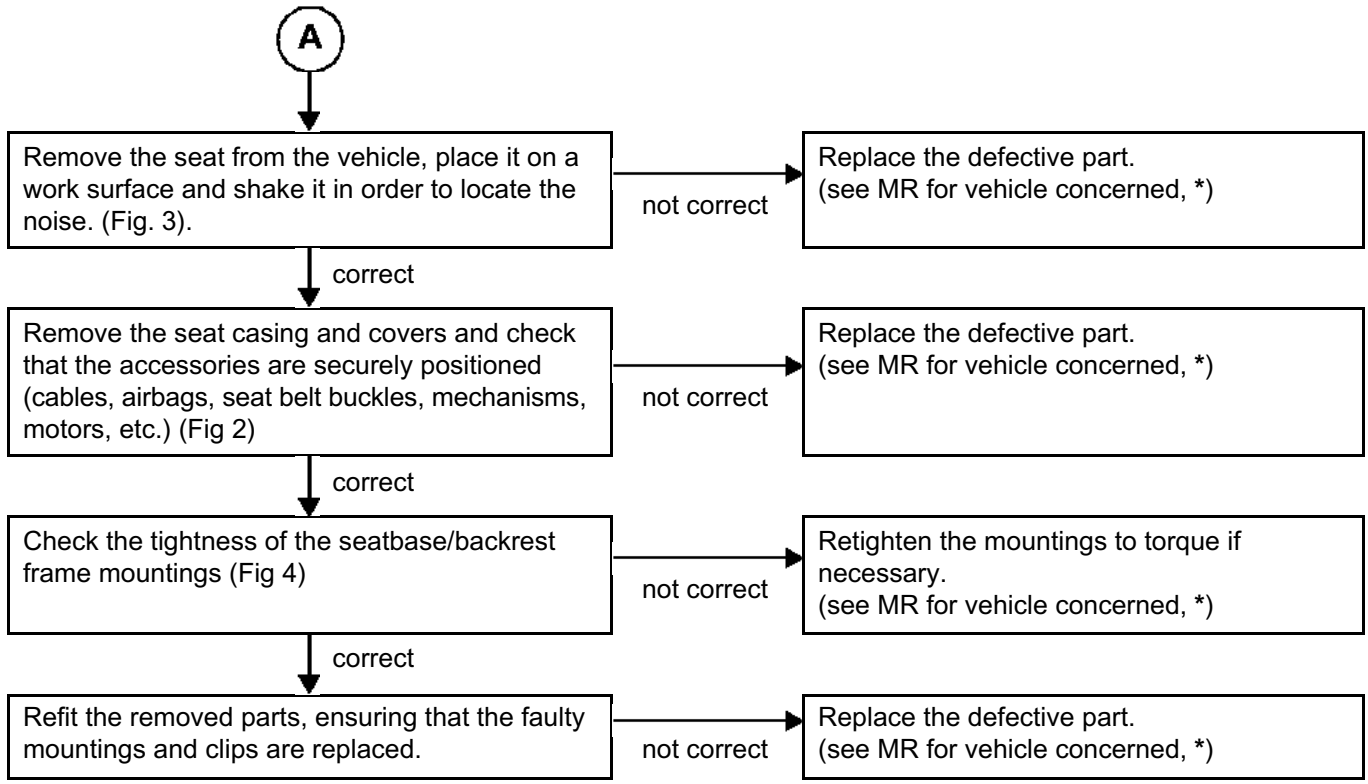




ALP 18 CONTINUED 5	Noise from the dashboard



ALP 19	Noise from the upholstery



NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

*

75A, FRONT SEAT FRAMES AND RUNNERS
76A, REAR SEAT FRAMES AND RUNNERS
77A, FRONT SEAT TRIMS

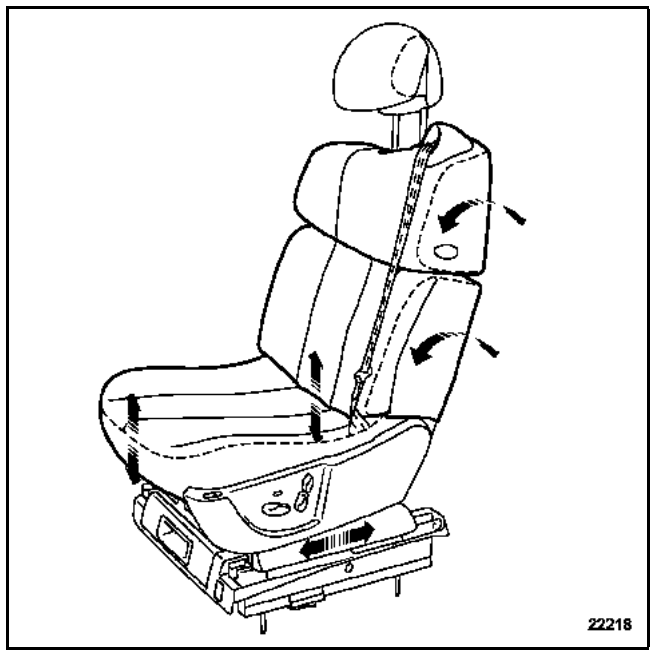
*

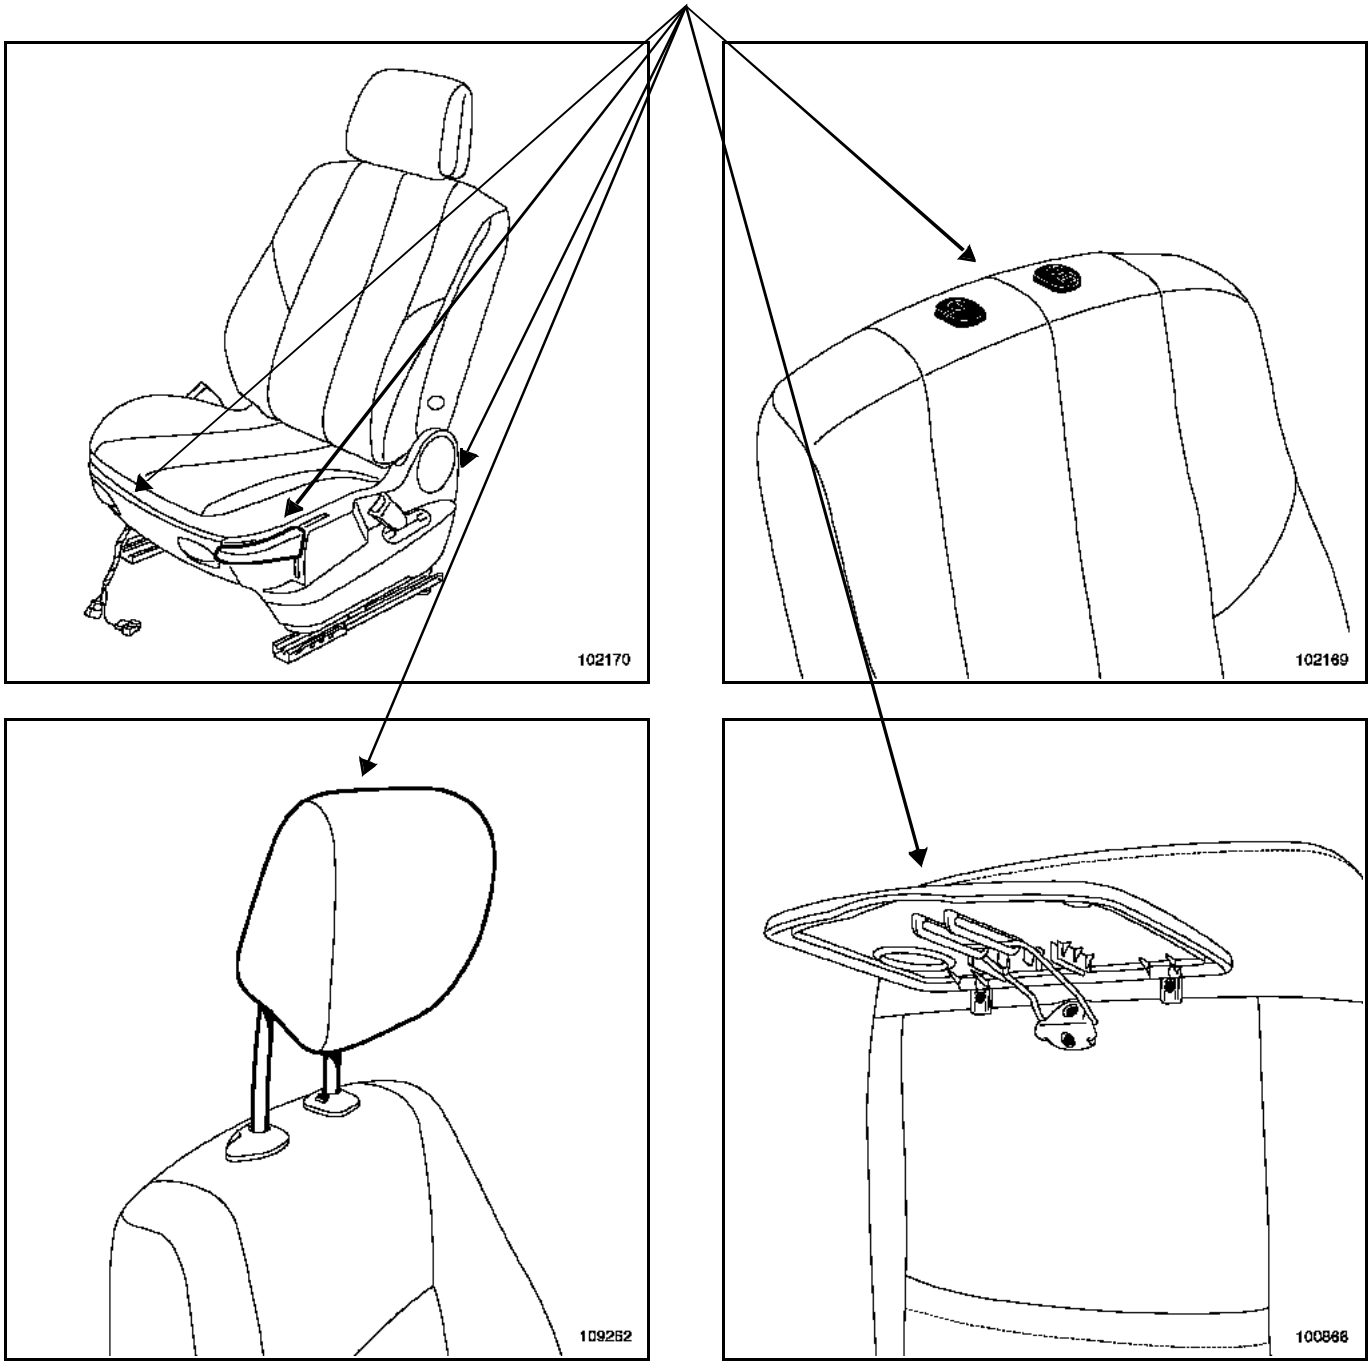


75A, FRONT SEAT FRAMES AND RUNNERS
76A, REAR SEAT FRAMES AND RUNNERS
77A, FRONT SEAT TRIMS
78A, REAR SEAT TRIMS

ALP 19 CONTINUED 2	Noise from the upholstery

Notes: before reading the ALP.

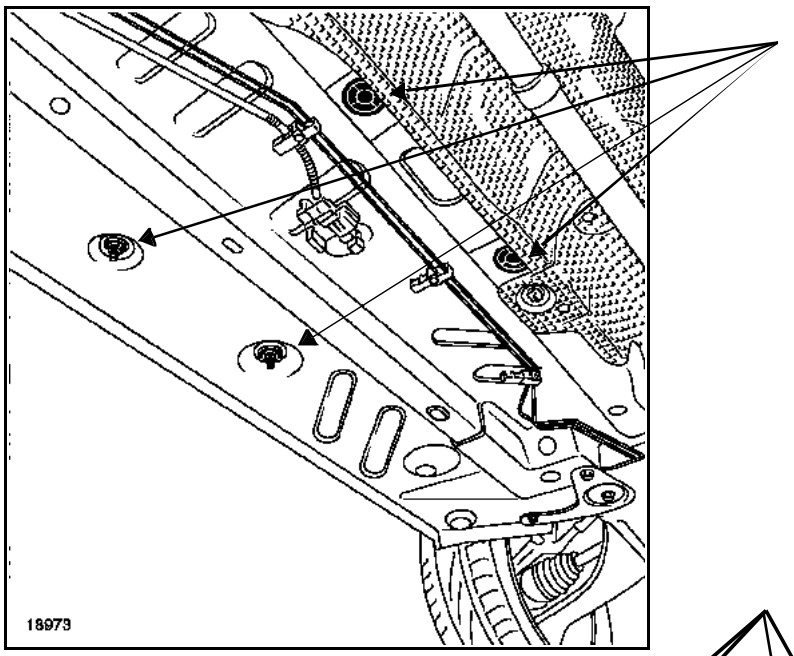
Fig. 1



Carry out an operational test on the seat

ALP 19 CONTINUED 3	Noise from the upholstery

Fig. 2



Check the resistance and mountings of the casings, control levers, headrest and guides, rear parcel shelf, etc.

ALP 19 CONTINUED 4	Noise from the upholstery

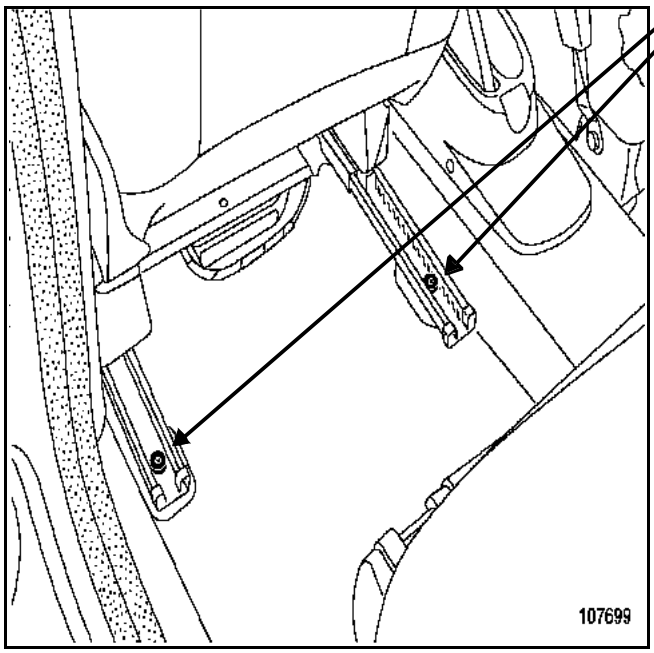


Fig. 3

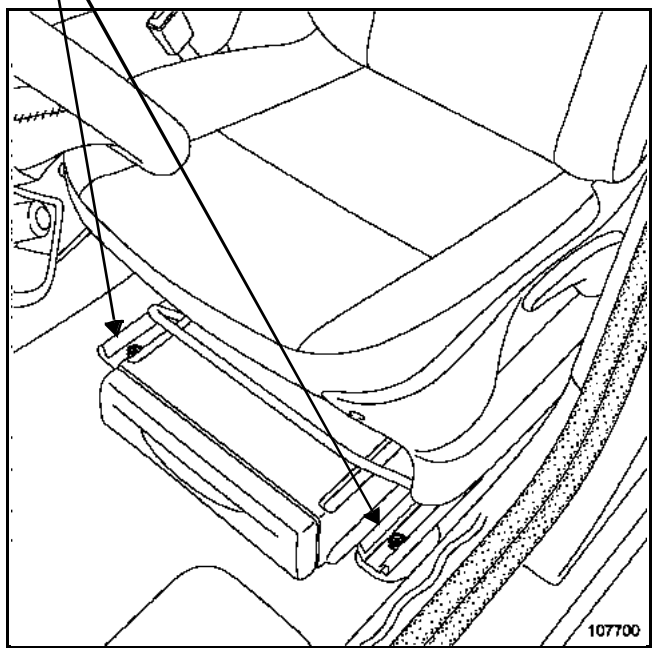
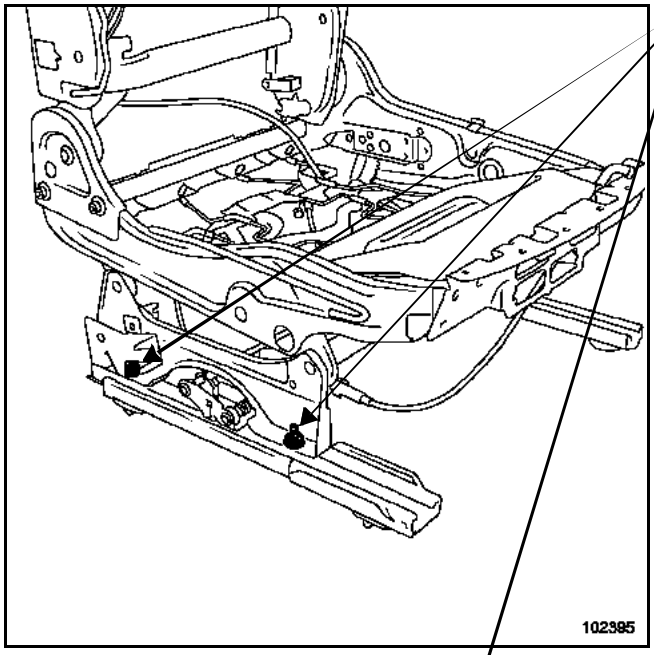
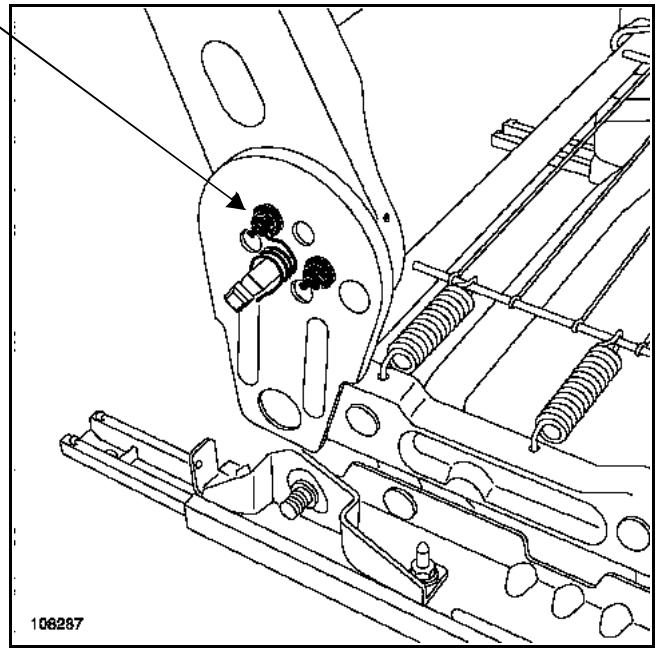


A seat can either be removed from underneath the vehicle or from the vehicle interior:

Mountings underneath the vehicle

Mountings inside the vehicle





ALP 19 CONTINUED 5	Noise from the upholstery

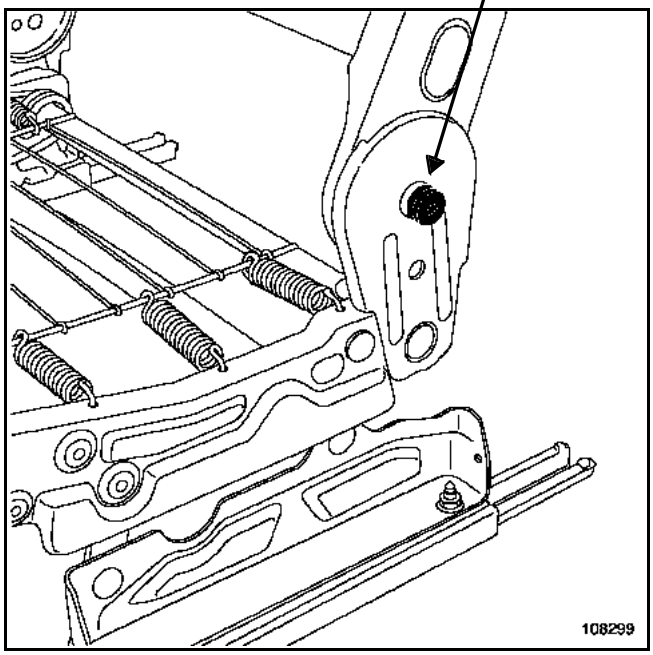


Fig. 4

The frame mountings to be checked include:

Seat base/backrest frame mountings and runners/seat base mountings

Consult the MR in order to respect the recommended tightening torques.

ALP 20	Noise when window is operated (squeaking/creaking)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies present
– no parts are loose, damaged or broken.

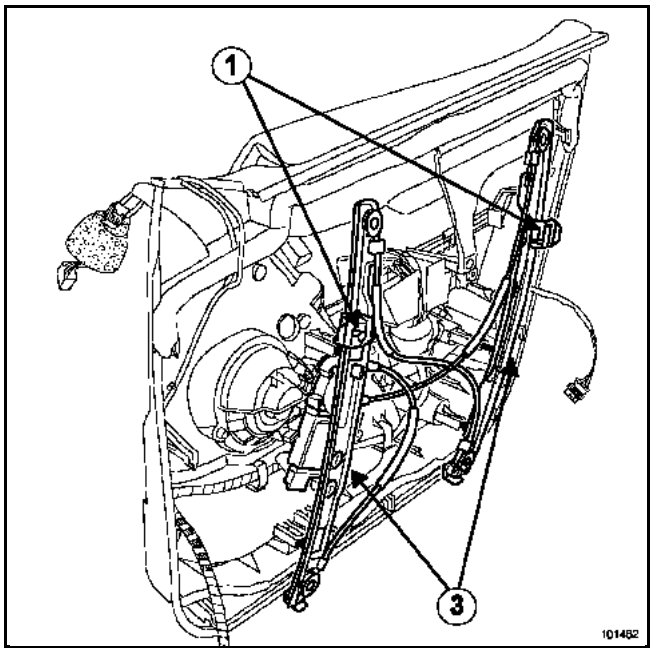
After the operation, check that the operation was successful by performing an operational test or road test.

Check that the runners* and the window winder drum are lubricated correctly

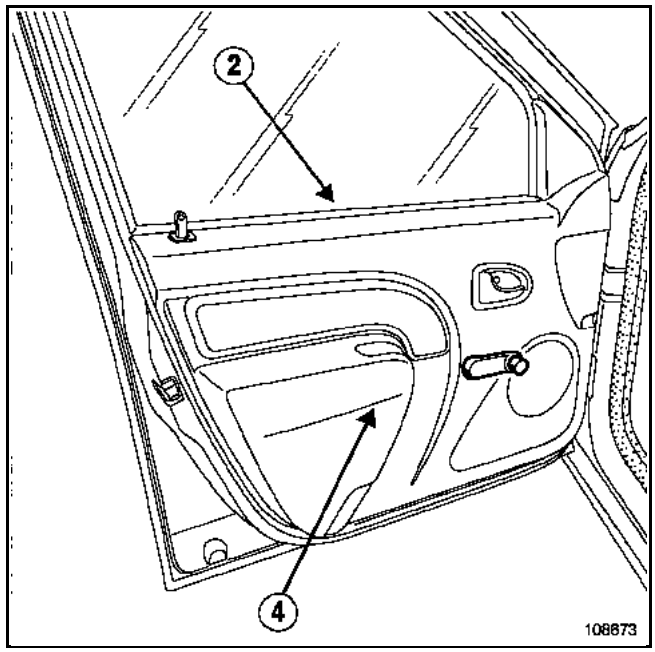
not correct → Clean the window winder (using a lint-free cloth soaked in heptane, Part no. 77 11 170 064), and lubricate the runners* and the window winder drum (mechanism lubricant: Part no. 77 11 419 865), removing the window winder mechanism if necessary (see MR for the vehicle, **51A, SIDE OPENING ELEMENT MECHANISMS, Front or rear manual or electric window mechanism: Removal - Refitting**)

correct

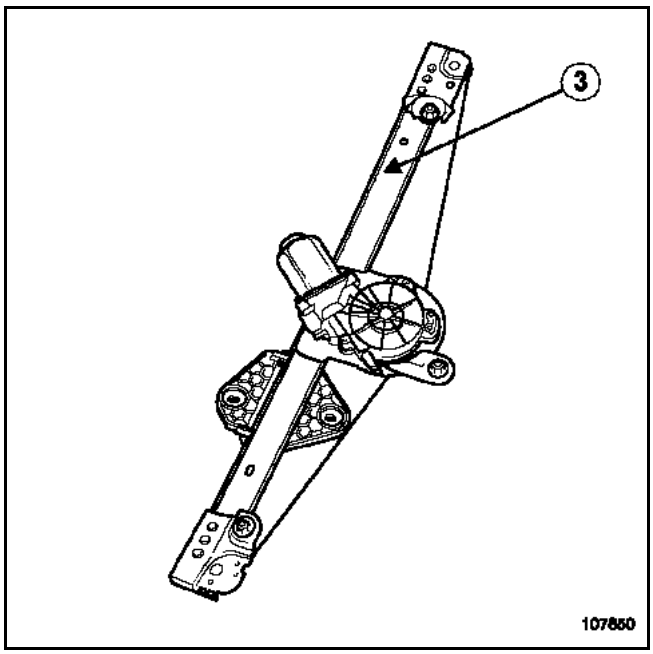
Check the cleanliness and wear of the exterior weatherstrip* and/or the glass run channel*.



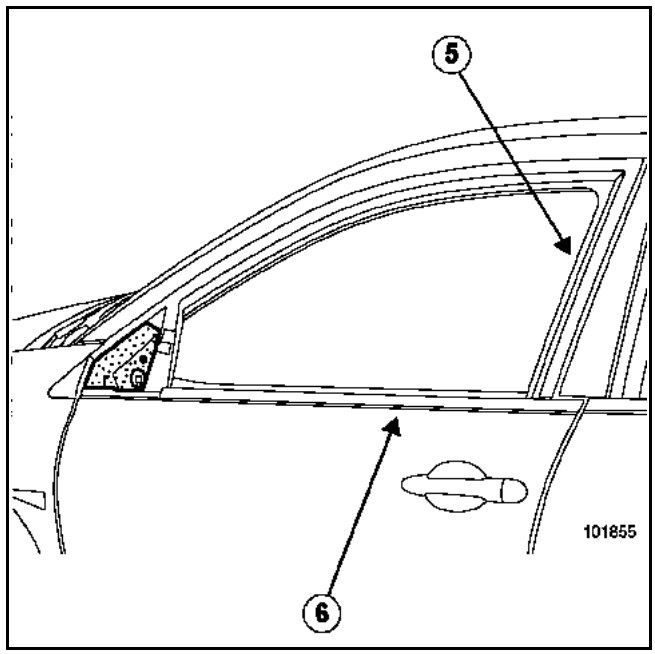
not correct → Remove the exterior weatherstrip* and/or the glass run channel* (see MR for vehicle, **66A WINDOW SEALING, Front or rear door exterior weather strip: Removal - Refitting** and **66A WINDOW SEALING, Front or rear door glass run channel: Removal - Refitting**)



1) Clean the exterior weatherstrip* and/or the glass run channel* using a flexible brush and soapy water (under no circumstances must abrasive soap be used).



2) If the first operation is not successful, replace the weatherstrip* and/or the window channel*.



*: see the illustrations on the following page

ALP 20 CONTINUED	Noise when window is operated (squeaking/creaking)

1 Window winder sliders
2 Interior weatherstrip
3 Window winder mechanism runners
4 Interior door trim
5 Glass run channel
6 Exterior weatherstrip

ALP 21	Noise when window is operated (scratching)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies present
– no parts are loose, damaged or broken.

After the operation, check that the operation was successful by performing an operational test or road test.

↓

Check that the internal section of the slide* is not damaged.

→ not correct

1) Use the CAR 1363 special tool to realign the damaged section.

2) If the first operation is not successful, replace the glass run channel*. (see MR for the vehicle, **66A WINDOW SEALING, Front or rear door glass run channel: Removal - Refitting**)

*: see illustrations in ALP: Noise when window is operated (squeaking / creaking)

ALP 22	Noise from the window when closing the door (rattling)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies present
– no parts are loose, damaged or broken.

After the operation, check that the operation was successful by performing an operational test or road test.

Check that the interior * and/or exterior weatherstrip* are correctly positioned.

not correct → 1) Reposition the interior* and/or exterior* weatherstrips.
2) If the first operation is not successful, replace the weatherstrip* on the front or rear door. (see MR for vehicle, **66A WINDOW SEALING, Front or rear side door exterior weatherstrip: Removal - Refitting** or **Front or rear side door trim: Removal - Refitting**).

correct ↓

Check that the internal section of the slide* is not damaged.

not correct → 1) Use the CAR 1363 special tool to realign the damaged section.
2) If the first operation is not successful, replace the glass run channel*. (see MR for the vehicle, **66A WINDOW SEALING, Front or rear door glass run channel: Removal - Refitting**)

correct ↓

Check the play of the window winder slider* in relation to the window (check that no noise can be detected)

not correct → Fit a square piece of foam between the window and the window winder slider*
Part no.: 77 05 042 122

*: see illustrations in ALP: Noise when window is operated (squeaking / creaking)

ALP 23	Sunroof chattering: jerky movement when opening/closing sunroof mobile panel

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Check the tyre pressures.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies in the sunroof side runners,
– no parts are broken.

After the operation, check that the operation was successful by performing an operational test or road test.

↓

Check the operation of the mobile panel* by initialising the sunroof motor, with the vehicle's engine running (see fault finding MR for vehicle, **87D ELECTRIC WINDOW - SUNROOF, Electric sunroof: Initialisation**)

↓ correct

Check the cleanliness of the side runners*

not correct → Clean the internal and external side runners* and, depending on the vehicle, only lubricate the internal side runners* or the external side runners* without removing the sunroof mobile panel (see MR for the vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof mobile panel: Removal - Refitting**)

↓ correct

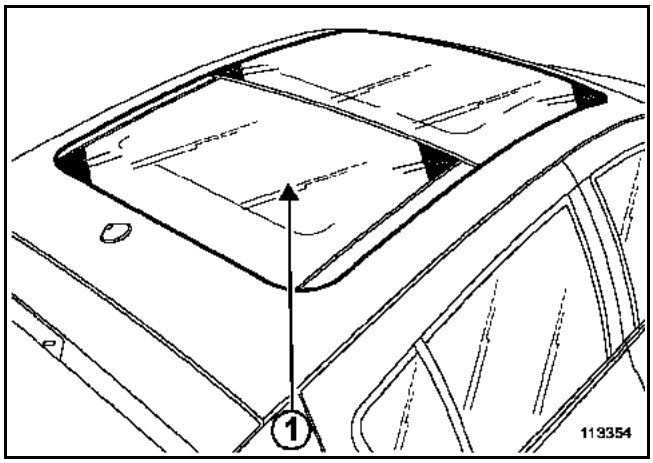
Check the condition of the mobile panel linkages*

not correct → Remove the mobile panel* and replace the runners and/or the mobile panel linkages. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof mobile panel: Removal - Refitting**)

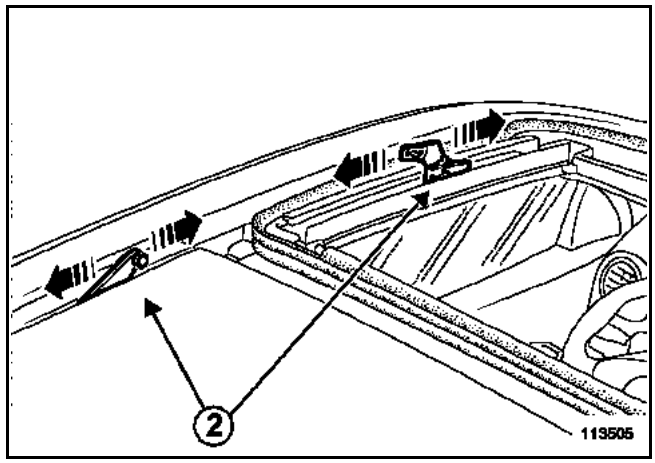
↓ correct

Check that the mobile panel* slides correctly (no jerky movement)

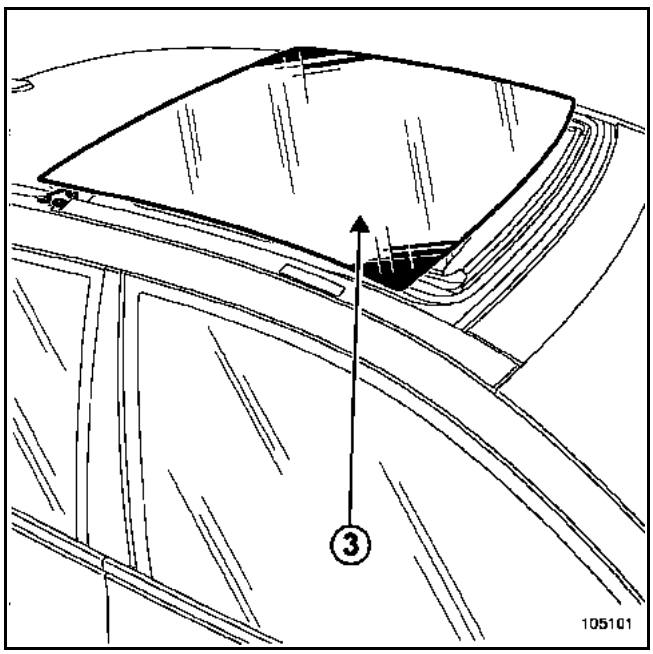
not correct → Replace the sunroof* motor. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS**, or **87D ELECTRIC WINDOWS - SUNROOF, Sunroof opening motor: Removal - Refitting**)



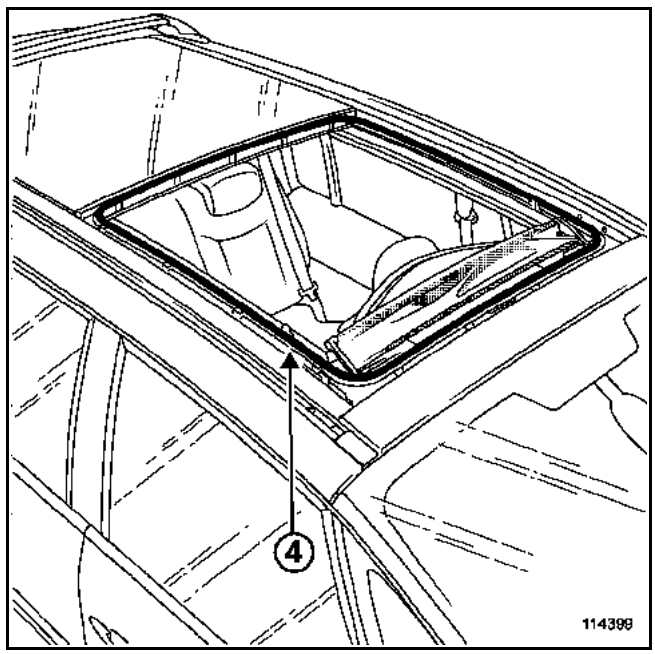
↓ correct



Check the conformity of the sunroof* (damaged runners, operating mechanism, etc.)

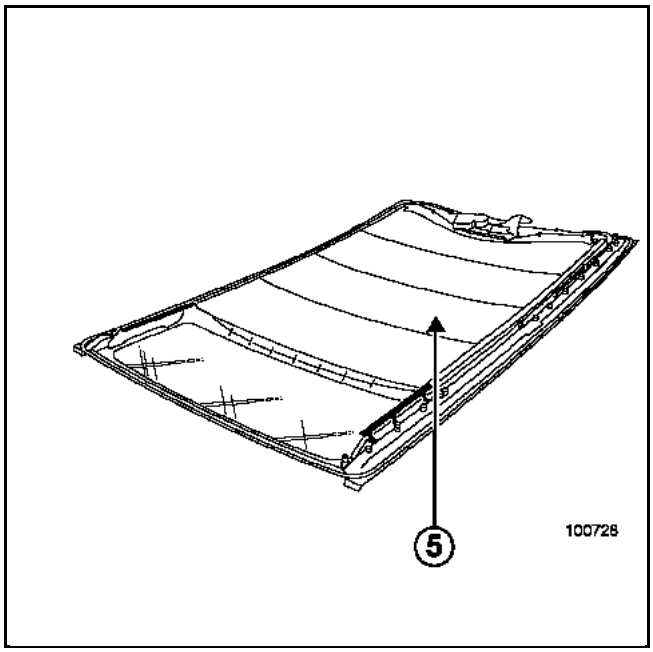


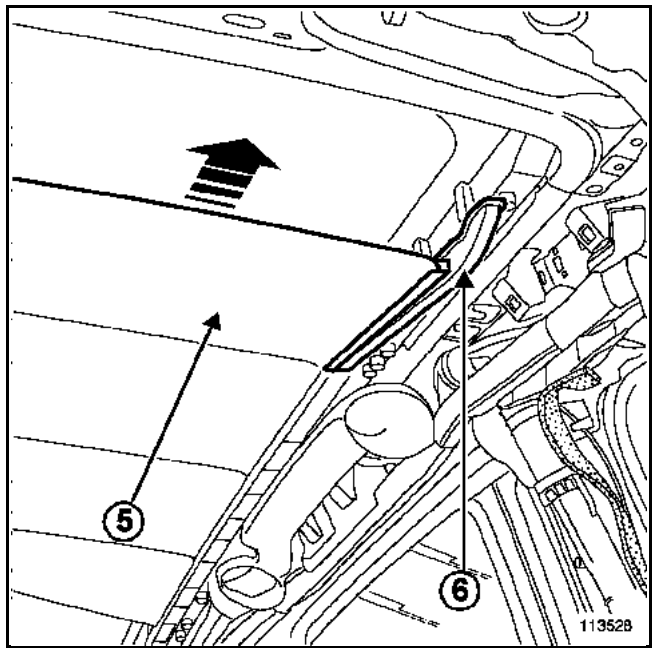
not correct → Replace the sunroof*. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof operating mechanism: Removal - Refitting**).

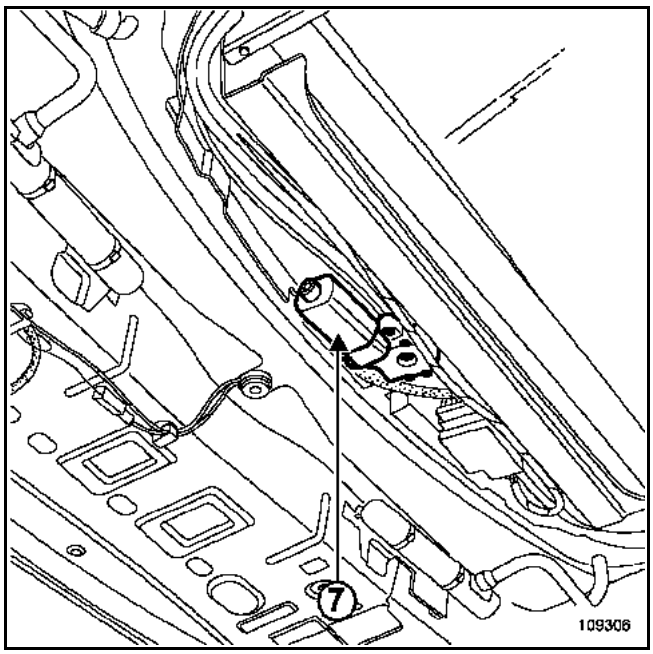


*: see the illustrations on the following page

ALP 23 CONTINUED 1	Sunroof chattering: jerky movement when opening/closing sunroof mobile panel







1 Sunroof operating mechanism (sunroof assembly)
2 Linkages and side runners (position of sliding linkages)
3 Sunroof mobile panel
4 Seal

ALP 23 CONTINUED 2	Sunroof chattering: jerky movement when opening/closing sunroof mobile panel

5 Sunroof blind (e.g. Espace IV)
6 Sunblind storage unit
7 Sunroof motor

ALP 24	Sunroof creaking

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Check the tyre pressures.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies in the sunroof side runners,
– no parts are broken.

After the operation, check that the operation was successful by performing an operational test or road test.

↓

Check the cleanliness:
– of the seal on the front section of the sunroof*
– of the seal between the mobile panel* and the sunroof operating mechanism*.

→ not correct → In all cases: Clean the seals* using a sponge and soapy water (under no circumstances must abrasive soap be used).

↓ correct

Check the condition:
– of the seal on the front section of the sunroof*.
– of the seal between the mobile panel* and the sunroof operating mechanism*.

→ not correct → If the seal is worn and/or broken, replace:
– the seal* on the front section of the sunroof, and/or
– the seal* between the mobile panel* and the sunroof operating mechanism*.
(see MR for vehicle, **65A OPENING ELEMENT SEALING, Sunroof seal: Removal - Refitting**).

*: see the illustrations in ALP: Sunroof chattering

ALP 25	Grating noise from the sunblind

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Check the tyre pressures.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies in the sunroof side runners,
– no parts are broken.

After the operation, check that the operation was successful by performing an operational test or road test.

↓

Remove the headlining (see MR for vehicle, **71A BODY INTERNAL TRIM, Headlining: Removal - Refitting**)

↓ correct

Check the cleanliness of the side runners* and the sunblind storage units*.

→ not correct: Clean then lubricate the side runners* and the sunblind storage units* (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof blind: Removal - Refitting**).

↓ correct

Check the condition of the sunblind side runners*.

→ not correct: Clean and lubricate the sunblind side runners* (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof blind: Removal - Refitting**).

*: see the illustrations in ALP: Sunroof chattering

CHART 26	Sunroof rattling

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Consult the ICM database and check the conformity of the vehicle.
Check the tyre pressures.
Visually inspect the vehicle:
– exterior cleanliness,
– no foreign bodies in the sunroof side runners,
– no parts are broken.

After the operation, check that the operation was successful by performing an operational test or road test.

↓

Check the tightness of the **detachable** side runners* at the front of the sunroof*. (e.g. Modus)

→ not correct: Torque tighten the detachable side runners* (see MR for vehicle concerned, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof mobile panel: Removal - Refitting**)

↓ correct

Check the cleanliness of the side runners*

→ not correct: Clean the internal and external side runners* and, depending on the vehicle, only lubricate the internal side runners* or the external side runners* without removing the sunroof mobile panel (see MR for the vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof mobile panel: Removal - Refitting**)

↓ correct

Check the linkage* - linkage mounting contact.

→ not correct: Insulate the contact between the linkage* and the linkage mounting by bonding a piece of felt (part no.: 82 00 281 967) to the front and/or rear linkages.

↓ correct

(A)

*: see the illustrations in ALP: Sunroof chattering

CHART 26 CONTINUED	Sunroof rattling

Check the condition of the mobile panel linkages*.

not correct → Remove the mobile panel* and replace the runners and/or the linkages* of the mobile panel*. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof mobile panel: Removal - Refitting**)

correct ↓

Check the conformity of the sunroof* (damaged runners, operating mechanism, etc.)

not correct → Replace the sunroof*. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof operating mechanism: Removal - Refitting**).

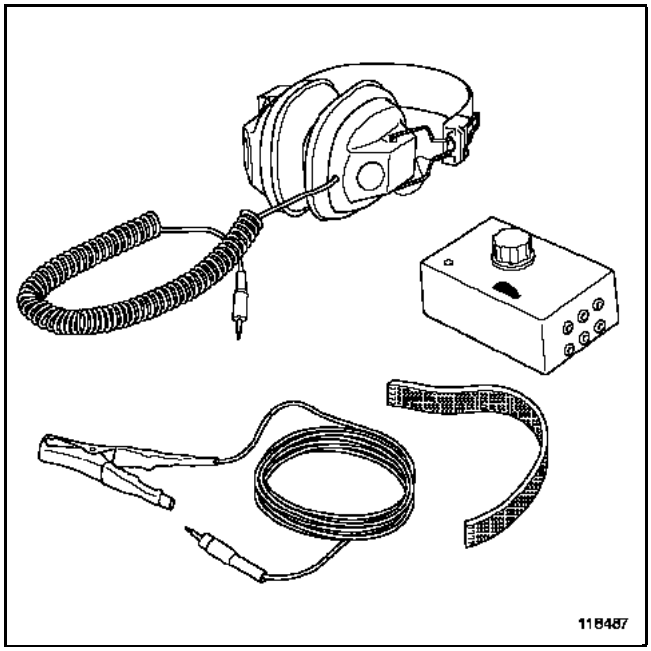
correct ↓

Check the geometry of the sunroof* in relation to the bodywork.
(Front, rear and side play)

not correct → Correct the geometry of the sunroof operating mechanism*. (see MR for vehicle, **52A NON-SIDE OPENING ELEMENT MECHANISMS, Sunroof operating mechanism: Removal - Refitting**).
Bolted sunroof operating mechanism*:
Use the centring kit corresponding to the vehicle and tighten the sunroof operating mechanism, observing the tightening order specified in the procedure in sub-section **52A NON-SIDE OPENING ELEMENT MECHANISMS**.
Bonded sunroof operating mechanism*:
Use the centring kit which corresponds to the vehicle.
Remove and reattach the sunroof operating mechanism following the procedure in the sub-section **52A NON-SIDE OPENING ELEMENT MECHANISMS**.

*: see the illustrations in ALP: Sunroof chattering

Introduction:



Before using the diagnostic tool (**Part no. 77 11 421 103**), it is essential to identify that the noise heard by the customer comes from the vehicle (and not from various objects in the vehicle or from the surrounding environment, etc.).

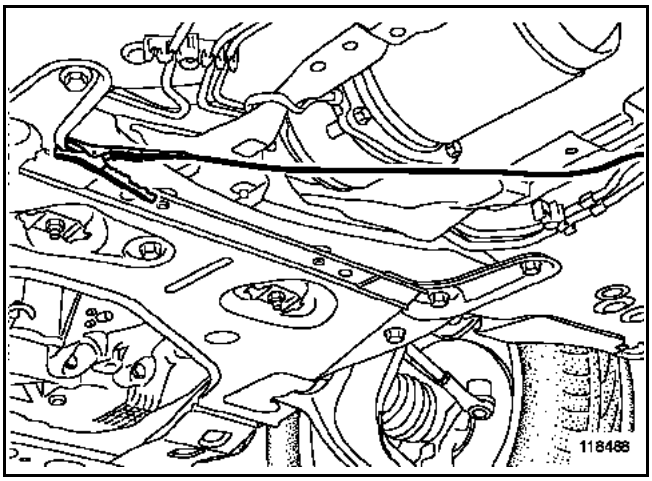
Note: Whenever possible, empty the contents of the vehicle's various storage compartments.

The **ChassisEar** is an electronic, versatile diagnostic tool designed to enable the user, during a road test, to amplify the sounds produced by different areas of the vehicle:

- Suspension
- Rotating components
- Front panel
- Engine
- Engine sub-frame
- Steering column
- Under body
- Rear face

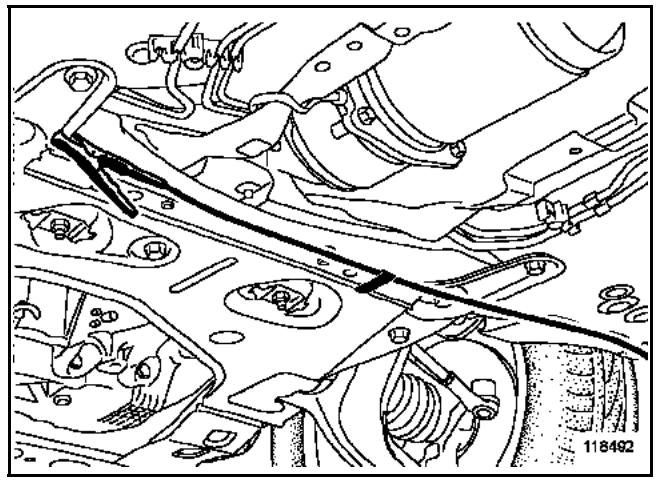
Diagram of the tool:

The tool case is composed of the following:



- Control unit (1)
- Clamp - Cable assembly (2)
- Headset (3)
- Velcro strip (4)

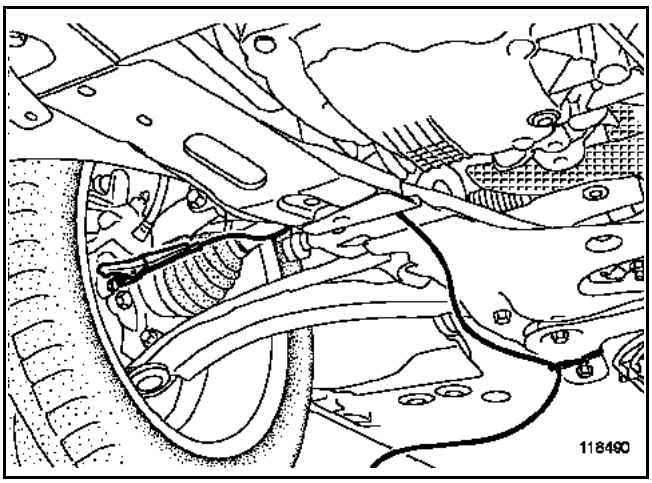
1) Fitting the tool:



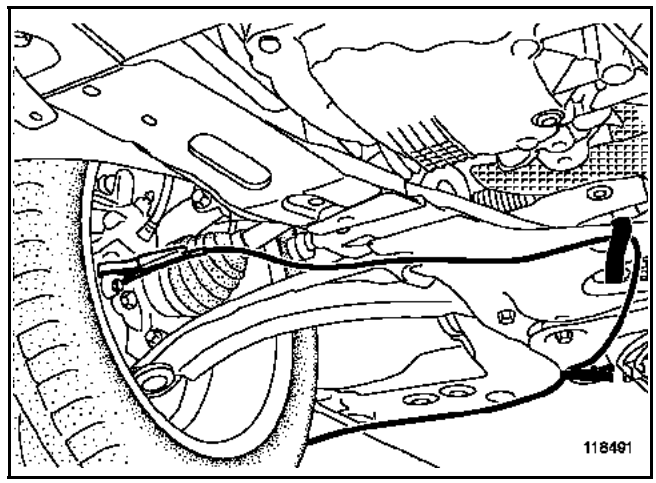
1.1) Precautions to observe when fitting the tool:

1.1.1) Assembly (wire – clamp):

– Ensure that the clamps are not:
  ● In contact with or near to sources of heat (exhaust, etc.)

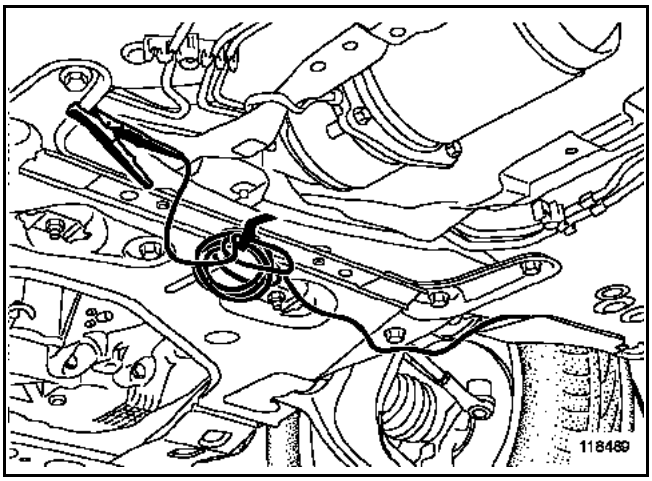


Incorrect fitting

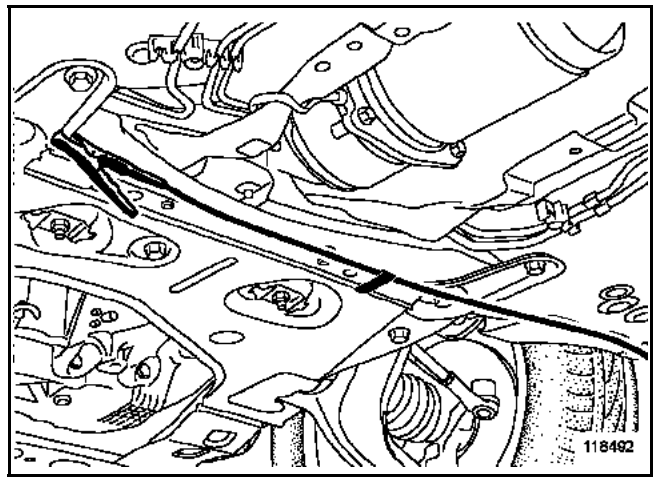


Correct fitting

  ● In contact with highly corrosive liquids (brake fluid, etc.).
– Ensure that the clamps are not:
  ● In contact with rotating components.



Incorrect fitting



Correct fitting

  ● Make provision for parts to move whilst driving (wheels turned to full lock, movement) to prevent the clamp from becoming unclipped and the wire being severed.

- Do not twist the wires.

Incorrect fitting

Correct fitting

- Only attach the wires using the velcro strips supplied in the tool case.

1.1.1) Connection (Clamps-Control unit):

The control unit has 6 inputs which correspond to clamps of the following colours:

- **1: Red**
- **2: Green**
- **3: White**
- **4: Pink**
- **5: Blue**
- **6: Orange**

1.1.2) Fitting the tool:

– Place the vehicle on a lift.
– Fit the clamps to the components which may be causing the noise.
● Attach the wires using velcro strips.
● A coloured ring on the wire aids their identification.

– Remember the area or the component studied, according to the position of the clamps.
– Connect the clamps to the control unit.
– Connect the headset.

2) Stages of the test:

WARNING
When driving, **2 people are required**. Someone other than the driver must wear the headpiece.

Do not move the clamps during the driving test.
If the position of the clamps has to be adjusted, the vehicle must be in the workshop.

Perform the vehicle test according to the information collected and shown on the **Fault finding log**, when the customer complaint was registered (conditions under which noise appears).

Confirm the components in question during the test phase by a performing a check in the workshop:
– Special tooling.
– Visual or tactile inspection.

TECHNICAL NOTE

04 SERVICING PROGRAMME

- Engine: **XXX**
- Gearbox: **XXX**

Basic manual:
All Workshop Repair Manuals

NEW SERVICING PROGRAMME WITH EFFECT FROM 1 JANUARY 2001

From this date, the majority of vehicles in the range will have a service interval of 18 000 miles (30 000 kilometres) (petrol and diesel engines).

This note only describes the procedures linked to this new interval; for other vehicles, refer to Technical Note 3399E.

The new servicing programme will involve the use of high technology oil complying with ACEA standards, A1, A3 or A5 for petrol engines and B3 or B4 for diesel engines.

This servicing schedule (engine oil change) requires the engine oil level to be topped up carefully during services and safety checks.

The Servicing booklet is now separate from the Warranty booklet and will be placed in vehicles on the production line.

"The repair methods given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The methods may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All copyrights reserved by Renault.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault.

A SERVICE INTERVAL (.... miles (... km))

Vehicles	Interval
TWINGO	**18 000 miles (30 000 km)**
CLIO (except CLIO 2L 16V, CLIO V6, CLIO 1.9D)	**18 000 miles (30 000 km)**
KANGOO (except 1.9D)	**18 000 miles (30 000 km)**
MEGANE (except 1.9D)	**18 000 miles (30 000 km)**
SCENIC (EXCEPT 1.9D)	**18 000 miles (30 000 km)**
LAGUNA	**18 000 miles (30 000 km)**
ESPACE	**18 000 miles (30 000 km)**
AVANTIME	**18 000 miles (30 000 km)**
MASTER (2.2 dCi)	**18 000 miles (30 000 km)**
CLIO (2L 16V and V6)	**12 000 miles (20 000 km)** (see Technical Note 3399E)
MASTER (1.9 dTi and 2.8 dTi)	**12 000 miles (20 000 km)** (see Technical Note 3399E)
CLIO (1.9D)	**9 000 miles (15 000 km)** (see Technical Note 3399E)
KANGOO (1.9D)	**9 000 miles (15 000 km)** (see Technical Note 3399E)
MEGANE (1.9D)	**9 000 miles (15 000 km)** (see Technical Note 3399E)
SCENIC (1.9D)	**9 000 miles (15 000 km)** (see Technical Note 3399E)

Or every 2 YEARS depending on which is reached first.

B SERVICE INTERVAL (.... miles (....km))

	Interval
ALL VEHICLE TYPES	**36 000 miles (60 000 km)**

THE RECOMMENDED SERVICE PLAN FOR THE NEW 18 000 mile (30 000 km) SERVICING POLICY IS AS FOLLOWS:

- A free Renault safety check after **6 000 miles (10 000 km)** or **6 months**.
- An A service after **18 000 miles (30 000 km)** or **2 years**.
- A free Renault safety check after **28 000 miles (45 000 km)** or **3 years**.
- A B service after **36 000 miles (60 000 km)** or **4 years**.
- A free Renault safety check after **45 000 miles (75 000 km)** or **5 years**.
- An A service after **55 000 miles (90 000 km)** or **6 years**.
- A free Renault safety check after **63 000 miles (105 000 km)** or **7 years**.
- A B service after **75 000 miles (120 000 km)** or **8 years**.

and so on...
Whichever deadline is reached first.

Renault safety checks (except the first) are only free if the preceding service was carried out by the Renault network.

Complete all the coupons in the Servicing booklet correctly to avoid any dispute.

The first visit to Renault (free)

This visit enables the Renault network to carry out various checks and top up various fluids (details on page 04-4).

The second and subsequent Renault visits (free)

This visit has the same principles as the first visit. It is carried out free by the Renault network **9 000 miles (15 000 km)** or **1 year** after the last service if it was carried out by the Renault network (the corresponding coupon must be filled in) (details on page 04-4).

The A service

During this service, service operations and parts replacement will be carried out, depending on the mileage of your vehicle.
The A service is based on a list of operations including an oil change, replacement of the oil filter, inspections and topping up the levels (details on page 04 - 5).
Added to this list are extra operations that are carried out at the appropriate times, as set out on page 04 - 6.

The B service

This service follows the same principles as the A service, but the operations list is longer as more checks are carried out. The list includes an oil change and a road test as well as specific checks and topping up (details on page 04 - 5).

Added to this list are extra operations that are carried out at the appropriate times, as set out on page 04 - 6.

OPERATIONS FOR THE 1st RENAULT SAFETY CHECK

Listed below are the operations carried out during the first (free) Renault safety check, scheduled for when the car has been driven **6 000 miles (10 000 km)** or after 6 months (whichever is reached first):

- Top up the engine oil (up to **2.l**).
- Top up the washer fluid (up to **2 l**).
- Check the coolant level.
- Check the brake fluid level.
- Check the power steering fluid level.
- Check the condition of the windscreen.
- Check the condition of the rear-view mirrors.
- Check the wiper blades.
- Check the indicator lights.
- Check the condition and pressure of the tyres.
- Visual inspection of shock absorbers.
- Computer fault finding.

OPERATIONS FOR THE 2nd AND SUBSEQUENT RENAULT SAFETY CHECKS

Listed below are operations carried out on any subsequent (free*) visits to Renault safety checks:

- Top up the engine oil (up to **2.l**).
- Top up the washer fluid (up to **2 l**).
- Check the coolant level.
- Check the brake fluid level.
- Check the power steering fluid level.
- Check the condition of the windscreen.
- Check the condition of the rear-view mirrors.
- Check the wiper blades.
- Check the indicator lights.
- Check the condition and pressure of the tyres.
- Check the brake pads.
- Visual inspection of shock absorbers.

* These checks are only free on the condition that the previous service was carried out by the Renault network.

SERVICE OPERATIONS (PETROL AND DIESEL ENGINES)

THE A * SERVICE	THE B * SERVICE	OPERATIONS
☐	☐	**Body** – Examination of underside of the car, wheel arches, doors and windows...
☐ ☐ ☐	☐ ☐ ☐	**Engine** – Oil change. – Replacement of oil filter. – Visual inspection of exhaust pipe
☐ ☐	☐ ☐ ☐ ☐	**Brakes** – Visual inspection of pads. – Circuit tightness. – Check the brake fluid level. – Check condition of trim and remove dust (including removal/refitting drums).
☐ ☐ ☐ ☐ ☐	☐ ☐ ☐ ☐ ☐	**Check fluid levels and tightness of circuits** – Hydraulic clutch. – Power assisted steering. – Front/rear screen washers. – Coolant circuit. – Sequential gearbox hydraulic unit (TWINGO)
	☐	**Steering/front and rear axle geometry** – Check ball joint play - Condition of rubber gaiters.
☐ ☐	☐ ☐	**Tyres** – Check condition and pressure of tyres (including spare wheel). – Visual inspection and tightness check of front and rear shock absorbers.
☐ ☐ ☐ ☐	☐ ☐ ☐ ☐	**Equipment** – Check bulbs (headlights, indicators, brakelights). – Check condition of the car battery (1). – Check the condition of the windscreen and rear-view mirrors. – Check condition of front and rear wiper blades.
☐	☐ ☐	**Delivery** – Check safety and service labels are in correct positions. – Road test.

*** N.B.: services are compulsory during the car's warranty period and for all cars under the Service Contract.**

(1) if possible, this battery check will be carried out using the MIDTRONICS tool.

OPERATIONS ADDITIONAL TO THE A AND B SERVICES

Components to be replaced (every ... miles/km)

PETROL engines	SPARK PLUG	AIR FILTER (1)	PARTICLE FILTER (if fitted)
TWINGO	36 000 miles (60 000 km)	18 000 miles (30 000 km)	-
CLIO (not 2L 16V or V6)	36 000 miles (60 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
KANGOO	36 000 miles (60 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
MEGANE (not 2L 16V IDE)	36 000 miles (60 000 km)	36 000 miles (60 000 km)	18 000 miles (30 000 km)
MEGANE 2L 16V IDE	18 000 miles (30 000 km)	36 000 miles (60 000 km)	18 000 miles (30 000 km)
SCENIC	36 000 miles (60 000 km)	36 000 miles (60 000 km)	18 000 miles (30 000 km)
LAGUNA (not V6 24V)	36 000 miles (60 000 km)	36 000 miles (60 000 km)	18 000 miles (30 000 km)
LAGUNA V6 24V	75 000 miles (120 000 km)	36 000 miles (60 000 km)	18 000 miles (30 000 km)
ESPACE (not V6 24V)	36 000 miles (60 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
ESPACE V6 24V	75 000 miles (120 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
AVANTIME 2L 16V	36 000 miles (60 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
AVANTIME V6 24V	75 000 miles (120 000 km)	18 000 miles (30 000 km)	18 000 miles (30 000 km)

Components to be replaced (every ... miles/km)

DIESEL engines	AIR FILTER (1)	PARTICLE FILTER (if fitted)
CLIO (not 1.9D)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
KANGOO (except 1.9D)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
MEGANE (except 1.9D)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
SCENIC (not 1.9D)	18 000 miles (30 000 km)	18 000 miles (30 000 km)
LAGUNA	36 000 miles (60 000 km)	18 000 miles (30 000 km)
ESPACE	18 000 miles (30 000 km)	18 000 miles (30 000 km)
MASTER 2.2 dCi	36 000 miles (60 000 km)	18 000 miles (30 000 km)

(1) or every **4 years** whichever is reached first.

OPERATIONS ADDITIONAL TO THE A AND B SERVICES

PETROL and DIESEL engines

Components to be replaced (every ...)

Timing belt (1)	petrol and diesel engines: 75 000 miles (120 000 km) or 5 years. N.B.: 45 000 miles (75 000 km) or 5 years for 1.9 dTi diesel engines
Accessories belt	petrol and diesel engines: 75 000 miles (120 000 km) or 5 years. N.B.: 45 000 miles (75 000 km) or 5 years for 1.9 dTi diesel engines
Fuel filters (petrol and diesel)	36 000 miles (60 000 km). N.B.: 95 000 miles (150 000 km) for the petrol engine Laguna and 75 000 miles (120 000 km) for the Avantime The diesel filter must have any water drained from it if it is not replaced during the course of the service
Brake fluid	75 000 miles (120 000 km) or every 4 years
Remote control door locking batteries *	Every 2 years
Air conditioning circuit *; check and top up refrigerant fluid	Every 4 years
Coolant	75 000 miles (120 000 km) or every 4 years
Tyre pressure monitoring system batteries *	Every 10 years
Air bags and pretensioners pyrotechnic system	Every 10 years

* if fitted

(1) Belts

The mileages and intervals for belt replacement listed above must be respected. The customer should consult his nearest Renault Dealer for advice on when a timing belt should be replaced depending on his individual driving style and how he uses the car. This is particularly important when the car is being used for:
– constant door to door journeys,
– urban driving,
– repeated short journeys, with cold engine at low temperatures, etc.

ADDITIONAL OPERATIONS TO BE CARRIED OUT DURING SERVICING

Servicing periods are the same for LPG-equipped cars as those for equivalent models with petrol engines.

Also:

All services must include:
– a check on the safety solenoid valve,
– a check for the presence of a blanking cover on the pressure relief valve.

All services must include:
– a gas filter change.

Every eight years:
– a hydraulic test must be performed on the LPG tank.

Vehicles	Replace spark plugs	Check/adjust the valve clearances
KANGOO - CLIO II - TWINGO - ESPACE	every 18 000 miles (30 000 km)	every 18 000 miles (30 000 km) except for 16V engines

CHECKING THE OIL LEVEL

Renault engines are designed and built to the highest technological standards, and naturally need a little oil for optimum running.

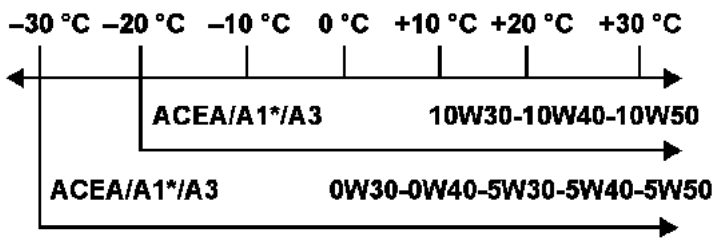
For this reason, and to avoid any potential engine failure, the engine oil level must be **regularly checked** in particular before long journeys.

It may be necessary to top up the oil once or twice between changes and especially during the running in period; **do this when the oil is level with the minimum mark on the gauge.**

The level should be checked with the car on a flat surface, with the engine stopped and cold (e.g.: before the engine is started for the first time of the day).

Let the oil settle after refilling (approximately **2 minutes**), (**15 minutes** for Master vehicles) before checking the level with the dipstick.

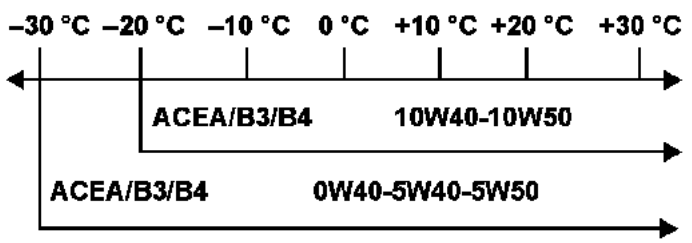
It is very important not to exceed the maximum mark on the gauge (in this case oil consumption is greater; it can also cause engine damage).



The service has been designed for regular use of your vehicle.

In the event of use in certain difficult conditions, such as:
– constant door to door journeys,
– urban driving,
– repeated short journeys, with cold engine at low temperatures, etc.
Renault recommends that your oil is changed every **9 000 miles (or 15 000 km)** or at least once a year.

Only ACEA standard oils may be used for an **18 000 mile (30 000 km)** change interval.



The tables below show the oil grades which must be used to ensure correct operation of the engine (for European Union countries and Turkey):

PETROL ENGINE

* Oil for fuel economy. This type of oil is not recommended for 2L 16V F4R Renault Sport engines.

DIESEL ENGINE

ACEA B1 (diesel) oils must not be used for diesel engines.

ACEA A1 oils (petrol) allow a reduction in fuel consumption, Renault recommends this oil for all engines with the exception of the 2L 16V Renault Sport.

Observe the recommendation on the label located on the engine for diesel vehicles with automatic gearboxes.

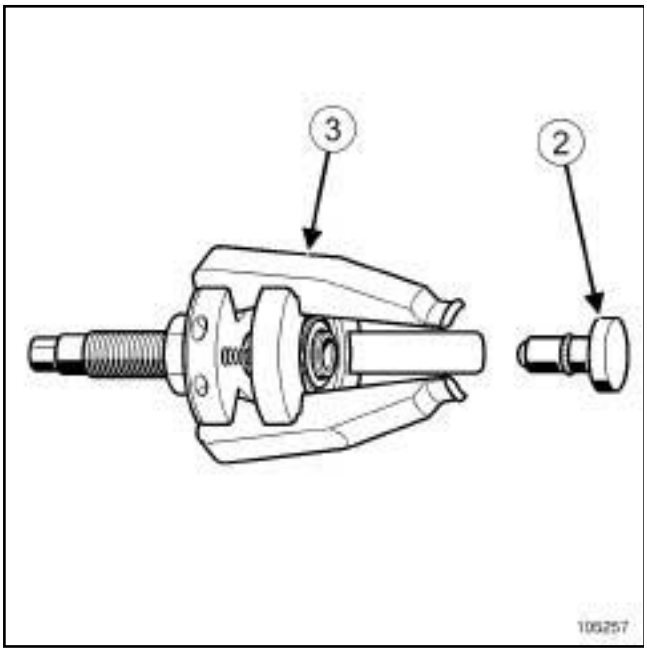
REMOVAL

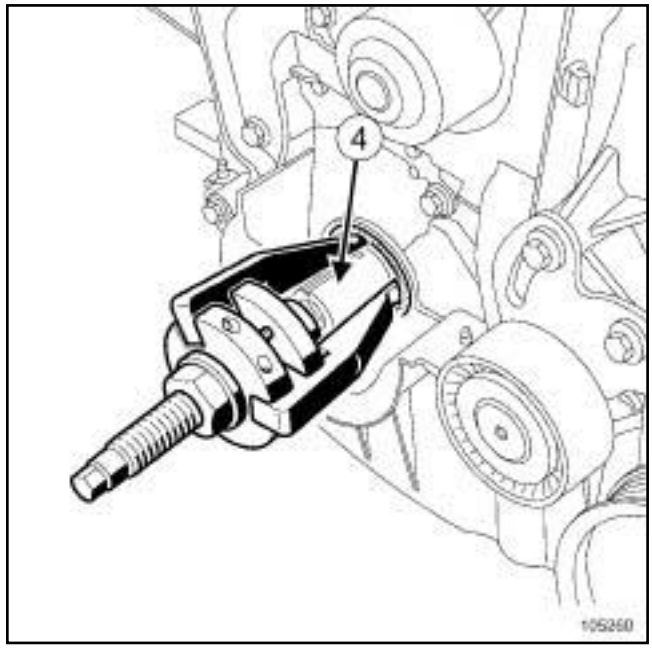
I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

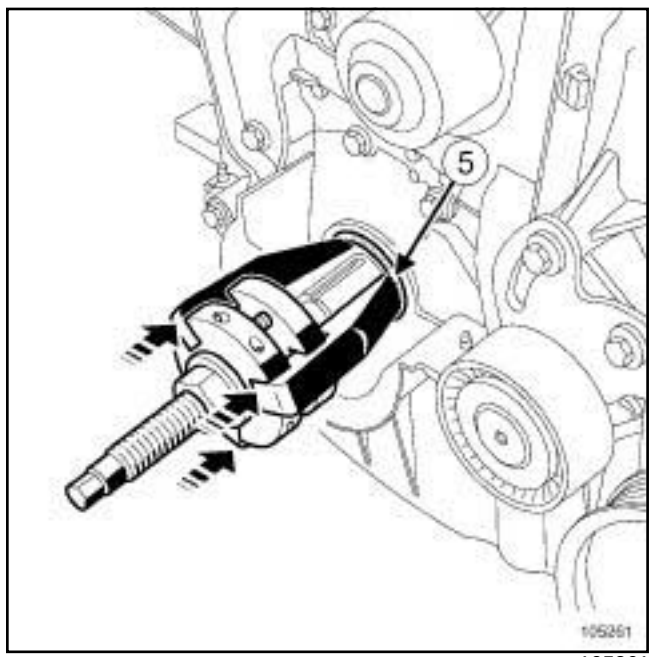
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:



- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the timing belt sprocket (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .

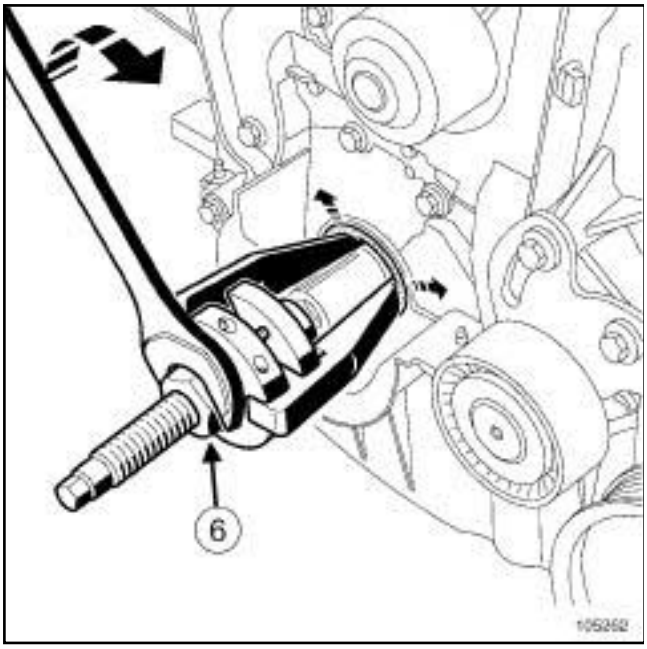
II - REMOVAL OPERATION



105257

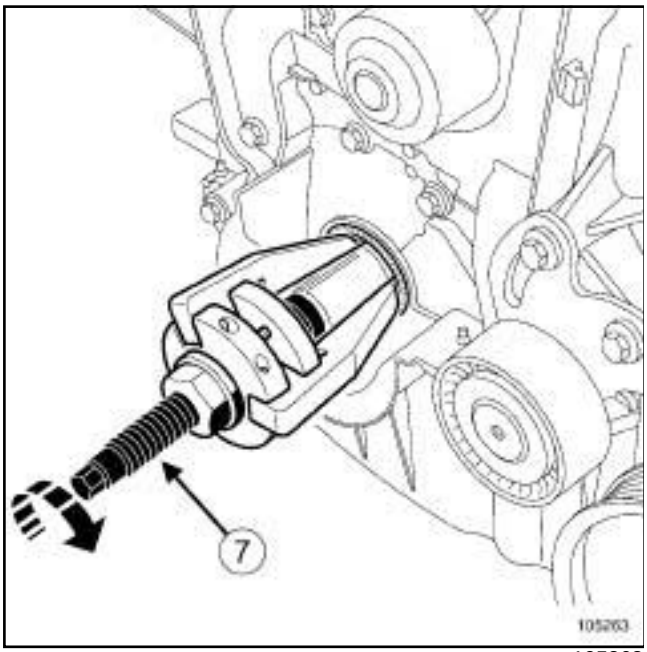
❑ Fit the end piece (**2**) onto the tool (**3**) .

105260



❑ Position the jaws of the toolonto the crankshaft nose (**4**) .

105261



❑ Push on the tooluntil contact is made between the ends (**5**) of the jaws and the crankshaft seal.

K9K

105262

❑ Separate the jaws by screwing the nutof the tool (**6**) .

105263

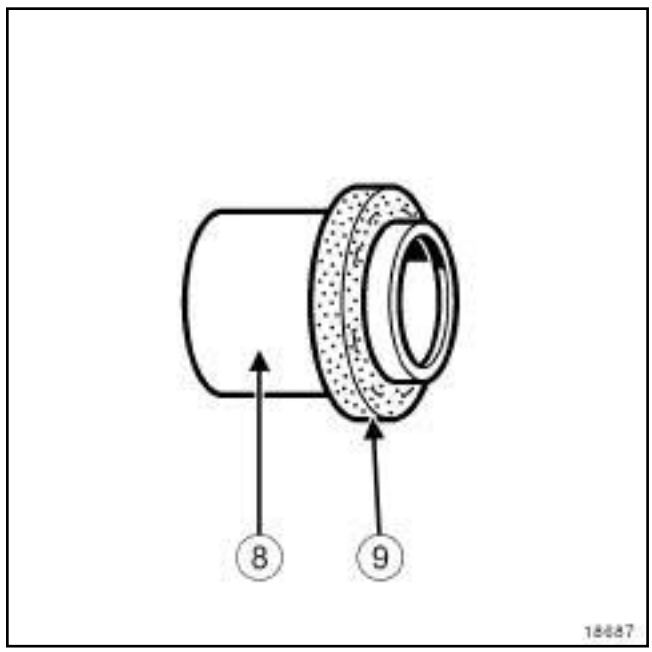
❑ Screw down the threaded rod (**7**) of the.

❑ Refit the crankshaft seal at the timing end using the tool.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Crankshaft seal on timing end**.



WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

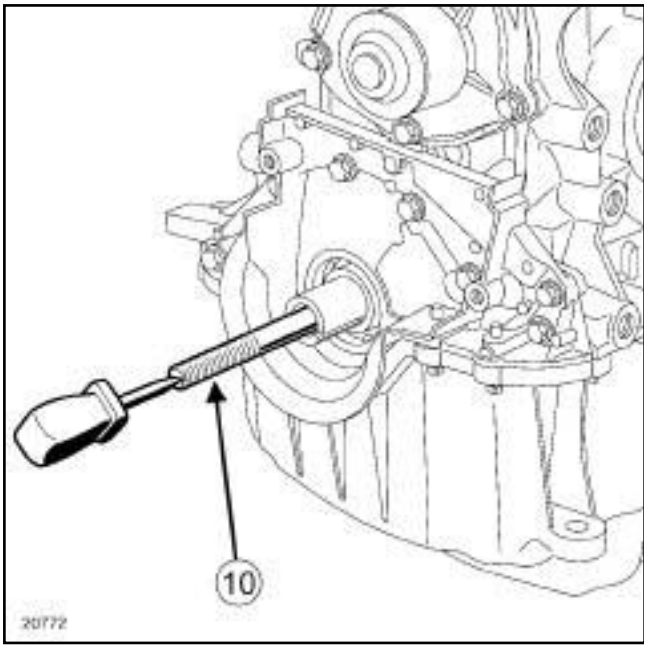
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the crankshaft seal mating face,

- the crankshaft seal housing in the crankshaft closure panel.

II - REFITTING OPERATION

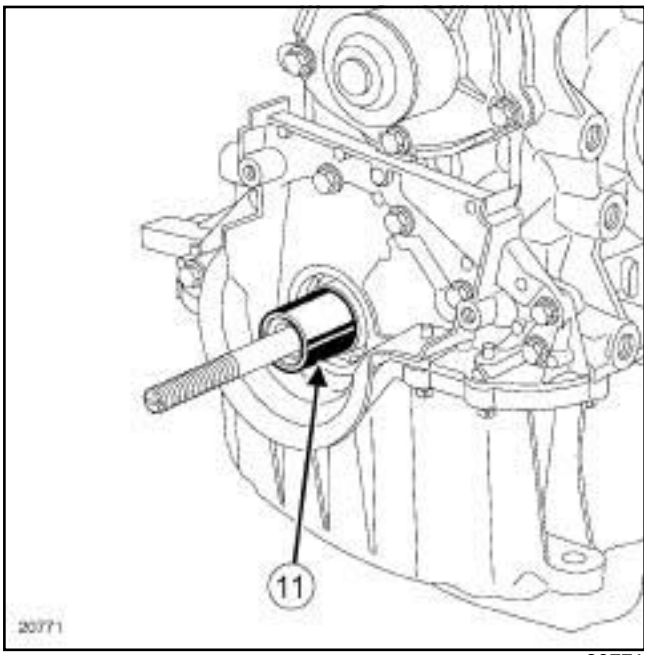
18687



❑

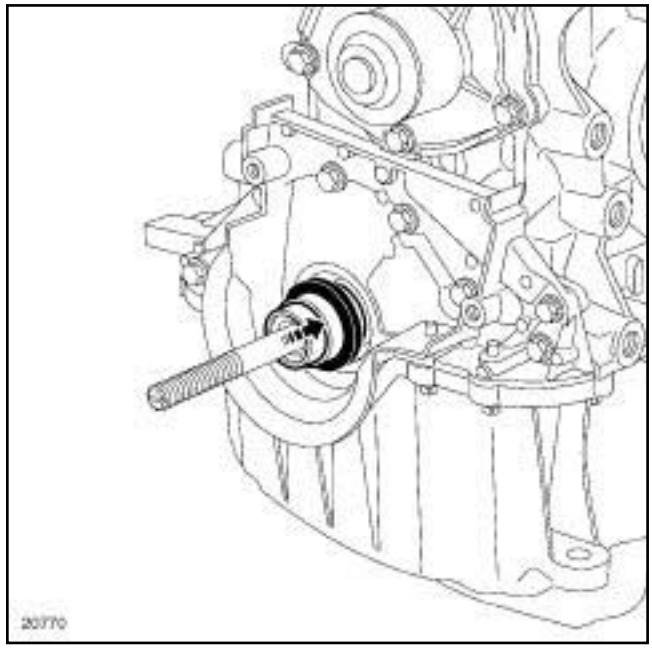
Note:

This type of seal is extremely fragile.



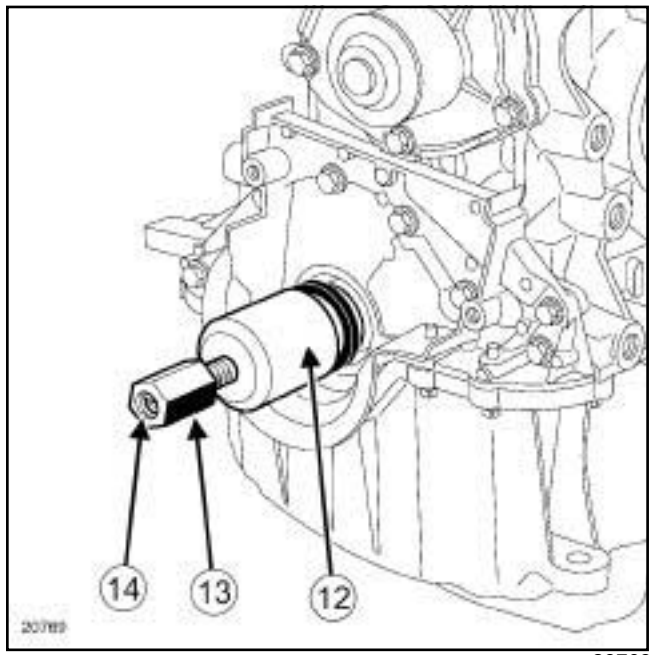
Only touch the protective part (**8**) when handling the gasket. It is strictly forbidden to touch the seal (**9**) ; this is to prevent any oil leaks once the oil seal is fitted to the engine.

K9K



20772

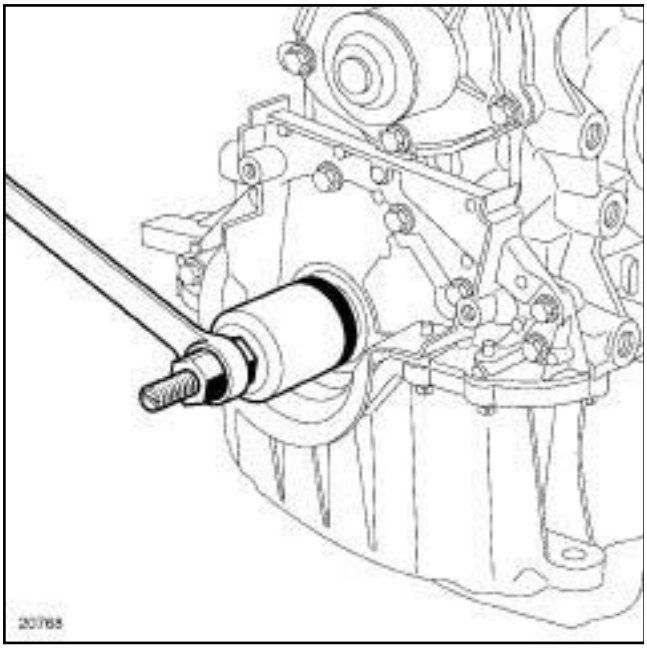
❑ Screw the threaded rod (**10**) of theinto the crankshaft.



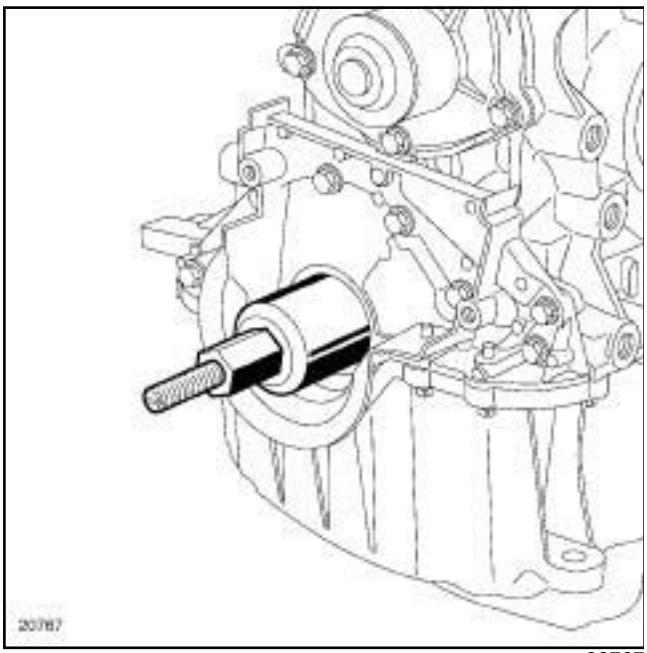
20771

❑ On the crankshaft, fit the spacer (**11**) of the.

20770



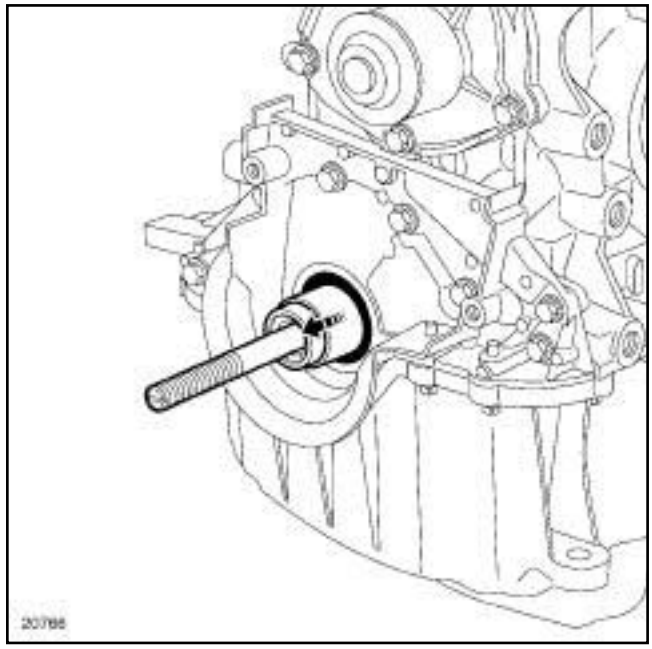
❑ Fit the protector with the new seal in place on the spacer, taking care not to touch the seal.



20769

❑ Fit the cover (**12**) and nut (**13**) (with the thread (**14**) of the nut towards the outside of the engine) of the.

K9K



20768

20767

❏ Screw on the nut until the cover touches the spacer.

20766

❏ Remove the nut, the cup, the protector and the threaded rod.

III - FINAL OPERATION

❏ Refit:

- the timing belt sprocket (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

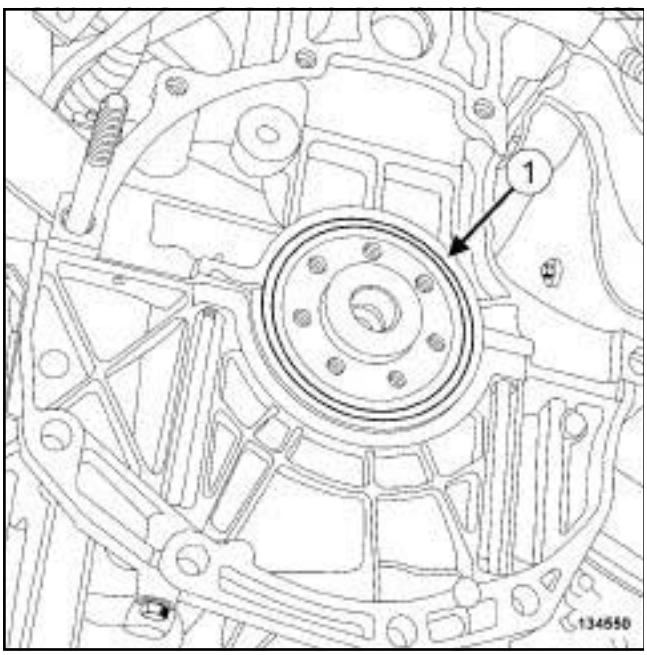
❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M or K9K

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



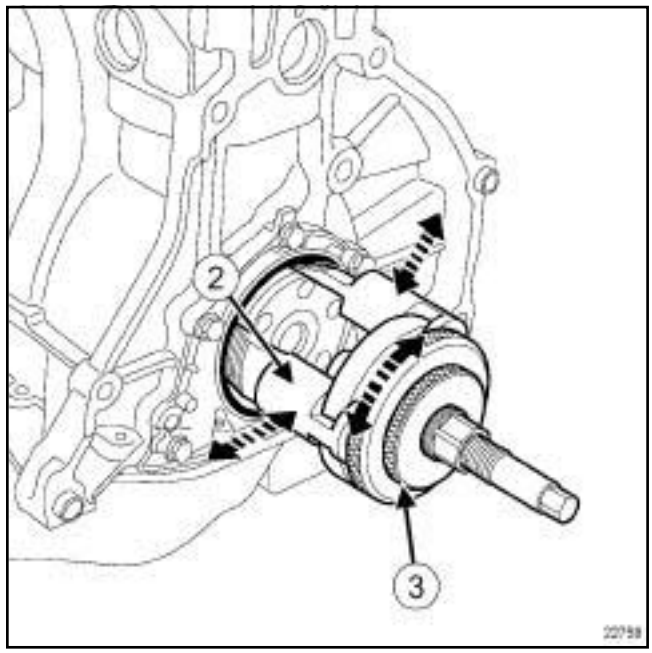
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox),
- the clutch (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch),
- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-75**) (20A, Clutch).

II - REMOVAL OPERATION

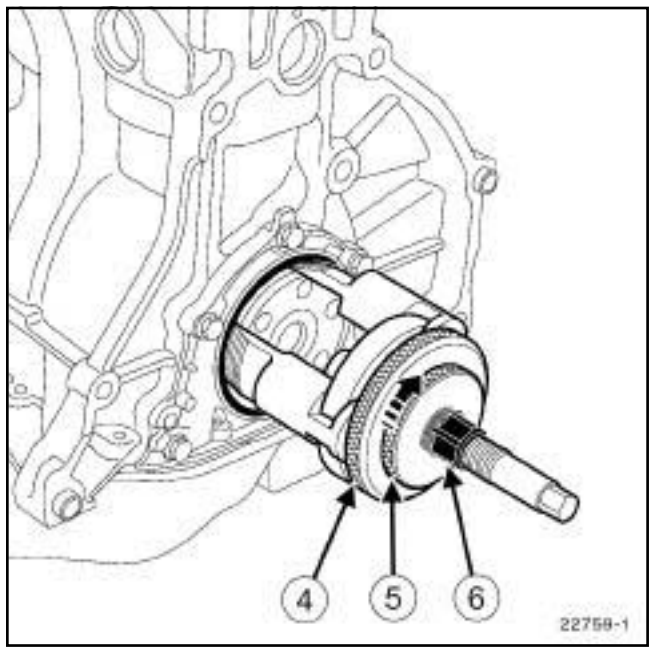
K4M



134550

❑ Remove the crankshaft seal (**1**) at the gearbox end using a screwdriver.

Note:

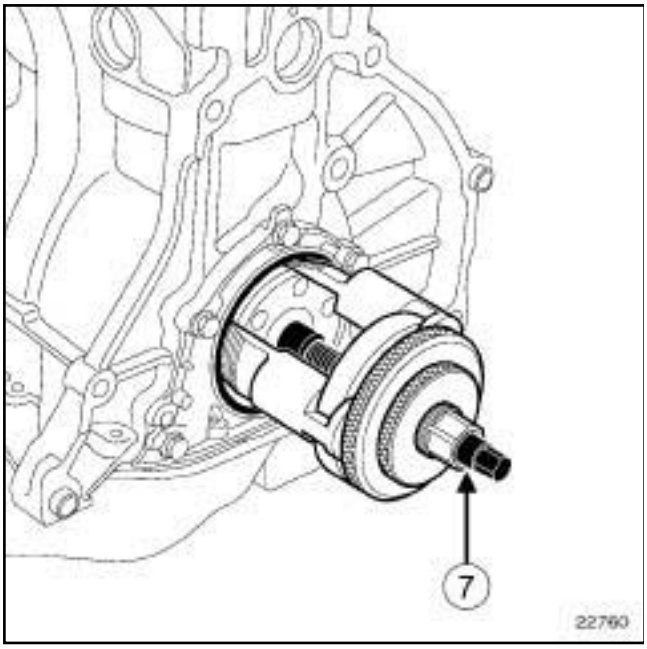


Take care not to damage the crankshaft mating face.

K9K

22759

❑ Fit the extractorto the shaft, adjusting the fingers (**2**) to the diameter of the shaft using the knurled plate (**3**) .



22759-1

❑ Screw knurled plate (**5**) until it is locked to knurled plate (**4**) to keep the fingers in position on the shaft.

❑ Screw the extractor into the seal using the hexagonal nut (**6**) .

K4M or K9K

22760

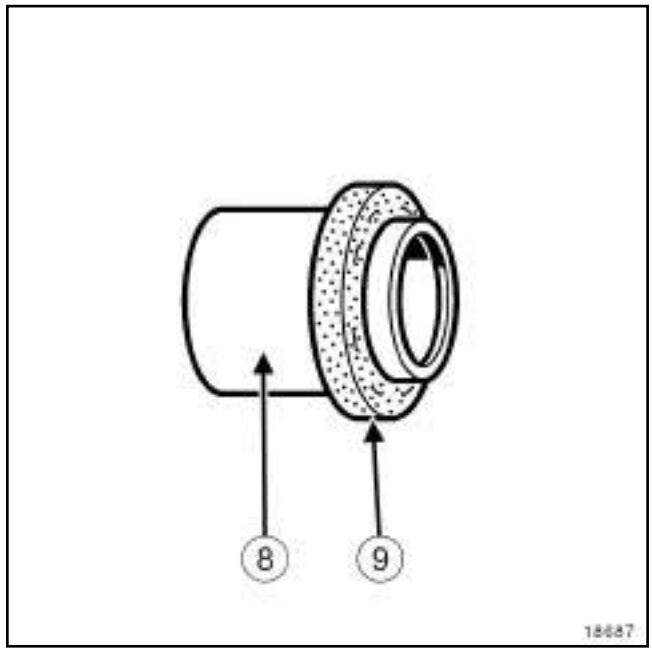
❑ Extract the crankshaft seal at the gearbox end by screwing the threaded rod (**7**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Crankshaft seal on gearbox end**.

WARNING



To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

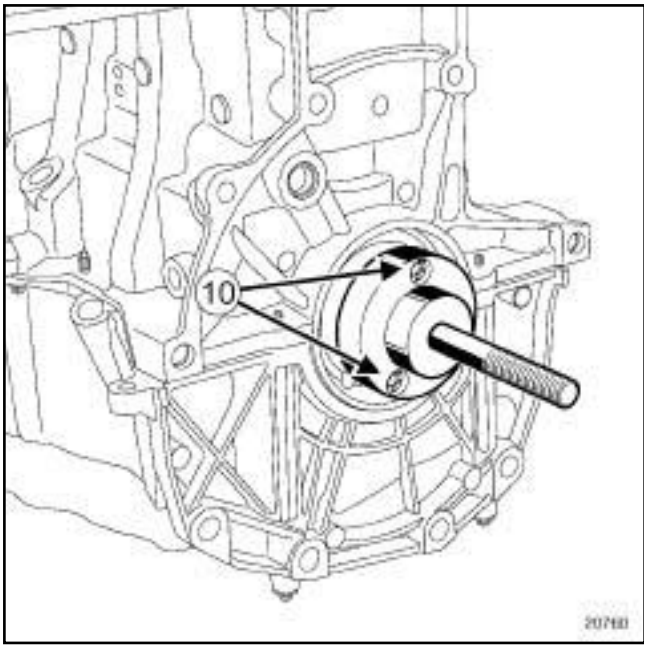
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the crankshaft seal mating face,
- the crankshaft seal housing on the cylinder block.

II - REFITTING OPERATION

K9K

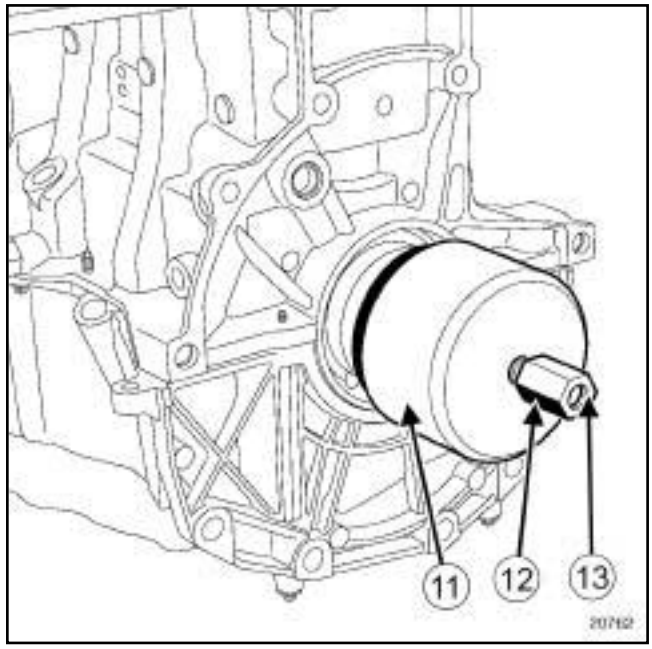
18687



❑

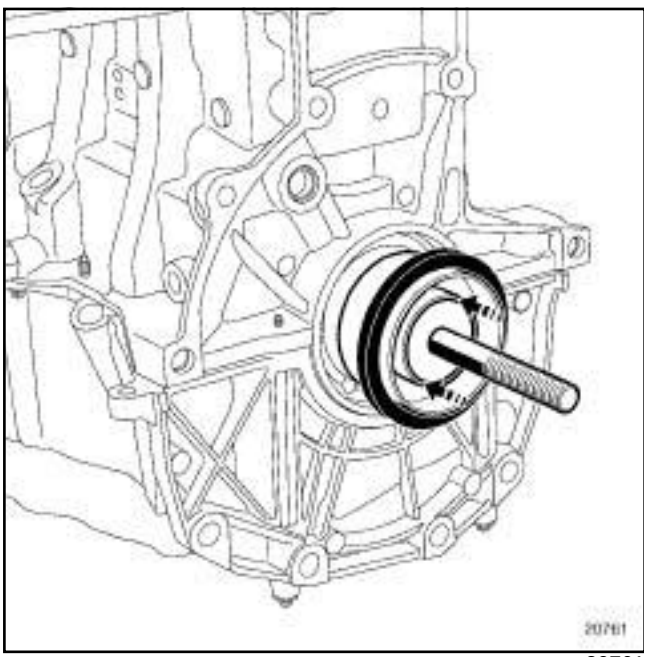
Note:

This type of seal is extremely fragile.



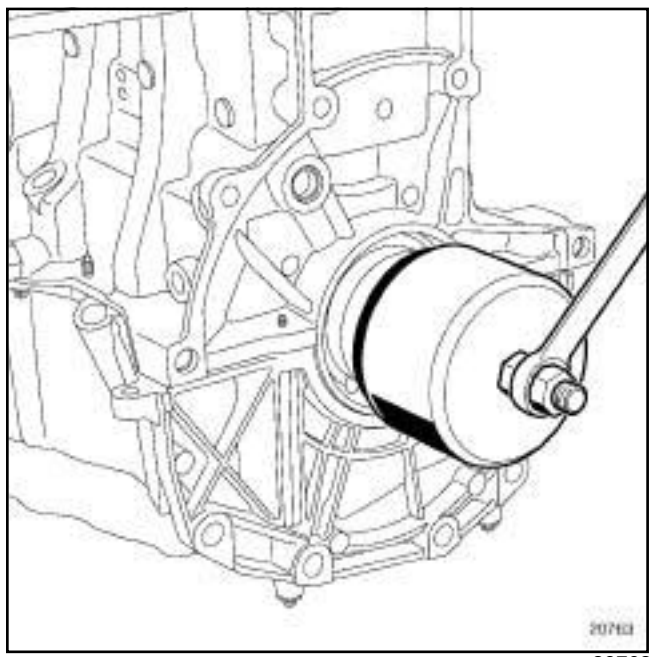
Only touch the protective part (**8**) when handling the gasket. It is strictly forbidden to touch the seal (**9**) ; this is to prevent any oil leaks once the oil seal is fitted to the engine.

K4M or K9K



20760

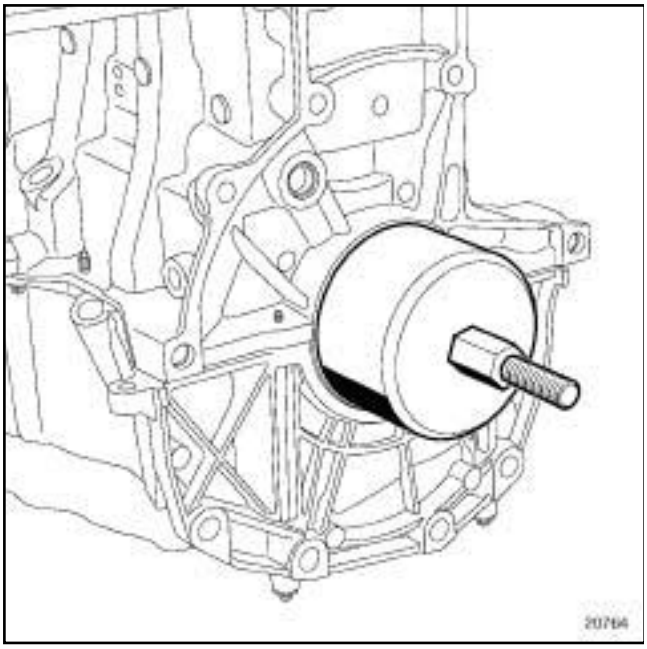
❑ Mount theon the crankshaft, securing it using bolts (**10**) .



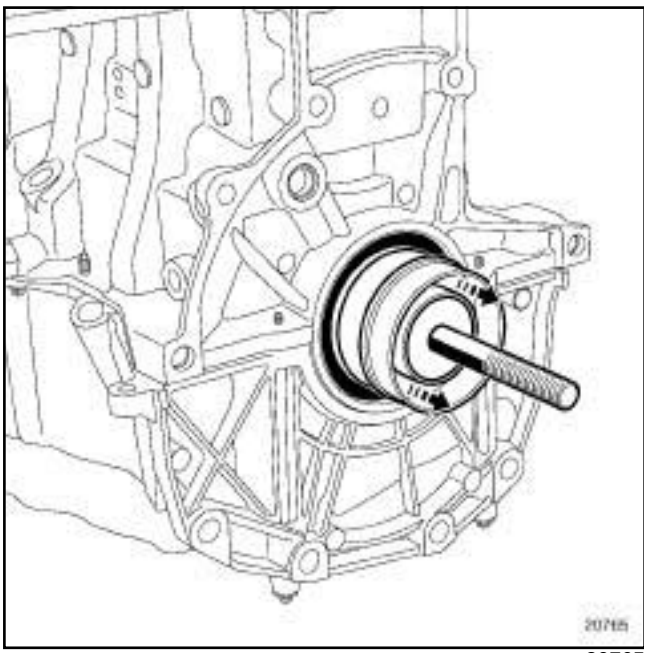
20762

❑ Fit the cover (**11**) and nut (**12**) (with the thread (**13**) of the nut towards the outside of the engine) of the.

20761



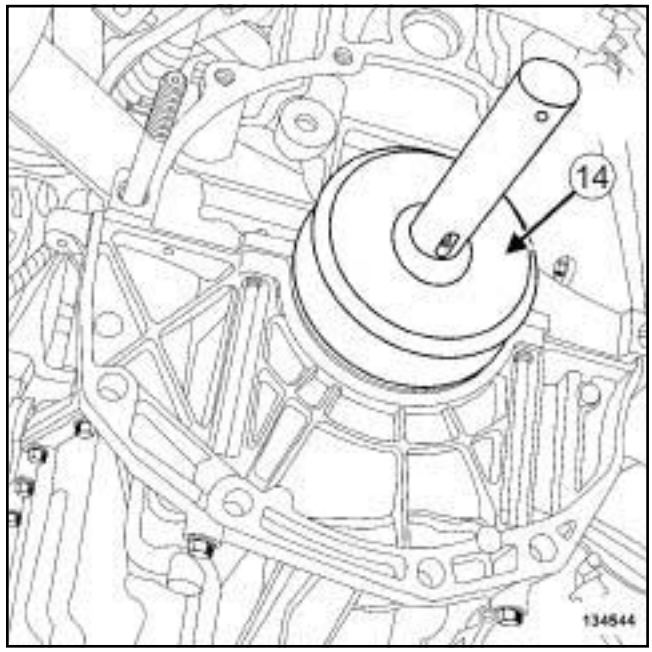
❑ Fit the protector with its seal in place on the, taking care not to touch the seal.



20763

❑ Tighten the nut until the cover touches the cylinder block.

K4M or K9K



20764

20765

❑ Remove the nut, the cover, the protector and the base plate.

K4M

134544

❑ Refit the crankshaft seal at the gearbox end, using the tool (**14**) .

III - FINAL OPERATION

❑ Refit:

- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-75**) (20A, Clutch),
- the clutch (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch),
- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Perform the following operations:

- fill the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- bleed the clutch control circuit (see **Clutch circuit: Bleed**) (37A, Mechanical component controls).

K9K

Special tooling required	
Tav. 1747	Threaded rods for carrying out subframe operations.

Tightening torques ▽	
oil pump bolts	**25 N.m**
sump bolts on the cylinder block	**14 N.m**
sump bolts on the gearbox	**44 N.m**
sump bolts on the multifunction support	**25 N.m**
power assisted steering pump support bolt on the sump	**25 N.m**
bracket bolts	**62 N.m**
relay bearing bolts	**44 N.m**
right-hand driveshaft flange bolt(s) on the relay bearing	**21 N.m**
front axle subframe tie-rod upper bolts	**21 N.m**
power-assisted steering low pressure pipe bolt on the front axle subframe	**25 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

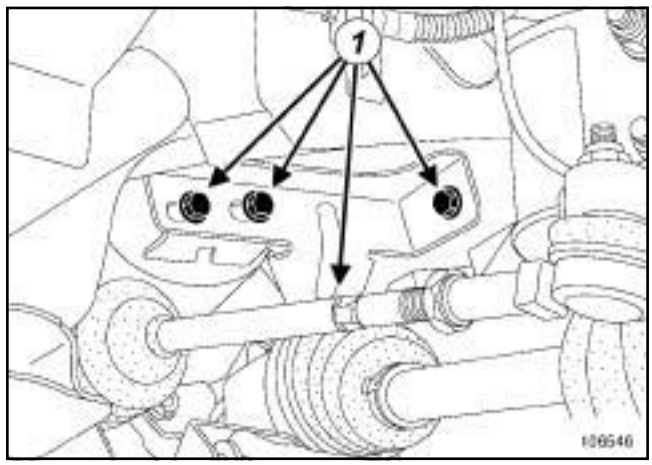
❏ Remove the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55, Exterior protection).

❏ Remove:

- the engine undertray bolts,
- the engine undertray.

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

❏ Remove:



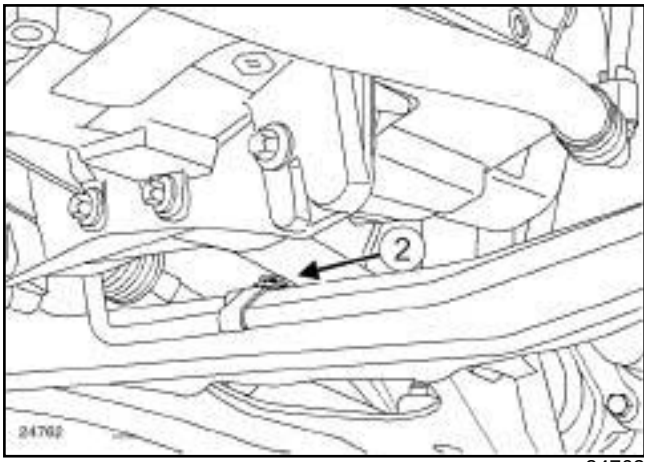
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch side liners,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

❏ Extract the lower arm ball joints from the stub axle carrier (see **Front driveshaft lower arm: Removal - Refitting**) (31A, Front axle components).

❏ Remove (see **Steering box: Removal - Refitting**) (36A, Steering assembly):

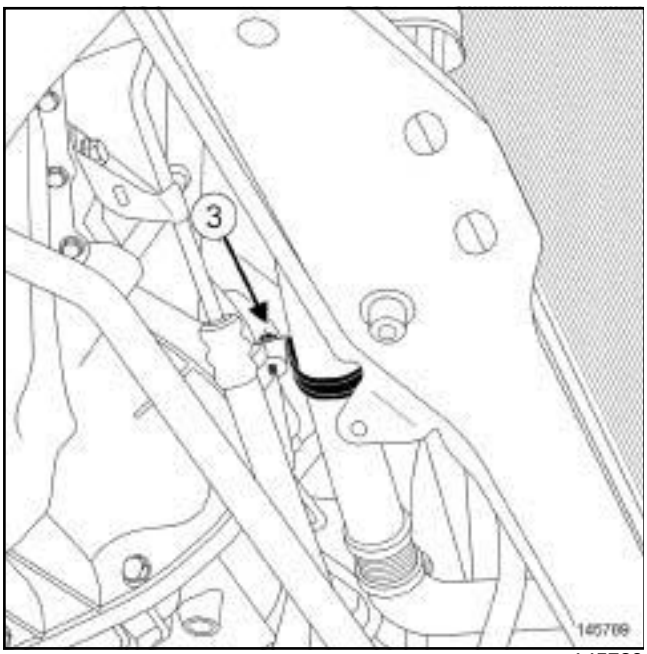
- the heat shield bolts on the steering box,
- the steering box heat shield,
- the steering box bolts on the front axle subframe.

❏ Attach the steering rack to the body.



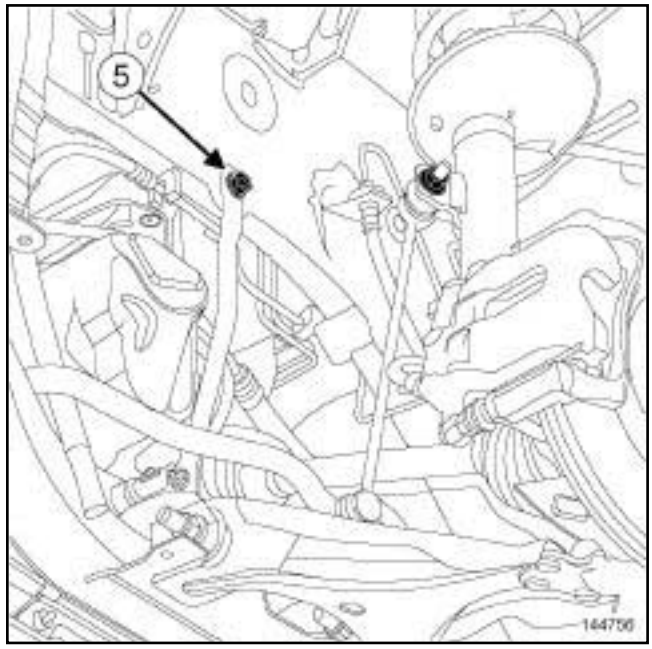
106546

❏ Remove:



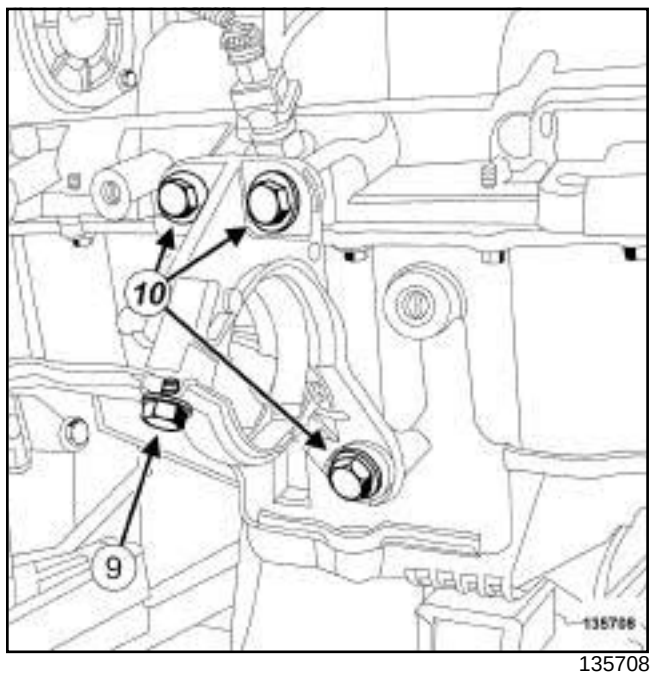
- the catalytic converter upstream strut bolts (**1**) ,
- the catalytic converter upstream strut.

K9K



24762

❏ Remove the power-assisted steering low pressure pipe bolt (**2**) on the front axle subframe.

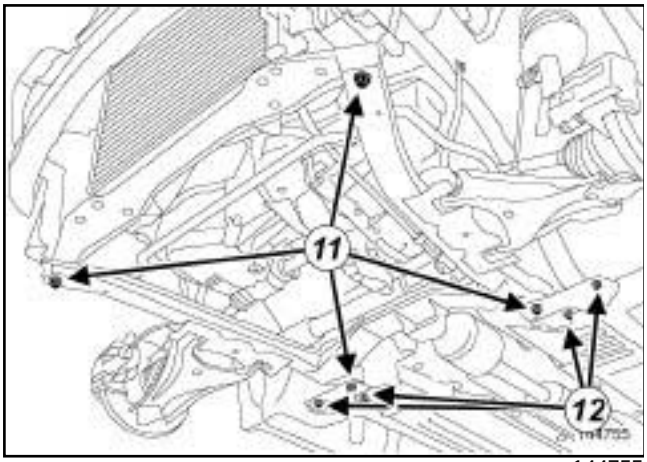


145789

❏ Remove the cooling pipe support bolt (**3**) on the sump.

144756

❏ Remove the front axle subframe tie-rod upper bolts (**5**) .

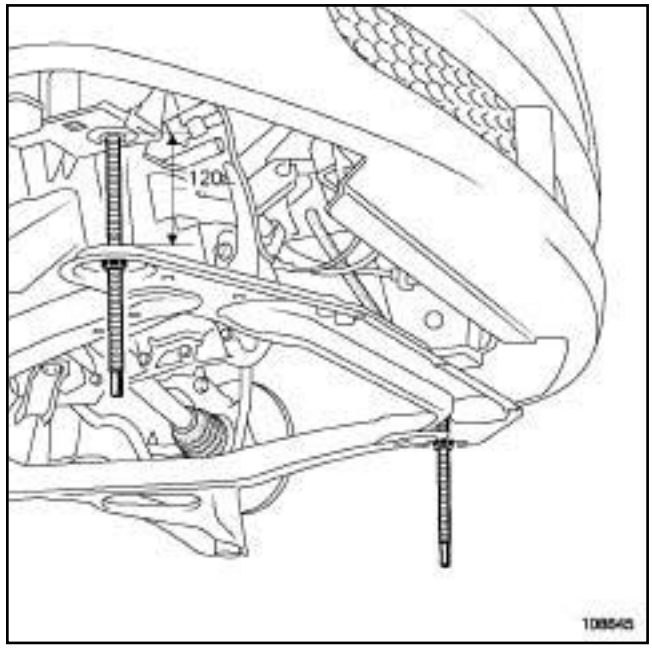


135708

❏ Remove:

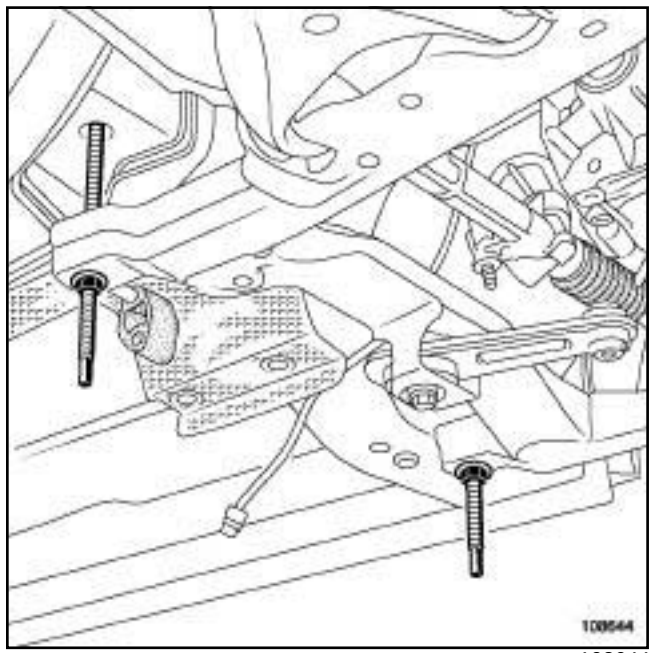
- the right-hand driveshaft flange bolt (**9**) on the relay bearing,
- the bolts (**10**) from the relay bearing,
- the relay bearing.

K9K



144755

❑ Remove:

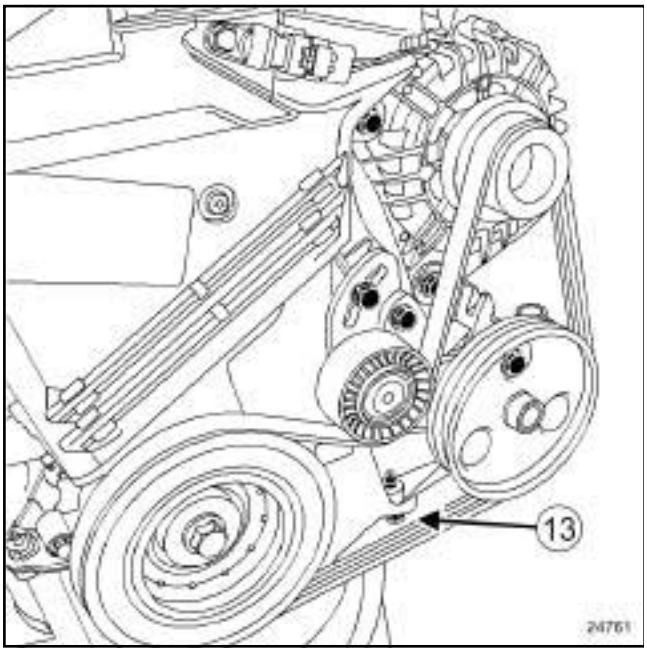


- the bracket bolts (**12**) ,
- one by one, the front axle subframe bolts (**11**) and replace them in turn with the threaded rods of the **(Tav. 1747)**.

Note:

Make sure the threaded rod of the **(Tav. 1747)** is sufficiently screwed into the threaded hole and that the nut of the tool is correctly resting on the front axle subframe.

108645



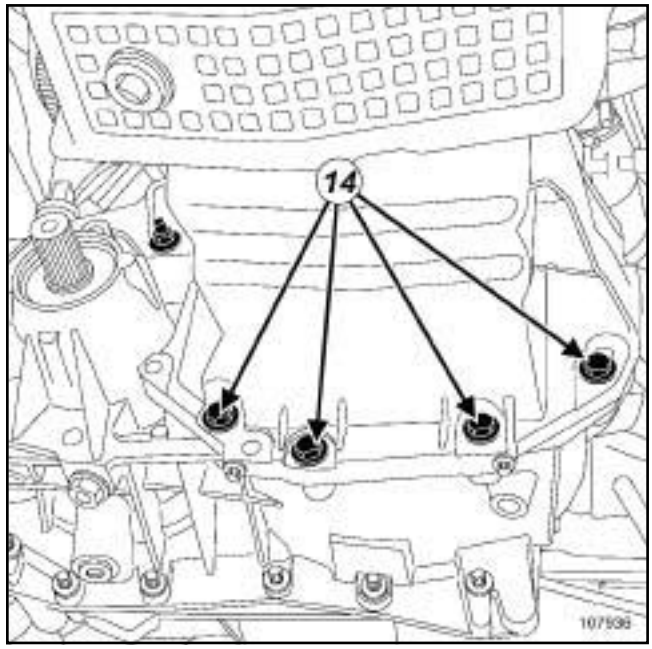
108644

❑ Lower the front axle subframe **120 mm**, gradually loosening the nuts of the **(Tav. 1747)**.

K9K

II - REMOVAL OPERATION

STANDARD HEATING RECIRCULATION



24761

❑ Remove the power-assisted steering pump support bolt (**13**) on the sump.

AIR CONDITIONING

❑ Remove the bolt from the sump on the multifunction support.

107936

❑ Remove:

- the engine-gearbox coupling bolts (**14**) ,
- the sump bolts,
- the sump.

Note:

If the sump cannot be extracted because it is in contact with the oil pump strainer, do not force the removal of the sump as this may damage the oil splash plate.

Loosen the oil pump bolts by a few turns (the tip of your finger should pass between the bolt head and the oil pump casing) using 10 mm and 13 mm open-jawed spanners and while tilting the sump towards the front of the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: engine oil sump seal**.

❑ **parts always to be replaced: Front sub-frame bolt**.

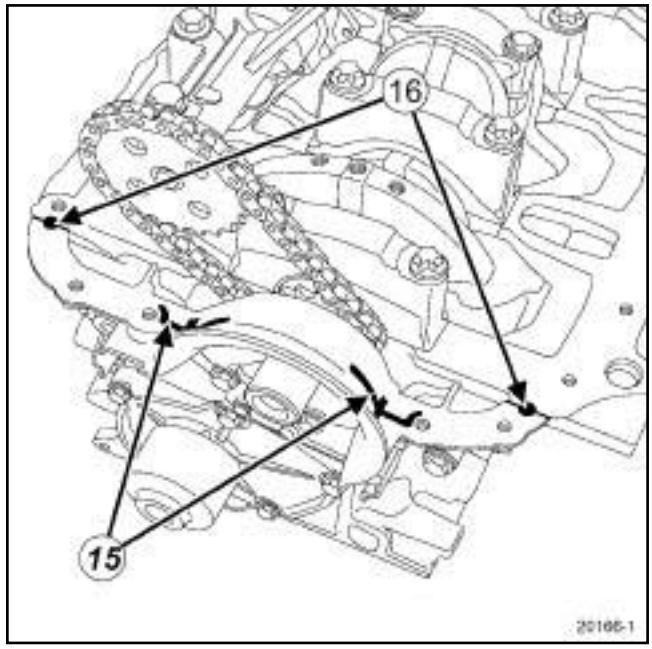
WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

K9K

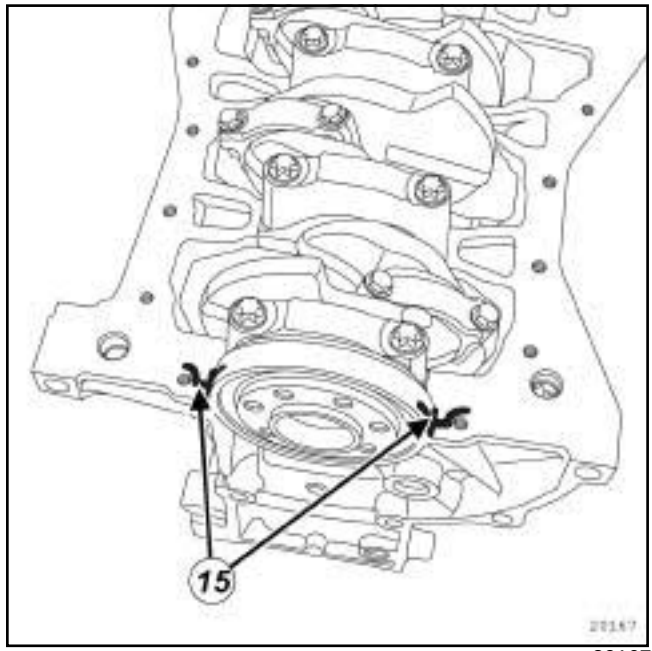
❑ Clean the cylinder block joint face using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

WARNING



To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

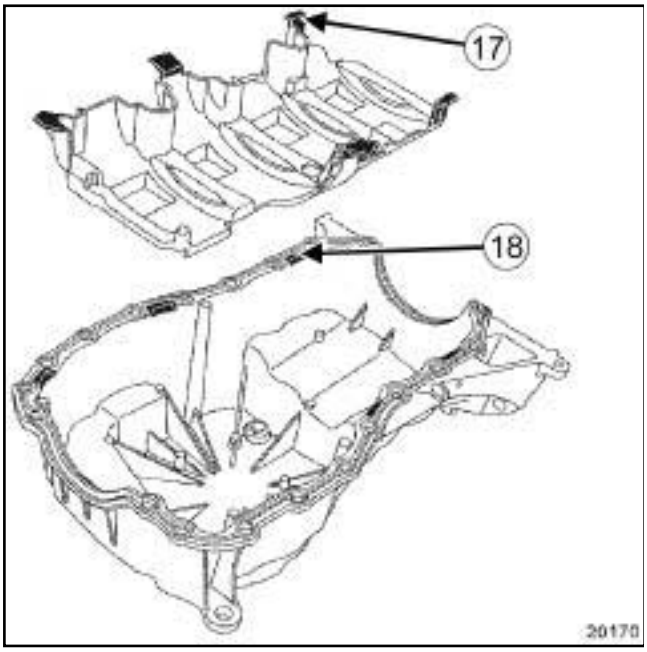


- the sump joint face if it is to be reused,
- the cylinder block gasket face.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

20166



20167

❑ Apply:

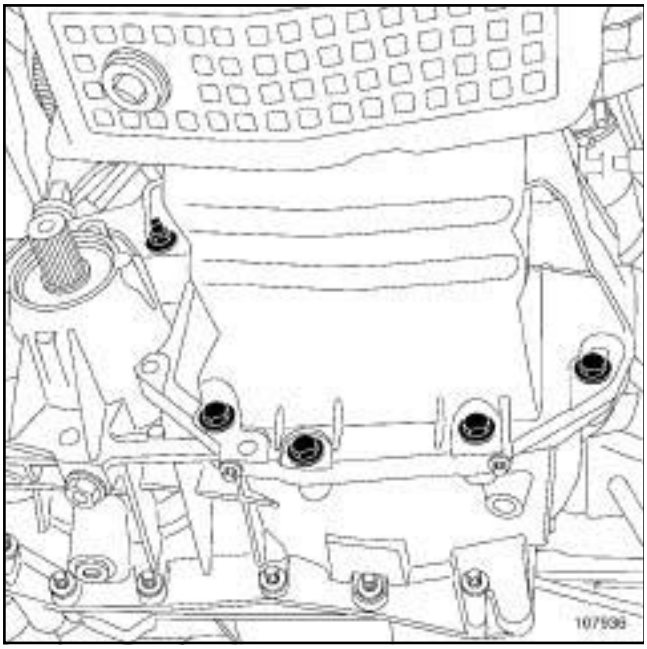
- four beads (**15**) of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm**,
- two drops (**16**) of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm** at the intersection between the cylinder block and the crankshaft closure panel.

K9K

II - REFITTING OPERATION

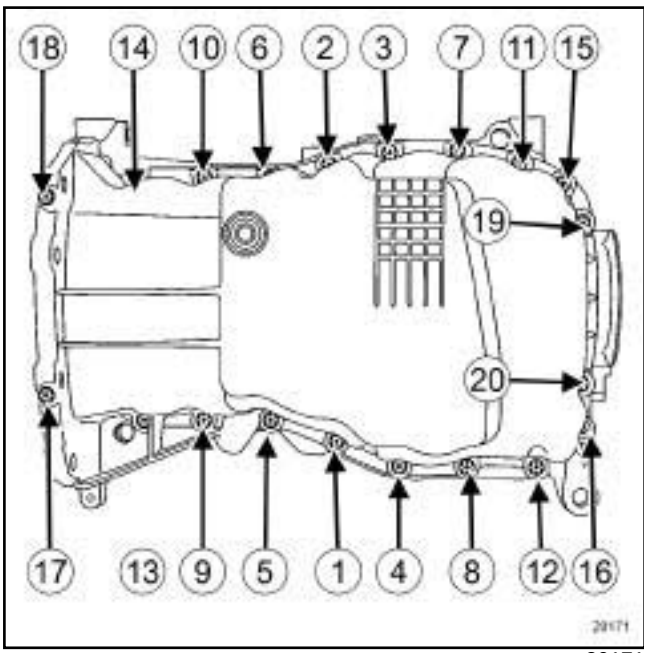
20170

❑



Note:

When refitting the sump, ensure that:



- the oil splash plate tabs (**17**) are positioned correctly in the slots (**18**) ,
- the coupling faces of the sump and cylinder block are correctly aligned, to prevent the clutch housing being deformed when fitting the gearbox.

Refit the oil splash plate.

K9K

107936

20171

❑ Refit the oil sump fitted with a new seal.

Note:

If the oil pump was loosened beforehand in order to extract the sump, position the sump in order to slide the oil pump strainer into the oil splash plate of the sump.

Position a component jack to support the sump.

Lean the sump towards the front of the vehicle in order to access the oil pump bolts.

Torque tighten the **oil pump bolts (25 N.m)** using the small torque wrench **77 11 226 888**.

Note:

Before pressing the sump on the cylinder block, check that the sump seal is still in place and that it has not come out of the grooves on the sides.

❑ Tighten until contact:

- the sump bolts on the cylinder block,
- the sump bolts on the gearbox.

❑ Torque tighten:

- in order the **sump bolts on the cylinder block (14 N.m)**,
- the **sump bolts on the gearbox (44 N.m)**.

AIR CONDITIONING

❑ Refit the sump bolt on the multifunction support.

❑ Torque tighten the **sump bolts on the multifunction support (25 N.m)**.

STANDARD HEATING RECIRCULATION

❑ Refit the power-assisted steering pump support on the sump.

❑ Torque tighten the **power assisted steering pump support bolt on the sump (25 N.m)**.

III - FINAL OPERATION

❑ Fit the front axle subframe.

❑ Refit the brackets.

❑ Torque tighten the **bracket bolts (62 N.m)**.

K9K

❏ One by one, remove the threaded rods of the **(Tav. 1747)** and replace them in turn with new front axle subframe bolts.

❏ Refit:

- the relay bearing bolts,
- the right-hand driveshaft flange bolt(s) on the relay bearing.

❏ Tighten to torque and in order:

- the **relay bearing bolts (44 N.m)**,
- the **right-hand driveshaft flange bolt(s) on the relay bearing (21 N.m)**.

❏ Refit the front axle subframe tie-rod upper bolts.

❏ Torque tighten the **front axle subframe tie-rod upper bolts (21 N.m)**.

❏ Refit the cooling pipe support bolt on the sump.

❏ Refit the power-assisted steering low pressure pipe bolt on the front axle subframe.

❏ Torque tighten the **power-assisted steering low pressure pipe bolt on the front axle subframe (25 N.m)**.

❏ Refit the catalytic converter upstream stay (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .

❏ Refit the steering box bolts on the front axle subframe (see **Steering box: Removal - Refitting**) (36A, Steering assembly).

❏ Refit:

- the steering box heat shield,
- the lower arm ball joints (see **Front driveshaft lower arm: Removal - Refitting**) (31A, Front axle components),
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

❏ Refit the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55, Exterior protection).

❏ Refit:

- the engine undertray,
- the front wheel arch side liners,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

K4M

Special tooling required	
Tav. 1747	Threaded rods for carrying out subframe operations.

Tightening torques ▽	
sump bolts on the cylinder block	**14 N.m**
sump bolts on the gearbox	**44 N.m**
sump bolt on the multifunction support	**25 N.m**
bracket bolts	**62 N.m**
front axle subframe bolts	**110 N.m**
relay bearing bolts	**44 N.m**
right-hand driveshaft flange bolt(s) on the relay bearing	**21 N.m**
front axle subframe tie-rod upper bolts	**21 N.m**
power-assisted steering low pressure pipe bolt on the front axle subframe	**21 N.m**
steering box bolts on the front axle subframe	**105 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

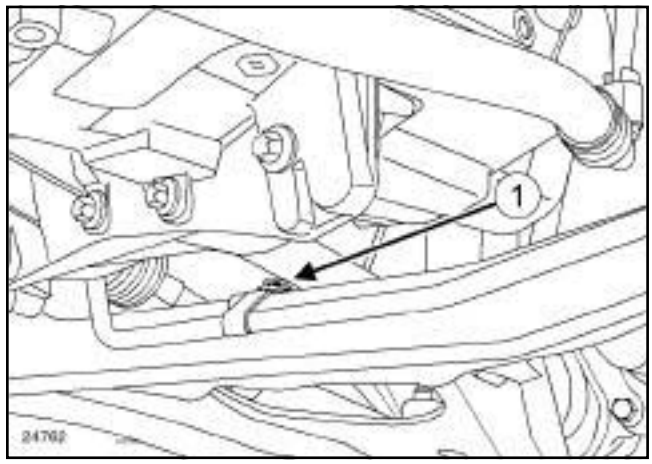
❏ Remove:

- the engine undertray bolts,
- the engine undertray.

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

❏ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch side liners,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

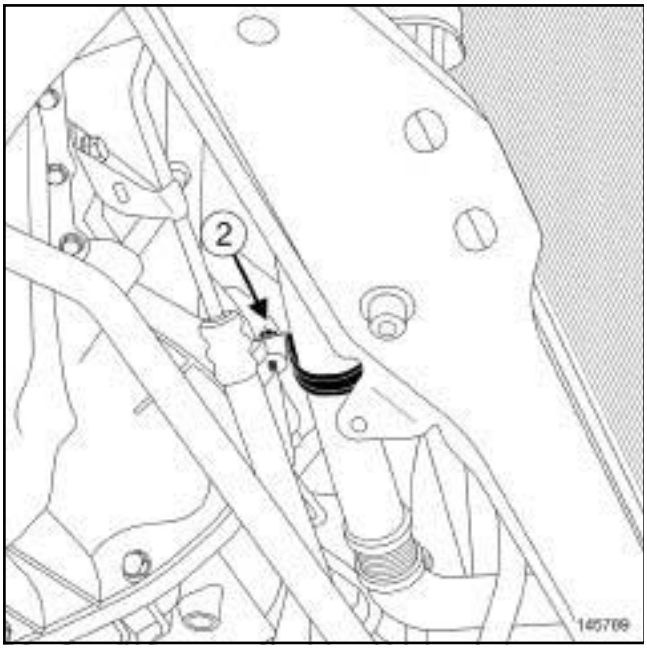


❏ Extract the lower arm ball joints from the stub axle carrier (see **Front driveshaft lower arm: Removal - Refitting**) (31A, Front axle components).

❏ Unclip the downstream oxygen sensor wiring on the heat shield on the steering box.

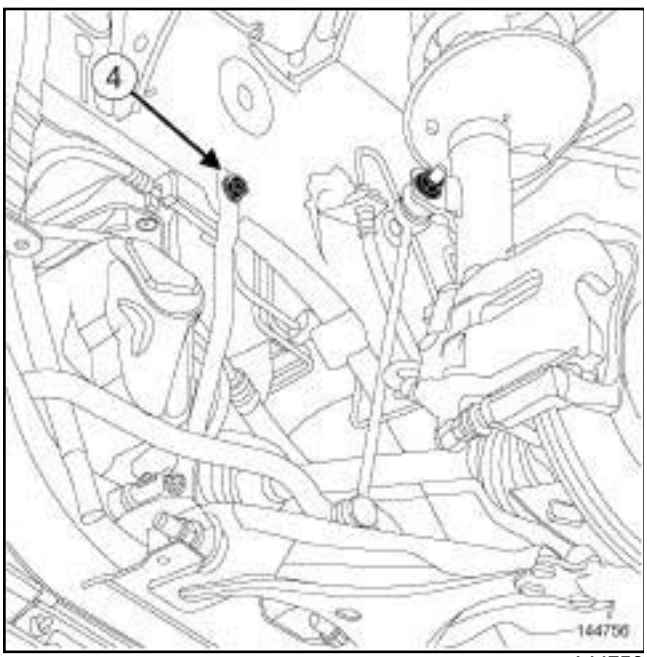
❏ Remove (see **Steering box: Removal - Refitting**) (36A, Steering assembly):

- the heat shield bolts on the steering box,
- the steering box heat shield,
- the steering box bolts on the front axle subframe.



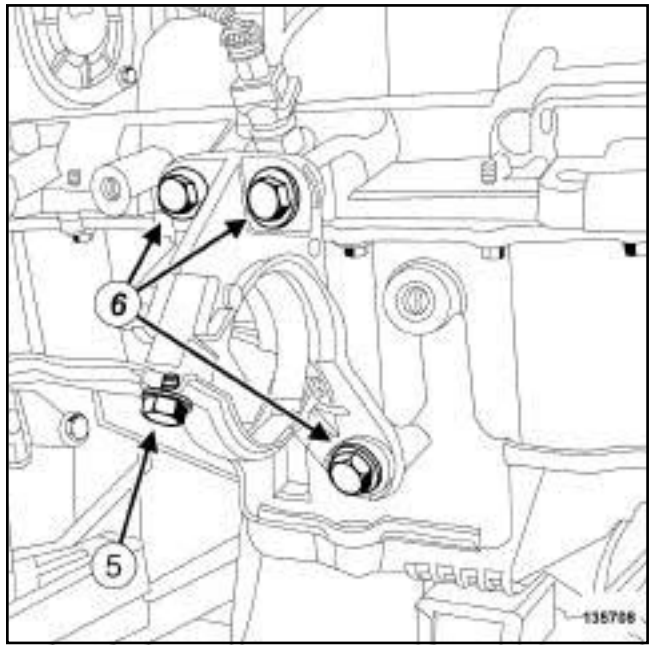
❏ Attach the steering rack to the body.

24762



❏ Remove the power-assisted steering low pressure pipe bolt (**1**) on the front axle subframe.

K4M

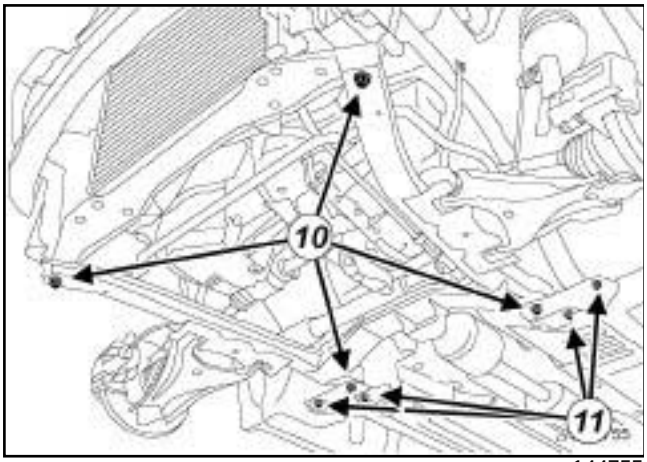


145789

❑ Remove the cooling pipe support bolt (**2**) on the sump.

144756

❑ Remove the front axle subframe tie-rod upper bolts (**4**) .

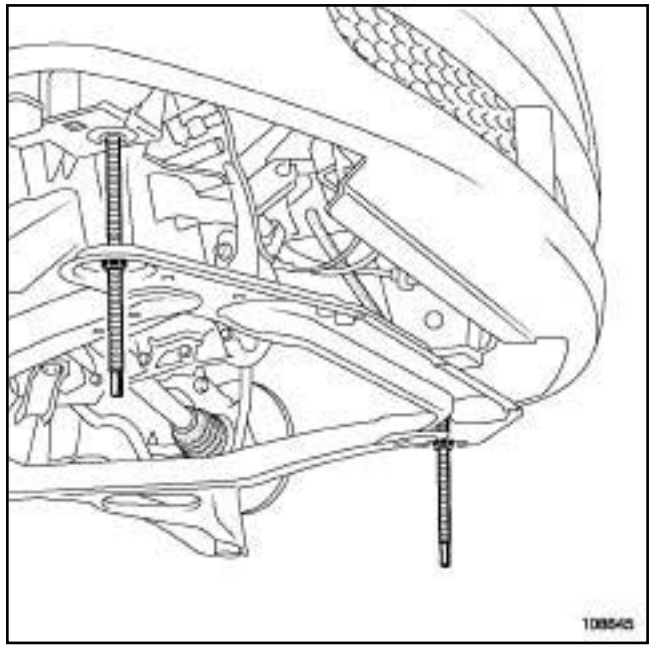


135708

❑ Remove:

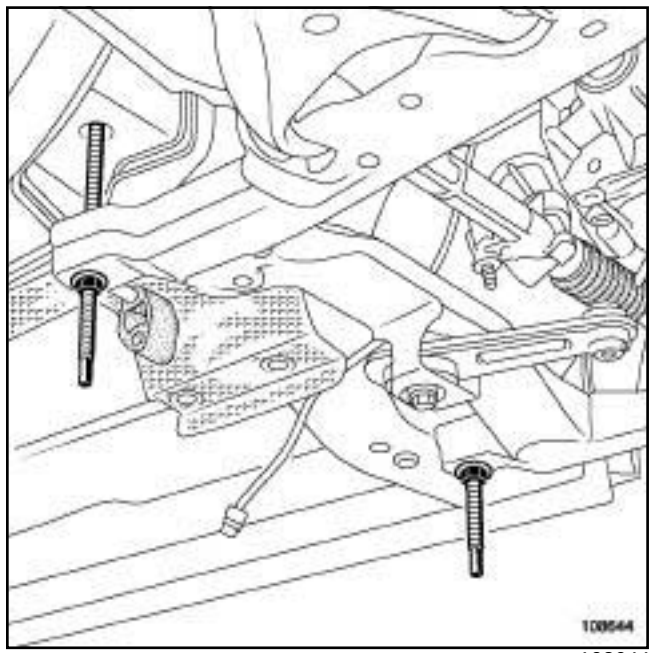
- the right-hand driveshaft flange bolt (**5**) on the relay bearing,
- the bolts (**6**) from the relay bearing,
- the relay bearing.

K4M



144755

❑ Remove:

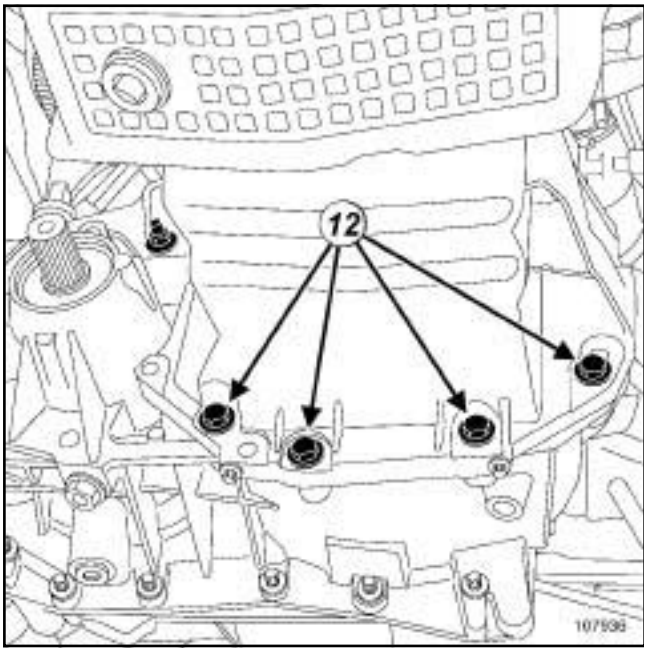


- the bracket bolts (**11**) ,
- one by one, the front axle subframe bolts (**10**) and replace them in turn with the threaded rods of the **(Tav. 1747)**.

Note:

Make sure the threaded rod of the **(Tav. 1747)** is sufficiently screwed into the threaded hole and that the nut of the tool is correctly resting on the front axle subframe.

108645



108644

❑ Lower the front axle subframe by at least **120 mm**, gradually loosening the nuts of the **(Tav. 1747)**.

K4M

II - REMOVAL OPERATION

107936

❑ Remove:

- the sump bolt from the multifunction support,
- the engine-gearbox coupling bolts (**12**) ,
- the sump bolts on the cylinder block,
- the sump,
- the oil splash plate.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: engine oil sump seal**.

❑ **parts always to be replaced: Front sub-frame bolt**.

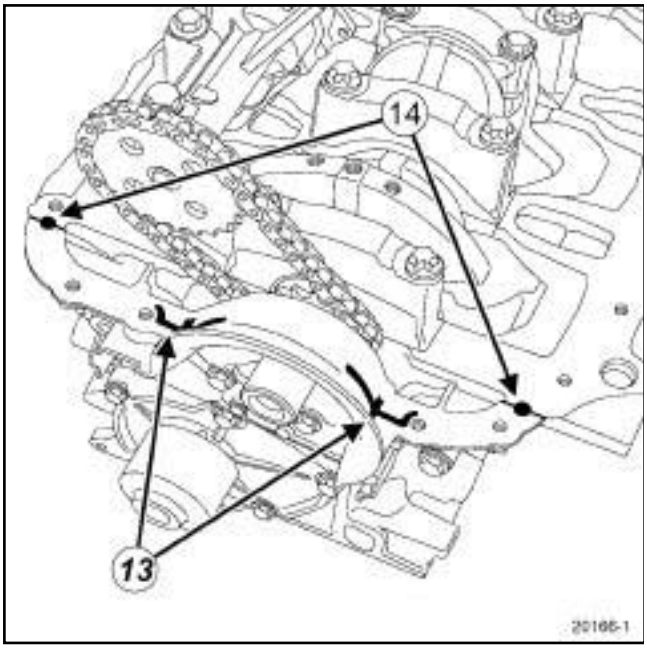
WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Clean the cylinder block joint face using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

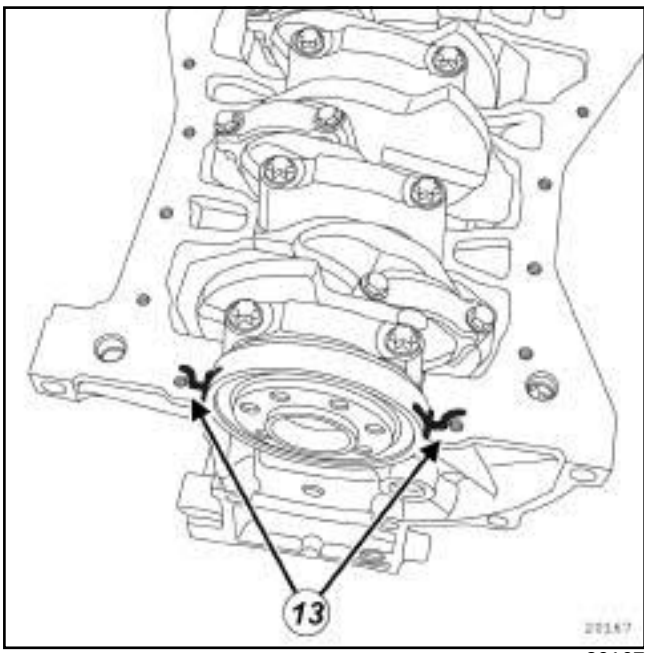
WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

- the sump joint face if it is to be reused,
- the cylinder block gasket face.

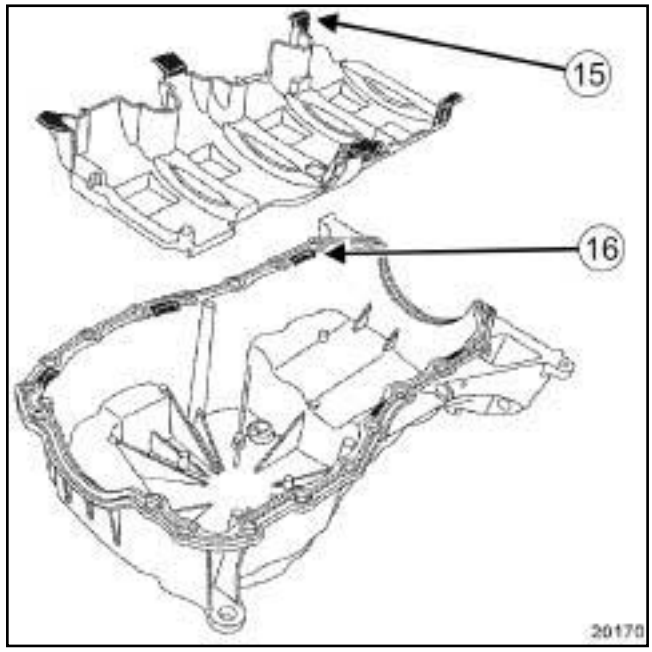


WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

K4M

20166



20167

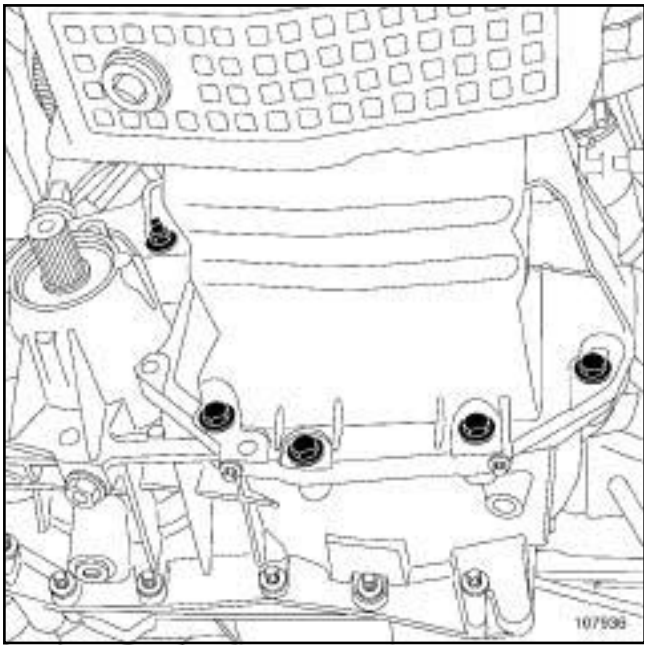
❑ Apply:

- four beads (**13**) of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm**,
- two drops (**14**) of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm** at the intersection between the cylinder block and the crankshaft closure panel.

II - REFITTING OPERATION

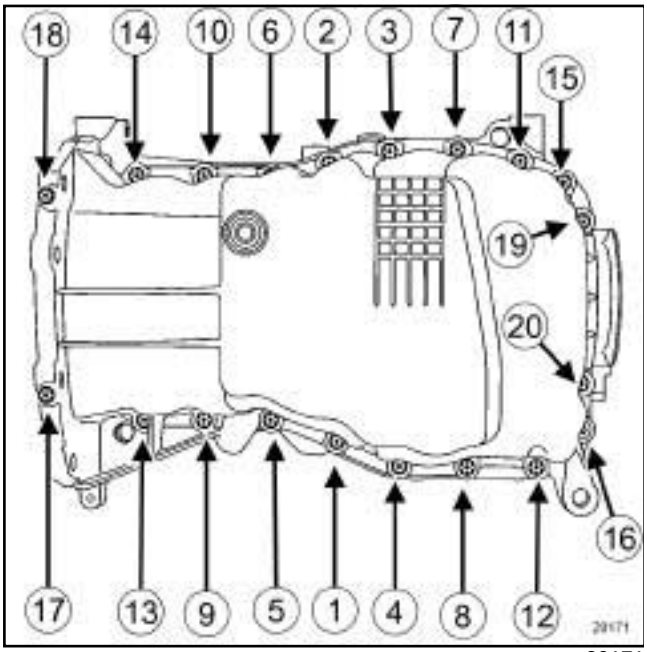
20170

❑



Note:

When removing the sump, ensure that:



- the oil splash plate tabs (**15**) are positioned correctly in the slots (**16**) ,
- the coupling faces of the sump and cylinder block are correctly aligned, to prevent the clutch housing being deformed when fitting the gearbox.

Refit the oil splash plate.

K4M

107936

20171

❏ Refit the oil sump fitted with a new seal.

❏ Tighten until contact:

- the sump bolts on the cylinder block,
- the bolts from the sump on the gearbox,
- the sump bolts from the multifunction support.

❏ Torque tighten:

- in order the **sump bolts on the cylinder block (14 N.m)**,
- the **sump bolts on the gearbox (44 N.m)**,
- the **sump bolt on the multifunction support (25 N.m)**.

III - FINAL OPERATION

❏ Fit the front axle subframe.

❏ Refit the brackets.

❏ Torque tighten the **bracket bolts (62 N.m)**.

❏ One by one, remove the threaded rods of the **(Tav. 1747)** and replace them in turn with new front axle subframe bolts.

K4M

❏ Torque tighten the **front axle subframe bolts (110 N.m)**.

❏ Refit:

- the relay bearing bolts,
- the right-hand driveshaft flange bolt(s) on the relay bearing.

❏ Tighten to torque and in order:

- the **relay bearing bolts (44 N.m)**,
- the **right-hand driveshaft flange bolt(s) on the relay bearing (21 N.m)**.

❏ Refit the front axle subframe tie-rod upper bolts.

❏ Torque tighten the **front axle subframe tie-rod upper bolts (21 N.m)**.

❏ Refit the cooling pipe support bolt on the sump.

❏ Refit the power-assisted steering low pressure pipe bolt on the front axle subframe.

❏ Torque tighten the **power-assisted steering low pressure pipe bolt on the front axle subframe (21 N.m)**.

❏ Refit the steering box bolts on the front axle subframe.

❏ Tighten to torque the **steering box bolts on the front axle subframe (105 N.m)**.

❏ Refit:

- the steering box heat shield,
- the lower arm ball joints (see **Front driveshaft lower arm: Removal - Refitting**) (31A, Front axle components),
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

K4M

❑ Refit the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

❑ Refit:

- the engine undertray,
- the front wheel arch side liners,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

K9K

Equipment required
safety strap(s)
component jack
indelible pencil
torque wrench
Diagnostic tool

Tightening torques ▽	
con rod cap bolts	**20 N.m + 45° ± 6°**
oil pump bolts	**25 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Vehicle: Precautions for the repair**) .

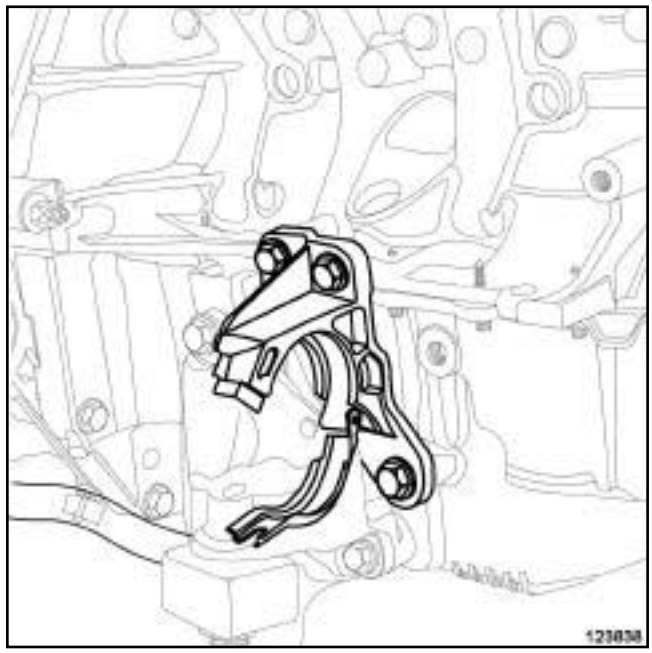
IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

REMOVAL

I - REMOVAL PREPARATION OPERATION

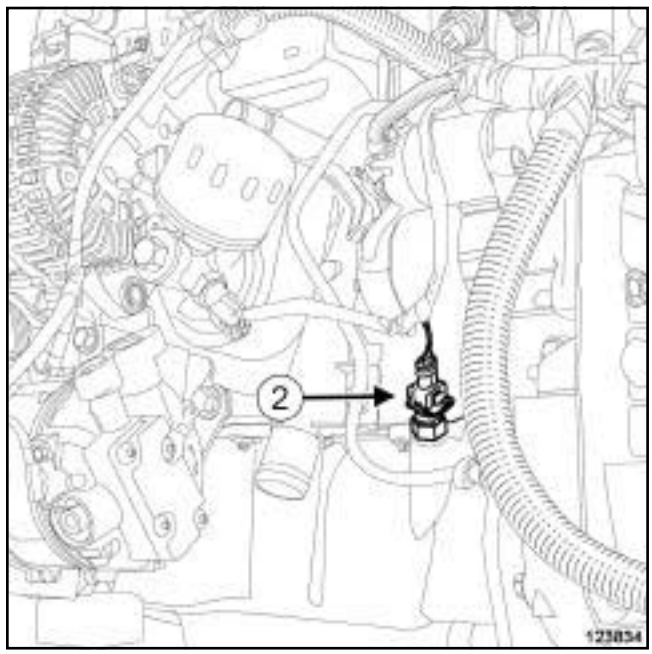
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove the engine undertray.



❏ Drain the oil from the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

❏ Remove the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-34**) .

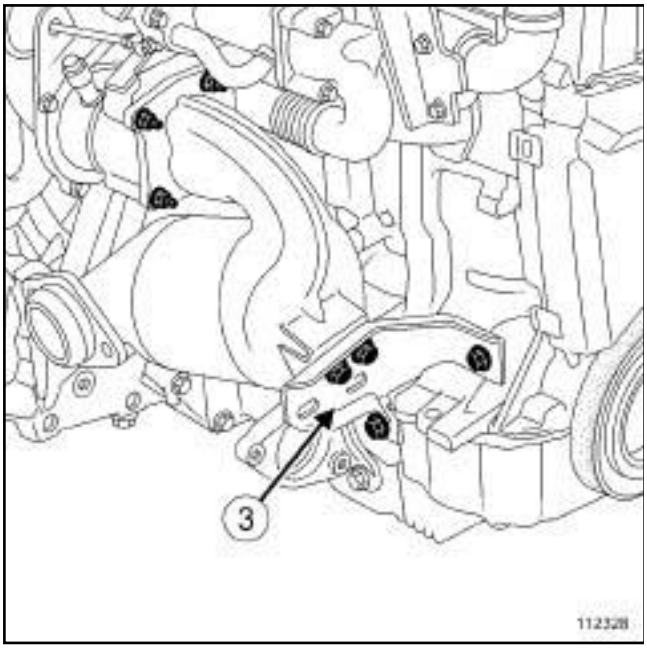


❏ Remove the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

❏ Strap the radiator to the vehicle using **safety strap(s)**.

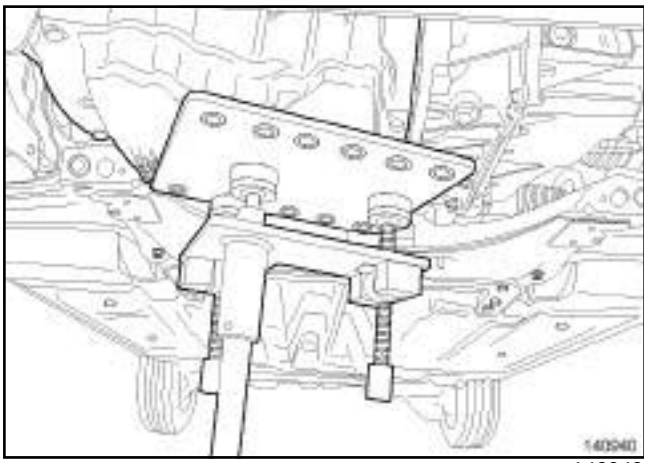
❏ Remove the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).

123838



❏ Remove the relay bearing of the front right-hand wheel driveshaft.

123834



❏ Disconnect the oil level sensor connector (if equipped) (**2**) .

K9K

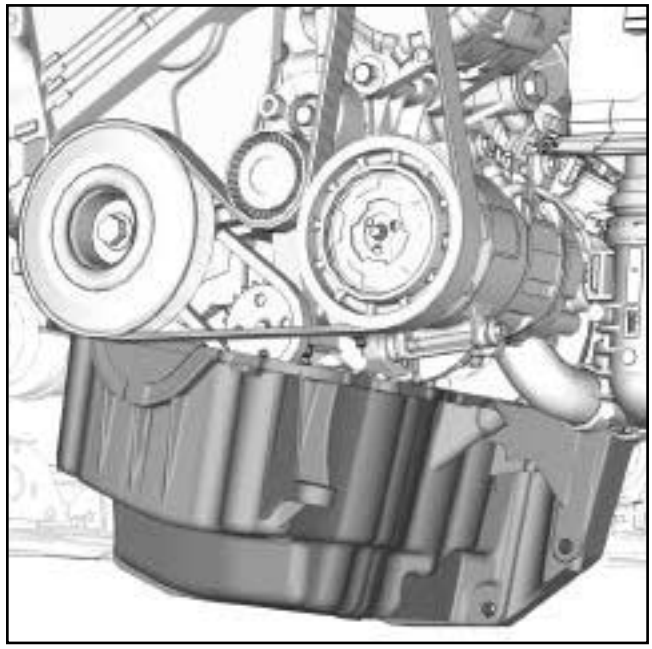
112328

❑ Remove the catalytic converter upstream stay (**3**) .

140940

❑

WARNING



Failure to observe the following procedure may damage the oil pump strainer.

Undo the bolts of the engine oil sump.

❑ Fit a **component jack** to support the engine oil sump.

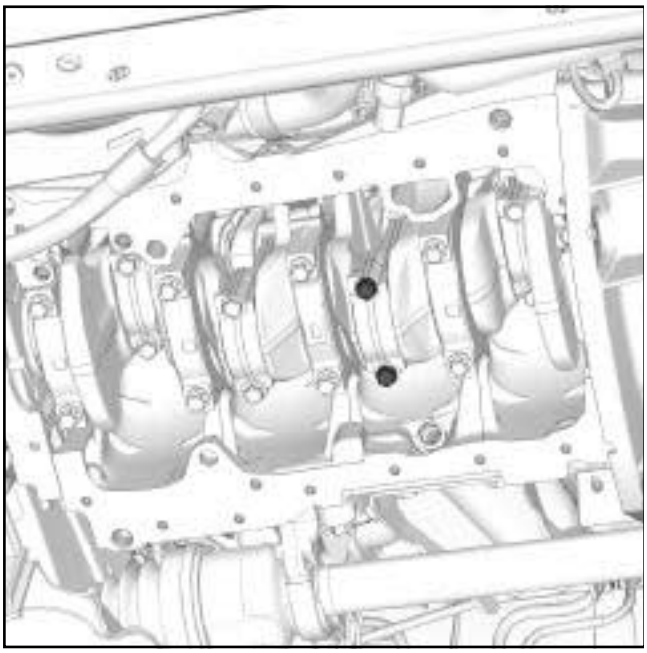
❑ Remove the bolts from the engine oil sump.

❑ Detach the engine oil sump, while supporting it with the **component jack**.

140917

❑ Tilt the engine oil sump forwards in order to access the oil pump bolts.

❑ Partially loosen the oil pump bolts **3 mm** to **5 mm**.



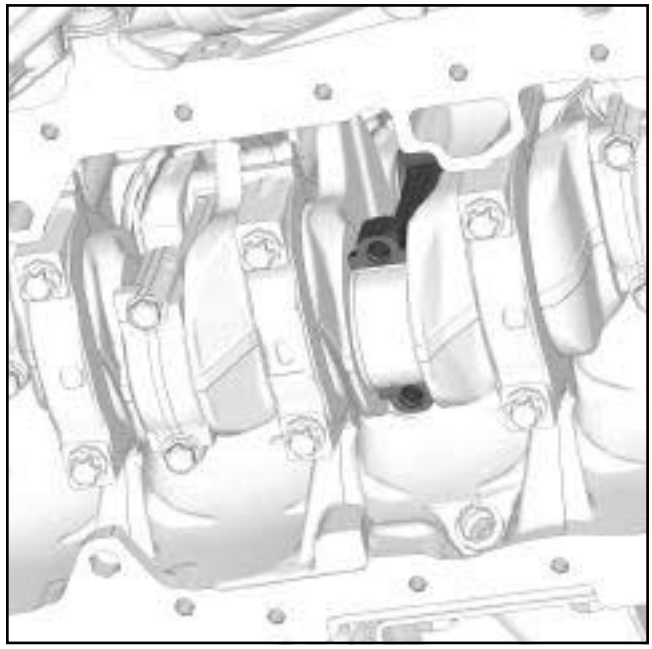
❑ Detach the oil pump from its position in order to remove the engine oil sump.

❑ Remove:

- the engine oil sump,
- the engine oil sump seal,
- the oil pump.

K9K

II - REMOVAL OPERATION FOR THE CON ROD BEARING SHELLS NO.2



139306

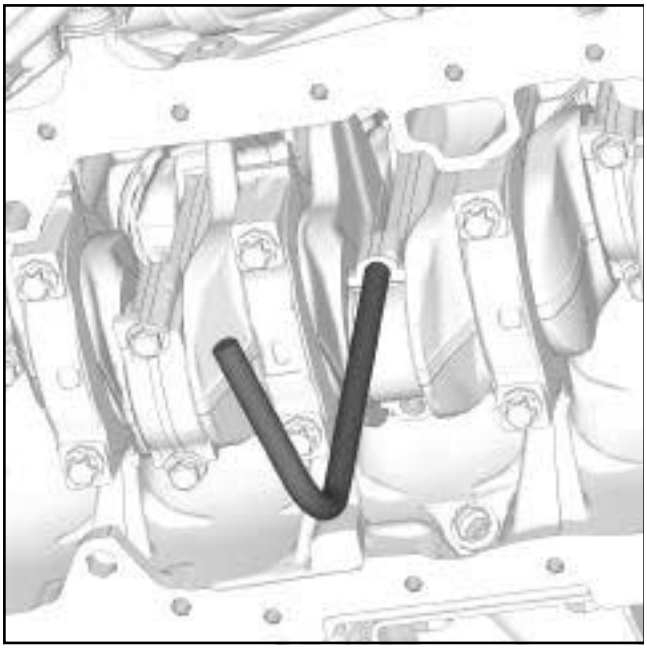
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the big ends.

❑ Mark the position of the con rod cap in relation to the con rod body using a **indelible pencil**.

❑ Position the crankshaft at Top Dead Centre.

139300

❑ Remove:



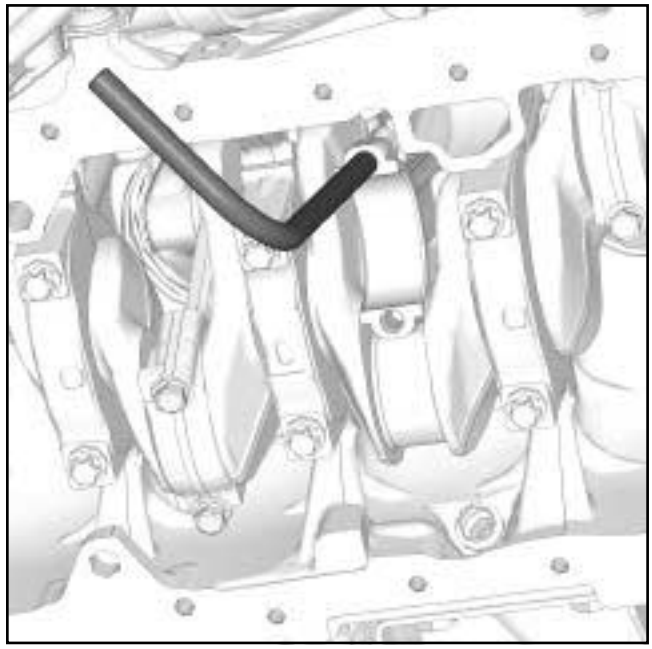
- the con rod bolts,
- the con rod cap,
- the lower con rod bearing shell.

Note:

If reusing the con rod bearing shells, mark the position of the lower con rod bearing shell in relation to the con rod cap.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - products) to clean the bearing mating face on the con rod cap.

K9K



139310

❑ Fit the tie rod of the toolon the con rod body.

❑ Push the con rod upwards to release the con rod from the crankpin.

❑ Turn the crankshaft **90°** clockwise (timing end).

139315

❑

WARNING

Failure to observe the following procedure may damage the piston base cooling jets.

Pull the con rod - piston assembly using the tie rod of the tool, taking care not to allow the piston to touch the piston base cooling jets.

❑ Remove the upper con rod bearing shell.

Note:

If reusing the con rod bearing shells, mark the position of the upper con rod bearing shell in relation to the con rod body.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - products) to clean the bearing mating face on the con rod body.

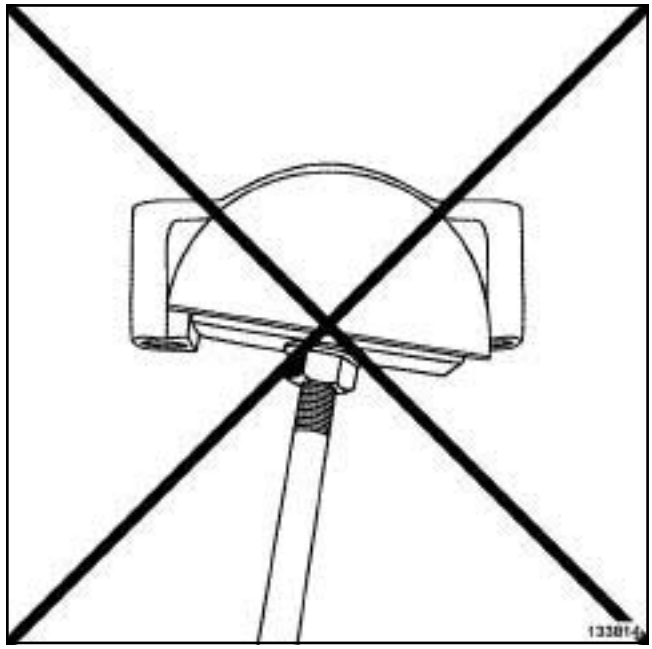
REFITTING

I - REFITTING OPERATION FOR THE CON ROD BEARING SHELLS ON CYLINDER NO.2

❑ **parts always to be replaced: con rod cap bolts**

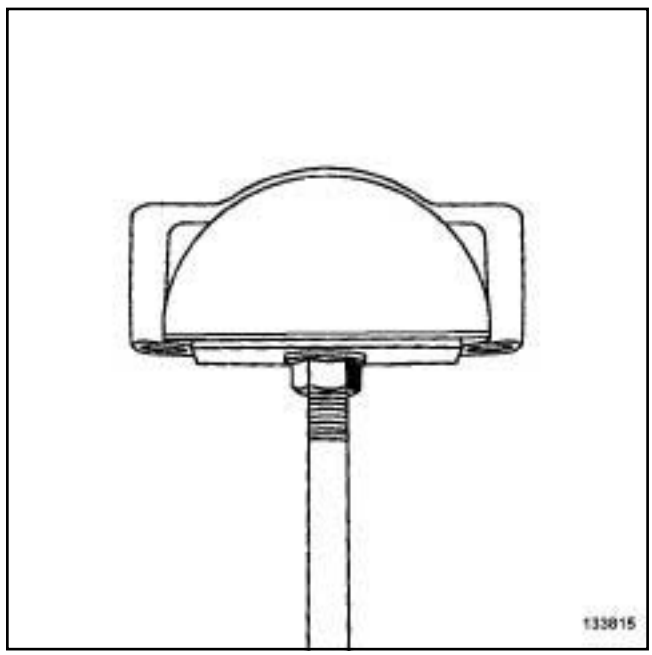
K9K

❑



Note:

Always replace con rod bearing shells with a width of **20 mm** by con rod bearing shells with a width of **18 mm**.



If the set of con rod bearing shells only includes con rod bearing shells which are **18mm** wide, only use the head of the toolwith the marking " **K9K SUP** ".

Fit the head of the toolwith the marking " **K9K INF** " on the threaded sleeve of the tool.

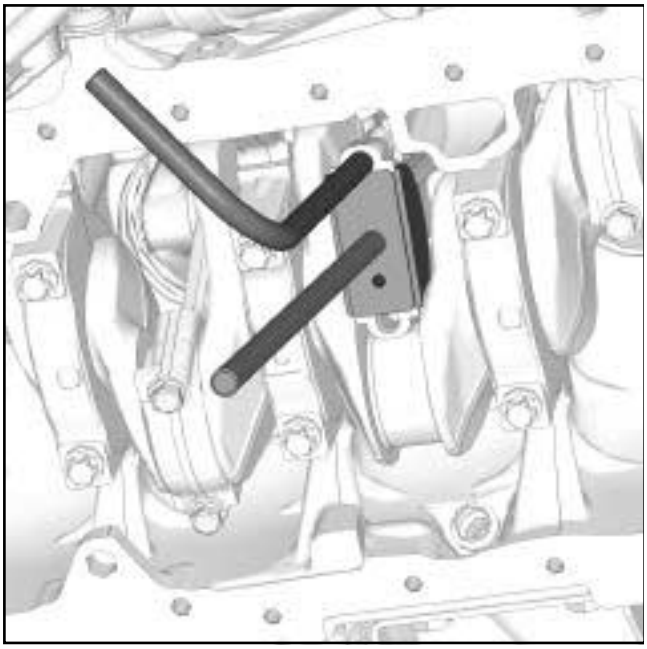
❑ Position the lower con rod bearing shell on the tool.

133814

133815

❑

Note:



The contact surface between the bearing shell and the con rod must be dry and free of grease.

Fit the lower con rod bearing shell on the con rod cap using the tool.

❑ Position the lower con rod bearing shell so that the ends do not protrude beyond the con rod cap.

❑ Lubricate the surface of the con rod bearing shell (crankshaft end) using new engine oil.

K9K

139318

❑ Remove the tool head with the marking " **K9K INF** " and fit the head with the marking " **K9K SUP** ".

❑ Position the upper con rod bearing shell on the tool.

❑ Fit the upper con rod bearing shell on the con rod body using the tool.

❑ Position the upper con rod bearing shell so that the ends do not protrude beyond the con rod body.

❑ Lubricate the surface of the con rod bearing shell (crankshaft end) using new engine oil.

❑ Push the con rod - piston assembly back up into place.

❑ Turn the crankshaft **90°** anticlockwise.

❑ Lubricate the crankpin with new engine oil.

❑ Pull the con rod - piston assembly to position the con rod on the crankshaft.

❑

Note:

Before refitting the con rod cap, ensure that there are no impurities (filings, cloth lint, etc.) on the con rod body or cap surfaces.

Refit:

- the con rod cap according to the mark made during removal,
- the new con rod bolts.

❑ Torque and angle tighten the **con rod cap bolts (20 N.m + 45° ± 6°)**.

II - REMOVAL - REFITTING OPERATIONS FOR THE CON ROD BEARING SHELLS ON CYLINDERS NO.3, 1 AND 4

❑ Perform the same removal - refitting operations as for the con rod bearing shells on cylinder no. 2.

Note:

For removing and refitting the con rod bearing shells on cylinders no. 1 and no. 4, position the pistons at Bottom Dead Centre before performing the same removal and refitting operations as for the con rod bearing shells on cylinder no. 2.

III - FINAL OPERATION

❑ **parts always to be replaced: engine oil sump seal**

parts always to be replaced: Oil filter

parts always to be replaced: Drain plug seal on engine oil sump

WARNING

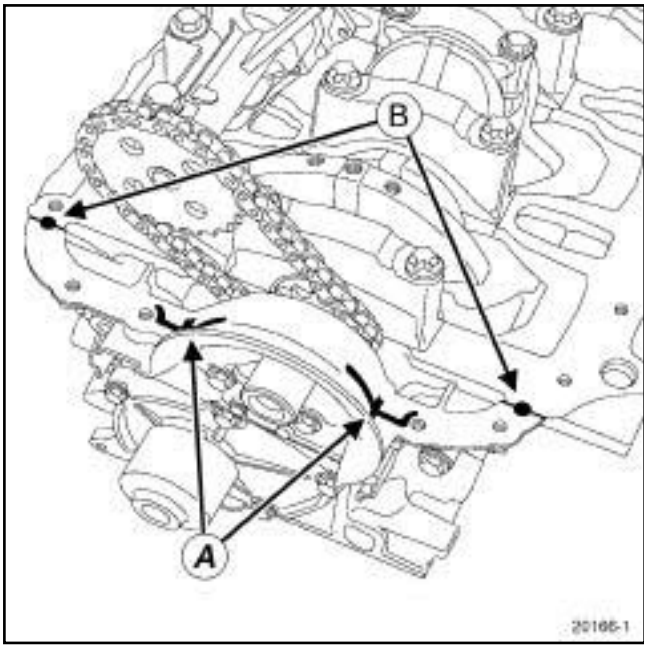
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

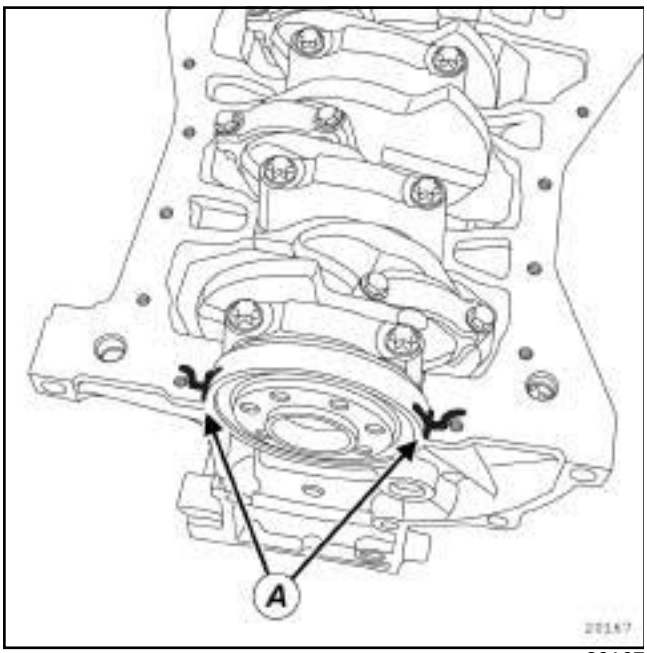
❑ Use a wooden spatula or an **ABRASIVE PAD** to clean the joint face of the cylinder block and engine oil sump.

❑ Refit the oil pump.



❑ Fit without tightening the oil pump bolts, while keeping a clearance of **3 mm** to **5 mm**.

❑ Fit the engine oil sump seal.

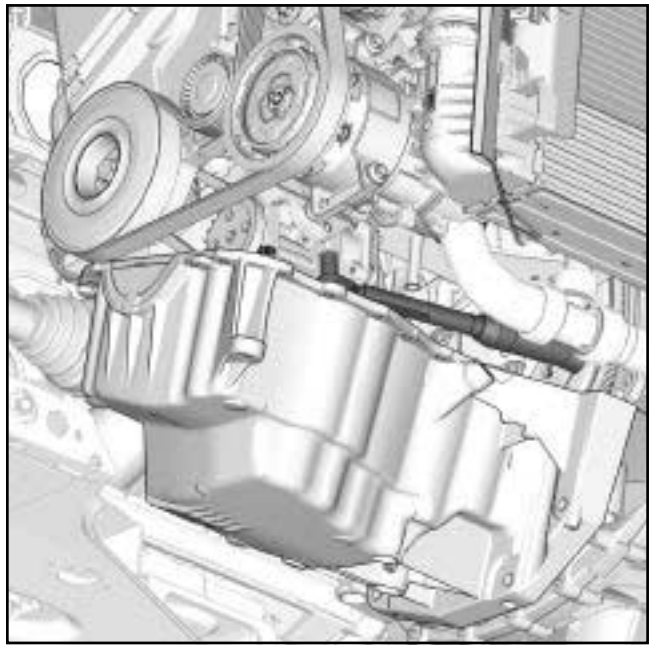


WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

K9K

20166



20167

❑ Apply **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) :

- four beads with a diameter of **5 mm** at (**A**) ,
- two drops with a diameter of **5 mm** at (**B**) .

❑ Fit the engine oil sump while supporting it using a **component jack**.

140918

❑ Tilt the engine oil sump forwards in order to access the oil pump bolts.

❑ Torque tighten the **oil pump bolts (25 N.m)** using the **torque wrench** PROSTEEL, part number **77 11 226 888** starting with the **13 mm** bolt.

❑

Note:

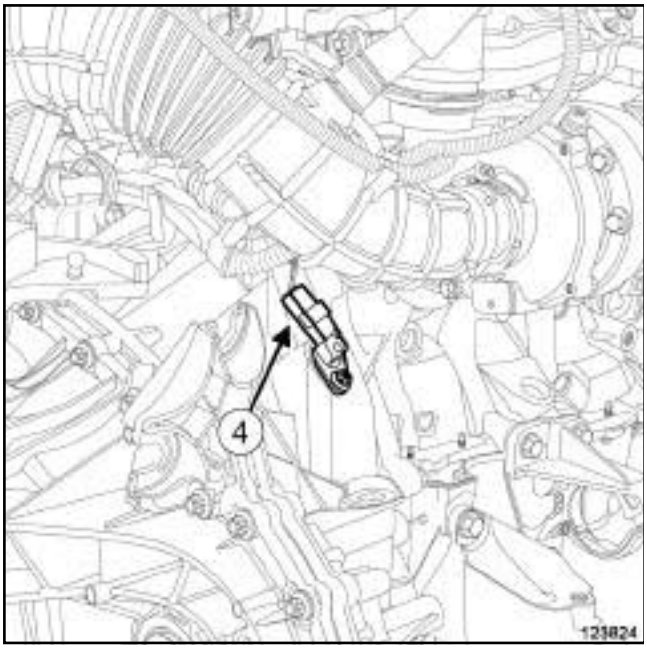
Check that the engine oil sump seal is definitely in place before tightening the engine oil sump bolts.

❑ Refit the engine oil sump bolts.

❑ Torque tighten in order the engine oil sump bolts (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-9**) .

❑ Refit the catalytic converter upstream stay (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .

❑ Connect the connector to the oil level sensor.



❑ Refit the relay bearing of the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) .

❑ Refit the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).

❑ Remove the **safety strap(s)** from the radiator.

❑ Refit the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

K9K

123824

- ❏ Disconnect the crankshaft position sensor (**4**) to prevent the engine from starting.
- ❏ Refit the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-34**)
- ❏ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .
- ❏ Start the engine using the starter until the engine oil warning light goes out.
- ❏ Connect the crankshaft position sensor.
- ❏ Refit the engine undertray.
- ❏ Clear the present faults using the **Diagnostic tool**.

K4M or K9K

Equipment required
oil recovery tray
oil change wrench
torque wrench
oil change end piece with an 8 mm square drive

Tightening torques ▽	
drain plug	**20 N.m**

DRAINING

I - AVERAGE CAPACITY OF ENGINE OIL

K4M

❑ **4.7 litres** (without oil filter replacement).

❑ **4.8 litres** (with oil filter replacement).

K9K

❑ **4.0 litres** (without oil filter replacement).

❑ **4.1 litres** (with oil filter replacement).

II - RECOMMENDATIONS FOR REPAIR

❑

WARNING
Always check the oil level using the dipstick.

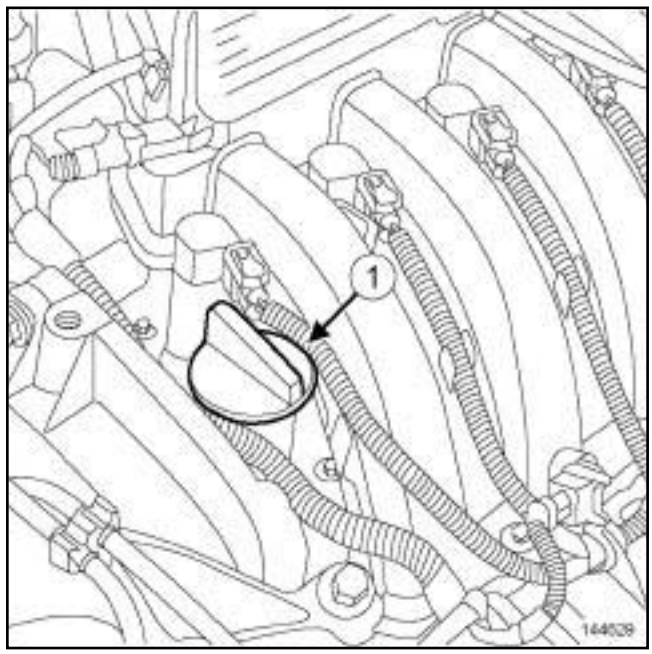
Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When filling up the engine oil, always leave at least **10 minutes** for the oil to drain down before checking with a dipstick.

III - PARTS AND CONSUMABLES FOR REPAIR



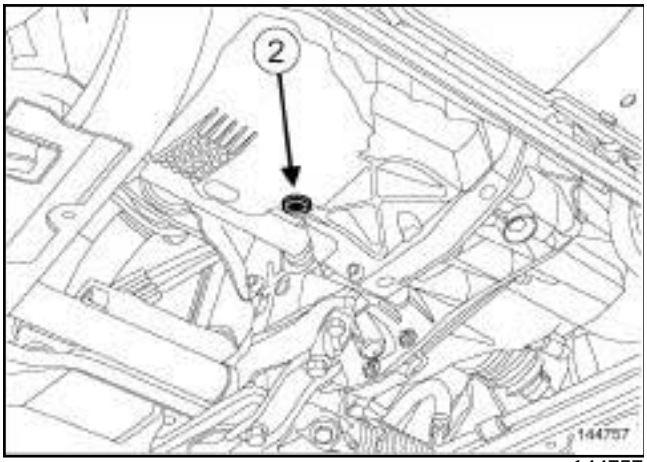
❑ **parts always to be replaced: Drain plug seal on engine oil sump**.

❑ Consumable:

- Engine oil (see **Engine oil: Specifications**) .

IV - OIL SERVICE

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



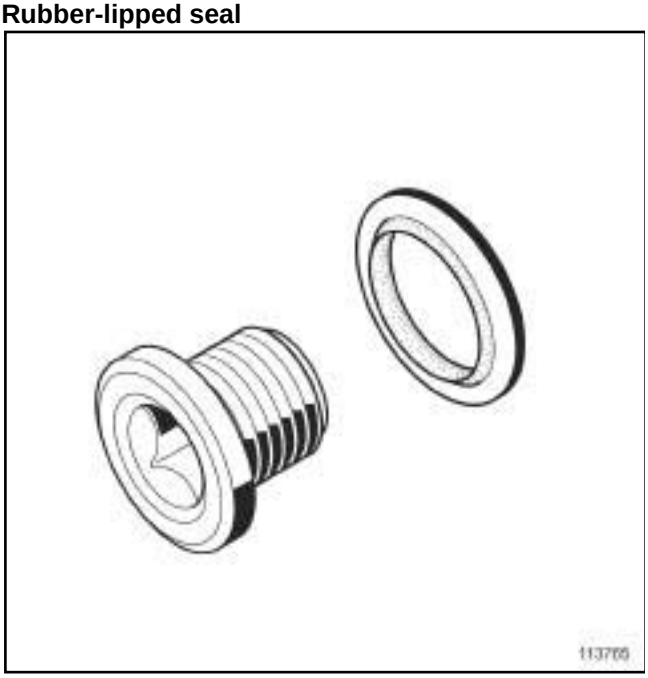
144629

❑ Remove:

- the engine oil filler cap (**1**) ,
- the dipstick.

❑ Place the **oil recovery tray** under the engine.

K4M or K9K



144757

❏ Remove the drain plug (**2**) using theor a **oil change wrench**.

❏ Let the engine oil flow out completely.

❏ Remove the drain plug seal.

Rubber-lipped seal

113765

❏ Refit a new seal to the drain plug (no direction of fitting).

❏ Refit the drain plug.

❏ Torque tighten the **drain plug (20 N.m)** using a **torque wrench** fitted with a **oil change end piece with an 8 mm square drive**.

❏ Clean any oil run-off from the engine oil sump using a cloth.

❏ Remove the **oil recovery tray**.

V - FILLING

❏ Fill the engine with oil, respecting the recommended quantity.

❏ Wait at least **10 minutes**.

❏ Check the oil level using the dipstick.

❏ Top up the engine oil level if necessary.

❏ Refit:

- the engine oil filler cap,
- the dipstick.

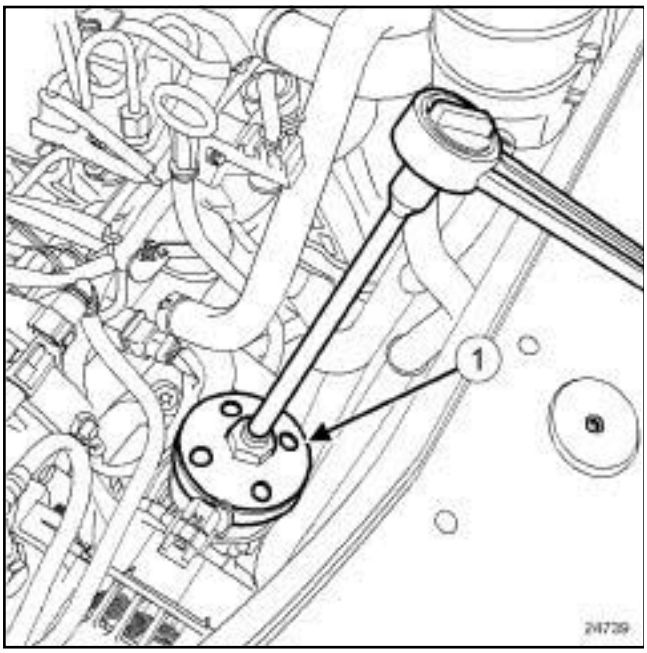
K9K

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter)

WARNING

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).



Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When topping up the engine oil, always leave at least 10 minutes for the oil to drain down before checking with a dipstick.

REMOVAL

OPERATION FOR REMOVAL OF PART CONCERNED

24739

❑ Position the **(Mot. 1329)** (**1**) with an extension piece and a ratchet on the oil filter.

❑ Remove the oil filter.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Oil filter**.

❑ Lubricate the new oil filter seal with new engine oil.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Tighten the oil filter by hand until the oil filter seal makes contact with the oil filter support.

❑ Tighten the oil filter 3/4 of a turn manually or using the tool **(Mot. 1329)**.

III - FINAL OPERATION

❑ Wipe any oil run-off with a cloth.

❑ Check the oil level with the dipstick.

❑ Top up the oil level (if necessary).

K4M

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter)

Equipment required
oil recovery tray

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

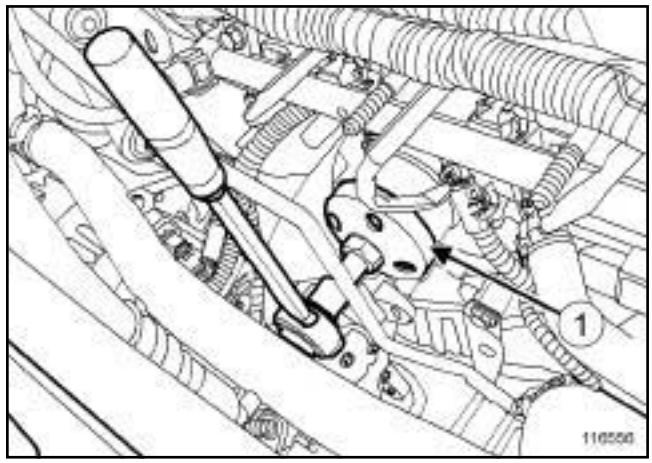
When filling up the engine oil, always leave at least **10 minutes** for the oil to drain down before checking with a dipstick.

When removing the oil filter, check that the oil filter seal is not still stuck to the cylinder block or the oil filter support.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Remove:

- the engine undertray bolts,
- the engine undertray.

❑ Place the **oil recovery tray** under the engine.

❑ Remove the injector rail protector.

II - REMOVAL OPERATION

116556

❑ Remove the oil filter using the **(Mot. 1329)** (**1**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Oil filter**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease the cylinder block joint face.

❑ Lubricate the oil filter seal with new engine oil.

II - REFITTING OPERATION

❑ Fit a new oil filter.

❑ Tighten the oil filter until it makes contact with the engine.

❑ Manually tighten the oil filter by 3/4 of a turn.

III - FINAL OPERATION

❑ Refit the injector rail protector.

❑ Remove the **oil recovery tray**.

❑ Wipe any oil run-off with a cloth.

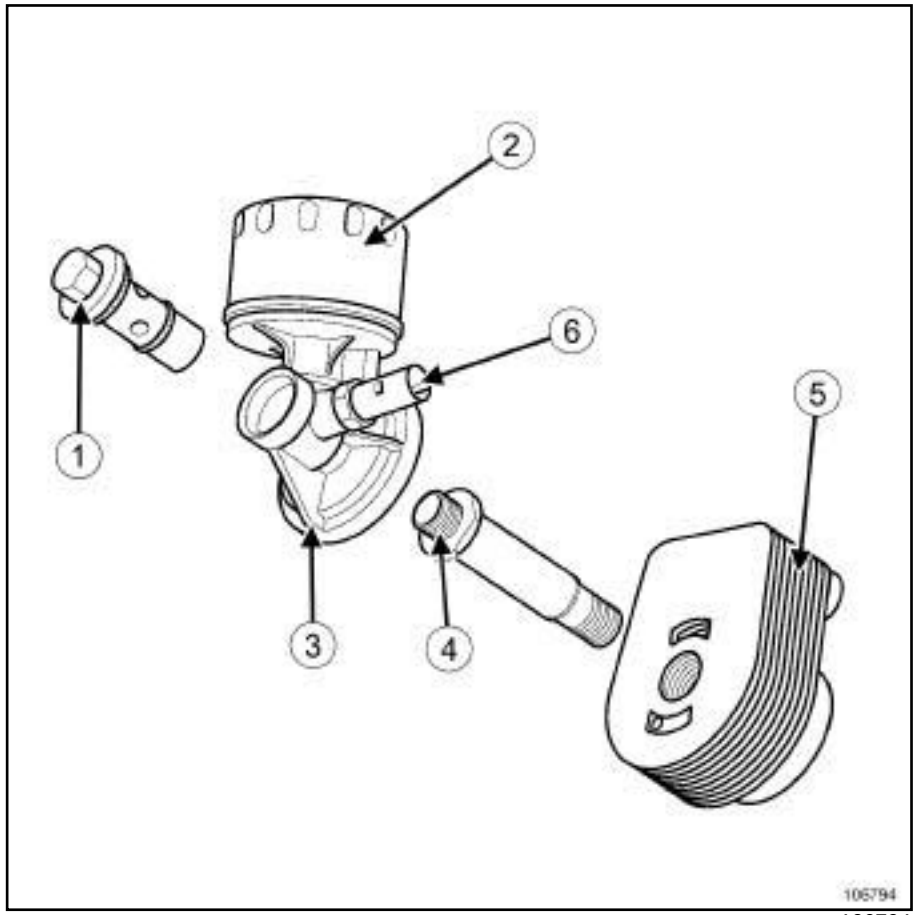
❑ Top up with engine oil recommended by the manufacturer (see **Engine oil: Specifications**) .

❑ Start the engine and wait until the oil pressure warning light goes out on the instrument panel.

❑ Check for leaks from the oil filter.

❑ Refit the engine undertray.

❑ Wait at least **10 minutes**.



❑ Check the oil level using the dipstick.

K4M

❑ Top up the engine oil level to the dipstick if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

K9K, and 796

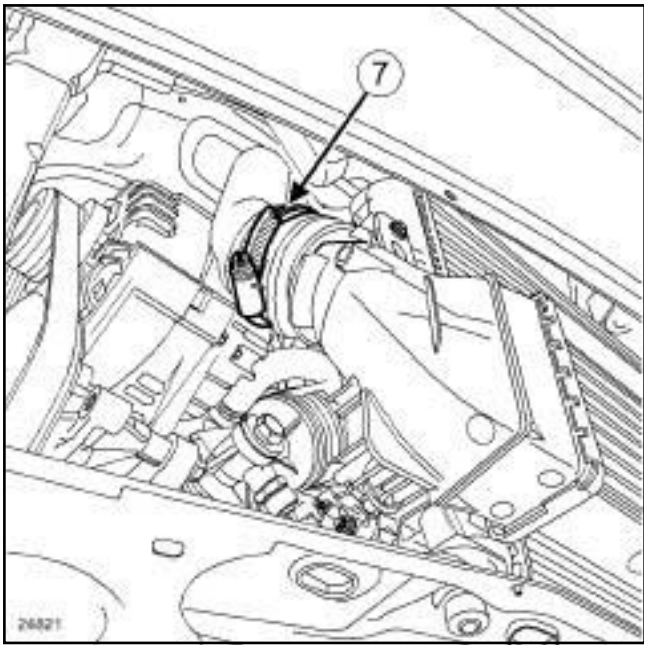
❑

REMOVAL

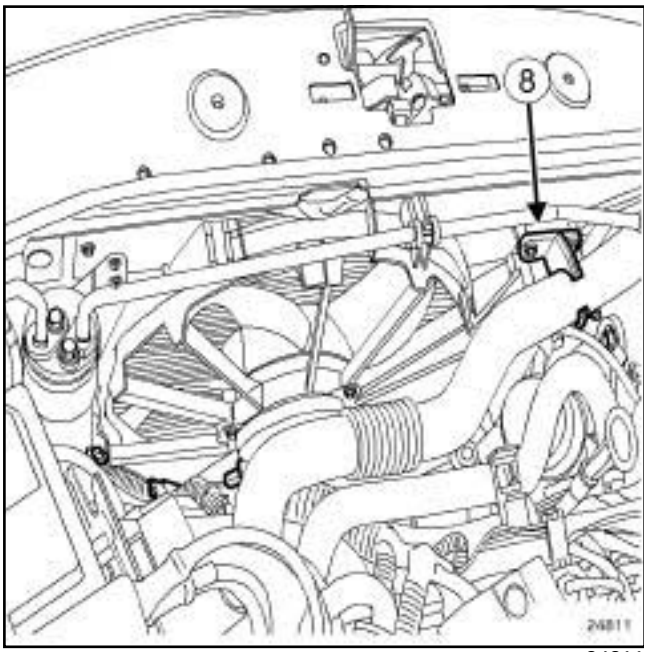
REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

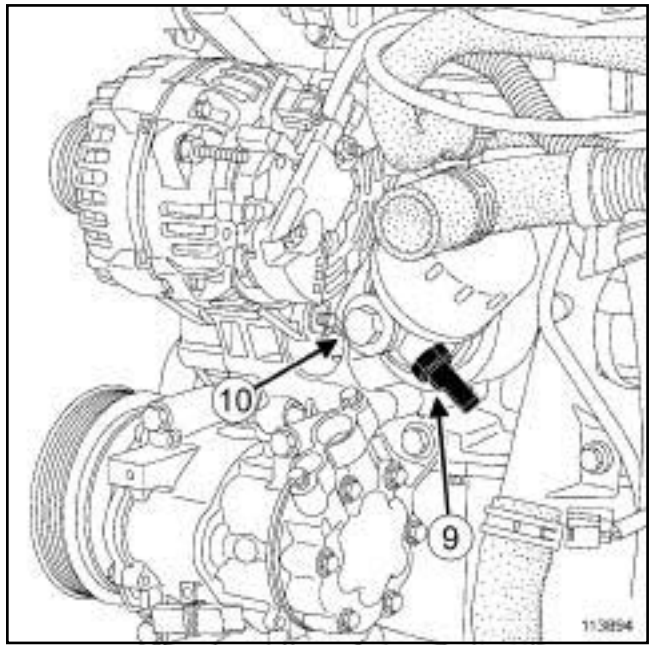
- the engine cover,
- the engine undertray,
- the closure panel component under the diesel filter.



❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

K9K, and 796

24821

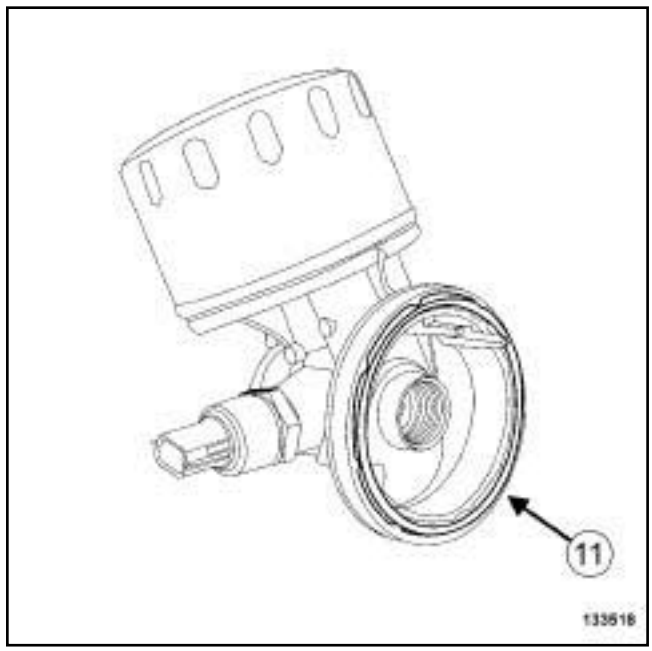


❏ Disconnect the air outlet duct (**7**) on the intercooler.

24811

❏ Move aside the air outlet duct.

❏ Remove the air outlet duct support (**8**) from the fan assembly mounting.

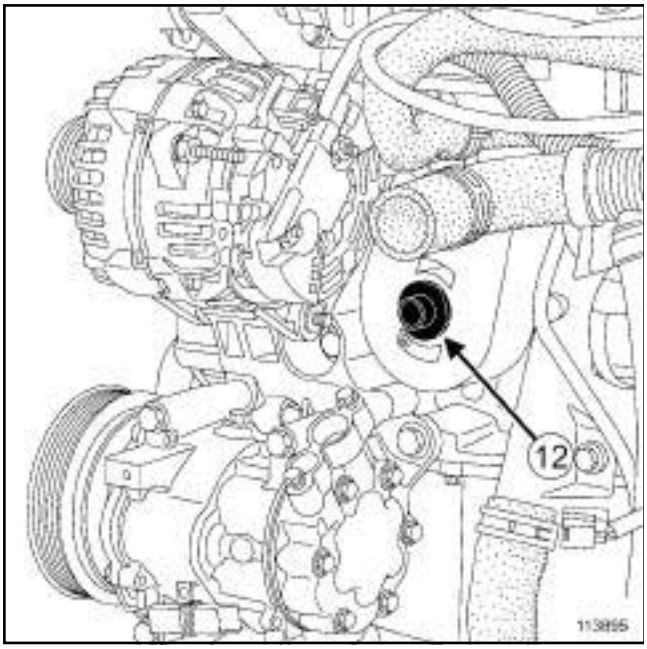


113894

❏ Disconnect the oil pressure sensor connector (**9**) .

❏ Place a container under the engine on the oil filter side.

❏ Remove the bolt (**10**) from the oil filter support.



❏ Remove the oil filter support.

133518

❏ Remove the seal (**11**) from the oil filter support.

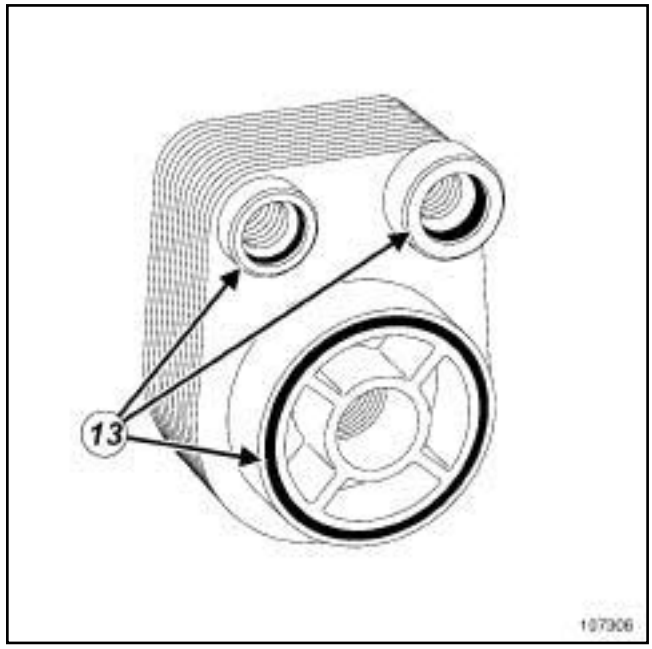
K9K, and 796

113895

❏ Remove:

- the bolt (**12**) from the oil-coolant heat exchanger,
- the oil-water heat exchanger.

❏ Using a clean cloth, clean up any oil and coolant runs on the cylinder block and on the oil filter support.



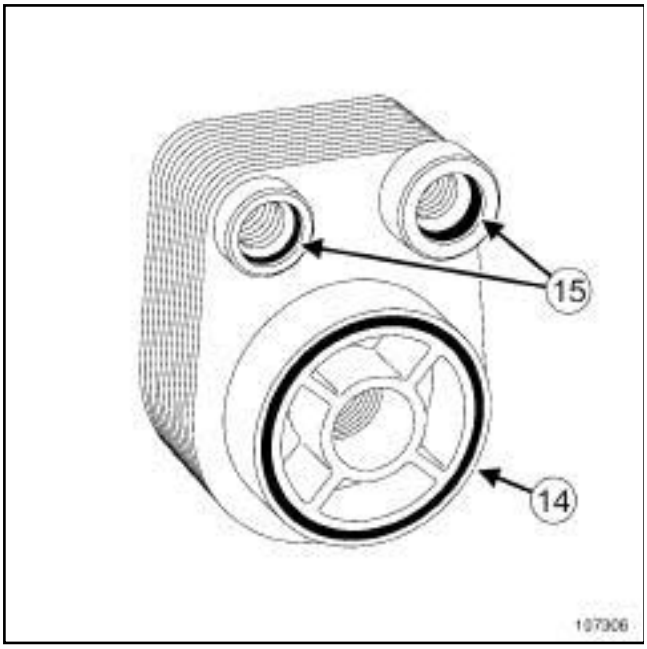
REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block**.

❏ Always replace:

- the seals of the oil filter support bolt,
- the oil filter support seal.



107306

❏ Remove the oil-water heat exchanger seals (**13**) .

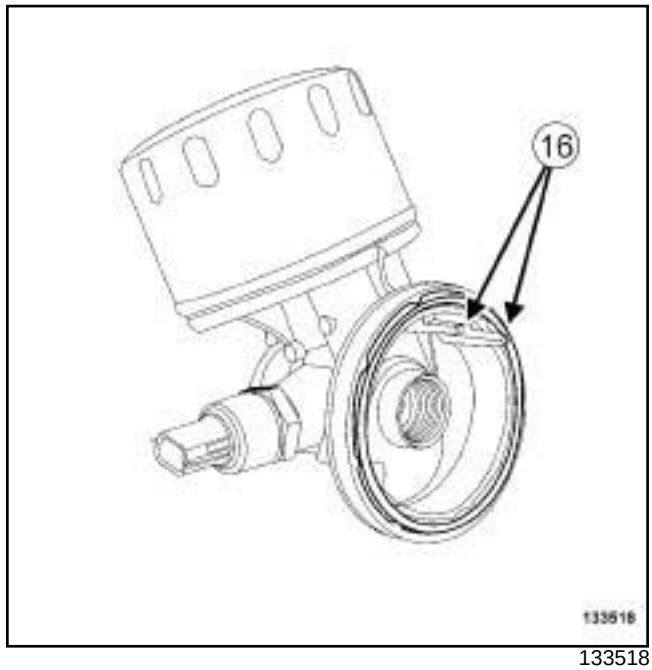
❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the housing of each seal in the oil-water heat exchanger if it is to be reused,
- the oil-coolant heat exchanger seal face if it is to be reused,
- the mating face of each seal on the coolant pump inlet pipe,
- the joint face on the cylinder block,
- the housing of each oil filter support seal,
- the housing of each seal in the oil filter support.

K9K, and 796

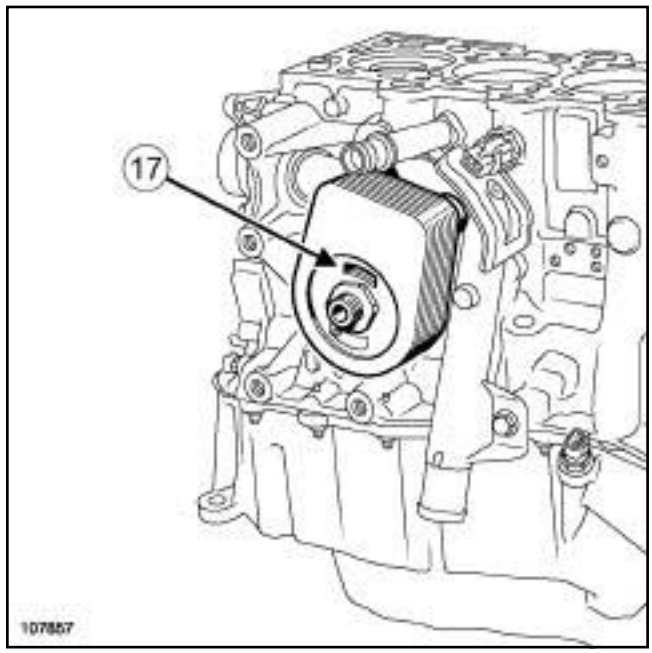
107306

❏ Refit new seals (**14**) and (**15**) on the oil-water heat exchanger.



❏ Apply soapy water to the two seals ***(15)*** in contact with the coolant pump inlet pipe.

II - REFITTING OPERATION FOR PART CONCERNED



❏ Refit the oil-water heat exchanger.

❏ Torque tighten the **oil heat exchanger bolt (39 N.m)**.

III - FINAL OPERATION

133518

107857

❏ Refit:

- a new seal in the housing of the oil filter support,
- the oil filter support, positioning the lug (**16**) in the hole (**17**) of the oil-water heat exchanger.

❏ Refit the oil filter holder bolt.

❏ Torque tighten the **oil filter support bolt (28 N.m)**.

❏ Connect the oil pressure sensor connector.

❏ Refit the air outlet duct support on the fan assembly mounting.

K9K, and 796

❑ Connect the air outlet duct to the intercooler.

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❑ Refit:

- the closure panel component under the diesel filter,
- the engine undertray,
- the engine cover.

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113894

❏ Disconnect the oil pressure sensor connector.

❏ Remove the oil pressure sensor (**2**) using the.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil pressure sensor.

❏ Torque tighten the **oil pressure sensor (33 N.m)**.

❏ Connect the oil pressure sensor connector.

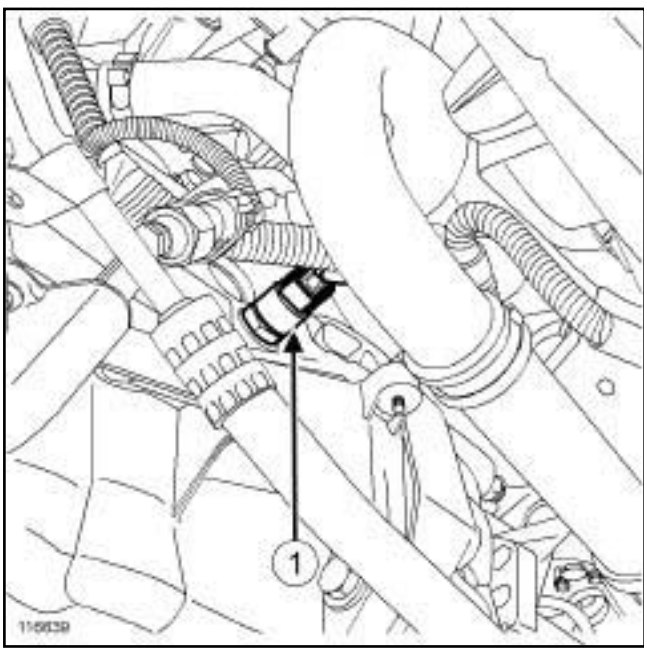
II - FINAL OPERATION

❏ Refit the engine undertray.

K4M

Tightening torques ▽	
oil pressure sensor	**35 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray bolts,
- the engine undertray.

II - REMOVAL OPERATION

116639

❏ Disconnect the oil pressure sensor connector (**1**) .

❏ Remove the oil pressure sensor.

REFITTING

I - REFITTING OPERATION

❏ Degrease the mating face of the oil pressure sensor on the cylinder block using **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❏ Refit the oil pressure sensor.

❏ Torque tighten the **oil pressure sensor (35 N.m)**.

II - FINAL OPERATION

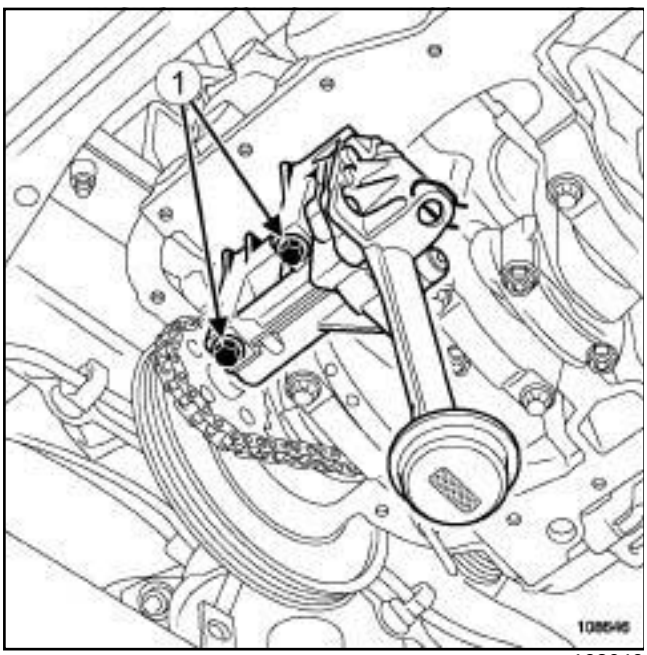
❏ Connect the oil pressure sensor connector.

❏ Refit the engine undertray.

K9K

Tightening torques ▽	
oil pump bolts	**25 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

❏ Remove the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-9**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

108646

❏ Remove:

- the oil pump bolts (**1**) ,
- the oil pump.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check for oil pump centering rings on the cylinder block.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil pump.

❏ Torque tighten the **oil pump bolts (25 N.m)**.

III - FINAL OPERATION

❏ Refit the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-9**) .

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

II - REMOVAL OPERATION

108646

❏ Remove:

- the oil pump bolts (**1**) ,
- the oil pump.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check for centering rings on the oil pump.

II - REFITTING OPERATION

❏ Refit the oil pump.

❏ Torque tighten the **oil pump bolts (25 N.m)**.

III - FINAL OPERATION

❏ Refit the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-9**) .

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) .

K4M or K9K

Oil pressure tables:

Engine	Minimum oil pressure (bar)		Maximum oil pressure (bar)
	Idling speed	3000 rpm	3000 rpm
D4D, D4F	**1.5**	**3.9**	**5.3**
K7J, K7M	**1.3**	**3.7**	**5.0**

Engine	Minimum oil pressure (bar)		Maximum oil pressure (bar)
	Idling speed	4000 rpm	4000 rpm
K4M	**0.5**	**3.1**	**4.4**
K9K	**0.8**	**3.4**	**5.2**

End pieces to be used:

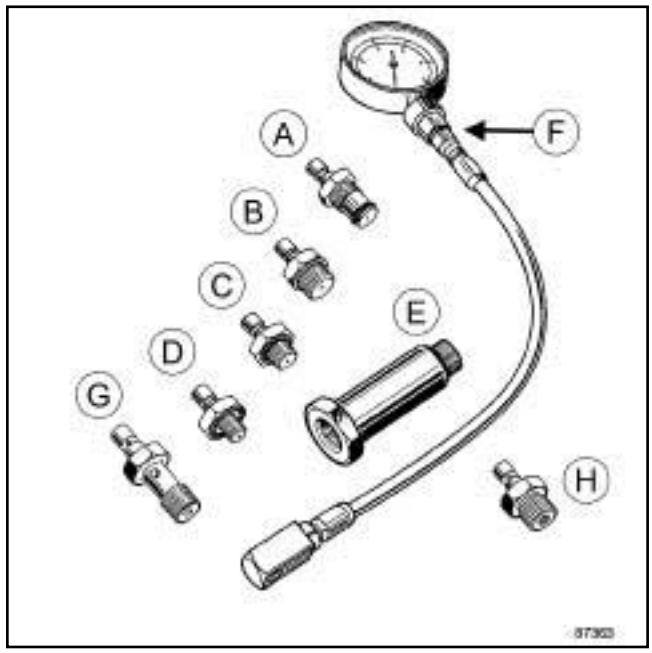
Engine	End pieces
D4D, D4F	**C + F**
K4M, K7J, K7M, K9K	**E + C + F**

I - REMOVAL PREPARATION OPERATION

❑

WARNING
Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).



Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When topping up the engine oil, always leave at least **10 minutes** before checking the level with a dipstick.

II - CHECK

❑ Remove the oil pressure sensor (see **10A**, **Engine and cylinder block assembly**, **Oil pressure sensor: Removal - Refitting**, page **10A-42**) .

87363

❑ In place of the oil pressure sensor, fit thewith suitable adapters using theor a **22 mm** long socket.

❑ Start the vehicle.

❑ Monitor the engine oil pressure as the oil temperature rises (approximately **80°C** or the first time the engine cooling fan is activated); it should not be less than the pressure at idle speed.

❑ If the oil pressure is lower than the pressure at idle speed, check that:

- the oil filter is not clogged,
- dirt or swarf is not present in the engine oil,
- the oil pump is in good condition and being correctly driven.

❑ Check the oil pressure in comparison with the values given in the table above.

❑ Switch off the engine.

❑ Remove thewith the end pieces.

❑ Refit the oil pressure sensor (see **10A**, **Engine and cylinder block assembly**, **Oil pressure sensor: Removal - Refitting**, page **10A-42**) .

❑ Wipe any oil run-off with a cloth.

❑ Wait at least **10 minutes**.

❑ Check the oil level using the dipstick.

Oil pressure: Check

K4M or K9K

- ❏ Top up the engine oil level if necessary (see **Engine oil: Specifications**) .
- ❏ Start the vehicle and check that there are no oil leaks at the oil pressure sensor.

Tightening torques ▽	
multifunction support bolts on the cylinder block	**44 N.m**
lower bolt of the multifunction support on the sump	**25 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch side liner,
- the injector rail protector,
- the engine undertray bolts,
- the engine undertray.

❏ Remove the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

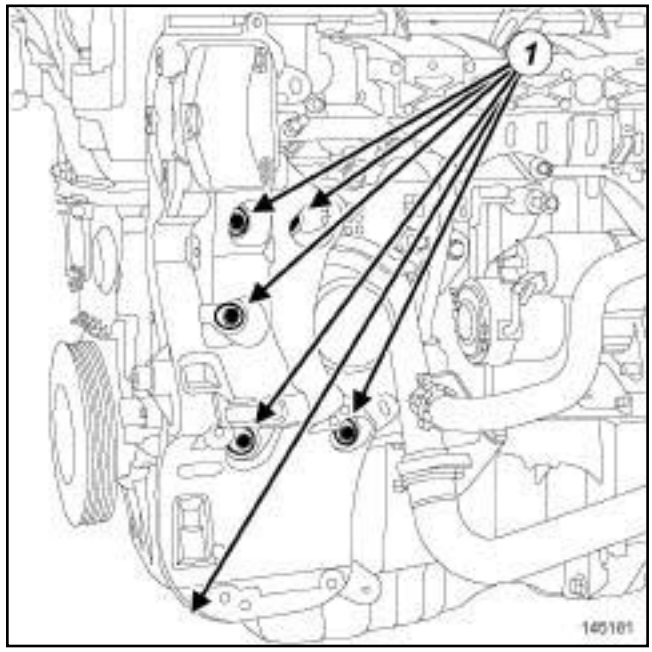
❏ Disconnect fuel supply pipe on the injector rail.

❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) .

❏ Remove (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the bolt from the power-assisted steering high pressure pipe on the cylinder block,
- the bolts from the power-assisted steering pump on the multifunction support (without opening the circuit).



❏ Attach the power-assisted steering pump to the front end panel.

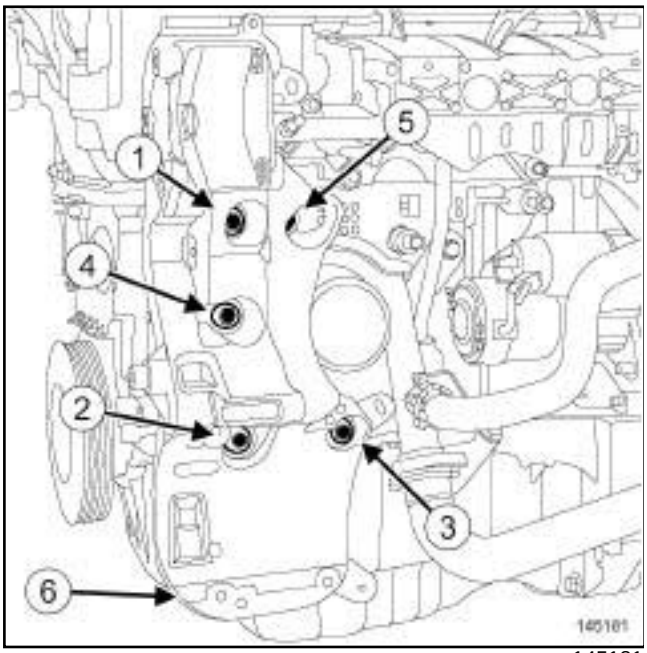
❏ Disconnect the connector from the air conditioning compressor.

❏ Remove the air conditioning compressor bolts (without opening the circuit) (see **Compressor: Removal - Refitting**) (62A, Air conditioning).

❏ Attach the air conditioning compressor to the subframe.

II - REMOVAL OPERATION

145181



❏ Remove:

- the multifunction support bolts (**1**) ,
- the multifunction support.

K4M, and POWER ASSISTED STEERING, and AIR CONDITIONING

REFITTING

I - REFITTING OPERATION

145181

❑ Refit the multifunction support.

❑ Position bolts (**1**) to (**6**) without tightening them.

❑ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.

❑ Loosen bolts (**1**) and (**2**) of the multifunction support by one half-turn.

❑ Pretighten the multifunction support bolt (**6**) on the sump **5 N.m**.

❑ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.

❑ Pretighten in order (**3**) , (**4**) , (**5**) , (**6**) the multifunction support bolts on the cylinder block (**5 N.m**).

❑ Torque tighten in order (**1**) , (**2**) , (**3**) , (**4**) , (**5**) the **multifunction support bolts on the cylinder block (44 N.m)**.

❑ Torque tighten the **lower bolt of the multifunction support on the sump (25 N.m)** (**6**) .

II - FINAL OPERATION

❑ Refit the air conditioning compressor (see **Compressor: Removal - Refitting**) (62A, Air conditioning).

❑ Connect the air conditioning compressor connector.

❑ Refit (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the power-assisted steering pump,
- the bolt of the power-assisted steering high pressure pipe on the cylinder block.

❑ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

❑ Connect the fuel supply pipe on the injector rail.

❑ Refit the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

❑ Refit:

- the engine undertray,
- the injector rail protector.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M, and STANDARD HEATING RECIRCULATION

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

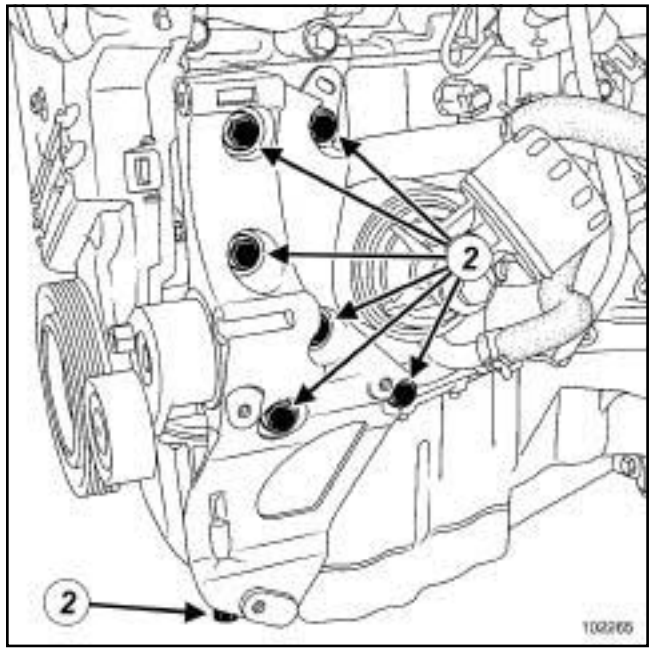
❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch side liner,
- the engine undertray bolts,
- the engine undertray.

❏ Remove the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) .



POWER ASSISTED STEERING

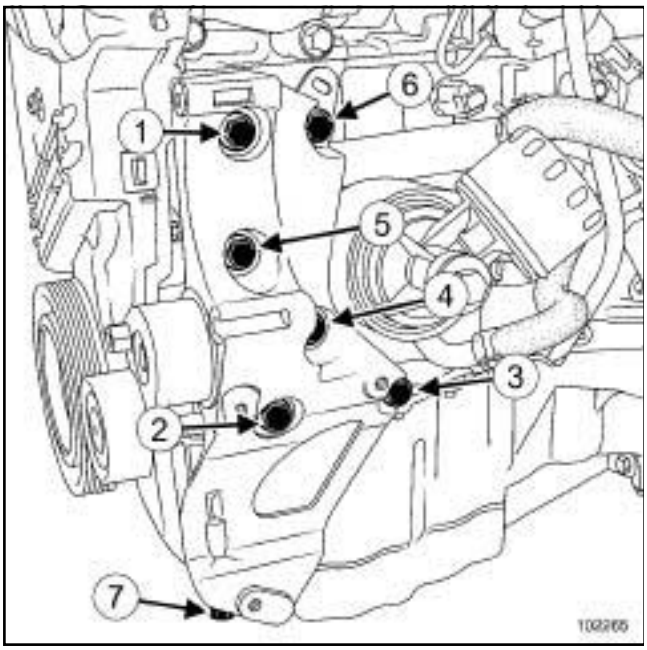
❏ Remove (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the power-assisted steering pump bolts,
- the high pressure pipe bolt on the cylinder block.

❏ Attach the power-assisted steering pump to the front end panel.

II - REMOVAL OPERATION

102265



❏ Remove:

- the multifunction support bolts (**2**) ,
- the multifunction support.

K4M, and STANDARD HEATING RECIRCULATION

REFITTING

I - REFITTING OPERATION

102265

❏ Refit the multifunction support.

❏ Position bolts (**1**) to (**7**) without tightening them.

❏ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.

❏ Loosen bolts (**1**) and (**2**) a half-turn.

❏ Pretighten the multifunction support bolt (**7**) on the sump **5 N.m**.

❏ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.

❏ Pretighten the multifunction support bolts (**3**) , (**4**) , (**5**) , (**6**) on the cylinder block **5 N.m**.

❏ Torque tighten in order **(1), (2), (3), (4), (5), (6)** the **multifunction support bolts on the cylinder block (44 N.m)**.

❏ Torque tighten the **multifunction support bolt on the sump (25 N.m)** (**7**) .

II - FINAL OPERATION

POWER ASSISTED STEERING

❏ Refit (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the power-assisted steering pump,
- the power-assisted steering pump bolts,
- the high pressure pipe bolt on the cylinder block.

❏ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

❏ Refit the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

❏ Refit the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Tightening torques ▽

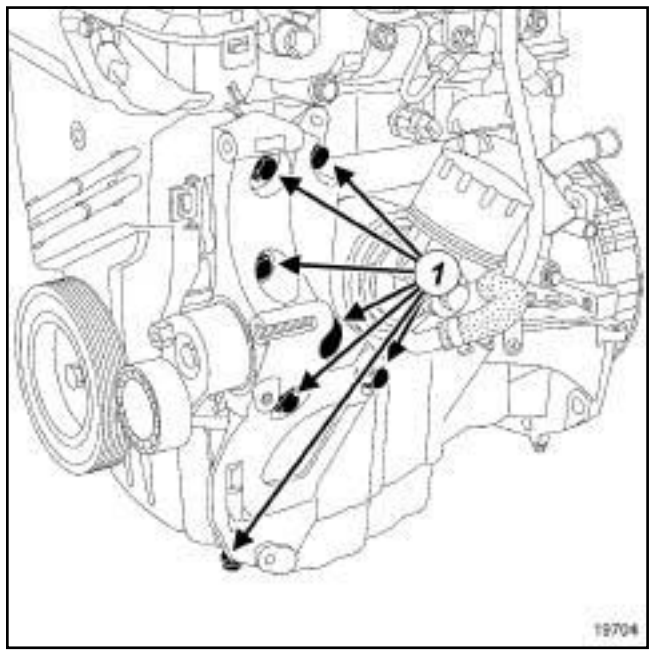
POWER ASSISTED STEERING, and STANDARD HEATING RECIRCULATION

❑ Remove the bolts from the power-assisted steering pump on the multifunction support (without opening the circuit) (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering).

❑ Attach the power-assisted steering pump to the front end panel.

AIR CONDITIONING



❑ Disconnect the air conditioning compressor connector.

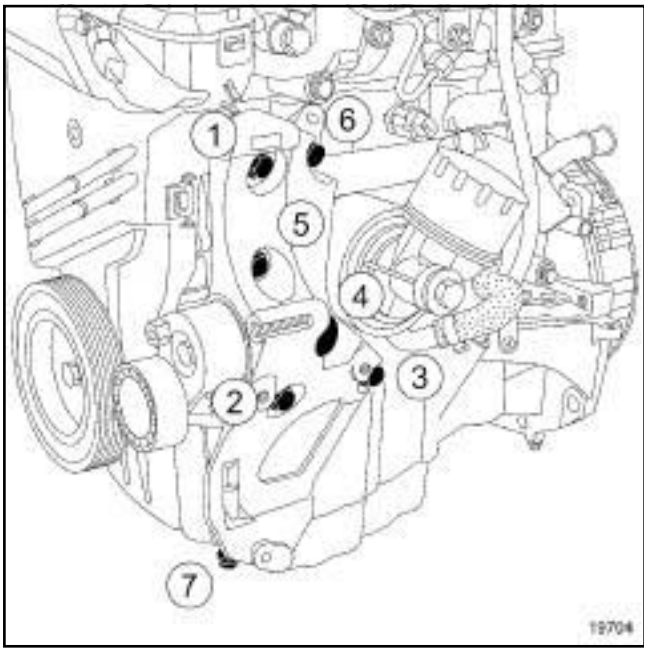
❑ Remove the air conditioning compressor bolts (without opening the circuit) (see **Compressor: Removal - Refitting**) (62A, Air conditioning).

❑ Attach the air conditioning compressor to the lower front cross member.

❑ Unpick the wiring harness on the multifunction support.

II - REMOVAL OPERATION

19704



❑ Remove:

- the multifunction support bolts (**1**) ,
- the multifunction support.

K9K

REFITTING

REFITTING OPERATION

19704

- ❏ Refit the multifunction support.
- ❏ Position bolts (**1**) to (**7**) without tightening them.
- ❏ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.
- ❏ Loosen bolts (**1**) and (**2**) a half-turn.
- ❏ Pretighten the multifunction support bolt (**7**) on the sump **5 N.m**.
- ❏ Pretighten the multifunction support bolts (**1**) and (**2**) on the cylinder block **5 N.m**.
- ❏ Pretighten the multifunction support bolts (**3**) , (**4**) , (**5**) , (**6**) on the cylinder block **5 N.m**.
- ❏ Torque tighten in order (**1**) , (**2**) , (**3**) , (**4**) , (**5**) , (**6**) the **multifunction support bolts on the cylinder block (44 N.m)**.
- ❏ Torque tighten the **multifunction support bolt on the sump (25 N.m)** (**7**) .
- ❏ Proceed in the reverse order to removal.

K4M

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
nut on the rubber pad support of the left-hand suspended engine mounting	**62 N.m**
exhaust flange bolts	**21 N.m**
front axle subframe tie-rod upper bolts	**21 N.m**
anti-roll bar tie rod upper bolts	**37 N.m**
earth strap bolt on the gearbox	**21 N.m**
power-assisted steering low pressure pipe bolt on the front axle sub-frame	**21 N.m**
power-assisted steering pipe bolts on the gear-box support	**21 N.m**
power-assisted steering pipe bolts on the gear-box	**21 N.m**
power-assisted steering pipe bolt on the cylinder block	**21 N.m**

IMPORTANT
Wear cut-resistant gloves during the operation.

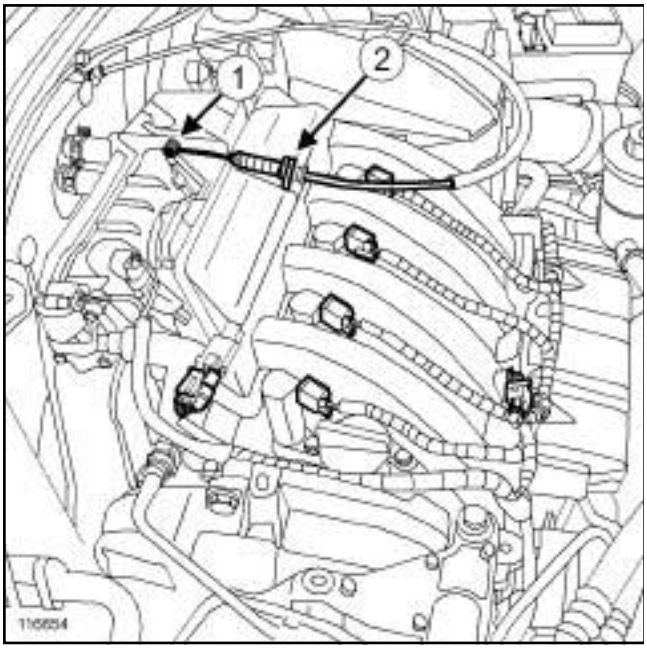
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑

IMPORTANT
To prevent the vehicle from falling, lash it to the vehicle lift using a strap.

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

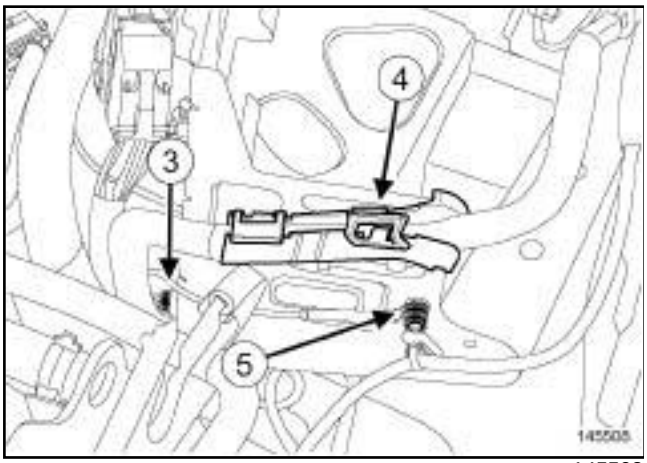


AIR CONDITIONING

❑ Drain the refrigerant circuit using the tool **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❑ Remove:

- the air inlet sleeve,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the injector rail protector,
- the battery tray,
- the injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-7**) .

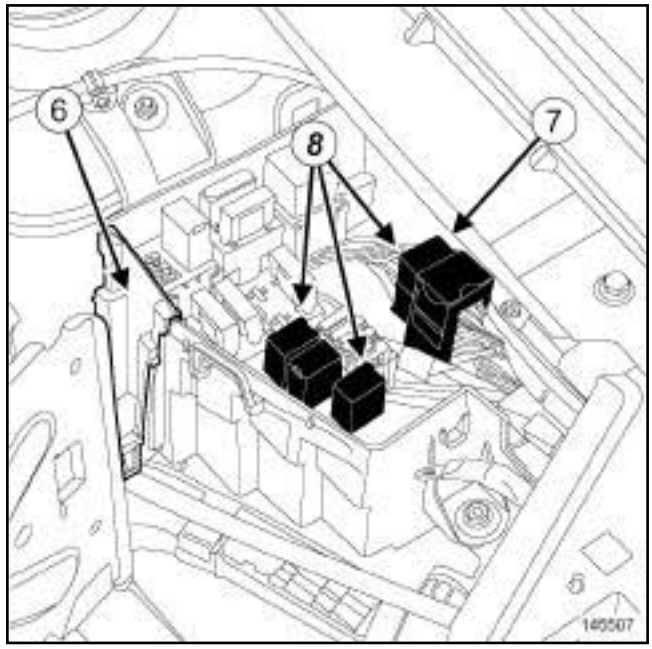


K4M

116654

❏ Disconnect the accelerator cable on the throttle valve at (**1**) .

❏ Remove the accelerator cable from the inlet distributor at (**2**) .



145508

❏ Remove the engine wiring bolt (**3**) on the battery mounting.

❏ Unclip the battery wiring at (**4**) .

❏ Remove the earth strap bolt (**5**) on the battery mounting.

145507

❏ Remove the fuse and relay box cover.

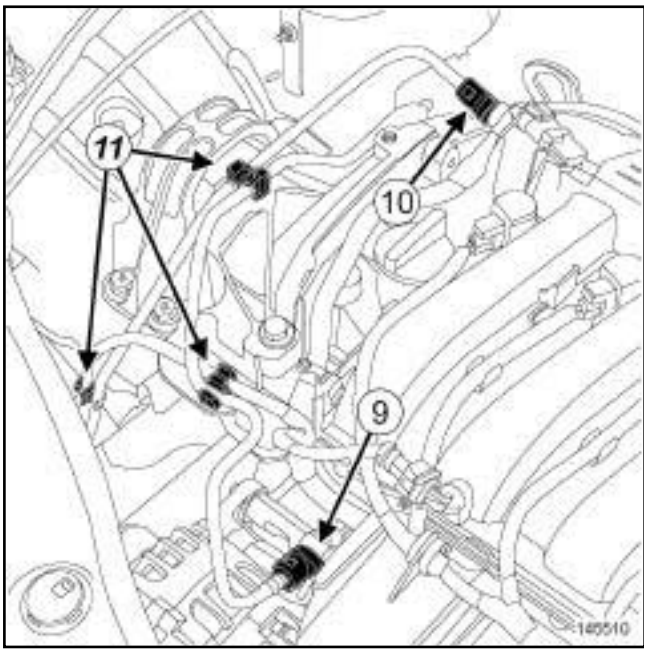
❏ Remove the side protector (**6**) of the fuse and relay box.

❏ Disconnect the engine harness - front wiring connector (**7**) .

❏ Unclip the engine harness fuse holders and relays (**8**) from their mountings on the fuse and relay box in the engine compartment.

❏ Position the engine harness, fuses and relays on the engine.

❏ Remove:



- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray bolts,
- the engine undertray,
- the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection),
- the front wheel arch liners (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

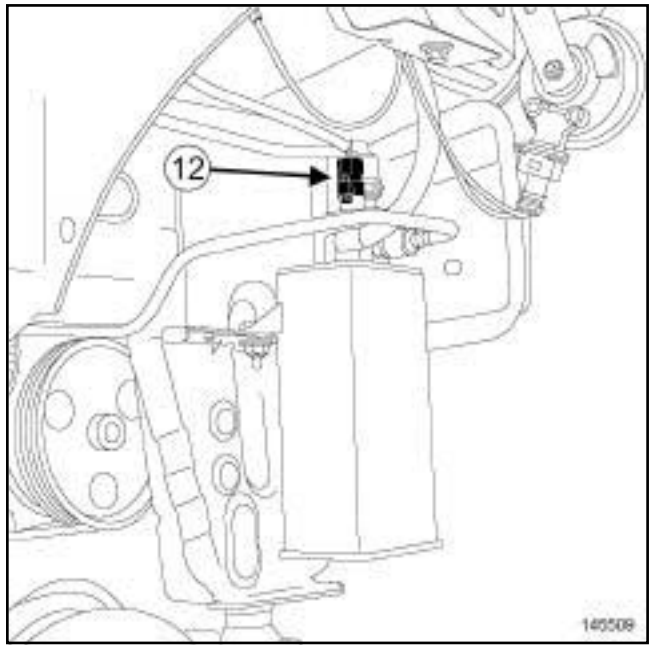
❏ Drain:

- the engine oil if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) ,
- the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),

K4M

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

145510



❏ Disconnect:

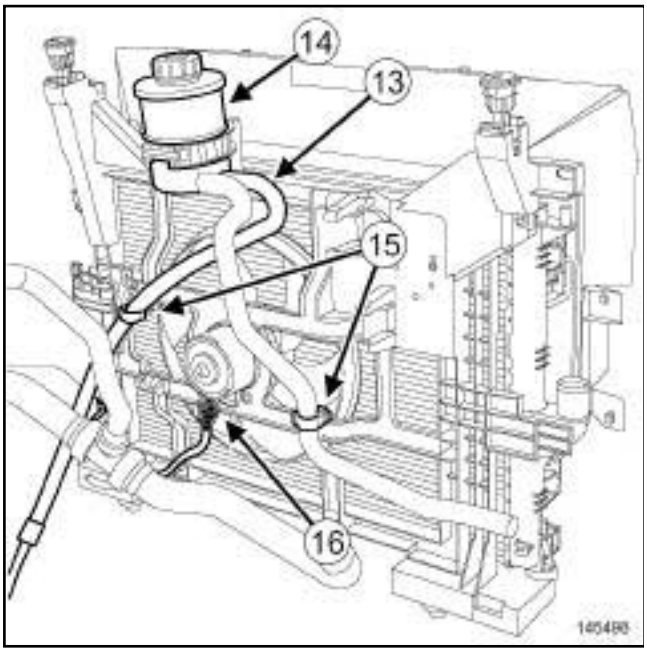
- the fuel supply pipe (**9**) on the injector rail,
- the petrol vapour rebreather pipe (**10**) .

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❏ Fit blanking plugs on the fuel supply pipe.

❏ Unclip the pipes at (**11**) .

145509



❏ Disconnect the connector (**12**) from the fuel vapour recirculation solenoid valve.

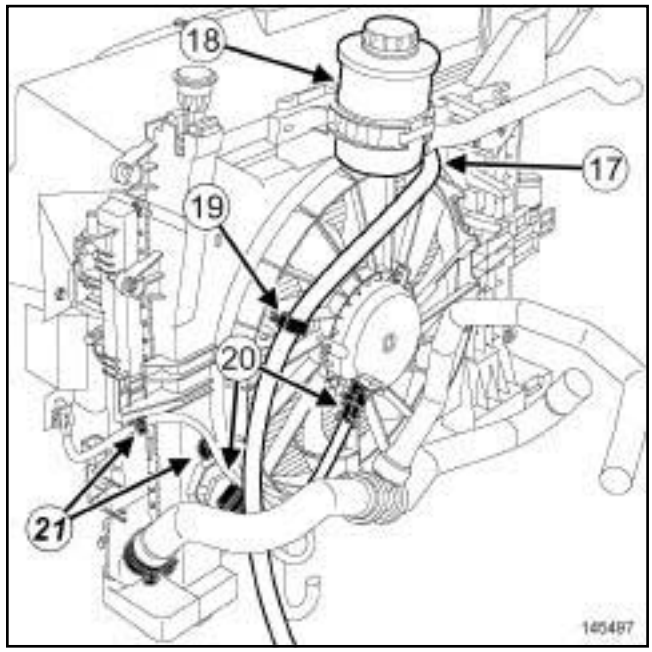
❏ Disconnect (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the power-assisted steering low pressure hose on the power-assisted steering pump using the **(Mot. 1448)** and drain the circuit,
- the power-assisted steering high pressure pipe on the power-assisted steering pump,
- the connector from the power-assisted steering pressure switch.

K4M

STANDARD HEATING RECIRCULATION

145498



❏ Remove:

- the power-assisted steering low pressure pipe (**13**) on the oil reservoir using the **(Mot. 1448)**,
- the power assisted steering oil reservoir (**14**) ,
- the bolt of the power-assisted steering high pressure pipe on the cylinder block.

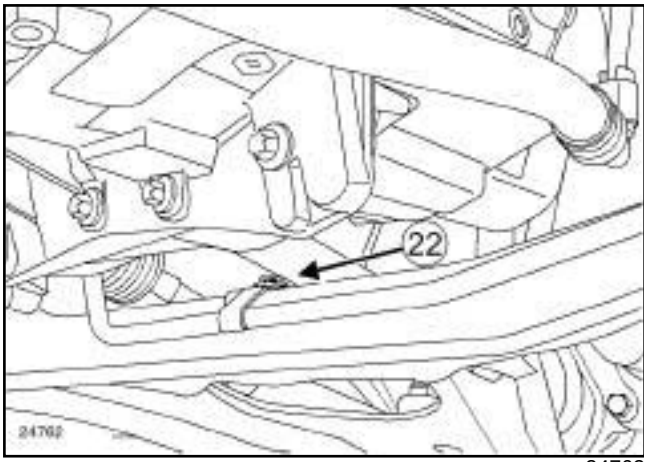
❏ Unclip the power-assisted steering pipes on the fan assembly mounting at (**15**) .

❏ Disconnect the fan assembly connector (**16**) .

AIR CONDITIONING

145497

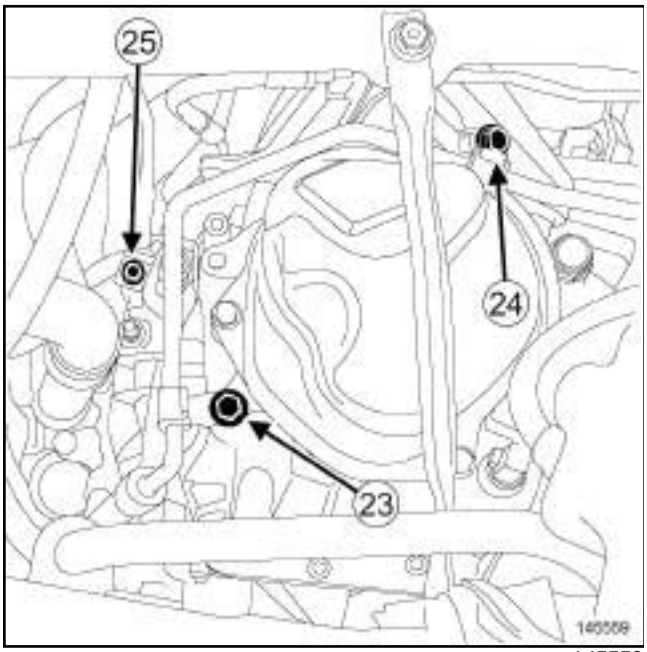
❏ Remove:



- the power-assisted steering low pressure pipe (**17**) on the oil reservoir using the **(Mot. 1448)**,
- the power assisted steering oil reservoir (**18**) ,
- the bolt of the power-assisted steering high pressure pipe on the cylinder block.

❏ Unclip the power-assisted steering pipes on the fan assembly mounting at (**19**) .

❏ Disconnect the connectors (**20**) from the fan assembly.



❏ Unclip the fan assembly wiring at (**21**) .

K4M

24762

❏ Remove the power-assisted steering low pressure pipe bolt (**22**) on the front axle subframe.

145559

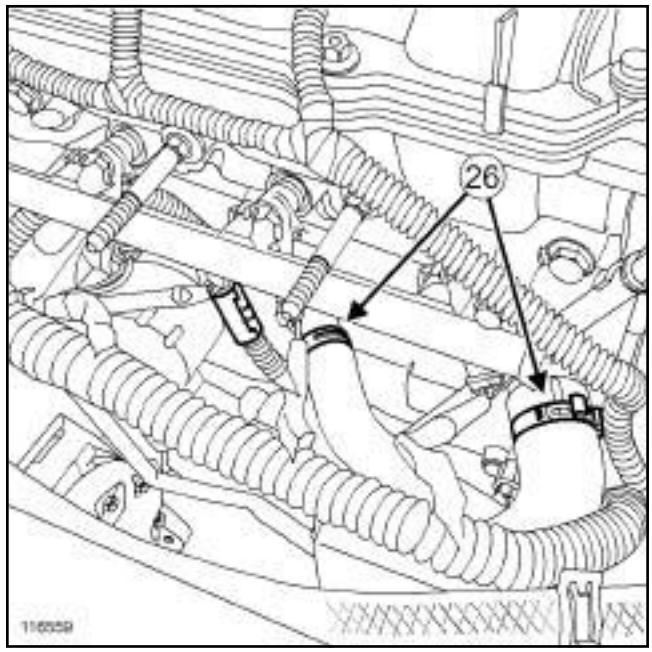
❏ Remove:

- the power-assisted steering high pressure pipe bolt (**23**) on the gearbox,
- the power-assisted steering high pressure pipe bolt (**24**) on the gearbox support,
- the earth strap bolt (**25**) on the gearbox.

AIR CONDITIONING

❏ Remove (see **Compressor: Removal - Refitting**) (62A, Air conditioning):

- the pipe retaining bracket bolt on the compressor,
- the pipe union bolts on the compressor.



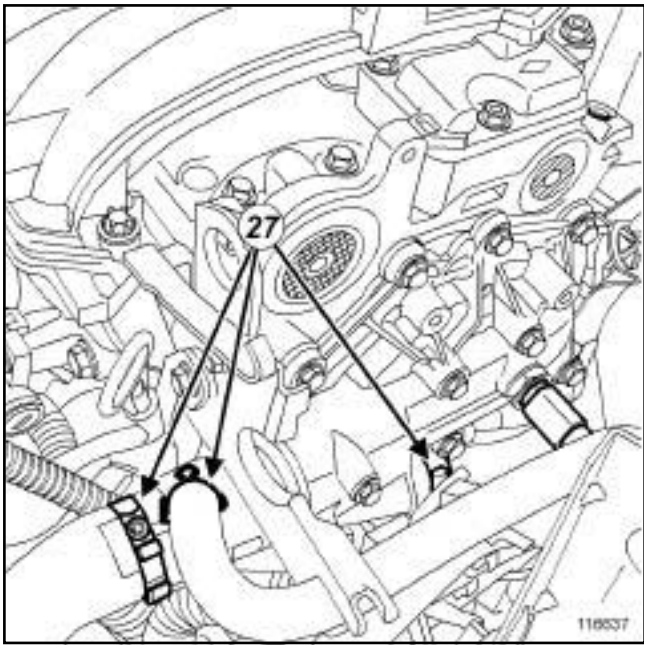
Note:

Plugs must be fitted on the hoses to prevent moisture from entering the system.

❏ Disconnect the compressor pipes.

❏ Fit blanking plugs in the pipe openings.

❏ Disconnect the air conditioning pressostat connector.



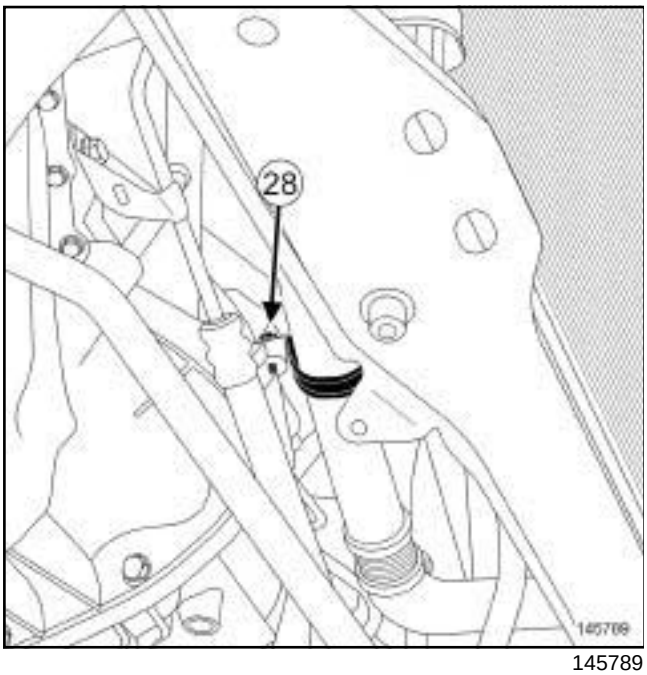
116559

❏ Move aside the cooling hose clips (**26**) on the coolant pump inlet pipe using the **(Mot. 1448)**.

❏ Disconnect:

- the cooling hoses on the coolant pump inlet pipe,
- the vacuum pipe on the inlet distributor chamber.

K4M



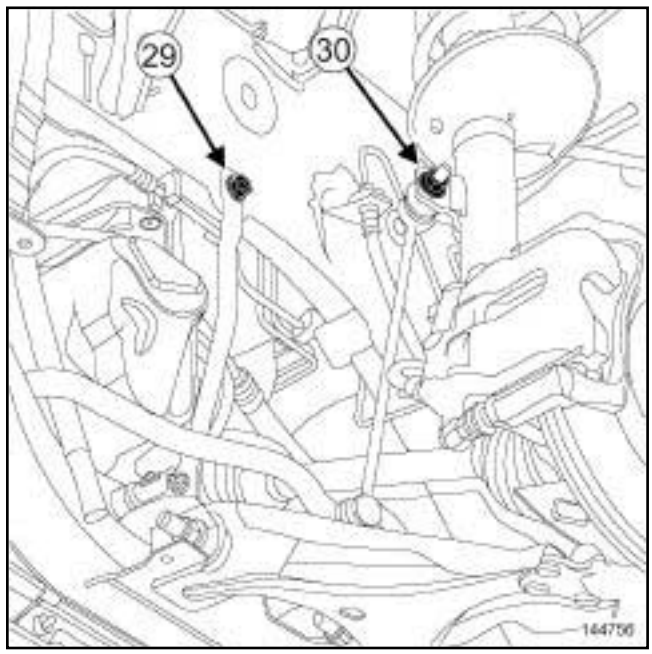
116637

❑ Move aside the clips (**27**) of the coolant hoses on the water chamber using the **(Mot. 1448)**.

❑ Disconnect the cooling hoses from the water chamber.

❑ Unclip the downstream oxygen sensor wiring on the steering box heat shield.

❑ Disconnect the downstream oxygen sensor connector.



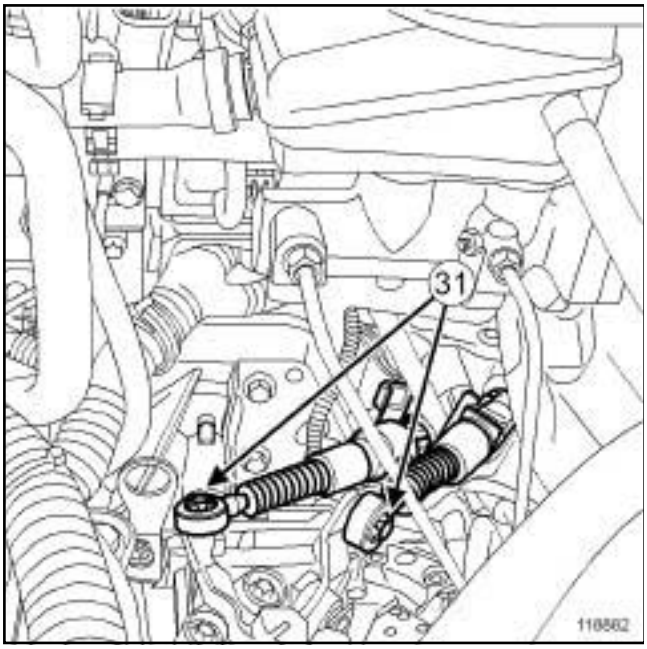
145789

❑ Remove the cooling pipe support bolt (**28**) on the sump.

❑ Remove (see) (36A, Steering assembly):

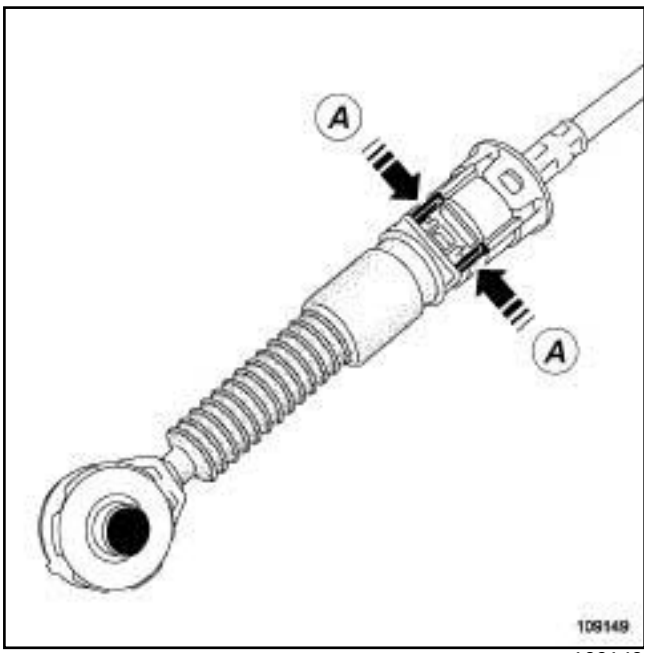
- the heat shield bolts on the steering box,
- the steering box heat shield,
- the steering box bolts on the front axle subframe.

❑ Attach the steering rack to the body.



144756

❑ Remove:

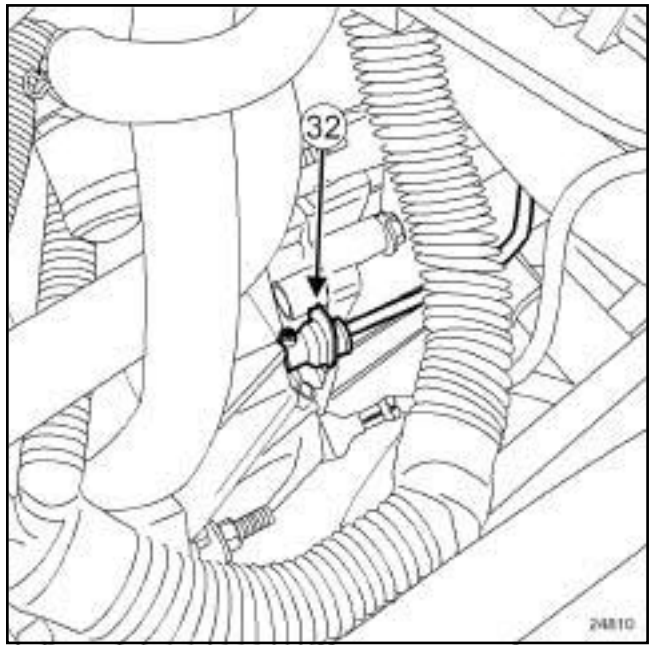


- the front axle subframe tie-rod upper bolts (**29**) ,
- the anti-roll bar tie rod upper bolts (**30**) ,
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshaft),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Transmission).

❑ Pass the power-assisted steering low pressure pipe over the gearbox cover.

K4M

118882



109149

❑ Unclip:

- the gear control cables on the gearbox at (**31**) using a screwdriver,
- the gear control cables from the sleeve stops by pressing at (**A**) .

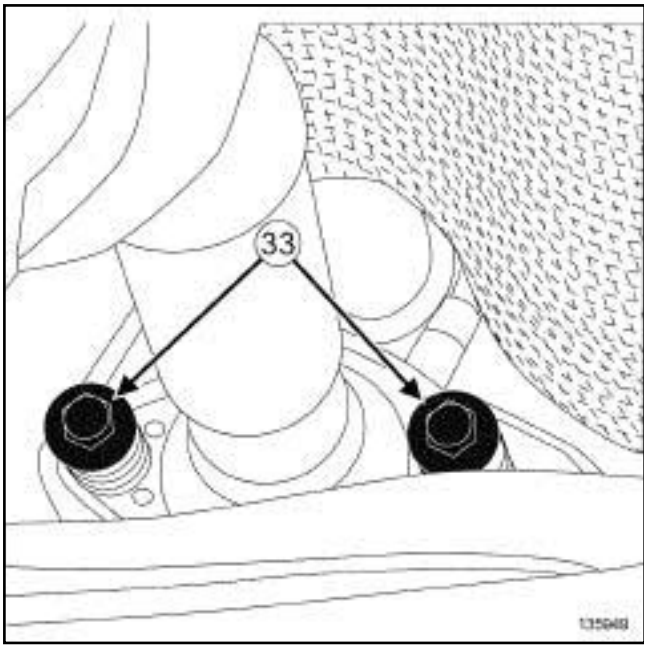
❑ Move the gear control cables away from the gearbox.

24810

❑

WARNING

Do not pull the clip. If it is incorrectly handled in any way, the pipe will need to be replaced.



❑ Disconnect the clutch control pipe on the clutch slave cylinder by pressing the clip (**32**) .

❑ Recover the brake fluid in a container.

❑ Fit blanking plugs on the pipe openings.

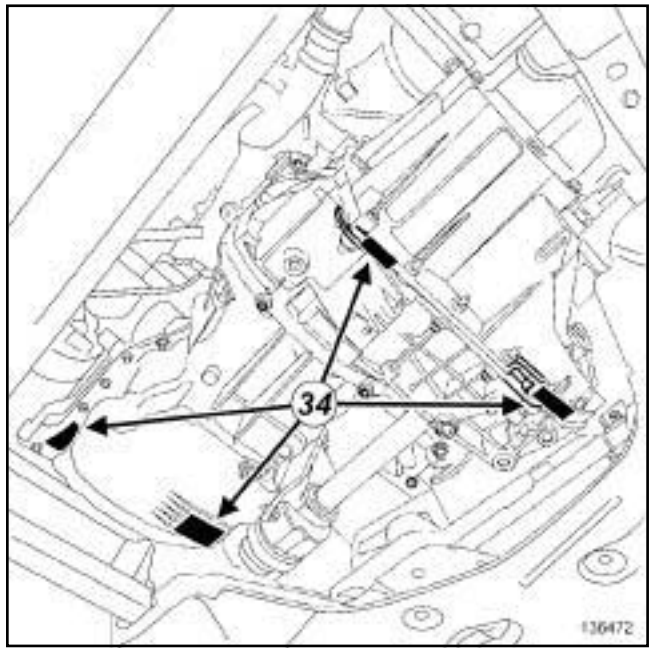
❑ Remove the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

K4M

135949

❏ Remove:

- the bolts (**33**) from the exhaust flange,
- the exhaust bracket ring.



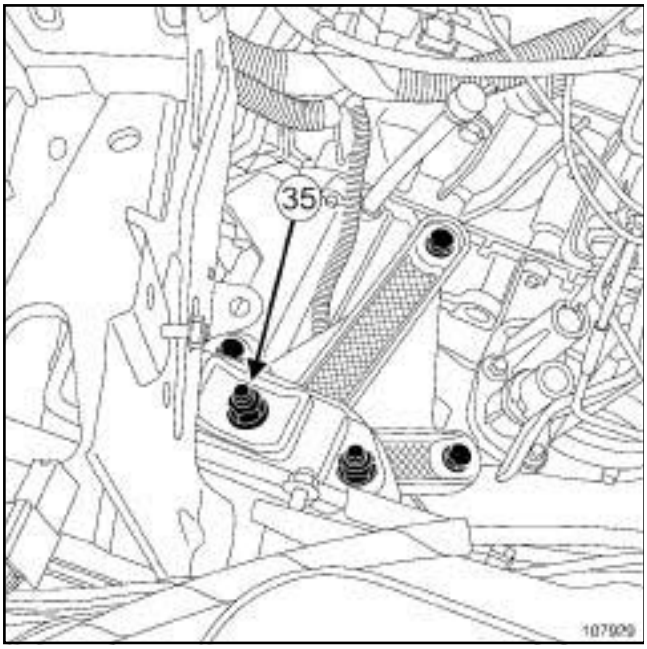
❏ Move aside the exhaust pipe.

Note:

Pull the exhaust pipe backwards.

❏ Remove the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).

II - REMOVAL OPERATION

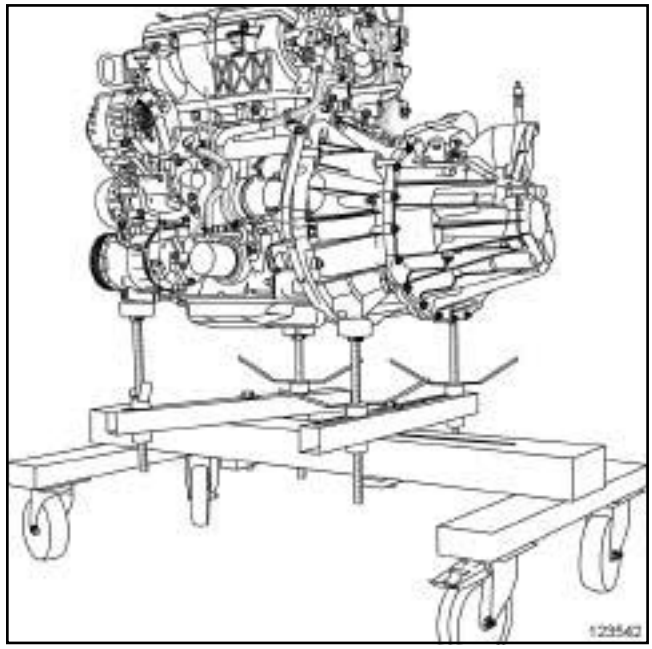


136472

❏ Mark the positions of the suspended engine mountings on the body.

❏ Support the engine - gearbox assembly on the engine marks (**34**) using the **(Mot. 1390)**.

❏ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) .



K4M

107929

❑ Remove the nut (**35**) on the rubber pad support of the left-hand suspended engine mounting.

❑ Strike the gearbox stud with a copper hammer to separate the engine - gearbox assembly from the body.

123542

❑ Lift the vehicle to remove the engine - gearbox assembly.

Note:

Ensure that no component obstructs the movement of the body around the engine - gearbox assembly.

❑ Remove the engine - gearbox assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Engine: Standard replacement**) (Technical Note 6006A, 10A, Engine and peripherals).

❑ **parts always to be replaced: ring between exhaust manifold and catalytic converter**

II - REFITTING OPERATION

❑ Fit the engine - gearbox assembly.

❑ Refit the nut on the rubber pad support of the left-hand suspended engine mounting.

❑ Torque tighten the **nut on the rubber pad support of the left-hand suspended engine mounting (62 N.m)**.

❑ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) .

K4M

❑ Remove the **(Mot. 1390)** from the engine - gearbox assembly.

III - FINAL OPERATION

❑ Proceed in the reverse order to removal.

❑ Torque tighten:

- the **exhaust flange bolts (21 N.m)**,
- the **front axle subframe tie-rod upper bolts (21 N.m)**,
- the **anti-roll bar tie rod upper bolts (37 N.m)**,
- the **earth strap bolt on the gearbox (21 N.m)**,
- the **power-assisted steering low pressure pipe bolt on the front axle subframe (21 N.m)**,
- the **power-assisted steering pipe bolts on the gearbox support (21 N.m)**,
- the **power-assisted steering pipe bolts on the gearbox (21 N.m)**,
- the **power-assisted steering pipe bolt on the cylinder block (21 N.m)**.

❑ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) ,
- fill up the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- fill and bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) ,
- bleed the clutch circuit (see **Clutch circuit: Bleed**) (37A, Mechanical component controls).

AIR CONDITIONING

❑ Fill the refrigerant circuit using the tool **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❑ Fill up the power-assisted steering circuit.

❑ First, bleed the power-assisted steering circuit by turning the steering wheel fully from left to right with the engine off.

❑ Bleed the power-assisted steering circuit by turning the steering wheel fully from lock to lock with the engine running.

❑ Top up the oil in the power-assisted steering oil reservoir.

❑ Check that there are no leaks.

K9K, and 796

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
nut on the rubber pad support of the left-hand suspended engine mounting	**62 N.m**
exhaust flange bolts	**21 N.m**
front axle subframe tie-rod upper bolts	**21 N.m**
anti-roll bar tie rod upper bolts	**37 N.m**
earth strap bolt on the gearbox	**21 N.m**
power-assisted steering low pressure pipe bolt on the front axle sub-frame	**21 N.m**
power-assisted steering pipe bolts on the gear-box support	**21 N.m**
power-assisted steering pipe bolts on the gear-box	**21 N.m**
power-assisted steering pipe bolt on the cylinder block	**21 N.m**

IMPORTANT
Wear cut-resistant gloves during the operation.

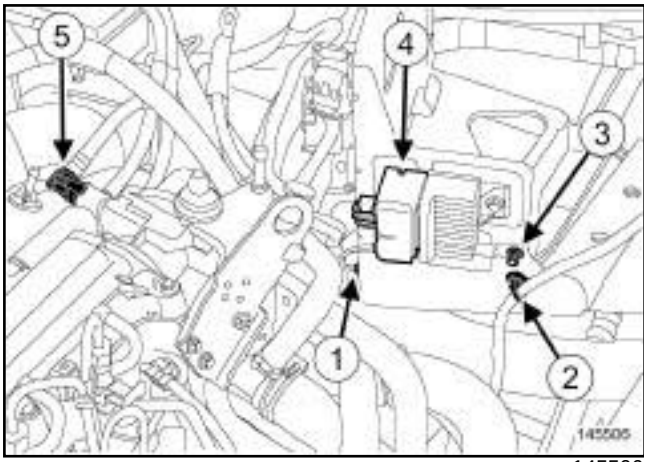
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑

IMPORTANT
To prevent the vehicle from falling, lash it to the vehicle lift using a strap.

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



AIR CONDITIONING

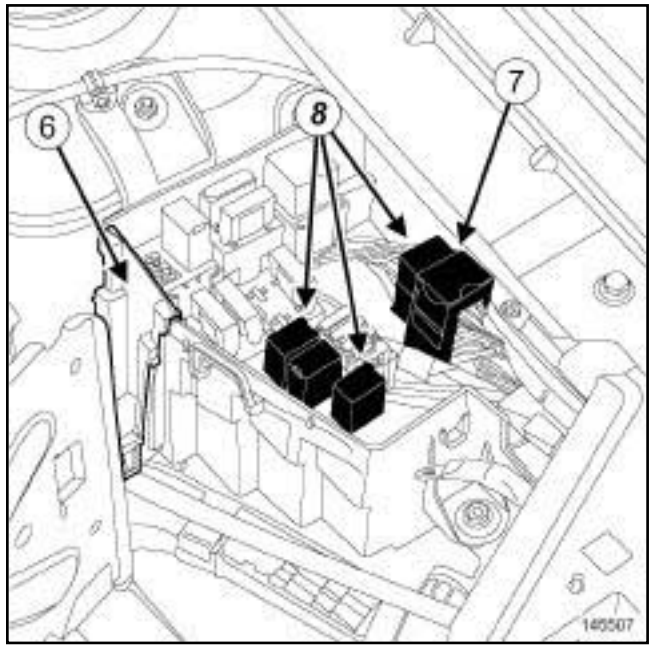
❑ Drain the refrigerant circuit using the tool **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❑ Remove:

- the engine cover,
- the air inlet sleeve,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray,
- the injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-7**) .

K9K, and 796

145506



❏ Remove the engine wiring bolt (**1**) on the battery mounting.

❏ Unclip the battery wiring at (**2**) .

❏ Remove the earth strap bolt (**3**) on the battery mounting.

❏ Disconnect the connector (**4**) from the pre-postheating unit.

❏ Disconnect the non-return valve (**5**) at the vacuum pump.

145507

❏ Remove the fuse and relay box cover.

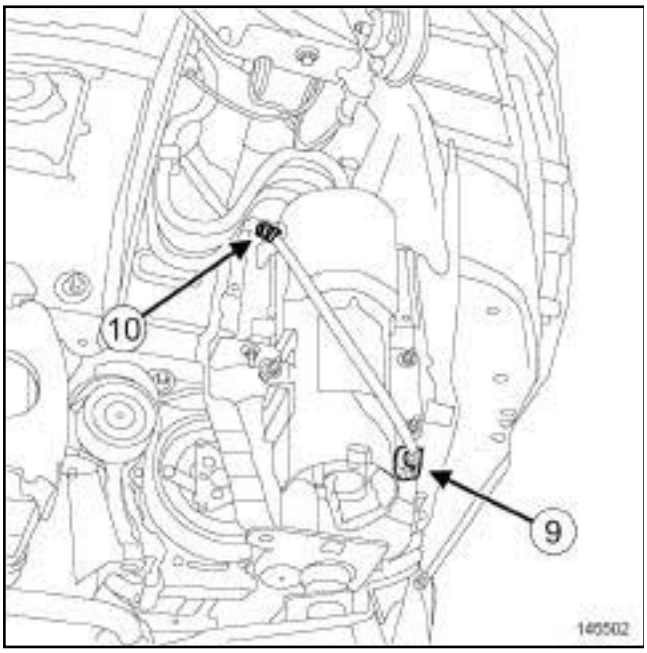
❏ Remove the side protector (**6**) of the fuse and relay box.

❏ Disconnect the engine harness - front wiring connector (**7**) .

❏ Unclip the engine harness fuse holders and relays (**8**) from their mountings on the fuse and relay box in the engine compartment.

❏ Position the engine harness, fuses and relays on the engine.

❏ Remove:

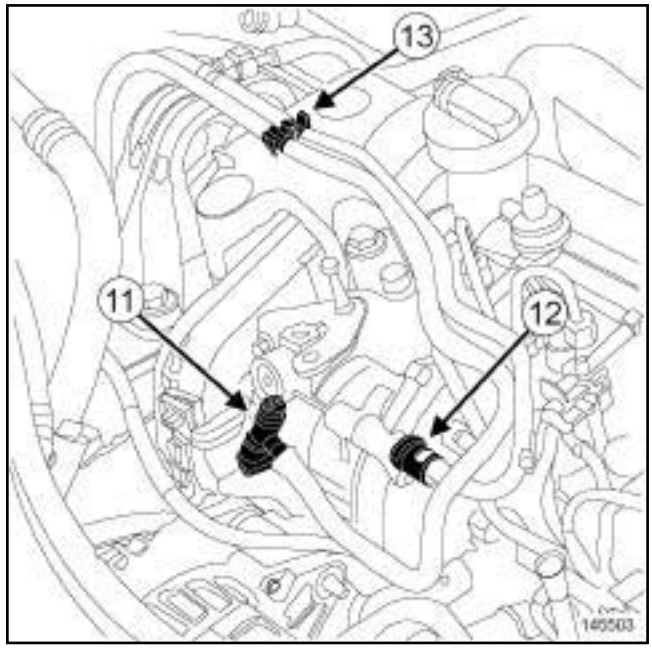


- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray bolts,
- the engine undertray,
- the front bumper (see **Front bumper assembly: Exploded view**) and (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection),
- the front wheel arch liners (see **Exterior body front trim assembly: Exploded view**) (55A, Exterior protection).

❏ Drain:

- the engine oil if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) ,
- the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),

K9K, and 796



- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

145502

❑ Disconnect the connector (**9**) from the water detection sensor on the diesel filter.

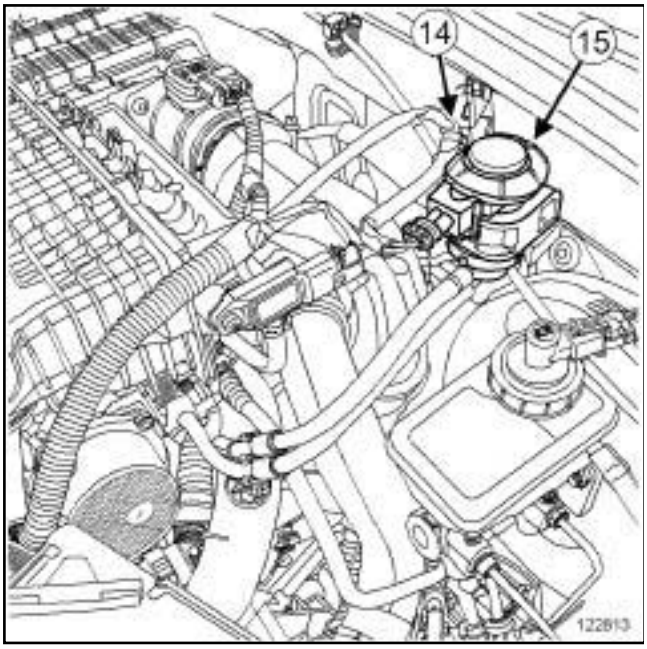
❑ Unclip the water detection connector on the diesel filter mounting at (**10**) .

145503

❑ Disconnect:

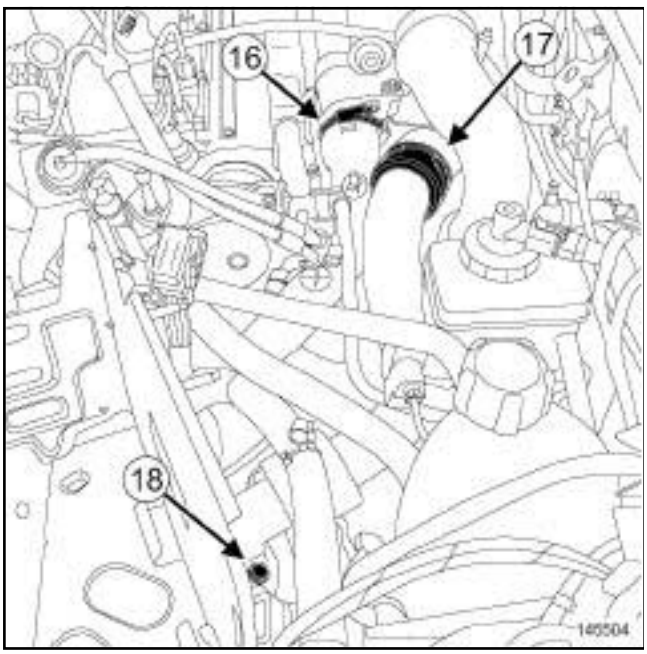
- the fuel supply pipe (**11**) ,
- the fuel return pipe (**12**) .

WARNING



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❑ Fit blanking plugs on the fuel supply pipe.



❑ Unclip the pipes at (**13**) .

❑ Disconnect the intercooler ducts (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-8**) .

K9K, and 796

122813

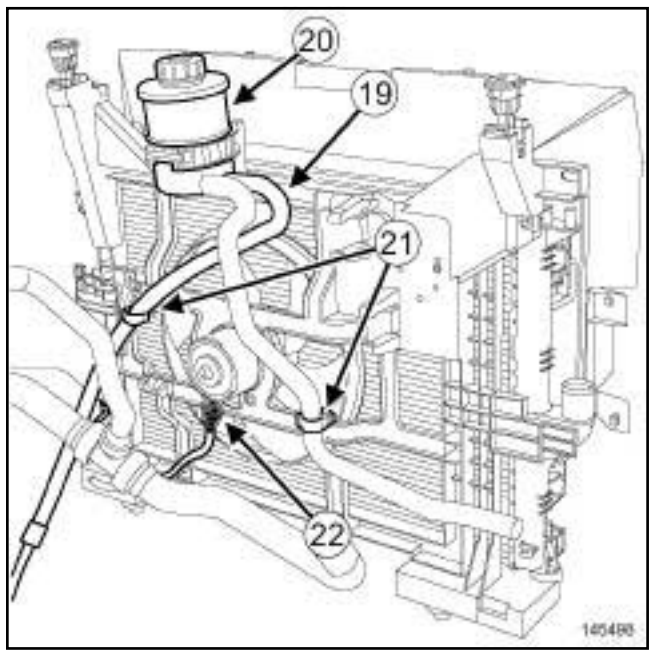
145504

❑ Unclip:

- the turbocharger control solenoid valve wiring at (**14**) ,
- the turbocharger control solenoid valve (**15**) from its support.

❑ Disconnect:

- the air duct (**16**) on the EGR assembly,
- the air duct between the turbocharger and the intercooler at (**17**) .



❑ Remove:

- the air duct nut (**18**) on the gearbox,
- the intercooler air ducts.

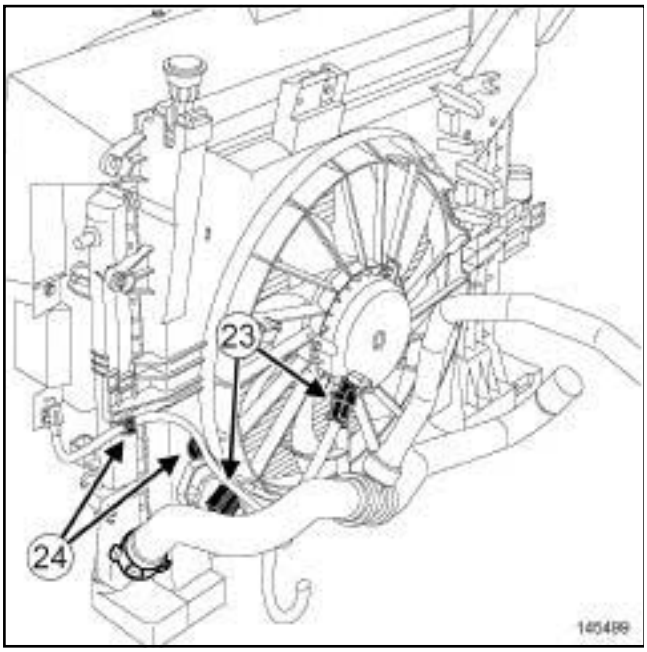
❑ Disconnect (see **Power-assisted steering pump: Removal - Refitting**) (36B, Power-assisted steering):

- the power-assisted steering low pressure hose on the power-assisted steering pump using the **(Mot. 1448)** and drain the circuit,
- the power-assisted steering high pressure pipe on the power-assisted steering pump,
- the connector from the power-assisted steering pressure switch.

STANDARD HEATING RECIRCULATION

145498

❑ Remove:



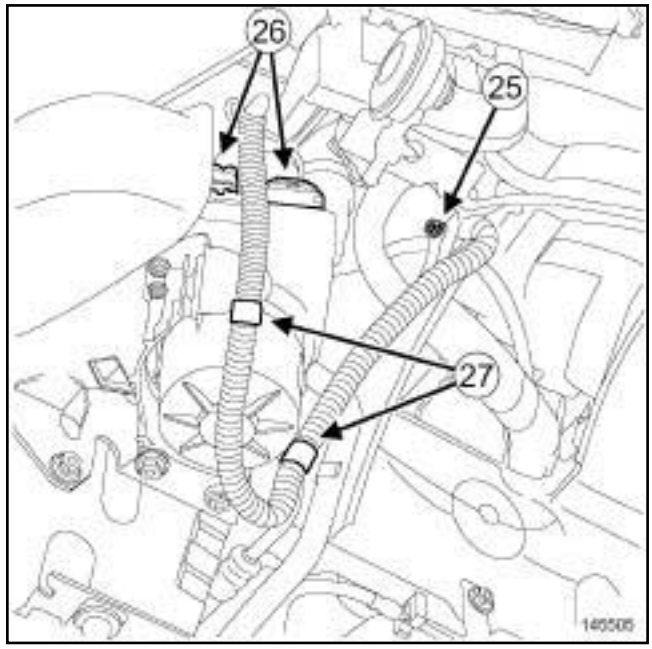
- the power-assisted steering low pressure pipe (**19**) on the oil reservoir using the **(Mot. 1448)**,
- the power assisted steering oil reservoir (**20**) ,
- the bolt of the power-assisted steering high pressure pipe on the cylinder block.

❑ Unclip the power-assisted steering pipes on the fan assembly mounting at (**21**) .

❑ Disconnect the fan assembly connector (**22**) .

K9K, and 796

AIR CONDITIONING

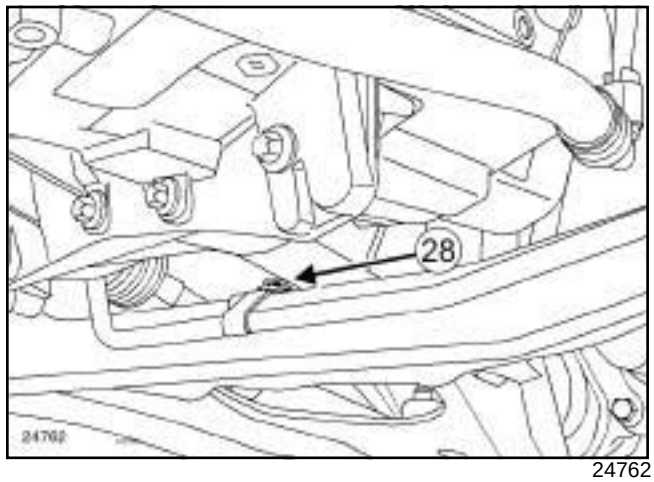


145499

❏ Remove the power-assisted steering high pressure pipe bolt on the cylinder block.

❏ Disconnect the connectors (**23**) from the fan assembly.

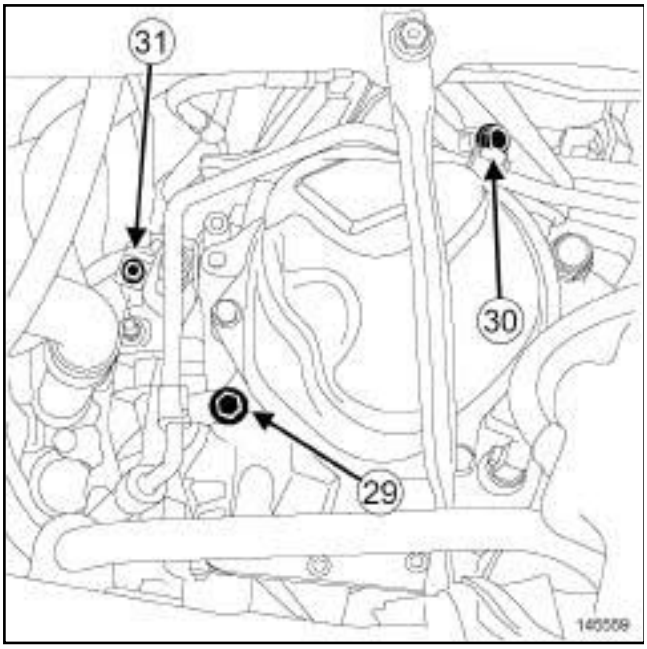
❏ Unclip the fan assembly wiring at (**24**) .



145505

❏ Remove the earth strap bolt (**25**) on the body.

❏ Disconnect the pump assembly connectors (**26**) .



❏ Unclip the pump assembly wiring at (**27**) .

24762

❏ Remove the power-assisted steering low pressure pipe bolt (**28**) on the front axle subframe.

K9K, and 796

145559

❏ Remove:

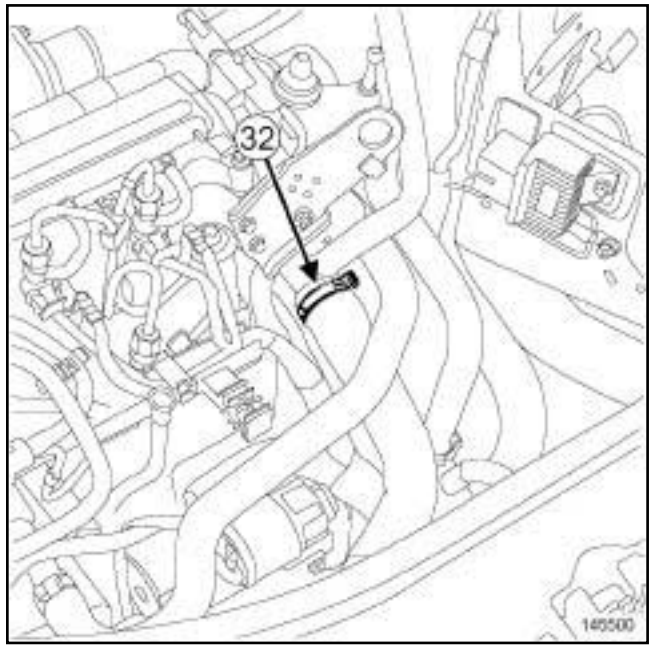
- the power-assisted steering high pressure pipe bolt (**29**) on the gearbox,
- the power-assisted steering high pressure pipe bolt (**30**) on the gearbox support,
- the earth strap bolt (**31**) on the gearbox.

AIR CONDITIONING

❏ Remove the bolts from the pipe unions on the compressor.

❏ Disconnect the compressor pipes.

Note:

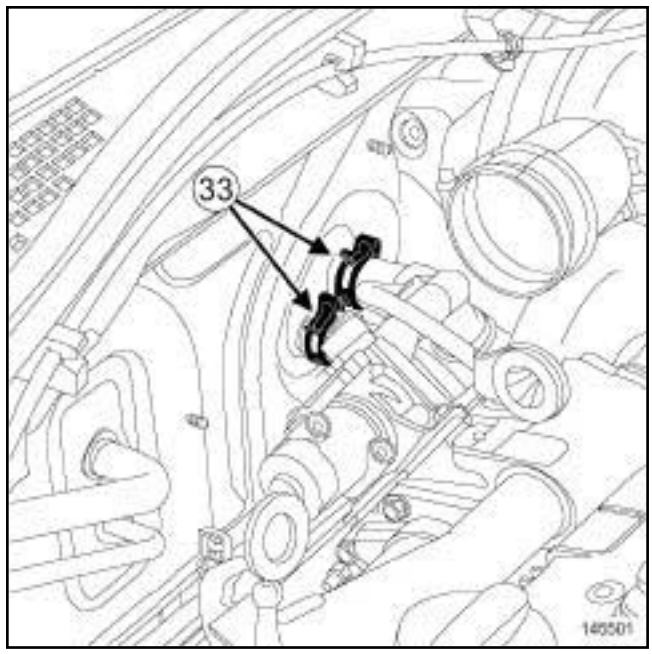


Plugs must be fitted on the hoses to prevent moisture from entering the system.

❏ Fit blanking plugs in the pipe openings.

❏ Disconnect the air conditioning pressostat connector.

❏ Remove the expansion bottle nuts.



❏ Move aside the expansion bottle.

145500

❏ Move aside the cooling hose clip (**32**) on the water chamber using the **(Mot. 1448)**.

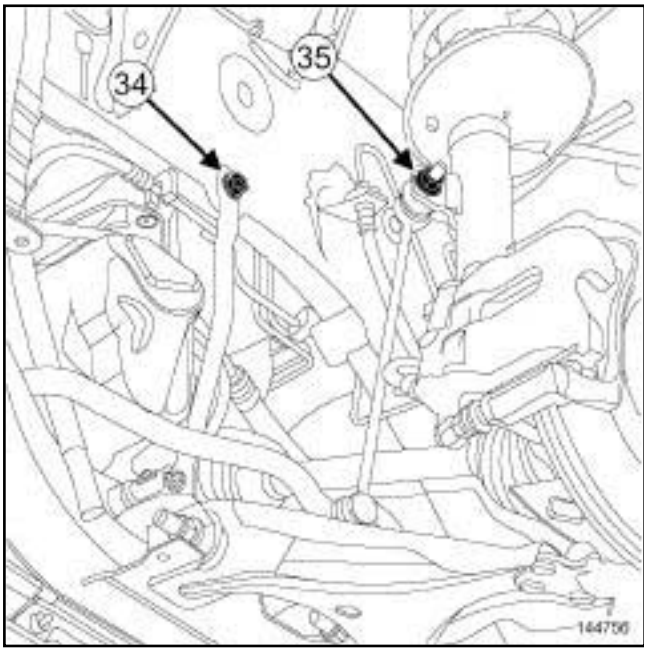
❏ Disconnect the cooling hose on the water chamber.

145501

❏ Move aside the cooling hose clips (**33**) on the heating radiator using the **(Mot. 1448)**.

❏ Disconnect the cooling hoses on the heating radiator.

❏ Remove the cooling hoses from their mountings.



❏ Remove (see) (36A, Steering assembly):

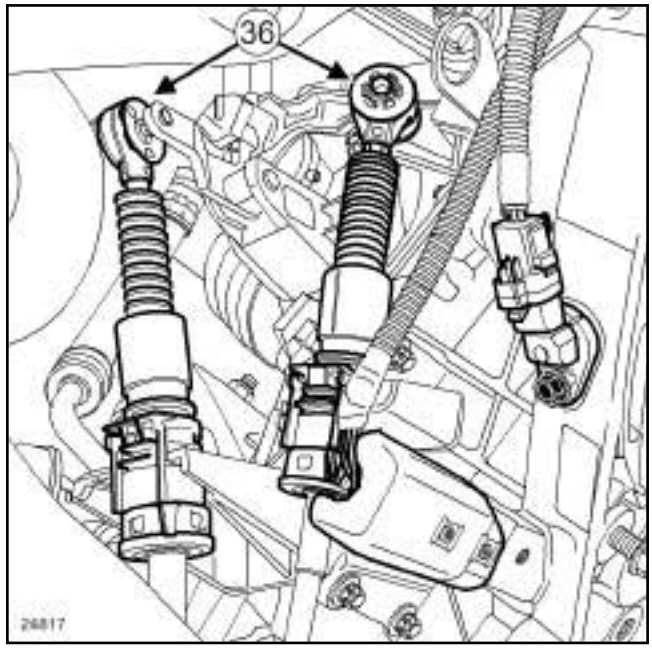
- the steering box heat shield bolts,

K9K, and 796

- the steering box heat shield,
- the steering box bolts on the front axle subframe.

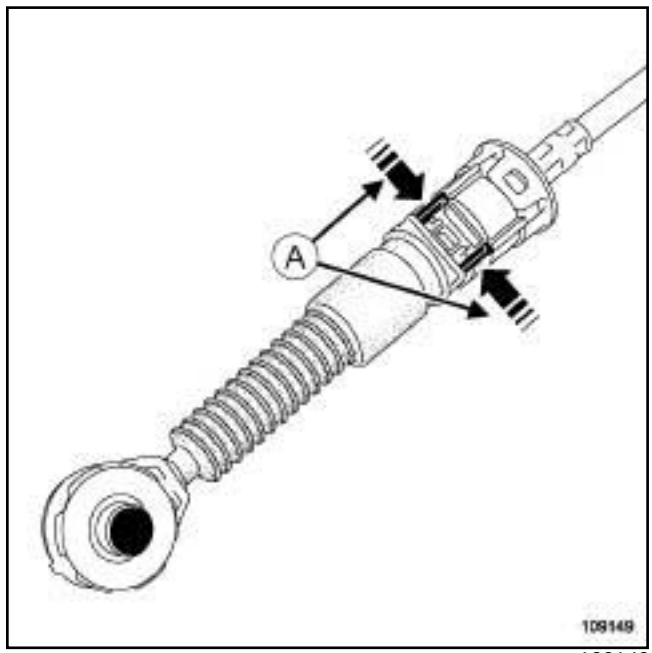
❏ Attach the steering rack to the body.

144756



❏ Remove:

- the front axle subframe tie-rod upper bolts (**34**) ,
- the anti-roll bar tie rod upper bolts (**35**) .

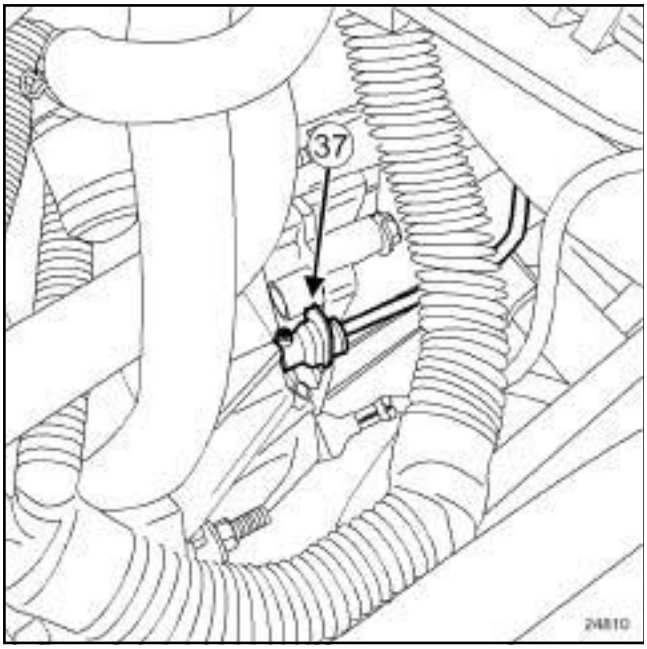


❏ Remove:

- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshaft),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Transmission).

❏ Pass the power-assisted steering low pressure pipe over the gearbox cover.

24817



109149

❏ Unclip:

- the gear control cables on the gearbox at (**36**) using a screwdriver,
- the gear control cables from the sleeve stops by pressing at (**A**) .

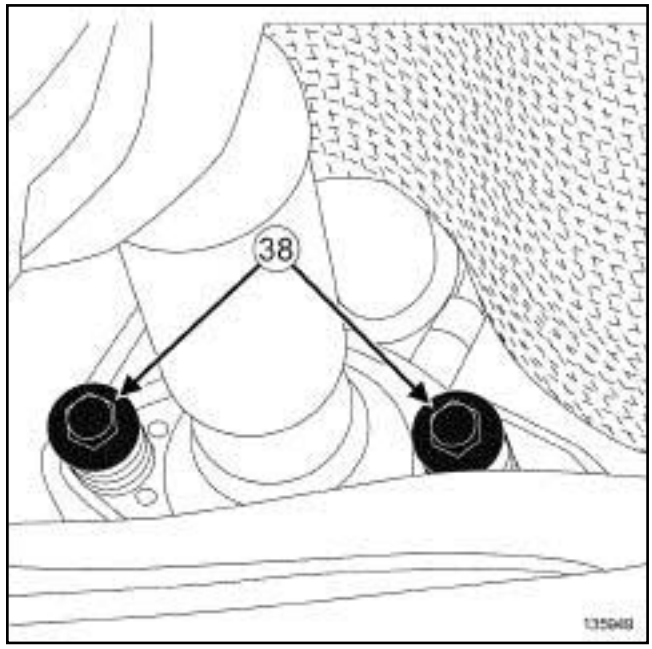
❏ Move the gear control cables away from the gearbox.

K9K, and 796

24810

❏

WARNING



Do not pull the clip. If it is incorrectly handled in any way, the pipe will need to be replaced.

❏ Disconnect the clutch control pipe on the clutch slave cylinder by pressing the clip (**37**) .

❏ Recover the brake fluid in a container.

❏ Fit blanking plugs in the pipe openings.

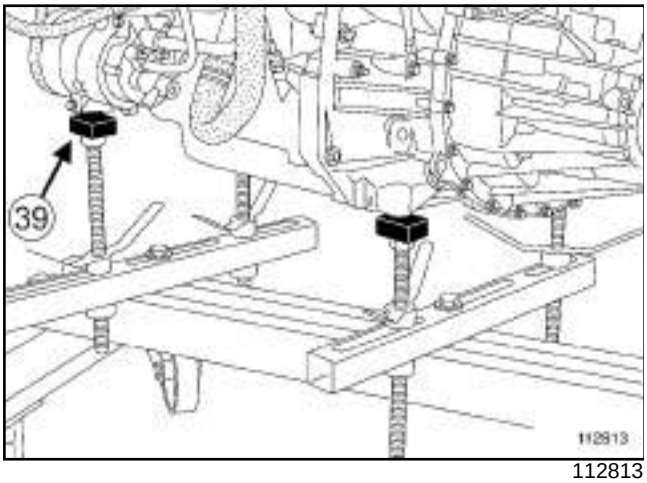
❏ Remove the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-8**) .

135949

❏ Remove:

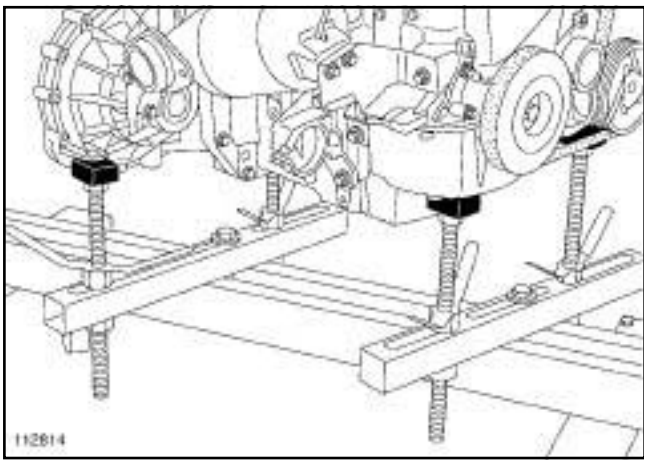
- the bolts (**38**) from the exhaust flange,
- the exhaust bracket ring.

❏ Move aside the exhaust pipe.



Note:

Pull the exhaust pipe backwards.



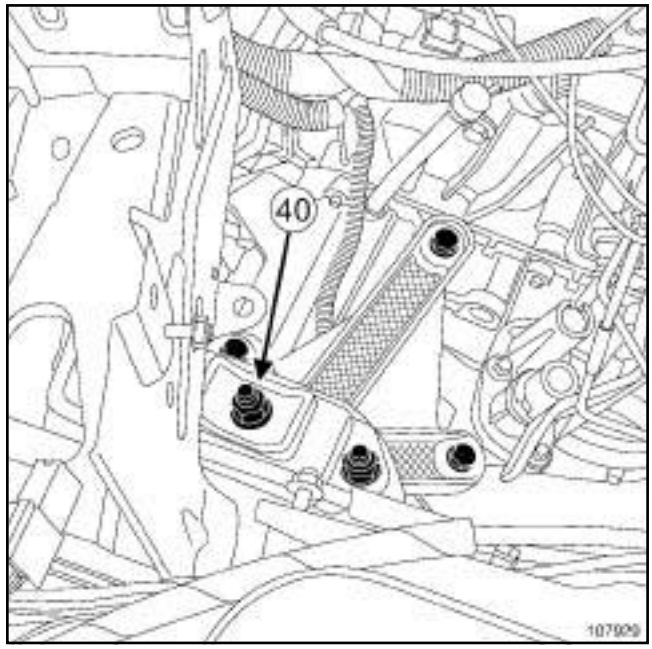
❏ Remove the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).

K9K, and 796

II - REMOVAL OPERATION

112813

112814



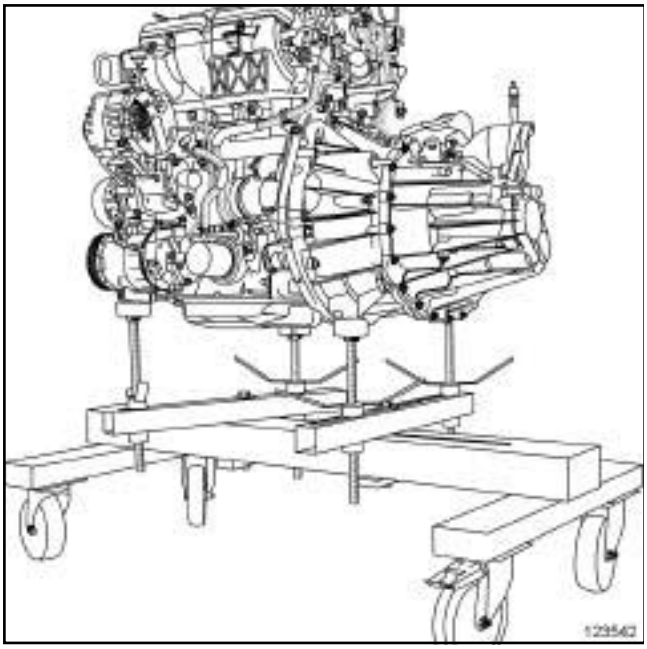
❑

Note:

Ensure that the **(Mot. 1390)** is correctly positioned on the multifunction support at (**39**) .

❑ Position the **(Mot. 1390)** under the engine - gearbox assembly.

❑ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) .



107929

❑ Remove the nut (**40**) on the rubber pad support of the left-hand suspended engine mounting.

❑ Strike the gearbox stud with a copper hammer to separate the engine - gearbox assembly from the body.

K9K, and 796

123542

❑ Lift the vehicle to remove the engine - gearbox assembly.

Note:

Ensure that no component obstructs the movement of the body around the engine - gearbox assembly.

❑ Remove the engine - gearbox assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Engine: Standard replacement**) (Technical Note 6006A, 10A, Engine and peripherals).

❑ **parts always to be replaced: ring between exhaust manifold and catalytic converter**

II - REFITTING OPERATION

❑ Fit the engine - gearbox assembly.

❑ Refit the nut on the rubber pad support of the left-hand suspended engine mounting.

❑ Torque tighten the **nut on the rubber pad support of the left-hand suspended engine mounting (62 N.m)**.

❑ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) .

❑ Remove the **(Mot. 1390)** from the engine - gearbox assembly.

III - FINAL OPERATION

❑ Proceed in the reverse order to removal.

❑ Torque tighten:

- the **exhaust flange bolts (21 N.m)**,
- the **front axle subframe tie-rod upper bolts (21 N.m)**,
- the **anti-roll bar tie rod upper bolts (37 N.m)**,
- the **earth strap bolt on the gearbox (21 N.m)**,
- the **power-assisted steering low pressure pipe bolt on the front axle subframe (21 N.m)**,
- the **power-assisted steering pipe bolts on the gearbox support (21 N.m)**,
- the **power-assisted steering pipe bolts on the gearbox (21 N.m)**,
- the **power-assisted steering pipe bolt on the cylinder block (21 N.m)**.

❑ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-32**) ,
- fill up the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- fill and bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) ,
- bleed the clutch circuit (see **Clutch circuit: Bleed**) (37A, Mechanical component controls).

AIR CONDITIONING

❑ Fill the refrigerant circuit using the tool **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❑ Fill up the power-assisted steering circuit.

❑ First, bleed the power-assisted steering circuit by turning the steering wheel fully from left to right with the engine off.

❑ Bleed the power-assisted steering circuit by turning the steering wheel fully from lock to lock with the engine running.

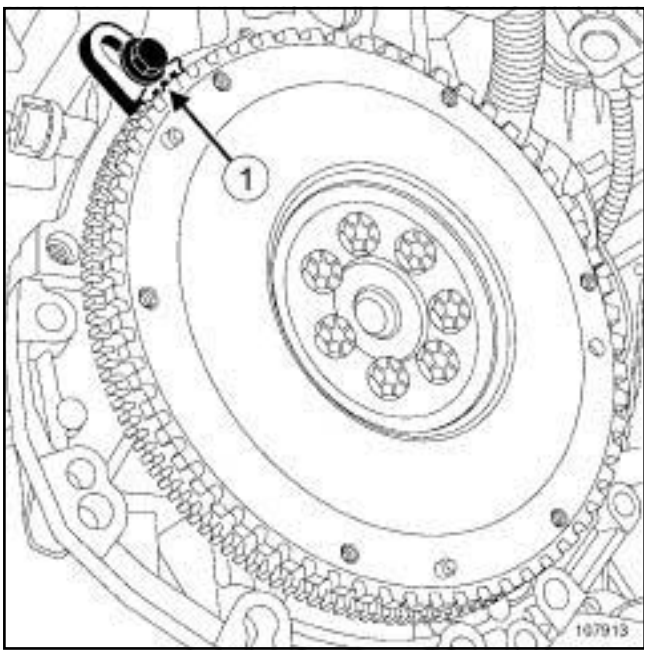
❑ Top up the oil in the power-assisted steering oil reservoir.

K9K, and 796

❑ Check that there are no leaks.

K4M

Tightening torques ▽	
flywheel bolts	25 N.m + 50° ± 6°



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove:

- the gearbox (see **Manual gearbox: Removal - Refitting**) ,
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) .

II - REMOVAL OPERATION

107913

❑ Lock the engine using the (**1**) .

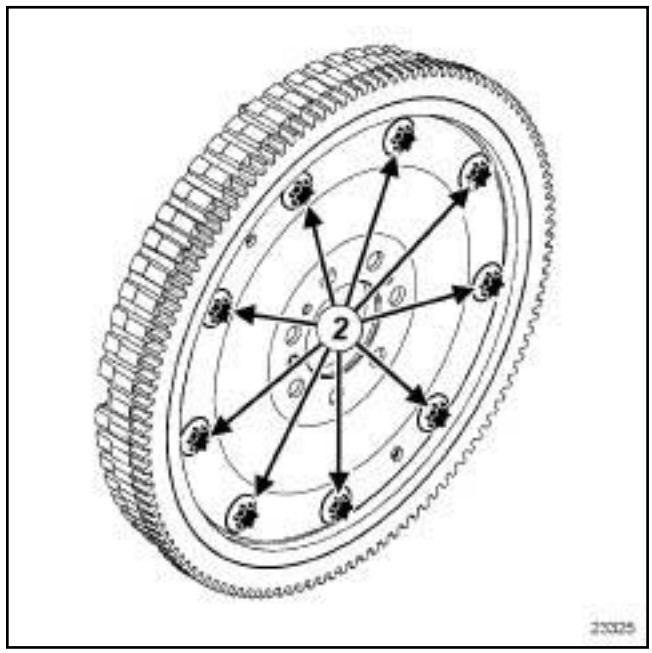
❑ Remove:

- the flywheel bolts,
- the flywheel,
- the.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check the condition of the flywheel.



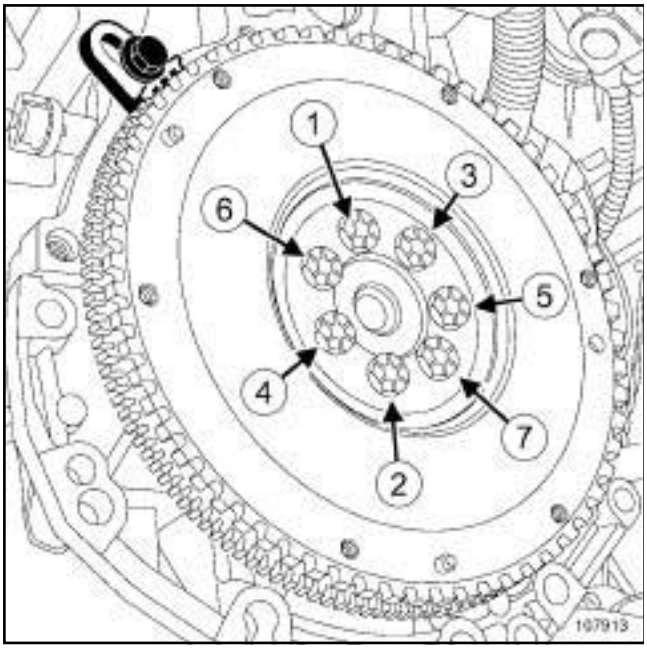
❑ On the crankshaft, clean the flywheel bolt threading.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the flywheel bearing face if reusing,
- the crankshaft bearing face.

❑ **parts always to be replaced: Flywheel bolts**.

❑ Coat the new flywheel bolts using **FRENETANCHE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).



23325

❑

WARNING
Do not remove the bolts (**2**) from the flywheel drive plate.

II - REFITTING OPERATION

❑ Refit the flywheel.

107913

❏ Screw in the new flywheel bolts without tightening them.

❏ Lock the engine using the.

❏ Torque tighten in order the **flywheel bolts (25 N.m + 50° ± 6°)**.

❏ Remove the tool.

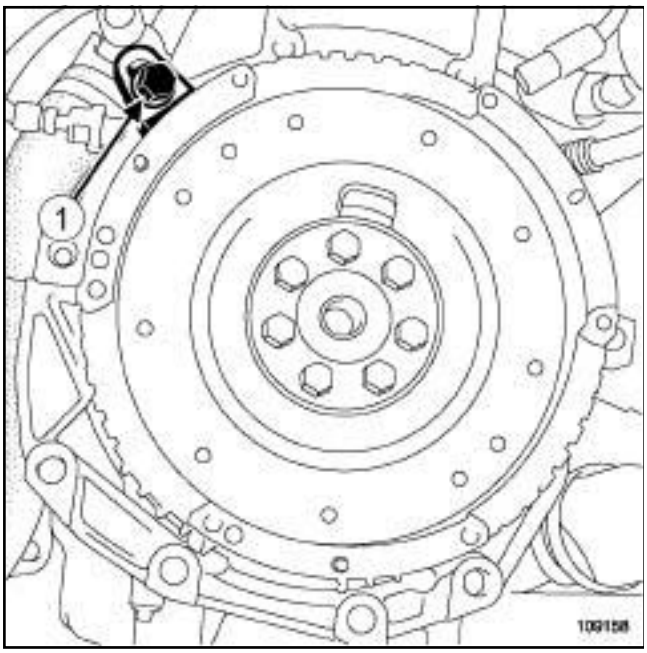
III - FINAL OPERATION

❏ Refit:

- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) ,
- the gearbox (see **Manual gearbox: Removal - Refitting**) .

K9K

Tightening torques ▽	
flywheel bolts	**55 N.m**



REMOVAL

- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

109158

❑ Lock the flywheel with the(**1**).

❑ Remove the flywheel bolts.

❑ Remove:

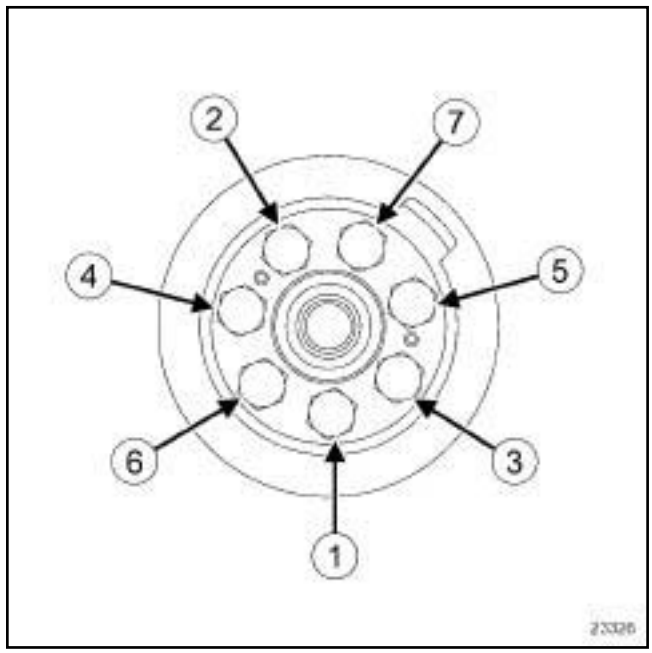
- the flywheel,
- the.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check the condition of the flywheel.

❑ **parts always to be replaced: Flywheel bolts**.



❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the crankshaft bearing face on the flywheel if reused,
- the flywheel pressure face on the crankshaft,
- the flywheel threading.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the flywheel.

❑ Coat the new flywheel bolts with **FRENETANCH** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

23326

❑ Lock the flywheel using tool.

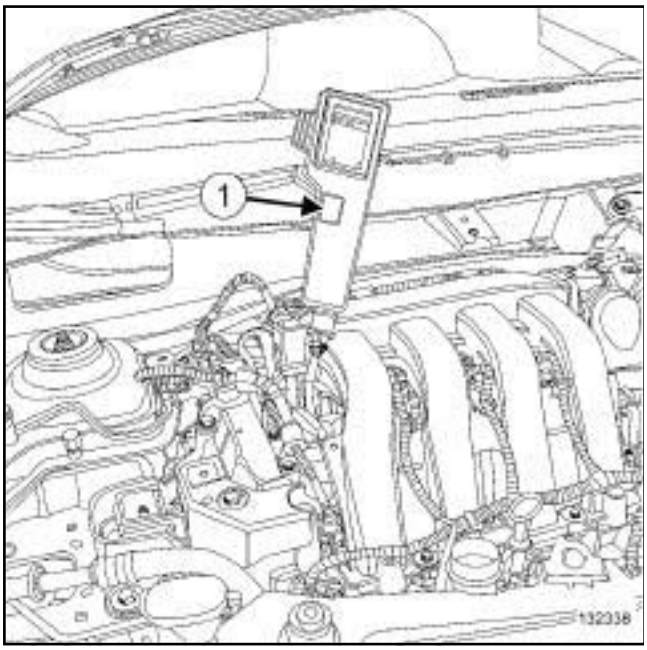
❑ Tighten to torque and in order the **flywheel bolts (55 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) ,
- the manual gearbox (see **Manual gearbox: Removal - Refitting**) .

K4M



Equipment required
petrol compression gauge
Diagnostic tool

CHECK

I - PREPARATION OPERATION FOR CHECK

❏ Remove:

- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the spark plugs (see **Plugs: Removal - Refitting**) .

132338

❏ Connect a **petrol compression gauge** (**1**) .

❏ Put the vehicle under starting conditions:

- gear lever in neutral position for manual gearbox,
- gear lever in position P (park) for an automatic gearbox.

❏ Disconnect the injector connectors.

II - TEST OPERATION

❏ Activate the starter until the needle of the petrol compression gauge stabilises.

❏ Measure the compression of the engine, cylinder by cylinder.

❏ Fully depress the accelerator pedal in order to open the throttle valve during the compression measurements.

> Note:
>
> It is necessary to wait for at least **10 seconds** before starting the engine each time (the starter will not run due to its thermal protection).

III - FINAL OPERATION

❏ Disconnect the **petrol compression gauge**.

❏ Refit:

- the spark plugs (see **Plugs: Removal - Refitting**) ,
- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) .

❏ Connect the injector connectors.

❏ Using the **Diagnostic tool**, check that there are no faults stored in the computer.

❏ Start the vehicle.

K9K, and STANDARD HEATING RECIRCULATION

Equipment required
offset spanner

Tightening torques ▽	
new accessories belt tensioning roller bolt	**40 N.m**

WARNING

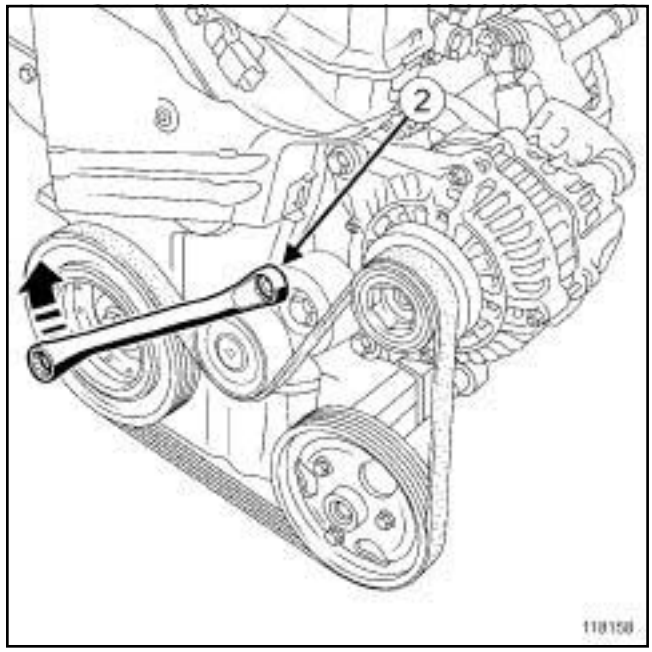
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

WARNING

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

REMOVAL

I - REMOVAL PREPARATION OPERATION

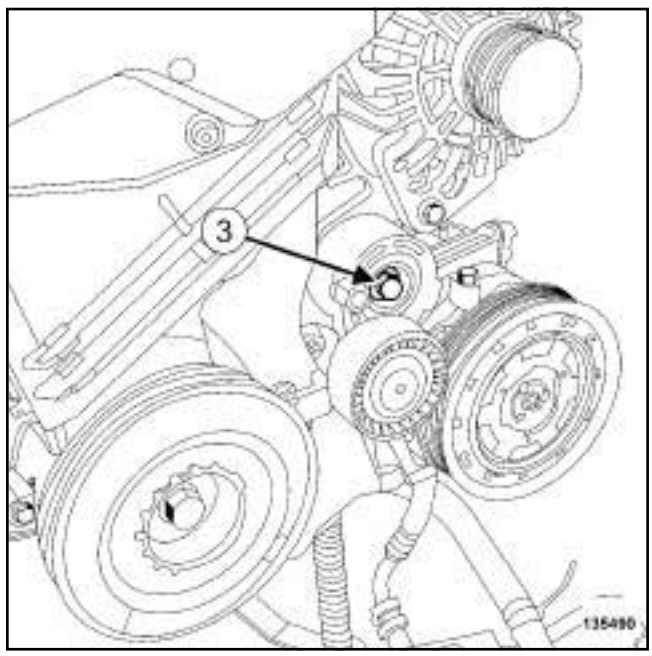


❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch side liner,
- the front right-hand wheel arch liner partially (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the plastic shield underneath the diesel filter.

II - OPERATION FOR REMOVAL OF PART CONCERNED



Auto tensioner

118158

❏ Turn the accessories belt tensioning roller clockwise at (**2**) using a **16 mm offset spanner**.

❏ Remove the accessories belt.

135490

❏ Remove:

- the accessories belt tensioning roller bolt (**3**) ,
- the accessories belt tension wheel.

K9K, and STANDARD HEATING RECIRCULATION

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
Only use brushes with plastic or non-corrosive metal (brass) bristles.

❑ Use a brush to remove any deposits from the crankshaft accessories pulley V-grooves.

❑ **parts always to be replaced: Accessories belt**

❑ **parts always to be replaced: Accessories belt tensioning roller**

❑ **parts always to be replaced: Accessories tensioning roller bolt**

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit a new accessories belt tensioning roller.

Auto tensioner

❑ Torque tighten the **new accessories belt tensioning roller bolt (40 N.m)**.

❑ Refit a new accessories belt.

❑ Rotate the crankshaft clockwise through two revolutions (timing end).

III - FINAL OPERATION

❑ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch side liner,
- the plastic shield underneath the diesel filter,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

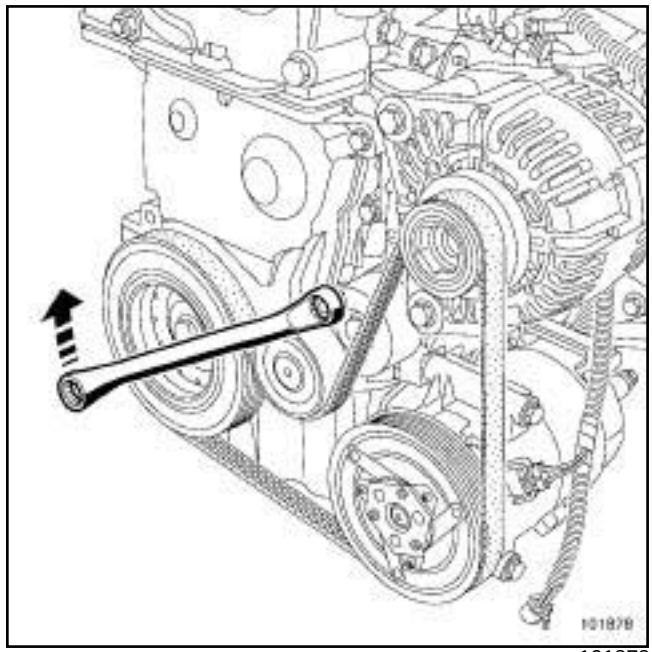
K9K, and AIR CONDITIONING

Tightening torques ▽	
tensioning roller bolt	**40 N.m**

WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

WARNING
In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch side liner,
- the front right-hand wheel arch liner partially (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the plastic shield underneath the diesel filter.

II - REMOVAL OPERATION

101878

❏ Rotate the accessories belt auto tensioner clockwise using a **16 mm** offset wrench.

❏ Remove:

- the accessories belt,
- the accessories belt tension wheel.

REFITTING

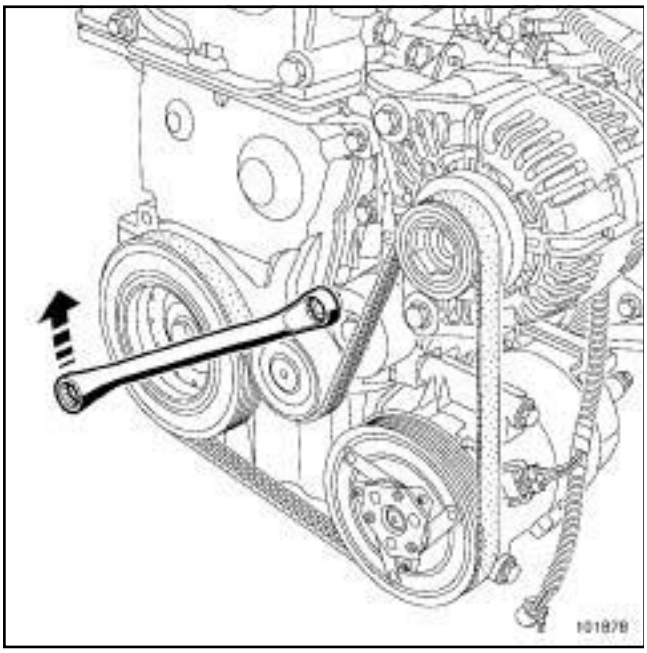
I - REPAIR PREPARATION OPERATION

❏ **parts always to be replaced: Accessories belt**.

❏ **parts always to be replaced: Accessories belt tensioning roller**

❏ **parts always to be replaced: Accessories tensioning roller bolt**

WARNING
Only use brushes with plastic or non-corrosive metal (brass) bristles.



❏ To remove all deposits, use a brush to clean the grooves of:

- the crankshaft pulley,
- the air conditioning compressor pulley,
- the alternator pulley,

❏ Refit a new tensioning roller fitted with a new bolt.

❏ Tighten to torque the **tensioning roller bolt (40 N.m)**.

II - REFITTING OPERATION FOR PART CONCERNED

101878

- ❏ Rotate the tensioning roller clockwise using a **16 mm** offset wrench.
- ❏ Refit a new accessories belt.
- ❏ Turn the crankshaft two revolutions clockwise (timing end) to position the accessories belt correctly.

III - FINAL OPERATION

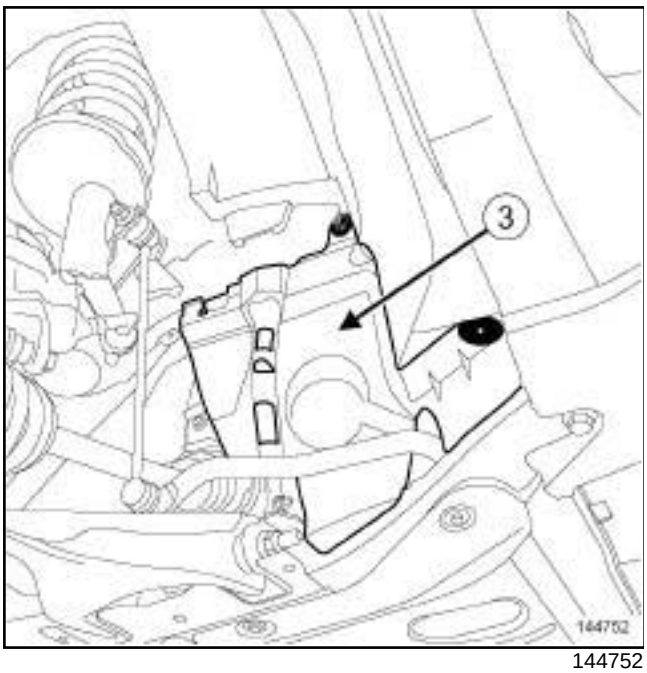
- ❏ Refit:
  - the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
  - the front right-hand wheel arch side liner,
  - the plastic shield underneath the diesel filter,
  - the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

K4M, and POWER ASSISTED STEERING, and AIR CONDITIONING

Tightening torques ▽	
the automatic tensioning roller mounting bolts	**21 N.m**
the fixed roller mounting bolt	**21 N.m**

❑

IMPORTANT
Wear cut-resistant gloves during the operation.

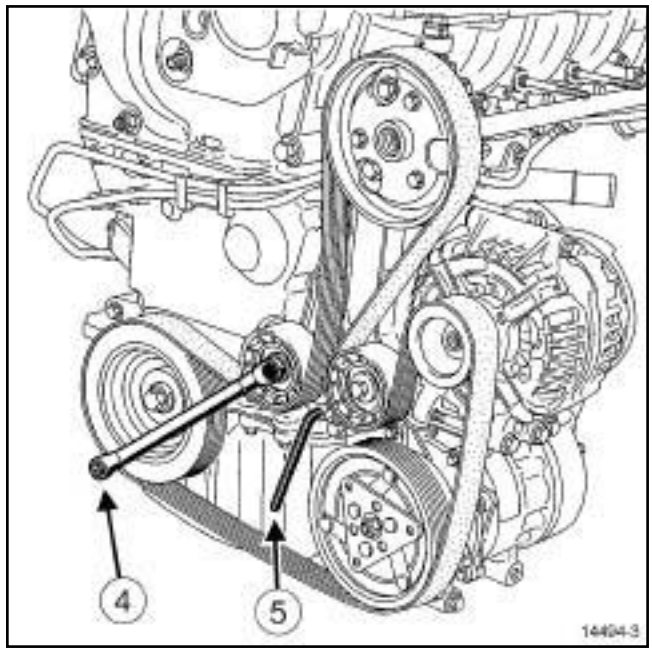


WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Remove the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

144752

❑ Remove the front right-hand wheel arch side liner (**3**) .

II - REMOVAL OPERATION

14494-3

❑ Turn the accessories belt auto tensioner anti-clockwise using a spanner (**4**) (**16 mm**), to relax the belt.

❑ Lock the auto tensioner using a **6 mm** Allen key (**5**) .

❑ Remove:

- the accessories belt,
- the auto tensioner bolts,
- the auto tensioner,
- the fixed roller bolt,
- the fixed roller.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Accessories belt**

parts always to be replaced: Accessories belt tensioning roller

parts always to be replaced: Accessories fixed roller

❑ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

II - REFITTING OPERATION

❑ Refit:

- a new fixed roller,
- a new automatic tensioner.

❏ Torque tighten:

- **the automatic tensioning roller mounting bolts (21 N.m)**,
- **the fixed roller mounting bolt (21 N.m)**.

❏ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❏ Lock the auto tensioner using a **6 mm** Allen key.

❏ Refit a new accessories belt.

❏ Unlock the auto tensioner.

❏ Turn the crankshaft two revolutions clockwise to position the accessories belt correctly.

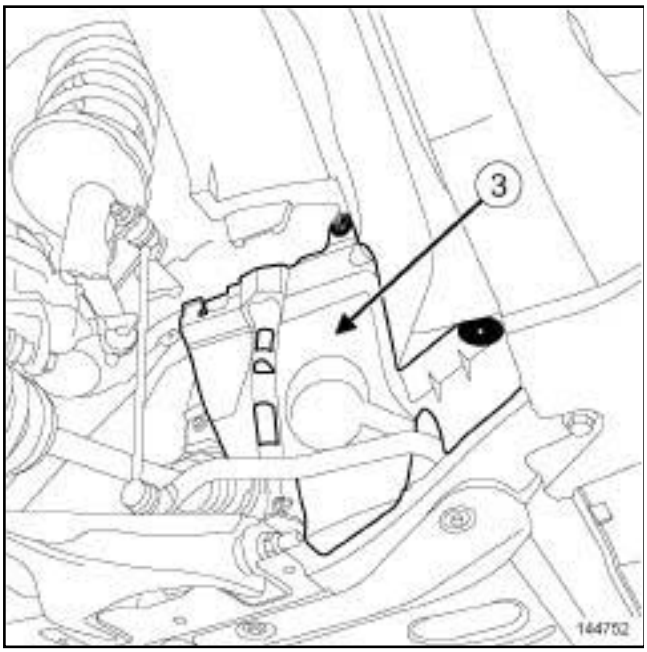
III - FINAL OPERATION

❏ Proceed in the reverse order to removal.

K4M, and STANDARD HEATING RECIRCULATION

Tightening torques ▽	
auto tensioner bolts	**40 N.m**

IMPORTANT
Wear cut-resistant gloves during the operation.

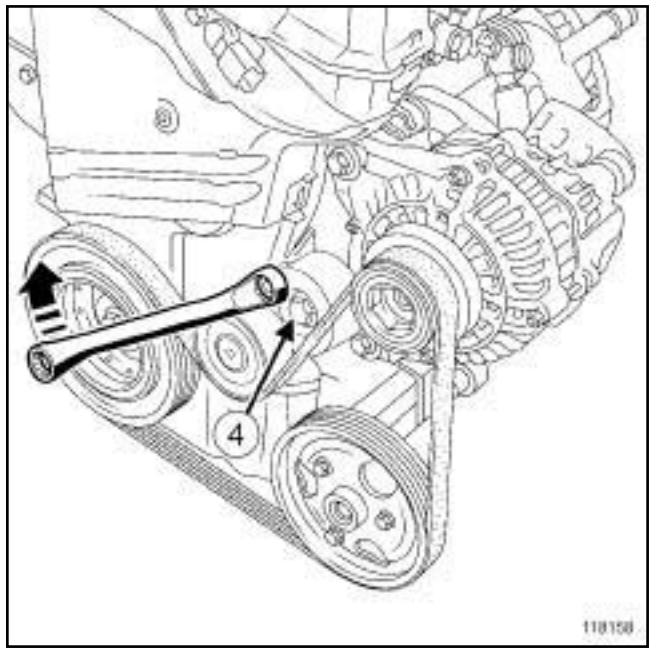


WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Remove the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

144752

❏ Remove the front right-hand wheel arch side liner (**3**) .

II - REMOVAL OPERATION

118158

❏ Pivot the accessories belt auto tensioner clockwise.

❏ Remove:

- the accessories belt,
- the tensioning roller bolt (**4**) ,
- the tensioning roller.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Accessories belt**

parts always to be replaced: Accessories belt tensioning roller

❏ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

II - REFITTING OPERATION

❏ Refit a new tensioning roller.

❏ Torque tighten the **auto tensioner bolts (40 N.m)**.

❏ Pivot the accessories belt auto tensioner clockwise.

❏ Refit a new accessories belt.

❏ Turn the crankshaft two revolutions clockwise to position the accessories belt correctly.

III - FINAL OPERATION

❏ Refit the front right-hand wheel arch side liner.

K4M, and STANDARD HEATING RECIRCULATION

❑ Refit the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

K9K

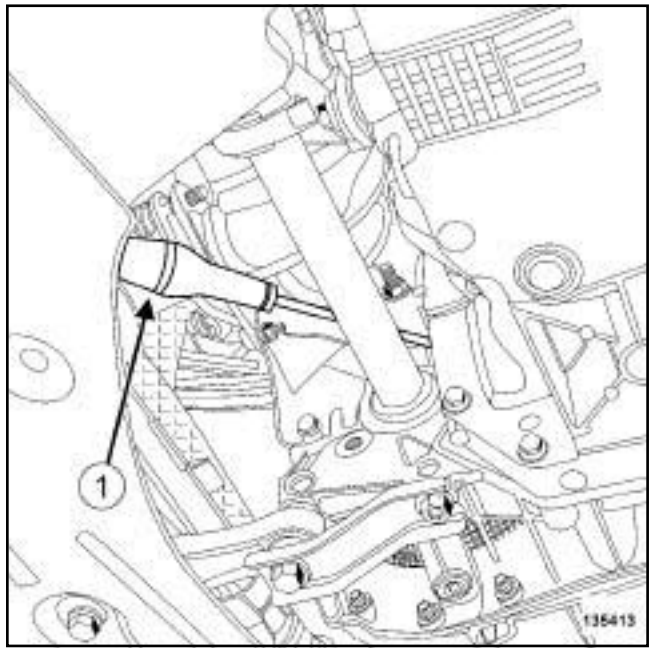
Special tooling required	
Mot. 1489	TDC locating pin.

Tightening torques ▽	
accessories pulley bolt	**120 N.m + 95° ±15°**
TDC pin plug	**25 N.m**

IMPORTANT
Wear cut-resistant gloves during the operation.

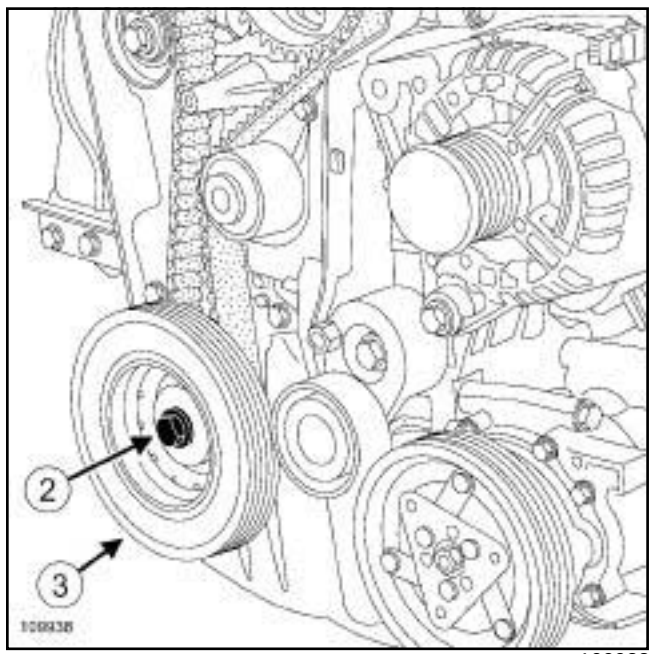
WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch side liner,
- the front right-hand wheel arch partially (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the plastic shield underneath the diesel filter,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

II - REMOVAL OPERATION

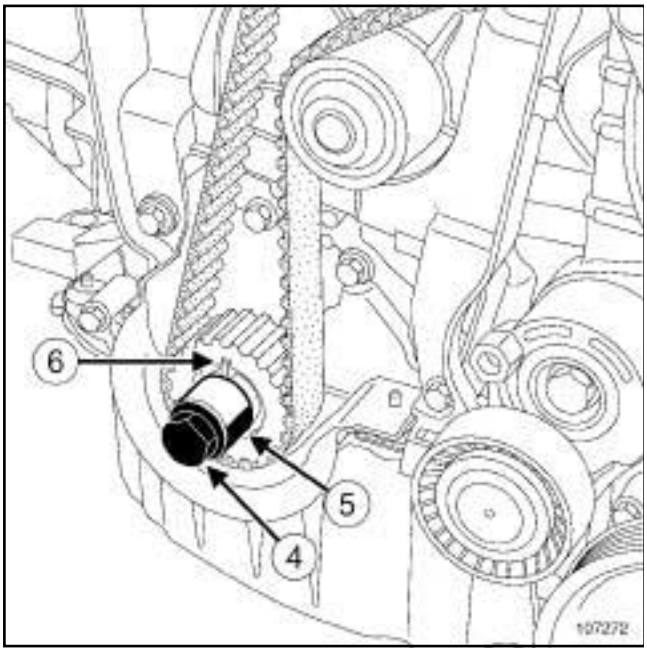
135413

109938

❏ Remove:

- the crankshaft accessories pulley bolt (**2**) , locking the flywheel using a large screwdriver (**1**) ,
- the crankshaft accessories pulley (**3**) .

K9K

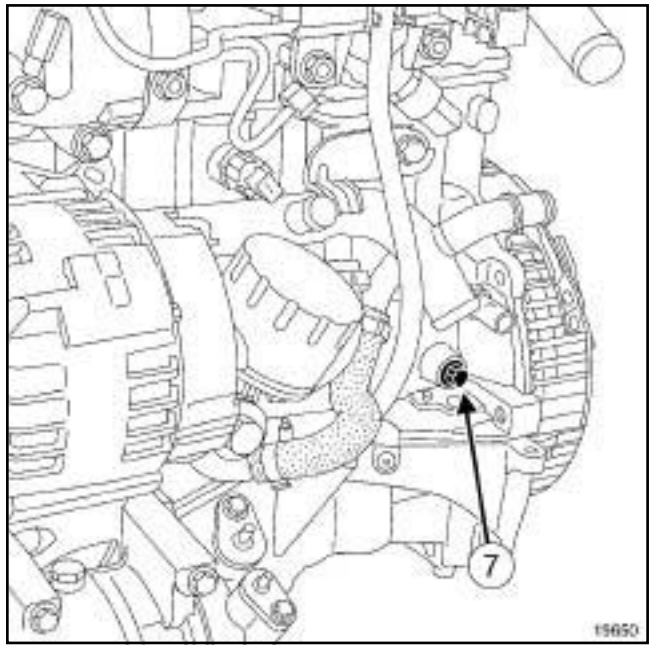


REFITTING

I - REFITTING PREPARATION OPERATION

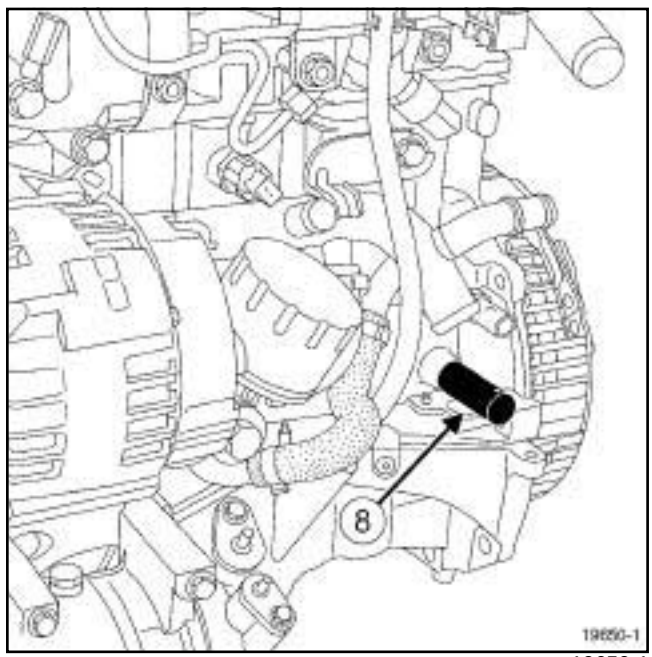
❑ **parts always to be replaced: Crankshaft accessories pulley bolts**.

> **WARNING**
> Only use brushes with plastic or non-corrosive metal (brass) bristles.



❑ If reusing the crankshaft accessories pulley, clean the crankshaft accessories pulley V-grooves with a brush to eliminate any deposits.

107272

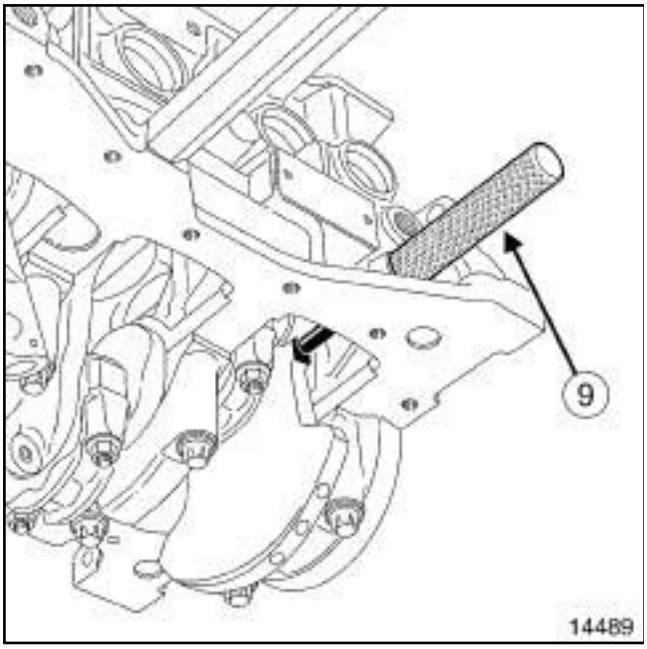


❑ Refit the old crankshaft accessories pulley bolt (**4**) with a spacer (**5**) .

❑ Turn the crankshaft clockwise (timing end) using the old bolt of the crankshaft accessories pulley, until the collet ***(6)*** of the crankshaft timing pinion is almost vertical and facing upwards.

19650

❑ Remove the TDC setting pin plug (**7**) .



19650-1

❑ Screw the TDC setting pin **(Mot. 1489)** (**8**) into the cylinder block.

❑ Remove the old bolt from the crankshaft accessories pulley fitted with its spacer.

II - REFITTING OPERATION

❑ Refit the accessories crankshaft pulley with a new bolt.

14489

- ❑ Turn the crankshaft clockwise (timing end) smoothly using the bolt of the crankshaft accessories pulley, until the crankshaft presses against the tool **(Mot. 1489)** (**9**) .
- ❑ Torque and angle tighten (with the crankshaft in contact with the TDC setting pin) the **accessories pulley bolt (120 N.m + 95° ±15°)**.
- ❑ Remove the TDC setting rod **(Mot. 1489)**.

III - FINAL OPERATION

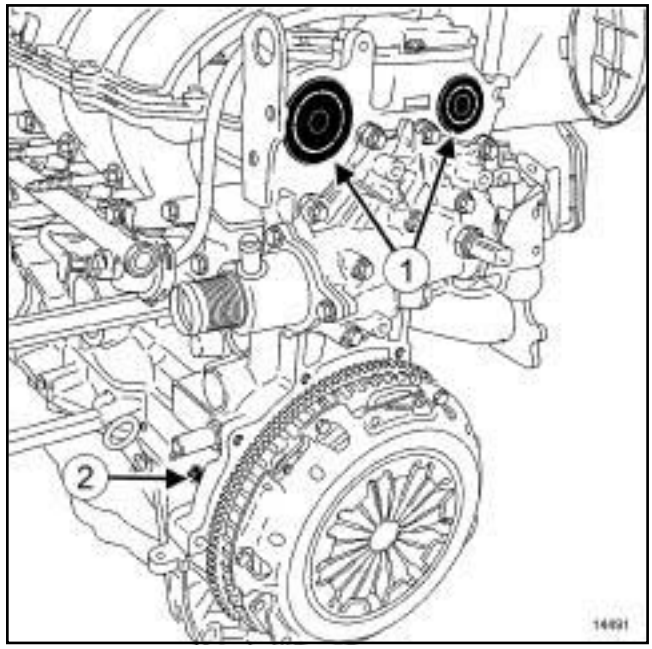
- ❑ Apply a drop of **silicone adhesive sealant** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the TDC setting pin plug.
- ❑ Torque tighten the **TDC pin plug (25 N.m)**.
- ❑ Refit:
  - the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
  - the front right-hand wheel arch side liner,
  - the front right-hand wheel arch (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
  - the plastic shield underneath the diesel filter,
  - the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

K4M

Tightening torques ▽	
new crankshaft accessories pulley bolt	**40 N.m + 145° ± 15°**
TDC pin plug	**25 N.m**

IMPORTANT
Wear cut-resistant gloves during the operation.

REMOVAL



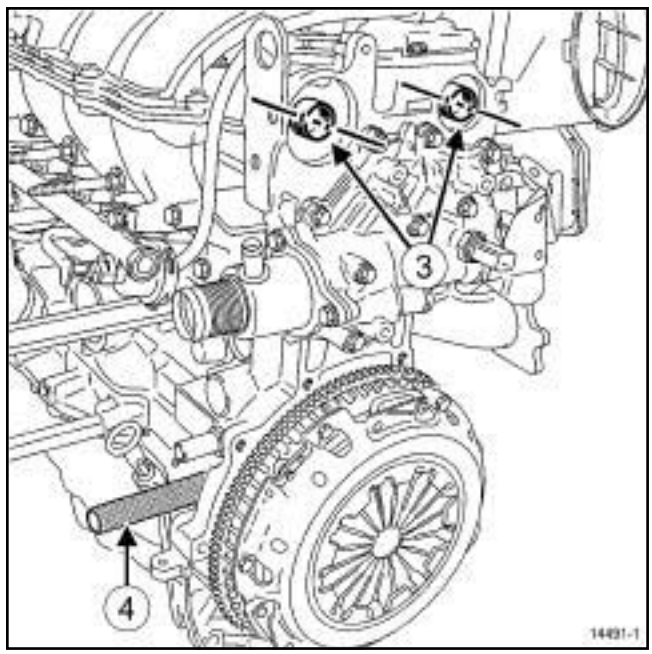
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the air inlet duct,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

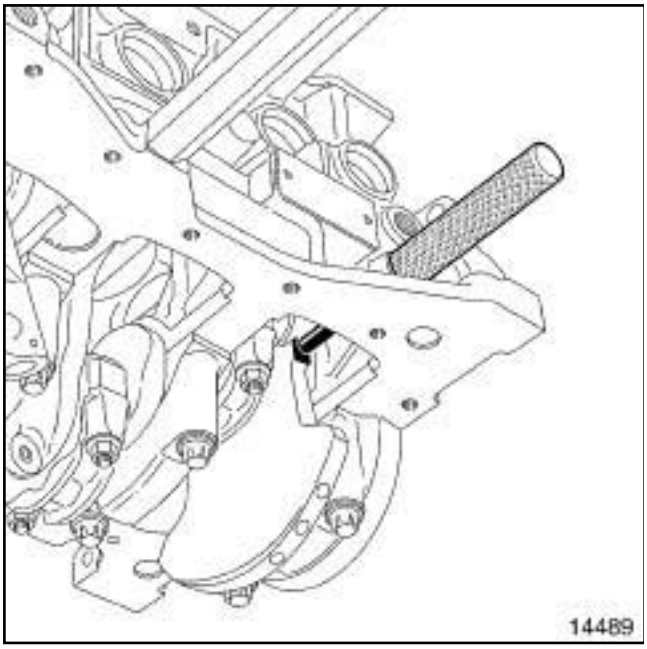


14491

❏ Pierce the centre of the plugs (**1**) at the camshaft ends with a screwdriver.

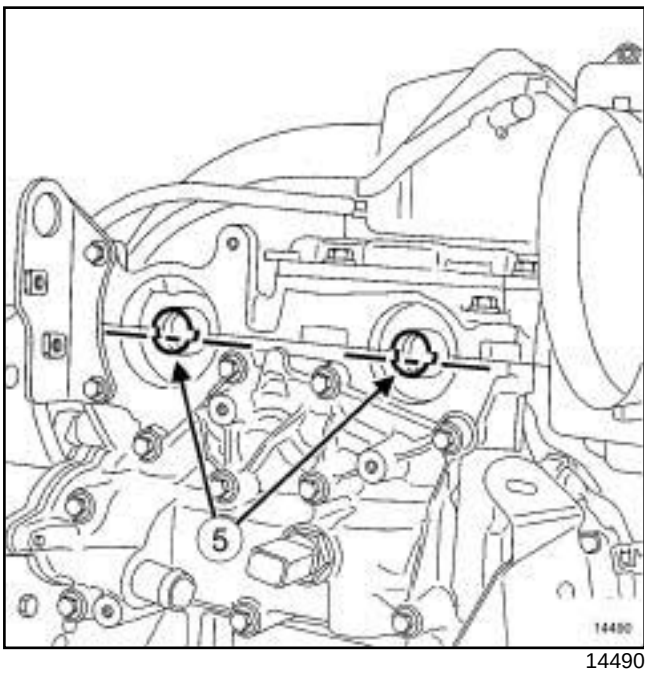
❏ Remove:

- the plugs from the camshaft ends with a screwdriver,
- the TDC setting pin plug (**2**) .



14491-1

❏ Position the camshaft grooves (**3**) almost horizontally and offset towards the bottom turning the crankshaft in the operating direction (clockwise at timing end).

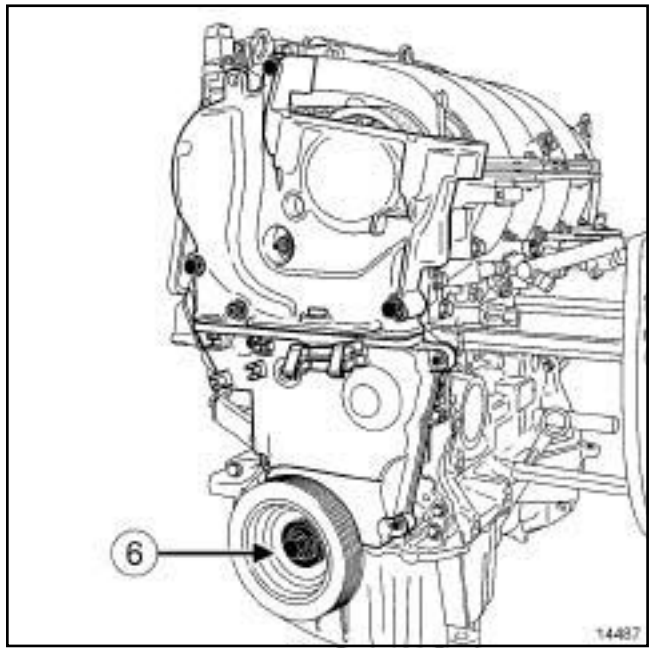


❏ Screw in the TDC setting pin (**4**) .

K4M

14489

❑ Turn the crankshaft in its operating direction (clockwise at timing end), until the crankshaft presses against the TDC setting pin.



14490

❑ The camshaft grooves (**5**) must be horizontal and offset downwards.

❑ Remove the TDC setting pin.

❑ Lock the flywheel using a screwdriver.

II - REMOVAL OPERATION

14487

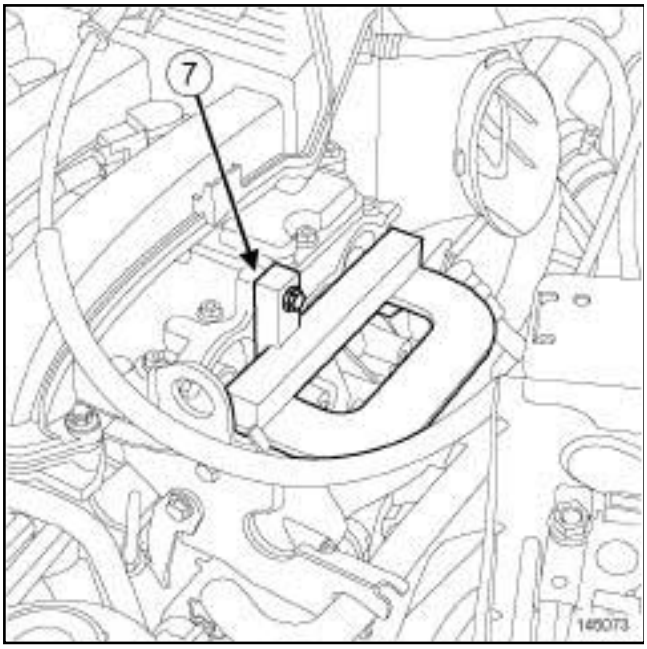
❑ Remove the crankshaft accessories pulley bolt (**6**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Crankshaft accessories pulley bolts**

❑

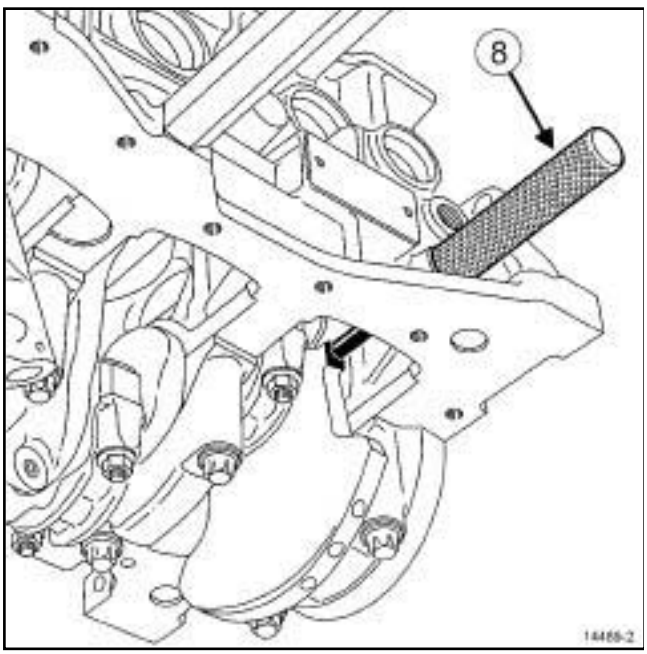


WARNING

Be sure to degrease:

- the end of the crankshaft,
- the bearing face of the crankshaft accessories pulley.

This is to prevent timing slippage.

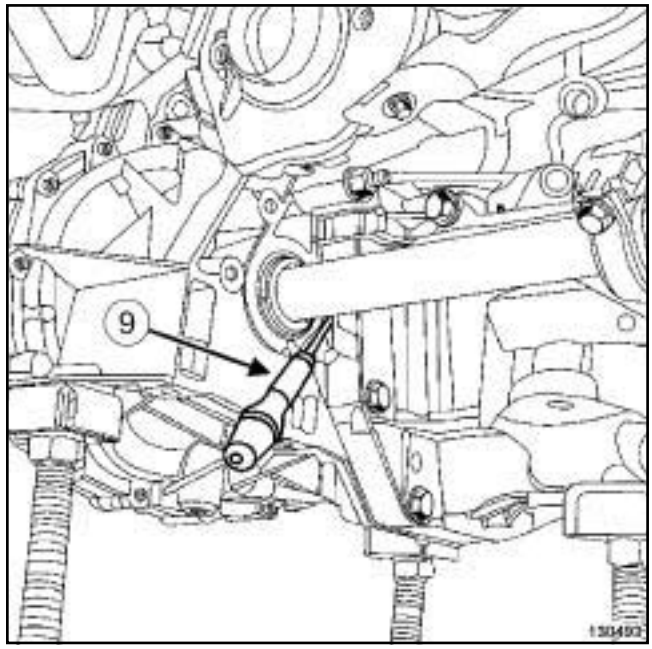


K4M

145073

❏ Position the setting tool.

❏ Secure theto the ends of the camshafts using an M6 bolt (**7**) .



14489-2

❏ Screw in the TDC setting pin (**8**) .

❏ Check that the crankshaft is pressing against the TDC tool.

❏ The crankshaft groove must be upwards.

130493

❏ If the crankshaft is not pressing against the TDC tool, bring the crankshaft back by turning the flywheel using a screwdriver (**9**) .

II - REFITTING OPERATION

❏ Refit the crankshaft accessories pulley.

❏ Torque and angle tighten the **new crankshaft accessories pulley bolt (40 N.m + 145° ± 15°)**.

III - FINAL OPERATION

❏ Remove:

- the TDC tool,
- the setting tool.

❏ Refit:

- a new inlet camshaft plug using the,
- a new exhaust camshaft plug using the.

❏ Place a drop of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) on the threading of the TDC pin plug.

❏ Refit the TDC setting pin plug.

❏ Torque tighten the **TDC pin plug (25 N.m)**.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),

K4M

- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the air inlet duct.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M

Tightening torques ▽	
timing fixed roller bolt	**50 N.m**
new crankshaft accessories pulley bolt	**40 N.m + 145° ± 15°**
timing tension wheel nut	**27 N.m**
lower timing cover bolts	**12 N.m**
nut of each camshaft sprocket	**30 N.m + 84° ± 4°**
TDC pin plug	**20 N.m**
upper timing cover bolts	**46 N.m**
upper timing cover nuts	**46 N.m**

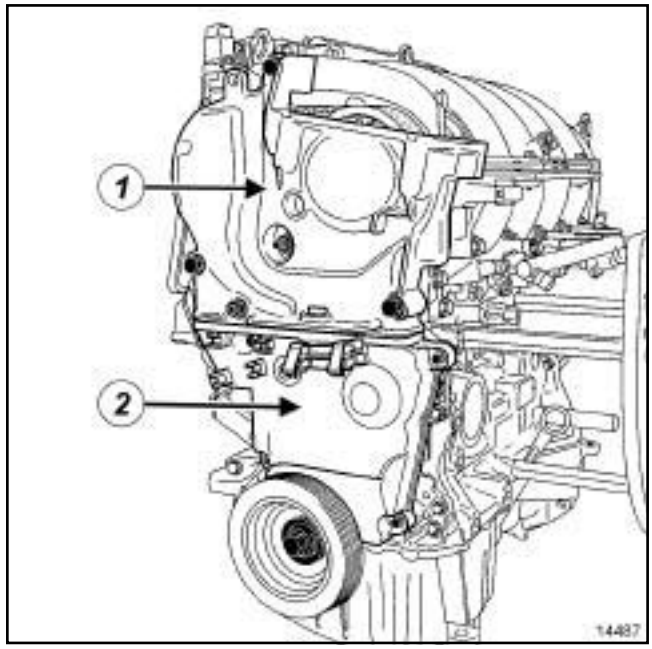
IMPORTANT
Wear cut-resistant gloves during the operation.

REMOVAL



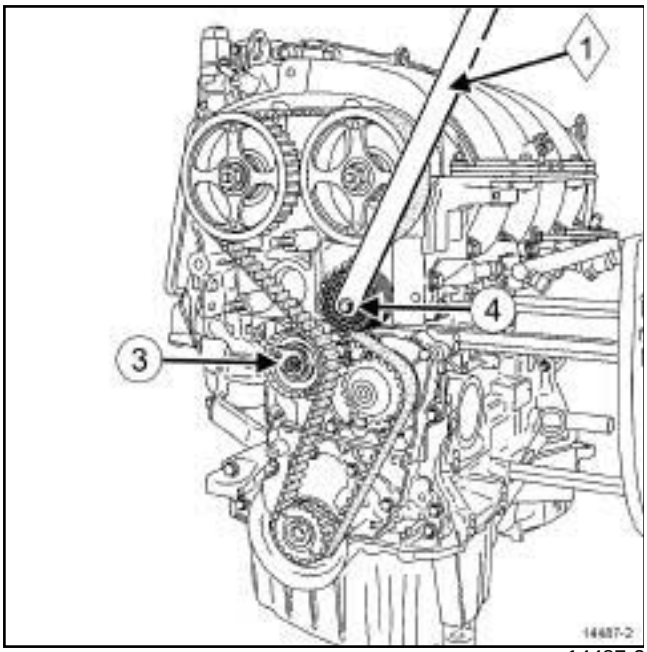
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the air inlet duct,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-10**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) .



14487

❏ Remove:

- the upper timing cover bolts (**1**) ,
- the upper timing cover,
- the lower timing cover bolts (**2**) ,
- the lower timing cover.

K4M

II - REMOVAL OPERATION

14487-2

❑ Loosen the nut (**3**) of the timing tensioning roller.

Note:

Do not drop the crankshaft timing sprocket when removing the timing belt.

❑ Remove:

- the timing fixed roller bolt (**4**) using the tool (**1**) ,
- the timing fixed roller,
- the timing belt,
- the timing tensioning roller nut,
- the timing tensioning roller,
- the crankshaft timing sprocket.

REFITTING - PROCEDURE 1

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Timing belt**,

❑ **parts always to be replaced: Timing belt tensioning roller**,

❑ **parts always to be replaced: Crankshaft accessories pulley bolts**,

❑ **parts always to be replaced: Inlet camshaft cap**,

❑ **parts always to be replaced: Timing fixed roller**,

❑ **parts always to be replaced: Exhaust camshaft cap**.

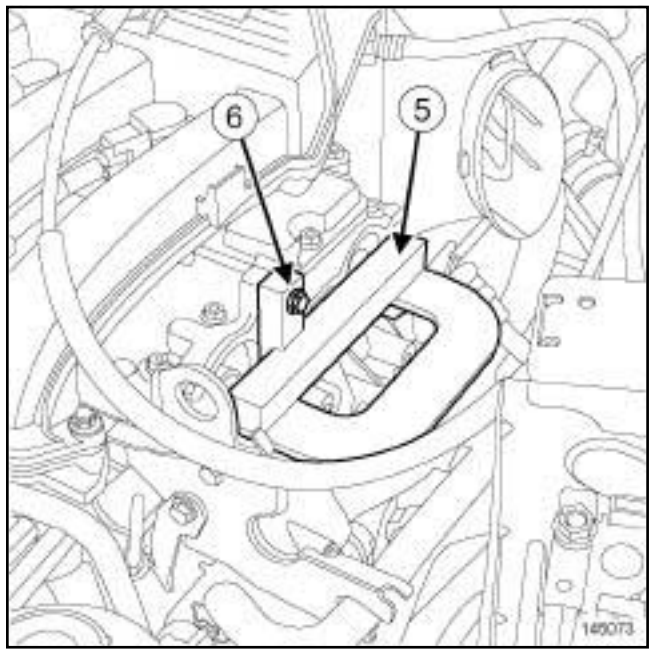
II - REFITTING OPERATION FOR PART CONCERNED

❑ The first procedure applies to replacing any timing face component which has a crankshaft timing sprocket without a collet and which does not require one or more of the camshaft sprockets to be loosened.

1 - Adjusting the timing

❑

WARNING

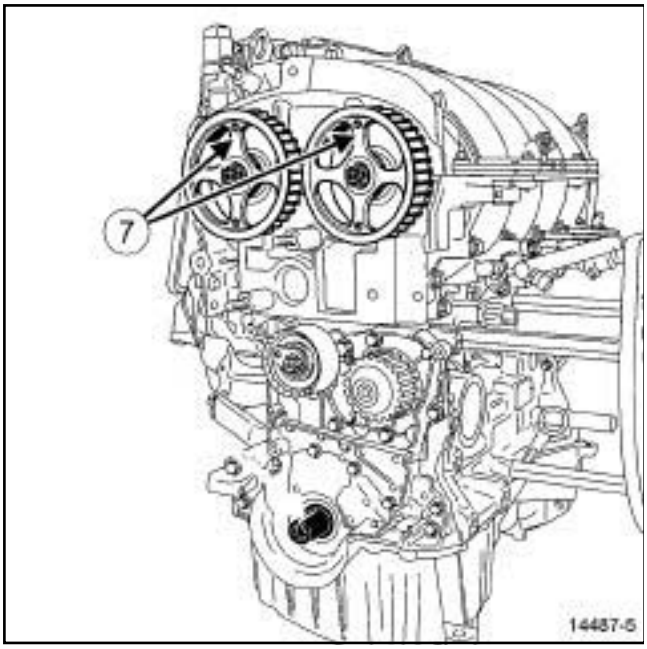


Be sure to degrease:

- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.

This is to avoid timing slippage.

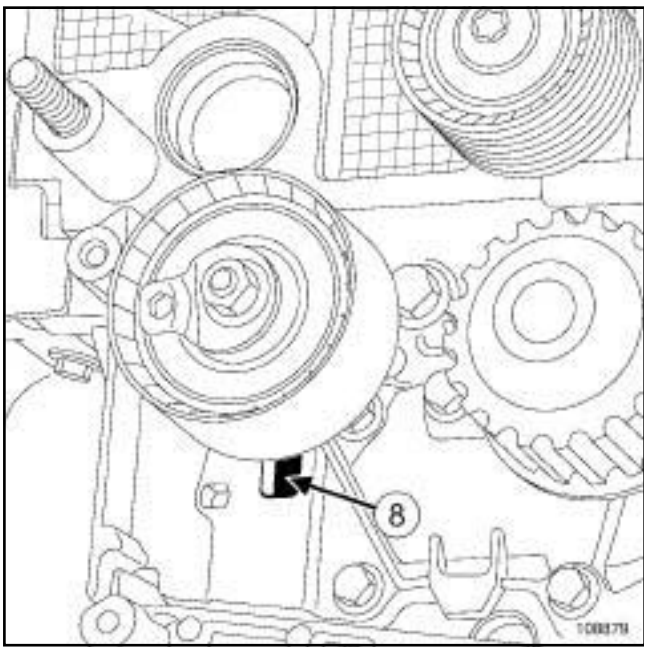
This slippage leads to engine damage.



❑ Set the camshaft grooves horizontally and below the centre line by turning the camshafts with theif necessary.

145073

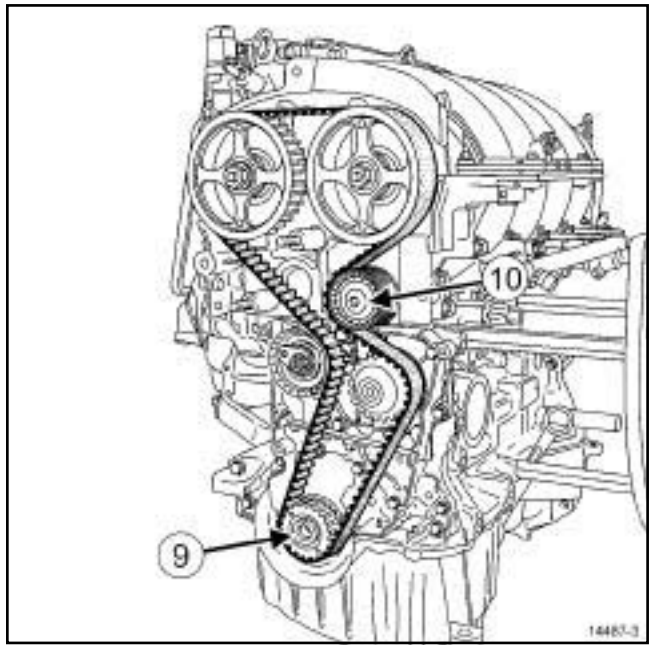
❑ Fit:



- the (**5**) onto the ends of the camshafts,
- a lifting eye bolt (**6**) to secure the.

14487-5

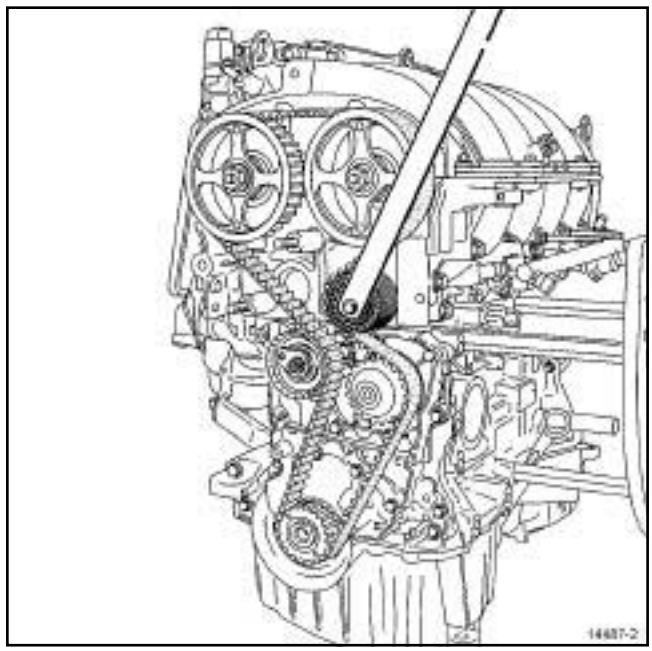
❑ Position the RENAULT badge (**7**) engraved on the stem of each camshaft sprocket vertically and pointing upwards.



2 - Refitting

108879

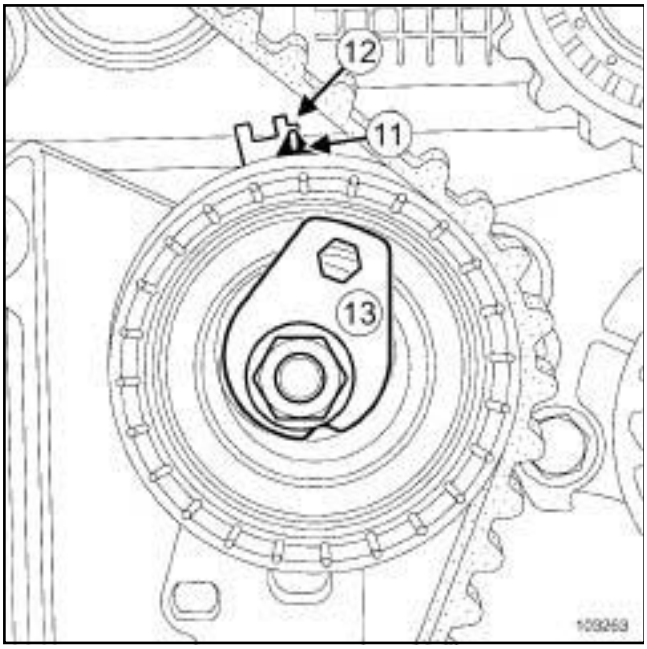
❑ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**8**) .



❑ Screw on the timing tensioning roller nut without tightening it.

14487-3

❑ Refit:



- the crankshaft timing sprocket (**9**) ,
- a new timing belt,
- a new timing fixed roller (**10**) .

14487-2

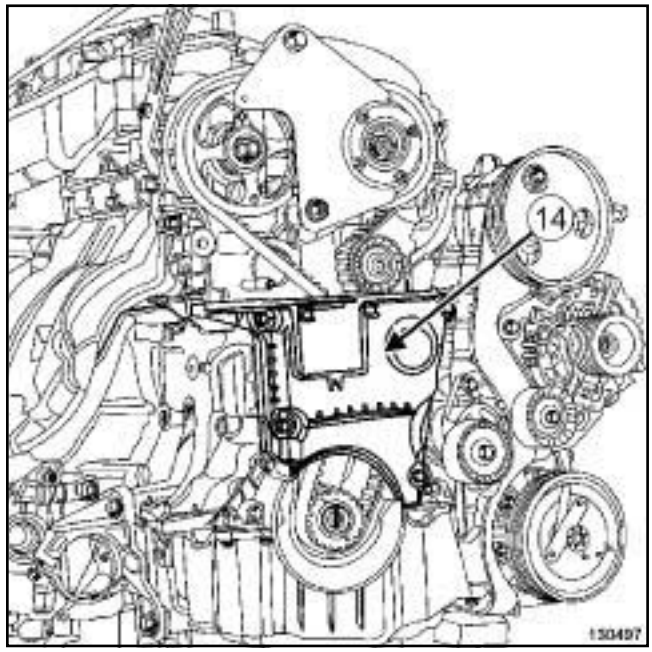
❑ Torque tighten the **timing fixed roller bolt (50 N.m)** using the tool.

K4M

103263

❑ Position the adjustable index (**11**) opposite the mark (**12**) , by turning the eccentric (**13**) clockwise using a **6 mm** Allen key.

❑ Torque tighten the **timing tensioning roller nut (7 N.m)**.



❑ Refit the toolon the cylinder block.

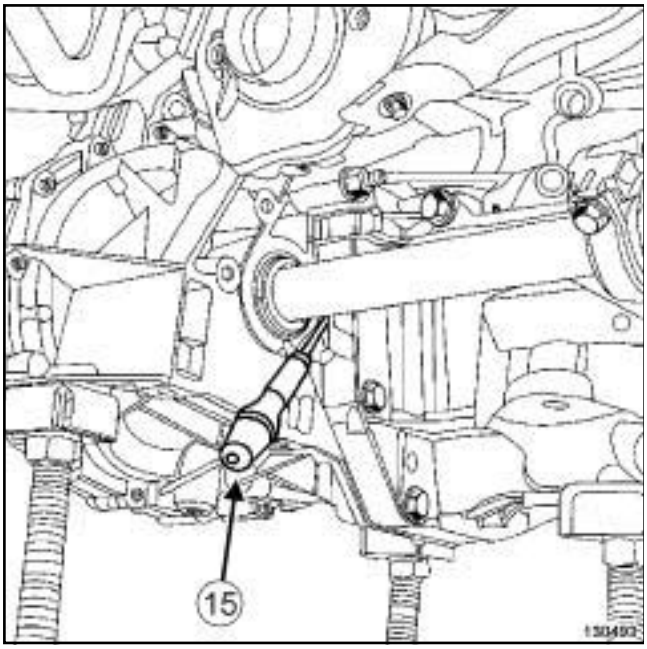
Note:

There are two types of lower timing cover:

- without a timing flap,
- with a timing flap.

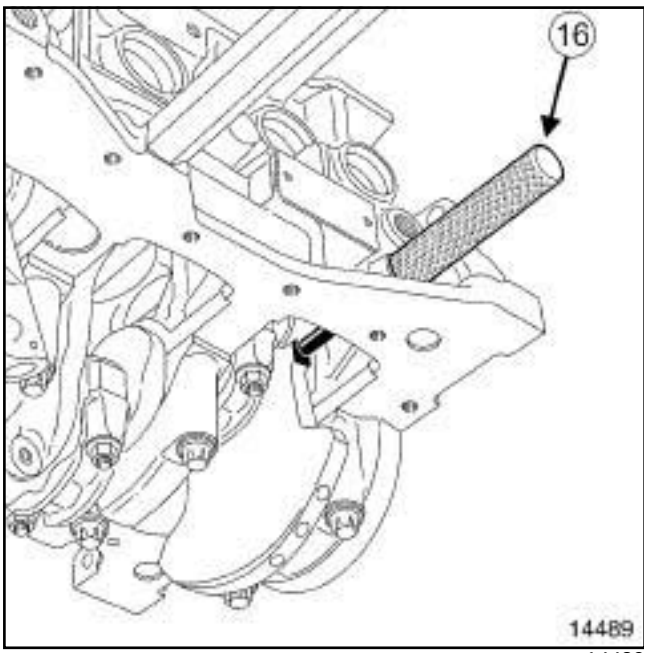
a - Lower timing cover with a timing flap

130497



❑ Refit the lower timing cover (**14**) .

❑ Tighten to torque the **lower timing cover bolts (12 N.m)**.

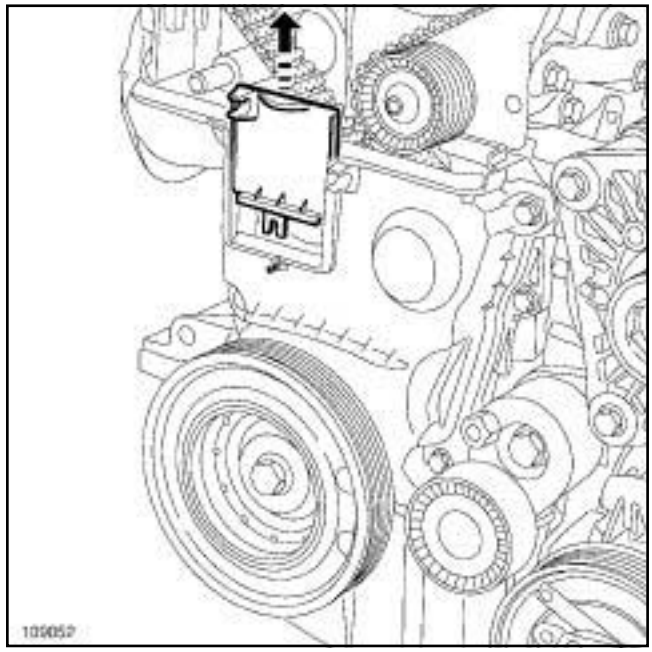


b - continuation of the refitting procedure regardless of the type of lower timing cover

❑ Refit a new crankshaft accessories pulley.

K4M

130493



14489

❑ Use a screwdriver (**15**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool (**16**) using the screwdriver; the crankshaft groove should be at the top.

❑ Torque and angle tighten a **new crankshaft accessories pulley bolt (40 N.m + 145° ± 15°)** (crankshaft in contact with the tool).

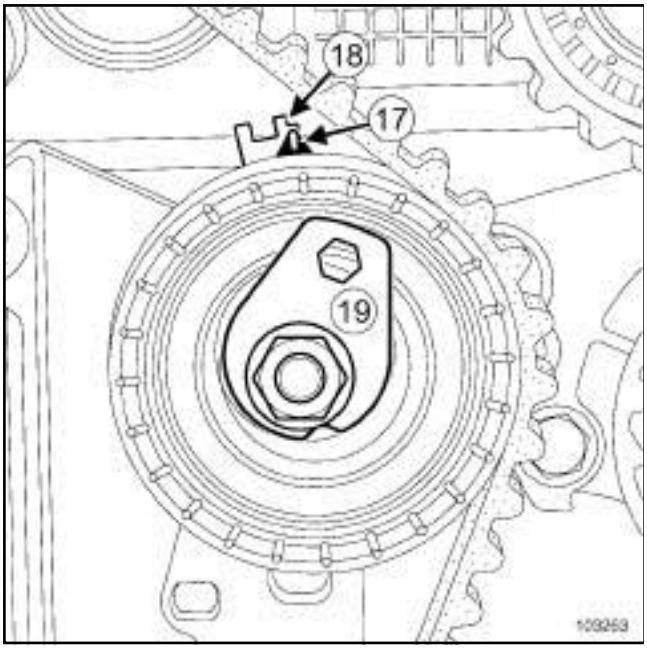
c - Lower timing cover with a timing flap

109052

❑ Remove the timing flap from the lower timing cover.

d - continuation of the refitting procedure regardless of the type of lower timing cover

❑ Remove:



- the bolt of the tool,
- the setting tool,
- thefrom the cylinder block.

3 - Checking the tension

❑ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the toolinto the cylinder block.

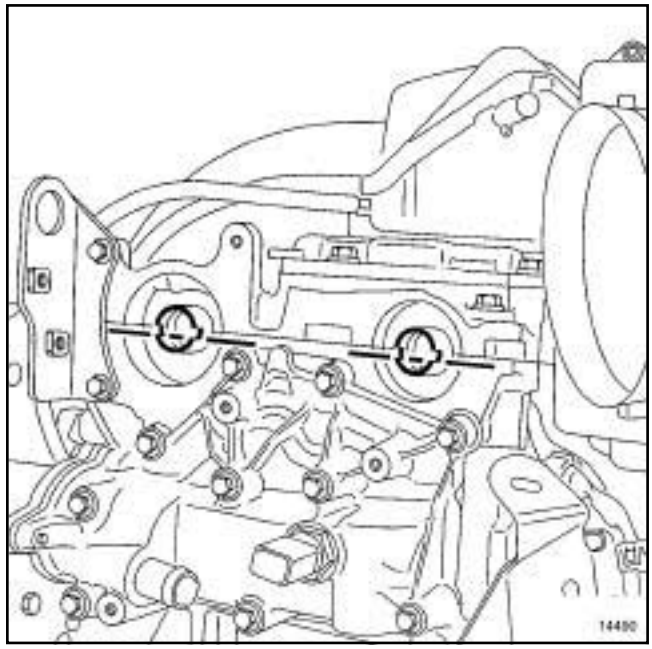
❑ Move the crankshaft slowly and smoothly until it comes into contact with the tool.

❑ Remove the toolfrom the cylinder block.

103263

❏ Check that the adjustable index (**17**) is opposite the notch (**18**) , if this is not the case:

- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with a **6 mm** Allen key,
- gradually move the adjustable index marker (**17**) opposite the mark (**18**) turning the eccentric cam (**19**) clockwise.



❏ Torque tighten the **timing tension wheel nut (27 N.m)**.

4 - Checking the timing

❏ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

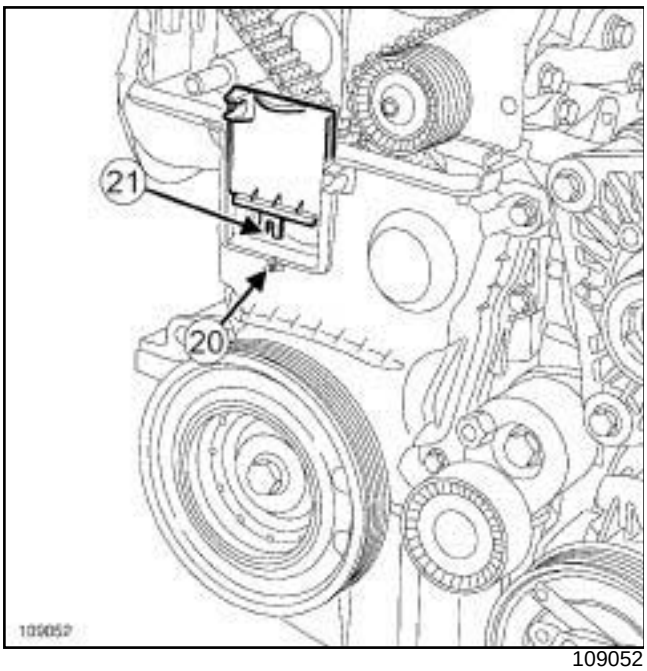
❏ Screw toolinto the cylinder block.

❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool.

14490

❏ Position (without forcing) the camshaft setting tool(the camshaft end grooves must be horizontal and offset towards the bottom).

Note:



The timing adjustment and tensioning operation must be repeated if the camshaft setting tool does not engage.

❏ Remove:

- the setting tool,
- thefrom the cylinder block.

K4M

a - Lower timing cover with a timing flap

109052

❏ Refit the lower timing cover flap, checking that the locating pin (**20**) fits properly in the notch (**21**) .

b - Lower timing cover without a timing flap

❏ Refit the lower timing cover.

❏ Tighten to torque the **lower timing cover bolts (12 N.m)**.

REFITTING -PROCEDURE 2

I - REFITTING PREPARATION OPERATION

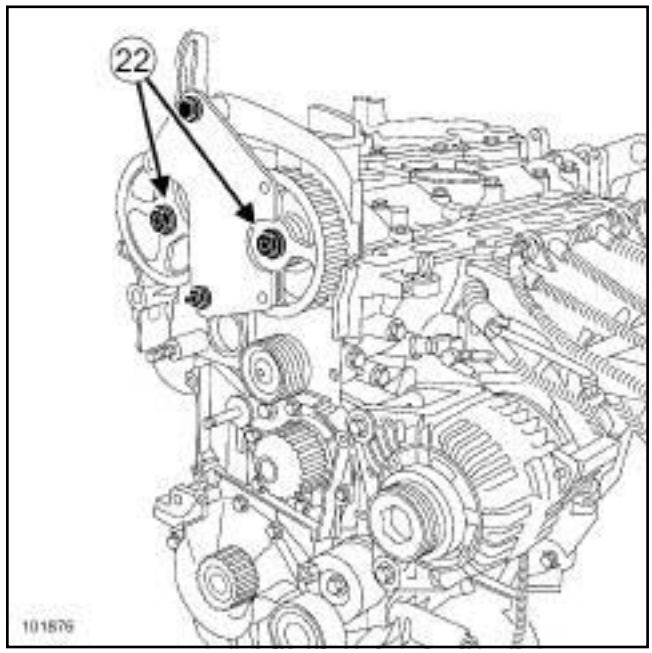
❏ **parts always to be replaced: Timing belt**,

❏ **parts always to be replaced: Timing belt tensioning roller**,

❏ **parts always to be replaced: Timing fixed roller**,

❏ **parts always to be replaced: Crankshaft accessories pulley**,

❏ **parts always to be replaced: camshaft timing sprocket nut**,



❏ **parts always to be replaced: Crankshaft accessories pulley bolts**,

❏ **parts always to be replaced: Inlet camshaft cap**,

❏ **parts always to be replaced: Exhaust camshaft cap**.

II - REFITTING OPERATION

❏ The second procedure is used when replacing any timing face component which has a crankshaft timing sprocket with or without a collet, that requires one or more of the camshaft sprockets to be loosened.

101876

❏ Fit the toolon the camshaft sprockets using the tool.

❏ Loosen the nuts (**22**) of each camshaft sprocket.

❏ Remove:

- the toolfrom the cylinder block,
- every camshaft sprocket nut,
- the camshaft sprockets.

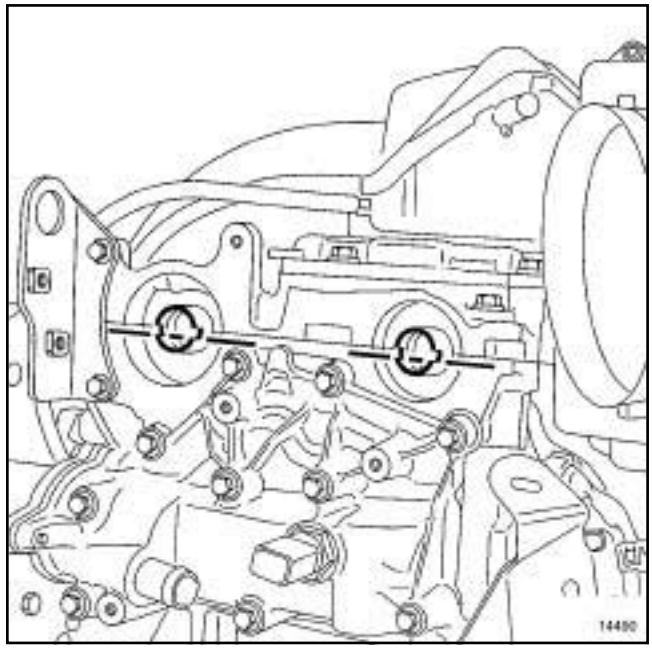
K4M

1 - Adjusting the timing

❑

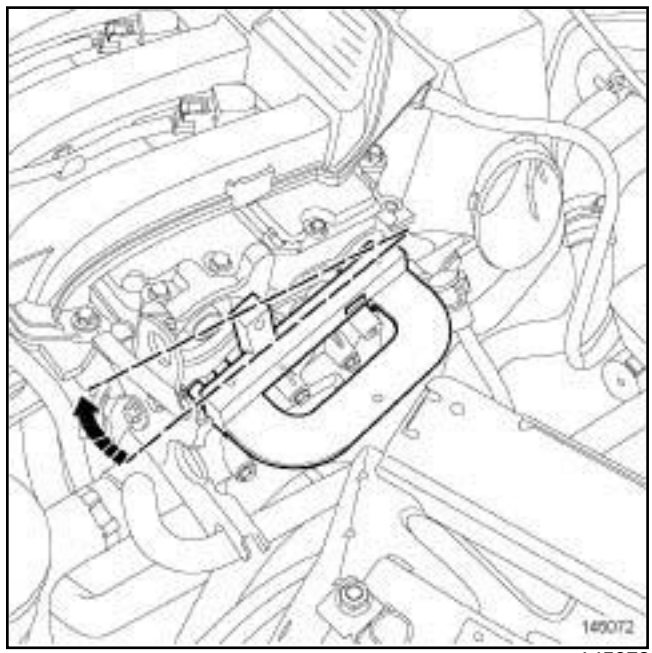
Note:

If the stud loosens with the nut (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-49**) (11A, Top and front of engine).



WARNING

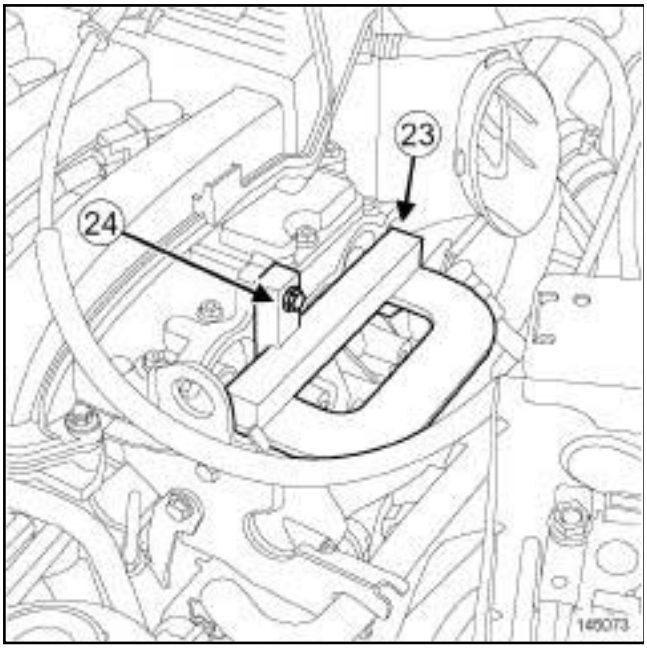
Always degrease:



- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.

This is to avoid timing slippage.

This slippage leads to engine damage.

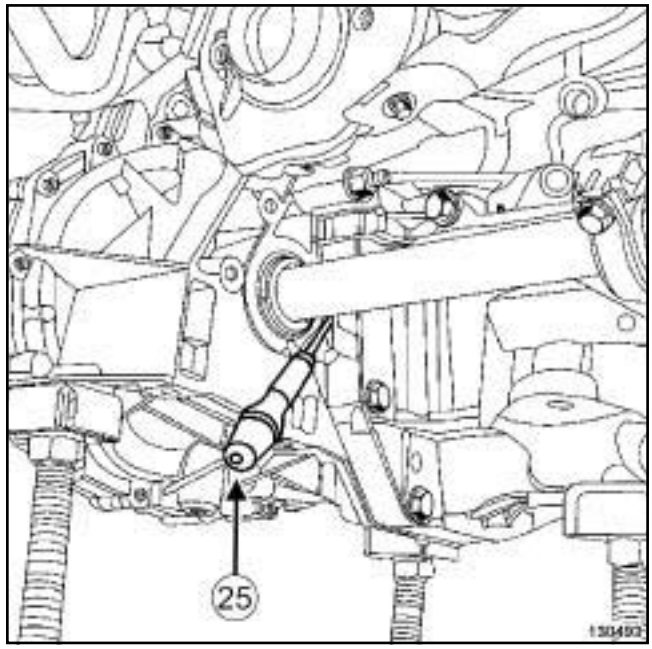


14490

145072

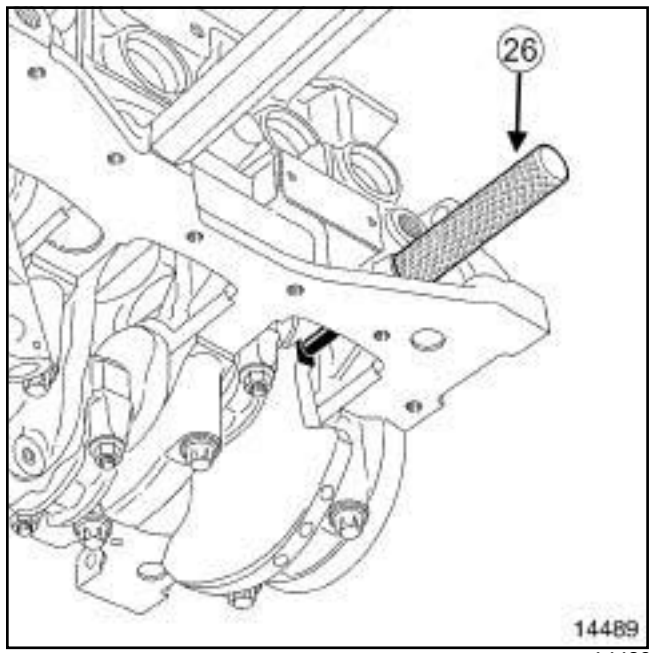
❑ Position the camshaft grooves horizontally and below the centre line, by turning the camshafts with theif necessary.

K4M



145073

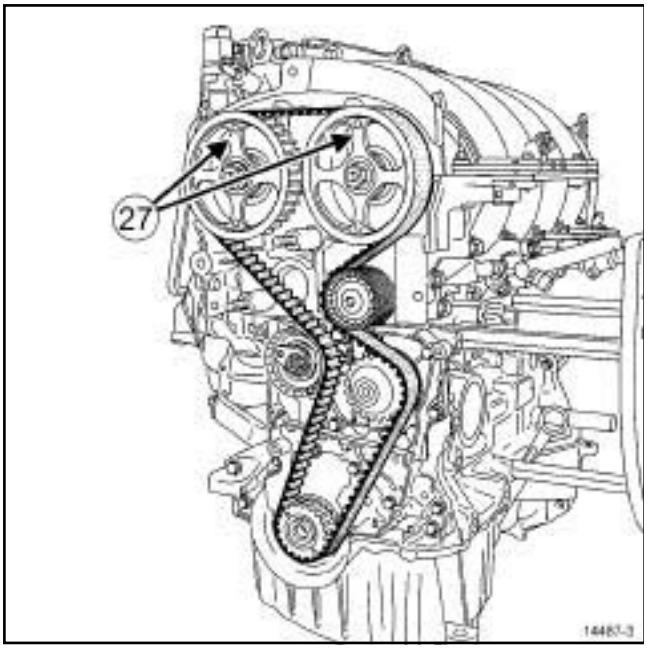
❑ Fit:



- the (**23**) onto the ends of the camshafts,
- an M6 bolt (**24**) to hold the.

❑ Refit:

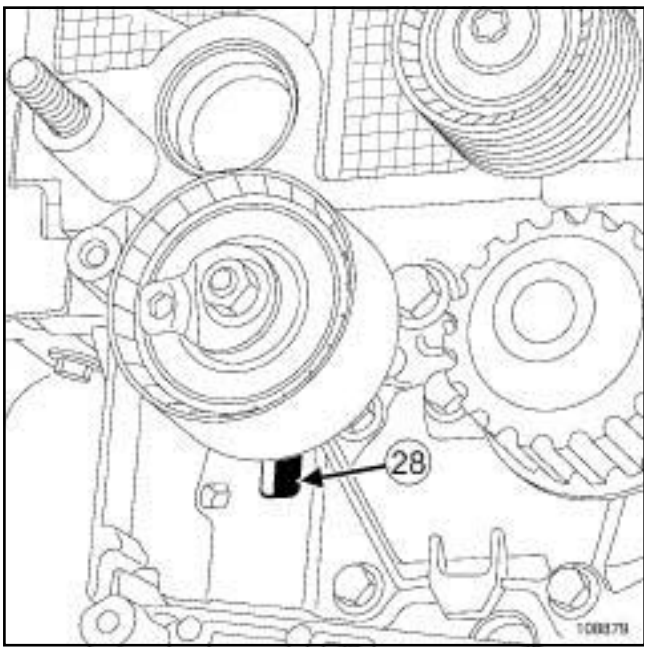
- the crankshaft timing sprocket,
- the camshaft sprockets,
- every camshaft sprocket nut.



130493

14489

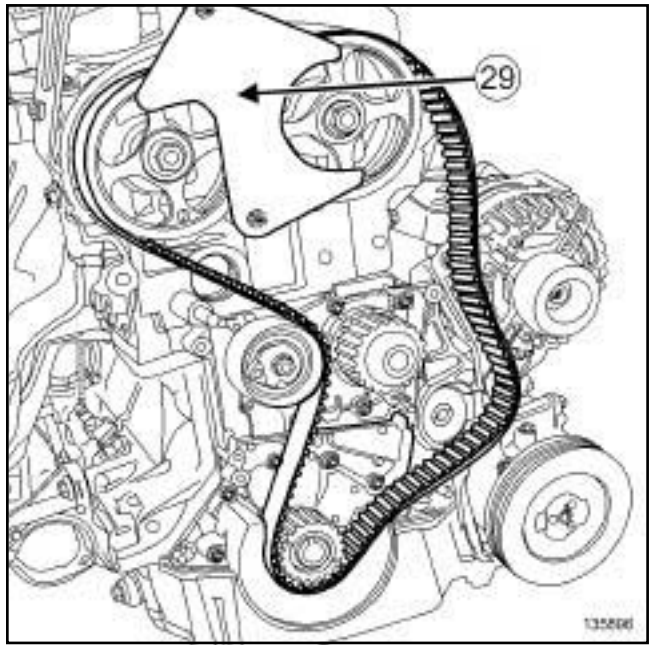
❑ Refit the toolon the cylinder block.



❑ Use a screwdriver (**25**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool (**26**) using the screwdriver; the crankshaft groove should be at the top.

14487-3

❑ Position the RENAULT badge (**27**) etched on the stem of each camshaft sprocket vertically and pointing upwards.



2 - Refitting

108879

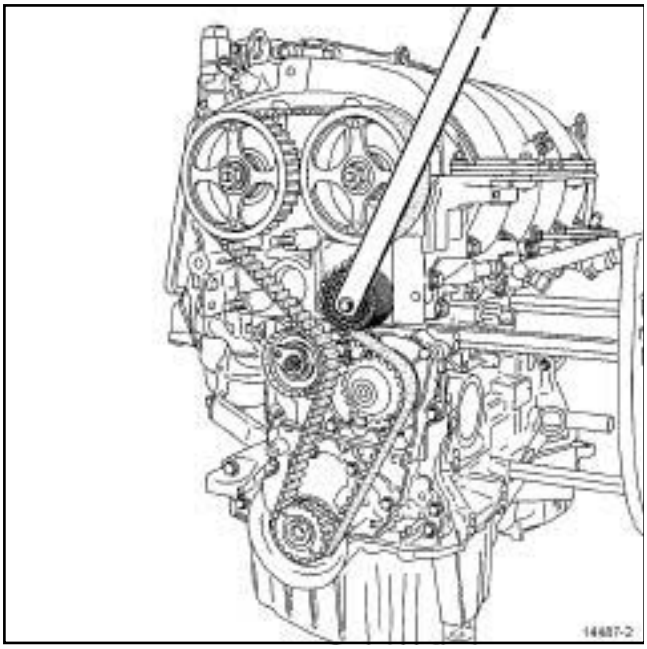
❑ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**28**) .

❑ Screw on the timing tensioning roller nut without tightening it.

135896

❑ Refit a new timing belt starting with the sprocket of each camshaft (without moving the sprocket of each camshaft).

❑ Fit the tool (**29**) on the camshaft sprockets (use the bolt and nut of the upper timing cover to fit the tool).



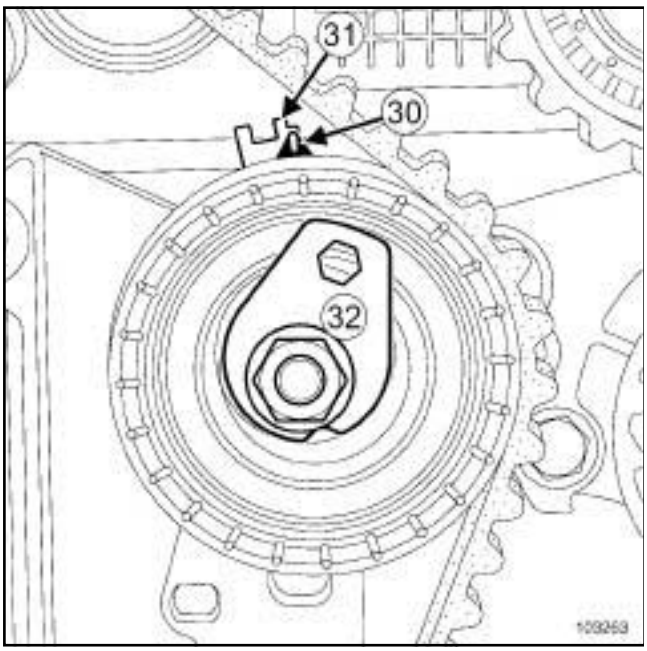
Note:

Take care to properly tighten the timing belt between the two camshaft sprockets.

Note:

If the engine is equipped with a crankshaft timing sprocket with a collet, take care to properly tighten the timing belt between the exhaust camshaft sprocket and the crankshaft timing sprocket.

K4M



14487-2

❑ Refit a new timing fixed roller.

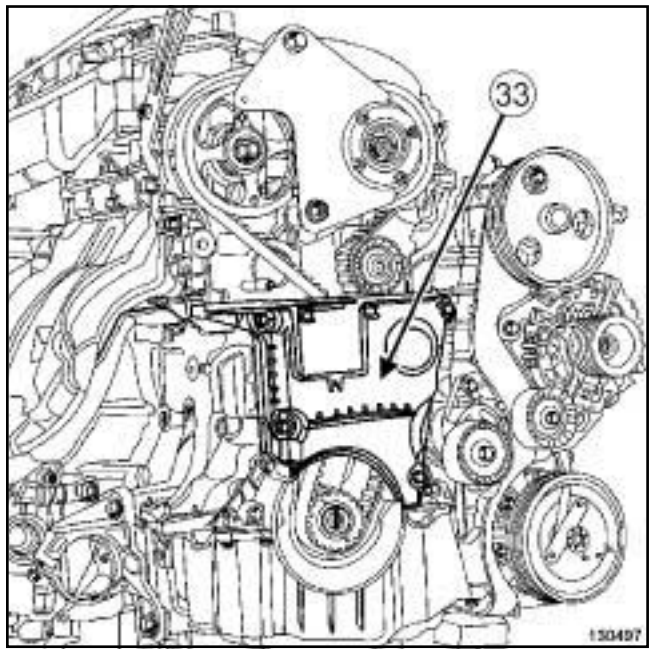
❑ Torque tighten the **timing fixed roller bolt (50 N.m)** using the tool.

3 - Timing belt tension

103263

❑ Position the adjustable index (**30**) opposite the mark (**31**) , by turning the eccentric (**32**) clockwise using an Allen key.

❑ Torque tighten the **timing tensioning roller nut (7 N.m)**.



Note:

There are two types of lower timing cover:

- without a timing flap,

- with a timing flap.

a - Lower timing cover with a timing flap

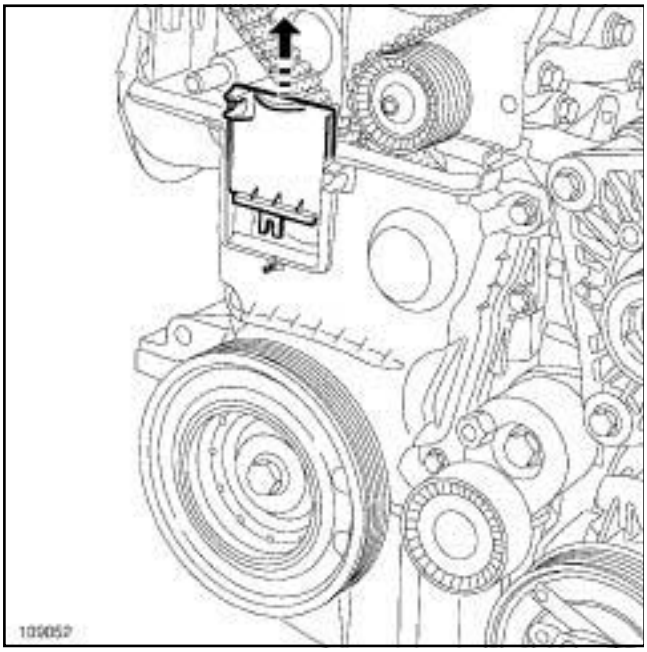
130497

❑ Refit the lower timing cover (**33**) .

❑ Tighten to torque the **lower timing cover bolts (12 N.m)**.

b - continuation of the refitting procedure regardless of the type of lower timing cover

❑ Refit a new crankshaft accessories pulley.



❑ Torque and angle tighten:

- the **new bolt of the crankshaft accessories pulley (40 N.m + 145° ± 15°)**,

- the **nut of each camshaft sprocket (30 N.m + 84° ± 4°)**.

K4M

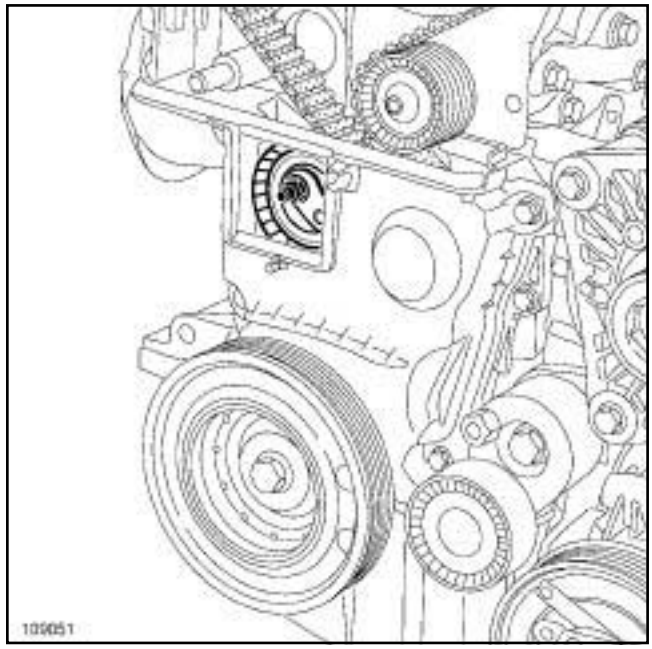
c - Lower timing cover with a timing flap

109052

❏ Remove the timing flap from the lower timing cover.

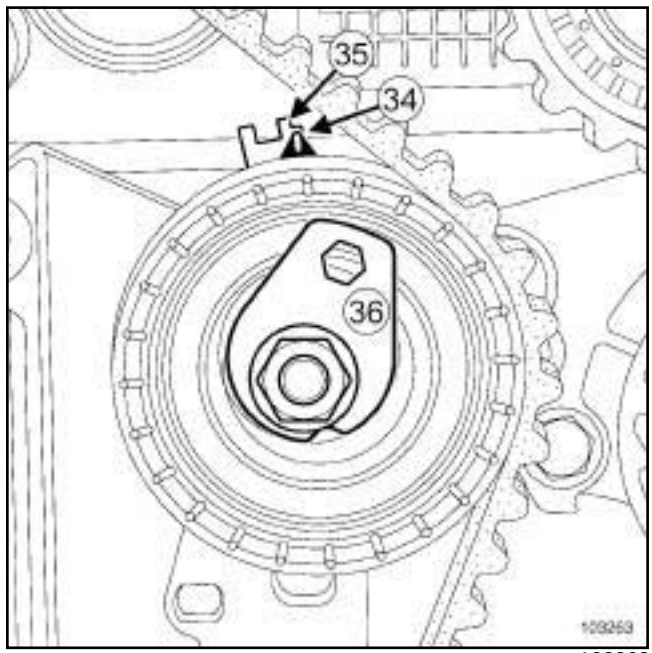
d - continuation of the refitting procedure regardless of the type of lower timing cover

❏ Remove:



- the bolt of the tool,
- the,
- the toolfrom the cylinder block,
- the.

4 - Checking the tension



❏ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the toolinto the cylinder block.

❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool.

❏ Remove the toolfrom the cylinder block.

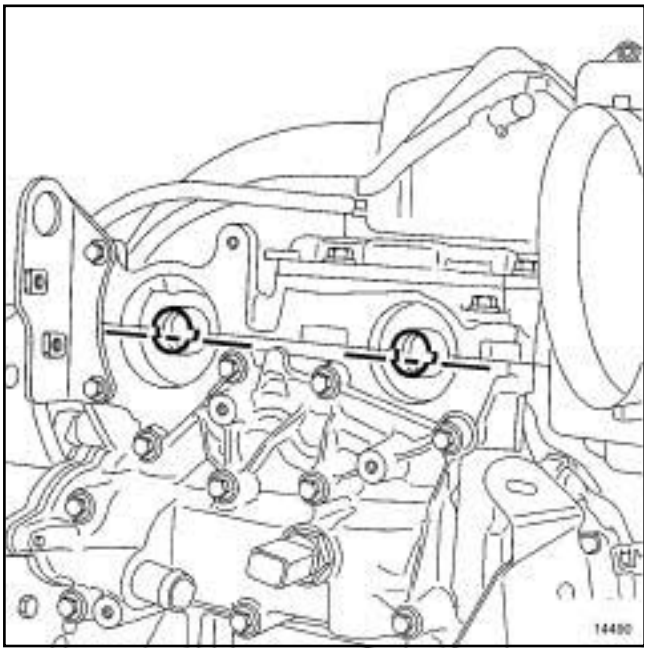
109051

103263

❏ Check that the adjustable index (**34**) is opposite the notch (**35**) , if this is not the case:

- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with an Allen key,
- gradually move the adjustable index marker (**34**) opposite the mark (**35**) turning the eccentric cam (**36**) clockwise.

❏ Torque tighten the **timing tensioning roller nut (27 N.m)**.



K4M

5 - Checking the timing

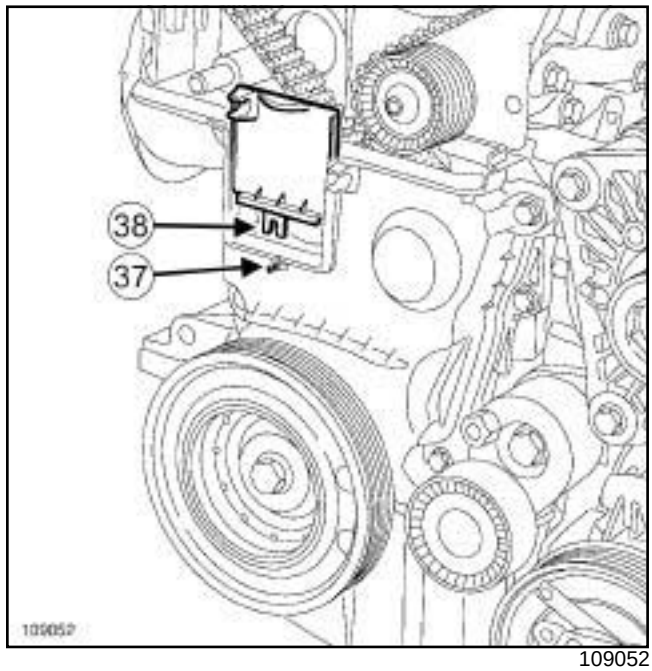
❑ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

❑ Screw toolinto the cylinder block.

❑ Move the crankshaft slowly and smoothly until it comes into contact with the tool.

14490

❑ Position (without forcing) the(the camshaft end grooves must be horizontal and offset downwards).



Note:

If thecannot be engaged, readjust the timing and the tension.

❑ Remove:

- the setting tool,
- thefrom the cylinder block.

a - Lower timing cover with a timing flap

109052

❑ Refit the lower timing cover flap, checking that the locating pin (**37**) fits properly in the notch (**38**) .

b - Lower timing cover without a timing flap

❑ Refit the lower timing cover.

❑ Tighten to torque the **lower timing cover bolts (12 N.m)**.

III - FINAL OPERATION

❑ Apply a drop of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the TDC pin plug.

❑ Tighten to torque the **TDC pin plug (20 N.m)**.

❑ Refit the upper timing cover.

❑ Torque tighten:

- the **upper timing cover bolts (46 N.m)**,
- the **upper timing cover nuts (46 N.m)**.

❑ Refit:

- a new inlet camshaft plug using the,
- a new exhaust camshaft plug using the,
- the engine lifting eye at the flywheel end.

❑ Torque tighten the **flywheel end lifting eye bolts (10 N.m)**.

K4M

❑ Refit:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the air inlet duct.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K, and 796

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

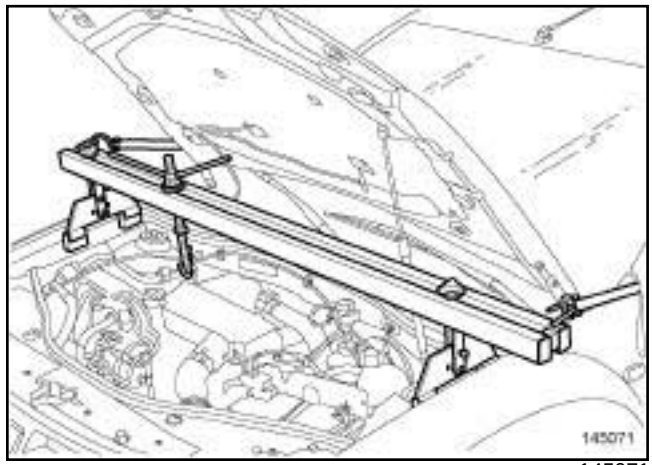
Tightening torques ▽	
timing belt tensioning roller bolt	**27 N.m**
accessories pulley M14 bolt	**120 N.m + 95° ± 15°**
timing belt tensioning roller bolt	**27 N.m**
TDC pin plug	**25 N.m**
right-hand suspended engine mounting bolts	**25 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Engine: Precautions for the repair**) .

IMPORTANT
Wear protective gloves during every operation.

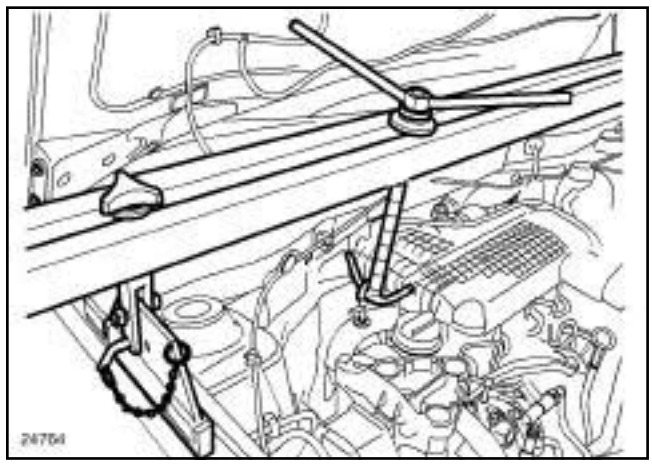
WARNING
Never run the engine in the opposite direction to that of normal operation.

WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.



REMOVAL

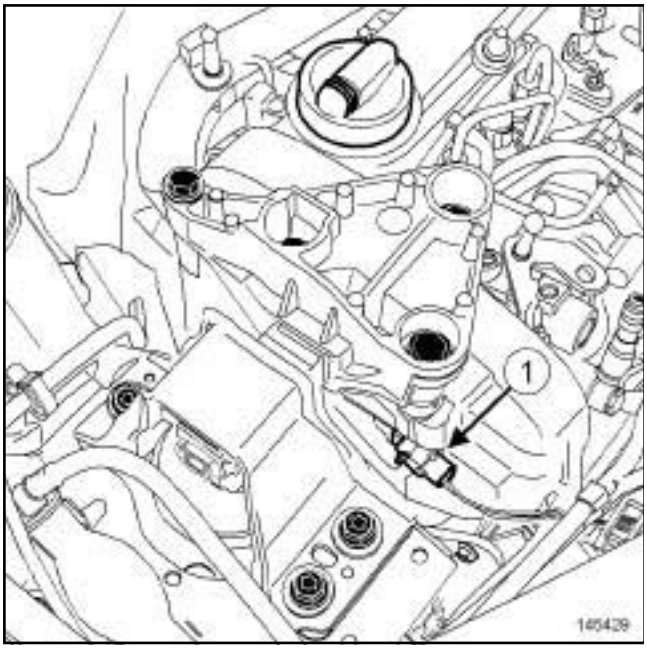
I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

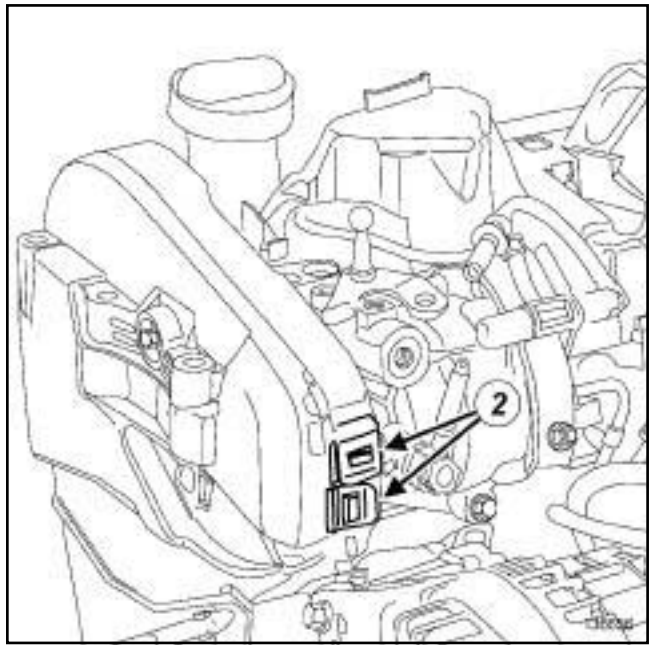


145071

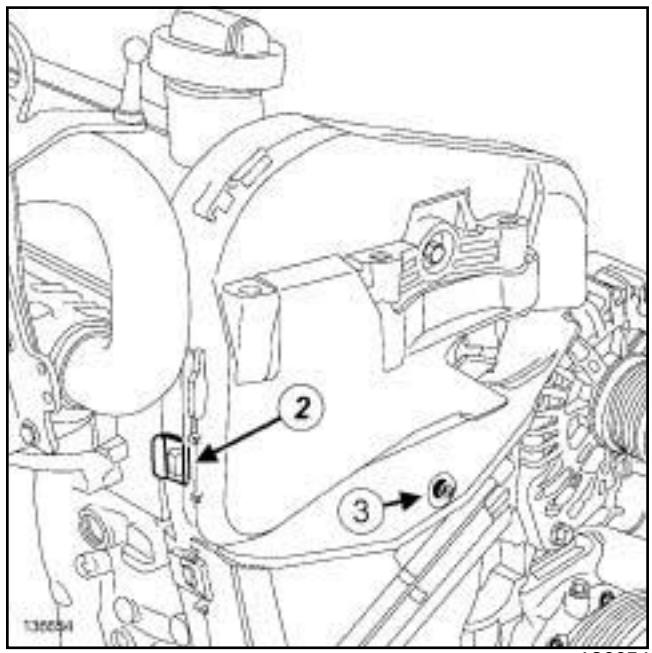
24764

❑ Fit the engine support tool **(Mot. 1453)** with the retaining belt, taking the timing end lifting eye as an anchoring point.

K9K, and 796



145429

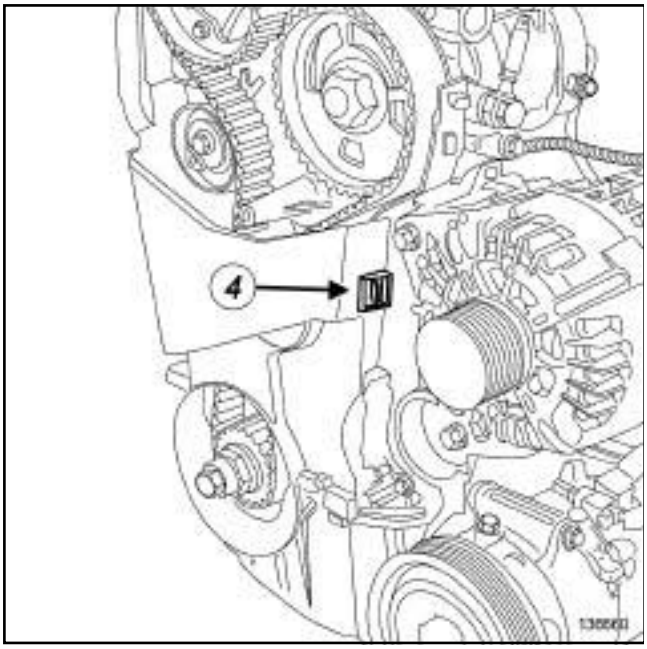


❑ Mark the position of the suspended engine mounting in relation to the body.

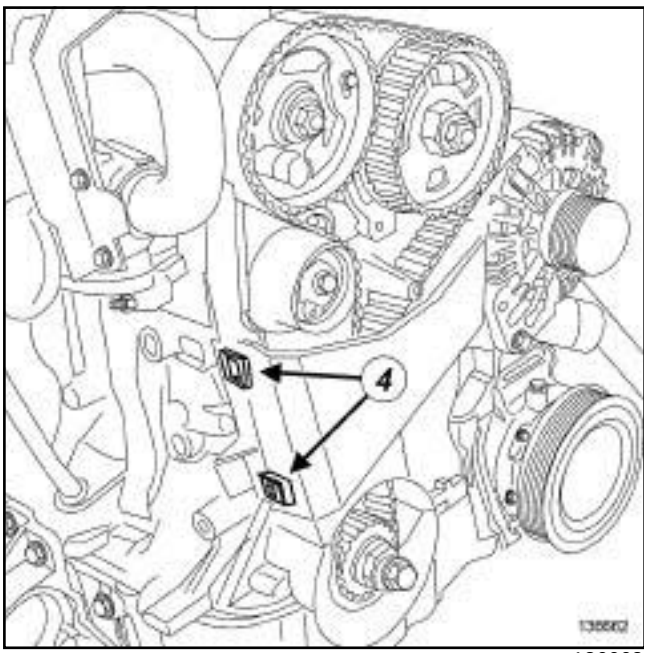
❑ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the camshaft position sensor (**1**) (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

136656



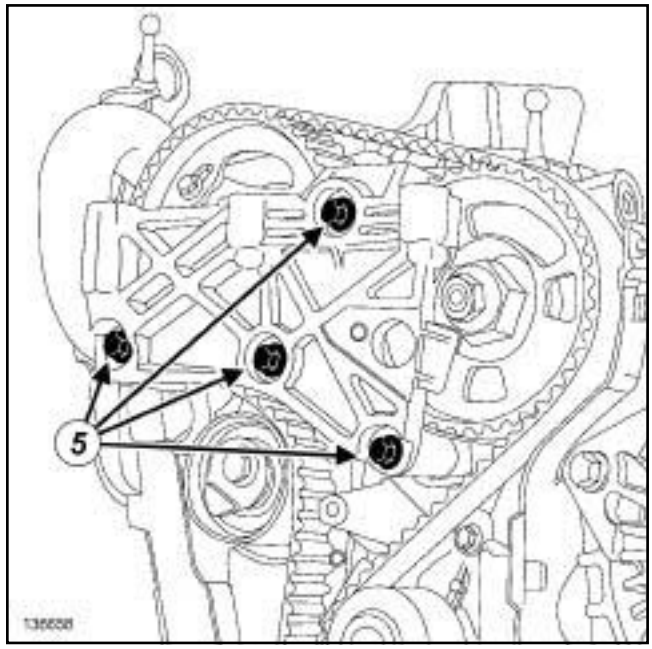
136654



❑ Remove:

- the bolt (**3**) from the upper timing cover,
- the upper timing cover by unclipping the three tabs (**2**) .

K9K, and 796

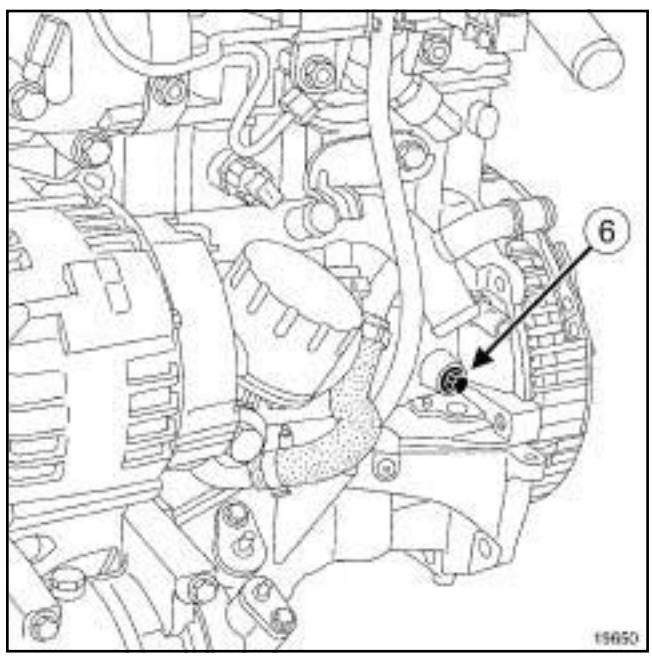


136660

136662

❑ Unclip the three tabs (**4**) .

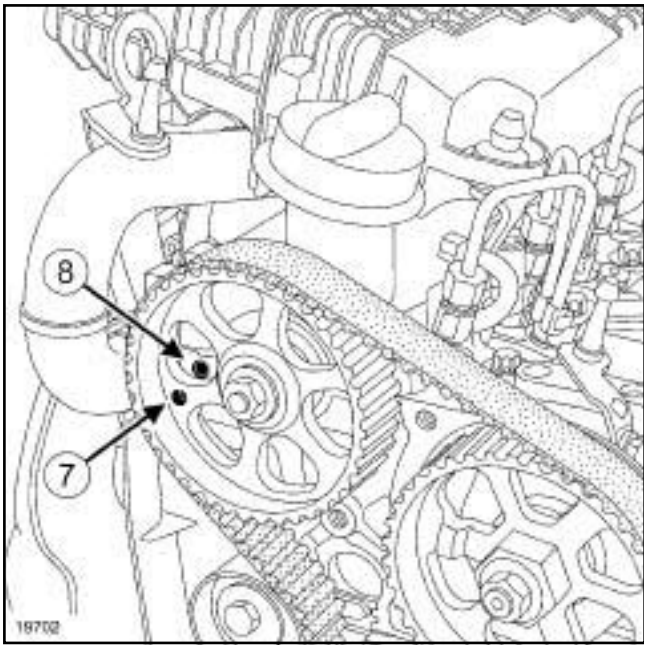
❑ Remove the lower timing cover.



136658

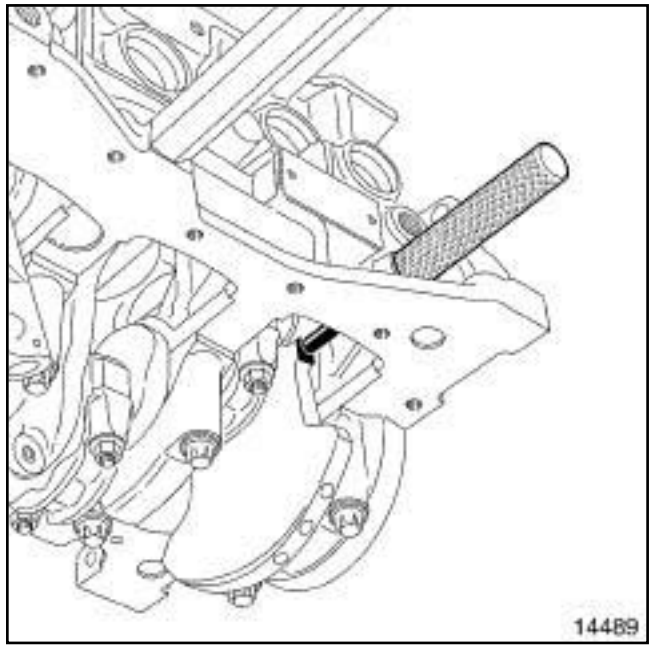
❑ Remove:

- the bolts (**5**) from the right-hand suspended engine mounting support on the cylinder head,
- the right-hand pendulum suspension support.



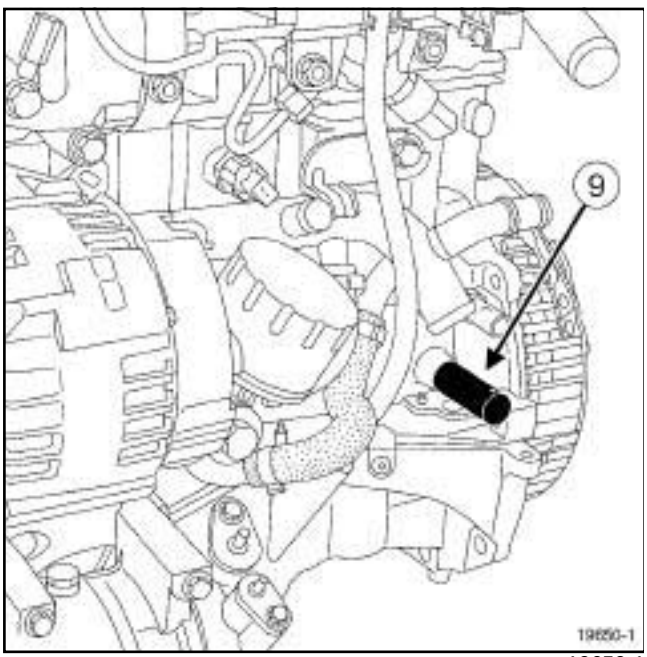
II - REMOVAL OPERATION

19650



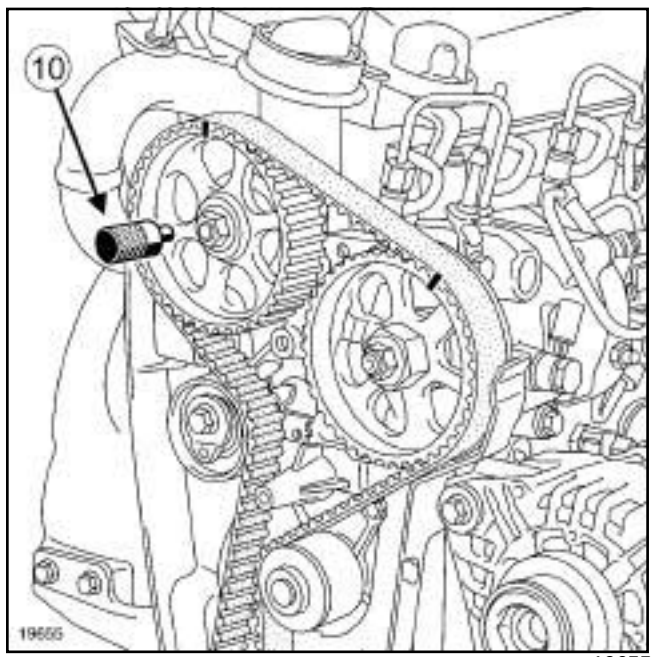
❑ Remove the TDC pin plug (**6**) using a **14** female torx socket.

K9K, and 796



19702

❏ Turn the crankshaft to position the camshaft pulley hole (**7**) almost opposite the cylinder head hole (**8**) .

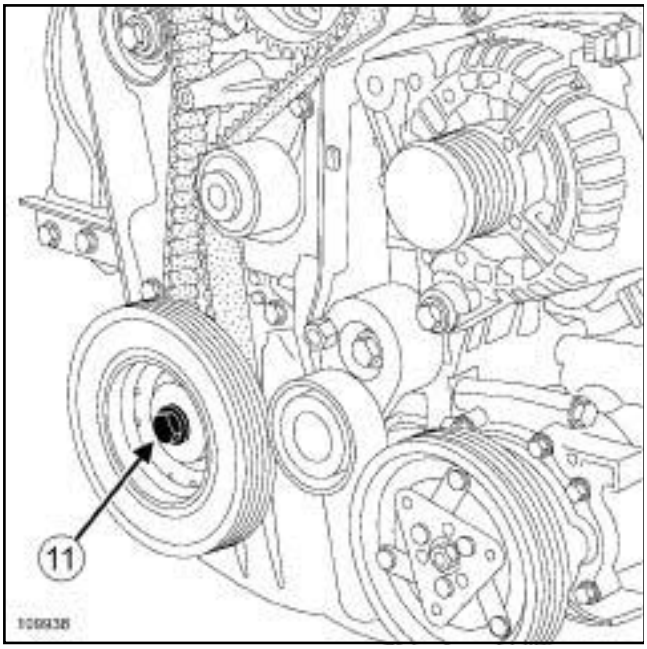


14489

❏ Turn the crankshaft clockwise (timing end) smoothly until the crankshaft is against the **(Mot. 1489)**.

19650-1

❏ Screw tool **(Mot. 1489)** (**9**) into the cylinder block.

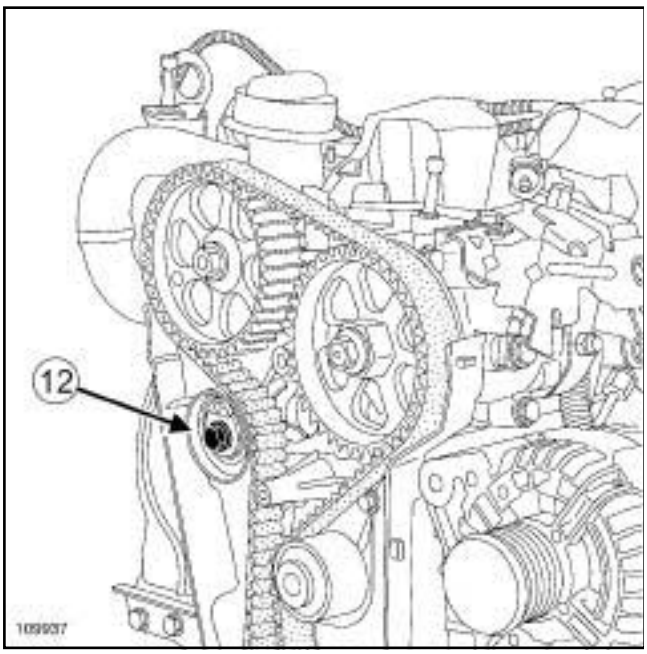


19655

❏ Insert the **(Mot. 1430)** (**10**) in the holes of the camshaft pulley and cylinder head.

❏ Remove:

- the **(Mot. 1430)**,
- the **(Mot. 1489)**.



K9K, and 796

109938

❑ Remove:

- the bolt (**11**) from the crankshaft accessories pulley, locking the flywheel using a large screwdriver,
- the crankshaft accessories pulley.

109937

❑ Undo the timing belt tensioning roller bolt (**12**) .

❑ Loosen the timing belt tensioning roller by turning the eccentric cam using a **6 mm** Allen key.

❑ Remove:

- the timing belt taking care not to let the crankshaft timing sprocket fall out.
- the timing belt tensioning roller.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
The belt must be replaced with a new one if it has been removed.

WARNING
When replacing the belt, always replace the tension wheels and idler pulleys.

WARNING

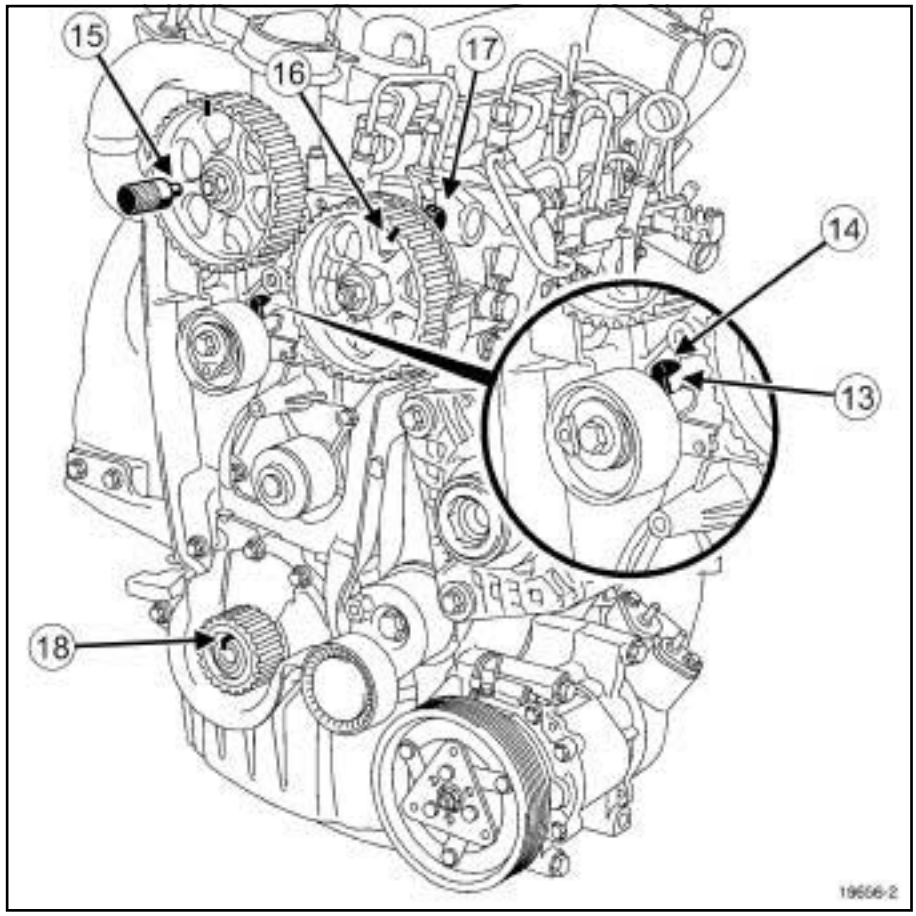
Always degrease:

- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the contact surfaces of the crankshaft accessories pulley.

This is to avoid timing slippage.

This slippage leads to engine damage.

II - PARTS AND CONSUMABLES FOR THE REPAIR



❑ **parts always to be replaced: Crankshaft accessories pulley bolts**,

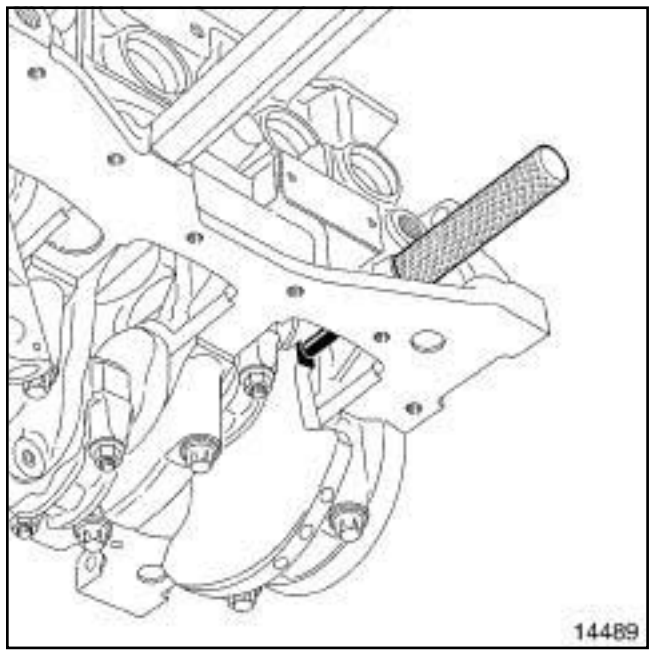
❑ **parts always to be replaced: Timing belt tensioning roller**,

❑ **parts always to be replaced: Timing belt**.

K9K, and 796

III - REFITTING OPERATION

19656-2



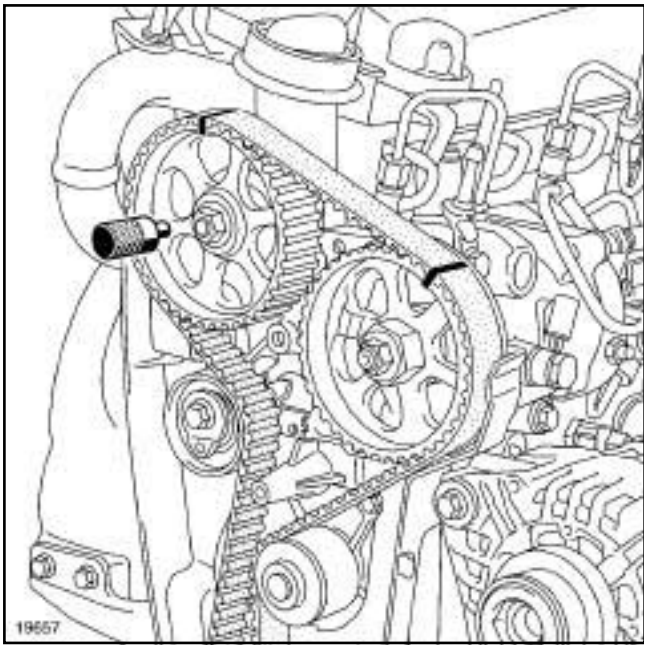
❏ Refit:

- the crankshaft timing sprocket,
- a new timing belt tensioning roller.

❏ Put the tensioning roller lug (**13**) in the cylinder head groove (**14**) .

❏ Engage the **(Mot. 1430)** in the camshaft pulley hole and the cylinder head hole at (**15**) , turning the camshaft using an **18 mm** offset wrench if necessary.

❏ Check that high-pressure pump pulley marking (**16**) is opposite the bolt head (**17**) .

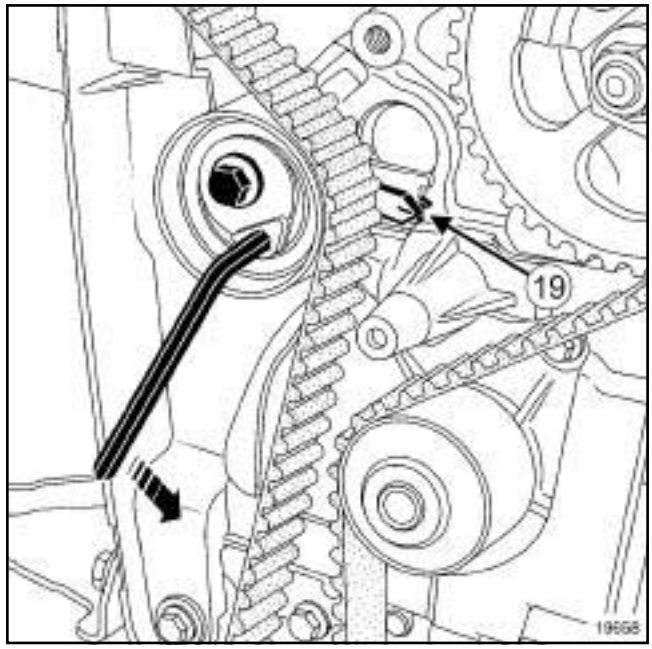


14489

❏ Refit the **(Mot. 1489)**.

❏ Place the crankshaft against the **(Mot. 1489)** (the crankshaft groove ***(18)*** must be upwards).

K9K, and 796



19657

❑ Fit the new timing belt, starting with the crankshaft sprocket, aligning the marks on the belt with those on the camshaft and high pressure pump pulleys.

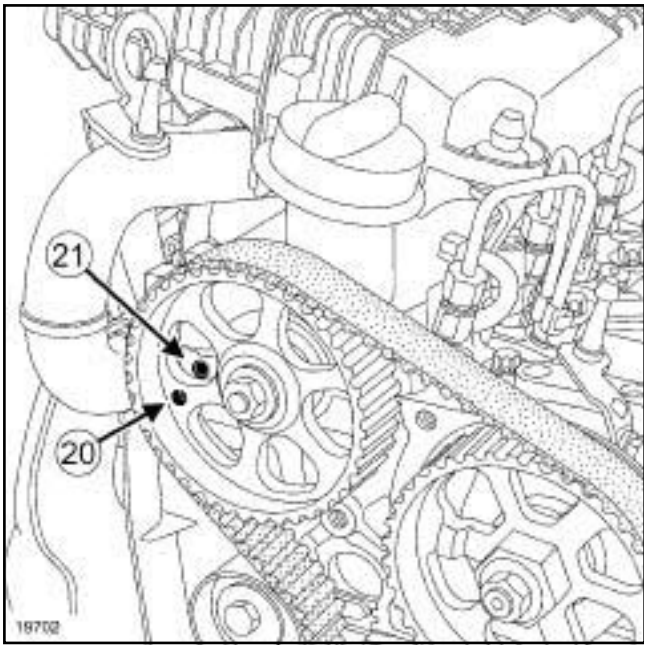
Note:

There must be **19 timing belt tooth grooves** between the marks of the camshaft and high pressure pump pulleys and **51 timing belt tooth grooves** between the marks of the crankshaft timing sprocket and the high pressure pump pulley.

19658

❑ Position the timing belt tensioning roller adjustable index opposite the lug (**19**) by turning the eccentric cam anti-clockwise using a **6 mm** Allen key.

❑ Torque tighten the **timing belt tensioning roller bolt (27 N.m)**.



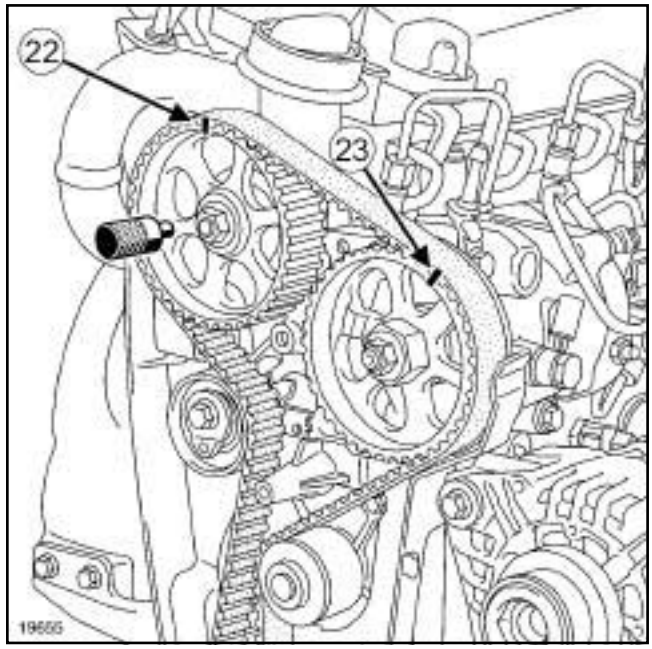
❑ Refit the accessories crankshaft pulley with a new bolt.

❑ Torque and angle tighten (crankshaft against the **(Mot. 1489)**) the **accessories pulley M14 bolt (120 N.m + 95° ± 15°)**.

❑ Remove:

- the **(Mot. 1430)**,
- the **(Mot. 1489)**.

K9K, and 796



19702

❏ Rotate the crankshaft clockwise through two revolutions (timing end).

❏ Before the camshaft pulley hole (**20**) is opposite the cylinder head hole (**21**) , screw the **(Mot. 1489)** into the cylinder block.

❏ Bring the crankshaft slowly and smoothly into contact with the tool **(Mot. 1489)**.

19655

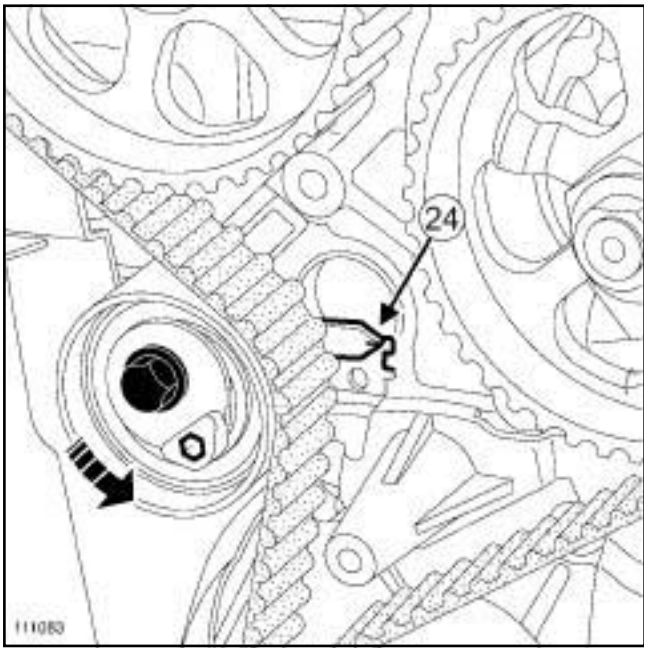
❏ Set the camshaft pulley using the **(Mot. 1430)**.

Note:

There should be **19 belt tooth grooves** between the marks on the camshaft pulley (**22**) and the high pressure pump pulley (**23**) .

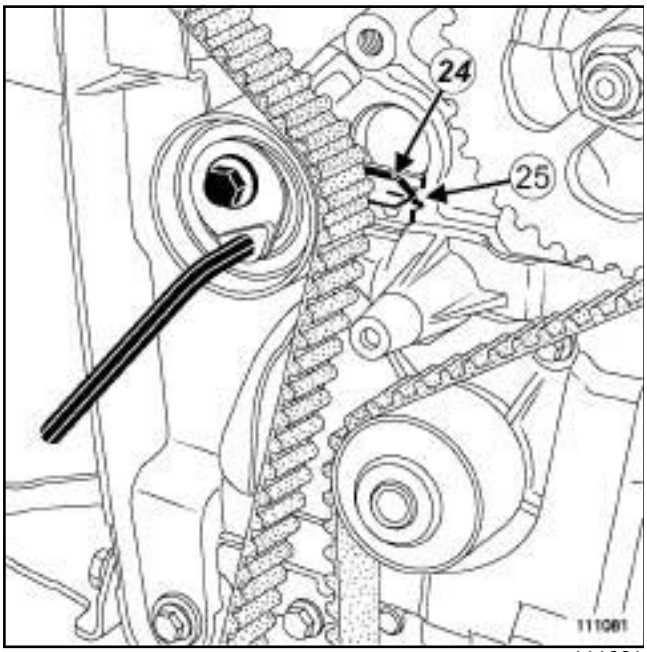
❏ Remove:

- the **(Mot. 1489)**,
- the **(Mot. 1430)**.



Note:

After rotating the crankshaft through two revolutions, the tensioning roller adjustable index may be in one of two positions.

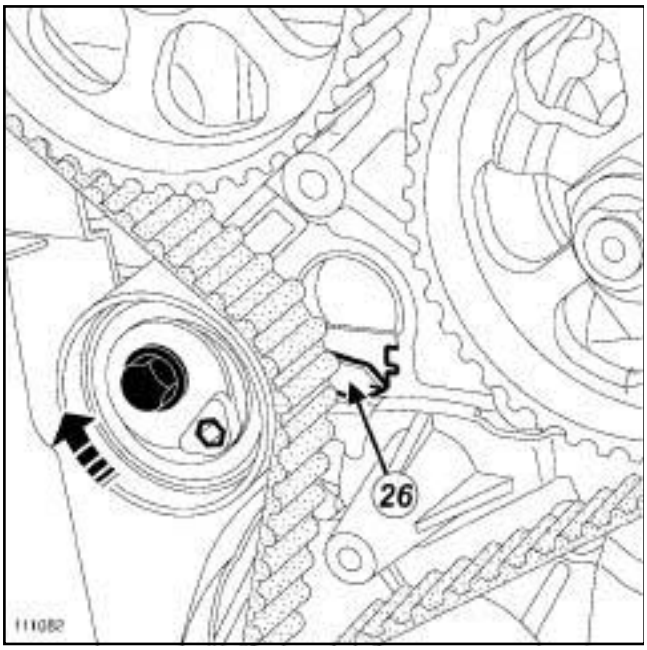


The rotation of the tension wheel eccentric depends on the position.

K9K, and 796

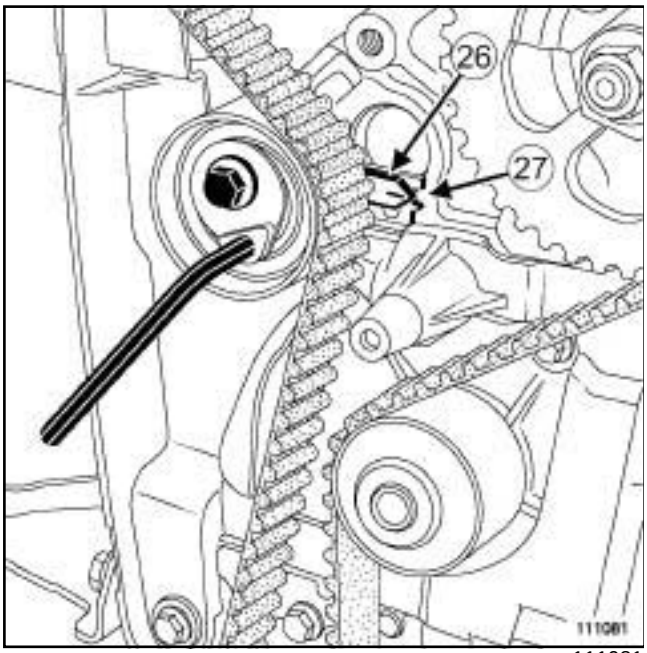
1 - First position

111083



111081

❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mmAllen key.**



❏ Gradually align the adjustable index marker (**24**) in the middle of the timing window (**25**) , turning the key anti-clockwise.

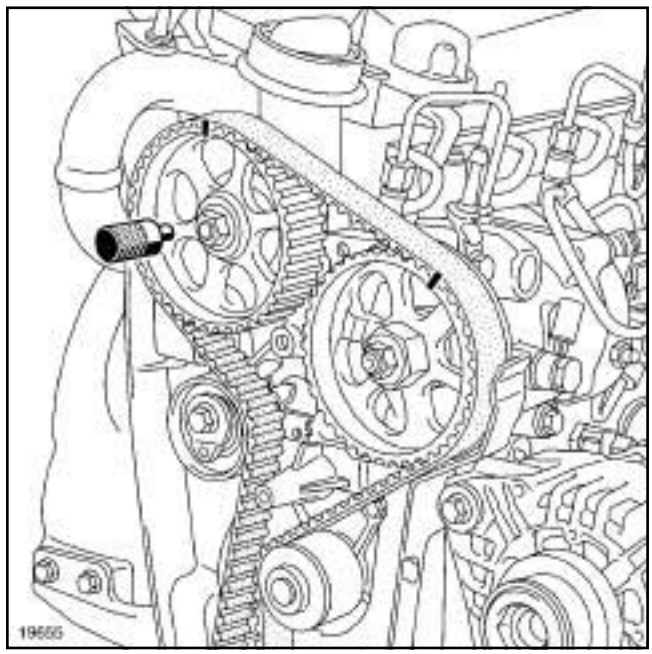
K9K, and 796

2 - Second position

111082

111081

❑ Loosen the tensioning roller bolt by one turn, holding it with a **6 mm** Allen key.



❑ Gradually align the adjustable index marker (**26**) in the middle of the timing window (**27**) , turning the key clockwise.

❑ Torque tighten the **timing belt tensioning roller bolt (27 N.m)**.

❑ Rotate the crankshaft clockwise through two revolutions (timing end).

❑ Before the camshaft pulley hole is opposite the cylinder head hole, screw the **(Mot. 1489)** into the cylinder block.

❑ Bring the crankshaft slowly and smoothly into contact with the tool **(Mot. 1489)**.

19655

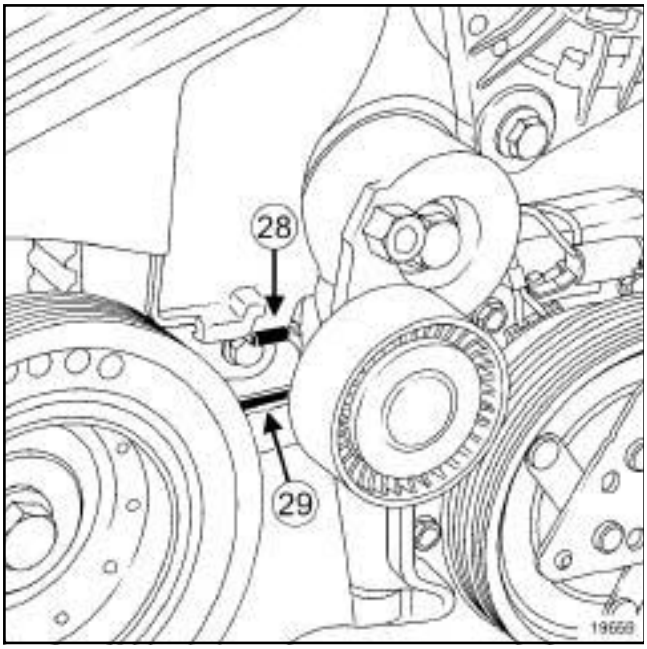
❑ Set the camshaft pulley using the **(Mot. 1430)**.

❑ If the tool **(Mot. 1430)** does not engage, repeat the timing belt refitting operation.

❑ Remove:

- the **(Mot. 1489)**,
- the **(Mot. 1430)**.

IV - FINAL OPERATION



❑ Place a drop of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) on the threading of the TDC pin plug.

❑ Torque tighten the **TDC pin plug (25 N.m)**.

❑ Refit the right-hand suspended engine mounting support on the cylinder head.

❑ Torque tighten the **right-hand suspended engine mounting bolts (25 N.m)**.

K9K, and 796

19659

❏ Refit the lower timing cover, positioning the tab (**28**) in the opening (**29**) on the inner cover.

❏ Clip on the lower timing cover.

❏ Refit:

- the upper timing cover,
- the upper timing cover bolt.

❏ Clip on the upper timing cover.

❏ Refit:

- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) , observing the marks made during removal.

❏ Remove the engine support tool **(Mot. 1453)**.

❏ Refit the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

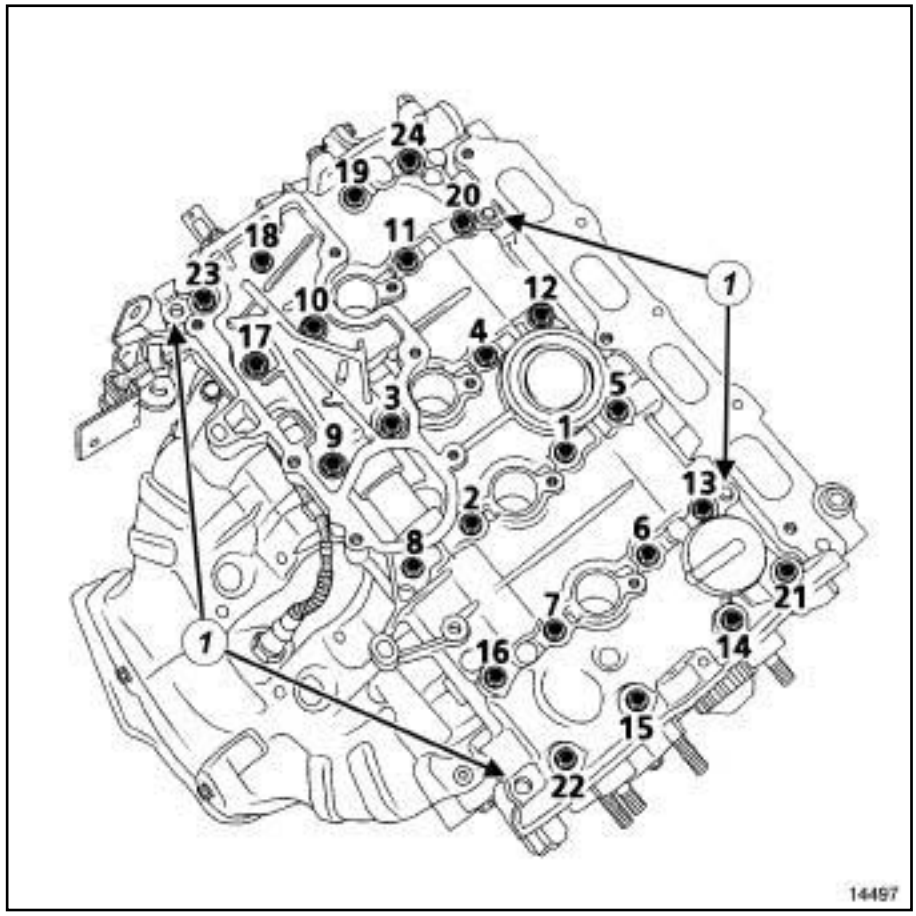
❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Tightening torques ▽	
rocker cover bolts 22, 23, 20 and 13	**8 N.m**
rocker cover bolts 1 to 12, 14 to 19, 21 to 24	**15 N.m**
rocker cover bolts 22, 23, 20 and 13	**15 N.m**
flywheel end lifting eye bolts on the rocker cover	**11 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the timing end camshaft seals (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-56**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-68**) ,
- the flywheel end lifting eye on the rocker cover.

K4M

II - REMOVAL OPERATION

14497

- ❏ Remove the rocker cover bolts.
- ❏ Remove the rocker cover vertically by tapping the lugs (**1**) with a copper hammer.
- ❏ Remove the rocker cover.

K4M

REFITTING

I - REFITTING PREPARATION OPERATION

❑

IMPORTANT
Wear cut-resistant gloves during the operation.

IMPORTANT
Wear goggles with side protectors for this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

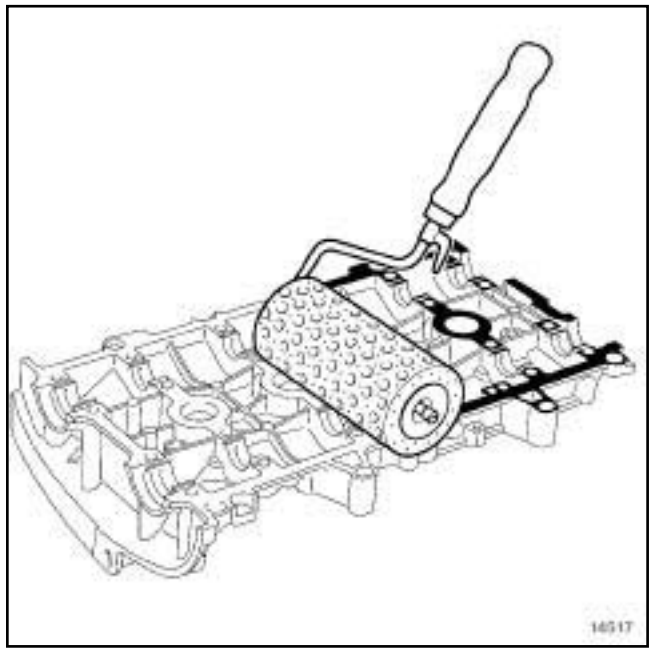
Note:

The gasket faces on the rocker cover must be clean, dry and free from grease (avoid finger marks).

❑ Clean the gasket face of the rocker cover and cylinder head with **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve any pieces of seal that are still attached.

❑ Apply the product to the section to be cleaned.

❑ Wait approximately fifteen minutes, then remove any residue with a wooden spatula.

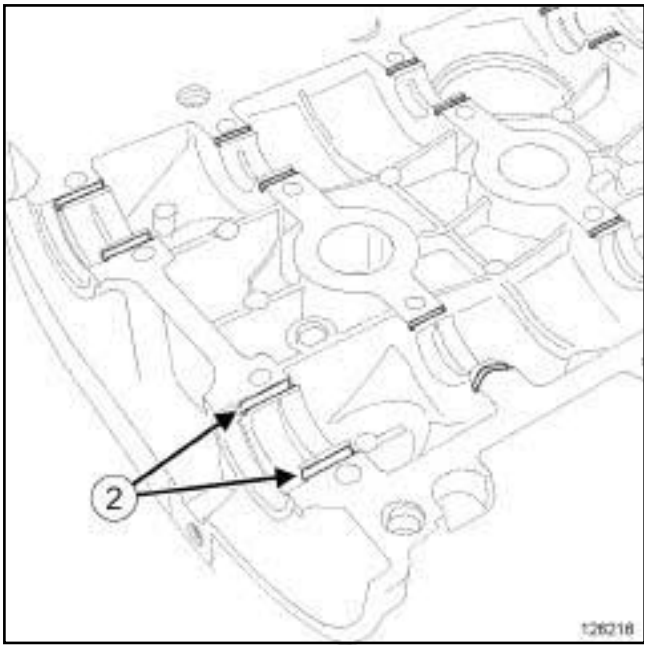


❑ Lubricate the cylinder head camshaft bearings with engine oil.

❑

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

Note:

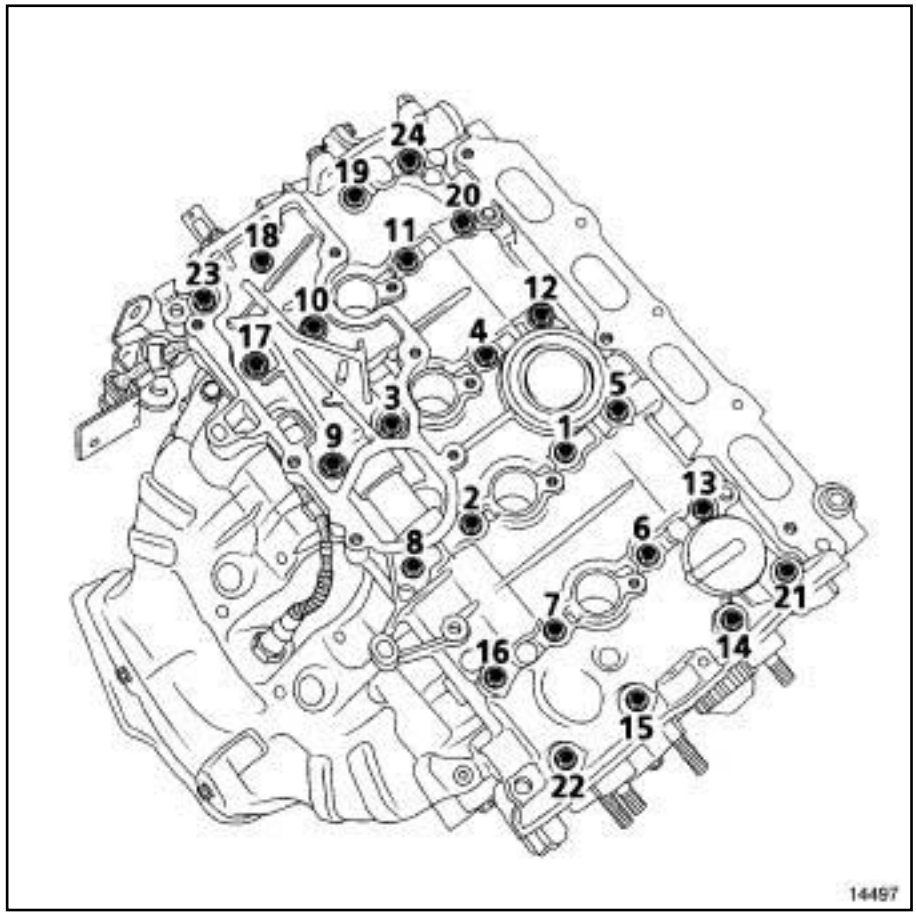


Do not put oil on the gasket face of the cylinder head cover.

14517

❑ Using a stipple roller, apply **RESIN ADHESIVE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the gasket face until it is well coated.

K4M



126216

❑ Use a cloth to remove any **RESIN GLUE** in the bearing channels (**2**) on the rocker cover.

K4M

II - REFITTING OPERATION

14497

❑ Refit the rocker cover.

❑ Tighten to torque and in order:

- **rocker cover bolts 22, 23, 20 and 13 (8 N.m)**,
- **rocker cover bolts 1 to 12, 14 to 19, 21 to 24 (15 N.m)**.

❑ Loosen bolts 22, 23, 20 and 13, in order.

❑ Torque tighten in order **rocker cover bolts 22, 23, 20 and 13 (15 N.m)**.

III - FINAL OPERATION

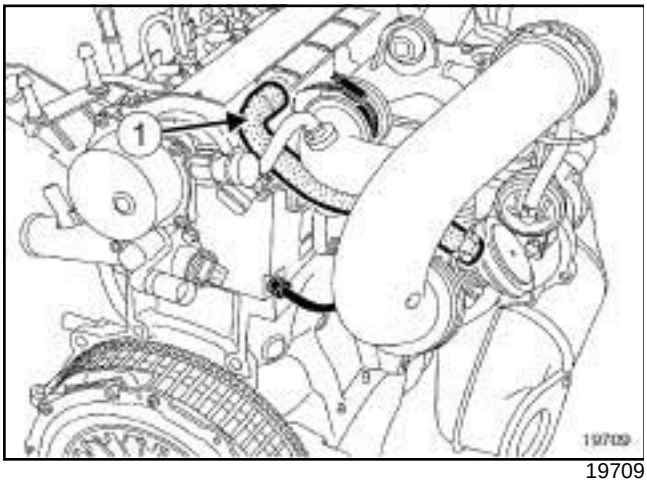
❑ Refit the flywheel end lifting eye.

❑ Torque tighten the **flywheel end lifting eye bolts on the rocker cover (11 N.m)**.

❑ Refit:

- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-68**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the camshaft seals (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-56**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



K9K

Tightening torques ▽	
rocker cover bolts	**12 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

19709

❑ Remove the oil vapour rebreathing hose (**1**) .

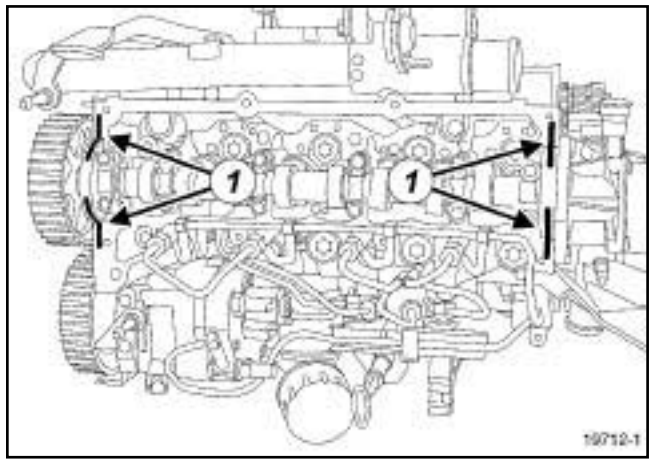
II - REMOVAL OPERATION

❑ Remove:

- the rocker cover bolts,
- the rocker cover,
- the rocker cover seal.

REFITTING

I - REFITTING PREPARATION OPERATION



❑ Clean the cylinder head joint face using **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

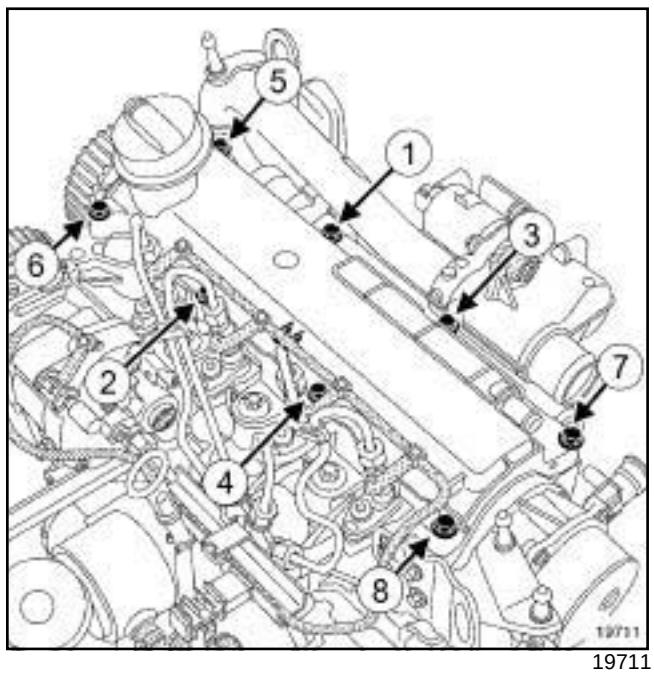
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

- the cylinder head joint face,
- the housing of the rocker cover seal, if reusing.

❑ **parts always to be replaced: rocker cover seal**.

II - REFITTING OPERATION

19712-1



❑

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Deposit four beads (**1**) of **SILICONE ADHESIVE SEALANT** that are **2 mm** in diameter and **10 mm** long.

❑ Refit:

- the rocker cover,
- the rocker cover bolts.

19711

❑ Torque tighten in order the **rocker cover bolts (12 N.m)**.

K9K

III - FINAL OPERATION

❑ Connect the oil vapour rebreathing pipe.

❑ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

K4M

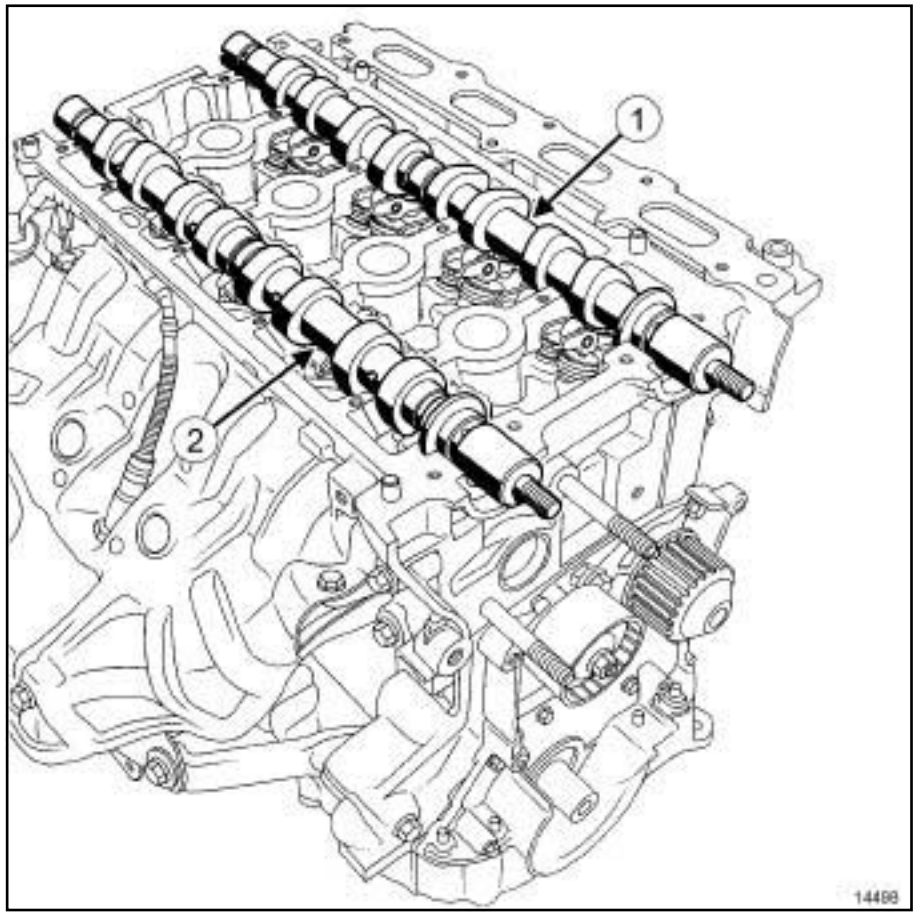
Equipment required
roller-type stud removal tool

Tightening torques ▽	
the camshaft dowel	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



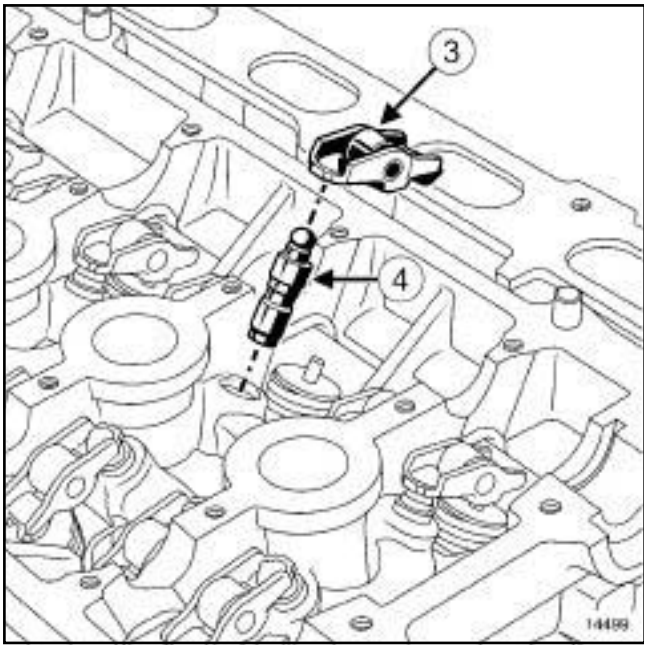
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-42**) ,
- the timing end camshaft seals (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-56**) .

K4M

II - REMOVAL OPERATION



14498

❑ Remove:

- the inlet camshaft (**1**) ,
- the exhaust camshaft (**2**) .

K4M

14499

❑ Remove:

- the valve rockers (**3**) ;
- the hydraulic tappets (**4**) .

Note:

To prevent any risk of unpriming the hydraulic tappets make sure that they are vertical.

REFITTING

I - REFITTING PREPARATION OPERATION

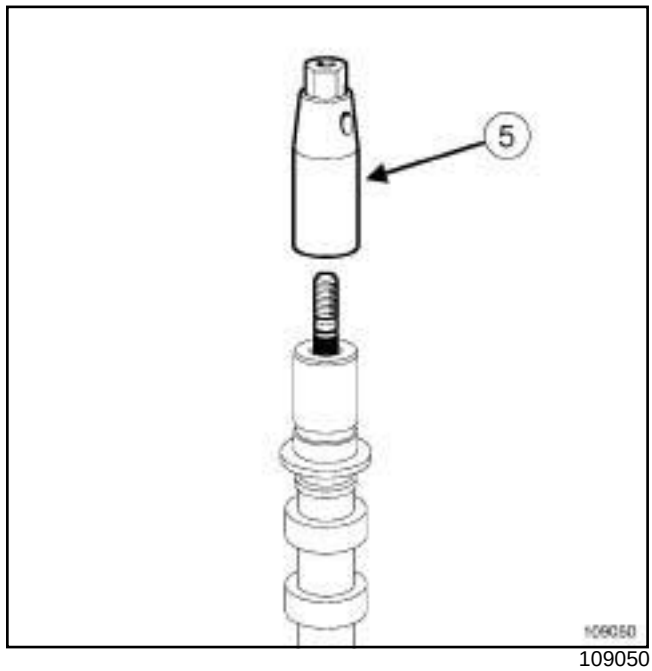
❑ Refit the camshafts while positioning them correctly (see) (Technical Note 6023A, 10A, Engine and peripherals).

Note:

It is essential to reprime the hydraulic tappets as these may become drained if removed for a long time.

❑ To check if re-priming is necessary, press the top of the tappet with your thumb. If the tappet piston depresses, immerse the tappets in a container full of diesel then reprime them.

Replacing a camshaft dowel



❑

Note:

It is essential to replace the camshaft dowel if it comes loose at the same time as the nut.

a - Removal

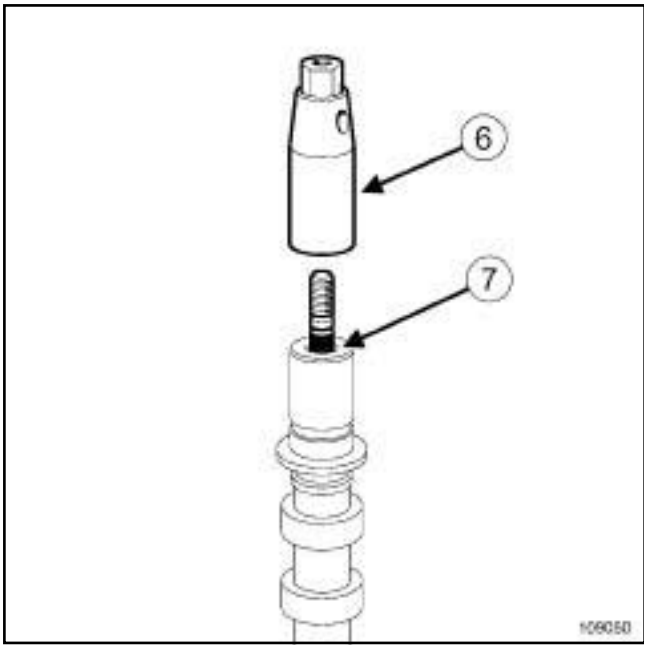
❑ Place the camshaft in a vice with **aluminium jaws**.

109050

❑ Remove the dowel using a **roller-type stud removal tool** (**5**) .

b - Cleaning the camshaft

❑



Note:

Clean the thread hole of the camshaft carefully to prevent foreign bodies from entering the latter.

Failure to follow this advice could lead to the blocking of the oil inlet holes, which would quickly result in engine damage.

c - Refitting

❑ Place the camshaft in a vice with **aluminium jaws**.

109050

❏ Refit the new camshaft dowel (precoated section (**7**) on the camshaft side).

❏ Torque tighten **the camshaft dowel (8 N.m)** using a **roller-type stud removal tool** (**6**) .

II - REFITTING OPERATION

❏ Refit:

- the hydraulic tappets,
- the valve rockers,
- the inlet camshaft, by lubricating the inlet camshaft bearings,
- the exhaust camshaft, by lubricating the exhaust camshaft bearings.

III - FINAL OPERATION

❏ Refit:

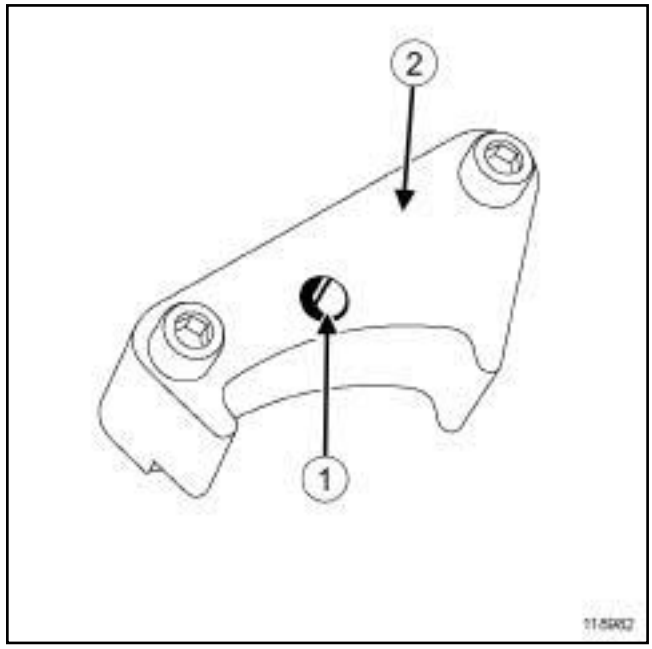
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-42**) ,
- the camshaft seals (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-56**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Tightening torques ▽	
bolts of the camshaft bearings	**10 N.m**

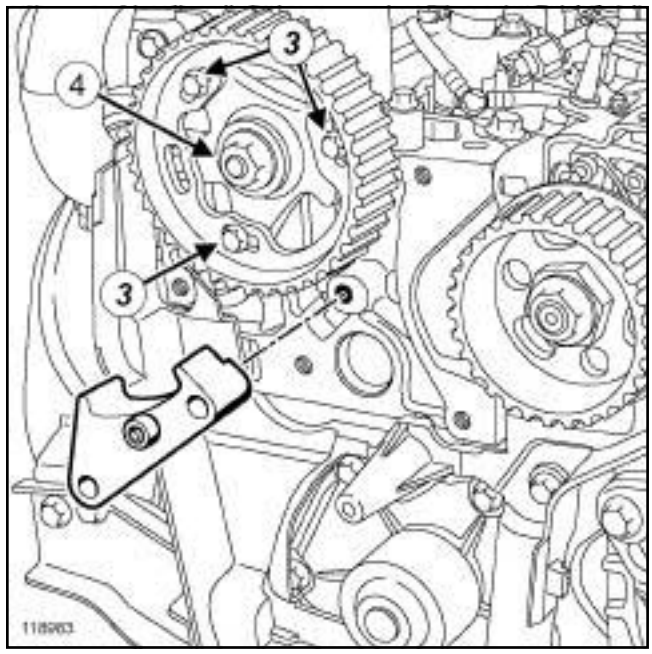
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❏ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner partially (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the engine undertray bolts,
- the engine undertray,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-10**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the vacuum pump (see **Vacuum pump: Removal - Refitting**) (37A, Mechanical component controls),
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-42**) .

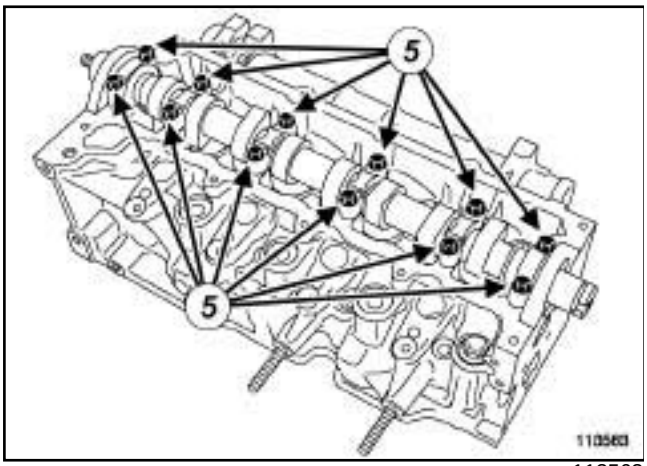
118982

❏ Increase the hole (**1**) of the (**2**) using an **8.5 mm** drill bit.

118983

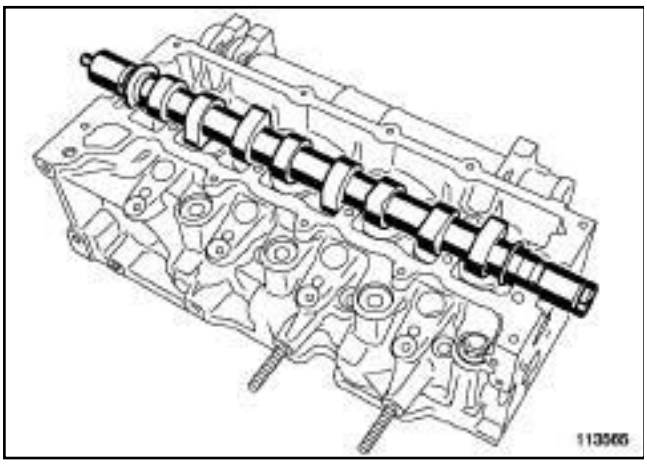
❏ Undo the camshaft pulley hub bolts (**3**) .

❏ Fit theon the cylinder head to lock the camshaft pulley wheel.



❏ Tighten the camshaft pulley hub bolts ***(3)*** .

❏ Remove:



- the nut ***(4)*** from the camshaft pulley,
- the,
- the camshaft pulley.

K9K

II - OPERATION FOR REMOVAL OF PART CONCERNED

113563

113565

❑ Mark the position of the camshaft bearings.

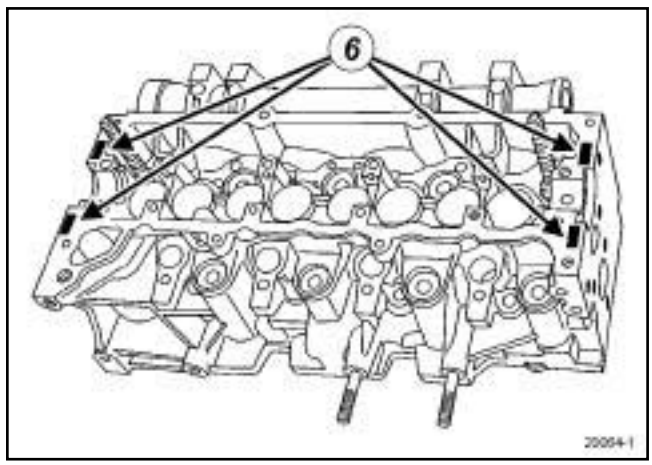
❑ Remove:

- the camshaft bearing bolts ***(5)*** ,
- the camshaft bearings,
- the camshaft,
- the timing end camshaft seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Camshaft seal on timing end**.



WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

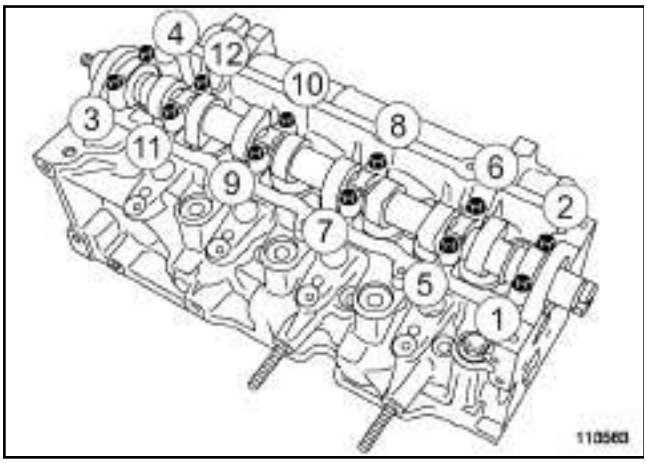
❑ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the bearing faces of the camshaft bearings.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the bearing faces of the camshaft bearings on the cylinder head,
- the bearing faces of the camshaft bearings on the camshaft bearings.

20064-1

❑



WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❏ Apply four beads (**6**) of **RESIN ADHESIVE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) **7 mm** in diameter on the cylinder head.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the camshaft in place by placing the camshaft groove on the timing end vertically and facing upwards.

❏ Refit the camshaft bearings, observing their original positions (bearing **No. 1** at the flywheel end).

113563

❏ Refit the camshaft bearing bolts (**1**) , (**3**) , (**4**) and (**2**) in order.

❏ Tighten the camshaft bearing bolts ***(1)*** , ***(3)*** , ***(4)*** and ***(2)*** in order.

❏ Refit the camshaft bearing bolts in order.

❏ Tighten to torque and in order the **bolts of the camshaft bearings (10 N.m)**.

❏ Check and adjust (if necessary) the valve clearance (see **Valves: Adjustment**) .

III - FINAL OPERATION

❏ Refit:

- the camshaft seal (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-56**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-42**) ,
- the vacuum pump (see **Vacuum pump: Removal - Refitting**) (37A, Mechanical component controls),
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-10**) ,
- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the engine undertray,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

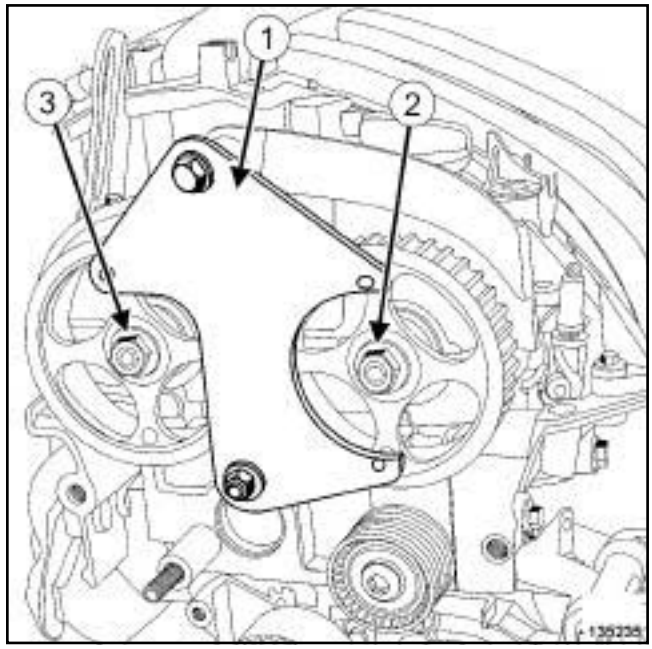
Tightening torques ▽	
inlet camshaft hub nut	**30 N.m + 84° ± 4°**
exhaust camshaft hub nut	**30 N.m + 84° ± 4°**

REMOVAL



I - REMOVAL PREPARATION OPERATION

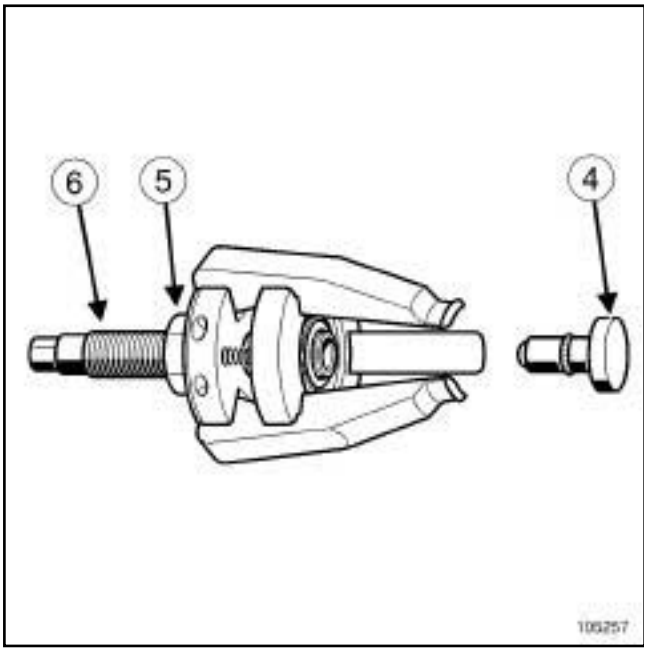
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the air inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .

135235



❏ Fit the locking tool (**1**) on the camshaft pulleys.

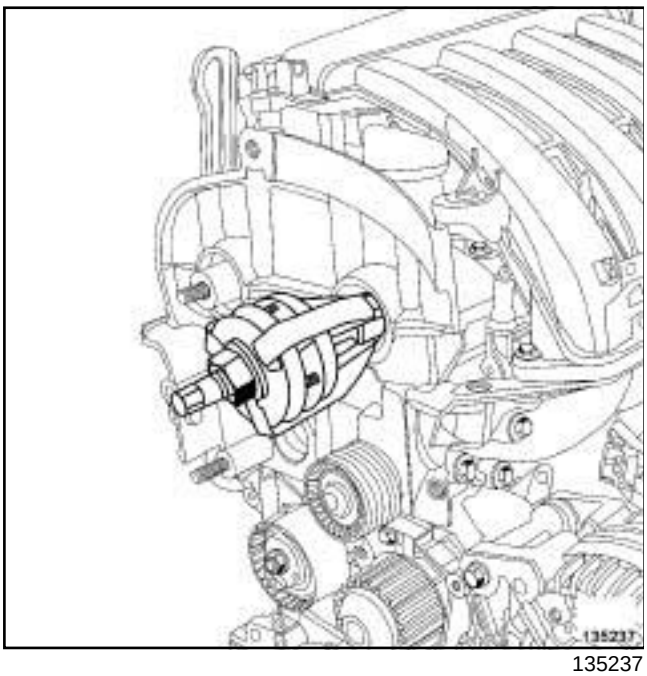
❏ Remove:

- the inlet camshaft pulley nut (**2**) ,
- the exhaust camshaft pulley nut (**3**) ,
- the,
- the inlet camshaft pulley,
- the exhaust camshaft pulley.

K4M

II - REMOVAL OPERATION

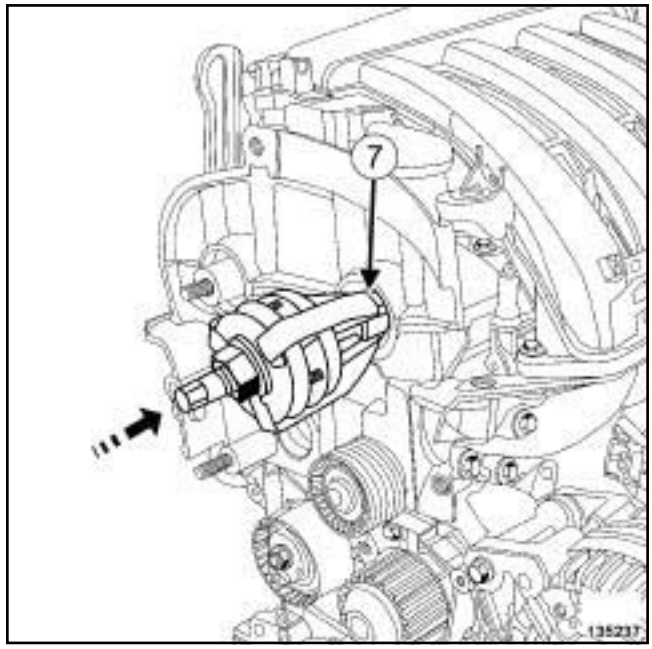
105257



❑

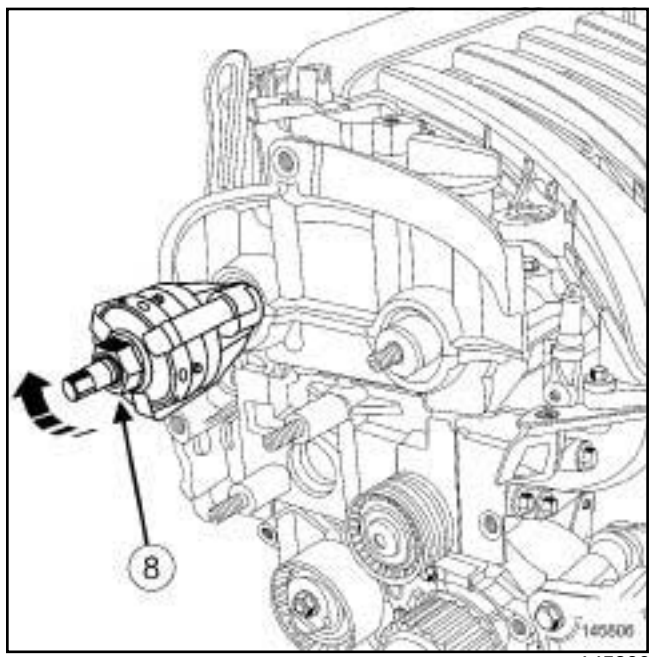
Note:

The inlet and exhaust camshaft seals are removed using the.



❑ Always remove the end piece (**4**) of the tool.

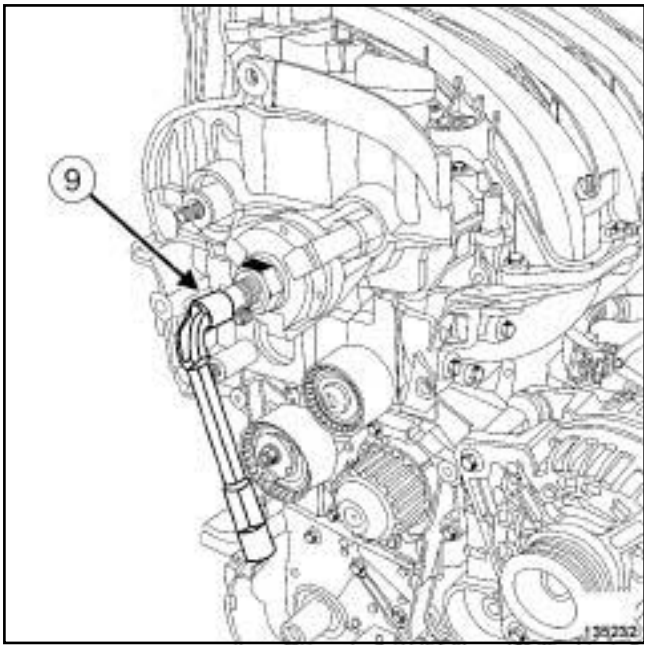
❑ Loosen bolts (**5**) and (**6**) fully from the.



135237

❑ Position the claws of theon the camshaft.

135237



❑ Push theuntil contact is made between the ends of the claws (**7**) and the camshaft seal.

145806

❑ Separate the claws by turning the nut (**8**) clockwise using an open-jawed spanner.

K4M

135232

❑ Remove the camshaft seal by turning the bolt (**9**) clockwise.

❑ Repeat the previous operations for the other camshaft seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Camshaft seal on timing end**

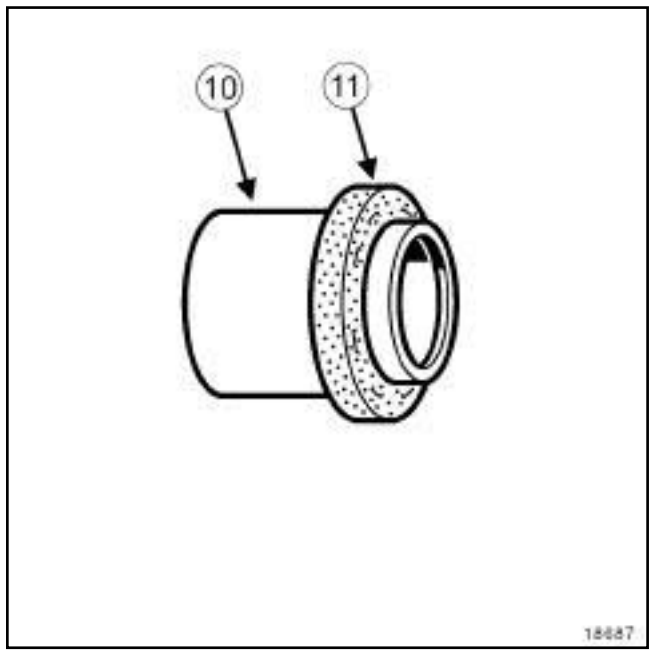
❑ **parts always to be replaced: Exhaust camshaft pulley nut**

❑ **Always replace the inlet camshaft pulley nut.**

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:



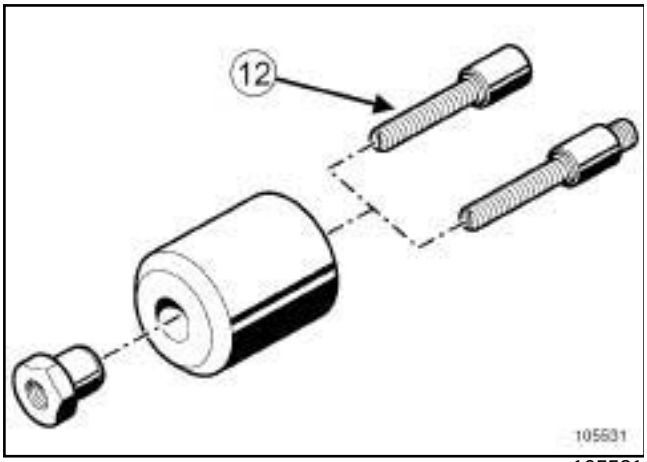
- the seal mating face of each camshaft,

- the camshaft seal housings.

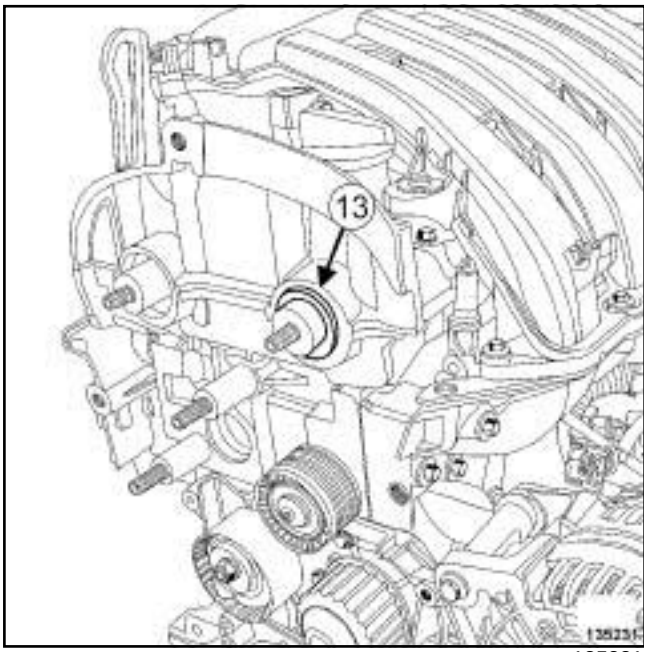
Note:
It is strictly forbidden to lubricate the outer diameter of the ring before fitting.

II - REFITTING OPERATION

Fitting the camshaft seal.



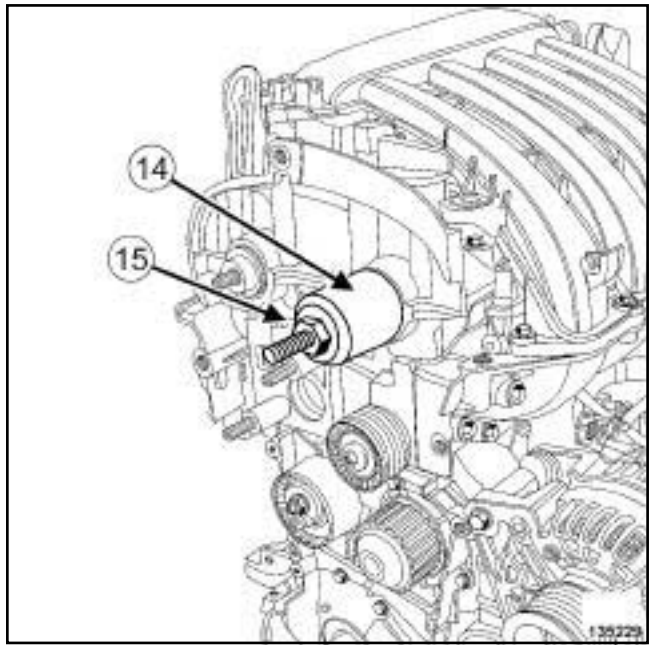
18687



❑

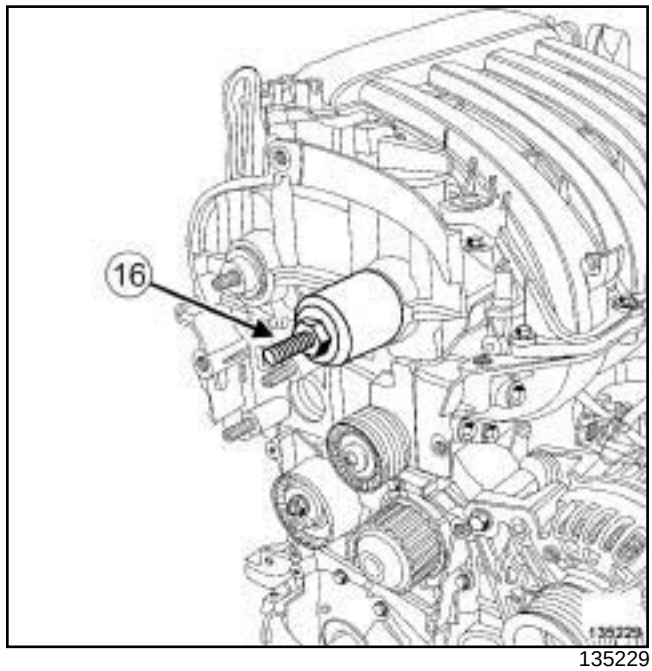
Note:
Always hold the camshaft seal with the protector (**10**) when handling, as this type of seal is very fragile. It is strictly forbidden to touch seal; (**11**) this is to prevent any oil leaks once the oil seal is fitted to the engine.

K4M



105531

135231



❑ Fit the protector fitted with a new seal (**13**) on the inlet and exhaust camshaft, taking care not to touch the seal.

❑ Screw on the stud (**12**) of the toolon the inlet and exhaust camshafts.

135229

❑ Fit the cover (**14**) and the collar nut (**15**) of the.

135229

❑ Screw on the collar nut until the cover touches the cylinder head.

❑ Remove:

- the nut,
- the cover,
- the threaded rod (**16**) .

K4M

III - FINAL OPERATION

❑ Refit:

- the inlet camshaft pulley with a new nut,
- the exhaust camshaft pulley with a new nut.

❑ Fit the locking toolon the camshaft pulleys.

❑ Torque tighten:

- the **inlet camshaft hub nut (30 N.m + 84° ± 4°)**,
- the **exhaust camshaft hub nut (30 N.m + 84° ± 4°)**.

❑ Remove the locking tool.

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

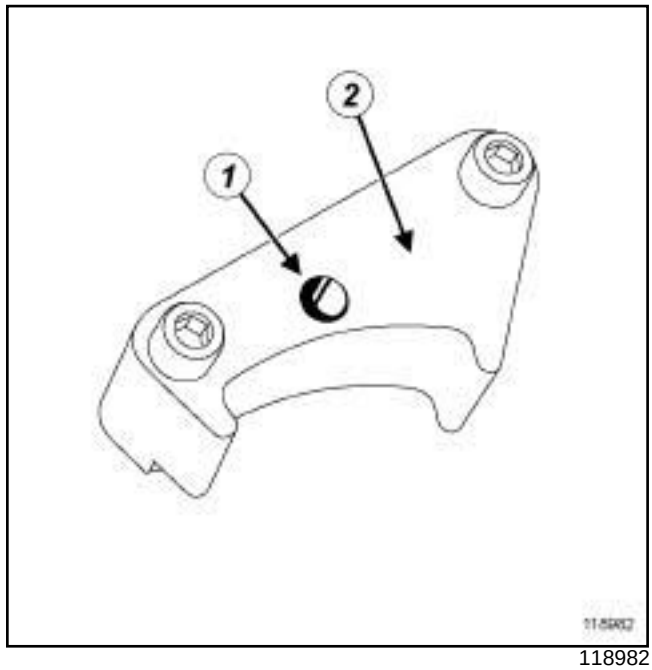
❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Special tooling required	
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

Tightening torques ▽	
camshaft stud	**12 N.m**
camshaft pulley nut	**30 N.m + 86° ± 6°.**

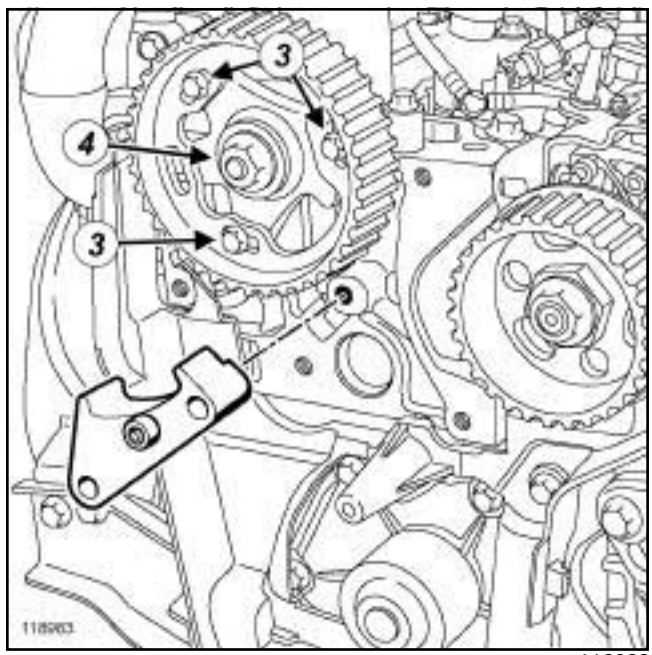
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Remove the front engine cover.

❏ Remove:



- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the engine undertray bolts,
- the engine undertray,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-10**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the **(Mot. 1430)**.

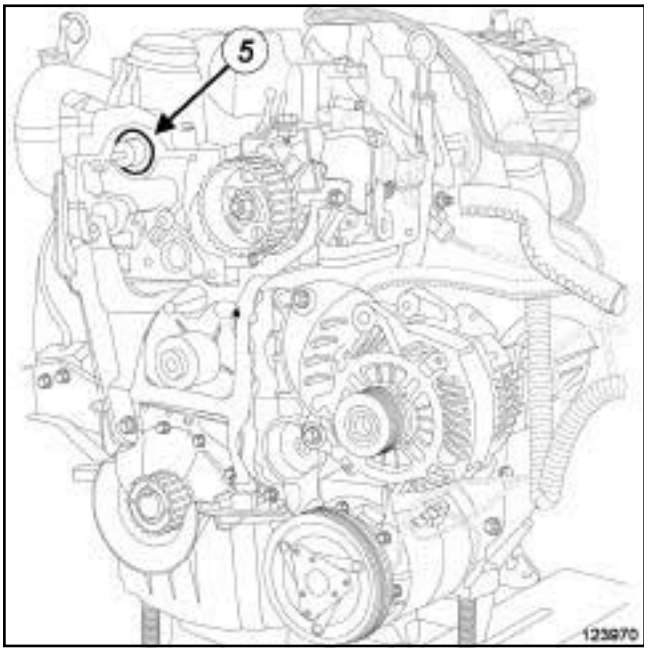
II - REMOVAL OPERATION

118982

❏ Increase the hole (**1**) of the (**2**) using an **8.5 mm** drill bit.

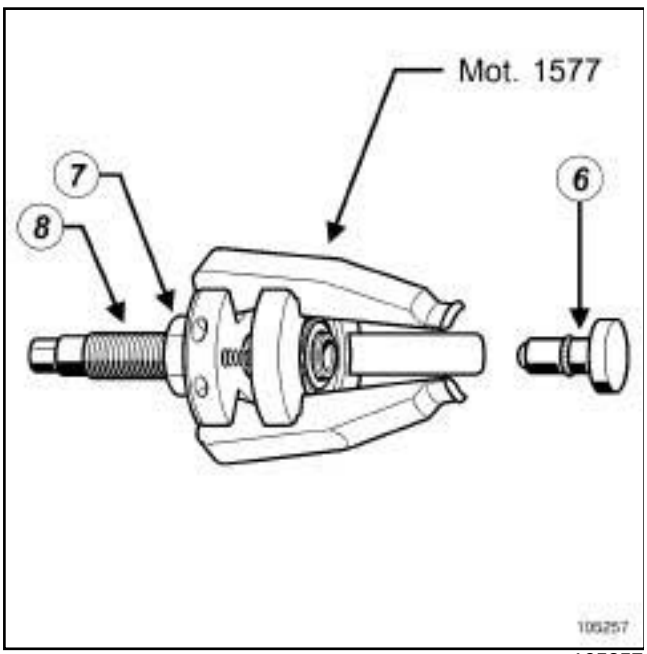
118983

❏ Undo the camshaft pulley hub bolts (**3**) .



❏ Fit theon the cylinder head to lock the camshaft pulley wheel.

❏ Tighten the camshaft pulley hub bolts (**3**) .



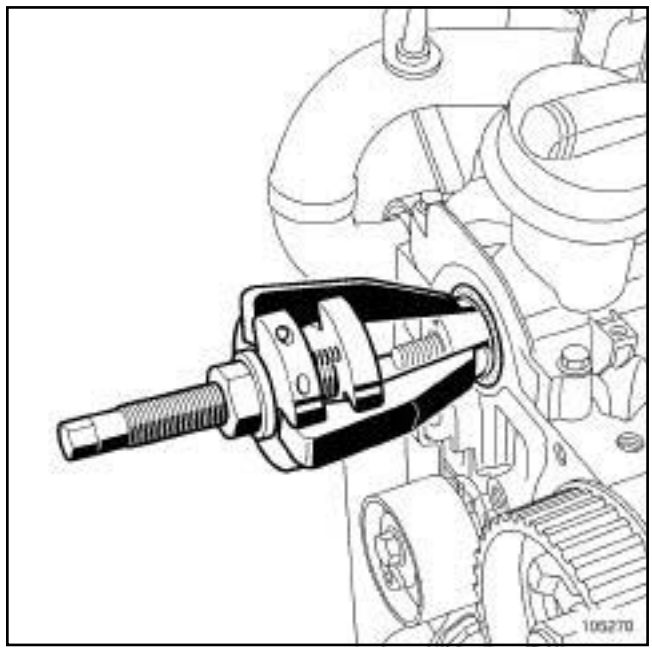
❏ Remove:

- the nut (**4**) from the camshaft pulley,
- the,

- the camshaft pulley.

123970

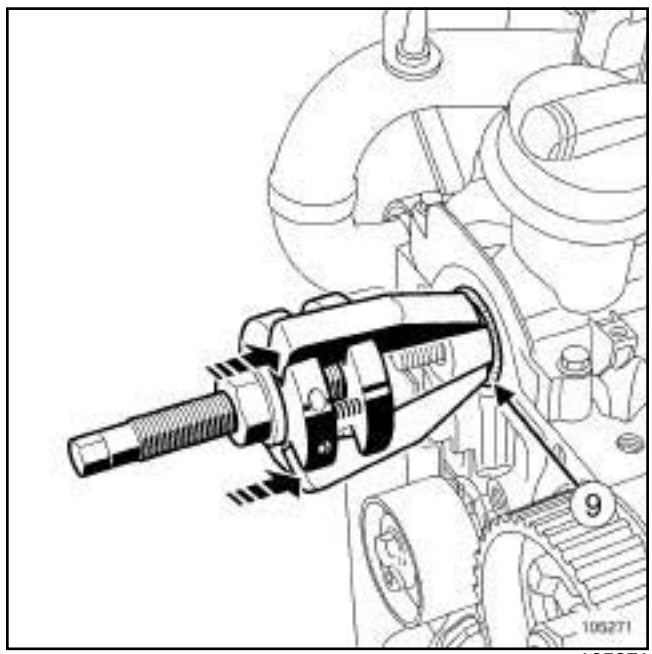
105257



❑

Note:

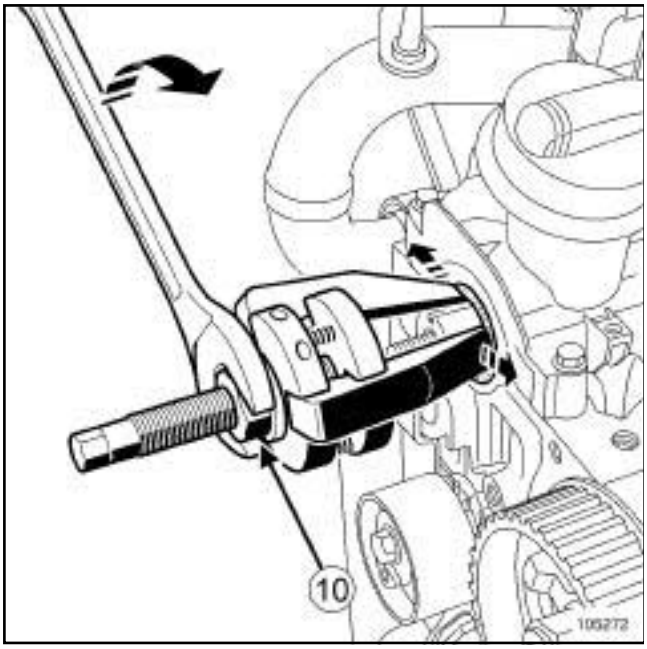
The camshaft seal is removed using the.



❑ Remove the camshaft seal (**5**) making sure that the end piece (**6**) of the toolis always removed.

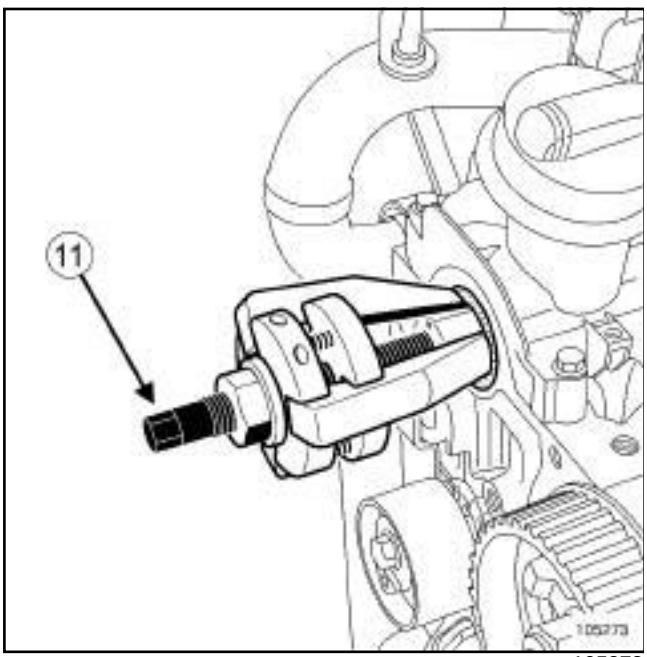
❑ Loosen bolts (**7**) and (**8**) fully from the.

105270



❑ Position the claws of theon the camshaft.

105271



❑ Push the tooluntil contact is made between the ends (**9**) of the claws and the camshaft seal.

K9K

105272

❑ Separate the claws by turning the bolt (**10**) clockwise using an open-jawed spanner.

105273

❑ Remove the camshaft seal by turning the bolt (**11**) clockwise.

REFITTING

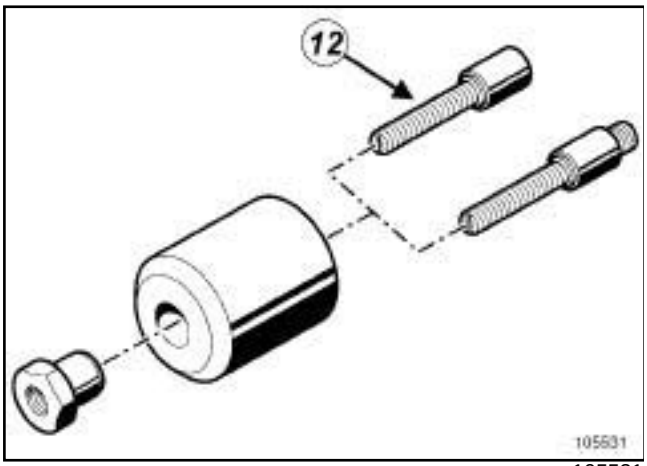
I - REFITTING PREPARATION OPERATION

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the camshaft seal housing in the cylinder head,
- the camshaft seal mating face on the camshaft.

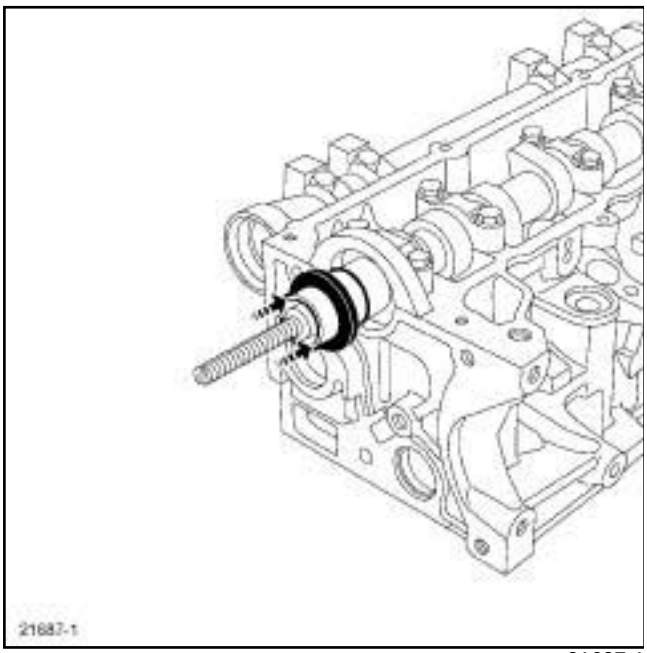
WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



❑ **parts always to be replaced: Camshaft seal on timing end**.

❑ **parts always to be replaced: camshaft timing sprocket nut**.



❑ **parts always to be replaced: camshaft timing sprocket stud (if loosened)**.

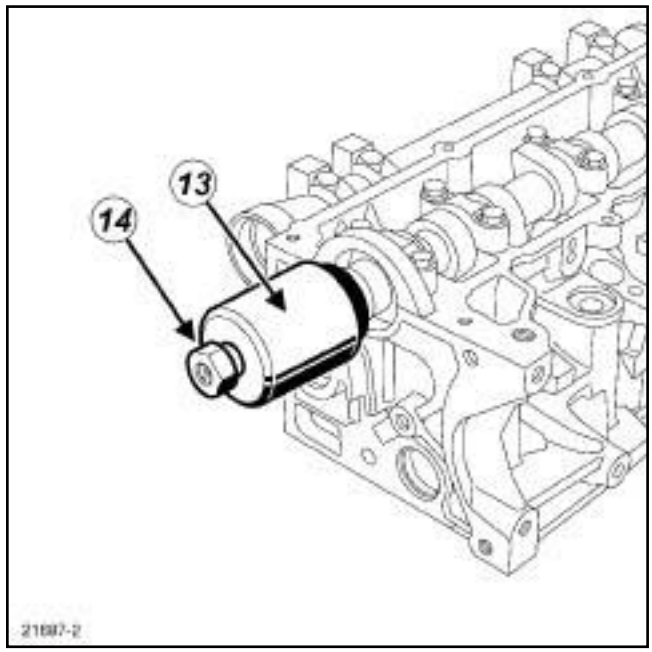
K9K

II - REFITTING OPERATION FOR PART CONCERNED

105531

21687-1

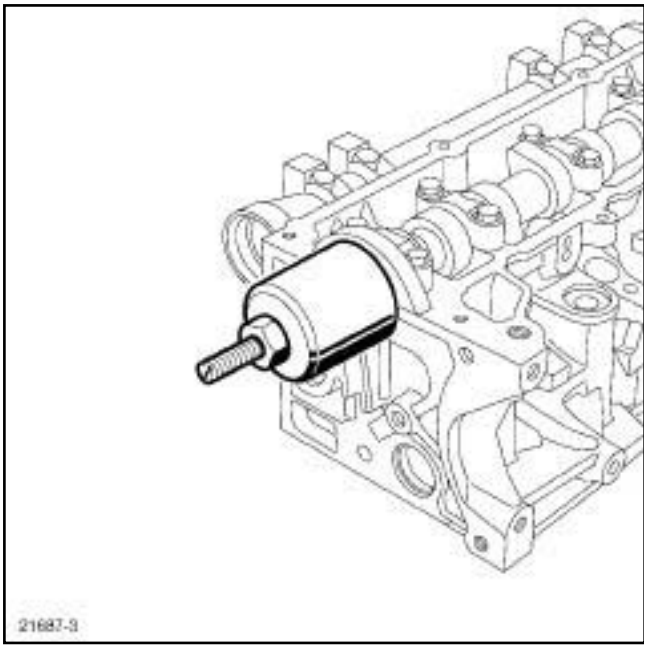
❏ Screw the stud (**12**) of theonto the camshaft.



❏ Fit a new camshaft seal on the camshaft.

Note:

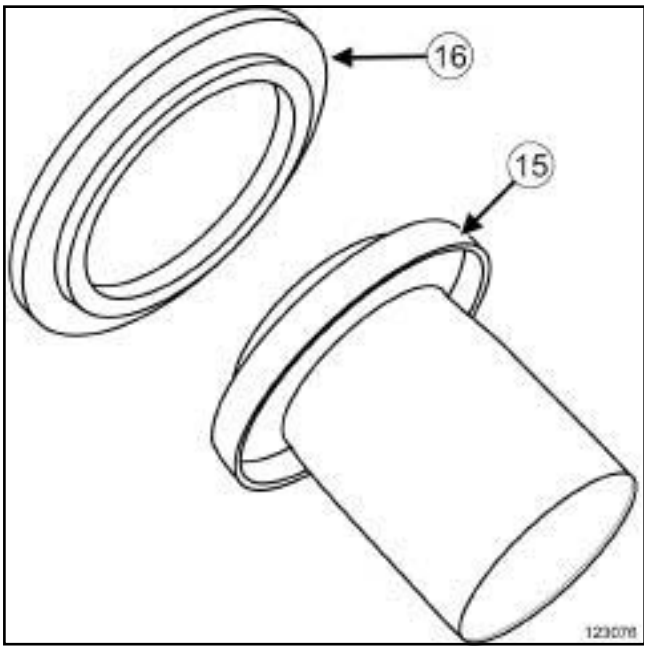
For camshaft seals delivered fitted to a protective sleeve:



- do not remove the camshaft seal from its protective sleeve,
- fit the sleeve fitted with the camshaft seal to the camshaft,
- push the protective sleeve towards the cylinder head until the camshaft seal reaches its limit on the cylinder head,
- fit the seal on the camshaft by following the recommendations below.

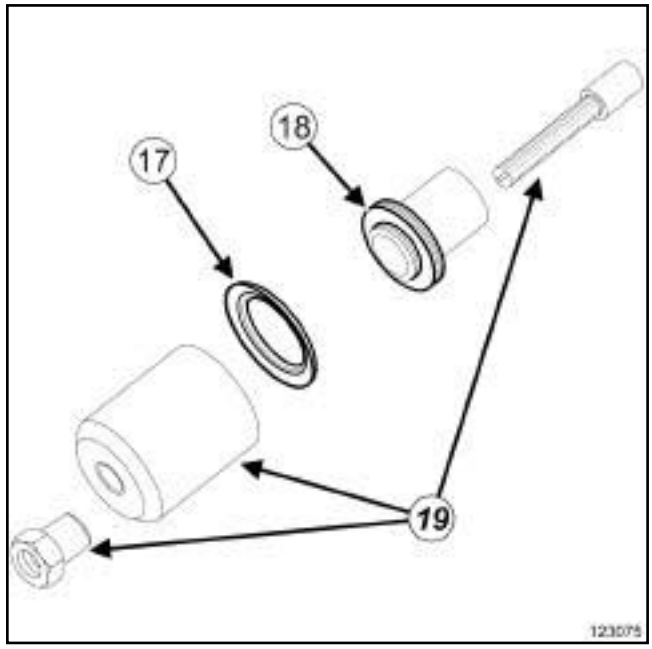
1 - First fitting of the camshaft seal

21687-2



❏ Fit the cover (**13**) and the collar nut (**14**) of the.

21687-3

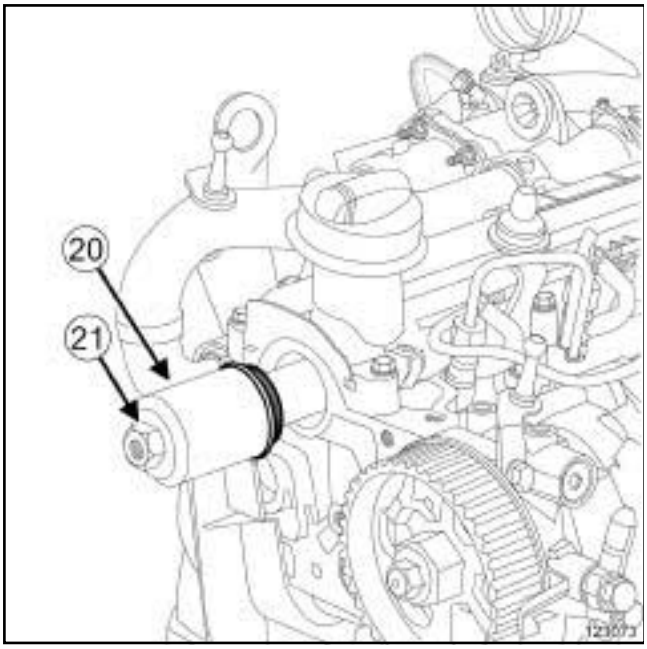


❏ Screw on the collar nut until the cover touches the cylinder head.

2 - Second fitting of the camshaft seal

123076

❏ Depending on the case, the Parts Department delivers seals (**15**) equipped with a spacer (**16**) amongst other things.



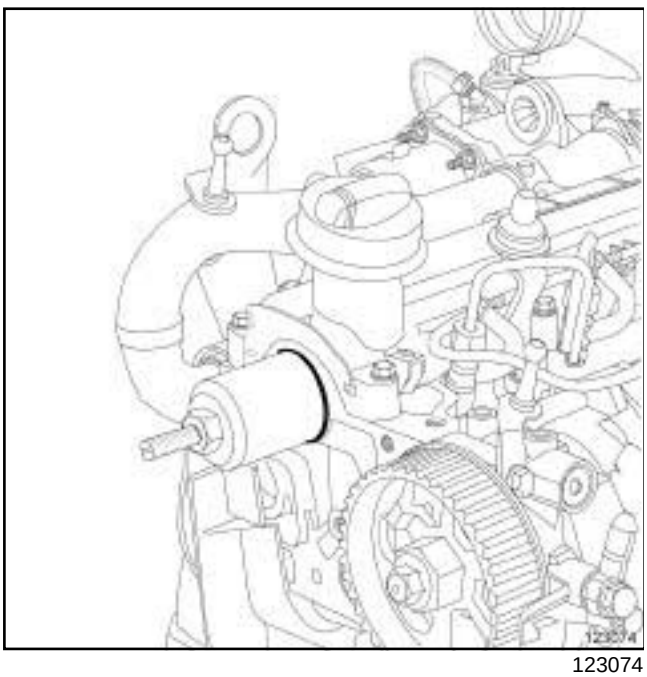
123075

❏

Note:

The spacer (**17**) is used to fit the seal (**18**) and is used in addition to the tool (**19**) .

K9K



123073

❑ Position the bell (**20**) fitted with the spacer on the camshaft seal side and then position the collared nut (**21**) of the tool.

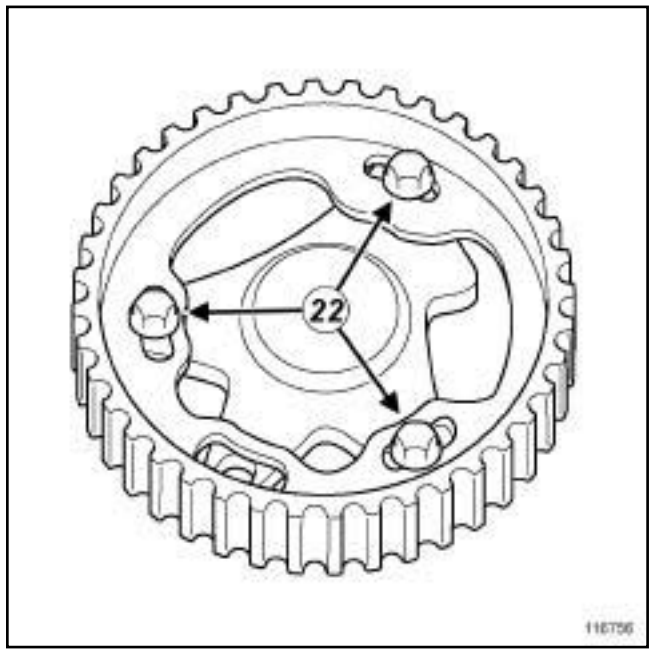
Note:

The spacer fits on the bell of the toolso that the internal edge of the spacer is on the side of the camshaft seal.

123074

❑ Screw on the collar nut until the spacer fitted on the cover touches the cylinder head.

3 - Continued for both methods



❑ Remove:

- the collar nut from the,
- the cover from the,
- the stud of the,
- the protective sleeve and the spacer, if fitted then throw them away.

❑ Torque tighten the **camshaft stud (12 N.m)**

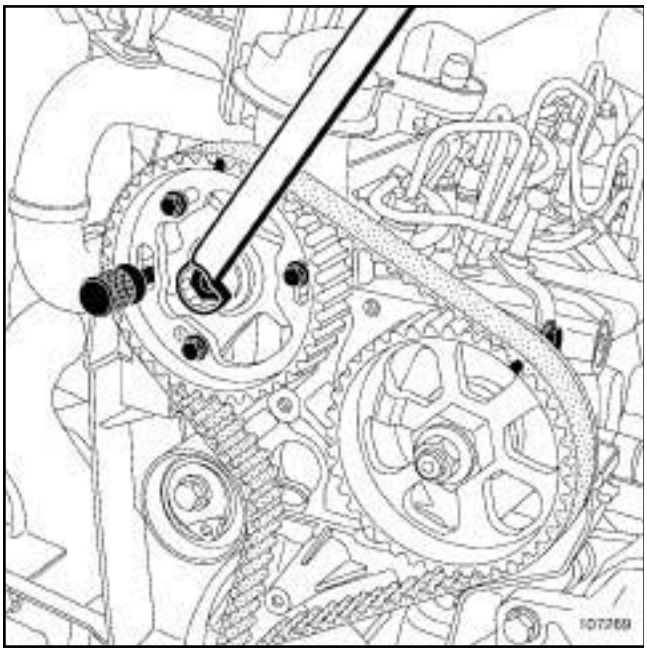
❑ Refit:

- the camshaft pulley,
- a new camshaft pulley nut.

116756

❑ Undo the camshaft pulley hub bolts (**22**) .

❑ Fit theon the cylinder head to lock the camshaft pulley wheel.



❑ Tighten:

- the camshaft pulley hub bolts,
- to torque and angle the **camshaft pulley nut (30 N.m + 86° ± 6°.)**

❑ Remove the tool.

K9K

III - FINAL OPERATION

107269

❏ Set the camshaft pulley hub using the tool **(Mot. 1430)**.

> Note:
>
> If the pin **(Mot. 1430)** does not engage, tum the camshaft pulley hub using an **18 mm** offset wrench to facilitate the setting of the camshaft pulley hub.

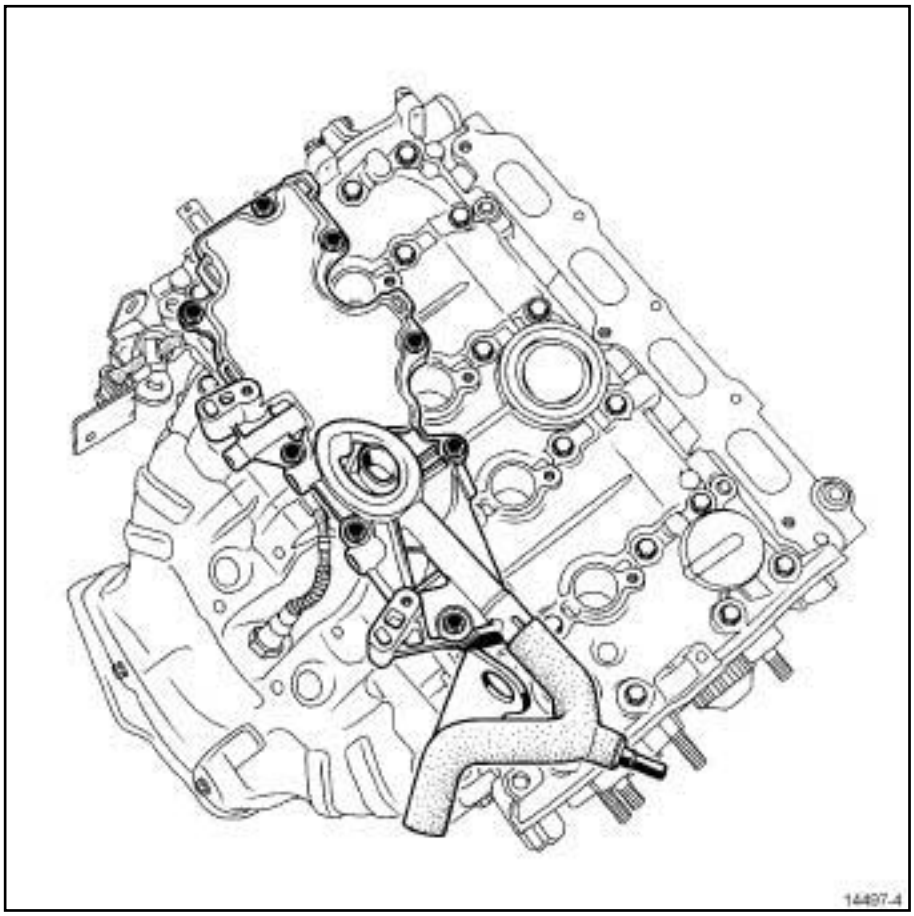
❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the engine undertray,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Refit the engine cover.

K4M

Tightening torques ▽	
new oil separator bolts	**15 N.m**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove:

- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) .

II - REMOVAL OPERATION

14497-4

❑ Remove:

- the oil decanter bolts,
- the oil decanter.

K4M

REFITTING

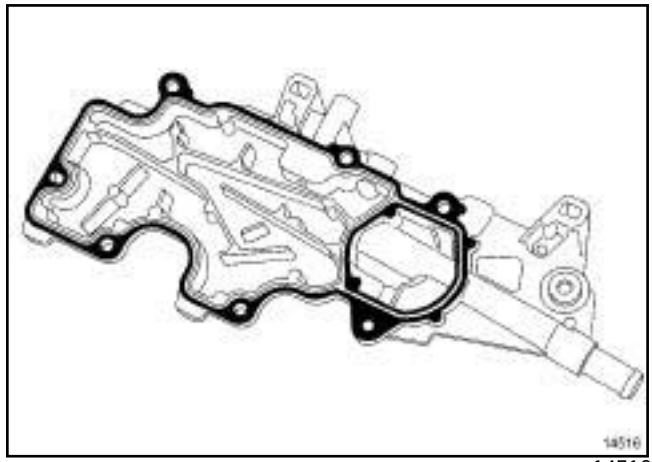
I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: oil decanter bolt**

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
When cleaning parts, it is essential that the parts do not impact on each other, otherwise their mating faces may be damaged and therefore their adjustments may be altered, which could damage the engine.

❑ Use **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:



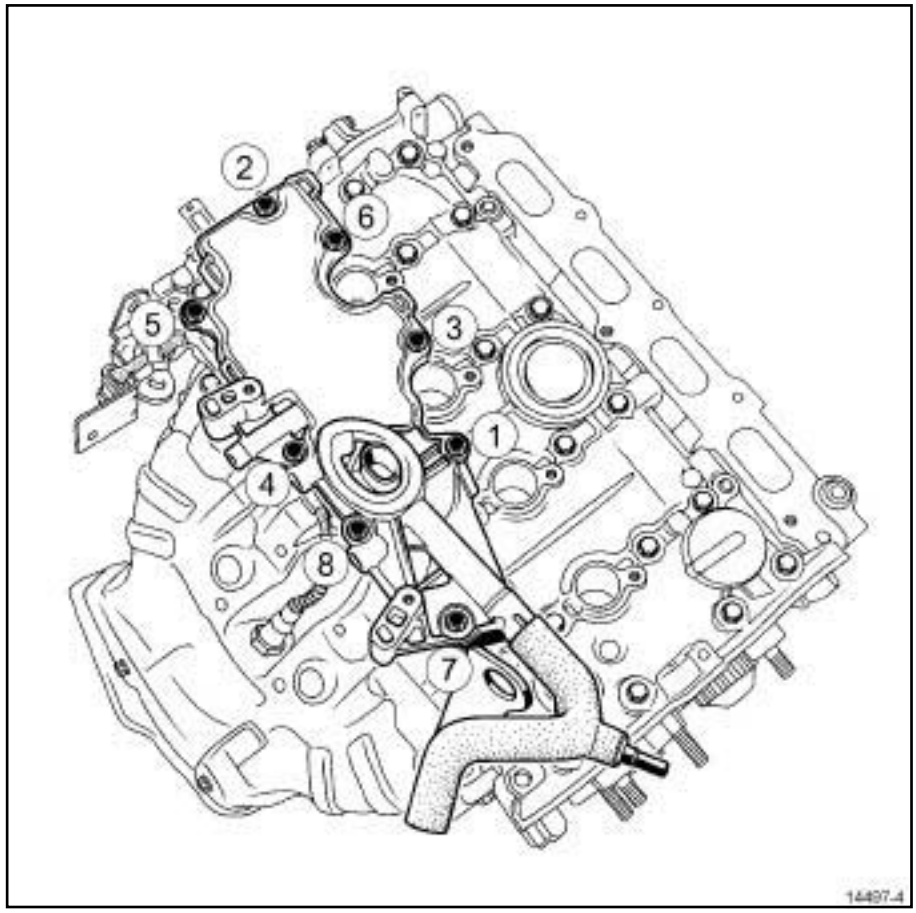
- the oil separator joint face if it is to be re-used,
- the rocker cover joint face.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

- the oil separator joint face if it is to be re-used,
- the rocker cover joint face.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).



14516

❑ Apply **RESIN ADHESIVE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) using a stipple roller on the joint face of the oil separator until the joint face is completely coated.

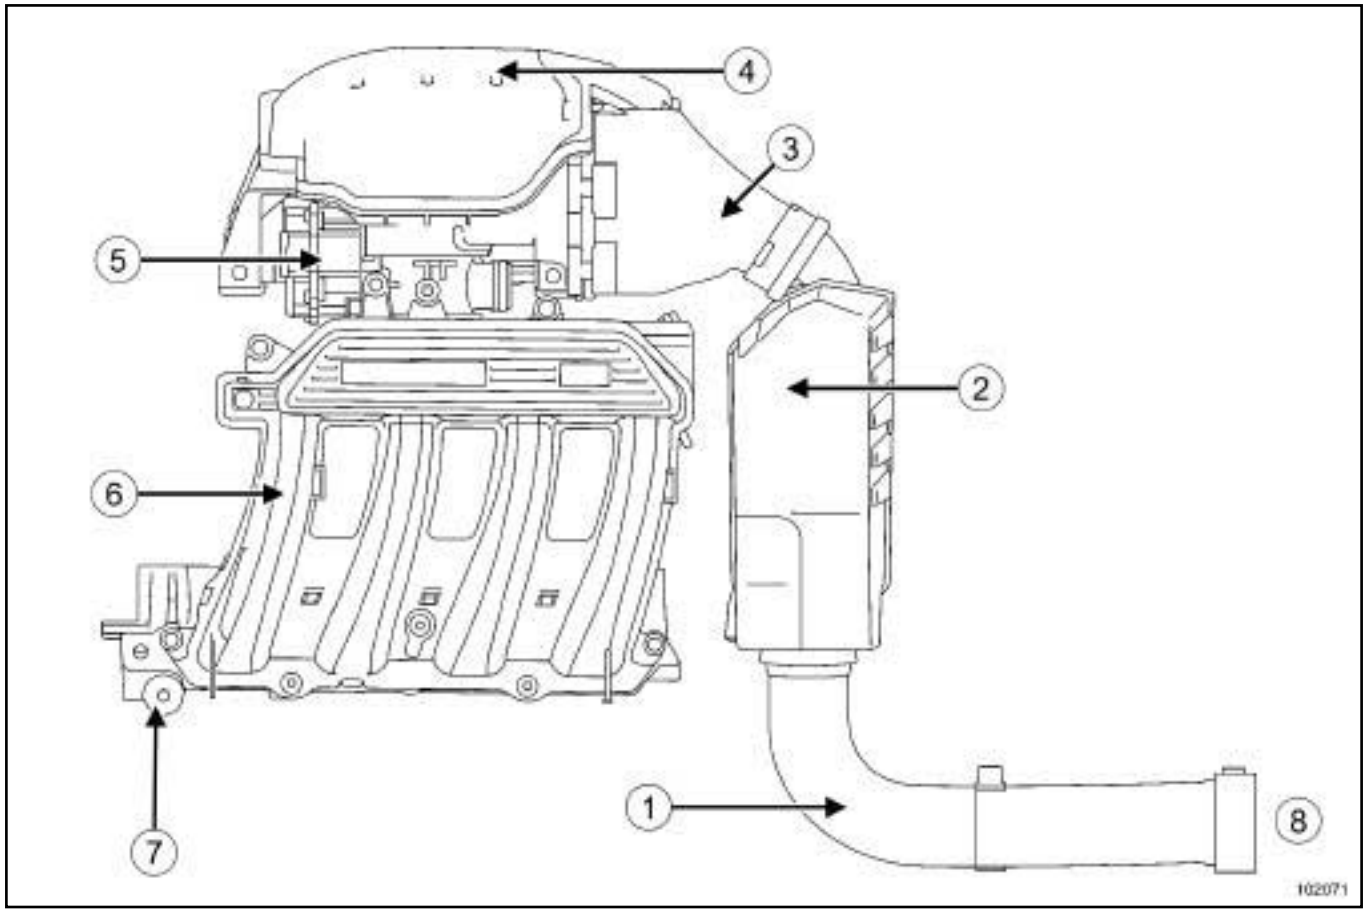
II - REFITTING OPERATION

❑ Refit the oil separator.

K4M

14497-4

❑ Torque tighten in order the **new oil separator bolts (15 N.m)**.



III - FINAL OPERATION

❑ Refit:

- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-1**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

K4M

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

❑ Disconnect the brake servo vacuum pipe ***(1)*** from the inlet distributor.

II - REMOVAL OPERATION

116552

❑

WARNING
Do not damage the vacuum outlet on the inlet distributor. If it is damaged, the inlet distributor will need to be replaced.

❑ Remove:

- the two bolts (**2**) from the air filter cover,
- the air filter cover (**3**) ,
- the air filter.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Clean the air filter housing.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

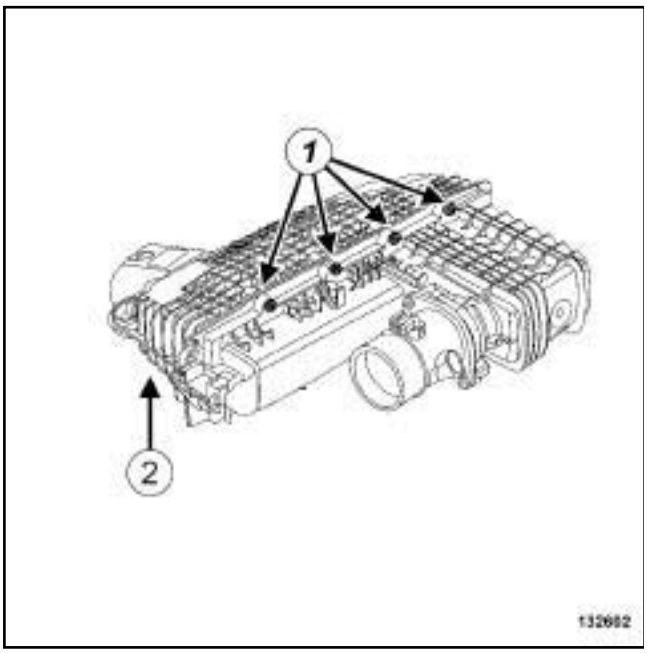
- the air filter,
- the air filter cover,
- the two air filter cover bolts.

III - FINAL OPERATION

❑ Reconnect the brake servo vacuum pipe to the inlet distributor.

❑ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

K9K



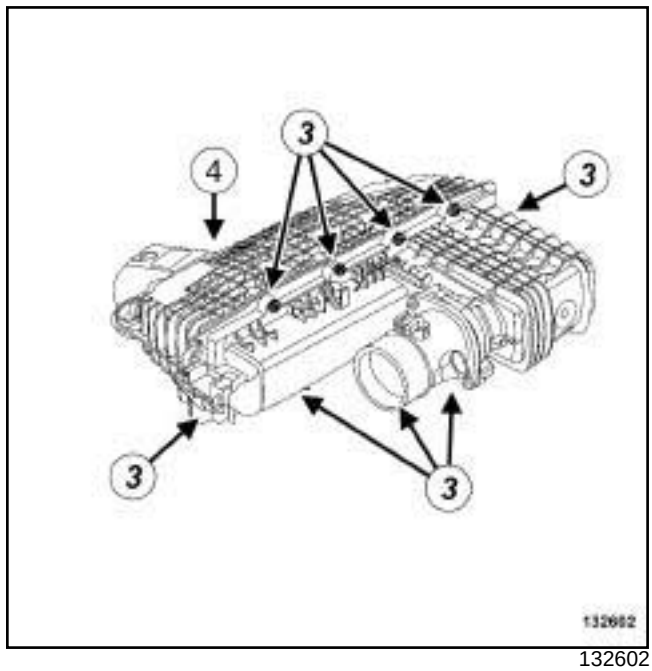
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - First fitting of air filter unit

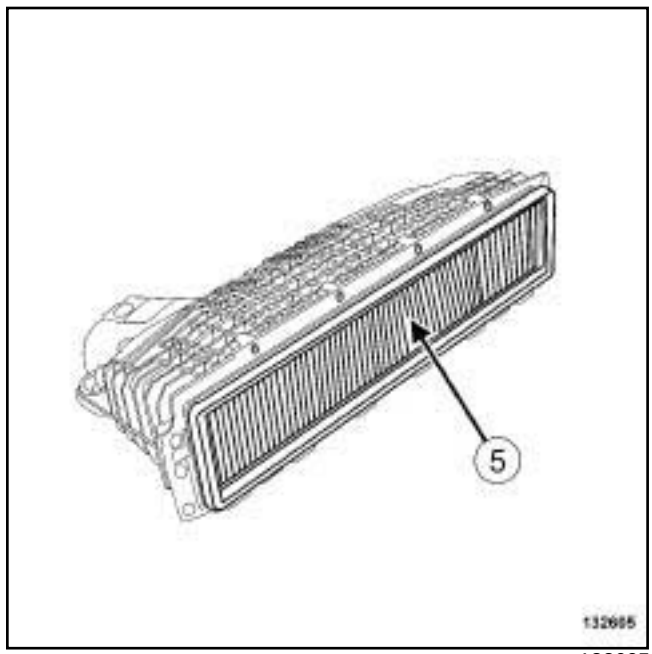


132602

❑ Remove the 4 bolts (**1**) from the air filter unit.

❑ Pivot the hinged cover (**2**) of the air filter unit in relation to the air filter unit tank.

❑ Move aside the air filter unit cover (**2**) .



2 - Second fitting of air filter unit

132602

❑ Remove the 9 bolts (**3**) from the air filter unit.

❑ Move aside the air filter unit cover (**4**) .

132605

❑ Remove the air filter (**5**) from the air filter unit cover.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Clean the air filter unit.

K9K

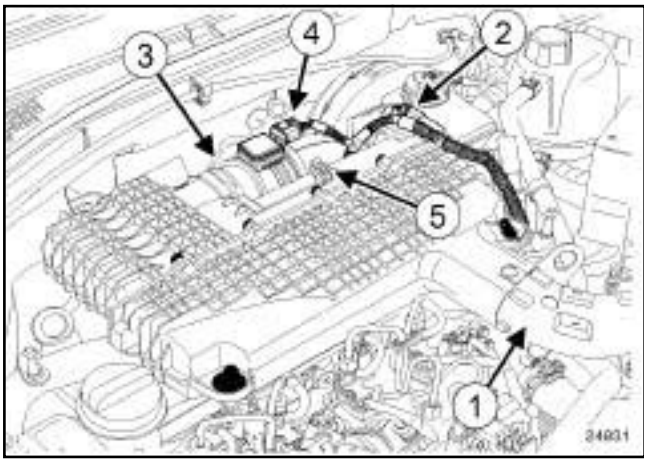
II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the air filter in the air filter unit cover.

> **WARNING**
> If the air filter is fitted incorrectly in the air filter unit, unfiltered air may enter the engine and cause the engine to malfunction.

❏ Fit the air filter unit cover.

III - FINAL OPERATION



❏ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

K9K

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the engine cover.

24831

❏ Disconnect:

- the air intake sleeve (**1**) on the air filter unit,
- the air pressure sensor connector (**2**) from the air filter unit.

❏ Disconnect the connector from the air flowmeter (**4**) .

❏ Disconnect the air inlet duct (**5**) from the air filter unit.

❏ Move aside the air filter unit wiring harness.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Lift up the front section of the air filter unit.

❏ Slide the air filter unit to the left.

❏ Remove:

- the bolt of the turbocharger pressure sensor,
- the turbocharger pressure sensor on the air filter unit.

❏ Remove the air filter unit.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check that there are mounting studs for the air filter unit on the EGR mounting and on the brackets.

Note:

Replace the studs if necessary.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the air filter unit sideways against the EGR valve mounting.

❏ Slide the air filter unit to the right.

❏ Refit:

- the turbocharger pressure sensor on the air filter unit.
- the bolt of the turbocharger pressure sensor,

❏ Refit the air filter unit by lowering it vertically from the injection end.

III - FINAL OPERATION

❏ Connect the air inlet duct to the air filter unit.

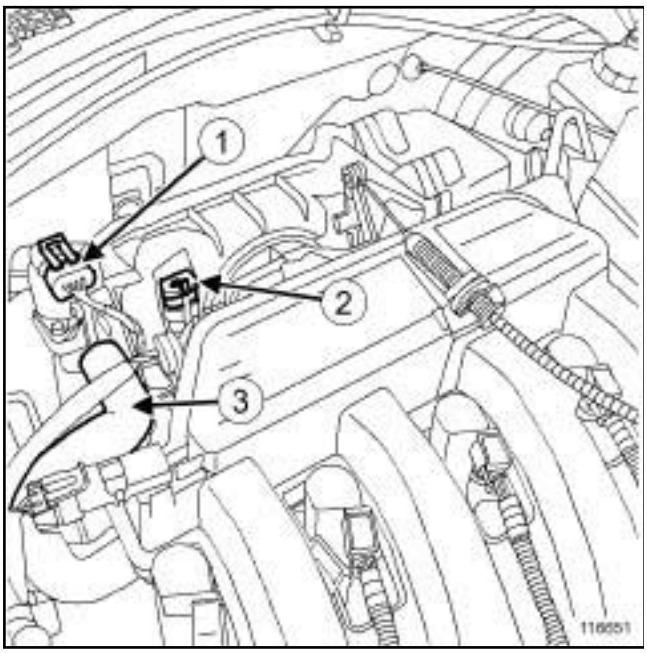
❏ Connect the air flowmeter connector.

❏ Connect:

- the turbocharging pressure sensor connector,
- the air intake sleeve on the air filter unit.

❏ Refit the engine cover.

K4M



Tightening torques ▽

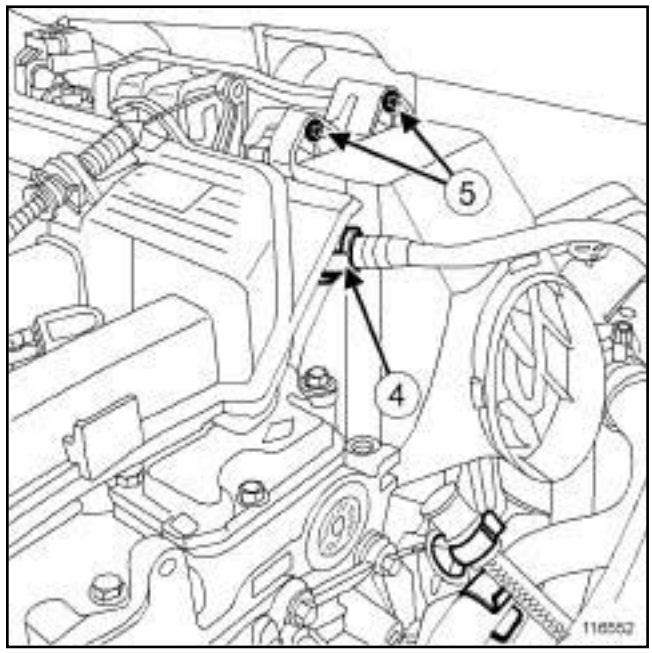
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .



116651

❏ Disconnect:

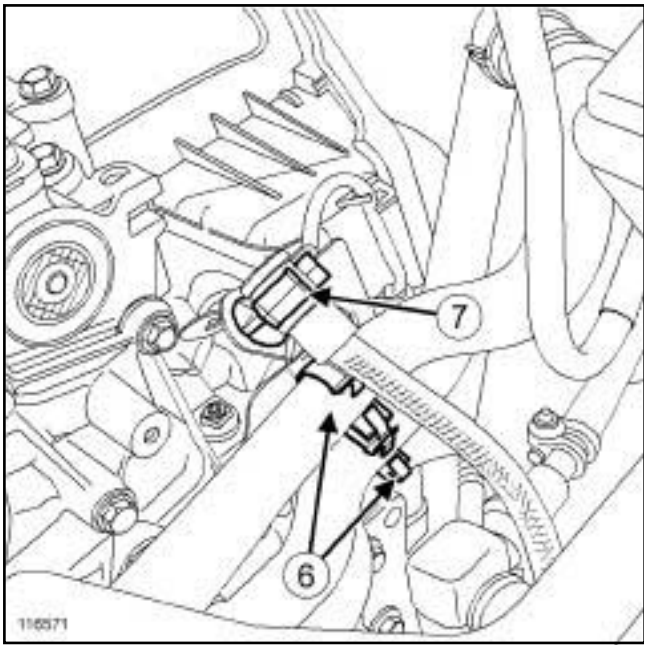
- the idle speed regulation stepping motor connector (**1**) ,
- the connector (**2**) from the throttle position potentiometer,
- the petrol vapour recirculation pipe (**3**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116552

❏ Disconnect the vacuum pipe (**4**) from the brake servo on the inlet distributor

❏ Remove:

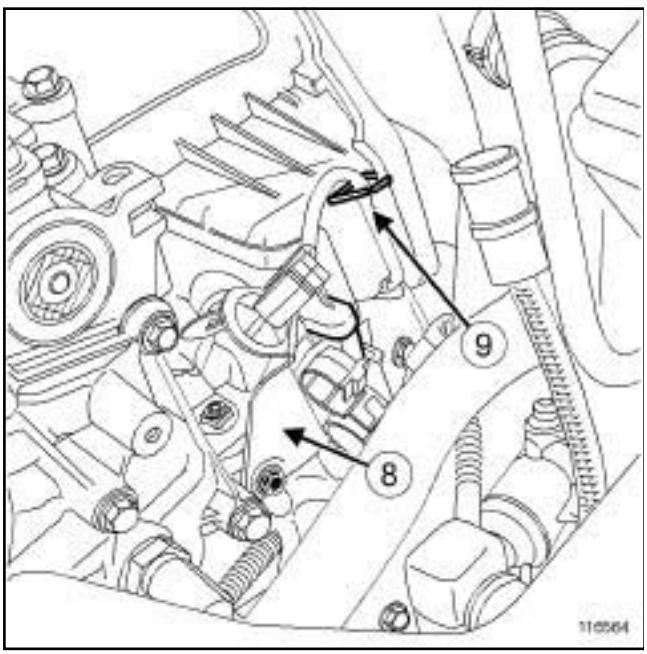


- the two bolts (**5**) from the air filter cover,
- the filter element.

❏

WARNING

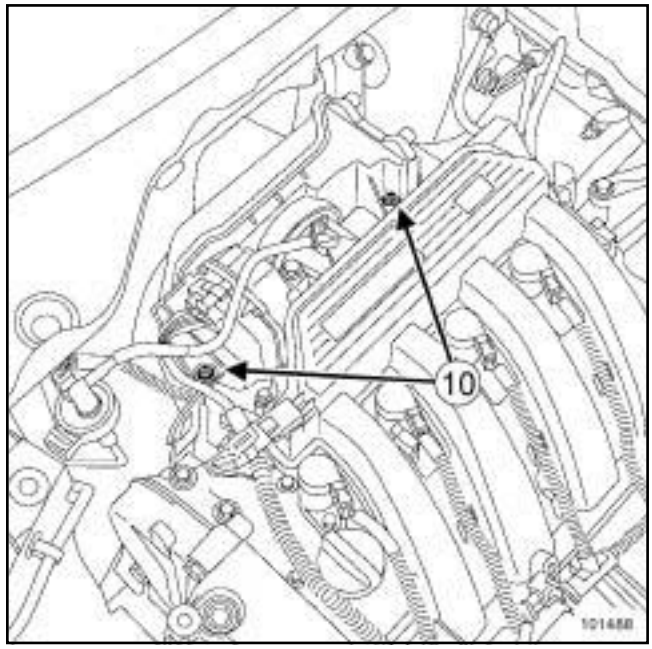
Do not damage the vacuum outlet on the inlet distributor. If it is damaged, the inlet distributor will have to be replaced.



K4M

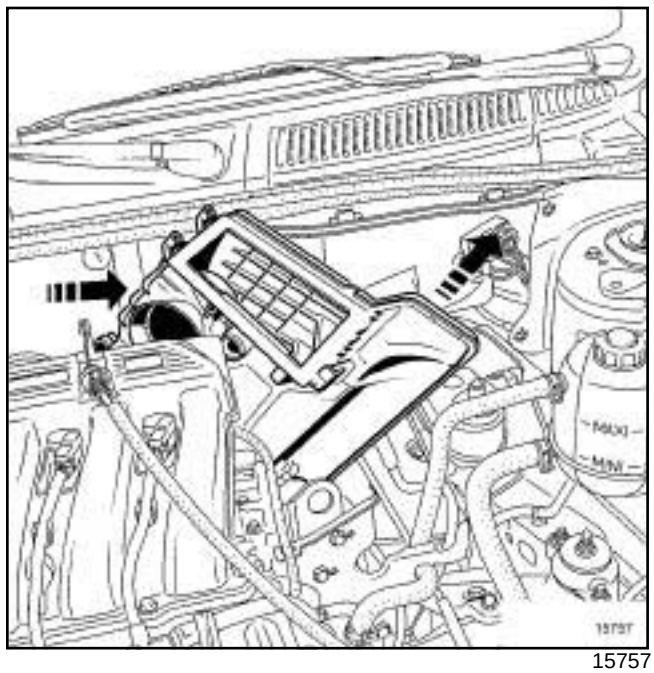
116571

❏ Unclip:



- the coolant pipes at (**6**) ,
- the breather (**7**) .

116564



❏ Remove the coolant pipes mounting bracket (**8**) .

❏ Unpick the electrical wiring (**9**) from the oxygen sensor.

101488

❏ Remove the two bolts (**10**) from the air filter unit.

15757

❏ Remove the air filter unit.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Replace:

- the throttle valve seal each time it is removed using grease to make fitting easier,

- the plastic rivets and clips every time they are removed.

II - REFITTING OPERATION

❏ Refit:

- the air filter unit,
- the two air filter unit bolts.

❏ Torque tighten the **air filter unit bolts (9 N.m)**.

❏ Attach the electrical wiring to the oxygen sensor.

❏ Refit the coolant pipes mounting bracket.

❏ Reclip:

- the breather,
- the coolant pipes.

❏ Refit:

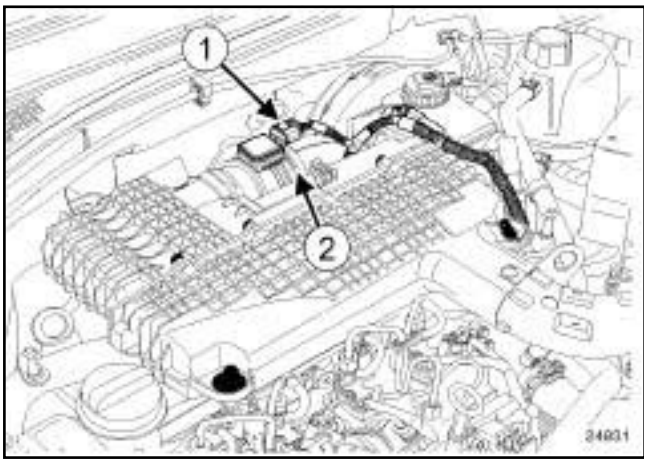
- the filter element,
- the two air filter cover bolts.

❏ Reconnect:

- the brake servo vacuum pipe on the inlet distributor,
- the petrol vapour recirculation pipe,
- the throttle position potentiometer connector,
- the idle speed regulation stepping motor connector.

III - FINAL OPERATION

❏ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .



❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

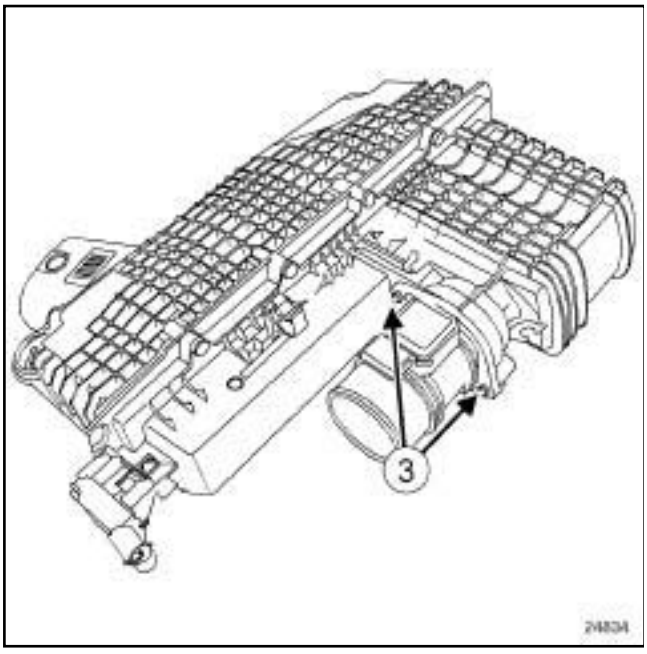
K9K, and 796

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the engine cover.

24831



❏ Disconnect the air flowmeter connector (**1**) .

❏ Undo the clip (**2**) from the air flowmeter outlet duct.

❏ Remove the air flowmeter outlet air duct.

❏ Remove the air flowmeter outlet air duct.

II - REMOVAL OPERATION FOR PART CONCERNED

24834

❏ Remove:

- the air flowmeter (**3**) bolts on the air filter box,
- the air flowmeter,
- the air flowmeter seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the air flowmeter seal on the air filter unit.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- a new air flowmeter seal on the air filter box,
- the air flowmeter,
- the air flowmeter bolts.

III - FINAL OPERATION

❏ Refit:

- the air flowmeter outlet air duct,
- the air flowmeter outlet air duct clip.

❏ Connect the air flowmeter connector.

❏ Refit the engine cover.

K4M

REMOVAL

I - REMOVAL PREPARATION OPERATION

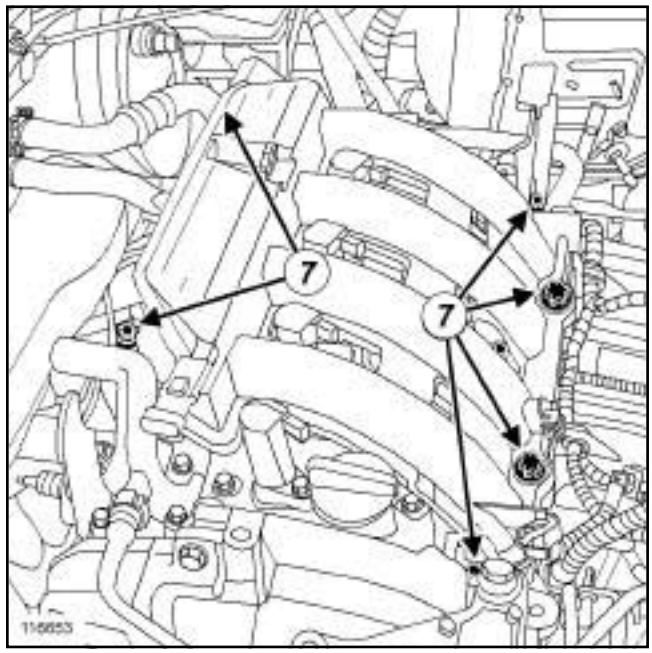
116654

❏ Disconnect the accelerator cable on the throttle valve at (**1**) .

❏ Remove the accelerator cable (**2**) from the inlet distributor.

❏ Disconnect:



- the air temperature sensor connector (**3**) ,
- the air inlet pressure sensor connector (**4**) ,
- the connectors (**5**) from the coils.

❏ Unclip the wiring (**6**) on the inlet distributor.

❏ Move the wiring aside.

❏ Remove the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116653

❏ Remove:

- the inlet distributor bolts (**7**) ,
- the inlet distributor.

❏ When replacing the inlet distributor, remove:

- the air temperature sensor,
- the inlet air pressure sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: inlet distributor seal**.

K4M

❏

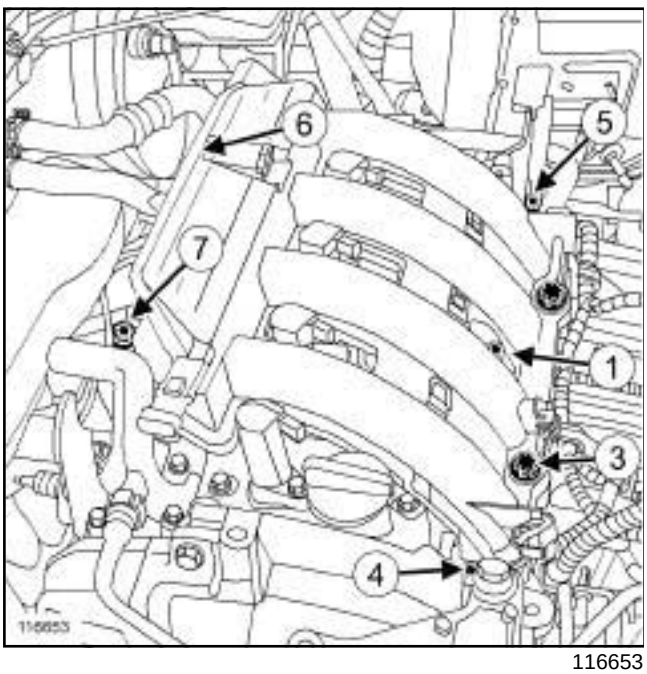
WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the housing of each inlet distributor seal if reused,
- the joint face of the injector holder shim.

❏ Fit new seals to the inlet distributor.



❏ When replacing the inlet distributor, refit:

- the air temperature sensor,
- the inlet distributor pressure sensor.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the inlet distributor,
- the inlet distributor mounting bolts.

116653

❏ Torque tighten in order the **intake distributor mounting bolts (9 N.m)**.

III - FINAL OPERATION

❏ Refit the throttle valve equipped with a new seal (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-11**) .

❏ Clip the wiring onto the inlet distributor.

❏ Connect:

- the coil connectors,
- the air inlet pressure sensor connector,
- the air temperature sensor connector.

❏ Position the accelerator cable on the inlet distributor and on the throttle valve.

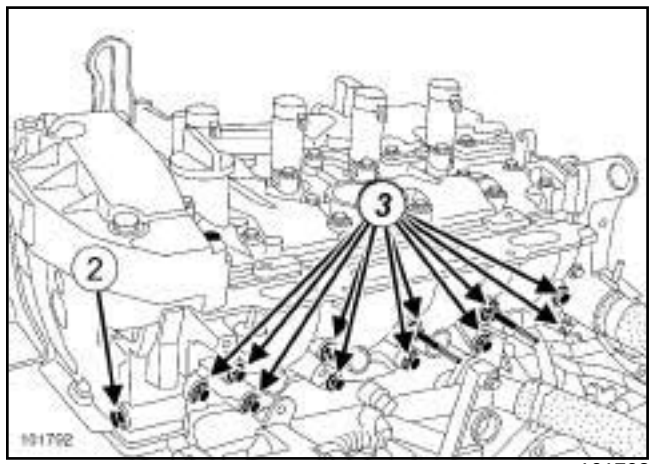
REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) ,
- the injector rail (see **17B**, **Petrol injection**, **Injector rail - Injectors: Removal - Refitting**, page **17B-10**) ,
- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-48**) .

116567

101792

❑ Remove:

- the bolt (**1**) of the suspended mounting on the injector holder shim,
- the bolt (**2**) mounting the upper timing cover on the injector holder shim.

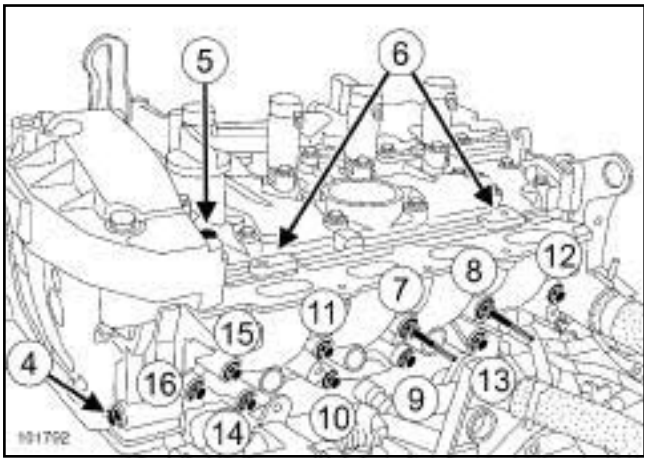
II - REMOVAL OPERATION

❑ Remove:

- the bolts ***(3)*** from the injector holder shim,
- the injector holder shim.

K4M

REFITTING



I - REFITTING PREPARATION OPERATION

❏ The injector holder shim seal must always be replaced.

II - REFITTING OPERATION

❏ Fit:

- the injector holder shim,
- all the injector holder shim bolts.

101792

❏ Place the injector holder shim against:

- the upper timing cover by manually tightening the bolt (**4**) ,
- the suspended engine mounting by manually tightening the bolt (**5**) .

❏ Position the injector holder shim against the shims (**6**) on the rocker cover.

❏ Tighten to torque and in order:

- the **injector holder shim bolts (7) and (8) (25 N.m)**,
- the **injector holder shim bolts 9 to 16 (21 N.m)**.

III - FINAL OPERATION

❏ Torque tighten:

- the **upper timing cover bolt (41 N.m)**,
- the **suspended mounting bolt (62N.m)**.

❏ Refit:

- the multifunction support (see **10A**, **Engine and cylinder block assembly**, **Multifunction support: Removal - Refitting**, page **10A-48**) ,
- the injector rail (see **17B**, **Petrol injection**, **Injector rail - Injectors: Removal - Refitting**, page **17B-10**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-12**) .

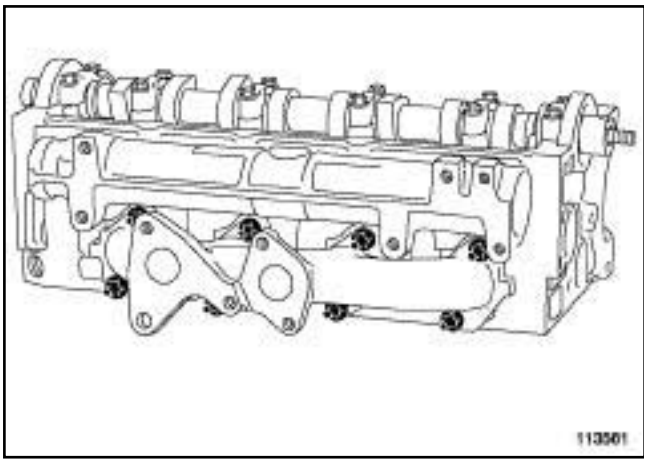
❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Tightening torques ▽	
exhaust manifold stud	**9 N.m**
exhaust manifold nuts	**26 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine undertray,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) ,
- the exhaust gas recirculation assembly (see **14A**, **Antipollution**, **Exhaust gas recirculation assembly: Removal - Refitting**, page **14A-9**) ,
- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-1**) .

II - REMOVAL OPERATION

113561

❏ Remove:

- the exhaust manifold nuts,
- the exhaust manifold.

❏ Mark the position of the exhaust manifold gasket.

❏ Remove the exhaust manifold gasket.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: exhaust manifold seal**.

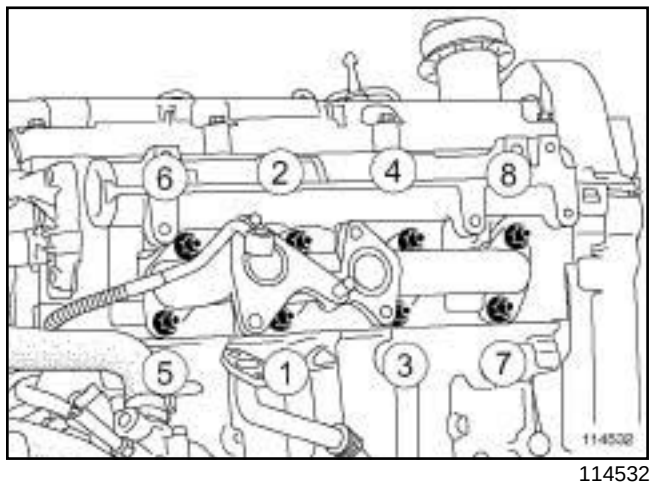
❏ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the joint face:

- the cylinder head,
- of the exhaust manifold, if it is to be reused.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and **CLEAN CLOTHS** to clean and degrease the joint faces:

- the cylinder head,
- of the exhaust manifold, if it is to be reused.

Note:



If a stud is loosened during this operation, coat the stud with **HIGH RESISTANCE THREAD LOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❏ Torque tighten the **exhaust manifold stud (9 N.m)**.

II - REFITTING OPERATION

❏ Refit:

- a new exhaust manifold gasket in the position marked during removal,
- the exhaust manifold.

114532

❏ Torque tighten in order the **exhaust manifold nuts (26 N.m)**.

K9K

III - FINAL OPERATION

❑ Refit:

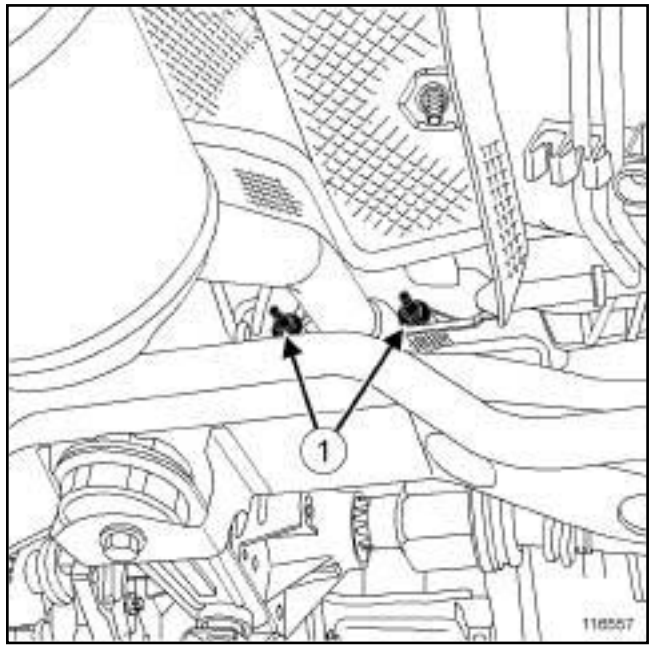
- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-1**) ,
- the exhaust gas recirculation assembly (see **14A**, **Antipollution**, **Exhaust gas recirculation assembly: Removal - Refitting**, page **14A-9**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) ,
- the engine undertray,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M

Tightening torques ▽	
exhaust manifold studs	**8 N.m**
exhaust manifold mounting nuts	**23 N.m**
bolts (6) mounting the stay on the cylinder block	**21 N.m**
nut (7) mounting the stay on the exhaust manifold	**21 N.m**
exhaust manifold upper heat shield mounting bolts	**12 N.m**
upstream oxygen sensor	**45 N.m**
exhaust bracket mounting bolts	**21 N.m**

REMOVAL

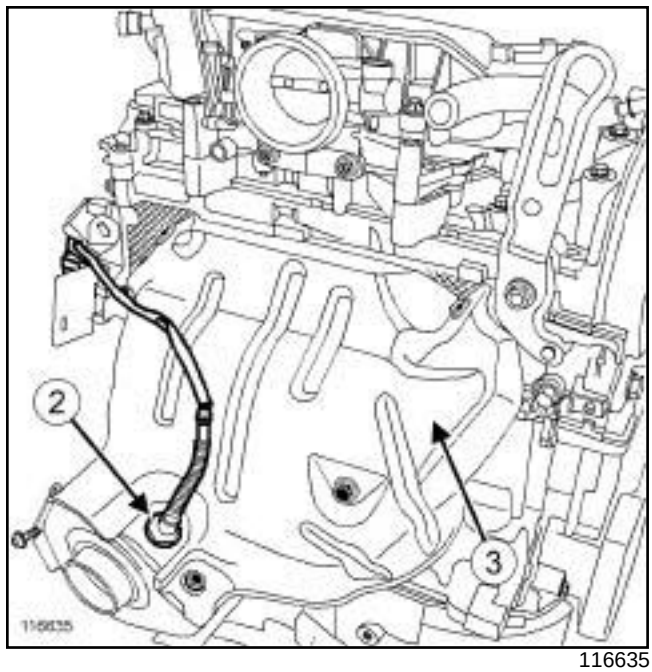


I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

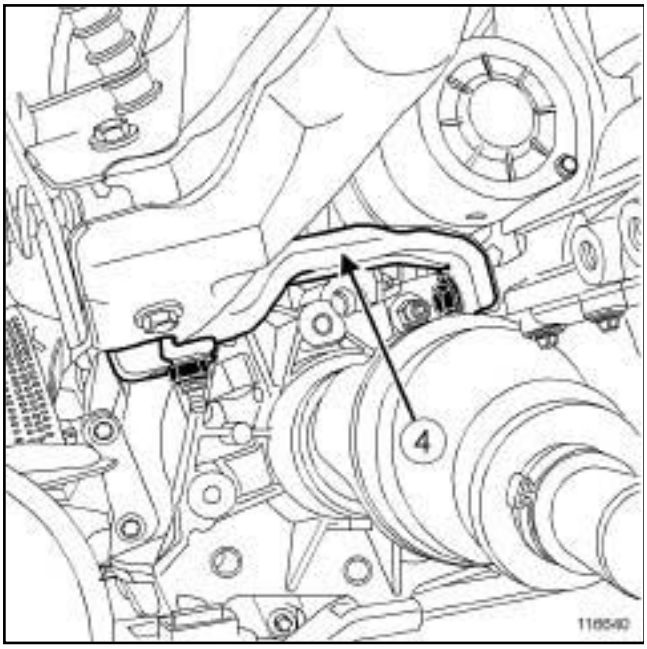


- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

116557

❏ Remove the nuts (**1**) from the exhaust flange.

❏ Push the exhaust pipe towards the rear of the vehicle.

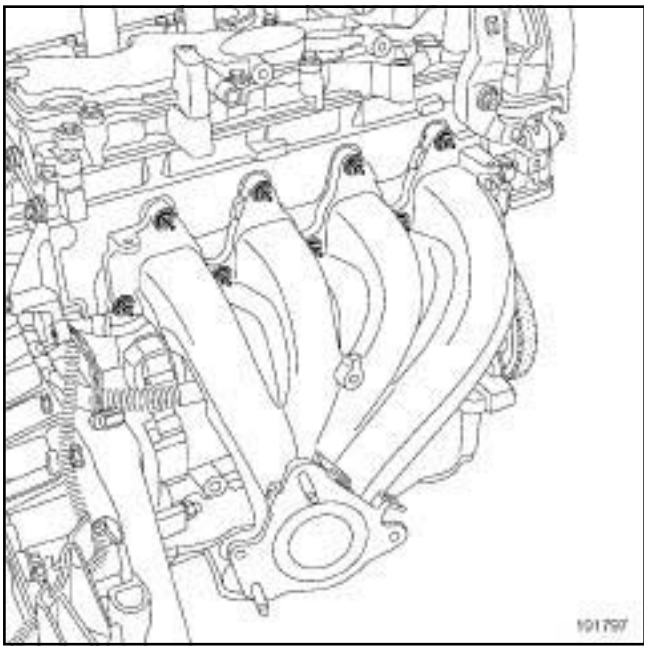


116635

❏ Disconnect the upstream oxygen sensor connector (**2**) .

❏ Remove:

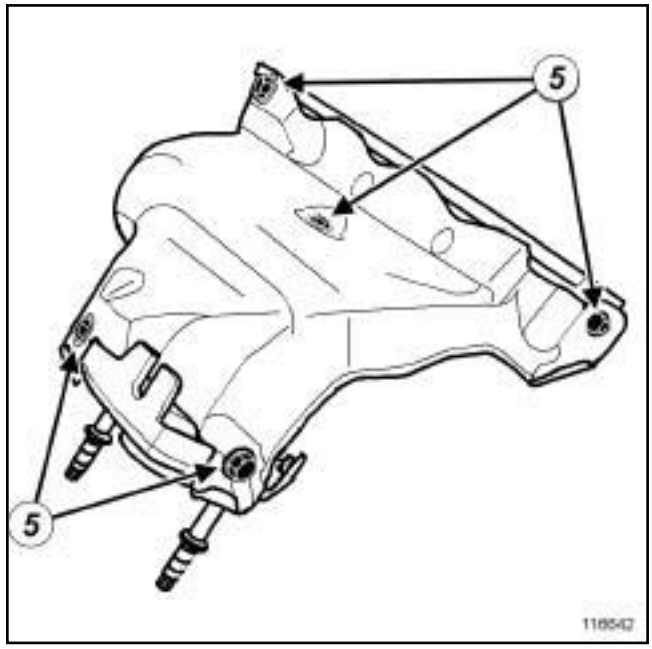
- the upstream oxygen sensor using the,
- the upper heat shield (**3**) from the exhaust manifold.



K4M

116640

❑ Remove the stay (**4**) between the exhaust manifold and the cylinder block.



II - REMOVAL OPERATION

101797

❑ Remove:

- the exhaust manifold nuts,
- the exhaust manifold.

116642

❑ Using the workbench, remove:

- the bolts (**5**) from the exhaust manifold lower heat shield,
- the lower heat shield from the exhaust manifold.

REFITTING

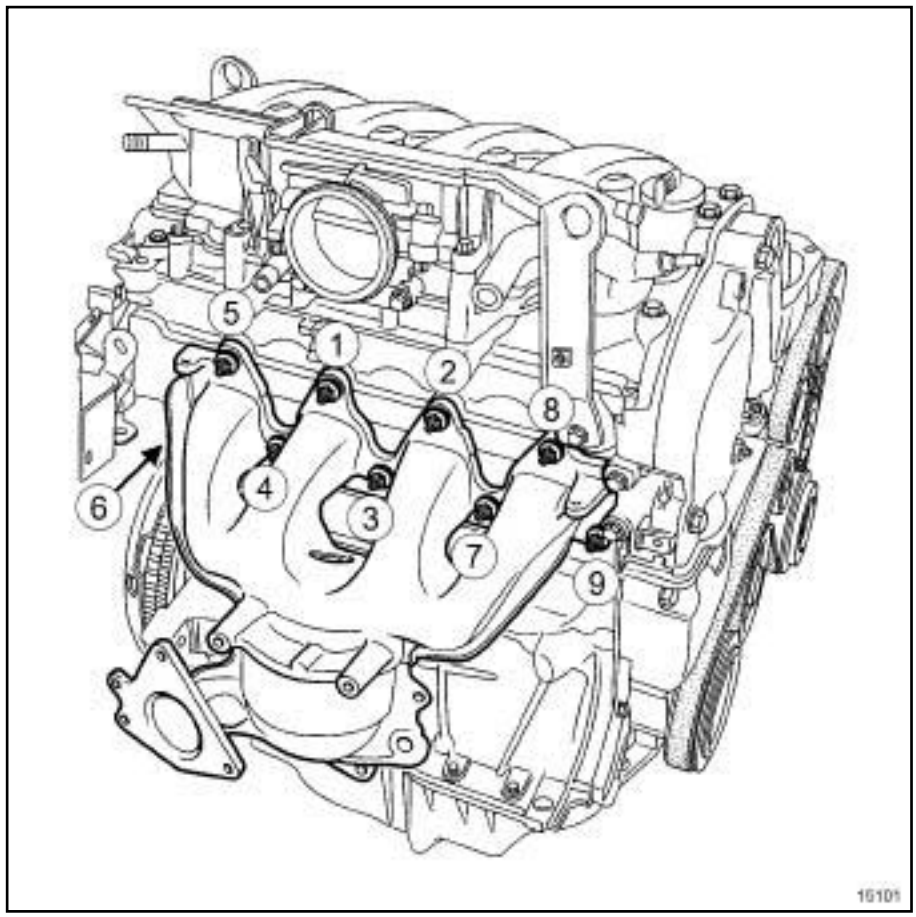
I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: exhaust manifold seal**.

❑ **parts always to be replaced: ring between exhaust manifold and catalytic converter**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the exhaust manifold joint face if it is to be re-used,
- the cylinder head joint face.



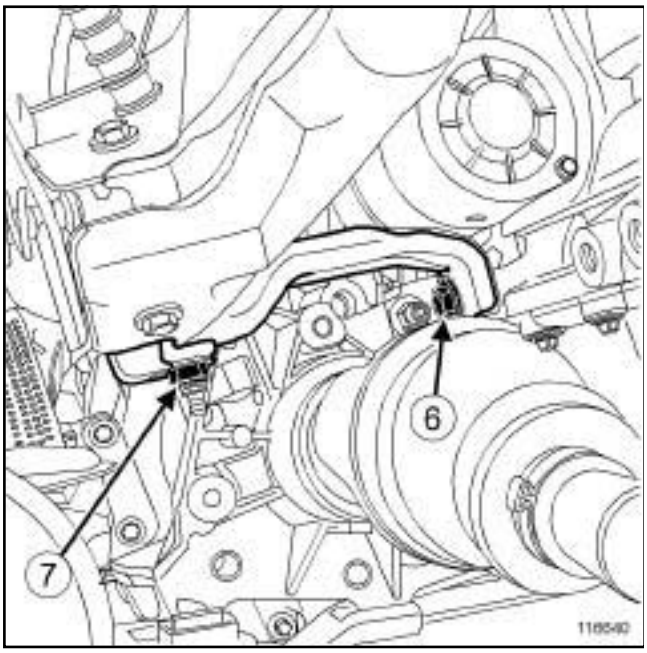
Note:

If a stud loosens during removal, coat it with **HIGH RESISTANCE THREADLOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❑ Tighten to torque the **exhaust manifold studs (8 N.m)**.

K4M

II - REFITTING OPERATION FOR PART CONCERNED



15101

❑ Refit the exhaust manifold.

❑ Tighten to torque and in order the **exhaust manifold mounting nuts (23 N.m)**.

III - FINAL OPERATION

116640

❑ Refit the stay between the exhaust manifold and the cylinder block.

❑ Tighten to torque and in order:

- the **bolts (6) mounting the stay on the cylinder block (21 N.m)**,
- the **nut (7) mounting the stay on the exhaust manifold (21 N.m)**.

❑ Refit the exhaust manifold upper heat shield.

❑ Torque tighten the **exhaust manifold upper heat shield mounting bolts (12 N.m)**.

❑ Refit the upstream oxygen sensor using the.

❑ Torque tighten the **upstream oxygen sensor (45 N.m)**.

❑ Connect the upstream oxygen sensor connector.

❑ Refit the exhaust bracket mounting bolts.

❑ Torque tighten the **exhaust bracket mounting bolts (21 N.m)**.

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 388, 80A, Battery).

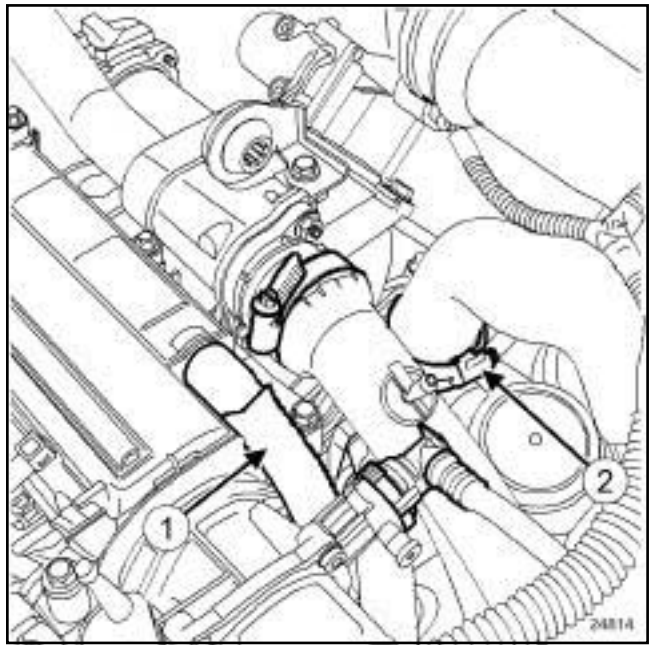
K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
new turbocharger studs on the exhaust manifold	**9 N.m**
new turbocharger stud on the turbocharger	**9 N.m**
turbocharger nuts	**28 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02, Lifting equipment).

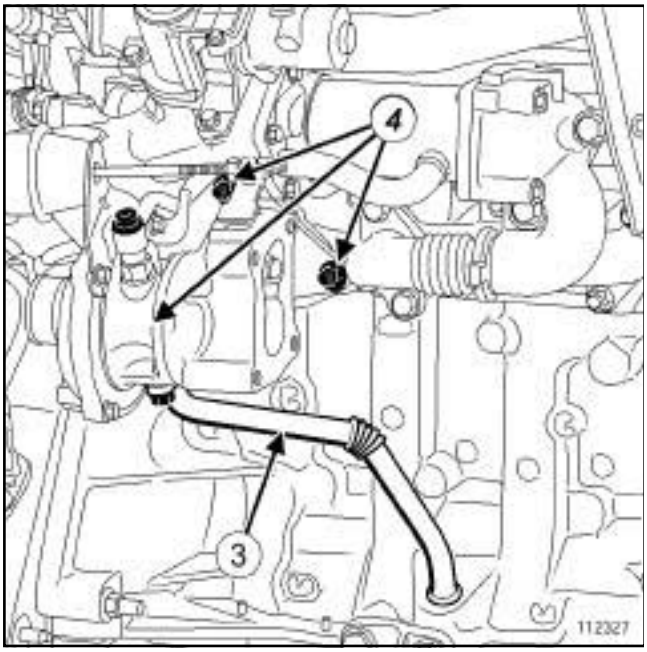
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine cover,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

24814

❏ Disconnect:



- the oil vapour rebreathing pipe (**1**) ,
- the duct between the turbocharger and the intercooler at (**2**) .

❏ Remove:

- the exhaust gas recirculation solenoid valve (see **14A**, **Antipollution**, **Exhaust gas recirculation solenoid valve: Removal - Refitting**, page **14A-4**) ,
- the air duct between the turbocharger and the air filter unit,
- the engine undertray,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .

K9K

II - REMOVAL OPERATION

112327

❑ Remove (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-4**) :

- the turbocharger oil return pipe (**3**) ,
- the turbocharger oil supply pipe.

❑ Remove:

- the nuts (**4**) from the turbocharger on the exhaust manifold,
- the turbocharger,
- the turbocharger seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Turbocharger nut**.

❑ **parts always to be replaced: seal between exhaust manifold and turbocharger**.

❑ **parts always to be replaced: exhaust manifold stud on the turbocharger (if loosened)**.

WARNING

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Check that there are no leaks. If there are, replace the part.

WARNING

Following a turbocharger fault, check that the intercooler and air circuit assembly are not full of oil. If they are, remove them and clean them with a cleaning tray or station and dry them with a compressed air gun.

❑ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the exhaust manifold joint face,
- the turbocharger gasket face if reused.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the exhaust manifold joint face,
- the turbocharger joint face if it is to be reused,
- the housing of the turbocharger air outlet pipe seal,
- the joint face of the exhaust gas cooler mounting on the gearbox end.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Torque tighten:

- the **new turbocharger studs on the exhaust manifold (9 N.m)**,
- the **new turbocharger stud on the turbocharger (9 N.m)**.

II - REFITTING OPERATION

❑ Refit:

- a new turbocharger seal on the exhaust manifold,
- the turbocharger.

K9K

❑ Use an open wrench to fit the new turbocharger nuts without tightening them (the turbocharger must be in contact with the manifold and the wrench should no longer turn without effort).

❑ Torque tighten the **turbocharger nuts (28 N.m)**.

III - FINAL OPERATION

❑ Refit (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-4**) :

- the turbocharger oil return pipe,
- the turbocharger oil supply pipe.

❑ Refit:

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**)
- the engine undertray,
- the air duct between the turbocharger and the air filter unit,
- the exhaust gas recirculation solenoid valve (see **14A**, **Antipollution**, **Exhaust gas recirculation solenoid valve: Removal - Refitting**, page **14A-4**)

❑ Connect:

- the duct between the turbocharger and the intercooler onto the turbocharger,
- the oil vapour rebreathing pipe .

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Check

❑ Disconnect the flow actuator connector (engine starting inhibition).

❑ Run the starter motor until the oil pressure warning light goes out (wait for a few seconds).

❑ Switch off the ignition.

❑ Reconnect the fuel flow actuator connector.

❑ Make sure that there are no oil leaks.

❑ Connect the **Diagnostic tool** and clear the stored faults.

K9K

Equipment required
self-contained starter
Diagnostic tool

Tightening torques ▽	
new turbocharger oil supply pipe hollow bolt to the turbocharger	**Torx bolt 18 N.m or Hexagonal bolt 14 N.m**
turbocharger oil supply pipe nut on the cylinder head	**shouldered nut 35 N.m or non-shouldered nut 23 N.m**
turbocharger oil return pipe bolts	**12 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Wear cut-resistant gloves during the operation.

WARNING
Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Check that there are no leaks. If there are, replace the part.

WARNING
Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

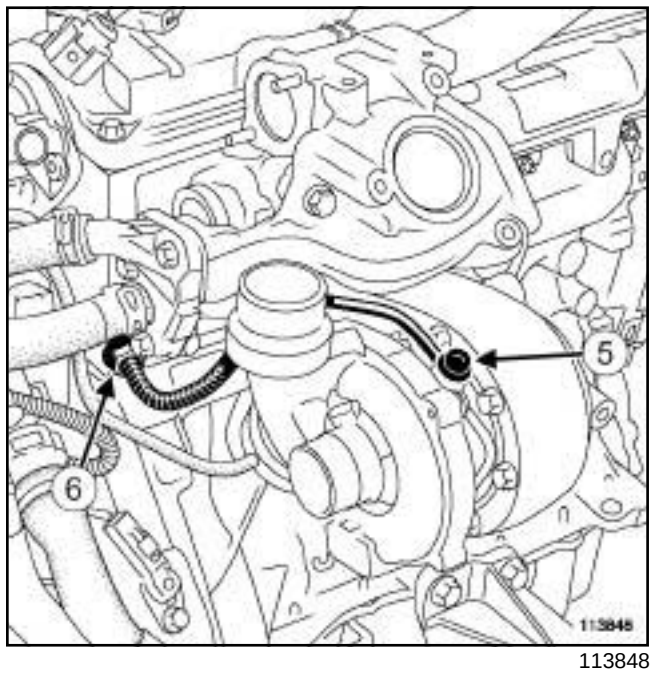
Failure to observe the following instructions will lead to the turbocharger breaking again.

Note:
This procedure deals with removing and refitting the turbocharger oil return pipe and the turbocharger oil supply pipe.

REMOVING THE TURBOCHARGER OIL SUPPLY PIPE

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❑ Remove:

- the engine cover,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

❑ Remove:

- the engine undertray,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .

II - REMOVAL OPERATION

113848

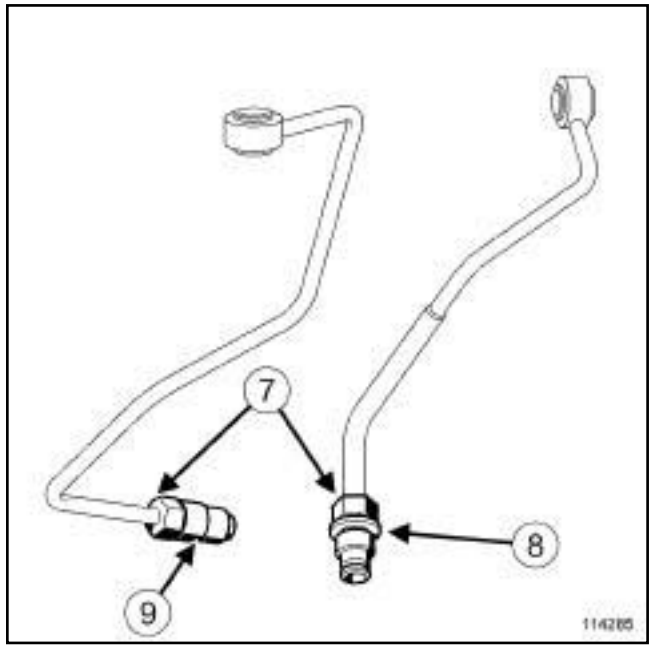
❑ Loosen the nut (**6**) for the turbocharger oil supply pipe on the cylinder head, using the tool.

K9K

❑ Remove:

- the turbocharger oil supply pipe hollow boltfrom the turbocharger,
- the turbocharger oil supply pipe.

❑ Wipe away any oil run-off.



REFITTING THE TURBOCHARGER OIL SUPPLY PIPE

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: turbocharger oil supply pipe**

❑ **parts always to be replaced: turbocharger oil pipe seal**

❑ **parts always to be replaced: Turbocharger oil supply pipe bolt**

114285

❑

Note:

These two turbocharger oil supply pipes may be used on the same engine. The tightening torque of the end pieces (**7**) on the cylinder head is different, depending on the following:

- if the end piece is **shouldered** (**8**) ; in this case, there is no need to apply **HIGH RESISTANCE THREADLOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the end piece,
- if the end piece is **not shouldered** (**9**) ; in this case, it is essential to apply **HIGH RESISTANCE THREADLOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the end piece.

II - REFITTING OPERATION

❑ Refit a new turbocharger oil supply pipe.

❑ Fit the turbocharger oil supply pipe nut on the cylinder head, without tightening it.

❑ Refit a new hollow bolt for the turbocharger oil supply pipe on the turbocharger.

❑ Torque tighten:

- a **new turbocharger oil supply pipe hollow bolt to the turbocharger (Torx bolt 18 N.m or Hexagonal bolt 14 N.m)**,

- the **turbocharger oil supply pipe nut on the cylinder head (shouldered nut 35 N.m or non-shouldered nut 23 N.m)** using toolor tool.

III - FINAL OPERATION

❑ Refit:

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) ,
- the engine undertray.

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Disconnect the high pressure pump flow actuator connector and the connector for each diesel fuel injector in order to prevent the engine from starting.

❑ Connect a **self-contained starter**.

❑ Run the starter until the oil pressure warning light goes out on the instrument panel (wait for a few seconds).

❑ Switch off the ignition.

❑ Disconnect the **self-contained starter**.

❑ Connect the high pressure pump flow actuator connector and the connector for each diesel fuel injector.

❑ Start the engine.

❑ Let the engine idle then depress the accelerator several times with no load.

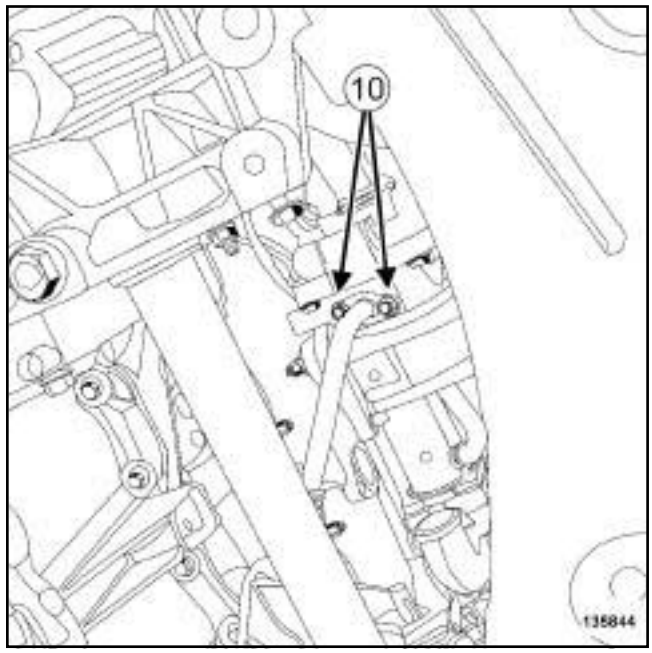
❑ Switch off the ignition.

❑ Check:

- that the turbocharger is operating correctly,
- that there are no oil leaks from the turbocharger.

❑ Use the **Diagnostic tool** to check for an absence of stored faults; deal with these and clear them as necessary.

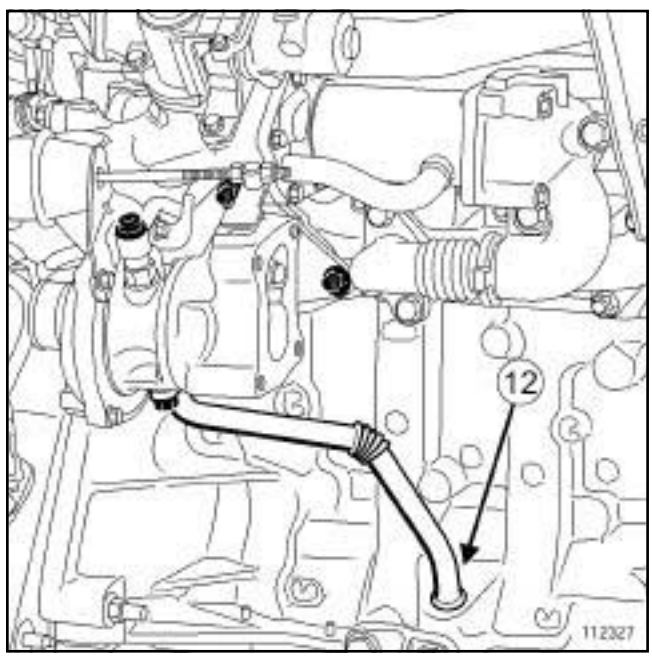
REMOVING THE TURBOCHARGER OIL RETURN PIPE



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:



- the engine undertray bolts,
- the engine undertray,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .

REMOVAL OPERATION

135844

❑ Remove the turbocharger oil return pipe bolts (**10**) .

112327

❑ Rotate the turbocharger oil return pipe (**12**) to facilitate its removal.

K9K

❑ Extract the turbocharger oil return pipe from the cylinder block.

❑ Remove the turbocharger oil return pipe seals.

REFITTING THE TURBOCHARGER OIL RETURN PIPE

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: turbocharger oil pipe seal**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Towing and lifting**) (04B, Consumables - Products) to clean and degrease:

- the seal housing on the turbocharger oil return pipe if it is to be reused,
- the turbocharger oil return pipe joint face if it is to be reused,
- the turbocharger oil return pipe joint face on the turbocharger,
- the turbocharger oil return pipe housing in the cylinder block.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

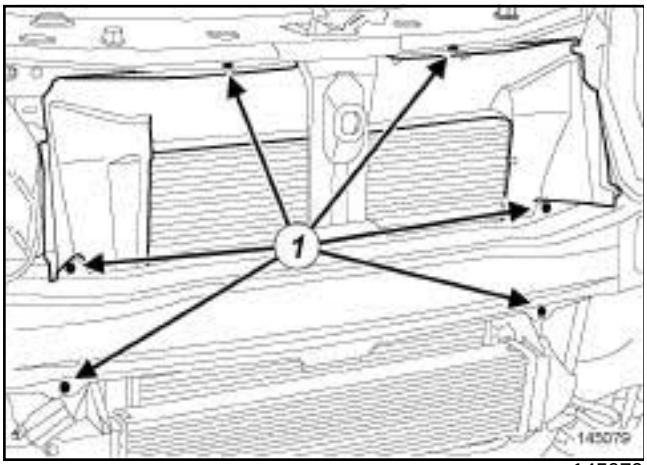
❑ Lubricate the turbocharger oil return pipe O-ring with clean engine oil.

II - REFITTING OPERATION

❑ Proceed in the reverse order to removal.

❑ Torque tighten the **turbocharger oil return pipe bolts (12 N.m)**.

K9K

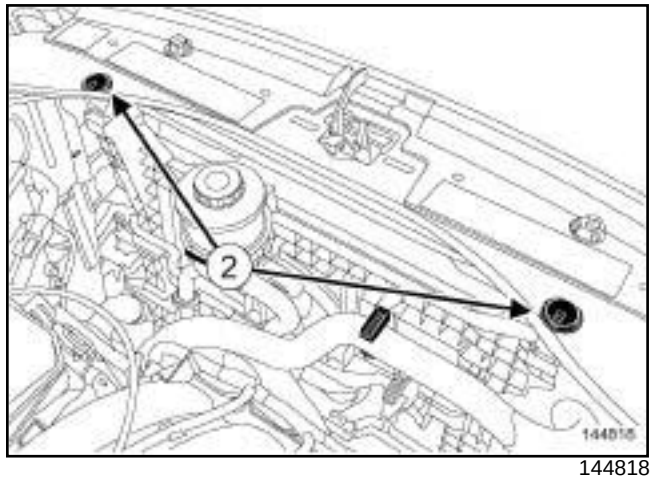


REMOVAL

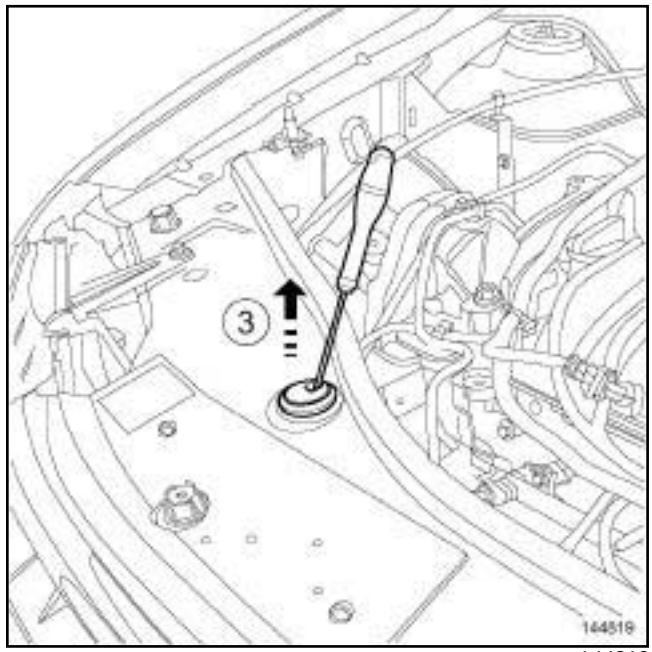
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❑ Remove the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection).



145079

❑ Remove:

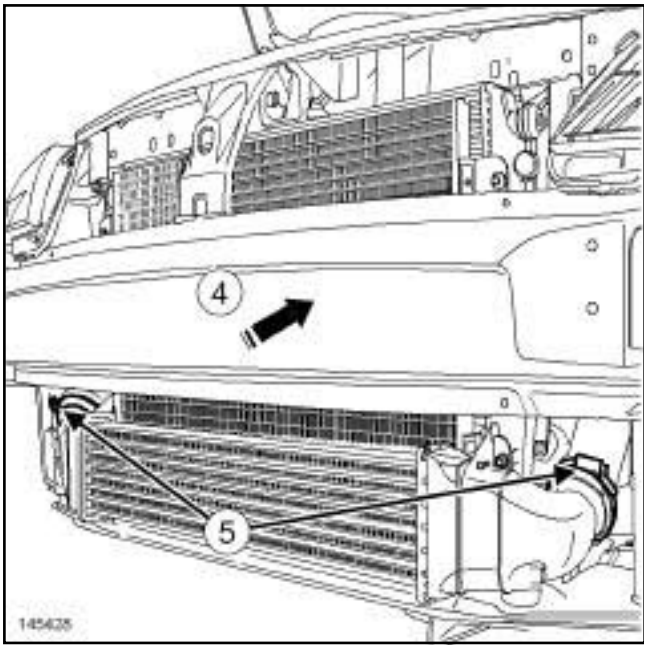
- the air deflector mounting pins (**1**) ,
- the air deflector.

144818

144819

❑ Press the clips of the fan assembly centring pins (**2**) using a screwdriver and pull them in the direction of the arrow (**3**) .

❑ Remove the fan assembly centring pins (**2**) .



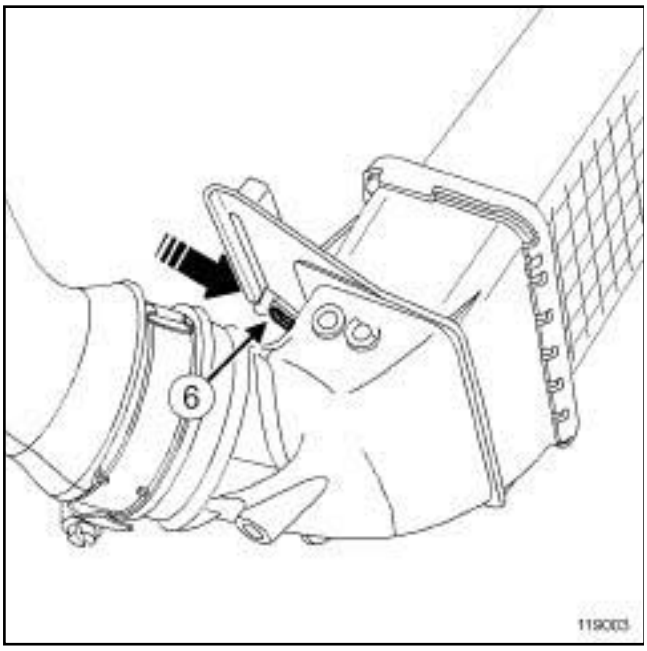
II - REMOVAL OPERATION

❑

Note:

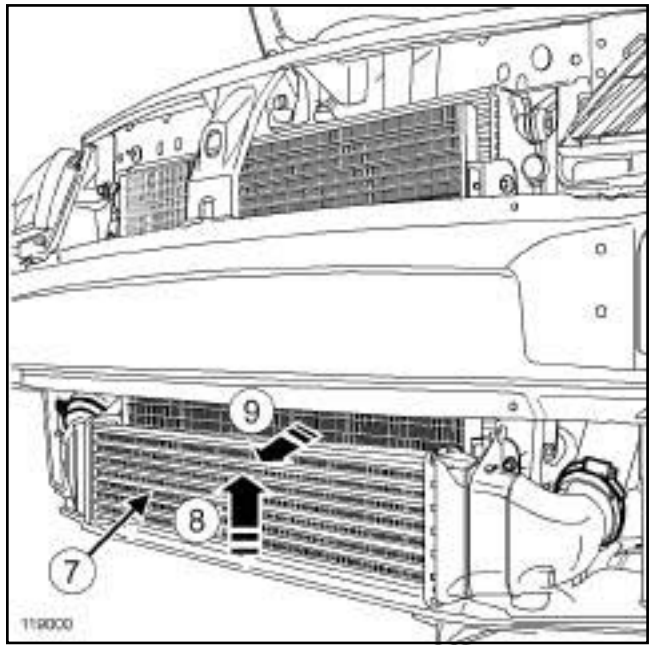
Do not damage the cooling unit vanes (radiator, condenser, etc.) during handling.

K9K



145428

❏ Push the « radiator - fan » assembly in the direction of the arrow (**4**) in order to remove the intercooler.



❏ Remove the clips (**5**) of the intercooler ducts.

❏ Disconnect the intercooler ducts.

119003

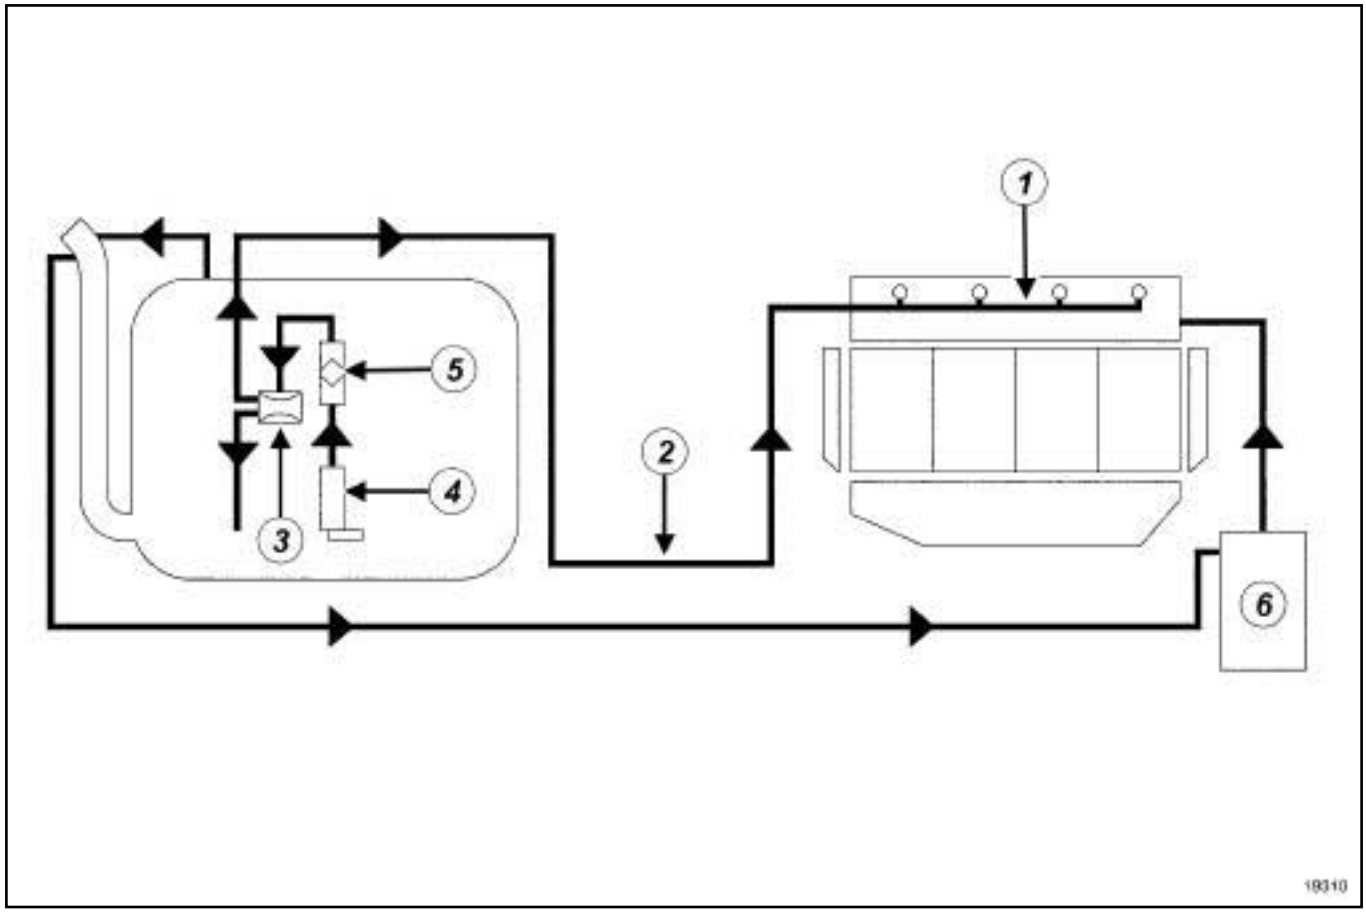
❏ Press the end piece of the intercooler mounting at (**6**) , in the direction of the arrow, to unclip it.

119000

❏ Remove the intercooler (**7**) in the direction of the arrows (**8**) then (**9**) .

REFITTING

I - REFITTING PREPARATION OPERATION



❏ Check that the intercooler is not full of oil. If this is the case, clean it with a cleaning agent and then let it dry.

II - REFITTING OPERATION

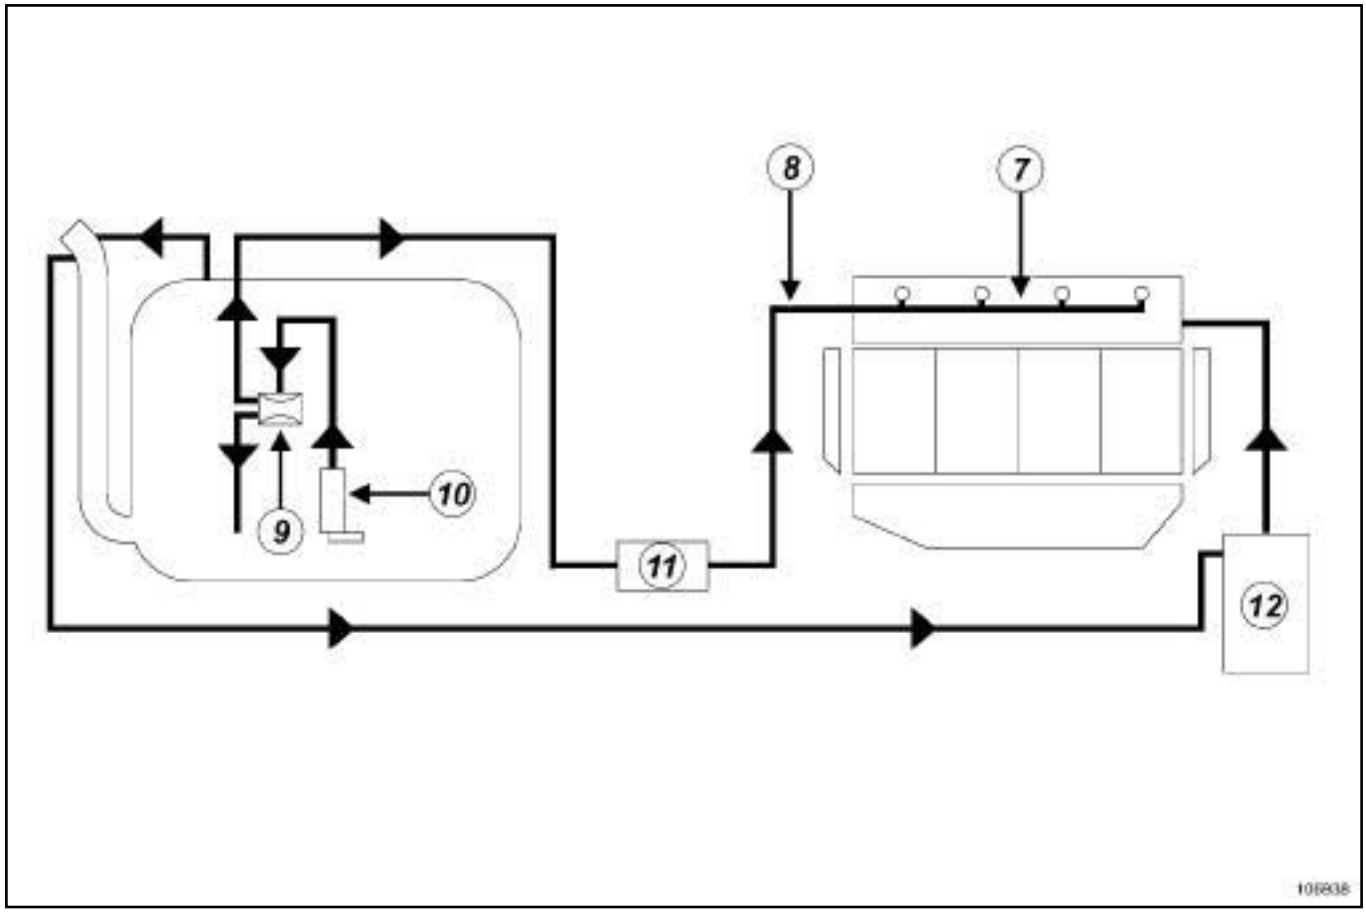
❏ Proceed in the reverse order to removal.

K4M

Operating diagram of the fuel supply circuit (« pump - sender - fuel filter » assembly)

19310

The fuel supply circuit does not have a return.



The fuel pressure does not vary with engine load.

The circuit comprises:

- a rail (**1**) without a return pipe and without a supply pressure regulator,
- a single pipe (**2**) coming from the tank,
- a « pump-sender-fuel filter » assembly fitted with the pressure regulator (**3**) , the pump (**4**) and the fuel filter (**5**) (all located in the tank),
- a fuel vapour recirculation tank (**6**) .

K4M

Operating diagram of the fuel supply circuit (external filter)

106938

The fuel supply circuit does not have a return.

The fuel pressure does not vary with engine load.

The circuit comprises:

- a rail (**7**) without a return pipe union and without a supply pressure regulator,
- a single pipe (**8**) coming from the tank,
- a « pump-fuel sender » supply assembly fitted with the pressure regulator (**9**) , the pump (**10**) and the fuel filter (**11**) ,
- a fuel vapour recirculation tank (**12**) .

K9K

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see **Diesel injection: Precautions for the repair**) ,
- (see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

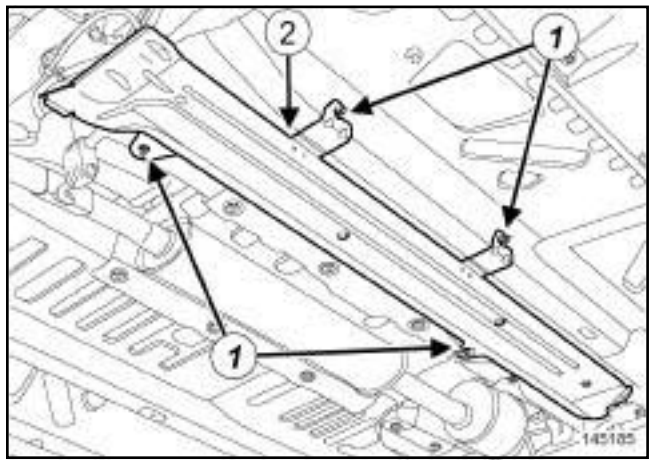
WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

Note:



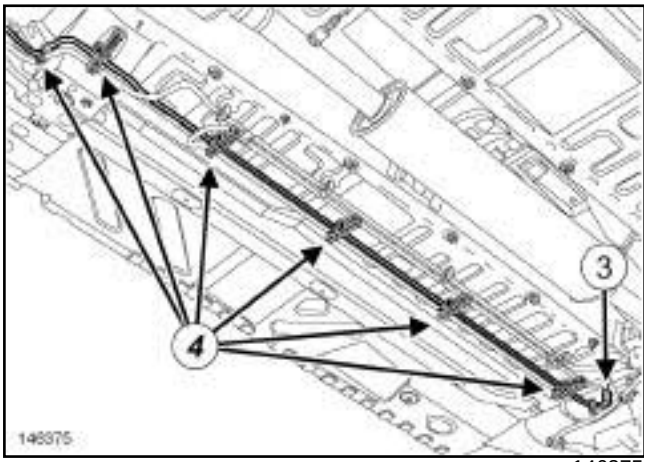
The priming pump is incorporated in the fuel supply pipe.

To remove the priming pump, remove the fuel supply pipe assembly.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



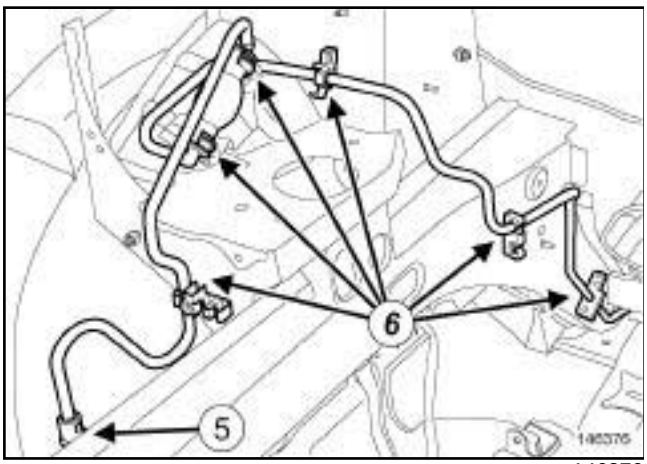
145185

❑ Remove:

- the fuel supply pipe protector nuts (**1**) ,
- the fuel supply pipe protector (**2**) .

K9K

II - OPERATION FOR REMOVAL OF PART CONCERNED



146375

❏ Disconnect the fuel supply pipe at the fuel tank end at (**3**) .

❏ Insert the blanking plugs.

❏ Unclip the fuel supply pipe under the body at (**4**) .

146376

❏ Disconnect the connection (**5**) from the fuel supply pipe on the fuel filter.

❏ Unclip the fuel supply pipe at (**6**) .

❏ Remove the fuel supply pipe through the engine compartment.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Proceed in the reverse order to removal.

❏ Ensure that the fuel supply pipe unions are clicked into position properly.

II - FINAL OPERATION

❏ Prime the fuel circuit using the priming pump.

WARNING

Check that there are no leaks:

- run the engine at idle speed for **2 minutes**,
- accelerate several times at no load,
- switch off the ignition,
- check that there is no fuel escaping.

K9K

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see **Diesel injection: Precautions for the repair**) ,
- (see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

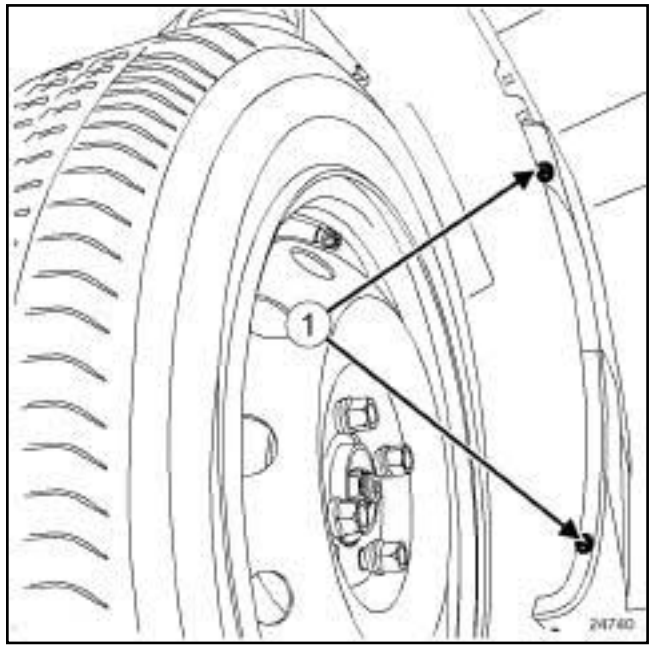
IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.



Note:

Make sure you have a new diesel filter before opening the fuel circuit.

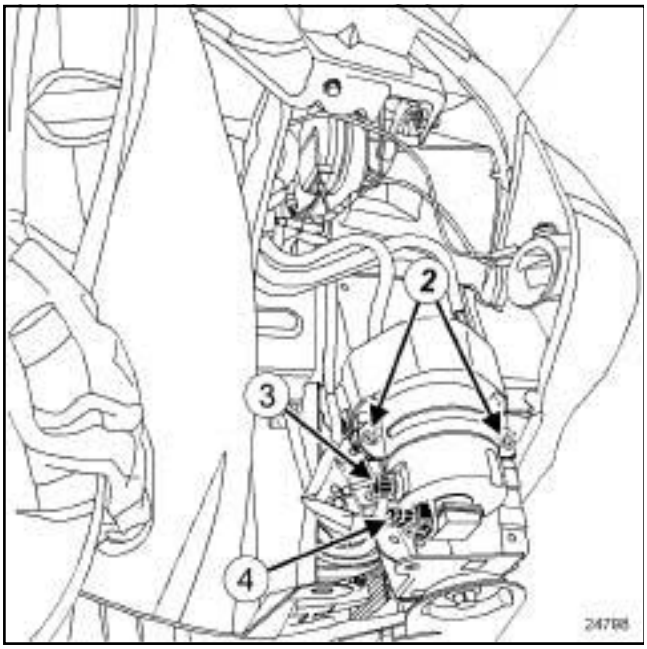
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

24740

❑ Remove:



- the plastic screen under the diesel filter,
- the front right-hand wheel arch liner bolts (**1**) .

❑ Move the front right-hand wheel arch liner slightly to one side.

K9K

II - REMOVAL OPERATION

MAHLE type filter

24798

❏ Remove:

- the diesel filter protection plate nuts (**2**) ,
- the diesel filter protection plate,
- the diesel filter from its mounting, noting its original position.

❏ Disconnect the water detection sensor connector (**4**) .

❏ Place a container under the diesel filter.

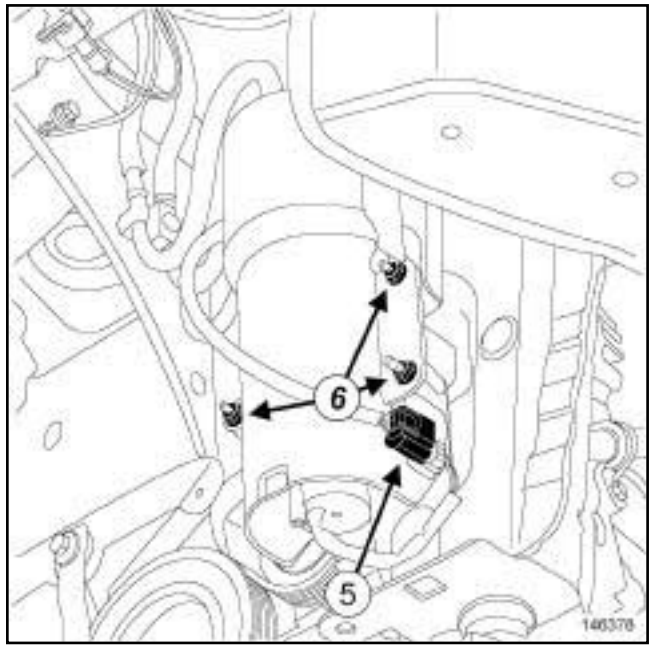
❏ Open the bleed screw (**3**) and let the diesel run out.

WARNING

Keep the pipe unions away from contaminated areas.

Note:

Mark the position of the fuel pipe unions in relation to the diesel filter before removing the diesel filter.



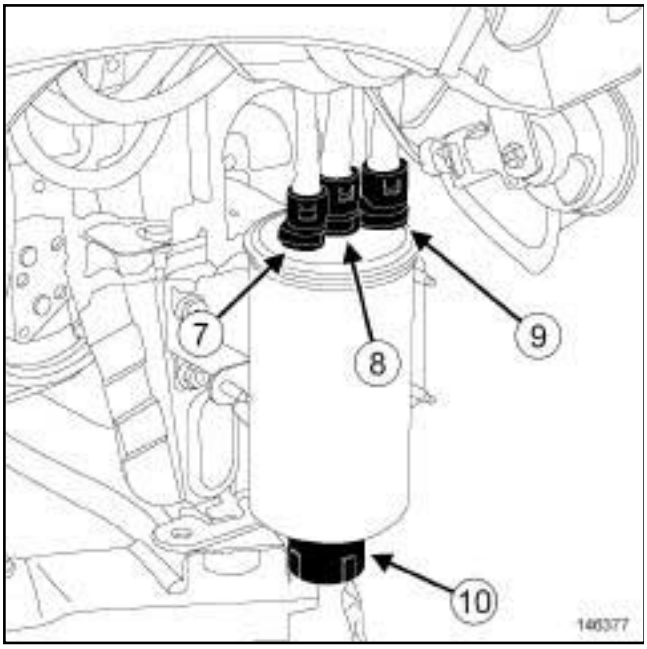
❏ Disconnect the pipe unions on the diesel filter.

❏ Let the diesel fuel flow out from the various pipes into the container.

❏ Fit plugs into the openings.

❏ Remove the water detection sensor, turning it anti-clockwise.

DELPHI type filter



146378

❏ Disconnect the water detection sensor connector (**5**) .

❏ Remove:

- the diesel filter protection plate nuts (**6**) ,
- the diesel filter protection plate,
- the diesel filter from its mounting, noting its original position.

❏ Place a container under the diesel filter.

146377

❑ Disconnect:

- the fuel inlet pipe union (**7**) ,
- the fuel outlet pipe union (**8**) ,
- the fuel return pipe union (**9**) .

❑ Let the diesel fuel flow out from the various pipes into the container.

❑ Remove the water detection sensor (**10**) , turning it anti-clockwise.

❑ Fit plugs into the openings.

REFITTING

I - REFITTING OPERATION

❑ Refit the water detection sensor, turning it clockwise.

❑ Connect:

- the pipe unions on the diesel filter,
- the water detection sensor connector.

❑ Refit:

- the new diesel filter in its original position,
- the diesel filter protection plate,
- the diesel filter protection plate nuts.

II - DRAINING THE WATER INSIDE THE DIESEL FILTER

❑

Note:

- Certain vehicles have a sensor for detecting water in the diesel fuel, located in the diesel filter. If water is detected, the injection fault warning light comes on.

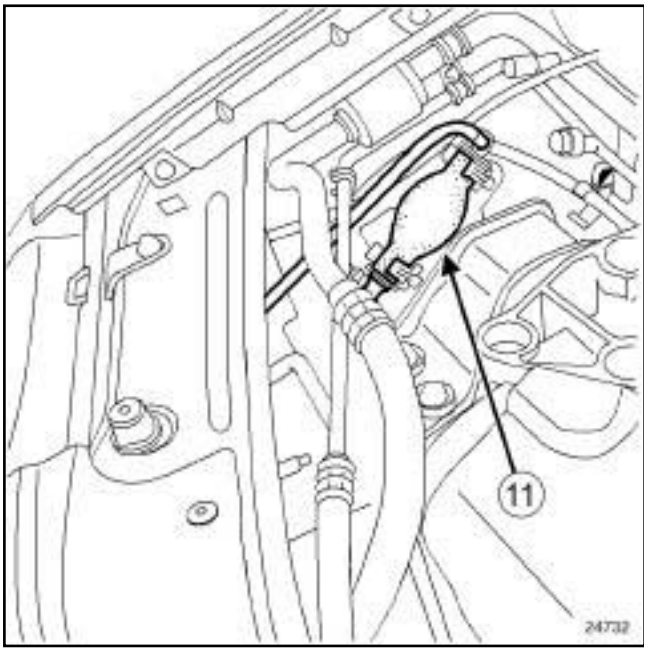
❑ Periodically drain any water contained in the diesel filter.

❑ For filters without a water presence sensor:

- open the drain plug,
- let the water flow out,
- close the plug.

❑ For filters with a water presence sensor:

- disconnect the water presence sensor connector,
- unclip the water presense sensor connector,
- loosen the water presence sensor by one turn,
- let the water flow out,
- tighten the water presence sensor,
- connect the water presence sensor connector.



III - FINAL OPERATION

❑ Refit:

- the front right-hand wheel arch liner,
- the plastic screen under the diesel filter.

K9K

Priming the supply circuit

24732

❑ Prime the fuel system with the manual priming pump (**11**) (automatic degassing).

K4M

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

Tightening torques ▽	
fuel pipe protector nuts	**7 N.m**
fuel pipe protector bolt	**7 N.m**

IMPORTANT

During this operation, be sure to:

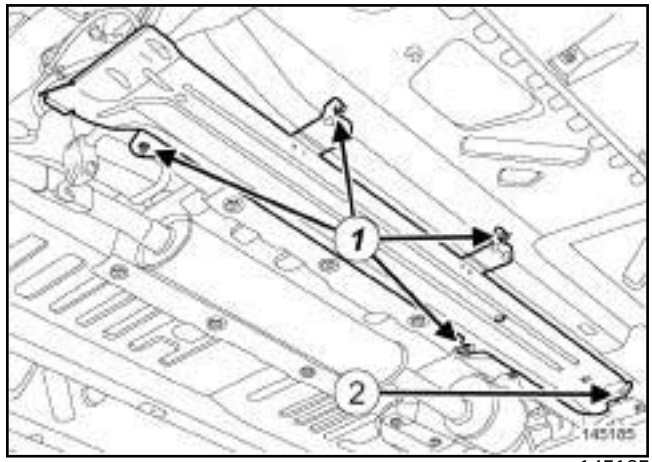
- refrain from smoking or bringing red hot objects near the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear leaktight gloves (nitrile type) for this operation.

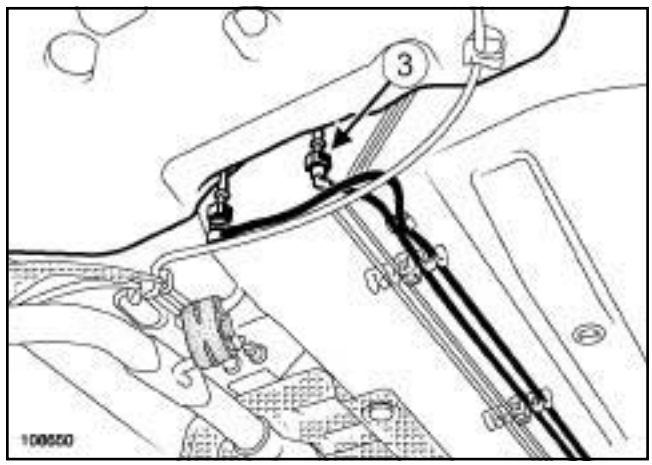


WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

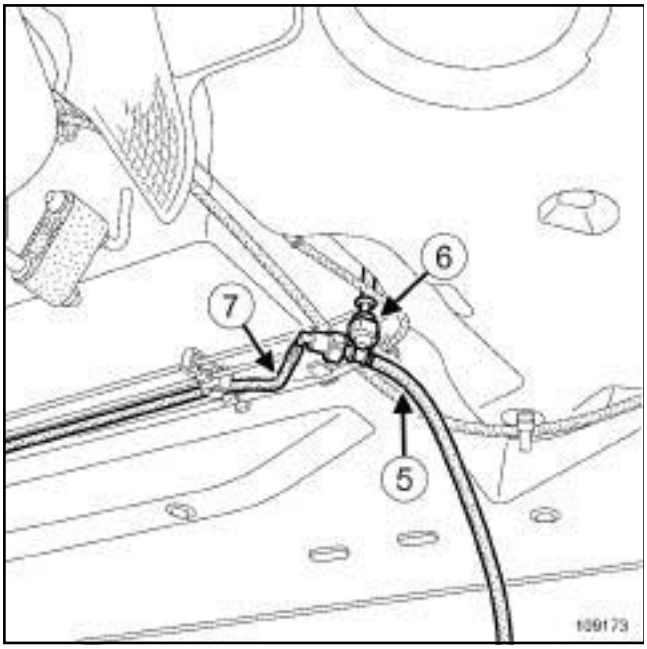
CHECK

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Switch off the ignition.

145185



❑ Remove:

- the nuts (**1**) and the bolt (**2**) from the fuel pipe protector,
- the fuel pipe protector.

108650

❑ Disconnect the fuel supply pipe union (**3**) .

109173

❏ Connect:

- the « T » union **(Mot. 1311-08)** (**6**) to the fuel tank outlet pipe,
- the pipe (**5**) fitted with a pressure gauge contained in the test kitonto the « T » union (**6**) ,
- the fuel supply pipe (**7**) to the « T » union (**6**) .

❏ Start the vehicle to run the fuel pump.

❏ Determine the pressure:

- the pressure must be constant (approximately **3.5 bar ± 0.2 bar**),
- It may take a few seconds to obtain a correct pressure reading.

❏ Disconnect:

- the pipe fitted with the pressure gauge contained in the test kitfrom the « T » union,
- the « T » union **(Mot. 1311-08)** from the fuel tank outlet pipe.

❏ Connect the fuel supply pipe union to the fuel tank outlet pipe.

❏ Refit the fuel supply pipe protector.

❏ Torque tighten:

- the **fuel pipe protector nuts (7 N.m)**,
- the **fuel pipe protector bolt (7 N.m)**.

K4M

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

Tightening torques ▽	
fuel pipe protector nuts	**7 N.m**
fuel pipe protector bolt	**7 N.m**

IMPORTANT

During this operation, be sure to:

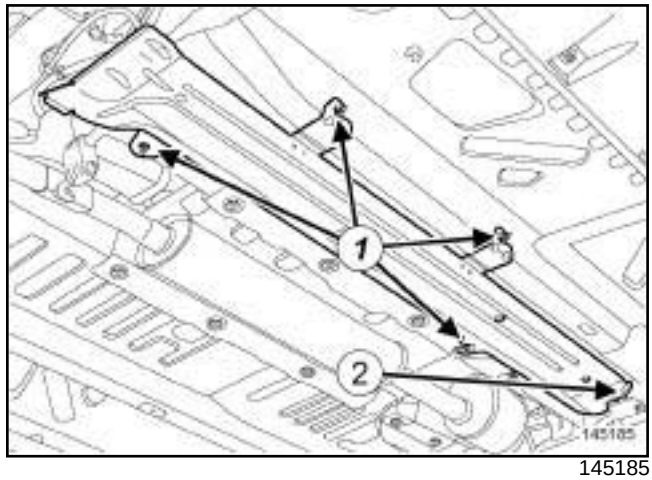
- refrain from smoking or bringing red hot objects near the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear leaktight gloves (nitrile type) for this operation.

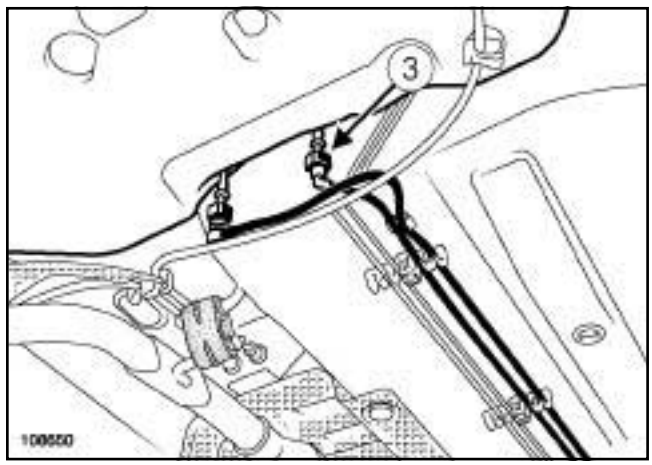


WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

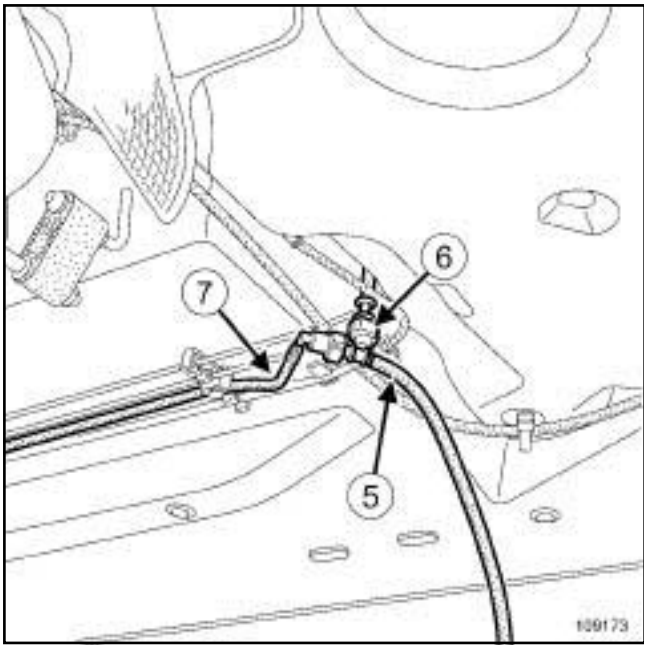
CHECK

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Switch off the ignition.

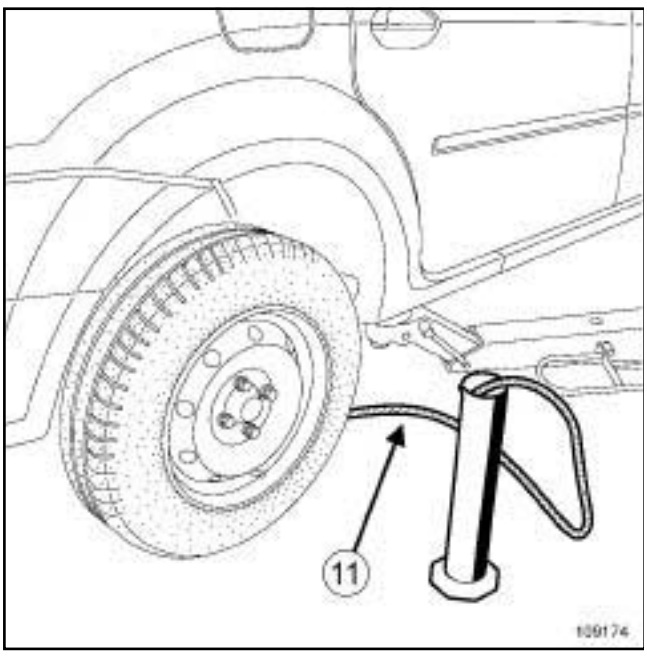
145185



❑ Remove:

- the nuts (**1**) and the bolt (**2**) from the fuel pipe protector,
- the fuel pipe protector.

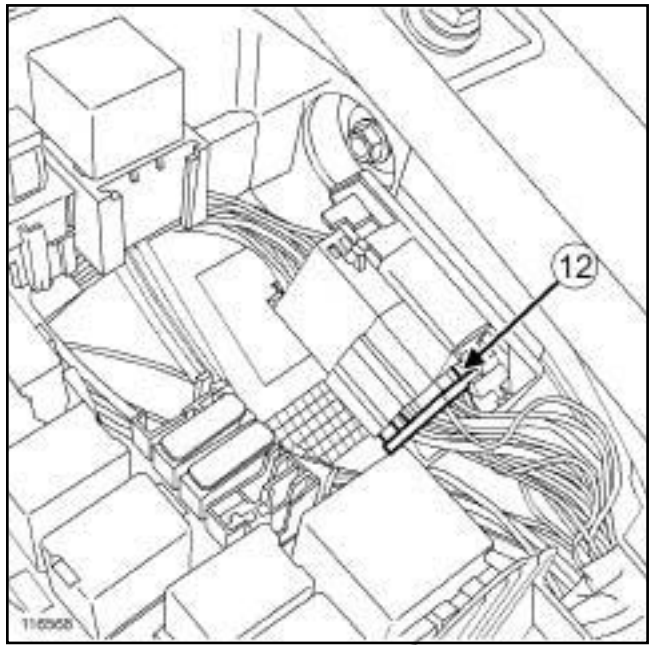
108650



❑ Disconnect the fuel supply pipe union (**3**) .

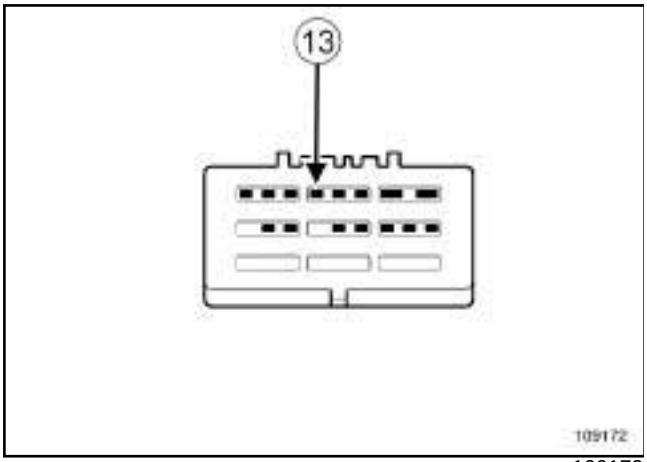
109173

❑ Connect:



- the « T » union **(Mot. 1311-08)** (**6**) to the fuel tank outlet pipe,
- the pipe (**5**) contained in the test kitonto the « T » union (**6**) ,
- the fuel supply pipe (**7**) to the « T » union (**6**) .

109174



❑ Insert the pipe (**11**) into a graduated measuring cylinder (**2000 ml**).

❑ Remove the Protection and Switching Unit cover.

116568

❑ Disconnect the connector (**12**) from the passenger compartment engine harness.

109172

❏ Connect the connector terminal (**13**) to the + **BATTERY** to operate the fuel pump.

❏ Note the time taken for the measuring cylinder to fill up.

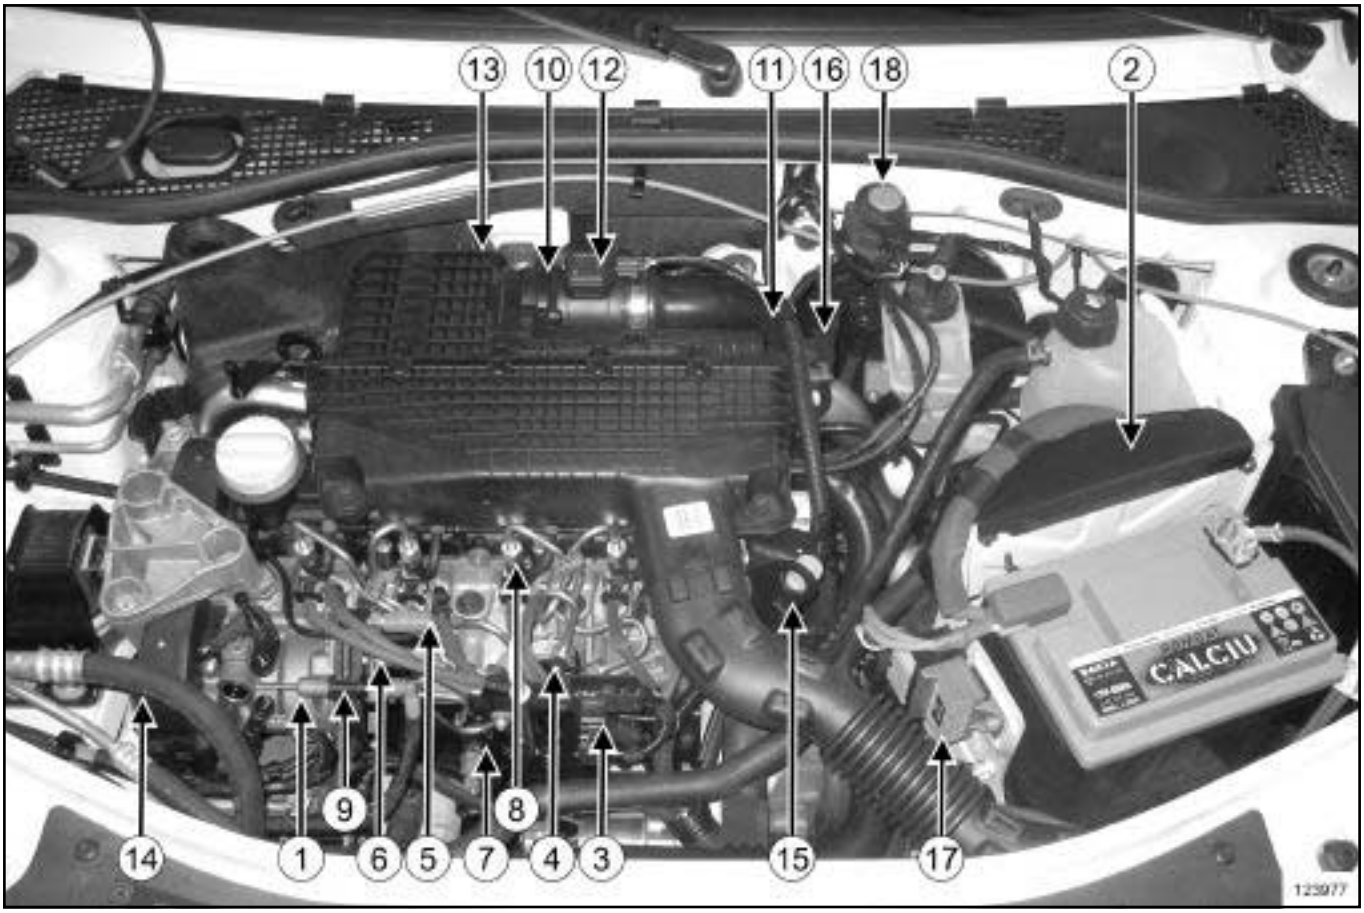
> Note:
>
> The minimum flow rate from the fuel pump is **60 l/h**.

❏ Remove the terminal (**13**) of the + **BATTERY** connector.

❏ Refit the Protection and Switching Unit cover.

❏ Disconnect:

- the pipe fitted with the pressure gauge contained in the test kitfrom the « T » union,
- the « T » union **(Mot. 1311-08)** from the fuel tank outlet pipe.



❏ Connect the fuel supply pipe union to the tank outlet pipe.

❏ Refit the fuel supply pipe protector.

❏ Torque tighten:

- the **fuel pipe protector nuts (7 N.m)**,
- the **fuel pipe protector bolt (7 N.m)**.

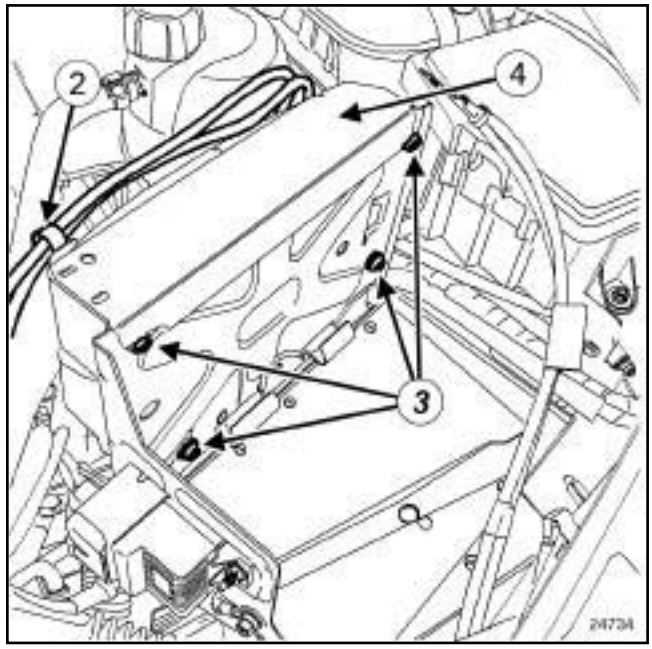
Tightening torques ▽	
injection computer nuts	**8 N.m**
injection computer protector bolts	**8 N.m**

Note:

When programming, reprogramming or replacing the computer, it is necessary to program the new computer with the C2I parameters (injector flow correction) and the engine adaptives using the **Diagnostic tool**.



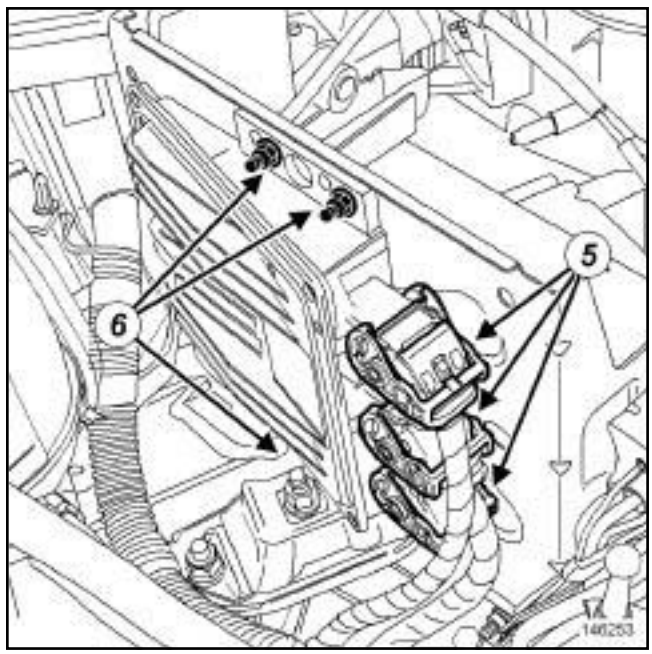
There are two ways to do this (see **Fault finding - Replacement of components**) (13B, Diesel injection):

- an automatic method which can be used if it is possible to read the information contained in the old computer,
- a manual method which is to be used if it is not possible to read the information contained in the old computer.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the battery (see **Battery: Removal - Refitting**) (80A, Battery).



24734

❑ Unclip the positive terminal wiring (**2**) .

❑ Remove:

- the bolts (**3**) from the injection computer protector,
- the injection computer protector (**4**) .

II - REMOVAL OPERATION

146253

❑ Remove the injection computer nuts (**6**) .

❑ Disconnect the three connectors (**5**) from the injection computer.

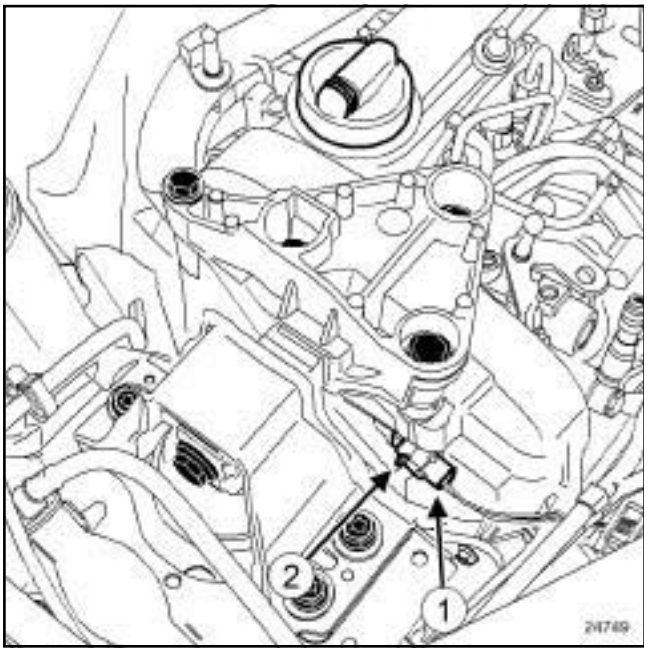
❑ Remove the injection computer.

K9K

REFITTING

I - REFITTING OPERATION

- ❏ Fit the injection computer on its mounting studs.
- ❏ Torque tighten the **injection computer nuts (8 N.m)**.
- ❏ Connect the injection computer connectors.



II - FINAL OPERATION

- ❏ Refit the injection computer protector.
- ❏ Tighten to torque the **injection computer protector bolts (8 N.m)**.
- ❏ Clip on the positive terminal wiring.
- ❏ Refit the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❏ Respect the programming settings for the C2I (individual injector correction) parameters and the engine adaptives (see **Fault finding - Replacement of components**) (13B, Diesel injection).
- ❏ Switch on the ignition and read the fault codes using the **Diagnostic tool**.
- ❏ If necessary, repair the faults indicated.
- ❏ Clear the faults.
- ❏ Check that the vehicle is working properly.

K9K

REMOVAL

OPERATION FOR REMOVAL OF PART CONCERNED

24749

❏ Disconnect the connector (**1**) from the camshaft position sensor.

❏ Remove:

- the bolt (**2**) from the camshaft position sensor,
- the camshaft position sensor.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the camshaft position sensor,
- the camshaft position sensor bolt.

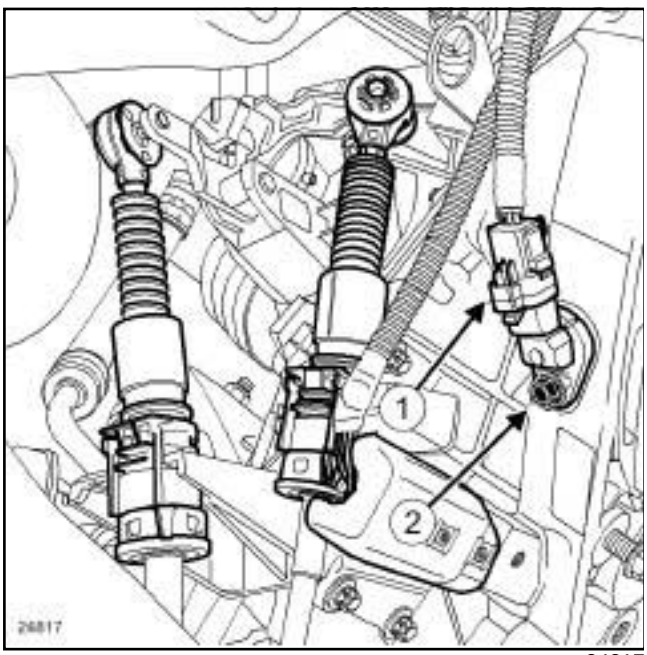
II - FINAL OPERATION

❏ Reconnect the camshaft position sensor connector.

K9K, and 796

Tightening torques ▽	
crankshaft position and speed sensor bolt	**8 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray bolts,
- the engine undertray.

II - REMOVAL OPERATION

24817

❏ Disconnect the crankshaft position sensor connector (**1**) from underneath the vehicle.

❏ From underneath the vehicle, remove:

- the crankshaft position sensor bolt (**2**) ,
- the crankshaft position sensor.

REFITTING

I - REFITTING OPERATION

❏ Refit the crankshaft position sensor.

❏ Torque tighten the **crankshaft position and speed sensor bolt (8 N.m)**.

❏ Connect the crankshaft position sensor connector.

II - FINAL OPERATION

❏ Refit the engine undertray.

K9K, and 796

Equipment required
Diagnostic tool

Tightening torques ▽	
the high pressure pump bolts	**23 N.m**
high pressure pump pulley nut	**70 N.m**
dipstick guide and filler neck nuts on the high pressure rail	**21 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, use the **Diagnostic tool** to check:

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

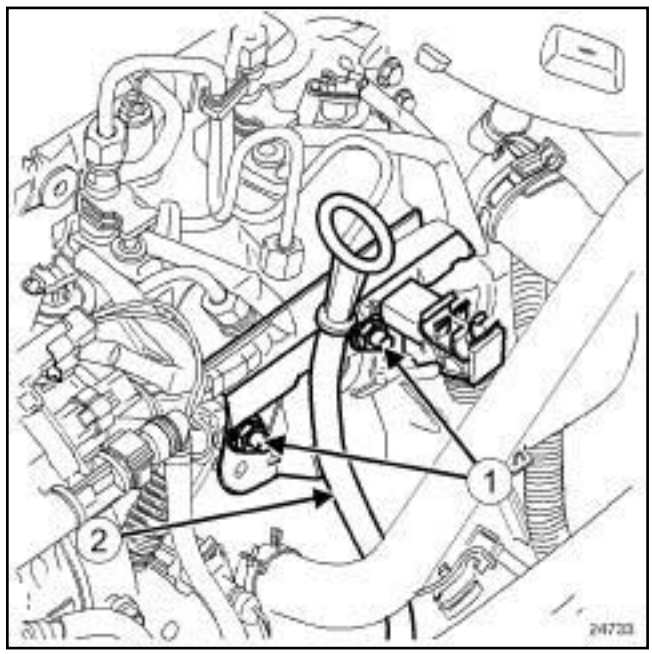
Working on the circuit with the engine running is strictly forbidden.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

Note:

Never run the engine in the opposite direction to that of normal operation.



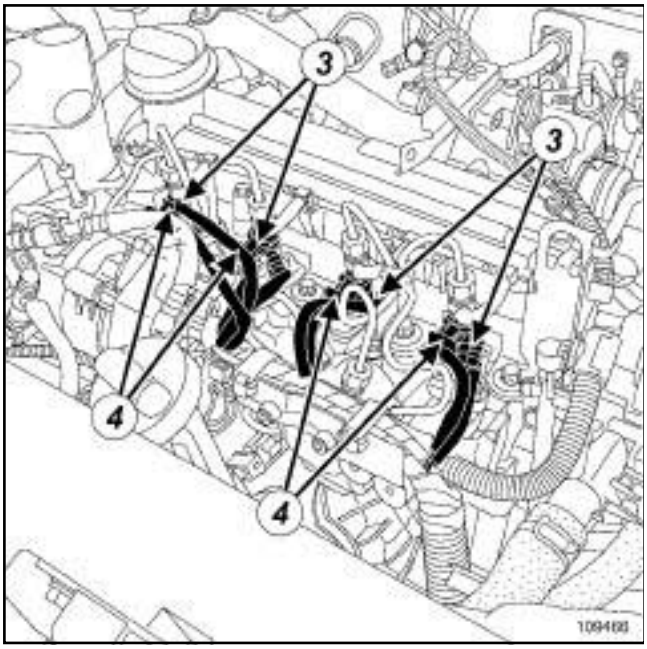
REMOVAL

I - REMOVAL PREPARATION OPERATION

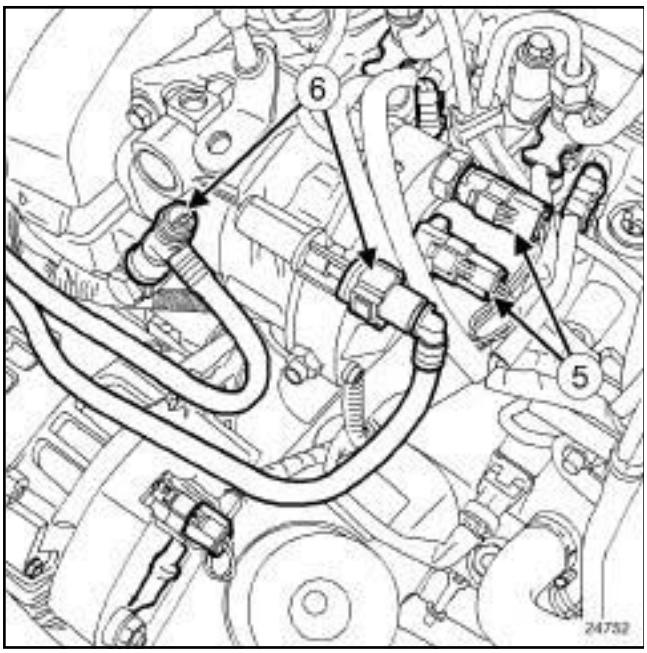
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove the front engine cover.



24733



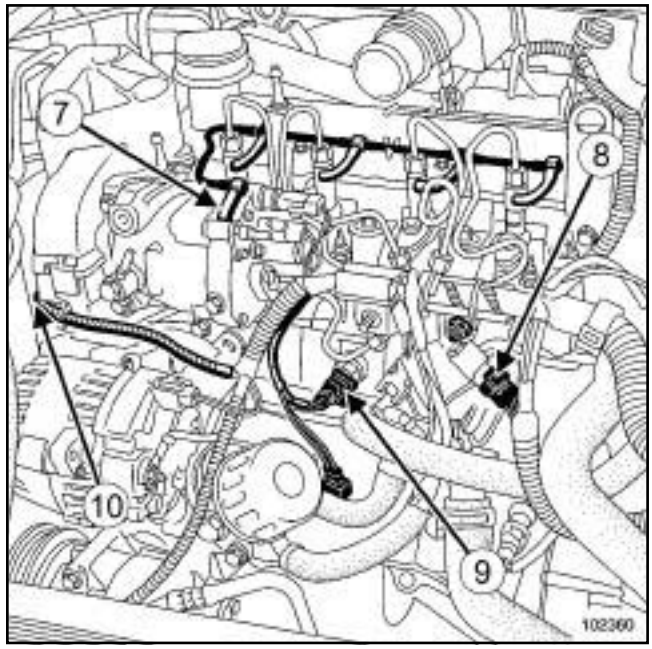
❑ Remove the dipstick guide and filler neck nuts (**1**) .

❑ Put the dipstick guide to one side (**2**) .

K9K, and 796

109466

24752

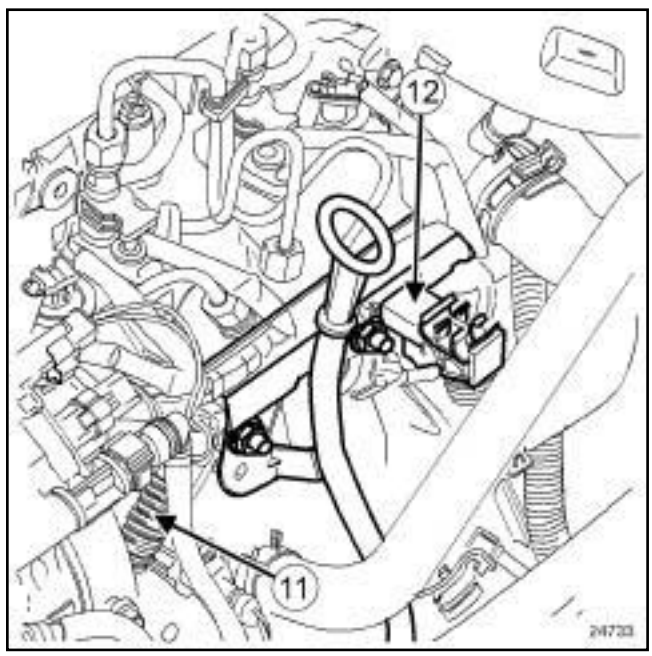


❏ Disconnect:

- the heater plugs (**3**) ,
- the injectors (**4**) ,
- the connectors from the high pressure pump (**5**) .

❏ Clean the diesel supply and return pipes (see **Diesel injection: Precautions for the repair**) .

❏ Disconnect the diesel supply and return pipes (**6**) .

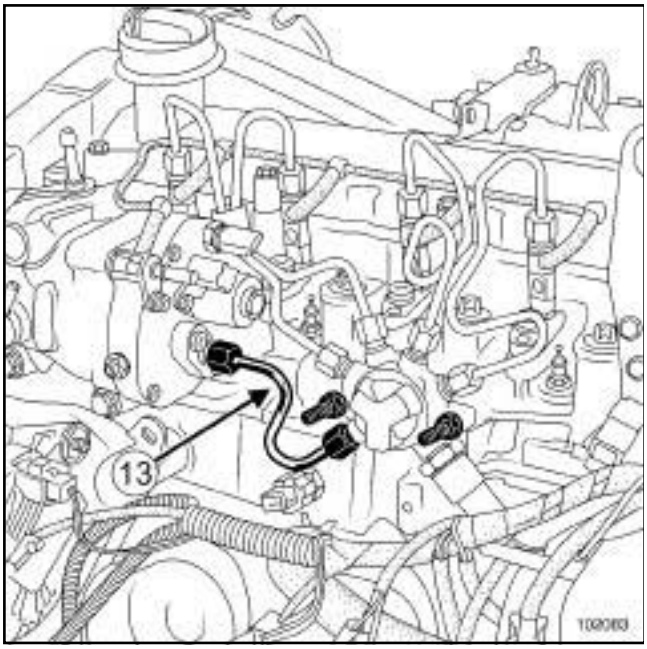


❏ Fit blanking plugs into the openings.

102360

❏ Disconnect:

- the fuel return pipe (**7**) connecting the injectors to the high-pressure pump,
- the injector rail pressure sensor (**8**) ,
- the accelerometer (**9**) ,
- the camshaft position sensor (**10**) .



24733

❏ Unclamp the engine wiring (**11**) and move it to one side.

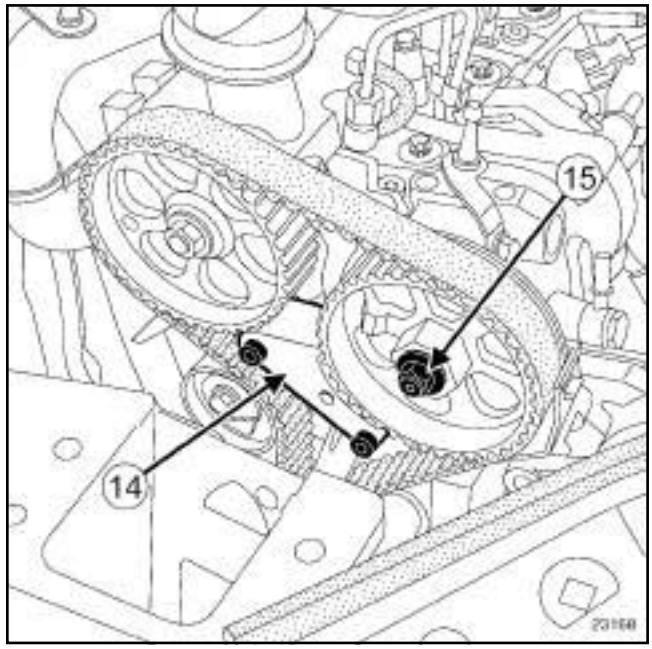
❏ Remove the channel (**12**) located on the injector rail.

K9K, and 796

102083

❏ Remove the high pressure pipe (**13**) between the injector rail and the high pressure pump (see **13B**, **Diesel injection**, **High pressure pipe between pump and rail: Removal - Refitting**, page **13B-19**) .

❏ Put blanking plugs in all the openings of the injection circuit.



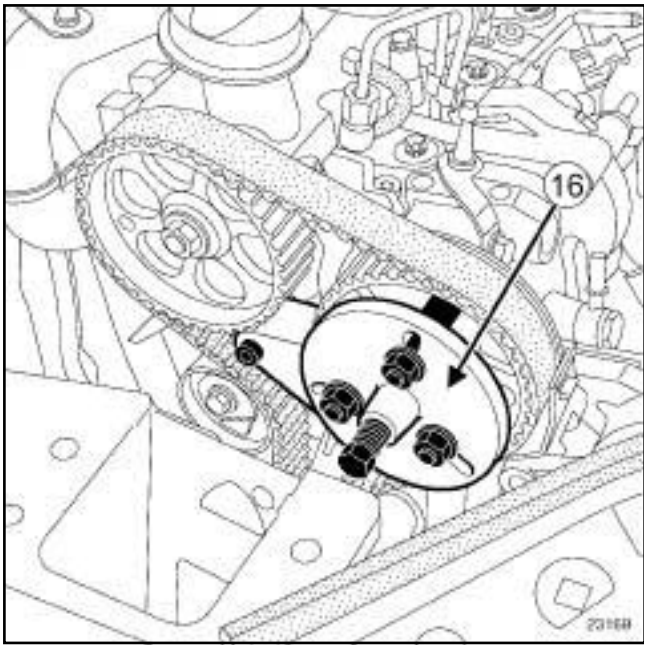
❏ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) .

❏ Remove (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) :

- the upper timing cover,
- the lower timing cover,
- the cylinder head suspended mounting.

❏ Position the engine at top dead centre (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .



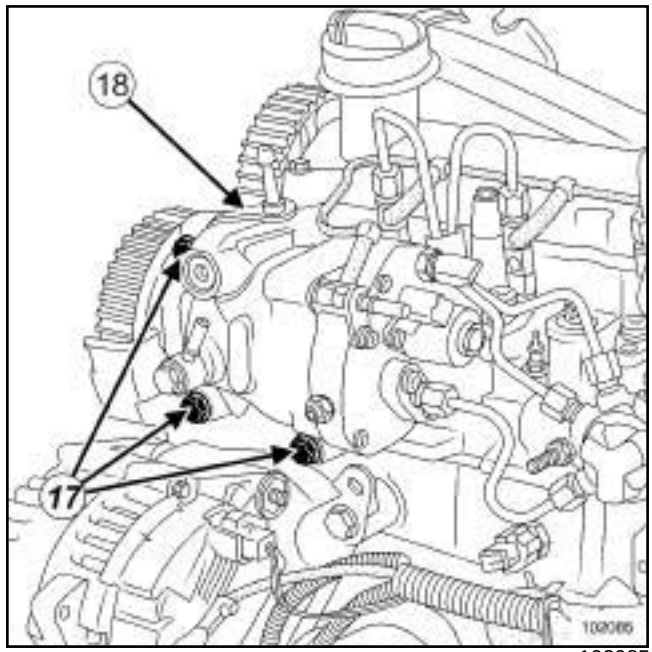
23168

❏ Fit the high pressure pump pulley retaining tool (**14**) .

❏ If necessary, turn the engine slowly to adjust the position of the locking tool on the pump pulley teeth.

❏ Remove the high pressure pump pulley nut (**15**) , holding the pulley with a **32 mm** open-jawed spanner.

K9K, and 796



23169

❑ Position the (**16**) fitted with the.

WARNING

Ensure that the tool pushrod is correctly oriented and is pressing against the high pressure pump shaft.

II - REMOVAL OPERATION

102085

❑ Remove:

- the high pressure pump bolts (**17**) ,
- the bracket (**18**) from the engine cover.

❑ Screw the pushrod of the tooluntil the high pressure pump becomes detached.

❑ Remove:

- the high pressure pump,
- the.

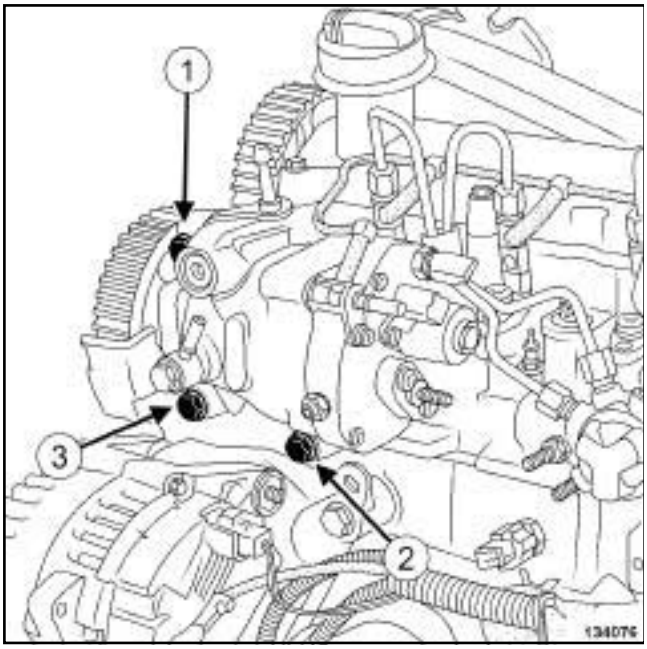
REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check for an index pin on the high pressure pump shaft.

II - REFITTING OPERATION

❑ Refit the high pressure pump on the cylinder head by inserting it into the high pressure pump pulley.



Note:

Check that the high pressure pump shaft is correctly orientated in relation to the high pressure pump pulley.

❑ Refit the engine cover bracket.

❑ Fit the high pressure pump bolts without tightening them.

K9K, and 796

134076

❑ Torque tighten in order **the high pressure pump bolts (23 N.m)**.

❑ Torque tighten the **high pressure pump pulley nut (70 N.m)** while holding the high pressure pump pulley using a **32 mm** spanner.

Note:

Check that the timing belt is correctly positioned and in good condition.

❑ Remove thefrom the cylinder head.

III - FINAL OPERATION

❑ Remove the blanking plugs.

❑ Refit the high pressure pipe between the injector rail and the high pressure pump (see **13B**, **Diesel injection**, **High pressure pipe between pump and rail: Removal - Refitting**, page **13B-19**) .

❑ Refit (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) :

- the suspended mounting on the cylinder head,
- the lower timing cover,
- the upper timing cover.

❑ Refit:

- the camshaft position sensor (see **13B**, **Diesel injection**, **Camshaft position sensor: Removal - Refitting**, page **13B-7**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-4**) ,
- the neck located on the injector rail.

❑ Secure the engine wiring on the neck.

❑ Connect:

- the camshaft position sensor,
- the accelerometer,
- the injector rail pressure sensor,
- the fuel return pipe connecting the injectors to the high-pressure pump,
- the supply and return pipes on the high pressure pump,
- the connectors to the high pressure pump,
- the injectors,
- the heater plugs.

❑ Refit the dipstick guide.

❑ Torque tighten the **dipstick guide and filler neck nuts on the high pressure rail (21 N.m)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Start the engine.

❑ Check that there are no fuel leaks.

❑ Refit the engine cover.

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
flow actuator bolts	**6 N.m**
dipstick guide and filler neck nuts on the high pressure rail	**21 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

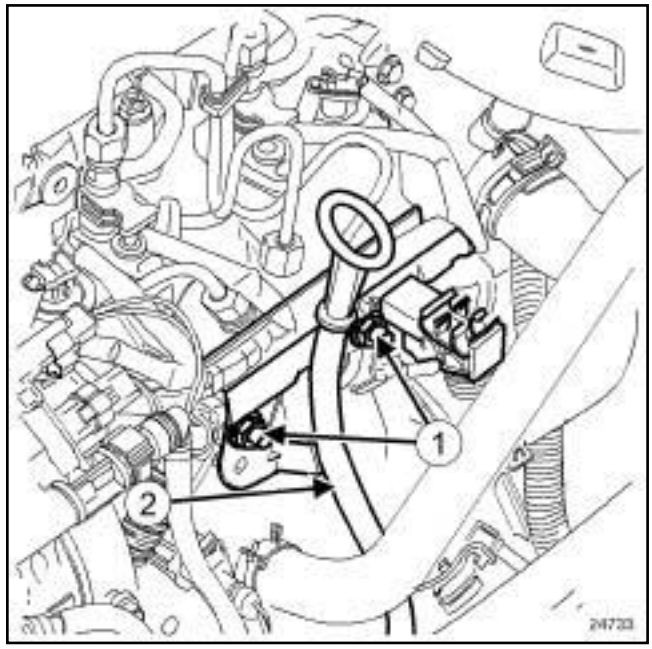
Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

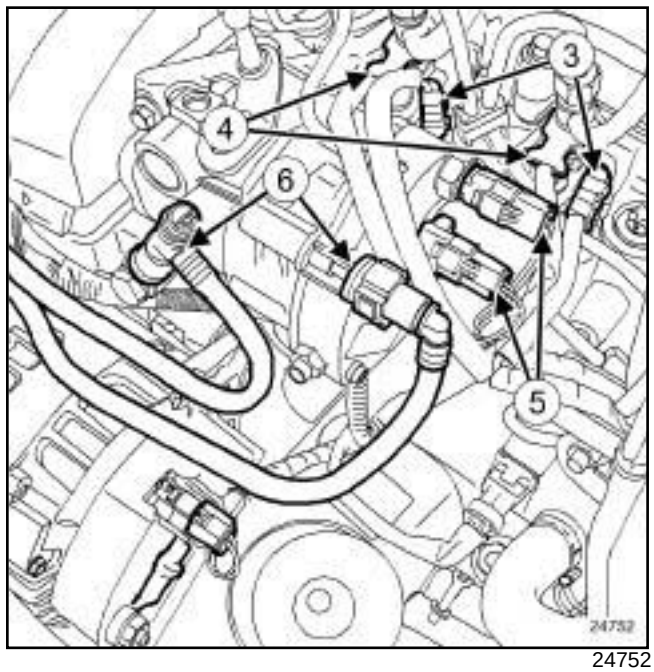


WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

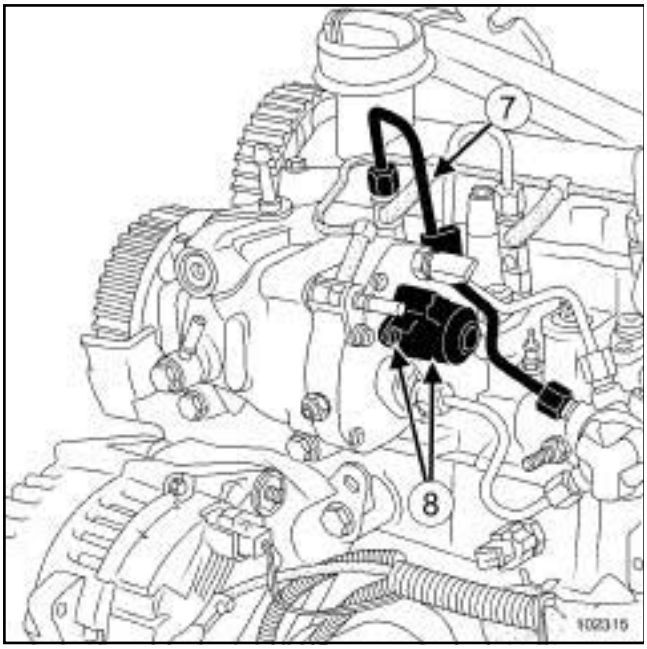


❏ Remove the front engine cover.

24733

❏ Remove the dipstick guide and filler neck nuts (**1**) .

❏ Put the dipstick guide to one side (**2**) .



24752

❏ Disconnect:

- the heater plugs (**3**) ,
- the injectors (**4**) ,
- the connectors from the high pressure pump (**5**) ,
- the diesel supply and return pipes (**6**) .

K9K

102315

❑ Disconnect:

- the injector rail pressure sensor,
- the accelerometer .

❑ Unclamp the engine wiring and put it to one side.

❑ Remove:

- the neck located on the injector rail,
- the high pressure pipe (**7**) between the injector rail and injector no. **4** (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

❑ Plug the openings.

II - REMOVAL OPERATION

❑ Loosen the fuel flow actuator bolts ***(8)*** .

WARNING
Do not use the electrical connector as a lever arm.

❑ Withdraw the fuel flow actuator (by hand using small successive turns).

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Only unpack the new component when you are ready to fit it.

WARNING
Do not remove the blanking plugs from each component until the last moment.

WARNING
Do not damage the seal when refitting.

Note:
Do not lubricate the seals with grease or old diesel fuel. Use the applicator provided in the kit for the new part.

II - REFITTING OPERATION

❑ Position the flow actuator.

❑ Finger tighten the flow actuator bolts.

❑ Torque tighten the **flow actuator bolts (6 N.m)**.

III - FINAL OPERATION

❑ Refit the new high pressure pipe between the injector rail and injector no. **4** (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

❑ Connect:

- the diesel supply and return pipes on the high pressure pump,
- the electrical connectors on the high-pressure pump,
- the injectors,
- the heater plugs.

❑ Refit the dipstick guide.

❑ Torque tighten the **dipstick guide and filler neck nuts on the high pressure rail (21 N.m)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Start the engine.

❑ Check that there are no fuel leaks.

❑ Refit the engine cover.

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
Venturi bolt	**6 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

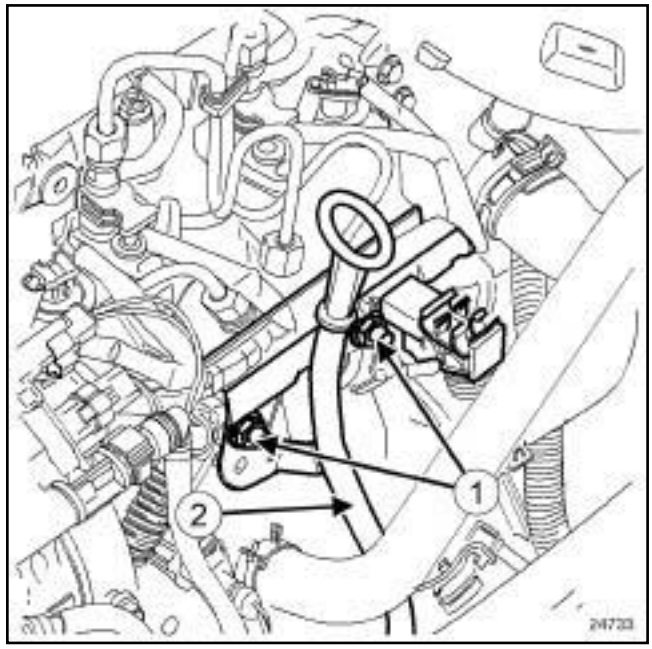
It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

Note:

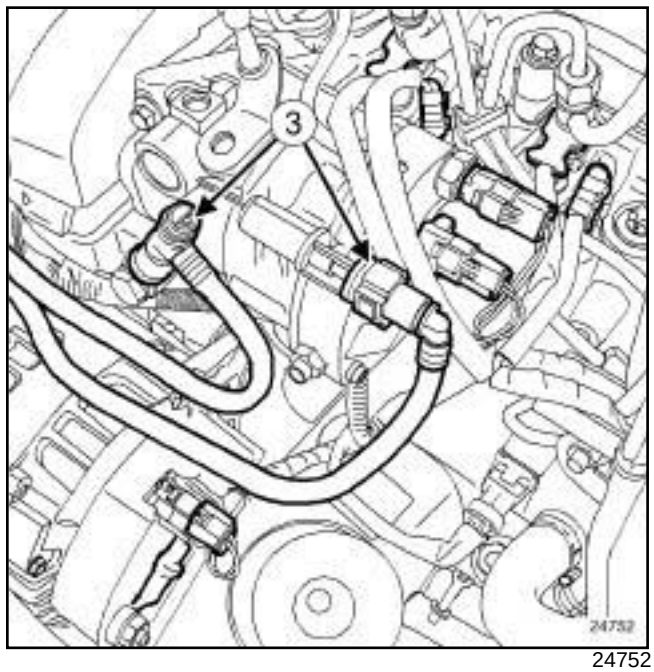


Ensure that you have a new Venturi before opening up the fuel circuit.

REMOVAL

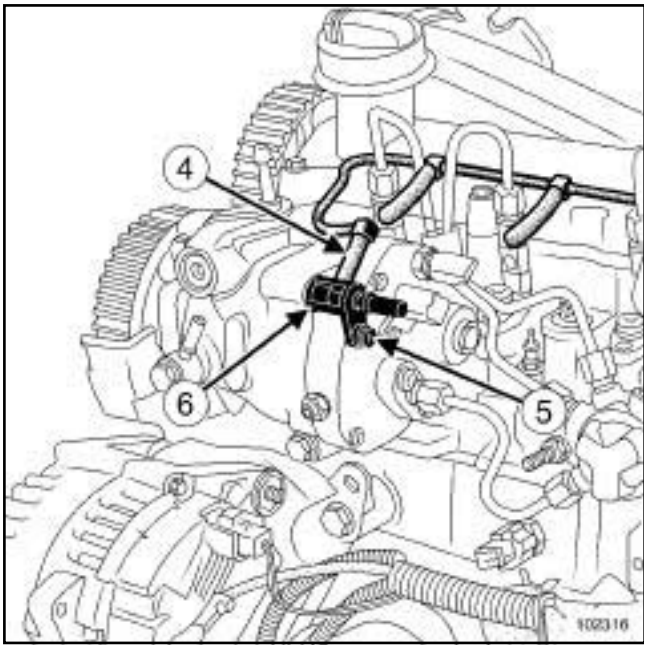
I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❏ Remove the front engine cover.

24733



❏ Remove the dipstick guide and filler neck nuts (**1**) .

❏ Put the dipstick guide to one side (**2**) .

24752

❏ Disconnect the diesel supply and return pipes (**3**) .

102316

❏ Disconnect the return pipe (**4**) connecting the injector to the high pressure pump.

II - REMOVAL OPERATION

❏ Remove:

- the bolt ***(5)*** of the Venturi ***(6)*** ,
- the Venturi.

❏ Plug the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

❏

> **WARNING**
> Do not remove the blanking plugs from each component until the last moment.

❏ Lubricate the O-ring with lubricant from the applicator supplied with the new part.

II - REFITTING OPERATION

❏ **parts always to be replaced: Venturi**.

> Note:
> Do not damage the seal when refitting.

❏ Fit the Venturi.

❏ Torque tighten the **Venturi bolt (6 N.m)**.

III - FINAL OPERATION

❏ Connect the return pipe connecting the injector to the high-pressure pump.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Start the engine.

❏ Check that there are no fuel leaks.

❏ Refit the engine cover.

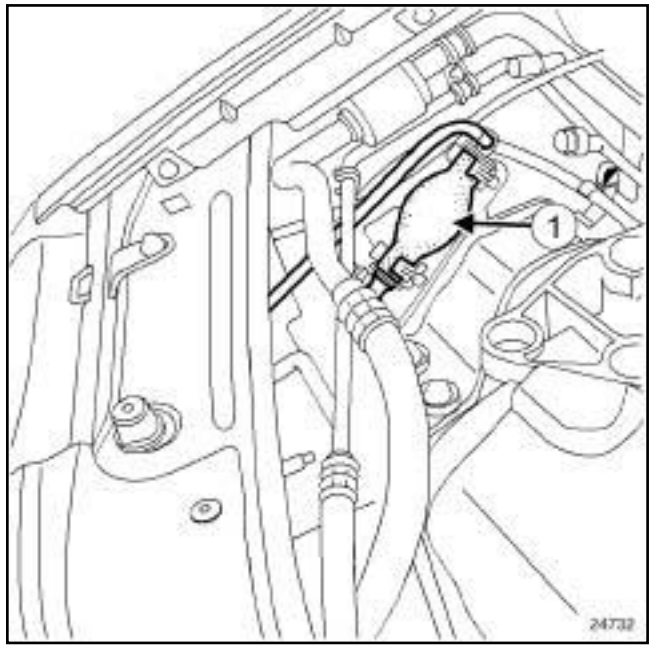
K9K

Equipment required
Diagnostic tool

❑

WARNING
Check that there are no diesel leaks after each operation.

Note:



the **Diagnostic tool** can be used for testing the high pressure circuit with the engine running. This command can be used to run fault finding on a leak due to an incorrectly fitted or tightened union. This command only works if the engine coolant temperature is over **60°C**. The fault finding procedure does not reveal small leaks caused by insufficient tightening.

Note:

Respect the repair precautions (see **Diesel injection: Precautions for the repair**) .

CHECK

❑ Remove the front engine cover.

24732

❑ Prime the fuel circuit using the manual priming pump (**1**) until the transparent pipes are filled with fuel (automatic degassing).

❑ Check that there are no fuel leaks.

❑ Connect the **Diagnostic tool** to the vehicle.

❑ Deal with present faults,

Note:

Certain faults will prevent this test from being carried out: deal with them first.

Note:

The engine automatically runs a cycle of four accelerations and decelerations to lower the rail pressure.

WARNING
Do not leave anything on the side of the engine housing during the test phase (significant vibration).

❑ Run command **AC 626 - high pressure circuit sealing test**.

❑ Check that there are no fuel leaks.

❑ Deal with the causes of any possible leaks.

❑ Use the **Diagnostic tool** to check for stored faults; deal with these and clear them as necessary.

❑ Disconnect the **Diagnostic tool**.

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
nut of the high pressure pipe between the pump and the injector rail on the high pressure pump	**28 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the rail is not under pressure,

- that the fuel temperature is not too high.

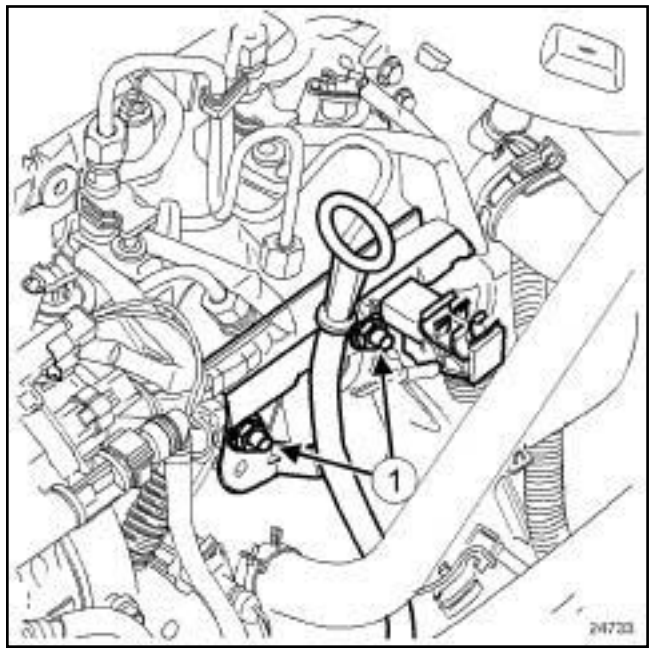
It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

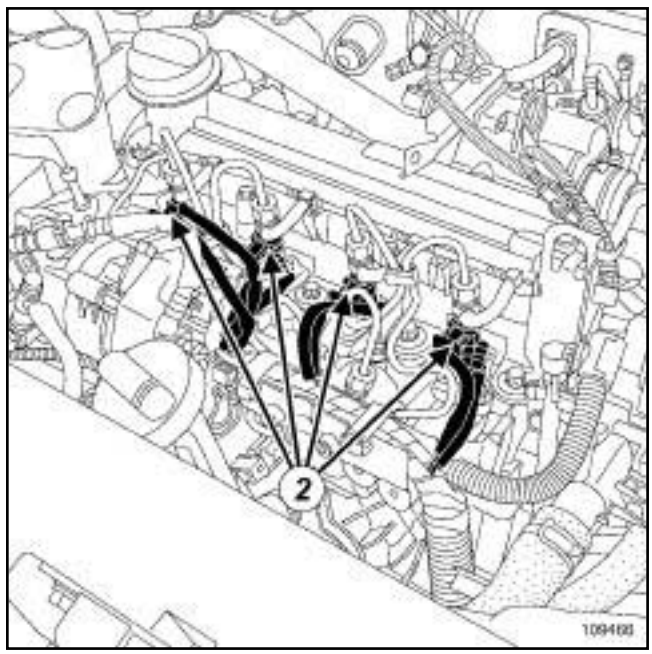


To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

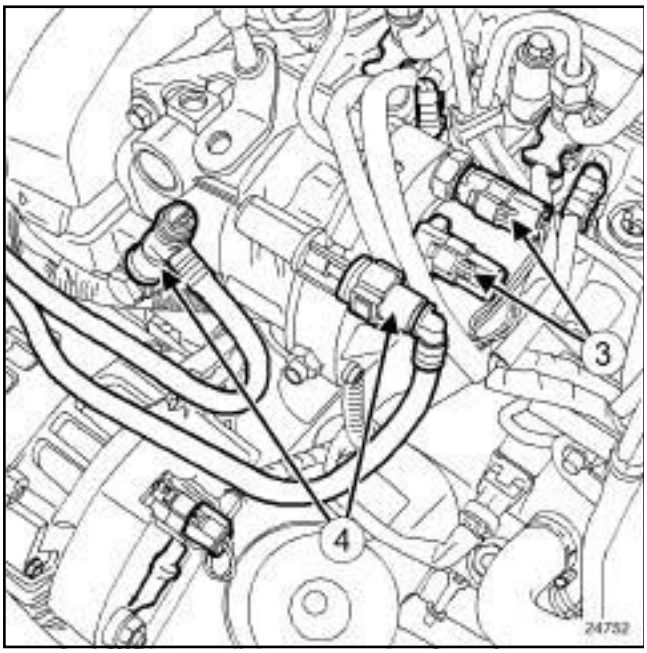


❑ Remove the front engine cover.

24733

❑ Remove the dipstick guide and filler neck bolts (**1**) .

❑ Put the dipstick to one side.



109466

❑ Disconnect the following connectors (**2**) :

- the heater plugs,

- the injectors.

24752

❑ Disconnect:

- the high pressure pump connectors (**3**) .
- the injector rail pressure sensor.

❑ Clean the diesel supply and return pipes (see **Diesel injection: Precautions for the repair**) .

❑ Disconnect the diesel supply and return pipes (**4**) .

❑ Disconnect the return pipe connecting the injectors to the high pressure pump.

❑ Fit the correct blanking plugs.

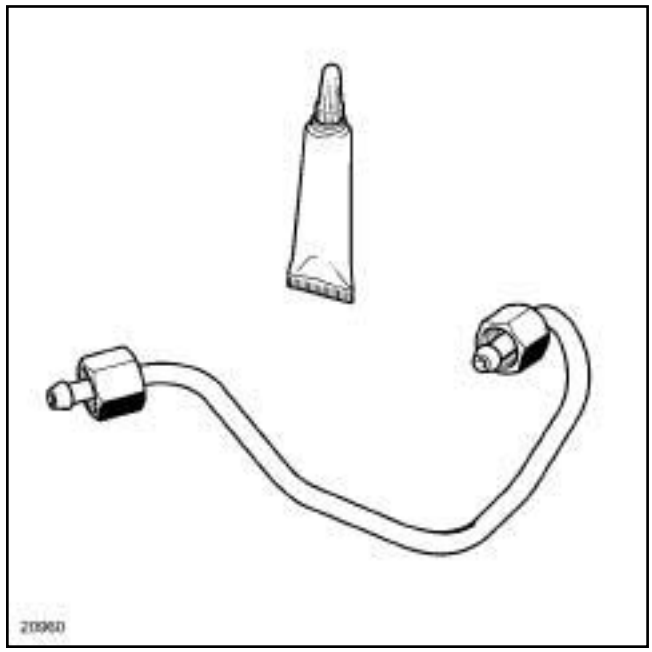
❑ Move the wiring to one side with the neck on the side.

❑ Clean the high pressure pipe unions between the rail and the injectors (see **Diesel injection: Precautions for the repair**) .

II - REMOVAL OPERATION

❑ Clean the unions of the high pressure pipe between the high pressure pump and the injector rail (see **Diesel injection: Precautions for the repair**) .

❑ Undo:



- the high pressure pipe nut at the high pressure pump end,
- the high pressure pipe nut at the injector rail end.

❑ Fit blanking plugs into the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: High pressure pipe between the pump and rail**.

20960

❑

WARNING

Before fitting a new high pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

II - REFITTING OPERATION

❑ Remove the blanking plugs.

❑ Insert the high pressure pipe olive in the high pressure pump high pressure outlet taper.

❑ Insert the high pressure pipe olive into the injector rail inlet taper.

❑ Finger tighten the high-pressure pipe nuts, starting with the one at the injector rail side.

K9K

❏ Slightly pretighten the high pressure pipe nuts.

❏ Torque tighten:

- the **nut of the high pressure pipe between the pump and the injector rail on the high pressure pump (28 N.m)**,
- the **nut of the high pressure pipe between the pump and the rail on the injector rail (28 N.m)**.

III - FINAL OPERATION

❏ Refit the neck on the injector rail.

❏ Connect:

- the injection rail pressure sensor,
- the diesel return pipe connecting the injectors to the high pressure pump,
- the diesel fuel supply and return pipes,
- the high pressure pump electrical connectors.

❏ Connect the connectors of:

- the injectors,
- the heater plugs.

❏ Insert the dipstick.

❏ Refit the dipstick guide.

❏ Torque tighten the **dipstick guide and filler neck nuts on the high pressure rail (21 N.m)**.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Prime the diesel circuit using the priming pump.

❏ Check the high pressure circuit (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-18**) .

❏ Refit the engine cover.

High pressure pipe between rail and injector: Removal - Refitting

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
injector rail nuts	**28 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

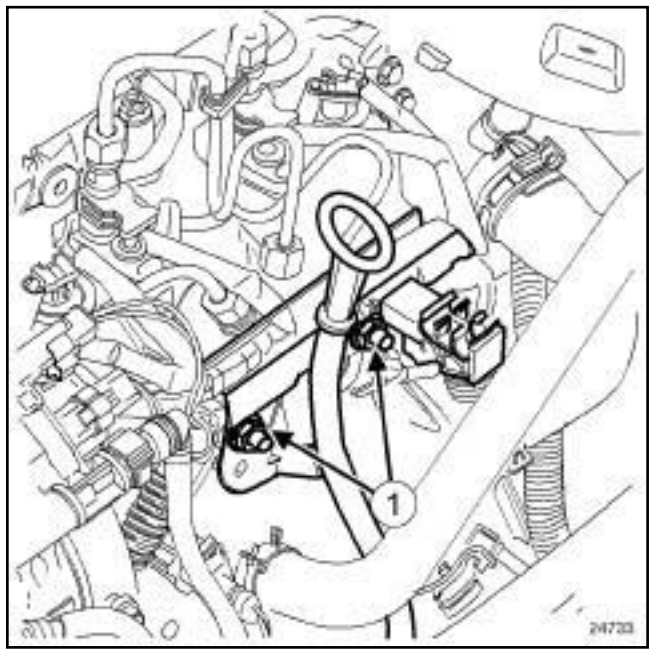
IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL



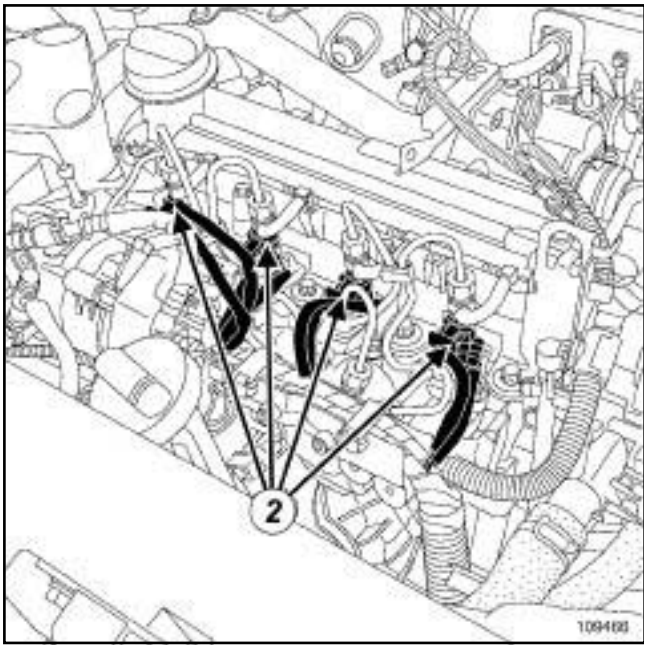
I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the engine cover,

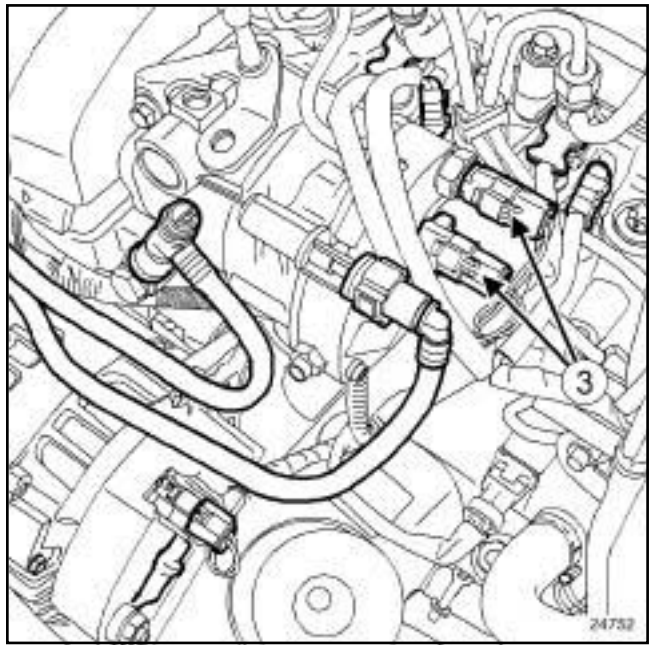
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .



24733

❑ Remove the nuts (**1**) from the dipstick guide and neck.

❑ Put the dipstick to one side.



K9K

109466

❏ Disconnect the following connectors (**2**) :

- the heater plugs,
- the injectors.

24752

❏ Disconnect the high pressure pump connectors (**3**) .

❏ Remove the bolts mounting the neck onto the injector rail.

❏ Move the wiring to one side with the neck on the side.

❏ Remove the clips connecting the high pressure pipes.

❏ Clean the high pressure pipe unions between the rail and the injectors (see **Diesel injection: Precautions for the repair**) .

II - REMOVAL OPERATION

❏ Undo:

- the high pressure nut at the injector end,
- the high pressure pipe nut at the injector rail end.

❏ Remove the pipe and discard it.

❏ Fit blanking plugs into the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: High pressure pipe between the rail and injector**.

K9K

20960

❑

WARNING

Before fitting a new high pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

❑ If replacing the four high pressure pipes:

- loosen the injector rail nuts by a few turns (the injector rail should be loose).

II - REFITTING OPERATION

❑ Remove the blanking plugs.

❑ Insert the high pressure pipe olive in the injector high pressure inlet taper.

❑ Position the high pressure pipe olive in the high pressure outlet taper of the injector rail.

❑ Finger tighten the high pressure pipe nuts, starting with the nut at the injector end.

❑ Slightly pretighten the high pressure pipe nuts.

Note:

The assembly order of the « rail-injector » high pressure pipes is not important.

❑ Mount a new clip provided with the new high pressure pipe.

❑ If replacing the four high pressure pipes, torque tighten the **injector rail nuts (28 N.m)**.

❑ Torque tighten in order the **« pump - rail » high pressure pipe nuts (28 N.m)** :

- injectors end,

- on the injector rail end.

Note:

Tighten each pipe fully before moving on to the next pipe.

III - FINAL OPERATION

❑ Refit the neck on the injector rail.

❑ Connect the connectors of:

- the injectors,

- the heater plugs.

❑ Insert the dipstick.

❑ Refit the dipstick guide.

❑ Torque tighten the **dipstick guide and filler neck nuts on the high pressure rail (21 N.m)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Prime the diesel circuit using the priming pump.

❑ Check the high pressure circuit (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-18**) .

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

- the engine cover,

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
injector rail nuts	**28 N.m**
nuts of the neck and dipstick guide on the injector rail	**21 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

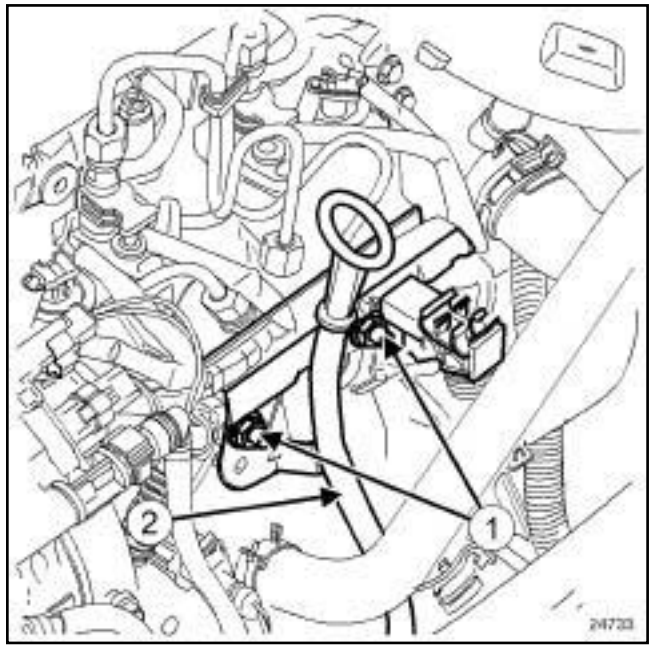
Before starting any work on the injection circuit, use the **Diagnostic tool** to check:

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.



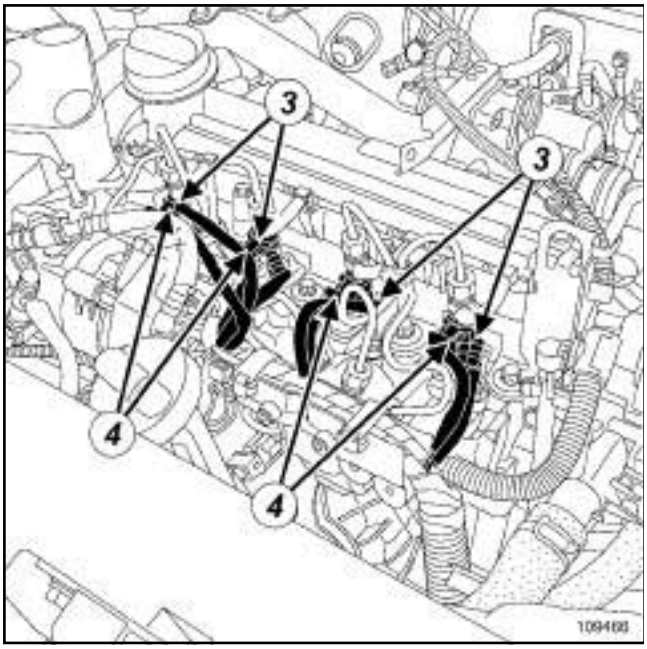
IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

REMOVAL

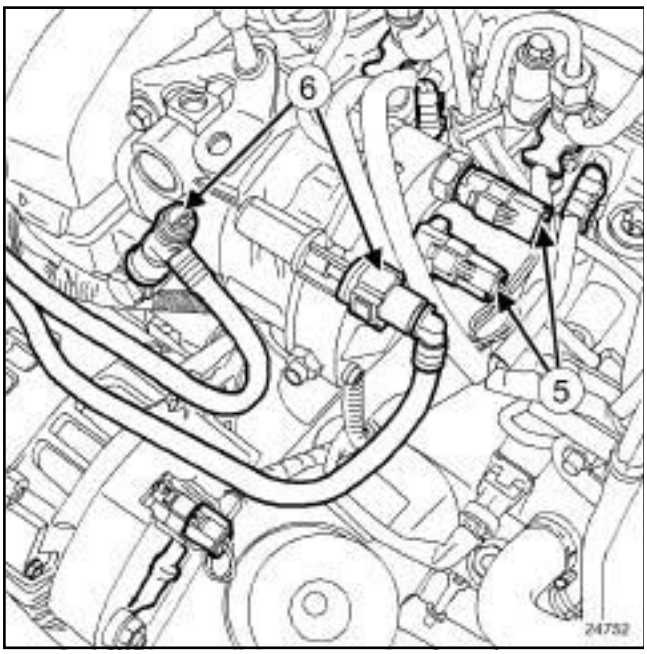
I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the front engine cover.



24733



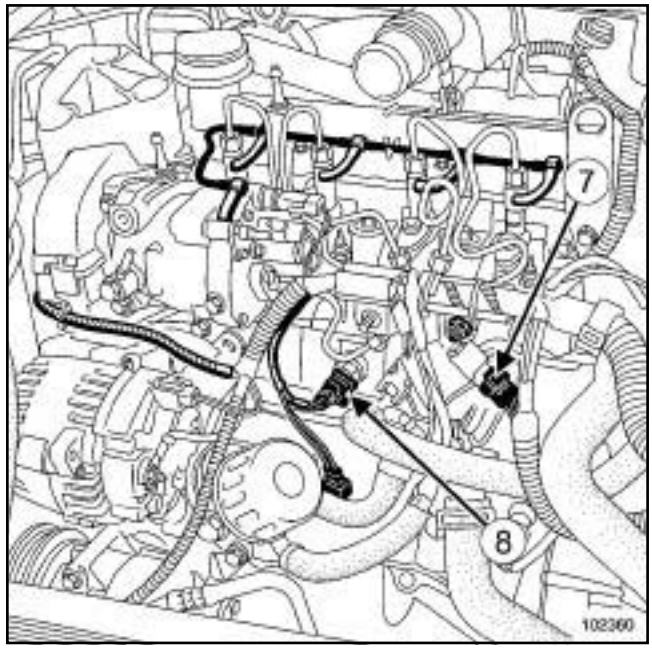
❏ Remove the nuts (**1**) from the dipstick guide and neck.

❏ Put the engine oil dipstick guide to one side (**2**) .

K9K

109466

24752

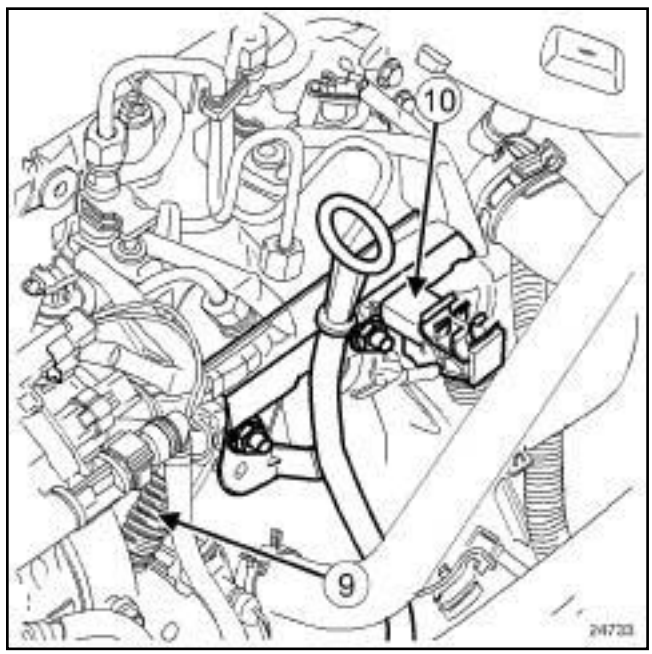


❏ Disconnect:

- the heater plugs (**3**) ,
- the injectors (**4**) ,
- the connectors on the high pressure pump (**5**) ,
- the diesel return pipe connecting the injectors to the high pressure injection pump.

❏ Clean the diesel supply and return pipes (see **Diesel injection: Precautions for the repair**) .

❏ Disconnect the diesel supply and return pipes (**6**) .



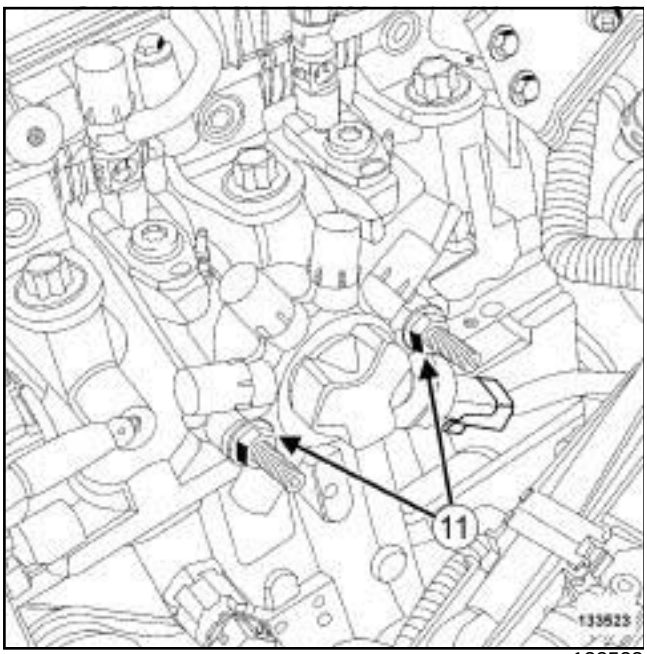
❏ Place blanking plugs on the openings.

102360

❏ Disconnect:

- the pressure sensor (**7**) from the injector rail,
- the accelerometer (**8**) .

24733



❏ Unclamp the engine wiring (**9**) and place it to one side.

❏ Remove:

- the neck (**10**) located on the spherical injector rail,
- the high pressure pipe between the high pressure pump and the injector rail (see **13B**, **Diesel injection**, **High pressure pipe between pump and rail: Removal - Refitting**, page **13B-19**) ,

- the high pressure pipes between the injector rail and the injectors (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

133523

❑ Remove:

- the nuts (**11**) from the injector rail,
- the injector rail.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑

> **WARNING**
> Do not remove the blanking plugs from each component until the last moment.

❑ Fit the injector rail.

❑ Finger tighten the nuts.

❑ Refit:

- the high pressure pipes between the injector rail and the injectors (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) ,
- the high pressure pipe between the high pressure pump and the injector rail (see **13B**, **Diesel injection**, **High pressure pipe between pump and rail: Removal - Refitting**, page **13B-19**) .

❑ Torque tighten the **injector rail nuts (28 N.m)**.

II - FINAL OPERATION

❑ Refit the neck located on the injector rail.

❑ Secure the engine wiring on the neck.

❑ Connect:

- the accelerometer,
- the injector rail pressure sensor,
- the diesel return pipe connecting the injectors to the high pressure pump,
- the diesel supply and return pipes on the high pressure pump,
- the connectors to the high pressure pump,
- the injectors,
- the heater plugs.

❑ Refit the dipstick guide.

❑ Torque tighten the **nuts of the neck and dipstick guide on the injector rail (21 N.m)**.

❑ Start the engine.

❑ Check that there are no fuel leaks.

❑ Check the high pressure circuit (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-18**) .

❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
fuel temperature sensor	**15 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

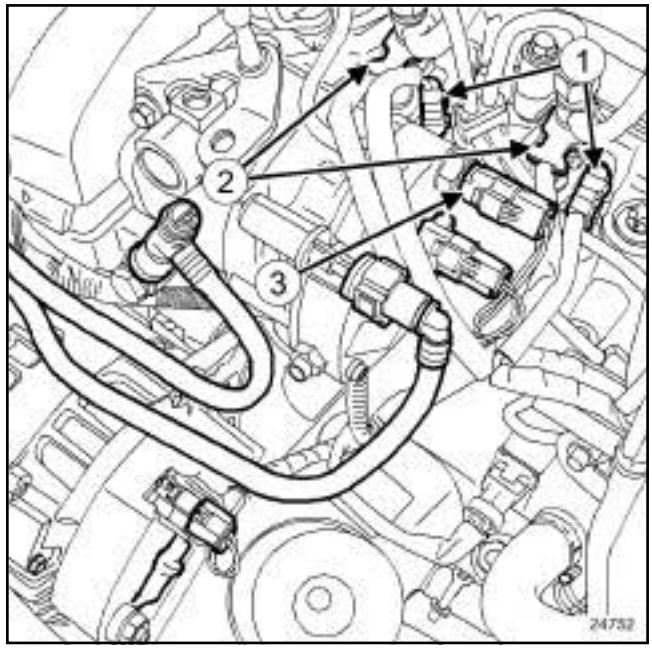
- that the rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

REMOVAL



❑

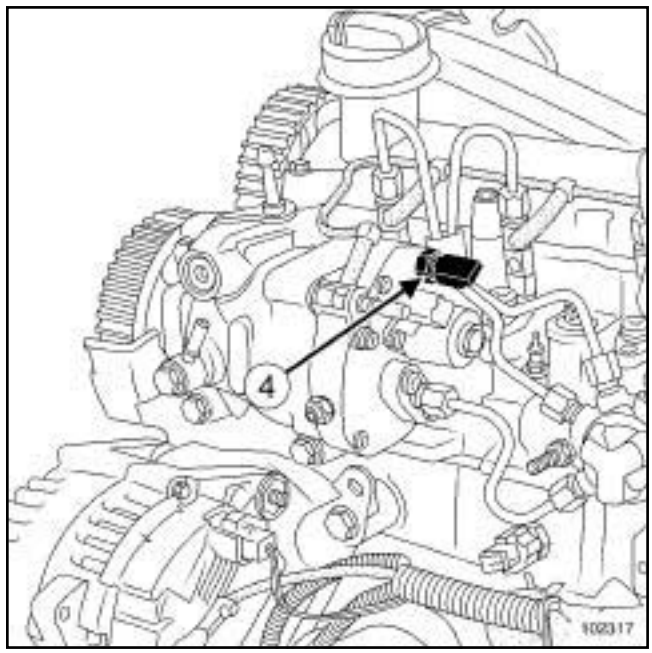
Note:

Make sure you have a new diesel temperature sensor before removal.

I - REMOVAL PREPARATION OPERATION

❑ Remove the front engine cover.

24752



❑ Disconnect:

- the heater plugs (**1**) on cylinders **3** and **4**,

- the injectors (**2**) of cylinders **3** and **4**,

II - REMOVAL OPERATION

❑ Disconnect the fuel temperature sensor connector ***(3)*** .

102317

❑ Clean the fuel temperature sensor.

❑ Remove the fuel temperature sensor (**4**) .

❑ Plug the openings.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Lubricate the O-ring with lubricant from the applicator supplied with the new part.

II - REFITTING OPERATION

❑

> Note:
>
> Do not damage the O-ring when refitting.

❑ Remove the blanking plugs.

❑ Fit the fuel temperature sensor.

❑ Torque tighten the **fuel temperature sensor (15 N.m)**.

❑ Connect the connector ***(3)*** of the fuel temperature sensor.

III - FINAL OPERATION

❑ Connect:

- the injectors ***(2)*** of cylinders **3** and **4**,
- the heater plugs ***(1)*** on cylinders **3** and **4**.

❑ Start the engine.

❑ Check that there are no fuel leaks.

❑ Refit the engine cover.

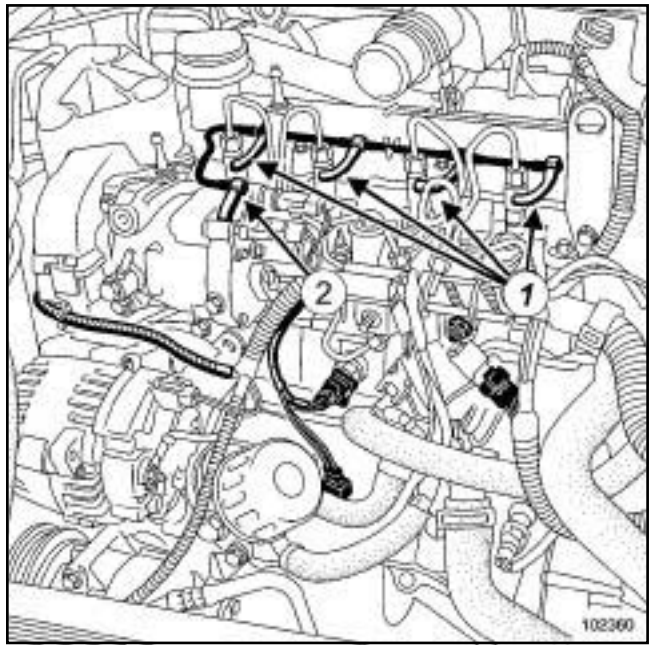
Diagnostic tool

PARTS AND CONSUMABLES FOR THE REPAIR



Consumables:

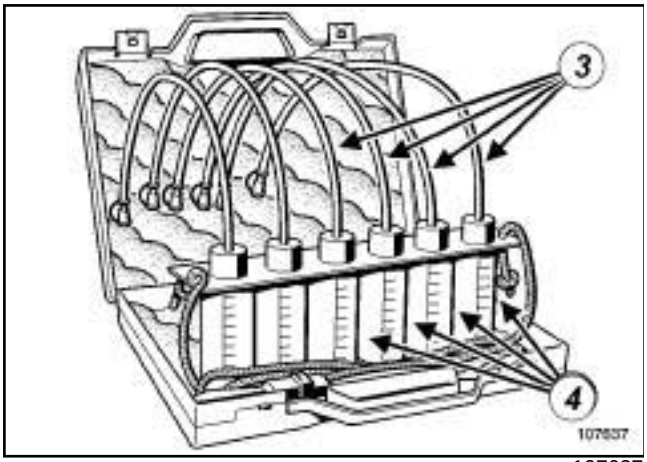
- cleaning cloths (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
- set of K9K blanking plugs (**DELPHI** injection) (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

CHECK

❏ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

102360



❏ Disconnect:

- the diesel return pipes (**1**) on the injectors,
- the diesel return pipe (**2**) on the venturi attached to the high pressure pump.

Note:
Make preparations for fuel outflow.

❏ Fit the correct blanking plug on the venturi.

Note:
It is essential to fit an appropriate blanking plug to the Venturi to avoid depriming the diesel return circuit.

107637

- ❏ Connect four of the transparent pipes (**3**) of theonto the diesel injector return.
- ❏ Insert these pipes in the four graduated measuring cylinders (**4**) of the.

> Note:
>
> If necessary, attach the graduated measuring cylinder rail of theto the bonnet.

- ❏ Connect the **Diagnostic tool** to the vehicle.
- ❏ Follow the instructions given in test 9: Injector sealing test (see **Fault finding - Test)** (13B, Diesel injection).
- ❏ Disconnect the transparent pipes from the.
- ❏ Remove the transparent pipes from the graduated measuring cylinder of the.
- ❏ Empty the diesel fuel out of the graduated measuring cylinders.
- ❏ Connect:
  - the diesel return pipes on the injectors,
  - the diesel return pipe to the Venturi attached to the high pressure pump.
- ❏ Replace the faulty injector(s) (see **13B**, **Diesel injection**, **Diesel injector: Removal - Refitting**, page **13B-32**) .
- ❏ Check that there are no fuel leaks.
- ❏ Use the **Diagnostic tool** to check for the absence of stored faults, deal with them and clear them, as necessary.
- ❏ Disconnect the **Diagnostic tool**.
- ❏ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Diesel injection: Precautions for the repair**) .

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

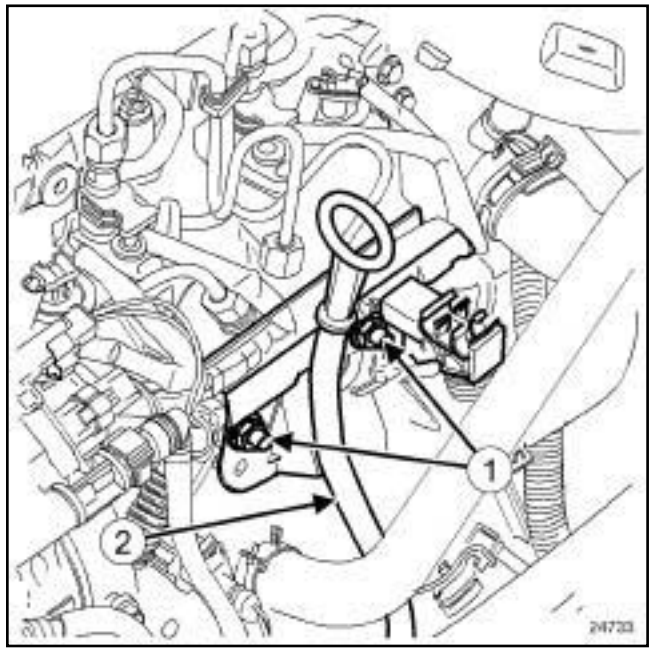
It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Working on the circuit with the engine running is strictly forbidden.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

Injectors may be replaced individually.

REMOVAL



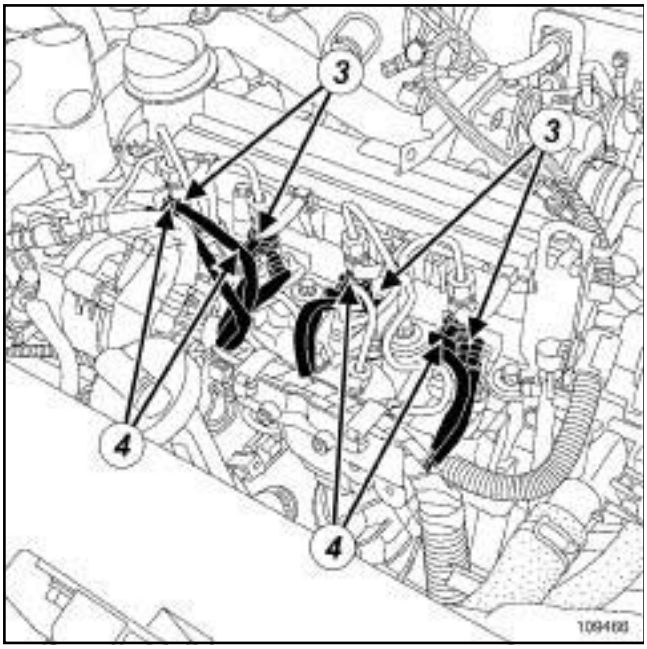
I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

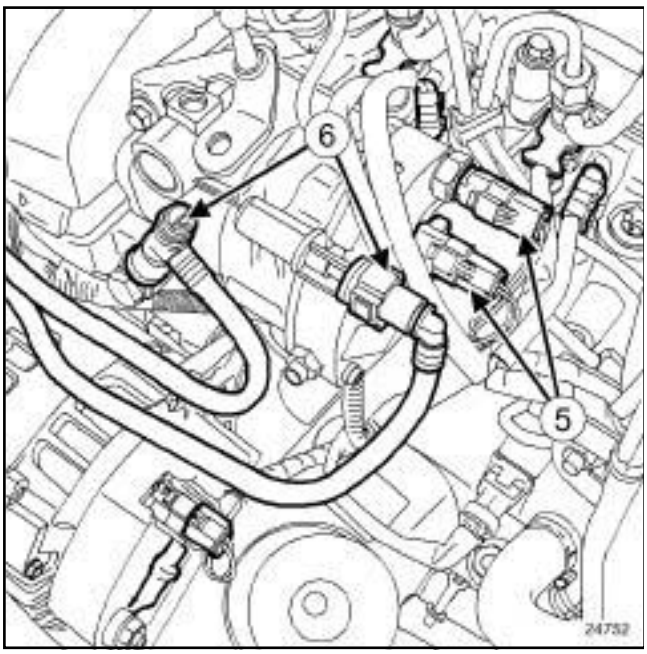
❏ Remove:

- the engine cover,

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .



24733



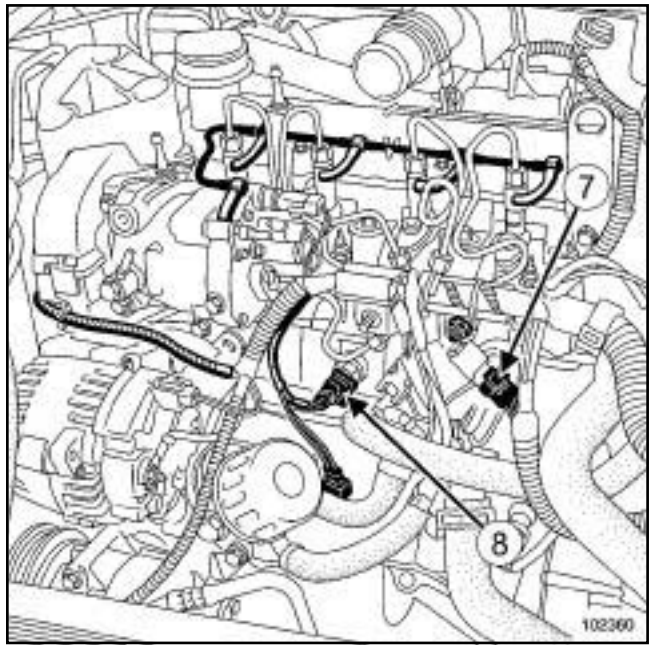
❏ Remove the nuts (**1**) from the dipstick guide and neck.

❏ Put the engine oil dipstick guide to one side (**2**) .

K9K

109466

24752

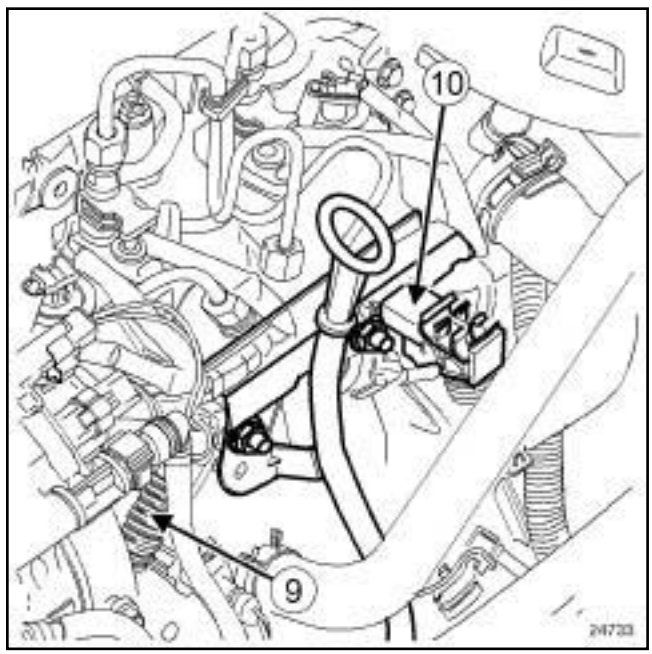


❏ Disconnect:

- the heater plugs (**3**) ,
- the injectors (**4**) ,
- the connectors (**5**) on the high pressure pump,
- the diesel return pipe connecting the injectors to the high pressure injection pump.

❏ Clean the diesel supply and return pipes (see **Diesel injection: Precautions for the repair**) .

❏ Disconnect the diesel supply and return pipes (**6**) .



❏ Plug the openings.

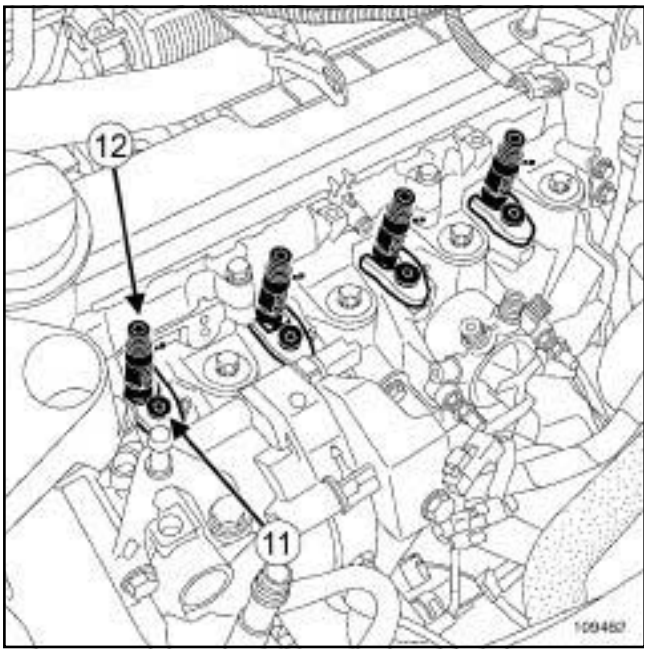
102360

❏ Disconnect:

- the pressure sensor (**7**) from the injector rail,
- the accelerometer (**8**) .

24733

❏ Unclamp the engine wiring (**9**) and place it to one side.



❏ Remove the neck (**10**) located on the injector rail.

❏ Remove the « rail-injector » high pressure pipes (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

❏ Plug the openings.

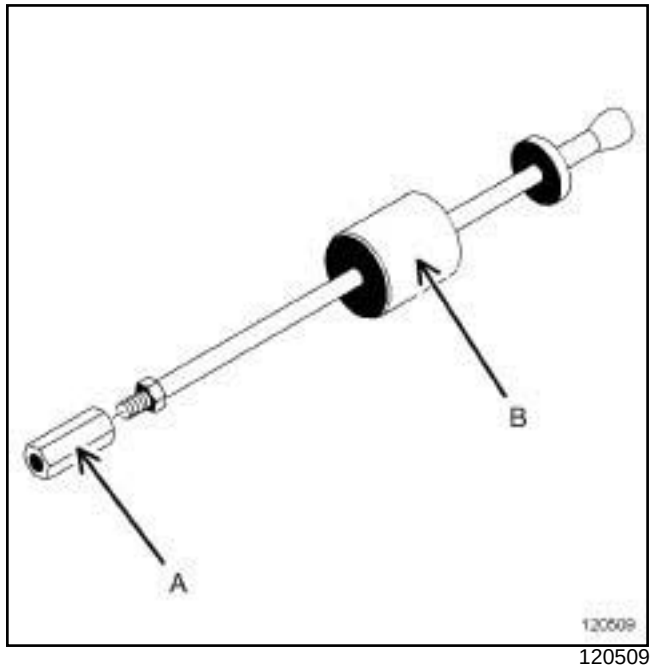
K9K

II - OPERATION FOR REMOVAL OF PART CONCERNED

109462

❏ Loosen the injector clamp bolt (**11**) .

> Note:
>
> If reusing a diesel injector, always mark the removed diesel injector in relation to its cylinder.



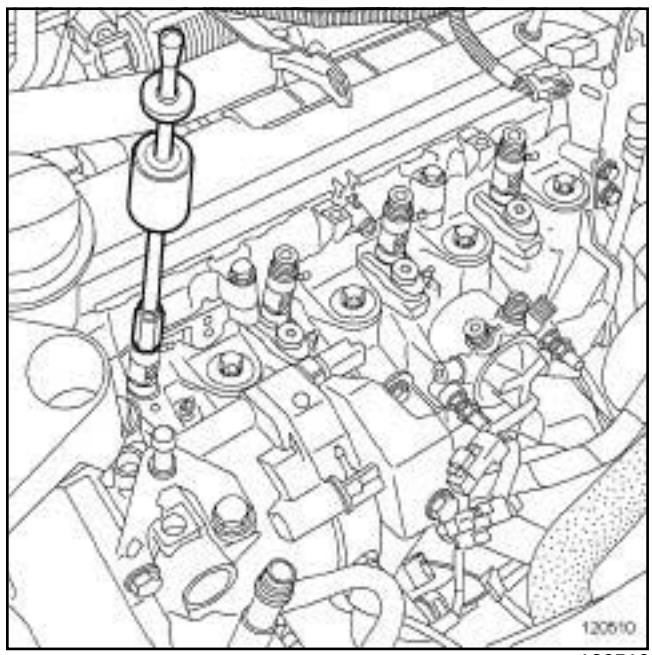
❏ Remove the diesel injector (**12**) .

> Note:
>
> If the diesel injector is jammed, remove the injector using the tooland the tool.

❏ Remove the heat protection washer.

> Note:
>
> If the heat protection washer is stuck at the bottom of the well, use the (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

REMOVING THE INJECTORS USING TOOLS (MOT. 921-01) AND (EMB. 880)



120509

(**A**) Tool for extracting injector holders (Mot. 921-01).

(**B**) Pin extractor (Emb. 880).

❏ Fit the toolon the extractor

❏ Apply releasing agent around the diesel injector.

120510

❏ Fit the slide hammer onto the diesel injector.

❏ Extract the jammed injector using the slide hammer.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace the heat protection washer of the diesel injector concerned.

Cleaning parts

❑

> **WARNING**
>
> It is strictly forbidden to clean the injectors with:
>
> - a wire brush,
> - an emery cloth,
> - an ultrasonic cleaner.

❑ Always clean the well of the removed injector (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

❑ If reusing the removed injector:

- clean the injector using a **CLOTH FOR INJECTION SYSTEM** soaked in **INJECTOR CLEANER** or **BRAKE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- if necessary, leave the injector nozzle to soak in **INJECTOR CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- wipe the injector with a new **CLOTH FOR INJECTION SYSTEM**, (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and (see **Diesel injection: Precautions for the repair**) (13B, Diesel injection).

II - REFITTING OPERATION FOR PART CONCERNED

❑

> **WARNING**
>
> Do not remove the caps from each component until the last moment.

> Note:
>
> If one or more injectors are replaced, note the alphanumeric code (C2I) and the cylinder on which it is fitted.

❑ Refit the injector with its clamp.

❑ Torque tighten the **diesel injector clamp bolt (28 N.m)**.

III - FINAL OPERATION

❑ Fit the high pressure pipes (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

❑ Torque tighten the **injector rail nuts (28 N.m)**.

❑ Torque tighten in order the **« rail-injector » high pressure pipe nuts (24 N.m)** (see **13B**, **Diesel injection**, **High pressure pipe between rail and injector: Removal - Refitting**, page **13B-22**) .

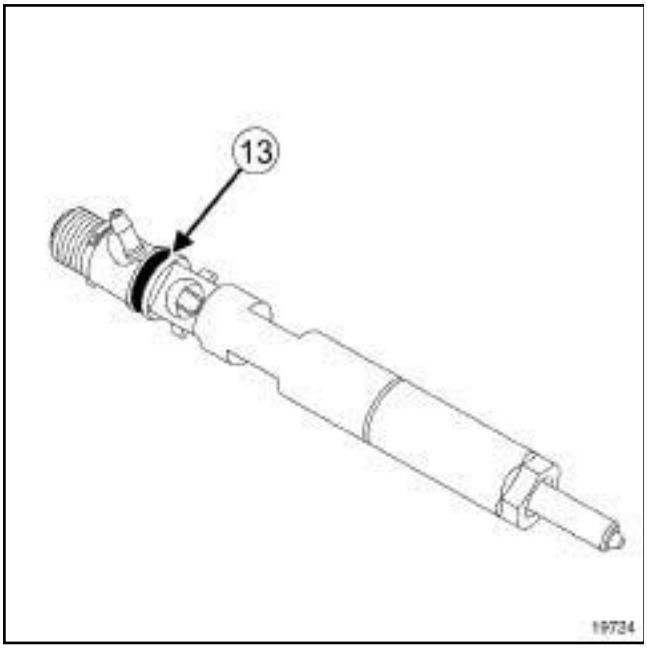
❑ Refit the neck located on the injector rail.

❑ Secure the engine wiring on the neck.

❑ Connect:

- the accelerometer,
- the high pressure rail pressure sensor,
- the diesel return pipe connecting the injectors to the high pressure pump,
- the diesel supply and return pipes on the high pressure pump,
- the electrical connectors on the high-pressure pump,
- the injectors,
- the heater plugs.

❑ Refit the dipstick guide.



❑ Torque tighten the **nuts of the neck and dipstick guide on the injector rail (21 N.m)**.

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .
- the engine cover,

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

19724

- ❏ Program the alphanumeric code (C2I) (**13**) for the replaced injector(s) using the **Diagnostic tool** (see **Fault finding - Replacement of components**) (13B, Diesel injection).
- ❏ Start the engine.
- ❏ Check that there are no fuel leaks.

K9K

Equipment required

(**5**) Intercooler bracket on the flywheel end

(**6**) Intercooler support on the timing end

K4M

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

Wear goggles with side protectors for this operation.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

WARNING

Keep the pipe unions away from contaminated areas.

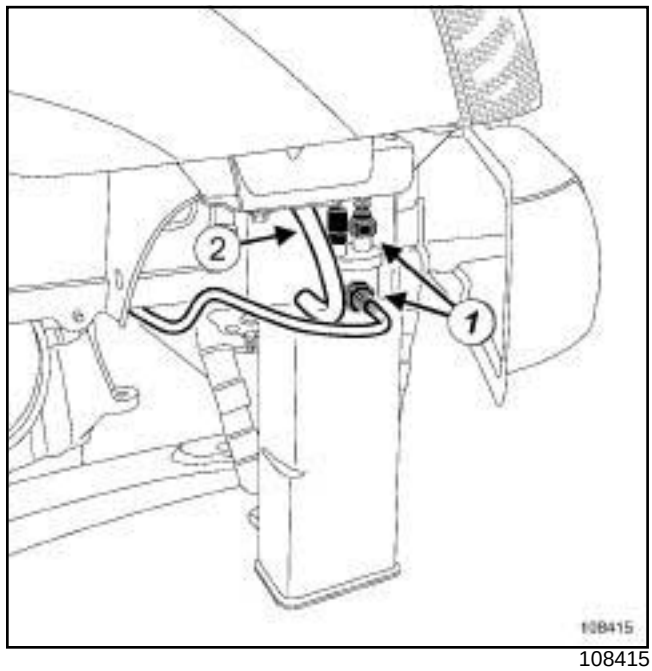
WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Note:

The fuel vapour absorber is located behind the front bumper, on the front right-hand side of the vehicle.

REMOVAL



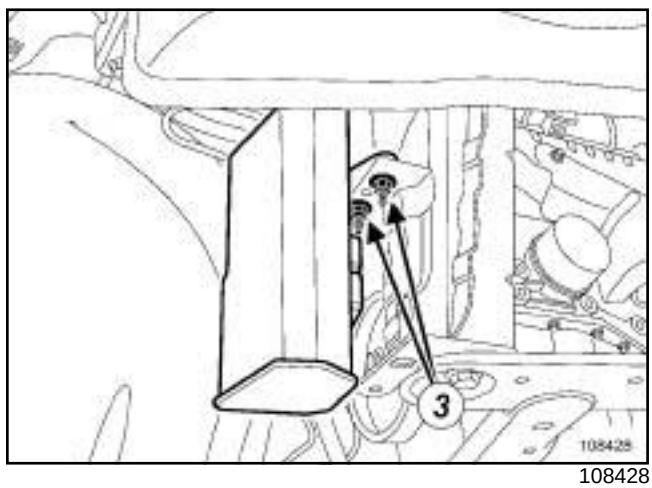
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❏ Move aside the front section of the front right-hand wheel arch liner.

II - REMOVAL OPERATION



108415

❏ Disconnect:

- the fuel vapour absorber pipes (**1**) ,
- the solenoid valve connector.

❏ Unclip the breather pipe (**2**) .

❏ Insert the blanking plugs.

108428

❏ Remove:

- the fuel vapour absorber nuts (**3**) ,
- the fuel vapour absorber.

K4M

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Remove the blanking plugs.

❏ Clip on the breather pipe ***(2)***

❏ Connect:

- the solenoid valve connector,
- the fuel vapour absorber pipes ***(1)*** .

III - FINAL OPERATION

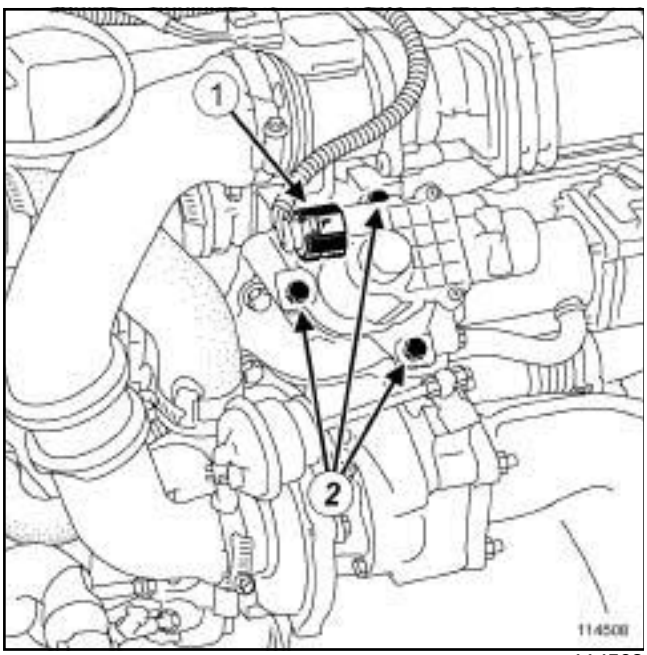
❏ Fit the front section of the front right-hand wheel arch liner.

❏ Refit the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

K9K, and 796

Tightening torques ▽	
exhaust gas recirculation solenoid valve bolts	**10 N.m**

Note:



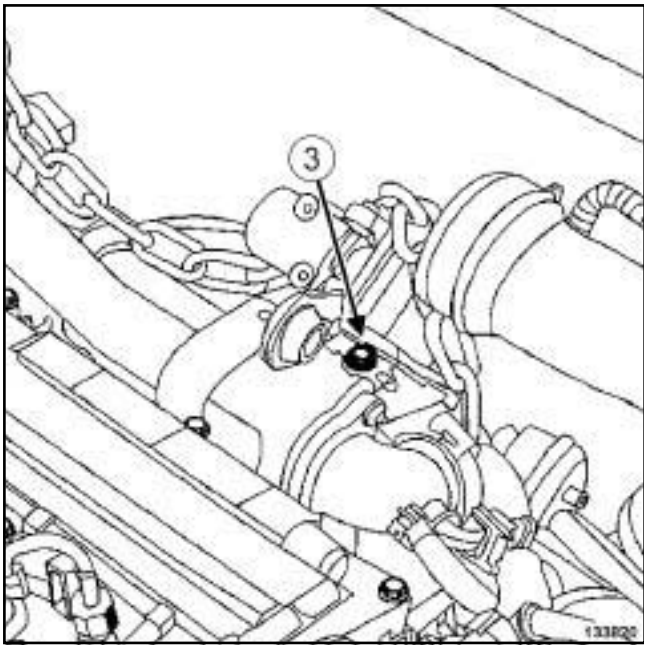
The exhaust gas recirculation solenoid valve is fitted into the exhaust gas recirculation unit.

REMOVAL

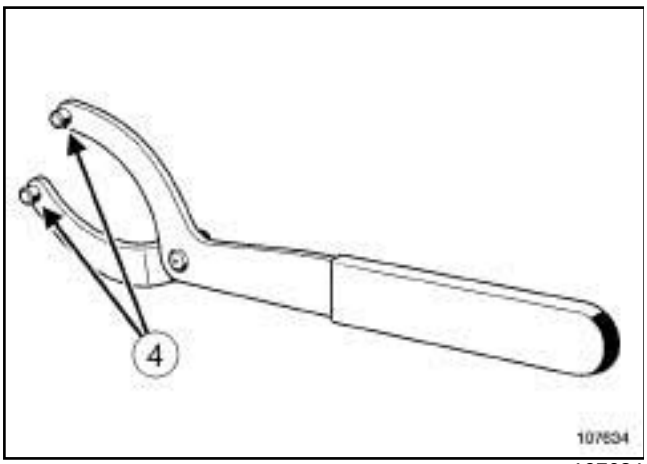
I - REMOVAL PREPARATION OPERATION

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

II - REMOVAL OPERATION



114508



❑ Disconnect the connector (**1**) from the exhaust gas recirculation solenoid valve.

❑ Remove:

- the bolts (**2**) from the exhaust gas recirculation solenoid valve,
- the exhaust gas recirculation solenoid valve,
- the exhaust gas recirculation solenoid valve seal.

133820

107634

❑

Note:

Use the toolto detach the exhaust gas recirculation solenoid valves jammed in their exhaust gas cooler mountings on the gearbox end.

Remove:

- the bracket bolt (**3**) from the air filter unit,

- the air filter unit bracket.

Position the lugs (**4**) of the toolin the bracket holes of the exhaust gas recirculation solenoid valve.

Unlock the exhaust gas recirculation solenoid valve by turning it on its axis using the.

Refit:

- the air filter unit bracket,

- the bolt on the air filter unit bracket.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: exhaust gas recirculation solenoid valve seal**.

❑ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the joint face of the exhaust gas recirculation solenoid valve if it is being reused,

- the joint face of the exhaust gas cooler mounting on the gearbox end.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the joint face of the exhaust gas recirculation solenoid valve if it is being reused,

- the joint face of the exhaust gas cooler mounting on the gearbox end.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

II - REFITTING OPERATION

❑ Position the exhaust gas recirculation solenoid valve with a new seal.

K9K, and 796

❑ Torque tighten the **exhaust gas recirculation solenoid valve bolts (10 N.m)**.

❑ Connect the exhaust gas recirculation solenoid valve connector.

III - FINAL OPERATION

❑ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

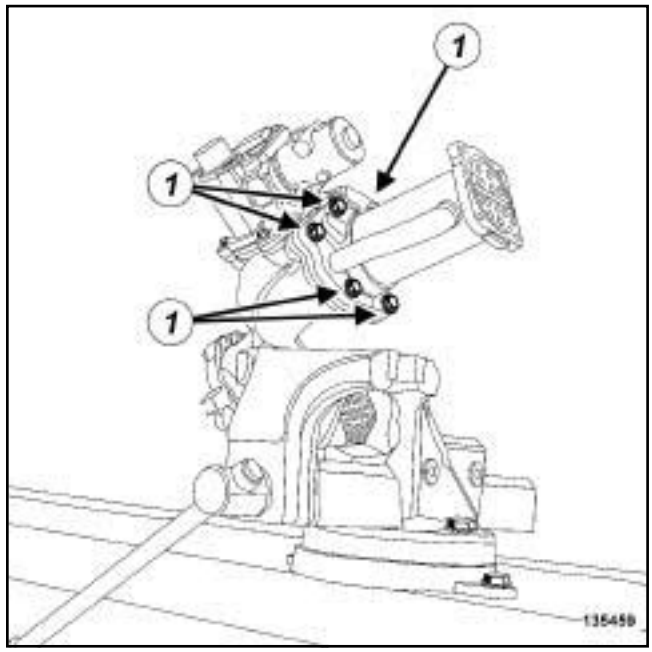
K9K, and 796

Tightening torques ▽	
exhaust gas cooler bolts	**12 N.m**
exhaust gas recirculation rigid pipe bolts	**12 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the engine cover,
- the engine undertray bolts,
- the engine undertray.
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) ,
- the exhaust gas recirculation rigid pipe (see **14A**, **Antipollution**, **Exhaust gas recirculation rigid pipe: Removal - Refitting**, page **14A-12**) ,
- the exhaust gas recirculation assembly (see **14A**, **Antipollution**, **Exhaust gas recirculation assembly: Removal - Refitting**, page **14A-9**) .

II - REMOVAL OPERATION

135459

❑ Remove the following on the workbench:

- the exhaust gas cooler bolts (**1**) from the exhaust gas cooler mounting at the gearbox end,
- the exhaust gas cooler from the exhaust gas cooler mounting at the gearbox end,
- the exhaust gas cooler seal at the gearbox end.

REFITTING

I - REMOVAL PREPARATION OPERATION

❑ **parts always to be replaced: exhaust gas cooler seal**

Note:
Take care not to damage the joint faces of the exhaust gas cooler to prevent any coolant leaks.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the joint faces of the exhaust gas cooler if it is to be reused,

K9K, and 796

- the joint face of the exhaust gas cooler mounting on the gearbox end,
- the joint face of the exhaust gas cooler mounting on the timing end.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the joint faces of the exhaust gas cooler if it is to be reused,
- the joint face of the exhaust gas cooler mounting on the gearbox end,
- the joint face of the exhaust gas cooler mounting on the timing end.

II - REFITTING OPERATION

❑ On the workbench, refit:

- the exhaust gas cooler fitted with a new seal on the exhaust gas cooler mounting at the gearbox end,
- fit without tightening the exhaust gas cooler bolts on the exhaust gas cooler mounting at the gearbox end,
- a new exhaust gas recirculation rigid pipe on the exhaust gas recirculation assembly,
- fit without tightening the bolts of the exhaust gas recirculation rigid pipe on the exhaust gas recirculation assembly.

Note:

The exhaust gas cooler must be able to move in relation to the exhaust gas cooler mounting and the exhaust gas recirculation rigid pipe so that it can be adjusted correctly.

❑ Fit the exhaust gas recirculation assembly equipped with the exhaust gas recirculation rigid pipe on the cylinder head.

❑ Tighten:

- the bolts of the exhaust gas recirculation assembly on the cylinder head,
- the bolts of the exhaust gas recirculation rigid pipe bracket on the cylinder head,
- the bolts of the exhaust gas cooler on the exhaust gas recirculation mounting,
- the bolts of the exhaust gas recirculation rigid pipe on the exhaust gas recirculation assembly,

❑ Remove:

- the exhaust gas recirculation assembly bolts,
- the bolts of the exhaust gas recirculation rigid pipe bracket,
- the exhaust gas recirculation assembly fitted with the exhaust gas recirculation rigid pipe.

❑ On the workbench, torque tighten:

- the **exhaust gas cooler bolts (12 N.m)**,
- the **exhaust gas recirculation rigid pipe bolts (12 N.m)**.

III - FINAL OPERATION

❑ Proceed in the reverse order to removal.

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

K9K, and 796

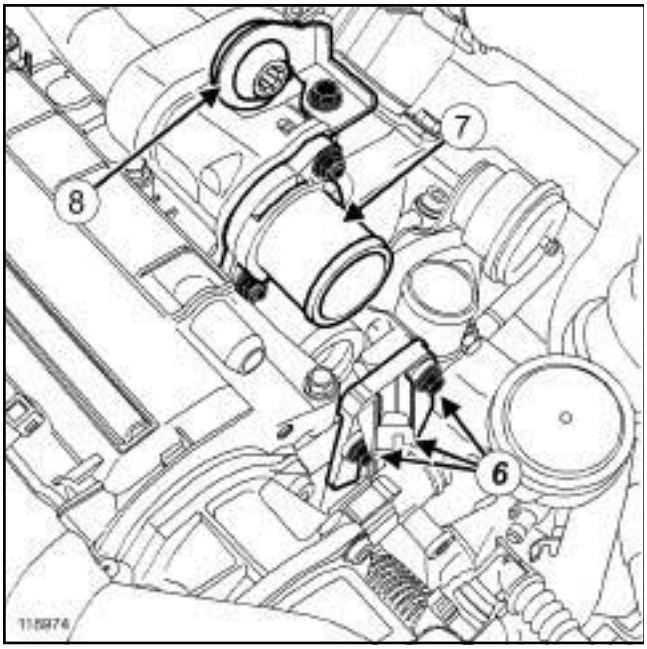
24814



❏ Remove:

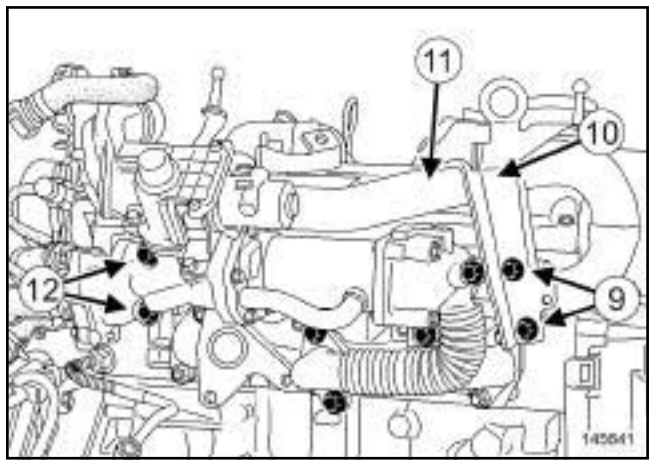
- the clip (**1**) on the air pipe between the intercooler and the exhaust gas recirculation assembly,
- the clip (**2**) on the air pipe between the intercooler and the turbocharger.

❏ Disconnect:

- the air pipe between the intercooler and the exhaust gas recirculation assembly,
- the air pipe between the intercooler and the turbocharger,
- the oil vapour rebreathing pipe (**3**) ,
- the non-return valve (**4**) at the vacuum pump,
- the exhaust gas recirculation solenoid valve connector (**5**) .

K9K, and 796

118974



❑ Position the **(Ms. 583)** or the hose clamps on the coolant inlet and outlet hoses of the exhaust gas cooler.

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

❑ Remove:

- the bolts (**6**) on the coolant circulation cover,
- the coolant circulation cover,
- the seals of the coolant circulation cover.

II - REMOVAL OPERATION

145641

❑ Remove:

- the bolts (**9**) from the lifting eye at the timing end,
- the lifting eye on the timing end (**10**) ,
- the air inlet metal tube (**11**) ,
- the air inlet metal tube seals,
- the exhaust gas recirculation rigid pipe (see **14A**, **Antipollution**, **Exhaust gas recirculation rigid pipe: Removal - Refitting**, page **14A-12**) ,
- the bolts (**12**) of the exhaust gas assembly mounting,
- the exhaust gas recirculation assembly.

❑ Remove the following on the workbench:

- the air duct sleeve ***(7)*** ,
- the centring ring ***(8)*** of the air filter unit.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ On the workbench, refit:

- the air pipe sleeve ***(7)*** ,
- the centring ring of the air filter unit.

❑ Always replace:

- the air inlet metal tube seals,
- the coolant circulation cover seals,
- the turbocharger air outlet pipe seal.

K9K, and 796

❏ Use **GREY ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the joint faces of the exhaust gas cooler mounting at the gearbox end.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the housing of the coolant circulation cover seals,
- the exhaust gas cooler mounting joint faces on the gearbox end,
- the housing of each air inlet metal tube seal,
- the housing of the turbocharger air outlet pipe seal,
- the housing of the air inlet metal tube in the cylinder head,
- the housing of the air inlet metal tube in the exhaust gas cooler mounting on the gearbox end.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

II - REFITTING OPERATION

❏ Proceed in the reverse order to removal.

❏ Torque tighten:

- the **bolts of the exhaust gas recirculation assembly (21 N.m)**,
- the **bolts on the « timing end lifting eye - air inlet metal tube assembly » (10 N.m)**.

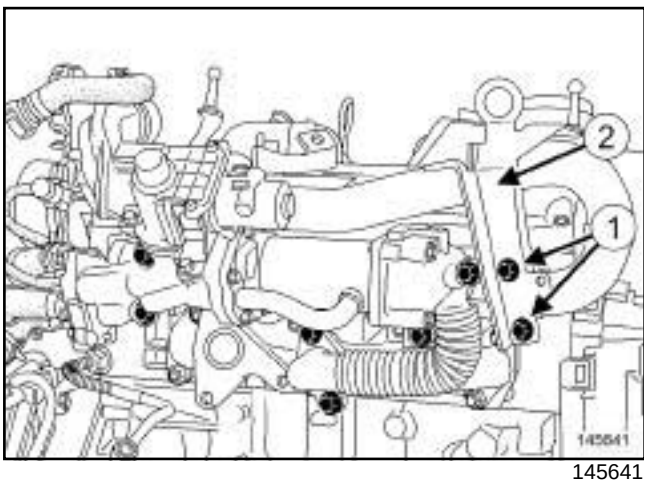
❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

K9K, and 796

Tightening torques ▽	
bolts of the exhaust gas recirculation rigid pipe bracket on the cylinder head	**21 N.m**
bolts of the exhaust gas recirculation rigid pipe on the exhaust manifold	**36 N.m**
bolts of the exhaust gas recirculation rigid pipe on the exhaust gas recirculation assembly	**12 N.m**
lifting eye bolts	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



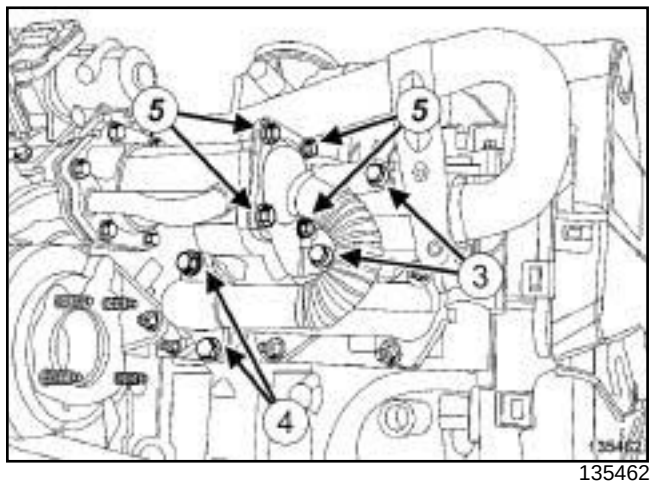
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine cover,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine undertray.

❏ Remove the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-10**) .



145641

❏ Remove:

- the bolts (**1**) from the lifting eye at the timing end,
- the timing end lifting eye (**2**) ,

II - REMOVAL OPERATION

135462

❏ Remove:

- the bolts (**3**) of the exhaust gas recirculation rigid pipe bracket from the cylinder head,
- the bolts (**4**) of the exhaust gas recirculation rigid pipe from the exhaust manifold,
- the bolts (**5**) of the exhaust gas recirculation rigid pipe from the exhaust gas recirculation rigid pipe,
- the exhaust gas recirculation rigid pipe,
- the seal between the exhaust gas rigid pipe and the exhaust gas manifold,
- the seal between the exhaust gas recirculation rigid pipe and the exhaust gas cooler.

REFITTING

I - REFITTING PREPARATION OPERATION

❏

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

K9K, and 796

❏ Clean using **ABRASIVE PADS** :

- the joint face of the exhaust gas recirculation assembly,
- the exhaust manifold seal face.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❏ Use **SURFACE CLEANER** (see) (04B, Consumables - Products) and **CLEAN CLOTHS** to degrease:

- the exhaust manifold joint face,
- the joint face of the exhaust gas recirculation assembly.

❏ **parts always to be replaced: Exhaust gas recirculation rigid pipe**.

❏ **parts always to be replaced: Exhaust gas recirculation pipe seal**.

❏ **parts always to be replaced: exhaust gas recirculation pipe bolt**

II - REFITTING OPERATION

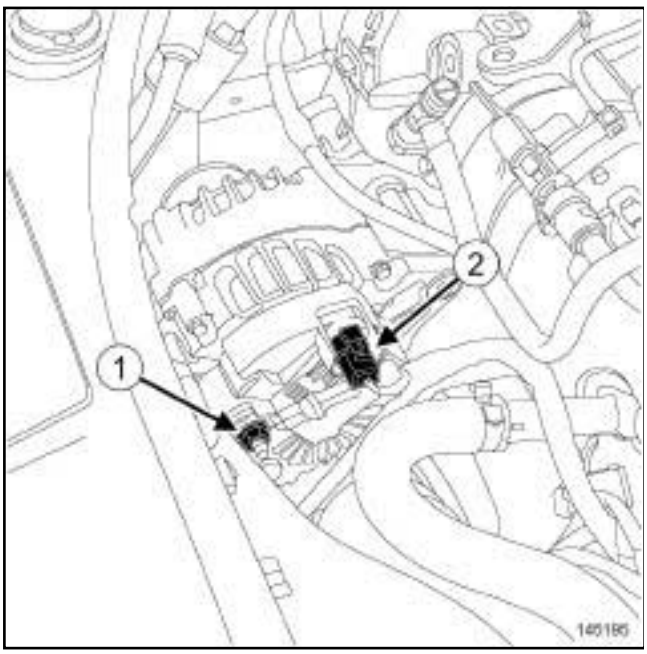
❏ Proceed in the reverse order to removal.

❏ Torque tighten:

- the **bolts of the exhaust gas recirculation rigid pipe bracket on the cylinder head (21 N.m)**,
- the **bolts of the exhaust gas recirculation rigid pipe on the exhaust manifold (36 N.m)**,
- the **bolts of the exhaust gas recirculation rigid pipe on the exhaust gas recirculation assembly (12 N.m)**,
- the **lifting eye bolts (10 N.m)**.

K9K

Tightening torques ▽	
alternator bolts	**21 N.m**
alternator lead nut	**14 N.m**



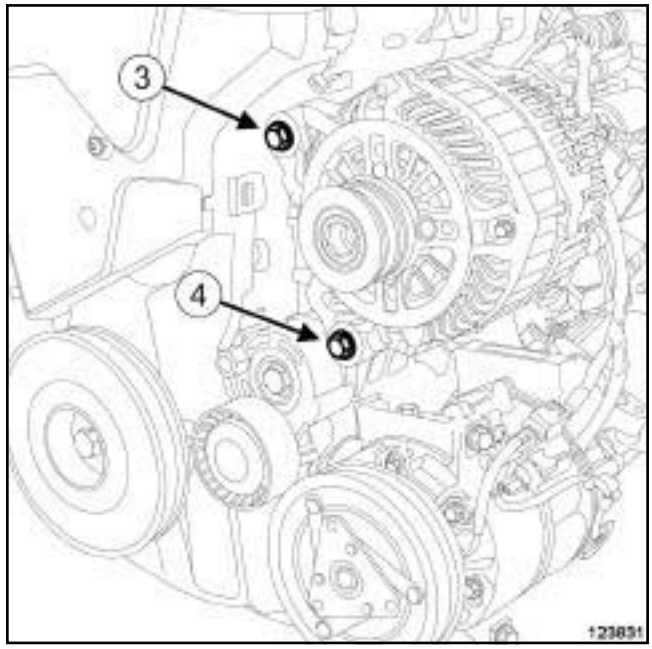
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

II - REMOVAL OPERATION



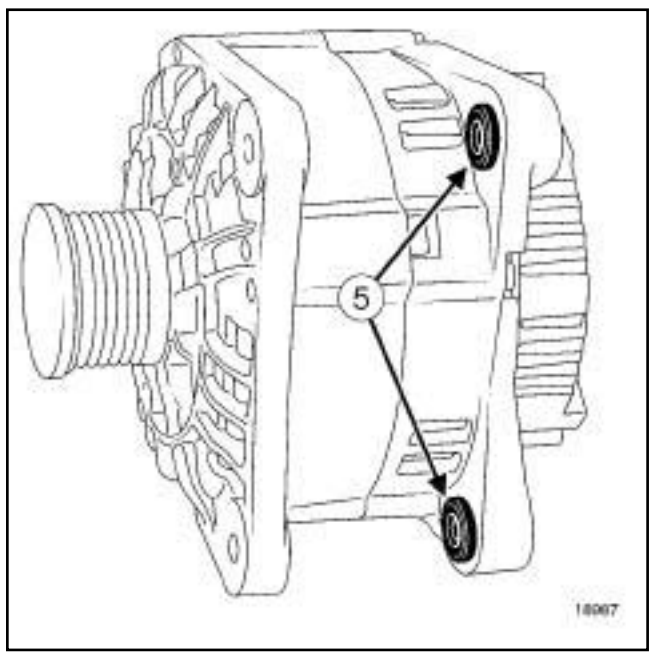
145195

❏ Remove:

- the alternator lead nut (**1**) ,
- the lead from the alternator.

❏ Disconnect the connector (**2**) .

123831



❏ Remove the alternator upper bolt (**3**) .

❏ Loosen the alternator lower bolt (**4**) .

❏ Remove the alternator with its lower bolt.

REFITTING

I - REFITTING PREPARATION OPERATION

18987

❏ Push in the alternator rings (**5**) to facilitate fitting.

K9K

II - REFITTING OPERATION

❏ Refit:

- the alternator with its lower bolt,
- the alternator upper bolt.

❏ Torque tighten the **alternator bolts (21 N.m)**.

❏ Connect the connector to the alternator.

❏ Refit the alternator lead.

❏ Torque tighten the **alternator lead nut (14 N.m)**.

III - FINAL OPERATION

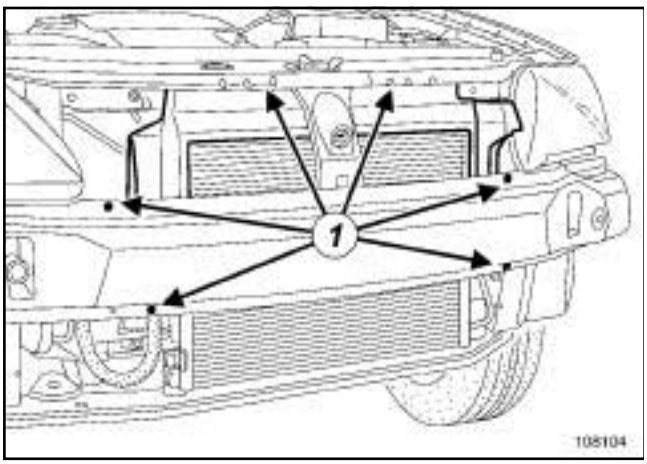
❏ Refit the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M, and POWER ASSISTED STEERING, and AIR CONDITIONING

Tightening torques ▽	
alternator bolts	**21 N.m**
alternator lead nut	**14 N.m**

REMOVAL

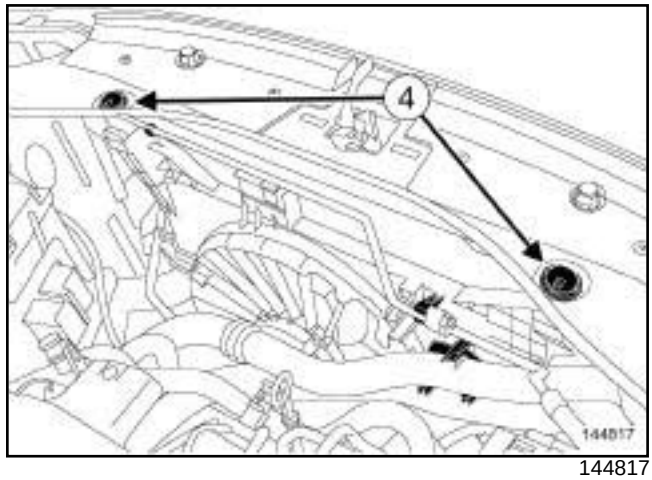


I - REMOVAL PREPARATION OPERATION

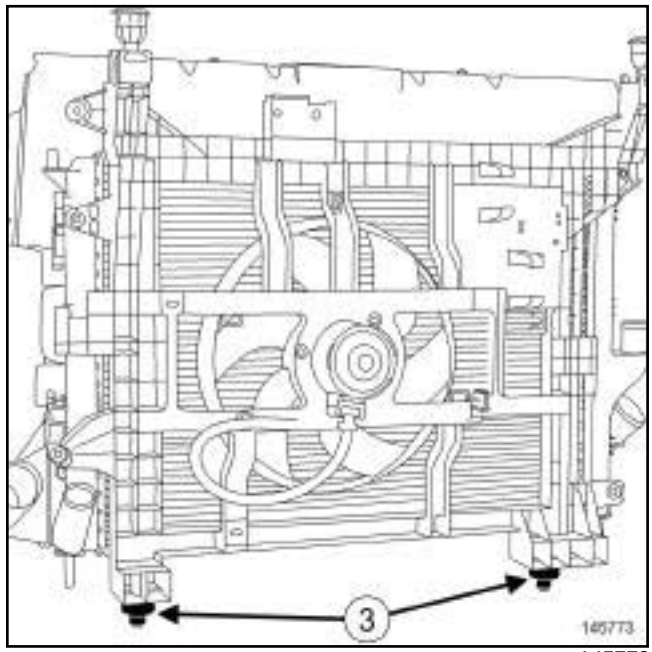
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:



- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

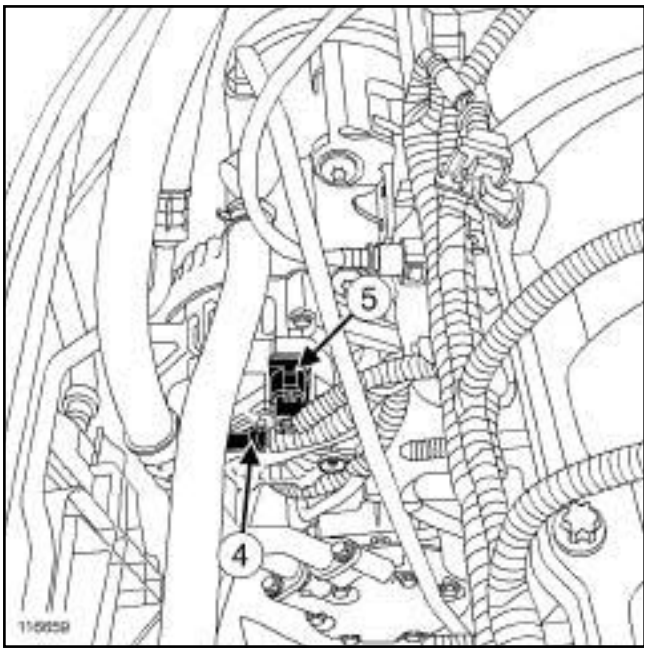


108104

❏ Remove:

- the air deflector mounting pins (**1**) ,
- the air deflector.

144817



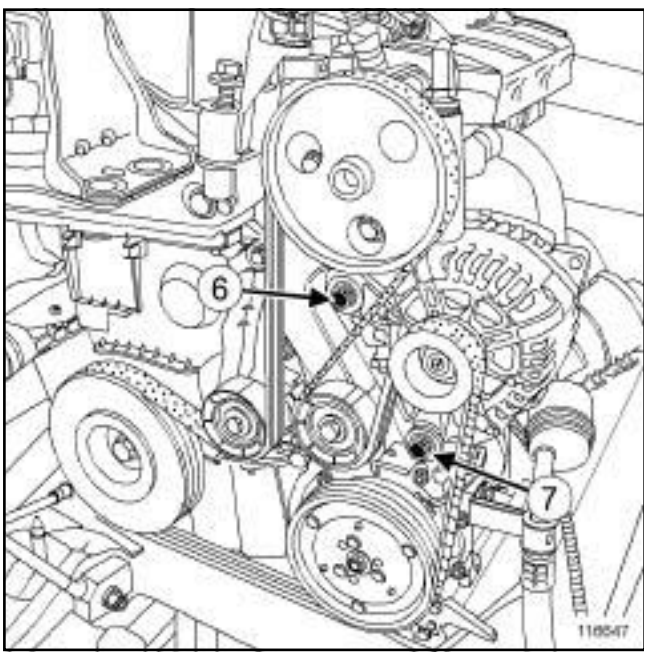
145773

❏ Remove the upper mountings (**4**) from the engine cooling fan assembly (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-27**) .

❏ Extract the « engine cooling fan - cooling radiator - condenser » assembly from its lower mountings ***(3)*** and slide it to the left.

K4M, and POWER ASSISTED STEERING, and AIR CONDITIONING

II - REMOVAL OPERATION



116659

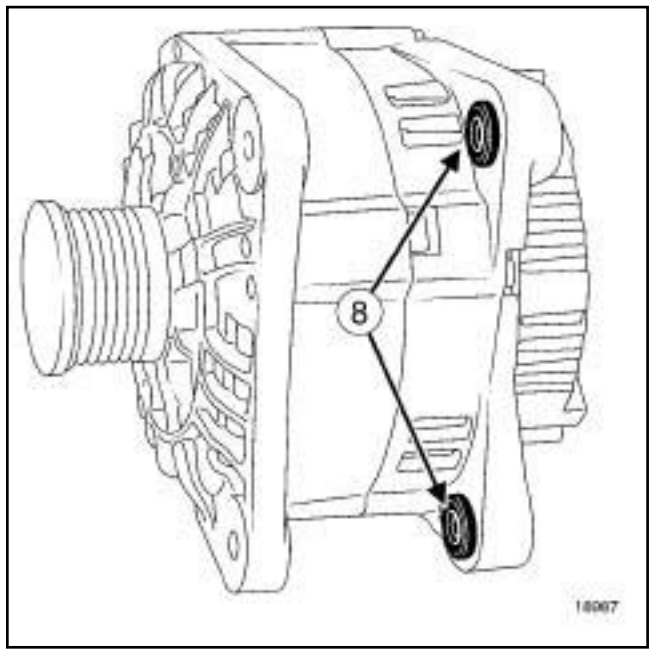
❑ Remove:

- the alternator lead nut,
- the alternator lead (**4**) .

❑ Disconnect the alternator connector (**5**) .

116647

❑ Remove the alternator upper bolt (**6**) .



❑ Loosen the alternator lower bolt ***(7)*** .

❑ Move the alternator away from the multifunction support using a screwdriver.

❑ Remove the alternator and its lower mounting bolt.

REFITTING

I - REFITTING PREPARATION OPERATION

18987

❑ Push the rings (**8**) to make fitting easier.

II - REFITTING OPERATION

❑ Refit the alternator.

❑ Torque tighten the **alternator bolts (21 N.m)**.

❑ Connect the connector to the alternator.

❑ Refit:

- the lead to the alternator,
- the alternator lead nut.

❑ Torque tighten the **alternator lead nut (14 N.m)**.

III - FINAL OPERATION

❑ Slide the « engine cooling fan - cooling radiator - condenser » assembly to the right and fit it in its lower mountings.

❑ Refit the upper mountings of the engine cooling fan assembly (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-27**) .

❑ Refit:

- the air deflector,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,

- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M, and STANDARD HEATING RECIRCULATION

Tightening torques ▽	
alternator bolts	**21 N.m**
positive terminal nut on the alternator	**14 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

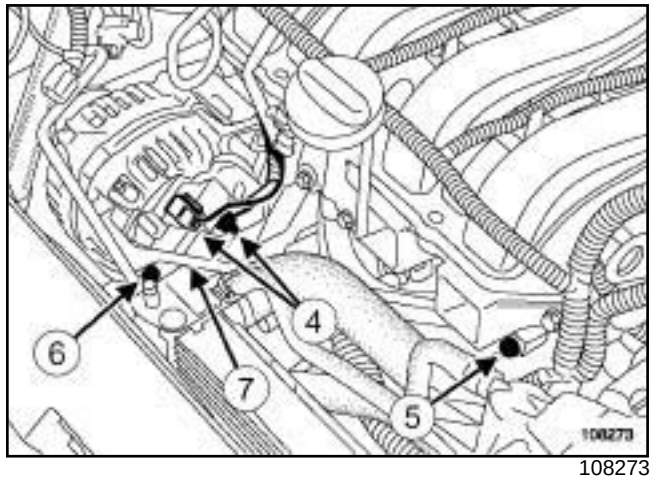
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

❏

IMPORTANT



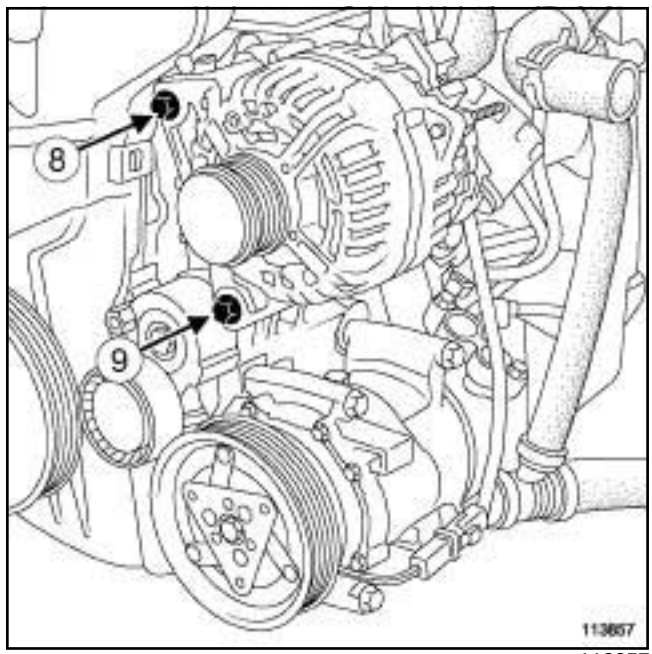
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❏ Disconnect the fuel supply pipe union ***(3)*** on the injector rail.



108273

❏ Disconnect the alternator's electrical connections (**4**) .

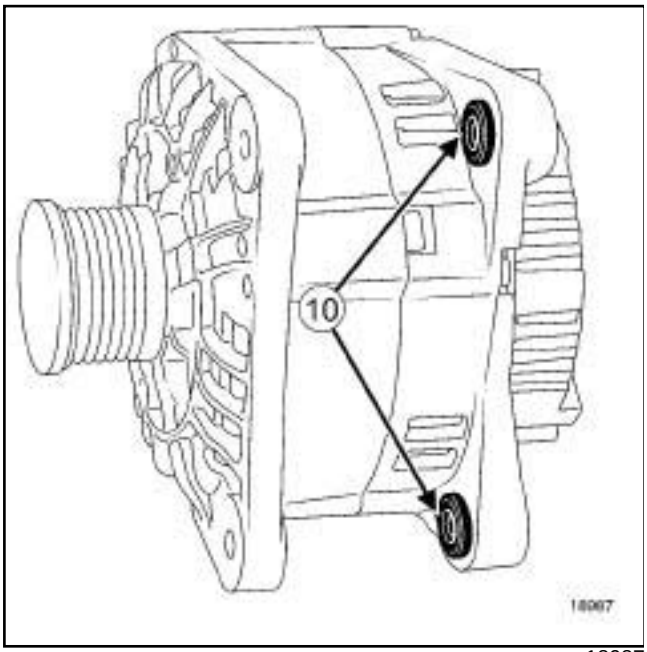
❏ Move aside the alternator wiring.

II - REMOVAL OPERATION

113857

❏ Remove the alternator upper bolt (**8**) .

❏ Loosen the alternator lower bolt (**9**) .



❏ Move the alternator away from the multifunction support using a screwdriver.

❏ Remove the alternator with its lower bolt upwards.

K4M, and STANDARD HEATING RECIRCULATION

REFITTING

I - REFITTING PREPARATION OPERATION

18987

❏ Push the rings (**10**) to make fitting easier.

II - REFITTING OPERATION

❏ Refit the alternator.

❏ Torque tighten the **alternator bolts (21 N.m)**.

III - FINAL OPERATION

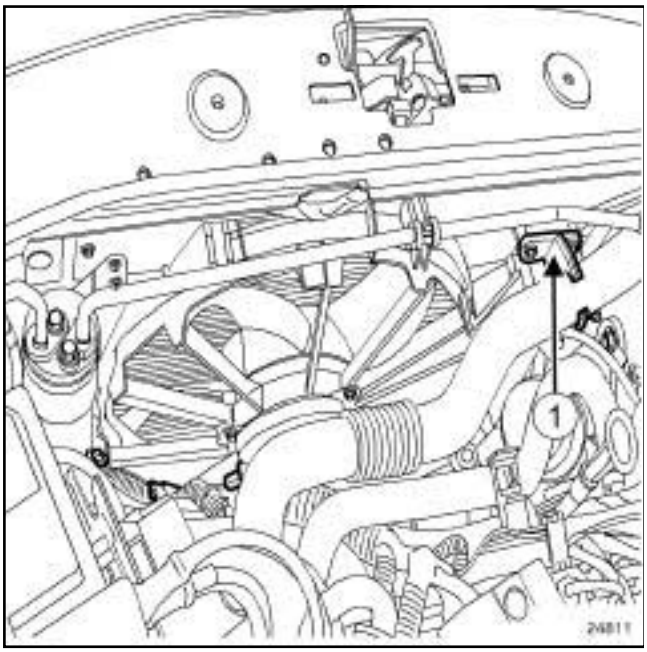
❏ Connect the alternator electrical connections.

❏ Torque tighten the **positive terminal nut on the alternator (14 N.m)**.

❏ Connect the fuel supply pipe union on the injector rail.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).



❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Tightening torques ▽

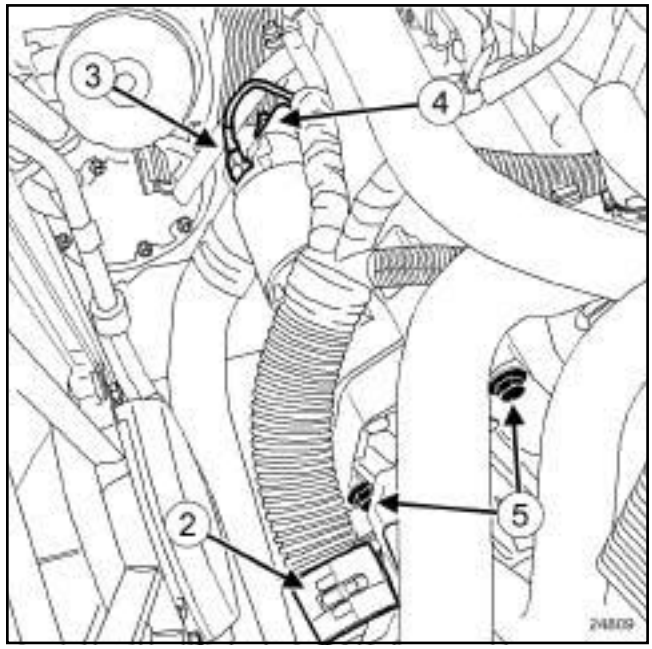
nut on the starter solenoid lead	**5 N.m**
starter lead nut	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

24811

❏ Unclip the intercooler duct on the fan assembly at (**1**) .

❏ Move aside the intercooler duct.

24809

❏ Unclip the engine wiring at (**2**) .

II - REMOVAL OPERATION

❏ Remove:

- the nut ***(3)*** on the starter solenoid lead,
- the nut ***(4)*** on the starter lead,
- the starter leads,
- the starter bolts ***(5)*** ,
- the starter.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check that the starter centring dowel is in place.

II - REFITTING OPERATION

❏ Refit the starter.

❏ Torque tighten the **starter bolts (44 N.m)**.

❏ Refit the starter leads.

❏ Torque tighten:

- the **nut on the starter solenoid lead (5 N.m)**,
- the **starter lead nut (8 N.m)**.

K9K

III - FINAL OPERATION

❑ Clip:

- the engine wiring,
- the intercooler duct on the fan assembly.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M

Tightening torques ▽

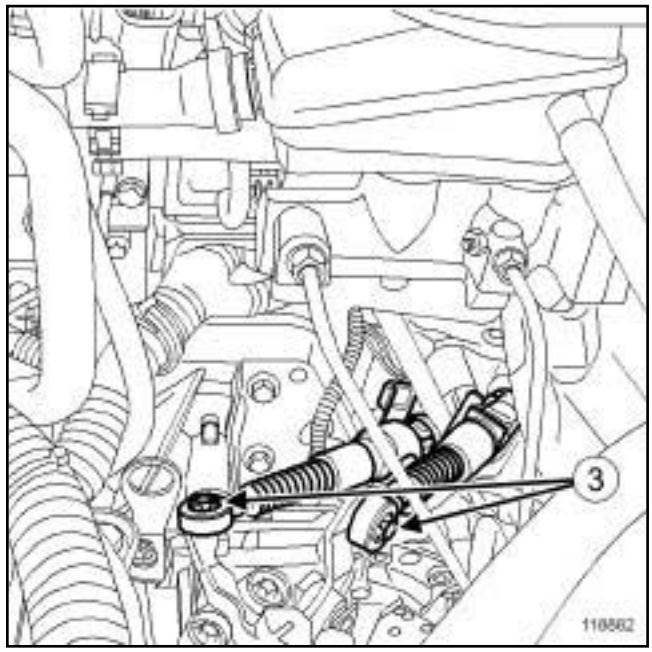
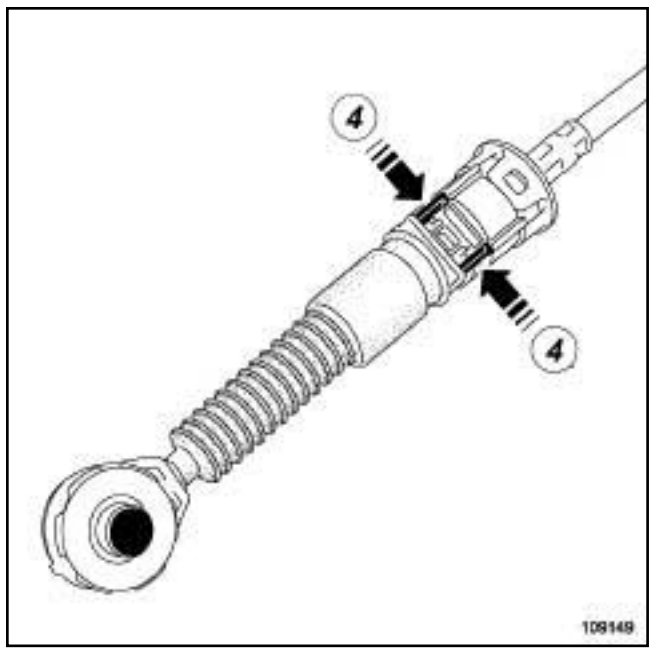
nut on the starter solenoid lead	**5 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

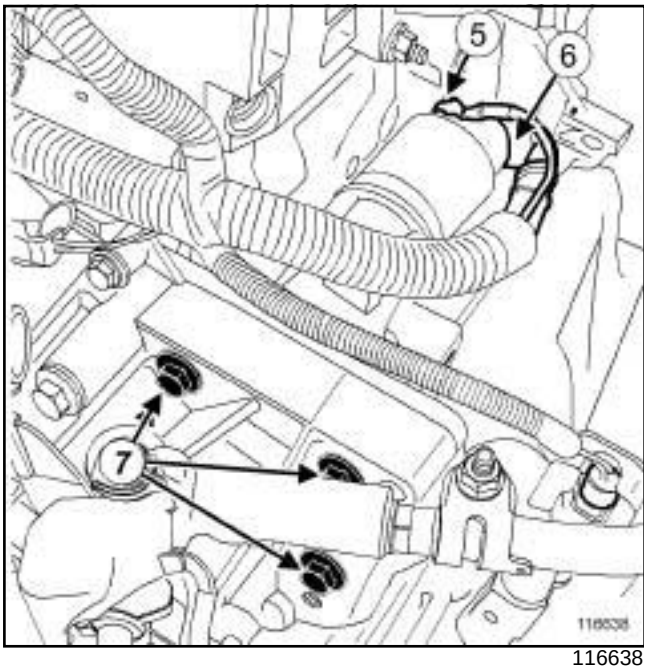


❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

JR5

118882



109149

❏ Unclip:

- the gear control cables on the gearbox at (**3**) using a screwdriver,
- the gearbox control cable sleeve stops by pressing at (**4**) .

K4M

II - REMOVAL OPERATION

116638

❑ Remove:

- the nut (**5**) on the starter solenoid lead,
- the nut (**6**) on the starter lead,
- the starter bolts (**7**) ,
- the starter from underneath the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check that the centring dowel is in place.

II - REFITTING OPERATION

❑ Refit:

- the starter from underneath the vehicle,
- the starter bolts.

❑ Torque tighten the **starter bolts (44 N.m)**.

❑ Refit:

- the starter leads,
- the starter lead nut,
- the nut on the starter solenoid lead.

❑ Torque tighten:

- the **starter lead nut (8 N.m)**,
- the **nut on the starter solenoid lead (5 N.m)**.

III - FINAL OPERATION

JR5

❑ Clip:

- the gearbox control cable sleeve stops on the gearbox,
- the control cables onto the gearbox.

❑ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

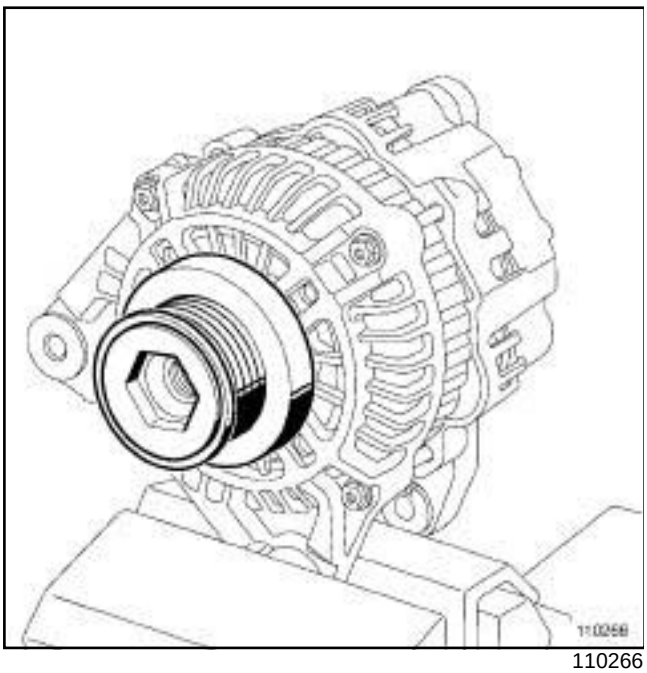
❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M

Equipment required
pneumatic or electric wrench
torque wrench
open-ended spanner for torque wrench

Tightening torques ▽	
alternator pulley	**80 N.m**

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

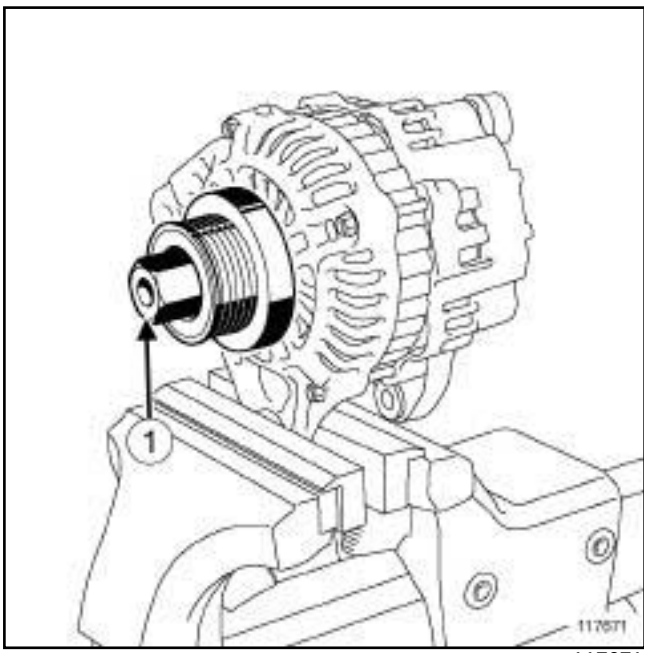
❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) .

II - REMOVAL OPERATION FOR ALTERNATOR PULLEY

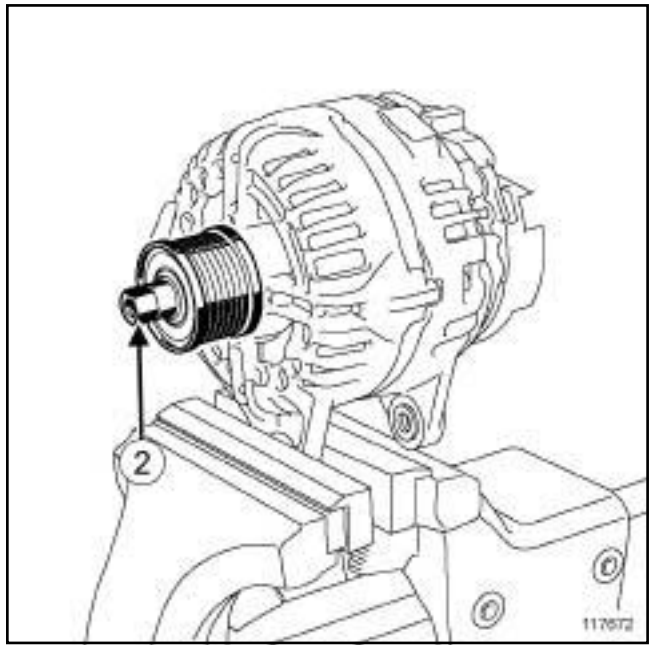
110266

❏ Unclip the alternator pulley protector (if equipped).



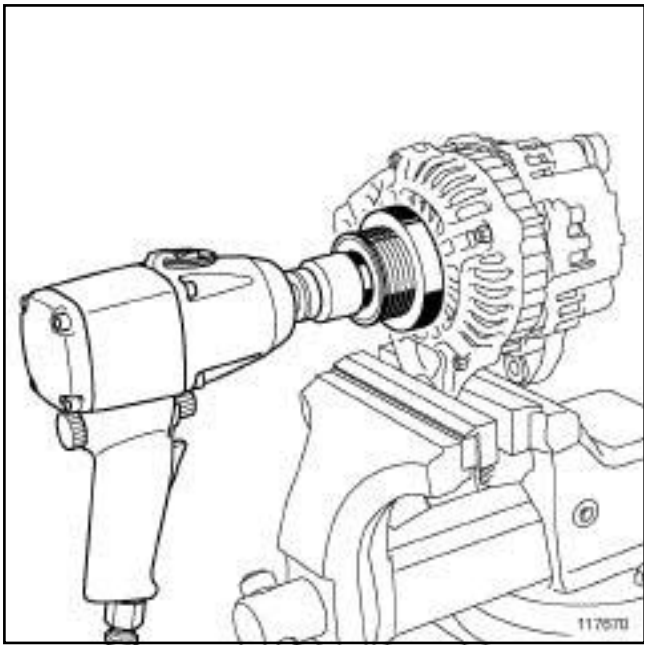
❏ Place the alternator in a vice jaw.

K4M

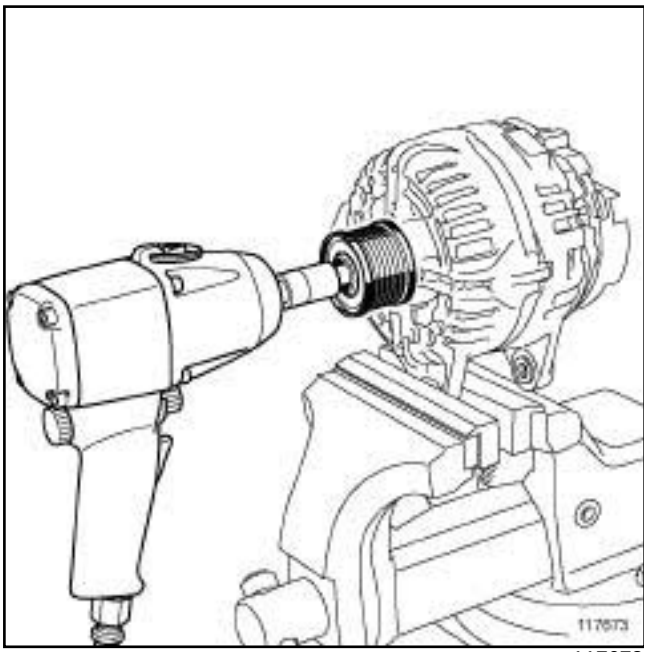


Mot. 1732

110276



117671



117672

❑ Position the hexagonal socket (**1**) or the splined socket (**2**) from the kitorin the alternator pulley (depending on the version).

K4M

117670

117673

❑

Note:

Always use a pneumatic or electric impact wrench to loosen the alternator pulley

Loosen the alternator pulley using a **pneumatic or electric wrench**.

❑

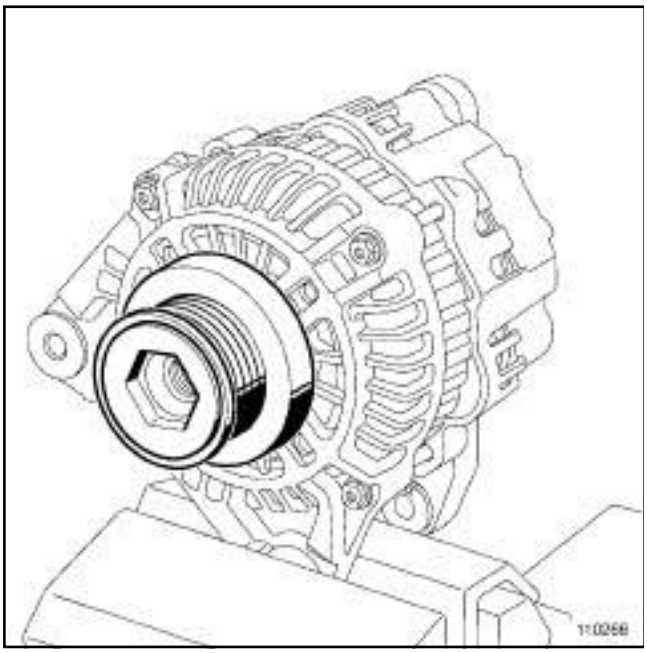
Remove:

- the tools,
- the alternator pulley.

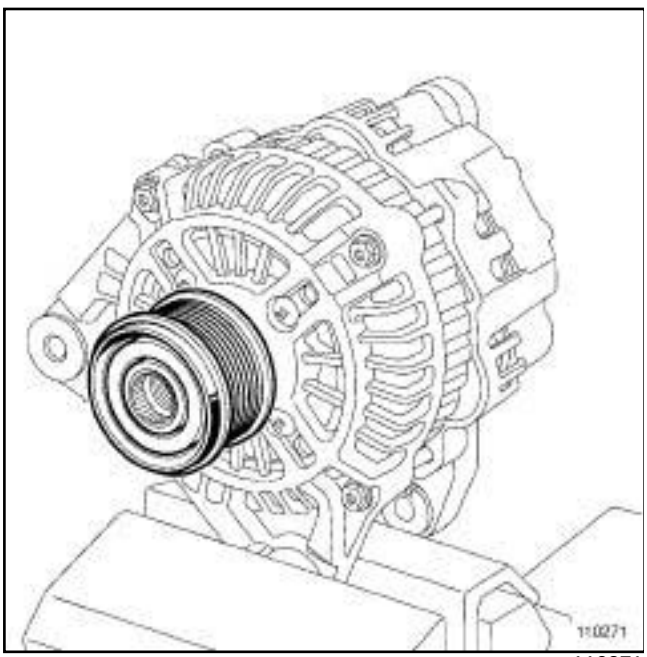
III - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Accessories belt**

parts always to be replaced: Accessories fixed roller

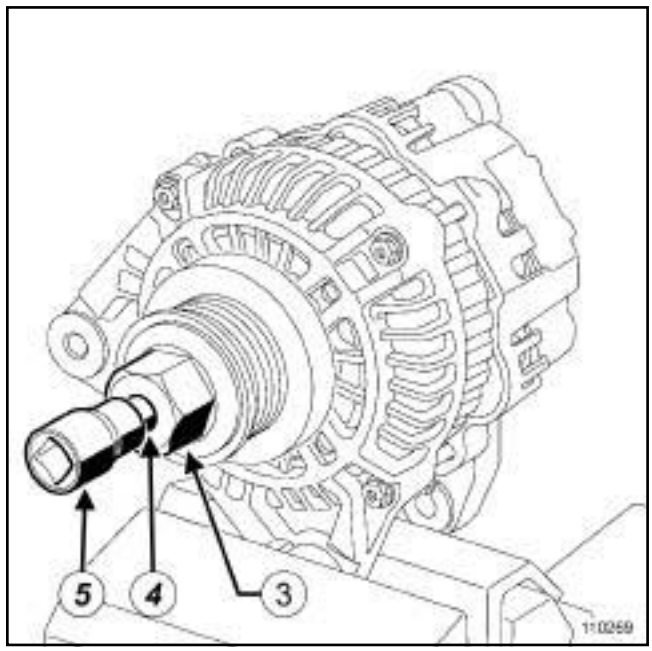


parts always to be replaced: Accessories belt tensioning roller



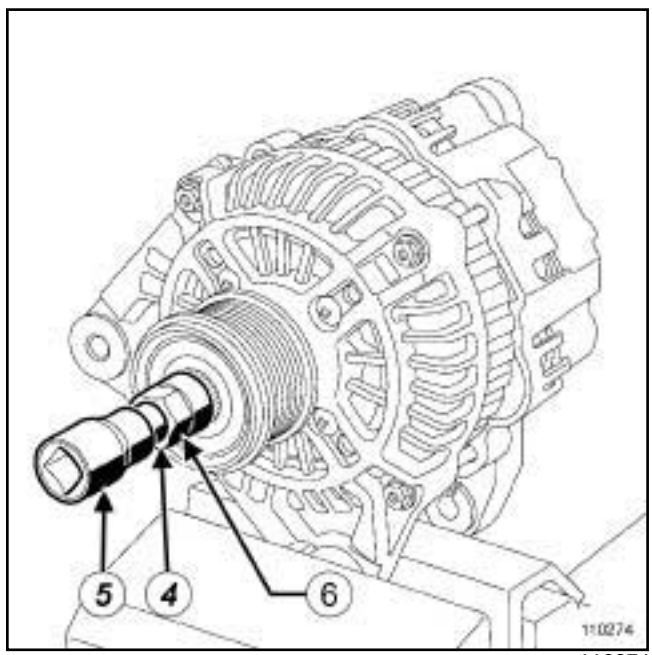
parts always to be replaced: Accessories tensioning roller bolt

parts always to be replaced: Alternator pulley



K4M

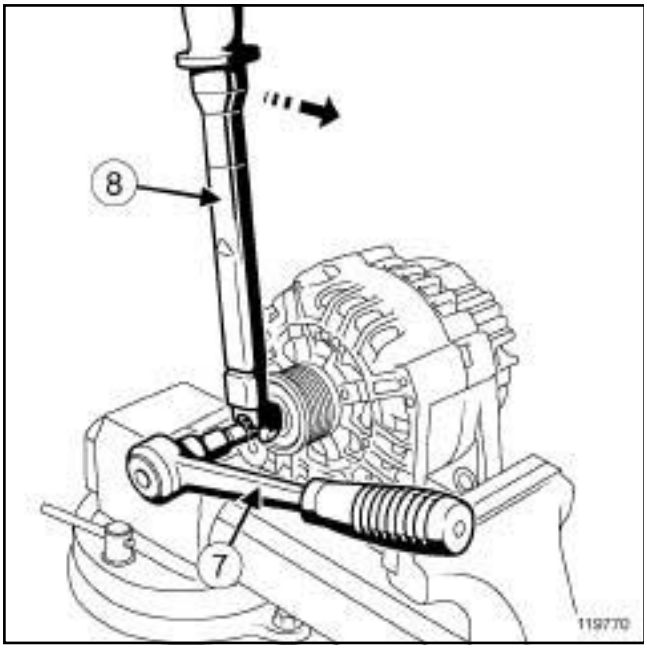
IV - REFITTING OPERATION FOR THE ALTERNATOR PULLEY



110266

110271

❑ Tighten the new alternator pulley.



110269

110274

❑ Position:

- the hexagonal socket (**3**) or the splined socket (**6**) in the alternator pulley (depending on the version),
- the end piece (**4**) in the recess of the alternator rotor,
- the end piece holder (**5**) on the end piece.

119770

❏ Immobilise the alternator rotor using the spanner (**7**) .

❏ Torque tighten the **alternator pulley (80 N.m)** using the **torque wrench** (**8**) equipped with a **15mm open-ended spanner for torque wrench**.

❏ Remove the tools.

❏ Clip the new protector onto the alternator pulley (if equipped).

V - FINAL OPERATION

❏ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

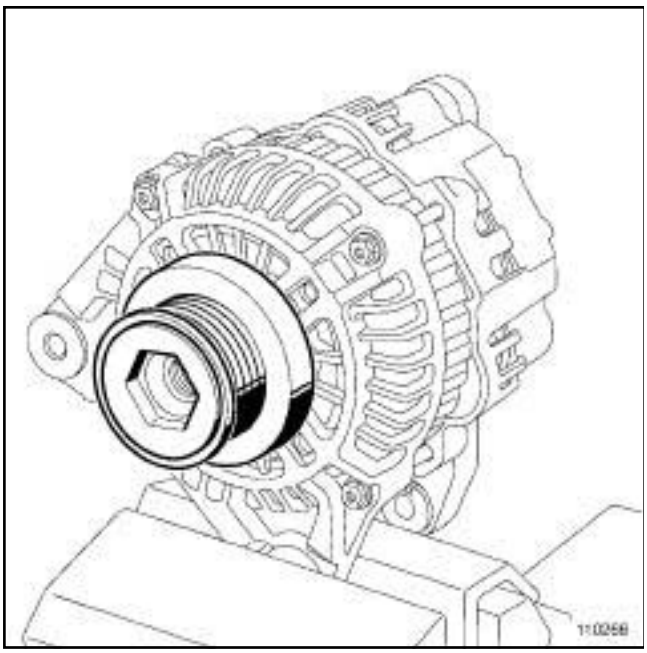
❏ Connect the battery (see **Battery: Removal - Refitting**) .

K9K

Tightening torques ▽	
alternator pulley nut	**80 N.m**

REMOVAL

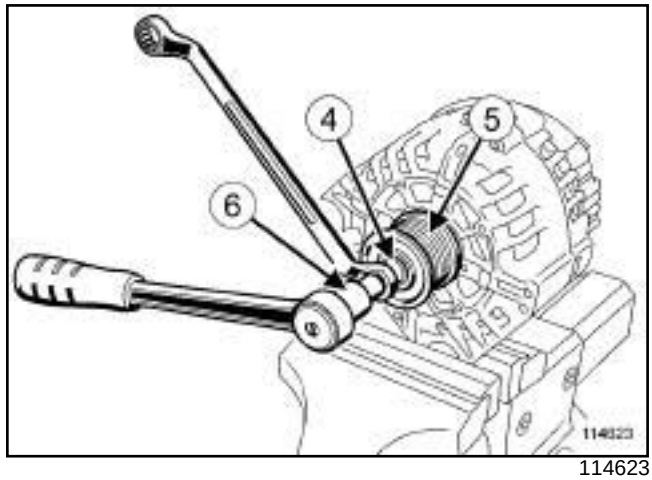
I - REMOVAL PREPARATION OPERATION



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) .



II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Unclip the alternator pulley protector (if equipped).

110266

❏ Place the alternator in a vice jaw.

114623

❏ Fit:

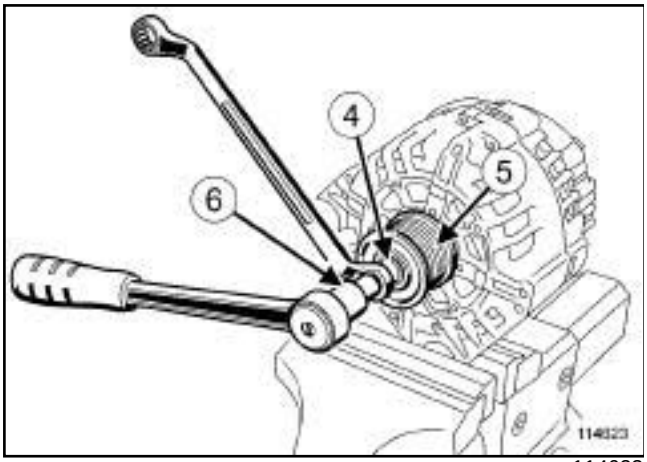
- the splined socket (**4**) of thein the free wheel pulley (**5**) ,
- the end piece and holder assembly (**6**) of theon the alternator shaft.

❏ Immobilise the splined socket (**4**) .

❏ Loosen the alternator shaft.

❏

Note:



Do not use a screwdriver to remove or refit the pulley. A damaged or deformed front bearing can lead to damage to the alternator.

❏ Remove the free wheel pulley.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the pulley to the alternator shaft

114623

❑ Fit:

- the splined socket (**4**) of thein the free wheel pulley (**5**) ,
- the end piece and holder assembly (**6**) of theon the alternator shaft.

❑ Immobilise the splined socket (**4**) .

❑ Torque tighten the **alternator pulley nut (80 N.m)**.

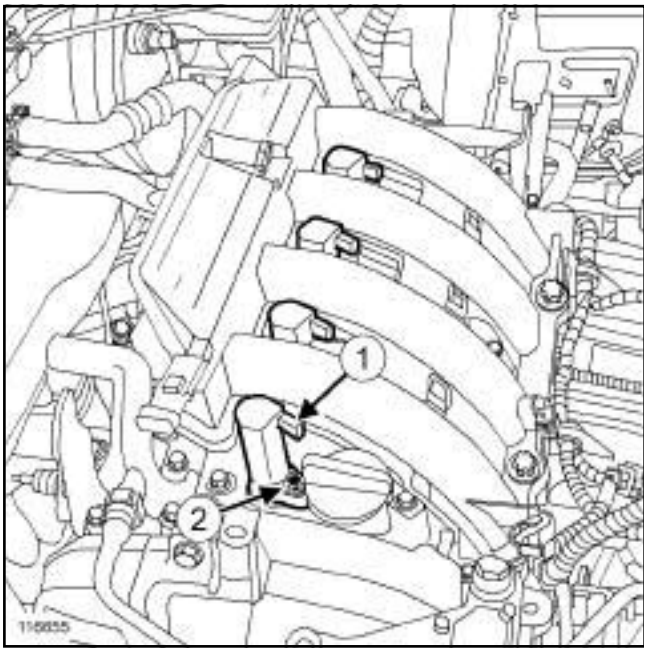
❑ Turn the pulley by hand to check that the rotor turns easily.

❑ Clip on the alternator pulley protector (if equipped).

II - FINAL OPERATION

❑ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-1**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .



❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M

Tightening torques ▽	
ignition coil bolts	**14 N.m**

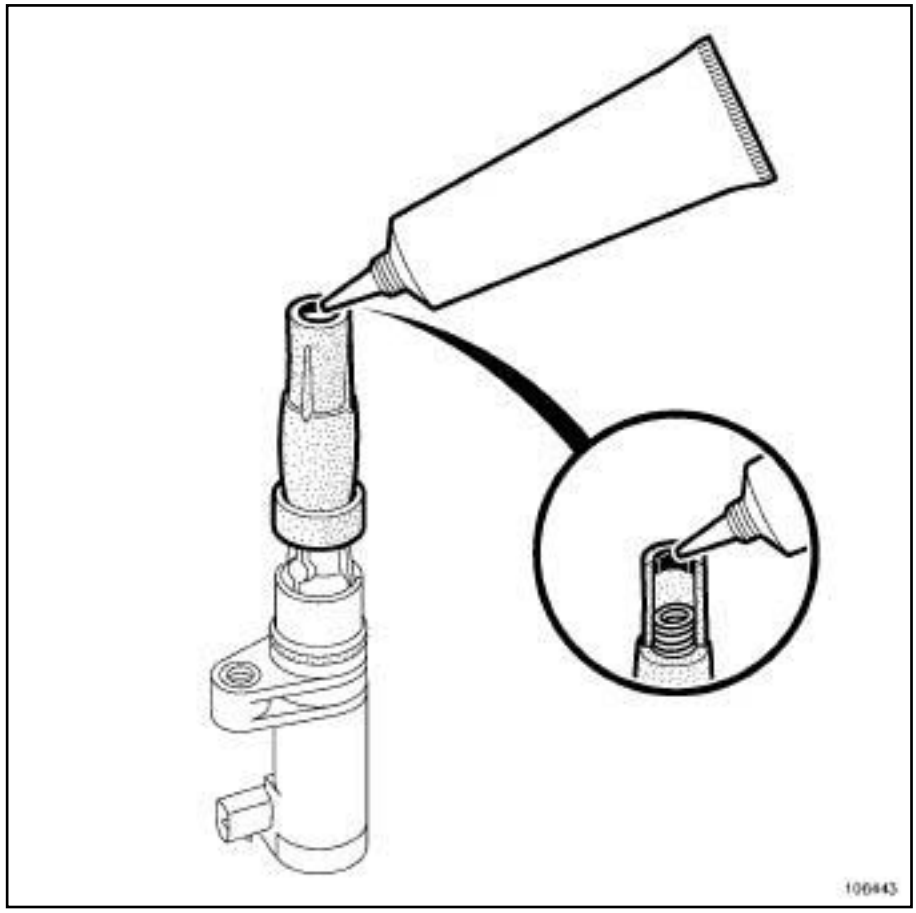
REMOVAL

REMOVAL OPERATION

116655

❏ Disconnect the connectors (**1**) from the ignition coils.

❏ Remove:



- the ignition coil bolts (**2**) ,
- the ignition coils.

REFITTING

I - REFITTING PREPARATION OPERATION

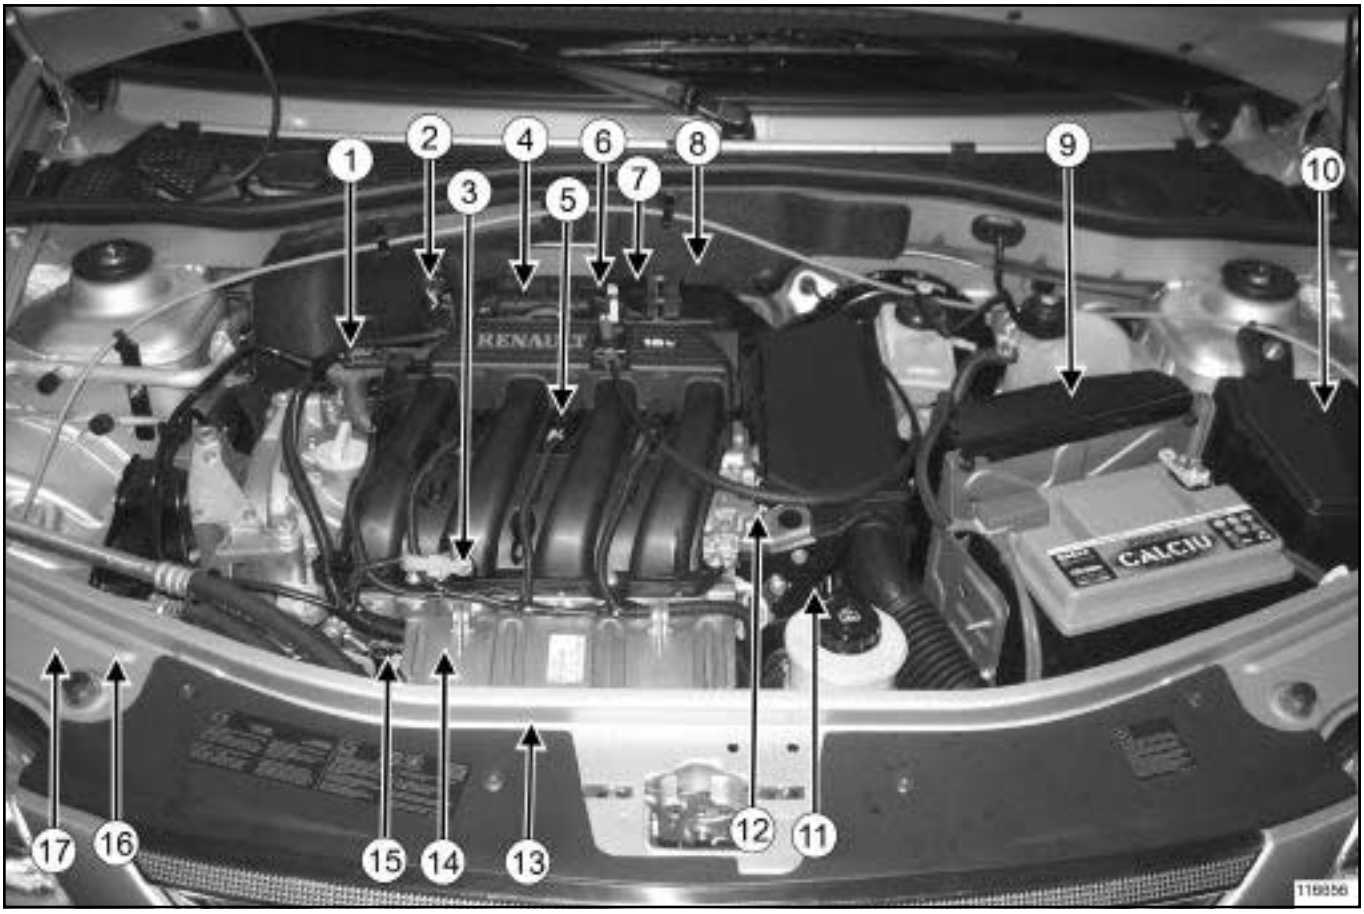
❏ Always replace the **ignition coil bolts**.

❏ If necessary, replace the ignition coil O-rings.

106443

❑ When refitting the ignition harness, it is essential to apply a bead of **FLUOSTAR 2L 2 mm** in diameter around the inner edge of the high-tension caps on the side of the spark plugs and coil (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables-Products).

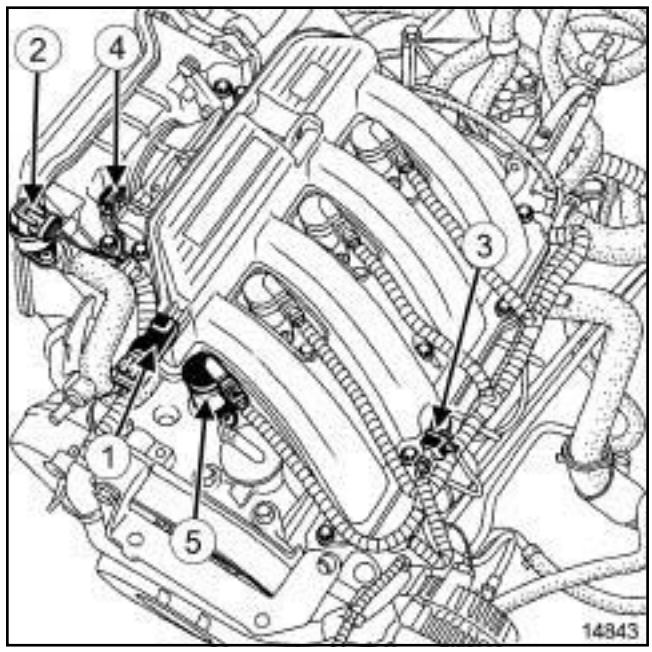
II - REFITTING OPERATION



❑ Refit:

- the ignition coils,
- the new ignition coil bolts.

❑ Torque tighten the **ignition coil bolts (14 N.m)**.



❑ Connect the ignition coil connectors.

❑ Disconnect the crankshaft position sensor connector (**1**) .

❑ Remove the two bolts (**2**) from the crankshaft position sensor.

❑ Move aside the engine wiring harness mounting support (**3**) .

❑ Remove the crankshaft position sensor.

REFITTING

I - REFITTING OPERATION

❑ Refit the crankshaft position sensor.

❑ Refit the engine wiring harness mounting support.

❑ Refit the two bolts of the crankshaft position sensor.

❑ Torque tighten the **crankshaft position sensor bolts (8 N.m)**.

II - FINAL OPERATION

❑ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

III - WHEN REPLACING THE CRANKSHAFT POSITION SENSOR

❑ Program the flywheel target:

- perform a deceleration with injection cut-off in second, third, fourth or fifth gear between **3500** and **3000 rpm**, for at least **2 seconds**,
- perform a deceleration with injection cut-off in second, third, fourth or fifth gear between **2400** and **2000 rpm**, for at least **3 seconds**.

❑ Use the **Diagnostic tool** to check that this programming has been successfully completed, **ET060 Flywheel signal with engine running**.

❑ Read the fault codes.

❑ Repair if necessary.

❑ Clear the fault codes.

❑ Check that the vehicle is working correctly.

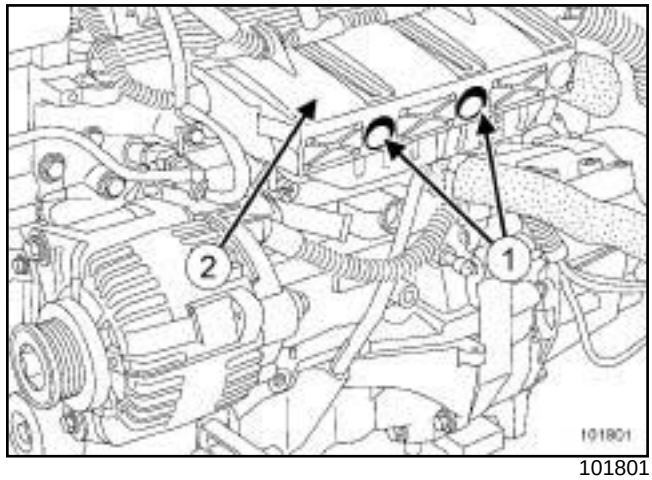
K4M

Tightening torques ▽	
injector rail bolts	**9 N.m**
injector rail protector nuts	**21 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

During this operation, be sure to:

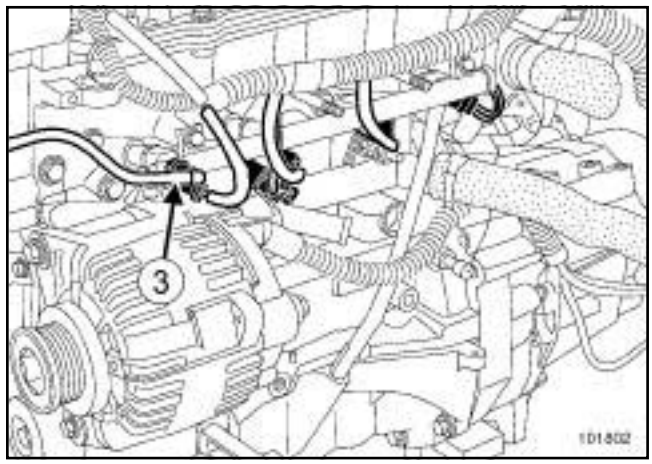


- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT
Be careful when removing the injectors or the injection rail as there will be a quantity of fuel in the rail and the union.

REMOVAL

I - REMOVAL PREPARATION OPERATION

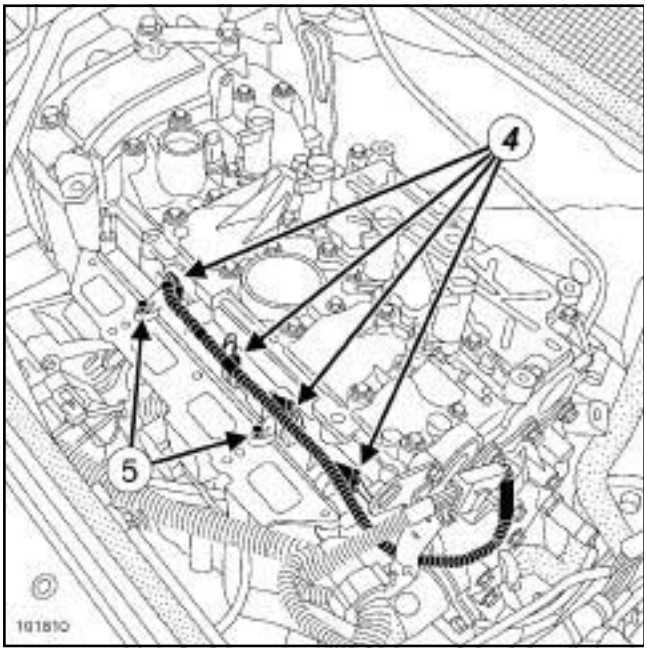


❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

101801

❏ Remove:

- the two nuts (**1**) from the injector rail protector,
- the injector rail protector (**2**) .



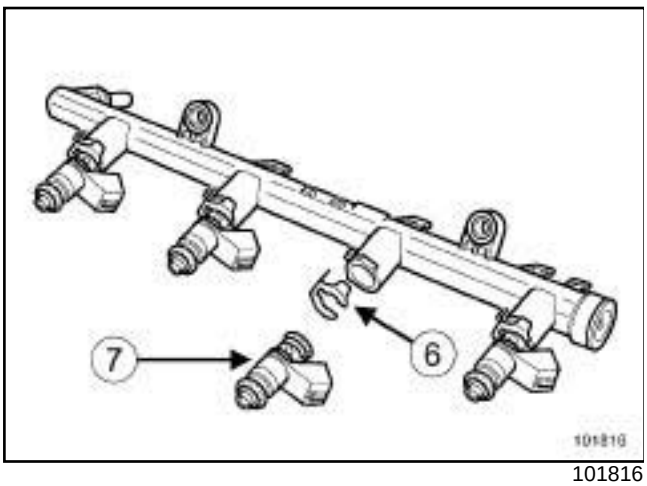
101802

❏ Disconnect the fuel supply pipe union (**3**) on the injector rail.

❏ Fit blanking plugs.

K4M

II - REMOVAL OPERATION



101810

❏ Disconnect the injector connectors (**4**) .

❏ Remove:

- the injector rail bolts (**5**) ,
- the « injector rail-injector» assembly by pulling it carefully towards the front of the vehicle.

101816

❏ Remove:

- the retaining clips (**6**) from the injectors,
- the injectors (**7**) .

❏ Insert the blanking plugs.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: injector clip on injector rail**.

❏ **parts always to be replaced: injector seal**.

❏ Refit:

- new seals on each injector,
- the injectors on the injector rail,
- a new clip on each injector.

II - REFITTING OPERATION

❏ Remove the blanking plugs.

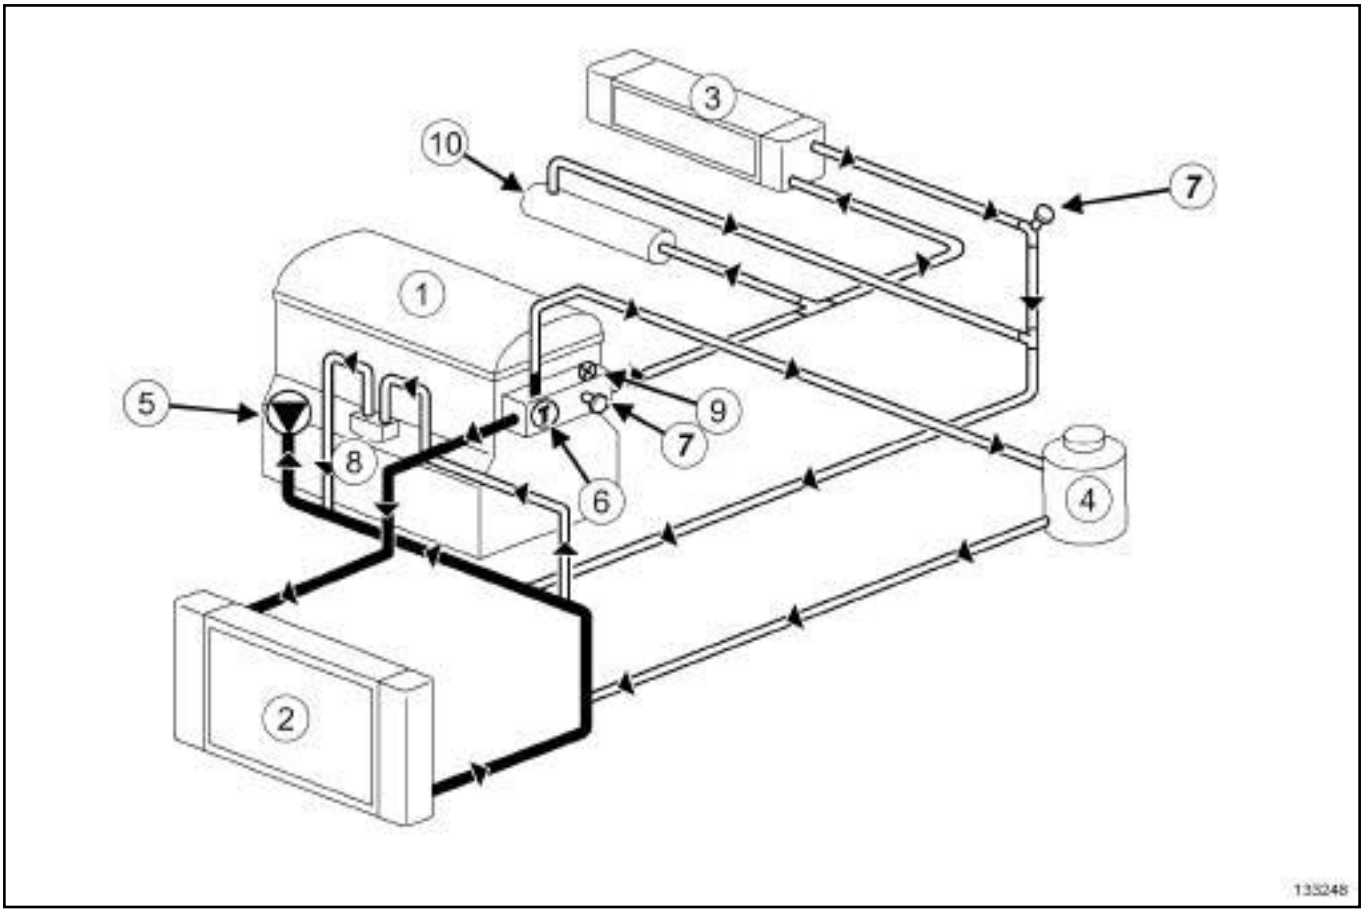
❏ Fit the « injector rail-injector » assembly.

❏ Torque tighten the **injector rail bolts (9 N.m)**.

III - FINAL OPERATION

❏ Connect:

- the injector connectors,
- the fuel supply union onto the injector rail,



❏ Refit the injector rail protector.

❏ Torque tighten the two **injector rail protector nuts (21 N.m)**.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Engine cooling system: Operating diagram

K9K, and 796

133248

(**1**)	Engine
(**2**)	Cooling radiator
(**3**)	Heater radiator
(**4**)	Expansion bottle
(**5**)	Water pump
(**6**)	Thermostat
(**7**)	Bleed screw
(**8**)	Oil-water heat exchanger
(**9**)	Temperature switch
(**10**)	EGR

Vehicles in the current range have cooling systems with the following basic specifications:

- hermetically-sealed pressurised circuit (expansion chamber valve),
- circuit using a type "D" coolant,
- passenger compartment heating system via a "heater matrix" type radiator under the dashboard.

I - GRADE AND QUANTITY OF COOLANT

Engine	Quantity (litres)	Grade
K4M	Approximately 5.45 (version with AC) Approximately 4.5 (version without AC)	**GLACEOL RX (TYPE D)** Use coolant only.
K9K		

Special notes:

- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for very cold countries

II - THERMOSTAT

Engine	Start of opening (°C)	End of opening (°C)
K4M	89	99 ± 2
K9K		

IMPORTANT

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

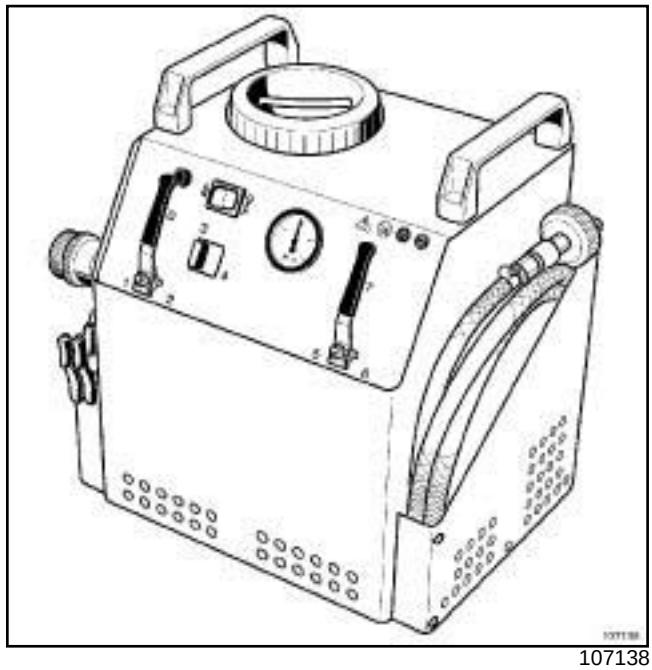
Note:

There are two procedures for checking the cooling system:

- the procedure using the
- the procedure using the

Expansion bottle cap valve rating:

Expansion bottle cap with ...	Valve rating
... a brown circle	**1.2 bar**
... a yellow marking	**1.4 bar**
... a white marking	**1.6 bar**
... a grey marking	**1.8 bar**



I - CHECKING THE COOLING SYSTEM USING THE TOOL (MOT. 1700)

❑

WARNING

If the coolant is leaking from the expansion bottle cap, replace the valve.

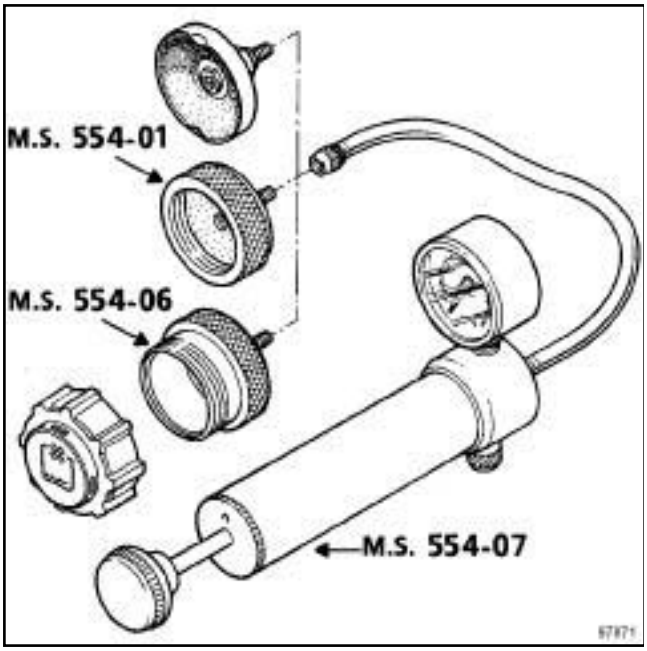
1 - Checking the expansion bottle cap valve

107138

❑ Use the cooling system filling and diagnostic tool. Consult the user's manual for this tool (see **Cooling system filling and diagnostic tool: Use**) (Technical Note 3857A, 19A, Cooling).

2 - Checking the sealing of the cooling circuit

❑ Use the cooling system filling and diagnostic tool. Consult the user's manual for this tool (see **Cooling system filling and diagnostic tool: Use**) (Technical Note 3857A, 19A, Cooling).



II - CHECKING THE COOLING SYSTEM USING THE TOOL (MS. 554-07)

❑

WARNING

If the coolant is leaking from the expansion bottle cap, replace the valve.

1 - Checking the expansion bottle cap valve

97871

❏ Fit onto the tester, the adapter **(Ms. 554-06)**.

❏ Fit the expansion bottle cap to the adapter **(Ms. 554-06)**.

> Note:
>
> The pressure should not drop; if it does, look for the leak.

❏ Pump with the, the pressure should stabilise at the expansion bottle cap valve rating with a test tolerance of ± **0.1 bar.**

2 - Checking the sealing of the cooling circuit

❏ Replace the expansion bottle cap with the adapter **(Ms. 554-01)**.

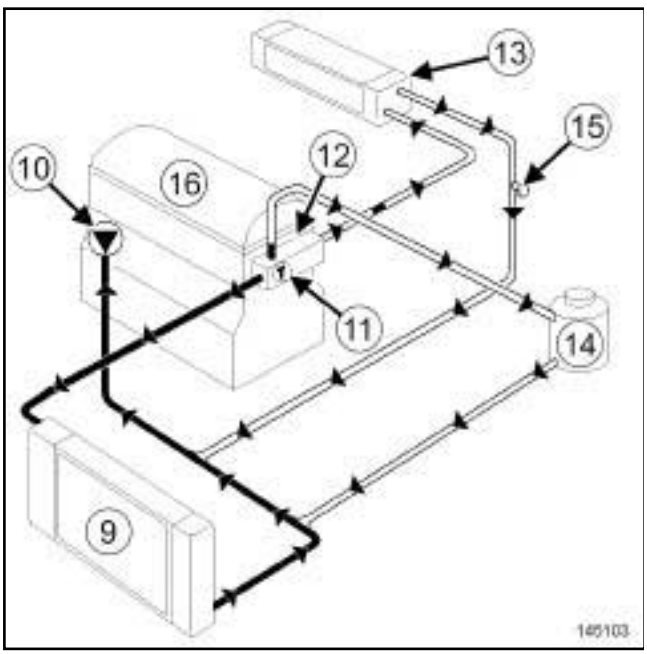
❏ Connect on the adapter **(Ms. 554-01)** the tool.

❏ Pump with theto put the cooling circuit under pressure.

❏ Stop pumping at **0.1 bar** below the valve rating for the expansion bottle cap valve.

> Note:
>
> The pressure should not drop; if it does, look for the leak.

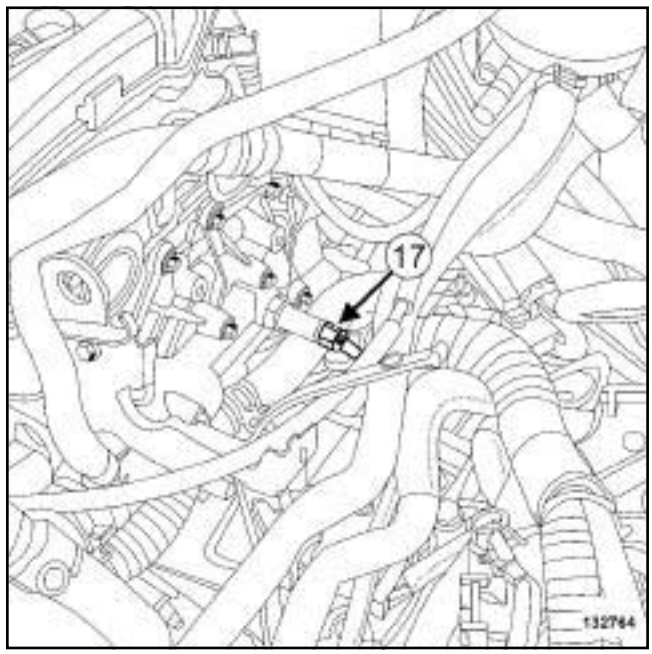
❏ Gradually unscrew the union of theto decompress the cooling system then remove the adapter **(Ms. 554-01)** and refit the expansion bottle cap.



K4M

I - LIST OF COMPONENTS

The engine cooling system is composed of:



- an engine cooling fan assembly (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-27**) ,
- a cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-9**) ,
- a coolant pump (see **19A**, **Cooling**, **Coolant pump: Removal - Refitting**, page **19A-13**) ,
- a thermostat (see **19A**, **Cooling**, **Thermostat: Removal - Refitting**, page **19A-19**) ,
- a water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-22**) ,
- a coolant pump inlet pipe (see **19A**, **Cooling**, **Coolant pump inlet pipe: Removal - Refitting**, page **19A-34**) ,
- an expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-38**) ,
- a coolant temperature sensor (see **19A**, **Cooling**, **Coolant temperature sensor: Removal - Refitting**, page **19A-40**) .

II - LOCATION OF COMPONENTS

145103

(**9**) Cooling radiator
(**10**) Water pump
(**11**) Thermostat
(**12**) Water chamber
(**13**) Heater radiator
(**14**) Expansion bottle
(**15**) Bleed screw
(**16**) Engine

132764

(**17**) Coolant temperature sensor

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

Equipment required
coolant recovery tray
compressed air nozzle

IMPORTANT

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

I - DRAINING

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the expansion bottle cap,
- the engine undertray.

❏ Remove the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection).

❏ Position the **coolant recovery tray** under the vehicle.

❏ Remove the cooling radiator bottom hose clip using theoror **(Mot. 1448)**.

❏ Open the cooling system by removing the cooling radiator bottom hose using the tool **(Car. 1363)**.

❏ Use a **compressed air nozzle** to blow air into the system through the expansion bottle opening to remove as much coolant as possible.

II - CLEANING

❏ Fill the cooling system with water through the expansion bottle.

❏ Let the water run until the water collected from the cooling radiator bottom hose becomes clear.

❏ Use a **compressed air nozzle** to blow air into the system through the expansion bottle opening to remove as much coolant as possible.

❏ Refit the cooling radiator bottom hose.

III - FILLING

❏

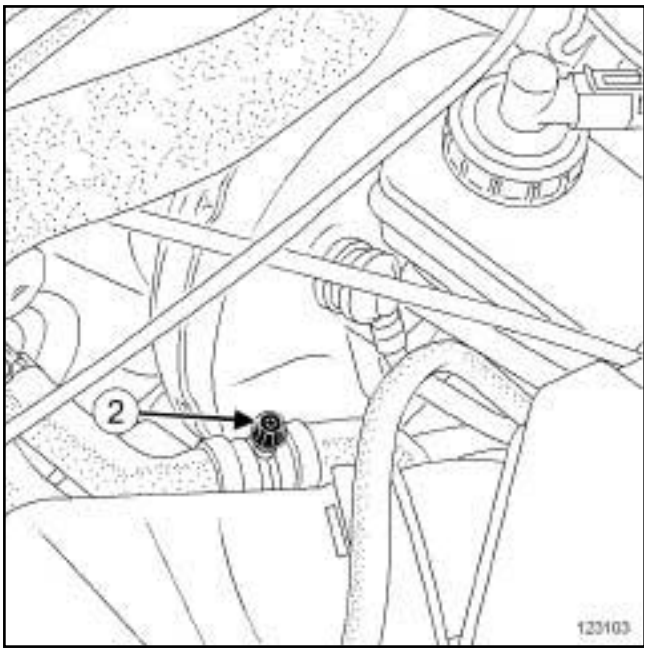
Note:

There are two procedures for filling the cooling system:

- the method using the tool, is recommended by Renault. It saves a considerable amount of time because it does not require the cooling system bleed screws to be opened,
- the procedure without a special tool.

1 - Filling procedure with the tool (Mot. 1700)

❏ Fill the cooling system with engine coolant recommended by the manufacturer (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) using the tool. Consult the user's manual for this tool (see) (Technical Note 3857A, 19A, Cooling).

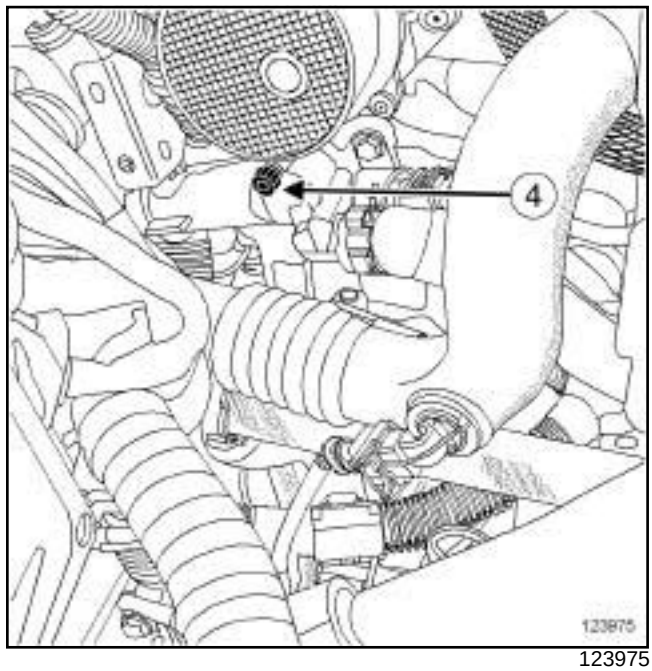


2 - Filling method without special tools

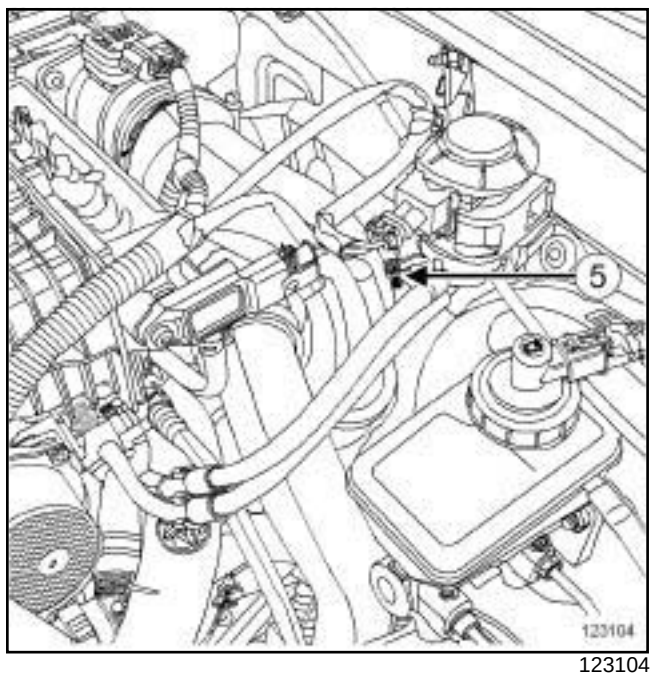
❏

WARNING

It is essential to open all of the bleed screws to remove as much as air as possible in the cooling system. Failure to perform this procedure may prevent the cooling system from filling properly and may damage the engine.



K4M



123103

❑ Open the bleed screw (**2**) .

K9K

123975

123104

❑ Open the bleed screws (**4**) and (**5**) .

❑ Fill the cooling system with engine coolant recommended by the manufacturer (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) via the expansion bottle until it overflows.

❑ Close all the bleed screws as soon as the coolant starts to flow in a continuous stream.

❏ Pressurise the system using the toolto check that there are no leaks (see **19A**, **Cooling**, **Engine cooling system: Check**, page **19A-3**) .

❏ Refit the expansion bottle cap.

❏ Clean any surfaces soiled by the coolant.

IV - BLEEDING

❏

WARNING
Do not open the bleed screw whilst the engine is running; this would damage the engine.

Start the engine.

K4M

❏ Maintain the engine speed at **2,500 rpm** until the engine cooling fan starts for the third time (time required for automatic degassing).

K9K

❏ Maintain the engine speed at **1500 rpm** varying the engine speed rapidly (until the maximum engine speed is reached) 2 to 3 times approximately every **2 minutes** until the engine cooling fan starts for the second time.

❏ Check that the heating is operating correctly.

❏ Let the engine cool until it reaches a coolant temperature below **50°C**.

❏ Make sure the coolant fluid level is at the « Maximum » mark.

❏ Refit the expansion bottle cap.

V - FINAL OPERATION

❏ Remove the **coolant recovery tray**.

❏ Refit the engine undertray.

❏ Refit the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection).

K4M

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

IMPORTANT
When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

WARNING
When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

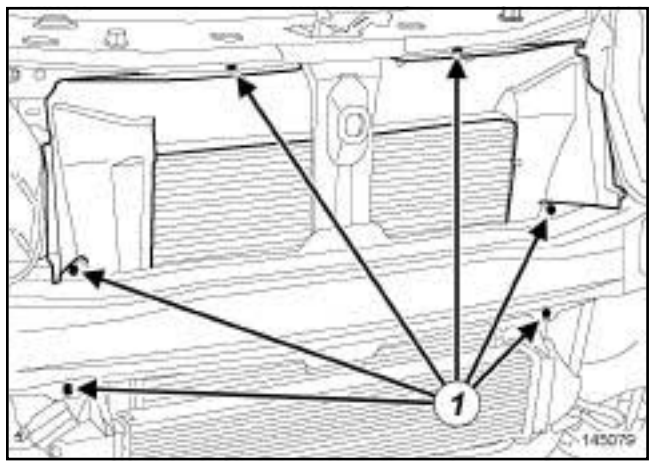
- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for "extreme cold" countries.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



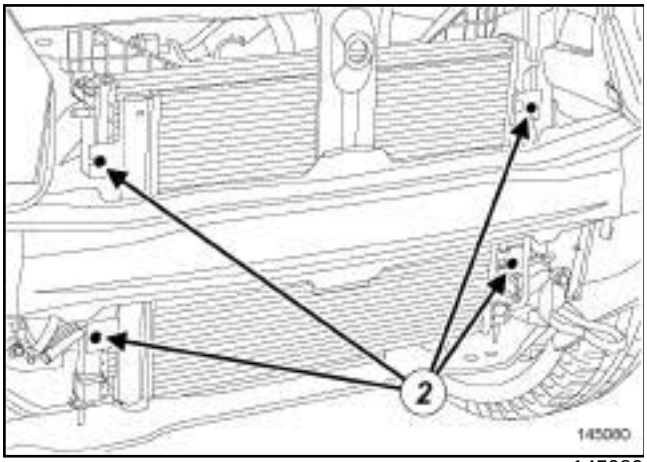
❑ Remove:

- the engine undertray,
- the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection),
- the injector rail protector (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-25**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the fan assembly (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-27**) .

❑ Drain the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

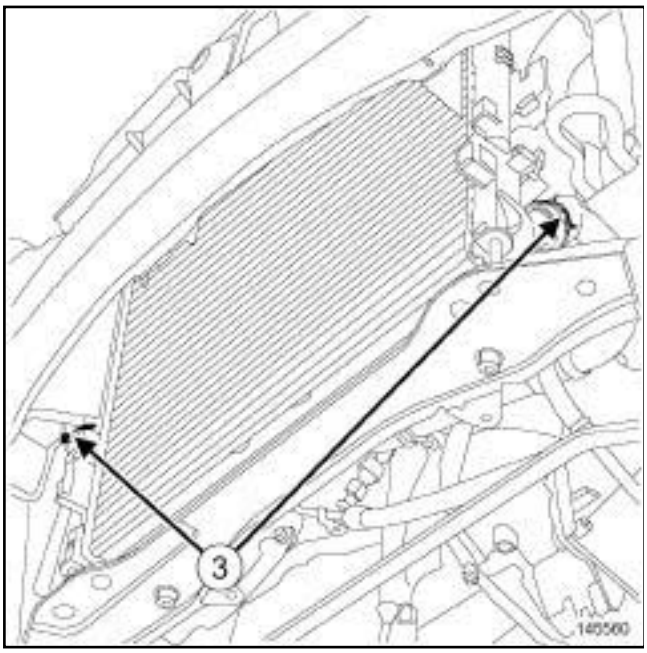
II - REMOVAL OPERATION

AIR CONDITIONING



145079

❑ Remove:



- the air deflector mounting pins (**1**) ,
- the air deflector.

❑ Attach the condenser to the front impact cross member using a safety strap.

145080

❏ Remove the condenser bolts (**2**) .

145560

❏ Remove the cooling radiator hose clips (**3**) using the tool **(Mot. 1448)**.

❏ Disconnect the cooling radiator hoses using the **(Car. 1363)**.

❏ Remove the engine cooling radiator from above the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the cooling radiator hose clips.

II - REFITTING OPERATION

❏ Proceed in the reverse order to removal.

❏ Refill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Car. 1363	Set of trim removal levers.

IMPORTANT
When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

WARNING
When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

The criteria to be met are:

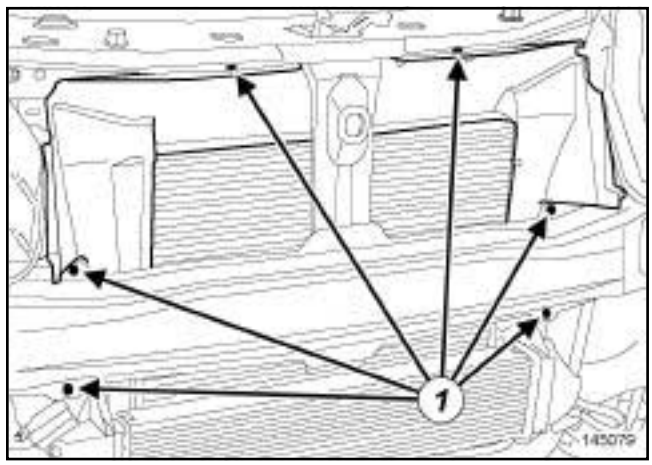
- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for "extreme cold" countries.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



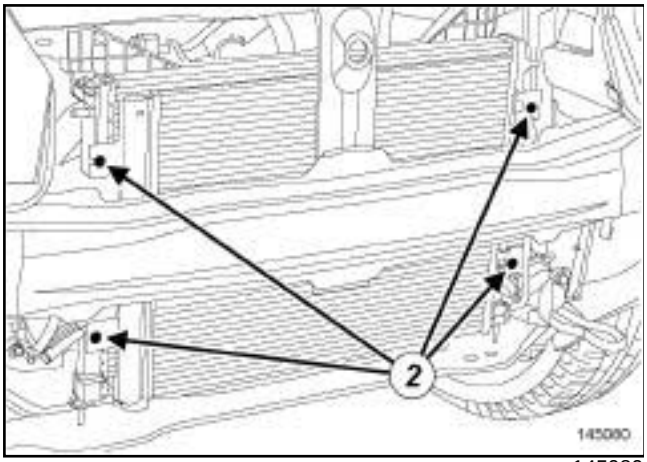
❑ Remove:

- the engine undertray,
- the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection),
- the engine cover,
- the air intake sleeve,
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-8**) ,
- the fan assembly (see **19A**, **Cooling**, **Engine cooling fan assembly: Removal - Refitting**, page **19A-27**) .

❑ Drain the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

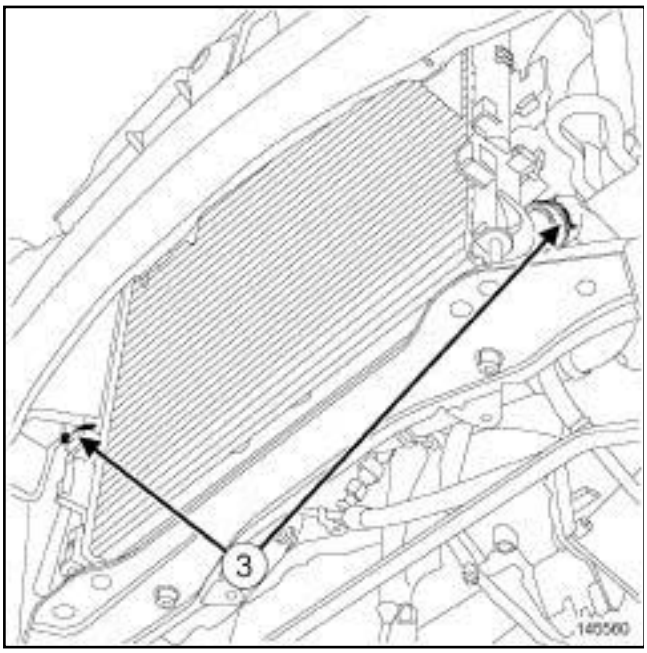
II - REMOVAL OPERATION

AIR CONDITIONING



145079

❑ Remove:



- the air deflector mounting pins (**1**) ,
- the air deflector.

❑ Attach the condenser to the front impact cross member using a safety strap.

145080

❏ Remove the condenser bolts (**2**) .

145560

❏ Remove the cooling radiator hose clips (**3**) using the tool **(Mot. 1448)**.

❏ Disconnect the cooling radiator hoses using the **(Car. 1363)**.

❏ Remove the engine cooling radiator from above the vehicle.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the cooling radiator hose clips.

II - REFITTING OPERATION

❏ Proceed in the reverse order to removal.

❏ Refill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K, and 796

Tightening torques ▽	
bolts of the coolant pump	**10 N.m**
inner timing cover bolts	**9 N.m**
alternator bolts	**21 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Wear heat protective gloves during the operation.

IMPORTANT
The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

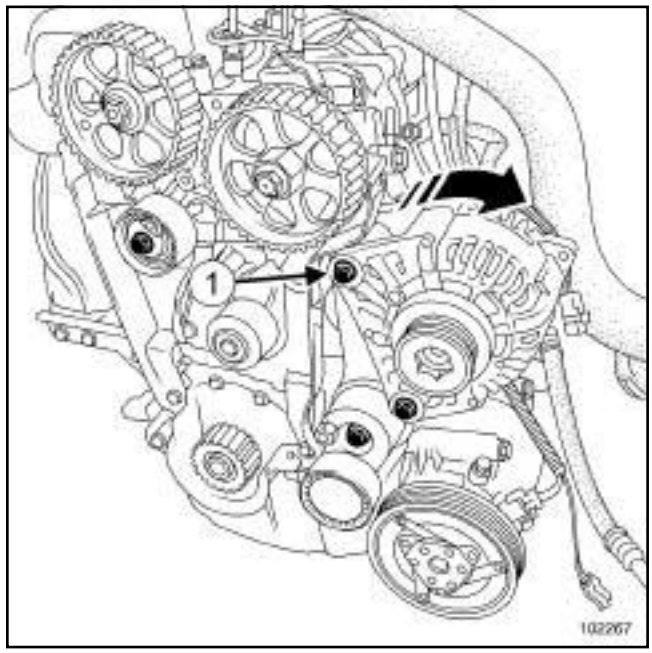
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:



- the engine cover,
- the engine undertray bolts,
- the engine undertray.

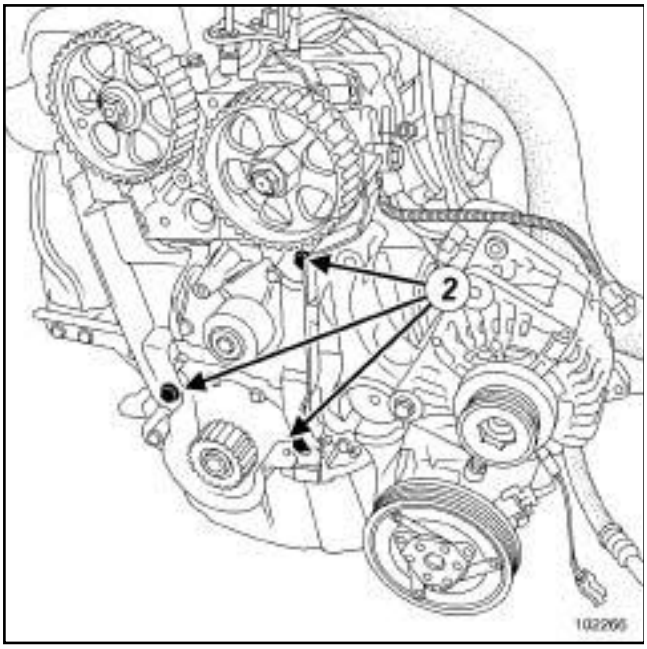
❏ Remove the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Remove:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .

102267



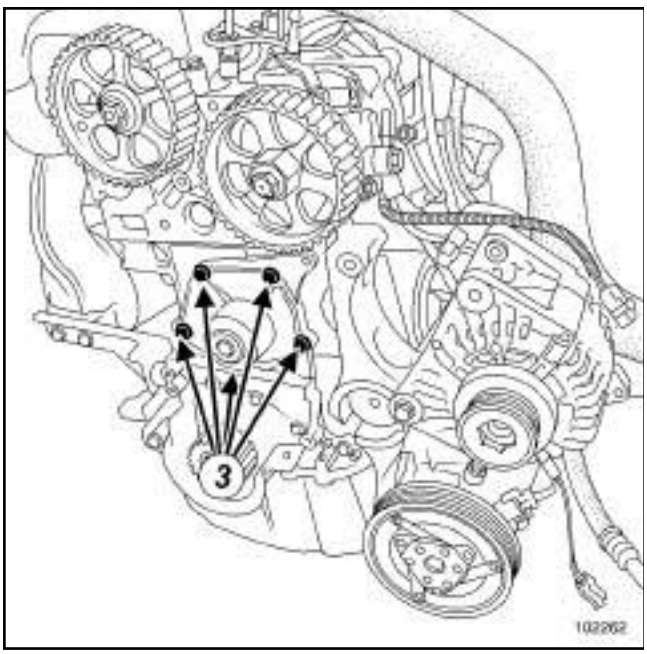
❏ Disconnect the electrical connections from the alternator.

❏ Remove the alternator upper bolt (**1**) .

❏ Loosen the alternator lower bolt.

❏ Tilt the alternator forward.

K9K, and 796



102266

❑ Remove:

- the inner timing cover bolts (**2**) ,
- the inner timing cover.

II - REMOVAL OPERATION

102262

❑ Remove:

- the coolant pump bolts (**3**) ,
- the coolant pump,
- the coolant pump seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: coolant pump seal**.

❑ Use **SURFACE CLEANER** (see) (04B, Consumables - Products) to clean and degrease:

- the coolant pump sealing face if it is to be reused,
- the cylinder block gasket face.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

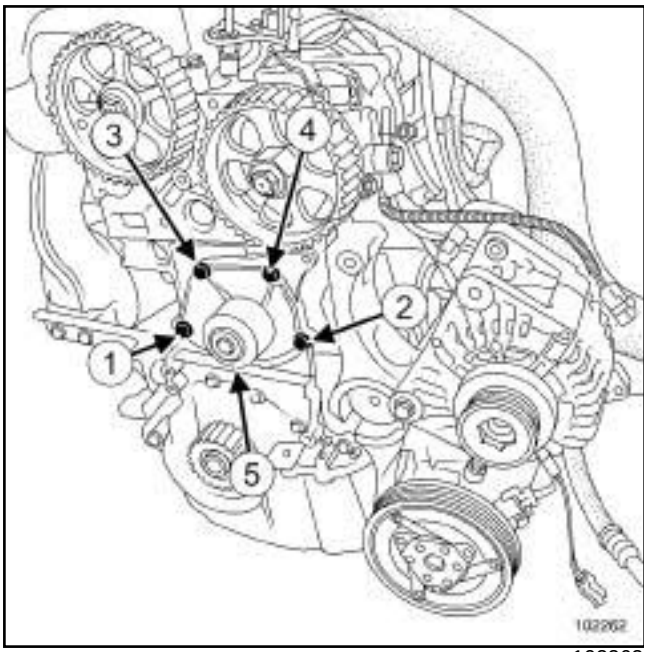
WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Apply **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the areas to be cleaned.

❑ Leave for approximately ten minutes.

❑ Remove the residue using a wooden spatula.

❑ Complete the cleaning of the parts using an abrasive pad.



WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the joint faces.

❑ Always replace the coolant pump seal.

K9K, and 796

II - REFITTING OPERATION

102262

❑ Refit:

- the coolant pump fitted with a new seal,
- the coolant pump bolts.

❑ Torque tighten in order **(1) (2) (3) (4) (5)** the **bolts of the coolant pump (10 N.m)**.

❑ Apply one or two drops of FRENETANCHE (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the coolant pump bolts.

III - FINAL OPERATION

❑ Refit the inner timing cover.

❑ Tighten to torque the **inner timing cover bolts (9 N.m)**.

❑ Refit the alternator.

❑ Torque tighten the **alternator bolts (21 N.m)**.

❑ Connect the alternator electrical connections.

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) .

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❑ Refit:

- the engine undertray,
- the engine undertray bolts,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

Coolant pump: Removal - Refitting

K4M

Tightening torques ▽	
coolant pump M8 bolt	**27 N.m**
coolant pump M6 bolts	**10 N.m**

IMPORTANT

When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

WARNING

Prepare for the flow of fluid, and protect the surrounding components.

WARNING

When carrying out a repair that requires a complete change, it is essential to flush the circuit with clean water, blast compressed air through the circuit to drive out the water, fill and bleed the circuit and then measure the effective protection.

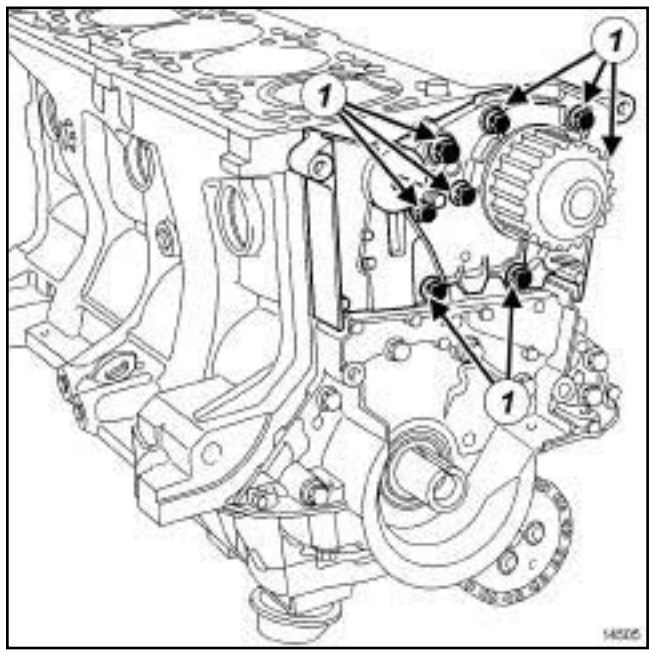
The criteria to be met are:

- protection down to **-25°C ± 2** for cold and temperate countries,
- protection down to **-40°C ± 2** for "extreme cold" countries.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) .

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

II - REMOVAL OPERATION

14505

❑ Remove:

- the coolant pump bolts (**1**) ,
- the coolant pump.

K4M

REFITTING

I - REFITTING PREPARATION OPERATION

❑

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

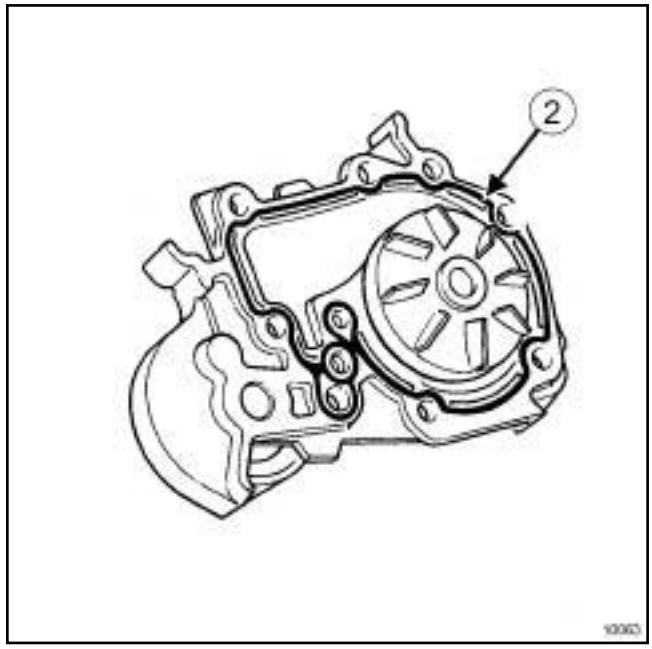
IMPORTANT
Wear goggles with side protectors for this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Use **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the coolant pump sealing face if it is to be reused,
- the cylinder block gasket face.

❑ Apply the product to the surfaces to be cleaned.



❑ Leave for approximately ten minutes.

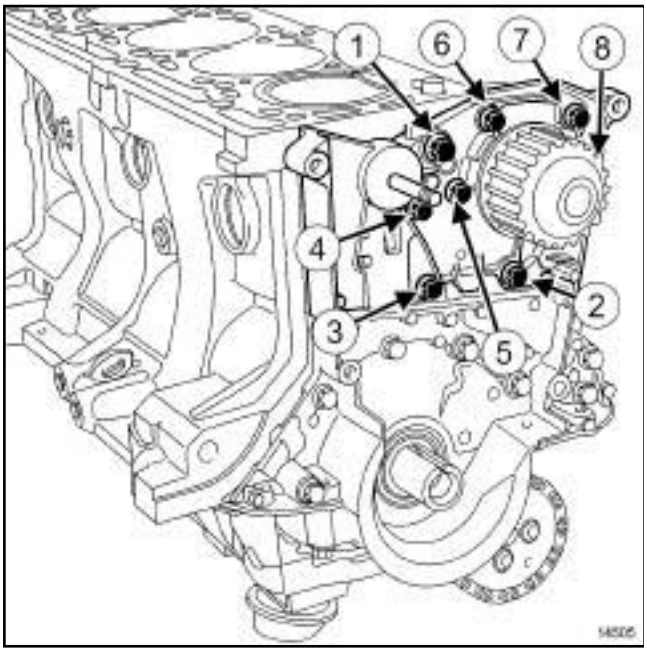
❑ Remove the residue using a wooden spatula.

❑ Complete the cleaning of the parts using an abrasive pad.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the joint faces.

10063



❑

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Apply at (**2**) a bead of **RESIN ADHESIVE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) **0.6** to **1 mm** wide.

K4M

II - REFITTING OPERATION

14505

- ❏ Apply one to two drops of **FRENETANCHE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the coolant pump bolts (**1**) and (**4**) .
- ❏ Refit the coolant pump.
- ❏ Fit the coolant pump bolts in order until contact is made.
- ❏ Torque tighten in order:
  - the **coolant pump M8 bolt (27 N.m)** (**1**) .
  - the **coolant pump M6 bolts (10 N.m)** (**2**) to (**8**) .

III - FINAL OPERATION

- ❏ Refit:
  - the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-17**) ,
  - the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-2**) ,
  - the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).
- ❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .
- ❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

K9K

❑ The thermostat is integral with the coolant outlet unit. The coolant outlet unit must be replaced to replace it (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-22**) .

K4M

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

IMPORTANT

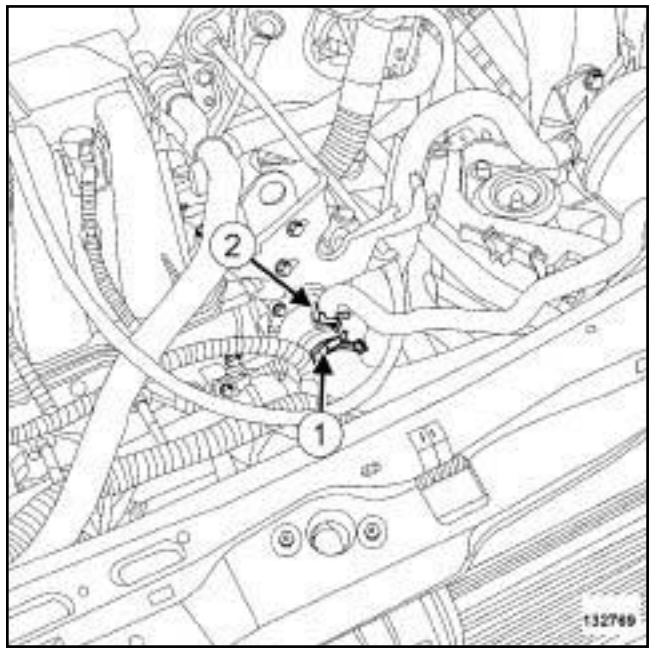
When working in the engine compartment, take care as the radiator fan(s) may start up unexpectedly (risk of being cut).

To avoid any risk of serious burns when the engine is hot:

- do not open the expansion bottle cap,
- do not drain the cooling system,
- do not open the bleed screw(s).

REMOVAL

I - REMOVAL PREPARATION OPERATION



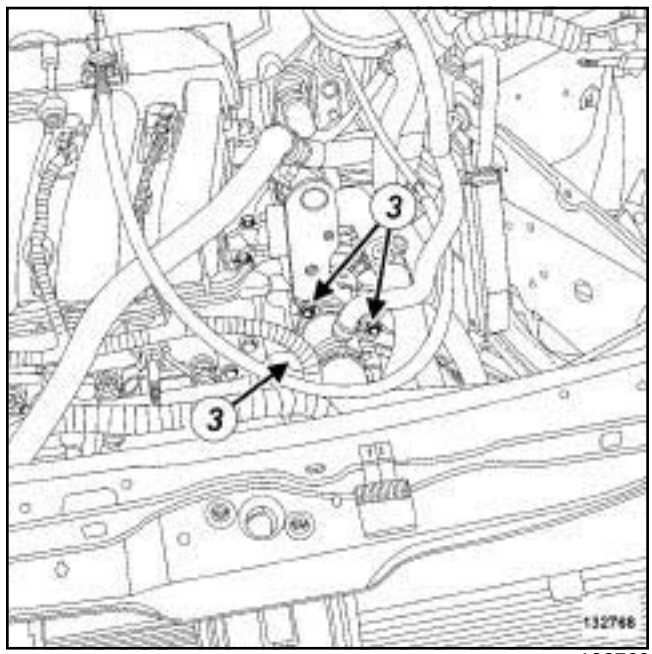
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) ,
- the engine undertray bolts,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED



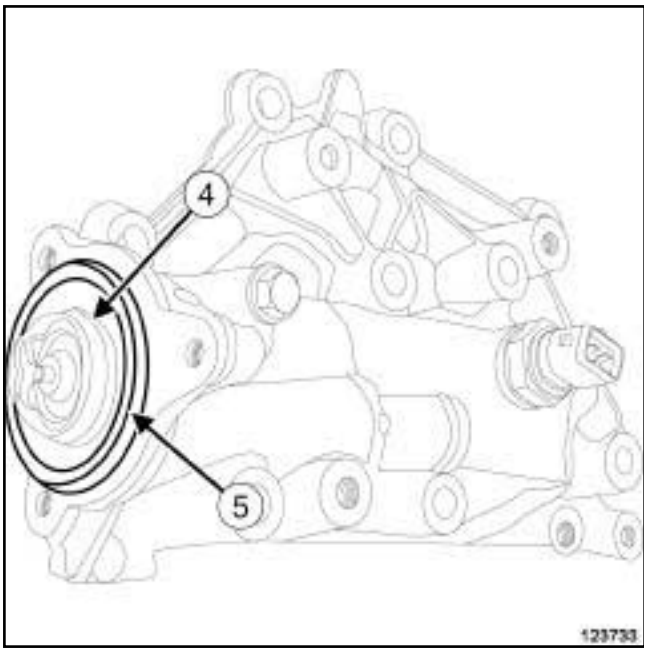
132769

❏ Using the **(Mot. 1448)** ororremove:

- the cooling radiator top hose clip (**1**) ,
- the clip (**2**) from the expansion bottle hose.

❏ Disconnect from the thermostat cover:

- the cooling radiator top hose,
- the expansion bottle hose.



132768

❏ Remove:

- the thermostat cover bolts (**3**) ,

- the thermostat cover.

123733

❑ Remove:

- the thermostat (**4**) ,
- the thermostat seal (**5**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease the thermostat housing.

❑ The thermostat seal must be replaced.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new seal on the thermostat,
- the thermostat,
- the thermostat cover.

❑ Connect the following to the thermostat cover:

- the expansion bottle hose,
- the cooling radiator top hose.

❑ Using the **(Mot. 1448)** orорfit:

- the expansion bottle hose clip,
- the cooling radiator top hose clip.

III - FINAL OPERATION

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❑ Refit:

- the engine undertray,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

K9K, and 796

Tightening torques ▽	
water chamber bolts	**11 N.m**
expansion bottle nuts	**8 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

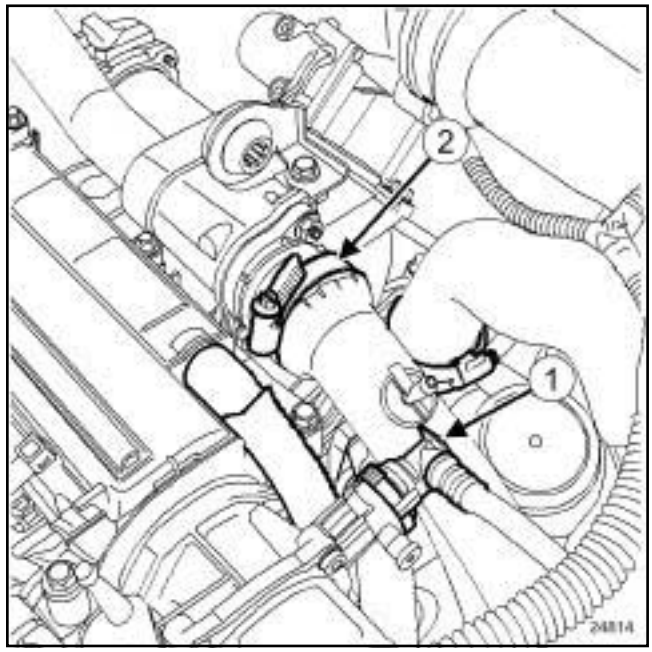
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine cover,
- the engine undertray bolts,
- the engine undertray.

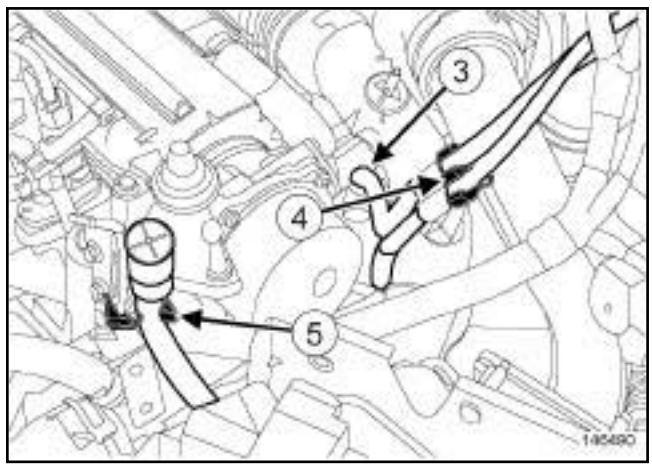


❏ Remove the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Remove:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the expansion bottle nuts.



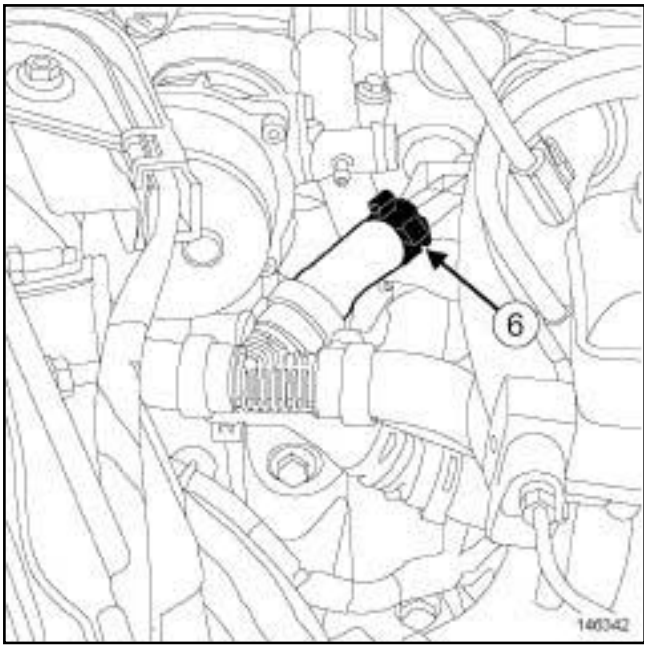
❏ Move aside the expansion bottle.

24814

❏ Disconnect:

- the union (**1**) on the vacuum pump,
- the air duct between the intercooler and the EGR assembly at (**2**) .

146490



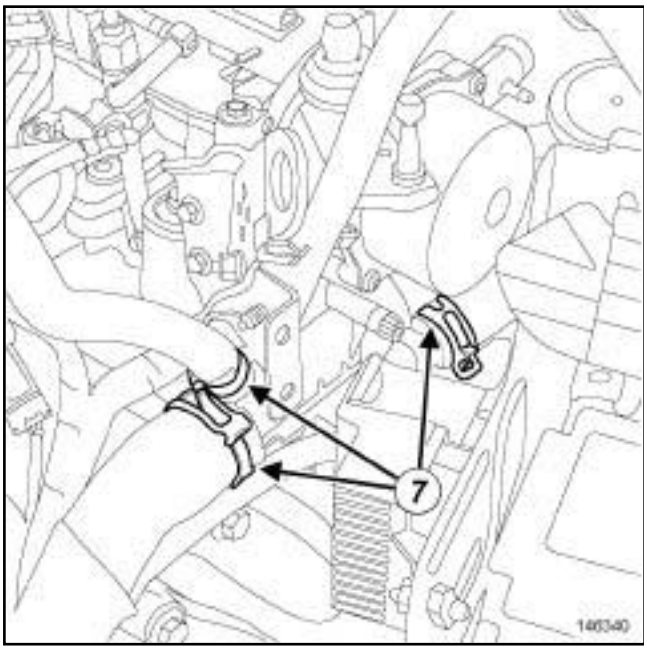
❏ Disconnect the EGR solenoid valve pipe at (**3**) .

❏ Unclip:

- the EGR solenoid valve pipes at (**4**) ,
- the gearbox breather pipe at (**5**) .

❏ Move aside the air duct between the intercooler and the EGR assembly.

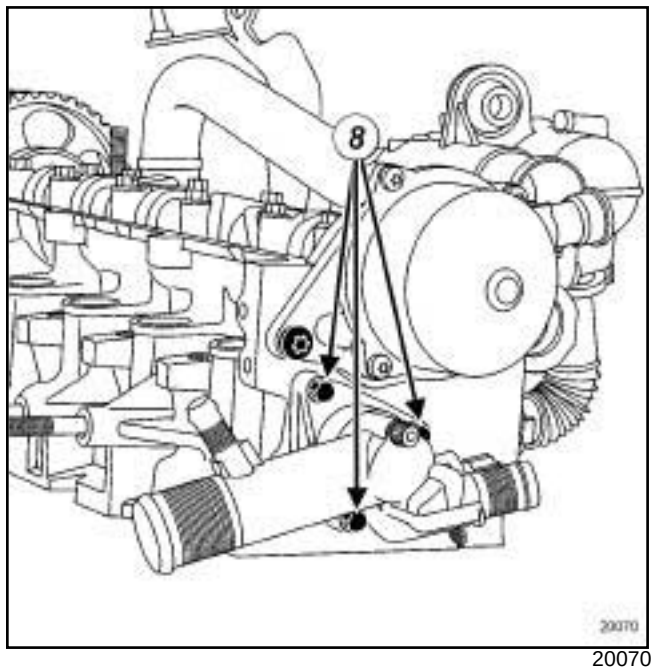
K9K, and 796



146342

❏ Disconnect the EGR assembly outlet pipe at (**6**) .

❏ Move the EGR assembly outlet pipe aside.



❏ Disconnect the coolant temperature sensor connector.

146340

❏ Disconnect the cooling hoses on the water chamber at (**7**) .

II - REMOVAL OPERATION

20070

❏ Remove:

- the water chamber bolts (**8**) ,
- the water chamber,
- the water chamber seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Cylinder head coolant outlet unit seal**.

❏ Use **SURFACE CLEANER** (see) to clean and degrease:

- the cylinder head joint face,
- the water chamber seal housing if it is to be reused.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

K9K, and 796

II - REFITTING OPERATION

❏ Refit:

- a new water chamber seal in the water chamber housing,
- the water chamber.

❏ Torque tighten the **water chamber bolts (11 N.m)**.

❏ Connect:

- the cooling hoses to the water chamber,
- the coolant temperature sensor connector,
- the EGR assembly outlet pipe,

❏ Position the air duct between the intercooler and the EGR assembly.

❏ Connect:

- the air duct on the EGR assembly,
- the union to the vacuum pump.

❏ Connect the EGR solenoid valve pipe to the vacuum pump.

❏ Clip on:

- the breather pipe from the gearbox,
- the EGR solenoid valve pipes.

❏ Position the expansion bottle.

❏ Torque tighten the **expansion bottle nuts (8 N.m)**.

III - FINAL OPERATION

❏ Refit the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❏ Refit:

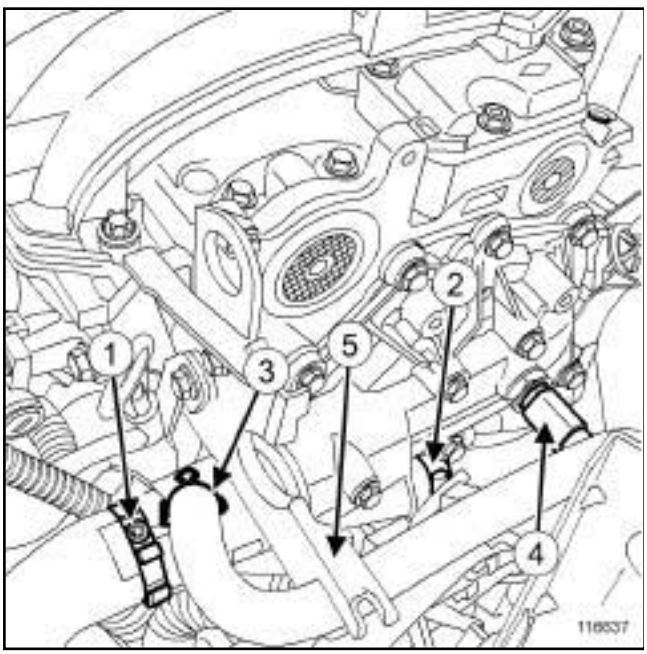
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine undertray,
- the engine cover.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

K4M

Tightening torques ▽	
coolant outlet unit bolts (initial torque)	**4 N.m**
water chamber bolts	**12 N.m**

REMOVAL



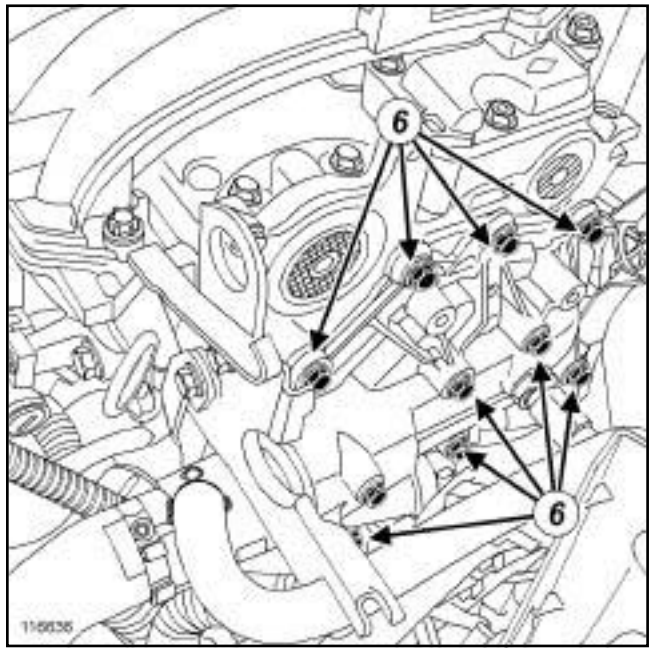
I - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .



116637

❏ Disconnect:

- the radiator top hose (**1**) from the water chamber,
- the passenger compartment heater hose (**2**) ,
- the expansion bottle hose (**3**) ,
- the coolant temperature sensor (**4**) .

❏ Unclip the hoses from their support at (**5**) .

II - REMOVAL OPERATION

116636

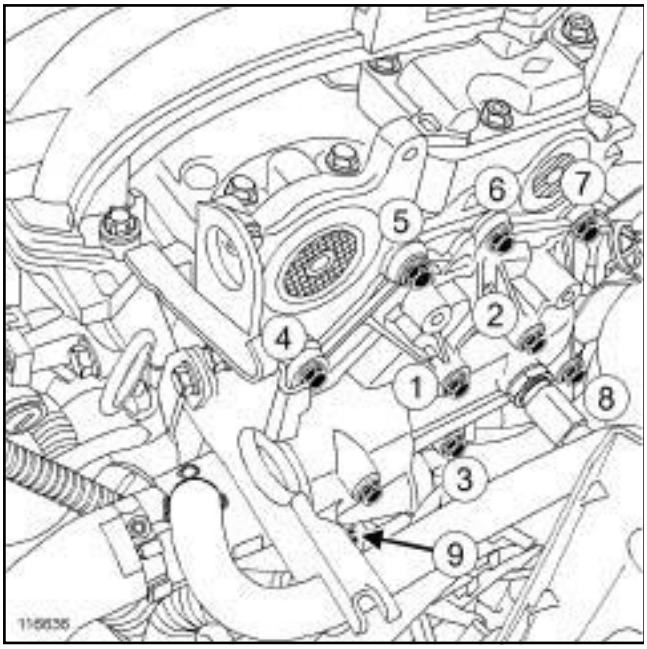
❏ Remove:

- the water chamber bolts (**6**) ,
- the water chamber.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Cylinder head coolant outlet unit seal**



> **WARNING**
> To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the cylinder head joint face,
- the water chamber joint face, if being reused.

II - REFITTING OPERATION

❏ Refit the water chamber.

116636

❏ Screw on the water chamber bolts without tightening them.

❏ Torque tighten in order:

- the **coolant outlet unit bolts (initial torque) (4 N.m)**,
- the **water chamber bolts (12 N.m)**.

III - FINAL OPERATION

❏ Connect:

- the coolant temperature sensor,
- the expansion bottle hose,
- the passenger compartment heater hose,
- the top hose to the water chamber.

❏ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

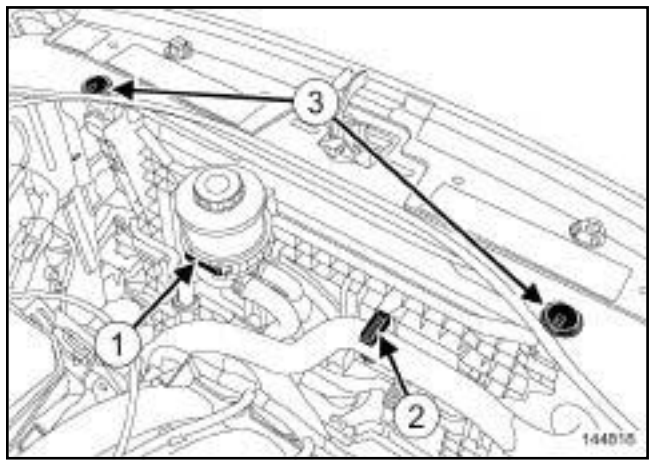
❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

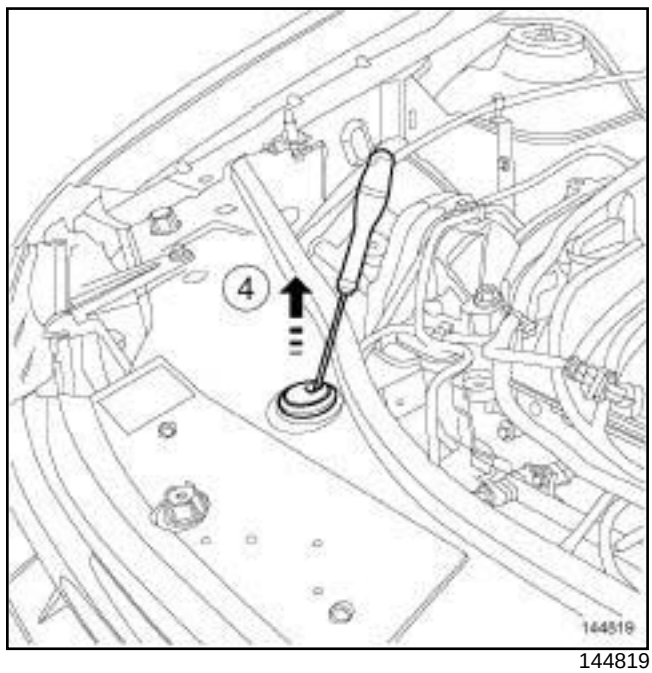
K4M

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❑ Remove:

- the injector rail protector (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-25**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

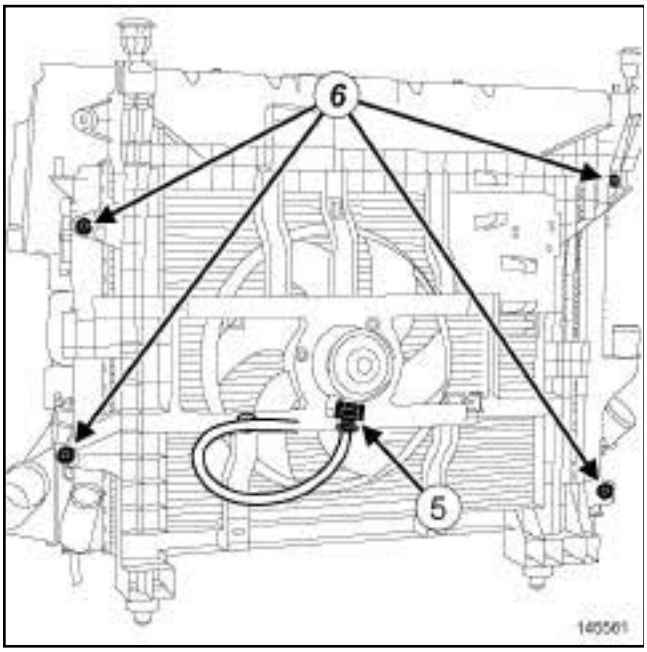
II - REMOVAL OPERATION

144818

144819

❑ Unclip:

- the power-assisted steering hoses on the fan assembly,
- the power-assisted steering fluid reservoir from its support at (**1**) ,
- the engine coolant hose at (**2**) .

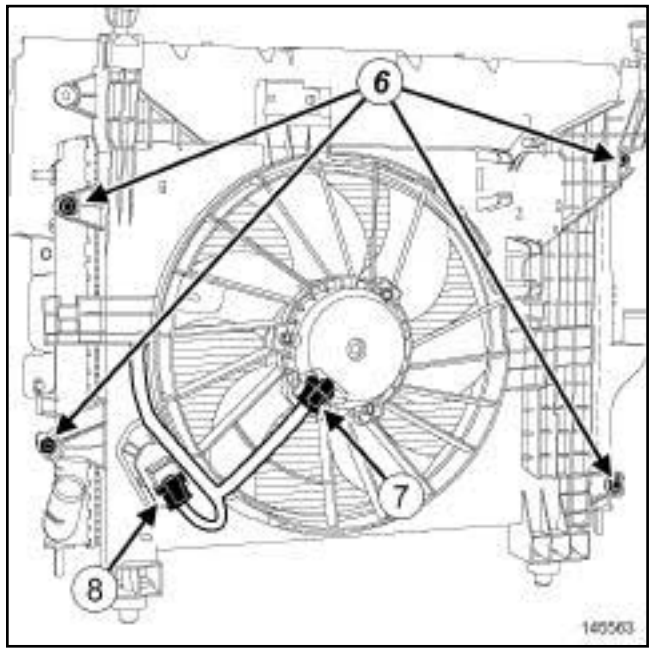


❑ Press on the clips of the centring pins (**3**) on the engine cooling fan assembly using a screwdriver and pull them according to the direction of the arrow (**4**) .

❑ Secure the power-assisted steering fluid reservoir to the engine.

❑ Remove the power assisted steering fluid reservoir bracket.

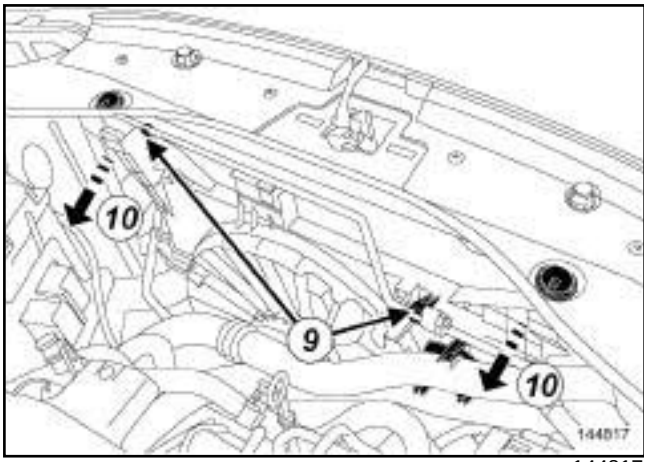
K4M



STANDARD HEATING RECIRCULATION

145561

- ❏ Disconnect the cooling fan assembly connector (**5**) .
- ❏ Unclip the engine cooling fan assembly wiring.
- ❏ Move aside the wiring of the engine cooling fan assembly.
- ❏ Remove the engine cooling radiator bolts (**6**) .



AIR CONDITIONING

145563

- ❏ Disconnect:
  - the engine cooling fan assembly connector (**7**) ,
  - the engine cooling fan assembly resistor connector (**8**) .
- ❏ Unclip the engine cooling fan assembly wiring.
- ❏ Move aside the wiring of the engine cooling fan assembly.
- ❏ Remove the engine cooling radiator bolts (**6**) .

K4M

144817

❑ Unclip the « condenser - expansion valve » connecting pipe at (**9**) .

WARNING
In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

❑ Pull the fan assembly according to the arrows (**10**) passing it under the «condenser - expansion valve » connecting pipe.

❑

Note:
Do not damage the cooling unit vanes (radiator, condenser, etc.) during handling.

❑ Remove the engine cooling fan assembly from above the vehicle.

In the event of replacement

❑ Remove from the fan assembly:

- the power-assisted steering hose clips,
- the wiring clip.

REFITTING

I - REFITTING PREPARATION OPERATION

In the event of replacement

❑ Refit on the fan assembly:

- the power-assisted steering hose clips,
- the wiring clip.

II - REFITTING OPERATION

❑ Proceed in the reverse order to removal.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

III - CHECKING THE OPERATION OF THE FAN UNIT

❑ Start the engine.

❑ Disconnect the coolant temperature sensor connector.

❑ Check the operation of the fan assembly.

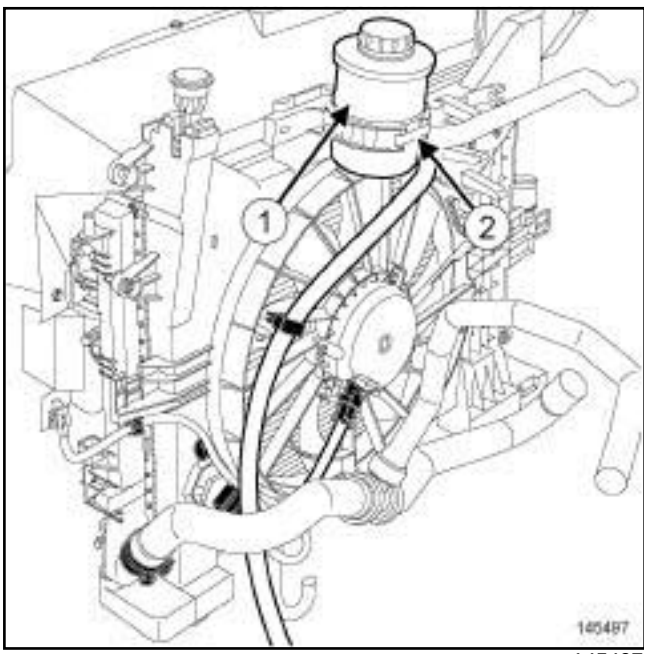
❑ Connect the coolant temperature sensor connector.

❑ Switch off the engine.

K9K

REMOVAL

I - REMOVAL PREPARATION OPERATION



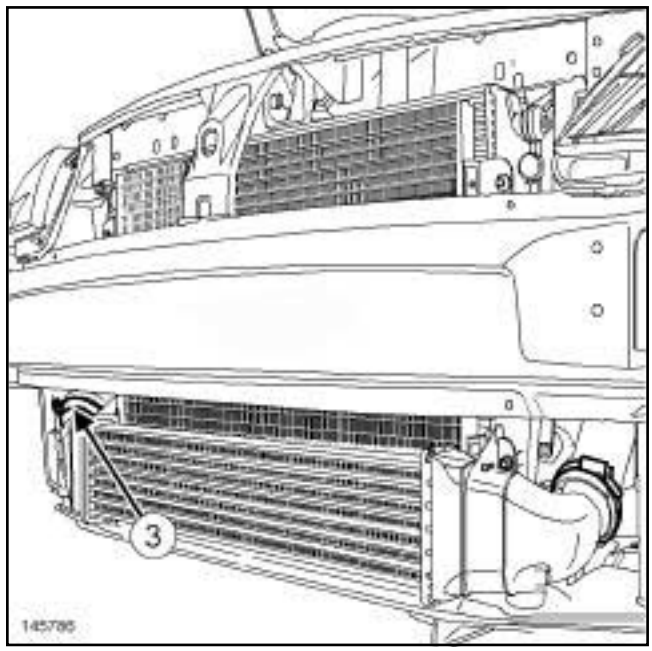
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine cover,
- the air intake sleeve,
- the front bumper (see **Front bumper assembly: Exploded view**) (55A, Exterior protection).

STANDARD HEATING RECIRCULATION



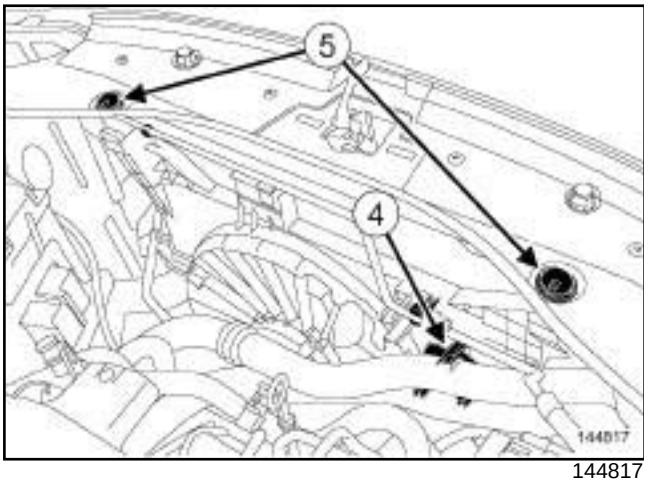
145497

❏ Unclip:

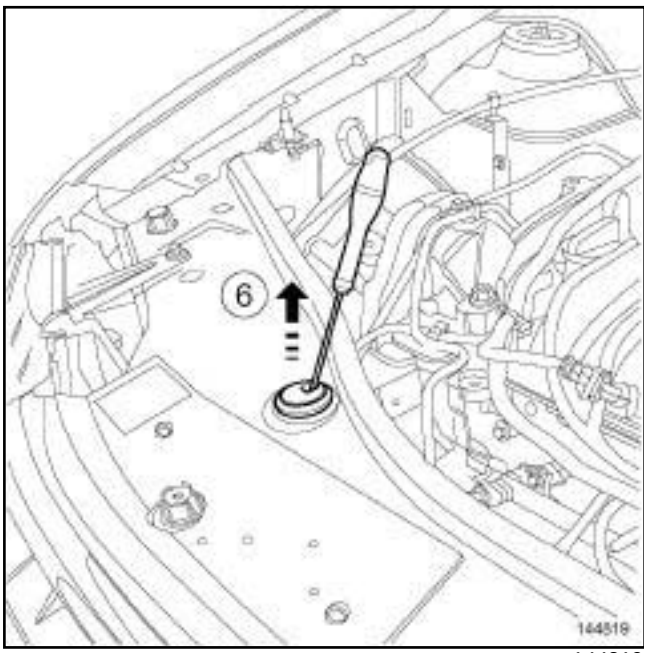
- the power-assisted steering hoses on the fan assembly,
- the power-assisted steering fluid reservoir (**1**) from its support at (**2**) .

❏ Secure the power-assisted steering fluid reservoir to the engine.

❏ Remove the power assisted steering fluid reservoir bracket.



145786

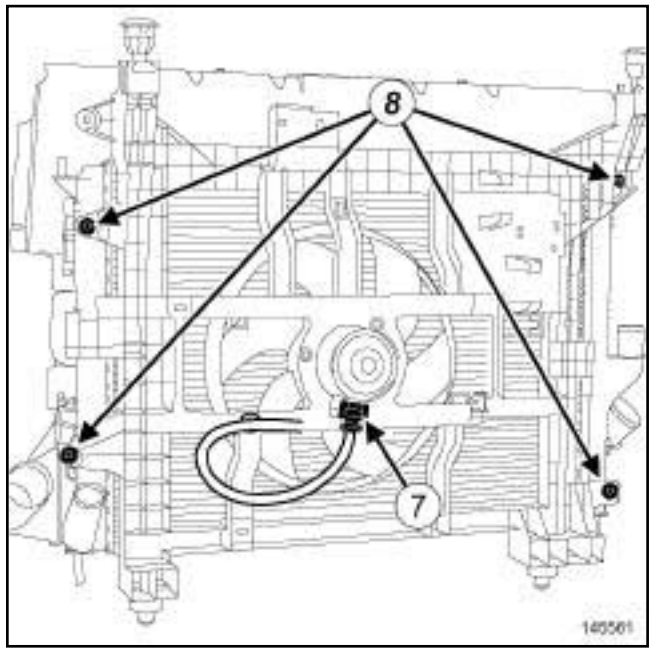


❏ Disconnect the intercooler duct at (**3**) .

K9K

II - REMOVAL OPERATION

144817



144819

❑ Unclip the following from the support (**4**) :

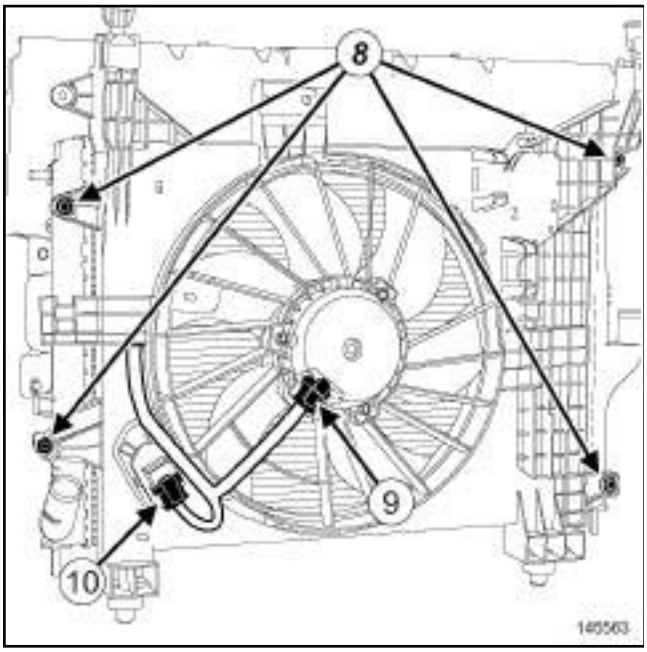
- the intercooler duct on the fan assembly,
- the engine coolant hose.

❑ Press on the clips of the centring pins (**5**) on the engine cooling fan assembly using a screwdriver and pull them according to the direction of the arrow (**6**) .

STANDARD HEATING RECIRCULATION

145561

❑ Disconnect the cooling fan assembly connector (**7**) .



❑ Unclip the engine cooling fan assembly wiring.

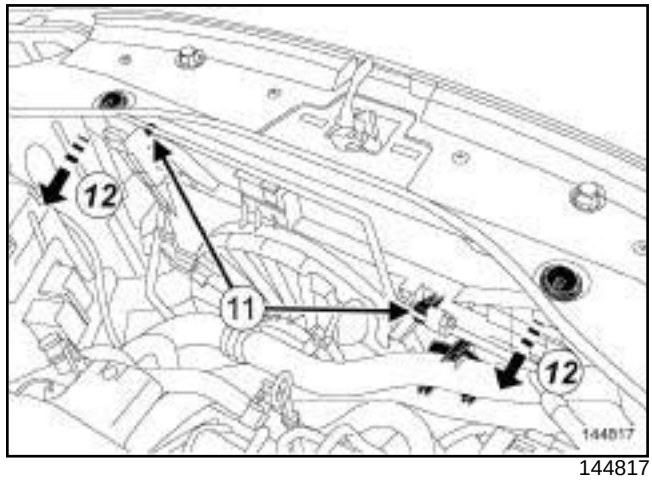
❑ Move aside the wiring of the engine cooling fan assembly.

❑ Remove the engine cooling radiator bolts (**8**) .

K9K

AIR CONDITIONING

145563



❑ Disconnect:

- the engine cooling fan assembly connector (**9**) ,
- the engine cooling fan assembly resistor connector (**10**) .

❑ Unclip the engine cooling fan assembly wiring.

❑ Move aside the wiring of the engine cooling fan assembly.

❑ Remove the engine cooling radiator bolts (**8**) .

144817

❑ Unclip the « condenser - expansion valve » connecting pipe at (**11**) .

WARNING

In order to avoid any refrigerant leaks, do not damage (deform, twist, etc.) the pipe.

❑ Pull the fan assembly according to the arrows (**12**) passing it under the « condenser - expansion valve » connecting pipe.

❑

Note:

Do not damage the cooling unit vanes (radiator, condenser, etc.) during handling.

❑ Remove the engine cooling fan assembly from above the vehicle.

In the event of replacement

❑ Remove from the fan assembly:

- the power-assisted steering hose clips,
- the wiring clip,
- the support of the intercooler duct and coolant hose on the fan assembly.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

In the event of replacement

❏ Refit on the fan assembly:

- the power-assisted steering hose clips,
- the wiring clip,
- the support of the intercooler duct and coolant hose on the fan assembly.

II - REFITTING OPERATION

❏ Proceed in the reverse order to removal.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

III - CHECKING THE OPERATION OF THE FAN UNIT

❏ Start the engine.

❏ Disconnect the coolant temperature sensor connector.

❏ Check the operation of the fan assembly.

❏ Connect the coolant temperature sensor connector.

❏ Switch off the engine.

Coolant pump inlet pipe: Removal - Refitting

K9K, and 796

Tightening torques ▽	
coolant pump inlet pipe bolt	**22 N.m**
accelerometer	**20 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Wear heat protective gloves during the operation.

IMPORTANT
The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

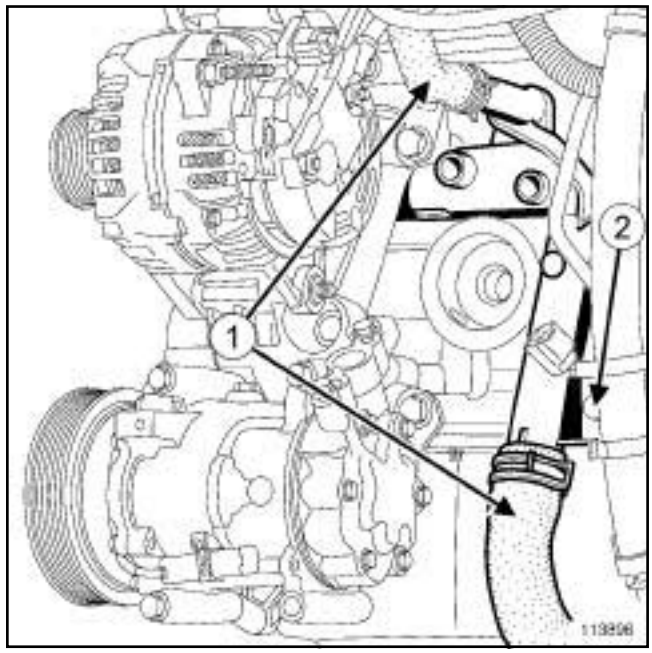
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:



- the engine cover,
- the engine undertray bolts,
- the engine undertray.

❏ Remove the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❏ Drain the engine cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❏ Remove the oil-water heat exchanger (see **10A**, **Engine and cylinder block assembly**, **Oil-coolant heat exchanger: Removal - Refitting**, page **10A-37**) .

II - REMOVAL OPERATION

113896

❏ Disconnect:

- the coolant hoses (**1**) from the coolant pump inlet pipe,
- the accelerometer connector.

❏ Remove the accelerometer using.

❏ Remove:

- the water pump inlet pipe bolt (**2**) ,
- the coolant pump inlet pipe.
- the coolant pump inlet pipe seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: seal between coolant pump inlet pipe and coolant pump**

K9K, and 796

❑ Use **SURFACE CLEANER** (see) (04B, Consumables - Products) to clean and degrease:

- the coolant pump inlet pipe seal housing if it is being reused,
- the seal housing in the cylinder block.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Replace the removed clips.

II - REFITTING OPERATION

❑ Refit the coolant pump inlet pipe to the cylinder block.

❑ Torque tighten the **coolant pump inlet pipe bolt (22 N.m)**.

❑ Refit the accelerometer using the tool.

❑ Tighten to torque the **accelerometer (20 N.m)**.

❑ Connect:

- the accelerometer connector,
- the coolant hoses onto the coolant pump inlet pipe.

III - FINAL OPERATION

❑ Refit the oil-water heat exchanger (see **10A**, **Engine and cylinder block assembly**, **Oil-coolant heat exchanger: Removal - Refitting**, page **10A-37**) .

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❑ Refit:

- the engine undertray,
- the engine undertray bolts,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

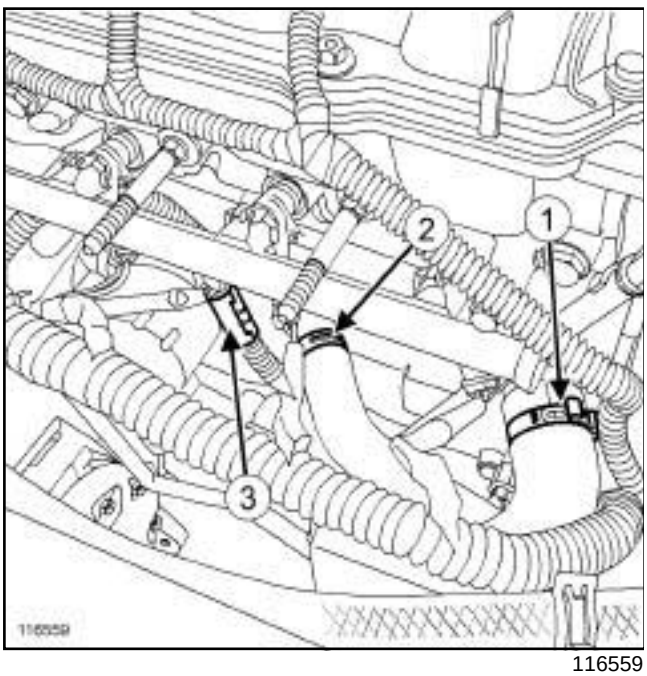
❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

Coolant pump inlet pipe: Removal - Refitting

K4M

Tightening torques ▽	
coolant pump inlet pipe bolt	**22 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

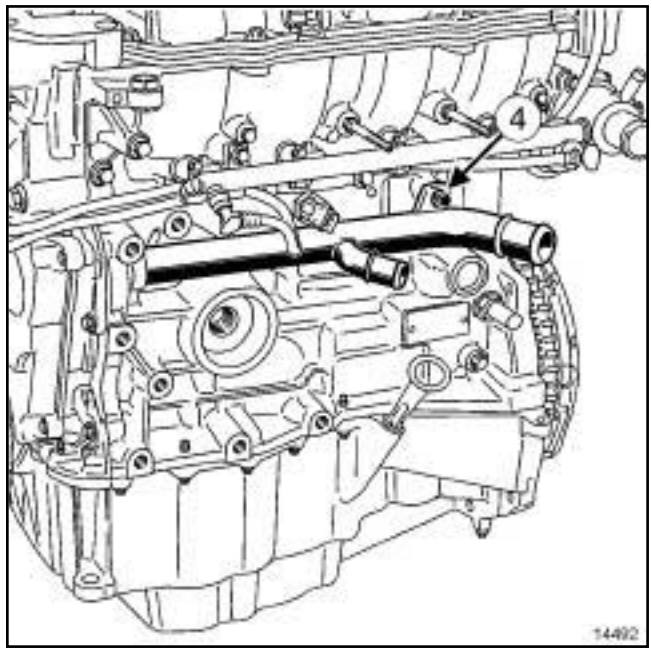
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the injector rail protector.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

116559



❏ Disconnect:

- the cooling radiator bottom hose (**1**) ,
- the heater hose (**2**) .

❏ Unclip the wiring on the coolant pump inlet pipe at (**3**) .

❏ Disconnect the connector from cylinder injector no. 3.

II - OPERATION FOR REMOVAL OF PART CONCERNED

14492

❏ Remove:

- the bolt (**4**) from the coolant pump inlet pipe,
- the coolant pump inlet pipe,
- the coolant pump inlet pipe seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: seal between coolant pump inlet pipe and coolant pump**

❏ Always replace the cooling hose clips.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the coolant pump inlet pipe fitted with a new seal.

❏ Torque tighten the **coolant pump inlet pipe bolt (22 N.m)**.

III - FINAL OPERATION

❏ Connect:

- the connector to cylinder injector no. 3.
- the heater hose on the coolant pump inlet pipe,
- the cooling radiator bottom hose.

❏ Clip the wiring onto the coolant pump inlet pipe.

K4M

- ❑ Refit the injector rail protector.
- ❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❑ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
expansion bottle nuts	**8 N.m**

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

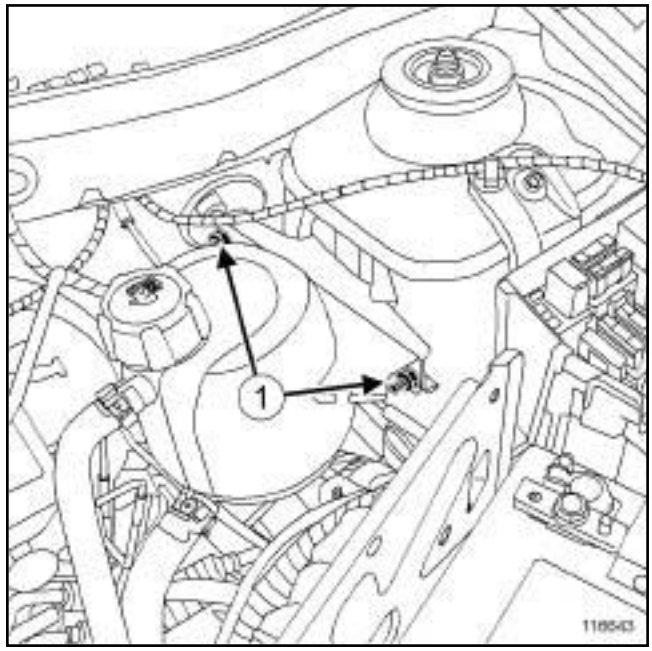
Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING

The coolant helps to keep the engine running properly (heat exchange).



The system does not operate using pure water.

WARNING

If the coolant is leaking from the expansion bottle cap, replace the valve.

REMOVAL

REMOVAL OPERATION

116643

❏ Remove the expansion bottle nuts (**1**) .

❏ Move aside the expansion bottle.

❏ Position hose clamps **(Ms. 583)** on the expansion bottle hoses.

❏ Remove the expansion bottle cap.

❏ Drain the coolant from the expansion bottle.

❏ Remove the following using the tool **(Mot. 1448)** or « CLIC » clip pliers:

- the clamp of the top hose of the expansion bottle,
- the clamp of the bottom hose of the expansion bottle.

❏ Disconnect:

- the expansion bottle bottom hose,
- the expansion bottle top hose.

❏ Remove the expansion bottle .

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the « CLIC » type clips.

II - REFITTING OPERATION

❏ Connect:

- the expansion bottle top hose,

- the expansion bottle bottom hose.

❏ Refit the following using the tool **(Mot. 1448)** or « CLIC » clip pliers:

- the clamp of the top hose of the expansion bottle,
- the clamp of the bottom hose of the expansion bottle.

❏ Fill the expansion bottle with coolant.

❏ Remove the hose clamps **(Ms. 583)**.

❏ Refit the expansion bottle.

❏ Torque tighten the **expansion bottle nuts (8 N.m)**.

III - FINAL OPERATION

❏ Top up the coolant level in the expansion bottle.

❏ Refit the expansion bottle cap.

❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

Coolant temperature sensor: Removal - Refitting

K9K

Tightening torques ▽	
expansion bottle nuts	**8 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

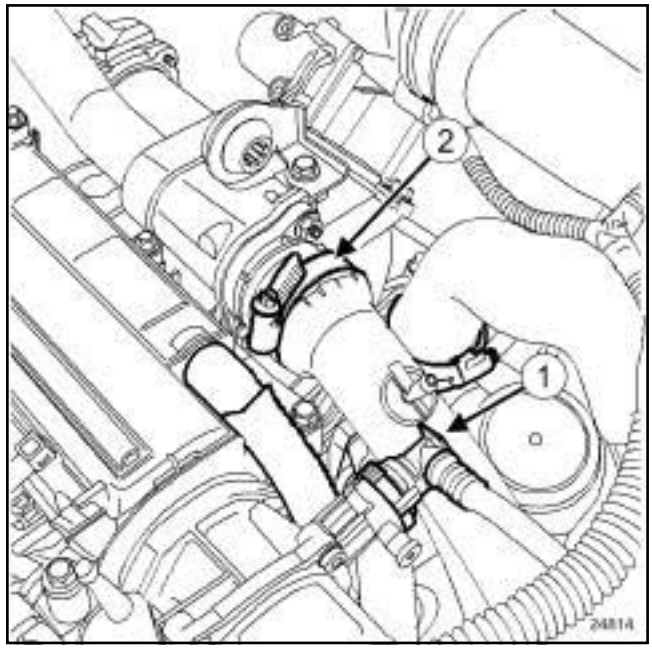
Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

Do not open the bleed screw(s) with the engine running.

WARNING
Prepare for the flow of fluid, and protect the surrounding components.

REMOVAL



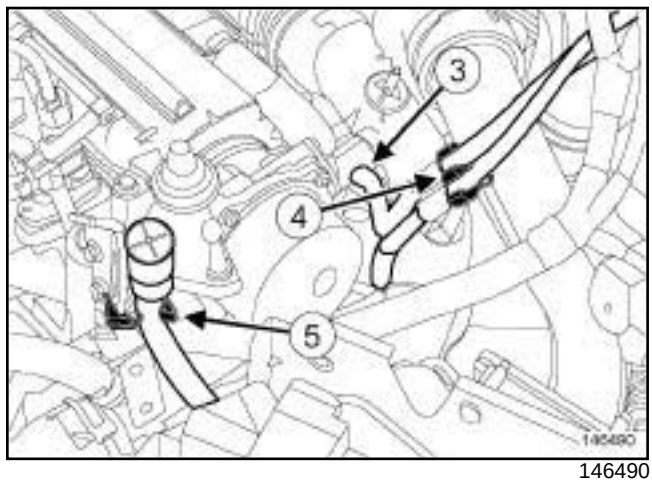
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove:

- the engine cover,
- the engine undertray bolts,
- the engine undertray,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the expansion bottle nuts.

❏ Move aside the expansion bottle.



24814

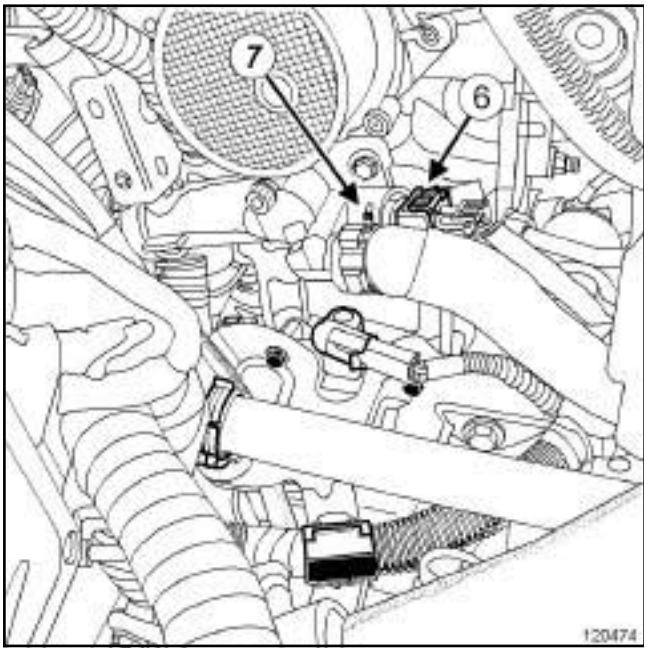
❏ Disconnect:

- the union (**1**) on the vacuum pump,
- the air duct between the intercooler and the EGR assembly at (**2**) .

K9K, and 796

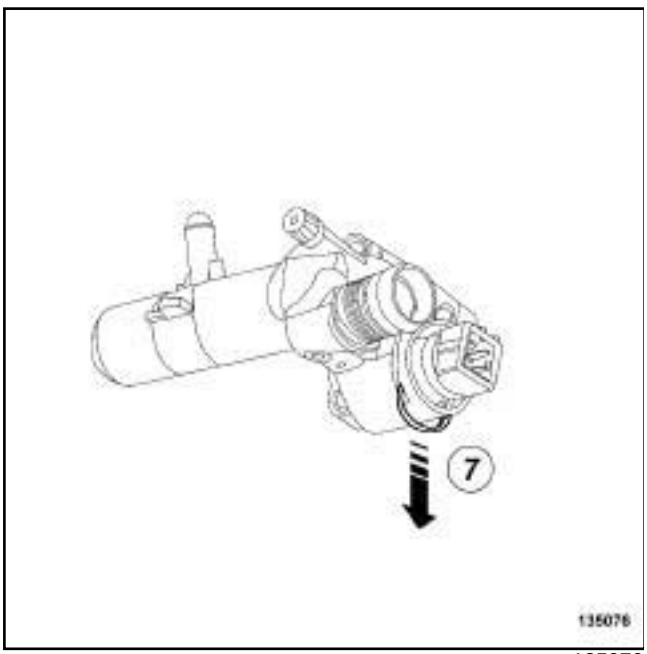
146490

❏ Disconnect the EGR solenoid valve pipe at (**3**) .



❏ Unclip:

- the EGR solenoid valve pipes at (**4**) ,
- the gearbox breather pipe at (**5**) .



❏ Move aside the air duct between the intercooler and the EGR assembly.

K9K

II - REMOVAL OPERATION

120474

135076

❏ Disconnect the coolant temperature sensor connector (**6**) .

❏ Remove:

- the coolant temperature sensor retaining clip (**7**) ,
- the coolant temperature sensor,
- the coolant temperature sensor O-ring.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: coolant temperature sensor seal**.

❏ Use **SURFACE CLEANER** (see) to clean and degrease:

- the mating face of the coolant temperature sensor if it is to be reused,
- the coolant outlet unit.

II - REFITTING OPERATION

❏ Refit:

- a new coolant temperature sensor seal on the coolant temperature sensor,
- the coolant temperature sensor,
- the coolant temperature sensor clip.

❏ Connect the coolant temperature sensor connector.

III - FINAL OPERATION

❏ Position the air duct between the intercooler and the EGR assembly.

❏ Connect:

- the air duct on the EGR assembly,
- the union to the vacuum pump.

K9K, and 796

❏ Connect the EGR solenoid valve pipe to the vacuum pump.

❏ Clip on:

- the breather pipe from the gearbox,
- the EGR solenoid valve pipes.

❏ Position the expansion bottle.

❏ Torque tighten the **expansion bottle nuts (8 N.m)**.

❏ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) ,
- the engine undertray,
- the engine undertray bolts,
- the engine cover.

K9K

❑ Perform the following operations:

- top up the cooling system,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

Coolant temperature sensor: Removal - Refitting

K4M

Tightening torques ▽	
coolant temperature sensor	30 N.m

IMPORTANT

The circuits are designed to be pressurised, so be careful at high temperatures (risk of serious burns).

Do not remove the cap from the expansion bottle while the engine is hot.

Take care when carrying out a repair under the bonnet, as the radiator fan(s) may start to operate without warning.

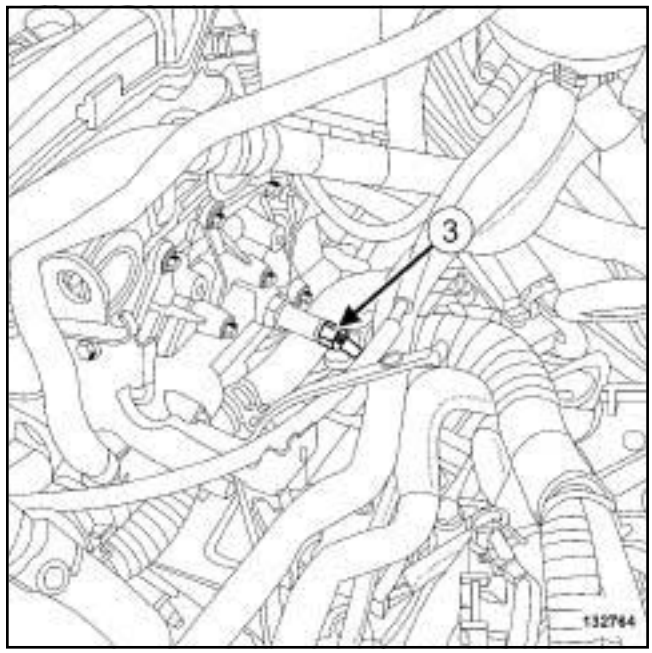
Do not open the bleed screw(s) with the engine running.

WARNING

Before the operation, protect the electrical accessories to prevent any risk of short circuiting and protect the belts to avoid damaging them.

WARNING

The coolant helps to keep the engine running properly (heat exchange).



The system does not operate using pure water.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

132764

❑ Disconnect the coolant temperature sensor connector (**3**) .

❑ Remove the coolant temperature sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

Note:

Apply 1 to 2 drops of **FRENETANCHE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the coolant temperature sensor thread (only if the sensor is to be reused).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease the mating face of the coolant temperature sensor on the water chamber.

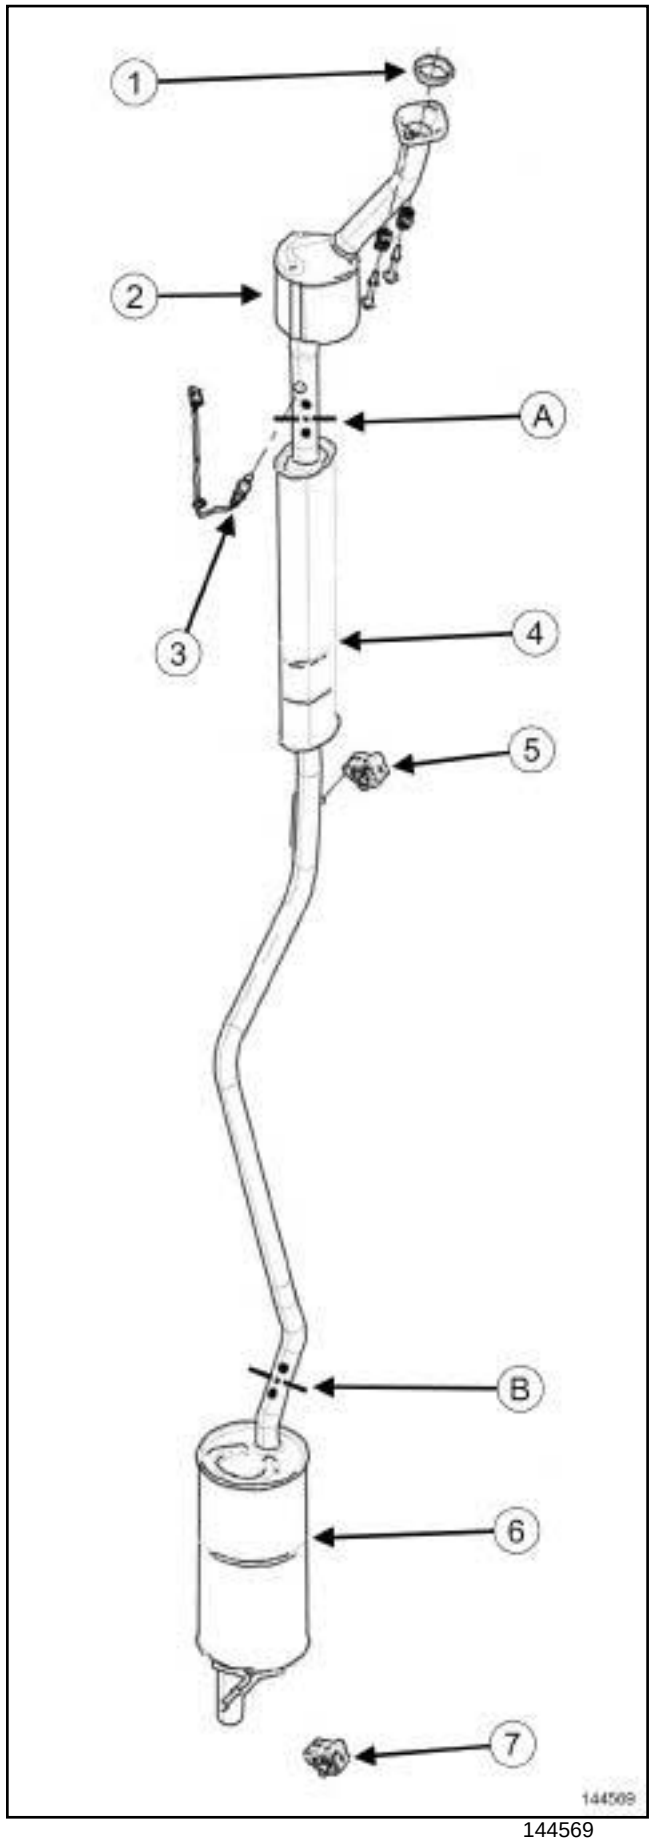
II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the coolant temperature sensor.

❑ Torque tighten the **coolant temperature sensor (30 N.m)**.

❑ Connect the coolant temperature sensor connector.

K4M



III - FINAL OPERATION

❑ Refit the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-2**) .

❑ Perform the following operations:

- top up the coolant level,
- bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-6**) .

(**5**)	Silencer rubber pad

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.

Equipment required
component jack

I - PARTS AND CONSUMABLES FOR THE REPAIR

1 - Parts always to be replaced:

- the exhaust sleeve (if fitted)

- the seal or sealing ring on the connection between the catalytic converter or catalytic pre-converter and the rest of the exhaust system

- the exhaust clip(s) (if fitted)

2 - Consumables (see Part number in Technical Note 5068, 04B, Consumables - Products):

- exhaust mastic

- surface cleaner

- grey abrasive pads

II - ADVICE TO OBSERVE

IMPORTANT
Do not park and run the engine in a place where combustible substances and materials such as grass or leaves can come into contact with the hot exhaust system.

IMPORTANT
Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

1 - During removal and refitting, the catalytic converter or catalytic pre-converter must not receive any knocks or impacts as this could damage it.

2 - The whole exhaust pipe is made of stainless steel.

3 - After working on the bracket between the catalytic converter or catalytic pre-converter and the rest of the exhaust system, ensure that the connection is perfectly sealed.

To do this:

- clean the bearing faces of the connection using **GREY ABRASIVE PADS**,

- degrease the bearing faces of the connection using **SURFACE CLEANER** and clean cloths,

- always replace the seal or sealing ring on the connection.

III - SPECIAL NOTES ON THE SINGLE UNIT EXHAUST PIPE

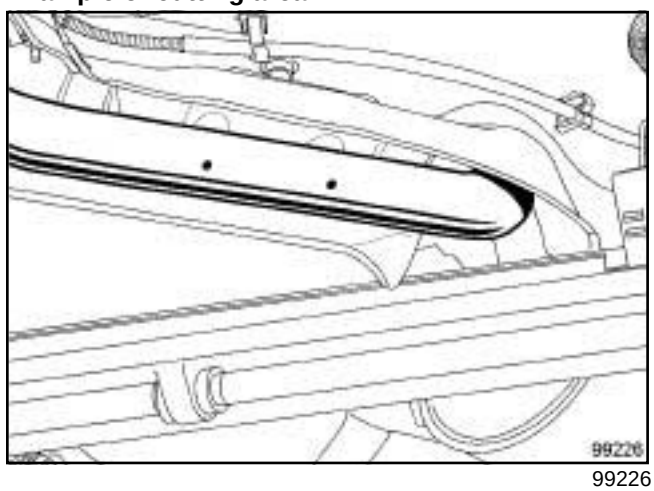
1 - Cutting the single unit exhaust pipe

The exhaust pipe is a « single unit type » .

To replace different parts of the exhaust system it must be cut.

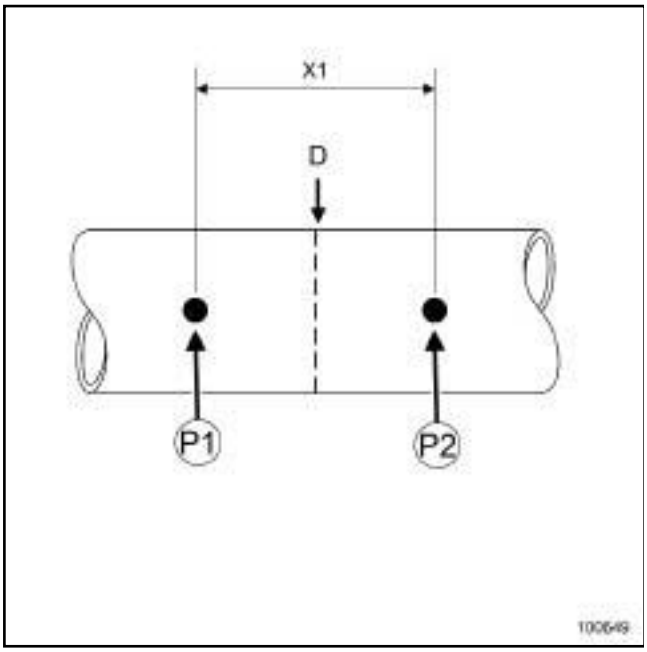
To do this be sure to carry out these precautions in the following order:

- correctly identify the area to be cut, as explained below,



- use the cutting tool correctly **(Mot. 1199-01)**,

- position the exhaust sleeve correctly.

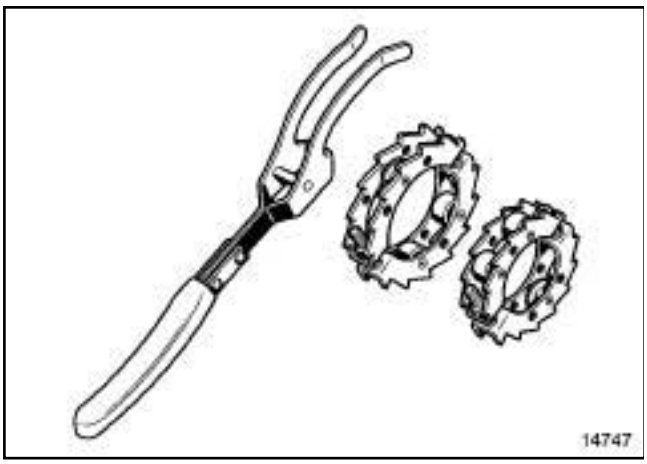


2 - Identifying the area of the exhaust system to be cut

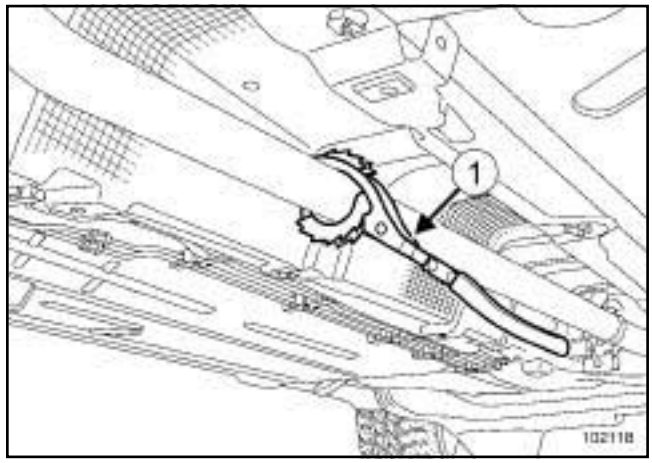
Two marks made on the exhaust system define the area to be cut (see **Exhaust: Parts and consumables for the repair**) (see MR for vehicle concerned, 19B, Exhaust).

Example of cutting area

99226



100649



Before cutting the exhaust system, draw a line (**D**) between the two marks (**P1**) and (**P2**) .

The distance between the two marks on the exhaust pipe is (**X1**) : **80 mm**.

3 - Operate tool Mot. 1199-01

14747

102118

Fit the **(Mot. 1199-01)** (**1**) on the exhaust pipe.

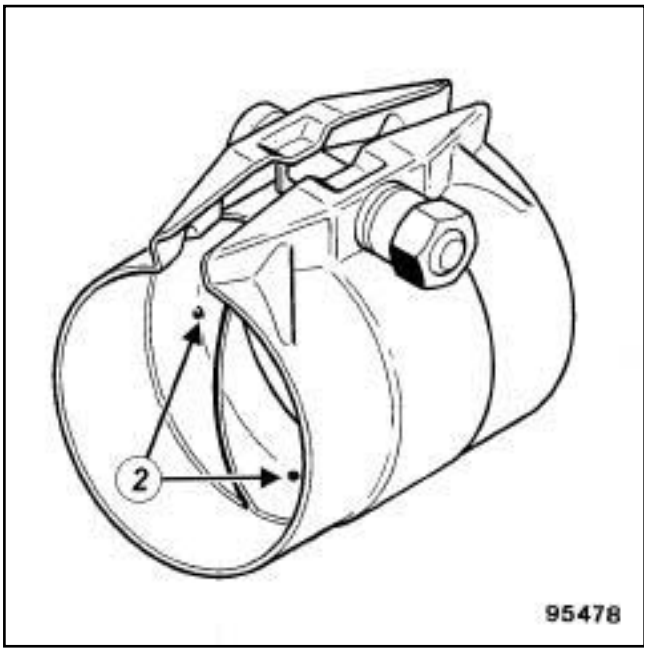
Tighten the two bolts on the tool until they touch the pipe in order to clamp the tool onto the pipe.

Turn the cutting tool using the handle and pressing it against the pipe (as indicated in the diagram above).

Tighten the two bolts on the tool whilst cutting, until the pipe is completely cut.

Note:

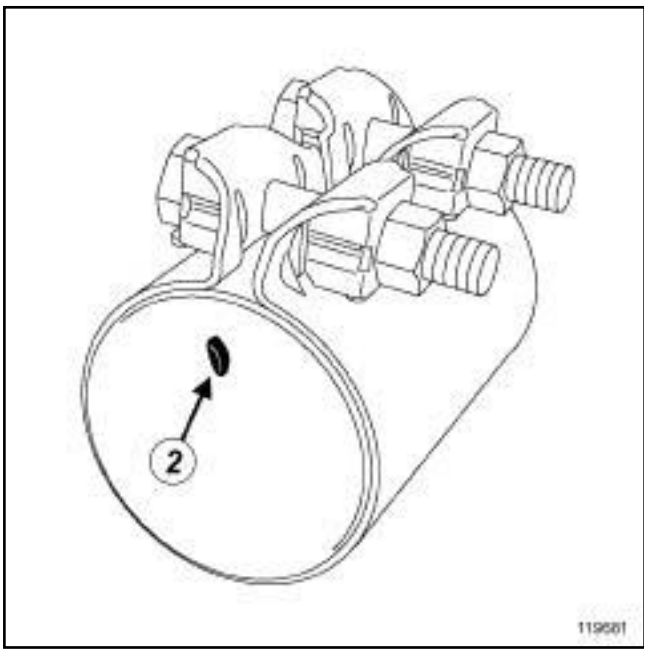
Do not over-tighten the tool onto the pipe to avoid deforming it.



Once the pipe is cut, file and deburr the end of the pipe to be used on the vehicle again.

4 - Positioning the exhaust sleeve

WARNING



Do not reuse an old exhaust sleeve.

Exhaust sleeve with 1 bolt

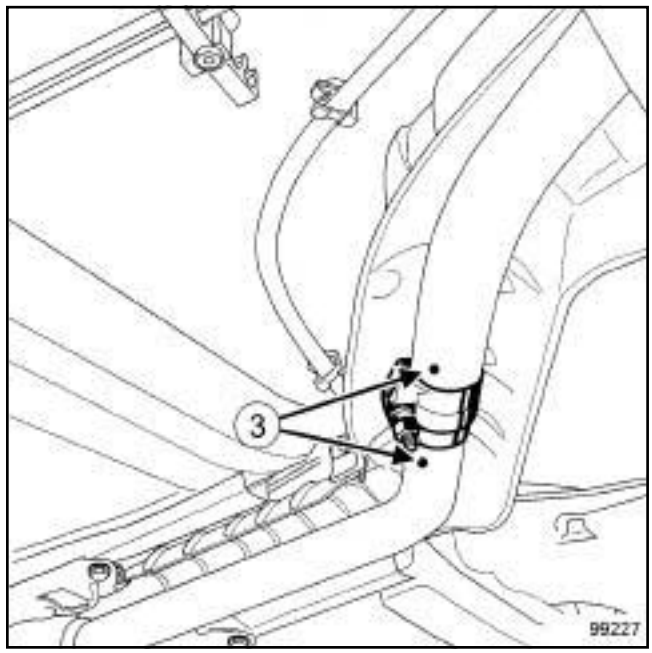
95478

Exhaust sleeve with 2 bolts

119681

Fit the exhaust sleeve onto the part of the exhaust system fitted to the vehicle.

Position the pipe onto the lugs (**2**) inside the exhaust sleeve.



Tighten the exhaust sleeve bolt(s) slightly (depending on the version).

Position the second part of the exhaust system under the vehicle, fitting it in the exhaust sleeve.

Note:

If necessary, use a **component jack** to lift and hold the heavy and bulky components of the exhaust system.

Position the second exhaust pipe onto the lugs inside the exhaust sleeve.

99227

Check that the two cut marks (**3**) are aligned (if applicable).

Position the sleeve so that there is no risk of contact between its bolt or bolts and the heat shields.

Torque tighten:

- the **exhaust sleeve nut with 1 bolt (25 N.m)** (if fitted),
- the **exhaust sleeve nuts with 2 bolts (18 N.m)** (if fitted).

Check the following and deal with if necessary:

- no underbody contact between the exhaust system and the heat shields,
- all of the heat shields are present and secure.

Note:

Any damaged heat shields must be replaced.

Start the engine.

Check that there are no leaks: deal with any leaks.

Note:

If there are leaks from the **EXHAUST SLEEVES WITH 1 BOLT**, apply **EXHAUST MASTIC** to the sleeve (see part no. in Technical Note 5068, 04B, Consumables - Products).

If the application of exhaust mastic does not fix the leak:

- remove and replace the used exhaust sleeve,
- check the condition of the exhaust pipes (condition of the pipe surface, deburring of the area cut, damage to the pipes).
- fit the new sleeve in accordance with the instructions given before.

K9K, and 796

Tightening torques ▽	
turbocharger output studs	**9 N.m**
catalytic converter nuts on the turbocharger	**28 N.m**
upstream strut bolts on the engine	**44 N.m**
downstream strut bolt and nut on the gearbox	**21 N.m**
upstream strut bolts on the catalytic converter	**26 N.m**
downstream strut bolt on the catalytic converter	**21 N.m**
exhaust flange bolts	**21 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

IMPORTANT

Wear cut-resistant gloves during the operation.

IMPORTANT

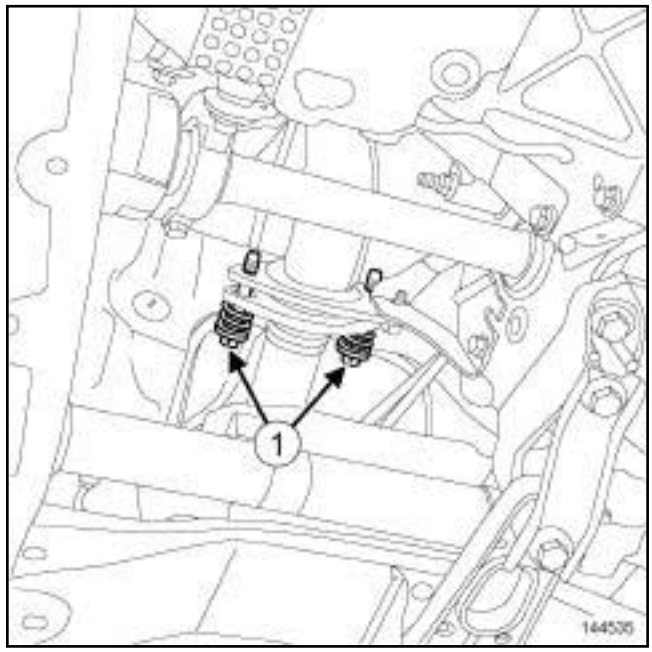
Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

WARNING

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

REMOVAL



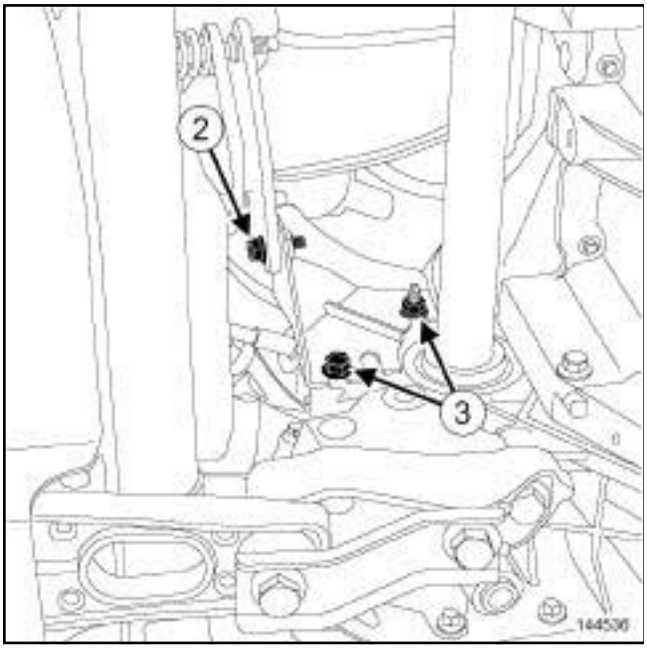
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-6**) .

II - REMOVAL OPERATION



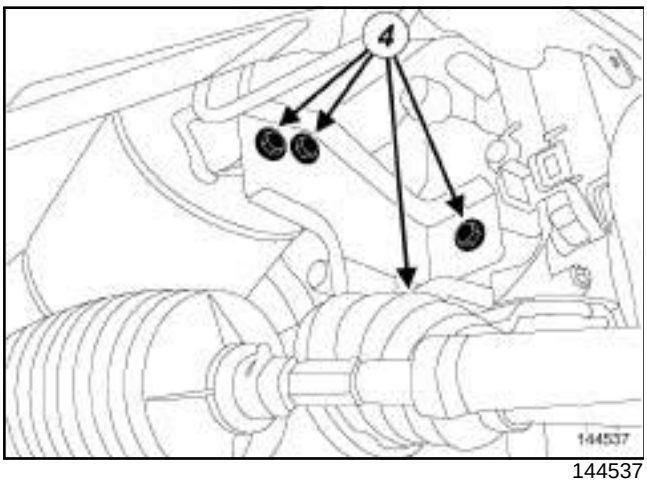
144535

❑ Remove the exhaust flange bolts (**1**) .

❑ Withdraw the exhaust pipe.

❑ Attach the exhaust pipe to the front left-hand lower arm.

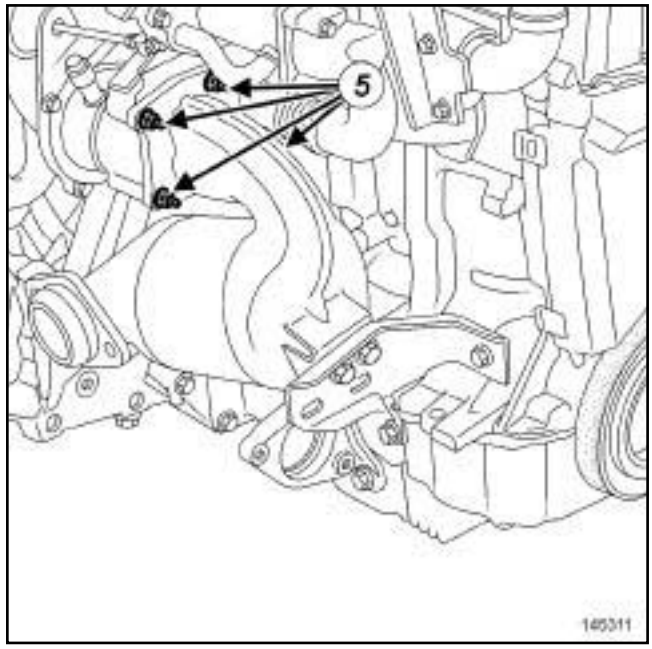
K9K, and 796



144536

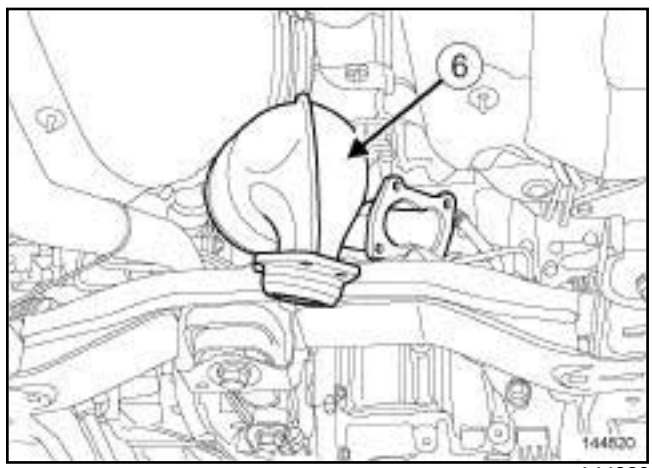
❏ Remove the bolt from the downstream strut on the catalytic converter (**2**) .

❏ Loosen the downstream strut bolt and nut on the gearbox (**3**) .



❏ Remove the downstream strut.

144537



❏ Remove:

- the bolts of the upstream strut (**4**) ,
- the upstream strut.

145311

❏ Remove the catalytic converter nuts on the turbocharger (**5**) .

144820

❏ Remove:

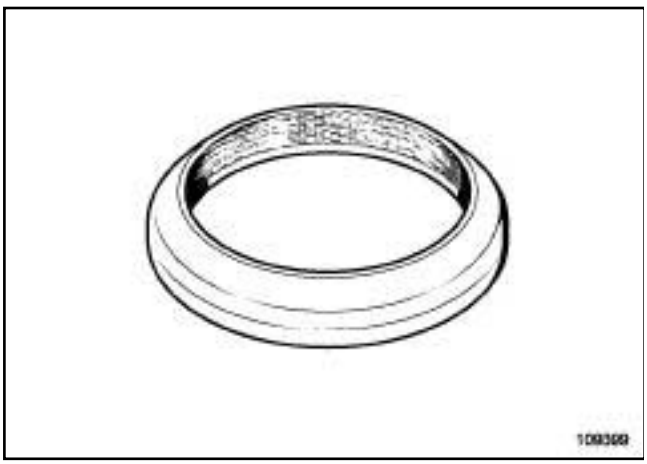
- the catalytic converter (**6**) ,
- the seal between the turbocharger and the catalytic converter,
- the exhaust flange sealing ring.

K9K, and 796

REFITTING

I - REFITTING PREPARATION OPERATION

❑



WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the joint face of:

- the intermediate pipe,
- the catalytic converter in case of reuse,
- the turbocharger.

❑ Use **SURFACE CLEANER** and **CLEAN CLOTHS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the joint face of:

- the intermediate pipe,
- the catalytic converter in case of reuse,
- the turbocharger.

109399

❑ Always replace the exhaust flange sealing ring.

❑ **parts always to be replaced: seal between turbocharger and catalytic converter**

II - REFITTING OPERATION

❑

Note:
If a stud loosens during this operation, coat it with **HIGH STRENGTH THREAD LOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).
Torque tighten the **turbocharger output studs (9 N.m)**.

❑ Fit:

- a new seal between the turbocharger and the catalytic converter,
- the catalytic converter on the turbocharger.

❑ Pretighten in order:

- the bolt and nut of the upstream strut on the engine,
- the downstream strut bolt and nut on the gearbox,
- the upstream strut bolts on the catalytic converter,
- the downstream strut bolt on the catalytic converter,
- the catalytic converter nuts on the turbocharger.

❑ Torque tighten in order:

- the **catalytic converter nuts on the turbocharger (28 N.m)**,
- the **upstream strut bolts on the engine (44 N.m)**,
- the **downstream strut bolt and nut on the gearbox (21 N.m)**,
- the **upstream strut bolts on the catalytic converter (26 N.m)**,
- the **downstream strut bolt on the catalytic converter (21 N.m)**.

❑ Make sure there is no contact between the catalytic converter and the turbocharger oil return pipe.

❑ Proceed in the reverse order to removal.

❑ Torque tighten the **exhaust flange bolts (21 N.m)**.

III - FINAL OPERATION

❑ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

❑ Start the vehicle.

K9K, and 796

❑ Check that there are no leaks and deal with them if necessary.

K4M, and 4X2 TRANSMISSION

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.

Equipment required
component jack

Tightening torques ▽	
bolt of the exhaust flange	**21 N.m**
oxygen sensor	**45 N.m**

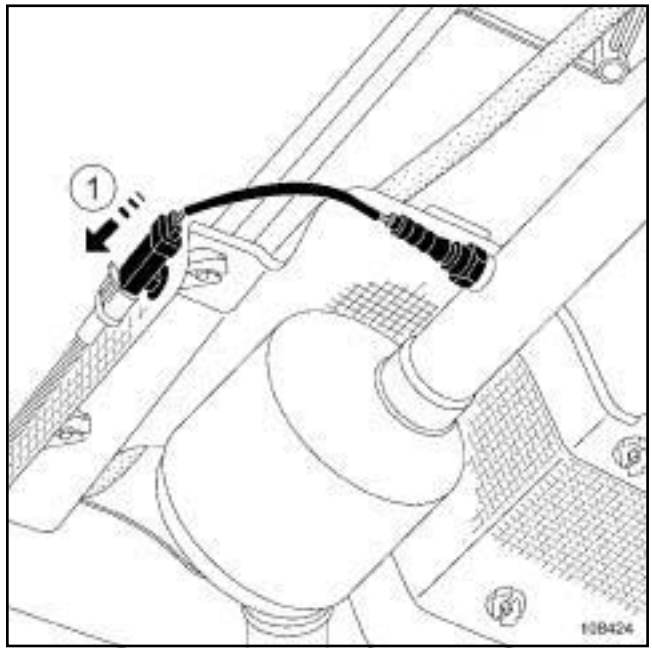
IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

IMPORTANT
Wear cut-resistant gloves during the operation.

IMPORTANT
Catalytic converters contain ceramic fibres, these are contained within a closed unit, and cannot disperse. Drilling or cutting catalytic converters is prohibited.

WARNING
To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.



REMOVAL

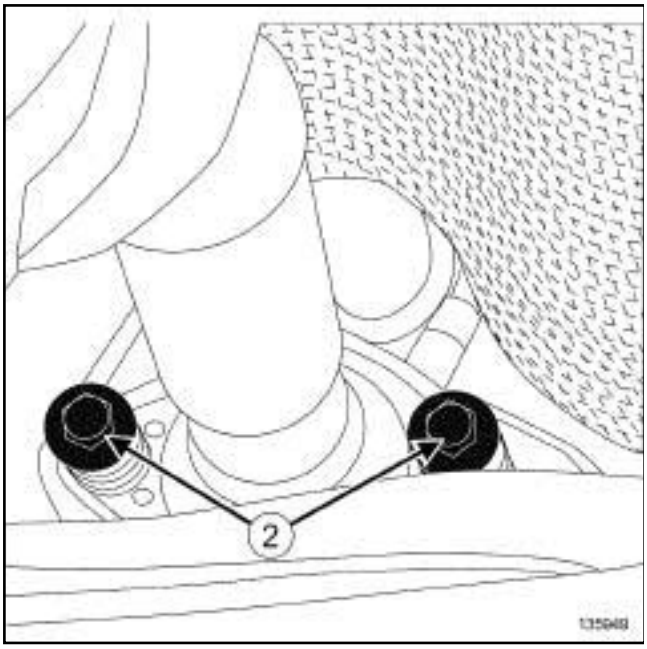
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

II - REMOVAL OPERATION

108424



❑ Remove the downstream oxygen sensor connector from its mounting by sliding it (**1**) .

❑ Disconnect the downstream oxygen sensor connector.

❑ Put a **component jack** under the catalytic converter.

❑ Locate the area of the catalytic converter to be cut (see **19B**, **Exhaust**, **Exhaust: List and location of components**, page **19B-1**) .

❑ Use the tool **(Mot. 1199-01)** to cut the exhaust pipe in the area to be cut (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

135949

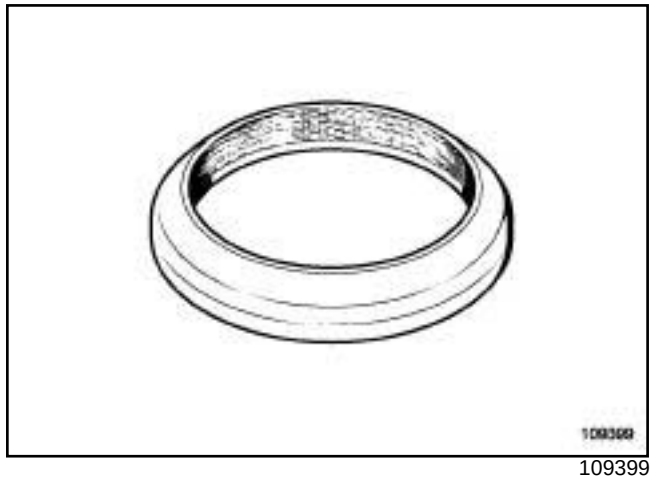
❑ Remove:

- the exhaust flange bolts (**2**) ,
- the catalytic converter,
- the exhaust flange ring.

IF REPLACING THE CATALYTIC CONVERTER

❑ Remove the downstream oxygen sensor on the catalytic converter (see) .

REFITTING



I - REFITTING PREPARATION OPERATION

❑

> **WARNING**
> To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Clean the bearing faces of the catalytic converter using **ABRASIVE PADS** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❑ Degrease the bearing faces of the catalytic converter using **SURFACE CLEANER** and clean cloths (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

109399

❑ **parts always to be replaced: ring between exhaust manifold and catalytic converter**

II - REFITTING OPERATION

❑ Refit:

- the downstream oxygen sensor (if replacing the catalytic converter),
- the catalytic converter.

❑ Fit a new After-Sales sleeve between the catalytic converter and the expansion chamber (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

> **IMPORTANT**
> Position the « nut and bolt securing the sleeve » assembly so that the assembly cannot come into contact with the underbody.

❑ Tighten the sleeve bolt while guiding the exhaust pipe to ensure correct alignment.

❑ Torque tighten:

- the **bolt of the exhaust flange (21 N.m)**,
- the **oxygen sensor (45 N.m)**.

III - FINAL OPERATION

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

❑ Start the vehicle.

K4M, and 4X2 TRANSMISSION

❑ Check that there are no leaks and deal with them if necessary.

K4M, and 4X2 TRANSMISSION

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.
Mot. 1857	Pliers for removing exhaust pipe rubber mounting bushes

Equipment required
component jack

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

WARNING
To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

IMPORTANT
Wear heat protective gloves during the operation.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Place a **component jack** under the expansion chamber.

II - REMOVAL OPERATION

❑ Locate the areas of the expansion chamber to be cut (see **19B**, **Exhaust**, **Exhaust: List and location of components**, page **19B-1**) .

❑ Cut the exhaust pipe using the tool **(Mot. 1199-01)** in the designated areas to be cut (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

❑ Remove the rubber pad from the expansion chamber using the tool **(Mot. 1857)**.

Note:
If the rubber pad is damaged, replace the rubber pad.

❑ Remove the expansion chamber.

REFITTING

I - REFITTING OPERATION

❑ Refit:

- the expansion chamber,
- the expansion chamber rubber pad.

❑ Fit new after-sales sleeves (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

IMPORTANT
Position the « nut and bolt securing the sleeve » assembly so that the assembly cannot come into contact with the underbody.

❑ Torque tighten the sleeve bolts while supporting the exhaust pipe to ensure alignment.

II - FINAL OPERATION

❑ Check:

- all the exhaust pipe heat shields are in place and properly attached.
- that there is no contact with the underbody,

❑ Start the vehicle.

❑ Check that there are no leaks and deal with them if necessary.

K9K

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.
Mot. 1857	Pliers for removing exhaust pipe rubber mounting bushes

Equipment required
component jack

Tightening torques ▽	
exhaust sleeve bolts	**25 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**)

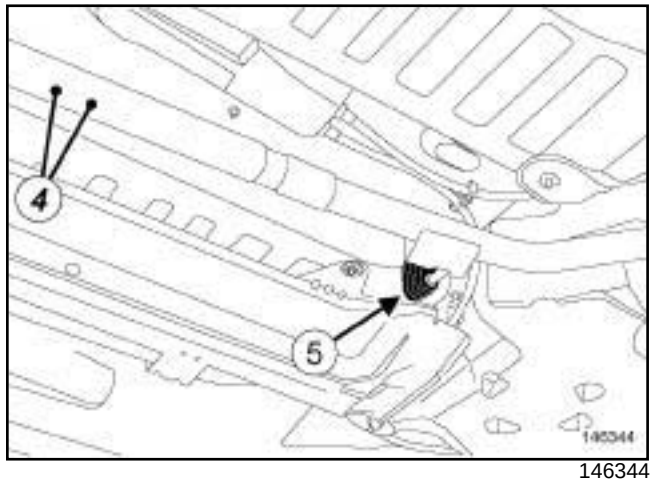
WARNING

To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

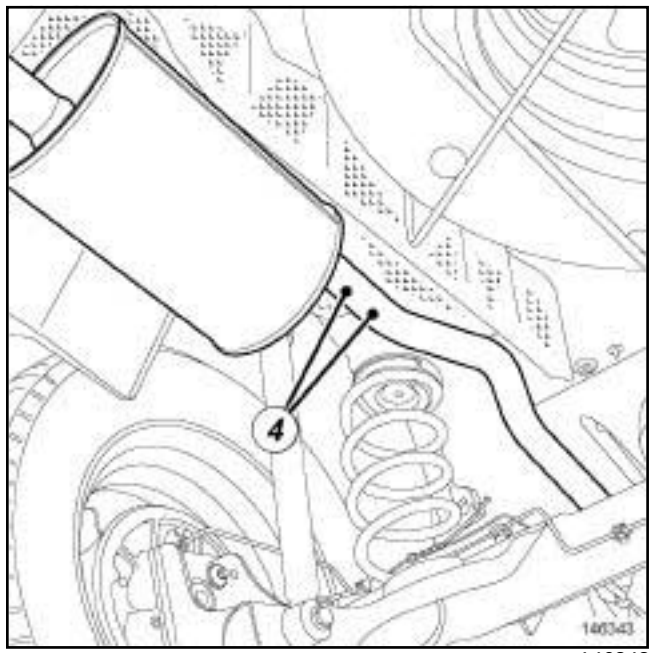
IMPORTANT

Wear heat protective gloves during the operation.



REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Fit a **component jack** under the intermediate pipe.

II - REMOVAL OPERATION

146344

146343

❏ Cut the exhaust pipe using the tool **(Mot. 1199-01)** in the centre of the areas to be cut (**4**) (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

❏ Remove the rubber mounting bush (**5**) from the intermediate pipe using the tool **(Mot. 1857)**.

Note:

If the rubber mounting bush is damaged, it must always be replaced.

❏ Remove the intermediate pipe.

K9K

REFITTING

I - REFITTING OPERATION

❑ Refit the intermediate pipe.

❑ Refit the exhaust sleeves (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

WARNING
Make sure:

- that the sleeve nut-bolt tightening assembly is vertical, with the nut facing downwards, to prevent any risk of underbody contact,
- that you position the new component in a way that the cutting area marks are aligned,
- that the two marks are flush with the two ends of the sleeve,
- that an old sleeve is not reused.

❑ Torque tighten the **exhaust sleeve bolts (25 N.m)**.

❑ Refit the rubber mounting bush of the intermediate pipe.

II - FINAL OPERATION

❑ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

4X2 TRANSMISSION

Special tooling required	
Mot. 1199-01	Exhaust pipe cutter (diameter 35/50 mm and diameter 50/65mm). Complete kit in a case.
Mot. 1857	Pliers for removing exhaust pipe rubber mounting bushes

Equipment required
component jack

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

WARNING
To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

IMPORTANT
Wear heat protective gloves during the operation.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Place a **component jack** under the silencer.

II - REMOVAL OPERATION

❏ Locate the area of the silencer to be cut (see **19B**, **Exhaust**, **Exhaust: List and location of components**, page **19B-1**) .

❏ Use the tool **(Mot. 1199-01)** to cut the exhaust pipe in the area to be cut (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

❏ Remove the rubber pad from the silencer using the tool **(Mot. 1857)**.

Note:
If the rubber pad is damaged, replace the rubber pad.

❏ Remove the silencer.

REFITTING

I - REFITTING OPERATION

❏ Refit:

- the silencer,
- the silencer rubber pad.

❏ Fit a new After-Sales exhaust sleeve (see **19B**, **Exhaust**, **Exhaust: Precautions for the repair**, page **19B-6**) .

IMPORTANT
Position the « nut and bolt securing the sleeve » assembly so that the assembly cannot come into contact with the underbody.

❏ Tighten the sleeve while relieving the exhaust to ensure alignment.

II - FINAL OPERATION

❏ Check:

- that all the exhaust pipe heat shields are in place and properly attached,
- that there is no contact with the underbody.

❏ Start the vehicle.

❏ Check that there are no leaks and deal with them if necessary.

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

Equipment required
pneumatic transfer pump for fuels

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

Wear goggles with side protectors for this operation.

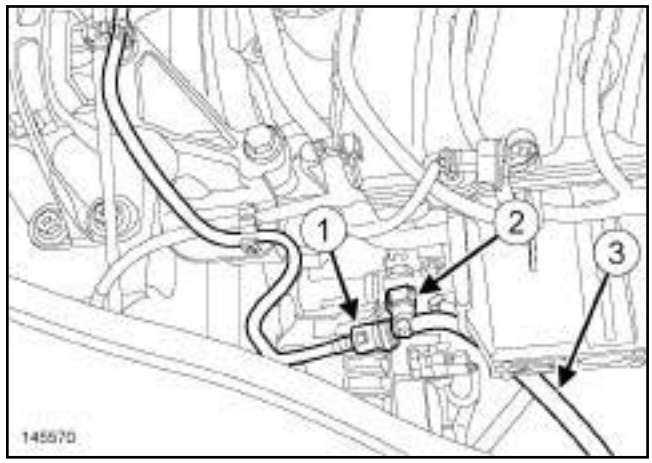
WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

DRAINING



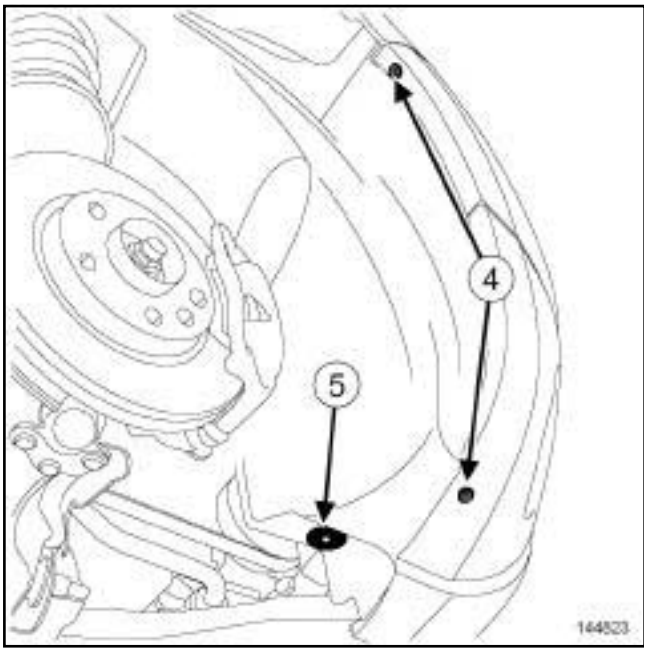
I - DRAINING PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

II - DRAINING OPERATION

K4M

❑ Disconnect the fuel supply union from the injector rail ***(1)*** .



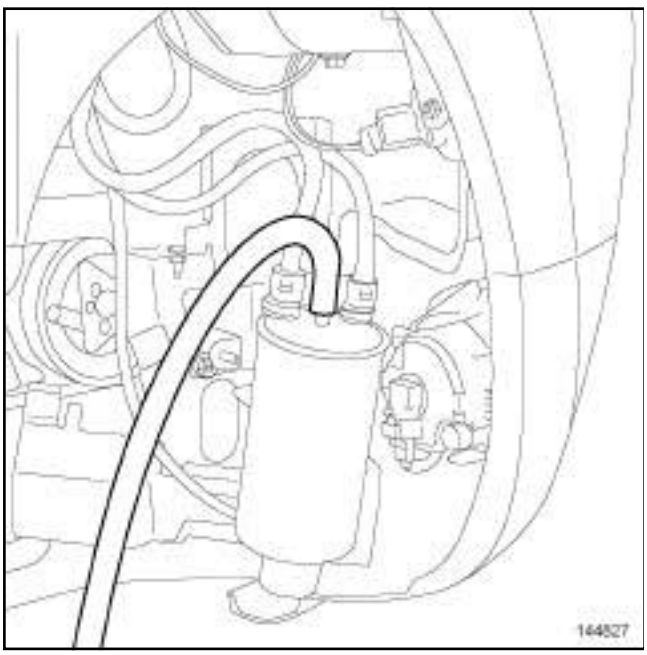
145570

❑ Fit a T-union **(Mot. 1311-08)** at (**2**) .

❑ Connect a **pneumatic transfer pump for fuels** to the T-union outlet (**3**) .

K9K

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



144823

❏ Remove:

- the front right-hand wheel arch liner bolts (**4**) ,
- the clip of the wheel arch liner (**5**) ,
- the diesel filter protector (see) .

❏ Disconnect the fuel outlet pipe from the fuel filter.

144827

❏ Connect a **pneumatic transfer pump for fuels** to the fuel filter.

❏ Prepare for fuel outflow.

❏ Drain the fuel tank.

REFITTING

❏ Proceed in the reverse order to removal.

Tightening torques ▽	
fuel tank bolts	**21 N.m**
exhaust pipe bolts on the catalytic converter	**21 N.m**
catalytic converter bolts on the exhaust manifold	**21 N.m**
earth cable nut on the body	**8 N.m**

This method describes the removal - refitting procedure for the plastic tank

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear leaktight gloves (nitrile type) for this operation.

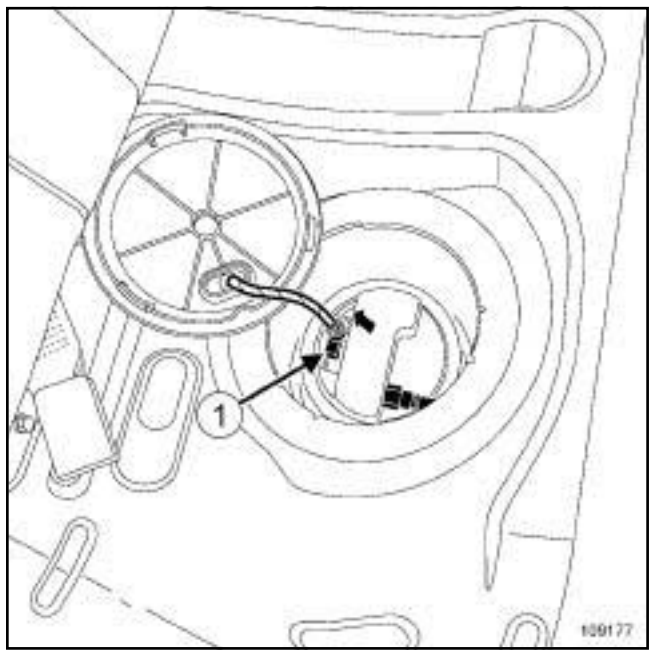
WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL



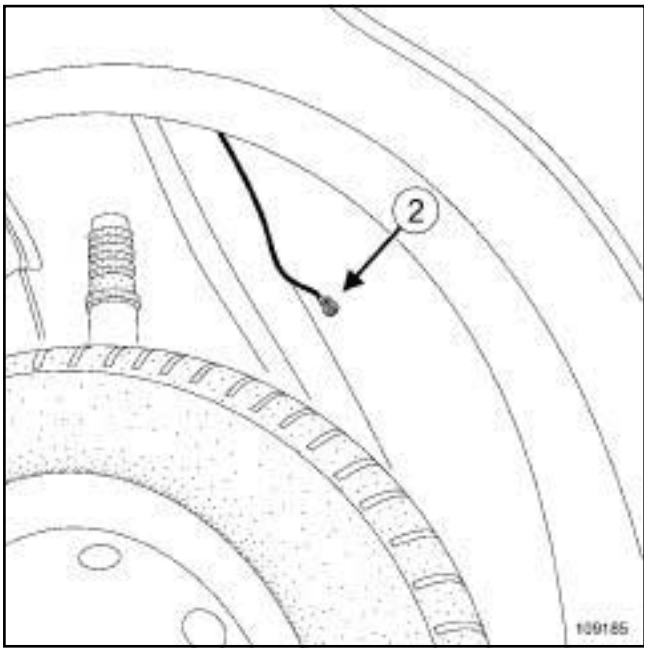
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Drain the tank (see **19C**, **Tank**, **Fuel tank: Draining**, page **19C-1**) .

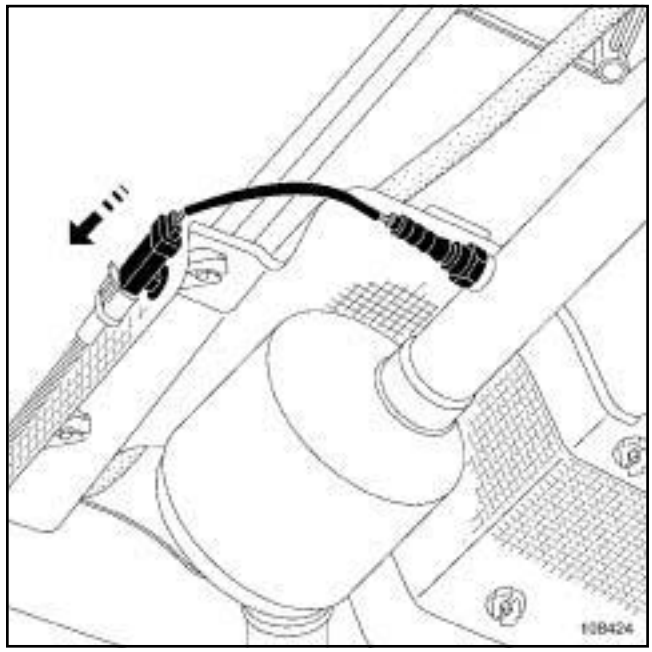
❏ Tilt the rear bench seat base (see) (76A, Rear seat frames and runners).



109177

❏ Remove the access flap to the fuel level sensor module on the floor.

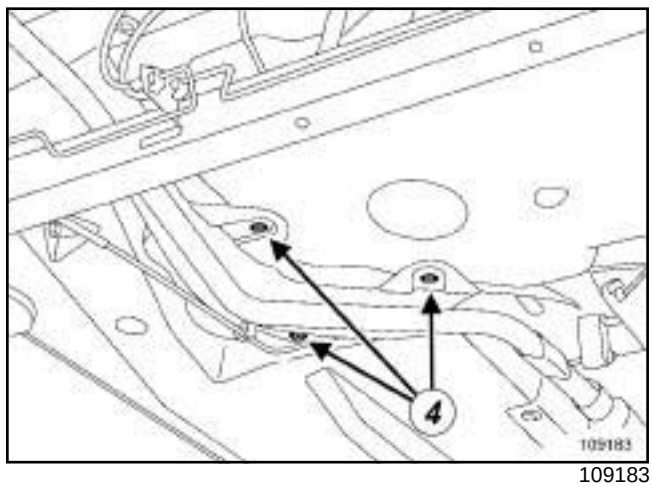
❏ Disconnect the connector (**1**) from the fuel pump.



K4M

109185

❏ Remove the body earth cable at (**2**) .

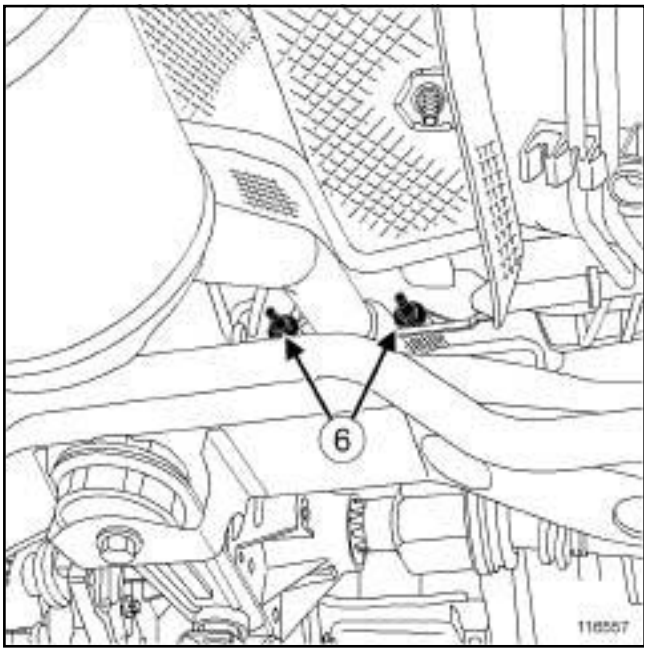


K4M

108424

❏ Remove the oxygen sensor connector by sliding it from its support (in the direction of the arrow).

❏ Disconnect the oxygen sensor connector.

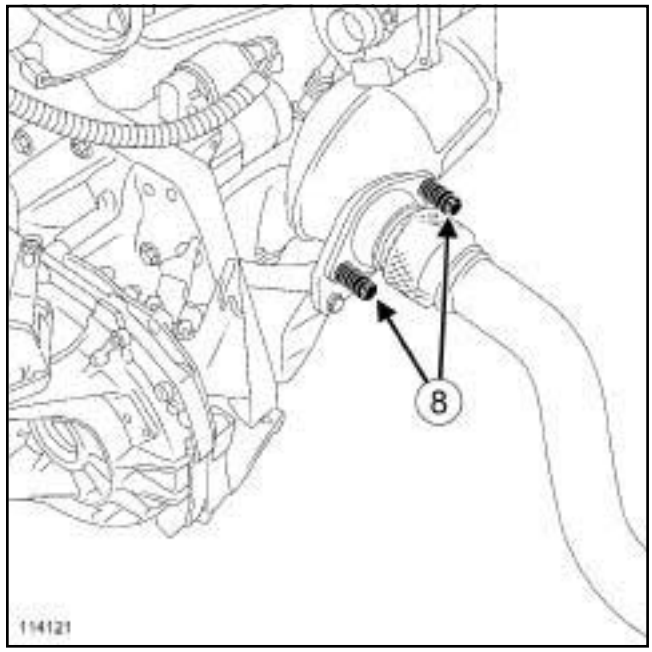


109183

❏ Remove:

- the heat shield pins (**4**) ,
- the fuel tank heat shield.

K4M



116557

❏ Remove the catalytic converter mountings (**6**) on the exhaust manifold.

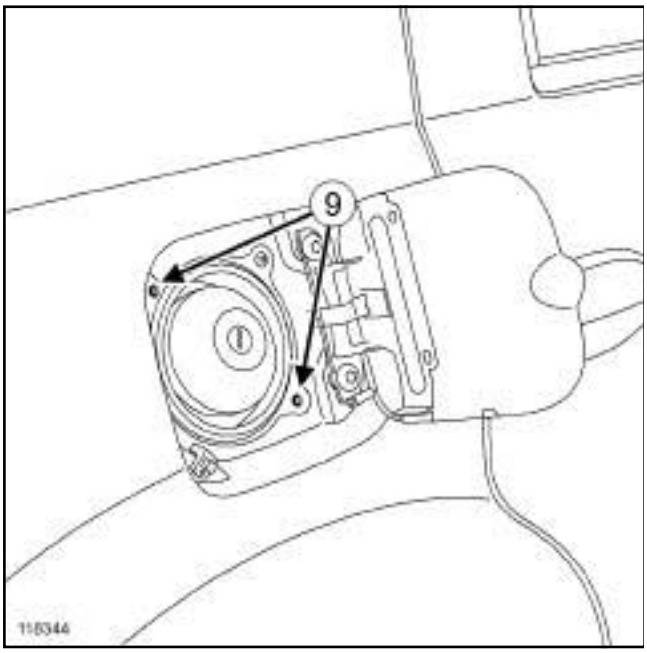
❏ Detach the exhaust line assembly on the left-hand side.

❏ Attach the front section of the exhaust line assembly to the front lower arm on the left-hand side.

K9K

114121

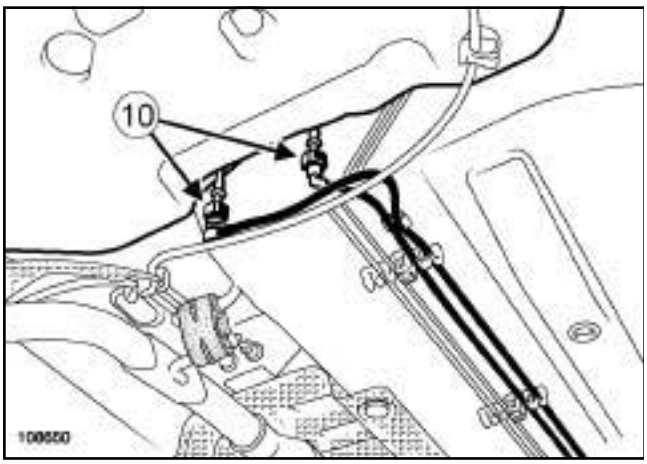
❏ Remove the exhaust pipe mountings (**8**) from the catalytic converter.



❏ Place the exhaust line assembly on the left-hand side.

❏ Attach the front section of the exhaust line assembly to the front lower arm on the left-hand side.

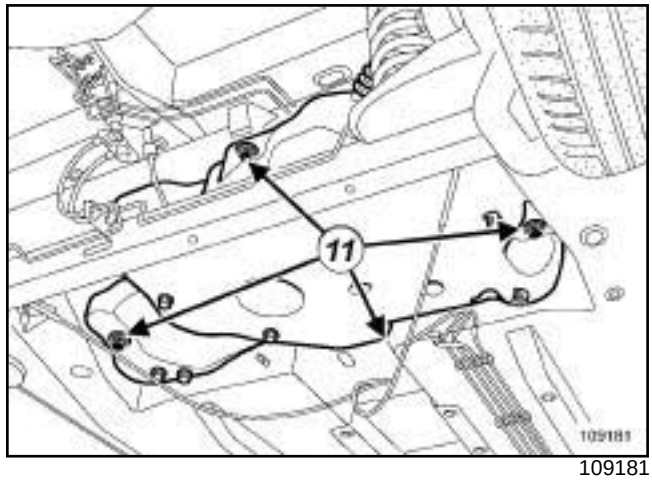
❏ Unclip the parking brake cables from:



- the fuel tank,
- on the body.

II - OPERATION FOR REMOVAL OF PART CONCERNED

118344



❏ Remove the bolts (**9**) from the filler neck.

108650

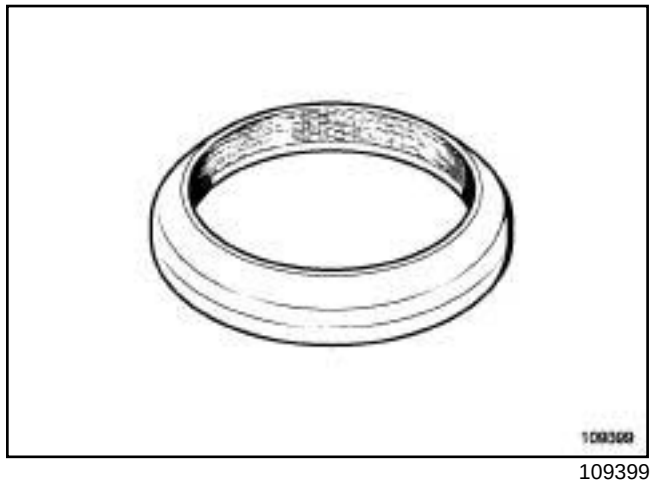
❏ Disconnect the snap-on unions (**10**) from the tank outlet pipes.

❏ Remove the external fuel filter (if fitted to the vehicle) (see **Fuel filter: Removal - Refitting**) .

109181

❏

Note:
This operation requires two people.



❏ Remove the bolts (**11**) from the fuel tank.

❏ Lower the tank slightly.

❏ Remove the fuel tank.

REFITTING

I - REFITTING PREPARATION OPERATION

109399

❏ It is essential to replace the sealing ring between the exhaust manifold and the catalytic converter.

II - REFITTING OPERATION FOR PART CONCERNED

❏

Note:
This operation requires two people.

4X2 TRANSMISSION

- ❏ Refit the fuel tank.
- ❏ Refit the fuel tank bolts.
- ❏ Torque tighten the **fuel tank bolts (21 N.m)**.
- ❏ Refit the external fuel filter (if fitted to the vehicle) (see **Fuel filter: Removal - Refitting**) .
- ❏ Reconnect the snap-on unions to the tank outlet fuel pipes.
- ❏ Refit the filler neck bolts.

III - FINAL OPERATION

- ❏ Clip the parking brake cables:
  - onto the body,
  - onto the fuel tank.

K9K

- ❏ Refit the exhaust system assembly onto the catalytic converter.
- ❏ Torque tighten the **exhaust pipe bolts on the catalytic converter (21 N.m)**.

K4M

- ❏ Refit the exhaust system assembly onto the exhaust manifold.
- ❏ Torque tighten the **catalytic converter bolts on the exhaust manifold (21 N.m)**.
- ❏ Connect the oxygen sensor connector.
- ❏ Refit:
  - the oxygen sensor connector to its support,
  - the earth cable on the body.
- ❏ Torque tighten the **earth cable nut on the body (8 N.m)**.

- ❏ Refit:
  - the fuel tank heat shield,
  - the heat shield pins.
- ❏ Reconnect the fuel level sensor module connector.
- ❏ Refit the access flap for the fuel level sensor module on the floor.
- ❏ Refit the rear bench seat base (see) (76A, Rear seat frames and runners).
- ❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Fuel level sensor module: Removal - Refitting

K4M or K9K

Special tooling required	
Car. 1363	Set of trim removal levers.
Mot. 1397	Universal spanner for removing fuel gauge nuts.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

WARNING

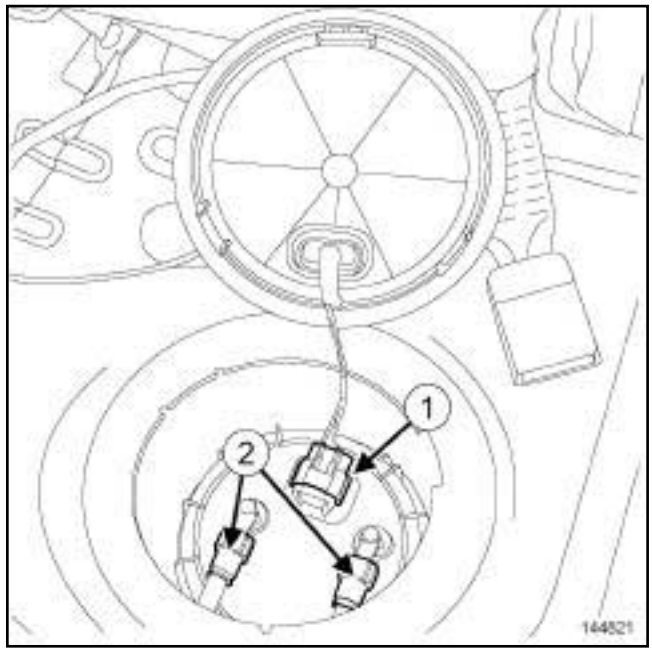
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Tilt the rear bench seat base.



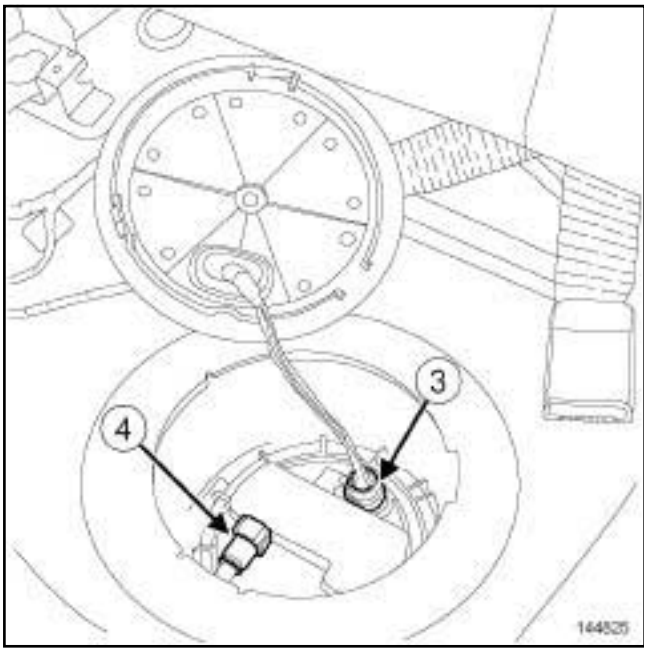
II - REMOVAL OPERATION

❑ Remove the blanking cover from the inspection flap using the tool **(Car. 1363)**.

Note:

Make provisions for the flow of fuel from the fuel supply and return pipes.

K9K

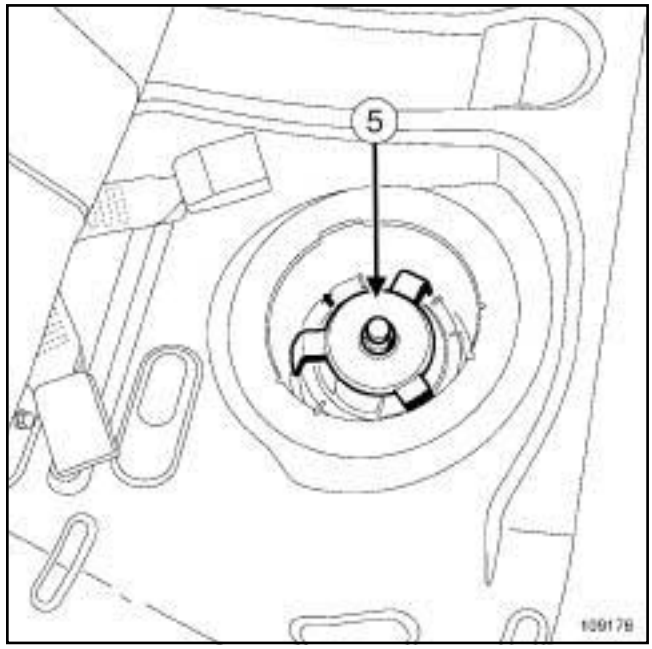


144821

❑ Disconnect:

- the connector (**1**) ,
- the unions (**2**) .

K4M or K9K



K4M

144825

❑ Disconnect:

- the connector (**3**) ,
- union (**4**) .

109176

❑ Remove the nut from the fuel level sensor module using the tool **(Mot. 1397)** (**5**) ,

❑ Let the fuel drain from the fuel level sensor module.

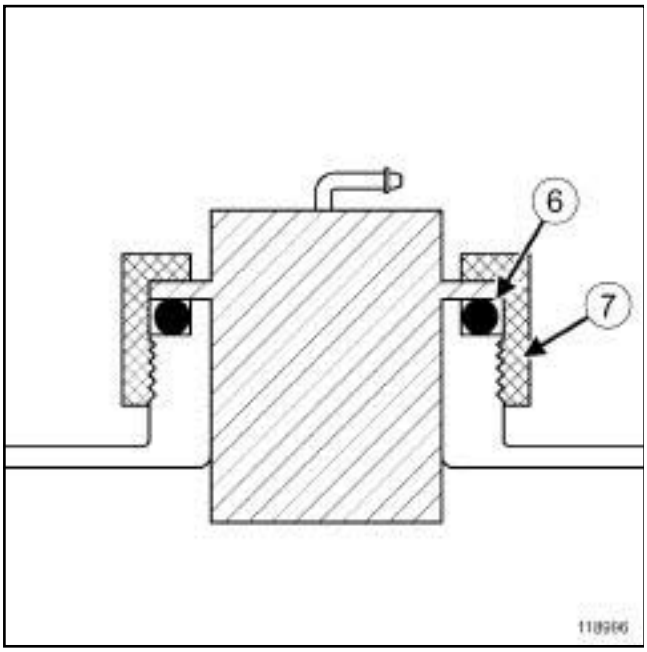
❑ Remove:

- the fuel level sensor module, taking care not to damage the float,
- the fuel level sensor module seal.

WARNING
To prevent the tank from deforming, refit the fuel sender unit nut to the tank well immediately.

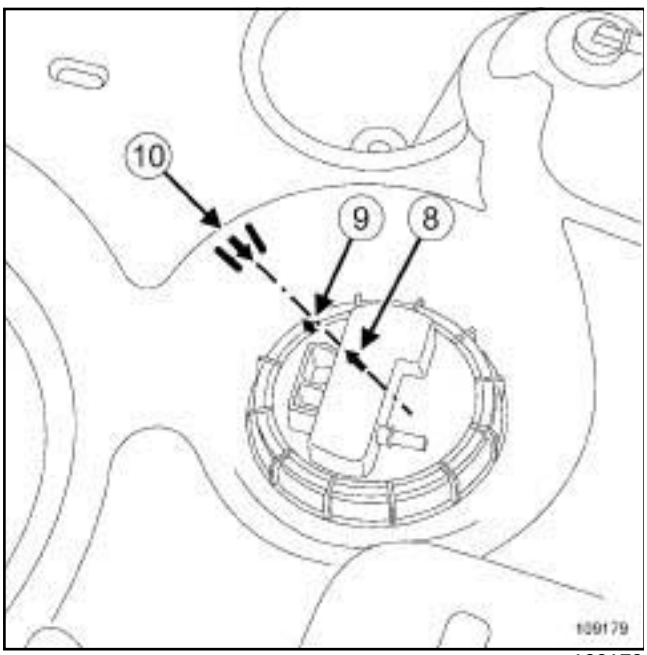
REFITTING

I - REFITTING PREPARATION OPERATION



❑ **parts always to be replaced: Fuel level sensor module nut**

❑ **parts always to be replaced: Fuel level sensor module seal**



K4M or K9K

II - REFITTING OPERATION

K4M

118996

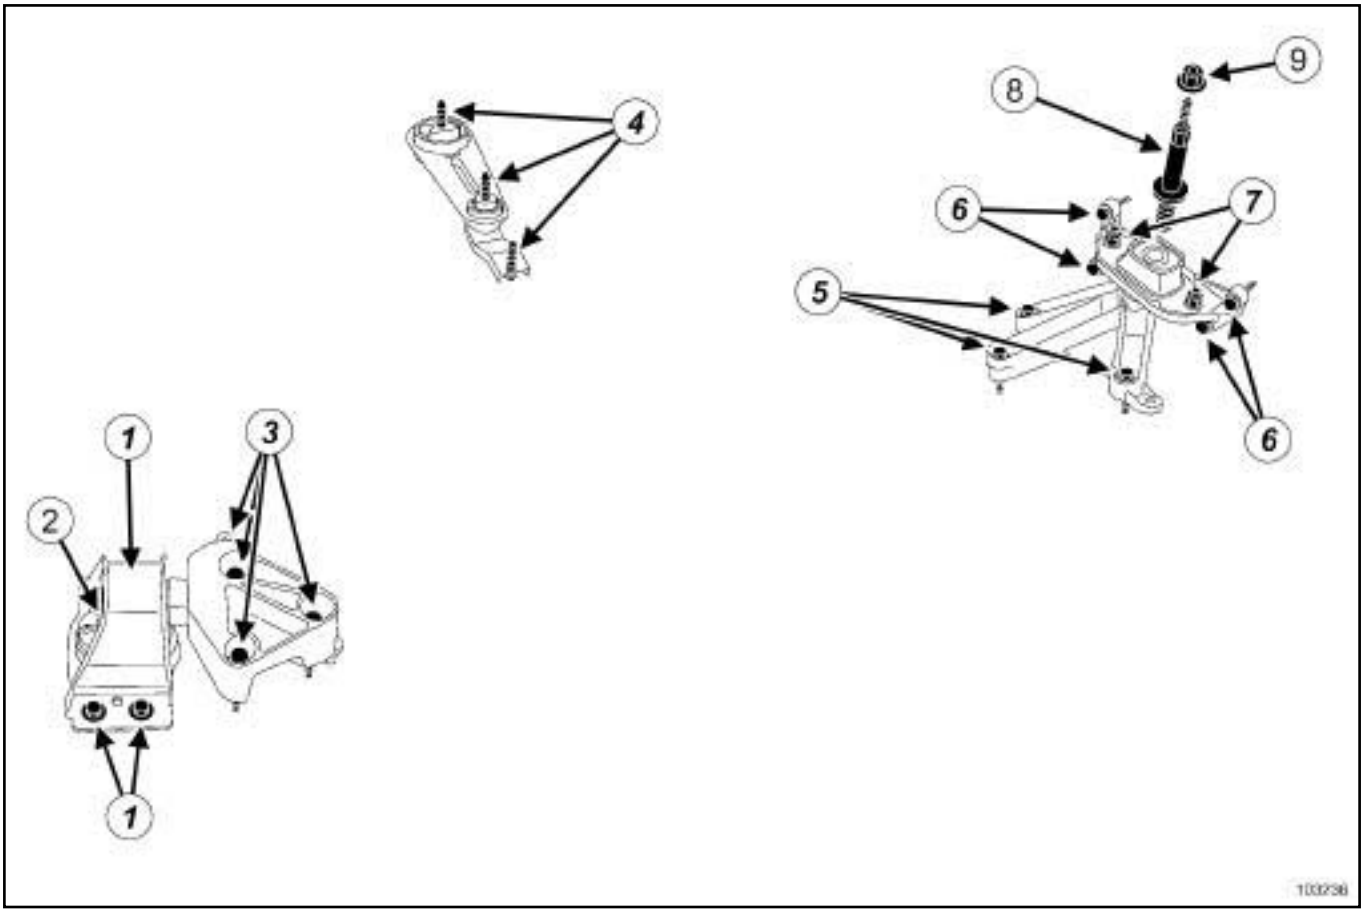
109179

❑ Position:

- the new seal (**6**) in the neck correctly,
- the fuel level sensor module on the fuel tank. A lug on the fuel level sensor module and a recess in the fuel tank ensure correct positioning in the fuel tank; the mark (**8**) on the fuel level sensor module must be positioned opposite the mark on the fuel tank (**10**) .

❑ Press the fuel level sensor module by hand (to prevent the seal from moving) and finger tighten the nut on the fuel tank.

❑ Then use the tool **(Mot. 1397)** to tighten the nut of the fuel level sensor module to the mark on the fuel tank.



K4M

❑ Tighten the nut ***(7)*** until the mark ***(9)*** on the nut is located opposite the mark ***(10)*** on the fuel tank using the tool **(Mot. 1397)**.

❑ Proceed in the reverse order to removal.

Suspended engine mounting: Tightening torque

K9K

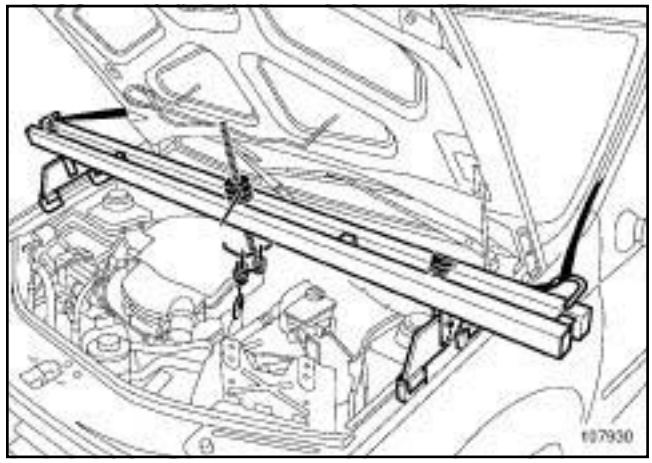
103236

No.	Description	Tightening torque (N.m)
(**1**)	Right-hand suspended mounting support bolt on the body	**62**
(**3**)	Right-hand suspended mounting support bolt on the engine	**62**
(**5**)	Left-hand mounting bolt on the gearbox	**62**
(**6**)	Left-hand rubber pad mounting bolt on the body	**21**
(**7**)	Left-hand rubber pad bolt on the mounting	**105**
(**8**)	Stud on the gearbox mounting	**180**
(**9**)	Gearbox mounting nut on the rubber pad	**62**

No.	Description	Tightening torque (N.m)
(4)	Engine tie-bar bolt	**180**

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽	
bolts mounting the left-hand suspended mounting on the gearbox	**62 N.m**
bolt of the power-assisted steering pipe on the left-hand suspended mounting	**21 N.m**
stud on the gearbox support	**180 N.m**
left-hand rubber pad mounting bolts on the body	**21 N.m**
rubber pad nuts on the left-hand suspended mounting	**105 N.m**
nut of the gearbox support on the rubber pad	**62 N.m**



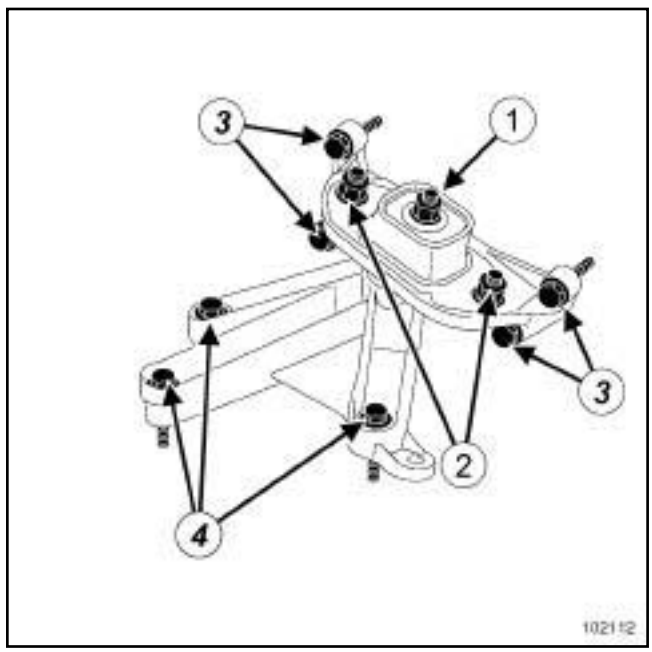
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the air inlet sleeve,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray,
- the injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-7**) ,
- the engine undertray.



107930

❏ Fit the engine support tool **(Mot. 1453)** with the retaining belt, taking the flywheel end lifting eye as an anchoring point.

❏ Mark the position of the left-hand suspended engine mounting on the body.

II - REMOVAL OPERATION

102112

❏ Remove the nut (**1**) from the gearbox support on the rubber pad.

❏ Strike the gearbox stud with a copper hammer to separate the engine and gearbox assembly from the body.

❏ Remove:

- the nuts (**2**) from the rubber pad,
- the rubber pad,

- the bolts (**3**) from the left-hand rubber pad mounting on the body,
- the left-hand rubber pad mounting,
- the power-assisted steering pipe bolt on the suspended mounting (if fitted to the vehicle),
- the left-hand suspended mounting bolts (**4**) on the gearbox,
- the left-hand suspended mounting on the gearbox.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Always replace the self-locking nuts.

II - REFITTING OPERATION

❏ Refit:

- the left-hand suspended mounting on the gearbox,
- the power-assisted steering pipe bolt on the suspended mounting (if fitted to the vehicle),
- the left-hand rubber pad mounting,
- the rubber pad,
- the rubber pad nuts on the left-hand suspended mounting,
- the gearbox support nut on the rubber pad.

❏ Torque tighten:

- the **bolts mounting the left-hand suspended mounting on the gearbox (62 N.m)**,
- the **bolt of the power-assisted steering pipe on the left-hand suspended mounting (21 N.m)**,
- the **stud on the gearbox support (180 N.m)**,
- the **left-hand rubber pad mounting bolts on the body (21 N.m)**,
- the **rubber pad nuts on the left-hand suspended mounting (105 N.m)**,
- the **nut of the gearbox support on the rubber pad (62 N.m)**.

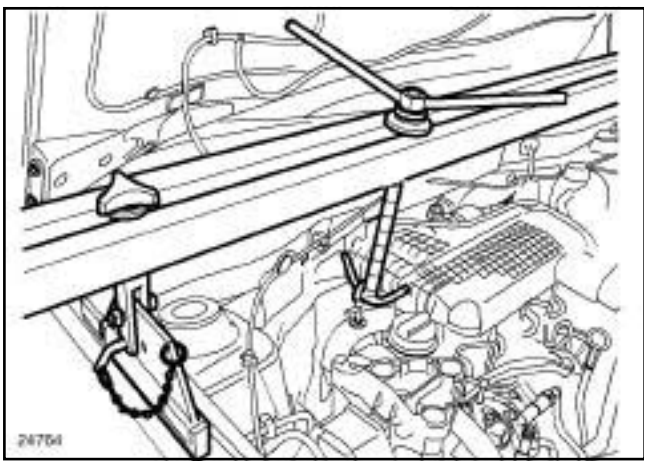
III - FINAL OPERATION

❏ Remove the engine support tool **(Mot. 1453)**.

❏ Refit:

- the engine undertray,
- the injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-7**) ,
- the battery tray,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air intake sleeve.

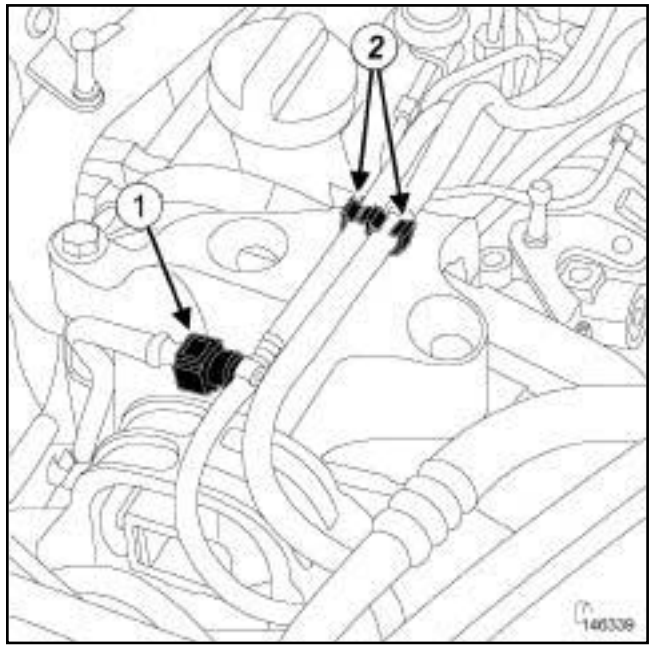
K9K



Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽	
right-hand suspended engine mounting bolts on the engine	**62 N.m**
right-hand suspended engine mounting bolts on the body	**62 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

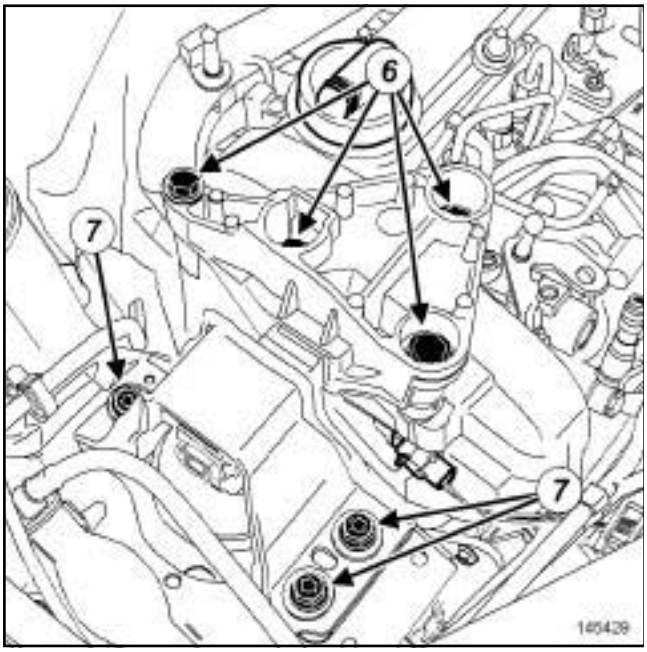
❏ Remove the front engine cover.

24764

❏ Fit the engine support tool **(Mot. 1453)** with the retaining belt, taking the timing end lifting eye as an anchoring point.

146339

❏ Disconnect the fuel pipe at (**1**) ,



❏ Insert the blanking plugs.

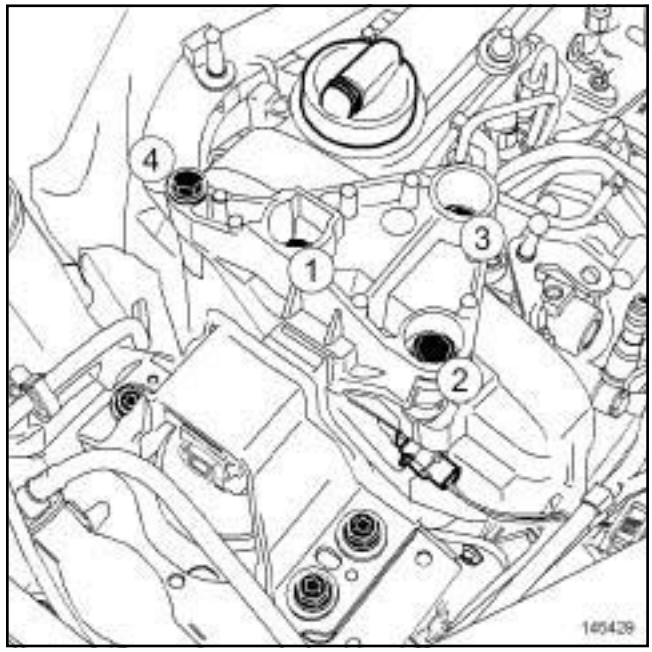
❏ Unclip the fuel pipes at (**2**) ,

❏ Move the fuel pipes aside.

K9K

II - REMOVAL OPERATION

145429



❏ Mark the position of the right-hand suspended engine mounting on the body.

❏ Remove:

- the bolts (**6**) from the right-hand suspended engine mounting on the engine,
- the right-hand suspended engine mounting bolts (**7**) on the body,
- the right-hand suspended engine mounting.

REFITTING

I - REFITTING OPERATION

145429

❏ Refit:

- the right-hand suspended engine mounting observing the marks made on the body during removal,
- the right-hand suspended engine mounting bolts on the engine,
- the right-hand suspended engine mounting bolts on the body.

❏ Torque tighten in order the **right-hand suspended engine mounting bolts on the engine (62 N.m)**.

❏ Torque tighten the **right-hand suspended engine mounting bolts on the body (62 N.m)**.

II - FINAL OPERATION

❏ Position the fuel pipes.

❏ Clip on the fuel pipes at ***(2)*** .

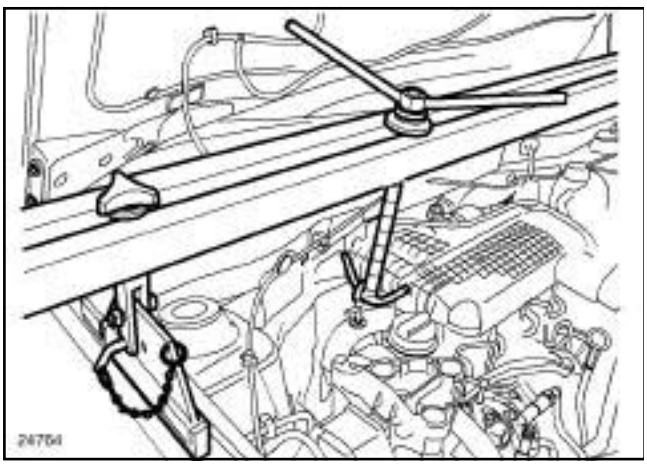
❏ Remove the blanking plugs.

❏ Connect the fuel pipe at ***(1)*** .

❏ Remove the engine support tool **(Mot. 1453)** and the retaining strap.

❏ Refit the engine cover.

K4M

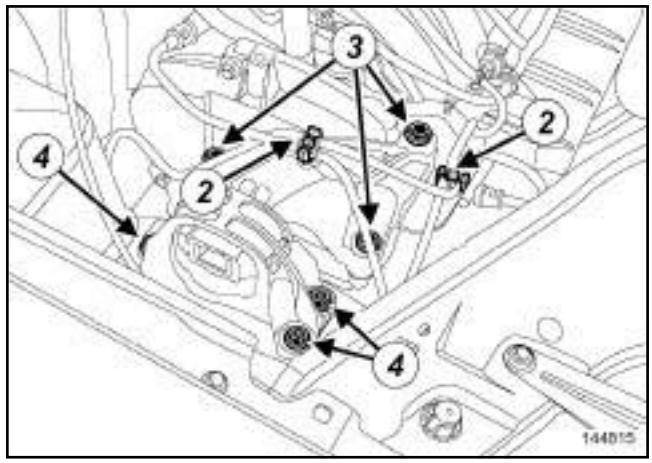


Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.

Tightening torques ▽	
right-hand suspended engine mounting bolts on the engine	**62 N.m**
right-hand suspended engine mounting bolts on the body	**62 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Remove the front engine cover.

24764

❏ Fit the engine support tool **(Mot. 1453)** with the retaining belt, taking the timing end lifting eye as an anchoring point.

II - REMOVAL OPERATION

144815

❏ Detach at (**2**) :

- the fuel supply pipe,
- the petrol vapour recirculation pipe.

❏ Mark the position of the right-hand suspended engine mounting on the body.

❏ Remove:

- the bolts ***(3)*** from the right-hand suspended engine mounting on the engine,
- the right-hand suspended engine mounting bolts ***(4)*** on the body,
- the right-hand suspended engine mounting.

REFITTING

I - REFITTING OPERATION

❏ Refit:

- the right-hand suspended engine mounting observing the marks made on the body during removal,
- the right-hand suspended engine mounting bolts on the engine,
- the right-hand suspended engine mounting bolts on the body.

❏ Torque tighten:

- the **right-hand suspended engine mounting bolts on the engine (62 N.m)**,
- the **right-hand suspended engine mounting bolts on the body (62 N.m)**.

❏ Clip:

- the fuel supply pipe,
- the petrol vapour recirculation pipe.

K4M

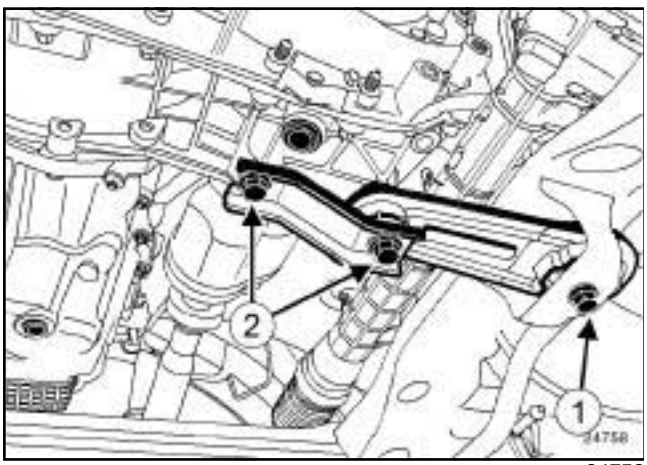
II - FINAL OPERATION

❑ Remove the engine support tool **(Mot. 1453)**.

❑ Refit the engine cover.

Tightening torques ▽	
rear suspended engine mounting bolt on the subframe	**105 N.m**
rear suspended engine mounting bolts on the gearbox	**105 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove the engine undertray.

II - REMOVAL OPERATION

JR5

24758

❏ Remove:

- the rear suspended engine mounting bolt (**1**) from the subframe,
- the rear suspended engine bolts (**2**) from the gear-box,
- the rear suspended engine mounting.

REFITTING

I - REFITTING OPERATION

❏ Refit:

- the rear suspended engine mounting,
- the rear suspended engine mounting bolts.

❏ Torque tighten:

- the **rear suspended engine mounting bolt on the subframe (105 N.m)**,
- the **rear suspended engine mounting bolts on the gearbox (105 N.m)**.

II - FINAL OPERATION

❏ Refit the engine undertray.

❏ Tighten the engine undertray bolts.

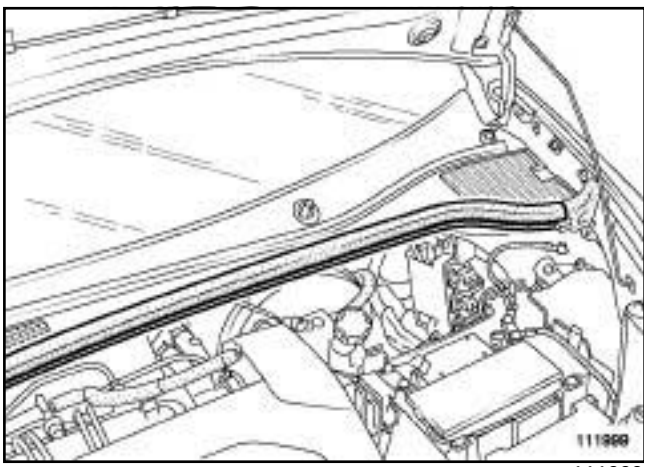
K9K

Special tooling required	
Mot. 1577	Lip seal extractor (shaft diameter 28 mm to 42 mm).



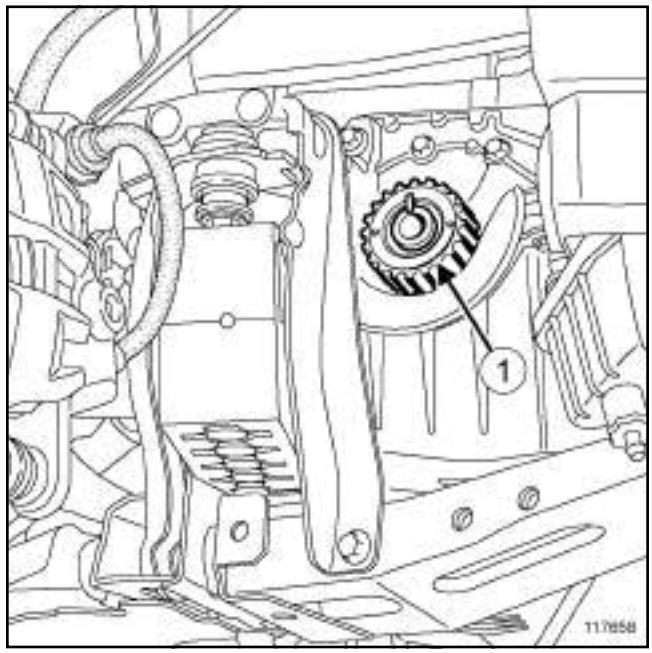
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

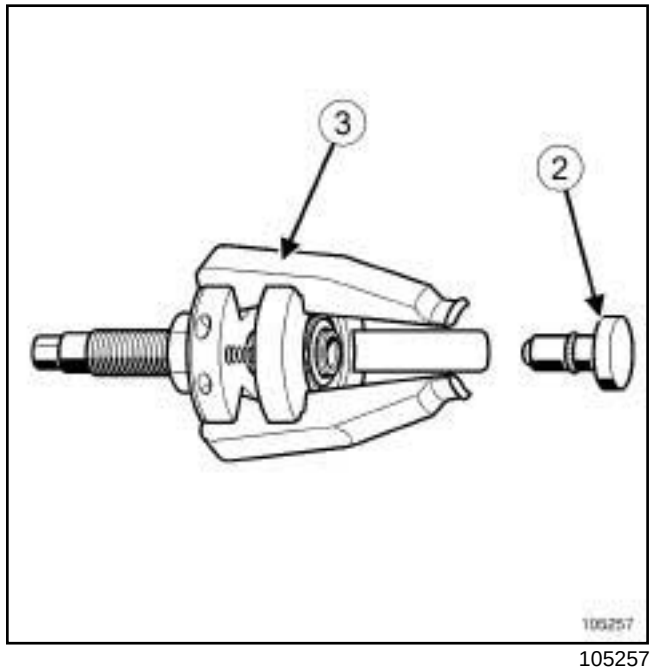
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the front engine cover.



111999

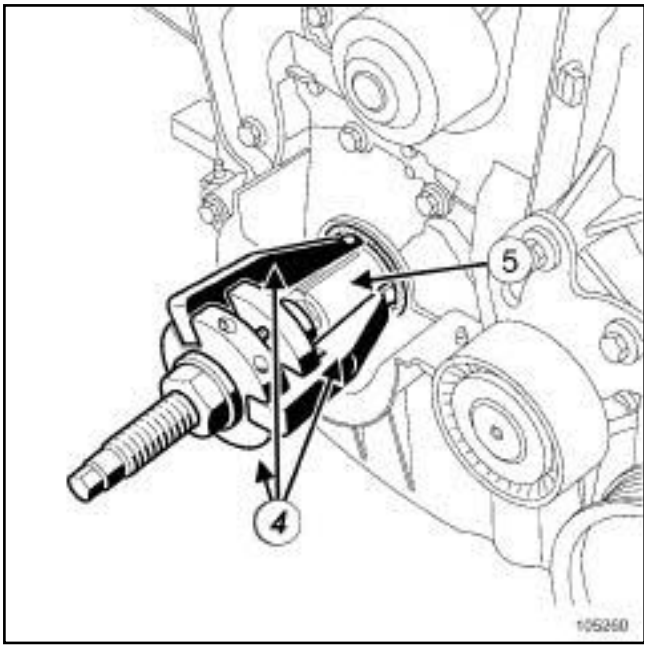
❏ Remove:



- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

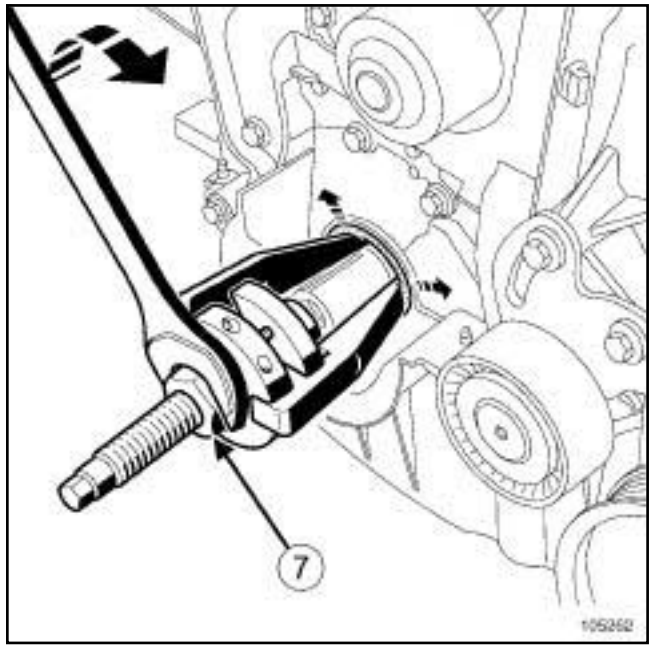
II - OPERATION FOR REMOVAL OF PART CONCERNED

117658



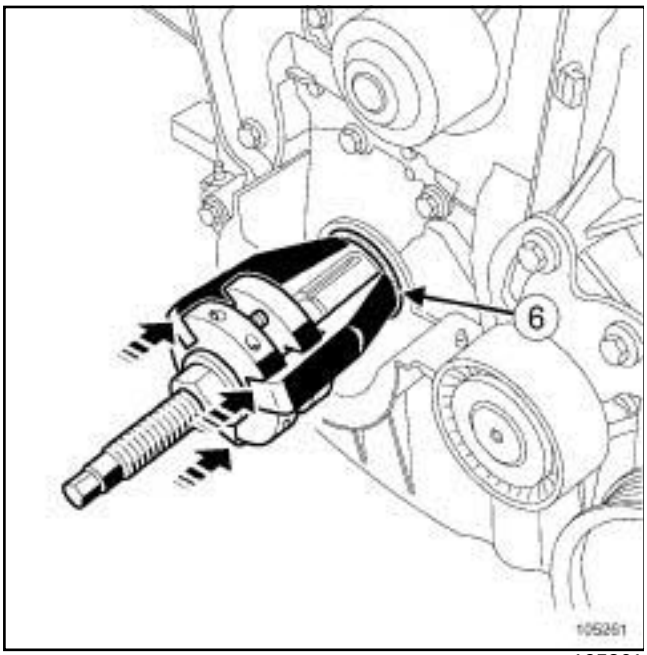
❏ Remove the timing sprocket (**1**) .

105257



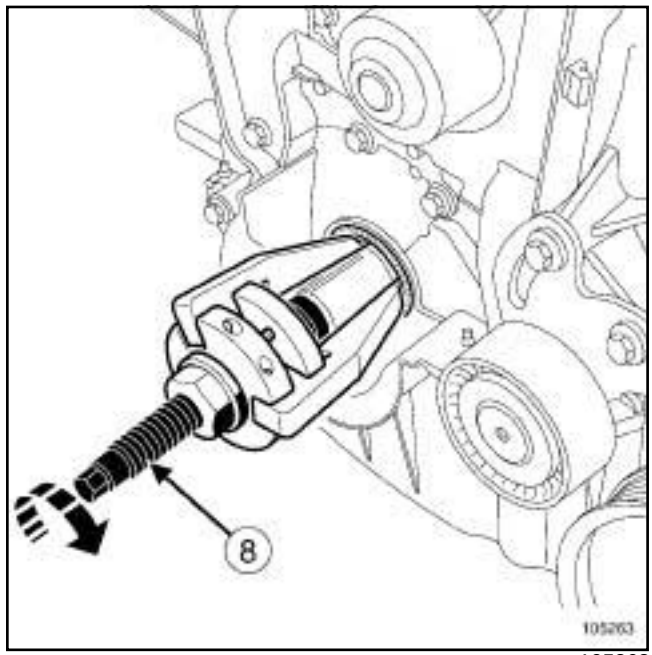
❏ Fit the end piece (**2**) of the **(Mot. 1577)** (**3**) .

K9K



105260

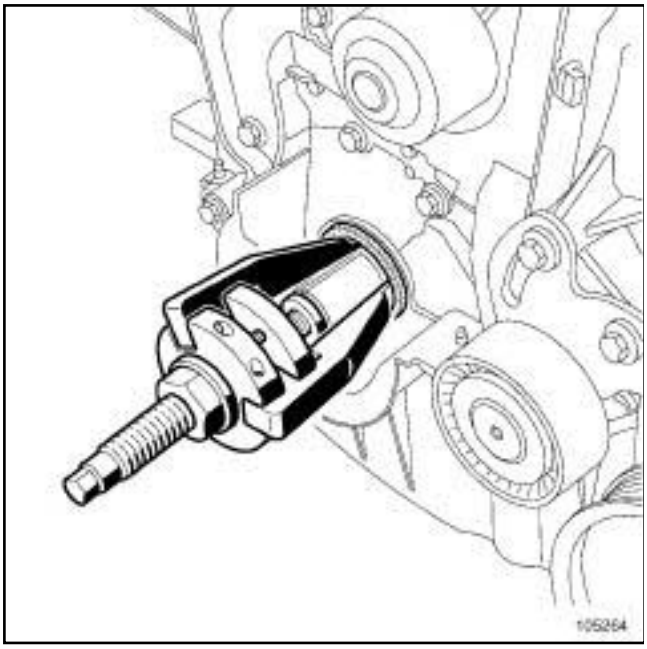
❑ Position the jaws (**4**) of the **(Mot. 1577)** on the crankshaft (**5**) .



105262

❑ Move the jaws away by tightening the bolt (**7**) using an open-jawed spanner.

105261



❑ Push the **(Mot. 1577)** until contact is made between the ends (**6**) of the jaws and the crankshaft seal.

105263

❑ Screw down the threaded rod (**8**) of the **(Mot. 1577)**.

K9K

105264

❑ Remove the crankshaft seal using the **(Mot. 1577)**.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

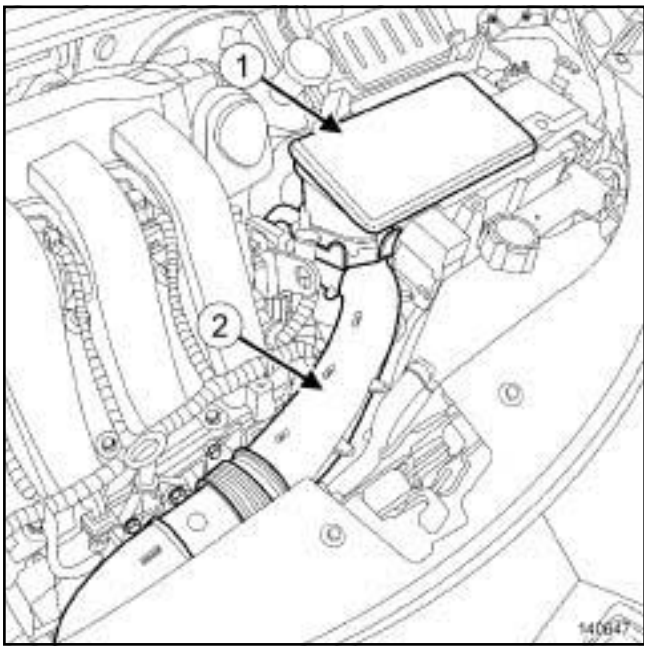
- the crankshaft seal (see **Cylinder block: Rebuilding**) (Technical Note 6006, 10A, Engine and peripherals),
- the timing sprocket.

II - FINAL OPERATION

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



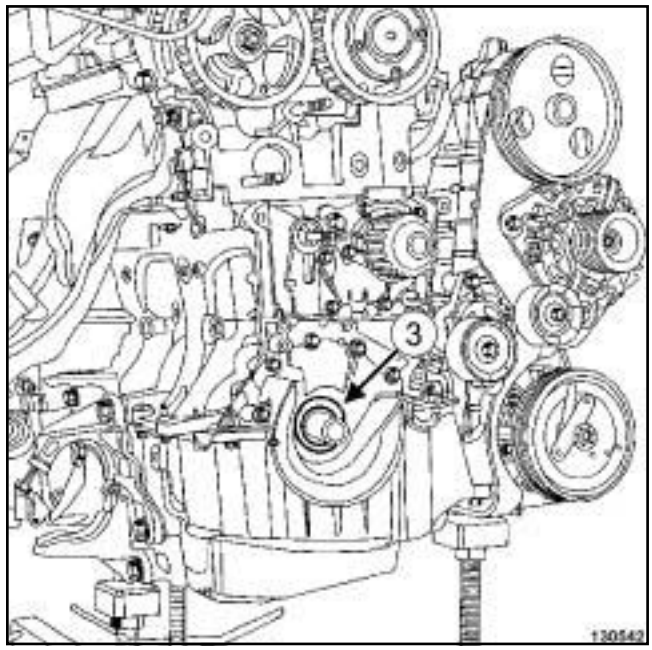
K4M

Special tooling required	
Mot. 1385	Tool for fitting the crankshaft seal, timing end (35 x 47 x 7).

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



140647

❑ Remove:

- the air resonator (**1**) ,
- the air filter unit air inlet pipe (**2**) ,
- the engine undertray bolts,
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

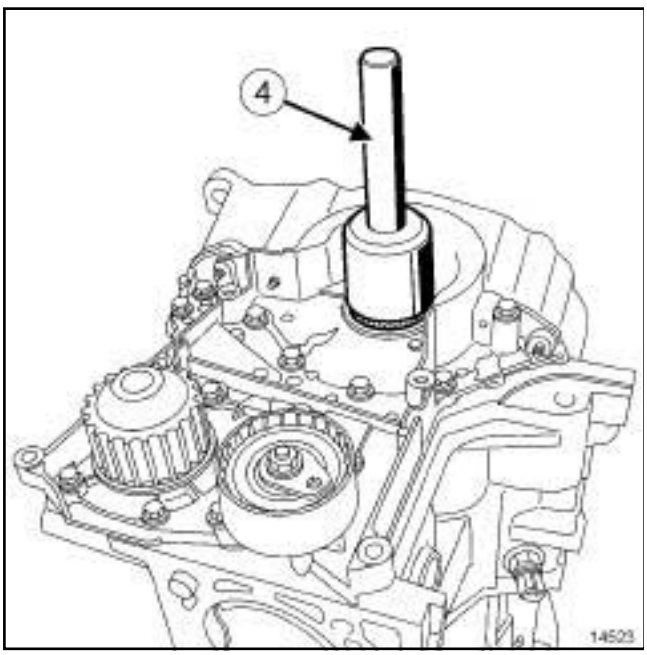
130542

❑ Remove the crankshaft seal (**3**) .

K4M

REFITTING

I - REFITTING PREPARATION OPERATION



❑ **parts always to be replaced: Crankshaft seal on timing end (10,03,03,04)**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the crankshaft seal mating face,
- the cylinder block seal housing.

> **WARNING**
> To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

II - REFITTING OPERATION FOR PART CONCERNED

14523

❑ Refit a new crankshaft seal using the **(Mot. 1385)** (**4**) .

III - FINAL OPERATION

❑ Refit:

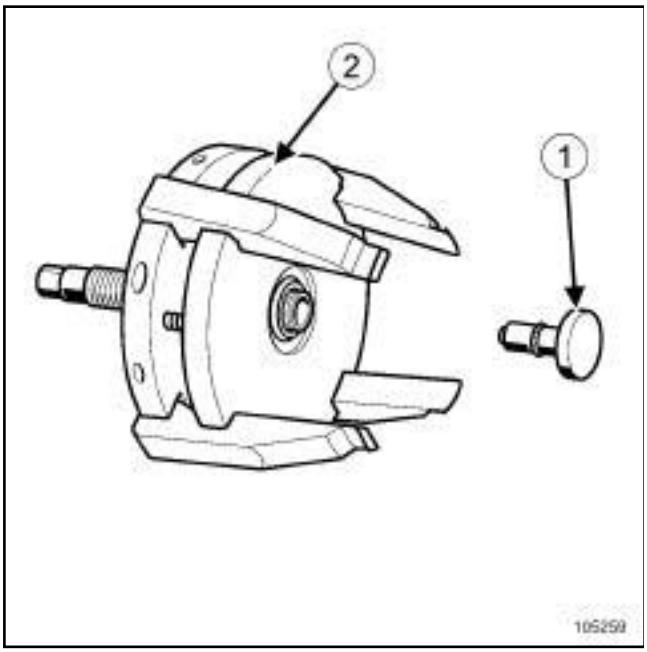
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray,
- the air filter unit air inlet pipe,
- the air resonator.

K4M

K9K

Special tooling required	
Mot. 1579	Lip seal extractor (shaft diameter 80 mm to 98 mm).

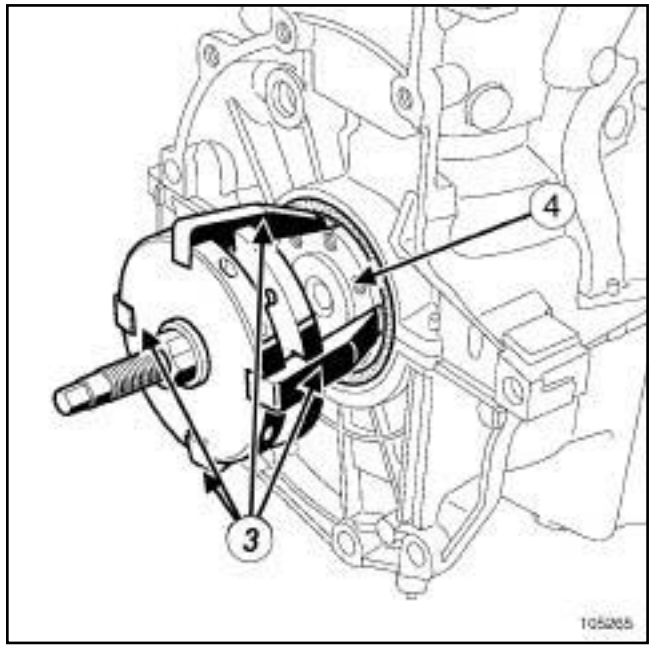
REMOVAL



I - REMOVAL PREPARATION OPERATION

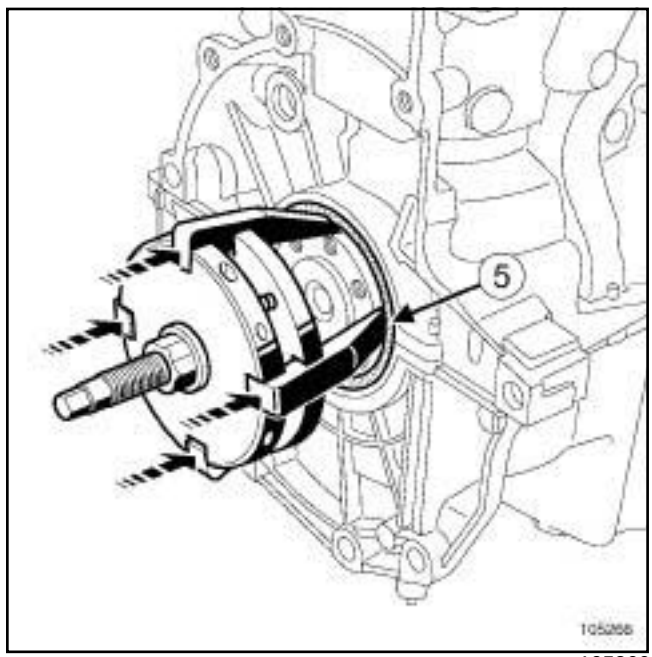
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:



- the gearbox (see **Manual gearbox: Removal - Refitting**) (MR 392, 21A, Manual gearbox),
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) (MR 392, 20A, Clutch),
- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-238**) (MR 392, 20A, Clutch).

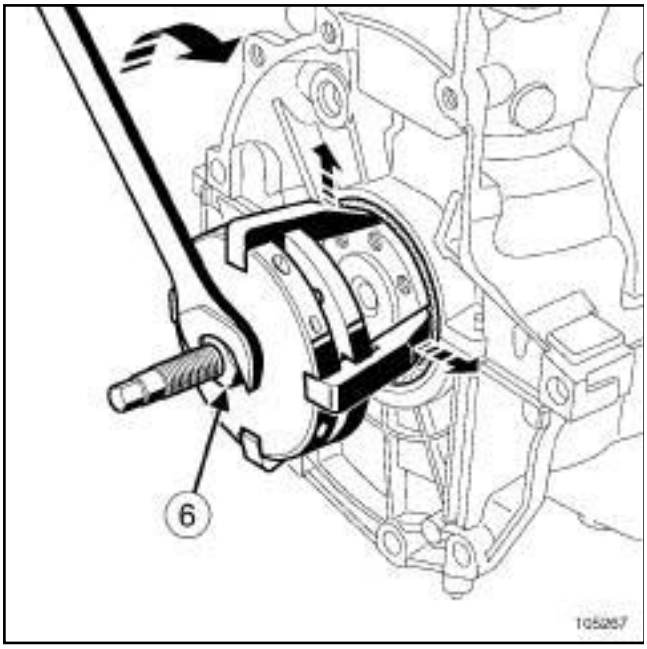
II - OPERATION FOR REMOVAL OF PART CONCERNED



105259

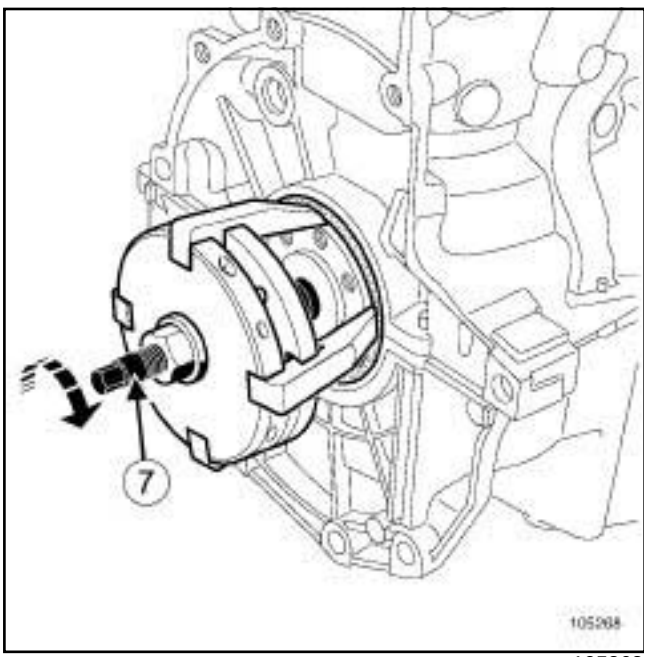
❏ Fit the end piece (**1**) of the **(Mot. 1579)** (**2**) .

105265



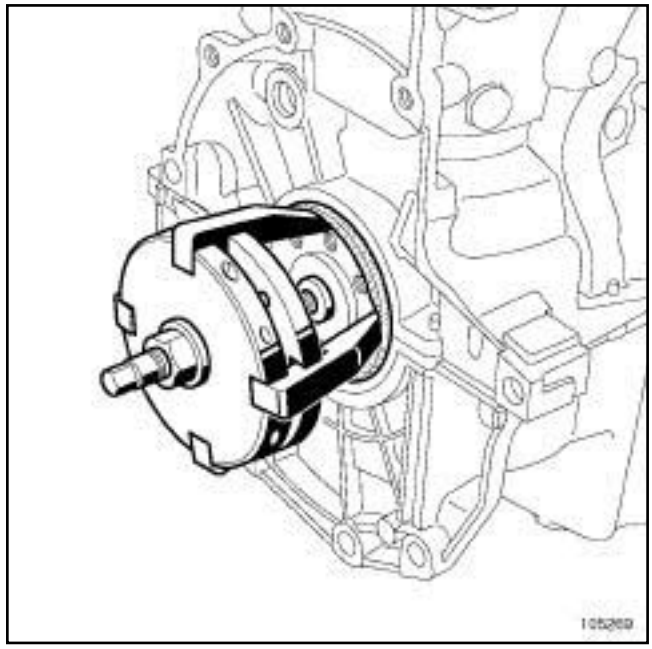
❏ Position the jaws (**3**) of the **(Mot. 1579)** on the crankshaft (**4**) .

105266



❏ Push the tool until contact is made between the ends (**5**) of the jaws and the crankshaft seal.

K9K



105267

❑ Move the jaws away by tightening the bolt (**6**) using an open-jawed spanner.

105268

❑ Screw down the threaded rod of the (**7**) **(Mot. 1579)**.

105269

❑ Remove the crankshaft seal using the **(Mot. 1579)**.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

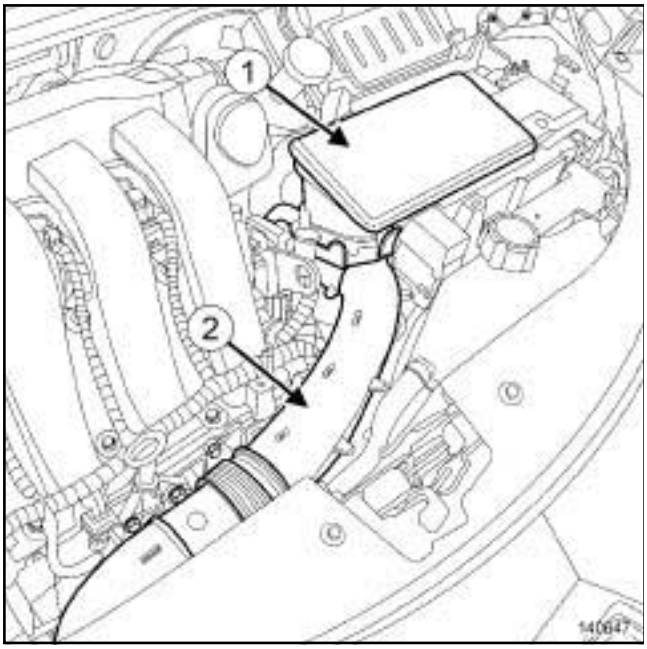
❑ Refit the crankshaft seal on the gearbox side (see **Cylinder block: Rebuilding**) (Technical Note 6006A, 10A, Engine and peripherals).

II - FINAL OPERATION.

❑ Refit:

- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-238**) (MR 392, 20A, Clutch),
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) (MR 392, 20A, Clutch),
- the gearbox (see **Manual gearbox: Removal - Refitting**) (MR 392, 21A, Manual gearbox).

K4M



Special tooling required	
Mot. 1129-01	Tool for fitting the crankshaft seal, flywheel end (80 x 100 x 8 seal).

REMOVAL

I - REMOVAL PREPARATION OPERATION

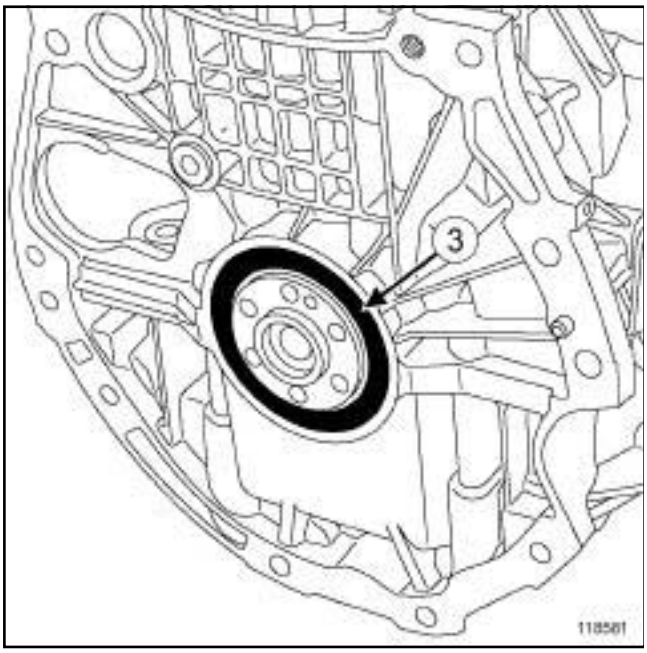
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

K4M

140647

❑ Remove:

- the air resonator (**1**) ,
- the air filter unit air inlet pipe (**2**) ,
- the engine undertray bolts,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) ,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .



❑ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❑ Remove:

- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox),
- the « pressure plate - disc » assembly (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch),
- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-238**) .

K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED

118581

❑ Remove the crankshaft seal (**3**) using a screwdriver.

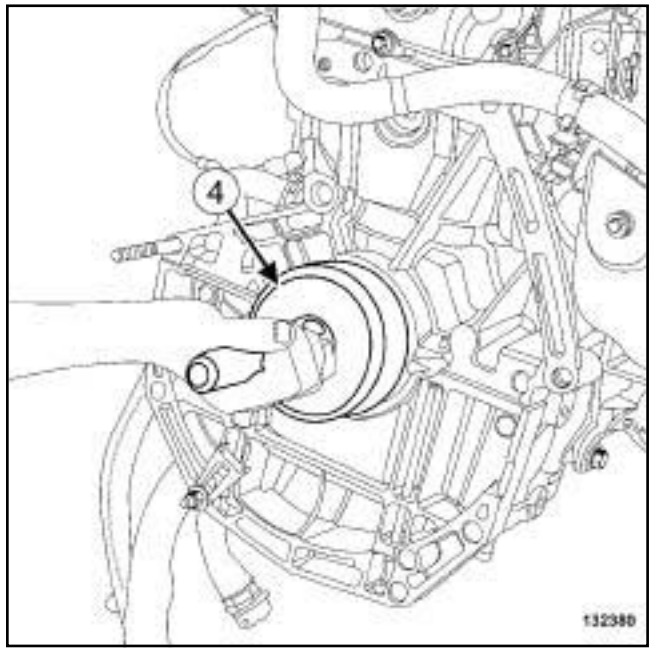
Note:

Take care not to damage the crankshaft mating face.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Crankshaft seal on gearbox end (10,03,03,05)**.



❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the crankshaft seal mating face,
- the seal housing on the cylinder block.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

II - REFITTING OPERATION FOR PART CONCERNED

132380

❑ Refit a new crankshaft seal using the **(Mot. 1129-01)** (**4**) .

III - FINAL OPERATION

❑ Refit:

- the flywheel (see **10A**, **Engine and cylinder block assembly**, **Flywheel: Removal - Refitting**, page **10A-238**) ,
- the « pressure plate - disc » assembly (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch),
- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❑ Fill the gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❑ Refit:

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,

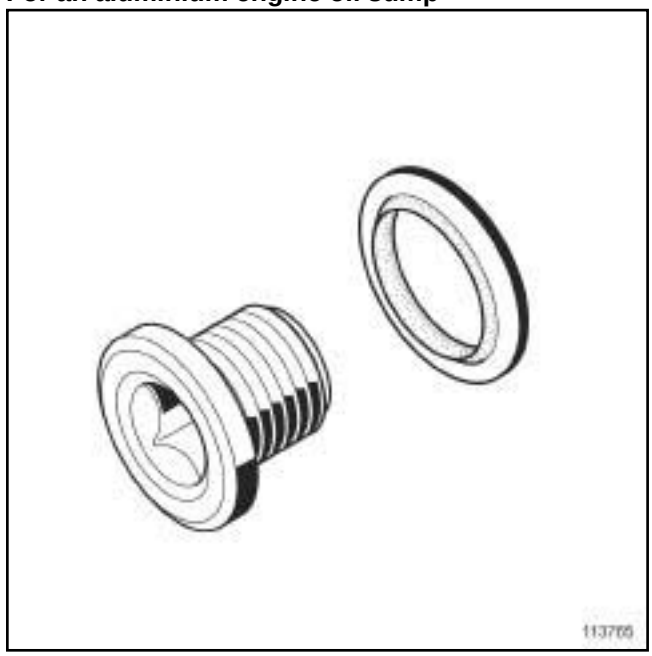
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .
- the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine undertray,
- the air filter unit air inlet pipe,
- the air resonator.

D4F or K4J or K4M or K9K

Special tooling required	
Mot. 1018	8 mm square engine drain plug spanner.

Equipment required
oil recovery tray
oil change wrench
torque wrench
oil change end piece with an 8 mm square drive

Tightening torques ▽	
drain plug	**20 N.m**



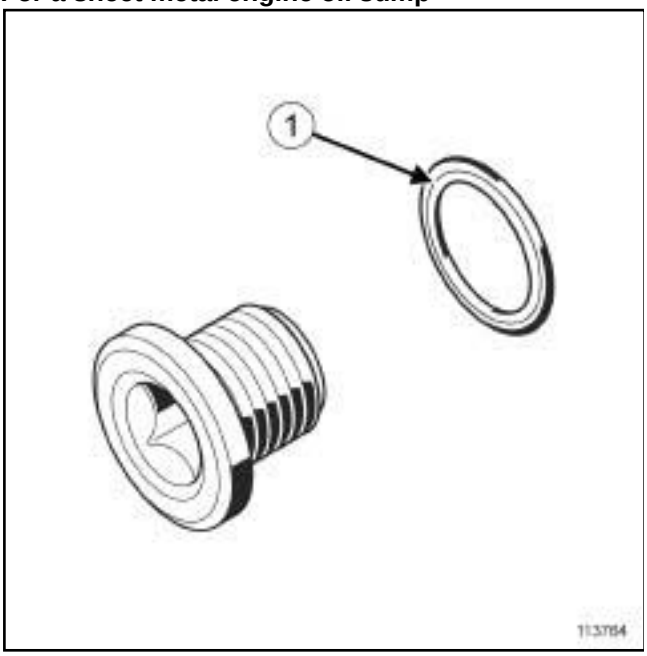
Engine	Average oil capacity (adjust with dipstick) (l)	
	Draining	**Oil change plus oil filter replacement**
K4J	4.9	5
K4M	4.9	5
K9K	4.4	4.5
D4F	3.8	4

I - RECOMMENDATIONS FOR REPAIR

❏ Direction of fitting of the drain plug seal.

K4J or K4M or K9K

For an aluminium engine oil sump



113765

❏ There is no direction of fitting for a seal fitted with a rubber lip.

D4F or K4J or K4M or K9K

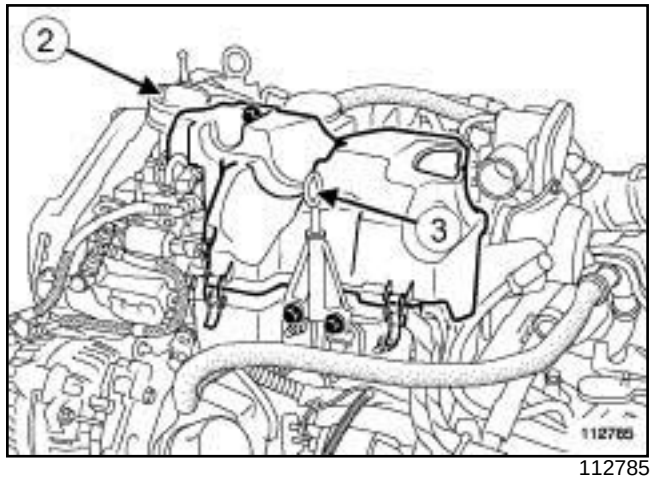
D4F

For a sheet metal engine oil sump

113764

❑ Position the slot (**1**) of the seal towards the drain plug.

II - PARTS AND CONSUMABLES FOR REPAIR



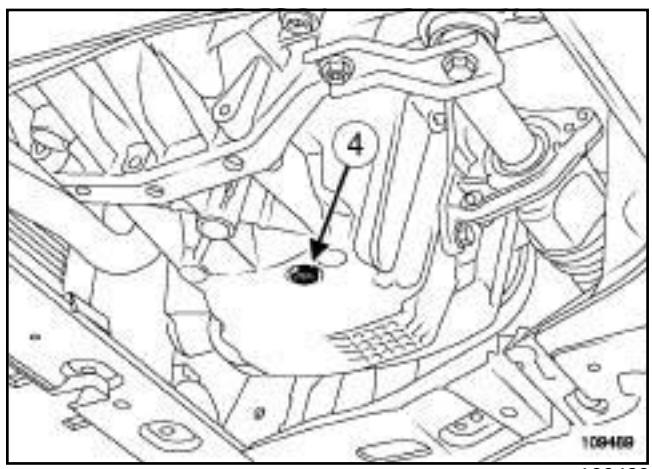
❑ **parts always to be replaced: Drain plug seal on engine oil sump (10,03,01,04)**.

❑ Consumable:

- engine oil (see **Engine oil: Specifications**) (Technical Note 6013A, 04A, Lubricants).

III - DRAINING

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



112785

❑ Remove

- the engine oil filler cap (**2**) ,
- the dipstick (**3**) ,
- the engine undertray.

❑ Place the **oil recovery tray** under the engine.

109489

❑ Remove the drain plug (**4**) from the engine oil sump using the **(Mot. 1018)** or a **oil change wrench**.

❑ Let the engine oil flow out.

❑ Remove the seal from the drain plug.

❑ Fit the new seal on the drain plug, positioning it correctly.

❑ Screw the drain plug onto the engine oil sump.

❑ Torque tighten the **drain plug (20 N.m)** using a **torque wrench** and a **oil change end piece with an 8 mm square drive**.

❑ Use a cloth to wipe away any oil drips on the engine oil sump.

❑ Remove the **oil recovery tray**.

❑ Refit the engine undertray.

D4F or K4J or K4M or K9K

IV - FILLING

❑

WARNING

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

Prevent oil outflow on the engine to avoid damaging the surrounding components.

❑ Use a funnel to fill the engine with engine oil recommended by the manufacturer (see **Engine oil: Specifications**) (Technical Note 6013A, 04, Lubricants).

Note:

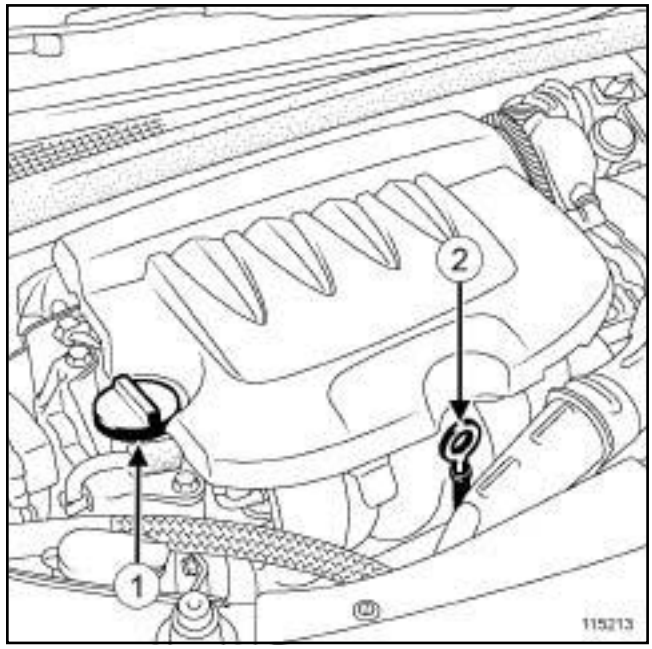
When filling up the engine oil, always leave at least **10 minutes** for the oil to drain down before checking the level on the dipstick.

❑ Top up the oil level if necessary.

❑ Refit:

- the engine oil filler cap,
- the dipstick.

M4R



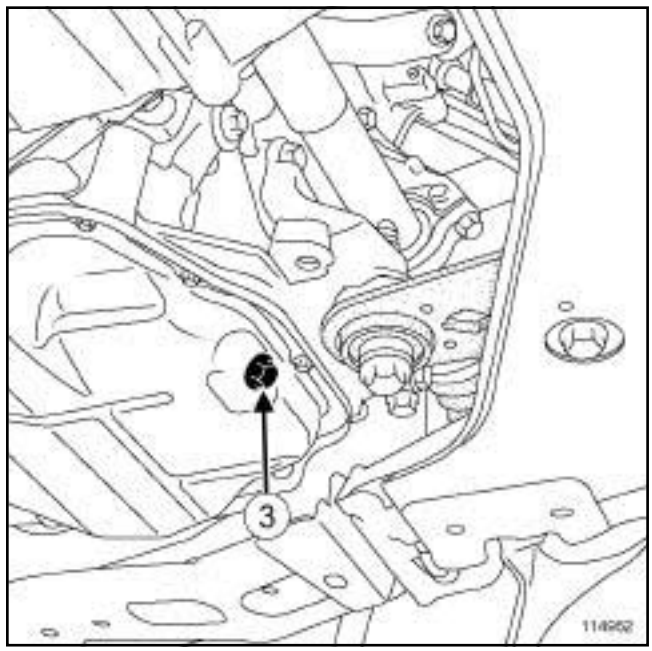
Equipment required
oil recovery tray
funnel

Tightening torques ▽	
drain plug	**34 N.m**

Engine	Average oil capacity (use dipstick)	
	Draining	**Oil change plus oil filter replacement**
M4R Without removal - refitting of sump	3.3	3.5
M4R With removal - refitting of sump	4.2	4.4

I - DRAINING

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

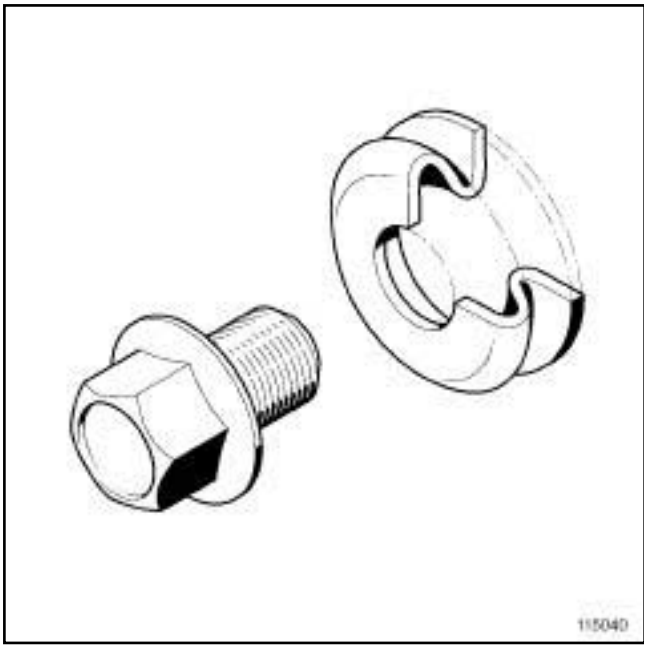


115213

❏ Remove:

- the oil filler cap (**1**) ,

- the dipstick (**2**) .



114952

❏ Fit a **oil recovery tray** under the engine oil drain plug.

❏ Remove the drain plug (**3**) .

❏ Allow the engine oil to flow into the oil recovery container.

115040

❑ Refit the new seal onto the drain plug, respecting the direction indicated in the diagram.

❑ Torque tighten the **drain plug (34 N.m)**.

❑ Clean the traces of oil around the drain plug so that any possible leaks can be detected.

II - FILLING

❑

WARNING
Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (as this could damage the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

Prevent oil outflow on the engine to avoid damaging the surrounding components.

❑ Use a **funnel** to fill the engine with engine oil recommended by the manufacturer (see **Engine oil: Specifications**) (Technical Note 6013A, 04, Lubricants)

Note:

When filling up the engine oil, always leave at least **10 minutes** for the oil to drain down before checking with a dipstick

❑ Check the oil level with the dipstick.

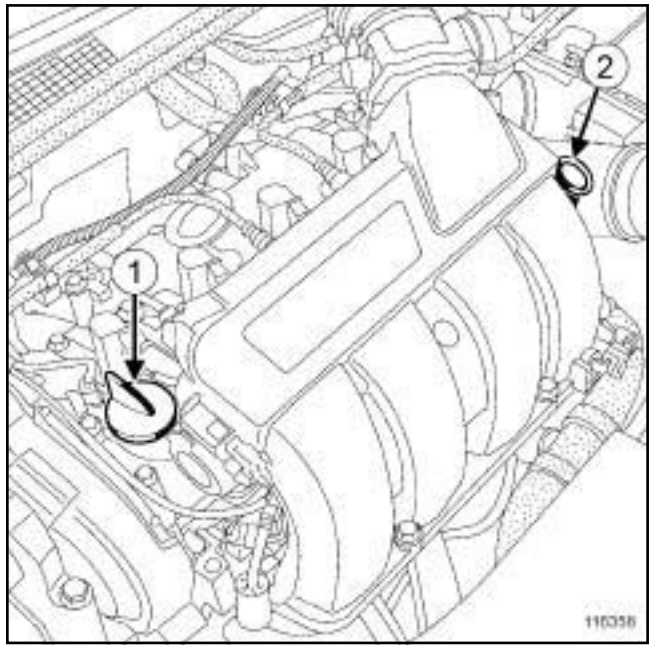
❑ Refit the engine oil filler cap.

Engine oil: Draining - Refilling

F4R

Special tooling required	
Mot. 1018	8 mm square engine drain plug spanner.

Equipment required
oil recovery tray
oil change end piece with an 8 mm square drive
funnel

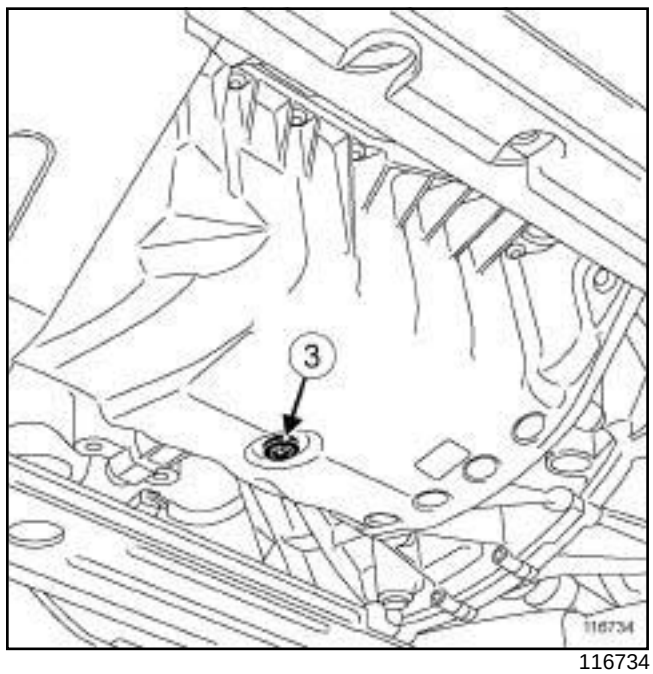


Tightening torques ▽	
drain plug	**20 N.m**

Engine	Average oil capacity (use dipstick)	
	Draining	**Oil change plus oil filter replacement**
F4R	5.2	5.4

❑ **parts always to be replaced: Drain plug seal on engine oil sump (10,03,01,04)**

I - DRAINING

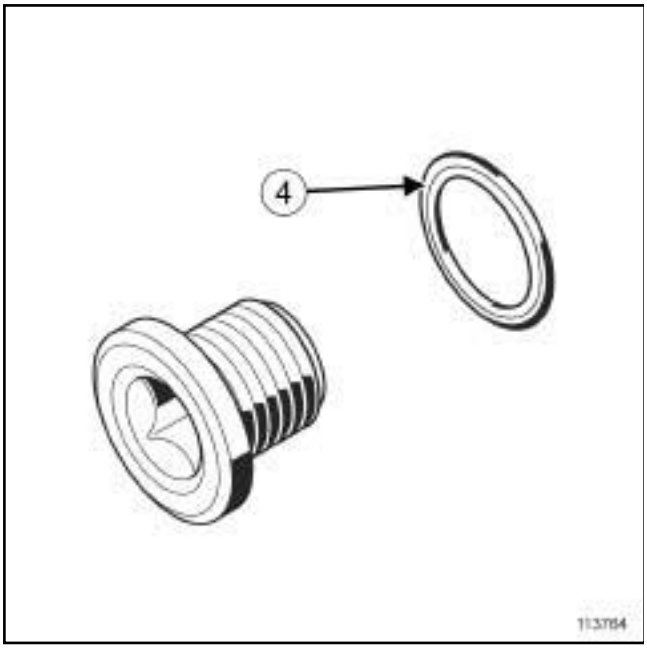


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

116358

❑ Remove:

- the oil filler cap (**1**) ,
- the dipstick (**2**) .



116734

❑ Fit a **oil recovery tray** under the drain plug (**3**) .

❑ Remove the drain plug (**3**) using the **(Mot. 1018)**.

❑ Allow the engine oil to flow into the oil recovery container.

F4R

113764

❑ Fit the new drain plug seal (position the seal groove (**4**) facing the drain plug).

❑ Torque tighten the **drain plug (20 N.m)** using a **oil change end piece with an 8 mm square drive**.

❑ Clean the traces of oil around the drain plug so that any possible leaks can be detected.

II - FILLING

❑

WARNING
Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (as this could damage the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

Prevent oil outflow on the engine to avoid damaging the surrounding components.

❑ Use a **funnel** to fill the engine with engine oil recommended by the manufacturer (see **Engine oil: Specifications**) (Technical Note 6013A, 04, Lubricants).

Note:

When filling up the engine oil, always leave at least **10 minutes** for the oil to drain down before checking the level on the dipstick.

❑ Check the engine oil level using the dipstick.

❑ Refit:

- the oil filler cap,

- the dipstick.

K9K

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter)

Equipment required
oil recovery tray

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

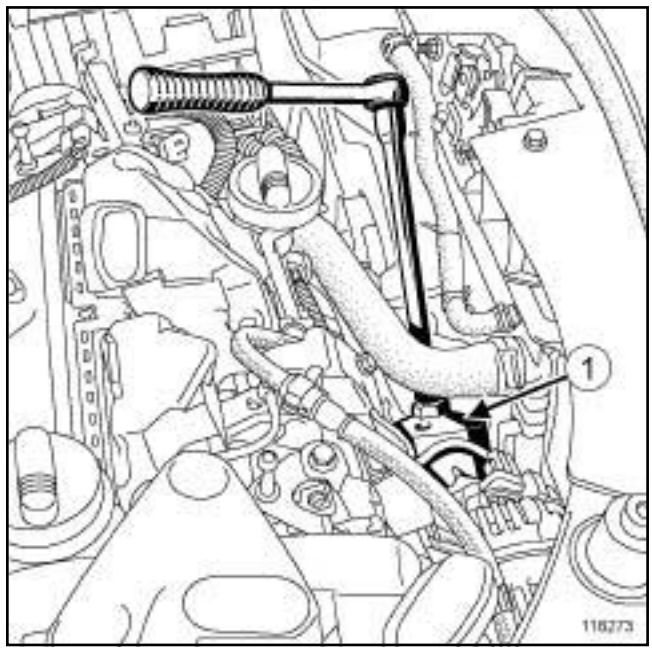
Correct the engine oil level if necessary before delivering the vehicle to the customer.

Note:

When topping up the engine oil, always leave at least **10 minutes** before checking the level with a dipstick.

When removing the oil filter, check that the oil filter seal is not still stuck to the cylinder block or oil filter.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Fit a **oil recovery tray**.

❏ Separate the turbocharger pressure regulation solenoid valve from the fan assembly (if equipped).

II - OIL FILTER REMOVAL OPERATION

118273

❏ Position the **(Mot. 1329)** (**1**) with an extension piece and a ratchet on the oil filter.

❏ Remove the oil filter.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - products) to clean and degrease the joint face of the oil filter on the engine.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❏ **parts always to be replaced: Oil filter (10,05,05, 03)**

❏ Lubricate the new oil filter seal.

II - OIL FILTER REFITTING OPERATION

❏ Refit the oil filter.

❏ Tighten the oil filter until the seal makes contact with the engine.

❏ Tighten the oil filter by hand **3/4** of a turn.

K9K

III - FINAL OPERATION

- ❑ Fit the turbocharger pressure regulation solenoid valve on the fan assembly (if equipped).
- ❑ Wipe any oil run-off with a cloth.
- ❑ Top up the engine oil with oil recommended by the manufacturer (see **Engine oil: Specifications**) (Technical Note 6013A, 04A, Lubricants).
- ❑ Start the vehicle and wait until the oil pressure warning light goes out on the instrument panel.
- ❑ Check for leaks from the oil filter.
- ❑ Remove the **oil recovery tray**.
- ❑ Check the oil level using the dipstick.

Note:

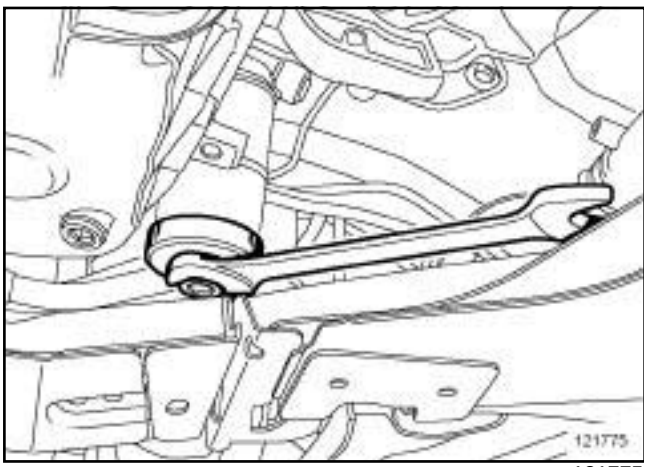
The level should be between MIN and MAX.

- ❑ Adjust the oil level.

D4F

Special tooling required	
Mot. 1330	Oil filter removing tool (66 mm diameter).

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove the engine undertray.

❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

121775

❑ Remove the oil filter using tool **(Mot. 1330)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Coat the new oil filter sealing ring with engine oil.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Tighten the oil filter until it makes contact.

❑ Tighten the **oil filter by 3/4 of a turn** with the **(Mot. 1330)**.

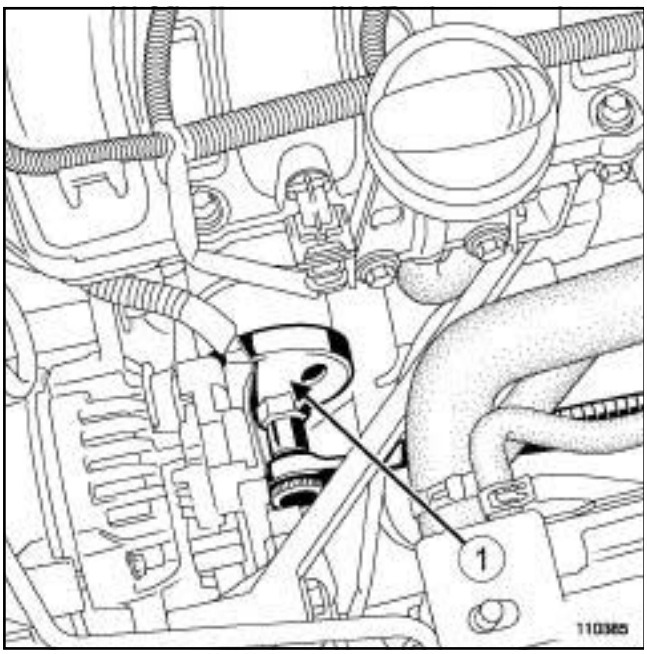
III - FINAL OPERATION.

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Refit the engine undertray.

K4J or K4M

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter)



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - REMOVAL OF THE PART CONCERNED

110385

❑ Fit the **(Mot. 1329)** (**1**) with a ratchet on the oil filter.

❑ Remove the oil filter.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Lubricate the new oil filter seal.

II - REFITTING PART CONCERNED

❑ Tighten the oil filter until the seal makes contact with the engine.

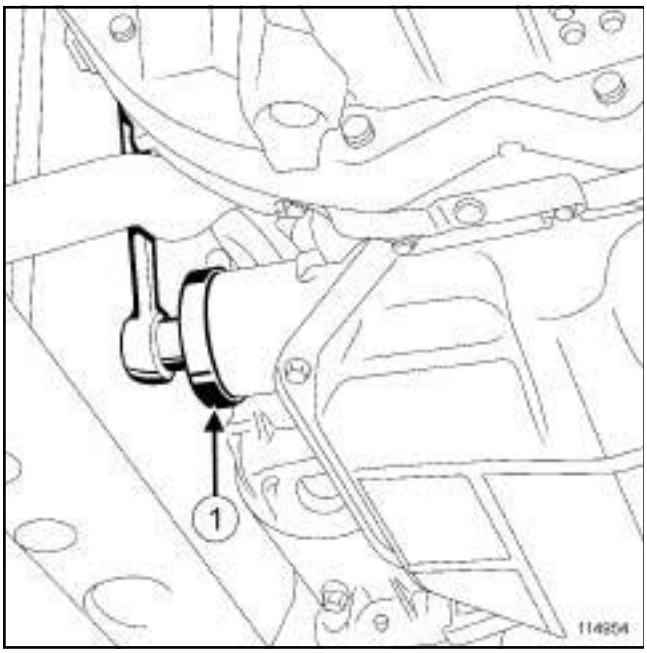
❑ Tighten the oil filter three-quarters of a turn by hand.

III - FINAL OPERATION

❑ Top up the engine with oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

M4R

Special tooling required	
Mot. 1654	Oil filter removing tool (64 mm diameter).



REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - REMOVAL OF PART CONCERNED

114954

❑ Fit at (**1**) the **(Mot. 1654)** with a ratchet on the oil filter.

❑ Remove the oil filter.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Lubricate the new oil filter seal with engine oil.

II - REFITTING THE PART CONCERNED

❑ Tighten the oil filter until the seal makes contact with the engine.

❑ Tighten oil filter **3/4 of a turn** by hand.

III - FINAL OPERATION

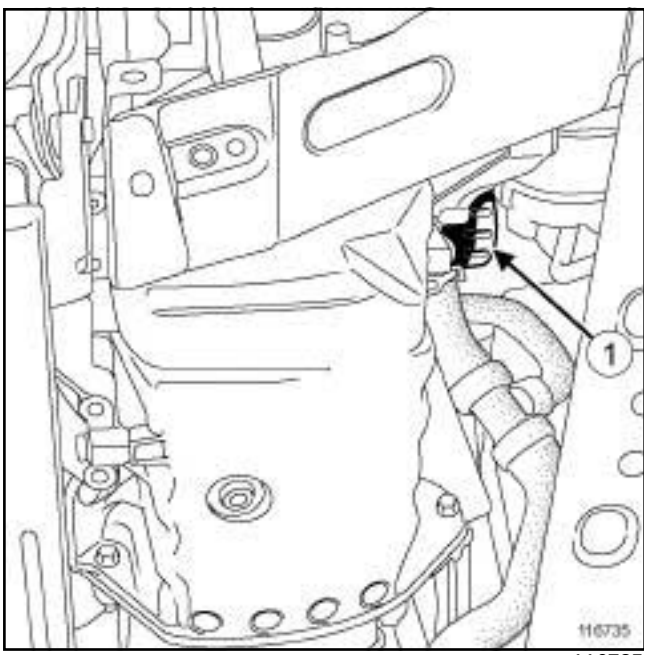
❑ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

F4R

Special tooling required	
Mot. 1329	Oil filter removing tool (76 mm diameter)

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the dipstick,
- the engine undertray.

❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116735

❑ Remove the oil filter using the **(Mot. 1329)** and a ratchet.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Lubricate the new oil filter seal.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the new oil filter.

❑ Tighten the oil filter until it makes contact.

❑ Tighten the oil filter **3/4 of a turn** by hand.

III - FINAL OPERATION.

❑ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Start the vehicle in order to check that there are no oil leaks from the oil filter.

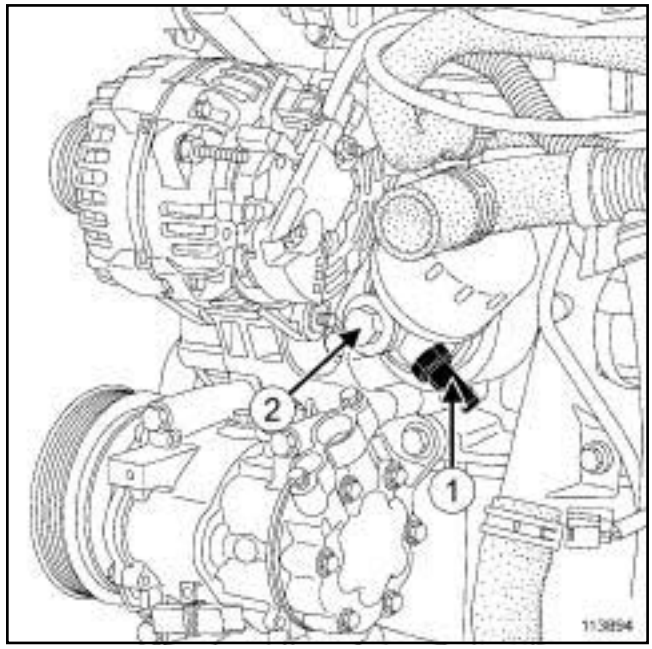
❑ Refit the engine undertray.

K9K, and 764 or 766 or 768

Tightening torques ▽	
oil-coolant heat exchanger nipple	**39 N.m**
oil filter holder bolt	**28 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



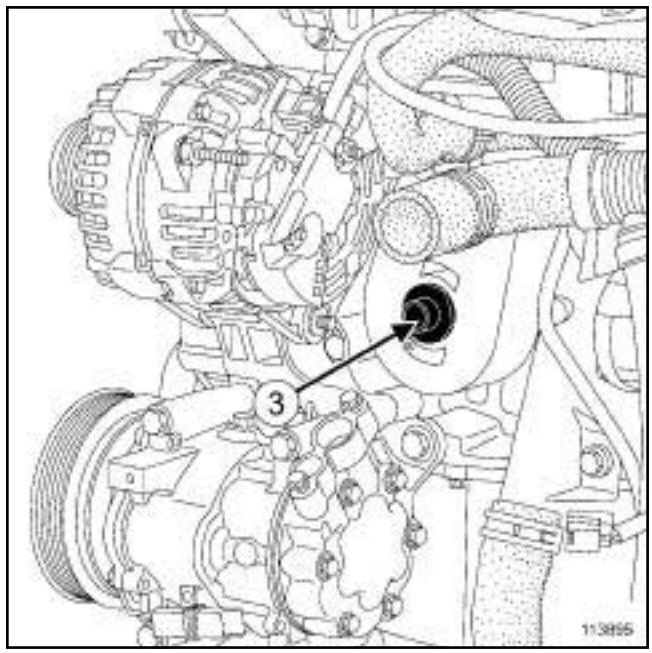
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine protector,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the engine undertray,
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

❏ Drain:

- the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .



113894

❏ Disconnect the oil pressure sensor connector (**1**) .

❏ Remove:

- the bolt (**2**) from the oil filter support,
- the oil filter holder.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113895

❏ Remove:

- the nipple (**3**) from the oil-coolant heat exchanger,
- the oil-coolant heat exchanger.

K9K, and 764 or 766 or 768

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block (10,05, 05,12)**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- new seals on the oil-coolant heat exchanger, previously lubricated with soapy water,
- the oil-coolant heat exchanger on the coolant inlet pipe.

❏ Put two drops of **HIGH RESISTANCE THREAD LOCK** on the nipple of the oil-coolant heat exchanger.

❏ Torque tighten the **oil-coolant heat exchanger nipple (39 N.m)**.

III - FINAL OPERATION

❏ Refit the oil filter holder.

❏ Torque tighten the **oil filter holder bolt (28 N.m)**.

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Wait **2 minutes**.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the engine protector.

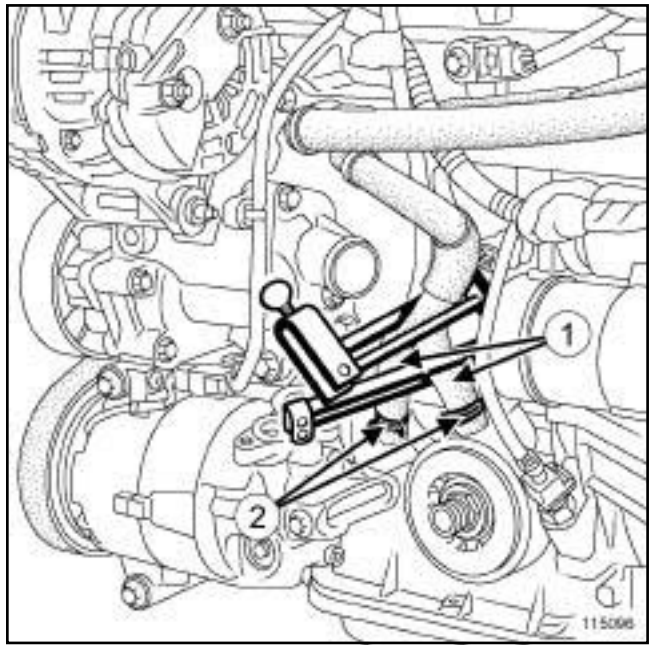
M4R

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)

Tightening torques ▽	
oil-coolant exchanger bolt	**49 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



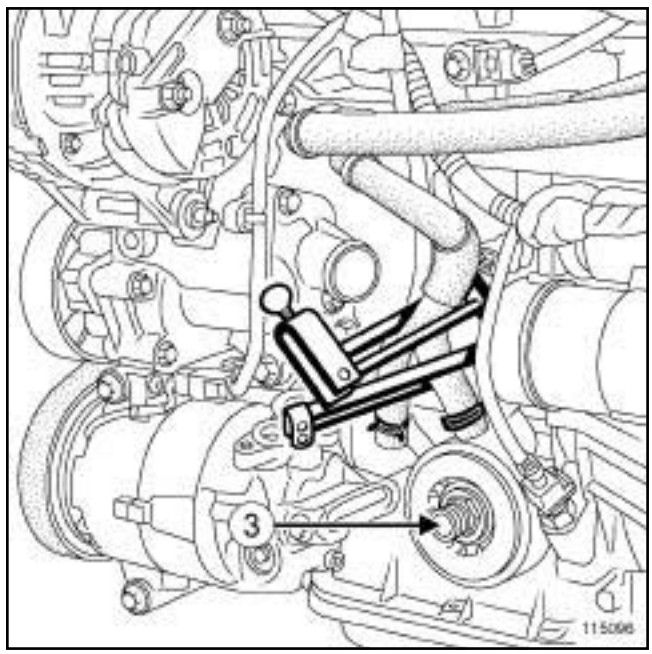
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Remove the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .



115096

❏ Fit hose clamps **(Ms. 583)** onto the oil-coolant heat exchanger hoses (**1**) .

❏ Separate the clips (**2**) on the oil-coolant heat exchanger inlet and outlet hoses, using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Connect the oil-coolant heat exchanger hoses.

II - OPERATION FOR REMOVAL OF PART CONCERNED

115096

❏ Remove:

- the bolt (**3**) from the oil-coolant heat exchanger,

- the oil-coolant heat exchanger,
- the oil-coolant heat exchanger O-ring.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block (10,05, 05,12)**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil-coolant heat exchanger equipped with a new seal.

❏ Torque tighten the **oil-coolant exchanger bolt (49 N.m)**.

III - FINAL OPERATION

❏ Connect the oil-coolant heat exchanger inlet and outlet hoses.

❏ Fit the oil-coolant heat exchanger inlet and outlet hose clips using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Remove the hose clamps **(Ms. 583)** on the oil-coolant heat exchanger inlet and outlet hoses.

❏ Refit the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the engine undertray.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

F4R

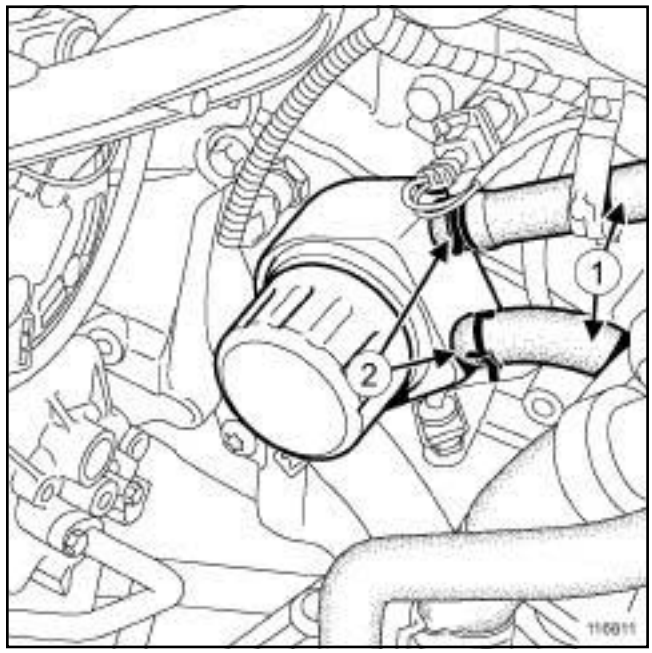
Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)

Tightening torques ▽	
oil filter nipple	**55 N.m**

If there is an internal leak in the coolant-oil exchanger resulting in a coolant-oil mixture, you will need to:

- drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- drain the coolant (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- replace the oil filter.

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

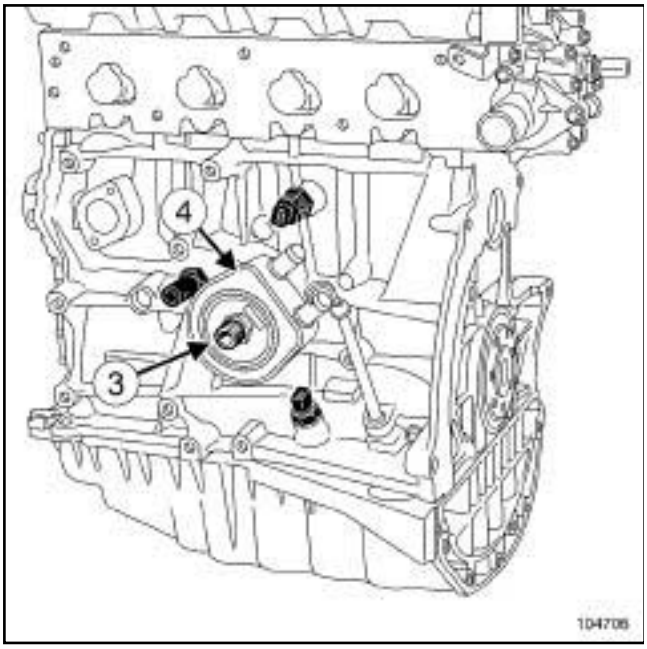
❏ Remove:

- the engine undertray,
- the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116811

❏ Fit a hose clamp **(Ms. 583)** on the coolant hoses (**1**) .



❏ Separate the hose clips (**2**) using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the oil-water heat exchanger cooling hoses.

Note:

Watch out for coolant outflow.

F4R

104706

❑ It is essential to mark the position of the coolant-oil heat exchanger.

❑ Remove:

- the oil filter nipple (**3**) ,
- the coolant-oil heat exchanger (**4**) ,
- the coolant-oil exchanger seal.

Note:

Watch out for the outflow of engine oil.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block (10,05, 05,12)**.

❑ Clean the sealing surfaces.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new seal on the oil-coolant heat exchanger,
- the oil-coolant heat exchanger with its new seal, observing its fitting position,
- the oil filter nipple, taking care not to alter the oil-coolant heat exchanger fitting position.

❑ Torque tighten the **oil filter nipple (55 N.m)**.

III - FINAL OPERATION

❑ Connect the cooling hoses to the oil-coolant heat exchanger.

❑ Fit the clips on the hoses using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Remove the hose clamp **(Ms. 583)**.

❑ Refit the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) with a new seal.

❑ Perform the following operations:

- top up the engine oil level using the dipstick,
- fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Check that there are no leaks from the oil filter and the coolant-oil heat exchanger.

❑ Refit the engine undertray.

K9K, and 772

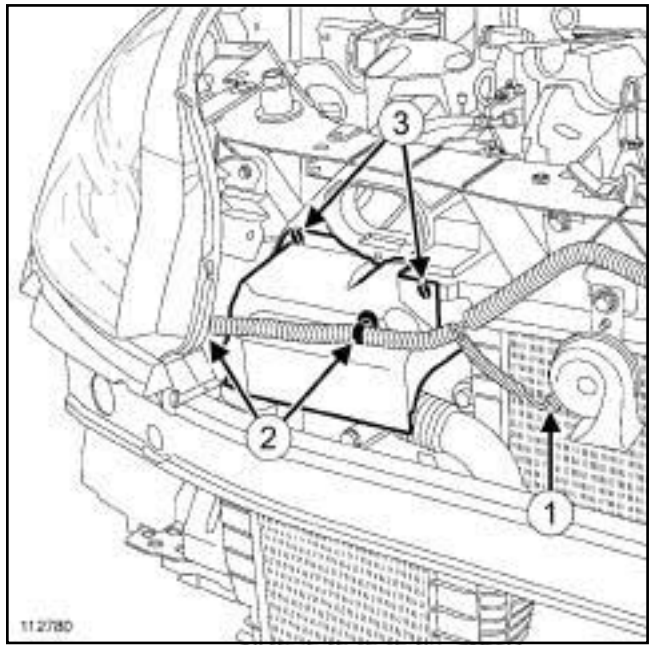
alternator bolts	**21 N.m**
air duct clips between the intercooler and the damper valve	**5.5 N.m**
exchanger inlet air pipe nut on the alternator	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Remove:

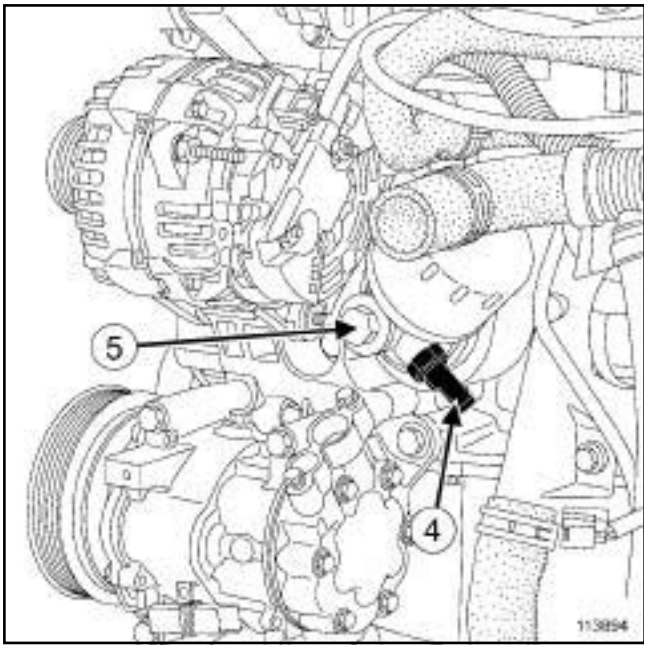
- the engine cover,
- the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

- the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

112780



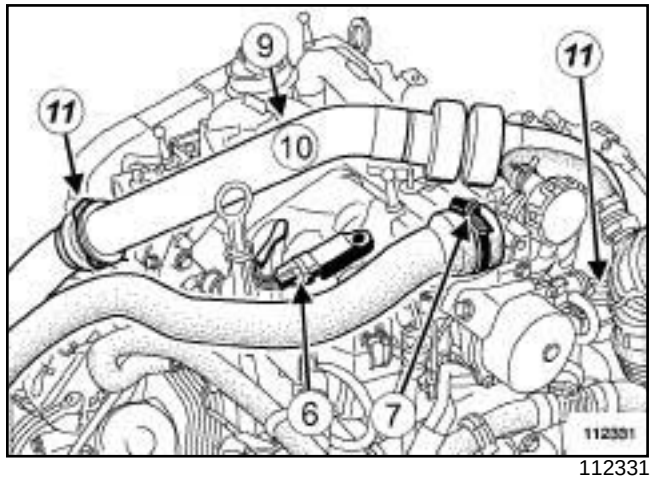
❏ Disconnect the horn connector (**1**) .

❏ Unclip the electrical wiring from the air deflector at (**2**) .

❏ Remove:

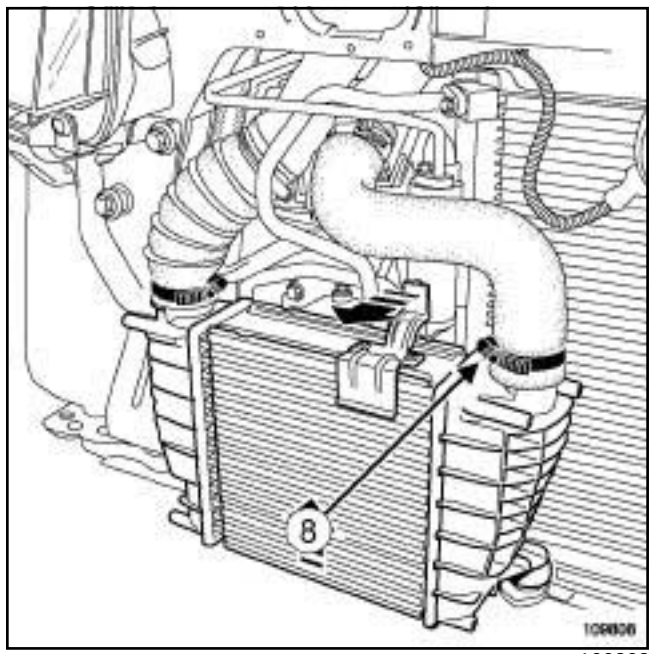
- the air deflector clips (**3**) ,
- the air deflector.

K9K, and 772



113894

❏ Disconnect the oil pressure sensor connector (**4**) .

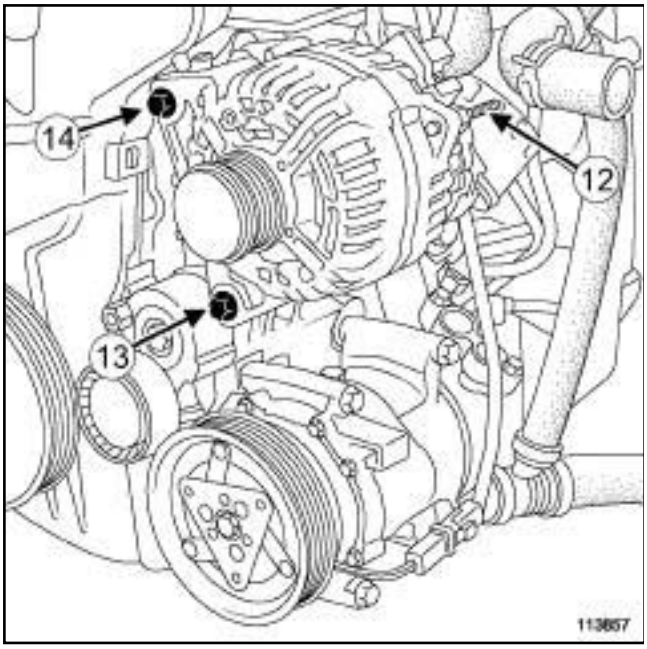


❏ Mark the position of the oil filter holder on the coolant-oil heat exchanger.

❏ Remove:

- the oil filter holder hollow bolt (**5**) ,
- the oil filter holder.

112331



109808

❏ Disconnect the inlet pressure sensor connector (**6**) .

❏ Undo:

- the air duct clip (**7**) between the intercooler and the damper valve on the damper valve,
- the air duct clip (**8**) between the intercooler and the damper valve on the intercooler,
- the bolt (**9**) of the upper air duct between the turbocharger and the intercooler,
- the upper section of the air duct (**10**) between the turbocharger and the intercooler by moving aside the clips (**11**) .

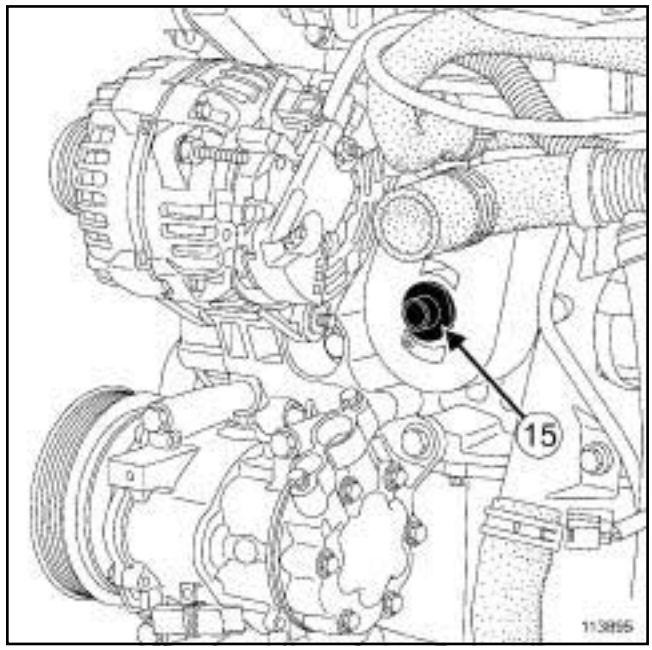
K9K, and 772

113857

❑ Remove:

- the nut (**12**) from the air inlet ducts on the alternator,
- the air duct between the intercooler and the damper valve,
- the bolt from the upper air duct between the turbocharger and the intercooler,
- the upper section of the air duct between the turbocharger and the intercooler by separating the clips.

❑ Move the lower section of the duct between the turbocharger and the intercooler away from the alternator.



❑ Remove the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❑ Loosen the alternator lower bolt (**13**) .

❑ Remove the alternator upper bolt (**14**) .

❑ Tip the alternator towards the front of the vehicle.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113895

❑ Remove:

- the nipple (**15**) from the oil-coolant heat exchanger,
- the coolant-oil heat exchanger by releasing it from the coolant pump inlet pipe.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block (10,05, 05,12)**.

❑ Clean the bearing faces on the coolant-oil heat exchanger and the cylinder block.

❑ Refit new seals on the oil-coolant heat exchanger, previously lubricated with soapy water.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the oil-coolant heat exchanger by connecting it to the coolant pump inlet pipe.
- the oil-coolant heat exchanger nipple.

❑ Put two drops of **HIGH RESISTANCE THREAD LOCK** on the nipple of the oil-coolant heat exchanger.

❑ Torque tighten the **oil-coolant heat exchanger nipple (39 N.m)**.

K9K, and 772

III - FINAL OPERATION

❑ Refit:

- the oil filter holder,
- the hollow bolt to the oil filter holder with new seals.

❑ Tighten to torque the **oil filter holder hollow bolt (28 N.m)**.

❑ Refit the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

❑ Fit the alternator in place.

❑ Refit the alternator upper bolt.

❑ Torque tighten the **alternator bolts (21 N.m)**.

❑ Position the lower section of the air duct between the turbocharger and the intercooler on the alternator.

❑ Refit:

- the air duct between the intercooler and the damper valve,
- the air duct nut on the alternator.

❑ Tighten to torque the **air duct clips between the intercooler and the damper valve (5.5 N.m)**.

❑ Connect the inlet pressure sensor connector.

❑ Fit:

- the clip to the inlet of the lower section of the air duct between the turbocharger and the intercooler,
- the clip to the inlet of the upper section of the air duct between the turbocharger and the intercooler.

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Snap the air duct to the turbocharger and to the air pipe at the intercooler inlet.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **exchanger inlet air pipe nut on the alternator (8 N.m)**.

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the deflector above the intercooler,
- the deflector clips.

❑ Connect the horn connector.

❑ Clip the electrical wiring onto the deflector.

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

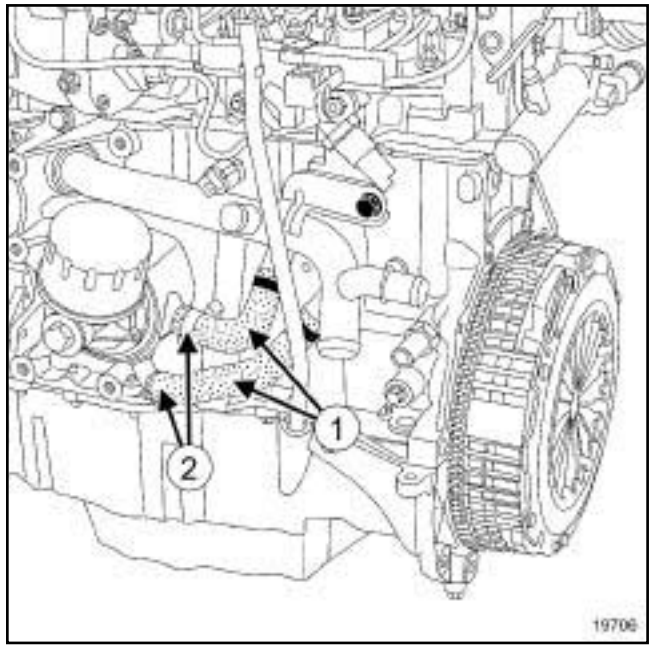
❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the engine undertray,
- the engine cover.

K9K, and 750 or 752

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)



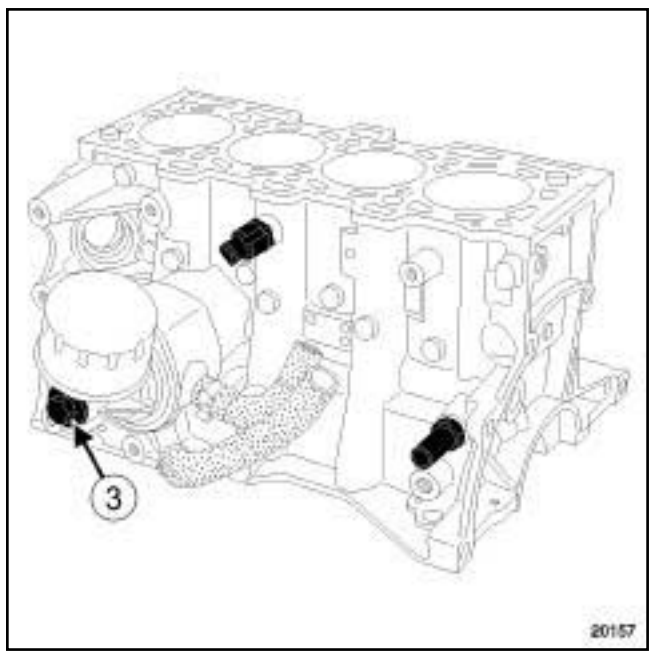
Tightening torques ▽	
oil-coolant heat exchanger nipple	**45 N.m**
oil filter holder bolt	**45 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove the engine undertray.

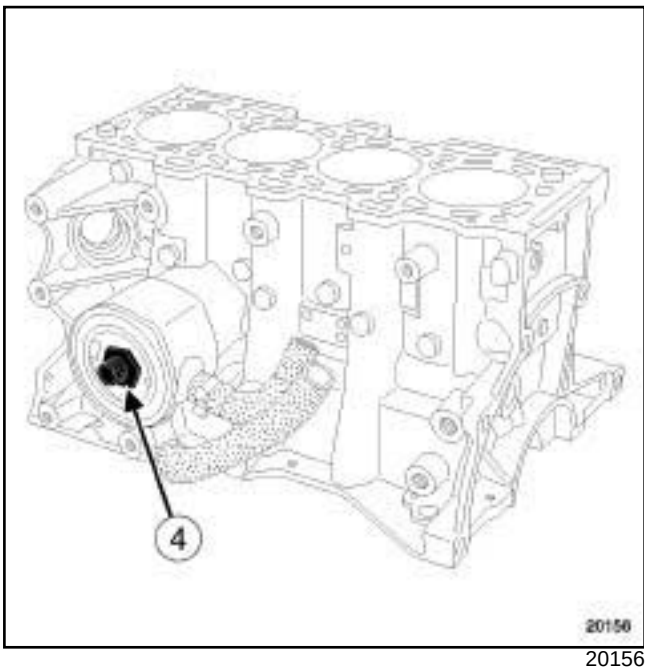


19706

❏ Fit the hose clamps **(Ms. 583)** on the oil-coolant heat exchanger inlet and outlet hoses (**1**) .

❏ Separate the clips (**2**) on the oil-coolant heat exchanger inlet and outlet hoses, using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the oil-coolant heat exchanger inlet and outlet hoses.



20157

❏ Remove:

- the bolt (**3**) from the oil filter support,
- the oil filter holder.

K9K, and 750 or 752

II - OPERATION FOR REMOVAL OF PART CONCERNED

20156

❑ Remove:

- the nipple (**4**) from the oil-coolant heat exchanger,
- the oil-coolant heat exchanger.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: coolant-engine oil heat exchanger seal on the cylinder block (10,05, 05,12)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new exchanger seal by positioning the seal lip behind the exchanger tabs,
- the oil-coolant heat exchanger.

❑ Screw in the oil-coolant heat exchanger nipple, without tightening it.

❑ Torque tighten the **oil-coolant heat exchanger nipple (45 N.m)**.

III - FINAL OPERATION

❑ Refit the oil filter holder.

❑ Torque tighten the **oil filter holder bolt (45 N.m)**.

❑ Connect the oil-coolant heat exchanger inlet and outlet hoses.

❑ Fit the oil-coolant heat exchanger inlet and outlet hoses clips using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Remove the hose clamps **(Ms. 583)** on the oil-coolant heat exchanger inlet and outlet hoses.

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit the engine undertray.

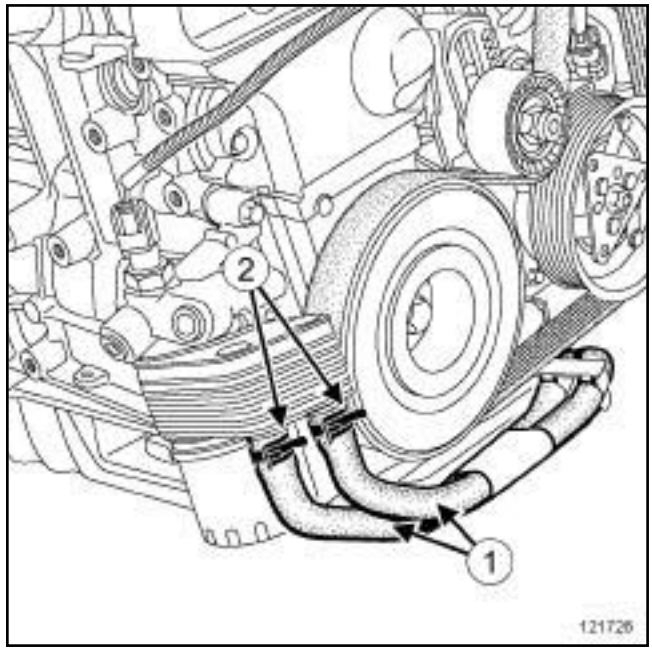
D4F, and 784

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
oil-coolant heat exchanger nipple	**30 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



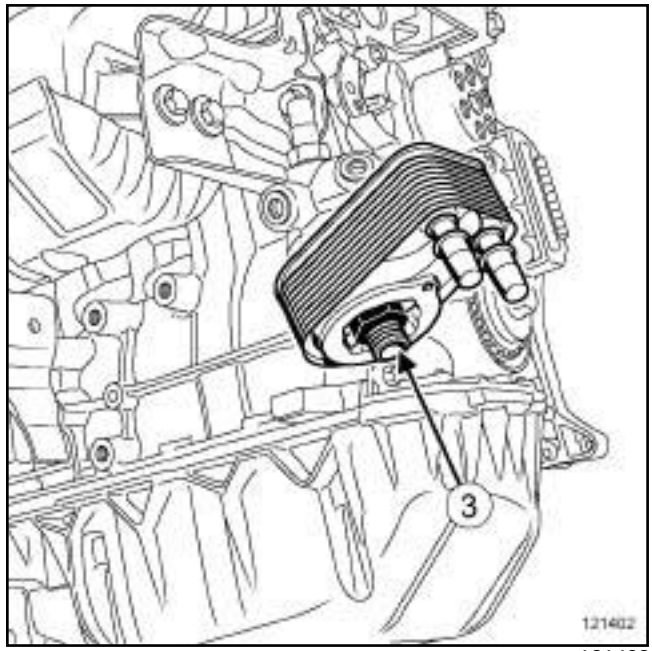
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED



121726

❏ Fit hose clamps **(Ms. 583)** onto the oil-coolant heat exchanger hoses (**1**) .

❏ Release the clips (**2**) using the **(Mot. 1448)**.

❏ Disconnect the oil cooler hoses.

121402

❏ Remove:

- the nipple (**3**) from the oil-water heat exchanger,
- the oil cooler.

D4F, and 784

REFITTING

I - REMOVAL PREPARATION OPERATION

- ❏ Clean the bearing faces on the coolant-oil heat exchanger and the cylinder block.
- ❏ Always replace the coolant-oil heat exchanger seals.

II - REFITTING OPERATION FOR PART CONCERNED

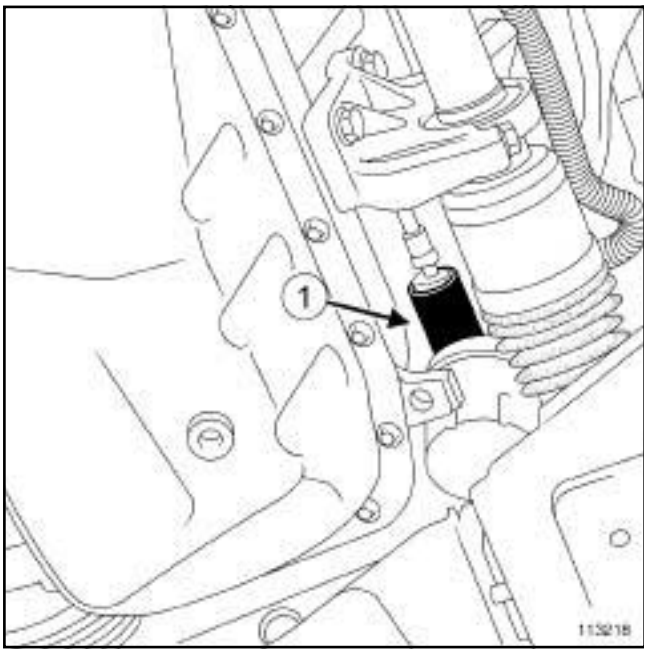
- ❏ Refit:
  - the oil cooler,
  - the oil-coolant heat exchanger fitting.
- ❏ Torque tighten the **oil-coolant heat exchanger nipple (30 Nm)**.
- ❏ Connect the oil-coolant heat exchanger hoses.
- ❏ Refit the clips using the **(Mot. 1448)**.
- ❏ Remove the hose clamps **(Ms. 583)**.

III - FINAL OPERATION.

- ❏ Refit:
  - the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) ,
  - the engine undertray.
- ❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).
- ❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

D4F, and 740 or 742 or 764

Tightening torques ▽	
oil pressure sensor	**32 N.m**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Put the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove the engine undertray.

113218

❏ Unclip the connector cover (**1**) .

❏ Remove the oil pressure sensor connector.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the oil pressure sensor.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil pressure sensor.

❏ Torque tighten the **oil pressure sensor (32 N.m)**.

II - FINAL OPERATION.

❏ Refit the oil pressure sensor connector.

❏ Clip the connector cover.

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

K9K

Tightening torques ▽	
oil pressure sensor	**40 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil pressure sensor.

❏ Torque tighten the **oil pressure sensor (40 N.m)**.

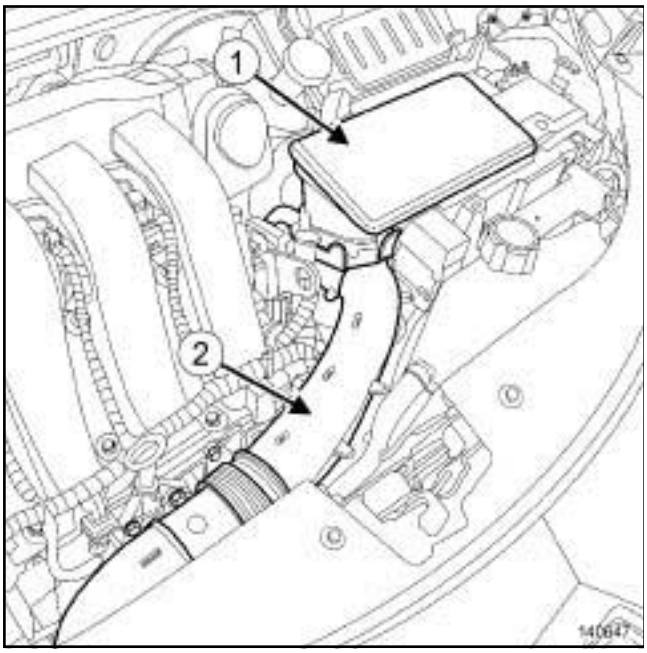
❏ Connect the oil pressure sensor connector.

II - FINAL OPERATION

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M



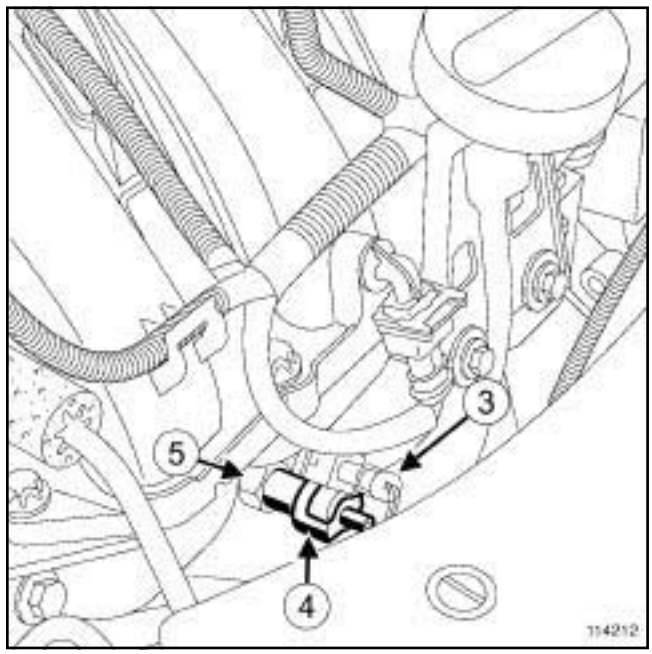
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove the front engine cover.

K4M, and 862



140647

❑ Remove:

- the air resonator (**1**) ,
- the air inlet pipe (**2**) from the air filter unit.

II - OPERATION FOR REMOVAL OF PART CONCERNED

114212

❑ Disconnect:

- the pinking sensor connector (**3**) ,
- the oil pressure sensor connector (**4**) .

❑ Remove the oil pressure sensor (**5**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the bearing face of the oil pressure sensor on the cylinder block.

❑ Refit the oil pressure sensor.

❑ Connect:

- the oil pressure sensor connector,
- the pinking sensor connector.

II - FINAL OPERATION

K4M, and 862

❑ Refit:

- the air filter unit air inlet pipe,

K4J or K4M

- the air resonator.

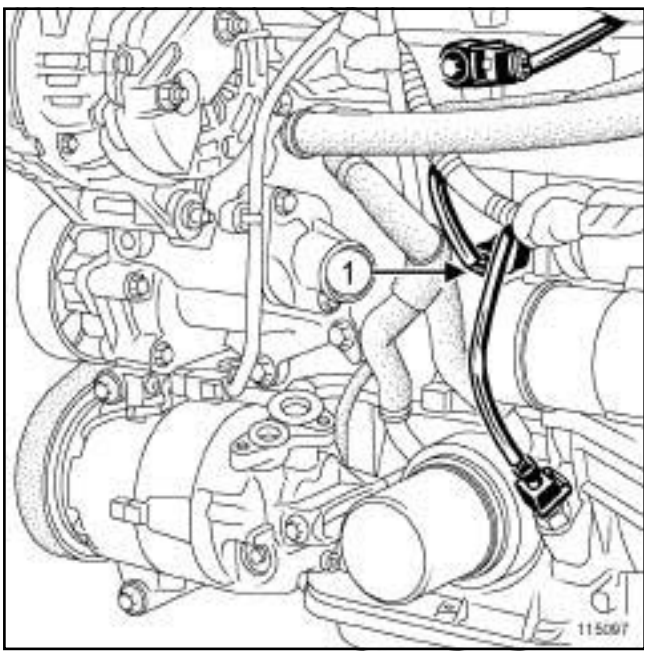
❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R

Tightening torques ▽	
oil pressure sensor	**15 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

115097

❑ Disconnect the oil pressure sensor connector (**1**) .

II - REMOVAL OF PART CONCERNED

❑ Remove the oil pressure sensor.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Coat the oil pressure sensor wire with **SILICONE ADHESIVE SEALANT (77 11 227 484)** to ensure a good seal.

II - REFITTING PART CONCERNED

❑ Refit the oil pressure sensor.

❑ Tighten to torque the **oil pressure sensor (15 Nm)**.

III - FINAL OPERATION.

❑ Connect the oil pressure sensor connector.

❑ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

121725

❑ Disconnect the oil pressure sensor connector (**1**) .

❑ Remove the oil pressure sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the oil pressure sensor.

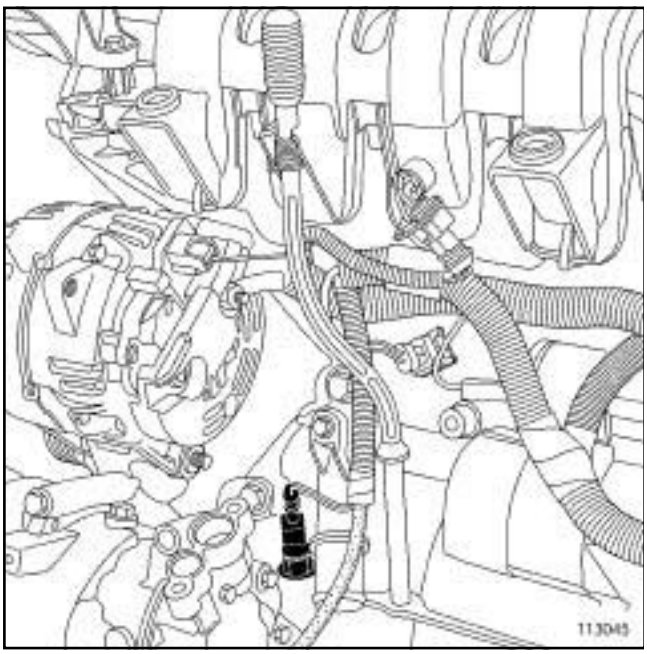
❑ Torque tighten the **oil pressure sensor (35 Nm)**.

❑ Connect the oil pressure sensor connector.

II - FINAL OPERATION.

❑ Refit the engine undertray.

D4F, and 740 or 742 or 764



Tightening torques ▽	
oil level sensor	**30 ± 5 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Move the air inlet hose to one side.

113045

❏ Disconnect the connector from the oil level sensor.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the oil level sensor.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the oil level sensor.

❏ Torque tighten the **oil level sensor (30 ± 5 N.m)**.

II - FINAL OPERATION.

❏ Connect the connector to the oil level sensor.

❏ Refit the air intake sleeve.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

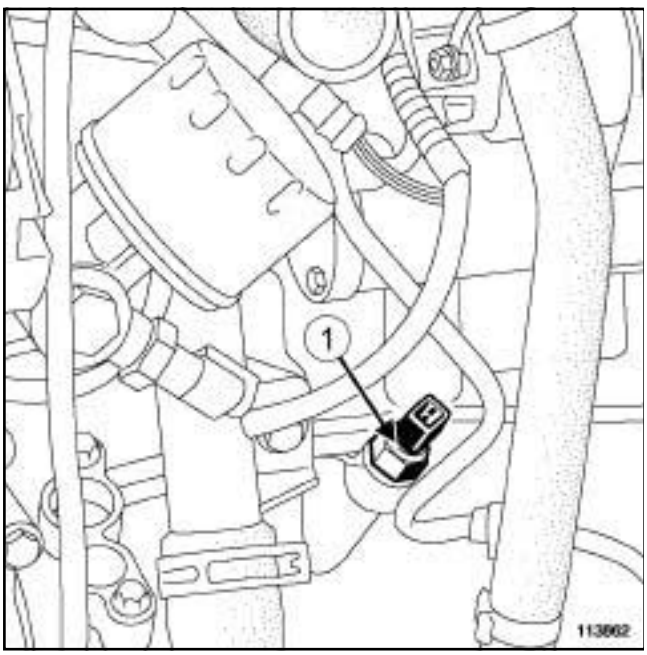
K9K

Tightening torques ▽	
oil level sensor	**25 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

❏ Unclip the water hose from the engine cooling fan support.

❏ Separate the regulation solenoid valve from the turbocharger (if equipped).

II - OPERATION FOR REMOVAL OF PART CONCERNED

113862

❏ Disconnect the connector from the oil level sensor.

❏ Remove the oil level sensor (**1**) .

REFITTING

I - REFITTING PART CONCERNED

❏ Refit the oil level sensor.

❏ Tighten to torque the **oil level sensor (25 N.m)**.

❏ Connect the connector to the oil level sensor.

II - FINAL OPERATION

❏ Clip the hose onto the engine cooling fan support.

❏ Fit the turbocharger regulation solenoid valve (if equipped).

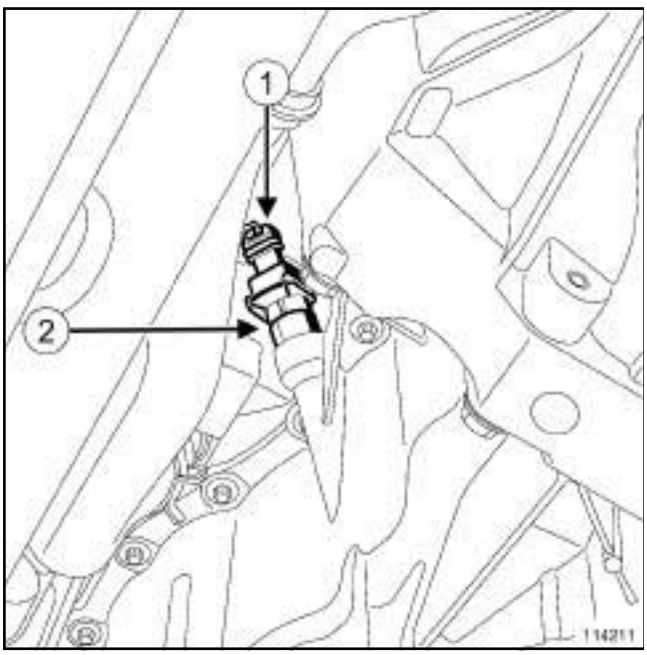
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the engine undertray.

K4J or K4M

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Put the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Unpick the engine radiator bottom hose.

❏ Move the bottom hose to the side without forcing it.

II - OPERATION FOR REMOVAL OF PART CONCERNED

114211

❏ Disconnect the connector (**1**) from the oil level sensor.

❏ Remove the oil level sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Clean the grease off the support area of the oil level sensor on the cylinder block.

❏ Refit the oil level sensor.

❏ Connect the connector to the oil level sensor.

II - FINAL OPERATION

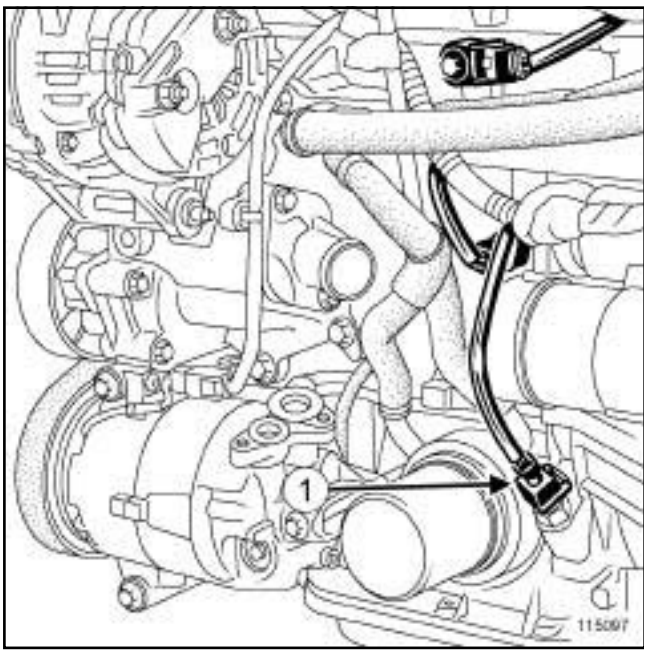
❏ Clip the engine radiator bottom hose into place.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

M4R

Tightening torques ▽	
oil level sensor	**20 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

115097

❑ Disconnect the connector (**1**) from the oil level sensor.

II - REMOVAL OF PART CONCERNED

❑ Remove the oil level sensor.

REFITTING

I - REFITTING PART CONCERNED

❑ Refit a new seal onto the new oil level sensor.

❑ Tighten to torque the **oil level sensor (20 Nm)**.

II - FINAL OPERATION.

❑ Connect the connector to the oil level sensor.

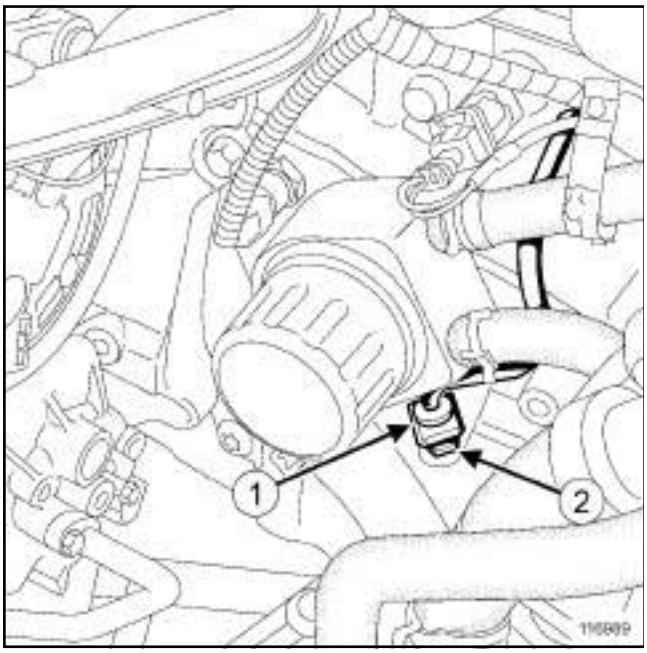
❑ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

F4R

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116989

❑ Disconnect the connector (**1**) from the oil level sensor.

❑ Remove the oil level sensor (**2**) using an open-jawed spanner.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the oil level sensor.

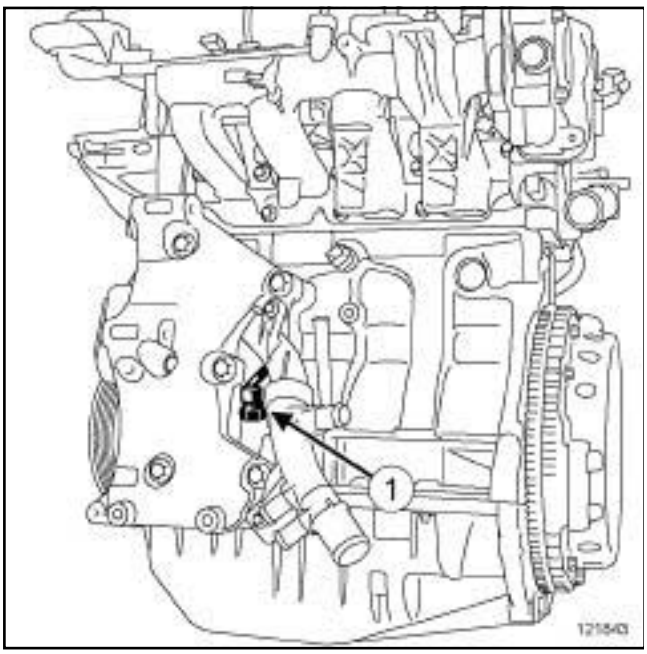
❑ Connect the connector to the oil level sensor.

II - FINAL OPERATION.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Start the engine to check that there are no leaks.

❑ Refit the engine undertray.



D4F, and 784

REMOVAL

I - REMOVAL PREPARATION OPERATION

- ❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).
- ❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).
- ❑ Remove the engine undertray.
- ❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .
- ❑ Remove the coolant pump inlet pipe (see **19A**, **Cooling**, **Coolant pump inlet pipe: Removal - Refitting**, page **19A-93**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

121843

- ❑ Disconnect the connector (**1**) from the oil level sensor.
- ❑ Remove the oil level sensor using a **19 mm** ring spanner.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

- ❑ Refit the oil level sensor.
- ❑ Connect the connector to the oil level sensor.

II - FINAL OPERATION.

- ❑ Refit the coolant pump inlet pipe (see **19A**, **Cooling**, **Coolant pump inlet pipe: Removal - Refitting**, page **19A-93**) .
- ❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .
- ❑ Refit the engine undertray.
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K

Equipment required
safety strap(s)

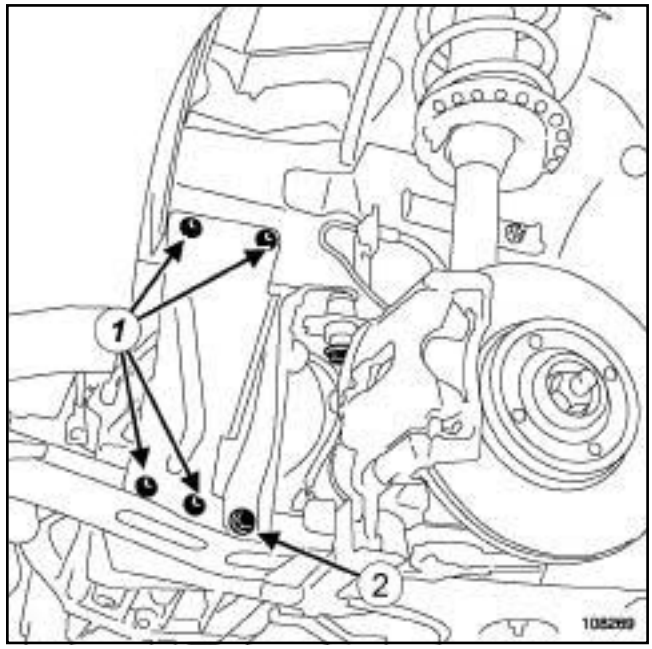
Tightening torques ▽	
sump bolts on the gear-box	**44 N.m**
sump bolts	**14 N.m**
sump bolts on the multi-function support	**21 N.m**
radiator cross member bolts	**105 N.m**
relay bearing bolts	**44 N.m**

REMOVAL

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the resonator on the battery,
- the battery covers.



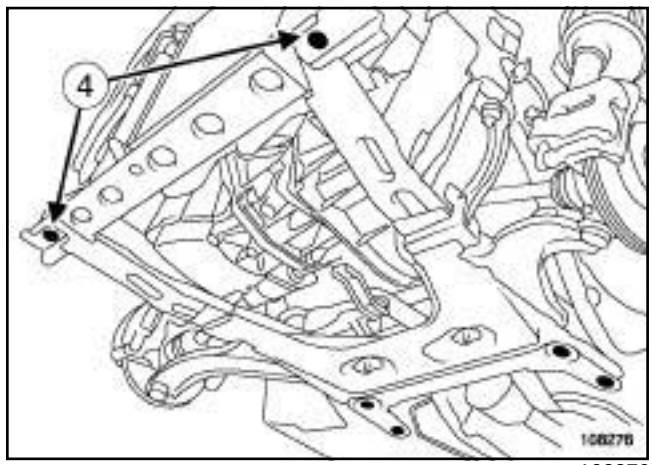
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the engine undertray.

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Remove:

- the dipstick,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).



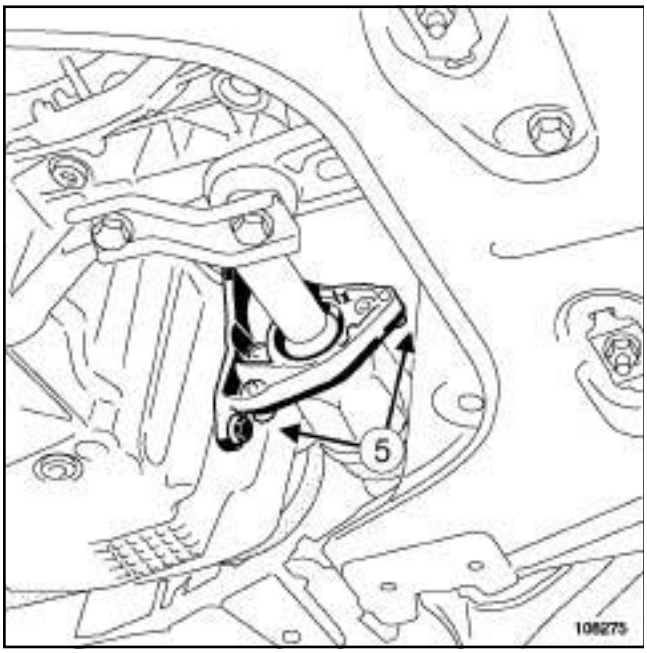
108269

❏ Remove:

- the left-hand side reinforcement bolts (**1**) ,
- the left-hand side reinforcement,
- the lower bolt (**2**) from the side tie rods.

❏ Fit the cooling assembly to the upper cross member using **safety strap(s)**.

108276



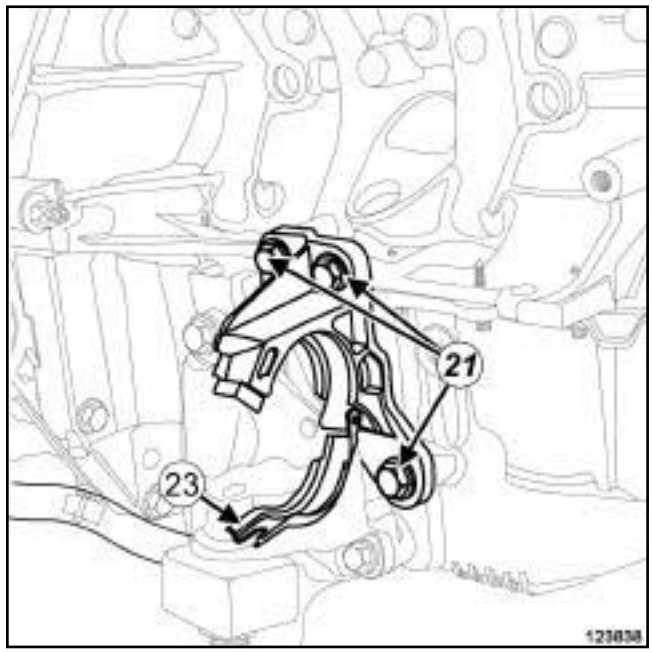
❏ Remove:

- the bumper bolts from the radiator cross member,
- the bolts (**4**) from the radiator lower cross member,
- the radiator lower cross member.

❏ Disconnect the connector from the oil level sensor.

K9K

I - FIRST FITTING OF RIGHT-HAND DRIVESHAFT RELAY BEARING



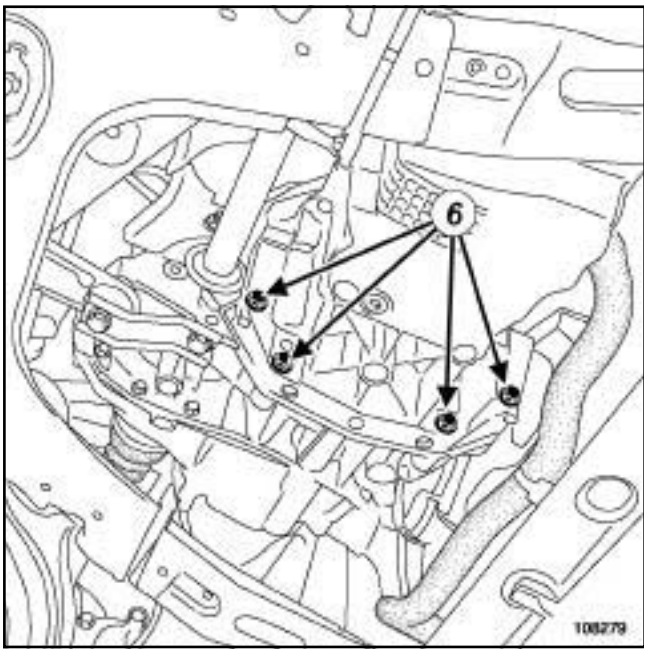
108275

❑ Remove:

- the bolts from right-hand driveshaft bracket (**5**) on the relay bearing,
- the relay bearing bolts from the sump,
- the sump bolts from the multifunction support.

II - SECOND FITTING OF RIGHT-HAND DRIVESHAFT RELAY BEARING

123838



❑ Remove:

- the half-shell bolt (**23**) ,
- the bolts (**21**) of the right-hand driveshaft relay bearing on the engine.

❑ Extract the relay bearing by sliding it towards the gearbox then turning it around the right-hand driveshaft.

K9K

III - OPERATION FOR REMOVAL OF PART CONCERNED

108279

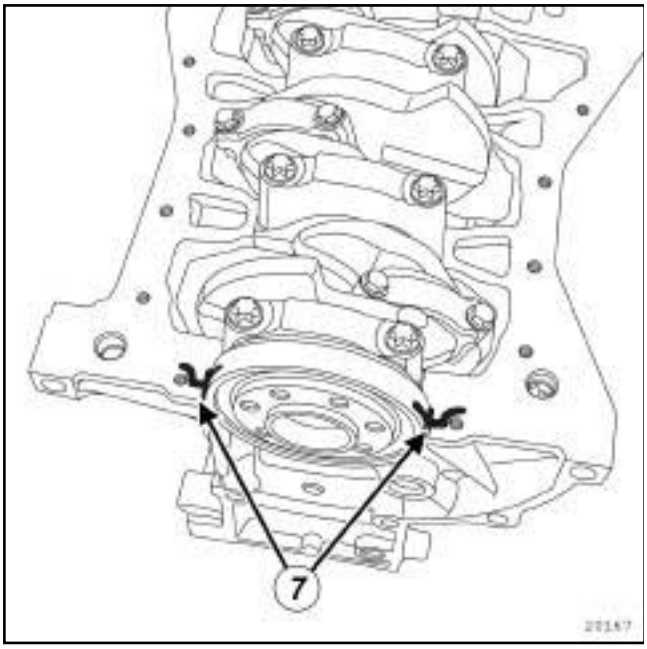
❑ Remove:

- the sump bolt on the gearbox,
- the sump bolts,
- the sump,
- the sump seal.

Note:

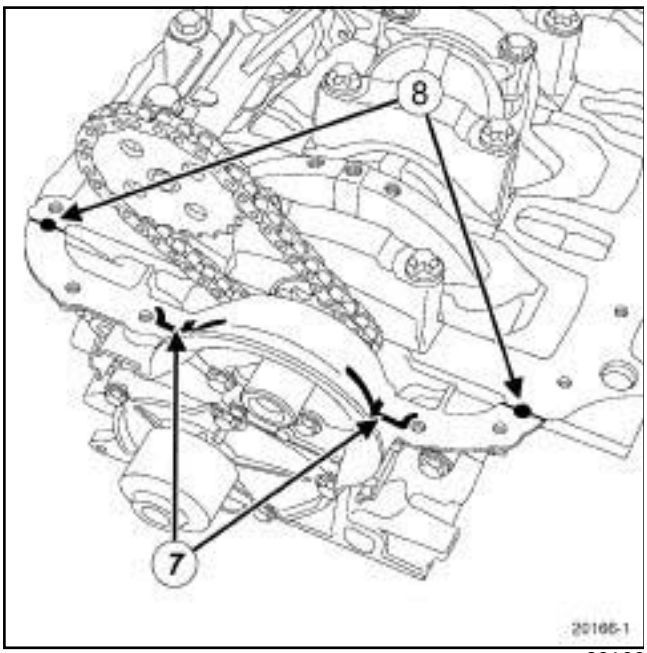
If the sump cannot be extracted because it is in contact with the oil pump strainer, do not force the removal of the sump as this may damage the oil splash plate.

Loosen the oil pump bolts by a few turns (the tip of your finger should pass between the bolt head and the oil pump casing) using 10 mm and 13 mm open-jawed spanners and while tilting the sump towards the front of the vehicle.



REFITTING

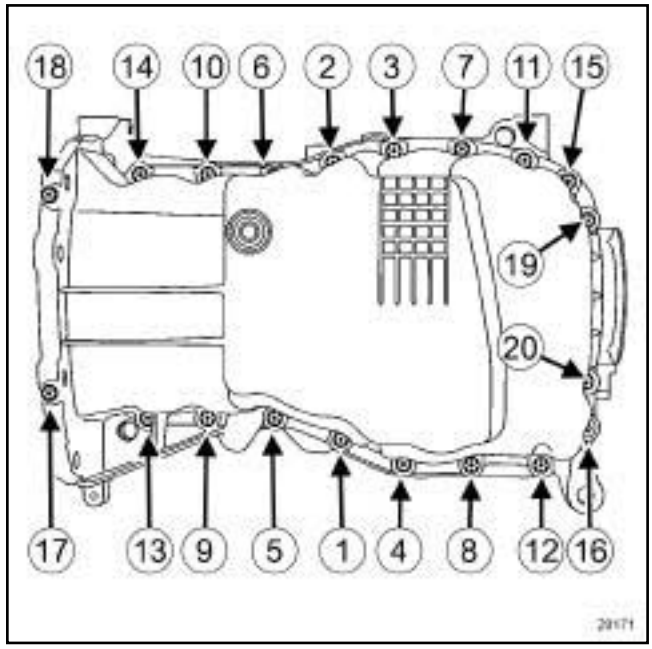
❑



WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

K9K



20167

20166

❑ Apply four beads of **ADHESIVE SILICONE SEALANT**, part number **77 11 227 484**, at (**7**) with a diameter of **5 mm**.

❑ Apply two dabs of **ADHESIVE SILICONE SEALANT**, part number **77 11 227 484**, at (**8**) with a diameter of **7 mm** at the connection between the crankshaft closure panel and the cylinder block.

20171

❑ Fit the sump.

Note:

If the oil pump was loosened beforehand in order to extract the sump, position the sump in order to pass the oil pump strainer into the oil splash plate of the sump.

Position a component jack to support the sump.

Tilt the sump towards the front of the vehicle, in order to facilitate access to the oil pump bolts.

Torque tighten the oil pump bolts (**25 N.m**) using the small torque wrench **77 11 226 888**.

Fit the sump and then follow the following instructions.

Note:

Before pressing the sump on the cylinder block, check that the sump seal is still in place and that it has not come out of the grooves on the sides.

❑ Tighten:

- the sump bolts on the gearbox, without locking them,
- to torque the **sump bolts on the gearbox (44 N.m)**,
- in order and to torque the **sump bolts (14 N.m)**.

AIR CONDITIONING

❑ Tighten to torque the **sump bolts on the multifunction support (21 N.m)**.

❑ Proceed in the reverse order to removal.

WARNING

A shim of **10 mm** in thickness must be placed between the radiator cross member and the subframe. Centre the radiator cross member pin in the subframe hole at the level of the lower arm front mounting, to torque tighten the radiator cross member mountings.

❑ Torque tighten:

- the **radiator cross member bolts (105 N.m)**,
- the **relay bearing bolts (44 N.m)**.

❑ Refit the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

D4F

Special tooling required	
Mot. 1716	Removes housing with silicone seals.

Tightening torques ▽	
sump bolts (initial torque)	**8 Nm**
sump bolts	**10 Nm**
sump bolts on the gearbox	**44 Nm**

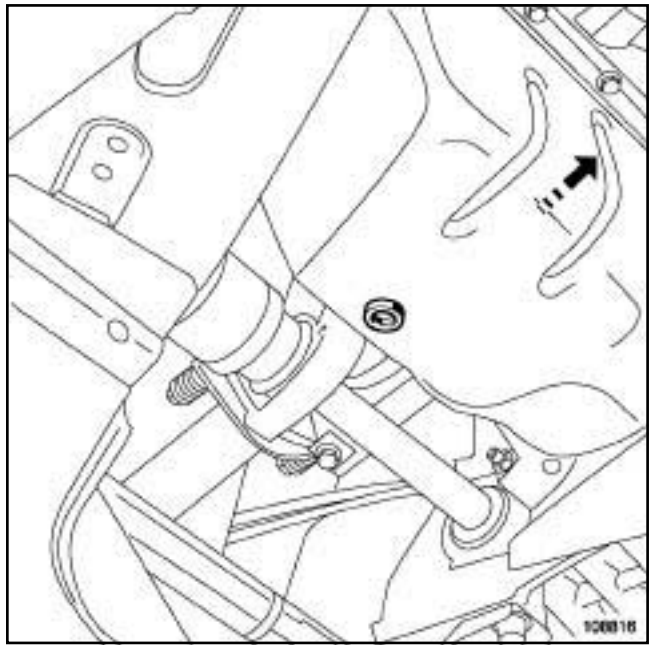
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the dipstick,
- the engine undertray.



❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

D4F, and 784

❑ Remove the bolts from the sump on the gearbox.

❑ Remove the sump bolts.

108816

❑ If the sump is fitted with **ADHESIVE SILICONE SEALANT** :

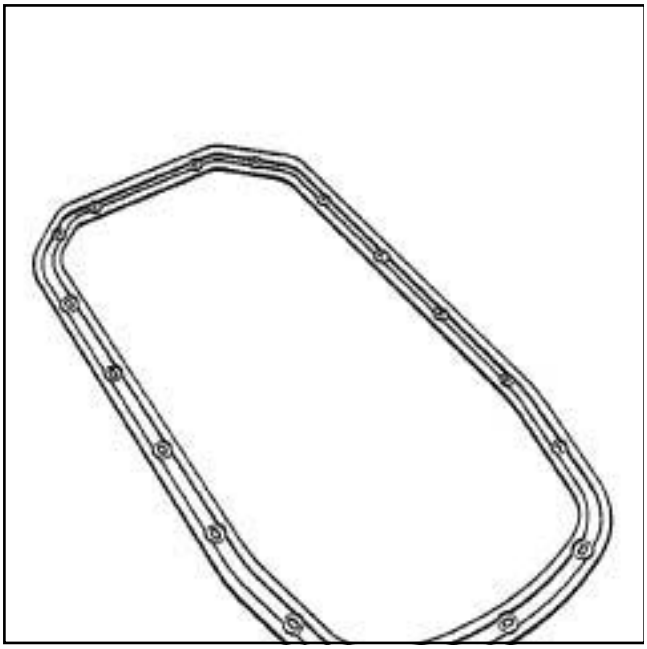
- cut the **ADHESIVE SILICONE SEALANT** using the **(Mot. 1716)**,
- gradually detach the sump,
- remove the sump.

❑ If the sump is fitted with a seal:

- remove the sump, rotating it forwards,
- remove the seal from the sump.

REFITTING

I - REFITTING PREPARATIONS OPERATION



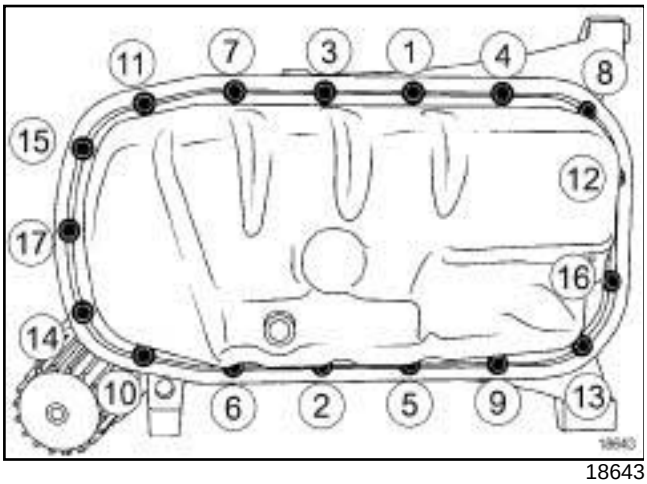
❑ Clean the sump sealing faces using **SUPER CLEANER FOR SEALING FACES**.

❑ Use **SURFACE CLEANER** to degrease the sump sealing faces.

WARNING
Do not scratch the aluminium joint faces: any surface damage to the joint faces may cause leaks.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

D4F



98978

❑ Fit a specific new after-sales seal to a steel sump or apply a beading of **SILICONE ADHESIVE SEALANT** to an aluminium sump.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the sump.

18643

❑ Refit the sump bolts.

❑ Pre-tighten in order and to torque the **sump bolts (initial torque) (8 Nm)**.

❑ Tighten to torque and in order the **sump bolts (10 Nm)**.

D4F, and 784

❑ Refit the sump bolts onto the gearbox.

❑ Torque tighten the **sump bolts on the gearbox (44 Nm)**.

III - FINAL OPERATION.

❑ Wipe any possible traces of oil from the sump.

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Check for leaks from the sump.

❑ Refit:

- the engine undertray,
- the dipstick.

K4J or K4M

Tightening torques ▽	
engine oil sump mounting bolts	**14 N.m**
bolts mounting the engine oil sump on the gearbox	**44 N.m**
engine oil sump bolt on the multifunction support	**25 N.m**
exhaust manifold upstream stay bolts	**44 N.m**
exhaust manifold downstream stay bolts	**44 N.m**
driveshaft flange bolts	**21 N.m**
driveshaft flange bolt	**21 N.m**

REMOVAL

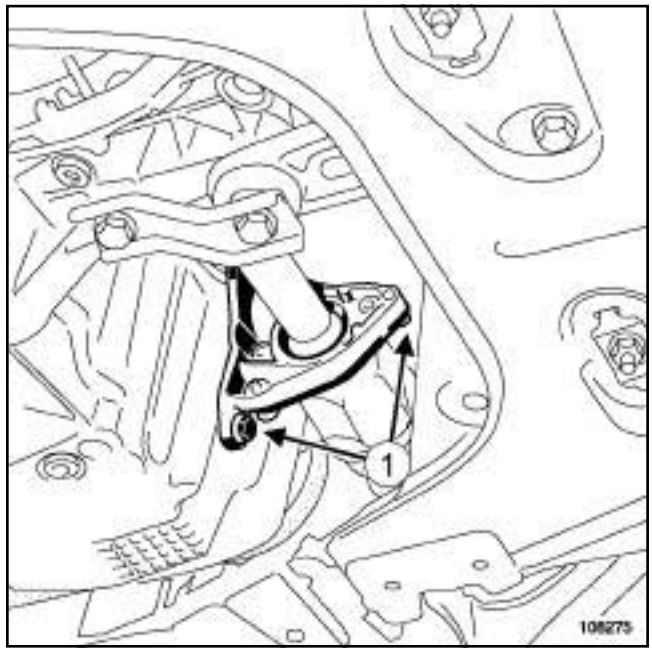
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine undertray bolts,
- the engine undertray.



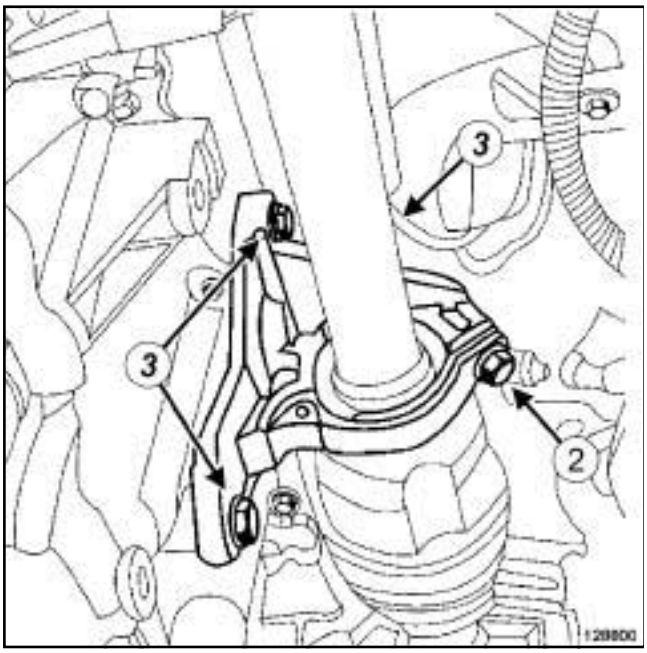
❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Remove:

- the dipstick,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure).

❏ Disconnect the oil level sensor.

K4J – K4M, and 800 or 801 or 804

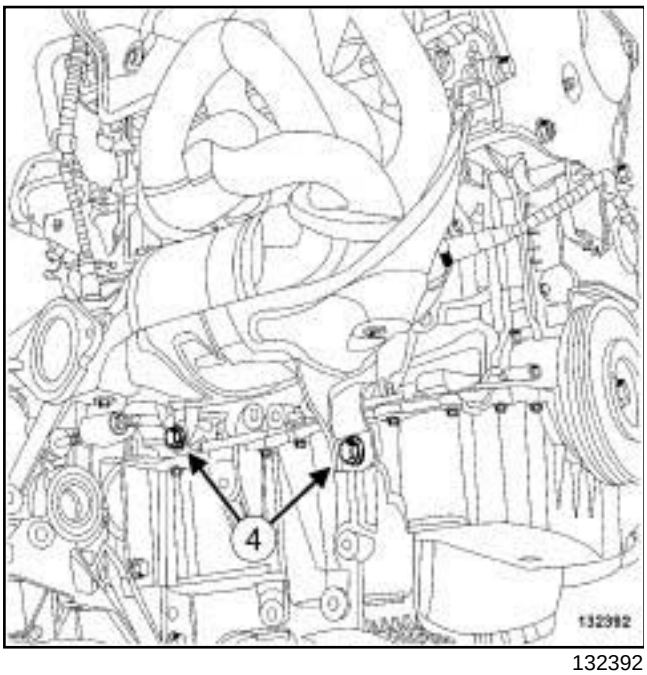


108275

❏ Remove:

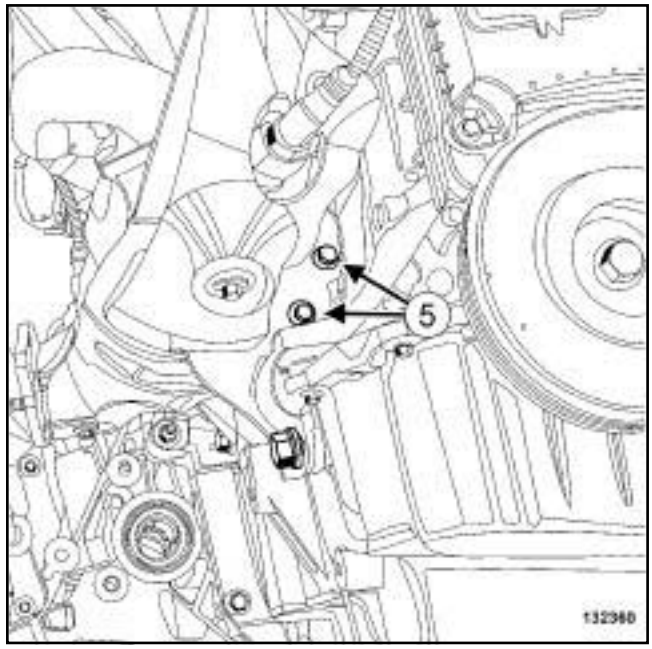
- the right-hand driveshaft flange bolts (**1**) on the driveshaft relay bearing,
- the relay bearing bolts on the engine oil sump,
- the relay bearing.

K4J or K4M



K4M, and 862

128800

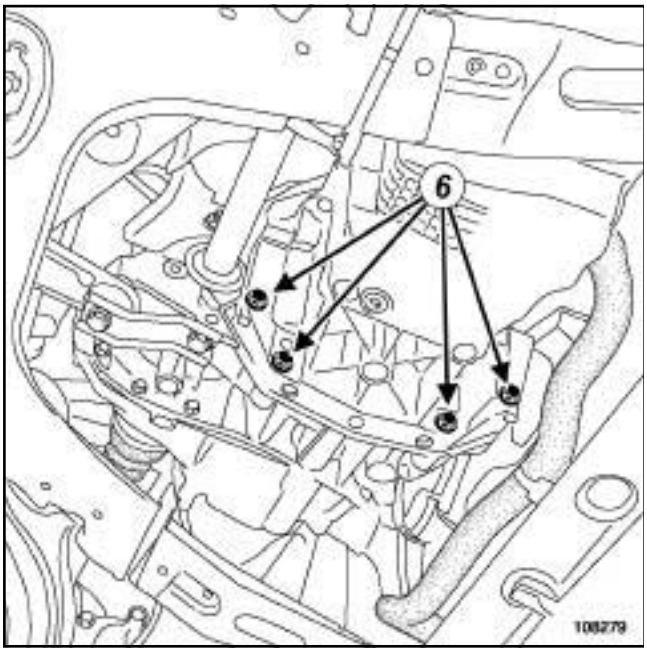


❑ Remove:

- the right-hand driveshaft flange bolt (**2**) on the relay bearing,
- the bolts (**3**) from the driveshaft relay bearing,
- the driveshaft relay bearing.

132392

❑ Remove the bolts (**4**) from the exhaust manifold downstream stay.

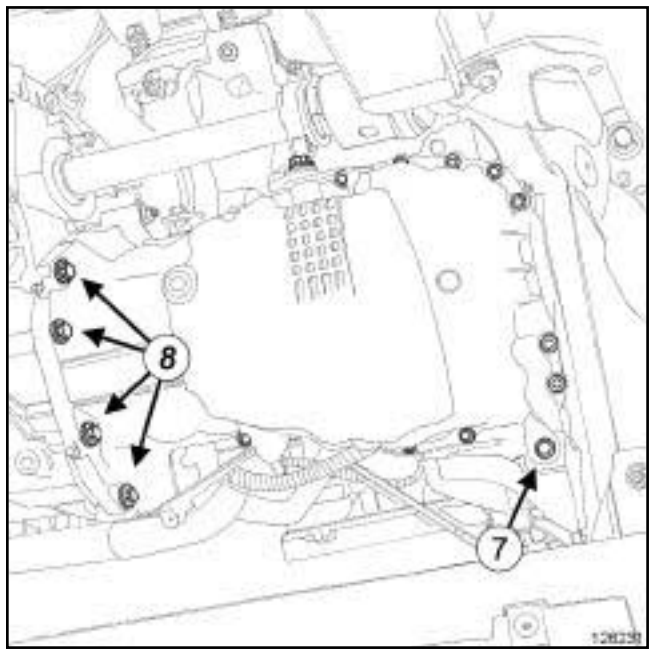


132360

❑ Remove the bolts (**5**) from the exhaust manifold upstream stay.

K4J or K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED



K4J – K4M, and 800 or 801 or 804

108279

❑ Remove the bolts (**6**) from the engine oil sump on the gearbox.

K4M, and 862

126231

❑ Remove:

- the engine oil sump bolt (**7**) on the multifunction support,
- the engine oil sump bolts (**8**) on the gearbox.

❑ Remove:

- the sump bolts,
- the engine oil sump,
- the engine oil sump seal.

REFITTING

I - REFITTING PREPARATION OPERATION

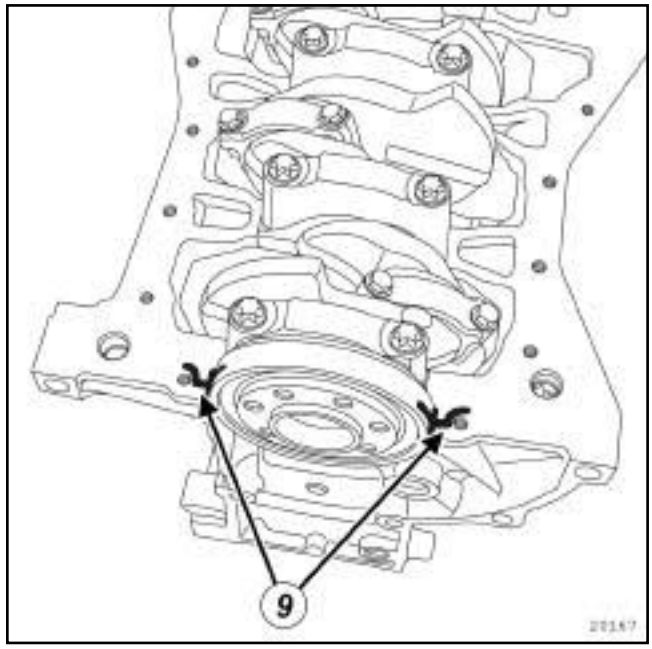
❑ **parts always to be replaced: engine oil sump seal (10,03,01,09)**.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

K4J or K4M

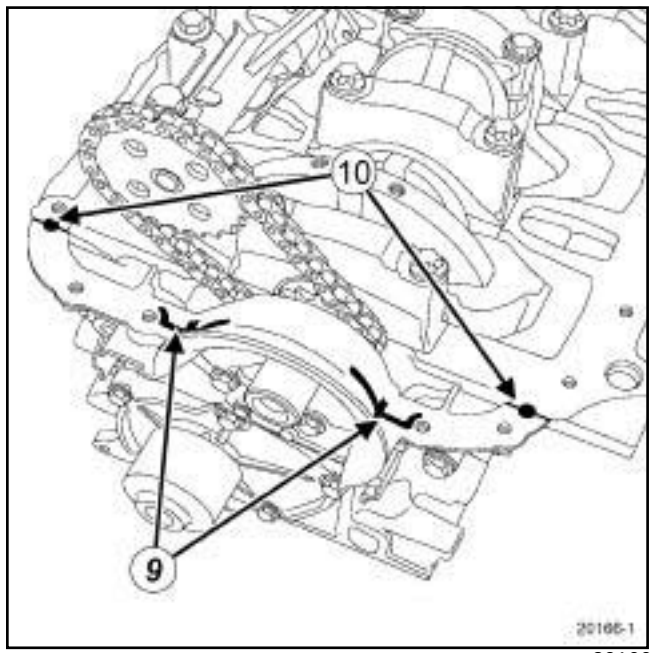
❑ Clean the cylinder block joint face using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

WARNING



To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

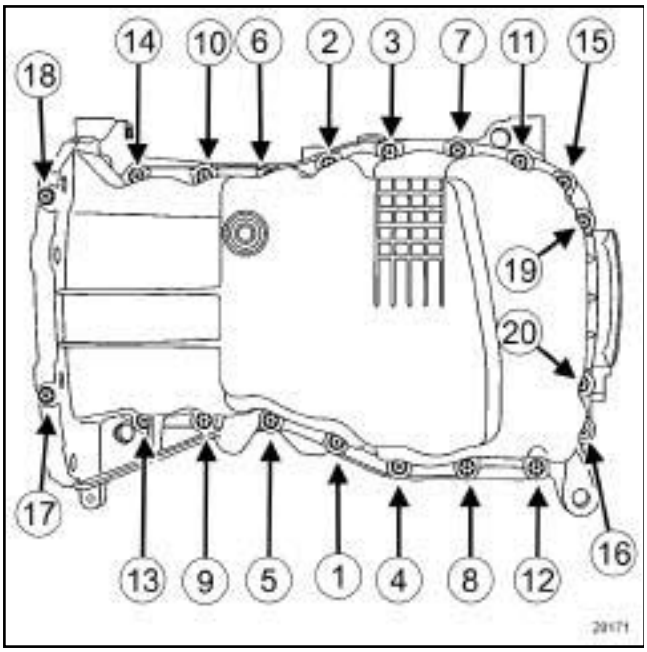


- the sump joint face if it is to be reused,
- the cylinder block gasket face.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. Mixing of the sealant with fluid could result in damage to certain components (engine, radiator, etc.).

20167



20166

❑ Apply:

- four beads (**9**) of **MASTIXO** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm**,
- two drops (**10**) of **MASTIXO** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) with a diameter of **5 mm**.

K4J or K4M

II - REFITTING OPERATION FOR PART CONCERNED

20171

❑ Refit:

- a new engine oil sump seal,
- the engine oil sump,
- the engine oil sump bolts without tightening them,
- the engine oil sump bolts on the gearbox without tightening them.

❑ Torque tighten the **engine oil sump bolts (14 N.m)** (**1**) , (**2**) , (**19**) , (**20**) , (**17**) and (**18**) .

❑ Tighten to torque and in order the **engine oil sump mounting bolts (14 N.m)**.

❑ Torque tighten the **bolts mounting the engine oil sump on the gearbox (44 N.m)**.

K4M, and 862

❑ Torque tighten the **engine oil sump bolt on the multifunction support (25 N.m)**.

III - FINAL OPERATION

K4M, and 862

❑ Tighten to torque:

- the **exhaust manifold upstream stay bolts (44 N.m)**,
- the **exhaust manifold downstream stay bolts (44 N.m)**.

❑ Refit:

- the relay bearing,
- the relay bearing bolts on the engine oil sump,
- the right-hand driveshaft flange bolts on the relay bearing.

❑ Refit the relay bearing bolts.

K4J – K4M, and 800 or 801 or 804

❑ Refit the driveshaft flange bolts.

❑ Torque tighten the **driveshaft flange bolts (21 N.m)**.

K4M, and 862

❑ Refit the driveshaft flange bolt.

❑ Torque tighten the **driveshaft flange bolt (21 N.m)**.

❑ Connect the oil level sensor.

WARNING
Place a **10 mm** thick shim between the radiator cross member and the sub-frame and centre the radiator cross member pin in the sub-frame hole at the level of the lower arm front mounting to torque tighten the radiator cross member mountings.

❑ Refit:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the dipstick.

K4J or K4M

- ❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .
- ❑ Refit the engine undertray.
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

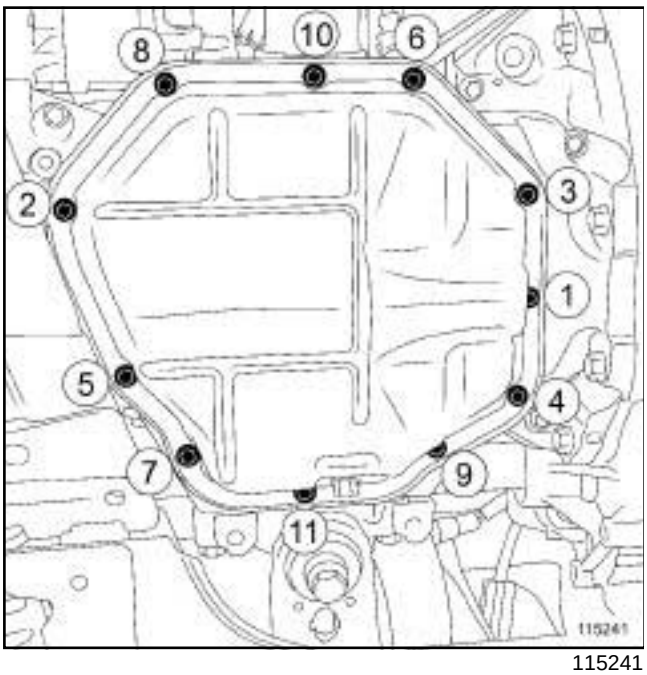
Lower cover: Removal - Refitting

M4R

Special tooling required	
Mot. 1716	Removes housing with silicone seals.

Tightening torques ▽	
sump mounting bolts	**10 Nm**

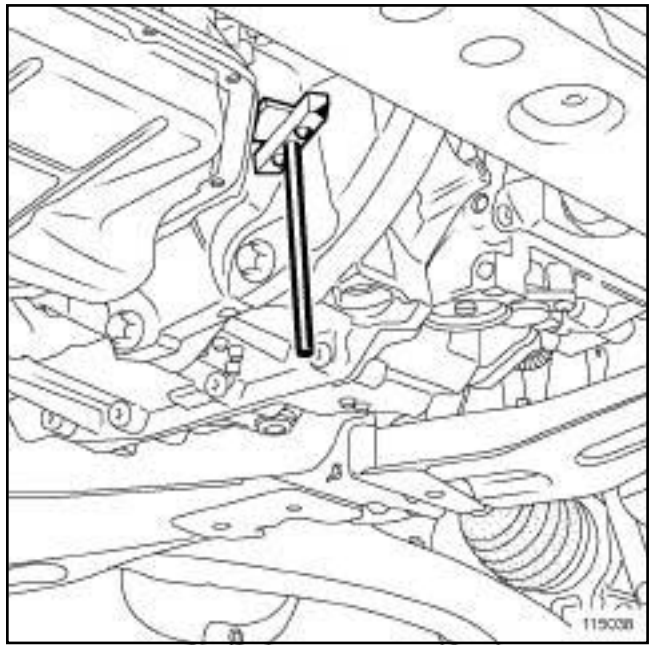
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove the engine undertray.



❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

II - REMOVAL OF PART CONCERNED

115241

❏ Remove the sump mounting bolts in the above order.

115038

❏ Detach the sump using the **(Mot. 1716)** and a hammer.

❏ Remove the sump.

IMPORTANT
Note the quantity of oil in the sump.

REFITTING

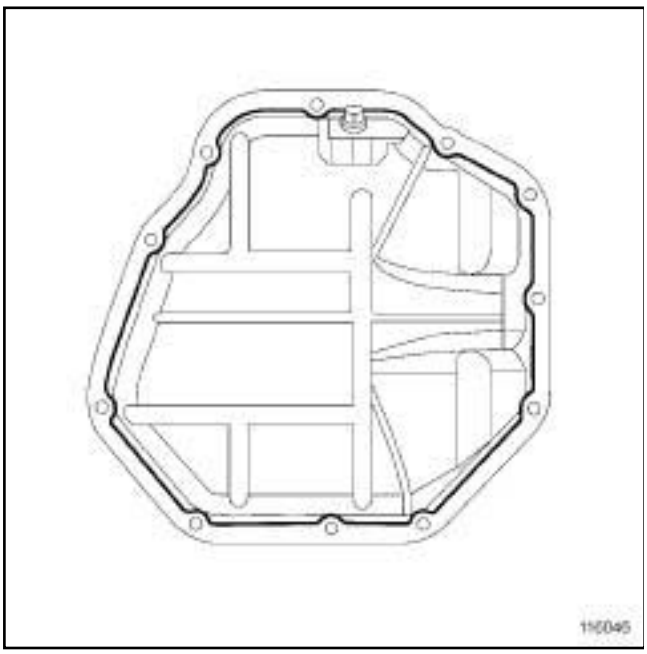
I - REFITTING PREPARATION OPERATION

❏ Clean the sealing surfaces using the **DECAPJOINT** product.

IMPORTANT
- Do not scratch the aluminium sealing surfaces.
- Wear goggles.
- Wear gloves during the operation.

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

WARNING
The gasket faces must be clean, dry and free from grease (avoid finger marks).



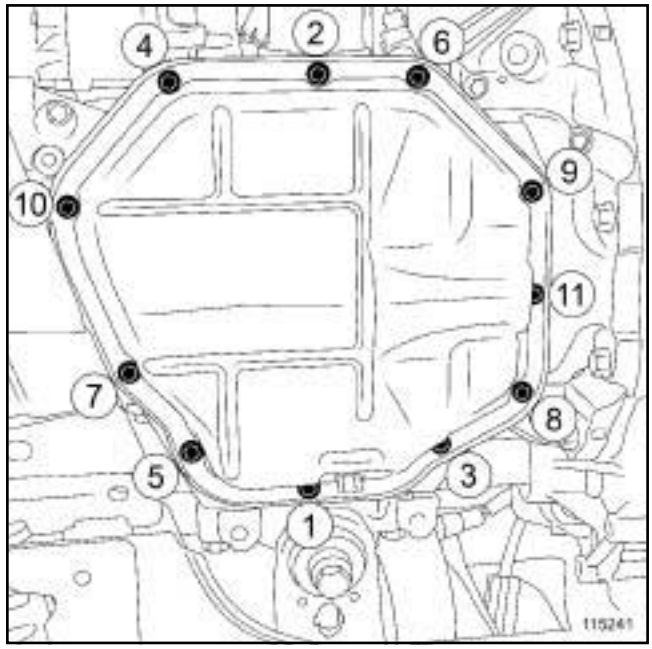
M4R

❏ Check that the sump is not:

- scratched,
- deformed.

If this is the case, replace the sump.

❏ Check that the baseplate is not scratched.



116046

❏ Apply a bead of **SILICONE ADHESIVE SEALANT (77 11 227 484)** approximately **5 mm** in diameter, approximately **8 mm** away from the inside rim of the sump to ensure a good seal.

II - REFITTING THE PART CONCERNED

❏ Fit the sump.

115241

❏ Finger tightenthe mounting bolts in the above order until they make contact with the sump.

❏ Tighten to torque and in order the **sump mounting bolts (10 Nm)**.

III - FINAL OPERATION

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Refit the engine undertray.

F4R

Tightening torques ▽	
sump mounting bolts (1) to (6)	**15 Nm**
sump mounting bolts (7) to (10), (1), (2), and (11) to (22)	**18 Nm**
sump mounting bolts on the gearbox	**44 Nm**
engine tie-bar mounting bolt on the mounting	**180 Nm**
engine tie-bar mounting bolt on the sub-frame	**105 Nm**
engine tie-bar support mounting bolts	**62 Nm**

REMOVAL

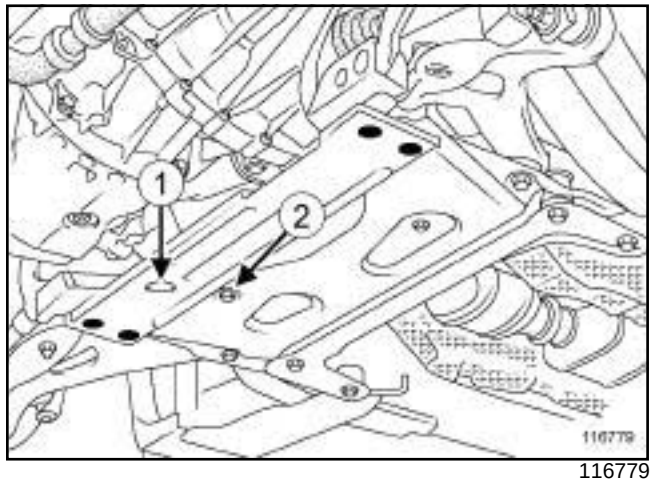
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.



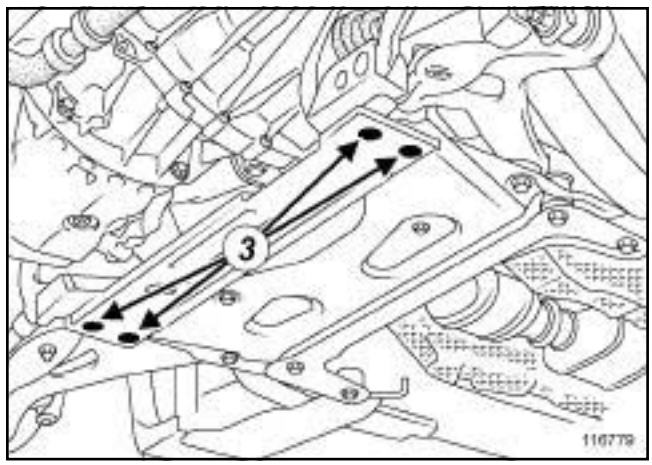
❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Refit the drain plug with its old seal.

❏ Strap the cooling unit in place.

❏ Remove the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

1 - Standard removal of sump



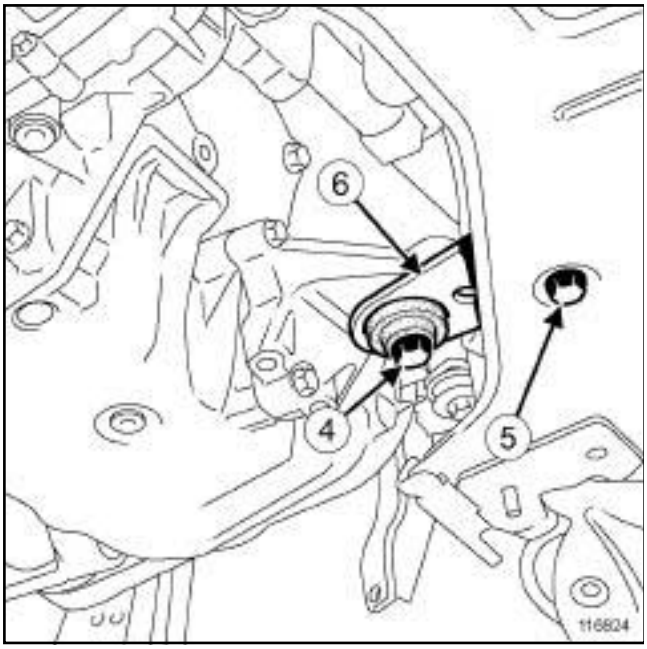
116779

❏ Remove the mounting bolt (**1**) from the lower engine tie-bar, engine side.

❏ Undo the mounting bolt (**2**) on the lower engine tie-bar, sub-frame side.

❏ Move the lower engine tie-bar to one side.

2 - Replacement of the sump

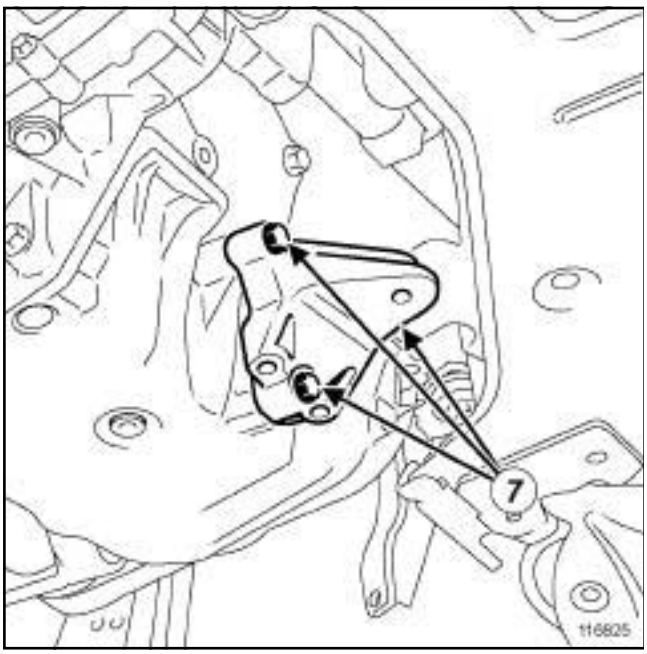


116779

❏ Remove:

- the mounting nuts (**3**) from the reinforcement lower cross member,
- the reinforcement lower cross member.

F4R

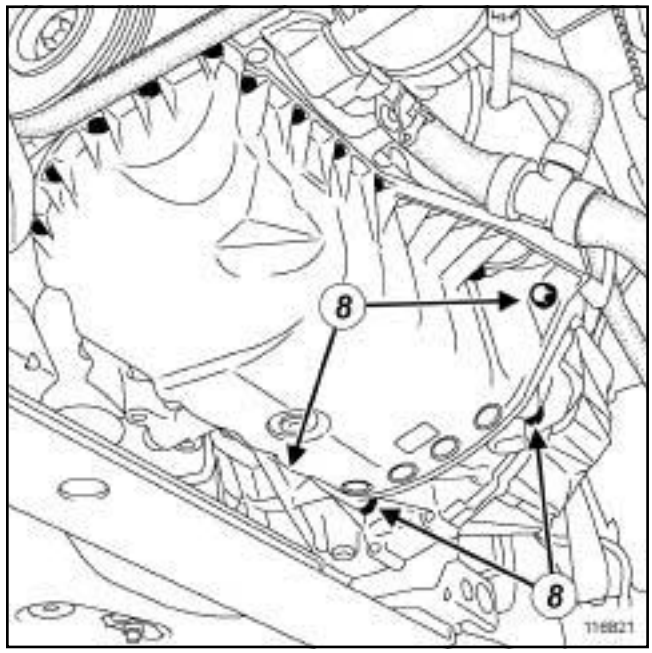


116824

❏ Remove the mounting bolt (**4**) from the lower engine tie-bar, engine side.

❏ Undo the mounting bolt (**5**) on the lower engine tie-bar, sub-frame side.

❏ Move the lower engine tie-bar (**6**) to one side.



116825

❏ Remove:

- the mounting bolts (**7**) from the engine tie-bar support, engine side,
- the engine tie-bar support, engine side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

116821

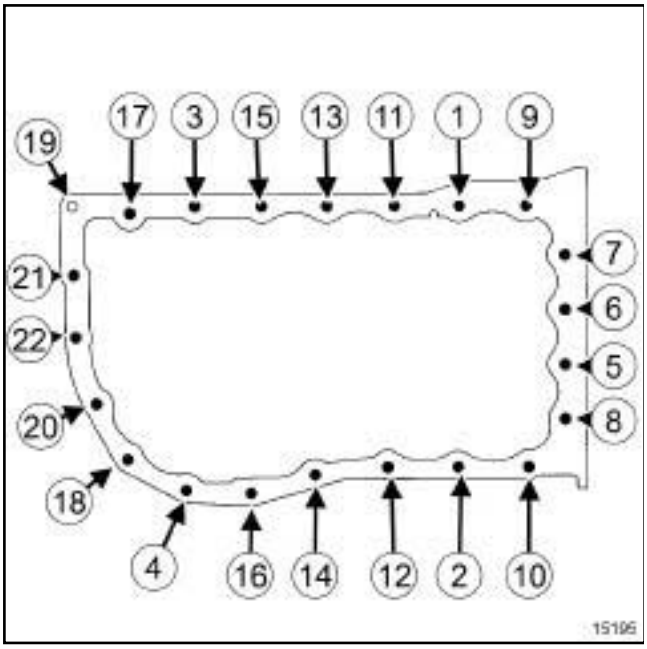
❏ Remove:

- the bolts (**8**) mounting the sump on the gearbox,
- the bolts mounting the sump on the cylinder block,
- the sump.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Clean:



- the sump joint face,
- the cylinder block joint face.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the sump with its new seal,
- the bolts mounting the sump on the cylinder block,
- the bolts mounting the sump on the gearbox.

F4R

15195

❏ Torque tighten and in order:

- the **sump mounting bolts (1) to (6) (15 Nm)**,
- the **sump mounting bolts (7) to (10), (1), (2), and (11) to (22) (18 Nm)**,
- the **sump mounting bolts on the gearbox (44 Nm)**.

❏ Clean around the sides of the sump.

❏ Remove the drain plug and its old seal.

❏ Refit the drain plug with its new seal.

WARNING
Systematically replace the gaskets.

1 - Standard refitting of sump

❏ Fit the lower engine tie-bar.

❏ Refit the lower engine tie-bar mounting bolt, engine side.

❏ Torque tighten:

- the **engine tie-bar mounting bolt on the mounting (180 Nm)**,
- the **engine tie-bar mounting bolt on the subframe (105 Nm)**.

2 - Replacement of the sump

❏ Refit:

- the lower cross member.
- the reinforcement lower cross member mounting nuts,

❏ Refit:

- the engine tie-bar support, engine side,
- the engine tie-bar support mounting bolts, engine side.

❏ Torque tighten the **engine tie-bar support mounting bolts (62 Nm)**.

❏ Fit the lower engine tie-bar.

❏ Refit the lower engine tie-bar mounting bolt, engine side.

❏ Torque tighten:

- the **engine tie-bar mounting bolt on its mounting (180 Nm)**,
- the **engine tie-bar mounting bolt on the subframe (105 Nm)**.

III - FINAL OPERATION

❏ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- check the engine oil level using the dipstick.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Start the engine and let it run for **5 minutes**.

❏ Check that there are no leaks between the cylinder block and the sump.

❏ Refit the engine undertray.

K9K

Special tooling required	
Mot. 1914	Tool for fitting G9 con rod bearing shells
Mot. 1920	Tool for fitting F9 / K9 con rod bearing shells

Equipment required
safety strap(s)
component jack
indelible pencil
torque wrench
Diagnostic tool

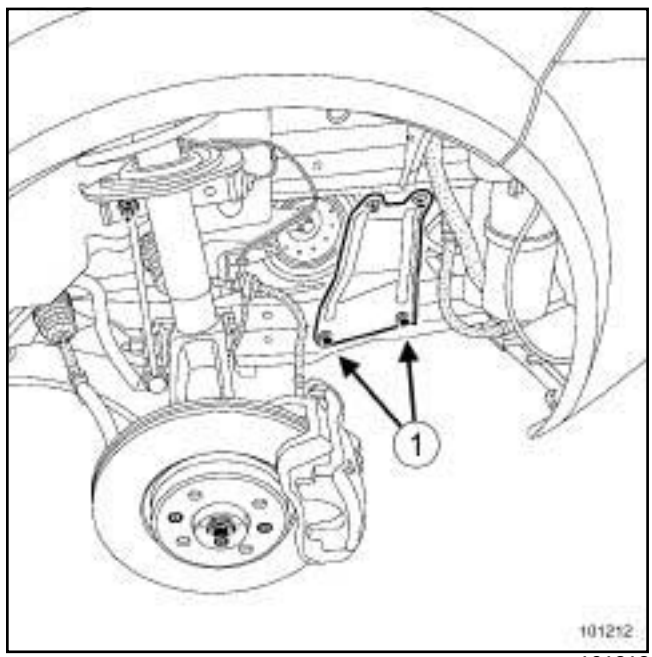
Tightening torques ▽	
con rod cap bolts	**20 N.m + 45° ± 6°**
oil pump bolts	**25 N.m**

IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Vehicle: Precautions for the repair**) .

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

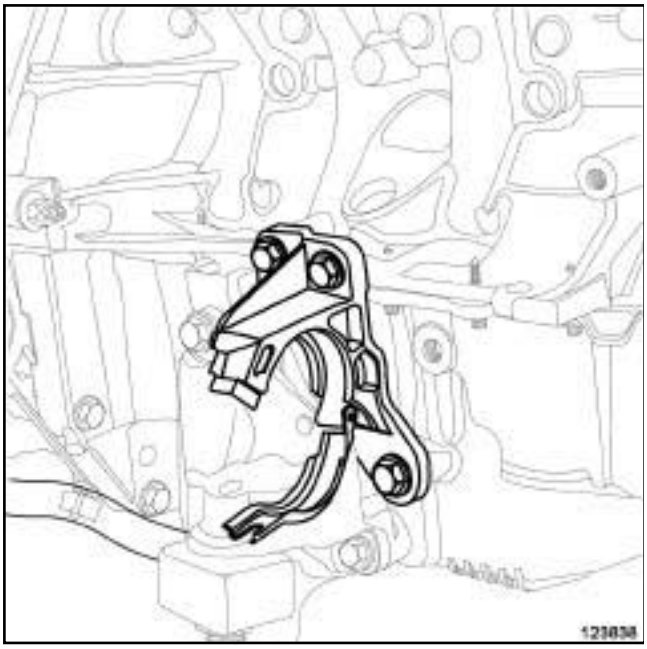
❑ Remove the engine undertray.

❑ Drain the oil from the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Remove the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

❑ Remove the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

101212



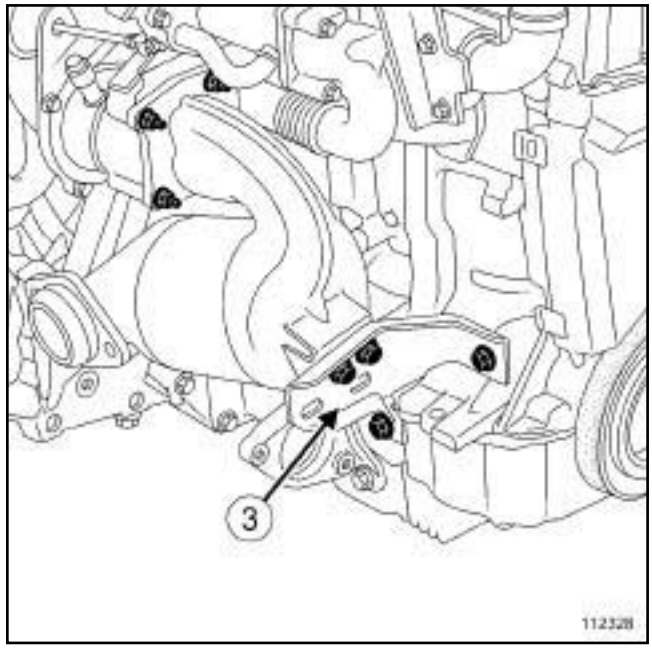
❑ Strap the radiator to the vehicle using **safety strap(s)**.

❑ Remove the clips from the front wheel arch liners on the radiator mounting cross member.

❑ Remove the side reinforcement mountings on the radiator mounting cross member (**1**) .

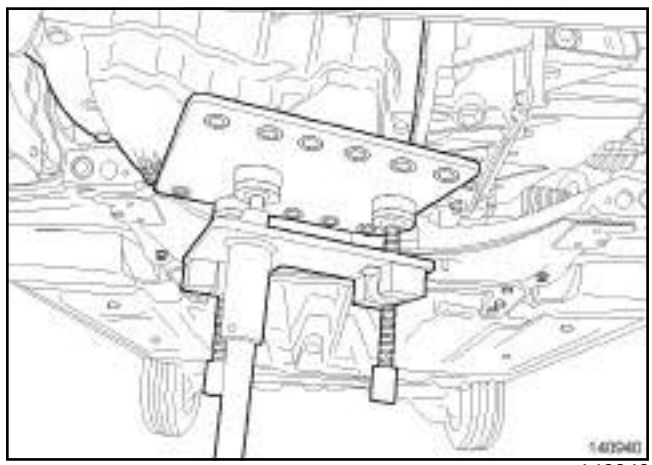
❑ Remove the radiator mounting cross member without removing the front bumper (see **Radiator mounting cross member: Removal - Refitting**) (31A, Front axle components).

K9K



123838

❑ Remove the relay bearing of the front right-hand wheel driveshaft.



123834

❑ Disconnect the oil level sensor connector (if equipped) (**2**) .

112328

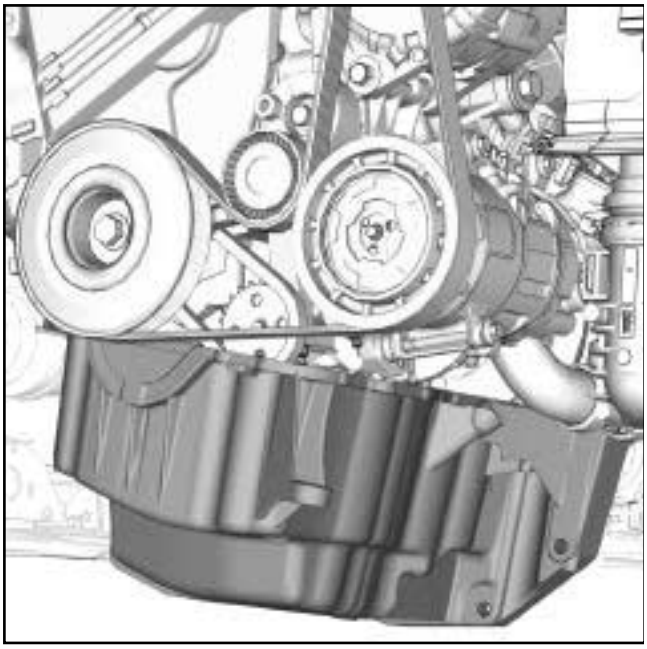
❑ Remove the catalytic converter upstream stay (**3**) .

140940

❑

WARNING

Failure to observe the following procedure may damage the oil pump strainer.



Undo the bolts of the engine oil sump.

❑ Fit a **component jack** to support the engine oil sump.

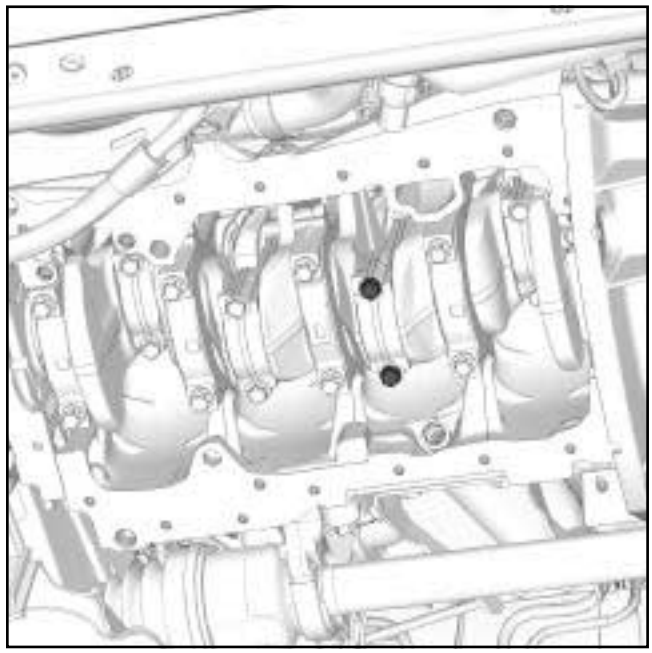
❑ Remove the bolts from the engine oil sump.

❑ Detach the engine oil sump, while supporting it with the **component jack**.

K9K

140917

❏ Tilt the engine oil sump forwards in order to access the oil pump bolts.



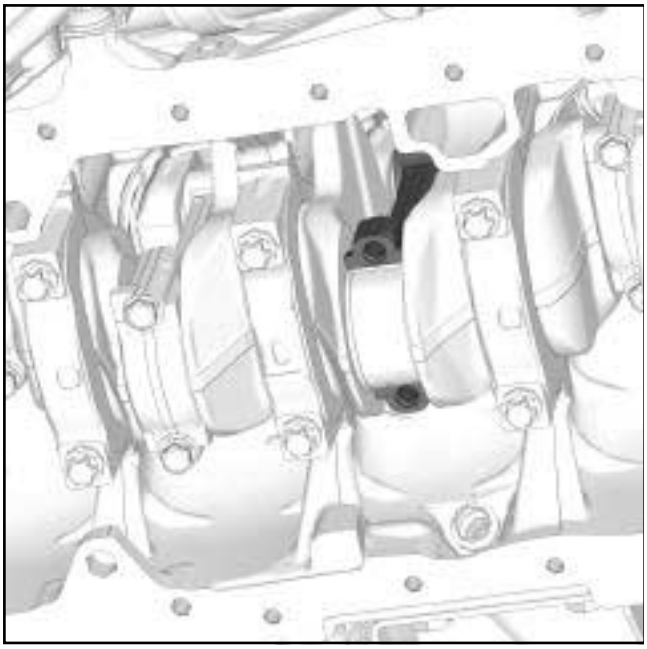
❏ Partially loosen the oil pump bolts **3 mm** to **5 mm**.

❏ Detach the oil pump from its position in order to remove the engine oil sump.

❏ Remove:

- the engine oil sump,
- the engine oil sump seal,
- the oil pump.

II - REMOVAL OPERATION FOR THE CON ROD BEARING SHELLS NO.2



139306

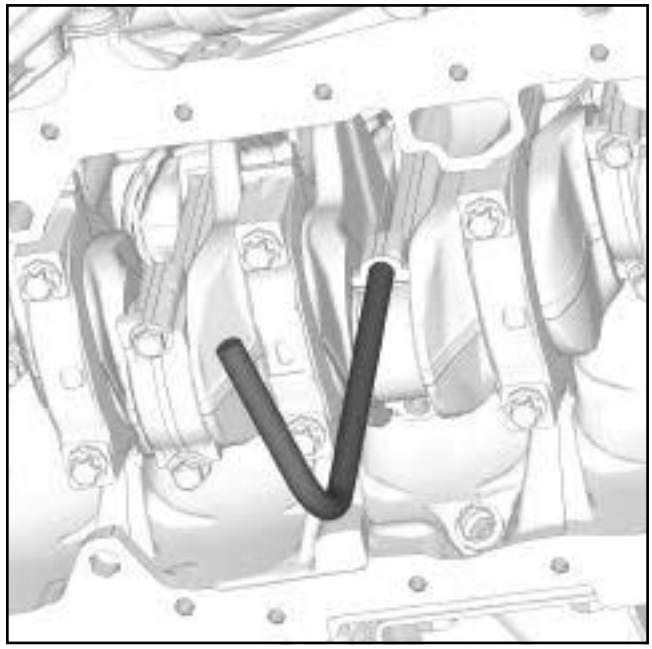
❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the big ends.

❏ Mark the position of the con rod cap in relation to the con rod body using a **indelible pencil**.

❏ Position the crankshaft at Top Dead Centre.

K9K

139300



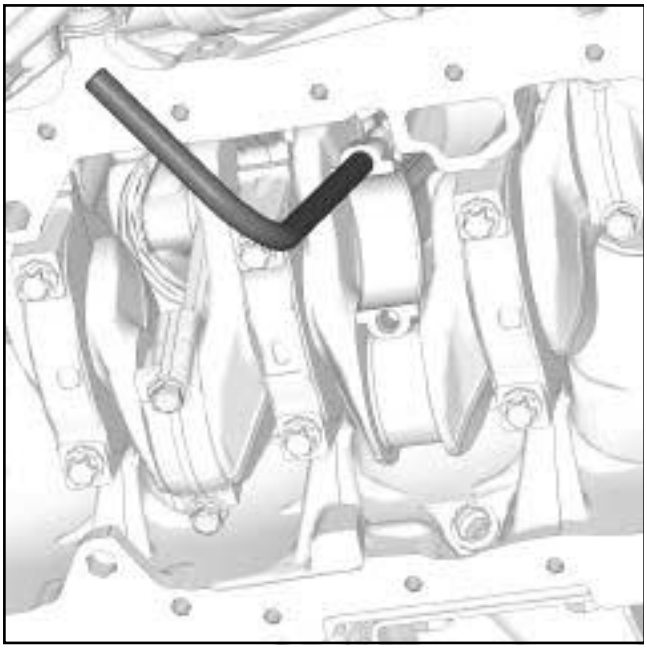
❑ Remove:

- the con rod bolts,
- the con rod cap,
- the lower con rod bearing shell.

Note:

If reusing the con rod bearing shells, mark the position of the lower con rod bearing shell in relation to the con rod cap.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - products) to clean the bearing mating face on the con rod cap.



139310

❑ Fit the tie rod of the tool **(Mot. 1914)** on the con rod body.

❑ Push the con rod upwards to release the con rod from the crankpin.

❑ Turn the crankshaft **90°** clockwise (timing end).

K9K

139315

❑

WARNING

Failure to observe the following procedure may damage the piston base cooling jets.

Pull the con rod - piston assembly using the tie rod of the tool **(Mot. 1914)**, taking care not to allow the piston to touch the piston base cooling jets.

❑ Remove the upper con rod bearing shell.

Note:

If reusing the con rod bearing shells, mark the position of the upper con rod bearing shell in relation to the con rod body.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - products) to clean the bearing mating face on the con rod body.

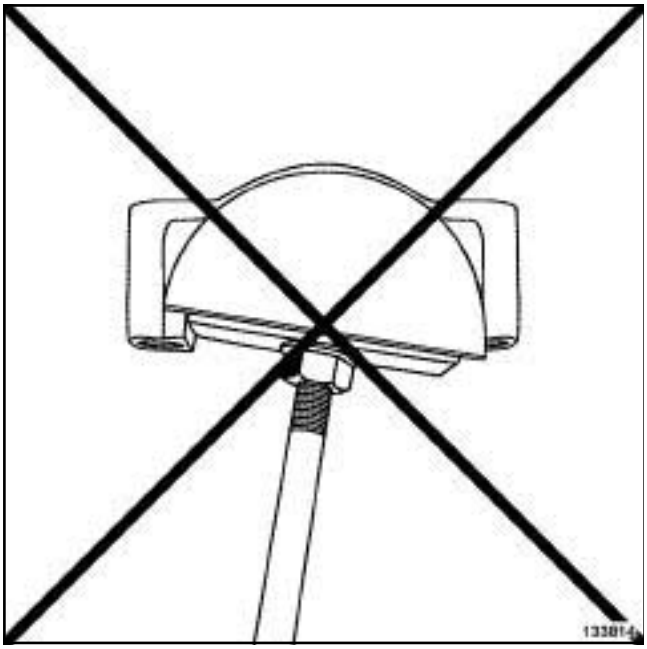
REFITTING

I - REFITTING OPERATION FOR THE CON ROD BEARING SHELLS ON CYLINDER NO.2

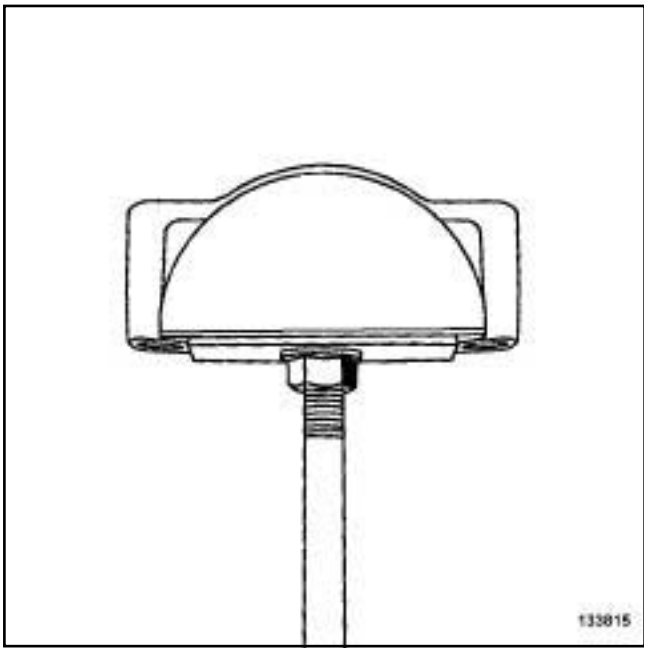
❑ **parts always to be replaced: con rod cap bolts (10,03,02,10)**

❑

Note:



Always replace con rod bearing shells with a width of **20 mm** by con rod bearing shells with a width of **18 mm**.



If the set of con rod bearing shells only includes con rod bearing shells which are **18mm** wide, only use the head of the tool **(Mot. 1920)** with the marking " **K9K SUP** ".

Fit the head of the tool **(Mot. 1920)** with the marking " **K9K INF** " on the threaded sleeve of the tool **(Mot. 1914)**.

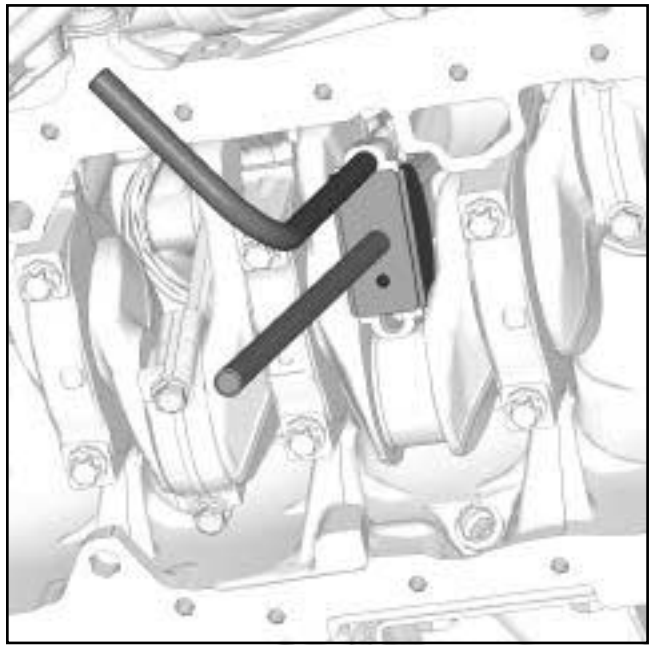
❑ Position the lower con rod bearing shell on the tool **(Mot. 1920)**.

K9K

133814

133815

❑



Note:

The contact surface between the bearing shell and the con rod must be dry and free of grease.

Fit the lower con rod bearing shell on the con rod cap using the tool **(Mot. 1920)**.

❑ Position the lower con rod bearing shell so that the ends do not protrude beyond the con rod cap.

❑ Lubricate the surface of the con rod bearing shell (crankshaft end) using new engine oil.

139318

❑ Remove the tool head with the marking " **K9K INF** " and fit the head with the marking " **K9K SUP** ".

❑ Position the upper con rod bearing shell on the tool **(Mot. 1920)**.

❑ Fit the upper con rod bearing shell on the con rod body using the tool **(Mot. 1920)**.

❑ Position the upper con rod bearing shell so that the ends do not protrude beyond the con rod body.

❑ Lubricate the surface of the con rod bearing shell (crankshaft end) using new engine oil.

❑ Push the con rod - piston assembly back up into place.

❑ Turn the crankshaft **90°** anticlockwise.

❑ Lubricate the crankpin with new engine oil.

❑ Pull the con rod - piston assembly to position the con rod on the crankshaft.

❑

Note:

Before refitting the con rod cap, ensure that there are no impurities (filings, cloth lint, etc.) on the con rod body or cap surfaces.

Refit:

- the con rod cap according to the mark made during removal,
- the new con rod bolts.

❑ Torque and angle tighten the **con rod cap bolts (20 N.m + 45° ± 6°)**.

K9K

II - REMOVAL - REFITTING OPERATIONS FOR THE CON ROD BEARING SHELLS ON CYLINDERS NO.3, 1 AND 4

❑ Perform the same removal - refitting operations as for the con rod bearing shells on cylinder no. 2.

Note:

For removing and refitting the con rod bearing shells on cylinders no. 1 and no. 4, position the pistons at Bottom Dead Centre before performing the same removal and refitting operations as for the con rod bearing shells on cylinder no. 2.

III - FINAL OPERATION

❑ **parts always to be replaced: engine oil sump seal (10,03,01,09)**

parts always to be replaced: Oil filter (10,05,05, 03)

parts always to be replaced: Drain plug seal on engine oil sump (10,03,01,04)

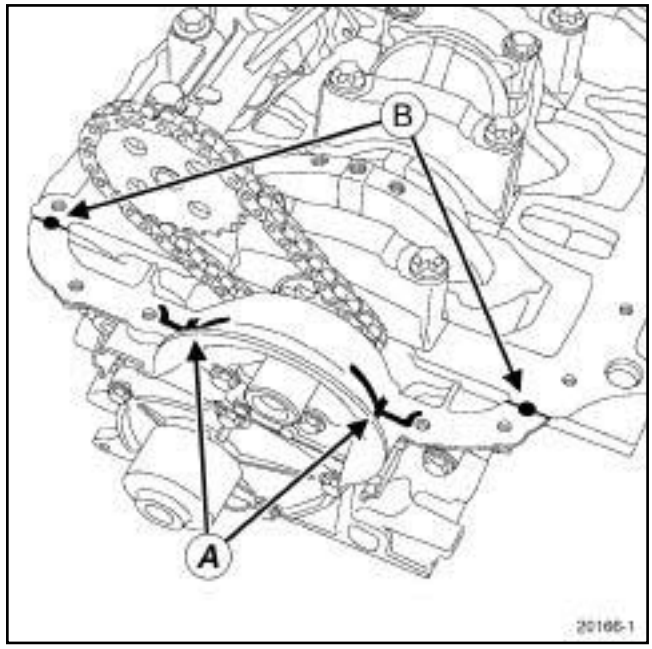
WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING

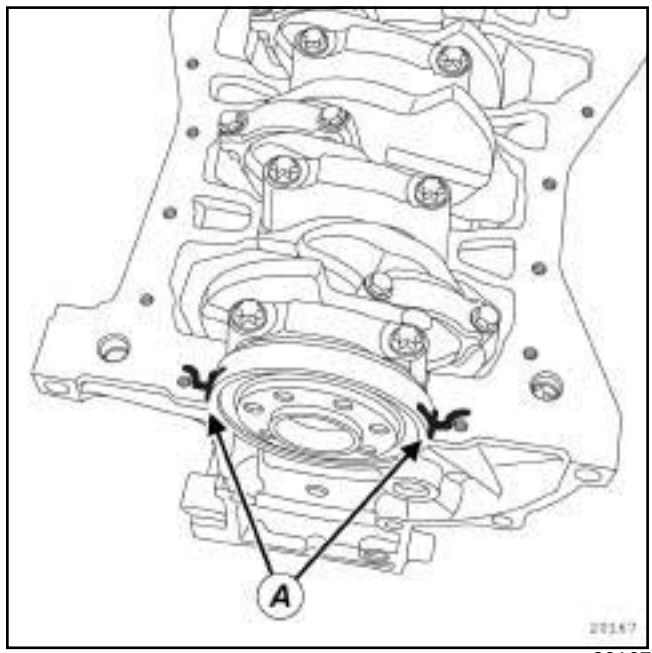
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Use a wooden spatula or an **ABRASIVE PAD** to clean the joint face of the cylinder block and engine oil sump.



❑ Refit the oil pump.

❑ Fit without tightening the oil pump bolts, while keeping a clearance of **3 mm** to **5 mm**.

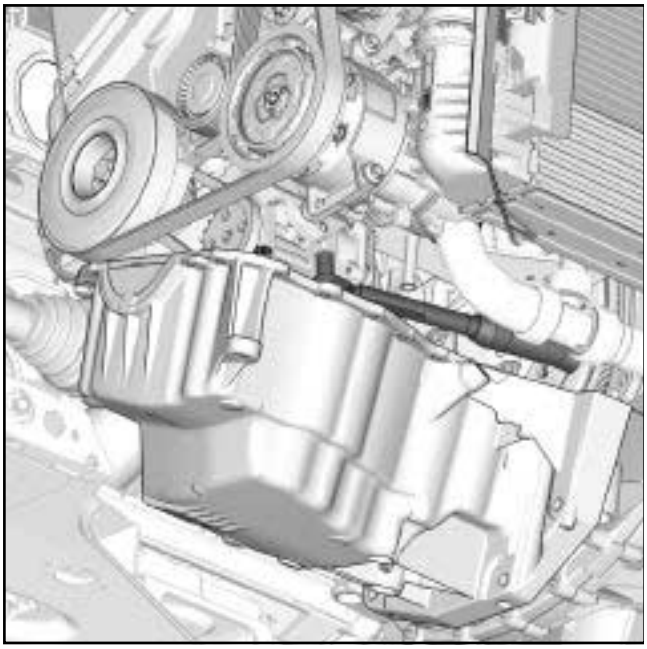


❑ Fit the engine oil sump seal.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

20166



20167

❑ Apply **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) :

- four beads with a diameter of **5 mm** at (**A**) ,
- two drops with a diameter of **5 mm** at (**B**) .

❑ Fit the engine oil sump while supporting it using a **component jack**.

K9K

140918

❑ Tilt the engine oil sump forwards in order to access the oil pump bolts.

❑ Torque tighten the **oil pump bolts (25 N.m)** using the **torque wrench** PROSTEEL, part number **77 11 226 888** starting with the **13 mm** bolt.

❑

Note:

Check that the engine oil sump seal is definitely in place before tightening the engine oil sump bolts.

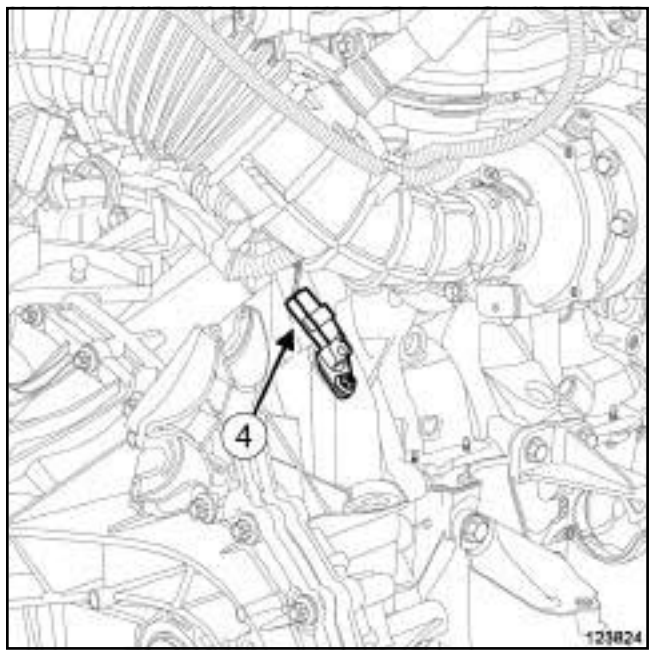
❑ Refit the engine oil sump bolts.

❑ Torque tighten in order the engine oil sump bolts (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

❑ Refit the catalytic converter upstream stay (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

❑ Connect the connector to the oil level sensor.

❑ Refit the relay bearing of the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) .



❑ Refit the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (31A, Front axle components).

❑ Refit the side reinforcement mountings on the radiator mounting cross member.

❑ Refit the mountings of the front right-hand wheel arch liner on the radiator mounting cross member.

❑ Remove the **safety strap(s)** from the radiator.

❑ Refit the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

123824

❑ Disconnect the crankshaft position sensor (**4**) to prevent the engine from starting.

❑ Refit the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**)

❑ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Start the engine using the starter until the engine oil warning light goes out.

❑ Connect the crankshaft position sensor.

❑ Refit the engine undertray.

❑ Clear the present faults using the **Diagnostic tool**.

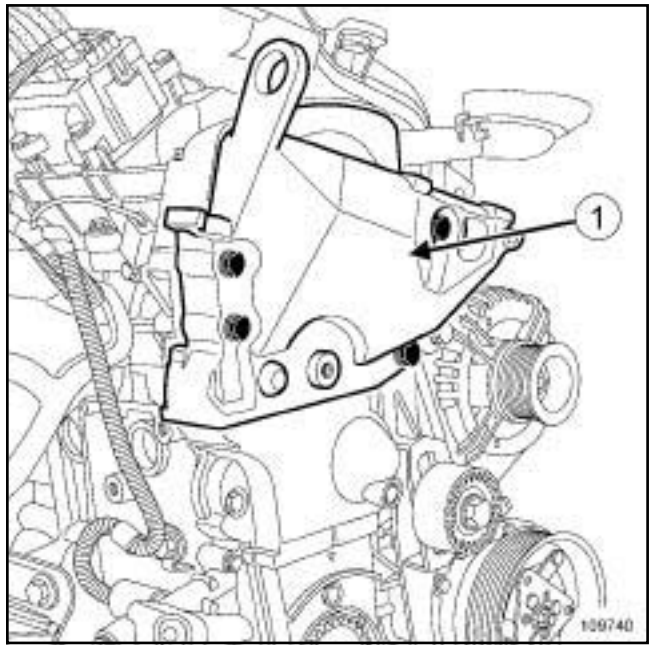
D4F, and 740 or 742 or 764

Special tooling required	
Mot. 1672	Lower engine support.
Mot. 1374	Oil pump seal extractor.
Mot. 1626	Tool for fitting the PTFE crankshaft seal, timing end.

Tightening torques ▽	
oil pump mounting bolts	**9 N.m**

REMOVAL

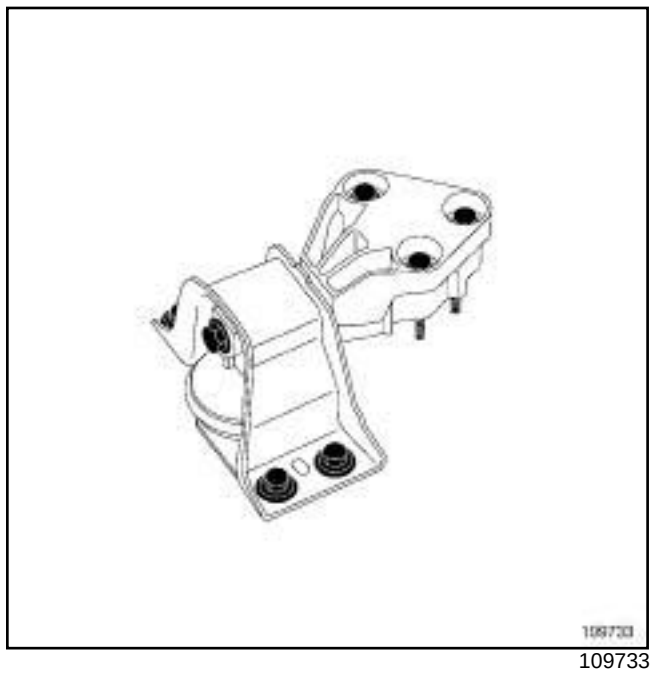
I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:



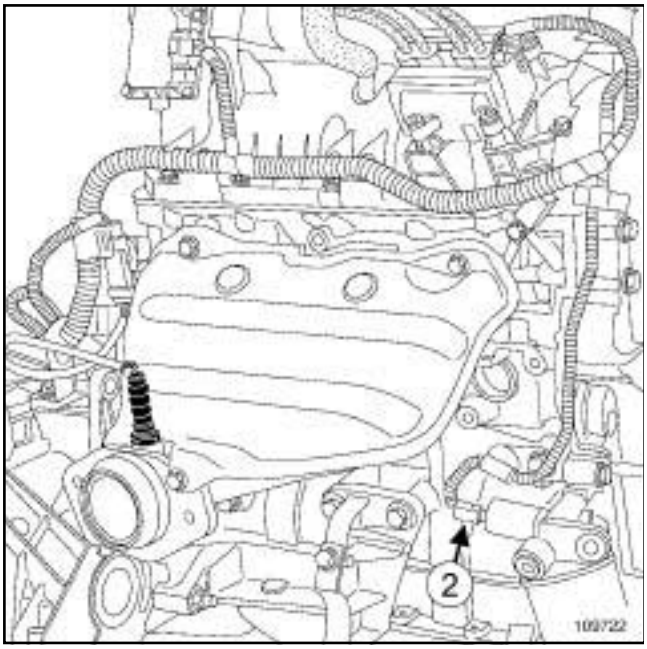
- the dipstick,
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

❏ Drain the oil from the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

109740

❏ Refit the upper timing cover (**1**) .

109733

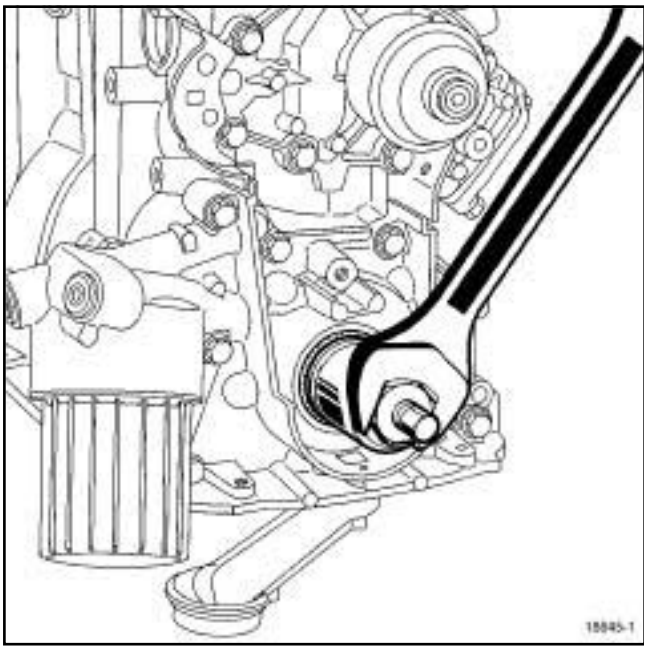


❏ Refit the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove the lower engine support tool **(Mot. 1672)**.

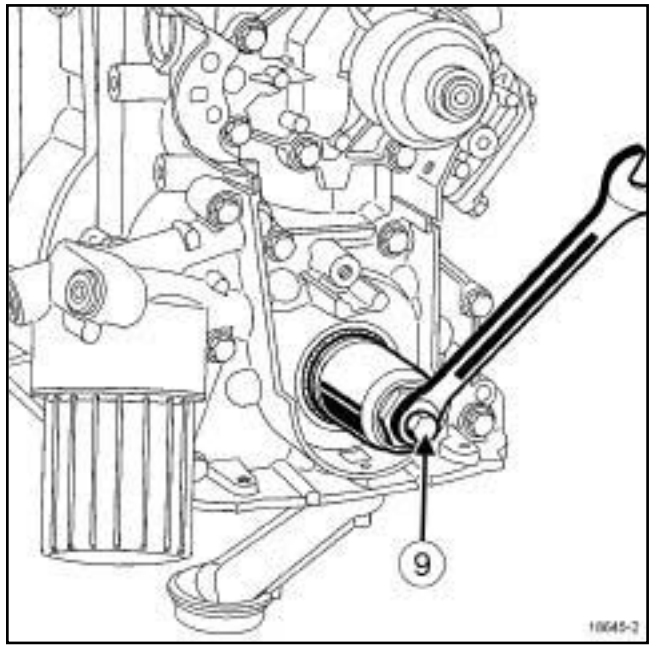
❏ Remove:

- the lower cover (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) ,



D4F, and 740 or 742 or 764

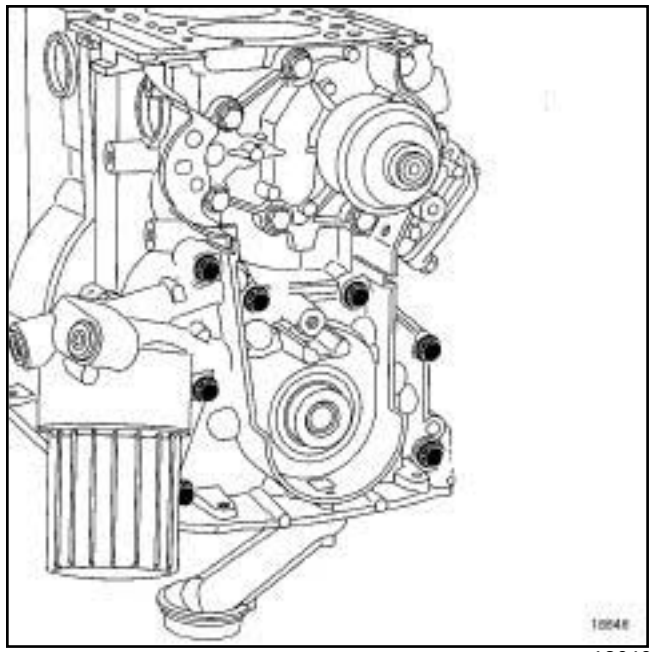
109722



❏ Disconnect the oil pressure sensor connector (**2**) .

❏ Remove the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) .

18645-1



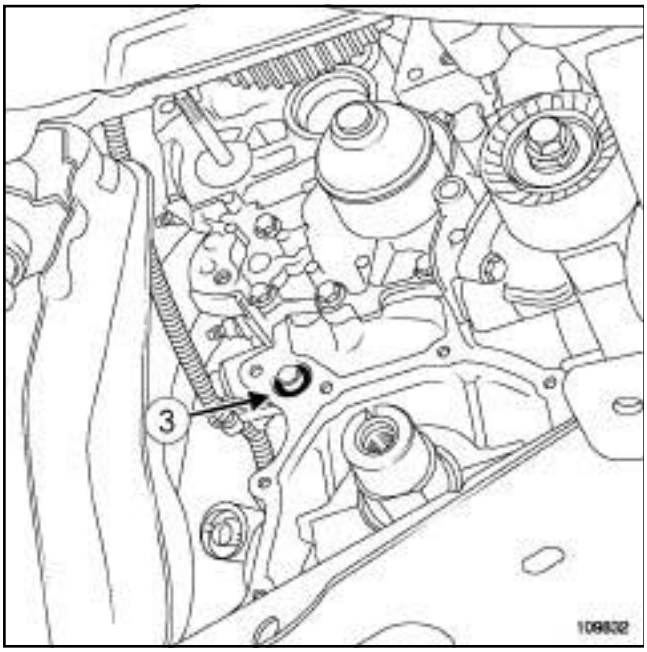
❏ Remove the crankshaft seal by turning tool **(Mot. 1374)**.

18645-2

❏ Remove the seal by tightening the bolt (**9**) on the **(Mot. 1374)**.

II - OPERATION FOR REMOVAL OF PART CONCERNED

18646

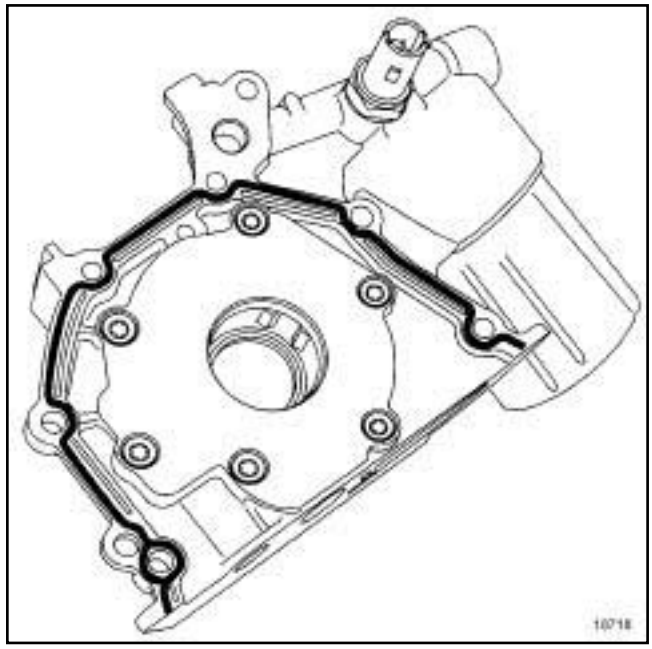


❏ Remove:

- the oil pump strainer,
- the oil pump mounting bolts,
- the oil pump.

D4F, and 740 or 742 or 764

REFITTING



I - REFITTING PREPARATION OPERATION

109832

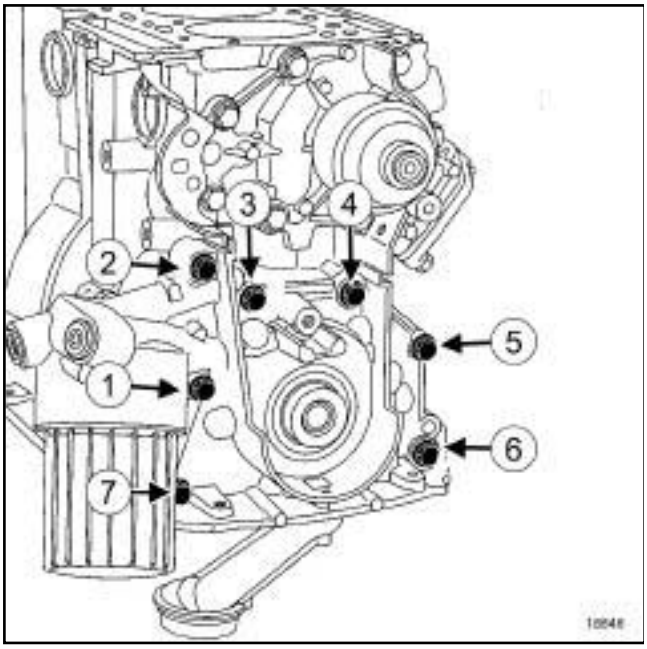
❑ Always replace:

- the O-ring (**3**) ,
- the crankshaft seal.

18718

❑ Refit the oil pump.

WARNING



The sealing surfaces must be clean, dry and free from grease (avoid finger marks).

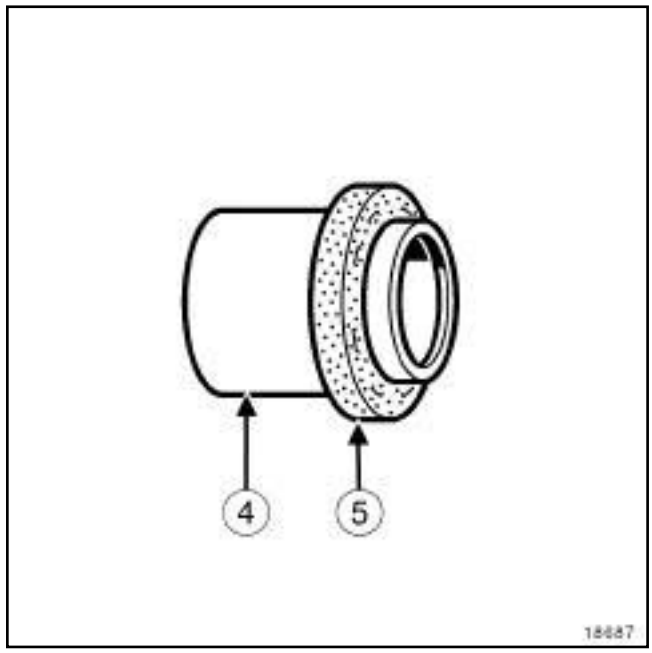
Apply a beading of **SILICONE ADHESIVE SEALANT 77 11 227 484** with a width of **1.3 mm** to seal the oil pump.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the oil pump, aligning the oil pump drive points with the flat surface of the crankshaft.

D4F, and 740 or 742 or 764

18646



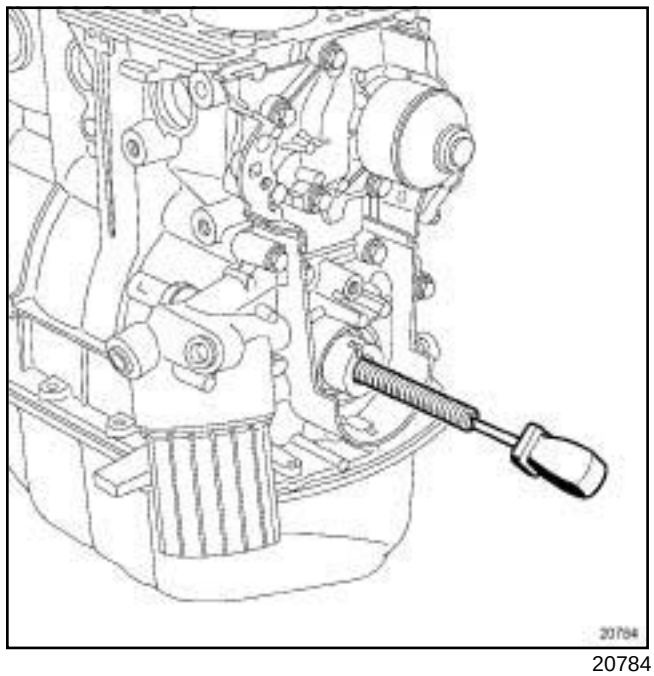
❏ Tighten to torque and in order the **oil pump mounting bolts (9 N.m)**.

❏ Refit the oil pump strainer.

Note:

The oil pump strainer does not have a seal.

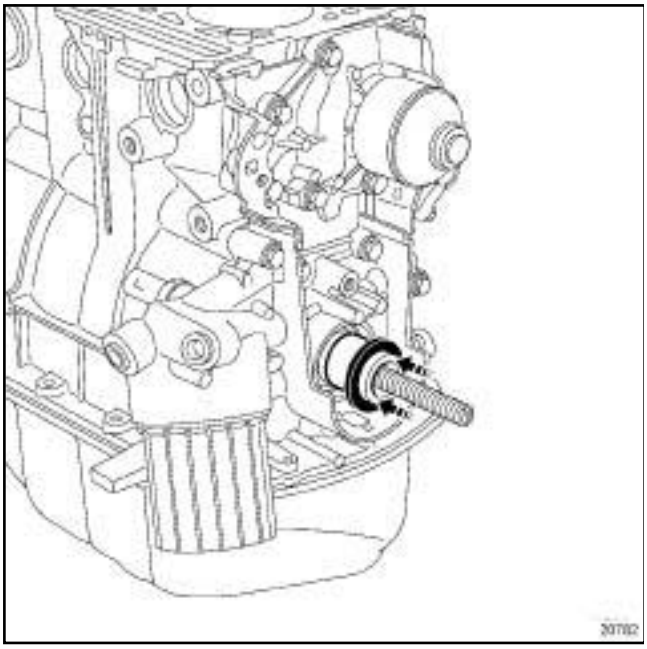
III - FINAL OPERATION.



18687

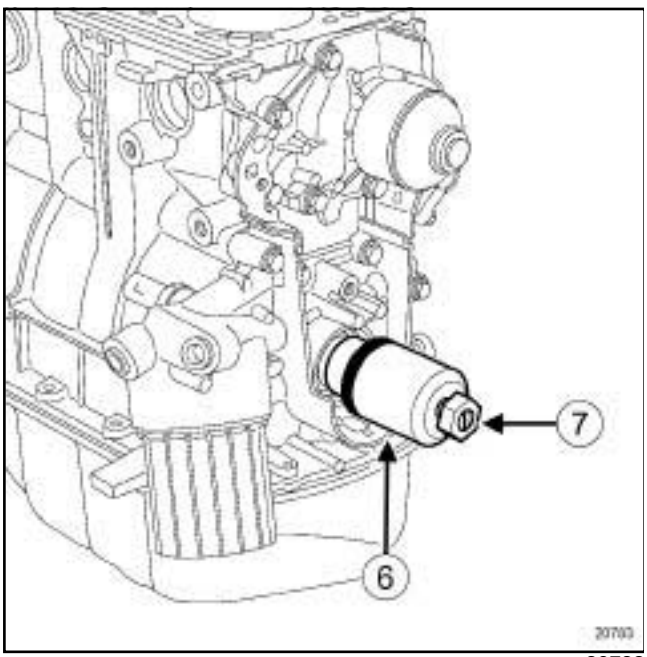
❏ Refit the crankshaft seal.

WARNING



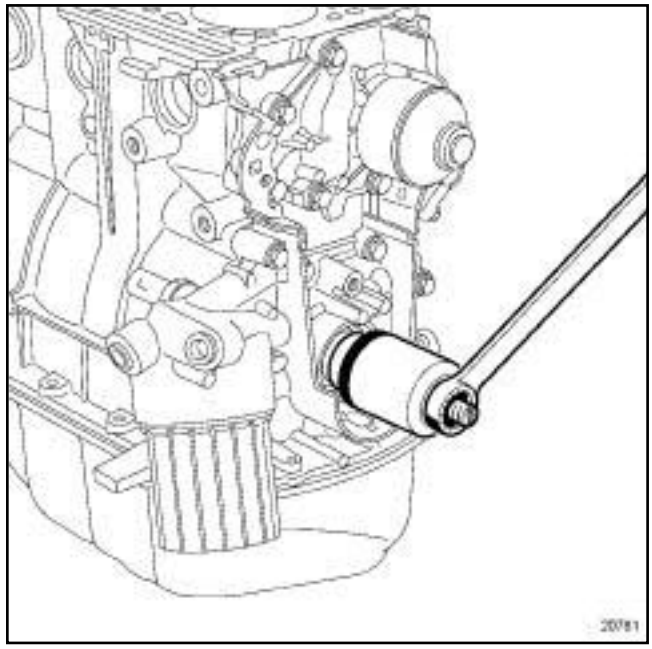
This type of seal is extremely fragile. When handling, it is essential to grip protective piece (**4**) . It is strictly forbidden to touch seal; (**5**) this is to prevent any oil leaks once the oil seal is fitted to the engine.

20784



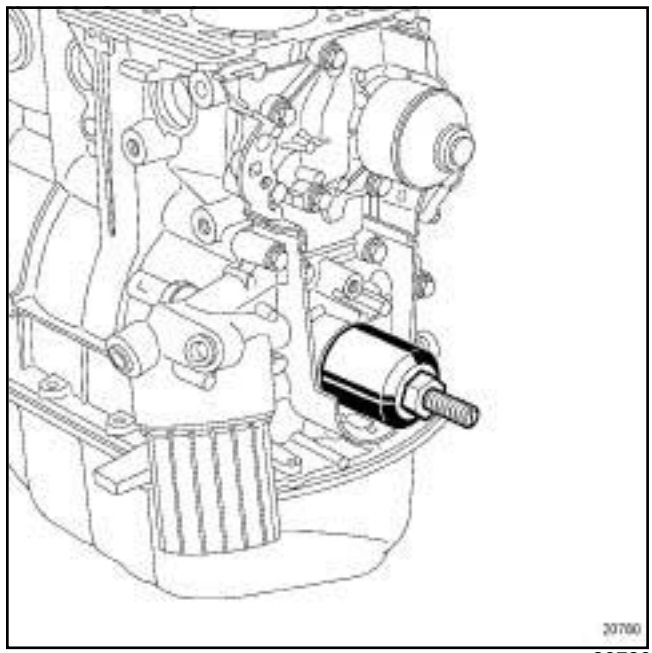
❏ Screw the threaded rod **(Mot. 1626)** into the crankshaft.

D4F, and 740 or 742 or 764



20782

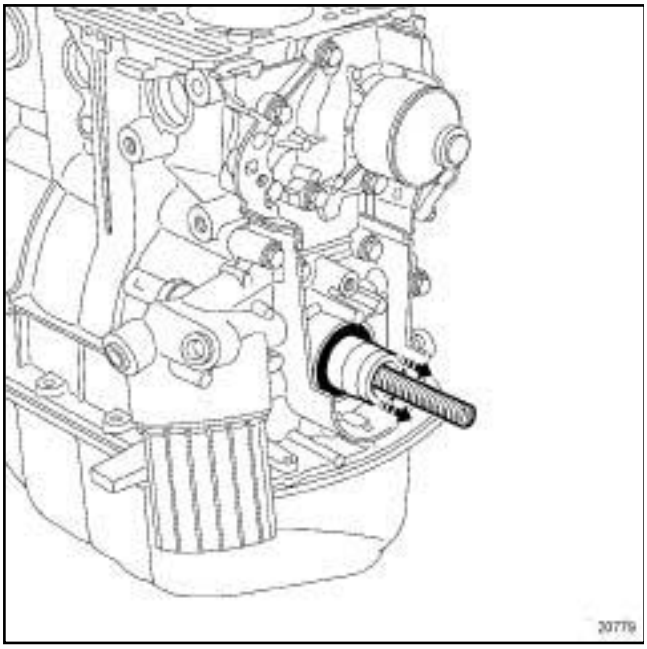
❑ Fit the seal and protector on the crankshaft, taking care not to touch the seal.



20783

❑ Fit the cover (**6**) and the collar nut (**7**) of the **(Mot. 1626)**.

20781



20780

❑ Tighten the collar nut until the cap touches the crankshaft closure panel.

Oil pump: Removal - Refitting

D4F, and 740 or 742 or 764

20779

❑ Remove:

- the nut,
- the cover,
- the guard,
- the threaded rod.

❑ Refit the lower cover (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

❑ Refit the lower engine support **(Mot. 1672)**.

❑ Remove:

- the right-hand suspended mounting support,
- the upper timing cover.

❑ Connect the oil pressure sensor connector.

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the dipstick,
- the engine undertray,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M

Tightening torques ▽	
oil pump bolts	**25 N.m**

REMOVAL

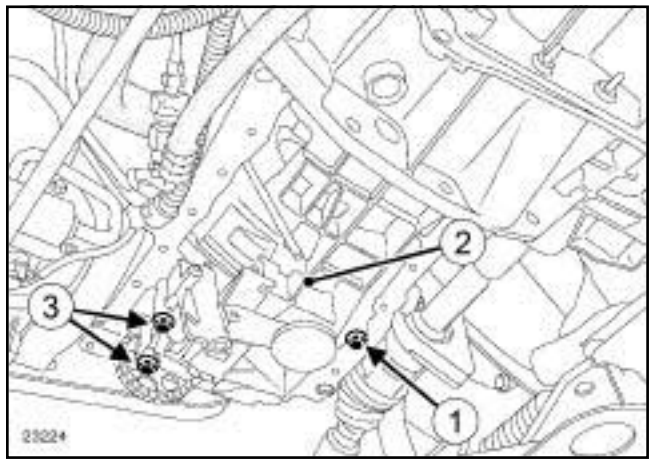
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:

- the engine undertray bolts,
- the engine undertray.



❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Remove:

- the dipstick,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the engine oil sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

K4J – K4M, and 800 or 801 or 804

23224

❏ Remove:

- the oil splash plate bolt (**1**) ,
- the oil splash plate (**2**) ,
- the oil pump bolts (**3**) .

K4M, and 862

128799

❏ Remove the oil pump bolts (**4**) .

K4J or K4M

❑ Remove the oil pump.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the oil pump,
- the oil pump bolts.

❑ Torque tighten the **oil pump bolts (25 N.m)**.

K4J – K4M, and 800 or 801 or 804

❑ Refit:

- the oil splash plate,
- the oil splash plate bolt.

II - FINAL OPERATION

❑ Refit:

- the engine oil sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the dipstick.

❑ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Refit the engine undertray.

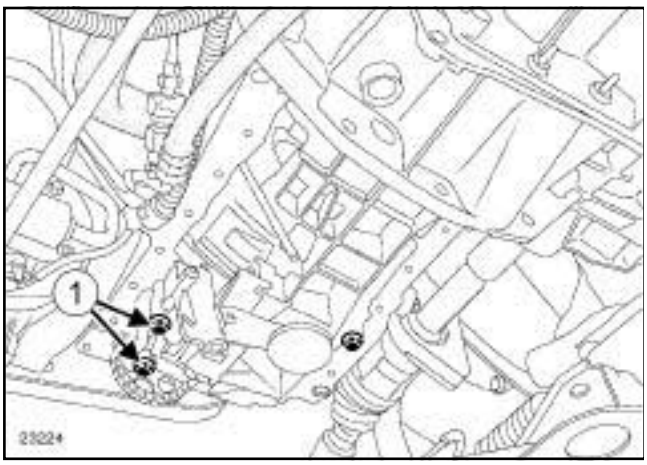
❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K

Tightening torques ▽	
oil pump bolts	**25 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine undertray,
- the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

23224

❑ Remove:

- the oil pump bolts (**1**) ,
- the oil pump.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the oil pump.

❑ Tighten the **oil pump bolts (25 Nm)**.

II - FINAL OPERATION.

❑ Refit:

- the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) ,
- the engine undertray.

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Oil pump: Removal - Refitting

M4R

- The engine and gearbox assembly must be removed to remove/refit the oil pump (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-113**) .
- For the removal and refitting procedure for the oil pump (see **Cylinder block: Stripping**) and (see **Cylinder block: Rebuilding**) (Technical Note 6020A, 10A, Engine and peripherals).

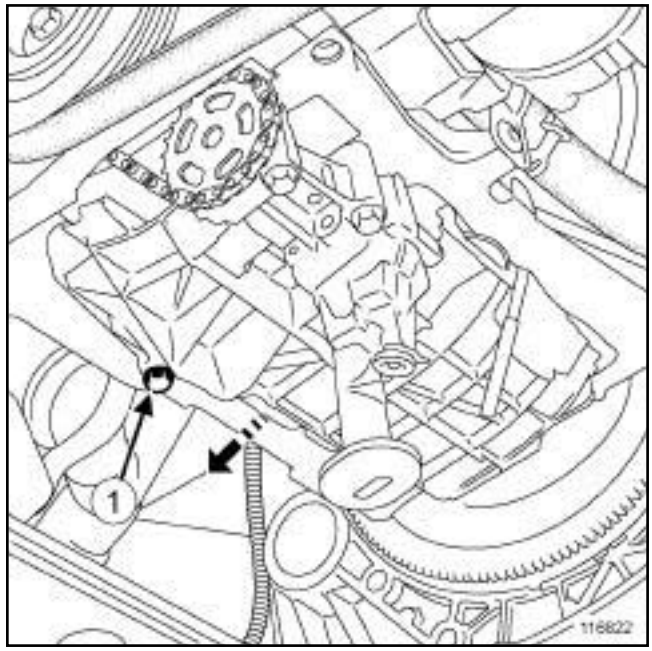
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

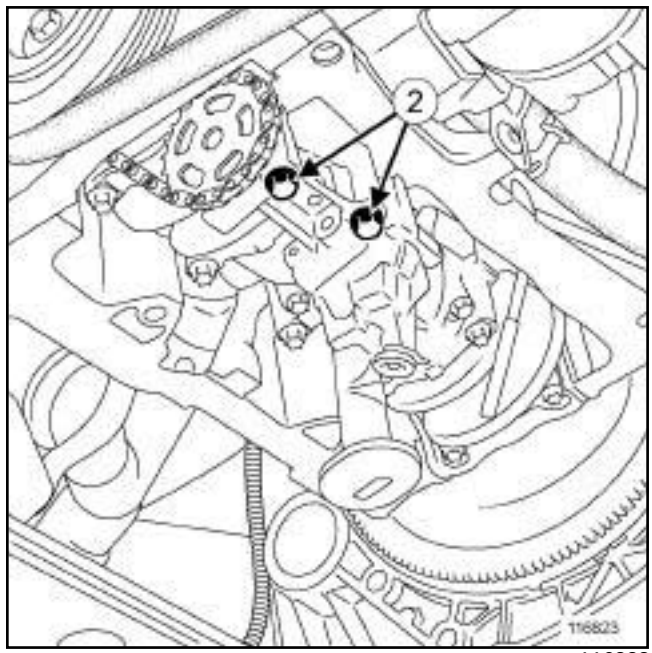


❏ Remove:

- the dipstick,
- the engine undertray.

❏ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❏ Remove the sump (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .



II - OPERATION FOR REMOVAL OF PART CONCERNED

116822

❏ Remove:

- the oil splash plate mounting bolt (**1**) ,
- the oil splash plate by sliding it in the direction of the arrow.

116823

❏ Remove:

- the oil pump mounting bolts (**2**) ,
- the oil pump.

F4R

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the oil pump,
- the oil pump mounting bolts.

❑ Torque tighten the **oil pump mounting bolts (24 Nm)**.

❑ Refit:

- the oil splash plate,
- the oil splash plate mounting bolts.

❑ Torque tighten the **oil splash plate mounting bolts (24 Nm)**.

II - FINAL OPERATION

❑ Refit the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

❑ Fill up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Start the engine and let it run for **5 minutes** after the engine oil warning light goes off.

❑ Check that there are no leaks between the cylinder block and the sump.

❑ Refit the engine undertray.

❑ Top up the engine oil level using the dipstick.

D4F, and 784

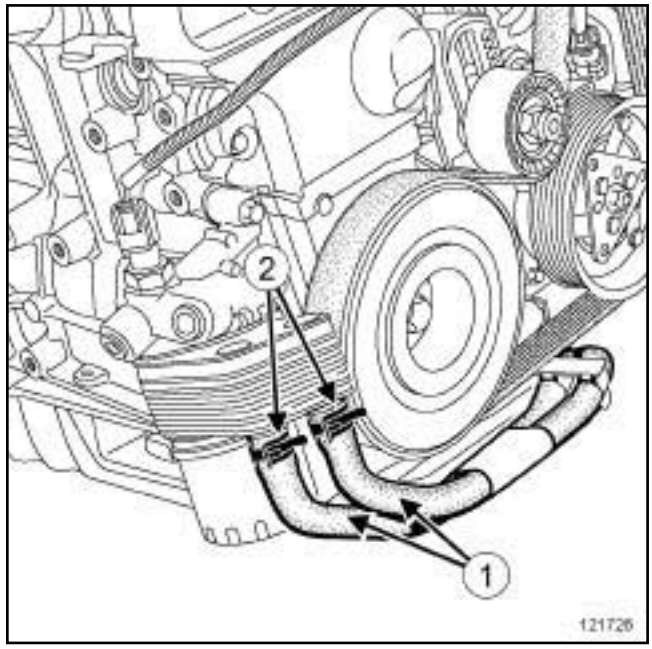
Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1672	Lower engine support.
Mot. 1374	Oil pump seal extractor.
Mot. 1626	Tool for fitting the PTFE crankshaft seal, timing end.

Tightening torques ▽	
oil pump bolts	**10 Nm**
oil pump strainer bolts	**10 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



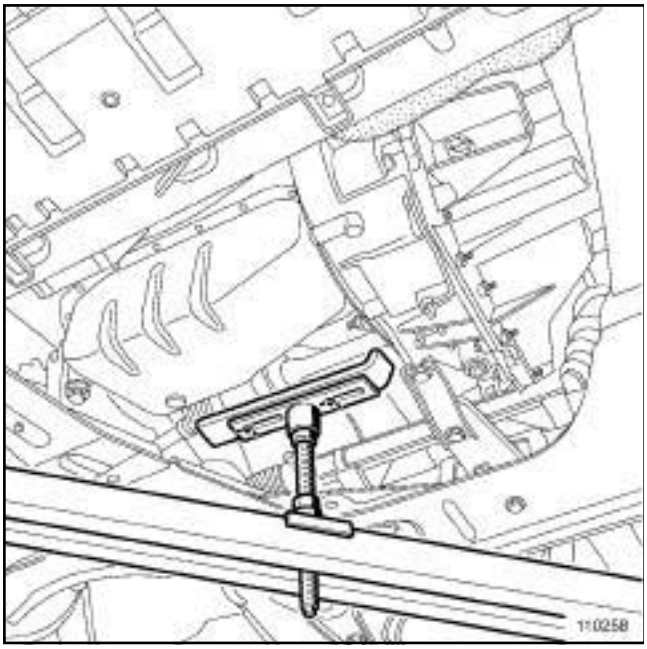
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the engine undertray.

❑ Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Remove:

- the dipstick,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).



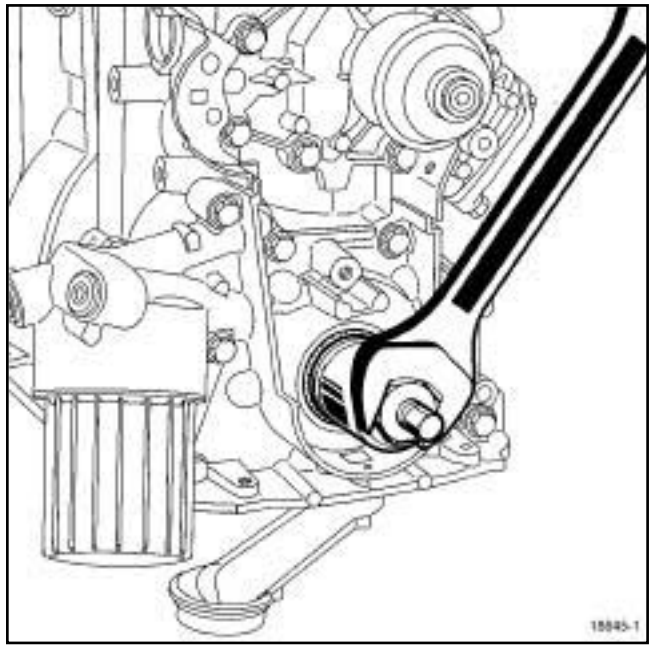
121726

❑ Fit hose clamps **(Ms. 583)** onto the oil-coolant heat exchanger hoses (**1**) .

❑ Release the clips (**2**) using the **(Mot. 1448)**.

❑ Disconnect the oil cooler hoses.

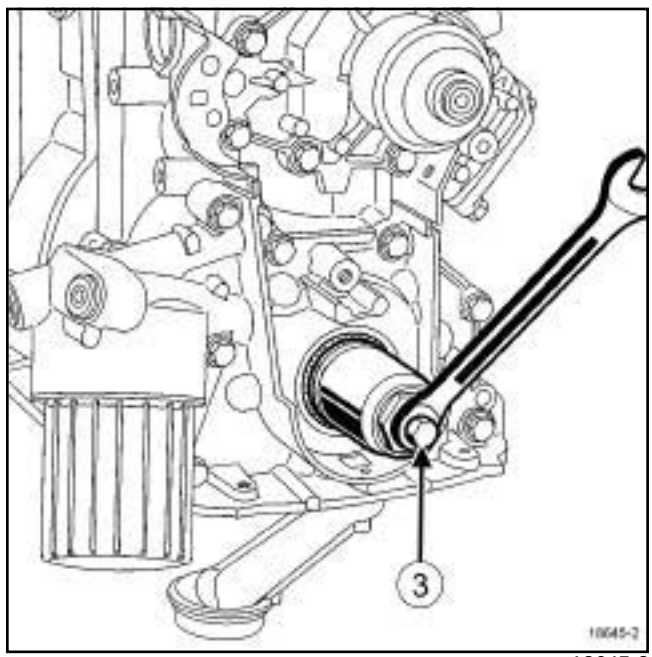
D4F, and 784



110258

❏ Fit the engine support tool **(Mot. 1672)** using the driveshaft relay bearing as a support.

❏ Remove:

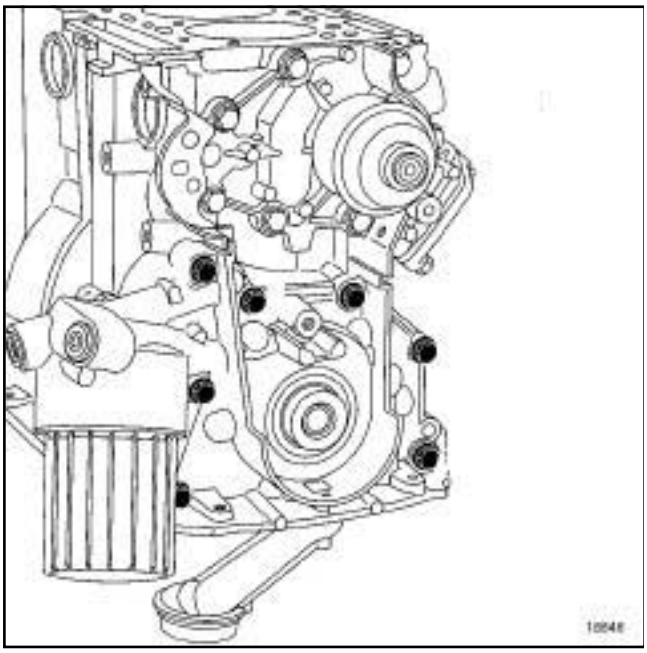


- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) .

❏ Disconnect the oil pressure sensor connector.

18645-1

❏ Remove the crankshaft seal by turning tool **(Mot. 1374)**.



18645-2

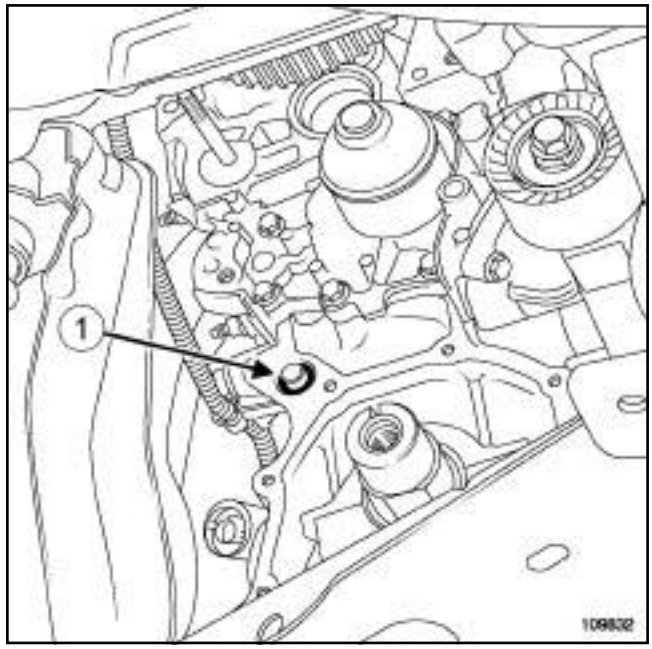
❏ Remove the seal by tightening the bolt (**3**) on the **(Mot. 1374)**.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

18646

❑ Remove:

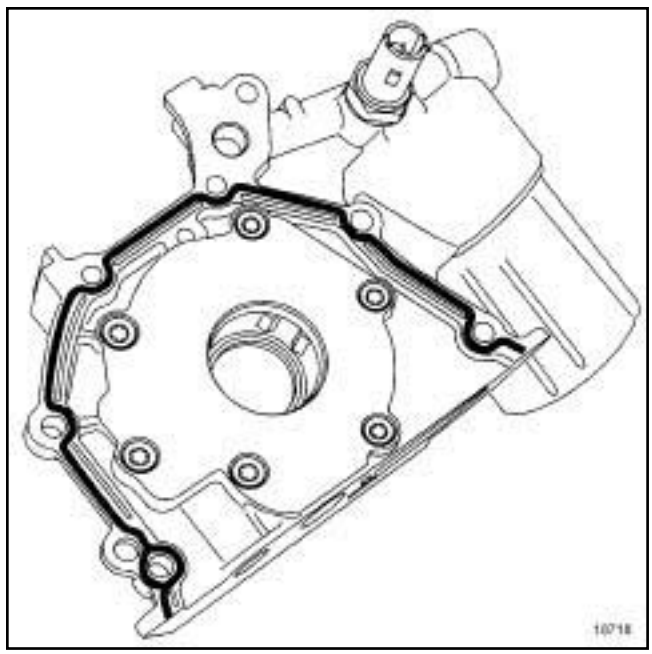


- the oil pump strainer bolts,
- the oil pump strainer,
- the oil pump bolts,
- the oil pump.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Clean the joint faces with **SUPER CLEANING AGENT FOR JOINT FACES** to dissolve any seal still adhering.

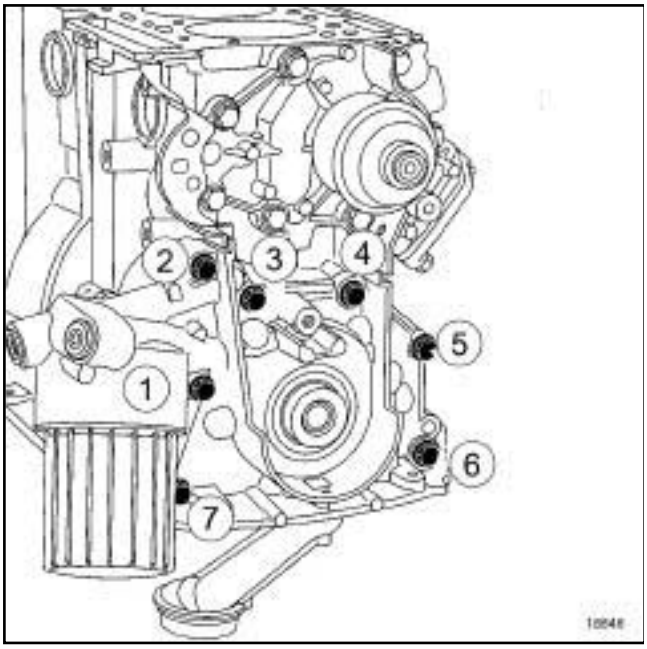


> **WARNING**
> The joint faces must be clean, dry and free from grease (avoid finger marks).

109832

❑ Always replace:

- the O-ring (**1**) ,
- the crankshaft seal.



18718

❑ Apply a bead of **MASTIXO** with a width of **1.3 mm** to ensure that the oil pump is sealed.

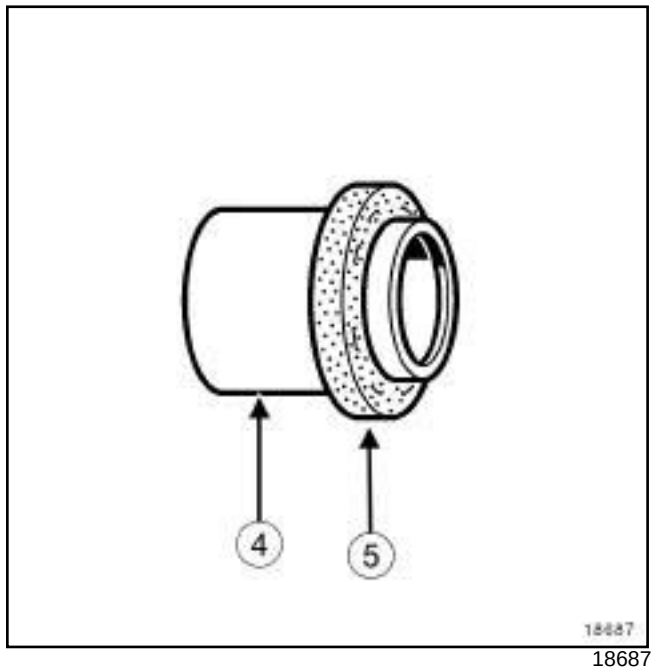
II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the oil pump, aligning the oil pump drive points with the flat surfaces of the crankshaft.

D4F, and 784

18646

❑ Refit the oil pump bolts.



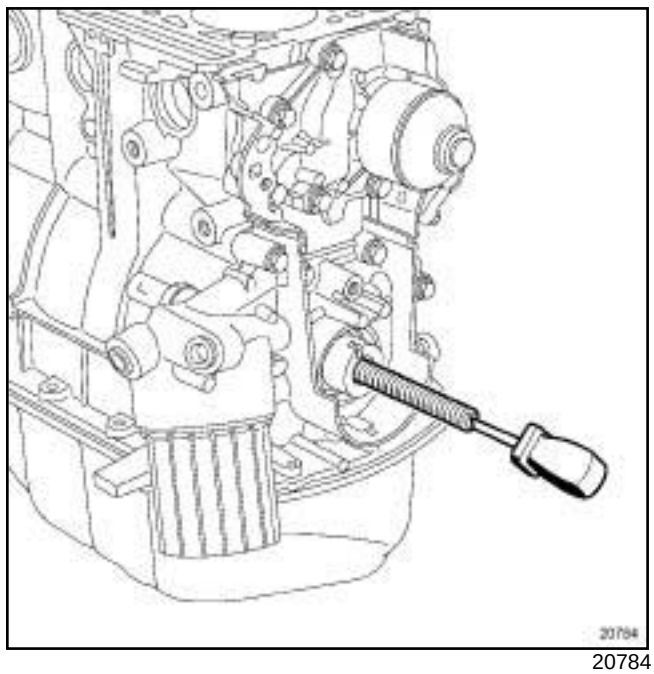
❑ Tighten to torque and in order the **oil pump bolts (10 Nm)**.

❑ Refit:

- the oil pump strainer,
- the oil pump strainer bolts.

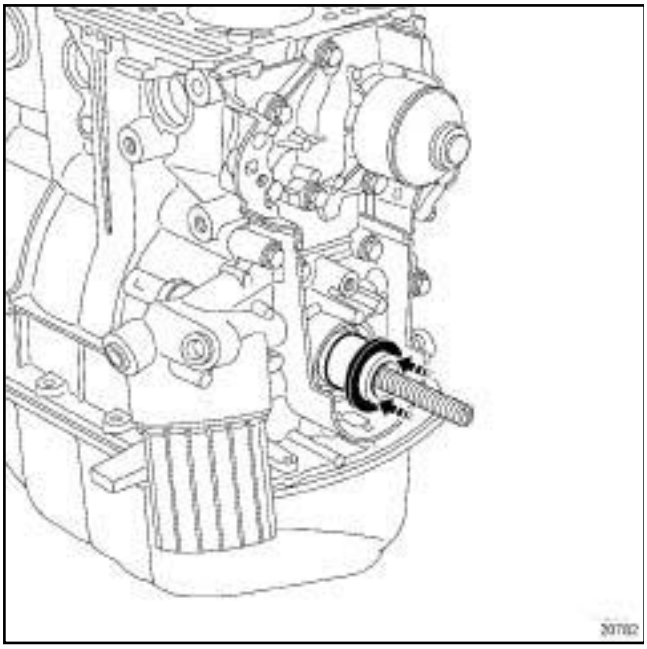
❑ Torque tighten the **oil pump strainer bolts (10 Nm)**.

III - FINAL OPERATION.



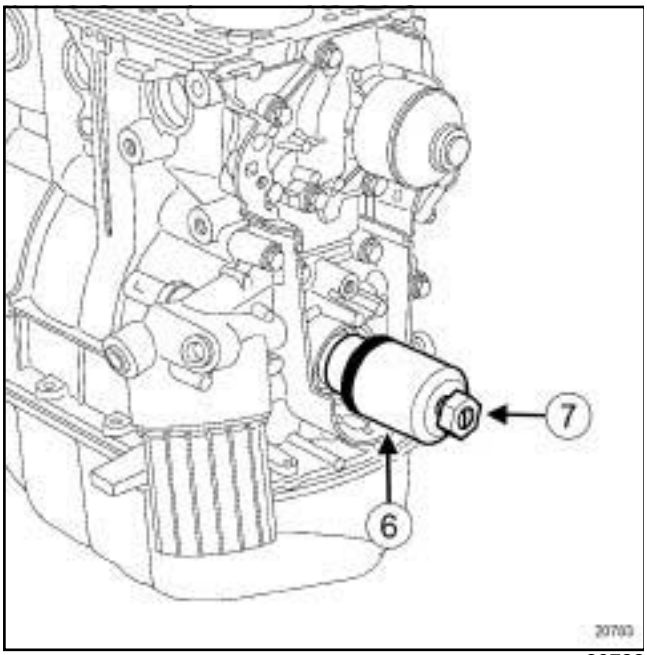
18687

❑ Refit the crankshaft seal.



Note:

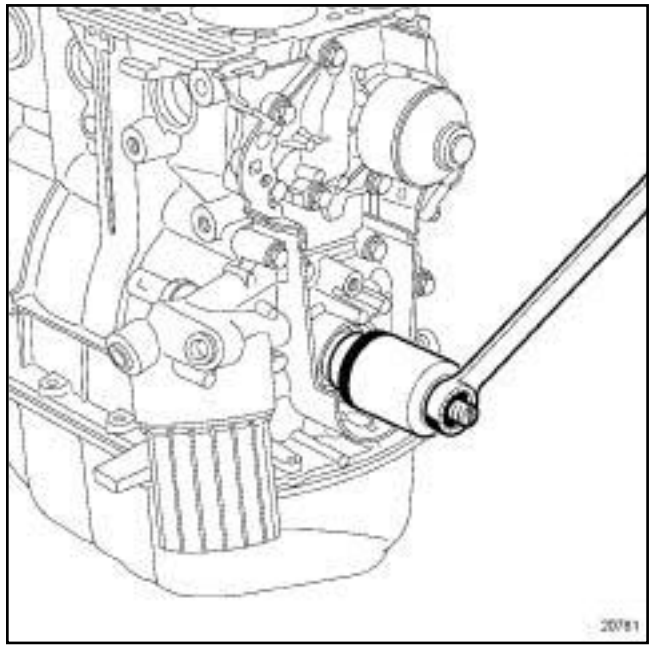
This type of seal is extremely fragile. When handling, it is essential to hold the protective piece (**4**) . It is strictly forbidden to touch the seal (**5**) ; this is to prevent any oil leaks once the oil seal is fitted to the engine.



20784

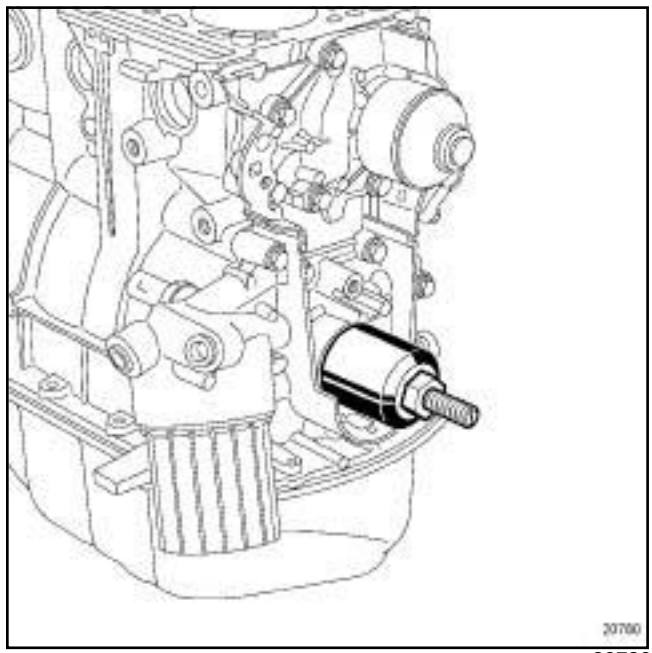
❑ Screw the threaded rod **(Mot. 1626)** into the crankshaft.

D4F, and 784

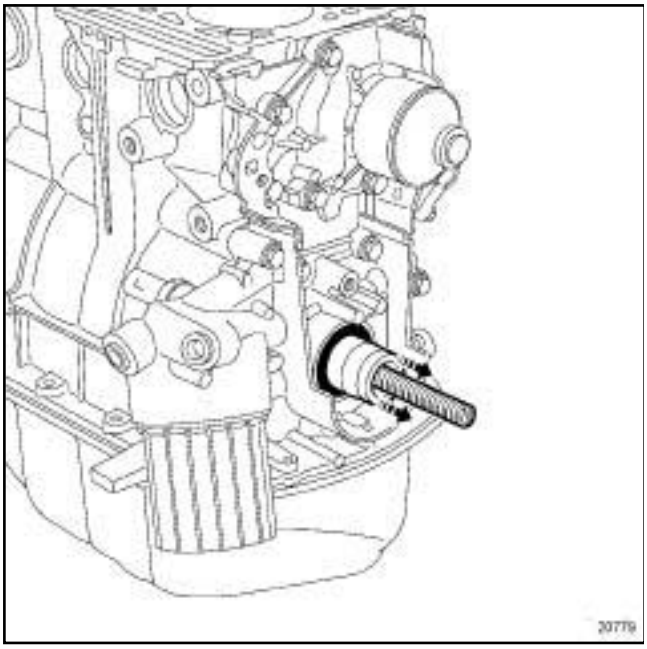


20782

❑ Fit the seal and protector on the crankshaft, taking care not to touch the seal.



20783



❑ Fit the cover (**6**) and the collar nut (**7**) of the **(Mot. 1626)**.

20781

❑ Tighten the collar nut until the cap touches the crankshaft closure panel.

20780

D4F, and 784

20779

❏ Remove:

- the nut,
- the cap,
- the guard,
- the threaded rod.

❏ Connect the oil pressure sensor connector.

❏ Refit:

- the sump (see **10A**, **Engine and cylinder block assembly**, **Lower cover: Removal - Refitting**, page **10A-53**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❏ Remove the engine support tool **(Mot. 1672)**.

❏ Connect the oil-coolant heat exchanger hoses.

❏ Refit the clips using the **(Mot. 1448)**.

❏ Remove the hose clamps **(Ms. 583)**.

❏ Refit:

- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the dipstick.

❏ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 740 or 742 or 764

Tightening torques ▽

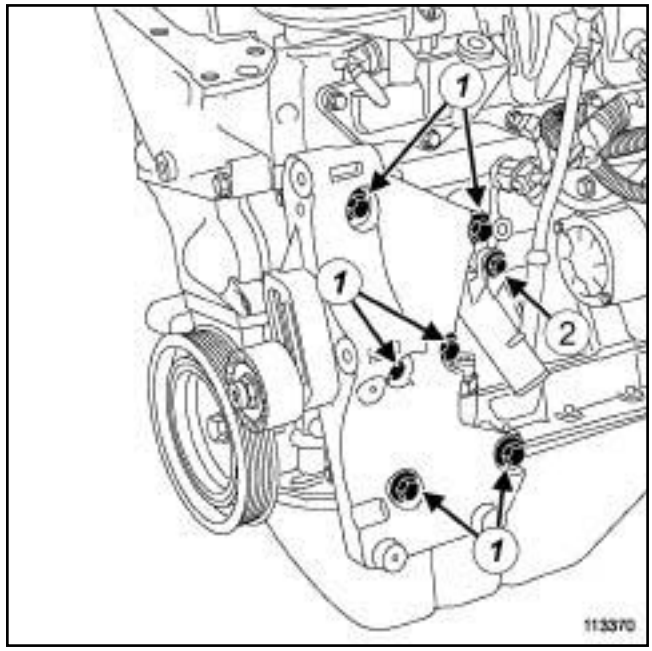
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) .

AIR CONDITIONING

❏ Remove the air conditioning compressor (see **Compressor: Removal - Refitting**) (MR 392, 62A, Air conditioning).

II - OPERATION FOR REMOVAL OF PART CONCERNED

113370

❏ Remove:

- the multifunction support mounting bolts (**1**) ,
- the coolant pump inlet pipe mounting bolt (**2**) ,
- the multifunction support.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Position the multifunction support.

❏ Tighten to torque the **multifunction support mounting bolts (50 N.m)**.

❏ Refit the water pump inlet pipe mounting bolt.

II - FINAL OPERATION.

AIR CONDITIONING

❏ Refit the air conditioning compressor (see **Compressor: Removal - Refitting**) (MR 392, 62A, Air conditioning).

❏ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,

D4F, and 740 or 742 or 764

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J or K4M, and AIR CONDITIONING

Tightening torques ▽

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

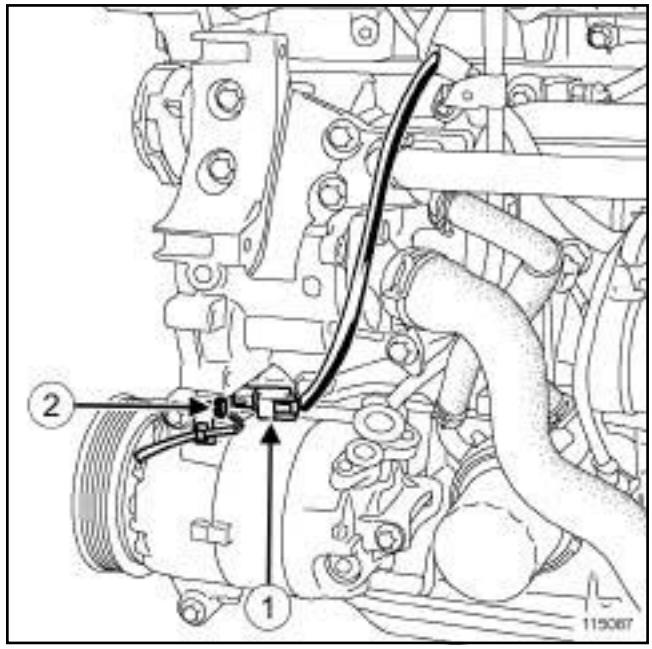
M4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
multifunction support mounting bolts	**50 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

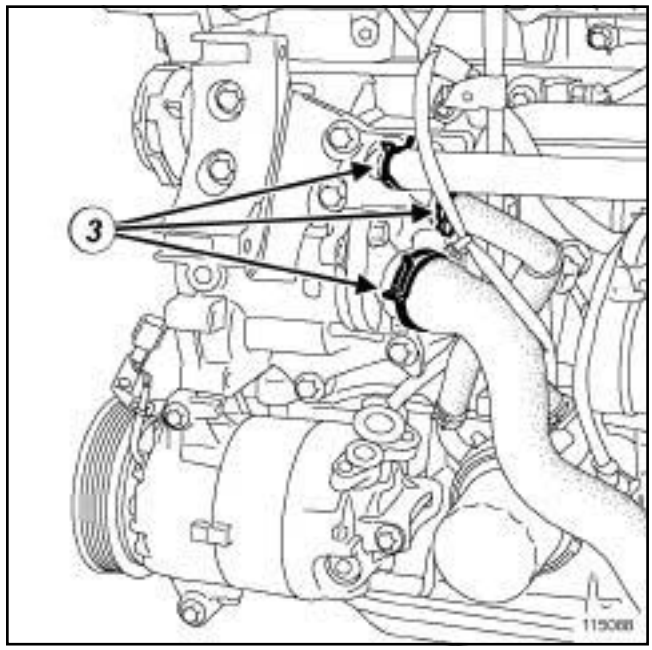


❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

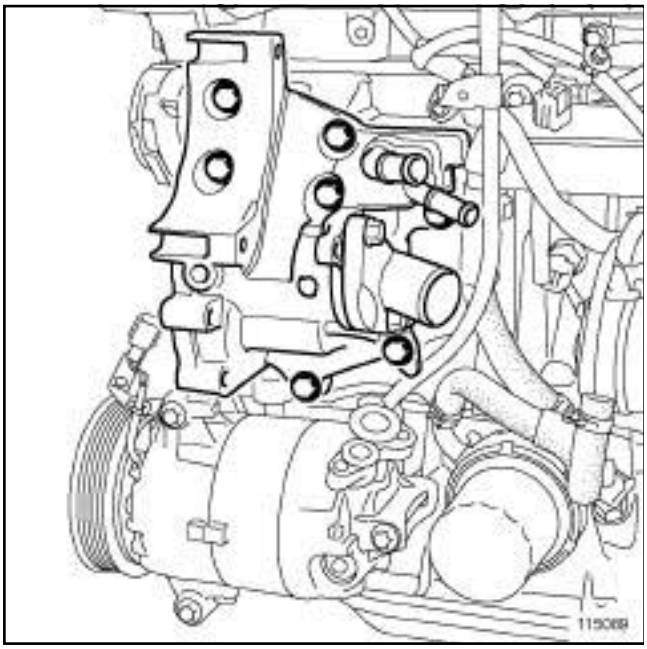
❑ Remove:



- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the coolant pump (see **19A**, **Cooling**, **Coolant pump: Removal - Refitting**, page **19A-41**) .

115087

❑ Disconnect the connector (**1**) from the air conditioning compressor.



❑ Remove the bolt (**2**) mounting the air conditioning connector mounting.

115088

❑ Disconnect the cooling hoses (**3**) using the **(Mot. 1448)**.

II - REMOVAL OF PART CONCERNED

115089

❑ Remove:

- the multifunction support mounting bolts,
- the multifunction support,
- the multifunction support seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ The multifunction support seal must be replaced.

II - REFITTING PART CONCERNED

❑ Refit the multifunction support.

❑ Finger tighten the multifunction support mounting bolts until contact.

❑ Tighten to torque the **multifunction support mounting bolts (50 Nm)**.

III - FINAL OPERATION.

❑ Connect the cooling hoses using the **(Mot. 1448)**.

❑ Refit the bolt securing the air conditioning connector mounting.

❑ Connect the air conditioning compressor connector.

❑ Refit:

- the coolant pump (see **19A**, **Cooling**, **Coolant pump: Removal - Refitting**, page **19A-41**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

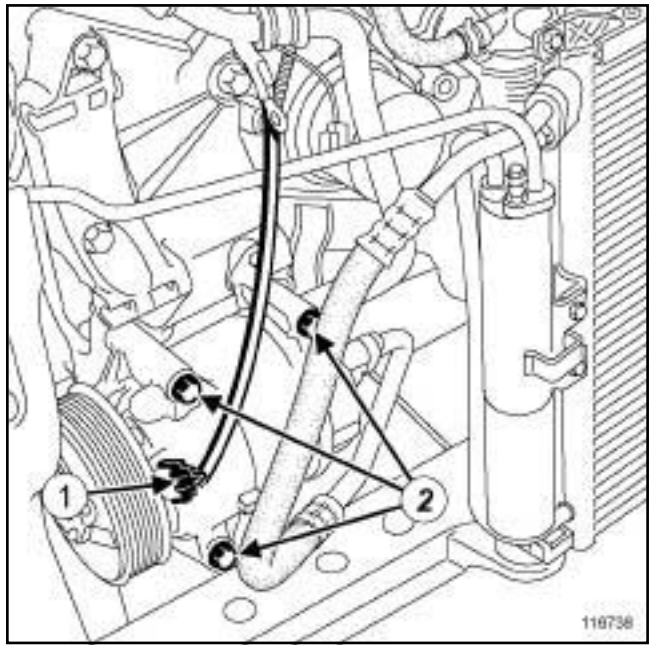
❑ Connect the battery (see **Battery: Removal - Refitting**) .

❑ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 80A, Battery).

F4R

Tightening torques ▽	
multifunction support mounting bolts	**44 N.m**
air conditioning compressor mounting bolts	**25 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

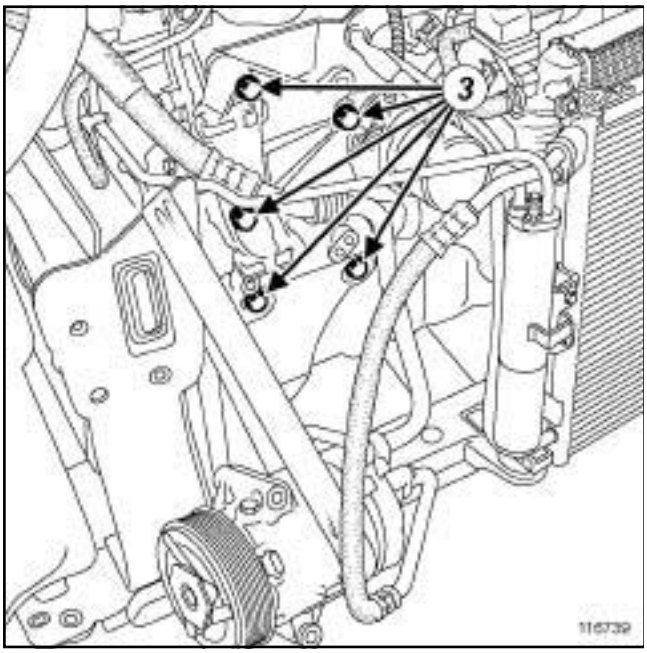
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) .

116738



❏ Disconnect the connector (**1**) from the air conditioning compressor.

❏ Remove the mounting bolts (**2**) from the air conditioning compressor.

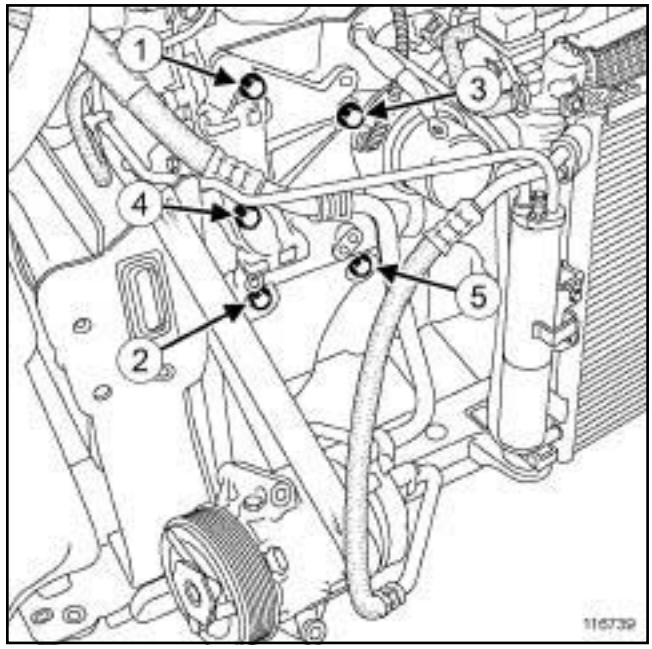
❏ Attach the air conditioning compressor to prevent the air conditioning ducts from being disturbed in any way.

F4R

II - OPERATION FOR PREPARATION OF PART CONCERNED

116739

❏ Remove:



- the multifunction support mounting bolts (**3**) ,
- the multifunction support.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the multifunction support,
- the multifunction support bolts.

116739

❏ Tighten to torque and in order the **multifunction support mounting bolts (44 N.m)**.

II - FINAL OPERATION

❏ Fit the air conditioning compressor.

❏ Refit the air conditioning compressor mounting bolts.

❏ Tighten to torque the **air conditioning compressor mounting bolts (25 N.m)**.

❏ Refit:

- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784

Tightening torques ▽	
multifunction support bolts	**50 Nm**
coolant pump inlet pipe bolts	**10 Nm**
air conditioning compressor bolts	**25 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

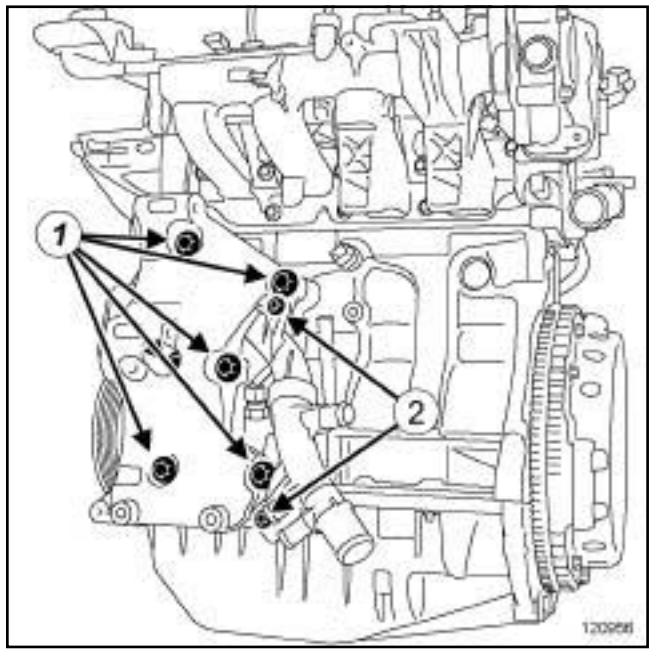
❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) .

AIR CONDITIONING



❏ Disconnect the air conditioning compressor clutch connector.

❏ Remove the air conditioning compressor bolts.

❏ Detach the air conditioning pipe from the body between the compressor and the expansion valve.

❏ Position the air conditioning compressor on the radiator mounting cross member.

II - OPERATION FOR REMOVAL OF PART CONCERNED

120956

❏ Remove:

- the bolts (**1**) from the coolant pump inlet pipe,
- the multifunction support bolts (**2**) ,
- the multifunction support.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the multifunction support,
- the multifunction support bolts,
- the coolant pump inlet pipe bolts.

❏ Torque tighten:

- the **multifunction support bolts (50 Nm)**,
- the **coolant pump inlet pipe bolts (10 Nm)**.

D4F, and 784

II - FINAL OPERATION.

AIR CONDITIONING

- ❑ Refit the air conditioning compressor.
- ❑ Attach the air conditioning pipe to the body between the compressor and the expansion valve.
- ❑ Refit the air conditioning compressor bolts.
- ❑ Torque tighten the **air conditioning compressor bolts (25 Nm)**.
- ❑ Connect the air conditioning compressor clutch connector.

- ❑ Refit:
  - the alternator (see **16A**, **Starting - Charging**, **Alternator: Removal - Refitting**, page **16A-5**) ,
  - the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
  - the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
  - the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
  - the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
  - the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
  - the engine undertray.
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Ms. 583	Pipe clamps.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
left-hand suspended engine mounting shaft nut	**62 N.m**
earth nut on the shock absorber cup height adjuster	**8 N.m**
nut of each earth cable on the side member	**8 N.m**
nut of the supply cable on the battery protection fuse box	**6 N.m**
nut of the fuse board supply cable	**8 N.m**
bolt of the connecting pipe between the « expansion valve - compressor »	**8 N.m**
air filter unit air outlet pipe clip	**5.5 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

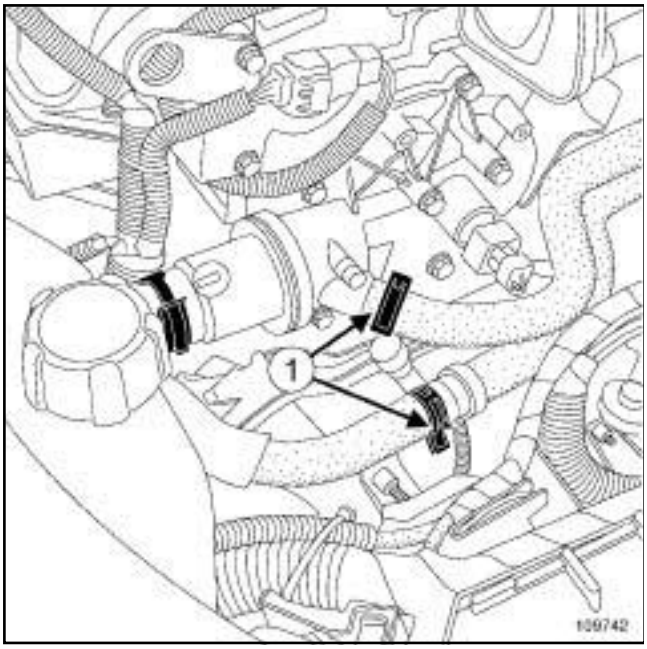
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit air inlet pipe,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

AIR CONDITIONING

❏ Drain the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).



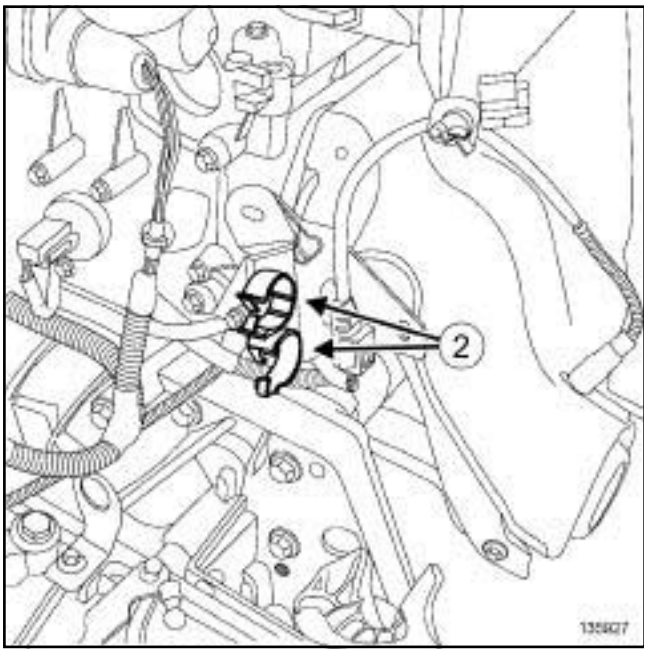
❏ Remove:

- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❏ Loosen the clip of the air filter unit air outlet pipe on the throttle valve.

❏ Disconnect the air filter unit air outlet pipe from the throttle valve.

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

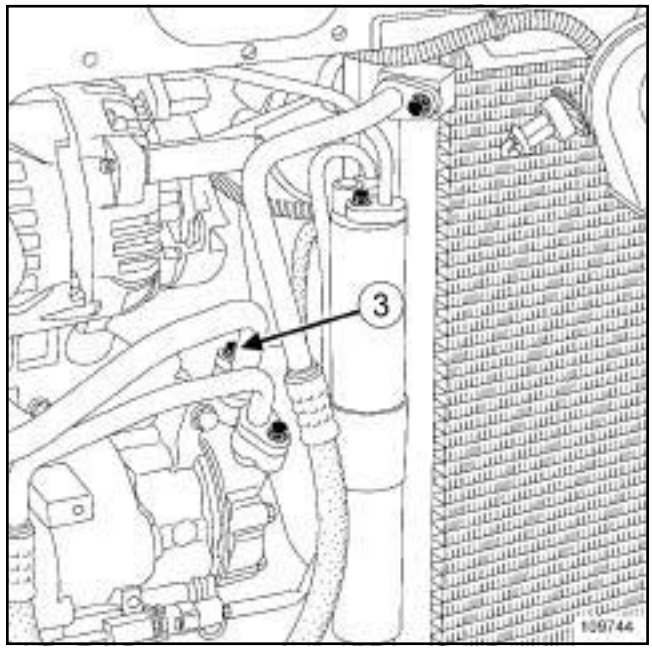


109742

❏ Separate the clip on each heater matrix cooling hose (**1**) using the tool **(Mot. 1448)**.

❏ Disconnect:

- the heater matrix cooling hose from the water chamber,
- the heater matrix cooling hose from the cylinder block cooling hose.



135927

❏ Unclip the heater matrix cooling hoses at (**2**) .

❏ Remove:

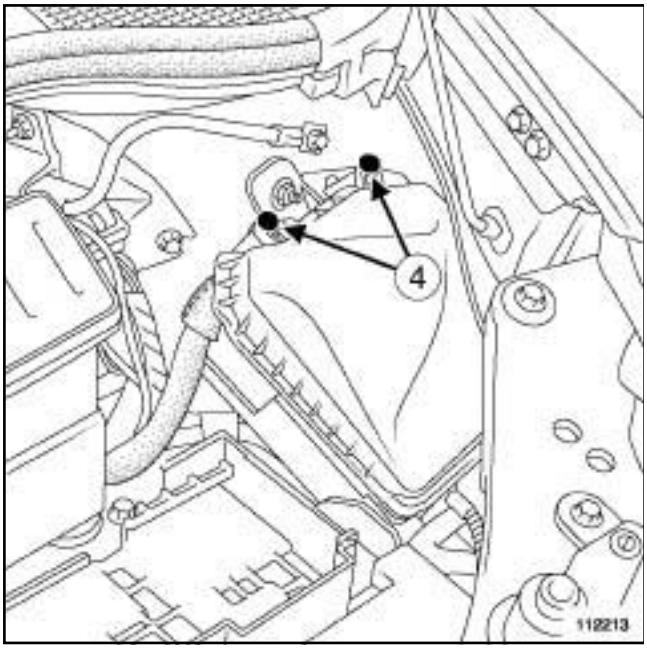
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the exhaust downpipe nuts,
- the seal between the catalytic converter and the exhaust downpipe hose.

AIR CONDITIONING or CLIMATE CONTROL

109744

❏ Remove the bolt (**3**) from the « expansion valve - compressor » connecting pipe on the compressor.

WARNING

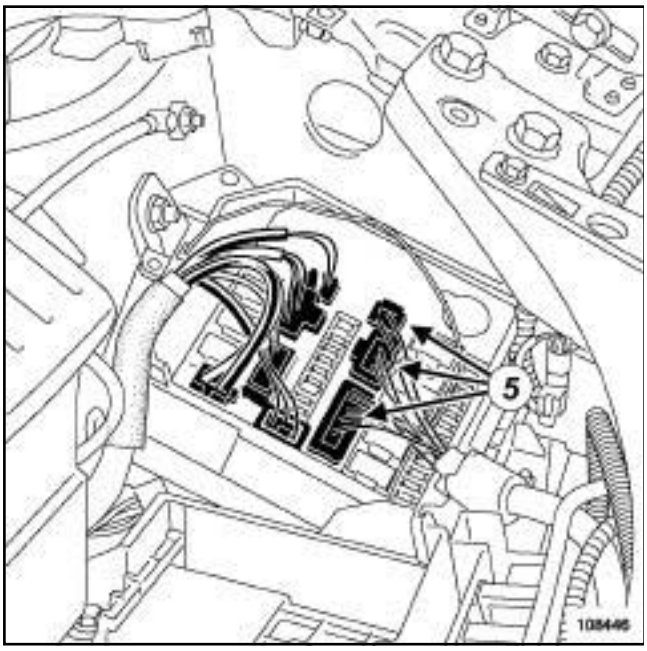


To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

❏ Disconnect the « expansion valve - compressor » connecting pipe from the compressor.

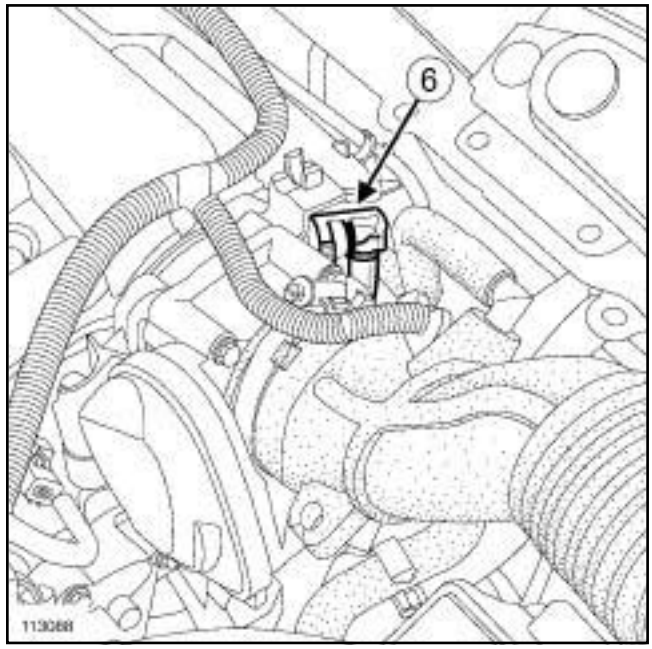
❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the « condenser - cooling radiator - engine cooling fan assembly » (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) .



K4M, and JH3 – K4J, and JH3 – K4M, and TL4

112213

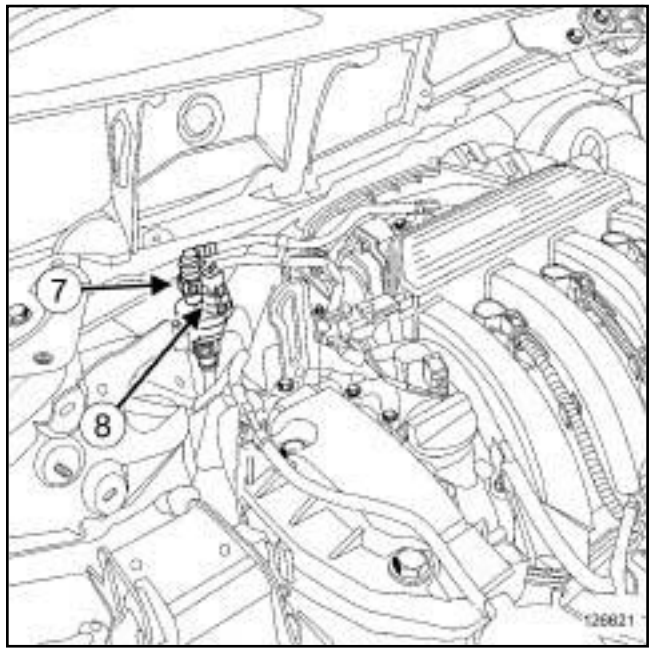


❏ Remove:

- the bolts (**4**) from the Protection and Switching Unit cover,
- the Protection and Switching Unit cover.

108446

❏ Disconnect the connectors (**5**) from the Protection and Switching Unit.

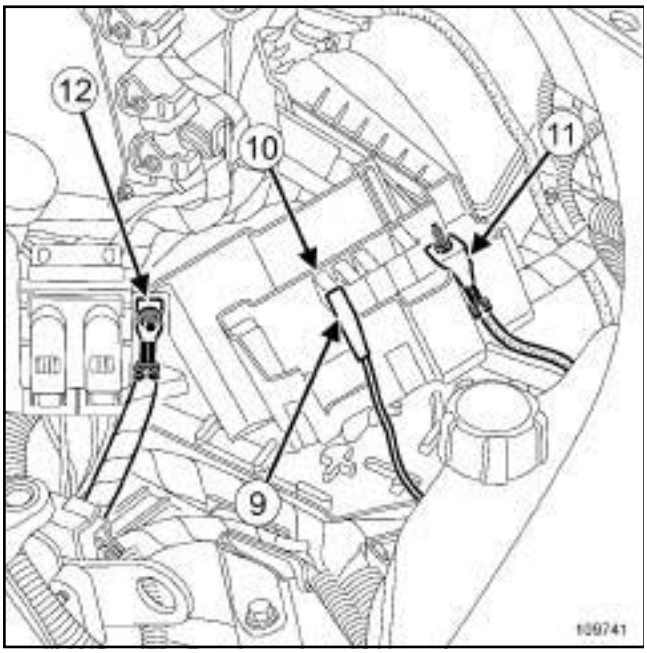


113088

❏ Disconnect the brake servo pipe union (**6**) from the inlet distributor.

K4J – K4M, and JH3

❏ Disconnect the oxygen sensor connectors.



126621

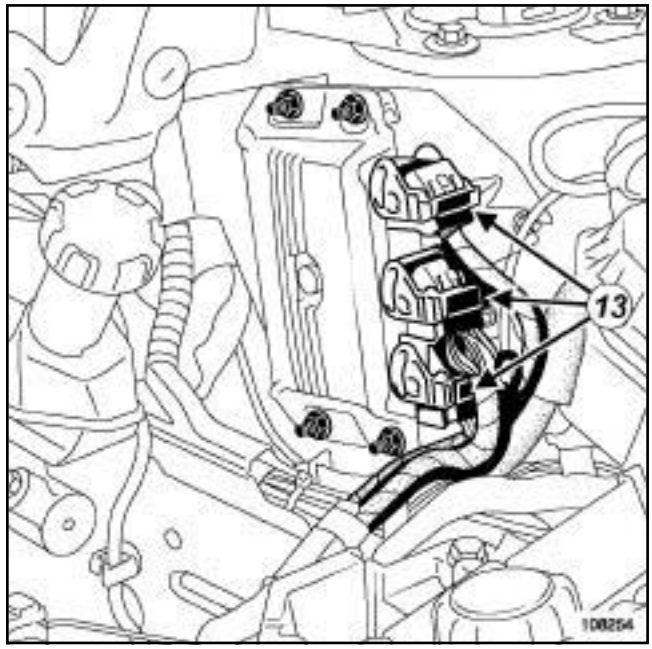
❏ Disconnect:

- the union (**7**) of the fuel vapour rebreathing pipe from the petrol vapour rebreathing solenoid valve,

- the connector (**8**) of the fuel vapour rebreathing solenoid valve.

109741

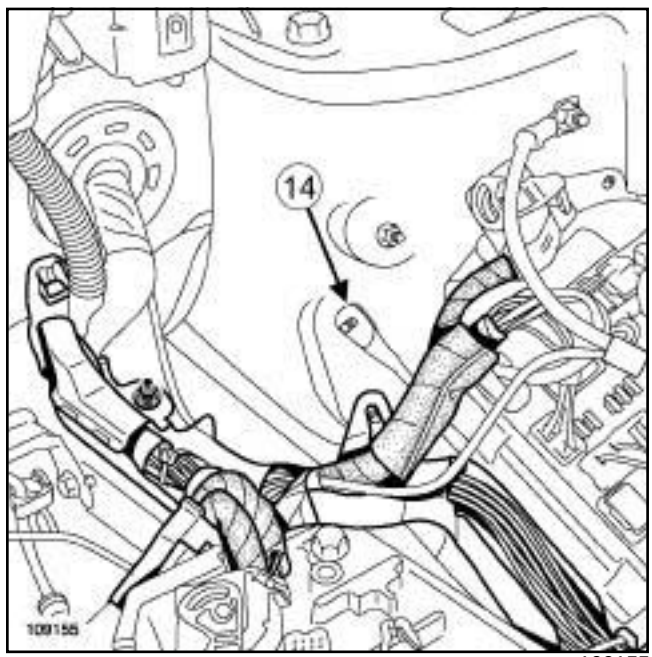
❏ Disconnect:



- the fuse (**9**) ,
- the fuse holder (**10**) from the fuse board.

❏ Remove:

- the nut from the supply cable of the fuse board (**11**) ,
- the supply cable nut from the battery protection fuse box (**12**) ,
- the nut of each side member earth cable.

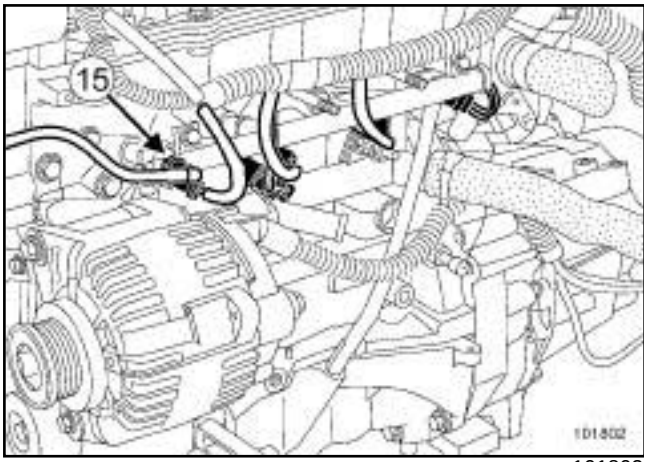


❏ Remove:

- the supply cable from the fuse board,
- the supply cable from the battery protection fuse box,
- the earth cables on the side member.

108254

❏ Disconnect the connector (**13**) from the petrol injection computer.



109155

❏ Remove the earth nut (**14**) .

❏ Remove:

- the earth cable from the shock absorber cup height adjuster,
- the wiring channel.

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

101802

❑

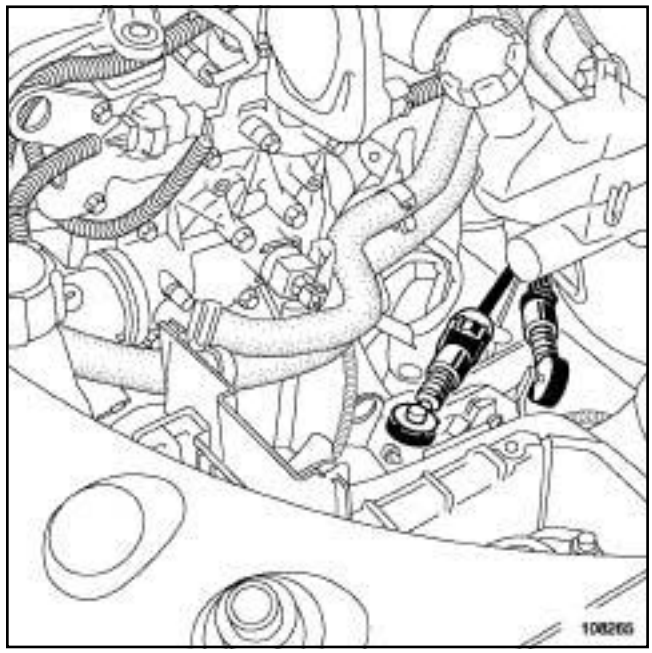
IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

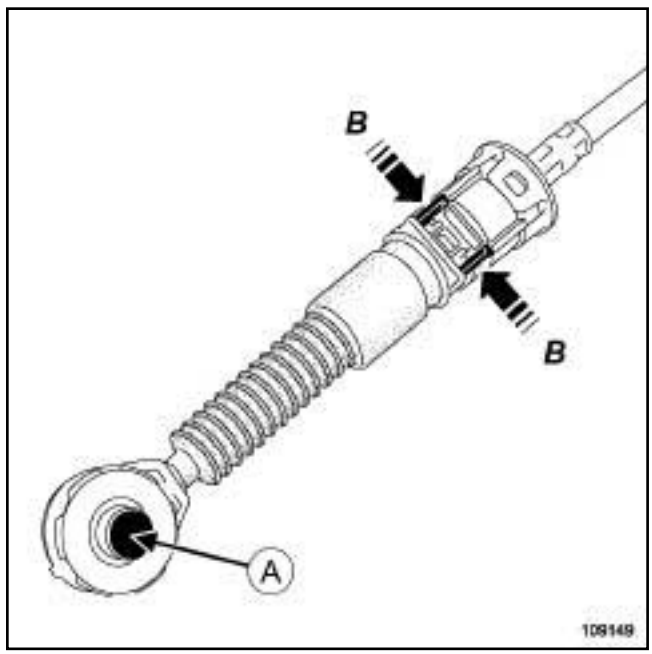
WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.



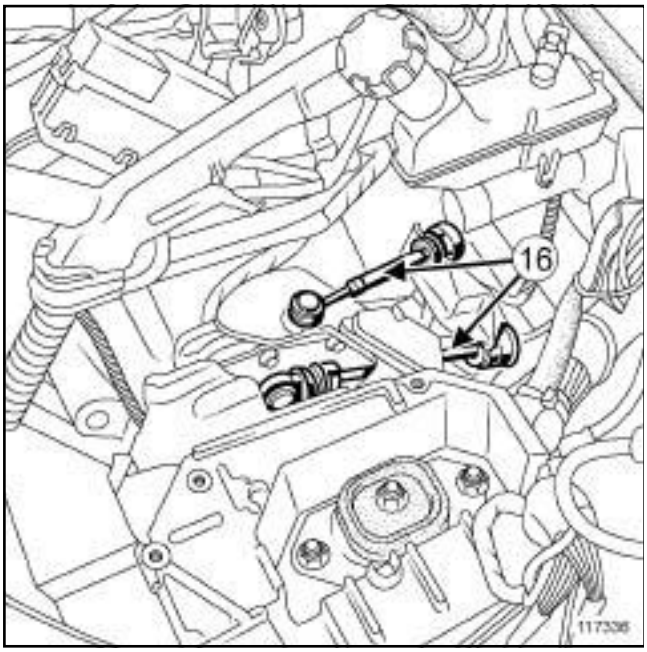
❑ Disconnect the fuel supply pipe union (**15**) from the injector rail.

❑ Unclip the fuel supply pipe from the retaining bracket.

JH3

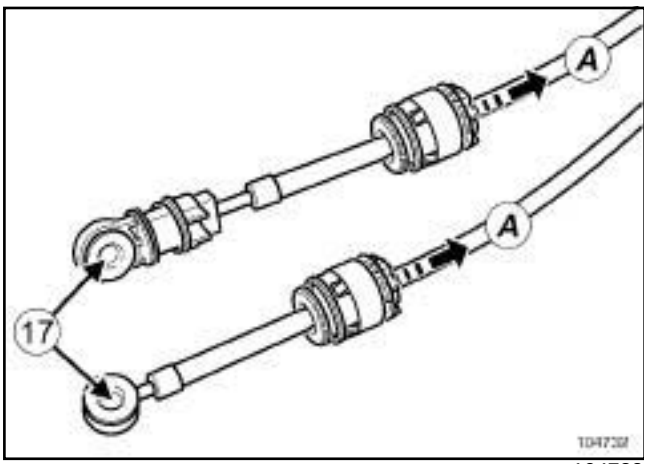
108265

109149



❑ Move aside the gear control cables by:

- pressing at (**A**) ,
- pressing at (**B**) .

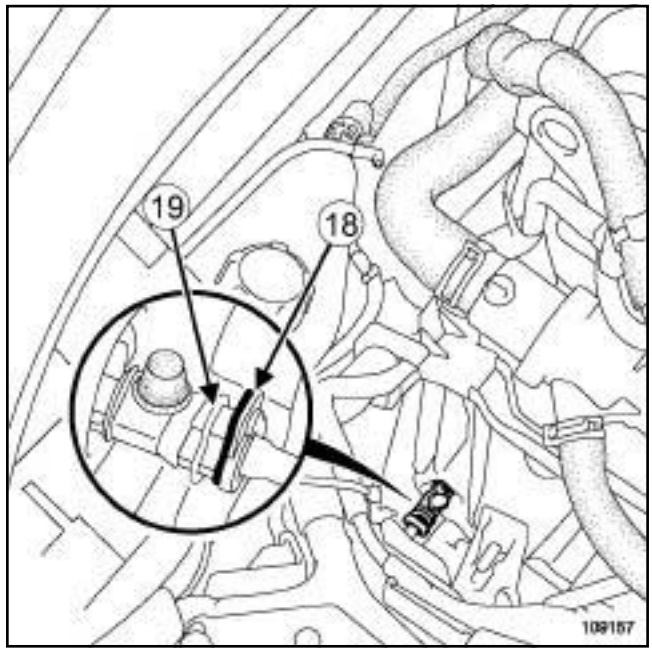


❑ Remove the wiring channel mountings from the gearbox.

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

TL4

117336



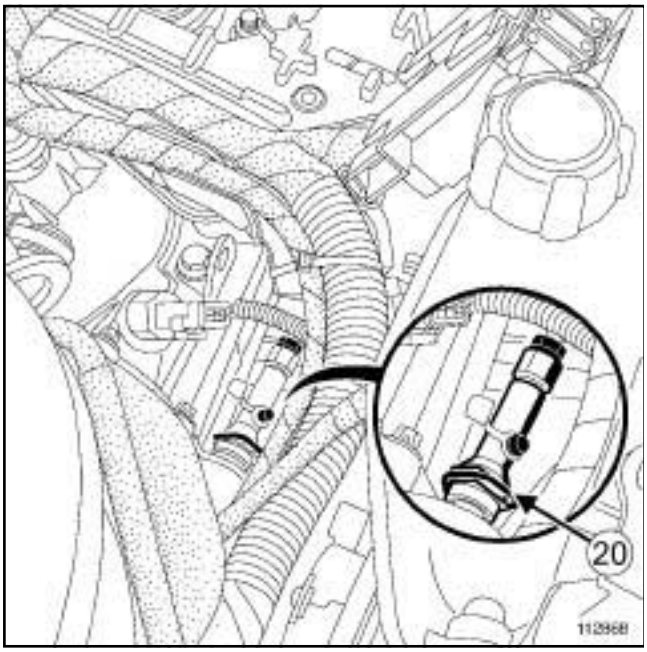
104732

❑ Move aside the gear control cables (**16**) by:

- unclipping each gear control cable (**17**) from the gearbox control levers using an open-jawed spanner,
- pulling each control cable sleeve stop ring towards (**A**) .

❑ Fit the tool **(Ms. 583)** between the brake fluid reservoir and the clutch master cylinder.

JH3



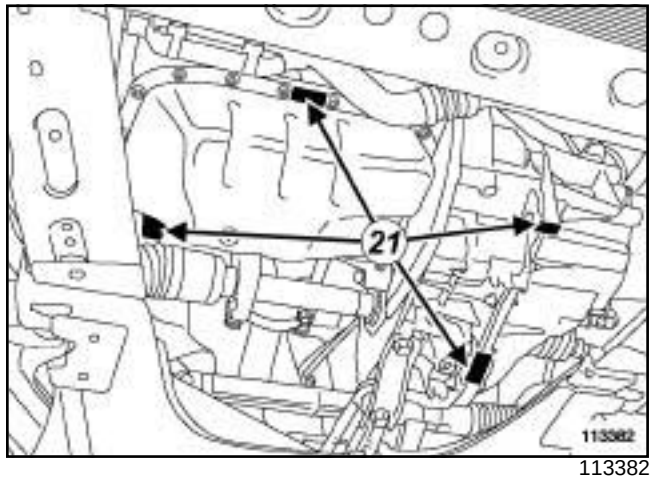
109157

❑ Disconnect the clutch pipe union from the hydraulic clutch slave cylinder by pulling on the clips (**18**) and (**19**) .

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

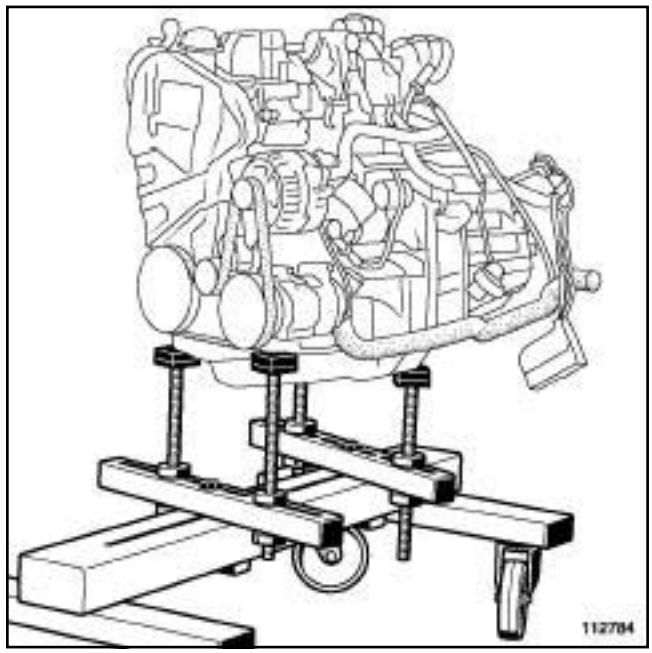
TL4

112868



❏ Disconnect the clutch pipe union from the hydraulic clutch slave cylinder by pressing the clip (**20**) .

❏ Fit a blanking plug:



- on the opening of the hydraulic clutch slave cylinder,
- on the clutch pipe union.

❏ Unclip the clutch pipe from the left-hand suspended engine mounting support on the gearbox.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113382

112784

❏ Remove:

- the « engine - gearbox » assembly using the tool **(Mot. 1390)** positioning it on the marks (**21**) of the « engine - gearbox » assembly,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the left-hand suspended engine mounting shaft nut.

❏ Hit the shaft of the left-hand suspended engine mounting using a copper hammer.

❏ Raise the vehicle, moving the engine towards the front.

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

❑ Remove the « engine and gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Standard replacement**) (Technical Note 6023A, 10A, Engine and peripherals).

❑ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the « engine - gearbox » assembly in the vehicle,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Torque tighten the **left-hand suspended engine mounting shaft nut (62 N.m)**.

❑ Remove the **(Mot. 1390)** from the «engine - gearbox » assembly.

III - FINAL OPERATION

❑ Remove the blanking plug:

- on the opening of the hydraulic clutch slave cylinder,
- on the clutch pipe union.

❑ Connect the clutch pipe to the hydraulic clutch slave cylinder.

❑ Clip the clutch pipe onto the left-hand suspended engine mounting support on the gearbox.

❑ Remove the tool **(Ms. 583)** between the brake fluid reservoir and the clutch master cylinder.

❑ Clip each gear control cable onto:

- the gear control cable sleeve stops,
- the gearbox control levers.

❑ Connect the fuel supply pipe union to the injector rail.

❑ Clip the fuel supply pipe onto the retaining bracket.

❑ Fit:

- the wiring channel,
- the earth cable on the shock absorber cup height adjuster.

❑ Tighten the **earth nut on the shock absorber cup height adjuster (8 N.m)**.

❑ Connect the petrol injection computer connectors.

❑ Fit:

- the earth cables on the side member,
- the supply cable of the battery protection fuse box on the battery protection fuse box,
- the fuse board supply cable on the fuse board.

❑ Torque tighten:

- the **nut of each earth cable on the side member (8 N.m)**,
- the **nut of the supply cable on the battery protection fuse box (6 N.m)**,
- the **nut of the fuse board supply cable (8 N.m)**.

❑ Connect:

- the fuse holder to the fuse board,
- the fuse,
- the connector of the fuel vapour rebreathing solenoid valve,
- the union of the fuel vapour rebreathing pipe to the petrol vapour rebreathing solenoid valve.

K4M, and JH3 – K4J, and JH3

❑ Connect the oxygen sensor connectors.

❑ Connect:

- the brake servo pipe union on the inlet distributor,
- the Protection and Switching Unit connectors.

❑ Refit:

- the Protection and Switching Unit cover,
- the bolts on the Protection and Switching Unit cover,
- the « condenser - cooling radiator - engine cooling fan assembly » (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure).

K4M, and JH3 – K4J, and JH3 – K4M, and TL4

AIR CONDITIONING or CLIMATE CONTROL

❑ Connect the « expansion valve - compressor » connecting pipe to the compressor.

❑ Torque tighten the **bolt of the connecting pipe between the « expansion valve - compressor » (8 N.m)**.

❑ Refit:

- a new seal between the catalytic converter and the exhaust downpipe hose,
- the exhaust downpipe nuts,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❑ Connect the heater matrix cooling hose to:

- the water chamber,
- the cylinder block cooling hose.

❑ Fit the clip on each heater matrix cooling hose using the tool **(Mot. 1448)**.

❑ Clip on the heater matrix cooling hoses.

❑ Connect the air filter box air outlet pipe to the throttle valve.

❑ Torque tighten the **air filter unit air outlet pipe clip (5.5 N.m)**.

❑ Refit:

- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the air filter unit air inlet pipe,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Perform the following operations:

- fill the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- fill and bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the clutch circuit (see **Clutch circuit: Removal - Refitting**) (37A, Mechanical component controls).

AIR CONDITIONING

❑ Fill the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

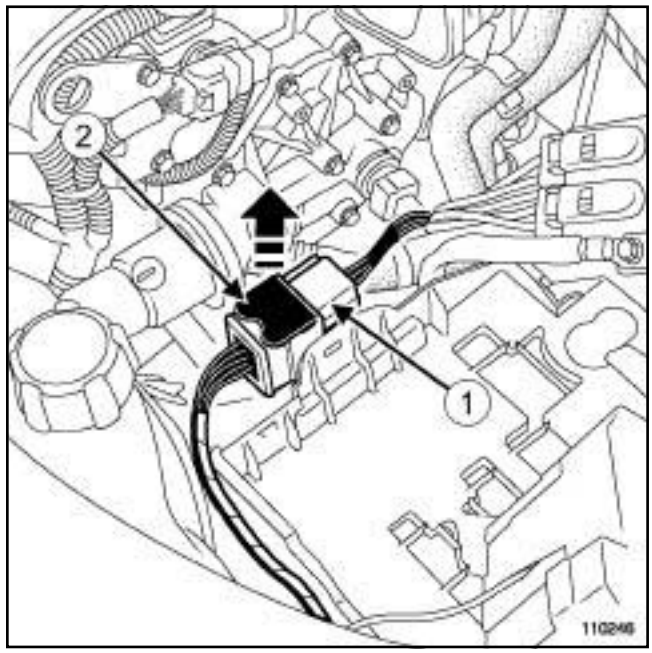
K4M, and DP0

Special tooling required	
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Tightening torques ▽	
exhaust downpipe mounting nuts	**9 Nm**
the air conditioning pipe mounting bolts on the air conditioning compressor	**8 Nm**
the bolts mounting the air conditioning pipes on the evaporator	**8 Nm**
the bolts mounting the air conditioning pipes on the condenser	**8 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

IMPORTANT
During this operation, secure the vehicle to the lift with a strap to prevent it from becoming unbalanced.

❑ To fit the strap to the vehicle (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

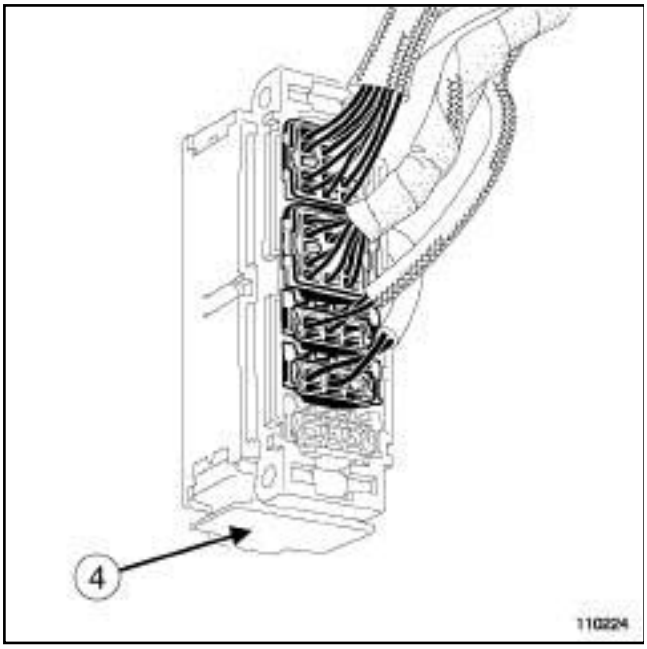
❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air inlet duct,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

110246

❑ Disconnect:

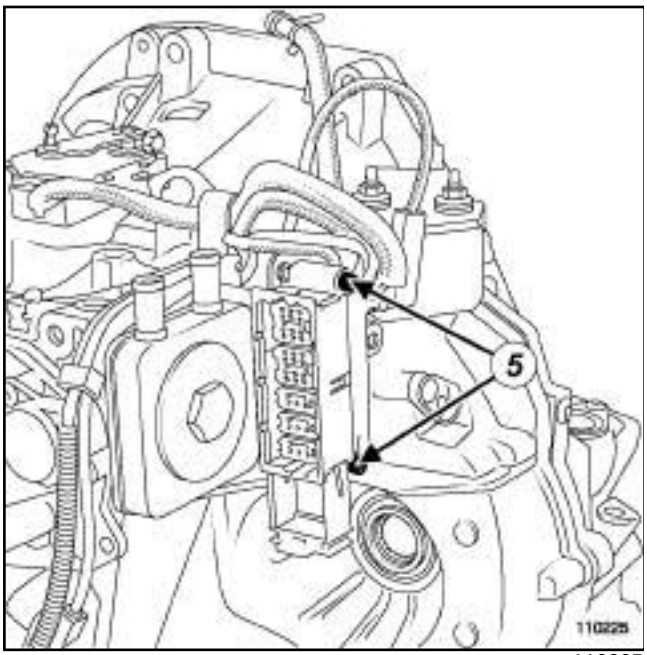
- the modular connector (**1**) by pulling the slide (**2**) ,
- the petrol vapour rebreathing pipe on the petrol vapour rebreathing solenoid valve.



❑ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (MR 392, 23A, Automatic transmission).

AIR CONDITIONING



❑ Drain the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

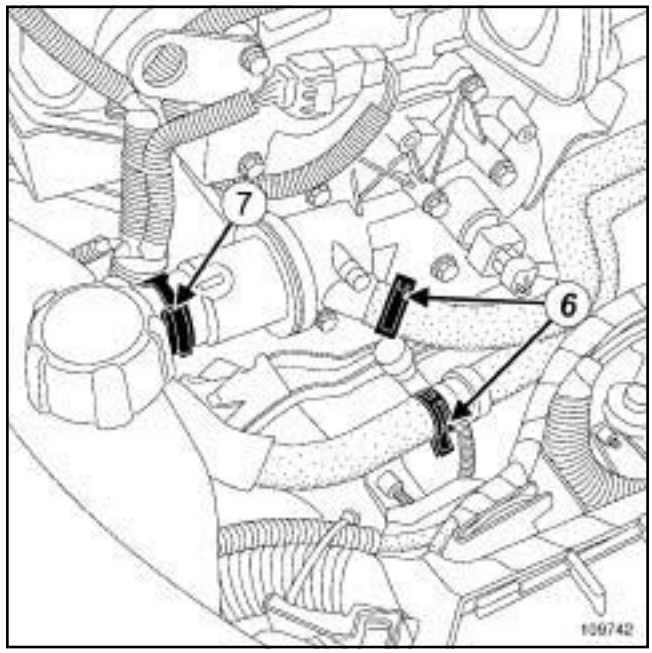
K4M, and DP0

110224

❏ Disconnect the connectors from the modular connector by pulling the slide (**4**) .

110225

❏ Remove the modular connector mounting bolts (**5**) .



❏ Protect the modular connector by putting it into a waterproof plastic bag.

❏ Disconnect the automatic transmission cooling hoses.

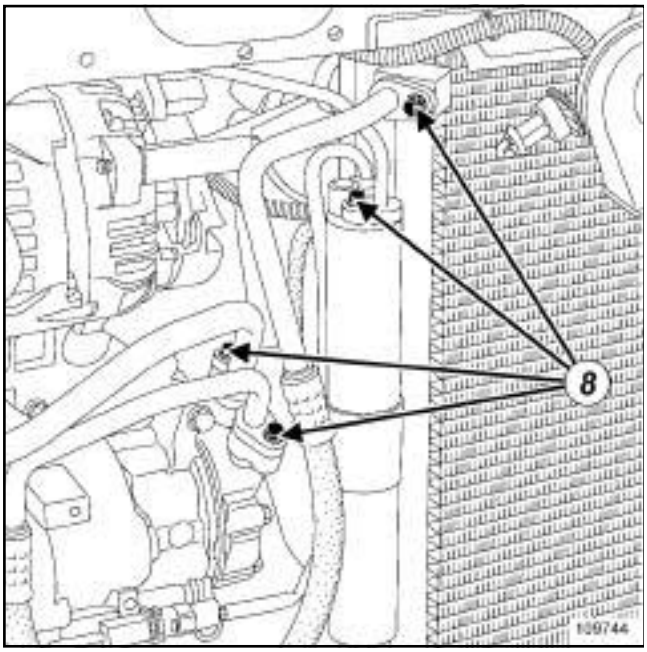
❏ Remove:

- the « left-hand driveshaft-stub axle carrier » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component),
- the « right-hand driveshaft-stub axle carrier » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❏ Attach the cooling radiator assembly to the front end panel.

109742

❏ Disconnect:



- the engine cooling fan assembly connectors,
- the top hose (**7**) on the cylinder head coolant pipe housing outlet,
- the passenger compartment heating hoses (**6**) .

❏ Remove:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

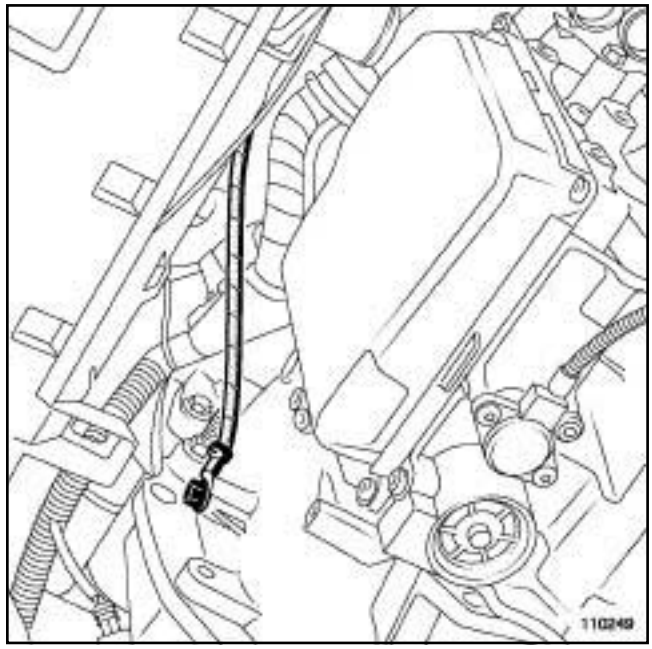
K4M, and DP0

AIR CONDITIONING

109744

❑ Disconnect:

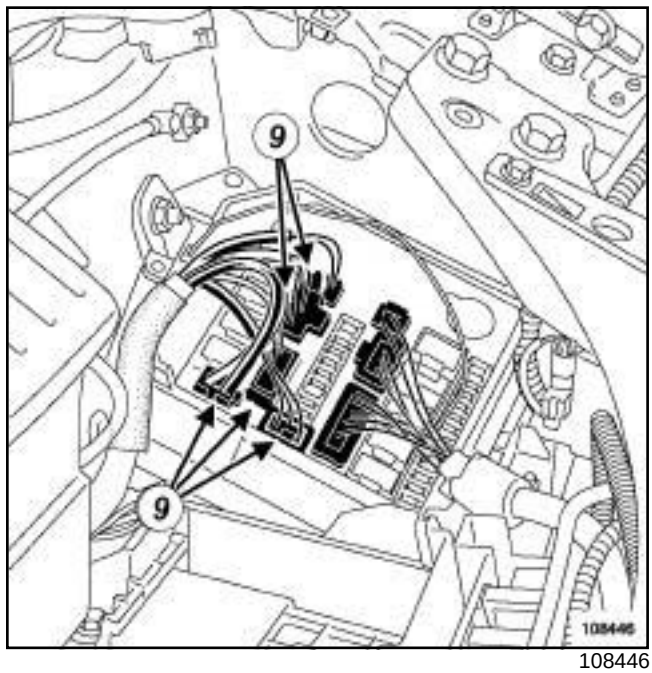
- the pressure switch from the condenser,
- the mounting bolts (**8**) from the air conditioning pipes on the air conditioning compressor, on the evaporator, and on the condenser.



WARNING

Fit plugs into the openings.

Plugs must be fitted on the hoses to prevent moisture from entering the system.



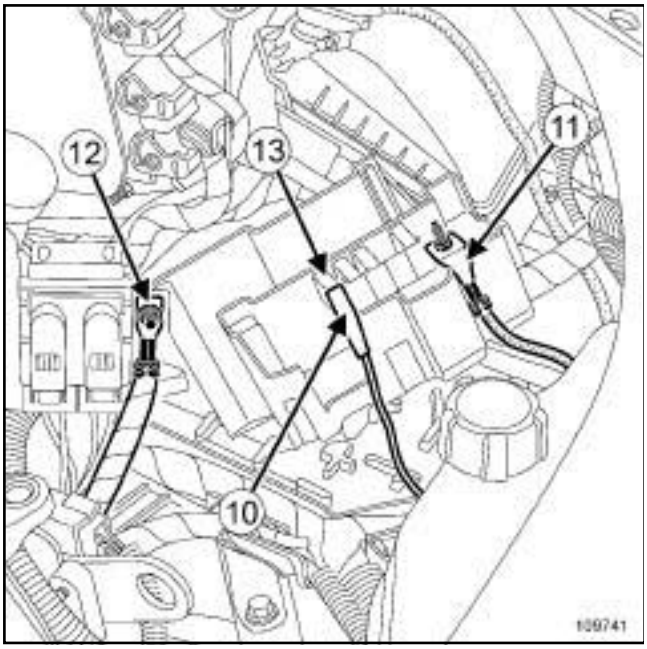
❑ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) .

110249

❑ Remove the earth strap from the gearbox.

❑ Remove the Protection and Switching Unit cover.

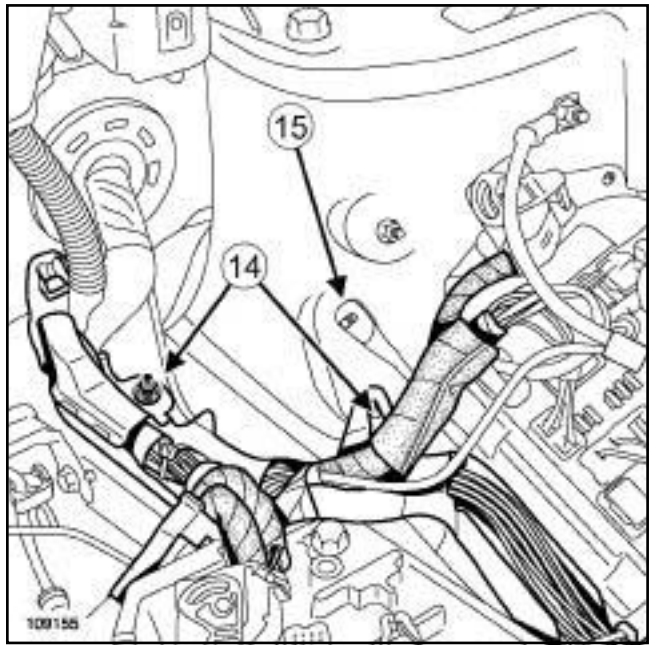


108446

❑ Disconnect:

- the Protection and Switching Unit connectors (**9**) ,
- the brake servo pipe,
- the oxygen sensor connectors,
- the petrol vapour rebreather connector,
- the connector from the lifting eye at the flywheel end,

K4M, and DP0



109741

❏ Disconnect:

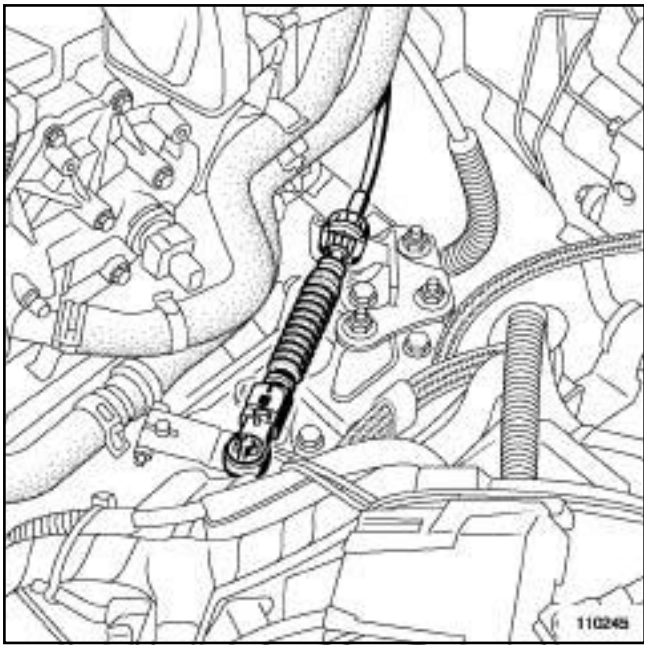
- the fuse (**10**) ,
- the fuse holder (**11**) from the fuse board,
- the feed wire (**12**) from the fuse board,
- the feed wire (**13**) from the battery protection fuse box,
- the earths on the side member.

❏ Remove:

- the computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the computer mounting.

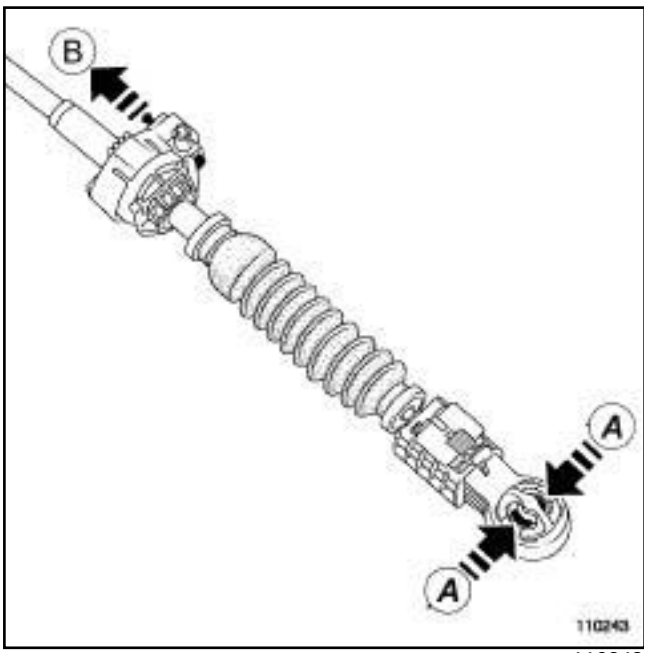
109155

❏ Remove:



- the wiring harness channel mounting bolts (**14**) on the body,
- the earth (**15**) .

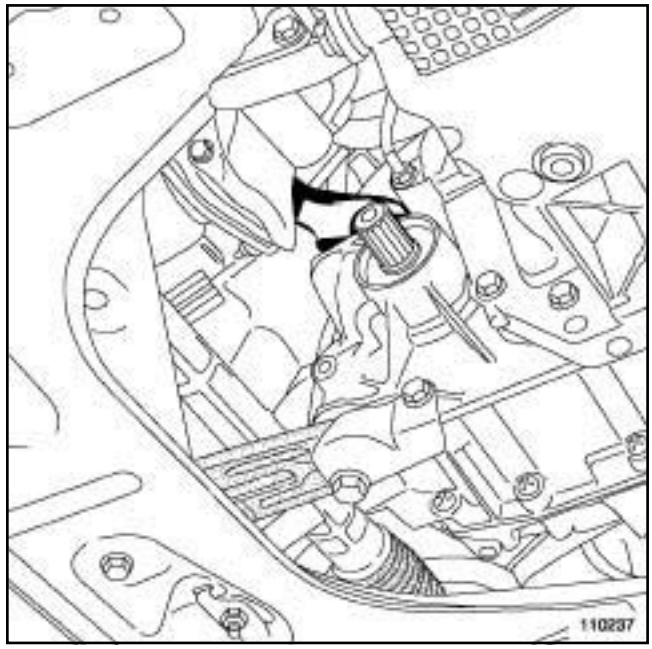
❏ Remove the adhesive tape from the electrical wiring harness.



❏ Disconnect the fuel supply pipe from the injection rail.

❏ Remove the wiring duct.

K4M, and DP0

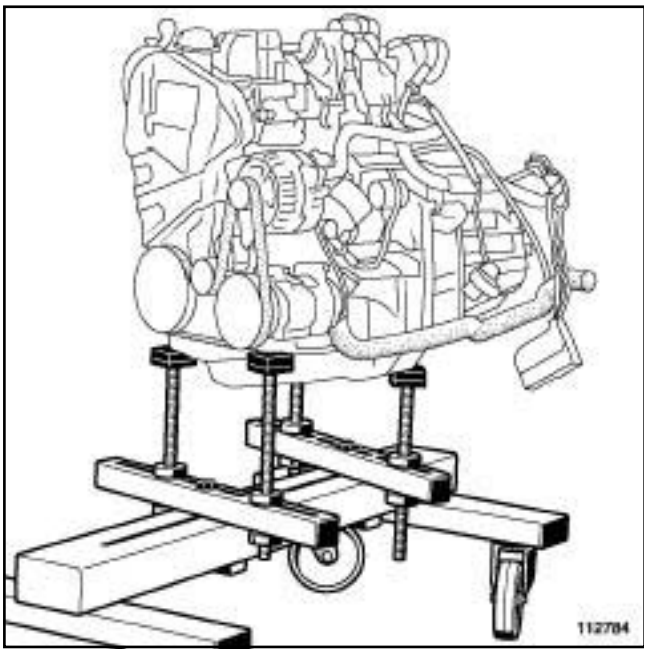


110245

110243

❑ Remove:

- the gear control cable on the box by pushing in (**A**) ,
- the control cable by pushing in (**B**) ,
- the wiring harness channel mountings on the gearbox.



110237

❑ Remove:

- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the exhaust downpipe mountings.

K4M, and DP0

II - OPERATION FOR REMOVAL OF PART CONCERNED

112784

❏ Mark the positions of the suspended engine mountings on the body.

❏ Support the « engine-gearbox assembly» on the **(Mot. 1390)**.

❏ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the left-hand suspended engine mounting nut (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .

❏ Strike the stud with a copper hammer.

❏ Remove:

- the gearbox mounting rubber pad,
- the left-hand suspended engine mounting.

❏ Raise the vehicle, moving the engine towards the front.

❏ Be sure to replace the clip on the automatic transmission control cable each time it is removed.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ For standard engine replacements (see **Standard replacement**) (Technical Note 3784A, 10A, Engine and peripherals).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Position the « engine-gearbox » assembly in the vehicle.

❏ Refit:

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove the **(Mot. 1390)** from the «engine - gearbox » assembly.

III - FINAL OPERATION.

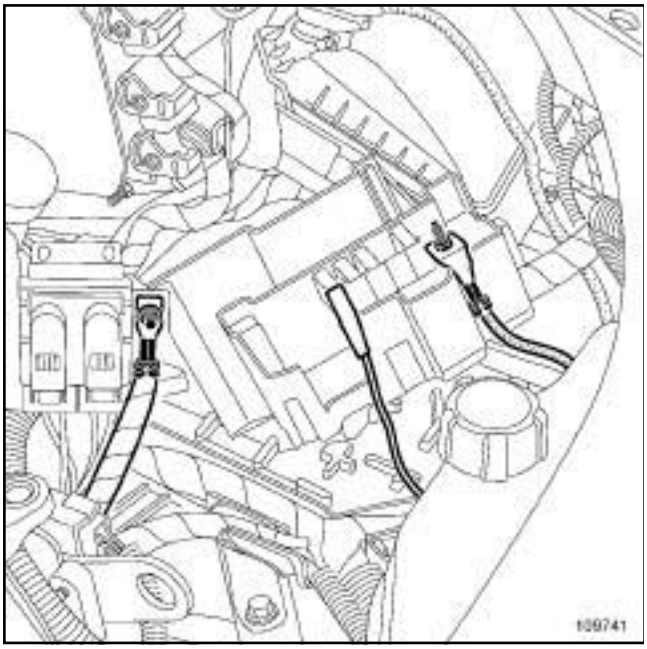
❏ Refit the exhaust downpipe mountings.

❏ Torque tighten the **exhaust downpipe mounting nuts (9 Nm)**.

❏ Refit the rear engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

❏ Refit the wiring harness channel to the gearbox.

❏ Refit the gearbox control cable.



❏ Reconnect the petrol supply pipe to the injector rail.

❏ Refit the wiring harness channel mountings to the body.

❏ Refit:

- the wiring harness channel mounting nuts on the body,
- the computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) .

K4M, and DP0

109741

❑ Connect:

- the supply cable to the battery protection fuse box,
- the supply cable on the fuse board,
- the fuse holder on the fuse board,
- the fuse,
- the connector on the lifting eye at the flywheel end,
- the petrol vapour rebreather connector,
- the oxygen sensor connectors,
- the brake servo pipe,
- the Protection and Switching Unit connectors.

❑ Refit:

- the Protection and Switching Unit cover,
- the earths,
- the cooling radiator assembly (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

AIR CONDITIONING

❑ Refit:

- the bolts mounting the air conditioning pipes on the air conditioning compressor,
- the bolts mounting for the air conditioning pipes on the evaporator,
- the bolts mounting the air conditioning pipe on the condenser.

Torque tighten:

- **the air conditioning pipe mounting bolts on the air conditioning compressor (8 Nm)**,
- **the bolts mounting the air conditioning pipes on the evaporator (8 Nm)**,
- **the bolts mounting the air conditioning pipes on the condenser (8 Nm)**.

❑ Connect the pressure switch connector to the condenser.

❑ Refit:

- the resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❑ Connect:

- the passenger compartment heater hoses,
- the top hose on the cylinder head coolant outlet unit,
- the fan assembly connectors.

❑ Refit:

- the « right-hand driveshaft-stub axle carrier » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component),
- the « left-hand driveshaft-stub axle carrier » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❑ Connect the automatic transmission cooling hoses.

❑ Remove the waterproof plastic bag from the modular connector.

❑ Refit the mounting bolts to the modular connector.

❑ Connect the connectors to the modular connector.

K4M, and DP0

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Refill:

- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (MR 392, 23A, Automatic transmission),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the air inlet duct,
- the two air inlet duct clips,
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the wiring harness channel mounting bolts on the body.

AIR CONDITIONING

❑ Fill the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

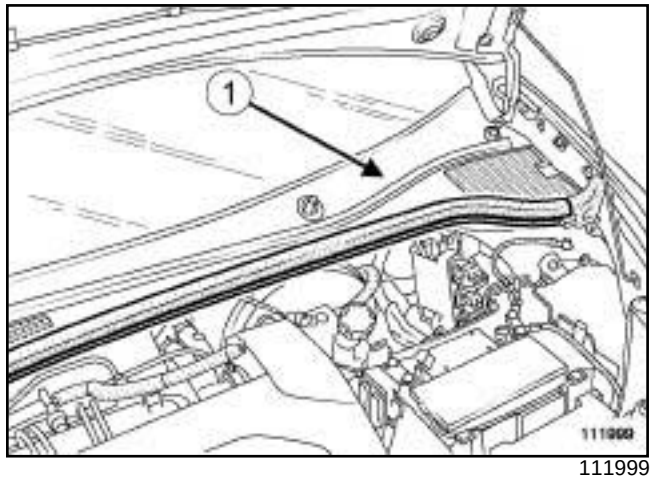
K9K, and JH3 or JR5 – K9K, and 772, and TL4

Special tooling required	
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
safety strap(s)
refrigerant charging station

Tightening torques ▽	
bolts for the gearbox suspended mounting	**62 Nm**
bolts for the suspended engine mounting on the engine	**62 Nm**
bolts for the suspended engine mounting on the body	**62 Nm**
engine tie-bar bolts	**105 Nm**
front cross member bolts	**105 Nm**
air conditioning pipe bolts	**8 Nm**
nut mounting the inter-cooler air inlet pipe on the alternator	**8 Nm**

REMOVAL



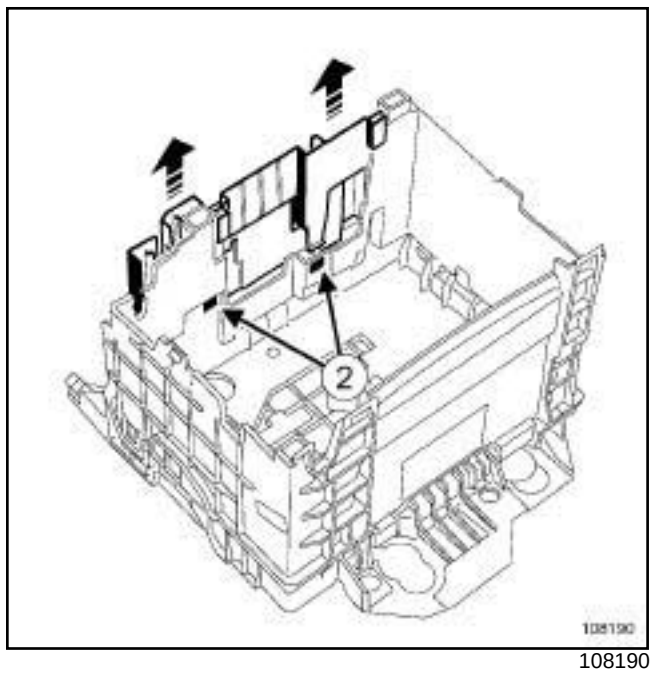
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

WARNING
During this operation, secure the vehicle to the lift with a **safety strap(s)**, to prevent it from becoming unbalanced.

To fit the strap to the vehicle (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove the front engine cover.

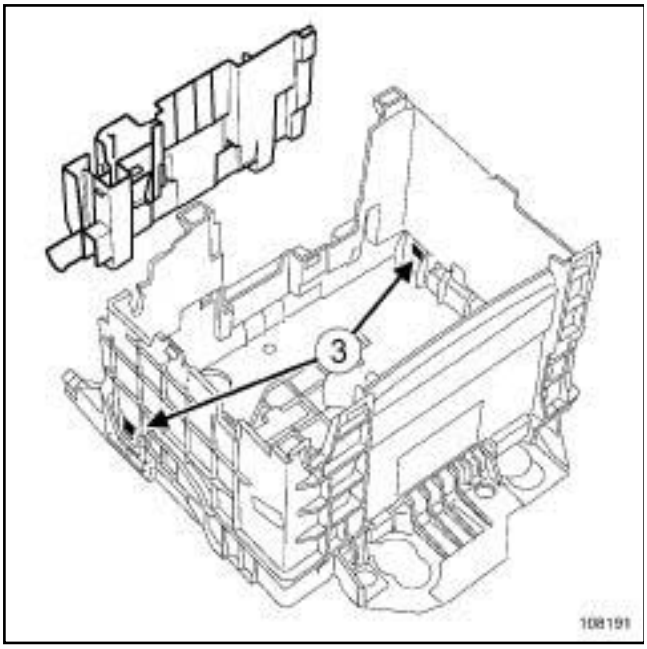


111999

❏ Remove:

- the scuttle panel grille (**1**) (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille.

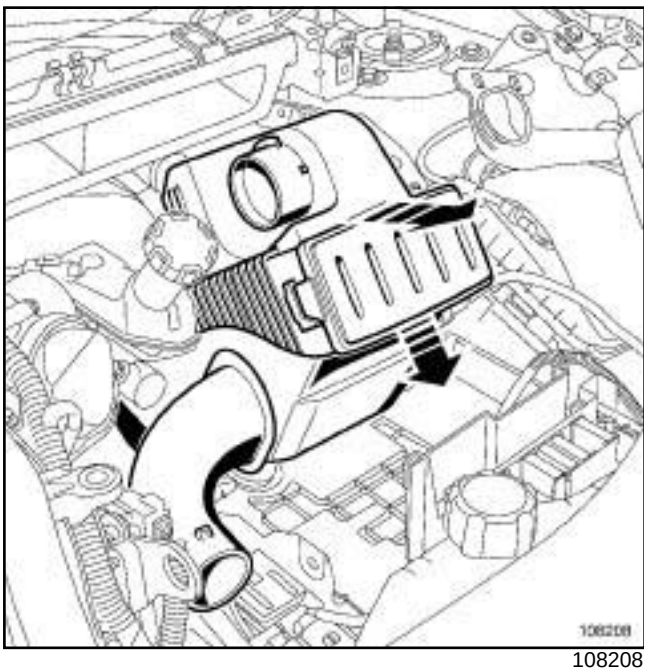
❏ Remove the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



108190

❏ Unclip the power supply fuse board support at (**2**) .

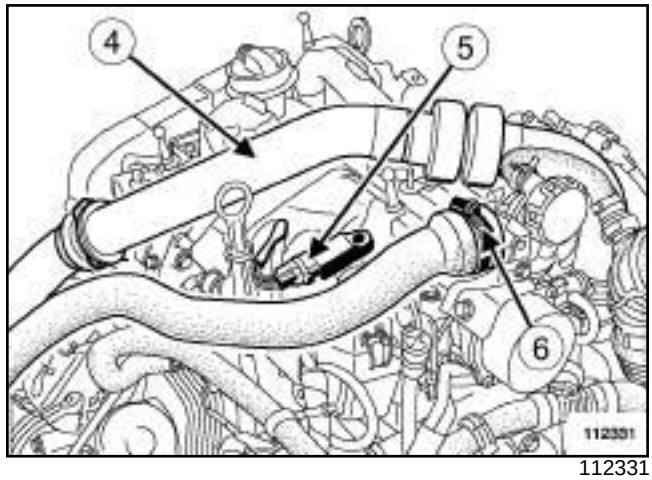
❏ Move the support from the fuse board as indicated by the arrows.



K9K, and JH3 or JR5 – K9K, and 772, and TL4

108191

❑ Remove the shielding by unclipping at (**3**) .



❑ Disconnect the air flow sensor connector.

108208

❑ Loosen the air inlet duct clip on the air filter unit.

❑ Remove:

- the air filter unit,
- the battery tray base.

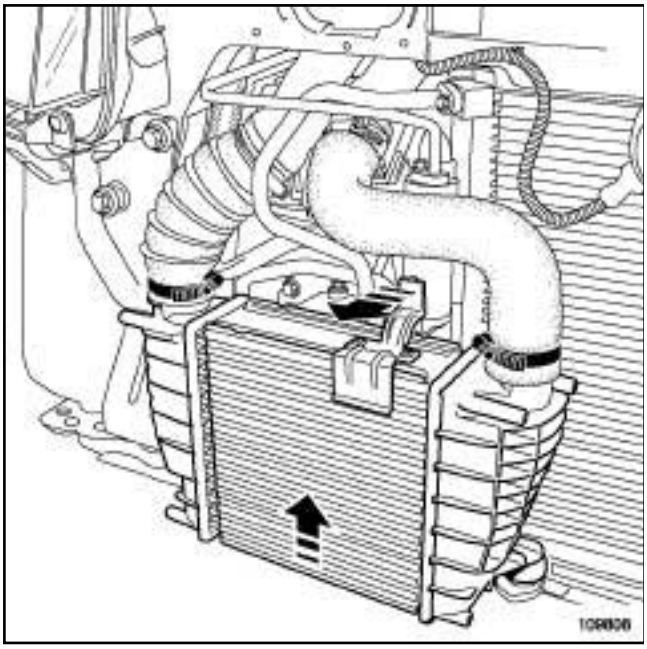
112331

❑ Loosen the mounting nut of the air pipe at the intercooler inlet on the alternator.

❑ Remove the air duct bolt on the rocker cover.

❑ Move the air duct clips to one side of the turbocharger and the air pipe at the intercooler inlet.

❑ Unclip the air duct (**4**) on the turbocharger and the air pipe at the intercooler inlet.



❑ Disconnect the connector (**5**) from the inlet air pressure sensor.

❑ Loosen the air inlet duct clip (**6**) .

❑ Remove the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❑ Remove the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

K9K, and JH3 or JR5 – K9K, and 772, and TL4

109808

❑ Remove the air duct clips on the intercooler.

❑ Pull the tab and lift the intercooler from its mounting studs.

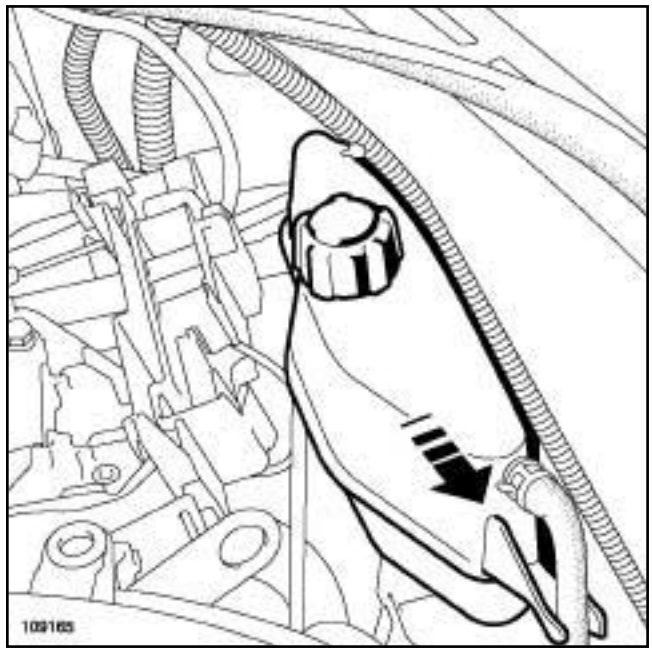
❑ Remove:

- the intercooler,
- the nut from the air pipes on the alternator,
- the turbocharging air ducts.

❑ Drain:

- the cooling circuit through the radiator bottom hose,
- the gearbox,
- the engine, if necessary.

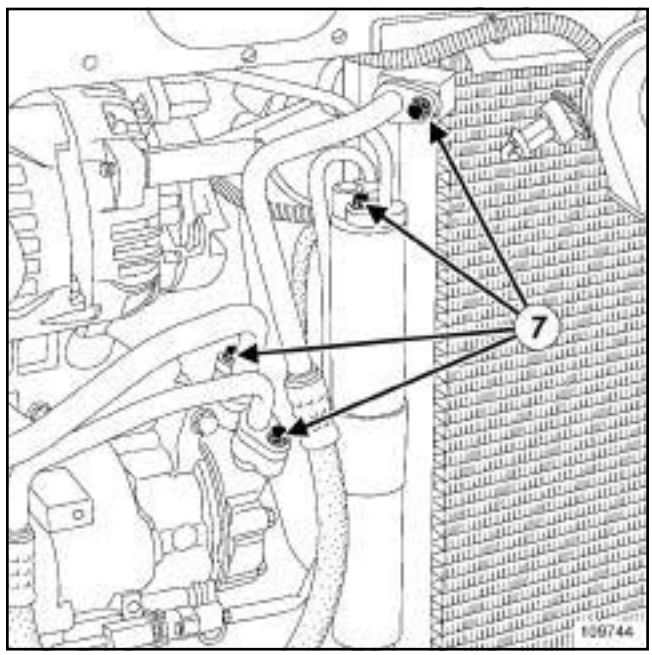
❑ Drain the coolant circuit using the **refrigerant charging station**.



❑ Remove the « hub carrier - left-hand driveshaft » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❑ Remove the « hub carrier - right-hand driveshaft » assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❑ Check the condition of the lip seal contact surface.



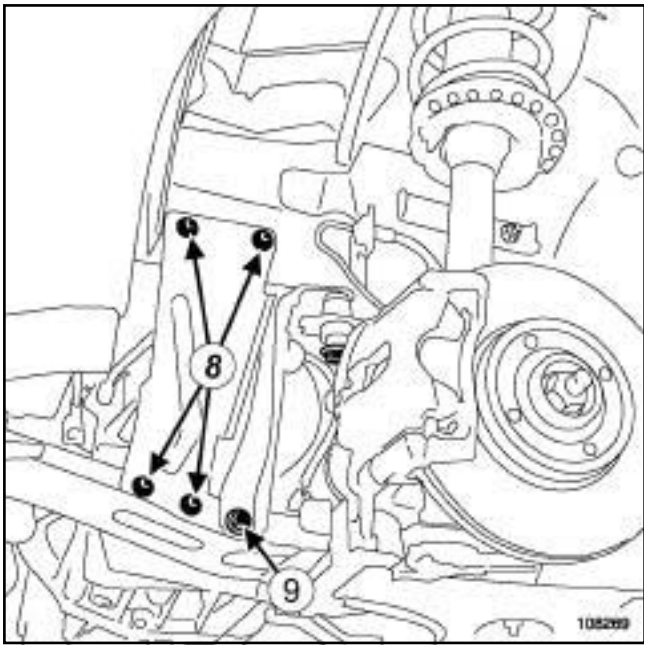
❑ Disconnect:

- the engine cooling fan assembly connectors,
- the top hose on the cylinder head coolant outlet unit,
- the passenger compartment heater hoses.

109165

❑ Extract the expansion bottle from its housing by following the direction of the arrow and put it to one side.

109744



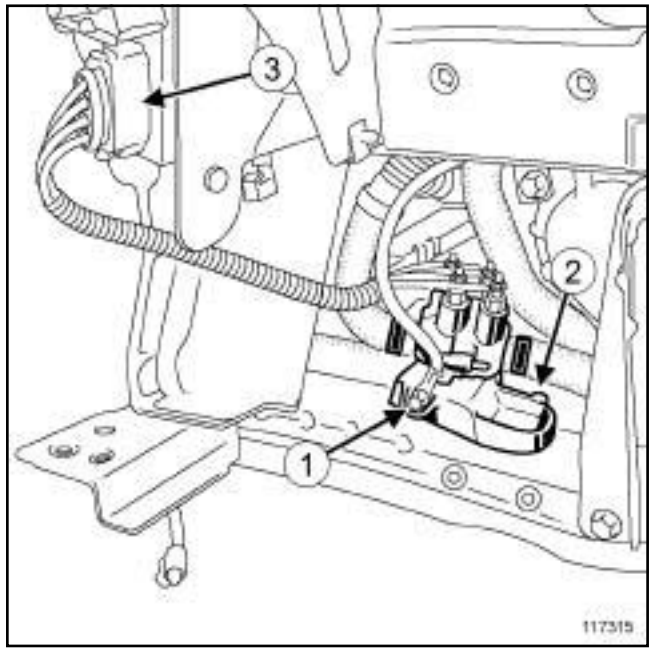
❑ Disconnect the pressure switch connector on the condenser.

❑ Remove the bolts (**7**) from the air conditioning pipes.

Note:

Plugs must be fitted on the hoses to prevent moisture from entering the system.

K9K, and JH3 or JR5 – K9K, and 772, and TL4

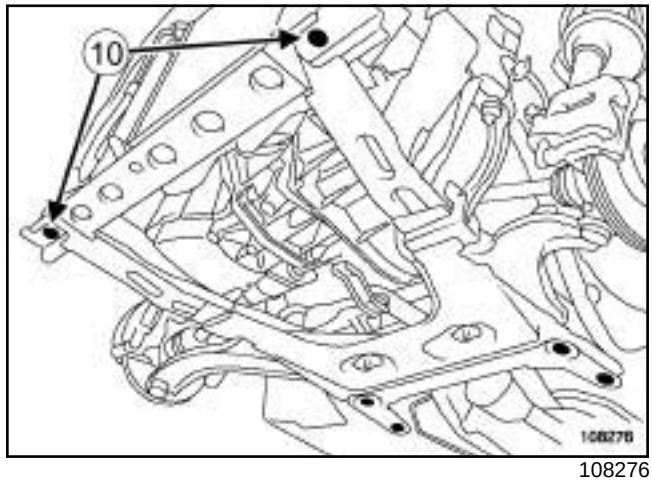


108269

❑ Remove:

- the left-hand side stiffener bolts (**8**) ,
- the left-hand side stiffener,
- the lower bolt (**9**) from the side tie rods.

K9K, and 772, and TL4



117315

❑ Remove:

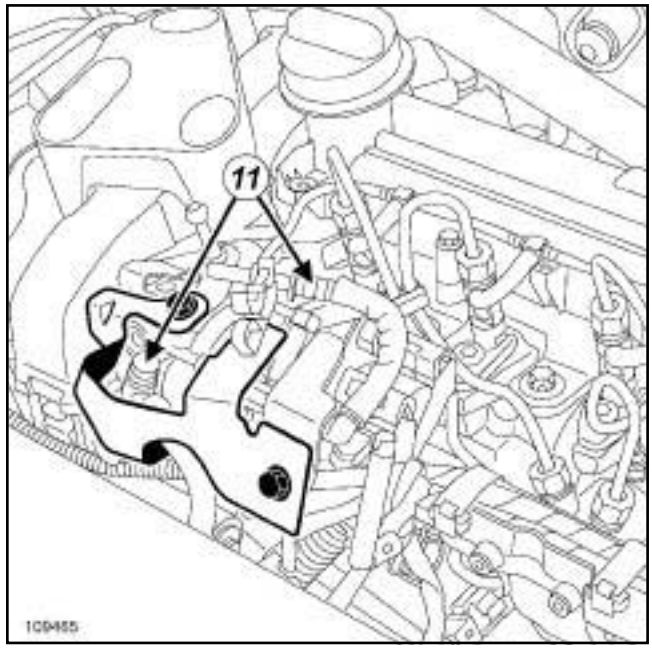
- the bolt (**1**) mounting the earth on the coolant pump and the heating element unit support,
- the bolt (**2**) mounting the coolant pump and the heating element unit support on the radiator mounting cross member.

❑ Disconnect the connector (**3**) from the heating element unit.

108276

❑ Remove:

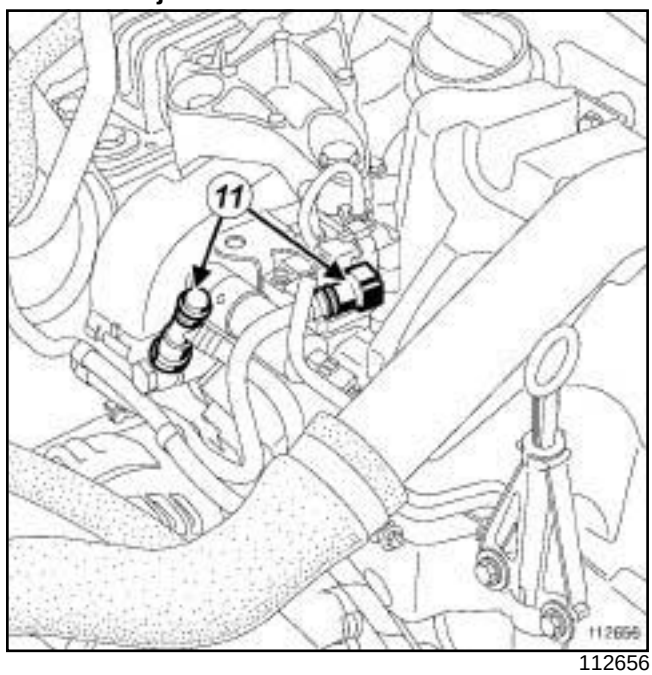
- the front cross member bolts (**10**) ,
- the front radiator cross member,



K9K, and JH3 or JR5 – K9K, and 772, and TL4

- the cooling radiator assembly,
- the earth wiring.

❏ Disconnect:

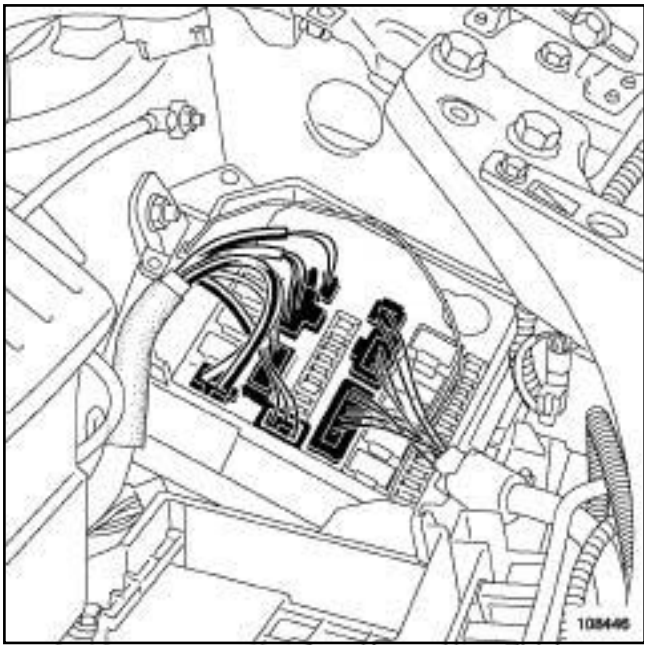


- the preheating unit connector.
- the coolant temperature sensor.

DELPHI injection

109465

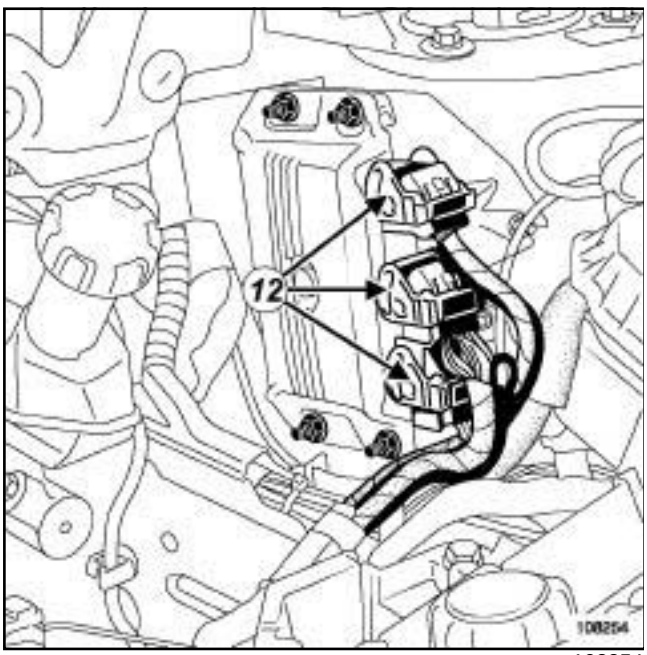
SIEMENS injection



112656

❏ Disconnect the fuel supply and return pipes on the high-pressure pump (**11**) .

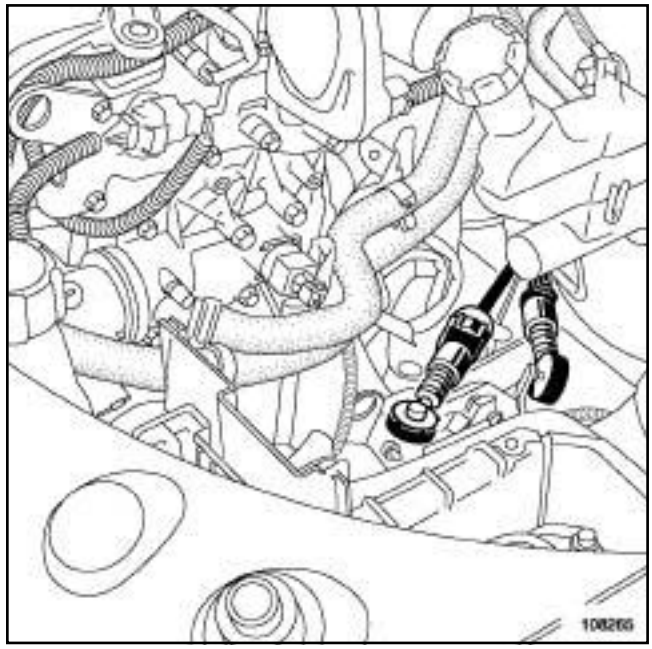
❏ Move the engine wiring harness to one side.



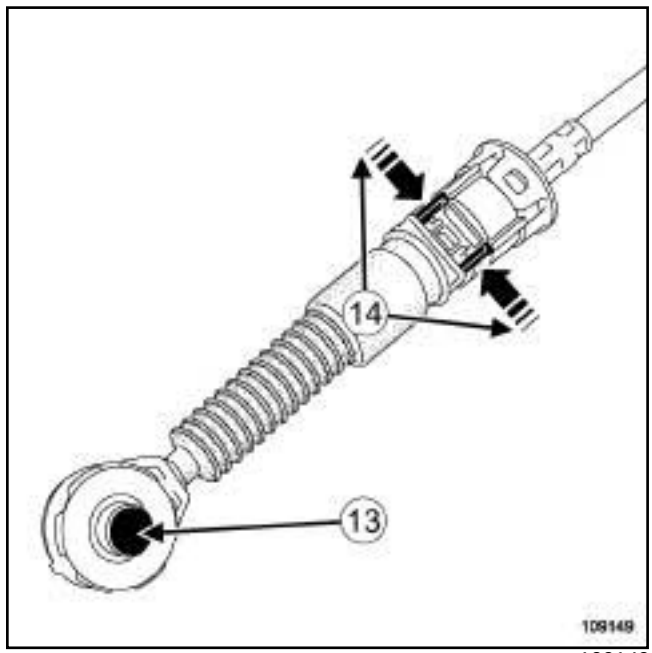
❏ Remove the Protection and Switching Unit cover.

K9K, and JH3 or JR5 – K9K, and 772, and TL4

108446



❑ Disconnect:

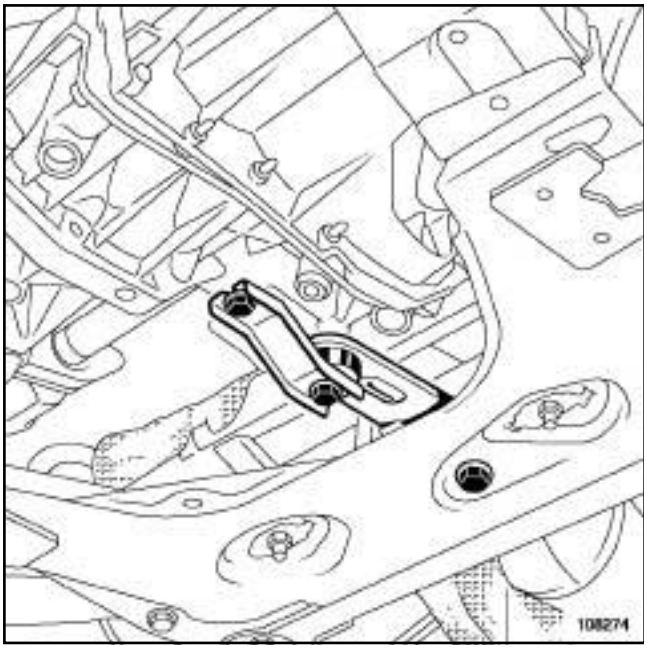


- the Protection and Switching Unit connectors,
- the brake servo pipe,
- the **30A** and **70A** engine fuses,
- the fuse holder on the fuse board,
- the feed wiring on the fuse board,
- the feed wiring on the battery protection fuse box.

108254

❑ Disconnect the injection computer connectors (**12**) .

108265

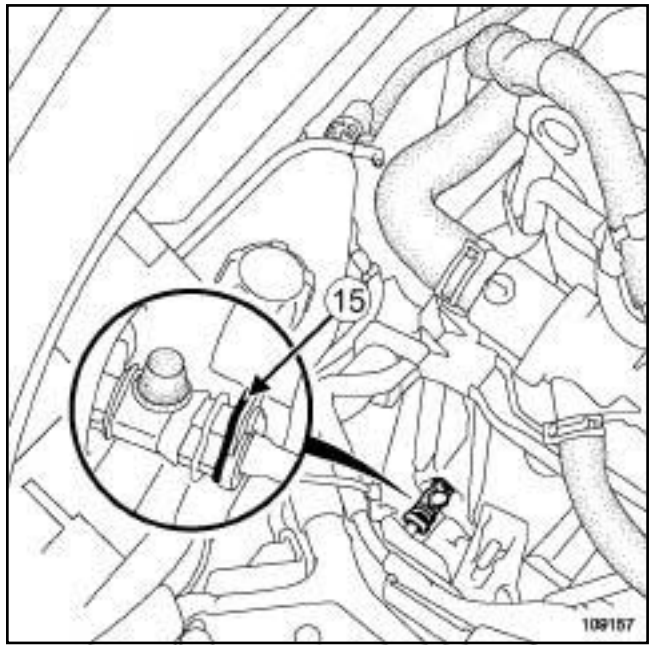


109149

❑ Remove:

- the gear control cables on the gearbox by pushing at (**13**) ,
- the gear control cables from the sleeve stops by pressing at (**14**) ,
- the wiring harness channel mountings on the gearbox.

K9K, and JH3 or JR5 – K9K, and 772, and TL4



108274

❑ Remove:

- the engine tie-bar,
- the exhaust downpipe bolts.

❑ Drain the brake fluid reservoir down to the clutch master cylinder pipe union using a syringe.

109157

❑ Remove the clip at the wheel end (**15**) .

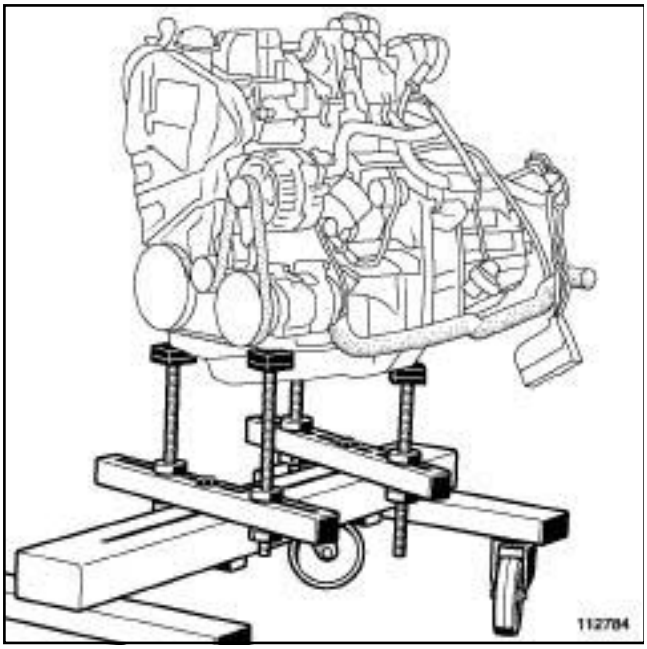
❑ Disconnect the clutch pipe from the clutch slave cylinder.

❑ Support the engine and gearbox assembly on **(Mot. 1390)**.

❑ Mark the positions of the suspended engine mountings on the body.

❑ Remove:

- the suspended engine mounting,
- the gearbox support rubber pad,
- the gearbox suspended engine mounting.



K9K, and 772, and TL4

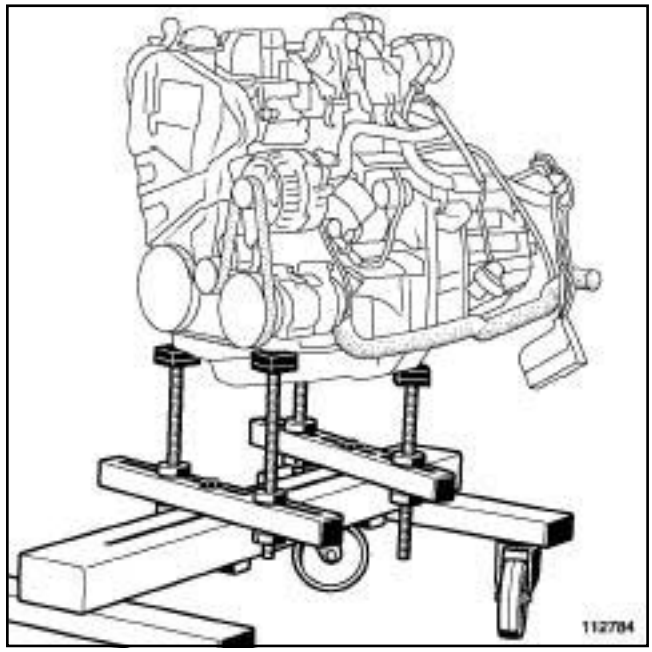
❑ Disconnect the fuel supply union from the diesel injector on the catalytic pre-converter.

II - REMOVAL OF PART CONCERNED

❑ Raise the vehicle, moving the engine towards the front.

K9K, and JH3 or JR5 – K9K, and 772, and TL4

112784



❑ Extract the engine and gearbox assembly from the engine compartment.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Standard replacement**) (Technical Note 6006A, 10A, Engine and peripherals).

II - REFITTING PART CONCERNED

112784

❑ Refit the engine and gearbox assembly in the engine compartment.

III - FINAL OPERATION.

K9K, and 772, and TL4

❑ Connect the fuel supply union to the diesel injector on the catalytic pre-converter.

❑ Refit:

- the gearbox suspended engine mounting,
- the gearbox support rubber pad,
- the suspended engine mounting.

❑ Remove the **(Mot. 1390)**.

❑ Torque tighten:

- the **bolts for the gearbox suspended mounting (62 Nm)**,
- the **bolts for the suspended engine mounting on the engine (62 Nm)**,
- the **bolts for the suspended engine mounting on the body (62 Nm)**.

❑ Connect the clutch pipe.

❑ Bleed the clutch system.

❑ Refit the exhaust downpipe bolts.

❑ Refit the lower engine tie-bar.

K9K, and JH3 or JR5 – K9K, and 772, and TL4

❏ Tighten to torque the **engine tie-bar bolts (105 Nm)**.

❏ Refit the gear control cables.

❏ Reconnect:

- the connectors to the injection computer,
- the feed wiring on the battery protection fuse box,
- the feed wiring on the fuse board,
- the fuse holder on the fuse board,
- the **30A** and **70A** engine fuses,
- the brake servo pipe,
- the Protection and Switching Unit connectors.

❏ Refit the Protection and Switching Unit cover.

❏ Refit the engine wiring harness.

❏ Connect the fuel supply and return pipes on the high-pressure pump.

❏ Connect:

- the coolant temperature sensor,
- the preheating unit connector.
- the earth wiring.

❏ Refit:

- the cooling radiator assembly,
- the front radiator cross member,
- the front cross member bolts.

❏ Tighten to torque the **front cross member bolts (105 Nm)**.

K9K, and 772, and TL4

❏ Refit:

- the bolt mounting the earth on the coolant pump and heating element unit support,
- the bolt mounting the coolant pump and heating element unit support on the radiator mounting cross member.

❏ Connect the connector to the heating element unit.

❏ Refit:

- the side tie-rod lower bolts,
- the left-hand side stiffener,
- the air conditioning pipes.

❏ Tighten to torque the **air conditioning pipe bolts (8 Nm)**.

❏ Connect the pressure switch connector to the condenser.

❏ Refit the expansion bottle.

❏ Connect:

- the passenger compartment heater hoses,
- the top hose on the cylinder head coolant outlet unit,
- the radiator bottom hose,
- the fan assembly connectors.

❏ Always replace the differential output lip seal each time the driveshaft is removed (see **Differential output seal: Removal - Refitting**) (MR 392, 21A, Manual gearbox).

❏ Refit the « hub carrier - right-hand driveshaft» assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❏ Refit the « hub carrier - left-hand driveshaft» assembly (see **Hub carrier - driveshaft assembly: Removal - Refitting**) (MR 392, 31A, Front axle component).

❏ Refit:

- the turbocharging pipes,
- the nut to the turbocharger pipes on the alternator,
- the intercooler.

❏ Refit the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Refit the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Refit the inlet pipe to the inlet manifold.

❏ Connect the inlet air pressure sensor

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Clip the air duct on the turbocharger and the air pipe at the intercooler inlet.

❏ Refit the air duct bolt on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ refit:

- the battery tray base,
- the air filter unit.

K9K, and JH3 or JR5 – K9K, and 772, and TL4

- ❑ Refit the air inlet duct to the air filter unit and tighten the clip.
- ❑ Refit the battery protective tray.
- ❑ Refit the fuse board.
- ❑ Perform the following operations:
  - refill the refrigerant circuit using the **refrigerant charging station**,
  - refill the engine if necessary,
  - refill the gearbox,
  - refill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .
- ❑ Bleed the cooling system (see **Cooling system: Bleed**) .
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).
- ❑ Refit:
  - the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
  - the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
  - the engine cover.

D4F, and 740 or 742 or 764

Tightening torques ▽	
exhaust downpipe mountings	9 N.m
air conditioning mounting bolts on the compressor, evaporator and condenser	8 N.m

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

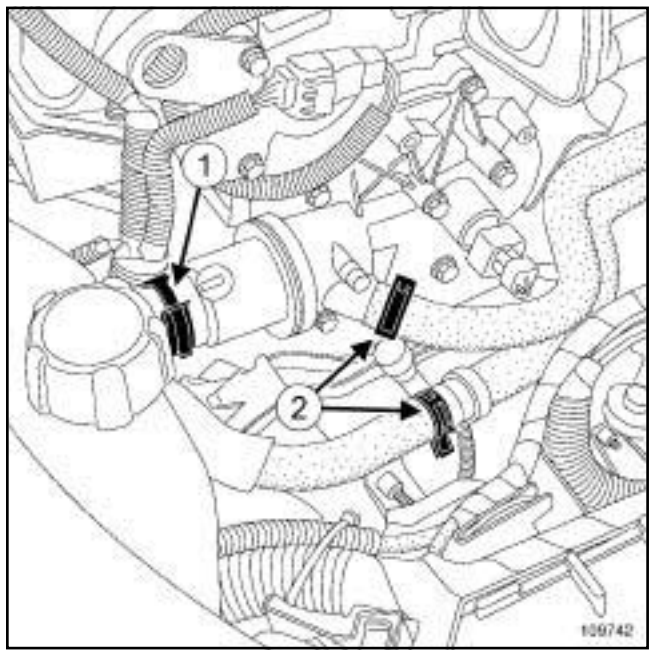
IMPORTANT
During this operation, secure the vehicle to the lift with a strap to prevent it from becoming unbalanced.

For strapping the vehicle (see **02A, Lifting equipment, Vehicle: Towing and lifting**).

❑ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) ,
- the engine undertray.

❑ Drain:



- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the gearbox (see **Manual gearbox oils: Draining - Filling**) ,
- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

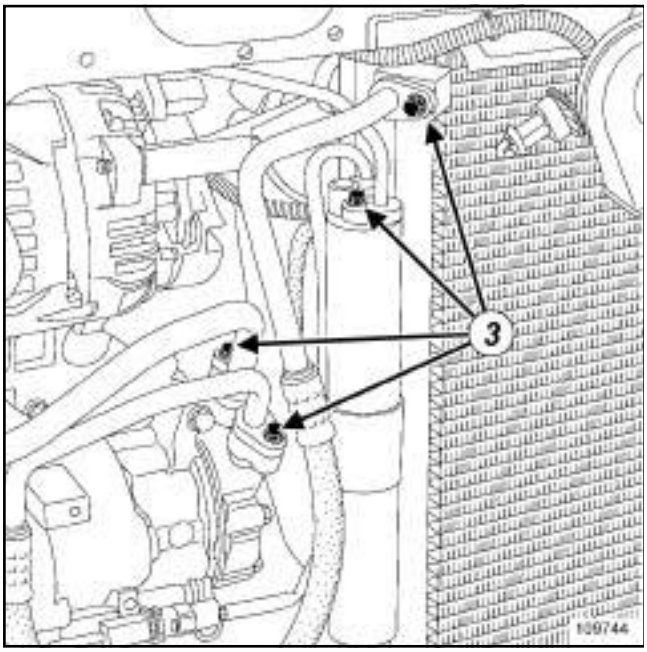
AIR CONDITIONING

❑ Drain the coolant circuit (see **Air conditioning: Parts and consumables for the repair**) .

❑ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) ,
- the front wheel arch liners (see **MR 393 Bodywork, 55A, Exterior protection, Front wheel arch liners**),
- the front bumper (see **MR 393, Bodywork, 55A, Exterior protection, Front bumper: Removal - Refitting**),
- the « left-hand driveshaft-stub axle carrier » assembly, (see **Hub carrier - driveshaft assembly: Removal - Refitting**)
- the « right-hand driveshaft-stub axle carrier » assembly. (see **Hub carrier - driveshaft assembly: Removal - Refitting**)

109742



❑ Disconnect:

- the engine cooling fan assembly connectors,
- the top hose (**1**) on the cylinder head coolant pipe housing outlet,
- the passenger compartment heater hoses (**2**) .

❑ Remove the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

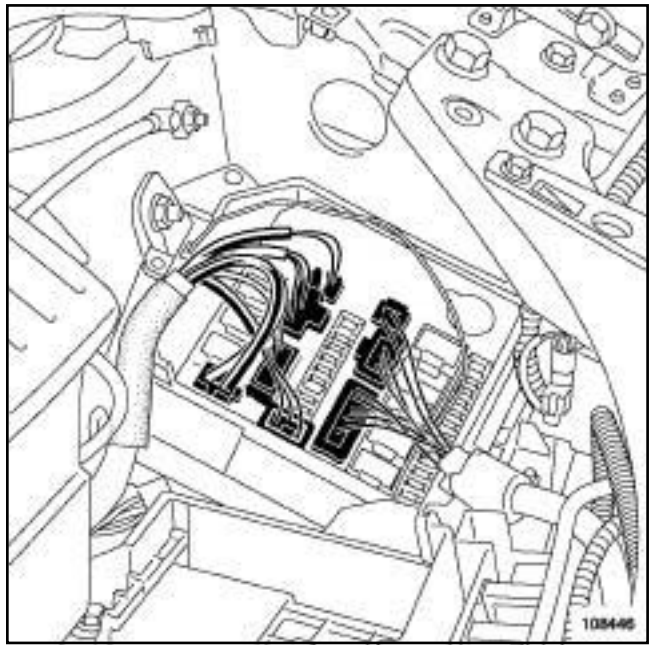
D4F, and 740 or 742 or 764

AIR CONDITIONING

109744

❑ Unclip the wiring harness of the pressure switch on the condenser.

❑ Disconnect:



- the pressure switch from the condenser,
- the air conditioning compressor clutch connector.

❑ Remove the air conditioning pipe union mounting bolts (**3**) on the compressor, evaporator and condenser.

❑ Fit plugs into the openings.

❑ Remove:

- the radiator mounting cross member (see **MR 393 Bodywork, 41A, Lower front structure, Radiator mounting cross member: Removal - Refitting**).
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the earths,
- the Protection and Switching Unit cover.

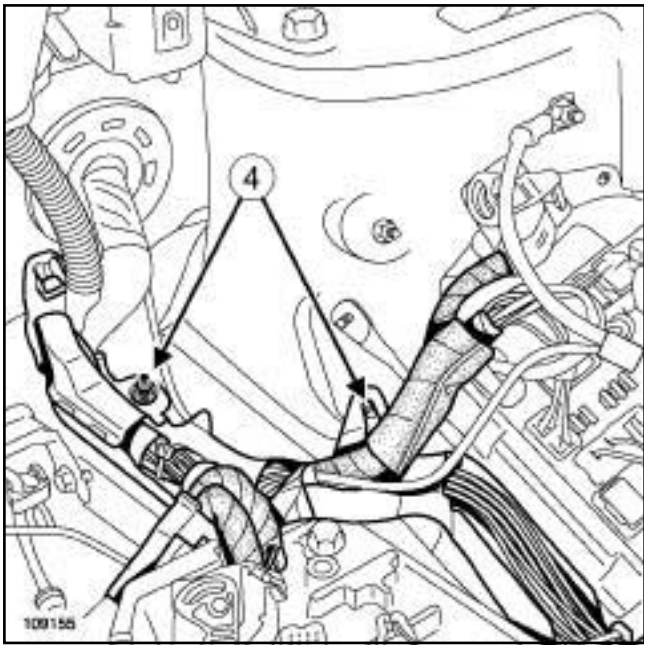
108446

❑ Disconnect the connectors from the protection and switching unit.

❑ Unclip the oxygen sensor harnesses.

❑ Disconnect:

- the brake servo pipe,
- the oxygen sensor connectors,
- the petrol vapour rebreather connector,
- the connector from the lifting eye at the flywheel end,



❑ Disconnect:

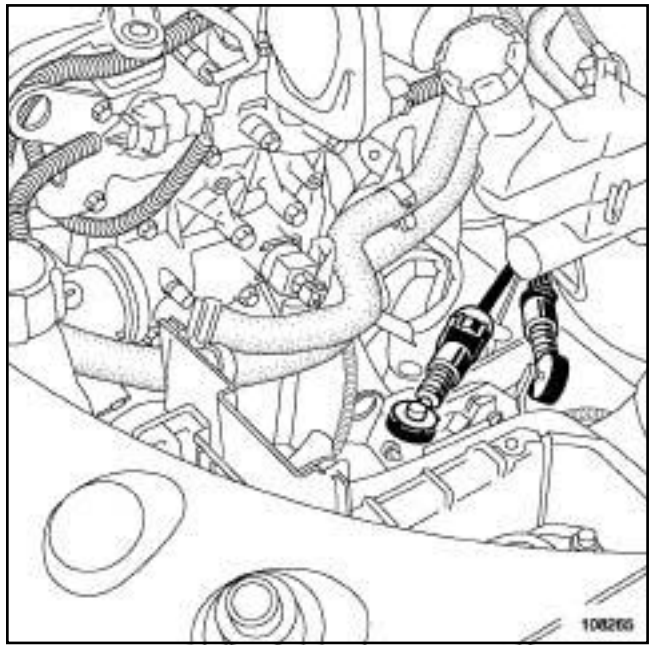
- the fuse,
- the fuse holder to the fuse board,
- the supply cable on the fuse board,
- the supply cable from the battery protection fuse box.

❑ Remove:

- the petrol injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the computer support mounting bolts,
- the computer bracket.

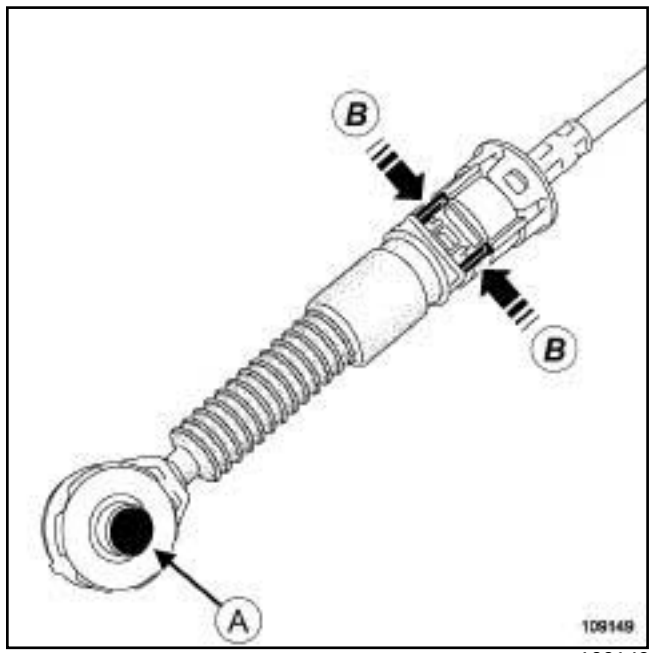
D4F, and 740 or 742 or 764

109155



❏ Remove the wiring channel mounting bolts (**4**) on the body.

❏ Remove the wiring duct.

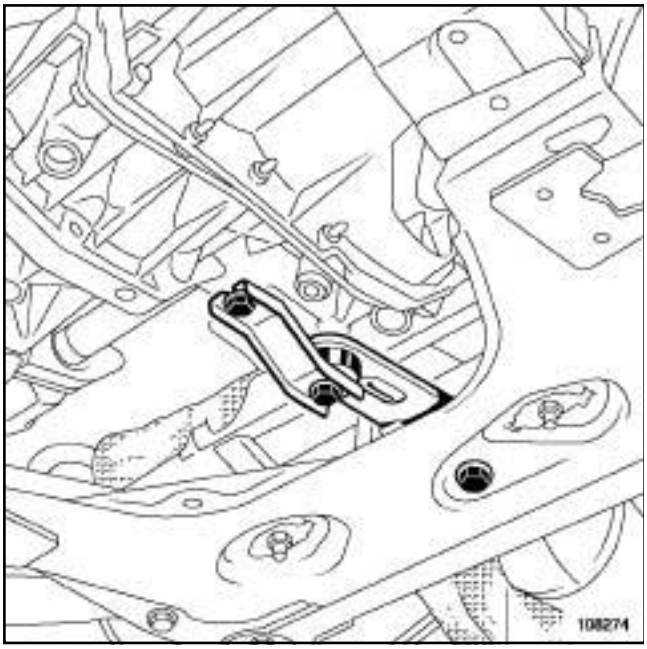


❏ Disconnect:

- the canister solenoid valve connector,
- the canister solenoid valve pipe,
- the petrol supply pipe from the injector rail.

❏ Fit plugs into the openings.

108265

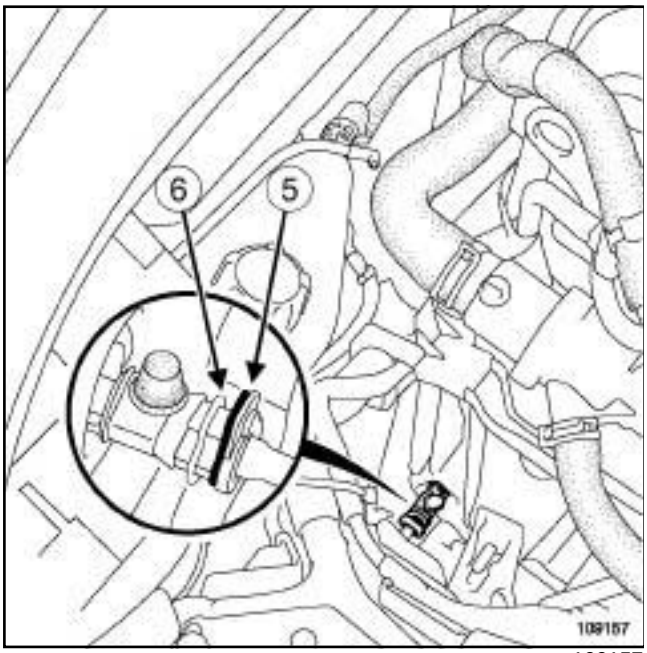


109149

❏ Remove:

- the gear control cables on the gearbox by pushing at (**A**) ,
- the control cables by pushing at (**B**) ,
- the wiring harness channel mountings on the gearbox.

D4F, and 740 or 742 or 764



108274

❏ Remove:

- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,

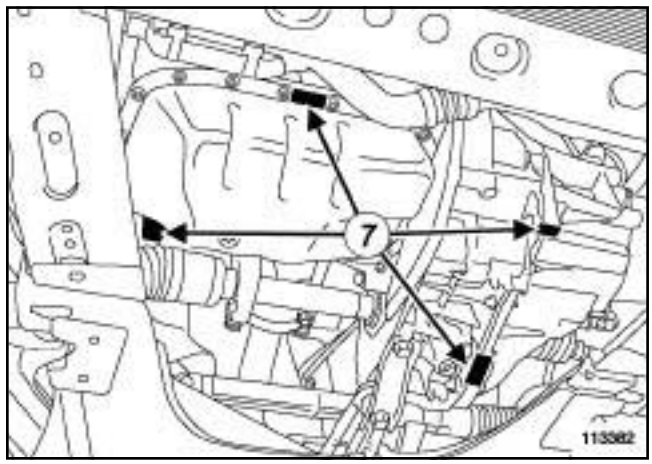
- the exhaust downpipe mountings.

❏ Fit a hose clamp between the brake fluid reservoir and the clutch master cylinder.

109157

❏ Disconnect the clutch slave cylinder by pulling the clips (**5**) and (**6**)

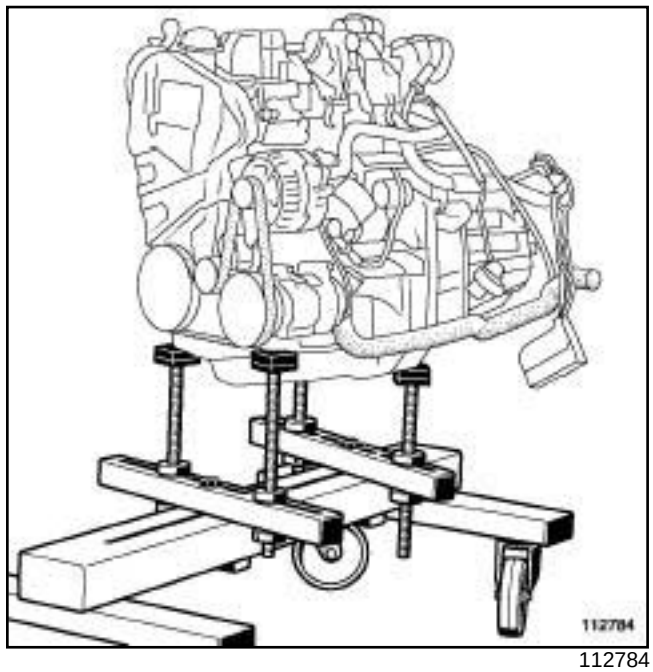
❏ Collect the fluid in a container.



WARNING

Fit plugs into the openings.

Plugs must be fitted on the pipes to prevent moisture from entering the system.



❏ Unclip the gearbox clutch pipe.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113382

❏ Support the « engine - gearbox » assembly on the engine marks (**7**) with the.

112784

❏ Mark the positions of the suspended engine mountings on the body.

D4F, and 740 or 742 or 764

❑ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .

❑ Raise the vehicle, moving the engine towards the front.

❑ Remove the « engine - gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ If carrying out a standard engine replacement (see **Technical Note 6004A, 4 cylinder - D4 - petrol engine, 10A, Engine and peripherals, Standard replacement**).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the « engine - gearbox » assembly in the vehicle.

❑ Refit:

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Remove thefrom the « engine - gearbox » assembly.

III - FINAL OPERATION.

❑ Clip the clutch pipe to the gearbox.

❑ Remove the protective plugs from the pipe openings.

❑ Connect the clutch slave cylinder pipes.

❑ Remove the hose clamp between the brake fluid reservoir and the clutch master cylinder.

❑ Refit the exhaust downpipe mountings.

❑ Torque tighten the **exhaust downpipe mountings (9 N.m)**.

❑ Refit the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

❑ Refit the wiring harness channel mountings on the gearbox.

❑ Refit the gearbox control cables.

❑ Remove the protective plug from the injector rail.

❑ Connect:

- the fuel supply pipe to the injector rail,
- the canister solenoid valve pipe,
- the canister solenoid valve connector.

❑ Refit the wiring harness channel mountings to the body.

❑ Refit:

- the wiring harness channel mountings to the body,
- the computer mounting,
- the computer bracket mounting bolts bolts,
- the injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) .

❑ Connect:

- the supply cable on the battery protection fuse box,
- the supply cable on the fuse board,
- the fuse holder to the fuse board,
- the fuse,
- the connector on the lifting eye at the flywheel end,
- the petrol vapour rebreather connector,
- the oxygen sensor connectors,
- the brake servo pipe ,
- the Protection and Switching Unit connectors.

❑ Refit:

- the Protection and Switching Unit cover,
- the earths,
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **MR 393 Bodywork, 41A, Lower front structure, Radiator mounting cross member: Removal - Refitting**).

❑ Clip the oxygen sensor wiring harnesses into place.

D4F, and 740 or 742 or 764

AIR CONDITIONING

❑ Refit the air conditioning pipe mounting bolts on the compressor, evaporator and condenser.

❑ Torque tighten the **air conditioning mounting bolts on the compressor, evaporator and condenser (8 N.m)**.

❑ Connect:

- the pressure switch from the condenser,
- the air conditioning compressor clutch connector.

❑ Clip the pressure switch wiring harness on the condenser.

❑ Refit the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

❑ Connect:

- the passenger compartment heating hoses,
- the top hose from the cylinder head coolant outlet unit,
- the fan assembly connectors.

❑ Refit:

- the « right-hand driveshaft and stub-axle carrier assembly » (see **Hub carrier - driveshaft assembly: Removal - Refitting**) ,
- the « left-hand driveshaft and stub axle carrier assembly » (see **Hub carrier - driveshaft assembly: Removal - Refitting**) ,
- the front bumper (see **MR 393, Bodywork, 55A, Exterior protection, Front bumper: Removal - Refitting**),
- the front wheel arch liners (see **MR 393 Bodywork, 55A, Exterior protection, Front wheel arch liners**),
- the front wheels (see **Wheel: Removal - Refitting**) .

❑ Refill:

- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- the gearbox (see **Manual gearbox oils: Draining - Filling**) ,
- the engine cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the engine undertray,
- the battery tray (see **Battery tray: Removal - Refitting**) ,
- the battery (see **Battery: Removal - Refitting**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

AIR CONDITIONING

❑ Refill the coolant circuit (see **Air conditioning: Parts and consumables for the repair**) .

M4R, and DP0

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

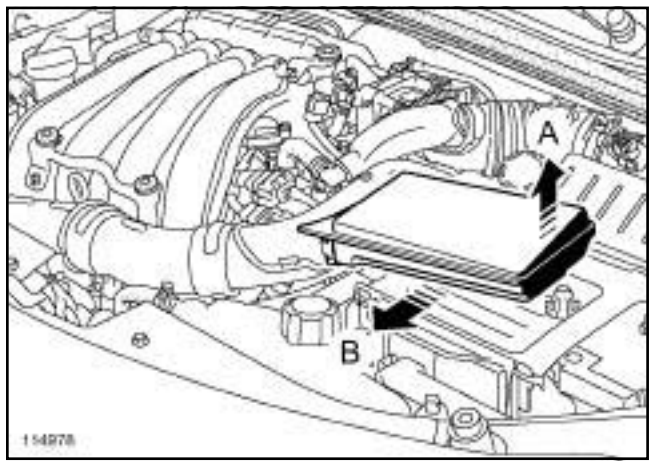
REMOVAL



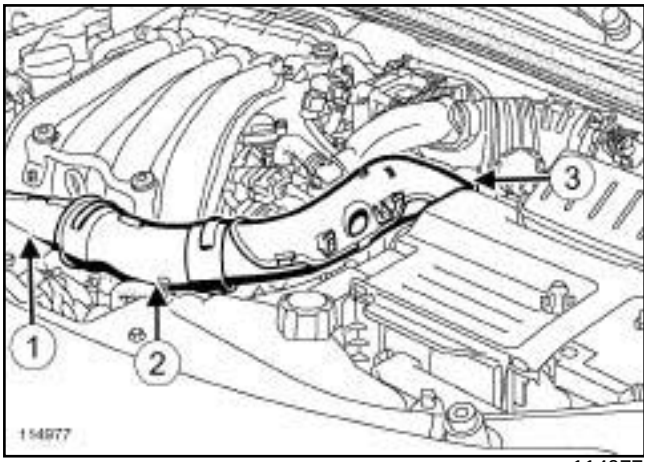
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

IMPORTANT
During this operation, secure the vehicle to the lift with a strap to prevent it from becoming unbalanced.

❑ Remove the engine cover.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

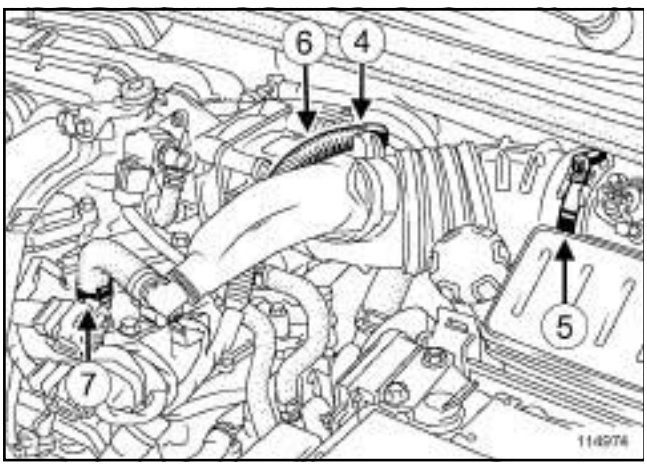


114978

❑ Lift the air resonator (**A**) to remove it from the battery cover.

❑ Pull the air resonator (**B**) towards the front of the vehicle to remove it.

M4R, and DP0



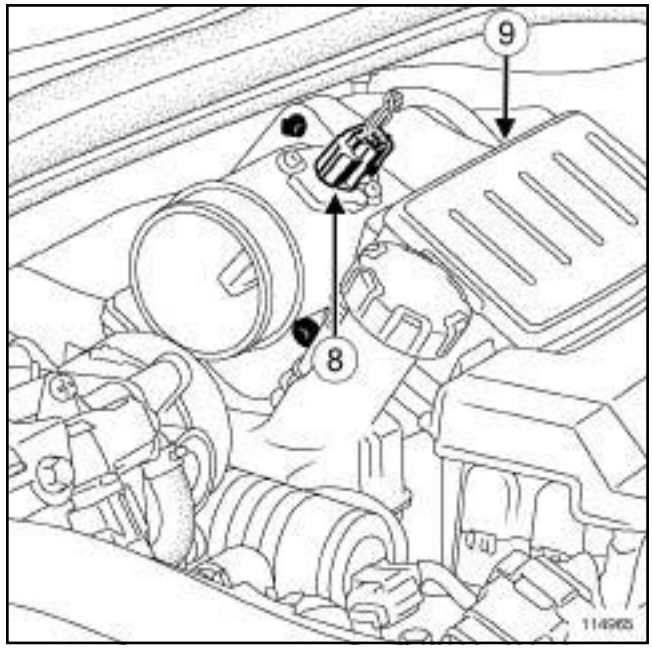
114977

❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove the air intake sleeve.

114974



❏ Detach the wiring harness from the air inlet duct at (**4**) .

❏ Undo the air duct securing clips:

- on the air flow sensor (**5**) ,
- on the motorised throttle valve (**6**) .

❏ Remove the oil vapour rebreather duct (**7**) from the rocker cover using the **(Mot. 1448)**.

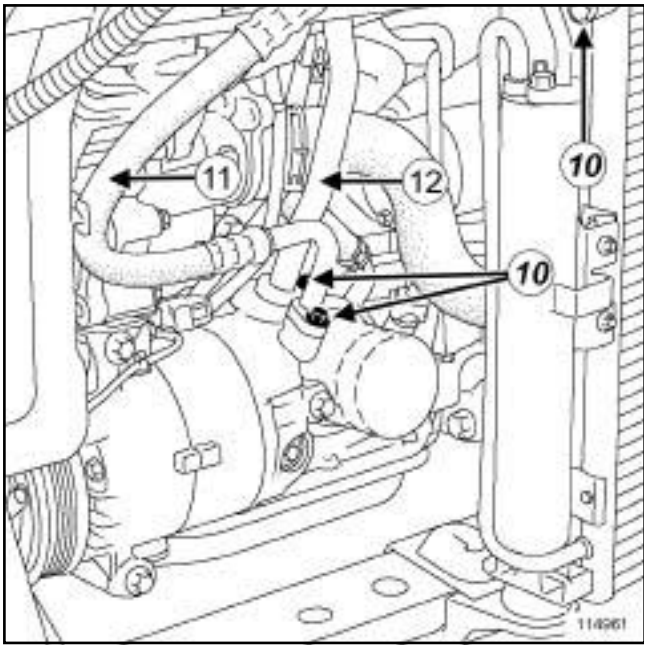
❏ Remove the air inlet duct.

114965

❏ Disconnect the air flowmeter connector (**8**) .

❏ Unclip the air flowmeter connector wiring harness at (**9**) .

❏ Remove the engine undertray.



❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (MR 392, 23A, Automatic transmission),
- the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

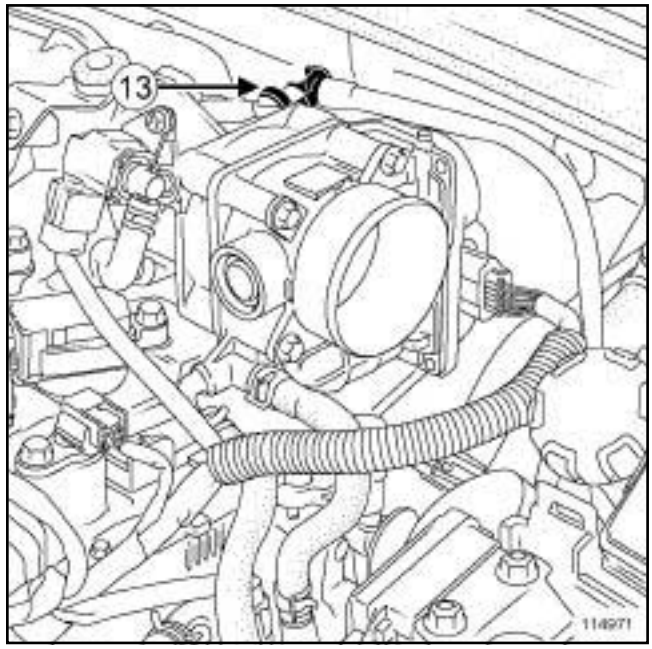
❏ Remove:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,

M4R, and DP0

114961

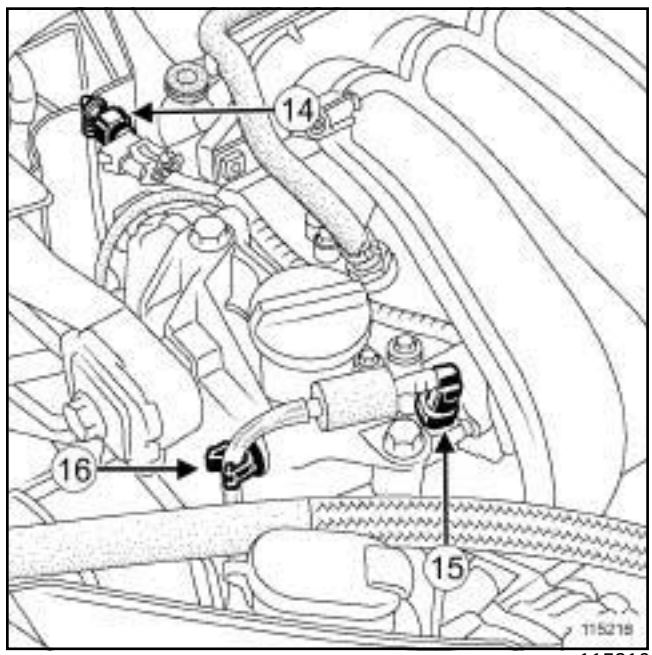
❏ Remove:



- the bolts (**10**) from the air conditioning pipe unions,
- the air conditioning pipe (**11**) .

WARNING
Plugs must be fitted on the hoses to prevent moisture from entering the system.

❏ Pull out the air conditioning pipe (**12**) .



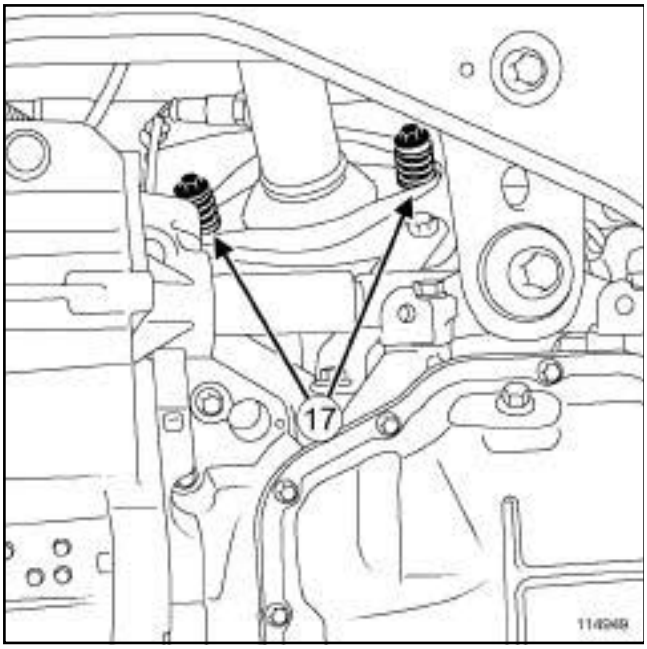
❏ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the driveshafts (see **Front left-hand driveshaft: Removal - Refitting**) (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts).

114971

❏ Disconnect the brake servo hose (**13**) .

115216

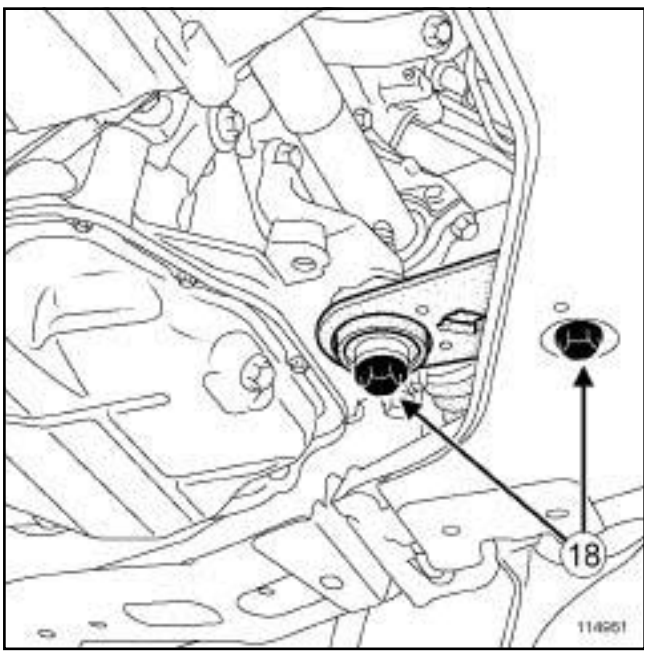


❏ Disconnect:

- the petrol vapour rebreather pipe (**14**) ,
- the fuel supply pipe (**15**) .

WARNING
Protect sensitive areas from fuel spillage.

❏ Unclip the fuel supply pipe at (**16**) .

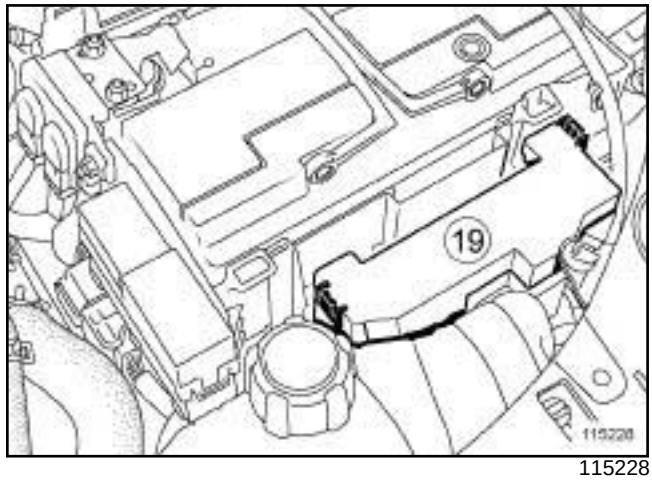


M4R, and DP0

114949

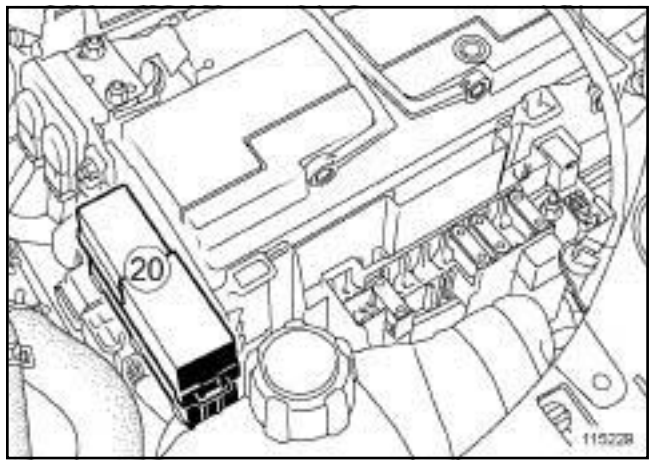
❑ Remove:

- the exhaust clamp mounting bolts (**17**) ,
- the exhaust clamp seal.



114951

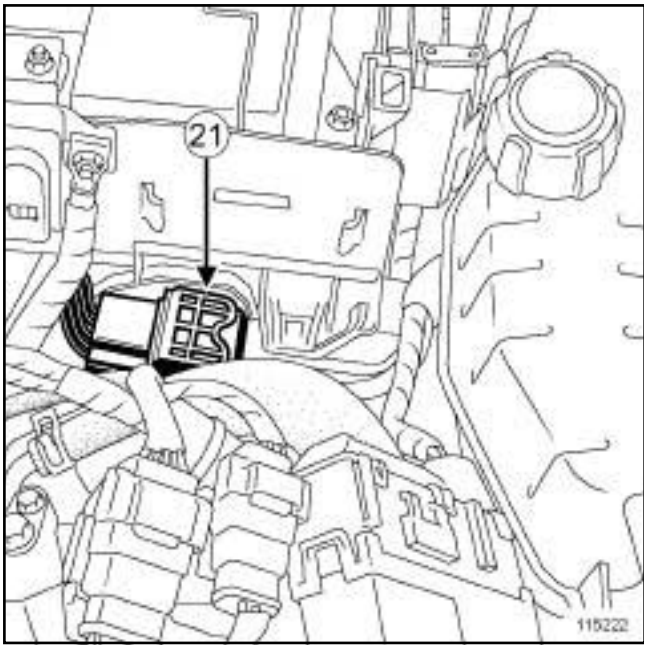
❑ Remove:



- the engine tie-bar mounting bolts (**18**) ,
- the engine tie-bar.

❑ Remove the battery cover.

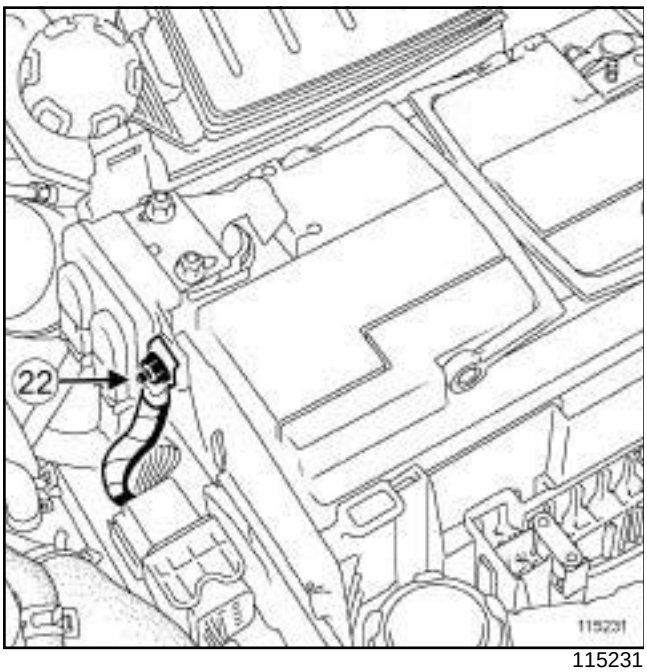
115228



❑ Remove the fuse box cover (**19**) .

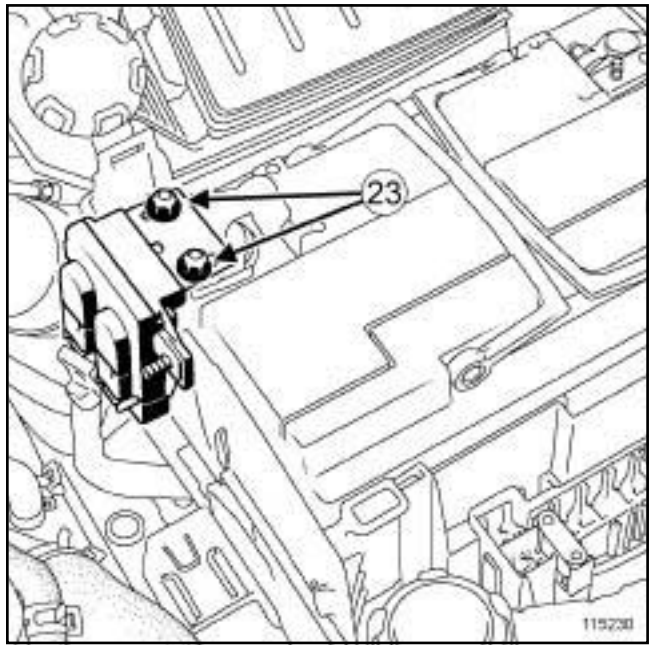
115229

❑ Unclip the relay box (**20**) .



M4R, and DP0

115222

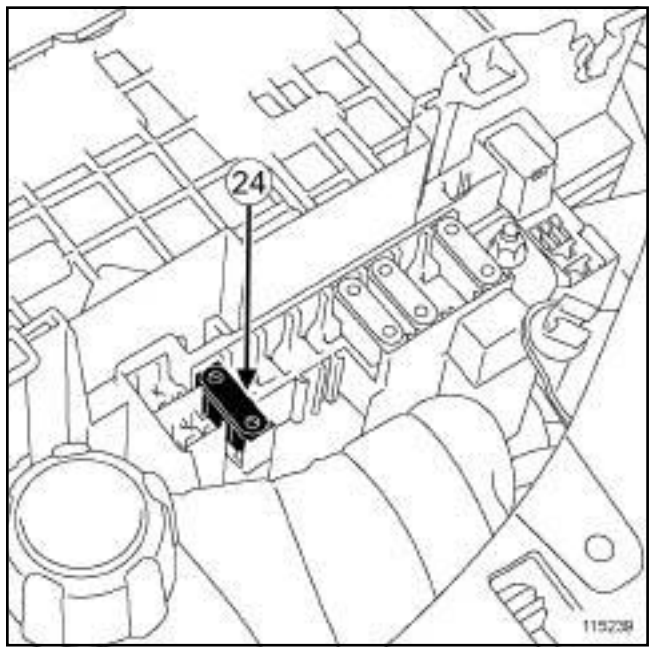


❏ Unclip the wiring harness connector (**21**) .

❏ Disconnect the wiring harness connector (**21**) .

115231

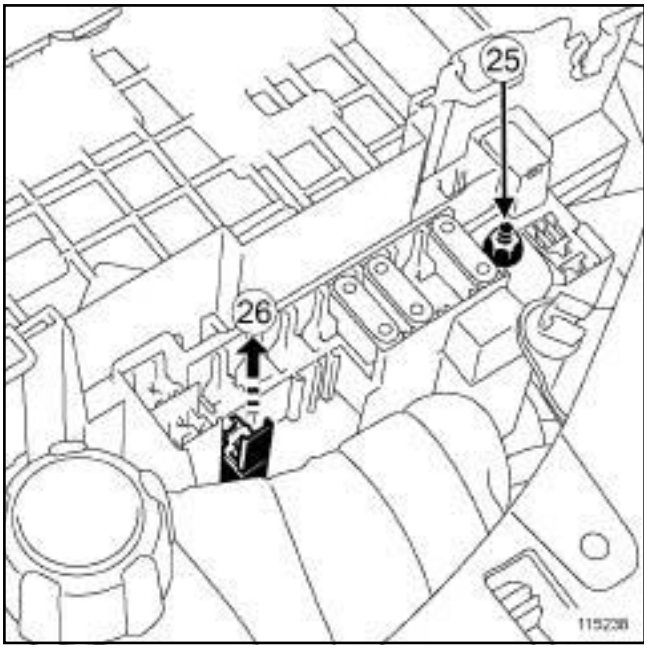
❏ Disconnect the lead (**22**) .



115230

❏ Disconnect the positive battery terminal (**23**) .

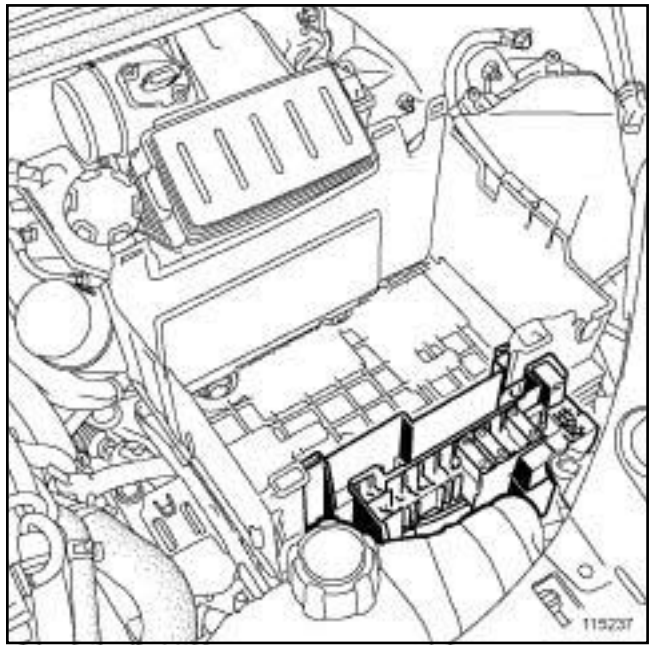
❏ Remove:



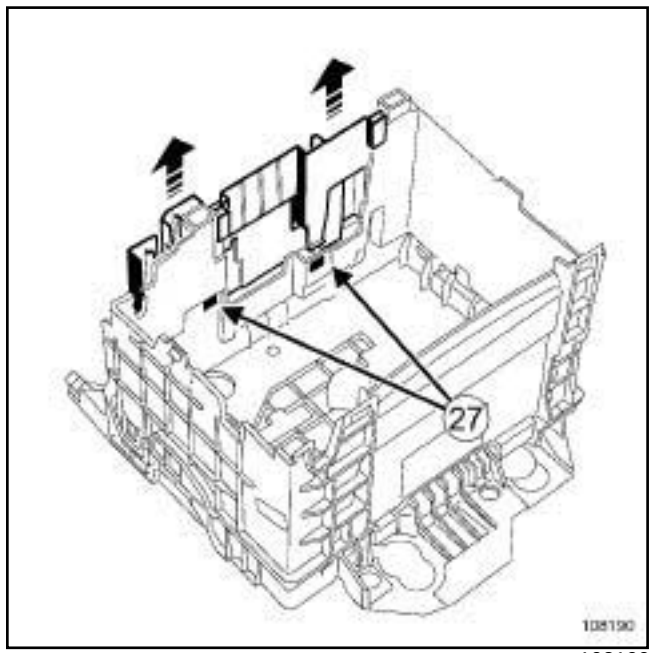
- the battery mounting clamp,
- the battery.

115239

❏ Remove the fuse (**24**) .



M4R, and DP0

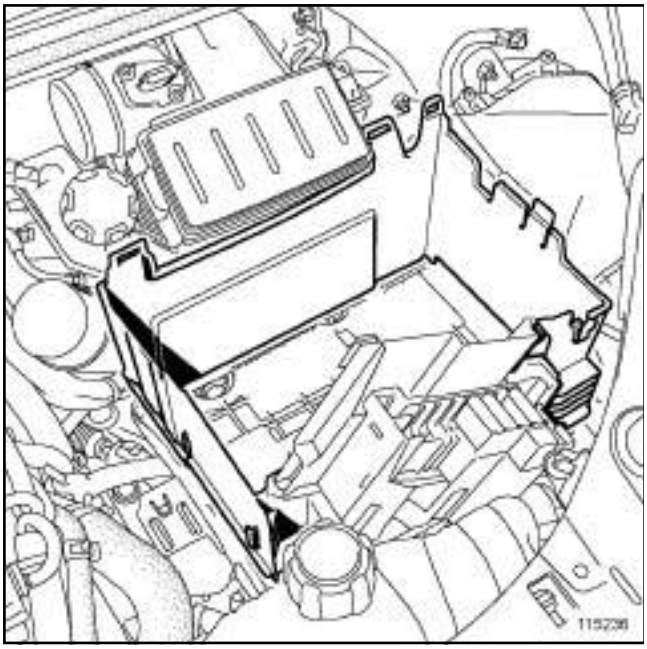


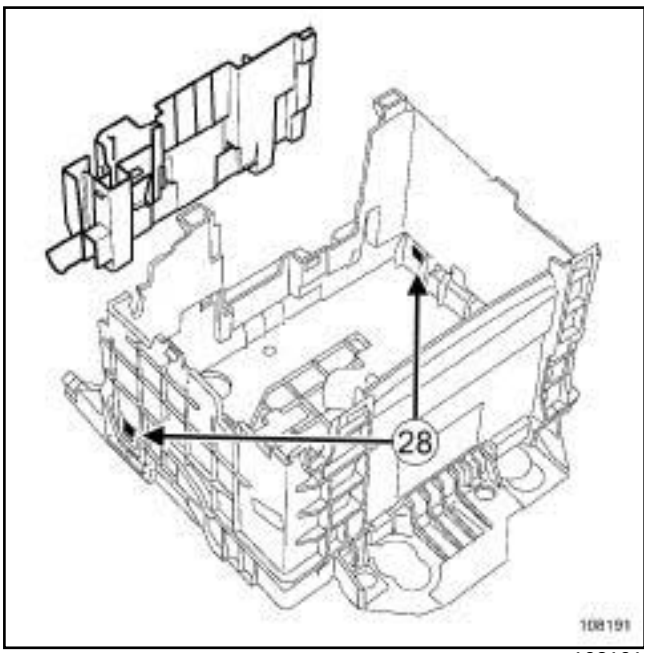
115238

❑ Disconnect the electrical connector (**25**) .

❑ Pull the fuse holder out from the fuse box (**26**) .

115237



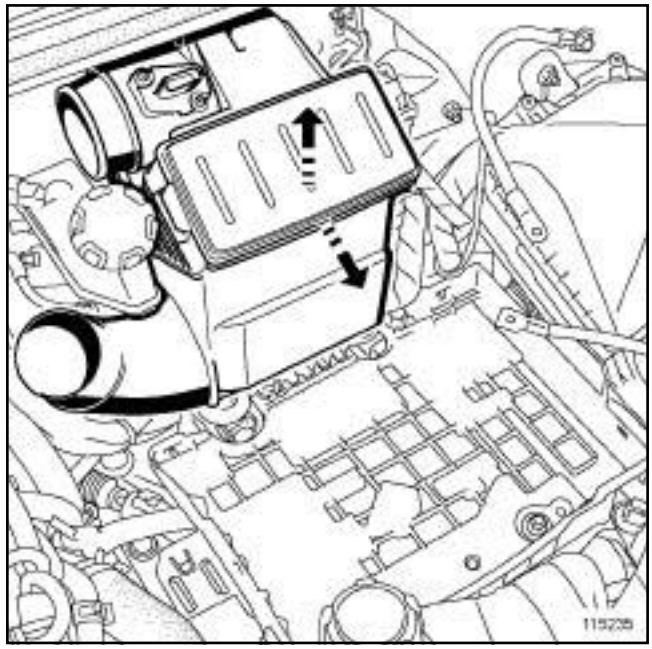


108190

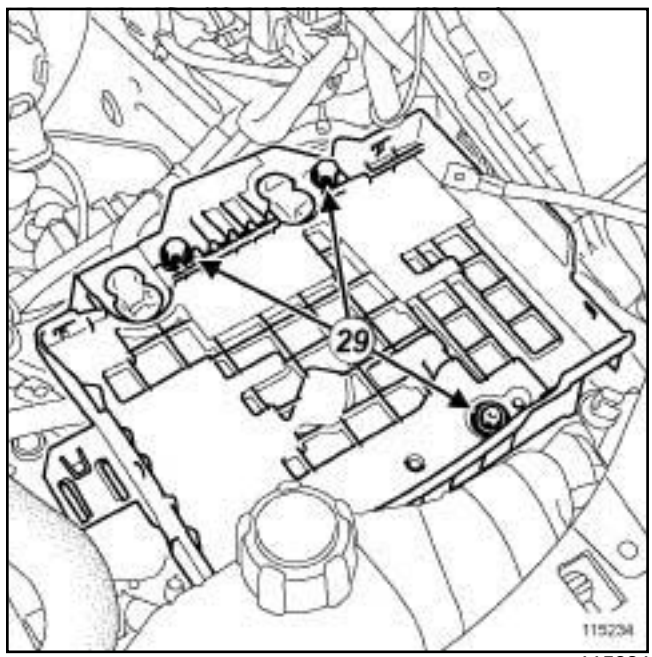
❑ Unhook the fuse box from the battery tray at (**27**) .

❑ Move the fuse box away from the battery tray.

M4R, and DP0



115236



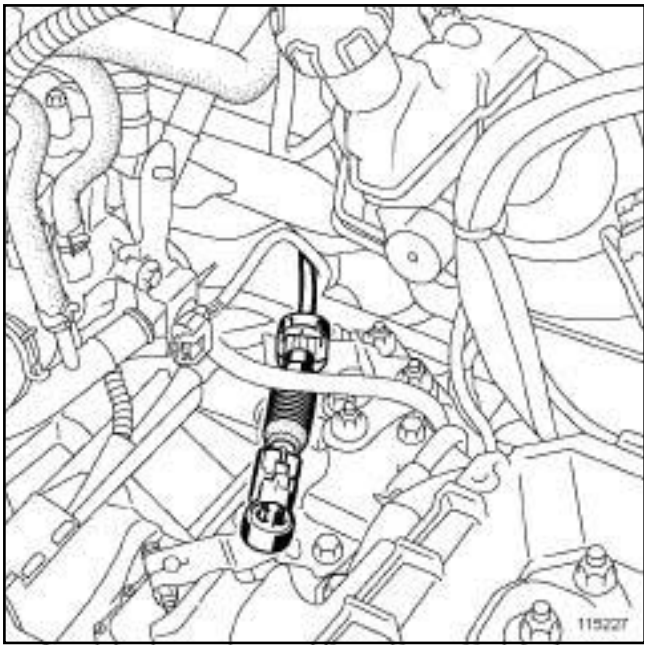
108191

❑ Unclip the battery tray from the battery tray base at (**28**) .

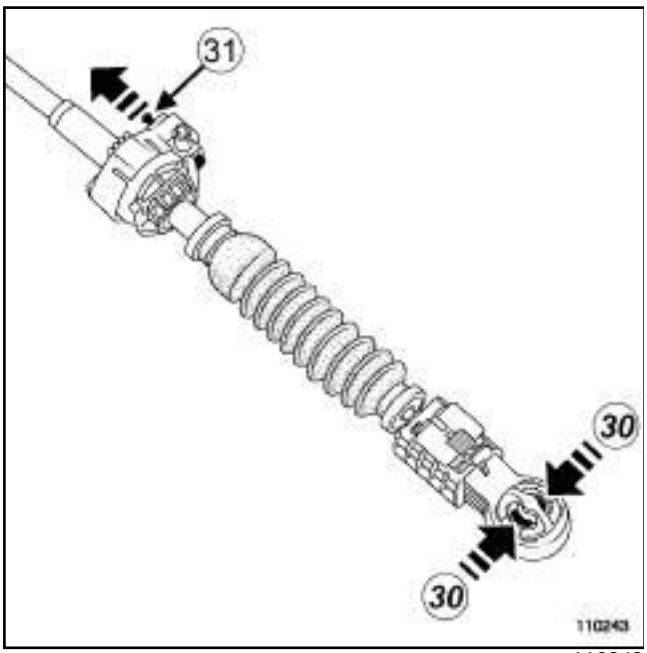
❑ Remove the battery tray.

115235

❑ Remove the air filter unit in the direction of the arrows.



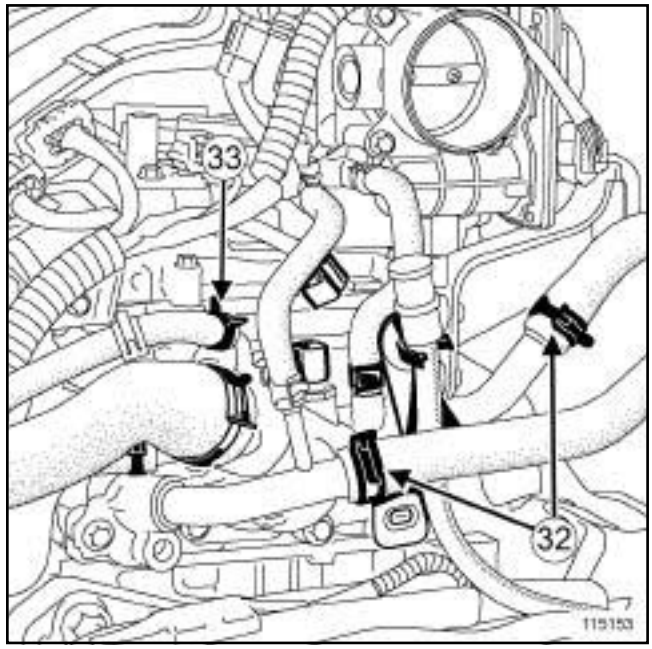
115234



❑ Remove:

- the battery tray base mounting bolts (**29**) ,
- the battery tray base.

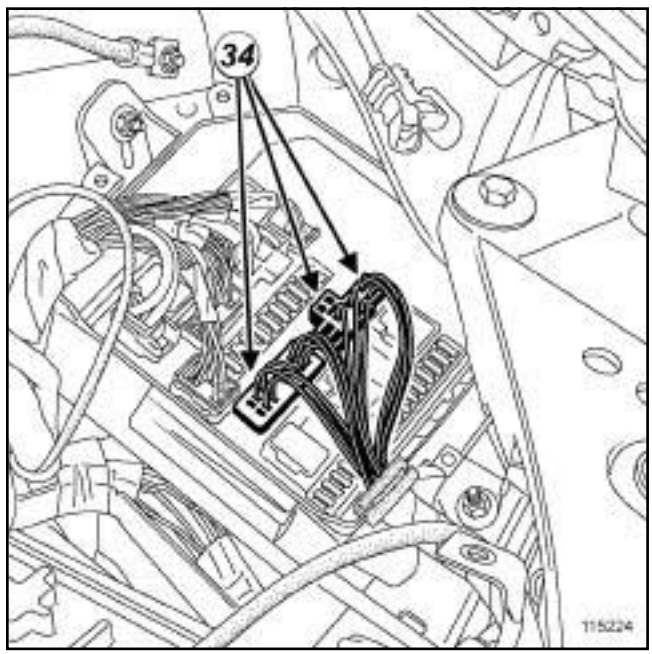
M4R, and DP0



115227

110243

❏ Detach the automatic transmission control cable ball joint by pressing at (**30**) .

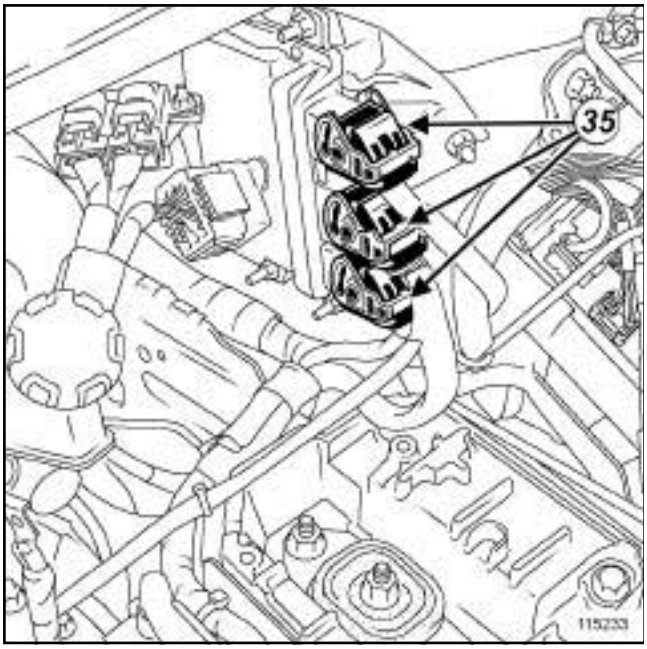


❏ Pull out the automatic transmission control cable by pulling tab (**31**) .

115153

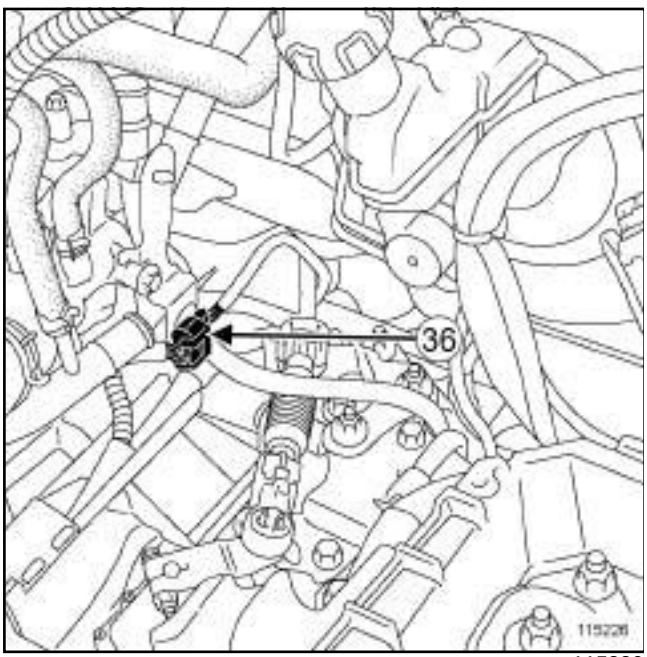
❏ Disconnect:

- the passenger compartment heating hoses (**32**) ,
- the expansion bottle hoses (**33**) .



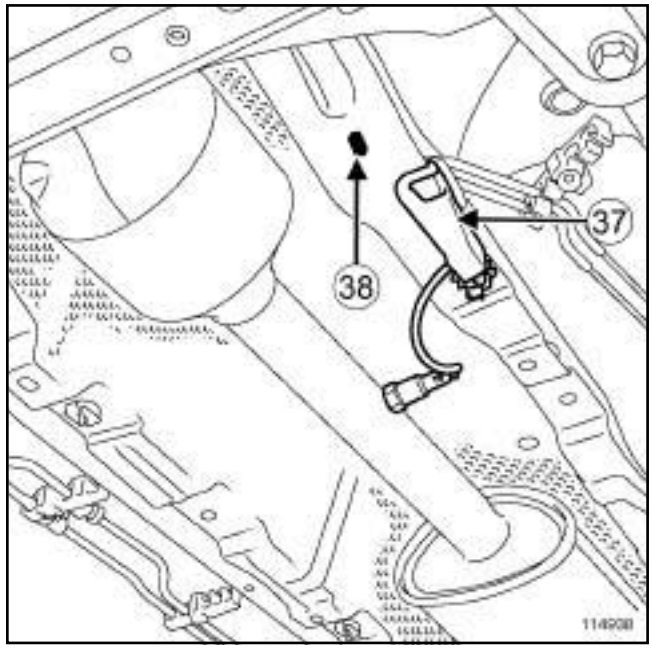
115224

❏ Remove the Protection and Switching Unit cover.



❏ Remove the engine wiring harness connectors (**34**) from the Protection and Switching unit.

M4R, and DP0



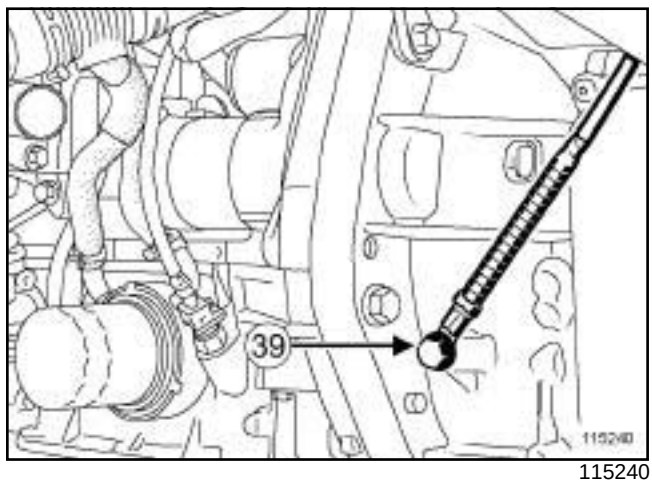
115233

❏ Disconnect the engine wiring harness connectors (**35**) from the injection computer.

115226

❏ Disconnect the upstream oxygen sensor connector (**36**) .

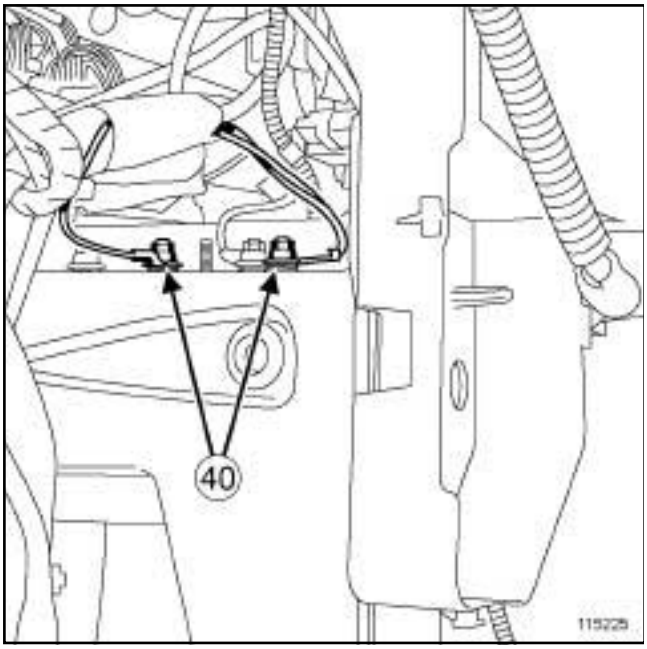
114938



❏ Remove the plastic cover (**37**) .

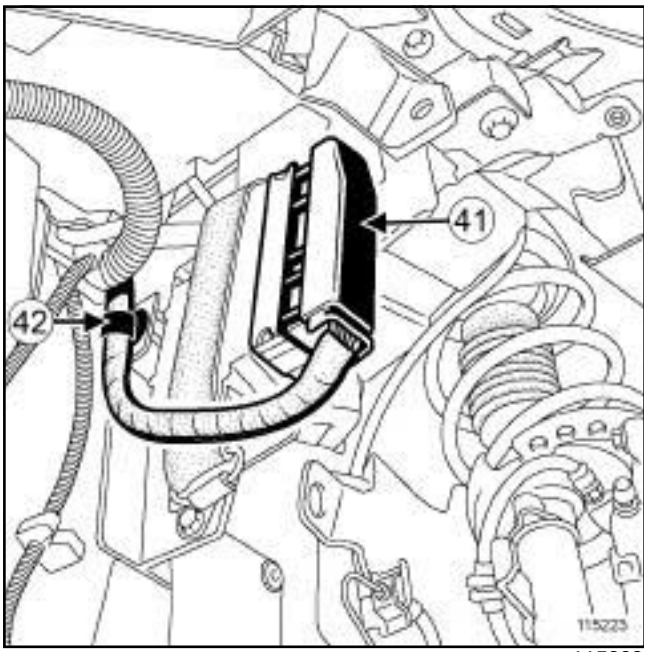
❏ Detach the downstream oxygen sensor connector at (**38**) .

❏ Disconnect the downstream oxygen sensor connector.



❏ Unclip the downstream oxygen sensor wiring harness from the power-assisted steering box.

❏ Feed the downstream oxygen sensor wiring harness into the engine compartment.

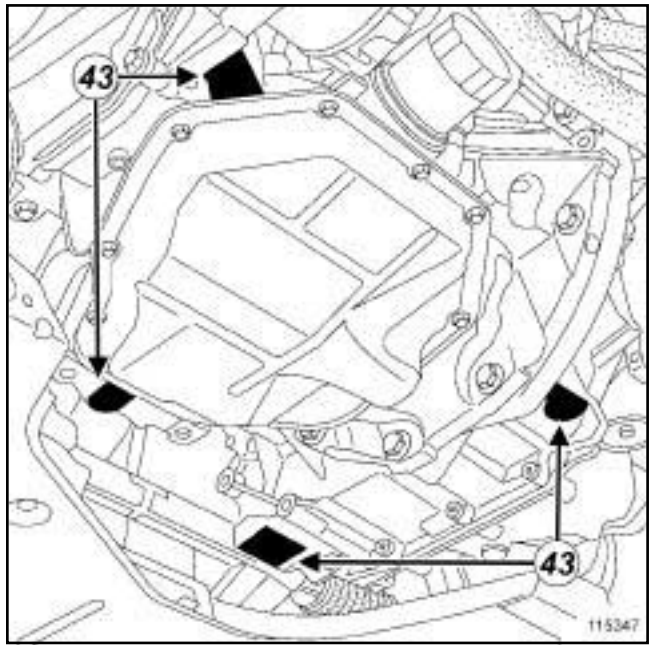


115240

❏ Disconnect the automatic transmission earth wire (**39**) .

115225

❏ Disconnect the side member earth wires.

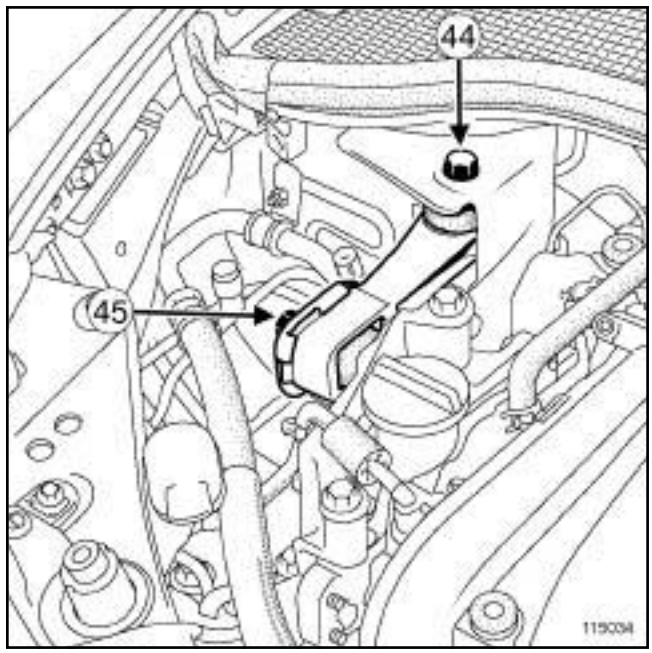


115223

❏ Disconnect the automatic transmission connector (**41**) .

❏ Unclip the automatic transmission wiring harness at (**42**) .

❏ Feed the automatic transmission wiring harness into the engine compartment.



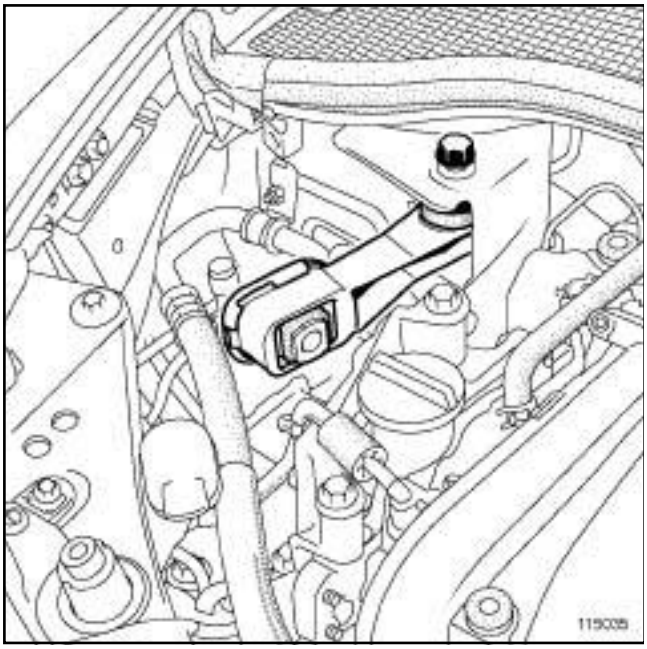
115347

❏ Position the **(Mot. 1390)** under the «engine-gearbox » assembly.

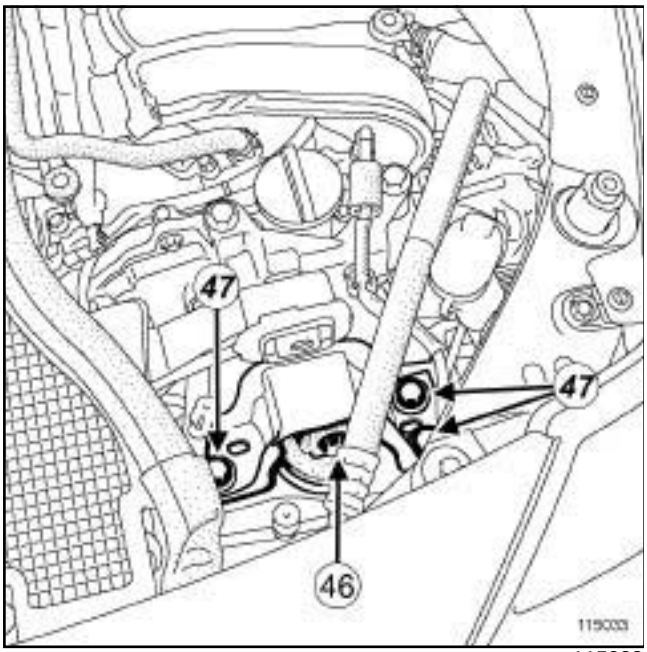
❏ Lower the vehicle down onto the pads of the **(Mot. 1390)**.

❏ Adjust the pads of the **(Mot. 1390)** at (**43**) to ensure that the « engine-gearbox » assembly is stable.

II - REMOVAL OF PART CONCERNED



115034

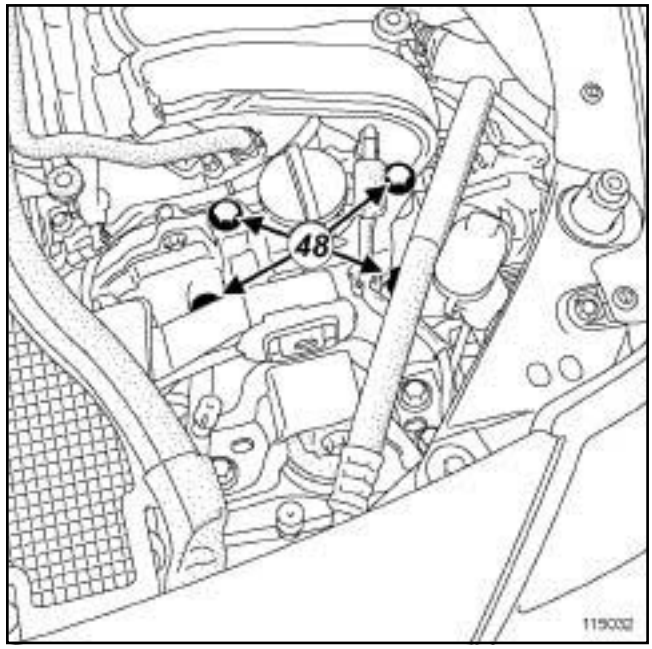


❏ Undo the upper engine tie-bar mounting bolt (**44**) .

❏ Remove the upper engine tie-bar mounting bolt (**45**) .

M4R, and DP0

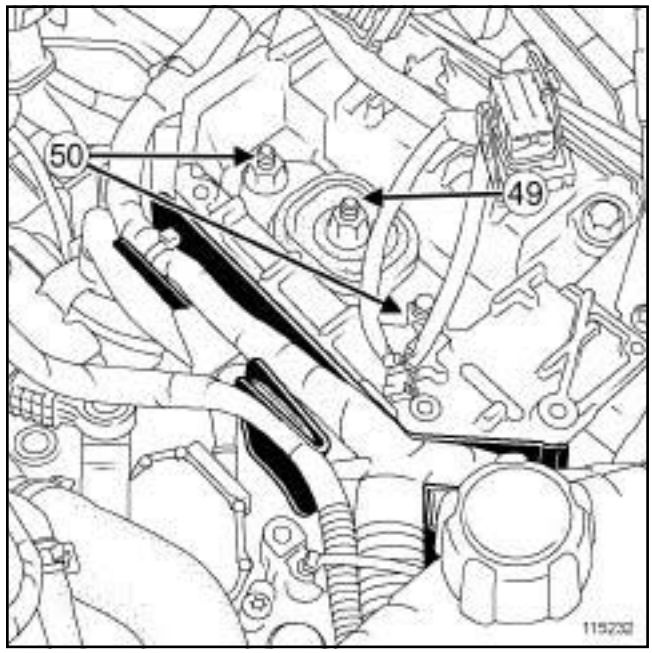
115035



❑ Remove the upper engine tie-bar.

115033

❑ Remove:

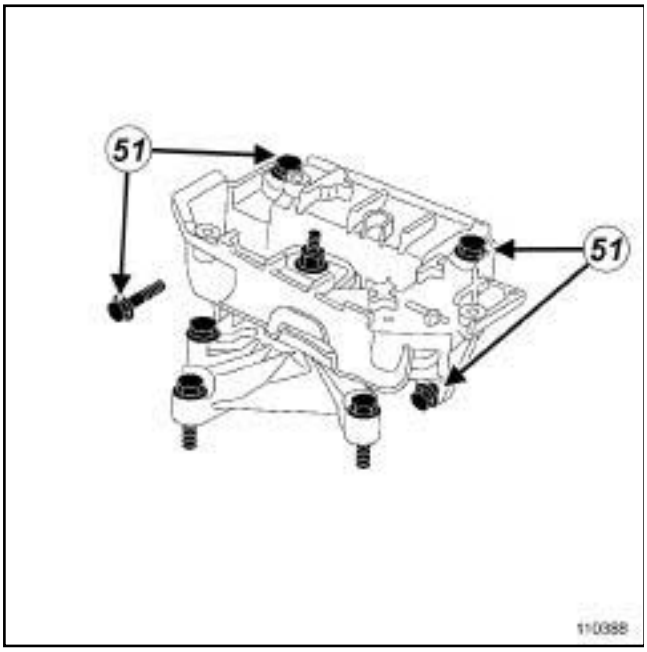


- the bolt (**46**) mounting the rubber mounting bush to the engine cover,
- the bolts (**47**) mounting the rubber mounting bush to the body.

115032

❑ Remove:

- the engine cover mounting bolts (**48**) ,
- the engine cover,
- the rubber mounting bush.



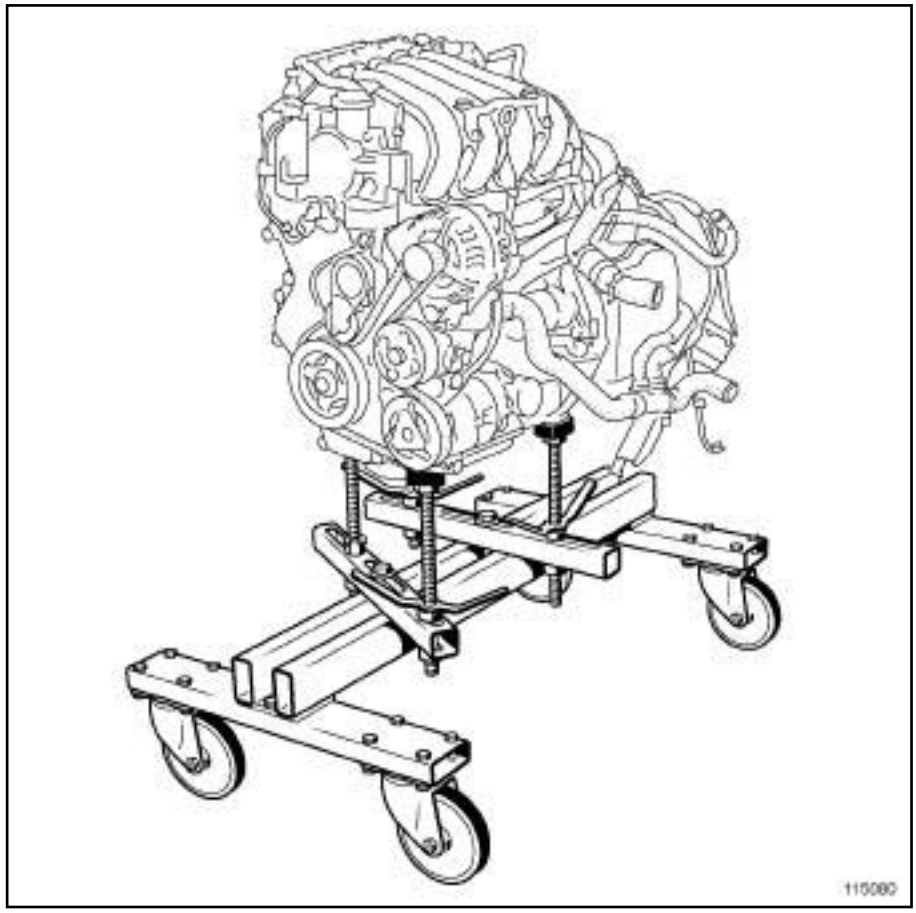
115232

❑ Separate the neck of the wiring harness from the gearbox support.

❑ Remove:

- the nut (**49**) mounting the rubber mounting bush to the gearbox cover,
- the rubber mounting bush mounting bolts (**50**) ,

- the rubber mounting bush.



110388

❏ Remove:

- the bolts (**51**) mounting the gearbox support on the body,
- the gearbox support.

❏ Gently move the engine towards the front of the vehicle.

M4R, and DP0

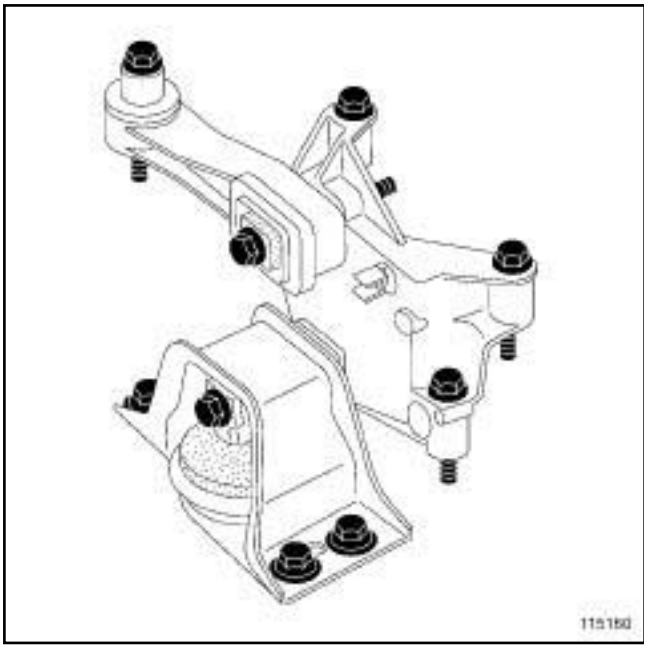
115080

❑ Lift the vehicle to remove the « engine-gearbox » assembly.

Note:

Check that no component obstructs the movement of the body around the « engine and gearbox » assembly.

REFITTING



I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Standard replacement**) (Technical Note 6020A, 10A, Engine and peripherals).

II - REFITTING PART CONCERNED

❑ Position the « engine - gearbox » assembly in the body.

M4R, and DP0

115160

❏ Fit:

- the rubber mounting bush,
- the engine cover.

❏ Pretighten:

- the engine cover mounting bolts,
- the bolts securing the rubber mounting bush to the body.

Note:

Allow the two parts to move freely.

❏ Fit the bolts securing the rubber mounting bush to the engine cover.

❏ Torque tighten and in order:

- the **engine cover mounting bolts (62 Nm)**,
- the **rubber mounting bush mounting bolts on the body (62 Nm)**,
- the **rubber mounting bush mounting bolt on the engine cover (105 Nm)**,
- the **upper engine tie-bar mounting bolts (105 Nm)**.

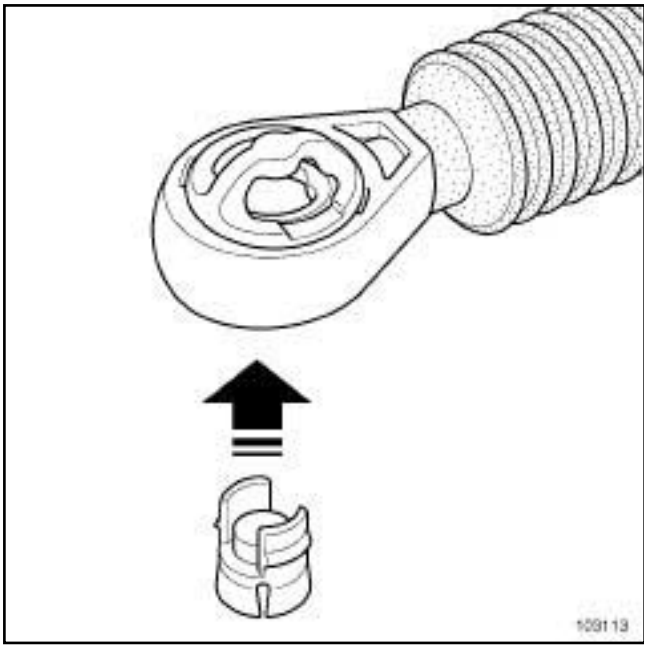
❏ Refit:

- the gearbox support,
- the mounting bolts securing the gearbox support to the body,
- the rubber mounting bush,
- the mounting studs securing the rubber mounting bush to the gearbox support,
- the mounting nut securing the rubber mounting bush to the gearbox cover.

❏ Torque tighten:

- the **gearbox support mounting bolts on the body (62 Nm)**,
- the **rubber mounting bush mounting bolts on the gearbox mounting (62 Nm)**,
- the **rubber mounting bush mounting nut on the gearbox (62 Nm)**.

III - FINAL OPERATION.



❏ Connect:

- the engine wiring harness,
- the air conditioning pipe unions,
- the cooling hoses,
- the air flowmeter connector,
- the fuel supply pipe,
- the petrol vapour rebreather pipe,
- the brake servo pipe.

❏ Clip:

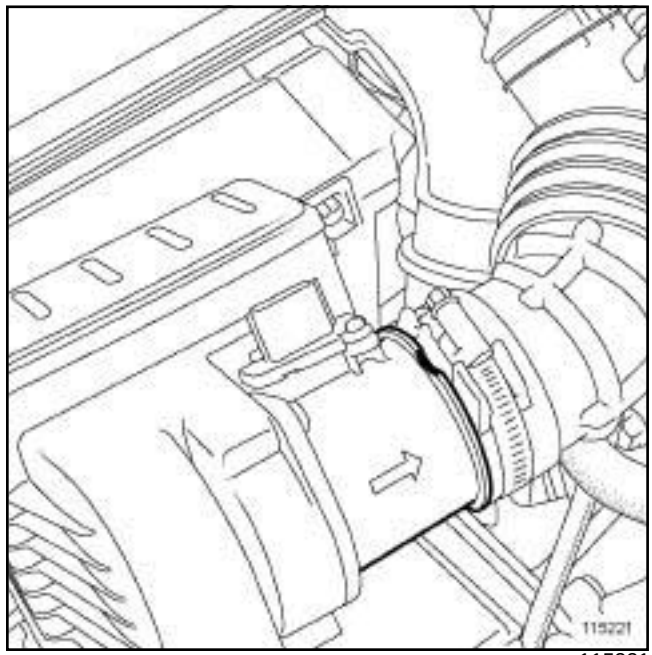
- the fuel supply pipe,
- the air flowmeter connector wiring harness.

M4R, and DP0

103113

❏ Be sure to replace the clip on the gearbox control cable ball joint each time it is removed.

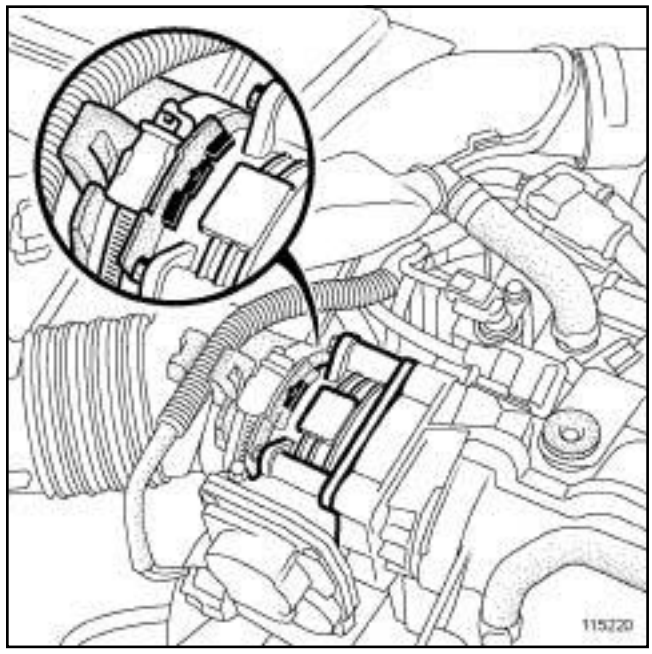
❏ Fit the gearbox control cable.



❏ The exhaust clamp seal must be replaced.

❏ Torque tighten:

- the **exhaust clamp mounting bolts (21 Nm)**,
- the **engine tie-bar mounting bolt on the engine (180 Nm)**,
- the **engine tie-bar mounting bolt on the sub-frame (105 Nm)**.



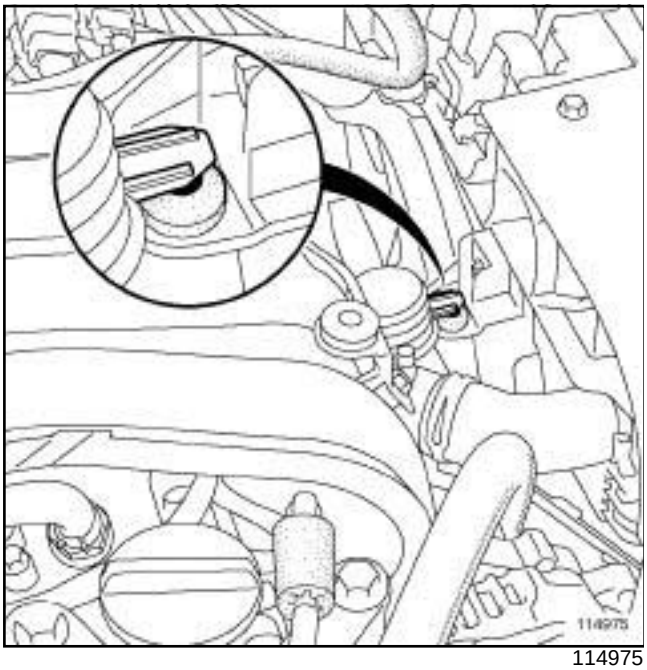
❏ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the driveshafts (see **Front left-hand driveshaft: Removal - Refitting**) and (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

115221

❏ Fit the air inlet duct on the air flowmeter following the assembly marking.

115220

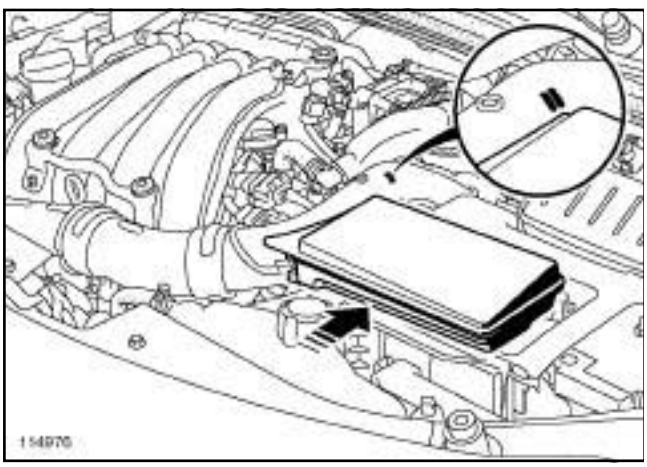


❏ Fit the air inlet duct on the motorised throttle valve following the assembly marking.

❏ Connect the oil vapour rebreather pipe to the rocker cover.

❏ Torque tighten the **air inlet duct clips (6 Nm)**.

M4R, and DP0



❏ Clip the wiring harness onto the air inlet duct.

114975

❏ Before refitting the air inlet hose, check that the air resonator upper mounting at the front end is correctly clipped at .

❏ Refit the air intake sleeve.

114976

❏ Push the air resonator towards the rear of the vehicle so that the corner of the air resonator is between the two lines marked on the air inlet hose.

❏ Press on the air resonator to fit it into the battery cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Perform the following operations:

- fill the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (MR 392, 23A, Automatic transmission),
- fill the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).
- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the cooling system (see **Cooling system: Bleed**) .

❏ Refit the engine cover.

F4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station
Diagnostic tool

Tightening torques ▽	
exhaust manifold nuts	**30 N.m**

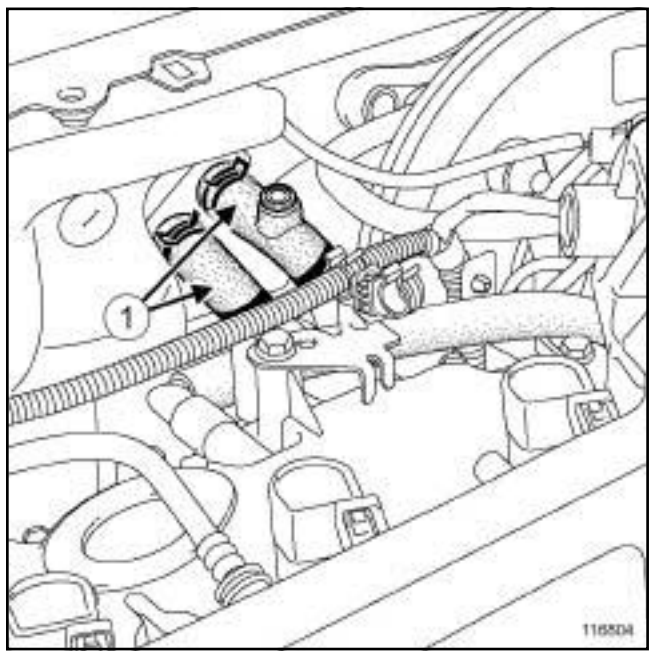
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

IMPORTANT
During this operation, secure the vehicle to the lift with a strap to prevent it from becoming unbalanced.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

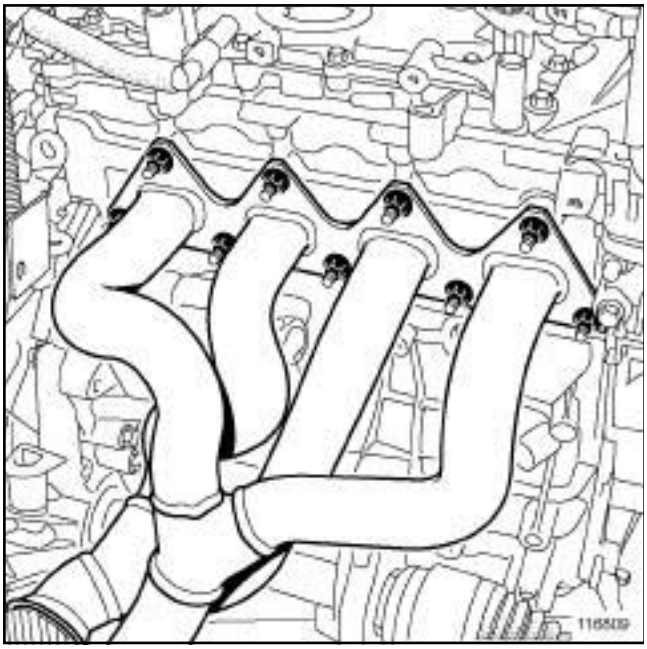


❑ Remove the engine undertray.

❑ Perform the following operations:

- drain the air conditioning circuit using the **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning),
- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- drain the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

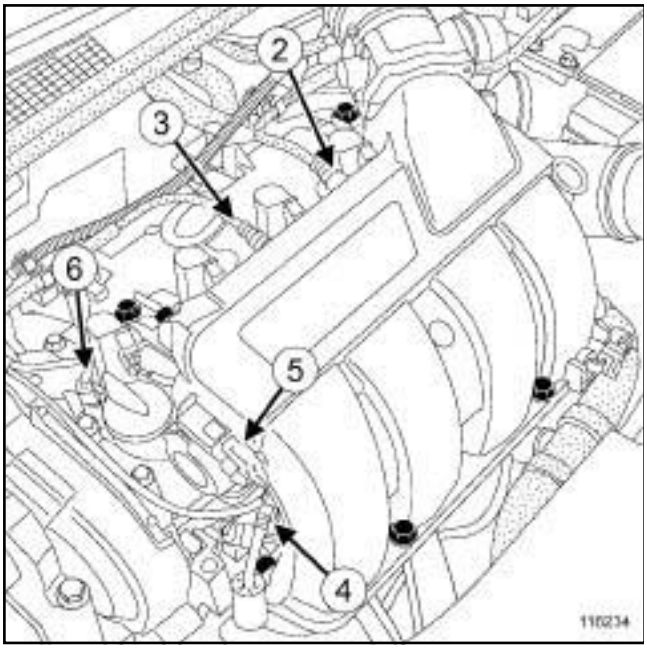
❑ Remove:



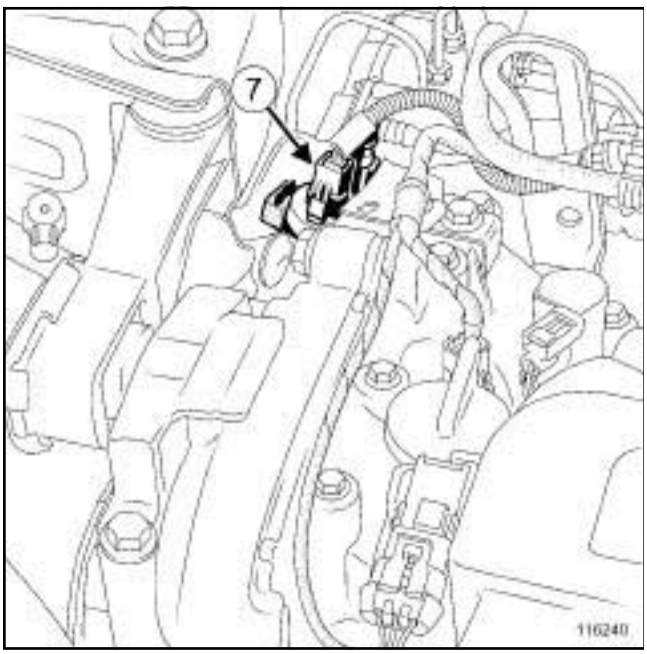
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the soundproofing unit,
- the battery tray mounting (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery tray).

116804

❑ Disconnect the hoses (**1**) from the heater radiator using the **(Mot. 1448)**.



F4R

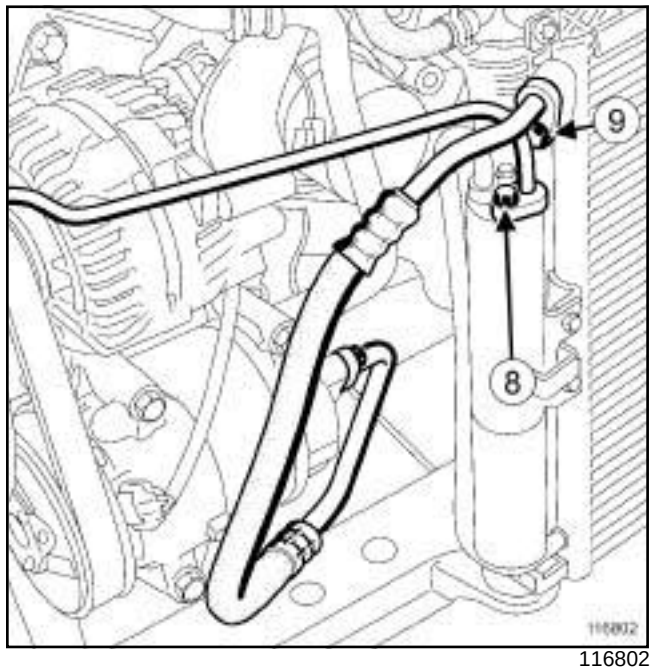


116809

❑ Remove the exhaust manifold nuts.

F4R

116234



116240

❑ Disconnect:

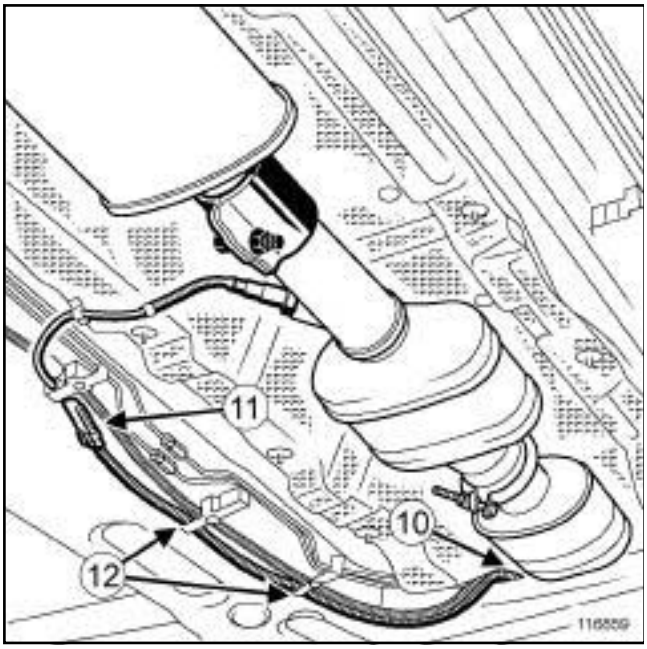
- the brake servo pipe (**2**) on the inlet distributor side,
- the petrol vapour rebreather pipe (**3**) on the inlet distributor side,
- the fuel supply pipe (**4**) from the injector rail,
- the connector (**5**) from the inlet air pressure sensor,
- the camshaft dephaser solenoid valve connector (**6**) ,
- the petrol vapour recirculation solenoid valve connector (**7**) .

❑ Move the wiring harness to one side.

116802

❑ Remove:

- the bolt (**8**) from the «expansion valve - condenser » connecting pipe,
- the « compressor - condenser » connecting pipe bolt (**9**) .



❑ Disconnect:

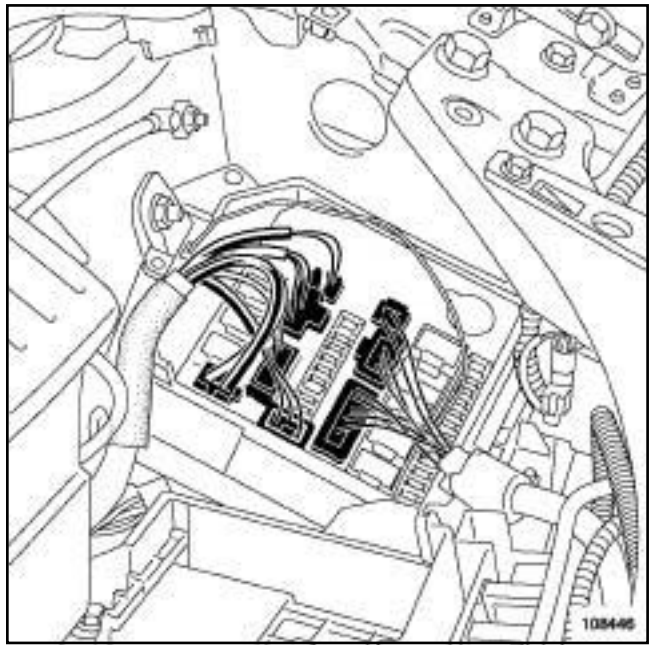
- the « expansion valve - condenser » connecting pipe on the condenser side,
- the « compressor - condenser » connecting pipe on the condenser side,
- the cooling radiator hose on the cooling radiator using the **(Mot. 1448)**,
- the fan assembly connectors.

❑ Remove:

- the « engine cooling fan - radiator - condenser - expansion bottle » assembly,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the driveshafts (see **Front left-hand driveshaft: Removal - Refitting**) and (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts).

F4R

116859

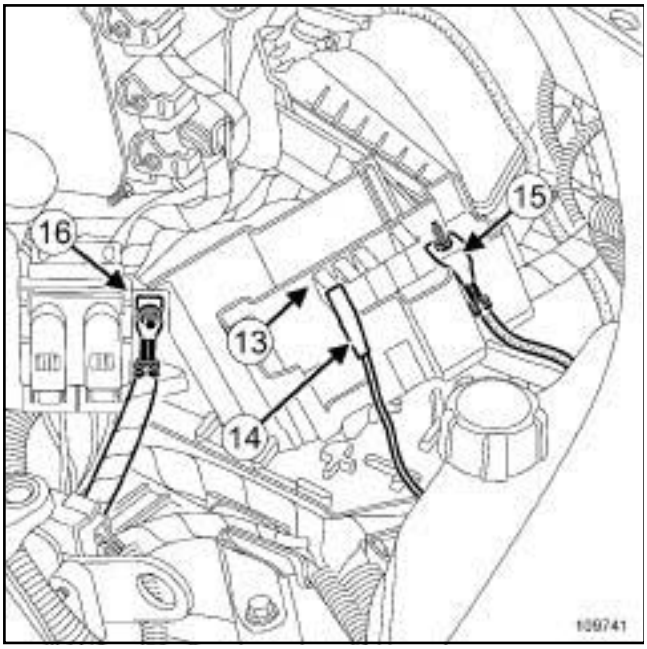


❏ Disconnect:

- the upstream oxygen sensor connector (**10**) ,
- the downstream oxygen sensor connector (**11**) .

❏ Unclip the wiring harness at (**12**) from the downstream oxygen sensor.

Note:

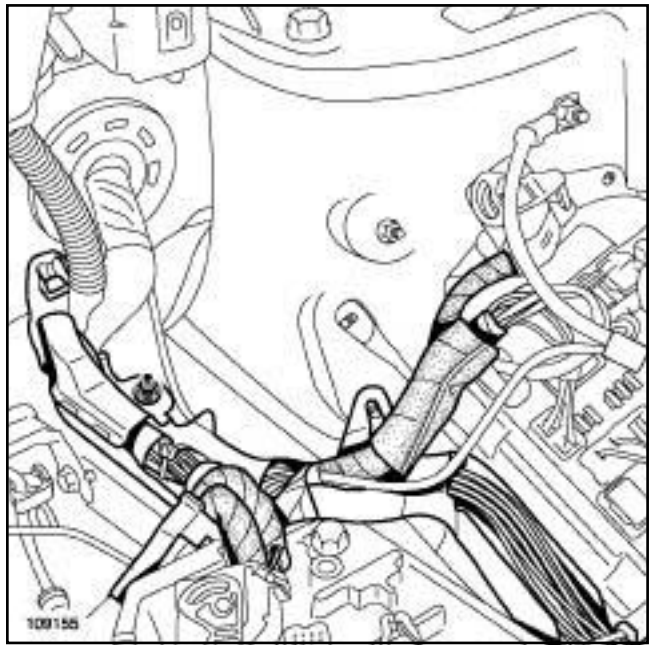


with the wiring harness sitting on the engine, it is necessary to move the heat shields aside when removing the engine.

108446

❏ Disconnect:

- the injection computer connectors,
- the connectors in the connection unit.

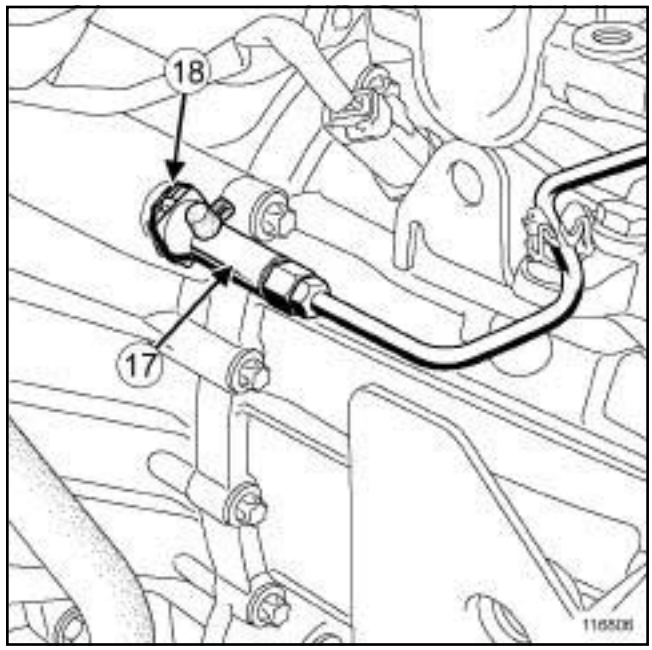


109741

❏ Disconnect:

- the fuse (**13**) ,
- the fuse holder (**14**) from the fuse board,
- the supply cable (**15**) from the fuse board,
- the supply cable (**16**) from the battery protection fuse box.

❏ Remove:



- the petrol injection computer,
- the earth nut on the side member,
- the earth nut on the left-hand wheel arch.

109155

❏ Cut the adhesive tape in order to move the wiring harness away from its channel.

❏ Move the engine wiring away from the channel

116806

❏ Disconnect the clutch control duct (**17**) by pushing the clip (**18**) and moving it aside.

❏ Remove the gearbox controls.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Position the **(Mot. 1390)**.

❏ Remove:

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Move the « engine-gearbox » assembly forward positioned on the **(Mot. 1390)**.

❏ Raise the vehicle using a two-post lift to remove the « engine-gearbox » assembly from the engine compartment.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ For standard engine replacements (see **Standard replacement**) (Technical Note 6027A, 10A, Engine and peripherals).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Position the « engine - gearbox » assembly in the engine compartment.

❏ Refit:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .

❏ Remove the tool **(Mot. 1390)**.

III - FINAL OPERATION

❏ Connect the clutch control duct.

❏ Bleed the clutch control.

❏ Refit the gearbox controls.

❏ Fit the wiring harness.

❏ Refit:

- the earth nut on the left-hand wheel arch,
- the earth nut on the side member,
- the petrol injection computer.

❏ Connect:

- the injection computer connectors,
- the connectors in the connection unit.

❏ Refit the engine compartment connection unit cover.

❏ Position the engine wiring harness in its channel.

❏ Attach the wiring harness using **ADHESIVE TAPE** on its channel.

❏ Connect:

- the supply cable to the battery protection fuse box,
- the supply cable to the fuse board,
- the fuse holder to the fuse board,
- the fuse .

❏ Pass the downstream oxygen sensor wiring harness behind the heat shield.

❏ Connect:

- the upstream oxygen sensor connector,
- the downstream oxygen sensor connector.

❏ Clip the downstream oxygen sensor wiring harness into place.

F4R

❏ Refit:

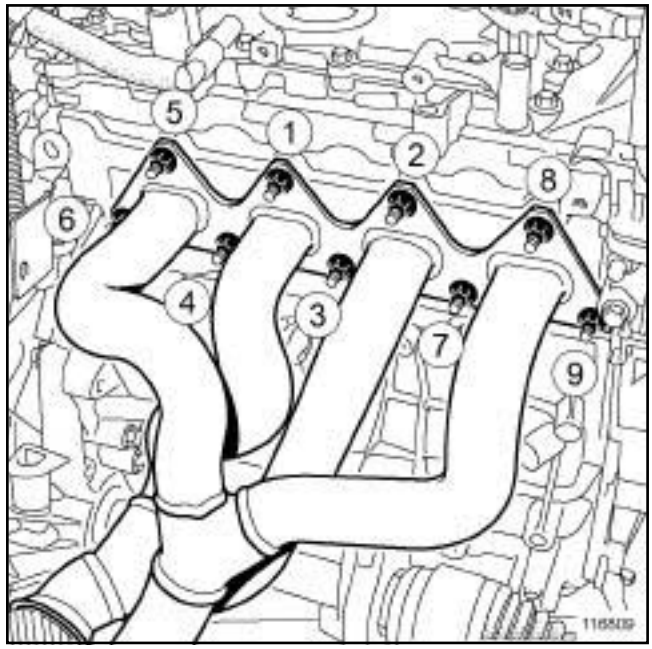
- the driveshafts (see **Front left-hand driveshaft: Removal - Refitting**) and (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the « engine cooling fan - radiator - condenser» assembly.

❏ Connect:

- the cooling radiator upper and lower hoses using the **(Mot. 1448)**,
- the engine cooling fan assembly connectors,
- the cooling radiator hose to the cooling radiator using the **(Mot. 1448)**,
- the « compressor - condenser » connecting pipe on the condenser side,
- the « expansion valve - condenser » connecting pipe on the condenser side.

❏ Refit:

- the bolt (**9**) on the « compressor - condenser » connecting pipe,
- the bolt (**8**) of the « expansion valve - condenser » connecting pipe.



❏ Connect:

- the petrol vapour recirculation solenoid valve connector.
- the camshaft dephaser solenoid valve connector,
- the inlet air pressure sensor connector,
- the fuel supply pipe on the injector rail,
- the petrol vapour rebreather pipe on the inlet distributor side,
- the brake servo pipe on the inlet distributor side

❏ Fit:

- a new exhaust manifold seal on the cylinder head,
- the exhaust manifold on the cylinder head.

❏ Refit the exhaust manifold nuts.

116809

❏ Torque tighten in order the **exhaust manifold nuts (30 N.m)**.

❏ Connect the heating radiator hoses using the **(Mot. 1448)**.

❏ Refit:

- the battery tray mounting (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery tray),
- the soundproofing unit,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- fill up the gearbox oil (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,

- bleed the cooling circuit,
- fill the air conditioning circuit using the **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

❏ Using the **Diagnostic tool**, check that there are no faults stored by the computer, and clear them if necessary.

❏ Check:

- that there are no leaks,
- using the **Diagnostic tool**, that there are no faults stored by the computer, and clear them if necessary.

❏ Refit the engine undertray.

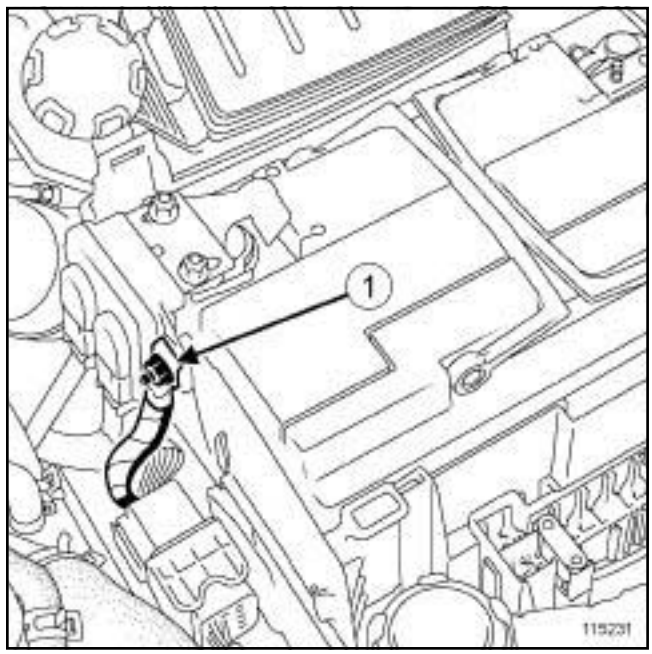
❏ Carry out a road test to check that the vehicle is in good working order.

M4R, and TL4

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
side member earth wiring nuts	**8 N.m**
manual gearbox earth wiring bolt	**21 N.m**
Protection and Switching Unit cover bolts	**4 N.m**
nut of the supply wiring for the power supply fuse unit	**8 N.m**
exhaust flange bolts	**21 N.m**
compressor-intermediate pipe connecting pipe bolt on the compressor	**8 N.m**
dehydrator reservoir - expansion valve connecting pipe bolt on the dehydrator reservoir	**8 N.m**
compressor-condenser connecting pipe bolt on the compressor	**8 N.m**
compressor-condenser connecting pipe bolt on the compressor	**8 N.m**
air filter box air outlet pipe clips	**6 N.m**
protective fuse mounting wiring nut	**6 N.m**



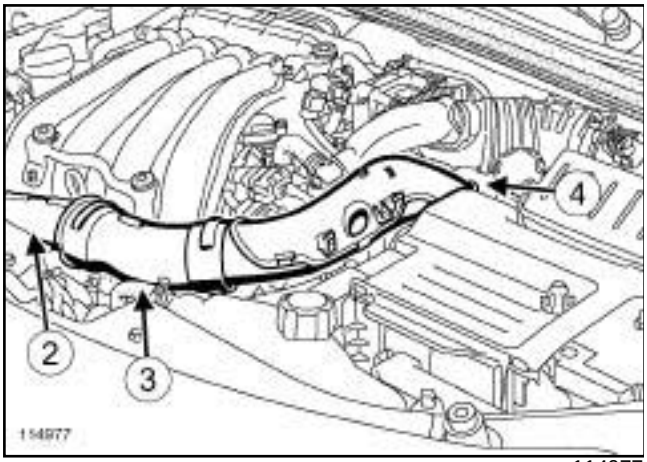
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove the front engine cover.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

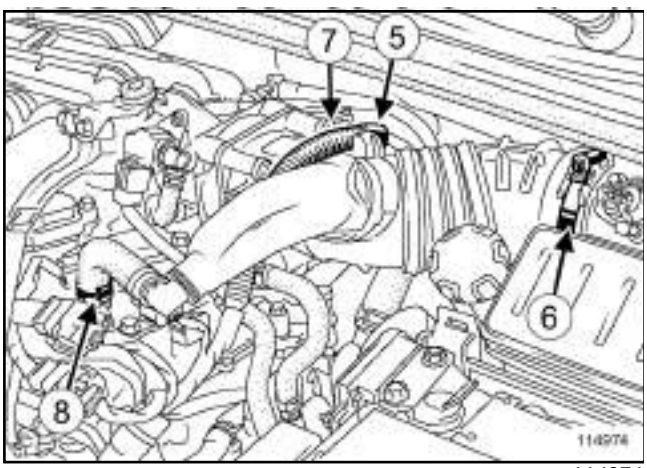


115231

❑ Remove:

- the nut (**1**) from the protective fuse mounting wiring,
- the protective fuse mounting wiring,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R, and TL4



114977

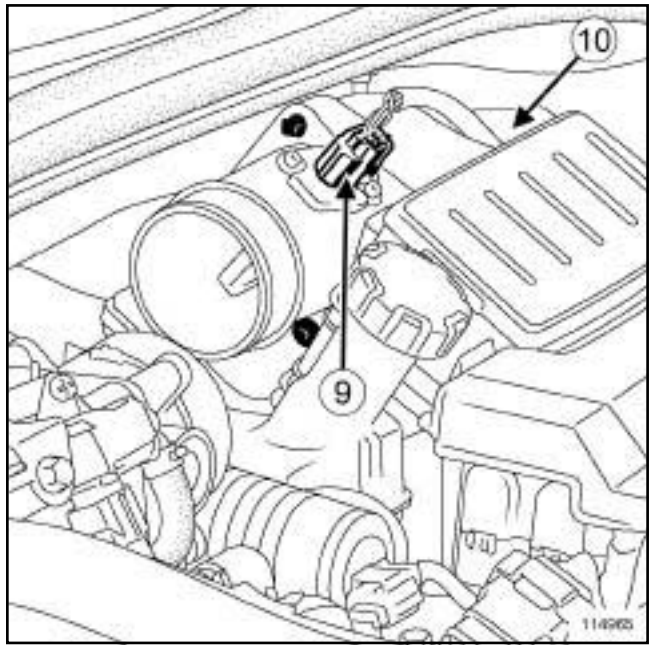
❏ Disconnect the air filter unit air inlet pipe:

- from the front end panel at (**2**) ,
- from the air resonator on the front end panel at (**3**) ,
- from the air filter unit at (**4**) .

❏ Remove the air pipe at the air filter unit inlet.

114974

❏ Unclip the wiring from the air filter unit air outlet pipe at (**5**) .



❏ Undo the clips on the air filter unit air outlet pipe:

- on the air flow sensor (**6**) ,
- on the motorised throttle valve (**7**) .

❏ Separate the clip (**8**) of the oil vapour rebreathing hose on the rocker cover using the tool **(Mot. 1448)**.

❏ Disconnect the oil vapour rebreathing hose on the rocker cover.

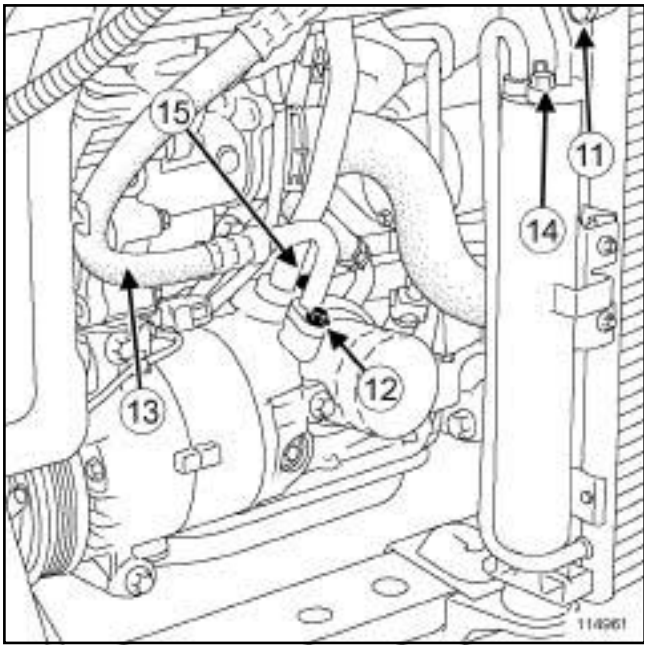
❏ Remove the air outlet pipe from the air filter box.

114965

❏ Disconnect the air flowmeter connector (**9**) .

❏ Unclip the air flowmeter connector wiring (**10**) .

❏ Remove the engine undertray.



❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).
- the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❏ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the headlights (see **Headlight: Removal - Refitting**) (80B, Headlights),
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

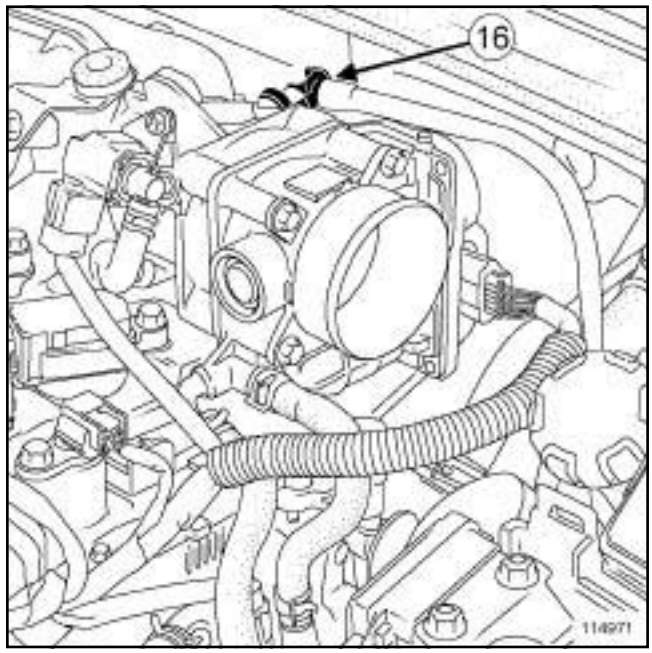
M4R, and TL4

114961

❏ Remove:

- the bolt (**11**) from the compressor-condenser connecting pipe, on the condenser,
- the bolt (**12**) from the compressor-condenser connecting pipe, on the compressor,
- the compressor-condenser connecting pipe (**13**) ,
- the bolt (**14**) from the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

❏ Disconnect the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

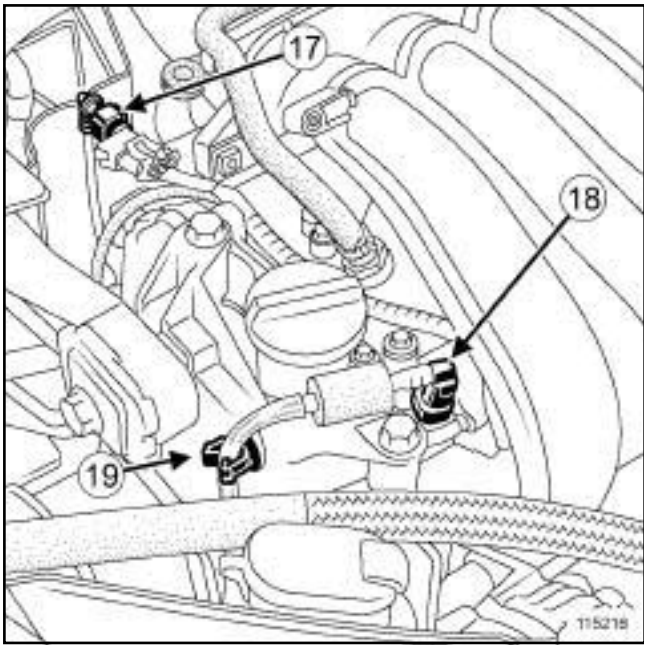


❏ Remove the bolt (**15**) from the compressor-intermediate pipe connecting pipe on the compressor.

❏ Disconnect the compressor-intermediate pipe connecting pipe on the compressor.

WARNING
Plugs must be fitted on the hoses to prevent moisture from entering the system.

❏ Remove:

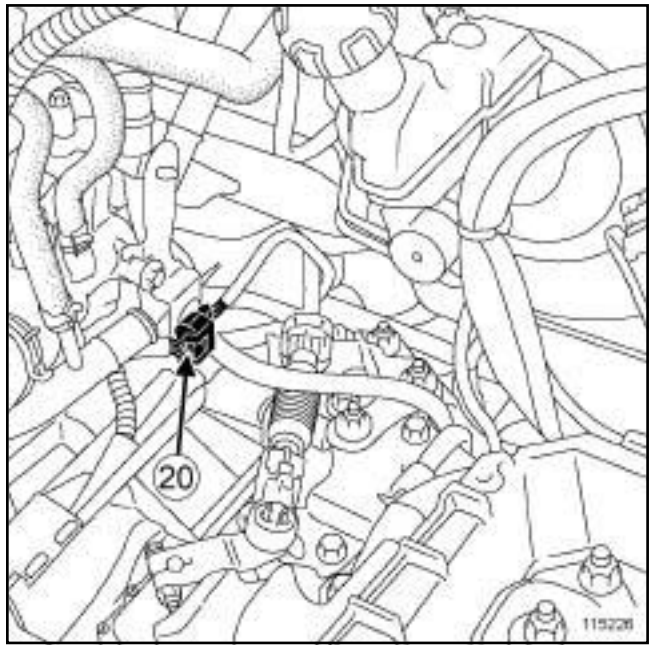


- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

114971

❏ Disconnect the brake servo pipe union (**16**) from the inlet distributor.

M4R, and TL4



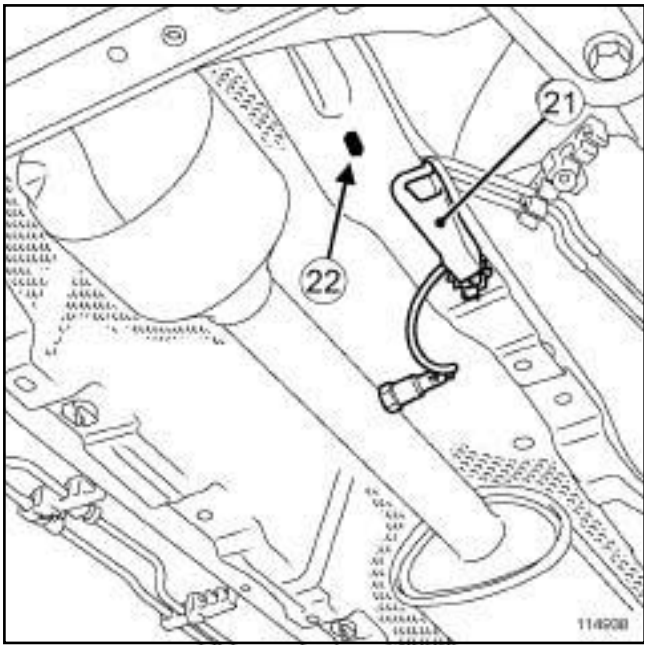
115216

❏ Disconnect:

- the petrol vapour rebreather pipe (**17**) ,
- the fuel supply pipe (**18**) .

WARNING
Protect sensitive areas from fuel spillage.

❏ Unclip the fuel supply pipe at (**19**) .



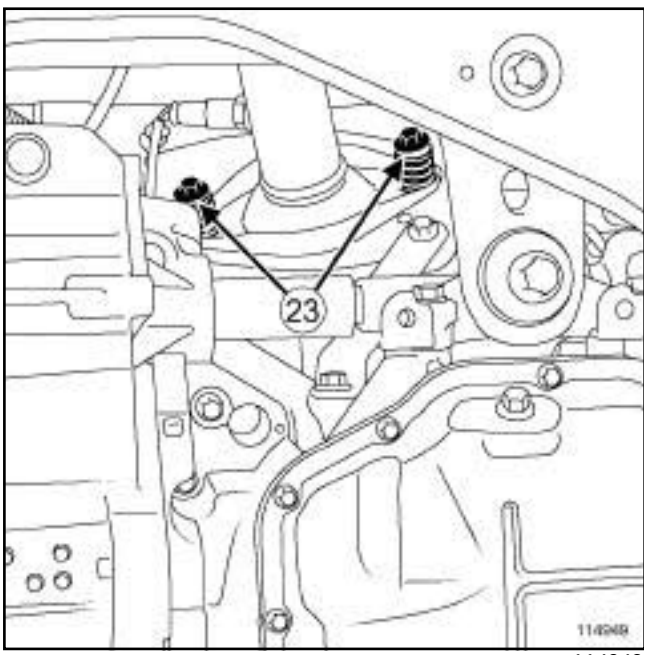
115226

❏ Disconnect the upstream oxygen sensor connector (**20**) .

❏ Move the connector away from the upstream oxygen sensor.

M4R, and TL4

114938



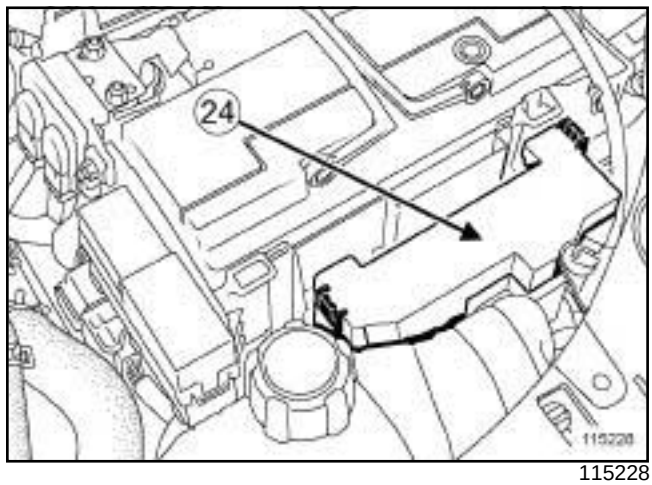
❏ Remove the plastic cover (**21**) .

❏ Detach the downstream oxygen sensor connector at (**22**) .

❏ Disconnect the downstream oxygen sensor connector.

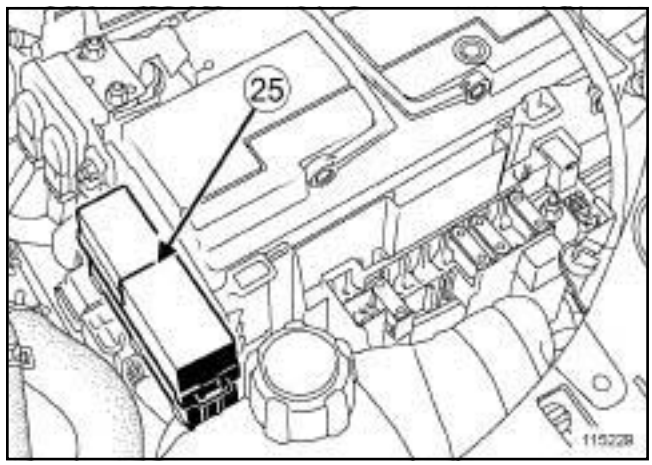
❏ Unclip the downstream oxygen sensor wiring from the power-assisted steering box.

❏ Feed the downstream oxygen sensor wiring into the engine compartment.



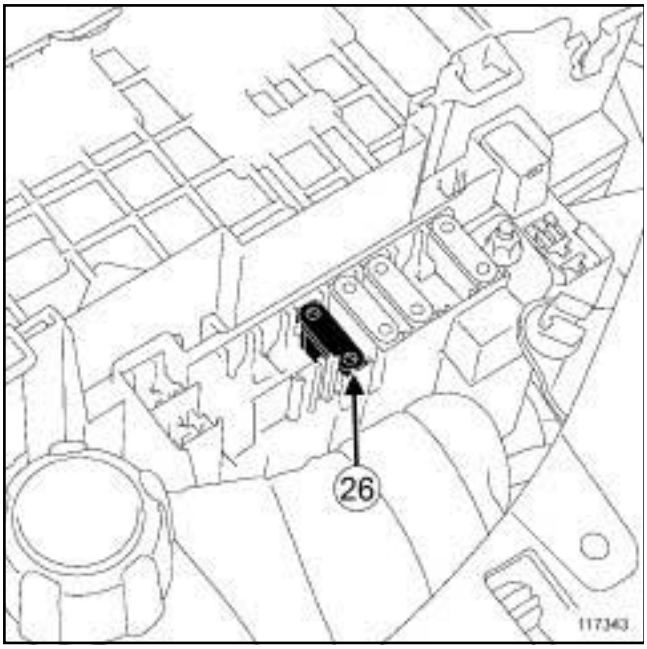
114949

❏ Remove:



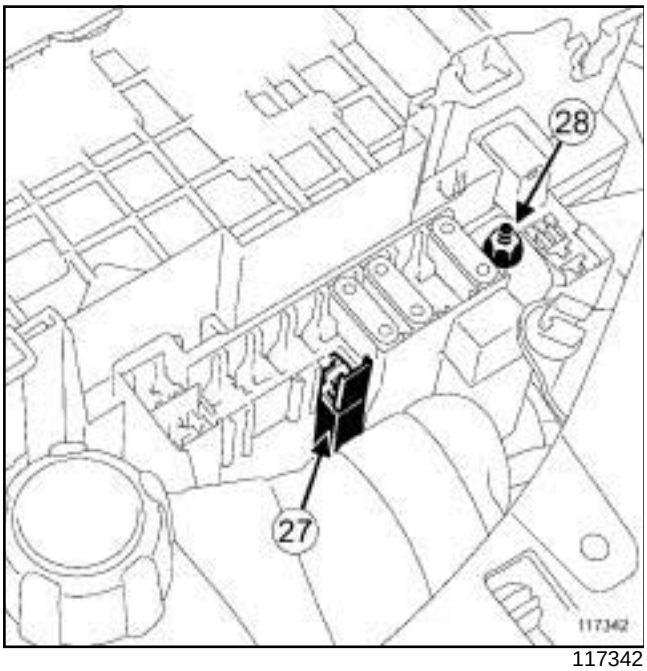
- the bolts (**23**) from the exhaust flange,
- the exhaust flange seal.

❏ Remove the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .



115228

❏ Remove the cover (**24**) from power supply fuse unit.

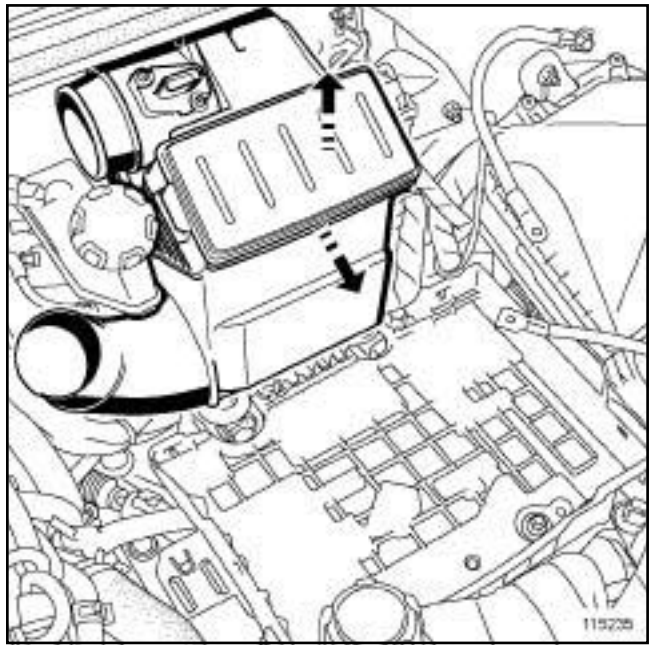


115229

❏ Unclip the optional relay unit (**25**) .

117343

❏ Remove the fuse (**26**) .

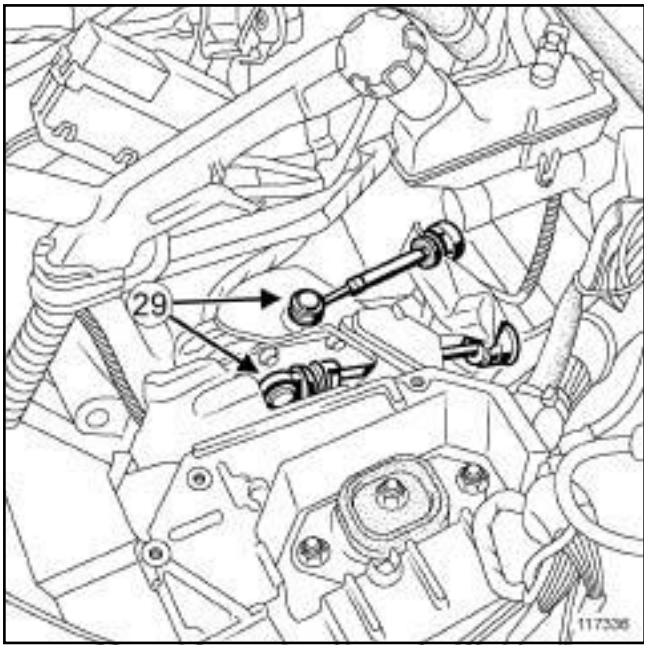


117342

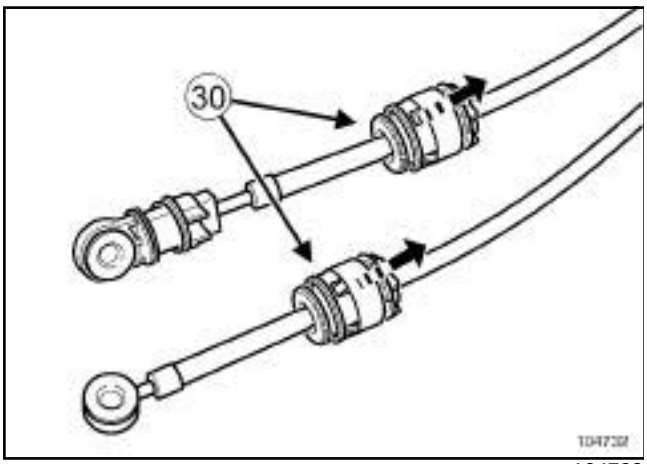
❏ Unclip the fuse holder (**27**) .

❏ Remove the nut (**28**) from the supply wiring of the power supply fuse unit.

❏ Disconnect the supply wiring from the power supply fuse unit.



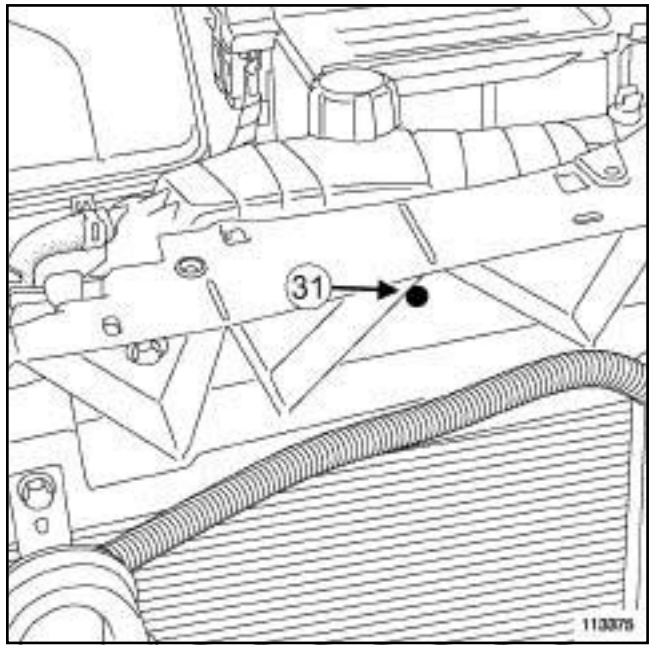
❏ Remove the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery).



115235

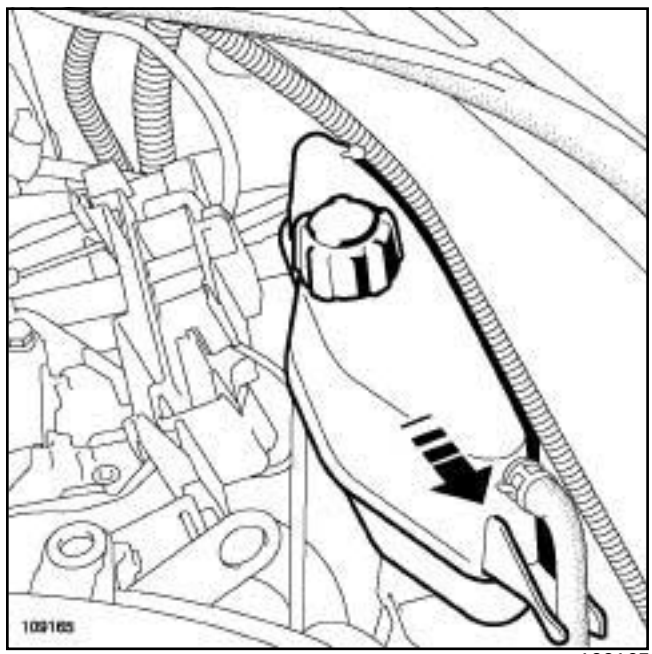
❏ Remove the air filter unit in the direction of the arrows.

M4R, and TL4



117336

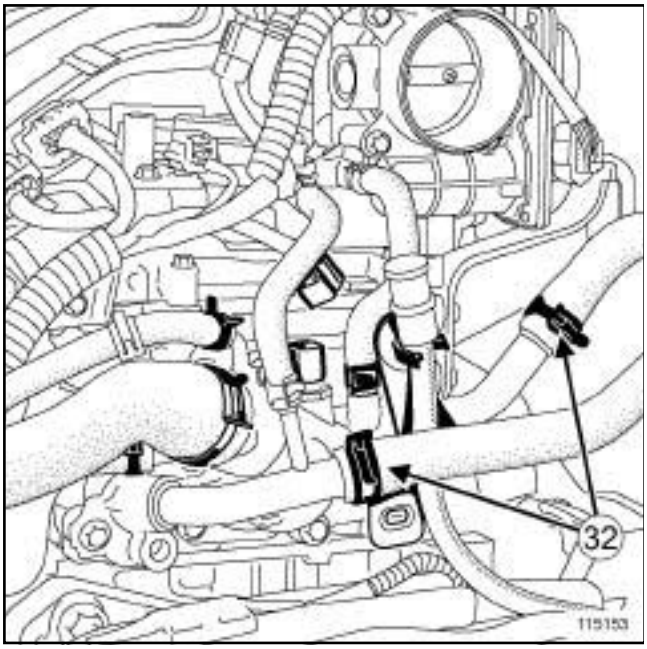
104732



❑ Unclip:

- the control cables (**29**) on the gearbox using an open-ended spanner,
- the control cable sleeve stops (**30**) on the gearbox.

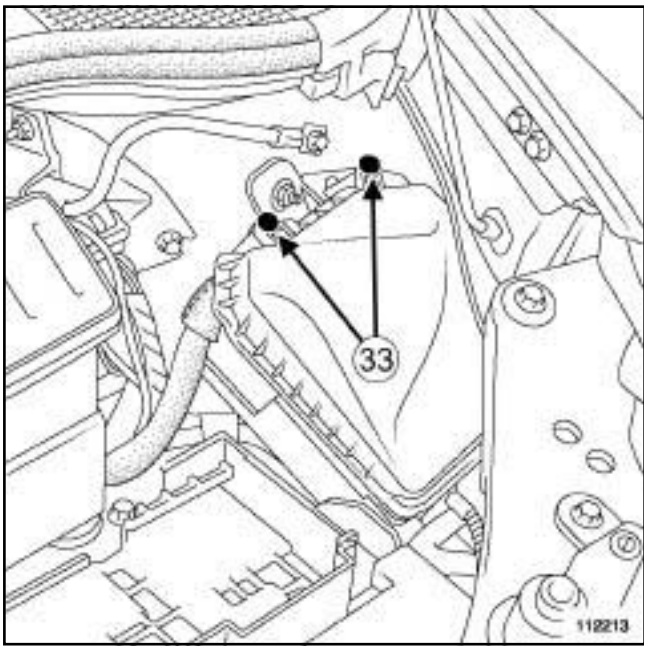
113375



❑ Remove the clip (**31**) from the expansion bottle.

109165

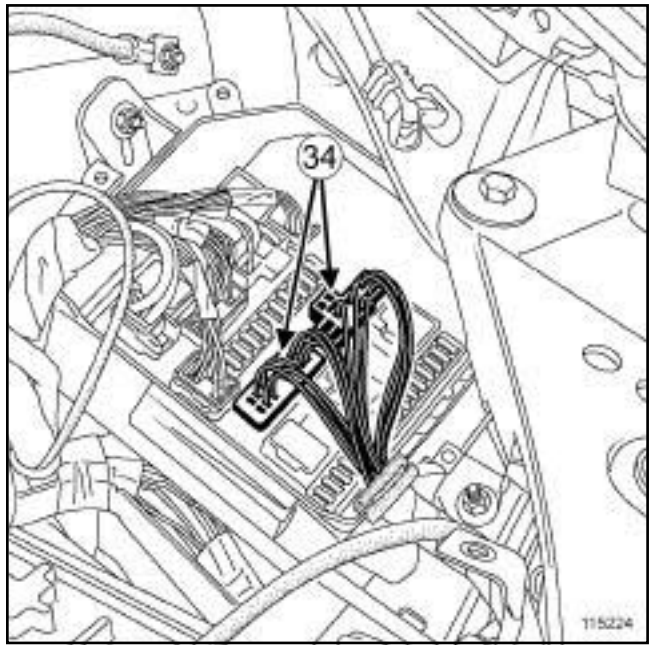
❑ Move the expansion bottle away from its housing in the direction of the arrow.



M4R, and TL4

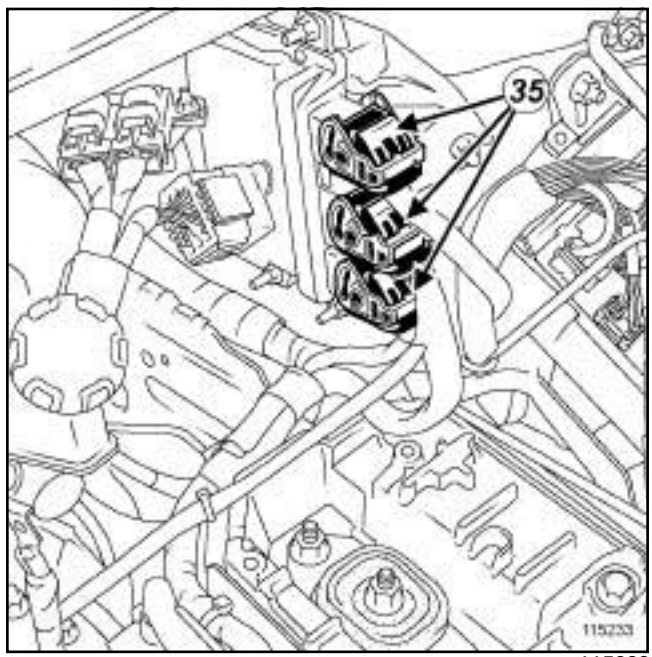
115153

❏ Separate the clips (**32**) on the passenger compartment heater hoses using the tool **(Mot. 1448)**.



❏ Disconnect the passenger compartment heater hoses.

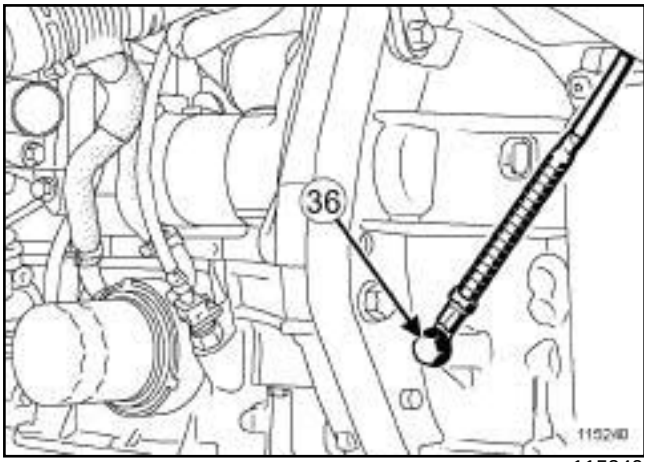
112213



❏ Remove:

- the bolts (**33**) from the Protection and Switching Unit cover,
- the Protection and Switching Unit cover.

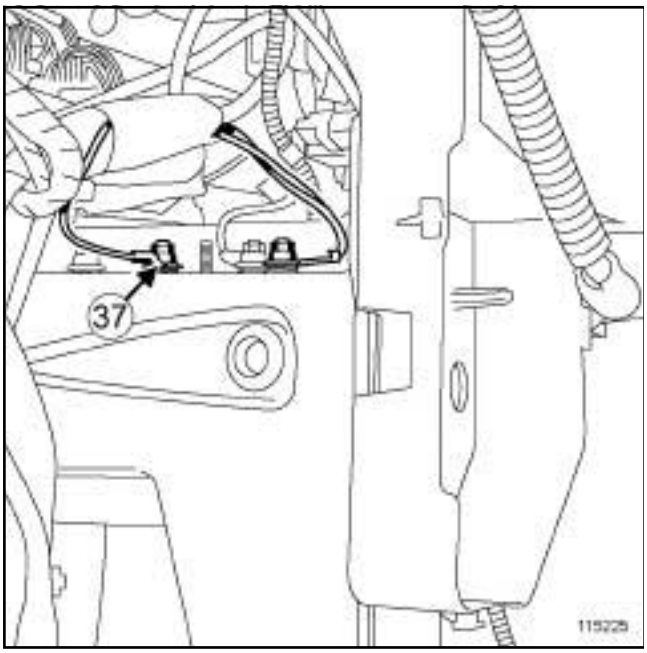
115224



❏ Disconnect the engine wiring connectors (**34**) from the Protection and Switching Unit.

115233

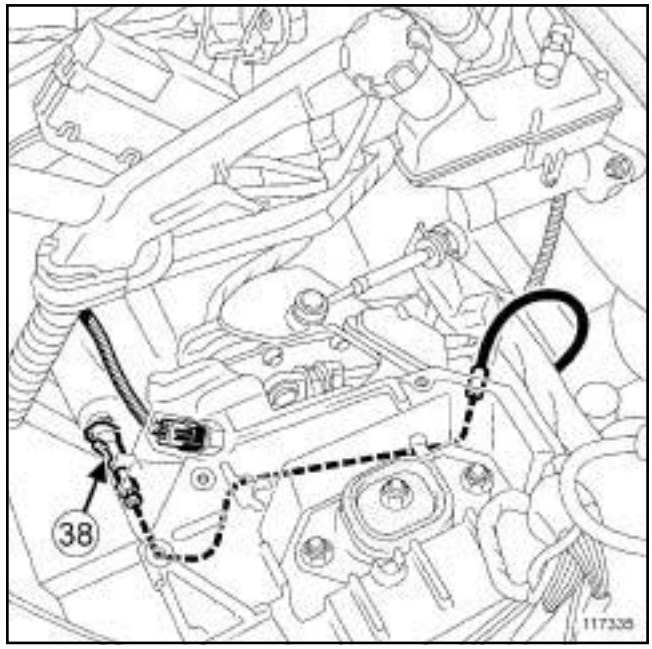
❏ Disconnect the injection computer connectors (**35**) .



M4R, and TL4

115240

❑ Remove:

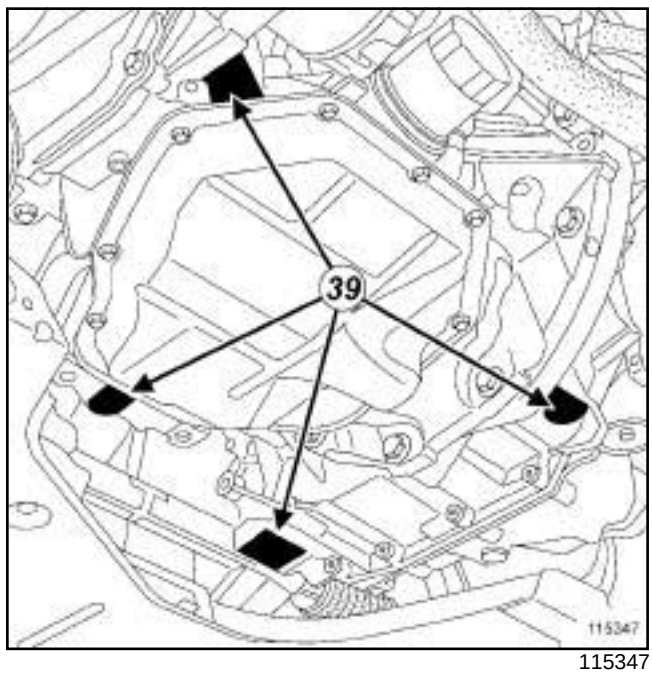


- the bolt (**36**) from the manual gearbox earth wiring.
- the manual gearbox earth wiring.

115225

❑ Remove the nut (**37**) from the side member earth wiring.

❑ Move the earth wiring away from the side member.

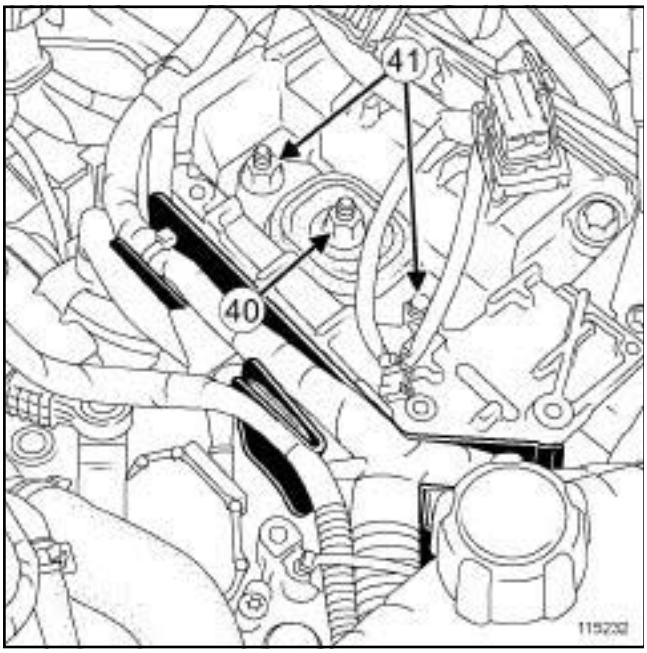


117335

❑ Push on the clip of the hydraulic clutch control pipe.

❑ Disconnect the hydraulic clutch control pipe (**38**) .

❑ Unclip the hydraulic clutch control pipe.



115347

❑ Support the **(Mot. 1390)** on the « engine - gearbox » assembly marks.

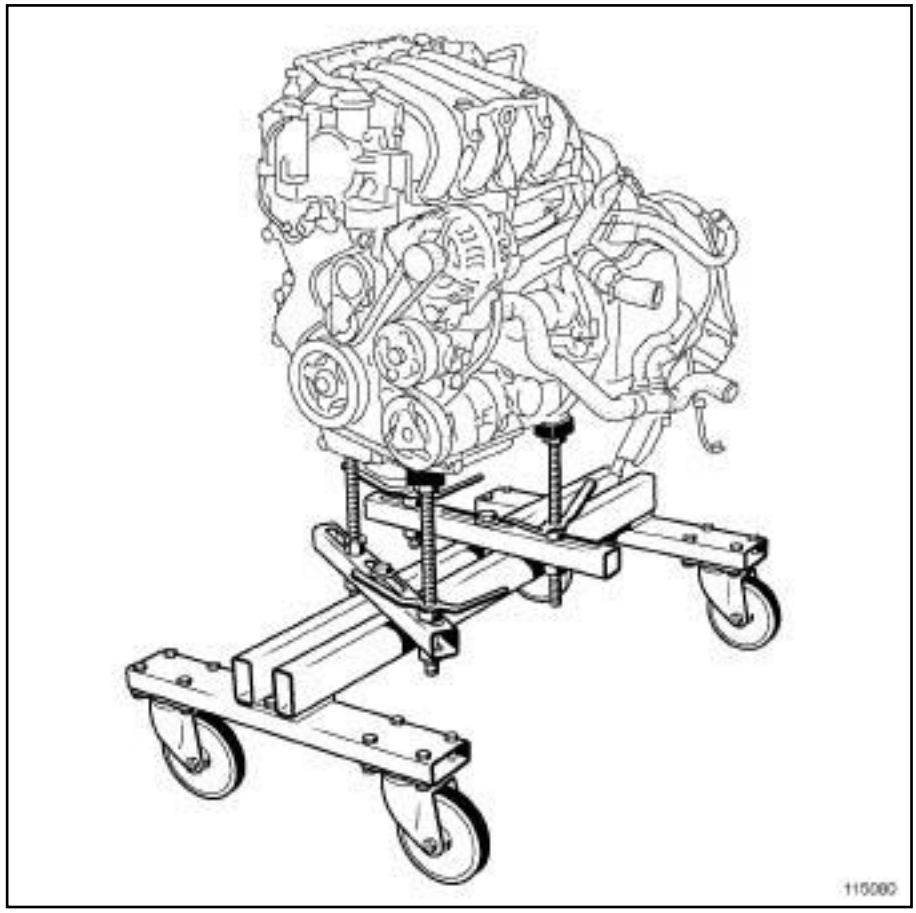
M4R, and TL4

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

115232

❏ Separate the neck of the electrical wiring from the gearbox support.



❏ Remove:

- the left-hand suspended engine mounting shaft nut (**40**) ,
- the nuts (**41**) from the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting rubber pad.

Note:

Tap the bolt with a copper hammer, if necessary.

M4R, and TL4

115080

❑ Remove the « engine and gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Engine: New replacement)** (Technical Note 6020A, 10A, Engine and peripherals).

❑ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the « engine - gearbox » assembly in the body.

❑ Refit:

- the left-hand suspended engine mounting rubber pad,
- the nuts for the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting shaft nut.

❑ Torque tighten (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) .

❑ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Lift the **(Mot. 1390)** from the « engine - gearbox» assembly.

III - FINAL OPERATION

❑ Connect the hydraulic clutch control pipe.

❑ Clip on the hydraulic clutch control pipe.

❑ Fit the side member earth wiring.

❑ Refit the side member earth wiring nuts.

❑ Torque tighten the **side member earth wiring nuts (8 N.m)**.

❑ Refit:

- the manual gearbox earth wiring,

M4R, and TL4

- the bolt to the manual gearbox earth wiring.

❏ Torque tighten the **manual gearbox earth wiring bolt (21 N.m)**.

❏ Connect:

- the injection computer connectors,
- the engine wiring connectors to the Protection and Switching Unit.

❏ Refit:

- the Protection and Switching Unit cover,
- the bolts on the Protection and Switching Unit cover.

❏ Torque tighten the **Protection and Switching Unit cover bolts (4 N.m)**.

❏ Connect the passenger compartment heater hoses.

❏ Fit:

- the passenger compartment heater hose clips,
- the expansion bottle into its housing.

❏ Refit the clip to the expansion bottle.

❏ Clip:

- the control cables onto the gearbox using an open-ended spanner,
- the gearbox control cable sleeve stops onto the gearbox.

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit.

❏ Connect the air flowmeter connector.

❏ Clip on the air flowmeter connector wiring.

❏ Connect the supply wiring of the power supply fuse unit.

❏ Refit the nut of the supply wiring for the power supply fuse unit.

❏ Torque tighten the **nut of the supply wiring for the power supply fuse unit (8 N.m)**.

❏ Clip in the fuse holder.

❏ Refit:

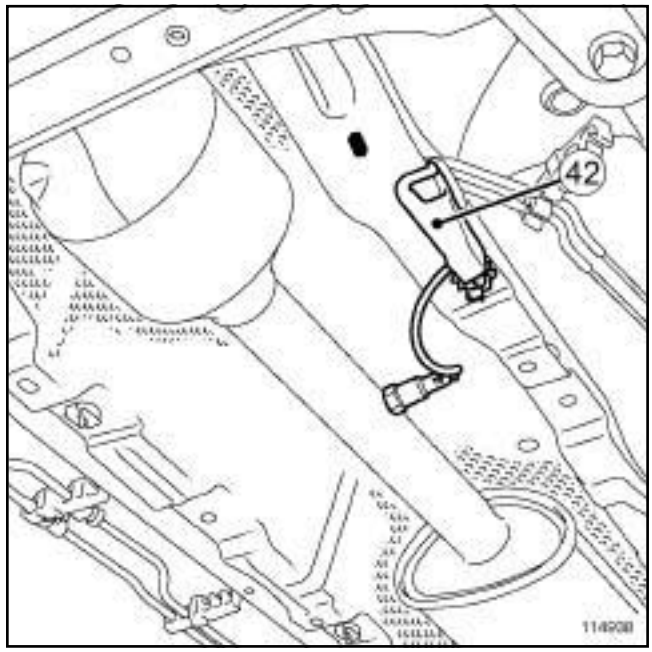
- the fuse,
- the cover of the power supply fuse unit.

❏ Clip on the optional relay unit.

❏ Refit the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

❏ Tighten to torque the (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**)

❏ Refit:



- a new exhaust flange seal,
- the exhaust flange bolts.

❏ Torque tighten the **exhaust flange bolts (21 N.m)**.

❏ Clip the downstream oxygen sensor wiring onto the power-assisted steering box.

❏ Connect the downstream oxygen sensor connector.

❏ Clip the downstream oxygen sensor connector.

114938

❏ Refit the plastic cover (**42**) .

❏ Connect:

- the upstream oxygen sensor connector,
- the brake servo pipe to the brake servo,
- the petrol vapour rebreathing pipe,
- the fuel supply pipe.

❏ Clip on the fuel supply pipe.

❏ Refit:

- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the air conditioning pipes,
- the air conditioning pipe bolts.

❑ Connect the compressor-intermediate pipe connecting pipe on the compressor.

❑ Refit the bolt to the compressor-intermediate pipe connecting pipe on the compressor.

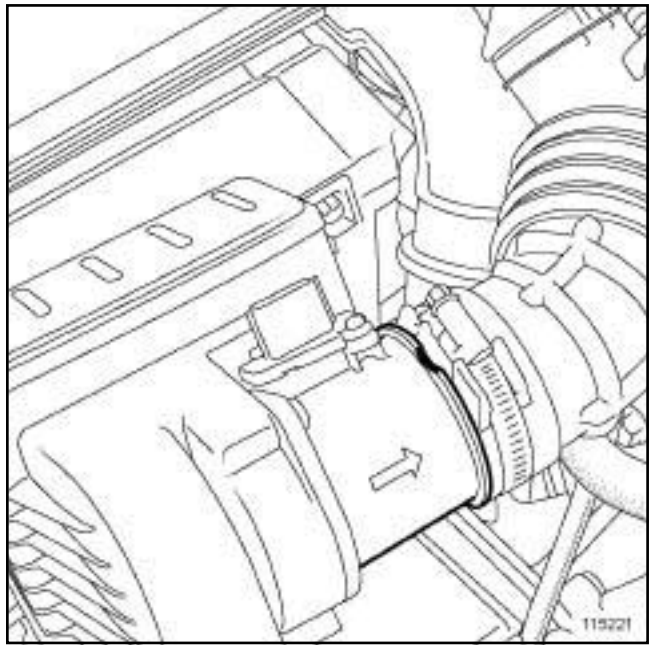
❑ Torque tighten the **compressor-intermediate pipe connecting pipe bolt on the compressor (8 N.m)**.

❑ Connect the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

❑ Refit the dehydrator reservoir-expansion valve connecting pipe bolt on the dehydrator reservoir.

❑ Torque tighten the **dehydrator reservoir - expansion valve connecting pipe bolt on the dehydrator reservoir (8 N.m)**.

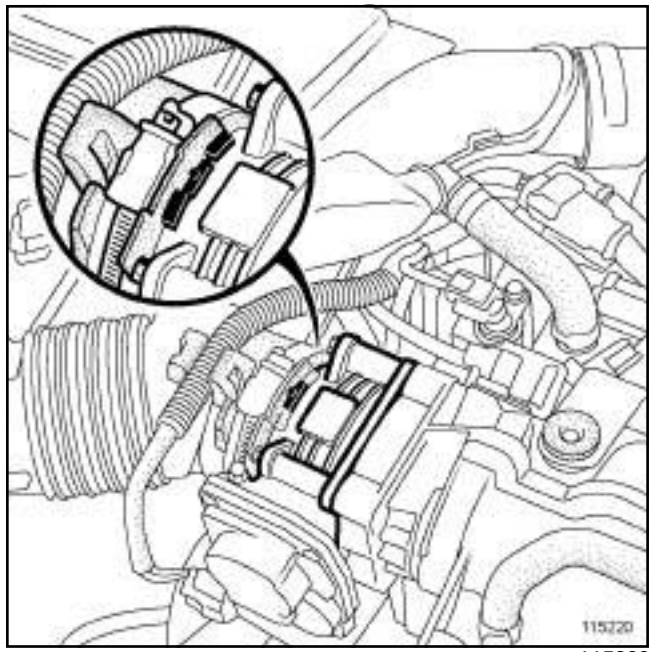
❑ Refit:



- the compressor-condenser connecting pipe,
- the condenser-compressor connecting pipe bolt on the compressor,
- the compressor-condenser connecting pipe bolt on the condenser.

❑ Tighten to torque:

- the **compressor-condenser connecting pipe bolt on the compressor (8 N.m)**,
- the **compressor-condenser connecting pipe bolt on the compressor (8 N.m)**.



❑ Refit:

- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the headlights (see **Headlight: Removal - Refitting**) (80B, Headlights),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

115221

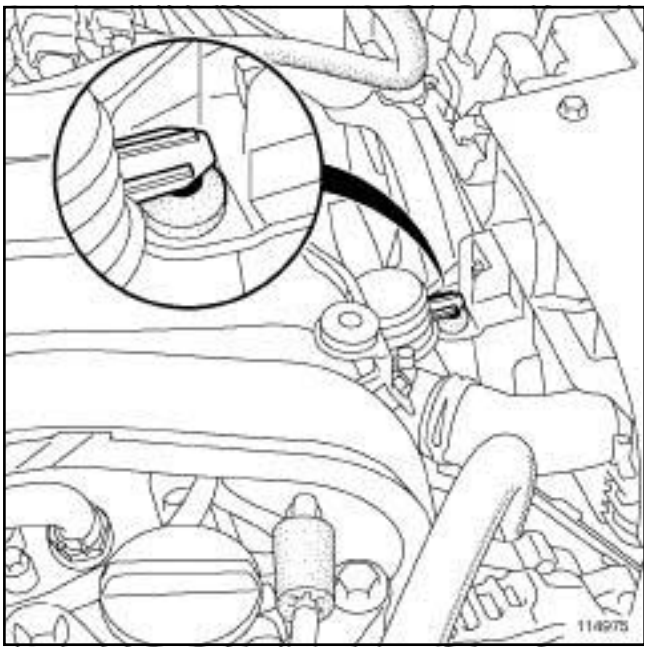
❑ Refit the air filter unit air outlet pipe on the air flowmeter, taking care to follow the markings for fitting.

115220

❑ Refit the air filter unit air outlet pipe on the motorised throttle valve, taking care to follow the markings for fitting.

❑ Connect the oil vapour rebreathing hose on the rocker cover.

❑ Fit the oil vapour rebreathing hose clip onto the rocker cover using the tool **(Mot. 1448)**.



❑ Torque tighten the **air filter box air outlet pipe clips (6 N.m)**.

M4R, and TL4

❏ Refit:

- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the protective fuse mounting wiring,
- the protective fuse mounting cable nut.

❏ Torque tighten the **protective fuse mounting wiring nut (6 N.m)**.

114975

❏ Before refitting the air filter unit air inlet pipe, check that the upper mounting of the air resonator is correctly clipped on the front end panel.

❏ Refit the air filter unit air inlet pipe.

❏ Connect the air filter unit air inlet pipe:

- to the front end panel,
- on the air resonator on the front end panel,
- on the air filter box.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Perform the following operations:

- fill the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- fill the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning),
- fill and bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the clutch circuit (see **Clutch circuit: Bleed**) (37A, Mechanical component controls).

❏ Refit:

- the engine cover,
- the engine undertray.

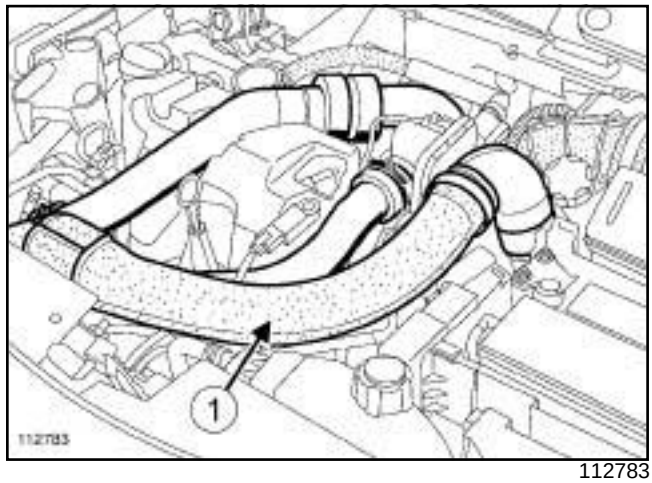
❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K, and JA5

Special tooling required	
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

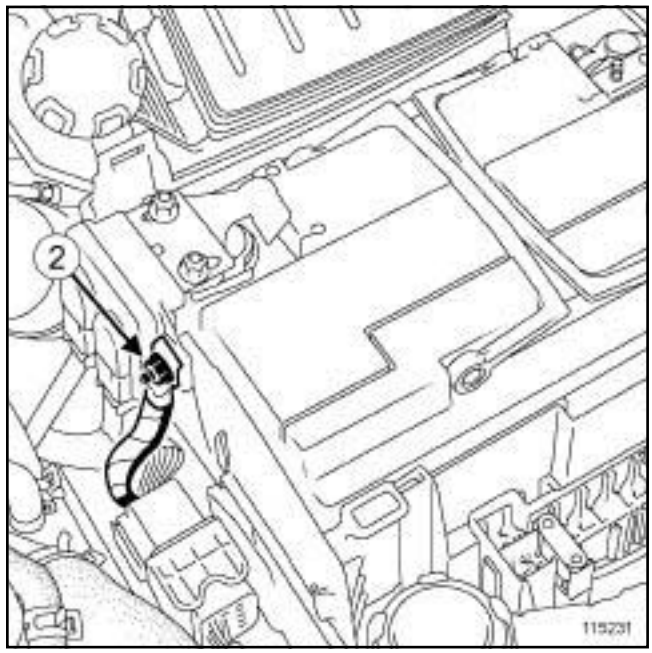
Tightening torques ▽	
side member earth wiring nuts	**8 N.m**
Protection and Switching Unit cover bolts	**4 N.m**
air filter unit air outlet pipe clip, turbocharger side, on the air filter unit air outlet pipe, turbocharger side	**5.5 N.m**
intercooler air outlet pipe clip	**5.5 N.m**
supply wiring nut of the power supply fuse unit	**8 N.m**
exhaust flange bolts	**21 N.m**
compressor-intermediate pipe connecting pipe bolt on the compressor	**8 N.m**
dehydrator reservoir - expansion valve connecting pipe bolt on the dehydrator reservoir	**8 N.m**
compressor-condenser connecting pipe bolt on the compressor	**8 N.m**
compressor-condenser connecting pipe bolt on the condenser	**8 N.m**
protective fuse mounting wiring nut	**6 N.m**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Remove the front engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

112783

❏ Remove the air pipe at the air filter unit inlet (**1**) .

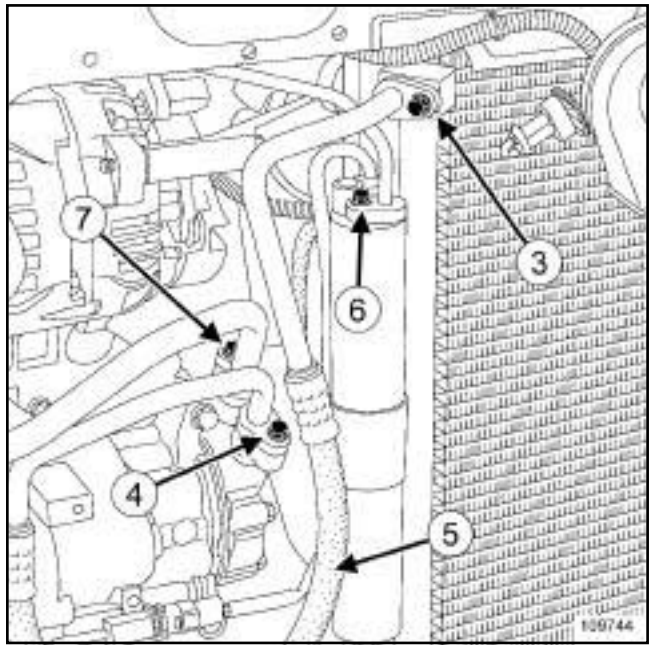
115231

❏ Remove the nut (**2**) from the protective fuse mounting wiring.

❏ Move the protective fuse mounting wiring to one side.

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine undertray.



❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,

- the sequential gearbox,
- the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❑ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the headlights (see **Halogen headlight: Removal - Refitting**) (80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (80C, Xenon bulbs),
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

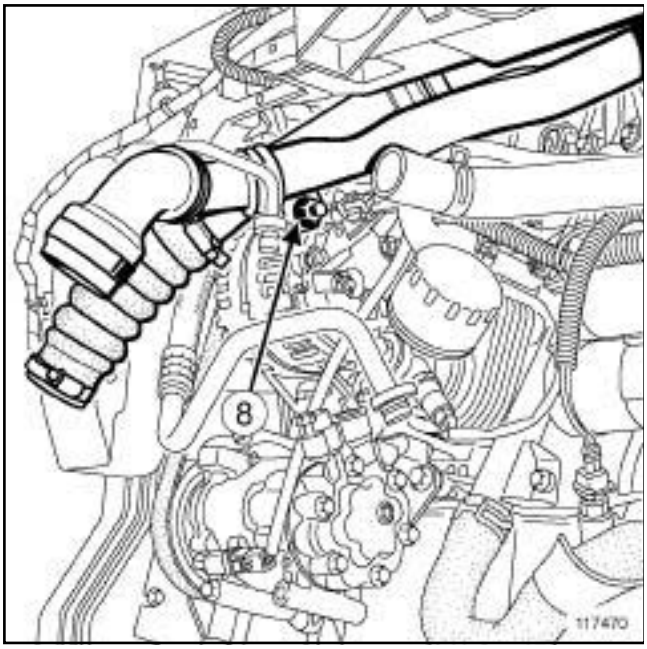
109744

❑ Remove:

- the bolt (**3**) from the compressor-condenser connecting pipe, on the condenser,
- the bolt (**4**) from the compressor-condenser connecting pipe, on the compressor,
- the compressor-condenser connecting pipe (**5**) ,
- the bolt (**6**) from the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

❑ Disconnect the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

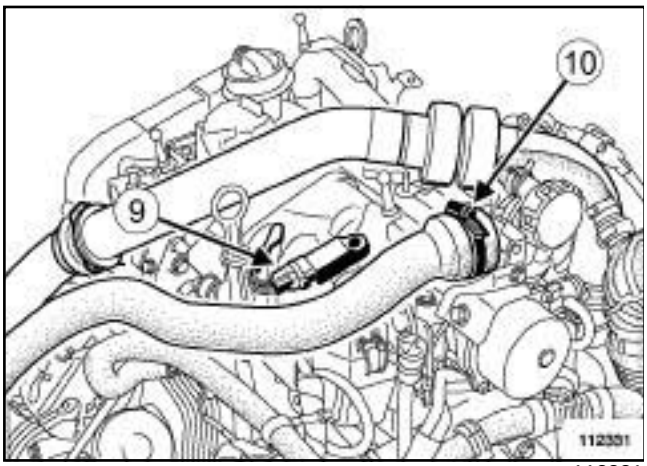
❑ Remove the bolt (**7**) from the compressor-intermediate pipe connecting pipe on the compressor.



❑ Disconnect the compressor-intermediate pipe connecting pipe on the compressor.

WARNING
Plugs must be fitted on the hoses to prevent moisture from entering the system.

❑ Remove:

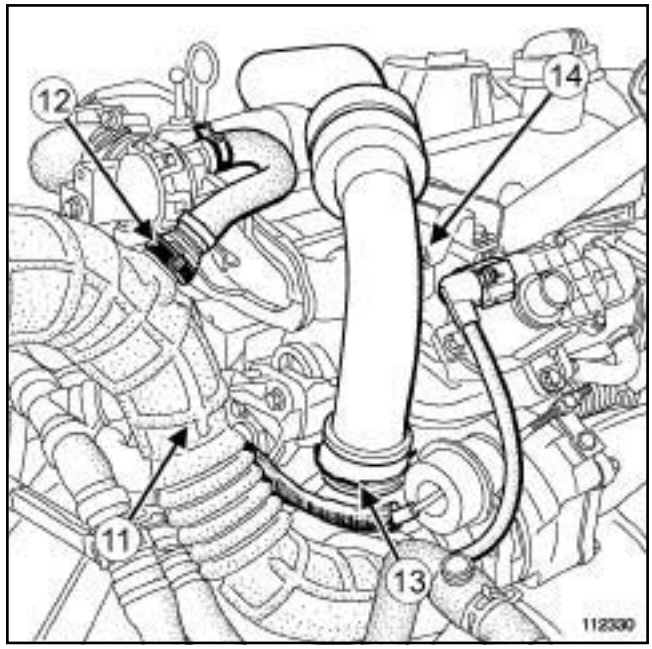


- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) .

K9K, and JA5

117470

❏ Remove the nut (**8**) from intercooler air inlet and outlet pipes.



112331

❏ Disconnect the connector (**9**) from the inlet air pressure sensor.

❏ Loosen the clip (**10**) on the intercooler air outlet pipe.

❏ Remove the intercooler air outlet pipe.

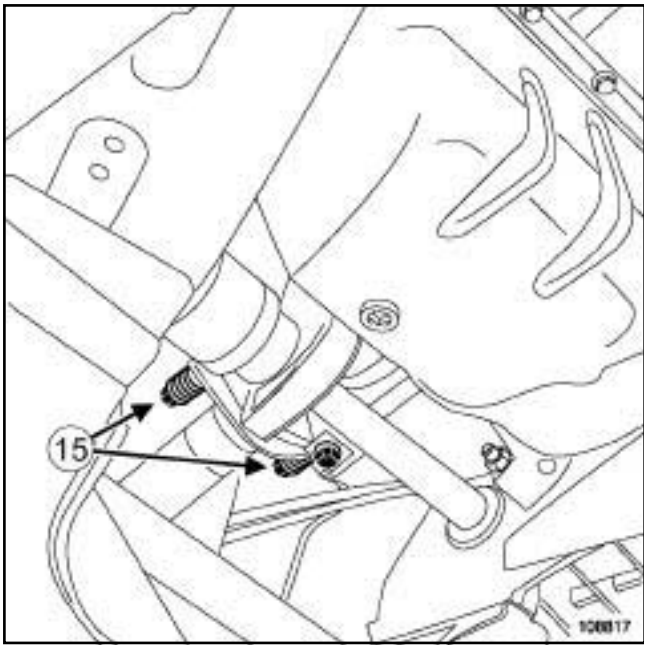
112330

❏ Undo the clip of the air filter unit air outlet pipe at the turbocharger side.

❏ Disconnect:

- the air filter unit air outlet pipe (**11**) on the turbocharger side,
- the oil rebreathing pipe (**12**) on the air filter unit air outlet pipe, on the turbocharger side.

❏ Remove:

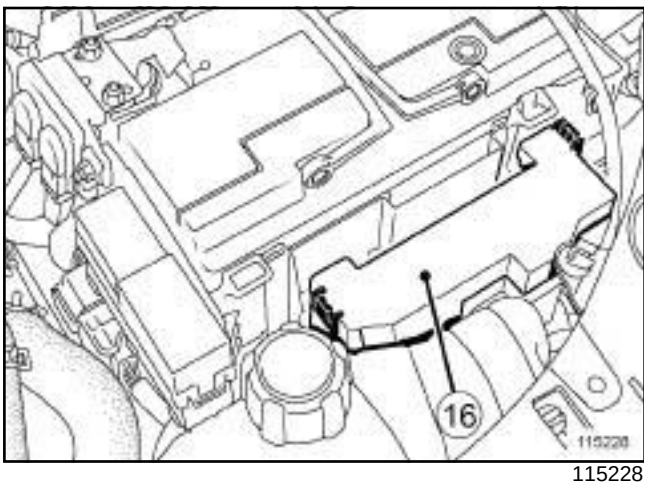


- the clip (**13**) of the turbocharger air outlet pipe,
- the bolt (**14**) from the turbocharger air outlet pipe,
- the turbocharger air outlet pipe.

❏ Disconnect the union from the brake servo pipe on the vacuum pump side.

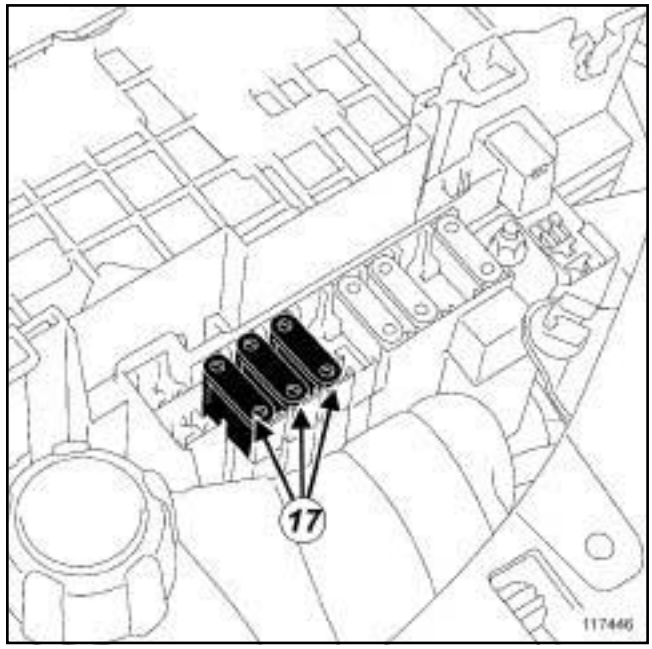
❏ Remove:

- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).



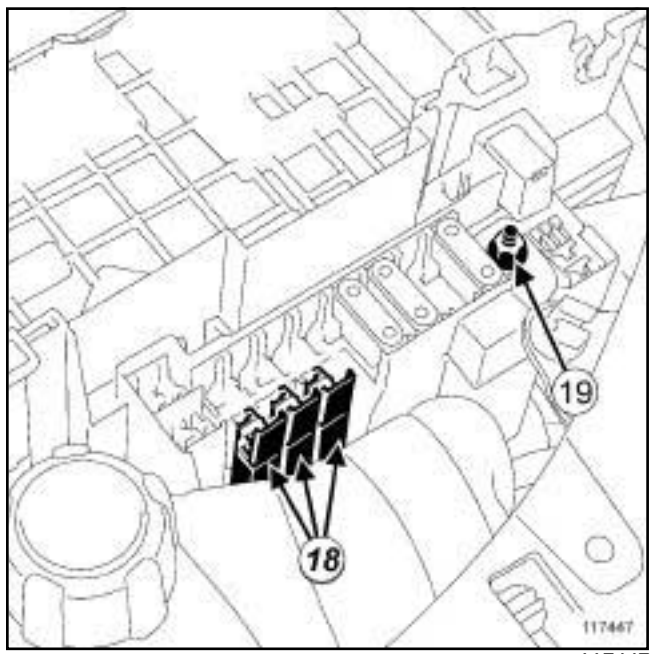
K9K, and JA5

108817



❑ Remove:

- the bolts (**15**) from the exhaust flange,
- the exhaust bracket gasket,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .



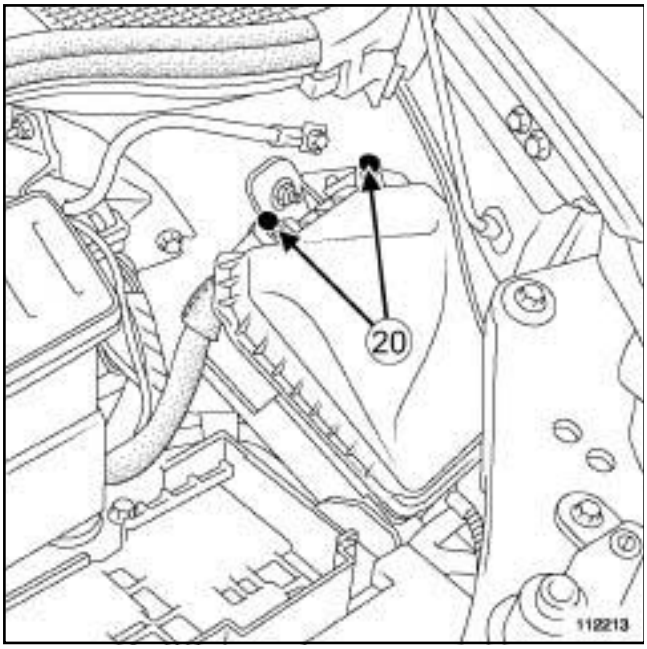
115228

❑ Remove the cover (**16**) from the power supply fuse unit.

117446

❑ Remove the fuses (**17**) .

117447

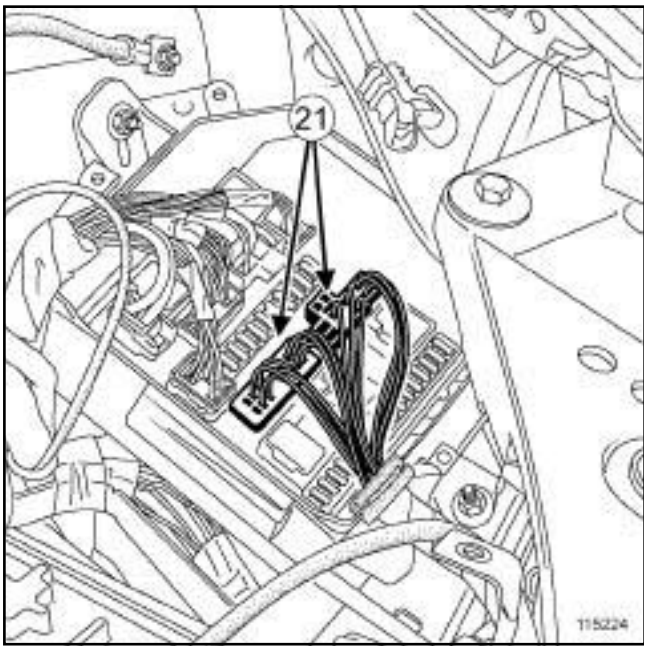


❑ Unclip the fuse holder (**18**) .

❑ Remove the nut (**19**) from the supply wiring of the power supply fuse unit.

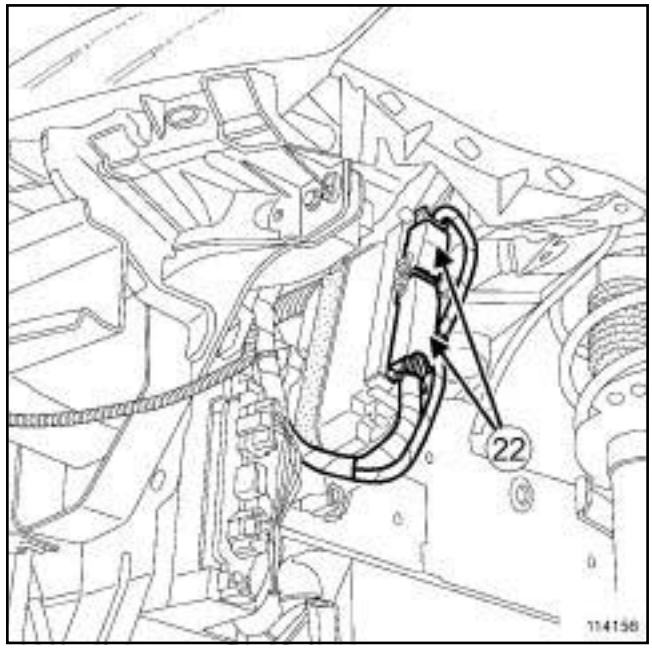
❑ Disconnect the supply wiring from the power supply fuse unit.

❑ Remove the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery).



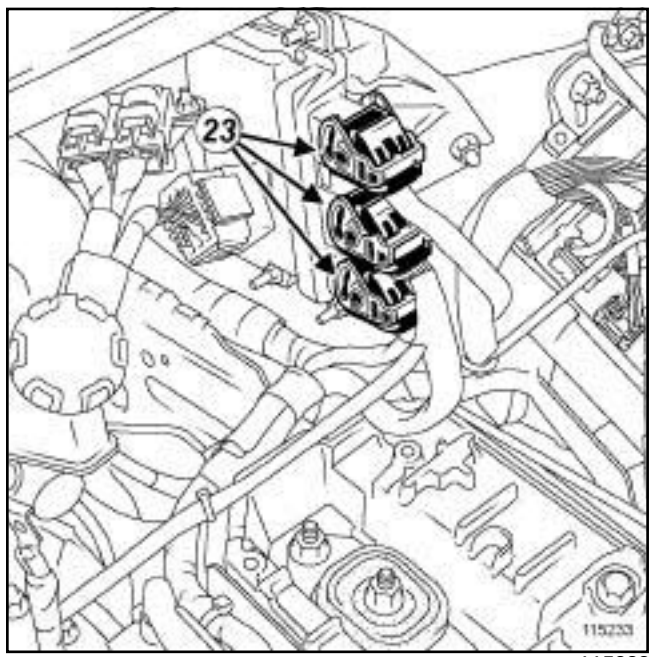
K9K, and JA5

112213



❏ Remove:

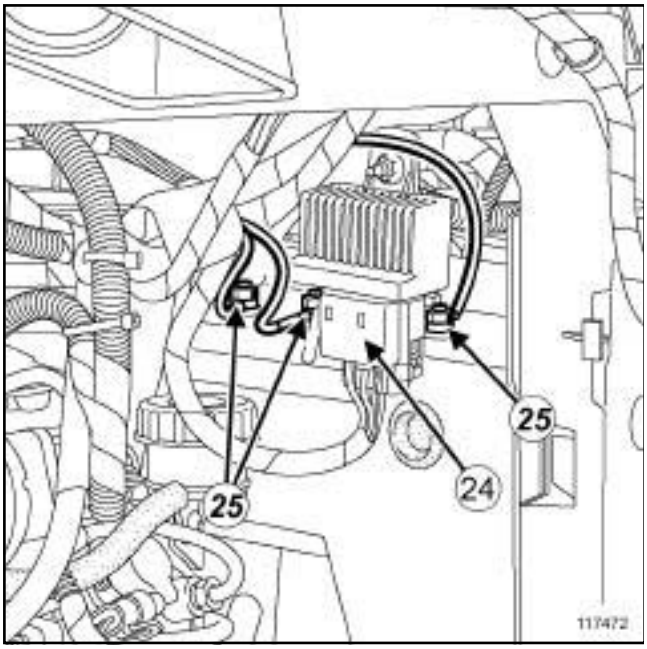
- the bolts (**20**) from the Protection and Switching Unit cover,
- the Protection and Switching Unit cover.



115224

❏ Disconnect the engine wiring connectors (**21**) from the Protection and Switching Unit.

114156

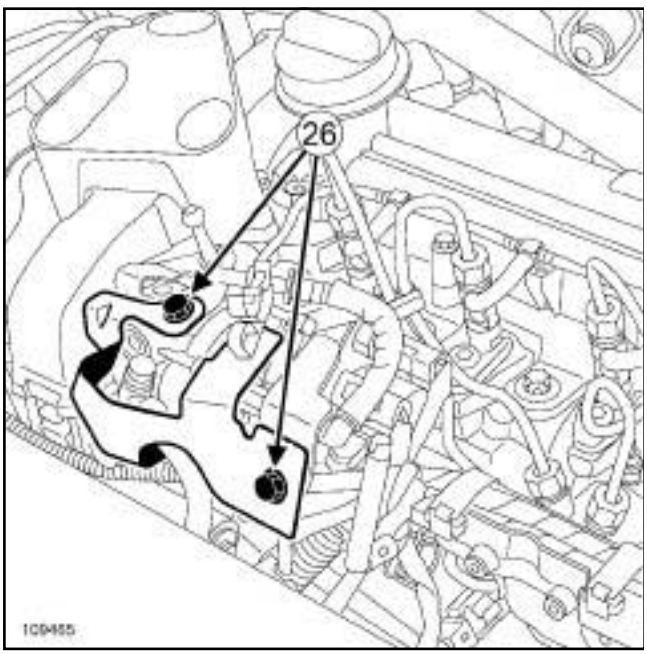


❏ Disconnect the connectors (**22**) from the sequential gearbox computer.

115233

❏ Disconnect the injection computer connectors (**23**) .

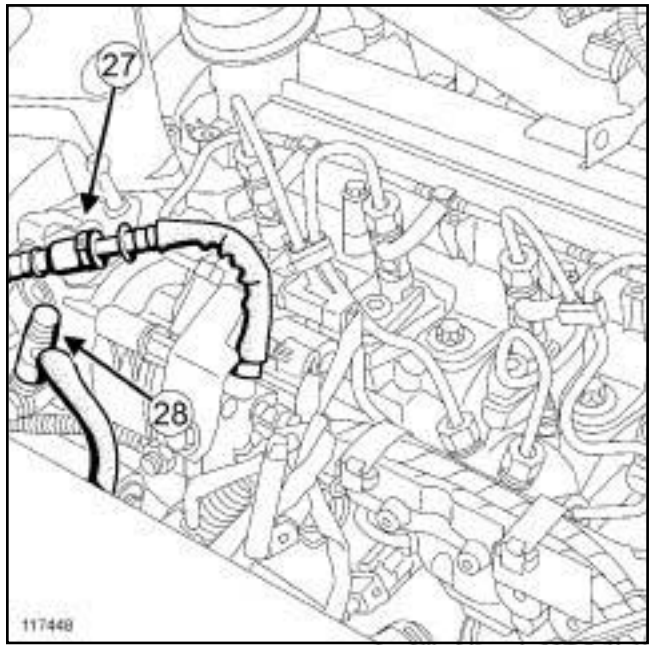
K9K, and JA5



117472

❏ Disconnect the pre-postheating unit connector (**24**) .

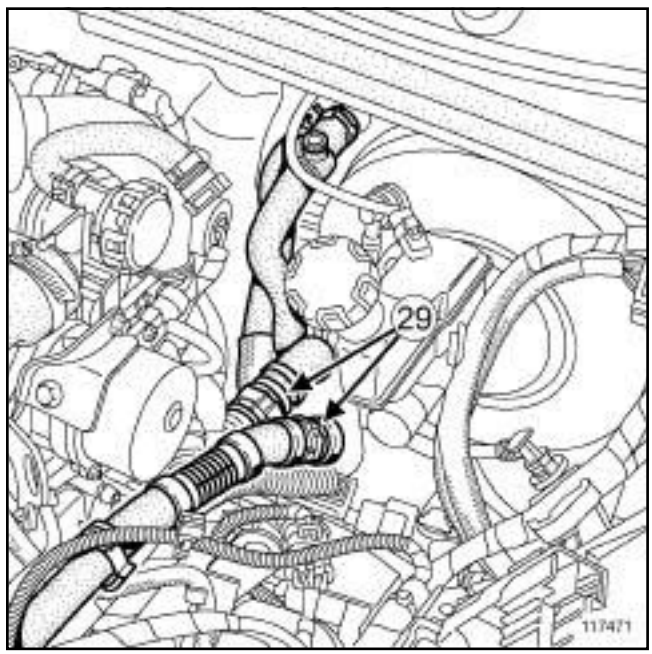
❏ Remove the nuts (**25**) from the side member earth wiring.



❏ Move the earth wiring away from the side member.

109465

❏ Remove:

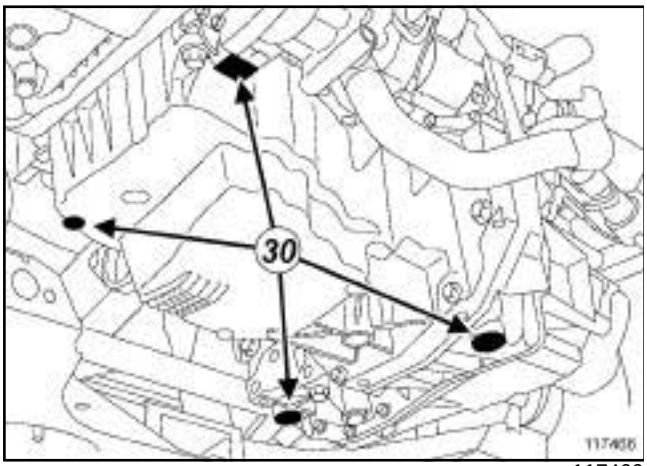


- the bolts (**26**) from the high pressure pump protector,
- the high pressure pump protector.

117448

❏ Disconnect:

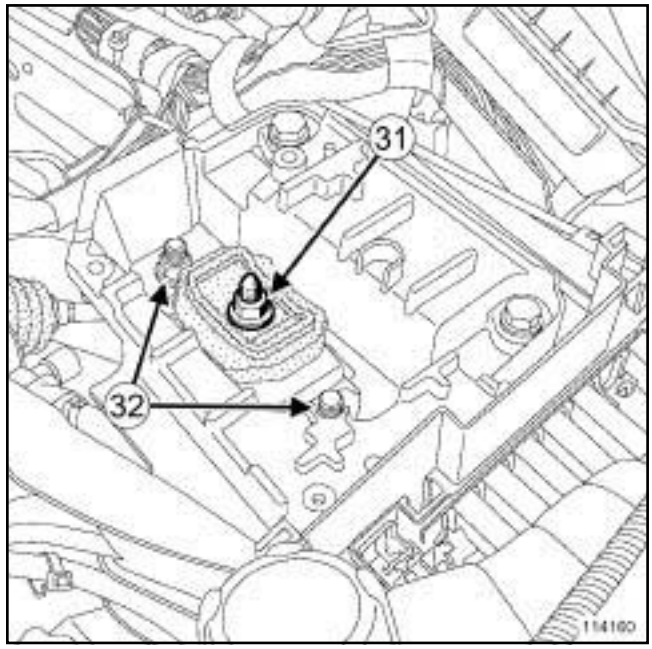
- the fuel supply pipe (**27**) ,
- the fuel return pipe (**28**) .



117471

❏ Disconnect the quick-release unions (**29**) from the heater radiator hoses.

K9K, and JA5



II - OPERATION FOR REMOVAL OF PART CONCERNED

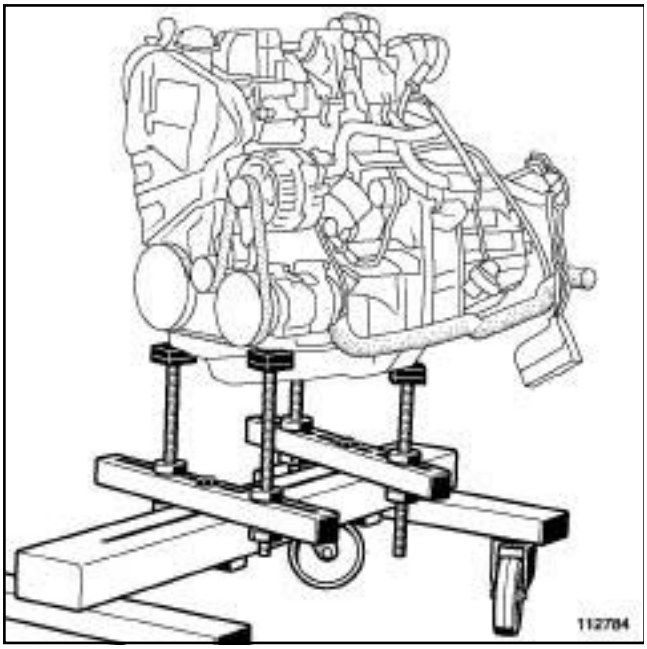
117466

❏ Support the **(Mot. 1390)** on the marks (**30**) on the « engine - gearbox » assembly.

❏ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

114160

❏ Separate the neck of the electrical wiring from the gearbox support.



❏ Remove:

- the left-hand suspended engine mounting shaft nut (**31**) ,
- the nuts (**32**) from the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting rubber pad.

Note:

Tap the bolt with a copper hammer, if necessary.

K9K, and JA5

112784

❏ Remove the « engine and gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ For standard engine replacements (see **Standard replacement**) (Technical Note 6006A, 10A, Engine and peripherals).

❏ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Position the « engine - gearbox » assembly in the body.

❏ Refit:

- the left-hand suspended engine mounting rubber pad,
- the nuts for the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting shaft nut.

❏ Torque tighten (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) .

❏ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Torque tighten (see **19D**, **Engine mounting**, **Suspended engine mounting: Tightening torque**, page **19D-1**) .

❏ Lift the **(Mot. 1390)** from the « engine - gearbox» assembly.

III - FINAL OPERATION

❏ Connect:

- the quick-release unions of the cooling radiator hoses,
- the fuel return pipe,
- the fuel supply pipe.

❏ Refit:

- the high pressure pump protector,
- the bolts of the high pressure pump protector.

❏ Fit the side member earth wiring.

❏ Refit the side member earth wiring nuts.

❏ Torque tighten the **side member earth wiring nuts (8 N.m)**.

❏ Connect:

- the pre-postheating unit connector,
- the injection computer connectors,
- the connectors to the sequential gearbox computer,
- the engine wiring connectors to the Protection and Switching Unit.

❏ Refit:

- the Protection and Switching Unit cover,
- the bolts on the Protection and Switching Unit cover.

❏ Torque tighten the **Protection and Switching Unit cover bolts (4 N.m)**.

❏ Refit:

- the turbocharger air outlet pipe,
- the clip of the turbocharger air outlet pipe,
- the turbocharger air outlet pipe bolt.

❏ Connect:

- the brake servo union on the vacuum pump,

K9K, and JA5

- the air filter unit air outlet pipe on the turbocharger side,
- the oil rebreathing pipe on the air filter unit air outlet pipe, on the turbocharger side.

❏ Torque tighten the **air filter unit air outlet pipe clip, turbocharger side, on the air filter unit air outlet pipe, turbocharger side (5.5 N.m)**.

❏ Refit:

- the intercooler air outlet pipe,
- the nut from the intercooler air inlet and outlet pipes.

❏ Torque tighten the **intercooler air outlet pipe clip (5.5 N.m)**.

❏ Connect the air inlet pressure sensor connector.

❏ Refit the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery).

❏ Clip on the fuse holder.

❏ Connect the supply wiring of the power supply fuse unit.

❏ Refit the supply wiring nut of the power supply fuse unit.

❏ Torque tighten the **supply wiring nut of the power supply fuse unit (8 N.m)**.

❏ Refit:

- the fuses,
- the fuse box cover,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .
- a new exhaust bracket seal,
- the exhaust bracket bolts,

❏ Torque tighten the **exhaust flange bolts (21 N.m)**.

❏ Refit:

- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) .
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),

❏ Connect the compressor-intermediate pipe connecting pipe on the compressor.

❏ Refit the bolt to the compressor-intermediate pipe connecting pipe on the compressor.

❏ Torque tighten the **compressor-intermediate pipe connecting pipe bolt on the compressor (8 N.m)**.

❏ Connect the dehydrator reservoir-expansion valve connecting pipe on the dehydrator reservoir.

❏ Refit the dehydrator reservoir-expansion valve connecting pipe bolt on the dehydrator reservoir.

❏ Torque tighten the **dehydrator reservoir - expansion valve connecting pipe bolt on the dehydrator reservoir (8 N.m)**.

❏ Refit:

- the compressor-condenser connecting pipe,
- the condenser-compressor connecting pipe bolt on the compressor,
- the compressor-condenser connecting pipe bolt on the condenser.

❏ Tighten to torque:

- the **compressor-condenser connecting pipe bolt on the compressor (8 N.m)**,
- the **compressor-condenser connecting pipe bolt on the condenser (8 N.m)**.

❏ Refit:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the headlights (see **Halogen headlight: Removal - Refitting**) (80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (80C, Xenon bulbs),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Fit the protective fuse mounting wiring.

❏ Refit the protective fuse mounting wiring nut.

K9K, and JA5

- ❏ Torque tighten the **protective fuse mounting wiring nut (6 N.m)**.
- ❏ Refit the air filter unit air inlet pipe.
- ❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❏ Perform the following operations:
  - fill the sequential gearbox,
  - fill the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).
  - fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .
- ❏ Refit:
  - the engine cover,
  - the engine undertray.

D4F, and JA3

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Tightening torques ▽	
exhaust downpipe bolts	**9 Nm**

REMOVAL

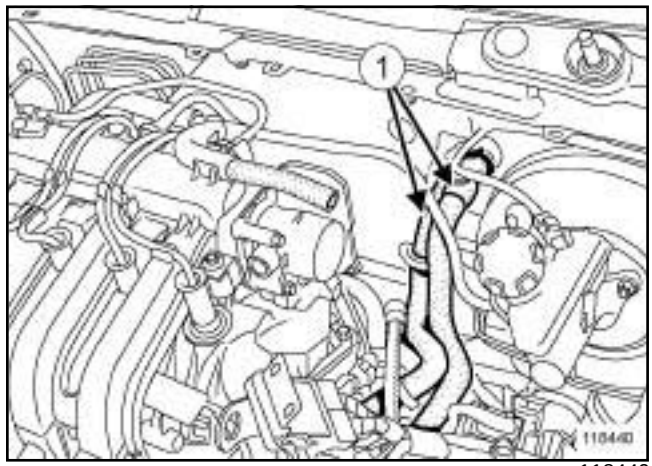
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine undertray,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

❑ Drain:



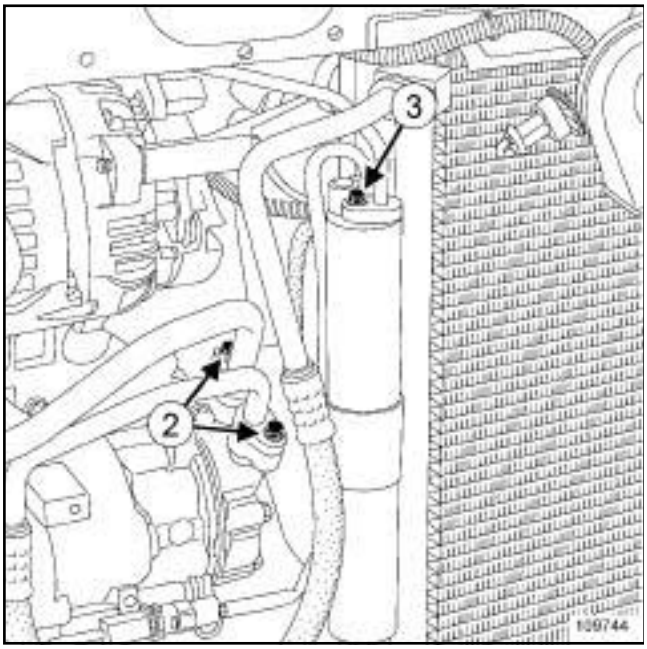
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

AIR CONDITIONING

❑ Drain the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

❑ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts).



118440

❑ Remove:

- the clips for the passenger compartment heating hoses using the **(Mot. 1448)**,
- the passenger compartment heater hoses (**1**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) .

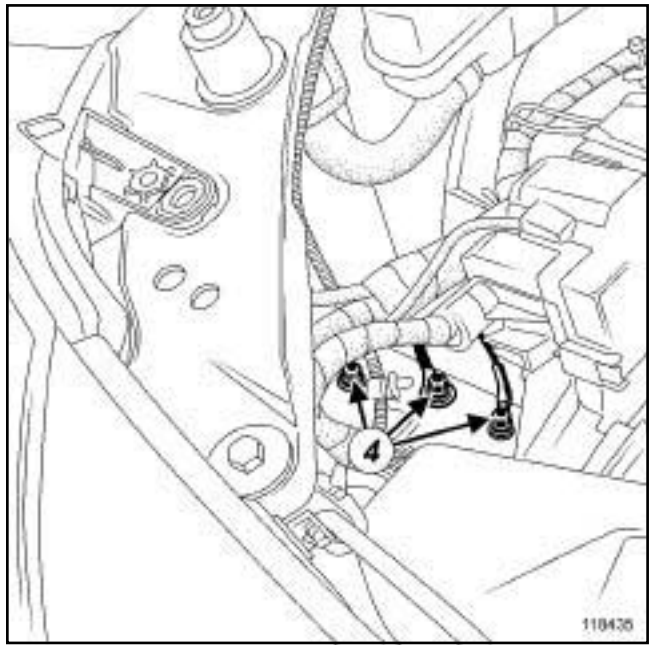
D4F, and JA3

AIR CONDITIONING

109744

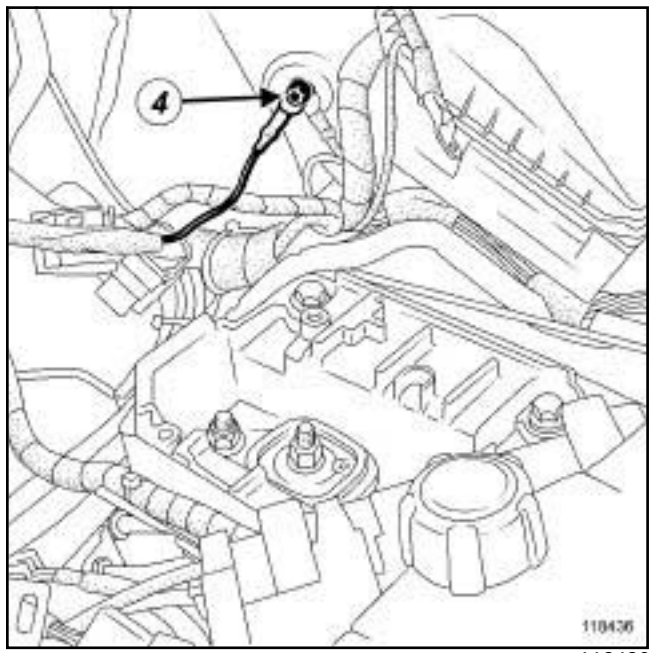
❏ Unclip the wiring harness of the pressure switch on the condenser.

❏ Disconnect the pressure switch connector on the condenser.



❏ Remove:

- the bolts (**2**) from the air conditioning pipe unions on the compressor,
- the bolts (**3**) from the air conditioning pipe unions on the condenser.

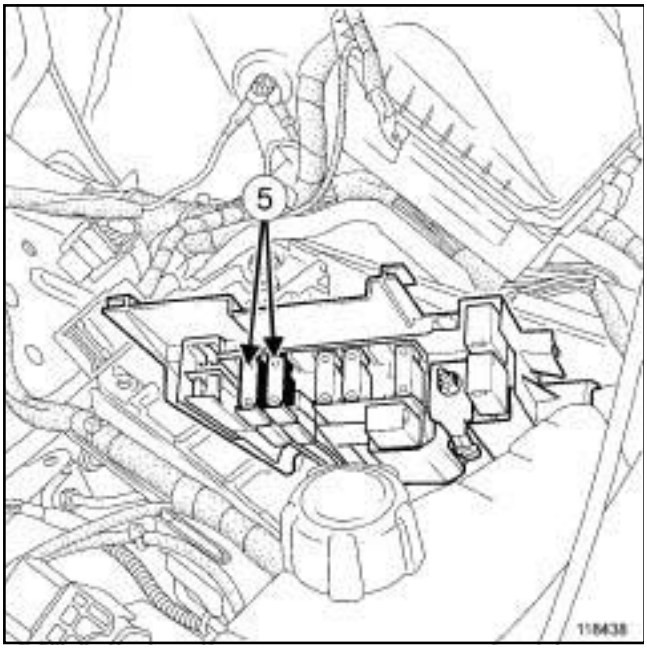


WARNING
Plugs must be fitted on the hoses to prevent moisture from entering the system.

❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the petrol injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the injection computer support mounting bolts,
- the injection computer support.

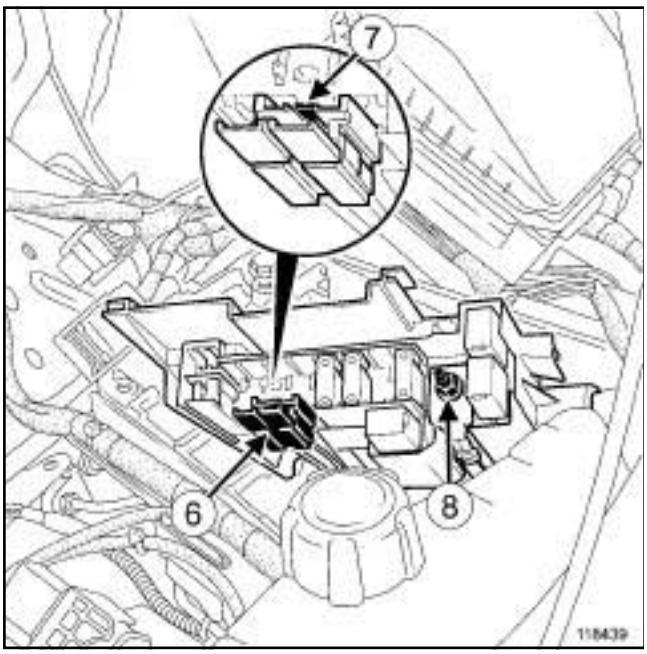
118435



118436

❏ Remove:

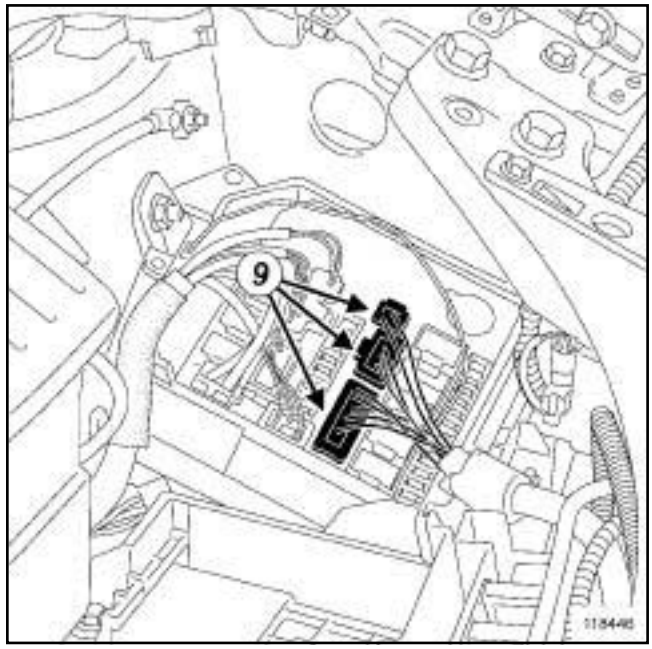
- the earth terminal nuts,
- the earth terminals (**4**) .



D4F, and JA3

118438

❏ Remove:

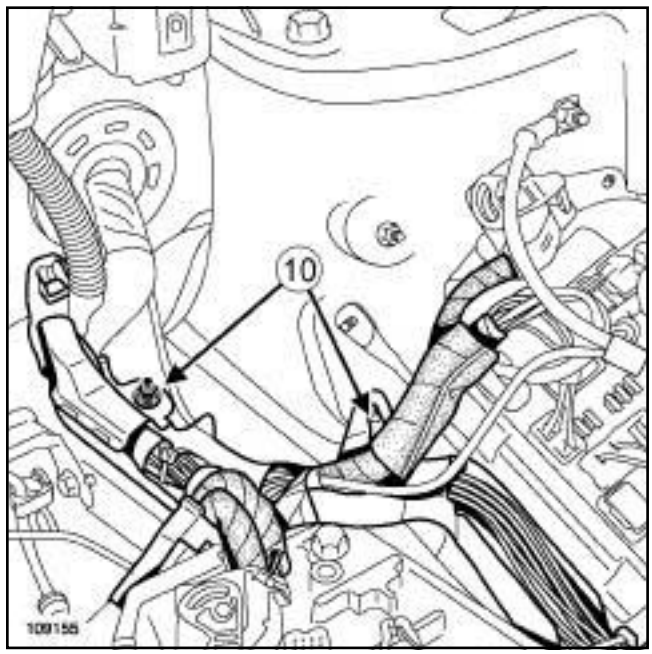


- the cover from the fuse holder board,
- the fuses (**5**) .

118439

❏ Remove:

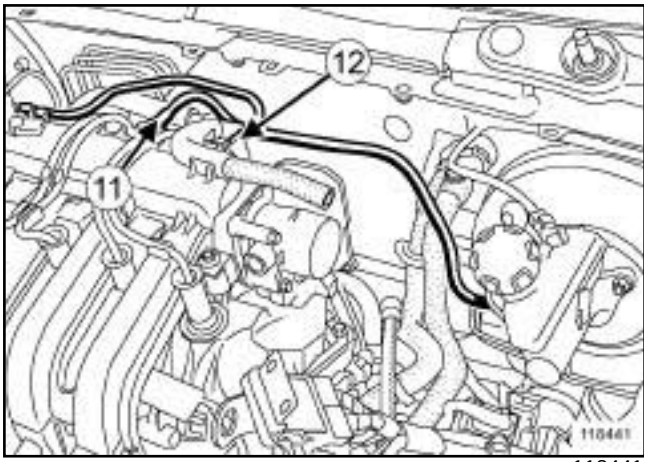
- the fuse holder (**6**) by pressing on the tab (**7**) ,
- the feed wire (**8**) from the fuse holder board,
- the supply cable from the battery protection fuse box.



118446

❏ Remove the Protection and Switching Unit cover.

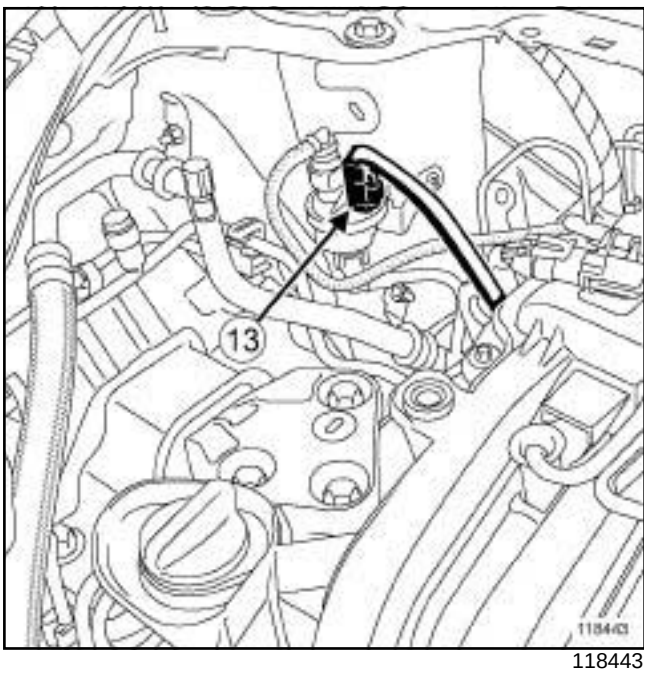
❏ Disconnect the connectors (**9**) from the Protection and Switching Unit.



❏ Remove the sequential gearbox computer (see **Sequential gearbox converter: Removal - Refitting**) (MR 392, 21B, Sequential gearbox).

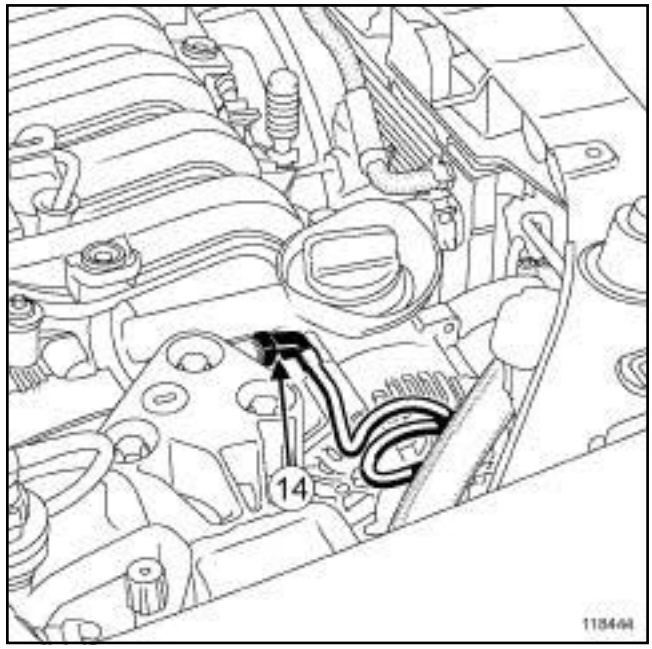
109155

❏ Remove the bolts (**10**) from the wiring channel on the body.



❏ Move the wiring harness to one side.

118441



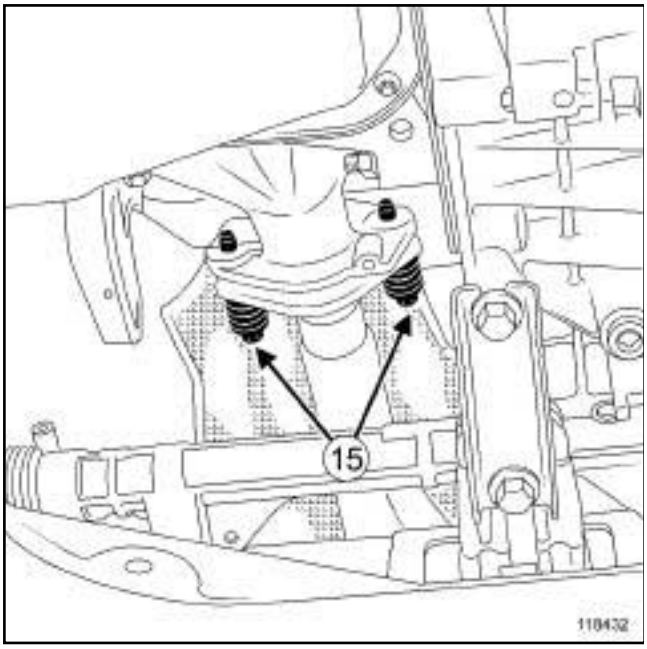
❏ Disconnect:

- the quick-release union from the brake servo pipe (**11**) ,
- the quick-release union from the petrol vapour re-breathing pipe (**12**) .

118443

❏ Disconnect the connector (**13**) from the fuel vapour absorber bleed solenoid valve.

118444

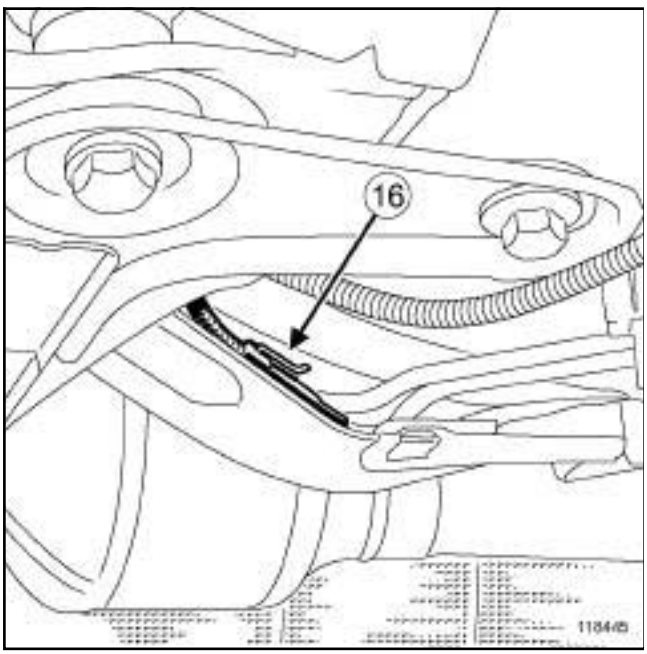


❏ Disconnect the quick-release union from the fuel supply pipe (**14**) on the injector rail.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

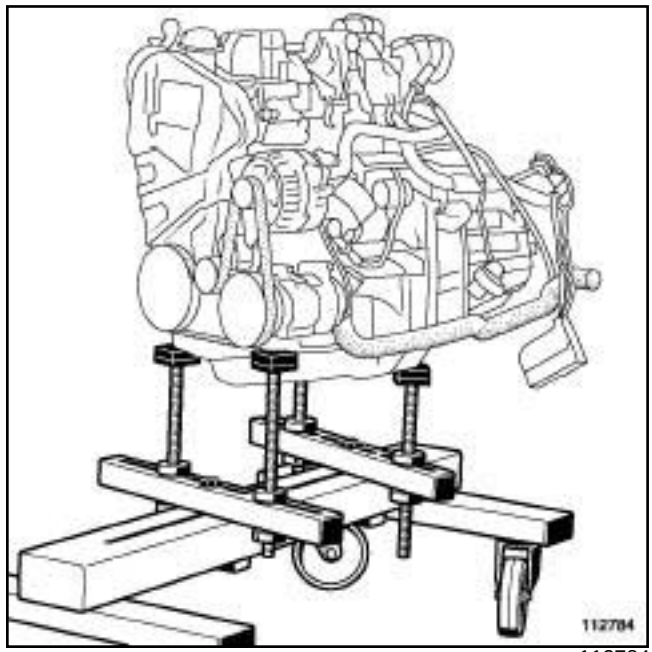


D4F, and JA3

118432

❑ Remove the bolts (**15**) from the exhaust downpipe.

❑ Remove the exhaust pipe towards the rear of the vehicle.



118445

❑ Disconnect the oxygen sensor connector (**16**) .

❑ Feed the oxygen sensor wiring harness into the engine compartment.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Remove the lower engine torque reaction tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

112784

❑ Support the « engine - gearbox » assembly on engine marks using the.

❑ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Remove the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .

❑ Raise the vehicle, moving the engine towards the front.

❑ Remove the « engine - gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Standard replacement**) (Technical Note 6004A, 10A, Engine and peripherals).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the « engine - gearbox » assembly in the vehicle,

D4F, and JA3

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove the.

III - FINAL OPERATION.

❏ Refit:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the oxygen sensor wiring harness.

❏ Connect the oxygen sensor connector.

❏ Refit the exhaust downpipe.

❏ Torque tighten the **exhaust downpipe bolts (9 Nm)**.

❏ Connect:

- the quick-release union to the fuel supply pipe on the injector rail,
- the quick-release union to the petrol vapour re-breathing pipe,
- the quick-release union to the brake servo pipe.

❏ refit the wiring harness.

❏ Screw the bolts for the wiring harness channel on the body.

❏ Refit the sequential gearbox computer (see **Sequential gearbox converter: Removal - Refitting**) (MR 392, 21B, Sequential gearbox).

❏ Connect the Protection and Switching Unit connectors.

❏ Refit:

- the Protection and Switching Unit cover,
- the supply cable on the battery protection fuse box,
- the feed wire on the fuse holder board,
- the fuse holder,
- the fuses,
- the cover from the fuse holder board,
- the earth terminals on the side member,
- the earth terminal nuts,
- the injection computer mounting,
- the injection computer support bolts,
- the petrol injection computer (see **17B**, **Petrol injection**, **Petrol injection computer: Removal - Refitting**, page **17B-37**) ,
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).

AIR CONDITIONING

❏ Refit:

- the bolts to the air conditioning pipe unions on the condenser,
- the bolts to the air conditioning pipe unions on the compressor.

❏ Connect the pressure switch connector to the condenser.

❏ Clip the pressure switch wiring harness on the condenser.

❏ Refit:

- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the passenger compartment heater hoses,
- the clips for the passenger compartment heating hoses using the **(Mot. 1448)**.

❏ Refit:

- the clip for the top hose on the cooling radiator using the **(Mot. 1448)**,
- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❏ Refill:

- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,

D4F, and JA3

- the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray,
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

AIR CONDITIONING

❑ Fill the refrigerant circuit (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).

D4F, and 784

Special tooling required	
Ms. 583	Pipe clamps.

Equipment required
refrigerant charging station

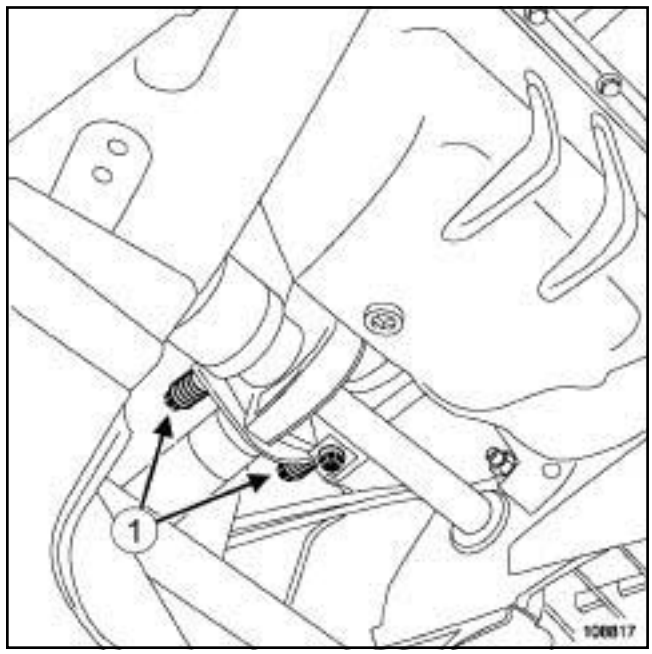
Tightening torques ▽	
connecting pipe bolts	**8 Nm**
exhaust downpipe bolts	**9 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:



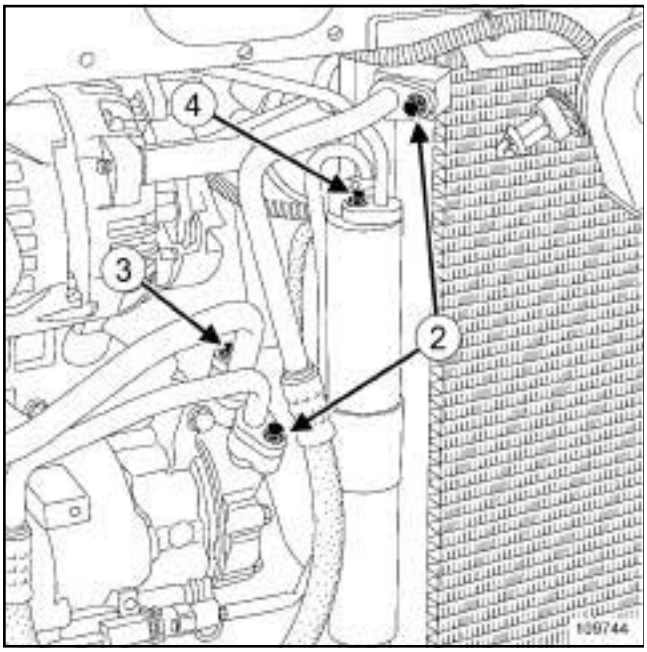
- the engine cover,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

❑ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- the engine if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

AIR CONDITIONING

❑ Drain the air conditioning circuit using the **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (MR 392, 62A, Air conditioning).



108817

❑ Remove:

- the exhaust downpipe bolts (**1**) ,
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

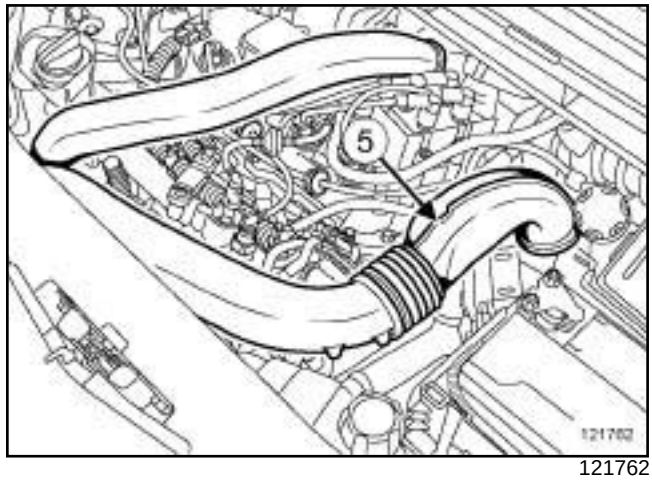
D4F, and 784

AIR CONDITIONING

109744

❏ Unclip the wiring harness of the pressure switch on the condenser.

❏ Disconnect:



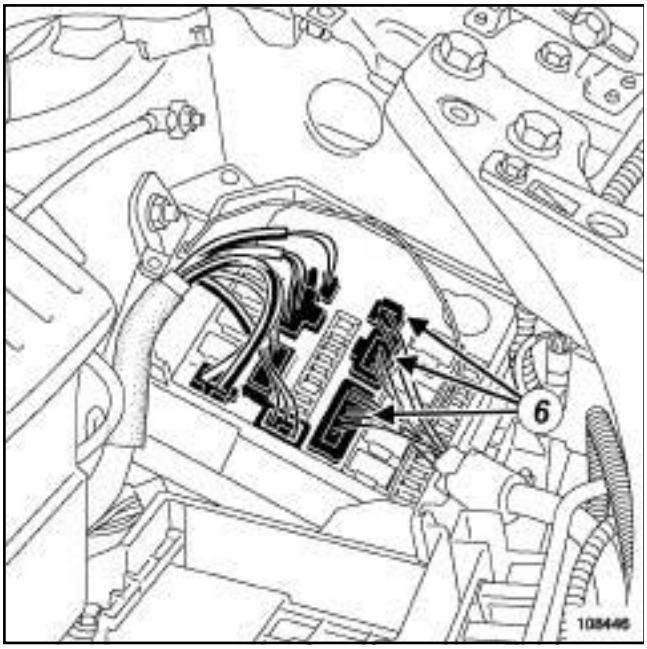
- the pressure switch from the condenser,
- the air conditioning compressor clutch connector.

❏ Remove:

- the compressor - condenser connecting pipe bolts (**2**) ,
- the compressor - condenser connection pipe.
- the compressor - expansion valve connecting pipe bolt (**3**) ,
- the dehydrator reservoir - expansion valve connecting pipe bolt (**4**) .

❏ Uncouple the connecting pipes.

❏ Plug the openings.

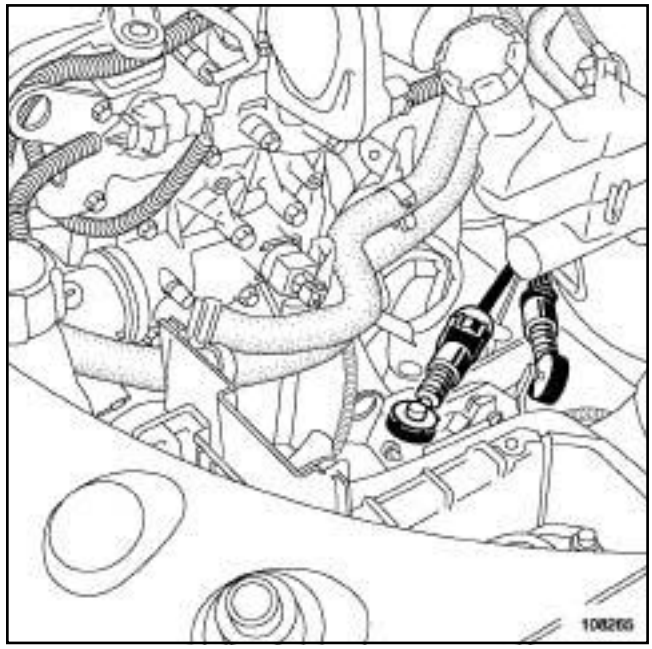


121762

❏ Remove:

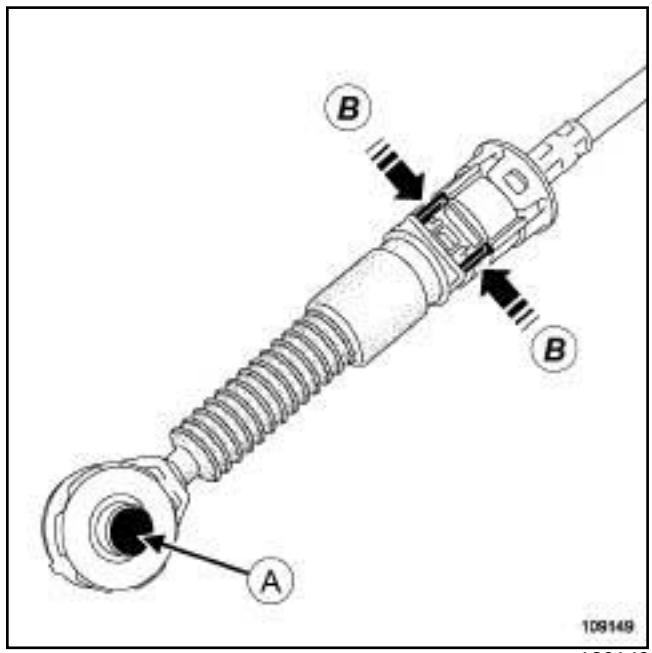
- the air filter unit air inlet pipe (**5**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the passenger compartment radiator cooling hoses on the bulkhead,
- the Protection and Switching Unit cover.

D4F, and 784



108446

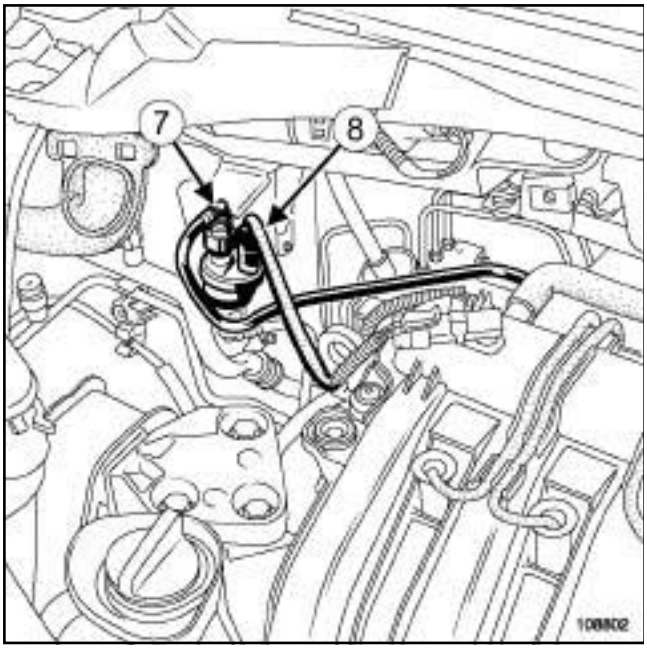
❏ Disconnect:



- the Protection and Switching Unit connectors (**6**) ,
- the fuse,
- the fuse holder to the fuse board,
- the supply cable on the battery protection fuse box,
- the petrol injection computer connectors.

❏ Remove the earth nuts.

❏ Move the wiring harness to one side.



108265

109149

❏ Remove:

- the gear control cables on the gearbox by pushing at (**A**) ,
- the control cables by pushing at (**B**) .

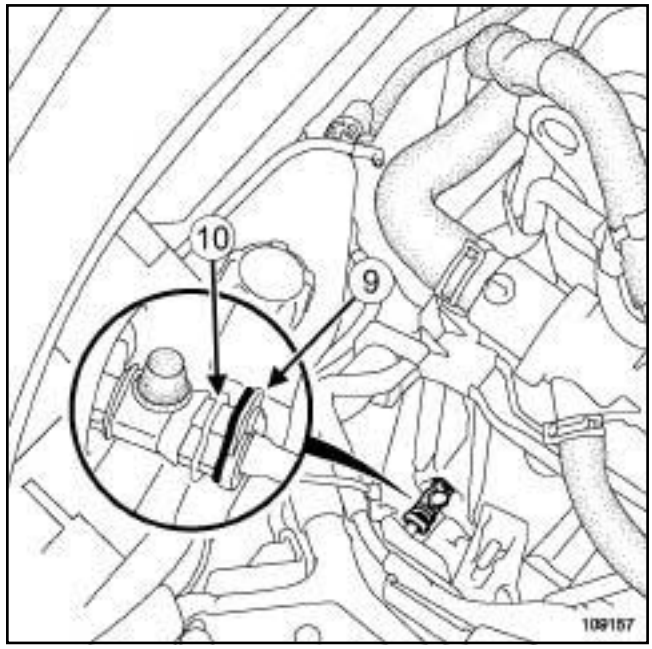
108802

❏ Disconnect:

- the petrol vapour recirculation solenoid valve connector (**8**) ,
- the fuel vapour recirculation pipe (**7**) ,
- the brake servo non-return valve.

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

IMPORTANT
Wear latex gloves during the operation.



IMPORTANT

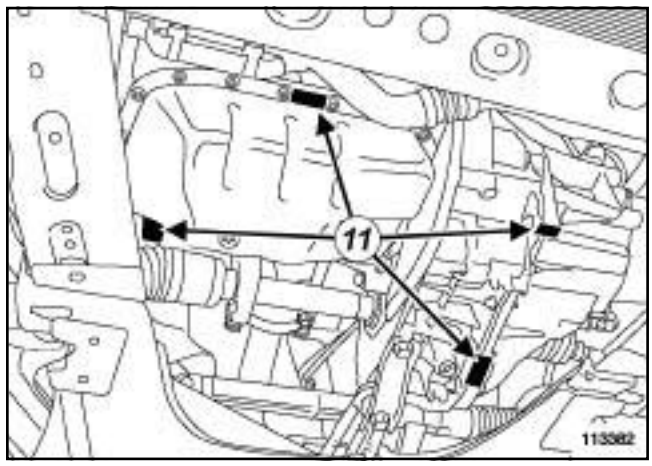
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

❏ Disconnect the fuel inlet union on the injection rail.

❏ Plug the openings.

109157



❏ Place a hose clamp **(Ms. 583)** between the brake fluid reservoir and the clutch master cylinder.

❏ Disconnect the clutch slave cylinder by pulling the clips (**9**) and (**10**)

❏ Unclip the gearbox clutch pipe.

❏ Plug the openings.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113382

❏ Support the « engine - gearbox » assembly on the engine marks (**11**) with the.

❏ Mark the positions of the suspended engine mountings on the body.

D4F, and 784

❏ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) .

❏ Raise the vehicle, moving the engine towards the front.

❏ Remove the « engine - gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ For standard engine replacements (see **Parts always to be replaced**) (Technical Note 6004A, 10A, Engine and peripherals).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Position the « engine-gearbox » assembly in the vehicle.

❏ Refit:

- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove thefrom the « engine - gearbox » assembly.

III - FINAL OPERATION.

❏ Clip the clutch pipe to the gearbox.

❏ Remove the blanking plugs from the openings.

❏ Connect the clutch slave cylinder pipes.

❏ Remove the hose clamp **(Ms. 583)**.

❏ Remove the blanking plugs from the openings.

❏ Connect:

- the petrol inlet union on the injector rail,
- the brake servo non-return valve,
- fuel vapour recirculation pipe,
- the petrol vapour recirculation solenoid valve connector.

❏ Refit:

- the gearbox control cables,
- the earth nuts.

❏ Connect:

- the connectors to the petrol injection computer,
- the Protection and Switching Unit connectors,
- the fuse,
- the fuse holder to the fuse board,
- the feed wire from the battery protection fuse box.

❏ Refit:

- the Protection and Switching Unit cover,
- the passenger compartment radiator cooling hoses on the bulkhead,
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the expansion bottle (see **19A**, **Cooling**, **Expansion bottle: Removal - Refitting**, page **19A-101**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the air filter unit air inlet pipe.

AIR CONDITIONING

❏ Remove the blanking plugs.

❏ Couple the connecting pipes.

❏ Refit:

- the dehydrator reservoir - expansion valve connecting pipe bolt,
- the compressor - expansion valve connecting pipe bolt,
- the compressor - condenser connection pipe.
- the compressor - condenser connecting pipe bolts.

❏ Torque tighten the **connecting pipe bolts (8 Nm)**.

❏ Connect:

- the pressure switch from the condenser,
- the air conditioning compressor clutch connector.

❏ Clip the pressure switch wiring harness on the condenser.

D4F, and 784

❑ Refit:

- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the front right-hand hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the exhaust downpipe bolts.

❑ Torque tighten the **exhaust downpipe bolts (9 Nm)**.

❑ Refit:

- the intercooler (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Perform the following operations:

- fill up the engine oil if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- fill the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox),
- fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- bleed the clutch circuit (see **Clutch circuit: Bleed**) (MR 392, 37A, Mechanical component controls).

❑ Refit:

- the engine undertray,
- the engine cover.

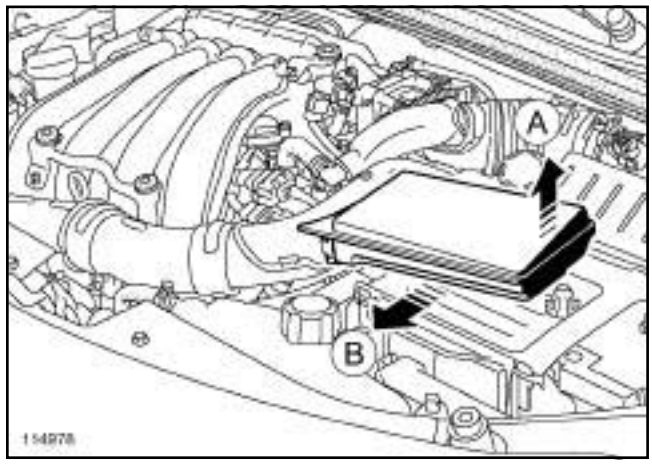
M4R, and DP0

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
bolts of the right-hand suspended engine mounting cover	**62 N.m**
bolts for the right-hand suspended engine mounting rubber pad	**62 N.m**
bolt of the right-hand suspended engine mounting rubber pad	**105 N.m**
upper engine tie-bar bolts	**105 N.m**
support bolts for the left-hand suspended engine mounting on the vehicle body	**62 N.m**
left-hand suspended engine mounting rubber pad nuts	**62 N.m**
left-hand suspended engine mounting central nut	**62 N.m**
exhaust flange bolts	**21 N.m**
engine tie-bar bolt on the engine	**180 N.m**
engine tie-bar bolt on the subframe	**105 N.m**
air inlet duct clips	**6 N.m**

REMOVAL



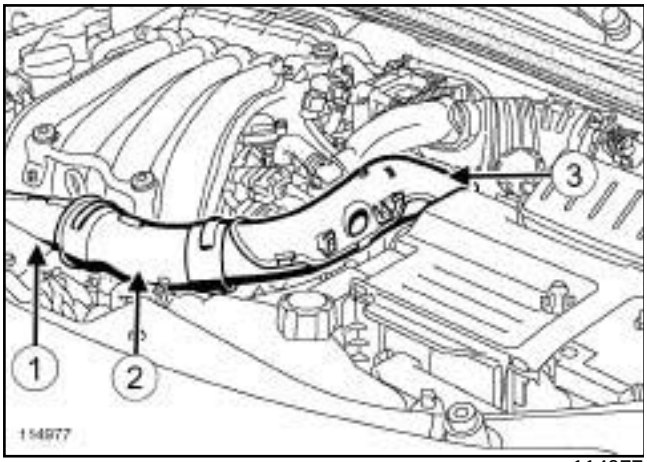
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

IMPORTANT
To prevent the vehicle from falling, lash it to the vehicle lift using a strap.

❑ Remove the engine cover.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

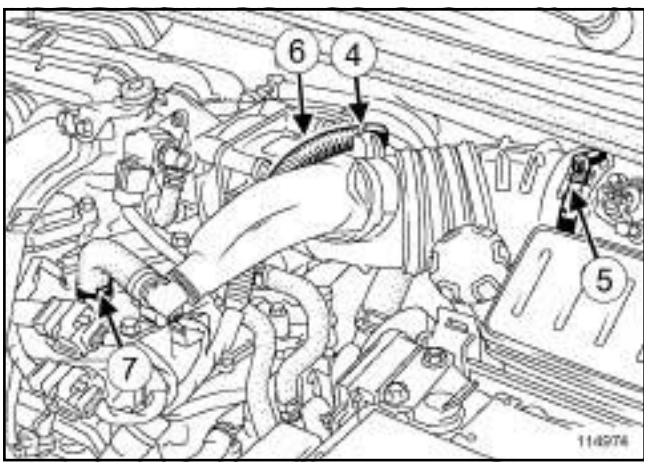


114978

❑ Lift the air resonator (**A**) to remove it from the battery cover.

❑ Pull the air resonator (**B**) towards the front of the vehicle to remove it.

M4R, and DP0



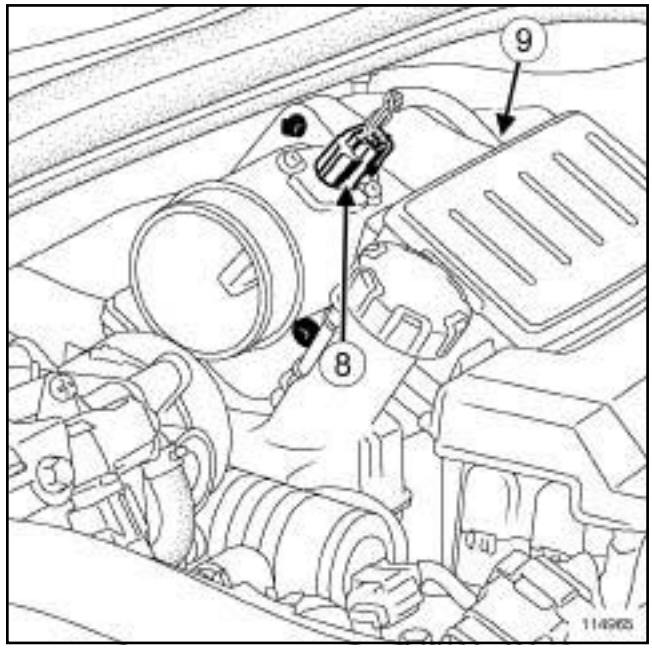
114977

❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove the air inlet sleeve.

114974



❏ Unclip the electrical wiring from the air inlet duct at (**4**) .

❏ Loosen the air duct clips:

- on the air flow sensor (**5**) ,
- on the motorised throttle valve (**6**) .

❏ Extract the oil vapour rebreathing hose (**7**) on the rocker cover using the tool **(Mot. 1448)**.

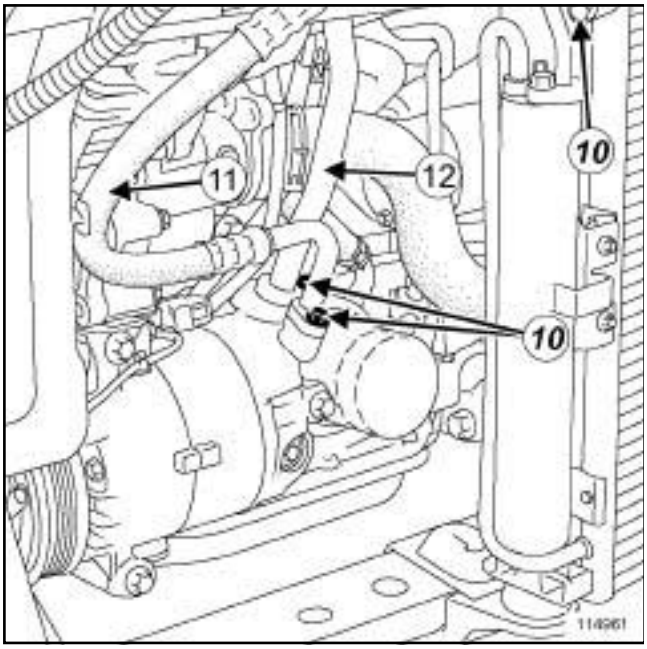
❏ Remove the air inlet duct.

114965

❏ Disconnect the air flowmeter connector (**8**) .

❏ Unclip the air flowmeter connector electrical wiring at (**9**) .

❏ Remove the engine undertray.



❏ Drain:

- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (23A, Automatic transmission),
- the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

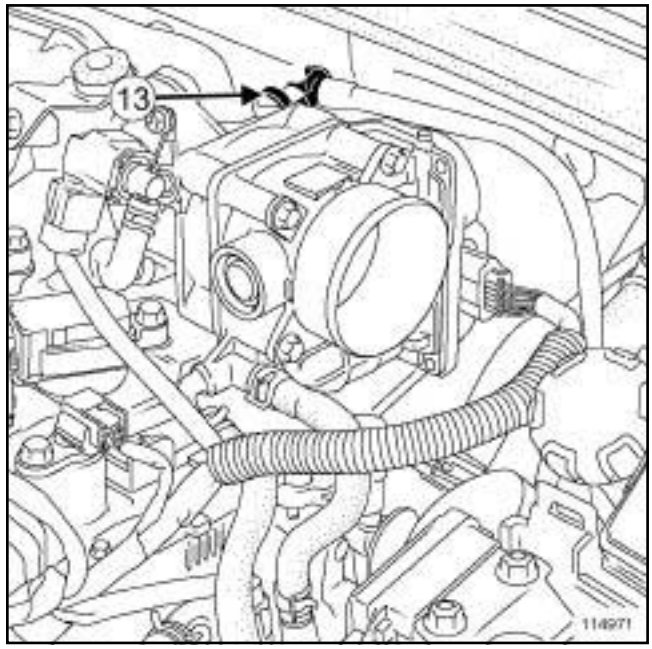
❏ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front sections of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) .

M4R, and DP0

114961

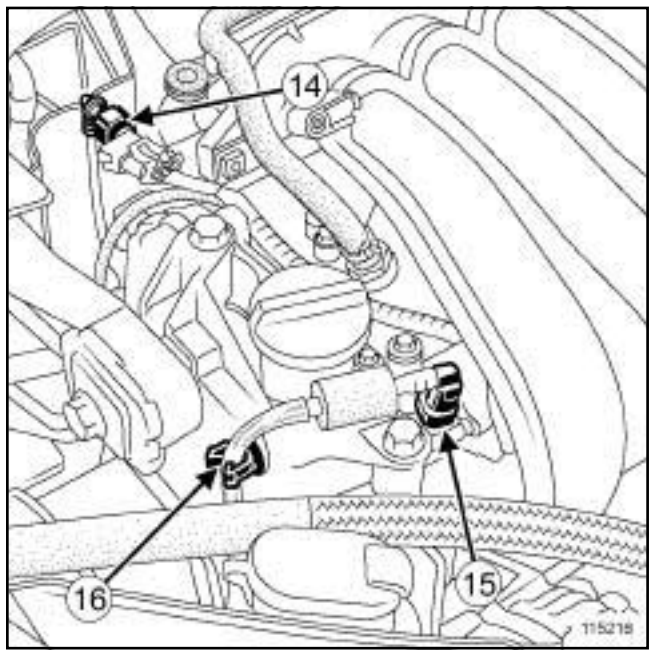
❏ Remove:



- the bolts (**10**) from the air conditioning pipe unions,
- the air conditioning pipe (**11**) .

WARNING
To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

❏ Pull out the air conditioning pipe (**12**) .



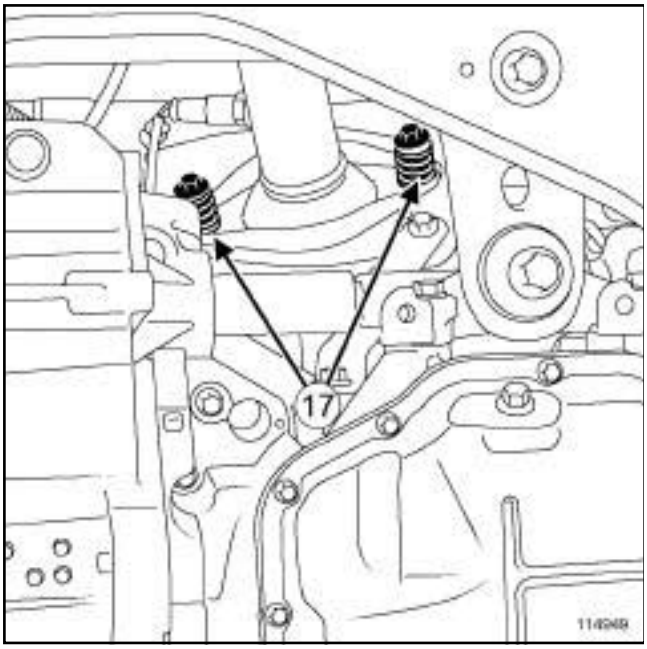
❏ Remove:

- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

114971

❏ Disconnect the brake servo pipe (**13**) from the intake distributor.

115216

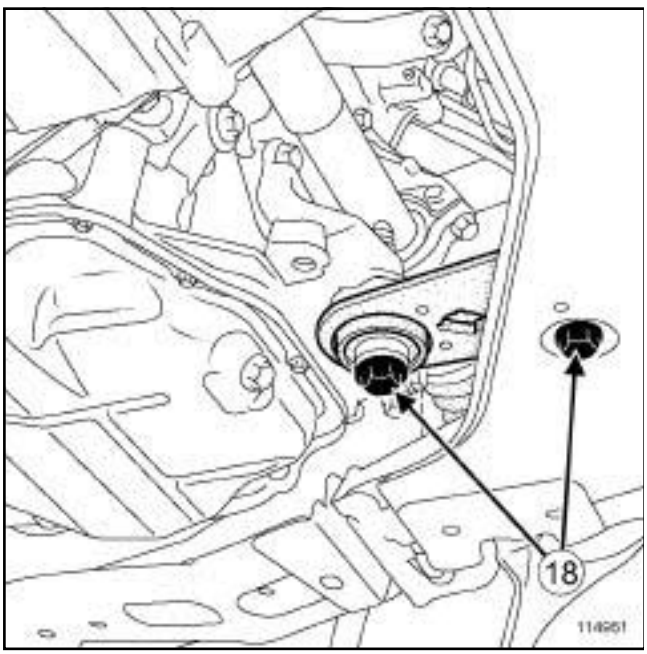


❏ Disconnect:

- the petrol vapour rebreather pipe (**14**) ,
- the fuel supply pipe (**15**) .

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❏ Unclip the fuel supply pipe at (**16**) .

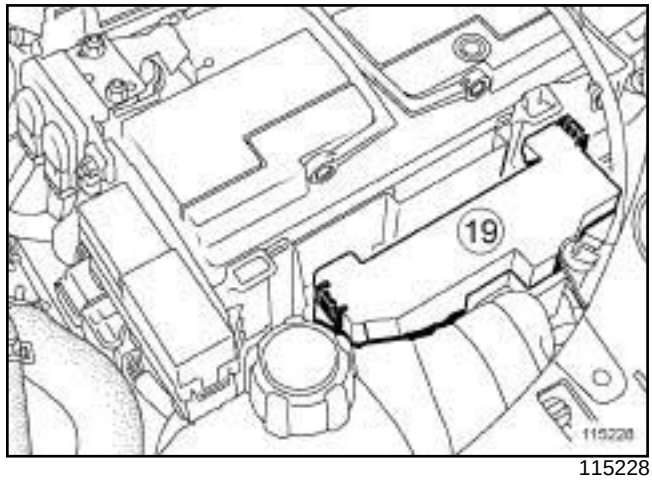


M4R, and DP0

114949

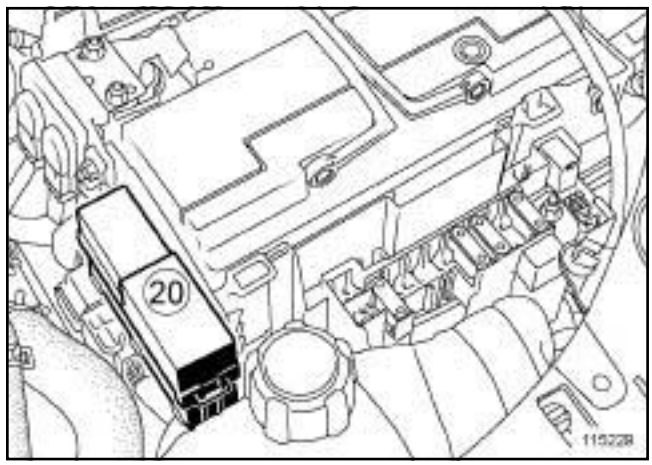
❑ Remove:

- the bolts (**17**) from the exhaust flange,
- the exhaust flange seal.



114951

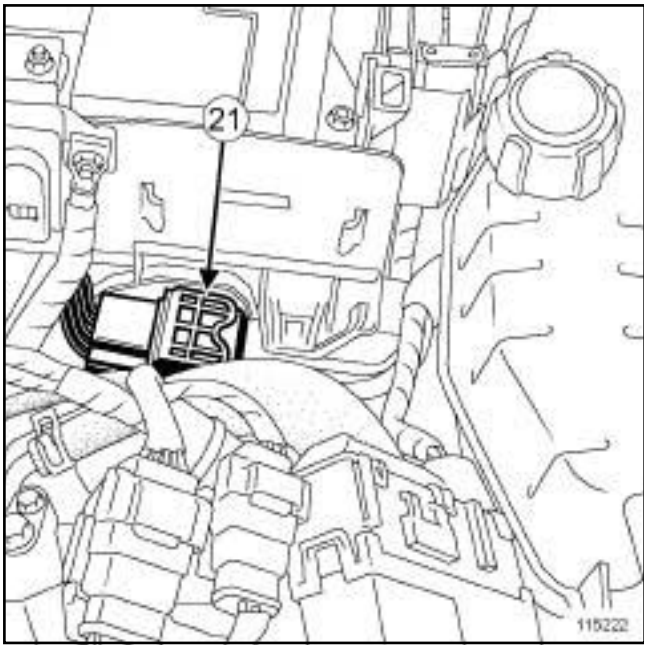
❑ Remove:



- the engine tie-bar bolts (**18**) ,
- the engine tie-bar .

❑ Remove the battery cover.

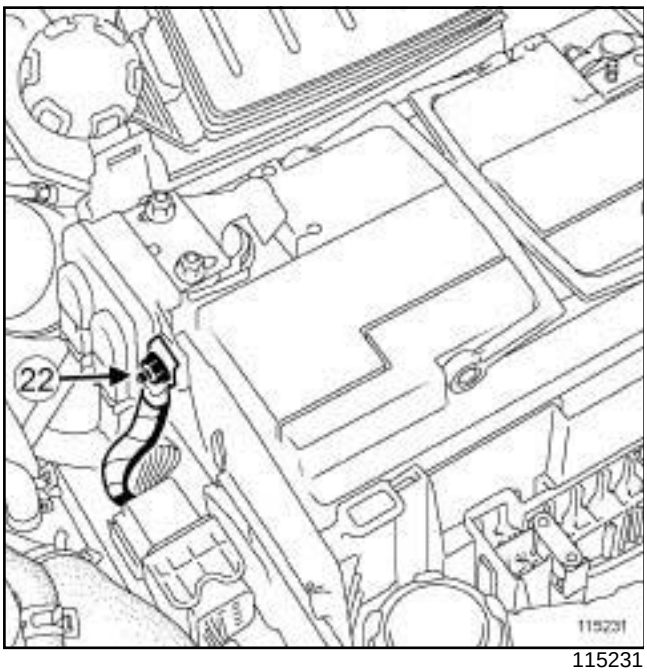
115228



❑ Remove the cover (**19**) from the power supply fuse unit.

115229

❑ Unclip the optional relay unit (**20**) .

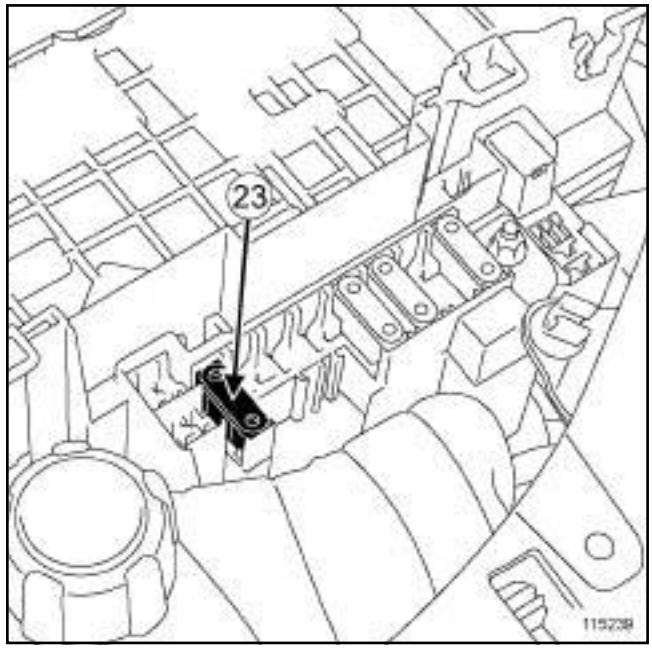


M4R, and DP0

115222

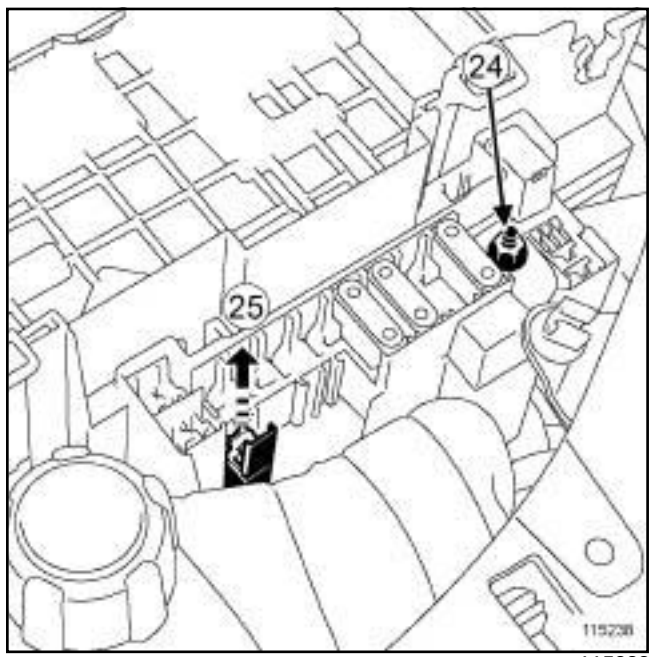
❏ Unclip the electrical wiring connector (**21**) .

❏ Disconnect the electrical wiring connector (**21**) .



115231

❏ Remove the nut (**22**) from the protective fuse mounting wiring.

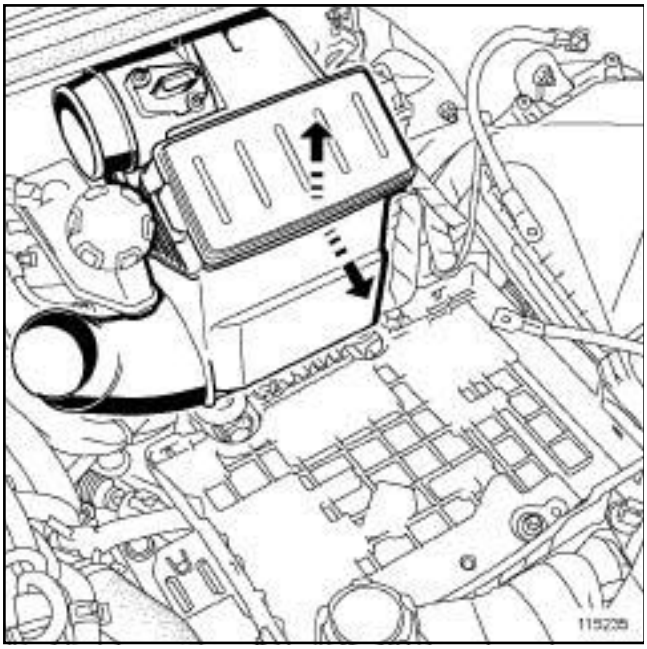


❏ Move aside the protective fuse mounting wiring.

❏ Remove the battery (see **Battery: Removal - Refitting**) (80A, Battery).

115239

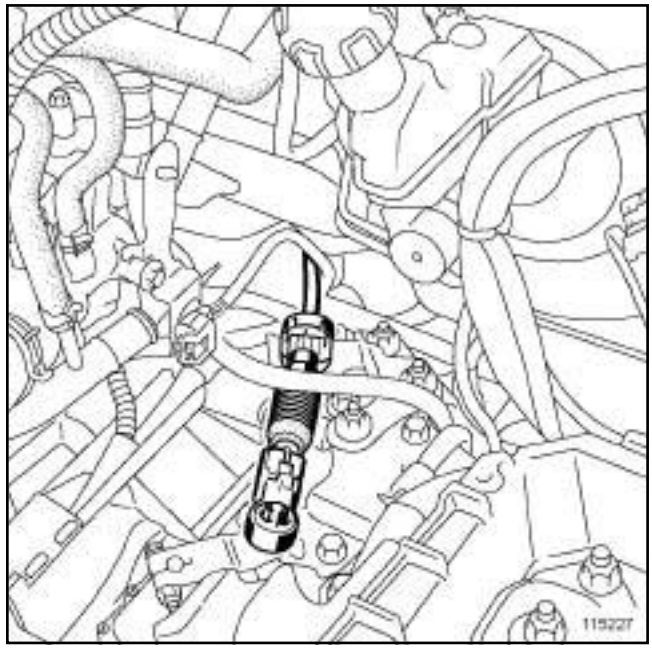
❏ Remove the fuse (**23**) .



115238

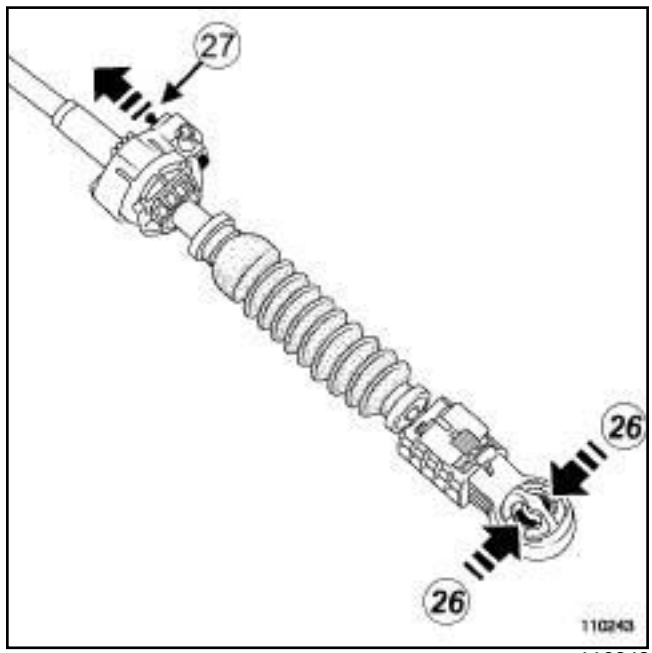
❏ Remove the nut (**24**) from the supply wiring of the power supply fuse unit.

❏ Disconnect the supply wiring from the power supply fuse unit.



❏ Extract the fuse holder from the power supply fuse unit (**25**) .

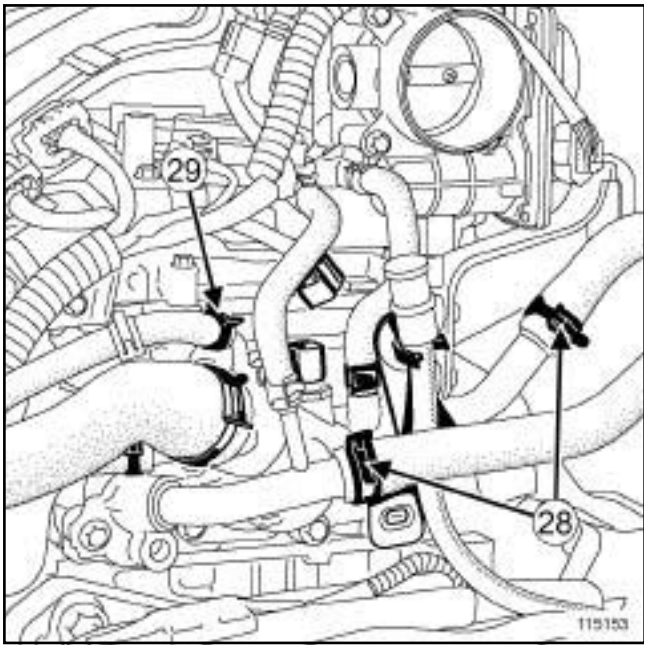
❏ Remove the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery).



115235

❑ Remove the air filter unit in the direction of the arrows.

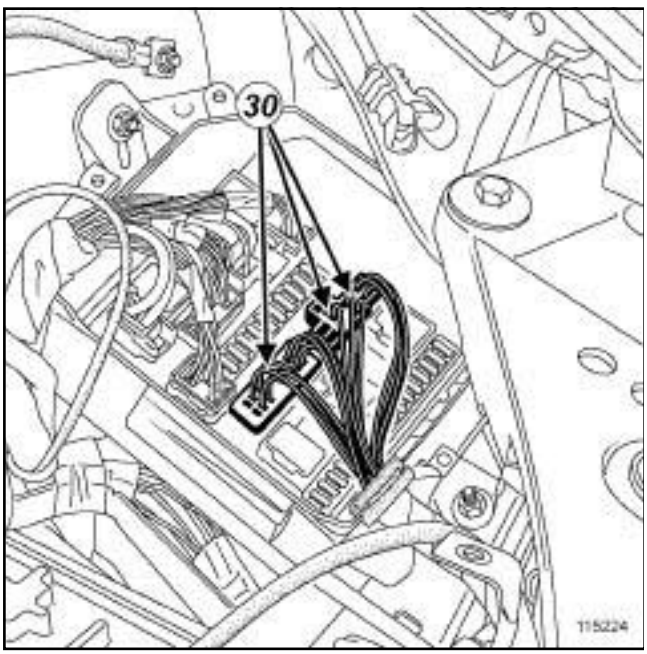
115227



110243

❑ Detach the automatic transmission control cable ball joint by pressing at (**26**) .

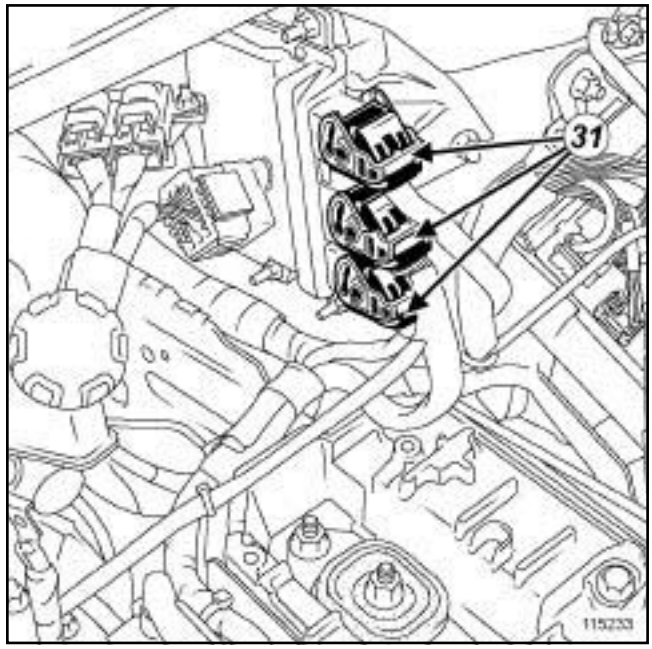
❑ Pull out the automatic transmission control cable by pulling tab (**27**) .



M4R, and DP0

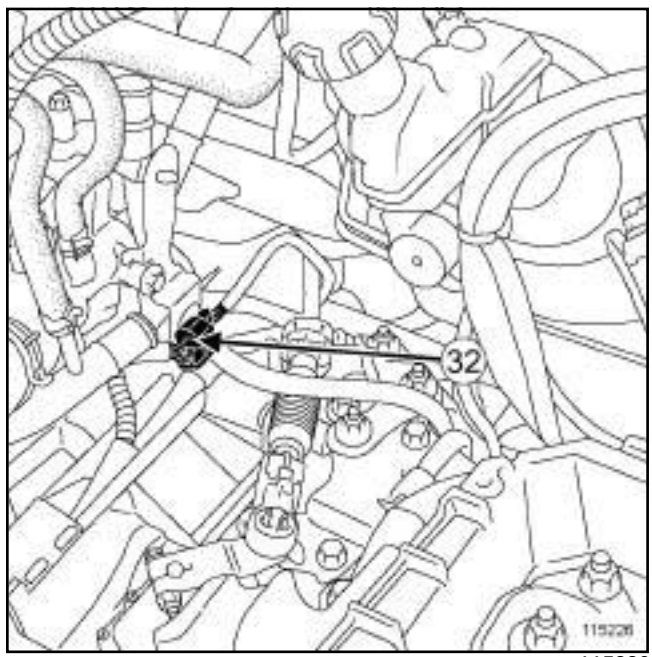
115153

❏ Disconnect the hoses from:



- the heater matrix (**28**) ,
- the expansion bottle (**29**) .

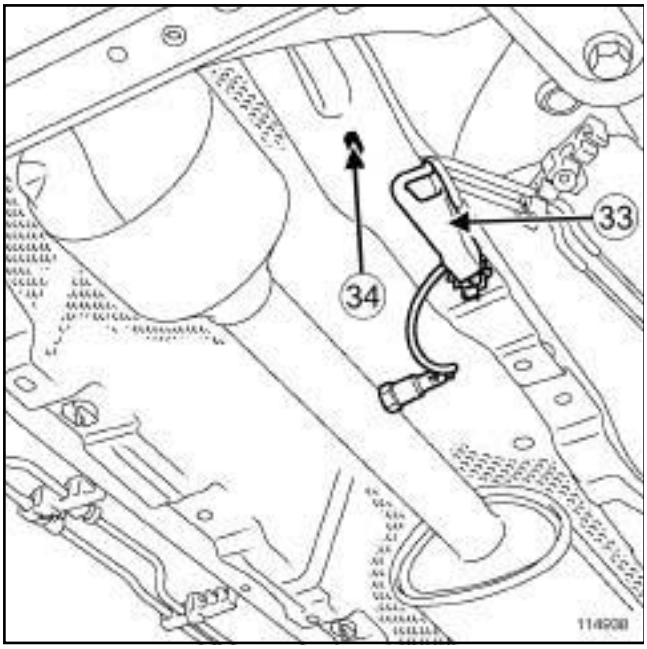
115224



❏ Remove the Protection and Switching Unit cover.

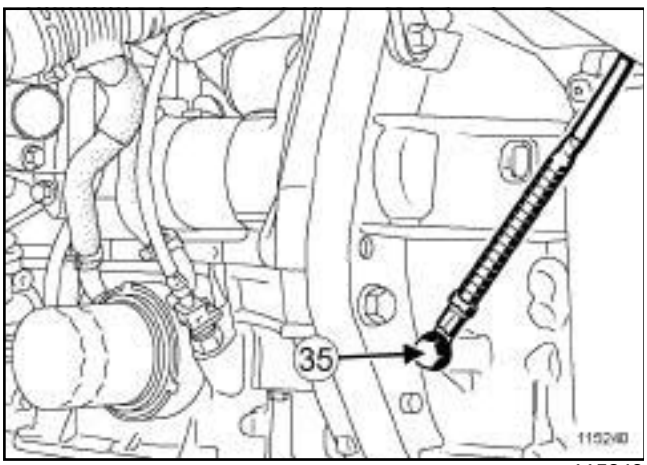
❏ Disconnect the engine electrical wiring connectors (**30**) from the Protection and Switching Unit.

115233



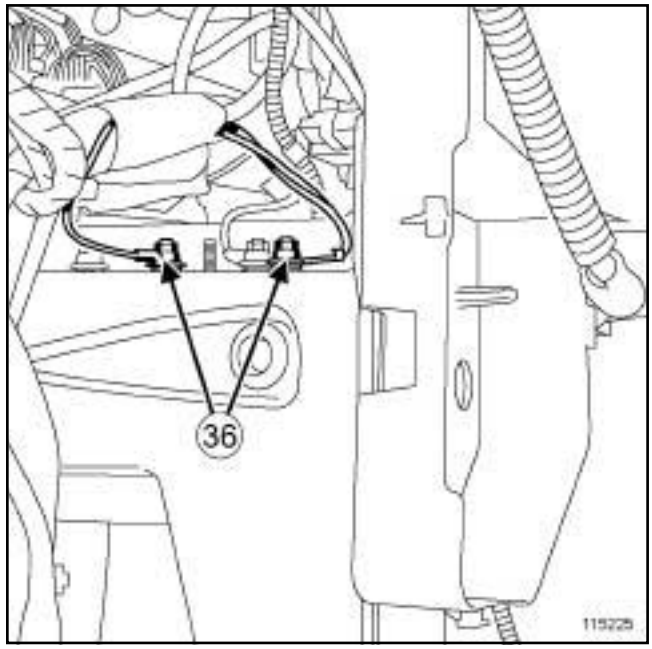
❏ Disconnect the engine electrical wiring connectors (**31**) from the injection computer.

115226



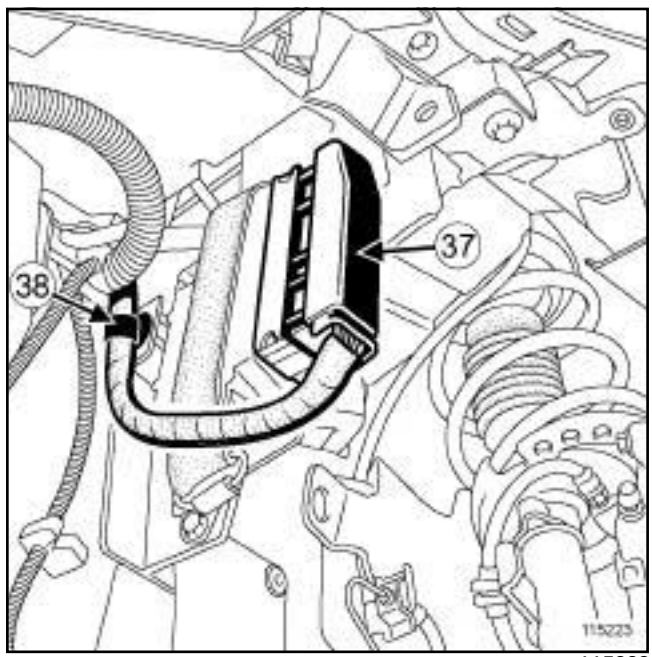
❏ Disconnect the upstream oxygen sensor connector (**32**) .

M4R, and DP0



114938

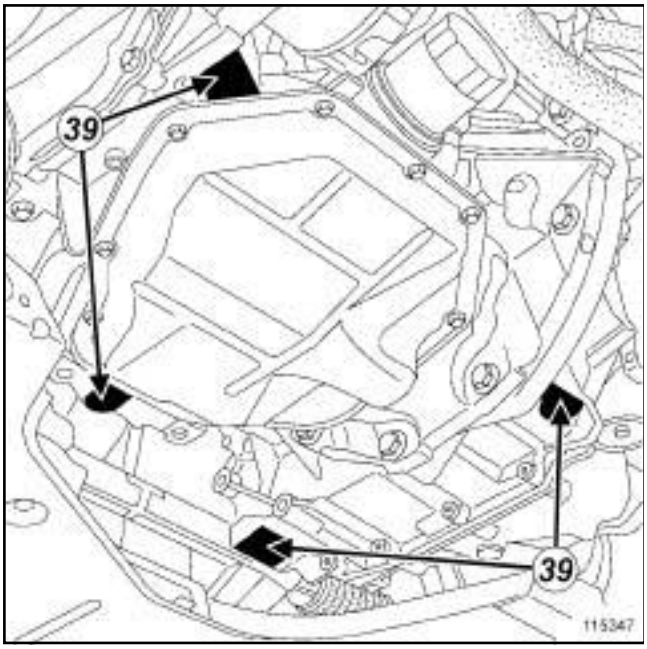
- ❏ Remove the plastic cover (**33**) .
- ❏ Detach the downstream oxygen sensor connector at (**34**) .
- ❏ Disconnect the downstream oxygen sensor connector.
- ❏ Unclip the downstream oxygen sensor electrical wiring from the power-assisted steering box.
- ❏ Feed the downstream oxygen sensor electrical wiring into the engine compartment.



115240

- ❏ Disconnect the automatic transmission earth wire (**35**) .

115225

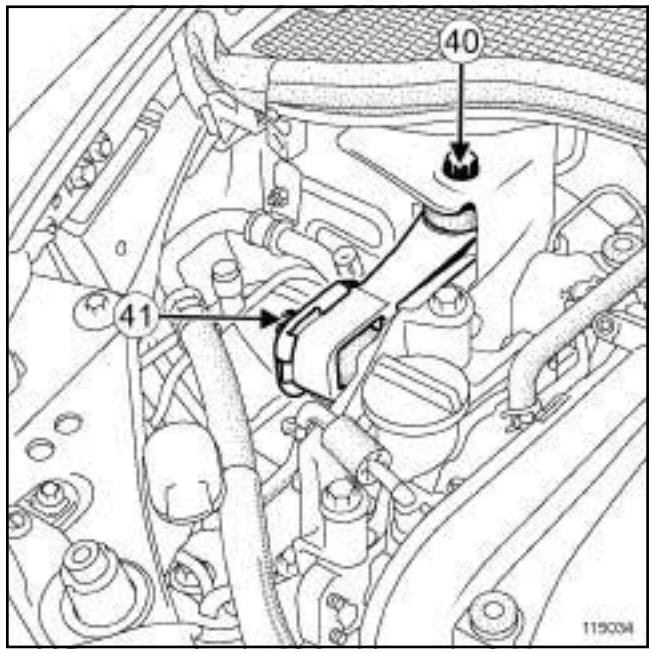


- ❏ Disconnect the earth cables (**36**) from the side member.

115223

- ❏ Disconnect the automatic transmission connector (**37**) .
- ❏ Unclip the automatic transmission electrical wiring at (**38**) .
- ❏ Feed the automatic transmission electrical wiring into the engine compartment.

M4R, and DP0

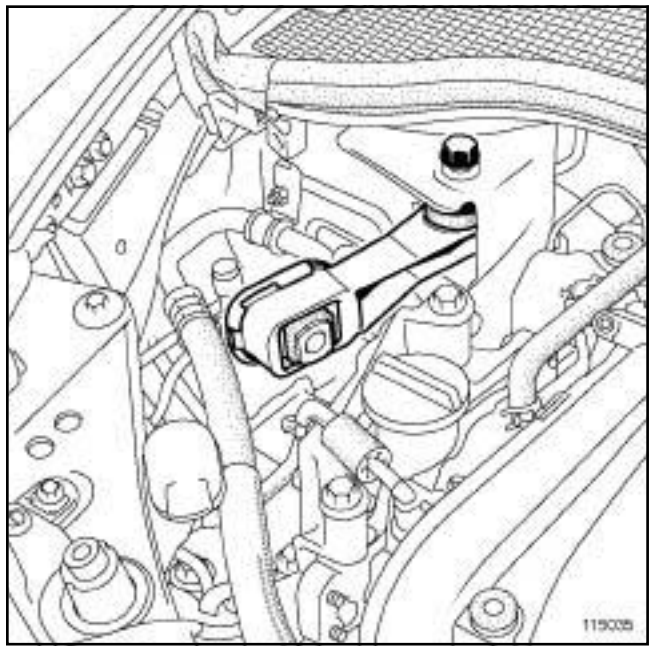


115347

❏ Position the **(Mot. 1390)** under the «engine - gearbox » assembly.

❏ Lower the vehicle down onto the pads of the **(Mot. 1390)**.

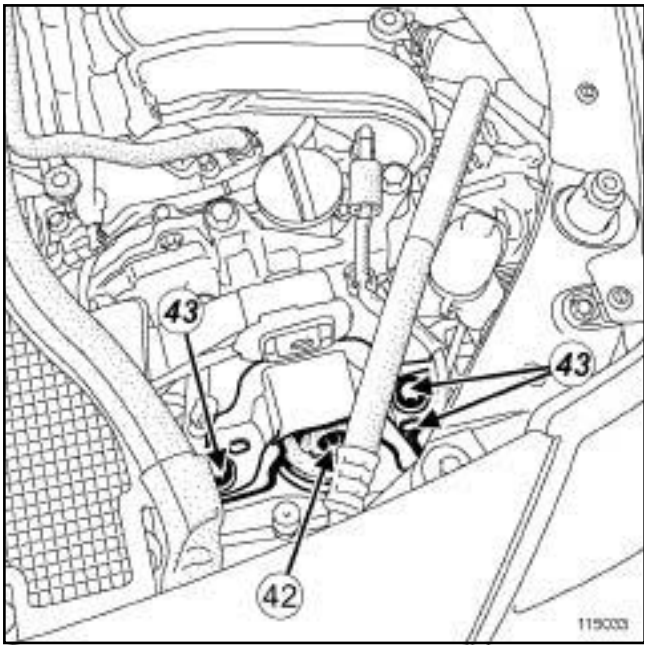
❏ Adjust the pads of the tool **(Mot. 1390)** at (**39**) to ensure that the « engine - gearbox » assembly is stable.



II - OPERATION FOR REMOVAL OF PART CONCERNED

115034

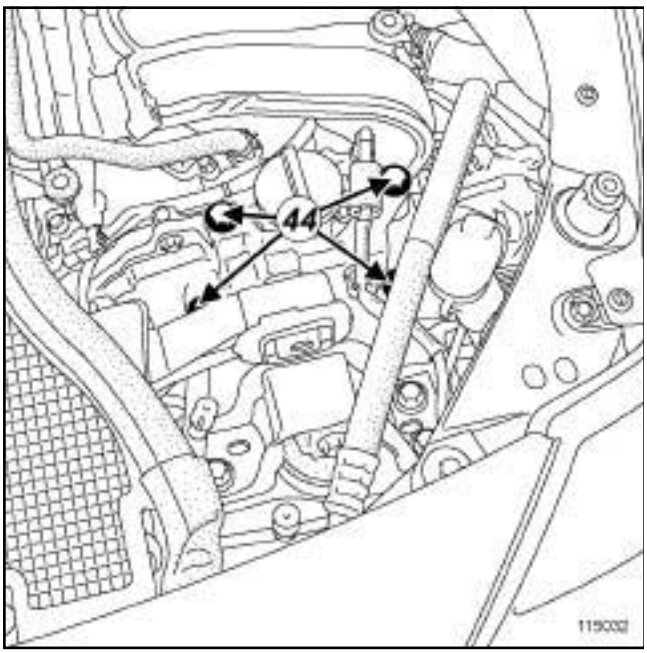
❏ Undo the upper engine tie-bar bolt (**40**) .



❏ Remove the upper engine tie-bar bolt (**41**) .

115035

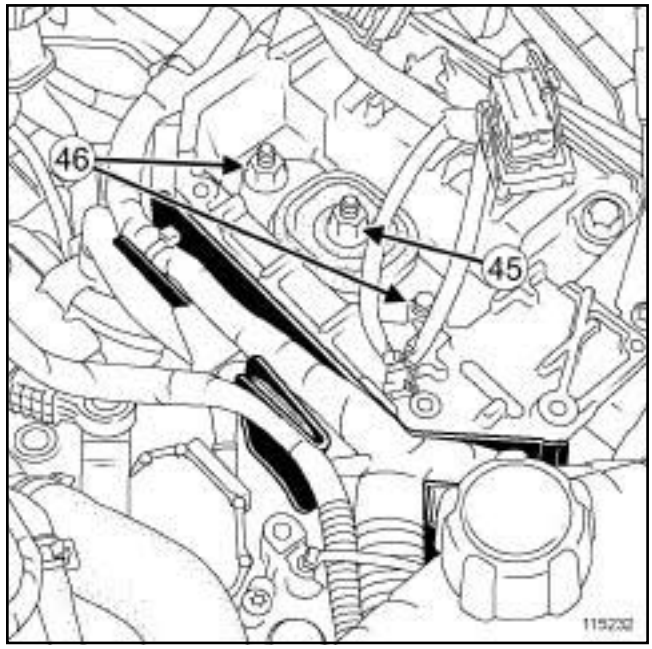
❏ Remove the upper engine tie-bar.



M4R, and DP0

115033

❑ Remove:

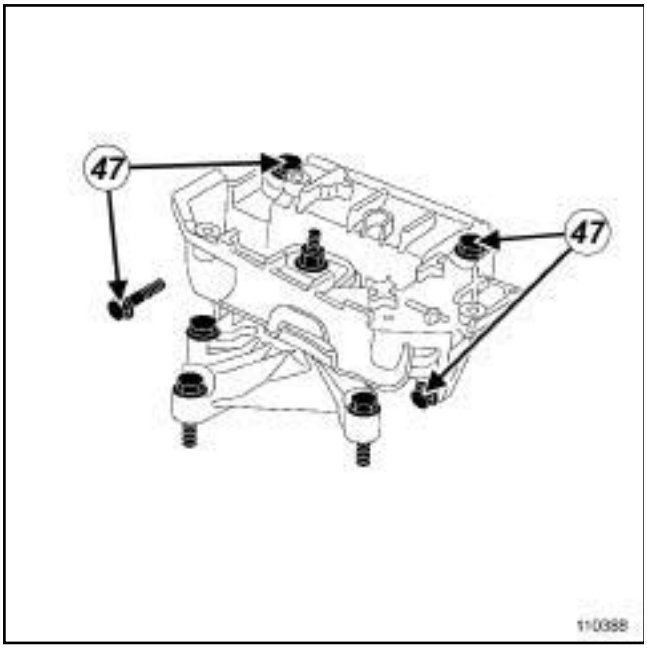


- the bolt (**42**) of the rubber pad on the right-hand suspended engine mounting,
- the bolts (**43**) of the rubber pad on the right-hand suspended engine mounting.

115032

❑ Remove:

- the bolts (**44**) from the right-hand suspended engine mounting cover,
- the right-hand suspended engine mounting cover,
- the rubber pad on the right-hand suspended engine mounting.



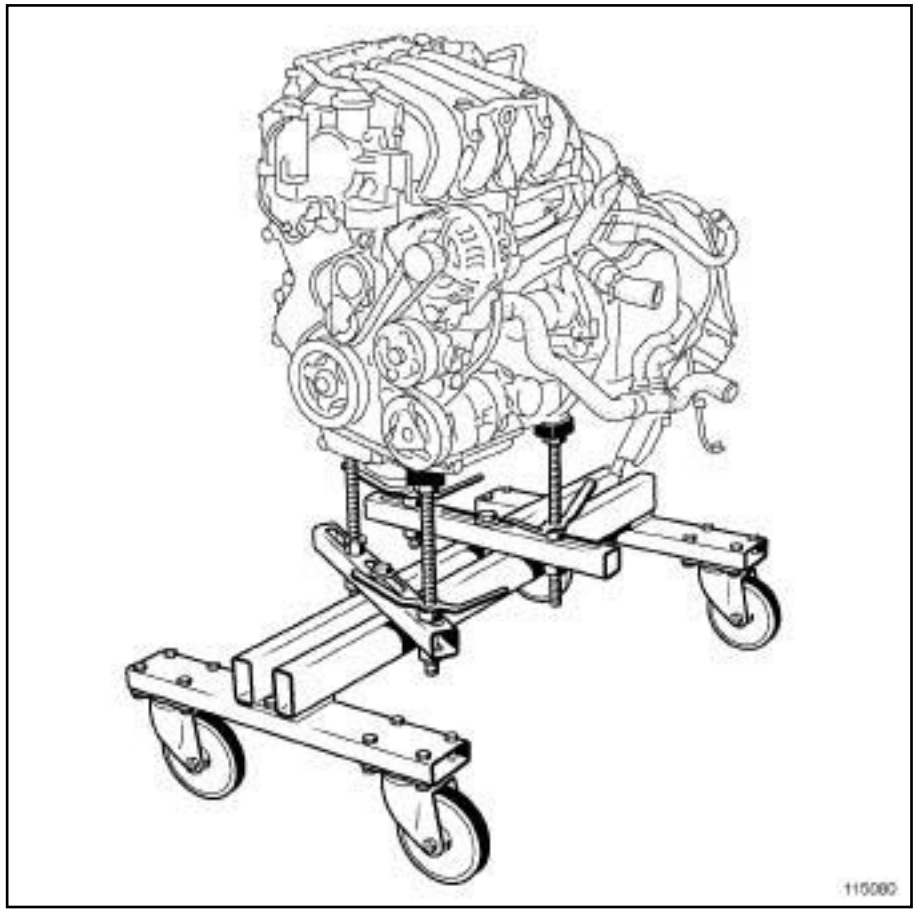
115232

❑ Separate the neck of the electrical wiring from the gearbox support.

❑ Remove:

- the left-hand suspended engine mounting shaft nut (**45**) ,
- the nuts (**46**) from the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting rubber pad.

M4R, and DP0



110388

❏ Remove:

- the bolts (**47**) from the left-hand suspended engine mounting support on the body,
- the left-hand suspended engine mounting support on the body.

❏ Gently move the engine towards the front of the vehicle.

M4R, and DP0

115080

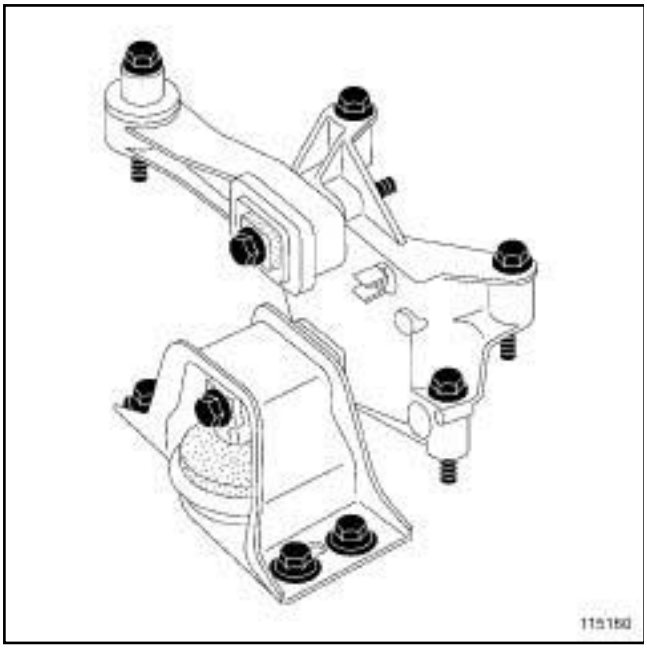
❑ Lift the vehicle to remove the « engine-gearbox » assembly.

Note:

Check that no component obstructs the movement of the body around the «engine - gearbox » assembly.

REFITTING

I - REFITTING PREPARATION OPERATION



❑ For standard engine replacements (see **Engine: Standard replacement**) (Technical Note 6020A, 10A, Engine and peripherals).

❑ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Position the « engine - gearbox » assembly in the body.

M4R, and DP0

115160

❏ Fit:

- the rubber pad on the right-hand suspended engine mounting.
- the right-hand suspended engine mounting cover.

❏ Pretighten:

- the bolts for the right-hand suspended engine mounting cover,
- the bolts for the right-hand suspended engine mounting rubber pad.

Note:

Allow the two parts to move freely.

❏ Fit the bolt of the right-hand suspended engine mounting rubber pad.

❏ Tighten to torque and in order:

- the **bolts of the right-hand suspended engine mounting cover (62 N.m)**,
- the **bolts for the right-hand suspended engine mounting rubber pad (62 N.m)**,
- the **bolt of the right-hand suspended engine mounting rubber pad (105 N.m)**,
- the **upper engine tie-bar bolts (105 N.m)**.

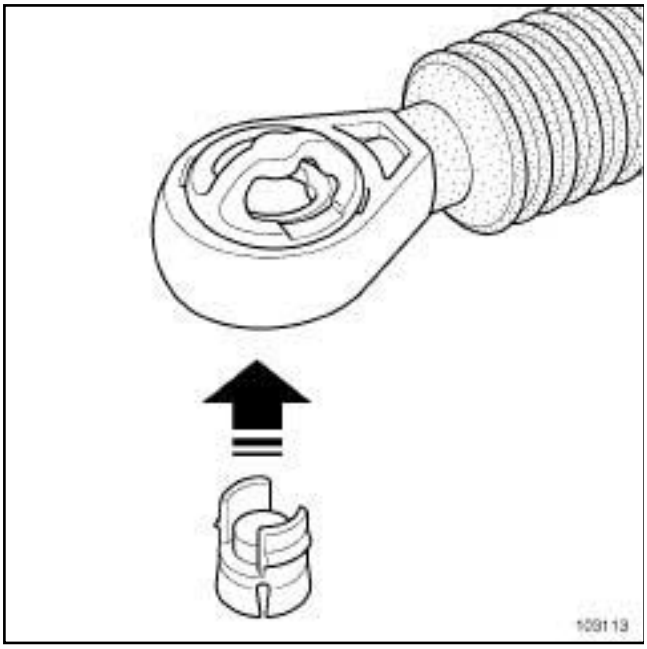
❏ Refit:

- the left-hand suspended engine mounting support on the body,
- the left-hand suspended engine mounting support bolts,
- the left-hand suspended engine mounting rubber pad,
- the nuts for the left-hand suspended engine mounting rubber pad,
- the left-hand suspended engine mounting shaft nut.

❏ Tighten to torque:

- the **support bolts for the left-hand suspended engine mounting on the vehicle body (62 N.m)**,
- the **left-hand suspended engine mounting rubber pad nuts (62 N.m)**,
- the **left-hand suspended engine mounting central nut (62 N.m)**.

III - FINAL OPERATION



❏ Connect:

- the engine electrical wiring,
- the air conditioning pipe unions,
- the cooling hoses,
- the air flowmeter connector,
- the fuel supply pipe,
- the petrol vapour rebreathing pipe,
- the brake servo pipe on the inlet manifold.

❏ Clip:

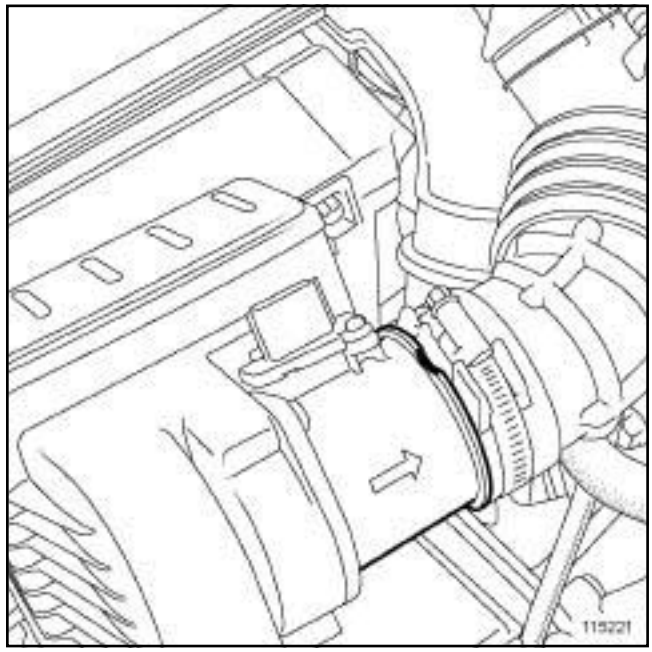
- the fuel supply pipe,
- the air flowmeter connector electrical wiring.

M4R, and DP0

103113

❏ Be sure to replace the clip on the gearbox control cable ball joint each time it is removed.

❏ Fit the gearbox control cable.

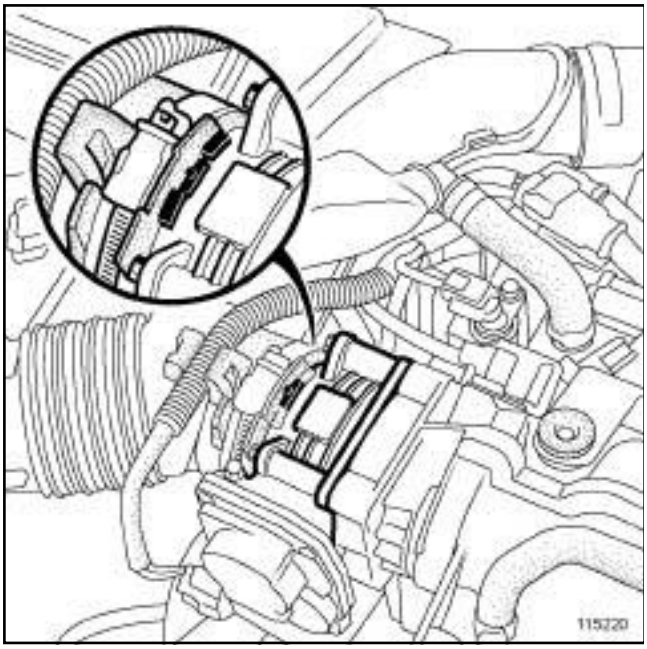


❏ Fit a new exhaust flange seal.

❏ Tighten to torque:

- the **exhaust flange bolts (21 N.m)**,
- the **engine tie-bar bolt on the engine (180 N.m)**,
- the **engine tie-bar bolt on the subframe (105 N.m)**.

❏ Refit:

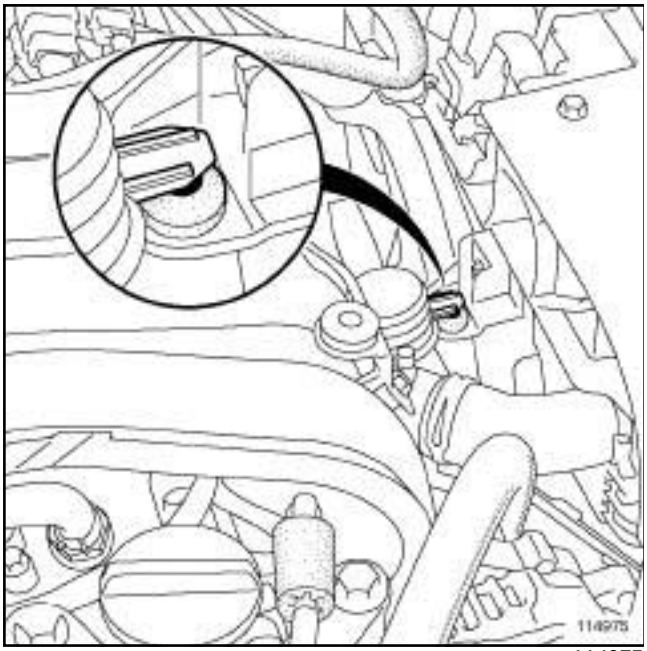


- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the front left-hand wheel driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (41A, Front lower structure),
- the front end panel air resonator (see **12A**, **Fuel mixture**, **Air resonator: Removal - Refitting**, page **12A-10**) ,
- the front impact cross member (see **Front impact cross member: Removal - Refitting**) (41A, Front lower structure),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front sections of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

115221

❏ Fit the air inlet duct on the air flowmeter, paying attention to the fitting mark.

M4R, and DP0

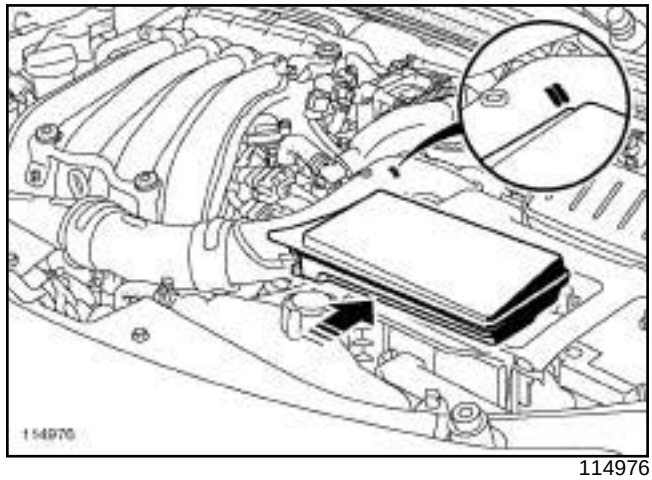


115220

❏ Fit the air inlet duct on the motorised throttle valve, paying attention to the fitting mark.

❏ Connect the oil vapour rebreathing hose on the rocker cover.

❏ Torque tighten the **air inlet duct clips (6 N.m)**.



❏ Clip the electrical wiring onto the air inlet duct.

114975

❏ Before refitting the air intake sleeve, check that the upper mounting is correctly clipped onto the front end panel air resonator.

❏ Refit the air intake sleeve.

114976

❏ Push the air resonator towards the rear of the vehicle so that the corner of the air resonator is between the two lines marked on the air inlet hose.

❏ Press on the air resonator to fit it into the battery cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Perform the following operations:

- fill the automatic transmission (see **Automatic gearbox oil: Draining - Filling**) (23A, Automatic transmission),
- fill the refrigerant circuit using a **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).
- fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit the engine cover.

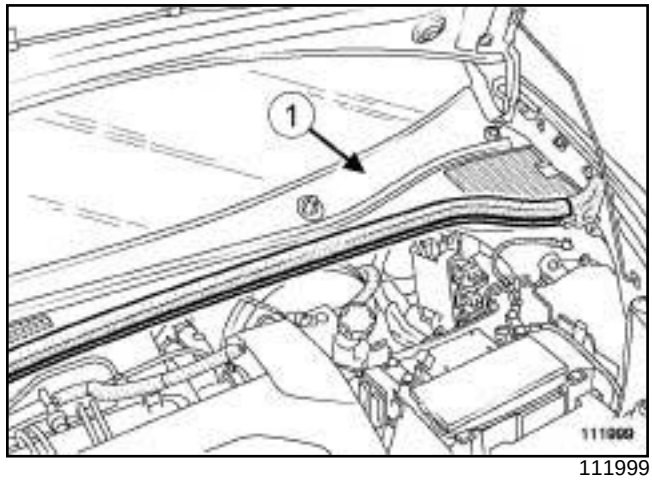
K9K, and JH3 or JR5 or TL4

Special tooling required	
Mot. 1390	Support for removal - refitting of engine - gearbox assembly

Equipment required
refrigerant charging station

Tightening torques ▽	
left-hand suspended engine mounting shaft nut	**62 N.m**
engine tie-bar bolts	**105 N.m**
front cross member bolts	**105 N.m**
air conditioning pipe bolts	**8 N.m**
nut mounting the inter-cooler inlet air pipe on the alternator	**8 N.m**

REMOVAL



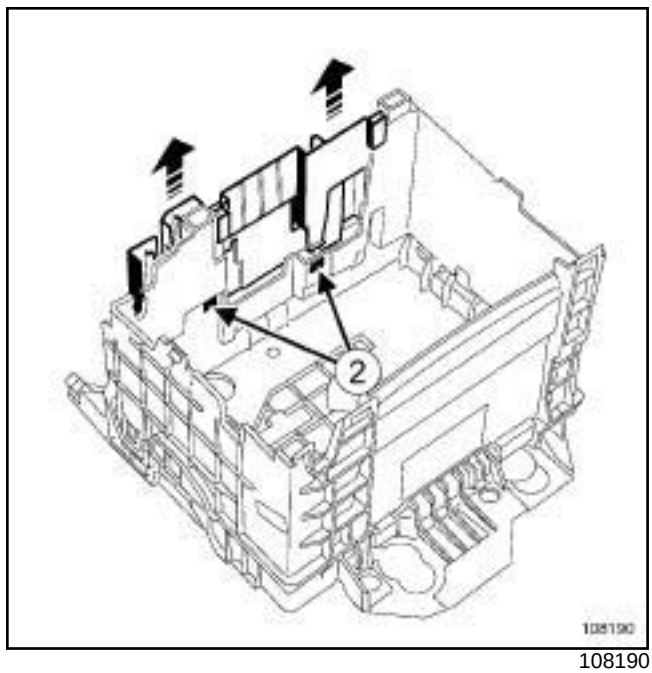
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove the front engine cover.

K9K, and 772

❑ Discharge the pressure in the fuel supply circuit of the exhaust fuel injector (see **19B**, **Exhaust**, **Exhaust fuel injector: Removal - Refitting**, page **19B-64**) .

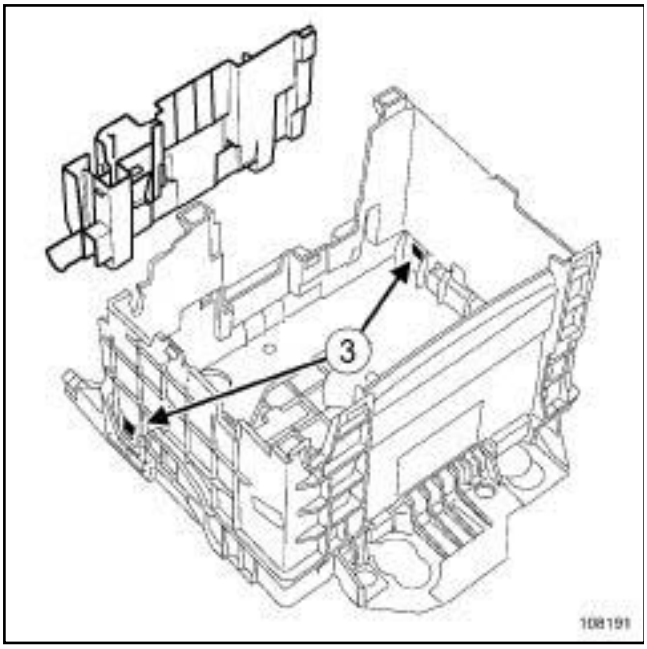


111999

❑ Remove:

- the scuttle panel grille (**1**) (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille.

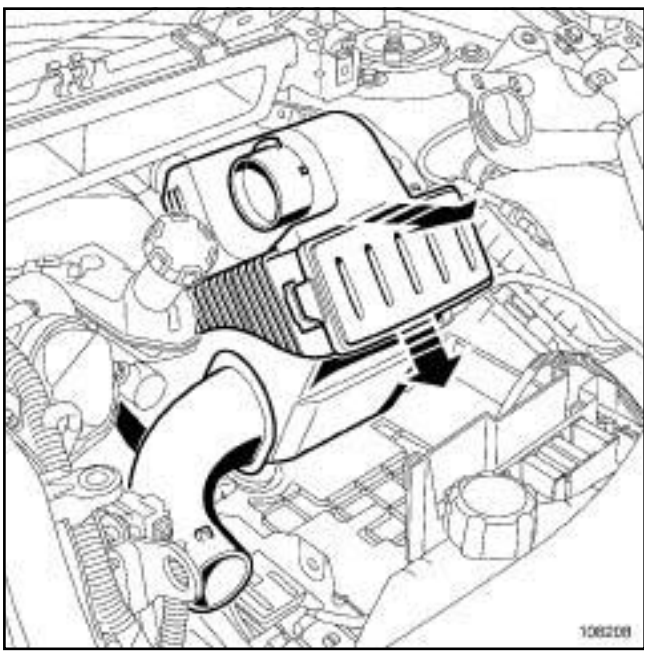
❑ Remove the battery (see **Battery: Removal - Refitting**) (80A, Battery).



108190

❑ Unclip the power supply fuse board support at (**2**) .

❑ Move the support from the fuse board as indicated by the arrows.

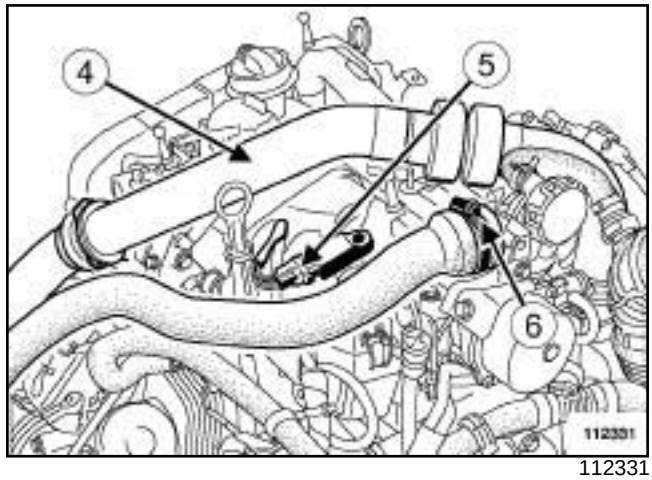


K9K, and JH3 or JR5 or TL4

108191

❏ Remove the shielding by unclipping at (**3**) .

❏ Disconnect the connector from the air flowmeter (if equipped).



108208

❏ Loosen the air inlet duct clip on the air filter unit.

❏ Remove:

- the air filter unit,
- the battery tray base.

112331

❏ Loosen the intercooler air inlet pipe nut on the alternator.

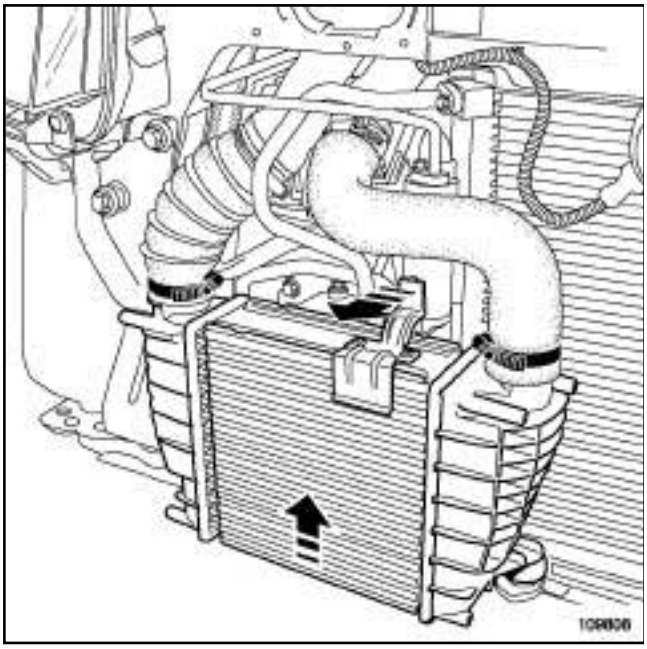
❏ Remove the air duct bolt on the rocker cover.

❏ Separate the clips on the turbocharger air duct and on the intercooler air inlet pipe.

❏ Unclip the air duct (**4**) on the turbocharger and the intercooler air inlet pipe.

❏ Disconnect the connector (**5**) from the inlet air pressure sensor.

❏ Loosen



❏ Remove:

- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

K9K, and 764 or 772

❏ Disconnect the electrical connector from the damper valve (if equipped).

K9K, and JH3 or JR5 or TL4

109808

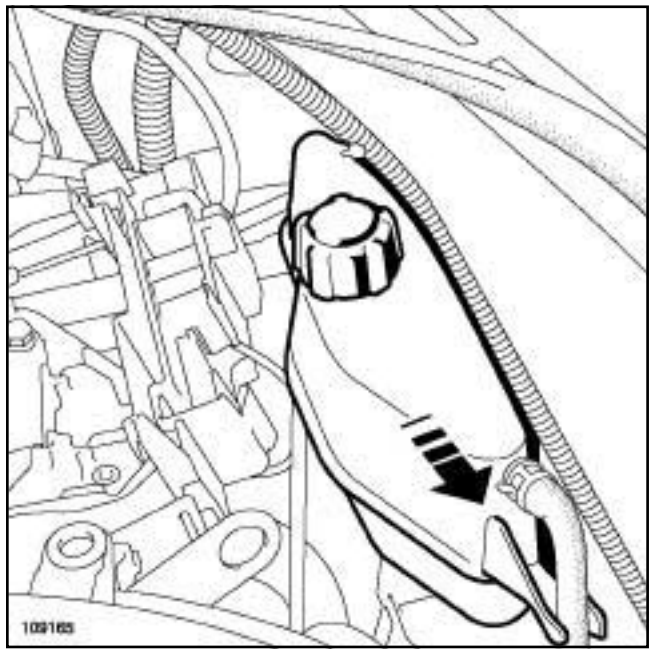
❏ Remove the air duct clips on the intercooler.

❏ Pull the tab and lift the intercooler from its mounting studs.

❏ Remove:

- the intercooler,
- the nut from the air ducts on the alternator,
- the turbocharging air ducts.

❏ Drain:

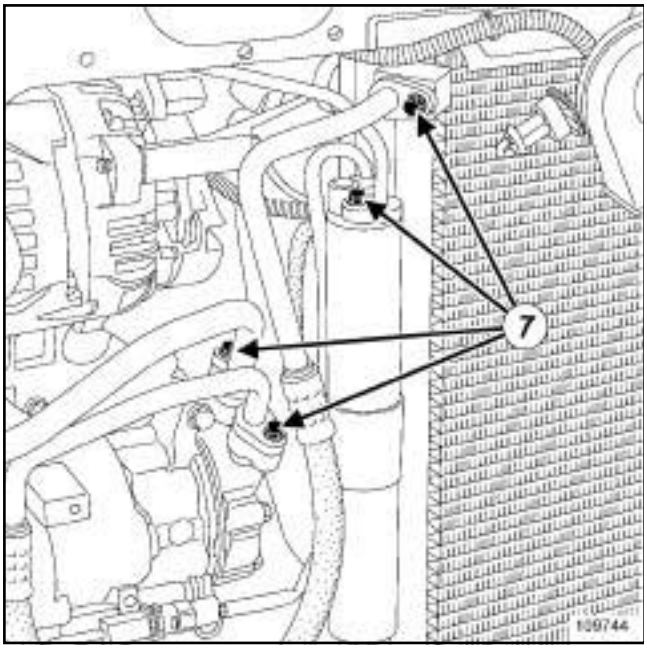


- the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) ,
- the manual gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- the engine oil if necessary (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- the refrigerant fluid circuit using the **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning).

❏ Remove:

- the front left-hand driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❏ Disconnect:

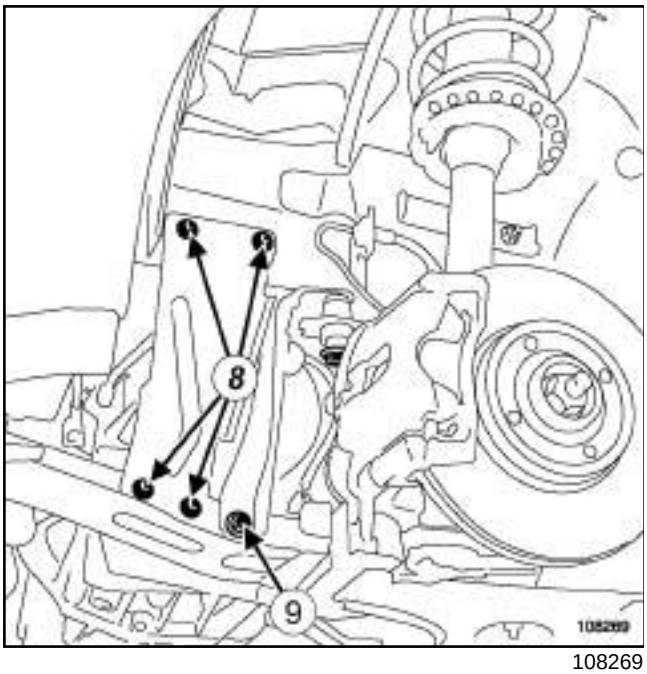


- the engine cooling fan assembly connectors,
- the top hose on the coolant outlet unit,
- the passenger compartment heating hoses.

109165

❏ Extract the expansion bottle from its housing by following the direction of the arrow and put it to one side.

K9K, and JH3 or JR5 or TL4



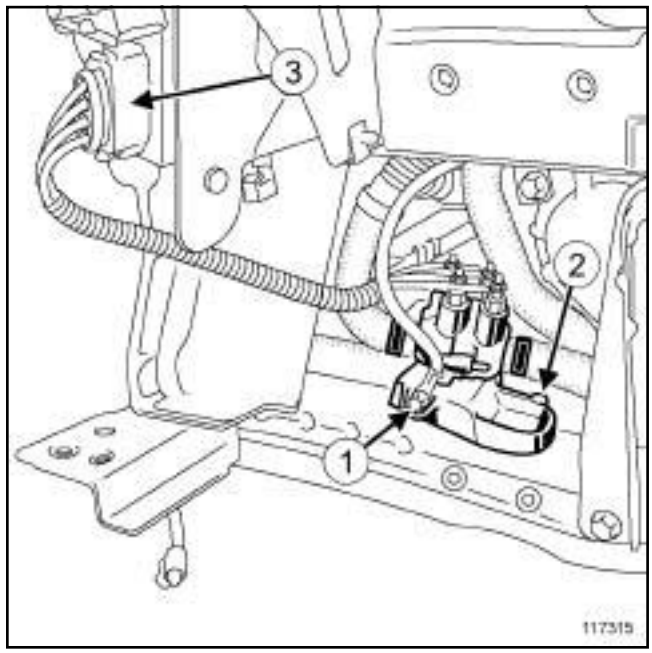
109744

❏ Disconnect the pressure switch connector on the condenser.

❏ Remove the bolts (**7**) from the air conditioning pipes.

WARNING

To prevent moisture from entering the system, place plugs on the cold loop components which are open to the air.

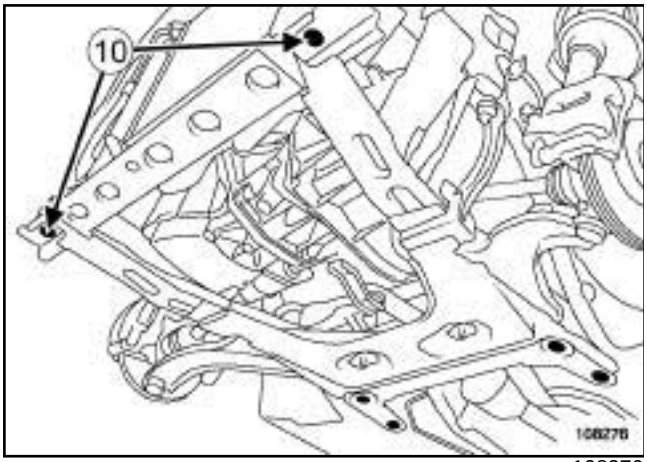


108269

❏ Remove:

- the left-hand side reinforcement bolts (**8**) ,
- the left-hand side reinforcement,
- the lower bolt (**9**) from the side tie rods.

K9K, and 772



117315

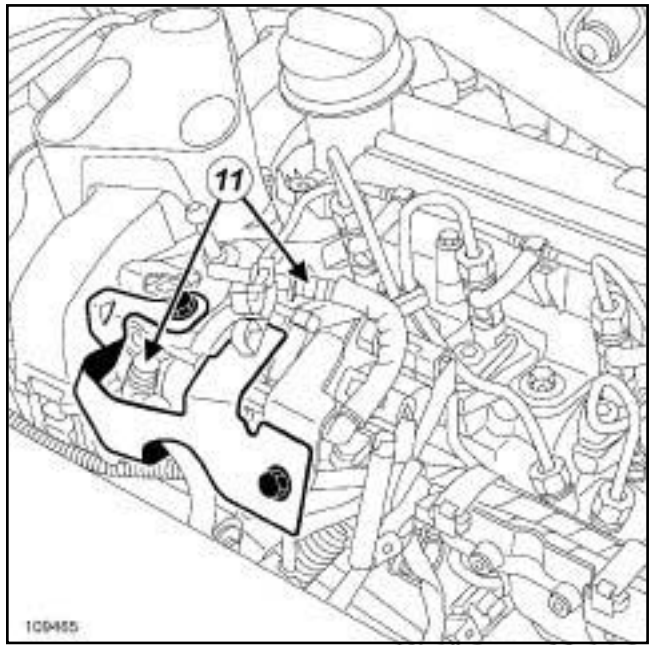
❏ Remove:

- the bolt (**1**) mounting the earth on the thermoplunger unit and the coolant pump mounting,
- the bolt (**2**) mounting the thermoplunger unit and the coolant pump mounting on the radiator mounting cross member.

❏ Disconnect the connector (**3**) from the thermoplunger unit.

K9K, and JH3 or JR5 or TL4

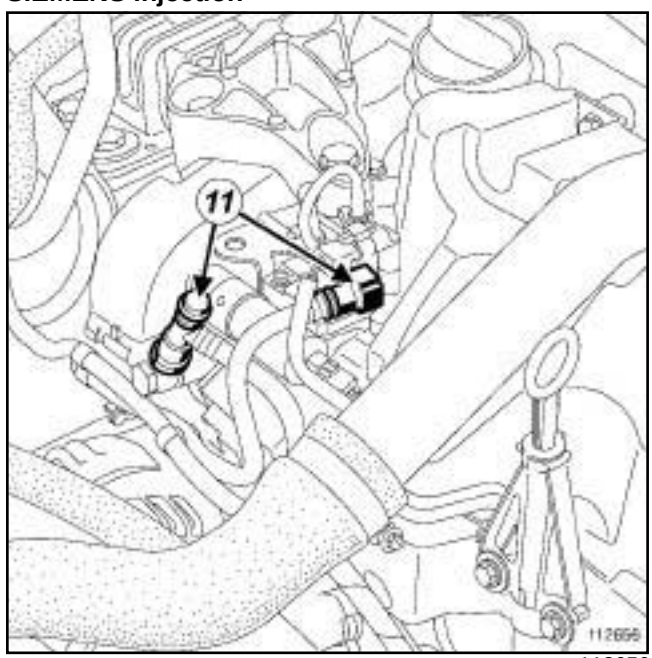
108276



❏ Remove:

- the front cross member bolts (**10**) ,
- the front radiator cross member,
- the cooling radiator assembly,
- the earth wiring.

❏ Disconnect:

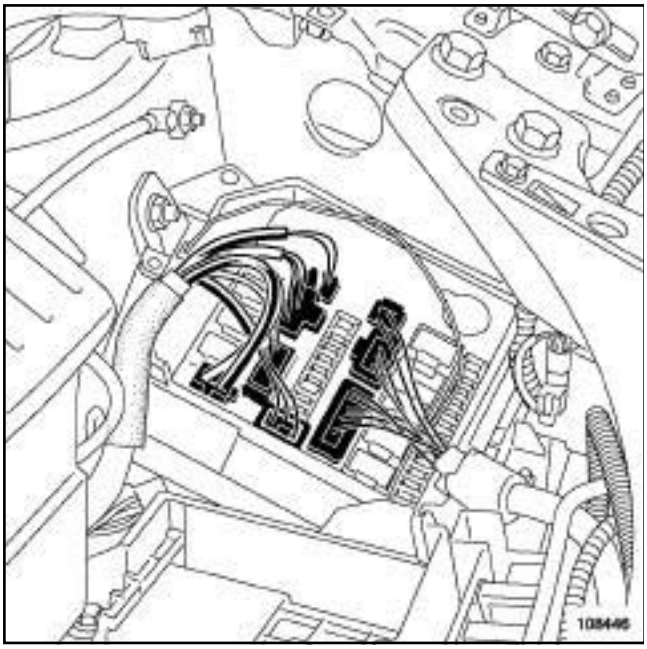


- the pre-postheating unit connector ,
- the coolant temperature sensor.

DELPHI injection

109465

SIEMENS injection

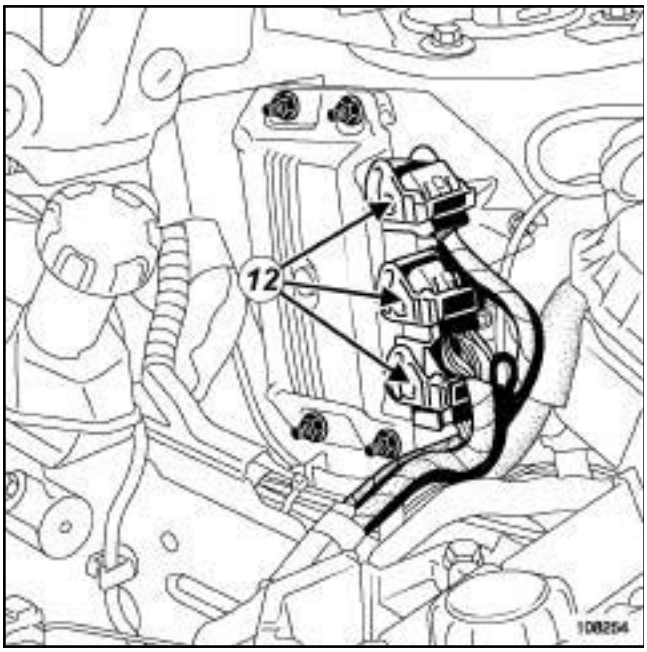


112656

❏ Disconnect the fuel supply and return pipes on the high-pressure pump (**11**) .

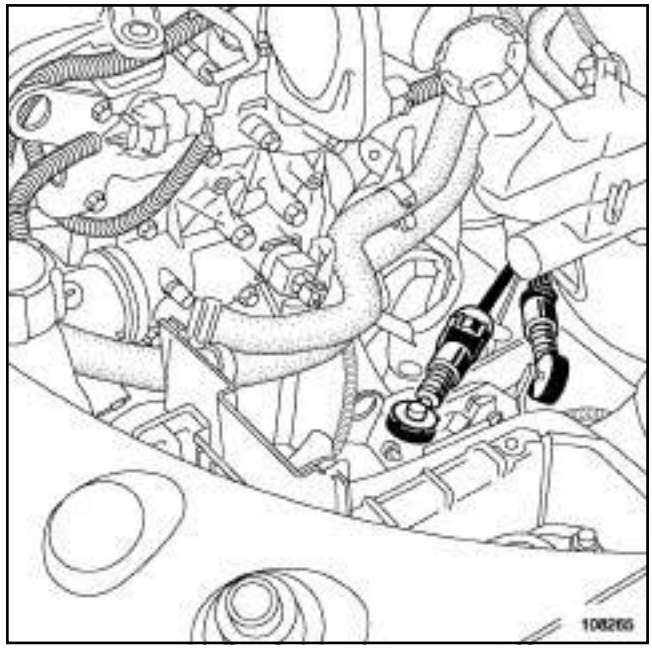
❏ Move aside the engine wiring.

❏ Remove the Protection and Switching Unit cover.



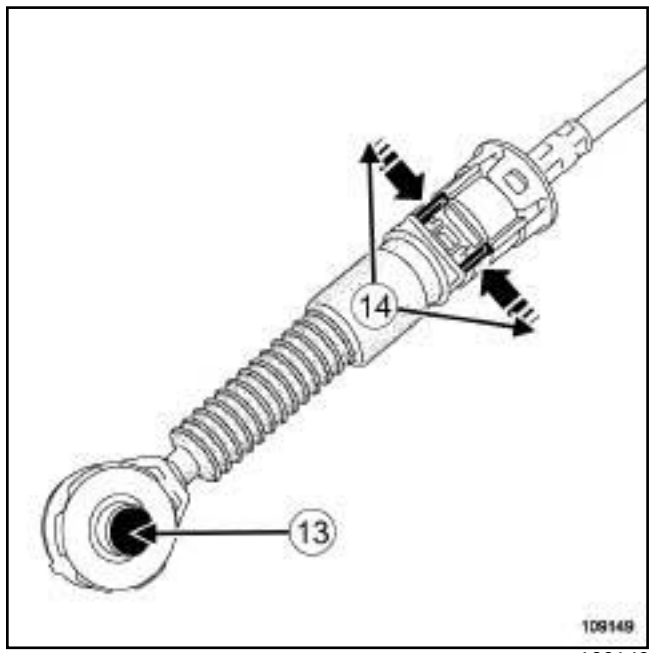
K9K, and JH3 or JR5 or TL4

108446



❑ Disconnect:

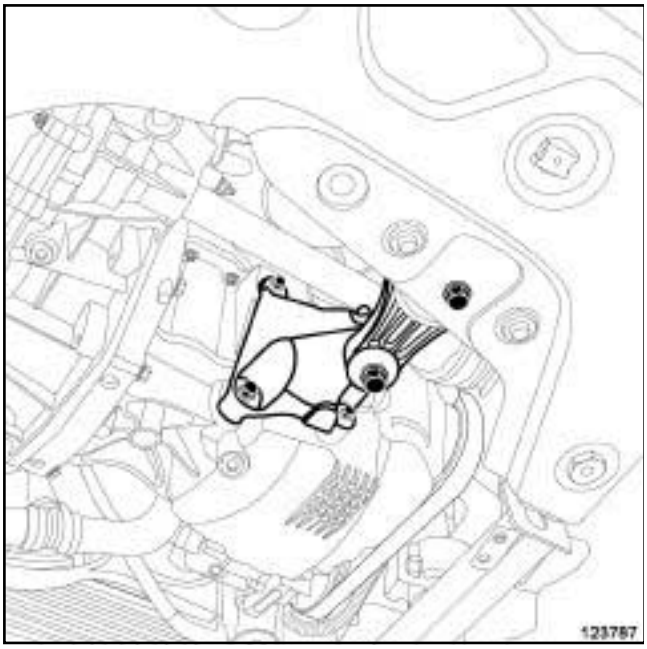
- the Protection and Switching Unit connectors,
- the brake servo pipe from the vacuum pump,
- the engine fuses **30A** and **70A**,
- the fuse holder on the fuse board,
- the feed wiring on the fuse board,
- the supply wiring on the battery protection fuse box.



108254

❑ Disconnect the injection computer connectors (**12**) .

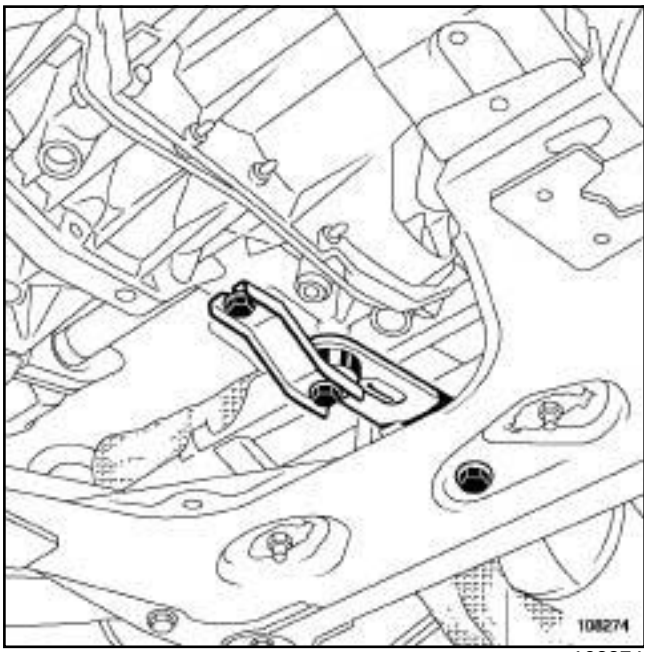
108265



109149

❑ Remove:

- the gear control cables on the gearbox by pushing at (**13**) ,
- the gear control cables from the sleeve stops by pressing at (**14**) ,
- the wiring harness channel mountings on the gearbox.

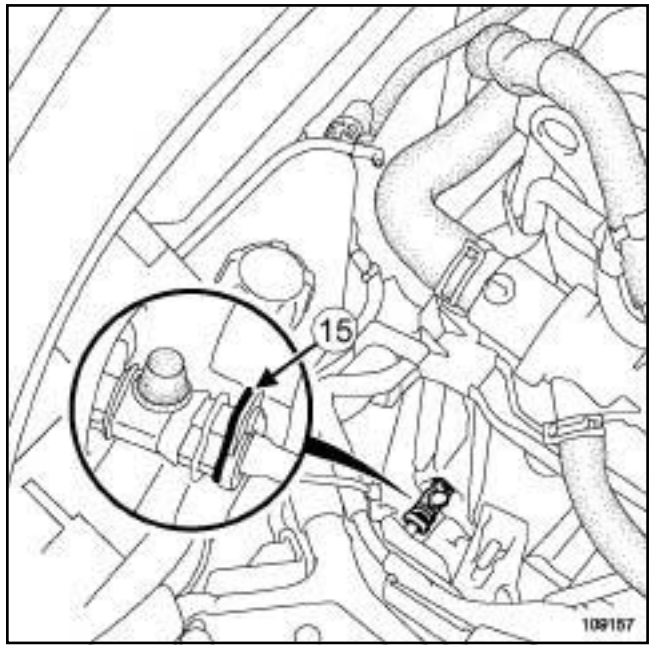


K9K, and JH3 or JR5 or TL4

K9K/TL4

123787

K9K/JH3, JR5



108274

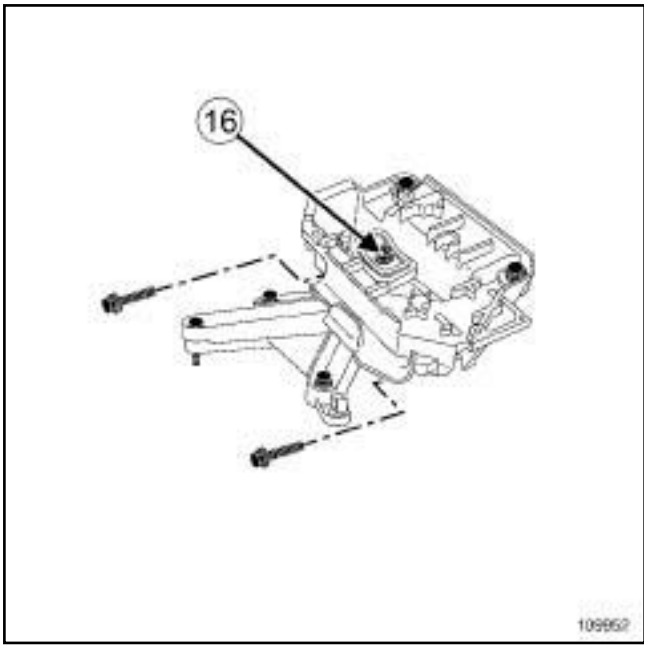
❑ Remove:

- the engine tie-bar,
- the exhaust downpipe bolts.

❑ Drain the brake fluid reservoir down to the clutch master cylinder pipe union using a syringe.

109157

❑ Remove the clip at the wheel end (**15**) .



❑ Disconnect the clutch pipe from the clutch slave cylinder.

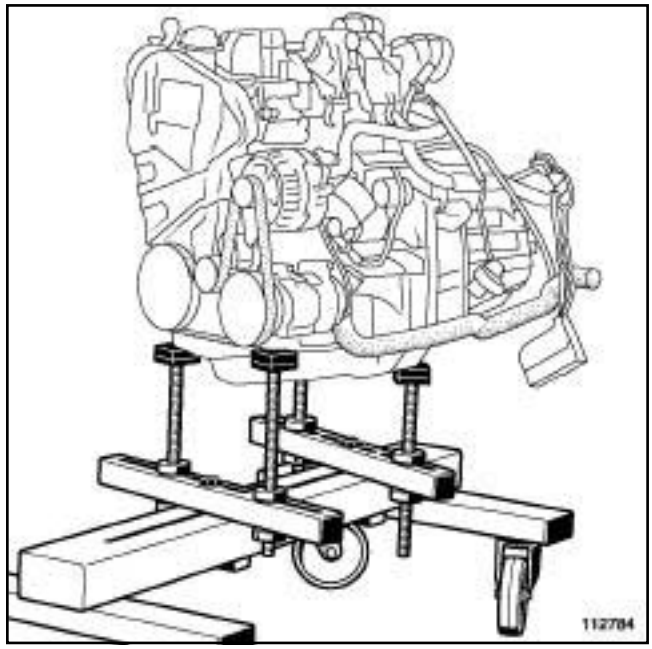
❑ Support the « engine-gearbox assembly» on the **(Mot. 1390)**.

❑ Mark the positions of the suspended engine mountings on the body.

❑ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

K9K, and JH3 or JR5 or TL4

109952



❑ Remove the left-hand suspended engine mounting shaft nut (**16**) .

K9K, and 772

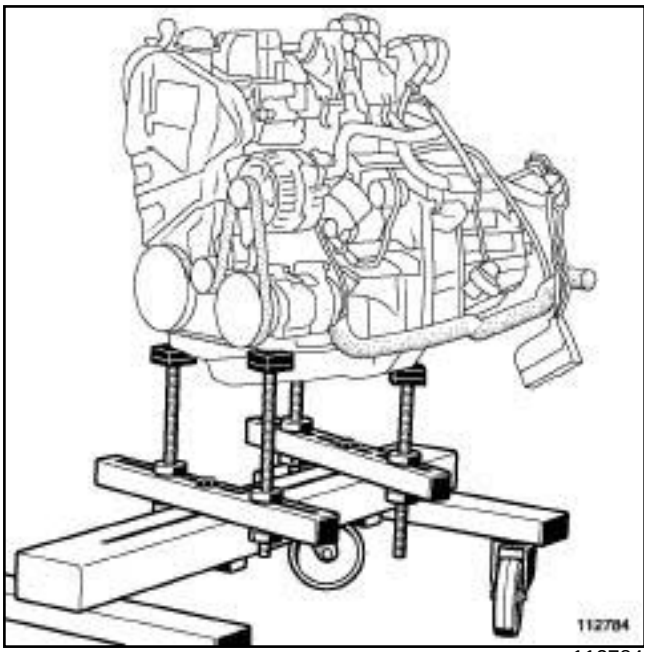
❑ Disconnect the fuel supply union from the diesel injector on the catalytic pre-converter.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Raise the vehicle, moving the engine towards the front.

112784

❑ Extract the « engine - gearbox » assembly from the engine compartment.



REFITTING

I - REFITTING PREPARATION OPERATION

❑ For standard engine replacements (see **Standard replacement**) (Technical Note 6006A, 10A, Engine and peripherals).

K9K, and JH3 or JR5 or TL4

II - REFITTING OPERATION FOR PART CONCERNED

112784

❏ Position the « engine - gearbox » assembly in the engine compartment.

III - FINAL OPERATION

K9K, and 772

❏ Connect the fuel supply union to the diesel injector on the catalytic pre-converter.

❏ Fit the left-hand suspended engine mounting shaft.

❏ Refit:

- the left-hand suspended engine mounting shaft nut,
- the right-hand suspended engine mounting.

❏ Remove the tool **(Mot. 1390)**.

❏ Torque tighten the **left-hand suspended engine mounting shaft nut (62 N.m)**.

❏ Connect the clutch pipe.

❏ Bleed the clutch circuit (see **Clutch circuit: Bleed**) (37A, Mechanical component control).

❏ Refit:

- the exhaust downpipe bolts,
- the lower engine tie-bar.

❏ Torque tighten the **engine tie-bar bolts (105 N.m)**.

❏ Refit the gear control cables.

❏ Connect:

- the injection computer connectors,
- the supply wiring on the battery protection fuse box,
- the feed wiring on the fuse board,
- the fuse holder on the fuse board,
- the engine fuses **30A** and **70A**,
- the brake servo pipe on the vacuum pump,
- the Protection and Switching Unit connectors.

K9K, and 764 or 772

❏ Disconnect the electrical connector from the damper valve (if equipped).

❏ Fit the engine wiring.

❏ Connect the fuel supply and return pipes on the high-pressure pump.

❏ Connect:

- the coolant temperature sensor,
- the pre-postheating unit connector ,
- the earth wiring.

❏ Refit:

- the cooling radiator assembly,
- the front radiator cross member,
- the front cross member bolts.

❏ Tighten to torque the **front cross member bolts (105 N.m)**.

TL4

❏ Refit:

- the bolt mounting the earth on the thermoplunger unit and the coolant pump mounting,
- the bolt on the thermoplunger unit and the coolant pump mounting on the radiator mounting cross member.

❏ Connect the thermoplunger unit connector.

❏ Refit:

- the side tie-rod lower bolts,

K9K, and JH3 or JR5 or TL4

- the left-hand side reinforcement,
- the air conditioning pipes.

❏ Torque tighten the **air conditioning pipe bolts (8 N.m)**.

❏ Connect the pressure switch connector to the condenser.

❏ Position the expansion bottle.

❏ Connect:

- the passenger compartment heating hoses,
- the top hose on the coolant outlet unit,
- the bottom radiator hose,
- the fan assembly connectors.

❏ Refit:

- the front left-hand driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the front right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the turbocharging ducts,
- the nut to the turbocharger pipes on the alternator,
- the intercooler,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the inlet pipe to the inlet manifold.

❏ Connect the inlet air pressure sensor.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Clip the air duct onto the turbocharger and the air pipe at the intercooler inlet.

❏ Refit the air duct bolt on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❏ Refit:

- the battery tray base,
- the air filter unit.

❏ Fit the air inlet duct on the air filter unit and tighten the clip.

❏ Refit the battery protective tray.

❏ Fit the fuse board.

❏ Refit the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Perform the following operations:

- fill the refrigerant circuit using the **refrigerant charging station** (see **Refrigerant circuit: Draining - Filling**) (62A, Air conditioning),
- top up the engine oil (if necessary) (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- fill the manual gearbox oil (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox),
- fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit:

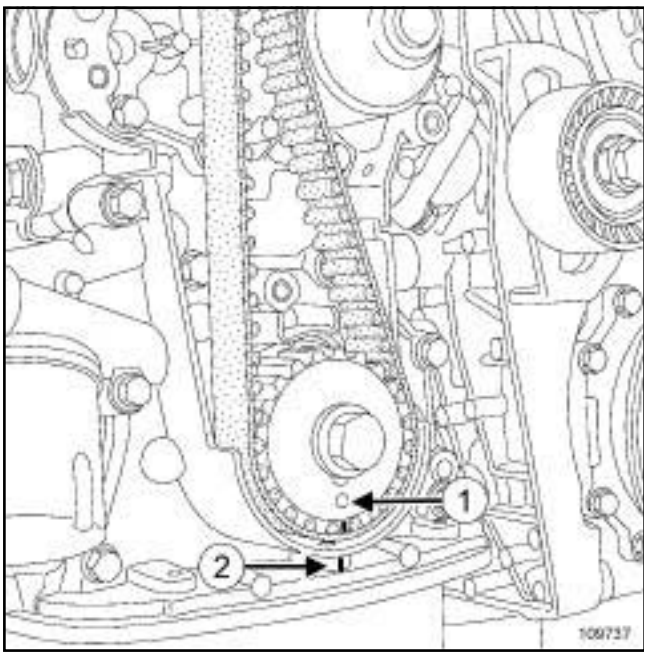
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the engine cover.

K9K, and 772

❏ Carry out a sealing test on the fuel supply circuit of the exhaust fuel injector (see **19B**, **Exhaust**, **Exhaust fuel injector: Removal - Refitting**, page **19B-64**) .

D4F

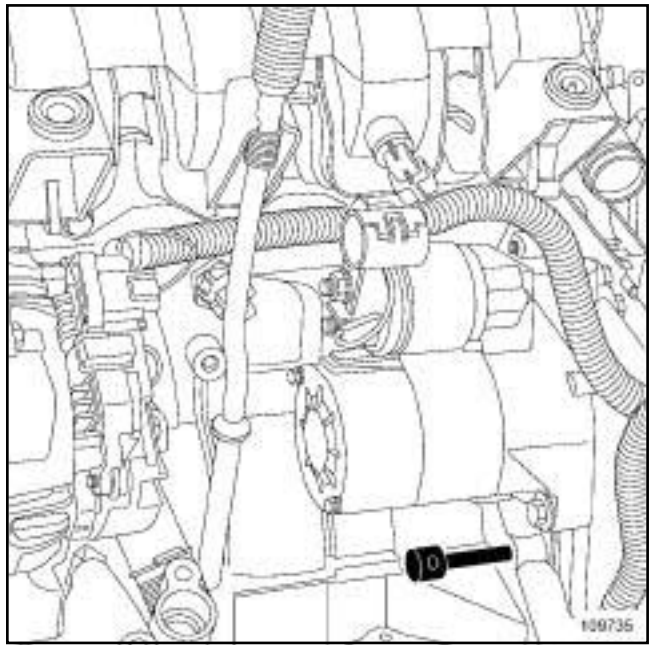
Special tooling required	
Mot. 1054	TDC setting pin.



I - VALVE CLEARANCE ADJUSTMENT PREPARATION OPERATION

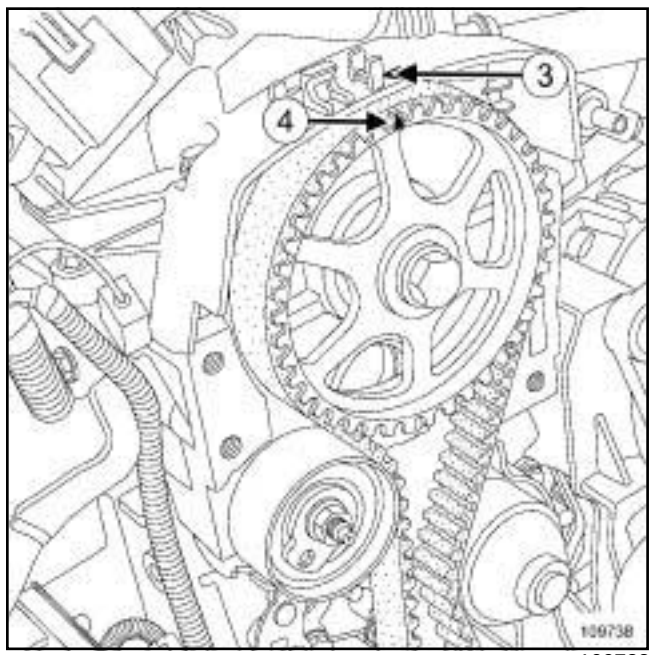
❏ Fit the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Remove:



- the front right-hand wheel (see **Wheel: Removal - Refitting**) ,
- the front right-hand wheel arch liner (see **MR 393 Bodywork, 55A, Exterior protection, Front wheel arch liners: Removal - Refitting**).
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the plenum chamber (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

Adjusting the timing



109737

❏ Turn the crankshaft clockwise (timing end), half a tooth before the alignment of the crankshaft pulley mark (**1**) with the fixed mark (**2**) .

109735

❏ Insert **(Mot. 1054)**.

❏ Turn the crankshaft clockwise to the timing point.

109738

❏ Check that the camshaft pulley mark (**4**) and the crankshaft pulley mark ***(1)*** are aligned with the fixed marks (**3**) .

II - ADJUSTING THE VALVE CLEARANCES

❏ To adjust the valves (see **Technical Note 6004A, Petrol engine - 4 cylinders - D4, 10A, Engine and peripherals, Timing - cylinder head: Refit**).

D4F

III - FINAL OPERATION

❑ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the plenum chamber (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel arch liner (see **MR 393 Bodywork, 55A, Exterior protection, Front wheel arch liners: Removal - Refitting**).
- the front right-hand wheel (see **Wheel: Removal - Refitting**) .

Valves: Adjustment

K9K

❑ To adjust the valves (see **Cylinder head: Rebuilding**) (Technical Note 6006A, 10A, Engine and peripherals).

M4R

- The engine and gearbox assembly must be removed to adjust the valves (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-113**) .
- For the valve adjustment procedure (see **Cylinder head: Rebuilding**) (Technical Note 6020A, 10A, Engine and peripherals).

Oil pressure: Check

D4F or F4R or K4J or K4M or K9K or M4R

Special tooling required	
Mot. 836-05	Oil pressure gauge kit.
Mot. 1495-01	22 mm socket for removal - refitting of oxygen sensors.

Oil pressure tables:

Engine	Minimum oil pressure (bar)		Maximum oil pressure (bar)
	Idling speed	**4000 rpm**	**4000 rpm**
F4R	0.8	3.7	5.3
K4J/K4M	0.5	3.1	4.4
K9K	0.8	3.4	5.2
M4R	1.0	5.5	7.3

Engine	Minimum oil pressure (bar)		Maximum oil pressure (bar)
	Idling speed	**3000 rpm**	**3000 rpm**
D4F	1.5	3.9	5.3

End pieces to be used:

Engine	End pieces
F4R	B + F
K4J/K4M	E + C + F
K9K	E + C + F
M4R	Mot. 1658 + F
D4F	C + F

REMOVAL

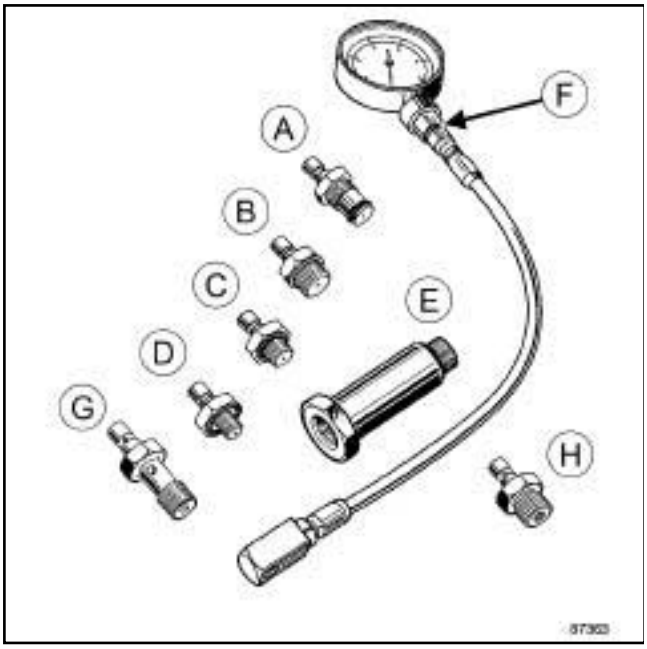
❑

WARNING

Always check the oil level using the dipstick.

Do not exceed the maximum level on the dipstick (could destroy the engine).

Correct the engine oil level if necessary before delivering the vehicle to the customer.



Note:

When topping up the engine oil, always leave at least **10 minutes** before checking the level with a dipstick.

CHECK

❑ Remove the oil pressure sensor (see **10A**, **Engine and cylinder block assembly**, **Oil pressure sensor: Removal - Refitting**, page **10A-40**) .

D4F or F4R or K4J or K4M or K9K or M4R

87363

- ❏ In place of the oil pressure sensor, fit the **(Mot. 836-05)** with suitable adapters using the **(Mot. 1495-01)** or a **22 mm** long socket.
- ❏ Start the vehicle.
- ❏ Monitor the engine oil pressure as the engine oil temperature rises **(approximately 80°C or the first time the engine cooling fan) is activated** it should not be less than the pressure at idle speed.
- ❏ If the oil pressure is lower than the pressure at idle speed, check that:
  - the oil filter is not clogged,
  - dirt or swarf is not present in the engine oil,
  - the oil pump is in good condition and being correctly driven.
- ❏ Check the oil pressure in comparison with the values given in the table above.
- ❏ Switch off the engine.
- ❏ Remove the **(Mot. 836-05)** with the end pieces.
- ❏ Refit the oil pressure sensor (see **10A**, **Engine and cylinder block assembly**, **Oil pressure sensor: Removal - Refitting**, page **10A-40**) .
- ❏ Wipe any oil run-off with a cloth.
- ❏ Wait at least **10 minutes**.
- ❏ Check the oil level using the dipstick.
- ❏ Top up the engine oil level if necessary (see **Engine oil: Specifications**) (04A, Lubricants).
- ❏ Start the vehicle and check that there are no oil leaks at the oil pressure sensor.

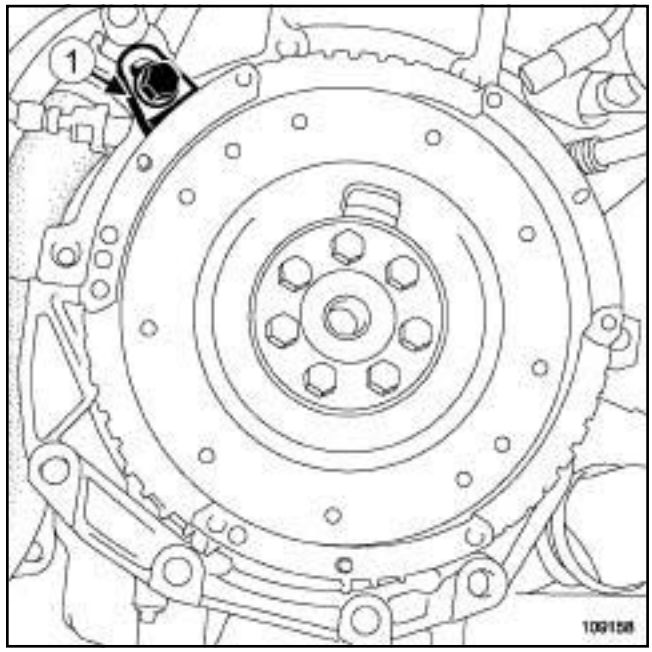
D4F or F4R or K4J or K4M or K9K

Special tooling required	
Mot. 582-01	Flywheel locking tool.

Tightening torques ▽	
flywheel bolts (K4)	**25 N.m + 50° ± 6°**
flywheel bolts (F4R)	**30 N.m + 60° ± 10°**
flywheel bolts (D4F)	**18 N.m + 110° ± 6°**
flywheel bolts (K9K/JA5, JH3, JR5)	**55 N.m**
flywheel bolts (K9K/TL4)	**20 +36° ± 6°**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox),
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch).

II - OPERATION FOR REMOVAL OF PART CONCERNED

109158

❑ Lock the flywheel using tool **(Mot. 582-01)** (**1**) .

❑ Remove:

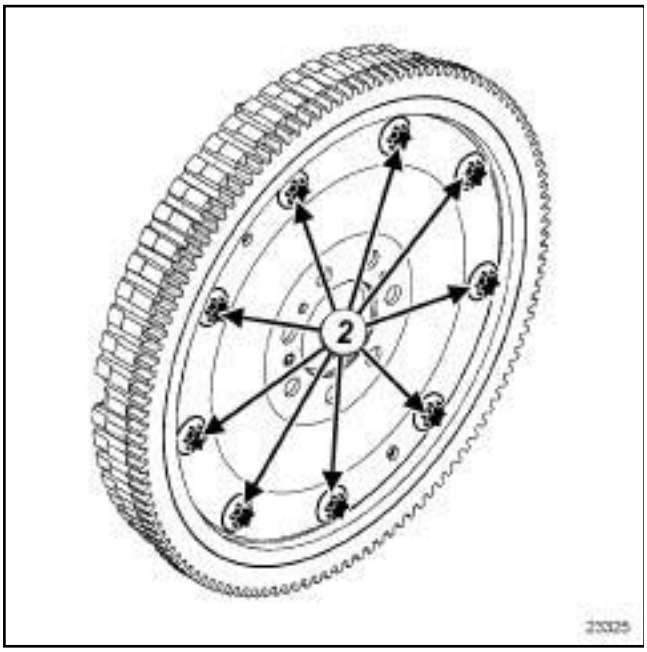
- the flywheel bolts,
- the flywheel,
- the **(Mot. 582-01)** (**1**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Flywheel bolts (10, 03,03,14)**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:



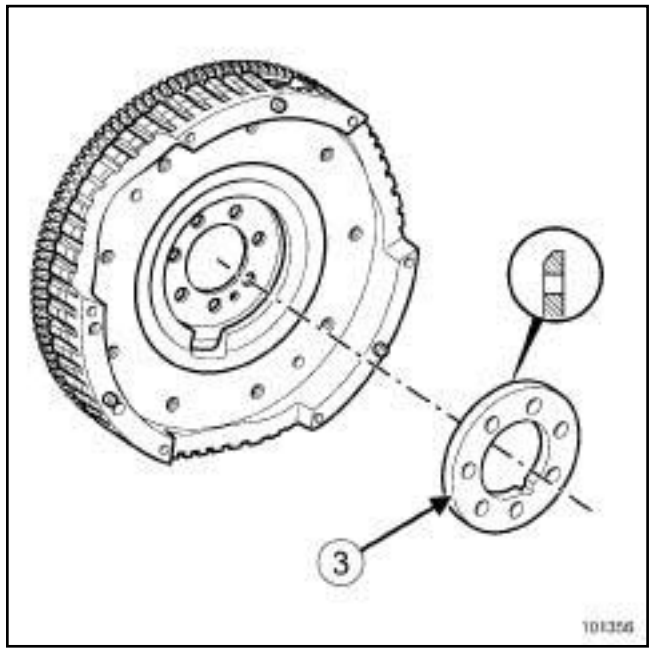
- the flywheel bearing face if reusing,
- the crankshaft bearing face.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the flywheel.

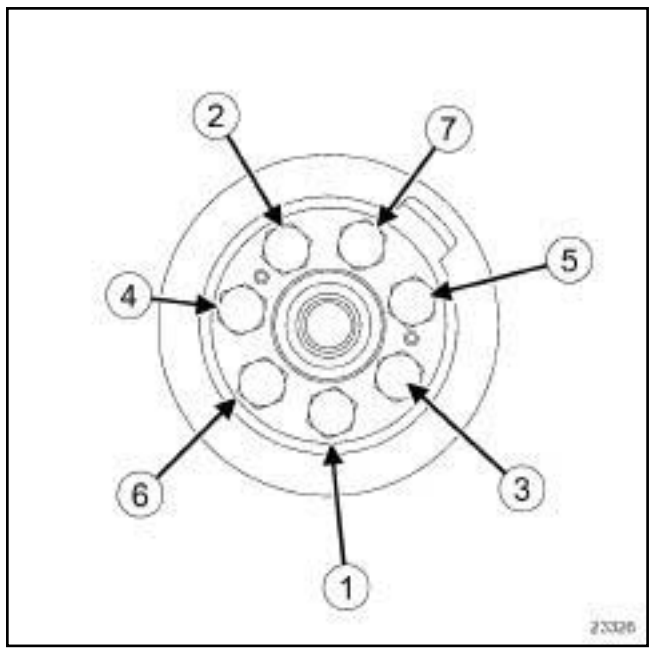
D4F or F4R or K4J or K4M or K9K

K9K, and TL4



23325

❑



WARNING
Do not remove the flywheel drive plate mounting bolts (**2**) .

K9K, and JA5 or JH3 or JR5

101356

❑ Refit the spacer (**3**) observing the fitting direction of the chamfer on the flywheel end.

23326

❑ Observe the tightening order.

D4F or F4R or K4J or K4M or K9K

K4J or K4M

❑ Tighten in order and to torque the **flywheel bolts (K4) (25 N.m + 50° ± 6°)**.

F4R

❑ Tighten in order and to torque the **flywheel bolts (F4R) (30 N.m + 60° ± 10°)**.

D4F

❑ Tighten in order and to torque the **flywheel bolts (D4F) (18 N.m + 110° ± 6°)**.

K9K, and JA5 or JH3 or JR5

❑ Torque tighten in order the **flywheel bolts (K9K/ JA5, JH3, JR5) (55 N.m)**.

K9K, and TL4

❑ Torque tighten in order the **flywheel bolts (K9K/ TL4) (20 +36° ± 6°)**.

III - FINAL OPERATION

❑ Refit:

- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) (20A, Clutch),
- the gearbox (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

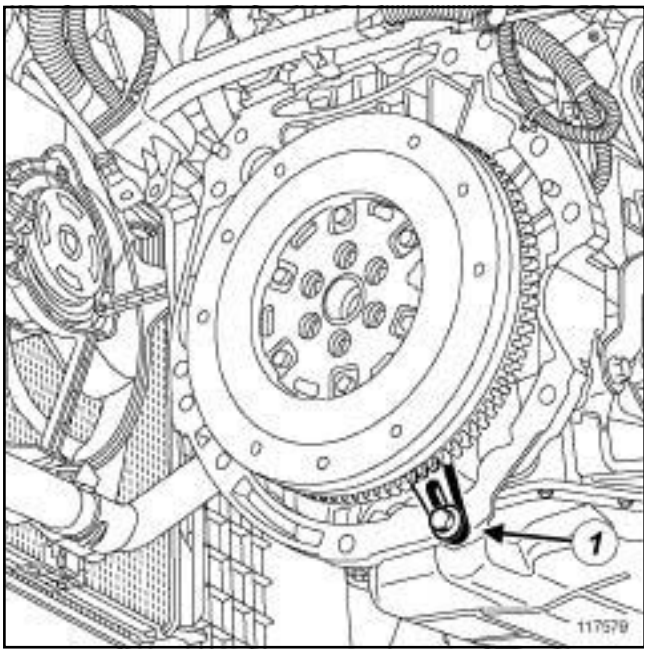
M4R, and TL4

Special tooling required	
Mot. 1677	Flywheel locking tool.

Tightening torques ▽	
flywheel bolts	**108 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **02A, Lifting Equipment, Vehicle: Towing and lifting**).

❏ Disconnect the battery (see **80A, Battery, Battery: Removal - Refitting**).

❏ Remove:

- the gearbox (see **Manual gearbox: Removal - Refitting**) ,
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) .

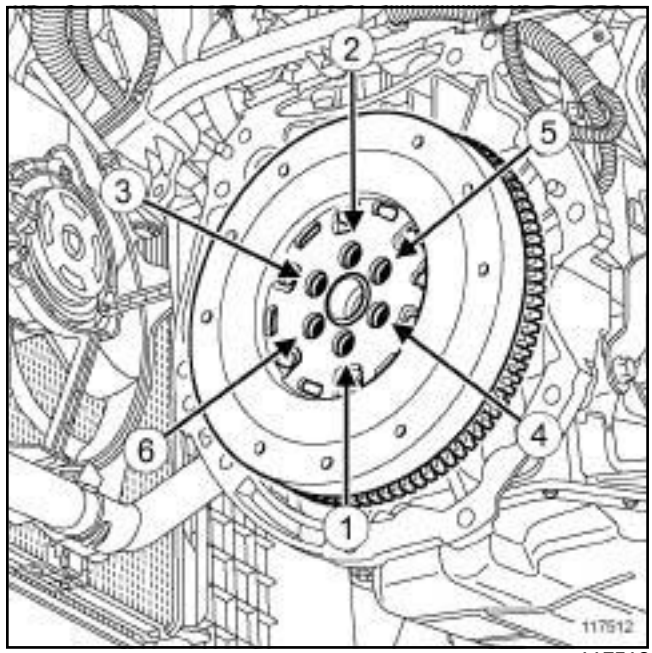
II - OPERATION FOR REMOVAL OF PART CONCERNED

117579

❏ Lock the engine using tool **(Mot. 1677)** (**1**) .

❏ Remove:

- the flywheel bolts,
- the flywheel,
- tool **(Mot. 1677)** (**1**) .



REFITTING

I - REFITTING PREPARATION OPERATION

❏ On the crankshaft, clean the flywheel bolt threading.

❏ Degrease the pressure face of the flywheel on the crankshaft.

II - REFITTING OPERATION FOR PART CONCERNED

117512

❏ Follow the flywheel bolt tightening order.

❏ Tighten to torque and in order the **flywheel bolts (108 Nm)**.

III - FINAL OPERATION

❏ Refit:

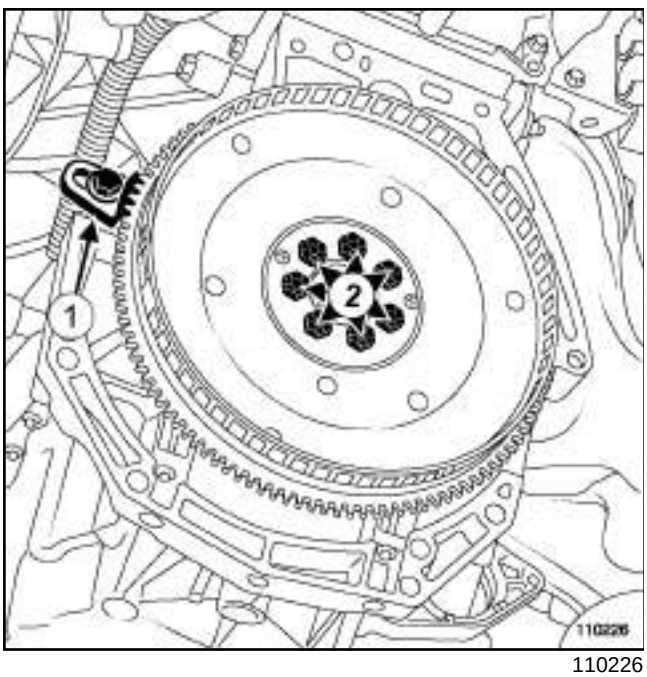
- the clutch pressure plate (see **Pressure plate - Disc: Removal - Refitting**) ,
- the gearbox (see **Manual gearbox: Removal - Refitting**) .

❏ Connect the battery (see **80A, Battery, Battery: Removal - Refitting**).

K4M, and DP0

Special tooling required	
Mot. 582-01	Flywheel locking tool.

Equipment required
Diagnostic tool



Tightening torques ▽	
drive plate bolts	**55 Nm + 50° ± 5**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the gearbox (see **Automatic gearbox: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

110226

❑ Set up the **(Mot. 582-01)** (**2**) .

❑ Remove:

- the bolts (**2**) ,
- the drive plate,
- tool **(Mot. 582-01)**.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Check that the drive plate is not damaged (run-out tolerance of **0.2 mm** on the outer diameter).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the drive plate, ensuring it is correctly positioned in relation to the centring pins.

❑ Apply **LOCTITE FRENBLOC** to the bolt threads.

❑ Tighten the bolts on the drive plate.

❑ Torque and angle tighten the **drive plate bolts (55 Nm + 50° ± 5)** by immobilising the starter ring using the **(Mot. 582-01)**.

III - FINAL OPERATION.

❑ Refit the gearbox (see **Automatic gearbox: Removal - Refitting**) .

❑ Connect the **Diagnostic tool** for the conformity check.

M4R, and DP0

Special tooling required	
Mot. 919-02	Flywheel locking tool.

Tightening torques ▽	
drive plate bolts	**108 Nm**

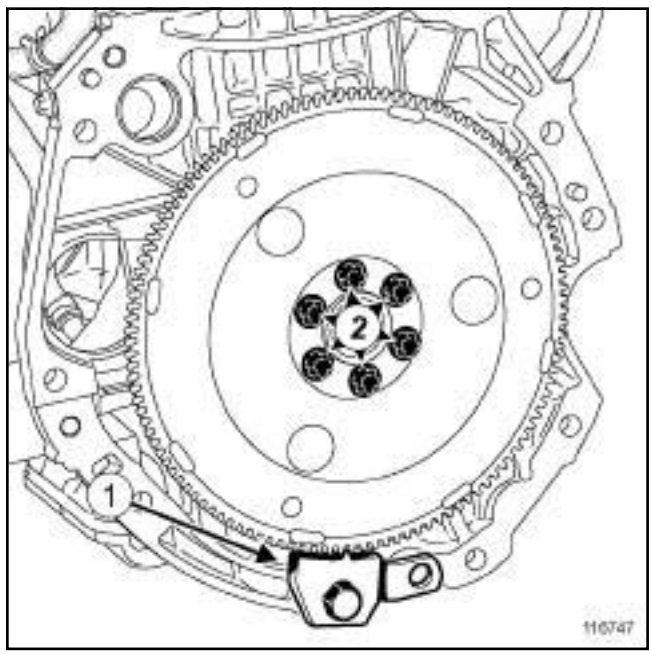
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

IMPORTANT
During this operation, secure the vehicle to the lift with a strap to prevent it from becoming unbalanced.

❑ Remove:



- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),

❑ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❑ Remove:

- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the headlights (see **Halogen headlight: Removal - Refitting**) (MR 392, 80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (MR 392, 80C, Xenon bulbs),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) (MR 392, 19A, Cooling),
- the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) (MR392, 16A, Starting-charging),
- the left-hand driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) ,
- the right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) ,
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) (MR 392, 19D, Engine mounting),
- the automatic gearbox (see **Automatic gearbox: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116747

❑ Set up the **(Mot. 919-02)** (**1**) .

❑ Remove:

- the drive plate mounting bolts (**2**) ,
- the drive plate,
- the **(Mot. 919-02)**.

M4R, and DP0

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Check that the drive plate is not damaged (run-out tolerance of **0.2 mm** on the outer diameter).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Fit the drive plate, ensuring it is correctly positioned in relation to the centring pins.

❏ Apply **HIGH RESISTANCE THREAD LOCK** to the bolt threads.

❏ Finger tighten the drive plate mounting bolts.

❏ Torque and angle tighten the **drive plate bolts (108 Nm)** by immobilising the starter ring with the tool.

III - FINAL OPERATION.

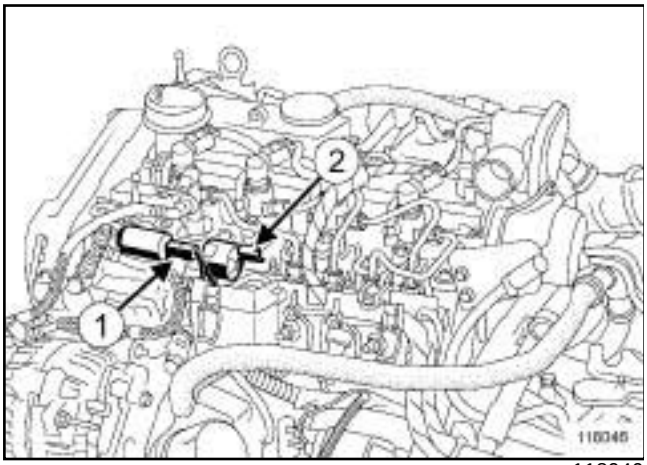
❏ Refit:

- the automatic gearbox (see **Automatic gearbox: Removal - Refitting**) ,
- the left-hand suspended engine mounting (see **19D**, **Engine mounting**, **Left-hand suspended engine mounting: Removal - Refitting**, page **19D-34**) (MR 392, 19D, Engine mounting),
- the radiator mounting cross member (see **Radiator mounting cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) ,
- the left-hand driveshaft (see **Front left-hand driveshaft: Removal - Refitting**) ,
- the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) (MR392, 16A, Starting-charging),
- the cooling radiator (see **19A**, **Cooling**, **Cooling radiator: Removal - Refitting**, page **19A-20**) (MR 392, 19A, Cooling),
- the front end panel (see **Front end panel: Removal - Refitting**) (MR 393, 42A, Upper front structure),
- the frontal impact cross member (see **Front impact cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure),
- the headlights (see **Halogen headlight: Removal - Refitting**) (MR 392, 80B, Headlights) or (see **Xenon headlight: Removal - Refitting**) (MR 392, 80C, Xenon bulbs),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❏ Fill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Refit:

- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) (MR 392, 12A, Fuel mixture),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



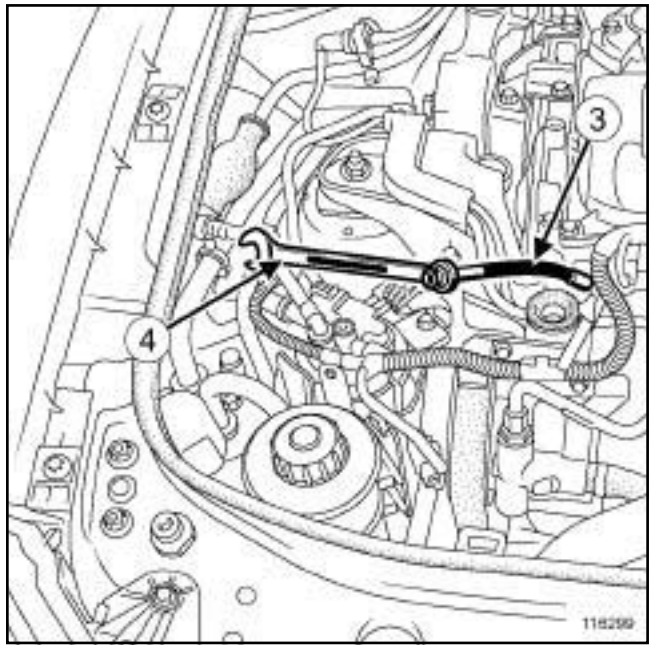
❏ Bleed the cooling system (see **Cooling system: Bleed**) (MR 392, 19A, Cooling).

K9K

Special tooling required	
Mot. 1592	Flexible end piece for taking end of compression pressure measurements.

Equipment required
Diagnostic tool

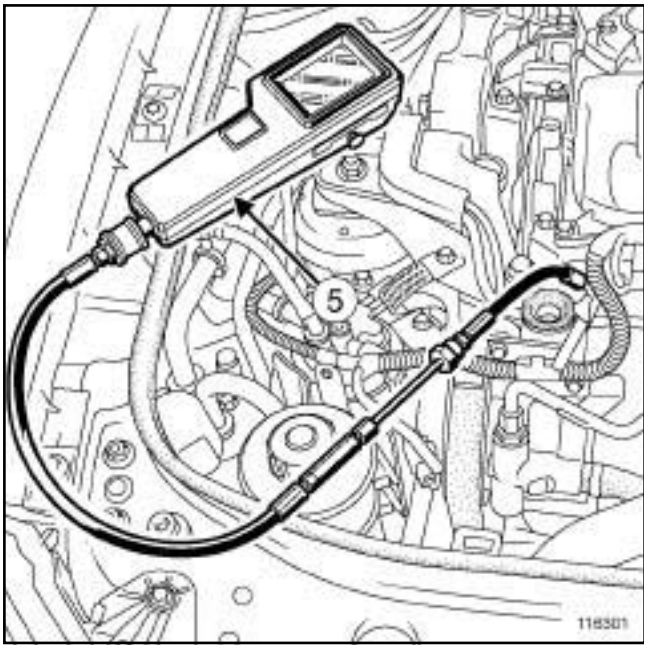
❏ Remove the heater plugs (see **13C**, **Preheating**, **Heater plugs: Removal - Refitting**, page **13C-2**) .



118046

❏ Disconnect:

- the pressure regulation solenoid valve connector (**1**) ,
- the flow control solenoid valve connector (**2**) ,



❏ Fit the hose end piece **(Mot. 1592)** in place of one of the removed plugs.

116299

❏ Moderately tighten the hose end piece **(Mot. 1592)** using an open-jawed spanner.

K9K

116301

❏ Moderately tighten the diesel compression gauge on the hose end piece **(Mot. 1592)**.

❏ Connect a self-contained starter or an automatic battery charger.

❏ Vehicle which is equipped with RENAULT Card:

- run command **SC003 Save computer data**,
- run command **RZ019 Reinitialise programming**,
- run the starter for at least **15 seconds** until the compression gauge needle stabilises to obtain the maximum value,
- open the discharge valve to release all of the pressure in the compression gauge,
- proceed through the diagram sheet,
- carry out the same procedure for the other cylinders,
- run command **SC001 Write computer data**.

❏ For vehicles equipped with keys, follow the starting cycle until the compression gauge needle stabilises to obtain the maximum value:

- open the discharge valve to release all of the pressure in the compression gauge,
- proceed through the diagram sheet,
- carry out the same procedure for the other cylinders.

Note:

The pressure value after compression must be at least **18 bar**.

❏ Disconnect the self-contained starter or automatic battery charger.

❏ Loosen:

- the diesel compression gauge on the hose end piece **(Mot. 1592)**,
- the hose end piece **(Mot. 1592)** using an open-jawed spanner.

❏ Remove the hose end piece **(Mot. 1592)** which was fitted in place of one of the removed plugs.

❏ Connect:

- the connector to the pressure regulation solenoid valve,
- the flow control solenoid valve connector,

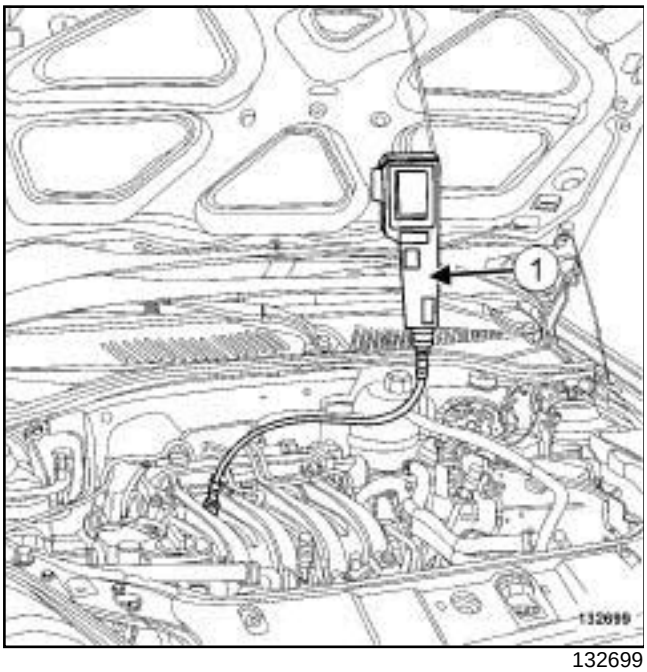
❏ Refit the heater plugs (see **13C**, **Preheating**, **Heater plugs: Removal - Refitting**, page **13C-2**) .

❏ Using the **Diagnostic tool**, check for the absence of stored faults in the computers; deal with any faults and clear them if necessary.

D4F

Equipment required
petrol compression gauge
Diagnostic tool

CHECK



I - PREPARATION OPERATION FOR CHECK

❏ Remove the plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) .

Note:

Use a petrol compression gauge compatible with the special tools.

The petrol compression gauge must be equipped with a universal end piece (rubber), or a gaz 1/4 thread bolt.

132699

❏ Connect a **petrol compression gauge** (**1**) .

❏ Run command with **Diagnostic tool** :

- **RZ009: VEHICLE FUNCTION PROGRAMMING**,
- **VP036: FUEL SUPPLY INHIBITION**.

❏ Put the vehicle under the starting conditions by positioning the gear lever in neutral.

II - TEST OPERATION

❏ Activate the starter until the needle of the **petrol compression gauge** stabilises.

❏ Measure the cylinder compressions, cylinder by cylinder.

❏ Fully depress the accelerator pedal in order to open the throttle valve during the compression measurements.

Note:

It is necessary to wait for at least **10 seconds** before starting the engine each time (the starter will not run due to its thermal protection).

III - FINAL OPERATION

❏ Disconnect the **petrol compression gauge**.

❏ Refit the plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) .

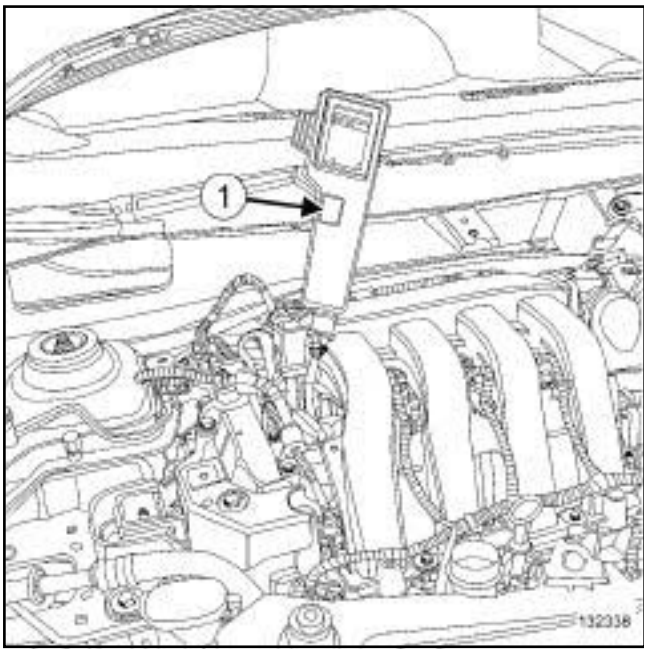
❏ Run command **VP037: "STOP INHIBIT FUEL SUPPLY"** using the **Diagnostic tool**.

❏ Start the engine.

Note:

If the engine does not start, run command **VP037: STOP FUEL SUPPLY INHIBITION** using the **Diagnostic tool** or switch off the ignition and wait **1 min** before starting the engine again.

K4M



Equipment required
petrol compression gauge
Diagnostic tool

CHECK

I - PREPARATION OPERATION FOR CHECK

❏ Remove:

- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) .

132338

❏ Connect a **petrol compression gauge** (**1**) .

❏ Put the vehicle under starting conditions:

- gear lever in neutral position for manual gearbox,
- gear lever in position P (park) for an automatic gearbox.

❏ Disconnect the injector connectors.

II - TEST OPERATION

❏ Activate the starter until the needle of the petrol compression gauge stabilises.

❏ Measure the compression of the engine, cylinder by cylinder.

❏ Fully depress the accelerator pedal in order to open the throttle valve during the compression measurements.

> Note:
>
> It is necessary to wait for at least **10 seconds** before starting the engine each time (the starter will not run due to its thermal protection).

III - FINAL OPERATION

❏ Disconnect the **petrol compression gauge**.

❏ Refit:

- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) ,
- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

❏ Connect the injector connectors.

❏ Using the **Diagnostic tool**, check that there are no faults stored in the computer.

❏ Start the vehicle.

K4J, and STANDARD HEATING – K4M, and STANDARD HEATING

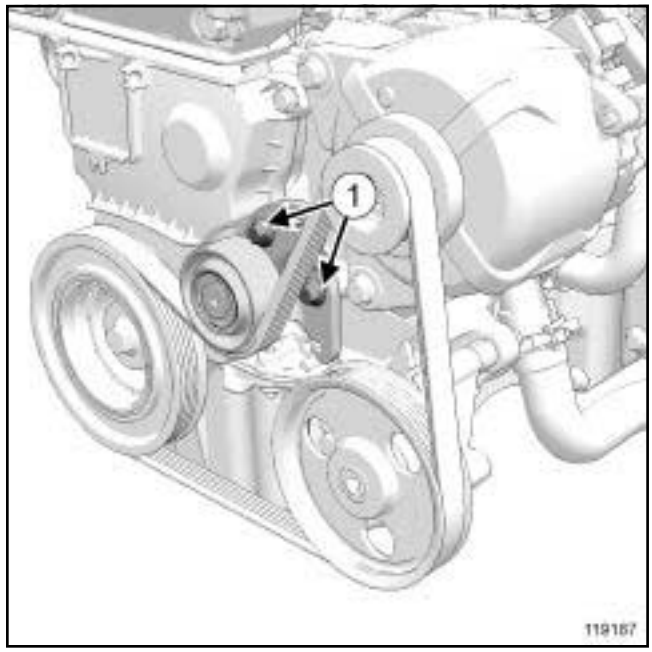
Special tooling required	
Mot. 1638	Accessories belt tensioning tool. For engines fitted with mechanical tensioning roller.
Mot. 1715	Belt tension checking tool (frequency indicator).
Mot. 1505	Belt tension setting tool (frequency meter)

Tightening torques ▽	
tensioning roller bolts	**30 N.m**
auto tensioner bolts	**40 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

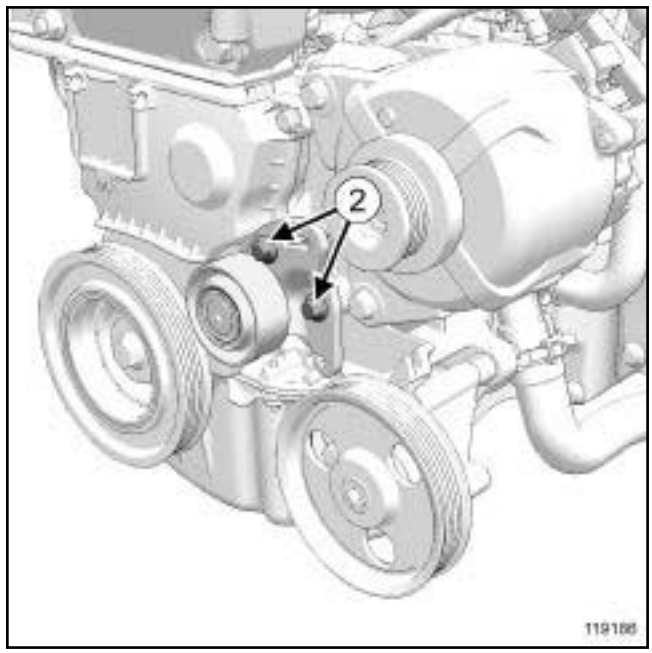


❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

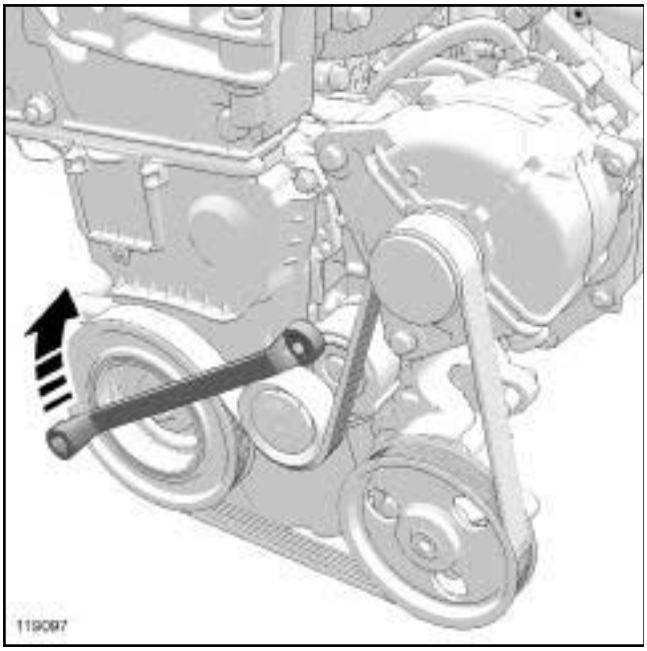


1 - Removal preparation operation for the part concerned: mechanical tensioning roller and accessories belt (5V)

119187

❑ Loosen the tensioning roller bolts (**1**) .

❑ Remove the accessories belt.



119186

❑ Remove:

- the tensioning roller bolts (**2**) ,
- the tensioning roller.

K4J, and STANDARD HEATING – K4M, and STANDARD HEATING

2 - Removal preparation operation for the part concerned: auto tensioner and accessories belt (6V)

119097

❑ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❑ Remove:

- the accessories belt,
- the tensioning roller bolt,
- the tensioning roller.

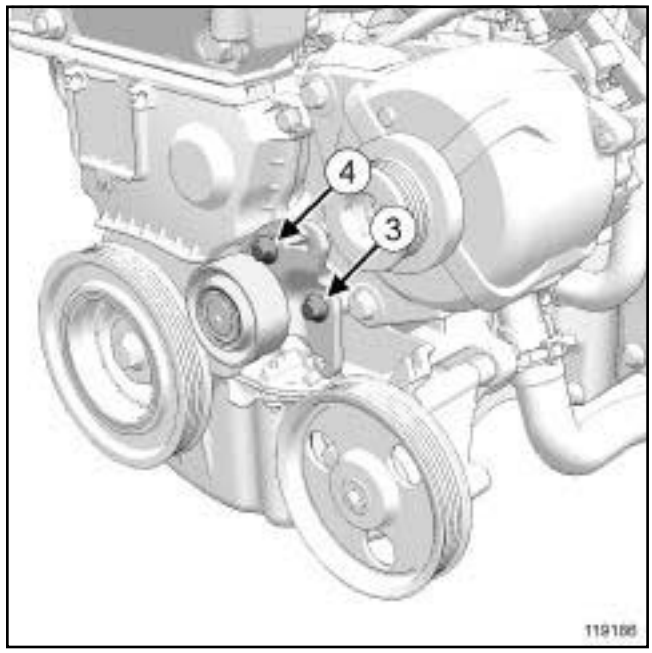
REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Accessories belt (10,10,01,03)**.

❑ **parts always to be replaced: Accessories belt tensioning roller (10,10,01,04)**.

❑ **parts always to be replaced: Accessories tensioning roller bolt (10,10,01,09)**.



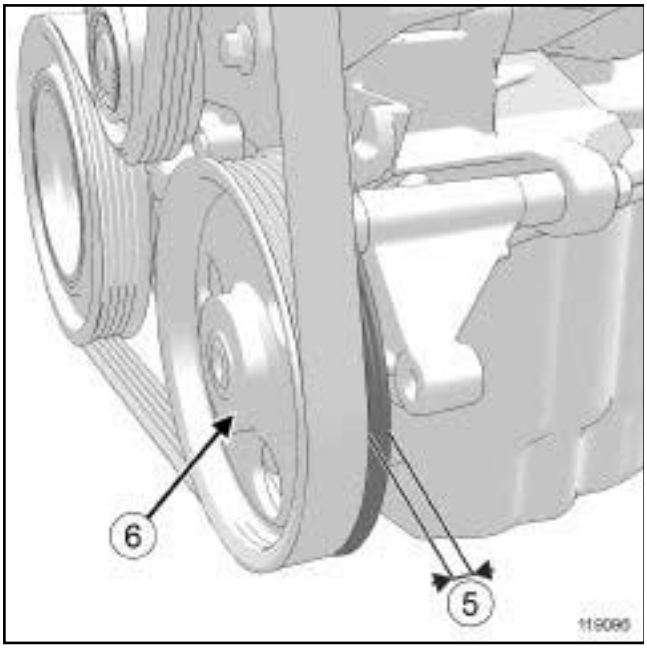
Refitting preparation operation for the two fittings

❑ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

II - REFITTING OPERATION FOR PART CONCERNED

1 - Refitting preparation operation for the part concerned: mechanical tensioning roller and accessories belt (5V)

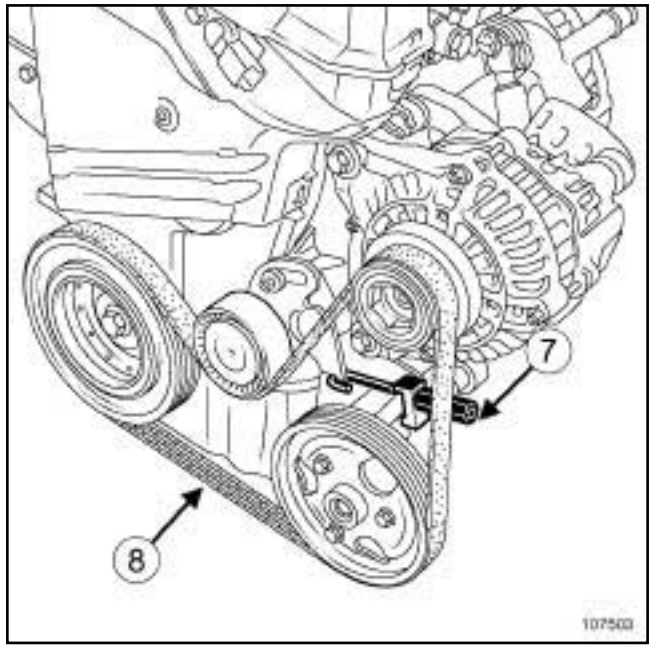


119186

❑ Refit:

- a new tensioning roller,
- a new tensioning roller bolt (**3**) ,
- a new tensioning roller bolt (**4**) .

❑ Fit a new accessories belt.



119096

❑

Note:

Check that the inner tooth (**5**) of the pulley (**6**) remains free.

107503

❑ Position the **(Mot. 1638)**.

❑ Tension the accessories belt using the **(Mot. 1638)**, tightening nut (**7**) .

❑ Use the **(Mot. 1715)** or **(Mot. 1505)** to measure the accessories belt tension **234 Hz ± 10 Hz**.

❑ Torque tighten the **tensioning roller bolts (30 N.m)**.

❑ Rotate the engine through two revolutions to position the accessories belt correctly.

❑ Use the **(Mot. 1715)** or **(Mot. 1505)** at (**8**) to measure the accessories belt tension again **234 Hz ± 10Hz**.

2 - Refitting preparation operation for the part concerned: auto tensioner and accessories belt (6V)

❑ Refit a new tensioning roller.

❑ Torque tighten the **auto tensioner bolts (40 N.m)**.

❑ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❑ Refit a new accessories belt.

❑ Rotate the engine through two revolutions to position the accessories belt correctly.

III - FINAL OPERATION

❑ Refit:

- the engine undertray,

K4J, and STANDARD HEATING – K4M, and STANDARD HEATING

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K9K, and AIR CONDITIONING or CLIMATE CONTROL

Tightening torques ▽	
tensioning roller bolt	**40 Nm**
the fuel filter interior protector nuts	**21 Nm**
fuel filter exterior protector nuts	**21 Nm**

❑

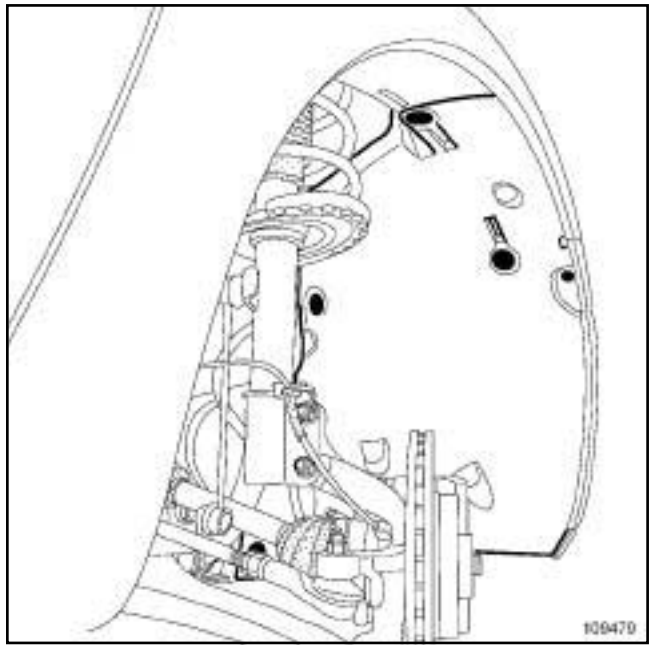
WARNING

The belt must be replaced with a new one if it has been removed.

The tensioning roller must be replaced when the belt is replaced.

Do not run the engine without the accessories belt, to avoid irreparable damage to the crankshaft accessories pulley.

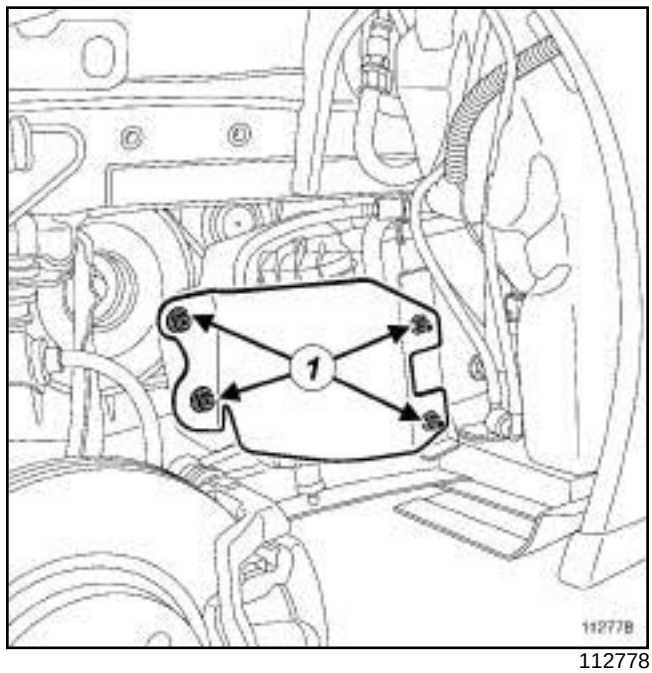
REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

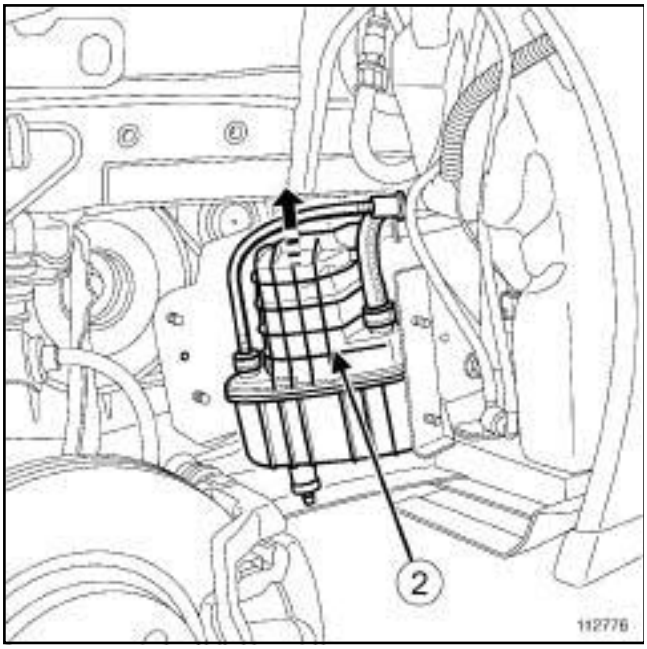


❑ Remove:

- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

109479

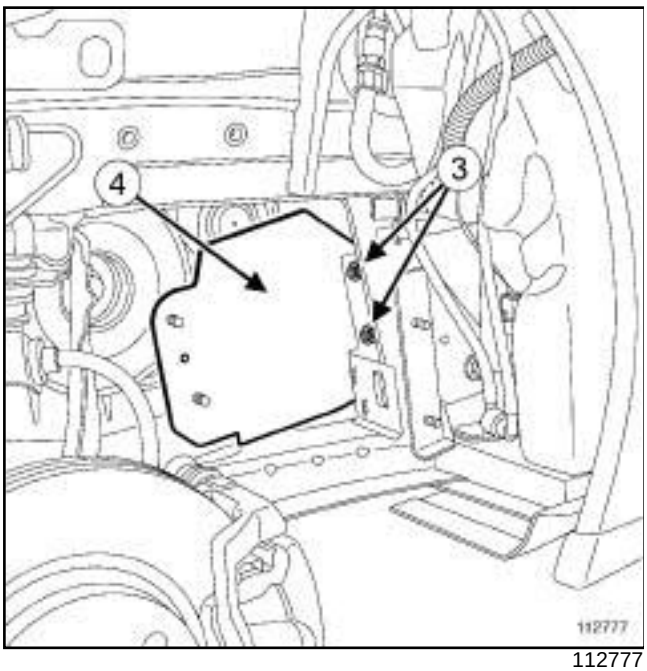
❑ Remove the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).



112778

❑ Remove:

- the fuel filter exterior protector nuts (**1**) ,
- the fuel filter exterior protector.

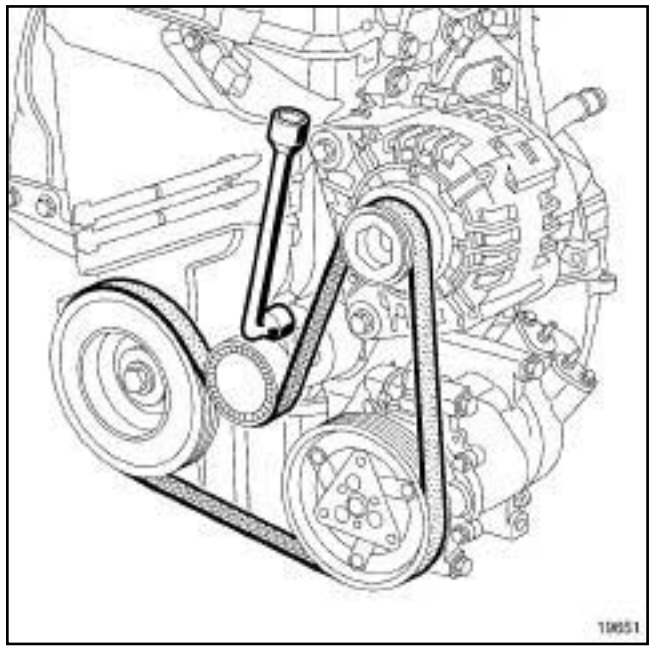


K9K, and AIR CONDITIONING or CLIMATE CONTROL

112776

❏ Lift the "fuel filter - pipe" assembly (**2**) .

❏ Fasten the "fuel filter - pipe" assembly to the vehicle.



112777

❏ Remove:

- the fuel filter interior protector nuts (**3**) ,
- the fuel filter interior protector (**4**) .

II - REMOVAL OF PART CONCERNED

19651

❏ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❏ Remove the accessories belt.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

❏ Replace the tension wheel.

❏ Torque tighten the **tensioning roller bolt (40 Nm)**.

II - REFITTING PART CONCERNED

❏ Turn the auto tensioning roller anti-clockwise using a **16 mm** spanner.

❏ Refit the accessories belt.

III - FINAL OPERATION.

❏ Refit:

- the fuel filter interior protector,
- the fuel filter interior protector nuts,

❏ Torque tighten the **the fuel filter interior protector nuts (21 Nm)**.

❏ Reinstall the "fuel filter - pipe" assembly.

❏ Refit:

- the fuel filter exterior protector,

K9K, and AIR CONDITIONING or CLIMATE CONTROL

- the fuel filter exterior protector nut.

❑ Torque tighten the **fuel filter exterior protector nuts (21 Nm)**.

❑ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J, and AIR CONDITIONING or CLIMATE CONTROL – K4M, and AIR CONDITIONING or CLIMATE CONTROL

Tightening torques ▽	
tensioning roller mounting bolt	**40 Nm**

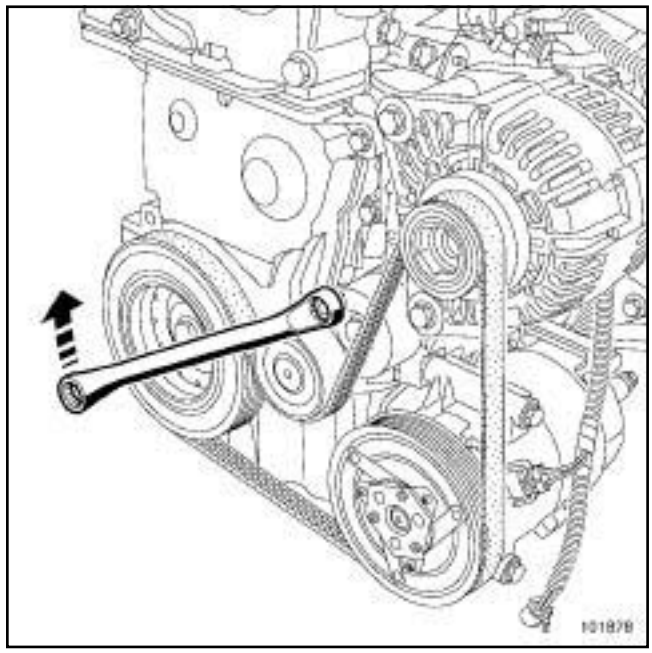
IMPORTANT
Wear gloves throughout the operation.

WARNING
Never turn the engine in the opposite direction to its normal operating direction.

WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

II - REMOVAL OF PART CONCERNED

101878

❏ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❏ Remove:

- the accessories belt,
- the tensioning roller mounting bolt,
- the tensioning roller.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

WARNING
It is essential to replace the accessories belt and the tensioning roller.

❏ Refit the tensioning roller.

❏ Tighten to torque the **tensioning roller mounting bolt (40 Nm)**.

II - REFITTING PART CONCERNED

❏ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner.

❏ Refit the accessories belt.

III - FINAL OPERATION.

❑ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

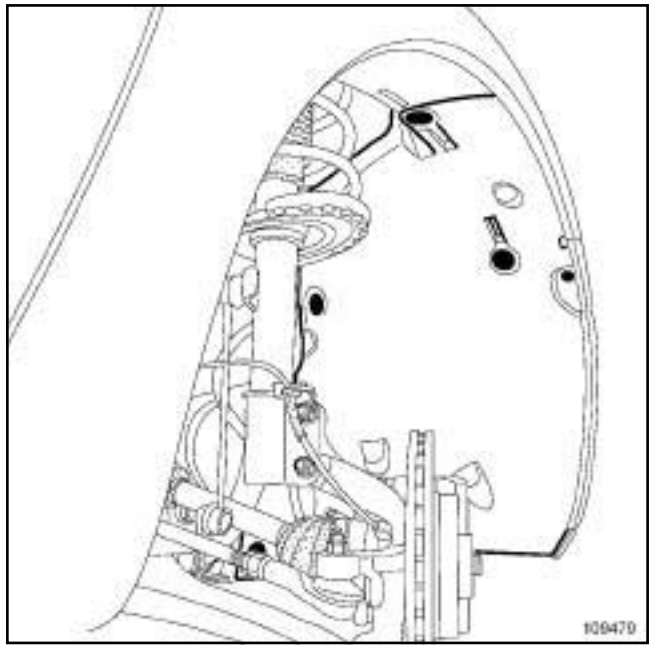
❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and STANDARD HEATING

Special tooling required	
Mot. 1638	Accessories belt tensioning tool. For engines fitted with mechanical tensioning roller.
Mot. 1505	Belt tension setting tool (frequency meter)
Mot. 1715	Belt tension checking tool (frequency indicator).

Tightening torques ▽	
mechanical tensioning roller bolts	**35 N.m**
auto tensioner bolts	**40 N.m**
the fuel filter interior protector nuts	**21 N.m**
fuel filter exterior protector nuts	**21 N.m**

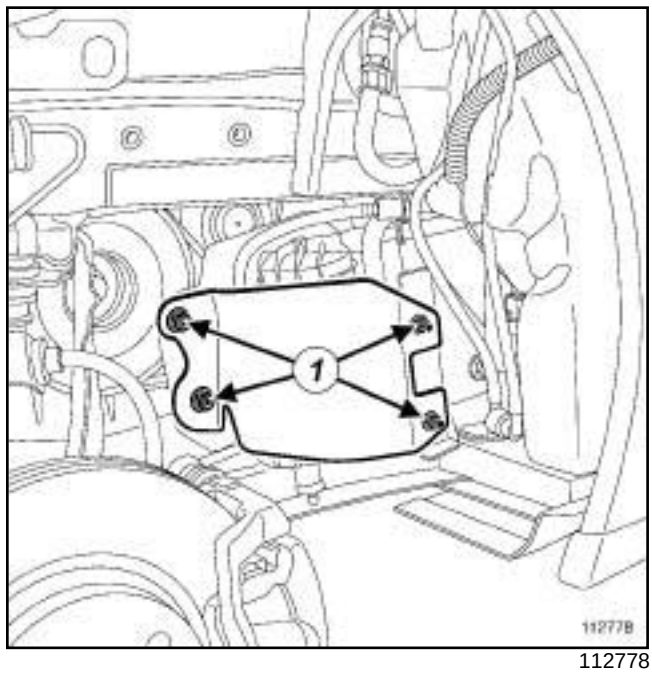
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

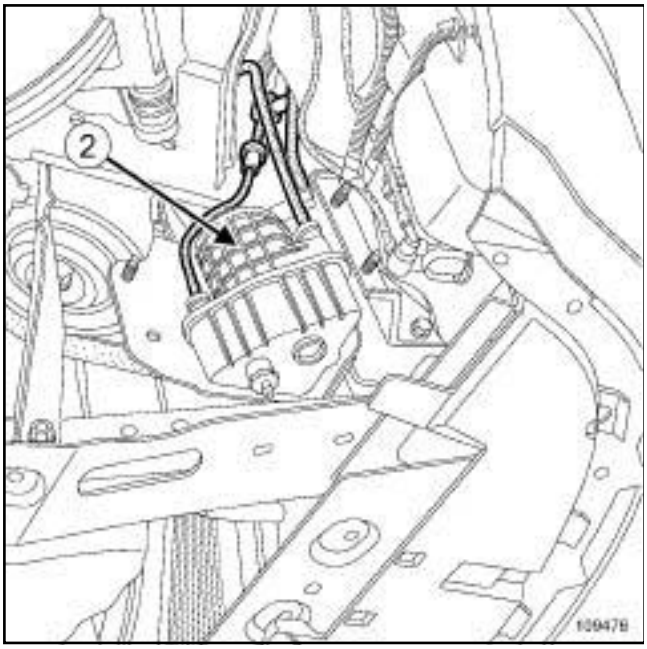
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

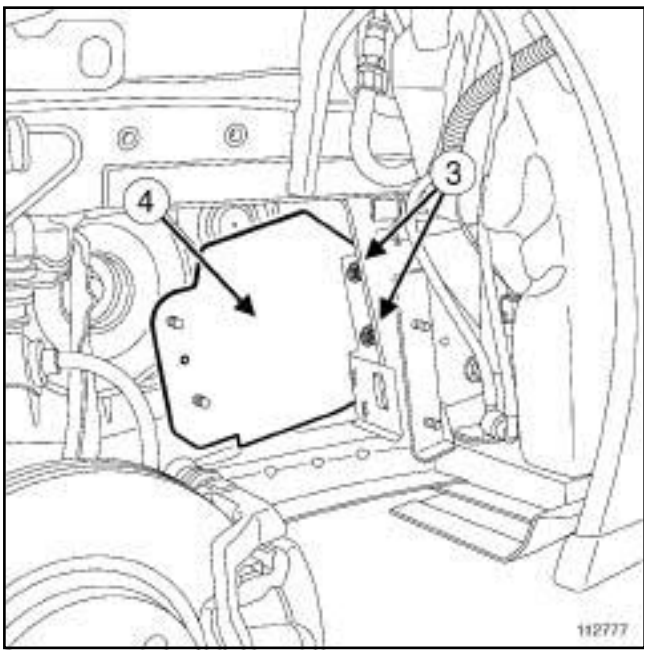
109479



❏ Remove the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

112778

❏ Remove:



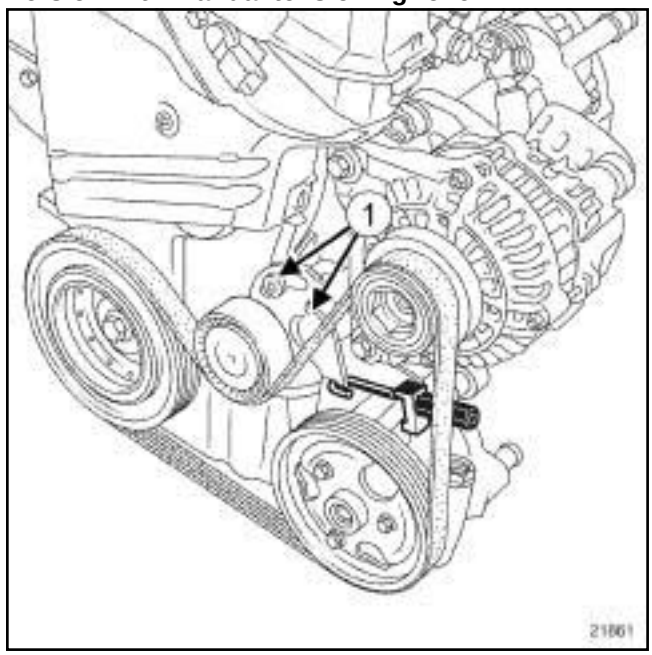
- the fuel filter exterior protector nuts (**1**) ,
- the fuel filter exterior protector.

109476

❏ Move the « fuel filter - pipe » assembly (**2**) to one side.

❏ Attach the « fuel filter - pipe » assembly to the vehicle.

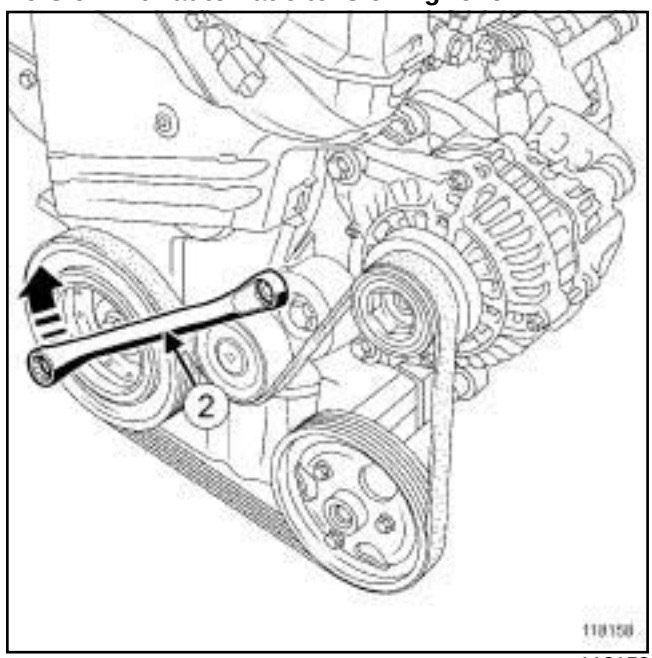
112777



❏ Remove:

- the fuel filter interior protector nuts (**3**) ,
- the fuel filter interior protector (**4**) .

❏ Loosen the accessories belt tensioning roller nuts.



II - OPERATION FOR REMOVAL OF PART CONCERNED

Version with manual tensioning roller

21861

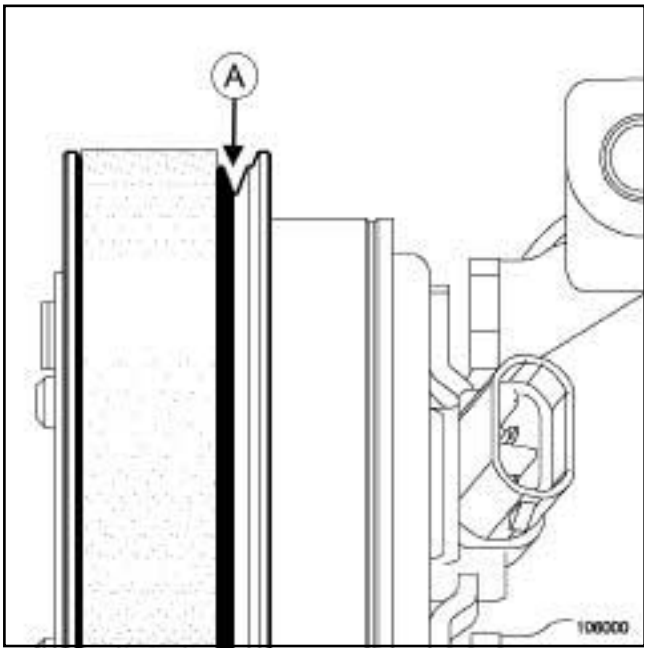
Version with automatic tensioning roller

118158

❏ Undo the manual tensioning roller bolts (**1**) or pivot the auto tensioner using a spanner (**2**) to slacken the belt (depending on the version).

❏ Remove:

- the accessories belt then discard it in the waste bin,
- the accessories belt tensioning roller then discard it in the waste bin as well as its bolt.



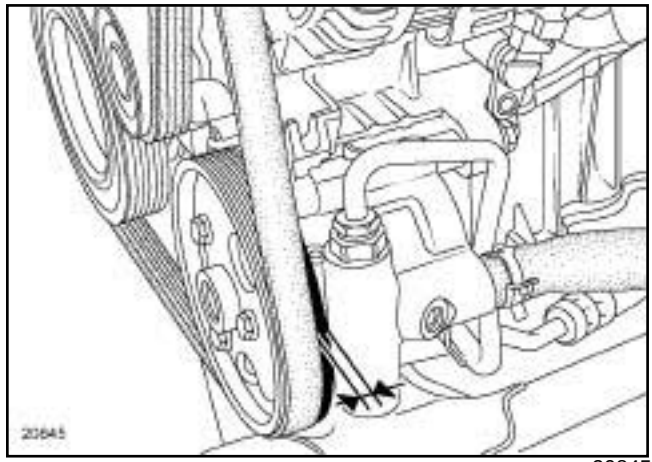
K9K, and STANDARD HEATING

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

WARNING
It is essential to replace the accessories belt and the tensioning roller.

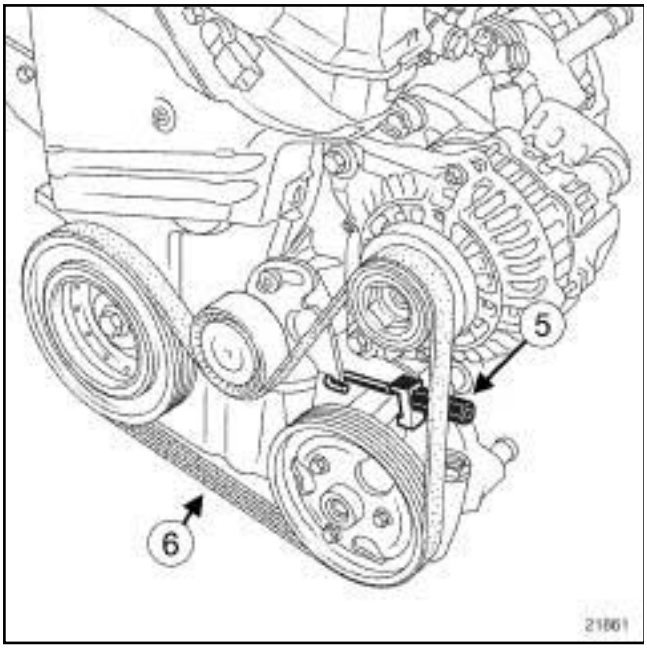


❑ It is essential to leave the inner tooth (**A**) of the pulleys free for engines fitted with an accessories belt with **5 teeth** for pulleys with **6 teeth**.

II - REFITTING OPERATION FOR PART CONCERNED

1 - Accessories belt fitted with a manual tensioning roller

❑ Refit:



- the tensioning roller,
- the new tensioning roller bolts.

❑ It is essential to leave the inner tooth free for engines fitted with an accessories belt with **5 teeth** on pulleys with **6 teeth**.

❑ Refit the accessories belt.

Note:
Ensure that the 2 bolts of the tensioning roller are not tightened, in order to be able to pivot the roller when tensioning the belt.

21861

❑ Position the tool **(Mot. 1638)** in the notch of the tensioning roller.

❑ Tension the accessories belt using the tool Mot.1638 by tightening the nut (**5**) .

❑ Check the accessories belt tension at point (**6**) using the tools **(Mot. 1505)** or **(Mot. 1715)**.

Note:

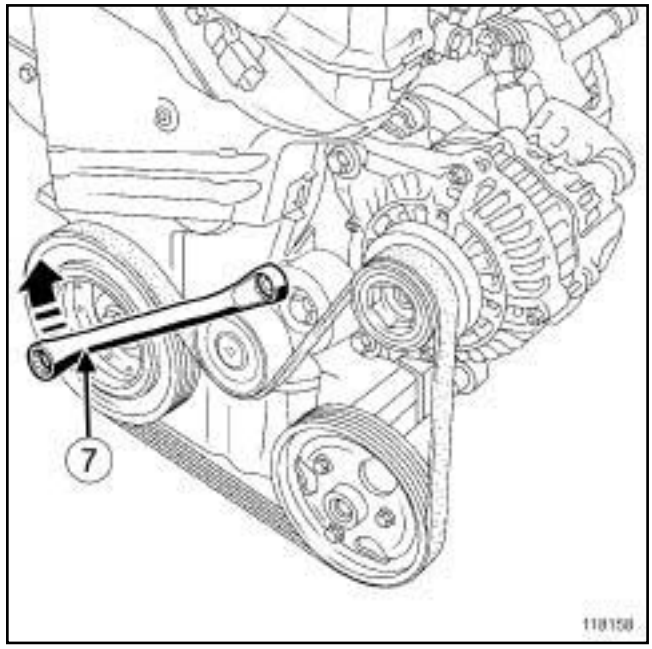
The accessories belt tension should be **254 Hz ± 11 Hz**.

❑ It is essential to turn the engine through 2 revolutions to position the accessories belt correctly.

❑ At the measuring point (**6**) , check that the belt tension is **254 Hz ± 11 Hz**.

❑ Adjust the accessories belt tension, if necessary, by turning the bolts of the tensioning roller then check again.

❑ Torque tighten the **mechanical tensioning roller bolts (35 N.m)**.



❑ Remove tool Mot.1638.

2 - Accessories belt fitted with an auto tensioner

❑ Refit:

- the auto tensioner,
- the new tensioning roller bolt.

❑ Torque tighten the **auto tensioner bolts (40 N.m)**.

118158

❑ Turn the accessories belt auto tensioner clockwise using a **16 mm** spanner (**7**) .

❑ Refit the accessories belt then release the tensioning roller.

❑ It is essential to turn the engine through 2 revolutions to position the accessories belt correctly.

III - FINAL OPERATION

❑ Refit:

- the fuel filter interior protector,
- the fuel filter interior protector nuts.

❑ Torque tighten the **the fuel filter interior protector nuts (21 N.m)**.

❑ Detach the « fuel filter - pipe» assembly from the vehicle.

❑ Refit:

- the « fuel filter - pipe » assembly,
- the fuel filter exterior protector,
- the fuel filter exterior protector nuts.

❑ Torque tighten the **fuel filter exterior protector nuts (21 N.m)**.

❑ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),

K9K, and STANDARD HEATING

- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

M4R

Special tooling required	
Mot. 1672	Lower engine support.

Tightening torques ▽	
auto tensioner mounting bolt	**22 Nm**
engine cover mounting bolts	**62 Nm**
bolts mounting the rubber mounting bush on the body	**62 Nm**
bolts mounting the rubber mounting bush on the engine	**105 Nm**
upper engine tie-bar mounting bolts	**105 Nm**
bolt mounting the engine tie-bar on the subframe	**105 Nm**
bolt mounting the engine tie-bar on the engine	**180 Nm**
lifting eye mounting bolts	**33 Nm**
radiator mounting cross member right-hand mounting bolt	**105 Nm**
subframe tie-rod left-hand mounting bolt	**105 Nm**
exhaust bracket mounting bolts	**21 Nm**

WARNING

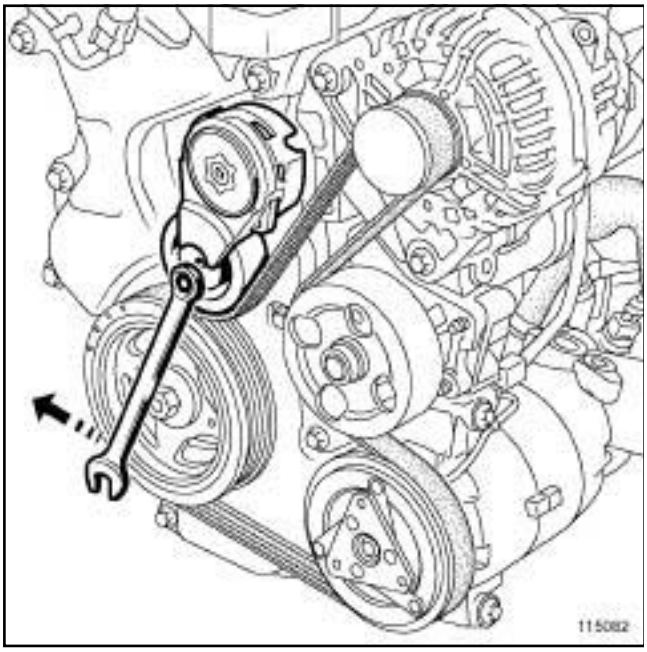
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL

I - REMOVAL PREPARATION OPERATION

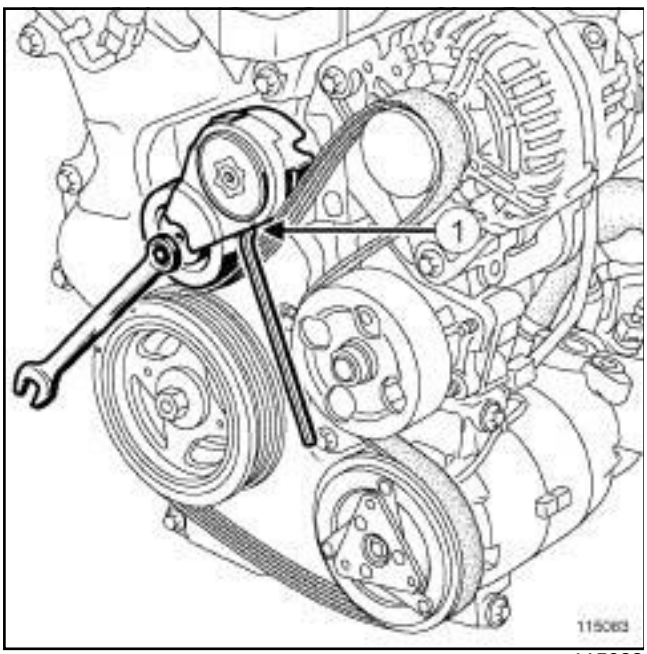
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove the engine cover.



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:



- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

M4R

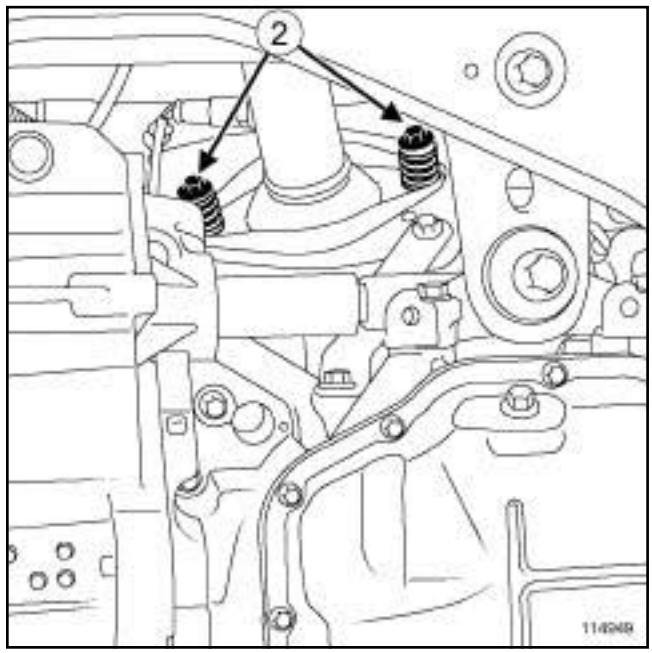
II - REMOVAL OF PART CONCERNED

115082

115083

❏ Turn the accessories belt auto tensioner clockwise using a **14 mm** spanner.

❏ Lock the auto tensioner using a **6 mm** Allen key at (**1**) .

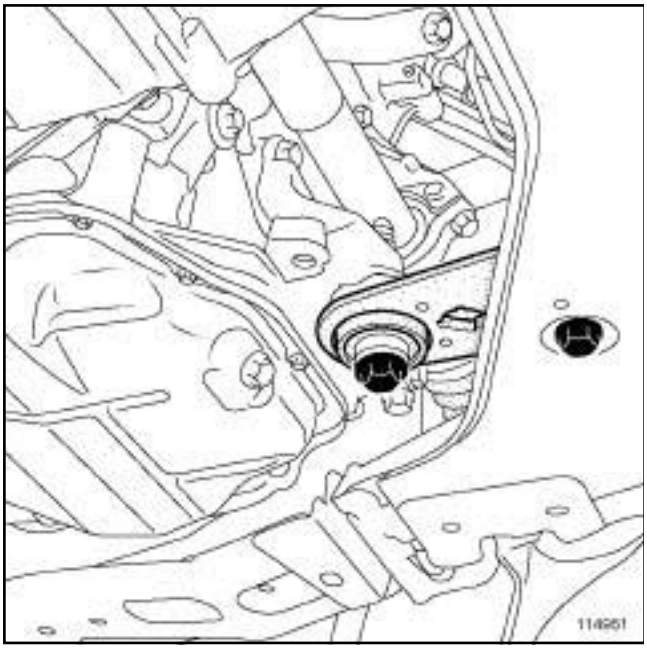


❏ Remove the accessories belt.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Use a brush to remove any deposits from the crankshaft pulley V-grooves.

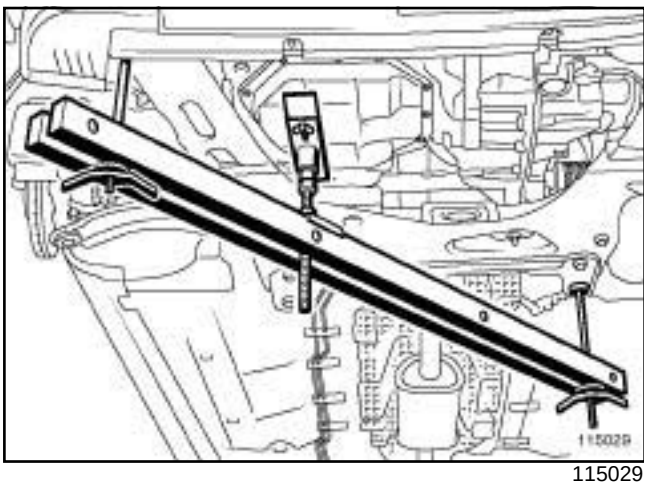


Replacing the auto tensioner

114949

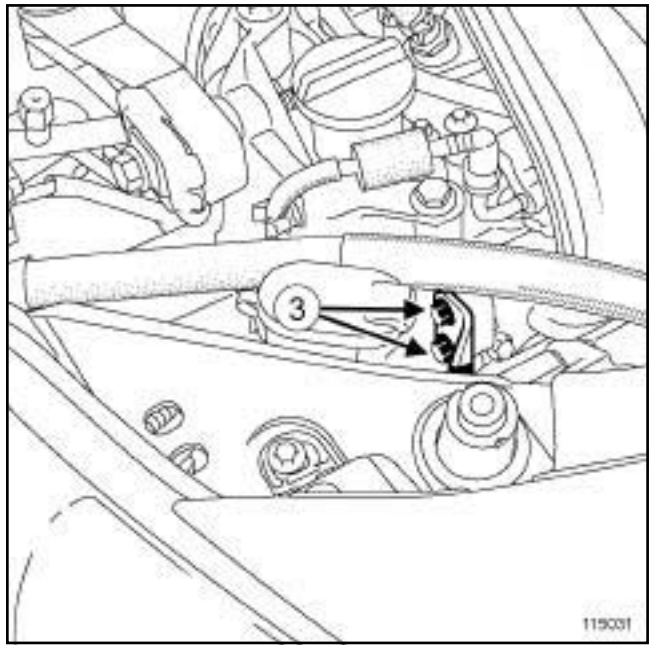
❏ Remove:

- the exhaust bracket mounting bolts (**2**) ,
- The exhaust bracket seal.



114951

❏ Remove:

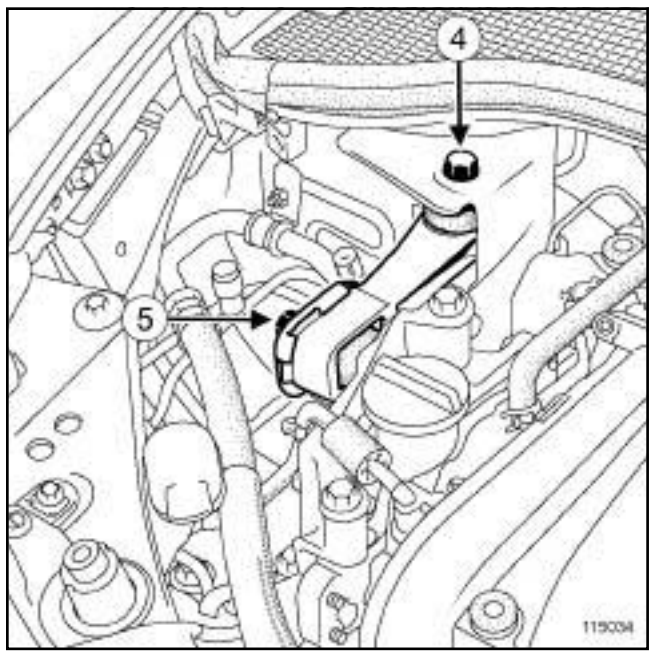


- the mounting bolts from the engine tie-bar,
- the engine tie-bar.

❏ Remove:

- the right-hand mounting bolt from the radiator support cross member,
- the left-hand mounting bolt from the sub-frame tie-rod.

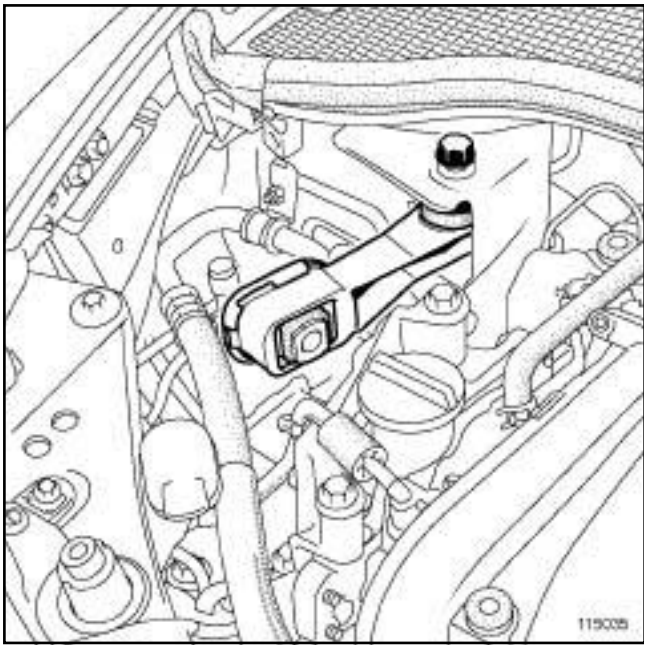
115029



❏ Fit the lower engine support tool **(Mot. 1672)**.

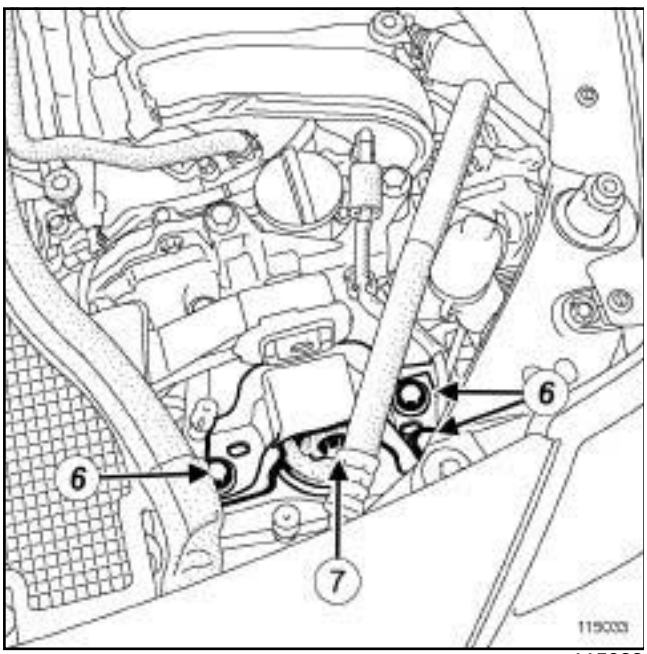
115031

❏ Remove:



- the lifting eye mounting bolts (**3**) ,
- the lifting eye.

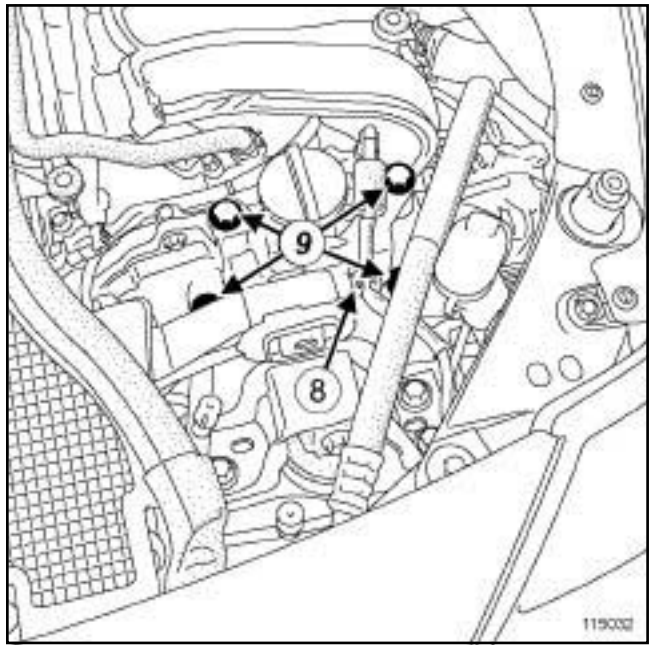
115034



❏ Undo the upper engine tie-bar mounting bolt (**4**) .

❏ Remove the upper engine tie-bar mounting bolt (**5**) .

115035

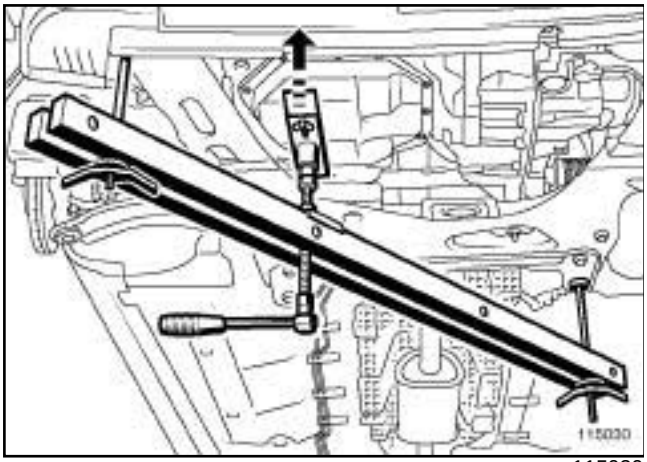


❏ Remove the upper engine tie-bar.

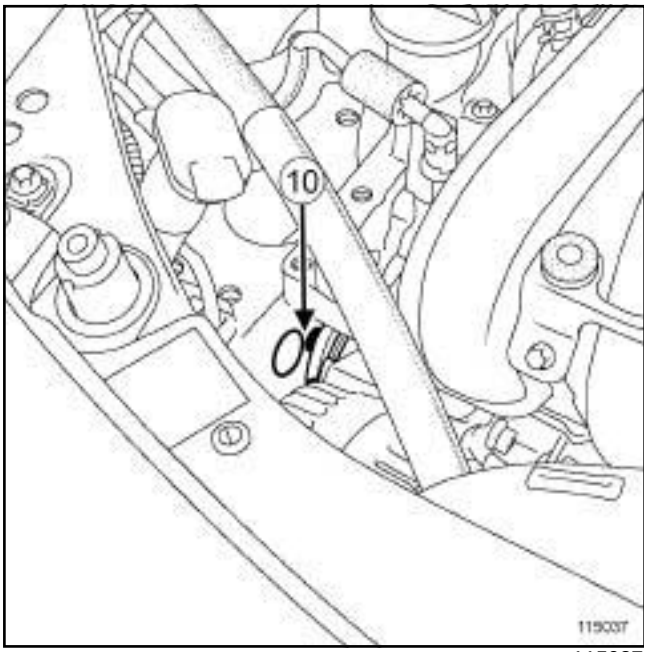
115033

❏ Remove:

- the engine cover rubber mounting bush mounting bolt (**6**)
- the rubber mounting bush mounting bolts (**7**) on the body,



115032

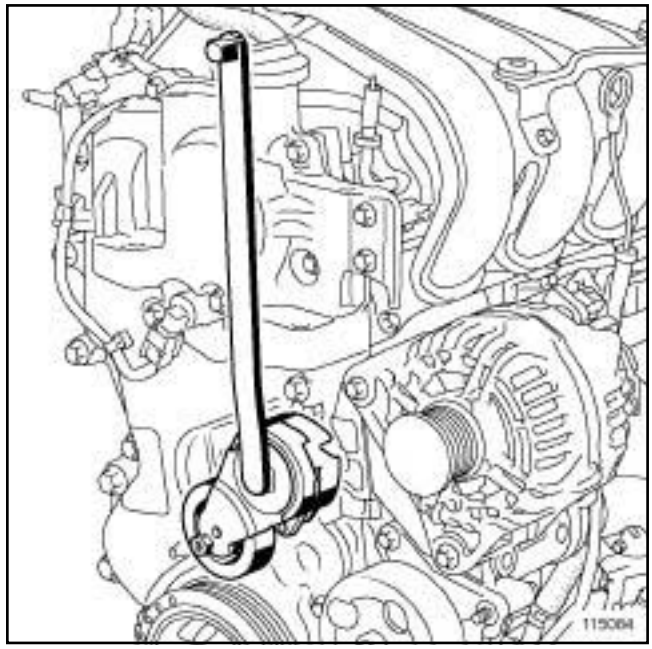


❏ Unclip the fuel supply pipe at (**8**) .

❏ Remove:

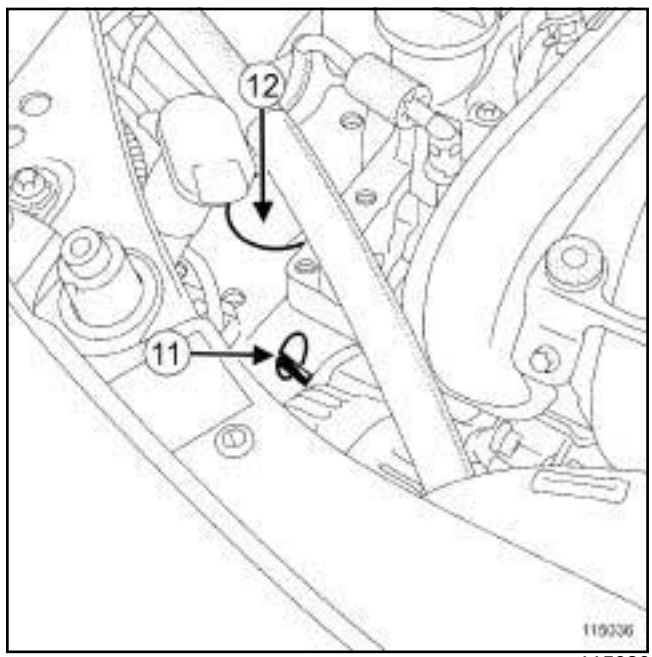
- the engine cover mounting bolts (**9**) ,
- the engine cover,
- the rubber mounting bush.

115030



115037

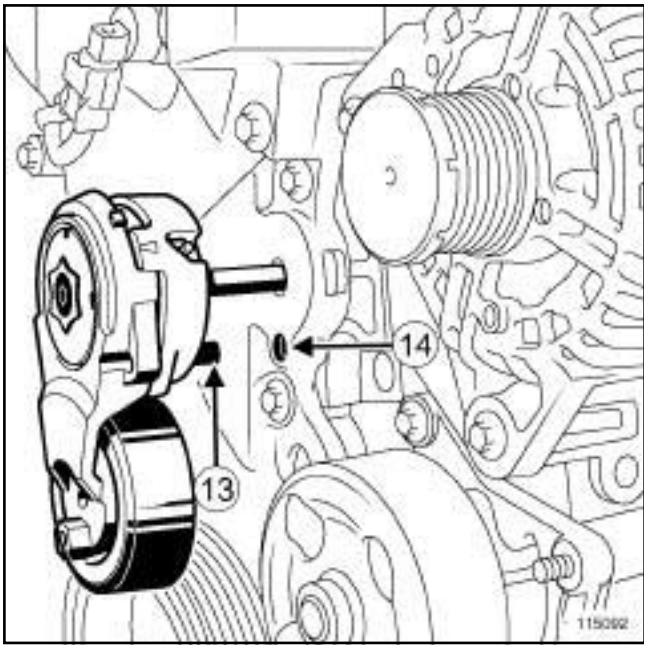
❑ Fit the engine at approximately **25 mm** so that the auto tensioner mounting bolt is opposite the side member hole at (**10**) .



Note:

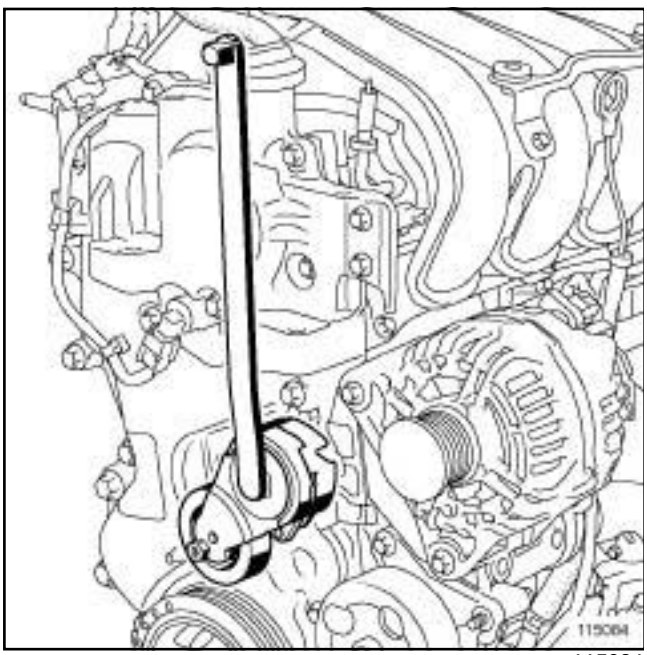
Before removing the auto tensioner, it is essential to retrieve the **6 mm** Allen key by unlocking the tensioning roller using a **14 mm** open-jawed spanner.

115084



❑ Undo the auto tensioner mounting bolt completely using the.

115036



❑ Remove the auto tensioner by inserting the mounting bolt into the side member hole at (**11**) .

❑ Retrieve the auto tensioner mounting bolt via the side member hole at (**12**) .

115092

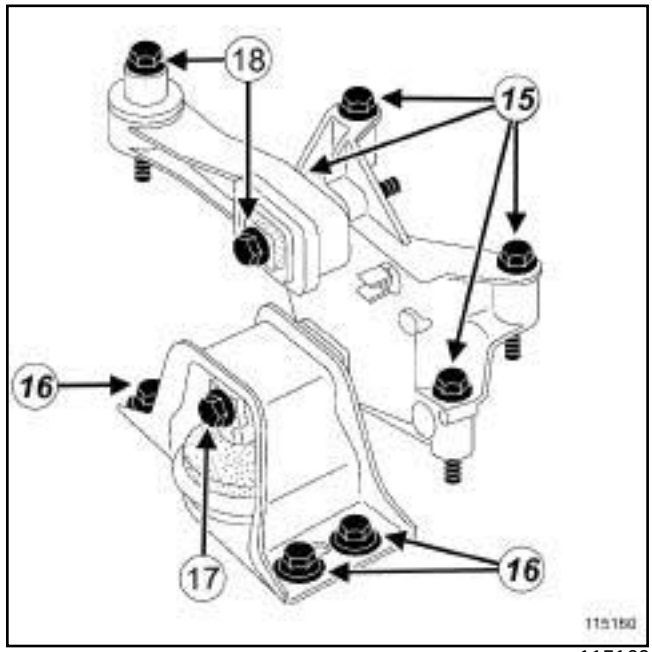
❑ Refit the new auto tensioner by inserting lug (**13**) into its housing (**14**) .

115084

❑ Torque tighten the **auto tensioner mounting bolt (22 Nm)** using the.

II - REFITTING PART CONCERNED

❑ Turn the accessories belt auto tensioner clockwise using a **14 mm** spanner.



Lock the auto tensioner using a **6 mm** Allen key.

❑ Refit the accessories belt.

❑ Retrieve the **6 mm** Allen key and gradually unlock the auto tensioner using a **14 mm** open-jawed spanner.

❑ Rotate the crankshaft clockwise twice to balance the accessories belt tension on every pulley.

III - FINAL OPERATION.

115160

❑ Fit:

- the rubber mounting bush,
- the engine cover.

❑ Without tightening, fit:

- the engine cover mounting bolts (**15**) ,
- the rubber mounting bush mounting bolts (**16**) on the body.

Note:

Allow the two parts to move freely.

❑ Lower the engine to fit the engine cover rubber mounting bush mounting bolt (**17**) .

❑ Torque tighten and in order:

- the **engine cover mounting bolts (62 Nm)** at (**15**) ,
- the **bolts mounting the rubber mounting bush on the body (62 Nm)** at (**16**) ,
- the **bolts mounting the rubber mounting bush on the engine (105 Nm)** at (**17**) ,

- the **upper engine tie-bar mounting bolts (105 Nm)** at (**18**) .

❏ Remove the lower engine support tool **(Mot. 1672)**.

❏ Refit the lifting eye.

❏ Torque tighten:

- the **bolt mounting the engine tie-bar on the sub-frame (105 Nm)**,
- the **bolt mounting the engine tie-bar on the engine (180 Nm)**,
- the **lifting eye mounting bolts (33 Nm)**.

❏ The exhaust clamp seal must be replaced.

❏ Torque tighten:

- the **radiator mounting cross member right-hand mounting bolt (105 Nm)**,
- the **subframe tie-rod left-hand mounting bolt (105 Nm)**,
- the **exhaust bracket mounting bolts (21 Nm)**.

❏ Refit:

- the front section of the wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the engine cover.

F4R

Tightening torques ▽	
tensioning roller mounting bolt	**50 Nm**

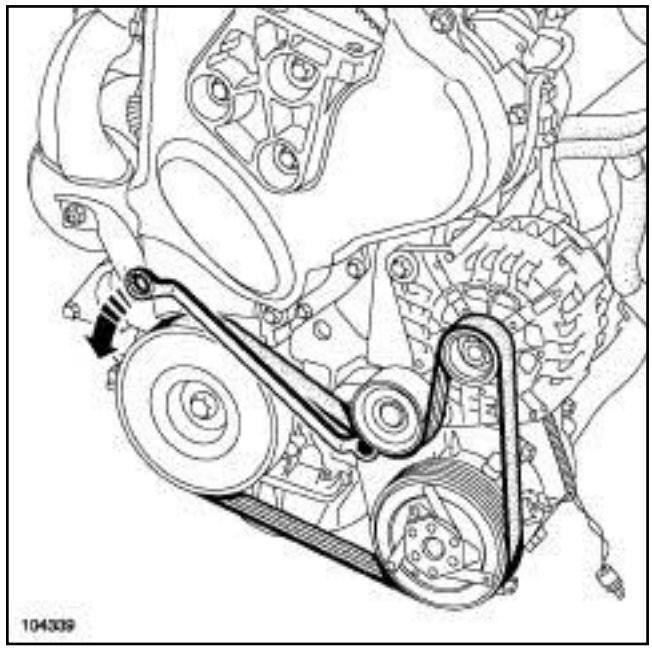
WARNING
The belt must be replaced with a new one if it has been removed.

WARNING
The tensioning roller must be replaced when the belt is replaced.

WARNING
Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner on the front bumper side (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).

II - OPERATION FOR REMOVAL OF PART CONCERNED

104339

❑ Turn the tensioning roller anti-clockwise using a **16 mm** spanner.

❑ Remove:

- the accessories belt,
- the tensioning roller mounting bolt,
- the tensioning roller,

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the new tensioning roller,
- the tensioning roller new mounting bolt.

❑ Tighten to torque the **tensioning roller mounting bolt (50 Nm)**.

❑ Refit the belt by turning the tensioning roller anti-clockwise using a **16 mm** spanner.

❑ Rotate the crankshaft twice to position the accessories belt correctly.

II - FINAL OPERATION.

❑ Refit:

- the front right-hand wheel arch liner on the front bumper side (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F

Special tooling required	
Mot. 1715	Belt tension checking tool (frequency indicator).
Mot. 1505	Belt tension setting tool (frequency meter)

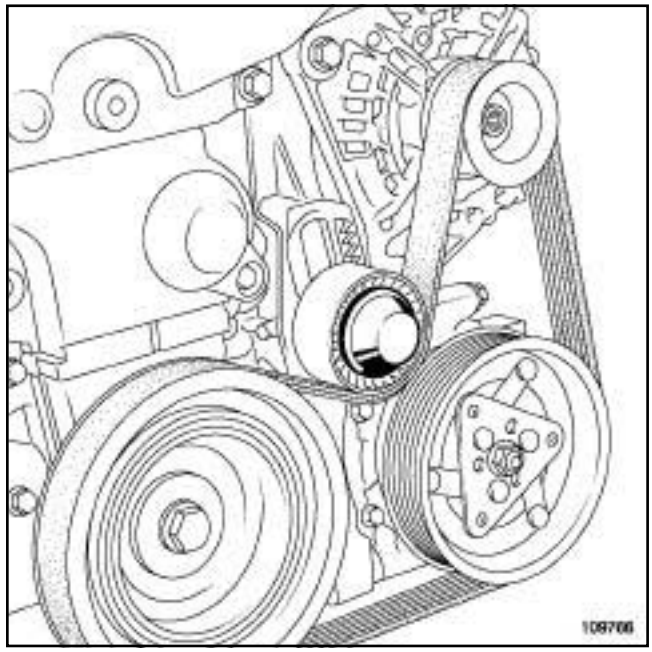
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray.

IMPORTANT
Wear protective gloves during the operation.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109766

❑ Remove the accessories belt tensioning roller protector.

❑ Undo the accessories belt tensioning roller bolt.

❑ Remove:

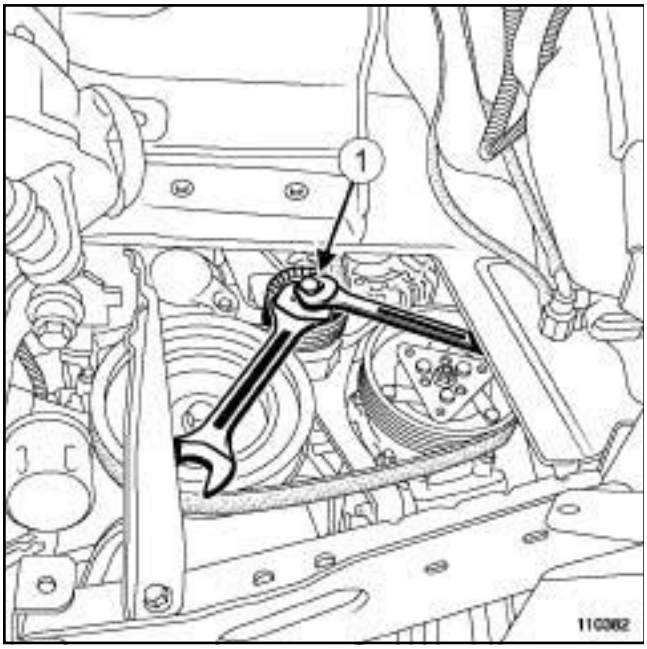
- the accessories belt,
- the tensioner roller bolt,
- the accessories belt tension wheel.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Accessories belt (10,10,01,03)**.

❑ **parts always to be replaced: Accessories belt tensioning roller (10,10,01,04)**.



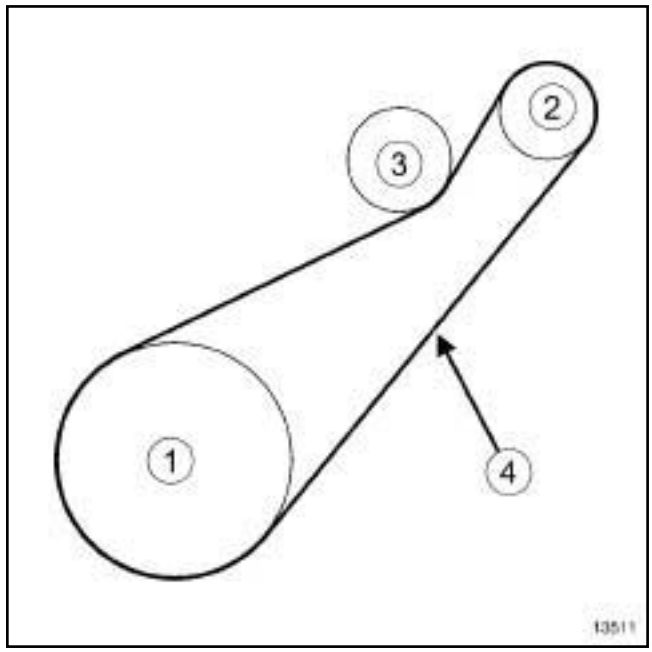
❑ It is essential to replace the tensioning roller torx bolt with a hexagonal-head bolt, part no. **77 03 101 075**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the accessories belt tensioning roller,
- the accessories belt.

D4F



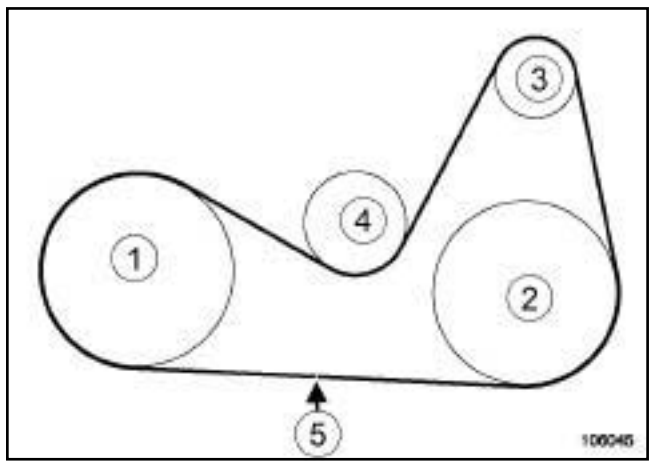
110382

❏ Tighten the accessories belt by turning the tensioning roller anti-clockwise, using a **20 mm** open-jawed spanner.

❏ Adjust the accessories belt tension using the **(Mot. 1715)** or **(Mot. 1505)**.

❏ Without locking, tighten the bolt (**1**) on the tensioning roller with a **16 mm** open-jawed spanner, while keeping the tensioning roller tension at the adjustment value using a **20 mm** open-jawed spanner.

STANDARD HEATING



13511

(**1**) Crankshaft
(**2**) Alternator
(**3**) Tensioning roller
(**4**) Measuring point

❏ The accessories belt tension value is **210 Hz ± 10**.

AIR CONDITIONING

106045

(**1**) Crankshaft
(**2**) Air conditioning compressor

(**3**) Alternator

(**4**) Tensioning roller

(**5**) Measuring point

❏ The accessories belt tension value is **277 Hz ± 5**.

❏ Torque tighten the **tensioning roller bolt (50 N.m)** using a **16 mm** socket and a **repositioner**, while keeping the tensioning roller tension at the adjustment value with a **20 mm** open-jawed spanner.

❏ Turn the engine through three revolutions clockwise (timing end) to position the belt correctly.

❏ Check the accessories belt tension value with the **(Mot. 1715)** or **(Mot. 1505)**.

❏ If the accessory belt tension is outside permitted tolerance values, readjust it.

❏ Refit the accessories belt tension wheel protector.

III - FINAL OPERATION.

❏ Refit:

- the engine undertray,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Crankshaft accessories pulley: Removal - Refitting

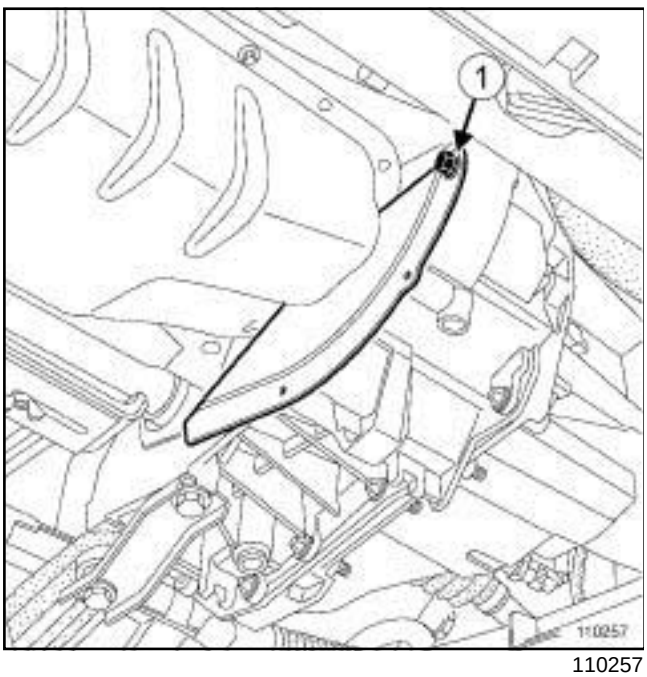
Mot. 582-01	Flywheel locking tool.

Tightening torques ▽	
crankshaft accessories pulley mounting bolt	**40 N.m + 70° ± 6°**

REMOVAL

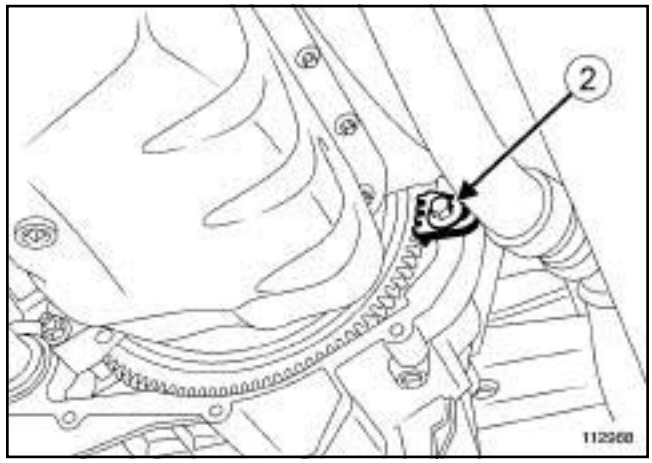


I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .



II - OPERATION FOR REMOVAL OF PART CONCERNED

110257

❑ Remove:

- the flywheel cover mounting bolt (**1**) ,
- the flywheel cover.

112988

❑ Fit the immobilising tool **(Mot. 582-01)** (**2**) .

❑ Remove:

- the accessories pulley mounting bolt,
- the accessories pulley.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
You must replace the crankshaft accessories pulley mounting bolt.

Clean the crankshaft accessories pulley grooves with a wire brush to ensure there are no deposits.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the crankshaft accessories pulley using a new bolt.

❑ Torque tighten the **crankshaft accessories pulley mounting bolt (40 N.m + 70° ± 6°)**.

III - FINAL OPERATION.

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),

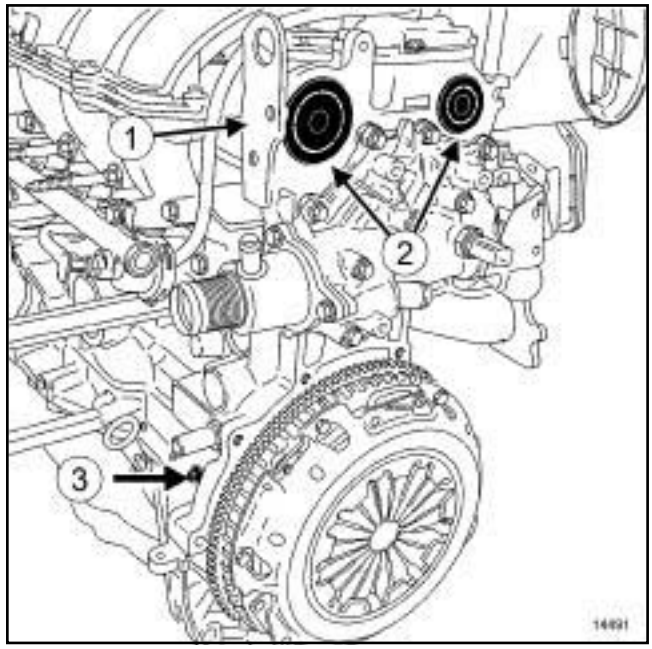
D4F, and 740 or 742 or 764

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

K4J or K4M

Special tooling required	
Mot. 1489	TDC locating pin.
Mot. 1496	Camshaft timing tool.
Mot. 1750	Additional tool to support the camshaft adjusting tool, Mot. 1496.
Mot. 1487	Tool for refitting camshaft covers (57 mm diameter).
Mot. 1488	Tool for refitting camshaft covers (43 mm diameter).

Tightening torques ▽	
crankshaft accessories pulley mounting bolt	**40 N.m + 145° ± 15°**
TDC setting pin plug	**20 N.m**



REMOVAL

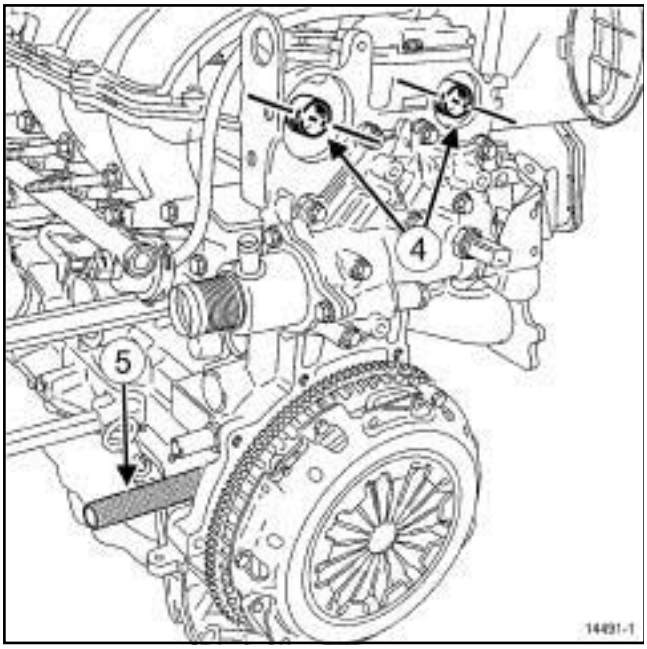
I - REFITTING PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the air inlet duct clips,
- the air inlet duct,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

14491

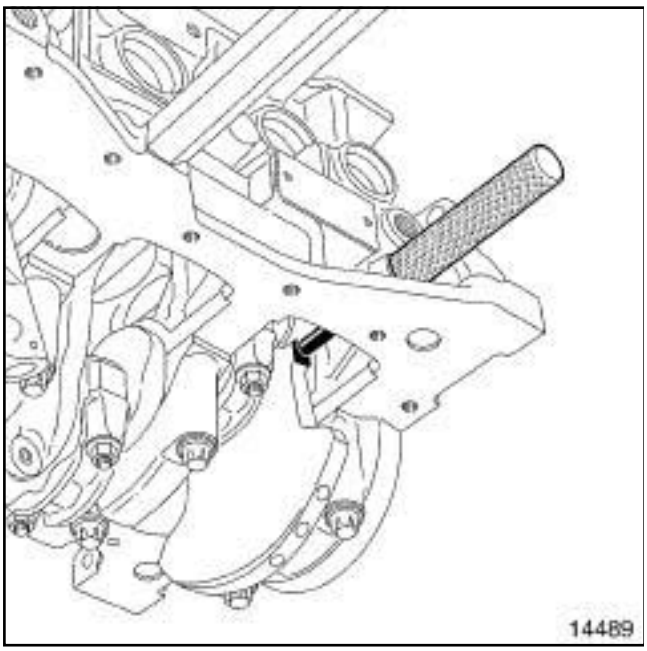


❑ Remove the engine lifting eye (**1**) on the flywheel side.

❑ Pierce the centre of the plugs (**2**) at the camshaft ends with a screwdriver.

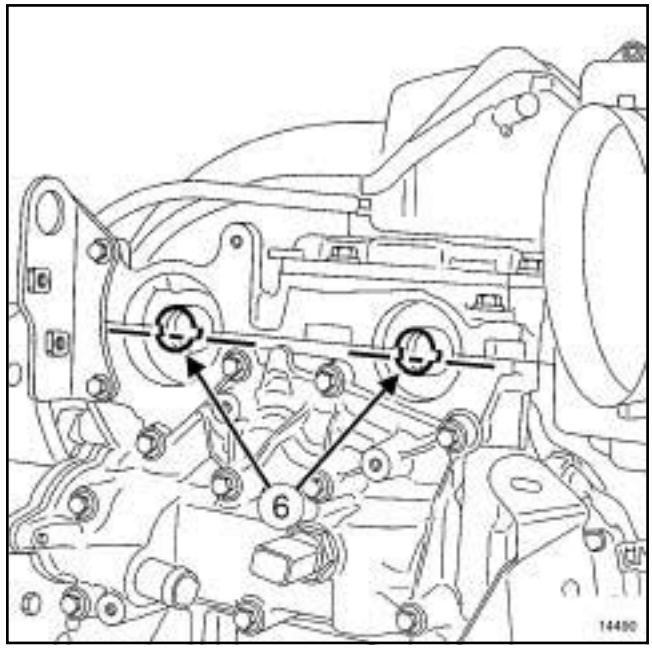
❑ Remove:

- the plugs from the camshaft ends with a screwdriver,
- the TDC setting pin plug (**3**) .



K4J or K4M

14491-1

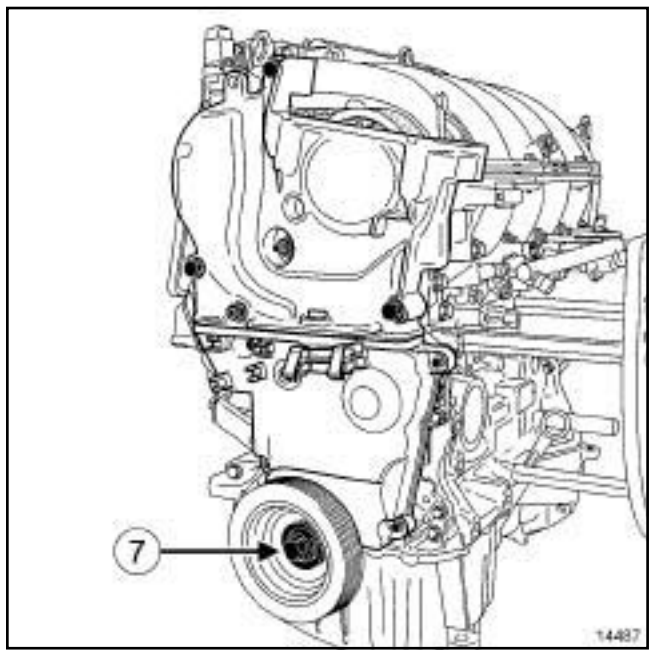


❏ Position the camshaft grooves (**4**) almost horizontally and offset towards the bottom turning the crankshaft in the operating direction (clockwise at timing end).

❏ Screw in the TDC setting pin (**5**) **(Mot. 1489)**.

14489

❏ Turn the crankshaft in its operating direction (clockwise at timing end), until the crankshaft presses against the TDC setting pin **(Mot. 1489)**.



14490

❏ The camshaft grooves (**6**) must be horizontal and offset downwards.

❏ Remove the TDC setting pin **(Mot. 1489)**.

❏ Lock the flywheel using a screwdriver.

II - REMOVAL OF PART CONCERNED

14487

❏ Remove the crankshaft accessories pulley mounting bolt (**7**) .

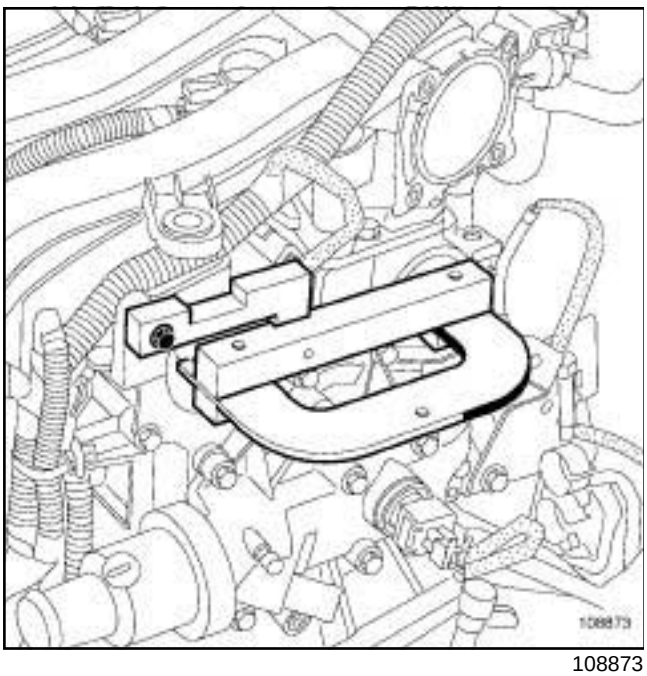
K4J or K4M

REFITTING

I - REFITTING PREPARATION OPERATION

❑

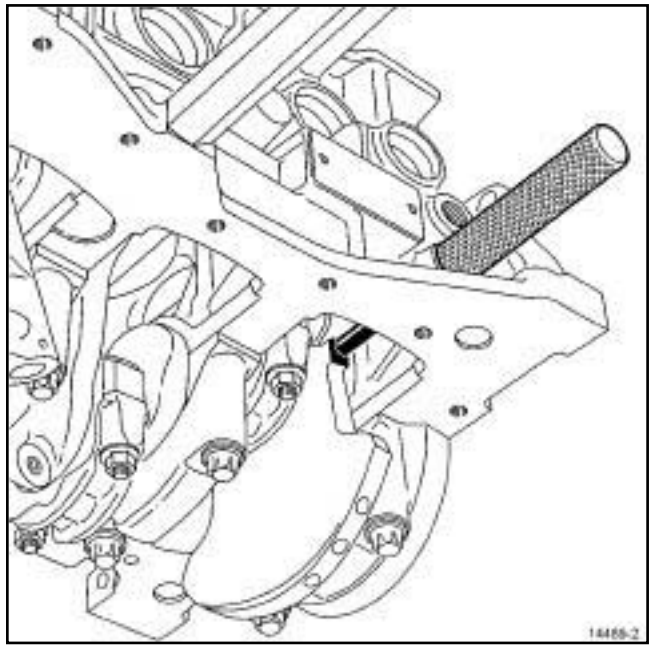
WARNING
Always replace the bolt and the crankshaft accessories pulley.



WARNING

Be sure to degrease:

- the end of the crankshaft,
- the bearing face of the crankshaft accessories pulley.



This is to prevent timing slippage.

WARNING
Never run the engine in the opposite direction to that of normal operation.

108873

❑ Position timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**.

14489-2

❑ Screw in the TDC setting pin **(Mot. 1489)**.

❑ Check that the crankshaft is pressing against the TDC setting pin **(Mot. 1489)**.

❑ The crankshaft groove must be upwards.

II - REFITTING PART CONCERNED

❑ Refit the crankshaft accessories pulley.

❑ Tighten to torque and angle the **crankshaft accessories pulley mounting bolt (40 N.m + 145° ± 15°)**.

III - FINAL OPERATION

❑ Remove:

- the TDC setting pin **(Mot. 1489)**,
- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**.

❑ Refit:

- the inlet camshaft plug using the **(Mot. 1487)**,
- the exhaust camshaft plug using the **(Mot. 1488)**.

❑ Place a drop of **SILICONE ADHESIVE SEALANT** on the thread hole of the TDC pin plug.

❑ Refit the TDC setting pin plug.

❑ Torque tighten the **TDC setting pin plug (20 N.m)**.

❑ Refit:

- the engine lifting eye at the flywheel end,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

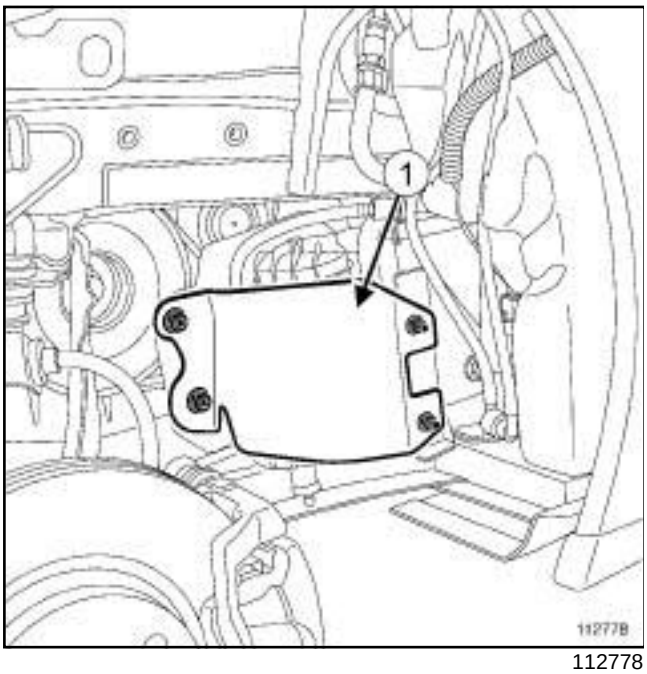
K4J or K4M

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the air inlet duct,
- the air inlet duct clips,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),

❏ Connect the battery (see **Battery tray: Removal - Refitting**) (80A, Battery).

K9K

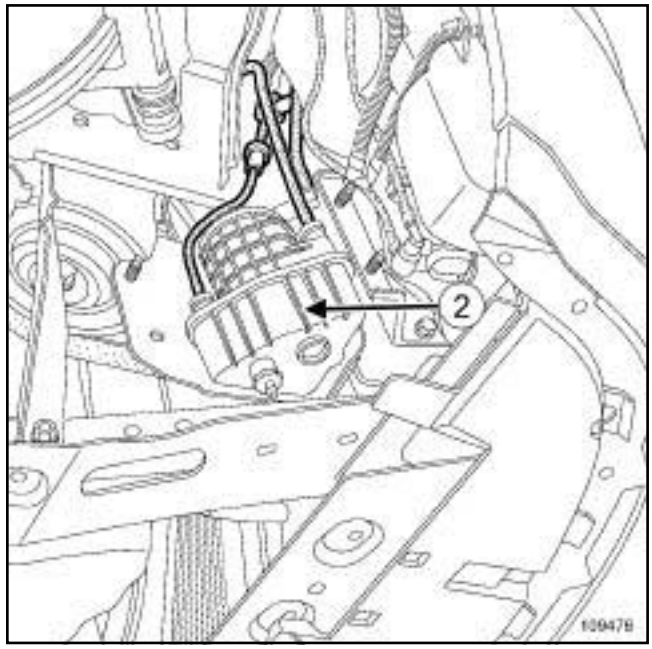
Tightening torques ▽	
M12 bolt of the crankshaft accessories pulley	**60 N.m +100°**
M14 bolt of the crankshaft accessories pulley	**120 N.m + 95° ± 15°**



REMOVAL

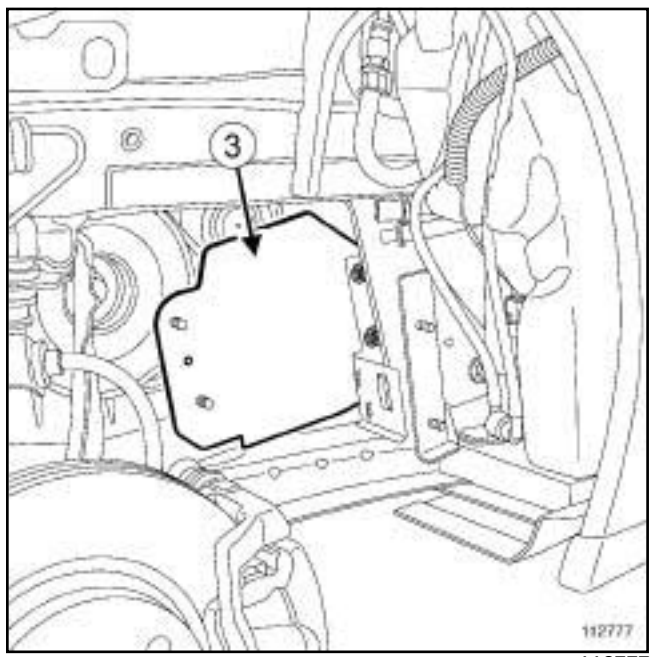
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the right-hand wheel arch (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).



112778

❏ Remove the protector (**1**) in front of the diesel filter.

109476

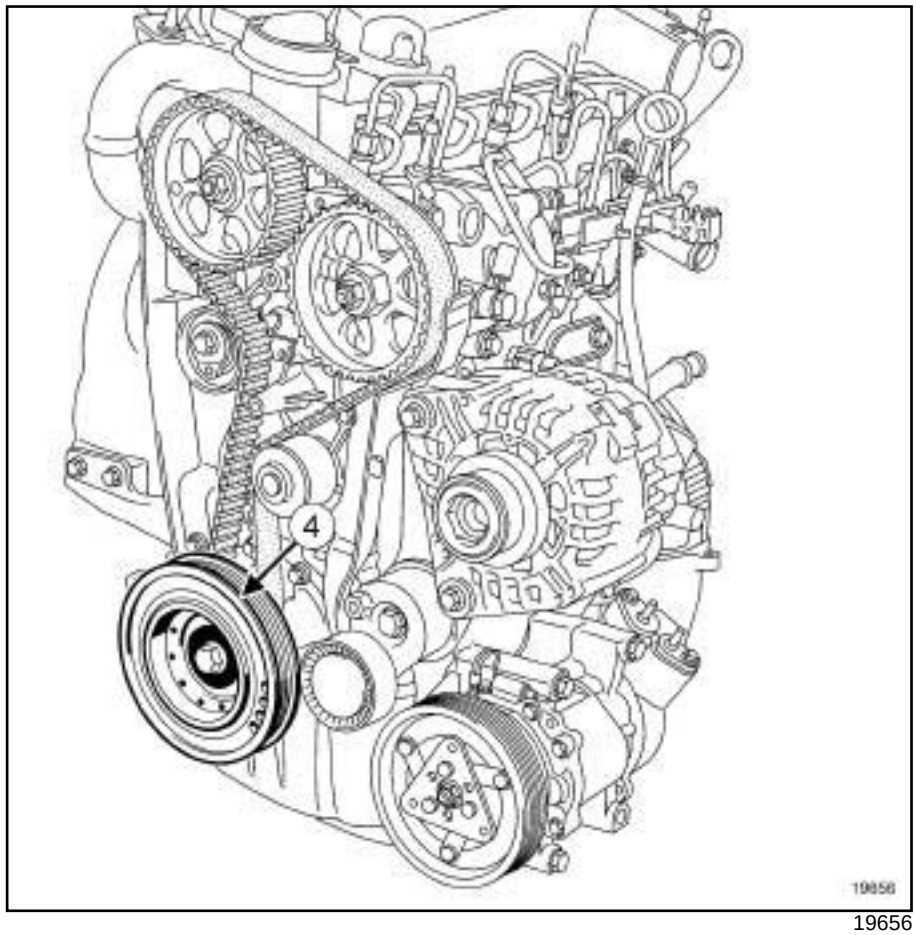
❏ Lift the diesel filter (**2**) and fasten it to a suspension spring.

112777

❏ Remove:

- the protector (**3**) behind the diesel filter,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the accessories belt tensioning roller.

K9K



TL4

❑ Lock the flywheel using a flat-blade screwdriver positioned in the window under the starter.

JA5 or JH3 or JR5

❑ Immobilise the flywheel using a flat-blade screwdriver positioned in the window located in the clutch housing, at the rear of the engine.

II - OPERATION FOR REMOVAL OF PART CONCERNED

19656

❑ Remove the bolt (**4**) then the crankshaft accessories pulley.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ If reusing the crankshaft accessories pulley, clean the pulley V-grooves with a brush to eliminate any deposits.

❑ Refit the crankshaft accessories pulley.

TL4

❑ Lock the flywheel using a flat-blade screwdriver positioned in the window under the starter.

JA5 or JH3 or JR5

❑ Immobilise the flywheel using a flat-blade screwdriver positioned in the window located in the clutch housing, at the rear of the engine.

❑ Torque tighten the **M12 bolt of the crankshaft accessories pulley (60 N.m +100°)** or the **M14 bolt of the crankshaft accessories pulley (120 N.m + 95° ± 15°)**.

II - FINAL OPERATION

❑ Refit:

- the accessories belt tensioning roller,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the protector behind the diesel filter.

❑ Detach the diesel filter from the suspension spring and put it back into position.

❑ Refit:

- the protector in front of the diesel filter,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

120951

❏ Remove:

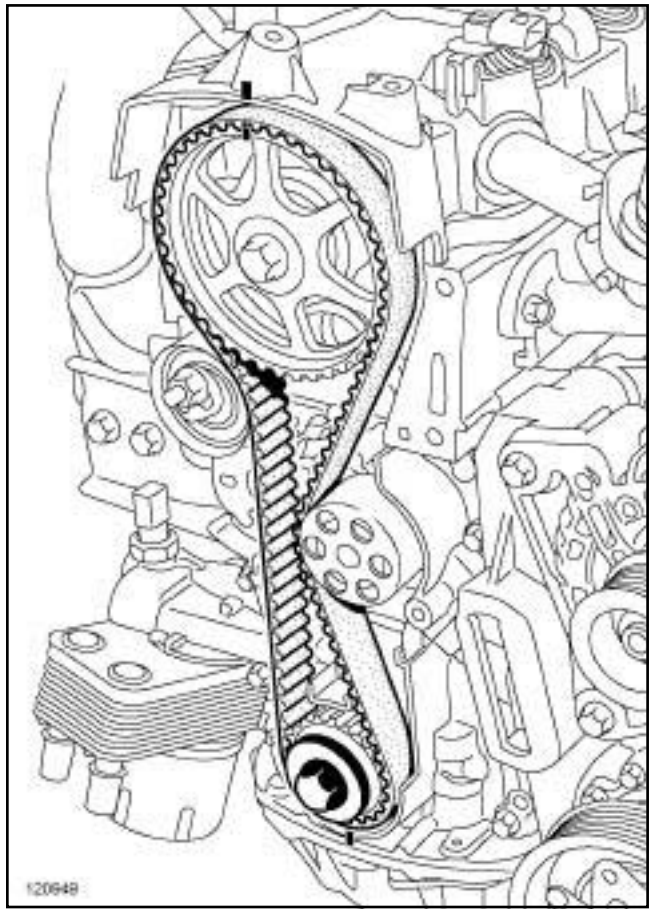
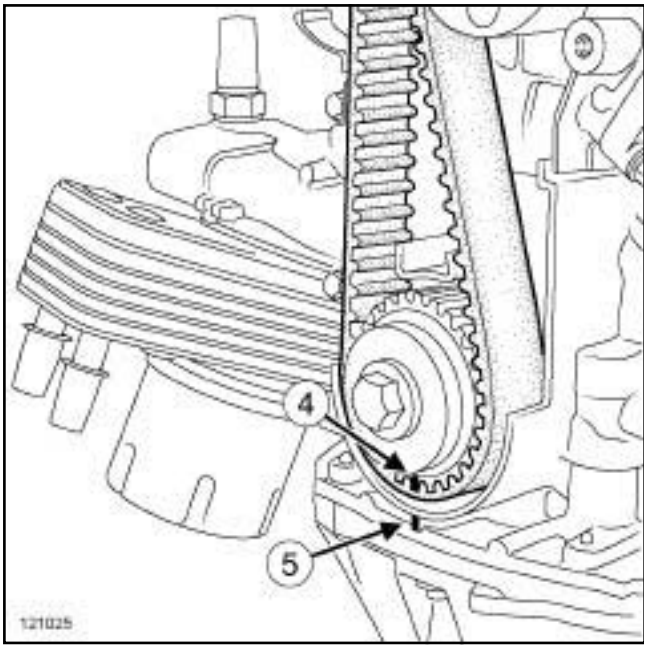
- the bolts (**1**) from the upper timing cover,
- the upper timing cover,

D4F



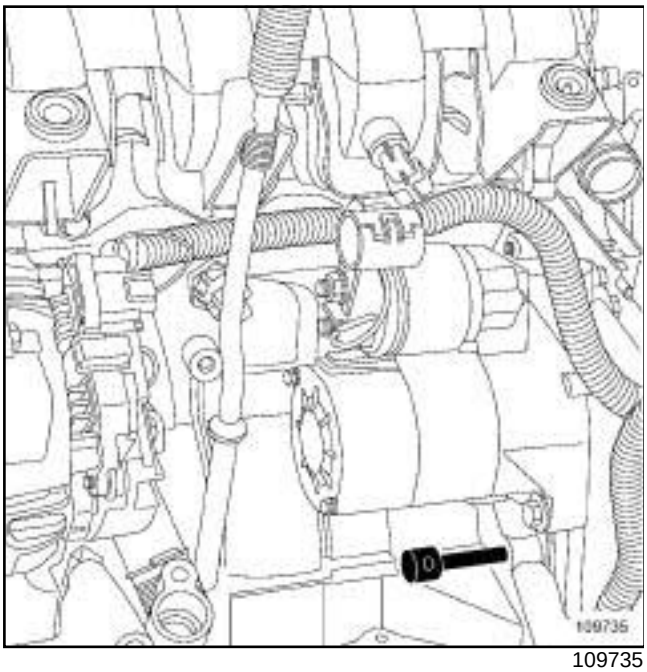
- the bolts (**2**) from the timing intermediate housing,
- the middle timing cover.

120950



❑ Remove:

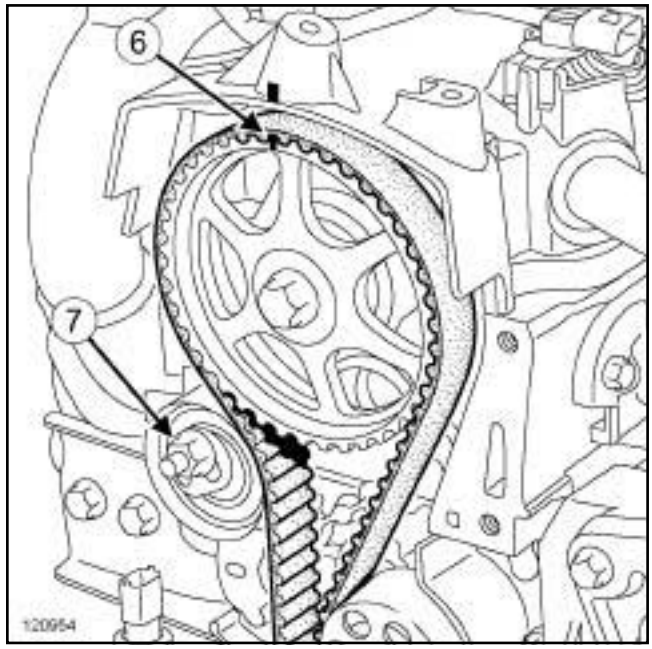
- the lower timing cover bolt (**3**) ,
- the lower timing cover.



120949

❑ Refit the crankshaft accessories pulley bolt and its retaining washer.

121025



❏ Turn the crankshaft clockwise (timing end) to position the crankshaft sprocket marking (**4**) half a tooth in front of the alignment of the fixed marking (**5**) on the oil pump casing.

109735

❏ Insert **(Mot. 1054)**.

❏ Turn the crankshaft clockwise until it is stopped.

120954

❏ Check that mark (**6**) of the camshaft sprocket is vertical to the engine and aligned with the rocker cover mark.

❏ Undo the timing tension wheel nut (**7**) .

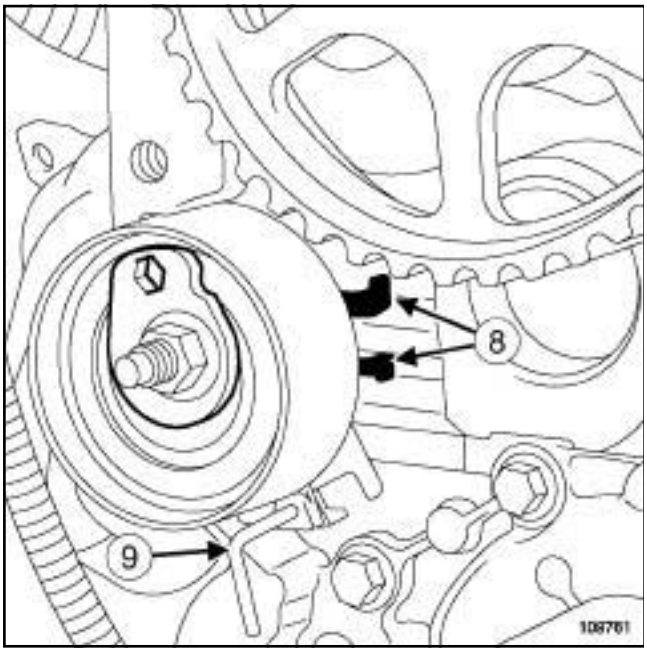
❏ Loosen the timing tension wheel by turning the eccentric cam using a **6 mm** Allen key.

❏ Remove:

- the timing belt,
- the timing tensioning roller nut,
- the timing tensioning roller.

REFITTING

I - REFITTING PREPARATIONS OPERATION



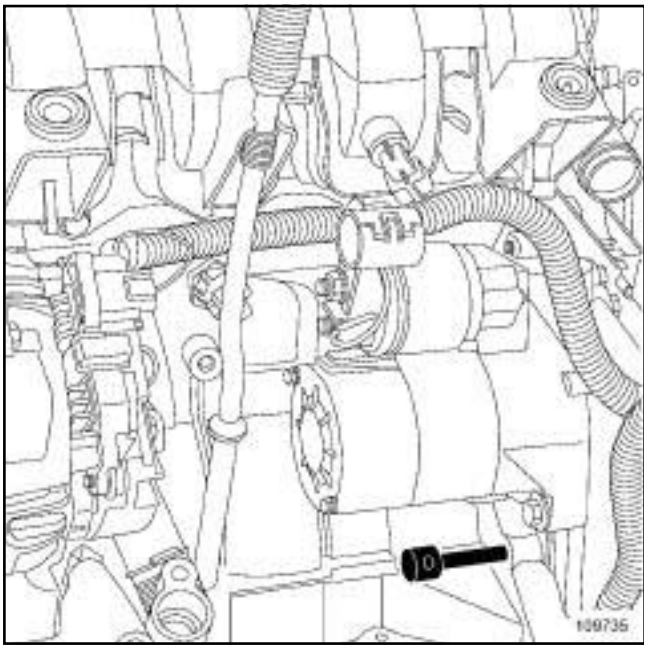
❏ **parts always to be replaced: Timing belt (10,02, 04,02)**.

❏ **parts always to be replaced: Timing belt tensioning roller (10,02,04,04)**.

❏ **parts always to be replaced: Crankshaft accessories pulley bolts (10,03,03,10)**

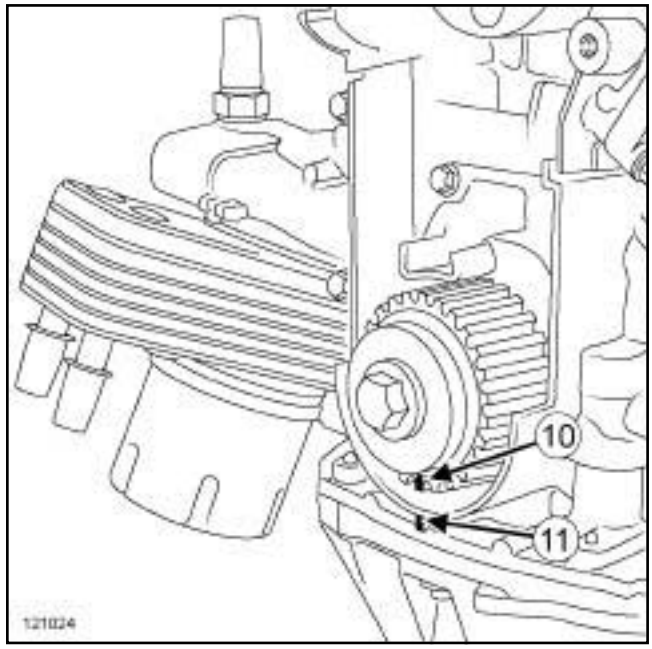
D4F

II - REFITTING OPERATION FOR PART CONCERNED



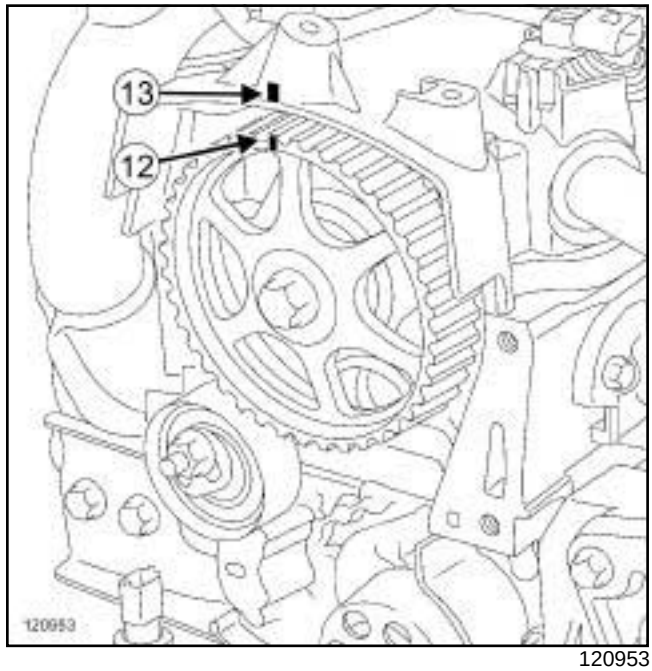
109761

❏ Refit the new tensioning roller.



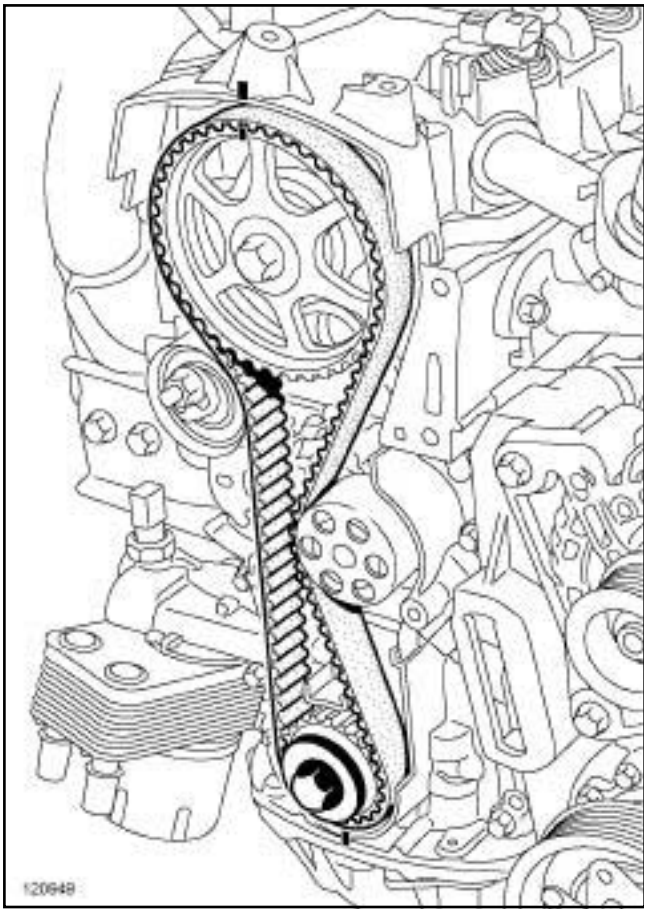
❏ Position both indexes (**8**) between the cylinder head groove.

❏ Do not remove the pin (**9**) before refitting the timing belt.



109735

❏ Check that the crankshaft is at its setting point using the **(Mot. 1054)**.

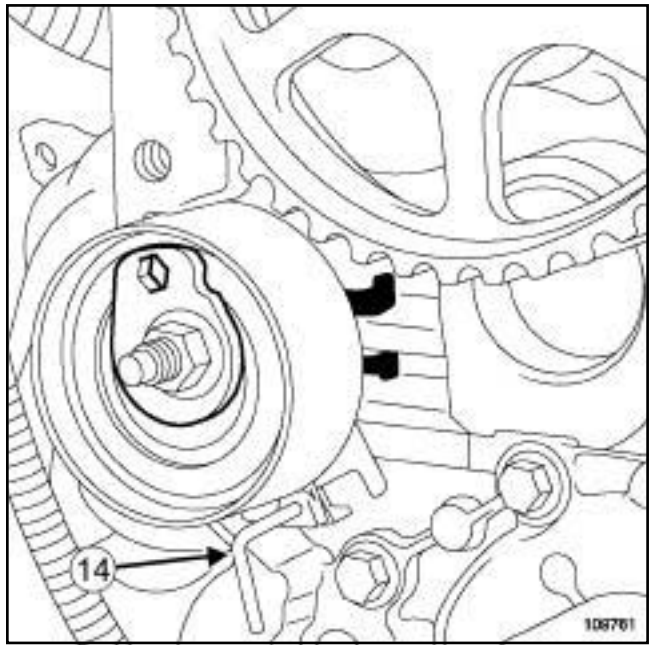


121024

❏ The mark on the crankshaft sprocket (**10**) must be aligned with the fixed marking (**11**) on the oil pump casing.

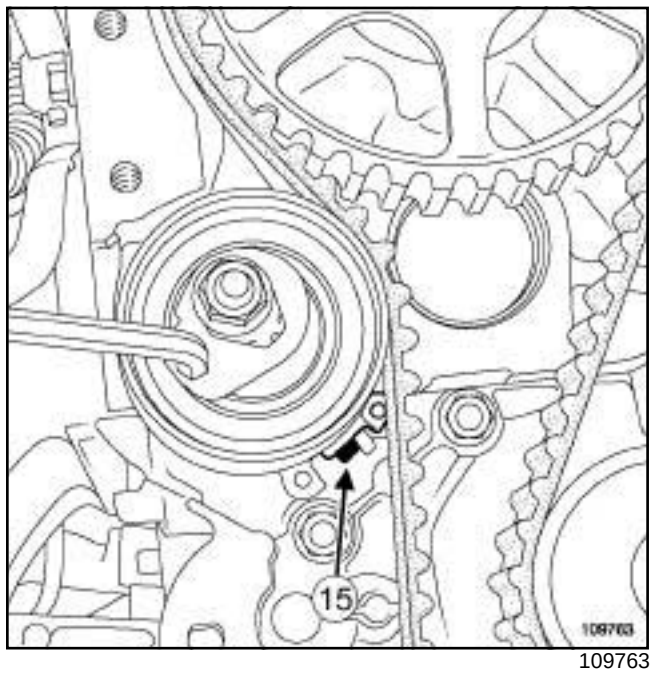
120953

❏ Align the mark on the camshaft sprocket (**12**) with the fixed marking (**13**) on the rocker cover using the **(Mot. 799-01)**.



120949

❏ Torque tighten the **crankshaft accessories pulley bolt (15 Nm)**.



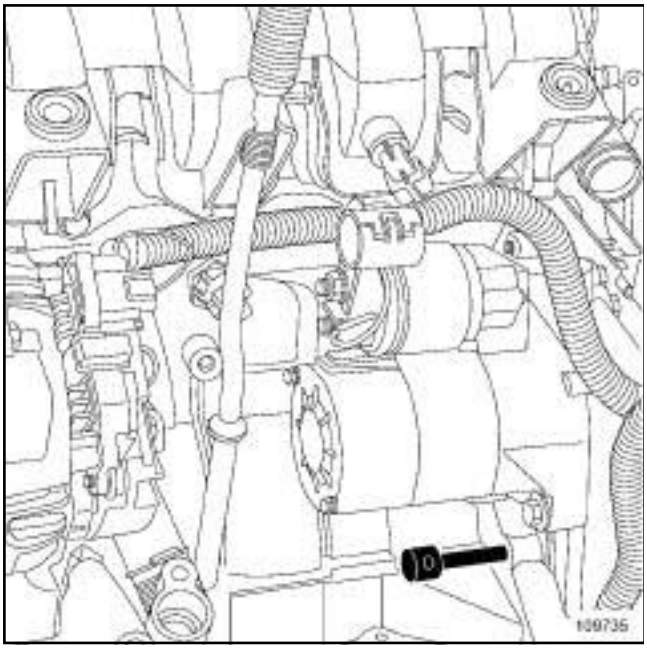
❏ Fit the timing belt, aligning the marks on the belt with those on the crankshaft sprocket and camshaft sprocket.

❏ Remove the **(Mot. 1054)**.

109761

❏ Remove the pin (**14**) from the timing tensioning roller.

109763



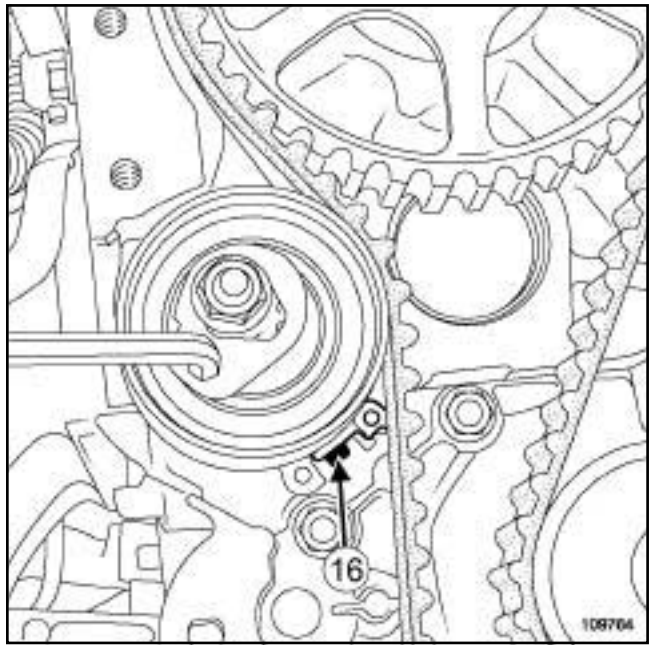
❏ Turn the tensioning roller eccentric in an anti-clockwise direction using a **6 mm** Allen key.

❏ Move the adjustable index (**15**) on the tensioning roller into the position indicated above.

❏ Torque tighten the **timing tensioning roller nut (24 Nm)**.

❏ Rotate the crankshaft through six revolutions in a clockwise direction (timing end).

D4F



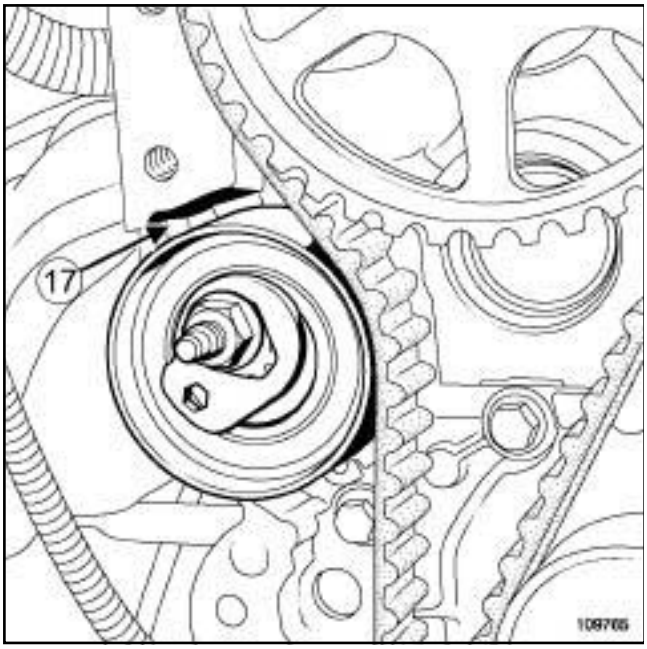
109735

❏ Insert **(Mot. 1054)**.

❏ Rotate the crankshaft to the setting point.

❏ Check that the camshaft and crankshaft sprockets markings are correctly aligned with the fixed markings.

❏ Remove the **(Mot. 1054)**.



109764

❏ Loosen the tensioning roller nut by up to one turn, holding the eccentric with a **6 mm** Allen key.

❏ Turn the adjustable index (**16**) on the tensioning roller in a clockwise direction into the position indicated above.

❏ Tighten to torque the **timing tensioning roller nut (24 Nm)**.

D4F

109765

❑ Check that the tensioning roller does not come into contact with the cylinder head (**17**) .

Note:

If the tensioning roller is in contact with the cylinder head:

- set the engine to Top Dead Centre,
- remove the tensioning roller and the timing belt,
- reposition the tensioning roller pin,
- repeat the timing belt refitting procedure, step by step, from the beginning.

❑ Remove the crankshaft accessories pulley bolt.

❑ Refit:

- the lower timing cover,
- the lower timing cover bolt.

❑ Torque tighten the **lower timing cover bolt (10 Nm)**.

❑ Refit:

- the timing intermediate housing,
- the timing intermediate housing bolts.

❑ Torque tighten the **timing intermediate housing bolts (10 Nm)**.

❑ Refit:

- the upper timing cover,
- the upper timing cover.

❑ Tighten to torque the **upper timing cover bolts (33 Nm)**.

III - FINAL OPERATION.

❑ Refit:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❑ Remove the lower engine support tool **(Mot. 1672)**.

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

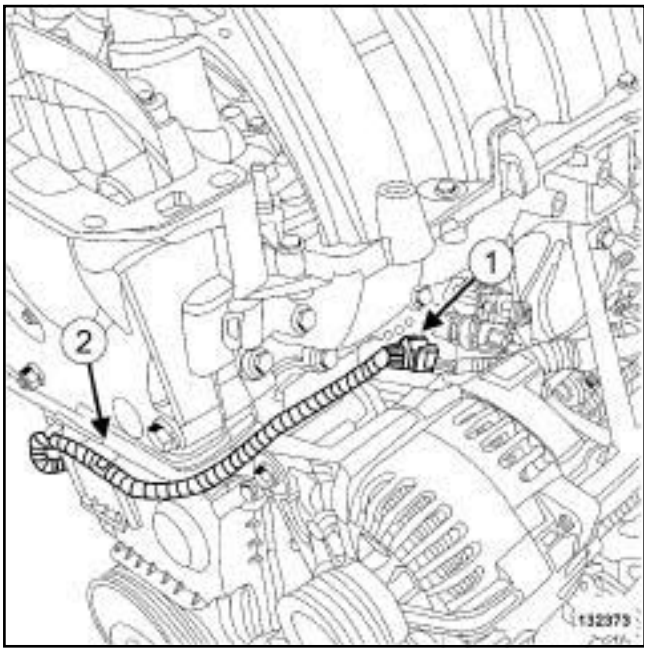
K4M

Special tooling required	
Mot. 1368	Tool for tightening eccentric tensioning roller bolt. 8 mm Torx wrench and 12.7 mm square.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1496	Camshaft timing tool.
Mot. 1750	Additional tool to support the camshaft adjusting tool, Mot. 1496.
Mot. 1489	TDC locating pin.
Mot. 1490-01	For locking and adjusting the camshaft pulleys.
Mot. 1487	Tool for refitting camshaft covers (57 mm diameter).
Mot. 1488	Tool for refitting camshaft covers (43 mm diameter).

Tightening torques ▽	
timing tension wheel nut	**27 N.m**
timing fixed roller bolt	**50 N.m**
lower timing cover bolts	**12 N.m**
new crankshaft accessories pulley bolt	**40 N.m + 145° ± 15°**
exhaust camshaft sprocket nut	**30 N.m + 84° ± 4**
camshaft dephaser bolt	**100 N.m**
TDC pin plug	**20 N.m**
upper timing cover bolts	**46 N.m**
upper timing cover nuts	**46 N.m**
dipstick guide tube bolt	**10 N.m**
flywheel end lifting eye bolts	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



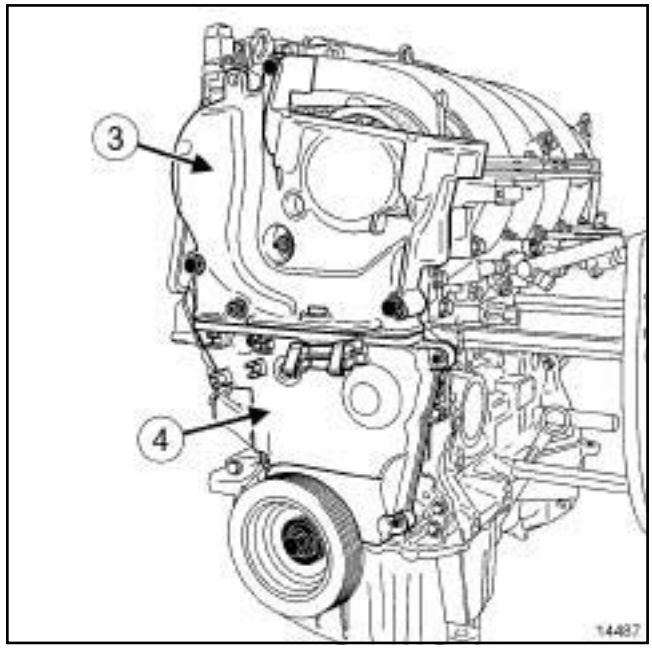
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the engine undertray bolts,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

K4M

K4M, and 862

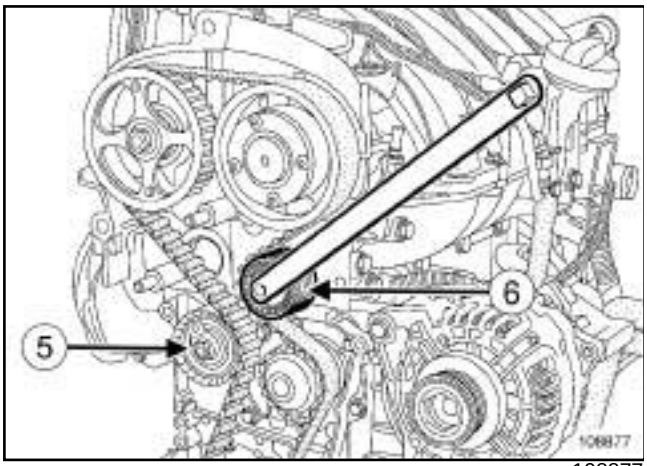


132373

❏ Disconnect the upstream oxygen sensor connector (**1**) .

❏ Unclip the wiring from the upstream oxygen sensor at (**2**) .

❏ Move the upstream oxygen sensor wiring aside.



14487

❏ Remove:

- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the upper timing cover bolts,
- the upper timing cover nuts,
- the upper timing cover (**3**) ,
- the lower timing cover bolts,
- the lower timing cover (**4**) .

K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED

108877

❑ Loosen the nut (**5**) of the timing tensioning roller.

Note:

Do not drop the crankshaft timing sprocket when removing the timing belt.

❑ Remove:

- the timing fixed roller bolt (**6**) using the tool **(Mot. 1368)**,
- the timing fixed roller,
- the timing belt,
- the timing tensioning roller nut,
- the timing tensioning roller,
- the crankshaft timing sprocket.

REFITTING - PROCEDURE 1

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Timing belt (10,02, 04,02)**,

parts always to be replaced: Timing belt tensioning roller (10,02,04,04),

parts always to be replaced: Timing fixed roller (10,02,04,05),

parts always to be replaced: Crankshaft accessories pulley bolts (10,03,03,10),

parts always to be replaced: Inlet camshaft cap (10,02,02,11),

parts always to be replaced: Exhaust camshaft cap (10,02,02,12).

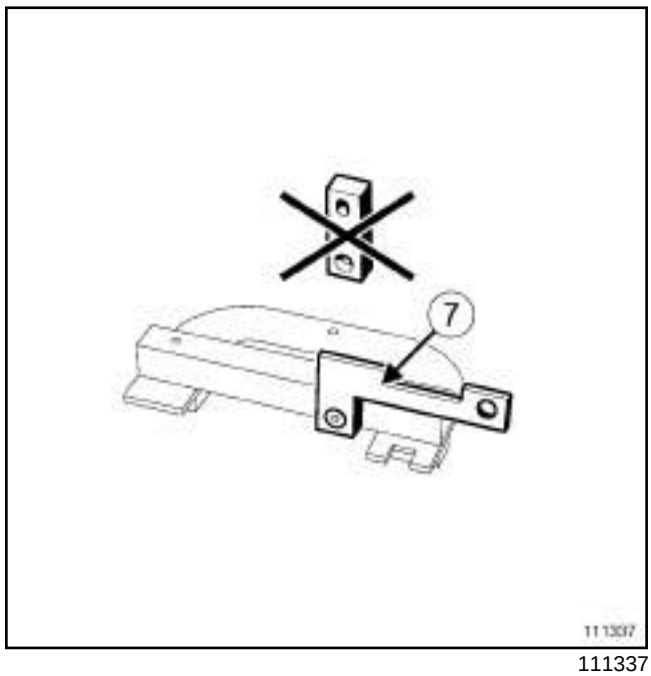
II - REFITTING OPERATION FOR PART CONCERNED

❑ The first procedure applies to replacing any timing face component which has a crankshaft timing sprocket without a collet and which does not require the exhaust camshaft sprocket or camshaft dephaser to be loosened.

1 - Adjusting the timing

❑

WARNING

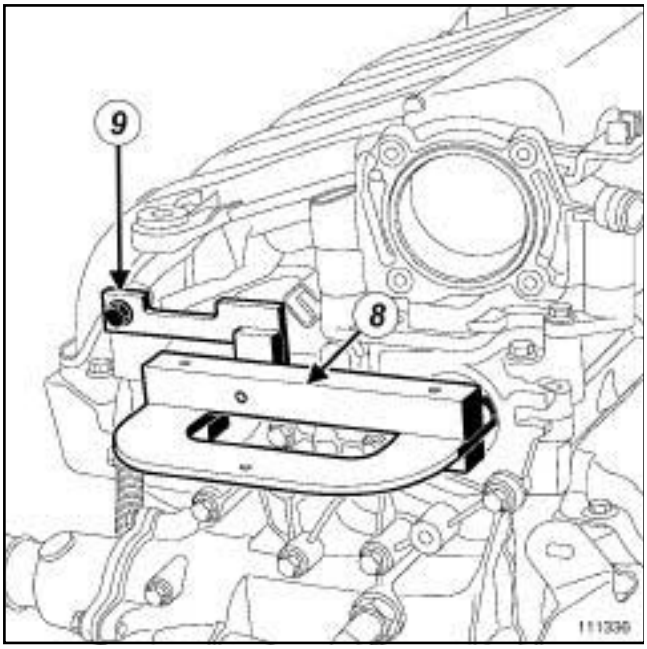


Be sure to degrease:

- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.

This is to avoid timing slippage.

This slippage leads to engine damage.

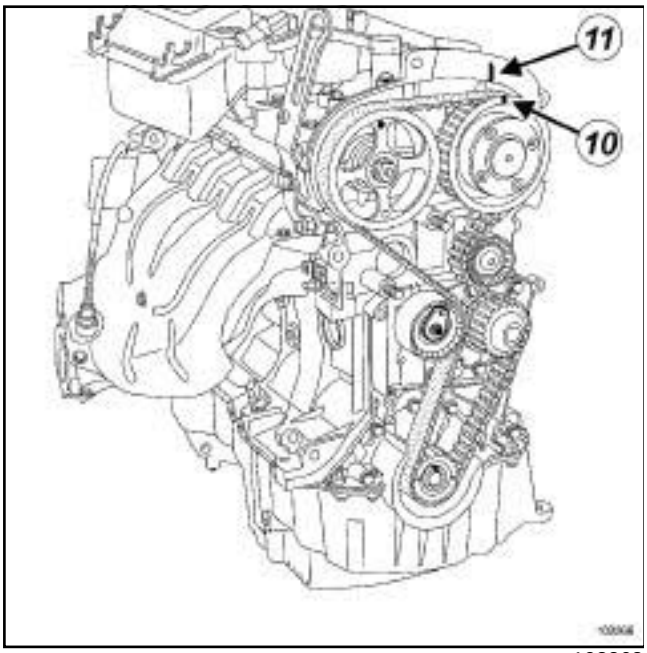


❑ Set the camshaft grooves horizontally and below the centre line by turning the camshafts with the **(Mot. 799-01)** if necessary.

111337

❑ Fit the **(Mot. 1496)** with the **(Mot. 1750)** (**7**) .

K4M

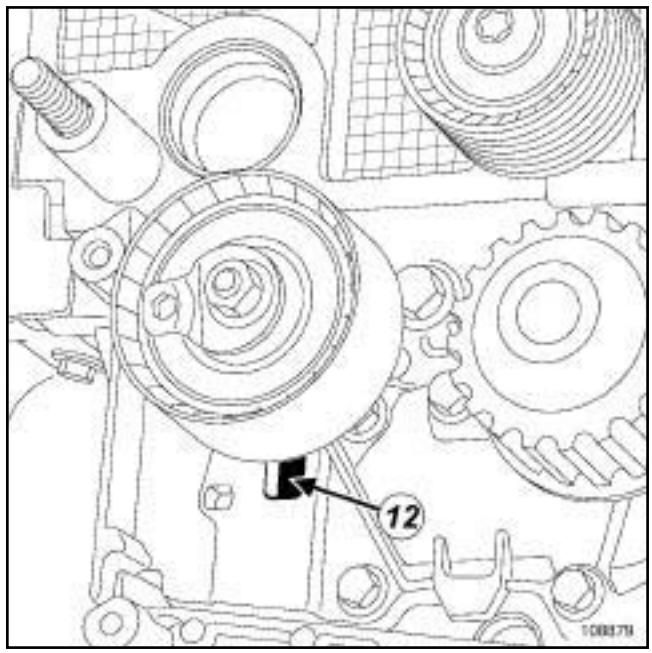


111336

❏ Fit:

- the **(Mot. 1496)** (**8**) fitted with the **(Mot. 1750)** on the end of the camshaft,

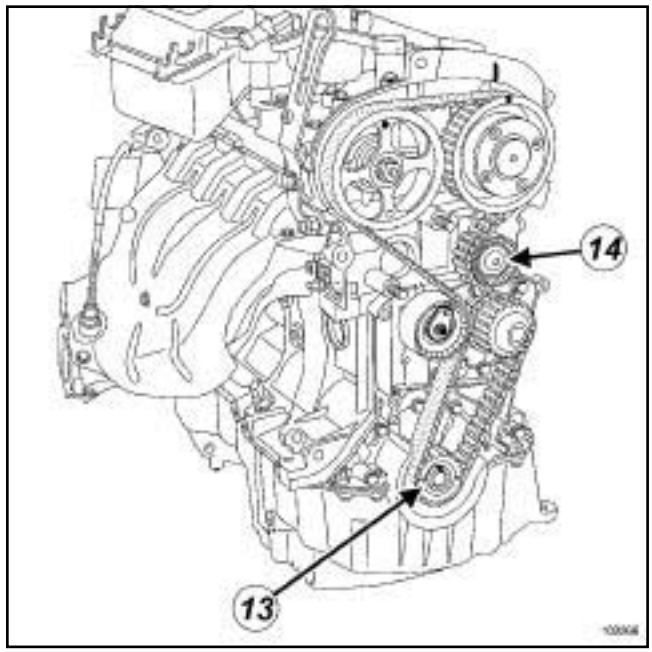
- a lifting eye bolt (**9**) to secure the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)**.



103268

❏ Check that the mark (**10**) on the camshaft dephaser is vertical and pointing upwards.

❏ Make a mark (**11**) with a pencil between the camshaft dephaser gear and the rocker cover.

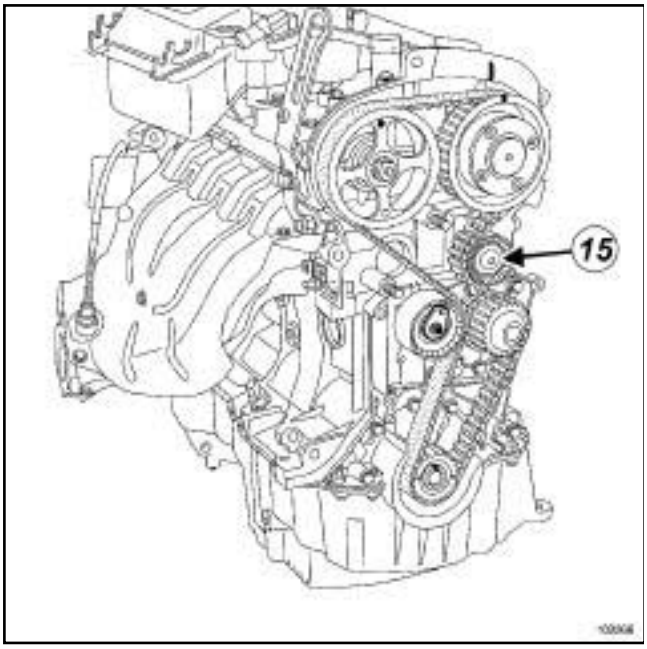


2 - Refitting

108879

❏ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**12**) .

❏ Screw on the timing tensioning roller nut without tightening it.

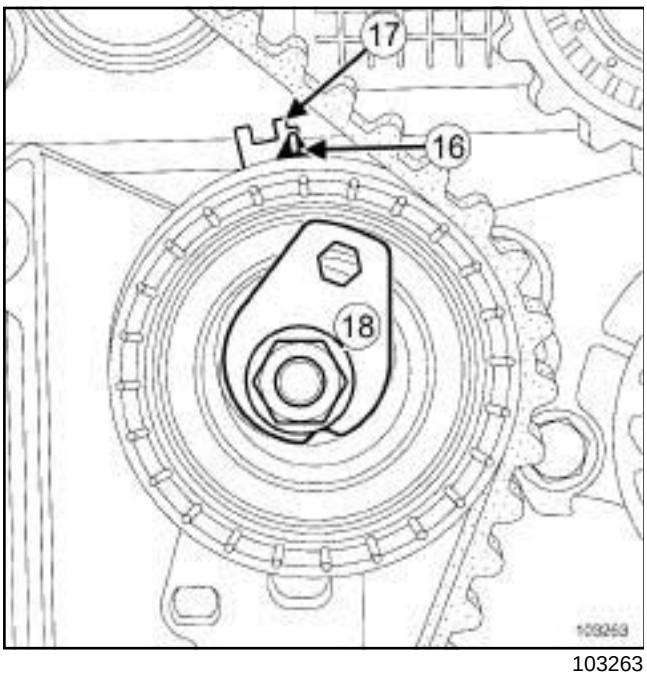


103268

❏ Refit:

- the crankshaft timing sprocket (**13**) ,

- a new timing belt,



- a new timing fixed roller (**14**) .

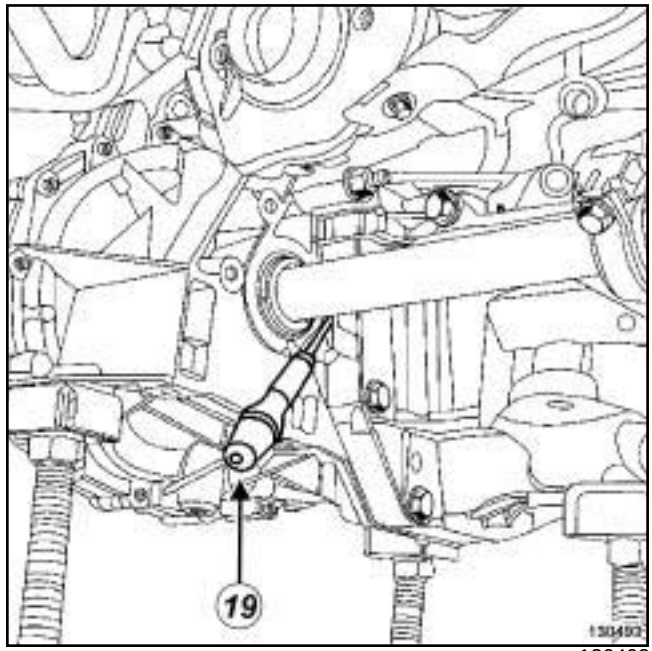
103268

❏ Torque tighten the **timing fixed roller bolt (50 N.m)** (**15**) .

3 - Timing belt tension

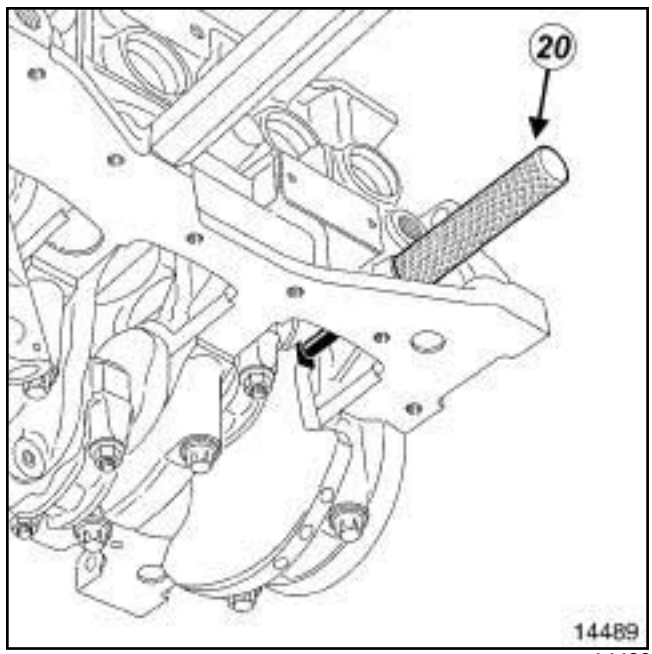
103263

❏ Position the adjustable index (**16**) opposite the mark (**17**) , by turning the eccentric (**18**) clockwise using a **6 mm** Allen key.



❏ Torque tighten the **timing tensioning roller nut (7 N.m)**.

❏ Refit:

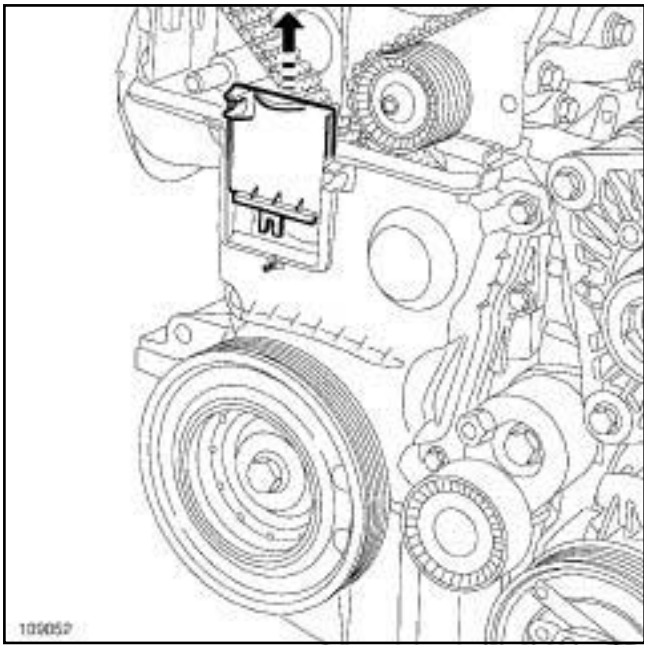


- the tool **(Mot. 1489)** in the cylinder block,
- the lower timing cover,

❏ Tighten to torque the **lower timing cover bolts (12 N.m)**.

❏ Refit a new crankshaft accessories pulley.

130493



14489

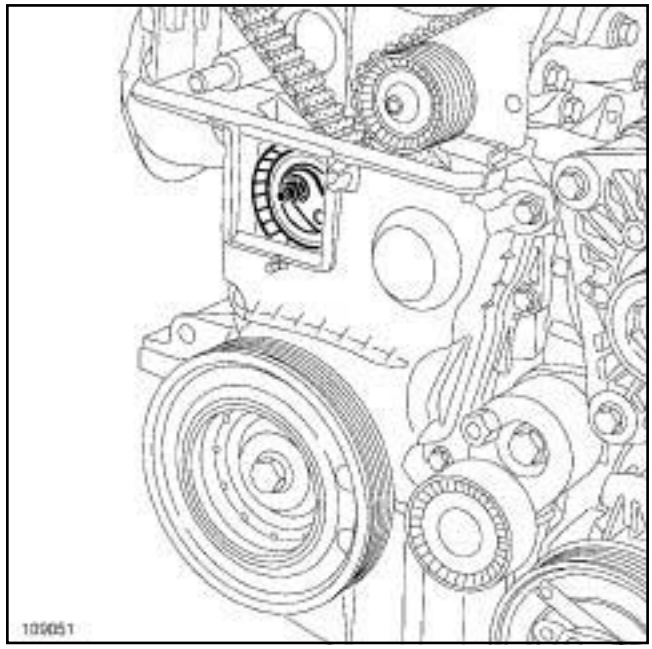
❏ Use a screwdriver (**19**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool **(Mot. 1489)** (**20**) using the screwdriver; the crankshaft groove should be at the top.

❏ Torque and angle tighten a **new crankshaft accessories pulley bolt (40 N.m + 145° ± 15°)** (crankshaft in contact with the tool **(Mot. 1489)**).

K4M

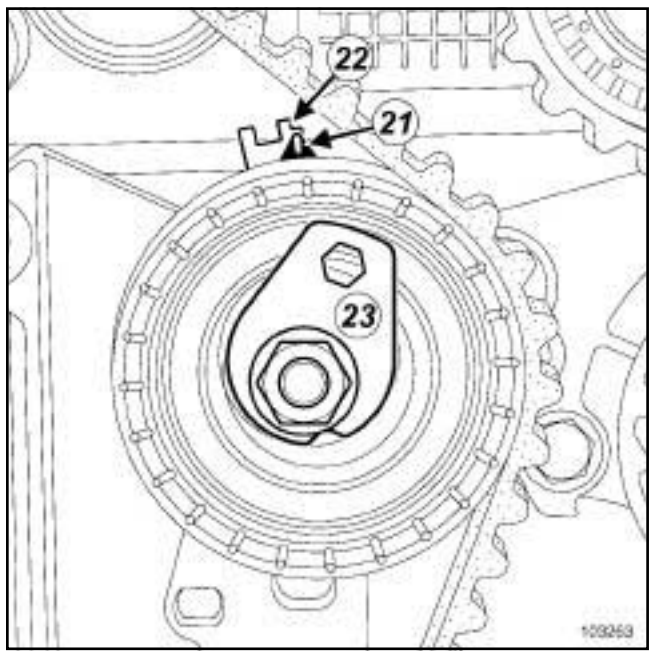
109052

❑ Remove:



- the timing flap from the lower timing cover,
- the lifting eye bolt from the **(Mot. 1496)**,
- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

4 - Checking the tension



❑ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the tool **(Mot. 1489)** into the cylinder block.

❑ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

❑ Remove the tool **(Mot. 1489)** from the cylinder block.

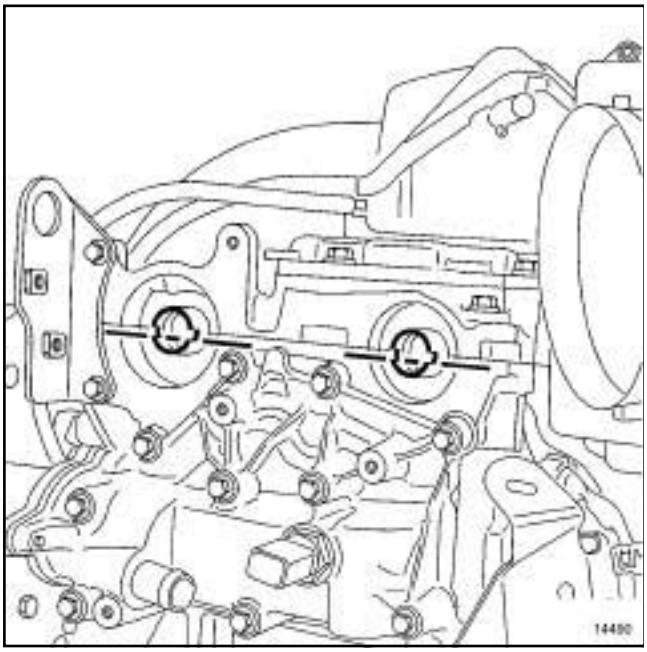
109051

103263

❑ Check through the lower timing cover window that the adjustable index (**21**) is opposite the notch (**22**) , if this is not the case:

- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with a **6 mm** Allen key,
- gradually move the adjustable index marker (**21**) opposite the mark (**22**) turning the eccentric cam (**23**) clockwise.

❑ Torque tighten the **timing tension wheel nut (27 N.m)**.



K4M

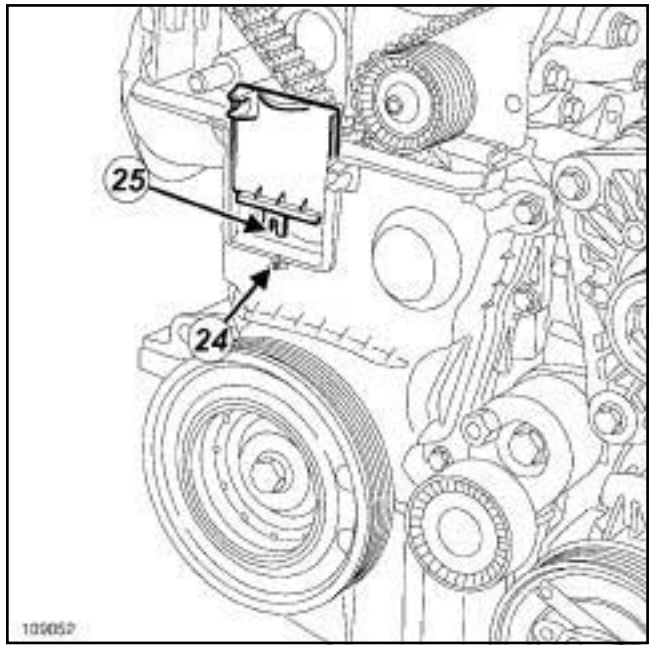
5 - Checking the timing

❑ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

❑ Screw tool **(Mot. 1489)** into the cylinder block.

❑ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

14490



❑ Position (without forcing) the camshaft setting tool **(Mot. 1496)** fitted with the **(Mot. 1750)** (the camshaft end grooves must be horizontal and offset towards the bottom).

Note:

The timing adjustment and tensioning operation must be repeated if the camshaft setting tool does not engage.

❑ Remove:

- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

109052

❑ Refit the lower timing cover flap, checking that the locating pin (**24**) fits properly in the notch (**25**) .

REFITTING -PROCEDURE 2

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Timing belt (10,02, 04,02)**,

parts always to be replaced: Timing belt tensioning roller (10,02,04,04),

parts always to be replaced: Timing fixed roller (10,02,04,05),

parts always to be replaced: Crankshaft accessories pulley (10,03,03,07),

parts always to be replaced: Crankshaft accessories pulley bolts (10,03,03,10),

parts always to be replaced: Inlet camshaft cap (10,02,02,11),

parts always to be replaced: Exhaust camshaft cap (10,02,02,12).

II - REFITTING OPERATION FOR PART CONCERNED

❑ The second procedure is used when replacing any timing face component which has a crankshaft timing sprocket with or without a collet, that requires the exhaust camshaft sprocket or camshaft dephaser to be loosened.

K4M

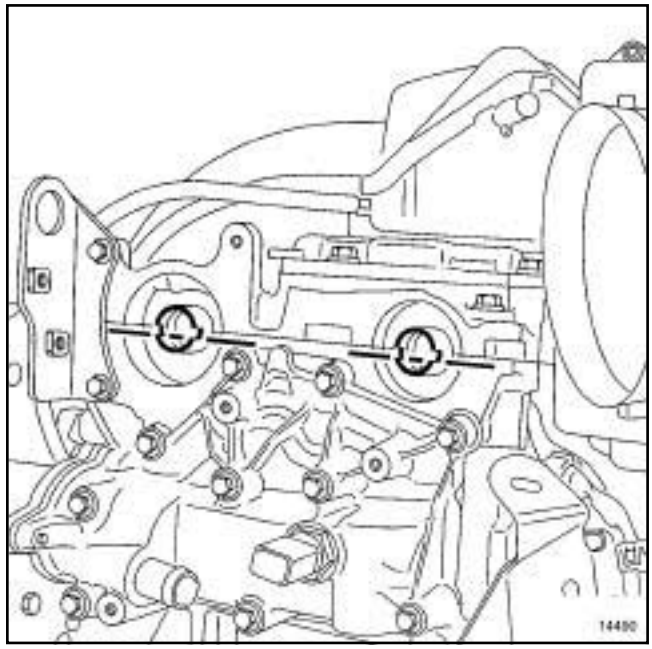
❑ Remove the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) .

1 - Adjusting the timing

❑

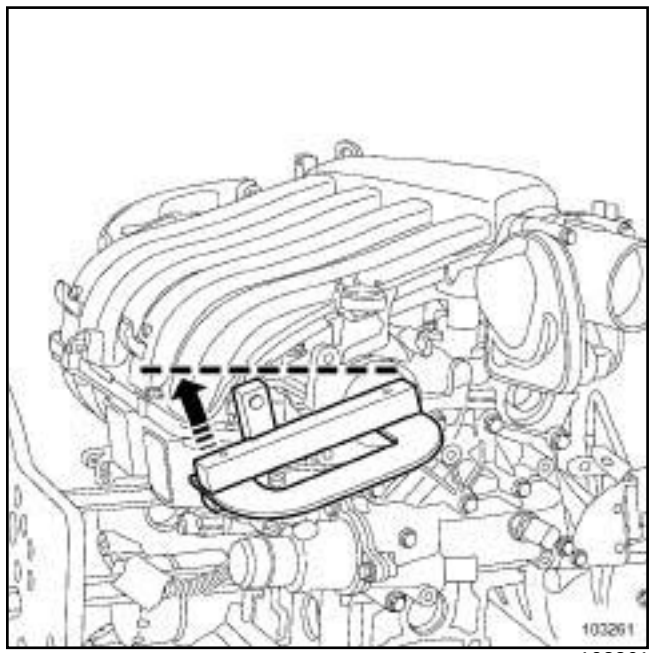
Note:

If the stud loosens with the nut (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) (Technical Note 3887A,11A, Top and front of engine).



WARNING

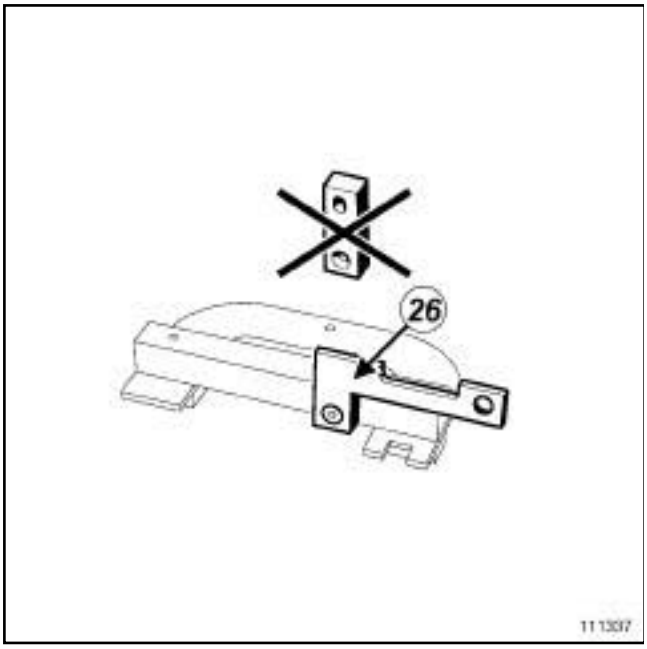
Always degrease:



- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.

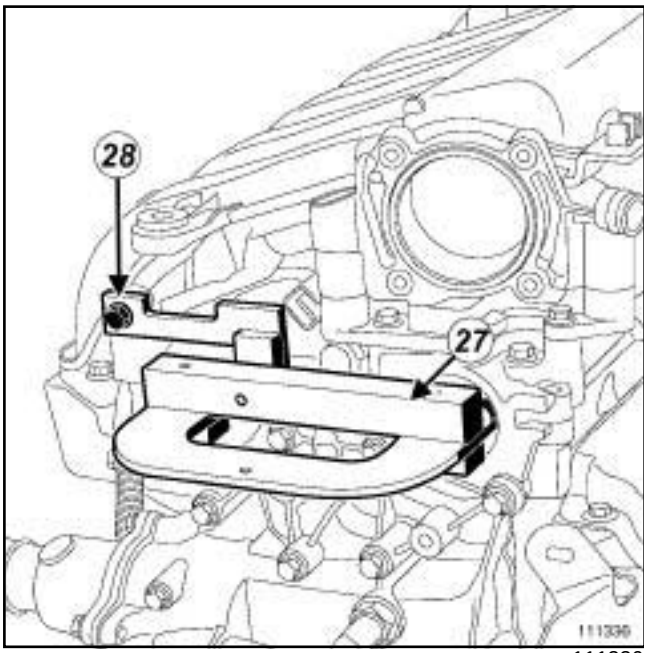
This is to avoid timing slippage.

This slippage leads to engine damage.



14490

103261

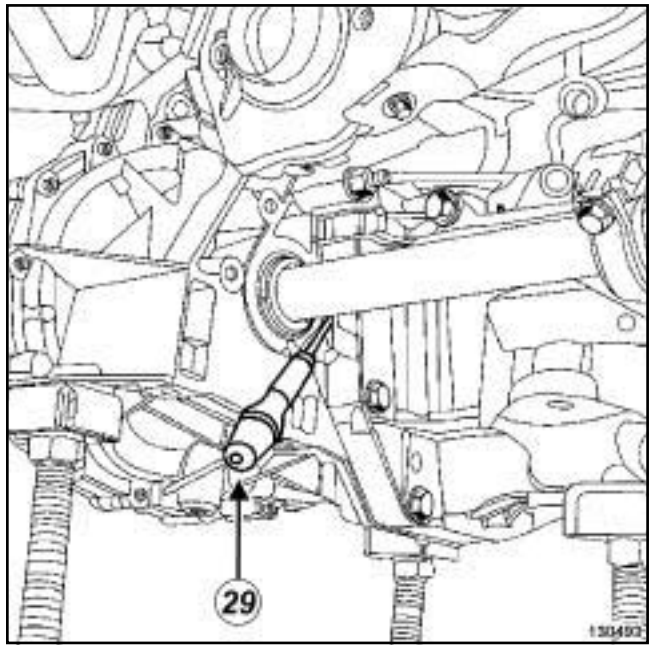


❑ Position the camshaft grooves horizontally and below the centre line, by turning the camshafts with the **(Mot. 1496)** if necessary.

K4M

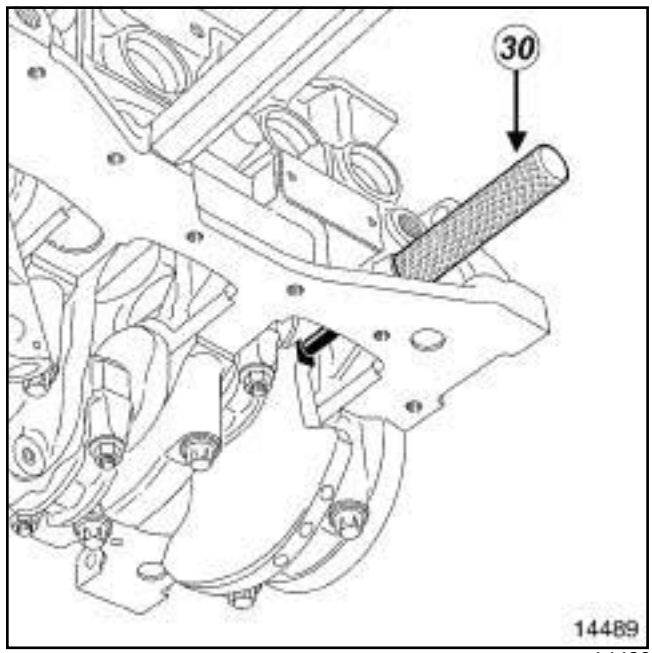
111337

❏ Fit the **(Mot. 1496)** with the **(Mot. 1750)** (**26**) .



111336

❏ Fit:

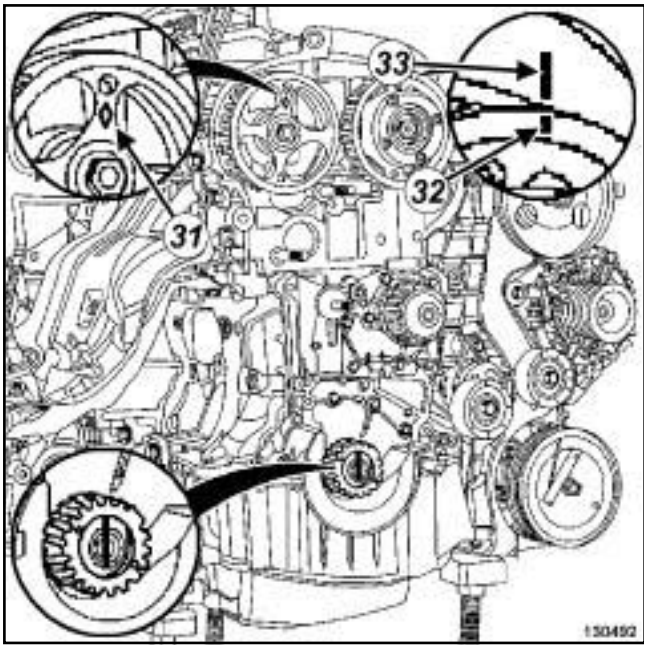


- the **(Mot. 1496)** (**27**) fitted with the **(Mot. 1750)** on the end of the camshaft,
- a lifting eye bolt (**28**) to secure the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)**.

❏ Refit:

- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) ,
- the crankshaft timing sprocket.

130493

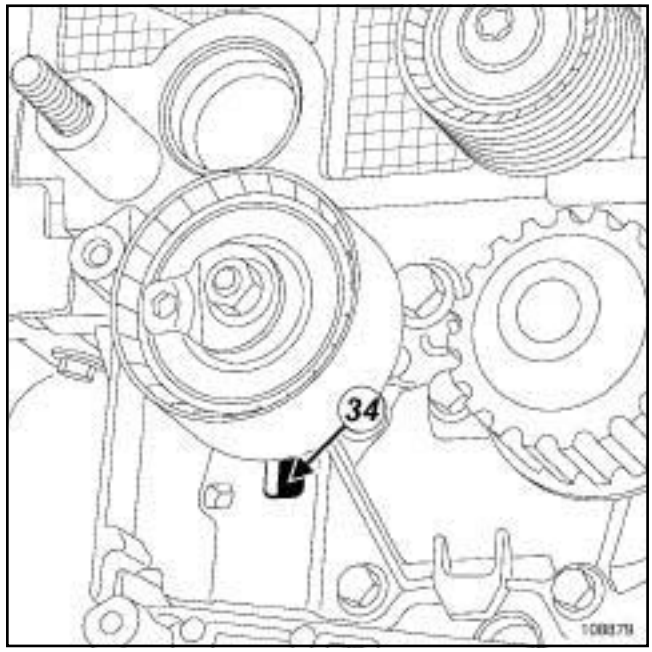


14489

❏ Refit the tool **(Mot. 1489)** on the cylinder block.

❏ Use a screwdriver (**29**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool **(Mot. 1489)** (**30**) using the screwdriver; the crankshaft groove should be at the top.

K4M

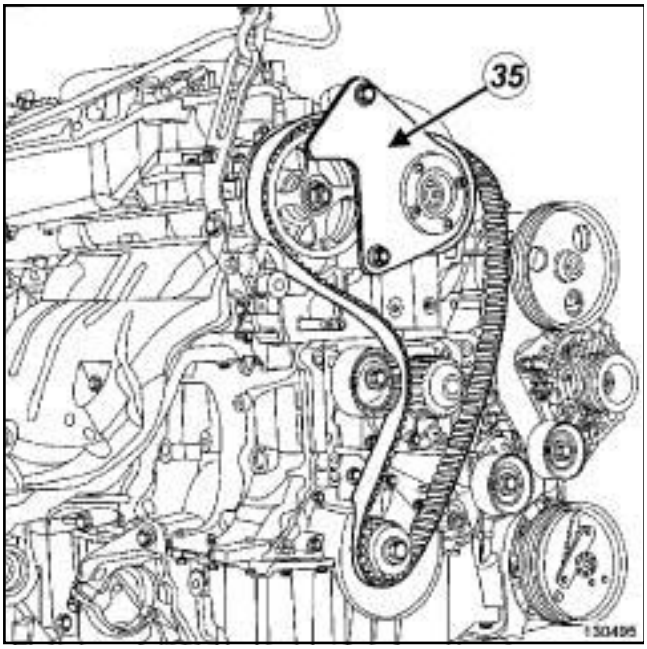


130492

❑ Position:

- the RENAULT badge (**31**) etched on the stem of the exhaust camshaft sprocket vertically and pointing upwards,
- the camshaft dephaser mark (**32**) vertically and pointing upwards.

❑ Make a mark (**33**) with a pencil between the camshaft dephaser gear and the rocker cover.



2 - Refitting

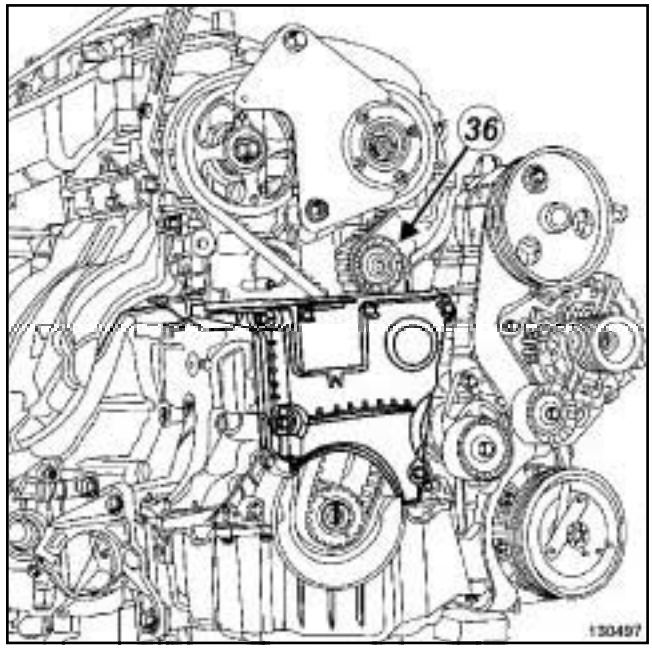
108879

❑ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**34**) .

❑ Screw on the timing tensioning roller nut without tightening it.

130495

❏ Refit a new timing belt starting with the sprocket of each camshaft (without moving the sprocket of each camshaft).



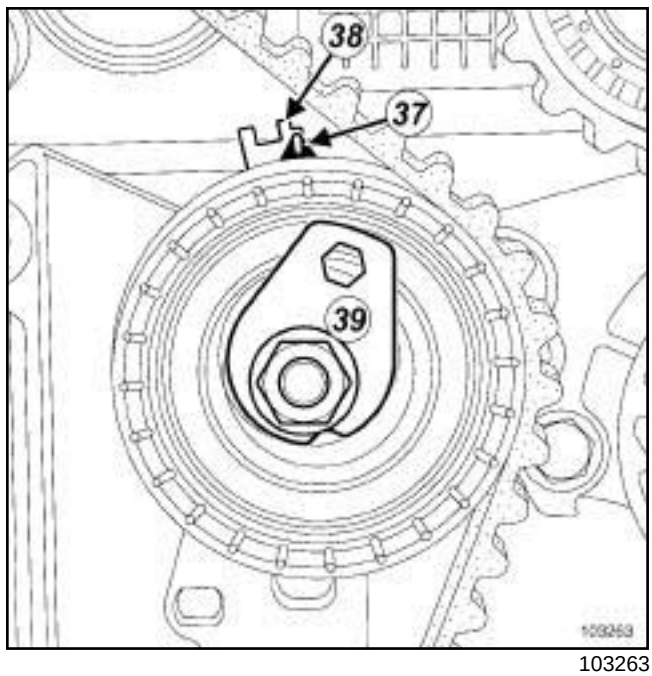
❏ Fit the tool **(Mot. 1490-01)** (**35**) on the camshaft sprockets (use the bolt and nut of the upper timing cover to fit the tool **(Mot. 1490-01)**).

Note:

Take care to properly tighten the timing belt between the two camshaft sprockets.

Note:

If the engine is equipped with a crankshaft timing sprocket with a collet, take care to properly tighten the timing belt between the exhaust camshaft sprocket and the crankshaft timing sprocket.

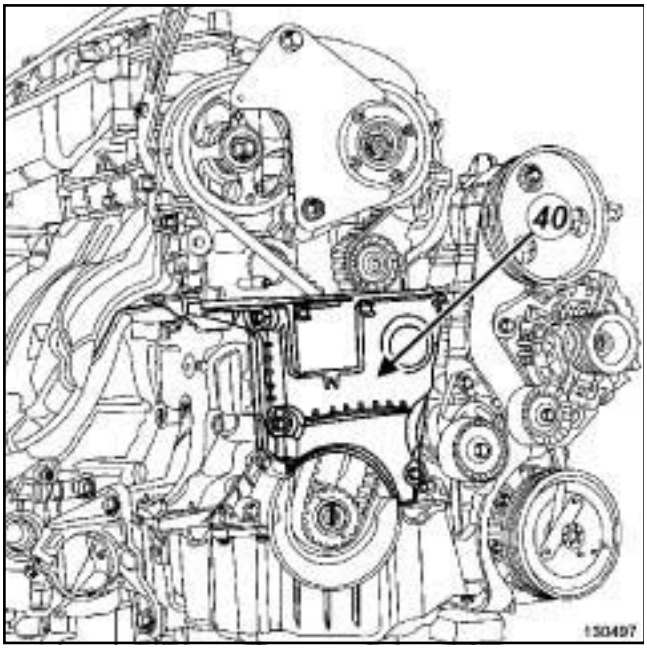


130497

❏ Refit a new timing fixed roller (**36**) .

❏ Torque tighten the **timing fixed roller bolt (50 N.m)**.

3 - Timing belt tension



103263

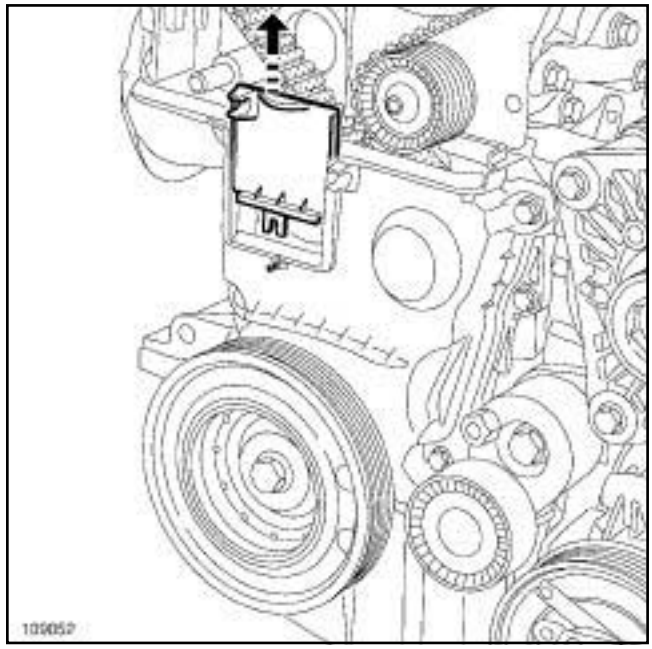
❏ Position the adjustable index (**37**) opposite the mark (**38**) , by turning the eccentric (**39**) clockwise using an Allen key.

❏ Torque tighten the **timing tensioning roller nut (7 N.m)**.

K4M

130497

❏ Refit the lower timing cover (**40**) .



❏ Tighten to torque the **lower timing cover bolts (12 N.m)**.

❏ Refit a new crankshaft accessories pulley.

❏ Torque tighten:

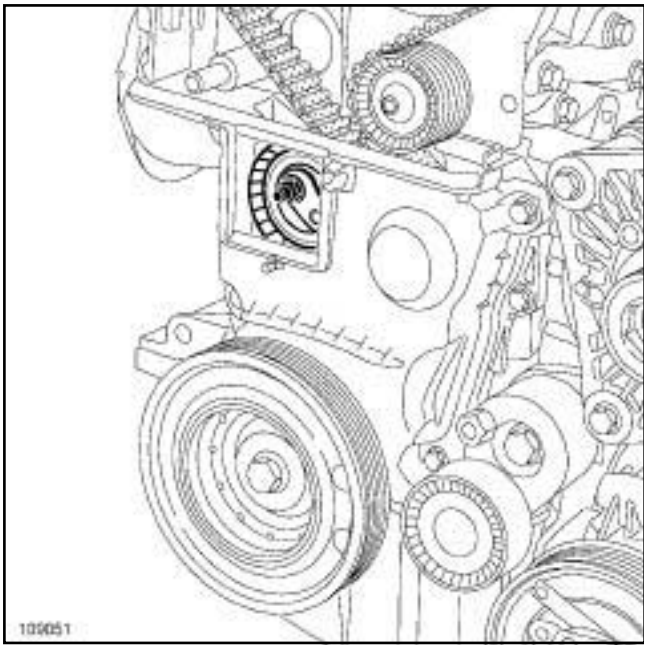
- and angle tighten a **new crankshaft accessories pulley bolt (40 N.m + 145° ± 15°)**,
- and angle tighten the **exhaust camshaft sprocket nut (30 N.m + 84° ± 4)**,
- the **camshaft dephaser bolt (100 N.m)**.

❏ Refit the camshaft dephaser plug.

109052

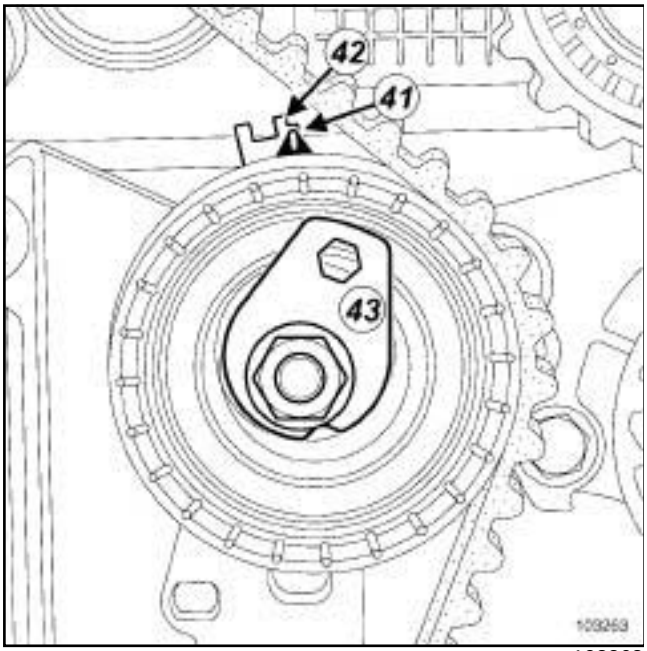
❏ Remove:

- the timing flap from the lower timing cover.
- the lifting eye bolt from the **(Mot. 1496)**,
- the **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the tool **(Mot. 1489)** from the cylinder block,
- the **(Mot. 1490-01)**.



4 - Checking the tension

❏ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the tool **(Mot. 1489)** into the cylinder block.



❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

❏ Remove the tool **(Mot. 1489)**.

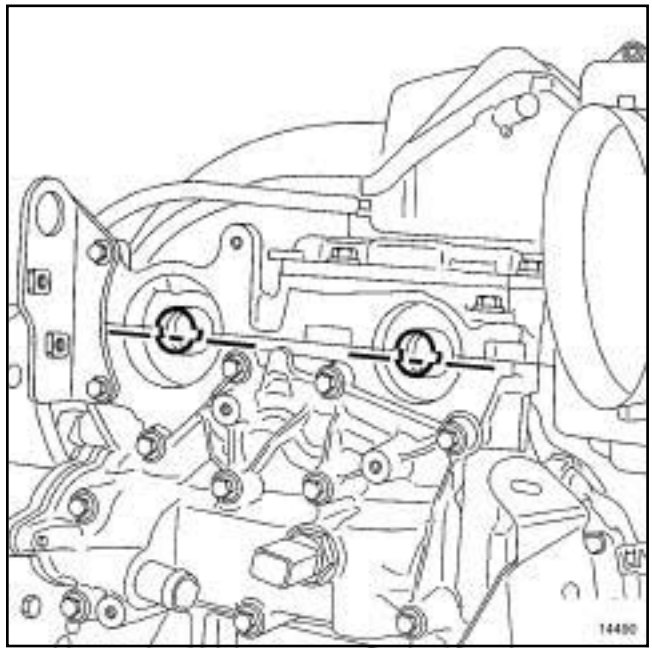
K4M

109051

103263

❏ Check through the lower timing cover window that the adjustable index (**41**) is opposite the notch (**42**) , if this is not the case:

- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with an Allen key,
- gradually move the adjustable index marker (**41**) opposite the mark (**42**) turning the eccentric cam (**43**) clockwise.



❏ Torque tighten the **timing tensioning roller nut (27 N.m)**.

5 - Checking the timing

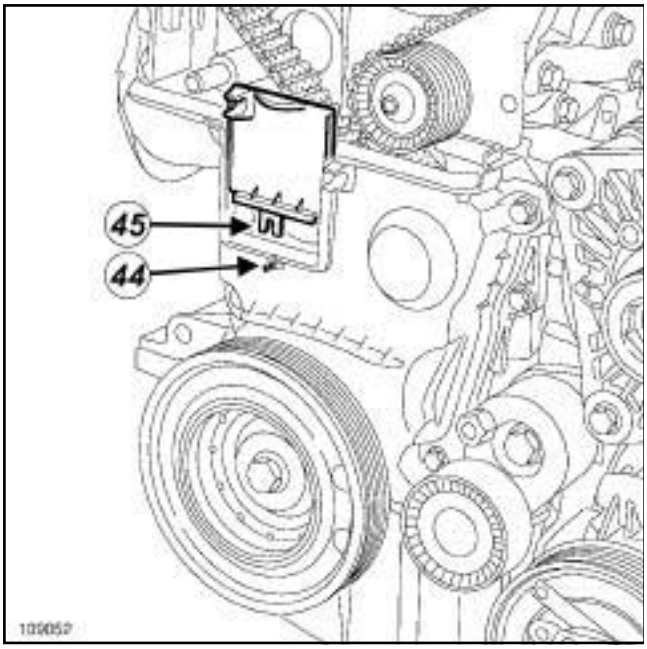
❏ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

❏ Screw tool **(Mot. 1489)** into the cylinder block.

❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

14490

❏ Position (without forcing) the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)** (the camshaft end grooves must be horizontal and offset downwards).



Note:

If the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)** cannot be engaged, readjust the timing and the tension.

❏ Remove:

- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

K4M

109052

❏ Refit the lower timing cover flap, checking that the locating pin (**44**) fits properly in the notch (**45**) .

III - FINAL OPERATION

❏ Refit:

- a new inlet camshaft plug using the **(Mot. 1487)**,
- a new exhaust camshaft plug using the tool **(Mot. 1488)**.

❏ Apply a drop of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the TDC pin plug.

❏ Tighten to torque the **TDC pin plug (20 N.m)**.

❏ Refit the upper timing cover.

❏ Torque tighten:

- the **upper timing cover bolts (46 N.m)**,
- the **upper timing cover nuts (46 N.m)**.

❏ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Refit:

- the engine wiring,
- the lifting eye on the flywheel end,
- the dipstick guide.

❏ Torque tighten:

- the **dipstick guide tube bolt (10 N.m)**,
- the **flywheel end lifting eye bolts (10 N.m)**.

❏ Clip on the lifting eye connector.

K4M, and 862

❏ Position the wiring of the upstream oxygen sensor.

❏ Clip the wiring to the oxygen sensor.

❏ Connect the oxygen sensor connector.

❏ Refit:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine undertray.

K9K, and 766 or 768

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

Equipment required
safety strap(s)
protective gloves
1/2" female torx socket (12.7 mm square drive)
torque wrench
offset spanner
torque/angle wrench
cylinder head bolt tightening gauge (angular measuring type)

Tightening torques ▽	
tensioning roller bolt	**27 Nm**
camshaft timing sprocket crown bolts	**14 Nm**
crankshaft accessories pulley bolt M14	**120 Nm + 95° ± 15°**
TDC setting pin plug	**25 Nm**
cylinder head suspended mounting bolts	**25 Nm**
camshaft position sensor bolt	**8 Nm**

IMPORTANT
Wear protective gloves during the operation.

WARNING
Never rotate the engine anti-clockwise (timing end).

WARNING
Do not run the engine without the accessories belt so as not to damage the crankshaft accessories pulley.

I - PARTS TO BE SYSTEMATICALLY REPLACED

❑ - the timing belt,

- the timing belt tensioning roller,

- the crankshaft accessories pulley bolt.

II - CONSUMABLES FOR REPAIR

❑ - **SILICONE ADHESIVE SEAL** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products).

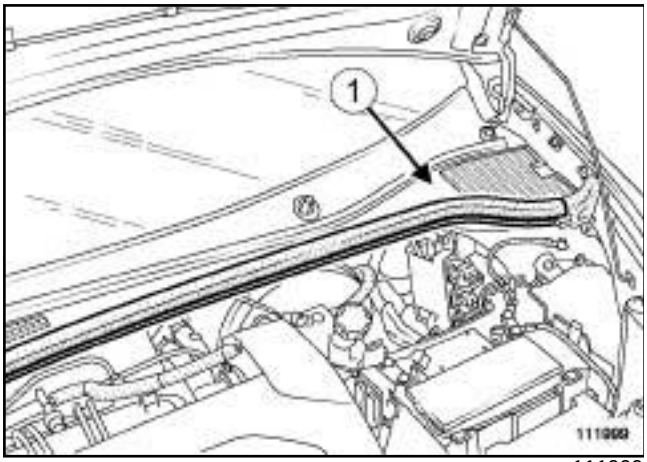
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

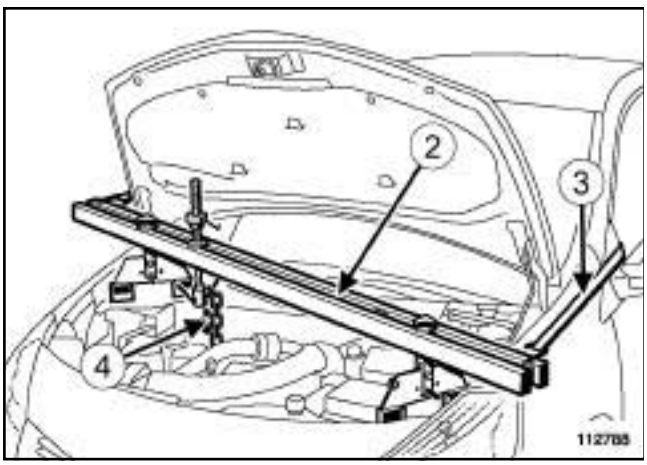


- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),

- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),

- the engine undertray,

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .



K9K, and 766 or 768

111999

❑ Remove:

- the engine cover,
- the scuttle panel grille (**1**) (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

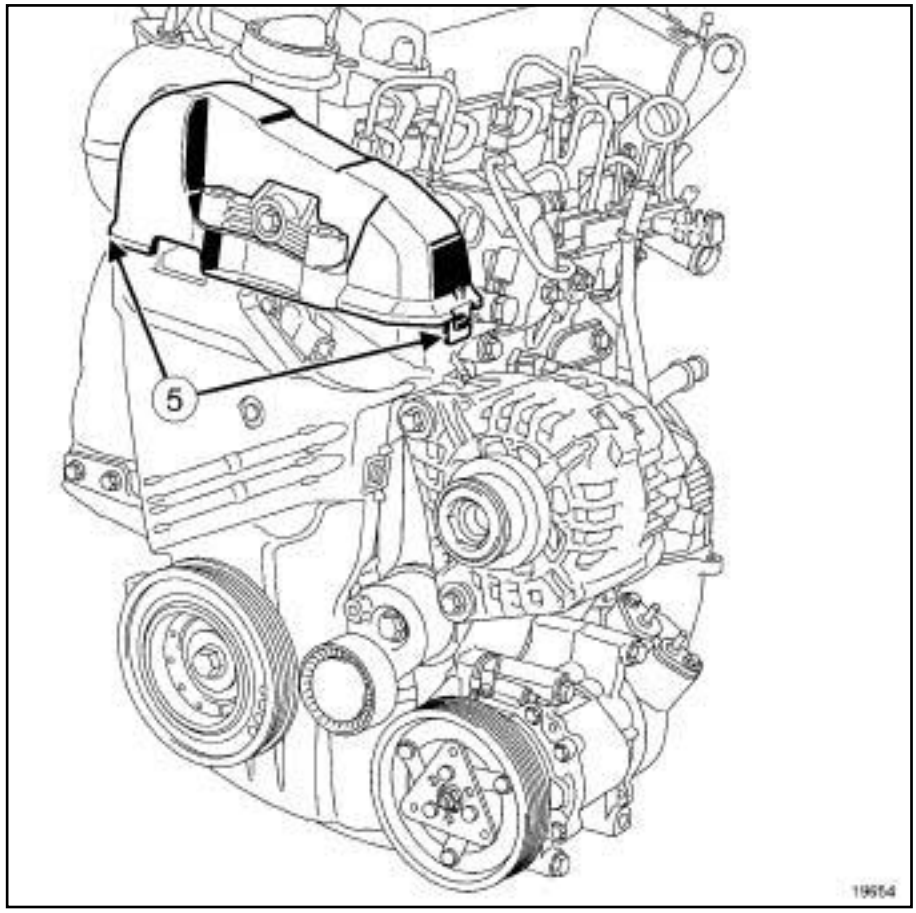
112788

❑ Position the **(Mot. 1453)** (**2**) and hold it in place using a **safety strap(s)** (**3**) .

❑ Fit a chain (**4**) on the lifting eye of the crankshaft end to enable the engine to be lifted using the **(Mot. 1453)**.

❑ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

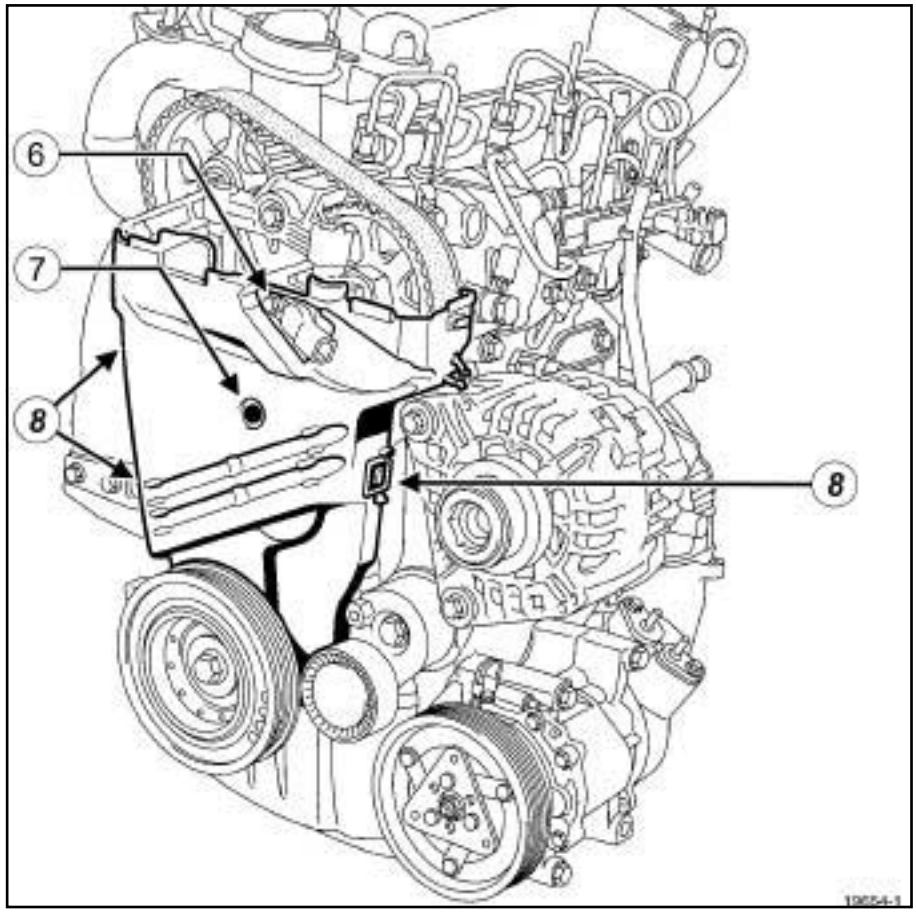


Note:

Do not damage the air conditioning pipes.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Fit **protective gloves**.

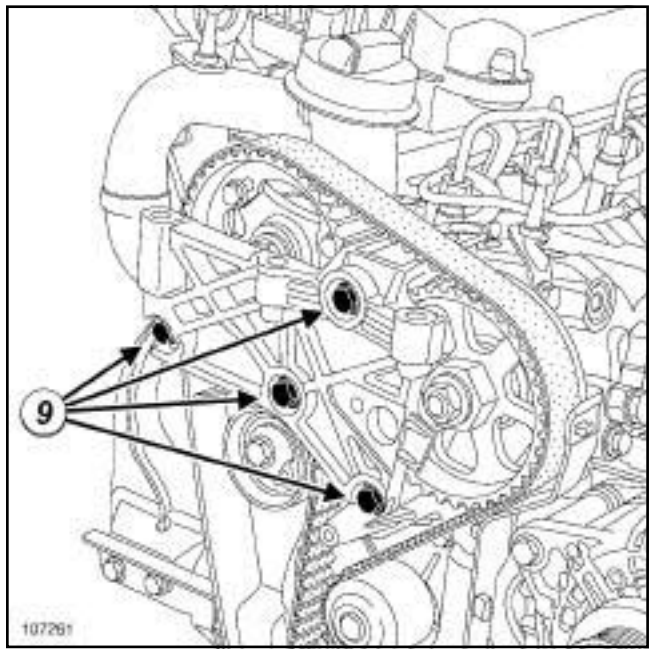


K9K, and 766 or 768

19654

❑ Remove the upper timing cover by unclipping both tabs (**5**) .

K9K, and 766 or 768



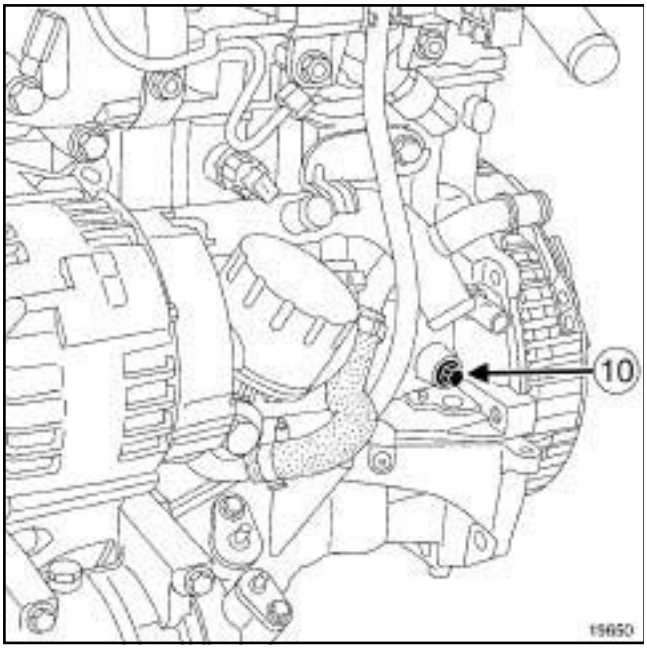
19654-1

❏ Remove:

- the camshaft position sensor (**6**) ,
- the plastic bolt (**7**) .

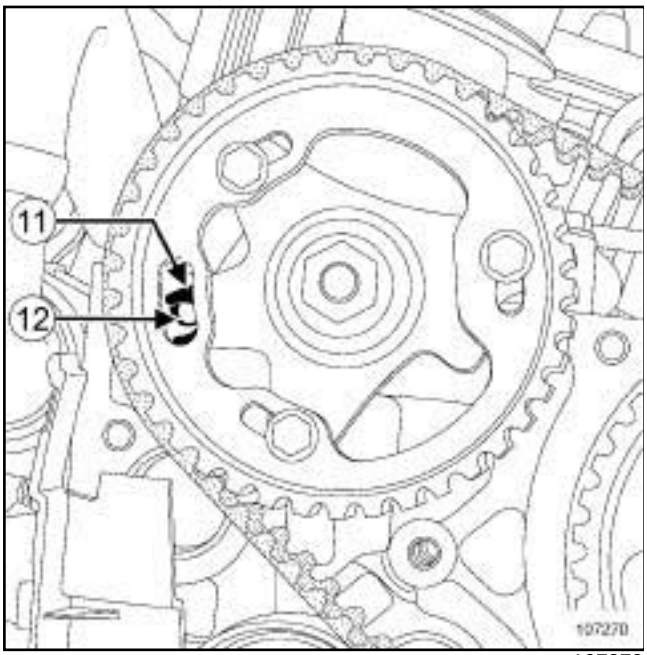
❏ Unclip the three tabs (**8**) .

❏ Remove the lower timing cover.



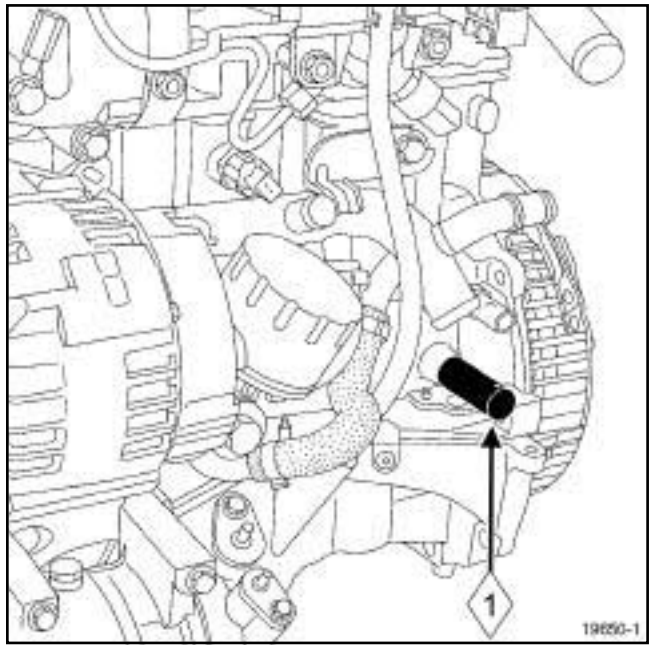
107261

❏ Remove:



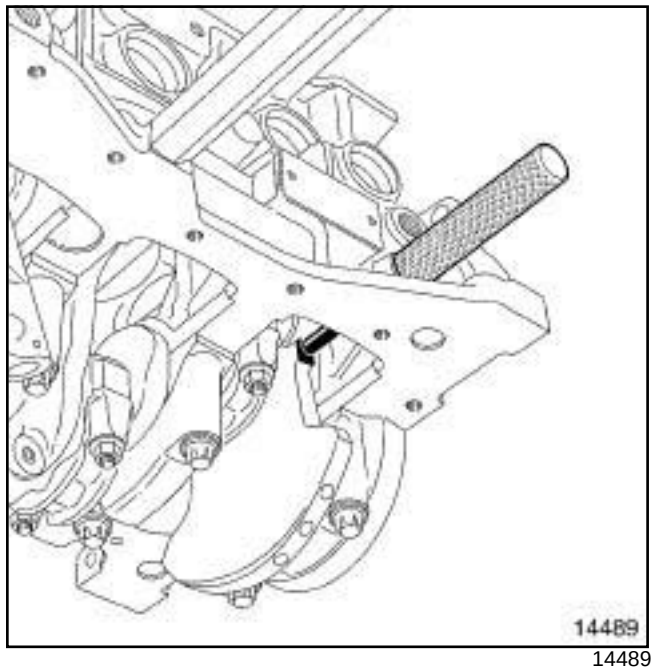
- the bolts (**9**) from the cylinder head suspended mounting,
- the cylinder head suspended mounting.

K9K, and 766 or 768



19650

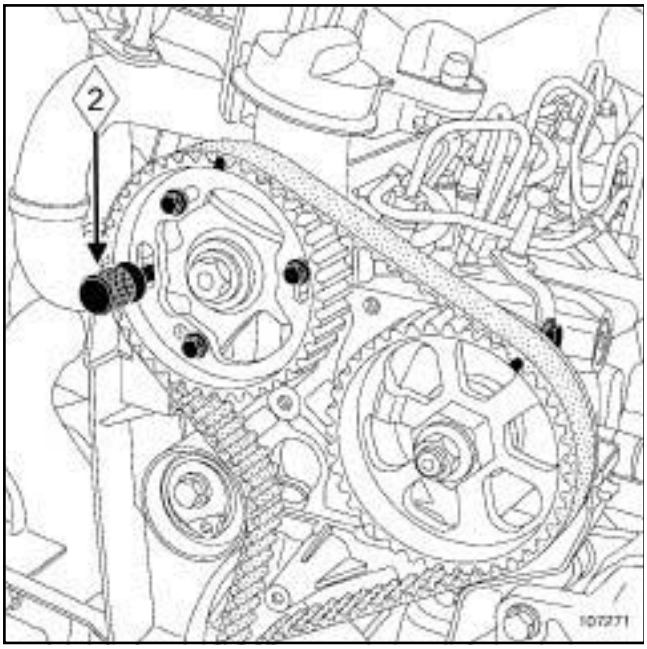
❑ Remove the TDC pin plug (**10**) using a **1/2" female torx socket (12.7 mm square drive) (14)**.



107270

❑ Rotate the crankshaft clockwise (timing end) to position the hole (**11**) in the camshaft timing sprocket almost opposite the hole (**12**) in the cylinder head.

19650-1

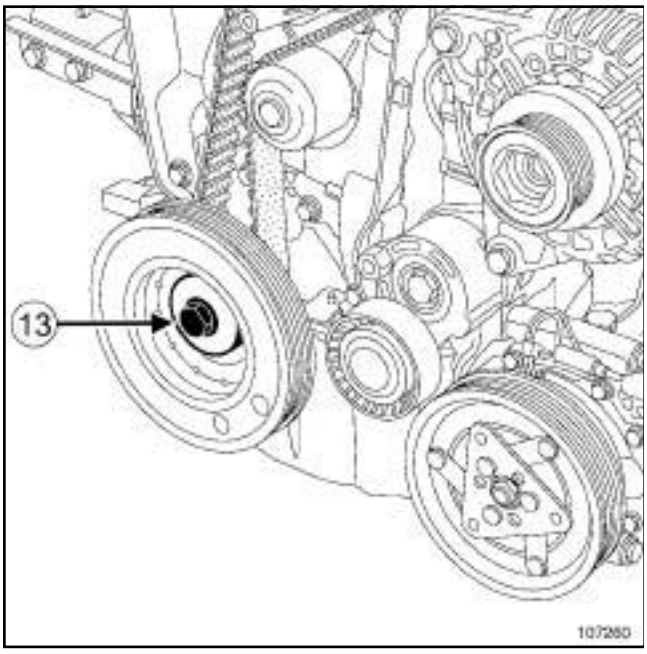


❑ Screw in the TDC setting pin (**1**) **(Mot. 1489)**.

14489

❑ Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.

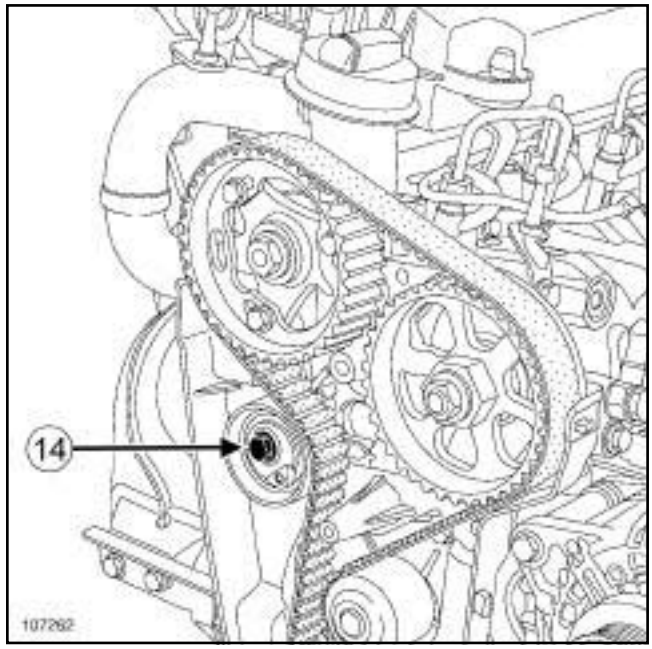
K9K, and 766 or 768



107271

❏ Engage the pin (**2**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes.

❏ Remove:



- the camshaft timing sprocket setting pin **(Mot. 1430)**,
- the TDC setting pin **(Mot. 1489)**.

107260

❏ Remove:

- the bolt (**13**) from the crankshaft accessories pulley, locking the engine flywheel with a large flat-blade screwdriver,
- the crankshaft accessories pulley.

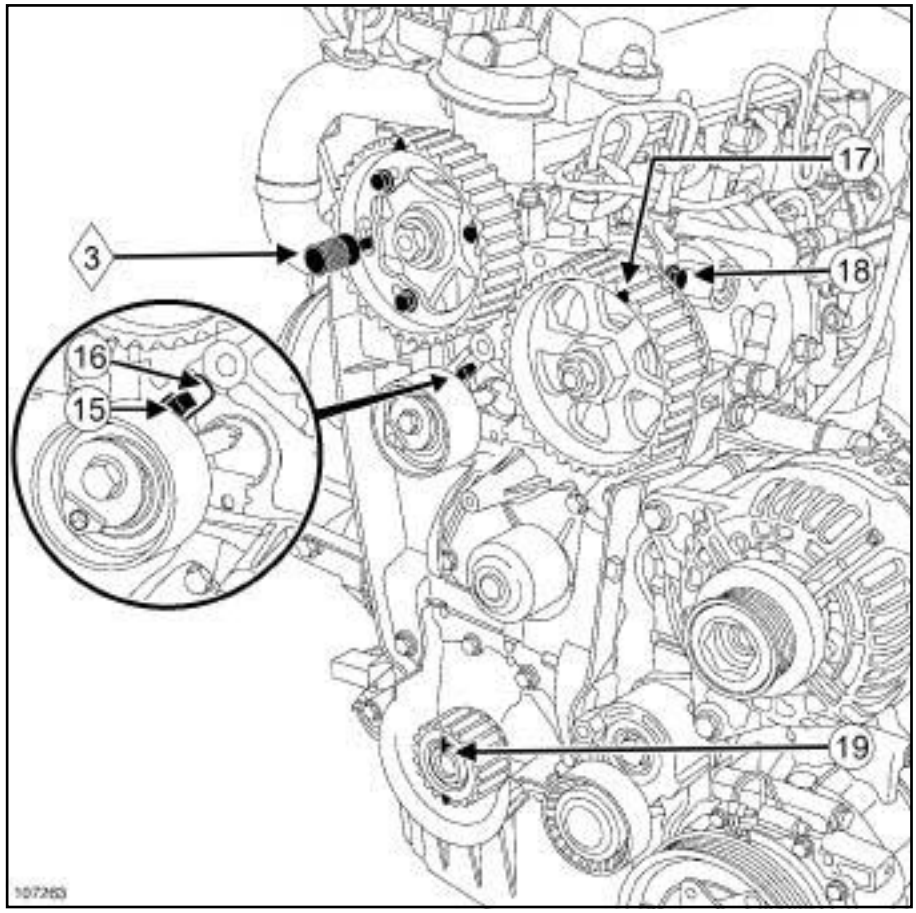
107262

❏ Undo the tensioning roller bolt (**14**) .

❏ Loosen the timing tension wheel by turning the eccentric cam using a **6 mm** Allen key.

❏ Remove:

- the timing belt,
- the timing tensioning roller.



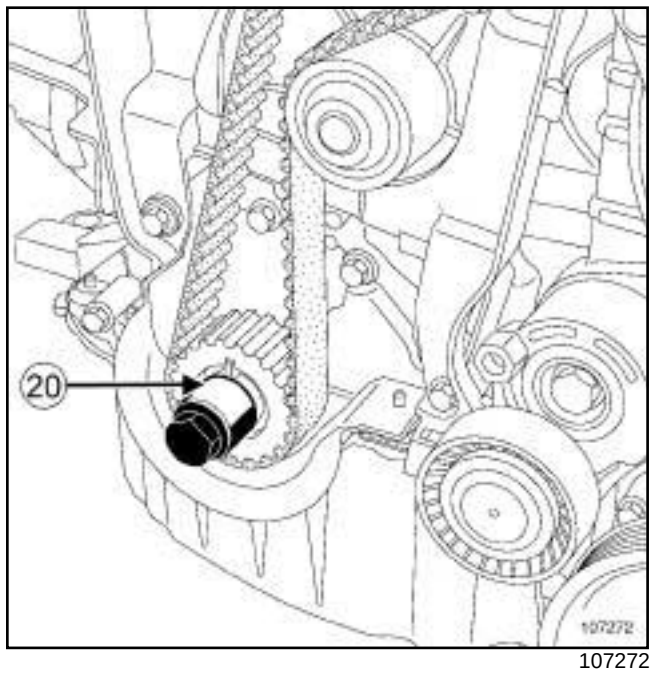
REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Check:

- that there is no oil leak from the camshaft and crankshaft seals,
- the condition of the coolant pump (hard seal, play in the shaft, fluid leak, shaft rotation, (see **Technical Note 3175A, Cooling system fault finding, 19A, Cooling, Cooling system - Fault finding chart ALP 8**).

K9K, and 766 or 768

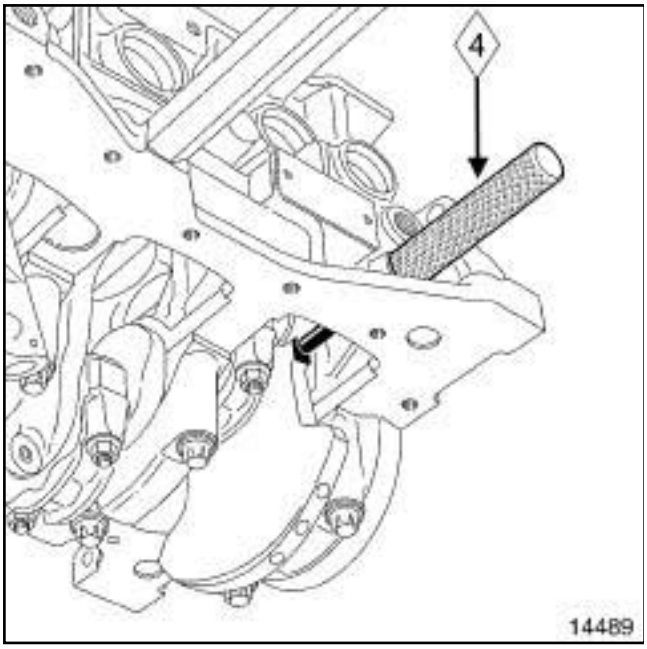


107263

❏ Refit the timing tension wheel.

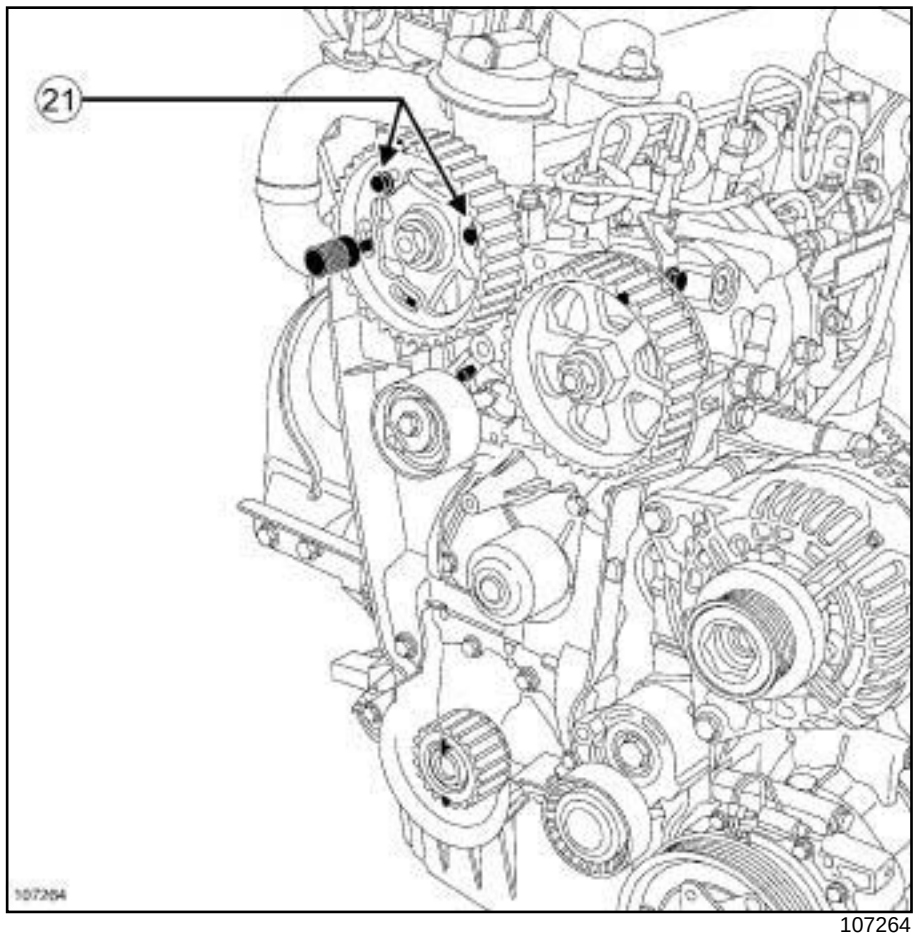
❏ Put the tensioning roller lug (**15**) in the cylinder head groove (**16**) .

❏ Engage the pin (**3**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes, turning the camshaft using an **18 mm** offset spanner if necessary.



❏ Check that the mark on the high pressure pump (**17**) is opposite the bolt head (**18**) .

107272

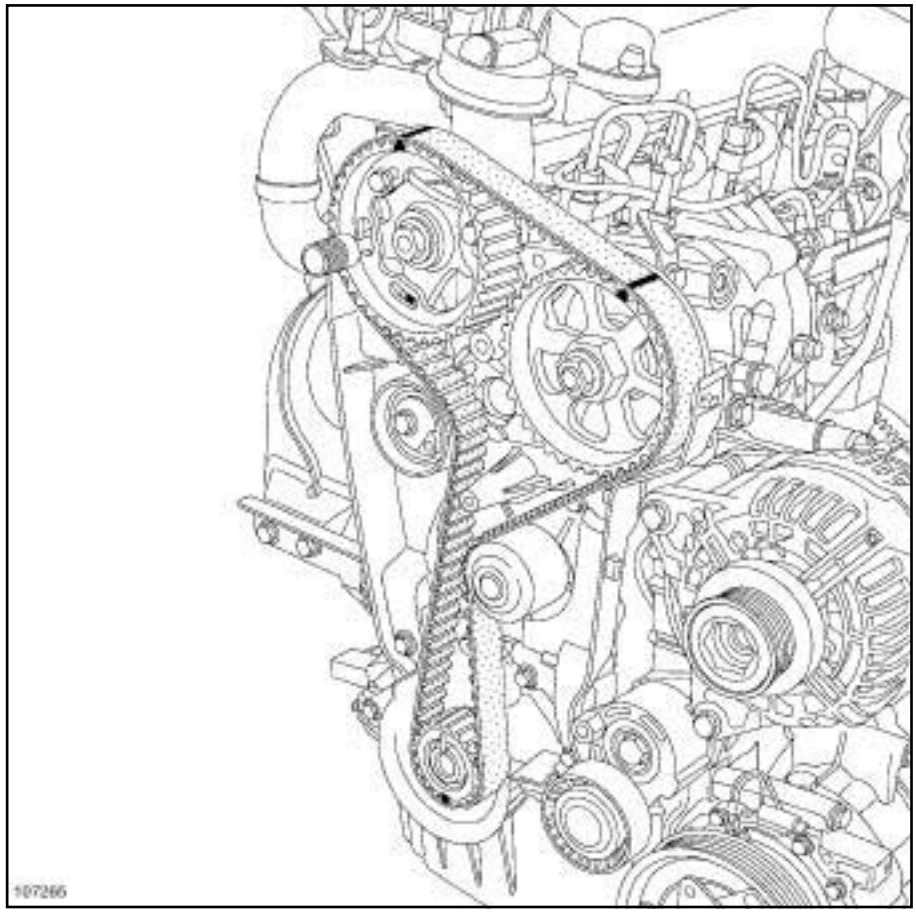


❏ Screw the old crankshaft accessories pulley bolt fitted with a spacer (**20**) (which does not cover the timing sprocket mark) into the crankshaft.

K9K, and 766 or 768

14489

❑ Position the crankshaft so that it presses against the TDC setting pin (**4**) **(Mot. 1489)** (the crankshaft sprocket collet ***(19)*** must face upwards).

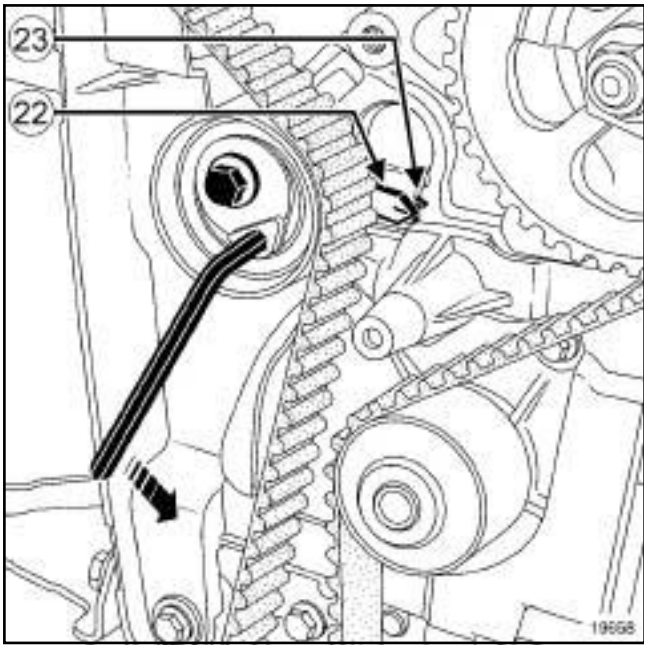


107264

❑ Remove one bolt from the camshaft timing sprocket crown.

❑ Loosen the other two camshaft timing sprocket crown bolts (**21**) by one turn.

K9K, and 766 or 768

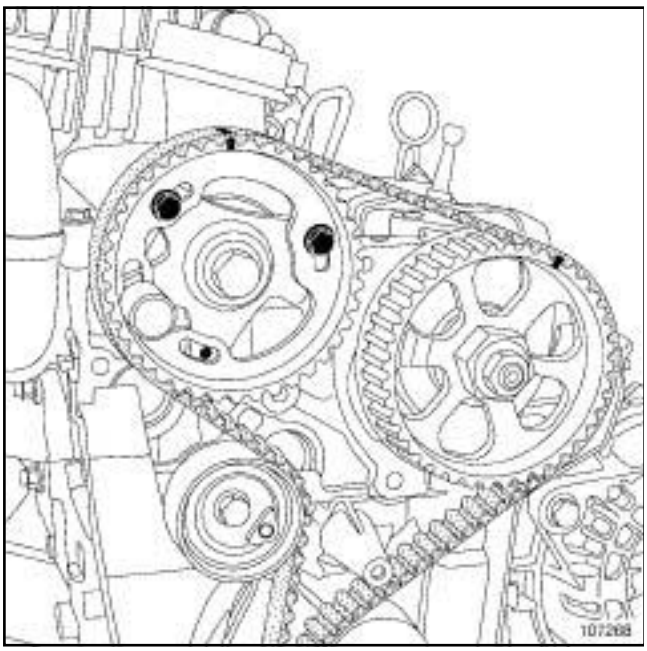


107265

❑ Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft and camshaft sprockets, and the high pressure pump pinion.

Note:

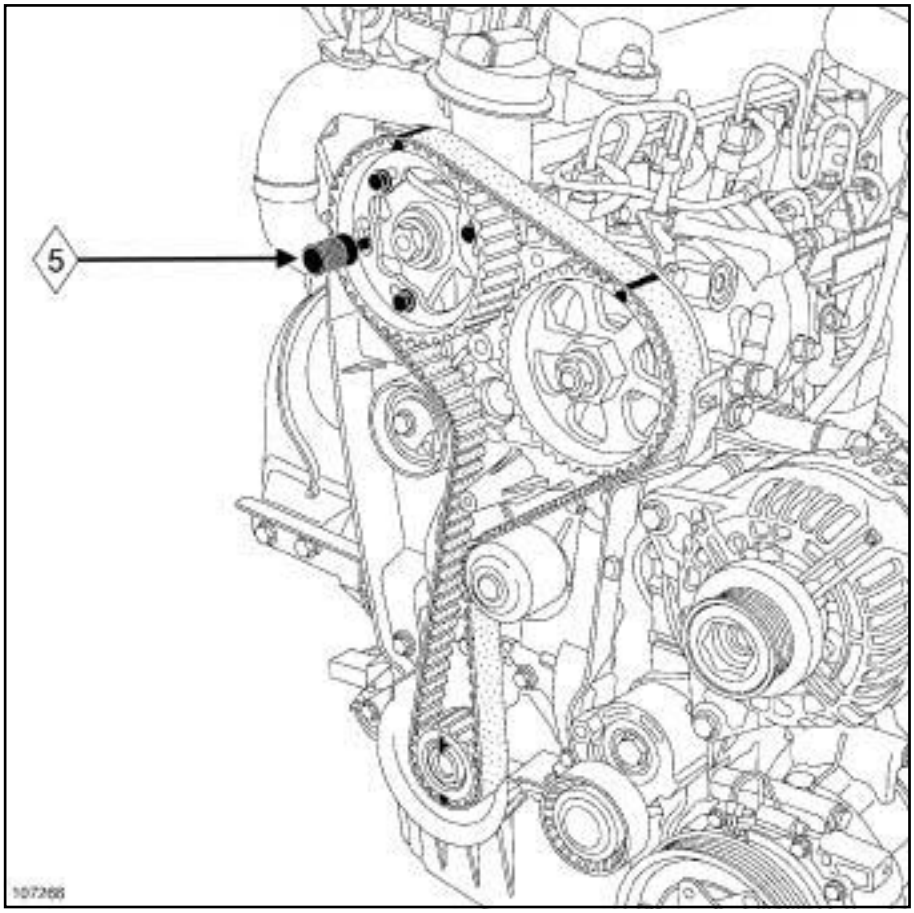
There should be 19 belt tooth grooves between the marks on the camshaft sprocket and the high pressure pump pinion, and 51 belt tooth grooves between the crankshaft sprocket and the high pressure pump pinion.



K9K, and 766 or 768

19658

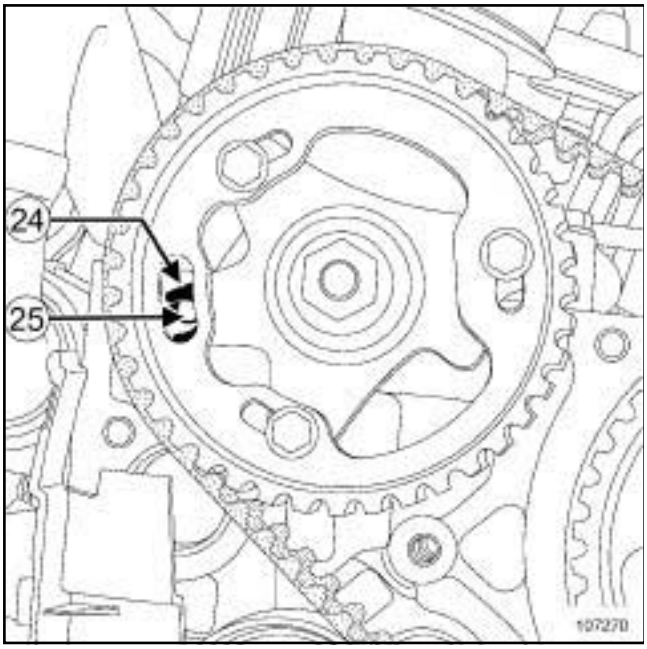
❏ Position the tensioning roller adjustable index marker (**22**) opposite the lug (**23**) , turning the eccentric cam anti-clockwise using a **6 mm** Allen key.



❏ Torque tighten the **tensioning roller bolt (27 Nm)** using a **torque wrench**.

107268

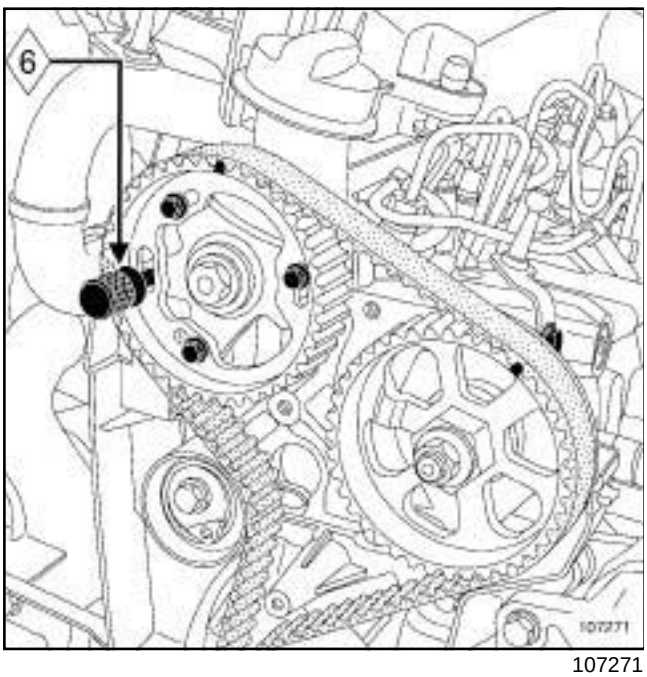
❏ Check that the camshaft timing sprocket crown bolts are not fully locked against the camshaft timing sprocket crown. If they are, repeat the timing belt refitting procedure.



K9K, and 766 or 768

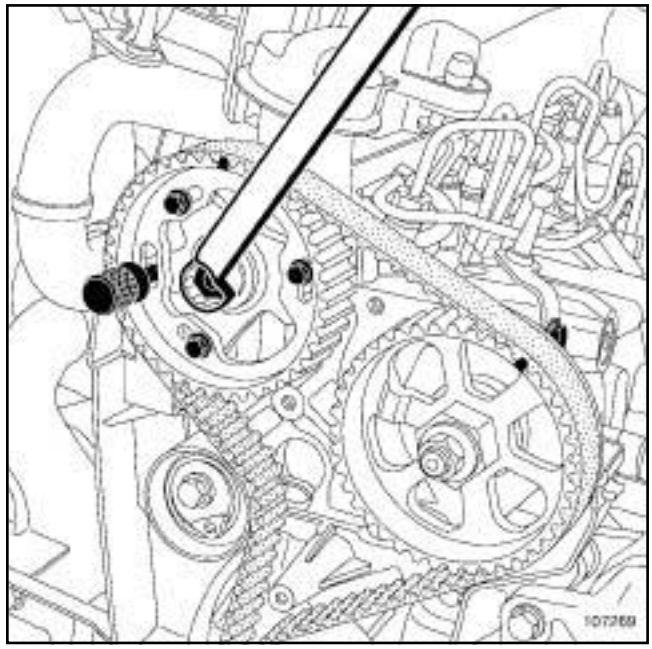
107266

- ❏ Refit the bolt from the camshaft timing sprocket crown.
- ❏ Torque tighten the **camshaft timing sprocket crown bolts (14 Nm)** using a **torque wrench**.
- ❏ Remove:
  - the TDC setting pin **(Mot. 1489)**,
  - the camshaft timing sprocket setting pin ***(5)*** **(Mot. 1430)**.



K9K, and 766 or 768

107270

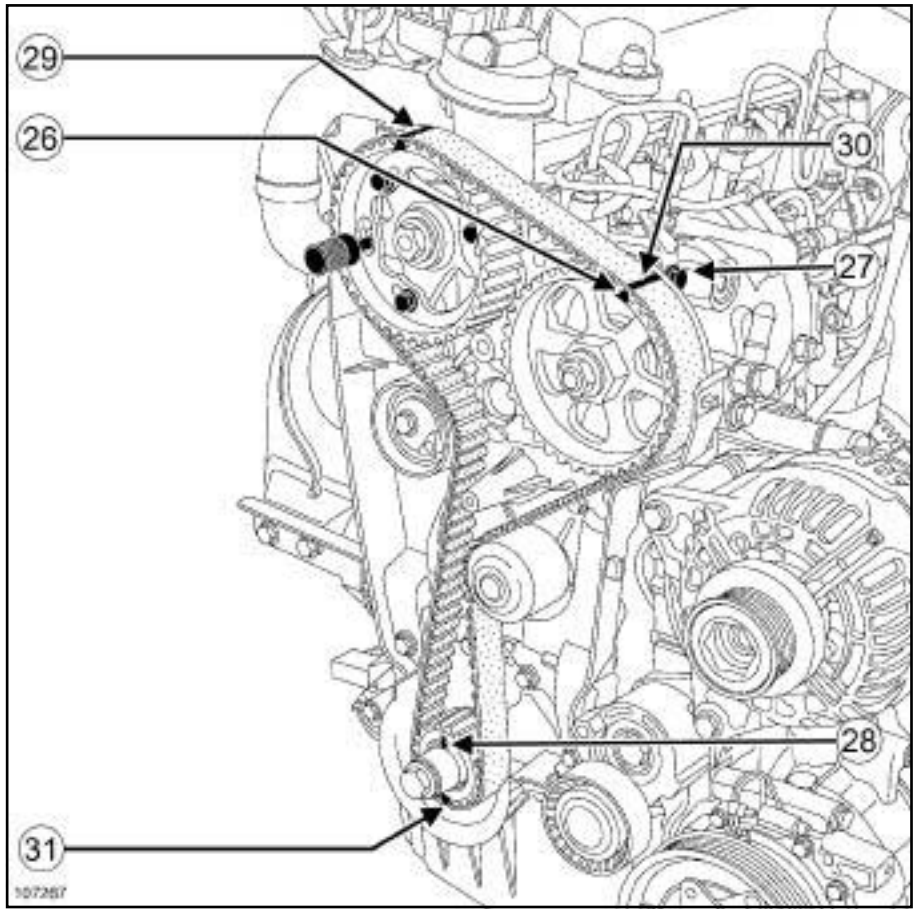


❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole (**24**) in the camshaft timing sprocket is opposite the hole (**25**) in the cylinder head:

- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

❏ Lock the camshaft timing sprocket using the (**6**) **(Mot. 1430)**.



107269

❏ If the pin **(Mot. 1430)** does not engage:

- loosen the camshaft timing sprocket crown bolts by a maximum of one turn,
- turn the camshaft timing sprocket hub using a **offset spanner (18 mm)** to set the camshaft timing sprocket hub,
- do not retighten the camshaft timing sprocket crown bolts.

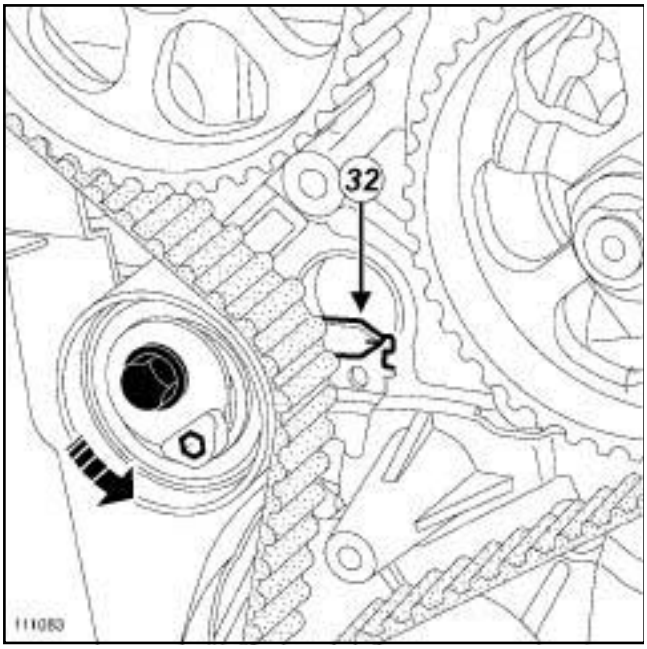
❏ Loosen the camshaft timing sprocket crown bolts by a maximum of one turn.

K9K, and 766 or 768

107267

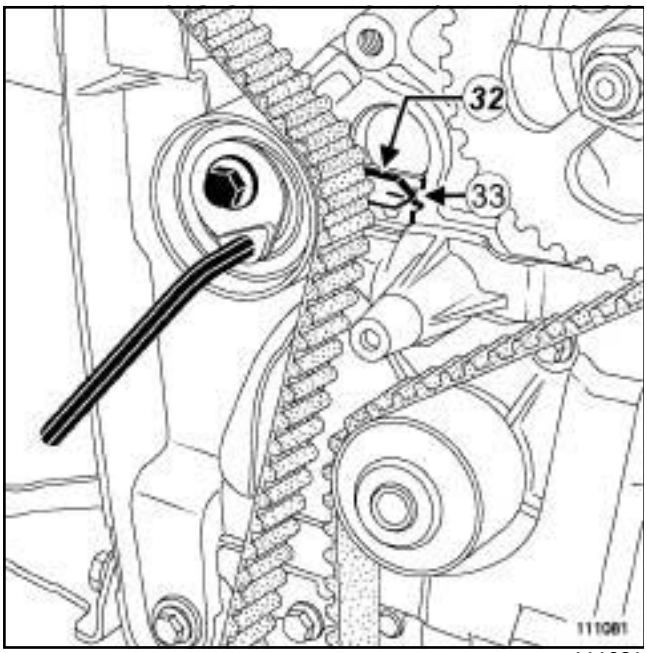
❏ Check:

- that the high pressure pump pinion mark (**26**) is opposite the bolt head (**27**) ,
- that the crankshaft timing sprocket collet (**28**) is positioned vertically at the top,
- that there are 19 belt tooth grooves between the marks on the camshaft sprocket (**29**) and the high pressure pump pinion (**30**) ,
- that there are 51 belt tooth grooves between the crankshaft sprocket marks (**31**) and the high pressure pump pinion (**30**) .



Note:

After two turns, the tensioning roller index markers may be in two different positions.



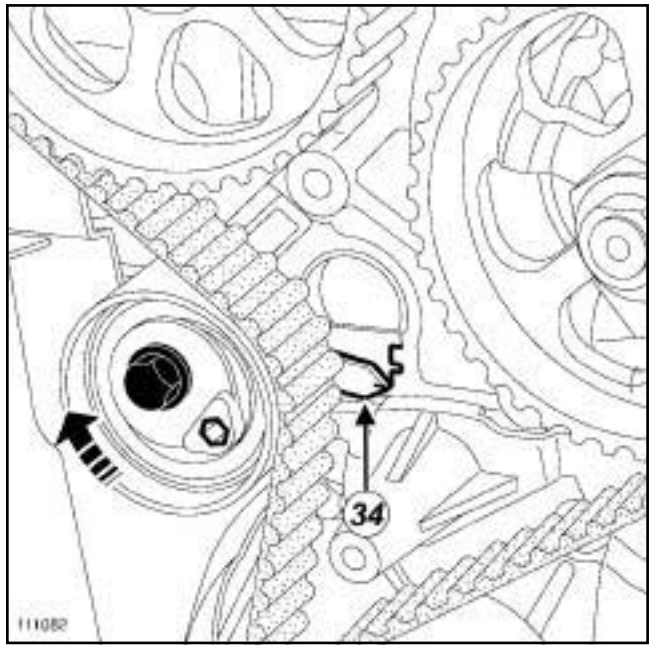
The rotation of the tensioning roller eccentric depends on the position.

K9K, and 766 or 768

First position

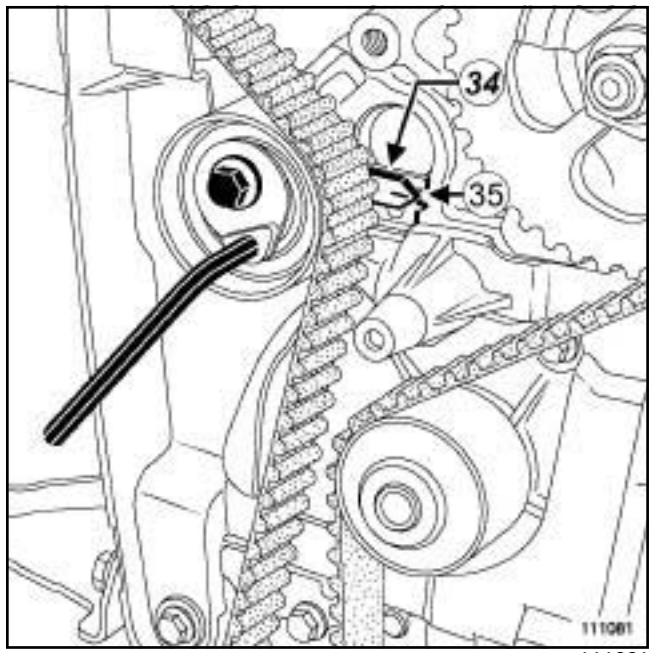
111083

111081



❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**32**) in the middle of the timing window (**33**) , turning the key anti-clockwise.



❏ Torque tighten:

- the **tensioning roller bolt (27 Nm)** using a **torque wrench**.
- the **camshaft timing sprocket crown bolts (14 Nm)** using a **torque wrench**.

Second position

111082

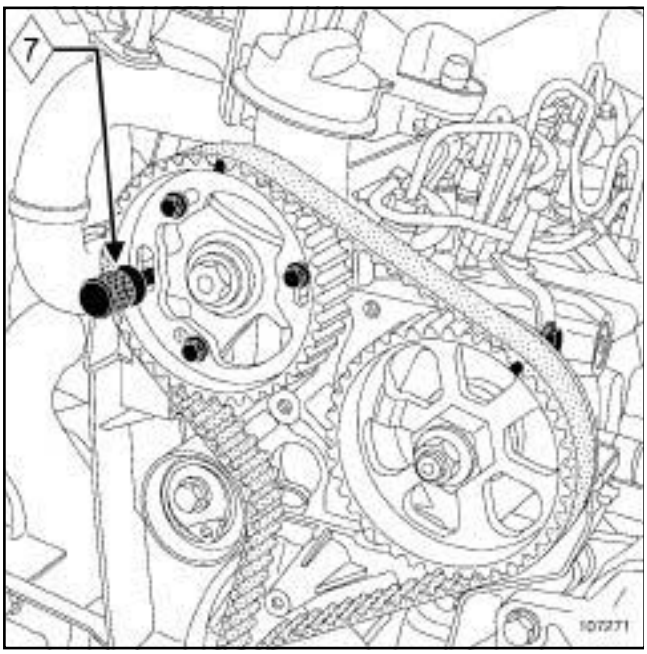
111081

❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**34**) in the middle of the timing window (**35**) , turning the key clockwise.

❏ Torque tighten:

- the **tensioning roller bolt (27 Nm)** using a **torque wrench**,
- the **camshaft timing sprocket crown bolts (14 Nm)** using a **torque wrench**.

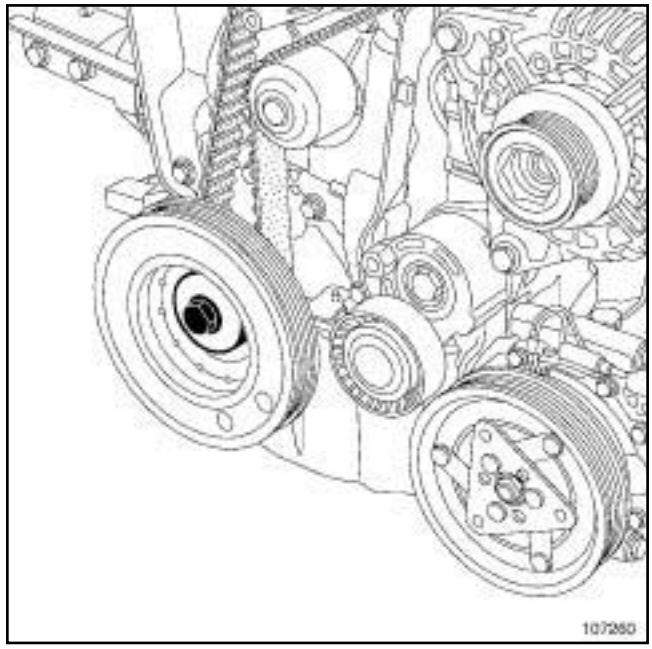


K9K, and 766 or 768

❏ Remove the following tools:

- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole in the camshaft timing sprocket is opposite the hole in the cylinder head:



- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

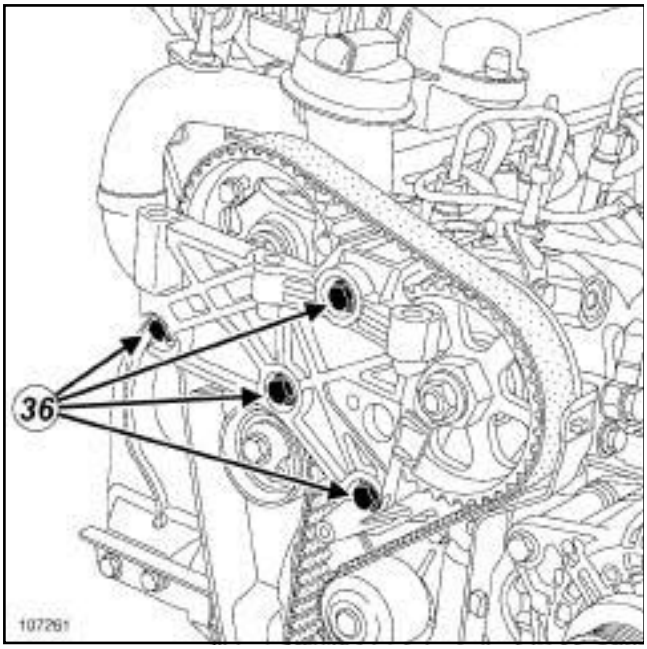
❏ Lock the camshaft timing sprocket using the (**7**) **(Mot. 1430)**.

❏ If the pin does not engage, repeat the timing belt refitting operation.

107260

❏ Refit the accessories crankshaft pulley with a new bolt.

❏ Tighten to torque and angle (crankshaft in contact with the TDC setting pin) the **crankshaft accessories pulley bolt M14 (120 Nm + 95° ± 15°)** using a **torque/angle wrench** or a **torque wrench** and a **cylinder head bolt tightening gauge (angular measuring type)**.



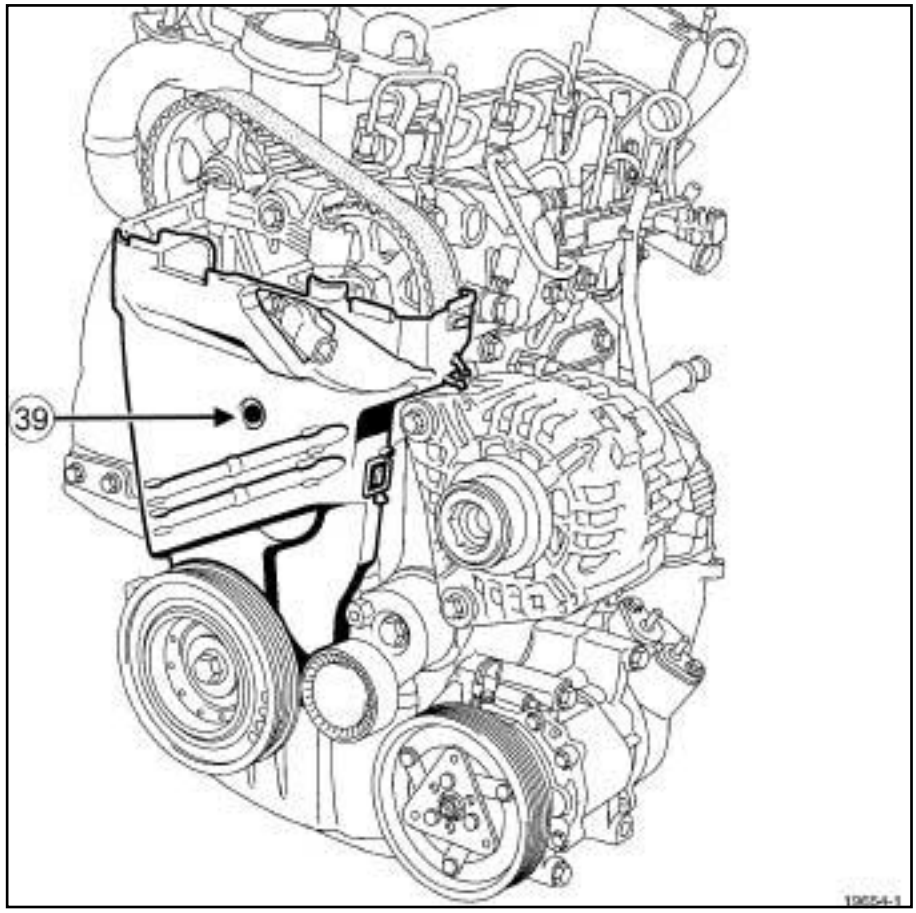
❏ Remove the following tools:

- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

❏ Refit the TDC pin plug, coating the threading with **SILICONE ADHESIVE SEALANT**.

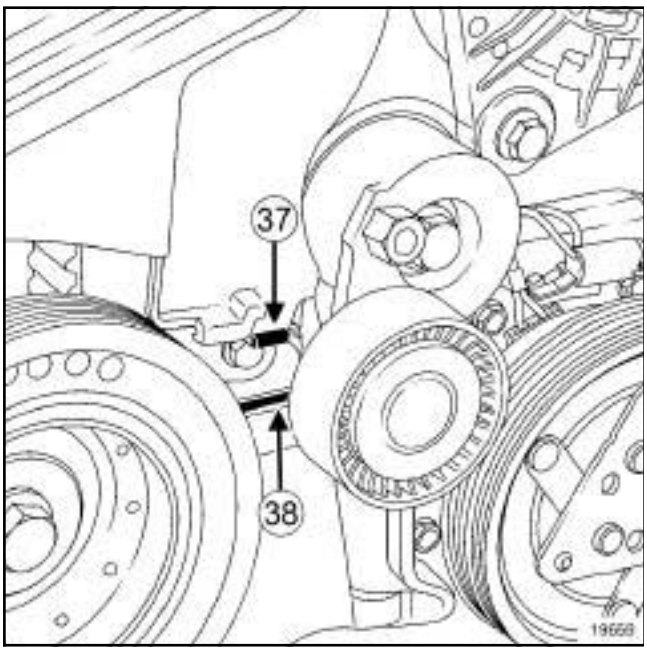
❏ Torque tighten the **TDC setting pin plug (25 Nm)** using a **torque wrench**.

K9K, and 766 or 768



107261

❑ Refit:

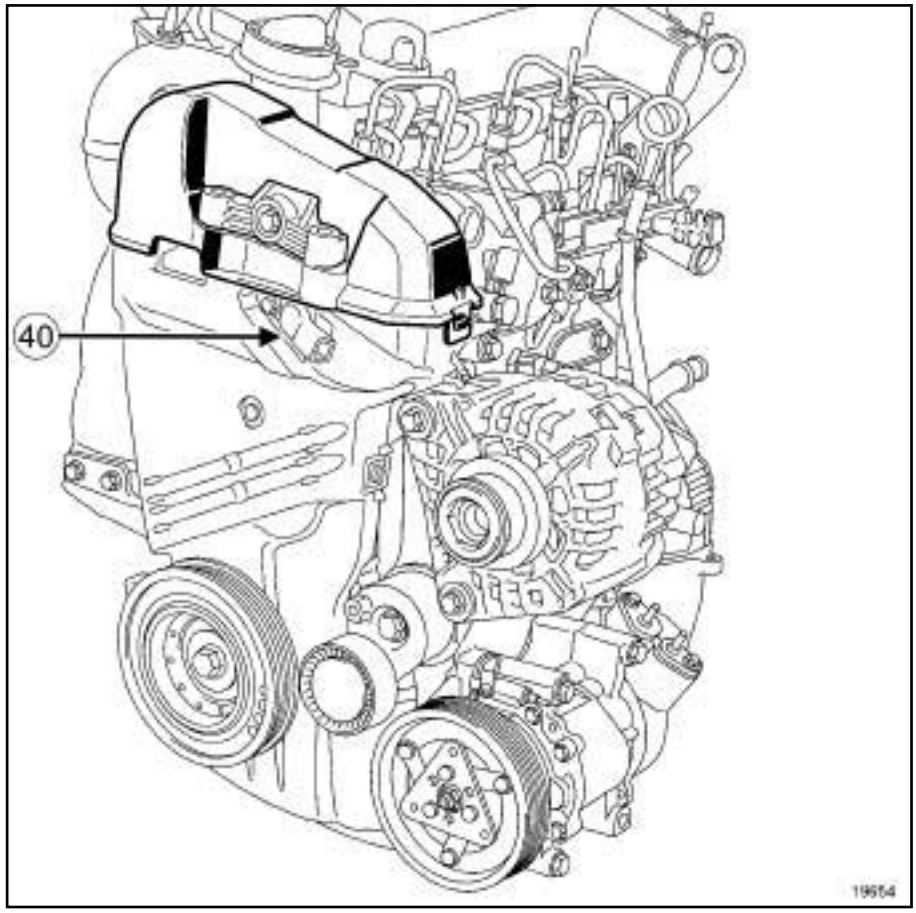


- the cylinder head suspended mounting support,
- the cylinder head suspended mounting bolts (**36**) ,

❑ Torque tighten the **cylinder head suspended mounting bolts (25 Nm)** using a **torque wrench**.

K9K, and 766 or 768

19654-1



19659

❑ Refit:

- the lower timing cover, positioning the tab (**37**) in the inner timing cover hole (**38**) ,
- the timing cover plastic bolt (**39**) .

K9K, and 766 or 768

19654

❑ Refit the high pressure pump position sensor (**40**) .

❑ Torque tighten the **camshaft position sensor bolt (8 Nm)** using a **torque wrench**.

❑ Refit the upper timing cover.

II - FINAL OPERATION

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,

Remove:

- the chain,
- the **safety strap(s)**,
- the **(Mot. 1453)**,

Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover,

K9K, and 766 or 768

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the engine undertray,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),

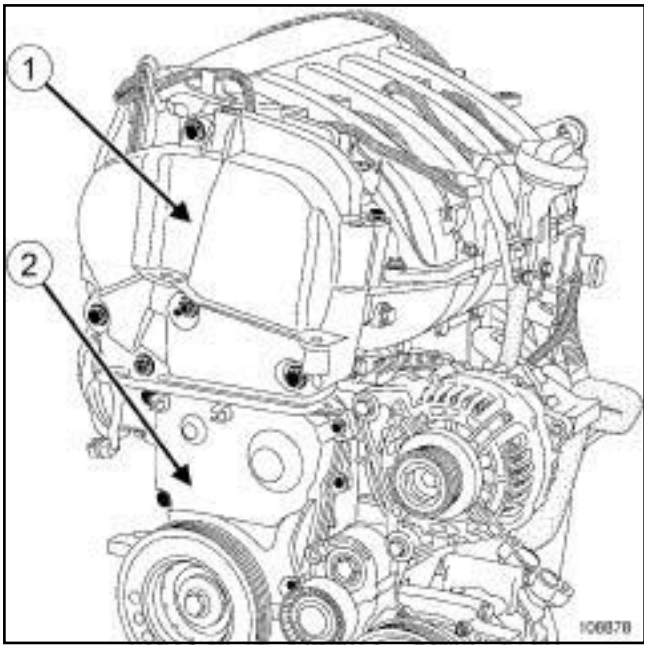
❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4J

Special tooling required	
Mot. 1368	Tool for tightening eccentric tensioning roller bolt. 8 mm Torx wrench and 12.7 mm square.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1496	Camshaft timing tool.
Mot. 1750	Additional tool to support the camshaft adjusting tool, Mot. 1496.
Mot. 1489	TDC locating pin.
Mot. 1490-01	For locking and adjusting the camshaft pulleys.
Mot. 1487	Tool for refitting camshaft covers (57 mm diameter).
Mot. 1488	Tool for refitting camshaft covers (43 mm diameter).

Tightening torques ▽	
new crankshaft accessories pulley bolt	**40 N.m + 145° ± 15°**
timing tension wheel nut	**27 N.m**
timing fixed roller bolt	**50 N.m**
lower timing cover bolts	**12 N.m**
nut of each camshaft sprocket	**30 N.m + 84° ± 4°**
TDC pin plug	**20 N.m**
upper timing cover bolts	**46 N.m**
upper timing cover nuts	**46 N.m**
dipstick guide tube bolt	**10 N.m**
flywheel end lifting eye bolts	**10 N.m**

REMOVAL



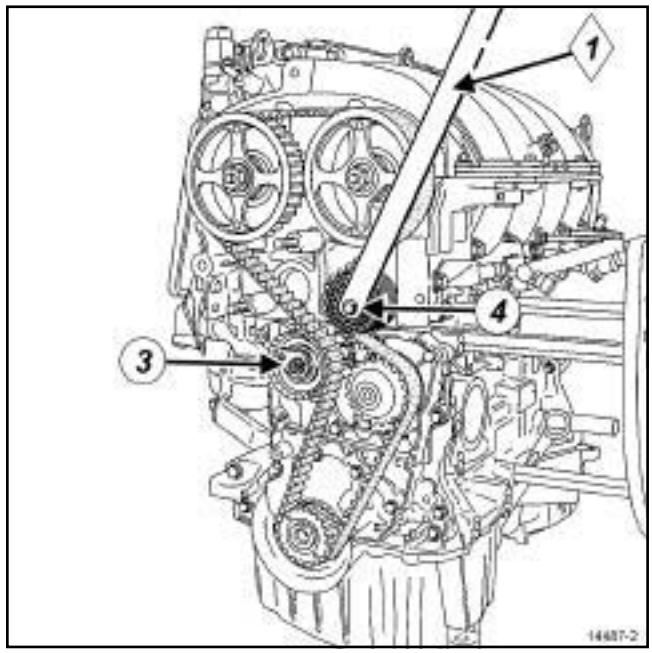
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air inlet duct clips,
- the air inlet duct,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

K4J



108878

❑ Remove:

- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the upper timing cover bolts,
- the upper timing cover nuts,
- the upper timing cover (**1**) ,
- the lower timing cover bolts,
- the lower timing cover (**2**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

14487-2

❑ Loosen the nut (**3**) of the timing tensioning roller.

Note:

Do not drop the crankshaft timing sprocket when removing the timing belt.

❑ Remove:

- the timing fixed roller bolt (**4**) using the tool **(Mot. 1368)** (**1**) ,
- the timing fixed roller,
- the timing belt,
- the timing tensioning roller nut,
- the timing tensioning roller,
- the crankshaft timing sprocket.

K4J

REFITTING - PROCEDURE 1

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Timing belt (10,02, 04,02)**,

parts always to be replaced: Timing belt tensioning roller (10,02,04,04),

parts always to be replaced: Timing fixed roller (10,02,04,05),

parts always to be replaced: Crankshaft accessories pulley (10,03,03,07),

parts always to be replaced: Crankshaft accessories pulley bolts (10,03,03,10),

parts always to be replaced: Inlet camshaft cap (10,02,02,11),

parts always to be replaced: Exhaust camshaft cap (10,02,02,12).

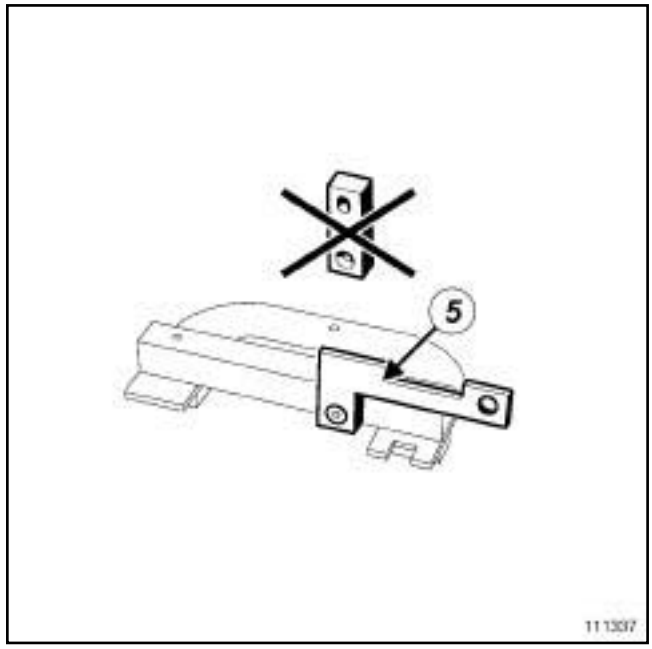
II - REFITTING OPERATION FOR PART CONCERNED

❑ The first procedure applies to replacing any timing face component which has a crankshaft timing sprocket without a collet and which does not require one or more of the camshaft sprockets to be loosened.

1 - Adjusting the timing

❑

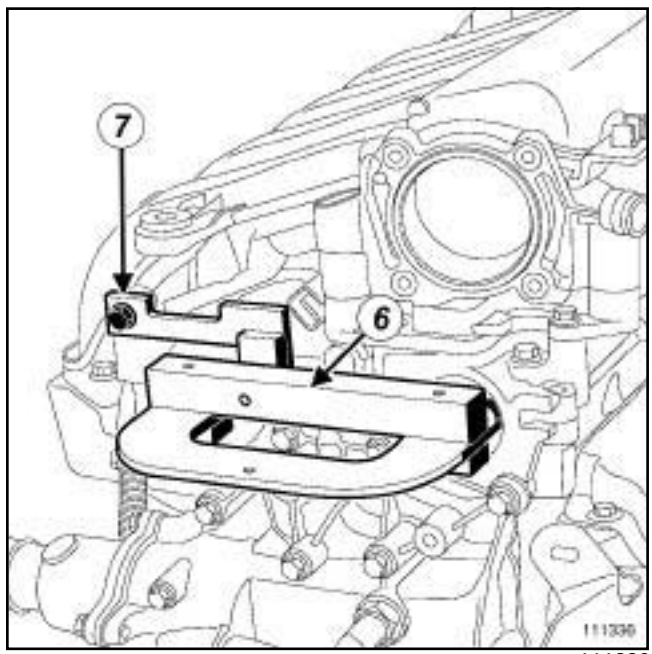
WARNING



Be sure to degrease:

- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.

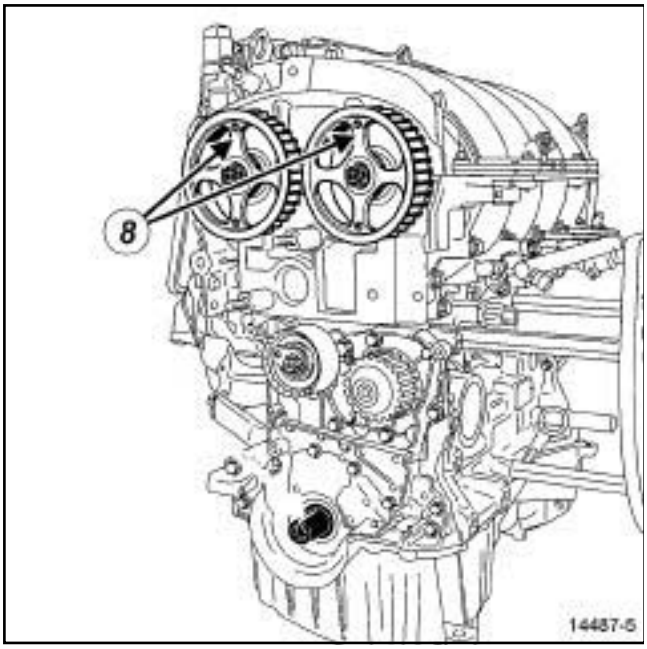
This is to avoid timing slippage.



This slippage leads to engine damage.

❑ Set the camshaft grooves horizontally and below the centre line by turning the camshafts with the **(Mot. 799-01)** if necessary.

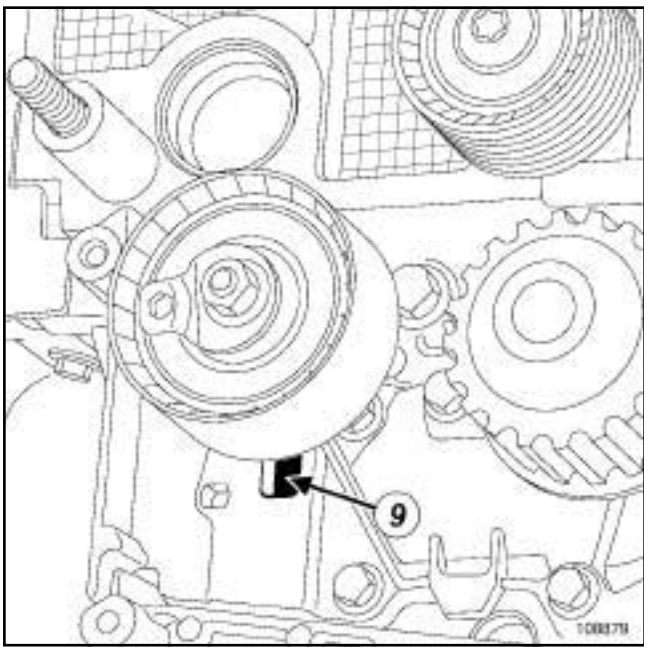
111337



❑ Fit the **(Mot. 1496)** with the **(Mot. 1750)** (**5**) .

111336

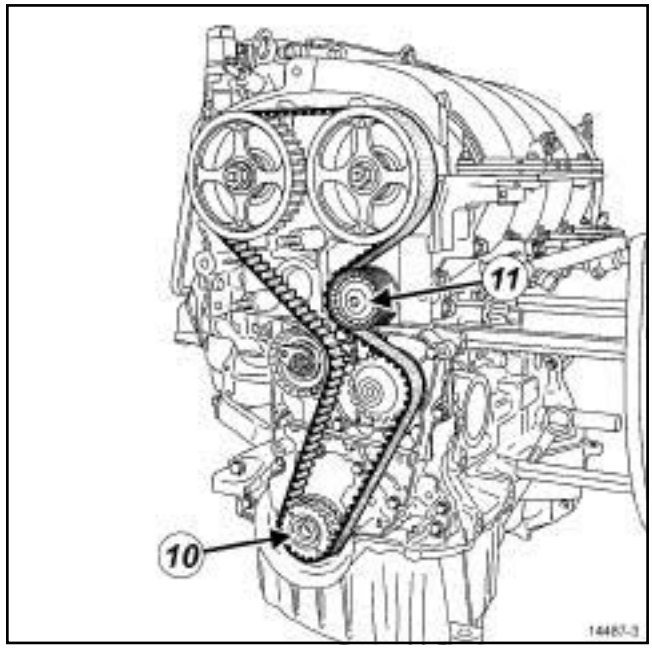
❑ Fit:



- the **(Mot. 1496)** (**6**) fitted with the **(Mot. 1750)** on the end of the camshaft,
- a lifting eye bolt (**7**) to secure the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)**.

14487-5

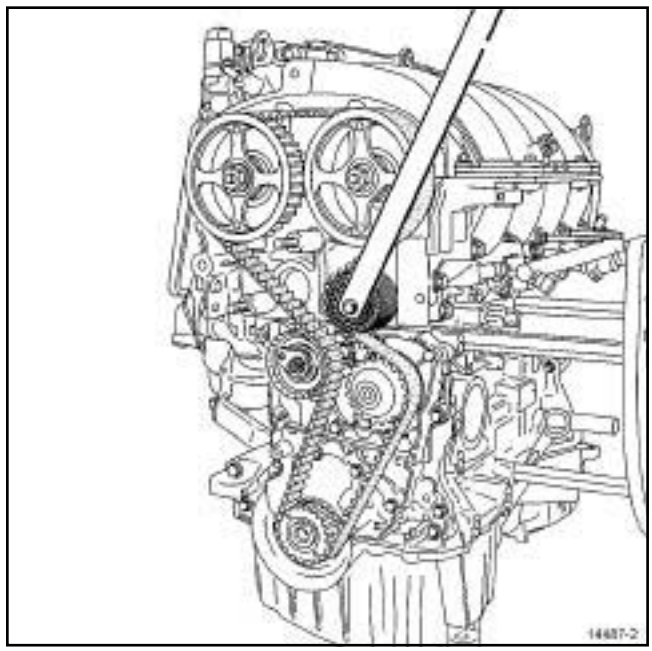
❏ Position the RENAULT badge (**8**) engraved on the stem of each camshaft sprocket vertically and pointing upwards.



2 - Refitting

108879

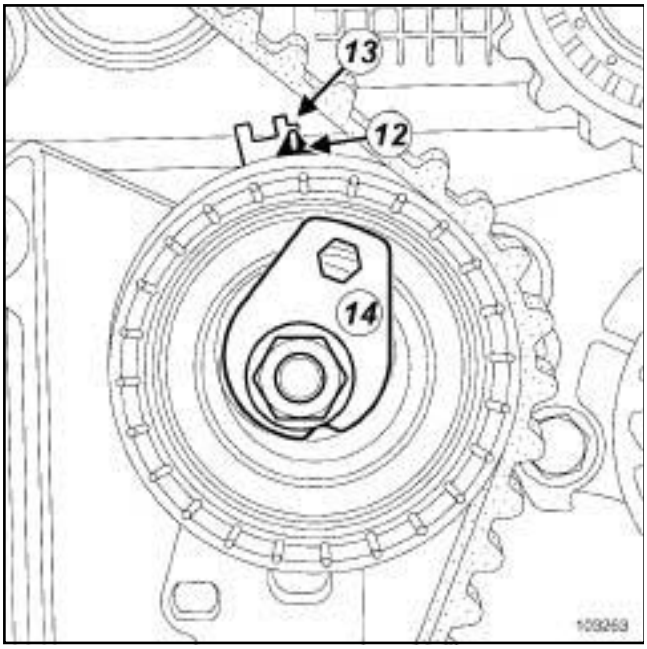
❏ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**9**) .



❏ Screw on the timing tensioning roller nut without tightening it.

14487-3

❏ Refit:

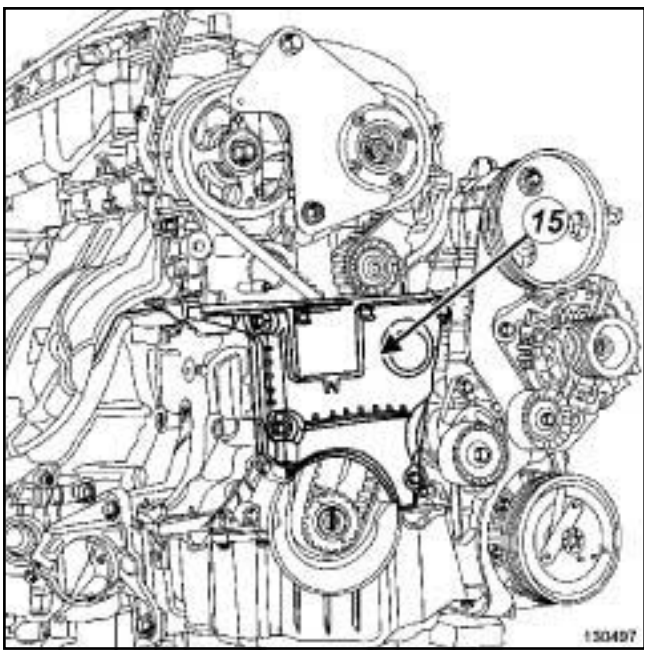


- the crankshaft timing sprocket (**10**) ,
- a new timing belt,
- a new timing fixed roller (**11**) .

14487-2

❏ Torque tighten the **timing fixed roller bolt (50 N.m)** using the tool **(Mot. 1368)**.

K4J

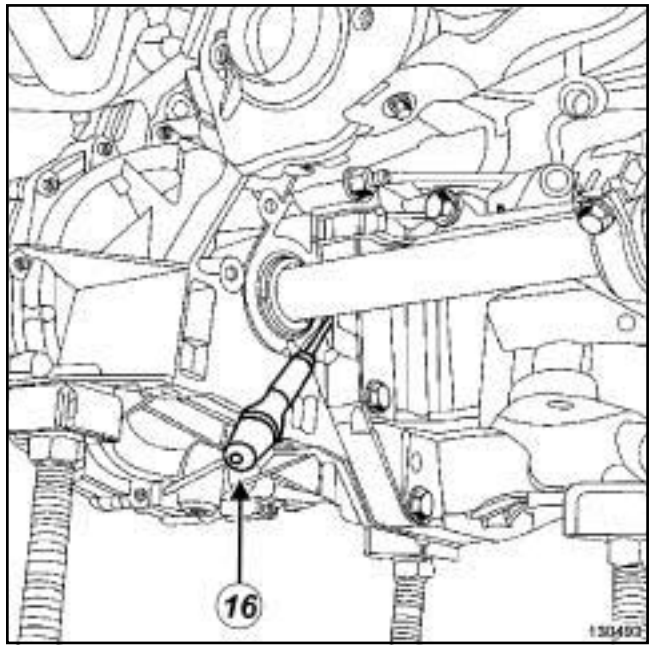


103263

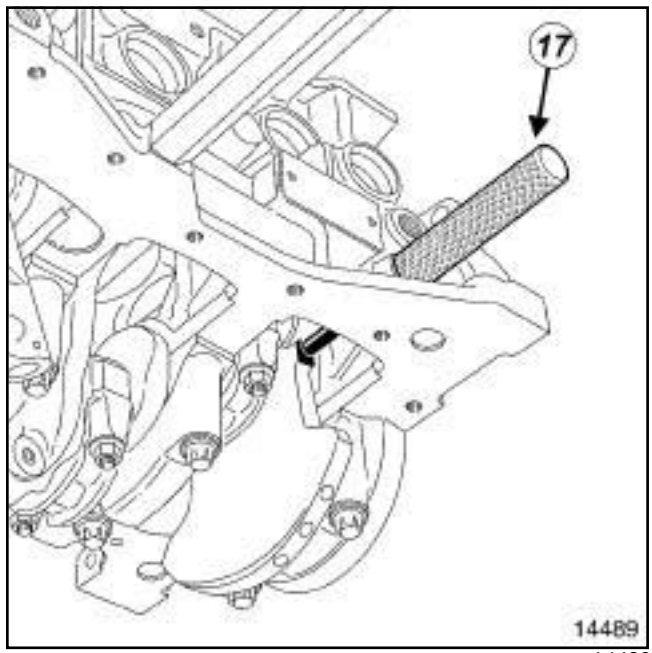
❏ Position the adjustable index (**12**) opposite the mark (**13**) , by turning the eccentric (**14**) clockwise using a **6 mm** Allen key.

❏ Torque tighten the **timing tensioning roller nut (7 N.m)**.

❏ Refit the tool **(Mot. 1489)** on the cylinder block.



130497

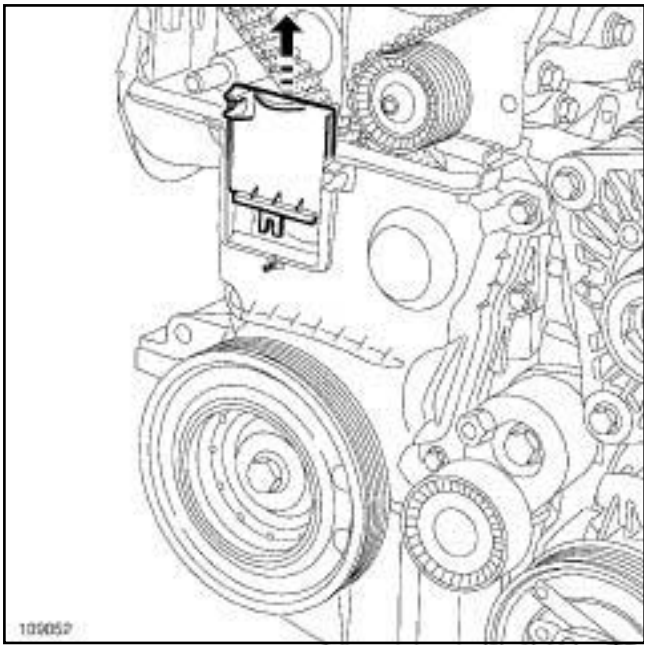


❏ Refit the lower timing cover (**15**) .

❏ Tighten to torque the **lower timing cover bolts (12 N.m)**.

❏ Refit a new crankshaft accessories pulley.

130493



14489

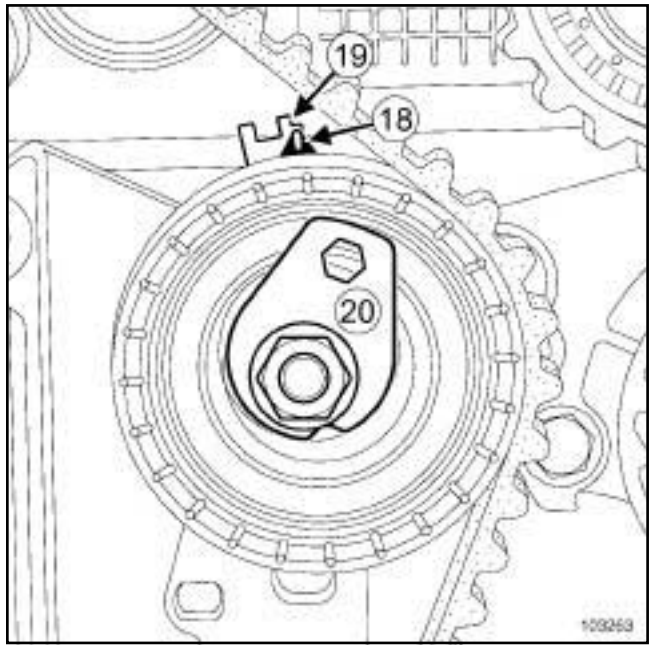
❏ Use a screwdriver (**16**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool **(Mot. 1489)** (**17**) using the screwdriver; the crankshaft groove should be at the top.

❏ Torque and angle tighten a **new crankshaft accessories pulley bolt (40 N.m + 145° ± 15°)** (crankshaft in contact with the tool **(Mot. 1489)**).

K4J

109052

❏ Remove:



- the timing flap from the lower timing cover,
- the lifting eye bolt from the **(Mot. 1496)**,
- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

3 - Checking the tension

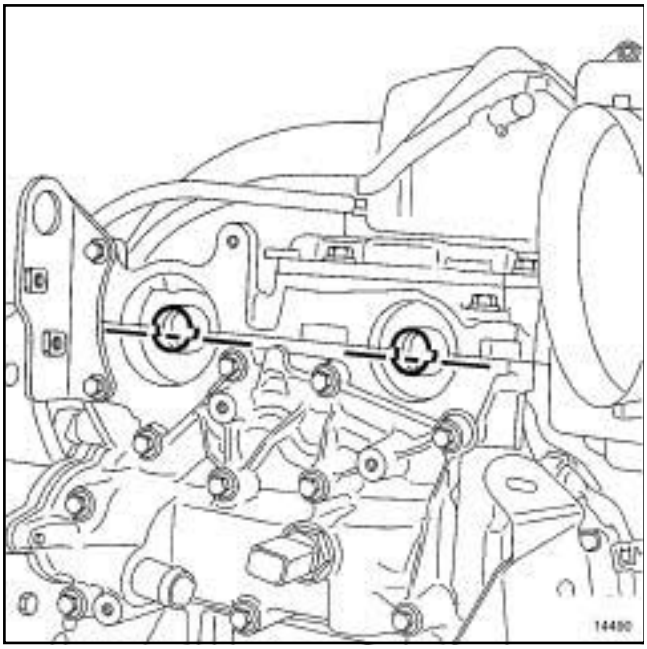
❏ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the tool **(Mot. 1489)** into the cylinder block.

❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

❏ Remove the tool **(Mot. 1489)** from the cylinder block.

103263

❏ Check that the adjustable index (**18**) is opposite the notch (**19**) , if this is not the case:



- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with a **6 mm** Allen key,
- gradually move the adjustable index marker (**18**) opposite the mark (**19**) turning the eccentric cam (**20**) clockwise.

❏ Torque tighten the **timing tension wheel nut (27 N.m)**.

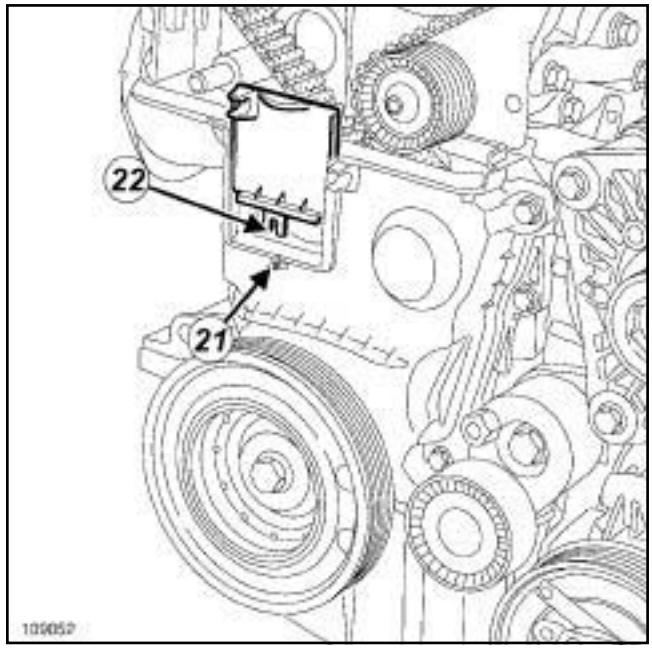
4 - Checking the timing

❏ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

❏ Screw tool **(Mot. 1489)** into the cylinder block.

14490

❑ Position (without forcing) the camshaft setting tool **(Mot. 1496)** fitted with the **(Mot. 1750)** (the camshaft end grooves must be horizontal and offset towards the bottom).



Note:

The timing adjustment and tensioning operation must be repeated if the camshaft setting tool does not engage.

❑ Remove:

- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

❑ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

109052

❑ Refit the lower timing cover flap, checking that the locating pin (**21**) fits properly in the notch (**22**) .

REFITTING -PROCEDURE 2

I - REFITTING PREPARATION OPERATION

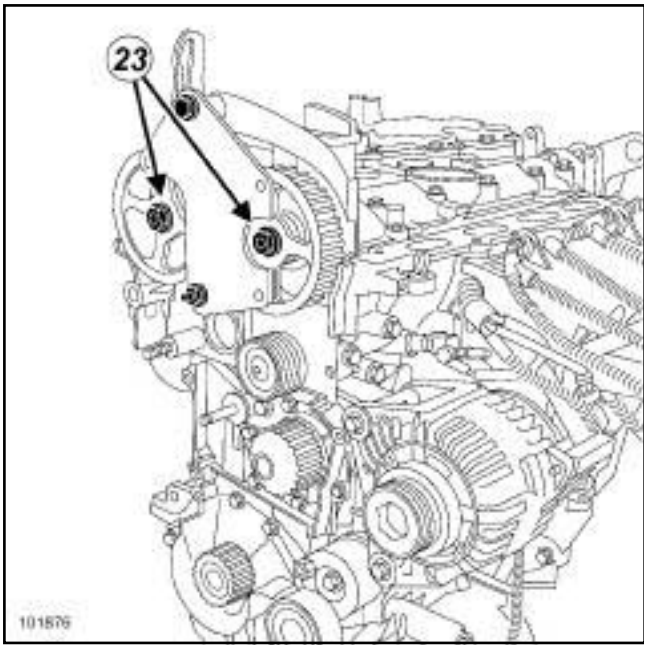
❑ **parts always to be replaced: Timing belt (10,02, 04,02)**,

parts always to be replaced: Timing belt tensioning roller (10,02,04,04),

parts always to be replaced: Timing fixed roller (10,02,04,05),

parts always to be replaced: Crankshaft accessories pulley bolts (10,03,03,10),

parts always to be replaced: camshaft timing sprocket nut (10,02,02,18),



parts always to be replaced: Inlet camshaft cap (10,02,02,11),

parts always to be replaced: Exhaust camshaft cap (10,02,02,12).

II - REFITTING OPERATION FOR PART CONCERNED

❑ The second procedure is used when replacing any timing face component which has a crankshaft timing sprocket with or without a collet, that requires one or more of the camshaft sprockets to be loosened.

K4J

101876

❑ Fit the tool **(Mot. 1490-01)** on the camshaft sprockets using the tool **(Mot. 799-01)**.

❑ Loosen the nuts (**23**) of each camshaft sprocket.

❑ Remove:

- the tool **(Mot. 1490-01)** from the cylinder block,
- every camshaft sprocket nut,
- the camshaft sprockets.

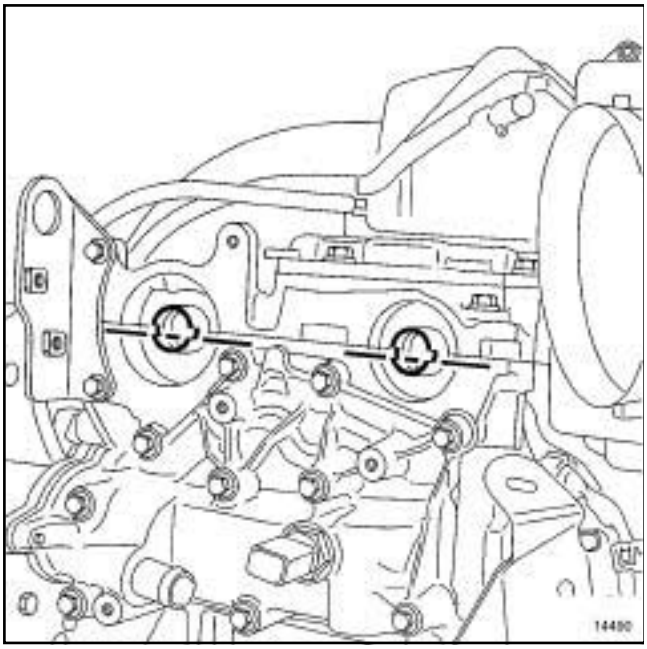
1 - Adjusting the timing

❑

Note:

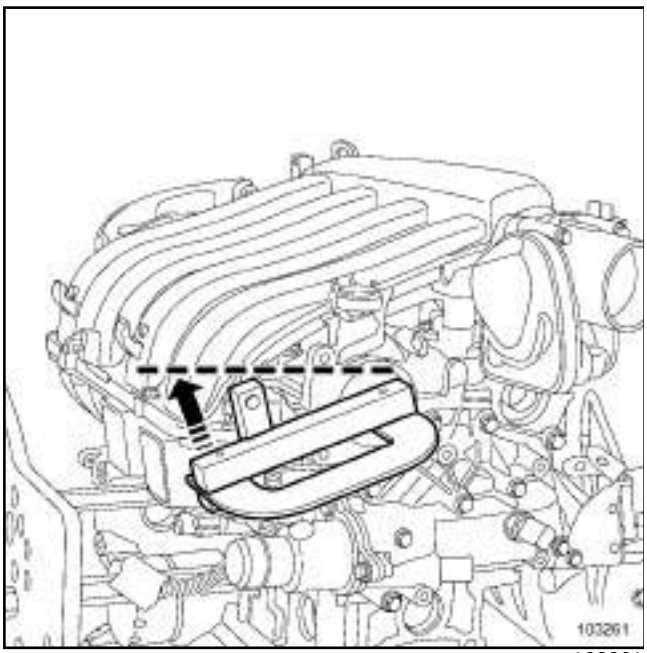
If the stud loosens with the nut (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) (Technical Note 3887A,11A, Top and front of engine).

WARNING



Always degrease:

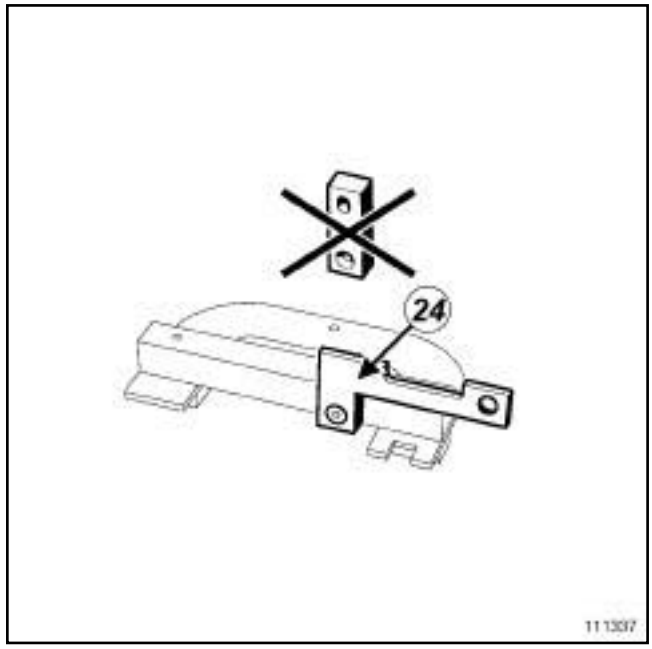
- the end of the crankshaft (timing end),
- the timing sprocket pressure faces and bore of the crankshaft,
- the crankshaft accessories pulley bearing faces,
- the camshaft ends (timing end),
- the camshaft sprocket bores and bearing faces.



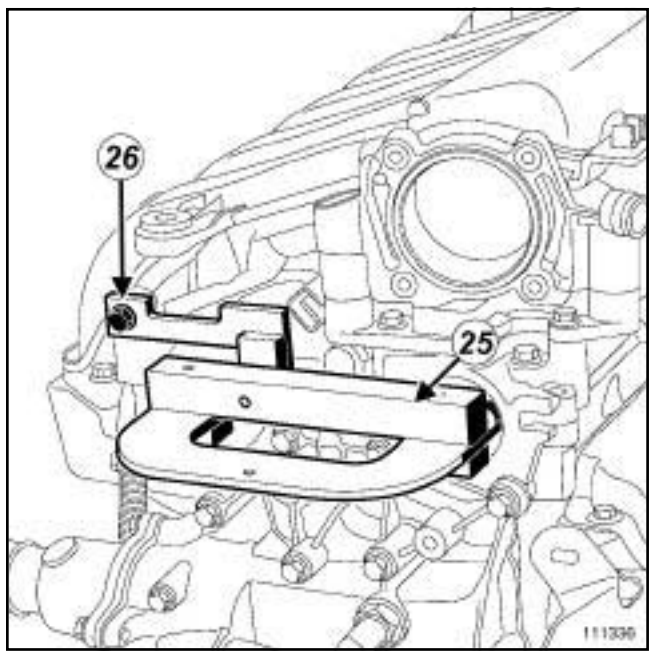
This is to avoid timing slippage.

This slippage leads to engine damage.

K4J



14490

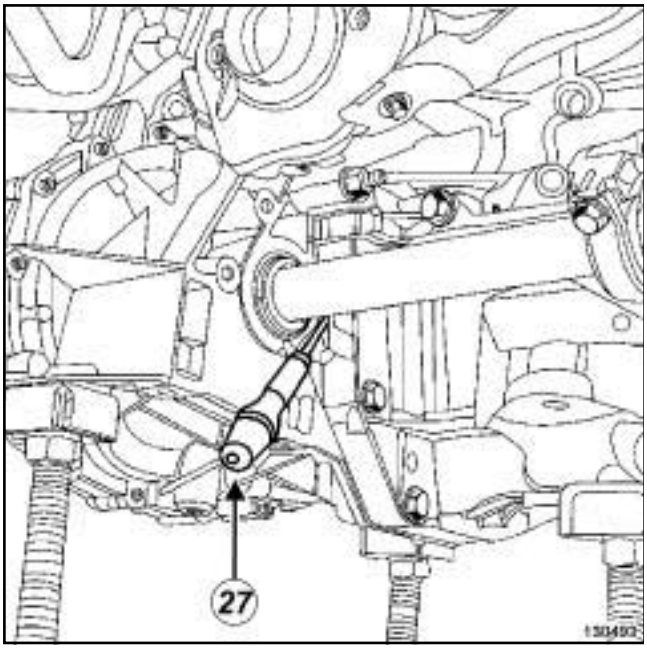


103261

❑ Position the camshaft grooves horizontally and below the centre line, by turning the camshafts with the **(Mot. 1496)** if necessary.

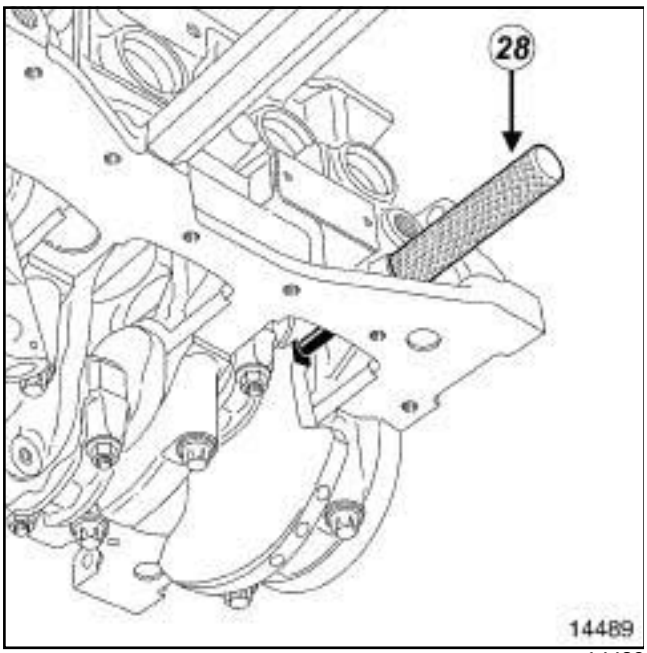
111337

❑ Fit the **(Mot. 1496)** with the **(Mot. 1750)** (**24**) .



111336

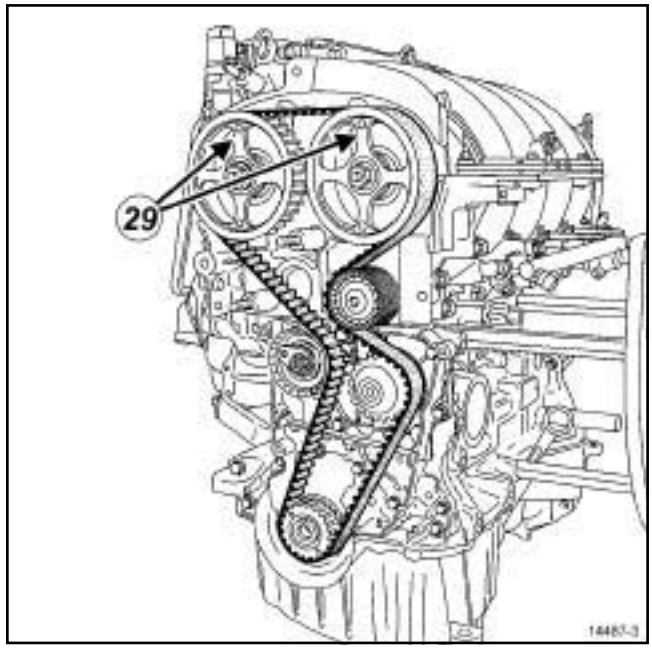
❑ Fit:



- the **(Mot. 1496)** (**25**) fitted with the **(Mot. 1750)** on the end of the camshaft,
- a lifting eye bolt (**26**) to secure the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)**.

❑ Refit:

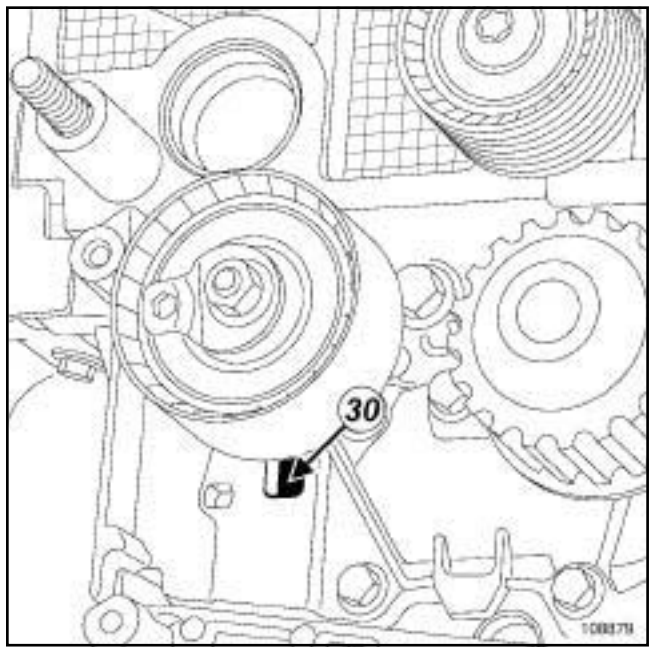
- the crankshaft timing sprocket,
- the camshaft sprockets,
- every camshaft sprocket nut.



130493

14489

❏ Refit the tool **(Mot. 1489)** on the cylinder block.

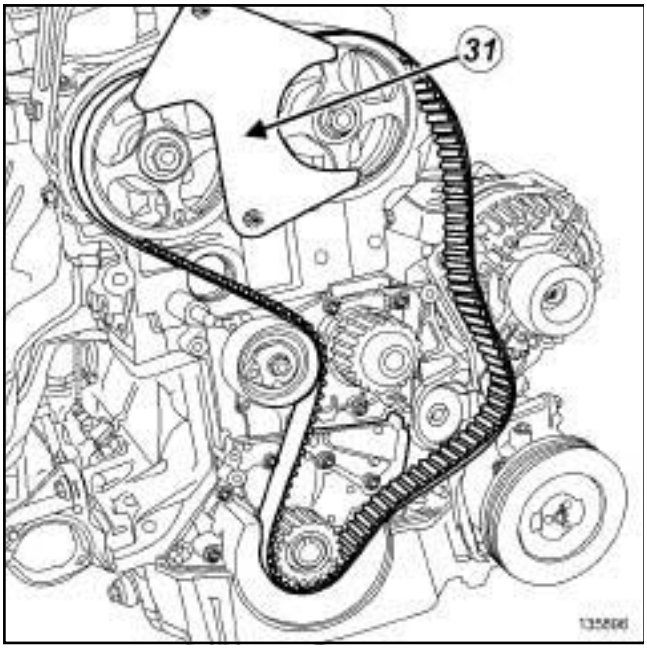


❏ Use a screwdriver (**27**) to check that the flywheel does not turn (clockwise at the timing end), otherwise bring the crankshaft back into contact with the tool **(Mot. 1489)** (**28**) using the screwdriver; the crankshaft groove should be at the top.

14487-3

❏ Position the RENAULT badge (**29**) etched on the stem of each camshaft sprocket vertically and pointing upwards.

2 - Refitting



108879

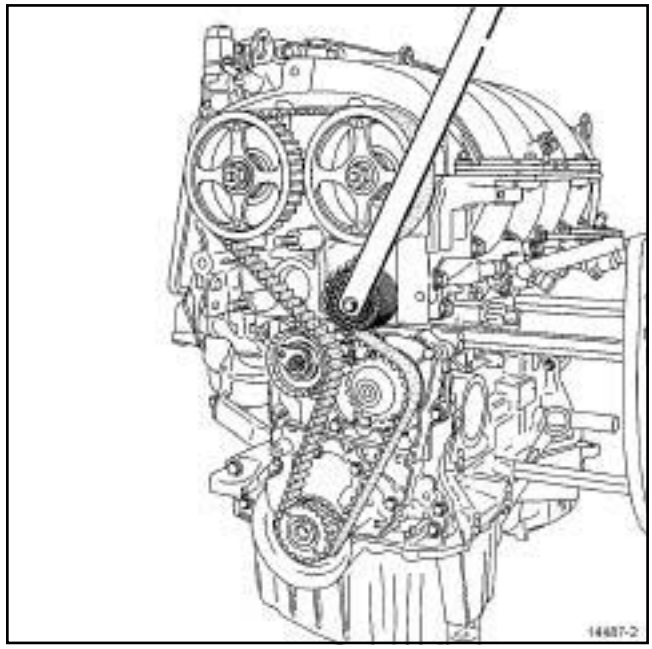
❏ Refit a new timing tensioning roller by positioning the lug of the timing tensioning roller in the groove (**30**) .

❏ Screw on the timing tensioning roller nut without tightening it.

K4J

135896

❑ Refit a new timing belt starting with the sprocket of each camshaft (without moving the sprocket of each camshaft).



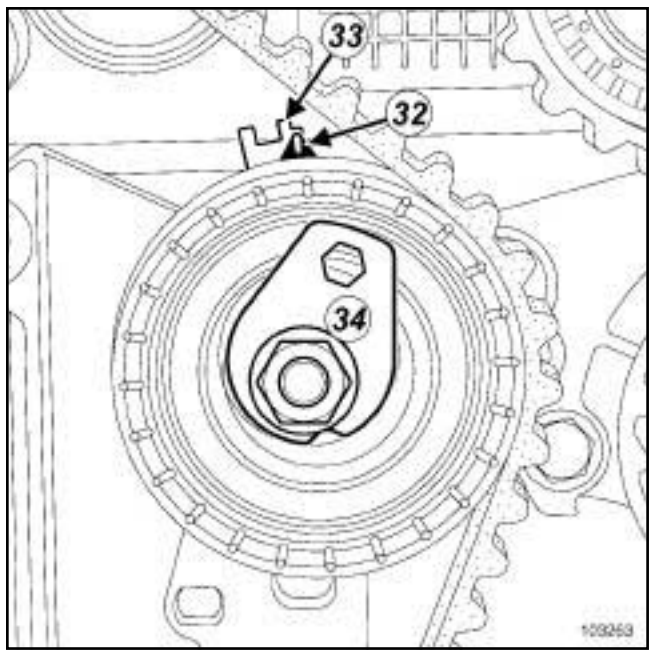
❑ Fit the tool **(Mot. 1490-01)** (**31**) on the camshaft sprockets (use the bolt and nut of the upper timing cover to fit the tool **(Mot. 1490-01)**).

Note:

Take care to properly tighten the timing belt between the two camshaft sprockets.

Note:

If the engine is equipped with a crankshaft timing sprocket with a collet, take care to properly tighten the timing belt between the exhaust camshaft sprocket and the crankshaft timing sprocket.

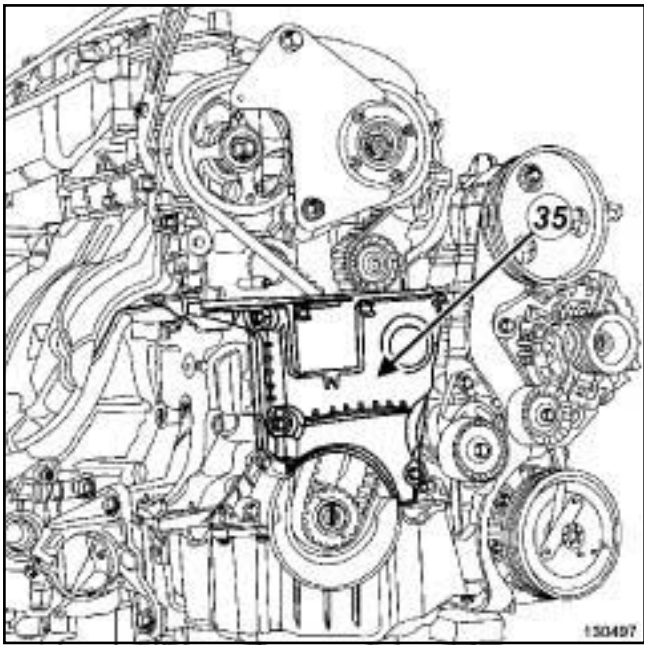


14487-2

❑ Refit a new timing fixed roller.

❑ Torque tighten the **timing fixed roller bolt (50 N.m)** using the tool **(Mot. 1368)**.

3 - Timing belt tension



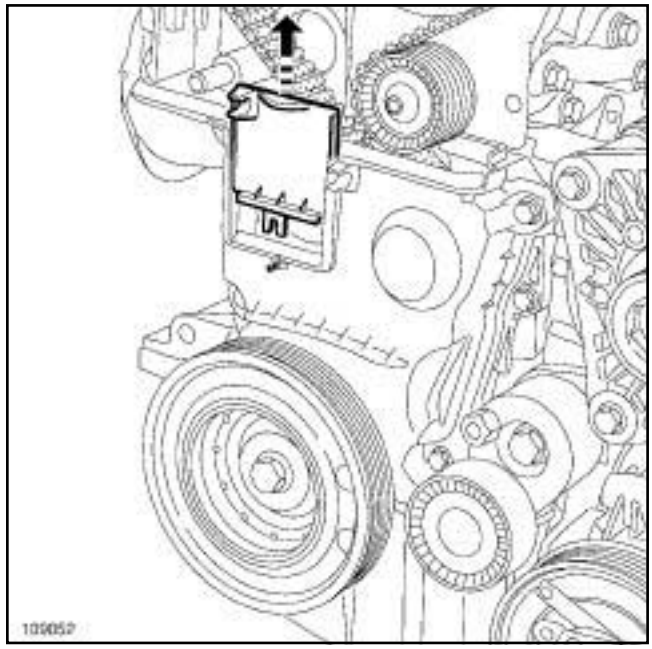
103263

❑ Position the adjustable index (**32**) opposite the mark (**33**) , by turning the eccentric (**34**) clockwise using an Allen key.

❑ Torque tighten the **timing tensioning roller nut (7 N.m)**.

K4J

130497



❏ Refit the lower timing cover (**35**) .

❏ Tighten to torque the **lower timing cover bolts (12 N.m)**.

❏ Refit a new crankshaft accessories pulley.

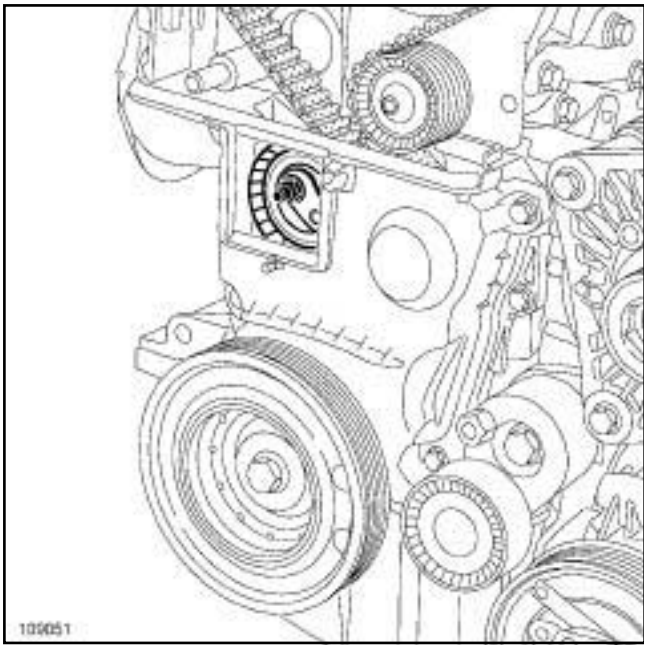
❏ Torque and angle tighten:

- the **new bolt of the crankshaft accessories pulley (40 N.m + 145° ± 15°)**,
- the **nut of each camshaft sprocket (30 N.m + 84° ± 4°)**.

109052

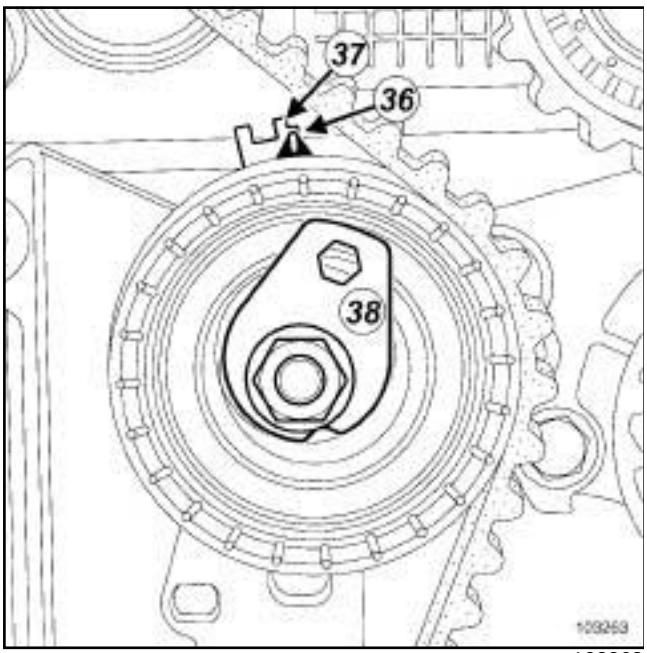
❏ Remove:

- the timing flap from the lower timing cover,
- the lifting eye bolt from the **(Mot. 1496)**,
- the **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the tool **(Mot. 1489)** from the cylinder block,
- the **(Mot. 1490-01)**.



4 - Checking the tension

❏ Rotate the crankshaft twice clockwise at the timing end and before aligning the marks made previously by the operator (on the camshaft dephaser), screw the tool **(Mot. 1489)** into the cylinder block.



❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

❏ Remove the tool **(Mot. 1489)** from the cylinder block.

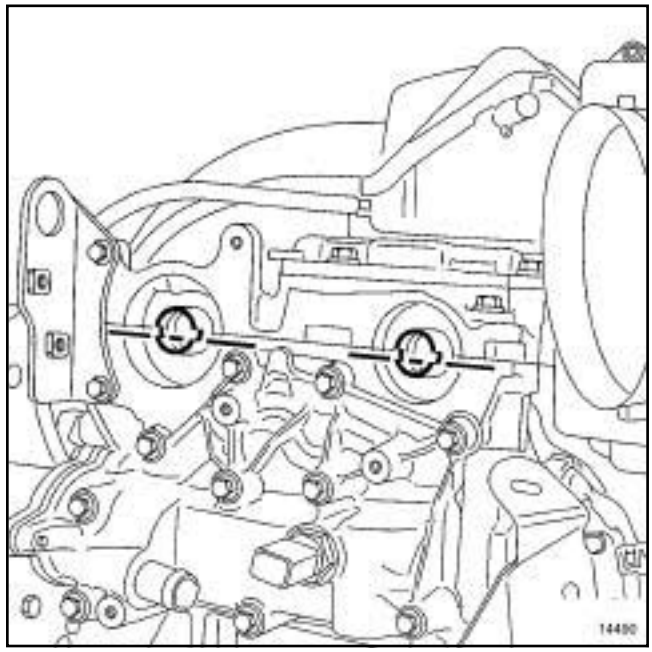
K4J

109051

103263

❏ Check that the adjustable index (**36**) is opposite the notch (**37**) , if this is not the case:

- loosen the timing tensioning roller nut by up to one turn while holding the eccentric with an Allen key,
- gradually move the adjustable index marker (**36**) opposite the mark (**37**) turning the eccentric cam (**38**) clockwise.



❏ Torque tighten the **timing tensioning roller nut (27 N.m)**.

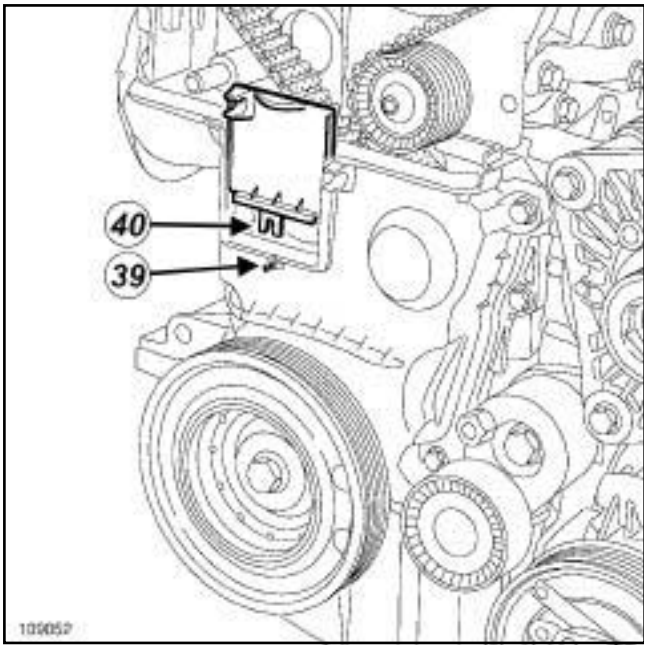
5 - Checking the timing

❏ Ensure that the index and the notch on the timing tensioning roller are in the correct position before checking the timing.

❏ Screw tool **(Mot. 1489)** into the cylinder block.

❏ Move the crankshaft slowly and smoothly until it comes into contact with the tool **(Mot. 1489)**.

14490



❏ Position (without forcing) the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)** (the camshaft end grooves must be horizontal and offset downwards).

Note:

If the tool **(Mot. 1496)** equipped with the tool **(Mot. 1750)** cannot be engaged, readjust the timing and the tension.

❏ Remove:

- the timing tool **(Mot. 1496)** fitted with the **(Mot. 1750)**,
- the **(Mot. 1489)** from the cylinder block.

❏ Refit the lower timing cover flap, checking that the locating pin (**39**) fits properly in the notch (**40**) .

III - FINAL OPERATION

❏ Refit:

- a new inlet camshaft plug using the **(Mot. 1487)**,
- a new exhaust camshaft plug using the tool **(Mot. 1488)**.

❏ Apply a drop of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the thread of the TDC pin plug.

❏ Tighten to torque the **TDC pin plug (20 N.m)**.

❏ Refit the upper timing cover.

❏ Torque tighten:

- the **upper timing cover bolts (46 N.m)**,
- the **upper timing cover nuts (46 N.m)**.

❏ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Refit:

- the engine wiring,
- the lifting eye on the flywheel end,
- the dipstick guide.

❏ Torque tighten:

- the **dipstick guide tube bolt (10 N.m)**,
- the **flywheel end lifting eye bolts (10 N.m)**.

❏ Clip on the lifting eye connector.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the air inlet duct,
- the air inlet duct clips,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

F4R

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1453-01	Additional handle nut for engine lifting support tool Mot. 1453.
Mot. 1672	Lower engine support.
Mot. 1054	TDC setting pin.
Mot. 1496	Camshaft timing tool.
Mot. 1801	Camshaft sprocket locking tool F4 engines.
Mot. 1509-01	Adapter kit for tool Mot.1509 or Mot.1801
Mot. 1487	Tool for refitting camshaft covers (57 mm diameter).
Mot. 1488	Tool for refitting camshaft covers (43 mm diameter).

Tightening torques ▽	
toothed sprocket nuts	**80 N.m**
fixed roller bolt	**50 N.m**
tensioning roller nut	**7 N.m**
toothed sprocket nuts	**80 N.m**
old inlet camshaft dephaser bolt	**30 N.m**
old exhaust camshaft pulley nut	**30 N.m**
tensioning roller nut	**32 N.m**
toothed sprocket nuts	**80 N.m**
new inlet camshaft dephaser bolt	**30 N.m**
new exhaust camshaft pulley nut	**30 N.m**
new inlet camshaft dephaser bolt	**90 N.m**
inlet camshaft dephaser pulley blanking cover	**15 N.m**

Tightening torques ▽	
new exhaust camshaft pulley nut	**86° ± 6°**
lower timing cover bolts	**9 N.m**
upper timing cover bolts	**38 N.m**
new bolt on the crankshaft accessories pulley	**40 N.m + 110° ± 10°**

WARNING

Do not run the engine without the accessories belt to avoid damaging the crankshaft accessories pulley.

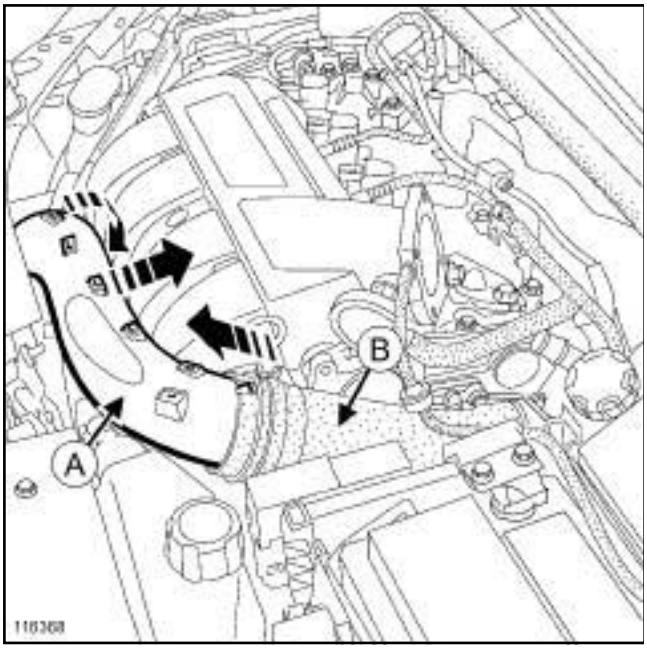
Note:

Two different engine support tools can be used to remove the right-hand suspended engine mounting:

- the **(Mot. 1453)** fitted with the **(Mot. 1453-01)** used only for standard removal and refitting of the timing belt,
- the **(Mot. 1672)** used for removing and refitting the timing belt followed by removal and refitting of the cylinder head, which releases the lifting eyes for the cylinder head to be removed.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

F4R

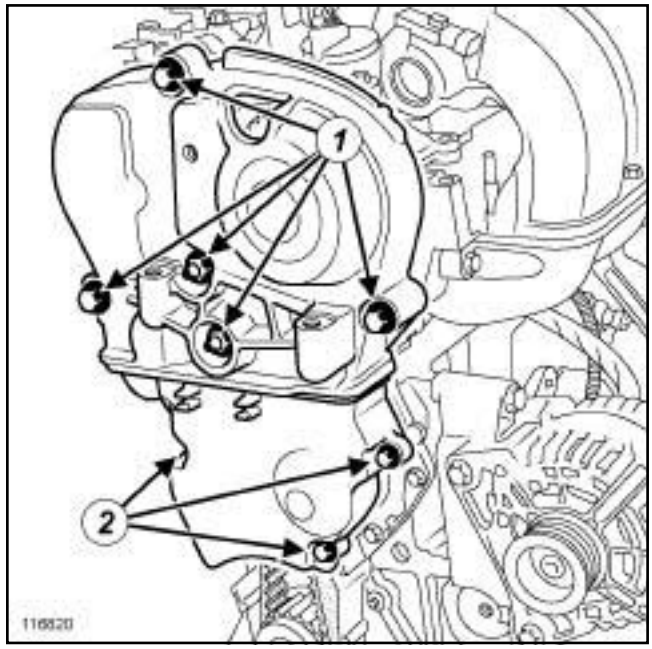
116368

❏ Remove the air inlet duct (**A**) :

- unclip it from the front end panel,
- turn it and disconnect it.

❏ Disconnect the duct (**B**) :

- from the air resonator,
- from the air filter unit.

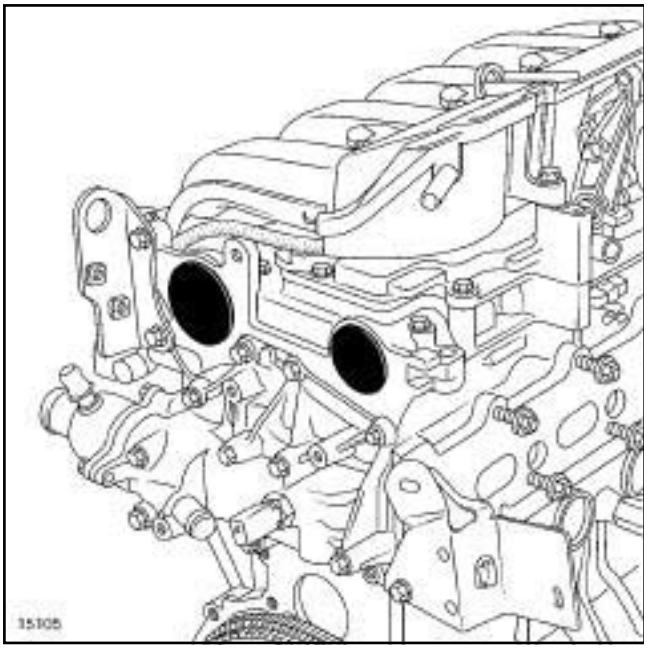


❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner on the front bumper side (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the engine undertray.

❏ Remove the crankshaft accessories pulley, locking the flywheel with a screwdriver.

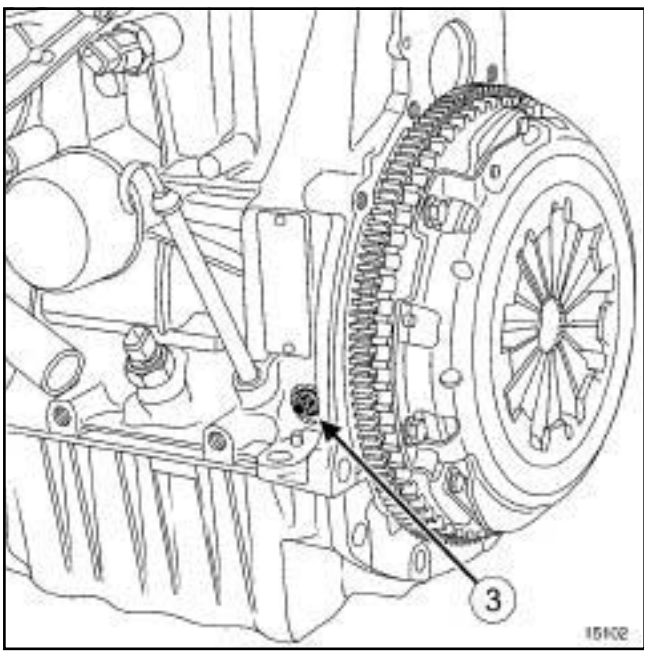
❏ Fit the timing end lifting eye (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .



❏ Fit the **(Mot. 1453)** with the **(Mot. 1453-01)** and with retaining belts.

116820

❏ Remove:



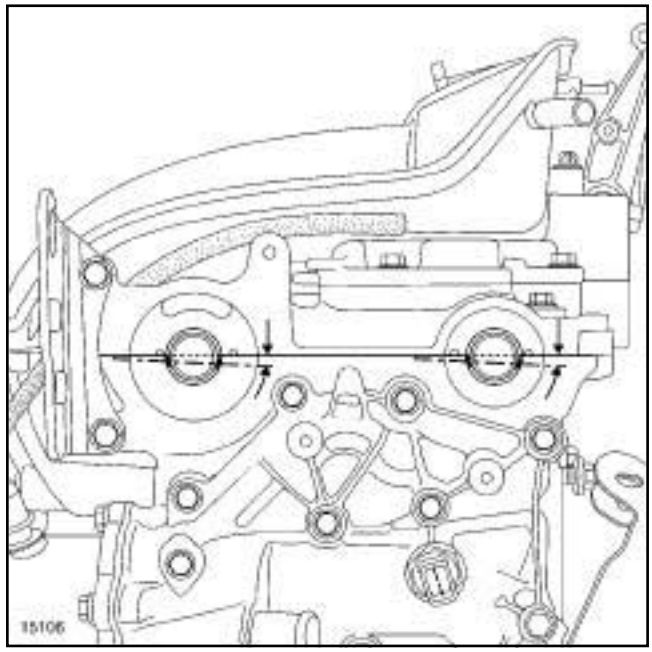
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the nuts and bolts (**1**) on the upper timing cover,
- the upper timing cover,
- the bolts (**2**) on the lower timing cover,
- the lower timing cover.

15105

❏ Use a screwdriver to make a hole in the middle of the camshaft sealing plugs.

❏ Remove the camshaft sealing plugs.

15102



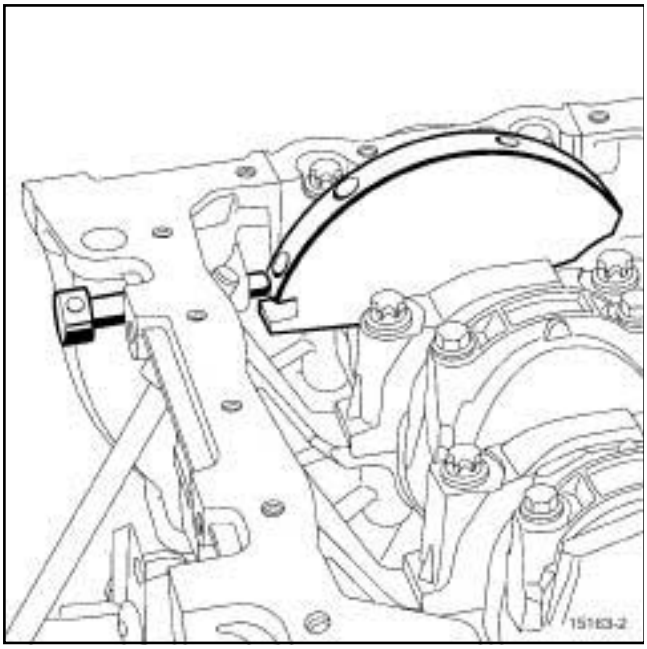
❏ Remove the TDC setting pin plug (**3**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - ADJUSTING THE TIMING

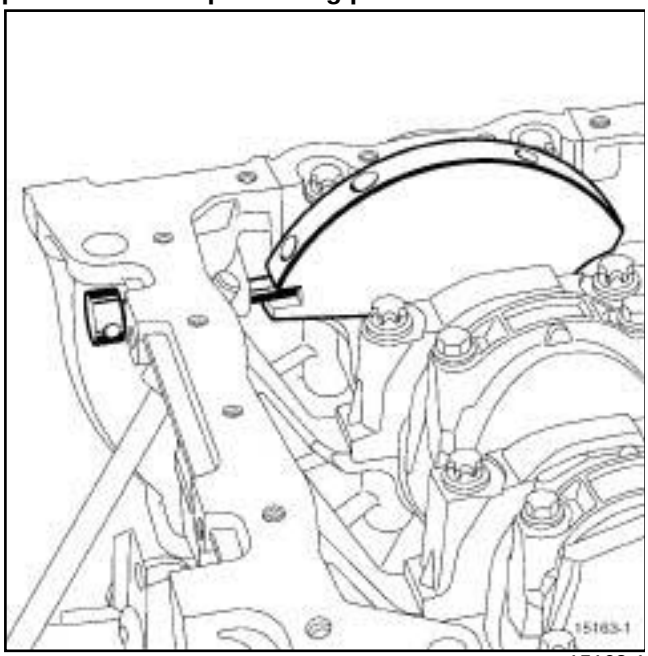
❏ Refit:

- the crankshaft accessories pulley,
- the crankshaft accessories pulley bolt.



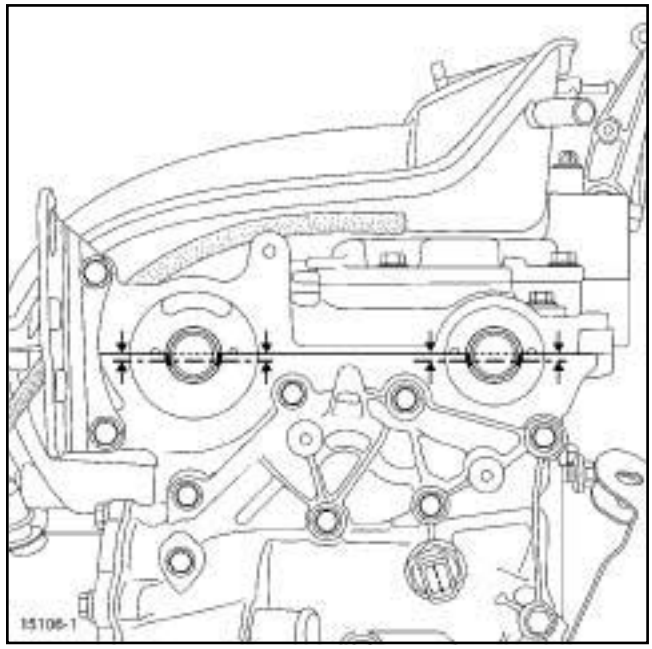
15106

❏ Rotate the engine clockwise (timing end) so that the camshaft grooves are offset below the centre line and almost horizontal.



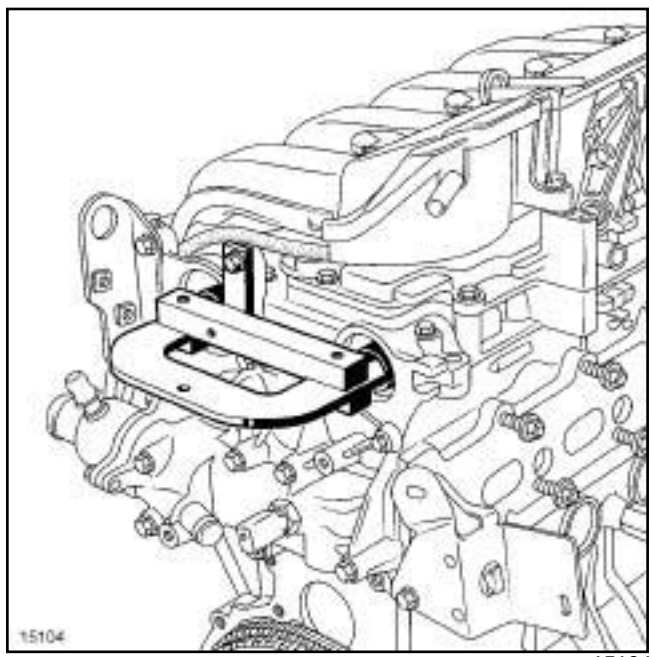
F4R

position of TDC pin before setting point



15163-2

position of TDC pin setting point



15163-1

❏ Insert the TDC setting pin **(Mot. 1054)** and rotate the engine slightly clockwise (timing end) until the setting point is reached.

15106-1

❏ At the setting point the camshaft grooves must be horizontal and offset below the centre line.

15104

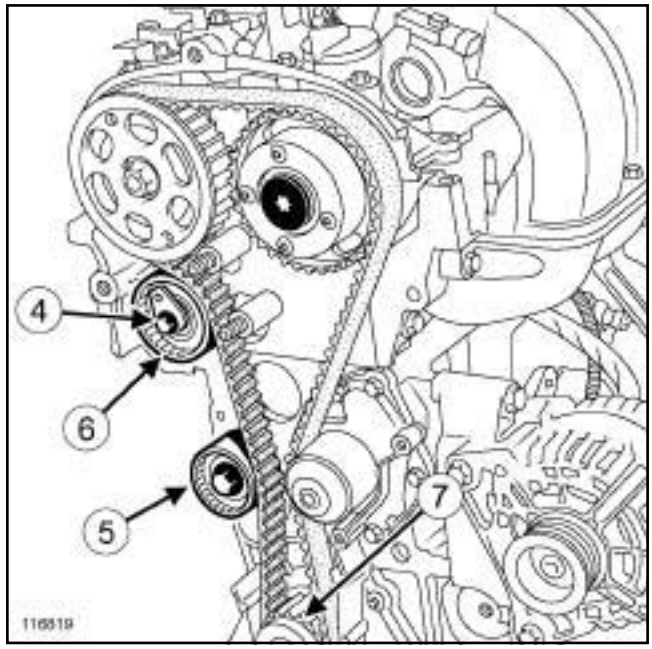
❏ Fit the **(Mot. 1496)** onto the ends of the camshafts.

❏ Remove:

- the crankshaft accessories pulley bolt,
- the crankshaft accessories pulley.

F4R

2 - REMOVING THE TIMING BELT



❑

WARNING
Never turn the engine against its operating direction.

WARNING
The belt must be replaced with a new one if it has been removed.

WARNING
When replacing the belt, be sure to replace the tensioning rollers and fixed rollers.

Note:
Always replace the inlet camshaft dephaser bolt and the exhaust camshaft pulley nut after checking the tension of the timing belt.

116819

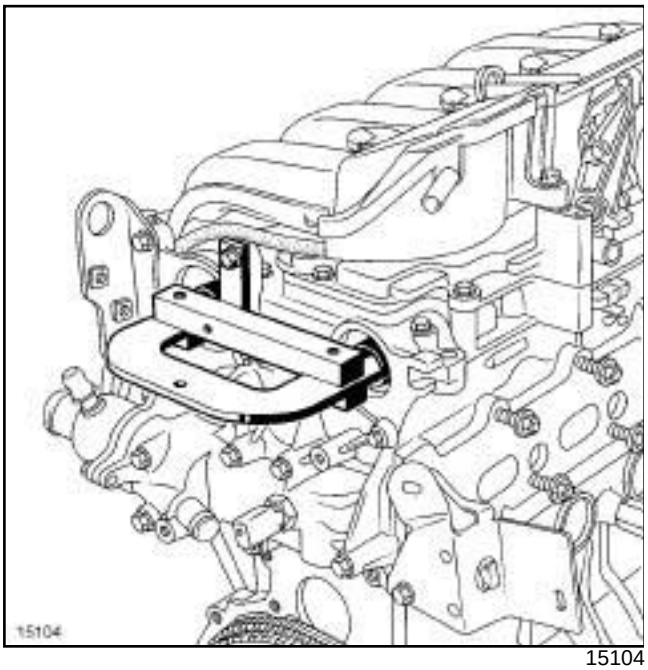
❑ Slacken the timing belt by undoing the tensioning roller nut (**4**) .

❑ Remove:

- the fixed roller (**5**) fitted with its bolt and spacer,
- the timing belt,
- the tensioning roller (**6**) fitted with its nut,
- the crankshaft sprocket (**7**) ,

❑ Check that the ring of the camshaft dephaser is correctly locked (no rotation of the ring to the left or to the right); if it is not, replace the inlet camshaft dephaser.

❑

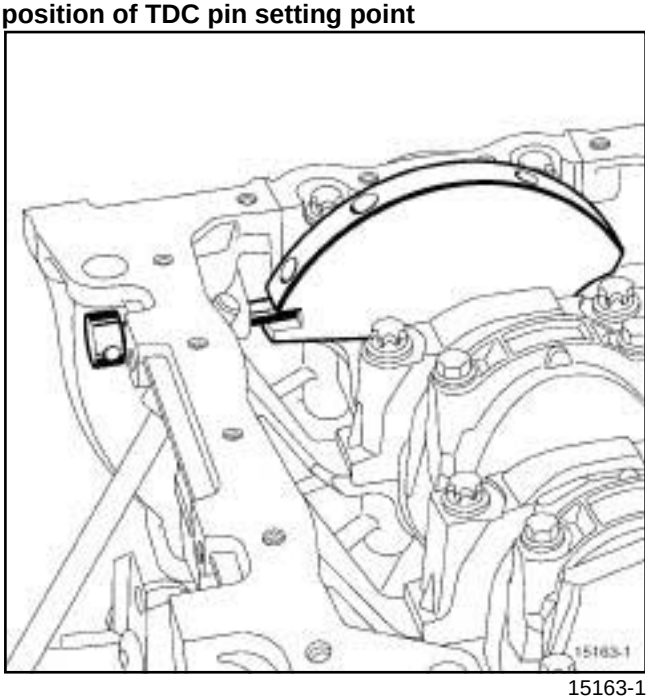


Note:
If the inlet camshaft dephaser must be removed, follow the removal-refitting procedure for the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) . Always lock the inlet camshaft dephaser when replacing it.

F4R

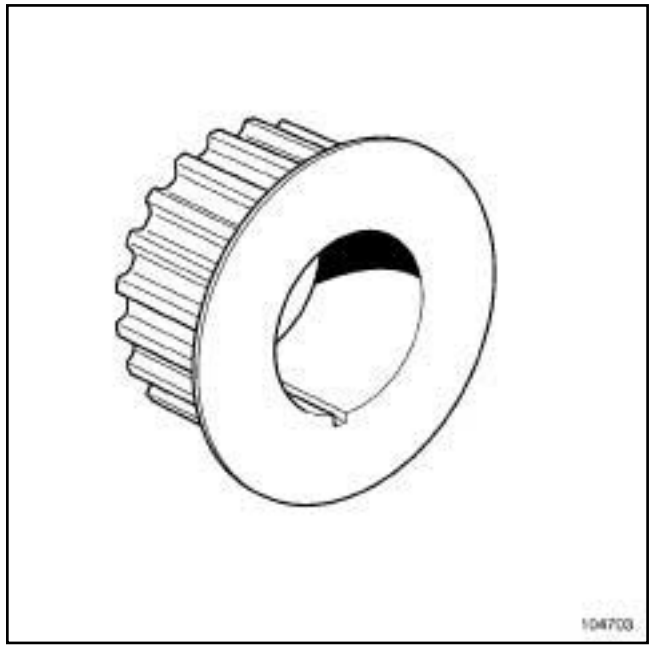
REFITTING

I - OPERATION FOR REFITTING THE TIMING BELT



1 - ADJUSTING THE TIMING

15104



❑ Check that camshaft setting tool **(Mot. 1496)** is still in place.

position of TDC pin setting point

15163-1

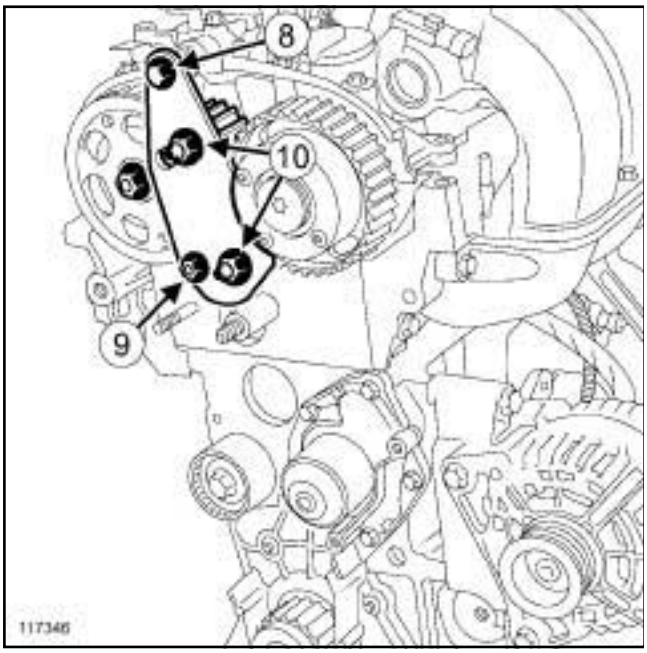
❑ Check that the TDC pin **(Mot. 1054)** is still in place and that the crankshaft is set.

104703

❑

WARNING

Always degrease:



- the end of the crankshaft (timing end),
- the timing sprocket bore and contact surfaces,
- the bearing faces of the crankshaft accessories pulley.

This is to avoid timing slippage.

This slippage causes engine damage.

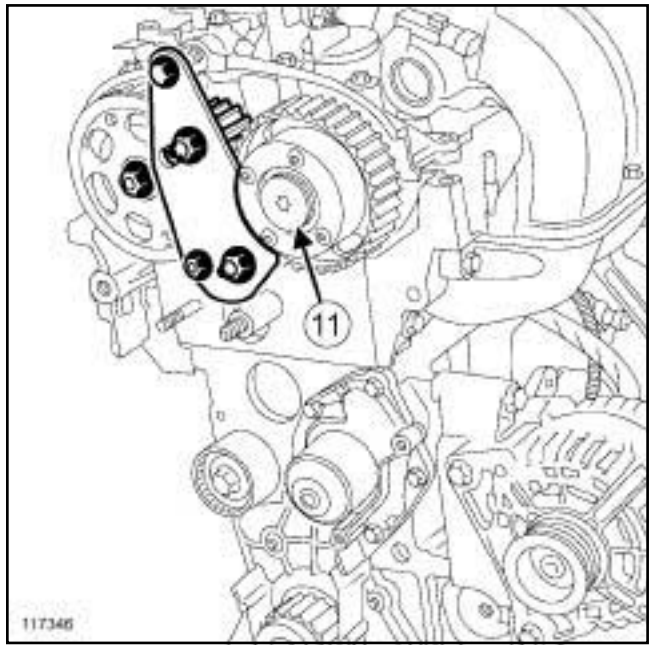
F4R

2 - TIMING BELT REFITTING PREPARATION OPERATION

117346

❏ Fit:

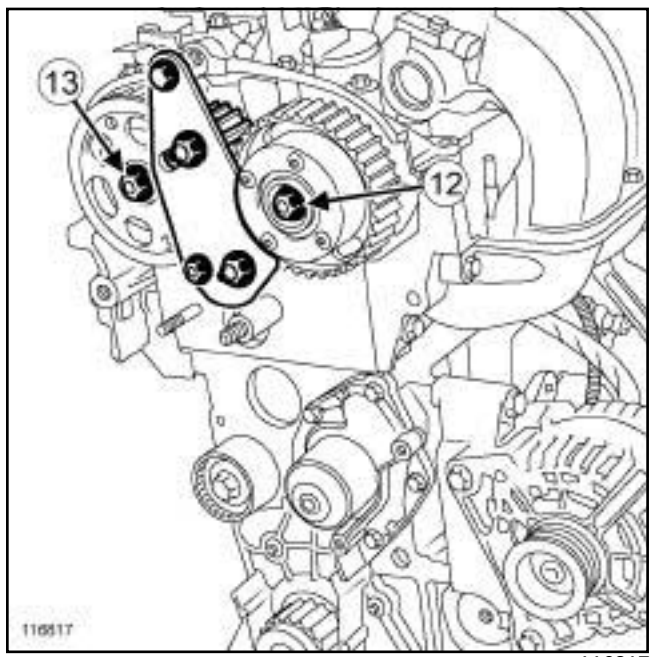
- the **(Mot. 1801)** fitted with the sprocket **(Mot. 1509-01)**,
- the upper bolt (**8**) on the upper timing cover and the collar nut (**9**) .



❏ Tighten the upper bolt on the upper timing cover and the collar nut.

❏ Bring the toothed sprockets of the tool into contact with the camshaft pulleys.

❏ Torque tighten the **toothed sprocket nuts (80 N.m)** (**10**) .



Note:

Beware of oil running out when removing the blanking cover from the camshaft dephaser and when removing the camshaft dephaser.

117346

❏ Remove the inlet camshaft dephaser blanking cover (**11**) .

116817

❏ Release by a single turn:

- the old inlet camshaft dephaser bolt (**12**) ,
- the old exhaust camshaft pulley nut (**13**) .

❏ Remove the **(Mot. 1801)** fitted with sprocket **(Mot. 1509-01)**.

F4R

3 - REFITTING THE TIMING BELT

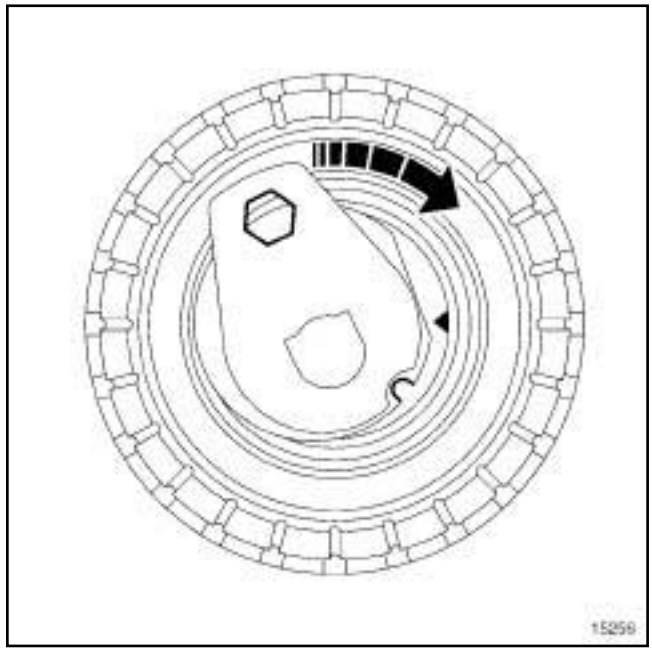
❑

WARNING
Never turn the engine against its operating direction.

WARNING
The belt must be replaced with a new one if it has been removed.

WARNING
When replacing the belt, be sure to replace the tensioning rollers and fixed rollers.

Note:
Always replace the inlet camshaft dephaser bolt and the exhaust camshaft pulley nut after checking the tension of the timing belt.



❑ Refit:
- the timing sprocket on the crankshaft,
- the new tensioning roller.

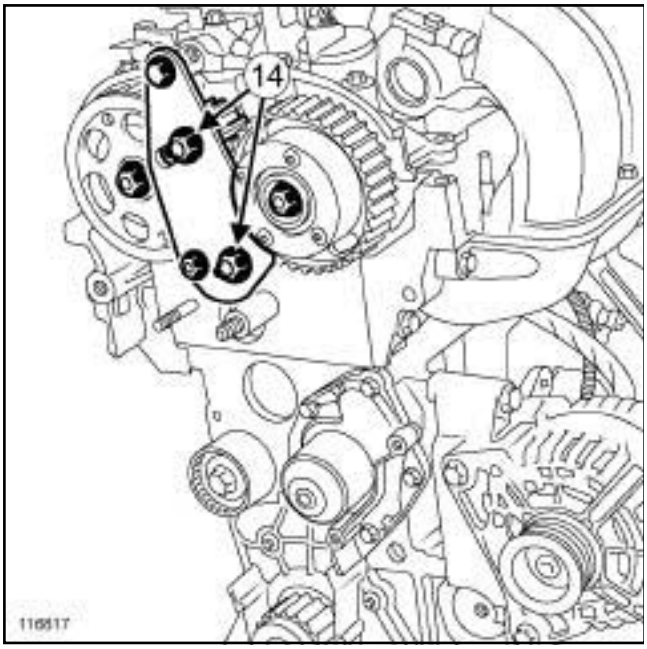
Note:
Ensure that the **(Mot. 1496)** is correctly fitted and that the inlet camshaft dephaser and the exhaust camshaft pulley can rotate freely so that the timing belt tension is correct.

❑ Refit:
- the new timing belt,
- the new fixed roller.

❑ Torque tighten the **fixed roller bolt (50 N.m)**.

4 - BELT TENSION

15256



❑

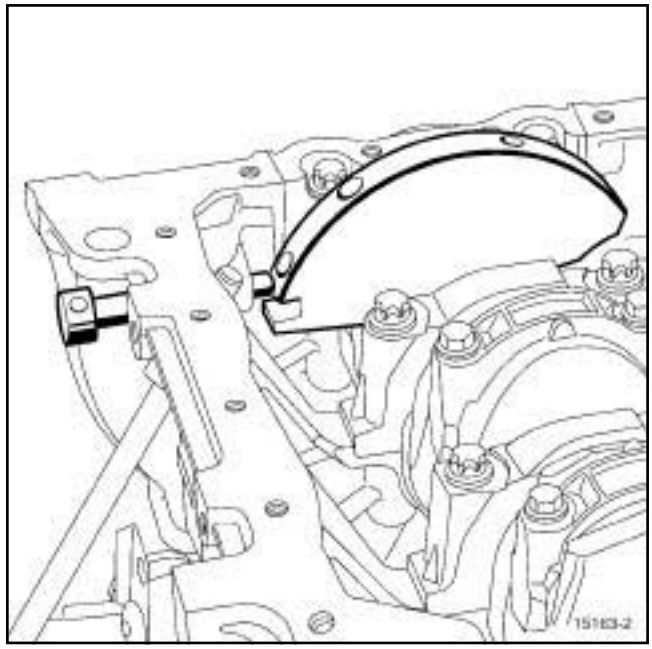
Note:
When tightening the tensioning roller, use a 6mm Allen key to stop the roller moving during the operation.

❑ Align the marks on the tensioning roller using a **6mm** Allen key.

❑ Torque tighten the **tensioning roller nut (7 N.m)**.

F4R

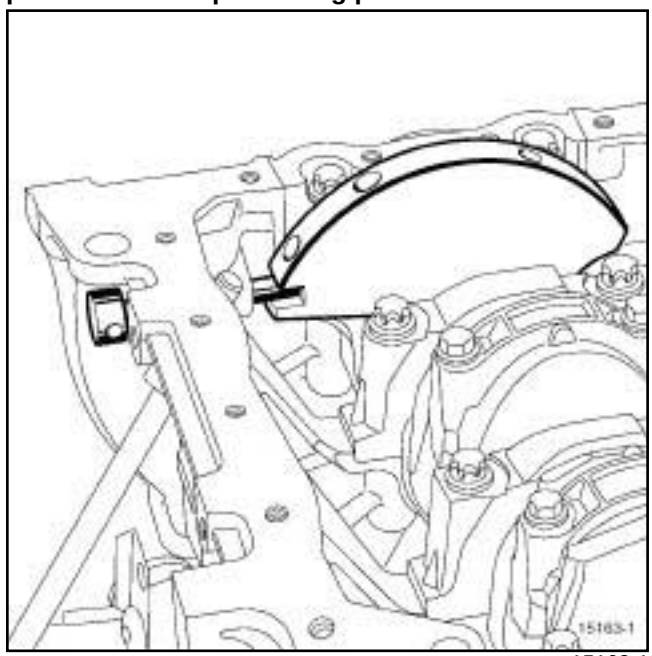
116817



- ❏ Fit the **(Mot. 1801)** fitted with the sprocket **(Mot. 1509-01)**.
- ❏ Bring the upper bolt on the upper timing cover into contact with the collar nut.
- ❏ Tighten the upper bolt on the upper timing cover and the collar nut.
- ❏ Bring the sprockets into contact with the camshaft pulleys.
- ❏ Tighten to torque:
  - the **toothed sprocket nuts (80 N.m)** (**14**) ,
  - the **old inlet camshaft dephaser bolt (30 N.m)**,
  - the **old exhaust camshaft pulley nut (30 N.m)**.
- ❏ Remove the **(Mot. 1801)**.
- ❏ Remove:
  - the TDC setting pin **(Mot. 1054)**,
  - the camshaft setting tool **(Mot. 1496)**.

5 - CHECKING THE TIMING AND THE TENSION OF THE TIMING BELT

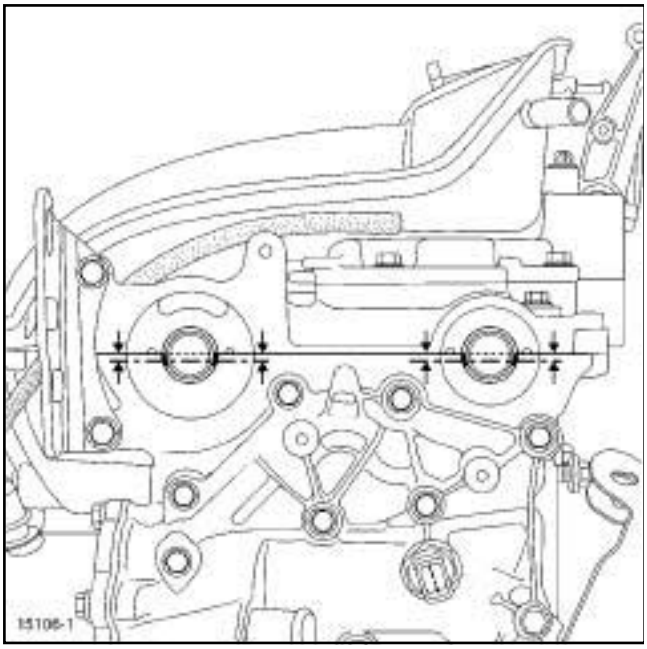
a - Checking the timing



- ❏ Refit:
  - the crankshaft accessories pulley,
  - the new crankshaft accessories pulley bolt.

position of TDC pin before setting point

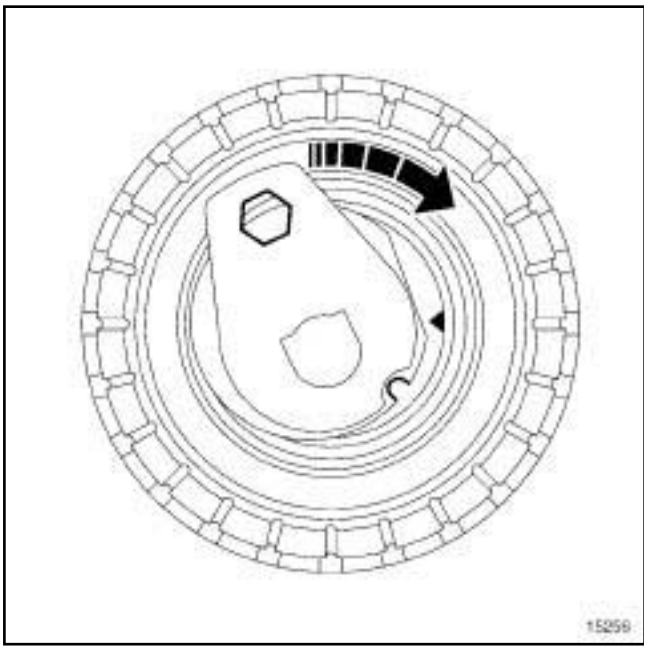
15163-2



position of TDC pin setting point

15163-1

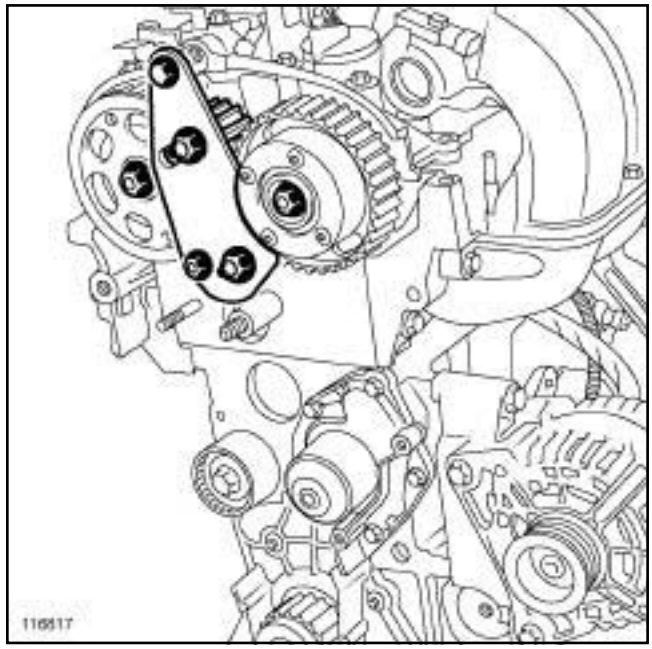
- ❏ Rotate the crankshaft clockwise by two turns (timing end), and before the end of the two turns insert the TDC pin **(Mot. 1054)** then move the crankshaft to its setting point.



position of camshaft setting point

15106-1

❑ Fit the camshaft setting tool **(Mot. 1496)** (without forcing it).



b - Checking the tension

15256

❑ After the engine has been rotated twice, check that the tensioning roller marks are correctly aligned; if they are not aligned return to the timing belt tension step.

❑ Torque tighten the **tensioning roller nut (32 N.m)**.

116817

❑ Position the **(Mot. 1801)**.

❑ Bring the upper bolt on the upper timing cover into contact with the collar nut.

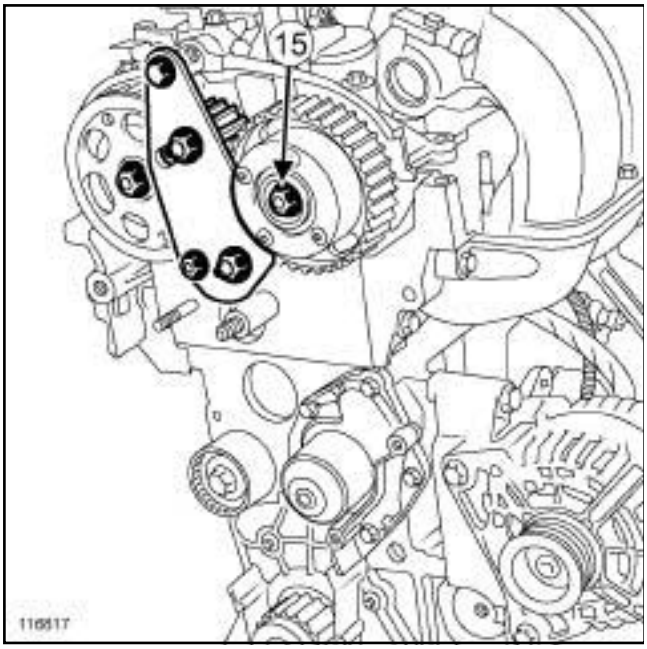
❑ Tighten the upper bolt on the upper timing cover and the collar nut.

❑ Bring the sprockets into contact with the camshaft pulleys.

❑ Torque tighten the **toothed sprocket nuts (80 N.m)**.

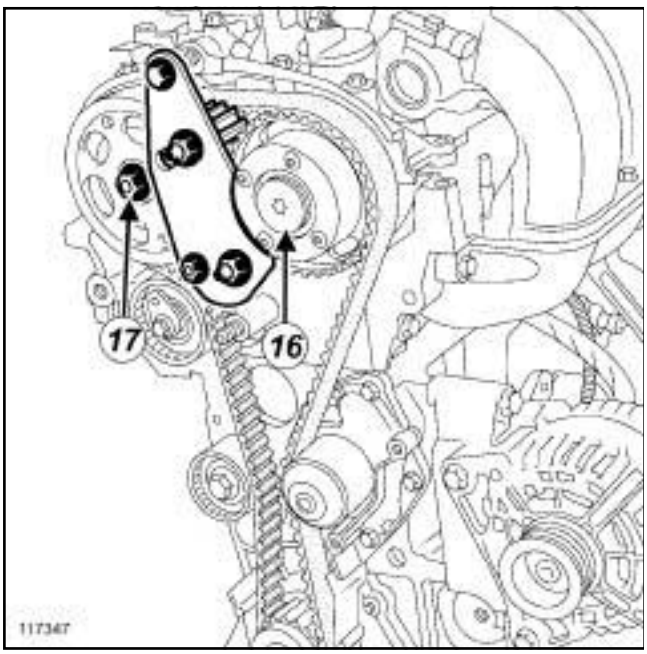
❑ Undo:

- the old inlet camshaft dephaser pulley mounting bolt,
- the old exhaust camshaft pulley nut.



❑ Fit without tightening:

- the new inlet camshaft dephaser bolt,
- the new exhaust camshaft pulley nut.



❑ Tighten to torque:

- the **new inlet camshaft dephaser bolt (30 N.m)**,
- the **new exhaust camshaft pulley nut (30 N.m)**.

F4R

116817

117347

❏ Remove the camshaft setting tool **(Mot. 1496)**.

❏ Tighten to torque:

- the **new inlet camshaft dephaser bolt (90 N.m)** (**15**) ,
- the **inlet camshaft dephaser pulley blanking cover (15 N.m)** (**16**) .

❏ Tighten to angle the **new exhaust camshaft pulley nut (86° ± 6°)** (**17**) .

❏ Remove:

- the **(Mot. 1801)**,
- the TDC setting pin **(Mot. 1054)**.

❏ Refit the new sealing plugs:

- at the inlet camshaft end using the **(Mot. 1487)**,
- at the exhaust camshaft end using the **(Mot. 1488)**.

II - FINAL OPERATION.

❏ Refit:

- the crankshaft TDC pin plug applying a drop of **MASTIXO** to the threading,
- the lower timing cover,
- the lower timing cover bolts.

❏ Torque tighten the **lower timing cover bolts (9 N.m)**.

❏ Refit:

- the upper timing cover,
- the upper timing cover.

❏ Torque tighten the **upper timing cover bolts (38 N.m)**.

❏ Refit the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove the **(Mot. 1453)** fitted with the **(Mot. 1453-01)**.

❏ Remove the engine lifting eye at the timing end (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),

❏ Torque tighten the **new bolt on the crankshaft accessories pulley (40 N.m + 110° ± 10°)**.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner on the front bumper side (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),

- the engine undertray,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air inlet duct on the air resonator and the air filter unit,
- the air inlet duct by clipping it onto the front end panel.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 750 or 752

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

Equipment required
safety strap(s)
protective gloves
1/2" female torx socket (12.7 mm square drive)
hexagonal socket
roll pin punch
offset spanner
torque wrench
torque/angle wrench
cylinder head bolt tightening gauge (angular measuring type)

Tightening torques ▽	
crankshaft accessories pulley M12 bolt	**60 N.m + 100° ± 10°**
tensioning roller bolt	**27 N.m**
camshaft timing sprocket crown bolts	**14 N.m**
crankshaft accessories pulley M 14 bolt	**120 N.m + 95° ± 15°**
TDC pin plug	**25 N.m**
cylinder head suspended mounting bolts	**25 N.m**
camshaft position sensor bolt	**8 N.m**

IMPORTANT
Wear protective gloves during the operation.

WARNING
Never rotate the engine anti-clockwise (timing end).

WARNING
Do not run the engine without the accessories belt, to avoid breaking the crankshaft accessories pulley.

❑ **Parts always to be replaced**

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

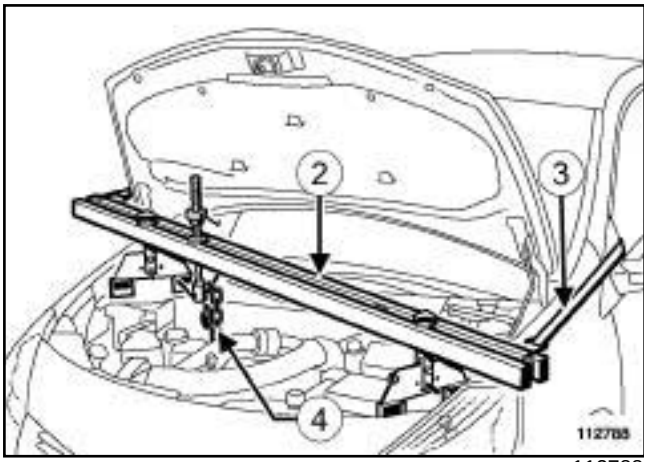
❑ **Consumables**

- Silicone adhesive sealant (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B Consumables - Products)
- Surface cleaner (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B Consumables - Products).

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.

❑ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

K9K, and 750 or 752

112788

❏ Position the **(Mot. 1453)** (**2**) and hold it in place using a **safety strap(s)** (**3**) .

❏ Fit a chain (**4**) on the lifting eye of the crankshaft end to enable the engine to be lifted using the **(Mot. 1453)**.

❏

Note:

Do not damage the air conditioning pipes.

Remove:

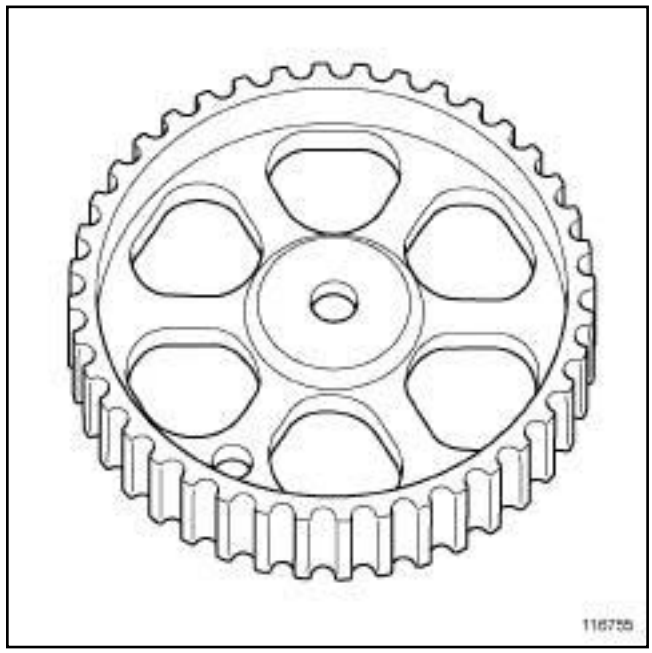
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .
- the engine undertray,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏

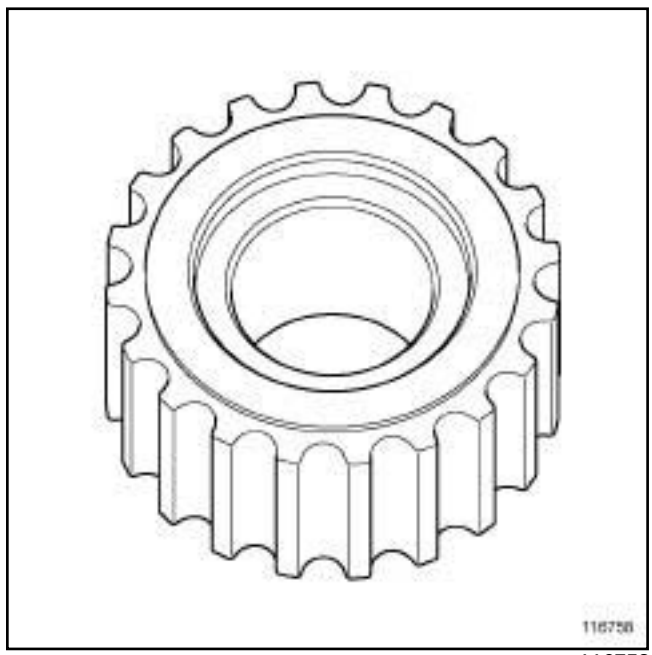
Note:

There are two types of timing belt assembly.



III - FIRST FITTING

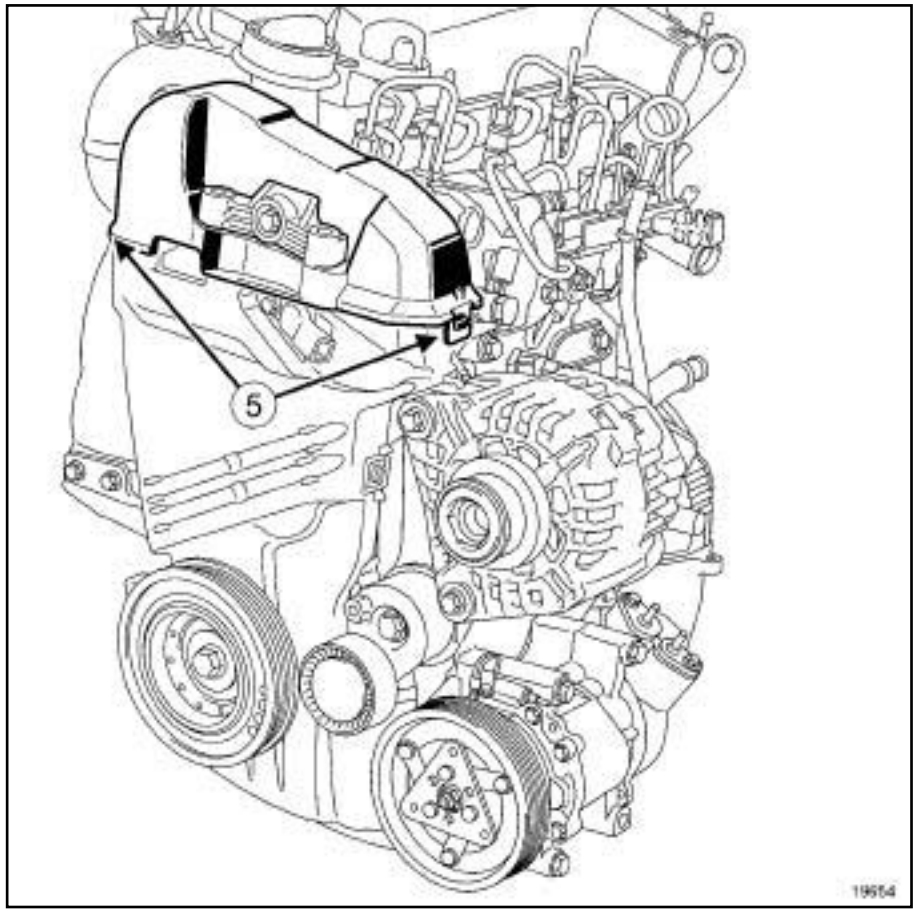
Recommendations for repair



❏

Note:

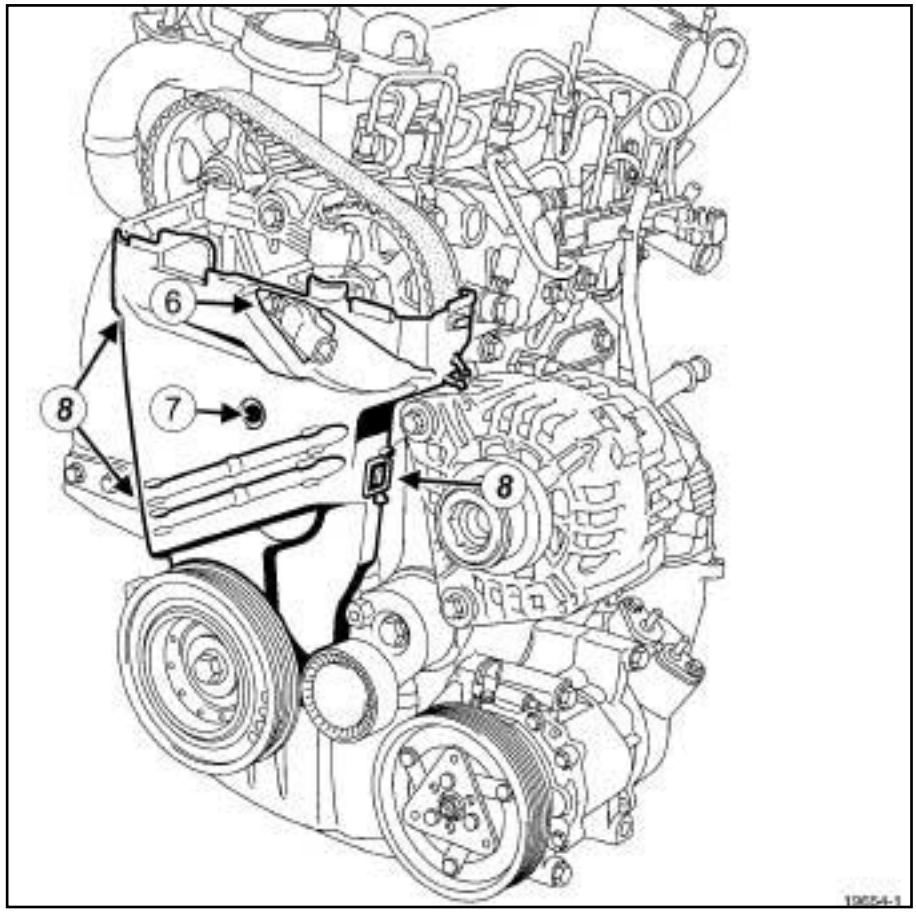
This procedure is applicable to engines manufactured up to 02/12/2005 fitted with a single unit camshaft timing sprocket and a crankshaft timing sprocket without collet.



116755

116758

❏ Wear **protective gloves** during the operation.



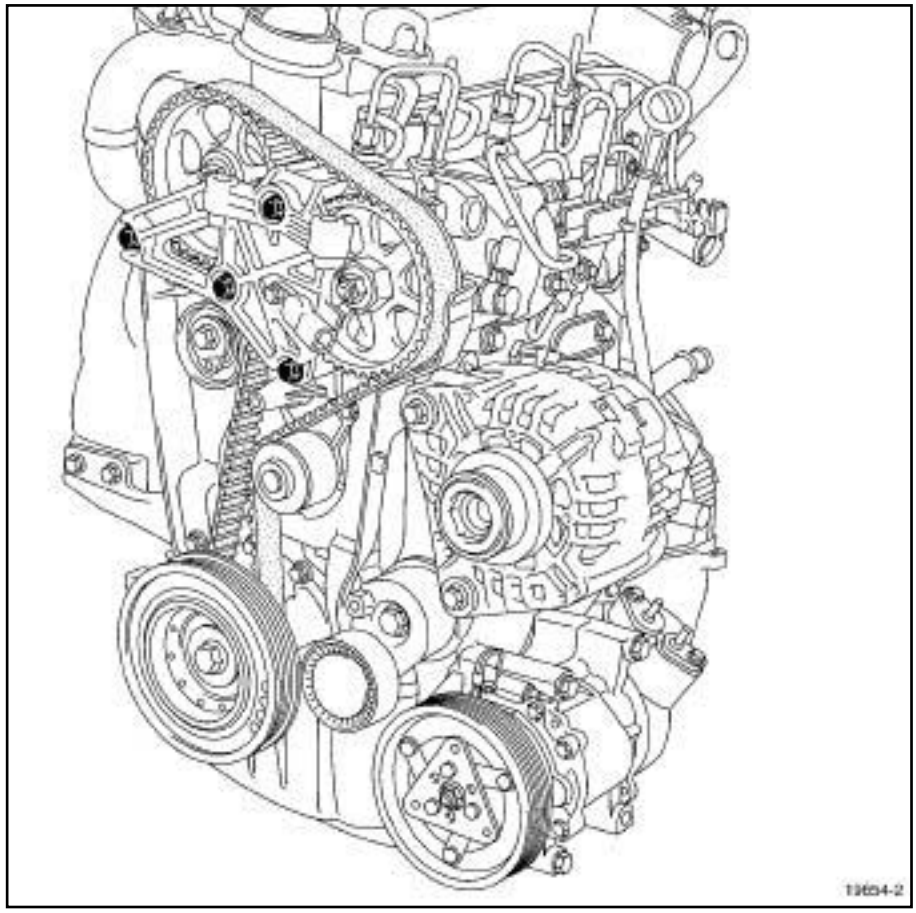
K9K, and 750 or 752

19654

❑ Remove the upper timing cover by unclipping both tabs (**5**) .

K9K, and 750 or 752

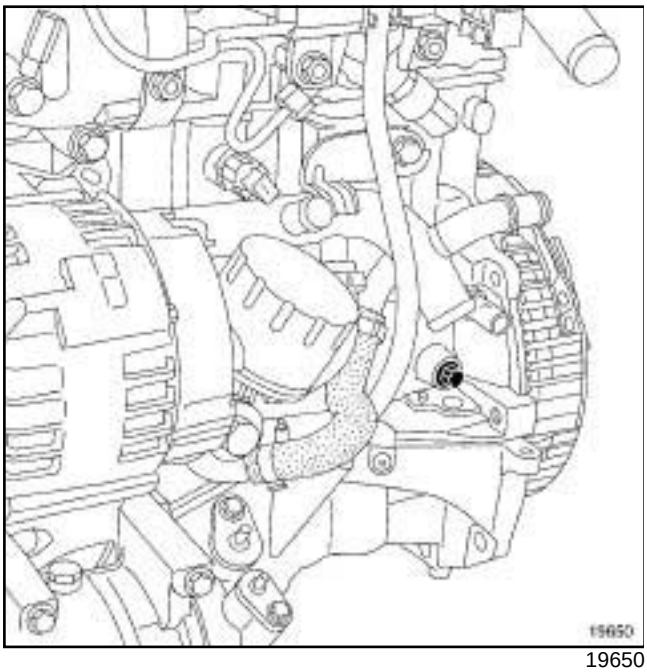
19654-1



❏ Remove:

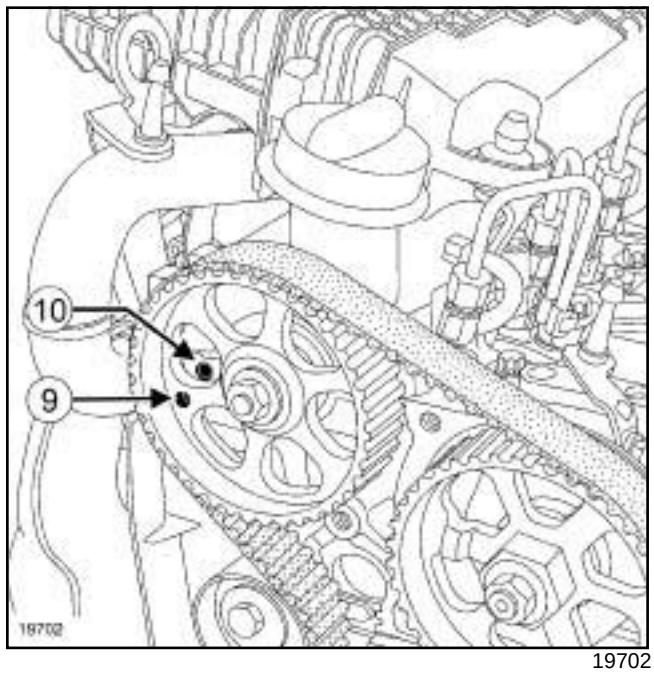
- the camshaft position sensor (**6**) ,
- the plastic bolt (**7**) .

❏ Unclip the three tabs (**8**) .



❏ Remove the lower timing cover.

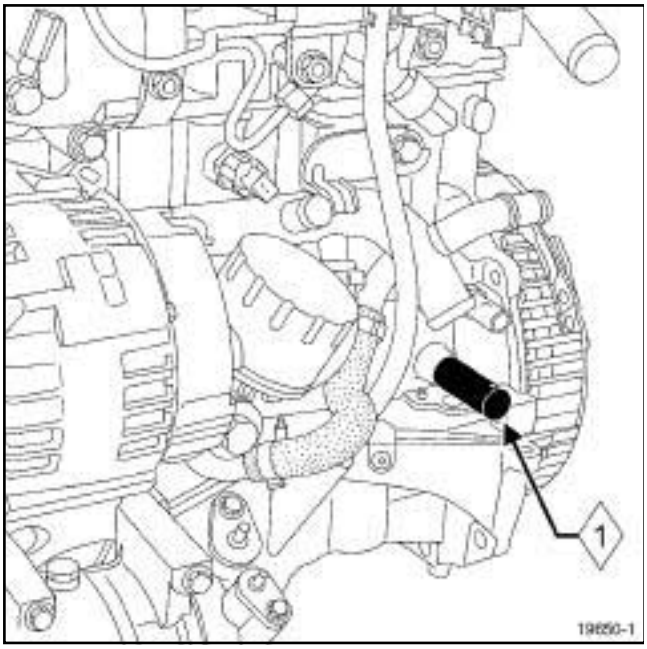
K9K, and 750 or 752



19654-2

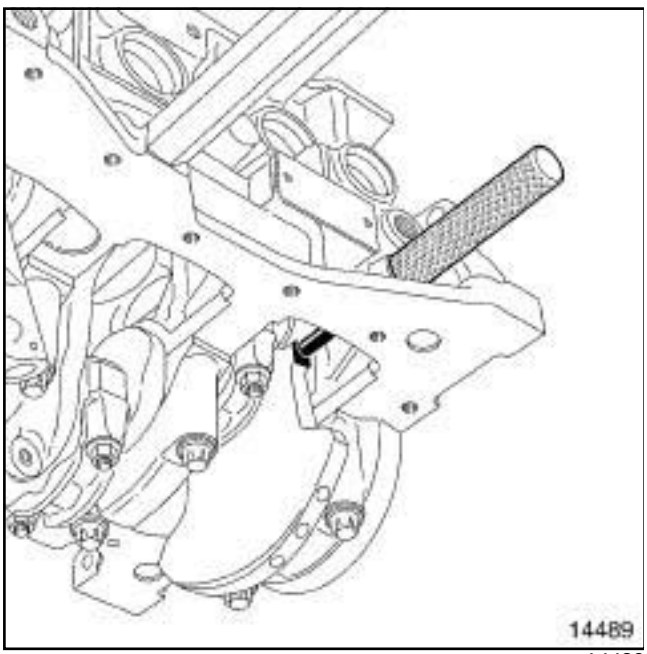
❑ Remove the cylinder head suspended mounting .

19650



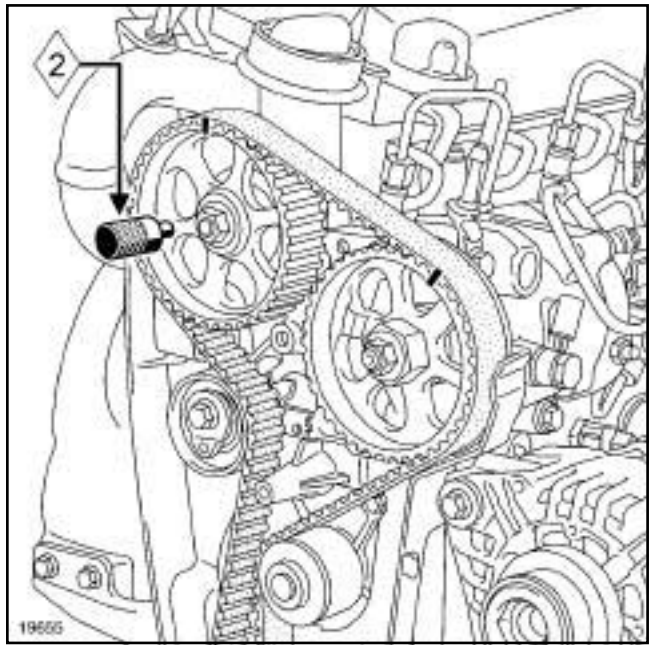
❑ Remove the TDC pin plug using a **1/2" female torx socket (12.7 mm square drive) (14)**.

19702



❑ Rotate the crankshaft clockwise (timing end) to position the hole (**9**) in the camshaft timing sprocket almost opposite the hole (**10**) in the cylinder head.

K9K, and 750 or 752

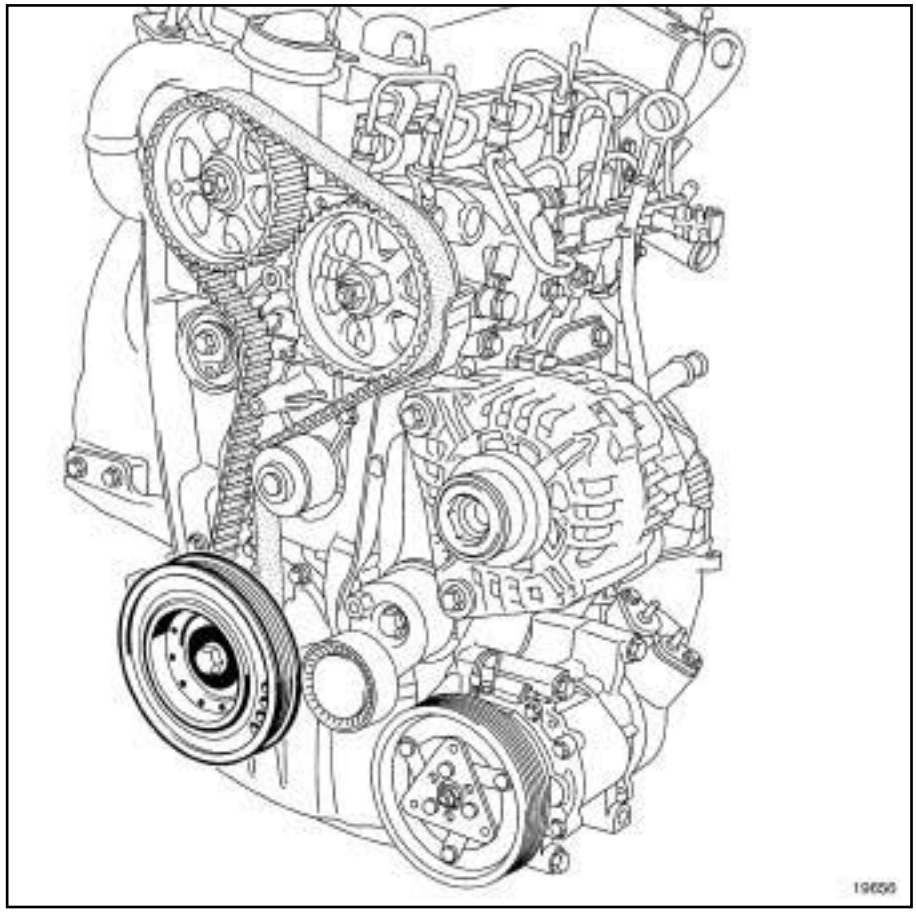


19650-1

❏ Screw in the TDC setting pin (**1**) **(Mot. 1489)**.

14489

❏ Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes in contact with the TDC setting pin.

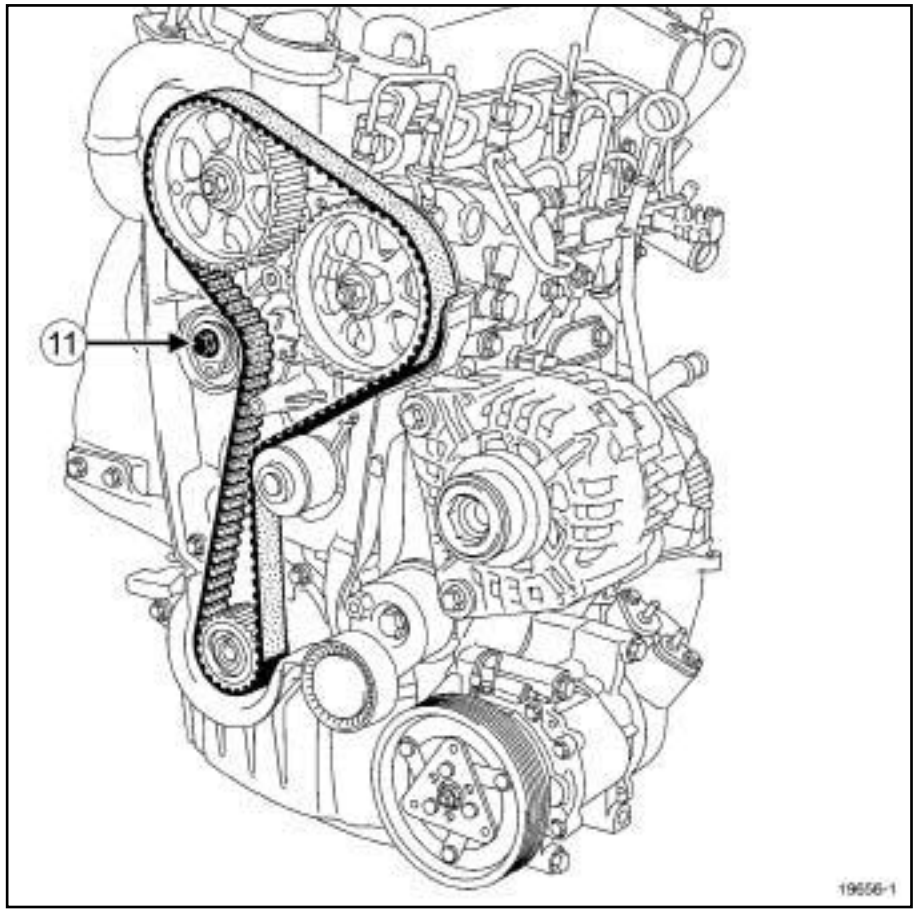


19655

❏ Engage the pin (**2**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes.

❏ Remove:

- the camshaft timing sprocket setting pin **(Mot. 1430)**,
- the TDC setting pin **(Mot. 1489)**.



K9K, and 750 or 752

19656

❏ Remove the crankshaft accessories pulley by locking the flywheel with a large flat-blade screwdriver.

K9K, and 750 or 752

19656-1

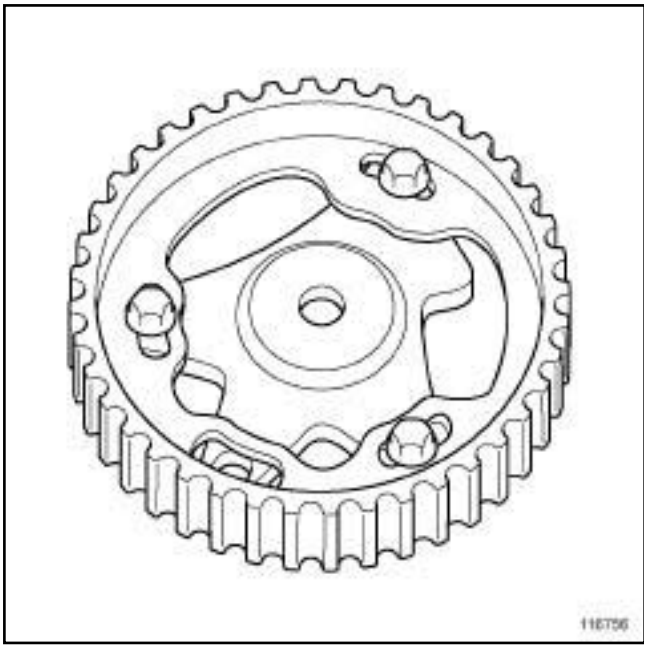
❑ Slacken the tensioning roller bolt (**11**) .

❑ Loosen the timing tension wheel by turning the eccentric using a **6 mm hexagonal socket**.

❑ Remove:

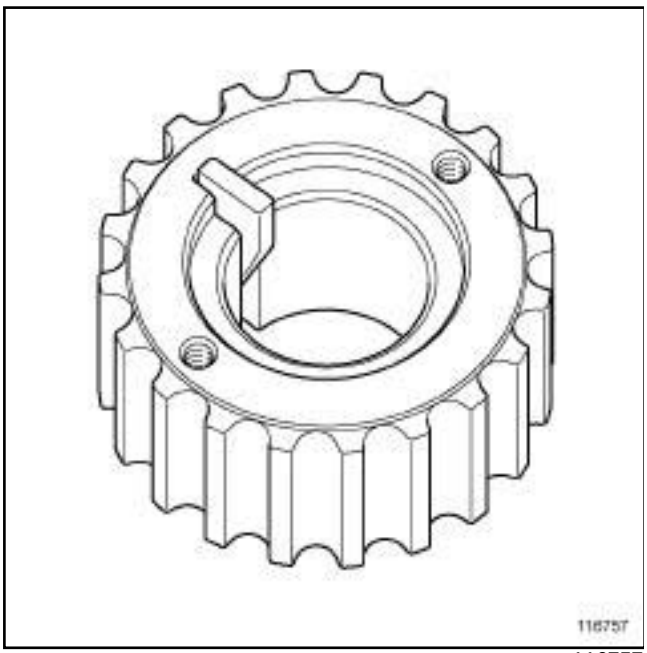
- the timing belt taking care not to let the crankshaft timing sprocket fall out,
- the timing tensioning roller,
- the timing sprocket.

IV - SECOND FITTING



Recommendations for repair

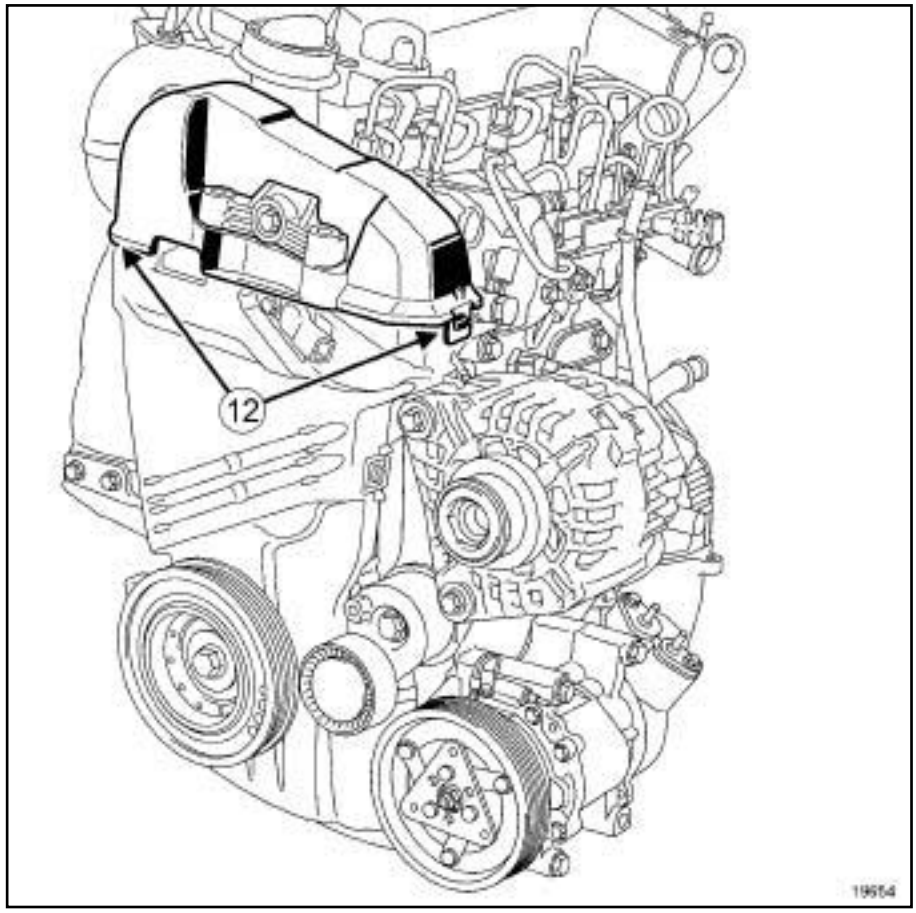
❑



Note:

This procedure is applicable to engines manufactured from 02/12/2005 fitted with a two-part camshaft timing sprocket and a crankshaft timing sprocket with collet.

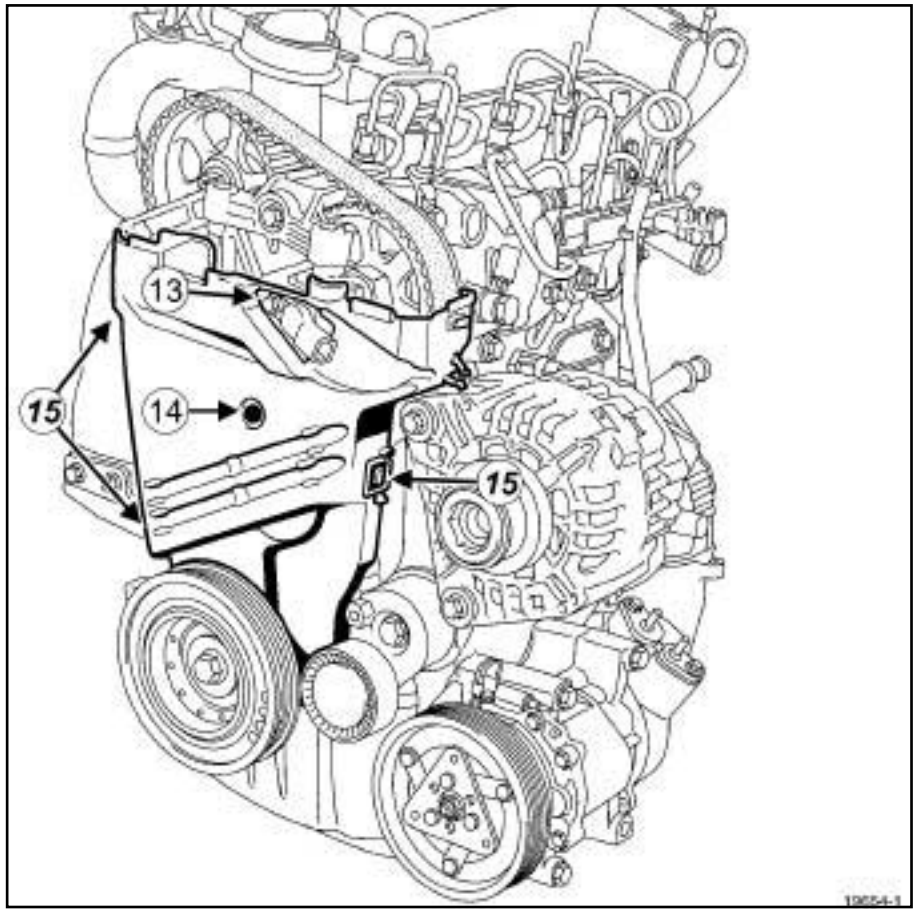
K9K, and 750 or 752



116756

116757

❑ Wear **protective gloves** during the operation.

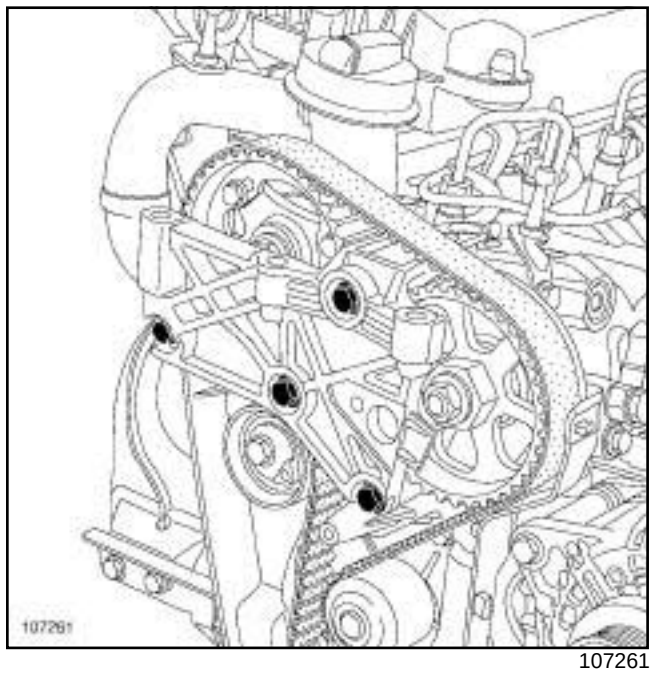


K9K, and 750 or 752

19654

❑ Remove the upper timing cover by unclipping both tabs (**12**) .

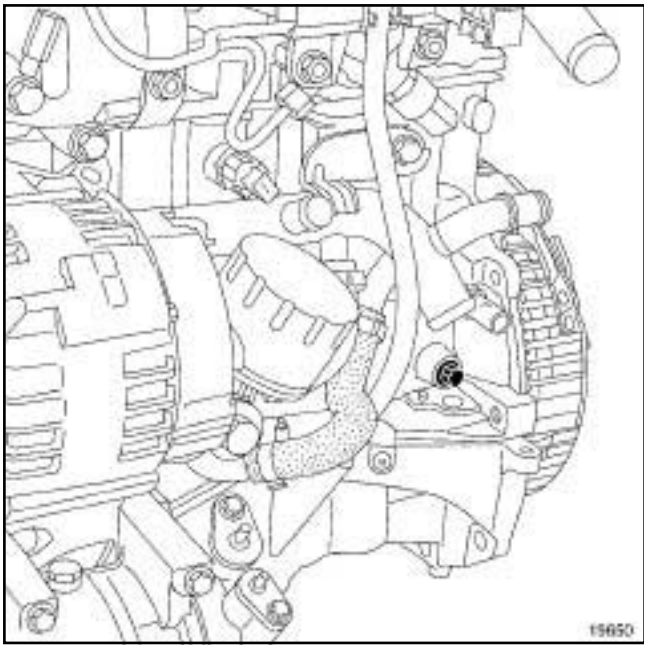
K9K, and 750 or 752



19654-1

❏ Remove:

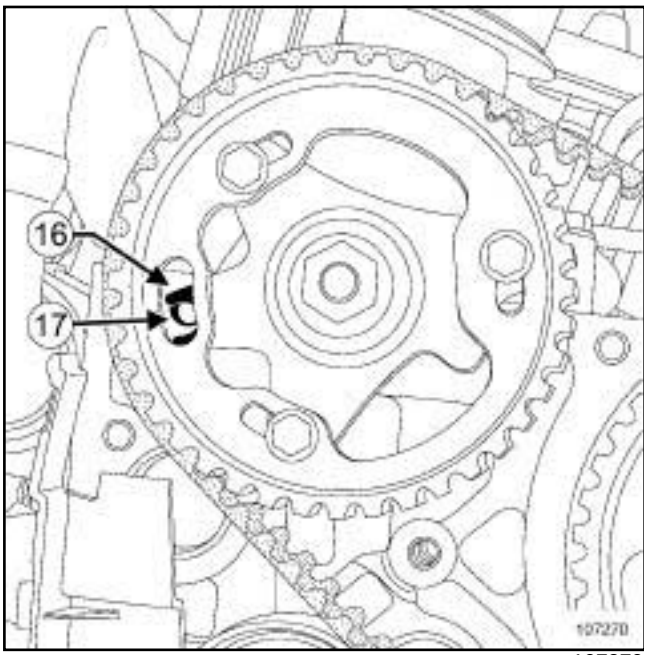
- the camshaft position sensor (**13**) ,
- the plastic bolt (**14**) .



❏ Unclip the three tabs (**15**) .

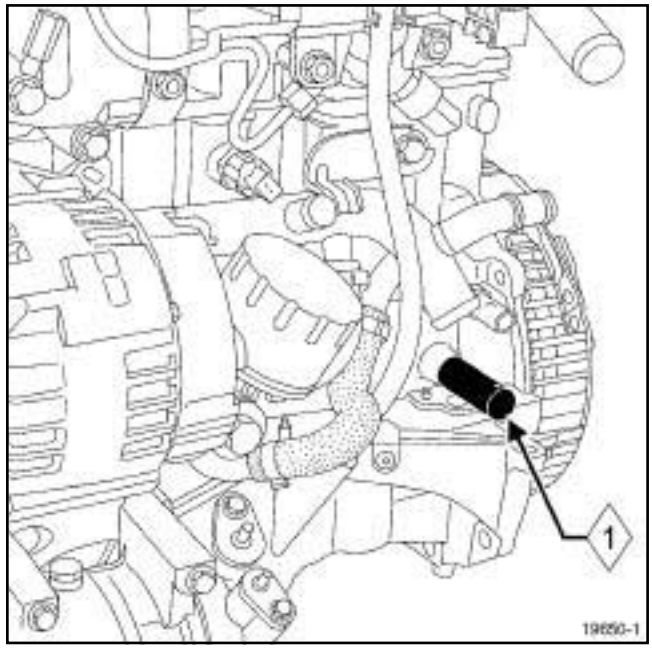
❏ Remove the lower timing cover.

107261



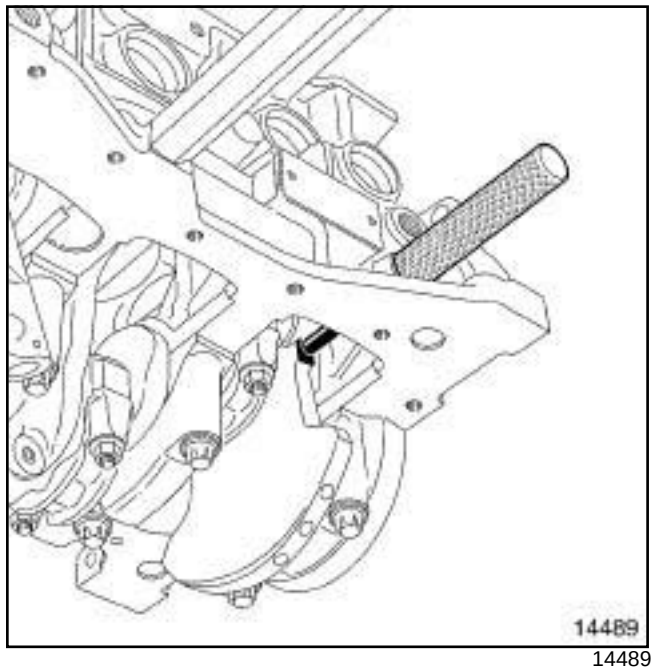
❏ Remove the cylinder head suspended mounting .

K9K, and 750 or 752



19650

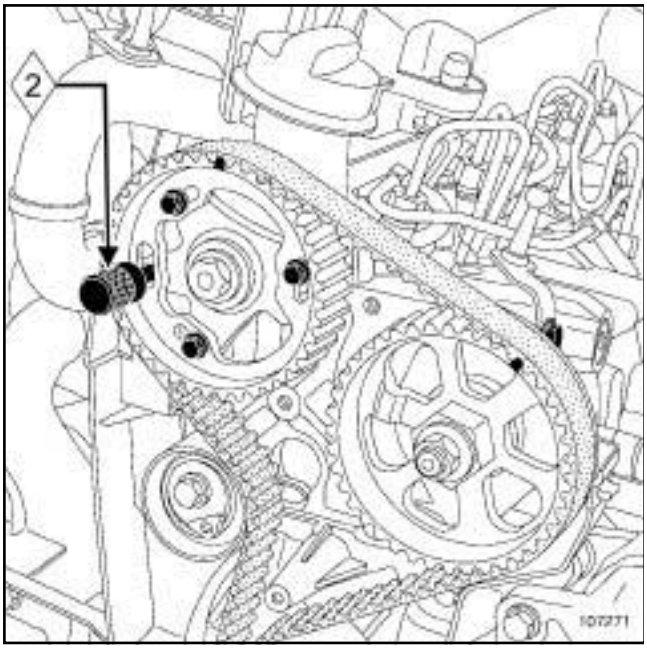
❑ Remove the TDC pin plug using a **1/2" female torx socket (12.7 mm square drive) (14)**.



107270

❑ Rotate the crankshaft clockwise (timing end) to position the hole (**16**) in the camshaft timing sprocket almost opposite the hole (**17**) in the cylinder head.

19650-1

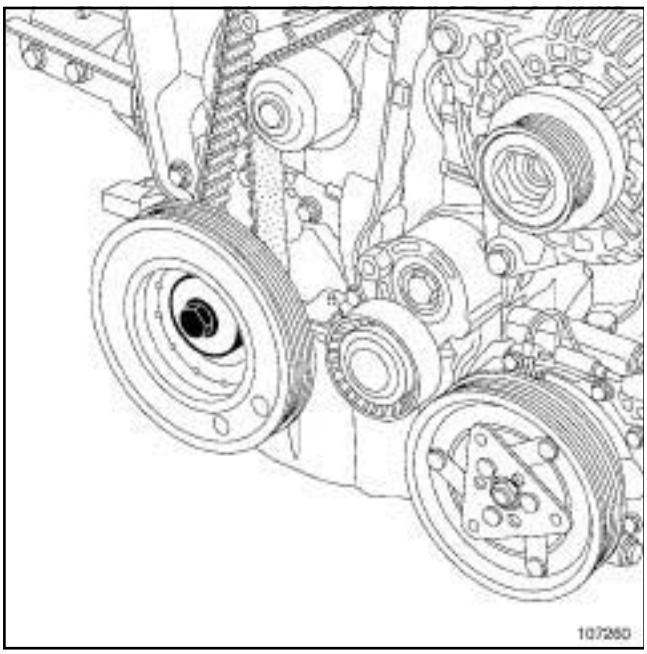


❑ Screw in the TDC setting pin (**1**) **(Mot. 1489)**.

14489

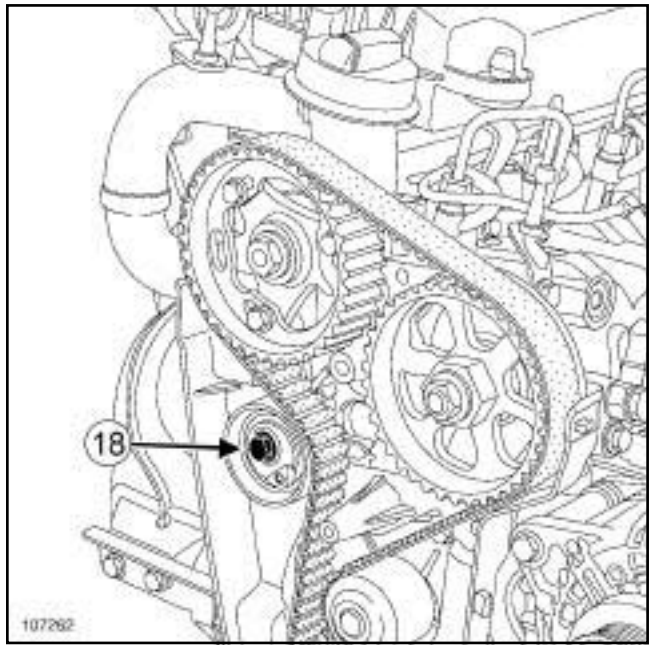
❑ Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes in contact with the TDC setting pin.

K9K, and 750 or 752



107271

❏ Engage the pin (**2**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes.



❏ Remove:

- the camshaft timing sprocket setting pin **(Mot. 1430)**,
- the TDC setting pin **(Mot. 1489)**.

107260

❏ Remove the crankshaft accessories pulley by locking the flywheel with a large flat-blade screwdriver.

107262

❏ Slacken the tensioning roller bolt (**18**) .

❏ Loosen the timing tension wheel by turning the eccentric using a **6 mm hexagonal socket**.

❏ Remove:

- the timing belt taking care not to let the crankshaft timing sprocket fall out,
- the timing tensioning roller,
- the timing sprocket.

REFITTING

❏ Check:

- that there is no oil leak from the camshaft and crankshaft seals,
- the condition of the coolant pump (hard seal, play in the shaft, fluid leak, shaft rotation, (see **Technical Note 3175A, Cooling system fault finding, 19A, Cooling, Cooling system - Fault finding chart ALP 8**).

❏

WARNING

It is essential to remove the grease from the end of the crankshaft, the camshaft timing sprocket and the bearing face of the crankshaft accessories pulley. This is to avoid timing slippage.

K9K, and 750 or 752

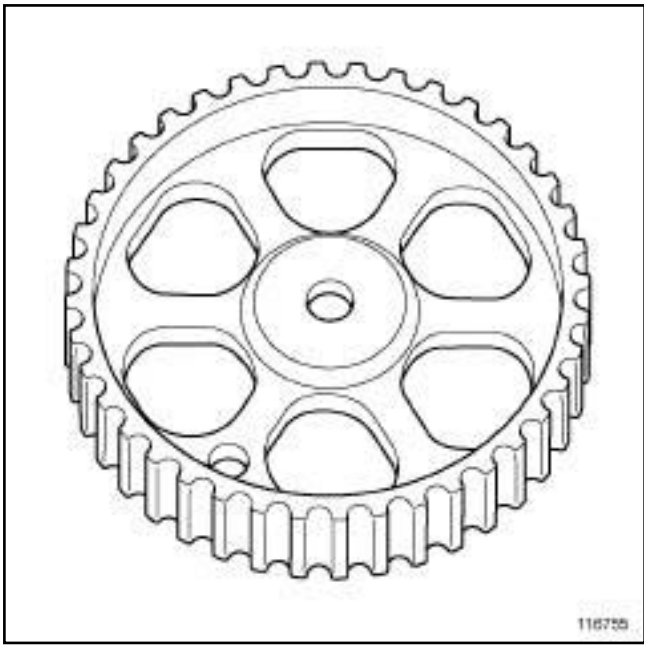
I - REFITTING OPERATION FOR PART CONCERNED

❑

Note:

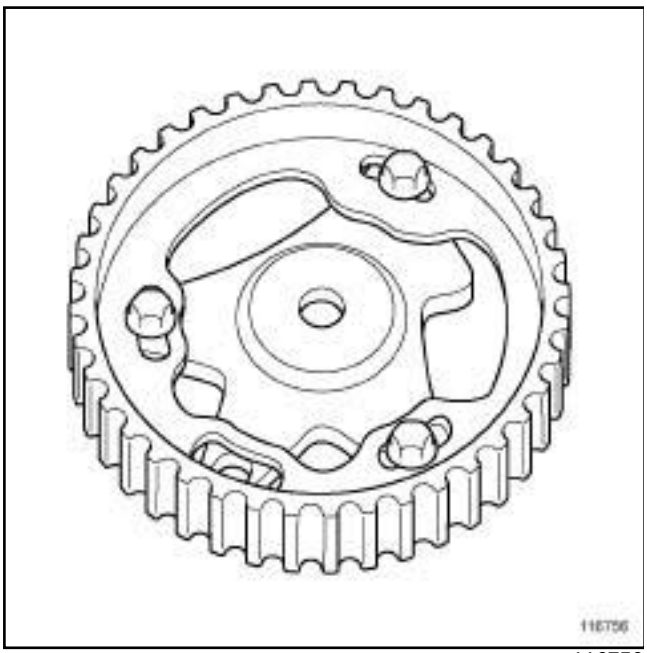
There are two types of timing belt assembly.

II - FIRST FITTING



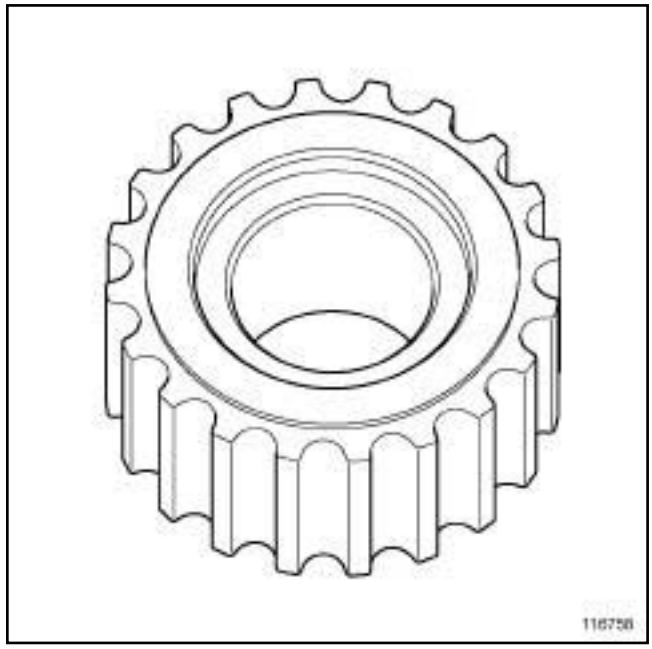
1 - Recommendations for repair

❑



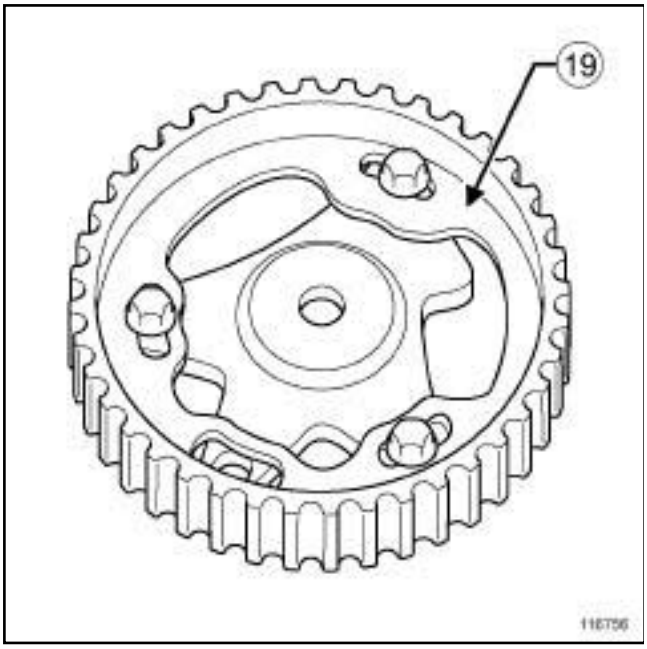
Note:

This procedure is applicable to engines manufactured up to 02/12/2005 fitted with a single unit or two-part camshaft timing sprocket and a crankshaft timing sprocket without collet.

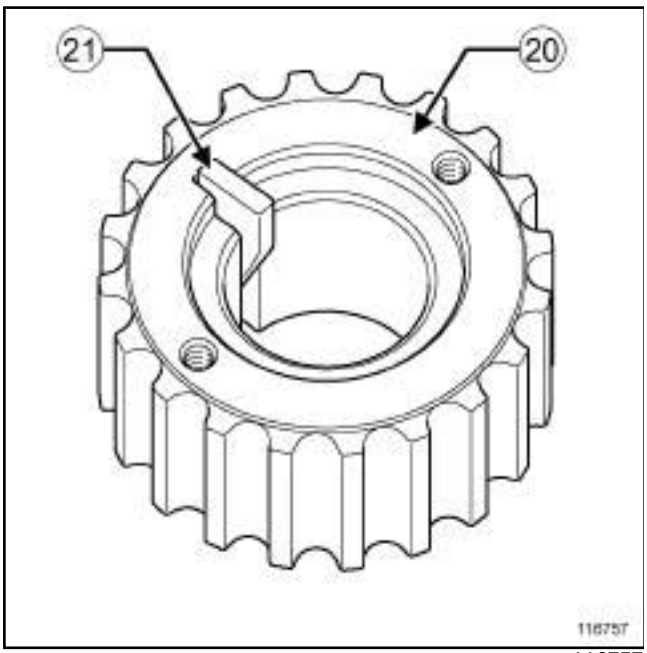


K9K, and 750 or 752

116755



116756



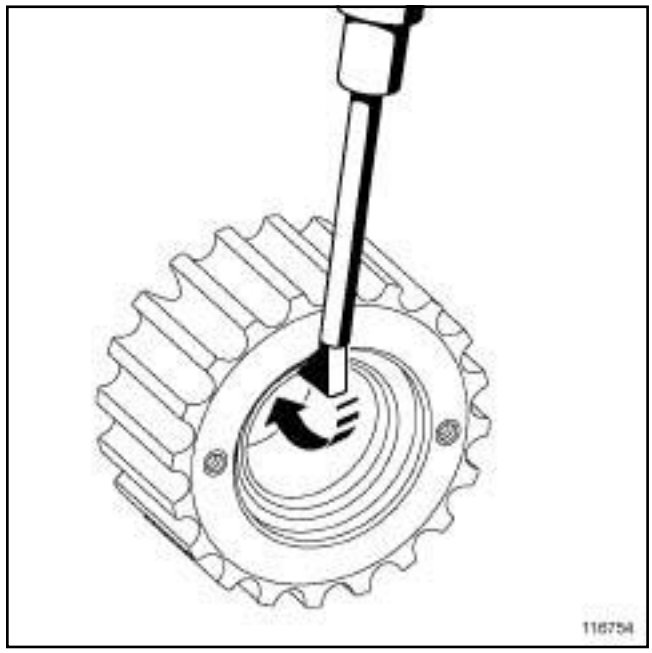
116758

❑ Wear **protective gloves** during the operation.

K9K, and 750 or 752

116756

116757

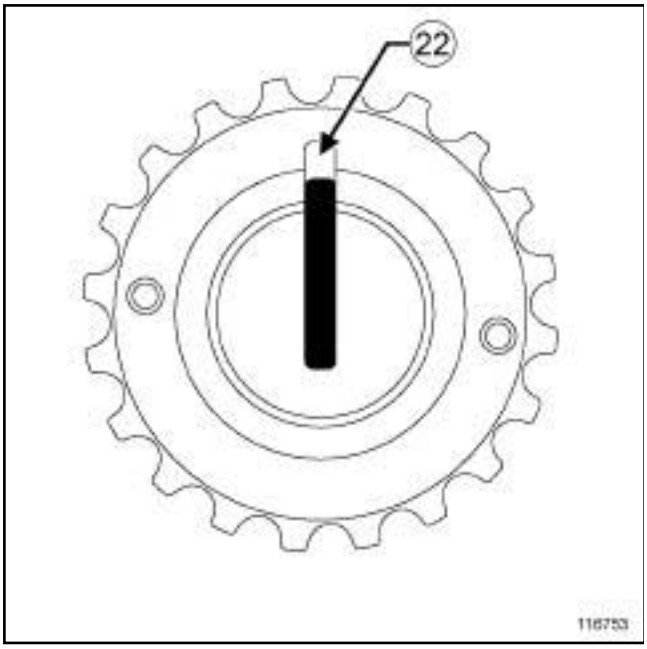


❏ In the event of replacement:

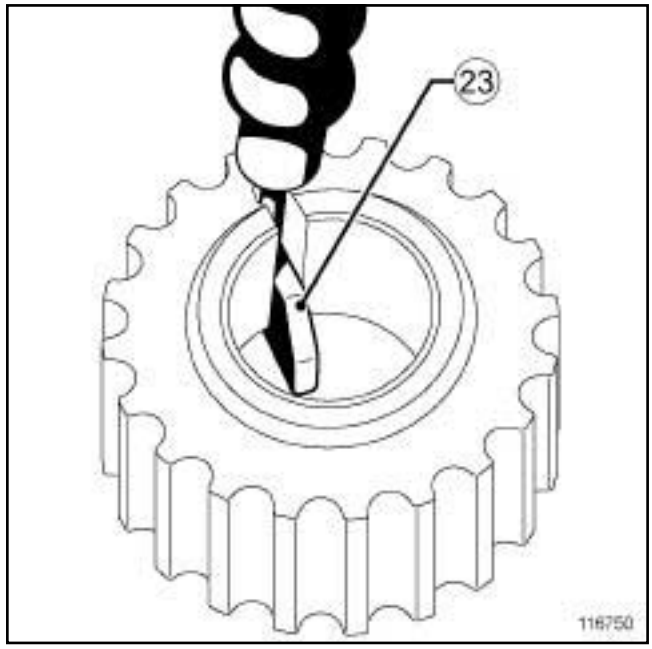
- of a camshaft timing sprocket, the Parts Department will only supply a two-part camshaft timing sprocket (**19**) ,
- of a crankshaft timing sprocket, the Parts Department will only supply a crankshaft timing sprocket with collet (**20**) .

❏ Before refitting the crankshaft timing sprocket; it is essential to remove the crankshaft timing sprocket collet (**21**) .

❏ Place the crankshaft timing sprocket on a wooden stand to avoid damaging its teeth.

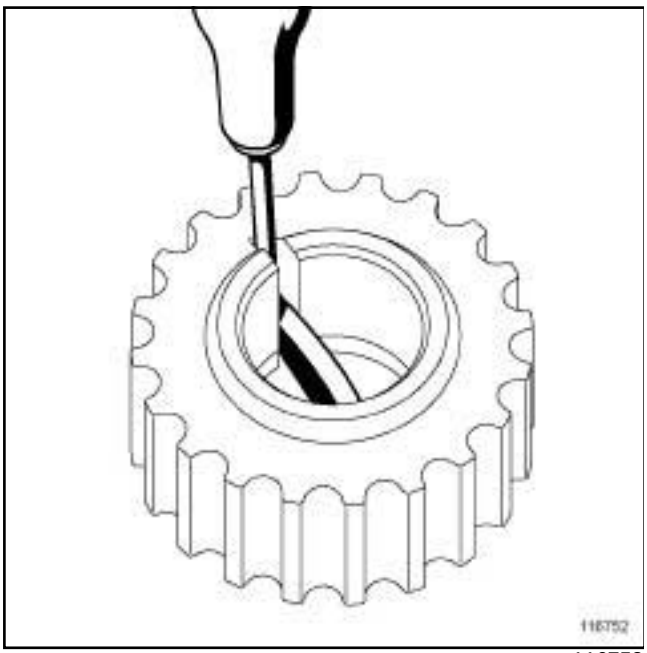


❏ When extracting the crankshaft timing sprocket collet, take care not to mark the crankshaft timing sprocket bore.



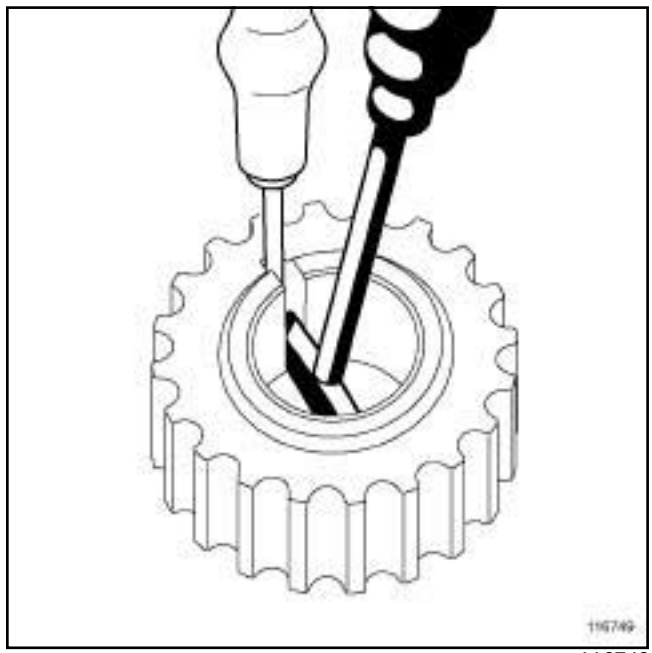
116754

❏ Pivot the collet towards the interior of the crankshaft timing sprocket using a **roll pin punch** with a diameter of **5 mm** and a mallet.



K9K, and 750 or 752

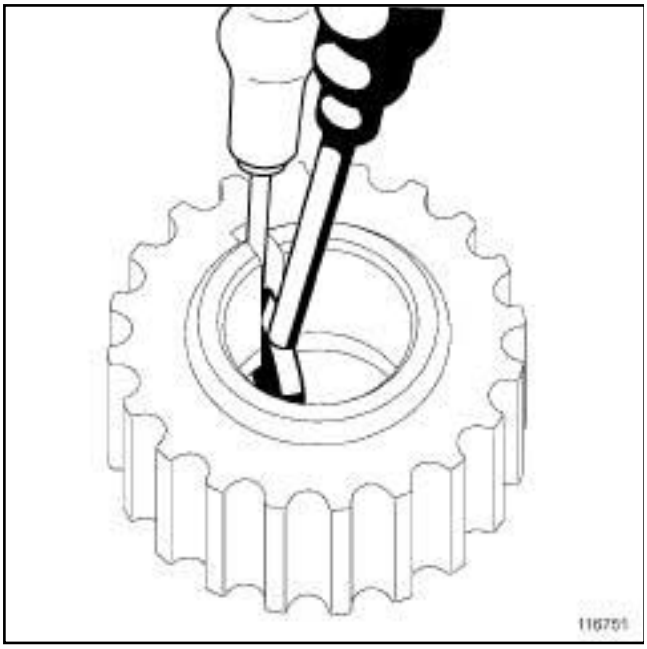
116753



116750

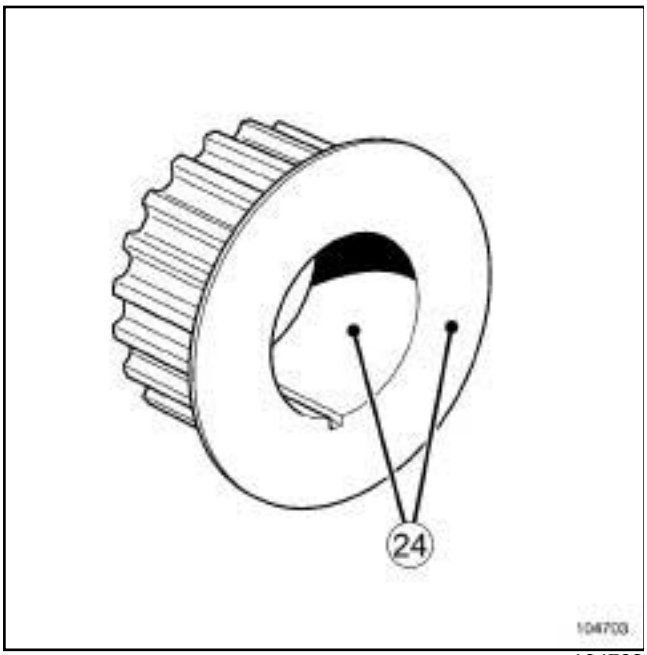
116752

❑ Slide a **roll pin punch** with a diameter of **3 mm** into the crankshaft timing sprocket groove (**22**) .



116749

❑ Position the **roll pin punch** with a diameter of **5 mm** at (**23**) on the collet.

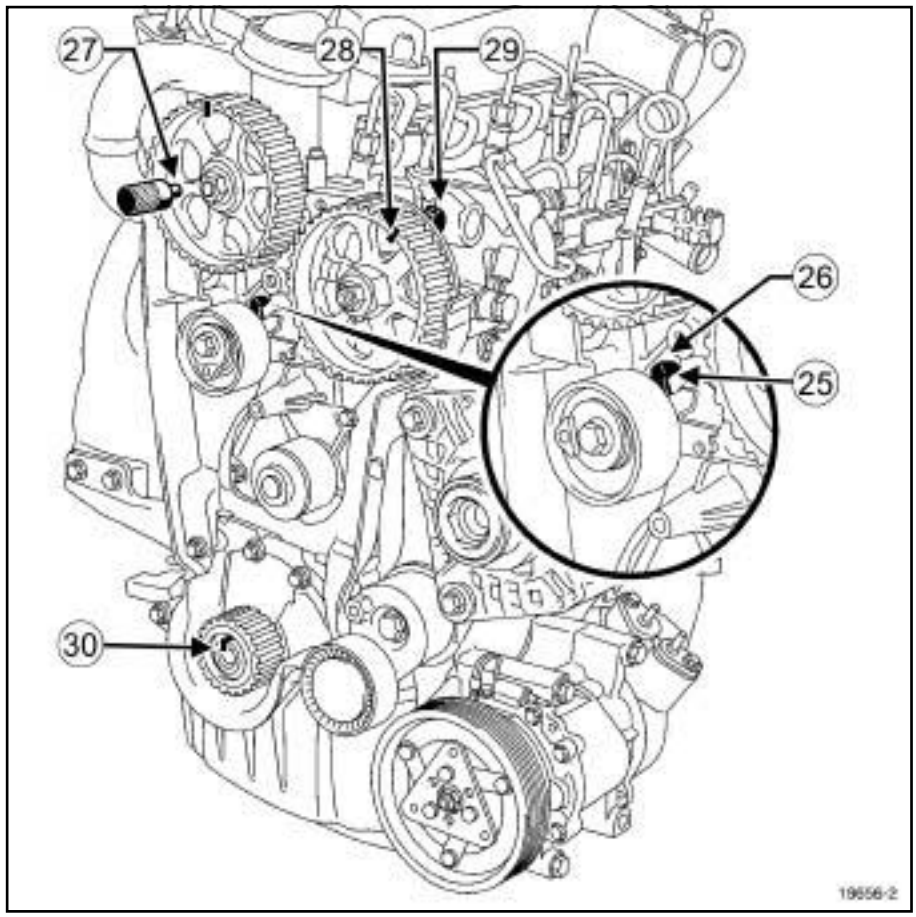


❑ Pivot the collet to position it vertically.

K9K, and 750 or 752

116751

❏ Extract the crankshaft timing sprocket collet using a **roll pin punch** and a mallet.



104703

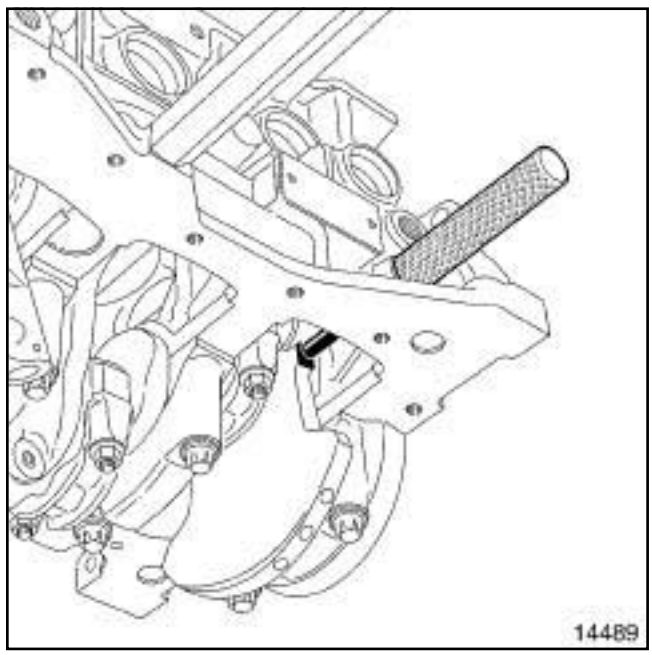
❏ Use surface cleaner to degrease:

- the end of the crankshaft (timing end),
- the crankshaft timing sprocket bore and pressure faces at (**24**) ,
- the contact surfaces of the crankshaft accessories pulley.

K9K, and 750 or 752

2 - Timing belt fitting procedure for engines fitted with a single unit camshaft timing sprocket

19656-2

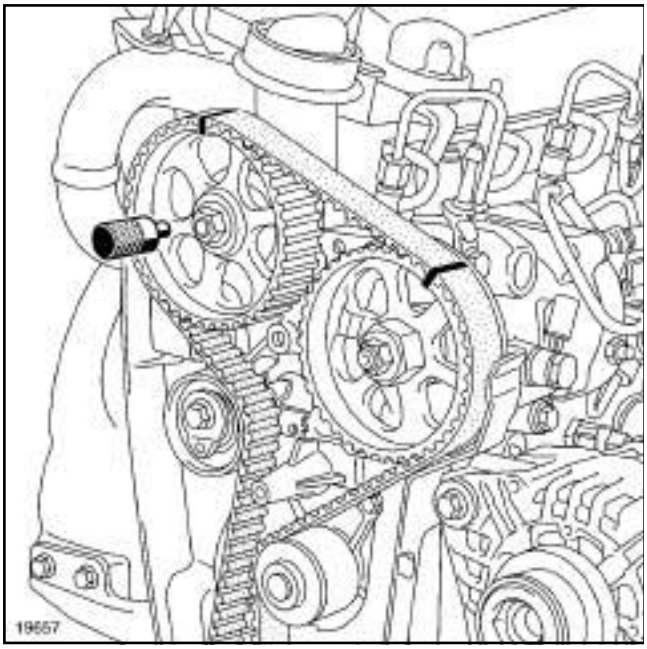


❏ Refit:

- the crankshaft timing sprocket,
- the timing tensioning roller.

❏ Put the tensioning roller lug (**25**) in the cylinder head groove (**26**) .

❏ Engage the pin **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes at (**27**) , turning the camshaft using a **offset spanner (18 mm)** if necessary.



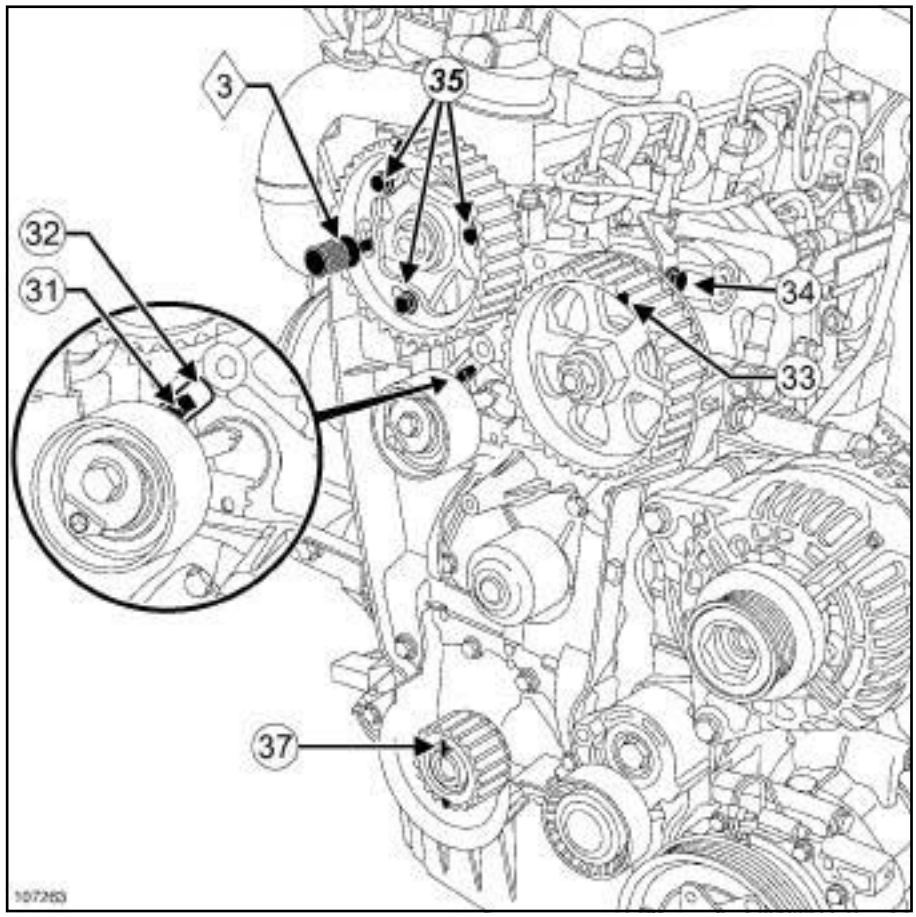
❏ Check that the mark on the high pressure pump pinion (**28**) is opposite the bolt head (**29**) .

14489

❏ Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft groove ***(30)*** must face upwards).

K9K, and 750 or 752

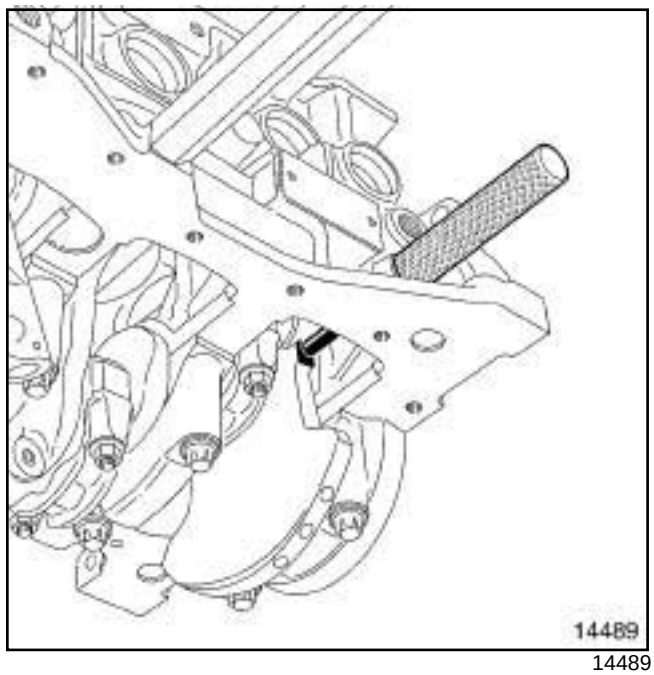
19657



❑ Fit the timing belt, starting with the crankshaft timing sprocket, by aligning the marks on the timing belt with those on the camshaft sprocket and the high pressure pump pinion.

Note:

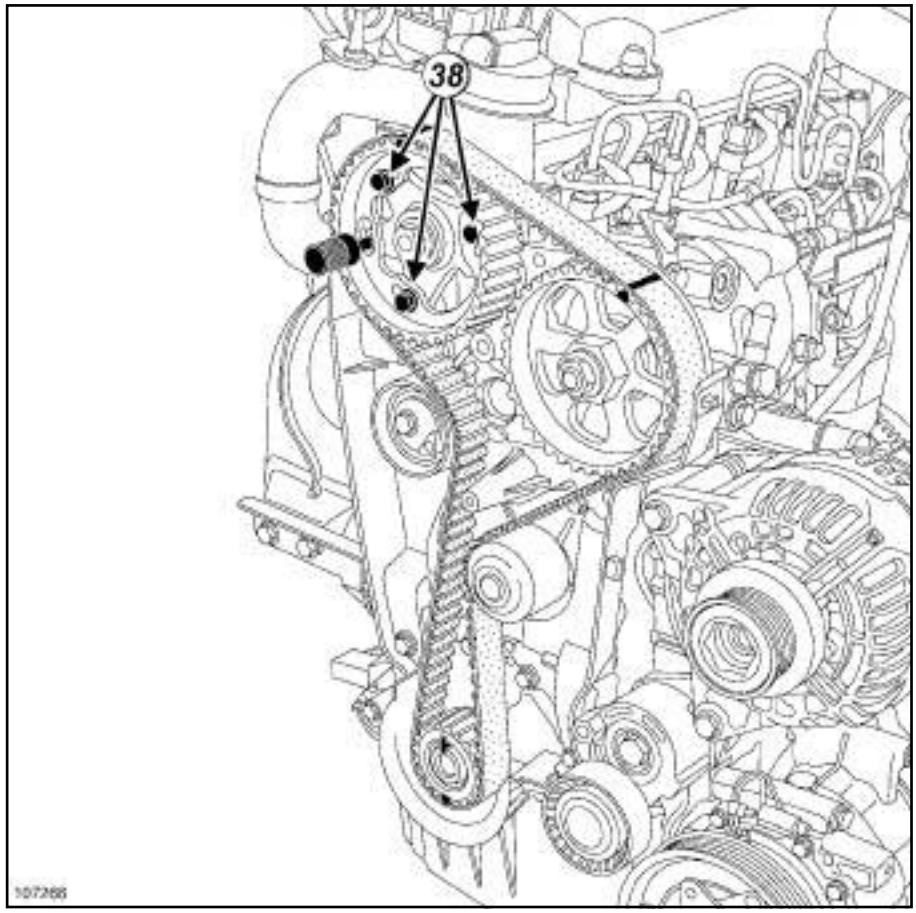
There should be 19 timing belt tooth spaces between the marks on the camshaft sprocket and the high pressure pump pinion.



K9K, and 750 or 752

3 - Timing belt fitting procedure for engines fitted with a two-part camshaft timing sprocket

107263



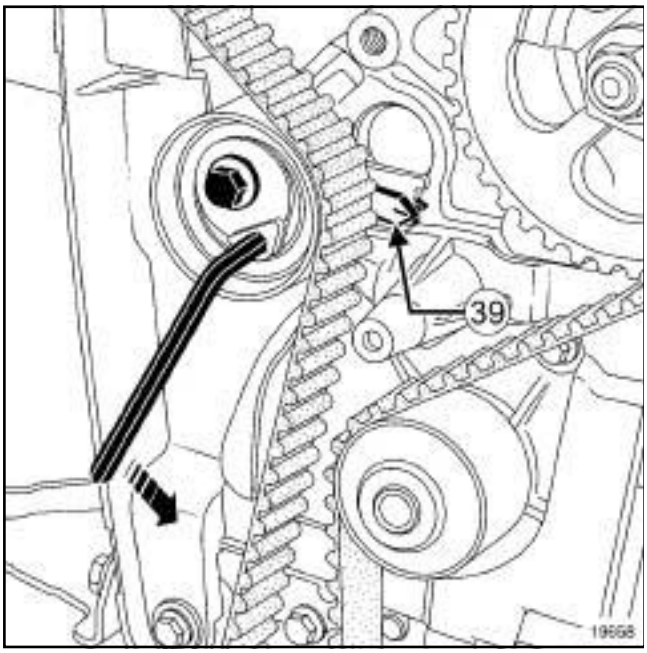
- ❏ Refit the timing tensioning roller.
- ❏ Put the tensioning roller lug (**31**) in the cylinder head groove (**32**) .
- ❏ Engage the pin (**3**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes, turning the camshaft using a **offset spanner (18 mm)** if necessary.
- ❏ Check that the mark on the high pressure pump pinion (**33**) is opposite the bolt head (**34**) .
- ❏ Loosen the three camshaft timing sprocket crown bolts (**35**) by one turn.

14489

- ❏ Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft groove ***(37)*** must face upwards).

K9K, and 750 or 752

107266



❑ Fit the timing belt, starting with the crankshaft timing sprocket, by aligning the marks on the timing belt with those on the camshaft sprocket and the high pressure pump pinion.

> Note:
>
> There should be 19 timing belt tooth spaces between the marks on the camshaft sprocket and the high pressure pump pinion.

❑ Use a **torque wrench** to torque tighten the **camshaft timing sprocket crown bolts (14 N.m)** (**38**) .

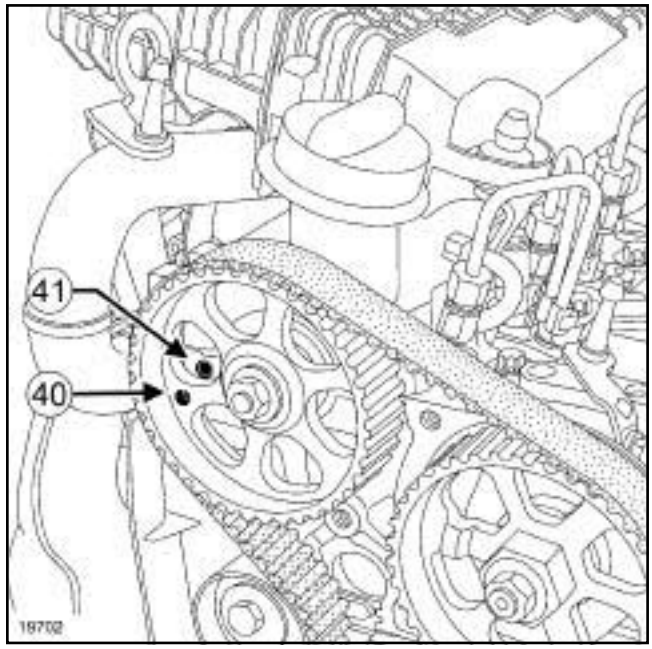
K9K, and 750 or 752

4 - Second part of the timing procedure for engines fitted with a single unit or two-part camshaft timing sprocket

19658

❏ Position the tensioning roller adjustable index marker (**39**) opposite the lug **, turning the eccentric cam anti-clockwise using a 6 mm** Allen key.

❏ Use a **torque wrench** to torque tighten the **tensioning roller bolt (27 N.m)**.



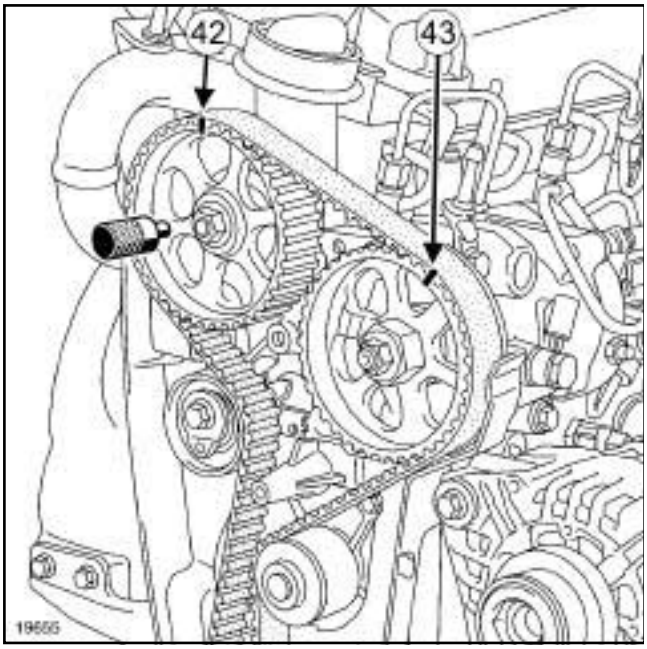
❏ Refit the accessories crankshaft pulley with a new bolt.

❏ Torque and angle tighten using a **torque/angle wrench** or a **torque wrench** and a **cylinder head bolt tightening gauge (angular measuring type)** (crankshaft against the TDC setting pin):

- the **crankshaft accessories pulley M12 bolt (60 N.m + 100° ± 10°)**,
- the **crankshaft accessories pulley M14 bolt (120 N.m + 95° ± 15°)**

❏ Remove the following tools:

- the camshaft timing sprocket setting pin **(Mot. 1430)**,
- the TDC setting pin **(Mot. 1489)**.



19702

❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole (**40**) in the camshaft timing sprocket is opposite the hole (**41**) in the cylinder head:

- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

K9K, and 750 or 752

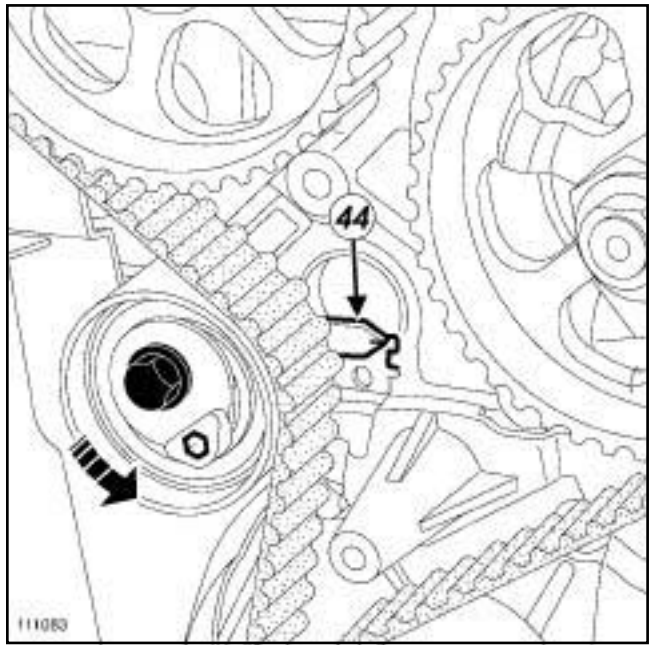
19655

❏ Lock the camshaft timing sprocket using the **(Mot. 1430)**.

Note:

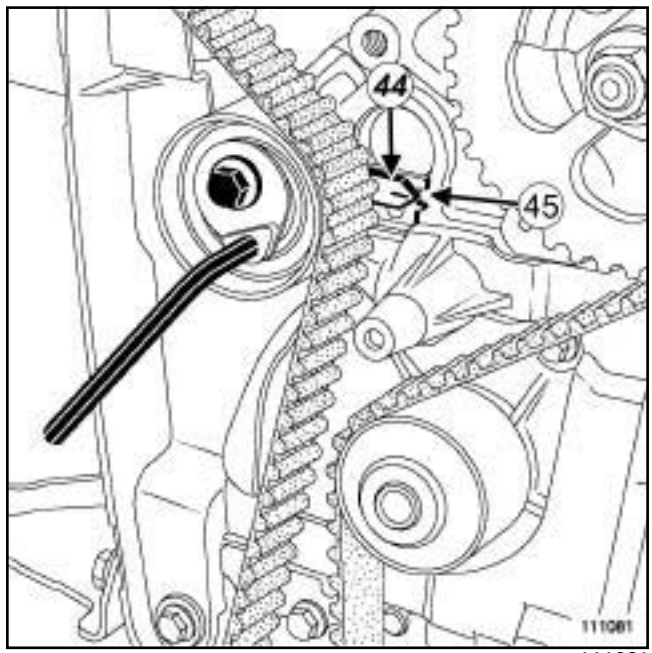
There should be 19 timing belt tooth grooves between the marks on the camshaft sprocket (**42**) and the high pressure pump pinion (**43**)

❏ Remove:



- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

Note:



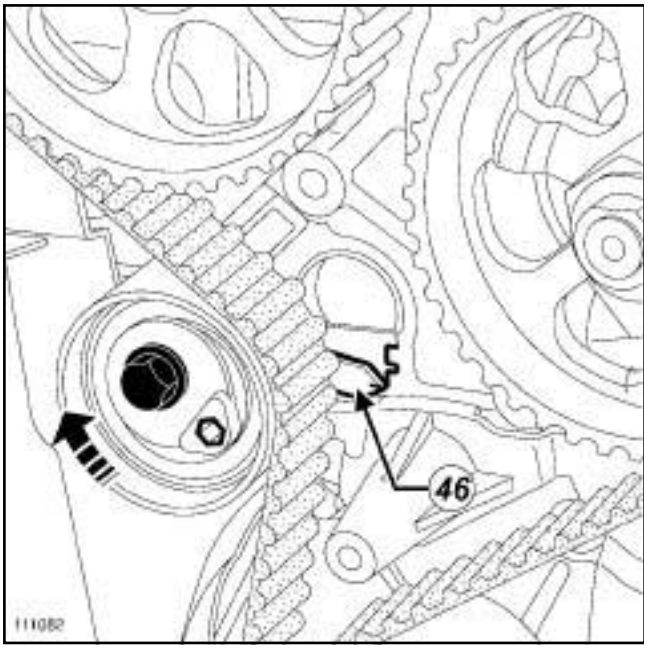
After two turns, the tension wheel index markers may be in two different positions.

The rotation of the tension wheel eccentric depends on the position.

First position

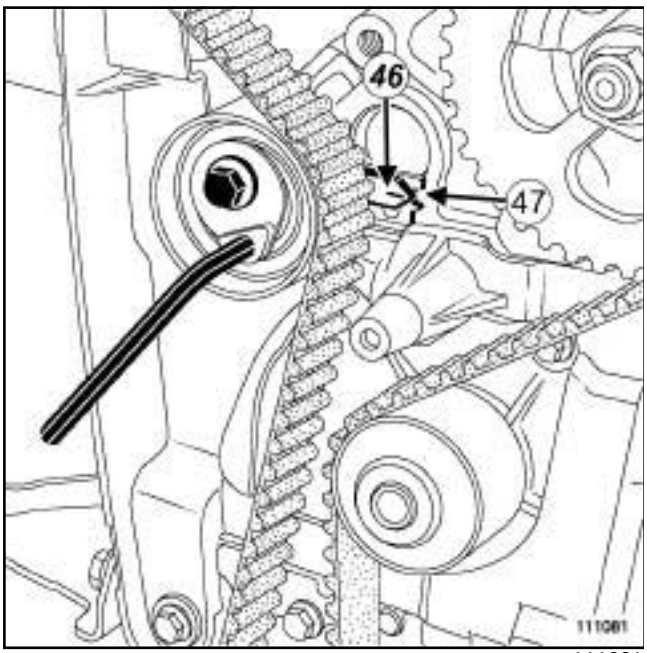
111083

111081



❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**44**) in the middle of the timing window (**45**) , **turning the key anti-clockwise**.



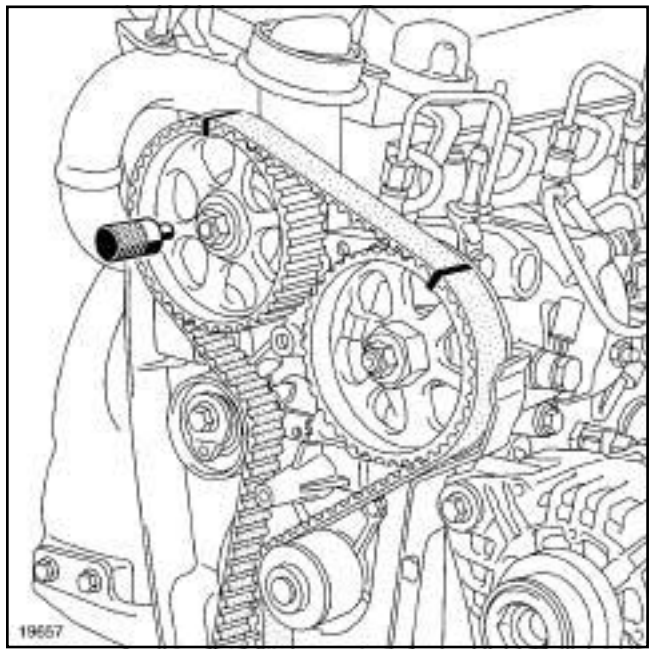
❏ Use a **torque wrench** to torque tighten the **tensioning roller bolt (27 N.m)**.

K9K, and 750 or 752

Second position

111082

111081



❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**46**) in the middle of the timing window (**47**) , **turning the key clockwise**.

❏ Use a **torque wrench** to torque tighten the **tensioning roller bolt (27 N.m)**.

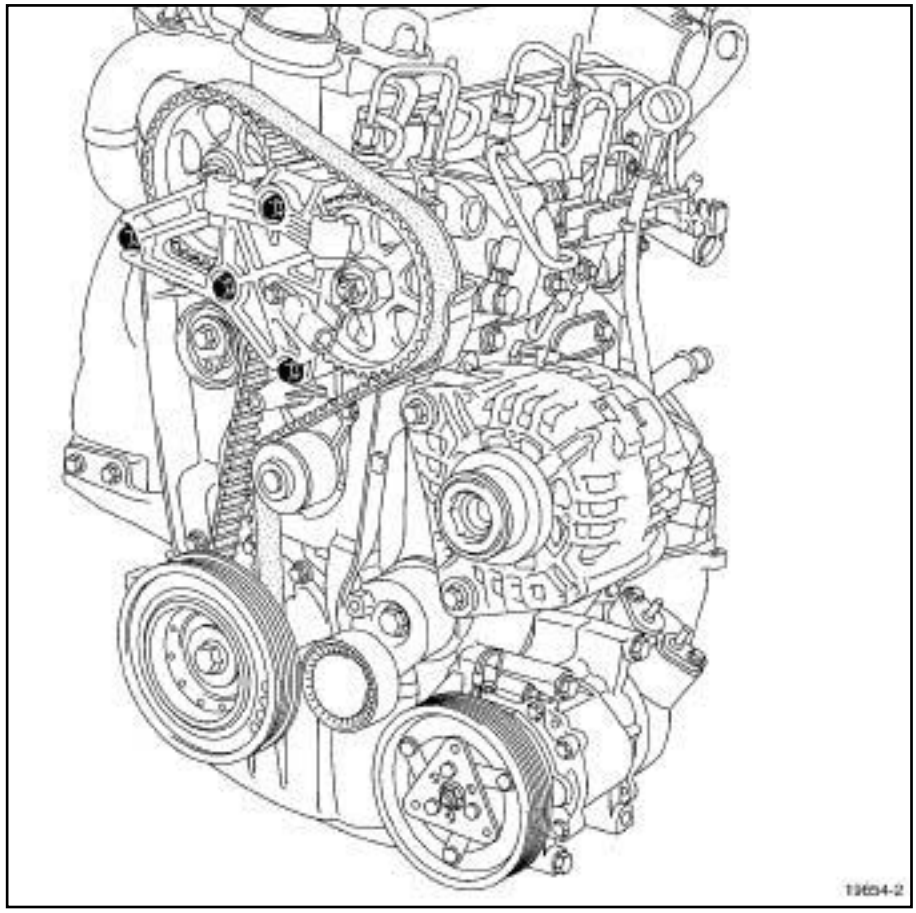
❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole in the camshaft timing sprocket is opposite the hole in the cylinder head:

- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

19657

❏ Lock the camshaft timing sprocket using the **(Mot. 1430)**.

❏ If the pin does not engage, repeat the timing belt refitting operation.



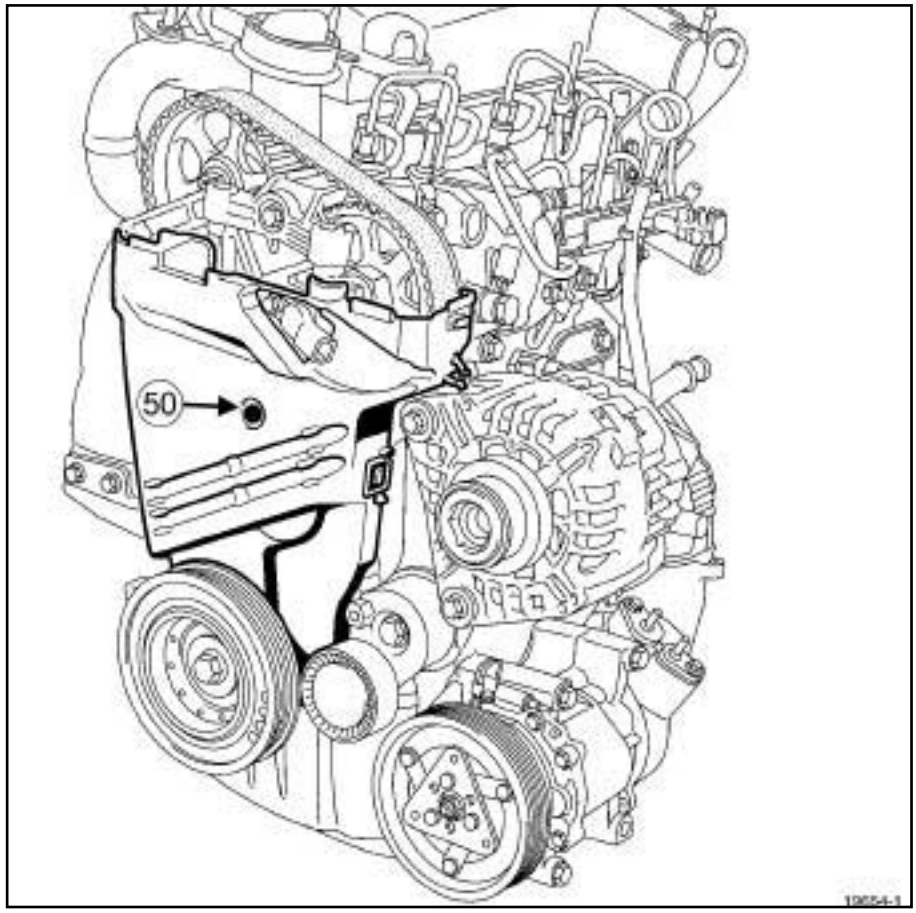
❏ Remove the following tools:

- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**

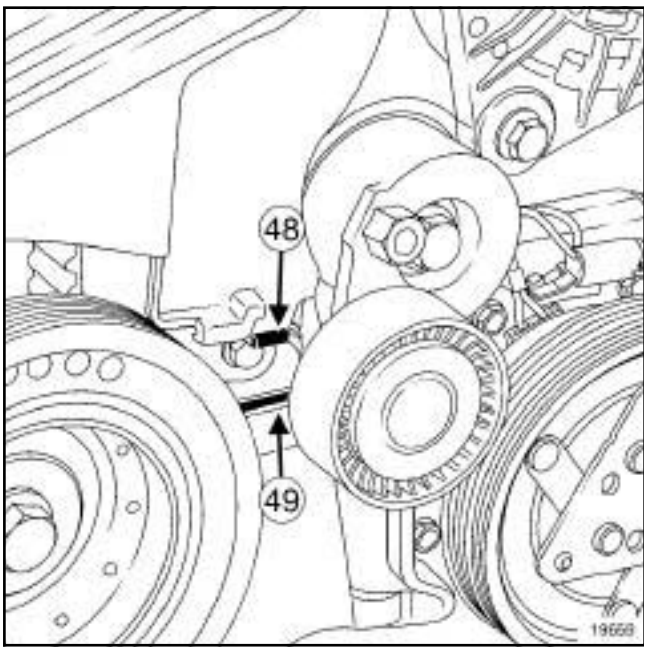
❏ Apply a drop of **SILICONE ADHESIVE SEALANT** to the threading of the TDC pin plug.

❏ Use a **torque wrench** to torque tighten the **TDC pin plug (25 N.m)**.

K9K, and 750 or 752



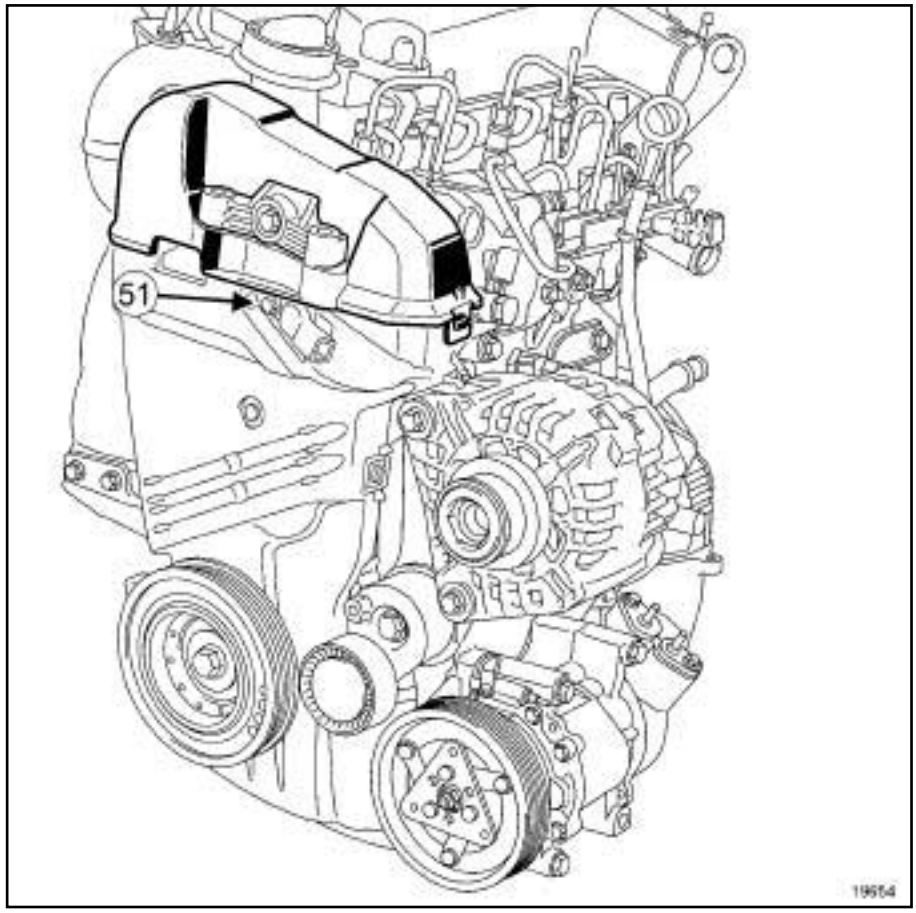
19654-2



❏ Refit the cylinder head suspended mounting.

❏ Use a **torque wrench** to torque tighten the **cylinder head suspended mounting bolts (25 N.m)**.

K9K, and 750 or 752



19654-1

19659

❑ Refit:

- the timing cover, positioning the tab (**48**) in the inner timing cover hole (**49**) ,
- the timing cover plastic bolt (**50**) .

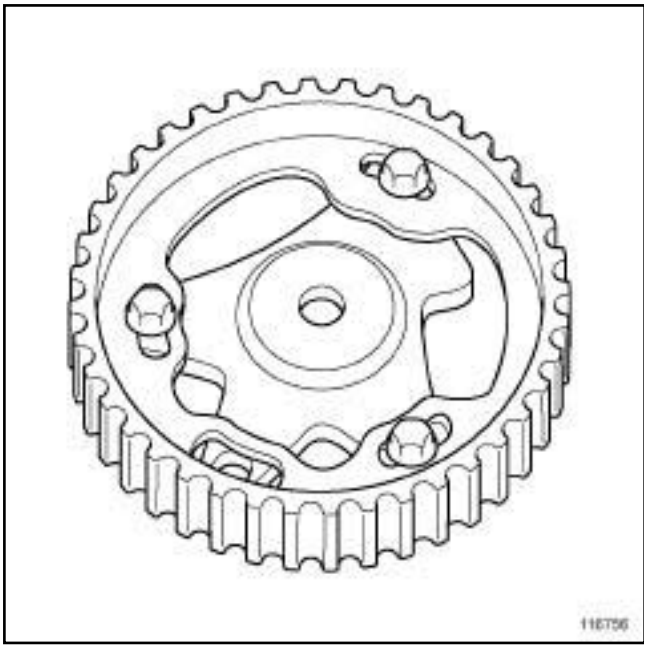
19654

❑ Refit the camshaft position sensor (**51**) .

❑ Use a **torque wrench** to torque tighten the **camshaft position sensor bolt (8 N.m)**.

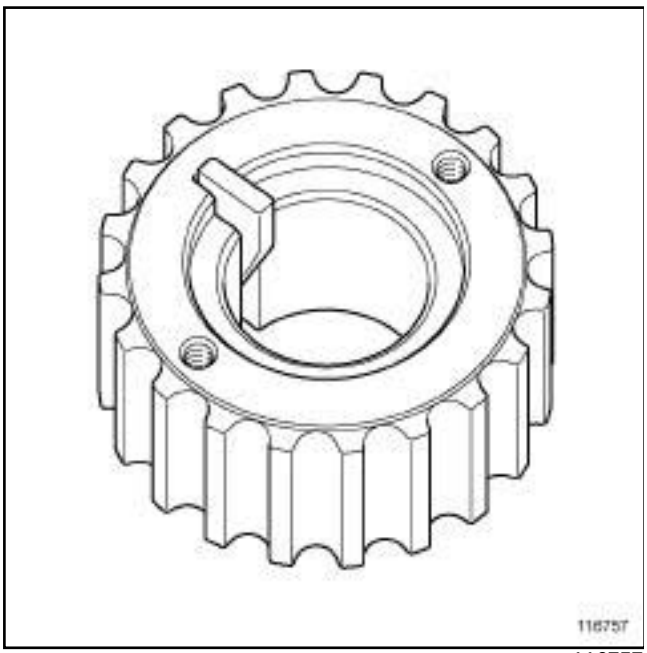
❑ Refit the upper timing cover.

III - SECOND FITTING



Recommendations for repair

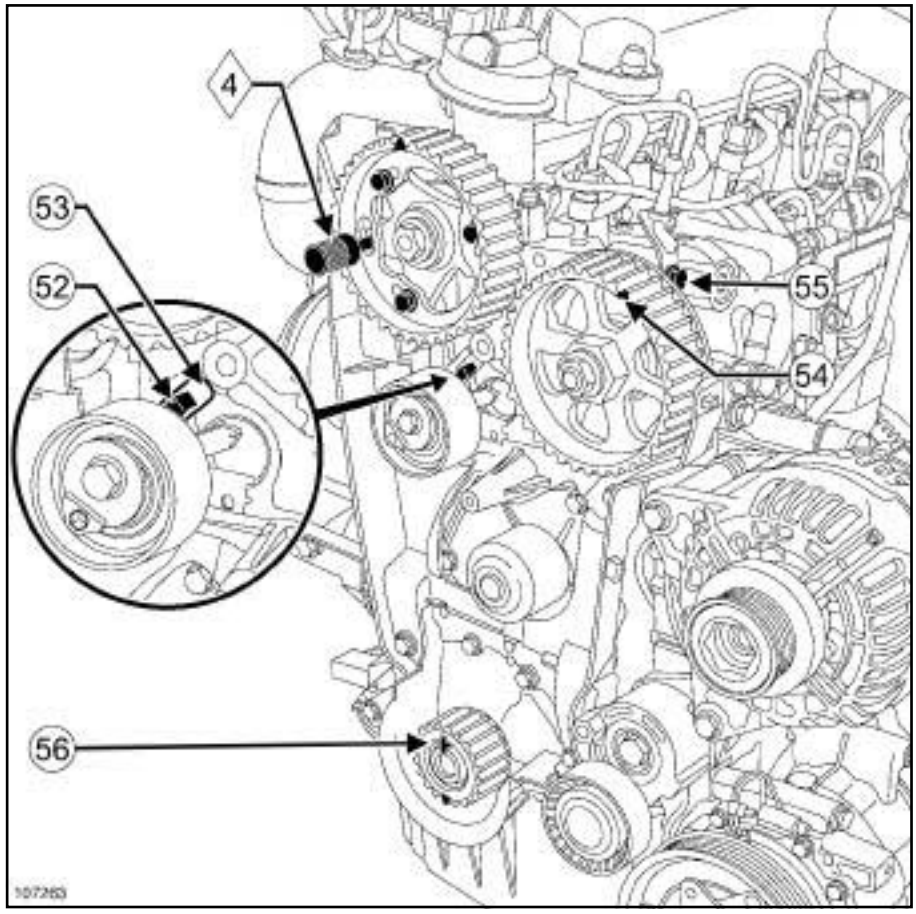
❑



Note:

This procedure is applicable to engines manufactured from 02/12/2005 fitted with a two-part camshaft timing sprocket and a crankshaft timing sprocket with collet.

K9K, and 750 or 752

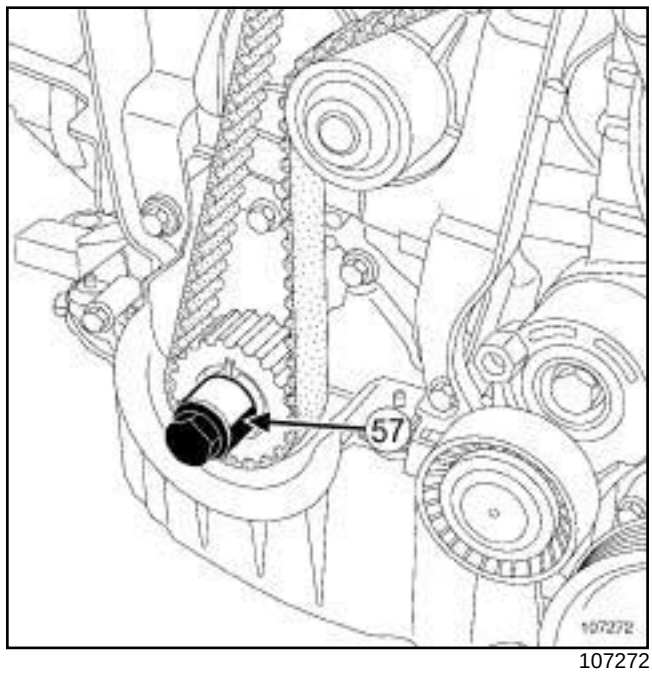


116756

116757

❑ Wear **protective gloves** during the operation.

K9K, and 750 or 752

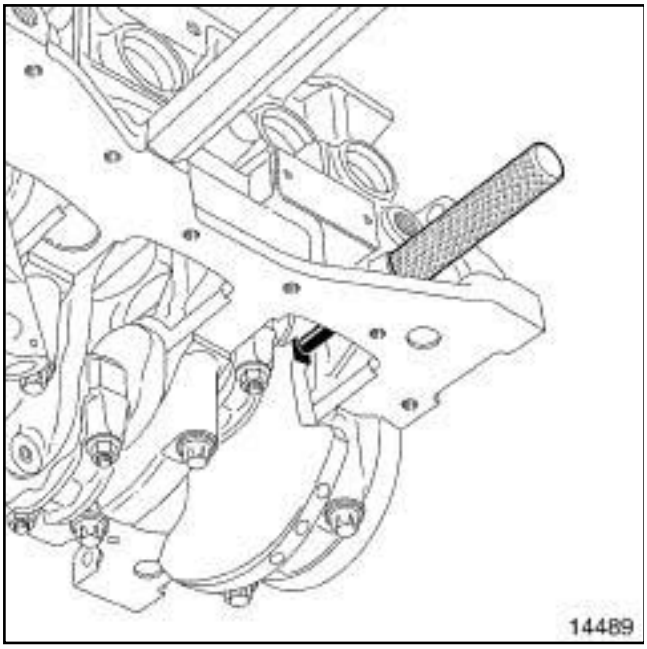


107263

❏ Refit the timing tensioning roller.

❏ Put the tensioning roller lug (**52**) in the cylinder head groove (**53**) .

❏ Engage the pin (**4**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes, turning the camshaft using a **offset spanner (18 mm)** if necessary.



❏ Check that the mark on the high pressure pump (**54**) is opposite the bolt head (**55**) .

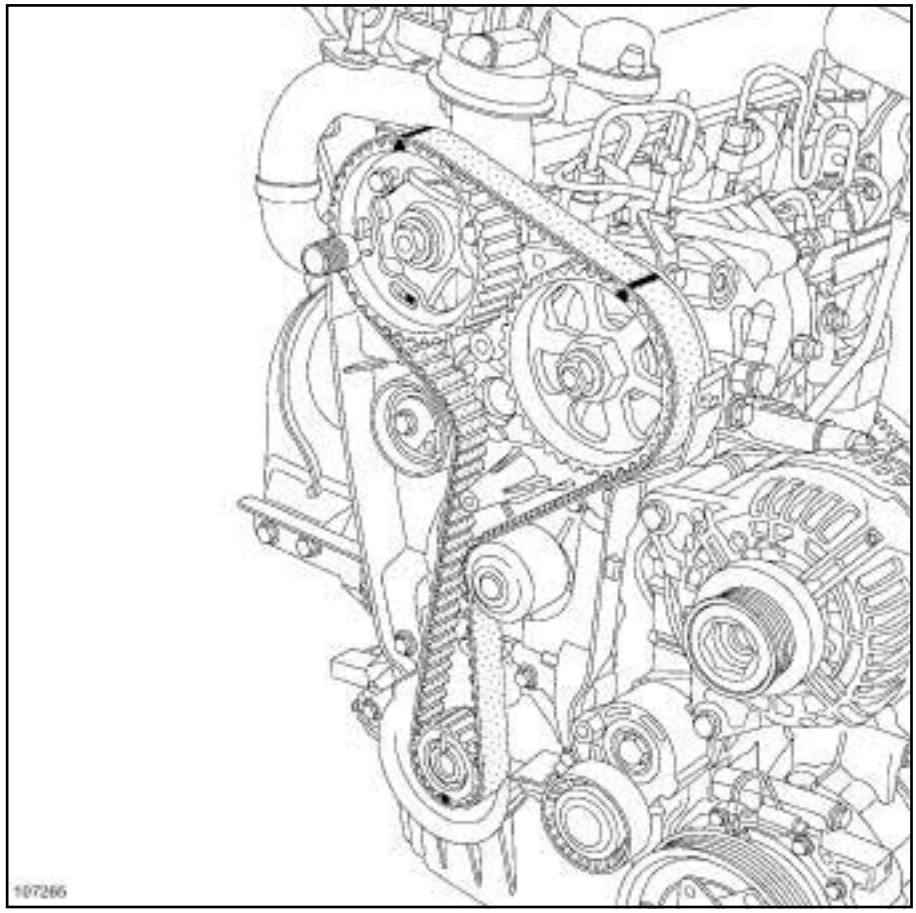
107272

❏ Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**57**) onto the crankshaft.

K9K, and 750 or 752

14489

❏ Position the crankshaft so that it presses against the TDC setting pin **(Mot. 1489)** (the crankshaft sprocket ***(56)*** collet must face upwards).

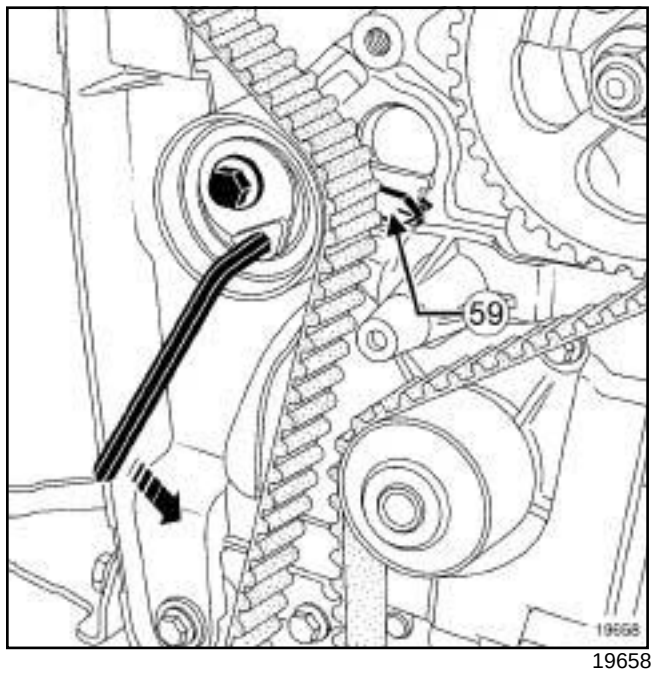


107264

❏ Remove one bolt from the camshaft timing sprocket crown.

❏ Loosen the other two camshaft timing sprocket crown bolts (**58**) by one turn.

K9K, and 750 or 752

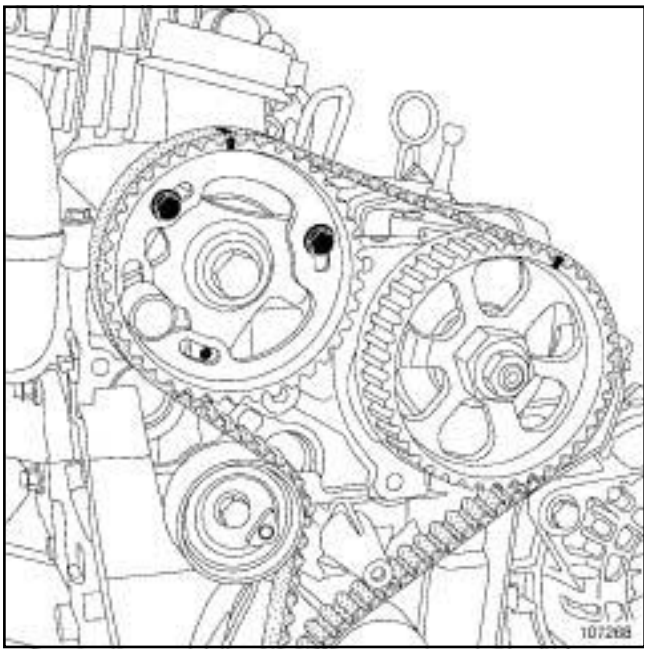


107265

❑ Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the timing belt with those on the crankshaft sprockets and camshaft and high pressure pump pinions.

Note:

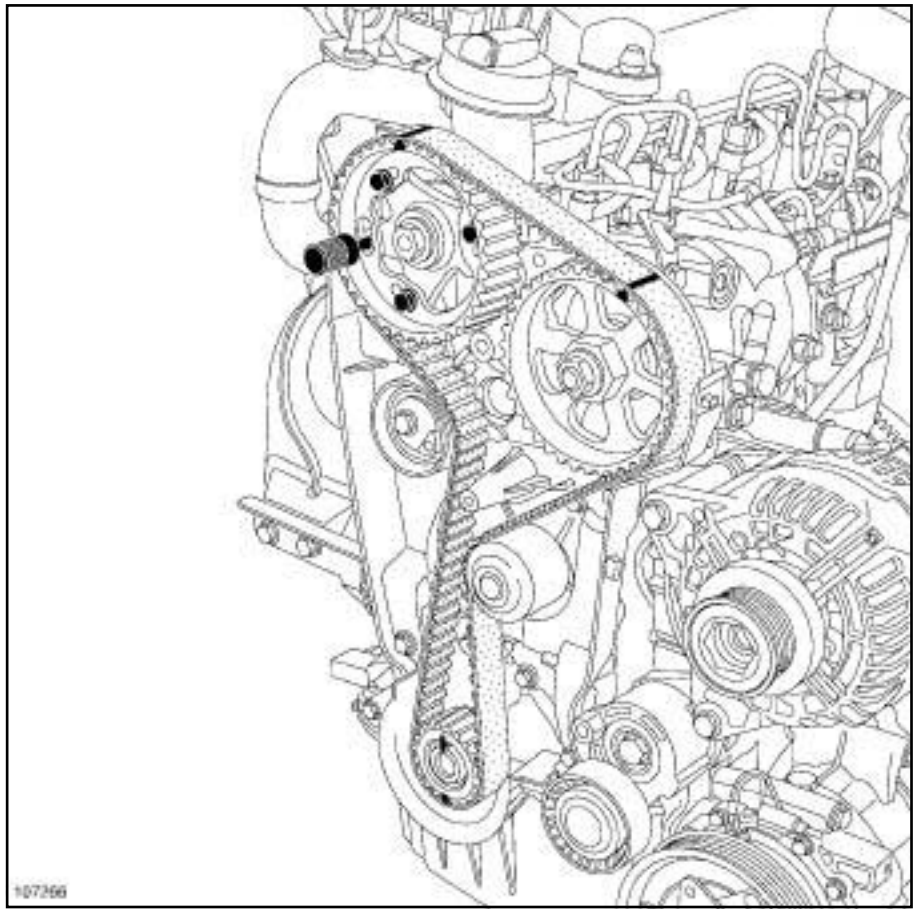
There should be 19 timing belt tooth grooves between the marks on the camshaft sprocket and the high pressure pump pinion, and 51 timing belt tooth grooves between the crankshaft sprocket and the high pressure pump pinion.



19658

❑ Position the tensioning roller adjustable index marker (**59**) opposite the lug **, turning the eccentric cam anti-clockwise using a 6 mm** Allen key.

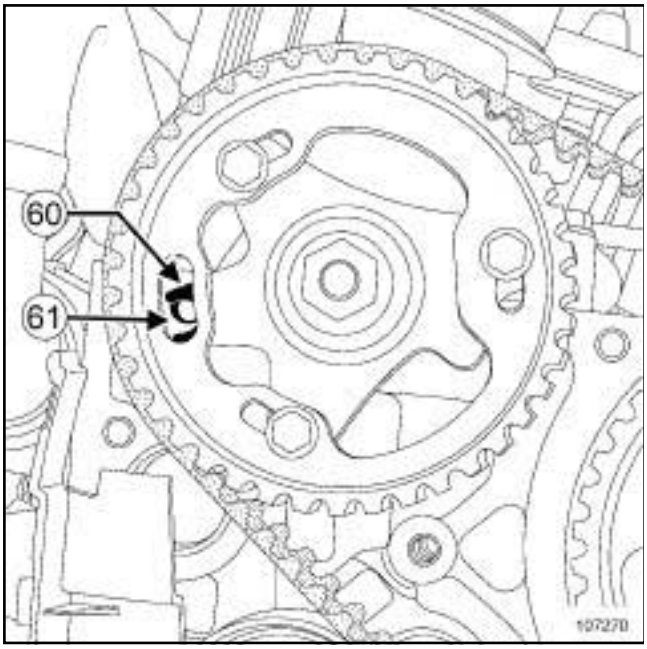
K9K, and 750 or 752



❏ Use a **torque wrench** to torque tighten the **tensioning roller bolt (27 N.m)**.

107268

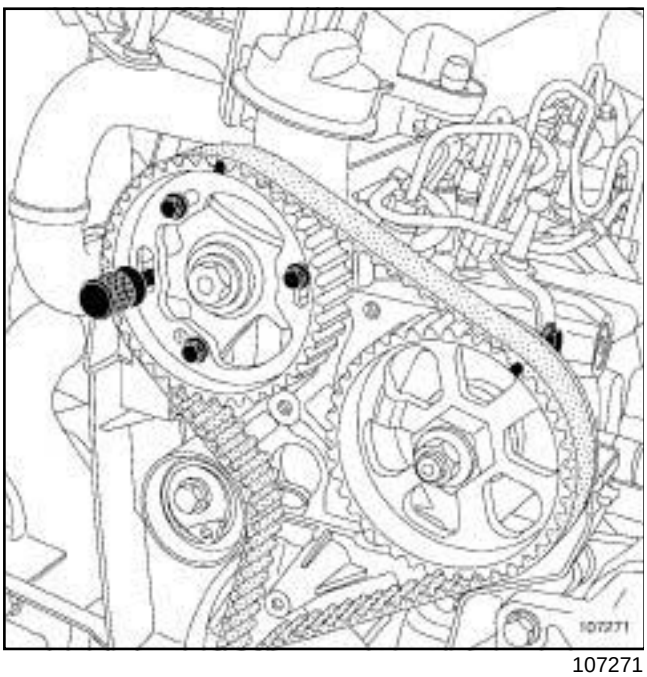
❏ Check that the camshaft timing sprocket crown bolts are not fully locked against the camshaft timing sprocket crown. If they are, repeat the timing belt refitting procedure.



K9K, and 750 or 752

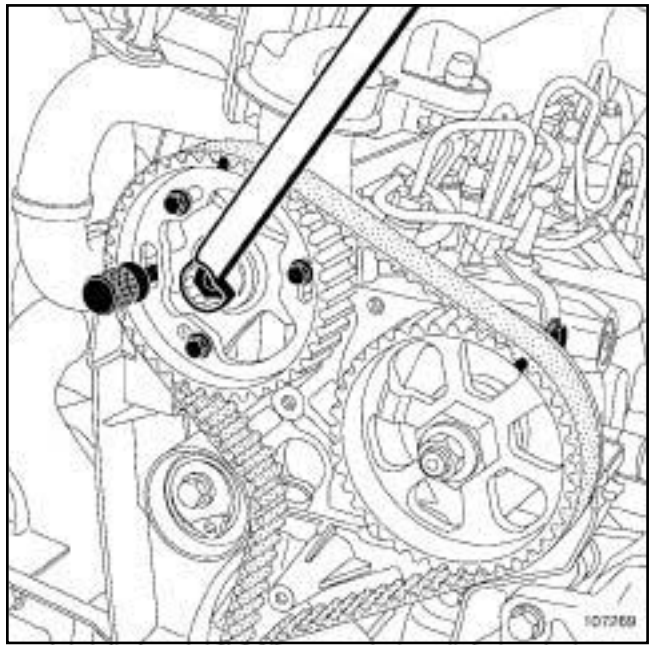
107266

- ❏ Refit the bolt from the camshaft timing sprocket crown.
- ❏ Use a **torque wrench** to torque tighten the **camshaft timing sprocket crown bolts (14 N.m)**.
- ❏ Remove:
  - the TDC setting pin **(Mot. 1489)**,
  - the camshaft timing sprocket setting pin **(Mot. 1430)**.



K9K, and 750 or 752

107270

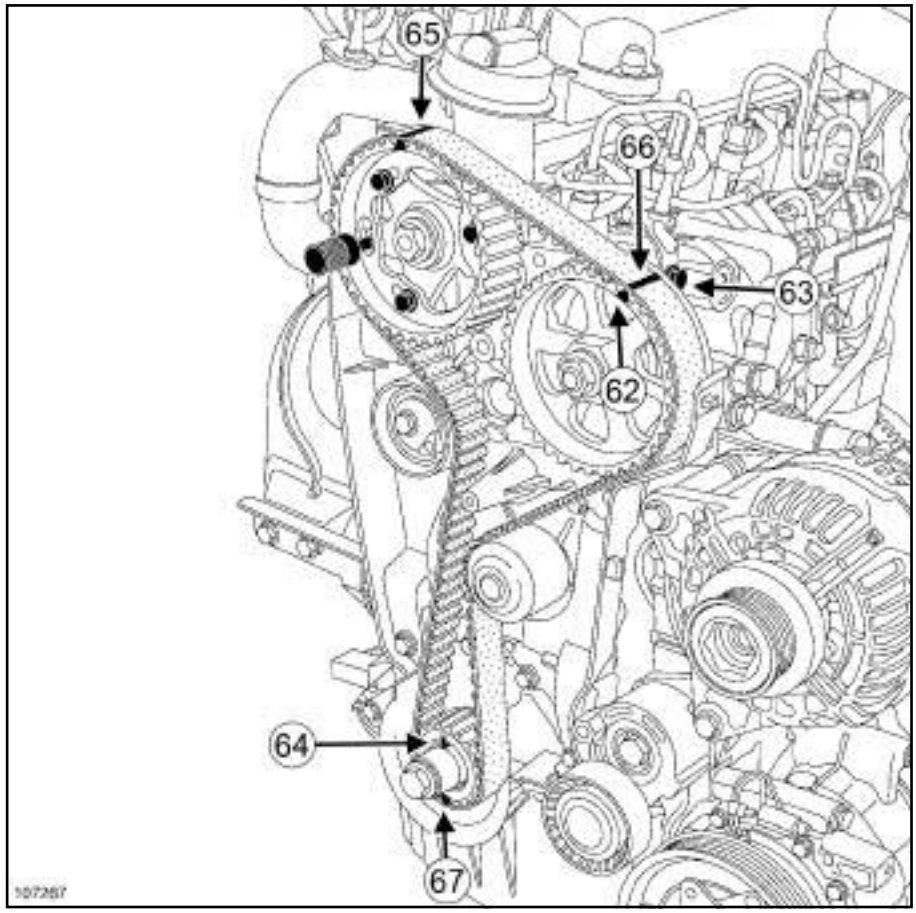


❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole (**60**) in the camshaft timing sprocket is opposite the hole (**61**) in the cylinder head:

- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

❏ Lock the camshaft timing sprocket using the **(Mot. 1430)**.



107269

❏ If the pin **(Mot. 1430)** does not engage:

- loosen the camshaft timing sprocket crown bolts by a maximum of one turn,
- turn the camshaft timing sprocket hub using a **offset spanner (18 mm)** to set the camshaft timing sprocket hub,
- do not retighten the camshaft timing sprocket crown bolts.

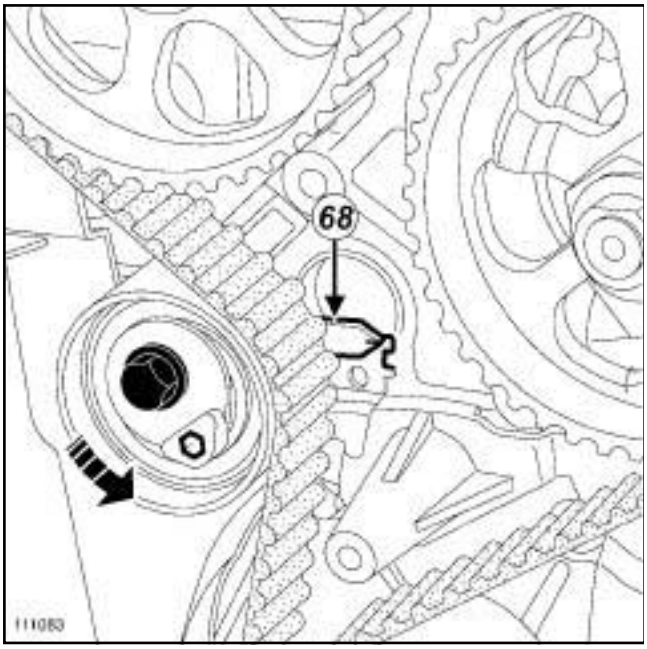
❏ Undo the camshaft timing sprocket crown bolts.

K9K, and 750 or 752

107267

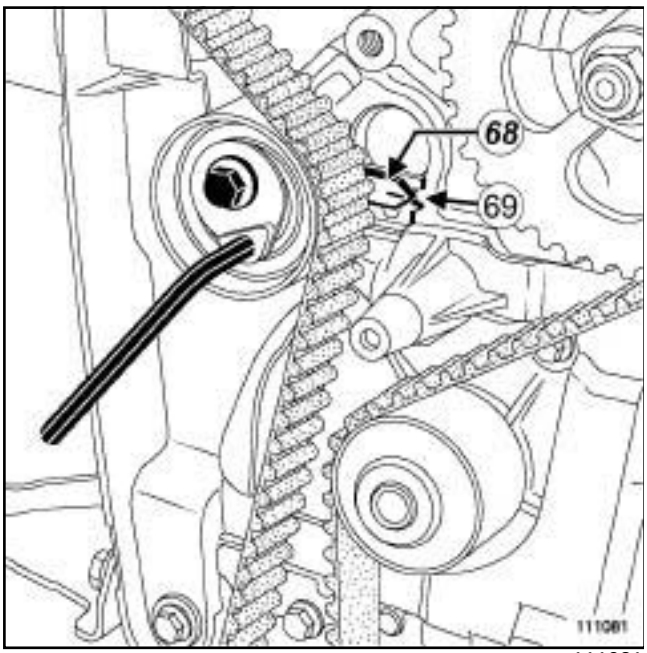
❑ Check:

- that the high pressure pump pinion mark (**62**) is opposite the bolt head (**63**) ,
- that the crankshaft timing sprocket collet (**64**) is positioned vertically at the top,
- that there are 19 belt tooth grooves between the marks on the camshaft sprocket (**65**) and the high pressure pump pinion (**66**) ,
- that there are 51 belt tooth grooves between the marks on the crankshaft sprocket (**67**) and the high pressure pump pinion (**66**) .



Note:

After two turns, the tension wheel index markers may be in two different positions.



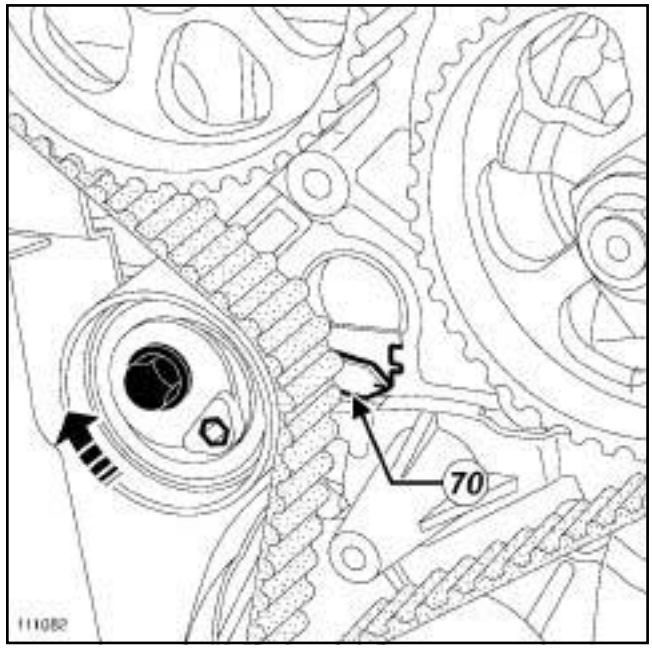
The rotation of the tension wheel eccentric depends on the position.

K9K, and 750 or 752

First position

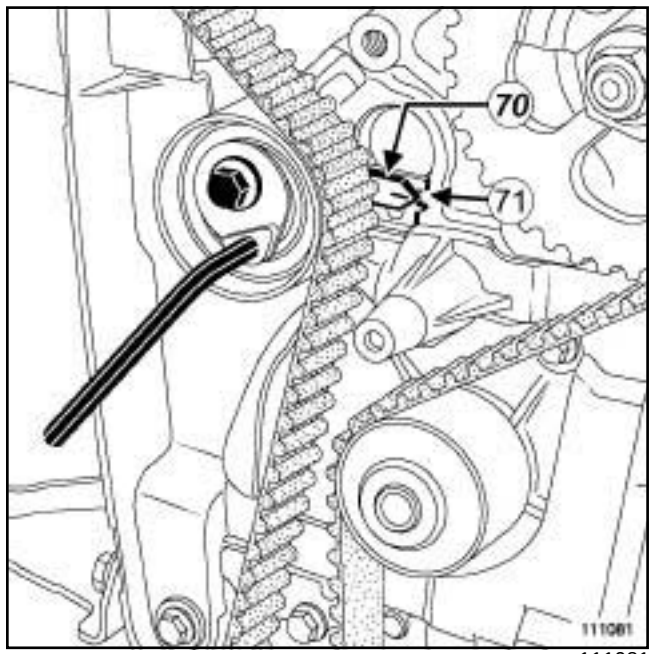
111083

111081



❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**68**) in the middle of the timing window (**69**) , **turning the key anti-clockwise**.



❏ Use a **torque wrench** to torque tighten:

- the **tensioning roller bolt (27 N.m)**,
- the **camshaft timing sprocket crown bolts (14 N.m)**.

Second position

111082

111081

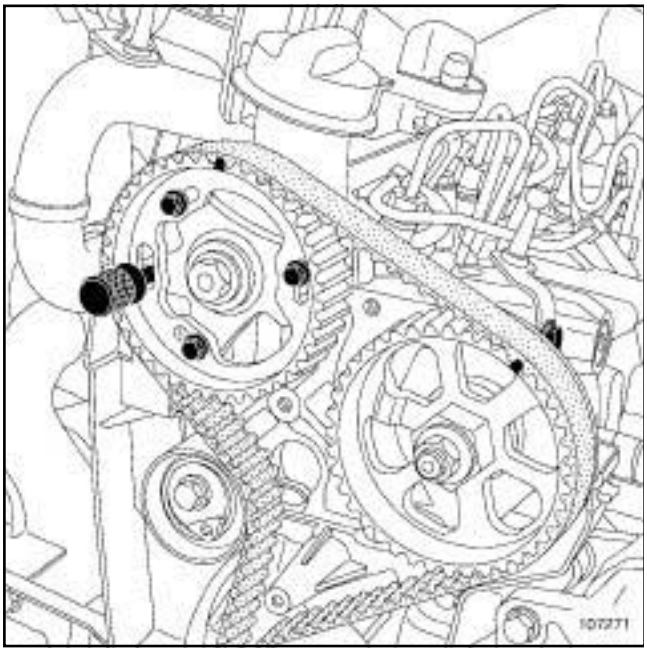
❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**70**) in the middle of the timing window (**71**) , **turning the key clockwise**.

❏ Use a **torque wrench** to torque tighten:

- the **tensioning roller bolt (27 N.m)**,
- the **camshaft timing sprocket crown bolts (14 N.m)**.

❏ Remove the following tools:

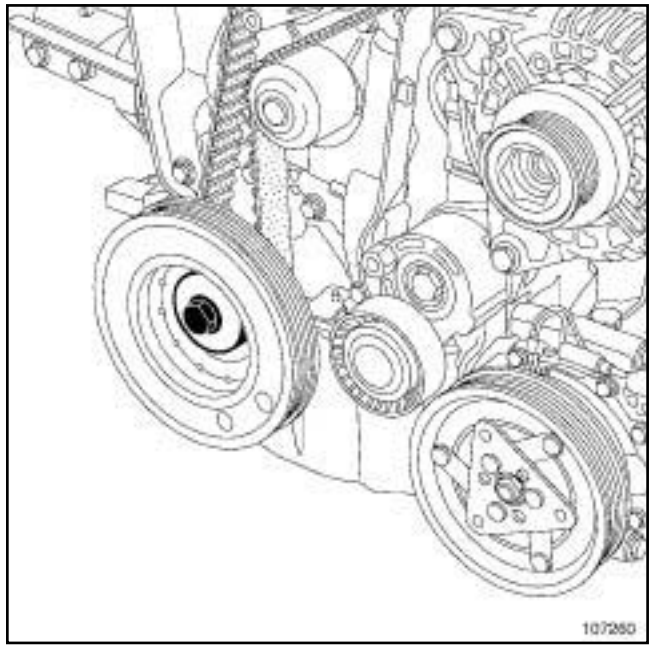


- the TDC setting pin **(Mot. 1489)**,

K9K, and 750 or 752

- the camshaft timing sprocket setting pin **(Mot. 1430)**.

❑ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole in the camshaft timing sprocket is opposite the hole in the cylinder head:



- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

107271

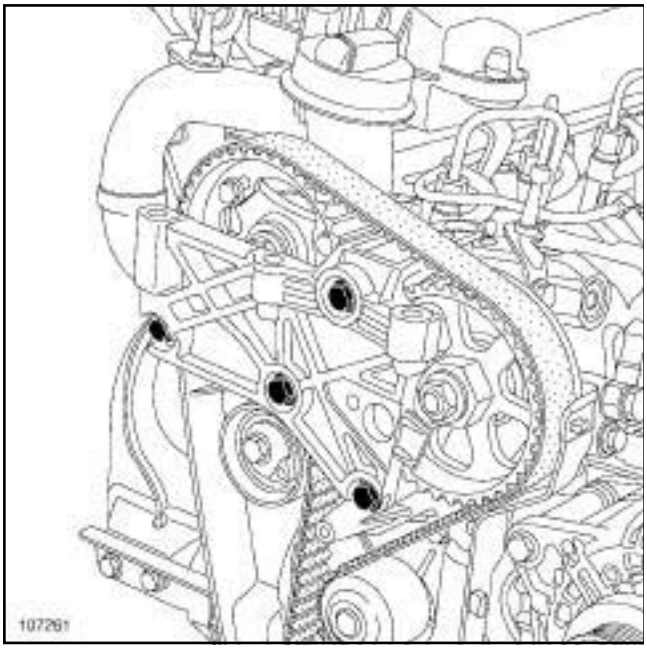
❑ Lock the camshaft timing sprocket using the **(Mot. 1430)**.

❑ If the pin does not engage, repeat the timing belt refitting operation.

107260

❑ Refit the accessories crankshaft pulley with a new bolt.

❑ Use a **torque/angle wrench** or a **torque wrench** and a **cylinder head bolt tightening gauge (angular measuring type)** (crankshaft against the TDC setting pin) to torque and angle tighten the **crankshaft accessories pulley M 14 bolt (120 N.m + 95° ± 15°)**.



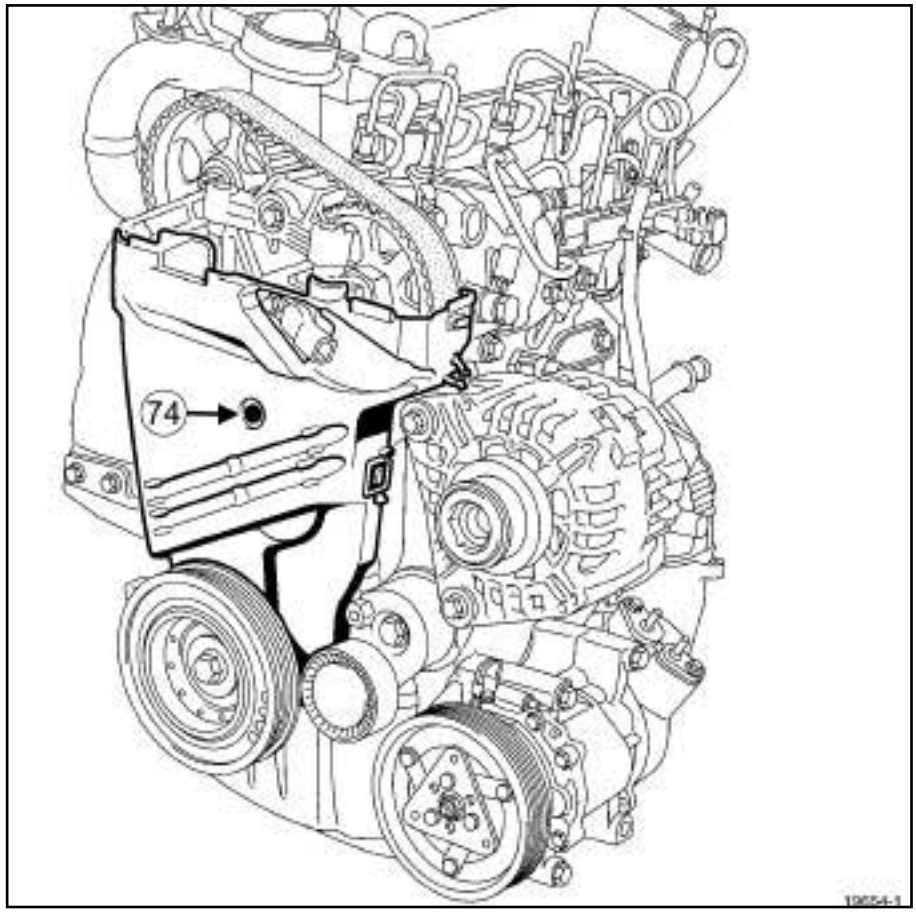
❑ Remove the following tools:

- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

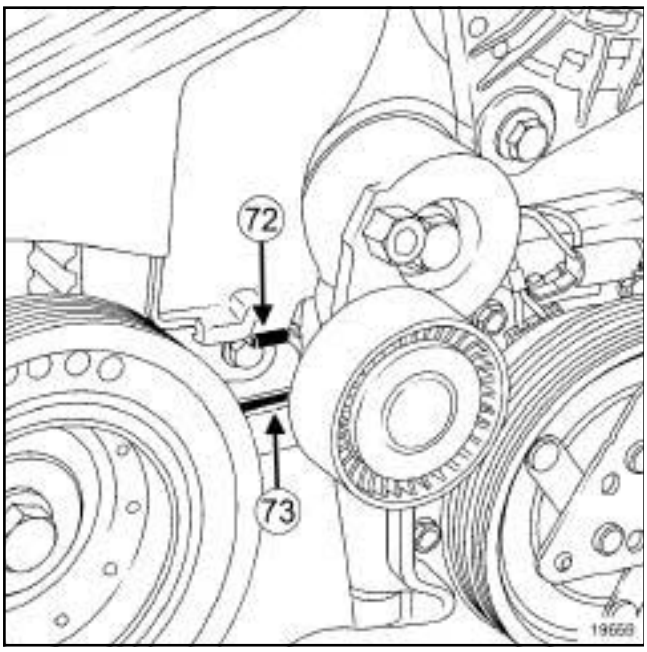
❑ Refit the TDC pin plug, coating the threading with **SILICONE ADHESIVE SEALANT**.

❑ Use a **torque wrench** to torque tighten the **TDC pin plug (25 N.m)**.

K9K, and 750 or 752



107261

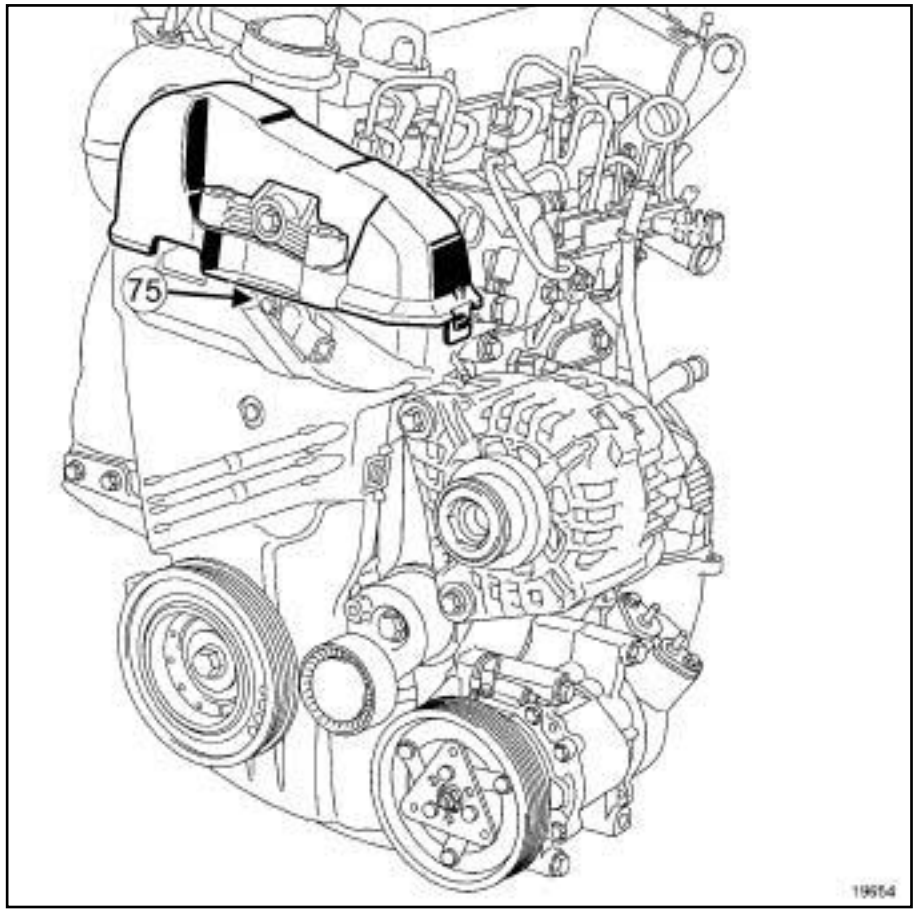


❏ Refit the cylinder head suspended mounting .

❏ Use a **torque wrench** to torque tighten the **cylinder head suspended mounting bolts (25 N.m)**.

K9K, and 750 or 752

19654-1



19659

❑ Refit:

- the lower timing cover, positioning the tab (**72**) in the inner timing cover hole (**73**) ,
- the timing cover plastic bolt (**74**) .

K9K, and 750 or 752

19654

❑ Refit the camshaft position sensor (**75**) .

❑ Use a **torque wrench** to torque tighten the **camshaft position sensor bolt (8 N.m)**.

❑ Refit the upper timing cover.

IV - FINAL OPERATION

❑ Refit:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the engine undertray.

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,

❑ Remove:

- the chain,
- the **safety strap(s)**,
- the **(Mot. 1453)**.

❑ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 764 or 772

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1489	TDC locating pin.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.

Equipment required
protective gloves
safety strap(s)
1/2" female torx socket (12.7 mm square drive)
offset spanner
torque/angle wrench
torque wrench
cylinder head bolt tightening gauge (angular measuring type)

Tightening torques ▽	
tensioning roller bolt	**27 N.m**
camshaft timing sprocket crown bolts	**14 N.m**
crankshaft accessories pulley M14 bolt	**120 N.m + 95°± 15°**
TDC setting pin plug	**25 N.m**
cylinder head suspended mounting bolts	**25 N.m**

IMPORTANT
Wear **protective gloves** during the operation.

WARNING
Never rotate the engine anti-clockwise (timing end).

WARNING
Do not run the engine without the accessories belt, to avoid breaking the crankshaft accessories pulley.

PARTS AND CONSUMABLES FOR THE REPAIR WORK

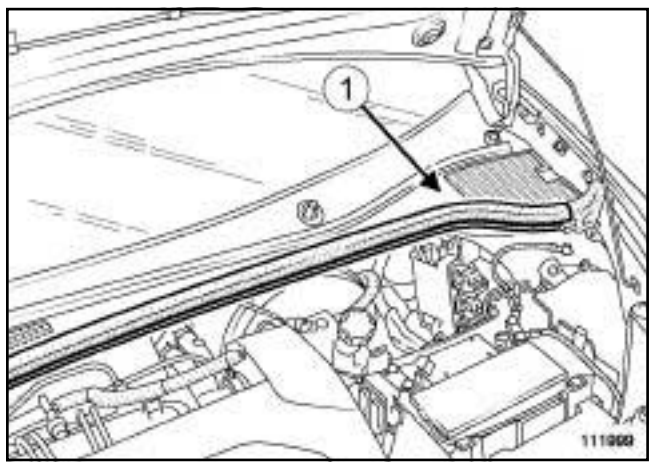
❑ **Parts always to be replaced**

- Timing belt,
- Timing belt tensioning roller,
- Crankshaft accessories pulley bolt.

❑ **Consumables**

- Silicone adhesive sealant (see **Vehicle: Parts and consumables for the repair**) (MR392, 04B, Consumables - Products).

REMOVAL



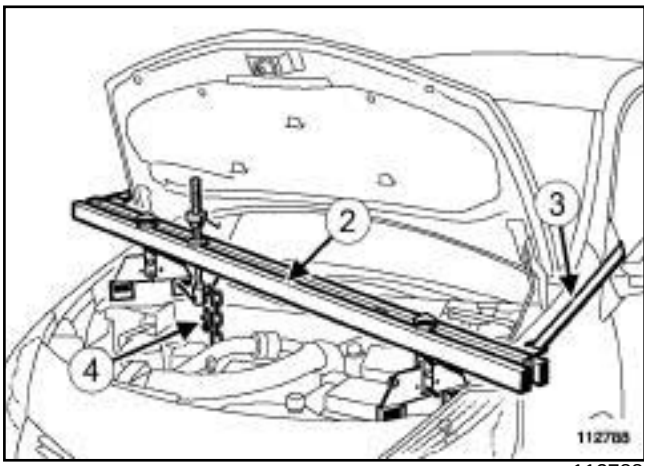
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .



111999

❑ Remove:

- the engine cover,

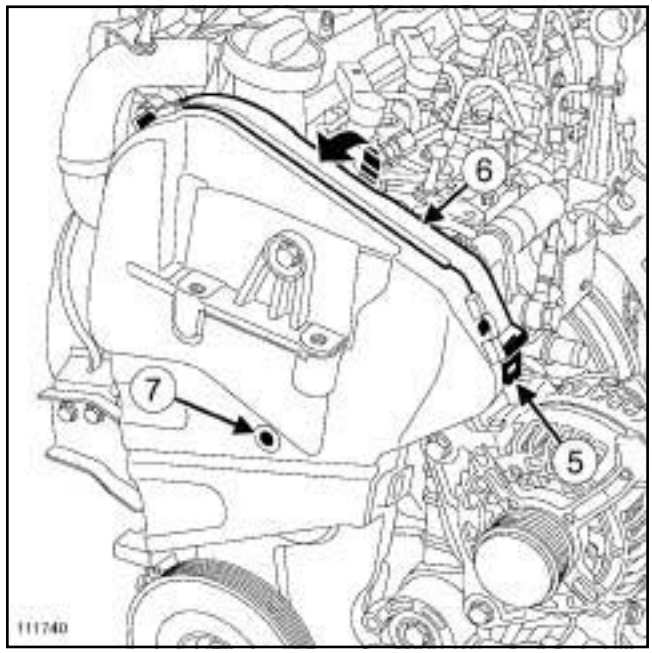
K9K, and 764 or 772

- the scuttle panel grille (**1**) (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

112788

❏ Position the **(Mot. 1453)** (**2**) and hold it in place using a **safety strap(s)** (**3**) .

❏ Fit a chain (**4**) on the lifting eye of the crankshaft end to enable the engine to be lifted using the **(Mot. 1453)**.



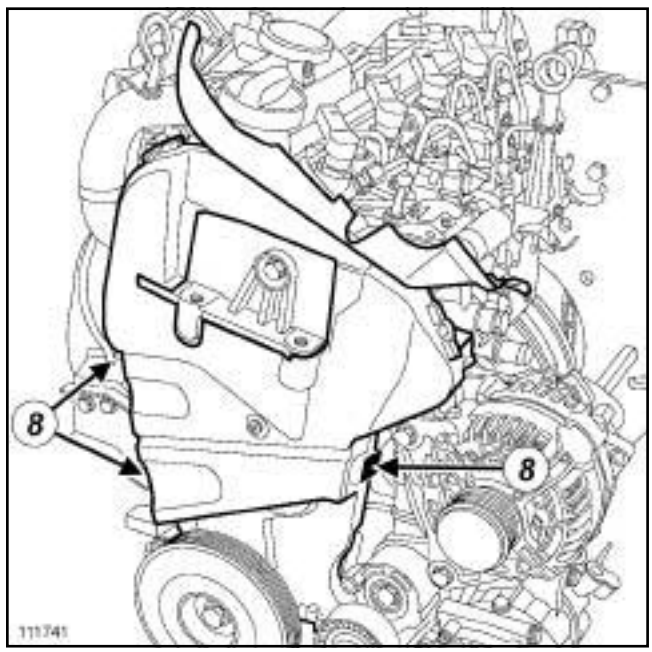
❏ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

Note:

Do not damage the air conditioning pipes.

II - OPERATION FOR REMOVAL OF PART CONCERNED

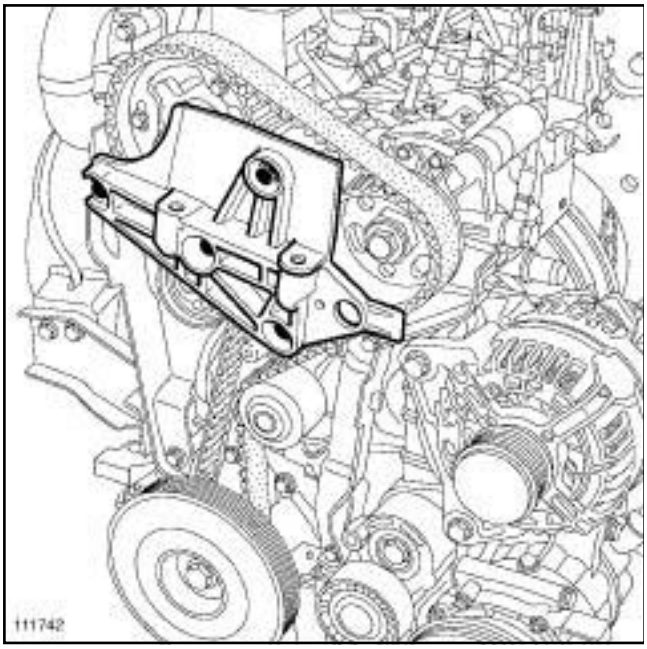


111740

❏ Unclip the tab (**5**) .

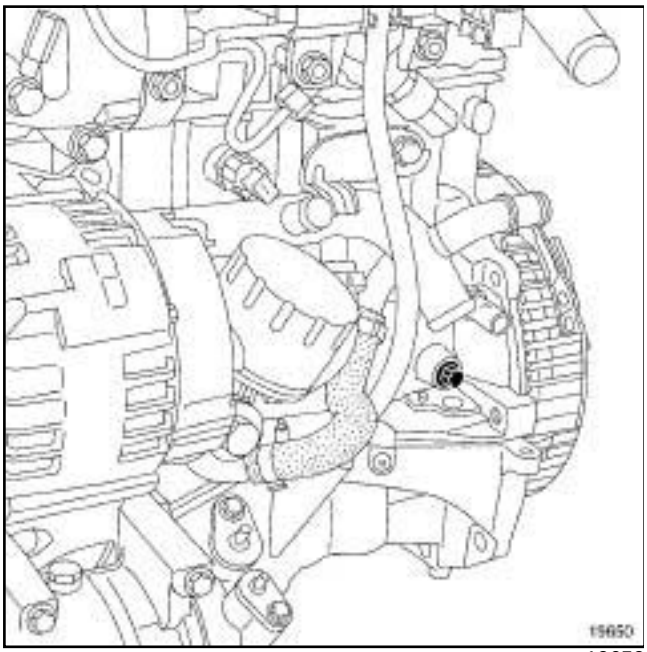
❏ Rotate the timing cover (**6**) in the direction of the arrow.

❏ Remove the plastic bolt (**7**) .



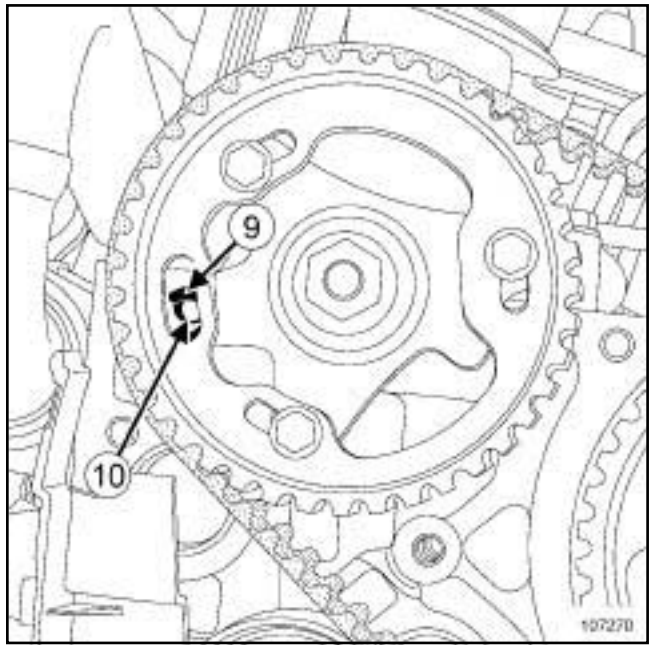
111741

❏ Unclip the three tabs (**8**) .



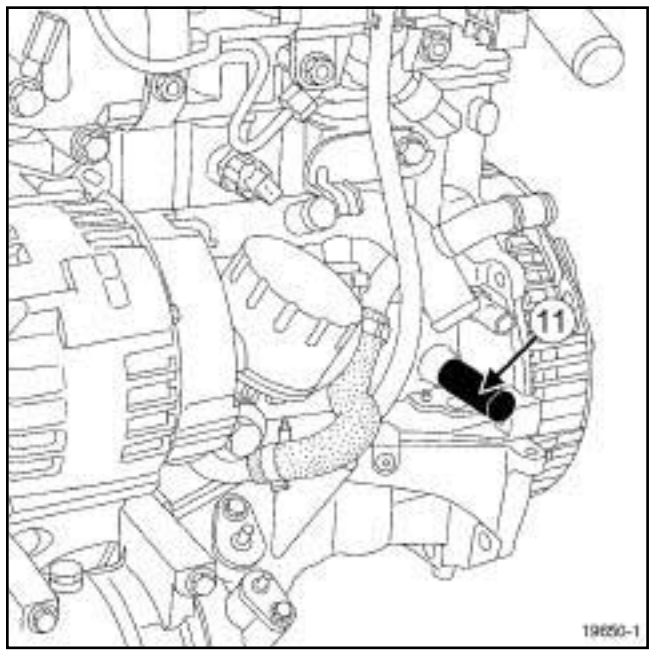
❏ Remove the timing cover.

K9K, and 764 or 772



111742

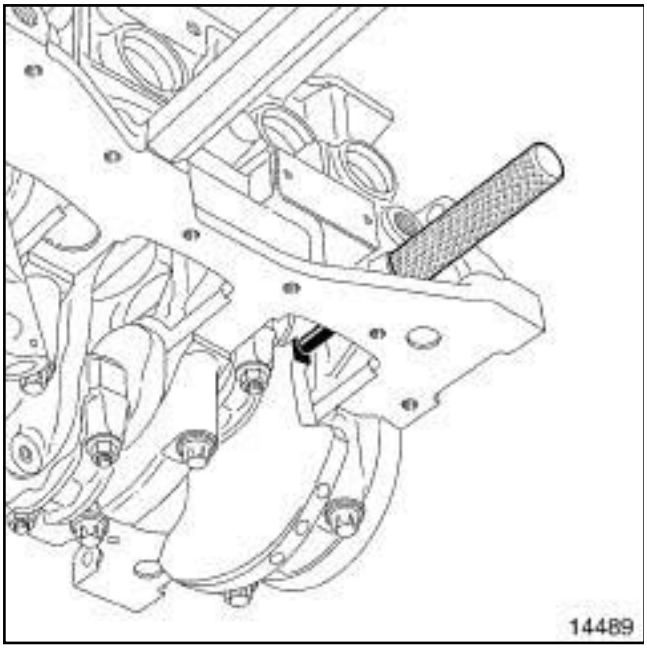
❏ Remove the cylinder head suspended mounting .



19650

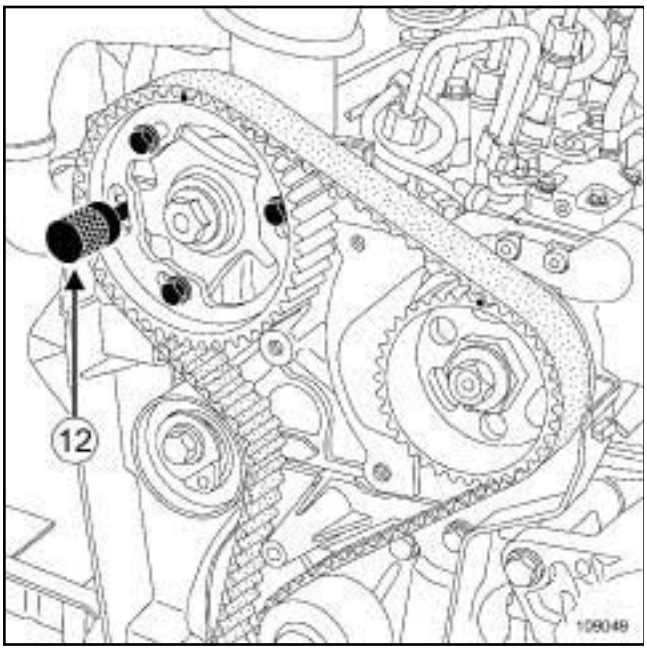
❏ Remove the TDC pin plug using a **1/2" female torx socket (12.7 mm square drive) (14)**.

107270



❏ Rotate the crankshaft clockwise (timing end) to position the hole (**9**) in the camshaft timing sprocket almost opposite the hole (**10**) in the cylinder head.

19650-1

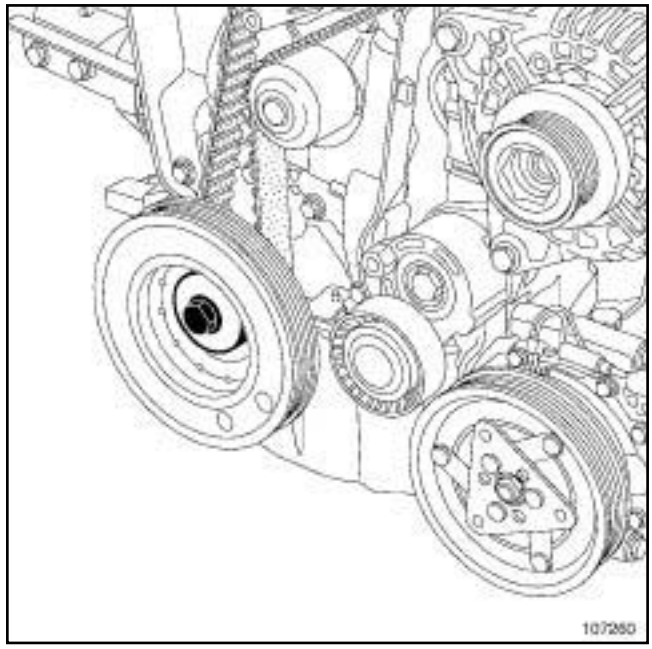


❏ Screw in the TDC setting pin (**11**) **(Mot. 1489)**.

K9K, and 764 or 772

14489

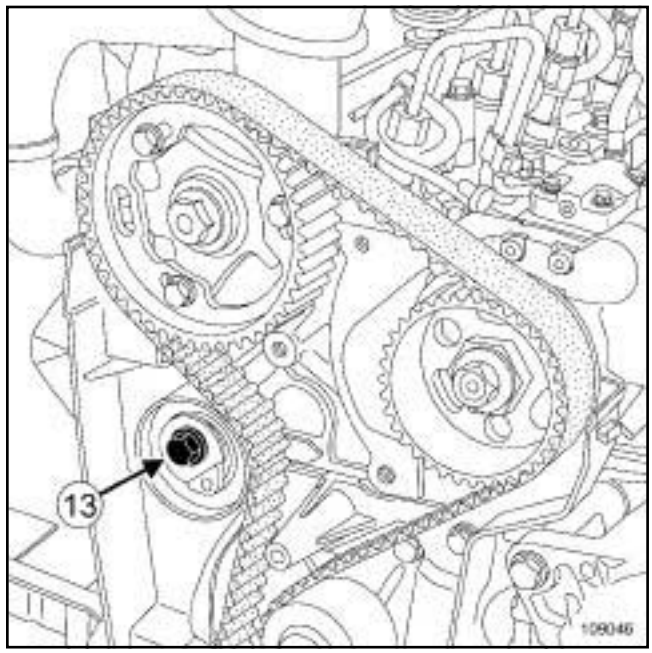
❏ Turn the crankshaft clockwise (timing end) smoothly until the crankshaft comes into contact with the TDC setting pin.



109049

❏ Engage the pin (**12**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes.

❏ Remove:



- the camshaft timing sprocket setting pin **(Mot. 1430)**,
- the TDC setting pin **(Mot. 1489)**.

❏ Remove the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) .

107260

❏ Remove the crankshaft accessories pulley by locking the flywheel with a large flat-blade screwdriver and passing via the starter location.

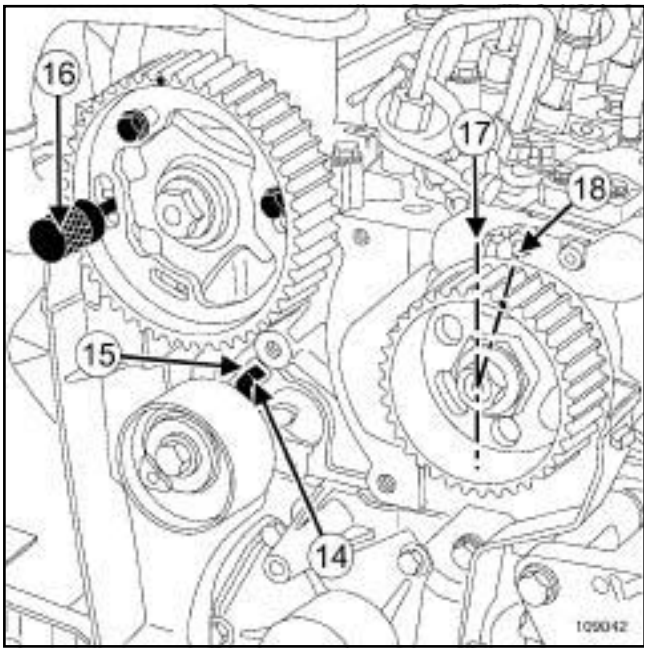
109046

❏ Slacken the tensioning roller bolt (**13**) .

❏ Slacken the timing tension wheel by turning the eccentric cam using a **6 mm** Allen key.

❏ Remove:

- the timing belt,
- the timing tensioning roller.



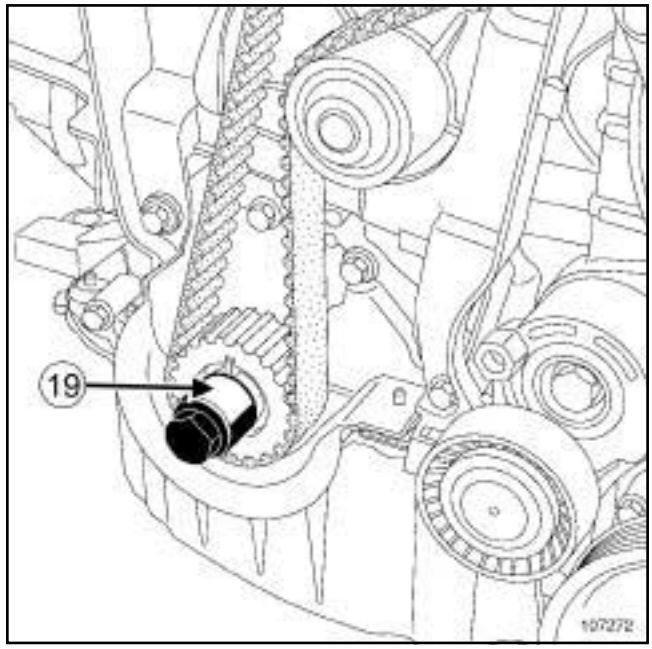
K9K, and 764 or 772

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Check:

- that there is no oil leak from the camshaft and crankshaft seals,
- the condition of the coolant pump (hard seal, play in the shaft, fluid leak, shaft rotation, (see **Technical Note 3175A, Cooling system fault finding, 19A, Cooling, Cooling system - Fault finding chart ALP 8**).

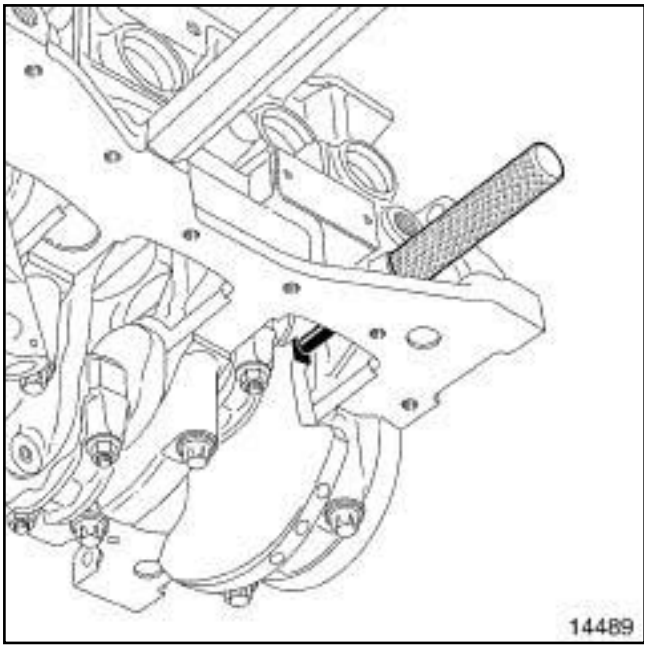


109042

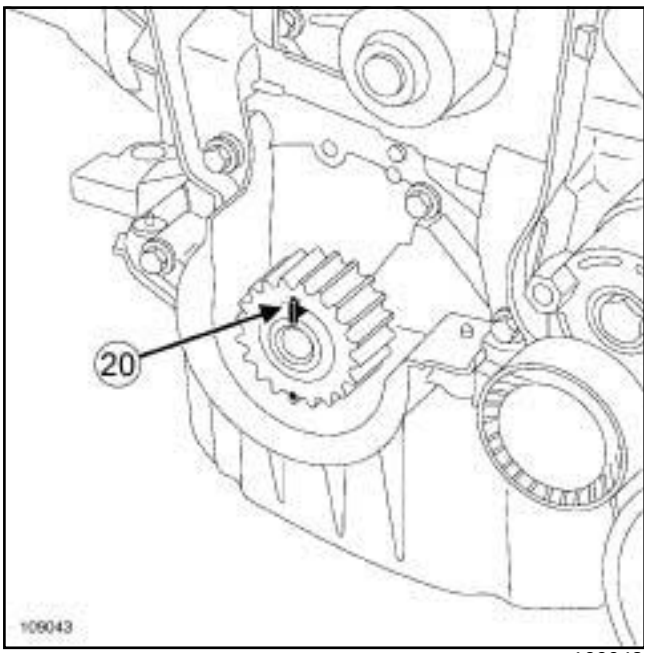
❏ Refit the timing tensioning roller.

❏ Put the tensioning roller lug (**14**) in the cylinder head groove (**15**) .

❏ Engage the pin (**16**) **(Mot. 1430)** in the camshaft timing sprocket and cylinder head holes, turning the camshaft using a **offset spanner (18 mm)** if necessary.



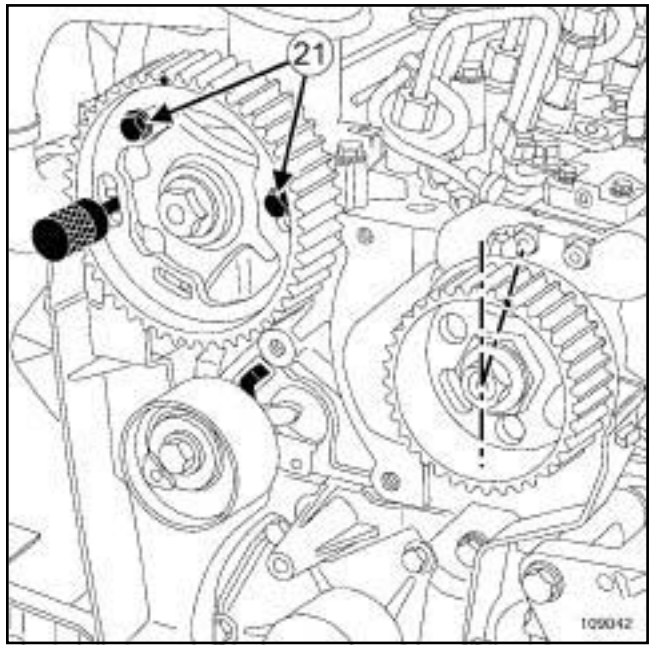
❏ Check that the high pressure pump mark (**18**) has shifted one tooth to the right of the vertical axle (**17**) .



107272

❏ Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) (**19**) onto the crankshaft.

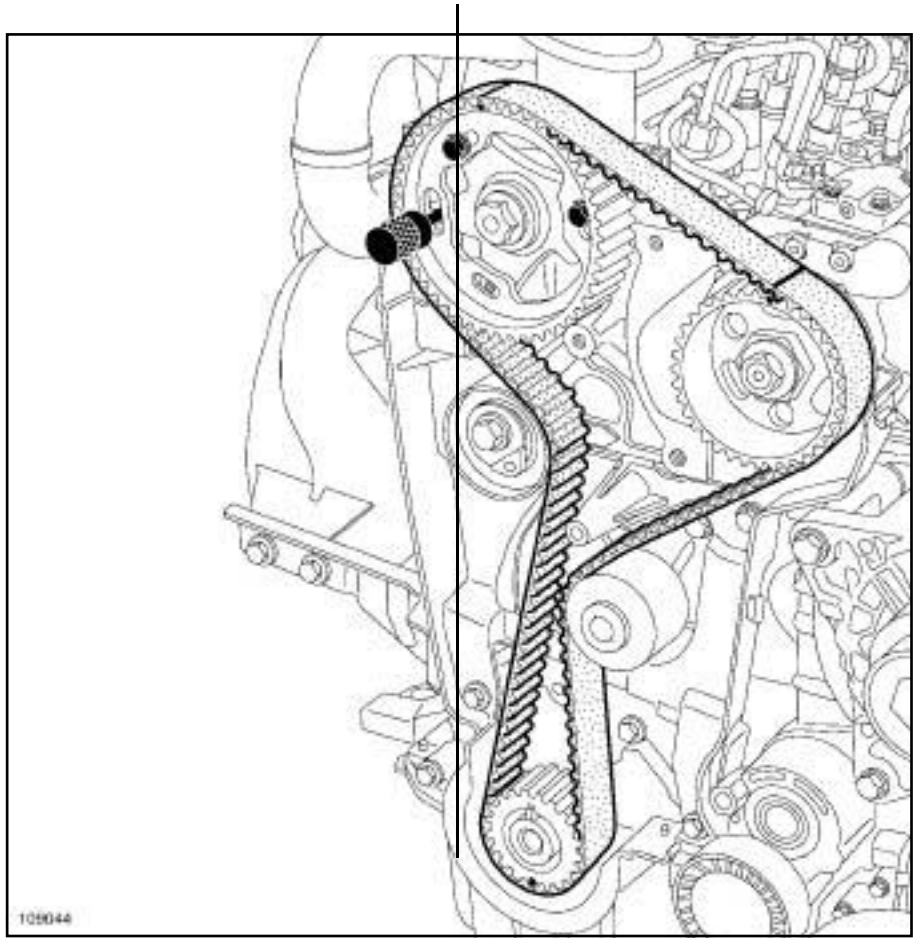
K9K, and 764 or 772



14489

109043

❑ Position the crankshaft so that it presses on the TDC setting pin **(Mot. 1489)** (the crankshaft timing sprocket collet (**20**) must face upwards).

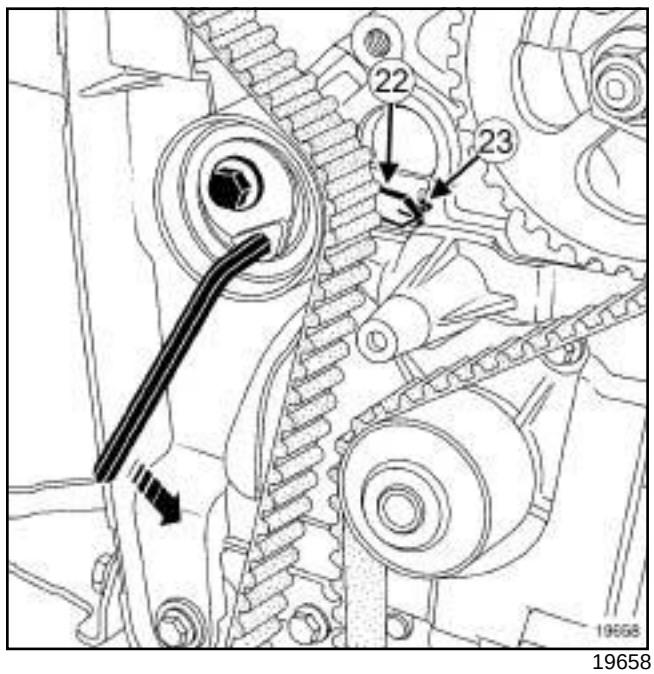


109042

❑ Remove one of the camshaft timing sprocket crown bolts to prevent full lock during the following actions.

❑ Loosen the other two camshaft timing sprocket crown bolts (**21**) by one turn.

K9K, and 764 or 772

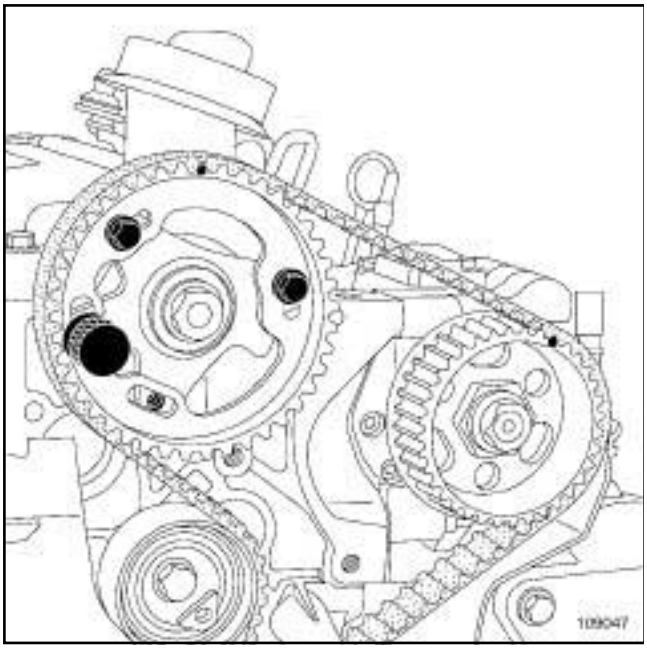


109044

❑ Fit the timing belt, starting with the crankshaft sprocket, by aligning the marks on the belt with those on the crankshaft and camshaft sprockets, and the high pressure pump pinion.

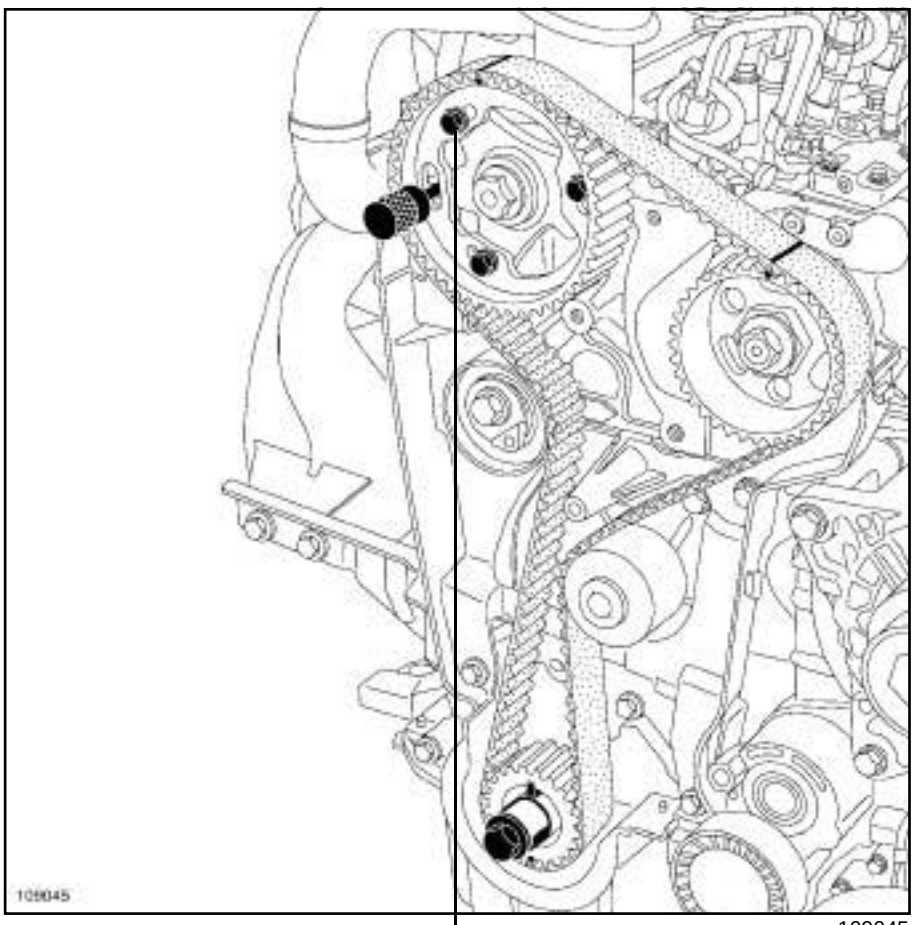
Note:

There should be 19 tooth valleys on the belt between the camshaft sprocket marks and the high-pressure pump, and 51 tooth valleys between the crankshaft sprockets and the high-pressure pump.



19658

❑ Position the tensioning roller adjustable index marker (**22**) opposite the lug (**23**) , turning the eccentric cam anti-clockwise using a **6 mm** Allen key.



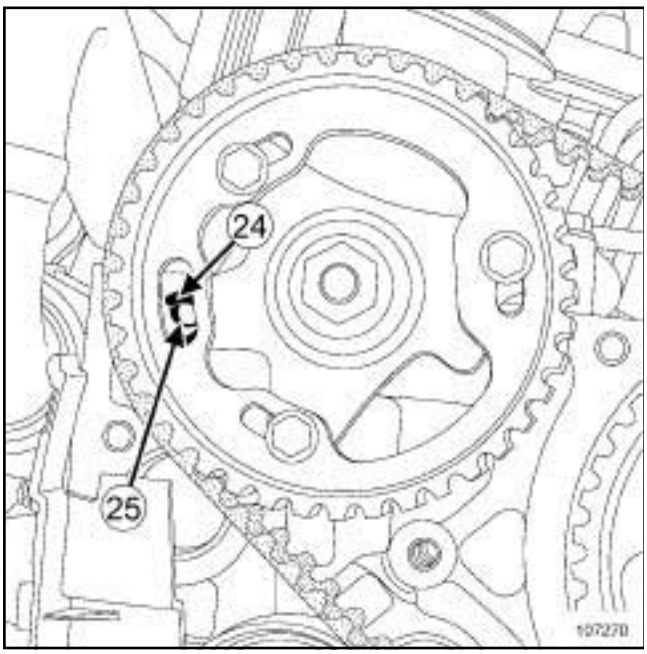
❑ Torque tighten the **tensioning roller bolt (27 N.m)**.

K9K, and 764 or 772

109047

❑ Check that the camshaft timing sprocket crown bolts are not fully locked against the camshaft timing sprocket crown. If they are, repeat the timing belt re-fitting procedure.

109045

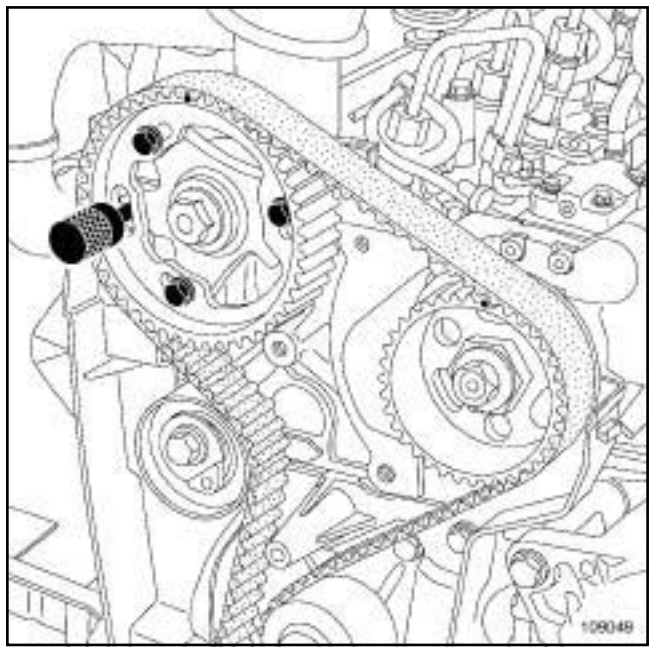


❑ Refit the bolt from the camshaft timing sprocket crown.

K9K, and 764 or 772

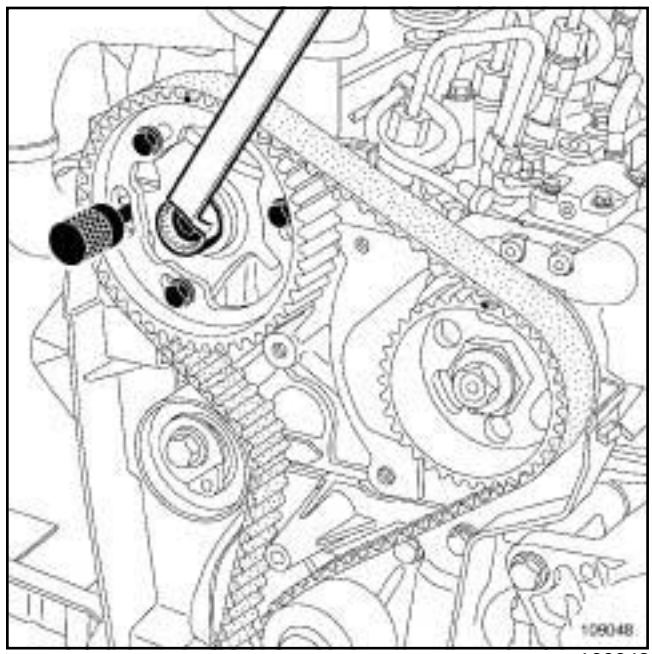
❏ Torque tighten the **camshaft timing sprocket crown bolts (14 N.m)**.

❏ Remove:



- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

107270

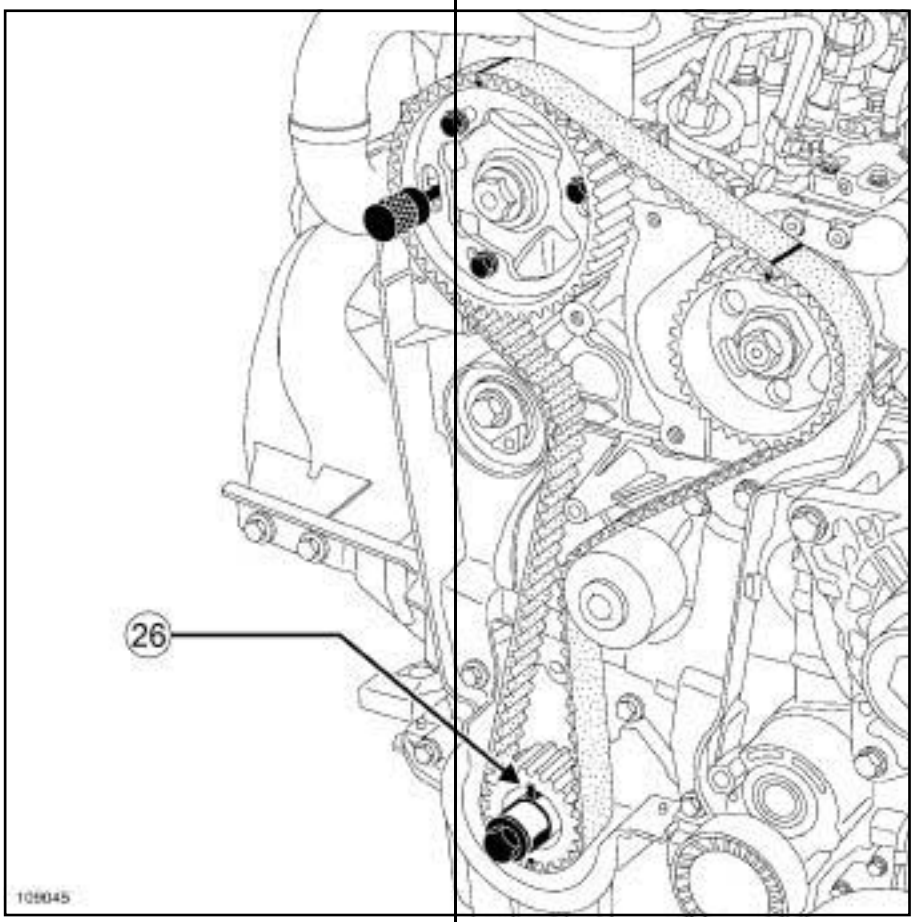


❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole (**24**) in the camshaft timing sprocket is opposite the hole (**25**) in the cylinder head:

- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

❏ Lock the camshaft timing sprocket using the **(Mot. 1430)**.



109048

❏ If the pin **(Mot. 1430)** does not engage:

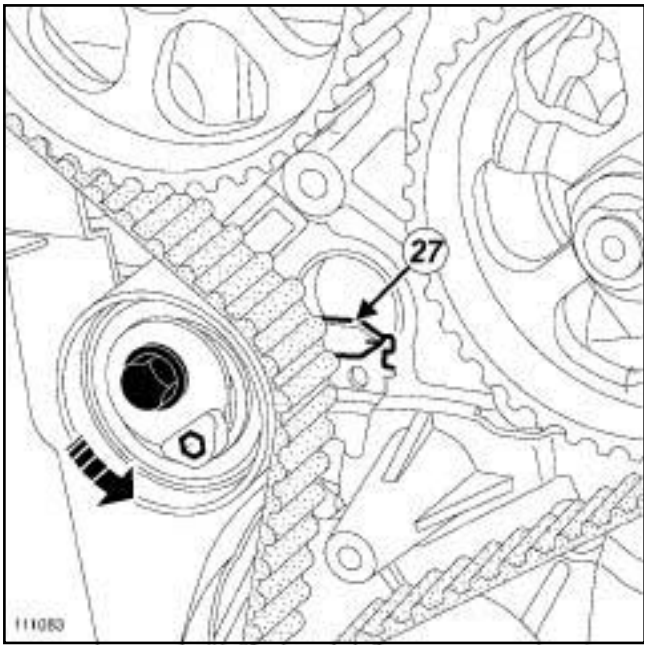
- loosen the camshaft timing sprocket crown bolts by a maximum of one turn,
- turn the camshaft timing sprocket hub using an **18 mm** offset spanner to facilitate setting of the camshaft timing sprocket hub,
- do not retighten the camshaft timing sprocket crown bolts.

K9K, and 764 or 772

❑ Loosen the camshaft timing sprocket crown bolts by a maximum of one turn.

109045

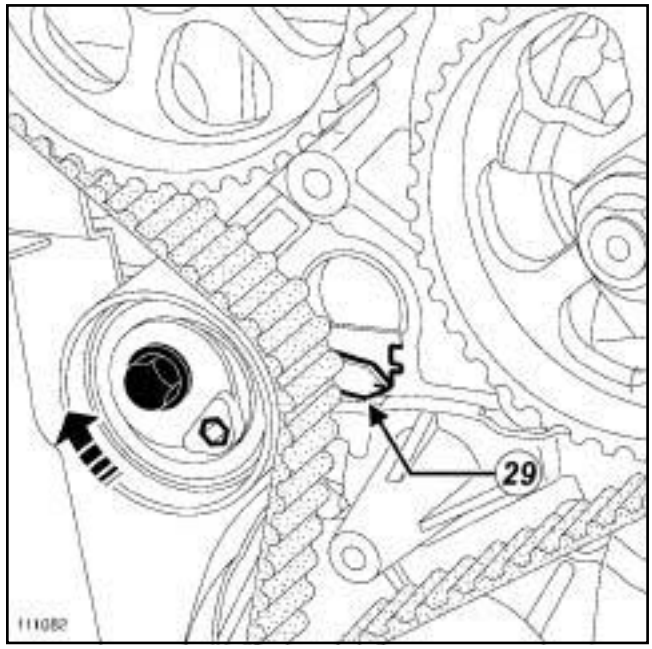
❑ Check that the crankshaft timing sprocket collet (**26**) is positioned vertically at the top.



Note:

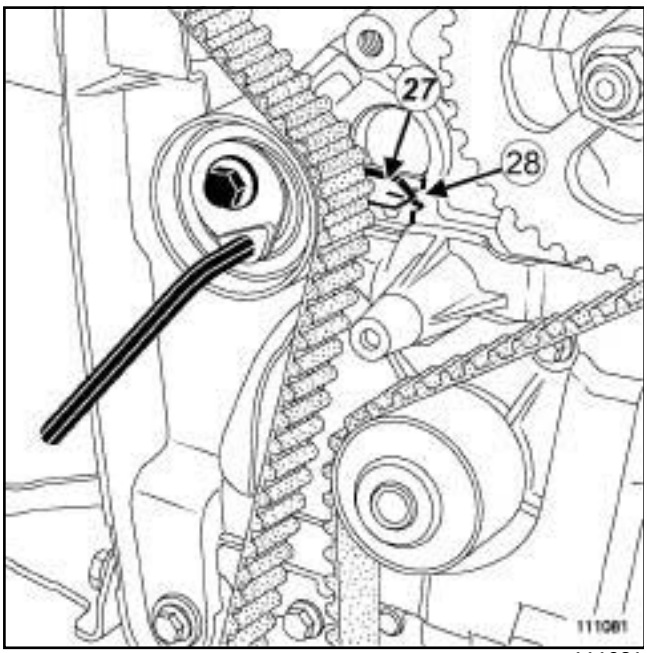
After two turns, the tension wheel index markers may be in two different positions.

The rotation of the tension wheel eccentric depends on the position.



K9K, and 764 or 772

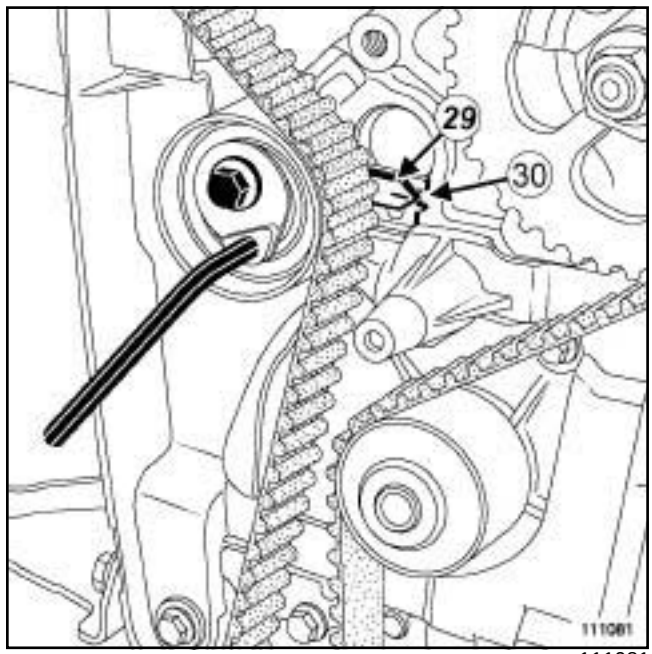
First position



111083

Second position

111082



111081

❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**27**) in the middle of the timing window (**28**) , turning the key anti-clockwise.

❏ Torque tighten:

- the **tensioning roller bolt (27 N.m)**,
- the **camshaft timing sprocket crown bolts (14 N.m)**.

111081

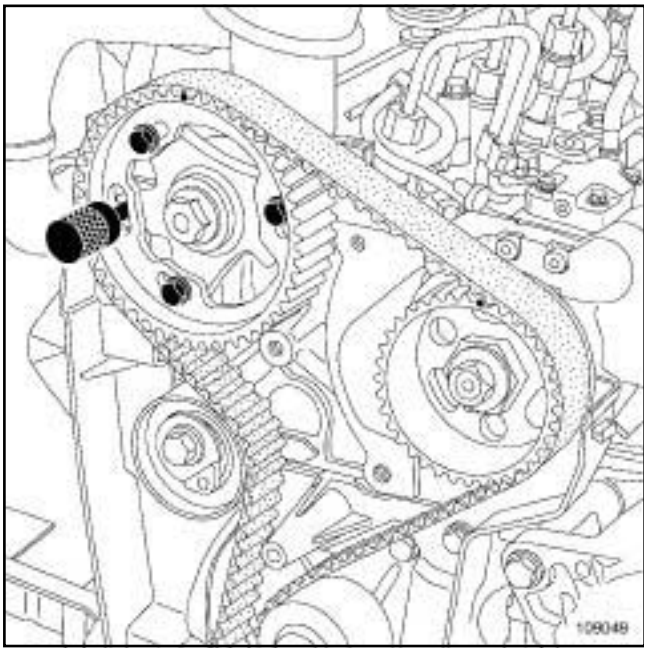
❏ Loosen the tensioning roller bolt by no more than one turn, holding it with a **6 mm** Allen key.

❏ Gradually align the adjustable index (**29**) in the middle of the timing window (**30**) , turning the key clockwise.

❏ Torque tighten:

- the **tensioning roller bolt (27 N.m)**,
- the **camshaft timing sprocket crown bolts (14 N.m)**.

❏ Remove the following tools:

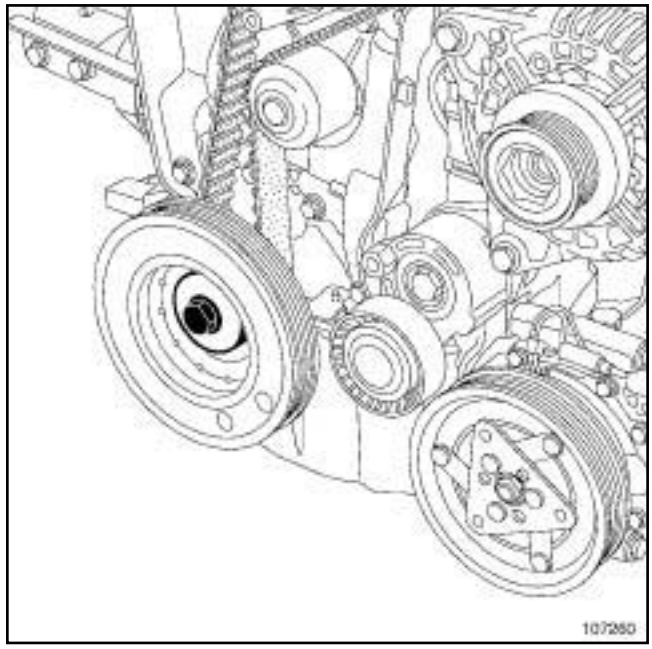


- the TDC setting pin **(Mot. 1489)**,

K9K, and 764 or 772

- the camshaft timing sprocket setting pin **(Mot. 1430)**.

❏ Rotate the crankshaft clockwise through two revolutions (timing end). Before the hole in the camshaft timing sprocket is opposite the hole in the cylinder head:



- screw the TDC setting pin **(Mot. 1489)** into the cylinder block,
- bring the crankshaft slowly and smoothly against the TDC setting pin.

109049

❏ Lock the camshaft timing sprocket using the **(Mot. 1430)**.

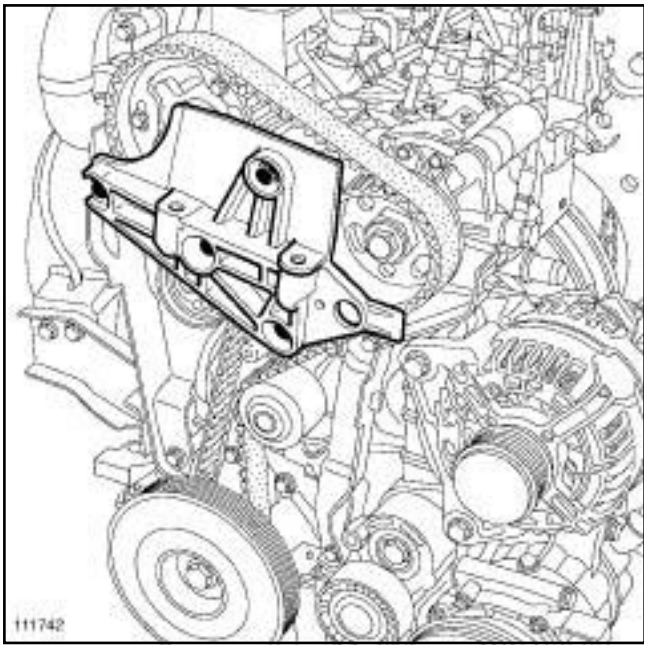
❏ If the pin does not engage, repeat the timing belt refitting operation.

107260

❏ Refit the accessories crankshaft pulley with a new bolt.

❏ Torque and angle tighten (crankshaft against the TDC setting pin) the **crankshaft accessories pulley M14 bolt (120 N.m + 95°± 15°)** using a **torque/angle wrench** or a **torque wrench** fitted with a **cylinder head bolt tightening gauge (angular measuring type)**.

❏ Remove the following tools:

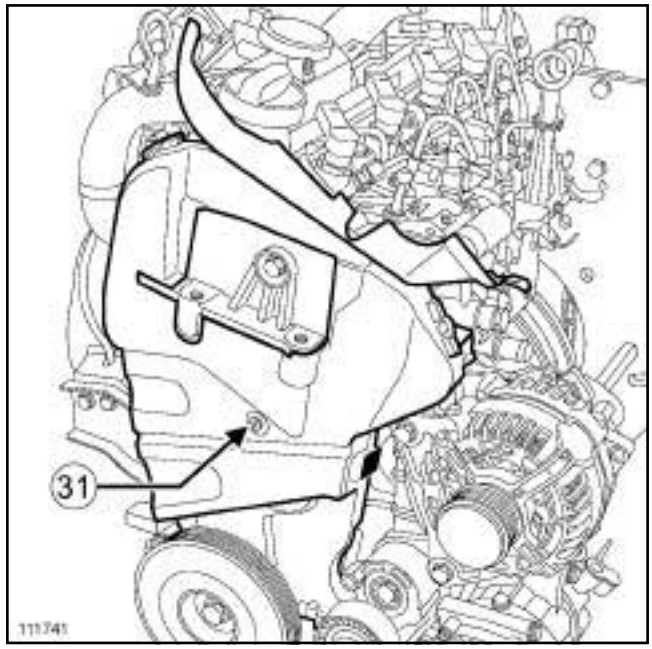


- the TDC setting pin **(Mot. 1489)**,
- the camshaft timing sprocket setting pin **(Mot. 1430)**.

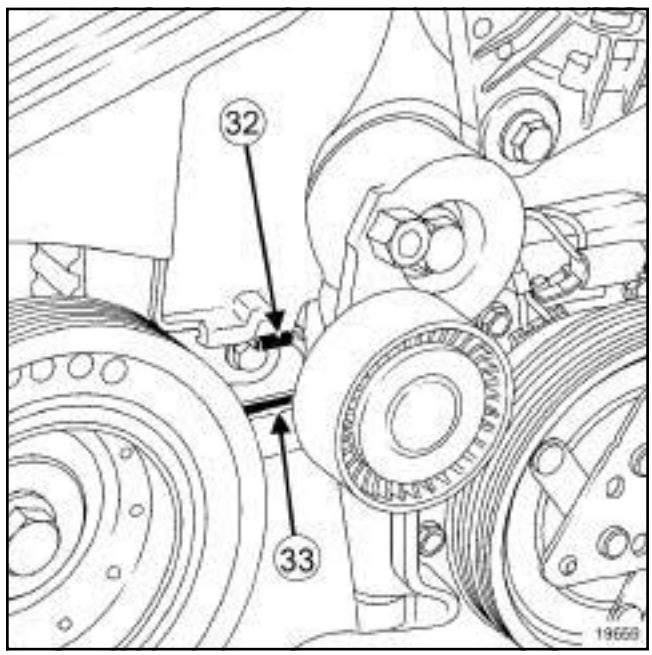
❏ Refit the TDC pin plug, coating the threading with **SILICONE ADHESIVE SEALANT**.

❏ Torque tighten the **TDC setting pin plug (25 N.m)**.

❏ Refit the starter (see **16A**, **Starting - Charging**, **Starter: Removal - Refitting**, page **16A-23**) .



K9K, and 764 or 772



111742

❑ Refit the cylinder head suspended mounting .

❑ Torque tighten the **cylinder head suspended mounting bolts (25 N.m)**.

111741

19659

❑ Refit:

- the timing cover, positioning the tab (**32**) in the inner timing cover hole (**33**) ,
- the timing cover plastic bolt (**31**) .

II - FINAL OPERATION

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,

K9K, and 764 or 772

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,

❑ Remove:

- the **safety strap(s)**,
- the chain,
- the **(Mot. 1453)**.

❑ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the engine undertray.
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 764 or 772

M4R

Special tooling required	
Mot. 919-02	Flywheel locking tool.
Mot. 1716	Removes housing with silicone seals.

Tightening torques ▽	
timing chain guide bolts	**25 N.m**
bolt of the timing chain tensioner pad	**25 N.m**
timing chain tensioner bolts	**10 N.m**
timing cover M5 bolts	**7 N.m**
timing cover M6 bolts	**25 N.m**
timing cover M10 bolts	**55 N.m**
timing cover M12 bolts	**75 N.m**
camshaft dephaser solenoid valve bolt	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑

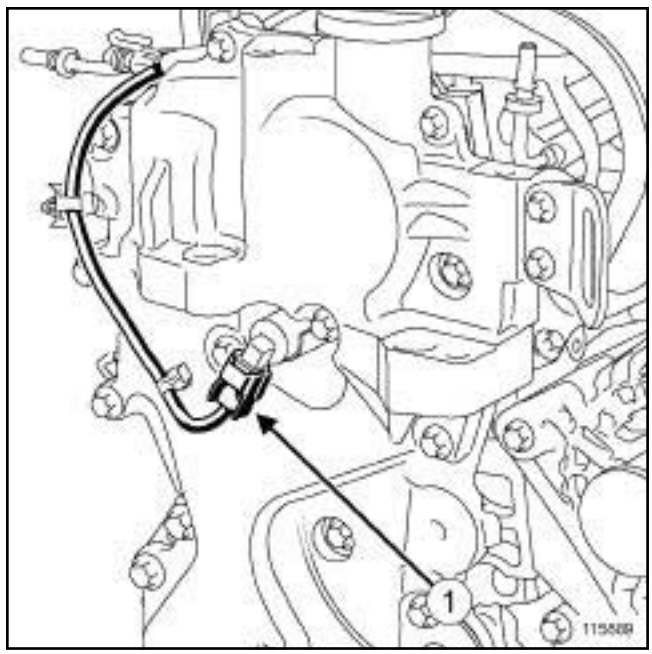
IMPORTANT
To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Engine: Precautions for the repair**) .

WARNING
Applying pressure to the engine oil sump is strictly forbidden. Any damage to the sump may also damage the engine.

❑ Remove the « engine and gearbox » assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .

M4R, and 700

❑ Disconnect the manual gearbox from the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

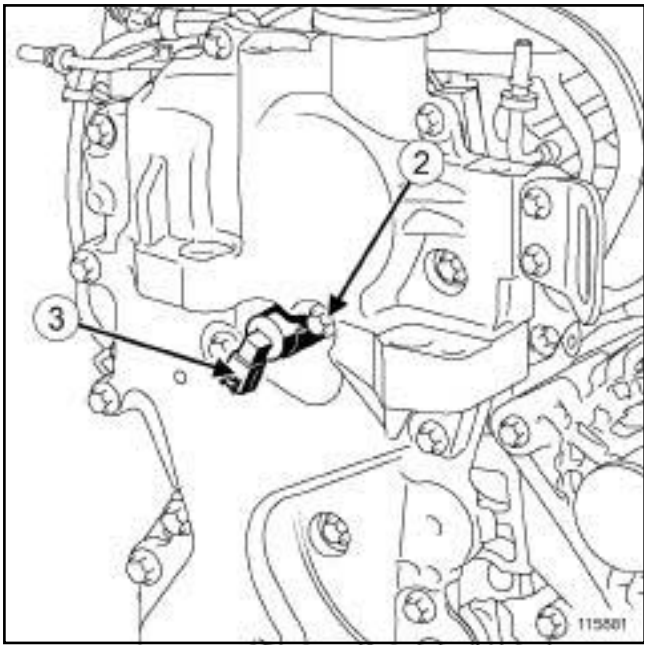


M4R, and 701

❑ Disconnect the automatic gearbox from the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

❑ Place the engine on the component support (see **Engine support equipment: Use**) .

❑ Drain the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

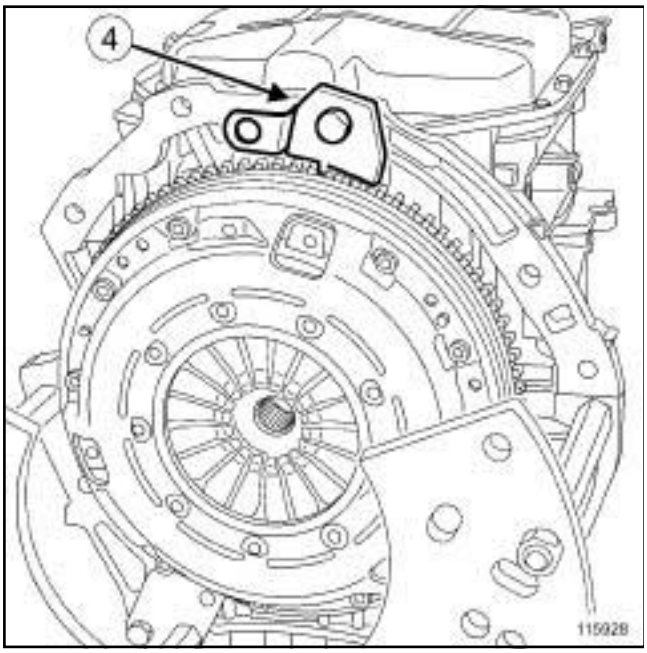


❑ Remove the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

115889

❑ Disconnect the wiring (**1**) from the camshaft dephaser solenoid valve.

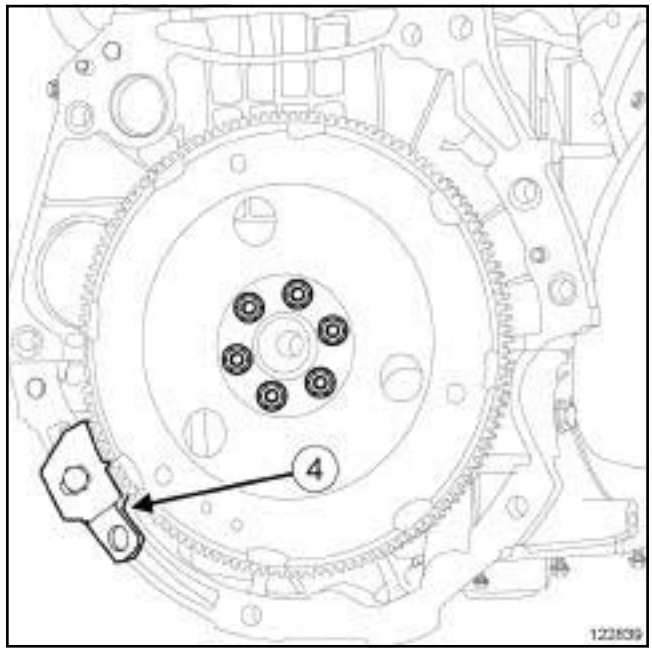
M4R



115881

❑ Remove:

- the bolt (**2**) from the camshaft dephaser solenoid valve,
- the camshaft dephaser solenoid valve (**3**) .



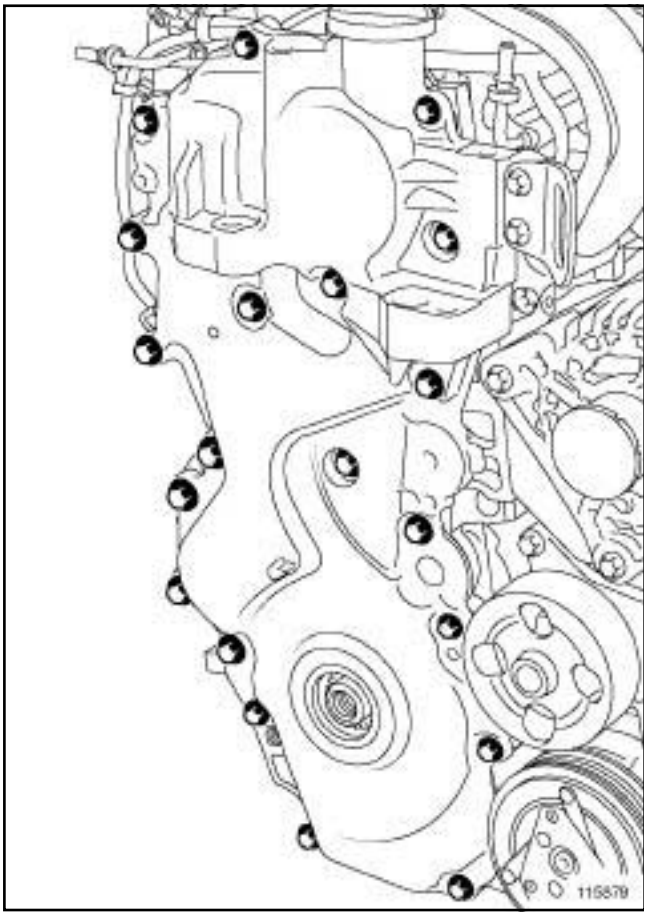
M4R, and 700

115928

❑ Fit the flywheel locking tool **(Mot. 919-02)** (**4**) onto the cylinder block.

M4R, and 701

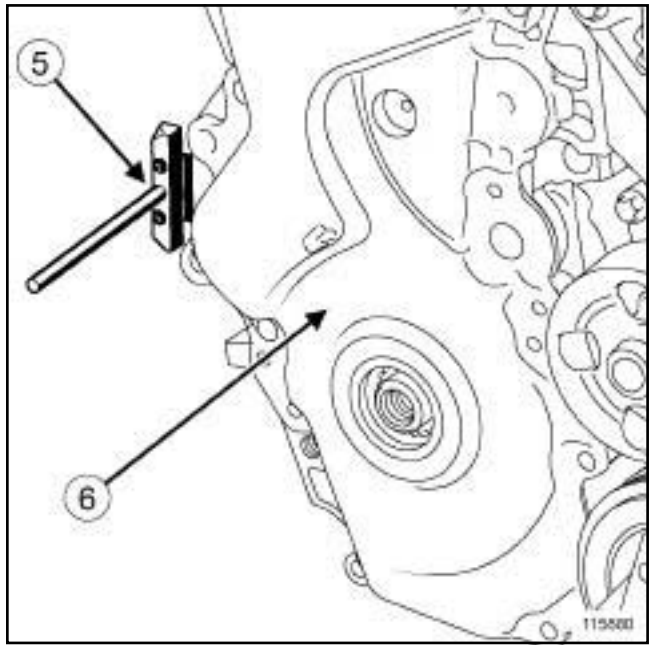
122839



❑ Fit the drive plate locking tool **(Mot. 919-02)** (**4**) on the cylinder block.

❑ Remove:

- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the crankshaft seal on the timing side (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) .

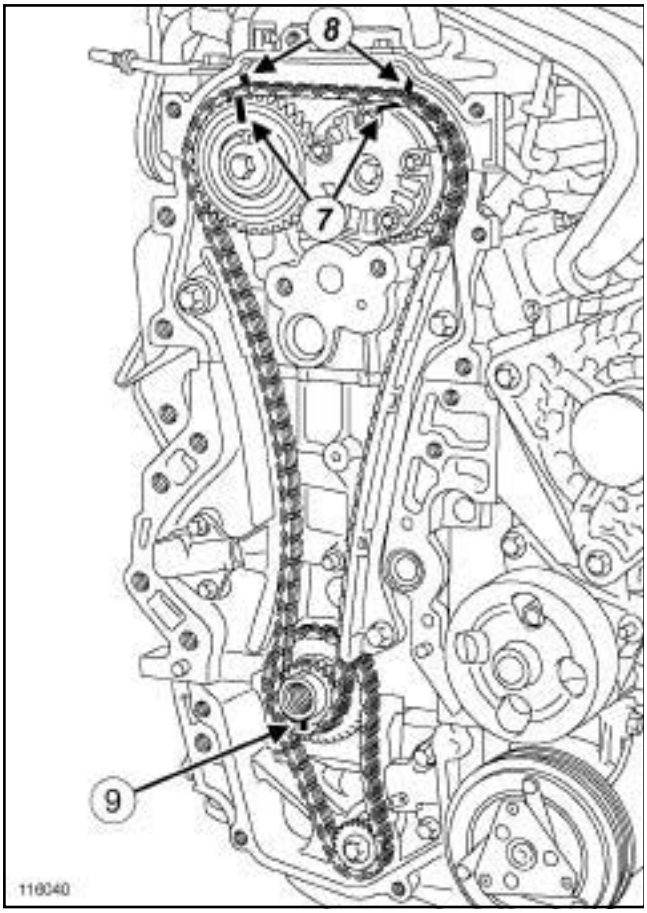


M4R

II - TIMING CHAIN REMOVAL OPERATION

115879

❏ Remove the bolts from the timing cover, marking the position of the bolts.



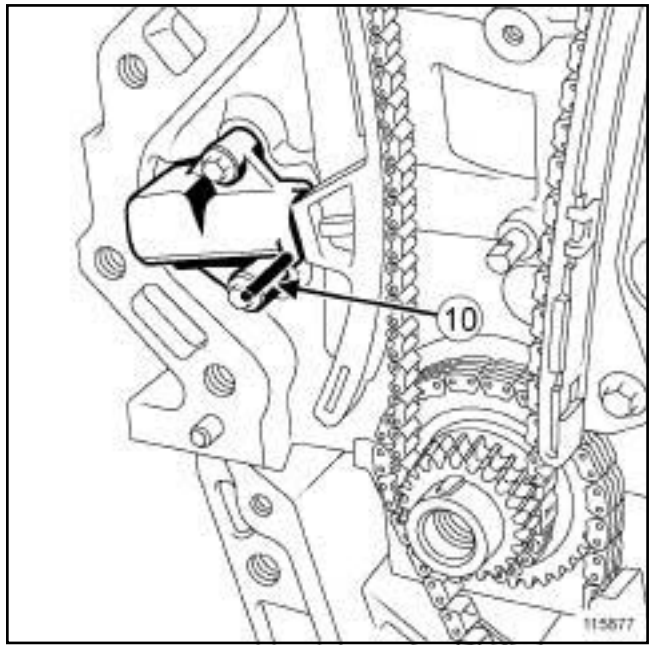
115880

❏ Remove the timing cover using the **(Mot. 1716)** (**5**) .

❏ Remove the timing cover (**6**) .

❏ Tighten the crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) onto the crankshaft.

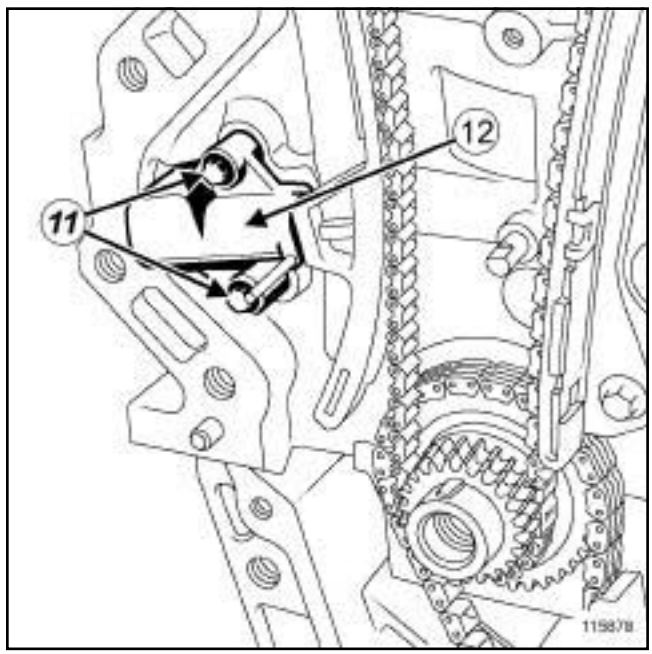
❏ Remove the tool **(Mot. 919-02)**.



116040

❏ With a smooth action, turn the crankshaft clockwise (timing end) so that marks (**7**) of the camshaft sprockets are aligned with marks (**8**) on the cylinder head cover, and ensure that mark (**9**) on the crankshaft sprocket is in the lower vertical position.

❏ Position the **(Mot. 919-02)**.

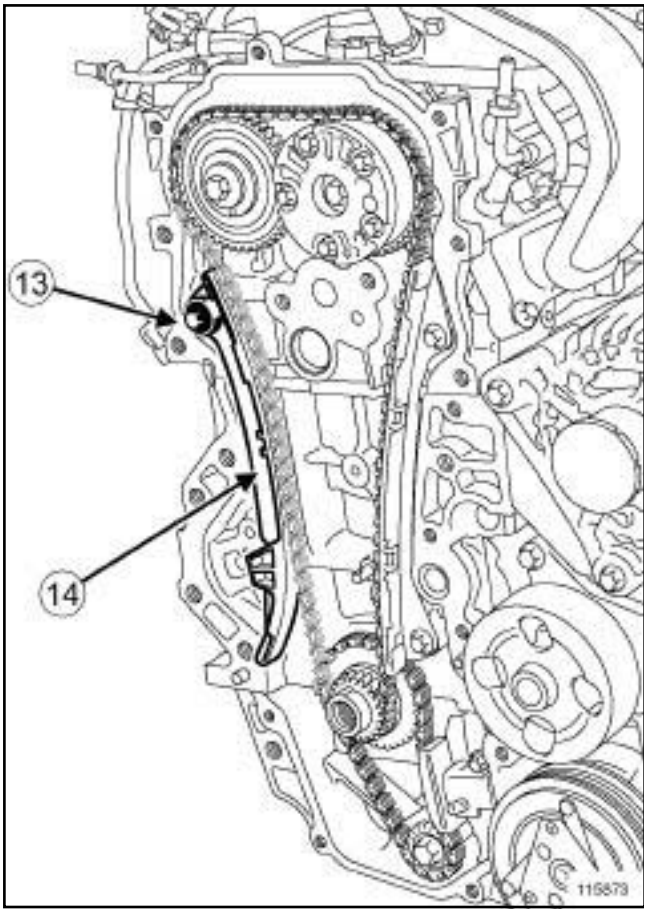


❏ Remove the crankshaft accessories pulley bolt.

115877

❏ Engage the timing chain tensioner.

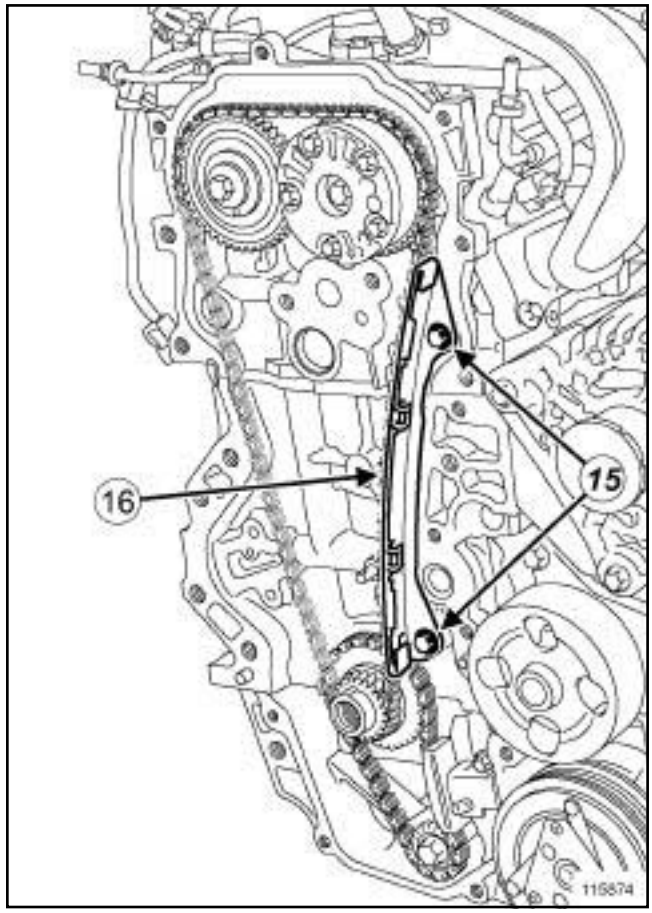
❏ Put a metal rod (**10**) into the tensioner to keep the chain loose.



115878

❏ Remove:

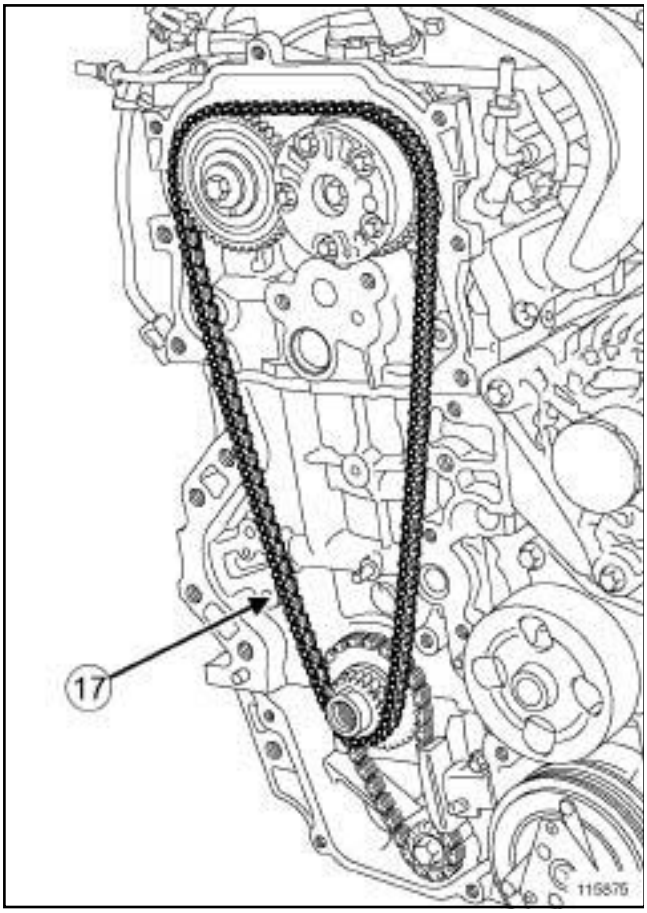
- the timing chain tensioner bolts (**11**) ,
- the timing chain tensioner (**12**) .



M4R

115873

❑ Remove:



- the bolt (**13**) of the timing chain tensioner pad,
- the timing chain tensioner pad (**14**) .

115874

❑ Remove:

- the timing chain guide bolts (**15**) ,
- the timing chain guide (**16**) .

115875

❑ Remove the timing chain (**17**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

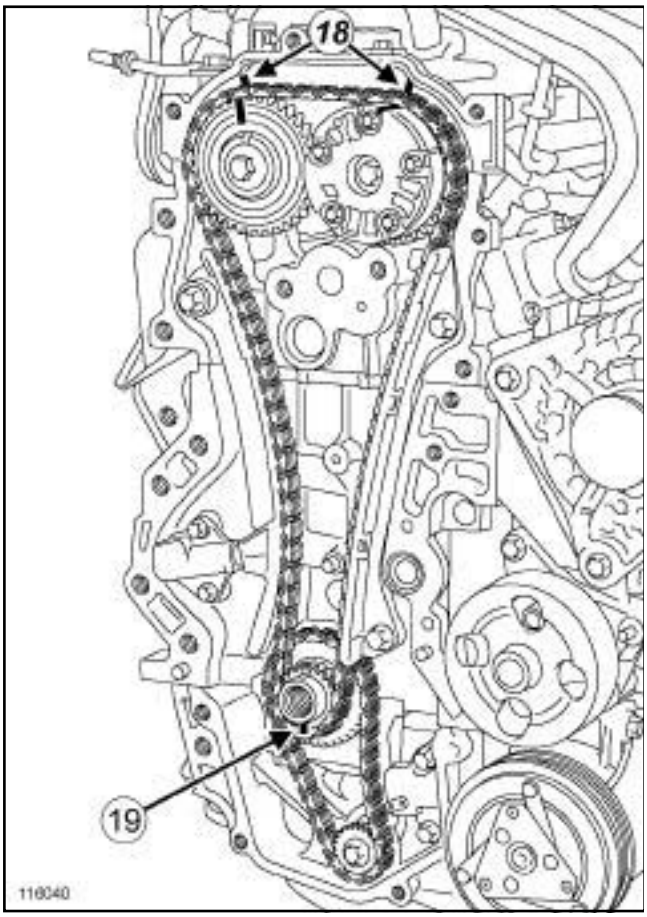
❑ Clean the joint faces of the timing cover using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❑ Remove the residue using a plastic spatula.

❑ Finish cleaning the joint faces using a **GREY ABRASIVE PAD**, part number **77 01 405 943**.

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



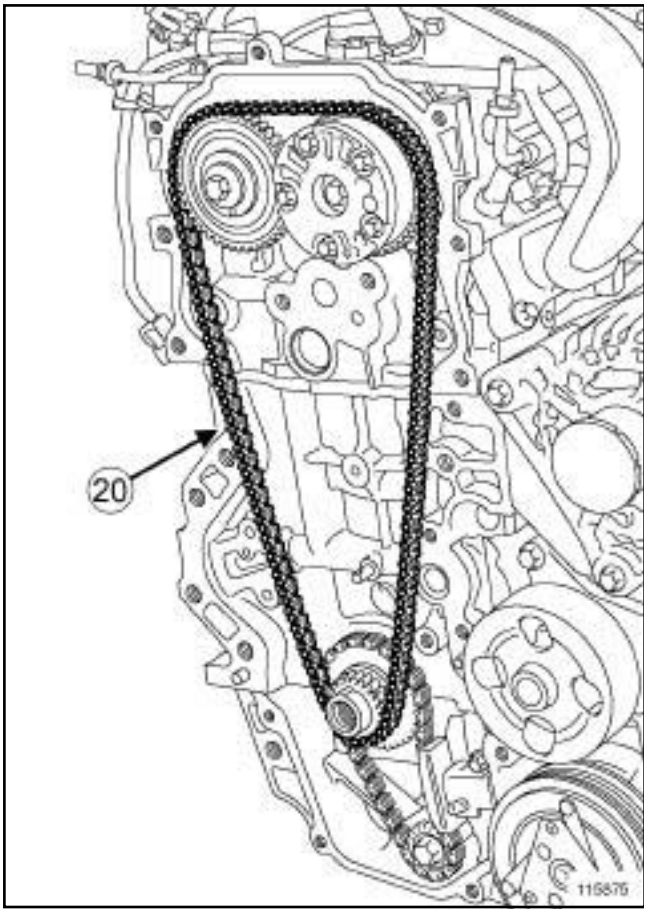
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the joint face of the timing cover on the cylinder block and on the cylinder head,
- the timing cover.

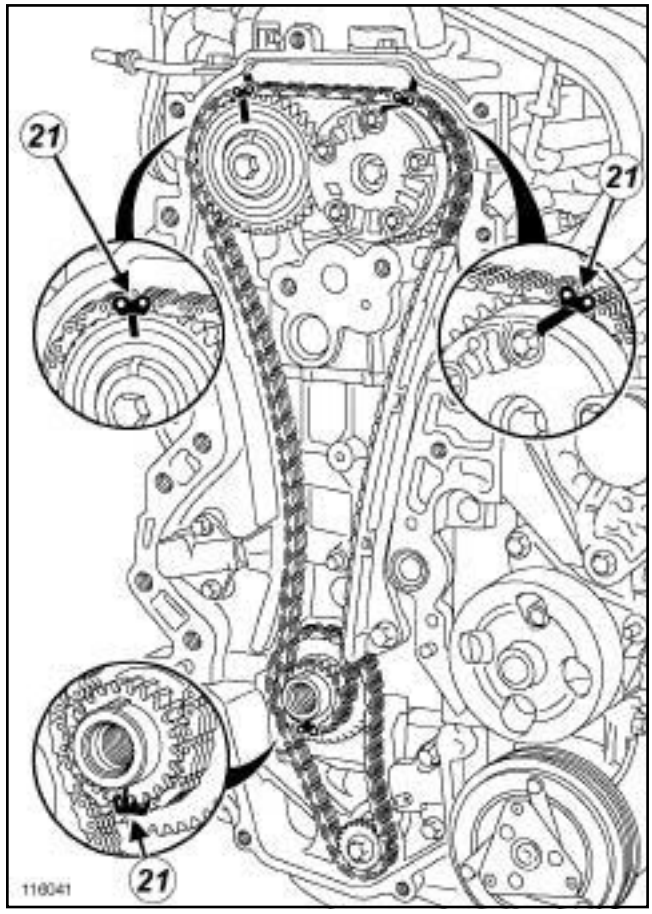
❑ Parts always to be replaced:

- the crankshaft accessories pulley bolt,
- the timing chain tensioner pad,
- the timing chain tensioner,
- the timing chain,
- the crankshaft seal on the timing side,
- the timing chain guide.

II - OPERATION FOR REFITTING THE TIMING CHAIN



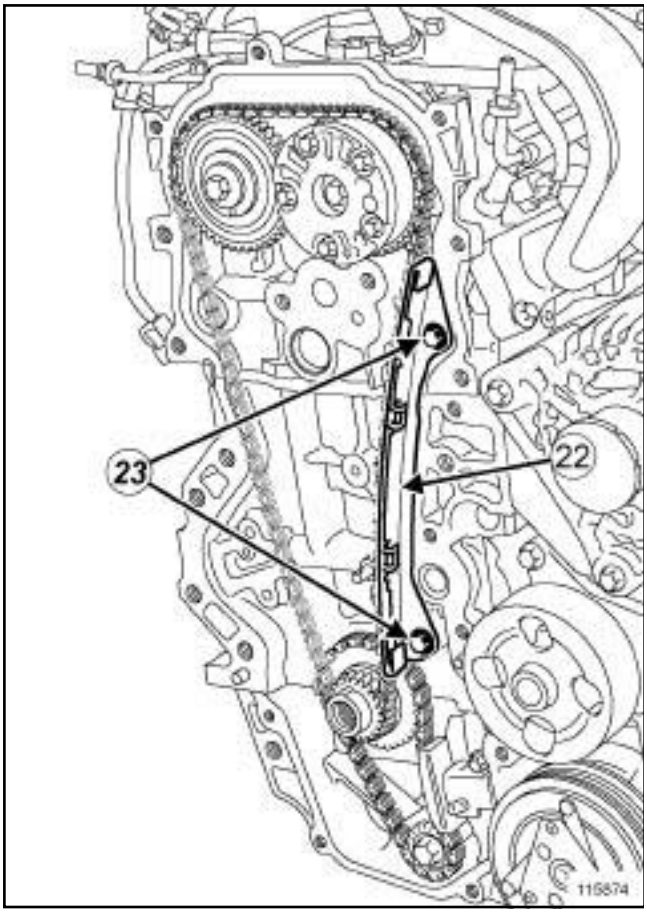
116040



❏ Check that:

- the marks (**18**) on the cylinder head cover are aligned with those on the camshaft sprockets,
- the mark on the crankshaft sprocket (**19**) is in the lower vertical position.

❏ Set the engine at top dead centre.

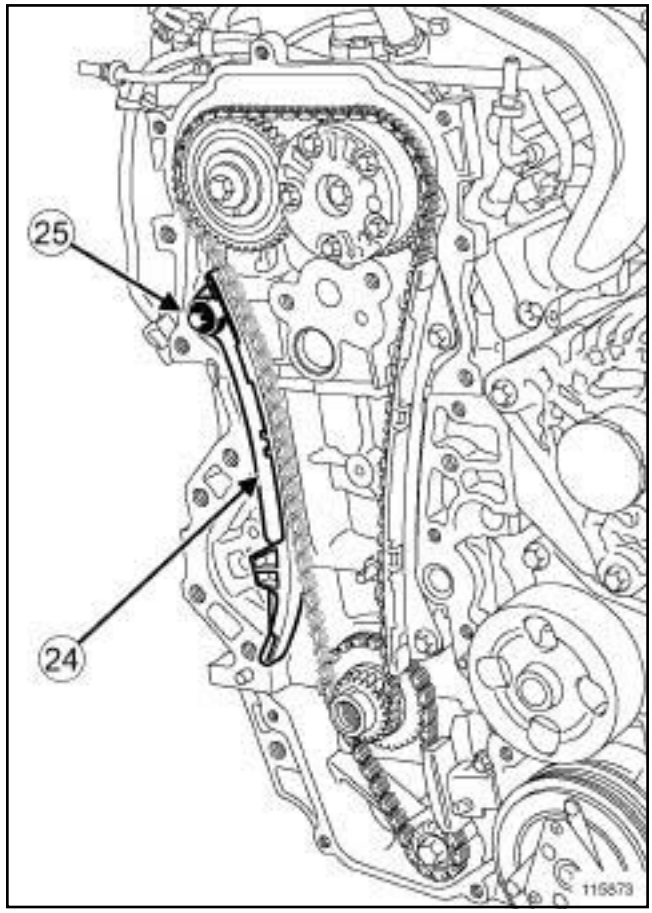


115875

116041

❑ Fit the new timing chain (**20**) so that the marks on the timing chain (**21**) are aligned with the marks on each of the sprockets.

M4R

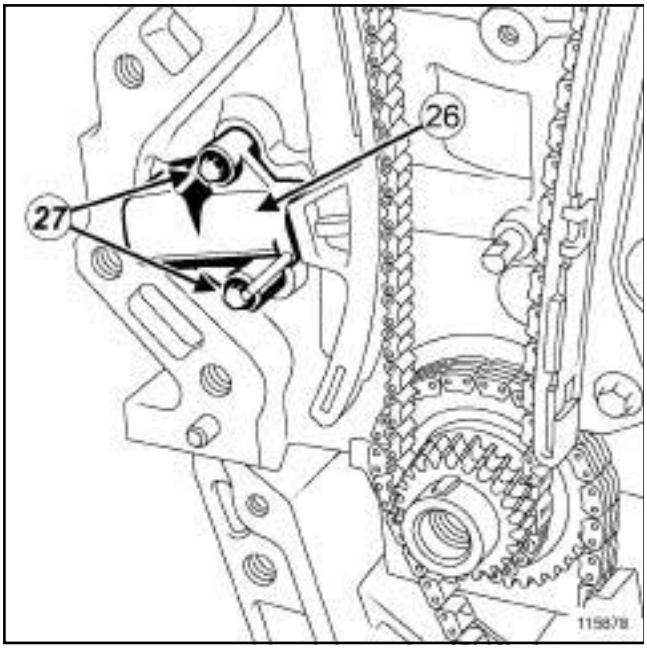


115874

❑ Refit:

- the new timing chain guide (**22**) ,
- the timing chain guide bolts (**23**) .

❑ Torque tighten the **timing chain guide bolts (25 N.m)**.



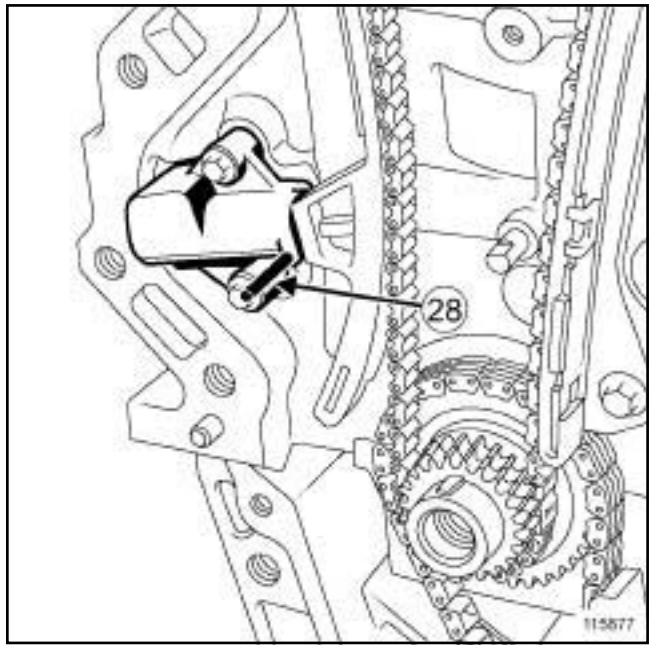
115873

❑ Refit:

- the new timing chain tensioner pad (**24**) ,
- the bolts (**25**) of the timing chain tensioner pad.

❑ Torque tighten the **bolt of the timing chain tensioner pad (25 N.m)**.

M4R



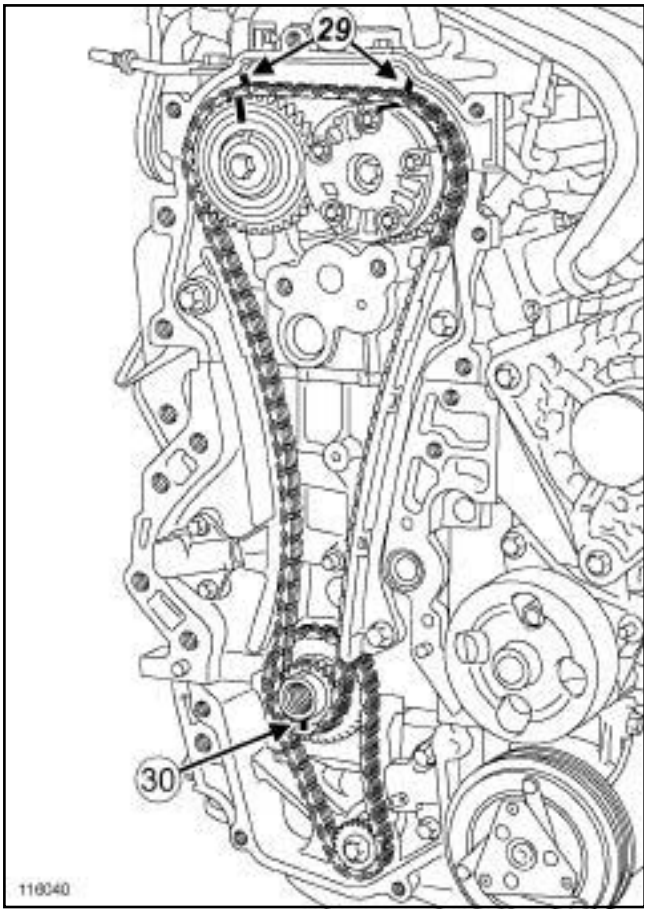
115878

❏ Refit:

- the new timing chain tensioner (**26**) ,
- the timing chain tensioner bolts (**27**) .

❏ Torque tighten the **timing chain tensioner bolts (10 N.m)**.

115877



❏ Remove the metal rod (**28**) in order to release the timing chain tensioner.

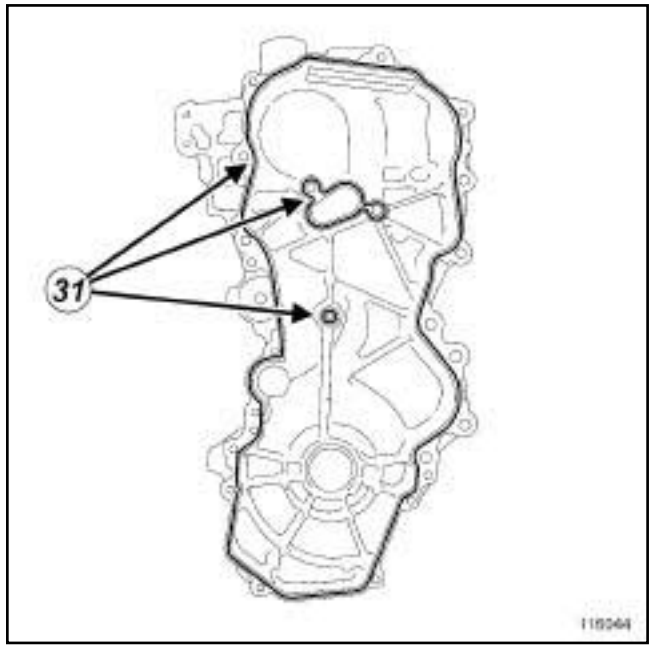
❏ Tighten the old crankshaft accessories pulley bolt fitted with a spacer (which does not cover the timing sprocket mark) onto the crankshaft.

❏ Remove the tool **(Mot. 919-02)**.

❏ Rotate the crankshaft clockwise through two revolutions (timing end).

M4R

116040



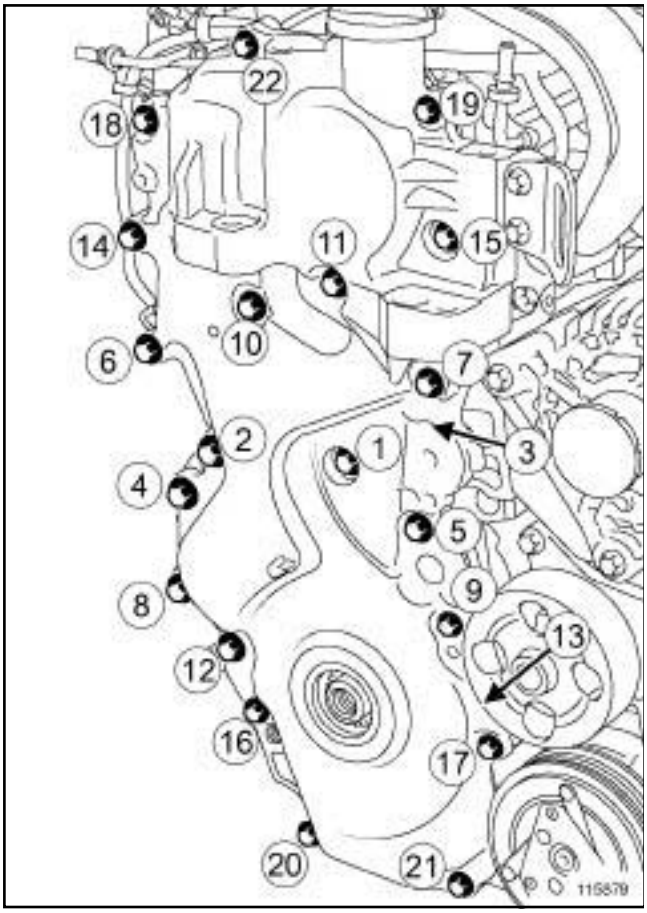
❏ Check that:

- the marks on the camshaft sprockets are correctly aligned with the marks on the cylinder head cover (**29**) ,
- the crankshaft sprocket mark is in the lower vertical position (**30**) .

❏ Immobilise the flywheel or the drive plate using the tool **(Mot. 919-02)**.

❏ Remove the old crankshaft pulley bolt and spacer.

❏ Remove the tool **(Mot. 919-02)**.



116044

❏

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❏ Apply a bead of **SILICONE ADHESIVE SEALANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Ingredients - Products) **4 mm** in diameter on the perimeter of the timing cover joint face (**31**) .

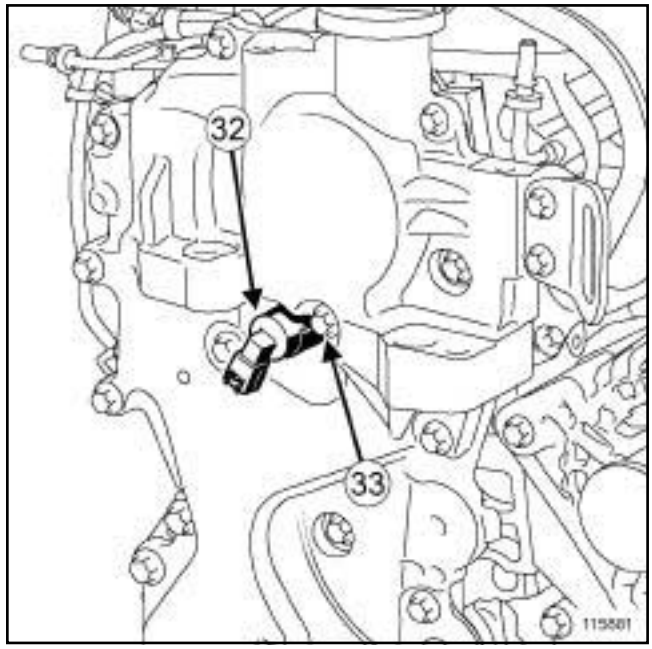
115879

❑ Refit:

- the timing cover,
- the timing cover bolts.

❑ Torque tighten in order:

- the **timing cover M5 bolts (7 N.m)**,
- the **timing cover M6 bolts (25 N.m)**,
- the **timing cover M10 bolts (55 N.m)**,
- the **timing cover M12 bolts (75 N.m)**.



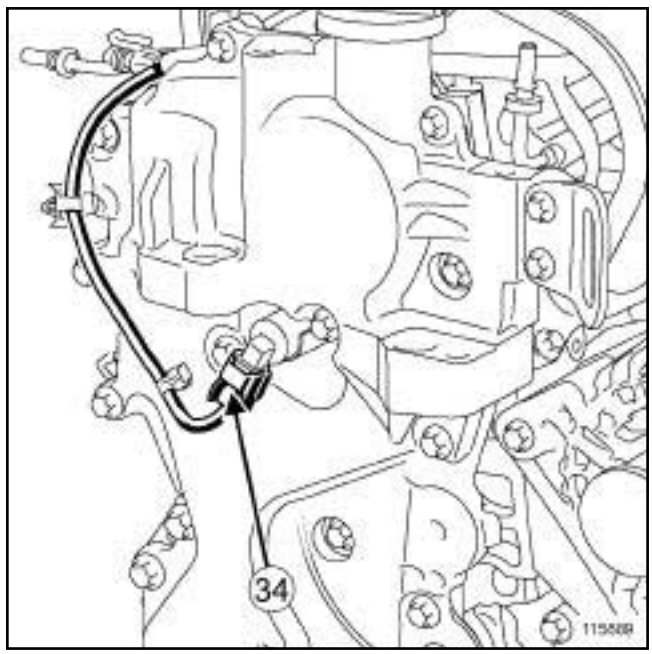
III - FINAL OPERATION

❑ Refit the crankshaft seal on the timing end (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) .

❑ Immobilise the flywheel or the drive plate using the tool **(Mot. 919-02)**.

❑ Refit the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) .

❑ Remove the tool **(Mot. 919-02)**.



115881

❑ Refit:

- the camshaft dephaser solenoid valve (**32**) ,
- the bolt (**33**) of the camshaft dephaser solenoid valve.

❑ Torque tighten the **camshaft dephaser solenoid valve bolt (10 N.m)**.

115889

❑ Connect the wiring (**34**) of the camshaft dephaser solenoid valve.

❑ Refit the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

M4R

❏ Remove the engine from the component support (see **Engine support equipment: Use**) .

M4R, and 700

❏ Connect the manual gearbox to the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

M4R, and 701

❏ Connect the automatic gearbox to the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

❏ Refit the « engine and gearbox» assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .

❏ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

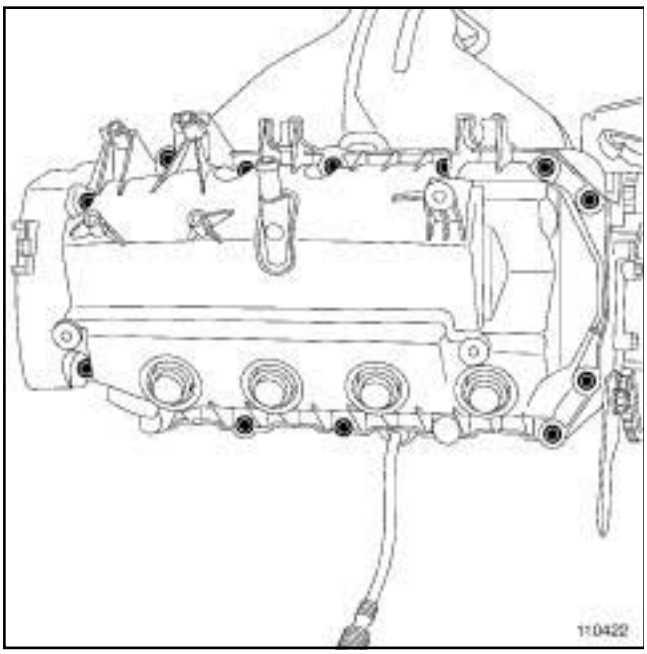
D4F, and 740 or 742 or 764

Tightening torques ▽	
rocker cover mounting bolts	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❏ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

❏ Remove the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

❏ Unclip the rocker cover electric wiring harnesses.

II - OPERATION FOR REMOVAL OF PART CONCERNED

110422

❏ Remove:

- the rocker cover mounting bolts,
- the rocker cover,
- the rocker cover gasket.

REFITTING

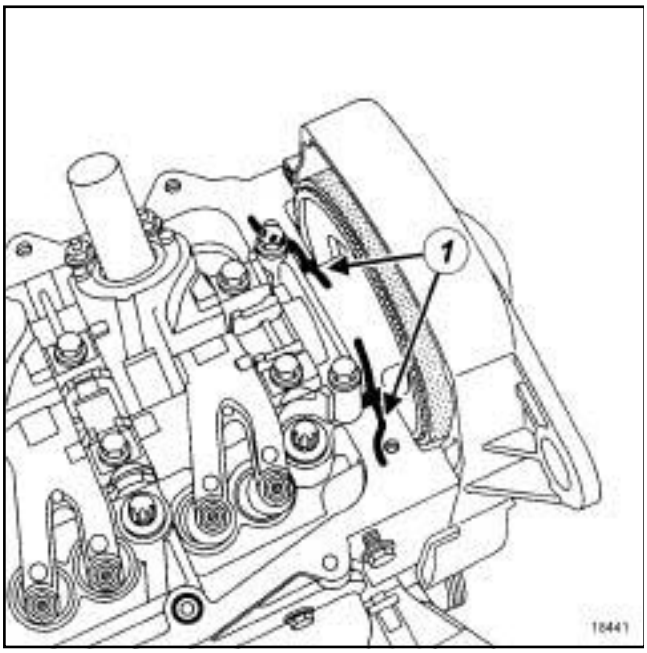
I - REFITTING PREPARATION OPERATION

❏ Clean the gasket faces with **DECAPJOINT** to dissolve off any part of the gasket still attached.

WARNING

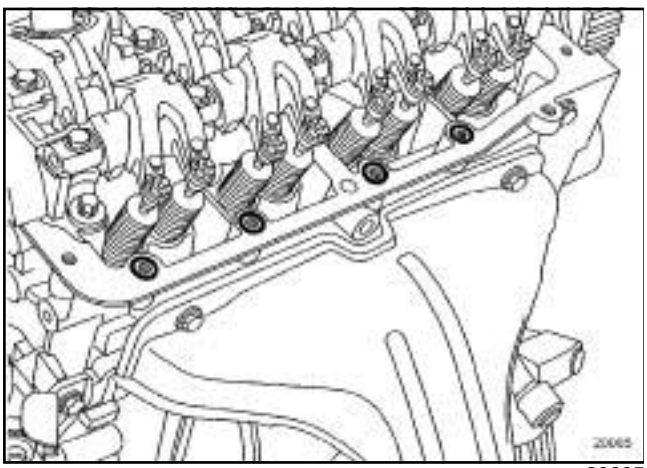
do not allow solvent to drip on the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.



Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

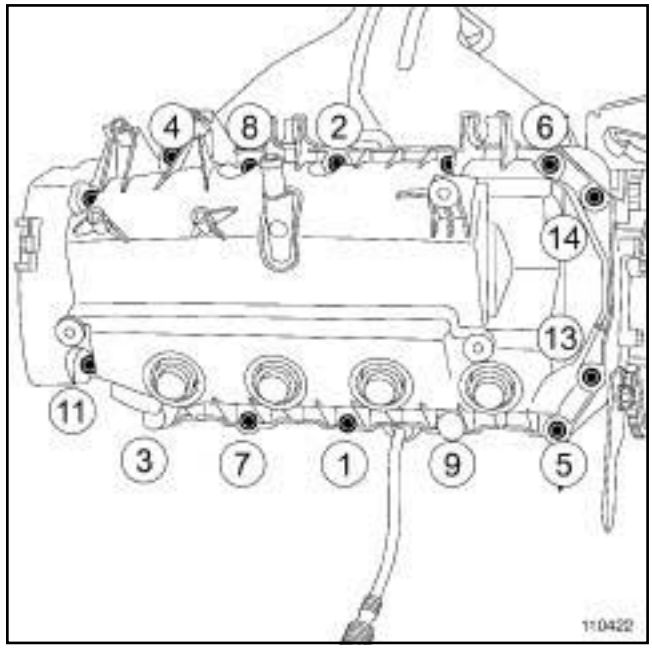
WARNING



Be sure to replace all seals that have been removed.

D4F, and 740 or 742 or 764

II - REFITTING OPERATION FOR PART CONCERNED



18441

20005

❑ Apply a bead ***(1)*** of **SILICONE ADHESIVE SEALANT 77 11 227 484** to camshaft bearings 1 and 5, and around the rear rocker cover mounting bolts.

❑ Fit the rocker cover with a new gasket.

110422

❑ Torque tighten in order the **rocker cover mounting bolts (10 N.m)**.

III - FINAL OPERATION.

❑ Clip the electric wiring harnesses onto the rocker cover.

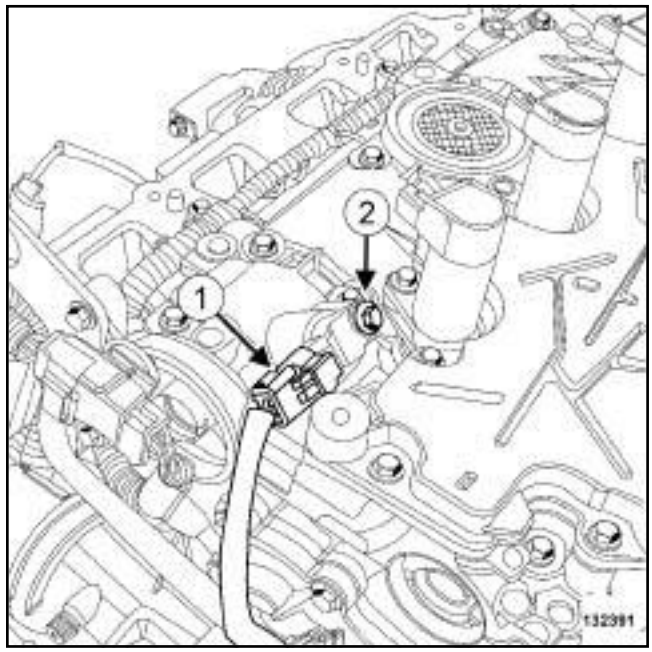
❑ Refit:

- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M

Tightening torques ▽	
rocker cover mounting bolts 1 to 17 and 20 to 22	**14 N.m**
mounting bolts 18, 19, 23, 24	**12 N.m**
camshaft position sensor mounting bolt	**8 N.m**



REMOVAL

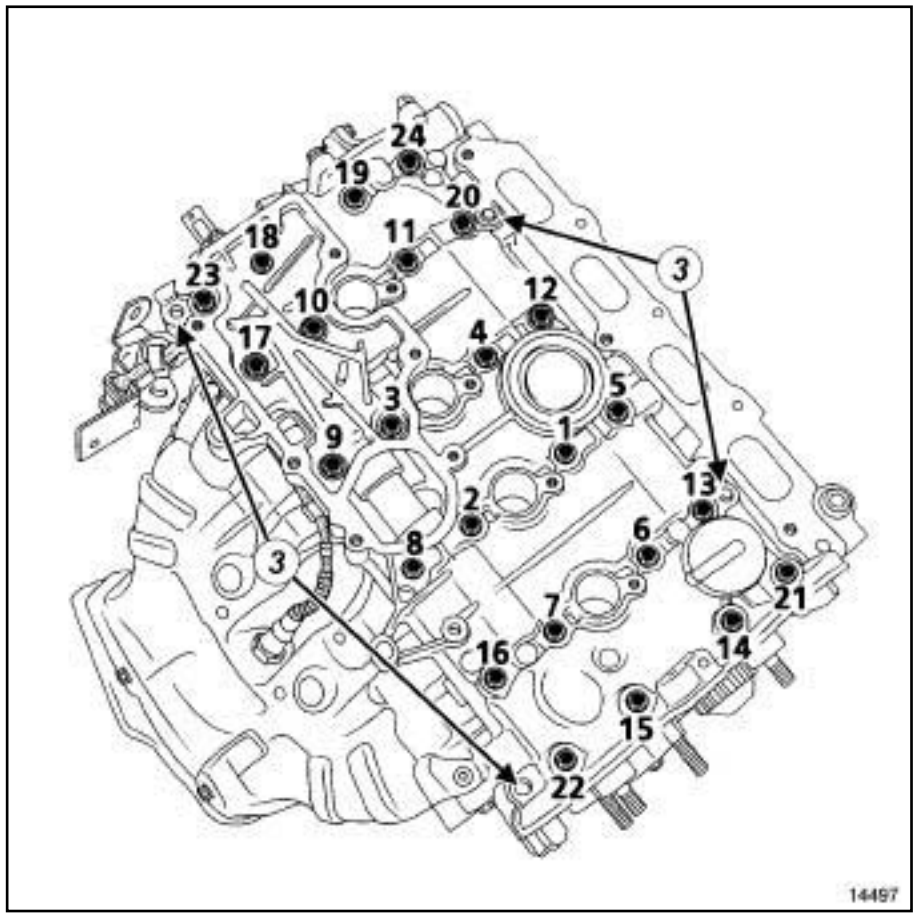
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) .

132391



❏ Disconnect the connector (**1**) from the camshaft position sensor.

❏ Remove:

- the bolt (**2**) from the camshaft position sensor,
- the camshaft position sensor,
- the camshaft position sensor seal,
- the camshaft dephaser solenoid valve (see **Camshaft dephaser solenoid valve: Removal - Refitting**) ,
- the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) .

K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED

14497

- ❏ Remove the rocker cover bolts.
- ❏ Remove the rocker cover vertically by tapping the lugs (**3**) with a screwdriver.
- ❏ Remove:
  - the rocker cover,
  - the camshaft seals on the timing end.

REFITTING

I - REFITTING PREPARATION OPERATION

- ❏ **parts always to be replaced: Camshaft seal on timing end (10,02,02,02)**.
- ❏ **parts always to be replaced: camshaft sensor seal (11,11,04,02)**.

K4M

K4M, and 800 or 801 or 804

❑ Remove the square cam tappet (see **Cylinder head: Stripping**) (Technical Note 6023A, 10A, Engine and cylinder block assembly).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear goggles with side protectors for this operation.

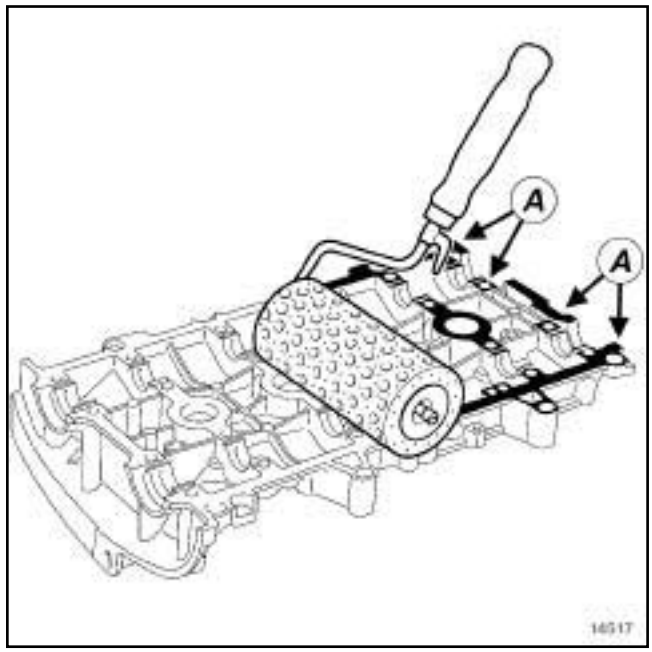
IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

❑ Clean the joint face of the rocker cover with **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve any seal still adhering.



❑ Apply the product to the section to be cleaned; wait approximately ten minutes, then remove the residue using a wooden spatula.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ Lubricate the cylinder head camshaft bearings with engine oil.

Note:
Do not put oil on the joint face of the cylinder head rocker cover.

❑ Refit the square cam tappet (see **Cylinder head: Rebuilding**) (Technical Note 6023A, 10A, Engine and cylinder block assembly).

14517

❑ Use a stipple roller to apply **SEALING RESIN** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) on the section (**A**) of the rocker cover joint face until the joint face is correctly coated.

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

K4M

K4M, and 862

❑

REMOVAL

I - REMOVAL PREPARATION OPERATION

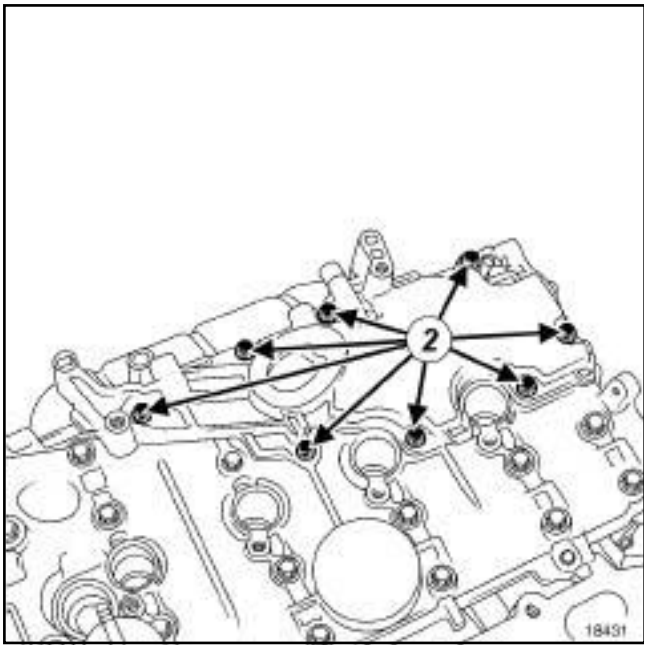
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

14839

❑ Position the **(Mot. 1490-01)** on the camshaft pulleys.



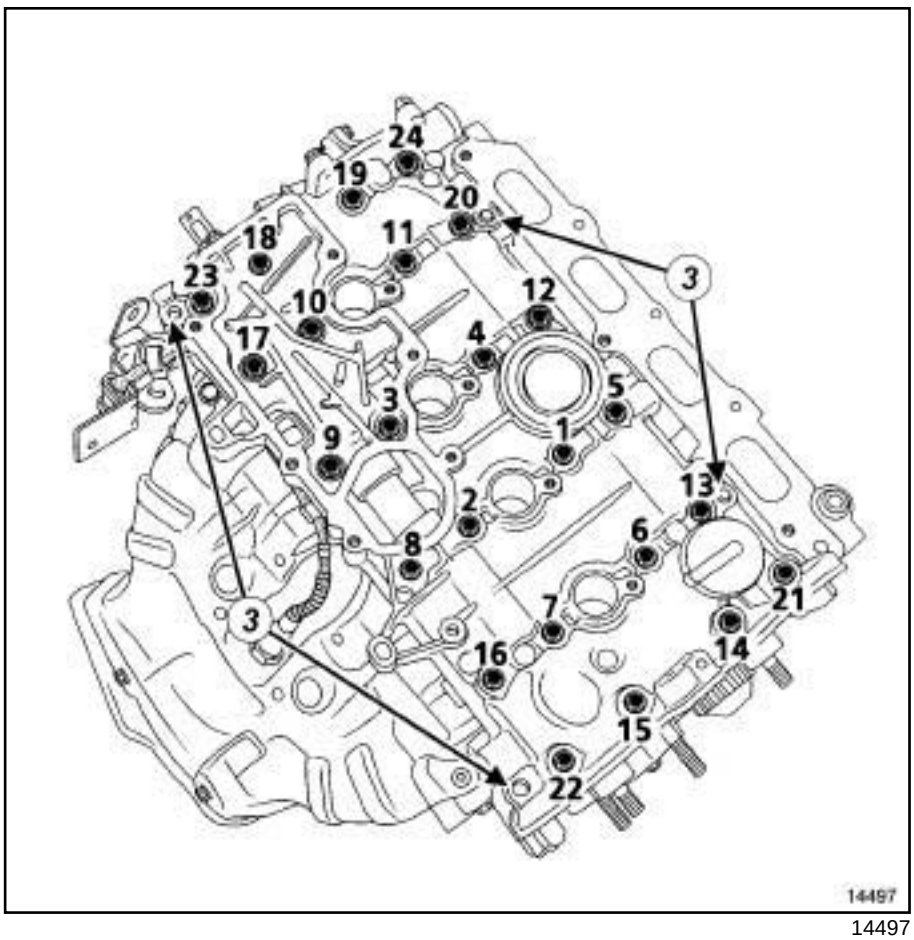
❑ Remove:

- the nut from the inlet camshaft pulley (**1**) and from the exhaust camshaft pulley (**2**) ,
- the **(Mot. 1490-01)**,
- the camshaft pulleys.

❑ Remove:

- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) .

K4J



18431

❏ Remove:

- the engine lifting eye at the timing end,
- the mounting bolts (**2**) from the oil decanter,
- the oil decanter.

II - OPERATION FOR REMOVAL OF PART CONCERNED

14497

❏ Remove the rocker cover mounting bolts.

❏ Detach the rocker cover vertically by tapping the lugs (**3**) with a copper hammer.

❏ Remove the rocker cover.

K4J

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑

IMPORTANT

Do not scratch the aluminium sealing surfaces.

Wear goggles.

Wear gloves during the operation.

WARNING

Do not allow this product to drip onto the paintwork.

Take care when cleaning to prevent any foreign bodies entering the oil pipes supplying oil under pressure to the hydraulic tappets, the camshafts (oil galleries are located both in the cylinder block and the cylinder head), and the oil return pipes.

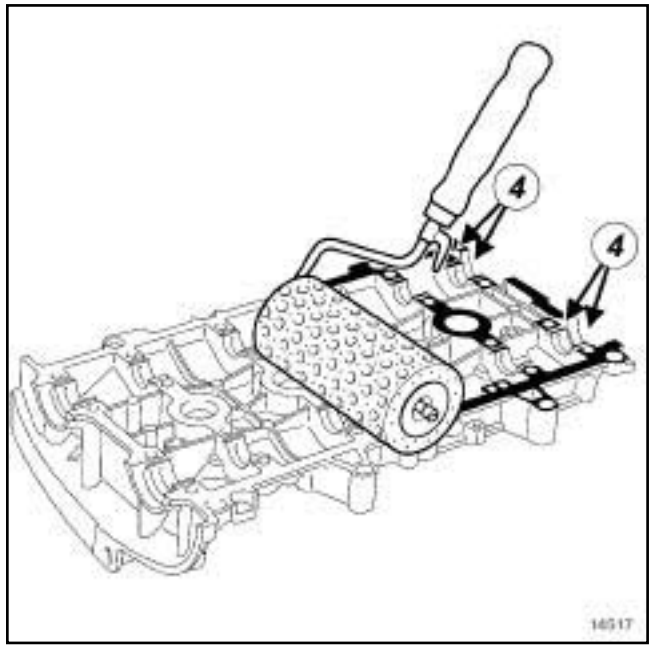
Failure to follow this advice could block the oilways, and rapidly destroy the engine.

❑ Clean the rocker cover gasket face with **DECAP-JOINT** to dissolve any gasket still adhering.

❑ Apply the product to the section to be cleaned; wait approximately ten minutes, then remove the residue using a wooden spatula.

Note:

The gasket faces on the rocker cover must be clean, dry and free from grease (avoid finger marks).



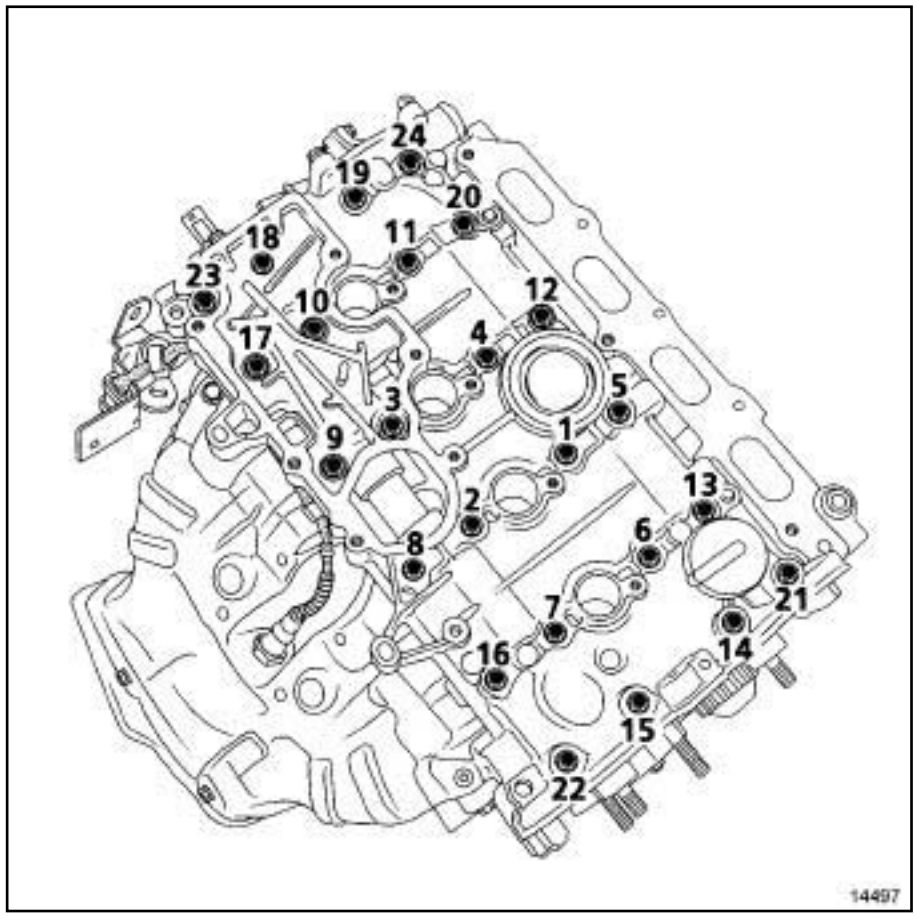
❑ Lubricate the cylinder head camshaft bearings with engine oil.

WARNING

Do not put oil on the cylinder head rocker cover.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. The mixture of sealant and fluid may damage some components (engine, radiator, etc.).



14517

❑ Using a stipple roller, apply **LOCTITE 518** to the gasket face until it turns reddish in colour.

❑ Use a cloth to remove any **LOCTITE 518** in the six bearing channels (**4**) on the rocker cover.

K4J

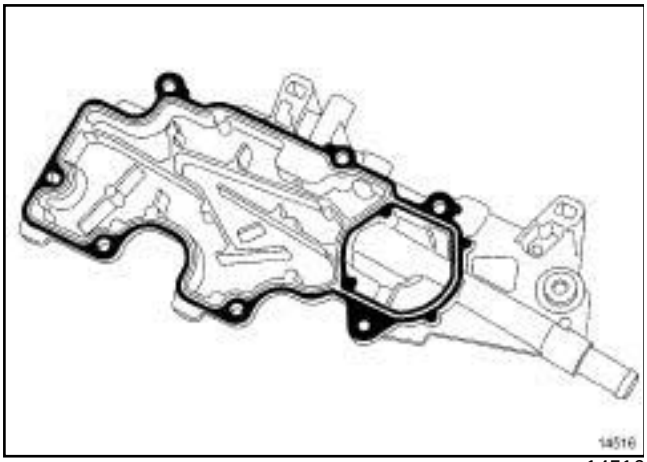
II - REFITTING OPERATION FOR PART CONCERNED

14497

- ❑ Refit the rocker cover.
- ❑ Tighten to torque and in order:
  - bolts 22, 23, 20, 13 **(8 Nm)**,
  - bolts 1 to 12, 14 to 19 and 21 to 24 **(14.5 Nm)**.
- ❑ Slacken bolts 22, 23, 20 and 13, in order.
- ❑ Tighten to torque and in order bolts 22, 23, 20, 13 **(14.5 Nm)**

III - FINAL OPERATION.

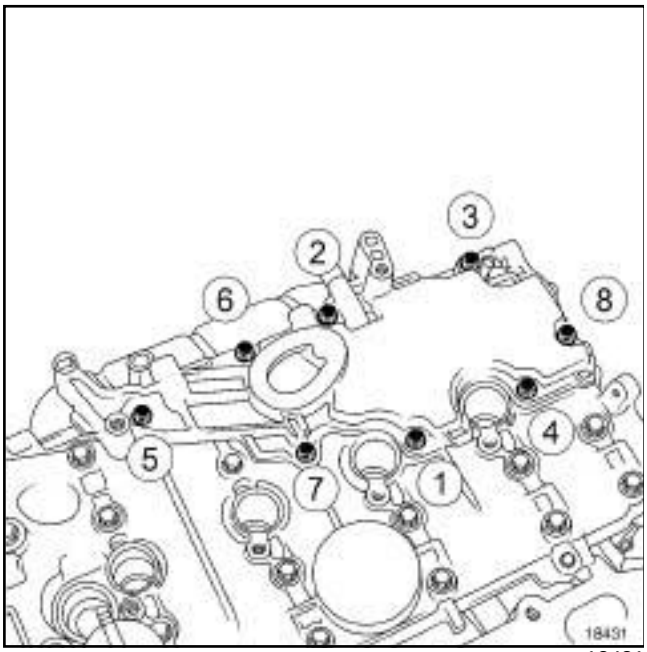
❑



Note:

The gasket face on the oil decanter must be clean, dry and free from grease (avoid finger marks).'

WARNING



Applying excess sealant could cause it to be squeezed out when parts are tightened. The mixture of sealant and fluid may damage some components (engine, radiator, etc.).

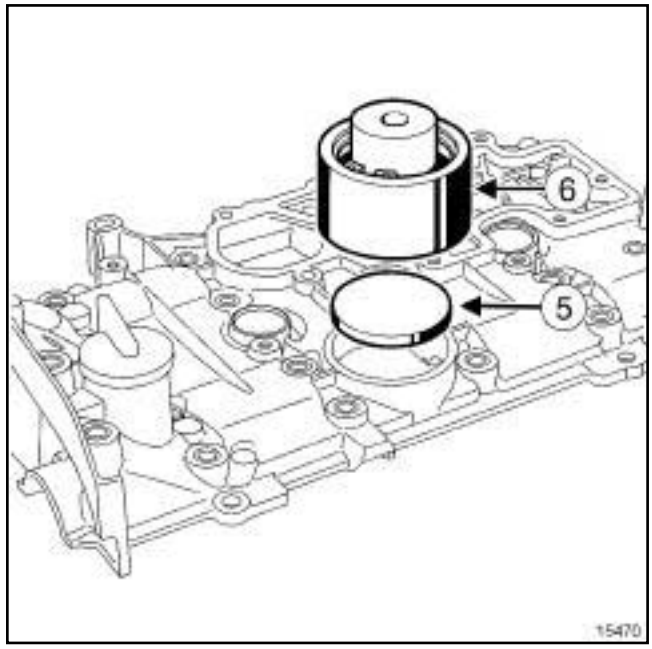
K4J

14516

14516

❑ Using a stipple roller, apply **LOCTITE 518** to the gasket face until it turns reddish in colour.

18431



18431

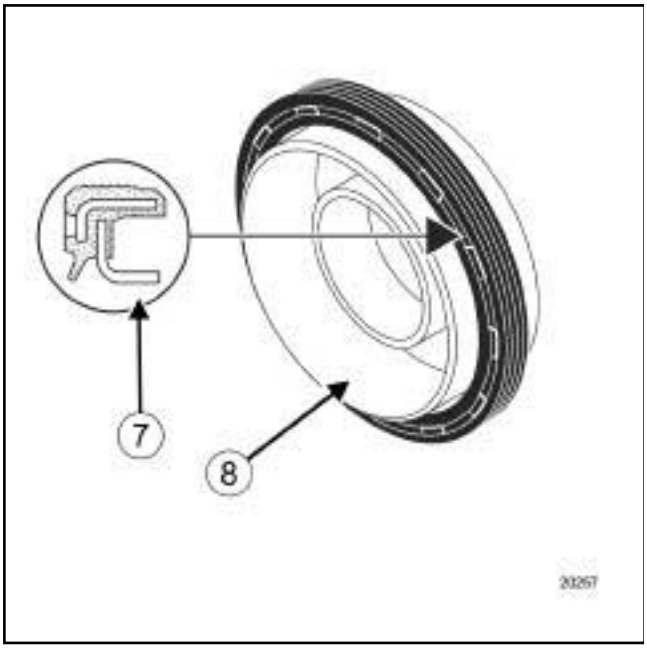
❑ Refit the oil decanter.

❑ Torque tighten and in order:

- the **new mounting bolts for the oil separator in the untapped holes (15 Nm)**,
- the **new mounting bolts for the oil separator in the tapped holes (10 Nm)**.

❑ Refit the engine lifting eye at the engine timing end.

15470

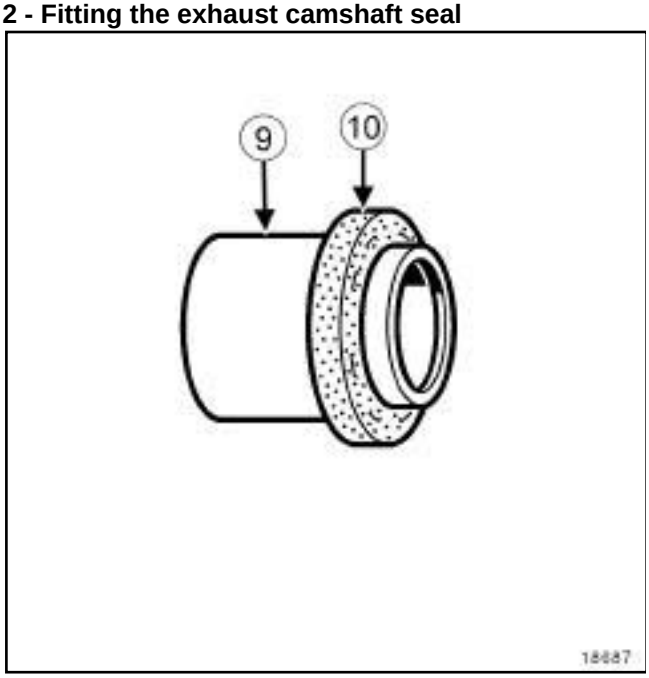


15470

❑ Refit:

- the rocker cover disc (**5**) using the **(Mot. 1503)** (**6**) ,
- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

K4J

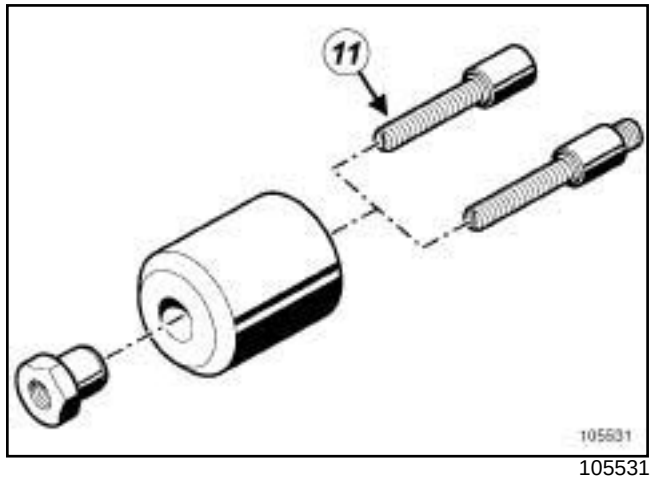


1 - Fitting the camshaft gaskets

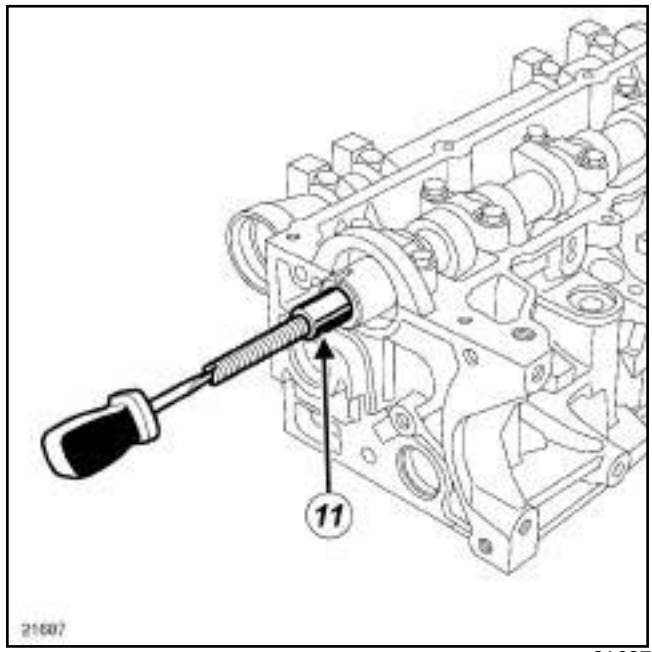
20257

❑ The elastomer seals on these engines come fitted with a flat lip seal (**7**) and a protector (**8**) (also used to fit the seal on the engine).

2 - Fitting the exhaust camshaft seal



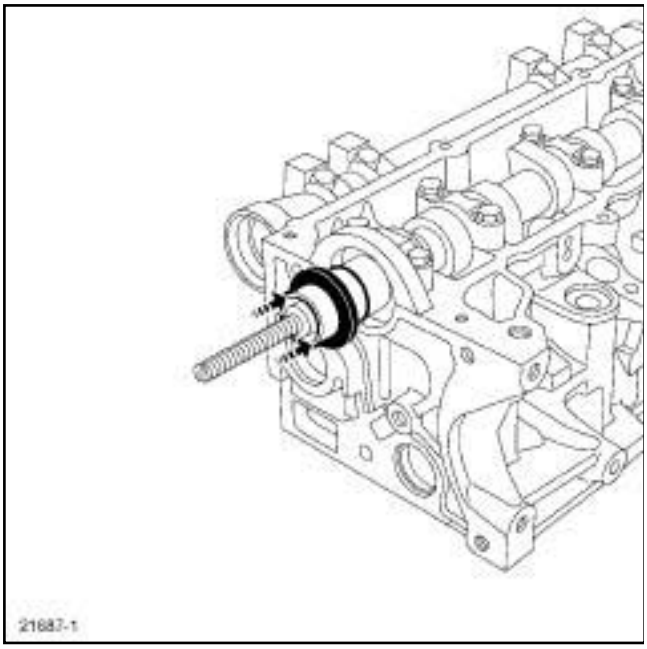
18687



❑

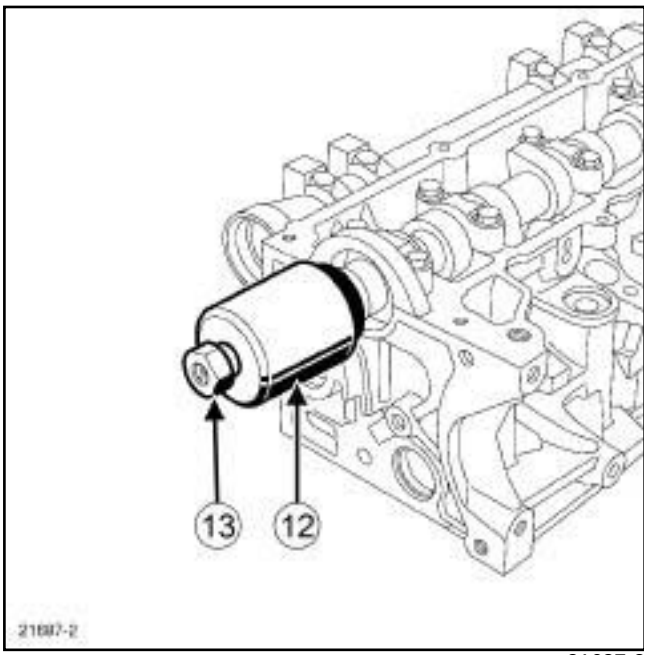
WARNING

When handling, be sure to hold the seal by the protector (**9**) , as this type of seal is highly FRAGILE. It is strictly forbidden to touch the elastomer seal (**10**) in order to prevent any oil leaks once the seal is fitted to the engine.



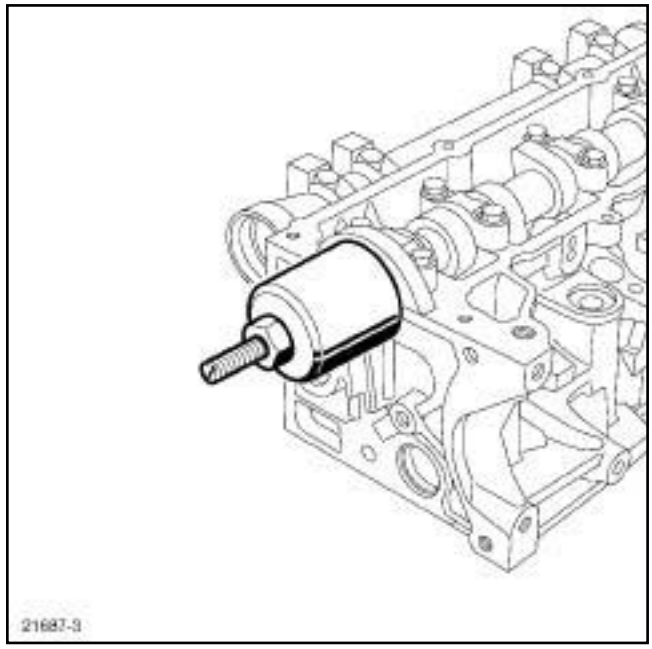
105531

21687



❑ Screw the stud (**11**) of the **(Mot. 1632)** onto the camshaft.

K4J

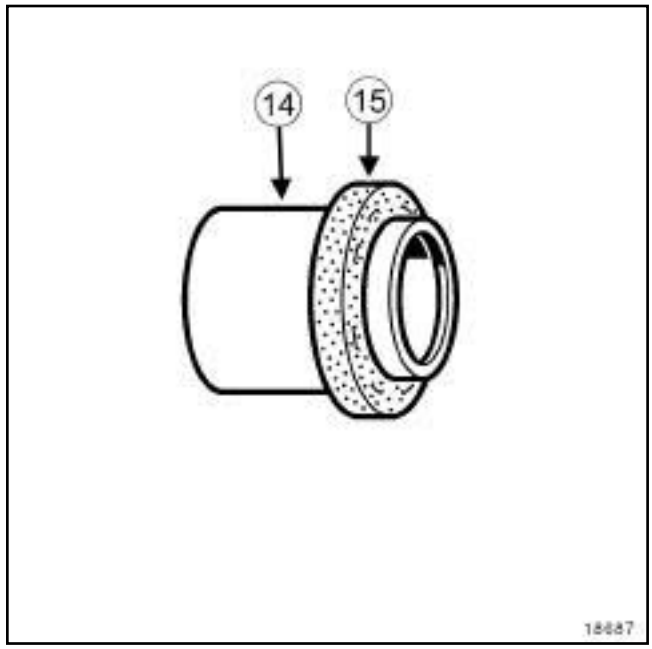


21687-1

❏ Mount the protector with its gasket in place onto the camshaft (taking care not to touch the gasket).

21687-2

❏ Fit the cover (**12**) and the collar nut (**13**) of the **(Mot. 1632)**.

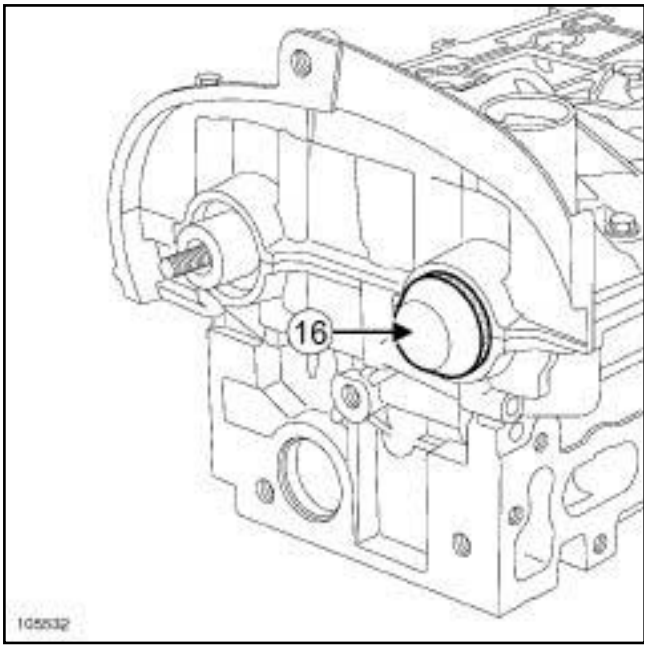


21687-3

❏ Screw on the collar nut until the cover touches the cylinder head.

❏ Remove the nut, cover, protector and threaded rod.

3 Fitting the inlet camshaft seal

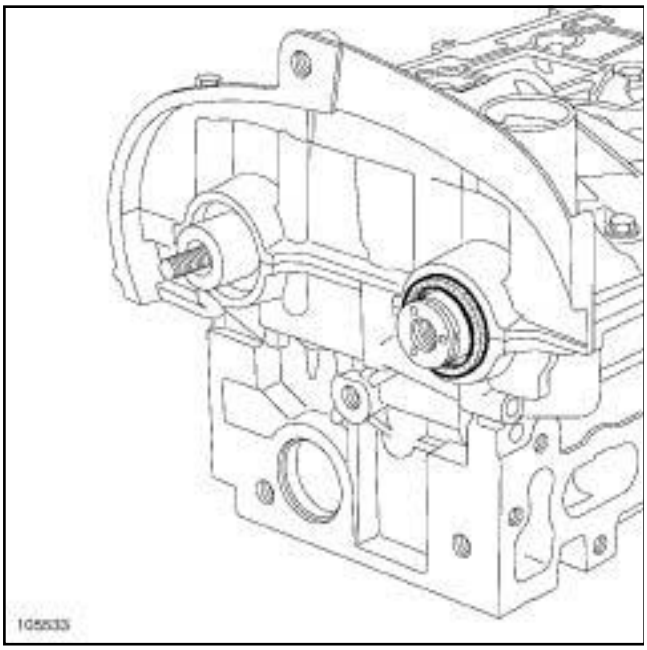


18687

❏

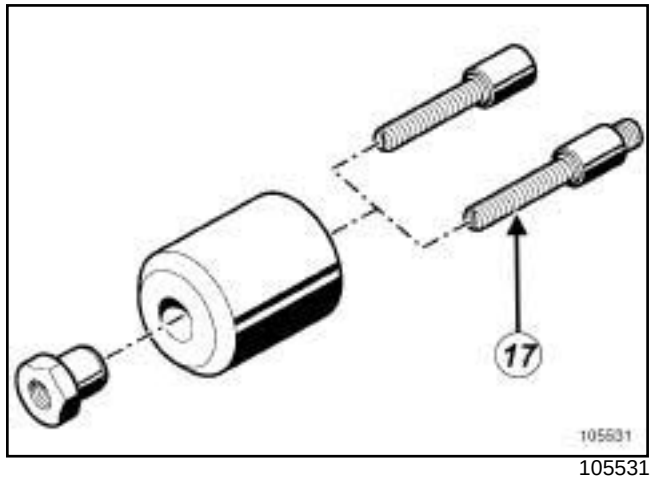
WARNING

When handling, be sure to hold the seal by the protector (**14**) , as this type of seal is highly FRAGILE. It is strictly forbidden to touch the elastomer seal (**15**) in order to prevent any oil leaks once the seal is fitted to the engine.



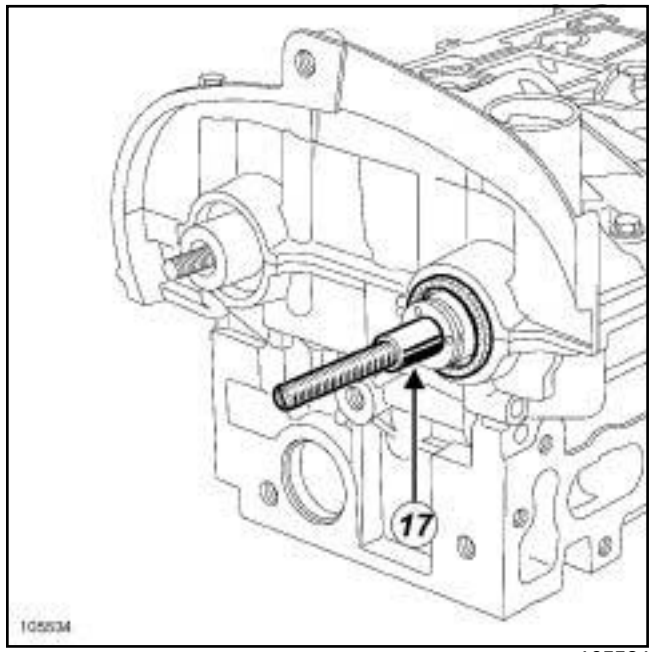
K4J

105532



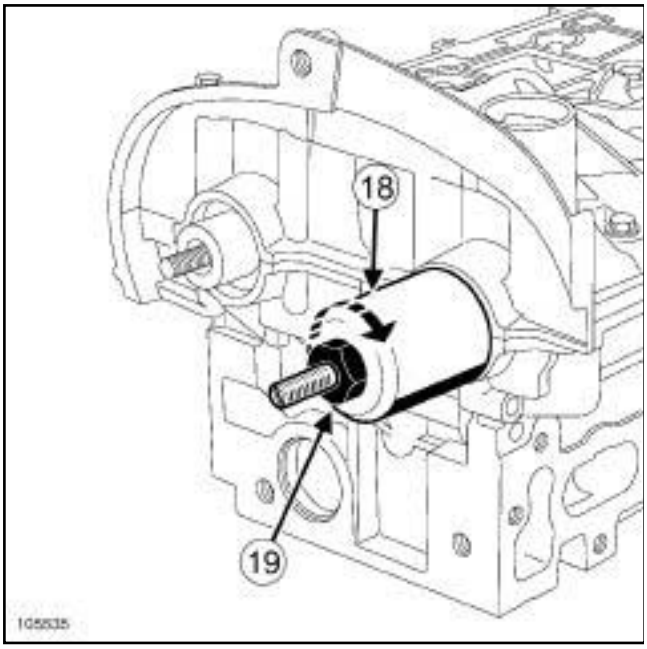
❑ Fit the protector (**16**) fitted with the seal onto the camshaft (taking care not to touch the seal).

❑ Push the centre of the protector to force the seal into its housing.



105533

❑ Remove the seal protector, taking care not to drop the seal.



105531

105534

❑ Fit the stud (**17**) on the camshaft using the **(Mot. 1632)**.

K4J

105535

❏ Fit the cover (**18**) and the collar nut (**19**) of the **(Mot. 1632)**.

❏ Screw on the collar nut until the cover touches the cylinder head.

❏ Remove the nut, cover and threaded rod.

❏ Refit the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

WARNING
Follow the second procedure for refitting the timing belt.

❏ Refit:

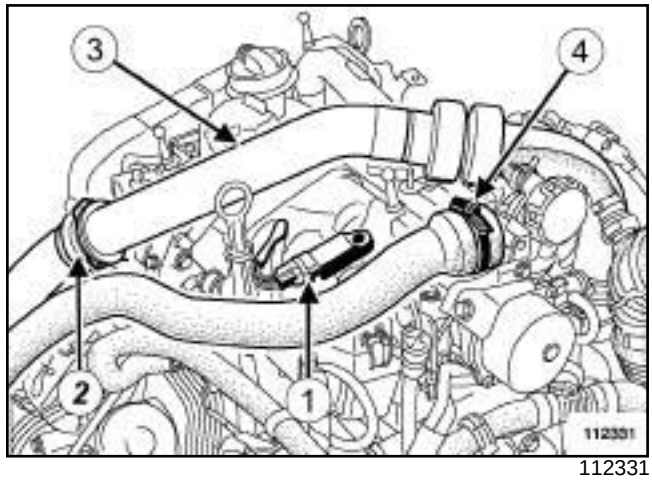
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 766 or 768

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

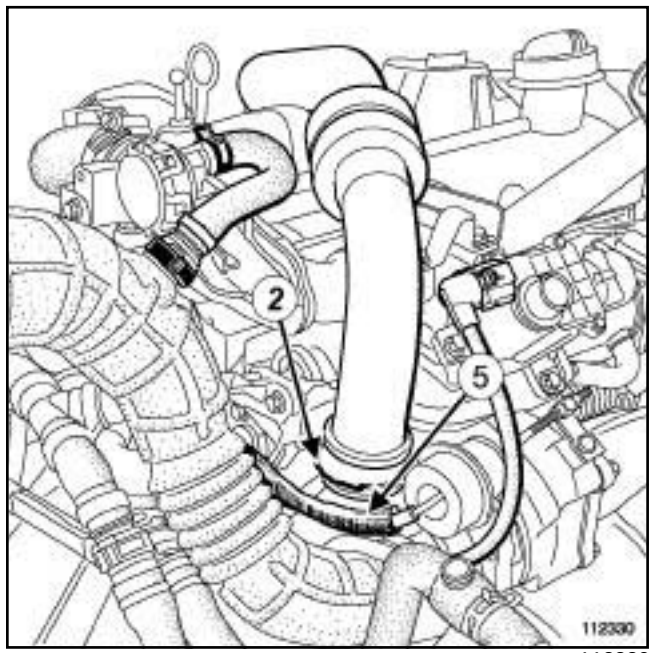
Tightening torques ▽	
rocker cover bolts	**10 N.m**
nut mounting the inter-cooler air inlet pipe on the alternator	**8 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine cover,
- the air inlet duct,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

112331

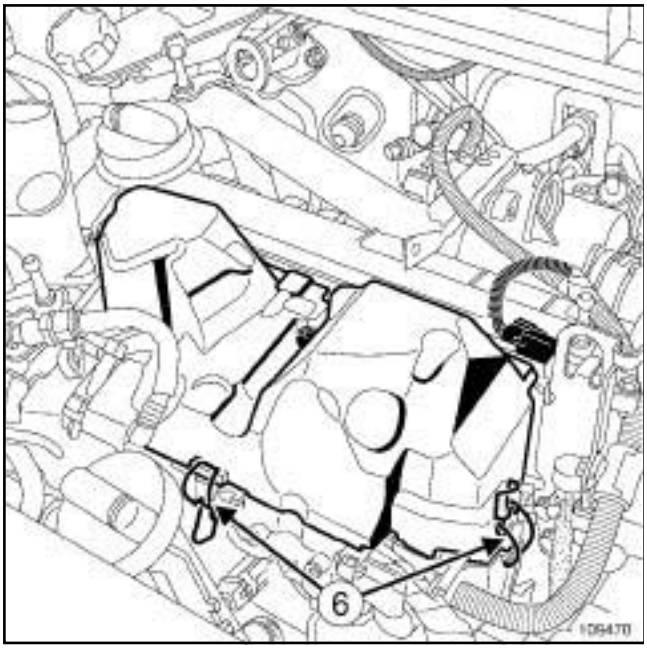
112330

❏ Disconnect:

- the pressure sensor (**1**) on the inlet duct,
- the turbocharger pressure regulation pipe (**5**) .

❏ Cut the Rislan clip.

❏ Pull the clips (**2**) from the air duct.



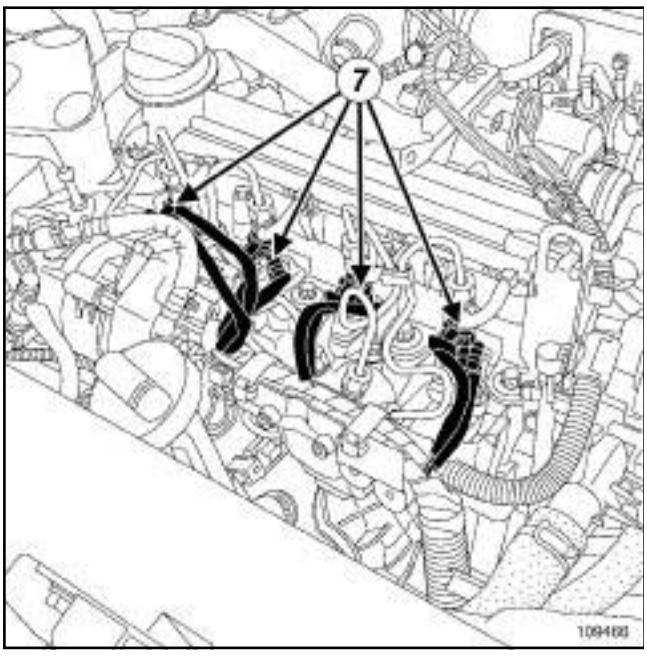
❏ Remove:

- the air pipe mounting nut on the alternator,
- the air duct bolt on the rocker cover,
- the air duct (**3**) .

❏ Undo the clip (**4**) from the intercooler tube on the inlet side.

❏ Remove the intercooler tube on the inlet side.

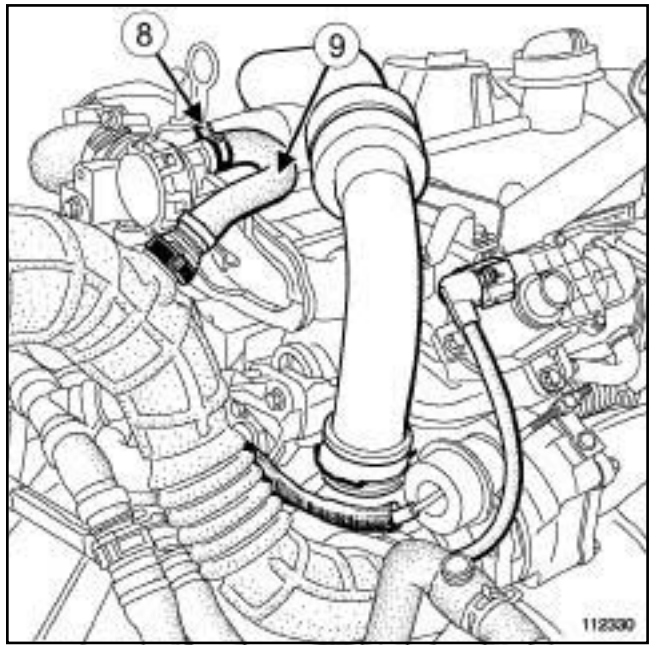
K9K, and 766 or 768



109470

❏ Unclip the clips (**6**) from the rail protector.

❏ Remove:

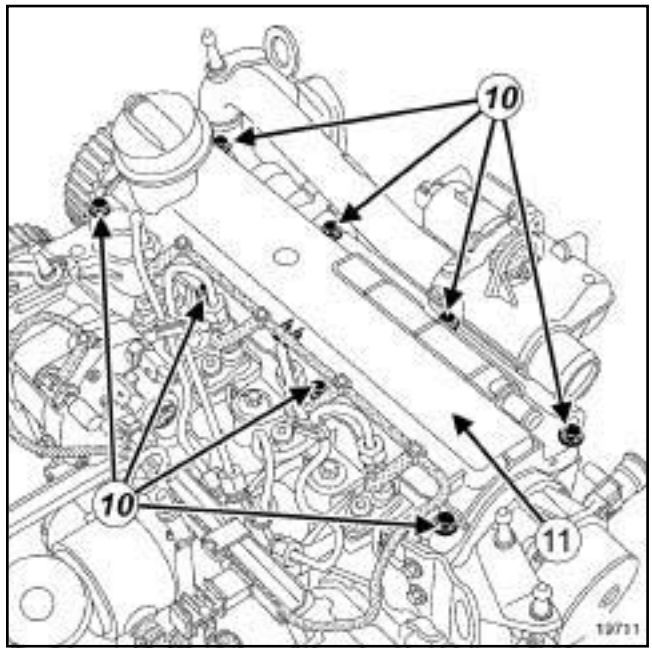


- the rail protector mountings,
- the retaining bracket of the engine cover on the gearbox side,
- the rail protector.

109466

❏ Disconnect:

- the heater plugs (**7**)
- the injector connectors.



112330

❏ Undo the clip (**8**) from the oil vapour rebreathing pipe using the **(Mot. 1448)**.

❏ Disconnect the oil vapour rebreathing pipe (**9**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

19711

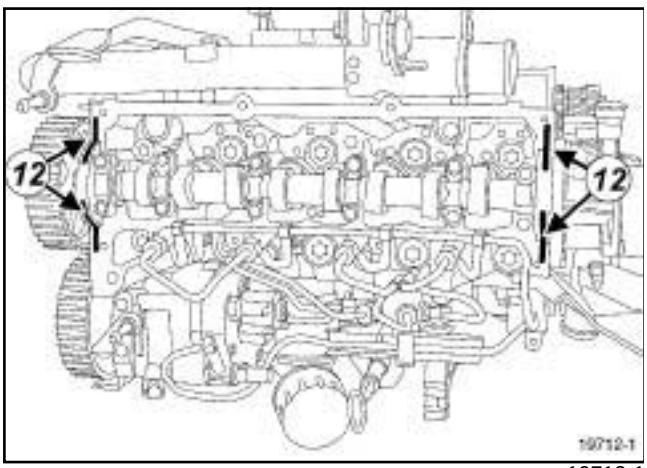
❏ Remove:

- the mounting bolts (**10**) from the rocker cover,
- the rocker cover (**11**) .

K9K, and 766 or 768

REFITTING

I - REFITTING PREPARATION OPERATION

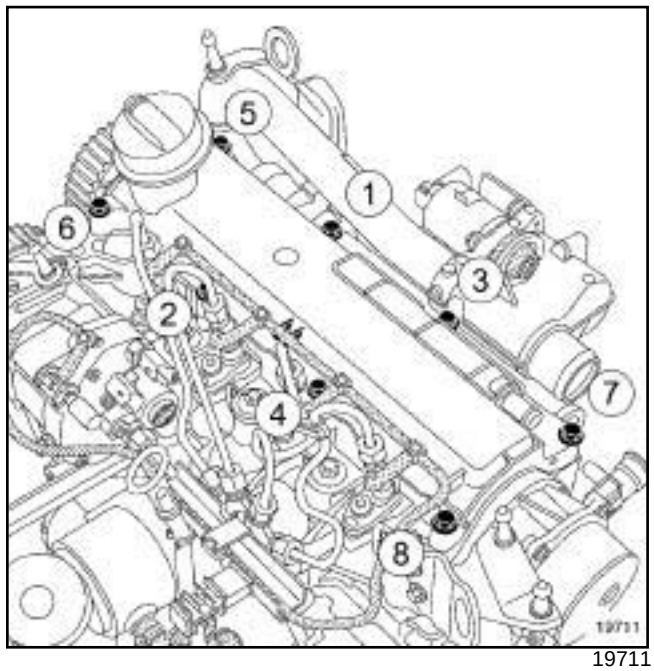


❑ Be sure to replace the rocker cover seal.

Note:

The cylinder head gasket and rocker cover faces must be clean, dry and free of grease (avoid finger marks).

Note:



Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.)

19712-1

❑ Apply **LOCTITE 518** (**12**) , **2 mm** in diameter

II - REFITTING OPERATION FOR PART CONCERNED

19711

❑ Refit the rocker cover, fitted with a new gasket.

❑ Torque tighten in order the **rocker cover bolts (10 N.m)**.

III - FINAL OPERATION

❑ Connect the oil vapour rebreathing pipe.

❑ Unclip the clip from the oil vapour rebreathing pipe using the tool **(Mot. 1448)**.

❑ Refit the inner timing cover.

❑ Connect:

- the injector connectors,
- the heater plugs.

❑ Refit:

- the rail protector,
- the retaining bracket of the engine cover on the gearbox side,
- the rail protector mountings,
- the intercooler tube on the inlet side.

❑ Fasten the clip on the intercooler tube on the inlet side.

❑ Fit the air duct between the turbocharger and the air pipe at the intercooler inlet.

❑ Clip the air duct on the turbocharger and the inlet pipe of the intercooler.

K9K, and 766 or 768

❑ Refit:

- the air duct bolt on the rocker cover,
- the air pipe mounting nut on the alternator,
- a Rislan clip.

❑ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 N.m)**.

❑ Connect:

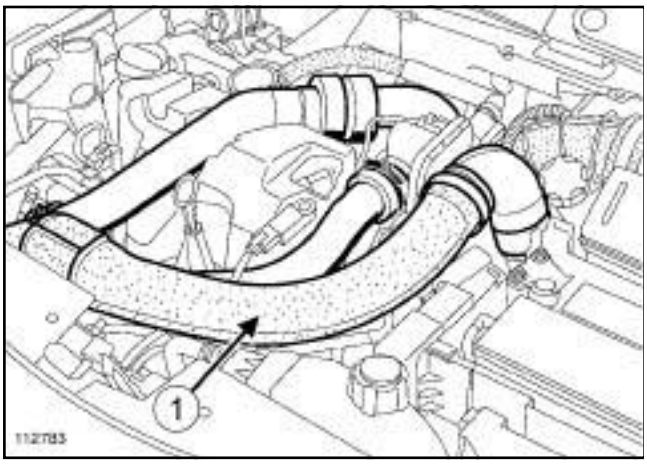
- the turbocharger pressure regulation pipe,
- the pressure sensor on the inlet tube.

❑ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the air inlet duct,
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

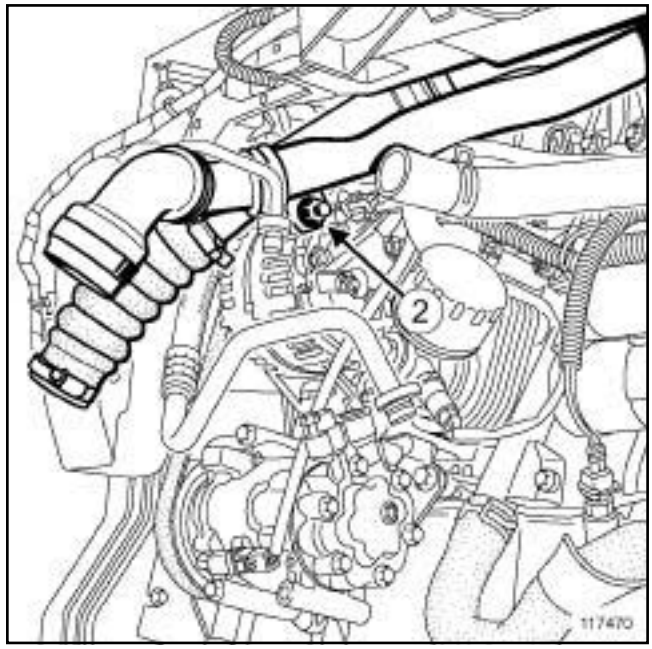
K9K, and 764 or 772



Tightening torques ▽	
rocker cover bolts	**11 N.m**
injector rail protector cover bolt	**8 N.m**
injector rail protector cover nut	**8 N.m**
intercooler outlet air pipe clip	**5.5 N.m**
the intercooler inlet and outlet pipe nut on the alternator	**8 N.m**

REMOVAL

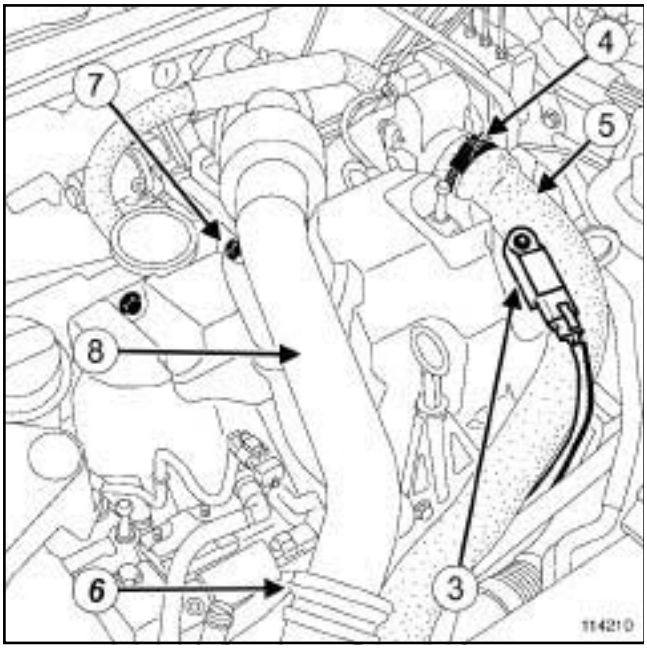
I - REMOVAL PREPARATION OPERATION



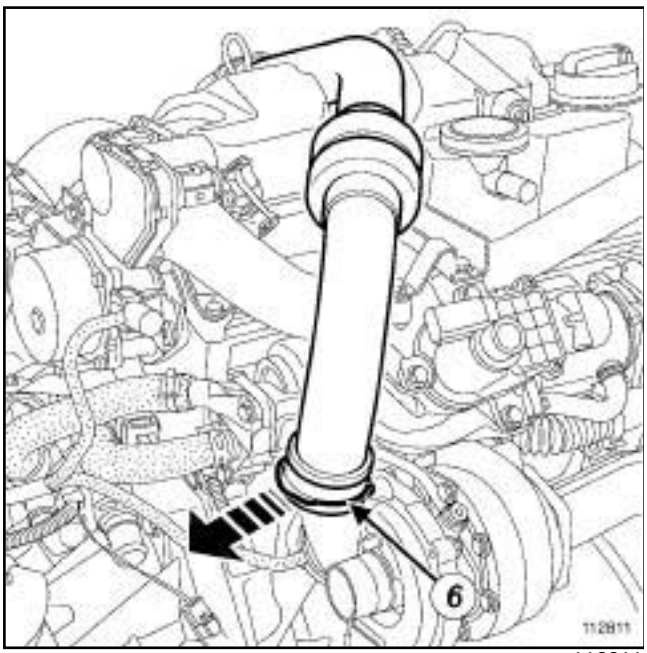
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the front engine cover.

112783



❏ Remove the air filter box air inlet pipe (**1**) .



117470

❏ Remove the intercooler inlet and outlet pipe nuts (**2**) on the alternator.

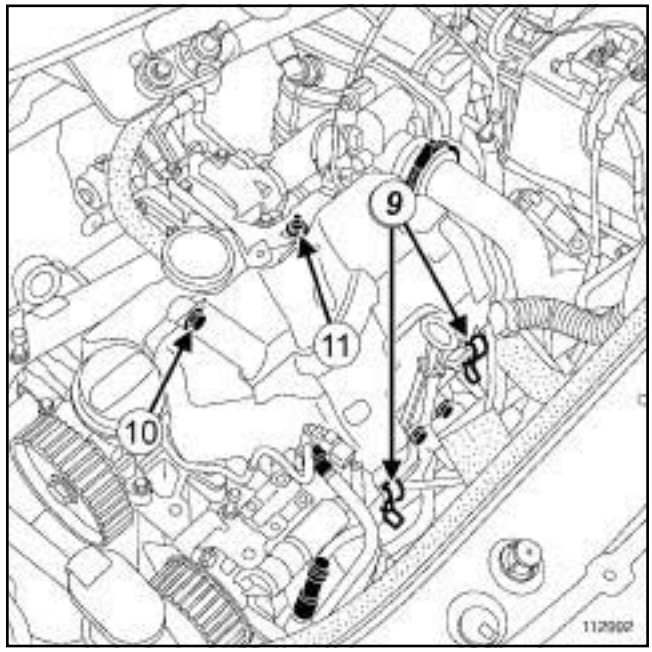
K9K, and 764 or 772

114210

112811

❏ Disconnect the connector (**3**) from the inlet air pressure sensor.

K9K, and 764



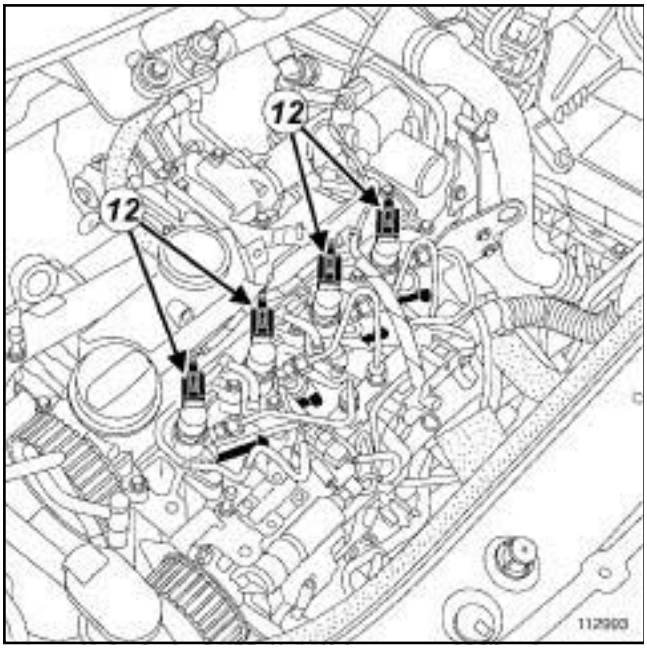
❏ Disconnect the turbocharger pressure regulation pipe.

❏ Undo the clip ***(4)*** from the intercooler outlet pipe.

❏ Move the intercooler outlet air pipe to one side ***(5)*** .

❏ Remove:

- the clips ***(6)*** from the intercooler inlet air pipe,
- the bolt (**7**) on the rocker cover,
- the intercooler air inlet pipe ***(8)*** .



112992

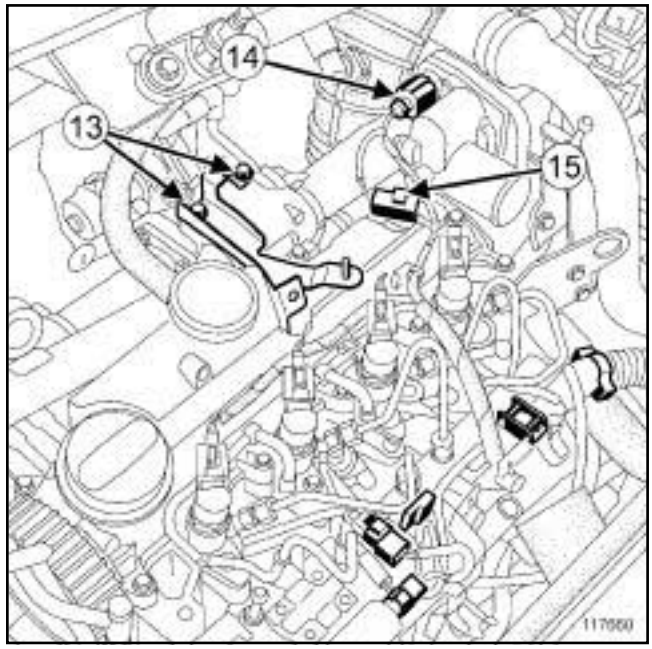
❏ Unclip the clips (**9**) from the injector rail protector cover.

❏ Remove:

- the injector rail protector cover bolt (**10**) ,
- the injector rail protector cover nut (**11**) ,
- the injector rail protector cover.

K9K, and 764 or 772

112993



❏ Disconnect the injector connectors (**12**) .

❏ Move the injector harness to one side.

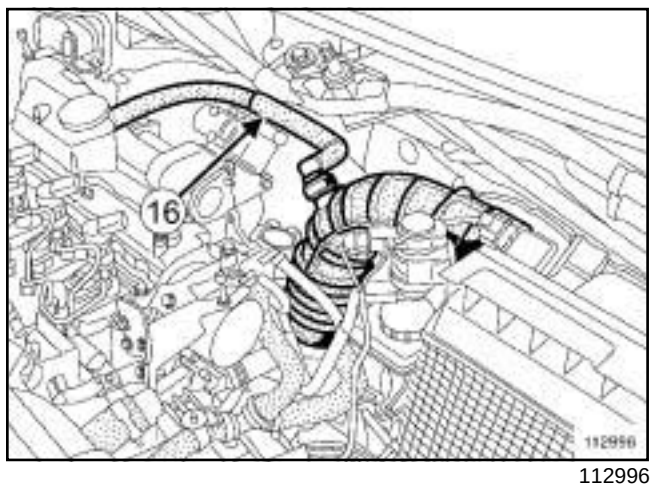
❏ Unclip the diesel return pipe.

K9K, and 772

❏ Detach the turbocharger front temperature sensor wiring harness on the injector rail protector mounting.

117660

❏ Remove:

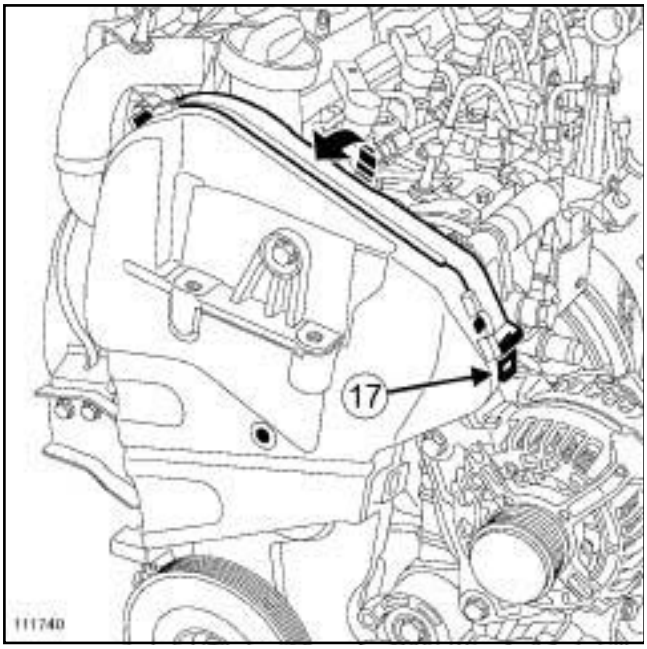


- the injector rail protector mounting bolts (**13**) ,
- the injector rail protector support.

❏ Disconnect:

- the damper valve connector (**14**) (if equipped),
- the camshaft position sensor connector (**15**) .

❏ Remove:

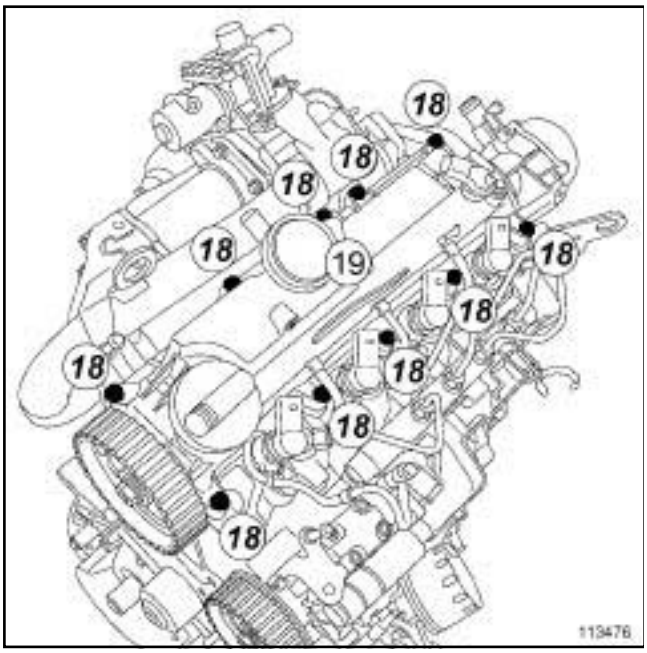


- the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (if equipped),
- the camshaft position sensor.

112996

❏ Disconnect the oil vapour rebreathing pipe (**16**) on the rocker cover side.

K9K, and 764 or 772



111740

❑ Unclip the tab (**17**) .

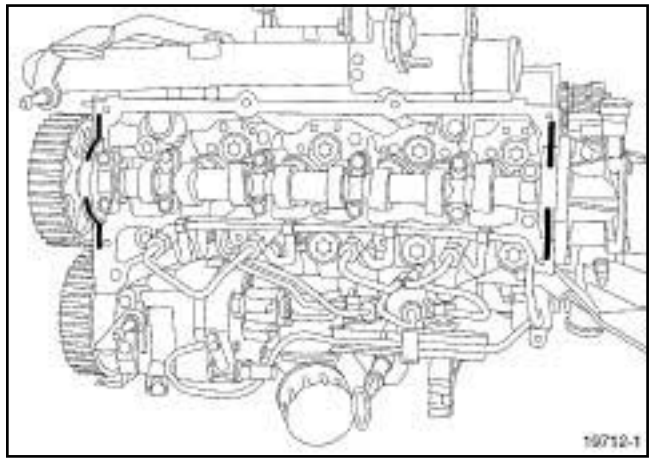
❑ Swivel the timing cover in the direction of the arrow.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113476

❑ Remove:

- the rocker cover bolts (**18**) ,
- the rocker cover (**19**) .



REFITTING

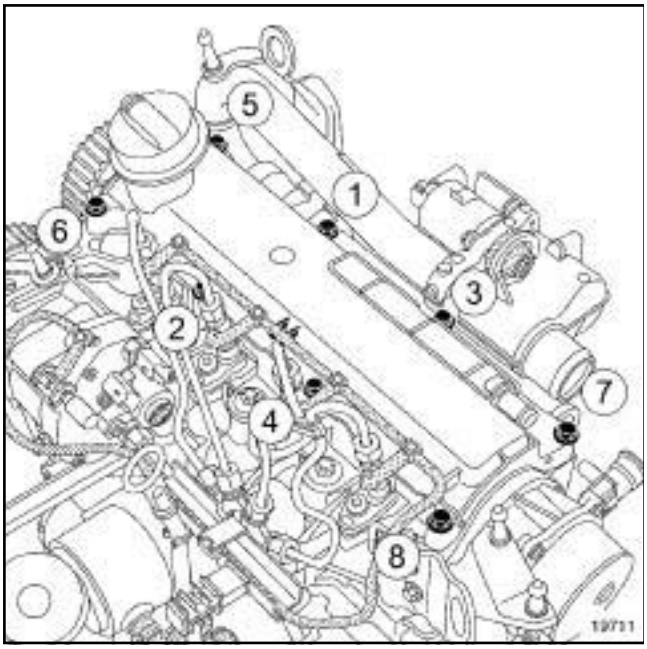
I - REFITTING PREPARATION OPERATION

❑ Always replace the rocker cover seal.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

19712-1



❑ Apply **RESIN ADHESIVE** (diameter **2 mm**).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the rocker cover,
- the rocker cover bolts.

K9K, and 764 or 772

19711

❏ Tighten to torque and in order the **rocker cover bolts (11 N.m)**.

III - FINAL OPERATION

❏ Fit the timing cover.

❏ Clip on the tab.

❏ Connect the oil vapour rebreathing pipe on the rocker cover side.

❏ Refit:

- the cylinder marking sensor,
- the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (if equipped).

❏ Connect:

- the damper valve connector (**14**) (if equipped),
- the camshaft position sensor connector (**15**) .

❏ Refit:

- the injector rail protector support,
- the injector rail protector mounting bolts.

K9K, and 772

❏ Clip on the turbocharger front temperature sensor wiring harness on the rail protector mounting.

❏ Clip on the diesel return pipe.

❏ Connect the injector connectors (**12**) .

❏ Position the injector wiring harness.

❏ Refit:

- the injector rail protector cover,
- the injector rail protector cover nut,
- the injector rail protector cover bolt.

❏ Torque tighten:

- the **injector rail protector cover bolt (8 N.m)**,
- the **injector rail protector cover nut (8 N.m)**.

❏ Fasten the clips of the injector rail protector cover.

❏ Refit:

- the intercooler air inlet pipe,
- the clips to the intercooler inlet air pipe,
- the bolt on the rocker cover.

❏ Fit the intercooler outlet air pipe.

❏ Torque tighten the **intercooler outlet air pipe clip (5.5 N.m)**.

K9K, and 764

❏ Connect the turbocharger pressure regulation pipe.

❏ Refit the intercooler inlet and outlet pipe nut on the alternator.

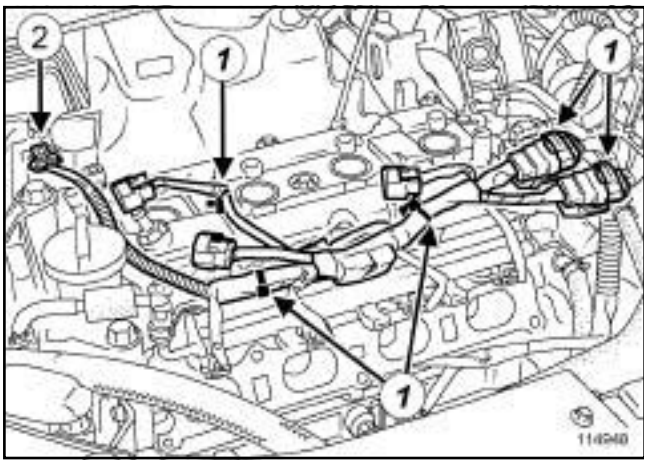
❏ Torque tighten **the intercooler inlet and outlet pipe nut on the alternator (8 N.m)**.

❏ Refit:

- the air filter unit air inlet pipe,
- the engine cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

M4R



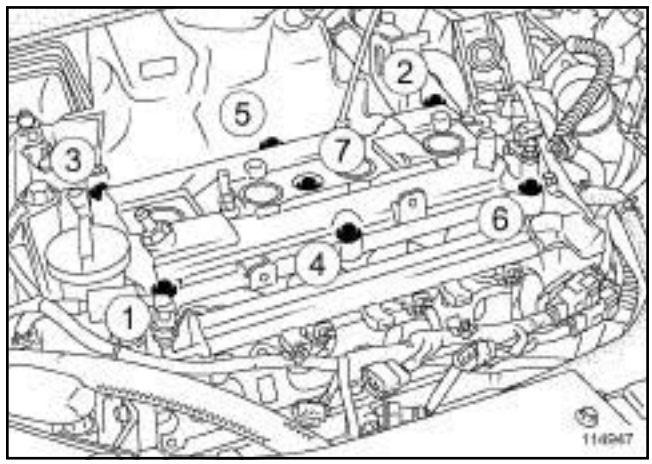
Tightening torques ▽	
rocker cover mounting bolts	**8 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .



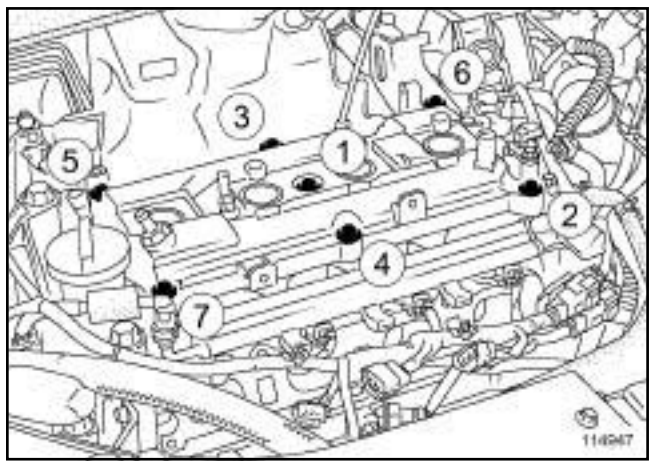
❏ Unclip:

- the wiring harness at (**1**) ,
- the atmospheric pressure sensor (**2**) .

❏ Move the wiring harness to one side.

II - REMOVAL OF PART CONCERNED

❏ Remove:



- in order, the rocker cover mounting bolts,
- the rocker cover,
- the rocker cover seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ The rocker cover seal must always be replaced.

II - REFITTING THE PART CONCERNED

❏ Fit the rocker cover.

❏ Tighten to torque and in order the **rocker cover mounting bolts (2 Nm)**.

❏ Tighten to torque and in order the **rocker cover mounting bolts (8 Nm)**.

M4R

III - FINAL OPERATION

❑ Clip:

- the atmospheric pressure sensor,
- the wiring harness.

❑ Refit the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) .

Rocker cover: Removal - Refitting

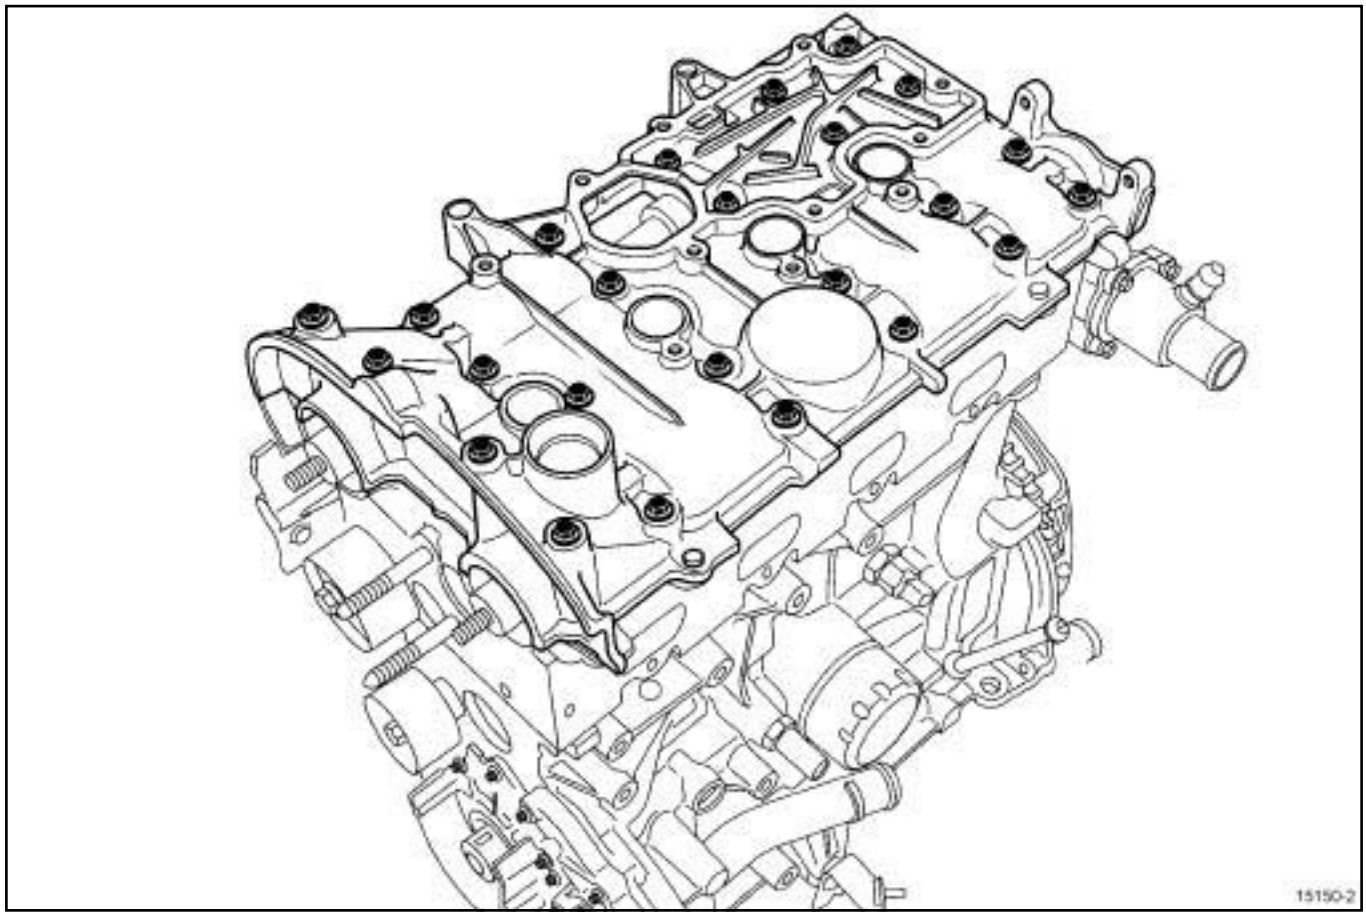
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **02A, Lifting equipment, Vehicle: Towing and lifting**).



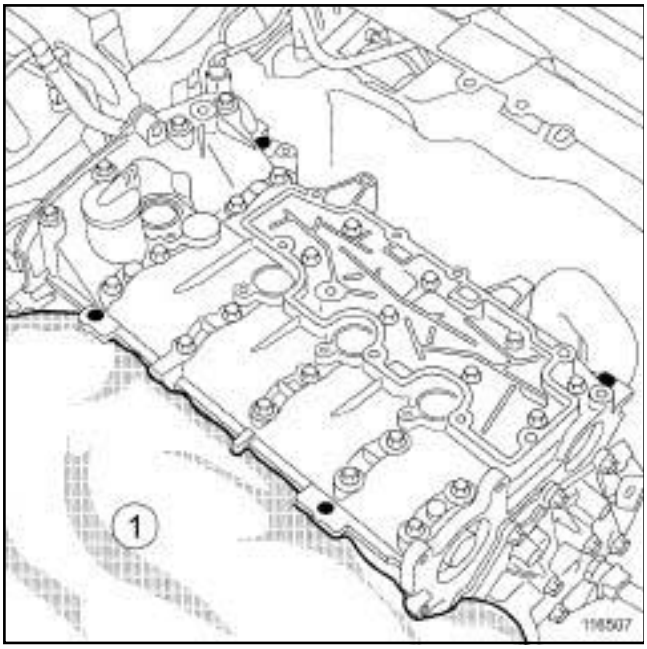
❑ Disconnect the battery (see **80A, Battery, Battery: Removal - Refitting**)

❑ Remove:

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the battery (see **80A, Battery, Battery: Removal - Refitting**),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel (see **35A, Wheels and tyres: Wheel: Removal - Refitting**),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

F4R

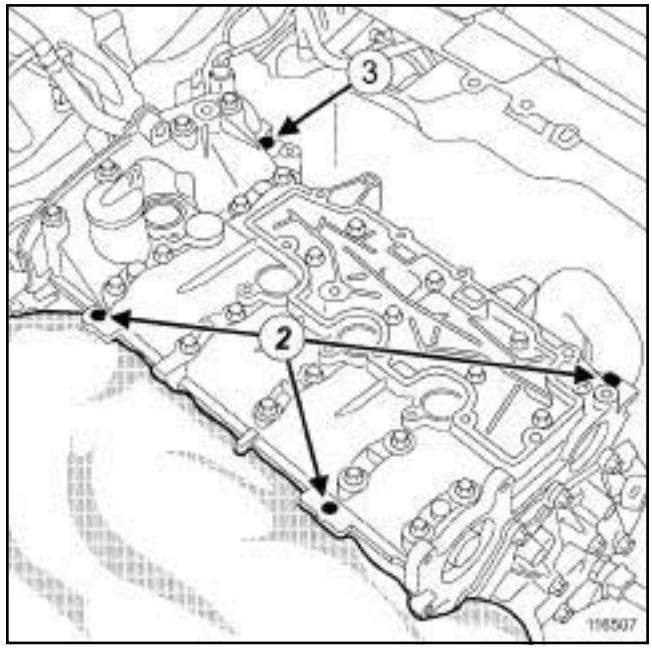
II - OPERATION FOR REMOVAL OF PART CONCERNED



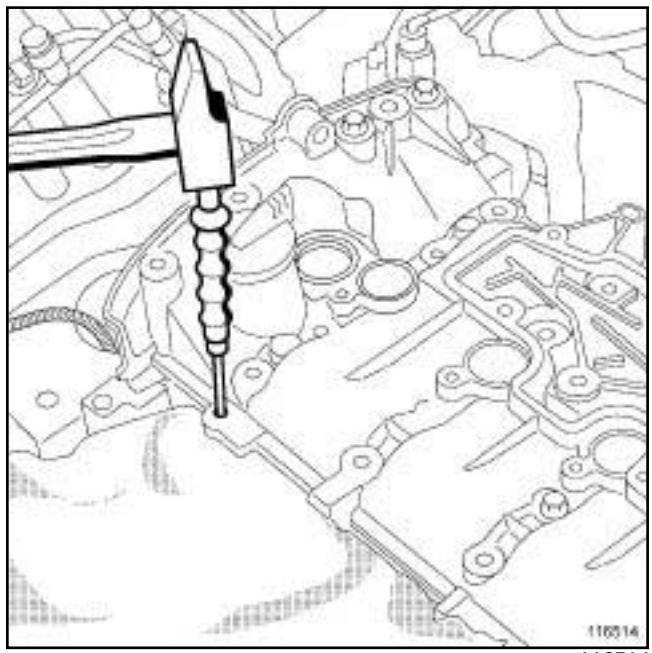
15150-2

❏ Undo all the mounting bolts from the rocker cover.

❏ Remove the rocker cover bolts.



F4R

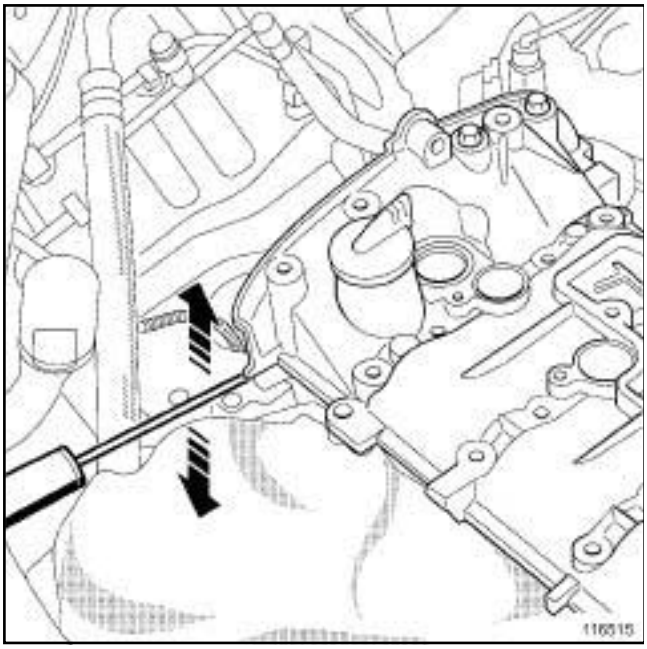


116507

❑ Using a clean cloth (**1**) , protect:

- the injector holder plate pipe openings to prevent any impurities from entering,
- the injector rail,
- the camshaft position sensor location.

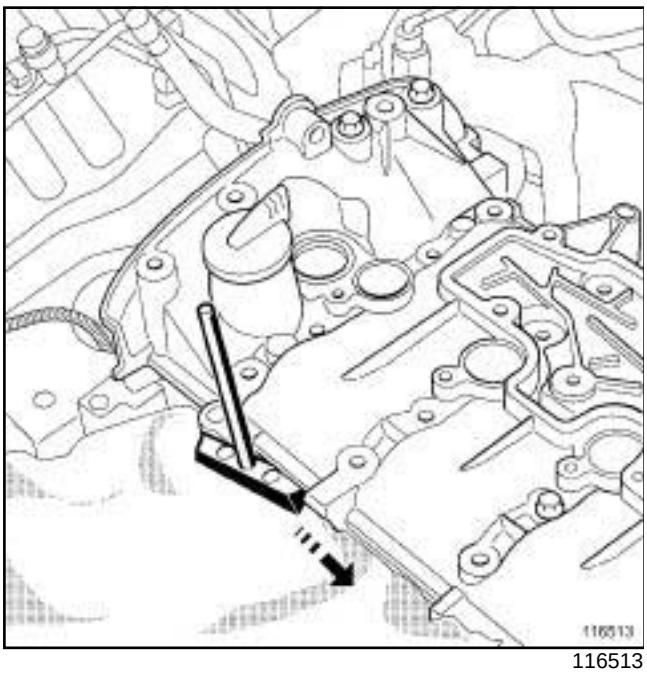
116507



116514

❑ Remove the rocker cover centring devices (**2**) using a hammer and a drift to knock them out from above.

Note:



The centring device (**3**) must not be removed under any circumstances. Not following these instructions could damage the cylinder head.

F4R

116515

❑ Press a flat-blade screwdriver onto the injector holder plate and use it to gently remove the adhesive from the rocker cover.

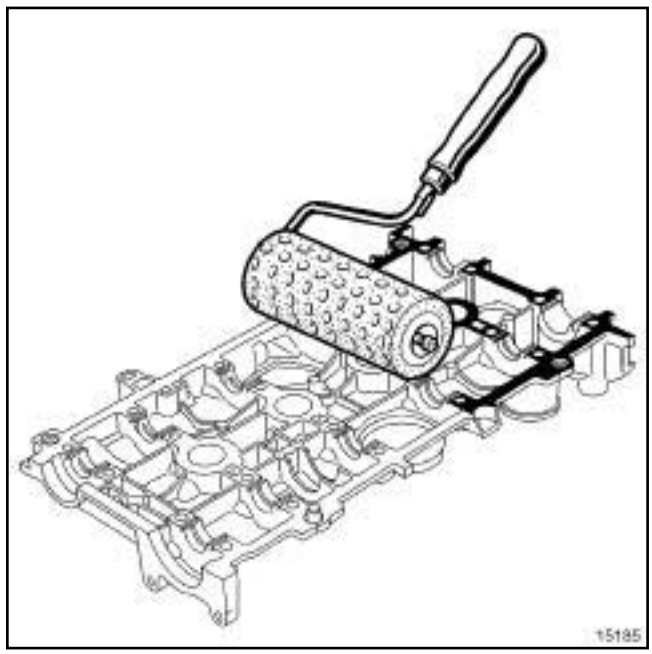
116513

❑ Remove the rocker cover using the **(Mot. 1716)**.

❑ Remove the rocker cover.

REFITTING

I - REFITTING PREPARATION OPERATION



❑ Refit the centring devices on the cylinder head using a hammer and drift.

Note:

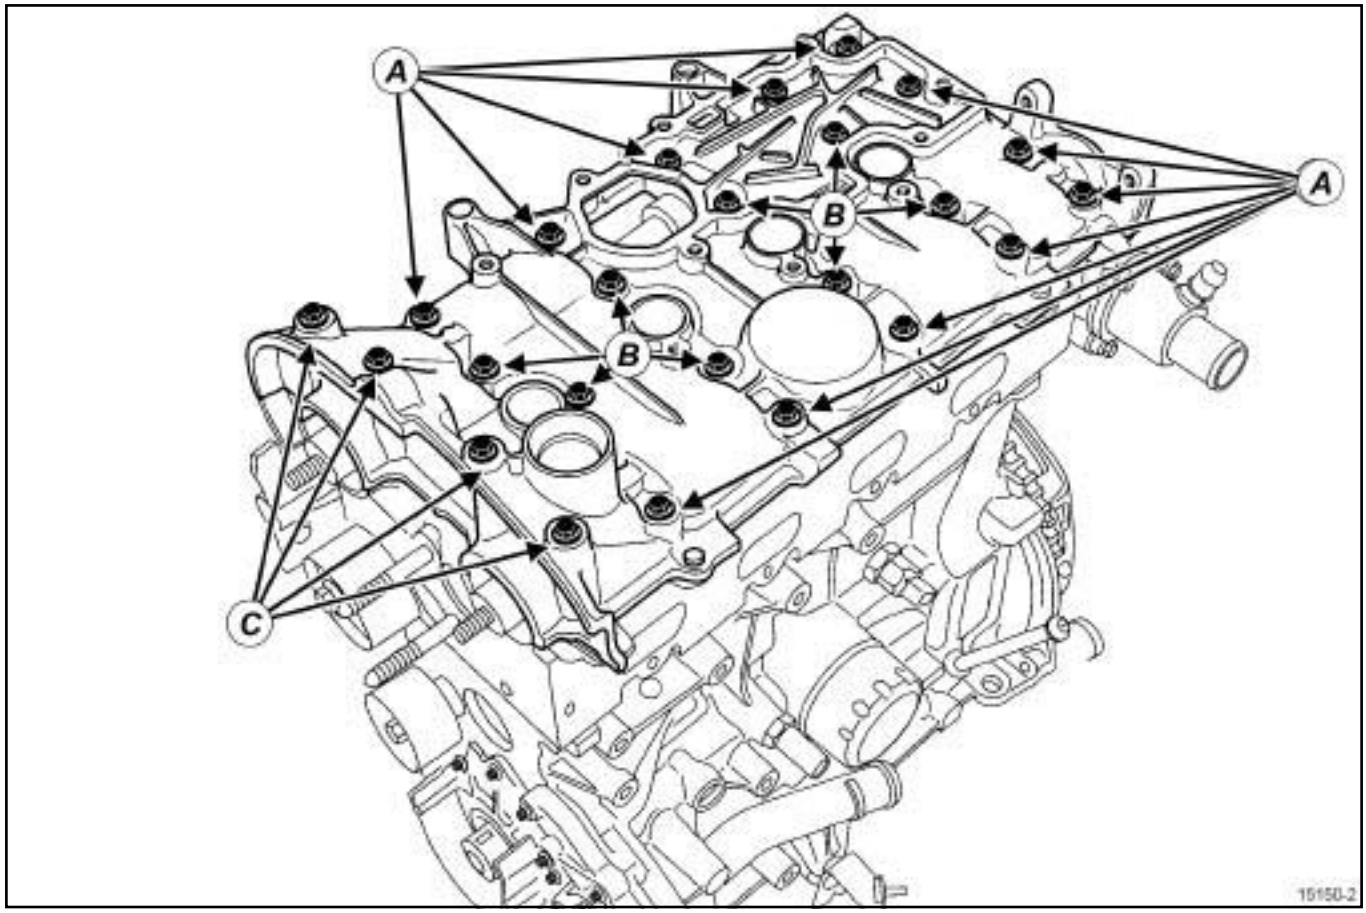
The seal faces must be clean, dry and free from grease (avoid finger marks).

Excess sealant could be squeezed out when the parts are tightened. The product-fluid mix may damage some components (engine, radiator).

II - REFITTING OPERATION FOR PART CONCERNED

15185

❑ Apply some **RESIN ADHESIVE** to the rocker cover gasket face using a stipple roller.



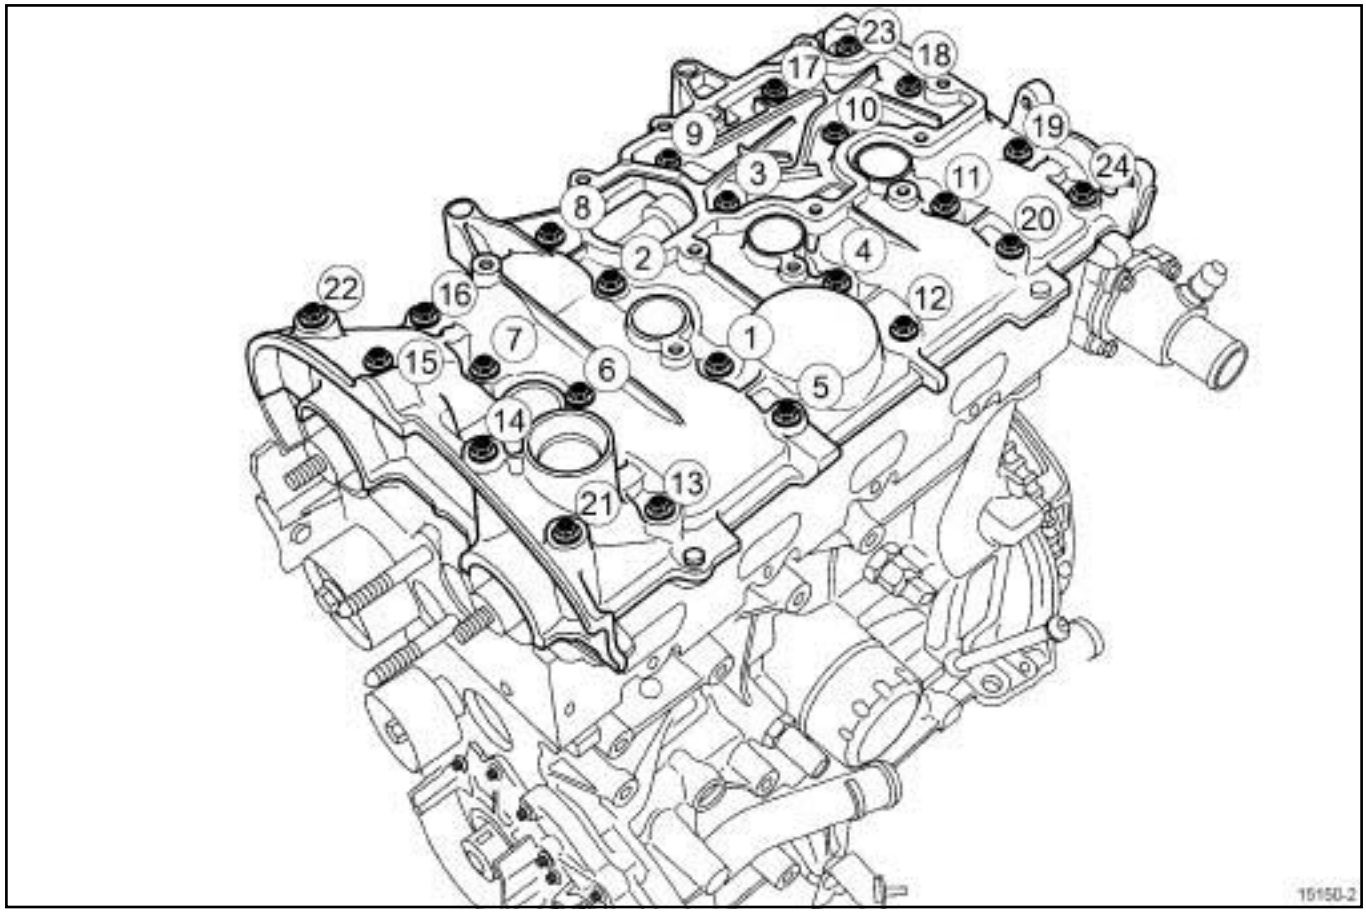
Note:

Use a cloth to remove any **RESIN ADHESIVE** on the rocker cover bearings.

❑ Fit the rocker cover.

F4R

mounting bolt location



15150-2

(**A**) short bolts
(**B**) medium bolts
(**C**) long bolts

❑ Insert all the rocker cover mounting bolts.

F4R

tightening order for rocker cover mounting bolts

15150-2

❏ Tighten in order and to torque the **rocker cover mounting bolts (22), (23), (20), (13) (8 Nm)** to correctly fit the rocker cover.

❏ Tighten in order and to torque the **rocker cover mounting bolts (1) to (12), (14) to (19), (21) and (24) (12 Nm)**.

❏ Loosen rocker cover mounting bolts (22), (23), (20) and (13).

❏ Tighten in order and to torque **rocker cover mounting bolts (22), (23), (20), (13) (12 Nm)**.

III - FINAL OPERATION

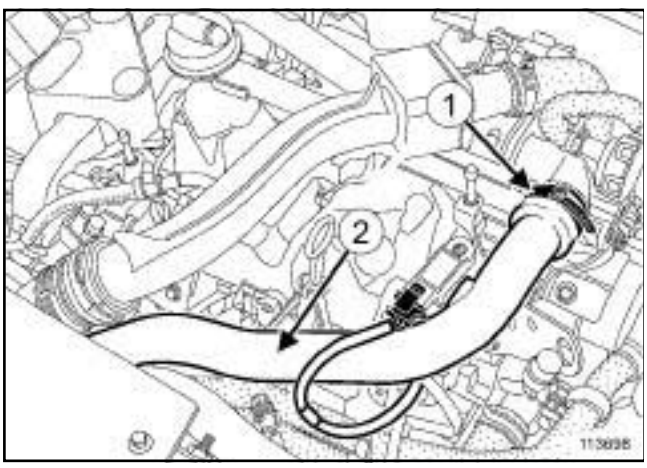
❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel (see **35A, Wheels and tyres: Wheel: Removal - Refitting**),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❏ Connect the battery (see **80A, Battery, Battery: Removal - Refitting**),

❏ Using the **Diagnostic tool**, check that there are no faults stored by the injection computer and clear them if necessary.

K9K, and 750 or 752



Tightening torques ▽	
rocker cover bolts	**11 N.m**
EGR solenoid valve strut nuts	**12 N.m**

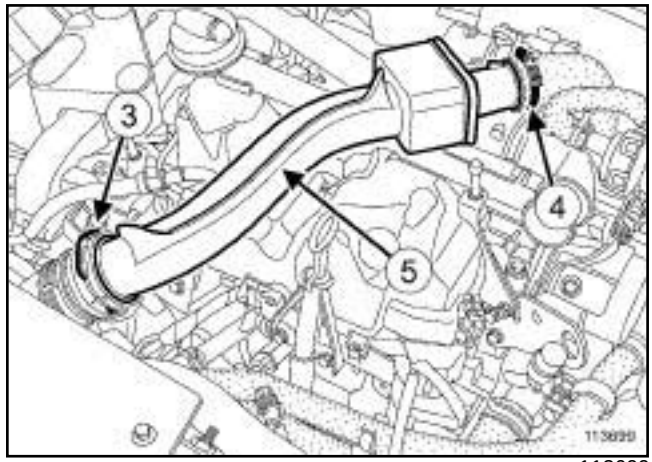
intercooler outlet air pipe clip	**5.5 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

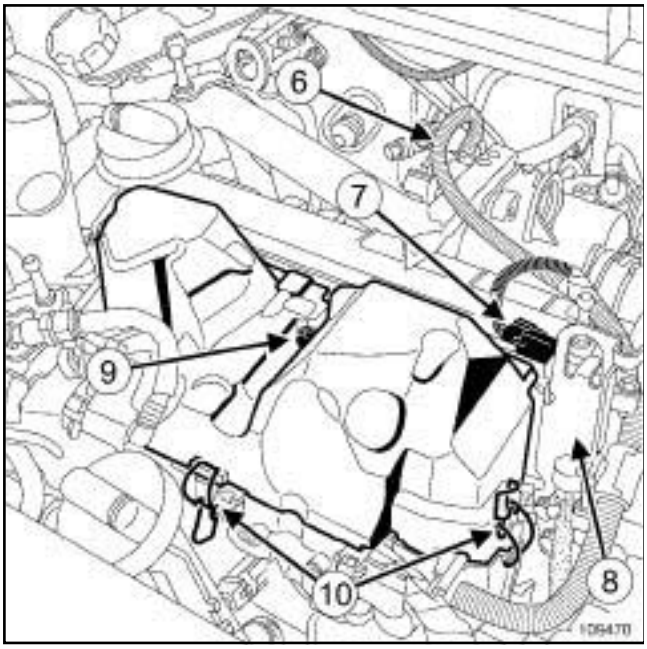


K9K, and 750

113698

❏ Undo the clip (**1**) from the intercooler outlet pipe.

❏ Move the intercooler outlet air pipe to one side (**2**) .



113699

❏ Remove the turbocharger outlet air pipe retaining pin (**3**) .

❏ Loosen the turbocharger outlet air pipe clip (**4**) .

❏ Remove the turbocharger air outlet pipe (**5**) .

K9K, and 750 or 752

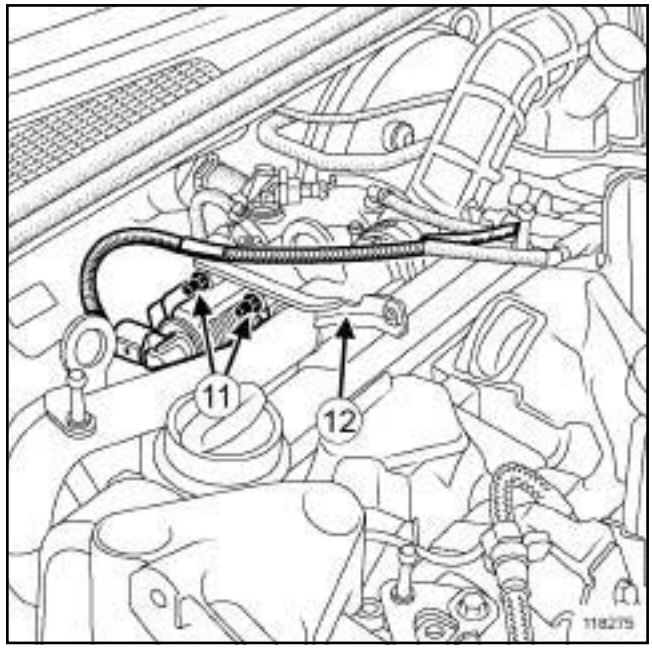
109470

❏ Disconnect:

- the oil vapour rebreathing pipe,
- the connector (**6**) from the EGR solenoid valve,
- the air pressure sensor connector (**7**) .

❏ Unclip the breather pipe from the gearbox.

❏ Remove:



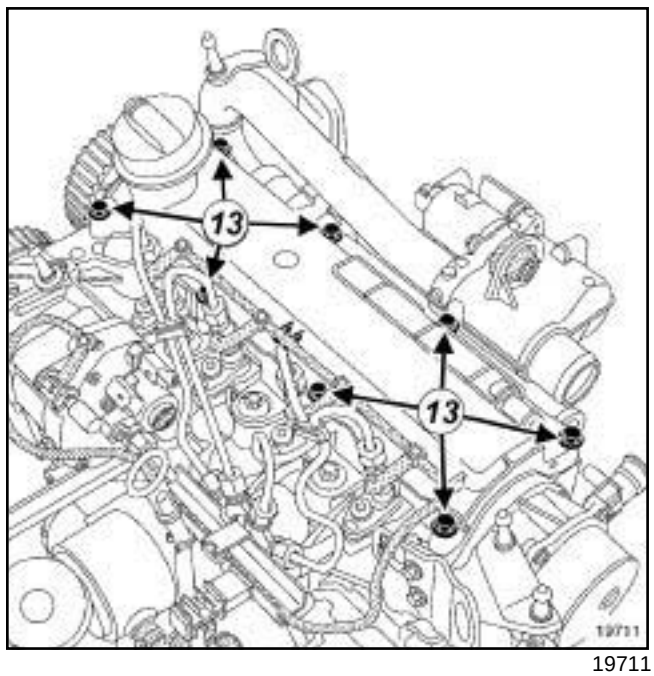
- the lifting eye bolts (**8**) on the gearbox side,
- the gearbox side lifting eye.

❏ Move the wiring harness to one side.

❏ Unclip the clips (**9**) from the injector rail protector.

❏ Remove:

- the injector rail protector bolt (**10**) ,
- the injector rail protector.



118275

❏ Remove:

- the nuts (**11**) from the EGR solenoid valve strut (**12**) ,
- the strut on the EGR solenoid valve.

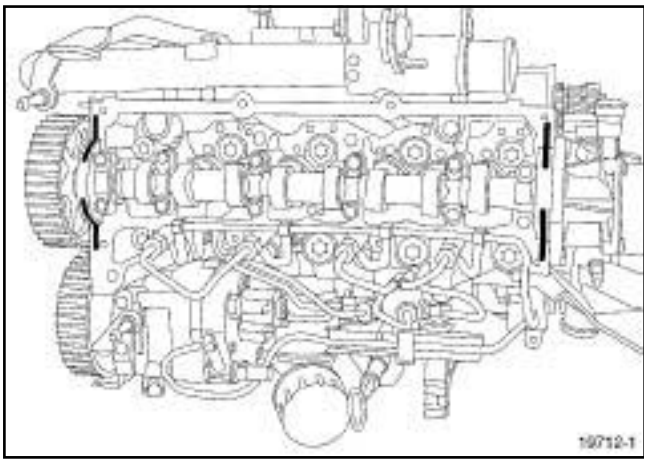
II - OPERATION FOR REMOVAL OF PART CONCERNED

19711

❏ Remove:

- the rocker cover bolts (**13**) ,
- the rocker cover.

K9K, and 750 or 752

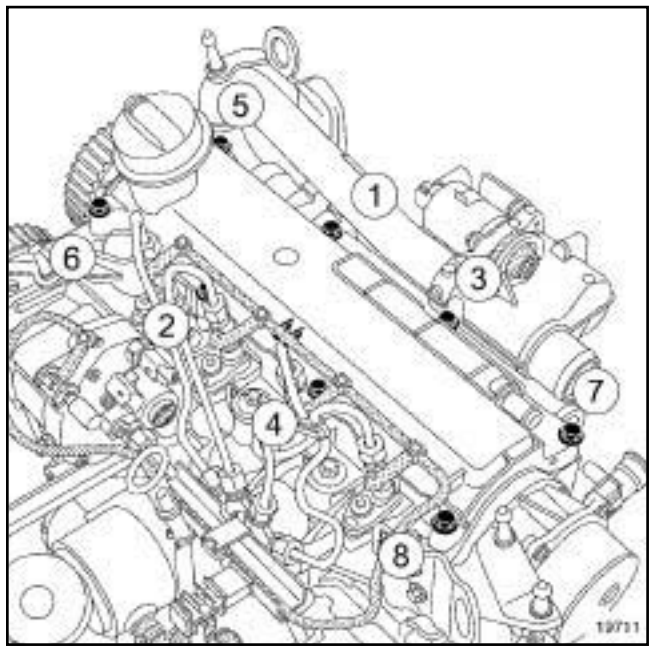


REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).



WARNING
Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

19712-1

❑ Apply **RESIN ADHESIVE**, **2 mm** in diameter.

II - REFITTING OPERATION FOR PART CONCERNED

19711

❑ Refit the rocker cover, fitted with a new gasket.

❑ Fit without tightening the rocker cover bolts.

❑ Tighten to torque and in order the **rocker cover bolts (11 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the strut on the EGR solenoid valve,
- the EGR solenoid valve strut nuts.

❑ Tighten to torque the **EGR solenoid valve strut nuts (12 N.m)**.

❑ Refit:

- the injector rail protector,
- the injector rail protector bolt.

❑ Torque tighten the **injector rail protector bolt (8 N.m)**.

❑ Clip the clips onto the injector rail protector.

❑ Refit:

- the gearbox side lifting eye,
- the gearbox side lifting eye bolts.

❑ Fit the wiring harness.

❑ Connect:

- the air pressure sensor connector.

K9K, and 750 or 752

- the exhaust gas recirculation solenoid valve connector,
- the oil vapour rebreathing pipe .

❏ Clip the breather pipe to the gearbox.

❏ Tighten to torque the **gearbox side lifting eye bolts (21 N.m)**.

K9K, and 750

❏ Loosen the intercooler inlet air pipe nut on the alternator.

❏ Fit:

- the turbocharger air outlet pipe,
- the turbocharger outlet air pipe retaining pins.

❏ Click into place the turbocharger outlet air pipe.

❏ Tighten the turbocharger outlet air pipe bolt on the rocker cover.

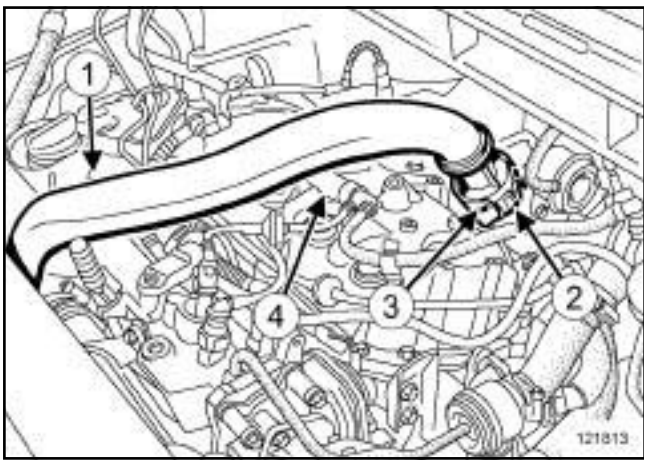
❏ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❏ Fit the intercooler outlet air pipe.

❏ Torque tighten the **intercooler outlet air pipe clip (5.5 N.m)**.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784



Tightening torques ▽	
rocker cover bolts (initial torque)	**5 Nm**
rocker cover bolts	**13 Nm**
heat shield bolts	**8 Nm**

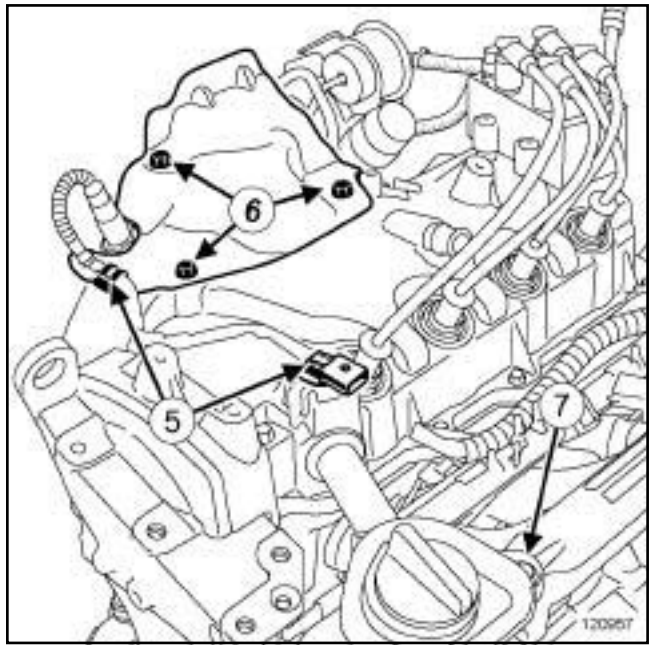
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the front engine cover

121813



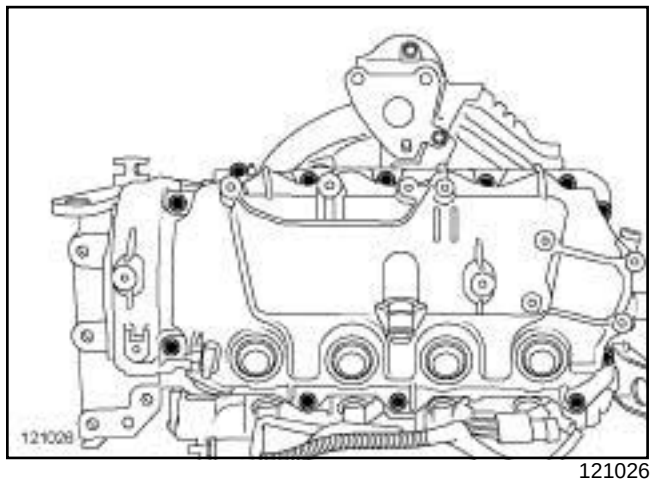
❏ Remove the bolt (**1**) from the intercooler air inlet pipe on the intake distributor.

❏ Remove the intercooler air inlet pipe clip (**2**) on the turbocharger.

> Note:
>
> If the clip (**3**) is removed from the heat resistant protector, the latter must be replaced.

❏ Move the intercooler inlet air pipe to one side.

❏ Disconnect the oil vapour rebreathing circuit union (**4**) .



120957

❏ Unpick the wiring harness from the upstream oxygen sensor at (**5**) .

❏ Remove:

- the bolts (**6**) from the heat shield,
- the heat shield,
- the filler neck bolt (**7**) ,
- the filler neck,
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

121026

❏ Remove:

- the rocker cover bolts,

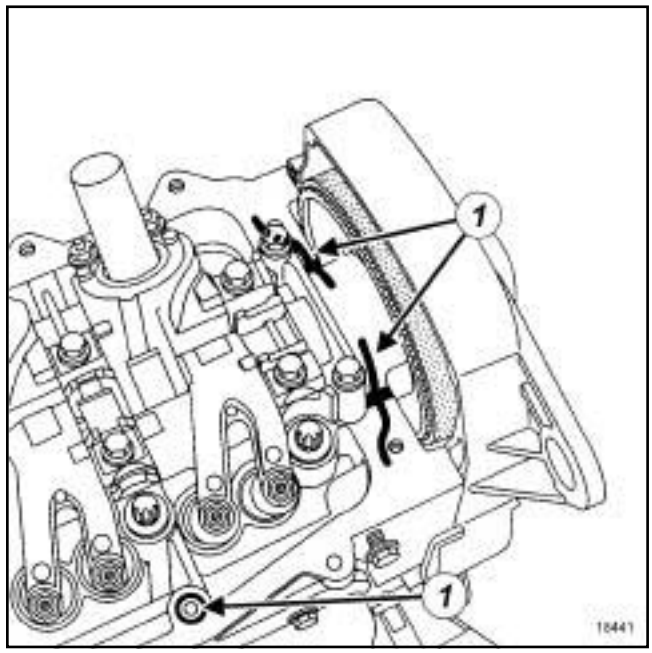
- the rocker cover,
- the rocker cover gasket.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Clean the joint faces using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) to dissolve the part of the seal which is still attached.

WARNING



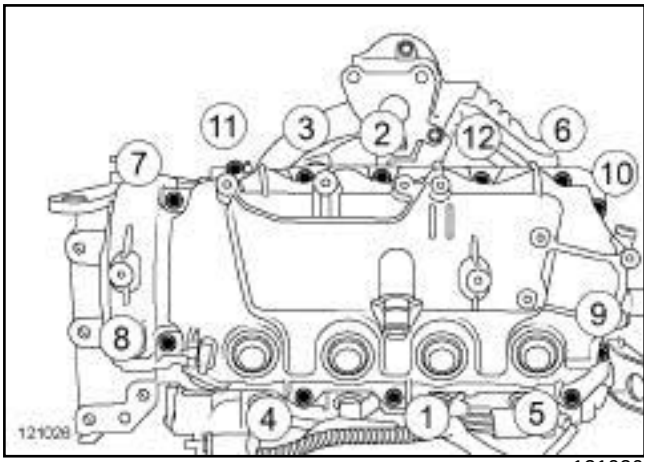
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

❑ Replace the rocker cover seal.

II - REFITTING OPERATION FOR PART CONCERNED



18441

❑ Apply beads (**1**) of **MASTIXO** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) around the 4 rocker cover bolts (lower bolts, exhaust side) and on camshaft bearing **no.5**.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Fit the new rocker cover seal, starting with bearing **No. 5**, then gradually insert the seal studs as the rocker cover fits into the groove.

121026

❏ Refit:

- the rocker cover fitted with a new seal,
- the rocker cover bolts.

❏ Pretighten to torque and in order the **rocker cover bolts (initial torque) (5 Nm)**.

❏ Torque tighten in order the **rocker cover bolts (13 Nm)**.

III - FINAL OPERATION.

❏ Remove:

- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the filler neck,
- the filler neck bolt,
- the heat shield,
- the heat shield bolts.

❏ Torque tighten the **heat shield bolts (8 Nm)**.

❏ Connect the oil vapour rebreathing circuit union.

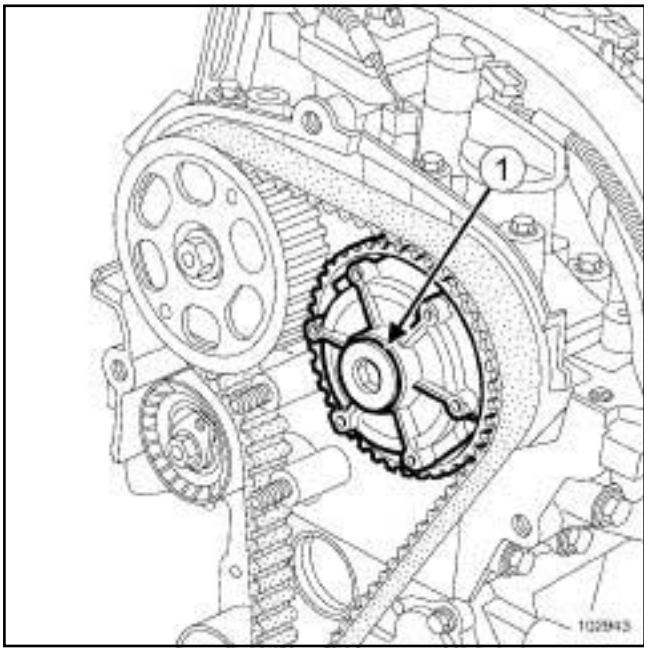
❏ Clip the upstream oxygen sensor wiring harness into place.

❏ Refit the intercooler air inlet pipe.

❏ Clip the intercooler air inlet pipe onto the turbocharger.

❏ Refit the intercooler air inlet pipe bolt on the intake distributor.

❏ Refit the engine cover.



❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M

I - SPECIAL NOTES

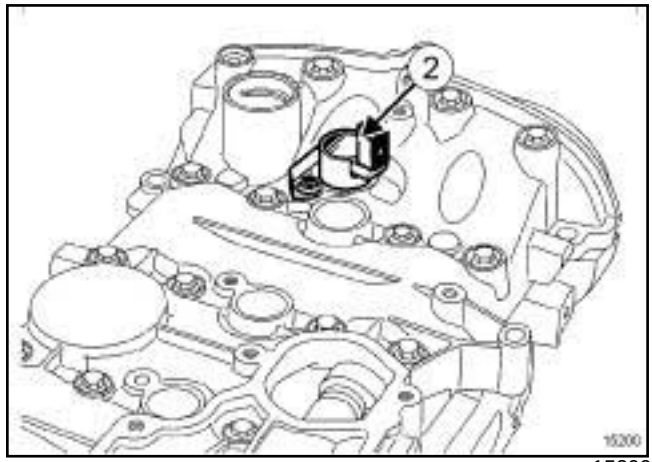
Its role is to modify the valve timing.

To improve cylinder filling at all engine speeds, the engine is fitted with an inlet camshaft dephaser (**1**) .

102943

Dephasing at the moment when the inlet valves close optimises filling according to engine speed. Torque at midrange engine speed and output at high engine speed are improved.

Leaving the inlet valves open for longer at high engine speed allows the mixture to be continually admitted thanks to its high speed.



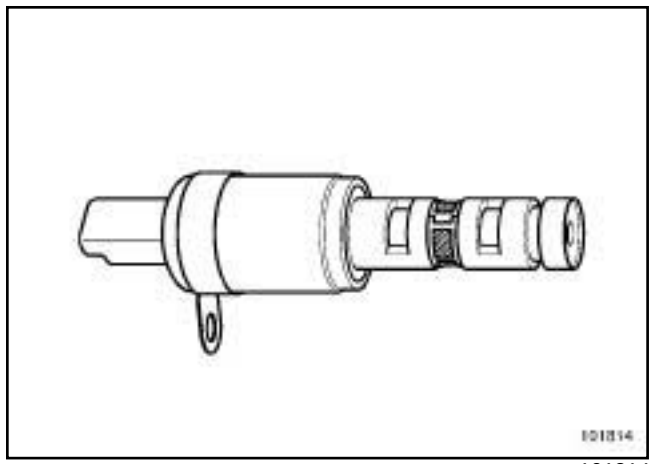
However, at lower engine speeds the gases do not have a high level of inertia. It is therefore preferable to close the inlet valves earlier to avoid incorrect filling and a loss of torque due to the reflux of fresh gases.

The higher the engine speed, the later the inlet valves must be closed.

II - OPERATION AND PROGRAMMING

The oil is supplied to the dephaser by a solenoid valve (**2**) located on the cylinder head.

The supply by a variable OCR signal (amplitude **12 V**, frequency **250 Hz**) enables oil to be distributed to the mechanism and the dephaser angle to be adjusted.



15200

The operation of the camshaft dephaser varies continuously.

The computer supplies the solenoid valve (**2**) with a variable opening cyclic ratio proportional to the desired dephasing.

Dephasing is varied continuously from **0 to 43°** of the crankshaft.

101814

The camshaft dephaser control solenoid valve is controlled if the following conditions are met:

- no speed sensor fault
- no camshaft position sensor fault
- no injection system faults,
- after the engine has started,
- outside idling speed and no load,
- threshold of mapping according to load and engine speed reached,
- coolant temperature between **10 and 120°C**,
- engine oil temperature too high.

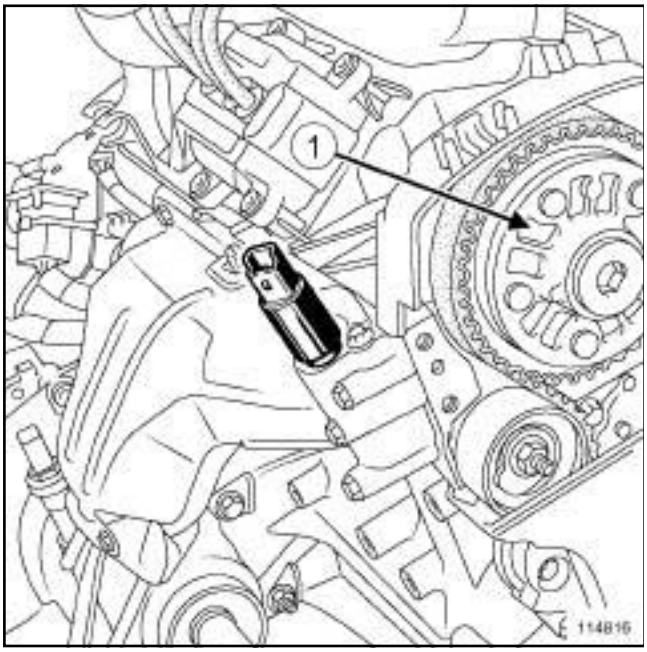
Camshaft dephaser: Function

K4M

Defect modes:

- dephaser returns to initial position,
- zero dephasing.

WARNING



A solenoid valve jammed open causes an unstable idle speed, manifold pressure which is too high at idle speed and significant engine operating noise.

D4F, and 764

I - SPECIAL NOTES

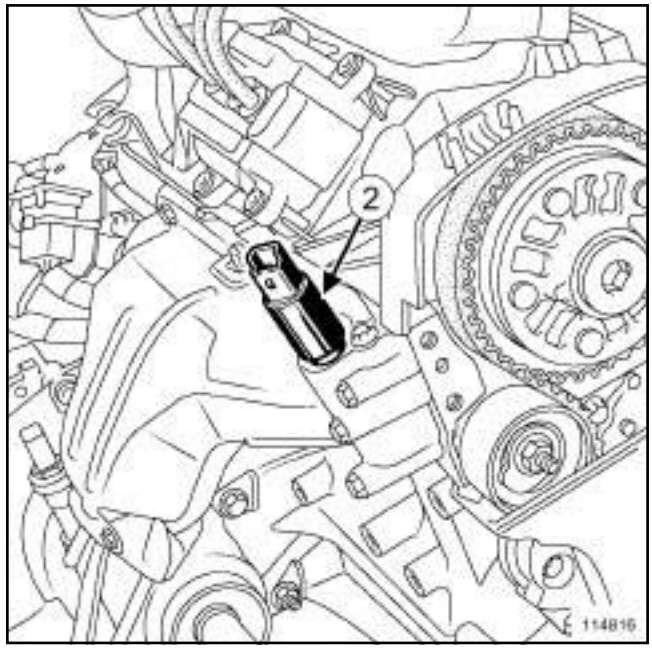
Its role is to modify the valve timing.

To improve cylinder filling at all engine speeds, the engine is fitted with a camshaft dephaser (**1**) .

114816

Dephasing at the moment when the inlet valves close optimises filling according to engine speed. Torque at midrange engine speed and output at high engine speed are improved.

Leaving the inlet valves open for longer at high engine speed allows the mixture to be continually admitted thanks to its high speed.



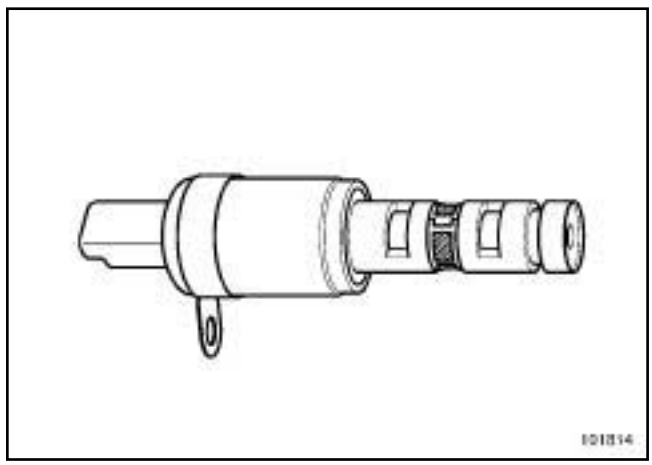
However, at lower engine speeds the gases do not have a high level of inertia. It is therefore preferable to close the inlet valves earlier to avoid incorrect filling and a loss of torque due to the reflux of fresh gases.

The higher the engine speed, the later the inlet valves must be closed.

II - OPERATION AND PROGRAMMING

The oil is supplied to the dephaser by a solenoid valve (**2**) located on the cylinder head.

The supply by a variable OCR signal (amplitude **12 V**, frequency **250 Hz**) enables oil to be distributed to the mechanism and the dephaser angle to be adjusted.



114816

The operation of the camshaft dephaser varies continuously.

The computer supplies the solenoid valve (**2**) with a variable opening cyclic ratio proportional to the desired dephasing.

Dephasing is varied continuously from **0 to 43°** of the crankshaft.

101814

The camshaft dephaser control solenoid valve is controlled if the following conditions are met:

- no speed sensor fault
- no camshaft position sensor fault
- no injection system faults,
- after the engine has started,
- outside idling speed and no load,

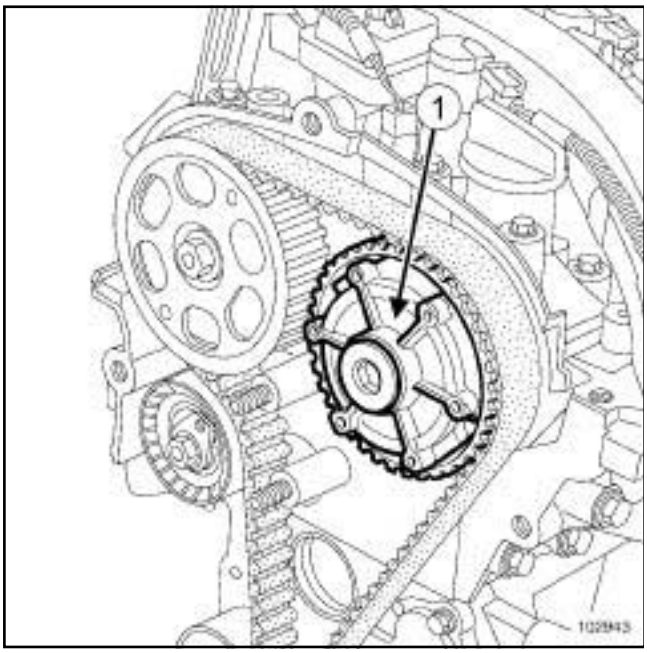
D4F, and 764

- threshold of mapping according to load and engine speed reached,
- coolant temperature between **10 and 120°C**,
- engine oil temperature too high.

Defect modes:

- dephaser returns to initial position,
- zero dephasing.

Note:



A solenoid valve jammed in the open position causes:

- rough idle speed,
- high pressure in the intake distributor,
- significant engine operating noises.

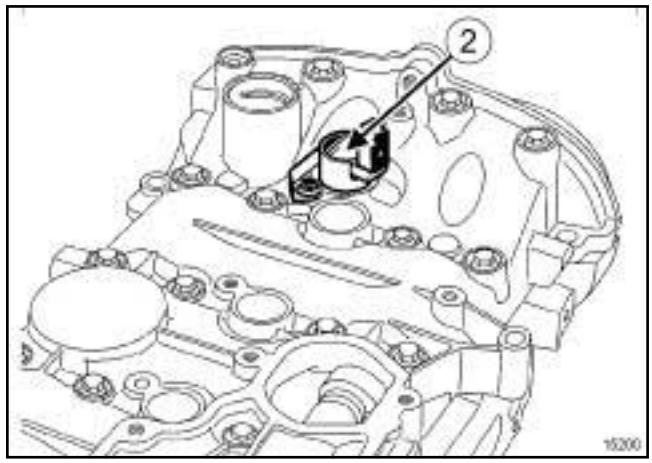
K4M

I - SPECIAL NOTES

Its role is to modify the valve timing.

102943

To improve cylinder filling at all engine speeds, the engine is fitted with an inlet camshaft dephaser (**1**) .



Dephasing at the moment when the inlet valves close optimises filling according to engine speed. Midrange torque and output are improved.

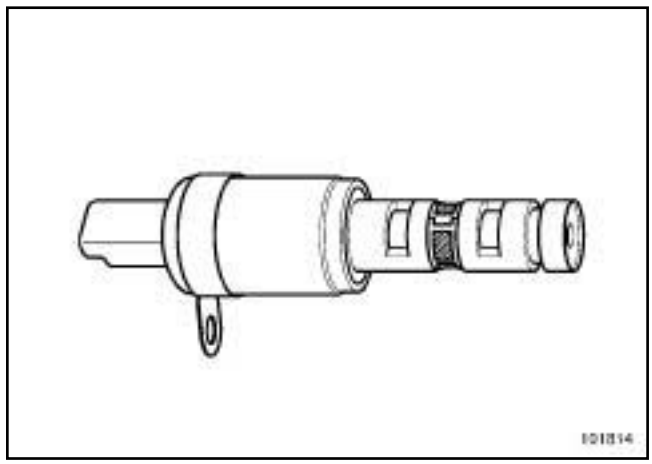
Leaving the inlet valves open for longer at high engine speed allows the mixture to be continually admitted thanks to its high speed.

However, at lower engine speeds the gas has low inertia. It is therefore preferable to close the inlet valves earlier to avoid incorrect filling and a loss of torque due to the reflux of cold gases.

The higher the engine speed, the later the inlet valves must be closed.

II - OPERATION AND PROGRAMMING

15200



The oil is supplied to the dephaser by a solenoid valve (**2**) located on the cylinder head.

The supply by a variable OCR signal (amplitude **12 V**, frequency **250 Hz**) enables oil to be distributed to the mechanism and the dephaser angle to be adjusted.

The operation of the camshaft dephaser varies continuously.

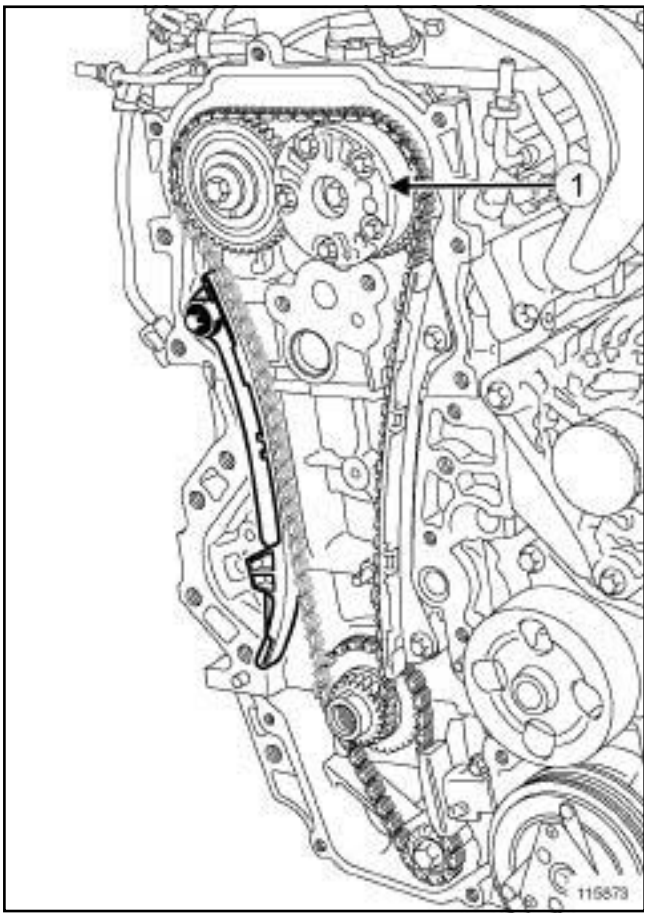
The computer supplies the solenoid valve (**2**) with a variable opening cyclic ratio proportional to the desired dephasing.

Dephasing is varied continuously from **0 to 43°** of the crankshaft.

101814

The camshaft dephaser control solenoid valve is controlled if the following conditions are met:

- no speed sensor fault
- no camshaft position sensor fault
- no injection system faults,
- after the engine has started,
- outside idling speed and no load,



K4M

- threshold of mapping according to load and engine speed reached,
- coolant temperature between **10 and 120°C**,

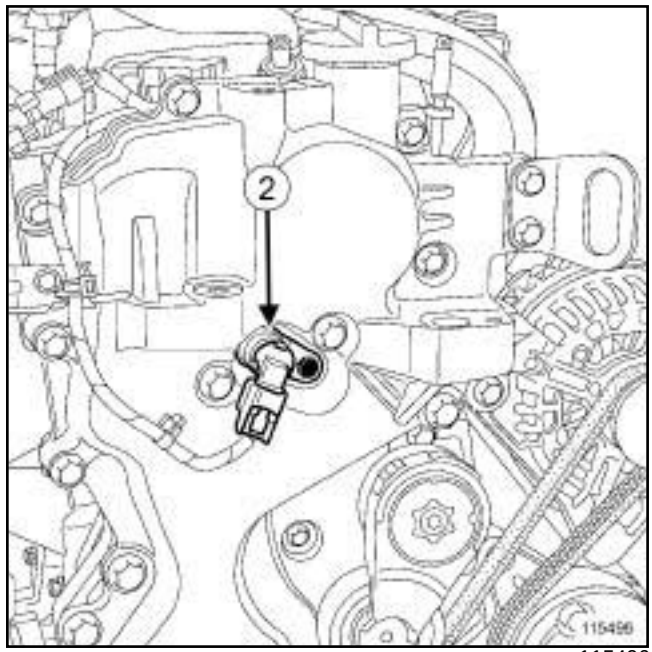
M4R

I - SPECIAL NOTES

The camshaft dephaser modifies the valve timing.

115873

To improve cylinder filling at all engine speeds, the engine is fitted with an inlet camshaft dephaser (**1**) .



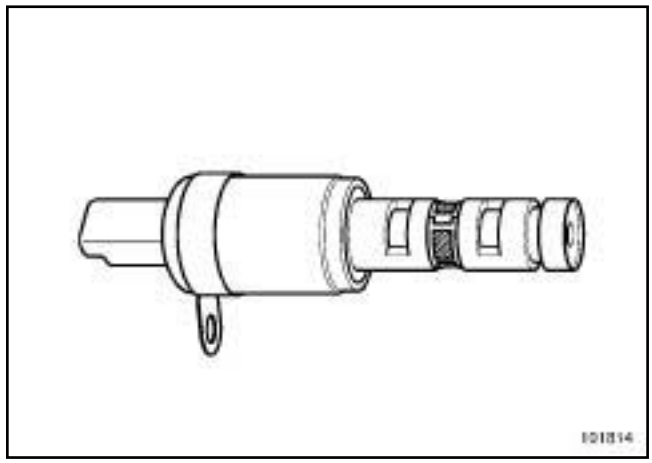
Dephasing at the moment when the inlet valves close optimises filling according to engine speed. Torque at midrange engine speed and output at high engine speed are improved.

Leaving the inlet valves open for longer at high engine speed allows the mixture to be continually admitted thanks to its high speed.

However, at lower engine speeds the gases do not have a high level of inertia. It is therefore preferable to close the inlet valves earlier to avoid incorrect filling and a loss of torque due to the reflux of fresh gases.

The higher the engine speed, the later the inlet valves must be closed.

II - OPERATION AND PROGRAMMING



115496

The oil is supplied to the dephaser by a solenoid valve (**2**) located on the timing cover.

Supply by a variable opening cyclic ratio signal enables oil to be distributed to the mechanism and the dephaser angle to be adjusted.

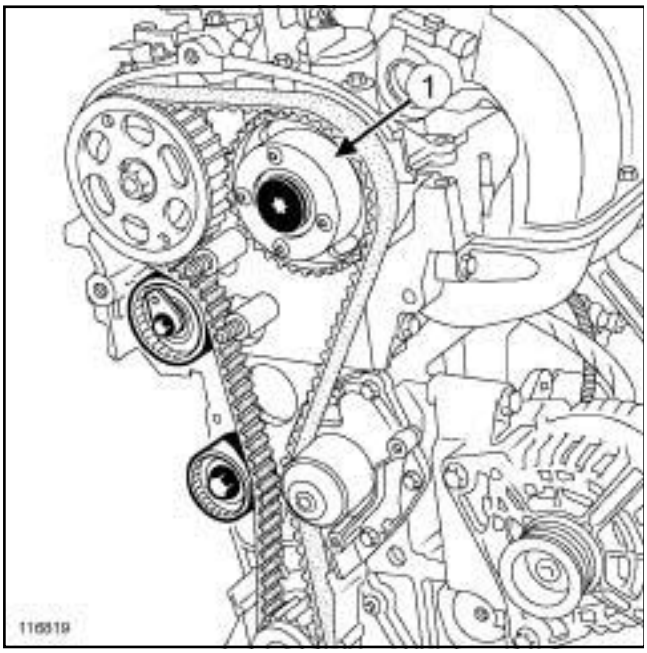
The operation of the camshaft dephaser varies continuously.

The computer supplies the solenoid valve with a variable opening cyclic ratio proportional to the desired dephasing.

101814

The camshaft dephaser control solenoid valve is controlled if the following conditions are met:

- no engine speed sensor fault
- no camshaft position sensor fault
- no injection system faults,



M4R

- after the engine has started,
- outside idling speed and no load,
- threshold of mapping according to load and engine speed reached,
- threshold of mapping according to the coolant temperature.

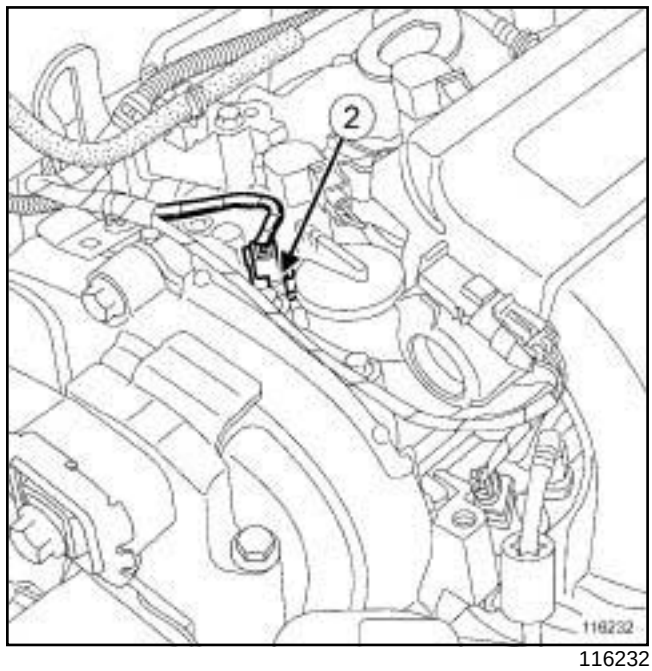
F4R

I - SPECIAL NOTES

The camshaft dephaser modifies the valve timing.

116819

To improve cylinder filling at all engine speeds, the engine is fitted with an inlet camshaft dephaser (**1**) .



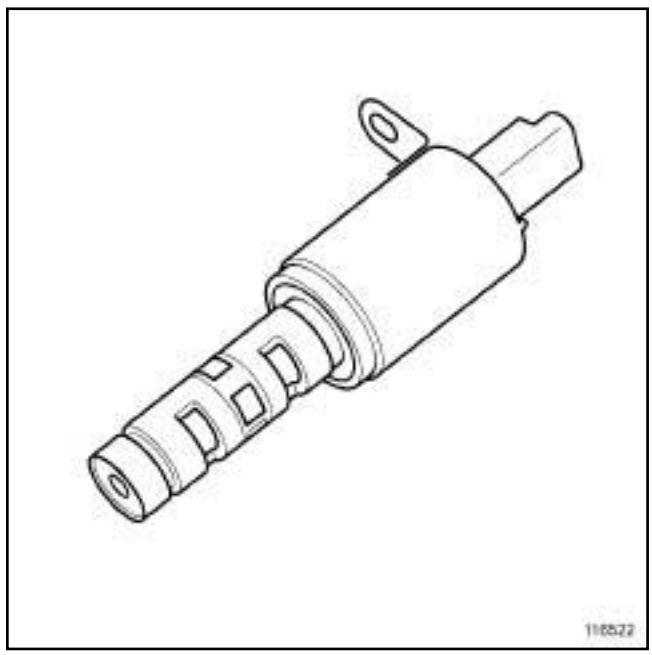
Dephasing at the moment when the inlet valves close optimises filling according to engine speed. Torque at midrange engine speed and output at high engine speed are improved.

Leaving the inlet valves open for longer at high engine speed allows the mixture to be continually admitted thanks to its high speed.

However, at lower engine speeds the gases do not have a high level of inertia. It is therefore preferable to close the inlet valves earlier to avoid incorrect filling and a loss of torque due to the reflux of fresh gases.

The higher the engine speed, the later the inlet valves must be closed.

II - OPERATION AND PROGRAMMING



116232

The oil is supplied to the dephaser by a solenoid valve (**2**) located on the timing cover.

Supply by a variable opening cyclic ratio signal enables oil to be distributed to the mechanism and the dephaser angle to be adjusted.

The operation of the camshaft dephaser varies continuously.

The computer supplies the solenoid valve with a variable opening cyclic ratio proportional to the desired dephasing.

116522

Camshaft dephaser: Function

F4R

The camshaft dephaser control solenoid valve is controlled if the following conditions are met:

- no speed sensor fault
- no camshaft position sensor fault
- no injection system faults,
- after the engine has started,
- outside idling speed and no load,
- threshold of mapping according to load and engine speed reached,
- threshold of mapping according to the coolant temperature.

Camshaft dephaser: Removal - Refitting

M4R

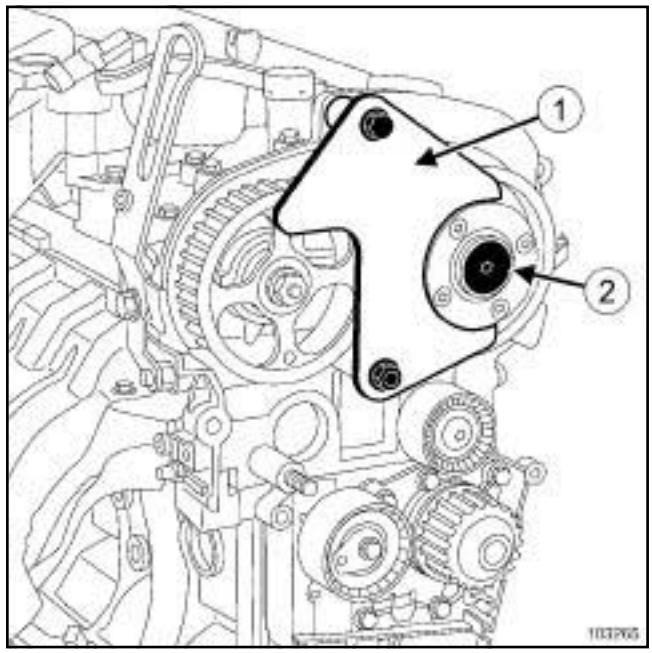
- The engine and gearbox assembly must be removed to remove/refit the camshaft dephaser (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-113**) .
- For the camshaft dephaser removal-refitting procedure (see **Timing - cylinder head: Removal**) (Technical Note 6020A, 10A, Engine and peripherals) and (see **Timing - cylinder head: Refitting**) (Technical Note 6020A, 10A, Engine and peripherals).

K4M

Special tooling required	
Mot. 1490-01	For locking and adjusting the camshaft pulleys.

Tightening torques ▽	
camshaft dephaser pulley bolt	**100 N.m**
exhaust camshaft pulley nut	**30 N.m + 84° ± 4°**
blanking cover of the camshaft dephaser	**15 N.m ± 3 N.m**

REMOVAL

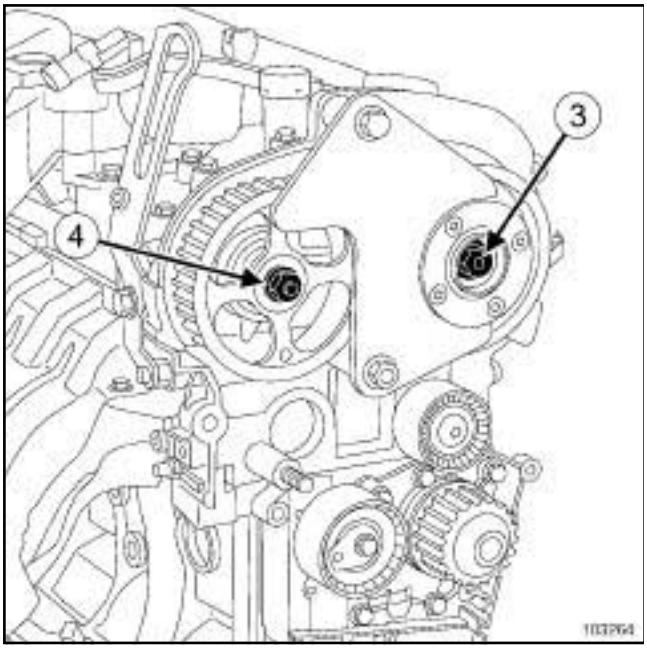


I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery)
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection).
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .



II - OPERATION FOR REMOVAL OF PART CONCERNED

103265

❏ Position the **(Mot. 1490-01)** (**1**) .

❏ Remove the camshaft dephaser blanking cover (**2**) .

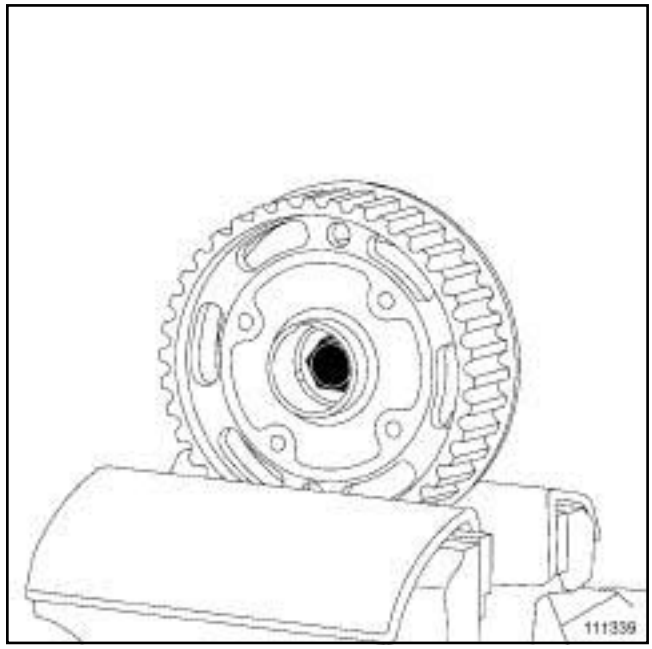
103264

❑ Remove:

- the bolt (**3**) from the camshaft pulley dephaser,
- the exhaust camshaft pulley nut (**4**) ,
- the **(Mot. 1490-01)**,
- the exhaust camshaft pulley.
- the camshaft dephaser pulley.

REFITTING

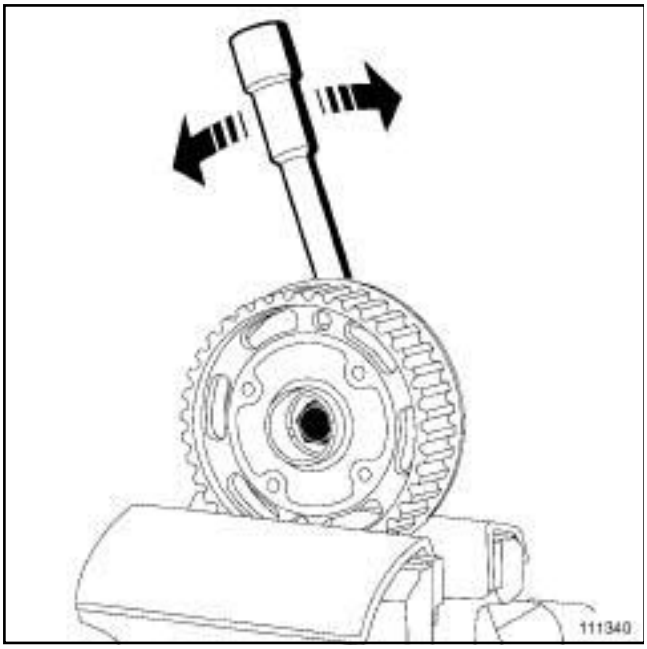
I - REFITTING PREPARATION OPERATION



❑ **parts always to be replaced: Exhaust camshaft pulley nut (10,02,02,13)**.

❑ **parts always to be replaced: Camshaft dephaser sprocket bolt (10,02,02,06)**.

WARNING
Failure to adhere to the following procedure may cause the timing belt to be incorrectly timed.



❑ If fitting a new camshaft dephaser, check that it is locked by following the procedure described below.

❑ Fit a stud to the camshaft dephaser hub and tighten it.

111339

❑ Place the camshaft dephaser in a vice fitted with jaws.

K4M

111340

❏ Mechanically lock the camshaft dephaser by rotating it to the left or right using a tubular hexagon box spanner.

❏ Check that the camshaft dephaser is correctly locked (no rotation of the hub in relation to the wheel to the left or right).

❏ If there is a rotation of the hub in relation to the wheel, the camshaft dephaser is faulty and must be replaced.

❏ Degrease the end of the inlet camshaft (timing end) and clean the bores and bearing faces of the camshaft dephaser.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the exhaust camshaft pulley.
- the camshaft dephaser pulley,
- a new nut on the exhaust camshaft pulley,
- a new bolt on the camshaft dephaser pulley.

❏ Position the tool **(Mot. 1490-01)** on the camshaft pulleys.

❏ Tighten to torque:

- the **camshaft dephaser pulley bolt (100 N.m)**,
- the **exhaust camshaft pulley nut (30 N.m + 84° ± 4°)**.

❏ Fit a new blanking cover on the camshaft dephaser.

❏ Torque tighten the **blanking cover of the camshaft dephaser (15 N.m ± 3 N.m)**.

❏ Remove the **(Mot. 1490-01)**.

III - FINAL OPERATION

❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery)
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the engine undertray.

F4R

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1453-01	Additional handle nut for engine lifting support tool Mot. 1453.
Mot. 1496	Camshaft timing tool.
Mot. 1054	TDC setting pin.
Mot. 1801	Camshaft sprocket locking tool F4 engines.
Mot. 1509-01	Adapter kit for tool Mot.1509 or Mot.1801

Tightening torques ▽	
toothed sprocket nuts	**80 Nm**
old inlet camshaft dephaser bolt	**30 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

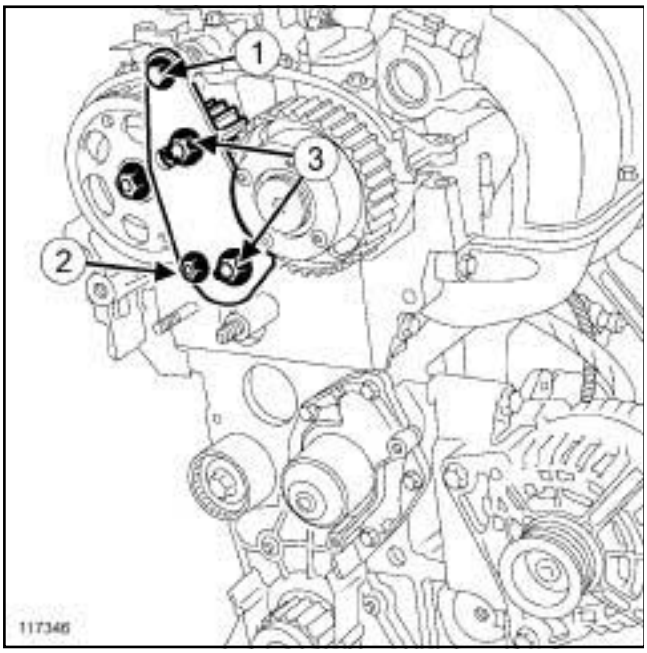
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the engine undertray.

❑ Fit the timing end lifting eye (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .



❑ Fit the **(Mot. 1453)** fitted with the **(Mot. 1453-01)**.

❑ Remove the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Remove the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

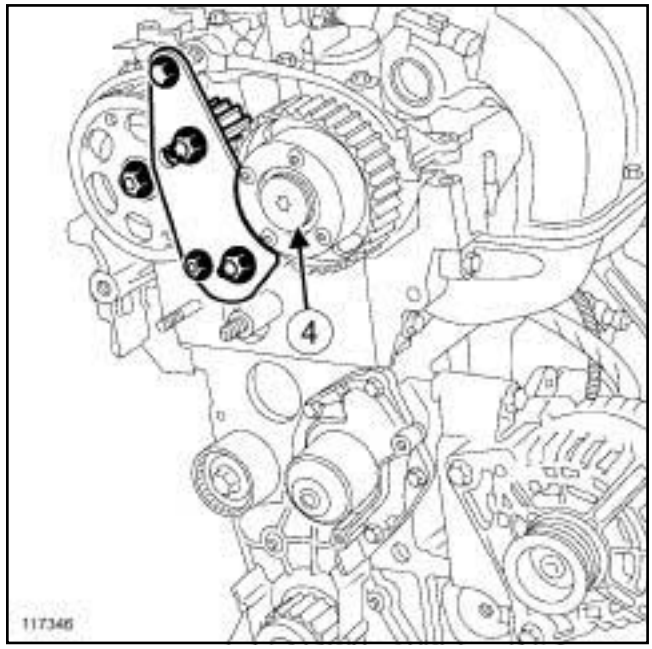
117346

❏ Check that camshaft setting tool **(Mot. 1496)** is still in place.

❏ Check that the TDC pin **(Mot. 1054)** is still in place and that the crankshaft is set.

❏ Fit:

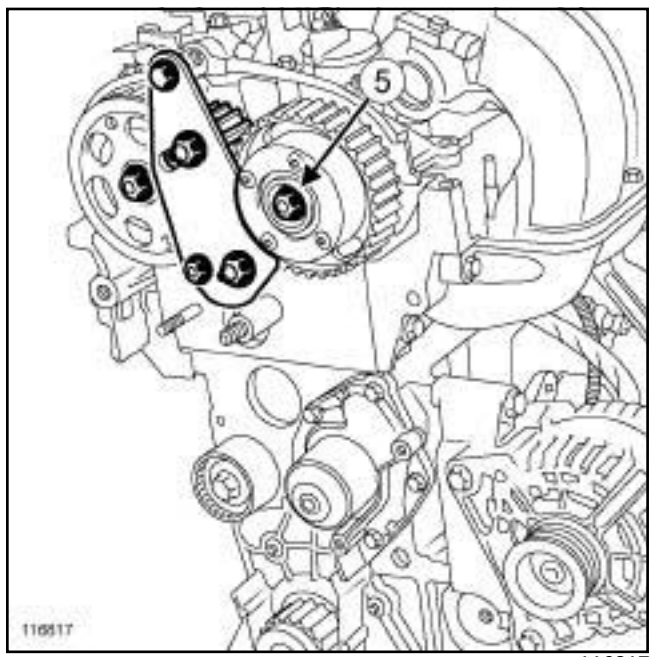
- the **(Mot. 1801)** fitted with the sprocket **(Mot. 1509-01)**,
- the upper bolt (**1**) on the upper timing cover and the collar nut (**2**) .



❏ Tighten the upper bolt on the upper timing cover and the collar nut.

❏ Bring the toothed sprockets of the tool into contact with the camshaft pulleys.

❏ Torque tighten the **toothed sprocket nuts (80 Nm)** (**3**) .



Note:

Beware of oil running out when removing the blanking cover from the camshaft dephaser and when removing the camshaft dephaser.

117346

❏ Remove the inlet camshaft dephaser blanking cover (**4**) .

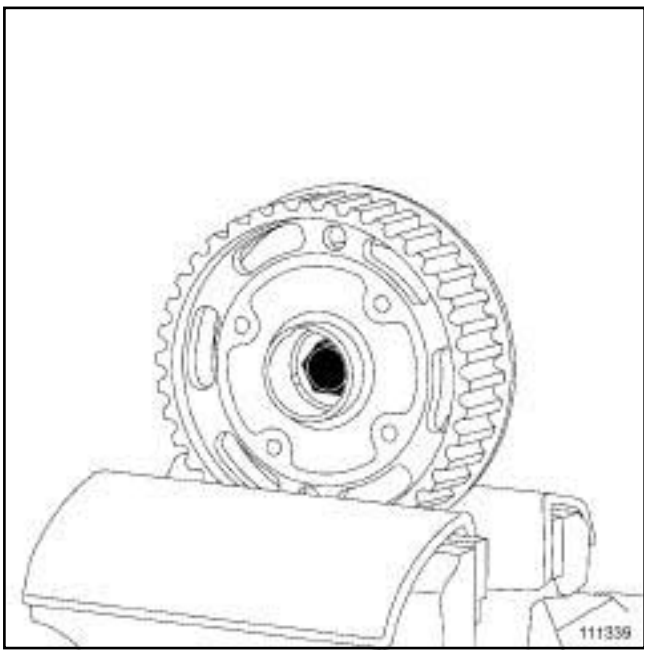
116817

❏ Remove:

- the inlet camshaft dephaser bolt (**5**) ,
- the **(Mot. 1801)** fitted with the sprocket **(Mot. 1509-01)**,
- the inlet camshaft dephaser.

F4R

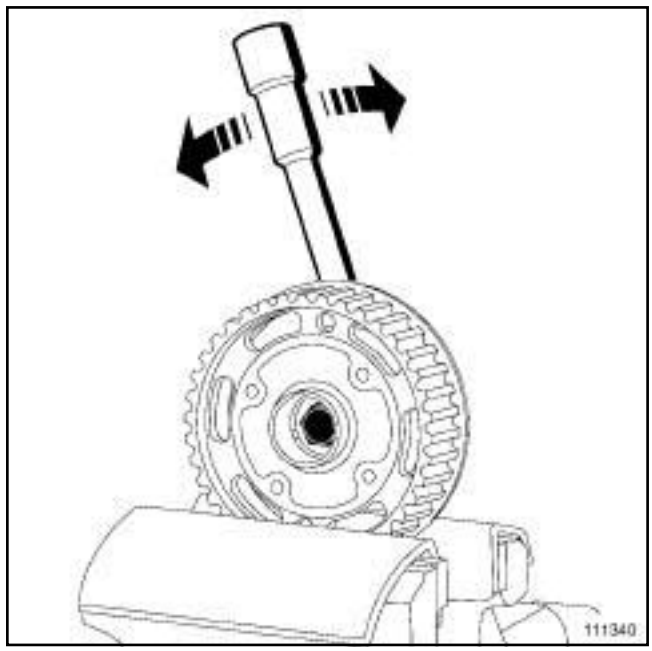
REFITTING



I - REFITTING PREPARATIONS OPERATION

❑

WARNING
Failure to observe the following procedure can lead to the destruction of the engine.



❑ If fitting a new inlet camshaft dephaser, check that it is locked by following the procedure described below:

❑ Fit a stud in the dephaser hub and tighten it.

111339

❑ Place the inlet camshaft dephaser in a vice fitted with jaws.

111340

❑ Mechanically lock the dephaser by rotating it to the left or to the right using a tubular hexagon box spanner.

❑ Check that the inlet camshaft dephaser is correctly locked (no rotation of the hub in relation to the wheel to the left or right).

❑ If there is a rotation of the hub in relation to the wheel, the camshaft dephaser is faulty and must be replaced.

❑ Grease the end of the inlet camshaft (timing end) and clean the bores and bearing faces of the inlet camshaft dephaser.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the inlet camshaft dephaser,
- the old inlet camshaft dephaser bolt.

❑ Tighten to torque the **old inlet camshaft dephaser bolt (30 Nm)**.

III - FINAL OPERATION.

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

F4R

❏ Remove:

- the **(Mot. 1453)** fitted with the **(Mot. 1453-01)**,
- the lifting eye on the timing end (see **11A**, **Top and front of engine**, **Lifting eyes: Removal - Refitting**, page **11A-305**) .

❏ Refit:

- the engine undertray,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

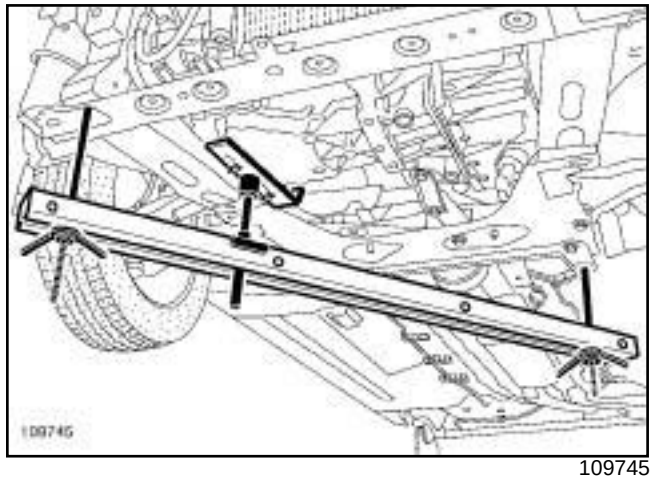
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 764

Special tooling required	
Mot. 1672	Lower engine support.
Mot. 1054	TDC setting pin.

Tightening torques ▽	
camshaft dephaser bolt	**75 Nm**
camshaft dephaser blanking cover	**15 Nm**
lower timing cover bolt	**10 Nm**
timing intermediate housing bolts	**10 Nm**
upper timing cover bolts	**33 Nm**

REMOVAL

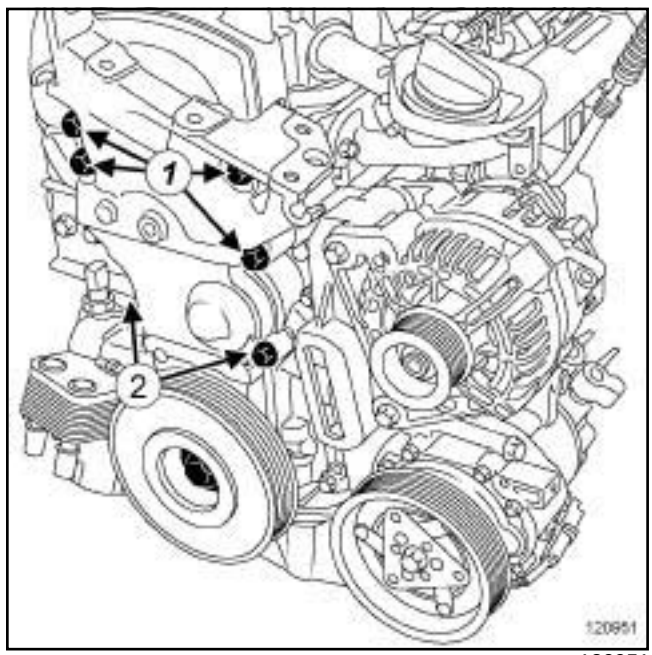


I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

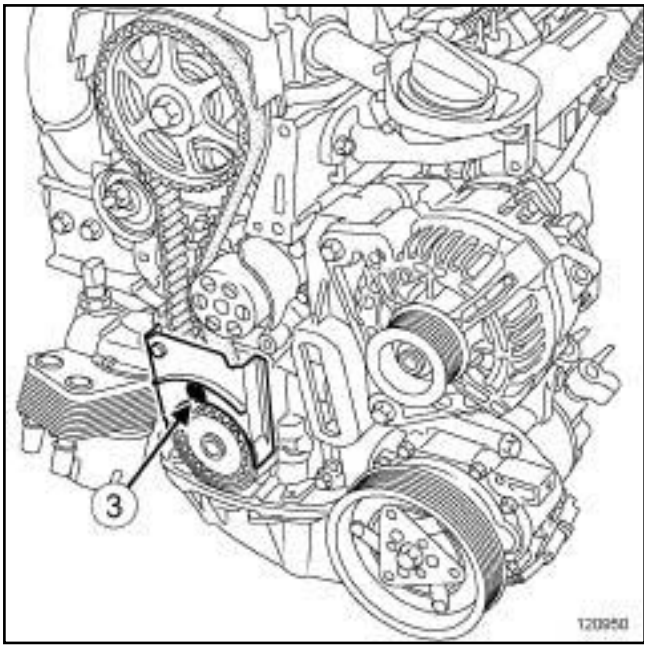


- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

109745

❑ Fit the engine support tool **(Mot. 1672)** under the lower cover.

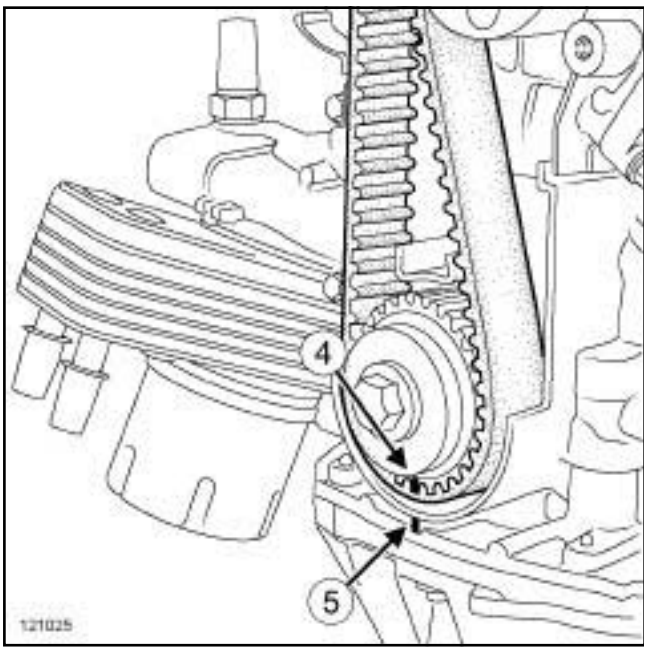
❑ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .



120951

❑ Remove:

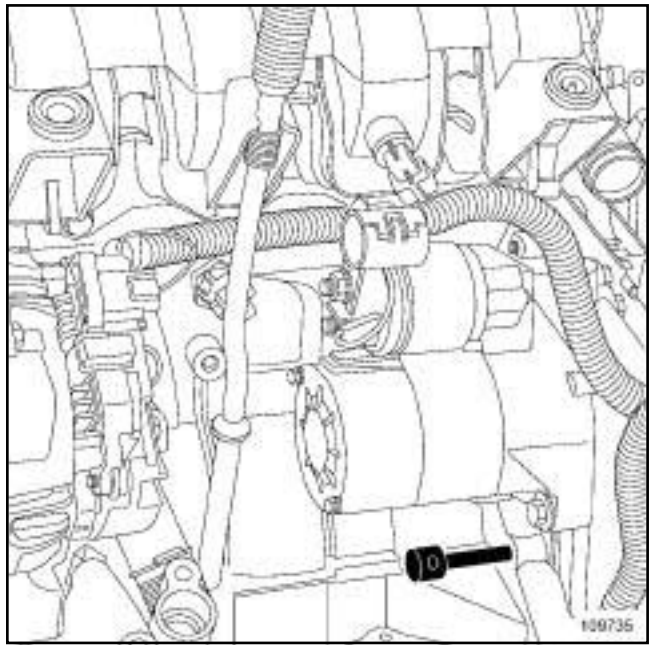
- the bolts (**1**) from the upper timing cover,
- the upper timing cover,
- the bolts (**2**) from the timing intermediate housing,
- the timing intermediate housing,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) .



D4F, and 764

120950

❑ Remove:



- the lower timing cover bolt (**3**) ,
- the lower timing cover.

121025

❑ Refit the crankshaft accessories pulley bolt and its retaining washer.

❑ Turn the crankshaft clockwise (timing end) to position the crankshaft sprocket marking (**4**) half a tooth in front of the alignment of the fixed marking (**5**) on the oil pump casing.

109735

❑ Insert **(Mot. 1054)**.

❑ Turn the crankshaft clockwise until it is stopped.

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - Dephaser removal with timing belt present

❑

Note:

With the timing belt present, use it to loosen then torque tighten the camshaft dephaser bolt.

❑ Remove the camshaft dephaser blanking cover.

❑ Undo the camshaft dephaser bolt.

❑ Remove:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser bolt,
- the camshaft dephaser.

D4F, and 764

2 - Dephaser removal without timing belt

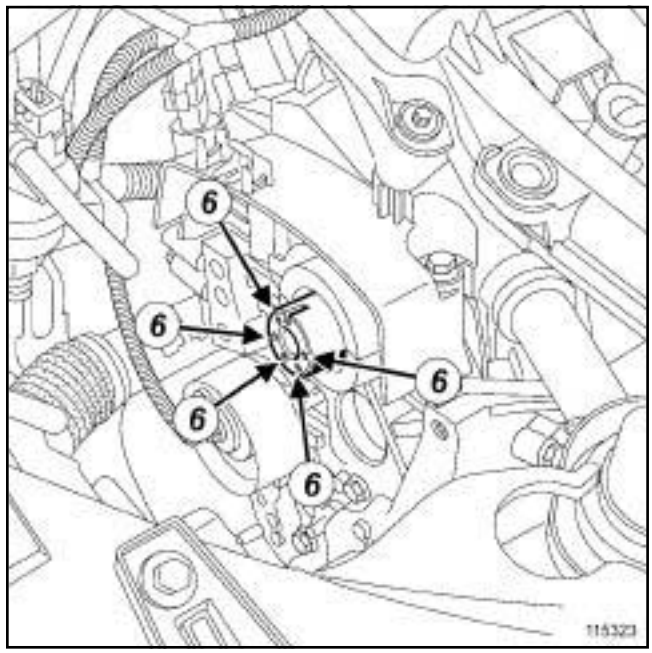
❑

Note:

If the timing belt is missing or broken, without damage to the engine, a used timing belt must be fitted before carrying out this procedure, to allow the dephaser bolt to be loosened then tightened.

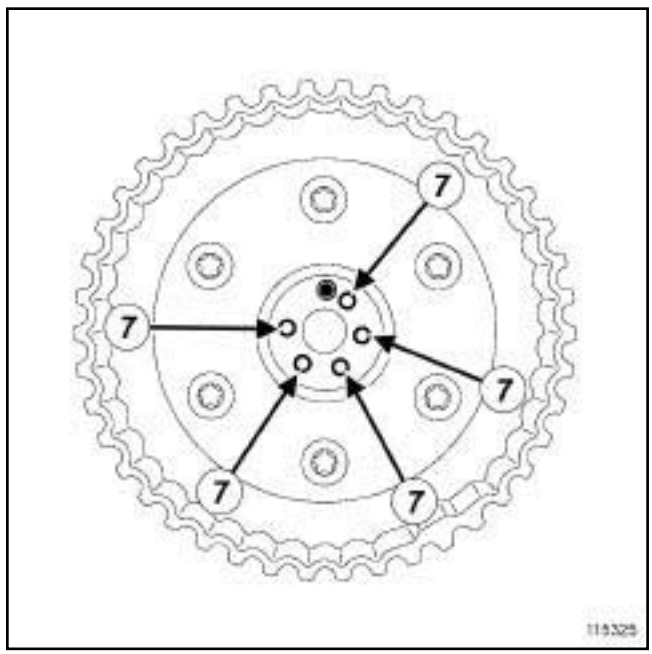
❑ Refit the used timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

❑ Remove the camshaft dephaser blanking cover.



❑ Undo the camshaft dephaser bolt.

❑ Remove:

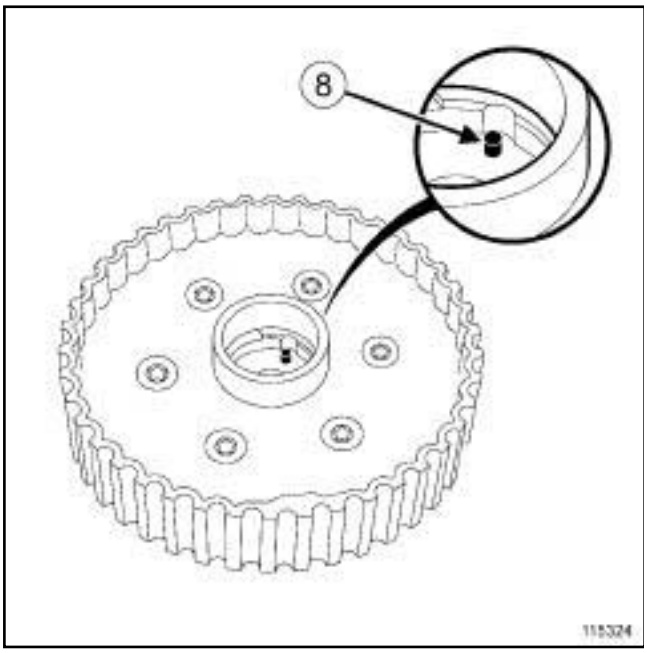


- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser bolt,
- the camshaft dephaser.

REFITTING

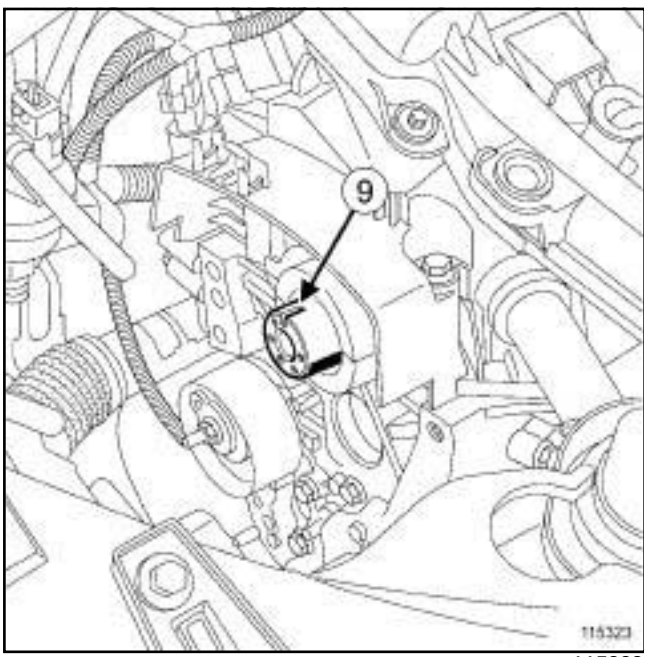
I - REFITTING PREPARATIONS OPERATION

115323



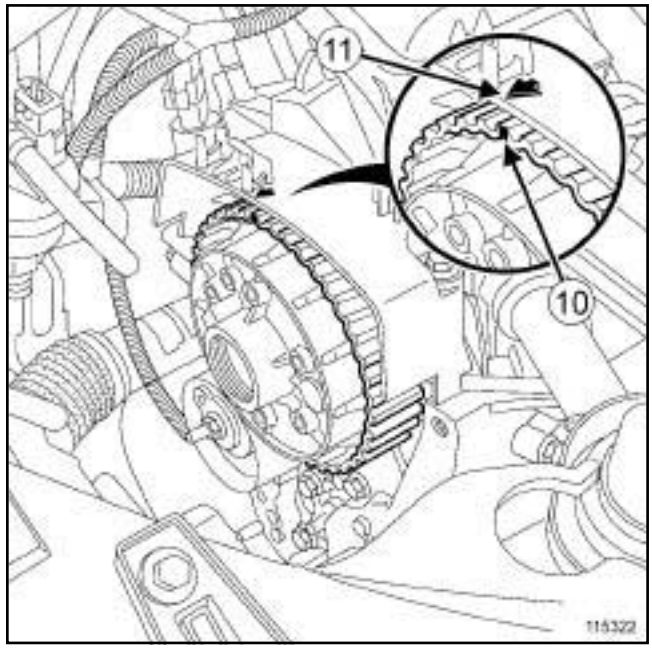
115325

❑ Check:



- that the camshaft dephaser wheel is correctly locked (wheel does not rotate right or left),
- that the camshaft dephaser bearing face is clean and in good condition,
- that there are no foreign bodies in the camshaft oil ducts (**6**) and in the camshaft dephaser oil ducts (**7**) .

D4F, and 764



II - REFITTING OPERATION FOR PART CONCERNED

115324

115323

115322

❑ Fit the camshaft dephaser.

Note:

Check that the camshaft dephaser is correctly positioned in relation to the camshaft:

- the oil ducts should match,
- the dephaser spigot (**8**) should fit into the camshaft groove (**9**) ,
- the mark (**10**) on the camshaft dephaser and the fixed marking (**11**) must be aligned.

Failure to respect these instructions could result in destruction of the engine.

❑ Refit:

- the camshaft dephaser bolt,
- a used timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

Note:

The **(Mot. 1054)** must be in place.

❑ Torque tighten the **camshaft dephaser bolt (75 Nm)**.

❑ Remove the used timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

D4F, and 764

❑ Fit the new timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

❑ Refit the new camshaft dephaser blanking cover.

❑ Torque tighten the **camshaft dephaser blanking cover (15 Nm)**.

❑ Remove the **(Mot. 1054)**.

III - FINAL OPERATION.

❑ Refit:

- the lower timing cover,
- the lower timing cover bolt.

❑ Torque tighten the **lower timing cover bolt (10 Nm)**.

❑ Refit:

- the timing intermediate housing,
- the timing intermediate housing bolts.

❑ Torque tighten the **timing intermediate housing bolts (10 Nm)**.

❑ Refit:

- the upper timing cover,
- the upper timing cover.

❑ Tighten to torque the **upper timing cover bolts (33 Nm)**.

❑ Refit the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❑ Remove the engine support tool **(Mot. 1672)**.

❑ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

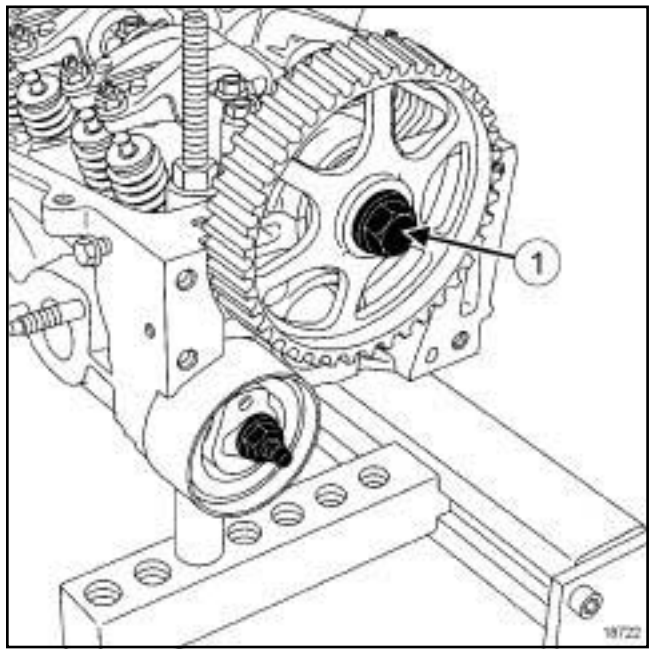
❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 740 or 742 or 764

Special tooling required	
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1381	Camshaft seal extractor tool 30 x 42 x 7.
Mot. 1605	Tool for fitting cylinder head plugs.
Mot. 1587	Tool for fitting camshaft "PTFE" seal.

Tightening torques ▽	
mounting bolts of camshaft bearing cap no. 5	**9 N.m**
camshaft bearing cap mounting bolt	**7 N.m + 50° ± 6°**
camshaft pulley mounting bolt	**30 N.m + 45° ± 6**

REMOVAL



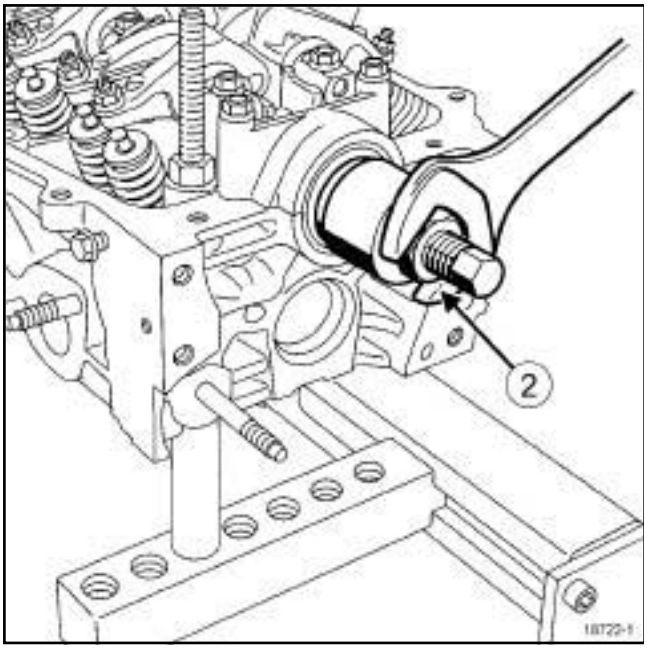
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

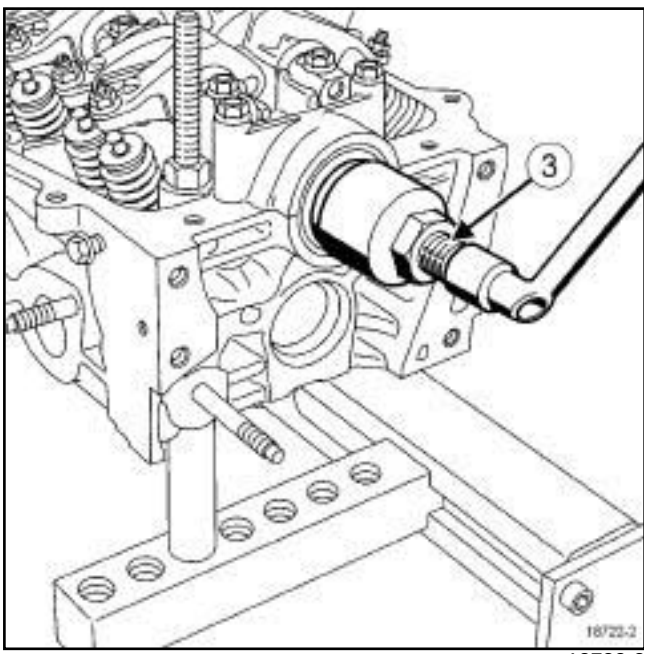
❏ Remove:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .



18722

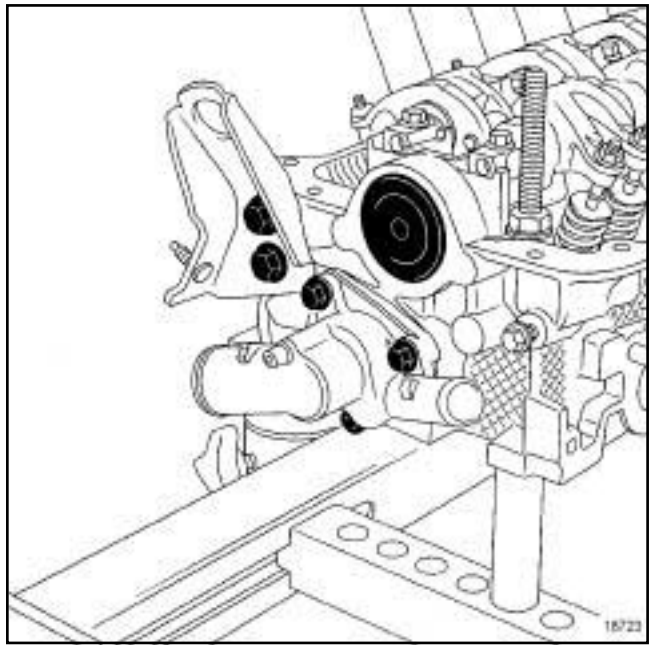
❏ Remove:



- the camshaft pulley mounting bolt using the **(Mot. 799-01)**,
- the camshaft pulley.

D4F, and 740 or 742 or 764

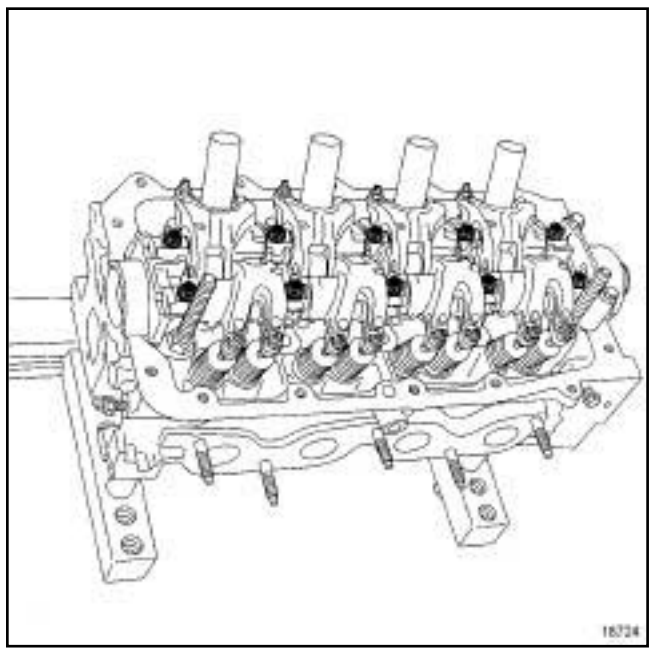
18722-1



❏ Position the **(Mot. 1381)** (**2**) .

18722-2

❏ Tighten the bolt (**3**) of the **(Mot. 1381)**.

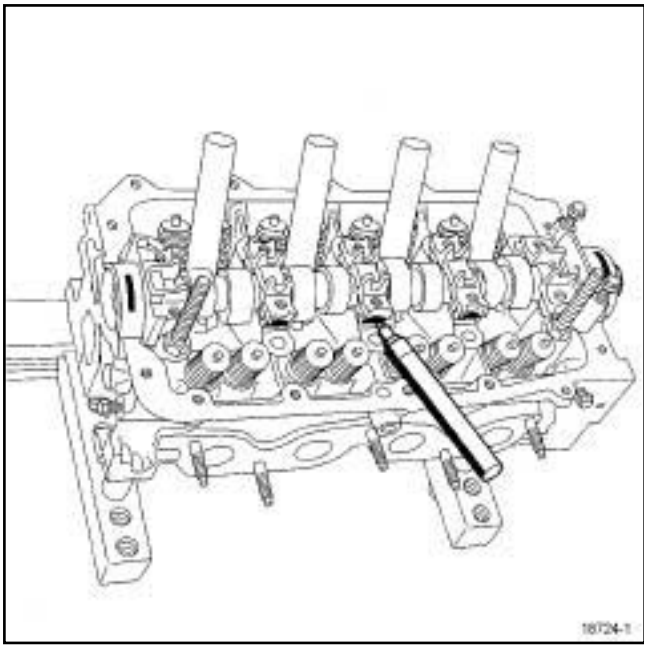


❏ Remove the lip seal.

18723

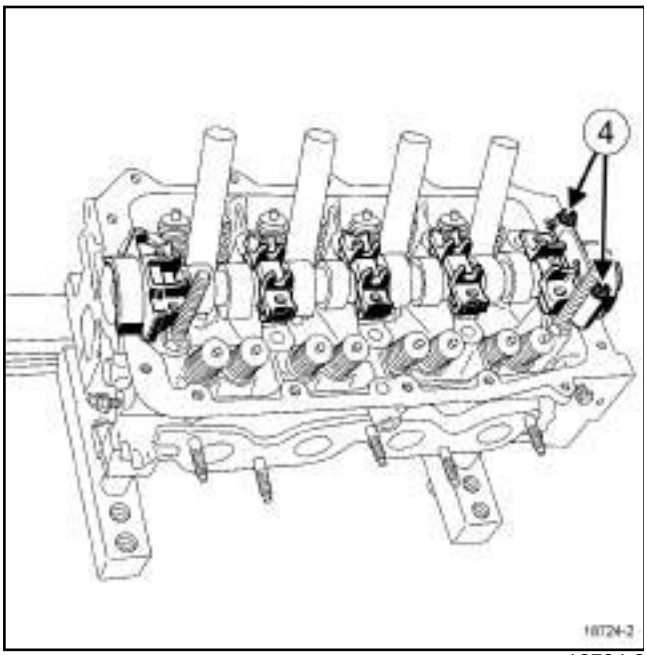
❏ Remove the camshaft seal cap.

II - OPERATION FOR REMOVAL OF PART CONCERNED



18724

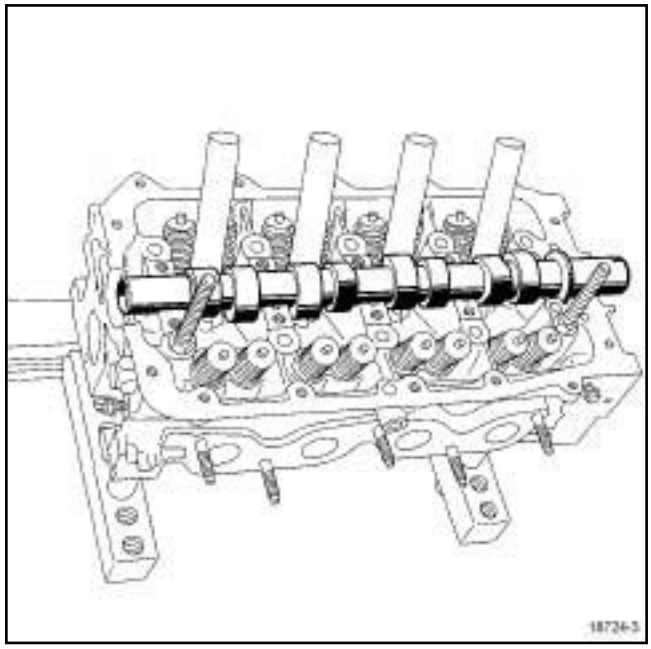
❏ Remove:



- the camshaft mounting bolts,
- the camshafts.

D4F, and 740 or 742 or 764

18724-1

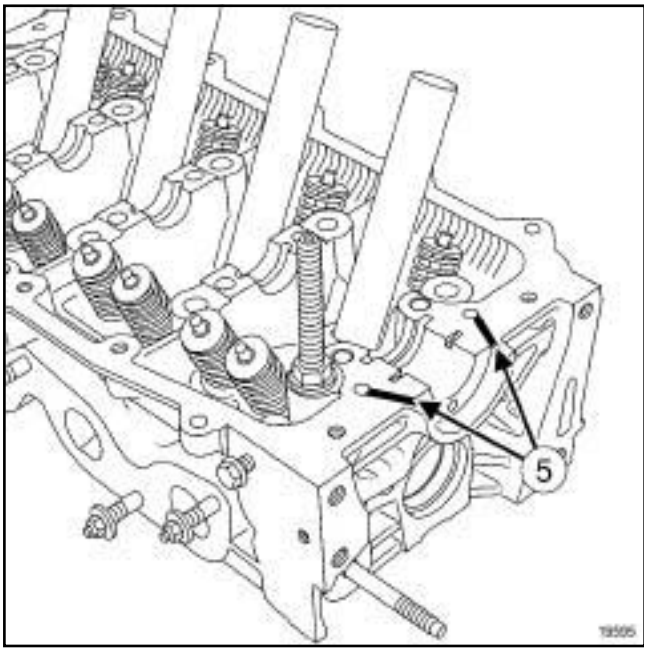


❏ Mark the camshaft bearing caps with an indelible marker pen.

18724-2

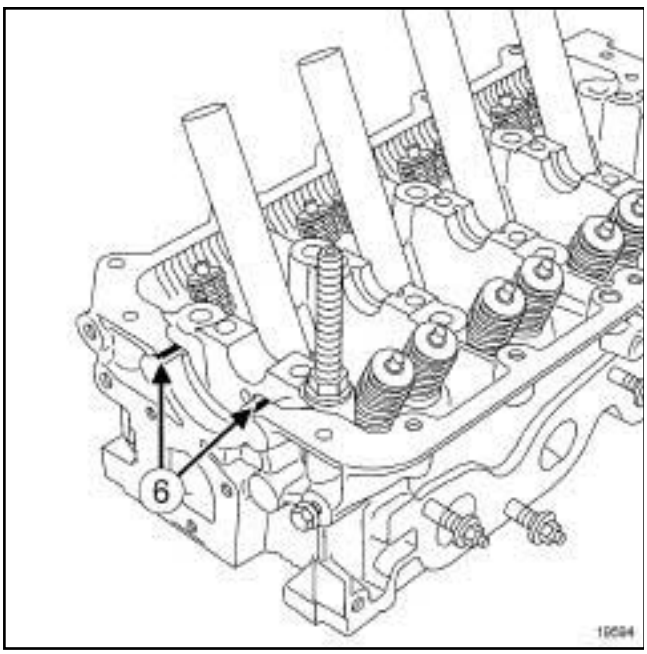
❏ Remove:

- the mounting bolts (**4**) from camshaft bearing cap no. 5,
- the camshaft bearing caps.



18724-3

❏ Remove the camshaft.



D4F, and 740 or 742 or 764

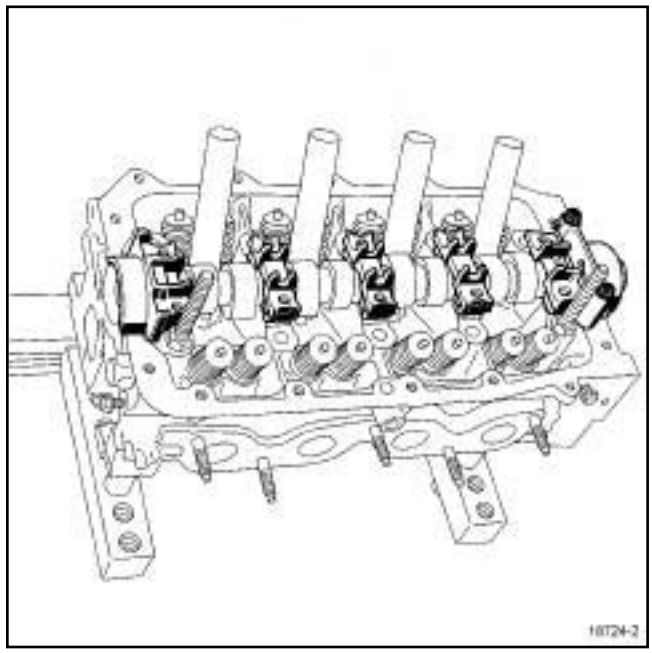
REFITTING

I - REFITTING PREPARATION OPERATION

19595

19594

❑ Apply:

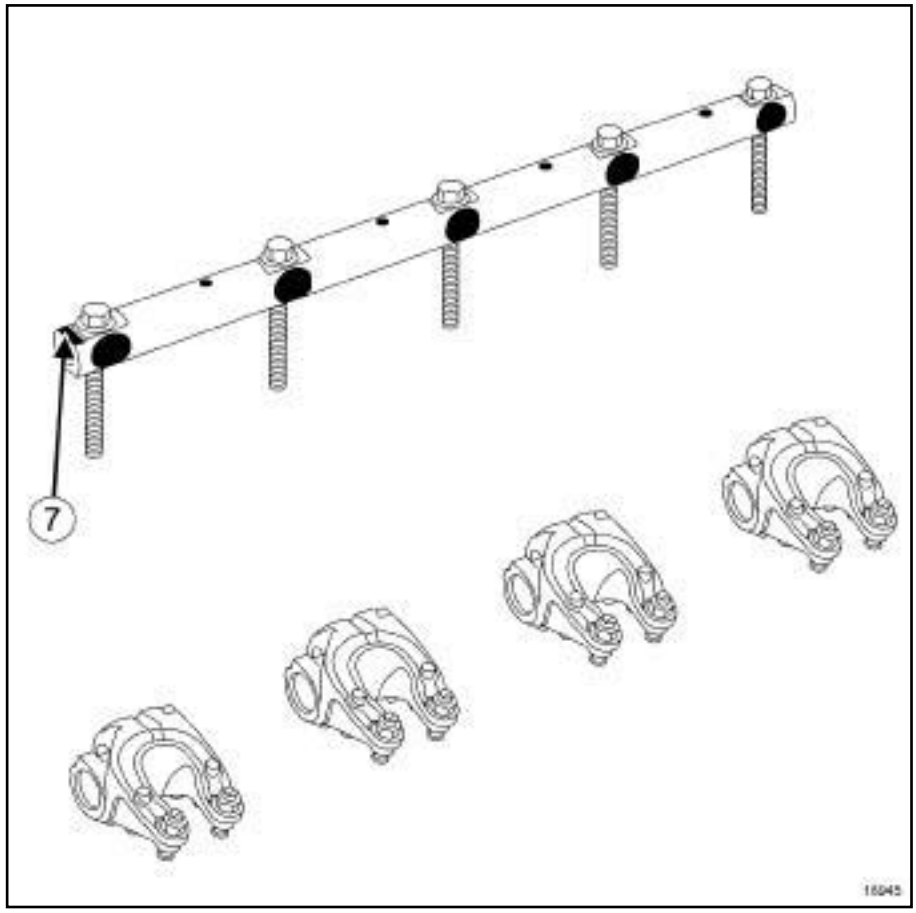


- two beads (**5**) of **RHODORSEAL 5661** with a width of **2 mm** on cylinder head bearing no. 5,
- two drops (**6**) of **RHODORSEAL 5661** to cylinder head bearing no. 1.

❑ Apply a blob of oil to the camshaft bearings.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

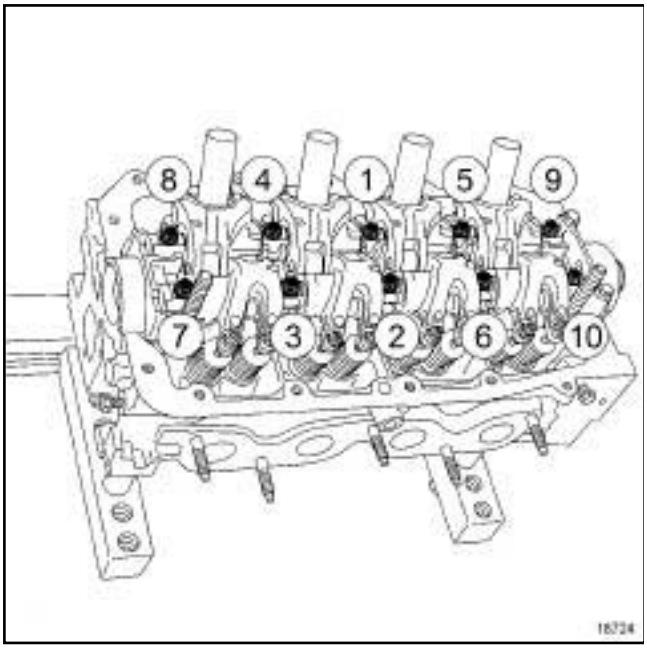


- the camshaft,
- the camshaft bearing caps.

18724-2

❑ Torque tighten the **mounting bolts of camshaft bearing cap no. 5 (9 N.m)**.

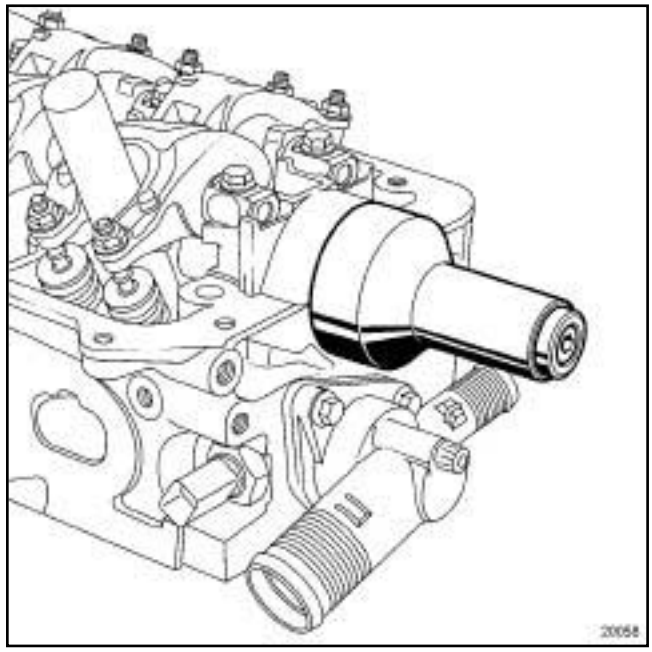
D4F, and 740 or 742 or 764



18945

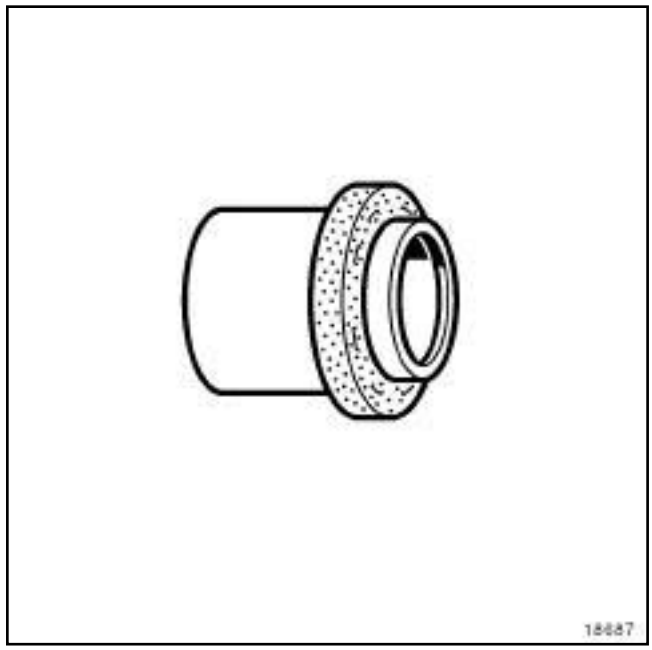
❑ Refit the camshafts, positioning:

- the rails in relation to the tappets,
- the marks (**7**) on the flywheel end.



D4F, and 740 or 742 or 764

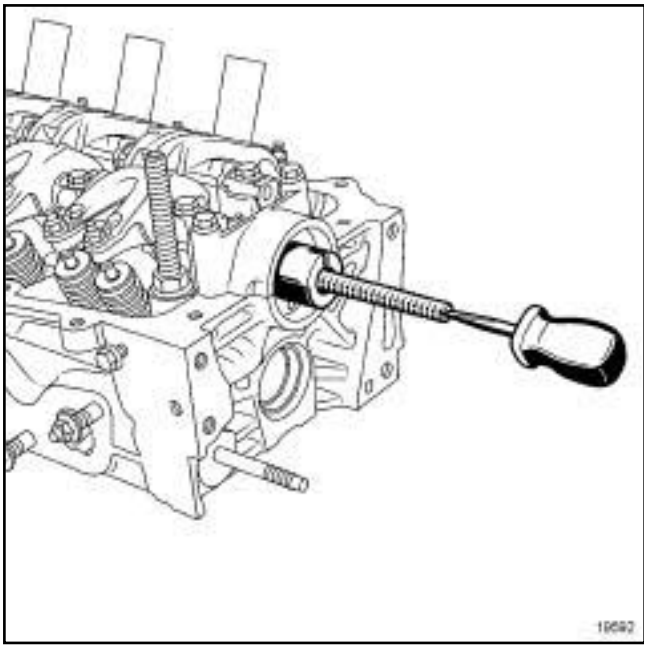
18724



- ❏ Pretighten in order and to torque the mounting bolts of the camshaft bearing caps **(5 N.m)**.
- ❏ Loosen the mounting bolt (**1**) .
- ❏ Torque and angle tighten the **camshaft bearing cap mounting bolt (7 N.m + 50° ± 6°)**.
- ❏ Repeat these two operations for each bolt from (**2**) to (**10**) .

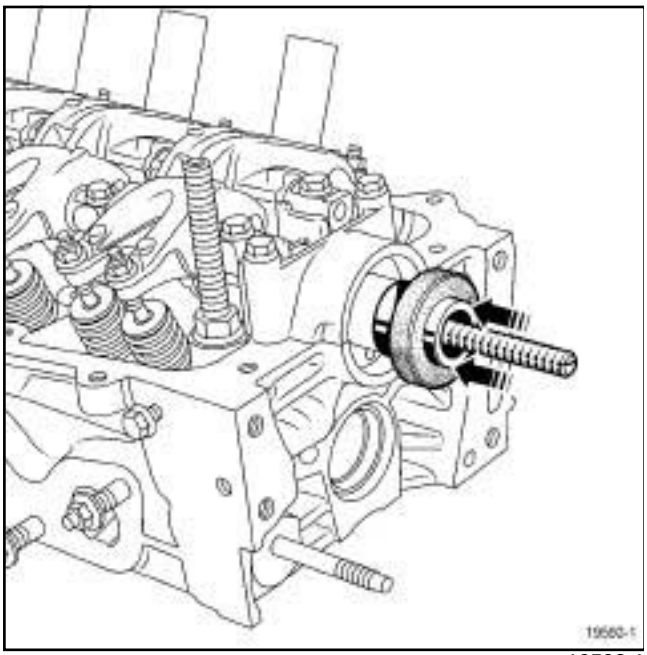
III - FINAL REFITTING

20058



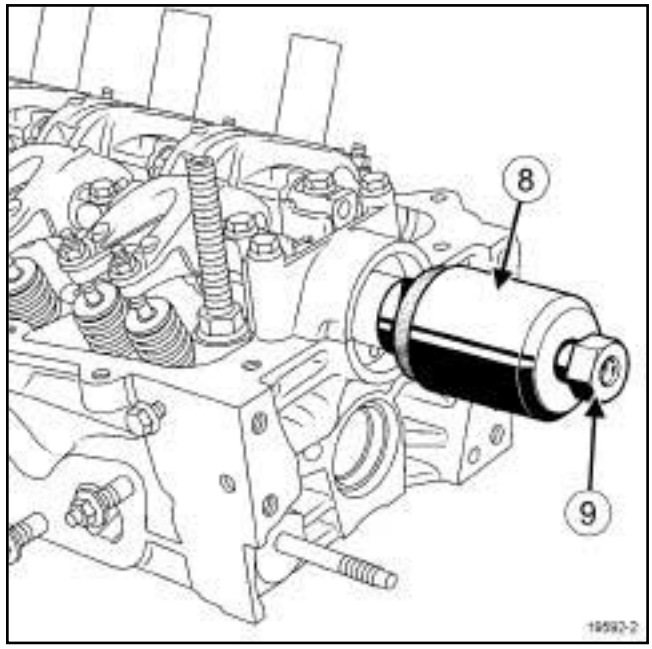
- ❏ Ensure that the seal bearing surfaces are clean.
- ❏ Refit the seal cap to the end of the camshaft using the **(Mot. 1605)**.

18687



- ❏ Fit the lip seal.

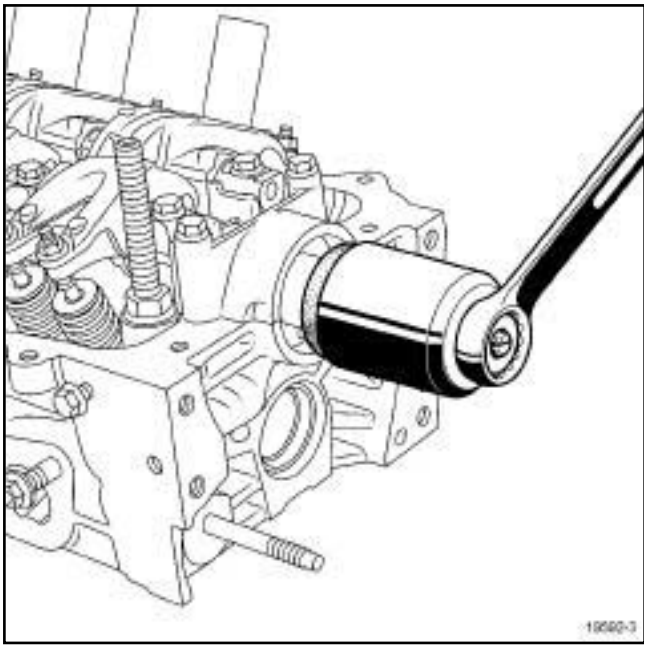
D4F, and 740 or 742 or 764



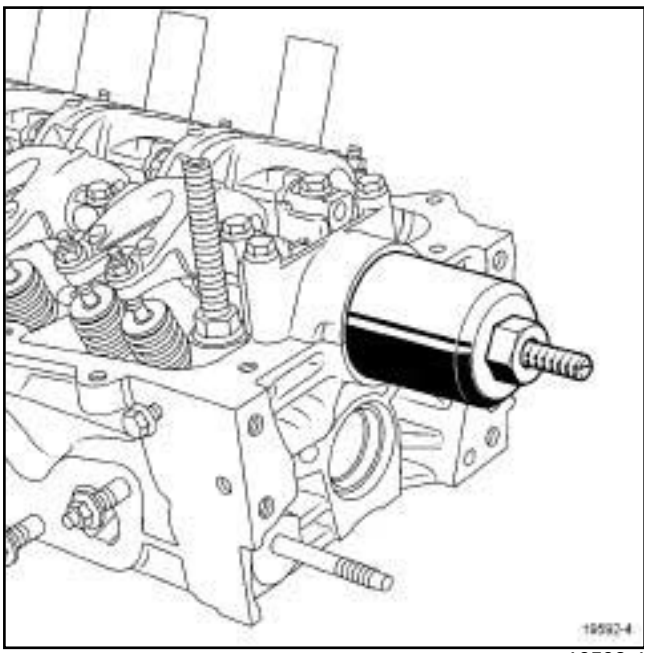
19592

❑ Screw the threaded rod of the **(Mot. 1587)** into the camshaft.

19592-1



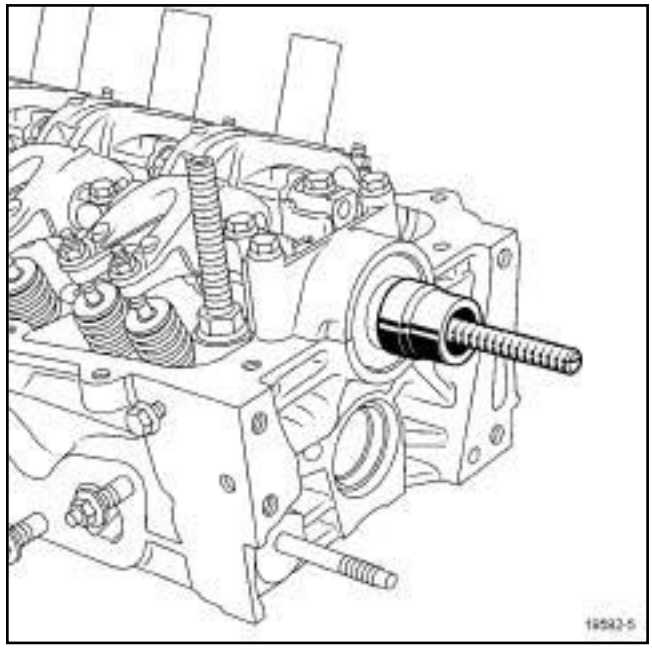
❑ Fit the seal gasket and protector on the camshaft. Be careful not to touch the seal.



19592-2

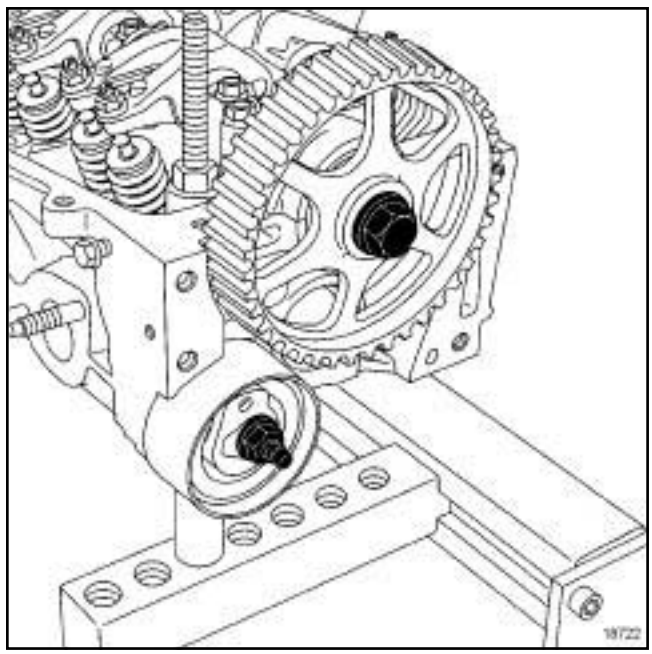
❑ Fit the cover (**8**) and the collar nut (**9**) of the **(Mot. 1587)**.

D4F, and 740 or 742 or 764



19592-3

19592-4



❑ Screw on the collar nut until the cover touches the cylinder head.

19592-5

❑ Remove:

- the nut from the,
- the cover from the,
- the seal protector,
- the threaded rod of the.

18722

❑ The camshaft pulley mounting bolt must always be replaced.

❑ Refit the camshaft pulley.

❑ Torque tighten the **camshaft pulley mounting bolt (30 N.m + 45° ± 6)** using the **(Mot. 799-01)**.

D4F, and 740 or 742 or 764

❑ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M

Equipment required
roller-type stud removal tool

Tightening torques ▽	
camshaft dowel	**0.8 daN.m**

REMOVAL

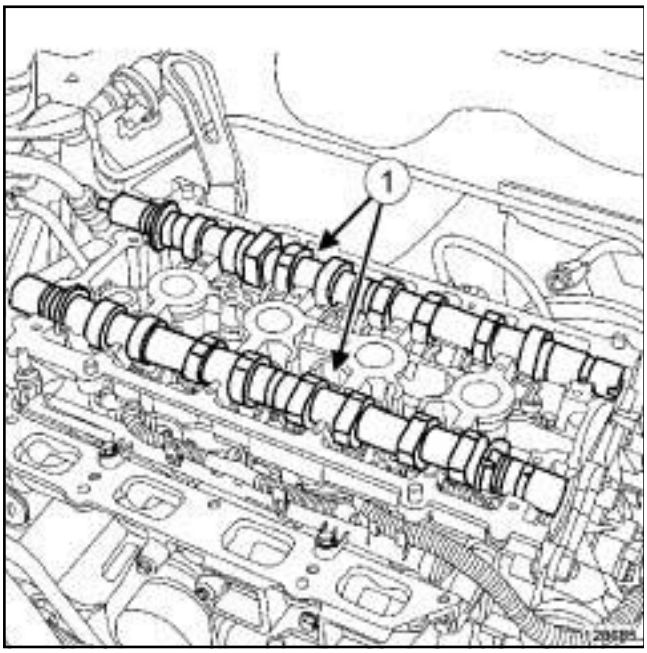
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the engine undertray bolts,
- the engine undertray,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

K4M, and 862

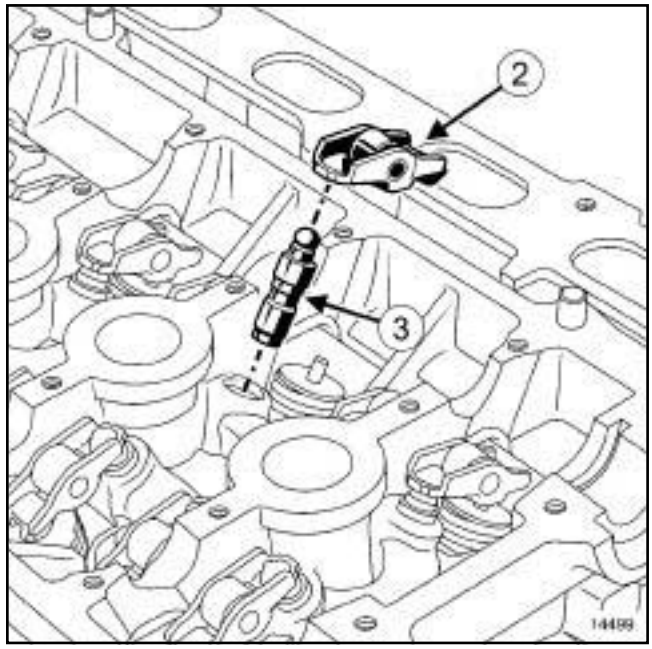


❑ Remove the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) .

❑ Remove:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

K4M



II - OPERATION FOR REMOVAL OF PART CONCERNED

128685

❑ Remove:

- the camshafts (**1**) ,
- the camshaft seals on the timing end.

14499

❑ Remove:

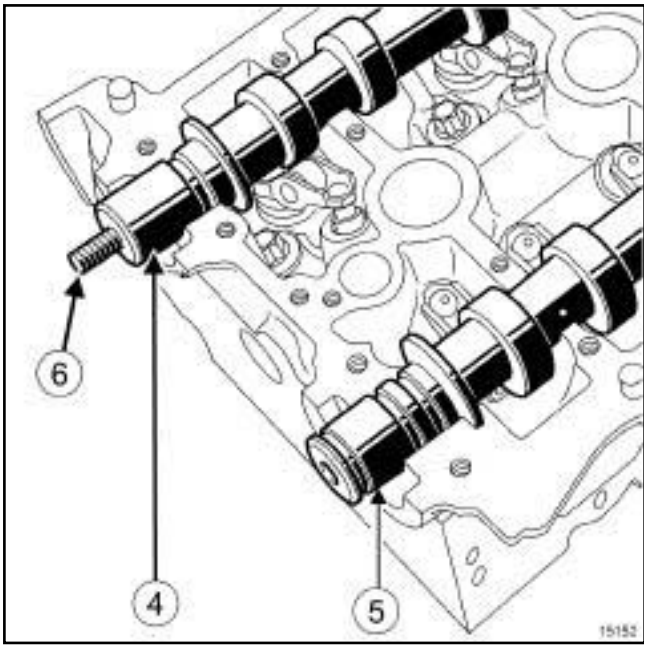
- the valve rockers (**2**) ,
- the hydraulic tappets (**3**) .

Note:

Always keep the hydraulic tappets vertical or immerse them in a bath of clean engine oil or diesel to avoid any risk of depriming the hydraulic tappets.

REFITTING

I - REFITTING PREPARATION OPERATION



❑

Note:

It is essential to reprime the hydraulic tappets as these may become drained if removed for a long time.

To check if re-priming is necessary, press the top of the tappet with your thumb. If the tappet piston de-presses, immerse the tappets in a container full of new oil or diesel, then reprime them.

K4M

15152

(**4**) Exhaust camshaft

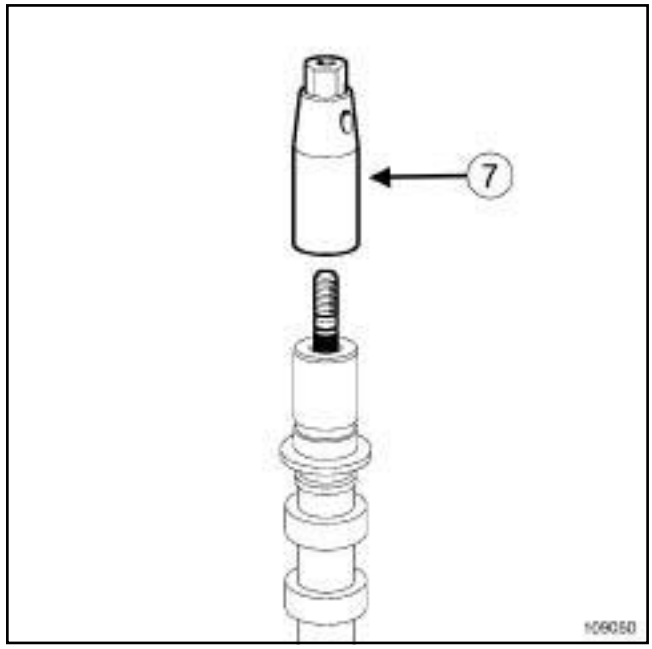
(**5**) Inlet camshaft

❑

Note:

The camshafts are identified by the pulley mountings.

Replacing a camshaft dowel



❑

Note:

It is essential to replace the camshaft dowel ***(6)*** if it comes loose at the same time as the nut.

a - Removal

❑ Place the camshaft in a vice with aluminium jaws.

109050

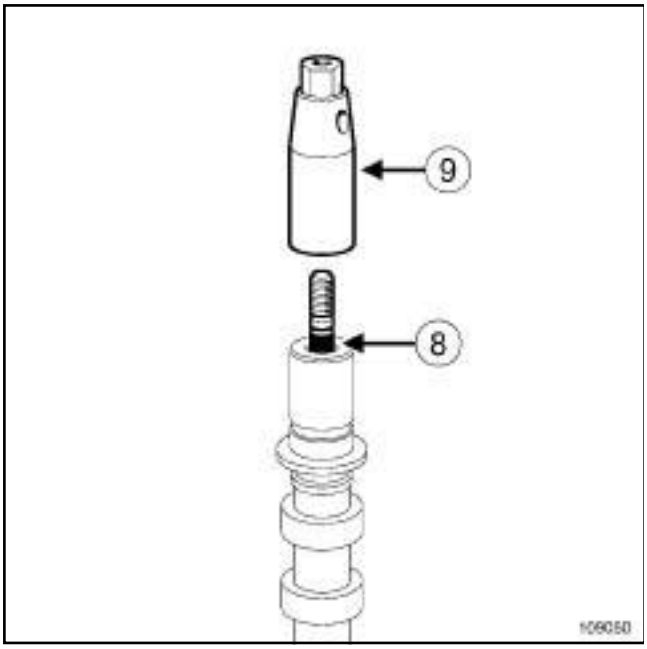
❑ Remove the dowel using a **roller-type stud removal tool** (**7**) .

b - Cleaning the camshaft

❑

Note:

Clean the thread hole of the camshaft carefully to prevent foreign bodies from entering the latter.



WARNING

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

c - Refitting

❑ Place the camshaft in a vice with aluminium jaws.

K4M

109050

❏ Refit the new camshaft dowel (precoated section (**8**) on the camshaft side).

❏ Torque tighten the **camshaft dowel (0.8 daN.m)** using a **roller-type stud removal tool** (**9**) .

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the hydraulic tappets,
- the valve rockers,
- the inlet camshaft, by lubricating the inlet camshaft bearings,
- the exhaust camshaft, by lubricating the exhaust camshaft bearings.

III - FINAL OPERATION

❏ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the camshaft seals on the timing end (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-284**) ,
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

K4M, and 862

❏ Refit the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) .

❏ Refit:

- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine undertray.

K4J

REMOVAL

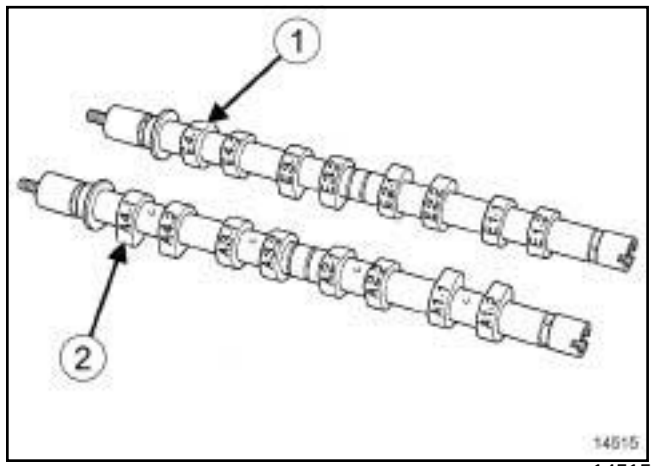
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,

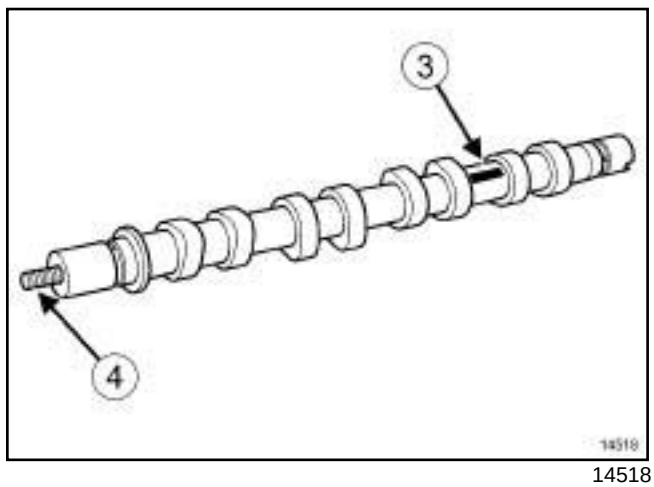


II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Remove:

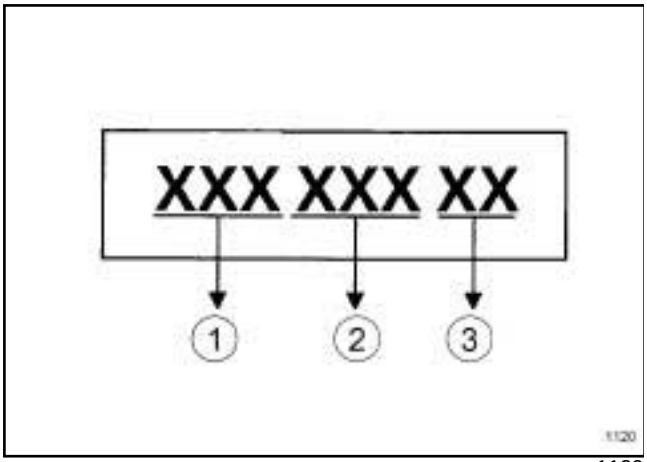
- the inlet camshaft,
- the exhaust camshaft.

REFITTING



I - REFITTING PREPARATIONS OPERATION

14515



(**1**) E 4 -1 = Exhaust camshaft

(**2**) A 4 - 1 = Inlet camshaft

14518

❑ The camshaft can be identified by an etching (**3**) .

1120

❑ Numbers (**1**) and (**2**) are only used by the supplier.

❑ Number (**3**) identifies the camshafts:

- AM = Inlet
- EM = Exhaust

❑ It is essential to replace the camshaft stud (**4**) if the stud becomes loose with the nut (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) (Technical Note 3887A, 11A, Top and front of engine).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the inlet camshaft,
- the exhaust camshaft.

III - FINAL OPERATION

❑ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the spark plugs (see **17A**, **Ignition**, **Plugs: Removal - Refitting**, page **17A-11**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended mounting support (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery tray (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K

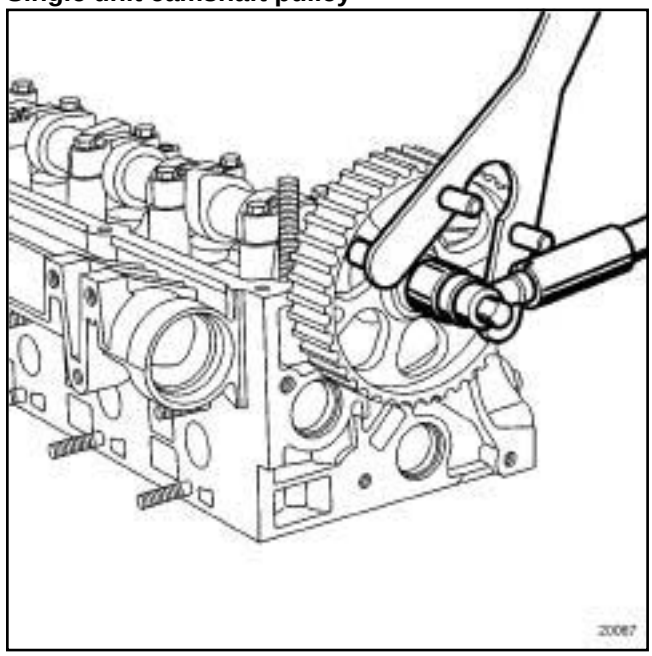
Special tooling required	
Mot. 799-01	Timing gear wheel immobiliser.

Tightening torques ▽	
camshaft bearing bolts	**10 N.m**
camshaft pulley nut	**30 N.m + 86° ± 6°**
camshaft hub nut	**30 N.m + 86° ± 6°**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

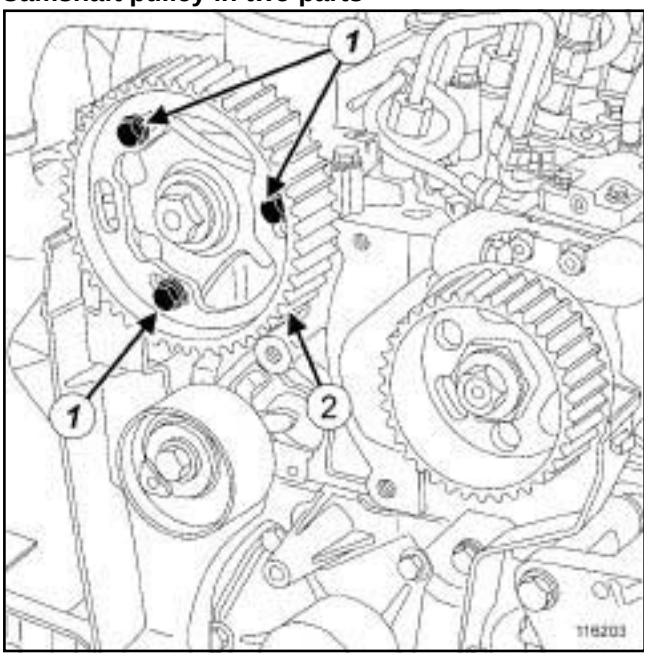
- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (K9K/764, 772, if equipped),
- the vacuum pump (see **Vacuum pump: Removal - Refitting**) (MR 392, 37A, Mechanical component controls),
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

1 - First fitting of camshaft pulley

Single unit camshaft pulley

20067

❏ Immobilise the single unit camshaft pulley using the tool **(Mot. 799-01)**.



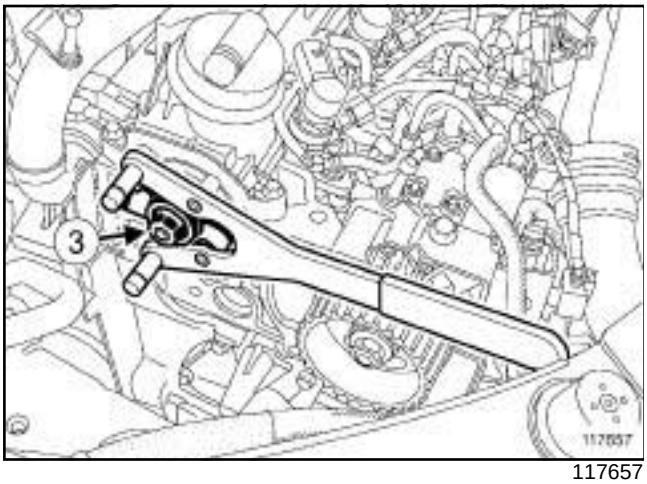
❏ Remove:

- the nut from the camshaft pulley,
- the camshaft pulley.

K9K

2 - Second fitting of camshaft pulley

Camshaft pulley in two parts

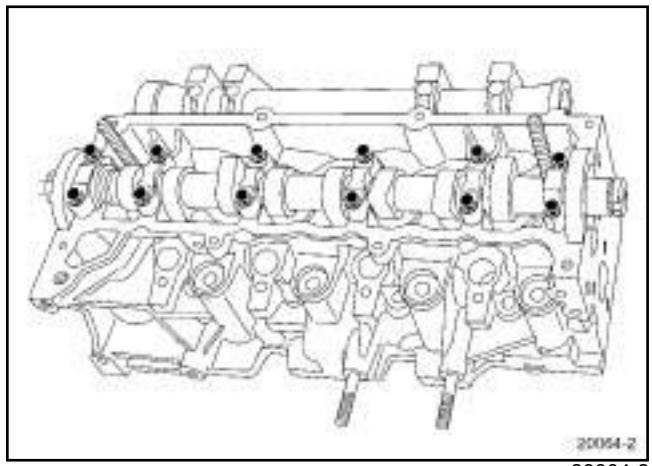


116203

❏ Remove:

- the camshaft pulley wheel bolts (**1**) ,
- the camshaft pulley wheel (**2**) .

❏ Gently turn the camshaft anti-clockwise.



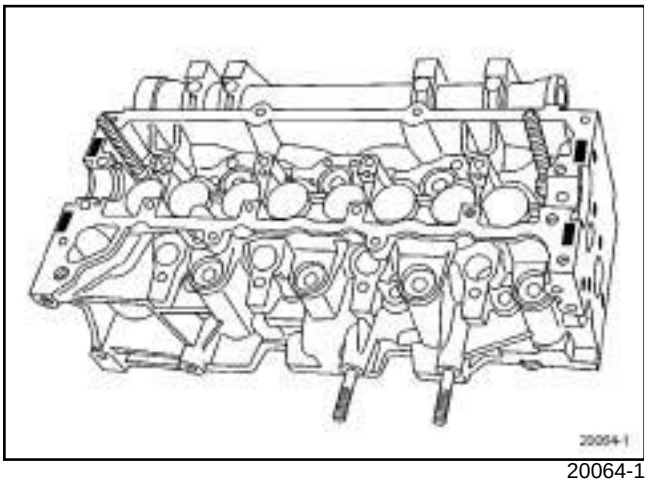
117657

❏ Remove:

- the camshaft hub nut (**3**) using the **(Mot. 799-01)**,
- the camshaft hub.

II - OPERATION FOR REMOVAL OF PART CONCERNED

20064-2



❏ Remove:

- the camshaft bearing bolts,
- the camshaft bearings,
- the camshaft,
- the camshaft seal.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

20064-1

20064-1

❑ It is essential to replace the camshaft stud if the stud becomes loose with the nut (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) (Technical Note 3887A, 11A, Top and front of engine).

Note:

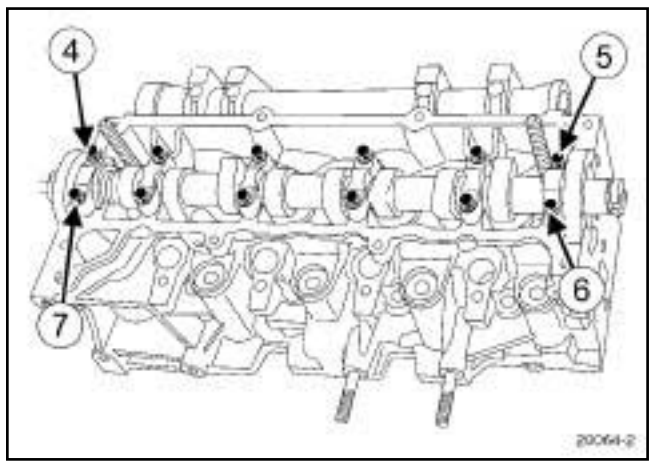
The cylinder head gasket faces and camshaft bearings No.1 and No.6 must be clean, dry and free of grease (avoid finger marks).

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Apply four beads of **RESIN ADHESIVE**, **1 mm** wide to cylinder head bearings no.1 and no.6.

II - REFITTING OPERATION FOR PART CONCERNED



❑ Refit:

- the camshaft,
- the camshaft bearings (observing their original positions, no.1 flywheel end).

Note:

Always replace any camshaft pulley studs which were loosened during the operation.

Do not touch or soil the pre-coated section of the new stud as this may cause oil to leak out from the camshaft. In this case, torque tighten the **camshaft stud 12 N.m**.

20064-2

20064-2

❑ Pretighten camshaft bearing bolts (**4**) , (**5**) , (**6**) and (**7**) .

❑ Tighten to torque **bolts** (**4**) , (**5**) , (**6**) and (**7**) **on the camshaft bearings** (**10 N.m**).

❑ Pretighten the camshaft intermediate bearing bolts.

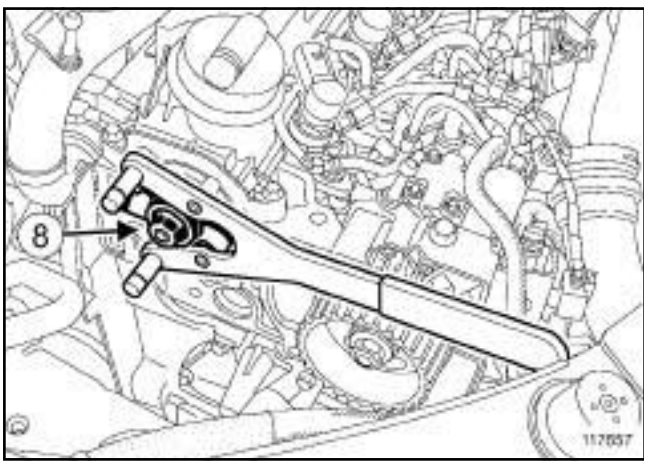
❑ Torque tighten the **camshaft bearing bolts (10 N.m)**.

III - FINAL OPERATION

❑ Refit the camshaft seal (see **11A**, **Top and front of engine**, **Camshaft seal, timing end: Removal - Refitting**, page **11A-284**) .

K9K

1 - First fitting of camshaft pulley



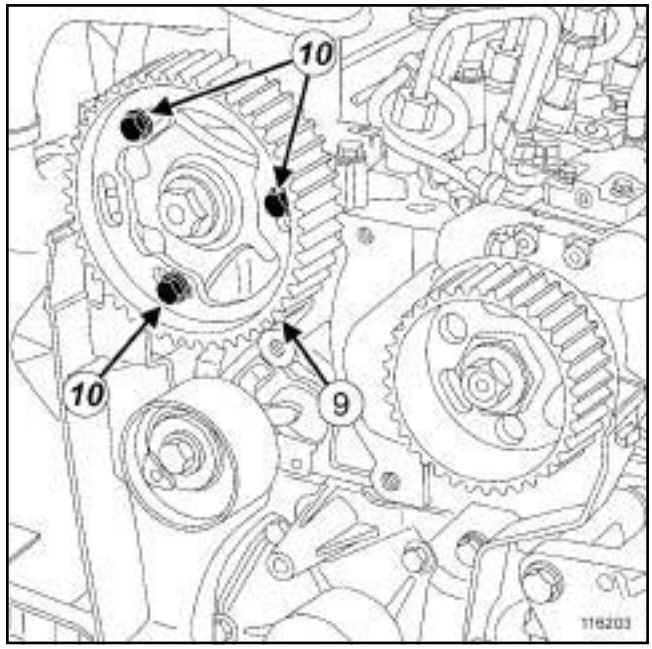
❑ Refit:

- the camshaft pulley,
- a new nut on the camshaft pulley.

> Note:
>
> When replacing the camshaft pulley, the Parts Department supplies a camshaft pulley in two parts.

❑ Torque and angle tighten the **camshaft pulley nut (30 N.m + 86° ± 6°)**, locking the pulley with the tool **(Mot. 799-01)**.

2 - Second fitting of camshaft pulley



117657

❑ The camshaft hub nut (**8**) must always be replaced.

❑ Refit the camshaft hub.

❑ Torque and angle tighten the **camshaft hub nut (30 N.m + 86° ± 6°)**, locking the hub using the tool **(Mot. 799-01)**.

116203

❑ Refit:

- the camshaft pulley wheel (**9**) ,
- the camshaft pulley wheel bolts (**10**) .

❑ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the vacuum pump (see **Vacuum pump: Removal - Refitting**) (MR 392, 37A, Mechanical component controls),
- the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (K9K/764, 772, if equipped),
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front section of the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray,

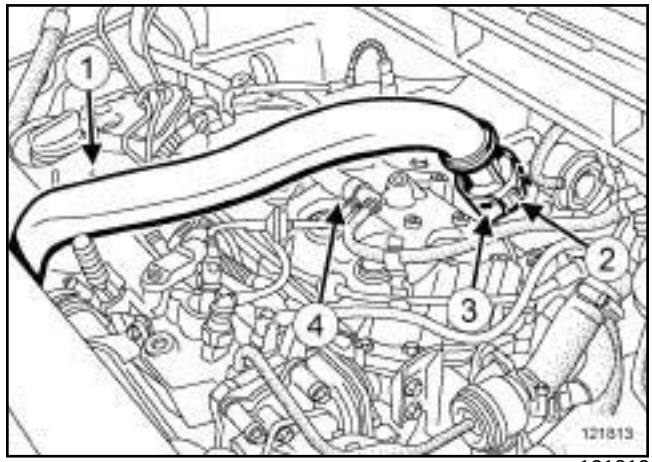
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F, and 784

Special tooling required	
Mot. 1672	Lower engine support.
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1381	Camshaft seal extractor tool 30 x 42 x 7.
Mot. 1587	Tool for fitting camshaft "PTFE" seal.

Tightening torques ▽	
bolts on camshaft bearing No.5	**9 Nm**
camshaft bearing cap bolt	**7 Nm + 50° ± 6°**
camshaft pulley bolt	**30 Nm + 45° ± 6°**
heat shield bolts	**8 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

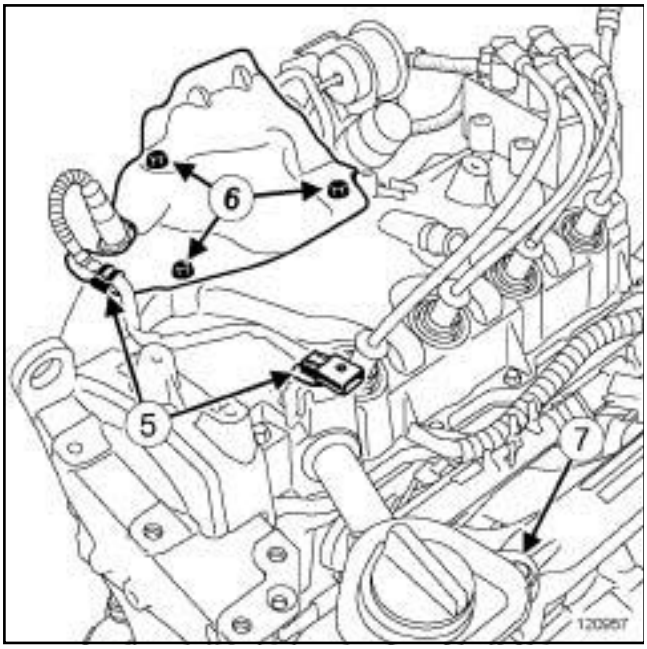
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.

121813

❑ Remove the bolt (**1**) from the intercooler air inlet pipe on the intake distributor.



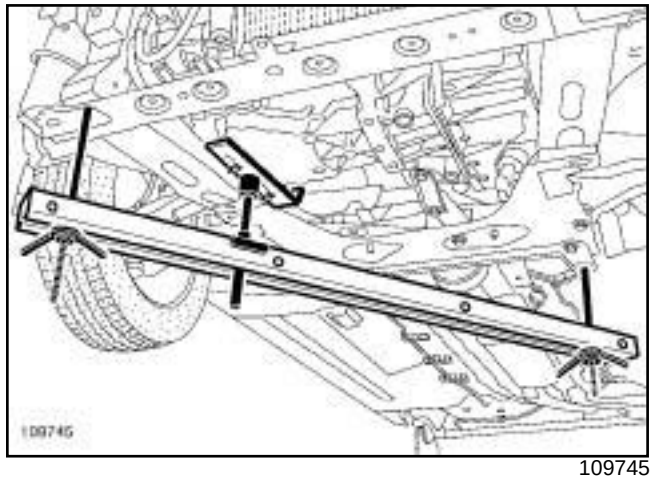
❑ Remove the intercooler inlet pipe clip (**2**) from the turbocharger.

Note:

If the thermal protection clip (**3**) is removed, the intercooler air inlet pipe must also be replaced.

❑ Move the intercooler inlet air pipe to one side.

❑ Disconnect the oil vapour rebreathing circuit union (**4**) .



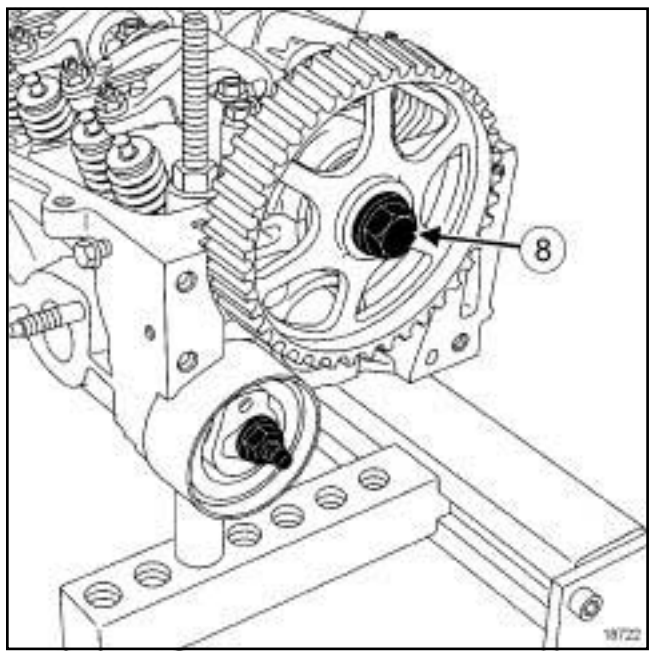
120957

❏ Disconnect the upstream oxygen sensor connector.

❏ Unpick the wiring harness from the upstream oxygen sensor at (**5**) .

❏ Remove:

- the bolts (**6**) from the heat shield,
- the heat shield,
- the filler neck bolt (**7**) ,
- the filler neck,
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

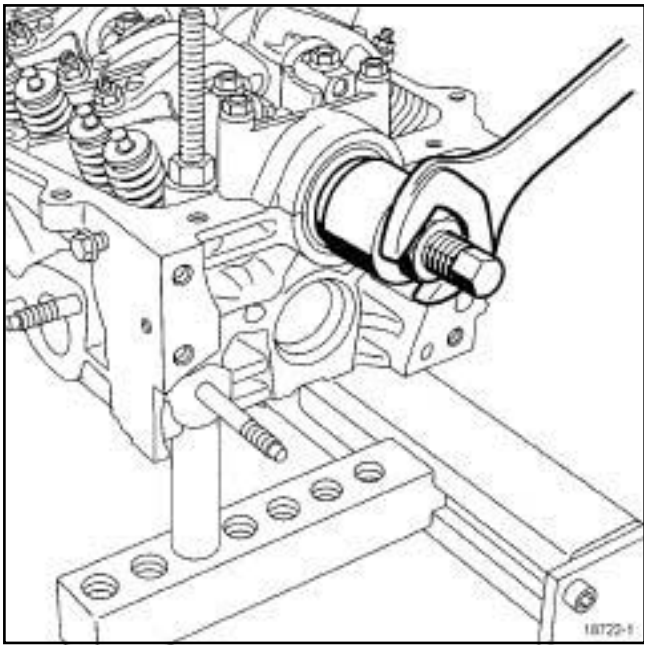


109745

❏ Set up engine support tool **(Mot. 1672)**.

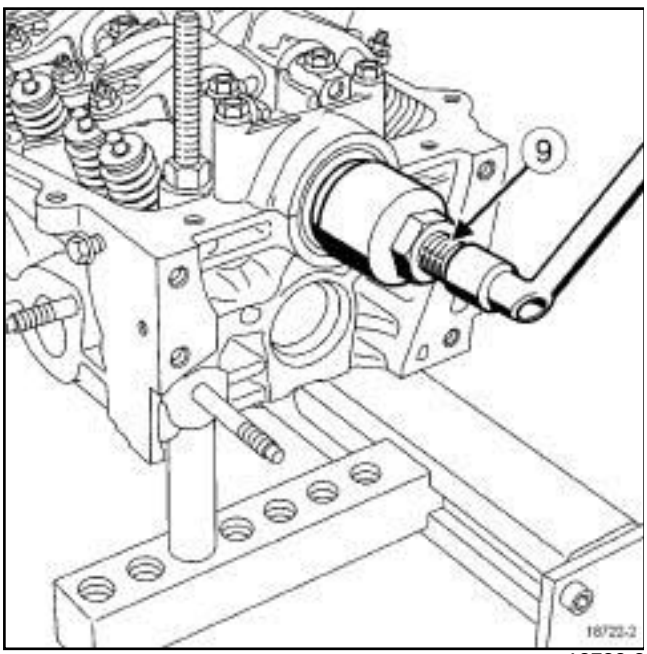
❏ Remove:

- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .



18722

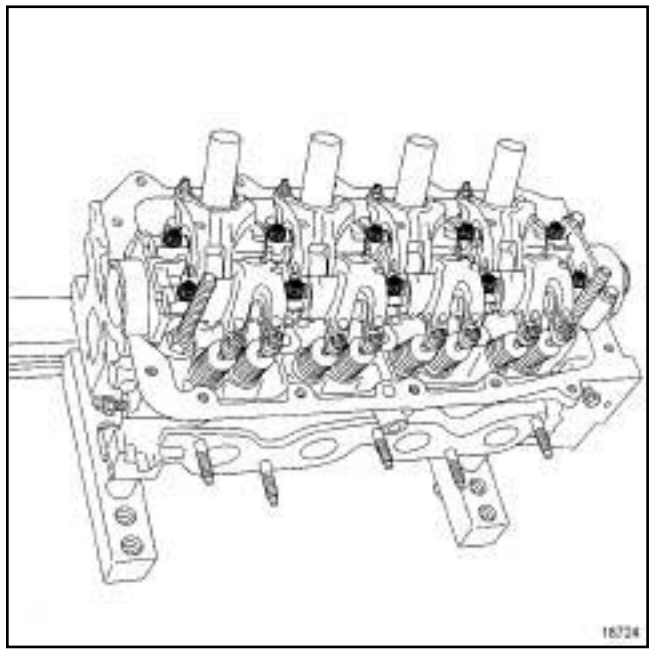
❏ Remove:



- the camshaft pulley bolt (**8**) using the **(Mot. 799-01)**,
- the camshaft pulley.

D4F, and 784

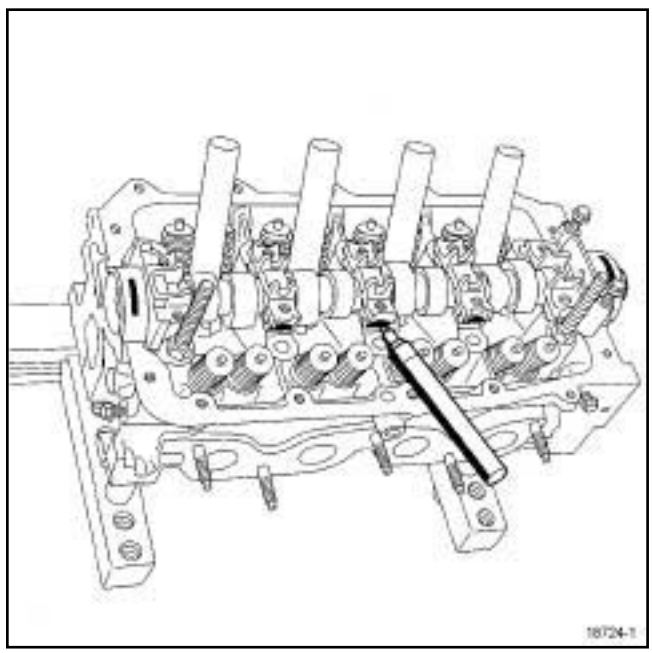
18722-1



❏ Position the **(Mot. 1381)**.

18722-2

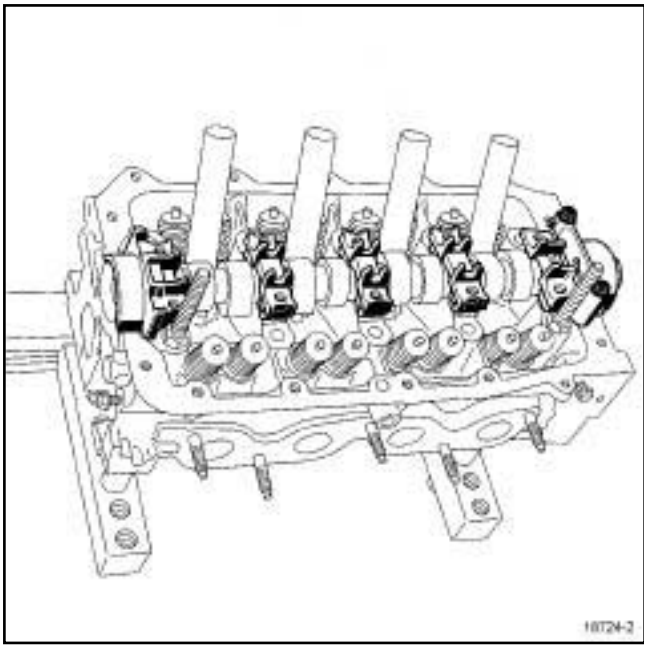
❏ Remove the seal by tightening the bolt (**9**) on the **(Mot. 1381)**.



II - OPERATION FOR REMOVAL OF PART CONCERNED

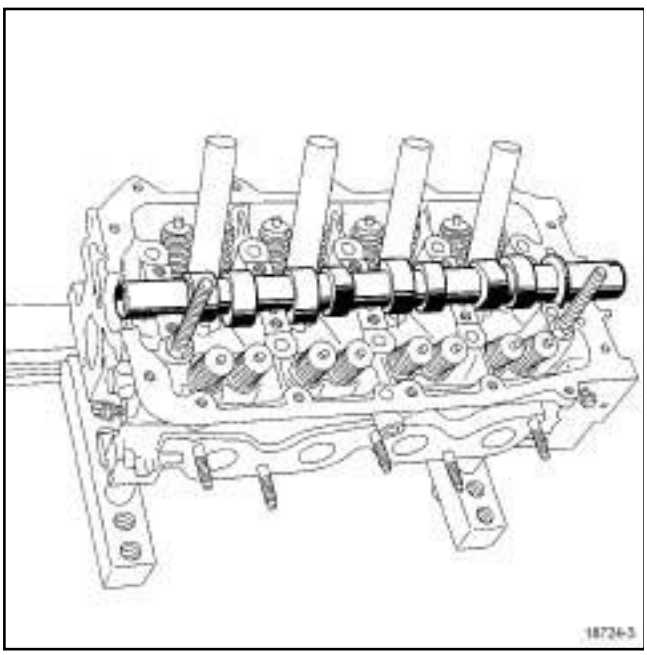
18724

❏ Remove:



- the camshaft bolts,
- the camshafts.

18724-1



❏ Mark the camshaft bearing caps with a permanent marker pen.

D4F, and 784

18724-2

❑ Remove the camshaft bearing caps.

18724-3

❑ Remove the camshaft.

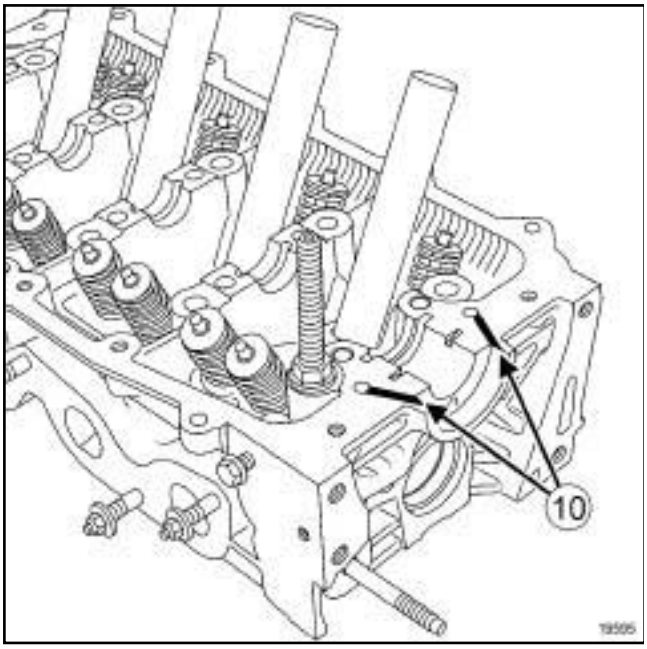
REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Always replace:

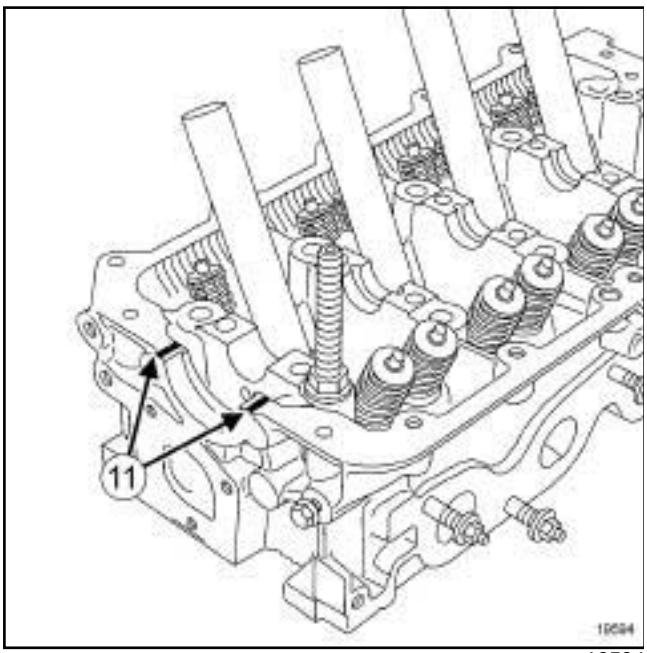
- the camshaft seal,
- the camshaft pulley bolt.

❑ Clean the joint faces with **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) to dissolve any part of the joint still remaining.



WARNING

Do not allow this product to drip onto the paintwork.



Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

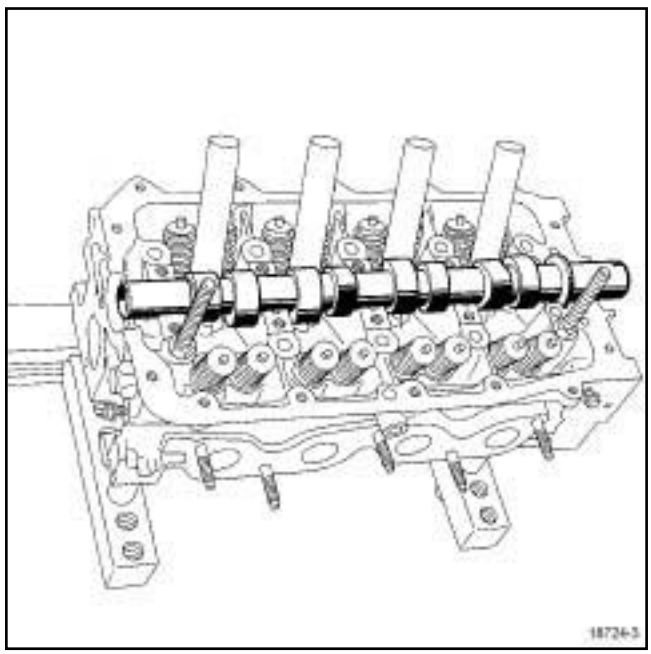
Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

D4F, and 784

19595

19594

❑ Apply:

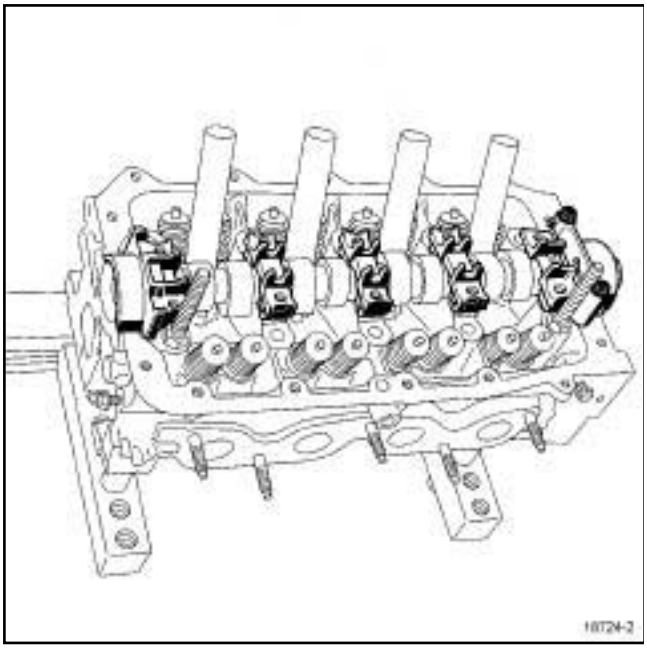


- two beads (**10**) of **MASTIXO** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products) with a width of **2 mm** to bearing No.5 on the cylinder head,
- two drops (**11**) of **MASTIXO** to bearing No.1 on the cylinder head.

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Apply a blob of oil to the camshaft bearings.

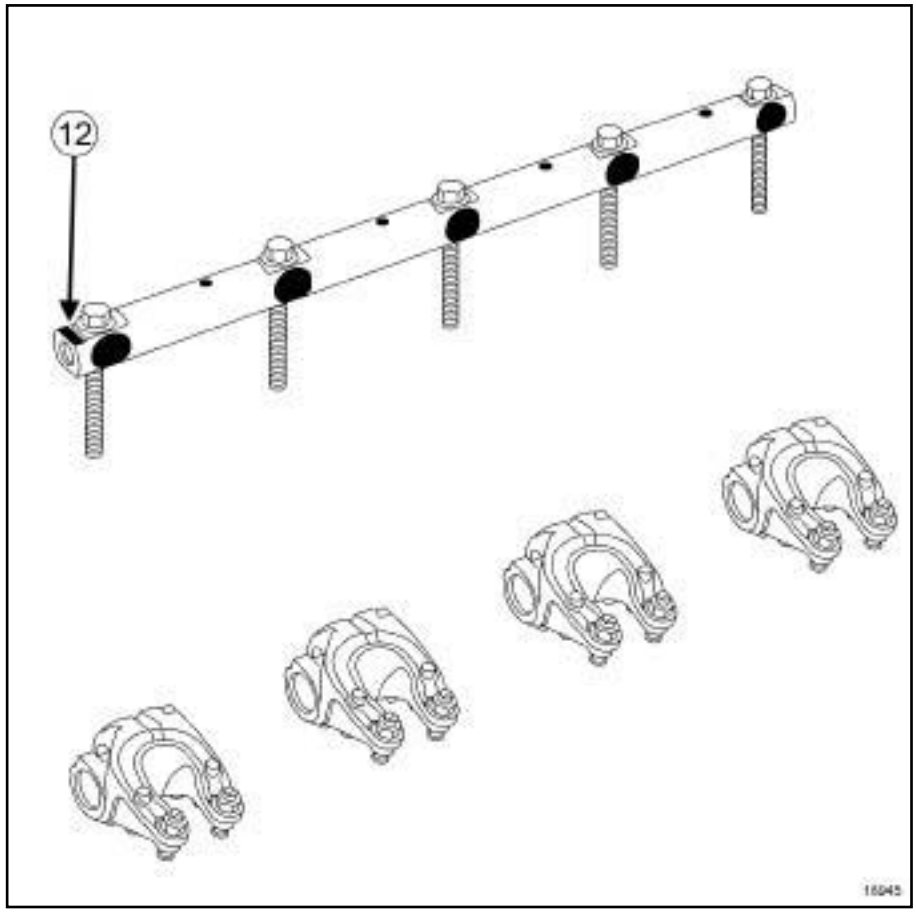


II - REFITTING OPERATION FOR PART CONCERNED

18724-3

❑ Refit the camshaft.

D4F, and 784

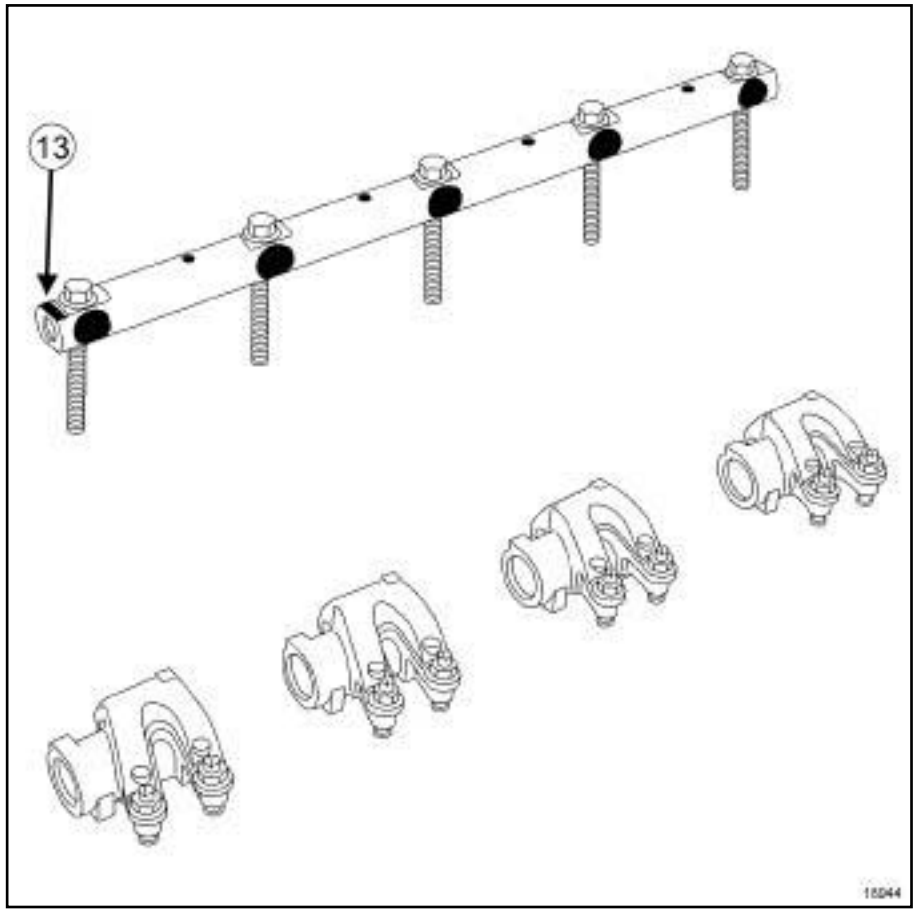


18724-2

- ❏ Refit the camshaft bearing caps.
- ❏ Torque tighten the **bolts on camshaft bearing No.5 (9 Nm)**.

D4F, and 784

Inlet camshaft



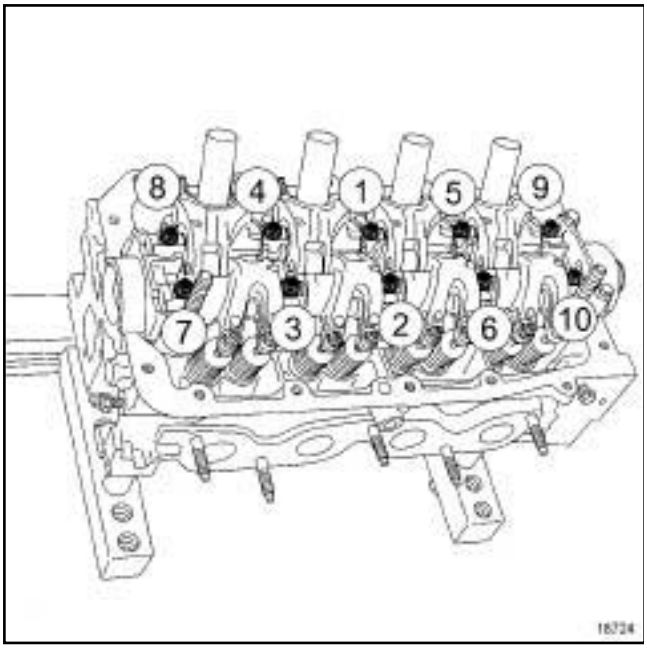
18945

❏ Refit the inlet camshaft by positioning:

- the rails in relation to the tappets,
- the marking (**12**) on the timing end.

D4F, and 784

Exhaust camshaft



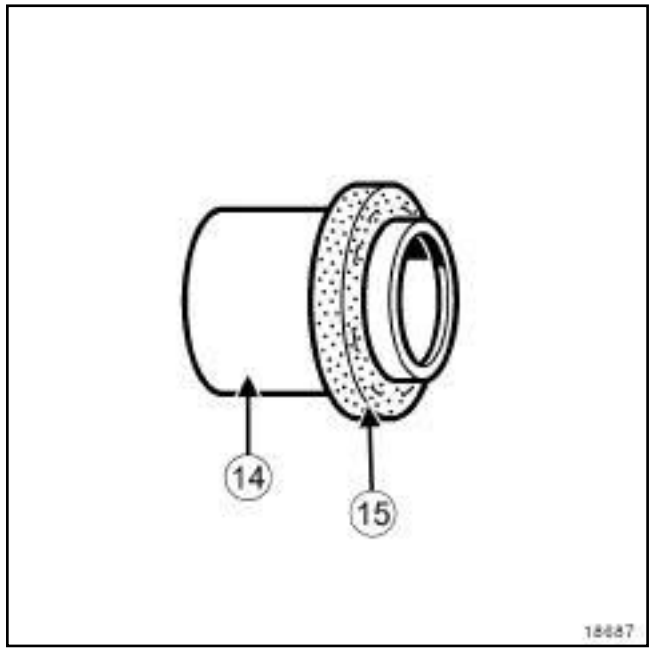
18944

❑ Refit the exhaust camshaft by positioning:

- the rails in relation to the tappets,
- the marking (**13**) on the flywheel end.

D4F, and 784

18724



❏ Tighten to torque and in order the **camshaft bearing cap bolts (5 Nm)**.

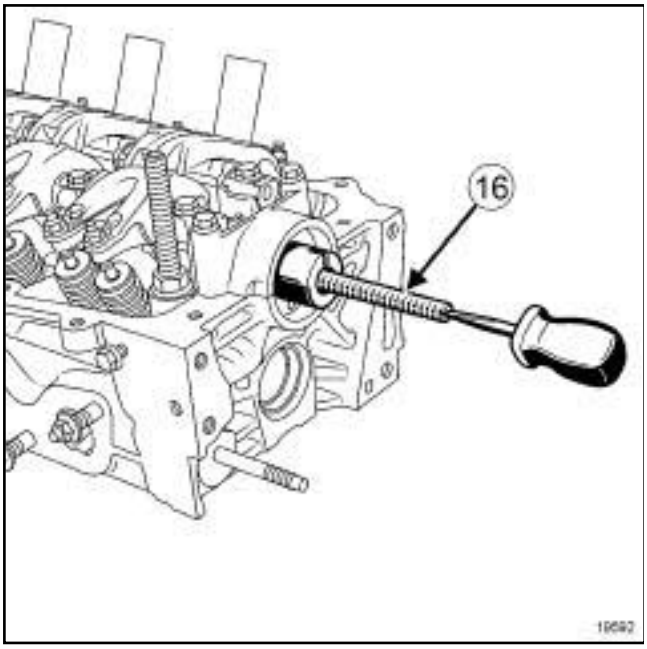
❏ Completely loosen bolt (**1**) .

❏ Torque and angle tighten the **camshaft bearing cap bolt (7 Nm + 50° ± 6°)**.

❏ Carry out the previous operations for each bolt from (**2**) to (**10**) .

III - FINAL OPERATION.

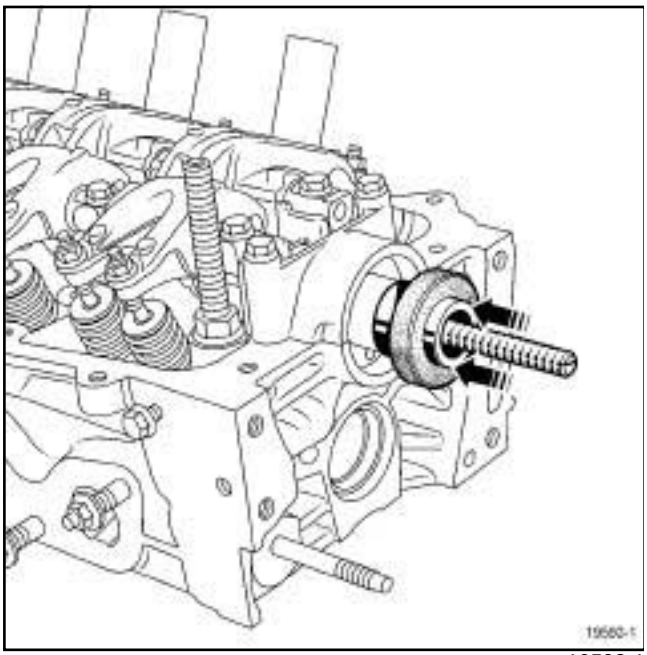
18687



❏ Prepare the camshaft seal with its protector.

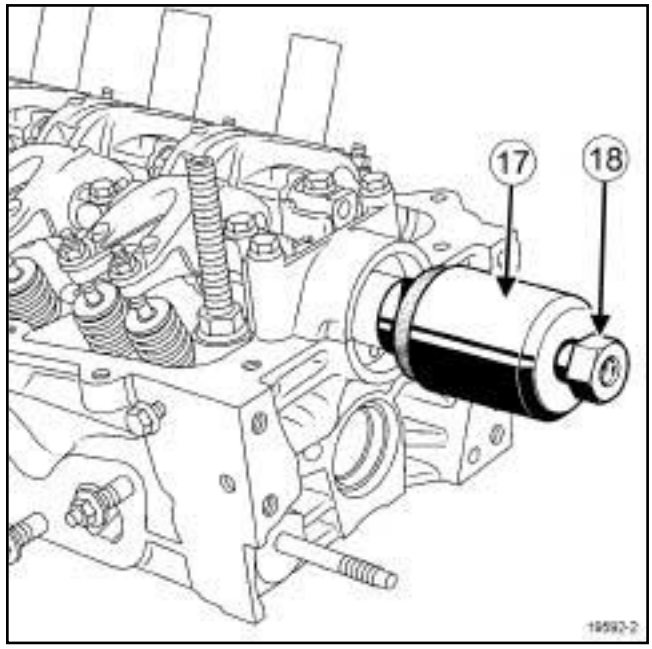
Note:

This type of seal is extremely fragile. Only touch the protective part (**14**) when handling the gasket. It is strictly forbidden to touch the seal (**15**) ; this is to prevent any oil leaks once the oil seal is fitted to the engine.



❏ Fit the seal using the **(Mot. 1587)**.

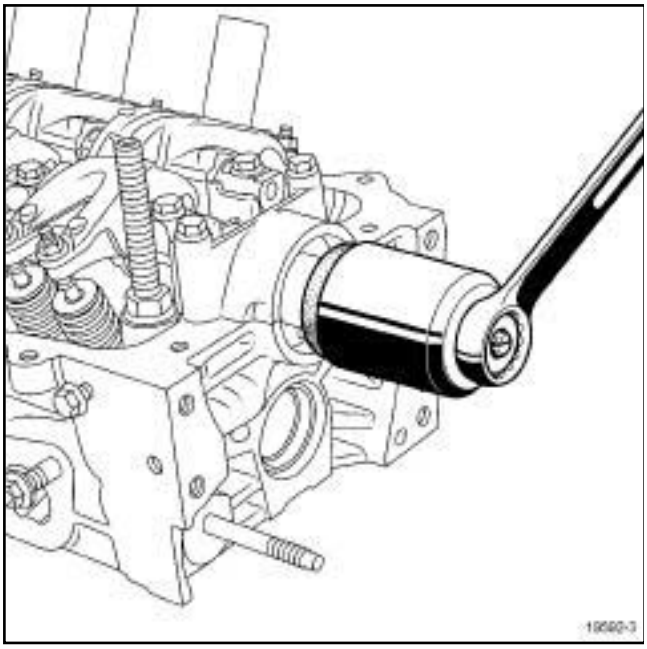
D4F, and 784



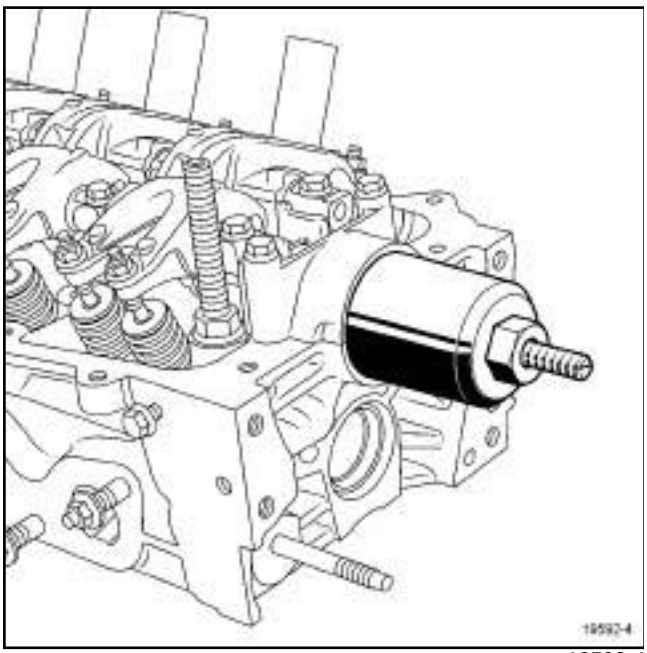
19592

❑ Fit the threaded rod (**16**) of the **(Mot. 1587)** into the camshaft.

19592-1



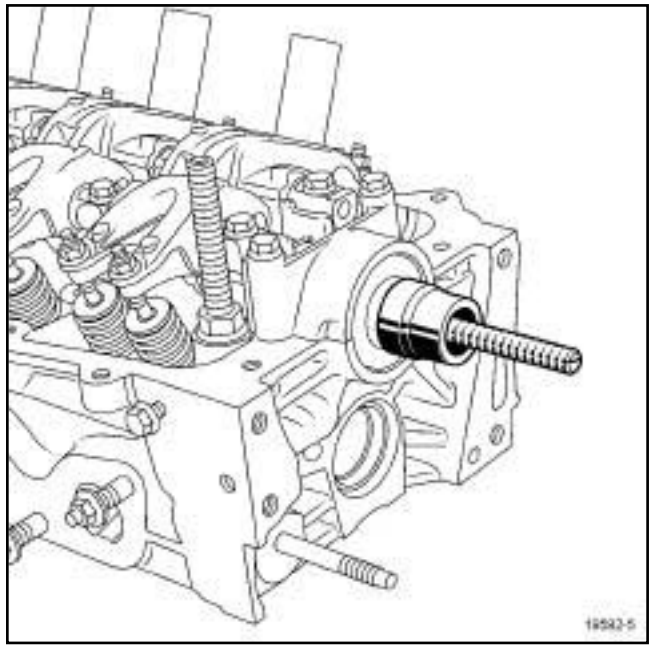
❑ Fit the seal gasket and protector on the camshaft. Be careful not to touch the seal.



19592-2

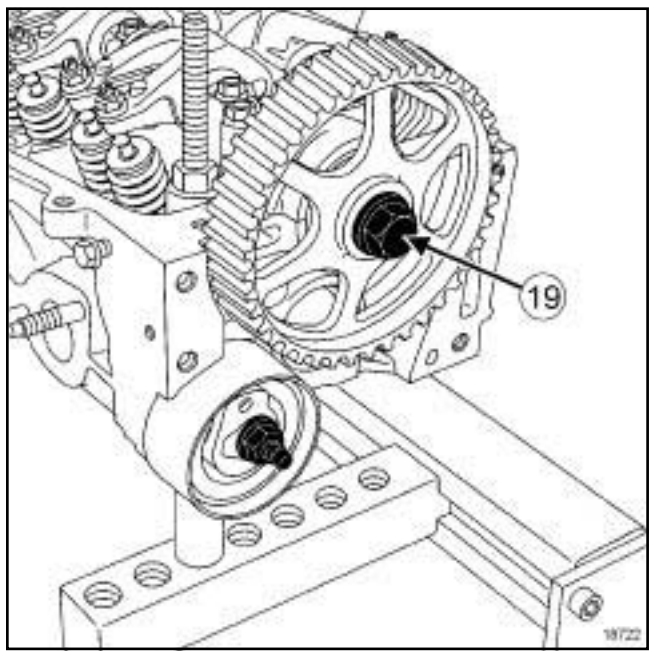
❑ Fit the cover (**17**) and the collar nut (**18**) of the **(Mot. 1587)**.

D4F, and 784



19592-3

19592-4



❏ Tighten the collar nut until the cover comes into contact with the cylinder head.

19592-5

❏ Remove:

- the nut ***(18)*** ,
- the cover ***(17)*** ,
- the guard ***(14)*** ,
- the threaded rod ***(16)*** .

18722

❏ Refit:

- the camshaft pulley,
- the new camshaft pulley bolt (**19**) .

❏ Torque and angle tighten the **camshaft pulley bolt (30 Nm + 45° ± 6°)** using the **(Mot. 799-01)**.

D4F, and 784

❏ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) .

❏ Remove the engine support tool **(Mot. 1672)**.

❏ Refit:

- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the filler neck,
- the filler neck bolt,
- the heat shield,
- the heat shield bolts.

❏ Torque tighten the **heat shield bolts (8 Nm)**.

❏ Clip the upstream oxygen sensor wiring harness into place.

❏ Connect:

- upstream oxygen sensor connector,
- the oil vapour rebreathing circuit union.

❏ Refit the intercooler air inlet pipe.

❏ Clip the intercooler air inlet pipe onto the turbocharger.

❏ Refit:

- the intercooler air inlet pipe bolt on the intake distributor,
- the engine cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Camshaft: Removal - Refitting

M4R

Special tooling required	
Mot. 919-02	Flywheel locking tool.
Mot. 1716	Removes housing with silicone seals.

Tightening torques ▽	
cylinder head cover bolts (first initial torque)	**2 N.m**
cylinder head cover bolts (second initial torque)	**6 N.m**
cylinder head cover bolts	**10 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Engine: Precautions for the repair**) .

WARNING

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

REMOVAL

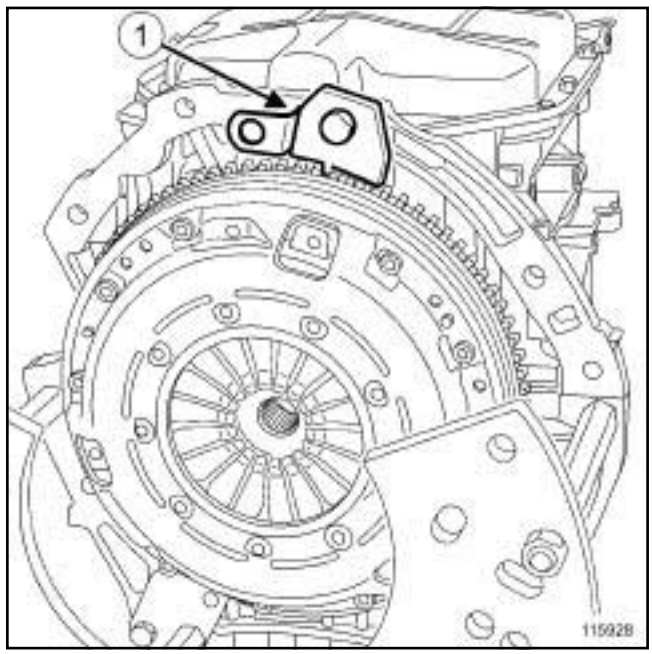
I - REMOVAL PREPARATION OPERATION

❑ Remove the « engine and gearbox » assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .

M4R, and 700

❑ Disconnect the manual gearbox from the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

M4R, and 701



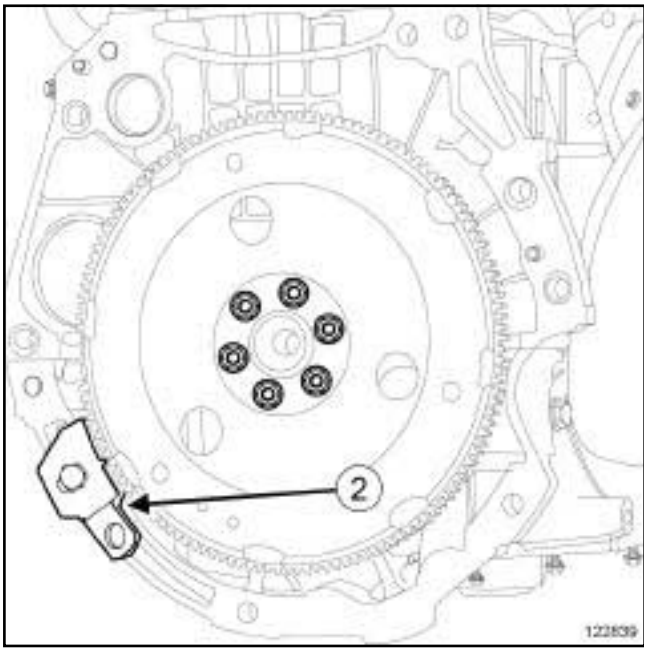
❑ Disconnect the automatic gearbox from the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

❑ Place the engine on the component support (see **Engine support equipment: Use**) .

❑ Drain the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Remove the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

M4R, and 700

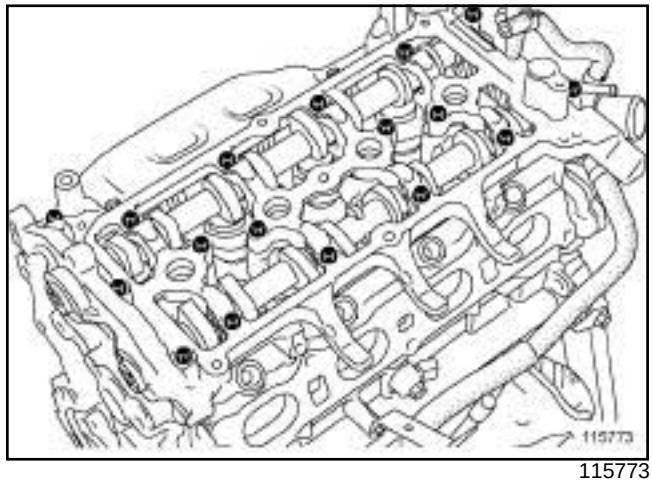


115928

❑ Immobilise the flywheel by fitting the tool **(Mot. 919-02)** (**1**) on the cylinder block.

M4R

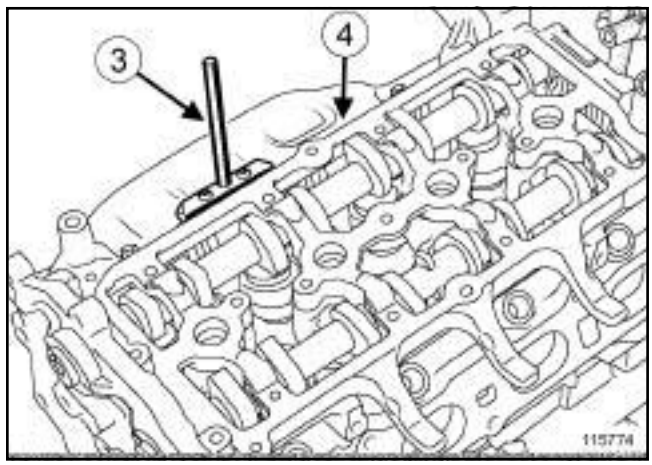
M4R, and 701



122839

❏ Immobilise the drive plate by fitting the tool **(Mot. 919-02)** (**2**) on the cylinder block.

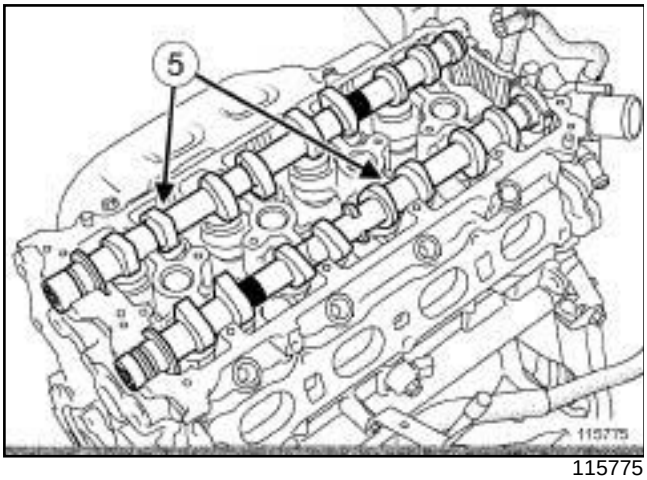
❏ Remove:



- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the **(Mot. 919-02)**,
- the crankshaft seal on the timing side (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) ,
- the timing chain (see **11A**, **Top and front of engine**, **Timing chain: Removal - Refitting**, page **11A-170**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing sprockets (see **Timing sprocket: Removal - Refitting**) ,
- the injector rail (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) .

II - CAMSHAFT REMOVAL OPERATION

115773



❏ Remove the cylinder head cover bolts.

115774

❏ Detach the cylinder head cover using the tool **(Mot. 1716)** (**3**) .

❏ Remove the cylinder head cover (**4**) .

115775

❑ Remove the camshafts (**5**) .

REFITTING

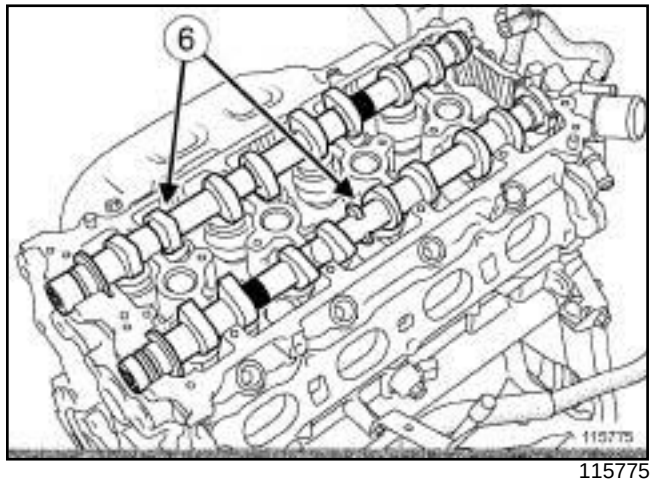
I - REFITTING PREPARATION OPERATION

❑

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

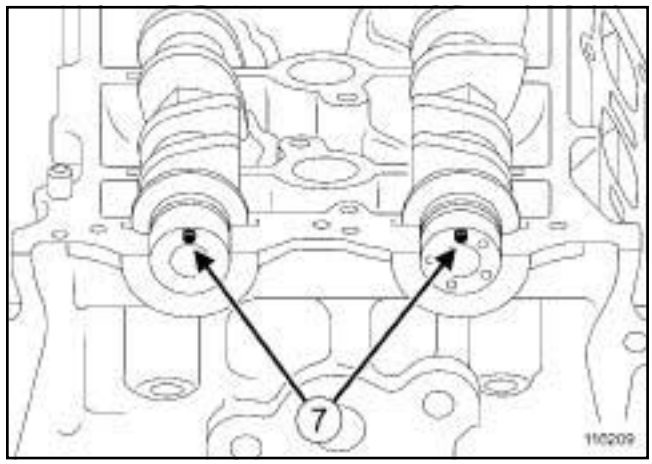
❑ Clean the joint faces of the cylinder head cover with **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❑ Remove the residue using a plastic spatula.



❑ Finish cleaning the joint faces using a **GREY ABRASIVE PAD**, part number **77 01 405 943**.

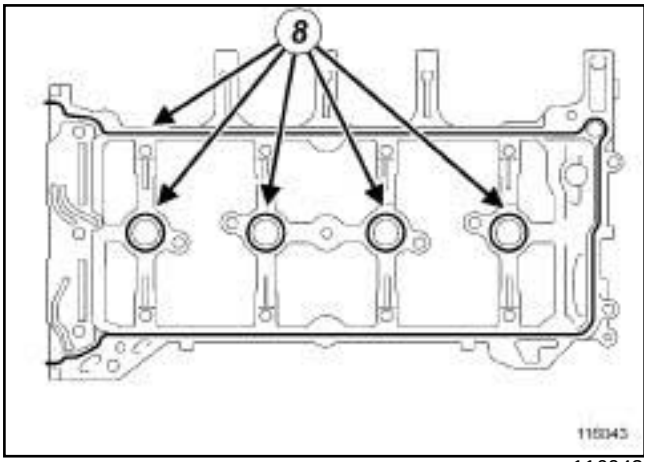
WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the cylinder head cover,
- the camshafts.

II - CAMSHAFT REFITTING OPERATION

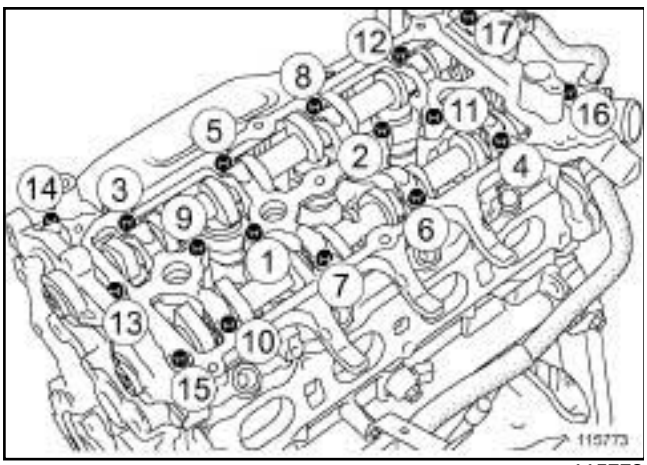


115775

116209

❑ Refit the camshafts (**6**) (see **Camshaft: Check**) , placing the lugs (**7**) upwards.

M4R



116043

❑

WARNING

Applying excess sealant could cause it to be squeezed out when parts are tightened. A mixture of sealant and fluid could damage certain components (engine, radiator, etc.).

❑ Apply a bead of **SILICONE ADHESIVE SEALANT** with a diameter of **4 mm** (**8**) around the edge of the joint face of the cylinder head cover and the plug wells.

115773

❑ Refit:

- the cylinder head cover,
- the cylinder head cover bolts.

❑ Pretighten to torque and in order:

- the **cylinder head cover bolts (first initial torque) (2 N.m)**,
- the **cylinder head cover bolts (second initial torque) (6 N.m)**.

❑ Torque tighten in order the **cylinder head cover bolts (10 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the injector rail (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) ,
- the timing sprockets (see **Timing sprocket: Removal - Refitting**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the timing chain (see **11A**, **Top and front of engine**, **Timing chain: Removal - Refitting**, page **11A-170**) ,
- the crankshaft seal on the timing side (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) .

❑ Immobilise the flywheel or the drive plate using the tool **(Mot. 919-02)**.

❑ Refit the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) .

❑ Remove the tool **(Mot. 919-02)**.

❑ Refit the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❑ Remove the engine from the component support (see **Engine support equipment: Use**) .

M4R, and 700

❑ Connect the manual gearbox to the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

M4R, and 701

❑ Connect the automatic gearbox to the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

M4R

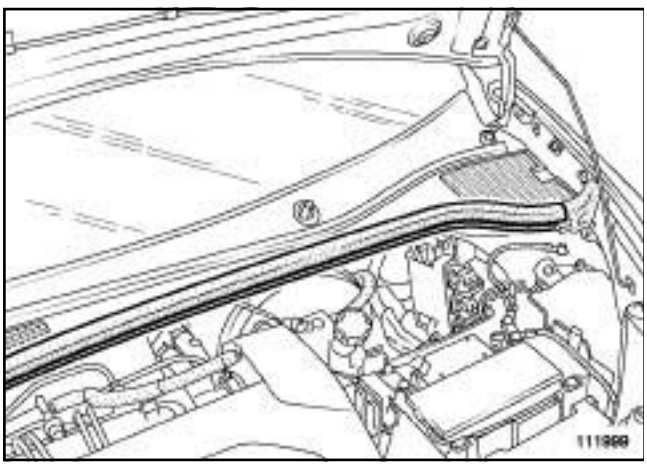
- ❑ Refit the « engine and gearbox» assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .
- ❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

Camshaft seal, timing end: Removal - Refitting

K9K

Special tooling required	
Mot. 799-01	Timing gear wheel immobiliser.
Mot. 1577	Lip seal extractor (shaft diameter 28 mm to 42 mm).
Mot. 1632	Tool for fitting camshaft PTFE seal

Tightening torques ▽	
camshaft hub bolt	**30 N.m + 86° ± 6°**
camshaft hub bolt	**30 N.m + 86° ± 6°**
camshaft pulley bolts	**14 N.m**



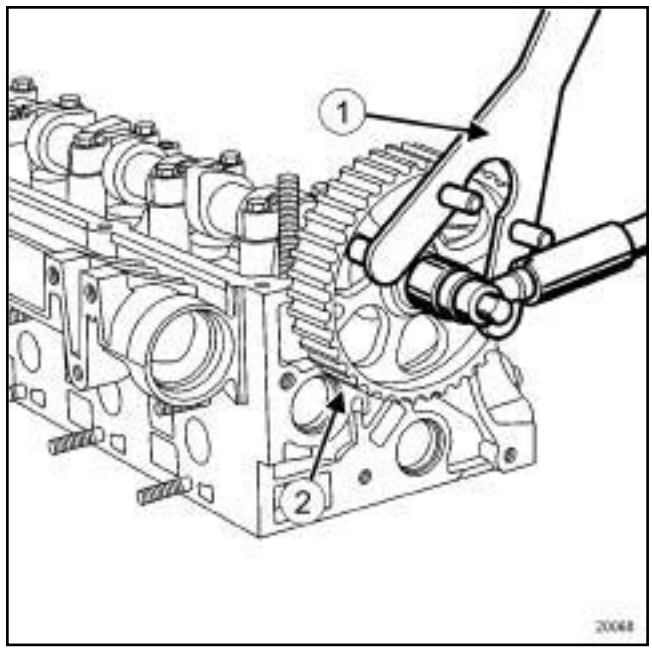
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.



111999

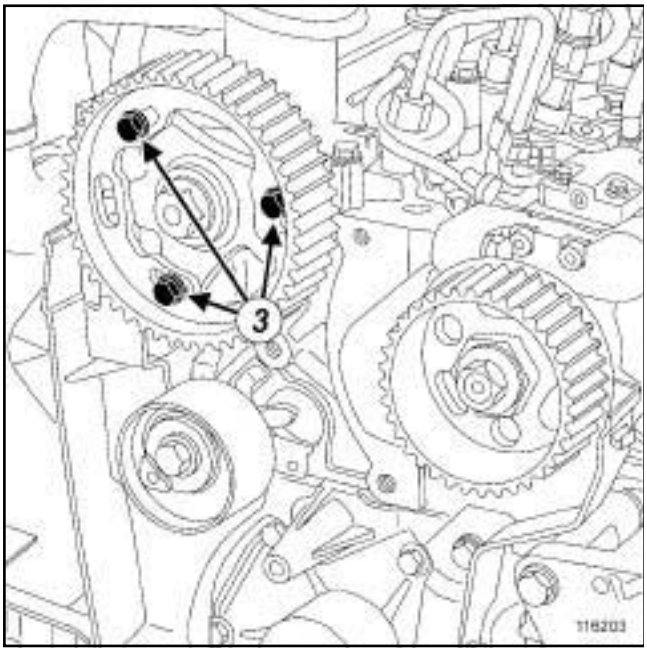
❑ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

FACTORY FITTING:

20068

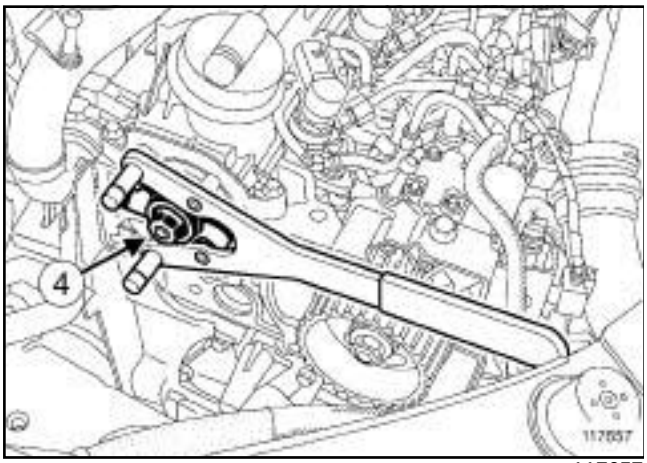


❑ Immobilise the camshaft hub using the **(Mot. 799-01)** (**1**) .

❑ Remove:

- the nut from the camshaft pulley,
- the camshaft pulley (**2**) .

K9K

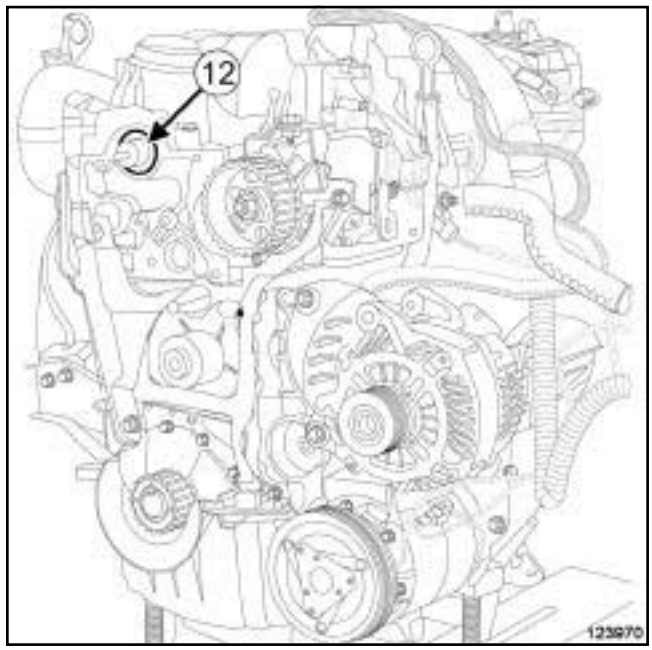


RETRO-FITTING:

116203

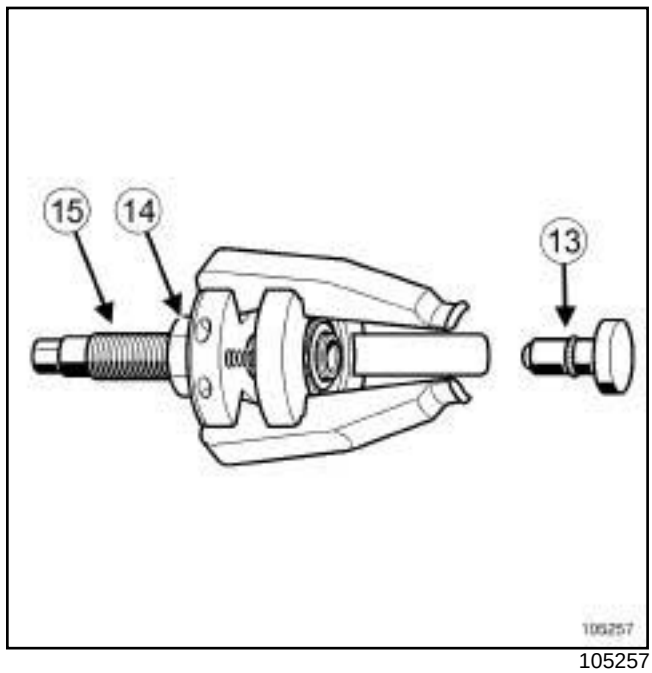
❏ Remove:

- the camshaft pulley bolts (**3**) ,
- the camshaft pulley.



117657

❏ Immobilise the camshaft hub using the **(Mot. 799-01)**.



❏ Remove:

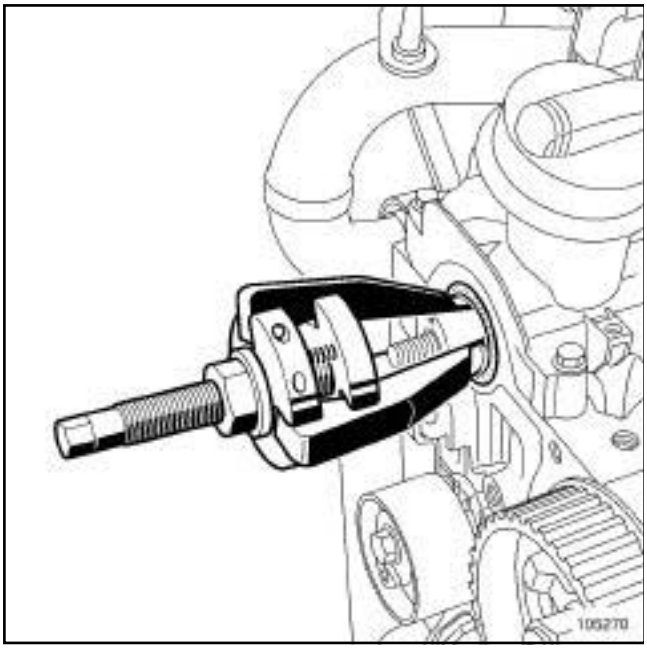
- the camshaft hub nut (**4**) ,
- the camshaft hub.

REMOVAL OPERATION FOR THE PART CONCERNED, FOR BOTH FITTINGS

123970

105257

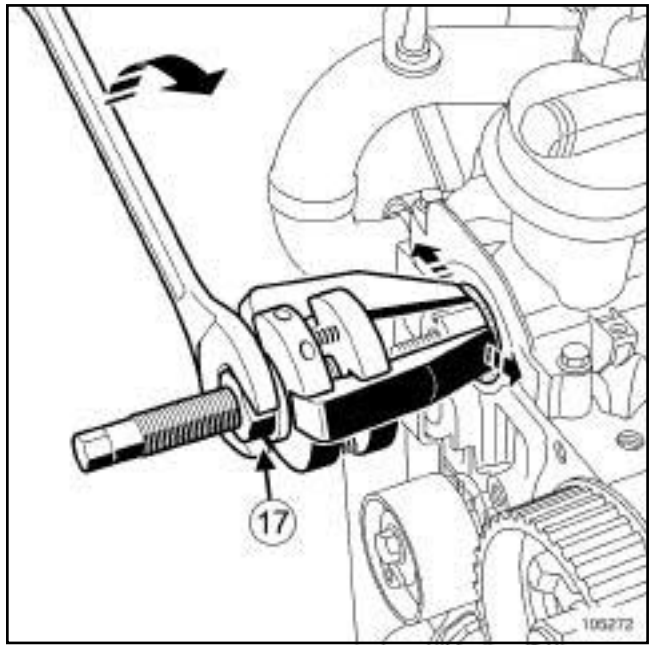
❏



Note:

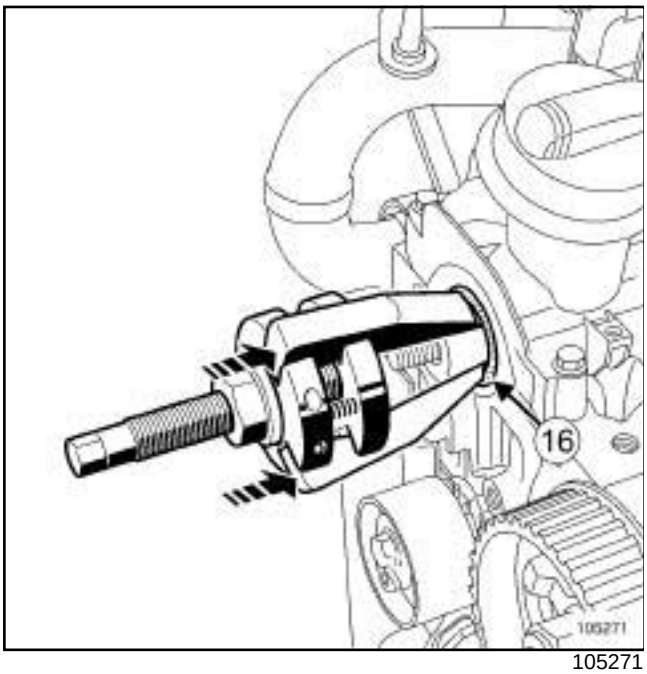
The camshaft seal is removed using the **(Mot. 1577)**.

❏ Remove the camshaft seal (**12**) making sure that the end piece (**13**) of the tool **(Mot. 1577)** is always removed.



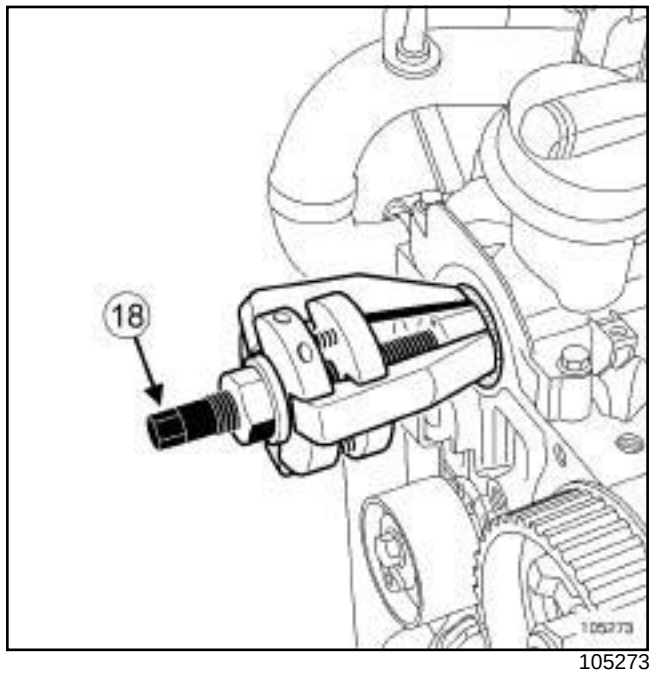
❏ Loosen bolts (**14**) and (**15**) fully from the **(Mot. 1577)**.

K9K



105270

❑ Position the claws of the **(Mot. 1577)** on the camshaft.



105272

❑ Separate the claws by turning the bolt (**17**) clockwise using an open-jawed spanner.

105271

❑ Push the tool **(Mot. 1577)** until contact is made between the ends (**16**) of the claws and the camshaft seal.

105273

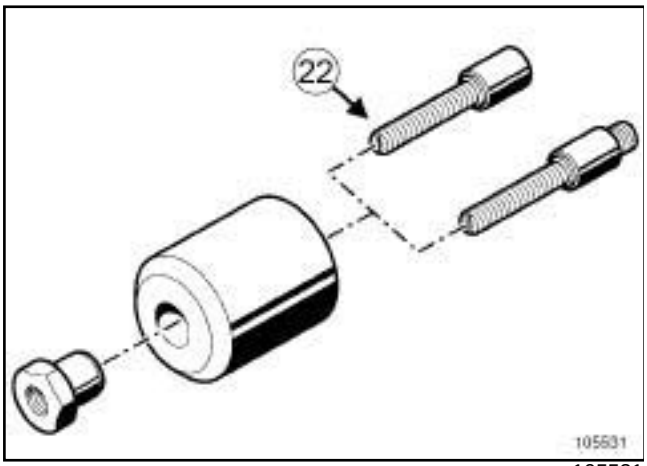
❑ Remove the camshaft seal by turning the bolt (**18**) clockwise.

K9K

REFITTING

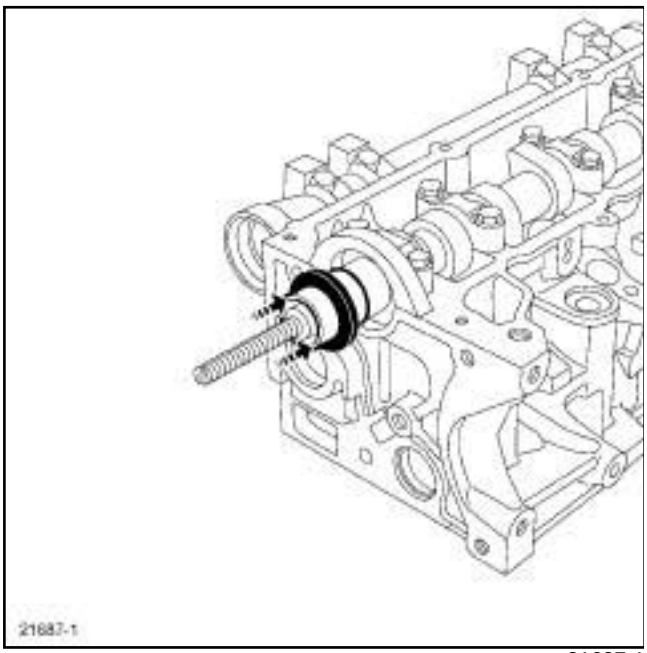
I - REFITTING PREPARATION OPERATION

❑ It is essential to replace the camshaft seal.



Note:

Always replace any camshaft pulley studs which were loosened during the operation.



Do not touch or soil the pre-coated section of the new stud as this may cause oil to leak out from the camshaft. In this case, torque tighten the **camshaft stud 12 N.m**.

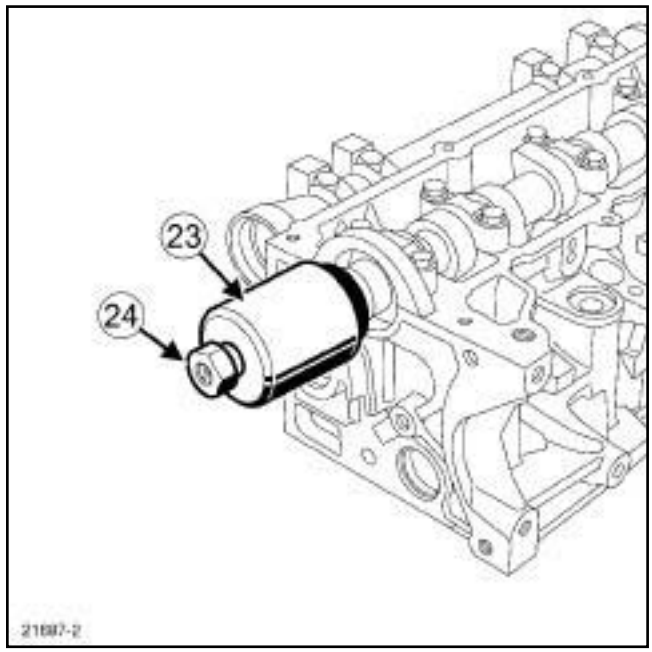
K9K

II - REFITTING OPERATION FOR PART CONCERNED

105531

21687-1

❏ Screw the stud (**22**) of the **(Mot. 1632)** onto the camshaft.

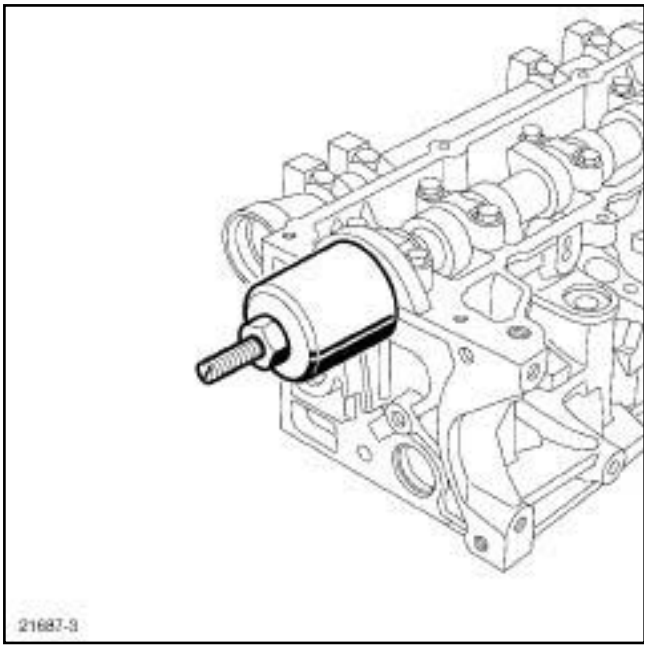


❏ Fit a new camshaft seal on the camshaft.

Note:

For camshaft seals delivered fitted to a protective sleeve:

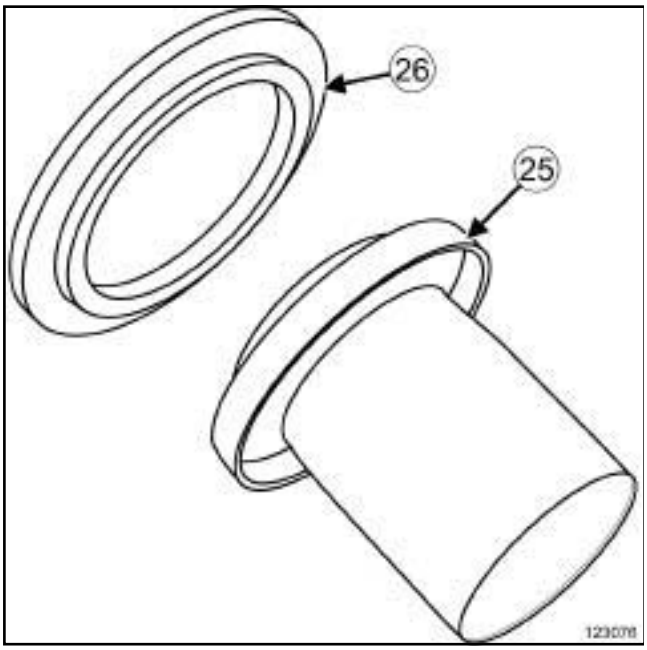
- do not remove the camshaft seal from its protective sleeve,
- fit the sleeve fitted with the camshaft seal to the camshaft,
- push the protective sleeve towards the cylinder head until the camshaft seal reaches its limit on the cylinder head,
- fit the seal on the camshaft by following the recommendations below.



1 - First fitting of the camshaft seal

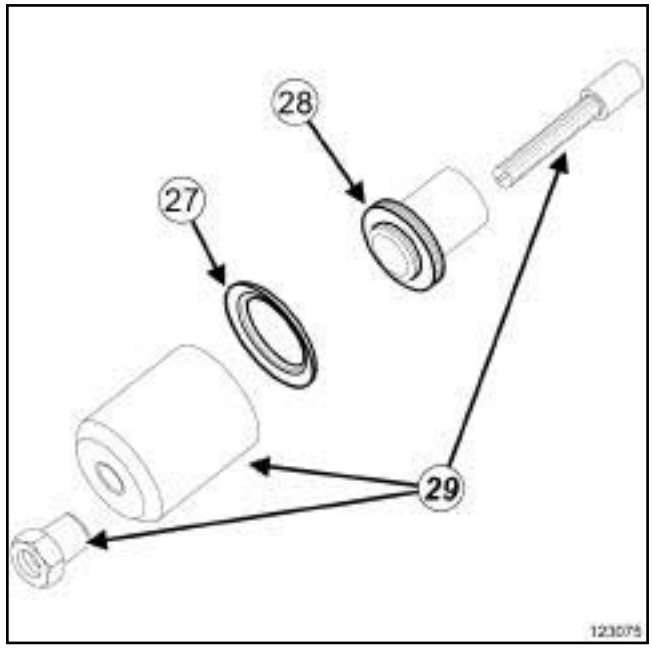
21687-2

❏ Fit the cover (**23**) and the collar nut (**24**) of the **(Mot. 1632)**.



K9K

21687-3

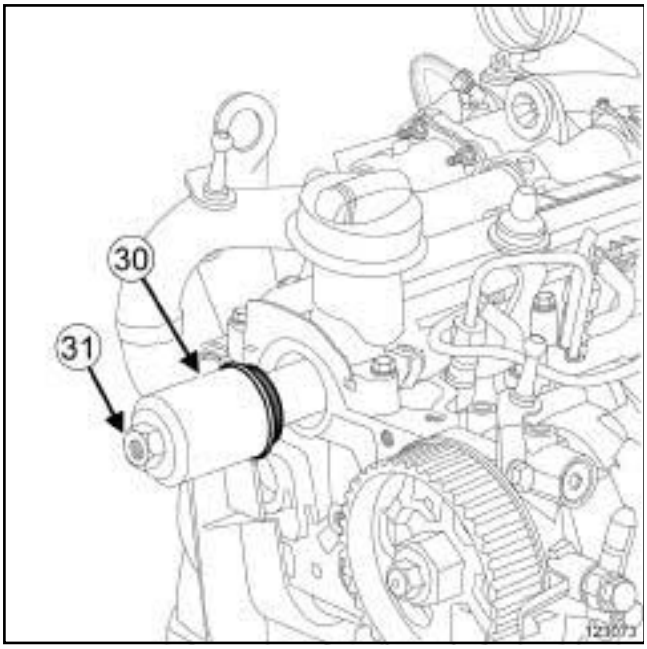


❏ Screw on the collar nut until the cover touches the cylinder head.

2 - Second fitting of the camshaft seal

123076

❏ Depending on the case, the Parts Department delivers seals (**25**) equipped with a spacer (**26**) amongst other things.



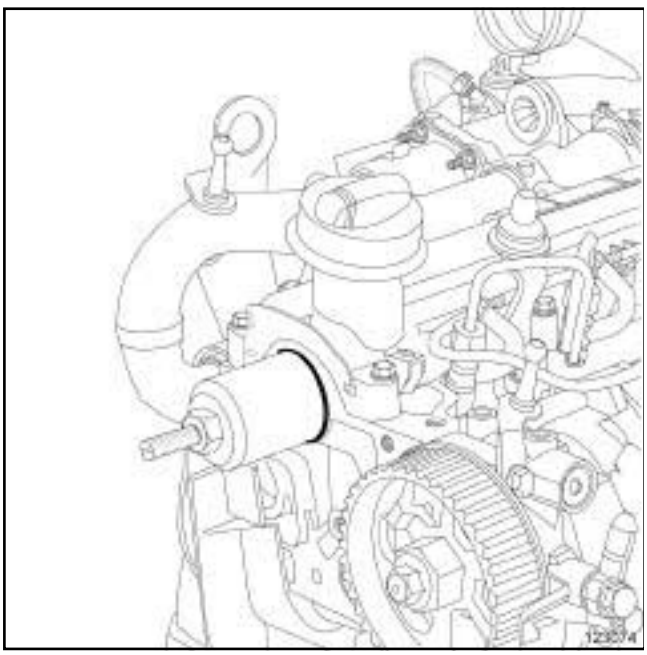
123075

❏

Note:

The spacer (**27**) is used to fit the seal (**28**) and is used in addition to the tool **(Mot. 1632)** (**29**) .

K9K



123073

❑ Position the bell (**30**) fitted with the spacer on the camshaft seal side and then position the collared nut (**31**) of the tool **(Mot. 1632)**.

Note:

The spacer fits on the bell of the tool **(Mot. 1632)** so that the internal edge of the spacer is on the side of the camshaft seal.

123074

❑ Screw on the collar nut until the spacer fitted on the cover touches the cylinder head.

3 - Continued for both methods

❑ Remove:

- the collar nut from the **(Mot. 1632)**,
- the cover from the **(Mot. 1632)**,
- the stud of the **(Mot. 1632)**,
- the protective sleeve and the spacer, if fitted then throw them away.

FACTORY FITTING:

❑ Refit:

- the camshaft pulley,
- the camshaft pulley nut.

Note:

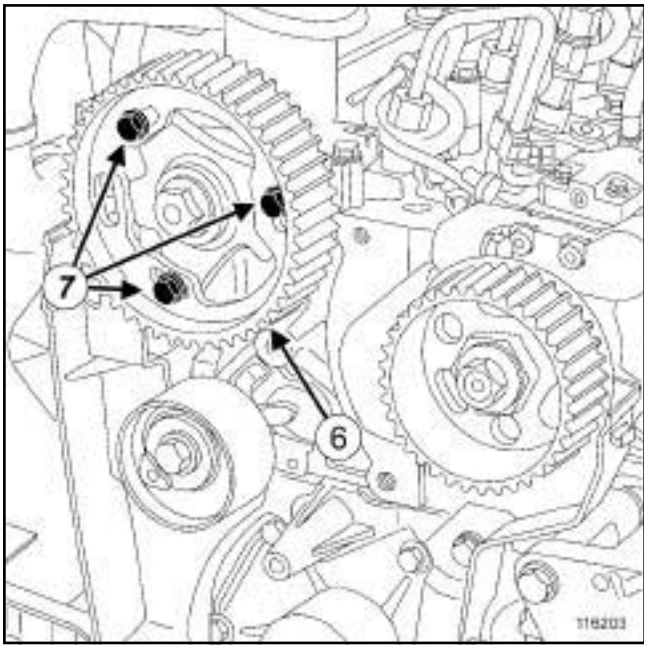
When replacing the camshaft pulley, the Parts Department supplies a camshaft pulley in two parts.

❑ Immobilise the camshaft hub using the **(Mot. 799-01)**.

❑ Torque tighten the **camshaft hub bolt (30 N.m + 86° ± 6°)**, locking the hub using the tool **(Mot. 799-01)**.

RETRO-FITTING:

❑ Refit:



- the camshaft hub,
- the camshaft hub nut.

❑ Immobilise the camshaft hub using the **(Mot. 799-01)**.

❑ Torque tighten the **camshaft hub bolt (30 N.m + 86° ± 6°)**, locking the hub using the tool **(Mot. 799-01)**.

❑ Refit:

- the camshaft pulley,
- the camshaft pulley bolts.

116203

❑ Position the pulley (**6**) in the centre of the ellipses (**7**) .

❑ Tighten to torque the **camshaft pulley bolts (14 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the front section of the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the engine undertray,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),

❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

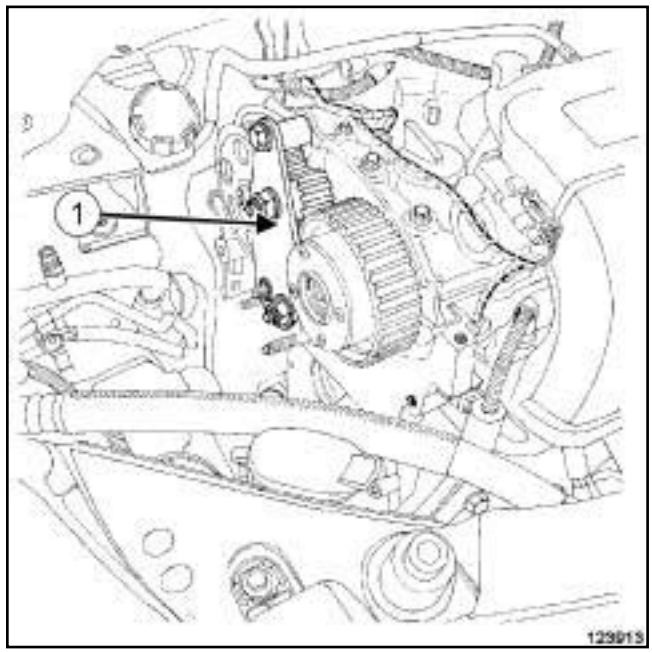
Camshaft seal, timing end: Removal - Refitting

F4R

Special tooling required	
Mot. 1801	Camshaft sprocket locking tool F4 engines.
Mot. 1509-01	Adapter kit for tool Mot.1509 or Mot.1801
Mot. 1577	Lip seal extractor (shaft diameter 28 mm to 42 mm).
Mot. 1814	Tool for fitting the PTFE seal to the inlet camshaft F4R/830
Mot. 1512	Tool for fitting exhaust camshaft seals (28 x 47).

Tightening torques ▽	
toothed sprocket nuts	**80 Nm**
exhaust camshaft pulley nut	**30 Nm**
intake camshaft pulley nut	**30 Nm**
inlet camshaft dephaser blanking cover	**25 Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

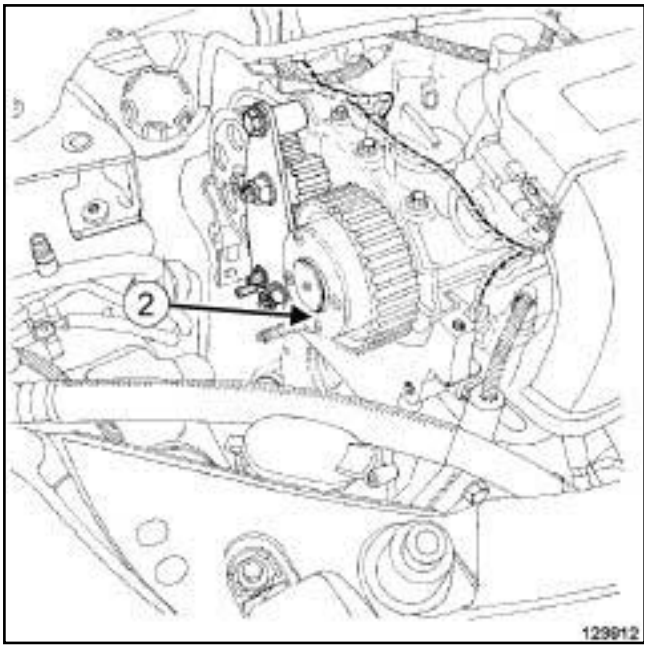
❏ Remove:

- the engine undertray bolts,
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the right-hand protector bolts,
- the right-hand protector,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

123913

❏ Position the **(Mot. 1801)** (**1**)

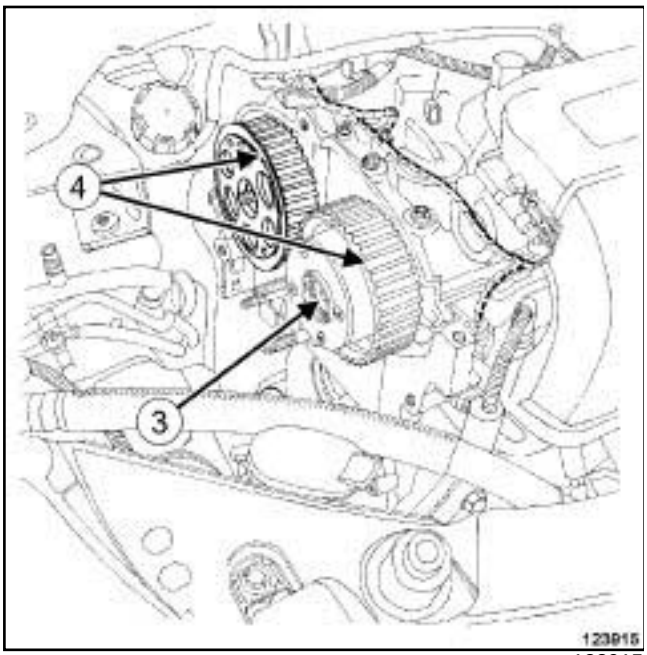
equipped with the tool **(Mot. 1509-01)**.



❏ Tighten the bolt and the collar nut.

❏ Torque tighten the **toothed sprocket nuts (80 Nm)**.

❏ Remove:

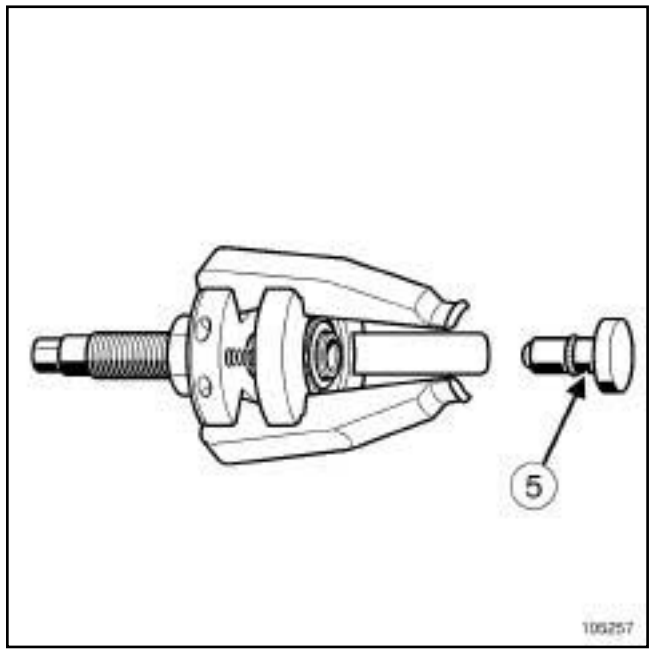


- the camshaft pulley nuts,
- the **(Mot. 1801)** fitted with the **(Mot. 1509-01)**,
- the camshaft pulleys.

F4R

123912

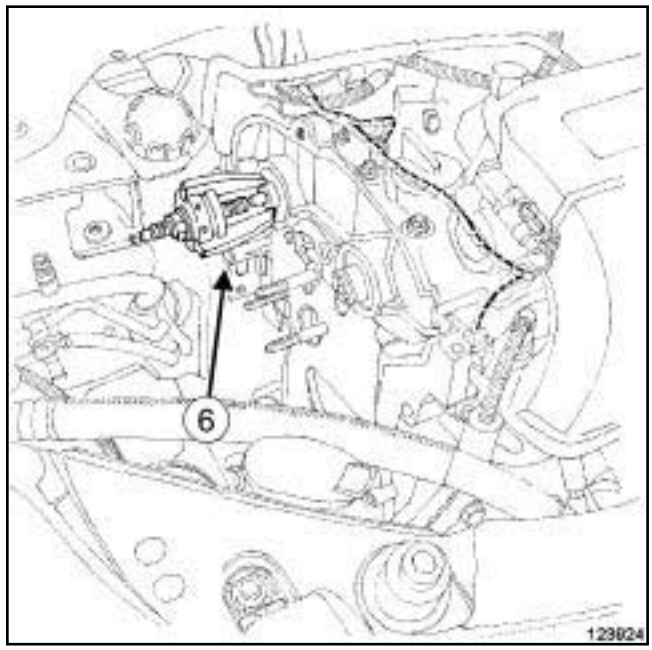
❏ Remove the intake camshaft dephaser blanking cover (**2**) .



123915

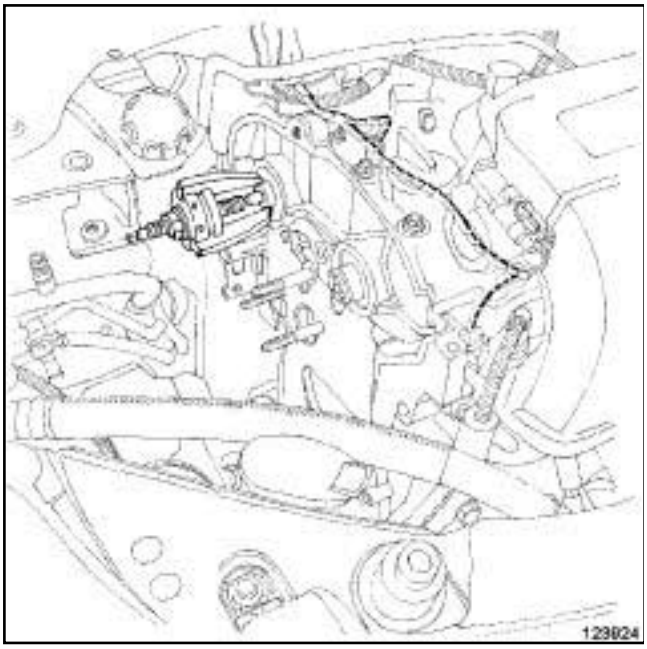
❏ Remove:

- the camshaft pulley nuts (**3**) ,
- the **(Mot. 1801)** fitted with the **(Mot. 1509-01)**,
- the camshaft pulleys (**4**) .



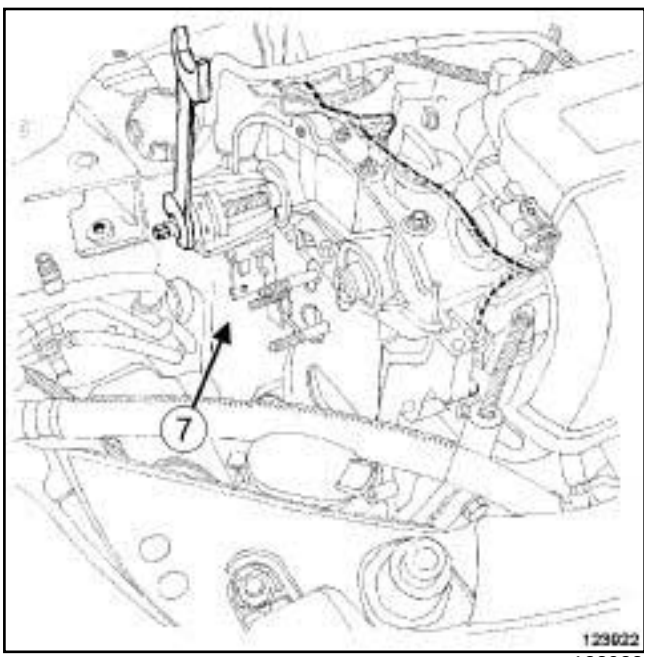
II - OPERATION FOR REMOVAL OF PART CONCERNED

105257



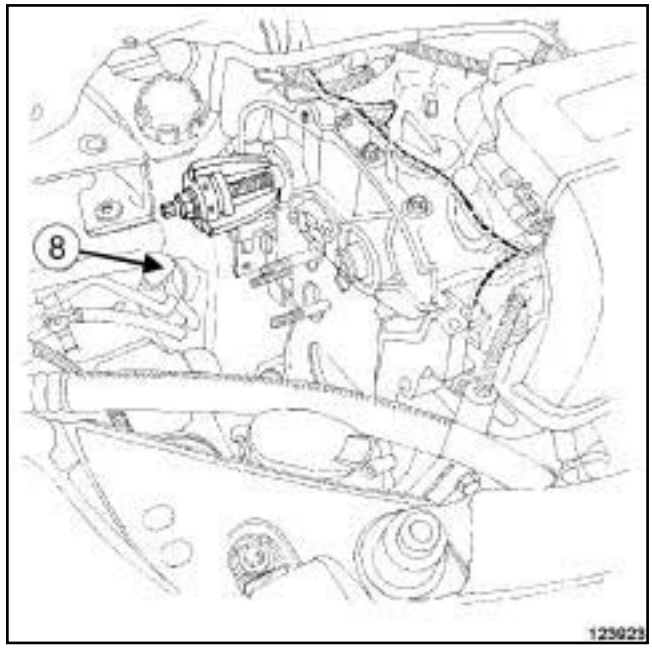
❏ Remove the end piece (**5**) from the **(Mot. 1577)**.

❏ Position the **(Mot. 1577)**.



123924

❏ Position the claws (**6**) of the tool **(Mot. 1577)** on the camshaft.

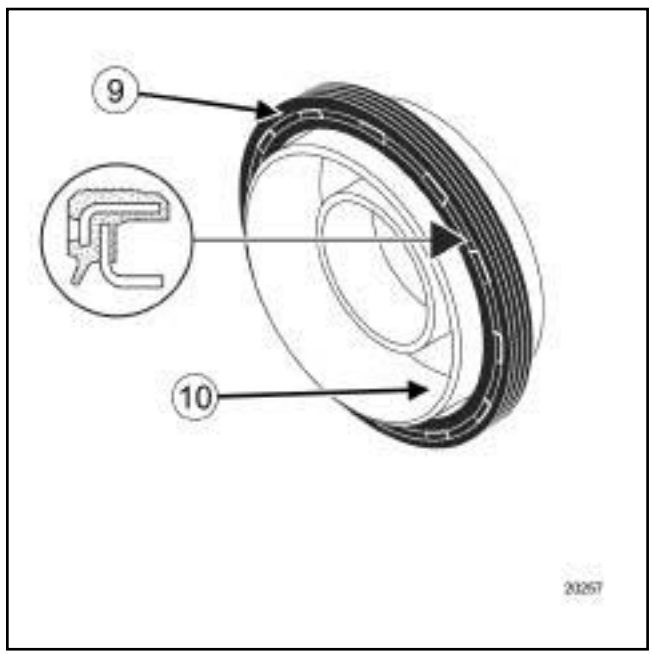


123924

❑ Push the tool **(Mot. 1577)** until contact is made between the ends of the claws and the camshaft seal.

123922

❑ Separate the claws by screwing the bolt using an open-jawed spanner (**7**) .

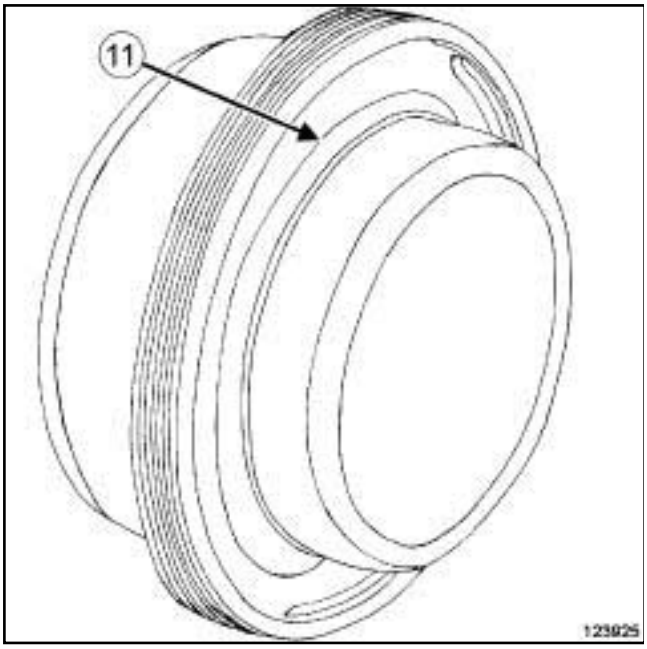


123923

❑ Remove the camshaft seal by screwing the bolt (**8**) .

❑ Repeat the previous operations in order to remove the other camshaft seal.

REFITTING

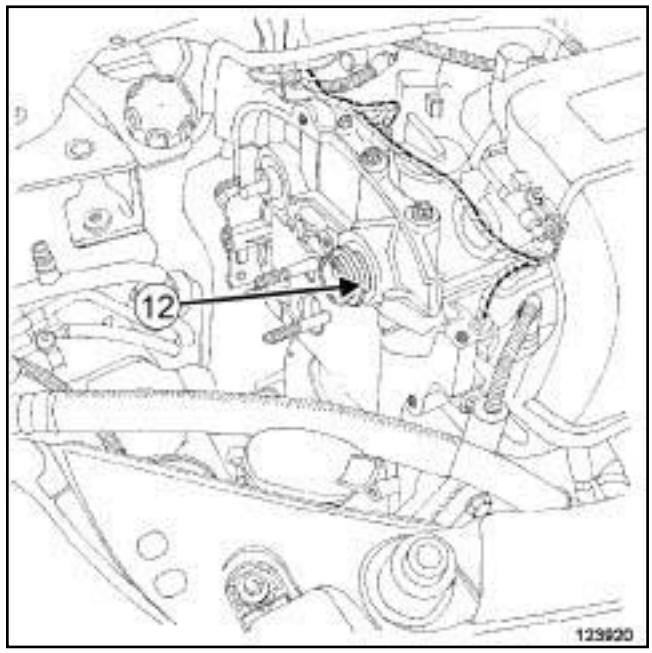


I - REFITTING PREPARATION OPERATION

20257

❑ The seals on these engines come fitted with an elastomer flat lip seal (**9**) and a protector (**10**) (also used to fit the seal on the engine).

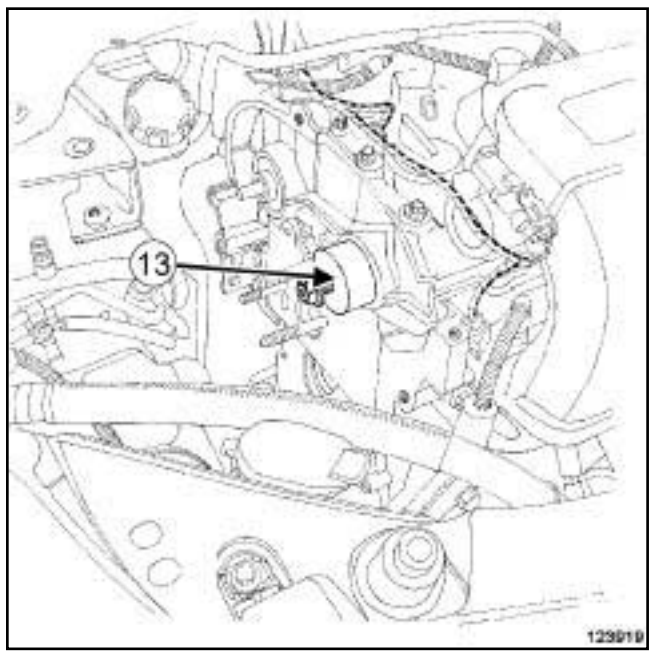
F4R



123925

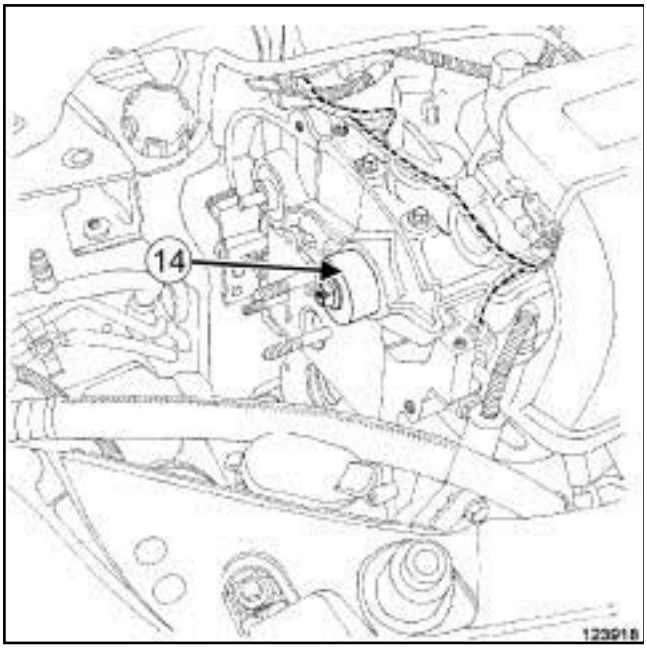
❑

Note:



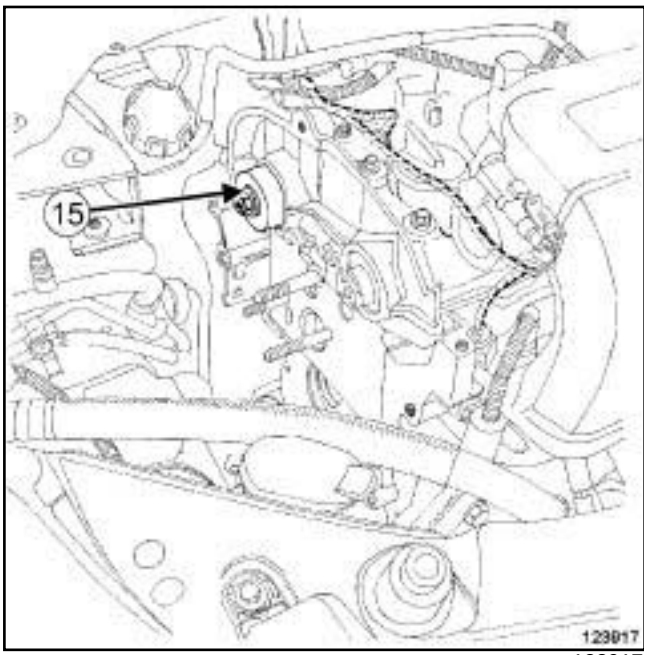
This type of seal is very delicate. When handling, it is essential to grip the seal using its protector. It is strictly forbidden to touch seal; (**11**) this is to prevent any oil leaks once the oil seal is fitted to the engine.

II - REFITTING OPERATION FOR PART CONCERNED



123920

❑ Fit the seal (**12**) and protector on the camshaft, being careful not to touch the seal.



123919

❑ Position the **(Mot. 1814)** (**13**) .

123918

❏ Tighten the nut (**14**) until the tool comes in contact against the cylinder head.

123917

❏ Repeat the previous operations for refitting the exhaust camshaft seal with the tool **(Mot. 1512)**.

❏ Remove:

- the **(Mot. 1814)**,
- the tool **(Mot. 1512)**.,

III - FINAL OPERATION.

❏ Refit:

- the camshaft pulleys,
- the **(Mot. 1801)** fitted with the **(Mot. 1509-01)**,
- the camshaft pulley nuts.

❏ Tighten to torque:

- the **exhaust camshaft pulley nut (30 Nm)**,
- the **intake camshaft pulley nut (30 Nm)**.

❏ Refit the inlet camshaft dephaser blanking cover.

❏ Torque tighten the **inlet camshaft dephaser blanking cover (25 Nm)**.

❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the rear suspended engine mounting (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand protector,
- the right-hand protector bolts,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 392, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 393, 35A, Wheels and tyres),
- the engine undertray,
- the engine undertray bolts.

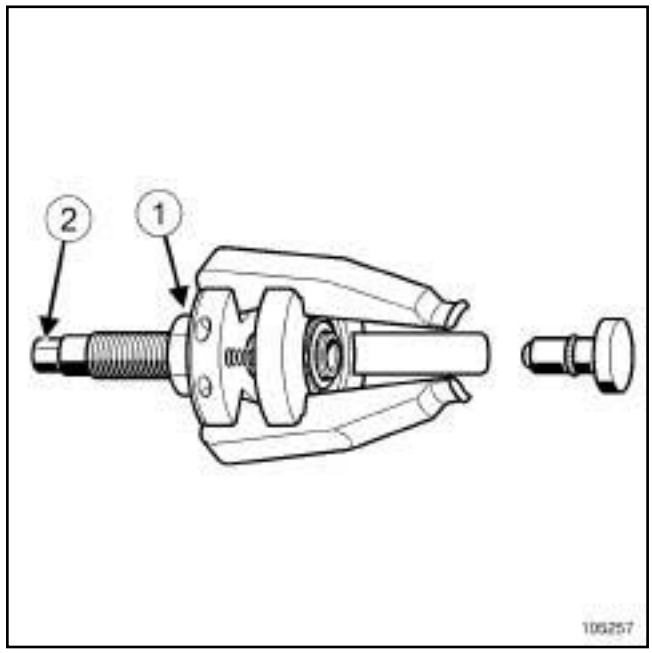
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M

Special tooling required	
Mot. 1577	Lip seal extractor (shaft diameter 28 mm to 42 mm).
Mot. 1632	Tool for fitting camshaft PTFE seal

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

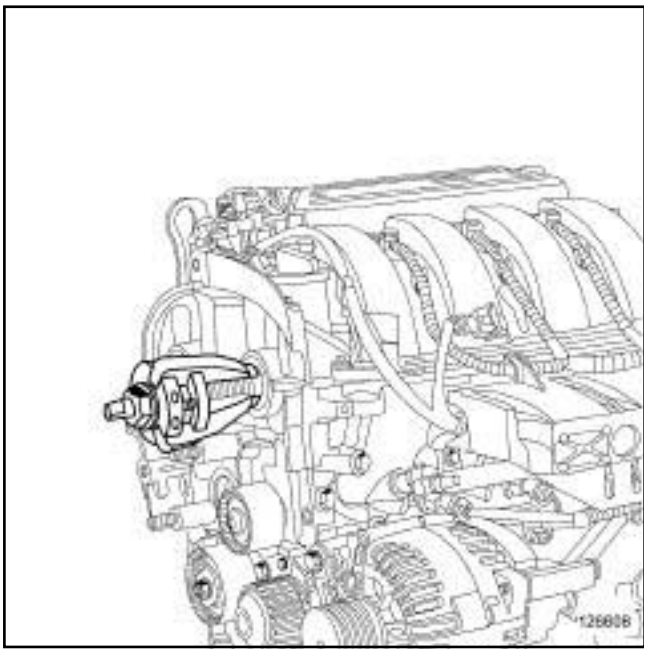
❑ Remove:

- the engine undertray bolts,
- the engine undertray,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

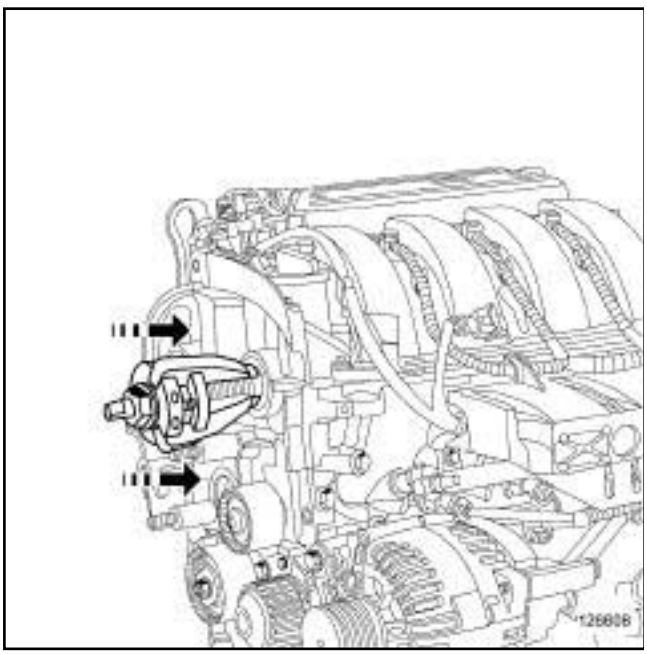
105257

❑



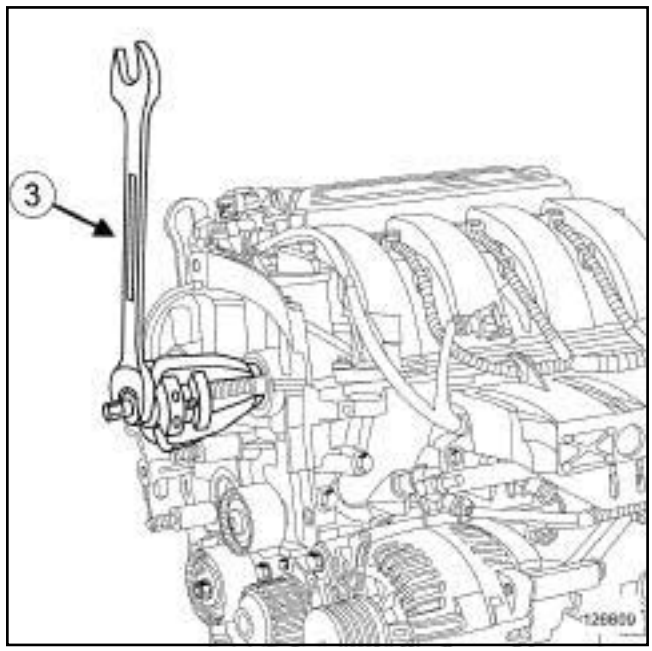
Note:

The camshaft seal is removed from the timing end using the **(Mot. 1577)**.



❑ Completely unscrew the nut (**1**) and the bolt **(Mot. 1577)** of the (**2**) .

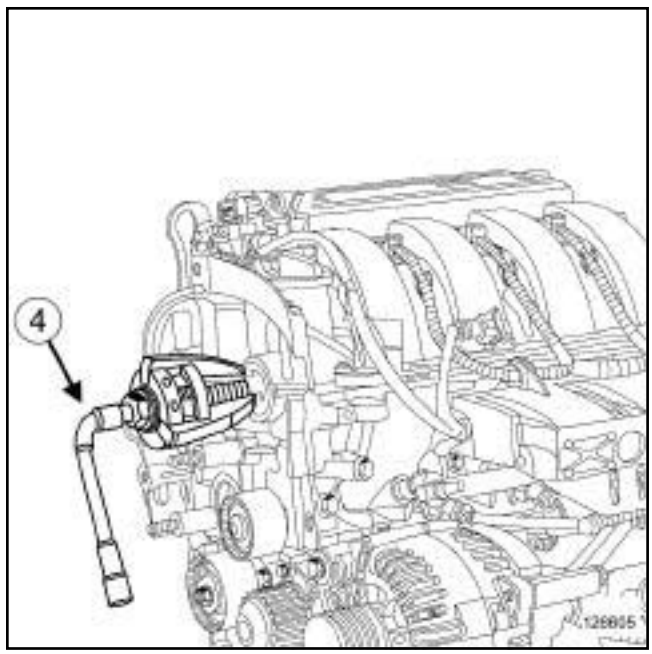
K4M



Removing the seal on the exhaust side and inlet side

126608

❑ Position the claws of the **(Mot. 1577)** on the camshaft.



126608

❑ Push the tool **(Mot. 1577)** until contact is made between the ends of the claws and the camshaft seal.

126609

❑ Separate the claws by turning the nut (**3**) clockwise using an open-jawed spanner.

126605

❑ Remove the camshaft seal by turning the bolt clockwise using a spanner (**4**) .

REFITTING

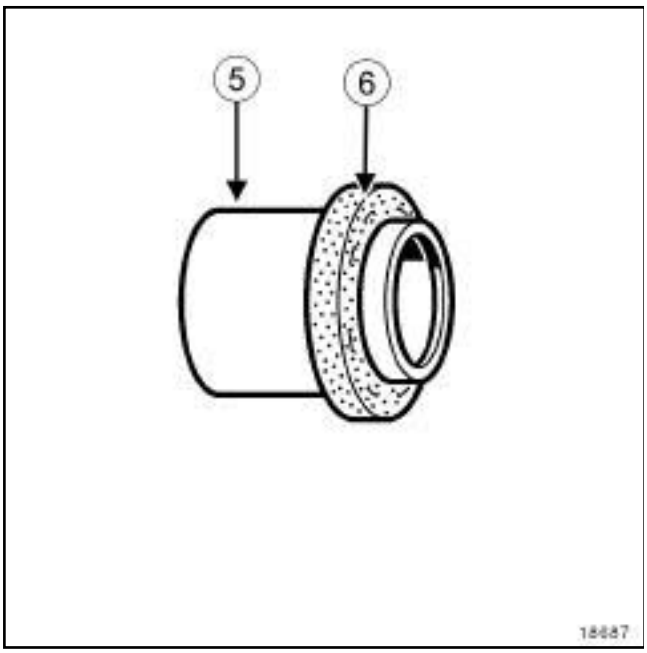
I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Camshaft seal on timing end (10,02,02,02)**.

K4M

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the seal mating face of each camshaft,
- the camshaft seal housings.



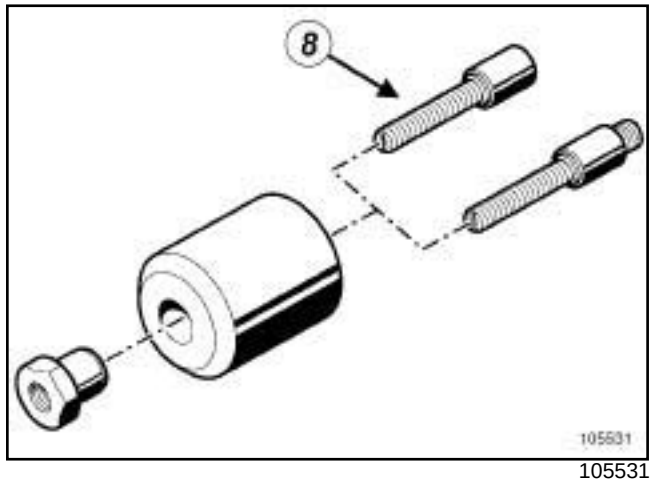
WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING

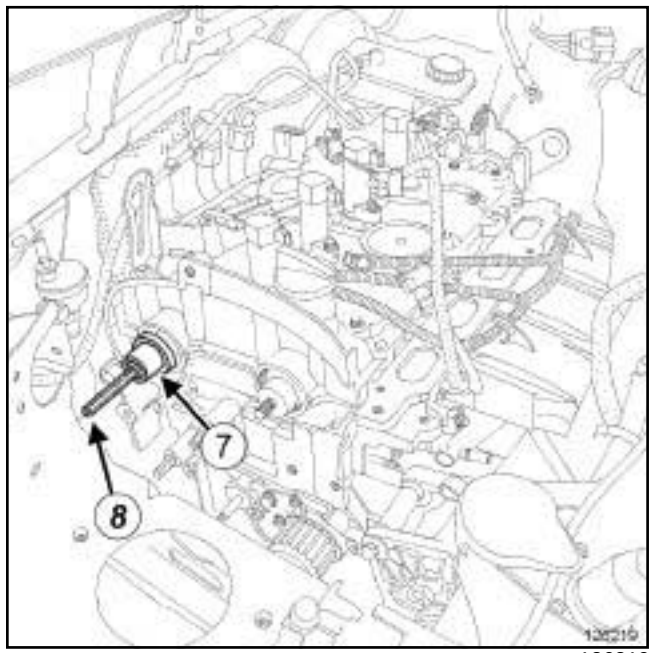
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

II - REFITTING OPERATION FOR PART CONCERNED



18687

❑

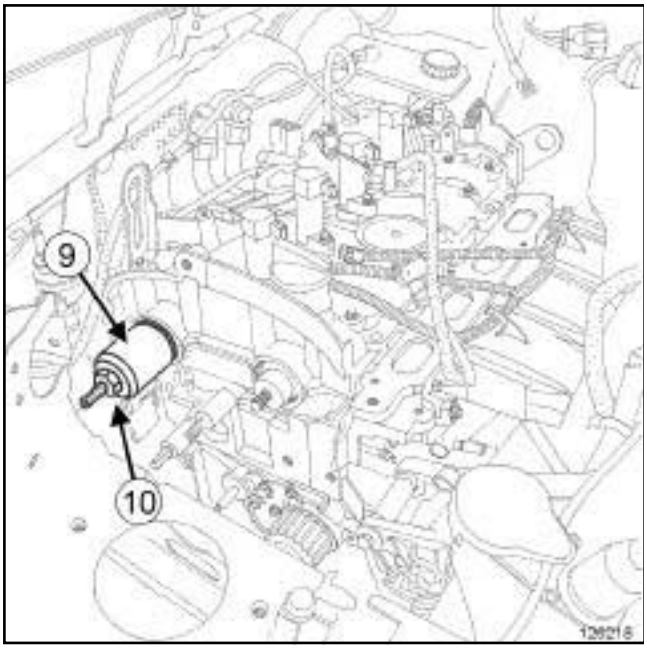


Note:

Always hold the camshaft seal with the protector (**5**) when handling, as this type of camshaft seal is very FRAGILE. Touching the camshaft seal (**6**) is strictly forbidden in order to avoid any oil leaks once the camshaft seal is fitted on the engine.

1 - Refitting the exhaust side seal

105531



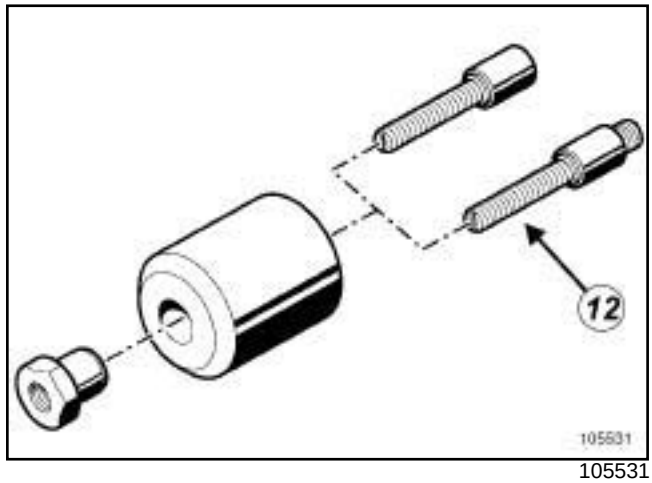
126219

❑ Position the protector fitted with a new seal (**7**) on the camshaft (taking care not to touch the seal).

❑ Screw the stud (**8**) of the **(Mot. 1632)** onto the camshaft.

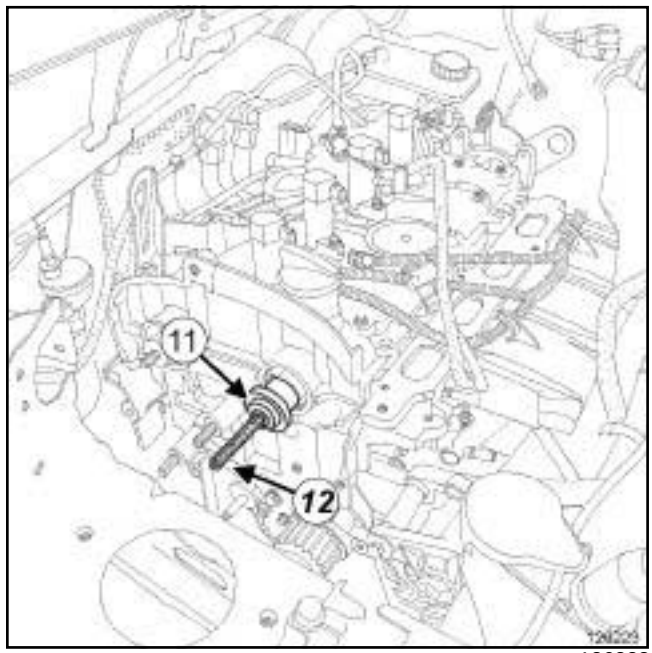
K4M

126218



❏ Fit the cover (**9**) and the collar nut (**10**) of the **(Mot. 1632)**.

❏ Screw on the collar nut until the cover touches the cylinder head.

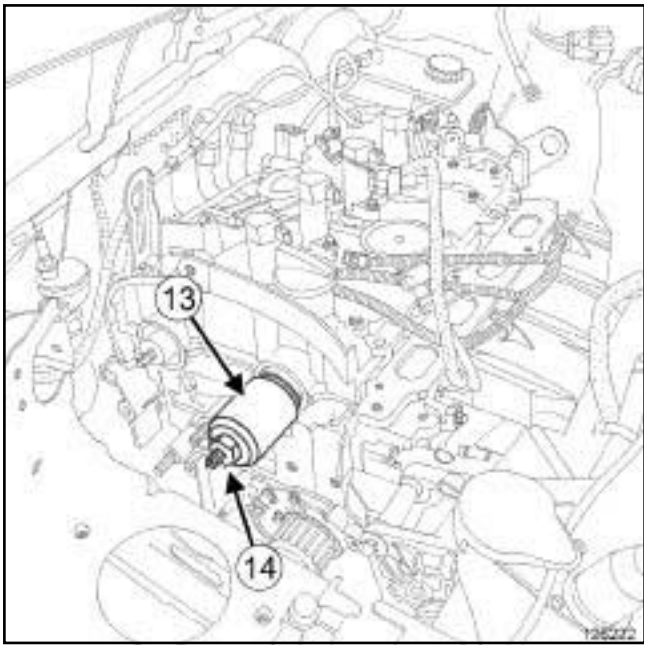


❏ Remove:

- the collar nut from the **(Mot. 1632)**,
- the cover from the **(Mot. 1632)**,
- the stud of the **(Mot. 1632)**,
- the camshaft seal protector.

2 - Refitting the inlet side seal

105531



126223

❏ Position the protector fitted with a new seal (**11**) on the camshaft (taking care not to touch the seal).

❏ Remove the camshaft seal protector.

❏ Screw the stud (**12**) of the **(Mot. 1632)** onto the camshaft.

K4M

126222

❏ Fit the cover (**13**) and the collar nut (**14**) of the **(Mot. 1632)**.

❏ Screw on the collar nut until the cover touches the cylinder head.

❏ Remove:

- the collar nut from the **(Mot. 1632)**,
- the cover from the **(Mot. 1632)**,
- the stud from the **(Mot. 1632)**.

III - FINAL OPERATION

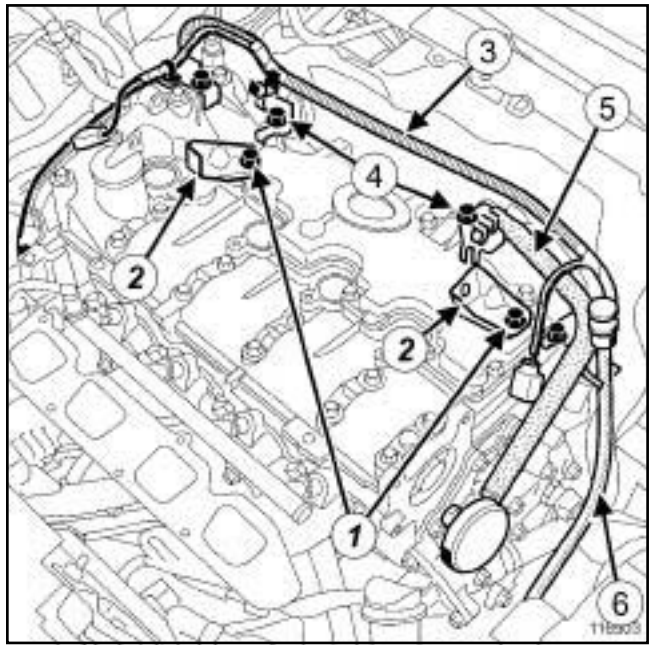
❏ Refit:

- the camshaft dephaser (see **11A**, **Top and front of engine**, **Camshaft dephaser: Removal - Refitting**, page **11A-234**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

F4R

Tightening torques ▽	
oil decanter mounting bolts	13 Nm



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils from cylinders 2, 3 and 4 (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

116503

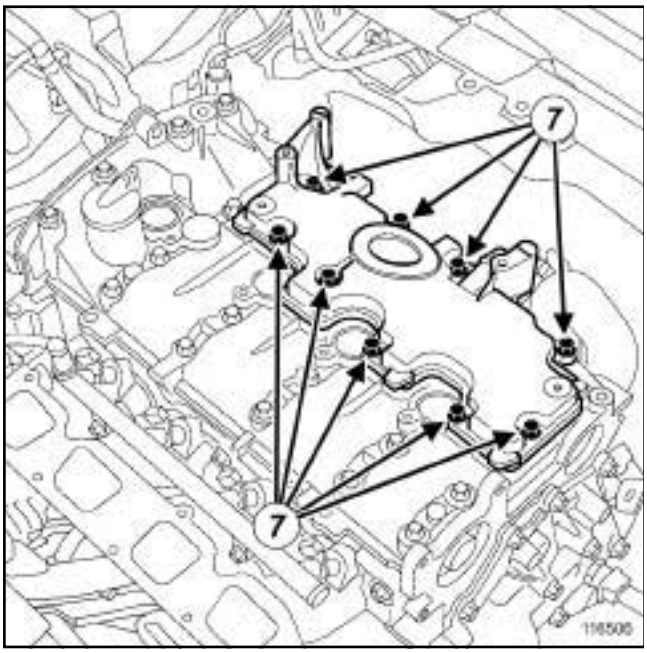
❏ Remove:

- the inlet manifold retaining bracket mounting bolts (**1**) ,
- the inlet manifold retaining brackets (**2**) .

❏ Unclip the petrol vapour rebreathing solenoid valve wiring harness (**3**) .

❏ Remove:

- the retaining bracket mounting bolts (**4**) ,
- the retaining brackets.



❏ Disconnect the oil vapour rebreathing pipe (**5**) from the oil decanter.

❏ Remove the oil vapour rebreathing pipe.

❏ Unclip the breather hose (**6**) from the gearbox.

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

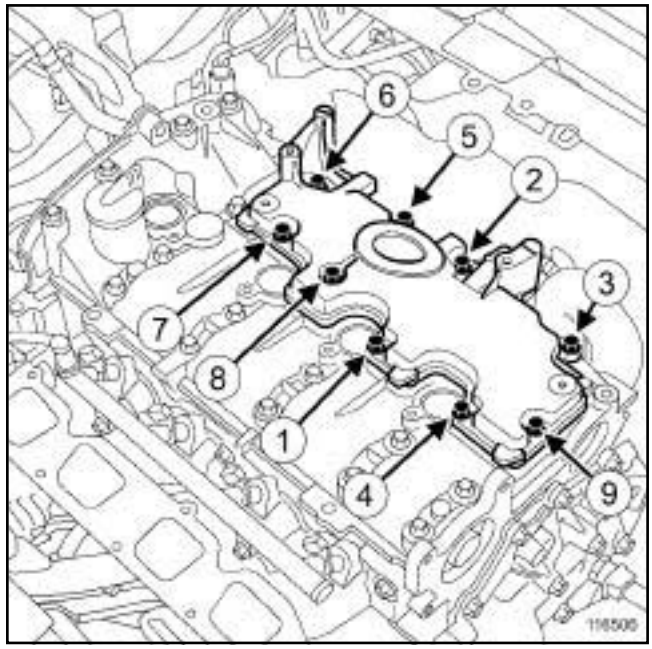
116506

❑ Remove:

- the mounting bolts (**7**) from the oil separator,
- the oil decanter.

REFITTING

I - REFITTING PREPARATIONS OPERATION



❑ Clean the joint faces.

> **WARNING**
> The joint faces must be clean, dry and free from grease (avoid finger marks).

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the oil decanter fitted with a new seal,
- the oil decanter mounting bolts.

116506

❑ Tighten to torque and in order the **oil decanter mounting bolts (13 Nm)**.

III - FINAL OPERATION.

❑ Refit the oil vapour rebreathing pipe.

❑ Connect the oil decanter oil vapour rebreathing hose.

❑ Refit:

- the retaining brackets,
- the retaining bracket mounting bolts.

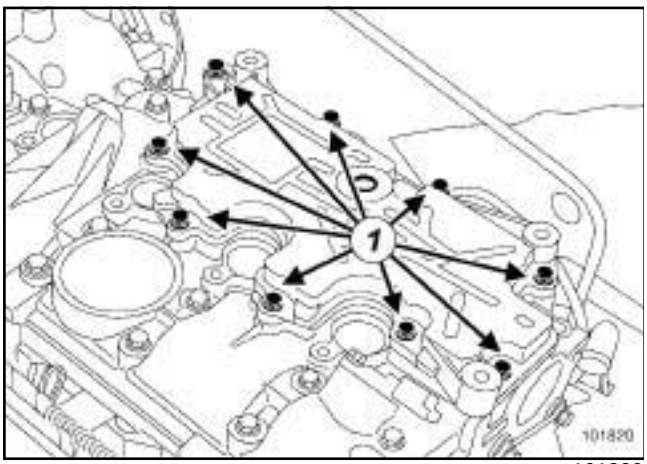
❑ Connect the petrol vapour rebreathing solenoid valve wiring harness.

❑ Refit:

- the inlet manifold retaining brackets,
- the inlet manifold retaining bracket mounting bolts,
- the ignition coils for cylinders 2, 3 and 4 (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K4M



Tightening torques ▽	
oil separator bolts	**15 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the intake distributor (see **Front inlet distributor: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

101820

❏ Remove:

- the bolts (**1**) from the oil separator,
- the oil separator,
- the oil separator seal.

REFITTING

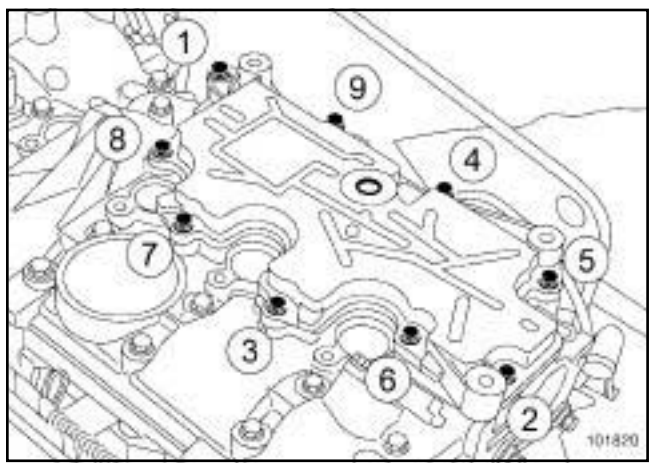
I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: oil decanter bolt (11,04,06,23)**.

parts always to be replaced: Oil decanter seal (11,04,06,24).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❏ Use **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:



- the oil separator joint face if it is to be re-used,
- the rocker cover joint face.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease:

- the oil separator joint face if it is to be re-used,
- the rocker cover joint face.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

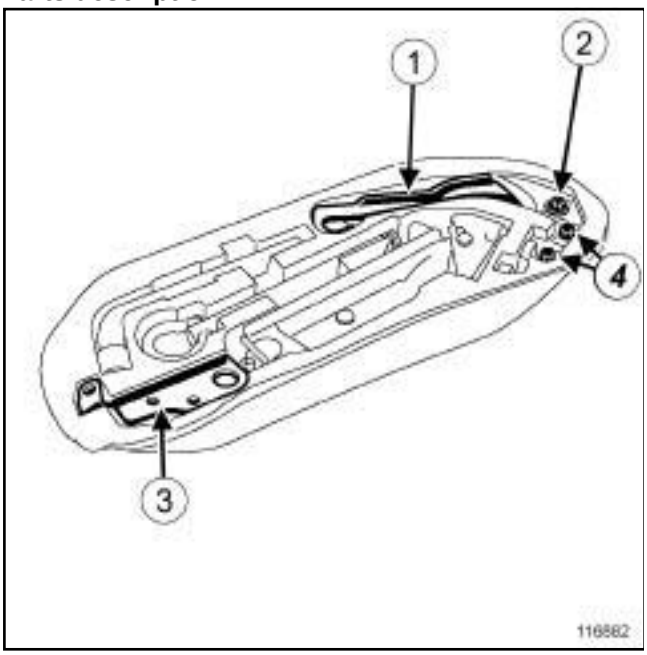
II - REFITTING OPERATION FOR PART CONCERNED

101820

❏ Refit:

- a new seal on the oil separator,
- the oil separator,
- new oil separator bolts.

❏ Torque tighten in order the **oil separator bolts (15 N.m)**.



III - FINAL OPERATION

❏ Refit the intake distributor (see **Front inlet distributor: Removal - Refitting**) .

F4R

IDENTIFICATION

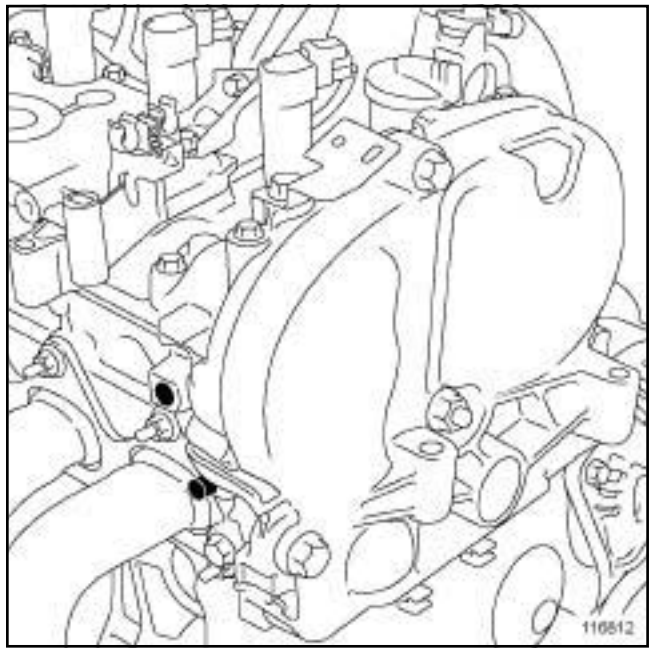
Parts description

116882

(**1**) timing end lifting eye

(**2**) timing end lifting eye mounting bolt

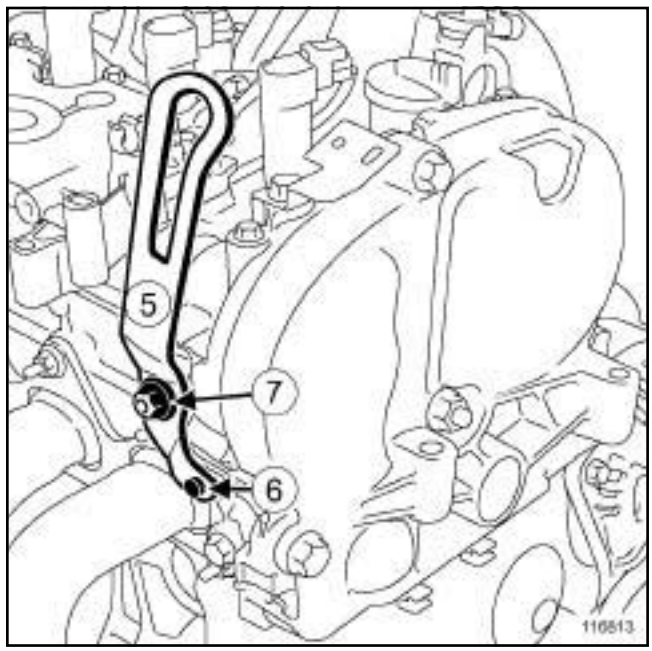
(**3**) gearbox side lifting eye



(**4**) gearbox side lifting eye mounting bolt

❑ The lifting eyes and their mounting bolts are in the tool tray under the carpet in the bottom of the luggage compartment.

> Note:
>
> The lifting eyes fitted must be removed and put back in the vehicle once the operation is completed.



REMOVAL - REFITTING

I - FITTING THE TIMING END LIFTING EYE

116812

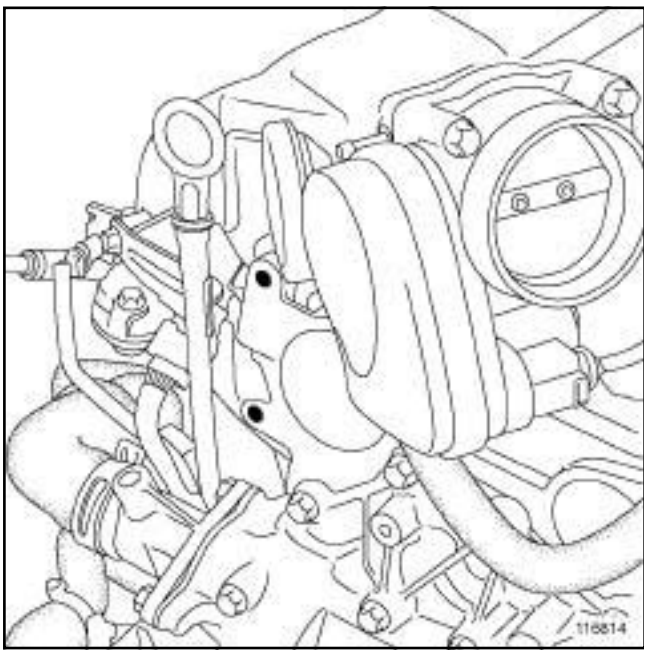
❑ Obtain the timing end lifting eye and its mounting bolt.

116813

❑ Position the lifting eye (**5**) in the cylinder head centring device (**6**) .

❑ Tighten the lifting eye mounting bolt (**7**) .

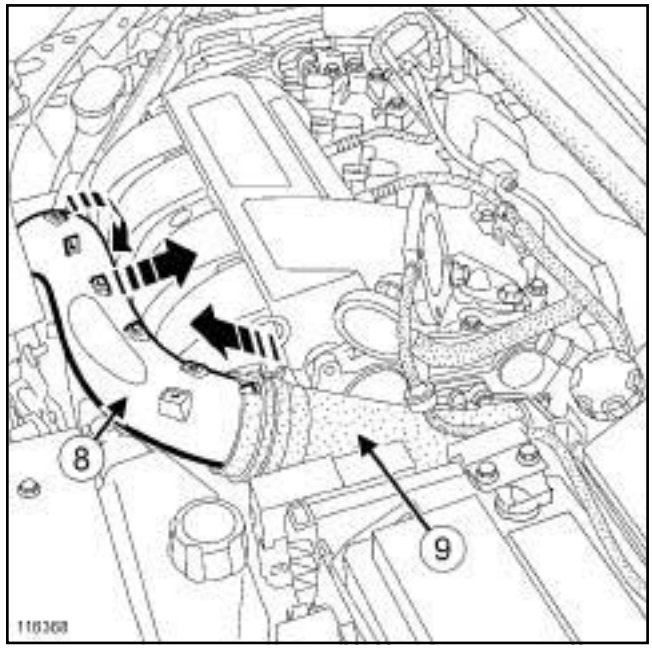
F4R



II - REMOVING THE TIMING END LIFTING EYE

❑ Remove:

- the timing end lifting eye mounting bolt,
- the lifting eye on the timing end.

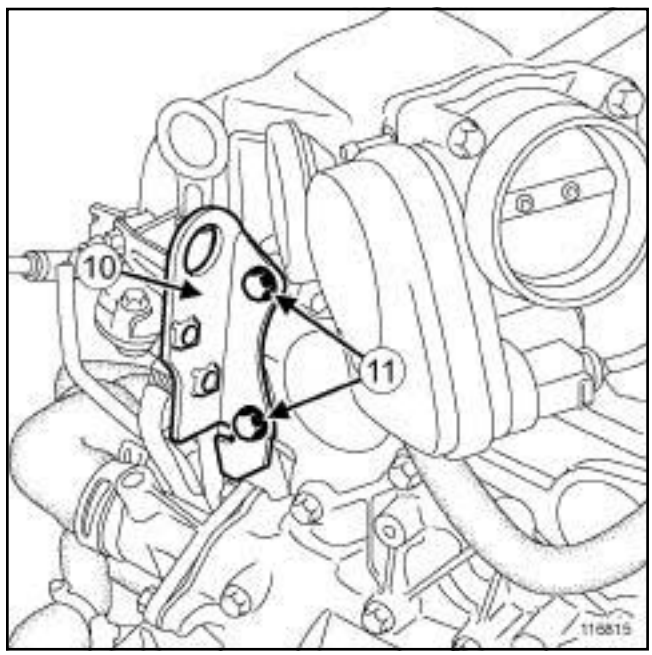


❑ Put the lifting eye and mounting bolt back in the tool tray.

III - FITTING THE GEARBOX SIDE LIFTING EYE.

116814

❑ Obtain the lifting eye and its mounting bolt.



116368

❑ Remove the air inlet duct (**8**) :

- by unclipping it from the front end panel,
- by rotating it and disconnecting it.

❑ Disconnect the duct (**9**) :

- air resonator side,
- air filter unit side.

116815

❑ Fit the timing end lifting eye (**10**) .

❑ Tighten the timing end lifting eye mounting bolts (**11**) .

F4R

IV - REMOVING THE GEARBOX SIDE LIFTING EYE

❏ Remove:

- the gearbox side lifting eye mounting bolts,
- the gearbox side lifting eye.

❏ Put the lifting eye and mounting bolts back in the tool tray.

D4F, and 740 or 742 or 764

Equipment required
cylinder head testing tools

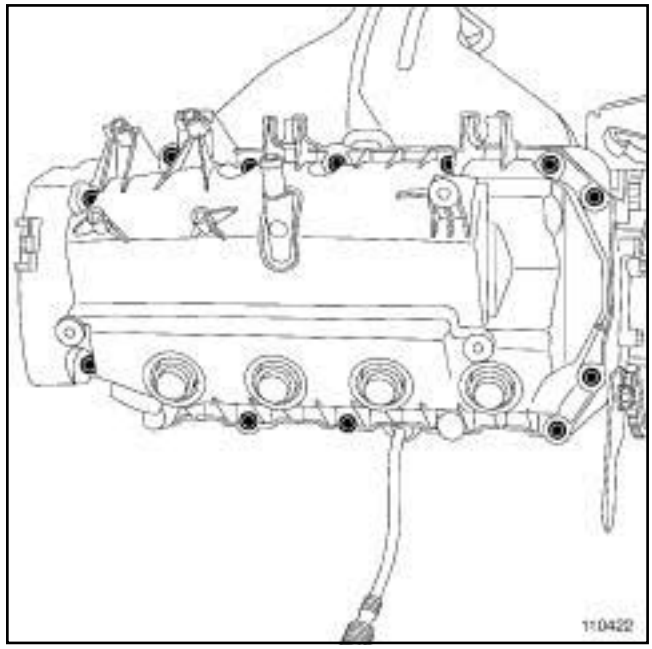
Tightening torques ▽	
cylinder head bolts (initial torque)	**20 N.m**
cylinder head bolts	**230° ± 6°**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

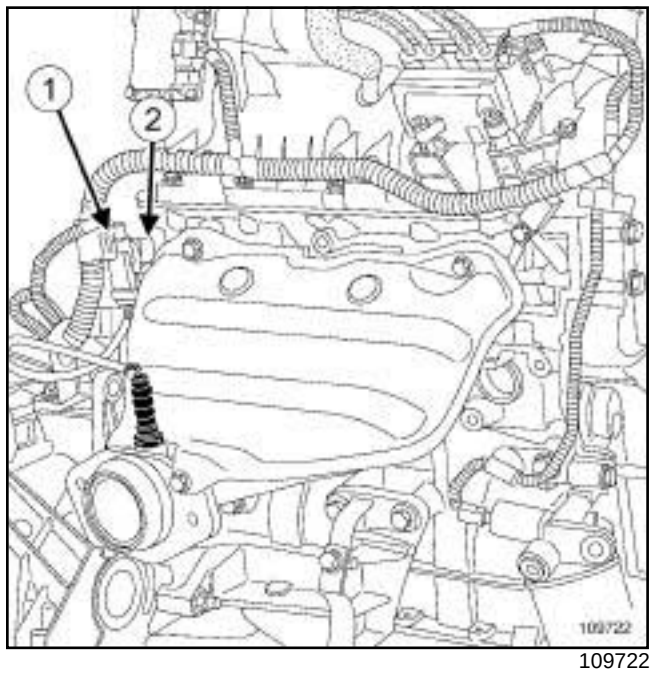
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



❏ Remove the engine undertray.

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

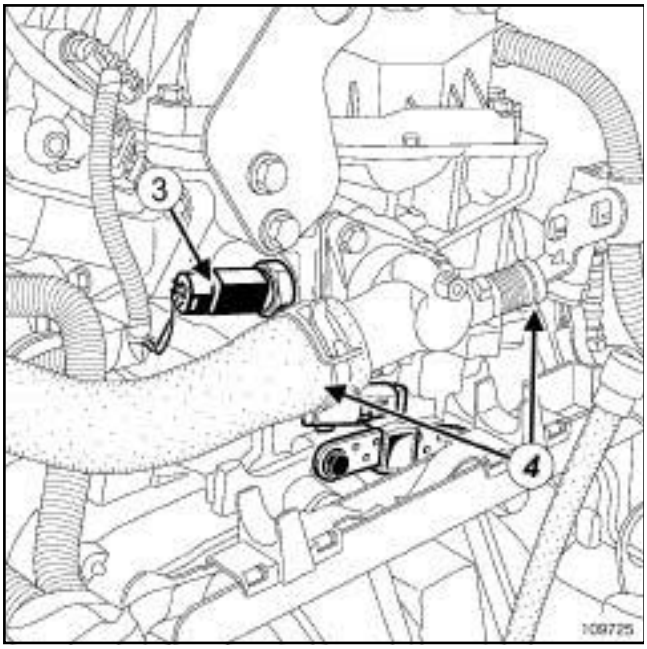


- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

❏ Unclip the electrical wiring from the rocker cover.

110422

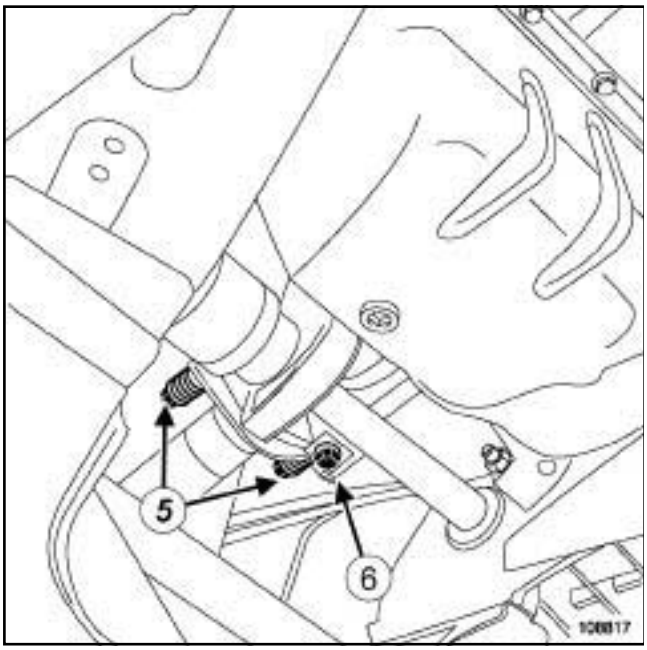
❏ Remove the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .



109722

❏ Disconnect the upstream oxygen sensor connector (**1**) .

❏ Remove the mounting (**2**) from the upstream oxygen sensor connector.

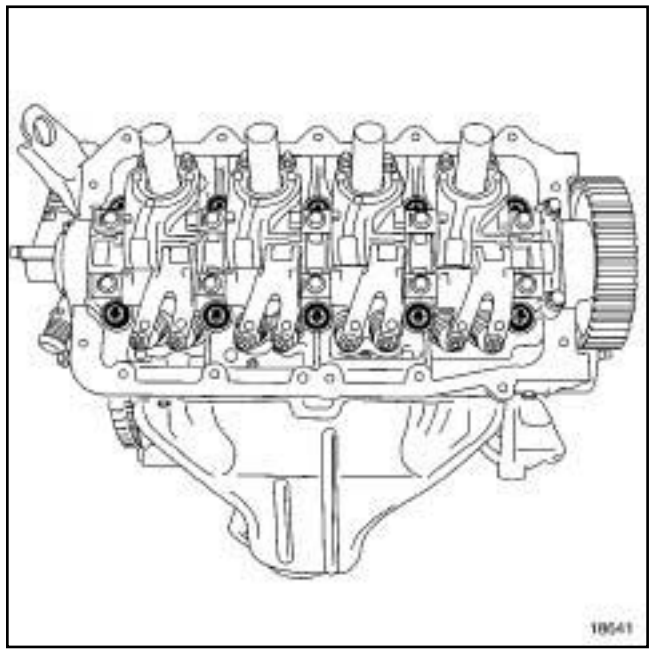


D4F, and 740 or 742 or 764

109725

❏ Disconnect the coolant temperature sensor connector (**3**) .

❏ Remove the cooling hoses (**4**) on the water chamber.



108817

❏ Remove:

- the bolts (**5**) from the exhaust flange,
- the strut bolt (**6**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

18641

❏ Remove:

- the cylinder head bolts,
- the cylinder head,
- the cylinder head gasket.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Cylinder head gasket (10,02,01,04)**.

❏ **parts always to be replaced: cylinder head bolts (10,02,01,14)**.

D4F, and 740 or 742 or 764

1 - Cleaning the cylinder head

❏ Clean the cylinder head.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

❏ Clean the joint faces with **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve any part of the seal still adhering.

❏ Apply the product to the part to be cleaned. Wait approximately ten minutes, then remove the residue using a wooden spatula.

WARNING
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

2 - Checking the gasket face

❏ With a ruler and shim set, check for cylinder head gasket face bow.

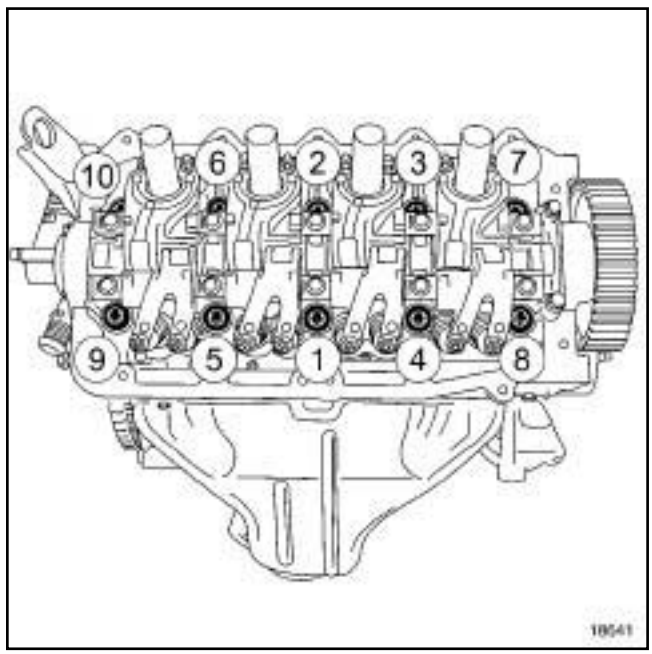
The maximum deformation is **0.05 mm**.

WARNING
No regrinding of the cylinder head is permitted.

❏ Test the cylinder head for any cracks using the **cylinder head testing tools** (see **garage equipment catalogue**).

❏ Strip the cylinder head (see **Cylinder head: Stripping**) (Technical Note 6004A, 10A, Engine and peripherals).

❏ Adjust the valve clearances (see **10A**, **Engine and cylinder block assembly**, **Valves: Adjustment**, page **10A-232**) .



WARNING
In order to ensure that the bolts are correctly tightened, use a syringe to remove any oil which may be in the cylinder head mounting holes.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Bring the pistons to mid-stroke position to prevent them from coming into contact with the valves during the tightening of the cylinder head.

❏ Fit the cylinder head with a new gasket.

❏ Refit new cylinder head bolts.

18641

❏ Tightening the cylinder head:

- pretighten to torque and in order the **cylinder head bolts (initial torque) (20 N.m)**,
- check that all of the cylinder head bolts are tightened to the correct torque,
- angle tighten in order the **cylinder head bolts (230° ± 6°)**.

III - FINAL OPERATION

❏ Refit the upstream oxygen sensor connector attachment.

❏ Connect:

- the upstream oxygen sensor connector,

D4F, and 740 or 742 or 764

- the coolant temperature sensor connector.

❑ Refit:

- the water chamber cooling hoses,
- the exhaust clamp mounting bolts,
- the strut bolt.
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

❑ Clip the electrical wiring onto the rocker cover.

❑ Refit:

- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray,
- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K4J or K4M

Special tooling required	
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1672	Lower engine support.
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1573	Cylinder head support
Mot. 104	Cylinder head gasket centring pins

Equipment required
cylinder head test tank

Tightening torques ▽	
cylinder head bolts	**20 N.m**
cylinder head bolts	**240° ± 6°**
exhaust manifold studs	**8 N.m**
exhaust manifold nuts	**26 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

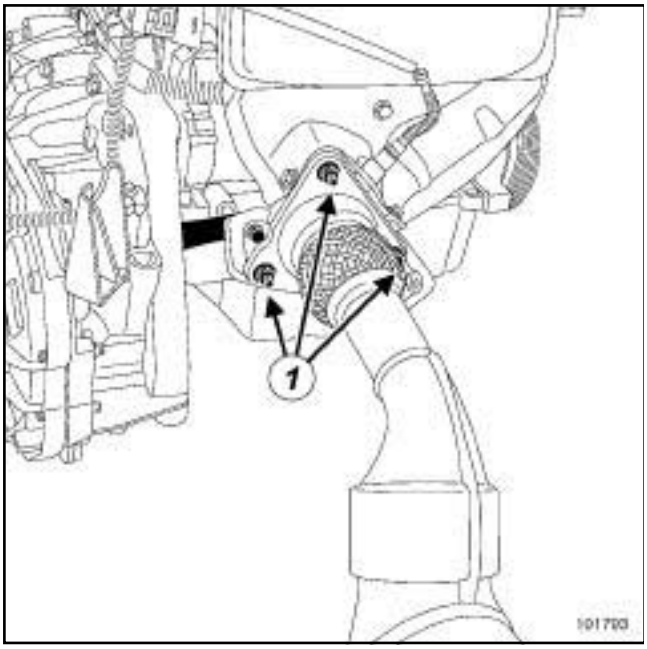
❏ Remove:

- the engine cover,
- the engine undertray bolts,
- the engine undertray,
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter: Removal - Refitting**, page **12A-15**) ,
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .



K4M, and 862

❏ Remove the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) .

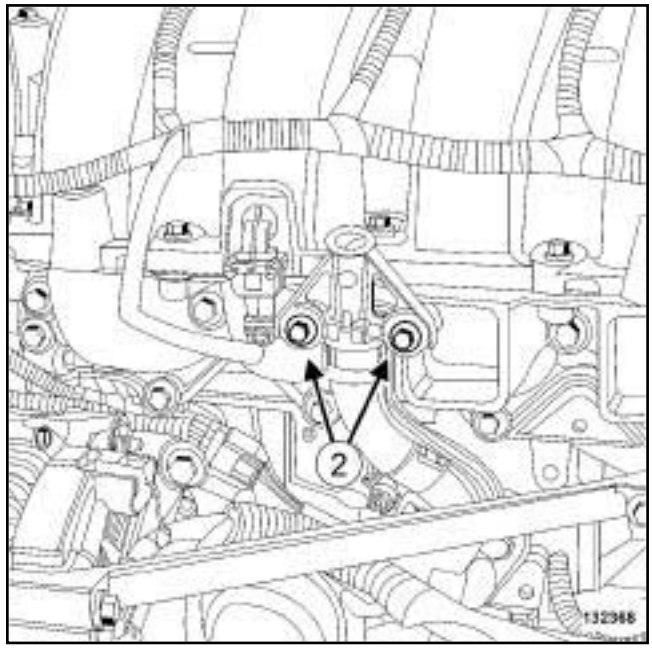
❏ Remove:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

K4J or K4M

101793

❏ Remove the nuts (**1**) from the exhaust flange.



❏ Disconnect the oxygen sensor connectors .

K4M, and 862

❏ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❏ Remove:

- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

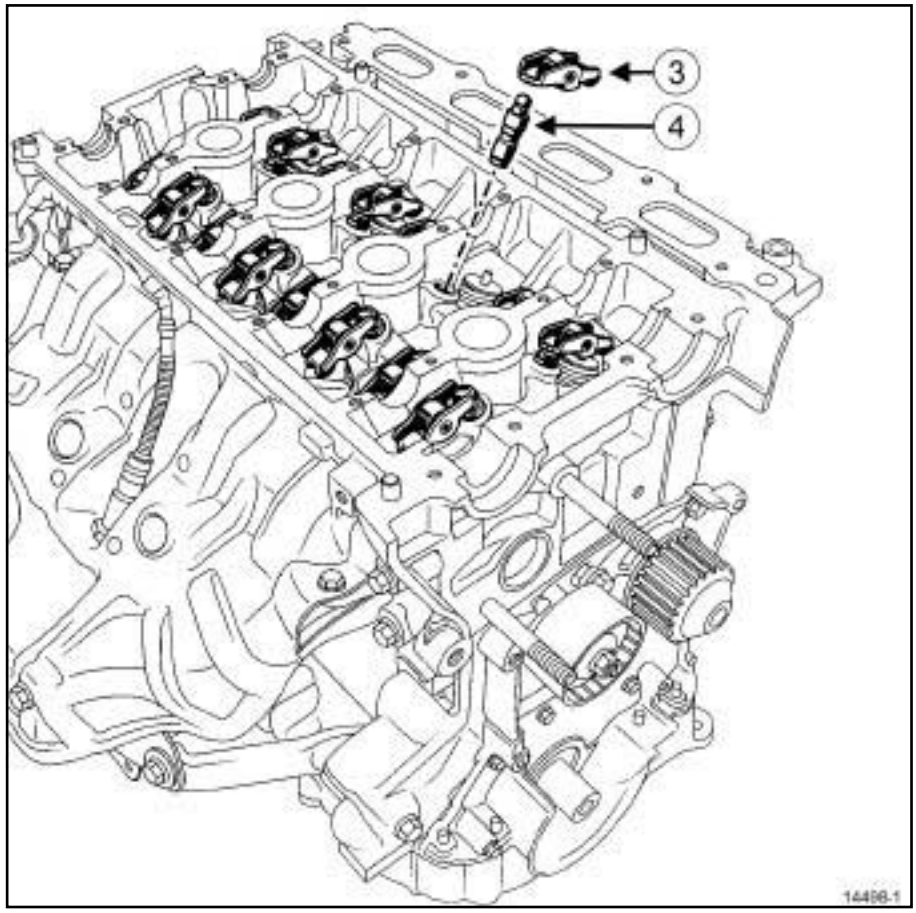
132368

❏ Remove:

- the dipstick,
- the dipstick guide bolts (**2**) .

❏ Move aside the dipstick guide.

❏ Disconnect:



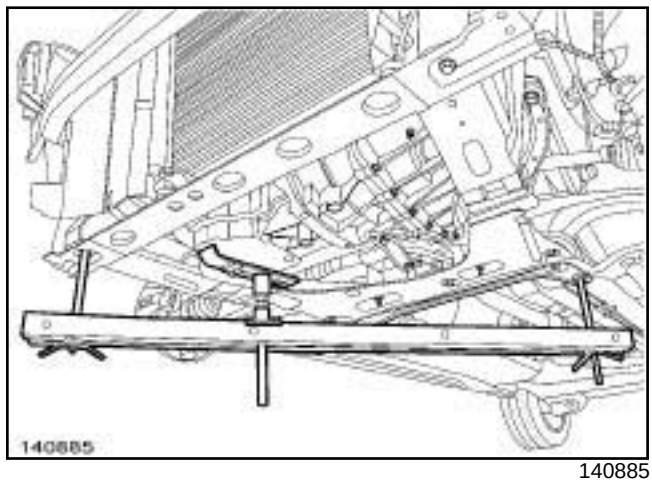
- the coolant temperature sensor connector,
- the coolant hoses using the tool **(Mot. 1202-01)** or the tool **(Mot. 1202-02)** or the tool **(Mot. 1448)** on the cylinder head coolant unit.

❏ Move the electrical wiringto one side.

❏ Remove:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the inlet camshaft,
- the exhaust camshaft.

K4J or K4M



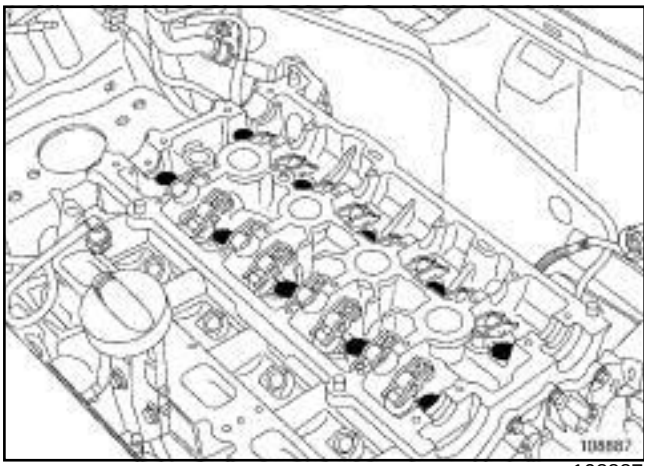
14498-1

❏ Remove:

- the valve rockers (**3**) ,
- the hydraulic tappets (**4**) .

Note:

To prevent any risk of unpriming the hydraulic tappets make sure that they are vertical.



140885

❏ Position the **(Mot. 1672)**.

❏ Remove the **(Mot. 1453)**.

K4J or K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED

108887

❑ Remove:

- the cylinder head bolts,
- the cylinder head.

❑ Mount the cylinder head on the cylinder head support **(Mot. 1573)**.

❑ Remove the cylinder head gasket from the cylinder block.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Cylinder head gasket (10,02,01,04)**.

❑ **parts always to be replaced: cylinder head bolts (10,02,01,14)**.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear protective gloves during the operation.

WARNING
Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

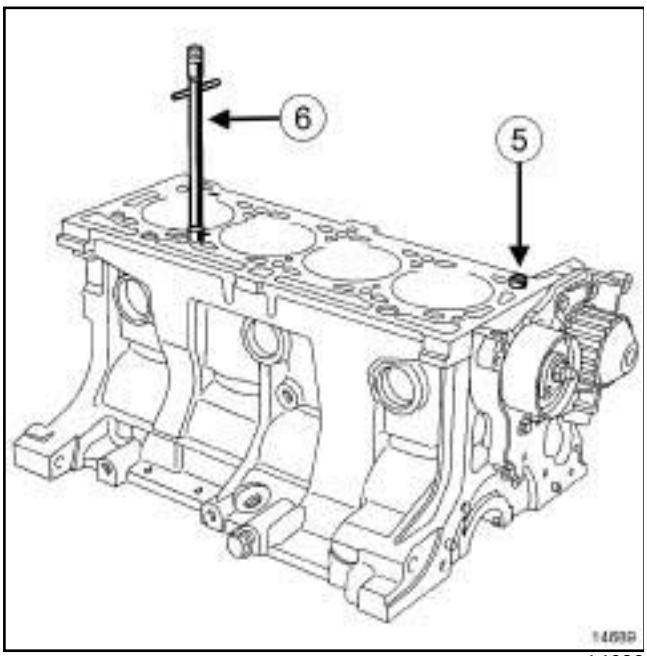
❑ Apply **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) on the parts to be cleaned (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

❑ Leave for approximately ten minutes.

❑ Remove residues with a wooden spatula.

❑ Finish cleaning the parts using a **GREY ABRASIVE PAD**.

❑ Use a ruler and set of feeler gauges to check that there is no gasket face bow.



Maximum distortion: **0.05 mm**

WARNING
No regrinding of the cylinder head is permitted.

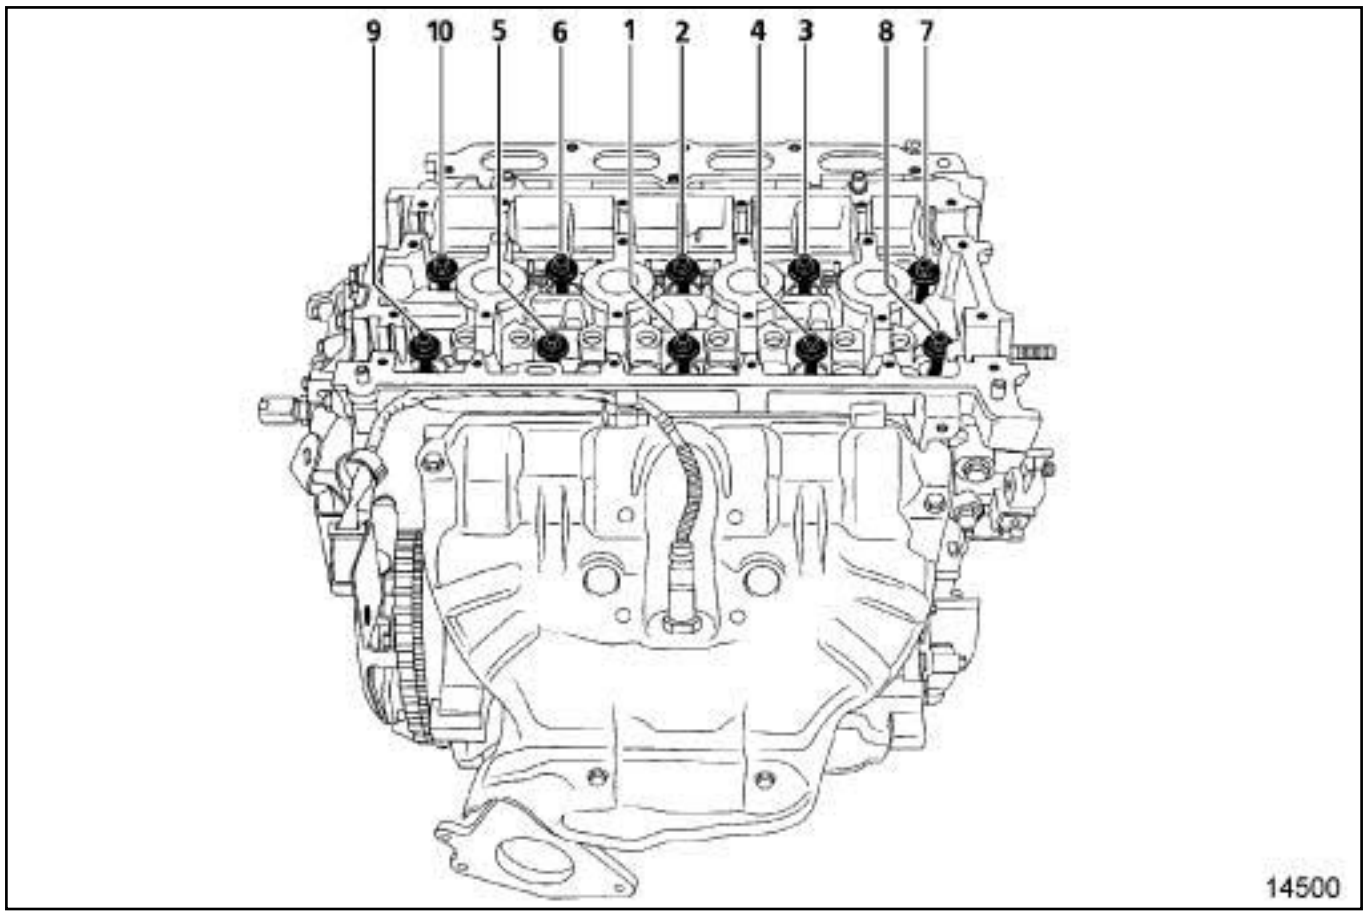
K4J or K4M

- ❑ Test the cylinder head to detect any possible cracks using a **cylinder head test tank**.
- ❑ For the procedure of stripping down the cylinder head (see **Cylinder head: Stripping**) (Technical Note 6006A, 10A, Engine and peripherals).
- ❑ Position the pistons at mid-stroke to prevent any contact with the valves when refitting the camshafts.
- ❑ Be sure to degrease:

  - the combustion side of the cylinder head,
  - the combustion side of the cylinder block.

14689

- ❑ Check that the centring dowel (**5**) is on the cylinder block.
- ❑ Set up tool **(Mot. 104)** (**6**) on the cylinder block.



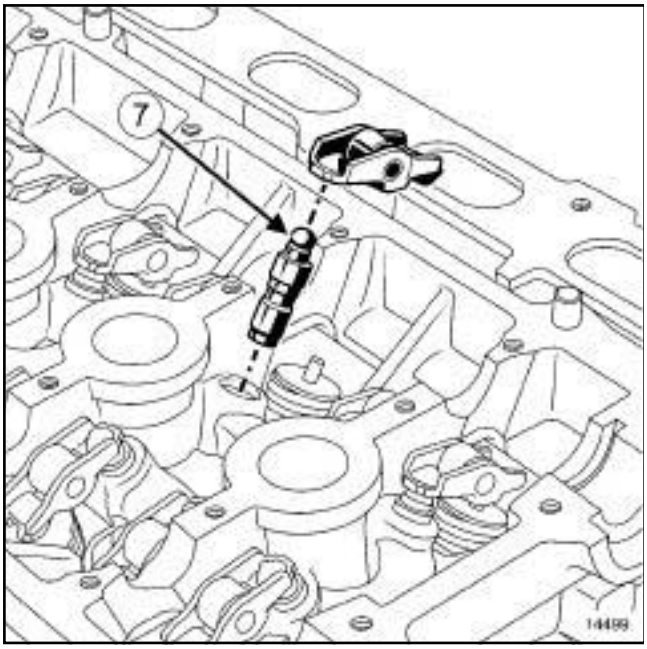
II - REFITTING OPERATION FOR PART CONCERNED

- ❑ Fit a new cylinder head gasket.
- ❑ Refit the cylinder head.

WARNING
In order to ensure that the bolts are correctly tightened, use a syringe to remove any oil which may be in the cylinder head mounting holes.

WARNING
Do not oil the new bolts. Be sure to oil bolts being reused.

K4J or K4M



14500

- ❑ Pretighten to torque and in order the **cylinder head bolts (20 N.m)**.
- ❑ Check that all the cylinder head bolts are tightened to the correct torque of **20 N.m**.
- ❑ Angle tighten in order the **cylinder head bolts (240° ± 6°)**.

III - FINAL OPERATION

- ❑ Position the **(Mot. 1453)**.
- ❑ Remove the **(Mot. 1672)**.

K4J or K4M

14499

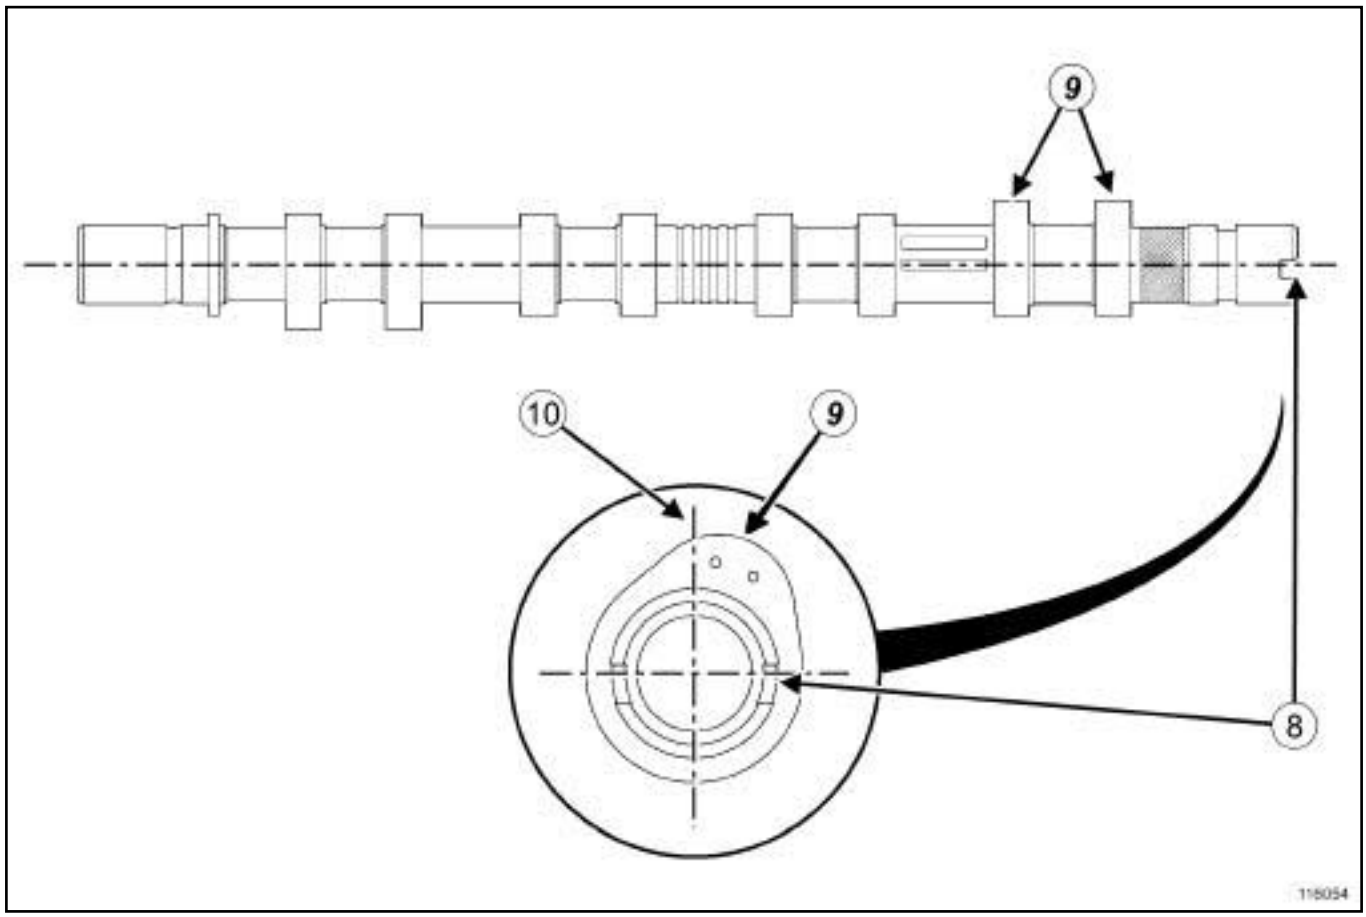
❏ Reprime the hydraulic tappets (hydraulic tappets may empty after a long down time).

To check if repriming is necessary, press the top of the tappet (**7**) with your thumb.

If the tappet piston depresses:

- immerse the tappets in a container of diesel fuel,
- refit the hydraulic tappets.

❏ Refit:



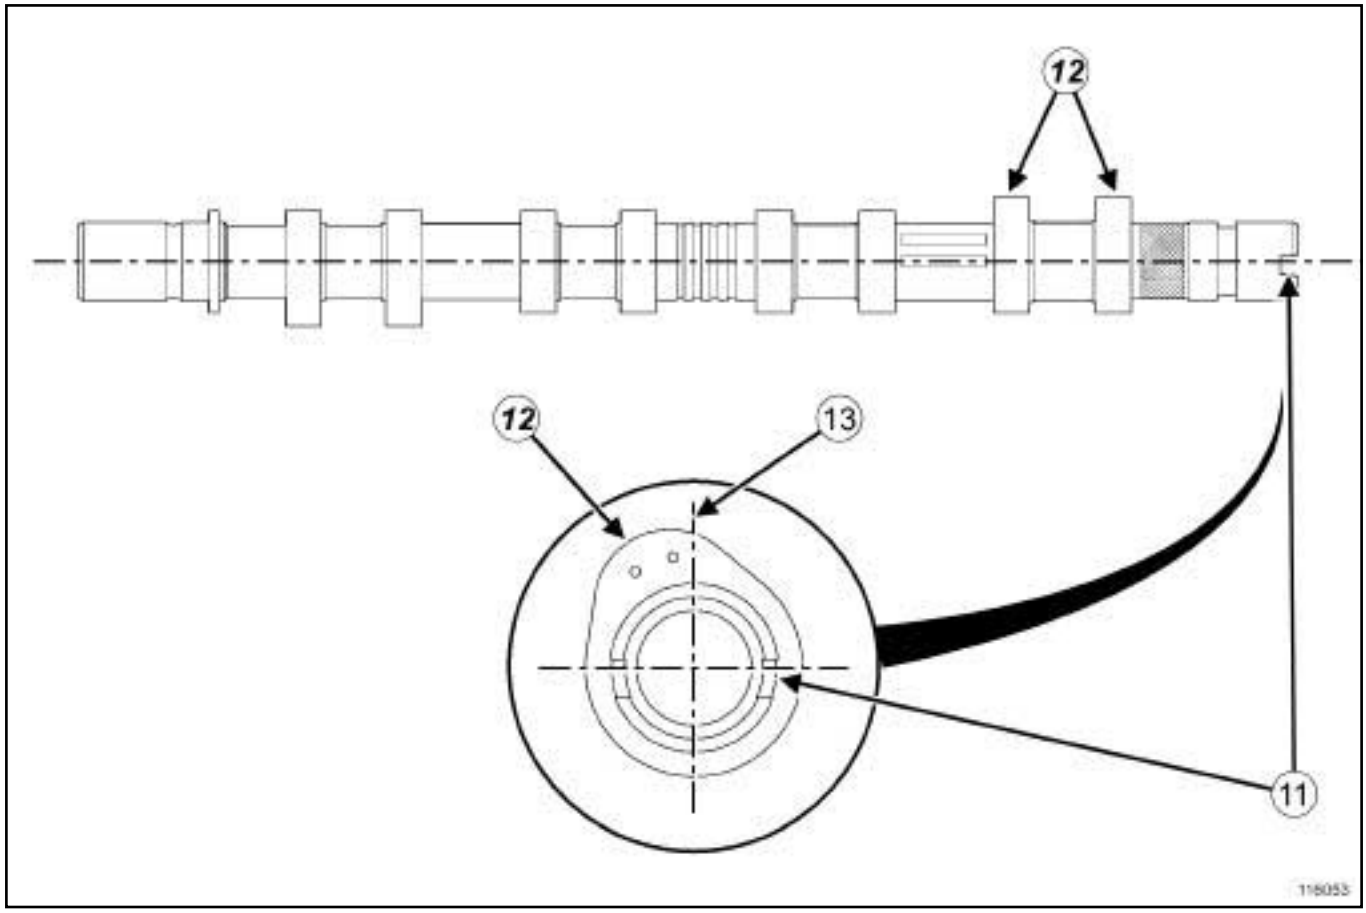
- the hydraulic tappets,
- the valve rockers.

K4J or K4M

Camshaft marking

K4J

Inlet camshaft



116054

❑ Position the groove (**8**) at the end of the camshaft so that it is horizontal and offset downwards.

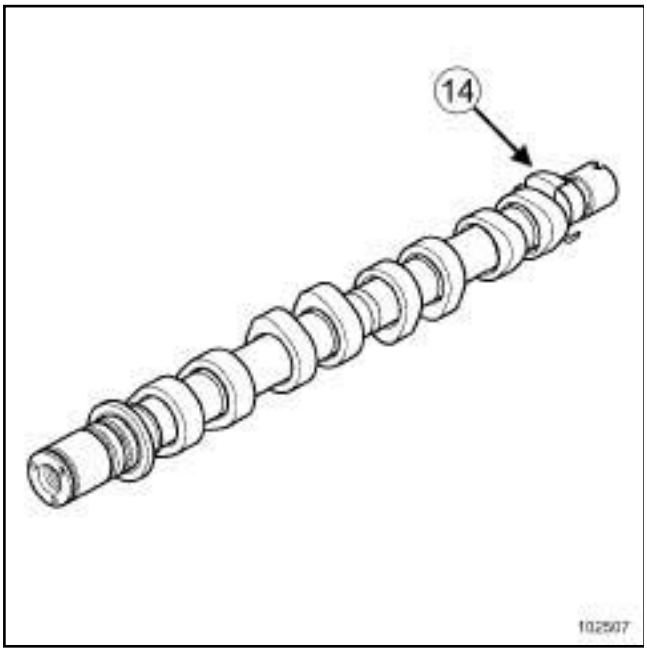
The cams (**9**) for cylinder 1 must be located to the right of the vertical axis (**10**) , flywheel end view.

K4J or K4M

Exhaust camshaft

116053

❏ Position the groove (**11**) at the end of the camshaft so that it is horizontal and offset downwards.

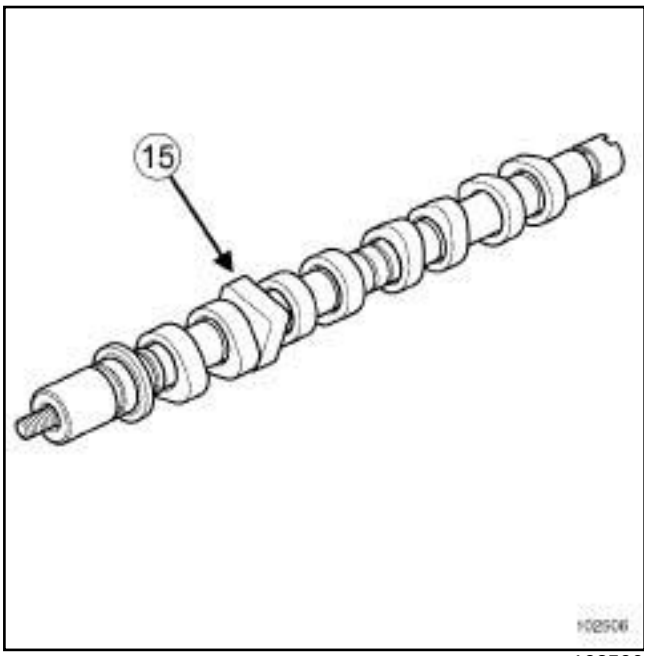


The cams (**12**) for cylinder 1 must be located to the left of the vertical axis (**13**) , flywheel end view.

❏ Refit the camshafts, oiling the bearings.

K4J or K4M

K4M



Inlet camshaft

102507

(**14**) The inlet camshaft is fitted with the camshaft sensor target

Exhaust camshaft

102506

(**15**) The exhaust camshaft is fitted with the square cam

❏ Refit the camshafts, oiling the bearings.

❏ Refit the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

❏ Connect:

- the coolant hoses using the tool **(Mot. 1202-01)** or the tool **(Mot. 1202-02)** or the tool **(Mot. 1448)** on the cylinder head coolant unit.
- the coolant temperature sensor connector.

K4M, and 862

❏ Refit:

- the dipstick guide,
- the dipstick,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❏ Fill the gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❏ Connect the oxygen sensor connectors.

❏ Refit the exhaust flange nuts.

❏ Tighten to torque:

- the **exhaust manifold studs (8 N.m)**.
- the **exhaust manifold nuts (26 N.m)**,

❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) ,

K4J or K4M

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

K4M, and 862

❑ Refit the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) .

❑ Refit:

- the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

❑ Refit:

- the scoop under the scuttle panel grille (see **Scoop under the scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the windscreen wiper arms (see **Windscreen wiper arm: Removal - Refitting**) (85A, Wiping - Washing),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front wheels (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the engine undertray,
- the engine cover.

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K9K, and 764 or 772

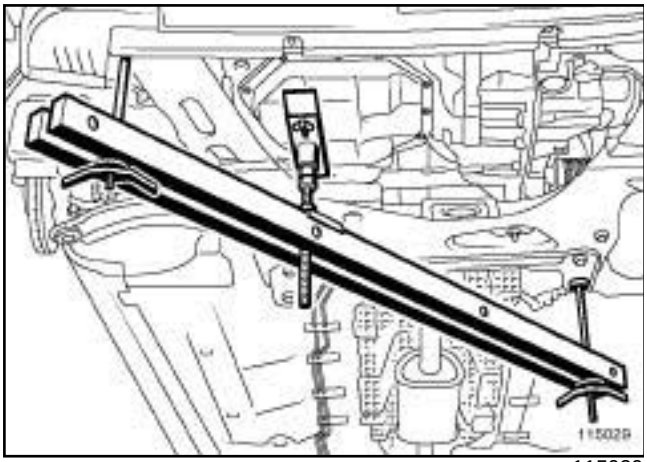
Special tooling required	
Mot. 1672	Lower engine support.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)

Equipment required
workshop hoist
cylinder head testing tools

Tightening torques ▽	
cylinder head bolts (initial torque)	**25 N.m**
cylinder head bolts	**270° ± 10°**
inner timing cover bolts	**9 N.m**
alternator bolts	**21 N.m**
subframe tie-rod bolt on the left-hand side	**105 N.m**
radiator mounting cross member bolt on the right-hand side	**105 N.m**
turbocharger oil return pipe bolts on the turbocharger	**12 N.m**
studs of the catalytic converter (K9K*764) or of the catalytic pre-converter (K9K*772) on the turbocharger	**7 N.m**
nuts of the catalytic converter (K9K*764) or of the catalytic pre-converter (K9K*772) on the turbocharger	**26 N.m**
downstream strut lower bolt	**44 N.m**
downstream strut upper bolts	**26 N.m**

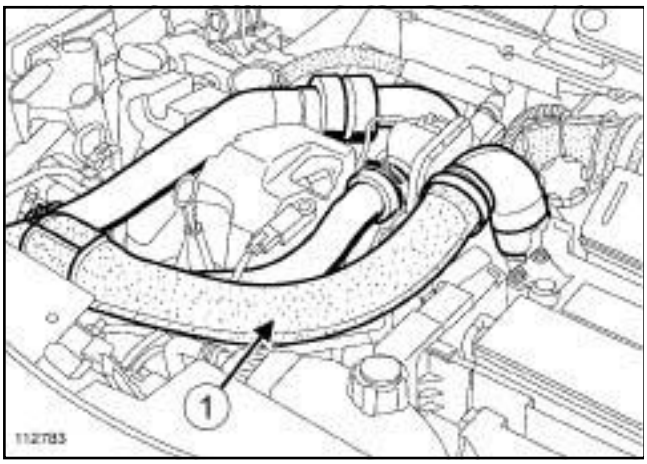
Tightening torques ▽	
upstream strut bolt on the cylinder block	**21 N.m**
upstream strut nut on the cylinder block	**21 N.m**
bolt of the upstream strut on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772)	**21 N.m**
studs of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772)	**7 N.m**
nuts of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772)	**21 N.m**
timing side lifting eye bolts	**10 N.m**
clip of the air filter unit air outlet pipe	**5.5 N.m**
intercooler air outlet pipe clip	**5.5 N.m**
exchanger inlet air pipe nut on the alternator	**8 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

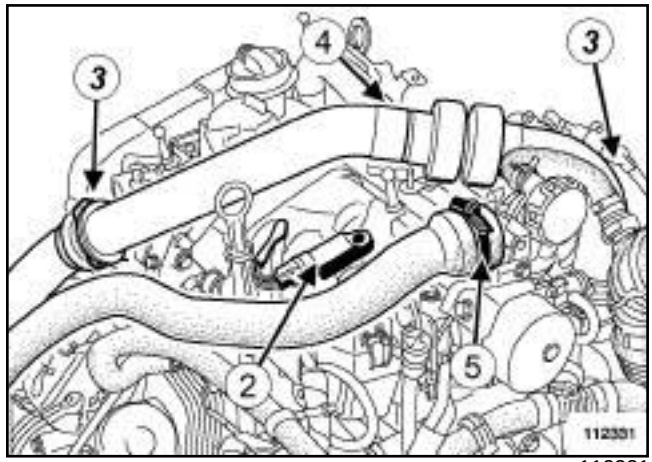


❑ Remove:

- the engine cover,
- the engine undertray,
- the radiator mounting cross member bolt on the right-hand side,
- the subframe tie-rod bolt on the left-hand side.

K9K, and 764 or 772

115029



❏ Fit the lower engine support tool **(Mot. 1672)**.

112783

❏ Remove:

- the air filter unit air inlet pipe (**1**) ,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

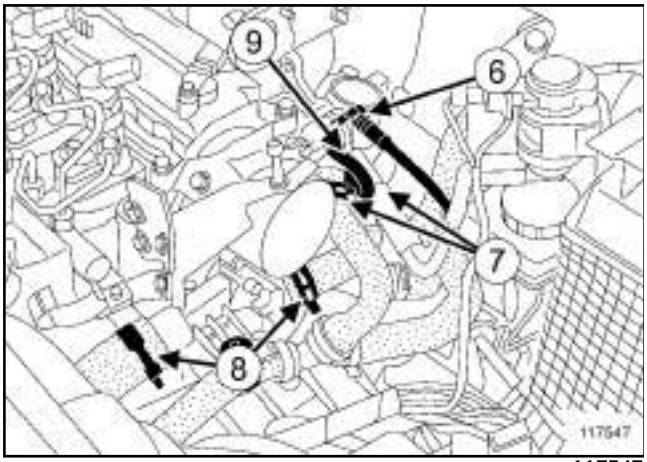
112331

❏ Disconnect the connector (**2**) from the inlet air pressure sensor.

❏ Move aside the turbocharger air outlet pipe retaining pins (**3**) .

❏ Remove:

- the bolt (**4**) from the turbocharger air outlet pipe,
- the turbocharger air outlet pipe.



❏ Loosen the clip (**5**) on the intercooler air outlet pipe.

❏ Disconnect the intercooler air outlet pipe.

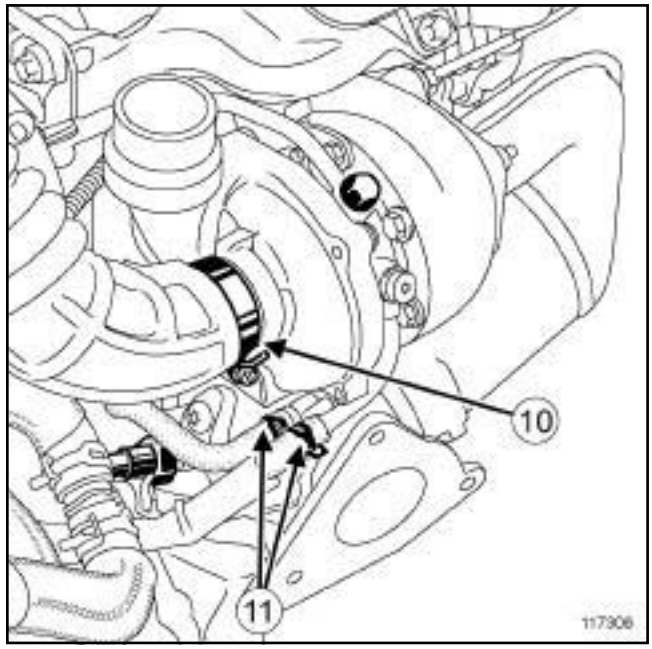
❏ Remove the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K9K, and 764 or 772

117547

❏ Disconnect the vacuum pipe union (**6**) from the vacuum pump.



❏ Separate the clip (**7**) on the EGR cooler hoses using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the EGR cooler hoses.

❏ Separate the clip (**8**) on the water chamber hoses using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect:

- the water chamber hoses,
- the coolant temperature sensor connector (**9**) .

117306

❏ Disconnect:

- the oil vapour rebreathing pipe on the rocker cover,
- the turbocharging pressure regulation valve pipe.

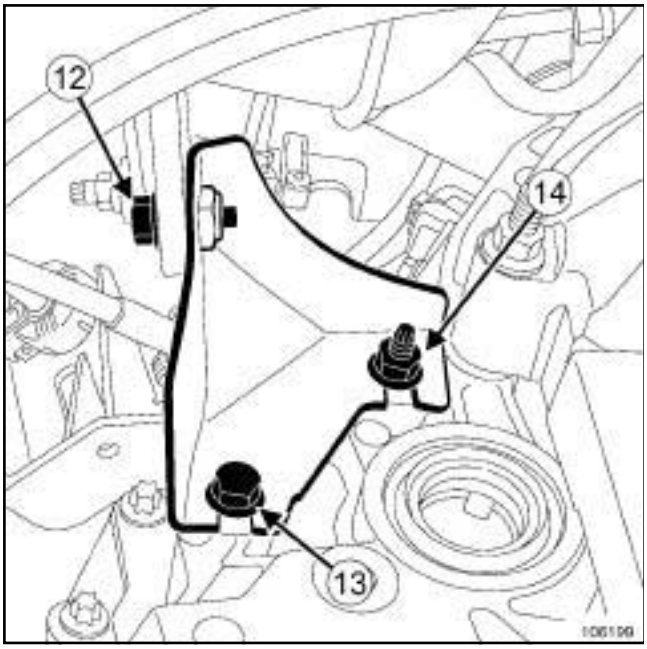
❏ Loosen the clip (**10**) of the air outlet pipe on the air filter unit.

❏ Disconnect the air outlet pipe from the air filter unit.

❏ Remove the air outlet pipe from the air filter box.

K9K, and 772

❏ Remove the turbocharger cooling hose clip (**11**) using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.



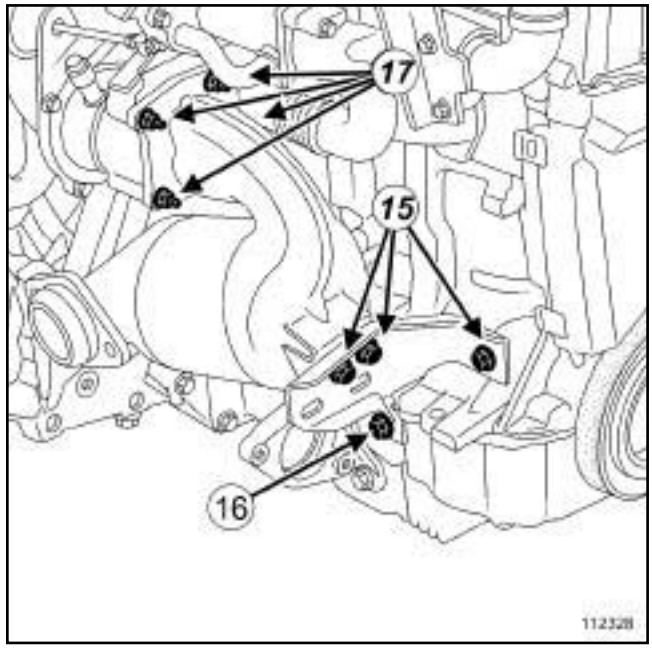
❏ Disconnect the turbocharger cooling hoses.

❏ Remove the nuts from the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Move aside the connecting hose.

❏ Remove the seal between the connecting hose and the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772).

K9K, and 764 or 772



106199

❏ Remove the bolt (**12**) from the upstream strut on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Undo:

- the upstream strut bolt (**13**) on the cylinder block,
- the upstream strut nut (**14**) on the cylinder block.

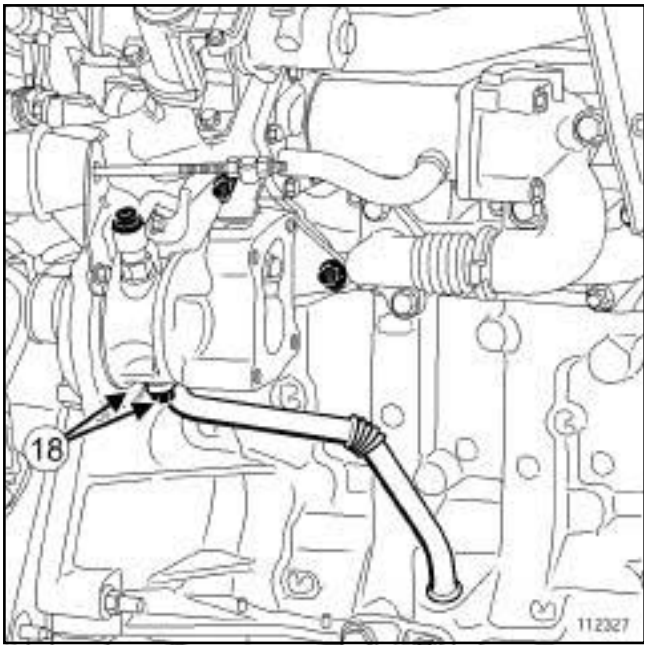
❏ Remove the upstream strut.

112328

❏ Remove:

- the bolts from the lifting eye, timing end,
- the lifting eye on the timing end,
- the upper bolts (**15**) from the downstream strut on the catalytic converter (K9K*764) or catalytic pre-converter (K9K*772).

❏ Undo the downstream strut lower bolt (**16**) .

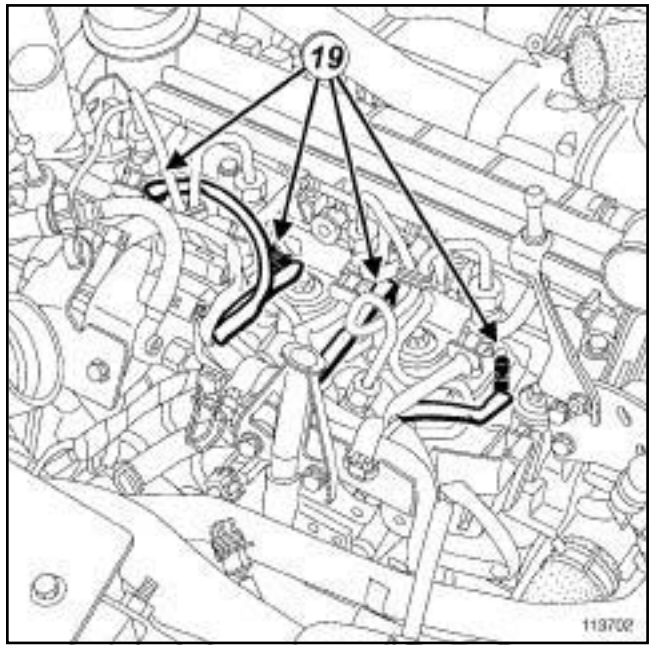


❏ Remove:

- the downstream strut,
- the nuts (**17**) from the catalytic converter (K9K*764) or from the catalytic pre-converter (K9K*772) on the turbocharger.

❏ Move the catalytic pre-converter towards the timing.

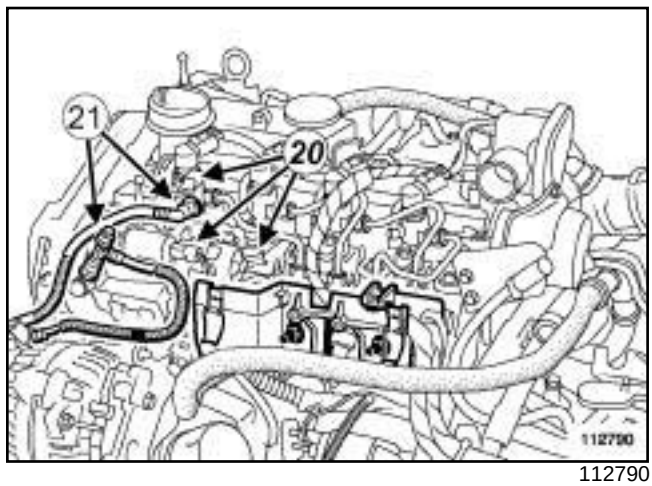
❏ Remove the seal between the turbocharger and the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772).



K9K, and 764 or 772

112327

❏ Remove:



- the bolts (**18**) from the turbocharger oil return pipe,
- the turbocharger oil return pipe,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

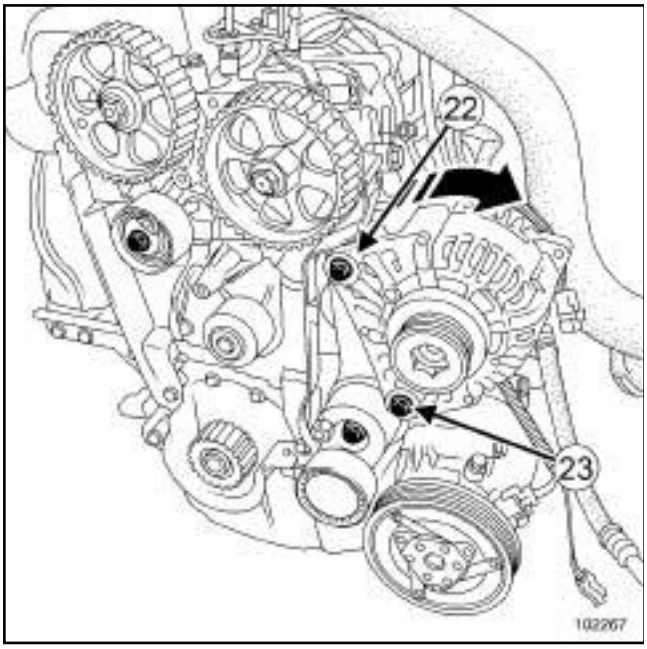
113702

❏ Disconnect:

- the heater plugs (**19**) ,
- the exhaust gas recirculation solenoid valve connector,
- the damper valve connector (if fitted).

112790

❏ Disconnect the high pressure pump connectors (**20**) .



❏ Unclip the clip on the injector rail protector mounting.

❏ Move aside the wiring of the injector rail protector mounting.

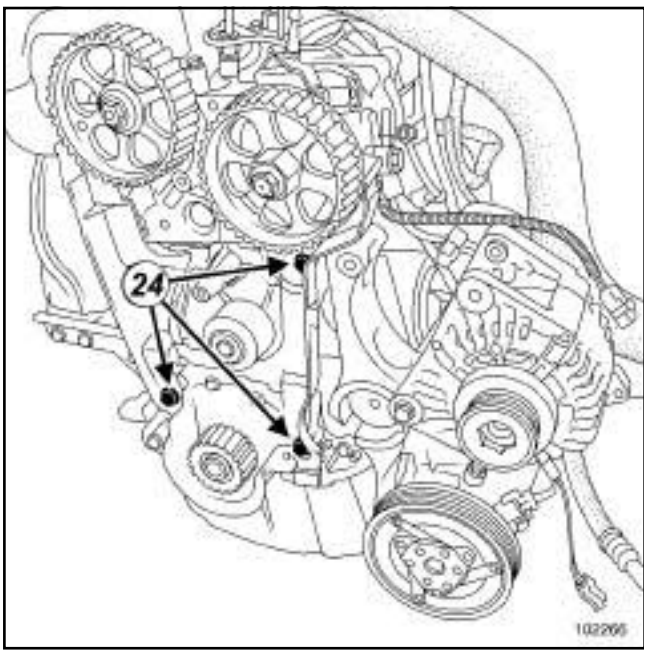
❏ Disconnect the diesel supply and return pipes (**21**) from the high pressure pump then fit the blanking plugs.

❏ Plug the openings.

K9K, and 764 or 772

102267

❏ Disconnect the alternator connector.



❏ Remove the alternator electrical wiring nut.

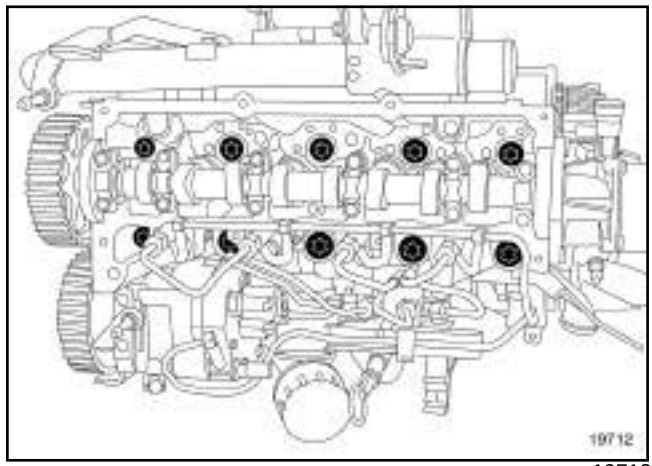
❏ Move aside the alternator electrical wiring.

❏ Remove the alternator upper bolt (**22**) .

❏ Loosen the alternator lower bolt (**23**) .

❏ Tilt the alternator forward.

102266



❏ Remove:

- the inner timing cover bolts (**24**) ,
- the inner timing cover.

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Refit:

- the lifting eye on the timing end,
- the timing end lifting eye bolts.

19712

❏ Remove the cylinder head bolts.

❏ Fit **workshop hoist**.

❏ Remove the cylinder head.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Cylinder head gasket (10,02,01,04)**.

❏ **parts always to be replaced: seal between turbocharger and catalytic converter (10,09,01,08)**.

❏ **parts always to be replaced: cylinder head bolts (10,02,01,14)**.

K9K, and 764 or 772

❑ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**.

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear gloves during this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Use a **GREY ABRASIVE PAD** to clean the joint faces of:

- the cylinder head,
- the cylinder block

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the joint faces of:

- the cylinder head,
- the cylinder block.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Protect the oilway so that foreign bodies do not enter the oil pipes in the cylinder head.

Failure to follow this instruction could lead to the blocking of the oilways, resulting in a rapid deterioration of the camshaft.

❑ Check for gasket face deformation using a ruler and a set of shims.

❑ The maximum deformation is **0.05 mm**.

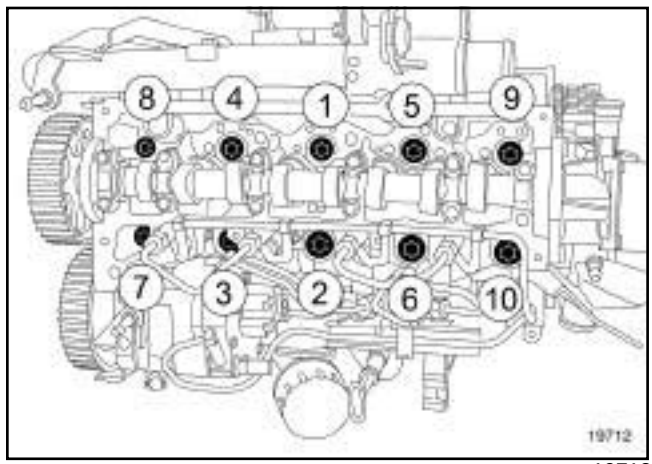
WARNING
No regrinding of the cylinder head is permitted.

❑ Test the cylinder head to detect any possible cracks using **cylinder head testing tools**.

❑ Strip down the cylinder head (see **Cylinder head: Stripping**) (Technical Note 6006A, 10A, Engine and peripherals).

WARNING
In order to ensure that the bolts are correctly tightened, use a syringe to remove any oil which may be in the cylinder head mounting holes.

❑ Fit a new cylinder head seal, centred by two dowels.



❑ Bring the pistons to mid-stroke position to prevent any risk of contact with the valves when tightening the cylinder head.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the cylinder head.

WARNING
Do not retighten the cylinder head bolts after applying this procedure.

❑ Remove **workshop hoist**.

19712

❑ Refit new cylinder head bolts.

❑ Pretighten to torque and in order the **cylinder head bolts (initial torque) (25 N.m)**.

❑ Check that all of the cylinder head bolts are tightened to the correct torque.

❑ Angle tighten in order the **cylinder head bolts (270° ± 10°)**.

III - FINAL OPERATION

❑ Refit:

- the inner timing cover,
- the inner timing cover bolts.

K9K, and 764 or 772

❏ Tighten to torque the **inner timing cover bolts (9 N.m)**.

❏ Fit the alternator in place.

❏ Refit the alternator upper bolt.

❏ Torque tighten the **alternator bolts (21 N.m)**.

❏ Refit the alternator electrical wiring nut.

❏ Connect the alternator connector.

❏ Fit the wiring of the injector rail protector mounting.

❏ Clip the clip onto the injector rail protector mounting.

❏ Remove the blanking plugs from the openings.

❏ Connect:

- the diesel supply and return pipes on the high pressure pump,
- the high pressure pump connectors.
- the exhaust gas recirculation solenoid valve connector,
- the heater plugs,
- the damper valve (if equipped).

❏ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❏ Remove the lower engine support tool **(Mot. 1672)**.

❏ Refit:

- the subframe tie-rod bolt on the left-hand side,
- the radiator mounting cross member bolt on the right-hand side.

❏ Torque tighten:

- the **subframe tie-rod bolt on the left-hand side (105 N.m)**,
- the **radiator mounting cross member bolt on the right-hand side (105 N.m)**.

❏ Refit the turbocharger oil return pipe with its new seals, starting at the inlet in the cylinder block.

WARNING

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not completely or partially blocked by scale. Check that there are no leaks. If there are, replace the part.

Note:

During this operation, make sure that the turbocharger oil return pipe does not fold.

Respect the direction of fitting of the turbocharger oil return pipe seal.

❏ Fit without tightening the turbocharger oil return pipe bolts on the turbocharger.

❏ Tighten to torque the **turbocharger oil return pipe bolts on the turbocharger (12 N.m)**.

❏ Remove:

- the bolts from the lifting eye, timing end,
- the lifting eye on the timing end.

❏ Refit the studs of the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772) on the turbocharger.

❏ Torque tighten the **studs of the catalytic converter (K9K*764) or of the catalytic pre-converter (K9K*772) on the turbocharger (7 N.m)**.

❏ Refit a new seal between the turbocharger and the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772).

❏ Fit the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772).

❏ Refit the nuts of the catalytic converter (K9K*764) or of the catalytic pre-converter (K9K*772) on the turbocharger.

❏ Torque tighten the **nuts of the catalytic converter (K9K*764) or of the catalytic pre-converter (K9K*772) on the turbocharger (26 N.m)**.

❏ Refit the downstream strut.

❏ Fit without tightening:

- the downstream strut lower bolt,
- the downstream strut upper bolts.

❏ Refit the upstream strut.

K9K, and 764 or 772

❏ Fit without tightening the upstream strut bolts on the cylinder block.

❏ Fit without tightening:

- the upstream strut bolt on the cylinder block,
- the upstream strut nut on the cylinder block.

❏ Refit the bolt of the upstream strut on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Refit without tightening the bolt of the upstream strut on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Torque tighten:

- the **downstream strut lower bolt (44 N.m)**,
- the **downstream strut upper bolts (26 N.m)**,
- the **upstream strut bolt on the cylinder block (21 N.m)**,
- the **upstream strut nut on the cylinder block (21 N.m)**,
- the **bolt of the upstream strut on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772) (21 N.m)**.

❏ Refit the studs of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Torque tighten the **studs of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772) (7 N.m)**.

❏ Refit:

- a new seal between the hose and the catalytic converter (K9K*764) or the catalytic pre-converter (K9K*772),
- the nuts of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772).

❏ Torque tighten the **nuts of the connecting hose on the catalytic converter (K9K*764) or on the catalytic pre-converter (K9K*772) (21 N.m)**.

❏ Refit:

- the lifting eye on the timing end,
- the timing end lifting eye bolts.

❏ Tighten to torque the **timing side lifting eye bolts (10 N.m)**.

K9K, and 772

❏ Connect the turbocharger cooling hoses.

❏ Fit the turbocharger cooling hose clip using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

K9K, and 764 or 772

❑ Refit the air outlet pipe onto the air filter unit.

❑ Connect the air outlet pipe of the air filter unit.

❑ Torque tighten the **clip of the air filter unit air outlet pipe (5.5 N.m)**.

❑ Connect:

- the oil vapour rebreathing pipe on the rocker cover,
- the turbocharging pressure regulation valve pipe.

❑ Connect:

- the coolant temperature sensor connector,
- the water chamber hoses.

❑ Fit the water chamber hose clips using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Connect the exhaust gas cooler hoses.

❑ Fit the clip of the exhaust gas cooler hose using the **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Connect the vacuum pipe to the vacuum pump.

❑ Refit the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

❑ Connect the intercooler air outlet pipe.

❑ Torque tighten the **intercooler air outlet pipe clip (5.5 N.m)**.

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit:

- the turbocharger air outlet pipe,
- the turbocharger air outlet pipe retaining pins.

❑ Snap on the turbocharger air outlet pipe.

❑ Tighten the turbocharger outlet air pipe bolt on the rocker cover.

❑ Torque tighten the **exchanger inlet air pipe nut on the alternator (8 N.m)**.

❑ Connect the air inlet pressure sensor connector.

❑ Refit:

- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit air inlet pipe,
- the engine undertray,
- the engine cover.

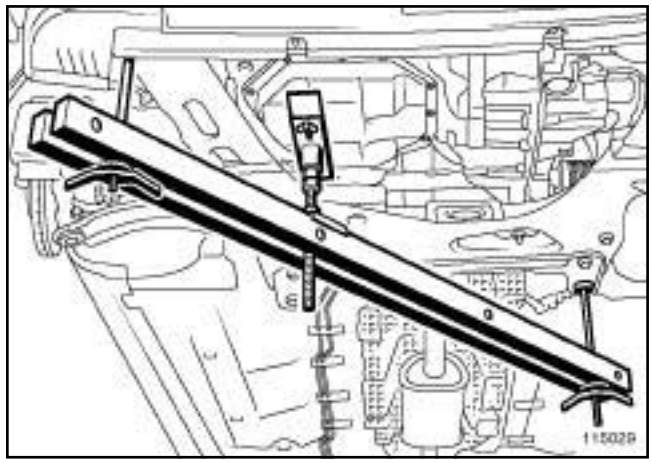
❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1672	Lower engine support.
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1202-01	Clip pliers for hose clips (large size).
Mot. 1202-02	Clip pliers for hose clips (small size)

Equipment required
workshop hoist
cylinder head testing tools

Tightening torques ▽	
cylinder head bolts (initial torque)	**25 N.m**
cylinder head bolts	**270° ± 10°**
inner timing cover bolts	**9 N.m**
alternator bolts	**21 N.m**
injector rail protector mounting bolts	**21 N.m**
high pressure pump protector bolts	**21 N.m**
turbocharger oil return pipe bolts	**12 N.m**
subframe tie-rod bolt on the left-hand side	**105 N.m**
radiator mounting cross member bolt on the right-hand side	**105 N.m**



REMOVAL

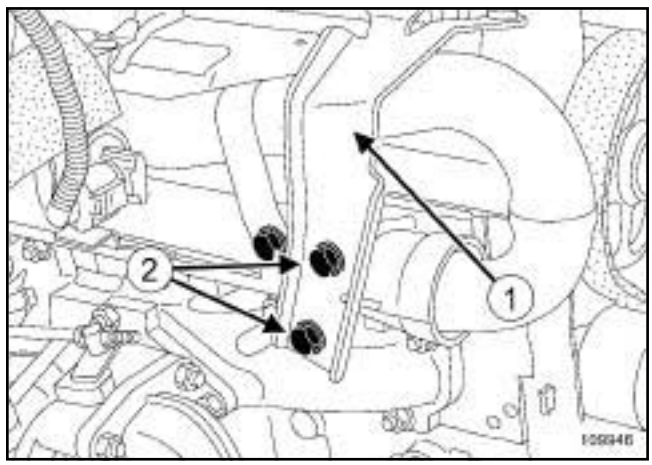
I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:

- the engine undertray,
- the radiator mounting cross member bolt on the right-hand side,
- the subframe tie-rod bolt on the left-hand side.

115029



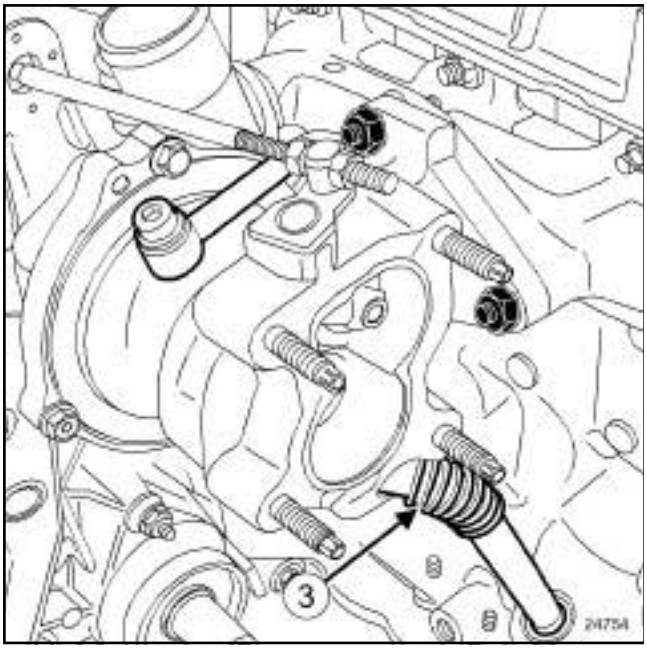
❏ Fit the lower engine support tool **(Mot. 1672)**.

❏ Remove:

- the air filter unit air inlet pipe,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment).

❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

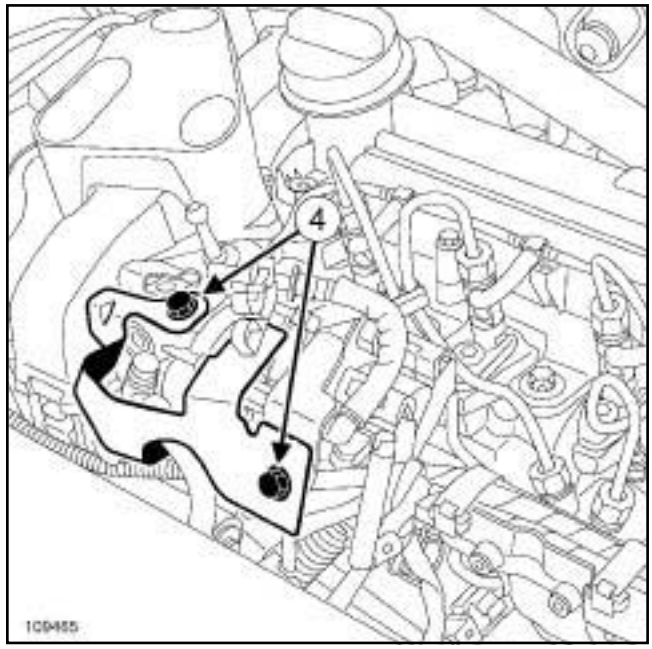
❏ Remove the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .



109946

❏ Refit:

- the timing end lifting eye (**1**) ,
- the timing end lifting eye bolts (**2**) .

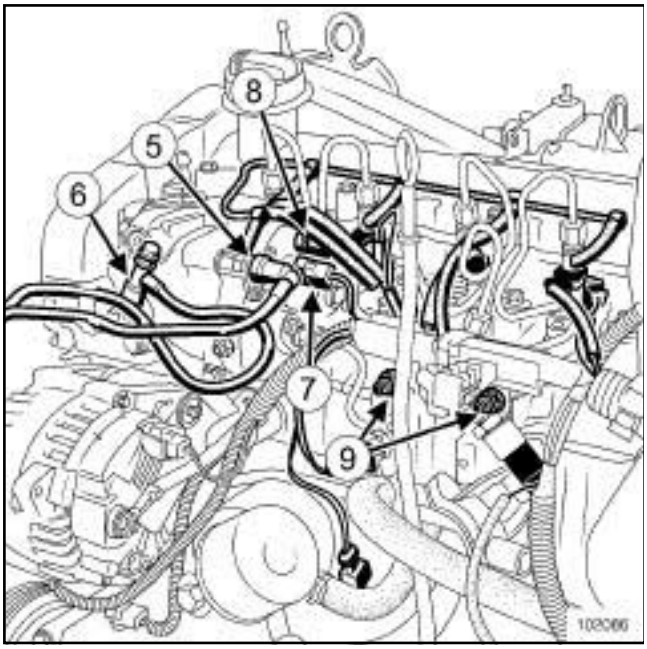


K9K, and 750 or 752 or 766 or 768

24754

❏ Remove:

- the turbocharger oil return pipe bolts
- the turbocharger oil return pipe (**3**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

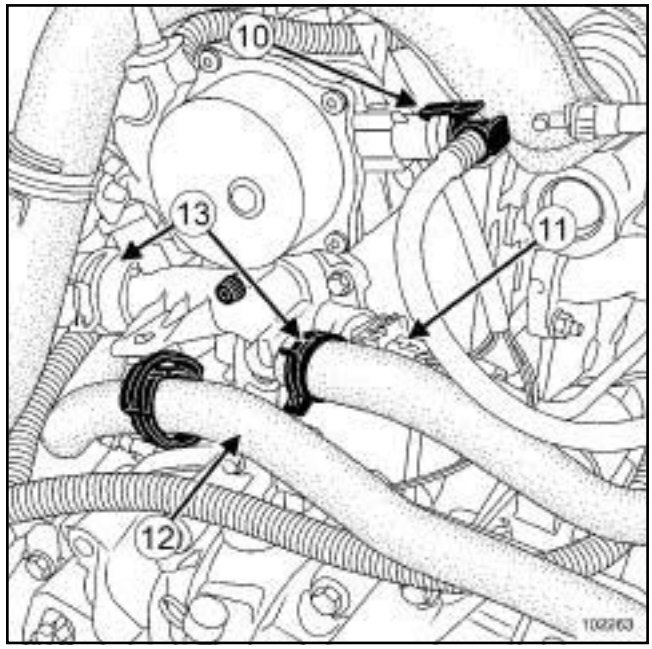


109465

❏ Remove:

- the bolts (**4**) from the high pressure pump protector,
- the high pressure pump protector.

K9K, and 750 or 752 or 766 or 768



102086

❏ Disconnect:

- the fuel supply pipe (**5**) ,
- the fuel return pipe (**6**) ,
- the fuel flow actuator connector (**7**) ,
- the diesel temperature sensor connector (**8**) ,
- the injector connectors,
- the heater plug connectors.

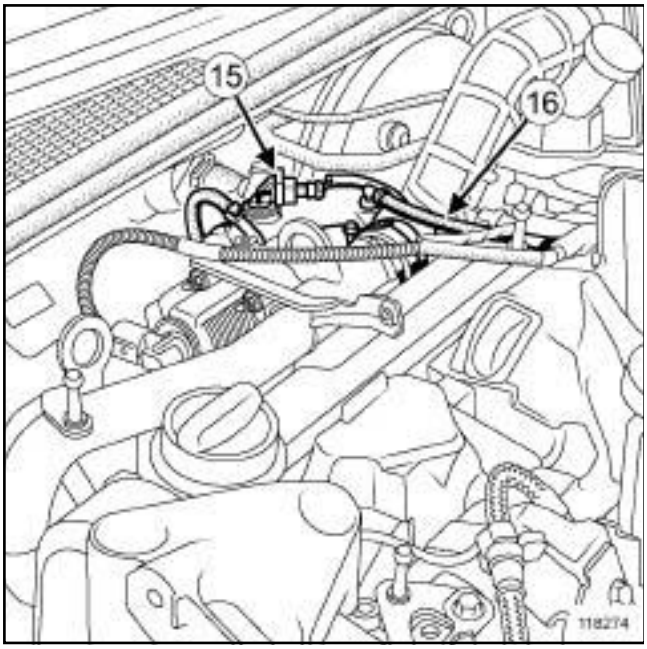
❏ Remove the injector rail protector mounting bolts (**9**) .

❏ Move aside the injector rail protector mounting.

102263

❏ Disconnect:

- the brake servo pipe union (**10**) from the vacuum pump,
- the temperature sensor connector (**11**) on the water chamber.

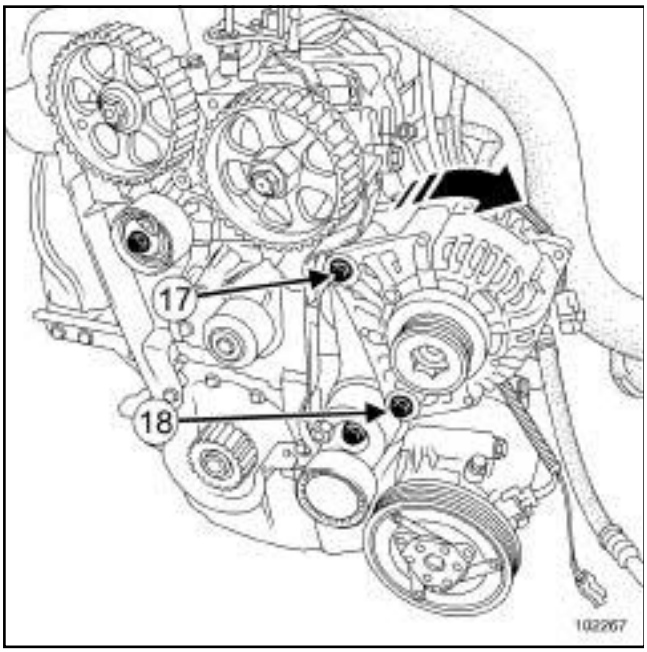


❏ Unclip the cooling hose (**12**) .

❏ Separate the water chamber inlet and outlet hose clip (**13**) using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❏ Disconnect the water chamber inlet and outlet hoses.

❏ Disconnect the crankshaft position sensor connector.



K9K, and 750 or 752 or 766 or 768

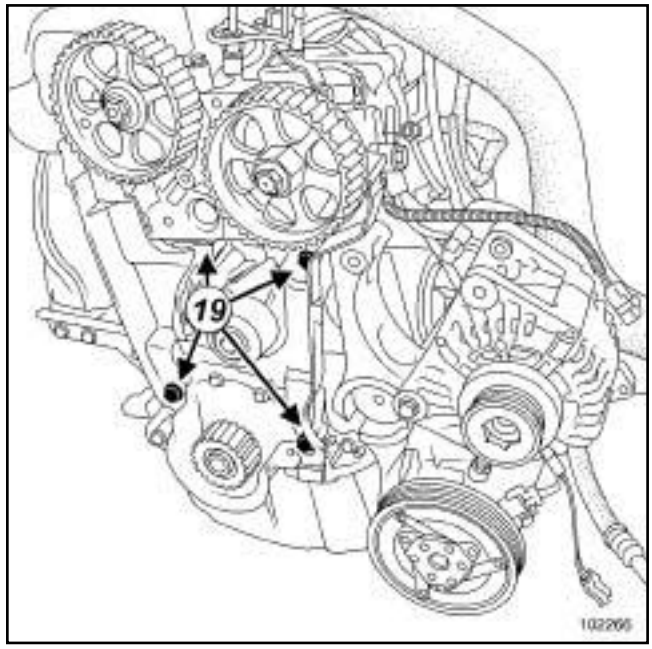
118274

❏ Disconnect:

- the air temperature sensor connector (**15**) ,
- the vacuum pipe (**16**) between the pressure sensor and the turbocharger air outlet pipe.

102267

❏ Disconnect the alternator connector.



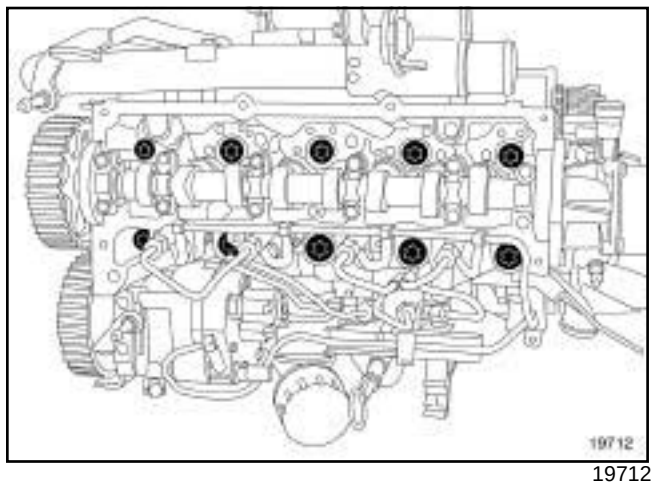
❏ Remove the alternator electrical wiring nut.

❏ Move aside the alternator electrical wiring.

❏ Remove the alternator upper bolt (**17**) .

❏ Loosen the alternator lower bolt (**18**) .

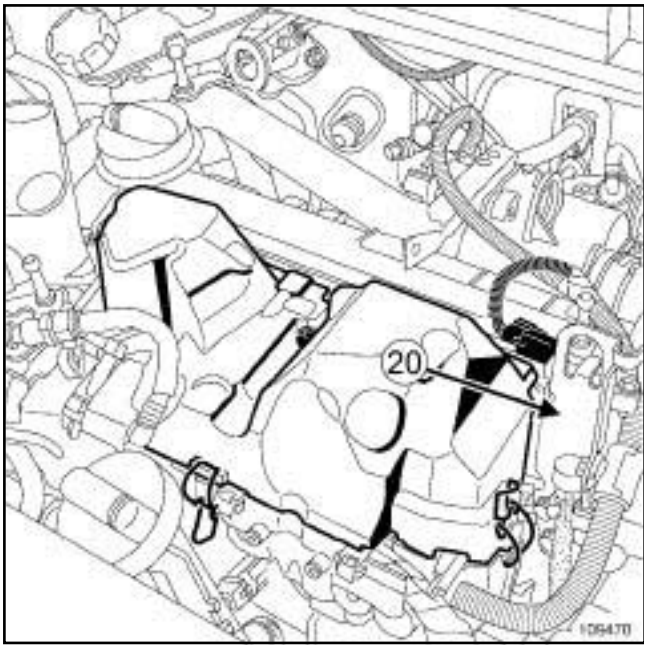
❏ Tilt the alternator forward.



102266

❏ Remove:

- the inner timing cover bolts (**19**) ,
- the inner timing cover.



II - OPERATION FOR REMOVAL OF PART CONCERNED

19712

❏ Remove the cylinder head bolts.

K9K, and 750 or 752 or 766 or 768

109470

❑ Refit:

- the lifting eye (**20**) on the gearbox side,
- the gearbox side lifting eye bolts.

❑ Fit **workshop hoist**.

❑ Remove the cylinder head.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Cylinder head gasket (10,02,01,04)**.

❑ **parts always to be replaced: cylinder head bolts (10,02,01,14)**.

❑ **parts always to be replaced: seal between turbocharger and catalytic converter (10,09,01,08)**.

❑ **parts always to be replaced: seal between catalytic converter and exhaust downpipe hose (10, 08,02,21)**.

IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear gloves during this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Use a **GREY ABRASIVE PAD** to clean the joint faces of the cylinder head and cylinder block.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to degrease the joint face of the cylinder head and cylinder block.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Protect the oilway so that foreign bodies do not enter the oil pipes in the cylinder head.

Failure to follow this advice could block the oil supply pipes, causing rapid camshaft damage.

❑ Check for gasket face deformation using a ruler and a set of shims.

❑ The maximum deformation is **0.05 mm**.

WARNING
No regrinding of the cylinder head is permitted.

❑ Test the cylinder head to detect any possible cracks using **cylinder head testing tools**.

K9K, and 750 or 752 or 766 or 768

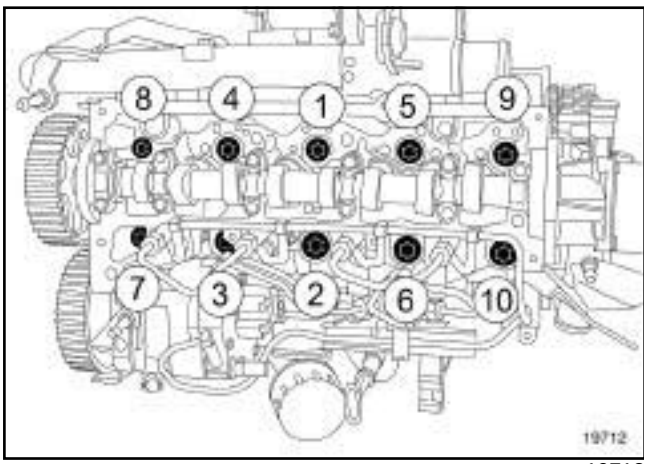
❑ Strip down the cylinder head (see **Cylinder head: Stripping**) (Technical Note 6006A, 10A, Engine and peripherals).

WARNING
In order to ensure that the bolts are correctly tightened, use a syringe to remove any oil which may be in the cylinder head mounting holes.

❑ Fit a new cylinder head seal, centred by two dowels.

❑ Bring the pistons to mid-stroke position to prevent any risk of contact with the valves when tightening the cylinder head.

II - REFITTING OPERATION FOR PART CONCERNED



❑ Refit the cylinder head.

WARNING
Do not retighten the cylinder head bolts after applying this procedure.

❑ Remove **workshop hoist**.

❑ Remove:

- the gearbox side lifting eye bolts,
- the gearbox side lifting eye.

19712

❑ Refit new cylinder head bolts.

❑ Pretighten to torque and in order the **cylinder head bolts (initial torque) (25 N.m)**.

❑ Check that all of the cylinder head bolts are tightened to the correct torque.

❑ Angle tighten in order the **cylinder head bolts (270° ± 10°)**.

III - FINAL OPERATION

❑ Refit:

- the inner timing cover,
- the inner timing cover bolts.

❑ Tighten to torque the **inner timing cover bolts (9 N.m)**.

❑ Fit the alternator in place.

❑ Refit the alternator upper bolt.

❑ Torque tighten the **alternator bolts (21 N.m)**.

❑ Connect:

- the alternator connector,
- the crankshaft position sensor,
- the vacuum pipe between the pressure sensor and the turbocharger air outlet pipe,
- the air temperature sensor connector,
- the water chamber inlet and outlet hoses.

❑ Fit the water chamber inlet and outlet hose clip using the tool **(Mot. 1448)** or **(Mot. 1202-01)** or **(Mot. 1202-02)**.

❑ Clip on the cooling hose.

❑ Connect:

- the brake servo pipe union onto the vacuum pump,
- the temperature sensor connector.

❑ Fit the injector rail protector mounting.

❑ Refit the injector rail protector mounting bolts.

❑ Tighten to torque the **injector rail protector mounting bolts (21 N.m)**.

❑ Connect:

- the heater plug connectors,
- the injector connectors,
- the diesel temperature sensor connector ,
- the fuel flow actuator connector,
- the fuel return pipe,
- the fuel supply pipe.

❑ Refit:

- the high pressure pump protector,
- the bolts of the high pressure pump protector.

❑ Torque tighten the **high pressure pump protector bolts (21 N.m)**.

K9K, and 750 or 752 or 766 or 768

❑ Refit:

- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the turbocharger oil return pipe,
- the turbocharger oil return pipe bolts.

❑ Torque tighten the **turbocharger oil return pipe bolts (12 N.m)**.

❑ Remove:

- the bolts from the lifting eye, timing end,
- the lifting eye on the timing end.

❑ Refit:

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the air filter unit air inlet pipe,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove the lower engine support tool **(Mot. 1672)**.

❑ Refit:

- the subframe tie-rod bolt on the left-hand side,
- the radiator mounting cross member bolt on the right-hand side.

❑ Torque tighten:

- the **subframe tie-rod bolt on the left-hand side (105 N.m)**,
- the **radiator mounting cross member bolt on the right-hand side (105 N.m)**.

❑ Refit the engine undertray.

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

D4F, and 784

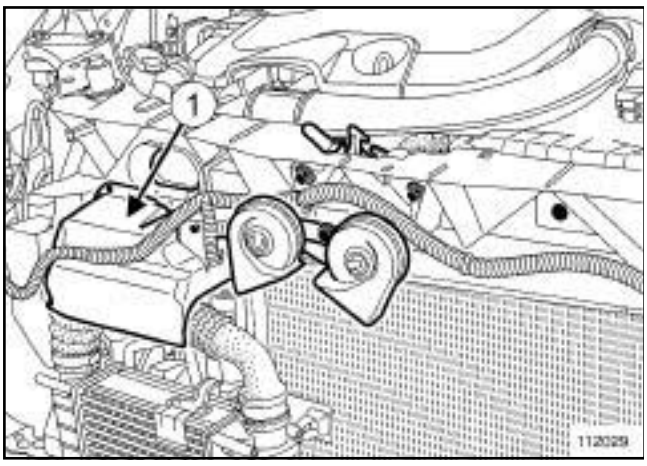
Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

Equipment required
cylinder head testing tools

Tightening torques ▽	
cylinder head bolts (initial torque)	**20 Nm**
cylinder head bolts	**230°± 6**

REMOVAL

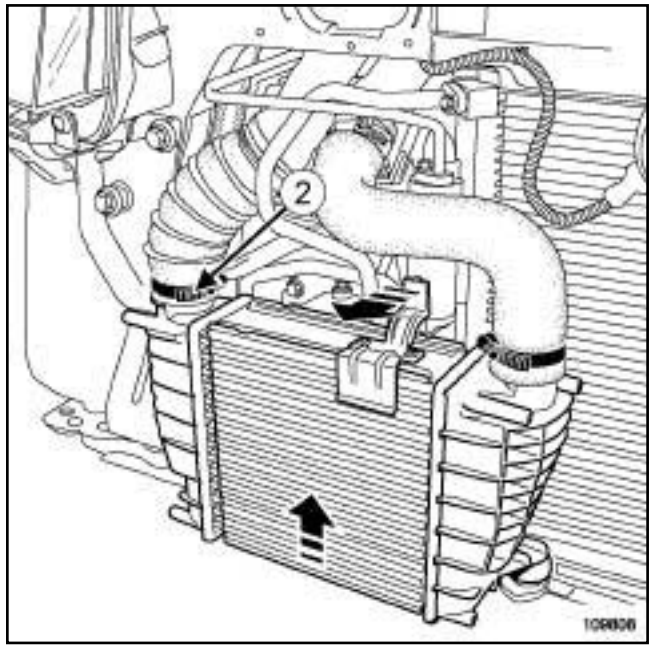
I - REMOVAL PREPARATION OPERATION



❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

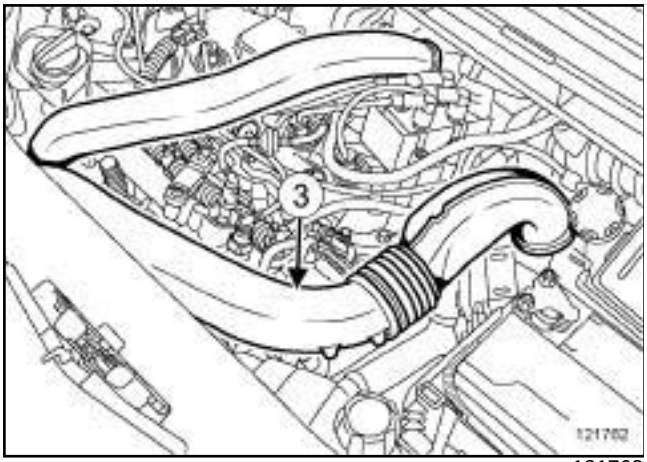


- the engine undertray,
- the engine cover,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection).

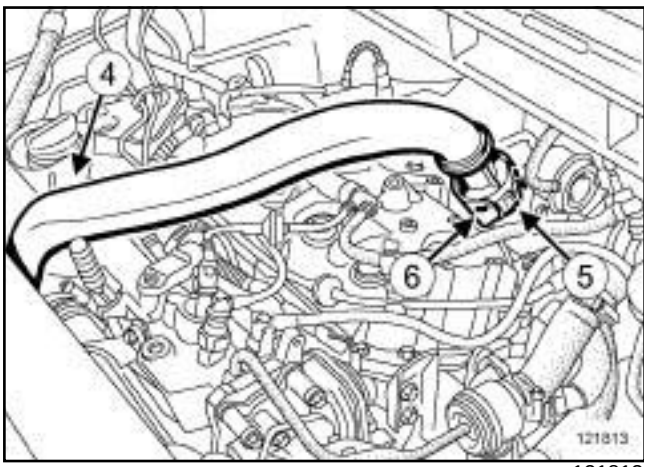
❏ Drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

112029

❏ Remove the air deflector (**1**) .



109808



❏ Undo the intercooler air inlet pipe clip (**2**) .

❏ Disconnect the intercooler air inlet pipe from the intercooler.

D4F, and 784

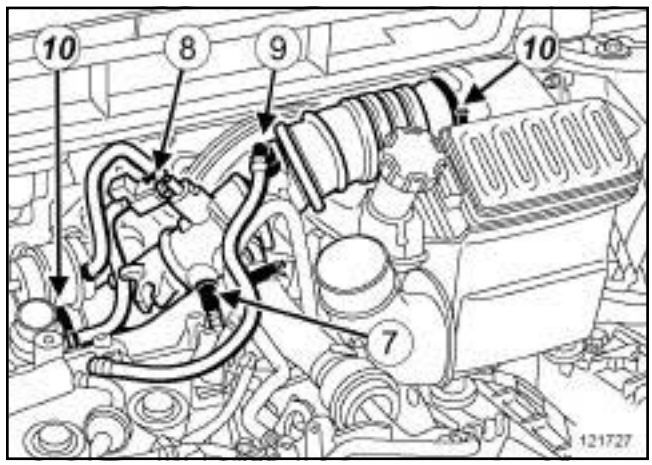
121762

121813

❏ Remove:

- the air pipe (**3**) from the air filter box inlet,
- the bolt (**4**) from the intercooler air inlet pipe on the intake distributor.

❏ Remove the intercooler air inlet pipe clip (**5**) on the turbocharger.



Note:

If the clip (**6**) is removed from the heat resistant protector, the latter must be replaced.

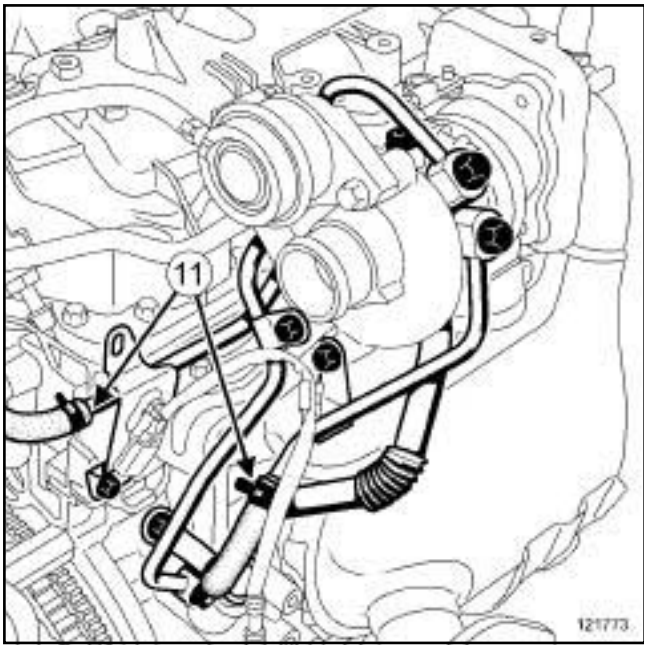
❏ Remove the intercooler air inlet pipe.

❏ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine undertray,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) ,
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) .

121727

❏ Disconnect:

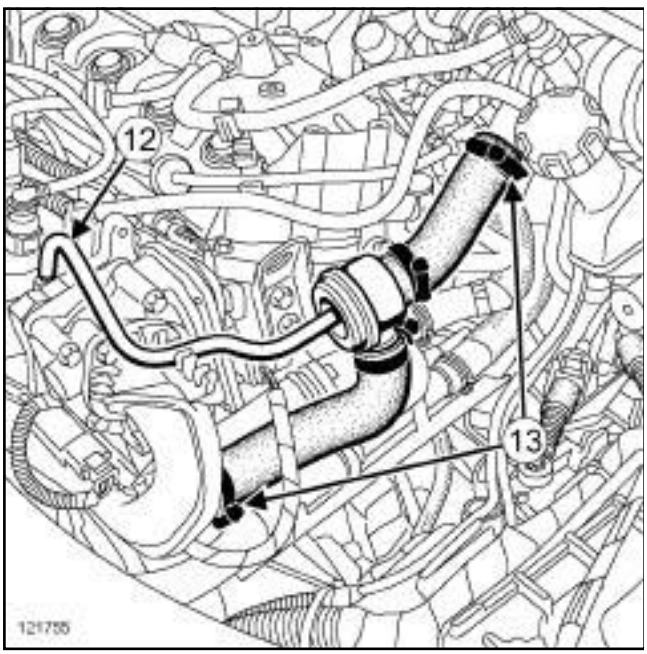


- the fuel vapour recirculation pipe (**7**) from the air filter box air outlet pipe,
- the oil vapour rebreathing pipe (**9**) from the air filter unit air outlet pipe,
- the turbocharging pressure relief valve (**8**) from the air filter unit air outlet pipe.

❏ Undo the air filter unit air outlet pipe clips (**10**) .

❏ Disconnect:

- the turbocharging pressure relief valve control pipes,
- the air filter box outlet air pipe.

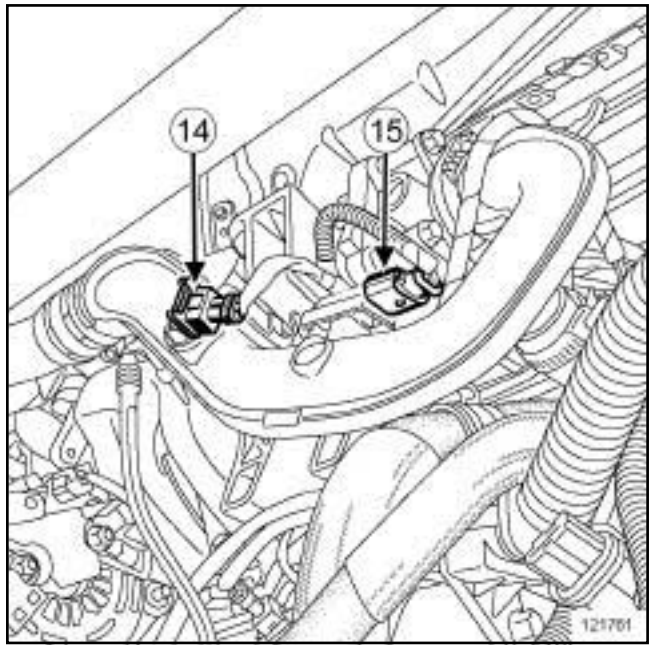


❏ Remove the air filter box air outlet pipe.

121773

❏ Move the clips (**11**) on the turbocharger cooling hoses to one side, using the **(Mot. 1448)**.

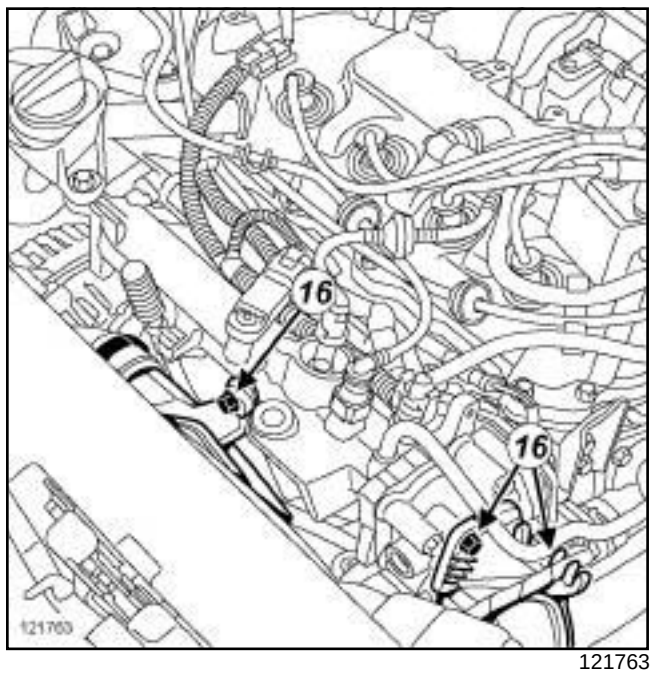
❏ Disconnect the turbocharger cooling hoses.



121755

❏ Disconnect the intake distributor vacuum hose (**12**) .

❏ Undo the clips (**13**) on the compressor discharge valve air pipe.

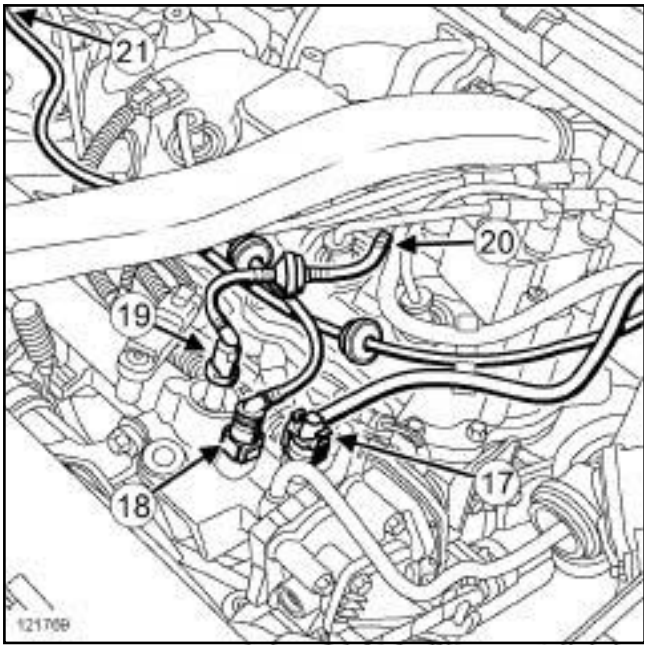


❏ Remove the compressor discharge valve air pipe.

121761

❏ Disconnect:

- the connector (**14**) from the air temperature sensor,
- the air pressure sensor connector (**15**) .

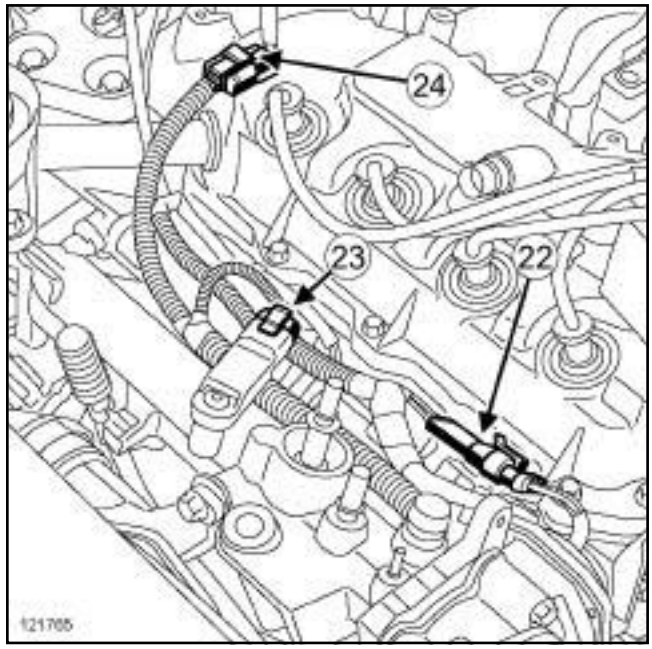


121763

❏ Remove the intercooler air outlet pipe bolts (**16**) .

❏ Move the intercooler air outlet pipe towards the front of the vehicle.

D4F, and 784



121769

❑ Disconnect:

- the brake servo non-return valve pipe (**17**) ,
- the petrol vapour rebreathing pipe (**18**) from the intake distributor,
- the oil vapour rebreathing pipe (**19**) on the intake distributor,
- the oil vapour rebreathing pipe (**20**) on the rocker cover,
- the petrol vapour rebreathing pipe (**21**) from the petrol vapour rebreathing solenoid valve.

❑ Remove:

- the oil vapour rebreathing pipe,
- the fuel vapour rebreathing pipe.

121765

❑ Disconnect:

- the injector rail - injector wiring harness connector (**22**) ,
- the air inlet pressure connector (**23**) ,
- the upstream oxygen sensor connector (**24**) ,
- the fuel vapour rebreather solenoid valve connector,
- the coolant temperature sensor connector,

IMPORTANT

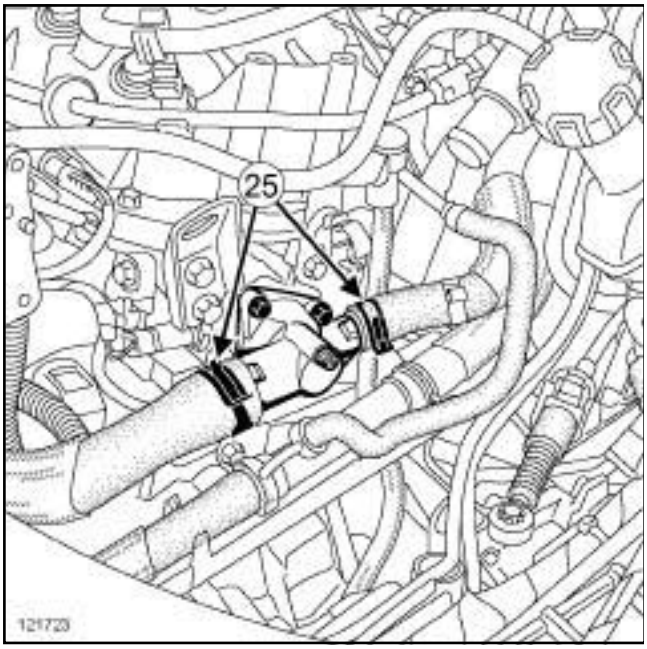
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear latex gloves during the operation.

WARNING



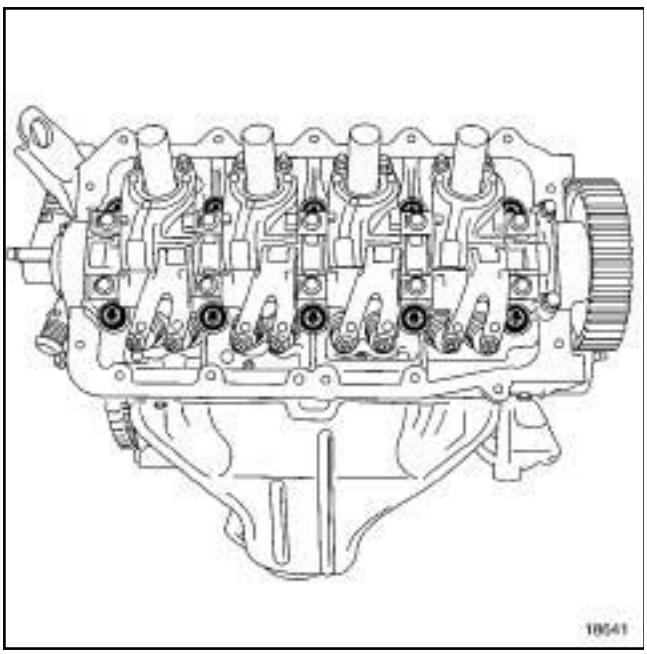
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❑ Disconnect the petrol supply union on the injector rail - injector.

❑ Plug the openings.

❑ Move the wiring harness away from the engine.

D4F, and 784



121723

❑ Remove the clips (**25**) from the cooling hoses using the **(Mot. 1448)**.

❑ Disconnect the cooling hoses.

❑ Remove the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

18641

❑ Remove:

- the cylinder head bolts,
- the cylinder head,
- the cylinder head gasket.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Clean the cylinder head with **SUPER CLEANER FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (MR 392, 04B, Consumables - Products).

WARNING

Do not scratch the aluminium joint faces: any surface damage to the joint faces may cause leaks.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear latex gloves during the operation.

WARNING

Do not allow this product to drip onto the paintwork.

Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

Note:

The cylinder head bolts must be replaced each time they are removed and should not be oiled before being fitted.

❑ Always replace:

- the cylinder head bolts,
- the cylinder head gasket.

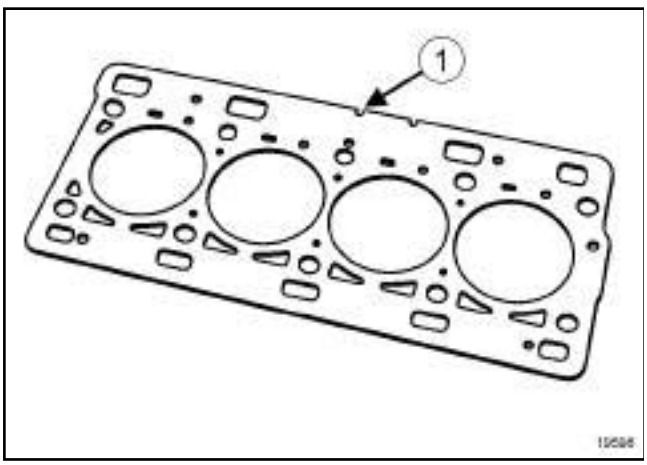
D4F, and 784

1 - Checking the gasket face

❑ With a ruler and set of feeler gauges, check for gasket face bow.

The maximum deformation is **0.05 mm**.

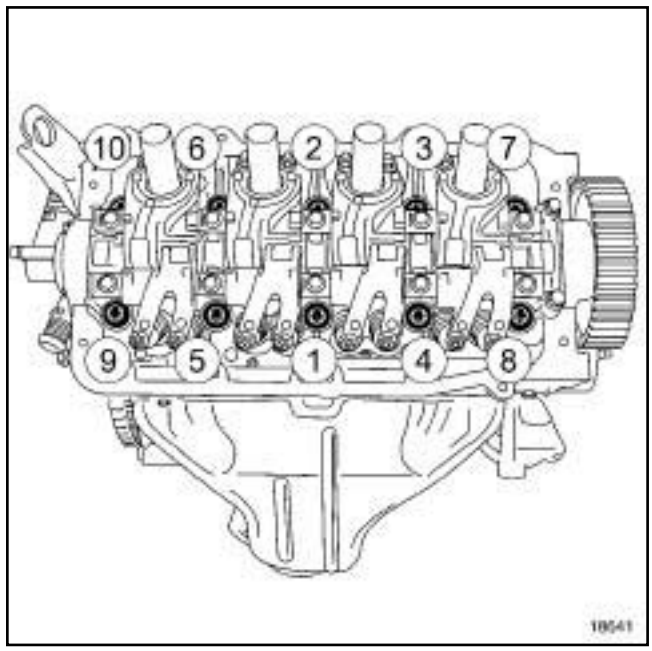
WARNING
No regrinding of the cylinder head is permitted.



❑ Test the cylinder head for any cracks using the **cylinder head testing tools** (see **Garage Equipment Catalogue**).

❑ Strip the cylinder head (see **Cylinder head: Stripping**) (Technical Note 6004A, 10A, Engine and peripherals).

2 - If replacing the cylinder head



❑ Rebuild the cylinder head (see **Cylinder head: Rebuilding**) (Technical Note 6004A, 10A, Engine and peripherals).

II - REFITTING OPERATION FOR PART CONCERNED

19598

❑ Fit the new cylinder head gasket onto the cylinder block, positioning the marking (**1**) on the oil filter side.

18641

❑ Refit:

- the cylinder head,
- the new cylinder head bolts.

❑ Pretighten to torque and in order the **cylinder head bolts (initial torque) (20 Nm)**.

❑ Check that all the cylinder head bolts are tightened to **20 Nm**.

❑ Angle tighten, in order the **cylinder head bolts (230°± 6)**.

III - FINAL OPERATION.

❑ Refit the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

❑ Connect the cooling hoses.

❑ Refit:

- the cooling radiator hose clips using the **(Mot. 1448)**,
- the engine wiring harness.

❑ Remove the blanking plugs.

❑ Connect:

- the petrol inlet union on the injector rail - injectors.
- the coolant temperature sensor connector,
- the fuel vapour rebreather solenoid valve connector,
- upstream oxygen sensor connector,

D4F, and 784

- the air inlet pressure connector.
- the injector rail - injector wiring harness connector.

❑ Refit:

- the petrol vapour rebreather pipe,
- the oil vapour rebreathing pipe.

❑ Connect:

- the petrol vapour rebreathing pipe to the solenoid valve,
- the oil vapour rebreathing pipe on the rocker cover,
- the oil vapour rebreather pipe from the inlet manifold,
- the fuel vapour rebreathing pipe onto the inlet manifold,
- the brake servo non-return valve pipe.

❑ Refit the air filter box air outlet pipe.

❑ Connect:

- the air filter box outlet air pipe,
- the turbocharging pressure relief valve control pipes.

❑ Tighten:

- the clips on the air filter box outlet air pipe,
- the turbocharging pressure relief valve control pipe clips.

❑ Connect:

- the oil vapour rebreathing pipe to the air filter unit air outlet pipe.
- the petrol vapour rebreathing pipe to the air filter unit air outlet pipe.

❑ Refit:

- the intercooler outlet air pipe,
- the intercooler air outlet pipe bolts.

❑ Connect:

- air pressure sensor connector,
- the air temperature sensor connector.

❑ Refit the compressor discharge valve air pipe.

❑ Tighten the compressor discharge valve pipe clips.

❑ Connect:

- the vacuum hose on the intake distributor,
- the turbocharger cooling hoses.

❑ Refit:

- the turbocharger cooling hose clips using the **(Mot. 1448)**,
- the ignition coil (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the engine undertray,
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

❑ Refit the intercooler air inlet pipe.

❑ Clip the intercooler air inlet pipe onto the turbocharger.

❑ Refit:

- the intercooler air inlet pipe bolt on the intake distributor,
- the air filter unit air inlet pipe.

❑ Connect the intercooler air inlet pipe to the intercooler.

❑ Tighten the intercooler inlet pipe clip.

❑ Refit:

- the air deflector,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, 55A, Exterior protection),
- the engine cover,
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

M4R

Special tooling required	
Mot. 919-02	Flywheel locking tool.

Equipment required
1/2" female torx socket (12.7 mm square drive)

Tightening torques ▽	
cylinder head bolts (1st tightening)	**40 N.m**
cylinder head bolts (2nd tightening)	**100°**
cylinder head bolts (3rd tightening)	**100°**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair (see **Engine: Precautions for the repair**) .

WARNING

It is strictly forbidden to apply any pressure to the engine oil sump. Damage to the sump will irreparably damage the engine by:

- blocking the strainer,
- raising the oil level above maximum, with a risk of engine racing.

REMOVAL

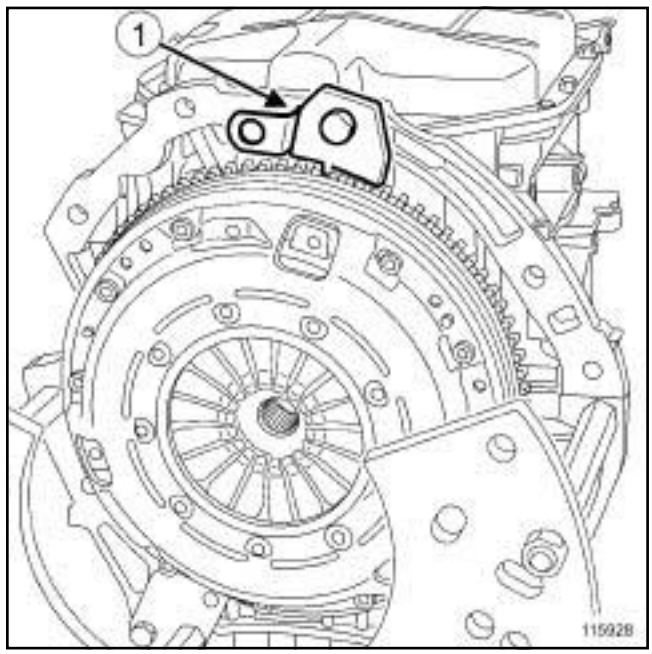
I - REMOVAL PREPARATION OPERATION

❑ Remove the « engine and gearbox » assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .

M4R, and 700

❑ Disconnect the manual gearbox from the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

M4R, and 701



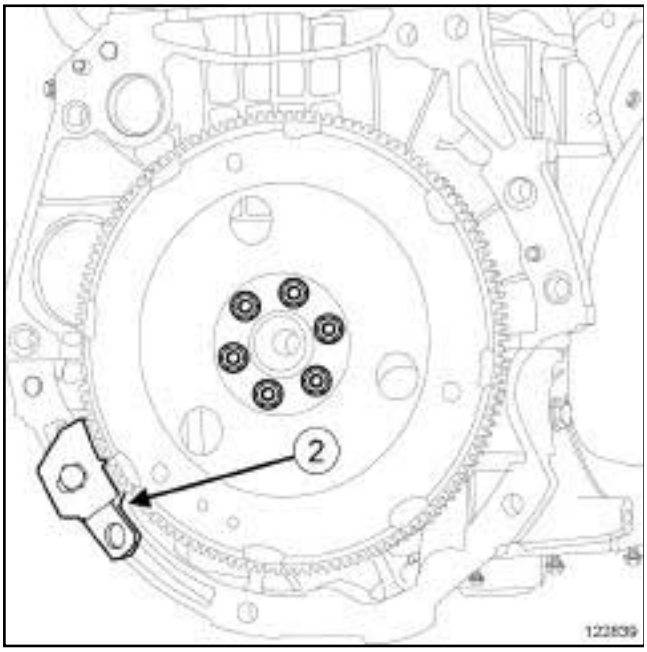
❑ Disconnect the automatic gearbox from the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

❑ Place the engine on the component support (see **Engine support equipment: Use**) .

❑ Drain the engine (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

❑ Remove the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

M4R, and 700

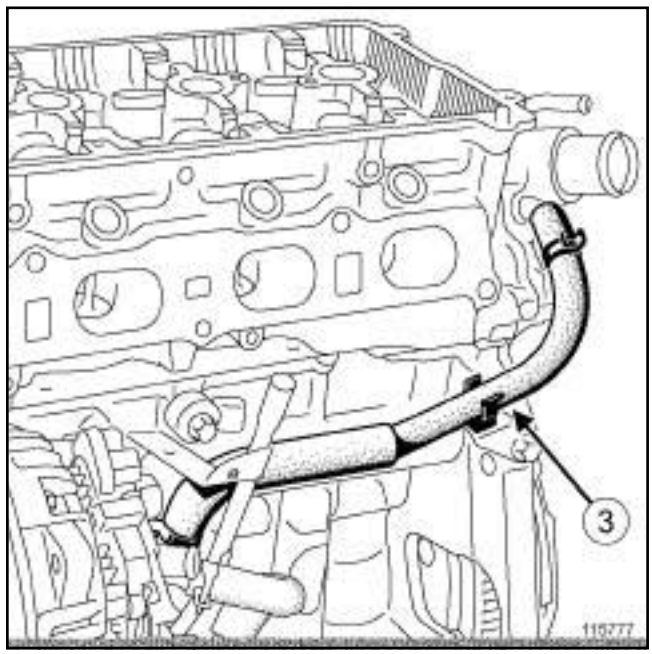


115928

❑ Immobilise the flywheel by fitting the tool **(Mot. 919-02)** (**1**) on the cylinder block.

M4R

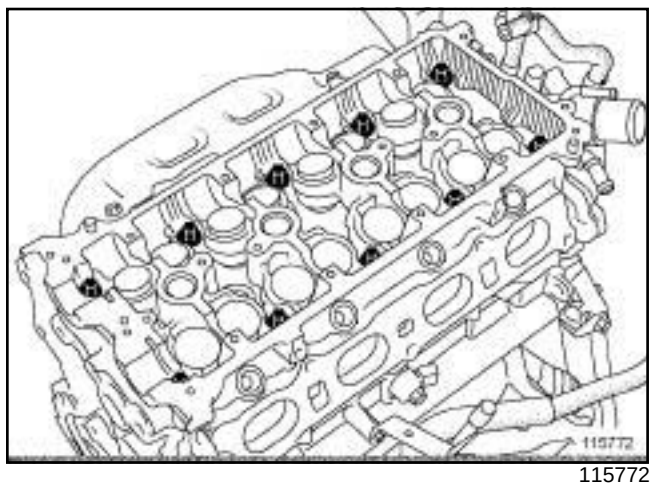
M4R, and 701



122839

❏ Immobilise the drive plate by fitting the tool **(Mot. 919-02)** (**2**) on the cylinder block.

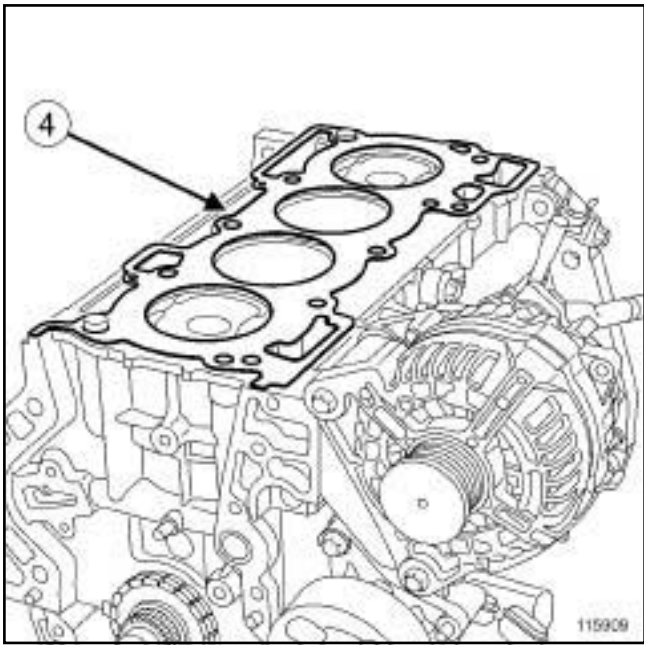
❏ Remove:



- the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) ,
- the **(Mot. 919-02)**,
- the crankshaft seal on the timing side (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) ,
- the timing chain (see **11A**, **Top and front of engine**, **Timing chain: Removal - Refitting**, page **11A-170**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the timing sprockets (see **Timing sprocket: Removal - Refitting**) ,
- the injector rail (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) ,
- the camshafts (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) .

II - REMOVAL OF CYLINDER HEAD

115777



❏ Remove the cooling hose (**3**) .

115772

❏ Remove:

- the cylinder head bolts using a **1/2" female torx socket (12.7 mm square drive)**,
- the cylinder head.

115909

❑ Remove the cylinder head gasket (**4**) from the cylinder block.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING

Protect the oilway so that foreign bodies do not enter the oil pipes in the cylinder head.

Failure to follow this instruction could lead to the blocking of the oilways, resulting in a rapid deterioration of the camshaft.

WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

❑ Use **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the cylinder block gasket face,
- the cylinder head joint face.

❑ Remove the residue using a plastic spatula.

❑ Finish cleaning the joint faces using a **GREY ABRASIVE PAD** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

WARNING

To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

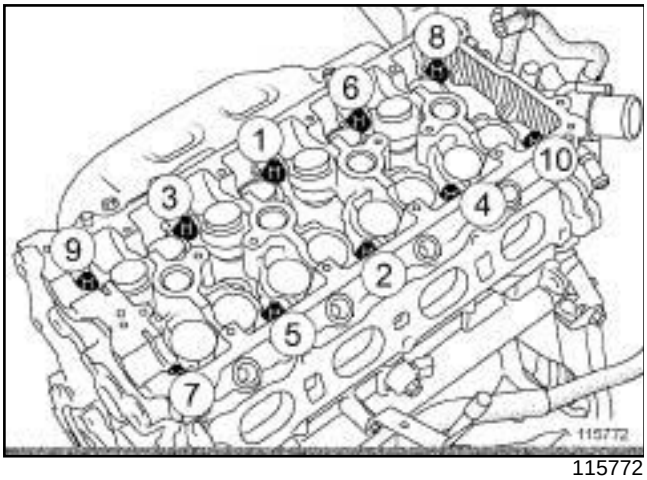
❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean:

- the cylinder block gasket face,
- the cylinder head joint face.

❑ Parts always to be replaced:

- the cylinder head gasket,
- the cylinder head bolts.

II - OPERATION FOR REFITTING THE CYLINDER HEAD



❑ Position piston 1 at Top Dead Centre.

❑ Check for the cylinder head centring dowels on the cylinder block.

❑ Refit:

- the new cylinder head gasket on the cylinder block,
- the cylinder head,
- the new cylinder head bolts.

M4R

115772

❑

Note:

Do not retighten the cylinder head bolts after applying this procedure.

❑ Tighten in order and to torque the cylinder head bolts **(40 N.m)**.

❑ Tighten to angle and in order the cylinder head bolts **(100°)**.

❑ Loosen all the cylinder head bolts.

❑ Tighten in order and to torque the **cylinder head bolts (1st tightening) (40 N.m)**.

❑ Tighten to angle and in order the **cylinder head bolts (2nd tightening) (100°)**.

❑ Retighten to angle and in order the **cylinder head bolts (3rd tightening) (100°)**.

❑ Refit the cooling hose ***(3)*** .

❑ Oil the camshaft bearings.

III - FINAL OPERATION

❑ Refit:

- the camshafts (see **11A**, **Top and front of engine**, **Camshaft: Removal - Refitting**, page **11A-247**) ,
- the injector rail (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) ,
- the timing sprockets (see **Timing sprocket: Removal - Refitting**) ,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the timing chain (see **11A**, **Top and front of engine**, **Timing chain: Removal - Refitting**, page **11A-170**) ,
- the crankshaft seal on the timing side (see **10A**, **Engine and cylinder block assembly**, **Crankshaft seal on timing end: Removal - Refitting**, page **10A-1**) .

❑ Immobilise the flywheel or the drive plate using the tool **(Mot. 919-02)**.

❑ Refit the crankshaft accessories pulley (see **11A**, **Top and front of engine**, **Crankshaft accessories pulley: Removal - Refitting**, page **11A-31**) .

❑ Remove the tool **(Mot. 919-02)**.

❑ Refit the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) .

❑ Remove the engine from the component support (see **Engine support equipment: Use**) .

M4R, and 700

❑ Connect the manual gearbox to the engine (see **Manual gearbox: Removal - Refitting**) (21A, Manual gearbox).

M4R, and 701

❑ Connect the automatic gearbox to the engine (see **Automatic gearbox: Removal - Refitting**) (23A, Automatic transmission).

❑ Refit the « engine and gearbox» assembly (see **10A**, **Engine and cylinder block assembly**, **Engine - gearbox assembly: Removal - Refitting**, page **10A-162**) .

❑ Top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

F4R

Special tooling required	
Mot. 1573	Cylinder head support

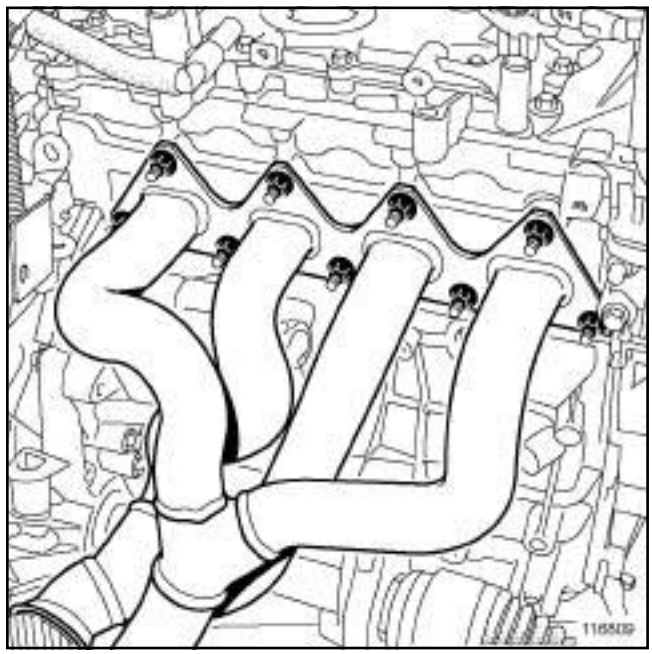
Equipment required
Diagnostic tool

Tightening torques ▽	
cylinder head bolts	**30 N.m**
cylinder head bolts	**30 N.m**
cylinder head bolts	**180° ± 25°**
exhaust manifold nuts	**30 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Perform the following operations:

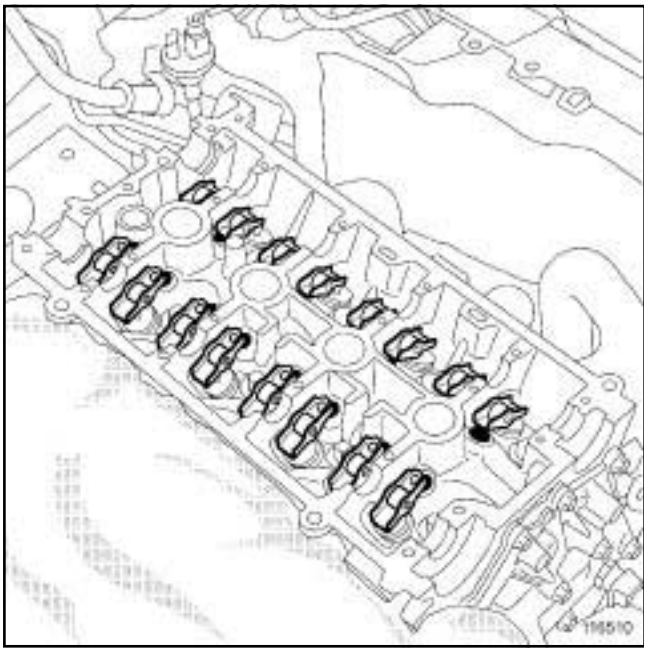
- drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

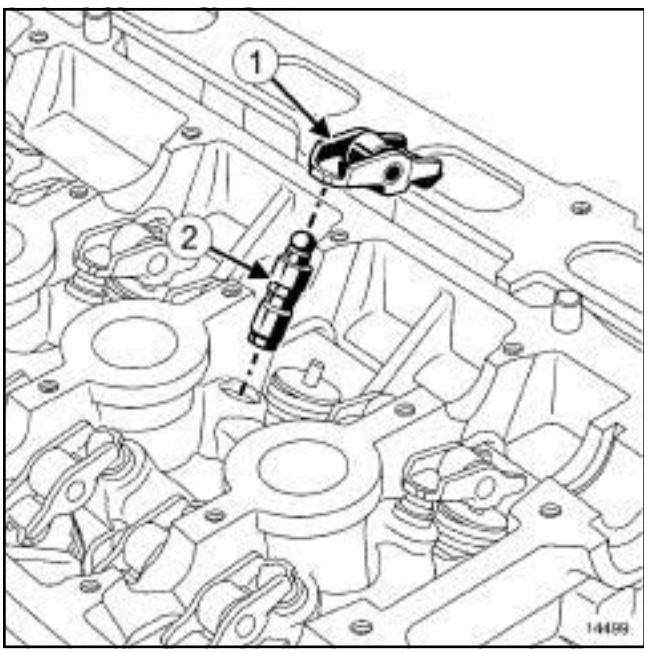
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the injector holder plate equipped with the injector rail (see **12A**, **Fuel mixture**, **Injector holder shim: Removal - Refitting**, page **12A-70**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

116809

❏ Remove the exhaust manifold nuts.



❏ Move aside the exhaust manifold.



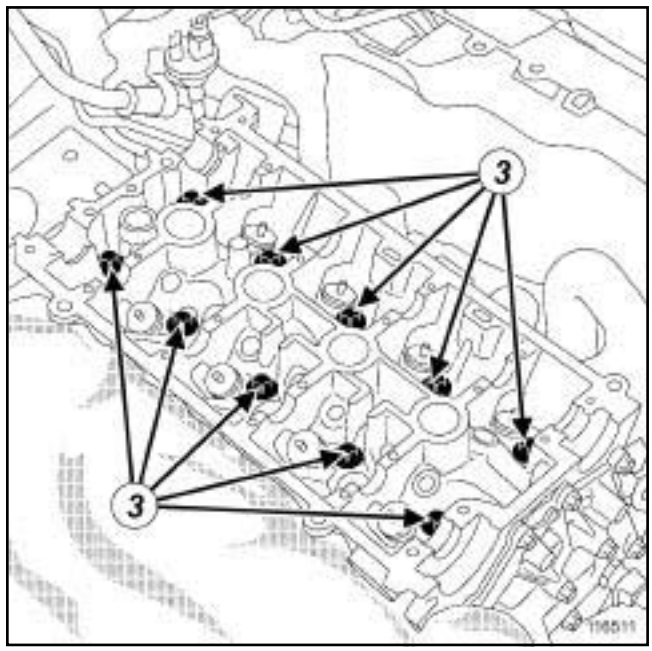
❏ Remove:

- the exhaust manifold gasket,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the inlet and exhaust camshafts.

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

116510



14499

❑ Remove:

- the valve rockers (**1**) ,
- the hydraulic tappets (**2**) .

Note:

To prevent any risk of unpriming the hydraulic tappets make sure that they are vertical.

116511

❑ Remove:

- the cylinder head bolts (**3**) ,
- the cylinder head.

❑ Mount the cylinder head on the cylinder head support **(Mot. 1573)**.

❑ Remove the cylinder head seal.

REFITTING

I - REFITTING PREPARATION OPERATION

1 - CLEANING THE CYLINDER HEAD

❑ **parts always to be replaced: cylinder head bolts (10,02,01,14)**.

❑ **parts always to be replaced: Cylinder head gasket (10,02,01,04)**.

❑ **parts always to be replaced: exhaust manifold seal (10,07,02,07)**.

F4R

❑ Clean the cylinder head.

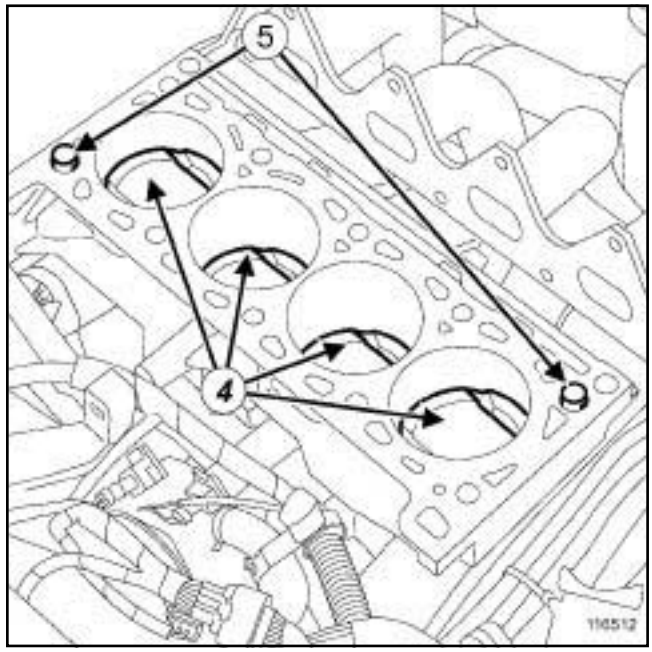
IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Do not allow this product to drip onto the paintwork.



Clean the cylinder head carefully to avoid any foreign bodies entering the oil return and supply pipes.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

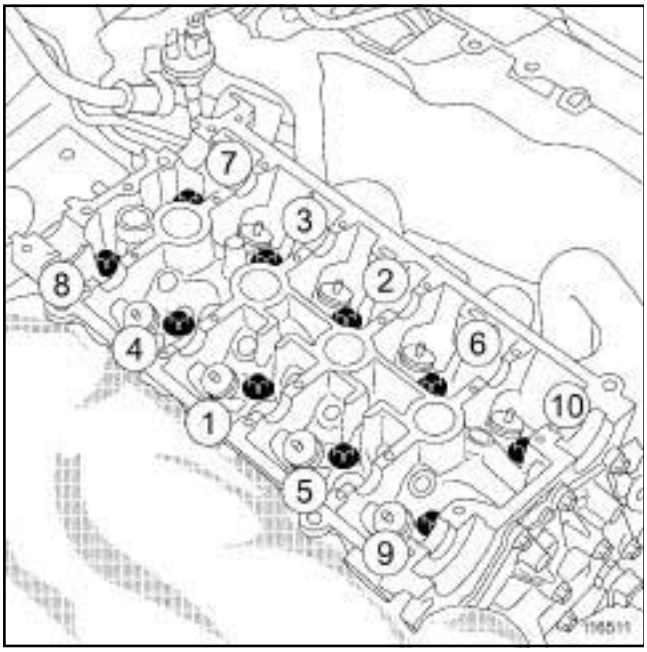
❑ Clean the joint faces using **SUPER CLEANING AGENT FOR JOINT FACES** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to dissolve the part of the seal that is still attached to the cylinder head and the cylinder block.

❑ Apply the product to the part to be cleaned, wait approximately ten minutes then remove the residue with a wooden spatula.

2 - PREPARING TO FIT THE CYLINDER HEAD

116512

❑ Place the pistons at (**4**) half stroke.



❑ Check that the centring devices (**5**) are present and in good condition on the cylinder block.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new cylinder head gasket,
- the cylinder head,
- new cylinder head bolts.

Tightening the cylinder head

116511

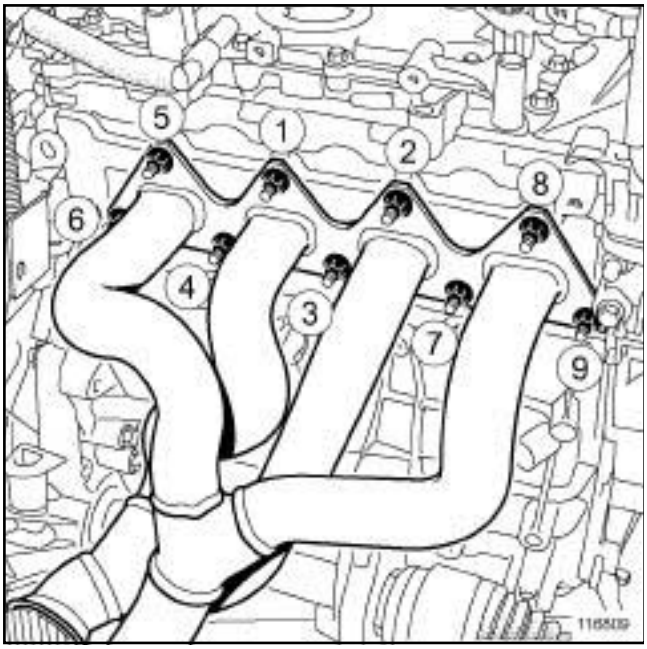
❏ Torque tighten (initial tightening) in order the **cylinder head bolts (30 N.m)**.

❏ Torque tighten (second tightening) in order the **cylinder head bolts (30 N.m)**.

❏ Angle tighten in order the **cylinder head bolts (180° ± 25°)**.

> Note:
>
> Do not retighten the cylinder head bolts after applying this procedure.

III - FINAL OPERATION



❏ Refit:

- the hydraulic tappets,
- the valve rockers,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

❏ Fit:

- a new exhaust manifold gasket,
- the exhaust manifold.

F4R

116809

❏ Refit the exhaust manifold nuts.

❏ Torque tighten in order the **exhaust manifold nuts (30 N.m)**.

❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the oil separator (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the injector holder plate equipped with the injector rail (see **12A**, **Fuel mixture**, **Injector holder shim: Removal - Refitting**, page **12A-70**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❏ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- fill and bleed the coolant circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Refit the engine undertray.

❏ Using the **Diagnostic tool**, check that there are no faults stored by the injection computer and clear them if necessary.

F4R, and 830

Special tooling required	
Mot. 1573	Cylinder head support

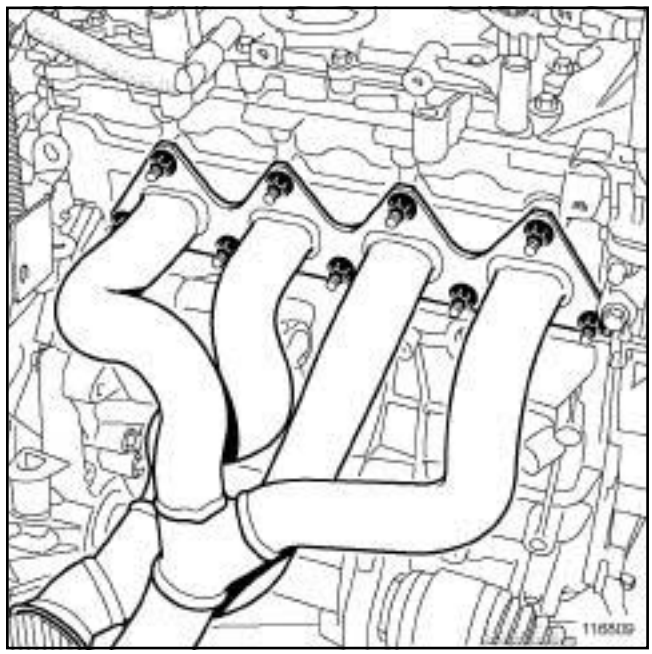
Equipment required
Diagnostic tool

Tightening torques ▽	
cylinder head mounting bolts	**30 Nm**
cylinder head mounting bolts	**180° ± 25°**
exhaust manifold mounting nuts	**18 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Perform the following operations:

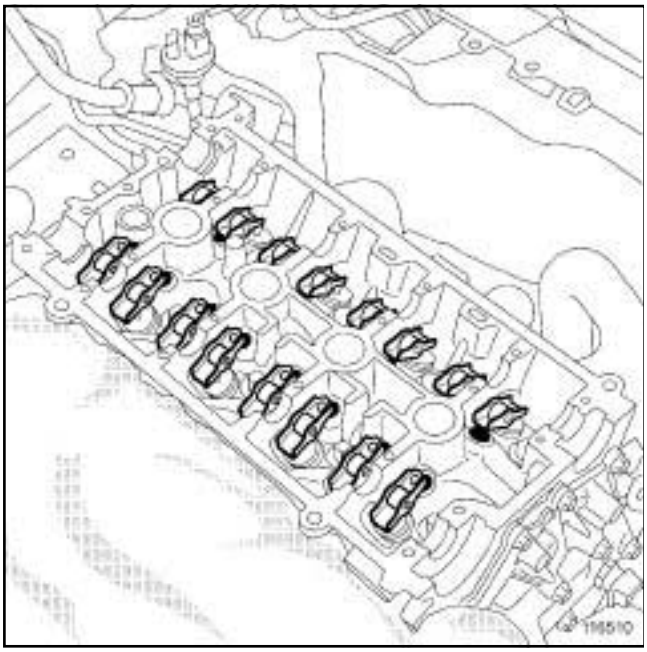
- drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- drain the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Remove:

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the injector holder plate equipped with the injector rail (see **12A**, **Fuel mixture**, **Injector holder shim: Removal - Refitting**, page **12A-70**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, Bodywork, 55A, Exterior protection),
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

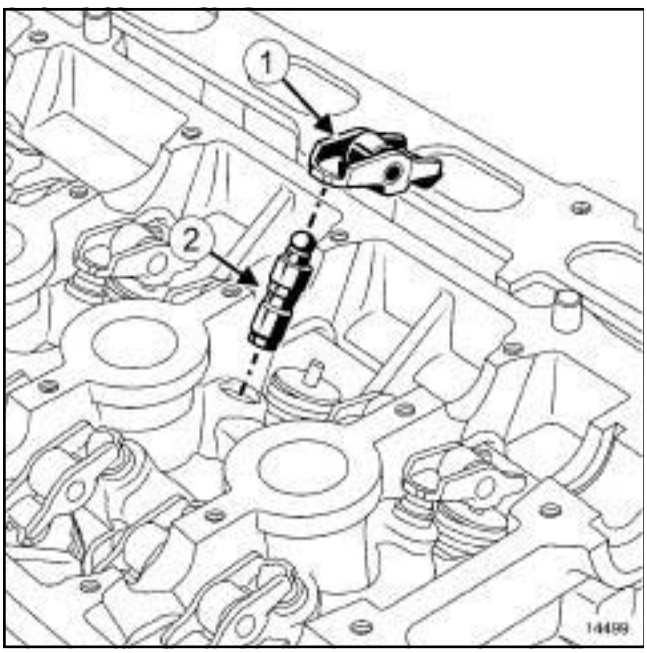
116809

❏ Remove the mounting nuts from the exhaust manifold.



❏ Move aside the exhaust manifold.

❏ Remove:

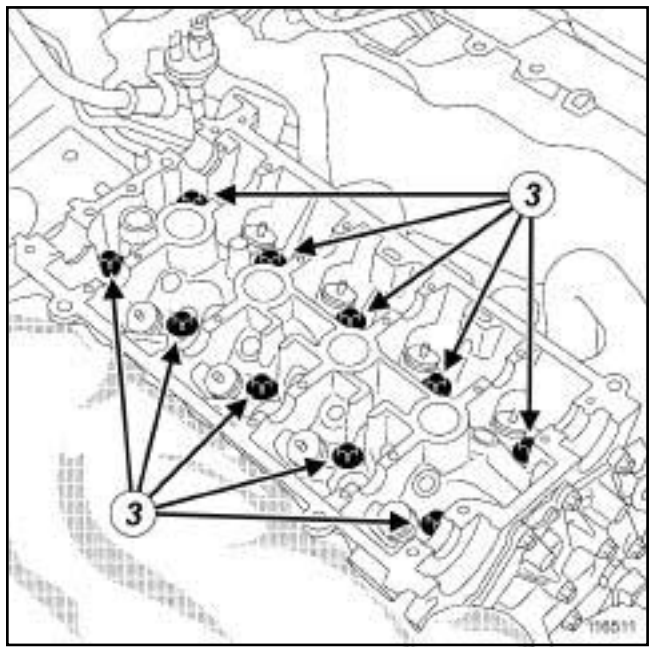


- the exhaust manifold gasket,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) ,
- the inlet and exhaust camshafts.

F4R, and 830

II - OPERATION FOR REMOVAL OF PART CONCERNED

116510



14499

❑ Remove:

- the valve rockers (**1**) ,
- the hydraulic tappets (**2**) .

Note:

To prevent any risk of unpriming the hydraulic tappets make sure that they are vertical.

116511

❑ Remove:

- the cylinder head mounting bolts (**3**) ,
- the cylinder head.

❑ Mount the cylinder head on the cylinder head support **(Mot. 1573)**.

❑ Remove the cylinder head gasket.

F4R, and 830

REFITTING

I - REFITTING PREPARATIONS OPERATION

1 - CLEANING THE CYLINDER HEAD

❑ Clean the cylinder head.

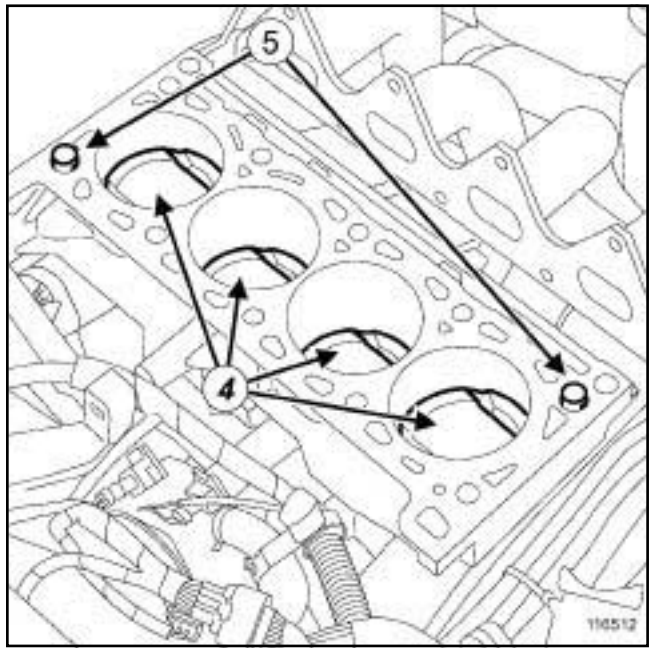
IMPORTANT
Wear goggles with side protectors for this operation.

IMPORTANT
Wear latex gloves during the operation.

WARNING
Do not scratch the aluminium joint faces: any surface damage to the joint faces may cause leaks.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

WARNING
Do not allow this product to drip onto the paintwork.



Clean the cylinder head carefully to prevent foreign bodies from entering the oil supply and return galleries.

Failure to follow this advice could lead to the blocking of the various oil inlet galleries, which would quickly result in engine damage.

❑ Clean the joint faces with **SUPER CLEANER FOR JOINT FACES** to dissolve any part of the seal still remaining on the cylinder head and cylinder block.

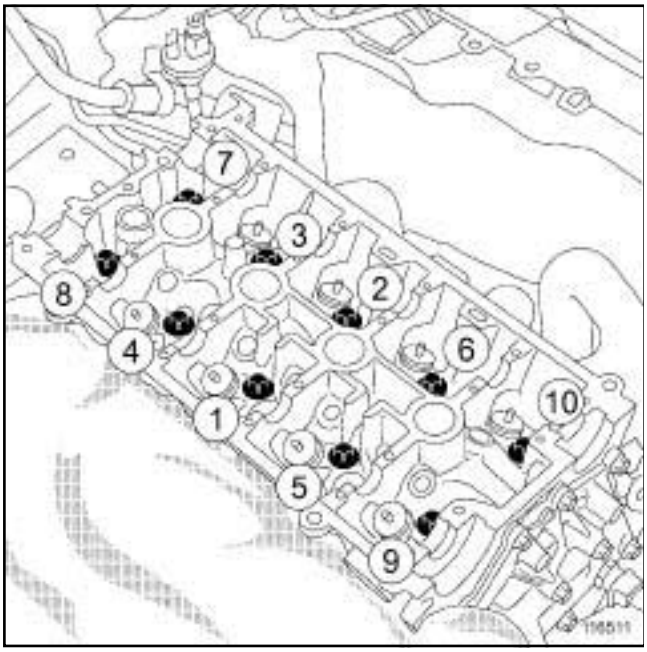
Apply the product to the part to be cleaned, wait approximately ten minutes then remove the residue with a wooden spatula.

2 - PREPARING TO FIT THE CYLINDER HEAD

116512

❑ Place the pistons at (**4**) half stroke.

❑ Check that the centring devices (**5**) are present and in good condition on the cylinder block.



II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the new cylinder head gasket,
- the cylinder head,
- the new cylinder head bolts.

F4R, and 830

Tightening the cylinder head:

116511

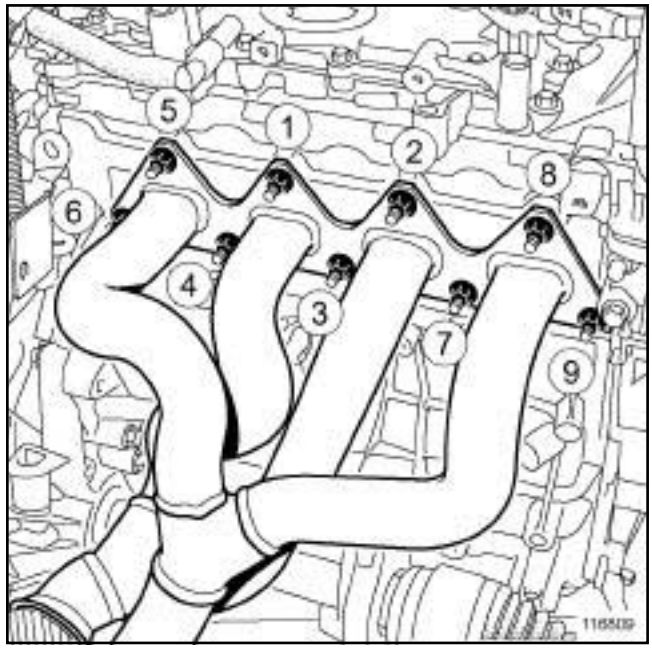
❏ First, torque tighten, in order the **cylinder head mounting bolts (30 Nm)**.

❏ Then torque tighten, in order the cylinder head mounting bolts again **(30 Nm)**.

❏ Angle tighten in order the **cylinder head mounting bolts (180° ± 25°)**.

Note:

Do not retighten the cylinder head mounting bolts after applying this procedure.



III - FINAL OPERATION.

❏ Refit:

- the hydraulic tappets,
- the valve rockers,
- the rocker cover (see **11A**, **Top and front of engine**, **Rocker cover: Removal - Refitting**, page **11A-183**) .

❏ Fit:

- the new exhaust manifold gasket,
- the exhaust manifold.

116809

❏ Refit the exhaust manifold mounting nuts.

❏ Torque tighten in order the **exhaust manifold mounting nuts (18 Nm)**.

❏ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- the accessories belt (see **11A**, **Top and front of engine**, **Accessories belt: Removal - Refitting**, page **11A-5**) ,
- the front bumper (see **Front bumper: Removal - Refitting**) (MR 393, Bodywork, 55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the oil decanter (see **11A**, **Top and front of engine**, **Oil decanter: Removal - Refitting**, page **11A-302**) ,
- the ignition coils (see **17A**, **Ignition**, **Coils: Removal - Refitting**, page **17A-2**) ,
- the injector holder plate equipped with the injector rail (see **12A**, **Fuel mixture**, **Injector holder shim: Removal - Refitting**, page **12A-70**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,

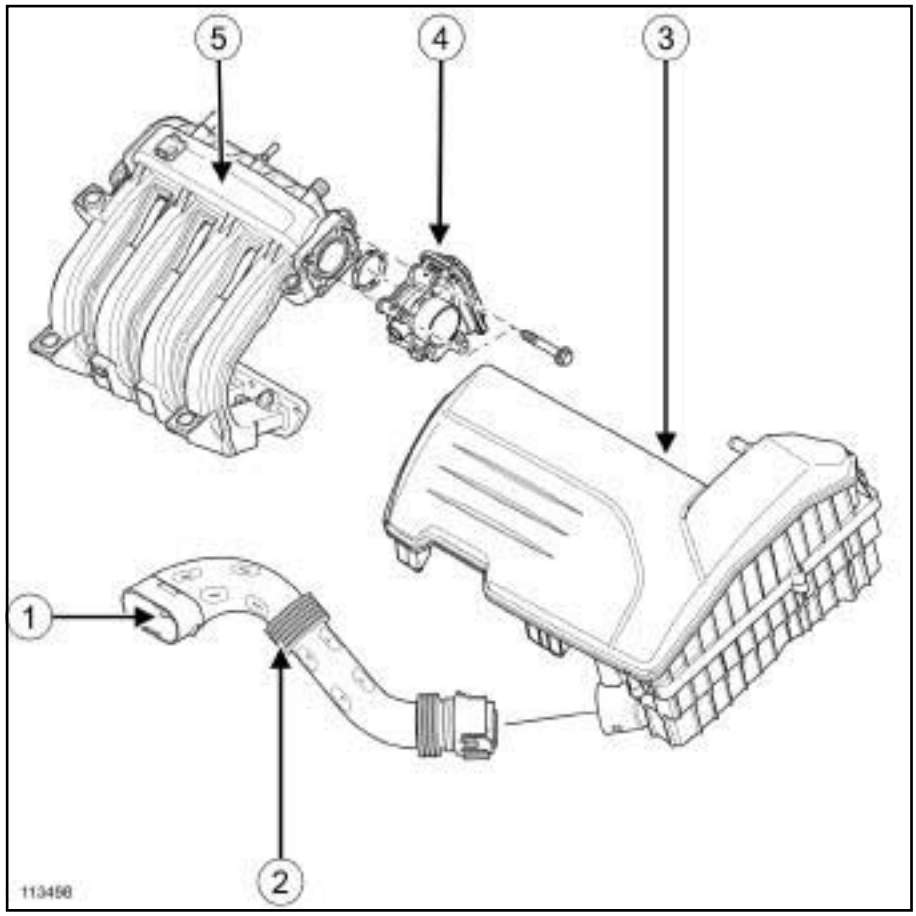
F4R, and 830

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,

❑ Perform the following operations:

- top up the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) ,
- refill the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



❑ Bleed the cooling system (see **Cooling system: Bleed**) .

❑ Refit the engine undertray.

❑ Using the **Diagnostic tool**, check that there are no faults stored by the injection computer and clear them if necessary.

I - AT LOW SPEED

The soundproofing unit control solenoid valve ***(6)*** controls the soundproofing unit valve, which is in the closed position. Air enters only via the main air inlet ***(1)*** .

II - AT HIGH SPEED

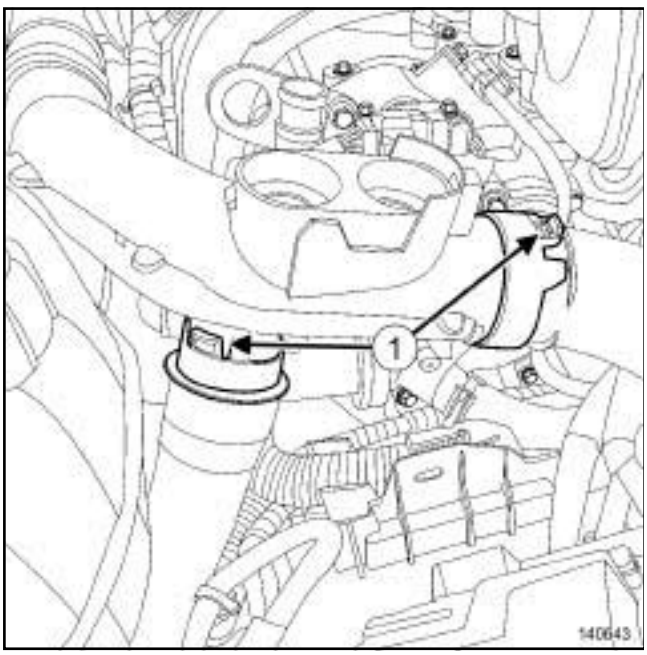
The soundproofing unit control solenoid valve ***(6)*** no longer controls the soundproofing unit valve, which is in the open position. Air enters via the main air inlet ***(1)*** and the soundproofing unit air inlet ***(4)*** at a ratio of 60% for the main air inlet and 40% for the soundproofing unit air inlet.

Note:

In rest position the soundproofing unit valve is open; if the control circuit is not correctly sealed, the valve will be in the rest position.

K4M – F4R

REMOVAL



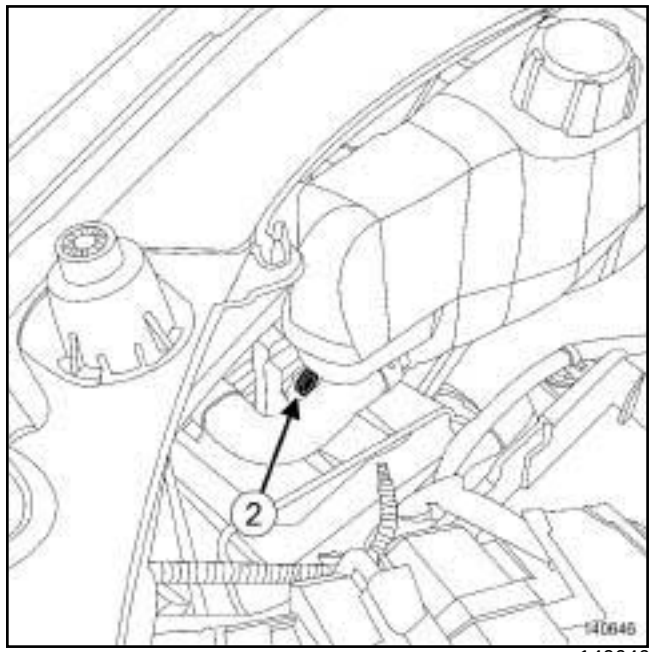
I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine cover,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery).

K4M, and 862



140643

❑ Unclip the air inlet pipe from the air filter unit (**1**) .

❑ Move aside the air filter unit air inlet pipe.

II - OPERATION FOR REMOVAL OF PART CONCERNED

140646

❑ Remove:

- the air resonator upper mounting (**2**) ,
- the air resonator.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

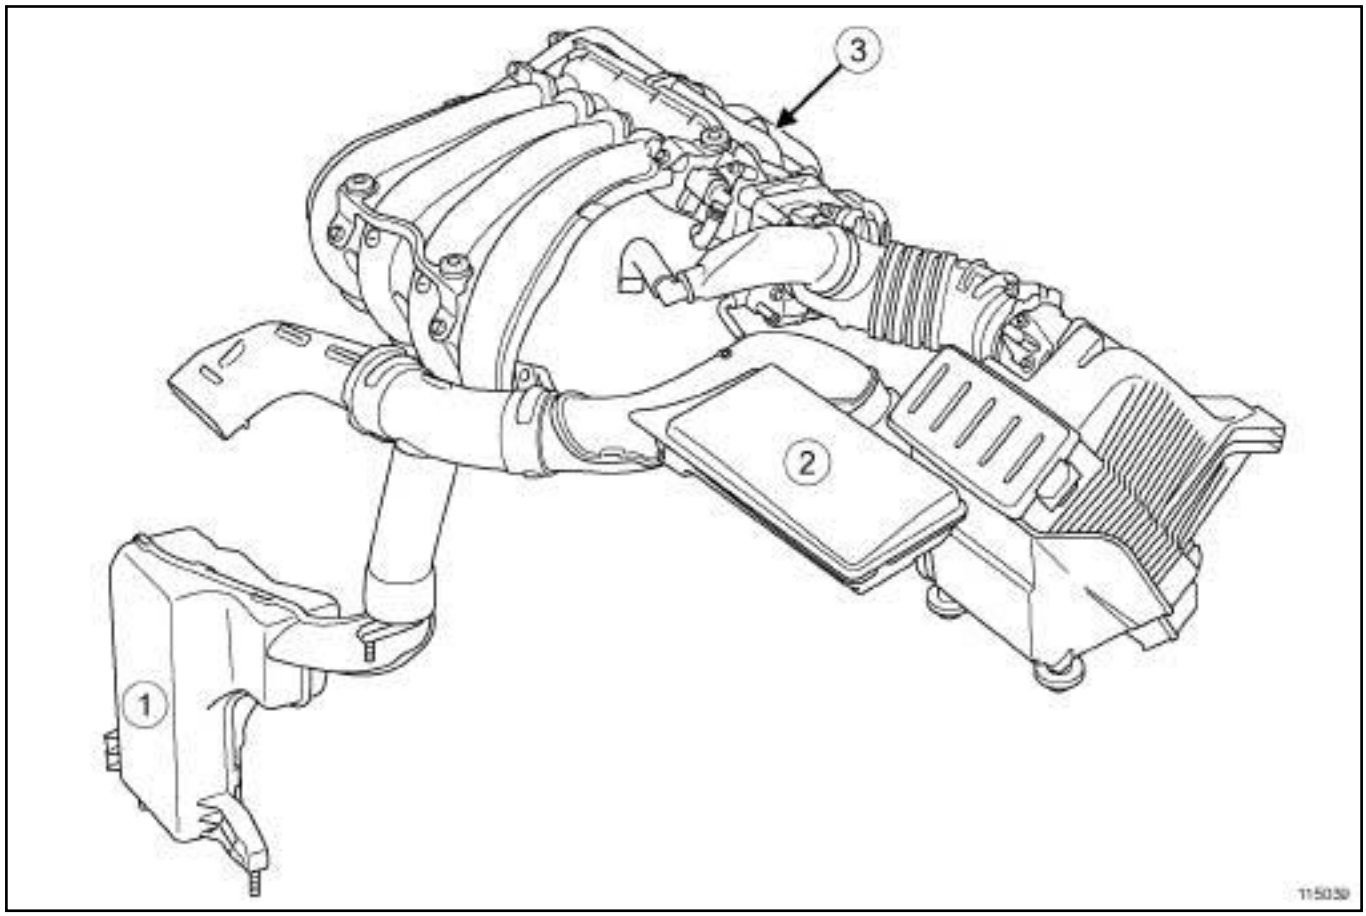
- the air resonator,
- the air resonator upper mounting.

II - FINAL OPERATION

K4M, and 862

❑ Refit the air filter unit air inlet pipe.

❑ Refit:



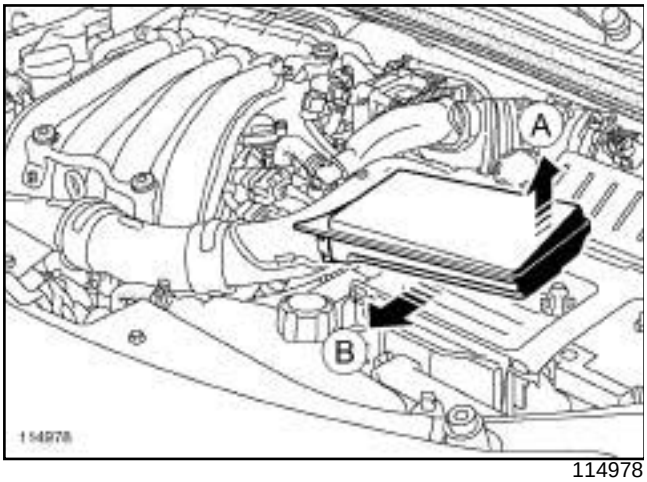
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the air inlet duct,
- the engine cover,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R

Tightening torques ▽	
air resonator mounting bolt on the intake distributor	**11 Nm**

Note:

The vehicle has three air resonators.

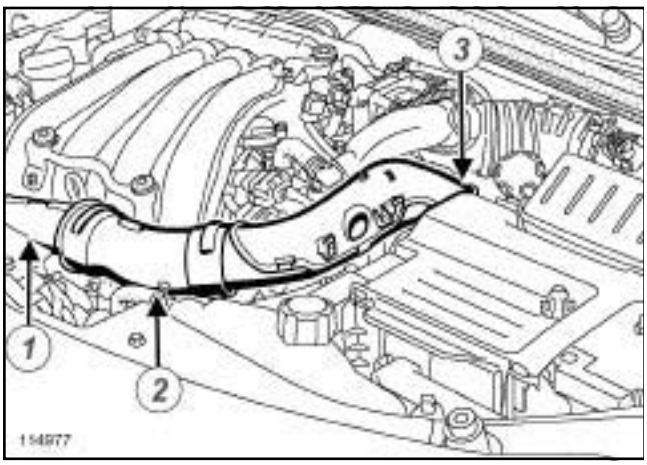


115039

(**1**) Air resonator on front end panel
(**2**) Air resonator on battery
(**3**) Air resonator on inlet manifold

M4R

REMOVING THE AIR RESONATOR ON THE FRONT END PANEL



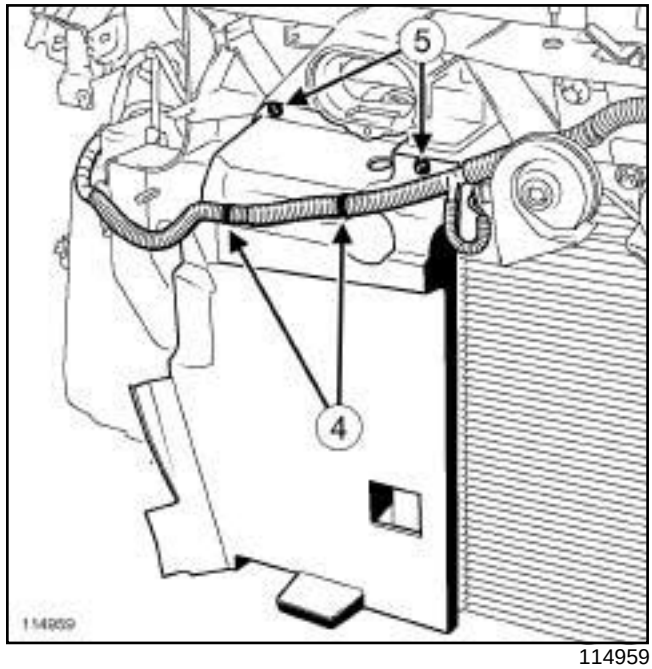
I - REMOVAL PREPARATION OPERATION

114978

❏ Lift the air resonator (**A**) to remove it from the battery cover.

❏ Pull the air resonator towards the front of the vehicle (**B**) to remove it.

114977



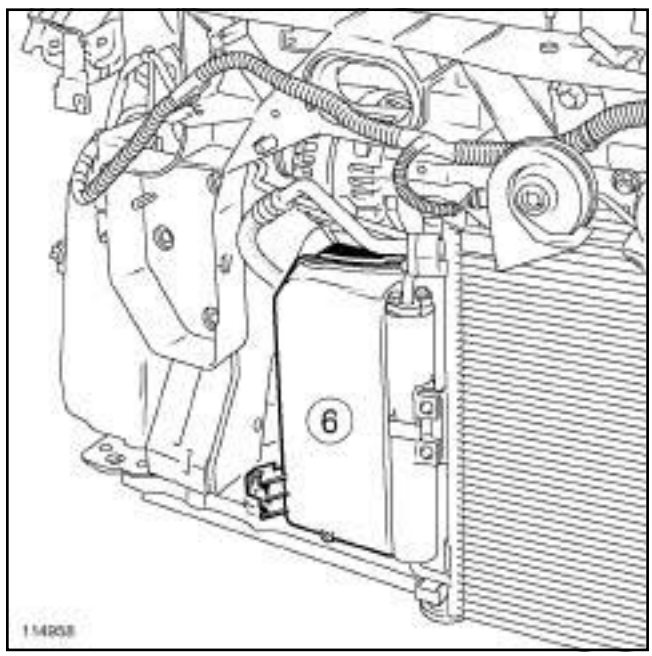
❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove the air intake sleeve.

❏ Remove the front bumper (see **Action / Front side roof rail lining**) (MR 393, 55A, Exterior protection).

❏ Remove the frontal impact cross member (see **Front end lower cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).



114959

❏ Unclip the wiring harness at (**4**) .

❏ Remove:

- plastic rivets (**5**) ,
- the air deflector.

II - REMOVAL OF PART CONCERNED

114958

❏ Lift the air resonator on the front end panel (**6**) to remove it from the mountings.

❏ Remove the air resonator on the front end panel.

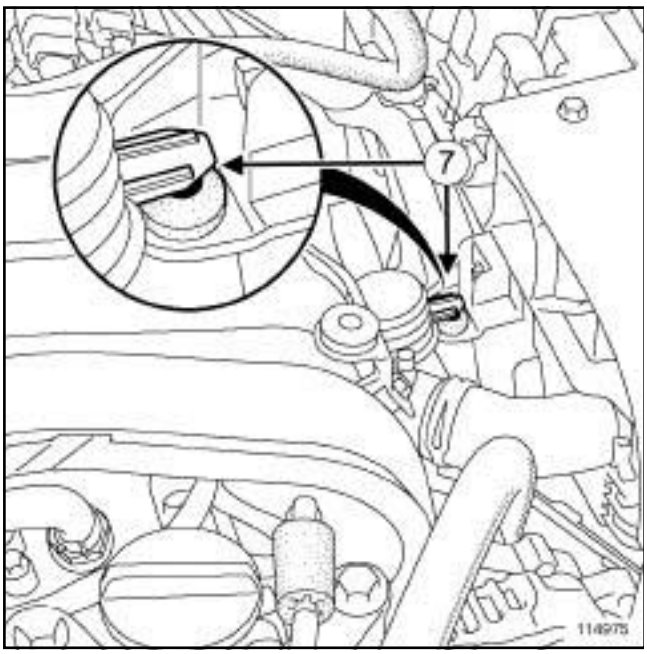
M4R

REFITTING THE AIR RESONATOR ON THE FRONT END PANEL

I - REFITTING PREPARATIONS OPERATION

❏ Check that there are three air resonator mountings on the front end panel.

II - REFITTING PART CONCERNED

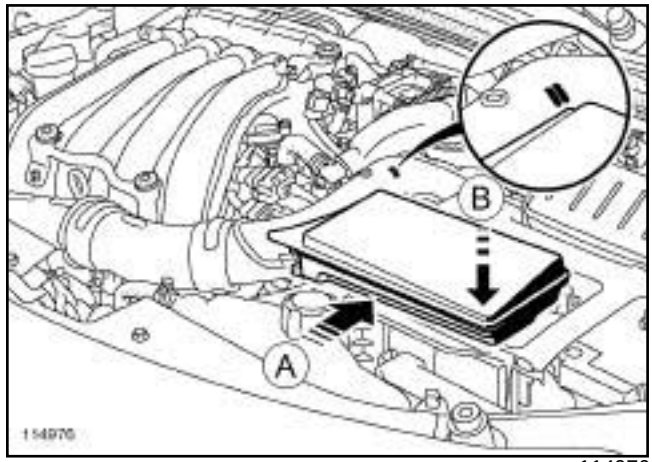


❏ Refit the air resonator on the front end panel.

III - FINAL OPERATION.

❏ Refit the air deflector.

❏ Refit the frontal impact cross member (see **Front end lower cross member: Removal - Refitting**) (MR 393, 41A, Front lower structure).



❏ Refit the front bumper (see **Action / Front side roof rail lining**) (MR 393, 55A, Exterior protection).

114975

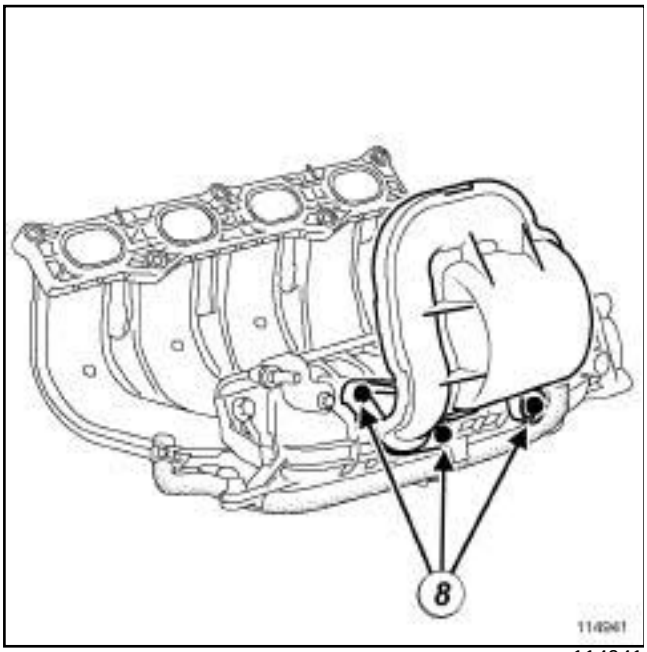
❏ Before refitting the air intake sleeve, check that the air resonator's upper mounting in the front end panel is correctly clipped at (**7**) .

❏ Refit the air intake sleeve.

114976

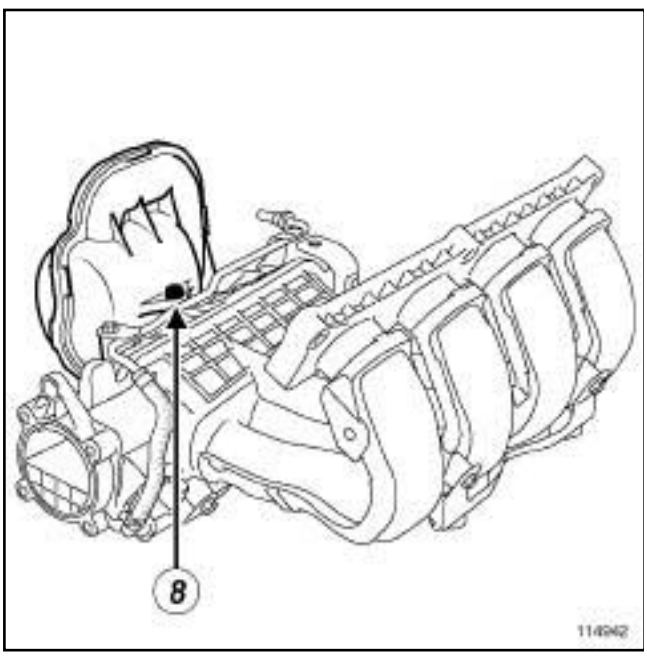
❏ Push the air resonator towards the rear of the vehicle (**A**) until the air resonator's rear face is located between the two marks on the air intake sleeve.

❏ Push the air resonator (**B**) to fit it onto the battery cover.



REMOVING THE AIR RESONATOR ON THE INLET MANIFOLD

I - REMOVAL PREPARATION OPERATION



❏ Remove the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

M4R

II - REMOVAL OF PART CONCERNED

114941

114942

❑ Remove the mounting bolts (**8**) from the air resonator on the intake distributor.

REFITTING THE AIR RESONATOR ON THE INLET MANIFOLD

I - REFITTING PREPARATIONS OPERATION

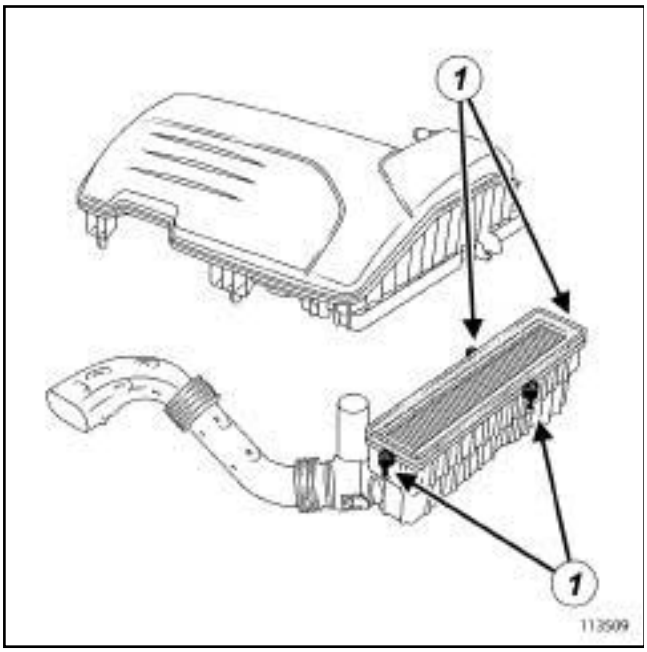
❑ The O-ring of the air resonator on the inlet manifold must always be replaced.

II - REFITTING PART CONCERNED

❑ Torque tighten the **air resonator mounting bolt on the intake distributor (11 Nm)**.

III - FINAL OPERATION.

❑ Refit the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .



D4F, and 740 or 742 or 764

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

113509

❑ Remove:

- the mounting bolts (**1**) from the air filter unit cover,
- the air filter.

REFITTING

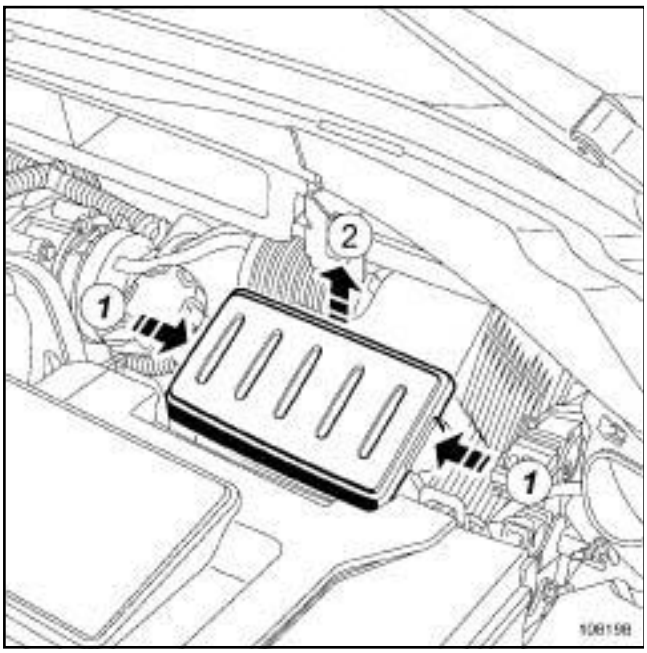
I - REFITTING PREPARATION OPERATION

❑ Clean the air filter housing.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the air filter,
- the bolts mounting the air filter unit cover.

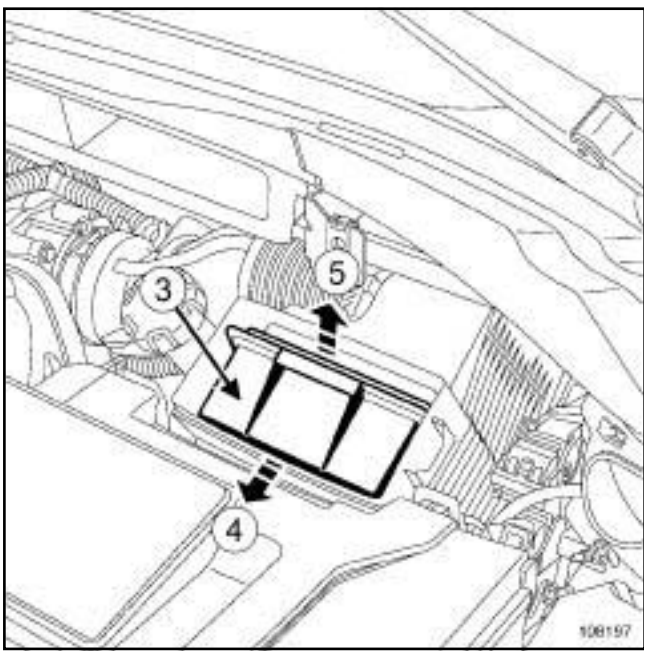


III - FINAL OPERATION.

❑ Refit the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

F4R or K4J or K4M or K9K or M4R – D4F, and 784

REMOVAL



I - REMOVAL PREPARATION OPERATION

108198

❑ Remove the air filter cover in the order of the arrows as shown above.

II - OPERATION FOR REMOVAL OF PART CONCERNED

108197

❑ Remove:

- the air filter (**3**) in the order of the arrows as shown above,
- the air filter from the air filter unit.

REFITTING

I - REFITTING PREPARATION OPERATION

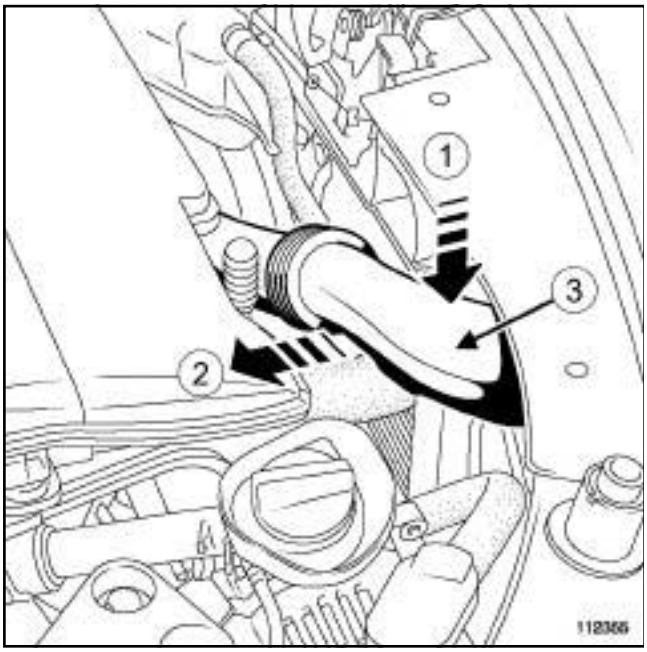
❑ Clean the air filter unit.

II - REFITTING OPERATION FOR THE PART IN QUESTION

❑ Reinsert the air filter into the air filter unit correctly.

WARNING
If the air filter is fitted incorrectly in the air filter unit, unfiltered air may enter the engine.

❑ Press down firmly on the air filter and then pull it down.



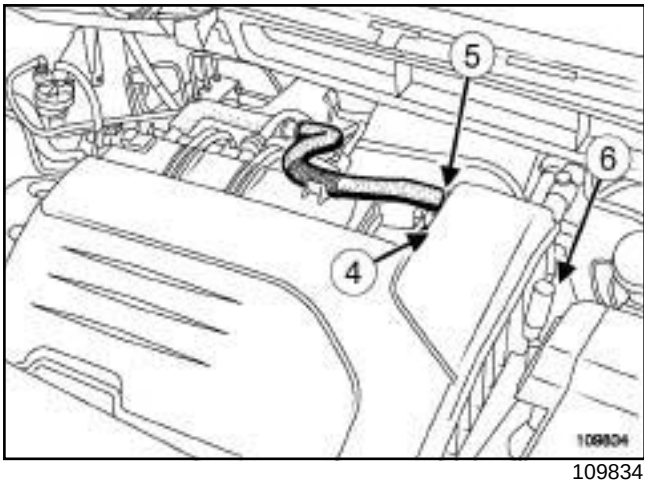
III - FINAL OPERATION

❑ Refit the cover on the air filter unit.

D4F, and 740 or 742 or 764

REMOVAL

I - REMOVAL PREPARATION OPERATION

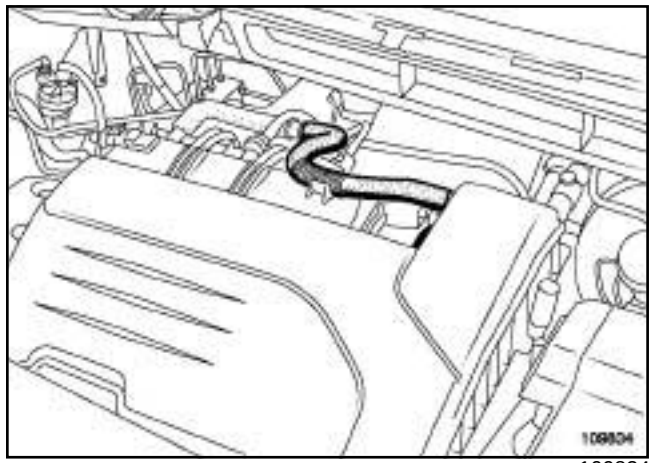


112355

❏ Apply pressure to (**1**) .

❏ Pull at (**2**) .

❏ Remove the air breather sleeve ***(3)*** from the front end panel.



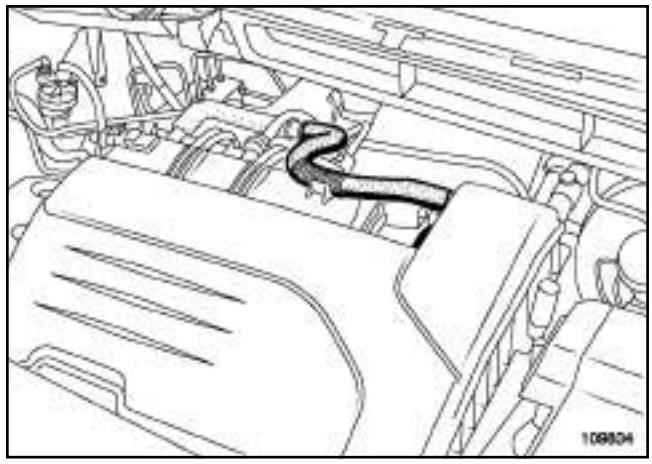
109834

❏ Undo the clip ***(4)*** mounting the air filter unit to the motorised throttle valve.

❏ Disconnect the oil vapour rebreathing hoses at ***(5)*** .

❏ Unclip the gearbox breather at ***(6)*** .

II - OPERATION FOR REMOVAL OF PART CONCERNED



109834

❏ Remove the air filter unit:

- lift out the air filter unit to remove it from the rocker cover,
- push the air filter unit towards the right to remove it from the motorised throttle valve.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

109834

❏ Refitting the air filter unit:

- push the air filter unit towards the left to attach it to the motorised throttle valve,
- lower the air filter unit to attach it to the rocker cover.

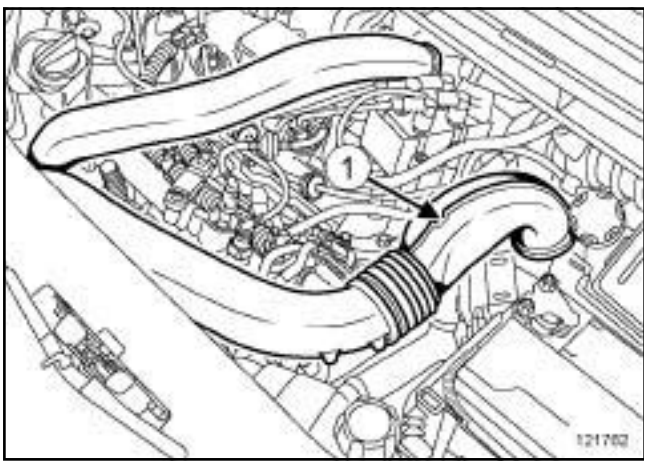
II - FINAL OPERATION.

❏ Retighten the clip securing the air filter unit onto the motorised throttle valve.

D4F, and 740 or 742 or 764

- ❏ Connect the oil vapour rebreathing hoses.
- ❏ Clip the gearbox breather into place.
- ❏ Connect the breather sleeve onto the front end panel.

K4J or K4M or K9K or M4R – D4F, and 784

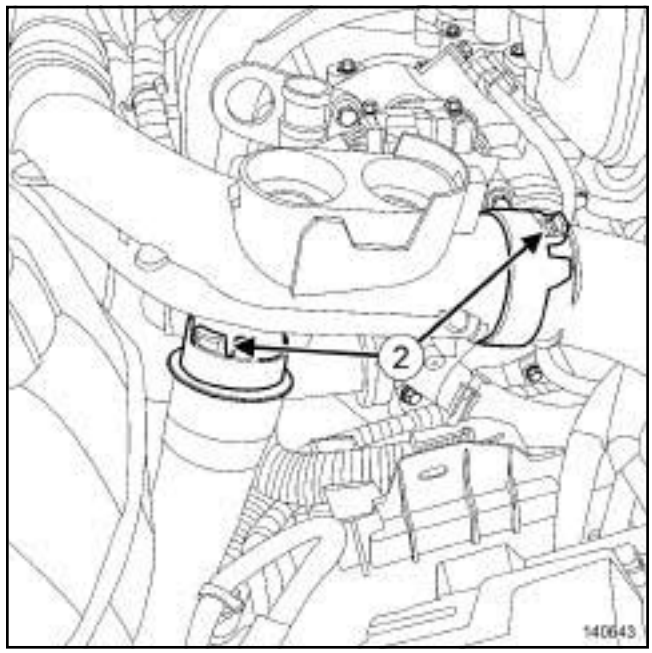


Tightening torques ▽	
air inlet duct clip	**6 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the battery (see **Battery: Removal - Refitting**) (80A, Battery).

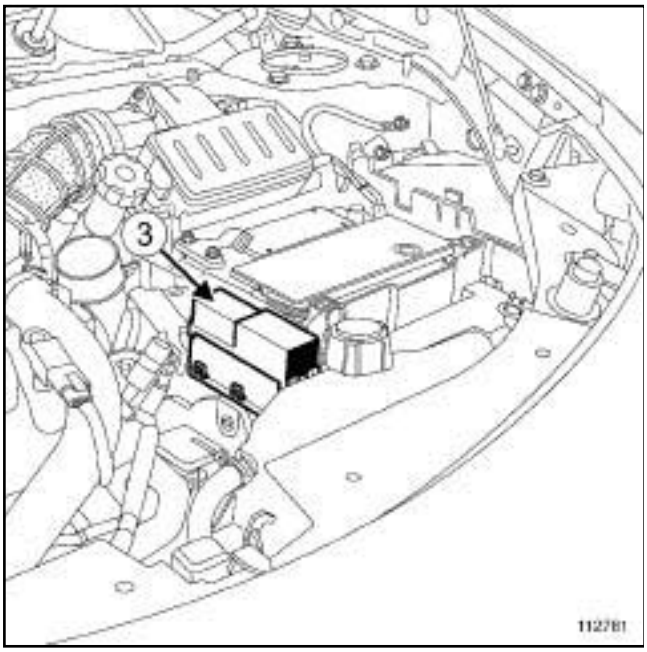


K4J or K9K or M4R – D4F, and 784 – K4M, and 800 or 801 or 804

121762

❏ Disconnect the air inlet pipe (**1**) from the air filter unit.

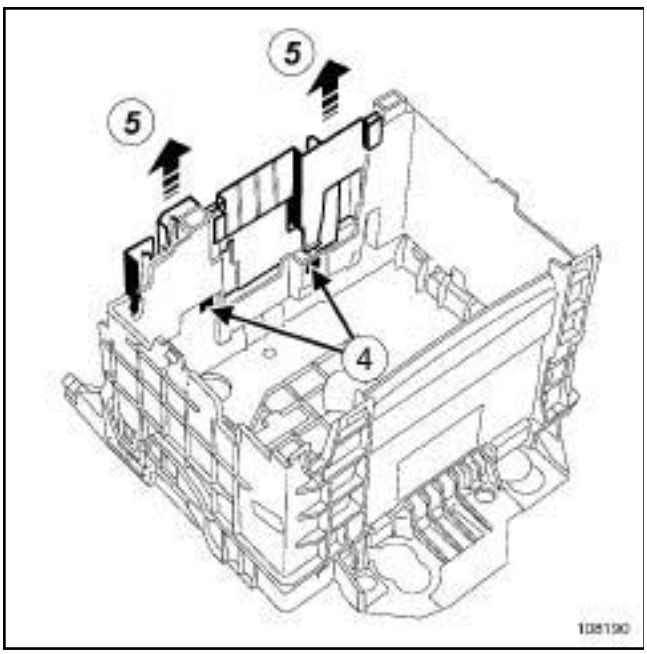
K4M, and 862



140643

❏ Unclip the air inlet pipe from the air filter unit at (**2**) .

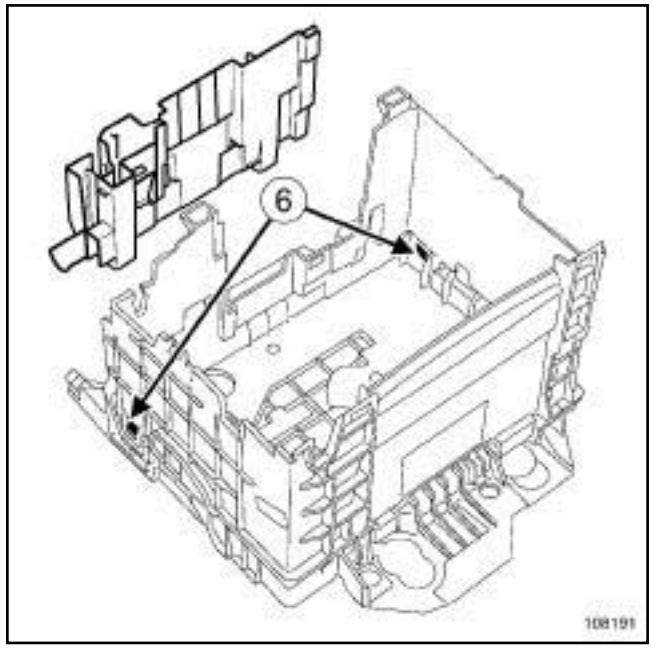
❏ Move aside the air inlet pipe from the air filter unit.



K4J or K4M or K9K or M4R – D4F, and 784

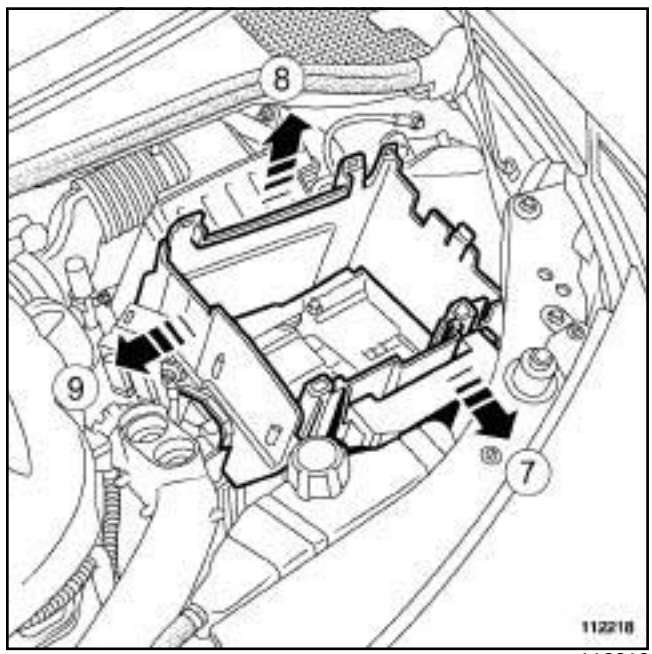
K4J or K4M or K9K or M4R

112781



❏ Remove the relay unit (**3**) from the thermal protection tray.

108190

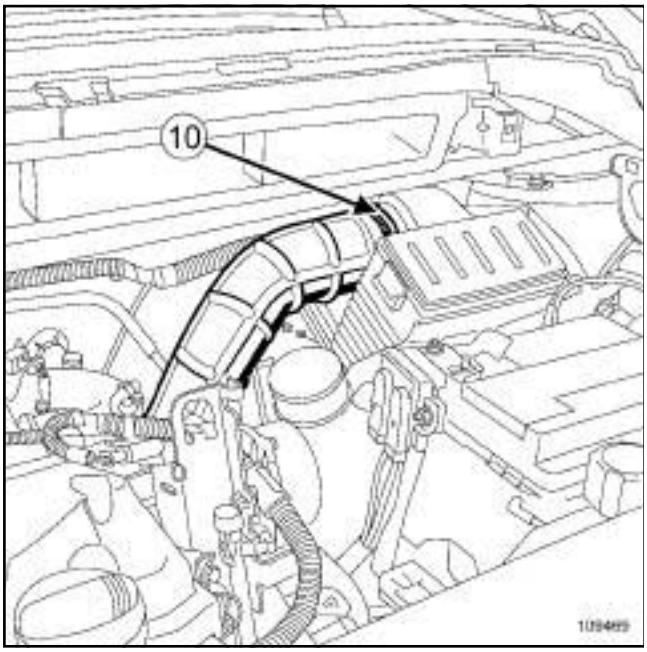


❏ Unclip the power feed fuse board support at (**4**) .

❏ Move aside the power feed fuse board support at (**5**) .

108191

❏ Unclip the thermal protection shield at (**6**) .



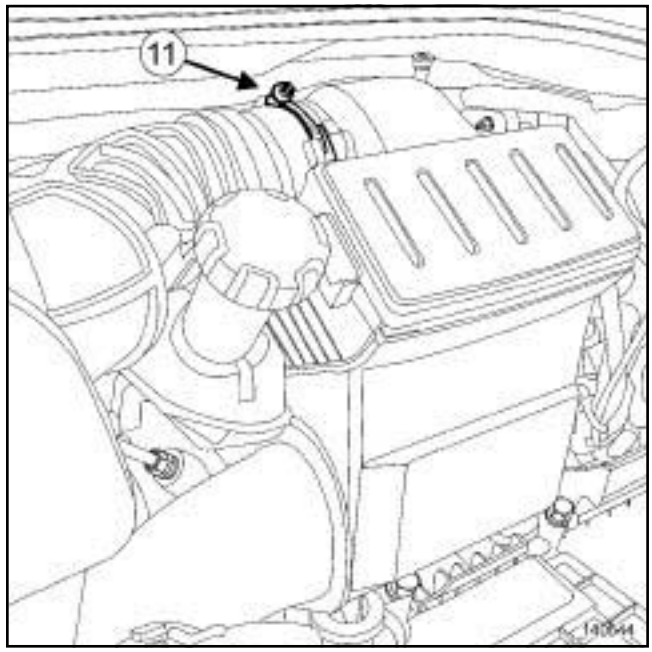
112218

❏ Hold the power feed fuse board mounting aside at (**7**) .

❏ Remove the thermal protection tray at (**8**) and (**9**) .

K4J or K4M or K9K or M4R – D4F, and 784

K4J or K9K or M4R – D4F, and 784 – K4M, and 800 or 801 or 804



109469

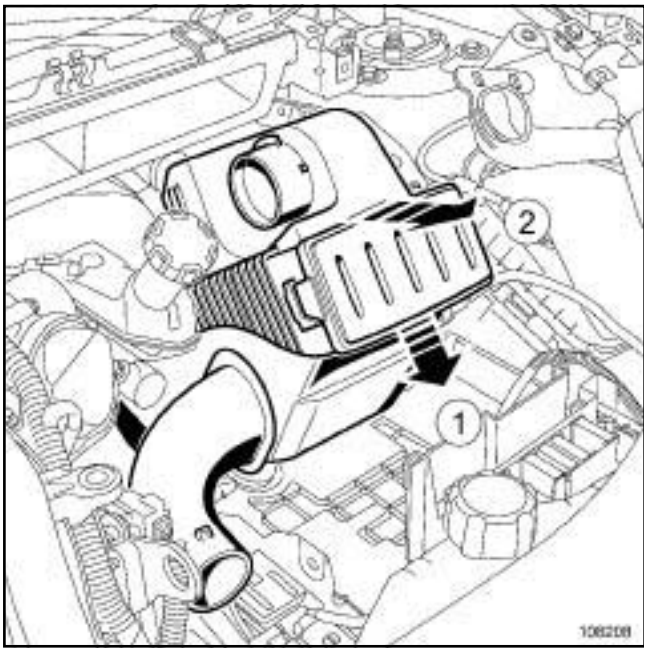
❏ Loosen the air inlet duct clip (**10**) .

❏ Disconnect the air inlet duct.

K4M, and 862

140644

❏ Loosen the air inlet duct clip (**11**) .



❏ Disconnect the pipe from the air inlet duct.

K9K or M4R

❏ Disconnect the air flowmeter connector.

K4J or K4M or K9K or M4R – D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

108208

❏ Remove the air filter box in the direction of the arrows (**1**) and (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the air filter unit.

II - FINAL OPERATION

K9K or M4R

❏ Connect the air flowmeter connector.

❏ Connect the air inlet duct.

❏ Torque tighten the **air inlet duct clip (6 N.m)**.

❏ Refit the thermal protection shield.

❏ Clip on the thermal protection shield.

❏ Refit the power feed fuse board mounting.

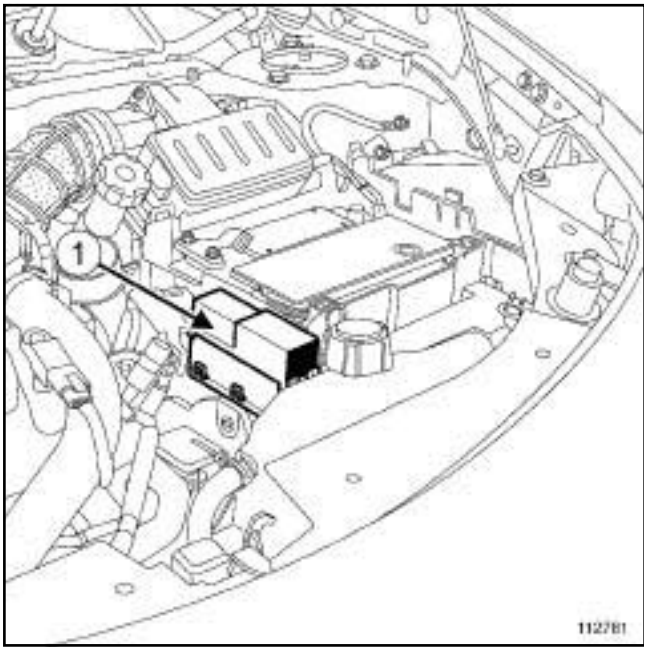
❏ Clip on the power feed fuse board support.

K4J or K4M or K9K or M4R

❏ Refit the relay unit on the thermal protection tray.

❏ Connect the air inlet pipe to the air filter unit.

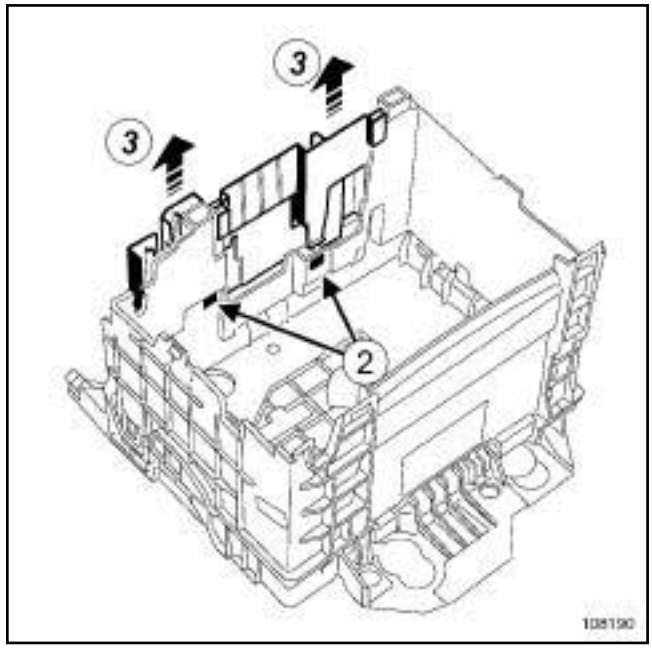
❏ Refit the battery (see **Battery: Removal - Refitting**) (80A, Battery).



F4R

Tightening torques ▽	
air duct clips between the throttle valve and the air filter box	**5.5 Nm**

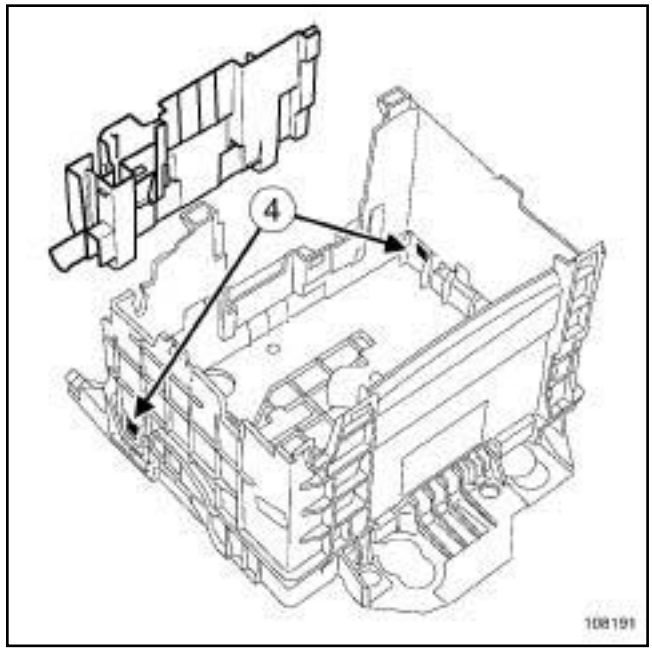
REMOVAL



I - REFITTING PREPARATIONS OPERATION

❏ Remove the battery (see **Battery: Removal - Refitting**) ((MR 392, 80A, Battery).

112781

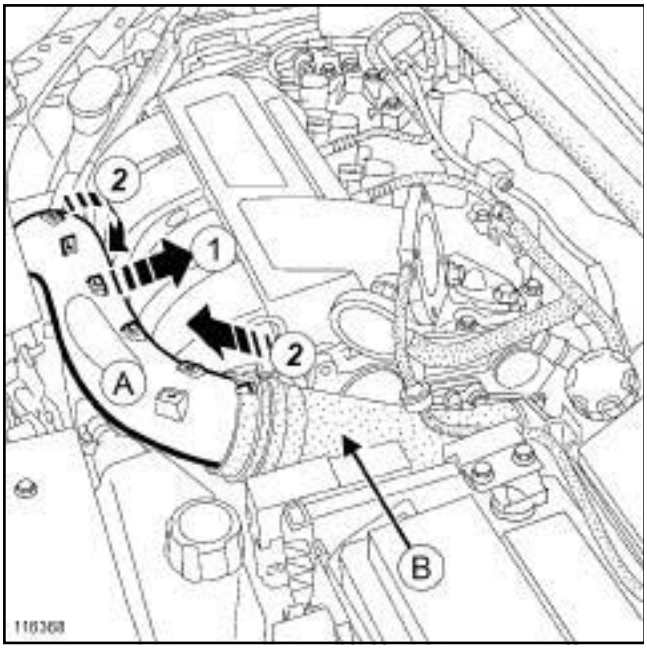


❏ Unclip the relay unit from the thermal protection shield (**1**) .

108190

❏ Unclip the power feed fuse board support at (**2**) .

❏ Move aside the power feed fuse board support at (**3**) .



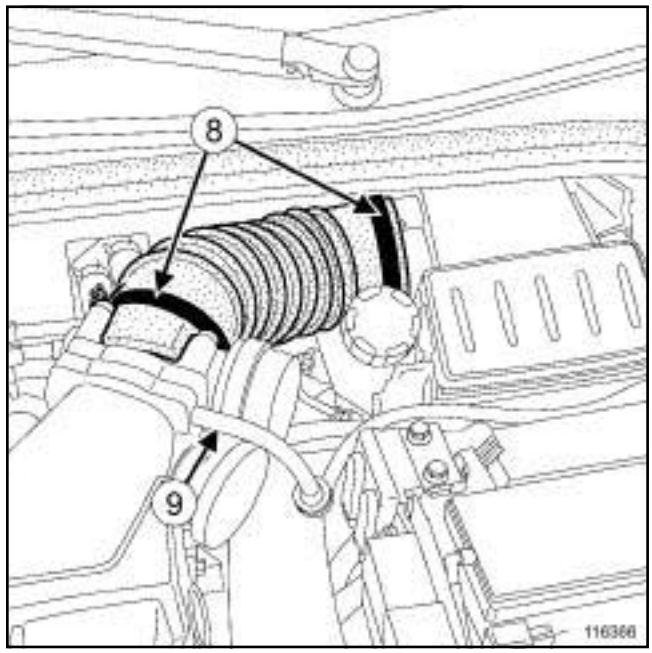
108191

❏ Unclip the thermal protection shield at (**4**) .

❏ Hold the power feed fuse board support aside.

❏ Remove the thermal protection shield.

F4R

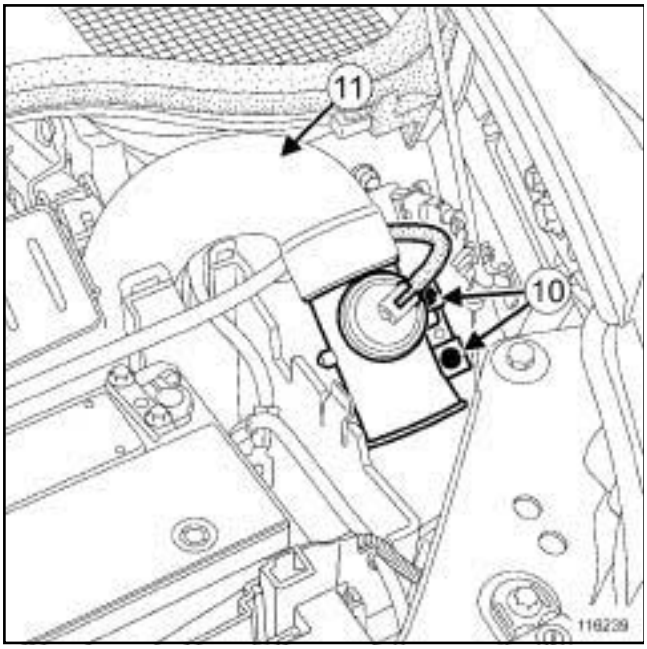


116368

❏ Remove:

- the air inlet duct (**A**) :
  - unclip it from the front end panel (**1**) ,
  - turn it and disconnect it (**2**) .
- the air inlet pipe (**B**) :
  - air resonator side,
  - air filter unit side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

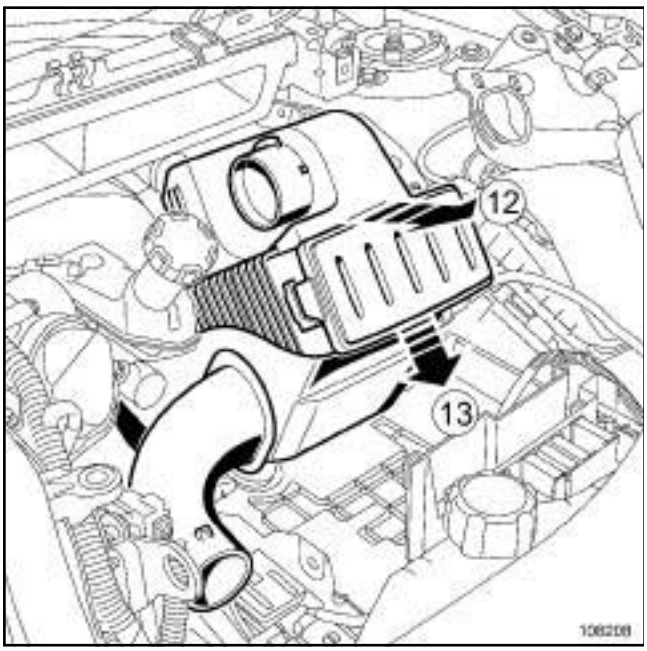


116366

❏ Unfasten the clips (**8**) .

❏ Remove the air inlet pipe between the throttle valve and the air filter box.

❏ Disconnect the vacuum pipe (**9**) from the throttle valve.



116239

❏ Remove the mounting nuts (**10**) from the soundproofing unit.

❏ Disconnect the air inlet pipe (**11**) .

❏ Move aside the « soundproofing unit - secondary pipe » assembly.

108208

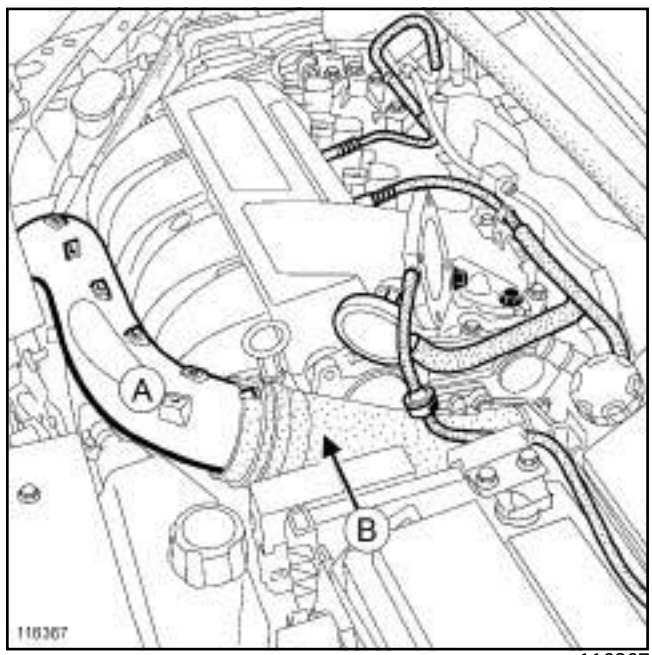
❏ Remove the air filter box in the direction of the arrows (**12**) and (**13**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the air filter box.

❏ Fit the soundproofing unit in place.



❏ Refit the soundproofing unit mounting nuts.

❏ Connect the vacuum pipe to the throttle valve.

❏ Refit the air inlet pipe between the throttle valve and the air filter box.

❏ Torque tighten the **air duct clips between the throttle valve and the air filter box (5.5 Nm)**.

II - FINAL OPERATION.

116367

❏ Refit:

- the air inlet pipe (**B**) ,
- the air filter box,
- the air resonator.
- the air inlet pipe (**A**) .

❏ Fit the thermal protection shield in place.

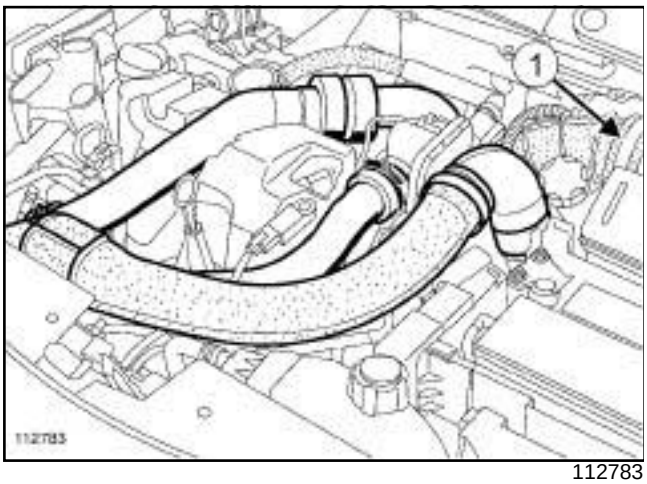
❏ Clip on the thermal protection shield.

❏ Fit the power feed fuse board support in place.

❏ Clip on:

- the power feed fuse board support to the thermal protection shield,
- the relay unit to the thermal protection shield.

F4R



❑ Refit the battery (see **Battery: Removal - Refitting**) ((MR 392, 80A, Battery).

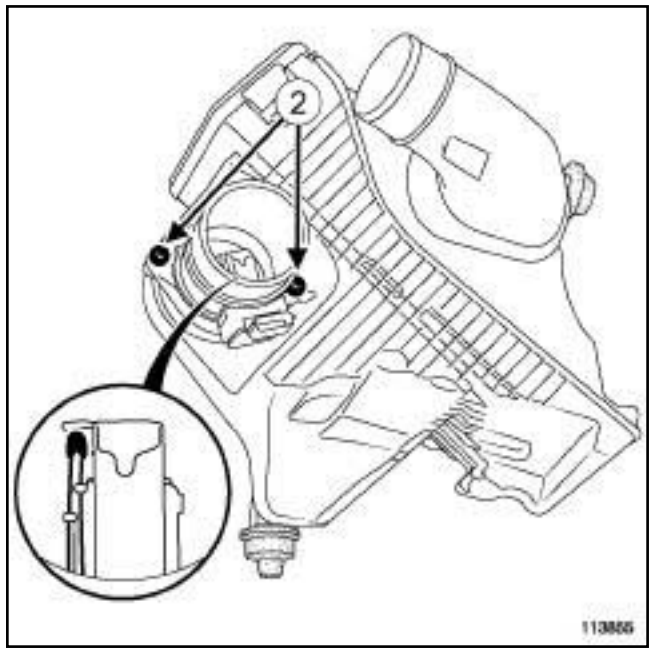
K9K

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

112783



❏ Loosen the clip (**1**) between the air duct and the air flowmeter.

❏ Disconnect the air flowmeter connector.

❏ Unfasten the air duct and remove it.

❏ Disconnect the air flowmeter connector.

II - OPERATION FOR REMOVAL OF PART CONCERNED

113855

❏ Remove:

- the bolts (**2**) securing the air flowmeter onto the air filter unit,
- the air flowmeter.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the air flowmeter.
- the bolts securing the air flowmeter.

> Note:
> Be sure not to damage the air flowmeter seal.
> Replace it if necessary.

II - FINAL OPERATION

❏ Connect the air flowmeter connector.

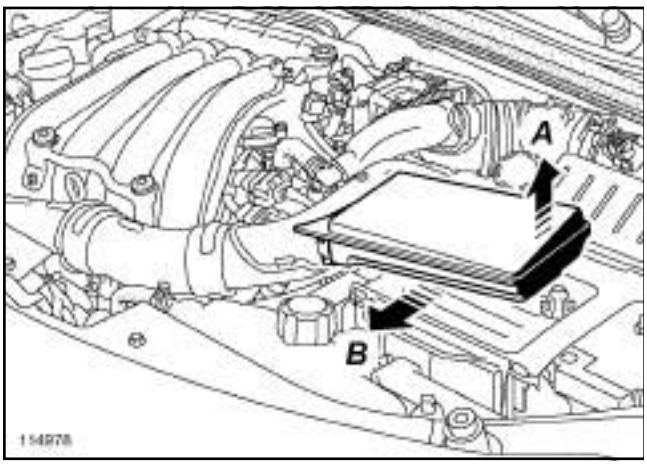
Refit:

- the air duct,
- the clip between the air duct and the air flowmeter.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

M4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.
Mot. 1608	Torque screwdriver 1 to 6.6 N.m.

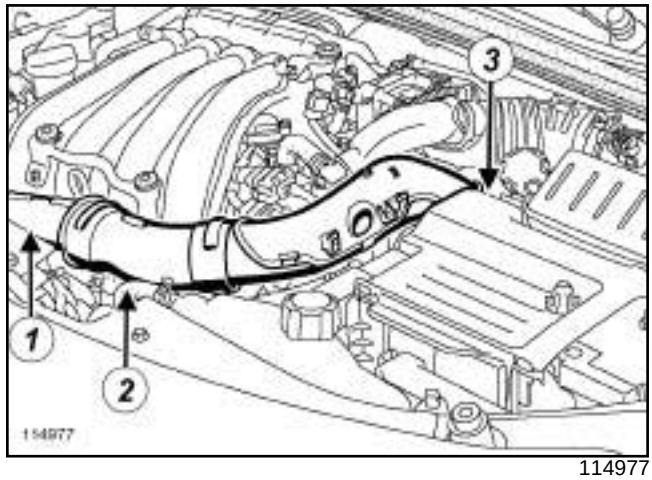


Tightening torques ▽	
air flow sensor mounting bolts	**4 Nm**
air inlet duct clips	**6 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the engine cover.

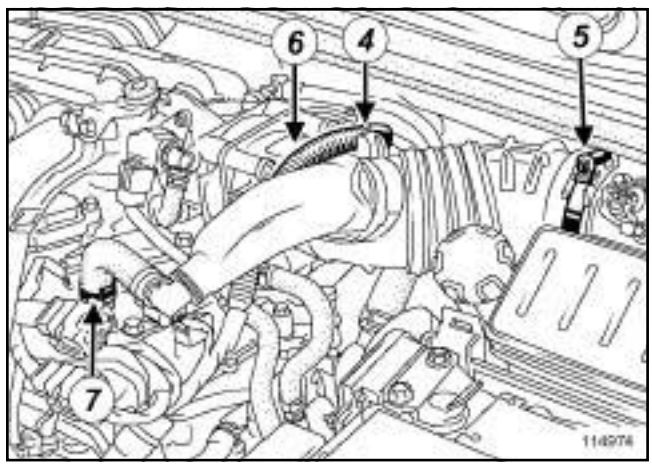


❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

114978

❏ Lift the air resonator to remove it from the battery cover (**A**) .

❏ Pull the air resonator towards the front of the vehicle (**B**) to remove it.



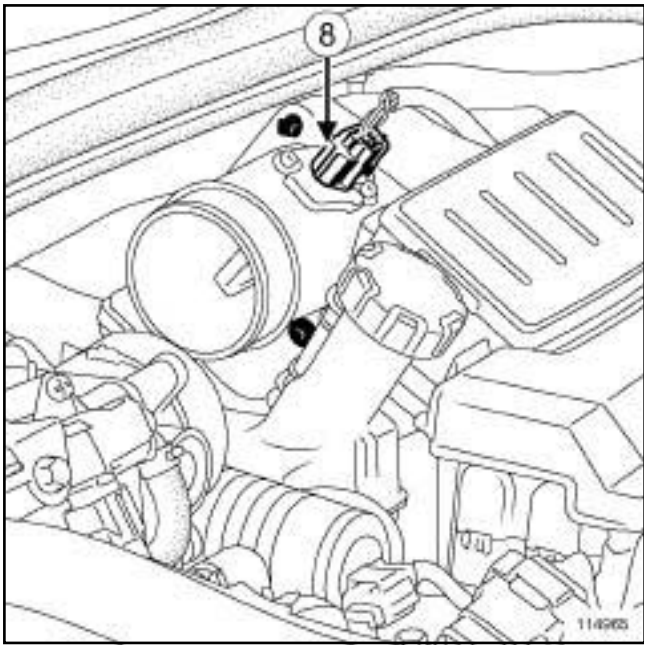
114977

❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove the air intake sleeve.

114974

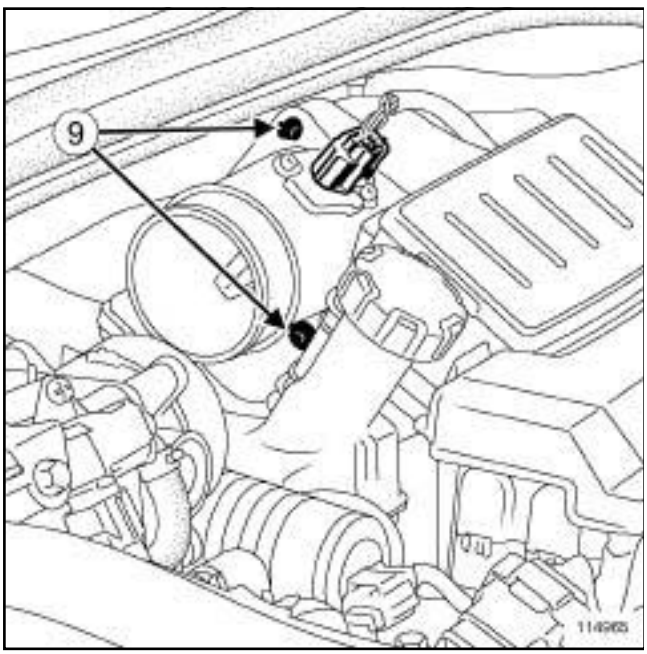


❏ Detach the wiring harness from the air inlet duct at (**4**) .

❏ Undo the air duct mounting clips:

- on the air flow sensor (**5**) ,
- on the motorised throttle valve (**6**) .

❏ Disconnect the oil vapour rebreather duct (**7**) from the rocker cover using the **(Mot. 1448)**.



❏ Remove the air inlet duct.

114965

❑ Disconnect the air flow sensor connector (**8**) .

II - REMOVAL OF PART CONCERNED

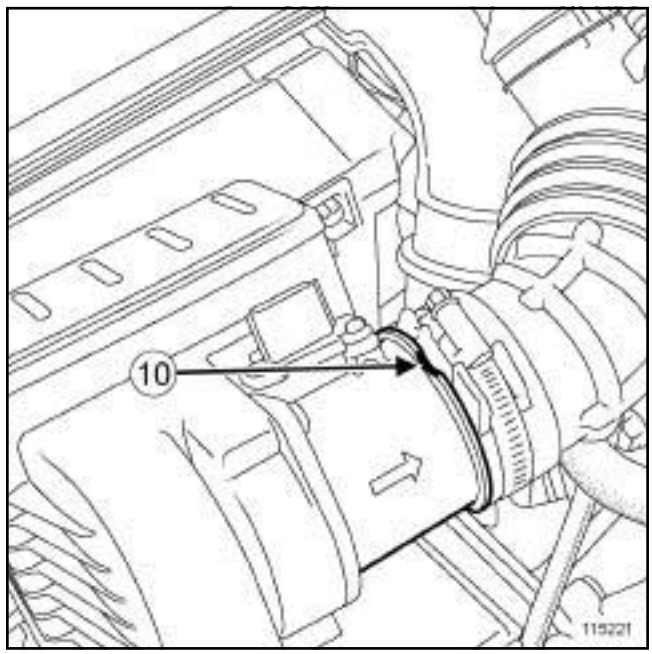
114965

❑ Remove:

- the air flow sensor mounting bolts (**9**) ,
- the air flow sensor,
- the air flow sensor seal.

REFITTING

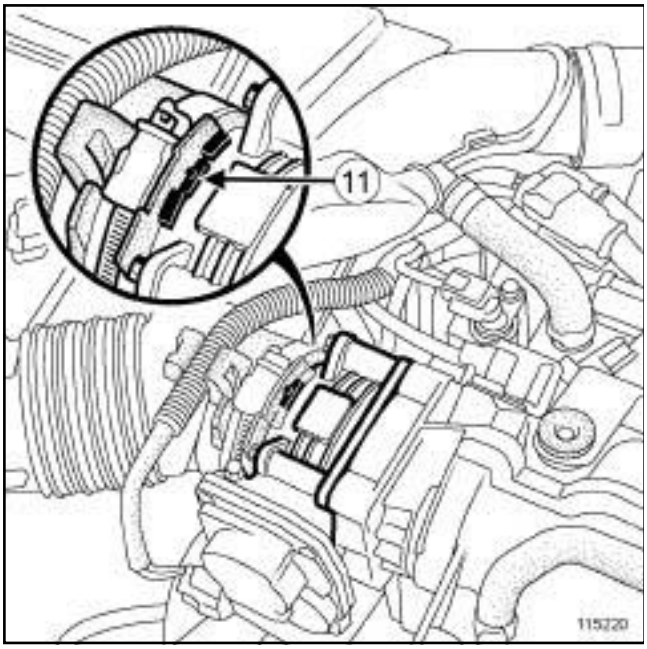
I - REFITTING PREPARATION OPERATION



❑ The air flow sensor seal must be replaced.

II - REFITTING THE PART CONCERNED

❑ Refit the air flow sensor.



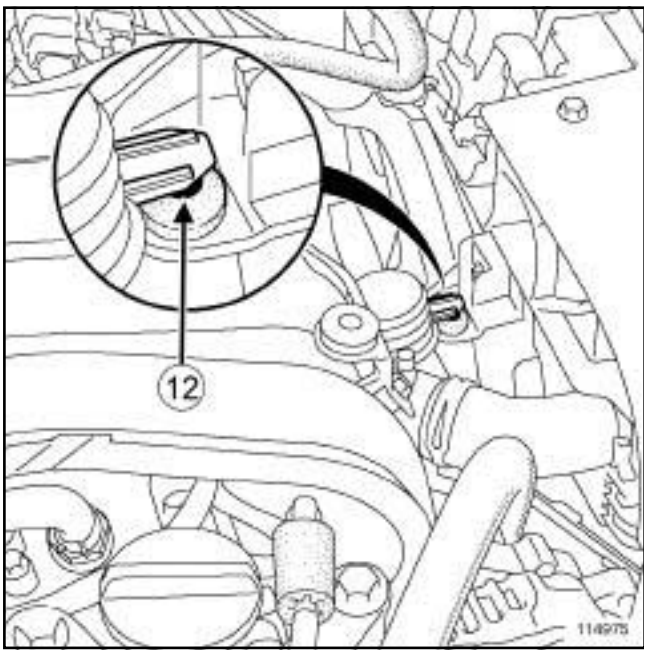
❑ Tighten to torque the **air flow sensor mounting bolts (4 Nm)** using the **(Mot. 1608)**.

III - FINAL OPERATION

115221

❑ Fit the air inlet duct on the air flow sensor, paying attention to the fitting mark (**10**) .

115220

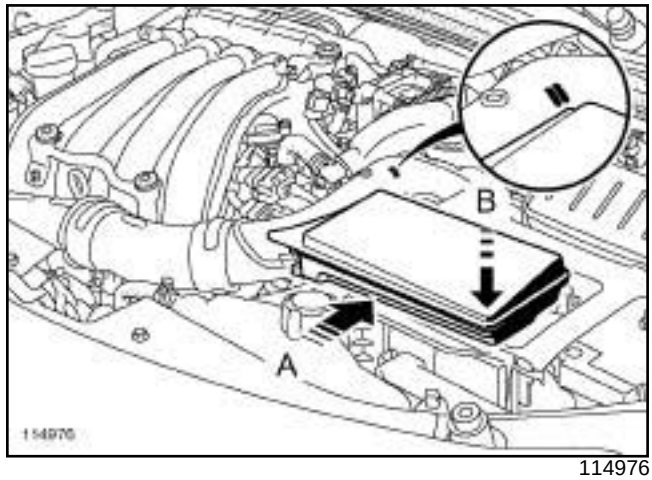


❏ Fit the air inlet duct on the motorised throttle valve, paying attention to the fitting mark (**11**) .

❏ Connect the oil vapour rebreather duct on the rocker cover.

❏ Tighten to torque the **air inlet duct clips (6 Nm)**.

❏ Clip the wiring harness on the air inlet duct.



❏ Connect the air flow sensor connector.

114975

❏ Before refitting the air intake sleeve, check that the front end panel air resonator's upper mounting is correctly clipped at (**12**) .

❏ Refit the air intake sleeve.

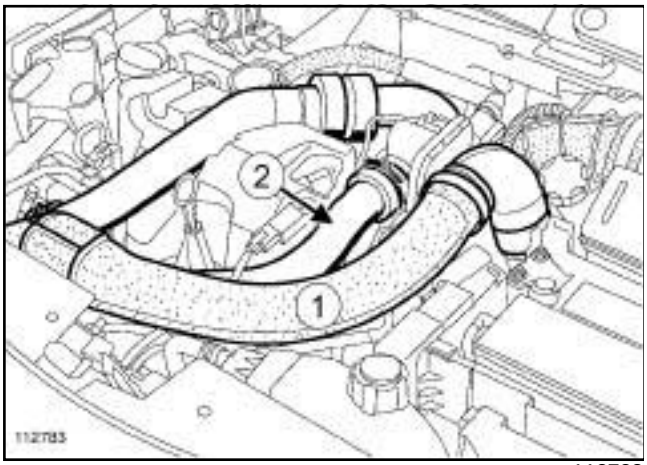
114976

❏ Push the air resonator towards the rear of the vehicle (**A**) until the air resonator's rear face is located between the two marks on the air intake sleeve.

❏ Push the air resonator (**B**) to fit it onto the battery cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

❏ Refit the engine cover.

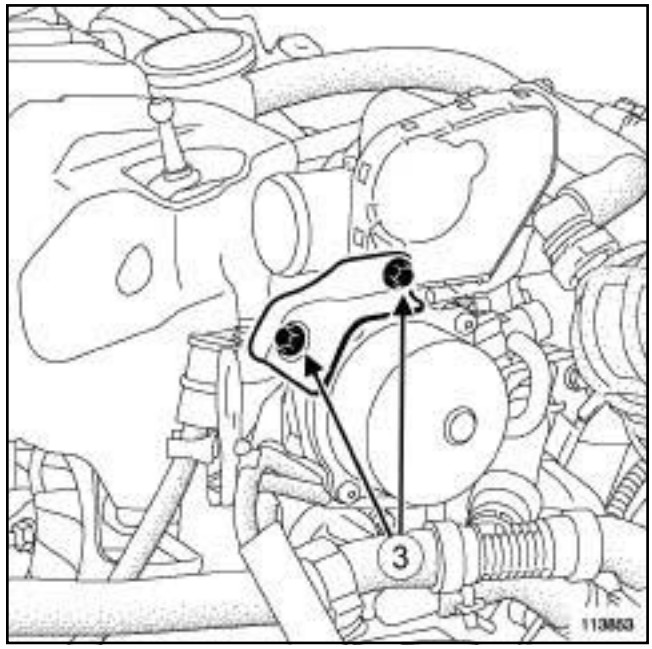


K9K

Tightening torques ▽	
damper valve mounting nuts	**12 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

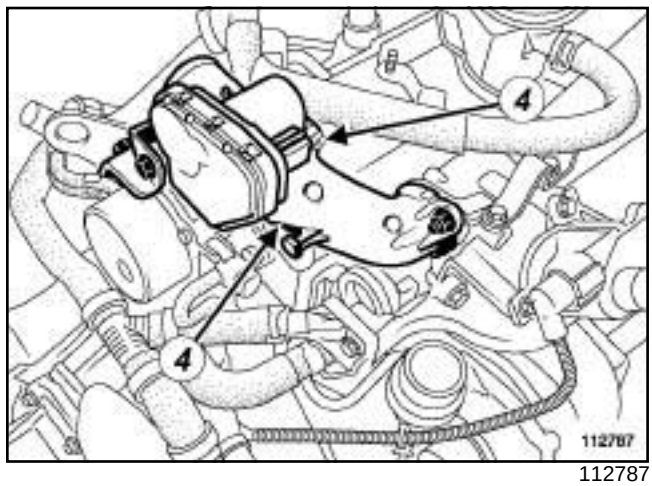


❑ Disconnect the battery (see **Battery: Removal - Refitting**)

112783

❑ Remove:

- the air inlet duct (**1**) ,
- the damper valve duct (**2**) .



113853

❑ Remove:

- the retaining bracket bolts (**3**) ,
- the retaining bracket.

II - OPERATION FOR REMOVAL OF PART CONCERNED

112787

❑ Remove:

- the damper valve connector,
- the damper valve mounting bolts (**4**) ,
- the damper valve.

K9K

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Check the condition of the contact surfaces.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new seal,
- the damper valve,
- the damper valve mounting nuts,
- the connector to the damper valve.

❑ Torque tighten the **damper valve mounting nuts (12 N.m)**.

III - FINAL OPERATION

❑ Refit:

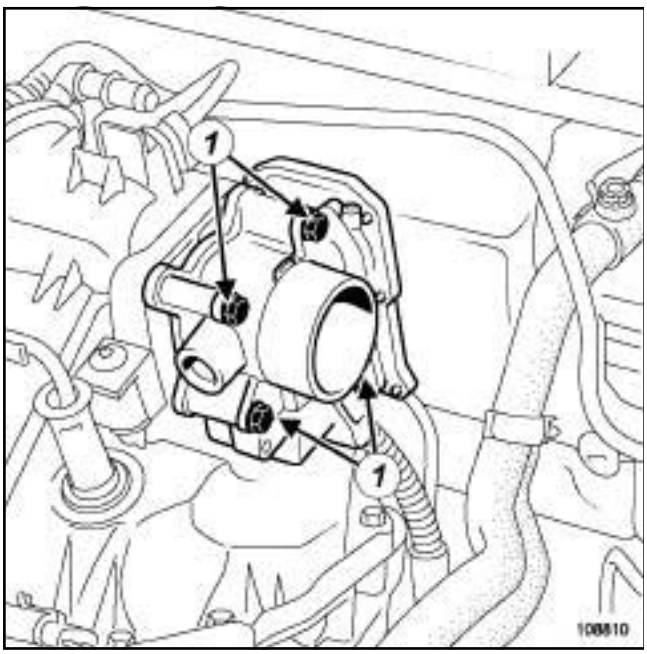
- the damper valve bracket,
- the damper valve bracket mounting bolts,
- the damper valve duct,
- the outer air inlet duct.

❑ Connect the battery (see **Battery: Removal - Refitting**) .

D4F, and 740 or 742 or 764

Tightening torques ▽	
motorised throttle valve mounting bolts	**9 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) .

❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Disconnect the motorised throttle valve connector.

II - OPERATION FOR REMOVAL OF PART CONCERNED

108810

❑ Remove:

- the motorised throttle valve mounting bolts (**1**) ,
- the motorised throttle valve,
- the motorised throttle valve seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Be sure to replace the seal.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the motorised throttle seal.
- the motorised throttle valve,
- the motorised throttle valve mounting bolts,

❑ Torque tighten the **motorised throttle valve mounting bolts (9 N.m)**.

III - FINAL OPERATION.

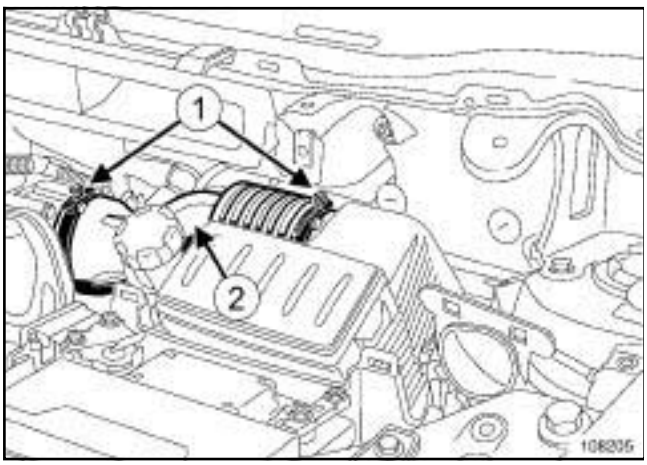
❑ Connect the motorised throttle valve connector.

❑ Refit the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) .

❑ Reinitialise the programming for the stops (see **MR 394 Fault finding, 17B, Replacement of components, Motorised throttle valve replacement operation**).

K4J or K4M



Tightening torques ▽	
throttle valve bolts	**10 N.m**

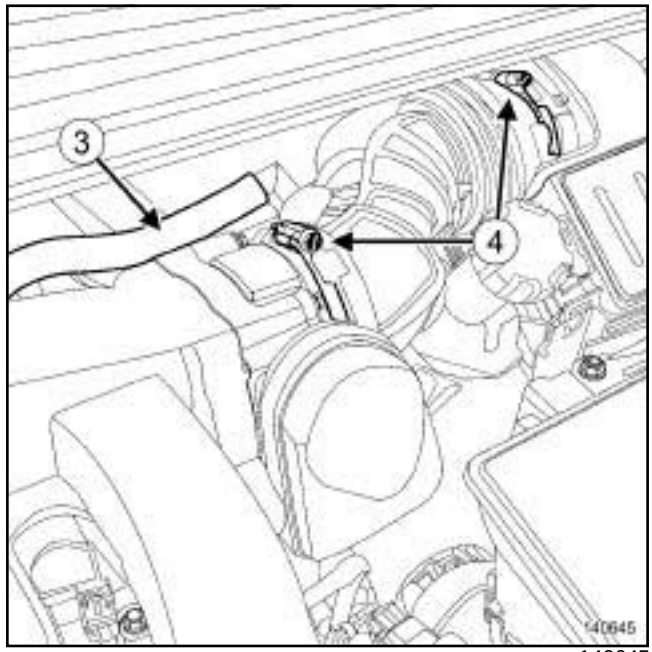
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

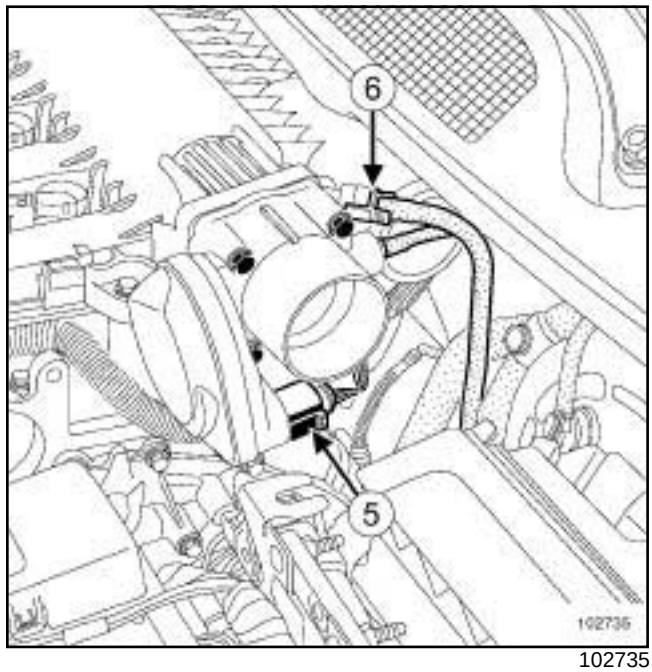
K4J – K4M, and 800 or 801 or 804



108205

❑ Remove:

- the air inlet duct clips (**1**) ,
- the air inlet duct (**2**) .

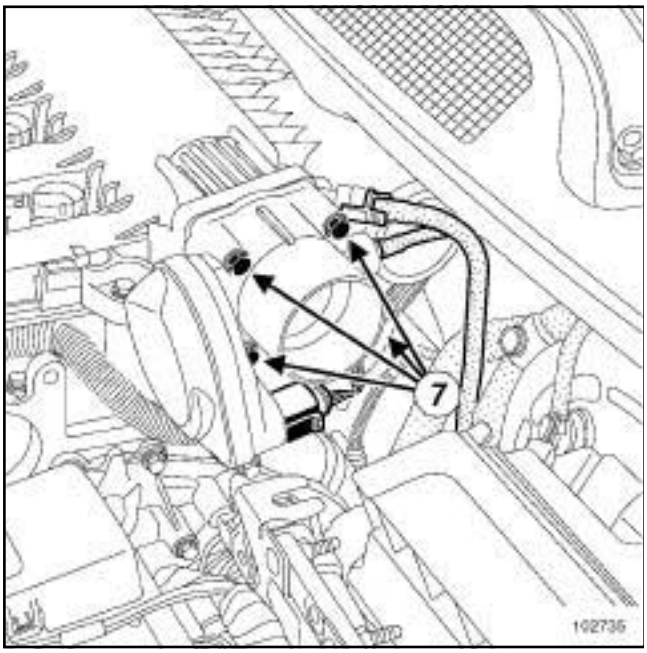


K4M, and 862

140645

❑ Remove:

- the oil vapour rebreathing pipe (**3**) ,
- the air inlet duct clips (**4**) ,
- the air inlet duct.



102735

❑ Disconnect:

- the throttle valve connector (**5**) ,

- the fuel vapour recirculation solenoid valve pipe (**6**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

102735

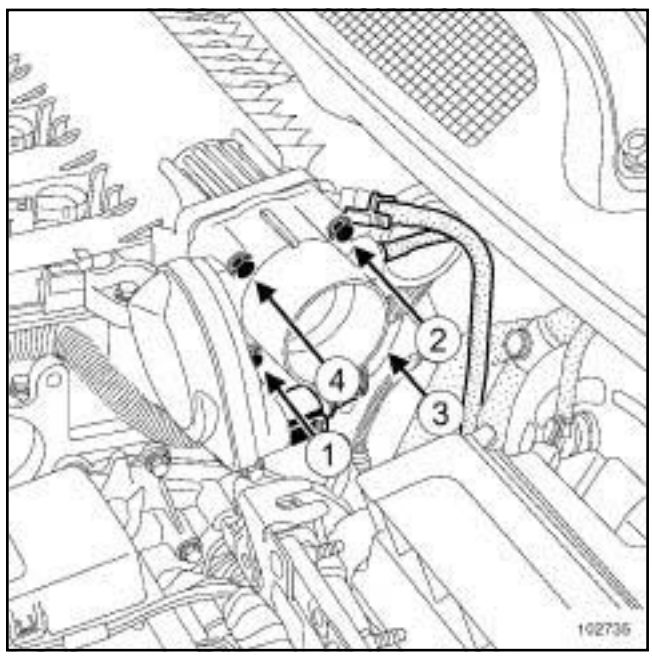
❑ Remove:

- the throttle valve bolts (**7**) ,
- the throttle valve.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Throttle valve seal (11,04,06,25)**.



❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the throttle valve joint face if it is to be re-used,
- the inlet distributor seal housing.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

II - REFITTING OPERATION FOR PART CONCERNED

102735

❑ Refit the throttle valve, fitted with a new seal.

❑ In order, torque tighten the **throttle valve bolts (10 N.m)**.

III - FINAL OPERATION

❑ Connect:

- the fuel vapour recirculation solenoid valve pipe,
- the throttle valve connector.

❑ Refit:

- the air inlet duct,

K4J or K4M

- the air inlet duct clips.

❑ Torque tighten the **inlet duct clips (6 N.m)**.

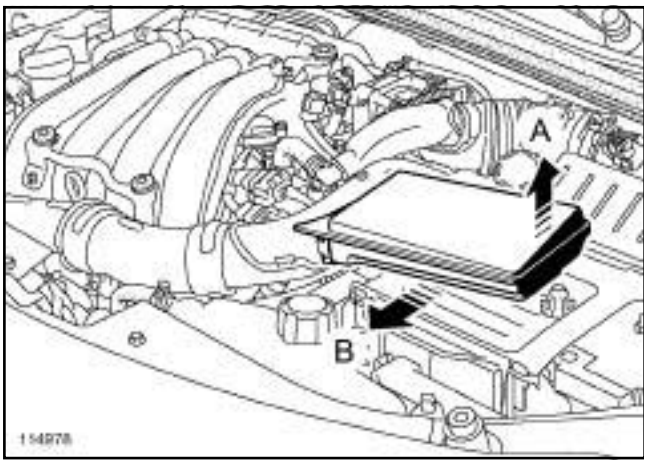
K4M, and 862

❑ Refit the oil vapour rebreathing pipe.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

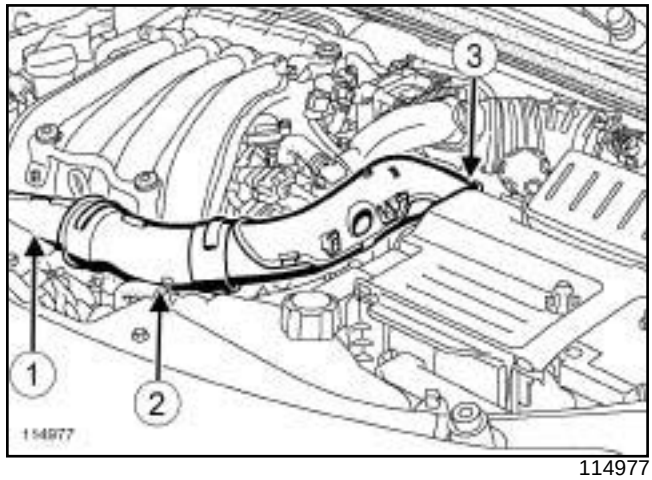


Tightening torques ▽	
motorised throttle valve mounting bolts	**10 N.m**
air inlet duct clips	**6 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the engine cover.

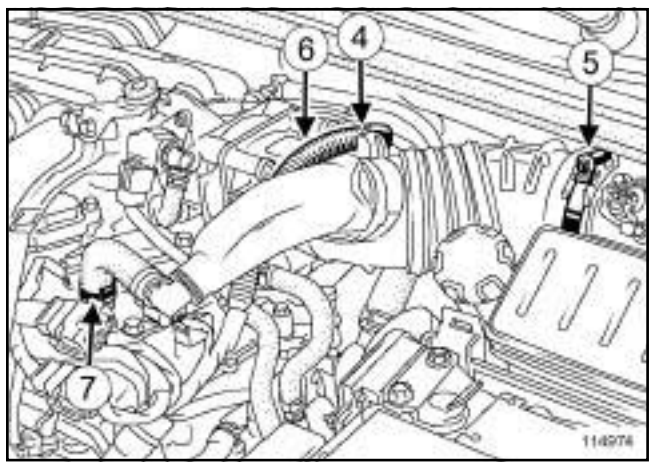


❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

114978

❏ Lift the air resonator (**A**) to remove it from the battery cover.

❏ Pull the air resonator towards the front of the vehicle (**B**) to remove it.



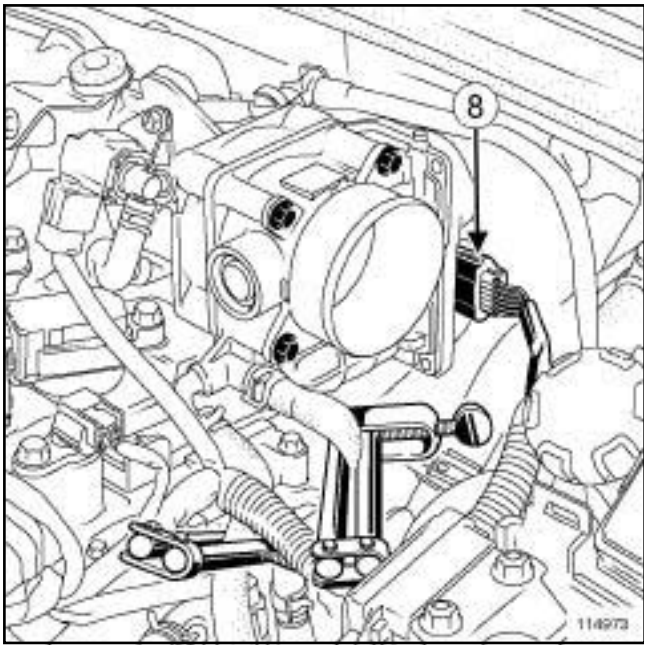
114977

❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove the air inlet sleeve.

114974



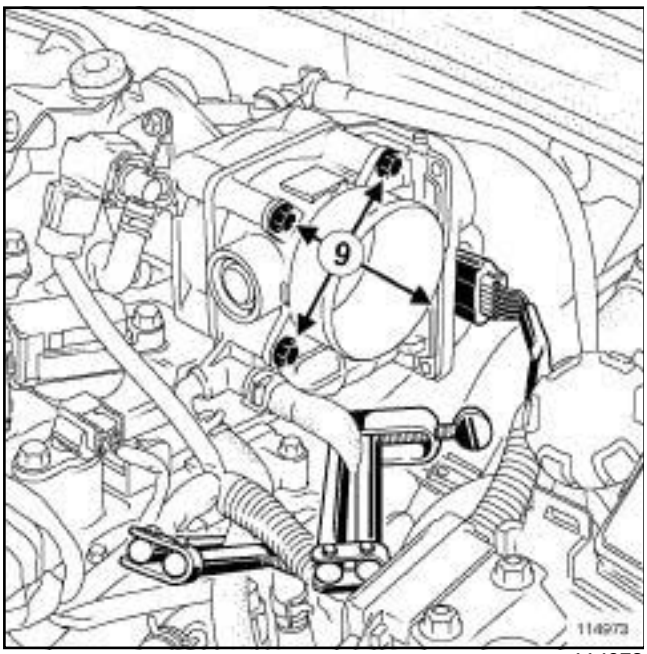
❏ Detach the wiring harness from the air inlet duct at (**4**) .

❏ Undo the air duct mounting clips:

- on the air flow sensor (**5**) ,
- on the motorised throttle valve (**6**) .

❏ Remove the oil vapour rebreather duct (**7**) from the rocker cover using the **(Mot. 1448)**.

❏ Remove the air inlet duct.



114973

❑ Fit hose clamps on the motorised throttle valve hoses.

❑ Remove the hoses from the motorised throttle valve using the **(Mot. 1448)**.

❑ Disconnect the motorised throttle valve connector (**8**) .

II - REMOVAL OF PART CONCERNED

114973

❑ Remove:

- the motorised throttle valve mounting bolts (**9**) ,
- the motorised throttle valve,
- the inlet distributor gasket.

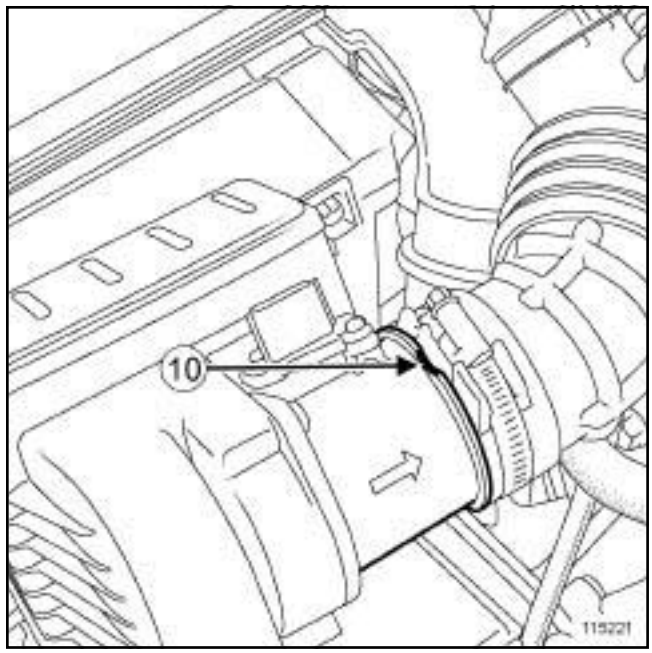
REFITTING

I - REFITTING PREPARATION OPERATION

❑ The motorised throttle valve seal must always be replaced.

II - REFITTING PART CONCERNED

❑ Finger tighten the motorised throttle valve mounting bolts.

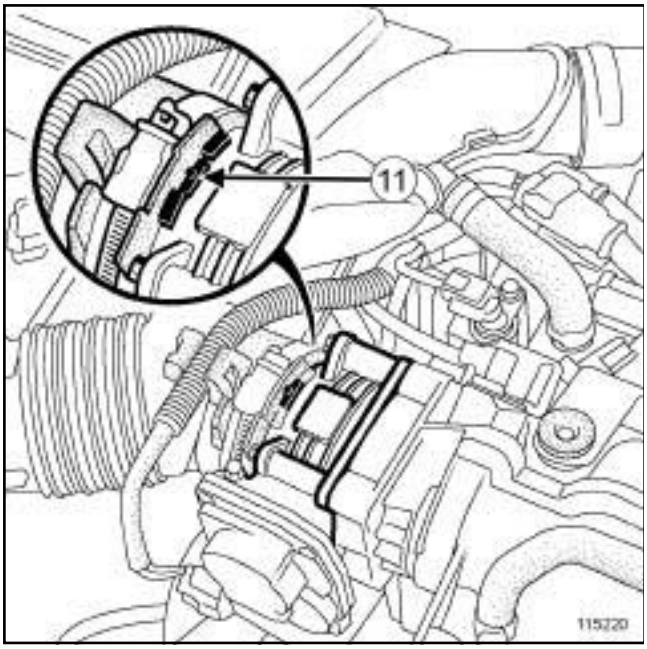


❑ Torque tighten the **motorised throttle valve mounting bolts (10 N.m)**.

III - FINAL OPERATION

❑ Connect the motorised throttle valve connector.

❑ Connect the motorised throttle valve hoses using the **(Mot. 1448)**.

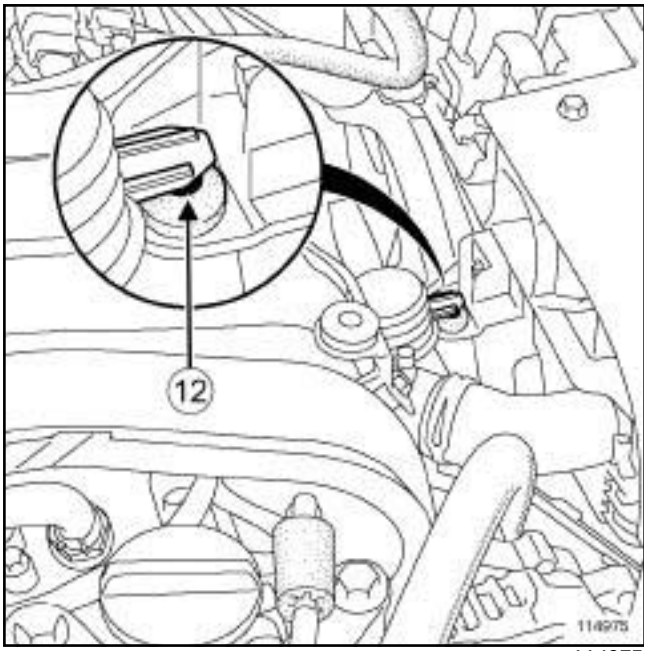


❑ Remove the hose clamps from the motorised throttle valve hoses.

115221

❑ Fit the air inlet duct on the air flow sensor, paying attention to the fitting mark (**10**) .

M4R

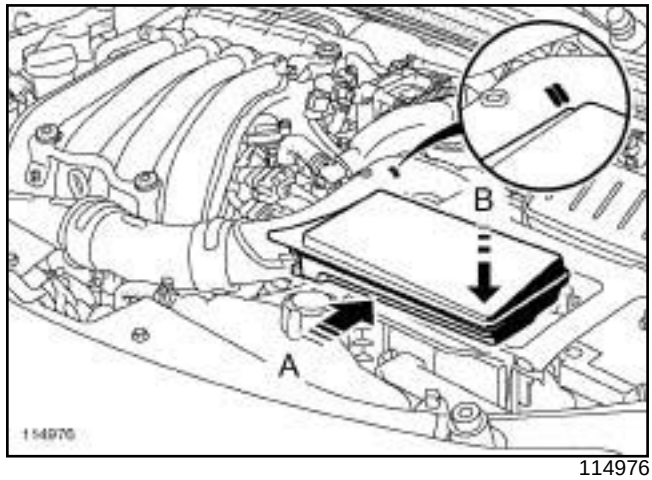


115220

❏ Fit the air inlet duct on the motorised throttle valve, paying attention to the fitting mark (**11**) .

❏ Connect the oil vapour rebreather duct on the rocker cover using the **(Mot. 1448)**.

❏ Torque tighten the **air inlet duct clips (6 N.m)**.



❏ Clip the wiring harness on the air inlet duct.

114975

❏ Before refitting the air intake sleeve, check that the front end panel air resonator's upper mounting is correctly clipped at (**12**) .

❏ Refit the air intake sleeve.

114976

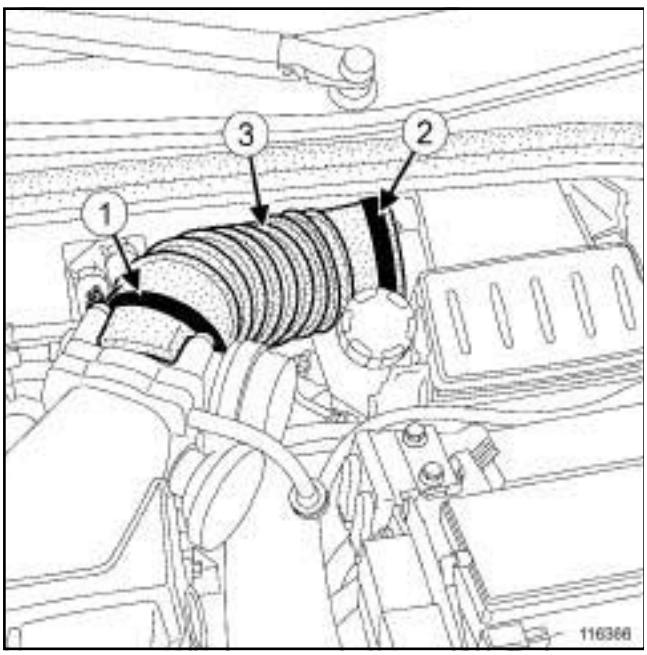
❏ Push the air resonator towards the rear of the vehicle (**A**) until the air resonator's rear face is located between the two marks on the air intake sleeve.

❏ Push the air resonator (**B**) to fit it onto the battery cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

❏ Bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit the engine cover.



F4R

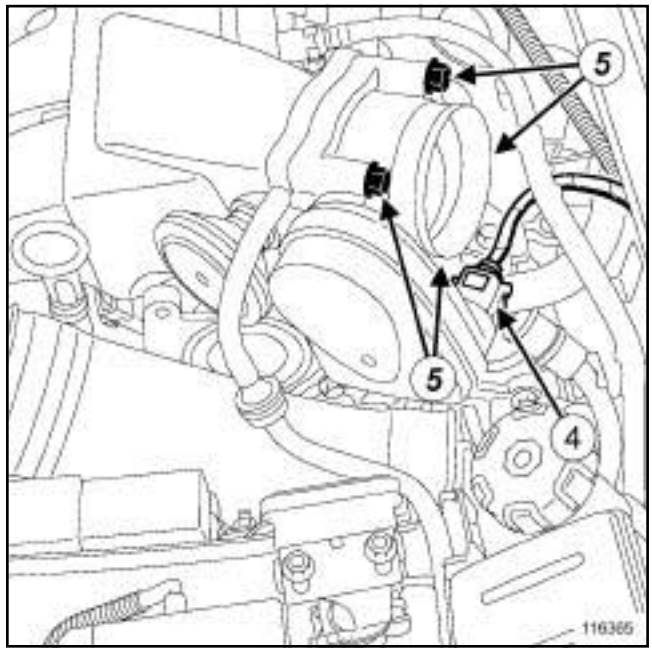
REMOVAL

I - REMOVAL PREPARATION OPERATION

116366



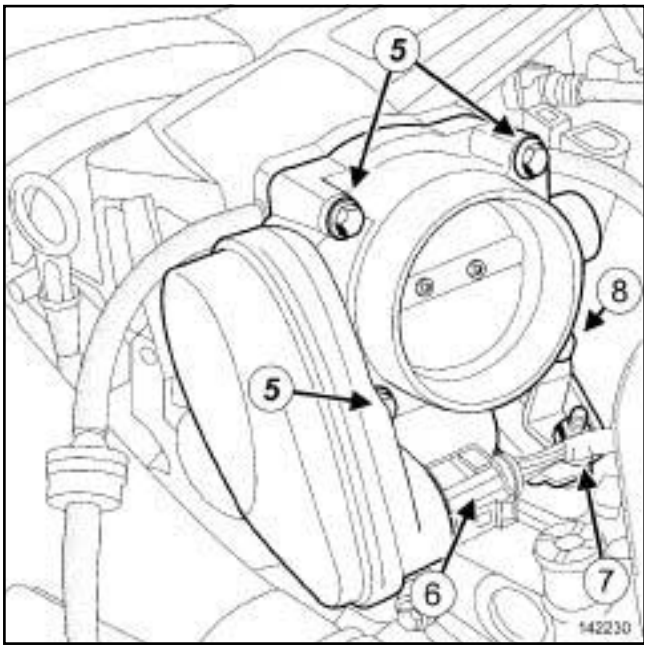
❏ Undo:

- the clip (**1**) on the air inlet pipe between the air filter box and the throttle valve on the damper valve side,
- the clip (**2**) on the air inlet pipe between the air filter box and the throttle valve on the air filter box side.

❏ Remove the air inlet pipe (**3**) between the air filter box and the throttle valve.

II - OPERATION FOR REMOVAL OF PART CONCERNED

F4R, and 830



116365

❏ Disconnect the connector (**4**) from the throttle valve.

F4R

F4R, and 832

142230

❏ Disconnect the connector (**6**) from the throttle valve.

❏ Remove:

- the nut (**7**) of the reinforcement bracket on the oil separator,
- the bolt (**8**) of the reinforcement bracket on the throttle valve,
- the reinforcement bracket.

❏ Remove:

- the throttle valve bolts ***(5)*** ,
- the throttle valve.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: Throttle valve seal (11,04,06,25)**.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the throttle valve joint face if it is to be re-used,
- the seal housing on the inlet distributor.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the throttle valve, fitted with a new seal.

F4R, and 832

❏ Refit:

- the reinforcement bracket,
- the bolt of the reinforcement bracket on the throttle valve,
- the nut of the reinforcement bracket on the oil separator.

❏ Torque tighten:

- the **bolt of the reinforcement bracket on the throttle valve (12 N.m)**,
- the **nut of the reinforcement bracket (9 N.m)**.

❏ Refit the throttle valve bolts.

❏ Torque tighten the **throttle valve bolts (10 N.m)**.

❏ Connect the throttle valve connector.

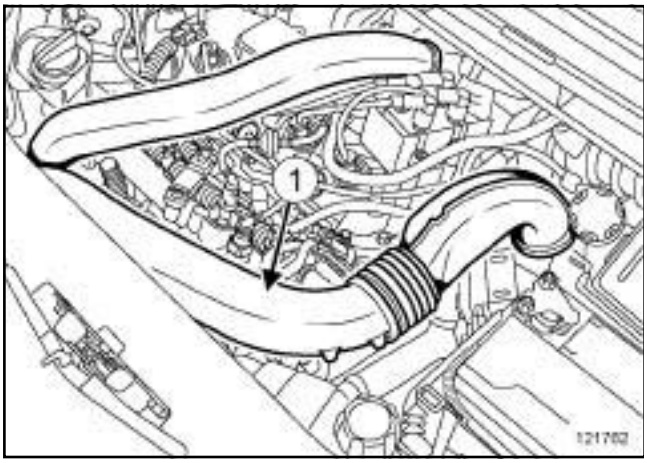
III - FINAL OPERATION

❏ Refit the air inlet duct between the throttle valve and the air filter box.

❏ Torque tighten the **air inlet pipe clips between the air filter unit and the throttle valve (6 N.m)**.

❏ Using the **Diagnostic tool**, check that there are no faults stored by the computer, and clear them if necessary.

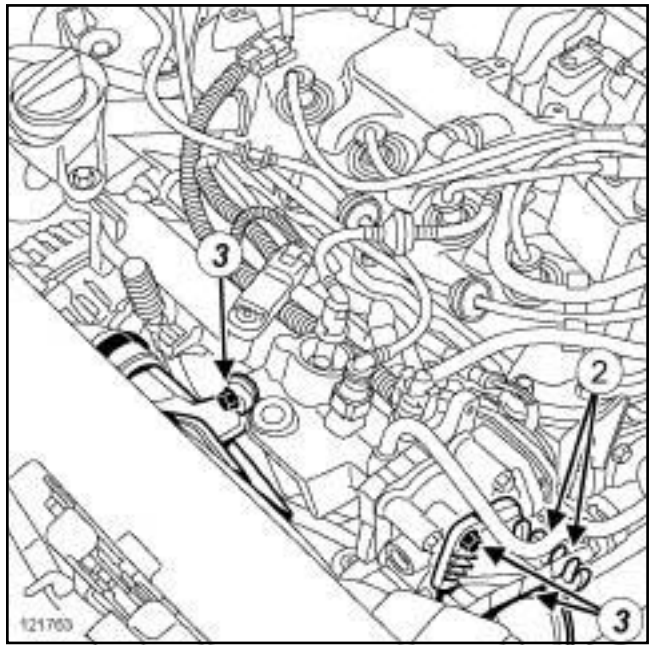
D4F, and 784



Tightening torques ▽	
throttle valve bolts	**10 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

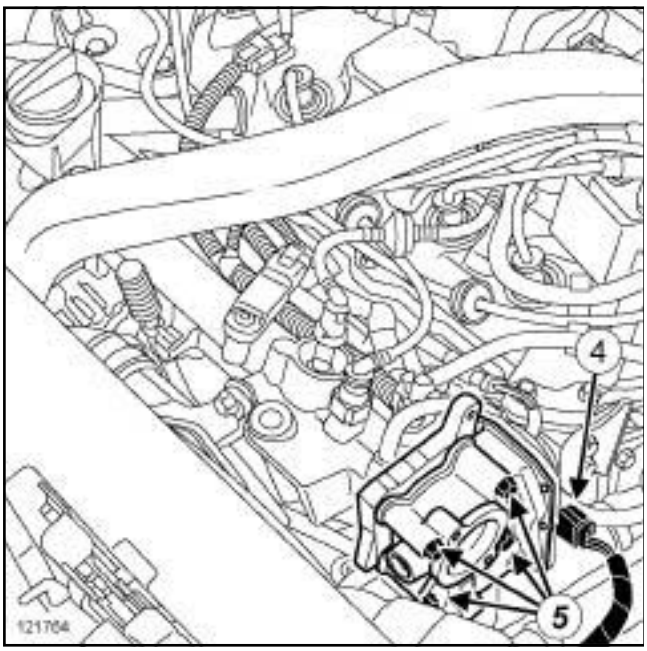
❏ Remove the front engine cover.

121762

❏ Disconnect the air filter unit air inlet pipe (**1**) .

121763

❏ Detach at (**2**) :



- the wiring harness,
- the vacuum pipe.

❏ Remove the intercooler air outlet pipe bolts (**3**) .

❏ Move the intercooler outlet air pipe to one side.

D4F, and 784

II - OPERATION FOR REMOVAL OF PART CONCERNED

121764

❏ Disconnect the connector (**4**) from the throttle valve.

❏ Remove:

- the throttle valve bolts (**5**) ,
- the throttle valve,
- the throttle valve seal.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Replace the throttle valve seal.

❏ Use abrasive pads to clean the bearing faces of:

- the intake distributor - throttle valve,
- the throttle valve - intercooler air outlet pipe.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (MR 398, 04B, Consumables - Products) and clean cloths to de-grease the bearing faces:

- the intake distributor - throttle valve,
- the throttle valve - intercooler air outlet pipe.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the throttle valve seal,
- the throttle valve,
- the throttle valve bolts.

❏ Torque tighten the **throttle valve bolts (10 Nm)**.

❏ Connect the throttle valve connector.

III - FINAL OPERATION.

❏ Refit:

- the intercooler outlet air pipe,
- the intercooler air outlet pipe bolts.

❏ Clip:

- the vacuum pipe,
- the harness.

❏ Connect:

- the air filter box air inlet pipe,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Refit the engine cover.

❏ Program the motorised throttle valve (see **Fault finding - Replacement of components**)(MR387, 17B, Petrol injection).

D4F or F4R or K4J or K4M or M4R

Equipment required
compressed air nozzle

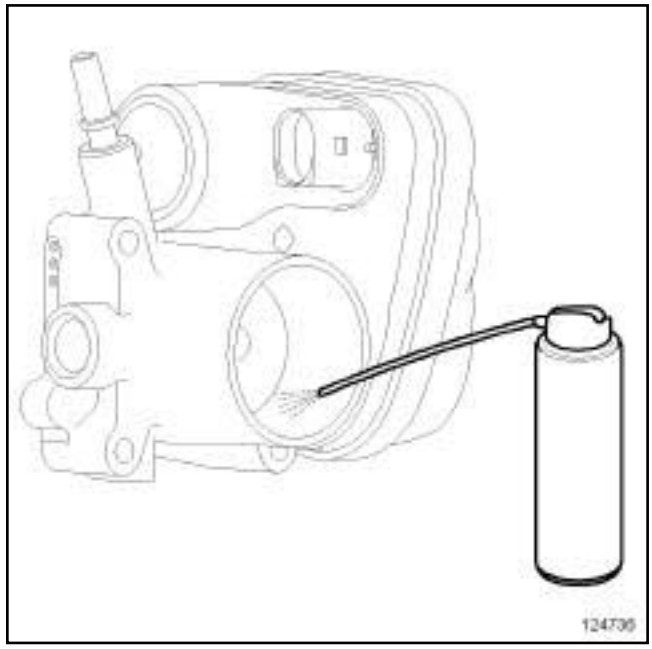
IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT
Always wear protective gear (gloves, goggles and breathing masks).

Note:
Be sure to work in a clean environment so as not to allow any contamination of the throttle valve.

CLEANING

I - CLEANING PREPARATION OPERATION



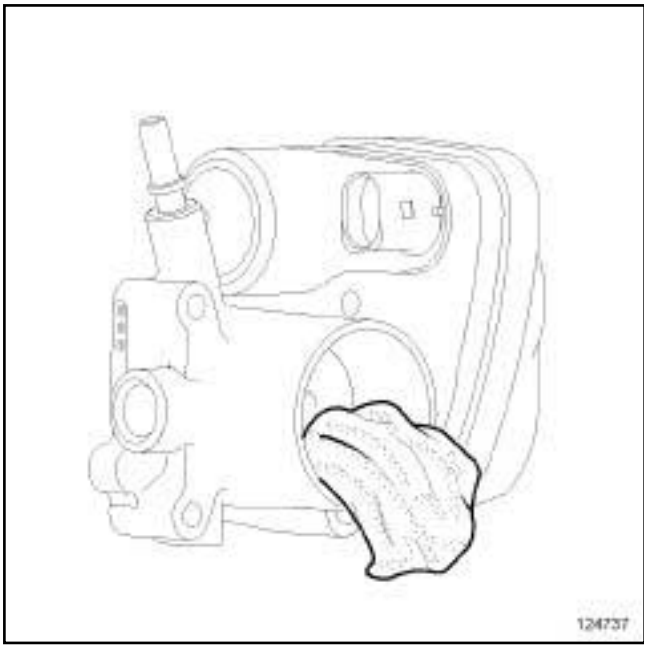
❑ Remove the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

II - CLEANING THE PART CONCERNED

❑

Note:
The **CARBURETTOR CLEANING** product damages the seals.

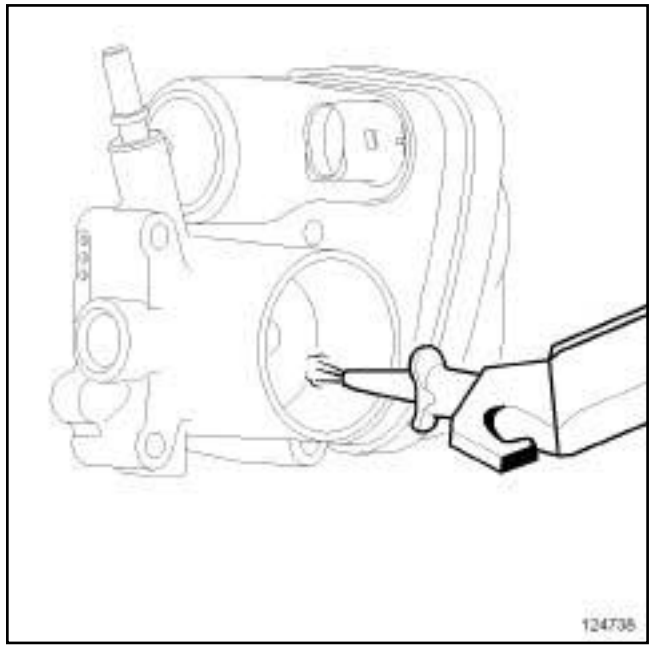
❑ Remove the seal(s) of the throttle valve.



124736

❑ Hold the throttle valve flap open manually.

Note:
Do not spray any cleaning product onto the outside of the cylinder, inside the spring housing or onto the connector.



❑ Spray **CARBURETTOR CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) into the air vent until all traces of clogging have disappeared.

D4F or F4R or K4J or K4M or M4R

124737

❑ Remove the residues of **CARBURETTOR CLEANER** and the residual dirt using a **LINT-FREE CLOTH** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

124738

❑ Use a **compressed air nozzle** to blast the throttle valve edges and the air vent.

parts always to be replaced: Throttle valve seal (11,04,06,25)

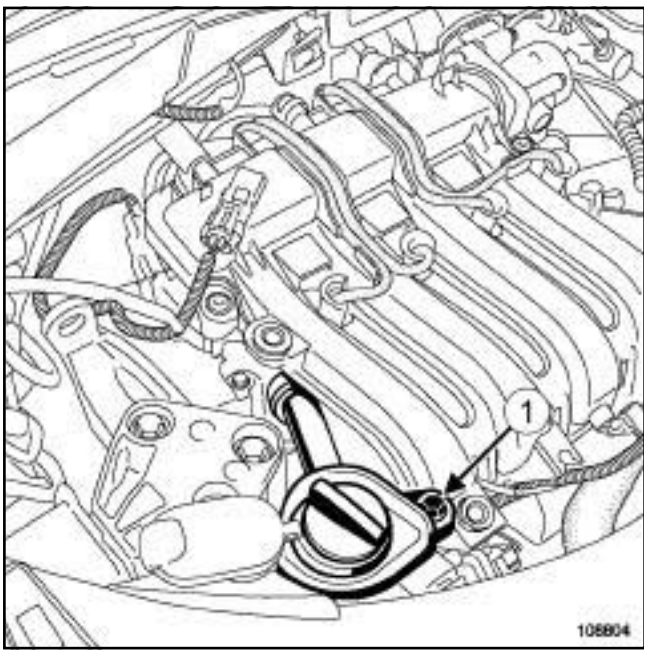
Note:

If the throttle valve is dropped or receives any other impact, it will need to be replaced.

III - FINAL OPERATION

❑ Refit the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

D4F, and 740 or 742 or 764

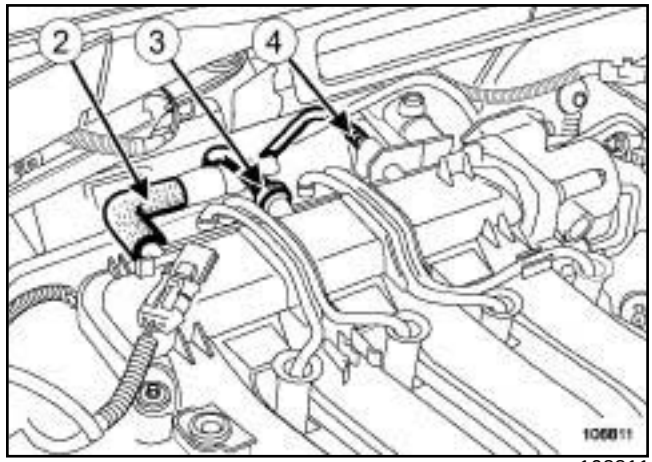


Tightening torques ▽	
intake distributor mounting bolts on the cylinder head	**10 N.m**
intake distributor mounting bolts on the rocker cover	**10 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) .

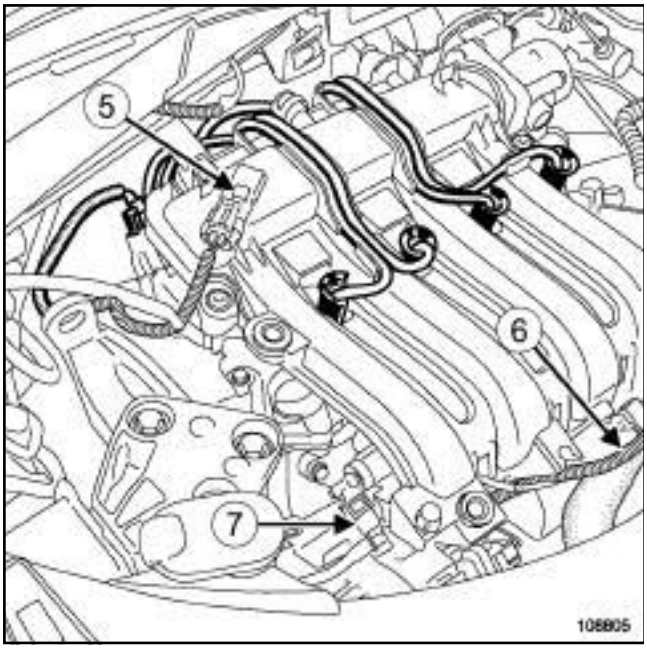


❑ Remove the air filter unit (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

108804

❑ Remove:

- the oil filler neck mounting bolt (**1**) ,
- the oil filler neck.



108811

❑ Disconnect:

- the oil vapour rebreathing pipe (**2**) ,
- the brake servo pipe (**3**) ,
- the petrol vapour rebreather pipe (**4**) .

D4F, and 740 or 742 or 764

108805

❑ Disconnect:

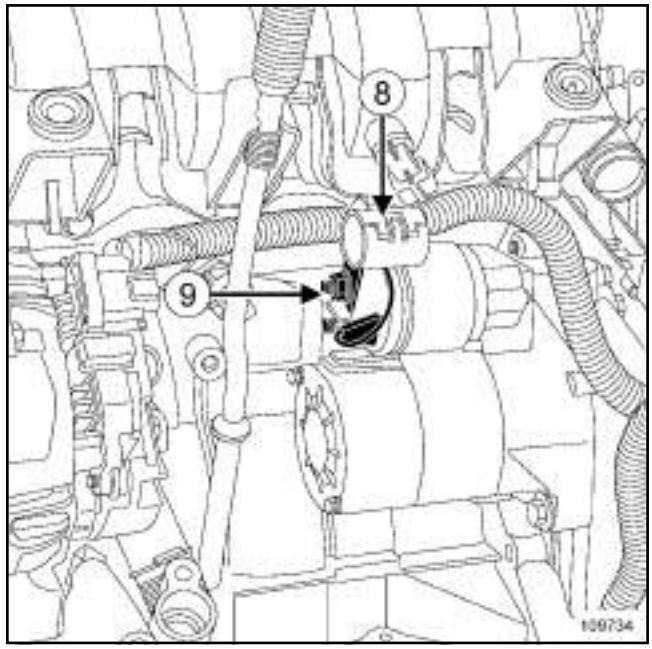
- the inlet air vacuum sensor connector (**5**) ,
- the air temperature sensor connector (**6**) ,
- the injector connector,
- the motorised throttle valve connector.

❑ Disconnect the petrol supply pipe from the injector rail (**7**) .

IMPORTANT

During this operation, it is essential to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.



IMPORTANT

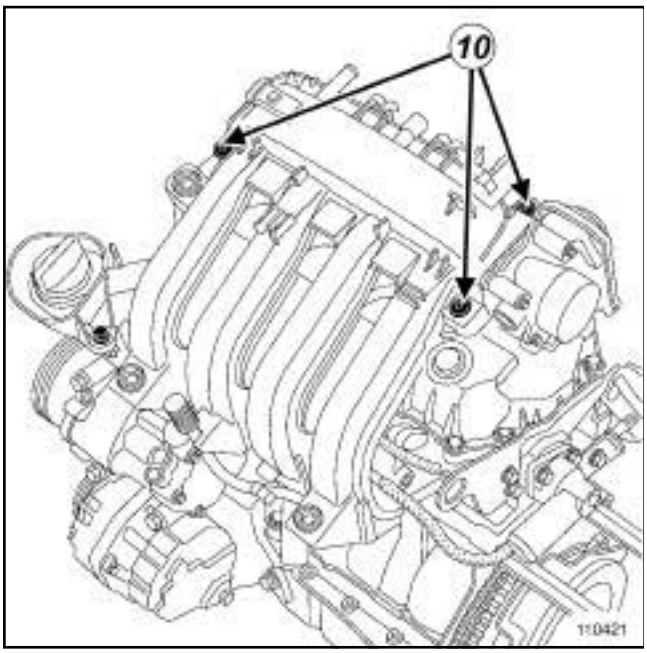
Wear gloves during the operation.

❑ Disconnect the spark plug leads.

WARNING

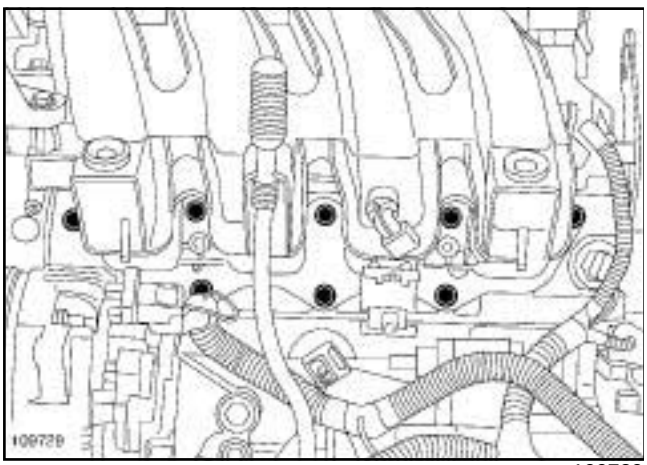
Pull on the connectors and not the leads to disconnect the spark plug leads.

109734



❑ Unclip the following from the inlet manifold:

- the spark plug leads,
- the wiring harness (**8**) ,
- the oil level dipstick.



❑ Remove the starter supply terminal (**9**) ,

D4F, and 740 or 742 or 764

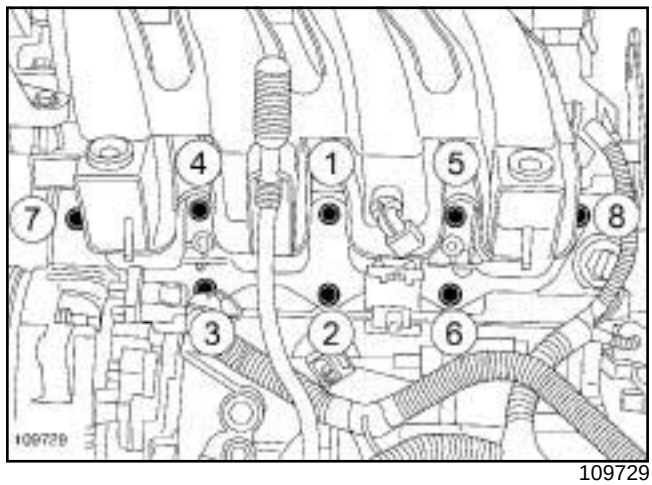
II - OPERATION FOR REMOVAL OF PART CONCERNED

110421

109729

❑ Remove:

- the inlet manifold mounting bolts from the rocker cover (**10**) ,
- the inlet manifold mounting bolts on the cylinder head,
- the plenum chamber - motorised throttle valve assembly,
- the inlet manifold gasket.



REFITTING

I - REFITTING PREPARATION OPERATION

❑ It is essential to replace the sealing rings.

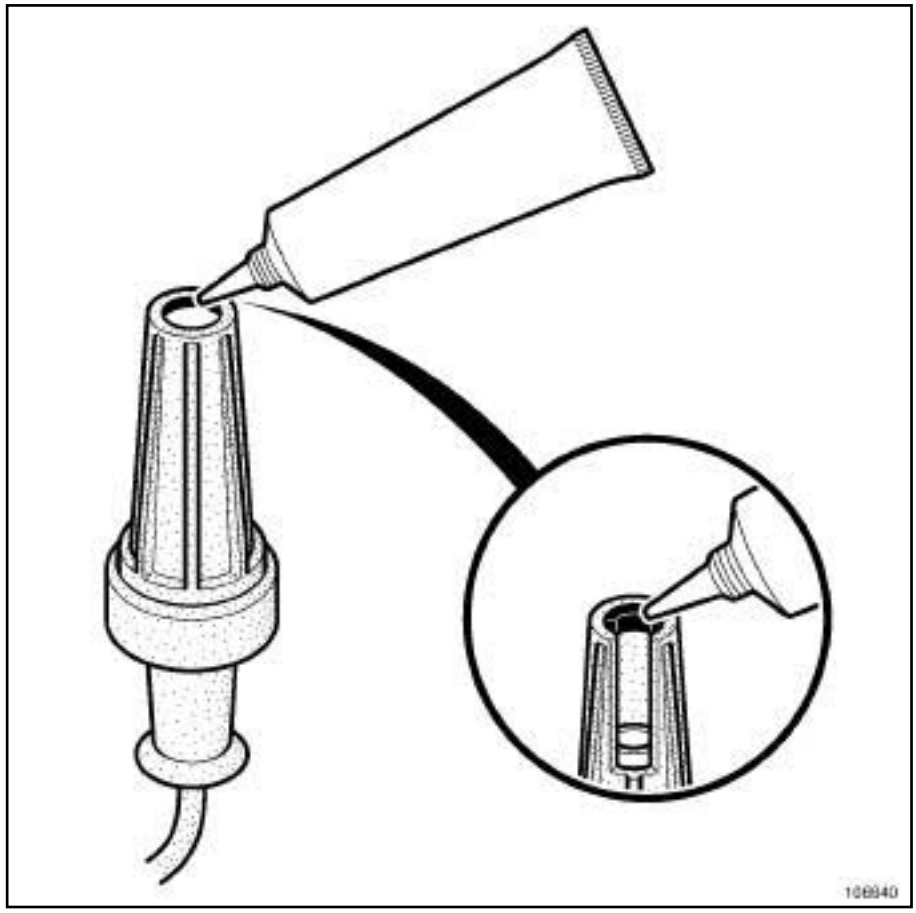
II - REFITTING STAGE FOR THE PART IN QUESTION

❑ Refitting the plenum chamber gasket

109729

❑ Apply **LOCTITE FRENETANCH** to the intake distributor mounting bolts on the cylinder head.

❑ Pretighten all the **intake distributor mounting bolts (6 N.m).**



❑ Tighten to torque and in order:

- the **intake distributor mounting bolts on the cylinder head (10 N.m)**,
- the **intake distributor mounting bolts on the rocker cover (10 N.m)**.

III - FINAL OPERATION.

❑ Clip the dipstick onto the plenum chamber

D4F, and 740 or 742 or 764

106640

❑ When refitting the spark plug feed wires a bead of **FLUORINATED GREASE (PART NO. 82 00 168 855)** with a diameter of **2 mm** must be applied to the inner edge of the high-tension caps.

❑ Refit:

- the spark plug leads,
- the wiring harness,
- the starter supply terminal,
- the oil filler neck.

❑ Reconnect:

- the injector rail petrol supply pipe,
- the motorised throttle valve connector,
- the injector connector,
- the air temperature sensor connector,
- the inlet air depression sensor connector,
- the oil vapour rebreathing pipe.
- the brake servo pipe ,
- the petrol vapour rebreather pipe.

❑ Refit the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) .

K4J or K4M

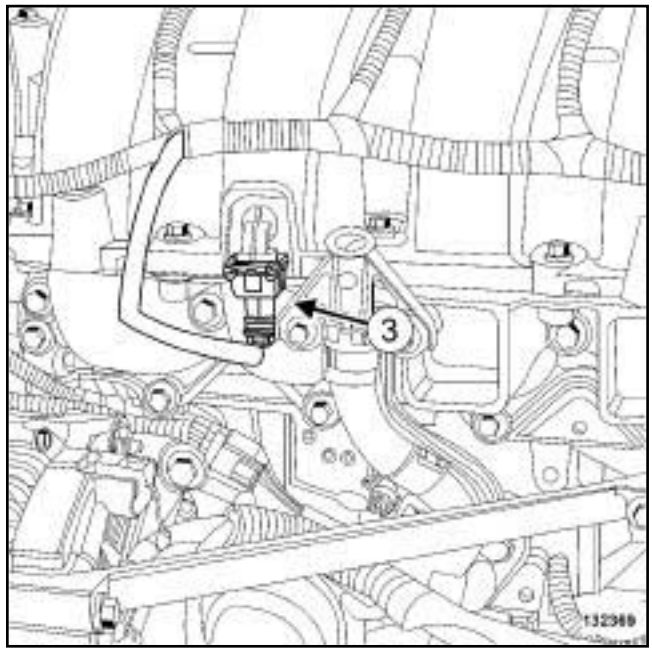
Tightening torques ▽	
bolts of the inlet distributor on the injector holder shim	**10 N.m**
inlet distributor bolts on the oil separator	**12 N.m**

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

WARNING
To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

REMOVAL

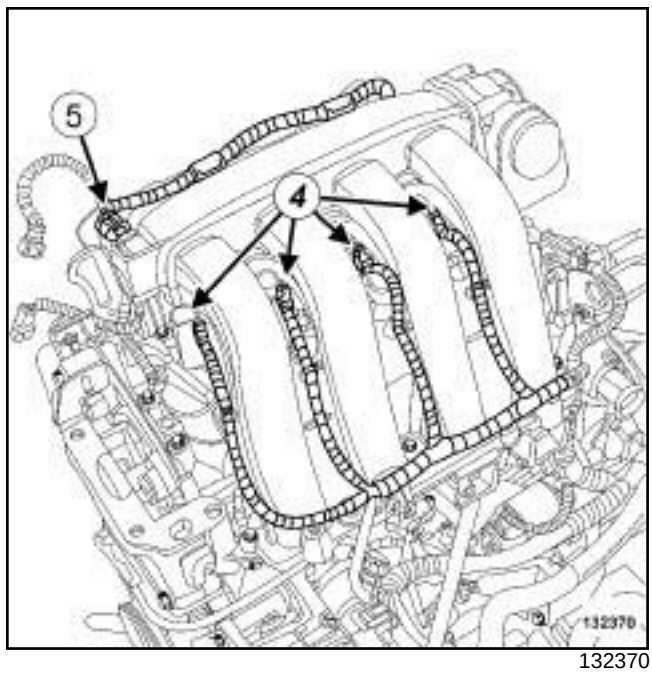
I - REMOVAL PREPARATION OPERATION



❏ Remove the front engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove:



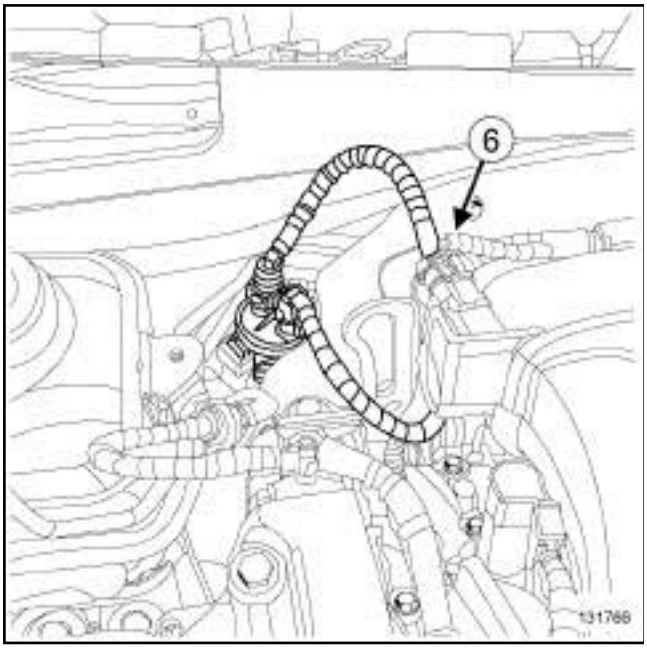
- the air inlet duct clips on the throttle valve side and the air filter unit clips,
- the air inlet duct,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

K4M, and 862

132369

❏ Disconnect the air temperature sensor connector (**3**) .

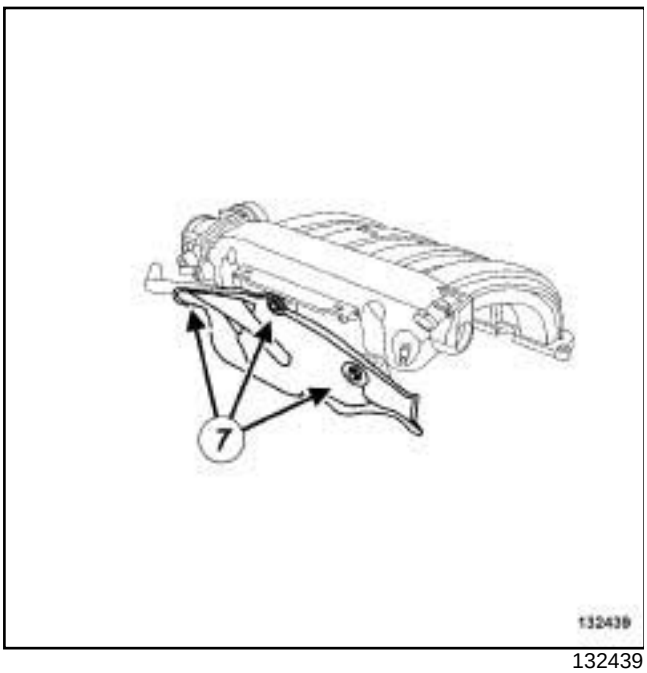
132370



❏ Disconnect:

- the connectors (**4**) from the coils,
- the connector (**5**) of the inlet air pressure sensor.

❏ Unclip the electrical wiring.



❏ Move the electrical wiringto one side.

K4J or K4M

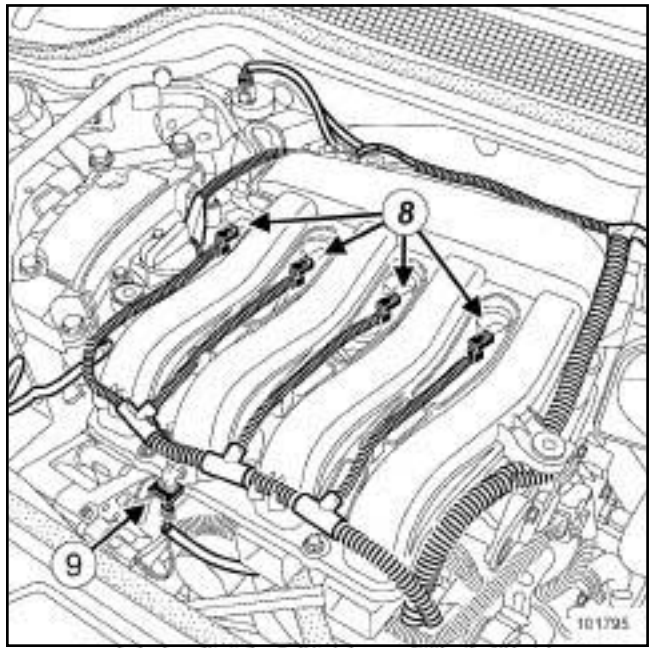
131766

❏ Disconnect the petrol vapour recirculation pipe (**6**) .

132439

❏

WARNING



To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

❏ Remove:

- the bolts (**7**) from the heat shield,
- the heat shield.

K4J

101795

❏ Disconnect:

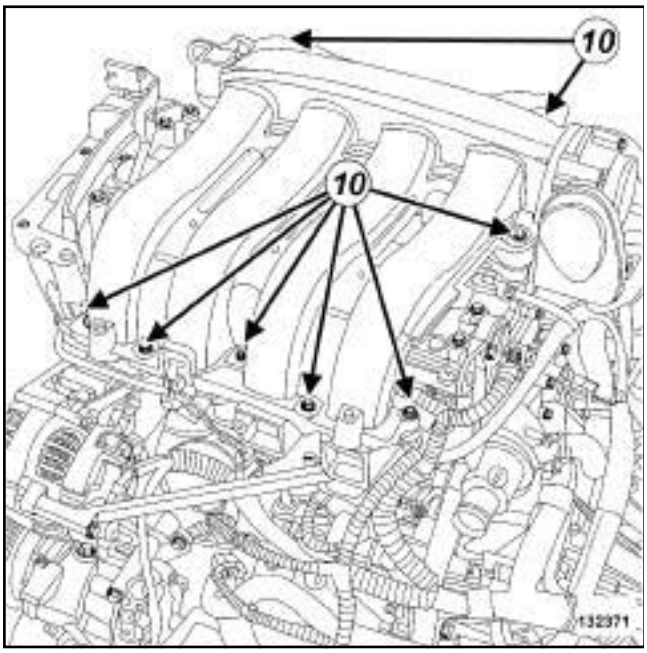
- the connectors (**8**) from the coils,
- the connector (**9**) from the air temperature sensor,
- the inlet air pressure sensor.

❏ Unclip the electrical wiring.

❏ Move the electrical wiringto one side.

❏ Disconnect the fuel supply pipe from the injection rail.

IMPORTANT



During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

❏ Unclip the fuel vapour recirculation pipe from the inlet distributor.

K4J or K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED

132371

❑ Remove:

- the inlet distributor bolts (**10**) ,
- the inlet distributor,
- the inlet distributor seal.

❑ When replacing the inlet distributor, remove:

- the air temperature sensor,
- the inlet air pressure sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: inlet distributor seal (10,07,01,07)**

❑

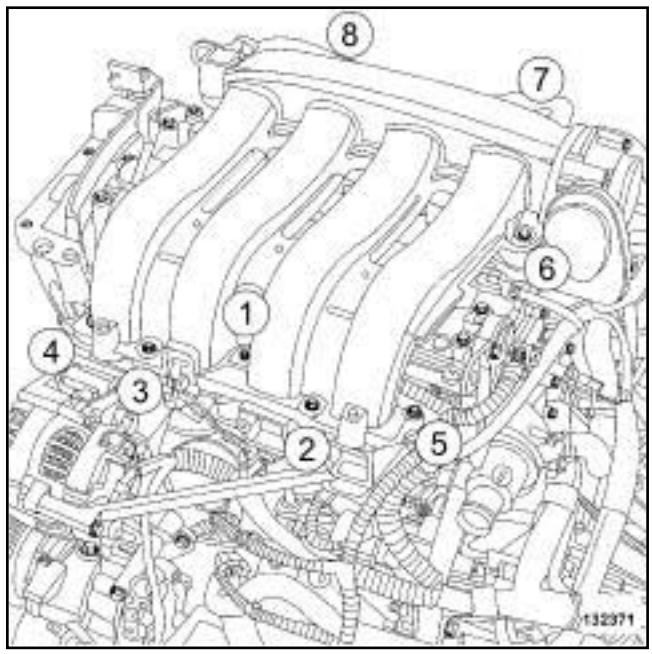
WARNING

Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the inlet distributor joint face,
- the joint face of the injector holder shim.

WARNING



To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).

❑ When replacing the inlet distributor, refit:

- the air temperature sensor,
- the inlet air pressure sensor.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the inlet distributor, with a new seal.

132371

❑ Tighten in order (**1**) , (**2**) , (**3**) , (**4**) , (**5**) , (**1**) , (**6**) , (**7**) and (**8**) .

❑ Tighten to torque:

- the **bolts of the inlet distributor on the injector holder shim (10 N.m)**,

K4J or K4M

- the **inlet distributor bolts on the oil separator (12 N.m)**.

III - FINAL OPERATION

❏ Clip the fuel vapour recirculation pipe onto the inlet distributor.

❏ Connect the petrol supply pipe to the injector rail.

❏ Clip on the electrical wiring.

❏ Connect:

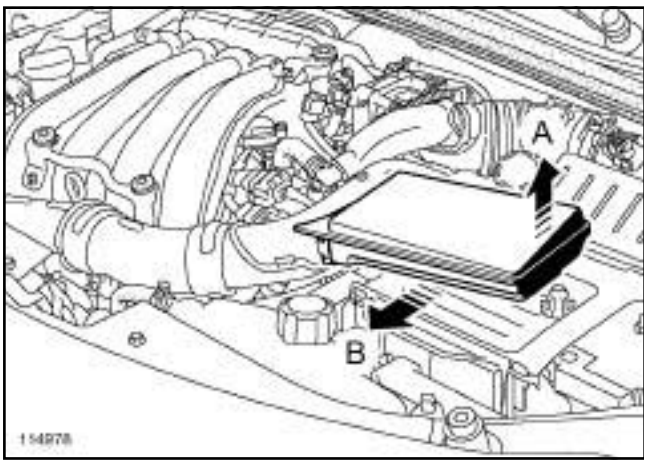
- the inlet air pressure sensor.
- the air temperature sensor connector,
- the coil connectors.

❏ Refit:

- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the engine cover.

M4R

Special tooling required	
Mot. 1448	Remote operation pliers for hose clips.

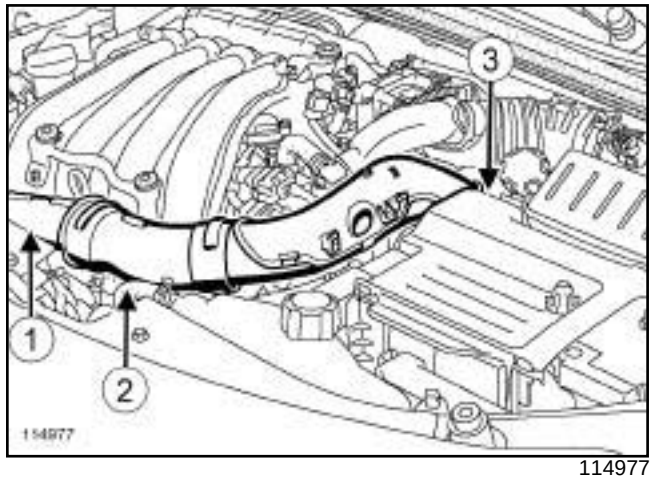


Tightening torques ▽	
inlet manifold mounting bolts	**27 Nm**
inlet manifold upper mounting bolts	**20 Nm**
motorised throttle valve mounting bolts	**10 Nm**
air inlet duct clips	**6 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the engine cover.

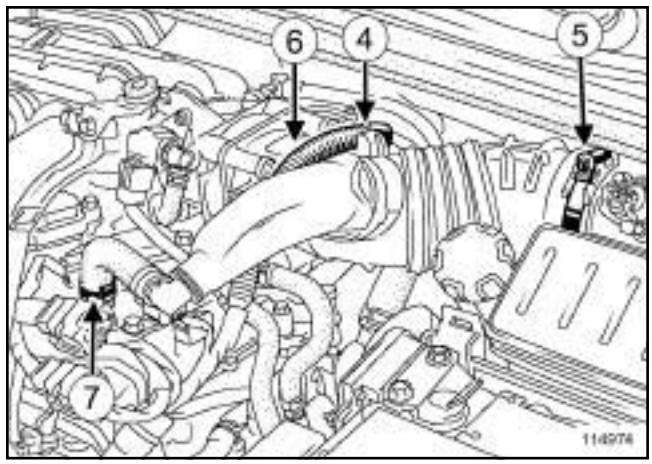


❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

114978

❏ Lift the air resonator to remove it from the battery cover (**A**) .

❏ Pull the air resonator towards the front of the vehicle (**B**) to remove it.



114977

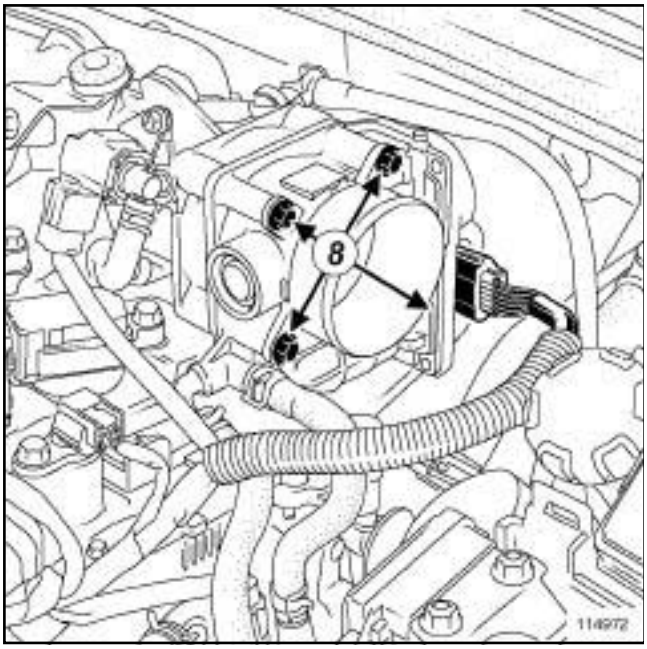
❏ Detach the air intake sleeve:

- from the front end panel at (**1**) ,
- from the air resonator on the front end panel at (**2**) ,
- from the air filter unit at (**3**) .

❏ Remove:

- the air intake sleeve,
- the dipstick.

114974

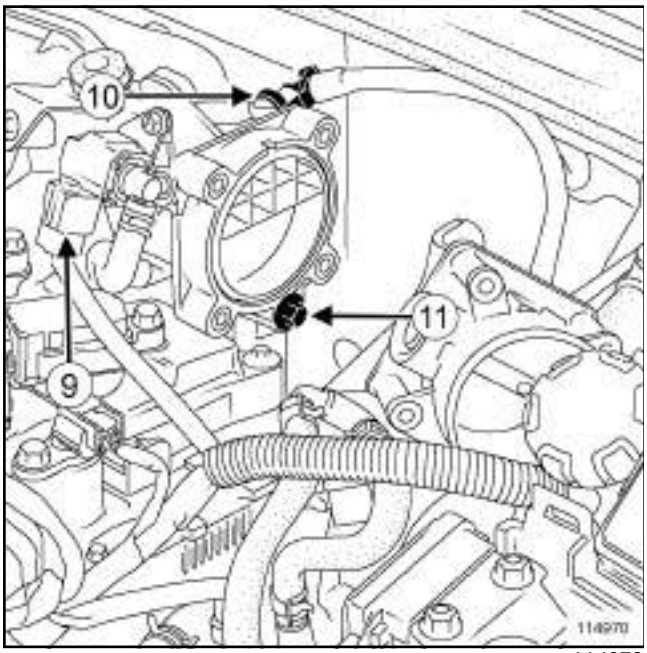


❏ Detach the wiring harness from the air inlet duct at (**4**) .

❏ Undo the air duct mounting clips:

- on the air flow sensor (**5**) ,
- on the motorised throttle valve (**6**) .

❏ Disconnect the oil vapour rebreather duct (**7**) from the rocker cover using the **(Mot. 1448)**.

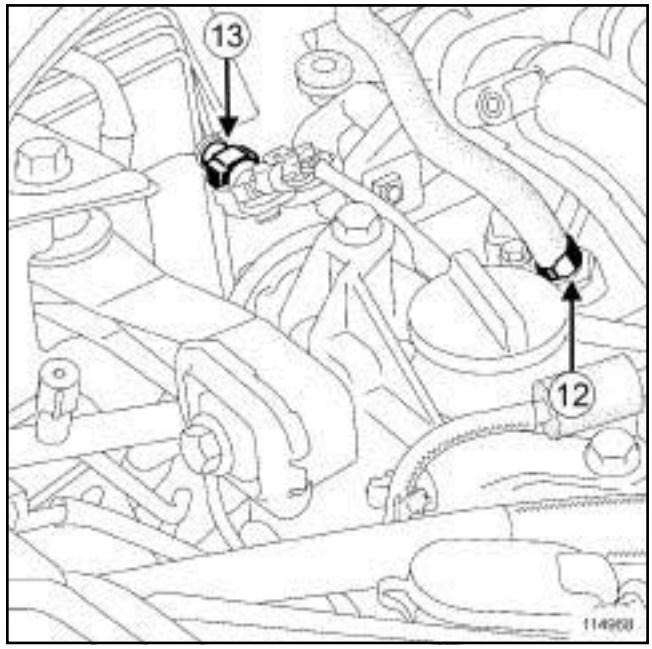


❏ Remove the air inlet duct.

114972

❏ Remove the motorised throttle valve mounting bolts (**8**) .

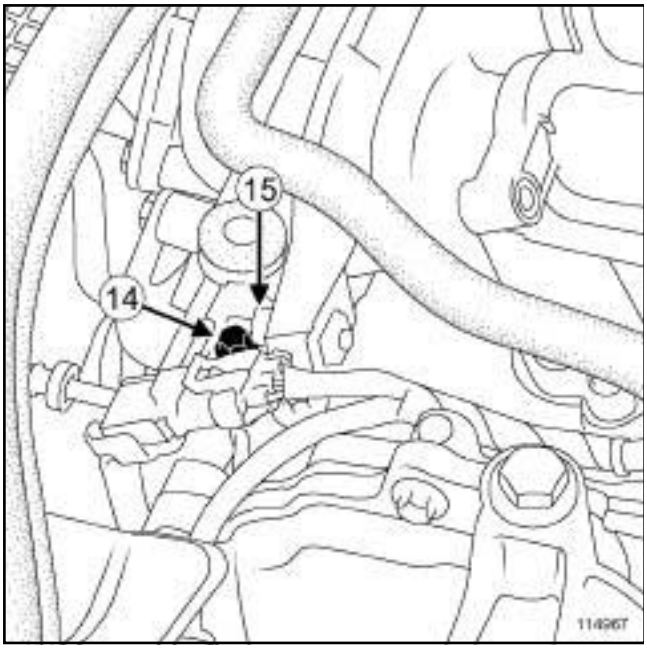
❏ Move the motorised throttle valve aside.



114970

❏ Disconnect:

- the petrol vapour rebreathing solenoid valve connector (**9**) ,
- the brake servo pipe (**10**) from the inlet manifold.

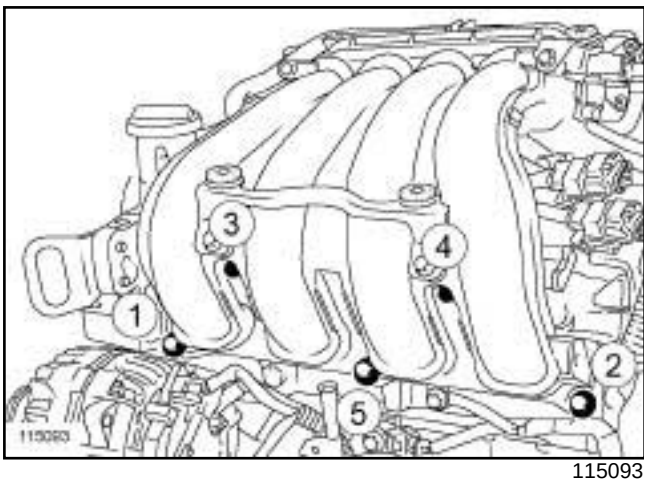


❏ Remove the inlet manifold upper mounting bolt (**11**) .

114968

❏ Disconnect:

- the oil vapour rebreather duct (**12**) from the rocker cover,
- the petrol vapour rebreather pipe (**13**) .



114967

❑ Remove the inlet manifold upper mounting bolt (**14**) .

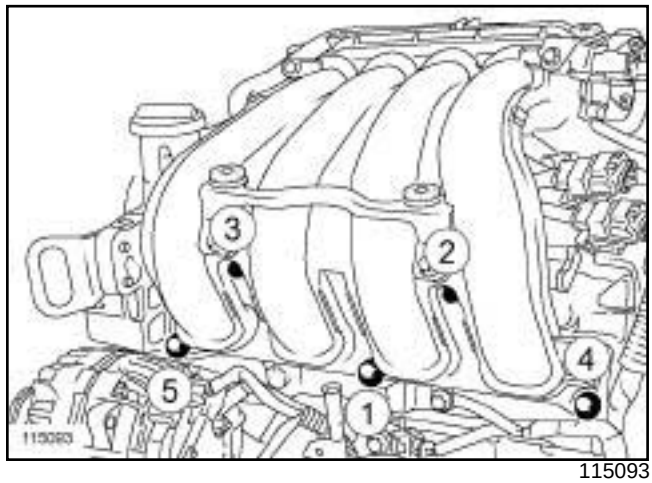
Note:

Do not remove the mounting bolt (**15**) from the manifold rear mounting bracket; removing this bolt may lead to destruction of the injector connections when the manifold is removed.

II - REMOVAL OF PART CONCERNED

115093

❑ Remove the inlet manifold mounting bolts in order.



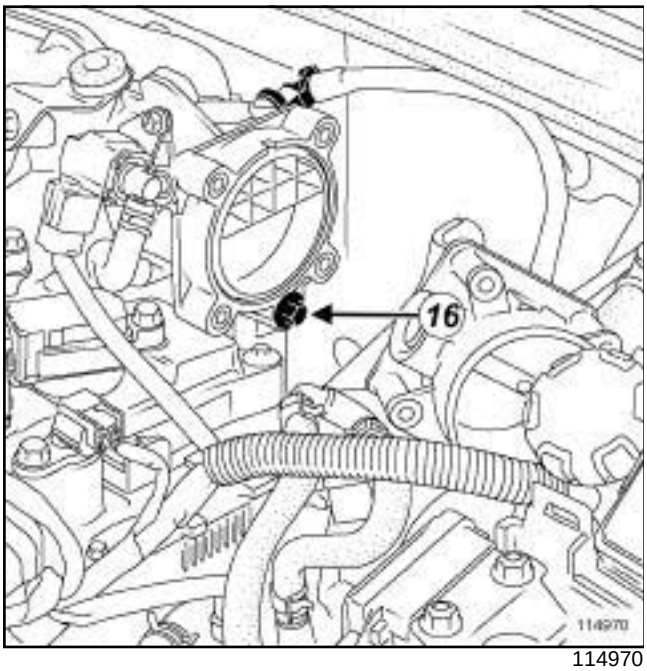
REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace:

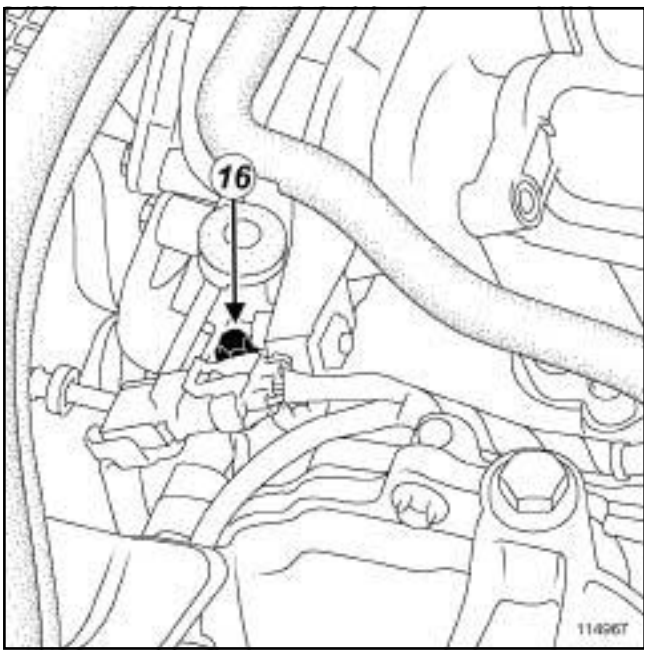
- the inlet manifold gasket,
- the motorised throttle valve seal.

II - REFITTING THE PART CONCERNED



115093

❑ Finger tighten the inlet manifold mounting bolts.

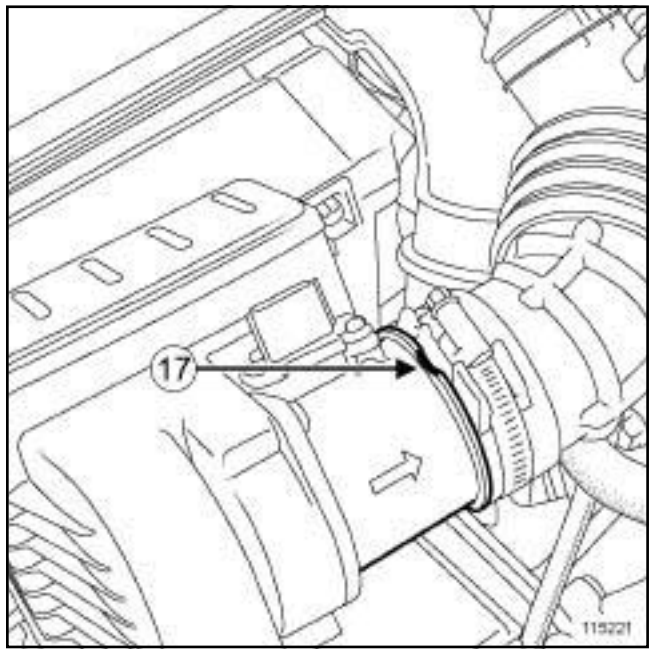


❑ Tighten to torque and in order the **inlet manifold mounting bolts (27 Nm)**.

M4R

III - FINAL OPERATION

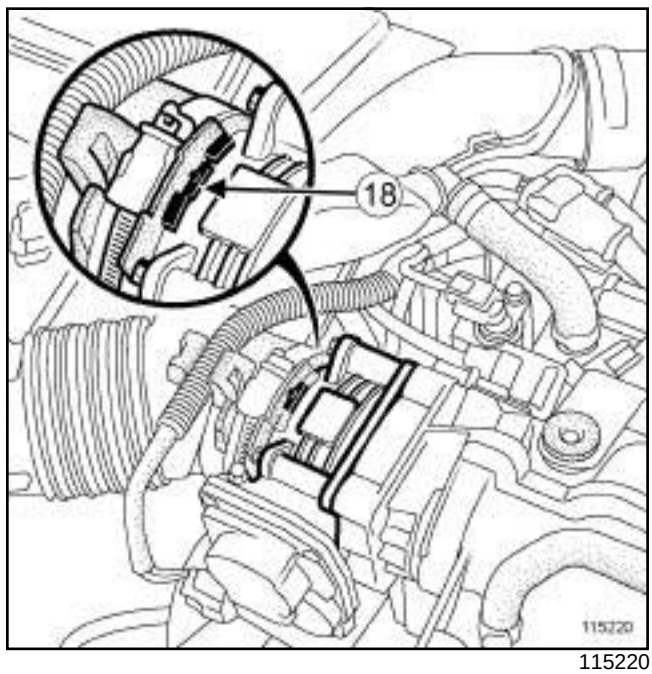
114970



114967

❑ Tighten to torque the **inlet manifold upper mounting bolts (20 Nm)** at (**16**) .

❑ Connect:

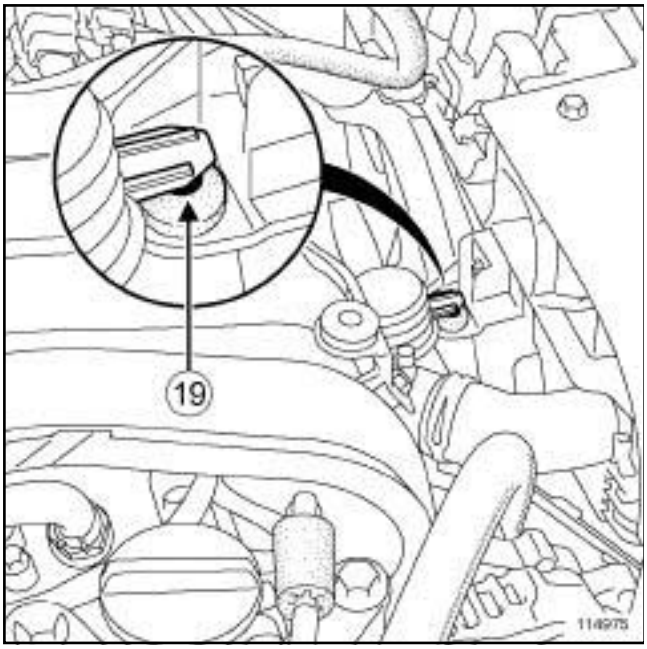


- the oil vapour rebreather duct on the rocker cover using the **(Mot. 1448)**,
- the petrol vapour rebreather pipe,
- the brake servo pipe on the inlet manifold,
- the petrol vapour rebreathing solenoid valve connector.

❑ Tighten to torque the **motorised throttle valve mounting bolts (10 Nm)**.

115221

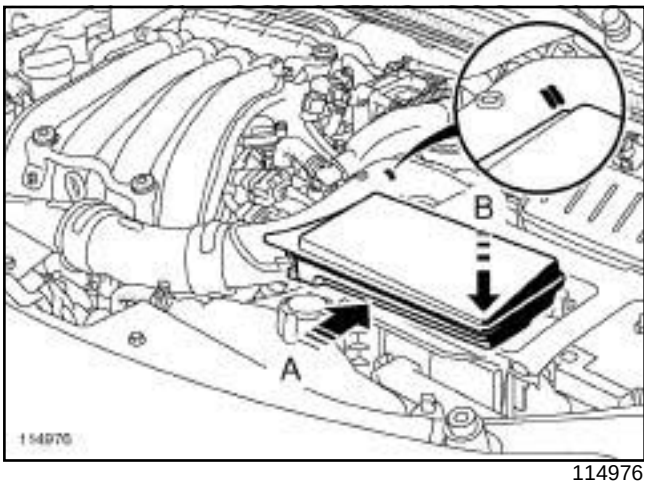
❑ Fit the air inlet duct on the air flow sensor, paying attention to the fitting mark (**17**) .



115220

❑ Fit the air inlet duct on the motorised throttle valve, paying attention to the fitting mark (**18**) .

❑ Tighten to torque the **air inlet duct clips (6 Nm)**.



❑ Clip the wiring harness on the air inlet duct.

114975

❏ Before refitting the air intake sleeve, check that the front end panel air resonator's upper mounting is correctly clipped at (**19**) .

❏ Refit the air intake sleeve.

114976

❏ Push the air resonator towards the rear of the vehicle (**A**) until the air resonator's rear face is located between the two marks on the air intake sleeve.

❏ Push the air resonator (**B**) to fit it onto the battery cover.

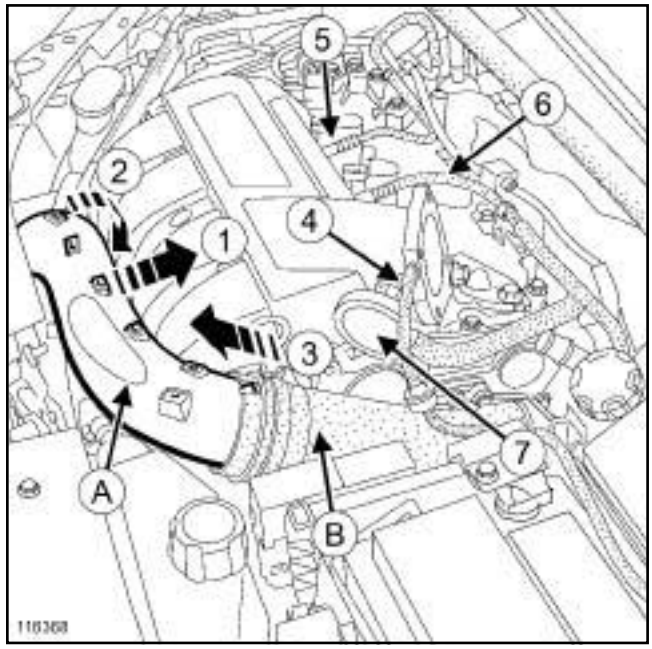
❏ Refit the dipstick.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

❏ Refit the engine cover.

F4R

Equipment required
Diagnostic tool



Tightening torques ▽	
inlet manifold mounting bolts	**15 Nm**
inlet manifold retaining bracket mounting bolts	**10 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

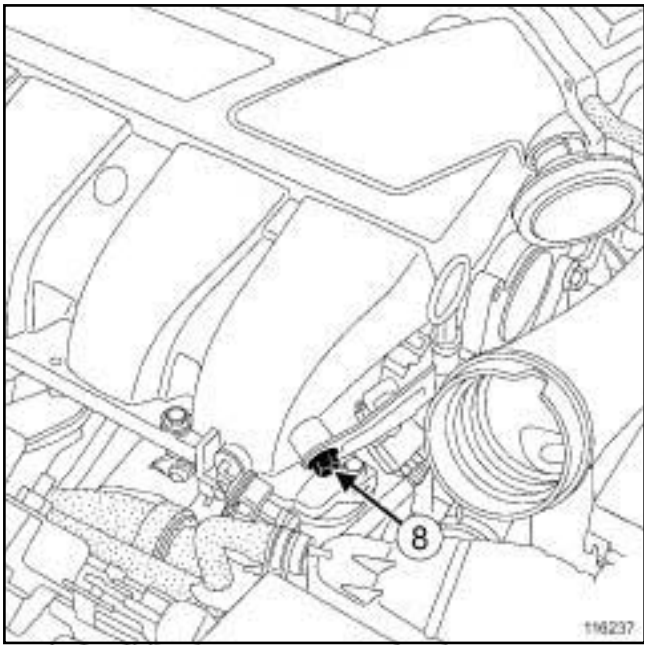
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

116368

❑ Remove:

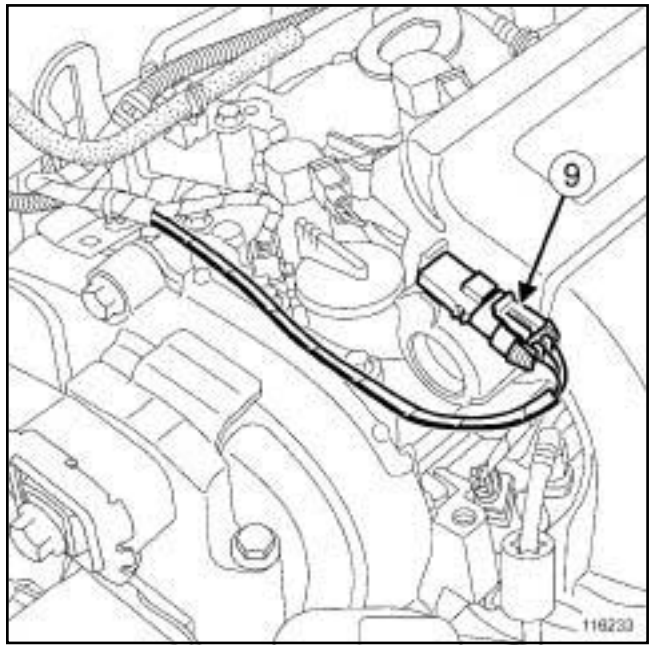
- the air inlet pipe (**A**) :
  - • unclip it from the front end panel (**1**) ,
  - • turn it (**2**) and disconnect it (**3**) .
- the air inlet pipe (**B**) :
  - • air resonator side,
  - • air filter unit side.



❑ Disconnect:

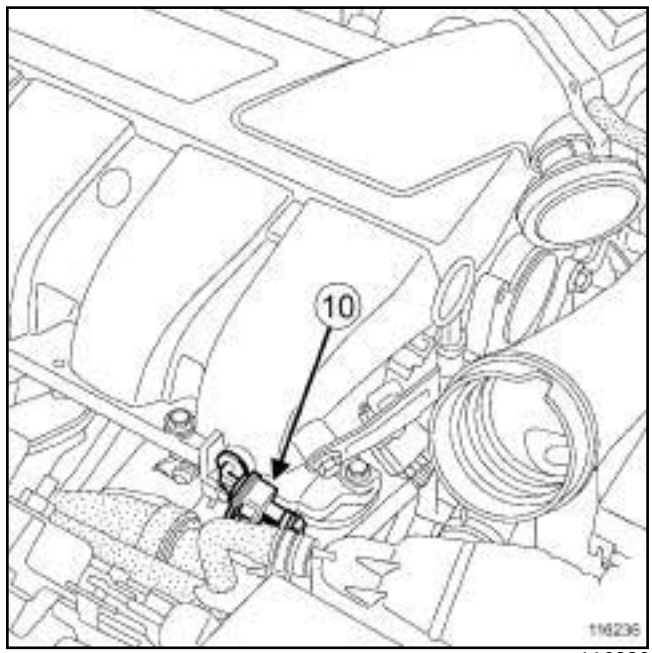
- the soundproofing unit control solenoid valve pipe (**4**) on the inlet manifold side,
- the fuel vapour rebreather pipe (**5**) on the inlet manifold side,
- the brake servo pipe (**6**) on the inlet manifold side.

❑ Remove:



- the oil vapour rebreather unit (**7**) on the inlet manifold, moving the mounting clips slightly to one side,
- the dipstick.

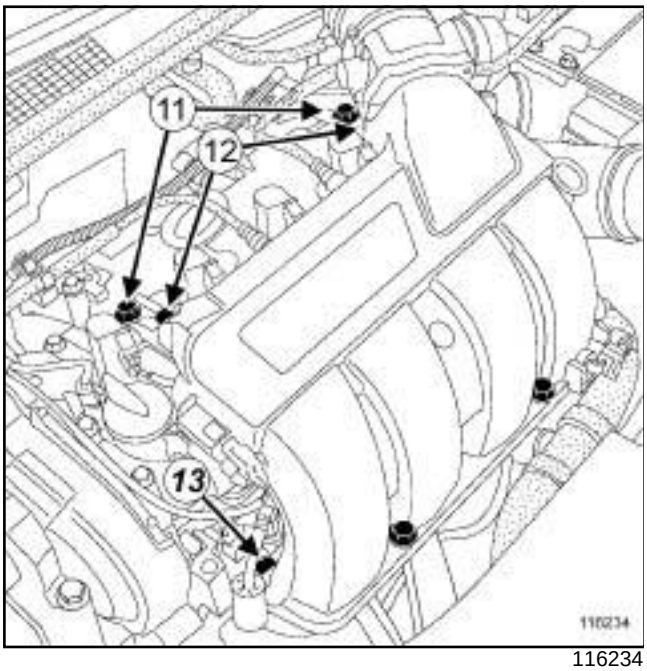
F4R



116237

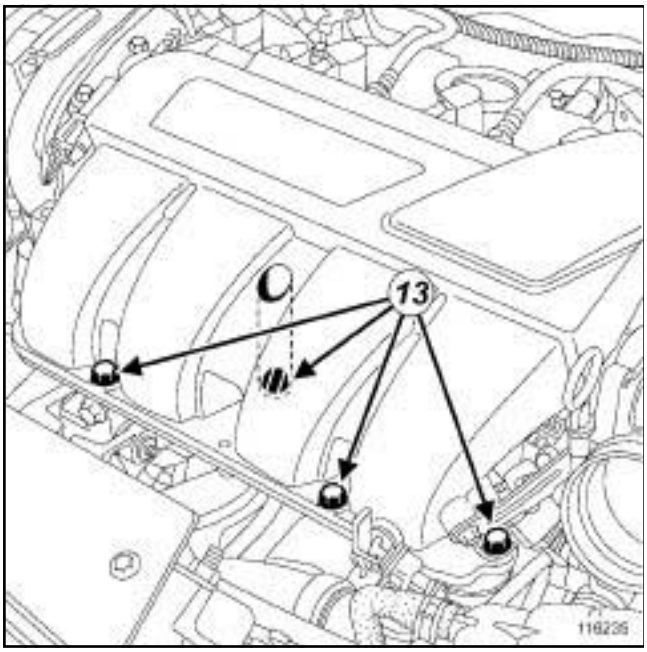
❑ Remove the dipstick tube mounting bolt (**8**) .

116233



116236

❑ Disconnect:



- the inlet air pressure sensor connector (**9**) ,
- the inlet air temperature sensor connector (**10**) .

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

116234

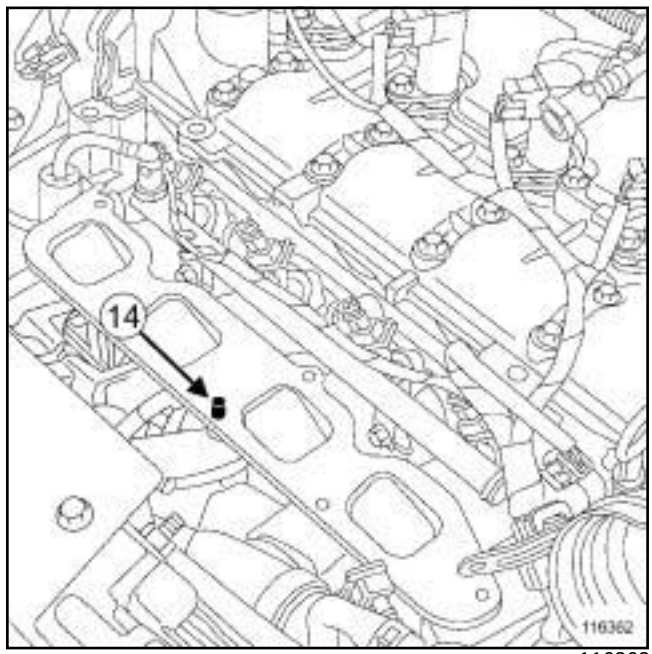
116235

❏ Unscrew by several turns the inlet manifold retaining bracket mounting bolts (**11**) on the oil decanter.

❏ Remove:

- the inlet manifold retaining bracket mounting bolts (**12**) ,
- the inlet manifold mounting bolts (**13**) ,
- the intake distributor.

When replacing the inlet manifold



❏ Remove:

- the inlet air pressure sensor.
- the inlet air temperature sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Carefully clean the joint faces.

116362

❏ Always check that the centring device (**14**) is fitted onto the injector holder plate or the inlet manifold. It can be ordered from the Parts Department if not.

> Note:
>
> If there is no centring device fitted this can cause the throttle valve to wear prematurely.

❏ Always replace all of the seals with new ones.

When replacing the inlet manifold

❏ Refit:

- the inlet air temperature sensor,
- the new inlet air pressure sensor.

II - REFITTING OPERATION FOR PART CONCERNED

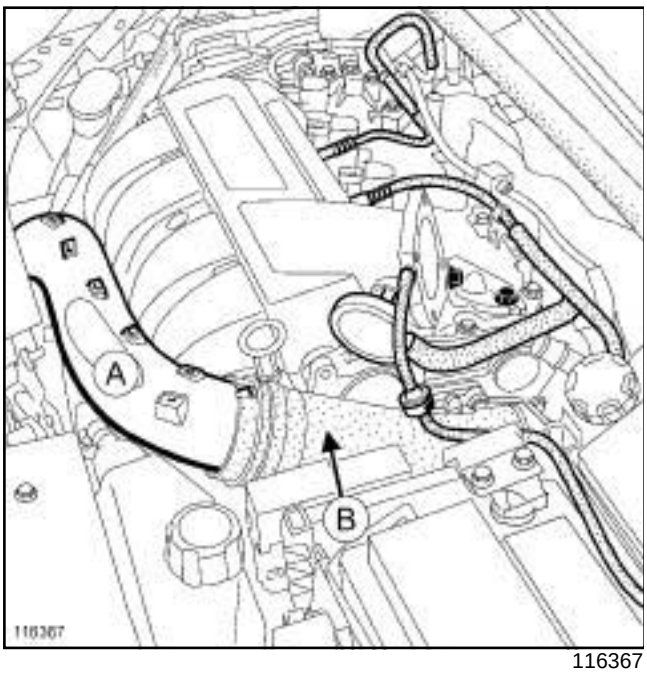
❏ Refit:

- the inlet manifold fitted with a new seal,

- the inlet manifold mounting bolts,
- the inlet manifold retaining bracket mounting bolts.

❏ Torque tighten and in order:

- the **inlet manifold mounting bolts (15 Nm)**,
- the **inlet manifold retaining bracket mounting bolts (10 Nm)**.



❏ Refit:

- the dipstick guide tube mounting bolt,
- the dipstick,
- the oil vapour rebreather unit on the inlet manifold fitted with a new seal.

❏ Connect:

- the soundproofing unit control solenoid valve pipe on the inlet manifold side,
- the inlet air temperature sensor connector.
- the air inlet pressure sensor connector,
- the fuel vapour rebreathing pipe onto the inlet manifold,
- the brake servo pipe on the inlet manifold side.

III - FINAL OPERATION.

116367

❏ Refit:

- the air inlet pipe (**B**) ,
- the air inlet pipe (**A**) .

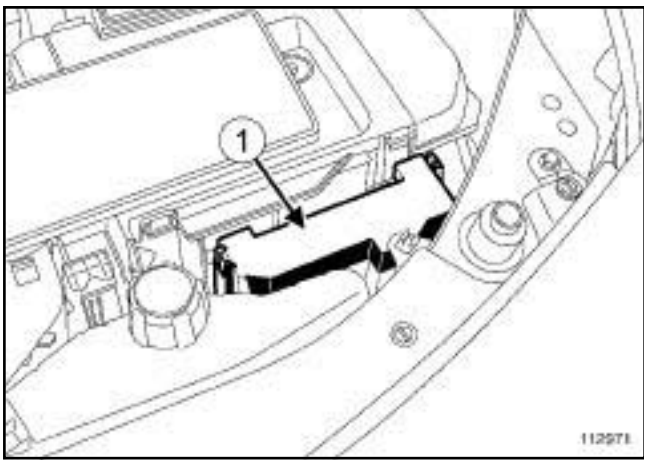
❏ Refit the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Using the **Diagnostic tool**, check that there are no faults stored by the computer, and clear them if necessary.

D4F, and 784

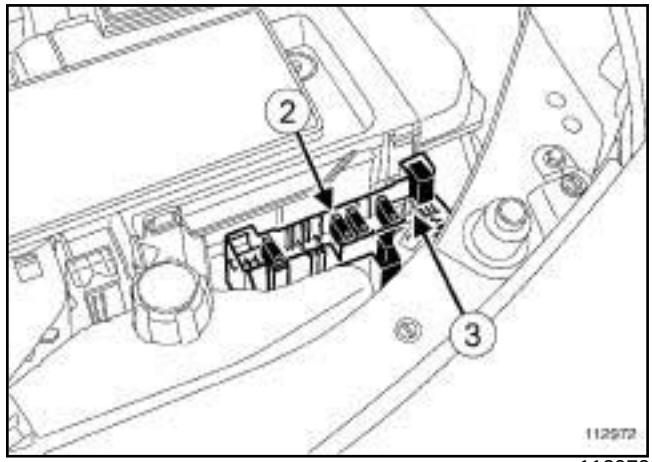
Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.



Tightening torques ▽	
throttle valve bolts	**10 N.m**
injector rail - injector bolts	**5 N.m**
inlet distributor bolts (initial torque)	**4 N.m**
inlet distributor bolts	**12 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION



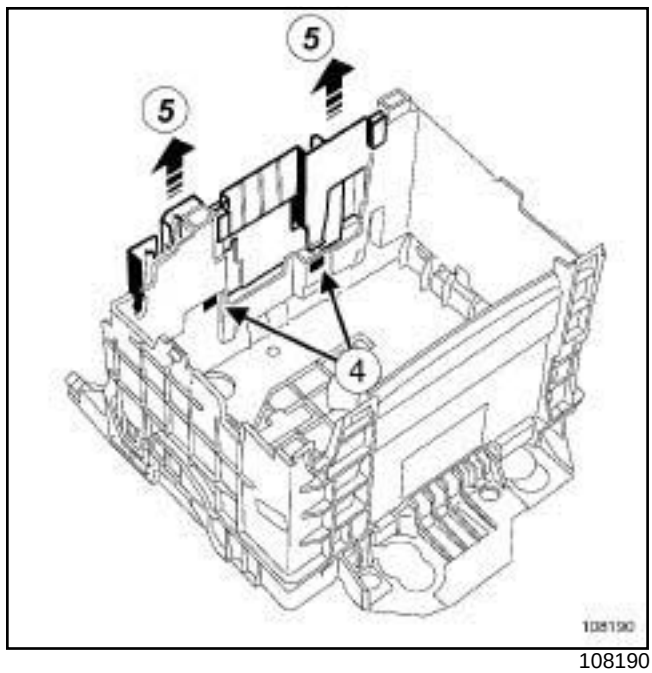
❏ Remove the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the front engine cover.

112971

❏ Remove the cover (**1**) from the power feed fuse board mounting.

112972



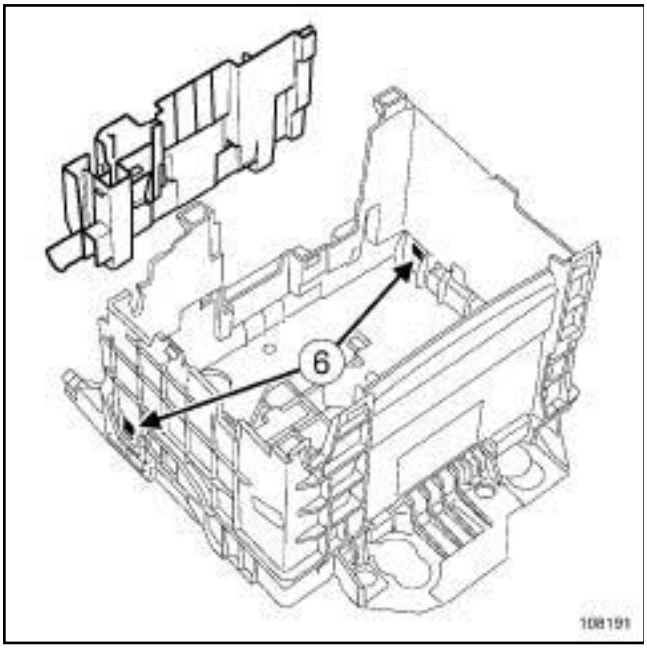
❏ Remove the green fuse (**2**) **(30 A)**.

❏ Detach the fuse connector from the fuse mounting.

❏ Remove the power wiring nut on the fuse mounting (**3**) .

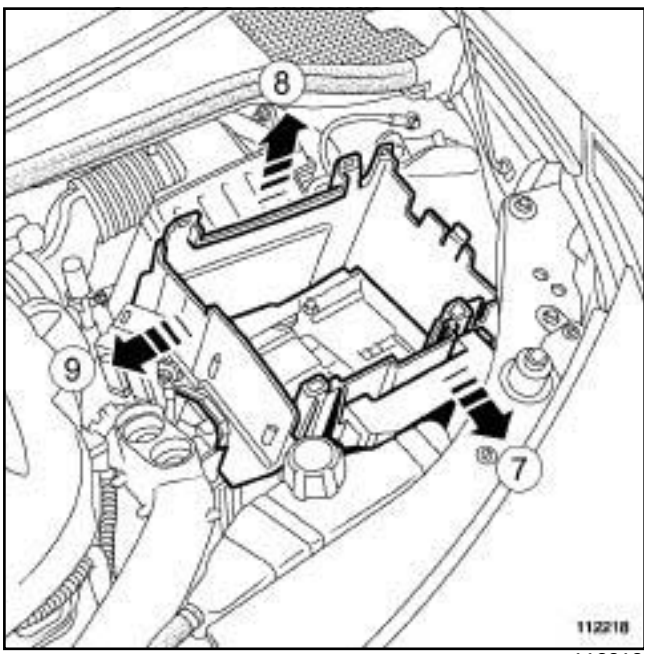
❏ Move the power wiring away from the fuse mounting.

❏ Detach the fuse board.



108190

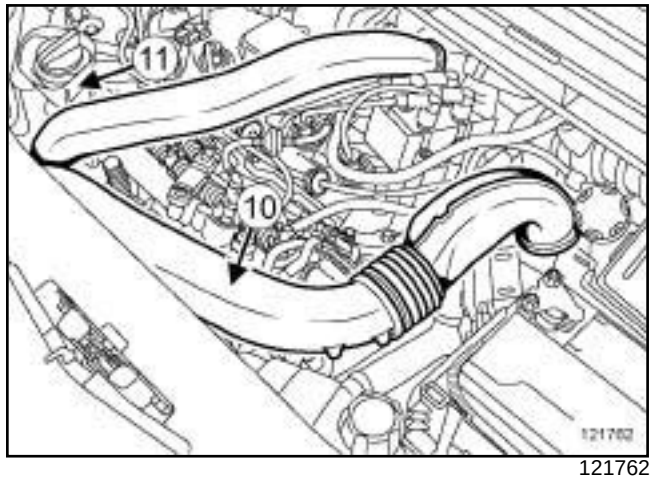
❏ Unclip the power feed fuse board support at (**4**) .



❏ Move aside the power feed fuse board support at (**5**) .

D4F, and 784

108191

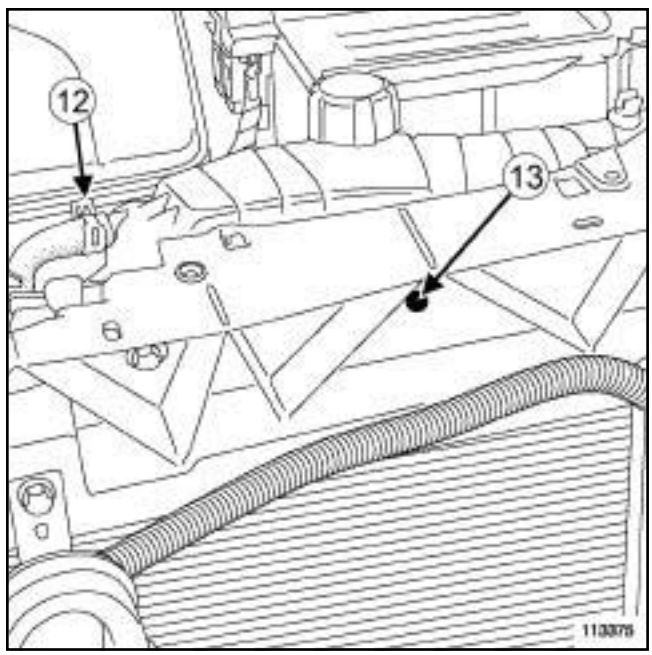


❏ Unclip the thermal protection shield at (**6**) .

112218

❏ Hold the power feed fuse board mounting aside at (**7**) .

❏ Remove the thermal protection tray at (**8**) and (**9**) .



121762

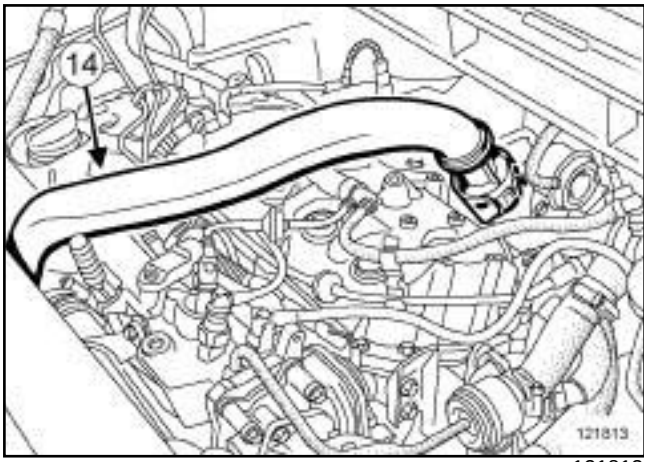
❏ Disconnect the air inlet pipe (**10**) from the air filter box.

❏ Remove:

- the bolt (**11**) from the engine oil filler neck,
- the engine oil filler neck,
- the dipstick,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

113375

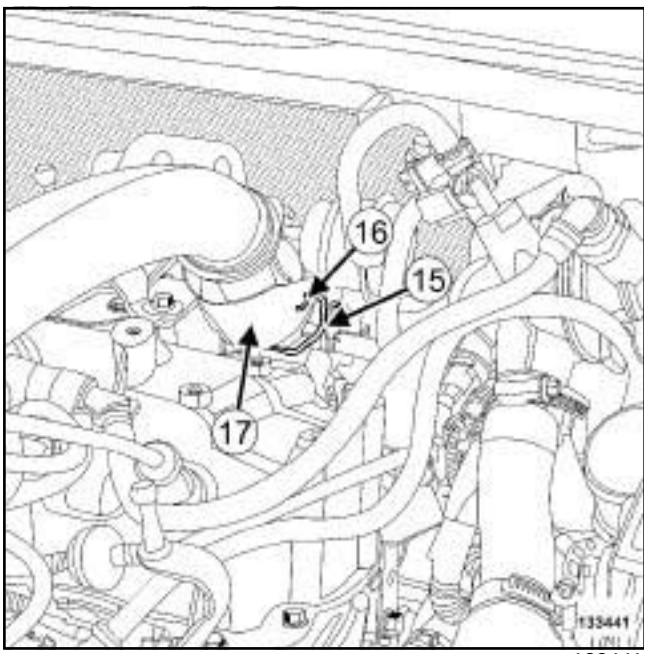
❏ Fit a hose clamp **(Ms. 583)** on the hose (**12**) .



❏ Separate the clip on the hose using the tool **(Mot. 1448)**.

❏ Disconnect the hose.

❏ Remove clip (**13**) .

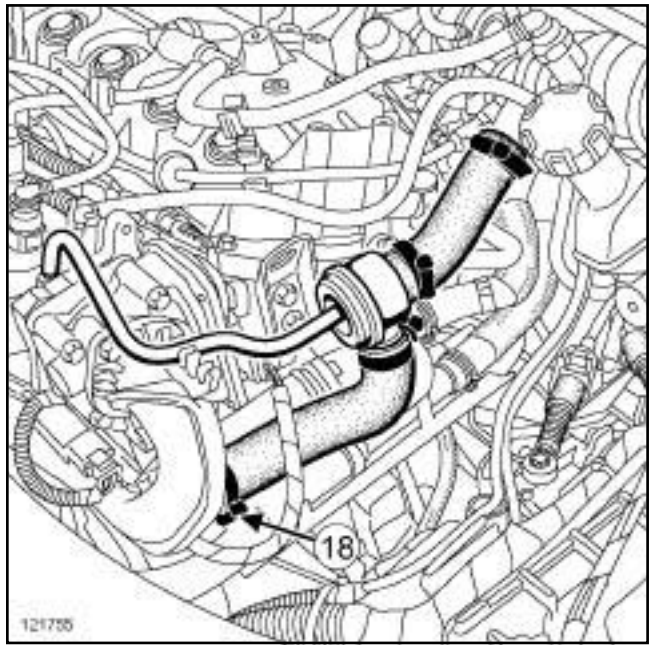


❏ Remove the expansion bottle.

D4F, and 784

121813

❏ Remove the bolt (**14**) from the turbocharger air outlet pipe on the inlet distributor.

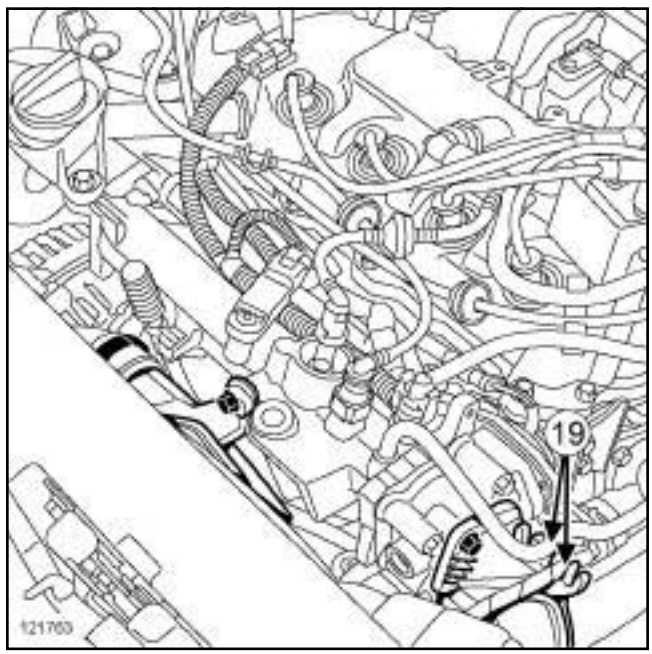


133441

❏ Separate the clip (**15**) on the turbocharger air outlet pipe.

Note:

If the clip (**16**) is removed from the flexible heat shield (**17**) , the latter must be replaced.

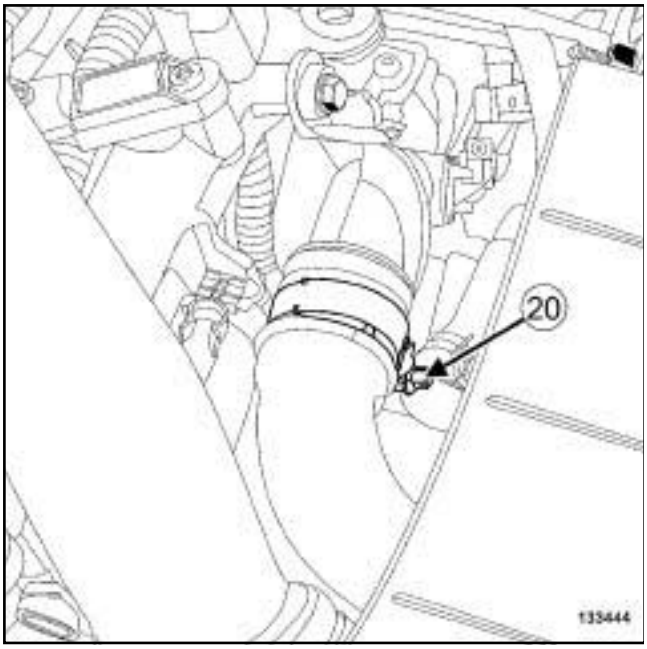


❏ Move aside the turbocharger air outlet pipe.

121755

❏ Undo the compressor discharge valve air pipe clip (**18**) .

❏ Disconnect the compressor discharge valve air pipe.

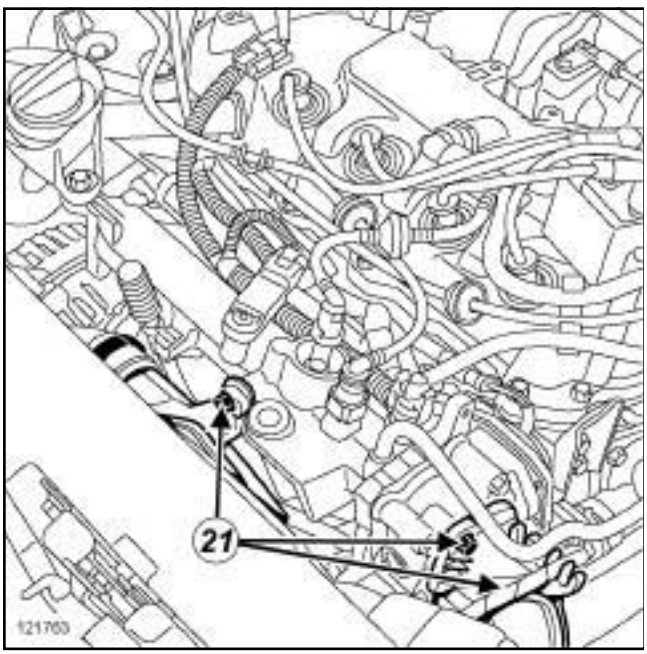


121763

❏ Detach at (**19**) :

- the vacuum pipe,
- the throttle valve electrical wiring.

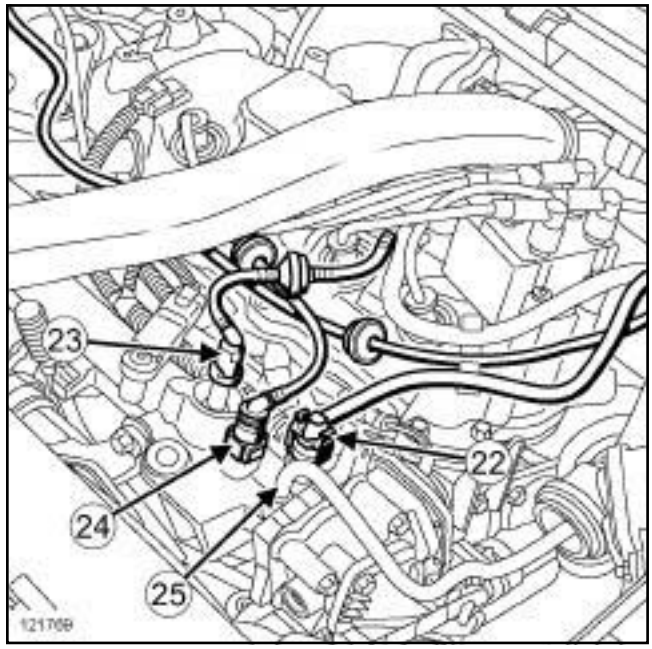
❏ Disconnect the throttle valve connector.



D4F, and 784

133444

❏ Loosen the clip (**20**) on the intercooler intermediate pipe.



❏ Disconnect the intercooler intermediate pipe.

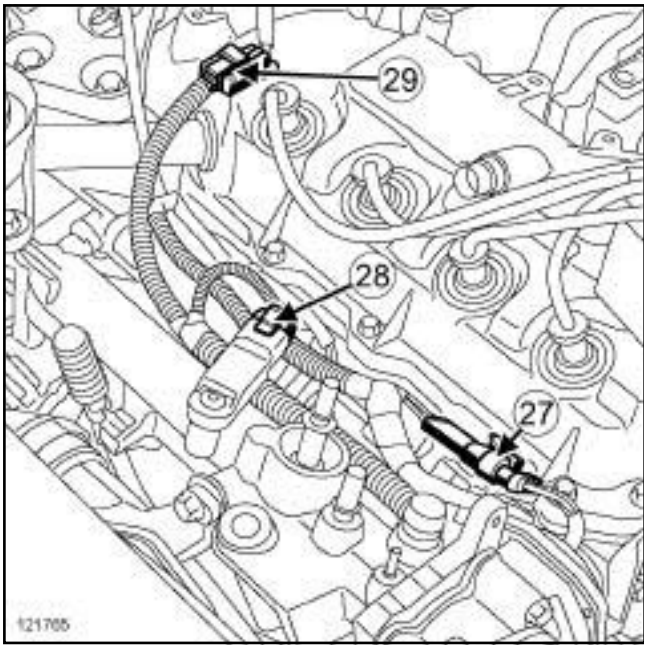
121763

❏ Remove:

- the bolts (**21**) of the intermediate pipe at the inlet of the inlet distributor,
- the intermediate pipe at the intercooler outlet.

121769

❏ Disconnect:



- the brake servo non-return valve (**22**) ,
- the oil vapour rebreathing pipe (**23**) ,
- the petrol vapour rebreathing pipe (**24**) ,
- the compressor discharge valve vacuum pipe (**25**) .

133356

❏ Disconnect the connector (**26**) from the fuel heater (if equipped).

D4F, and 784

121765

❑ Disconnect:

- the injector rail connector (**27**) ,
- the pressure sensor connector (**28**) ,
- the catalytic pre-converter upstream oxygen sensor connector (**29**) ,
- the petrol vapour recirculation solenoid valve connector.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

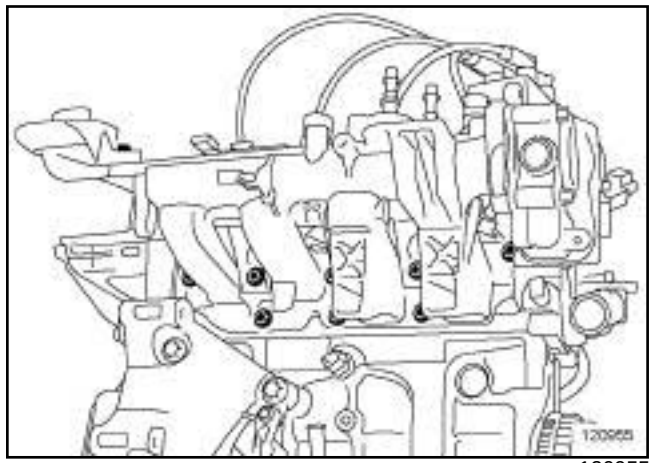
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

Wear goggles with side protectors for this operation.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



❑ Disconnect the fuel inlet pipe on the injector rail.

❑ Fit blanking plugs.

❑ Unclip the electrical wiring.

❑ Move the electrical wiringto one side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

120955

❑ Remove:

- the inlet distributor bolts,
- the inlet distributor,
- the inlet distributor seal.

When replacing the inlet distributor

❑ Remove:

- the « injection rail - injector » bolts,
- the « injection rail - injector » by pulling it gently,
- the throttle valve bolts,
- the throttle valve,
- the pressure sensor,
- the electric heater (if fitted).

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: inlet distributor seal (10,07,01,07)**.

❑ Use a **GREY ABRASIVE PAD** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean the bearing faces on:

- the inlet distributor,
- the cylinder head.

D4F, and 784

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and clean cloths to degrease the mating faces on:

- the inlet distributor,
- the cylinder head.

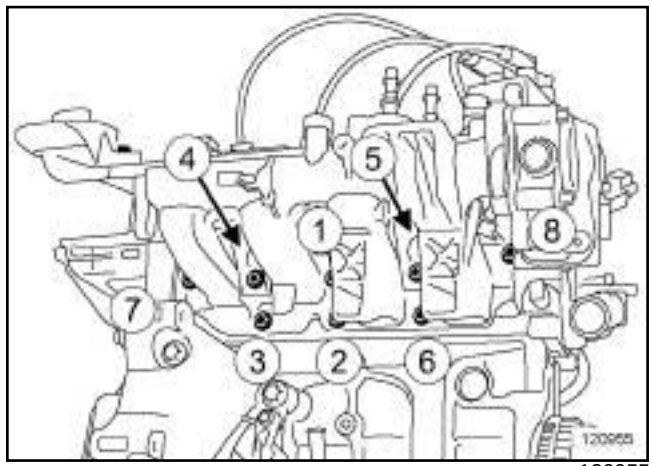
❏ Lubricate the injector seals with **SILICONE FREE LUBRICANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

When replacing the inlet distributor

❏ **parts always to be replaced: injector seal (11,11, 02,02)**.

❏ **parts always to be replaced: Throttle valve seal (11,04,06,25)**.

❏ Always replace the heater seal.



❏ Refit:

- the throttle valve,
- the throttle valve bolts,
- the « injector rail - injectors » carefully,
- the « injection rail - injector » bolts.

❏ Tighten to torque:

- the **throttle valve bolts (10 N.m)**,
- the **injector rail - injector bolts (5 N.m)**.

II - REFITTING OPERATION FOR PART CONCERNED

120955

❏ Apply a drop of **FRENETANCHE** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to the inlet distributor bolts.

❏ Refit:

- the inlet distributor fitted with a new seal,
- the inlet distributor bolts.

❏ Pretighten to torque and in order the **inlet distributor bolts (initial torque) (4 N.m)**.

❏ Tighten to torque and in order the **inlet distributor bolts (12 N.m)**.

III - FINAL OPERATION

❏ Clip on the electric wiring.

❏ Remove the blanking plugs.

❏ Connect:

- the fuel supply pipe on the injector rail,
- the petrol vapour recirculation solenoid valve connector.
- the catalytic pre-converter upstream oxygen sensor connector,
- the pressure sensor connector,
- the injector rail connector,
- the fuel heater connector,
- the compressor discharge valve vacuum pipe,
- the petrol vapour rebreathing pipe,
- the oil vapour rebreathing pipe,
- the brake servo non-return valve.

D4F, and 784

❏ Refit:

- the intermediate pipe at the inlet of the inlet distributor,
- the bolts for the intermediate pipe at the inlet of the inlet distributor.

❏ Connect the intermediate pipe at the intercooler outlet.

❏ Tighten the clip of the intermediate pipe at the intercooler outlet.

❏ Connect the throttle valve connector.

❏ Clip:

- the vacuum pipe,
- the throttle valve electrical wiring.

❏ Connect the compressor discharge valve air pipe.

❏ Tighten the compressor discharge valve air pipe clip.

❏ Connect:

- the air temperature sensor connector,
- the air pressure sensor connector.

❏ Refit the turbocharger air outlet pipe.

❏ Clip the turbocharger air outlet pipe onto the turbocharger.

❏ Refit:

- the turbocharger air outlet pipe bolt on the inlet distributor,
- the expansion bottle,
- the clip.

❏ Connect the hose.

❏ Refit the clip using the **(Mot. 1448)**.

❏ Remove the hose clamps.

❏ Refit:

- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the dipstick,
- the engine oil filler neck,
- the engine oil filler neck bolt.

❏ Connect the air inlet pipe to the air filter box.

❏ Refit the thermal protection shield.

❏ Clip on the thermal protection shield.

❏ Refit the power feed fuse board mounting.

❏ Clip on the power feed fuse board support.

❏ Refit the power wiring nut on the fuse mounting.

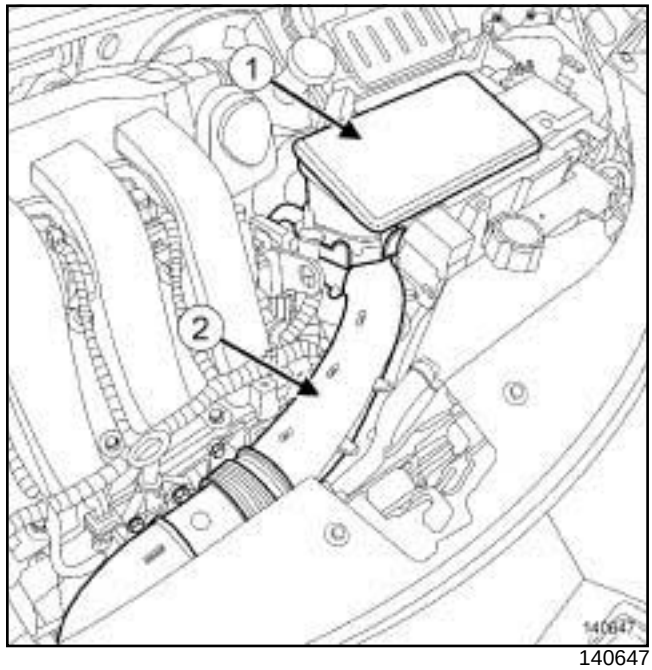
❏ Attach the fuse connector to the fuse mounting.

❏ Refit:

- the green fuse **(30A)**,
- the power feed fuse board mounting,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery).

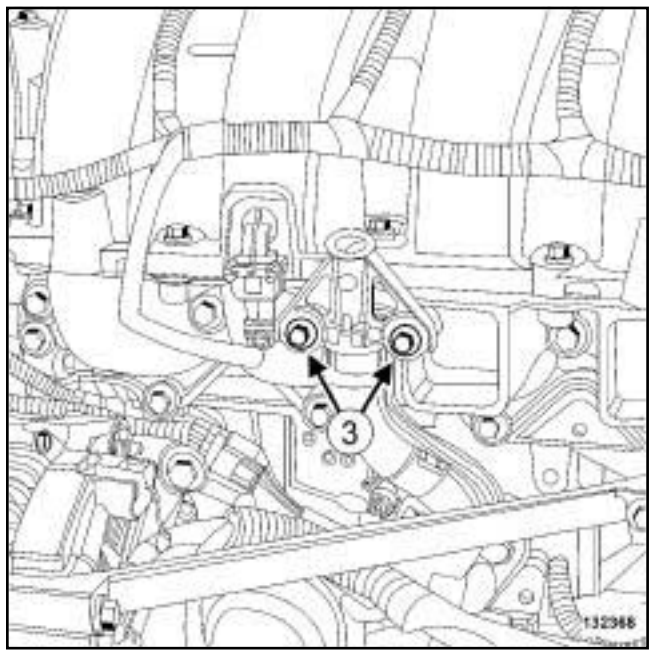
❏ Refit the engine cover.

K4J or K4M



Tightening torques ▽	
bolts 1 and 2 on the injector holder shim	**30 N.m**
bolts 3 to 10 on the injector holder shim	**25 N.m**
upper timing cover bolt	**46 N.m**
right-hand pendulum suspension bolt	**62 N.m**

REMOVAL



I - REMOVAL PREPARATION OPERATION

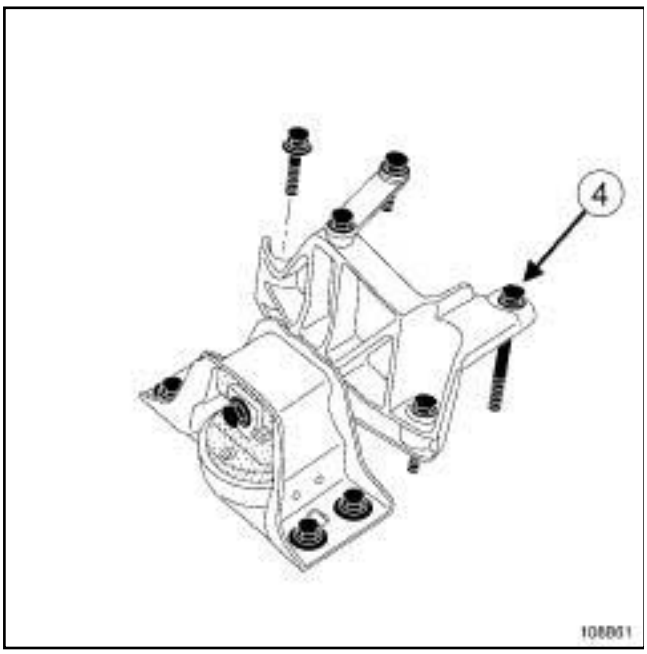
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

K4M, and 862

140647

132368

❑ Remove:

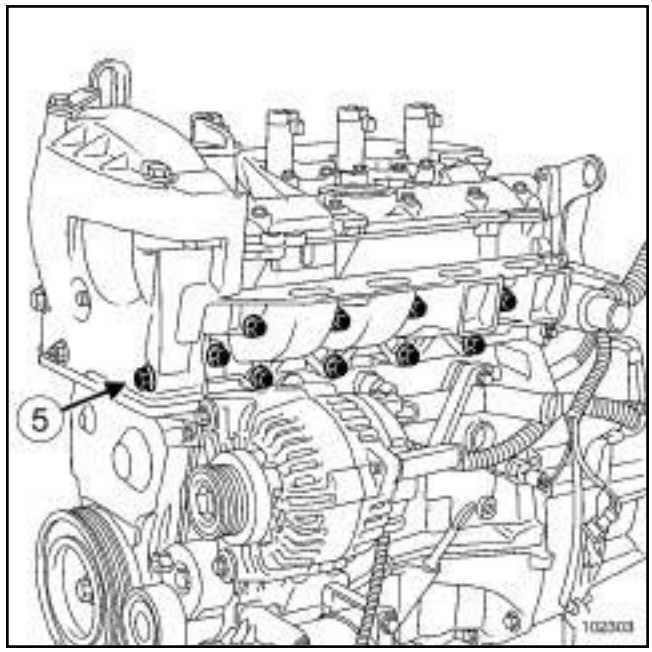


- the air resonator (**1**) .
- the air filter unit air inlet pipe (**2**) ,
- the dipstick,
- the dipstick guide bolts (**3**) .

❑ Move aside the dipstick guide.

K4J or K4M

❑ Remove:



- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the injector rail (see **13A**, **Fuel supply**, **Injector rail - Injectors: Removal - Refitting**, page **13A-11**) .

108861

❑ Remove the bolt (**4**) from the right-hand suspended engine mounting.

II - OPERATION FOR REMOVAL OF PART CONCERNED

102303

❑ Remove:

- the bolt (**5**) from the upper timing cover,
- the injector holder shim bolts,
- the injector holder shim,
- the injector holder shim seal.

REFITTING

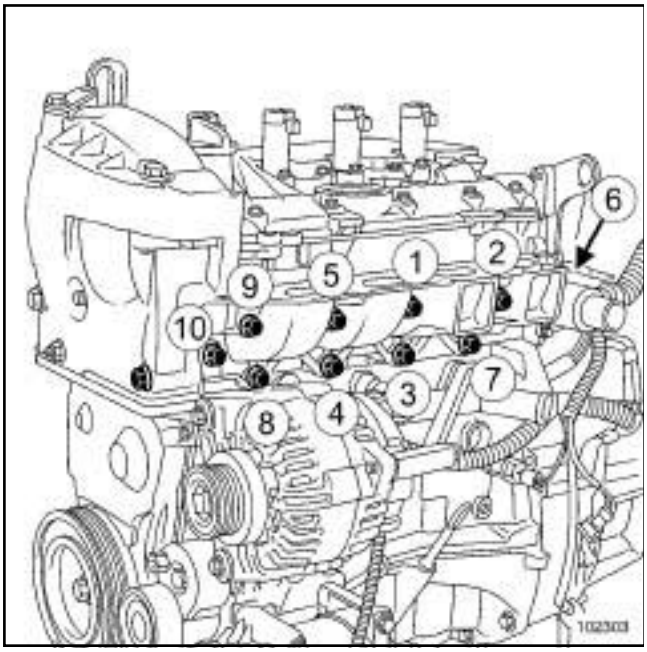
I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Inlet shim seal (11, 04,04,09)**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the gasket face of the injector holder shim, in case of reuse.

WARNING
To ensure proper sealing, the gasket surfaces must be clean, dry and not greasy (avoid any finger marks).



WARNING
Do not scrape the joint faces of the aluminium, any damage caused to the joint face will result in a risk of leaks.

K4J or K4M

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new seal on the injector holder shim,
- the injector holder shim.

102303

❑ Fit all the bolts.

❑ Place the injector holder shim against:

- the timing upper cover by manually bringing the bolt closer,
- the right-hand suspended engine mounting by tightening the bolt by hand.

❑ Tighten to torque and in order:

- **bolts 1 and 2 on the injector holder shim (30 N.m)**,
- **bolts 3 to 10 on the injector holder shim (25 N.m)**.

III - FINAL OPERATION

❑ Torque tighten:

- the **upper timing cover bolt (46 N.m)**,
- the **right-hand pendulum suspension bolt (62 N.m)**.

❑ Refit:

- the injector rail (see **13A**, **Fuel supply**, **Injector rail - Injectors: Removal - Refitting**, page **13A-11**) ,
- the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

K4M, and 862

❑ Refit:

- the dipstick guide bolts,
- the dipstick,
- the air filter unit air inlet pipe,
- the air resonator.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

F4R

Equipment required
Diagnostic tool

Tightening torques ▽	
injector holder plate mounting bolts	**21 Nm**
stay mounting bolt between the alternator and the injector holder plate	**21 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the motorised throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

❑

IMPORTANT

During this operation, be sure to:

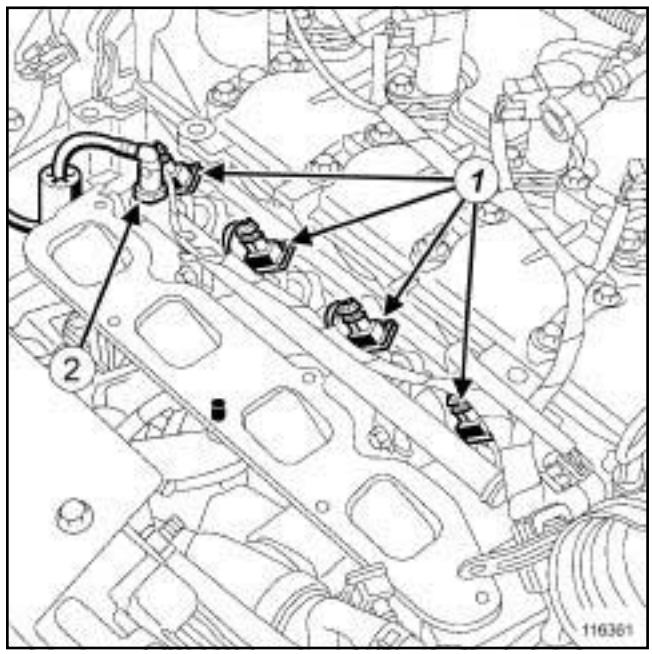
- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

IMPORTANT

This procedure must be carried out with the ignition off.

IMPORTANT

Wear gloves during this operation.



IMPORTANT

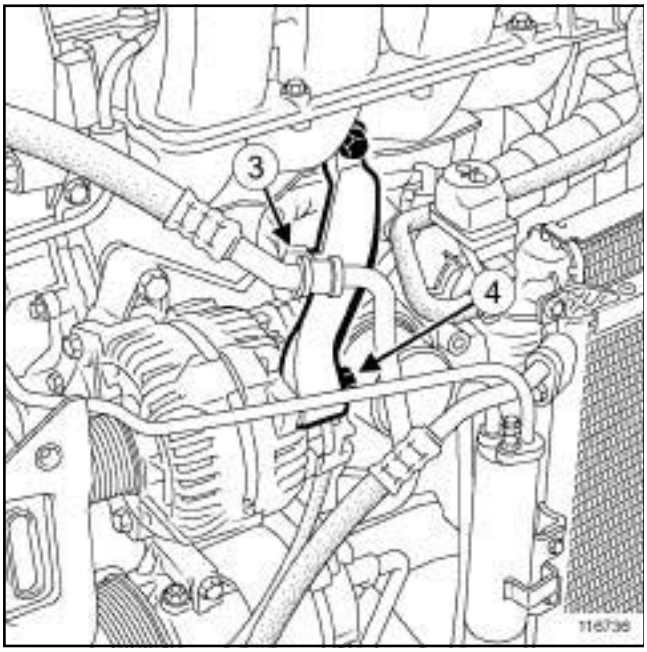
Beware of fuel outflow and splashes on the sensitive areas of the vehicle.

1 - When replacing the injector holder plate

❑ Remove the injector rail fitted with its injectors (see **13A**, **Fuel supply**, **Injector rail - Injectors: Removal - Refitting**, page **13A-11**) .

2 - removing a single injector holder plate

116361



❑ Disconnect:

- the injector connectors (**1**) ,
- the fuel inlet union (**2**) on the injector rail.

❑ Move the injector wiring harness to one side.

F4R

II - OPERATION FOR REMOVAL OF PART CONCERNED

116736

❑ remove the mounting bolt (**3**) from the pipe connecting the « expansion valve - compressor » on the stay.

❑ Loosen the lower mounting bolt (**4**) of the stay sufficiently between the alternator and the injector holder plate.

❑ Remove:

- the injector holder plate mounting bolts,
- the injector holder plate, moving aside the stay between the alternator and the injector holder plate.

Note:

Mark the length of the mounting bolts when they are removed.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Carefully clean the joint faces.

❑ Always replace all of the seals with new ones.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Move the top of the stay aside.

❑ Bring the injector holder plate and the stay alongside each other so that the upper mounting hole on the stay and the mounting hole on the injector holder plate are aligned.

❑ Pull back the injector holder plate - stay assembly.

❑ Refit the injector holder plate mounting bolts.

❑ Torque tighten the **injector holder plate mounting bolts (21 Nm)**.

❑ Torque tighten the **stay mounting bolt between the alternator and the injector holder plate (21 Nm)**

1 - When replacing the injector holder plate

❑ Refit the injector rail fitted with its injectors (see **13A**, **Fuel supply**, **Injector rail - Injectors: Removal - Refitting**, page **13A-11**) .

2 - refitting a single injector holder plate

❑ Position the injector wiring harness.

❑ Connect:

- the injector connectors,
- the fuel supply union on the injector rail.

III - FINAL OPERATION.

❑ Refit:

- the mounting bolts on the pipe connecting the « expansion valve - compressor » ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Using the **Diagnostic tool**, check that there are no faults stored by the computer, and clear them if necessary.

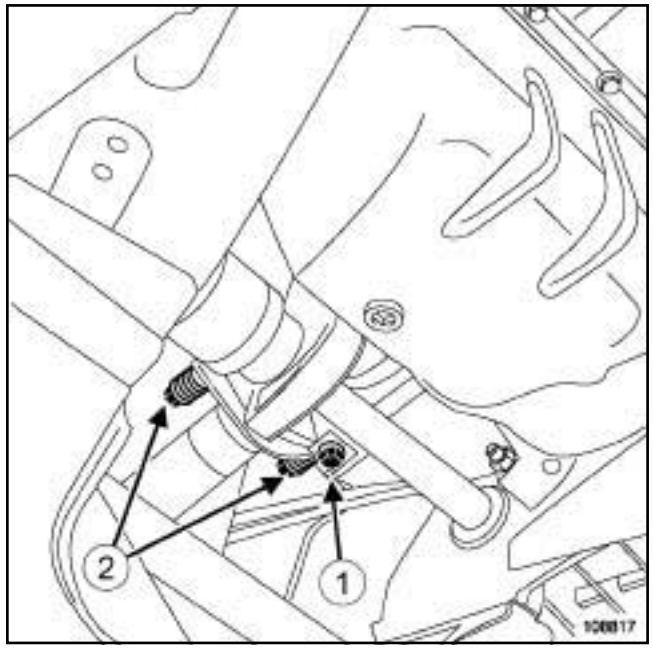
D4F, and 740 or 742 or 764

Tightening torques ▽	
manifold mounting stud	**9 N.m**
exhaust manifold mounting nuts	**25 N.m**
exhaust bracket mounting bolts	**25 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



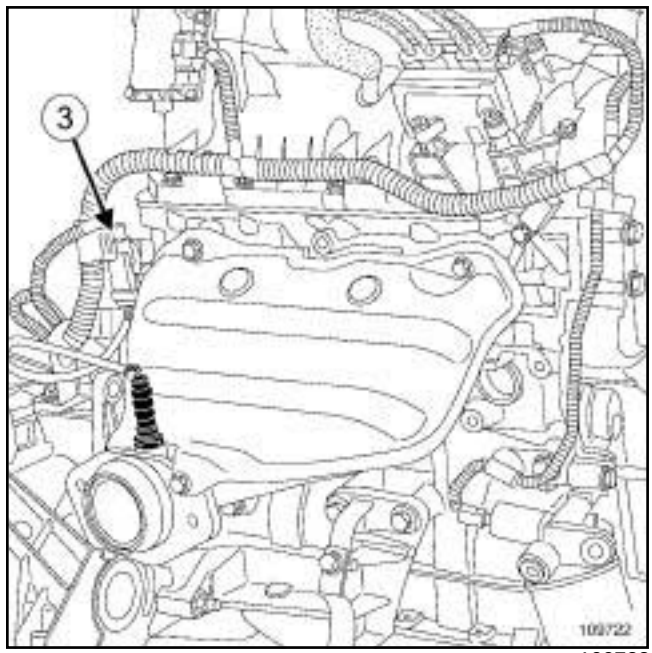
❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR392, 80A, Battery).

❑ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the engine undertray.

❑ Unclip the wiring harness from the downstream oxygen sensor.

❑ Disconnect the connector from the downstream oxygen sensor.

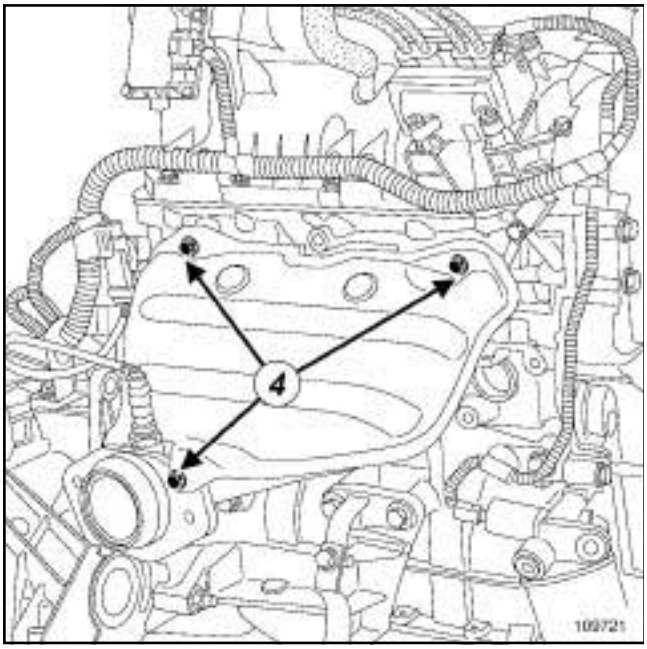


108817

❑ Remove:

- the exhaust manifold retaining strut mounting bolt ***(1)*** ,
- the exhaust bracket mounting bolts ***(2)*** .

❑ Remove the exhaust pipe towards the rear of the vehicle.

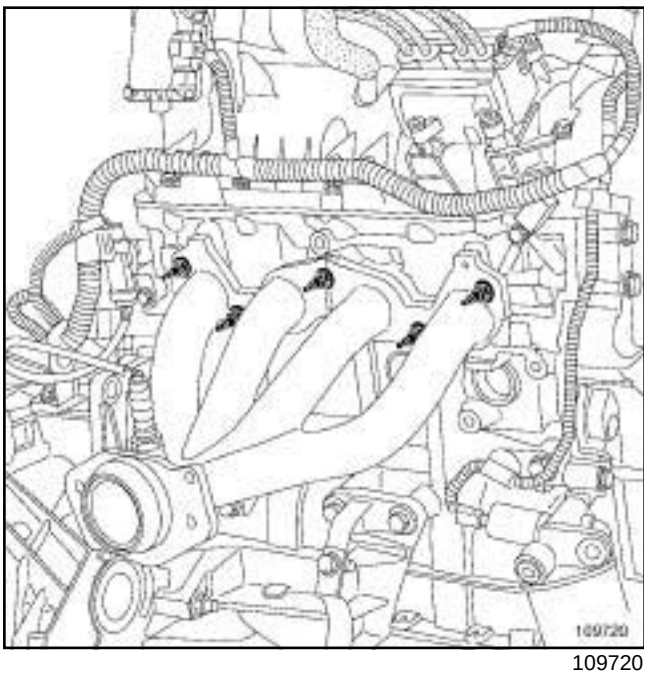


109722

❑ Unclip the upstream oxygen sensor electrical wiring harness at the cylinder head.

❑ Disconnect the upstream oxygen sensor connector (**3**) .

D4F, and 740 or 742 or 764

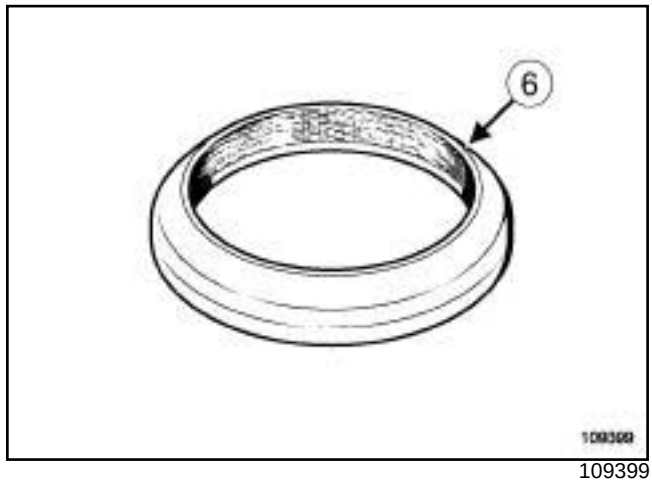


109721

❏ Remove:

- the heat shield mounting bolts ***(4)*** ,
- heat shield.

II - OPERATION FOR REMOVAL OF PART CONCERNED



109720

❏ Remove:

- the exhaust manifold mounting nuts,
- the exhaust manifold,
- the exhaust manifold gasket.

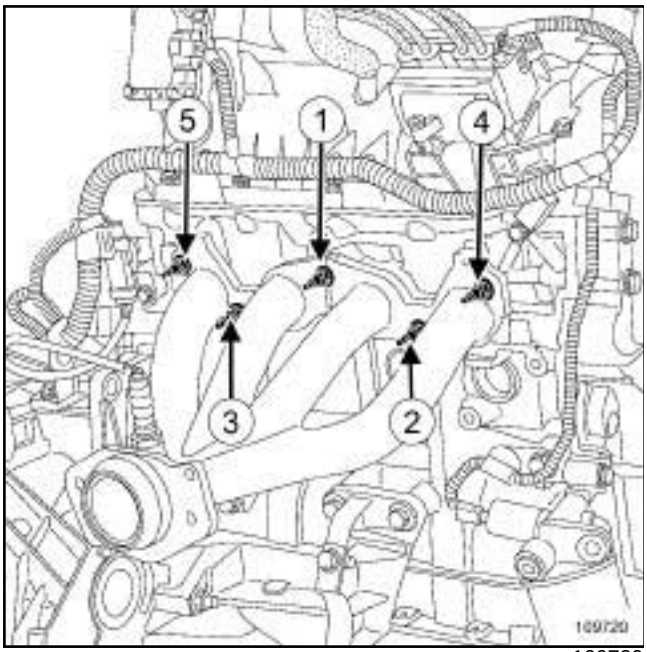
REFITTING

I - REFITTING PREPARATION OPERATION

109399

❏ Always replace:

- the sealing ring (**6**) between the exhaust manifold and the catalytic converter,
- the exhaust manifold seal.



Note:

If a stud becomes loose during this operation, coat it with **LOCTITE FRENBLOC**.

Torque tighten the **manifold mounting stud (9 N.m)**.

D4F, and 740 or 742 or 764

II - REFITTING OPERATION FOR PART CONCERNED

109720

❏ Pre-tighten to torque and in order the **exhaust manifold mounting nuts (10 N.m)**.

❏ Tighten to torque and in order the **exhaust manifold mounting nuts (25 N.m)**.

III - FINAL OPERATION.

❏ Refit:

- heat shield.
- the heat shield mounting bolts,

WARNING
Any damaged heat shields must be replaced.

❏ Clip the wiring harness to the downstream oxygen sensor.

❏ Connect the downstream oxygen sensor connector.

❏ Refit the exhaust manifold retaining strut bolt.

❏ Torque tighten the **exhaust bracket mounting bolts (25 N.m)**.

❏ Connect the upstream oxygen sensor connector.

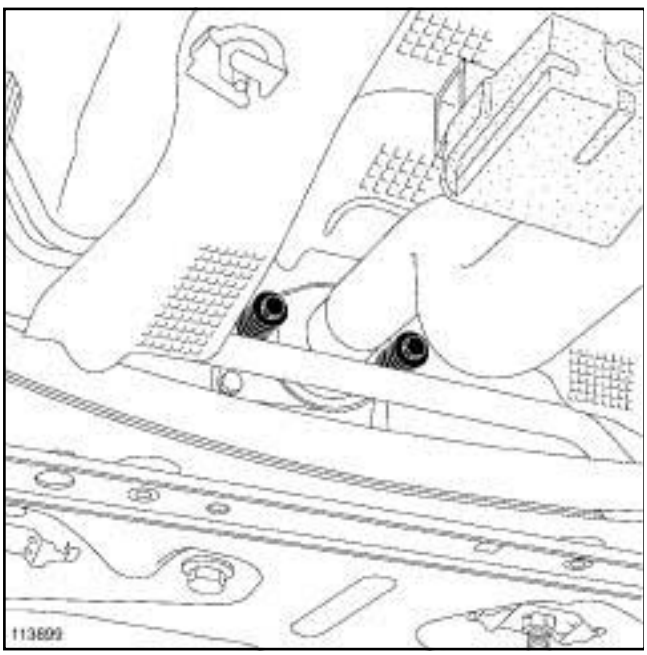
❏ Clip the upstream oxygen sensor wiring harness into place at the cylinder head.

❏ Refit:

- the engine undertray,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR392, 80A, Battery).

K9K



Tightening torques ▽	
exhaust manifold studs	**10 Nm**
exhaust manifold mounting nuts	**26 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

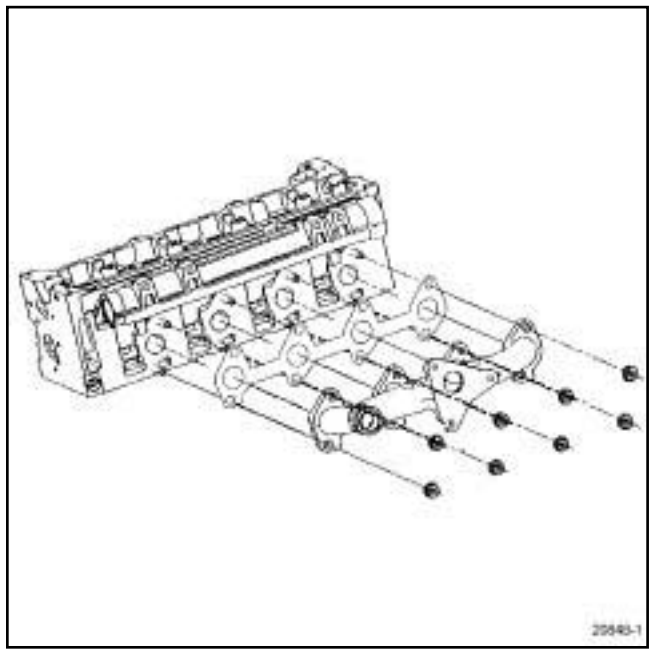
❑ Remove the engine undertray.

113899

❑ Remove:

- the exhaust downpipe bolts,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-4**) ,

II - OPERATION FOR REMOVAL OF PART CONCERNED



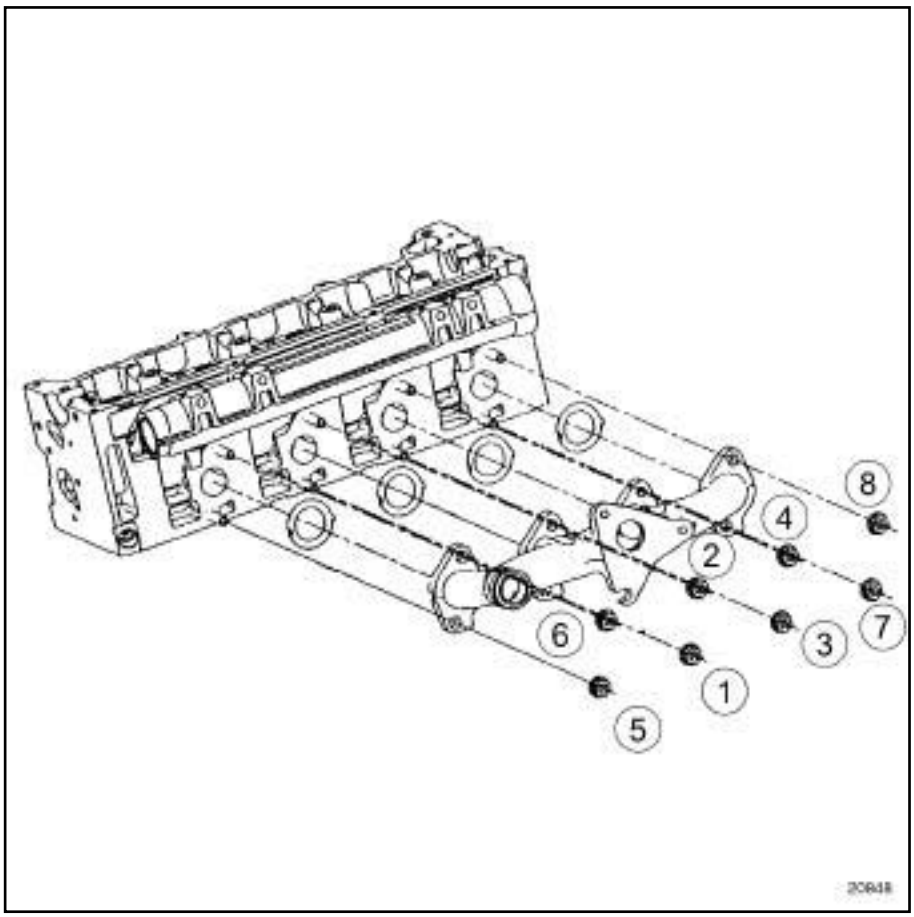
❑ Remove:

- the exhaust manifold mounting nuts,
- the exhaust manifold.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Clean the joint faces.



20848-1

❑

WARNING
It is essential to replace the seal with a new one.

K9K

II - REFITTING OPERATION FOR PART CONCERNED

20848

❑ If replacing, torque tighten the **exhaust manifold studs (10 Nm)**

❑ refit:

- the exhaust manifold,
- the exhaust manifold mounting nuts.

❑ Torque tighten in order the **exhaust manifold mounting nuts (26 Nm)**.

III - FINAL OPERATION.

❑ refit:

- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-4**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the exhaust downpipe,
- the engine undertray.

K4J or K4M

Tightening torques ▽	
exhaust manifold stud	**8 N.m**
lower heat shield bolts	**12 N.m**
exhaust manifold nuts	**26 N.m**
exhaust manifold nuts	**26 N.m**
exhaust manifold upstream and downstream stays	**44 N.m**
exhaust manifold upper heat shield bolts	**12 N.m**
upstream oxygen sensor	**44 N.m**
exhaust pipe support bolt on the body	**21 N.m**
exhaust flange bolts	**21 N.m**

IMPORTANT
Wear protective gloves during the operation.

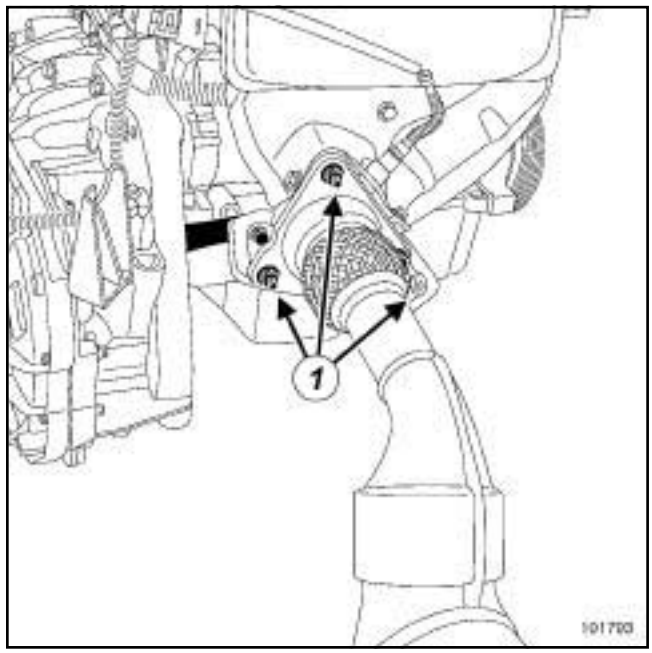
WARNING
To prevent the surrounding components from overheating, do not damage (tear, pierce, bend, etc.) a heat shield.

Any damaged heat shields must be replaced.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).



❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

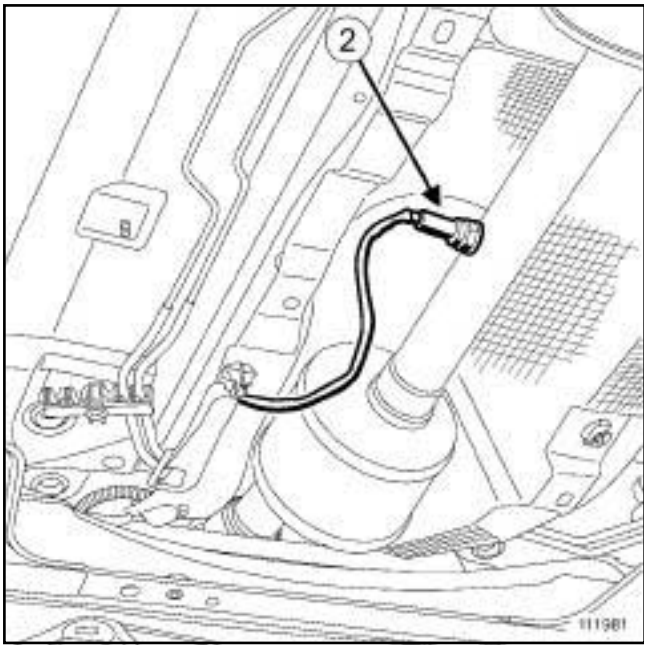
K4M, and 862

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres),
- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection).

❑ Remove the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

101793

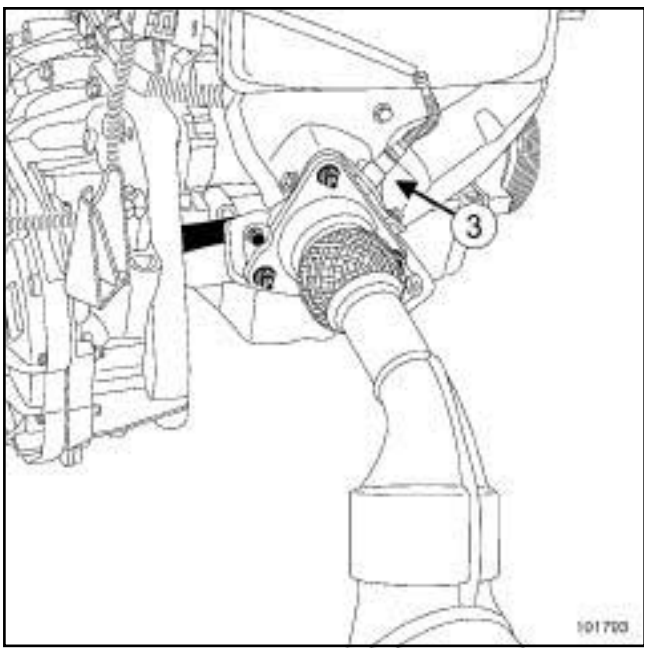


❑ Remove the bolts (**1**) from the exhaust bracket.

K4J – K4M, and 800 or 801 or 804

❑ Remove the exhaust pipe rubber mounting bush support bolt on the body.

Note:
Mark with a pen the position of the exhaust silentbloc supports on the vehicle body.



K4J or K4M

111981

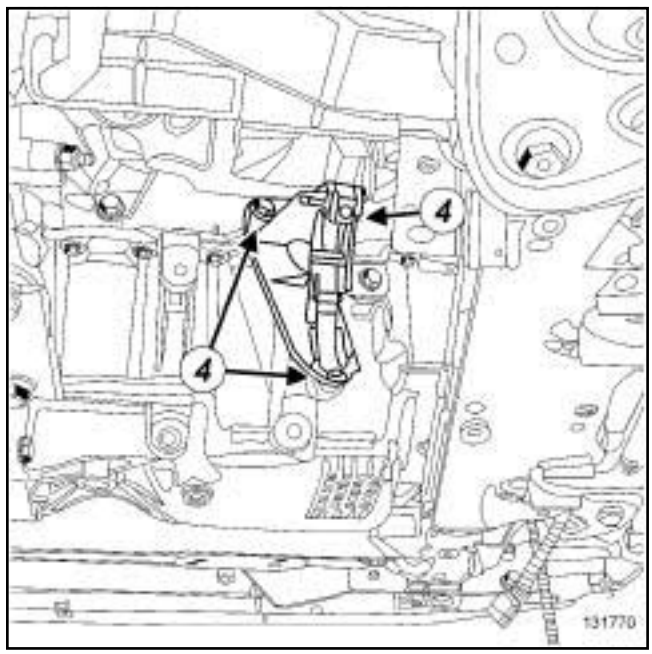
❑ Disconnect the downstream oxygen sensor connector at (**2**) .

❑ Withdraw the exhaust pipe towards the rear of the vehicle.

101793

❑ Disconnect the upstream oxygen sensor connector.

❑ Remove:



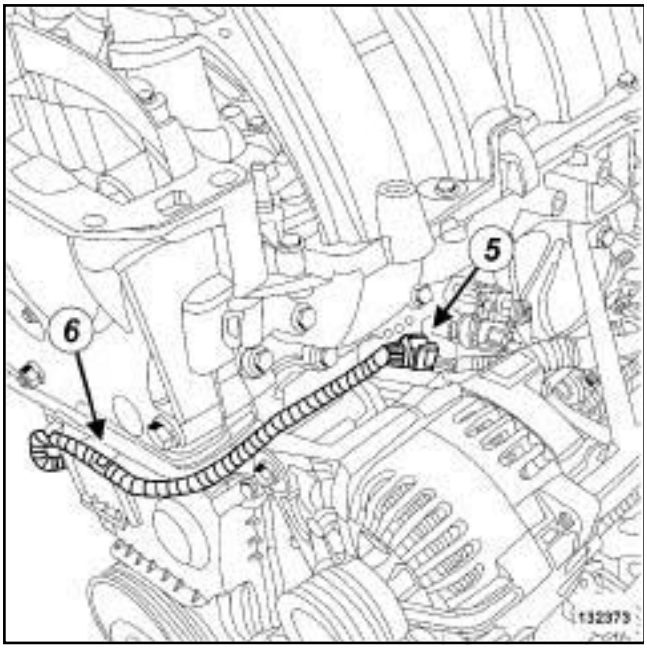
- the upstream oxygen sensor (**3**) ,
- the upper heat shield from the exhaust manifold.

K4M, and 862

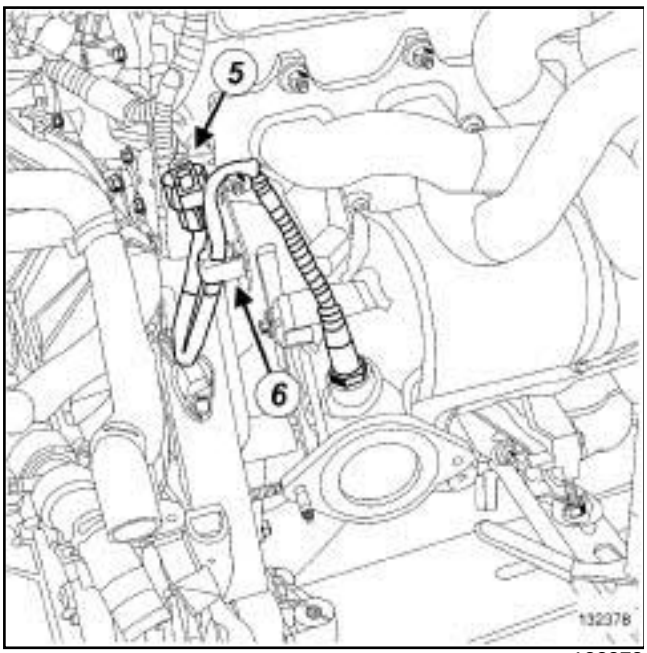
❑ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❑ Remove:

- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the differential output seal (see **Differential output seal: Removal - Refitting**) (21A, Manual gearbox).
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .



131770

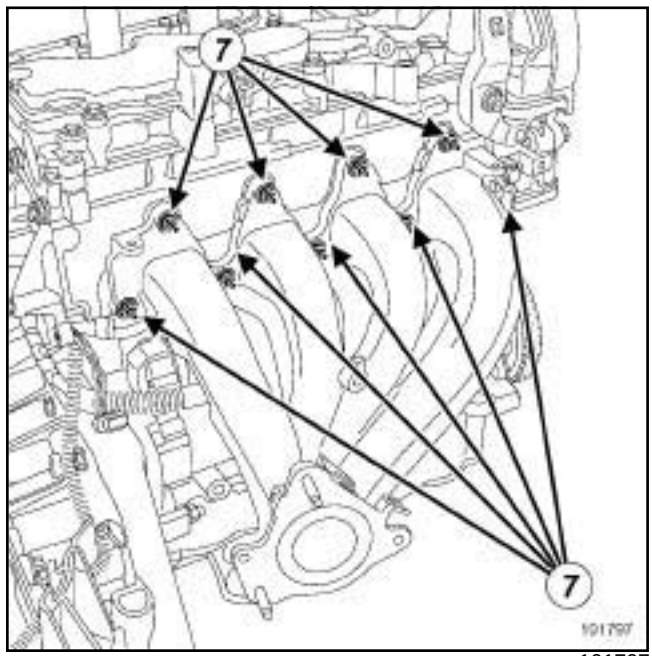


❑ Remove:

- the bolts (**4**) from the front right-hand wheel driveshaft relay bearing,
- the front right-hand wheel driveshaft relay bearing.

K4J or K4M

132373



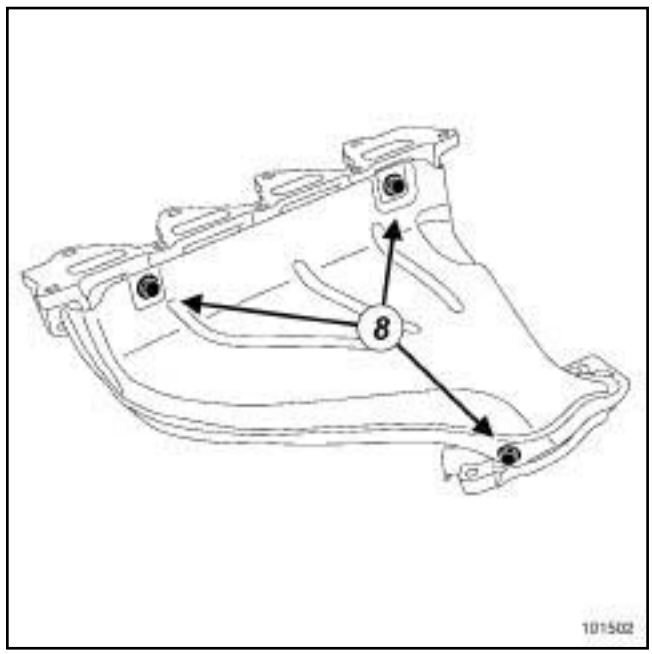
132378

❏ Disconnect the oxygen sensor connectors (**5**) .

❏ Unclip the oxygen sensor wiring (**6**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

K4J – K4M, and 800 or 801 or 804



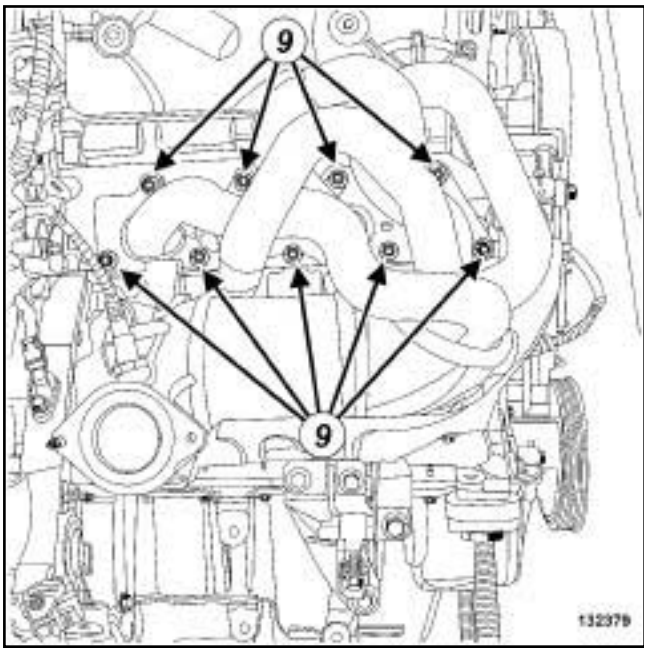
101797

❏ Remove:

- the nuts (**7**) from the exhaust manifold,

- the exhaust manifold.

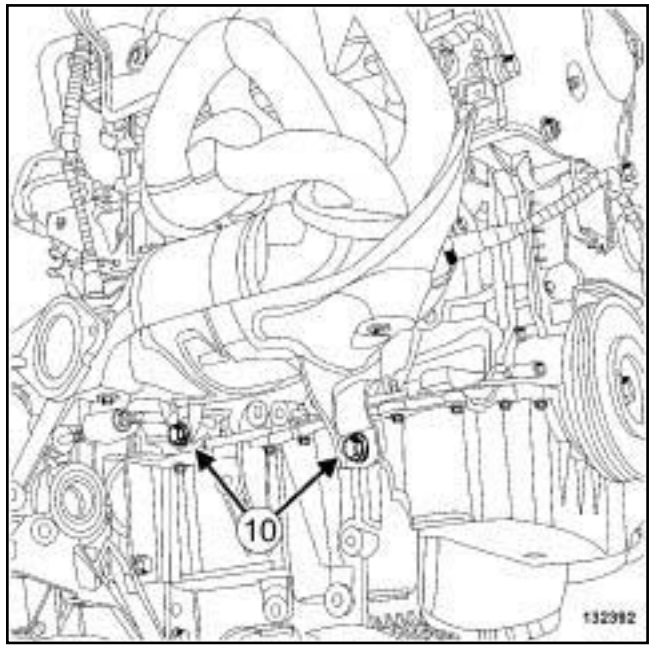
101502



❏ Using the workbench, remove:

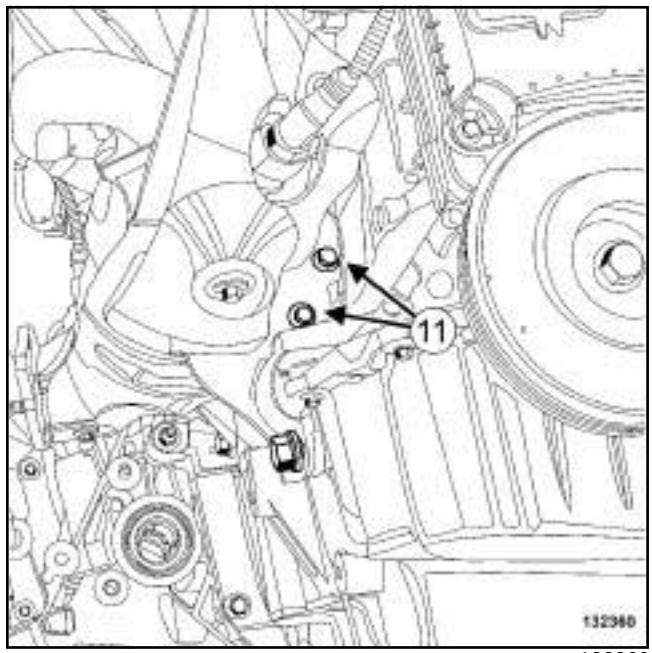
- the lower heat shield bolts,

K4J or K4M



- the lower heat shield.

K4M, and 862



132379

❑ Remove the exhaust manifold nuts (**9**) .

132392

132360

❑ Remove:

- the downstream stay bolts (**10**) of the exhaust manifold,
- the upstream stay bolts (**11**) of the exhaust manifold,
- the exhaust manifold,
- the exhaust manifold gasket.

K4J or K4M

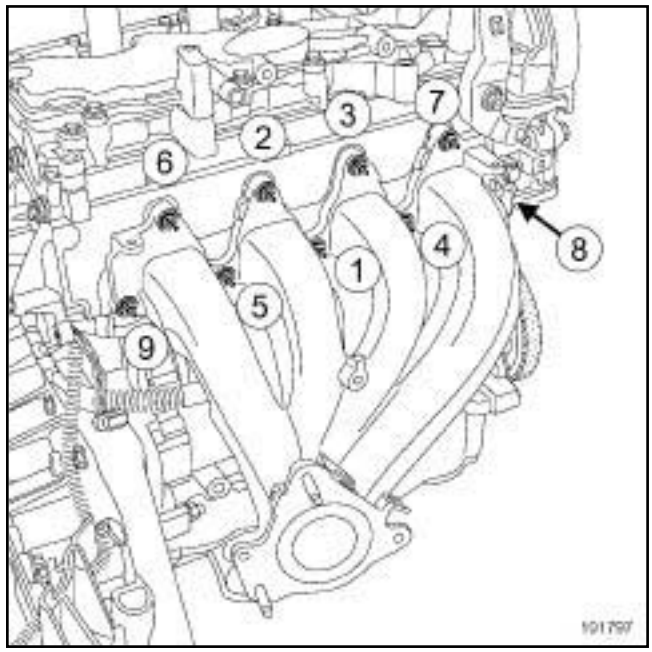
REFITTING

I - REFITTING PREPARATION OPERATION

- ❑ **parts always to be replaced: exhaust manifold seal (10,07,02,07)**
- ❑ Part always to be replaced: Exhaust bracket seal.
- ❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:
  - the exhaust manifold joint face if it is to be re-used,
  - the cylinder head joint face.

Note:

If a stud becomes loose during this operation, coat the stud with **LOCTITE HIGH STRENGTH THREAD LOCK** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products). Torque tighten the **exhaust manifold stud (8 N.m)**.

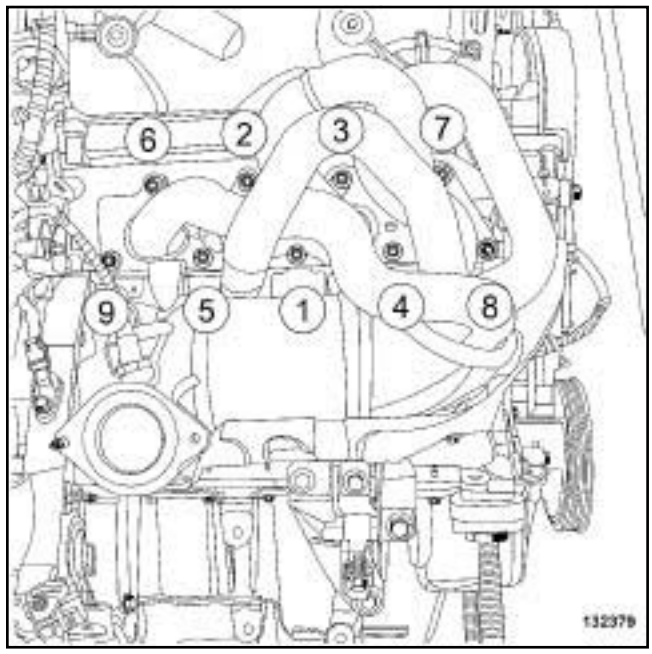


K4J – K4M, and 800 or 801 or 804

- ❑ Refit the lower heat shield.
- ❑ Torque tighten the **lower heat shield bolts (12 N.m)**.

II - REFITTING OPERATION FOR PART CONCERNED

- ❑ Refit the exhaust manifold with a new seal.



K4J – K4M, and 800 or 801 or 804

101797

- ❑ Torque tighten in order the **exhaust manifold nuts (26 N.m)**.

K4M, and 862

132379

- ❑ Tighten to torque and in order:
  - the **exhaust manifold nuts (26 N.m)**,

K4J or K4M

- the bolts of the **exhaust manifold upstream and downstream stays (44 N.m)**.

III - FINAL OPERATION

K4M, and 862

❑ Clip on the oxygen sensor wiring.

❑ Connect the oxygen sensor connectors.

❑ Refit:

- the front right-hand wheel driveshaft relay bearing,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the differential output seal (see **Differential output seal: Removal - Refitting**) (21A, Manual gearbox),
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❑ Fill the manual gearbox (see **Manual gearbox oils: Draining - Filling**) (21A, Manual gearbox).

❑ Refit the exhaust manifold upper heat shield.

❑ Torque tighten the **exhaust manifold upper heat shield bolts (12 N.m)**.

❑ Refit the upstream oxygen sensor.

❑ Torque tighten the **upstream oxygen sensor (44 N.m)**.

❑ Connect the oxygen sensors.

K4J – K4M, and 800 or 801 or 804

❑ Refit the exhaust pipe rubber mounting bush support bolt on the body.

❑ Torque tighten the **exhaust pipe support bolt on the body (21 N.m)**.

❑ Refit a new exhaust flange.

❑ Torque tighten the **exhaust flange bolts (21 N.m)**.

❑ Refit the inlet distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

K4M, and 862

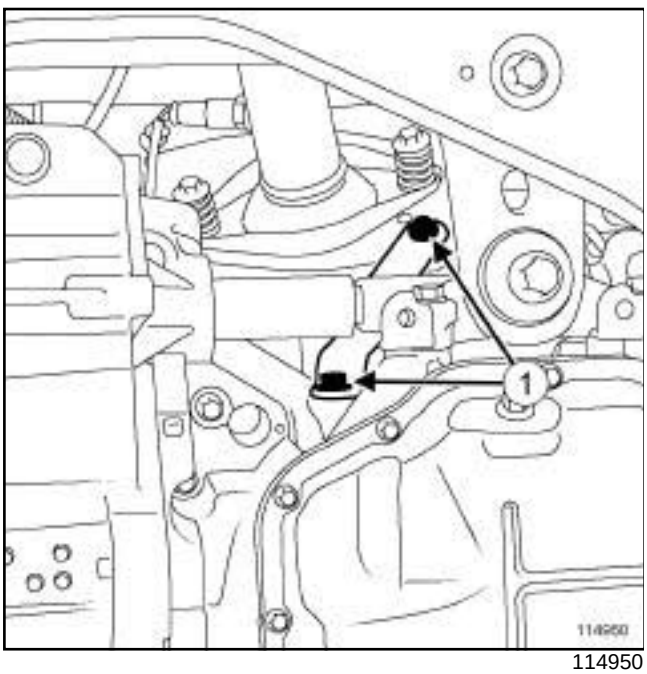
❑ Refit:

- the front right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection),
- the front right-hand wheel (see **Wheel: Removal - Refitting**) (35A, Wheels and tyres).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

M4R

Tightening torques ▽	
exhaust manifold mounting studs	**8 Nm**
exhaust manifold mounting nuts	**33 Nm**
exhaust manifold heat shield mounting bolts	**6 Nm**
exhaust manifold stay mounting bolts	**43 Nm**
exhaust bracket mounting bolts	**21 Nm**

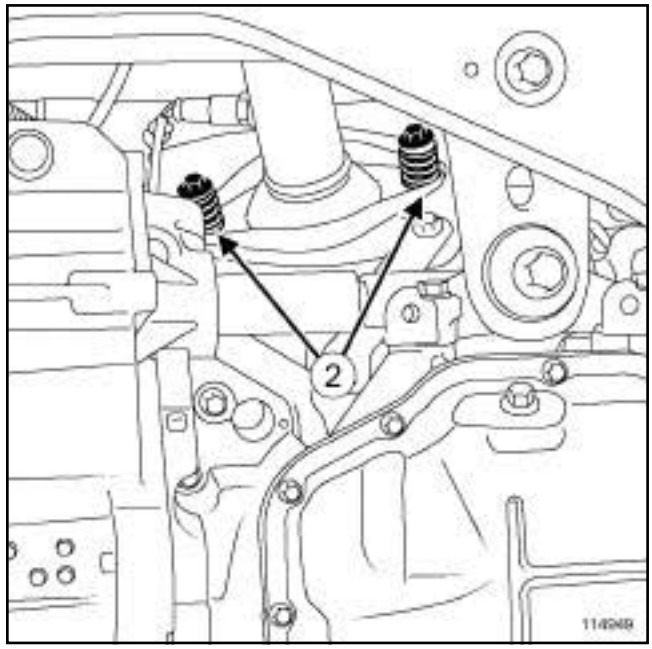


REMOVAL

I - REMOVAL PREPARATION OPERATION

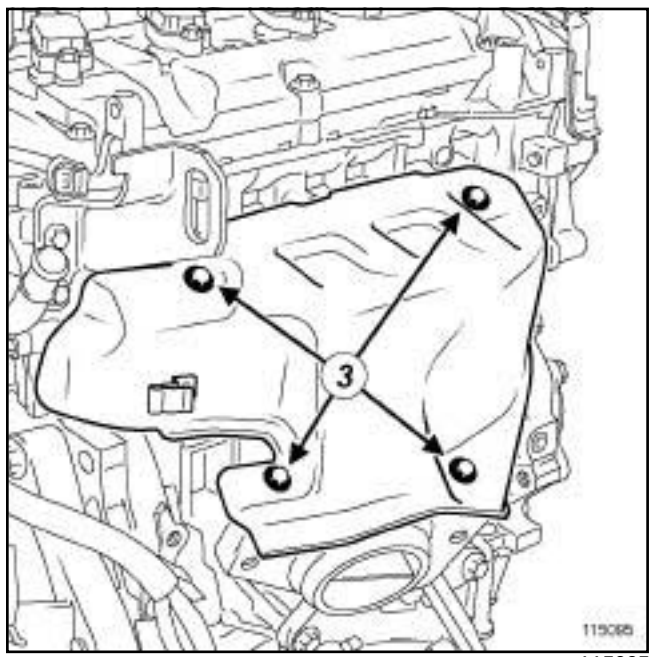
❏ Remove the engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .



❏ Remove the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

114950

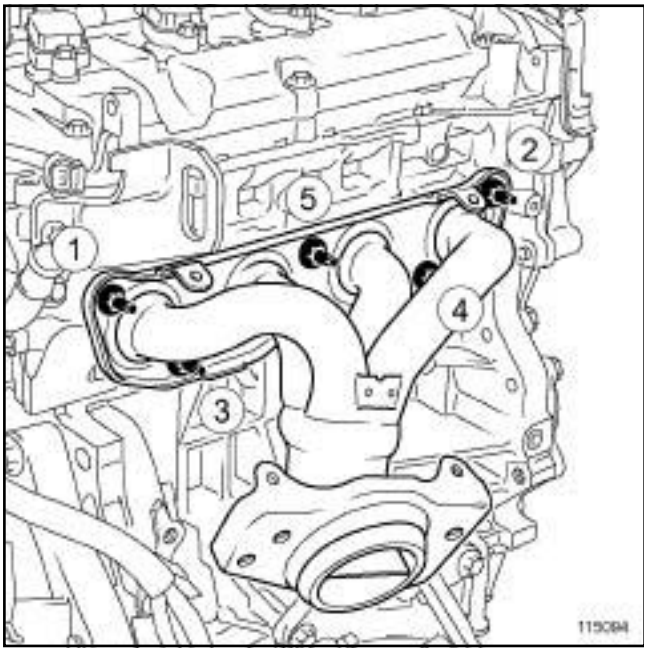


❏ Remove:

- the exhaust manifold stay mounting bolts (**1**) ,
- the exhaust manifold stay.

114949

❏ Remove the mounting bolts (**2**) from the exhaust bracket.



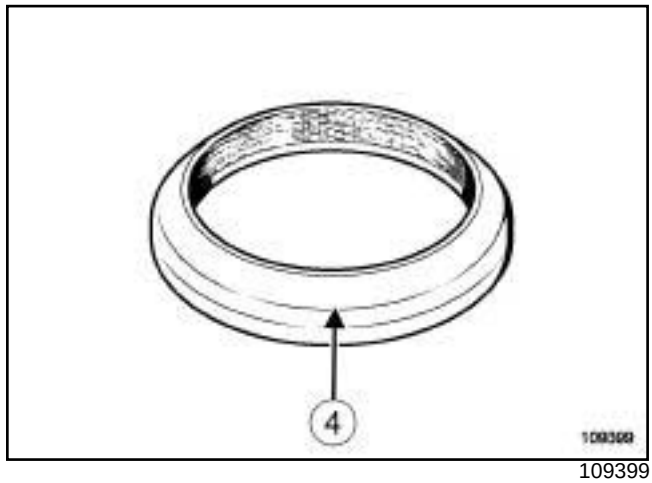
115095

❏ Remove:

- the mounting bolts from the exhaust manifold heat shield (**3**) ,
- the exhaust manifold heat shield.

M4R

II - REMOVAL OF PART CONCERNED



115094

❑ Remove:

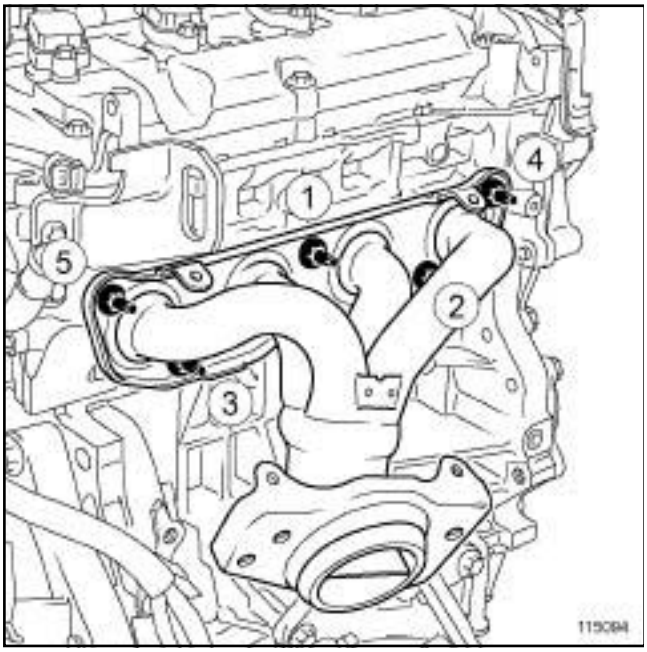
- the exhaust manifold mounting nuts, in order,
- the exhaust manifold,
- the exhaust manifold seal.

REFITTING

I - REFITTING PREPARATION OPERATION

109399

❑ Always replace:



- the sealing ring (**4**) between the exhaust manifold and the catalytic converter,
- the exhaust manifold seal.

> Note:
>
> If a stud loosens during this operation, it should be coated with **LOCTITE FRENBLOC**.

❑ Tighten to torque the **exhaust manifold mounting studs (8 Nm)**.

M4R

II - REFITTING THE PART CONCERNED

115094

- ❏ Finger tighten the mounting nuts until they are in contact with the exhaust manifold.
- ❏ Tighten to torque and in order the **exhaust manifold mounting nuts (33 Nm)**.

III - FINAL OPERATION

- ❏ Refit the exhaust manifold heat shield.
- ❏ Tighten to torque the **exhaust manifold heat shield mounting bolts (6 Nm)**.
- ❏ Refit the exhaust manifold stay.
- ❏ Tighten to torque:
  - the **exhaust manifold stay mounting bolts (43 Nm)**,
  - the **exhaust bracket mounting bolts (21 Nm)**.
- ❏ Refit the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .
- ❏ Connect the battery (see **Battery: Removal - Refitting**) .
- ❏ Refit the engine cover.

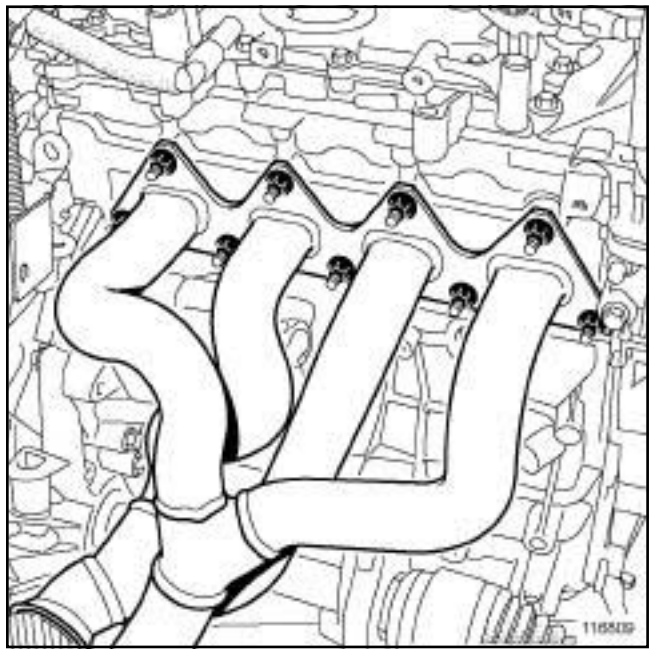
F4R

Tightening torques ▽	
exhaust manifold stud	**9 N.m**
upstream oxygen sensor	**44 N.m**
exhaust manifold nuts	**30 N.m**

Note:

When removing and refitting the exhaust manifold, remove the «manifold - catalytic converter» assembly.

REMOVAL

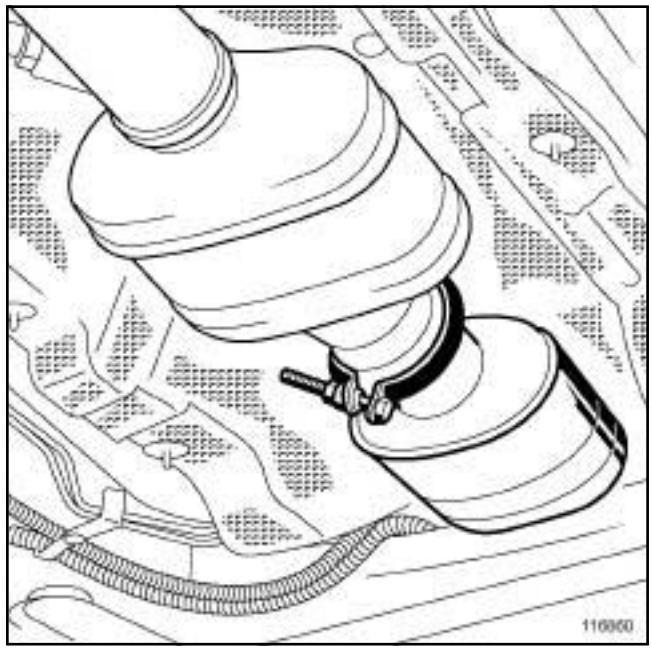


I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).



II - OPERATION FOR REMOVAL OF PART CONCERNED

116809

❏ Remove the exhaust manifold nuts.

❏ Disconnect the upstream oxygen sensor connector.

116860

❏ Remove:

- the clip connecting the catalytic converter and the expansion chamber,
- the « manifold - catalytic converter » assembly.

F4R

When replacing the exhaust manifold

❑ On the workbench:

- clamp the « manifold - catalytic converter » assembly in a vice to hold it in place,
- remove the upstream oxygen sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: exhaust manifold seal (10,07,02,07)**.

❑ **parts always to be replaced: Catalytic converter clip (10,08,02,17)**.

❑ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) to clean and degrease:

- the joint faces of the manifold if it is being reused,
- the cylinder head joint faces.

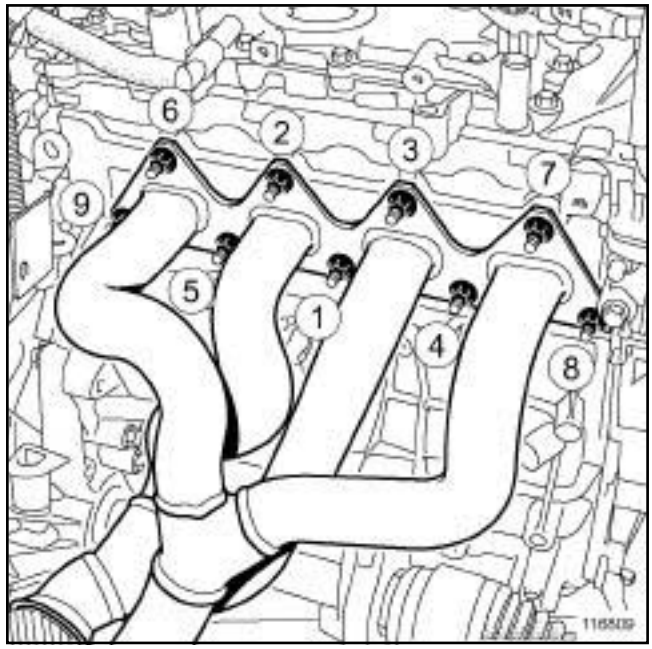
> Note:
>
> If a stud is loosened during this operation, coat the stud with **HIGH STRENGTH BOLT LOCKING PRODUCT**.
>
> Torque tighten the **exhaust manifold stud (9 N.m)**.

When replacing the exhaust manifold

❑ On the workbench:

- clamp the « manifold - catalytic converter » assembly in a vice to hold it in place.
- refit the upstream oxygen sensor.

> Note:
>
> Be careful not to damage the « manifold - catalytic converter » pipes during this operation.



❑ Torque tighten the **upstream oxygen sensor (44 N.m)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Fit the new exhaust manifold gasket.

❑ Refit:

- the « manifold - catalytic converter » assembly.
- the exhaust manifold nuts.

116809

❑ Torque tighten in order the **exhaust manifold nuts (30 N.m)**.

❑ Refit the new clip connecting the catalytic converter and the expansion chamber.

❑ Connect the upstream oxygen sensor connector.

III - FINAL OPERATION

❑ Refit the front axle subframe (see **Front axle subframe: Removal - Refitting**) (31A, Front axle components).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Check that there are no exhaust gas leaks.

❑ Check the axle assembly values (see **Front axle assembly: Adjustment values**) (30A, General information).

D4F, and 784

Tightening torques ▽	
exhaust manifold heat shield bolts	**18 Nm**
exhaust manifold nuts (initial torque)	**20 Nm**
exhaust manifold nuts	**30 Nm**

IMPORTANT
Wear protective gloves during the operation.

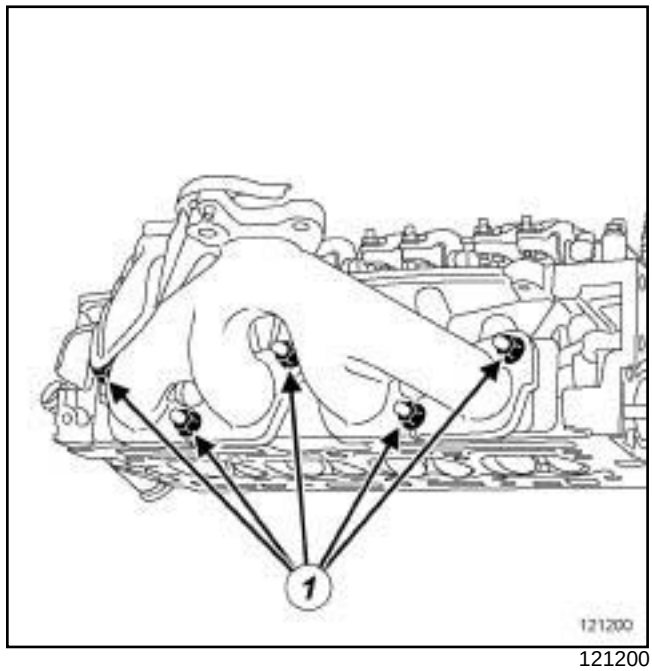
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

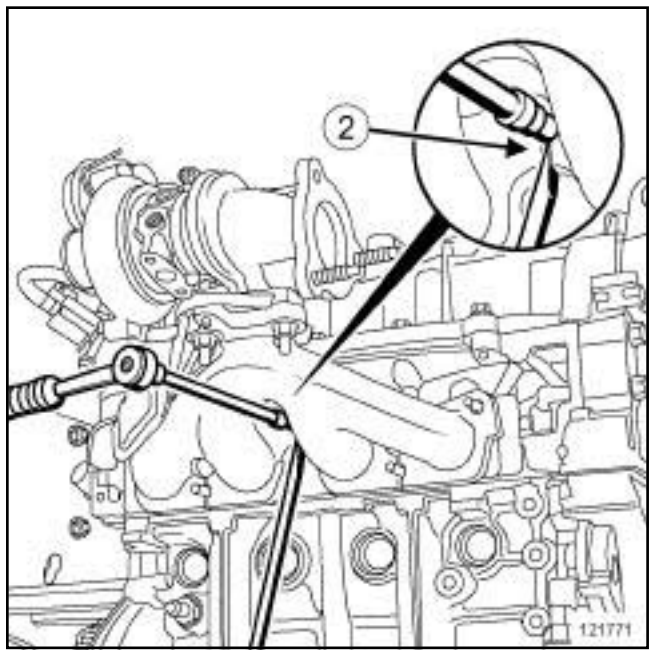
❏ Remove:



- the engine undertray,
- the engine cover.

❏ Drain the gearbox (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

❏ Remove:



- the front right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts),
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) ,
- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-4**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

121200

❏ Remove the exhaust manifold nuts (**1**) .

121771

❏ Remove:

- the exhaust manifold by holding the centre stud with a male torx socket and removing the manifold with a larger screwdriver as shown at (**2**) ,
- the exhaust manifold heat shield bolts,
- the exhaust manifold heat shield.

D4F, and 784

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Use abrasive pads to clean the bearing faces of:

- the exhaust manifold - cylinder head,
- the exhaust manifold - turbocharger.

❏ Use **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (MR 398, 04B, Consumables - Products) and clean cloths to degrease the bearing faces:

- the exhaust manifold - cylinder head,
- the exhaust manifold - turbocharger.

WARNING
The joint faces must be clean, dry and free from grease (avoid finger marks).

❏ Be sure to replace the exhaust manifold gasket.

WARNING
Any damaged heat shields must be replaced.

The sealing between the exhaust manifold sealing surface and the catalytic converter must be perfect.

Always replace all seals and exhaust pipe to rubber mounting bush mounting bolts whenever they are removed.

The catalytic converter must not be subjected to mechanical impacts during removal or refitting, as this could damage it.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the exhaust manifold heat shield,
- the exhaust manifold heat shield bolts.

IMPORTANT
Wear protective gloves during the operation.

❏ Torque tighten the **exhaust manifold heat shield bolts (18 Nm)**.

❏ Refit:

- the new exhaust manifold gasket,
- the exhaust manifold,
- the exhaust manifold nuts.

❏ Pretighten to torque the **exhaust manifold nuts (initial torque) (20 Nm)**.

❏ Torque tighten the **exhaust manifold nuts (30 Nm)**.

III - FINAL OPERATION.

❏ Refit:

- the turbocharger (see **12B**, **Turbocharging**, **Turbocharger: Removal - Refitting**, page **12B-4**) ,
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) ,
- the front right-hand driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, Driveshafts).

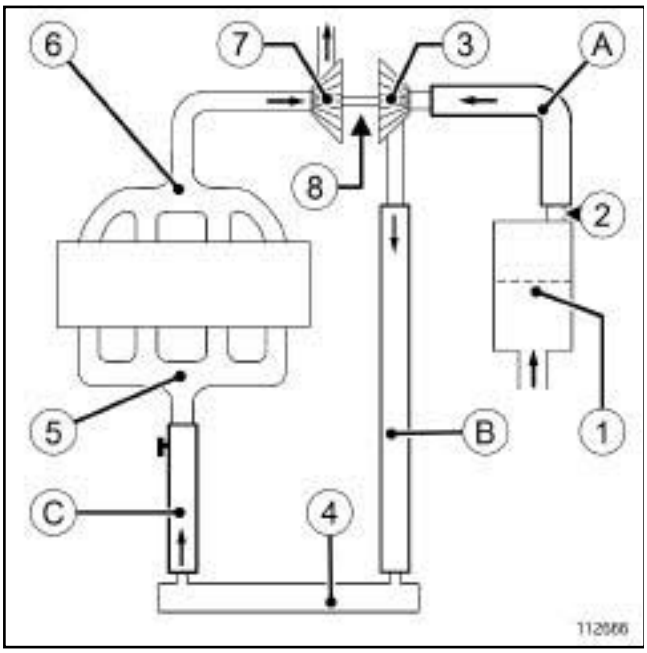
❏ Fill the gearbox with oil (see **Manual gearbox oils: Draining - Filling**) (MR 392, 21A, Manual gearbox).

❏ Refit:

- the engine undertray,
- the engine cover.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

D4F or K9K



Equipment required
parts washer

I - TURBOCHARGER: GENERAL INSTRUCTIONS

For the turbocharging pressure regulator check (see **Fault finding - Tests**) (Technical Note 3419A, 12B, Turbocharging).

WARNING
The turbocharger pressure regulator rod must not be adjusted.

II - TURBOCHARGER CIRCUIT DIAGRAM

112666

(**1**) Air filter unit
(**2**) Air flowmeter
(**3**) Compressor wheel
(**4**) Intercooler
(**5**) Inlet manifold
(**6**) Exhaust manifold
(**7**) Turbine wheel
(**8**) Bearing system (bearing + wheel shaft)
(**A**) Air filter box air outlet pipe
(**B**) Turbocharger air outlet pipe
(**C**) Intercooler air outlet pipe

III - APPLICATION CONDITIONS OF INSTRUCTIONS

The instructions below must be followed when replacing a turbocharger due to mechanical damage:

- damage to the bearing system,
- broken shaft or turbine wheel,
- compressor wheel rubbing against the turbocharger casing,
- broken or damaged compressor wheel,
- extensive clogging of the turbine wheel casing (hard deposits).

FOR THE AIR CIRCUIT:

- Consequences:
  - swarf or metal objects in the turbocharger inlet and outlet pipes,
  - oil in the air circuit (collected in the intercooler).
- Risks (after replacing the turbocharger):
  - metal objects sucked in by the compressor wheel (destruction of the turbocharger).

FOR THE LUBRICATION CIRCUIT:

- Consequences:
  - swarf found in the engine oil circuit,
  - circulation of swarf within the circuit.
- Risks (after replacing the turbocharger):
  - premature wear on the bearing system (destruction of turbocharger).

WARNING
Metal objects may enter the oil and air circuits as a result of a broken turbocharger.

Failure to follow the INSTRUCTIONS listed will lead to the turbocharger breaking again.

INSTRUCTIONS:

- Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**)
- Replace the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .
- Replace the seals and fittings,
- Carry out the following only if the compressor wheel is broken or rubbing against the turbocharger casing:
  - Drain the intercooler,

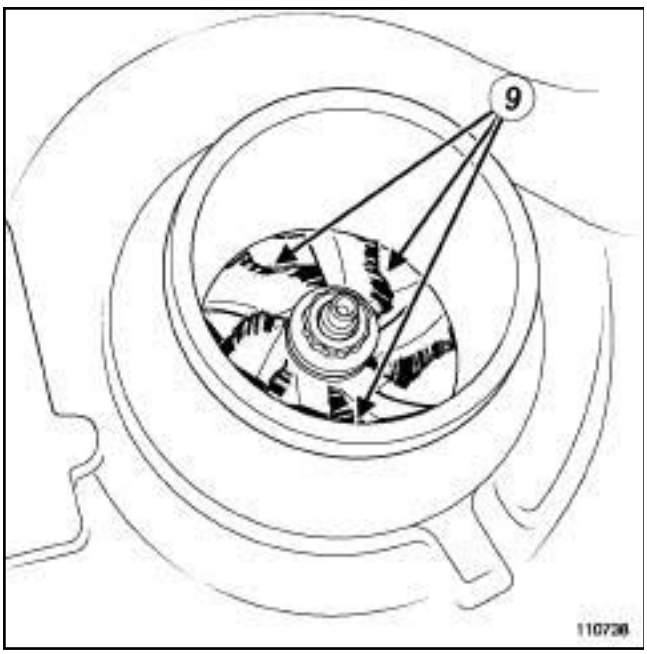
D4F or K9K

• Clean the turbocharger air pipes.

Note:

When carrying out an operation on the air or lubrication circuit, it is necessary to plug the open holes to prevent any risk of foreign bodies entering the system.

IV - AIR CIRCUIT*: INSTRUCTIONS FOLLOWING MECHANICAL DAMAGE TO THE TURBOCHARGER



Note:

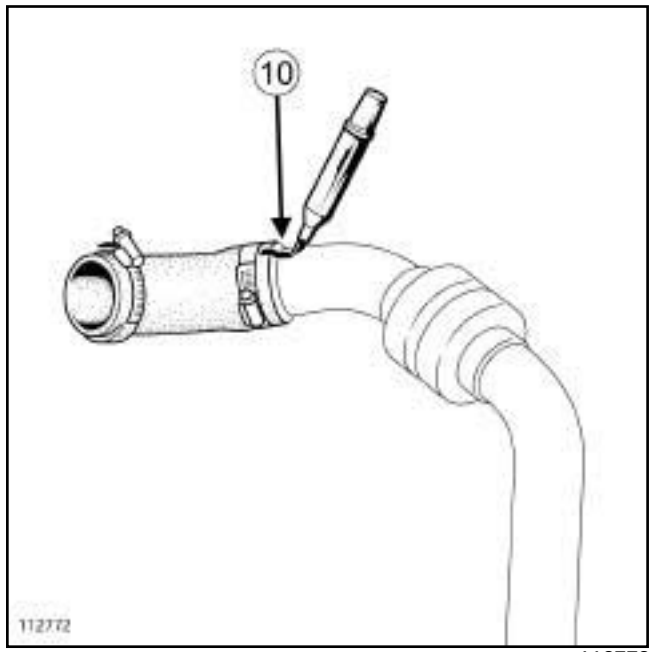
(*) These instructions for the air circuit are only to be followed in the case of:

- broken compressor wheel,
- compressor wheel rubbing against the turbocharger casing.

Remove the intercooler if fitted to the vehicle (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

Turn the intercooler over and allow the oil inside to drain out.

110738

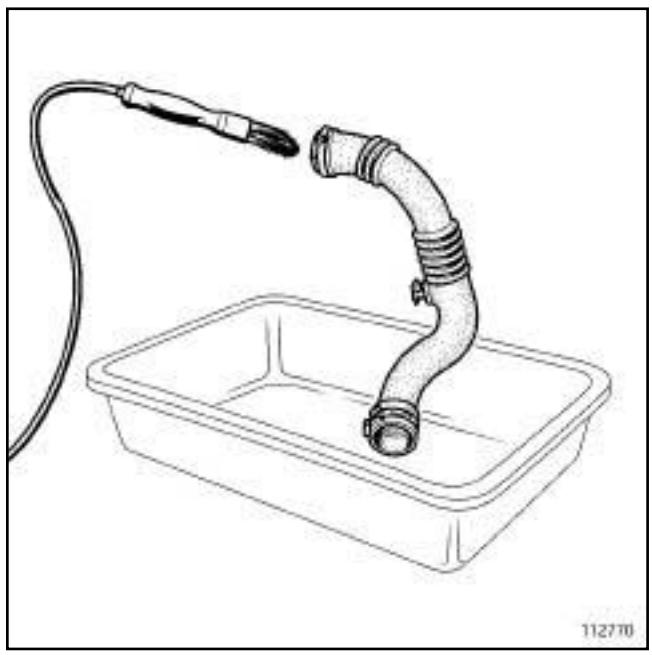


Note:

If the compressor wheel (**9**) is damaged, metal objects are ejected inside the air pipes.

Check that there are no metal objects inside the air flowmeter ***(2)*** .

Remove:

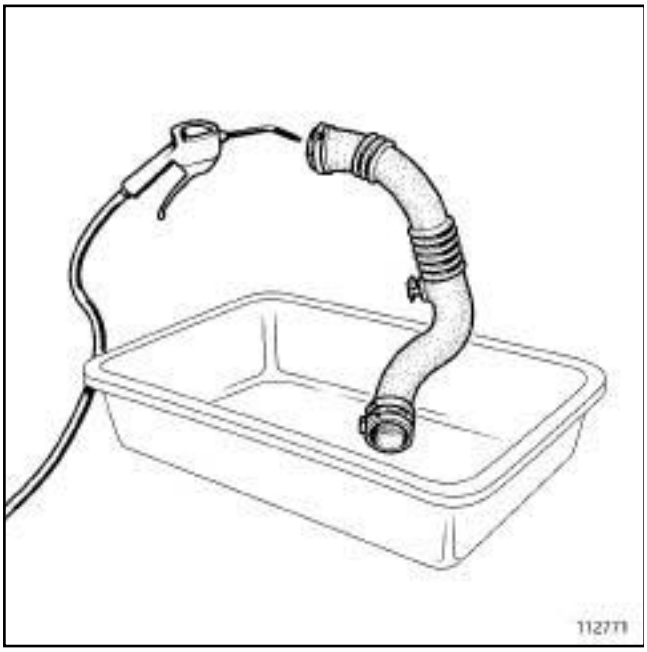


- the air pipe(between the air filter unit and the turbocharger) ***(A)*** ,
- the air pipe ***(B)*** (between the turbocharger and the intercooler).

112772

For air pipes comprising several components:

- mark (**10**) the fitting position of each component,
- separate all the components.



112770

D4F or K9K

One by one, clean the pipes removed with the **parts washer** :

- brush as much of the inside of the pipe as possible (only use brushes with plastic bristles),
- wash plenty of cleaning product from the cleaning station through the pipe,
- allow the cleaned pipe to drain by standing it upright,
- ensure the cleaning product has drained out completely (check areas where liquid may be retained, e.g. gaiters, resonators etc.).

112771

Dry the pipes one by one using a compressed air spray gun.

For pipes comprising several components:

- assemble the components, taking note of their correct fitting position ***(10)*** .

Refit:

- the air pipe(between the air filter unit and the turbocharger) ***(A)*** ,
- the air pipe ***(B)*** (between the turbocharger and the intercooler).

Refit the intercooler, if fitted to the vehicle (see **12B**, **Turbocharging**, **Intercooler: Removal - Refitting**, page **12B-21**) .

V - LUBRICATION CIRCUIT: INSTRUCTIONS FOLLOWING MECHANICAL DAMAGE TO THE TURBOCHARGER**

Note:

(**) These instructions relating to the lubrication circuit must always be followed in all cases of mechanical damage as listed above.

Drain the engine oil (see **10A**, **Engine and cylinder block assembly**, **Engine oil: Draining - Refilling**, page **10A-13**) .

Replace the oil filter (see **10A**, **Engine and cylinder block assembly**, **Oil filter: Removal - Refitting**, page **10A-20**) .

Only fill the engine with a suitable oil type (see **Engine oil: Specifications**) (Technical Note 6013A, 04A, Lubricants).

VI - GENERAL INSTRUCTIONS TO BE FOLLOWED WHEN REMOVING A TURBOCHARGER

Always replace:

- the oil supply pipe:
  - if the pipe is blocked, even partially (due to scale, carbonised oil etc.),
  - if the pipe is fitted with self-retaining seals.
- the oil return pipe:
  - if the pipe is blocked, even partially (due to scale, carbonised oil etc.),
  - if the pipe is fitted with self-retaining seals.
- all seals that have been removed,
- all fittings that have been removed.

WARNING
Failure to observe the following procedure may lead to destruction of the turbocharger.

When starting the engine:

- do not accelerate,
- allow the engine to run for **1 minute**,the time taken for the oil circuit pressure to increase (until the oil pressure warning light on the instrument panel goes out),
- accelerate several times at no load,
- check the air circuit and the oil circuit for leaks.

K9K, and 750 or 752 or 764 or 766 or 768

Equipment required
Diagnostic tool

Tightening torques ▽	
turbocharger studs on the exhaust manifold	**9 N.m**
turbocharger stud on the turbocharger	**9 N.m**
turbocharger lower nut on the exhaust manifold	**28 N.m**
turbocharger upper nuts on the exhaust manifold	**28 N.m**

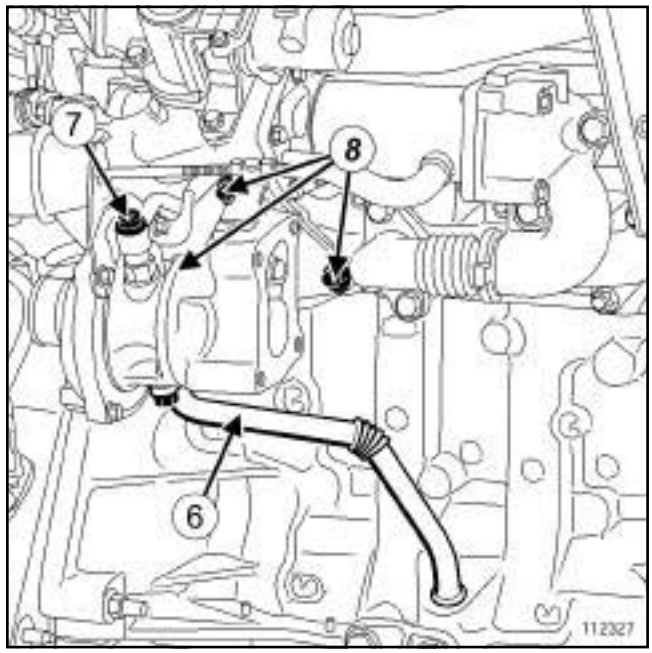
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove:

- the engine cover,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the tray under the battery (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) ,
- the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) .



K9K, and 764

❏ Remove the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (if equipped).

K9K, and 764 or 766 or 768

❏ Remove the exhaust gas recirculation solenoid valve (see **14A**, **Antipollution**, **Exhaust gas recirculation solenoid valve: Removal - Refitting**, page **14A-3**) .

II - REMOVAL OF THE PART CONCERNED

112327

❏ Remove:

- the turbocharger mounting nuts (**8**) ,
- the turbocharger.

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: seal between exhaust manifold and turbocharger (10,09,01,07)**

parts always to be replaced: Turbocharger oil supply pipe bolt (10,09,03,04)

parts always to be replaced: Turbocharger oil pipe (10,09,03,03)

K9K, and 750 or 752 or 764 or 766 or 768

❑

WARNING

- Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.
- Check that the turbocharger oil return pipe is not completely or partially blocked by scale. Check that it is not leaking; if it is, replace it.
- Always replace:
  - all of the O-rings and both copper seals on the turbocharger oil supply pipe,
  - the exhaust flange seal.
  - any damaged heat shield.

❑ If there has been a fault in the turbocharger, check that the intercooler is not full of oil. If it is, remove and rinse it with the cleaning agent, then let it drip dry.

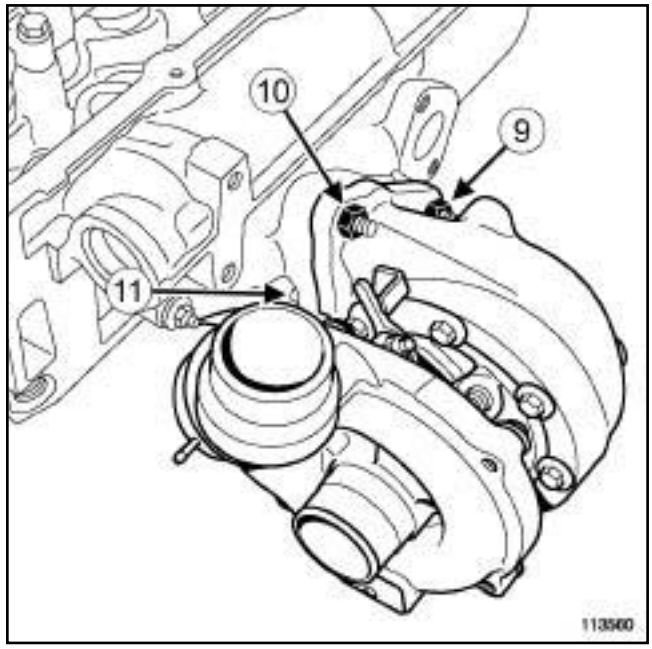
❑ Clean the bearing faces using **ABRASIVE PADS** on:

- the exhaust manifold in contact with the turbocharger,
- the catalytic converter in contact with the turbocharger.

❑ Next, degrease these bearing faces using **SURFACE CLEANER** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and clean cloths.

❑ If a replacement has been carried out, torque tighten:

- the **turbocharger studs on the exhaust manifold (9 N.m)**,
- the **turbocharger stud on the turbocharger (9 N.m)**.



II - REFITTING OPERATION FOR PART CONCERNED

❑

WARNING

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Check that there are no leaks. If there are, replace the part.

113560

❑ Fit the turbocharger with new seals on the exhaust manifold.

❑ Bolt without tightening the turbocharger nuts using an open-jawed spanner (the turbocharger must rest on the manifold and the spanner must no longer turn without effort).

❑ Put a paint mark on the turbocharger coinciding with a crest of the turbocharger lower nut (**11**) .

❑ Tighten the turbocharger lower nut until the next nut crest coincides with the paint mark made on the turbocharger (the final angle achieved is **60°**).

❑ Torque tighten:

- the **turbocharger lower nut on the exhaust manifold (28 N.m)** (**9**) ,
- the **turbocharger upper nuts on the exhaust manifold (28 N.m)** (**10**) .

III - FINAL OPERATION

❑ Refit:

- the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

K9K, and 750 or 752 or 764 or 766 or 768

K9K, and 764

❑ Refit the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (if equipped).

K9K, and 764 or 766 or 768

❑ Refit the exhaust gas recirculation solenoid valve (see **Exhaust gas recirculation assembly: Removal - Refitting**) .

❑ Refit:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Connect the air flowmeter connector.

❑ Refit:

- the air inlet duct,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the engine cover.

Check

❑ Disconnect the connector from the crankshaft position sensor.

❑ Run the starter motor until the oil pressure warning light goes out (wait for a few seconds).

❑ Switch off the ignition.

❑ Make sure that there are no oil leaks.

❑ Connect the crankshaft position sensor.

❑ Connect the **Diagnostic tool** and clear the stored faults.

❑ Refit the engine undertray.

K9K, and 772

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

Equipment required
Diagnostic tool

Tightening torques ▽	
turbocharger studs on the exhaust manifold	**9 N.m**
turbocharger stud on the turbocharger	**9 N.m**
nut for the exhaust gas temperature sensor upstream of the turbocharger	**32 N.m**
turbocharger lower nut on the exhaust manifold	**26 N.m**
turbocharger upper nuts on the exhaust manifold	**26 N.m**

PARTS AND CONSUMABLES FOR THE REPAIR WORK

❏ Parts always to be replaced:

- seal between the exhaust manifold and the turbocharger,
- seal between the turbocharger and the catalytic pre-converter,
- seal for the oil turbocharger return pipe on the cylinder block,
- turbocharger oil return pipe seal on the turbocharger,
- turbocharger oil supply pipe,
- oil supply hollow bolt on the turbocharger.

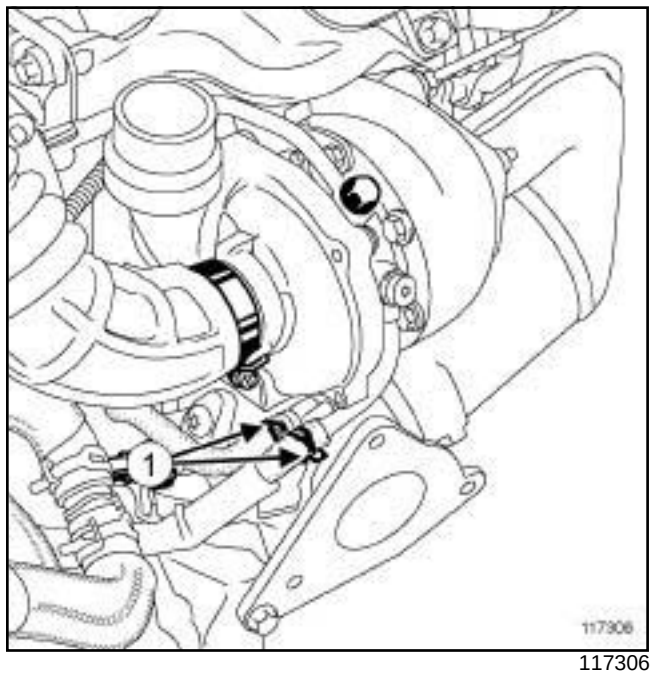
❏ Consumables:

- **ABRASIVE PAD**
- **SURFACE CLEANER**
- **COPPER ANTI-SEIZE AGENT**
- **COPPER-ALUMINIUM LUBRICANT**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

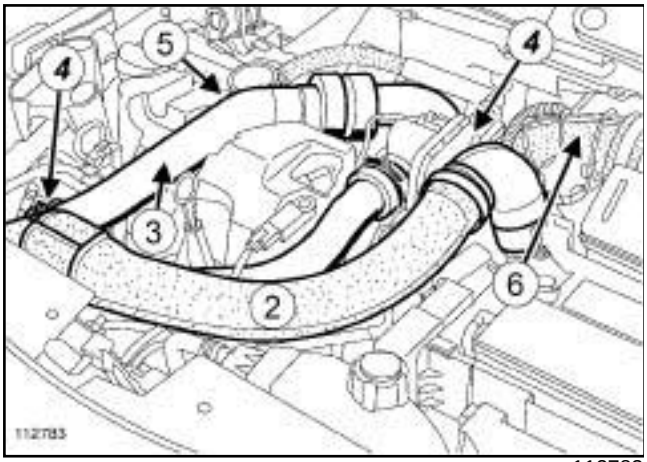
- the engine cover,
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

❏ Disconnect the turbocharging pressure regulation valve control hose .

117306

❏ Position the **(Ms. 583)** or a hose clamp on the turbocharger cooling hoses.

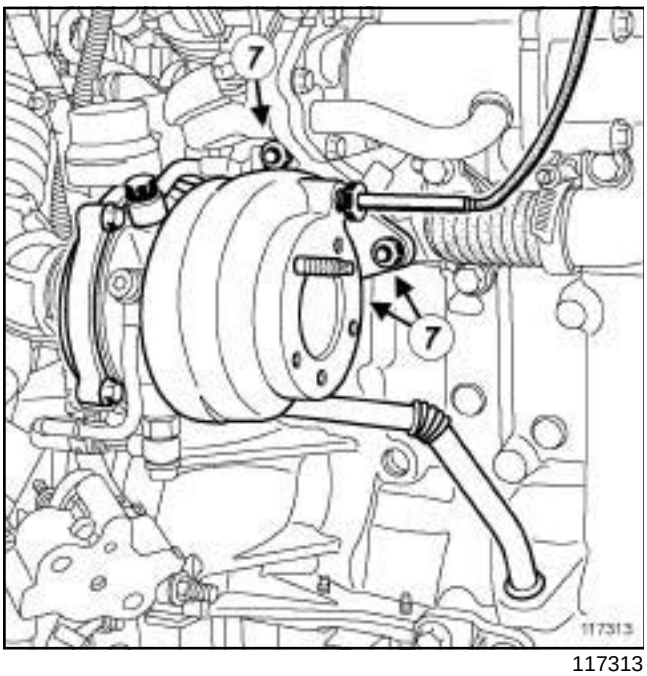


❏ Move the clips (**1**) on the turbocharger cooling hoses to one side, using the **(Mot. 1448)**.

❏ Disconnect the turbocharger cooling hoses.

Note:

Prepare for coolant outflow when the cooling hoses are disconnected from the turbocharger.



K9K, and 772

112783

❑ Remove:

- the air duct (**2**) from the air filter unit inlet,
- the upper section (**3**) of the air inlet duct between the turbocharger and the intercooler by moving the clips to one side (**4**) and by removing the bolt (**5**) ,
- the air inlet duct (**6**) between the air filter unit outlet and the turbocharger inlet.

117313

❑ Remove the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) .

❑ Remove:

- the nuts (**7**) from the turbocharger on the exhaust manifold,
- the turbocharger by moving the engine forwards,
- the seal between the exhaust manifold and the turbocharger,
- the turbocharger oil supply pipe and discard it.

❑ If the turbocharger is being replaced, remove the turbocharger temperature sensor.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: seal between exhaust manifold and turbocharger (10,09,01,07)**

parts always to be replaced: Turbocharger oil supply pipe bolt (10,09,03,04)

parts always to be replaced: Turbocharger oil pipe (10,09,03,03)

❑ Following a turbocharger fault, check that the intercooler and the air circuit assembly are not full of oil. In this case, remove them and clean them using a cleaning container or a cleaning fountain and then dry them using a compressed air gun.

Note:

If the turbocharger is to be re-used, clean it completely using a cleaning container or a cleaning fountain and then dry it using a compressed air gun and let it drip dry.

❑ Using a buffer pad, clean the pressure faces of the:

- the manifold and the turbocharger,
- turbocharger and the catalytic converter.

❑ Afterwards, degrease these bearing faces using **SURFACE CLEANER** and clean cloths.

❑ If a replacement has been carried out, torque tighten:

- the **turbocharger studs on the exhaust manifold (9 N.m)**,
- the **turbocharger stud on the turbocharger (9 N.m)**.

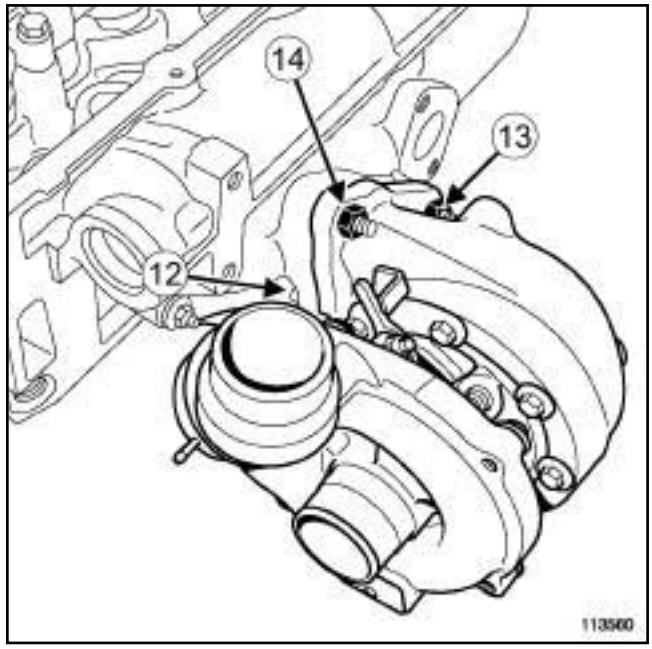
K9K, and 772

❑ If the turbocharger is being replaced:

- clean the exhaust gas temperature sensor upstream of the turbocharger using a clean, dry and lint-free cloth, if the turbocharger is to be re-used
- coat the temperature sensor threading with high temperature **COPPER ANTI-SEIZE AGENT** grease or **COPPER-ALUMINIUM LUBRICANT**,
- Insert the exhaust gas temperature sensor upstream of the turbocharger in its housing on the turbocharger,
- refit the nut for the exhaust gas temperature sensor upstream of the turbocharger,
- tighten to torque the **nut for the exhaust gas temperature sensor upstream of the turbocharger (32 N.m)** using an open-ended spanner.

Note:

The new exhaust gas temperature sensors upstream of the turbocharger supplied by the Parts Department are sold pre-coated. In this case, do not coat them but refit them directly, respecting the tightening torque.



II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- a new seal to the exhaust manifold,
- the turbocharger by moving the engine forwards,
- the upper and lower turbocharger nuts on the exhaust manifold.

WARNING

Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.

113560

❑ Fit the turbocharger with new seals on the exhaust manifold.

❑ Bolt without tightening the turbocharger nuts using an open-jawed spanner (the turbocharger must rest on the manifold and the spanner must no longer turn without effort).

❑ Put a paint mark on the turbocharger coinciding with a crest of the turbocharger lower nut (**12**) .

❑ Tighten the turbocharger lower nut until the next nut crest coincides with the paint mark made on the turbocharger (the final angle achieved is **60°**).

❑ Torque tighten:

- the **turbocharger lower nut on the exhaust manifold (26 N.m)** (**13**) ,
- the **turbocharger upper nuts on the exhaust manifold (26 N.m)** (**14**) .

❑ Connect the cooling hoses to the turbocharger.

❑ Fit the clips using the **(Mot. 1448)**.

❑ Remove the hose clamp.

❑ Connect the turbocharging pressure regulation valve control hose.

WARNING

Check that the turbocharger oil return pipe is not partially or completely blocked. Check that there are no leaks. If there are, replace the pipe.

K9K, and 772

❏ Refit the turbocharger oil return pipe with its new seals, starting at the inlet in the cylinder block.

WARNING
During this operation, make sure that the turbocharger oil return pipe does not fold.

WARNING
Respect the direction of fitting of the turbocharger oil return pipe seal.

❏ Refit the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) .

❏ Connect the turbocharging pressure regulation valve control hose.

III - FINAL OPERATION

❏ Refit the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

WARNING
Make sure that the recommendations for refitting the catalytic pre-converter are always followed closely.

❏ Refit:

- the air inlet duct between the air filter unit outlet and the turbocharger inlet,
- the upper section of the air inlet duct between the turbocharger and the intercooler,
- the air duct at the air filter unit inlet.

1 - Check

❏ Disconnect the crankshaft position sensor connector.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Run the starter motor until the oil pressure warning light goes out (wait for a few seconds).

❏ Switch off the ignition.

❏ Make sure that there are no oil leaks.

❏ Connect the **Diagnostic tool** and clear the stored faults.

❏ Connect the crankshaft position sensor connector.

2 - Final operation

❏ Bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❏ Refit:

- the engine undertray,
- the engine cover.

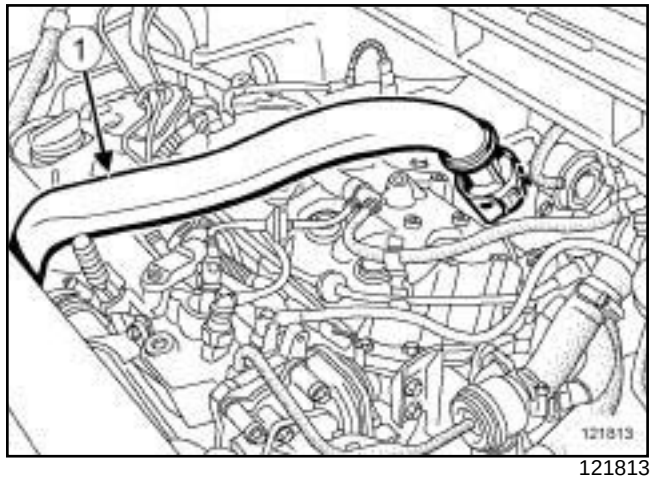
D4F, and 784

Special tooling required	
Ms. 583	Pipe clamps.
Mot. 1448	Remote operation pliers for hose clips.

Equipment required
set of feeler gauges

Tightening torques ▽	
turbocharger nuts	**21 N.m**
turbocharger cooling pipe hollow bolts	**30 N.m**
turbocharger cooling pipe bracket bolts	**10 N.m**

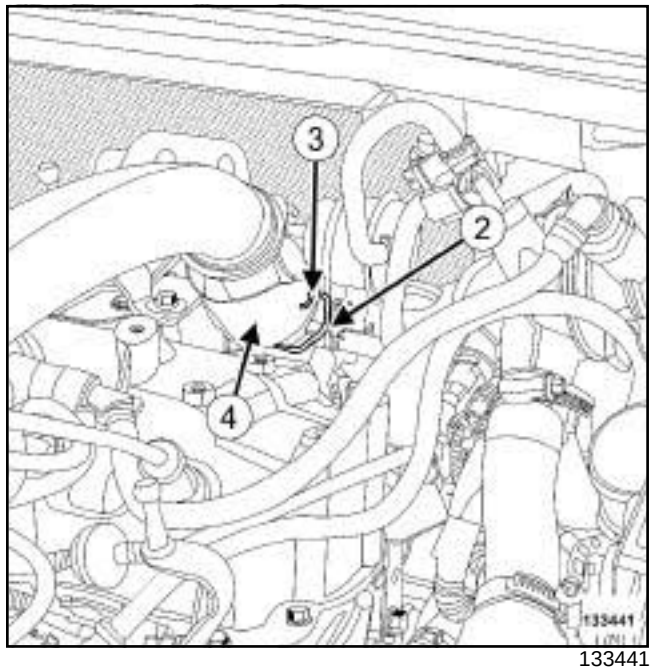
REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

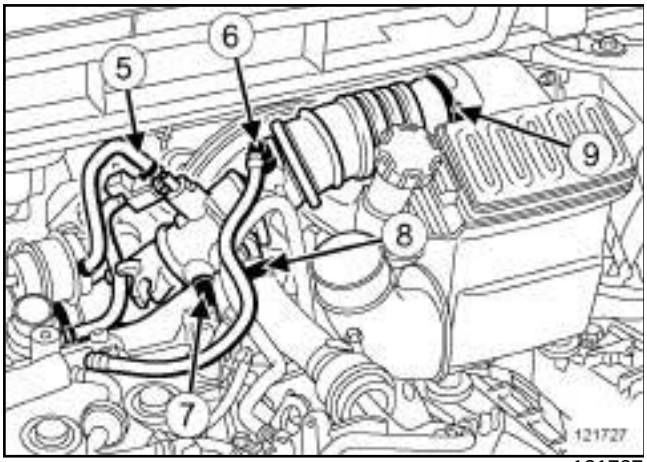


❑ Remove:

- the engine cover,
- the engine undertray,
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts),
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) ,
- the turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) .

121813

❑ Remove the bolt (**1**) from the turbocharger air outlet pipe on the inlet distributor.



133441

❑ Separate the clip (**2**) from the turbocharger air outlet pipe.

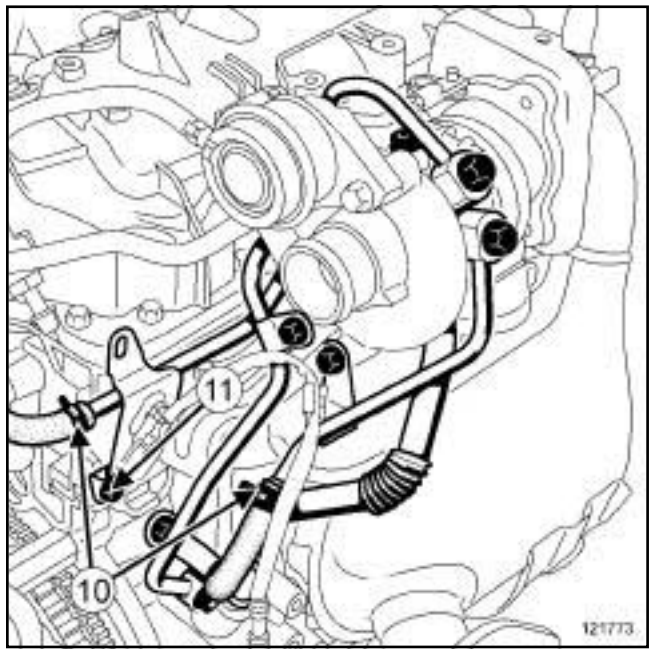
> Note:
>
> If the clip (**3**) is removed from the flexible heat shield (**4**) , the latter must be replaced.

❑ Move aside the turbocharger air outlet pipe.

D4F, and 784

121727

❏ Disconnect:



- the turbocharging pressure release valve (**5**) ,
- the oil vapour rebreathing pipe (**6**) ,
- the fuel vapour recirculation pipe (**7**) .

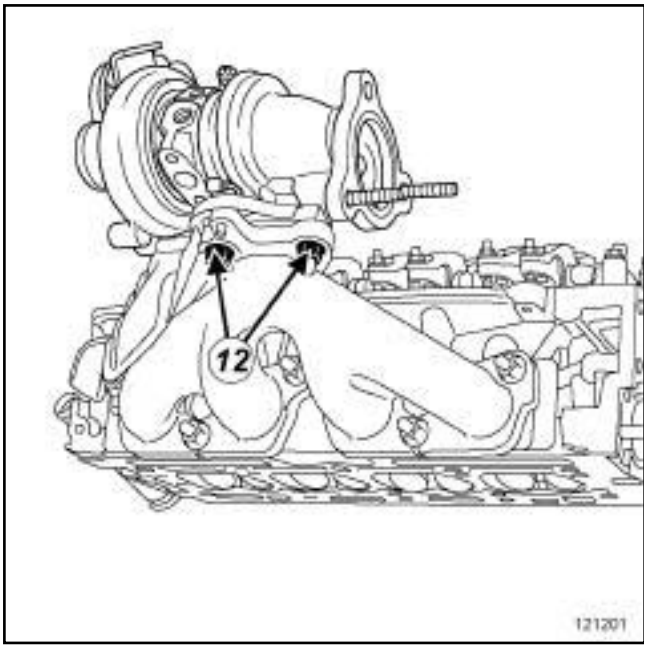
❏ Undo:

- the clip (**8**) of the compressor discharge air pipe,
- the clips (**9**) of the air outlet pipe of the air filter unit.

❏ Disconnect the air outlet pipe from the air filter unit.

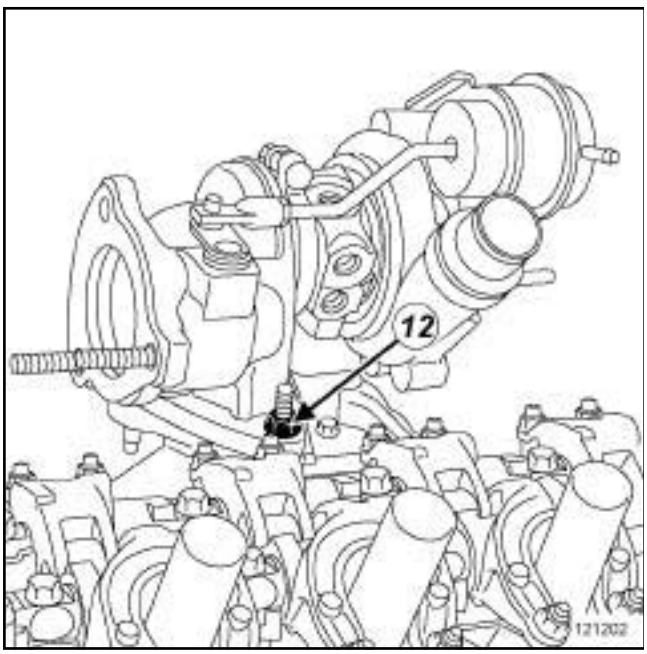
II - OPERATION FOR REMOVAL OF PART CONCERNED

121773



❏ Position the tool **(Ms. 583)** on the turbocharger cooling hoses (**10**) .

❏ Remove the turbocharger cooling hose clips using the tool **(Mot. 1448)**.



❏ Disconnect the turbocharger cooling hoses.

❏ Remove the turbocharger cooling pipe strut bolt (**11**) .

D4F, and 784

121201

121202

❑ Remove:

- the turbocharger nuts (**12**) ,
- the turbocharger,
- the turbocharger seal.

If replacing the turbocharger

❑ Undo the turbocharging pressure relief valve pipe clips.

❑ Disconnect the turbocharging pressure relief valve pipes.

❑ Remove

- the turbocharger cooling pipe bracket bolt,
- the turbocharger cooling hollow pipe bolts,
- the turbocharger cooling pipes.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: Turbocharger nut (10,09,01,03)**.

❑ **parts always to be replaced: seal between turbocharger and catalytic converter (10,09,01,08)**.

❑ **parts always to be replaced: Turbocharger coolant pipe (10,09,05,03)**.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

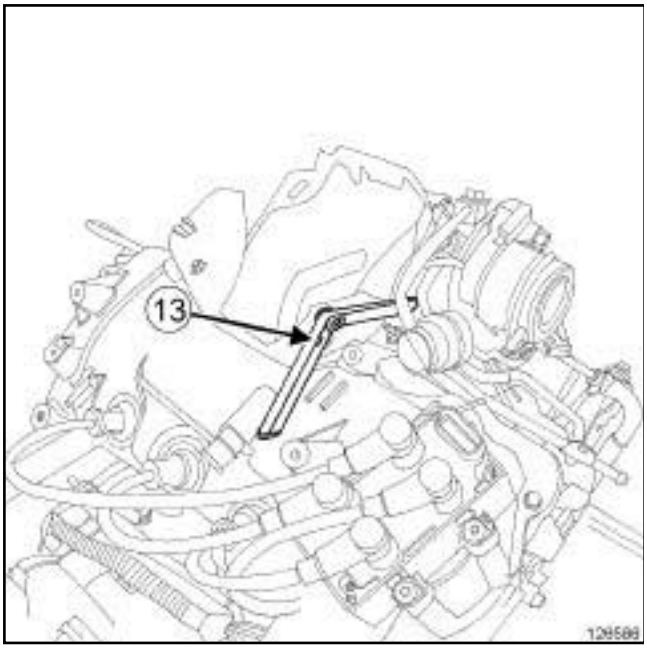
- a new turbocharger seal,
- the turbocharger,
- new turbocharger nuts.

❑ Torque tighten the **turbocharger nuts (21 N.m)**.

1 - If the turbocharger is not being replaced

❑ Refit the turbocharger cooling pipe strut bolt.

❑ Connect the turbocharger cooling hoses.



❑ Fit the turbocharger cooling hose clips.

❑ Remove the tool **(Ms. 583)**.

2 - If replacing the turbocharger

❑ Refit the turbocharger cooling pipes.

D4F, and 784

126586

❑ Position a **3 mm set of feeler gauges** (**13**) between the compressor cooling pipe and the compressor heat shield.

❑ Tighten to torque:

- the **turbocharger cooling pipe hollow bolts (30 N.m)**,
- the **turbocharger cooling pipe bracket bolts (10 N.m)**.

❑ Connect the turbocharging pressure relief valve pipes.

❑ Tighten the turbocharging pressure relief valve pipe clips.

III - FINAL OPERATION

❑ Connect the air outlet pipe of the air filter unit.

❑ Tighten:

- the clips of the air outlet pipe of the air filter unit,
- the compressor discharge air pipe clip.

❑ Connect:

- fuel vapour recirculation pipe,
- the oil vapour rebreathing pipe,
- the turbocharging pressure relief valve.

❑ Refit the turbocharger air outlet pipe.

❑ Clip the turbocharger air outlet pipe onto the turbocharger.

❑ Refit:

- the turbocharger air outlet pipe bolt,
- new turbocharger oil pipes (see **12B**, **Turbocharging**, **Turbocharger oil pipe: Removal - Refitting**, page **12B-15**) ,
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) ,
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (29A, Driveshafts).

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Fill and bleed the cooling system (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) .

❑ Check that there are no leaks:

- start the engine,
- check that the oil pressure warning light has gone out,
- leave the engine to idle,
- accelerate several times at no load,
- check that there are no leaks.

❑ Refit:

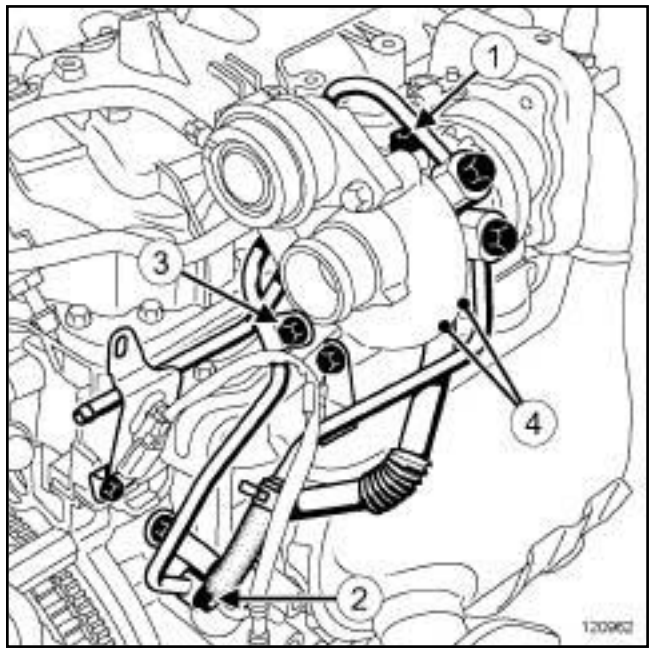
- the engine undertray,
- the engine cover.

D4F, and 784

Tightening torques ▽	
turbocharger oil return pipe bolts	**10 Nm**
turbocharger oil supply pipe bolt on the cylinder block	**19 Nm**
turbocharger oil supply pipe bolt on the turbo-charger	**19 Nm**
turbocharger oil supply pipe bracket bolt	**10 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine cover,
- the engine undertray,
- the front-right hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, driveshafts),
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

120962

❑ Remove:

- the bolt (**1**) from the turbocharger oil supply pipe on the turbocharger,
- the bolt (**2**) on the turbocharger oil supply pipe on the cylinder block,
- the bracket bolt (**3**) from the turbocharger oil supply pipe,
- the turbocharger oil supply pipe,
- the bolts (**4**) from the turbocharger oil return pipe,
- the turbocharger oil return pipe.

❑ Fit a blanking plug to the opening on the cylinder block after removal of the turbocharger oil return pipe.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ Always replace the turbocharger oil pipes.

❑ Remove the protective plug from the opening on the cylinder block.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the new turbocharger oil return pipe fitted with new seals,

- the turbocharger oil return pipe bolts.

❏ Torque tighten the **turbocharger oil return pipe bolts (10 Nm)**.

❏ Refit:

- the new turbocharger oil supply pipe fitted with its new seals,
- the turbocharger oil supply pipe bolt on the cylinder block,
- the turbocharger oil supply pipe bolt on the turbocharger,
- the turbocharger oil supply pipe bracket bolt.

❏ Torque tighten:

- the **turbocharger oil supply pipe bolt on the cylinder block (19 Nm)**,
- the **turbocharger oil supply pipe bolt on the turbocharger (19 Nm)**,
- the **turbocharger oil supply pipe bracket bolt (10 Nm)**.

III - FINAL OPERATION.

❏ Refit:

- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) ,
- the front right-hand wheel driveshaft (see **Front right-hand driveshaft: Removal - Refitting**) (MR 392, 29A, driveshafts).

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Check that there are no leaks:

- start the engine,
- check that the oil pressure warning light has gone out,
- leave the engine to idle,
- accelerate several times at no load,
- check that there are no oil leaks.

❏ Refit:

- the engine undertray,
- the engine cover.

Turbocharger oil pipe: Removal - Refitting

K9K

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
turbocharger oil supply pipe hollow bolt (turbocharger end)	**torx head bolt 18 N.m or bolt with head type H 14 N.m**
turbocharger oil supply pipe nut (cylinder head side)collar nut 35 N.m or non-collar nut	**23 N.m**
turbocharger oil return pipe bolts	**12 N.m**

IMPORTANT

Wear protective gloves during the operation.

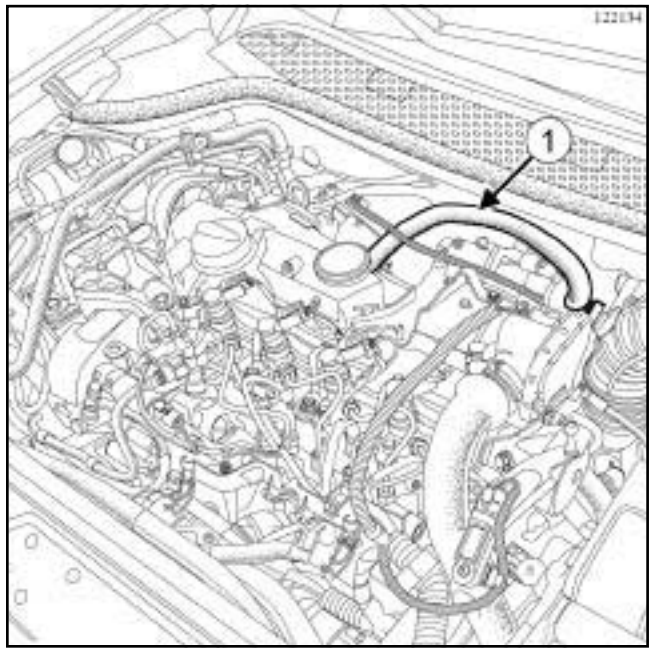
WARNING

Prepare for the flow of fluid, and protect the surrounding components.

Note:

This procedure deals with removing and refitting the turbocharger oil return pipe and the turbocharger oil supply pipe.

REMOVING THE TURBOCHARGER OIL SUPPLY PIPE



I - REMOVAL PREPARATION OPERATION

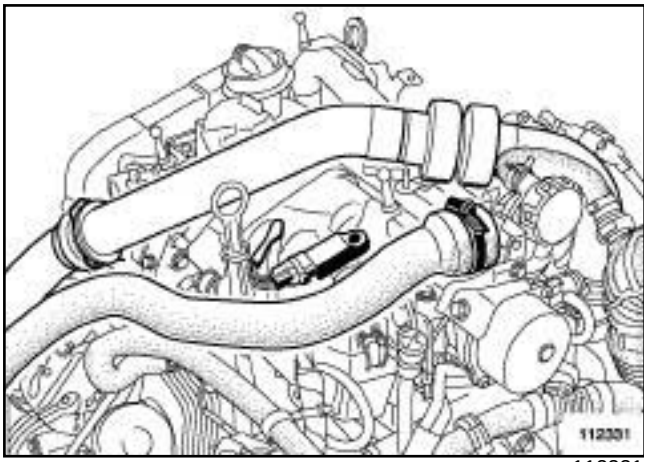
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Remove:

- the engine cover,
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) .

K9K, and 764 or 772

122134



❑ Disconnect the oil vapour rebreathing pipe (**1**) on the rocker cover side.

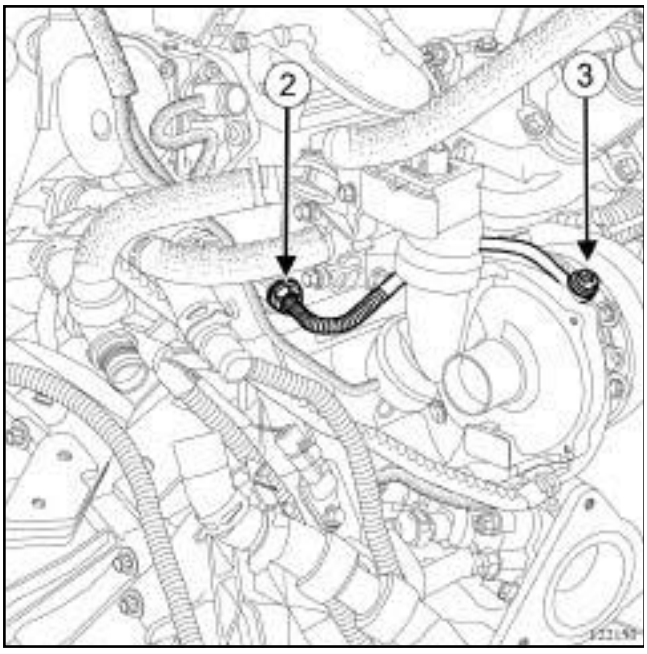
❑ Undo the clips on the air outlet pipe of the air filter unit.

❑ Disconnect the air outlet pipe from the air filter unit.

❑ Remove the air outlet pipe from the air filter box.

K9K

112331



❏ Remove the air pipe between the turbocharger outlet and the air pipe at the intercooler inlet.

❏ Remove the mounting nut from the intercooler air inlet pipe on the alternator using a ratchet spanner equipped with an extension piece and a universal joint.

❏ Move aside the intercooler air inlet pipe.

II - OPERATION FOR REMOVAL OF PART CONCERNED

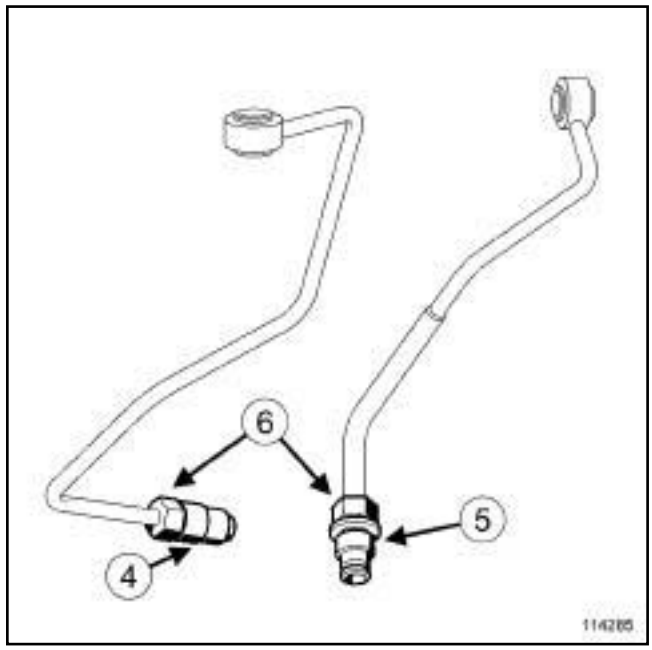
❏ Move the cooling hoses away from the cylinder head water chamber.

122150

❏ Undo the turbocharger oil supply pipe nut (**2**) from the cylinder head using the **(Mot. 1746)**.

❏ Remove:

- the turbocharger oil supply pipe hollow bolt (**3**) ,
- the turbocharger oil supply pipe.



REFITTING THE TURBOCHARGER OIL SUPPLY PIPE

REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: turbocharger oil supply pipe (10,09,03,01)**

parts always to be replaced: Turbocharger oil supply pipe bolt (10,09,03,04)

I - REFITTING OPERATION FOR PART CONCERNED

114285

❏

Note:

These two turbocharger oil supply pipes may be used on the same engine. The tightening torque of the end pieces (**6**) on the cylinder head is different, depending on the following:

- if the end piece is shouldered (**5**) , in this case there will be no need to place the high-resistance bolt locking product on the end piece thread,
- if the end piece is not shouldered (**4**) , it is essential to apply high-strength threadlock to the end piece threading.

❏ Refit a new turbocharger oil supply pipe.

K9K

❑ Fit without tightening:

- the turbocharger oil supply pipe nut on the cylinder head,
- the turbocharger oil supply pipe hollow bolt.

❑ Torque tighten:

- the **turbocharger oil supply pipe hollow bolt (turbocharger end) (torx head bolt 18 N.m or bolt with head type H 14 N.m)**,
- the **turbocharger oil supply pipe nut (cylinder head side)collar nut 35 N.m or non-collar nut (23 N.m)** using tool **(Mot. 1746)**.

❑ Clip the cooling hoses onto the cylinder head water chamber.

II - FINAL OPERATION

❑ Fit:

- the turbocharger air outlet pipe,
- the retaining pins of the turbocharger air outlet pipe.

❑ Snap on the turbocharger air outlet pipe.

❑ Tighten the turbocharger air outlet pipe bolt on the rocker cover.

❑ Tighten the mounting nut of the intercooler air inlet pipe on the alternator using a ratchet spanner equipped with an extension piece and a universal joint.

K9K, and 764 or 772

❑ Connect the oil vapour rebreathing pipe on the rocker cover side.

❑ Refit:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (80A, Battery),
- the battery (see **Battery: Removal - Refitting**) (80A, Battery),
- the engine cover.

Check

❑ Disconnect the crankshaft position sensor connector.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Run the starter motor until the oil pressure warning light goes out (wait for a few seconds).

❑ Switch off the ignition.

❑ Make sure that there are no oil leaks.

❑ Connect the **Diagnostic tool** and clear the stored faults.

❑ Connect the crankshaft position sensor connector.

REMOVING THE TURBOCHARGER OIL RETURN PIPE

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Remove:

- the engine cover,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the engine undertray bolts,
- the engine undertray,
- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) .

K9K, and 750 or 752 or 760 or 762 or 764 or 766 or 768

❑ Remove the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

K9K, and 772

❑ Remove the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

K9K

II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ Remove:

- the turbocharger oil return pipe bolts on the turbocharger,
- the turbocharger oil return pipe by extracting it from the cylinder block.

REFITTING THE TURBOCHARGER OIL RETURN PIPE

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: turbocharger oil pipe seal (10,09,03,05)**

❑ Oil the turbocharger oil return pipe O-ring.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit new seals on the turbocharger oil return pipe.

❑ Fit the turbocharger oil return pipe, first positioning it in the cylinder block.

❑ Torque tighten the **turbocharger oil return pipe bolts (12 N.m)**.

III - FINAL OPERATION

K9K, and 750 or 752 or 760 or 762 or 764 or 766 or 768

❑ Refit the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

K9K, and 772

❑ Refit the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

❑ Refit:

- the lower engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the engine undertray,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (56A, Exterior equipment),
- the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Check

❑ Disconnect the crankshaft position sensor connector.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Run the starter motor until the oil pressure warning light goes out (wait for a few seconds).

❑ Switch off the ignition.

❑ Make sure that there are no oil leaks.

❑ Connect the **Diagnostic tool** and clear the stored faults.

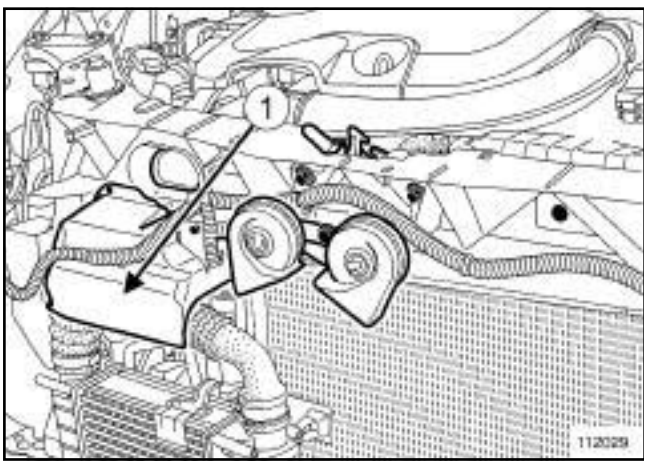
❑ Connect the crankshaft position sensor connector.

K9K – D4F, and 784

Equipment required
cleaning trough
parts washer
compressed air nozzle

Note:

Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

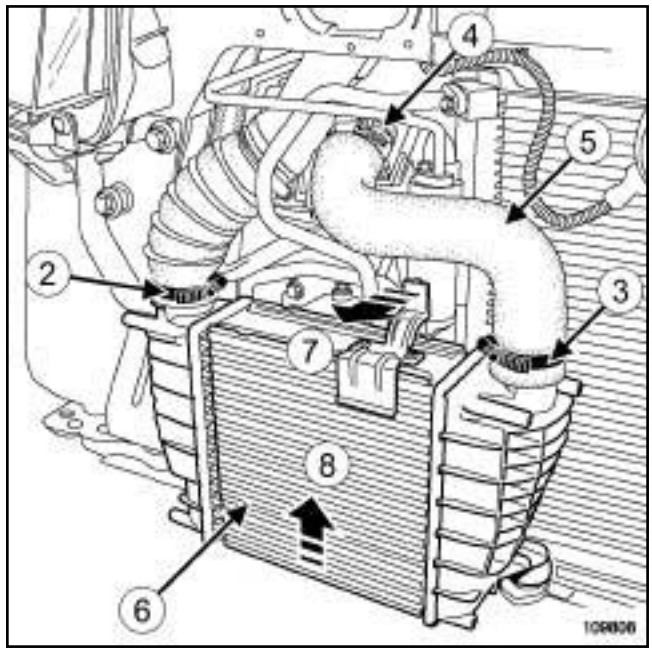


REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Remove:



- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection).
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection).

112029

❏ Remove the air deflector (**1**) from the intercooler.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109808

❏ Loosen the clips (**2**) , (**3**) and (**4**) of the intercooler air inlet and outlet pipes.

Note:

Whenever the clip (**3**) of the intercooler air outlet pipe is removed, only the flexible part (**5**) of the pipe must be replaced.

❏ Disconnect the intercooler air inlet and outlet pipes.

❏ Move aside the intercooler air inlet and outlet pipes.

❏ Remove the flexible part of the intercooler outlet pipe (**5**) .

❏ Remove the intercooler (**6**) in the direction of the arrows (**7**) and (**8**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❏ Check that the intercooler is not full of oil. If it is, clean it with a **cleaning trough** or with a **parts washer** then dry it with a **compressed air nozzle**.

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the flexible part of the intercooler air outlet pipe.

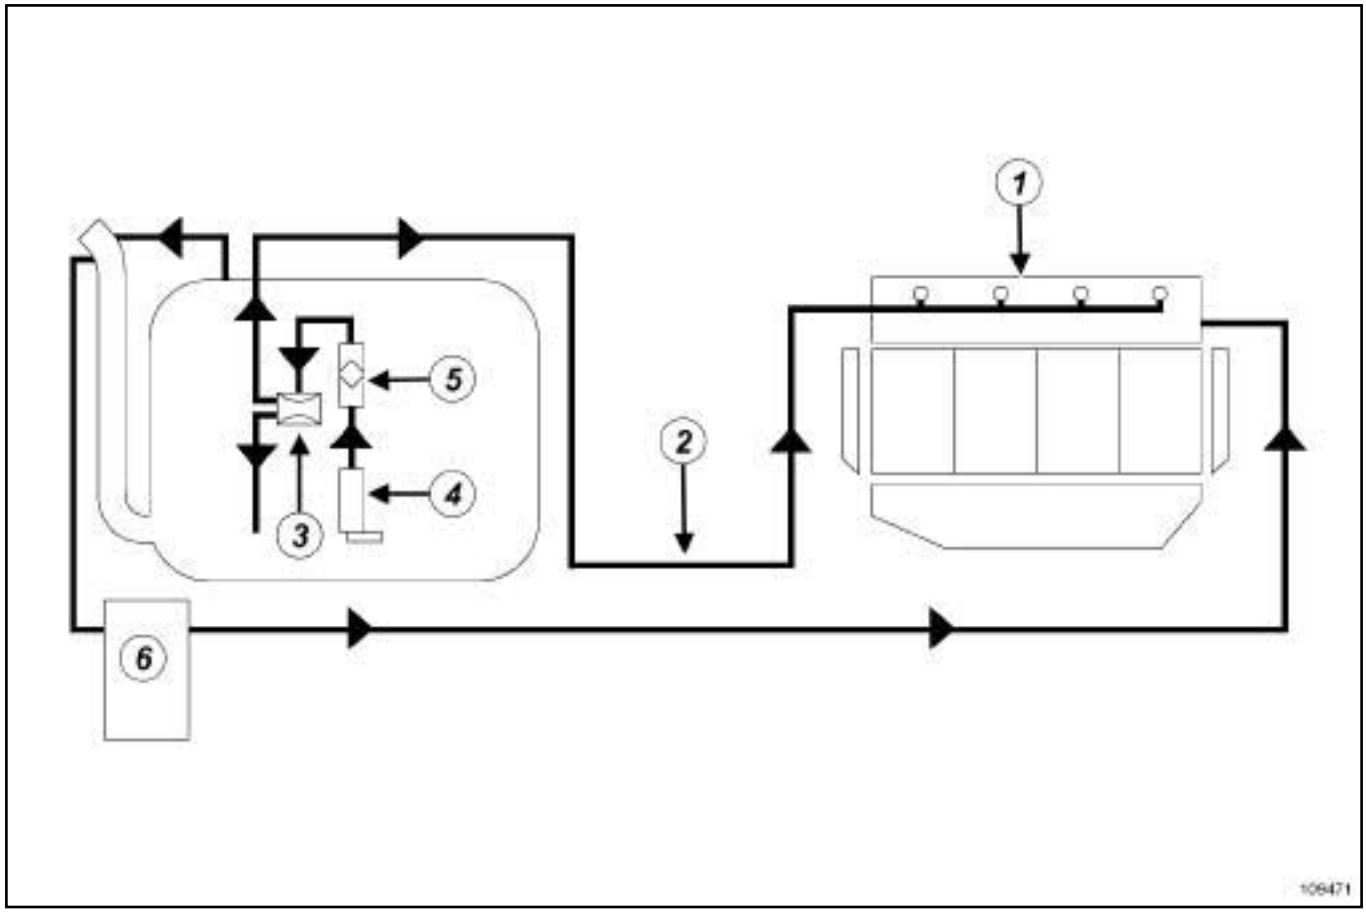
❏ Tighten the clip ***(4)*** of the flexible part of the intercooler air outlet pipe.

K9K – D4F, and 784

❏ Refit the intercooler.

❏ Connect the intercooler air inlet and outlet pipes.

❏ Tighten the clips of the intercooler air inlet and outlet pipes.



III - FINAL OPERATION

❏ Refit:

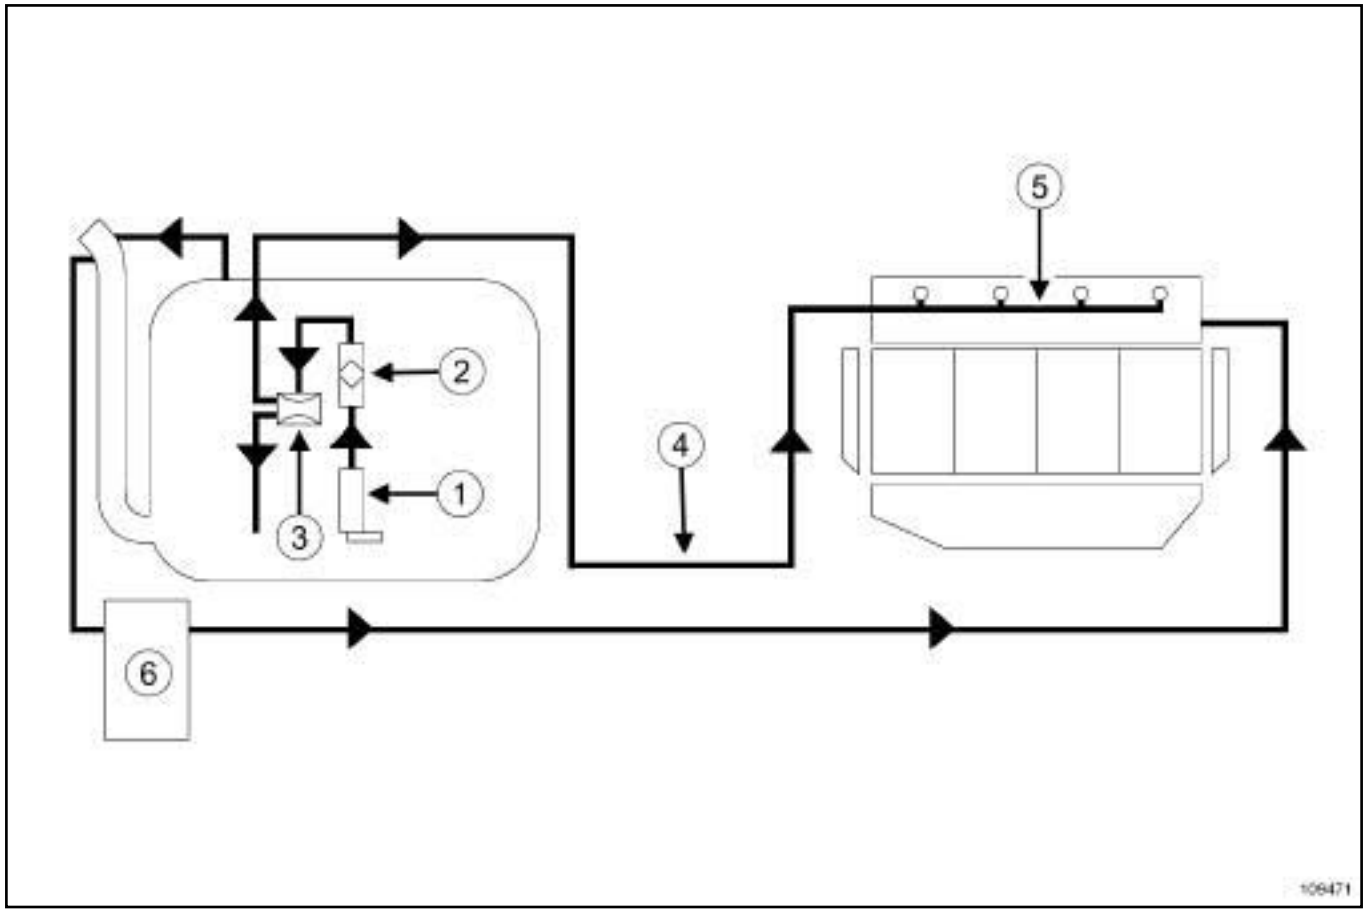
- the intercooler air deflector,
- the front bumper (see **Front bumper: Removal - Refitting**) (55A, Exterior protection),
- the front wheel arch liners (see **Front wheel arch liner: Removal - Refitting**) (55A, Exterior protection).

D4F or F4R or K4J or K4M

Operating diagram of the petrol supply circuit (« pump - sender - fuel filter » assembly).

109471

The fuel system does not have a return.



The fuel pressure does not vary with engine load.

The circuit comprises:

- a rail (**1**) without a return pipe union and without a supply pressure regulator,
- a single pipe (**2**) coming from the tank,
- a « pump - sender - fuel filter » petrol supply assembly fitted with a pressure regulator (**3**) , pump (**4**) and fuel filter (**5**) (all located in the tank),
- a fuel vapour recirculation tank (**6**) .

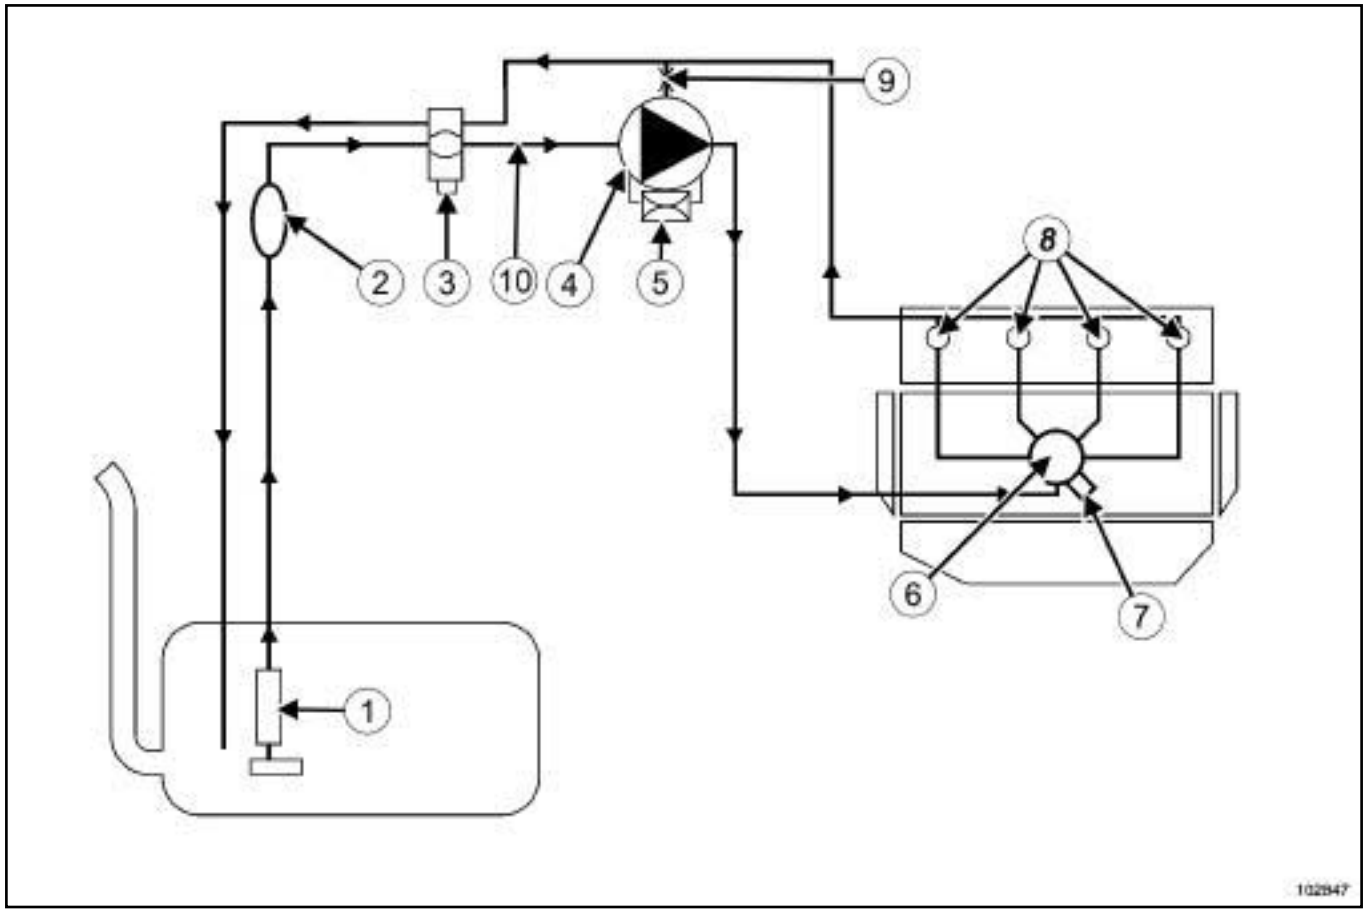
M4R

Operating diagram of the petrol supply circuit

109471

The fuel supply circuit does not have a return.

The fuel pressure does not vary with engine load.



The circuit comprises:

- a « pump-sender-filter » fuel supply assembly located in the tank; it is equipped with the pump (**1**) , the filter (**2**) and the pressure regulator (**3**) ,
- a single pipe (**4**) coming from the tank,
- a rail (**5**) with no return pipe and no pressure regulator,
- a petrol vapour recirculation reservoir (**6**) connected to the inlet manifold by a pipe and a solenoid valve.

Diesel supply circuit: Operating diagram

K9K, and 750 or 752 or 766 or 768

Operating diagram of the diesel fuel supply circuit

102847

The circuit comprises:

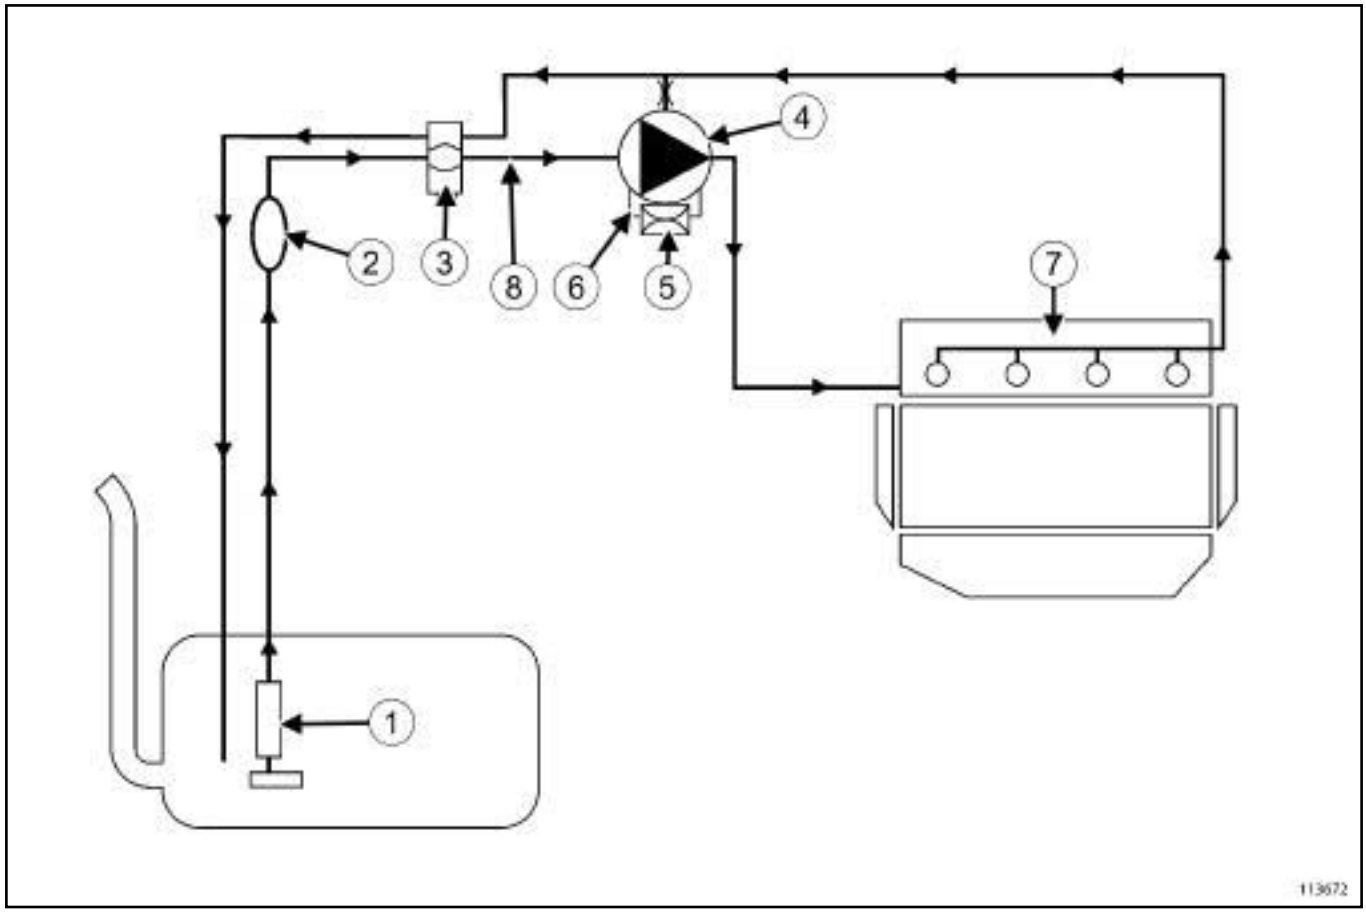
- a sender (**1**) ,
- a priming bulb (**2**) ,
- a fuel filter (**3**) that can be fitted with a water detection sensor,
- a high pressure pump (**4**) with a built-in mechanical low pressure pump (transfer pump),
- a fuel flow actuator (**5**) ,
- an injector rail (**6**) fitted with a diesel pressure sensor (**7**) ,
- four injectors (**8**) ,
- a venturi tube (**9**) ,
- a bleed screw (**10**) ,
- various sensors,
- an injection computer.

IMPORTANT

Loosening a high-pressure pipe union when the engine is running is strictly prohibited.

WARNING

It is forbidden:



- to dismantle the interior of the pump or injectors. Only the fuel flow actuator, the diesel fuel temperature sensor and the venturi tube can be replaced,
- to remove the pressure sensor from the fuel rail (because of circuit contamination problems). If the pressure sensor fails, the pressure sensor, the rail and the five high pressure pipes must be replaced.

Only the flow actuator, the diesel fuel temperature sensor and the venturi tube can be replaced.

Diesel supply circuit: Operating diagram

K9K, and 764

Operating diagram of the diesel fuel supply circuit

113672

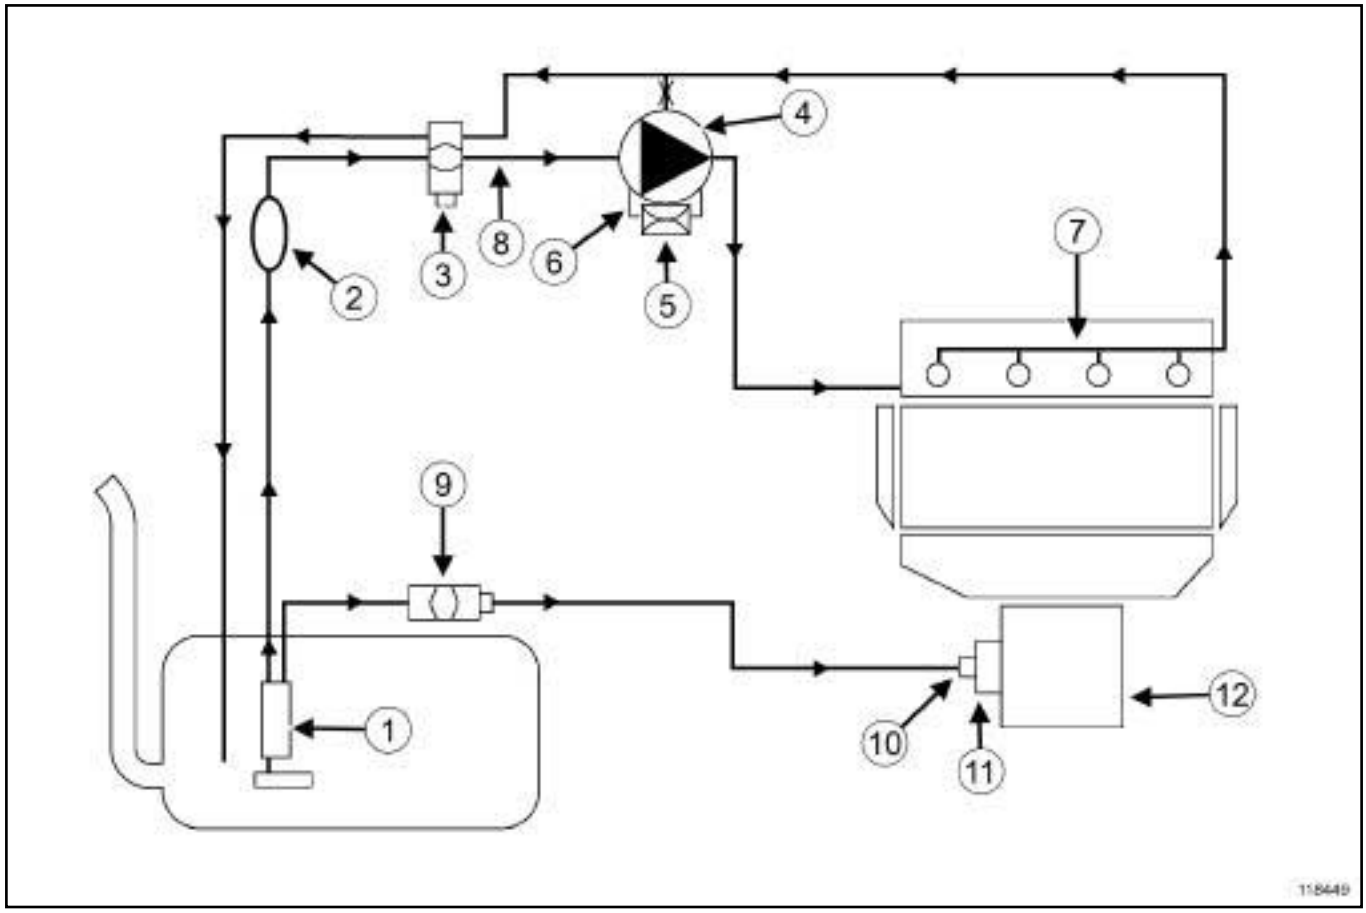
The circuit comprises:

- a sender (**1**) ,
- a priming bulb (**2**) ,
- a fuel filter (**3**) which may be fitted with a water detection sensor,
- a high pressure pump (**4**) with a built-in mechanical low pressure pump (transfer pump),
- a pressure regulator (**5**) , mounted on the high-pressure pump,
- a flow regulator (**6**) , mounted on the high-pressure pump,
- an injector rail (**7**) fitted with a pressure sensor,
- a bleed screw (**8**) ,
- four injectors,
- various sensors,
- an injection computer.

IMPORTANT

Loosening a high pressure pipe union when the engine is running is strictly prohibited.

WARNING



It is forbidden:

- to dismantle the interior of the pump or injectors.
- to remove the pressure sensor from the fuel rail (because of circuit contamination problems). If the pressure sensor fails, the pressure sensor, the rail and the five high pressure pipes must be replaced,
- to dismantle the flow regulator solenoid and the pressure regulator solenoid on the high-pressure pump.

Diesel supply circuit: Operating diagram

K9K, and 772

Operating diagram of the diesel fuel supply circuit

118449

The circuit comprises:

- a pump - sender (**1**) ,
- a priming bulb (**2**) ,
- a fuel filter (**3**) that can be fitted with a water detection sensor,
- a high pressure pump (**4**) with a built-in mechanical low pressure pump (transfer pump),
- a pressure regulator (**5**) mounted on the high pressure pump,
- a flow regulator (**6**) mounted on the high pressure pump,
- an injector rail (**7**) fitted with a pressure sensor,
- a bleed screw (**8**) ,
- four injectors,
- various sensors,
- an injection computer,
- a particle filter injector fuel filter (**9**) ,
- a diesel injector (**10**) on the catalytic pre-converter,
- a diesel injector cooler (**11**) ,
- a catalytic pre-converter (**12**) .

IMPORTANT

Loosening a high-pressure pipe union when the engine is running is strictly prohibited.

WARNING

It is forbidden:

- to dismantle the interior of the pump or injectors.
- to remove the pressure sensor from the fuel rail (because of circuit contamination problems). If the pressure sensor fails, the pressure sensor, the rail and the five high pressure pipes must be replaced,
- to dismantle the flow regulator solenoid valve and the pressure regulator solenoid valve on the high pressure pump.

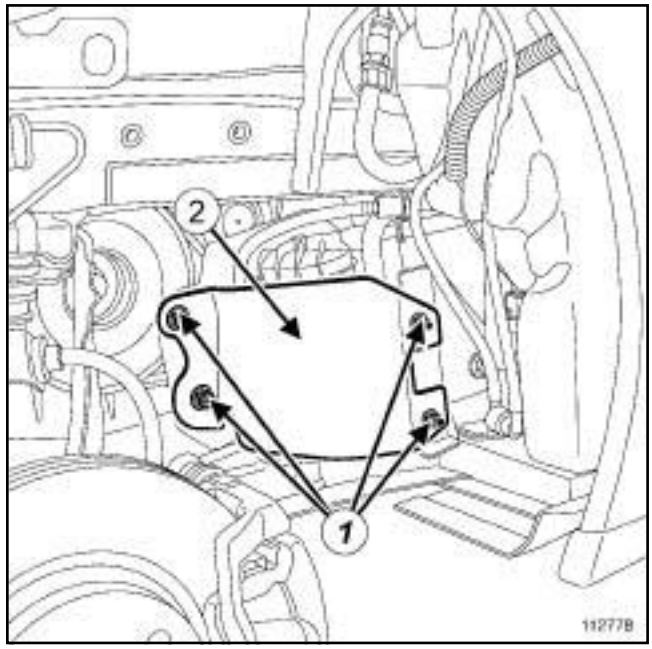
K9K

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove:

- the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres),
- the right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection).



II - OPERATION FOR REMOVAL OF PART CONCERNED

❑ The safety advice and cleanliness instructions must be respected (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

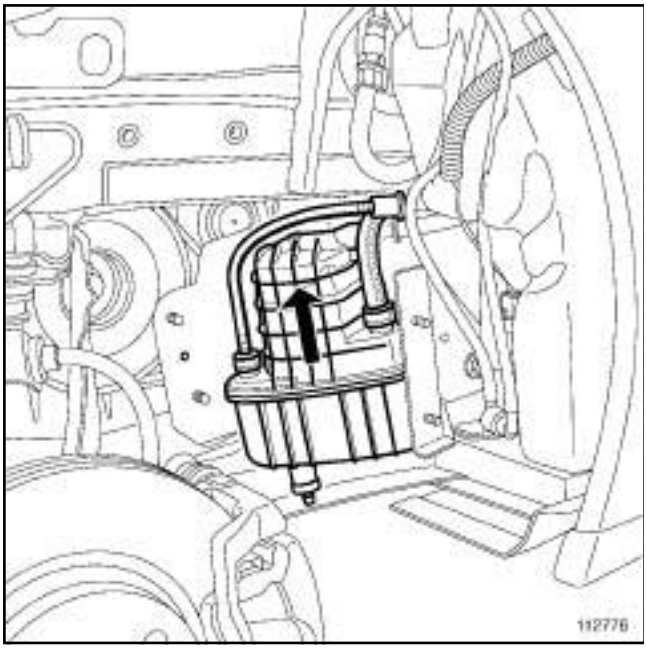
Note:

Use only wipes (**77 11 211 707**) to clean the filter and pipes once the fuel circuit is opened.

Be sure to have the new diesel filter to hand before starting work.

112778

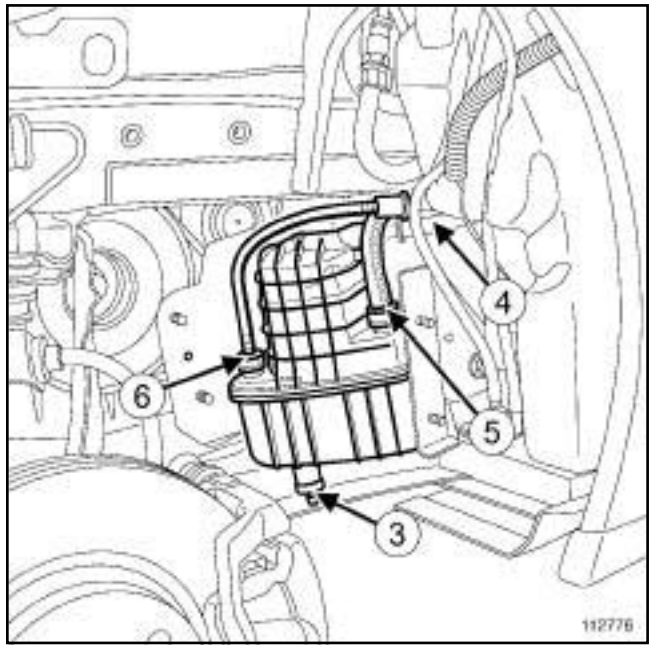
❑ Remove:



- the mounting nuts (**1**) from the diesel filter protection plate (**2**) ,
- the diesel filter protection plate.

IMPORTANT
Wear gloves during the operation.

IMPORTANT



During this operation, it is essential to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

112776

❏ Push the diesel filter upwards to remove it from its holder.

112776

❏ Place a container under the water separator bleed screw (**3**) to collect the diesel fuel.

❏ Open the bleed screw (**3**) .

❏ Disconnect the pipe unions on the diesel filter in the following order: (**4**) , (**5**) then (**6**) .

WARNING

Prevent the hose unions from coming into contact with a polluted environment.

❏ Remove the diesel filter.

❏ Let the diesel fuel flow out from the various pipes into a container.

Note:

Make preparations for fuel outflow.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Connect the pipe unions on the diesel filter (only remove the caps at the last moment).

❏ Refit:

- the diesel filter,

- the protection plate for the diesel filter.

K9K

SUPPLY CIRCUIT PRIMING PROCEDURE

- ❏ Open the bleed screw located between the filter and the high pressure pump (see **13A**, **Fuel supply**, **Diesel supply circuit: Operating diagram**, page **13A-3**) .
- ❏ Fit a pipe on the bleed screw and set up a container to recover the diesel fuel when priming the circuit.
- ❏ Prime the supply circuit with the priming bulb until diesel starts to run into the container.
- ❏ Close the air bleed screw.
- ❏ Remove the pipe from the bleed.

II - FINAL OPERATION.

- ❏ Refit:
  - the right-hand wheel arch liner (see **Front wheel arch liner: Removal - Refitting**) (MR 393, 55A, Exterior protection),
  - the front right-hand wheel (see **Wheel: Removal - Refitting**) (MR 392, 35A, Wheels and tyres).

REMOVAL

I - REMOVAL PREPARATION OPERATION

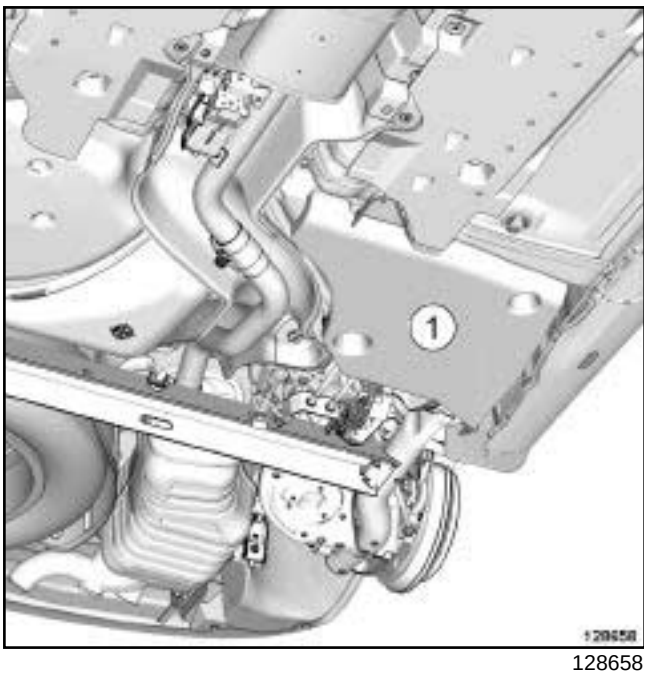
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

IMPORTANT

During this operation, be sure to:

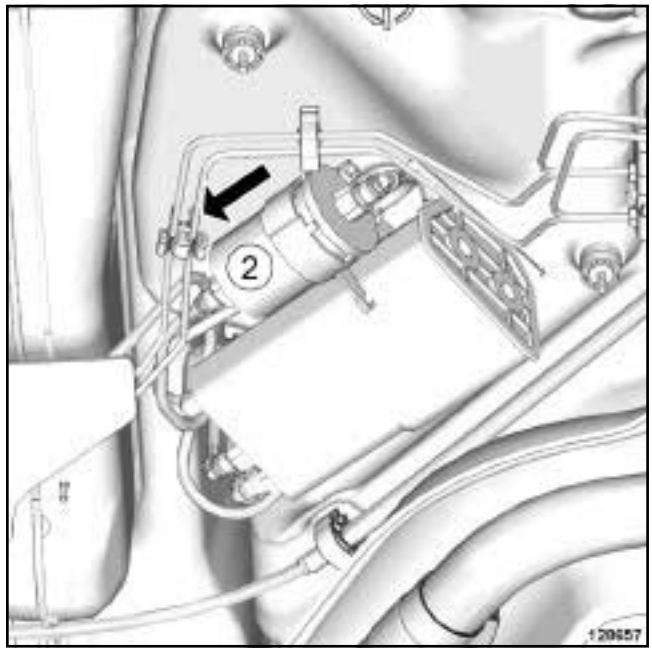
- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.



IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT



Wear heat protective gloves during the operation.

II - OPERATION FOR REMOVAL OF PART CONCERNED

128658

❑ Remove the fuel filter guard (**1**) .

128657

❑ Unclip the fuel filter (**2**) on the fuel vapour absorber in the direction of the arrow.

❑ Disconnect the fuel filter pipes.

❑ Remove the fuel filter.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the fuel filter.

❑ Connect the fuel filter pipes.

❑ Clip the fuel filter onto the fuel vapour absorber.

❑ Refit the fuel filter guard.

II - FINAL OPERATION.

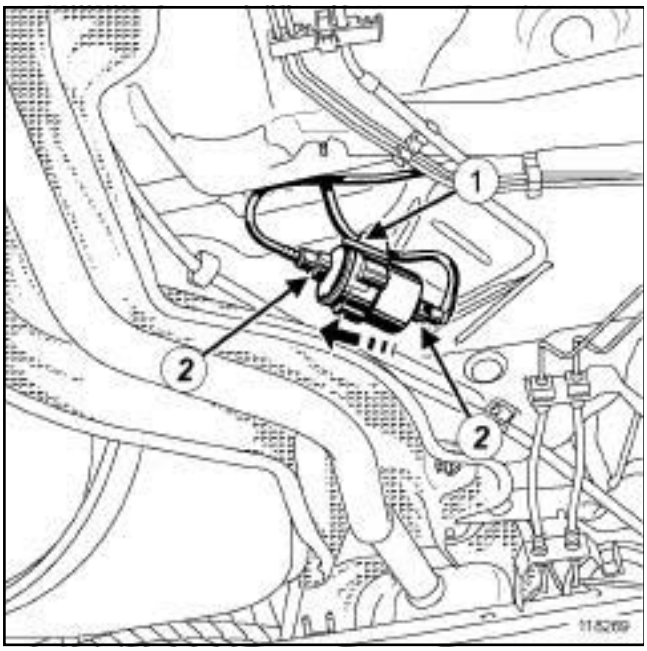
❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

Particle filter injector fuel filter: Removal - Refitting

K9K, and 772

REMOVAL

I - OPERATION FOR REMOVAL OF PART CONCERNED



❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

II - OPERATION FOR REMOVAL OF PART CONCERNED

118269

❑ Separate the tabs (**1**) of the particle filter injector fuel filter holder.

❑ Unclip the particle filter injector fuel filter unions (**2**) .

Note:

Make preparations for fuel outflow.

❑ Remove the particle filter injector fuel filter following the direction of the arrow.

REFITTING

REFITTING OPERATION FOR PART CONCERNED

❑ Refit the particle filter injector fuel filter.

❑ Clip on:

- the particle filter injector fuel filter,
- the particle filter injector fuel filter unions.

D4F, and 740 or 742 or 764

REMOVAL

I - REMOVAL PREPARATION OPERATION

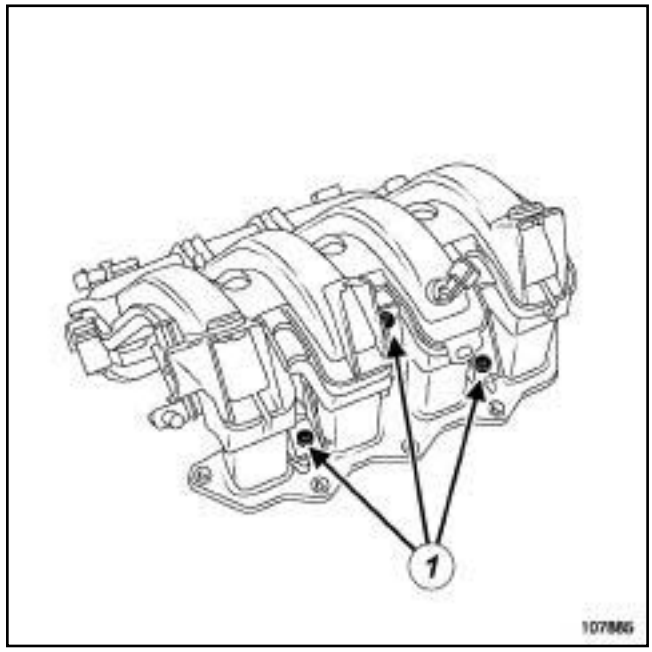
❑ Disconnect the battery (see **Battery: Removal - Refitting**) .

❑ Remove:

- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

IMPORTANT

During this operation, it is essential to:



- refrain from smoking or bringing red hot objects close to the working area,
- be aware of fuel splashes when disconnecting the supply union,
- protect sensitive areas from fuel outflow.

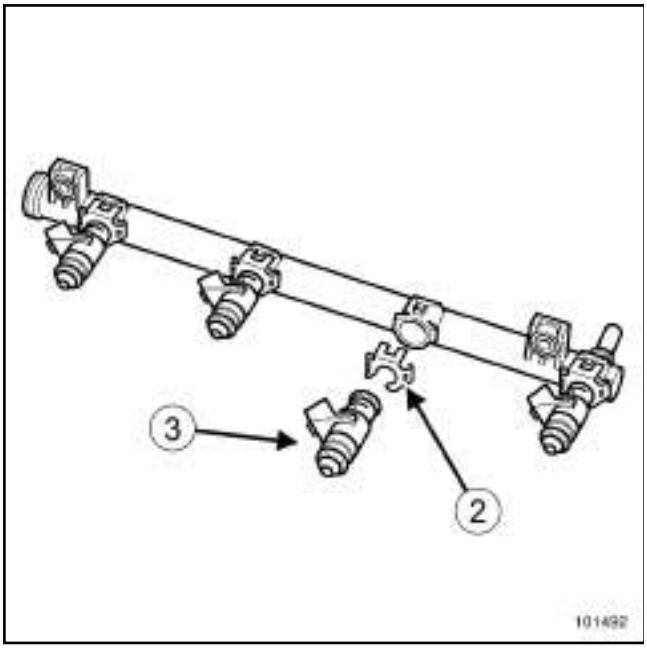
IMPORTANT

Wear gloves during the operation.

II - OPERATION FOR REMOVAL OF PART CONCERNED

ON THE WORKBENCH

107885



❑ Disconnect the injector wiring harness.

❑ Remove:

- the mounting bolts (**1**) from the injector rail,
- the injector rail.

❑ Remove the injector wiring harness.

D4F, and 740 or 742 or 764

101492

❑ Remove:

- the clips (**2**) from the injectors,
- the injectors (**3**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace:

- the injectors' O-rings,
- the injector mounting clips,

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the injectors,
- the injector clips,

❑ Refit the injector wiring harness.

❑ Refit:

- the injector rail,
- the injector rail mounting bolts,

❑ Connect the injector wiring harness.

III - FINAL OPERATION.

❑ Refit:

- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) .

K4J – K4M

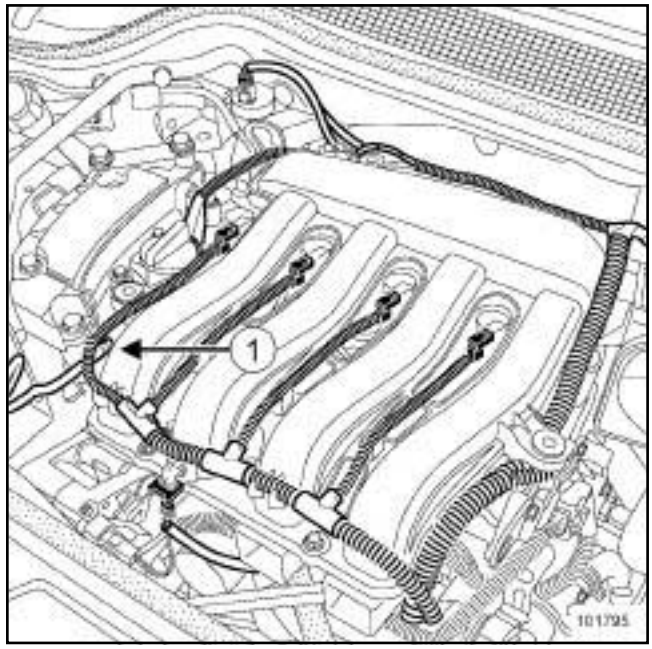
Tightening torques ▽	
injector rail bolts	**10 N.m**

IMPORTANT
Wear leaktight gloves (Nitrile type) for this operation.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.



IMPORTANT
Wear goggles with side protectors for this operation.

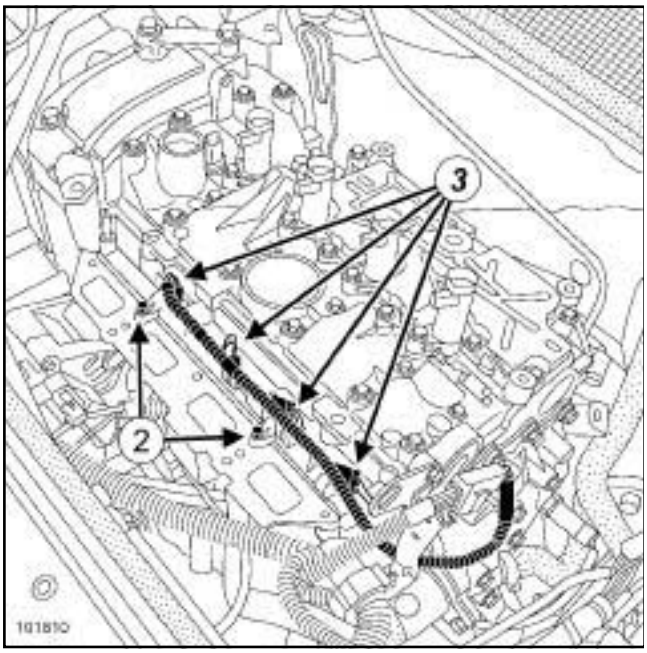
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

101795



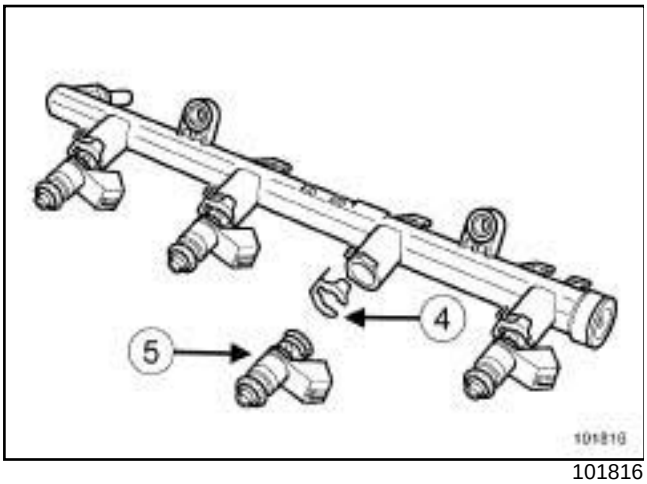
❏ Disconnect the fuel supply pipe union from the injector rail (**1**) .

WARNING
To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❏ Insert the blanking plugs.

K4J – K4M

II - OPERATION FOR REMOVAL OF PART CONCERNED



101810

❑ Remove:

- the injector rail bolts (**2**) ,
- the « injector rail-injector» assembly by pulling it carefully towards the front of the vehicle.

❑ Disconnect the connector from each injector (**3**) .

101816

❑ Remove:

- the injector retaining clips (**4**) ,
- the injectors (**5**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: injector clip on injector rail (11,04,04,10)**.

❑ **parts always to be replaced: injector seal (11,11, 02,02)**.

II - REFITTING PART CONCERNED

❑ Refit:

- new seals on each injector,
- the injectors on the injector rail,
- a new clip on each injector.

❑ Fit the « injector rail-injector » assembly.

❑ Torque tighten the **injector rail bolts (10 N.m)**.

❑ Connect the connector on each injector.

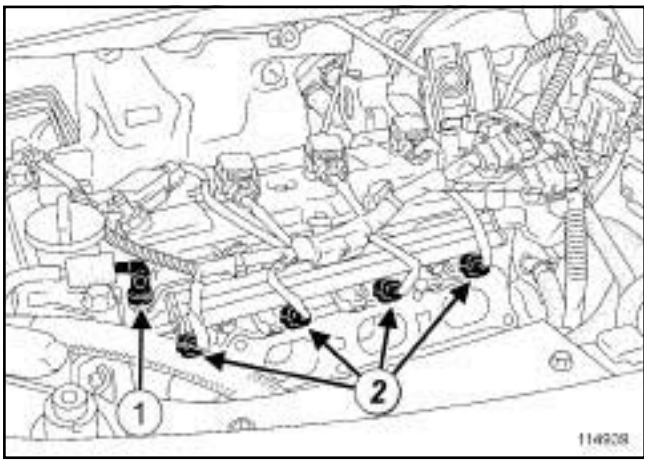
III - FINAL OPERATION

❑ Remove the blanking plugs.

❑ Connect the fuel supply pipe union on the injector rail.

❑ Refit the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).



Tightening torques ▽	
injector rail mounting bolts	**25 Nm**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

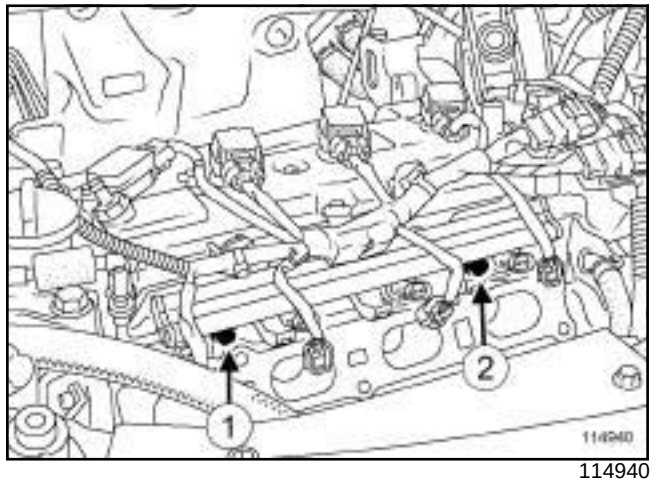
❏ Remove the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

114939

❏ Disconnect:

- the fuel supply union (**1**) on the injector rail,
- the injector connectors (**2**) .

IMPORTANT

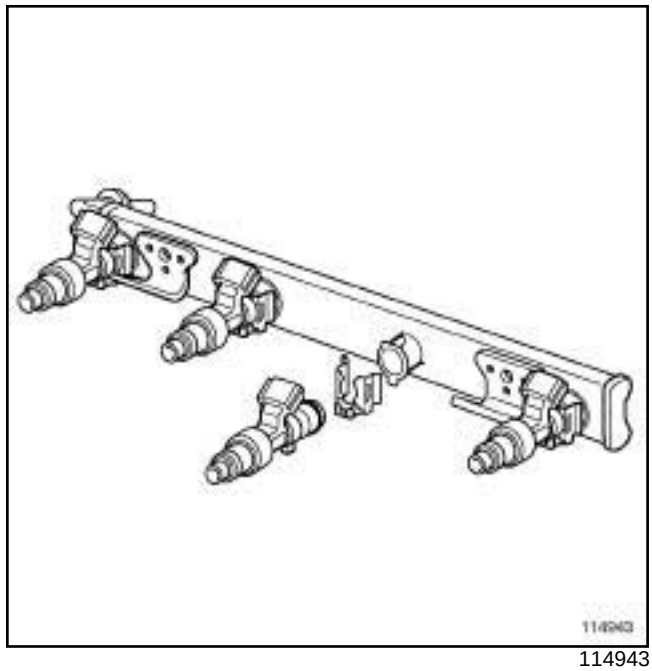


During this operation, it is essential to:

- refrain from smoking or bringing red hot objects near the working area,
- be aware of fuel splashes when disconnecting the supply union,
- protect sensitive areas from fuel outflow.

IMPORTANT

Wear gloves during the operation.

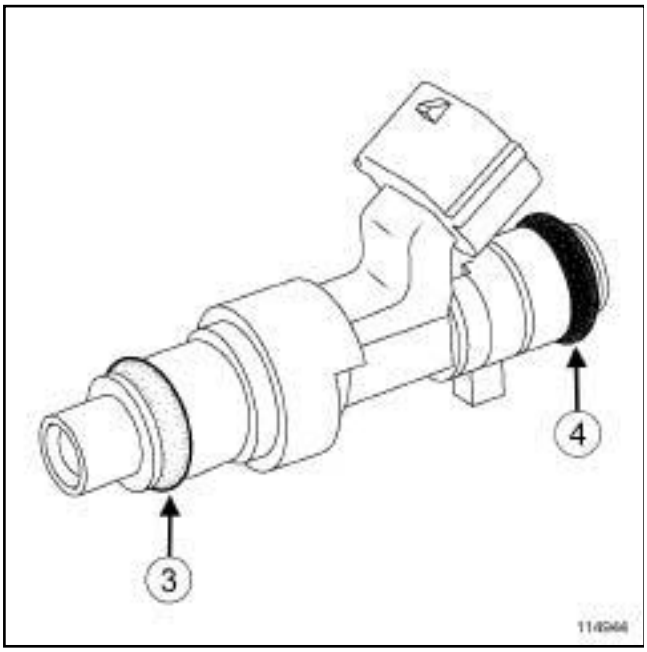


II - REMOVAL OF PART CONCERNED

114940

❏ Remove:

- in order, the injector rail mounting bolts,
- the « injector rail-injector » assembly by pulling carefully towards the front of the vehicle.



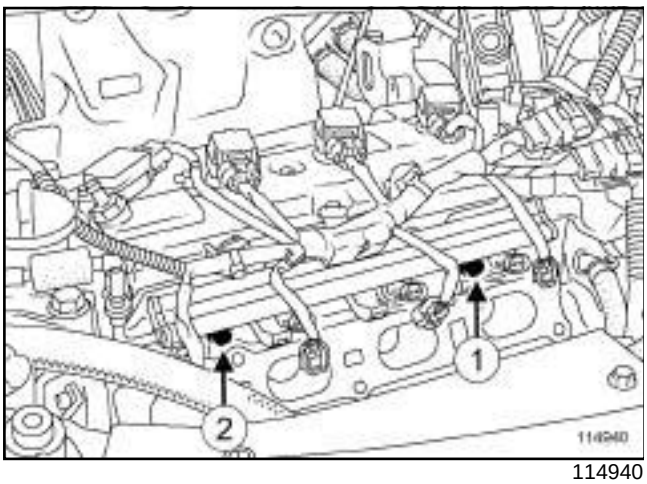
114943

❏ Remove:

- the injector mounting clips,
- the injectors.

REFITTING

I - REFITTING PREPARATION OPERATION



114944

❑ The O-rings and the injector mounting clips must be replaced with new ones.

The O-rings are different, do not mix them up. O-ring (**3**) is green and O-ring (**4**) is black.

II - REFITTING PART CONCERNED

❑ Refit the « injector rail-injector » assembly.

114940

❑ Tighten to torque and in order the **injector rail mounting bolts (25 Nm)**.

III - FINAL OPERATION

❑ Connect:

- the injector connectors,
- the fuel supply union onto the injector rail,

❑ Refit the inlet manifold (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

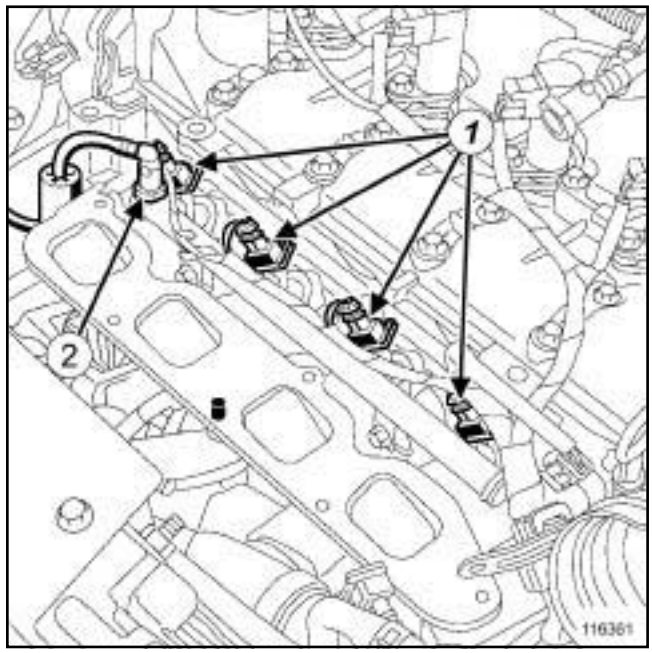
❑ Connect the battery (see **Battery: Removal - Refitting**) .

F4R

Equipment required
Diagnostic tool

Tightening torques ▽	
injector rail mounting bolts	**10Nm**

REMOVAL



I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

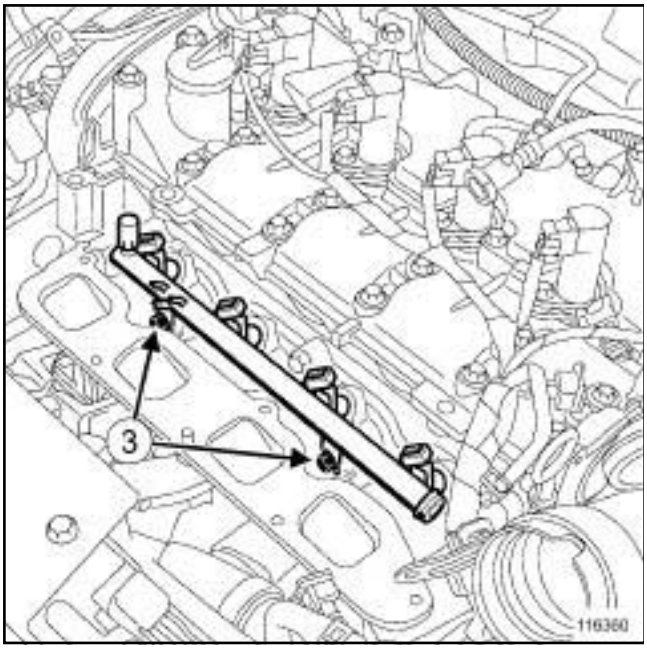
- the motorised throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) ,
- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

116361

❑

IMPORTANT
Wear gloves during the operation.



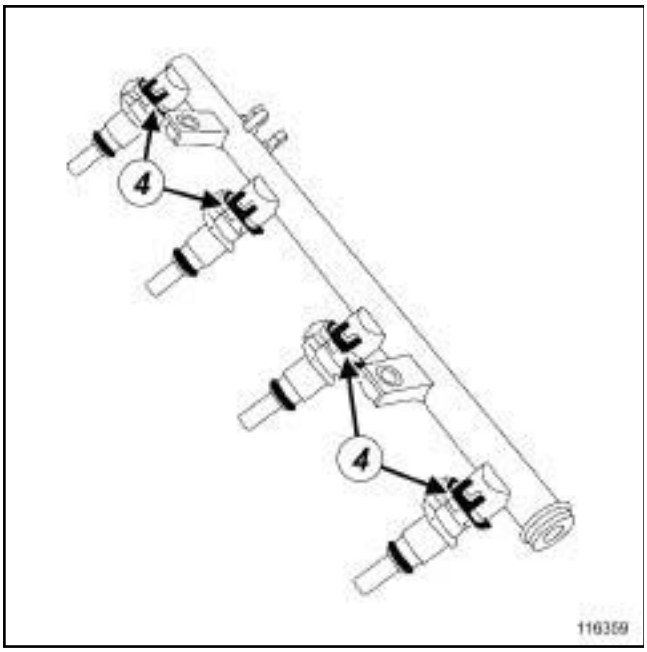
IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

❑ Disconnect:

- the injector connectors (**1**) ,
- the fuel supply union (**2**) on the injector rail.



116360

❑ Remove:

- the injector rail mounting bolts (**3**) ,
- the injector rail, pulling it carefully.

Separating the injectors from the injector rail

116359

❑ On a clean workbench:

- remove the retaining clips (**4**) from the injectors,
- separate the injectors from the injector rail.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑ The O-rings and the injector mounting clips must be replaced with new ones.

Separating the injectors from the injector rail

❑ On a clean workbench:

- assemble the injectors fitted with new seals on the injector rail,
- refit the injector retaining clips.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the injector rail fitted with its injectors with new seals,
- the injector rail mounting bolts,

❑ Torque tighten the **injector rail mounting bolts (10Nm)**.

❑ Connect:

- the fuel supply union on the injector rail,
- the injector connectors.

III - FINAL OPERATION.

❑ Refit:

- the intake distributor (see **12A**, **Fuel mixture**, **Inlet distributor: Removal - Refitting**, page **12A-46**) ,
- the throttle valve (see **12A**, **Fuel mixture**, **Throttle valve: Removal - Refitting**, page **12A-33**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Use the **Diagnostic tool** to check that there are no faults stored by the computer; clear any faults if need be.

D4F, and 784

Tightening torques ▽	
injector rail - injector bolts	**4.5 Nm**

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

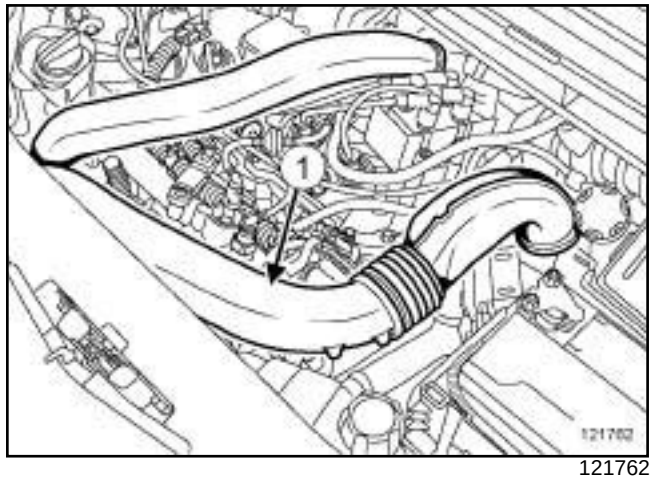
IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear latex gloves during the operation.

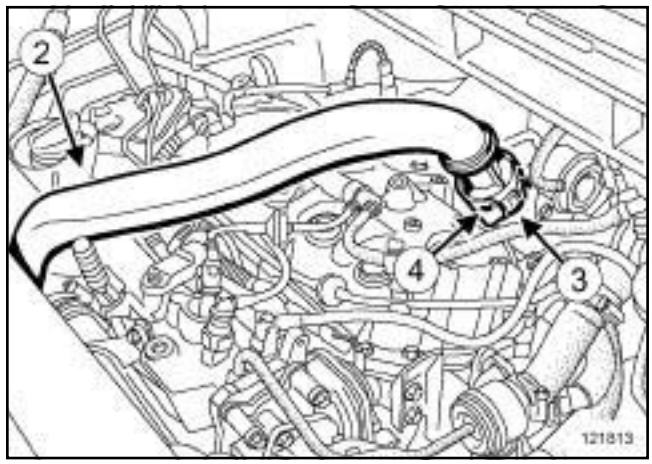
WARNING



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

REMOVAL

I - REMOVAL PREPARATION OPERATION



❏ Remove the front engine cover.

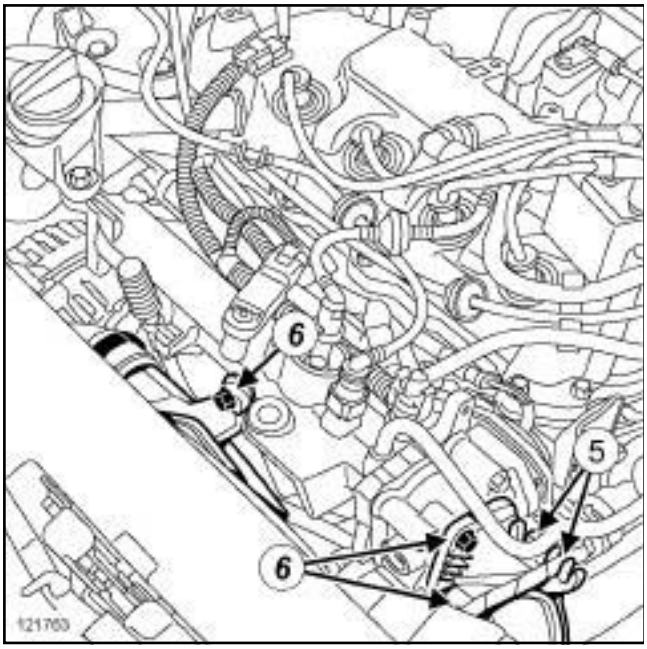
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

121762

❏ Disconnect the air filter unit air inlet pipe (**1**) .

121813

❏ Remove the turbocharger air outlet pipe bolt (**2**) from the intake distributor.



❏ Remove the turbocharger air outlet pipe clip (**3**) from the turbocharger.

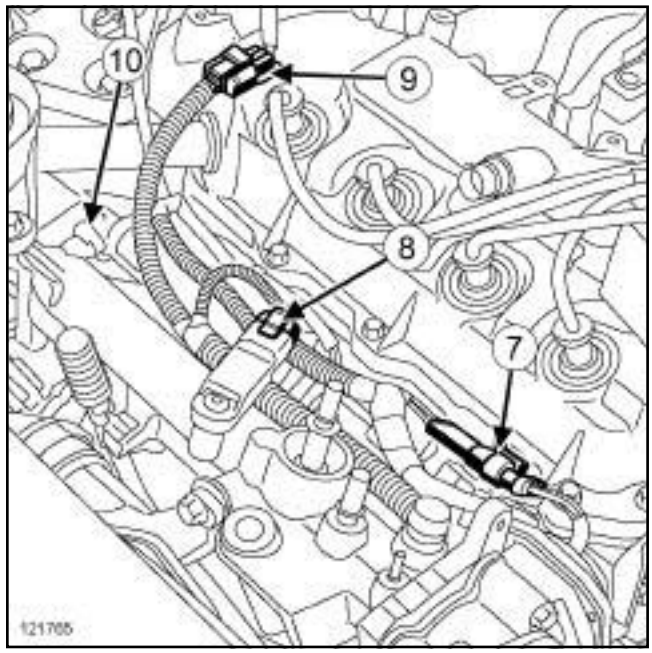
Note:

If the clip (**4**) is removed from the heat resistant protector, the latter must be replaced.

❏ Move aside the turbocharger air outlet pipe.

D4F, and 784

121763



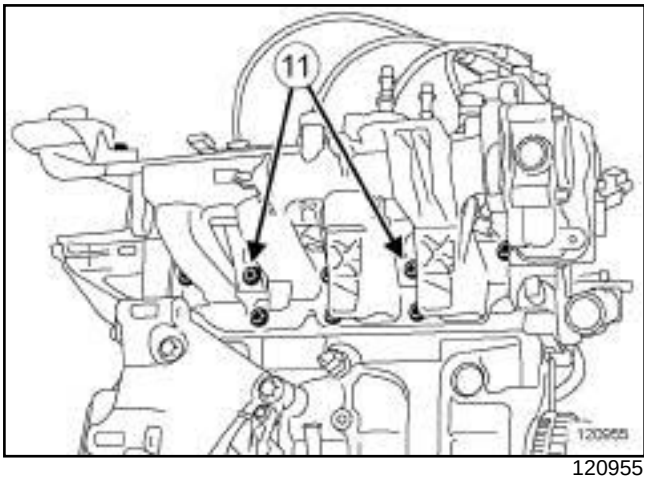
❏ Detach at (**5**) :

- the throttle valve wiring harness,
- the vacuum pipe.

❏ Remove the intercooler air outlet pipe bolts (**6**) .

❏ Move the intercooler outlet air pipe to one side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

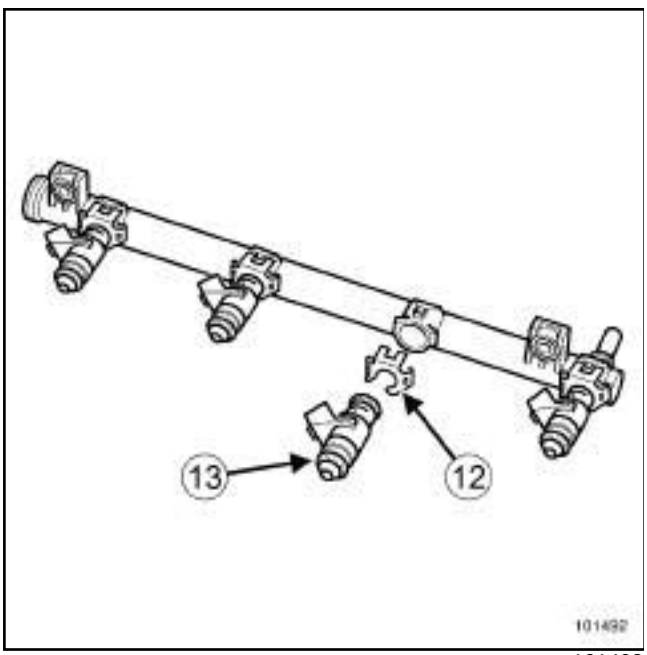


121765

❏ Disconnect:

- the wiring harness connector (**7**) from the injector rail,
- the turbocharger pressure sensor connector (**8**) ,
- the connector (**9**) from the oxygen sensor,
- the petrol inlet duct (**10**) from the injector rail.

D4F, and 784



120955

❏ Remove:

- the injector rail bolts (**11**) ,
- the « injector rail - injector » assembly by pulling it gently.

❏ Disconnect the wiring harness connectors on the injectors.

❏ Remove the wiring harness from the « injector rail - injector » assembly.

101492

❏ Remove:

- the clips (**12**) from the injectors,
- the injectors (**13**) .

REFITTING

I - REFITTING PREPARATIONS OPERATION

❏ Always replace:

- the injectors' O-rings,
- the injector clips,

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the injectors with new seals,
- the new injector clips,
- the injector rail - injector wiring harness.

❏ Connect the injector wiring harness connectors.

❏ Refit:

- the « injector rail - injector » assembly making sure the centring pins are correctly positioned on the intake distributor,
- the « injector rail - injector » assembly bolts.

❏ Torque tighten the **injector rail - injector bolts (4.5 Nm)**.

❏ Connect:

- the petrol inlet duct to the injector rail,
- the oxygen sensor connector,
- the turbocharger pressure sensor connector,
- the wiring harness connector to the injector rail.

III - FINAL OPERATION.

❏ Refit:

- the intercooler outlet air pipe,
- the intercooler air outlet pipe bolts.

❏ Clip:

- the vacuum pipe,
- the throttle valve wiring harness.

❏ Refit the turbocharger air outlet pipe on the turbocharger.

❏ Attach the turbocharger air outlet pipe to the turbocharger.

❏ Refit the turbocharger air outlet pipe bolt on the intake distributor.

❏ Refit the air filter box air inlet pipe.

D4F, and 784

- ❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).
- ❏ Refit the engine cover.

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

CHECK

❑

IMPORTANT

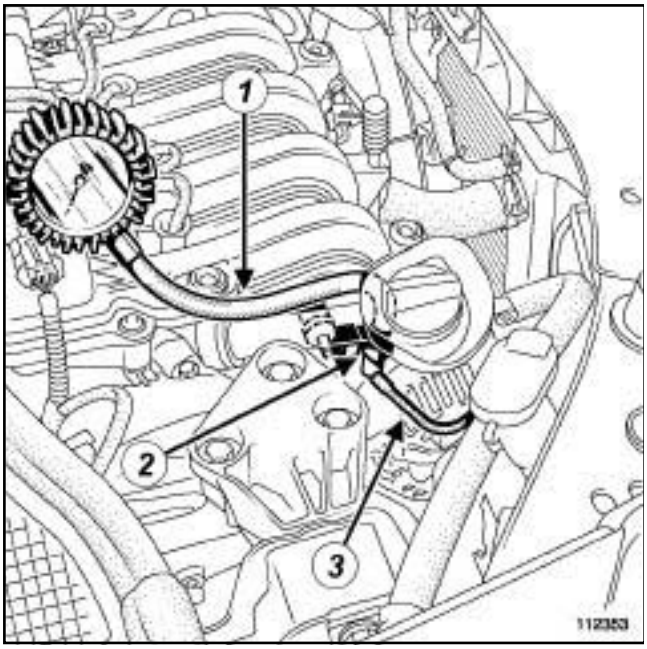
During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT



Wear latex gloves during the operation.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

K4J or K4M

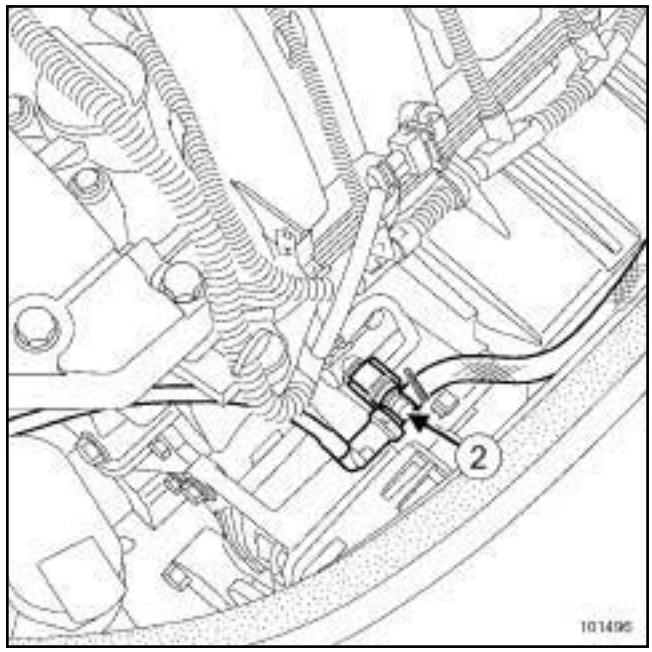
II - TEST OPERATION

K4M



101803

❏ Disconnect the fuel supply union from the injector rail.

❏ Connect:

- the pipe fitted with a test pressure gauge **(Mot. 1311-01)** with the « T » union **(Mot. 1311-08)** (**1**) ,
- the « T » union **(Mot. 1311-08)** to the injector rail,
- the injector rail fuel supply union to the « T » union **(Mot. 1311-08)**.

K4J

101496

❏ Disconnect the fuel supply union from the injector rail.

❏ Connect:

- the pipe fitted with a test pressure gauge **(Mot. 1311-01)** with the « T » union **(Mot. 1311-08)** (**2**) ,
- the « T » union **(Mot. 1311-08)** to the injector rail,
- the injector rail fuel supply union to the « T » union **(Mot. 1311-08)**.

❏ Start the engine.

❏ Record the pressure; this should be constant at **3.5 bar**.

Note:

It may take a few seconds to obtain a correct injector rail pressure reading.

❏ Switch off the engine.

III - FINAL OPERATION

❏ Disconnect the « T » union **(Mot. 1311-08)** from the injector rail.

❏ Separate the test tool **(Mot. 1311-01)** from the « T » union.

K4J or K4M

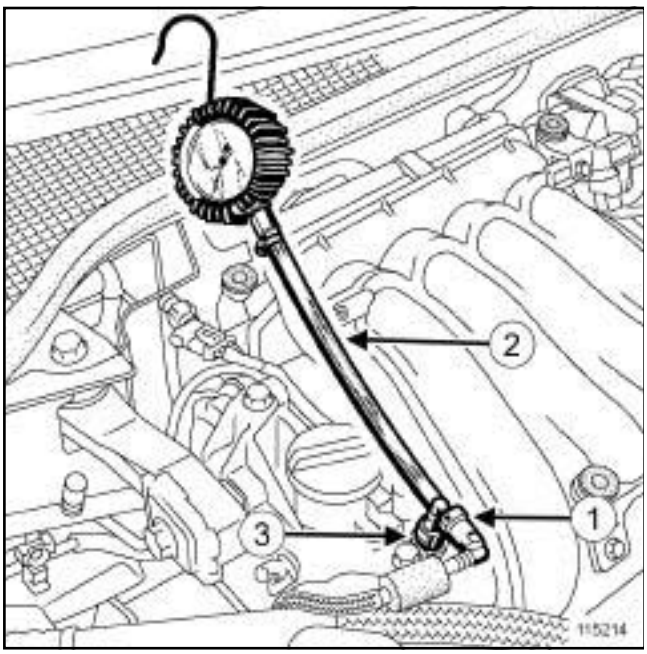
❑ Connect the fuel supply pipe union on the injector rail.

M4R

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

IMPORTANT

During this operation, it is essential to:



- refrain from smoking or bringing red hot objects near the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

IMPORTANT

Wear goggles with side protectors for this operation.

IMPORTANT

Wear gloves during this operation.

115214

❏ Disconnect fuel supply pipe union (**1**) on the injector rail.

❏ Connect:

- the pipe (**2**) attached to the trolley pressure gauge-with a « T » union (**3**) **(Mot. 1311-08)**,
- the « T » union to the injector rail,
- the injector rail fuel supply union to the « T » union.

❏ Note the fuel pressure.

- The fuel pressure must be constant (**3.5 bar ± 0.06**).
- It may take a few seconds to obtain a correct injector rail pressure reading.

F4R

Special tooling required	
Mot. 1311-01	Pressure gauges and petrol pressure measuring unions.
Mot. 1311-08	Union for taking fuel pressure measurements.

IMPORTANT

During this operation, be sure to:

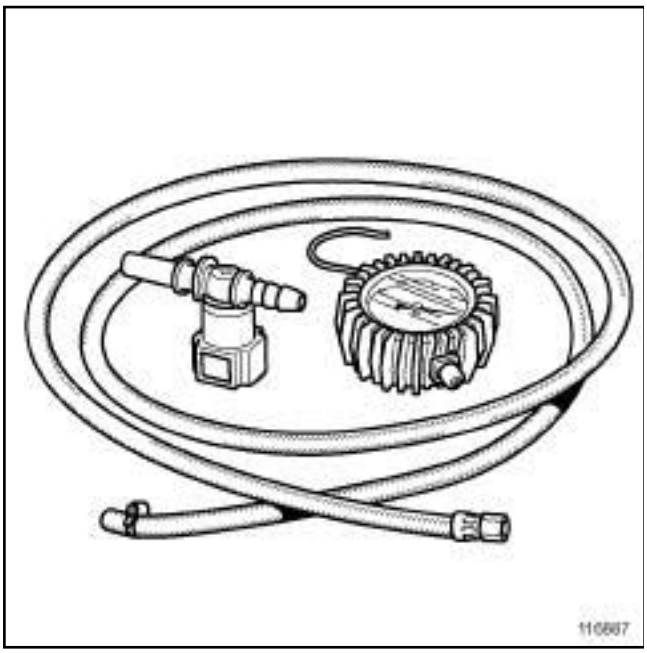
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.



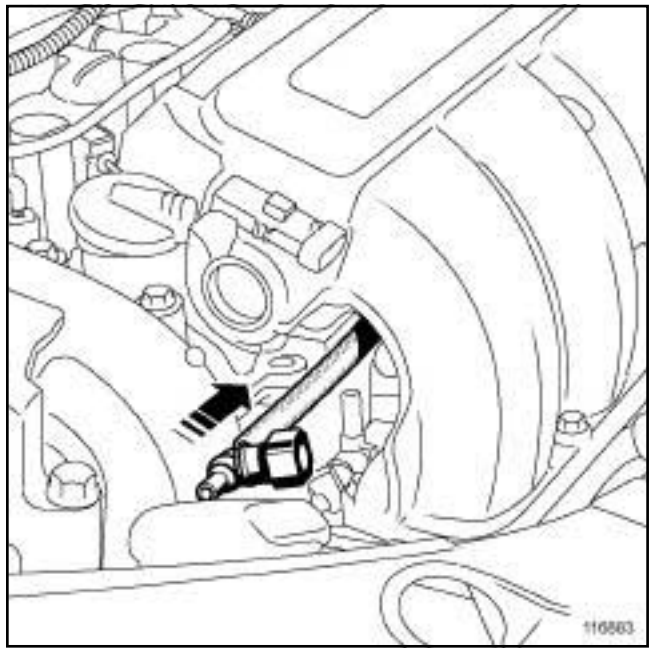
IMPORTANT

Wear gloves during this operation.

IMPORTANT

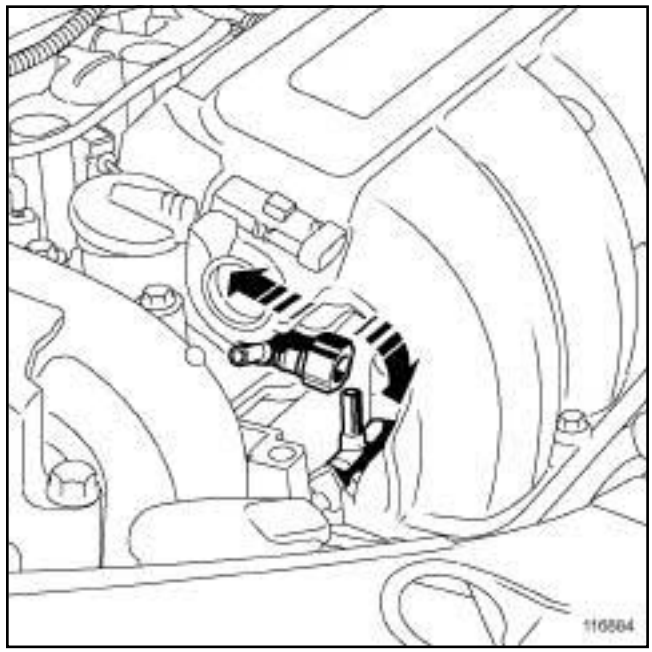
Wear goggles with side protectors for this operation.

I - REFITTING PREPARATION OPERATION BEFORE CHECK



116887

❏ Use the **(Mot. 1311-01)** and the **(Mot. 1311-08)**.



❏ Assemble the long flexible pipe of the **(Mot. 1311-01)** and the **(Mot. 1311-08)**.

❏ Disconnect the fuel supply union on the injector rail.

116883

❏ Pass the flexible pipe of the **(Mot. 1311-01)** fitted with the **(Mot. 1311-08)** under the inlet manifold.

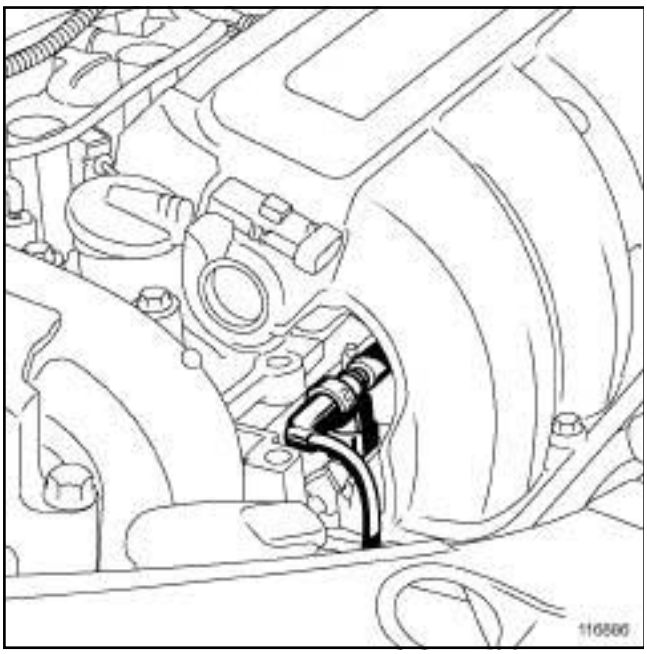
116884

❏ Connect:

- the **(Mot. 1311-08)** onto the injector rail positioning it between the rocker cover and the inlet manifold then pivoting it,
- the fuel supply union on the **(Mot. 1311-08)**,
- the fuel pressure gauge on the flexible pipe.

F4R

II - FUEL PRESSURE CHECK



❏ Switch on the ignition.

❏ Measure the fuel pressure.

❏ The value should be **3.5 bar ±0.2**.

> Note:
>
> It may take a few minutes to obtain the correct pressure value.

III - FINAL OPERATION

116886

❏ Disconnect the fuel supply union on the **(Mot. 1311-08)**.

❏ Disconnect:

- the **(Mot. 1311-08)** from the injector rail,
- the fuel pressure gauge on the flexible pipe.

❏ Remove the flexible pipe of the **(Mot. 1311-01)** fitted with the **(Mot. 1311-08)**.

❏ Separate the **(Mot. 1311-01)** from **(Mot. 1311-08)**.

❏ Connect the fuel supply union on the injector rail.

D4F or K4J or K4M or M4R

Special tooling required	
Mot. 1311-08	Union for taking fuel pressure measurements.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

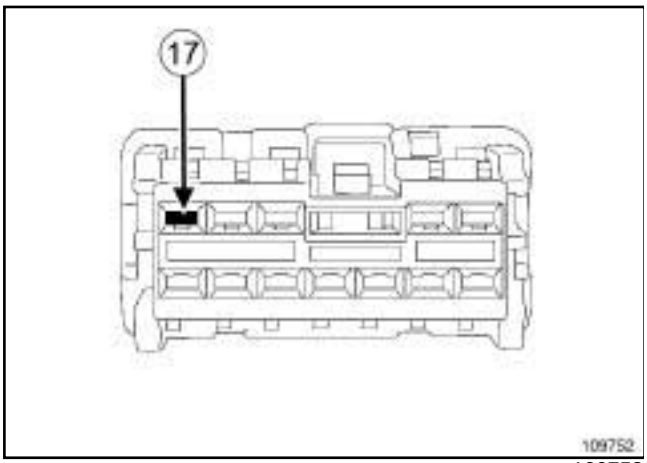
❏ Fit a « T » union **(Mot. 1311-08)** (**14**) .

❏ Fit to the « T » union outlet **(Mot. 1311-08)**, a pipe (**15**) which is long enough to drain the pump into a container.

❏ Insert the pipe into a graduated measuring cylinder (**2000 ml**).



❏ Remove the Protection and Switching Unit cover.

D4F or K4J or K4M or M4R

108446

❏ Remove the brown 12-track connector (**16**) .

109752

❏ Connect the terminal (**17**) of the brown connector to a + battery supply to operate the fuel pump.

Note:

The flow reading should be **80 to 120 l/h**.

❏ Removal the terminal (**17**) of the brown connector from the + battery supply.

❏ Refit the Protection and Switching Unit cover.

❏ Disconnect:

- the petrol inlet duct on the « T » union **(Mot. 1311-08)**,
- the « T » union **(Mot. 1311-08)** on the rail,
- the discharge pipe.

❏ Connect the fuel inlet pipe on the injector rail.

F4R

Special tooling required	
Mot. 1311-01	Pressure gauges and petrol pressure measuring unions.
Mot. 1311-08	Union for taking fuel pressure measurements.

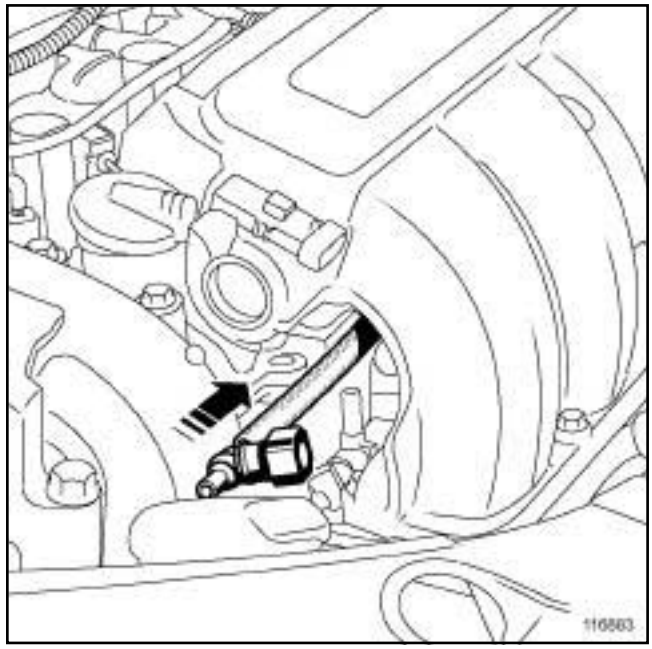
IMPORTANT
This procedure must be carried out with the ignition off.

IMPORTANT

During this operation, be sure to:

- refrain from smoking or bringing red hot objects close to the working area,
- beware of fuel splashes when disconnecting the union,
- protect sensitive areas from fuel outflow.

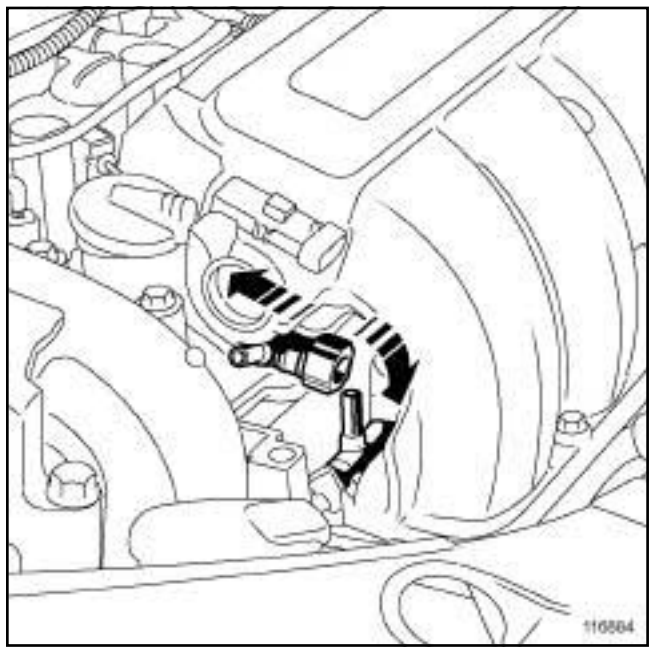
IMPORTANT
Wear gloves during this operation.



IMPORTANT
Wear goggles with side protectors for this operation.

I - REFITTING PREPARATION OPERATION BEFORE CHECK

❏ Use the **(Mot. 1311-01)** and the **(Mot. 1311-08)**.



❏ Assemble the long flexible pipe of the **(Mot. 1311-01)** and the **(Mot. 1311-08)**.

❏ Disconnect the fuel supply union on the injector rail.

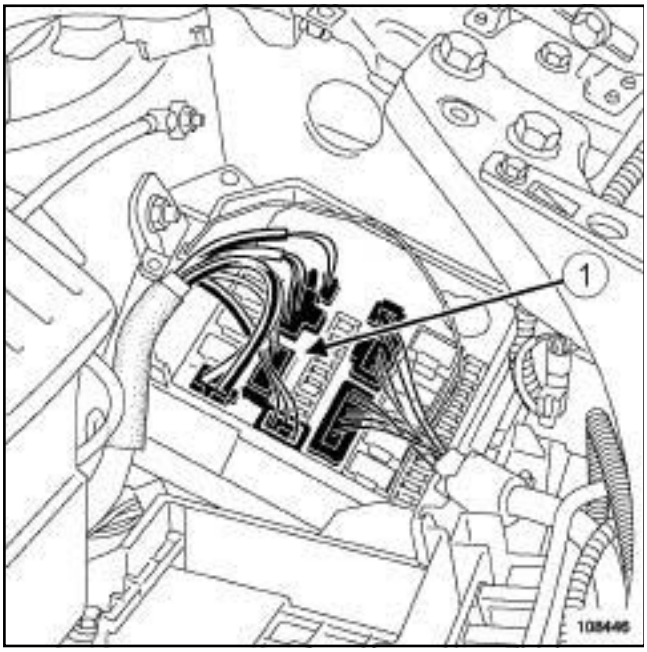
116883

❏ Pass the flexible pipe of the **(Mot. 1311-01)** fitted with the **(Mot. 1311-08)** under the inlet manifold.

116884

❏ Connect:

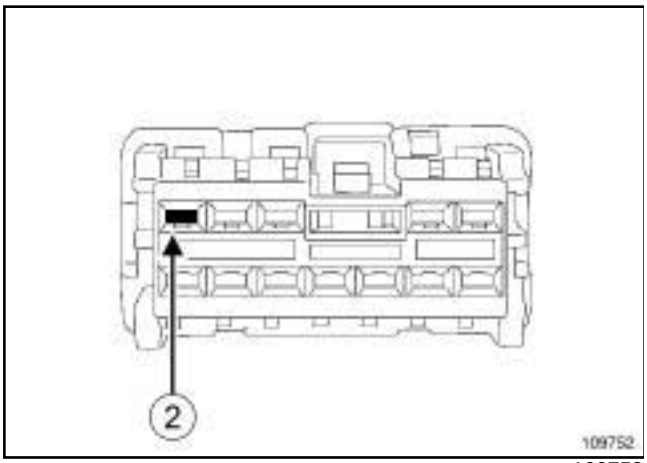
- the **(Mot. 1311-08)** onto the injector rail positioning it between the rocker cover and the inlet manifold then pivoting it,
- the fuel supply union on the **(Mot. 1311-08)**.



II - FUEL FLOW CHECK

❏ Insert the flexible pipe in a graduated measuring cylinder (**2000 ml**).

F4R



❏ Remove:

- the soundproofing unit,
- the UPC cover.

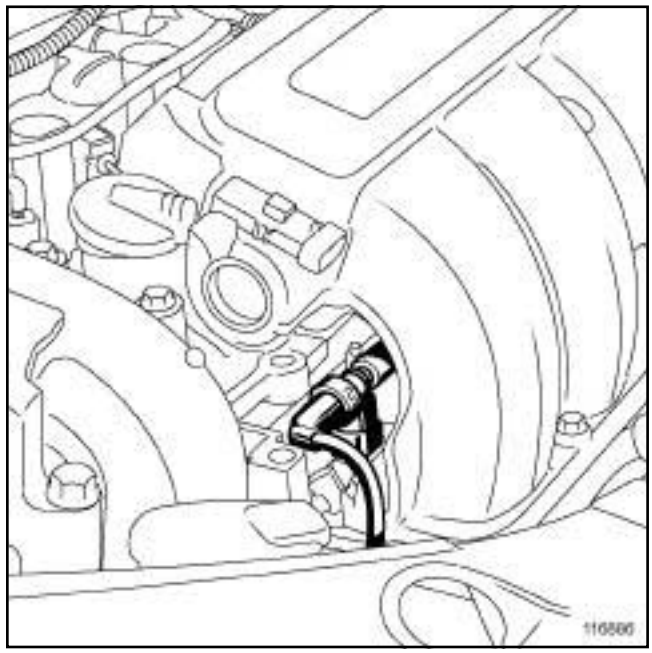
108446

❏ Disconnect the brown 12-track connector (**1**) .

109752

❏ Connect terminal (**2**) of the brown connector to a + battery supply to operate the fuel pump.

Note:



The flow reading should be **80 to 120 l/h**.

❏ Remove the + battery feed brown connector terminal .

III - FINAL OPERATION

❏ Refit:

- the UPC unit cover,
- the soundproofing unit.

116886

❏ Disconnect the fuel supply union on the **(Mot. 1311-08)**.

❏ Disconnect:

- the fuel supply union of the **(Mot. 1311-08)**,
- the **(Mot. 1311-08)** from the injector rail.

❏ Remove the flexible pipe of the **(Mot. 1311-01)** fitted with the **(Mot. 1311-08)**.

❏ Separate the **(Mot. 1311-01)** from **(Mot. 1311-08)**.

❏ Connect the fuel supply union on the injector rail.

K9K

I - RISKS RELATING TO CONTAMINATION

The high-pressure direct injection system is highly sensitive to contamination. The risks caused by contamination are:

- damage to or destruction of the high pressure injection system,
- a component seizing,
- a component not being properly sealed.

All After-Sales operations must be performed under very clean conditions. Having carried out an operation in good conditions means that no impurities (particles a few microns in size) have penetrated the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?

- metal or plastic swarf,
- paint,
- fibres:
  - cardboard,
  - brushes,
  - paper,
  - clothing,
  - cloth,
- foreign bodies such as hair,
- ambient air,
- etc.

WARNING
Do not clean the engine with a high pressure cleaner to prevent damaging the connections.

1 - Cleaning cloths

Use lint-free cleaning cloths (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

It is prohibited to use cloths or ordinary paper towels: these produce lint and lose fibres, which then contaminate the fuel circuit.

Each cloth must only be used once.

2 - Blanking plugs

The blanking plugs are used to cap the fuel circuit once it is opened and to therefore prevent contaminants from entering.

A set of blanking plugs should be used once only and used plugs must be discarded after use: once used, the plugs are soiled and cleaning them is not sufficient to make them reusable.

Unused plugs must also be discarded and must not be used when carrying out work on an injection system.

Part number for set of blanking plugs: (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

Note:
There is no specific set of blanking plugs for S9U and S9W engines. In order to comply with the cleanliness recommendations, use plugs that are compatible with the blanking plug sets for F9Q, G9U, G9T or ZD3 engines.

3 - Protective bags

Use hermetically-resealable plastic bags, using adhesive tape, for example, to store components which will be refitted and reused. Stored parts will therefore be less subject to the risk of contamination.

These are single-use bags: after use they must be discarded.

4 - Cleaning products

Two cleaning products can be used:

- an injector cleaner (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products),
- an aerosol spray brake cleaner (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products).

To use the injector cleaner, be sure to have a clean brush in good condition (the brush must not lose any bristles) as well as a clean container which has no impurities in it.

Note:
Use a new injector cleaner each time work is carried out (a used cleaning agent will contain impurities).

K9K

II - ADVICE TO BE FOLLOWED BEFORE ANY OPERATION

1) Carry out the work in a clean working area and take care to protect removed components from dust using plastic bags which are hermetically-resealable, for example.

2) Always order the following from the Parts Department before carrying out work:

- **a new set of blanking plugs**, specific to the engine,
- enough lint-free **cleaning cloths**.
- one of the two **cleaning products** for fuel pipe unions,
- **the parts that are always to be replaced** after each removal operation, mentioned in the operational procedures specific to the vehicle (see related Workshop Repair Manual).

3) Wear safety goggles fitted with side shields to prevent the cleaning product from splashing the eyes.

4) Wear leaktight protective gloves (Nitrile type) to avoid prolonged contact with the skin.

Note:

When using leather protective gloves, wear a pair of leaktight protective gloves (Nitrile type) over the top.

5) Before carrying out work on the injection system, use plastic bags or clean rags, for example, to protect:

- the accessories and timing belts,
- the electrical accessories (starter, alternator, power-assisted steering pump, sensors and electrical connectors),
- the flywheel face.

III - INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

Wash your hands before and while carrying out the work.

Replace leaktight protective gloves (Nitrile type) when they are soiled or damaged.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been capped.

Reseal the bag hermetically, for example using adhesive tape, even if the bag must be opened shortly afterwards: ambient air can be a source of impurities.

After opening the fuel circuit, the use of brushes, cleaning agents, air blow guns, rifle-type brushes or standard cloths is strictly prohibited: these items are likely to allow impurities to enter the system.

When replacing a component with a new one or when refitting it after storing it in a plastic bag, do not unpack it until it is time to fit it on the vehicle.

IV - CLEANING

There are currently two procedures for cleaning the fuel circuit before opening it in order to carry out work in the workshop.

These procedures enable the fuel circuit to be cleaned to prevent contamination from entering: they both have the same end result and neither is preferred over the other.

1 - Cleaning using injector cleaner

Clear the access to the unions that need opening, following the work procedures specific to the vehicle (see the relevant Workshop Repair Manual).

Protect sections which are sensitive to fuel leaks.

Pour the injector cleaning agent into a container which is free from impurities.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

Dip a clean brush, which is not shedding bristles, into the container of injector cleaning agent.

IMPORTANT

Wear goggles with side protectors for this operation.

Clean the unions carefully using the brush and the injector cleaning agent.

Blast the components that have been cleaned with compressed air (tools, workbench, and also parts, unions and around the injection system). Check that no bristles from the brush have come away and that the area is clean.

Wipe the sections that were cleaned with fresh cleaning cloths.

Open the circuit at the unions and immediately fit the relevant blanking plugs.

WARNING

To prevent impurities from entering, once the fuel circuit is opened, it must not be blasted with compressed air. Use cleaning cloths only, if necessary.

2 - Using the brake cleaner

Clear the access to the unions that need opening, following the work procedures specific to the vehicle (see the relevant Workshop Repair Manual).

Protect sections which are sensitive to fuel leaks.

IMPORTANT

Wear leaktight gloves (Nitrile type) for this operation.

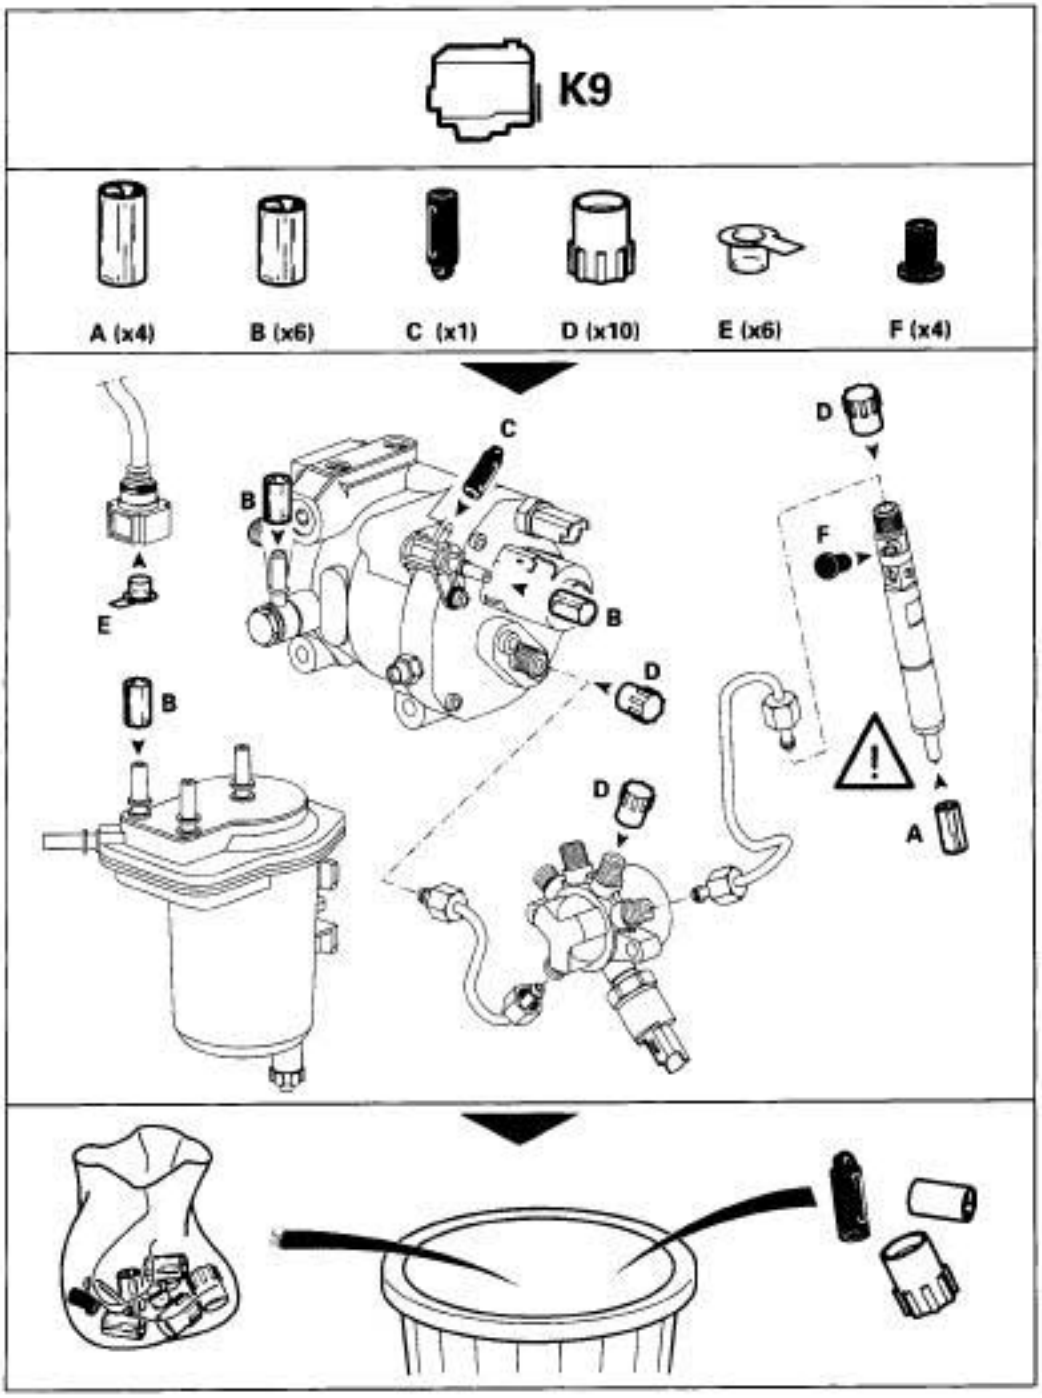
IMPORTANT

Wear goggles with side protectors for this operation.

Spray the brake cleaner onto the unions to be opened.

Clean the unions carefully using fresh cleaning cloths.

Blast the components that have been cleaned with compressed air (tools, workbench, and also parts, unions and around the injection system). Check that no bristles from the brush have come away and that the area is clean.



Open the circuit at the unions and immediately fit the relevant blanking plugs.

WARNING

To prevent impurities from entering, once the fuel circuit is opened, it must not be blasted with compressed air. Use cleaning cloths only, if necessary.

K9K

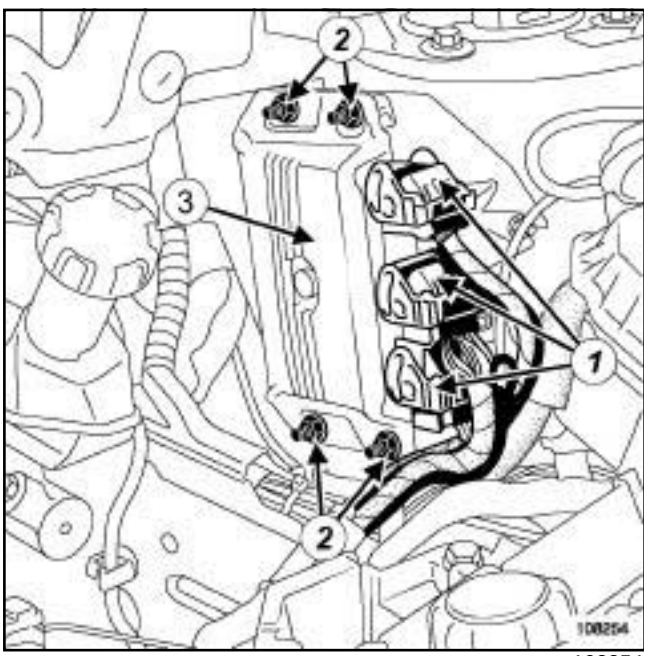
Tightening torques ▽	
injection computer mounting bolts	**10 Nm**



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the battery heat shield,
- the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

II - REMOVAL OF PART CONCERNED

108254

❏ Disconnect the three connectors (**1**) from the injection computer.

❏ Remove:

- the injection computer mounting bolts (**2**) ,
- the injection computer (**3**) .

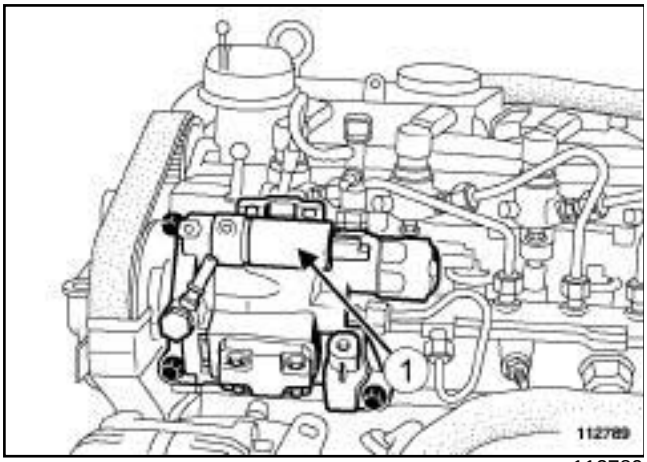
REFITTING

I - REFITTING PART CONCERNED

❏ Refit the injection computer.

❏ Torque tighten the **injection computer mounting bolts (10 Nm)**.

II - FINAL OPERATION.

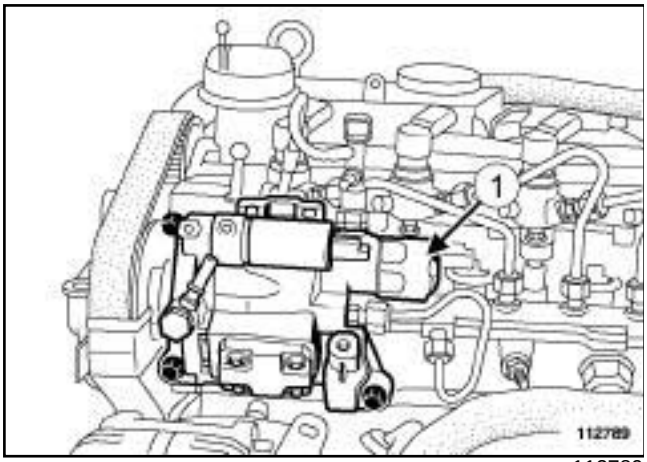


❏ Connect the injection computer connectors.

❏ Refit the air filter box (see **12A**, **Fuel mixture**, **Air filter unit: Removal - Refitting**, page **12A-17**) .

❏ Refit the battery heat shield,

❏ Refit the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



K9K, and 764 or 772

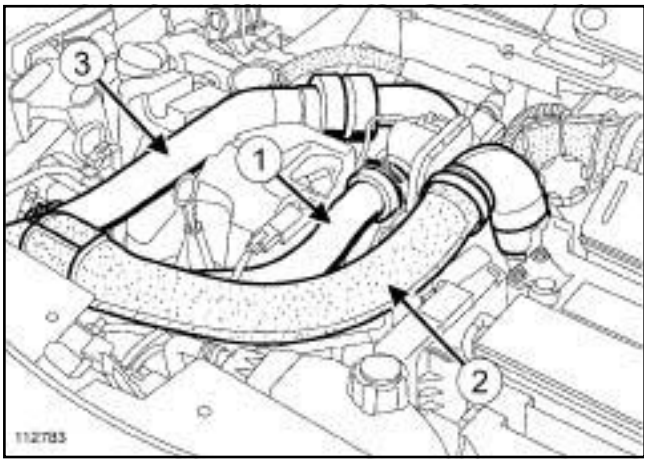
112789

- The flow regulation solenoid valve (**1**) is integral with the high pressure pump.
- Replace the « high pressure pump - flow regulation solenoid valve » assembly in the event of a fault in the flow regulation solenoid valve (see **13B**, **Diesel injection**, **High pressure pump: Removal - Refitting**, page **13B-23**) .

K9K, and 764 or 772

112789

❏ The pressure regulation solenoid valve (**1**) is integral with the high pressure pump.



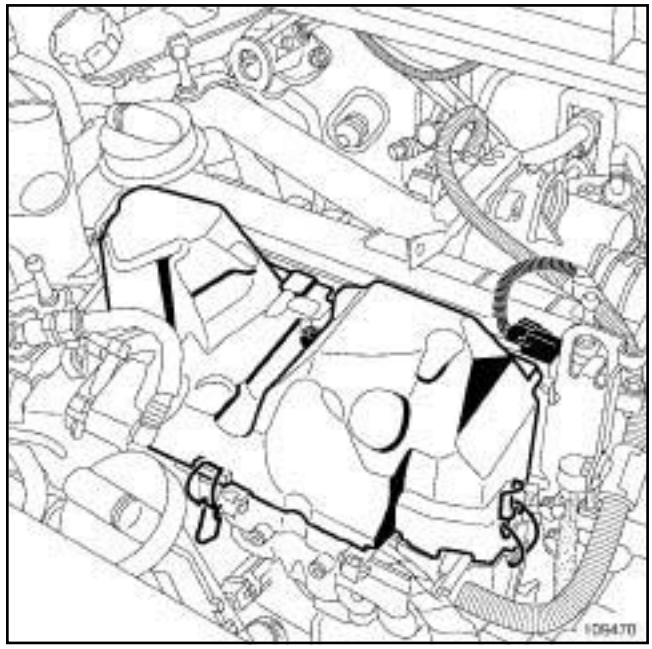
❏ Replace the « high pressure pump - pressure solenoid valve » assembly in the event of a fault in the pressure regulation solenoid valve (see **13B**, **Diesel injection**, **High pressure pump: Removal - Refitting**, page **13B-23**) .

K9K, and 764 or 772

Special tooling required	
Mot. 1771	Kit for measuring SIEMENS injector leakage flow rate.

Tightening torques ▽	
nut mounting the intercooler air inlet pipe on the alternator	**8 Nm**

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



112783

❏ Disconnect the inlet pressure sensor (**1**) .

❏ Remove:

- the air duct (**2**) between the air filter and the intercooler,
- the air duct (**3**) between the intercooler and the turbocharger.

109470

❏ Unclip the diesel anti-splash shield.

❏ Remove:

- the mounting bolt of the injector rail protector cover,
- the rail protector cover.

❏ Disconnect the fuel return pipe from the high-pressure pump.

❏ Place the correct blanking plug on the connector of the high-pressure pump fuel return pipe.

❏ Connect the offset union with a diameter of **8 mm** with its hose and contained in the **(Mot. 1771)** to the high pressure pump fuel return union.

❏ Insert this pipe into the graduated measuring cylinder.

❏ Refit the air duct between the air filter unit and the intercooler.

❏ Loosen the mounting nut of the pipe at the intercooler inlet on the alternator.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ Connect:

- the inlet pressure sensor,

K9K, and 764 or 772

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Follow the procedures described in the fault finding repair manual (see **MR 394 Fault finding, 13B, Diesel injection, Fault finding - Tests**) :

- TEST 2: Check internal fuel transfer pump (ITP)

IMPORTANT

Do not leave any object (tools or other) on the side of the engine housing during the entire operation.

Position the tools so that they do not fall during the « engine running » phase of the test.

K9K, and 764 or 772

Special tooling required	
Mot. 855	Tool for locking the timing wheels.
Mot. 1768	Injection pump pulley extraction claws.
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Tightening torques ▽	
high pressure pump pulley	**55 N.m**
high pressure pump mounting bolts	**21 N.m**
high pressure pipe nuts	**24 N.m**
nut mounting the intercooler air inlet pipe on the alternator	**8 N.m**

WARNING

Before starting work on the vehicle, obtain:

- a new plug kit (**PART NO. 77 01 476 857**),
- cleaning cloths (**PART NO. 77 11 211 707**),
- cleaning product (**PART NO. 77 11 224 188**).

WARNING

Parts always to be replaced:

- the high pressure pipe between the injector rail and the high pressure pump.

REMOVAL

I - REMOVAL PREPARATION OPERATION

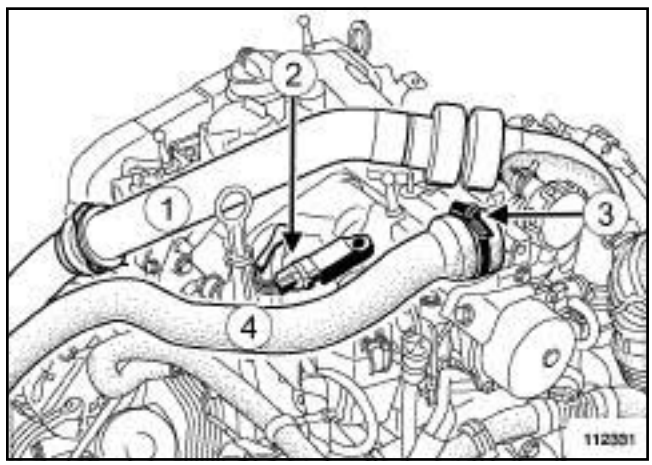
❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑

IMPORTANT

Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the rail is not under pressure,
- that the fuel temperature is not too high.



It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

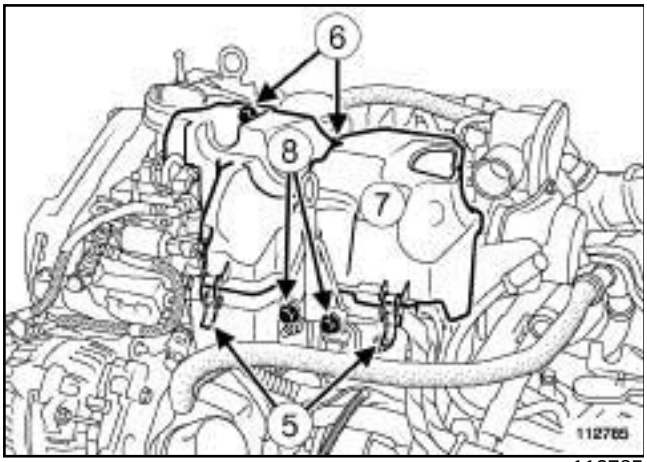
Working on the circuit with the engine running is strictly forbidden.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove:

- the engine protector,
- the engine undertray,
- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) .

112331



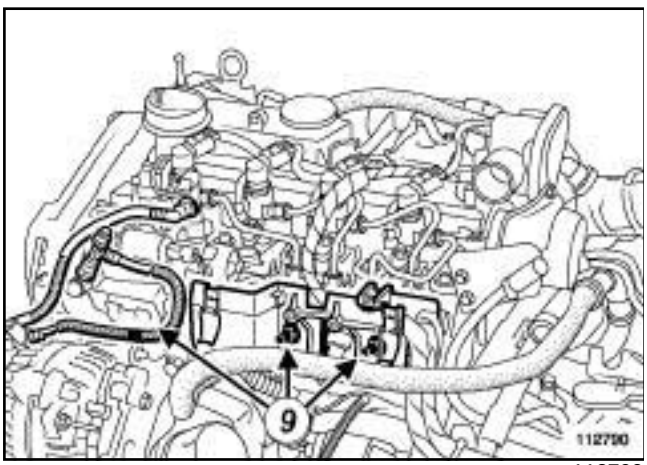
❑ Remove the upper part of the turbocharging duct (**1**) .

❑ Disconnect the inlet air pressure sensor (**2**)

❑ Loosen the clip (**3**) .

❑ Move the inlet duct to one side (**4**) .

K9K, and 764 or 772



112785

❏ Unclip the clips (**5**) from the injector rail protector cover.

❏ Remove:

- the injector rail protector cover mounting bolts (**6**) ,
- the injector rail protector cover (**7**) ,
- the dipstick,
- the dipstick tube mounting bolts (**8**) .

❏ Move the dipstick duct to one side.

112790

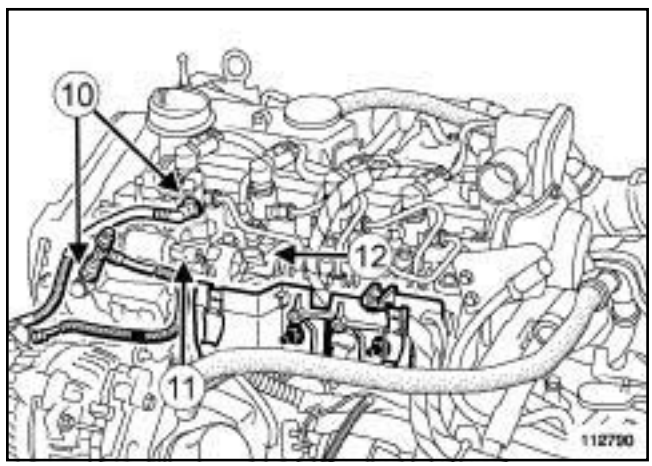
❏ Remove:

- the injector rail protector mounting bolts (**9**) ,
- the injector rail protector.

❏ Protect the alternator from fuel outflow.

❏ Pour cleaning product into a clean container.

IMPORTANT
Wear protective glasses when using cleaning product.



❏ Soak a brush with cleaning product, then clean the unions:

- of the fuel supply pipe fuel on the high pressure pump,
- on the high pressure pump fuel return pipe, taking care not to soak the diesel fuel temperature sensor,
- on the high-pressure pipe and the injector rail.

❏ Blow compressed air into the cleaned areas, then wipe them with new wipes.

IMPORTANT
Wear protective glasses.

WARNING
To prevent impurities from entering, once the fuel circuit is opened, it must not be blasted with compressed air. Use wipes if necessary.

112790

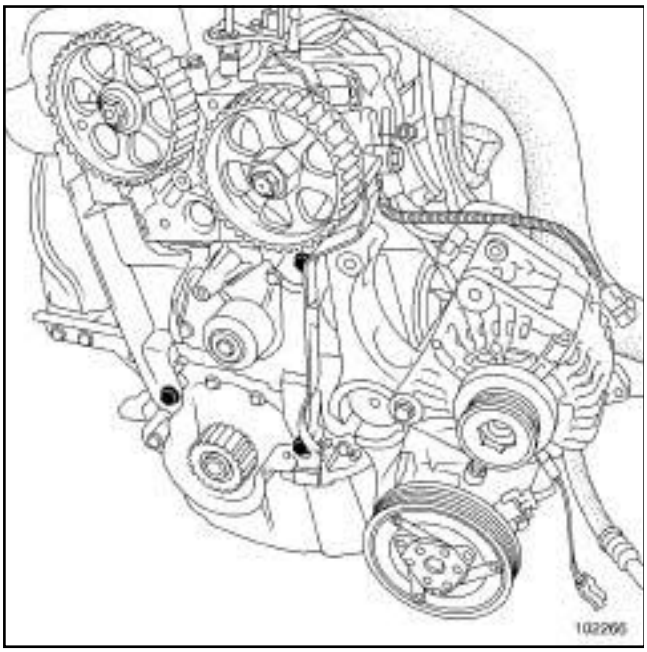
❏ Disconnect the high pressure pump from:

- the diesel fuel supply and return pipes (**10**) ,
- the fuel pressure regulating valve connector (**11**) ,
- the fuel flow regulating valve connector (**12**) .

Note:
Make preparations for fuel outflow. Clean with new cloths.

K9K, and 764 or 772

❑ Remove the high-pressure pipe between the high-pressure pump and the injector rail and discard it.



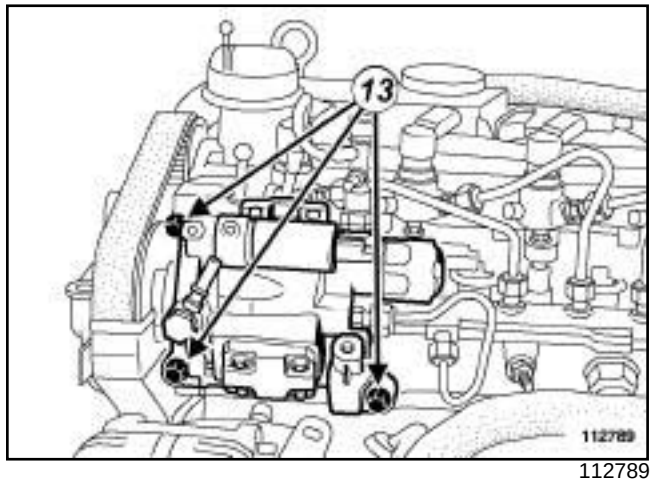
> Note:
>
> Hold the intermediate nut between the pump-rail pipe and the high pressure pump using a lock wrench.

❑ Insert the blanking plugs.

❑ Remove the lower mounting bolt from the alternator.

❑ Undo the alternator's upper mounting bolt.

❑ Tip the alternator towards the front of the vehicle.



102266

❑ Remove:

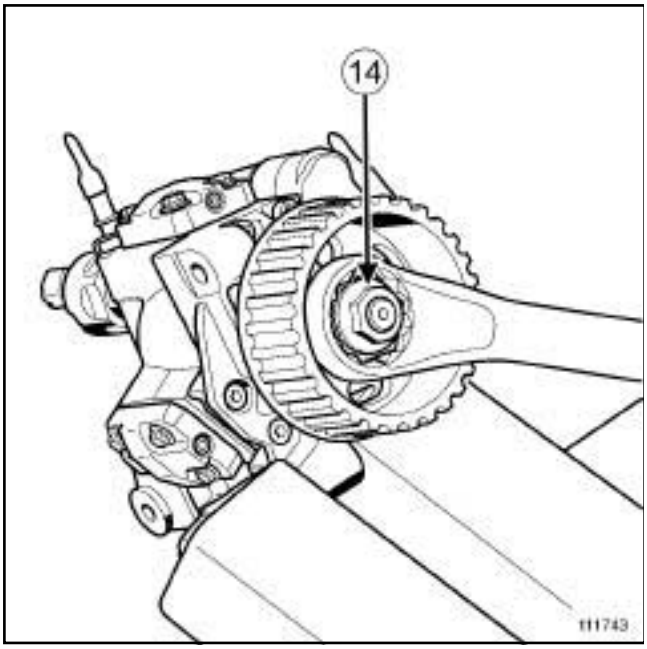
- the inner timing cover mounting bolts,
- the inner timing cover.

II - REMOVAL OF PART CONCERNED

112789

❑ Remove:

- the high-pressure pump mounting bolts (**13**) ,
- the high pressure pump.



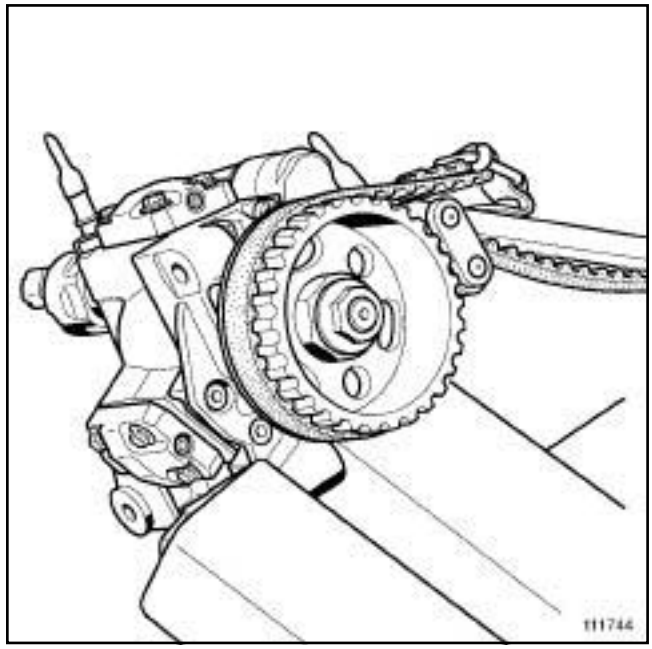
> **WARNING**
>
> If the high-pressure pump is to be reused, keep it in a sealed plastic bag all the time it is disconnected.

Remove the high pressure pump pulley

❑

> **WARNING**
>
> If the high-pressure pump is being replaced, take the high-pressure pump pulley and refit it to the new pump.

K9K, and 764 or 772



111743

❑ Hold the high pressure pump in a vice, using the lower securing point on the pulley side.

WARNING

Fix jaw covers onto the vice to protect the high-pressure pump.

❑ Hold the high pressure pump pulley with a **32 mm offset wrench** then remove the mounting nut (**14**) from the pulley.

111744

❑

Note:

The high pressure pump pulley can also be held with a **(Mot. 855)**.

❑ Fit the tool **(Mot. 1768)**, as well as the tool **Mot. 1525** without the spacer at the end of threaded rod, on the high pressure pump pulley, then extract the pulley.

WARNING

Take care not to mark the high-pressure pump when removing it.

A damaged high pressure pump pulley must always be replaced.

REFITTING

I - REMOVAL PREPARATION OPERATION

❑

WARNING

- Remove the blanking plugs only before reconnecting the fuel circuit pipes.
- The plugs are single-use. Do not reuse them and throw away the complete kit after opening.

K9K, and 764 or 772

Refitting the high pressure pump pulley

❑ Remove the injector rail from its plastic bag.

> **WARNING**
> If a high pressure pump is being replaced, only remove the new one from its original packaging when it is about to be fitted.

❑ Finger tighten the high-pressure pump pulley mounting nut as far as possible.

❑ Hold the high-pressure pump pulley with the previously used tool.

❑ Torque tighten the **high pressure pump pulley (55 N.m)**.

II - REFITTING PART CONCERNED

❑ Remove the injector rail from its plastic bag.

> **WARNING**
> If a high pressure pump is being replaced, only remove the new one from its original packaging when it is about to be fitted.

❑ Position the high-pressure pump on the cylinder head.

❑ Finger tighten the high-pressure pump mounting bolts as far as possible.

❑ Torque tighten the **high pressure pump mounting bolts (21 N.m)**.

III - FINAL OPERATION

❑ Fit the new high pressure pipe between the injector rail and the high pressure pump.

> Note:
> If the new pipe kit does not contain an applicator, lubrication of the high-pressure nut threads will be unnecessary (as they are self-lubricating pipes).

❑ Hand-tighten the nut on the high-pressure pipe on the pump end, then the one on the rail end.

❑ Tighten to torque the **high pressure pipe nuts (24 N.m)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting with the high pressure pump end.

❑ Disconnect the high pressure pump from:

- the fuel supply and return pipes,
- the fuel pressure regulating valve connector,
- the fuel flow regulating valve connector,

❑ Refit:

- the timing belt (see **11A**, **Top and front of engine**, **Timing belt: Removal - Refitting**, page **11A-48**) ,
- loosen the nut mounting the intercooler air inlet pipe to the alternator.
- fit the air duct between the turbocharger and the intercooler air inlet pipe,
- lock the air duct onto the turbocharger and the intercooler air inlet pipe.
- tighten the air duct bolt on the rocker cover,
- torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 N.m)**,
- the engine undertray.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

High pressure pump: Removal - Refitting

K9K, and 750 or 752 or 760 or 762 or 766 or 768

Special tooling required	
Mot. 1453	Engine anchorage support with multiple adjustments and retaining straps.
Mot. 1430	Set of 5 crankshaft and camshaft pulley timing pins.
Mot. 1606	High pressure pump pulley support tool.
Mot. 1525-02	Adapter claws for Mot. 1525.
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.

Equipment required
Diagnostic tool

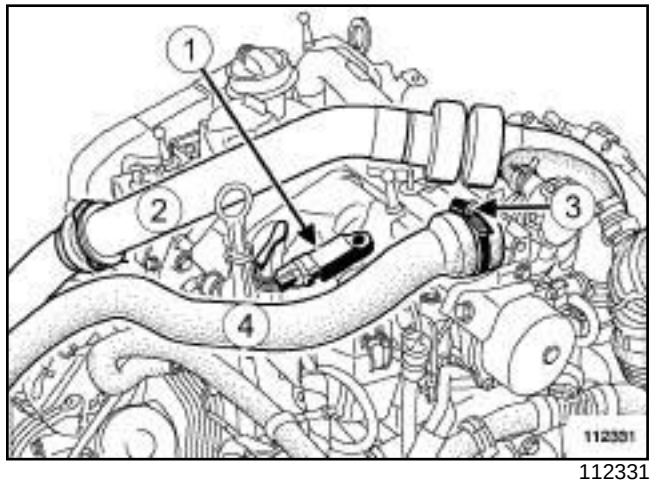
Tightening torques ▽	
high pressure pump bolts on the cylinder head	**23 N.m**
high pressure pump pulley nut	**55 N.m**
suspended mounting bolts on the cylinder head	**25 N.m**
camshaft position sensor bolt	**8 N.m**
right-hand suspended engine mounting bolts	**62 N.m**
engine tie-bar bolts	**105 N.m**
high pressure pipe unions between the pump and the yellow rail	**24 N.m**
high pressure pipe unions between the pump and the silver rail	**28 N.m**
high pressure pump protection bolts	**21 N.m**
dipstick guide tube nuts	**10 N.m**
exchanger inlet air pipe nut on the alternator	**8 N.m**

IMPORTANT
Consult the safety and cleanliness advice and operation recommendations before carrying out any repair (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

REMOVAL

I - PARTS AND CONSUMABLES FOR THE REPAIR

❑ Consumables: (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**)



- Cleaning cloths,

- Set of K9K blanking plugs (injection **DELPHI**).

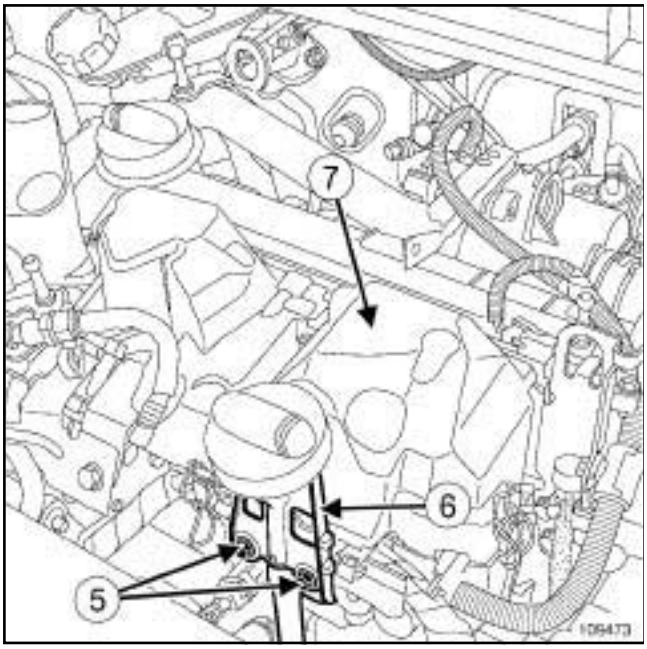
II - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

112331

❑ Disconnect the inlet air pressure sensor (**1**)



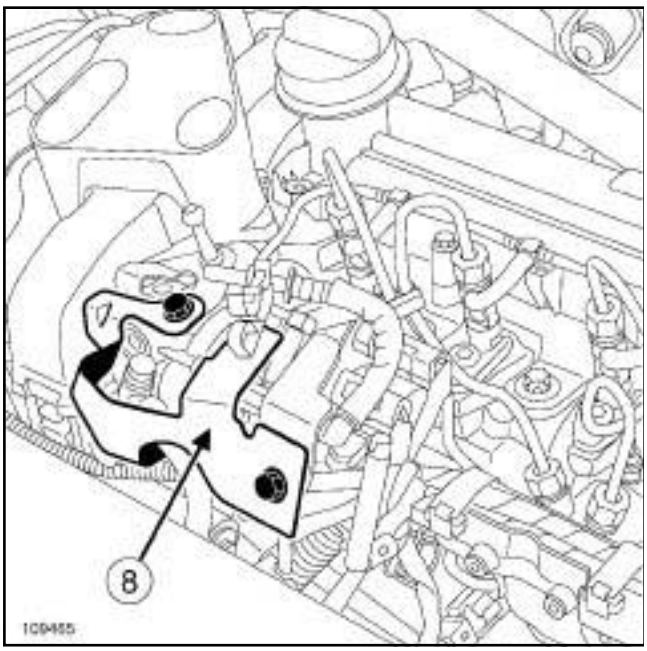
K9K, and 750 or 766 or 768

❑ Remove the turbocharger outlet air pipe (**2**) .

❑ Loosen the clip (**3**) on the intercooler outlet air pipe.

❑ Move the intercooler outlet air pipe to one side (**4**) .

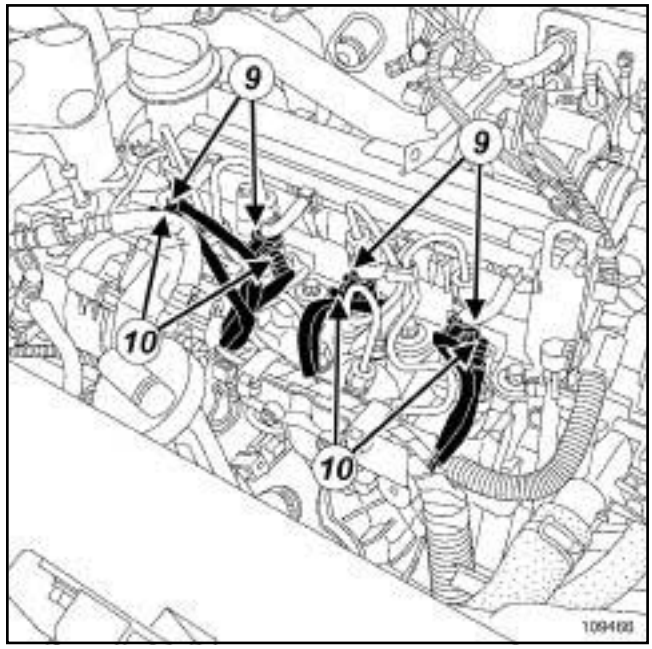
K9K, and 750 or 752 or 760 or 762 or 766 or 768



109473

❏ Remove the dipstick.

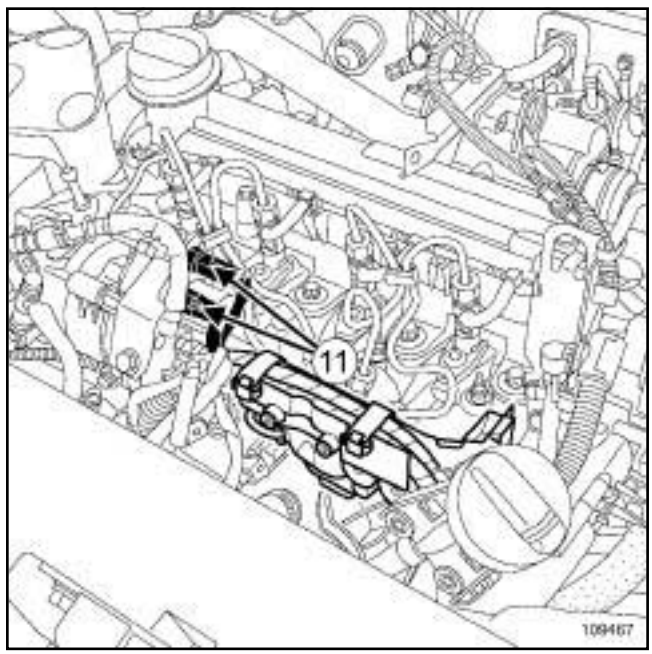
❏ Remove the engine oil dipstick guide bolts (**5**) .



❏ Put the engine oil dipstick guide (**6**) to one side.

❏ Remove the diesel fuel splash plate (**7**) .

109465

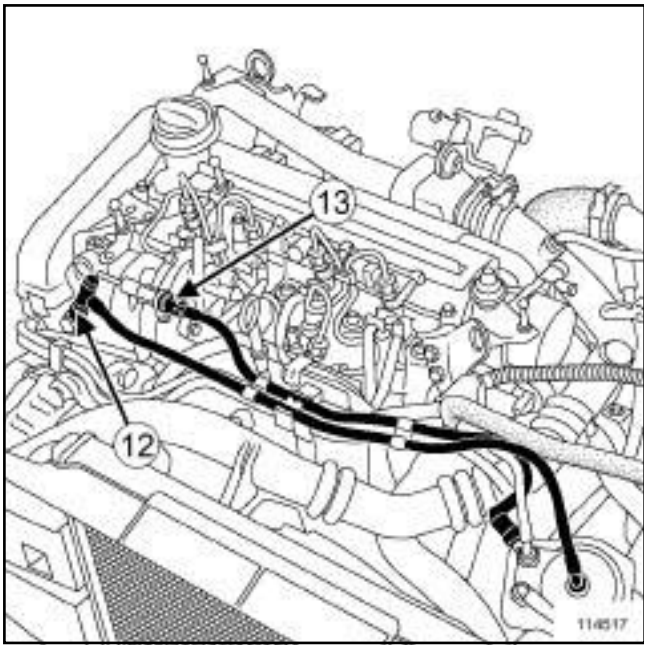


❏ Remove the high pressure pump protector (**8**) .

109466

❏ Disconnect:

- the heater plugs (**9**) ,
- the injectors (**10**) .



109467

❏ Disconnect the connectors on the high pressure pump (**11**) .

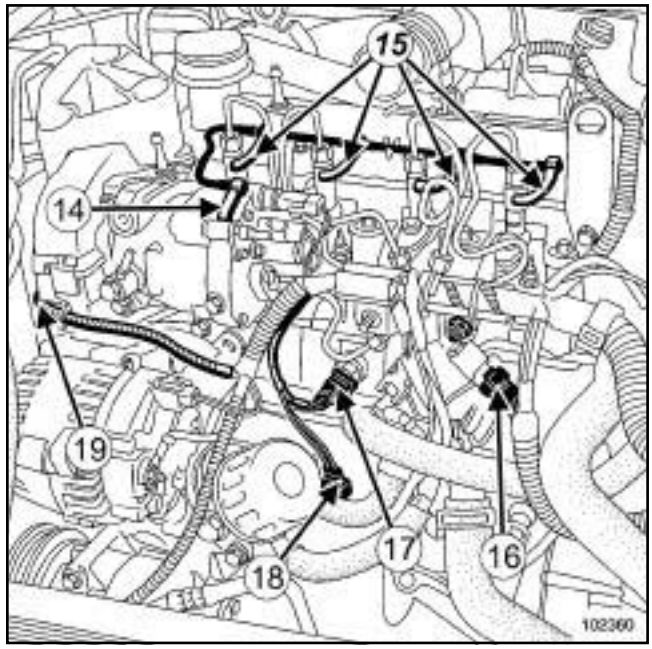
❏ Protect the alternator from fuel outflow.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

114517

❏ Clean the union (**12**) on the diesel supply pipe high pressure pump (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❏ Disconnect the high pressure pump from:



- the diesel supply pipe,
- the diesel return pipe (**13**) to the fuel filter.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

❏ Fit the appropriate blanking plugs on the high pressure pump and on the pipes.

❏ Disconnect the diesel supply and return pipes from the injection rail filler neck then move them away from the high pressure pump.

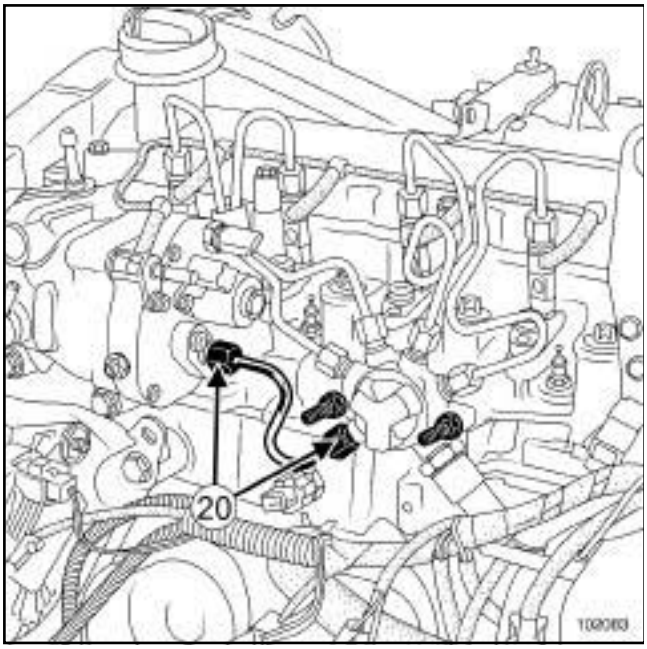
102360

❏ Disconnect:

- the diesel return pipe (**14**) on the venturi tube fitted to the high pressure pump,
- the diesel return pipes (**15**) on the diesel injectors,
- the rail pressure sensor connector (**16**) ,
- the accelerometer connector (**17**) ,
- the oil level sensor connector (**18**) ,
- the cylinder reference sensor (**19**) connector on the timing cover.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



❏ Fit suitable blanking plugs on:

- the Venturi,
- the diesel injectors.

❏ Unclip and move aside the electric wiring on the injection rail filler neck.

❏ Remove the filler neck on the injector rail.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

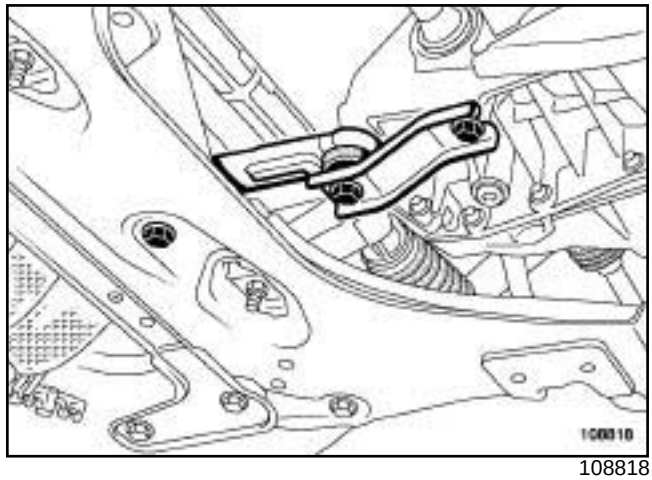
102083

❏ Clean the high pressure pipe unions (**20**) between the pump and the rail (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❏ Remove the high pressure pipe between the pump and the rail and discard it.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



❏ Fit suitable blanking plugs on:

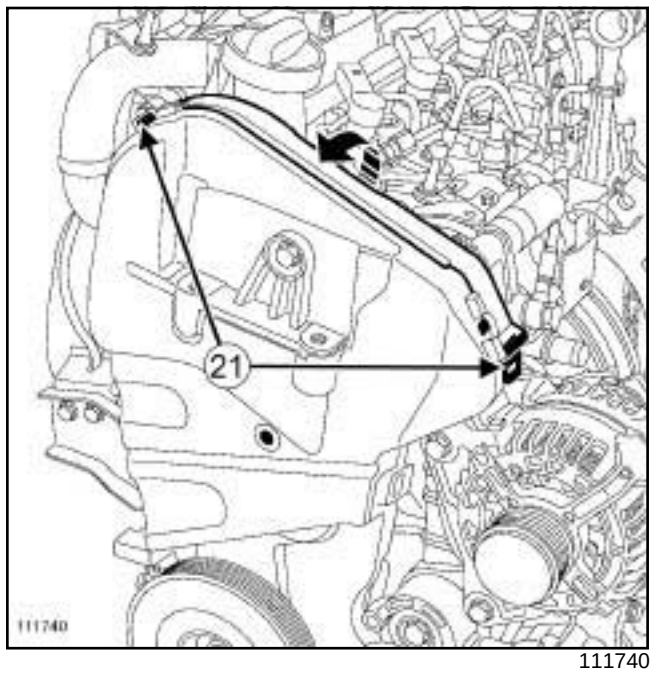
- the high pressure pump,
- the injector rail.

❏ Remove the right-hand suspended engine mounting (see **19D**, **Engine mounting**, **Right-hand suspended engine mounting: Removal - Refitting**, page **19D-22**) (19D, Engine mounting).

❏ Raise the vehicle.

❏ Remove the engine undertray.

108818



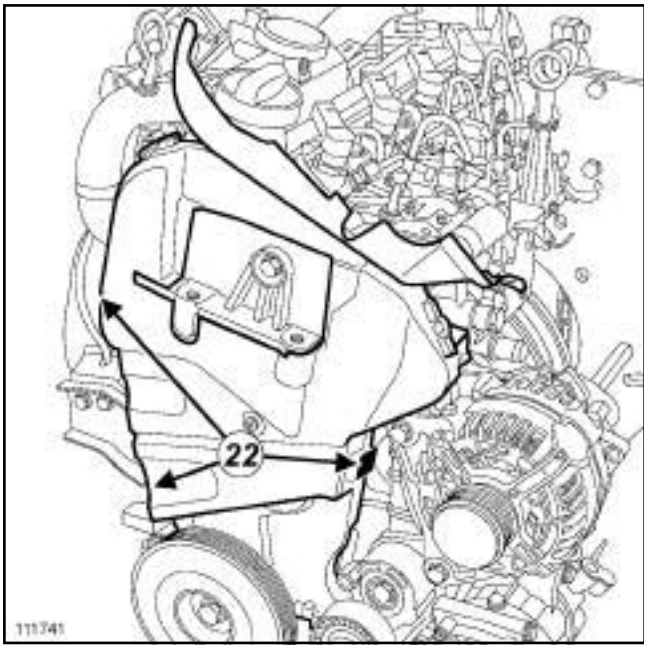
❏ Remove the engine tie-bar.

❏ Lower the vehicle.

❏ Lift the engine a few centimetres using the **(Mot. 1453)**.

Note:

Do not disconnect the right-hand driveshaft when raising the engine.

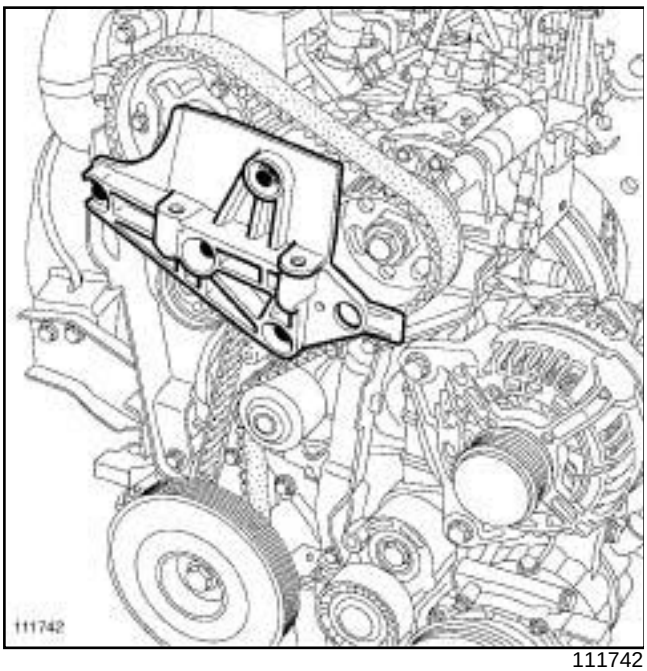


111740

❏ Unclip the upper timing cover tabs (**21**) .

❏ Swivel the timing cover in the direction of the arrow.

❏ Remove the plastic bolt.

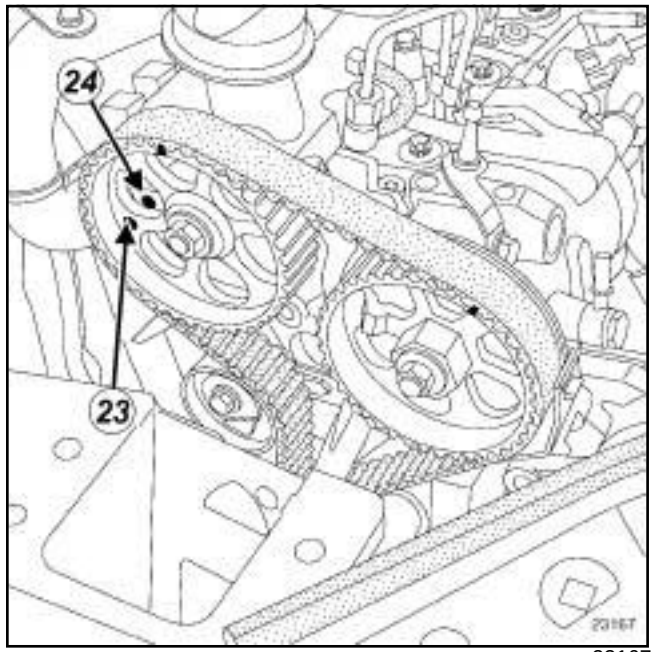


K9K, and 750 or 752 or 760 or 762 or 766 or 768

111741

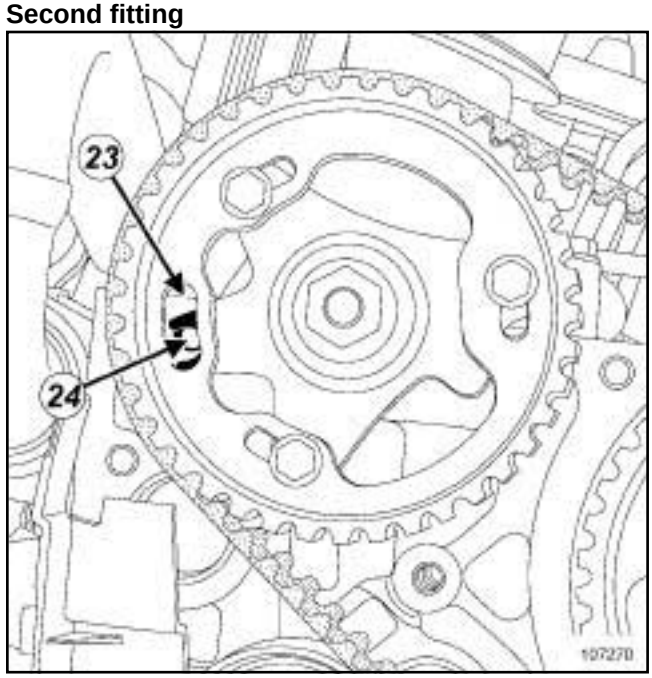
❏ Unclip the three tabs (**22**) .

❏ Remove the timing cover.



111742

❏ Remove the suspended mounting from the cylinder head.

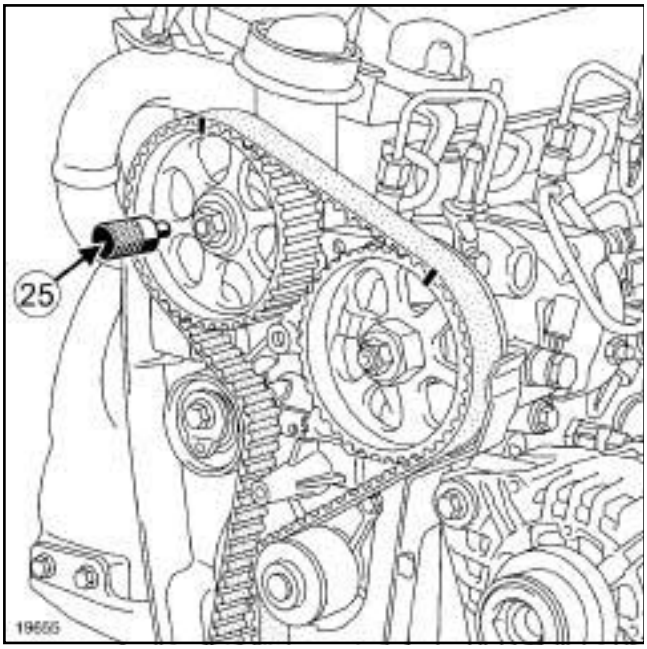


III - OPERATION FOR REMOVAL OF PART CONCERNED

First fitting

23167

Second fitting

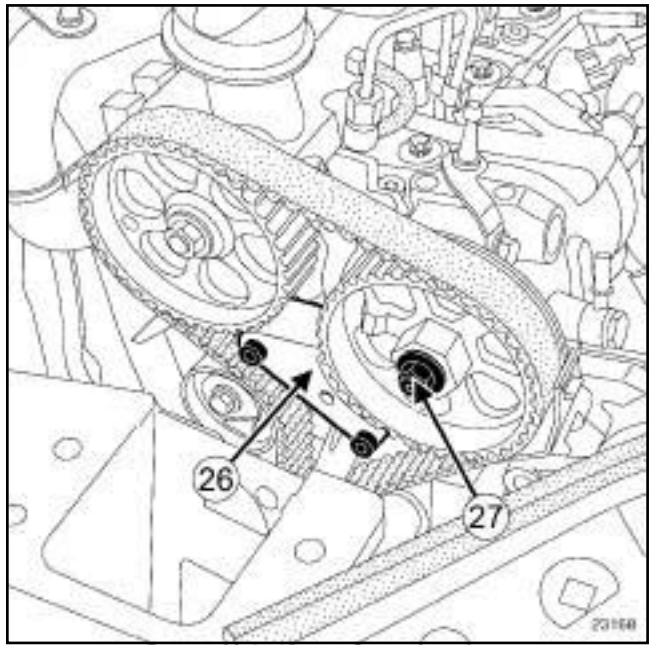


107270

❏ Position the engine at Top Dead Centre. The camshaft pulley hole (**23**) should be opposite the cylinder head hole (**24**) .

Note:

Never turn the engine against its operating direction.



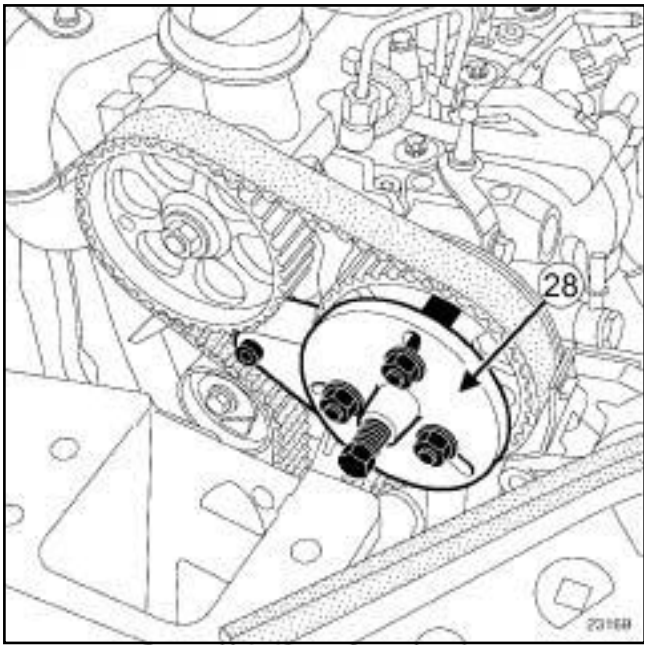
K9K, and 750 or 752 or 760 or 762 or 766 or 768

19655

❏ Insert the **(Mot. 1430)** (**25**) in the camshaft pulley hole and in the cylinder head hole to check that the engine operates correctly at top dead centre.

❏ Remove the **(Mot. 1430)** once the engine is in position.

23168



❏ Fit the **(Mot. 1606)** (**26**) on the cylinder head.

Note:

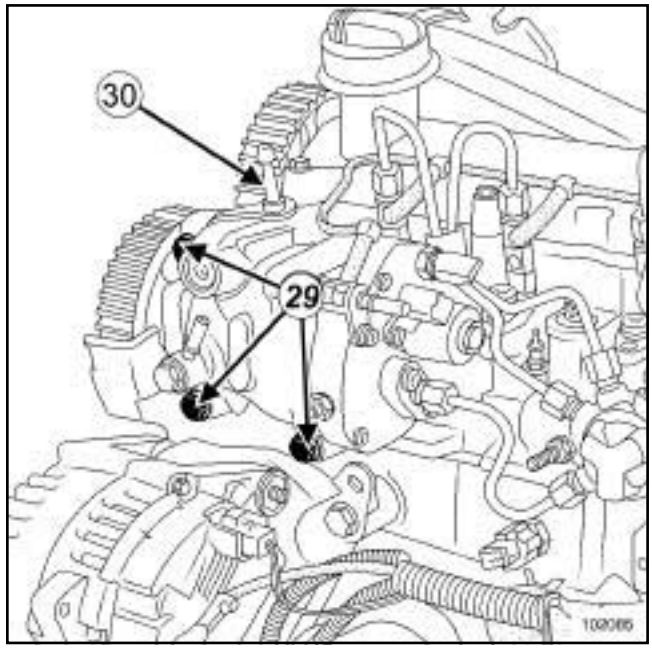
If necessary, tum the engine slowly to adjust the position of the **(Mot. 1606)** on the high pressure pump pulley teeth.

❏ Immobilise the high pressure pump pulley with a **32 mm spanner** then remove the nut (**27**) from the pulley.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

23169

❏ Fit the (**28**) with the **(Mot. 1525-02)** on the high pressure pump pulley.



Note:

If necessary, remove the spacer at the end pushrod of theto improve the positioning.

❏ Screw thepushrod until it makes contact with the high pressure pump shaft.

Note:

Check that thepushrod is correctly orientated and is pressing against the high pressure pump shaft. adjust the tool if necessary.

102085

❏ Remove:

- the bolts (**29**) from the high pressure pump on the cylinder head,
- the air filter unit bracket (**30**) .

❏ Gradually screw the pushrod of theuntil the high pressure pump becomes detached.

Note:

Guide and support the high pressure pump with one hand as it is being removed using the

❏ Remove the high pressure pump from the engine compartment.

Note:

If the high pressure pump is being reused, keep it in a sealed bag during the removal operation.

❏ Remove theand **(Mot. 1525-02)** from the high pressure pump pulley.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

REFITTING

I - PRECAUTIONS FOR REPAIR

❑

WARNING

Only remove the blanking plugs from the protected components at the last possible moment.

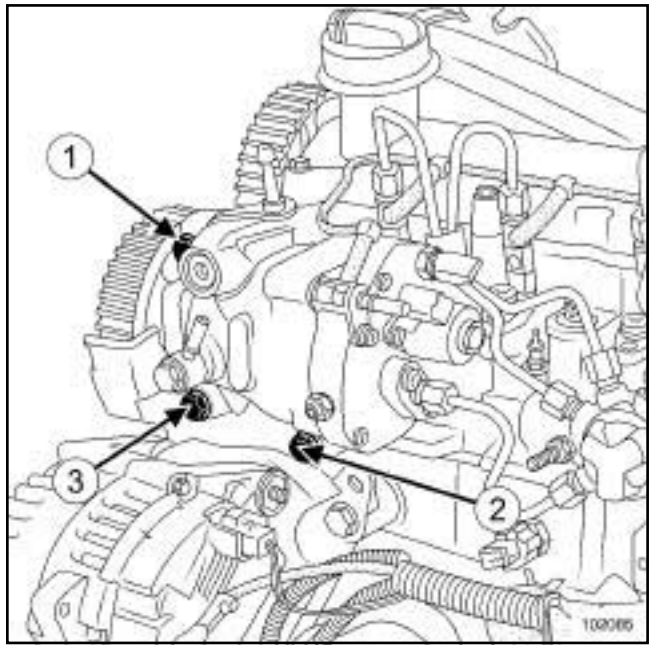
Also, do not remove the components from their packaging until just before fitting them to the vehicle.

II - PARTS AND CONSUMABLES FOR THE REPAIR

❑ **parts always to be replaced: High pressure pipe between the pump and rail (11,05,03,02)**

III - REFITTING OPERATION FOR PART CONCERNED

❑ Check that there is an indexing pin on the high pressure pump shaft.



❑ Position the high pressure pump on the cylinder head whilst inserting it in its pulley.

Note:

Check that the high pressure pump shaft is correctly orientated in relation to the pulley.

❑ Fit the air filter unit bracket.

❑ Tighten the high pressure pump bolts until they make contact with the cylinder head.

102085

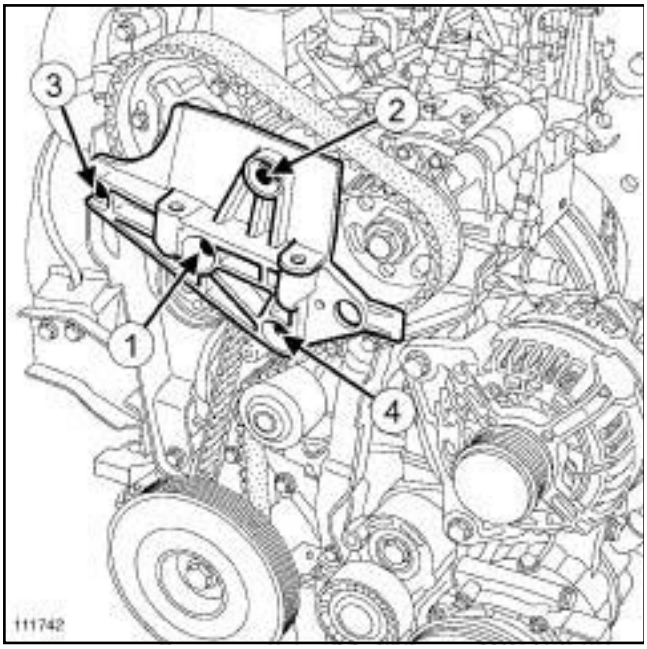
❑ Tighten to torque and in order the **high pressure pump bolts on the cylinder head (23 N.m)**.

❑ Fit the nut on the high pressure pump pulley.

❑ Torque tighten the **high pressure pump pulley nut (55 N.m)** holding the high pressure pump pulley with a **32 mm** spanner.

Note:

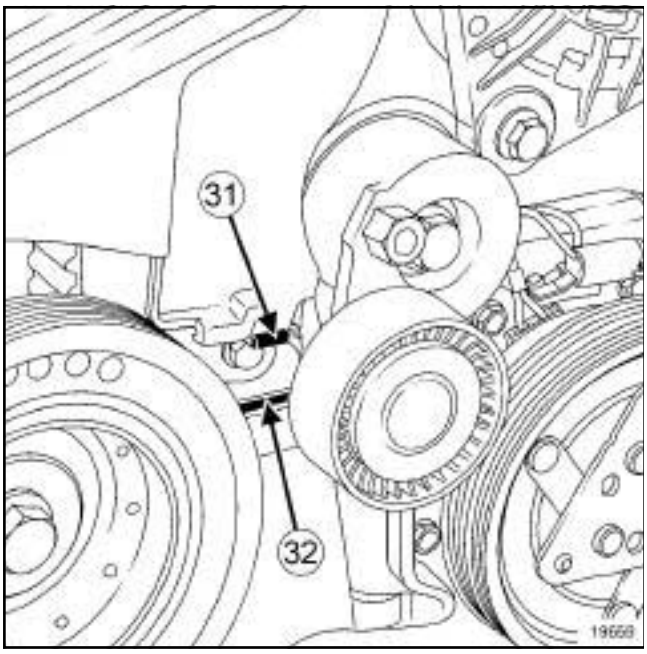
Check that the timing belt is operating correctly and in good condition.



❑ Remove the **(Mot. 1606)** from the cylinder head.

IV - FINAL OPERATION.

❑ Position the suspended mounting on the cylinder head.



❑ Tighten the suspended mounting bolts onto the cylinder head until they make contact.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

111742

❏ Tighten to torque and in order the **suspended mounting bolts on the cylinder head (25 N.m)**.

19659

❏ Refit and clip on the lower timing cover.

Note:

Make sure that the tab (**31**) is positioned opposite the mark (**32**) .

❏ Refit:

- the plastic bolt on the lower timing cover,
- the cylinder position sensor,

❏ Torque tighten the **camshaft position sensor bolt (8 N.m)**.

❏ Refit and clip on the upper timing cover.

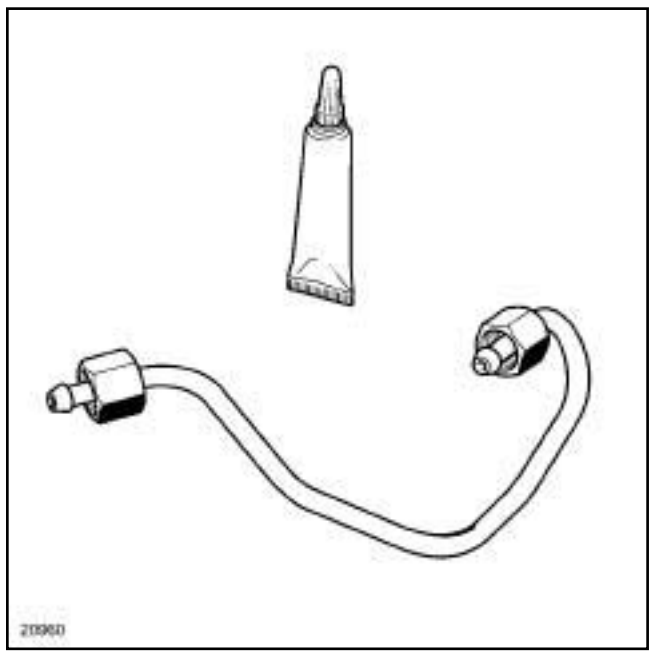
❏ Lower the engine using the **(Mot. 1453)**.

❏ Fit the right-hand suspended engine mounting with its bolts.

❏ Tighten the bolts on the straight suspended engine mounting until they make contact.

❏ Torque tighten the **right-hand suspended engine mounting bolts (62 N.m)**.

❏ Raise the vehicle.



❏ Refit the engine tie-bar.

❏ Torque tighten the **engine tie-bar bolts (105 N.m)**.

❏ Refit then tighten the protector under the engine.

❏ Remove tool **(Mot. 1453)** from the vehicle.

❏ Lower the vehicle.

20960

❏

WARNING

Before fitting a new high-pressure pipe, lightly lubricate the nut threads with the oil from the applicator provided in the new parts kit.

Be careful not to allow oil into the high-pressure pipe.

Do not lubricate high-pressure pipes supplied without an applicator, as these high-pressure pipes are self-lubricating.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

❑ Remove and discard the blanking plugs on:

- the high pressure pump,
- the injector rail.

❑ Fit a new high pressure pipe between the pump and the rail.

❑ Tighten the high pressure pipe unions between the pump and the rail until contact is made.

❑ Using the **(Mot. 1746)**, tighten to torque:

- the **high pressure pipe unions between the pump and the yellow rail (24 N.m)**,
- the **high pressure pipe unions between the pump and the silver rail (28 N.m)**,

❑ Refit the neck on the injector rail.

❑ Clip the wiring to the filler neck on the injector rail.

❑ Remove and discard the blanking plugs on:

- the Venturi,
- the diesel injectors.

❑ Connect:

- the cylinder position sensor connector on the timing cover,
- the oil level sensor connector,
- the accelerometer connector,
- the rail pressure sensor connector,
- the diesel return pipes on the fuel injectors,
- the diesel return pipe to the Venturi attached to the high pressure pump.

❑ Clip the high pressure pump diesel supply and return pipes to the filler neck.

❑ Remove the blanking plugs from the high pressure pump and the pipes and discard them.

❑ Connect to the high pressure pump:

- the diesel return pipe to the fuel filter,
- the diesel fuel supply pipe.

❑ Remove the protection on the alternator to prevent fuel flowing out.

❑ Connect the electrical connectors to:

- the diesel temperature sensor,
- the flow actuator,
- the injectors,
- of the heater plugs.

❑ Remove the protection on the inlet opening of the oil level dipstick guide.

❑ Refit the high pressure pump protection.

❑ Torque tighten the **high pressure pump protection bolts (21 N.m)**.

❑ Refit:

- the diesel splash plate cover,
- dipstick guide ,
- the oil dipstick guide nuts,
- the dipstick.

❑ Torque tighten the **dipstick guide tube nuts (10 N.m)**.

❑ Refit the inlet duct.

❑ Connect the inlet air sensor connector.

K9K, and 750 or 766 or 768

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air pipe on the turbocharger outlet and the air pipe on the intercooler inlet.

❑ Click the turbocharger outlet air pipe on the turbocharger and on the exchanger inlet air pipe.

❑ Tighten the turbocharger outlet air pipe bolt on the rocker cover.

❑ Torque tighten the **exchanger inlet air pipe nut on the alternator (8 N.m)**.

❑ Prime the fuel circuit with the manual priming pump until the disconnected pipes are filled with fuel (automatic degassing).

❑ Check that there are no fuel leaks.

❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❑ Check the high pressure circuit (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) .

❑ Refit the engine cover.

❑ Using the diagnostic tool, check for stored faults; deal with these and clear them as necessary.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

V - REPLACING THE HIGH PRESSURE PUMP

❑ If replacing the high pressure pump, reprime the diesel circuit using the **Diagnostic tool**.

> Note:
>
> For VDiag numbers before **Vdiag 48**, it is essential to reprogram the injection computer. **If the computer is not reprogrammed, do not apply the procedure described below but prime the circuit using the manual priming pump.**

> Note:
>
> Never start the engine until the pump has been reprimed.
>
> Also comply with the operation instructions provided to prevent the high pressure pump from being damaged internally, due to its running empty and with no diesel lubrication.

❑ Connect the **Diagnostic tool** to the vehicle.

❑ Connect to the diesel injection computer.

❑ Run command **AC212 "NEW PUMP HOUSING FILLING"**.

❑ Follow the instructions on the **Diagnostic tool** until the command is completed.

❑ Start the engine.

> Note:
>
> The starting phase can last up to **20 seconds**.

❑ If the engine does not start or if the start-up sequence is interrupted:

- switch off the ignition,
- wait **30s**,
- restart the engine.

❑ Using the **Diagnostic tool**, clear any faults stored in the injection computer.

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1566	Tool for removing high pressure pipes.
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.

Equipment required
Diagnostic tool
torque wrench

Tightening torques ▽	
two fuel flow actuator mounting bolts	**5.5 N.m**
high pressure pipe unions	**24 N.m**
intercooler air inlet pipe nut on the alternator	**8 N.m**

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Loosening a high pressure pipe union when the engine is running is strictly prohibited.

WARNING

Before starting work on the vehicle, obtain:

- a new blanking plug kit (**part no. 77 01 206 804**),

- cleaning cloths (**part no. 77 11 211 707**),

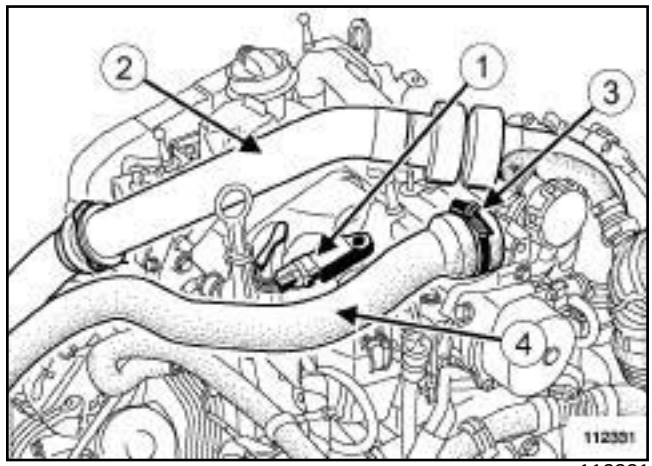
- cleaning product (**part no. 77 11 224 188**).

WARNING

Parts which must always be replaced:

- all the high pressure pipes which have been removed.

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.

112331

❑ Disconnect the inlet air pressure sensor (**1**) .

K9K, and 750 or 766 or 768

❑ Remove the upper section of the turbocharger air duct (**2**) .

❑ Loosen the clip (**3**) .

❑ Move the inlet air duct to one side (**4**) .

❑ Remove:

- the dipstick,

- the dipstick duct bolts.

❑ Move the dipstick duct to one side.

❑ Unclip the upper section of the injector rail protector.

❑ Unscrew the upper section of the injector rail protector.

❑ Remove:

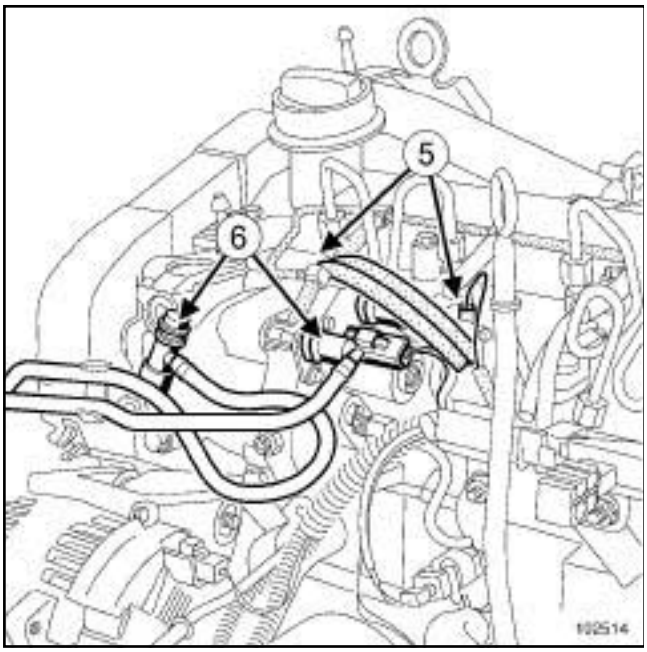
- the injector rail protector,

- Remove the high pressure pump protector plate.

K9K, and 750 or 752 or 766 or 768

❑ Protect the alternator from fuel outflow.

❑ Pour cleaning product into a container.



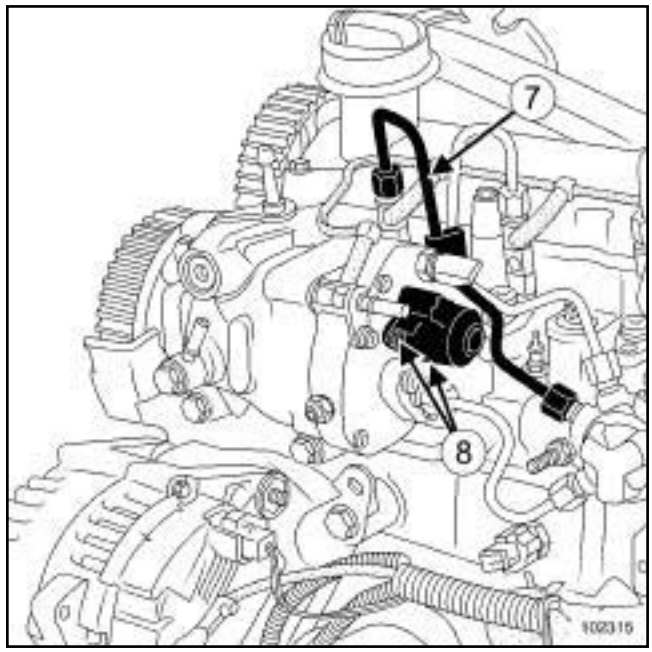
IMPORTANT
Wear protective gloves when using cleaning product.

❑ Soak the brush with cleaning product, then clean the diesel supply and return pipe unions on the high pressure pump.

❑ Blast the cleaned areas with compressed air then dry using new cloths.

IMPORTANT
Wear protective glasses.

WARNING
Do not blow compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cloths if necessary.



102514

❑ Disconnect:

- the heater plugs on cylinders no. 3 and 4,
- the injector connectors from cylinders no. 3 and 4 (**5**) ,
- the diesel supply and return pipes (**6**) ,
- the high pressure pump electrical connectors.

❑ Fit the correct blanking plugs on:

- the high pressure pump,
- the pipes.

102315

❑ Disconnect:

- the diesel temperature sensor,
- the flow actuator.

❑ Remove the high pressure pipe (**7**) between the rail and injector no.4.

❑ Fit the correct blanking plugs on:

- the rail,
- the injector.

II - REMOVAL OF THE PART CONCERNED

❑ Loosen the two bolts ***(8)*** from the fuel flow actuator.

❑ Withdraw the fuel flow actuator (by hand using small successive turns).

WARNING
Do not use the electrical connector as a lever arm.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING
Do not remove the blanking plugs from each component until the last moment.

K9K, and 750 or 752 or 766 or 768

❑ Only unpack the new component when you are ready to fit it.

WARNING
Do not damage the seal when refitting.

Note:

Do not lubricate the actuator seals with grease or used diesel oil. Use the applicator provided in the kit for the new part.

II - REFITTING PART CONCERNED

❑ Fit the actuator.

❑ Screw on the two actuator bolts without tightening them.

❑ Tighten to torque the **two fuel flow actuator mounting bolts (5.5 N.m)** using a **torque wrench**.

III - FINAL OPERATION

❑ Fit a new high pressure pipe to injector no. 4 and a new clip.

❑ Torque tighten the **high pressure pipe unions (24 N.m)** using the **(Mot. 1566)** or **(Mot. 1746)**.

❑ Connect:

- the high pressure pump electrical connectors,
- the diesel supply and return pipe,
- the injector connectors from cylinders no. 3 and 4,
- the heater plugs.

❑ Refit:

- the high pressure pump protector plate,
- the upper section of the injector rail protector,
- the dipstick pipe.

❑ Refit the air inlet duct.

❑ Connect the inlet air pressure sensor.

K9K, and 750 or 766 or 768

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Tighten the **intercooler air inlet pipe nut on the alternator (8 N.m)**.

❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Check that there are no diesel leaks:

- Check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) .
- Let the engine run at idle speed until the engine cooling fan starts to operate.
- Accelerate several times at no load.
- Switch off the ignition.
- Check that there is no diesel fuel escaping.

K9K, and 750 or 752 or 766 or 768

Equipment required
Diagnostic tool
torque wrench

Tightening torques ▽	
Venturi bolt	**5.5 N.m**
nut mounting the inter-cooler inlet air pipe on the alternator	**8 N.m**

IMPORTANT

Before carrying out any work on the injection circuit, check using the **Diagnostic tool**

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Loosening a high pressure pipe union when the engine is running is strictly prohibited.

WARNING

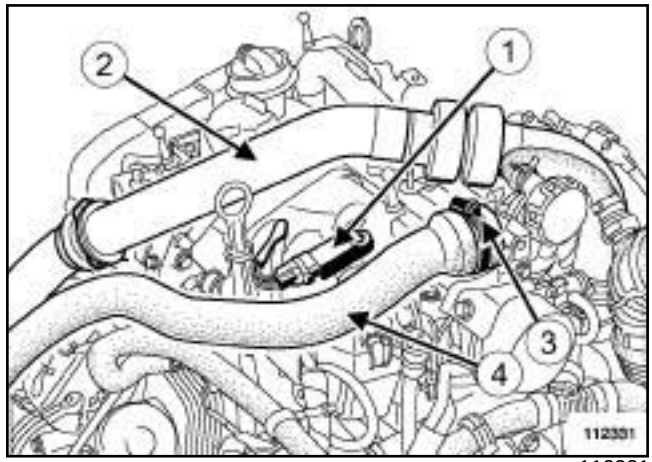
Before starting work on the vehicle, obtain:

- a new blanking plug kit (**part no. 77 01 206 804**),

- cleaning cloths (**part no. 77 11 211 707**),

- cleaning product (**part no. 77 11 224 188**).

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the front engine cover.

112331

❏ Disconnect the inlet air pressure sensor (**1**) .

K9K, and 750 or 766 or 768

❏ Remove the upper section of the turbocharger air duct (**2**) .

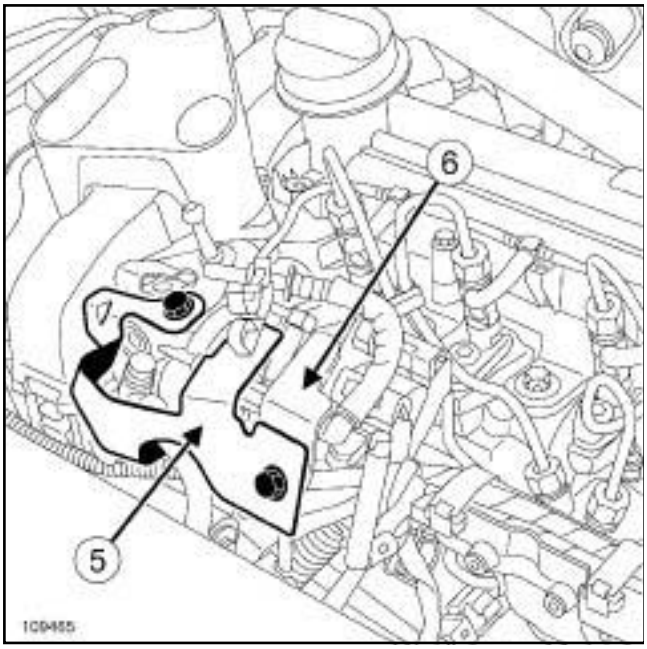
❏ Loosen the clip (**3**) .

❏ Move the inlet air duct to one side (**4**) .

❏ Remove:

- the dipstick,

- the dipstick duct bolts.



❏ Move the dipstick duct to one side.

❏ Unclip the upper section of the injector rail protector.

❏ Unscrew the upper section of the injector rail protector.

❏ Remove the injector rail protector.

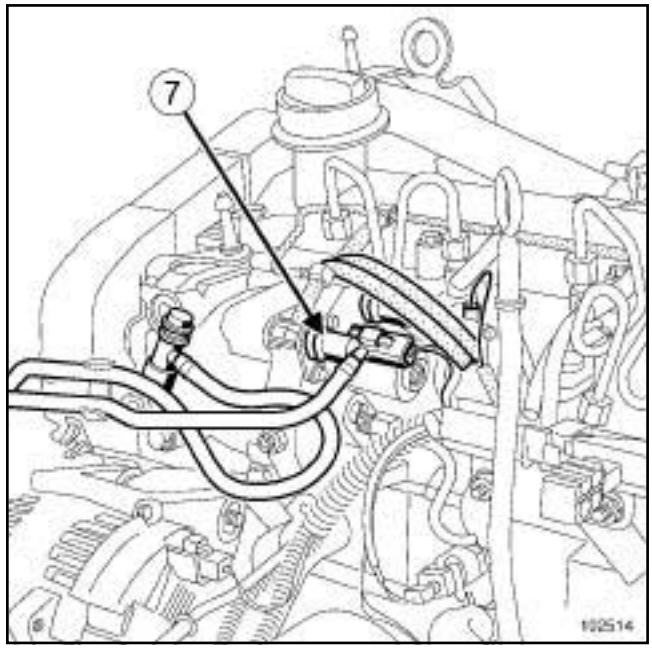
K9K, and 750 or 752 or 766 or 768

109465

❏ Remove the high pressure pump protectors (**5**) and (**6**) .

❏ Protect the alternator from fuel outflow.

❏ Pour cleaning product into a container.

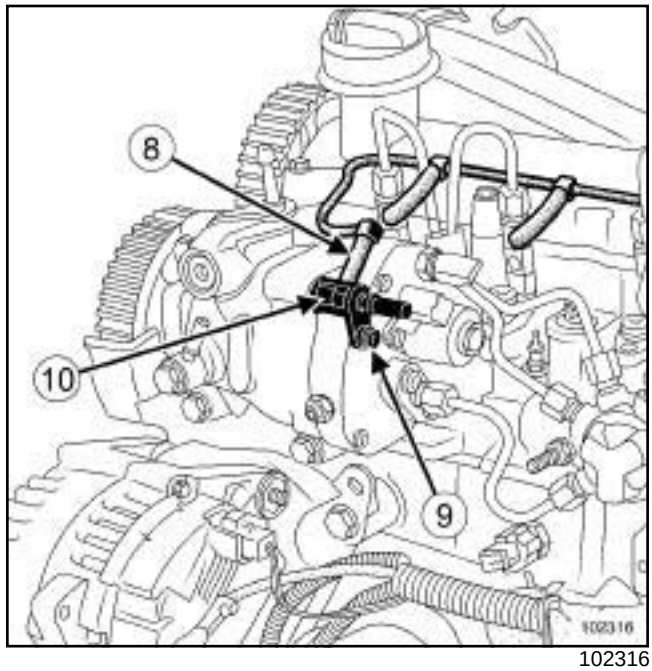


IMPORTANT
Wear protective gloves when using cleaning product.

❏ Soak the brush with cleaning product and clean the diesel return pipe union on the high pressure pump.

❏ Blow compressed air into the cleaned areas, then wipe with new cloths.

IMPORTANT
Wear protective glasses.



WARNING
Do not blow compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cloths if necessary.

102514

❏ Disconnect the diesel return pipe (**7**) .

❏ Fit the correct blanking plugs.

102316

❏ Disconnect the return pipe (**8**) connecting the injectors to the high pressure pump.

❏ Fit the correct blanking plugs.

II - REMOVAL OF THE PART CONCERNED

❏ Remove:

- the Venturi bolt ***(9)*** ,
- the Venturi ***(10)*** .

K9K, and 750 or 752 or 766 or 768

❑ Fit blanking plugs into the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING

Do not remove the blanking plugs from each component until the last moment.

❑ Lubricate the O-ring with lubricant from the applicator supplied with the new part.

Note:

Do not lubricate the Venturi seals with grease or used diesel fuel.

Use the applicator supplied with the kit.

II - REFITTING PART CONCERNED

❑ Fit the Venturi.

WARNING

Do not damage the O-ring when fitting the Venturi.

❑ Tighten to torque the **Venturi bolt (5.5 N.m)** using a **torque wrench**.

III - FINAL OPERATION

❑ Connect the return pipe connecting the injectors to the high pressure pump.

❑ Refit the high pressure pump protection.

❑ Refit the inlet air duct.

❑ Connect the inlet air pressure sensor.

K9K, and 750 or 766 or 768

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- switch off the ignition,
- check that there is no diesel fuel escaping.

K9K, and 764 or 772

Equipment required
Diagnostic tool

Tightening torques ▽	
intercooler inlet air pipe nut on the alternator	**8 Nm.**

IMPORTANT
Consult the safety instructions and cleanliness advice and the operation recommendations before carrying out any repairs (see **Diesel injection: Repair precautions**).

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the rail is not under pressure,

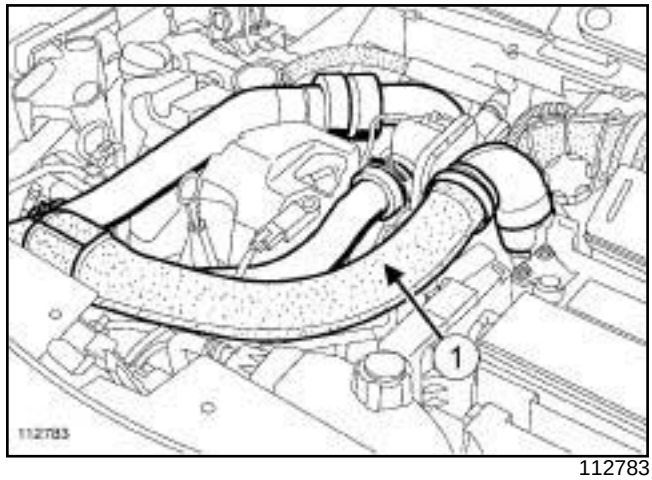
- that the fuel temperature is not too high.

Working on the circuit with the engine running is strictly forbidden.

IMPORTANT
Be careful when removing the injectors or the injection rail as there will be a quantity of fuel in the rail and the union.

IMPORTANT
Loosening a high pressure pipe union when the engine is running is strictly prohibited.

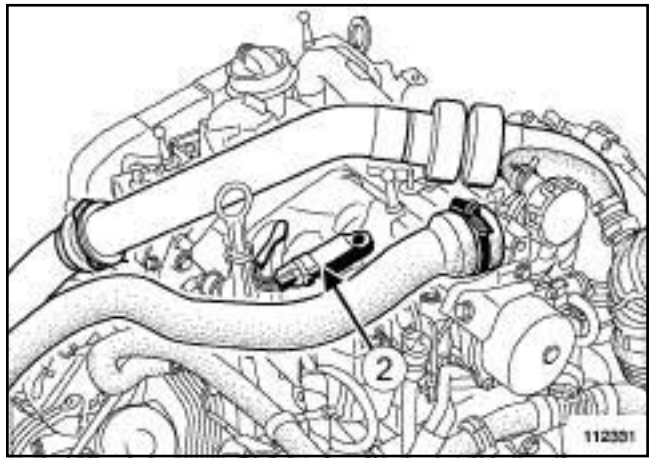
REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (02A, Lifting equipment).

❏ Switch off the ignition and wait **30 seconds** before starting work on the injection system.



❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

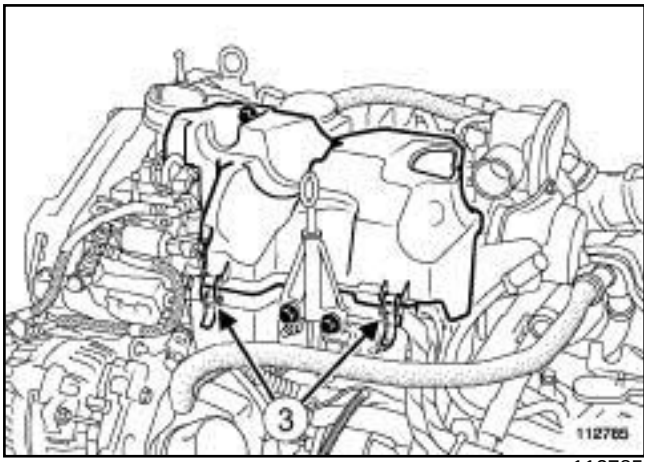
❏ Remove the engine undertray.

112783

❏ Remove the air inlet sleeve (**1**) .

112331

❏ Disconnect the inlet pressure sensor connector (**2**) .



❏ Remove:

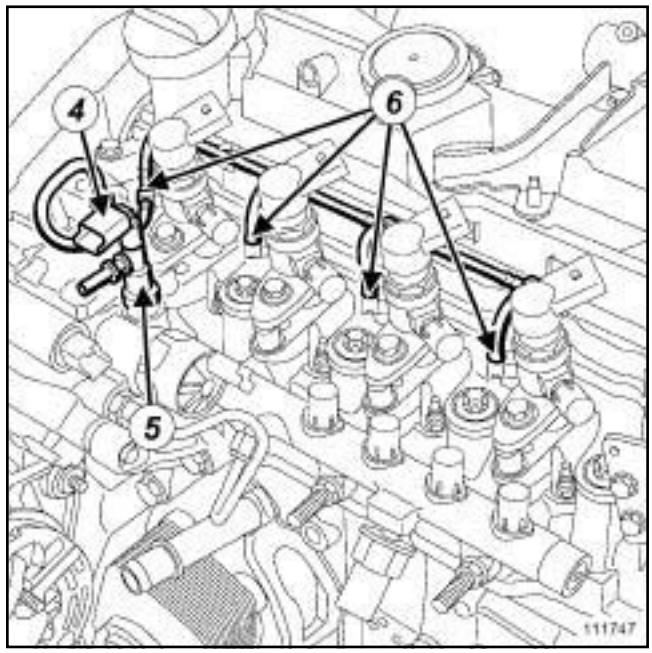
- the intercooler air outlet pipe,

- the air pipe at the intercooler inlet,

- the turbocharger outlet air pipe.

K9K, and 764 or 772

112785



❏ Unclip the rail protector cover at (**3**) .

❏ Remove:

- the rail protector cover bolts,
- the rail protector cover.

❏ Protect the alternator from fuel outflow.

II - OPERATION FOR REMOVAL OF PART CONCERNED

111747

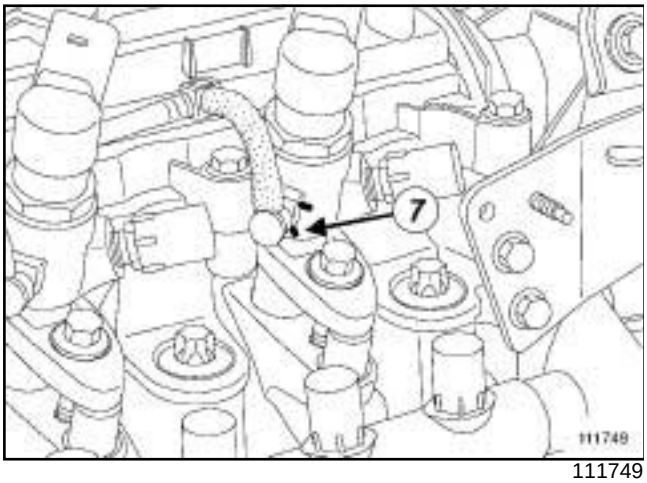
❏ Disconnect the diesel temperature sensor connector (**4**) .

❏ Clean the diesel return union (**5**) on the high pressure pump (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❏ Disconnect the diesel return union (**5**) from the high pressure pump.

Note:

Make preparations for the fuel outflow.



❏ Fit blanking plugs to:

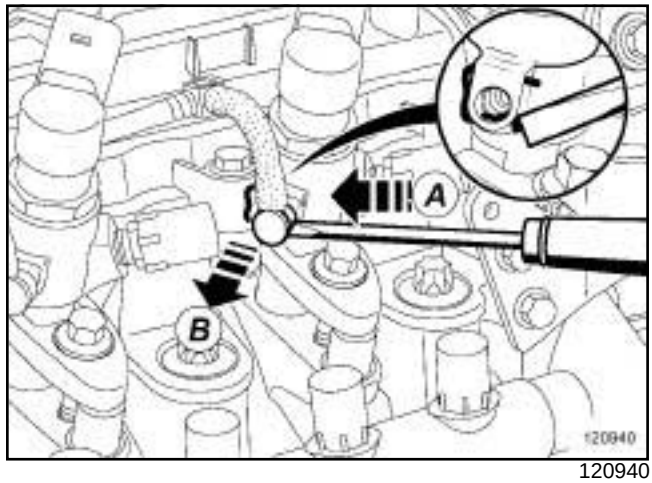
- the diesel return pipe,
- the high pressure pump.

❏ Clean the diesel return unions (**6**) on the injectors (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

K9K, and 764 or 772

First stage in removing the injector fuel return unions

111749



❏ Using a fine flat-blade screwdriver, push the lower tabs (**7**) of the injector fuel return union clips towards the rocker cover in order to unfasten them and fully fit them on the rocker cover.

Note:

Take care not to dislodge the clip fully from its housing in case it becomes damaged when extracting the diesel return union.

Any clips that become completely separated from a diesel injector that has not been removed must always be replaced: to do this, it is essential that the diesel injector in question is removed (see **13B**, **Diesel injection**, **Diesel injector: Removal - Refitting**, page **13B-83**) (13B, Injection).

Second stage in removing the injector fuel return unions

120940

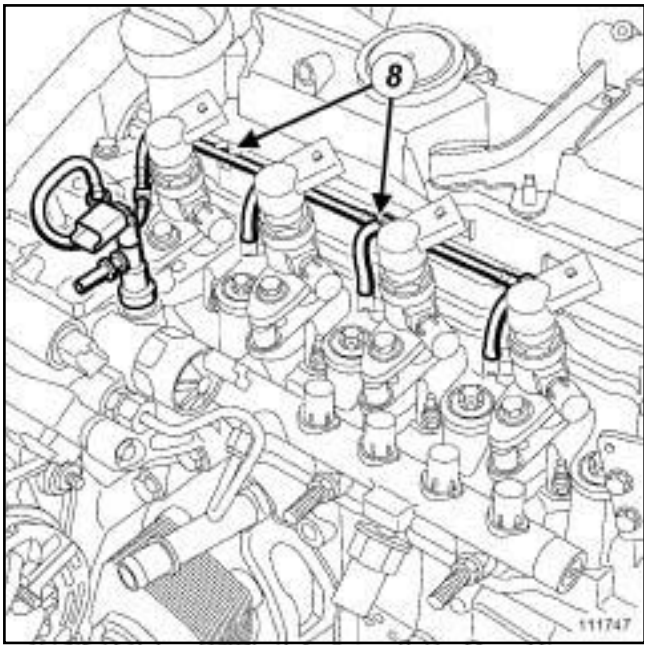
❏ Using a fine flat-blade screwdriver, push down (**A**) on the lower tabs of the clips, which were first resting on the rocker cover, without separating them fully from their injectors.

❏ Manually remove the injector diesel return unions at (**B**) , while **pressing (A) on the lower tabs of the clips using a fine flat-blade screwdriver.**

Note:

With sufficient force applied to the clip while pressing continuously with the screwdriver, the injector diesel return unions will come out effortlessly.

WARNING



Do not use the screwdriver as a lever on the injector fuel return unions.

❏ Fit blanking plugs on:

- the diesel return unions on the injectors,

- the diesel return openings on the injectors.

K9K, and 764 or 772

111747

❑ Unclip the diesel return pipe from the rocker cover at (**8**) .

❑ Remove the diesel return pipe.

Note:

If the diesel return pipe is to be reused, keep it in a sealed bag throughout the removal operation.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

WARNING

Only remove the blanking plugs from the protected components at the last possible moment.

Also, do not remove the components from their packaging until just before fitting them to the vehicle.

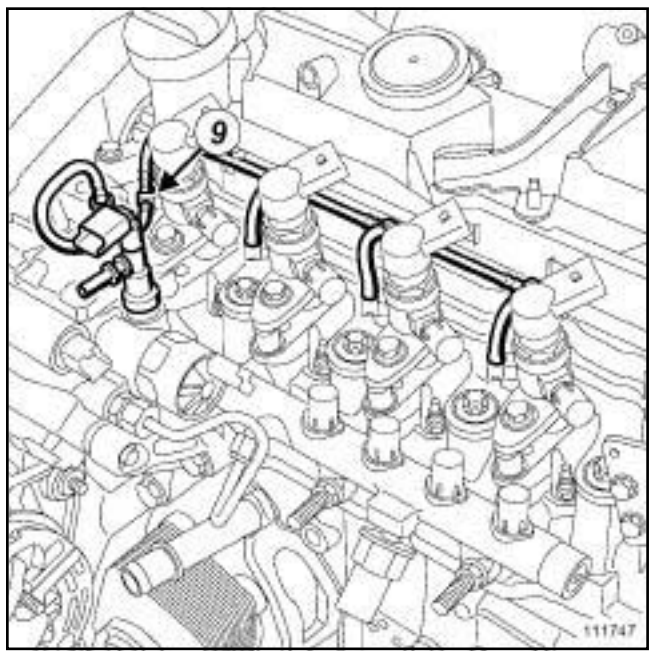
II - REFITTING OPERATION FOR PART CONCERNED

❑

WARNING

Check the condition of the seals on the fuel return unions on the injectors.

Check that they are not cut, crushed and have not come out of their grooves.



Replace the entire diesel return pipe if one of the components is damaged.

❑ Push the retaining clips for the diesel return unions on the injectors towards the front of the vehicle until they are in their original positions.

❑ Remove the blanking plugs from the injector fuel return openings, and discard.

❑ Remove the diesel return pipe from its packaging.

❑ Lubricate the injector diesel return unions with **SILICONE FREE LUBRICANT** (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) so that the seals are completely covered.

111747

❑ Offer up the diesel return unions to the injector diesel return openings, starting with injector number 4 (**9**) .

K9K, and 764 or 772

❏ Clip the injector diesel return unions onto the injectors, starting with injector number 4.

Note:

Check that the diesel return unions are clipped on properly.

❏ Clip the fuel return pipe onto the rocker cover.

III - FINAL OPERATION.

❏ Connect the diesel temperature sensor connector.

❏ Refit:

- the rail protector cover,
- the intercooler air outlet pipe,
- the air pipe at the intercooler inlet,
- the turbocharger outlet air pipe.

❏ Torque tighten the **intercooler inlet air pipe nut on the alternator (8 Nm.)**

❏ Refit the engine protector.

❏ Reprime the fuel circuit using the priming bulb.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Check the high pressure circuit (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) (13B, Injection).

High pressure pipe between pump and rail: Removal - Refitting

K9K, and 764 or 772

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
high pressure pipe nuts	**24 Nm**
intercooler inlet air pipe mounting nut on the alternator	**8 Nm**

WARNING

Before starting work on the vehicle, obtain:

- a new blanking plug kit (**part no. 77 01 476 857**),
- cleaning wipes (**part no. 77 11 211 707**),
- cleaning product (**part no. 77 11 224 188**).

WARNING

Parts always to be replaced:

- all the high pressure pipes which have been removed.

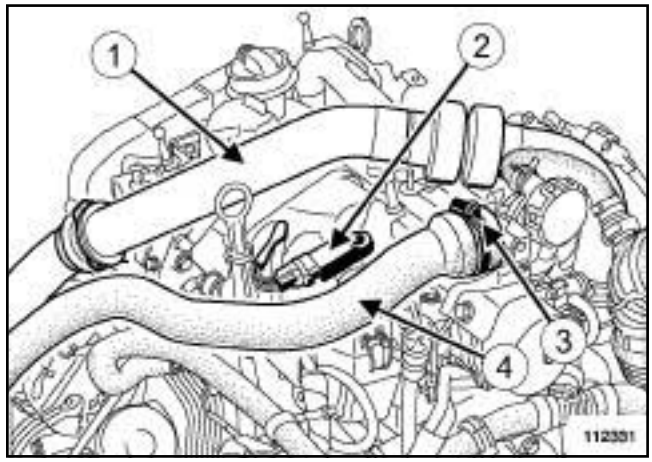
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

IMPORTANT



Before carrying out any work on the injection system, check using the **Diagnostic tool** :

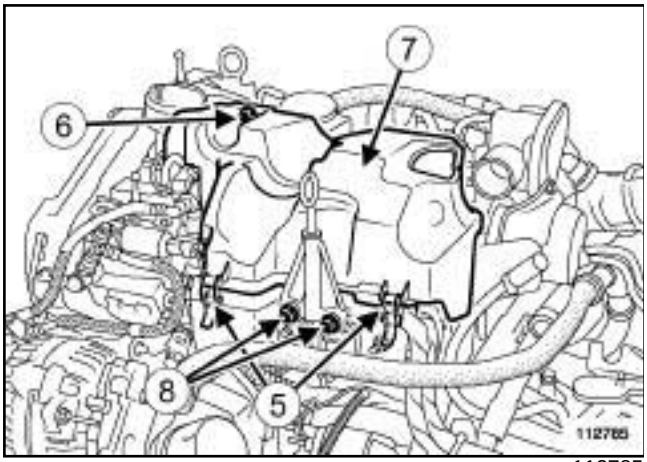
- that the rail is not under pressure,
- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine protector.

112331



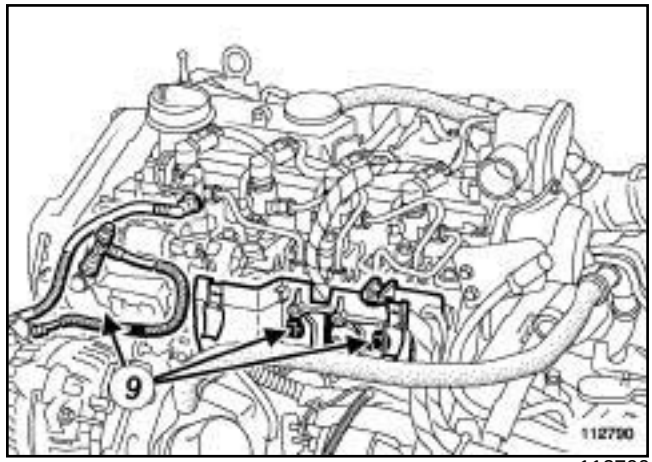
❏ Remove the upper section (**1**) of the turbocharging duct.

❏ Disconnect the inlet air pressure sensor (**2**)

❏ Loosen the clip (**3**) .

❏ Move the inlet duct to one side (**4**) .

K9K, and 764 or 772



112785

❏ Unclip the clips (**5**) from the injector rail protector cover.

❏ Remove:

- the injector rail protector cover mounting bolt (**6**) ,
- the injector rail protector cover (**7**) ,
- the dipstick,
- the dipstick tube (**8**) mounting bolts.

❏ Move the dipstick duct to one side.

112790

❏ Remove:

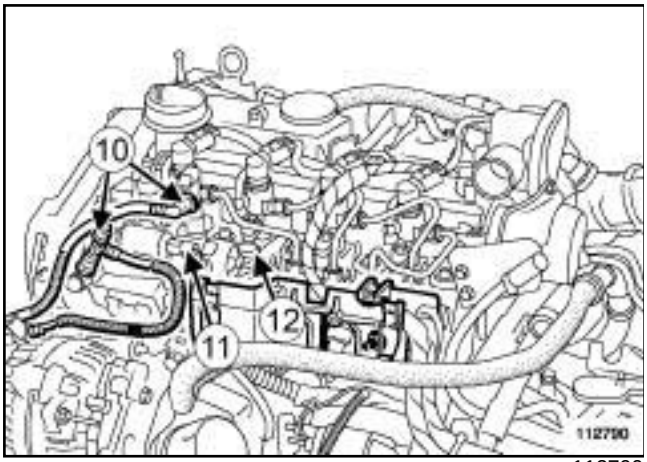
- the injector rail protector support mounting bolts (**9**) ,
- the injector rail protector mounting.

❏ Protect the alternator from fuel outflow.

❏ Pour cleaning product into a container.

IMPORTANT
Wear protective gloves when using cleaning product.

❏ Soak the brush with cleaning product, then clean the unions:



- on the high-pressure pump fuel supply pipe,
- on the high-pressure pump fuel return pipe, taking care not to soak the diesel fuel temperature sensor,
- on the high-pressure pipe between the high-pressure pump and the injector rail,

❏ Blast the cleaned areas with compressed air, then wipe them with new cleaning cloths.

IMPORTANT
Wear protective glasses.

WARNING
Do not blow compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use wipes if necessary.

K9K, and 764 or 772

112790

❑ Disconnect:

- the diesel fuel supply and return pipes (**10**) ,
- the pressure regulating valve connector (**11**) ,
- the volume regulating valve connector (**12**) ,

Note:

Be prepared for fuel outflow. Clean with new cloths.

❑ Fit the blanking plugs.

II - REMOVAL OF PART CONCERNED

❑ Remove the high-pressure pipe between the high-pressure pump and the injector rail and discard it.

Note:

Hold the intermediate nut between the pump-rail pipe and the high-pressure pump using a lock wrench.

❑ Fit the blanking plugs.

REFITTING

I - REFITTING PREPARATIONS OPERATION

❑

WARNING

Remove the blanking plugs only before reconnecting the fuel circuit pipes.

The blanking plugs are single-use only. Do not reuse them, and discard the whole kit once opened.

❑ Take the new high pressure pipe out of its plastic bag.

❑ Remove the blanking plugs.

II - REFITTING PART CONCERNED

❑ Fit the new high pressure pipe between the injector rail and the high pressure pump.

Note:

If the new pipe kit does not contain an applicator, lubrication of the nut threads will be unnecessary (as they are self-lubricating pipes).

❑ Hand-tighten the nut on the high-pressure pipe on the pump end, then the one on the rail end.

❑ Torque tighten the **high pressure pipe nuts (24 Nm)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting with the nut on the high pressure pump side.

III - FINAL OPERATION.

❑ Connect:

- the volume regulating valve connector,
- the pressure regulating valve connector,
- diesel fuel supply and return pipes.

❑ Refit:

- the injector rail protector mounting,
- the dipstick duct mounting bolts.
- the dipstick,
- the injector rail protector cover,

❑ Refit the air inlet duct and tighten the clip.

❑ Connect the inlet air pressure sensor

❑ Loosen the intercooler inlet air pipe mounting nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **intercooler inlet air pipe mounting nut on the alternator (8 Nm)**.

❑ Refit the engine cover.

❑ Reprime the fuel circuit.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 764 or 772

❏ Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- check that there are no diesel leaks.

❏ Use the **Diagnostic tool** to check for stored faults.

❏ Clear them if necessary.

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.

Tightening torques ▽	
high pressure pipe between the pump and the rail	**24 N.m**

❑

IMPORTANT

Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the rail is not under pressure,
- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

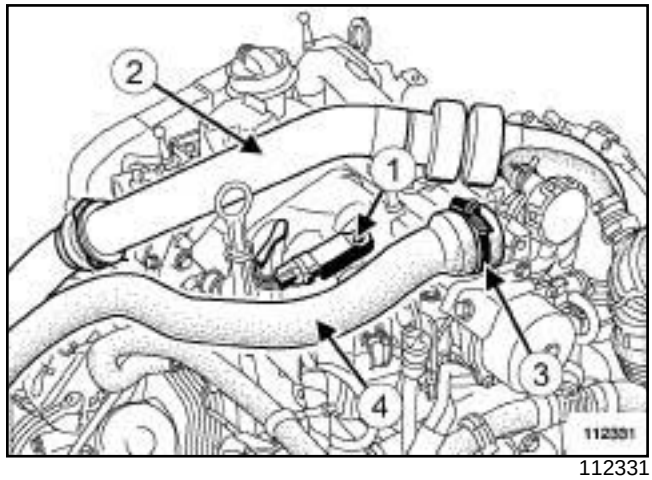
Working on the circuit with the engine running is strictly forbidden.

WARNING

Before starting work on the vehicle, obtain:

- a new set of plug welds (part no.: **77 01 206 804**),
- cleaning cloths (part no.: **77 11 211 707**),
- cleaning product (part no.: **77 11 224 188**).

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

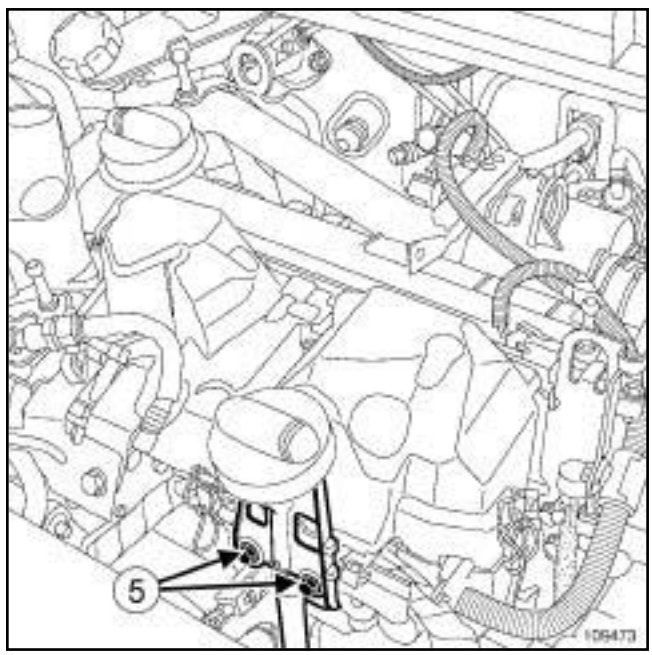
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Remove the front engine cover.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

112331



❑ Disconnect the inlet air pressure sensor (**1**) .

K9K, and 750 or 766 or 768

❑ Remove the turbocharging duct (**2**) .

❑ Loosen the air inlet duct clip (**3**) .

❑ Move the inlet duct to one side (**4**) .

109473

❑ Remove the dipstick bolts (**5**) .

❑ Remove the dipstick.

❑ Disconnect the accelerometer connector.

K9K, and 750 or 752 or 766 or 768

II - REMOVAL OF THE PART CONCERNED

❑ Clean the high pressure pipe between the pump and the rail (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❑ Undo:

- the high pressure pipe nut at the pump end using the **(Mot. 1746)**,
- the high pressure pipe nut at the injector rail end using the **(Mot. 1746)**.

❑ Fit blanking plugs into the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

20960

❑

WARNING

Before fitting a new high pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

II - REFITTING PART CONCERNED

❑ Remove the blanking plugs.

❑ Insert the high pressure pipe olive in the high pressure pump high pressure outlet taper.

❑ Insert the high pressure pipe olive into the injector rail inlet taper.

❑ Fit, without tightening, the high pressure pipe nuts by hand, starting with the nut at the rail end.

❑ Slightly pretighten the high pressure pipe nuts.

❑ Tighten to torque the **high pressure pipe between the pump and the rail (24 N.m)** using the **(Mot. 1746)**.

III - FINAL OPERATION

❑ Connect the accelerometer connector.

❑ Insert the dipstick.

❑ Refit the dipstick bolts ***(5)*** .

K9K, and 750 or 766 or 768

❑ Refit:

- the turbocharging pipe ***(2)*** ,
- the air inlet duct ***(4)*** .

❑ Tighten the air inlet duct clip ***(3)*** .

❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Prime the diesel circuit using the priming pump.

WARNING

Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- carry out a road test,
- Switch off the ignition.

K9K, and 764 or 772

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
injection rail mounting nuts	**28 Nm**
high-pressure pipe nuts	**24 Nm**
mounting nut of the air pipe at the intercooler inlet on the alternator	**8 Nm**

WARNING

Before starting work on the vehicle, make sure you have:

- a new blanking plug kit (**part no. 77 01 476 857**),
- cleaning wipes (**part no. 77 11 211 707**),
- cleaning product (**part no. 77 11 224 188**).

WARNING

Parts always to be replaced:

- all the high-pressure pipes which have been removed.

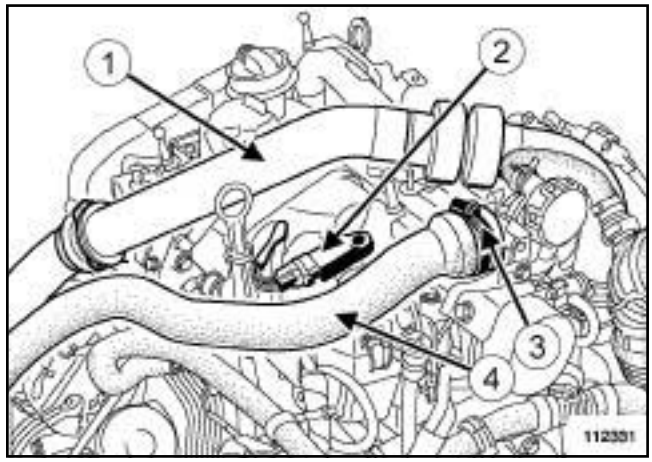
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) .

❑ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

IMPORTANT



Before carrying out any work on the injection system, check using the **Diagnostic tool** :

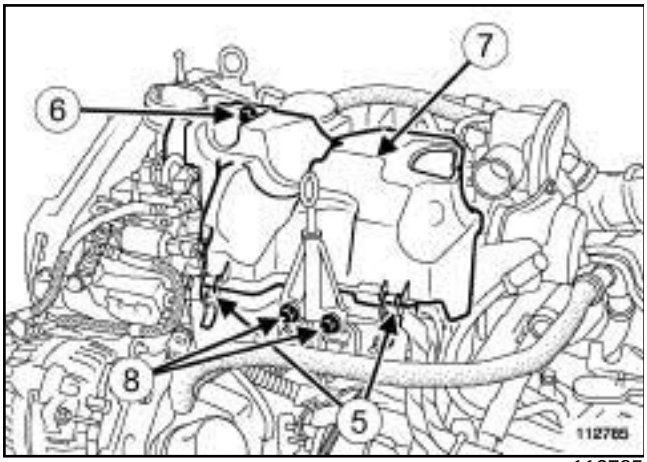
- that the rail is not under pressure,
- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❑ Disconnect the battery (see **Battery: Removal - Refitting**) .

❑ Remove the engine cover.

112331



❑ Remove the upper part (**1**) of the turbocharger duct

❑ Disconnect the air inlet pressure sensor (**2**)

❑ Loosen the clip (**3**) .

❑ Move the inlet duct to one side (**4**) .

K9K, and 764 or 772

112785

❏ Unclip the clips (**5**) from the injection rail protector cover.

❏ Remove:

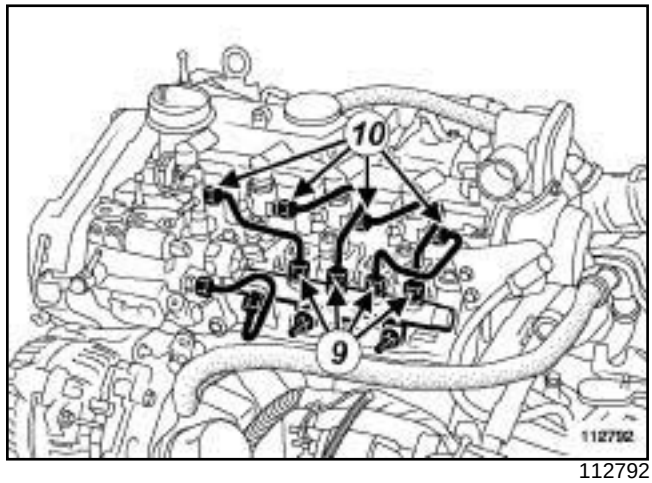
- the injection rail protector cover mounting bolts (**6**) ,
- the injection rail protector cover (**7**) ,
- the dipstick,
- the dipstick pipe mounting bolts (**8**) .

❏ Push the dipstick pipe to one side.

❏ Protect the alternator from fuel outflow.

❏ Pour cleaning product into a container.

IMPORTANT
Wear protective gloves when using cleaning product.



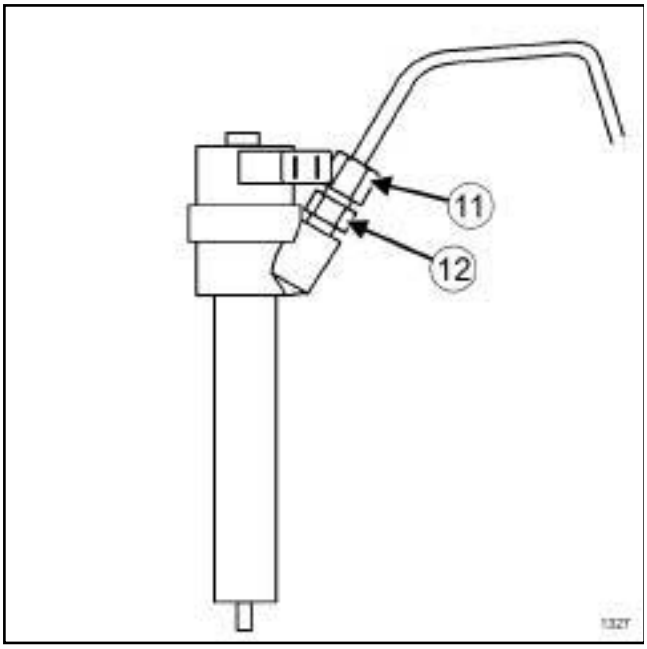
❏ Soak the brush with cleaning product, then clean the high-pressure pipe unions between the injection rail and the injectors

❏ Blast the cleaned areas with compressed air, then wipe them with new cleaning wipes.

IMPORTANT
Wear protective glasses.

WARNING
Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use wipes if necessary.

II - REMOVAL OF PART CONCERNED



112792

❏ Undo:

- the nut securing the high-pressure pipe between the injection rail and the injector at the rail end (**9**) ,
- the nut securing the high-pressure pipe between the injection rail and the injector at the injector end (**10**) ,

K9K, and 764 or 772

1327

❑

WARNING

When the high-pressure pipe unions (**11**) on the injector holder are loosened, it is imperative to hold the filter rod retaining nut (**12**) with a lock wrench.

❑ Remove the high-pressure pipe in question and discard it.

Note:

Be prepared for fuel outflow. Clean with new wipes.

❑ Insert the correct blanking plugs.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ If replacing the four high-pressure pipes:

- remove the anti-splash cover mounting,
- Undo the injection rail mounting nuts by a few turns (the injection rail should be loose).

II - REFITTING PART CONCERNED

❑

WARNING

Only remove the blanking plugs immediately before connecting the fuel circuit pipes.

The plugs are single-use. Do not reuse them.

❑ Take the new high-pressure pipe out of its plastic bag.

❑ Remove the blanking plugs from:

- the injection rail
- the injector fuel inlet.

Note:

If the new pipe kit does not contain an applicator, lubrication of the nut threads will be unnecessary (as they are self-lubricating pipes).

❑ Finger tighten the high-pressure pipe nuts as much as possible, starting at the injection rail end.

❑ If replacing the four high-pressure pipes:

- Tighten to torque the **injection rail mounting nuts (28 Nm)**,
- Refit the injection rail mounting.

❑ Tighten to torque the **high-pressure pipe nuts (24 Nm)** using **(Mot. 1746)** or **(Mot. 1566)** starting at the injection rail end.

III - FINAL OPERATION

❑ Refit:

- the dipstick pipe mounting bolts.
- the dipstick,
- the injection rail protector cover,
- the injection rail protector cover mountings.

❑ Loosen the mounting nut of the air pipe at the intercooler inlet on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler air inlet pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Tighten to torque the **mounting nut of the air pipe at the intercooler inlet on the alternator (8 Nm)**.

❑ Refit the air inlet duct and tighten its clip.

❑ Connect the inlet air pressure sensor

K9K, and 764 or 772

- ❏ Reprime the fuel circuit using the priming bulb.
- ❏ Connect the battery (see **Battery: Removal - Refitting**) .
- ❏ Confirm that there is no diesel fuel leak:
  - check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
  - accelerate several times at no load,
  - check for leaks and for diesel fuel outflow.
- ❏ Use the **Diagnostic tool** to check for stored faults.
- ❏ Clear them if necessary.

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
injector rail nuts	**28 N.m**
pump-rail high pressure pipe nuts	**24 N.m**
rail-injector high pressure pipe nuts	**24 N.m**
nuts of the neck on the rail	**21 N.m**
nut mounting the intercooler inlet air pipe on the alternator	**8 N.m**

❑

IMPORTANT

Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the injector rail is not under pressure,
- that the fuel temperature is not too high.

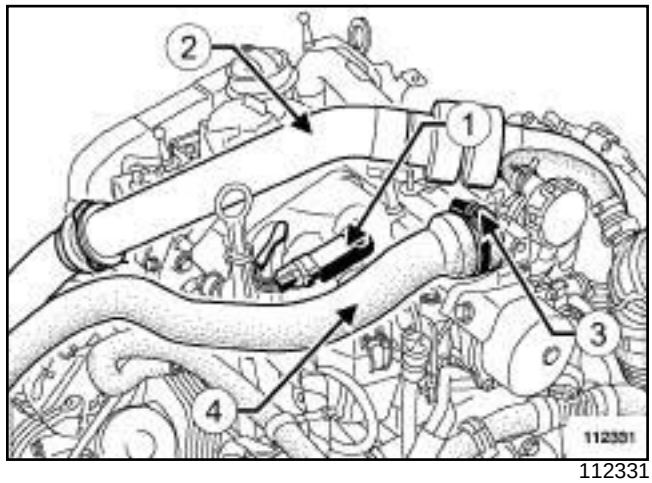
It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Loosening a high pressure pipe union when the engine is running is prohibited.

WARNING

Before starting work on the vehicle, obtain:

- a new set of blanking plugs (part no.: **77 01 206 804**),
- cleaning cloths (part no.: **77 11 211 707**),
- cleaning product (part no.: **77 11 224 188**).



Note:

Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

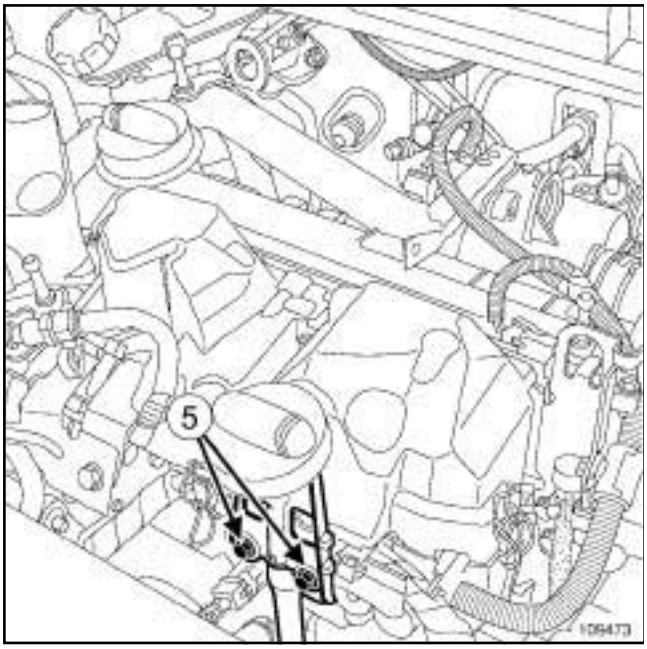
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) 392, 80A, Battery).

112331

❑ Disconnect the inlet air pressure sensor (**1**) .

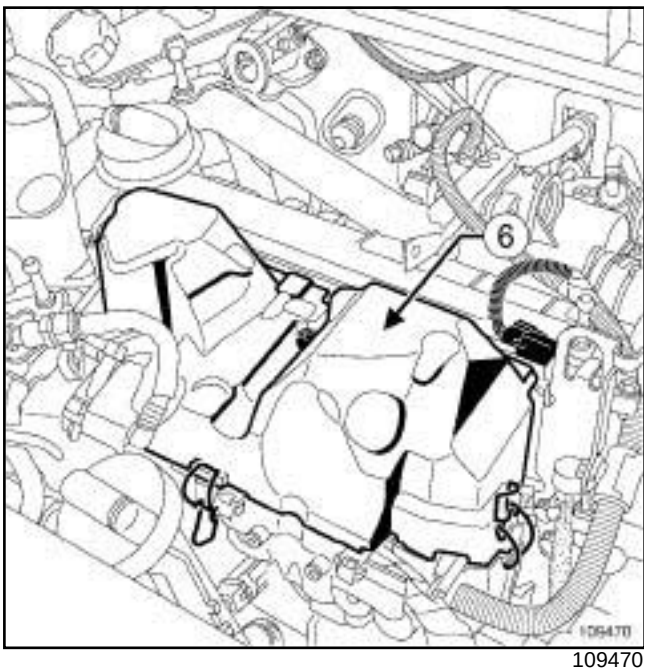


K9K, and 750 or 766 or 768

❑ Remove the upper section of the turbocharger air duct (**2**) .

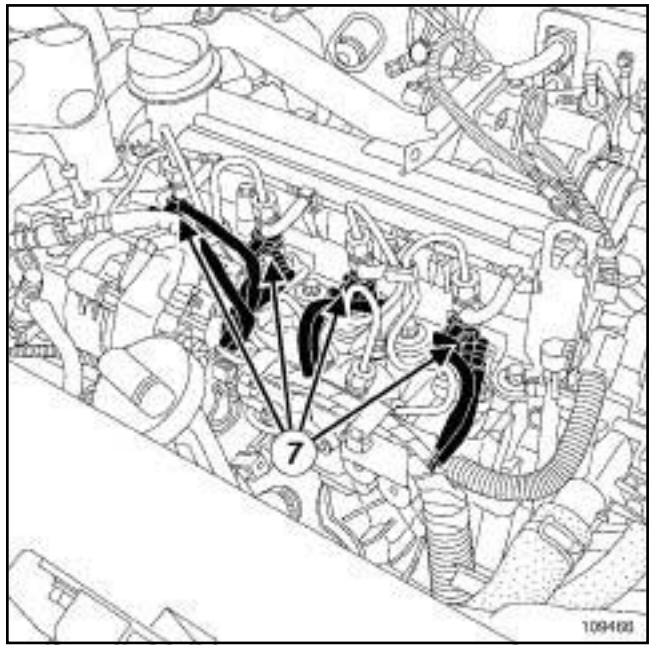
❑ Loosen the clip (**3**) .

❑ Move the inlet duct to one side ***(4)*** .



K9K, and 750 or 752 or 766 or 768

109473

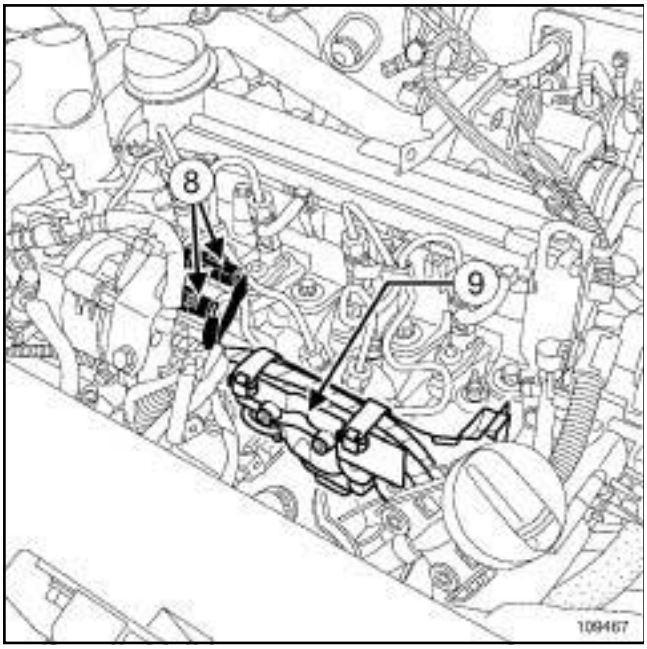


❏ Remove the dipstick bolts (**5**) .

❏ Put the dipstick to one side.

109470

❏ Remove the injector rail protector cover (**6**) .



109466

❏ Disconnect the following connectors (**7**) :

- the heater plugs,
- the injectors.

K9K, and 750 or 752 or 766 or 768

109467

❏ Disconnect the high pressure pump electrical connectors (**8**) .

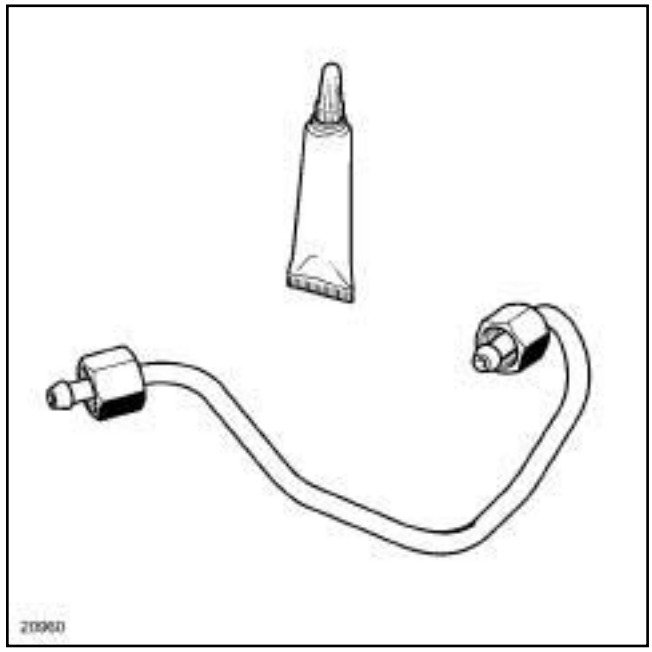
❏ Remove the bolts mounting the neck (**9**) onto the spherical injector rail.

❏ Move the electric wiring harness and neck to the side as shown by the arrow.

❏ Loosen the injector rail nuts by several turns.

❏ Remove the clips connecting the high pressure pipes.

II - REMOVAL OF THE PART CONCERNED



❏ Undo:

- the high pressure pipe nut at the injector end using the **(Mot. 1746)**,
- the high pressure pipe nut at the injector rail end using the **(Mot. 1746)**.

❏ Fit blanking plugs into the openings.

REFITTING

I - REFITTING PREPARATION OPERATION

20960

❏

WARNING

Before fitting a new high-pressure pipe, lightly lubricate the nut thread with oil from the applicator supplied in the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

❏ If replacing the four high pressure pipes:

- remove the anti-splash cover mounting,
- loosen the injector rail nuts by a few turns (the injector rail should be loose).

II - REFITTING OPERATION FOR PART CONCERNED

❏ Remove the blanking plugs.

❏ Insert the high pressure pipe olive in the injector high pressure inlet taper.

K9K, and 750 or 752 or 766 or 768

❑ Insert the high-pressure pipe olive in the rail high-pressure outlet taper.

❑ Fit the high pressure pipe nuts without tightening them, starting with the nut on the injector end.

❑ Slightly pretighten the high-pressure pipe nuts.

Note:

The order of fitting of the rail - injector high pressure pipes is not important.

❑ Mount a new clip provided with the new high pressure pipe.

❑ If replacing the four high pressure pipes, torque tighten the **injector rail nuts (28 N.m)**.

❑ Tighten to torque and in order the **pump-rail high pressure pipe nuts (24 N.m)**.

- pump end,
- rail end.

❑ Tighten to torque and in order the **rail-injector high pressure pipe nuts (24 N.m)**.

- injectors end,
- rail end.

Note:

Tighten each pipe fully before moving on to the next pipe.

III - FINAL OPERATION

❑ Refit the neck on the injector rail and torque tighten the **nuts of the neck on the rail (21 N.m)**.

❑ Connect the connectors of:

- the accelerometer,
- the injectors,
- the heater plugs.

❑ Refit the injector rail protector cover.

❑ Insert the dipstick.

❑ Refit the dipstick bolts.

❑ Refit the inlet duct and tighten its clip.

❑ Connect the inlet air pressure sensor.

K9K, and 750 or 766 or 768

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) 392, 80A, Battery).

❑ Prime the diesel circuit using the priming pump.

WARNING

Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- carry out a road test,
- switch off the ignition,
- confirm that there is no diesel fuel leakage.

K9K, and 764

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
injector rail mounting nuts	**28 Nm**
high pressure pipe nuts between the injector rail and the injectors	**24 Nm**
high pressure pipe nuts between the injector rail and the high pressure pump	**24 Nm**
nut mounting the inter-cooler air inlet pipe on the alternator	**8 Nm**

WARNING

Before starting work on the vehicle, have to hand:

- a new blanking plug kit (**part no. 77 01 476 857**),
- cleaning wipes (**part no. 77 11 211 707**),
- cleaning product (**part no. 77 11 224 188**).

WARNING

Parts always to be replaced:

- all the high pressure pipes which have been removed.

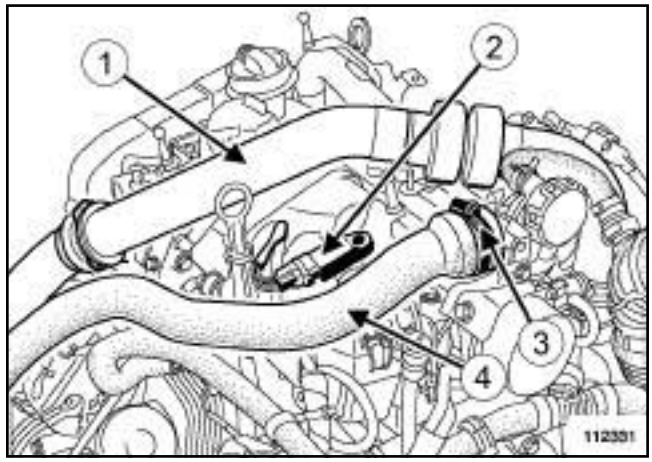
REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

IMPORTANT



Before carrying out any work on the injection system, check using the **Diagnostic tool** :

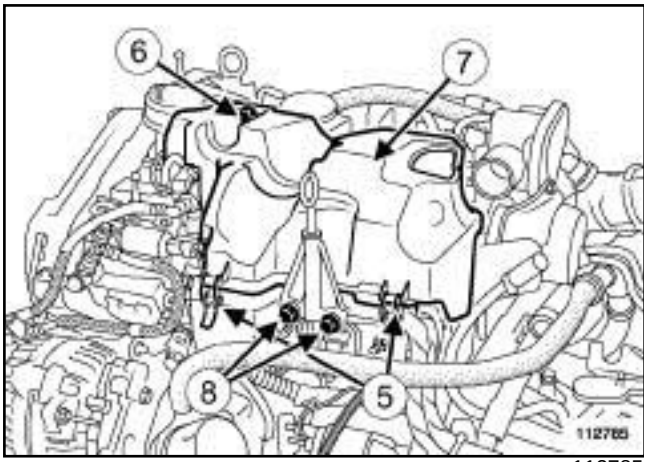
- that the rail is not under pressure,
- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine cover.

112331



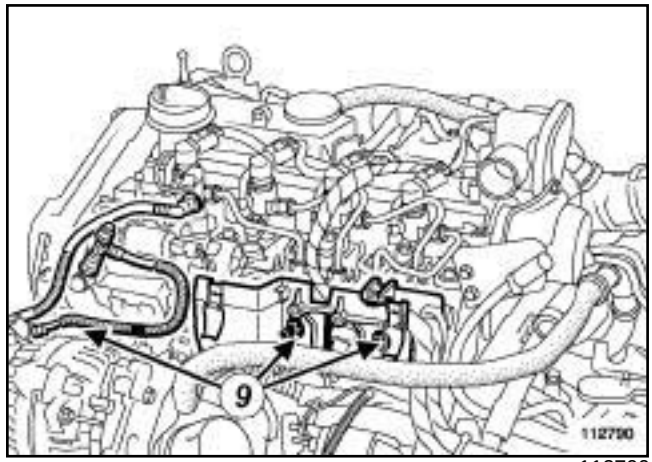
❏ Remove the upper section (**1**) of the turbocharging duct.

❏ Disconnect the inlet air pressure sensor (**2**)

❏ Loosen the clip (**3**) .

❏ Move the inlet duct to one side (**4**) .

K9K, and 764



112785

❏ Unclip the clips (**5**) from the injector rail protector cover.

❏ Remove:

- the injector rail protector cover mounting bolt (**6**) ,
- the injection rail protector cover (**7**) ,
- the dipstick,
- the dipstick tube (**8**) mounting bolts.

❏ Move the dipstick duct to one side.

112790

❏ Remove:

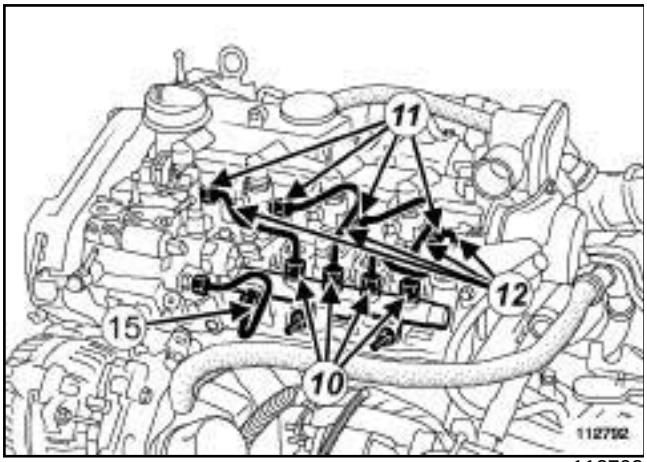
- the injector rail protector support mounting bolts (**9**) ,
- the injector rail protector mounting.

❏ Protect the alternator from fuel outflow.

❏ Pour cleaning product into a container.

IMPORTANT
Wear protective gloves when using cleaning product.

❏ Soak the brush with cleaning product, then clean the unions:

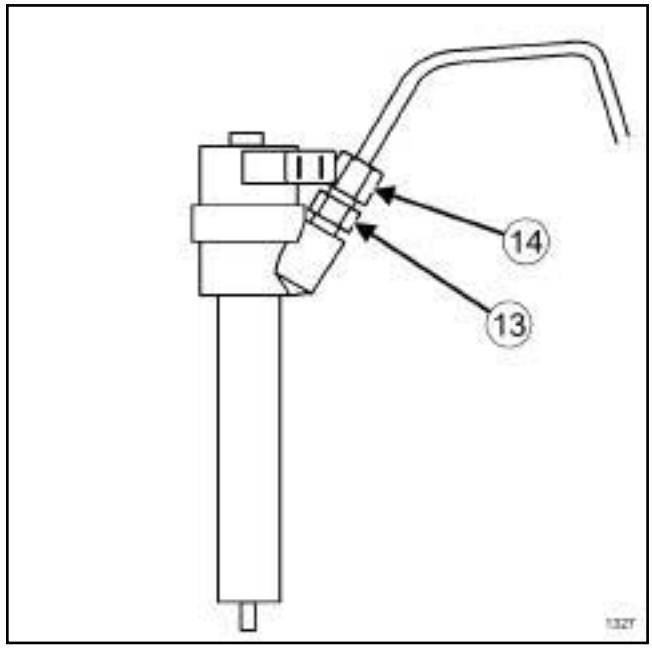


- of the high pressure pipes between the injector rail and the injectors
- of the high pressure pipe between the pump and the injection rail.

❏ Blast the cleaned areas with compressed air, then wipe them with new cleaning cloths.

IMPORTANT
Wear protective glasses.

WARNING
Do not blow compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use wipes if necessary.



K9K, and 764

112792

❑ Undo:

- the nut securing the four high pressure pipes between the injection rail and the injector at the rail end (**10**) ,
- the nut securing the high pressure pipes between the injection rail and the injector at the injector end (**11**) ,

1327

❑

WARNING

When the high pressure pipe unions (**14**) on the injector holder have been loosened, always hold the rod filter retaining nut (**13**) with a lock wrench.

❑ Remove the four high pressure pipes ***(12)*** and discard them.

Note:

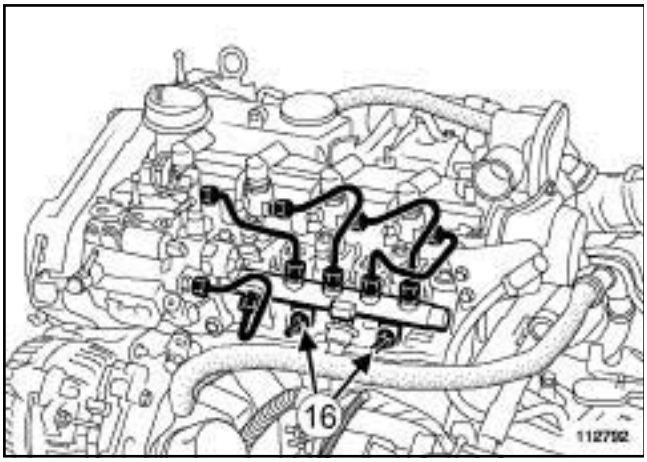
Make preparations for fuel outflow. Clean with new cloths.

❑ Fit the blanking plugs.

❑ Remove the high pressure pipe between the high pressure pump and the injection rail and discard it.

Note:

Hold the intermediate nut between the pump-rail pipe and the high pressure pump using a lock wrench.



Note:

Make preparations for fuel outflow. Clean with new cloths.

Insert the correct blanking plugs.

K9K, and 764

II - REMOVAL OF PART CONCERNED

112792

❑ Remove:

- the injector rail mounting nuts (**16**) ,
- the injector rail.

> **WARNING**
> If the injection rail is to be reused, keep it in a sealed plastic bag all the time it is disconnected.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

> **WARNING**
> Remove the blanking plugs only before reconnecting the fuel circuit pipes.
>
> The plugs are single-use only. Do not reuse them, and discard the kit once opened.

❑ Take the injector rail out of its plastic bag.

> **WARNING**
> If an injector rail is being replaced, only remove the new one from its original packaging when it is about to be fitted.

II - REFITTING PART CONCERNED

❑ Fit the injector rail.

❑ Finger tighten the injection rail mounting bolts (the injection rail should be loose).

III - FINAL OPERATION.

❑ Remove the blanking plugs from:

- the high pressure pump,
- the injection rail fuel inlet opening.

❑ Fit a new high pressure pipe between the injector rail and the high pressure pump.

> Note:
> If the new pipe kit does not contain an applicator, lubrication of the pipe threads will be unnecessary (as they are self-lubricating pipes).

❑ Finger tighten the high pressure pipe nuts until they make contact.

❑ Remove the blanking plugs from:

- the rail injector fuel return openings,
- the injector fuel inlet.

❑ Fit the new high pressure pipes between the rail and the injectors.

> Note:
> If the new pipe kit does not contain an applicator, lubrication of the pipe threads will be unnecessary (as they are self-lubricating pipes).

❑ Finger tighten the high pressure pipe nuts until they make contact.

❑ Torque tighten:

- the **injector rail mounting nuts (28 Nm)**,
- the **high pressure pipe nuts between the injector rail and the injectors (24 Nm)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting on the injector side,
- the **high pressure pipe nuts between the injector rail and the high pressure pump (24 Nm)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting on the high pressure pump side.

❑ Refit:

- the injector rail protector mounting,
- the mounting bolts from the injection rail protector mounting,
- the dipstick duct mounting bolts.
- the dipstick,
- the injector rail protector cover,
- injection rail protector cover mounting bolts,

❑ Refit the air inlet duct and tighten the mounting clip.

K9K, and 764

❏ Connect the inlet air pressure sensor

❏ Loosen the mounting nut securing the intercooler air inlet pipe to the alternator,

- fit the air duct between the turbocharger and the intercooler air inlet pipe,
- lock the air duct onto the turbocharger and the intercooler air inlet pipe.
- tighten the air duct bolt on the rocker cover,
- torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ Reprime the fuel circuit.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Confirm that there is no diesel fuel leak:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- check that there are no diesel leaks.

❏ Use the **Diagnostic tool** to check for stored faults. Clear them if necessary.

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Equipment required
Diagnostic tool

WARNING

Before starting work on the vehicle, have to hand:

- a new blanking plug kit (**part no. 77 01 206 804**),
- cleaning wipes (**part no. 77 11 211 707**),
- cleaning product (**part no. 77 11 224 188**).

WARNING

Parts always to be replaced:

- all the high pressure pipes which have been removed.

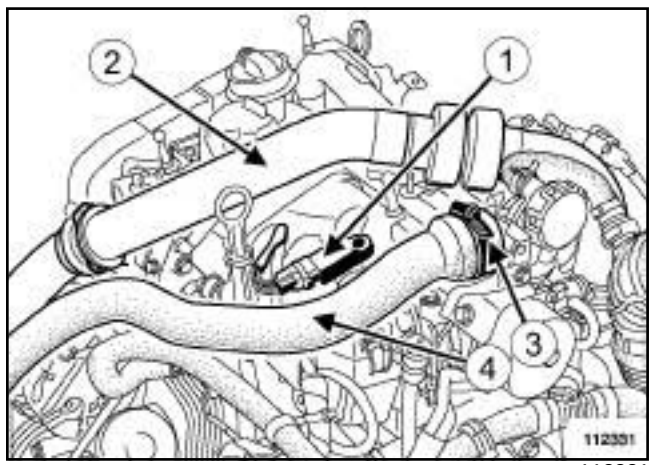
REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Position the vehicle on a lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❑ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

IMPORTANT



Before carrying out any work on the injection system, check using the **Diagnostic tool** :

- that the rail is not under pressure,
- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.

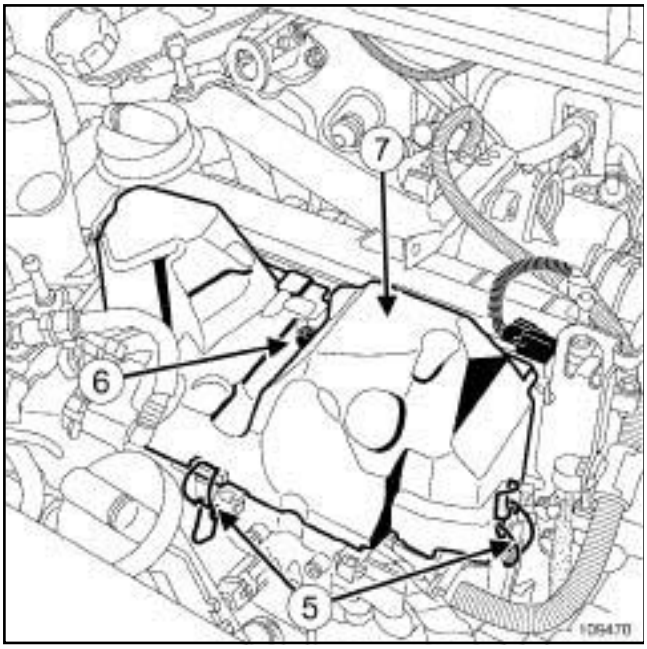
112331

❑ Disconnect the inlet air pressure sensor (**1**)

K9K, and 750 or 766 or 768

❑ Remove the upper section (**2**) of the turbocharging duct.

❑ Loosen the clip (**3**) .



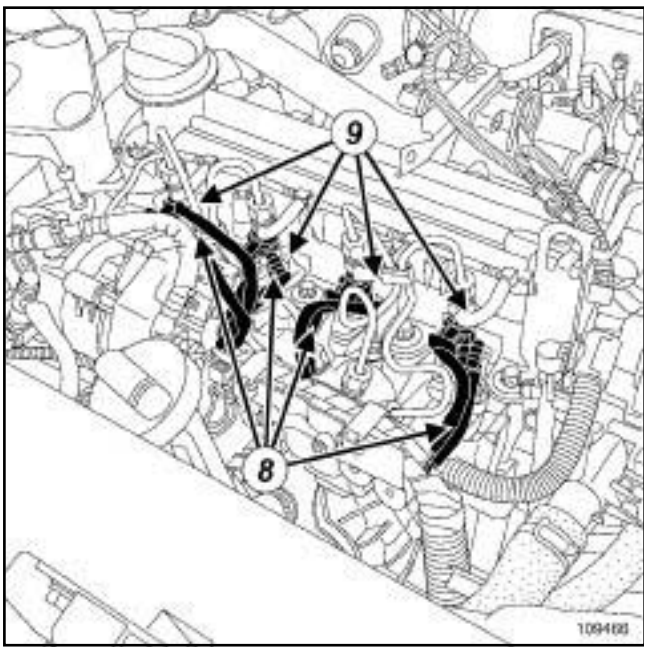
❑ Move the inlet duct to one side (**4**) .

❑ Remove:

- the dipstick,
- the dipstick tube bolts.

❑ Move the dipstick duct to one side.

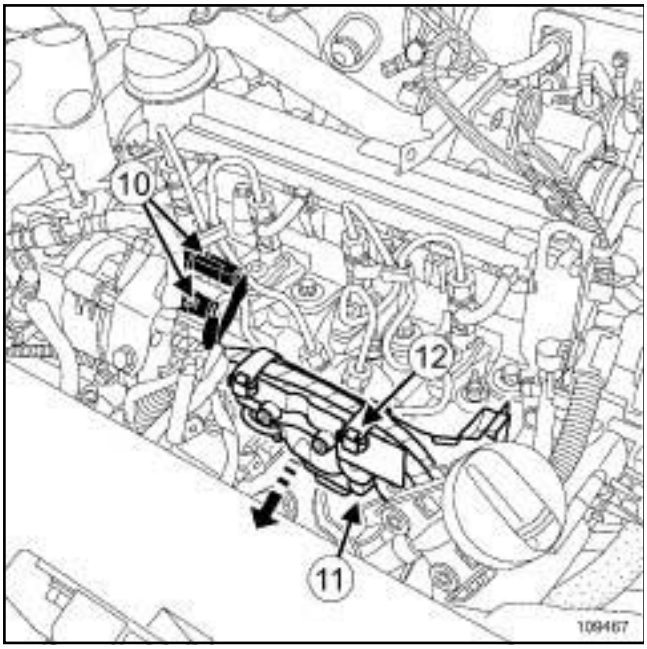
K9K, and 750 or 752 or 766 or 768



109470

❏ Unclip the clips (**5**) from the injector rail protector cover.

❏ Remove:



- the injector rail protector cover bolt (**6**) ,
- the injection rail protector cover (**7**) ,

109466

❏ Disconnect the connectors from the injectors (**8**) and the heater plugs (**9**) .

K9K, and 750 or 752 or 766 or 768

109467

❑ Disconnect:

- the connectors (**10**) from the fuel flow actuator and the diesel temperature sensor,
- the pressure sensor (**11**) from the spherical injector rail,

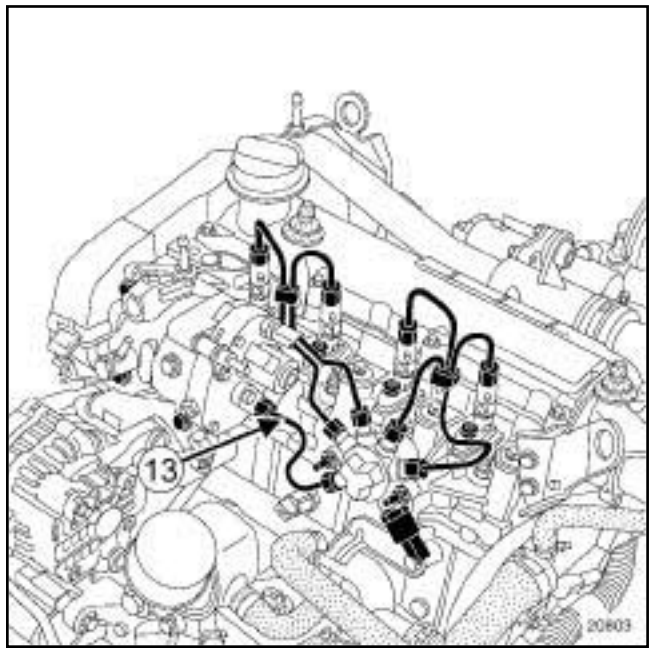
❑ Move the electric wiring harness and neck to the side as shown by the arrow.

❑ Remove the mountings from the neck (**12**) fixed on the spherical rail.

❑ Protect the alternator from fuel outflow.

❑ Pour cleaning product into a container.

IMPORTANT
Wear protective gloves when using cleaning product.



❑ Soak the brush with cleaning product, then clean the unions:

- of the high pressure pipes between the injector rail and the injectors
- of the high pressure pipe between the pump and the injection rail.

❑ Blast the cleaned areas with compressed air, then wipe them with new cleaning cloths.

IMPORTANT
Wear protective glasses.

WARNING
Do not blast with compressed air once the fuel circuit is open, otherwise impurities may enter the system. Use cloths if necessary.

20803

❑ Remove the clips between the high pressure pipes.

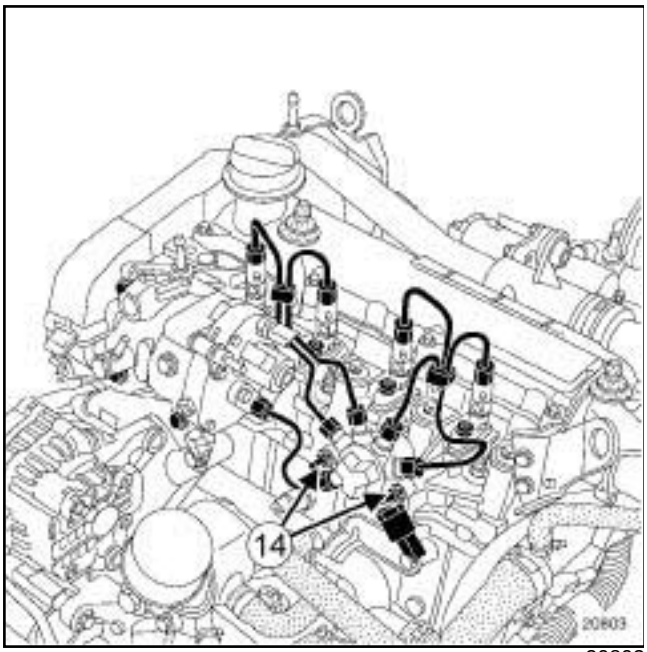
❑ Undo:

- the nut securing the high pressure pipes between the injection rail and the injector,

❑ Remove the four high pressure pipes and discard.

Note:
Make preparations for fuel outflow. Clean with new cloths.

❑ Fit the blanking plugs.



❑ Remove the high pressure pipe between the high pressure pump and the injector rail ***(13)*** .

Note:
Make preparations for fuel outflow. Clean with new cloths.

❑ Fit the blanking plugs.

K9K, and 750 or 752 or 766 or 768

II - REMOVAL OF PART CONCERNED

20803

❑ Remove:

- the nuts (**14**) from the injector rail,
- the injector rail.

> **WARNING**
> If the injector rail is to be reused, keep it in a sealed plastic bag all the time it is disconnected.

REFITTING

I - REFITTING PREPARATION OPERATION

❑

> **WARNING**
> Only remove the blanking plugs immediately before connecting the fuel circuit pipes.
>
> The plugs are single-use. Do not reuse them, and discard the whole kit once opened.

❑ Take the injector rail out of its plastic bag.

> **WARNING**
> If an injector rail is being replaced, only remove the new one from its original packaging when it is about to be fitted.

II - REFITTING PART CONCERNED

❑ Fit the injector rail.

❑ Screw on the injector rail bolts without tightening them (the rail should be loose).

III - FINAL OPERATION.

❑ Remove the blanking plugs from:

- the high pressure pump,
- the injection rail fuel inlet opening.

❑ Fit a new high pressure pipe between the injector rail and the high pressure pump.

> Note:
> If the new pipe kit does not contain an applicator, lubrication of the pipe threads will be unnecessary (as they are self-lubricating pipes).

❑ Screw on the high pressure pipe nuts by hand until contact is made, but without tightening them.

❑ Remove the blanking plugs from:

- the rail injector fuel return openings,
- the injector fuel inlet.

❑ Fit the new high pressure pipes between the rail and the injectors.

> Note:
> If the new pipe kit does not contain an applicator, lubrication of the pipe threads will be unnecessary (as they are self-lubricating pipes).

❑ Screw on the high pressure pipe nuts by hand until contact is made, but without tightening them.

❑ Torque tighten:

- the **injector rail nuts (28 Nm)**,
- the **high pressure pipe nuts between the injector rail and the injectors (24 Nm)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting on the injector side,
- the **high pressure pipe nuts between the injector rail and the high pressure pump (24 Nm)** using the **(Mot. 1746)** or **(Mot. 1566)**, starting on the high pressure pump side.

❑ Refit:

- the wiring harness with the neck,
- the channel mountings,
- the dipstick duct bolts,
- the dipstick,
- the injector rail protector cover,

K9K, and 750 or 752 or 766 or 768

- the injector rail protector cover bolt.

❏ Connect the electrical connectors.

❏ Refit the air inlet duct and tighten the mounting clip.

❏ Connect the inlet air pressure sensor

K9K, and 750 or 766 or 768

❏ Loosen the intercooler inlet air pipe nut on the alternator.

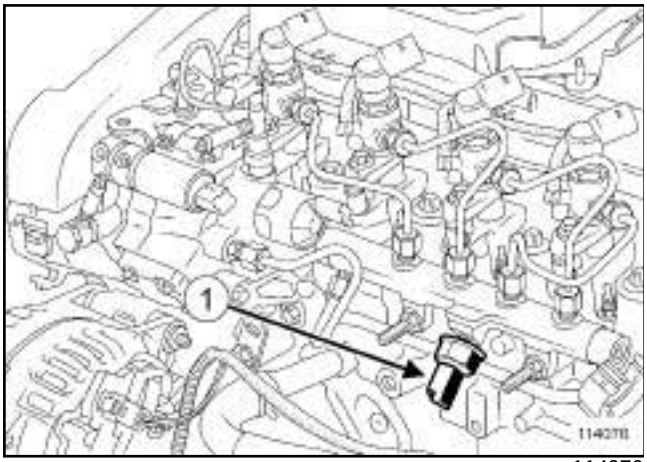
❏ Fit the air duct between the turbocharger and the intercooler inlet air pipe.

❏ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ Reprime the fuel circuit.



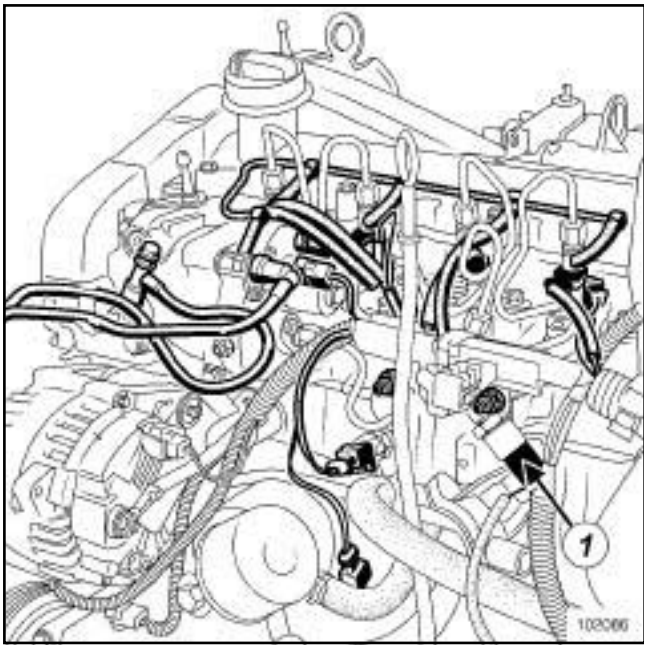
❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- check that there are no diesel leaks.

❏ Use the **Diagnostic tool** to check for stored faults. Clear them if necessary.

K9K, and 764 or 772



114076

The injector rail pressure sensor (**1**) cannot be separated from the injector rail.

In the event of a fault on the rail pressure sensor, replace the “rail pressure sensor - injector rail and high pressure pipes” assembly (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) .

K9K, and 750 or 752 or 766 or 768

102086

❑ The pressure sensor (**1**) cannot be removed from the spherical injector rail.

If the pressure sensor is faulty, replace the « pressure sensor - high pressure pipes and rail » assembly (see **13B**, **Diesel injection**, **Injector rail: Removal - Refitting**, page **13B-64**) .

K9K, and 750 or 752 or 766 or 768

Tightening torques ▽	
diesel temperature sensor	**15 N.m**
nut mounting the intercooler inlet air pipe on the alternator	**8 N.m**

IMPORTANT

Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the injector rail is not under pressure,

- that the fuel temperature is not too high.

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system.

Loosening a high pressure pipe union when the engine is running is strictly prohibited.

WARNING

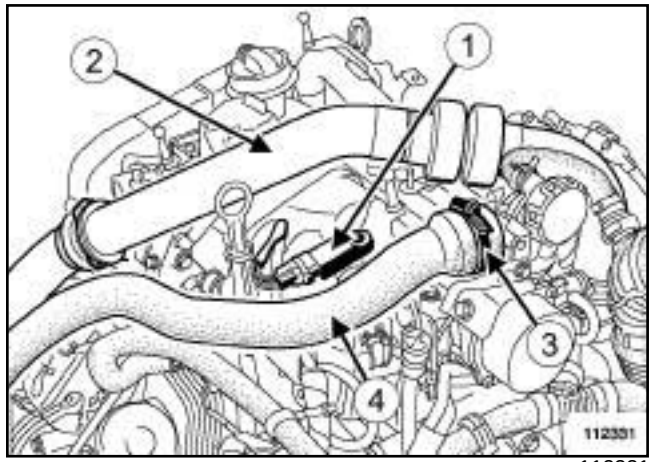
Before starting work on the vehicle, obtain:

- a new blanking plug kit (**part no. 77 01 206 804**),

- cleaning cloths (**part no. 77 11 211 707**).

It is essential to respect the safety and cleanliness advice whenever work is carried out on this system (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

REMOVAL

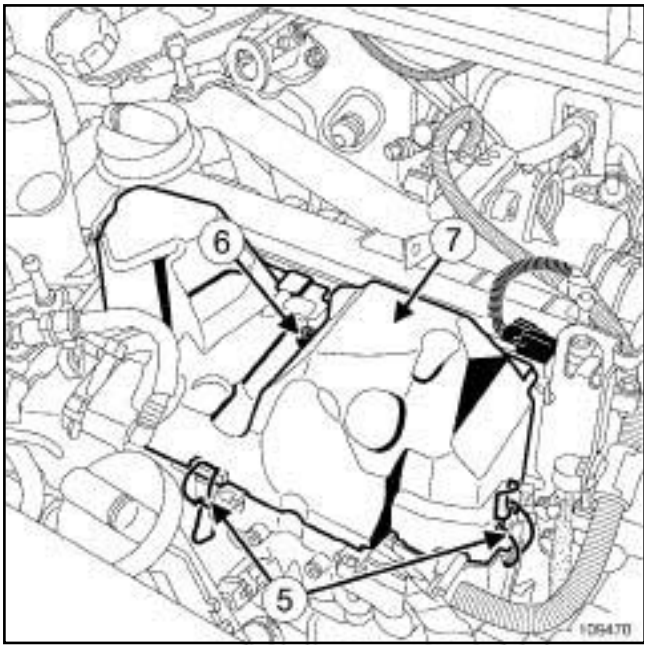
I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Remove the front engine cover.

112331

❑ Disconnect the inlet air pressure sensor (**1**) .



K9K, and 750 or 766 or 768

❑ Remove the upper section of the turbocharger air duct (**2**) .

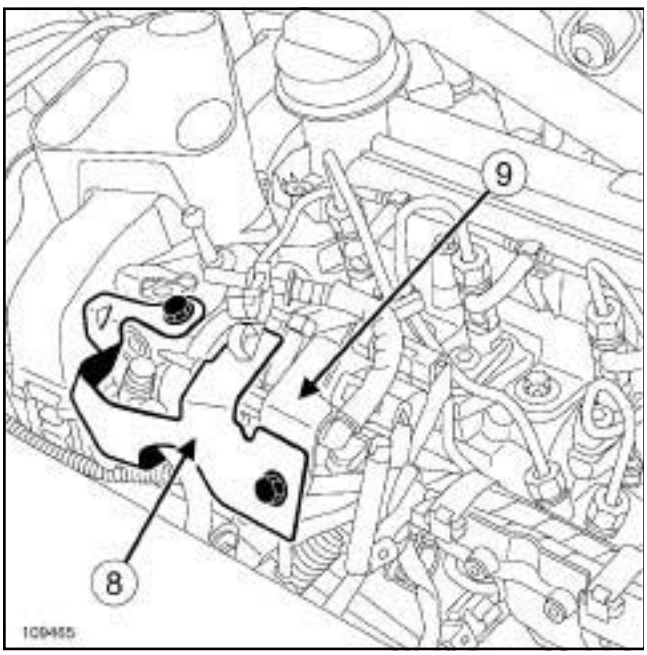
❑ Loosen the clip (**3**) .

❑ Move the inlet air duct to one side (**4**) .

K9K, and 750 or 752 or 766 or 768

109470

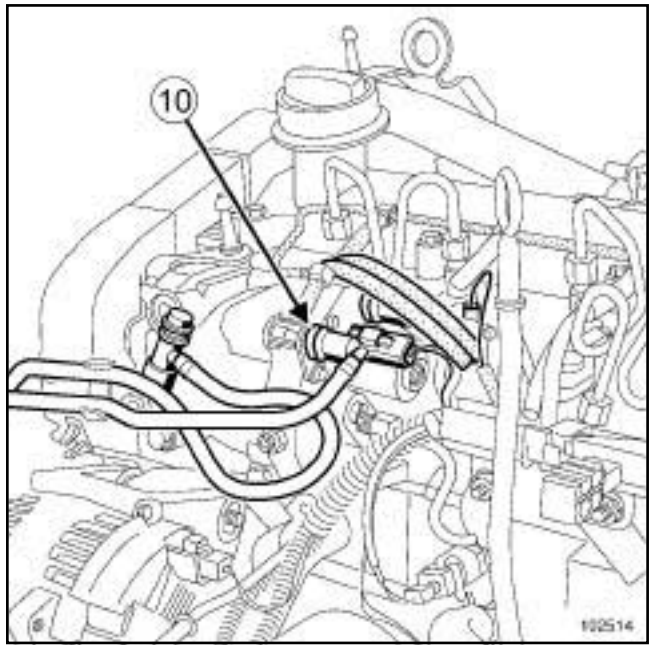
❏ Remove:



- the dipstick,
- the dipstick duct bolts.

❏ Move the dipstick duct to one side.

❏ Unclip the clips (**5**) from the injector rail protector.

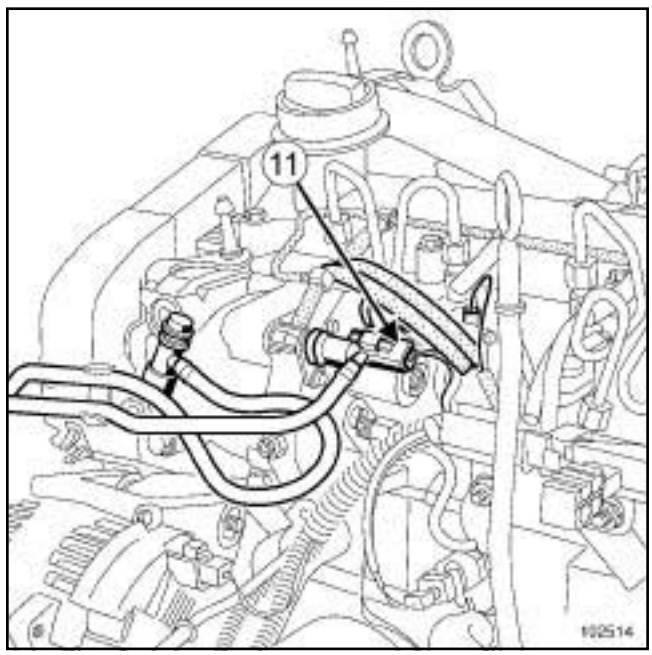


❏ Remove:

- the injector rail protector bolt (**6**) ,
- the injector rail protector (**7**) .

109465

❏ Remove the high pressure pump protectors (**8**) and (**9**) .



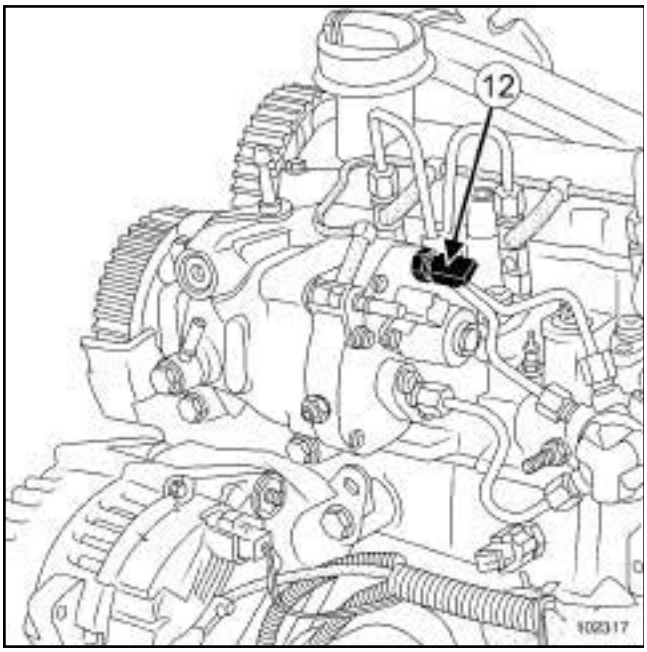
102514

❏ Disconnect the diesel supply and return pipes (**10**) .

Note:

Make preparations for fuel outflow. Clean with new cloths.

❏ Fit the correct blanking plugs.



102514

❏ Disconnect the diesel temperature sensor connector (**11**) .

K9K, and 750 or 752 or 766 or 768

II - REMOVAL OF PART CONCERNED

102317

❑ Remove the diesel temperature sensor (**12**) .

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Lubricate the O-ring with lubricant from the applicator supplied with the new part.

Note:

Do not lubricate the diesel temperature sensor seals with grease or used diesel. Use the applicator supplied with the kit.

WARNING

Do not damage the O-ring when refitting.

Do not remove the blanking plugs from each component until the last moment.

II - REFITTING PART CONCERNED

❑ Refit the diesel temperature sensor.

❑ Tighten to torque the **diesel temperature sensor (15 N.m)**.

III - FINAL OPERATION

❑ Reconnect:

- the diesel temperature sensor connector ,
- the diesel supply and return pipes.

❑ Refit:

- the high pressure pump protectors,
- the injector rail protector.

❑ Connect the inlet air pressure sensor.

K9K, and 750 or 766 or 768

❑ Refit the air inlet duct and tighten the clip.

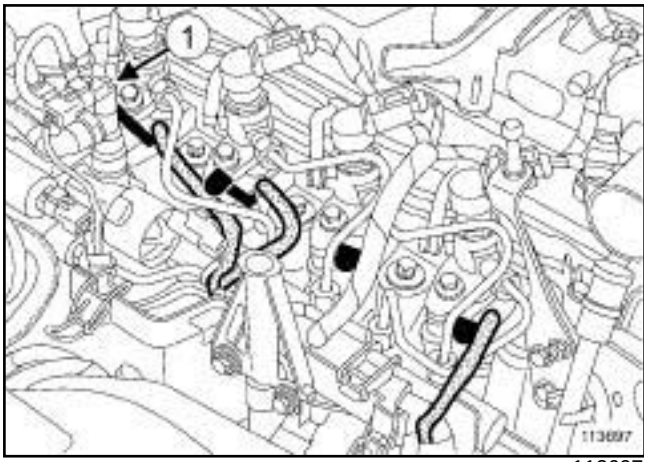
❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.



❑ Refit the engine cover.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Check that there are no diesel leaks:

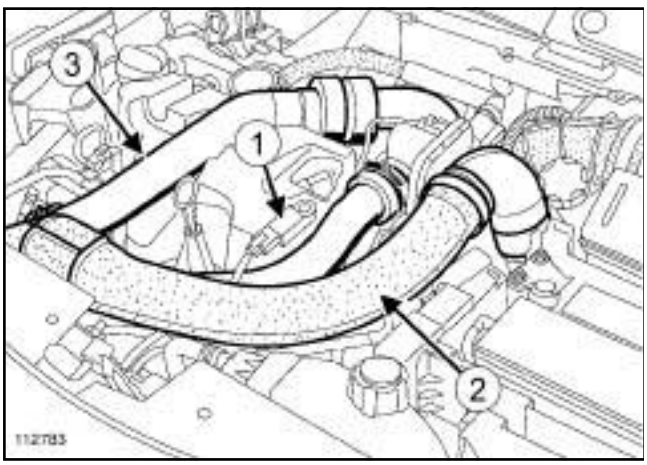
- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- run the engine at idle speed until the engine cooling fan starts operating,
- accelerate several times at no load,
- switch off the ignition,
- check that there is no diesel fuel escaping.

K9K, and 764 or 772

113697

❑ The diesel temperature sensor (**1**) is integral with the diesel return pipe. If the temperature sensor fails, replace the « temperature sensor-diesel return pipe assembly » (see **13B, Diesel injection, Diesel return pipe: Removal - Refitting**).

K9K, and 750 or 752 or 764 or 766 or 768



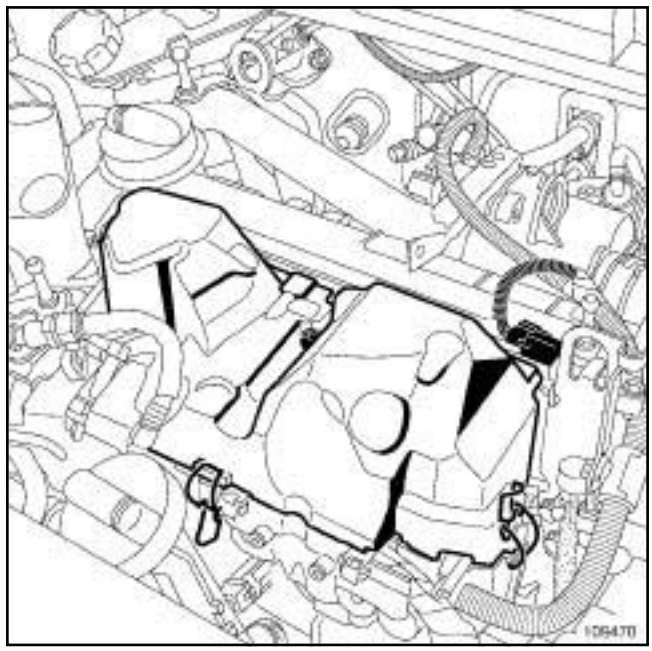
Special tooling required	
Mot. 1771	Kit for measuring SIEMENS injector leakage flow rate.
Mot. 1711	Kit for measuring the injector fuel flow rate.

Tightening torques ▽	
nut mounting the inter-cooler inlet air pipe on the alternator	**8 N.m**

Note:

Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).



112783

❏ Disconnect the inlet pressure sensor (**1**) .

❏ Remove the air duct (**3**) between the intercooler and the turbocharger.

K9K, and 750 or 766 or 768

❏ Remove the air duct (**2**) between the air filter and the intercooler.

109470

❏ Unclip the cover of the diesel rail protector.

❏ Remove:

- the diesel anti-splash shield bolt,

- the diesel anti-splash shield.

K9K, and 764

❏ Disconnect the four return pipes from the four injectors (see **Diesel injector fuel return rail: Removal - Refitting**) .

❏ Connect the four transparent hoses of the **(Mot. 1771)** to the injectors instead of the injector fuel return pipes.

❏ Place the correct blanking plug on the injector fuel return connectors.

K9K, and 766 or 768

❏ Connect the four transparent hoses of the **(Mot. 1711)** to the injectors instead of the injector fuel return pipes.

❏ Place the correct blanking plug on the injector fuel return connectors.

❏ Insert these hoses in the four graduated measuring cylinders of the **(Mot. 1711)**.

K9K, and 750 or 752 or 764 or 766 or 768

❑ Refit the air duct between the air filter and the intercooler.

K9K, and 750 or 766 or 768

❑ Loosen the intercooler inlet air pipe nut on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❑ Connect:

- the inlet pressure sensor,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Follow the procedures described in the fault finding repair manual (see **MR 394 Fault finding, 13B, Diesel injection, Fault finding - Tests**):

- TEST 6: Major leak in injectors / injectors open,
- TEST 7: Incorrect injection quantity.

IMPORTANT

Do not leave any object (tools or other) on the side of the engine housing during the entire operation.

Position the tools so that they do not fall during the « engine running » phase of the test.

K9K, and 750 or 752 or 766 or 768

❑ To configure the injectors, (see **MR 394 Fault finding, Diesel Injection, Configuration and programming**).

K9K, and 764 or 772

Special tooling required	
Mot. 1817	Injector well cleaning kit
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1566	Tool for removing high pressure pipes.

Equipment required
Diagnostic tool

Tightening torques ▽	
injector bracket bolt	**30 N.m**
high pressure pipe union on the injector rail side	**24 N.m**
high pressure pipe union on the injector side	**24 N.m**
intercooler air inlet pipe nut on the alternator	**8 N.m**
injector rail bolts	**28 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

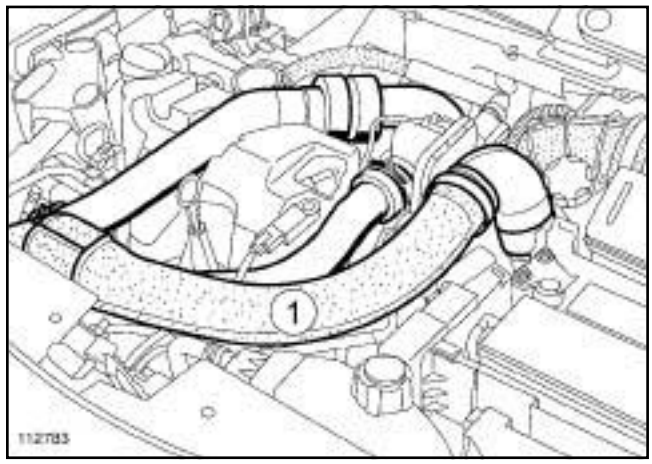
- (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) ,
- (see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

REMOVING AN INJECTOR

I - REMOVAL PREPARATION OPERATION

❑ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

IMPORTANT

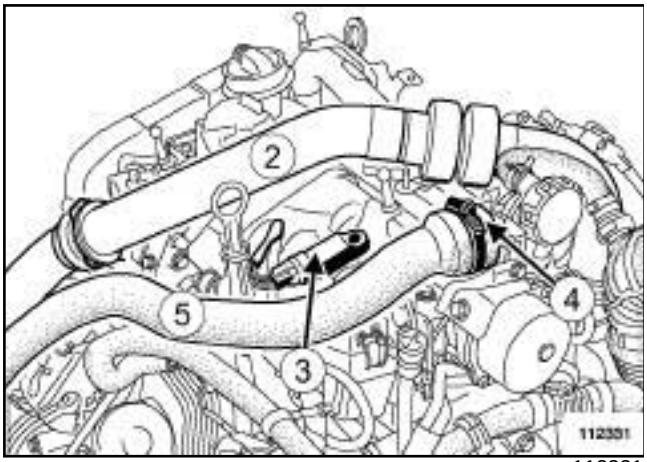


Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the rail is not under pressure,
- that the fuel temperature is not too high.

Working on the circuit with the engine running is strictly forbidden.

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

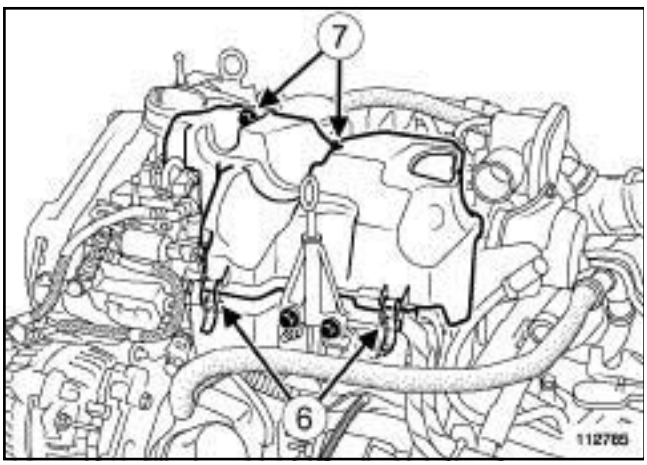


❑ Remove the engine cover.

112783

❑ Remove the air inlet sleeve (**1**) .

K9K, and 764 or 772



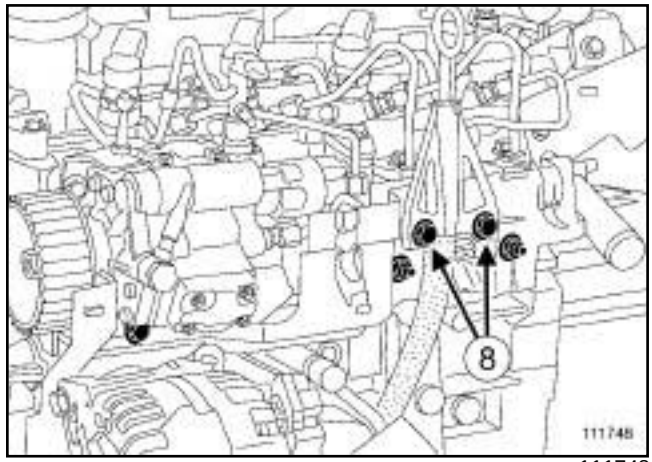
112331

❏ Remove the turbocharging duct (**2**) .

❏ Disconnect the inlet pressure sensor connector (**3**) .

❏ Loosen the inlet duct clip (**4**) .

❏ Move the air inlet duct (**5**) to one side.

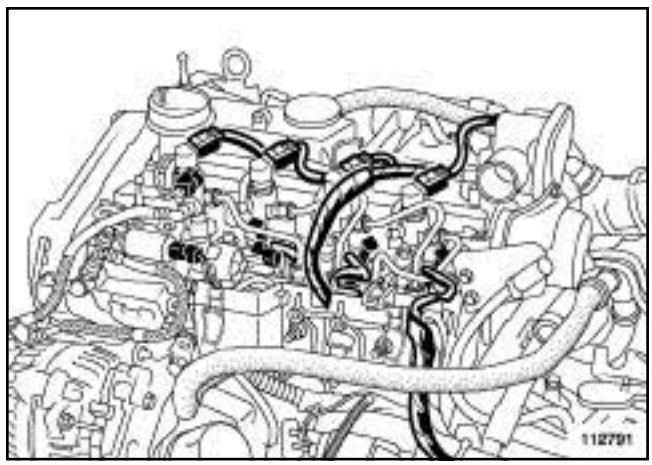


112785

❏ Unclip the rail protector cover at (**6**) .

❏ Remove:

- the bolts (**7**) from the rail protector cover,
- the rail protector cover,
- the dipstick.

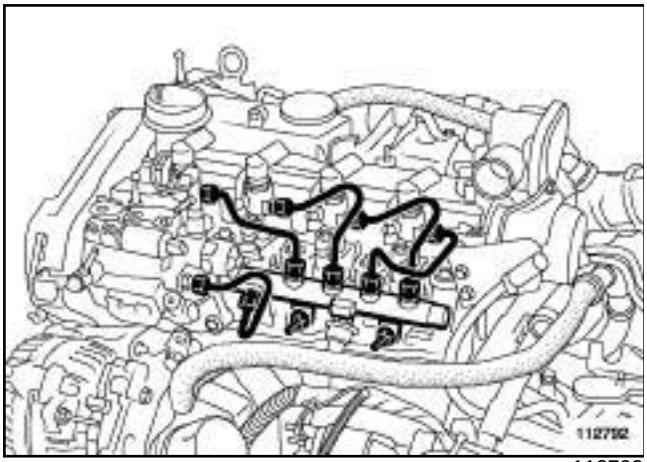


111748

❏ Remove the bolts (**8**) of the dipstick duct on the injector rail protector.

❏ Move the dipstick duct to one side.

❏ Protect the alternator from fuel outflow.



❏ Clean the high pressure pipes between the rail and the injectors, as well as the fuel return pipe (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

112791

❏ Disconnect the electrical connector of the injector to be removed.

K9K, and 764 or 772

112792

❏ Remove:

- the high pressure pipe union between the injector rail and the injector to be removed at the rail end,
- the high pressure pipe union between the injector rail and the injector to be removed at the injector end,

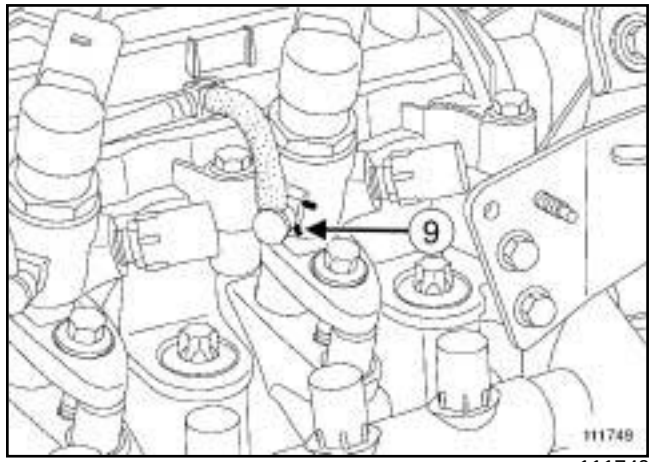
WARNING

Always hold the intermediate injector union in place with a wrench when loosening the high pressure pipes.

Do not damage the injector return nozzle.

❏ Remove the high pressure pipe concerned and discard it.

WARNING



To avoid any corrosion or damage, protect the areas on which fuel is likely to run.

WARNING

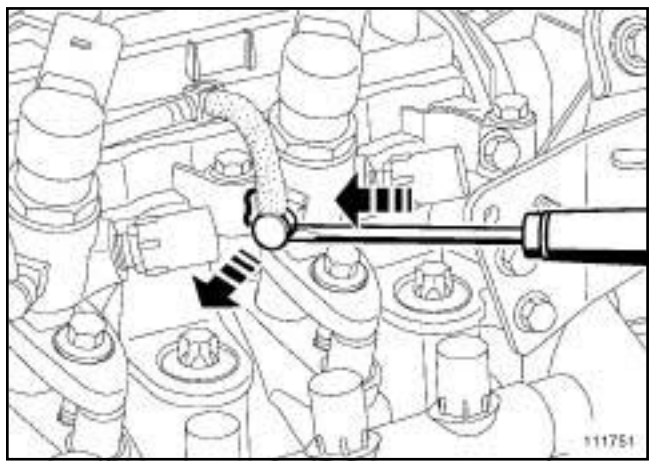
To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

❏ Insert the correct blanking plugs on the unions of:

- the injector fuel inlet,
- the injector rail fuel outlet.

111749

❏ Using a narrow, flat-blade screwdriver, push the lower bracket (**9**) of the retaining clip of the fuel return union on the injector towards the rocker cover.



WARNING

Do not use the screwdriver as a lever on the injector fuel return unions.

WARNING

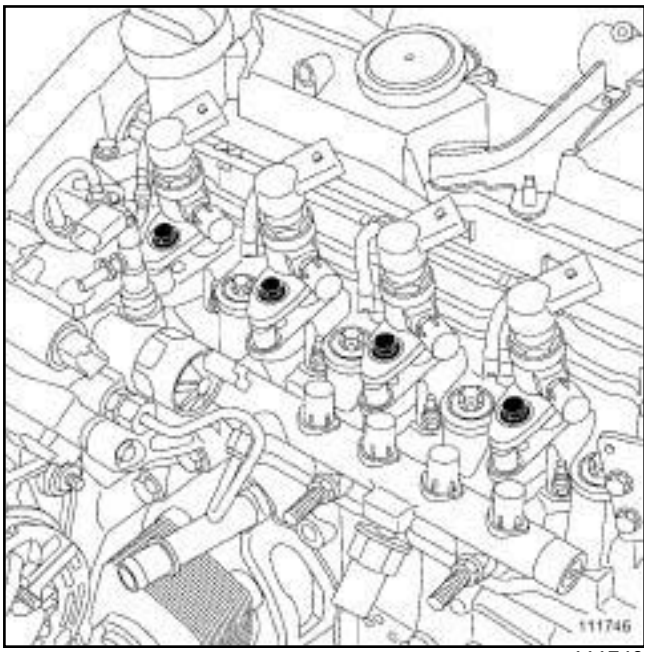
Ensure that the clip is not completely removed from its housing, otherwise it may be damaged when the diesel return union is removed.

In the case where a clip has been completely removed from its housing, remove the injector concerned and replace the clip with a new clip (see **13B**, **Diesel injection**, **Diesel injector: Removal - Refitting**, page **13B-83**) .

111751

❏ Pushing the lower bracket of the retaining clip downwards, pull out the injector fuel return union.

❏ Fit suitable blanking plugs on:



- the fuel return union,

K9K, and 764 or 772

- the return fuel connector of the injector.

❏ Push the fuel return pipe on the injector to one side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

111746

❏ Remove:

- the bolts on the injector bracket to be removed,
- the injector bracket,
- the spacer,
- the injector.

❏ Remove the heat protection washer.

Note:

If the heat protection washer is stuck at the bottom of the well, use the **(Mot. 1817)** (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

Note:

If the injector is stuck in its well and cannot be removed, turn the injector by the retaining lugs on the injector bracket, using a **13 mm fork wrench**.

❏ Fit the appropriate blanking plug on the injector's nose.

❏ If it is to be reused, keep the injector in a sealed plastic bag all the time it is removed.

❏ Take care not to allow impurities to enter the cylinder via the injector well.

❏ Block the opening with a clean cloth.

REFITTING AN INJECTOR

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: injector seal (11,11, 02,02)**.

❏ **parts always to be replaced: High pressure pipe (11,05,03,03)**.

❏ Parts always to be replaced:

- any injector that has been opened, contrary to instructions,
- all retaining clips on the fuel return union on the damaged injector.

Cleaning parts

❏

WARNING

It is strictly forbidden to clean the injectors with:

- a wire brush,
- an emery cloth,
- an ultrasonic cleaner.

❏ Always clean the well of the removed injector (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

❏ If reusing the removed injector:

- clean the injector using a wipe soaked in injector cleaning product or brake cleaner,
- if necessary, leave the injector nozzle to soak in injector cleaning product,
- wipe the injector with a new wipe,
- (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

K9K, and 764 or 772

II - REFITTING OPERATION FOR PART CONCERNED

❏ Remove the injector from its plastic bag.

> **WARNING**
> Do not remove the blanking plugs from each component until the last moment.
>
> Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

❏ Remove the blanking plug from the injector nose.

❏ Fit in order:

- a new fire-resistant washer at the bottom of the injector's well in the cylinder head,
- the injector,
- the spacer between the cylinder head and the injector bracket,
- the injector bracket,

❏ Finger tighten the injector bracket bolt.

❏ Torque tighten the **injector bracket bolt (30 N.m)**.

III - FINAL OPERATION

❏ Remove the blanking plugs from:

- the injector rail,
- the injector

> **WARNING**
> Before fitting a new high pressure pipe, lightly lubricate the nut threads with the oil from the applicator provided in the new parts kit.
>
> Be careful not to allow oil into the high pressure pipe.
>
> Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

❏ Fit a new high pressure pipe between the injector rail and the injector.

❏ Finger tighten the high pressure pipe unions, starting at the injector rail end.

❏ Torque tighten in order, using the **(Mot. 1746)** or **(Mot. 1566)** :

- the **high pressure pipe union on the injector rail side (24 N.m)**,
- the **high pressure pipe union on the injector side (24 N.m)**.

❏ Remove the blanking plugs from:

- the fuel return union,
- the return fuel port of the injector.

❏ Push the retaining clip for the fuel return union on the injectors towards the front of the vehicle until it is in its original position.

❏ Clip the fuel return union on the injector.

> **WARNING**
> Check the condition of the seals on the fuel return unions on the injectors. Check that they are not cut or crushed, and have not come out of their grooves. Replace the diesel return pipe assembly if one of its components is damaged.

❏ Replace the fuel return pipe assembly if one of its components is damaged.

❏ Connect the injector's electrical connector.

❏ Refit:

- the dipstick,
- the rail protector cover,
- the air duct between the intercooler and the cut-out valve.

❏ Loosen the intercooler air inlet pipe nut on the alternator.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Snap the air duct to the turbocharger and to the air pipe at the intercooler inlet.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **intercooler air inlet pipe nut on the alternator (8 N.m)**.

❏ Refit the engine cover.

❏ Reprime the fuel circuit using the manual priming pump.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Before restarting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

❏ Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,

K9K, and 764 or 772

- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- check that there is no diesel fuel escaping.

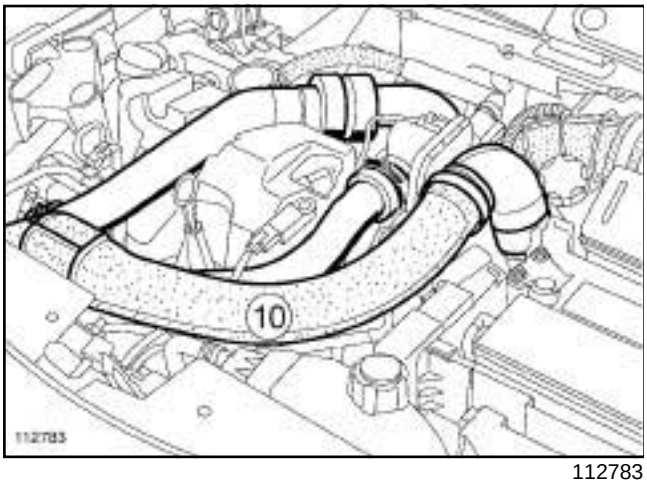
❏ Use the **Diagnostic tool** to check that there are no stored faults, and clear them if necessary.

REMOVING ALL FOUR INJECTORS

I - REMOVAL PREPARATION OPERATION

❏ Switch off the ignition and wait **30 seconds** before starting work on the injection system.

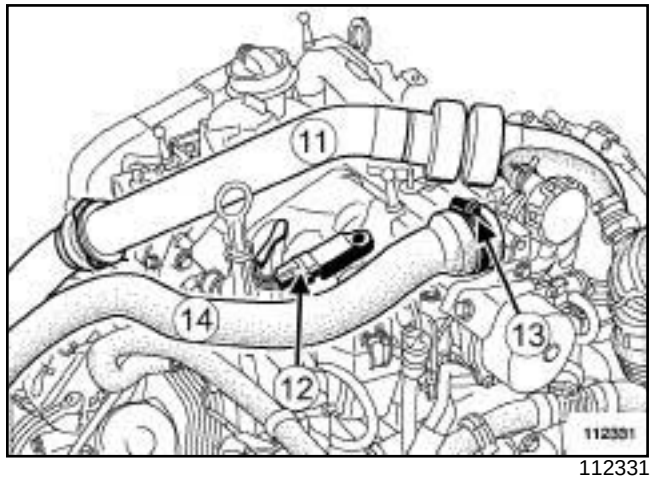
IMPORTANT



Use the diagnostic tool before any operation is carried out on the injection circuit to check:

- that the rail is not under pressure,
- that the fuel temperature is not too high.

Working on the circuit with the engine running is strictly forbidden.

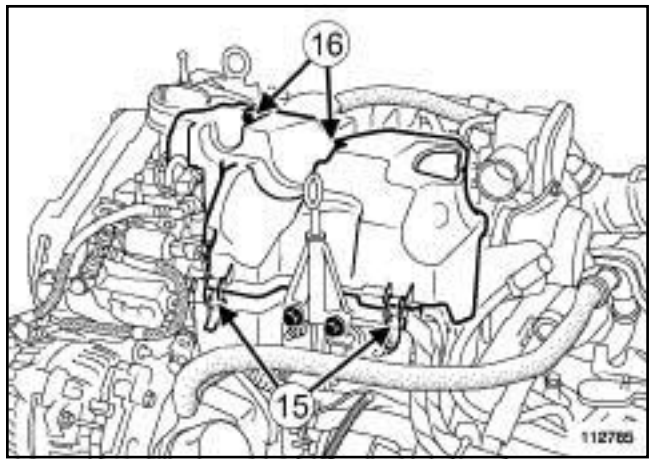


❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Remove the engine undertray.

112783

❏ Remove the air inlet sleeve (**10**) .



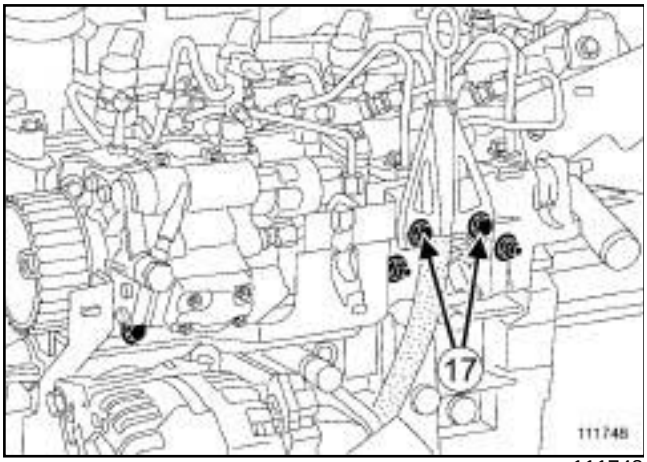
112331

❏ Remove the turbocharging duct (**11**) .

❏ Disconnect the inlet pressure sensor connector (**12**) .

❏ Loosen the inlet duct clip (**13**) .

❏ Move the air inlet duct (**14**) to one side.



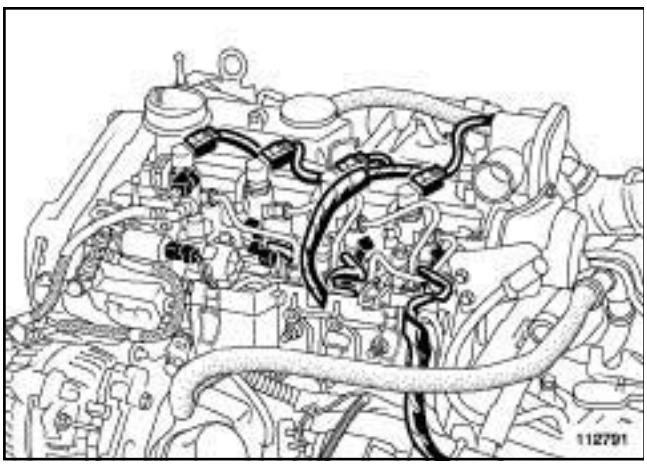
112785

❏ Unclip the rail protector cover at (**15**) .

❏ Remove:

- the bolts (**16**) from the rail protector cover,
- the rail protector cover,
- the dipstick.

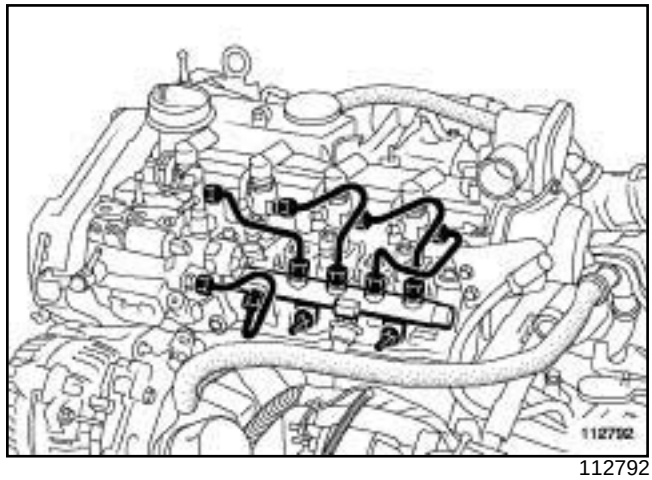
K9K, and 764 or 772



111748

❏ Remove the bolts (**17**) of the dipstick duct on the injector rail protector.

❏ Move the dipstick duct to one side.



❏ Protect the alternator from fuel outflow.

❏ Clean the high pressure pipes between the rail and the injectors, as well as the fuel return pipe (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

112791

❏ Disconnect the injector electrical connectors.

112792

❏ Remove:

- the high pressure pipe unions between the injector rail and the injectors at the rail end,
- the high pressure pipe unions between the injector rail and the injectors at the injector end,

WARNING

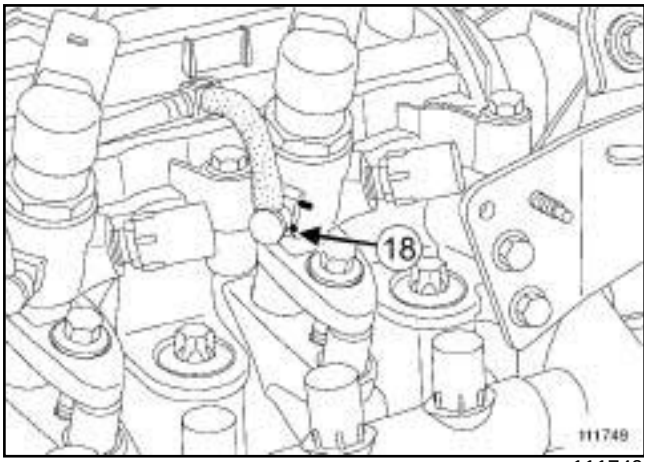
Always hold the intermediate injector union in place with a wrench when loosening the high pressure pipes.

Do not damage the injector return nozzle.

❏ Remove the high pressure pipes and discard.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

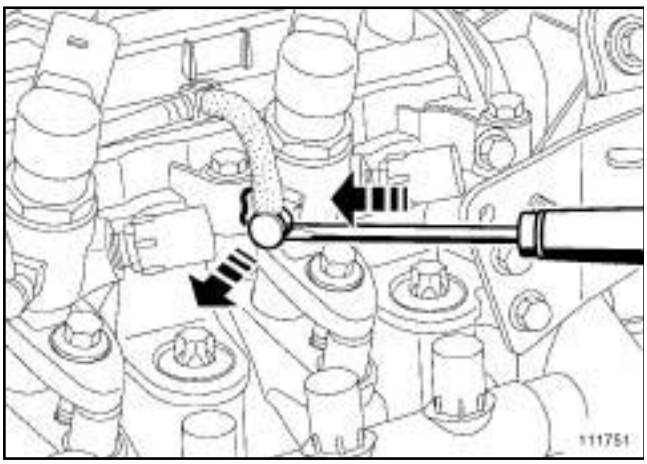
❏ Insert the correct blanking plugs on the unions of:

- the injector fuel inlet,
- the injector rail fuel outlet.

K9K, and 764 or 772

111749

❑ Using a narrow flat-blade screwdriver, push the lower brackets (**18**) of the fuel return union retaining clips on the injectors towards the rocker cover.



WARNING

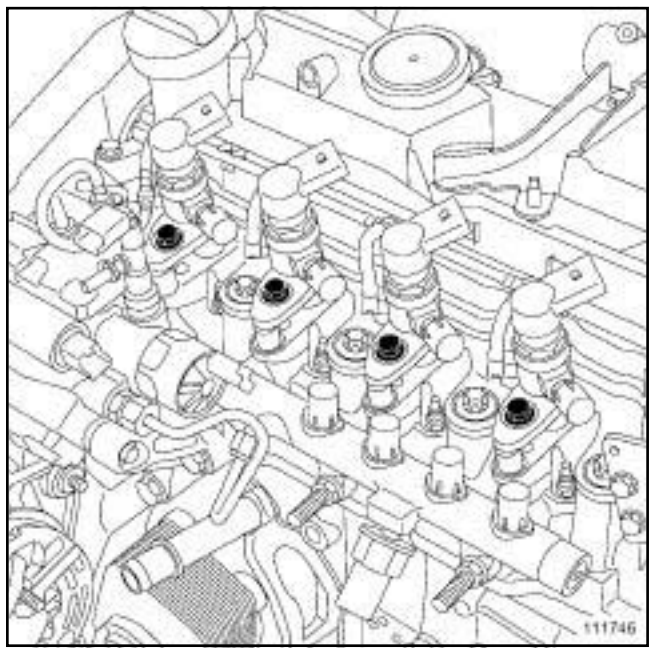
Do not use the screwdriver as a lever on the injector fuel return unions.

WARNING

Ensure that the clip is not completely removed from its housing, otherwise it may be damaged when the diesel return union is removed.

In the case where a clip has been completely removed from its housing, remove the injector concerned and replace the clip with a new clip (see **13B**, **Diesel injection**, **Diesel injector: Removal - Refitting**, page **13B-83**) .

111751



❑ Pushing the lower brackets of the retaining clips downwards, pull out the fuel return unions on the injectors.

❑ Fit suitable blanking plugs on:

- the fuel return unions,
- the fuel return openings on the injectors.

❑ Push the injector fuel return pipe to one side.

II - OPERATION FOR REMOVAL OF PART CONCERNED

111746

❑ Remove:

- the injector clamp bolts,
- the injector clamps,
- the spacers,
- the injectors.

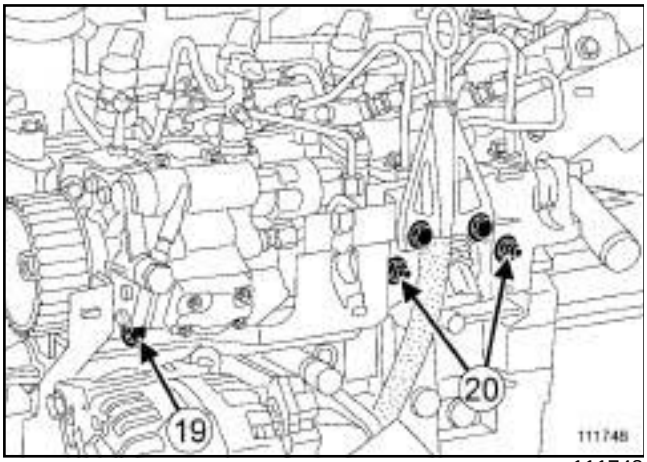
❑ Remove the heat protection washers.

Note:

If the compression washer is stuck at the bottom of the well, use the **(Mot. 1817)** (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

Note:

If the injector is stuck in its well and cannot be removed, turn the injector by the retaining lugs on the injector bracket, using a **13 mm fork wrench**.

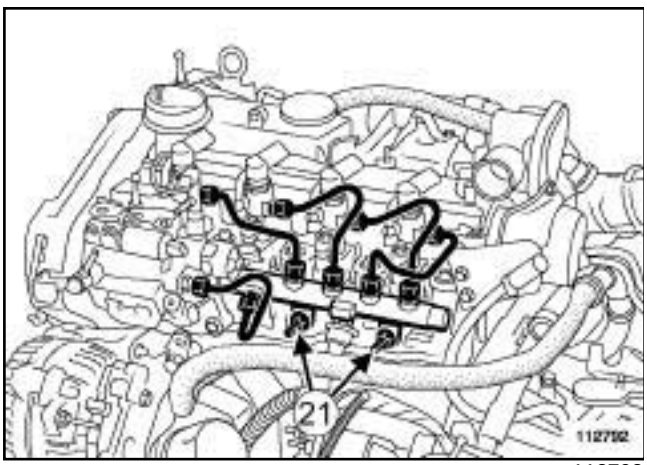


❑ Fit the correct blanking plugs on the injector noses.

K9K, and 764 or 772

❑ If they are to be reused, keep the injectors in a sealed plastic bag all the time they are removed.

❑ Take care not to allow impurities to enter the cylinders via the injector wells.



❑ Block the openings using clean cloths.

111748

❑ Remove:

- the bolt (**19**) and the nuts (**20**) of the rail protector,
- the rail protector.

112792

❑ Loosen the injector rail nuts (**21**) by a few turns.

Note:

The injector rail must be loose.

REFITTING THE FOUR INJECTORS

I - REFITTING PREPARATION OPERATION

❑ **parts always to be replaced: injector seal (11,11, 02,02)**.

❑ **parts always to be replaced: High pressure pipe (11,05,03,03)**.

❑ Parts always to be replaced:

- any injector that has been opened, contrary to instructions,
- all retaining clips on the fuel return union on the damaged injector.

Cleaning parts

❑

WARNING

It is strictly forbidden to clean the injectors with:

- a wire brush,
- an emery cloth,
- an ultrasonic cleaner.

❑ Always clean the well of the removed injectors **(Mot. 1817)** (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

❑ If reusing the removed injector:

- clean the injector using a wipe soaked in injector cleaning product or brake cleaner,
- if necessary, leave the injector nozzle to soak in injector cleaning product,
- wipe the injector with a new wipe,
- (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .

II - REFITTING OPERATION FOR PART CONCERNED

❑ Take the injectors out of their plastic bag.

WARNING

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

❑ Remove the blanking plug from the injector noses.

❑ Fit in order:

- new compression washers at the bottom of the injector wells in the cylinder head,
- the injectors,

K9K, and 764 or 772

- the spacers between the cylinder head and the injector brackets,
- the injector brackets.

❏ Finger tighten the injector bracket bolts.

❏ Torque tighten the **injector bracket bolts (30 N.m)**.

III - FINAL OPERATION

❏ Remove the blanking plugs from:

- the injector rail,
- the injectors.

> **WARNING**
> Before fitting a new high pressure pipe, lightly lubricate the nut threads with the oil from the applicator provided in the new parts kit.
>
> Be careful not to allow oil into the high pressure pipe.
>
> Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

❏ Fit the new high pressure pipes between the injector rail and the injectors.

❏ Finger tighten the high pressure pipe unions, starting at the injector rail end.

❏ Torque tighten the **injector rail bolts (28 N.m)**.

❏ Torque tighten in order, using the **(Mot. 1746)** or **(Mot. 1566)** :

- the **high pressure pipe unions on the injector rail side (24 N.m)**,
- the **high pressure pipe unions on the injector side (24 N.m)**.

❏ Remove the blanking plugs from:

- the fuel return unions,
- the fuel return openings on the injectors.

❏ Push the retaining clips for the fuel return unions on the injectors towards the front of the vehicle until they are in their original positions.

❏ Clip the fuel return unions on the injectors.

> **WARNING**
> Check the condition of the seals on the fuel return unions on the injectors. Check that they are not cut or crushed, and have not come out of their grooves. Replace the diesel return pipe assembly if one of its components is damaged.

❏ connect the electrical connectors to the injectors.

❏ Refit:

- the rail protector,
- the dipstick guide tube,
- the dipstick,
- the rail protector cover,
- the air duct between the intercooler and the cut-out valve.

❏ Loosen the intercooler inlet air pipe nut on the alternator.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Snap the air duct to the turbocharger and to the air pipe at the intercooler inlet.

❏ Refit the air duct bolt on the rocker cover.

❏ Torque tighten the **intercooler air inlet pipe nut on the alternator (8 N.m)**.

❏ Reprime the fuel circuit using the manual priming pump.

❏ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

❏ Before restarting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

❏ Check that there are no diesel leaks:

- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- check that there are no diesel leaks.

❏ Use the **Diagnostic tool** to check that there are no stored faults, and clear them if necessary.

❏ Refit the engine cover.

K9K, and 750 or 752 or 766 or 768

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Mot. 1817	Injector well cleaning kit

Equipment required
Diagnostic tool

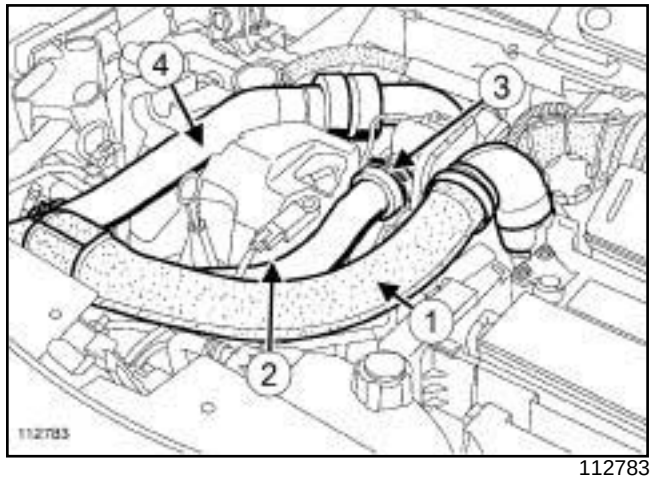
Tightening torques ▽	
injector clamp	**28 N.m**
injector rail nuts	**28 N.m**
« pump - rail» high pressure pipe nuts	**24 N.m**
« rail - injector» high pressure pipe nuts	**24 N.m**
nuts on the neck on the injector rail	**21 N.m**
intercooler inlet air pipe nut on the alternator	**8 N.m**

IMPORTANT

To avoid all risk of damage to the systems, apply the safety and cleanliness instructions and operation recommendations before carrying out any repair:

- (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) ,
- (see **Vehicle: Precautions for the repair**) (01D, Mechanical introduction).

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

REMOVAL

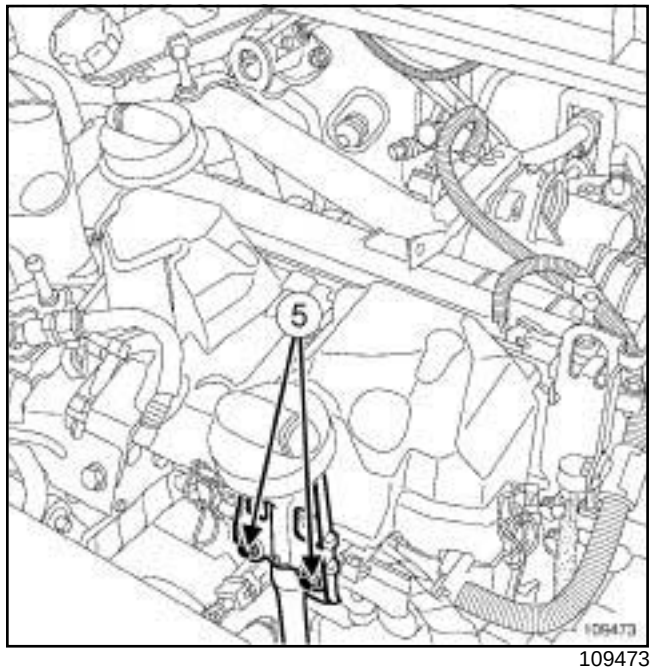
I - REMOVAL PREPARATION OPERATION

❏ Remove the front engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (80A, Battery).

112783

❏ Remove the air inlet duct (**1**) .



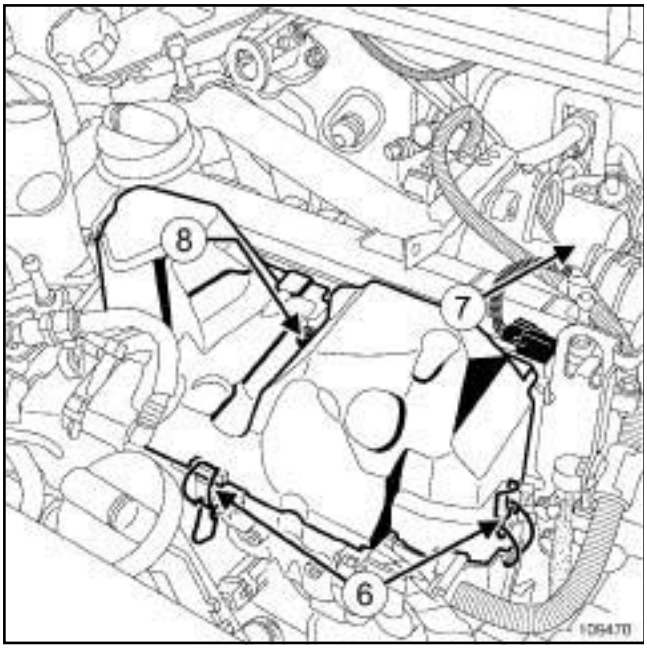
❏ Disconnect the turbocharger pressure sensor connector (**2**) .

K9K, and 750 or 766 or 768

❏ Loosen the clip of the air duct (**3**) between the intercooler and the damper valve.

❏ Move aside the air duct between the intercooler and the damper valve.

❏ Remove the stainless steel pipe (**4**) between the turbocharger and the intercooler.



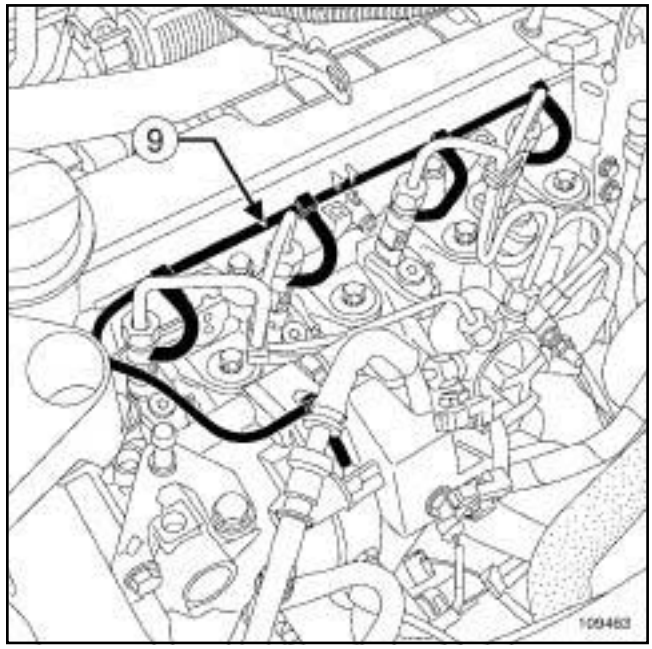
109473

❏ Remove the dipstick bolts (**5**) .

❏ Put the dipstick to one side.

K9K, and 750 or 752 or 766 or 768

109470



❏ Unclip the rail protector by the clips (**6**) .

❏ Remove:

- the engine cover bracket (**7**) on the flywheel end,
- the rail protector bolt (**8**) ,
- the rail protector.

❏ Disconnect:

- the heater plugs,
- injector connectors no. 3 and no. 4,
- injector connectors no. 1 and no. 2.

109463

❏

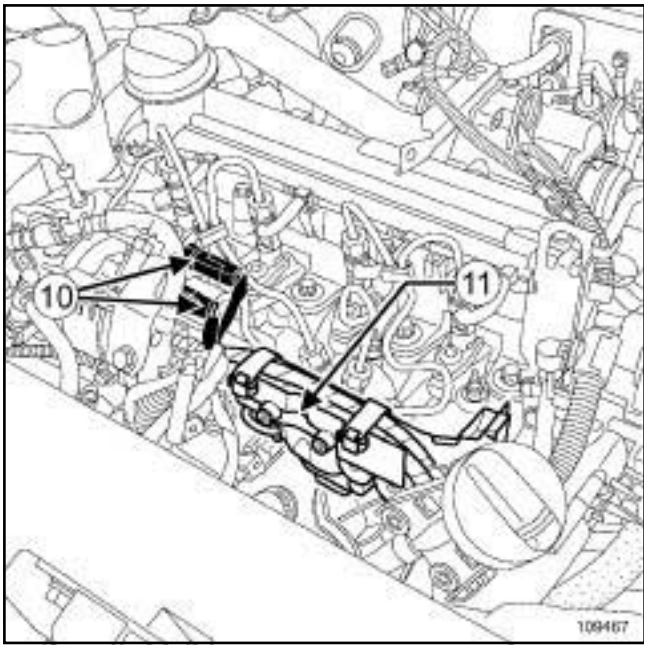
WARNING

Do not use the screwdriver as a lever on the injector fuel return unions.

WARNING

Ensure that the clip is not completely removed from its housing, otherwise it may be damaged when the diesel return union is removed.

In the case where a clip has been completely removed from its housing, remove the injector concerned and replace the clip with a new clip (see **13B**, **Diesel injection**, **Diesel injector: Removal - Refitting**, page **13B-83**) .



❏ Disconnect the injector diesel return pipe (**9**) .

WARNING

To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

❏ Fit plugs into the openings.

K9K, and 750 or 752 or 766 or 768

109467

❏ Disconnect the high pressure pump electrical connectors (**10**) .

❏ Remove the bolts of the neck (**11**) of the spherical injector rail.

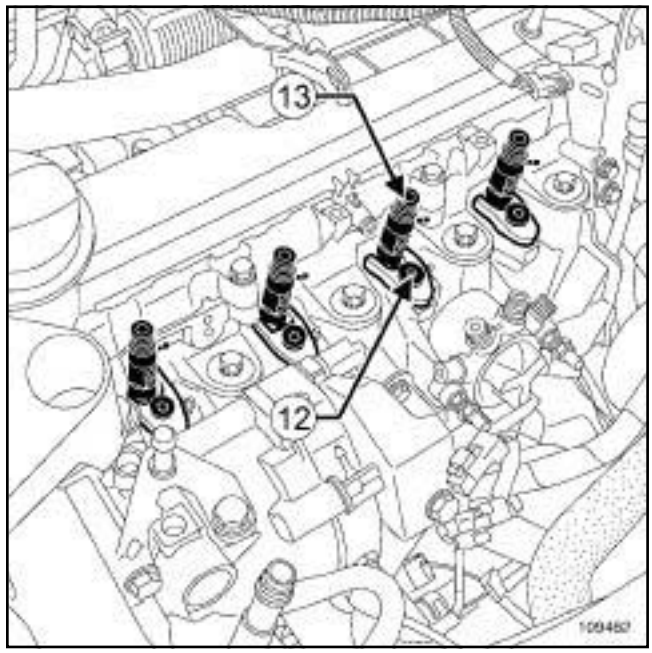
❏ Move aside the electrical wiring with the neck.

❏ Loosen the injector rail nuts by several turns.

❏ Remove the clips connecting the high pressure pipes.

WARNING

Always hold the intermediate injector union in place with a wrench when loosening the high pressure pipes.



Do not damage the injector return nozzle.

❏ Undo:

- the high pressure pipe nut at the injector end using the **(Mot. 1746)**,
- the high pressure pipe nut at the injector rail end using the **(Mot. 1746)**.

❏ Fit blanking plugs into the openings.

II - OPERATION FOR REMOVAL OF PART CONCERNED

109462

❏ Loosen the injector bracket (**12**) .

❏ Remove the injector (**13**) .

❏ If reusing an injector, always mark a removed injector in relation to its cylinder.

Note:

an injector corresponds to a cylinder.

❏ Remove the heat protection washer.

Note:

If the heat protection washer is stuck at the bottom of the well, use the **(Mot. 1817)** (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

REFITTING

I - REFITTING PREPARATION OPERATION

❏ **parts always to be replaced: injector seal (11,11, 02,02)**.

❏ **parts always to be replaced: High pressure pipe (11,05,03,03)**.

K9K, and 750 or 752 or 766 or 768

Cleaning parts

❑

WARNING

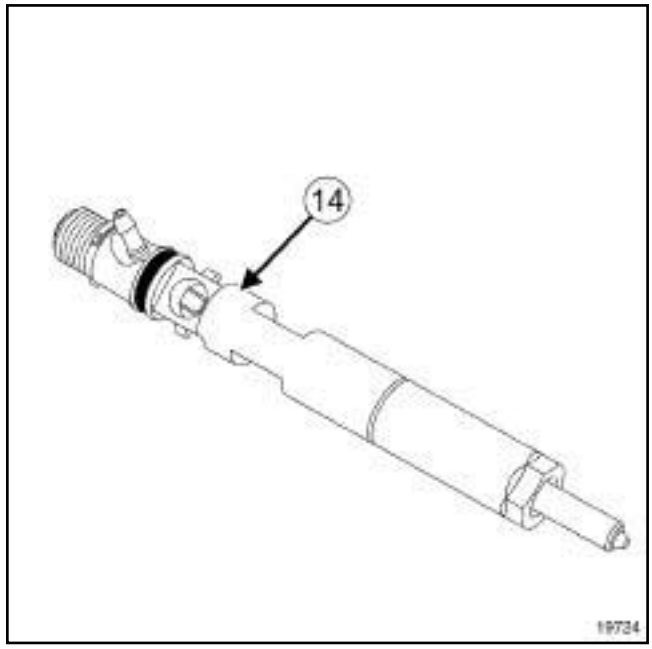
It is strictly forbidden to clean the injectors with:

- a wire brush,
- an emery cloth,
- an ultrasonic cleaner.

❑ Always clean the well of the removed injector (see **Injector well cleaning tool: Use**) (Technical Note 6040A, 13B, Diesel injection).

❑ If reusing the removed injector:

- clean the injector using a wipe soaked in injector cleaning product or brake cleaner,
- if necessary, leave the injector nozzle to soak in injector cleaning product,
- wipe the injector with a new wipe,
- (see **Vehicle: Parts and consumables for the repair**) (04B, Consumables - Products) and (see **13B**, **Diesel injection**, **Diesel injection: Precautions for the repair**, page **13B-1**) .



II - REFITTING OPERATION FOR PART CONCERNED

❑

WARNING

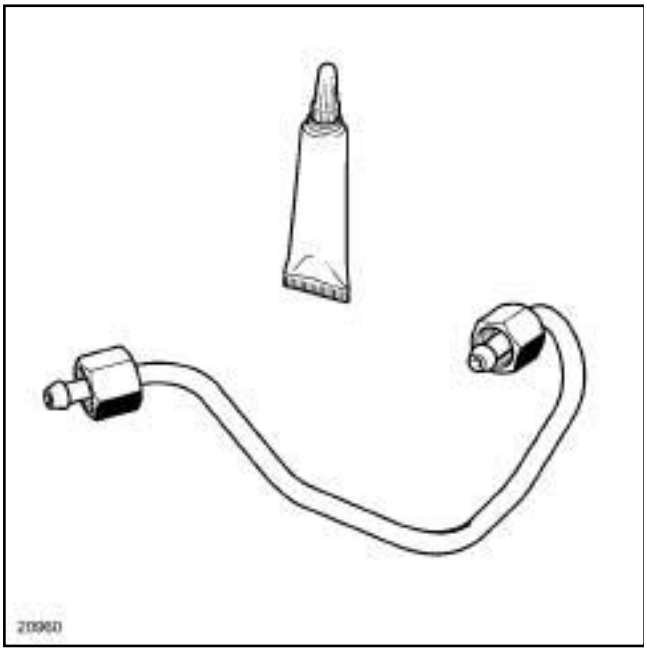
Do not remove the caps from each component until the last moment.

❑ If removing the four injectors, loosen the nuts of the injector rail by a few turns (the rail should be loose).

19724

❑ Replace the compression washer with a new one.

❑ Position the injector.



Note:

If one or more injectors are replaced, note the alphanumeric code (C2I) (**14**) and the cylinder on which it is fitted.

❑ Torque tighten the **injector clamp (28 N.m)**.

K9K, and 750 or 752 or 766 or 768

III - FINAL OPERATION

20960

❑

WARNING

Before fitting a new high pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator; these pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

Also, do not remove the components from their packaging until they are to be fitted to the vehicle.

❑ Position the high pressure pipe olive:

- in the high pressure inlet taper of the injector,
- in the high pressure outlet taper of the rail.

❑ Fit without tightening the high pressure pipe nuts by hand, starting with the nut at the injector end.

❑ Slightly pretighten the high pressure pipe nuts.

Note:

The assembly order of the « rail - injector » high pressure pipes is not important.

❑ Mount a new clip provided with the new high pressure pipe.

❑ If removing the four injectors, torque tighten the **injector rail nuts (28 N.m)**.

❑ Tighten to torque and in order the **« pump - rail » high pressure pipe nuts (24 N.m)** :

- high pressure pump end,
- rail end.

❑ Tighten to torque and in order the **« rail - injector » high pressure pipe nuts (24 N.m)** :

- injectors end,
- rail end.

Note:

Tighten each pipe fully before moving on to the next pipe.

❑ Refit the neck on the injector rail.

❑ Tighten to torque the **nuts on the neck on the injector rail (21 N.m)**.

WARNING

Check the condition of the seals on the fuel return unions on the injectors. Check that they are not cut or crushed, and have not come out of their grooves. Replace the diesel return pipe assembly if one of its components is damaged.

❑ Connect:

- the injector diesel fuel return pipe,
- the connectors to injectors no. 1 and no. 2,
- the connectors to injectors no. 3 and no. 4,
- the heater plugs.

❑ Refit:

- the rail protector,
- the front engine cover bracket on the flywheel end.

❑ Clip on the rail protector.

K9K, and 750 or 752 or 766 or 768

K9K, and 750 or 766 or 768

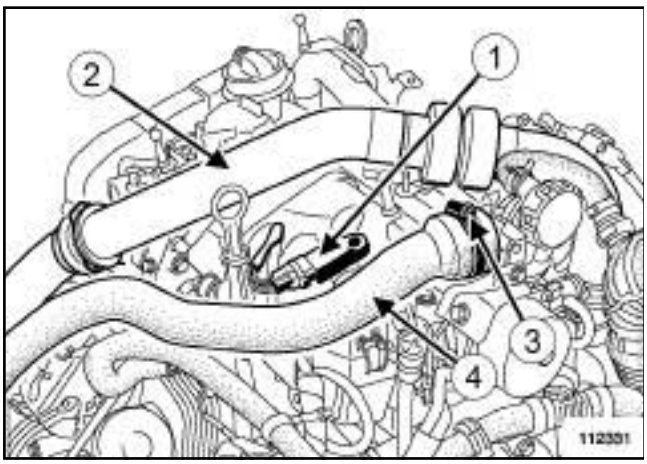
- ❑ Loosen the intercooler inlet air pipe nut on the alternator.
- ❑ Fit the air duct on the turbocharger and on the intercooler inlet air pipe.
- ❑ Tighten the bolt of the air duct on the rocker cover.
- ❑ Torque tighten the **intercooler inlet air pipe nut on the alternator (8 N.m)**.
- ❑ Tighten the clip of the air duct between the intercooler and the damper valve.

- ❑ Connect the turbocharger pressure sensor connector.
- ❑ Refit the air inlet duct.
- ❑ Connect the battery (see **Battery: Removal - Refitting**) (80A, Battery).
- ❑ Program the alphanumeric code (C2I) for the replaced injector(s) using the **Diagnostic tool** (see **Fault finding - Replacement of components**) (13B, Diesel injection).
- ❑ Check that there are no diesel leaks:
  - run the engine until the fan starts,
  - accelerate several times at no load,
  - switch off the ignition,
  - check that there is no diesel fuel escaping.
- ❑ Refit the engine cover.

K9K

Equipment required
Diagnostic tool

Tightening torques ▽	
nut mounting the inter-cooler air inlet pipe on the alternator	**8 Nm**
nut mounting the inter-cooler air inlet pipe on the alternator	**8 Nm**



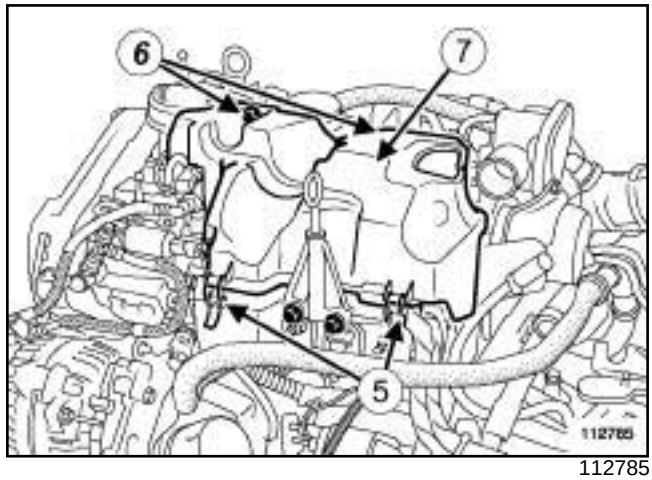
WARNING

After any operation, check that there are no diesel fuel leaks.

❏ Reprime the diesel circuit using the priming pump.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the engine protector.



112331

❏ Disconnect the inlet air pressure sensor (**1**)

❏ Remove the upper section (**2**) of the turbocharging duct.

❏ Loosen the clip (**3**) .

❏ Move the inlet duct to one side (**4**) .

112785

❏ Unclip the clips (**5**) from the injector rail protector cover.

❏ Remove the mounting (**6**) from the injector rail protector cover.

❏ Remove the injector rail protector cover (**7**) .

❏ Refit the inlet duct.

❏ Loosen the mounting nut of the air pipe at the intercooler inlet on the alternator.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Snap the air duct to the turbocharger and to the air pipe at the intercooler inlet.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ Connect:

- the inlet air pressure sensor.
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏

Note:

The **Diagnostic tool** can be used for testing the high pressure circuit with the engine running.

This command can be used to run fault finding on a leak due to an incorrectly fitted or tightened union. This command only works if the engine coolant temperature is above **60°C**. The fault finding procedure will not reveal small leaks due to incorrect tightening.

K9K

❏ Run command **AC029 "high pressure circuit sealing test"** in the "LPG/fuel circuit" tab of the **Diagnostic tool**.

WARNING
Do not leave anything on the side of the engine housing during the test phase (significant vibration).

Note:
The engine automatically runs a cycle of four accelerations and decelerations to lower the rail pressure.

❏ Check that there are no leaks in the high pressure circuit.

❏ Deal with the causes of any leaks.

❏ Disconnect:

- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery),
- the inlet air pressure sensor.

❏ Remove:

- the upper section of the turbocharging duct,
- the air inlet duct.

❏ Refit:

- the injector rail protector cover,
- the mountings of the injection rail protector cover,
- the air inlet duct.

❏ Loosen the intercooler inlet air pipe mounting nut on the alternator.

❏ Fit the air duct on the turbocharger and on the air pipe at the intercooler inlet.

❏ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 Nm)**.

❏ Connect:

- the inlet air pressure sensor.
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

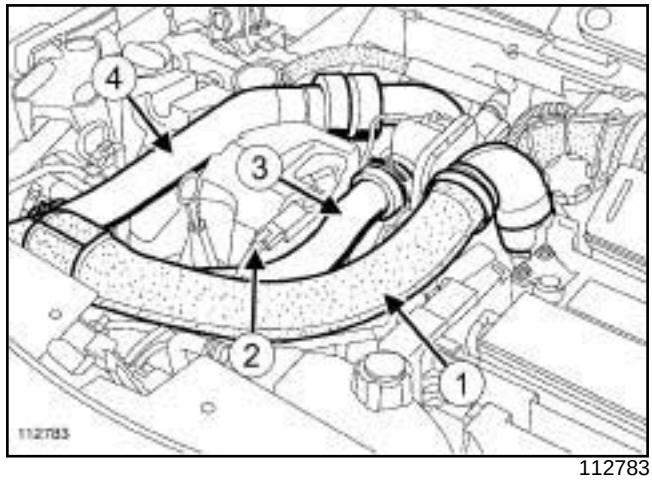
K9K, and 750 or 752 or 760 or 762 or 766 or 768

Special tooling required	
Mot. 1746	Offset wrench for tightening High Pressure pump pipes.
Emb. 1596	24 mm socket wrench for removal - refitting of clutch master cylinder.

Equipment required
torque wrench
Diagnostic tool

Tightening torques ▽	
accelerometer mountings	**21 N.m**
high pressure pipe	**24 N.m**
injector rail neck nuts	**21 N.m**
nut mounting the intercooler inlet air pipe on the alternator	**8 N.m**

Note:



Vehicles equipped with the K9K*768 engine may or may not be equipped with an intercooler.

REMOVAL

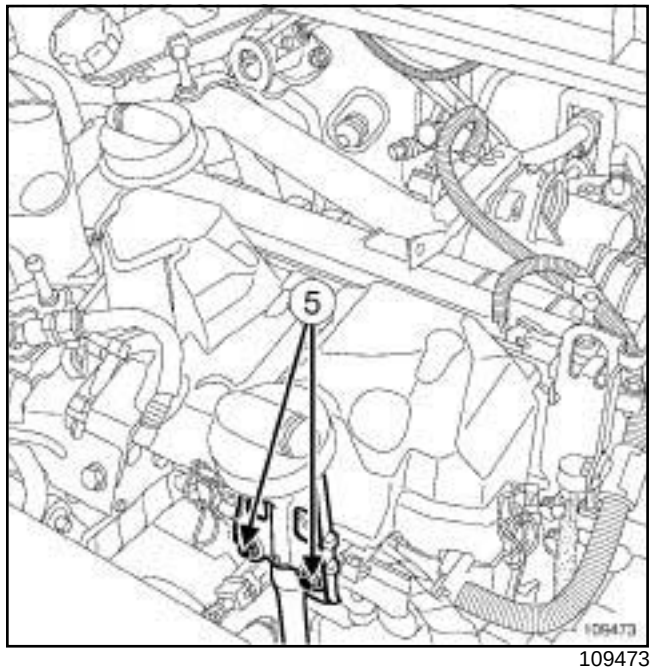
I - REMOVAL PREPARATION OPERATION

❏ Remove the front engine cover.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

112783

❏ Remove the inlet air duct (**1**) .



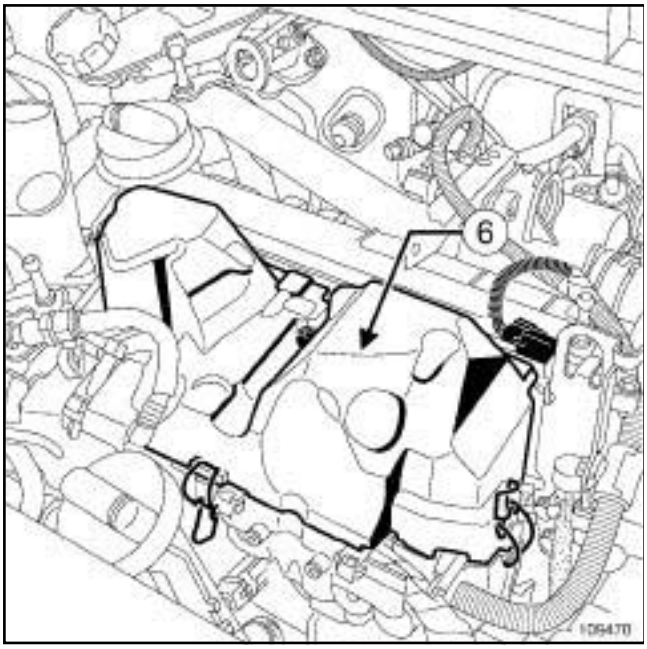
❏ Disconnect the turbocharger pressure sensor connector (**2**) .

K9K, and 750 or 760 or 762 or 766 or 768

❏ Loosen the clip of the air duct (**3**) between the intercooler and the inlet.

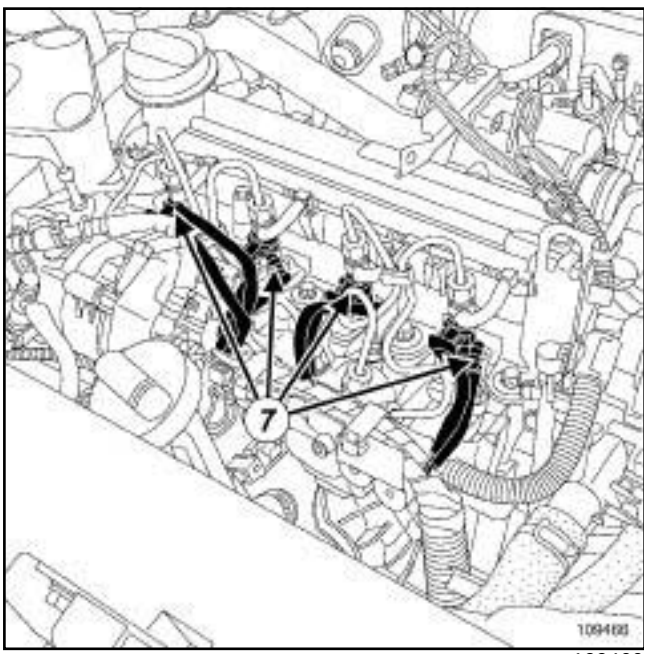
❏ Remove the air duct between the intercooler and the inlet.

❏ Remove the stainless steel pipe (**4**) between the turbocharger and the intercooler.



109473

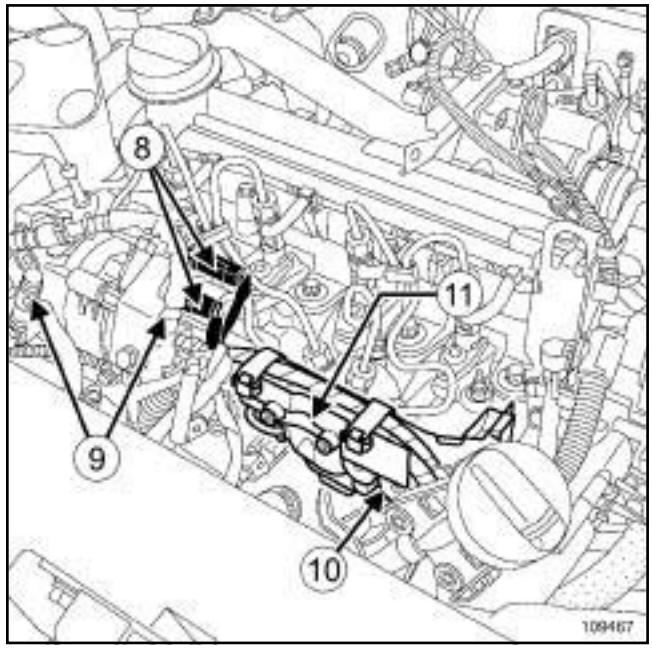
❏ Remove the dipstick bolts (**5**) .



❏ Put the dipstick to one side.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

109470



❏ Remove the cover (**6**) from the injector rail protector.

109466

❏ Disconnect the following connectors (**7**) :

- the heater plugs,
- the injectors.

109467

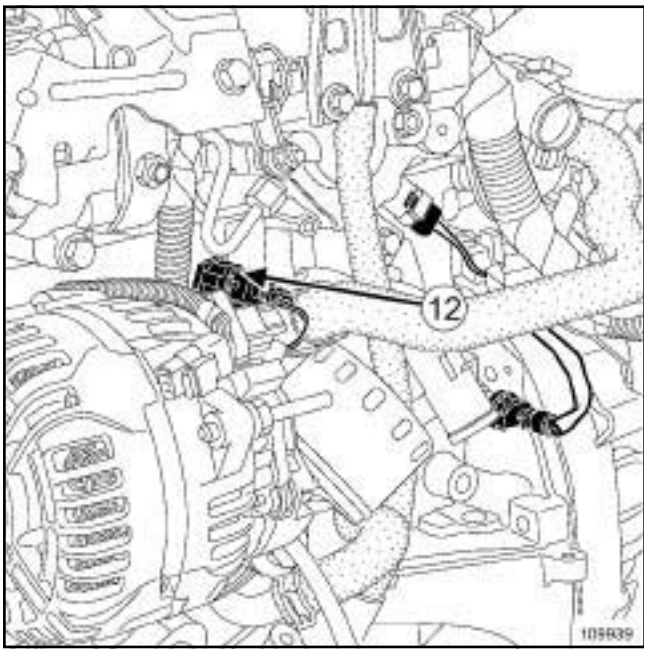
❏ Disconnect:

- the high pressure pump electrical connectors (**8**) ,
- the diesel supply and return pipes (**9**) ,
- the spherical injector rail pressure sensor (**10**) .

❏ Fit the correct blanking plugs.

❏ Remove the bolts mounting the neck (**11**) onto the spherical injector rail.

❏ Move the electric wiring harness and neck to the side as shown by the arrow.



❏ Undo:

- the high pressure pipe nut at the pump end using the **(Mot. 1746)**,
- the high pressure pipe nut at the injector rail end using the **(Mot. 1746)**.

❏ Fit blanking plugs into the openings.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

II - OPERATION FOR REMOVAL OF PART CONCERNED

109939

❑ Remove the accelerometer (**12**) using the **(Emb. 1596)**.

REFITTING

REFITTING OPERATION FOR PART CONCERNED

❑ Refit the accelerometer.

❑ Tighten to torque the **accelerometer mountings (21 N.m)** using the **torque wrench**.

20960

❑

WARNING

Before fitting a new high pressure pipe, lightly lubricate the nut threads with oil from the applicator provided with the new part.

Be careful not to allow oil into the high pressure pipe.

Do not lubricate high pressure pipes supplied without an applicator, as these high pressure pipes are self-lubricating.

WARNING

Do not remove the blanking plugs from each component until the last moment.

❑ Remove the blanking plugs.

❑ Insert the high pressure pipe olive in the high pressure pump high pressure outlet taper.

❑ Fit, without tightening, the high pressure pipe nuts by hand, starting with the nut at the rail end.

❑ Slightly pretighten the high pressure pipe nuts.

❑ Torque tighten the **high pressure pipe (24 N.m)**.

K9K, and 750 or 752 or 760 or 762 or 766 or 768

❏ Refit the neck on the injector rail.

❏ Tighten to torque the **injector rail neck nuts (21 N.m)**

❏ Connect:

- the spherical injector rail pressure sensor,
- the diesel return pipe connecting the injectors to the high pressure pump,
- the diesel fuel supply and return pipes,
- the high pressure pump electrical connectors.

❏ Connect the connectors of:

- the injectors,
- the heater plugs.

❏ Refit the injector rail protector cover.

❏ Insert the dipstick.

❏ Refit the dipstick bolts.

❏ Connect the inlet air pressure sensor.

K9K, and 750 or 760 or 762 or 766 or 768

❏ Refit the inlet duct and tighten its clip.

❏ Loosen the intercooler inlet air pipe nut on the alternator.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 N.m)**.

❏ Connect the battery (see **Battery: Removal - Refitting**) .

❏ Prime the diesel circuit using the priming pump.

WARNING

Check that there are no diesel leaks:

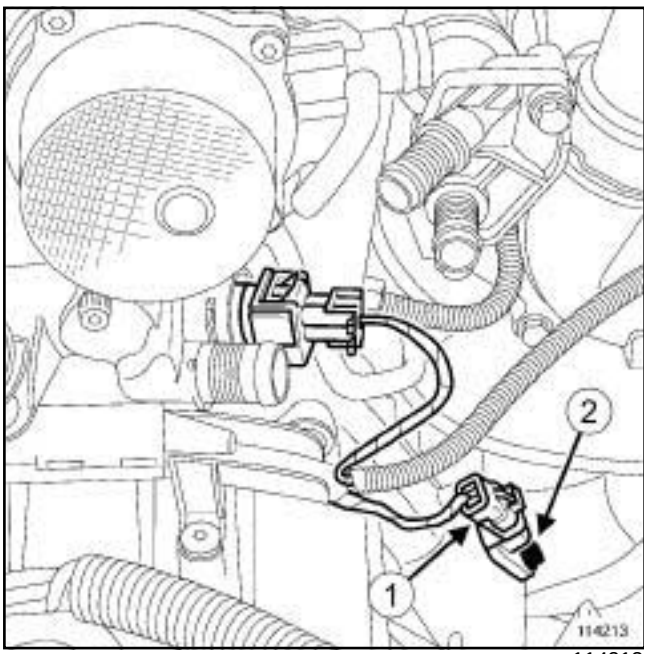
- check the sealing after repair (see **13B**, **Diesel injection**, **High pressure pipe: Check**, page **13B-99**) ,
- let the engine run at idle speed until the engine cooling fan starts to operate,
- accelerate several times at no load,
- carry out a road test,
- switch off the ignition,
- confirm that there is no diesel fuel leakage.

Note:

When replacing the accelerometer, run command **RZ004** using the **Diagnostic tool** in order to carry out the necessary programming.

K9K, and 764 or 766 or 768

REMOVAL



I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) .

❏ Disconnect the battery (see **Battery: Removal - Refitting**) .

❏ Remove the engine undertray.

II - OPERATION FOR REMOVAL OF PART CONCERNED

114213

❏ Disconnect the connector (**1**) from the engine speed and position sensor.

❏ Remove the engine speed and position sensor (**2**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

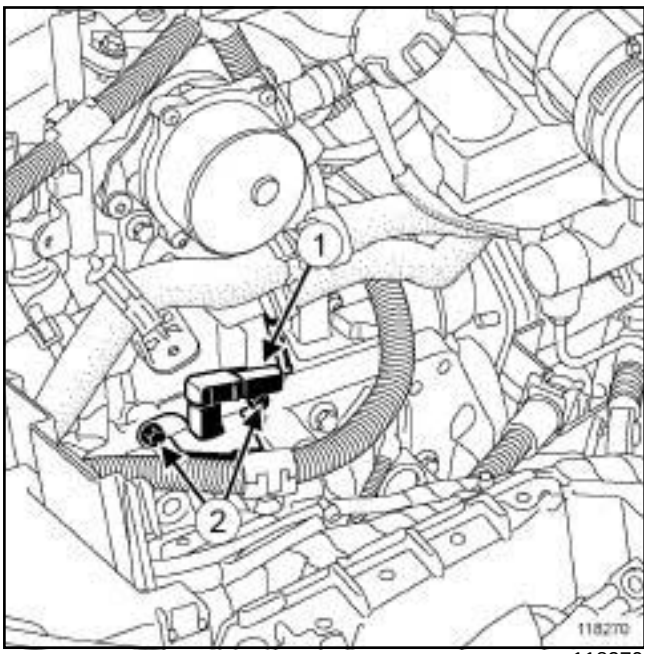
❏ Refit the engine speed and position sensor.

❏ Connect the engine speed and position sensor connector.

II - FINAL OPERATION

❏ Refit the engine undertray.

❏ Connect the battery (see **Battery: Removal - Refitting**) .



K9K, and 750 or 752

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove the air filter unit air inlet pipe.

II - OPERATION FOR REMOVAL OF PART CONCERNED

118270

❏ Disconnect the connector (**1**) from the engine speed and position sensor.

❏ Remove:

- the engine speed and position sensor bolts (**2**) ,
- the engine speed and position sensor.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the speed and position sensor,
- the engine speed and position sensor bolts.

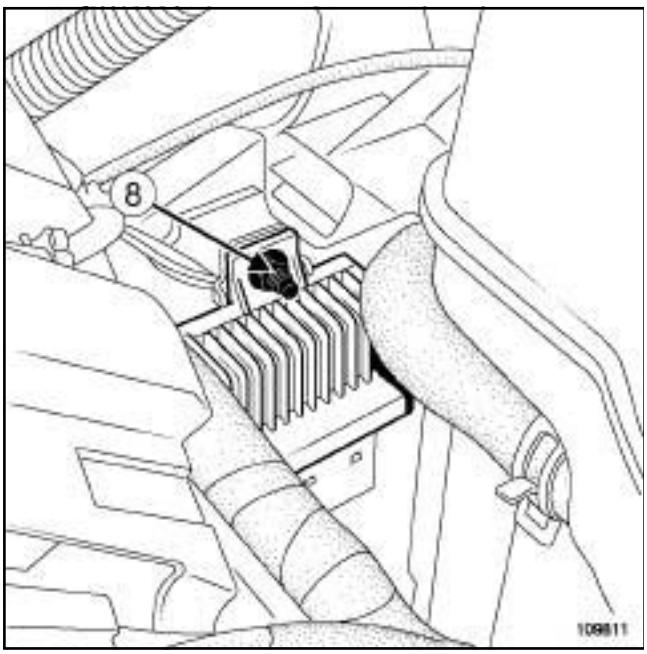
❏ Connect the engine speed and position sensor connector.

II - FINAL OPERATION

❏ Refit the air filter unit air inlet pipe.

K9K

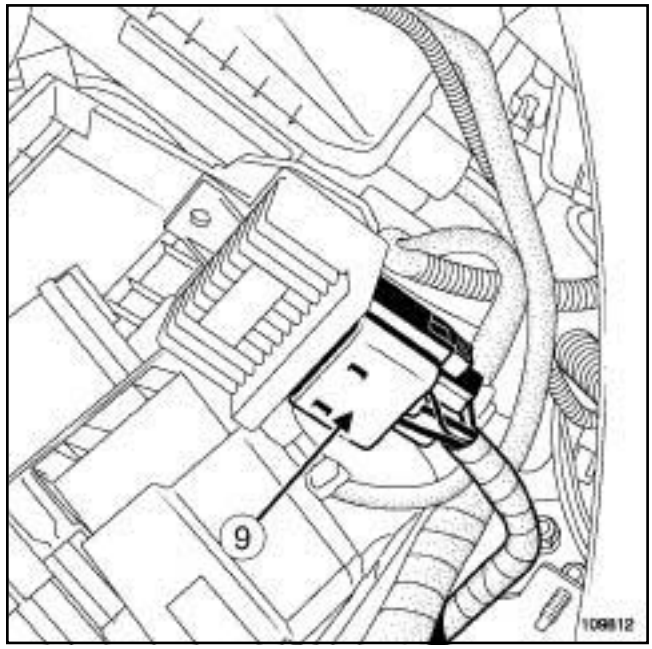
Tightening torques ▽	
pre-postheating unit mounting nut	9 Nm



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Remove:



- the battery (see **Battery: Removal - Refitting**) ,
- the battery tray (see **Battery tray: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

109811

❏ Remove the pre-postheating unit mounting bolt (**8**) .

109812

❏ Disconnect the pre-postheating unit connector (**9**) .

❏ Remove the pre-postheating unit.

REFITTING

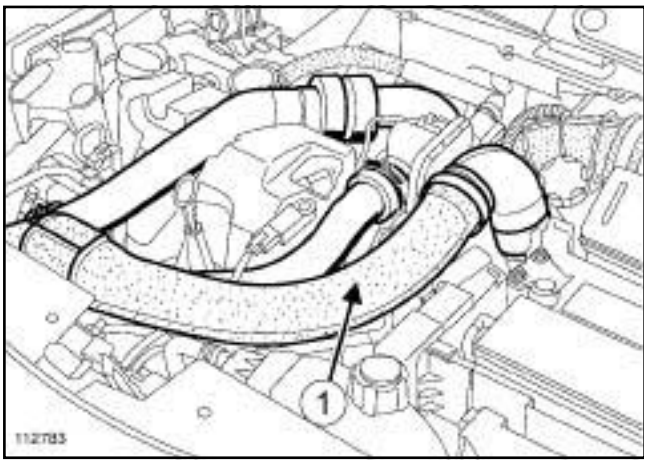
I - REFITTING OPERATION FOR PART CONCERNED

❏ Connect the pre-postheating unit connector.

❏ Refit the pre-postheating unit.

❏ Tighten to torque the **pre-postheating unit mounting nut (9 Nm)**.

II - FINAL OPERATION.



❏ Refit the battery (see **Battery: Removal - Refitting**) .

K9K, and 764 or 772

REMOVAL

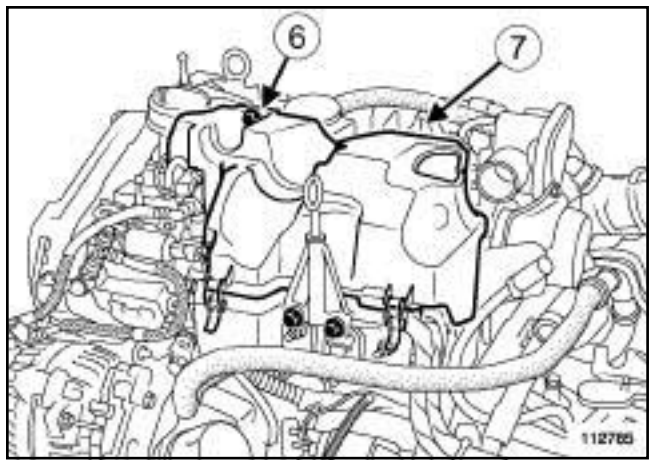
I - REMOVAL PREPARATION OPERATION

112783

❏ Remove the air filter box inlet air pipe (**1**) .

112782

❏ Remove the turbocharger outlet air pipe retaining pins (**2**) .



❏ Remove:

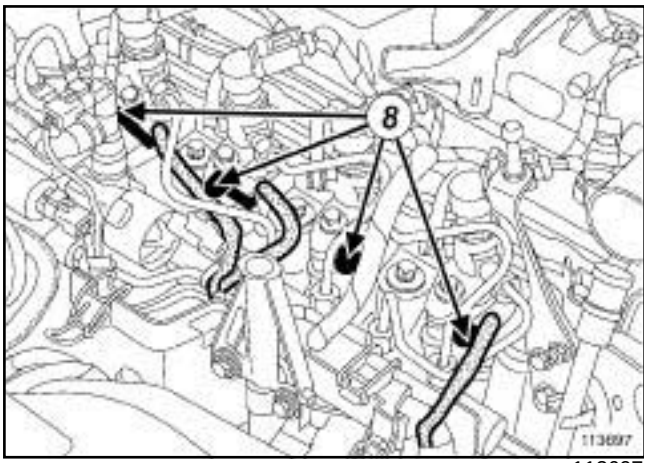
- the turbocharger outlet air pipe bolt (**3**) ,
- the turbocharger outlet air pipe

❏ Undo the clip (**4**) from the intercooler outlet air pipe.

❏ Move the intercooler outlet air pipe to one side (**5**) .

❏ Remove the dipstick.

112785



❏ Unclip the rail protector cover.

❏ Remove:

- the injector rail protector cover bolt (**6**) ,
- the injector rail protector cover nut (**7**) ,
- the injector rail protector cover,

K9K, and 764 or 772

II - OPERATION FOR REMOVAL OF PART CONCERNED

113697

❏ Disconnect the heater plug connectors (**8**) .

❏ Blow around the heater plugs with compressed air to prevent contamination of the cylinders.

❏ Undo then remove the plugs using a **10 mm** diameter long socket connected to a universal joint.

Note:
Use a hose to unscrew the plugs completely.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the heater plugs.

WARNING
Ensure that no foreign bodies enter the cylinder during this operation.

❏ Torque tighten the **heater plugs (15 Nm)**.

❏ Connect the heater plug connectors.

II - FINAL OPERATION

❏ Refit:

- the injector rail protector cover,
- the injector rail protector cover nut,
- the injector rail protector cover bolt.

❏ Tighten to torque:

- the **injector rail protector cover bolt (8 Nm)**,
- the **injector rail protector cover nut (8 Nm)**.

❏ Clip the injector rail protector cover into place.

❏ Refit the dipstick.

❏ Undo the intercooler inlet air pipe nut on the alternator.

❏ Fit:

- the turbocharger air outlet pipe,
- the turbocharger outlet air pipe retaining pins.

❏ Click into place the turbocharger outlet air pipe.

❏ Tighten the turbocharger outlet air pipe bolt on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler inlet air pipe on the alternator (8 Nm)**.

❏ Fit the intercooler outlet air pipe.

❏ Torque tighten the **intercooler outlet air pipe clip (5.5 Nm)**.

❏ Refit the turbocharger outlet air pipe.

❏ Fit the turbocharger outlet air pipe retaining pins.

❏ Refit the air filter box inlet air pipe.

REMOVAL

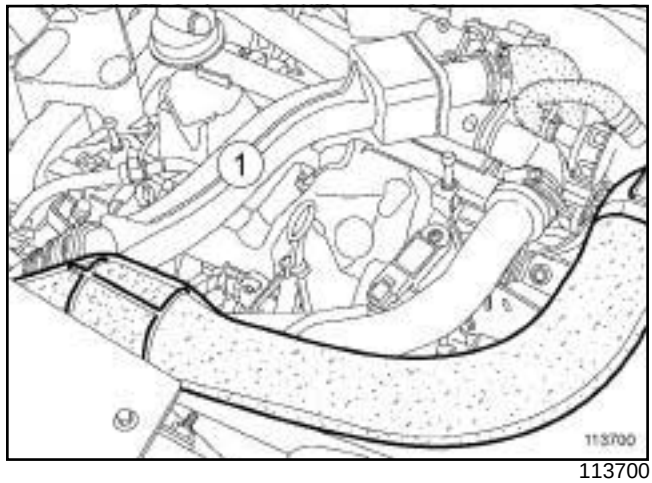
I - REMOVAL PREPARATION OPERATION

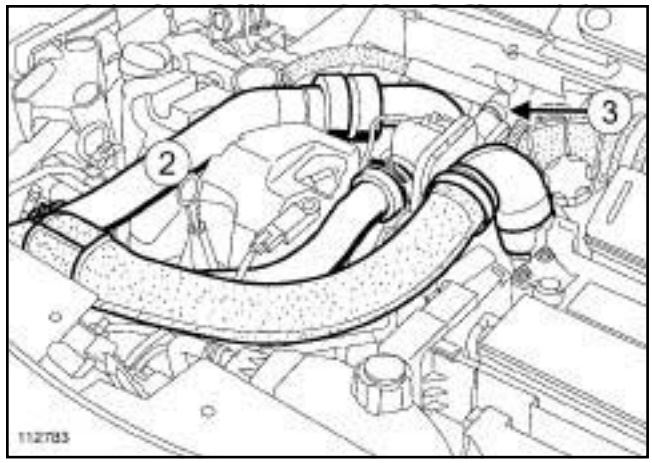


❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the engine undertray,
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

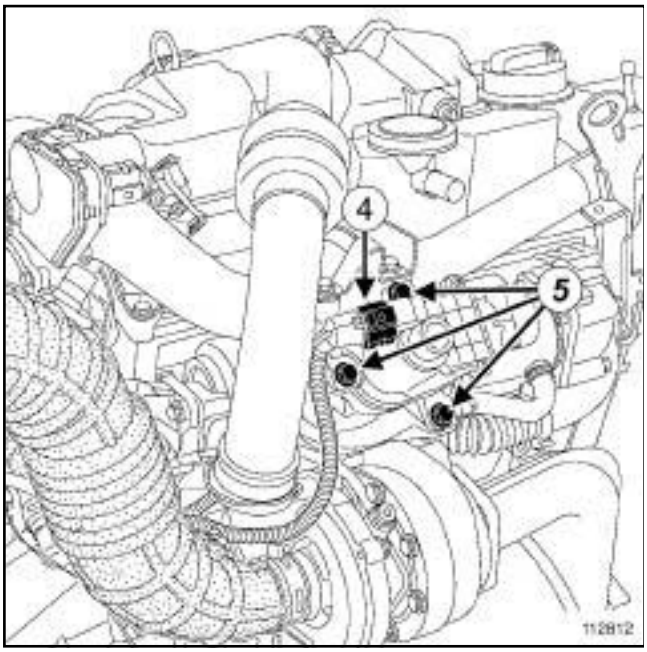


K9K, and 766 or 768

113700

❏ Remove the air duct (**1**) between the intercooler and the turbocharger.

K9K, and 764



112783

❏ Remove the air duct (**2**) between the intercooler and the turbocharger.

❏ Disconnect the oil vapour rebreathing pipe at (**3**) and move it aside.

K9K, and 764 or 766 or 768

II - REMOVAL OF PART CONCERNED

112812

❑ Disconnect the connector (**4**) from the exhaust gas recirculation solenoid valve.

❑ Remove:

- the exhaust gas recirculation solenoid valve mounting bolts (**5**) ,
- the exhaust gas recirculation solenoid valve, using the tool **(Mot. 1729)**,
- the seal of the exhaust gas recirculation solenoid valve.

Note:

During removal of the solenoid valve using the **(Mot. 1729)**, proceed slowly until the solenoid valve is loosened from its support to remove it.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace the seal of the exhaust gas recirculation solenoid valve.

II - REFITTING PART CONCERNED

❑ Offer up the exhaust gas recirculation solenoid valve with a new seal.

❑ Torque tighten the **exhaust gas recirculation solenoid valve mounting bolts (10 N.m)**.

III - FINAL OPERATION

K9K, and 764

❑ Reconnect the oil vapour rebreathing pipe.

❑ Loosen the mounting nut of the air pipe at the intercooler inlet on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 N.m)**.

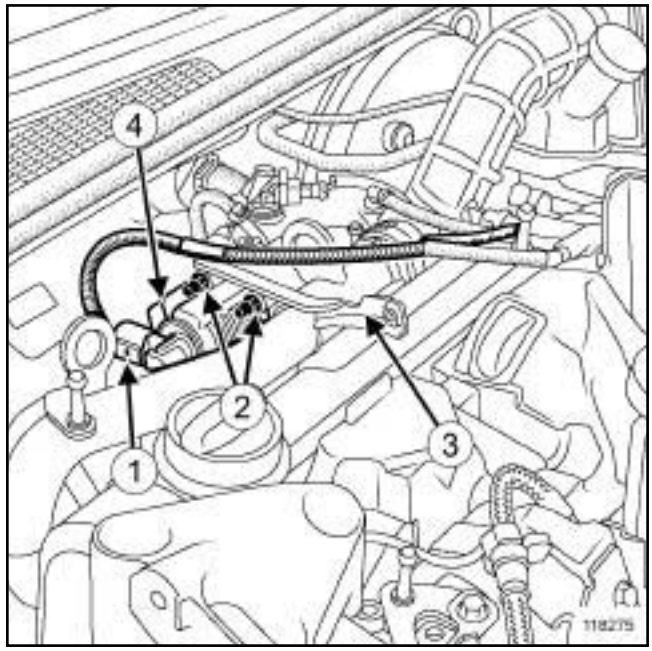
❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Note:

If replacing the exhaust gas recirculation solenoid valve, perform the necessary programming (**see MR394, Section 13B, Fault finding - Replacement of components**).

❑ Before restarting the engine, use the **Diagnostic tool** to clear any faults stored by the injection computer.

K9K, and 750 or 752



Tightening torques ▽	
EGR solenoid valve studs	**4 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❑ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

118275

❑ Disconnect the connector (**1**) from the EGR solenoid valve.

❑ Remove:

- the nuts (**2**) from the strut on the EGR solenoid valve,
- the strut (**3**) on the EGR solenoid valve,
- the bolt from the EGR solenoid valve heat shield,
- the heat shield (**4**) from the EGR solenoid valve,
- the EGR solenoid valve,
- the seal between the EGR solenoid valve and the EGR solenoid valve mounting.

Note:

Clean the exhaust gas recirculation solenoid valve if it is reinitialised (see **Exhaust gas recirculation solenoid valve: Cleaning**) (Technical Note 3916A, 14A, Emission control).

REFITTING

I - REFITTING PREPARATION OPERATION

❑ Always replace the seal between the EGR solenoid valve and the EGR solenoid valve mounting.

K9K, and 750 or 752

II - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the EGR solenoid valve studs, if necessary.

❏ Torque tighten the **EGR solenoid valve studs (4 N.m)**, if necessary.

❏ Refit:

- the seal between the EGR solenoid valve and the EGR solenoid valve mounting,
- the EGR solenoid valve,
- the EGR solenoid valve heat shield,
- the bolt from the EGR solenoid valve heat shield,
- the strut on the EGR solenoid valve,
- the nuts from the strut on the EGR solenoid valve,

❏ Torque tighten:

- the **EGR solenoid valve heat shield bolt (12 N.m)**,
- the **nuts for the strut on the EGR solenoid valve (12 N.m)**.

❏ Connect the EGR solenoid valve connector.

III - FINAL OPERATION

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Note:

If replacing the exhaust gas recirculation solenoid valve, perform the necessary programming (**see MR394, Section 13B, Fault finding - Replacement of components**).

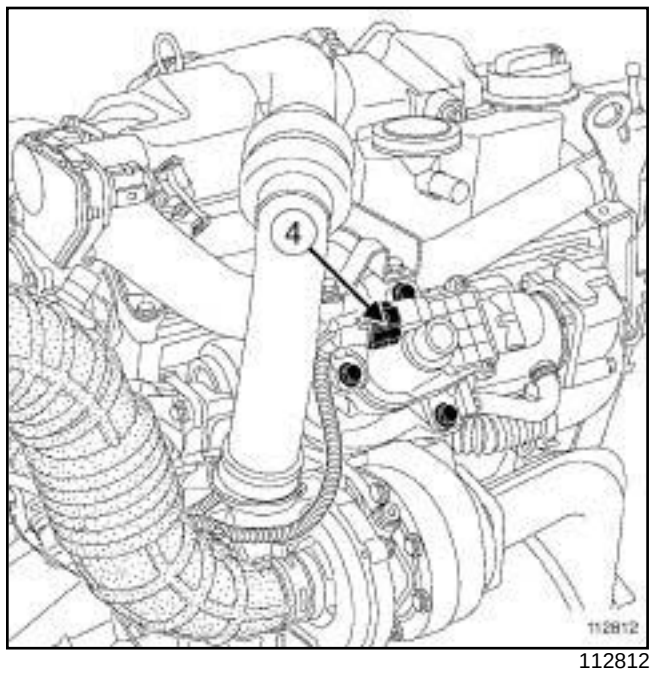
❏ Remove the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) .



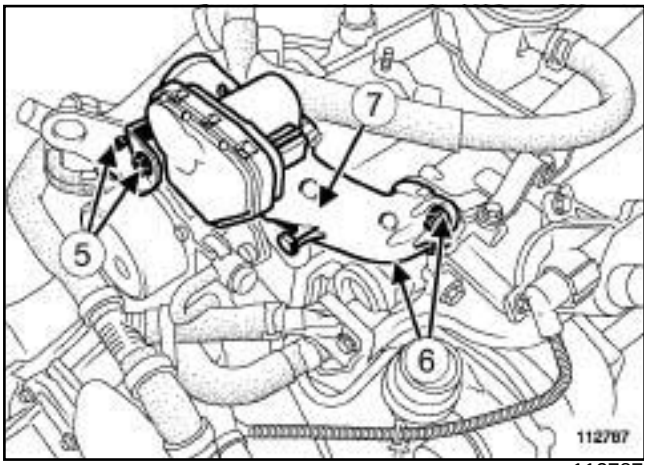
112782

❏ Remove the inlet duct (**1**) between the turbocharger and the intercooler.

❏ Disconnect the inlet duct (**2**) .

K9K, and 764 or 772

❏ Remove the oil vapour rebreathing pipe ***(3)*** .



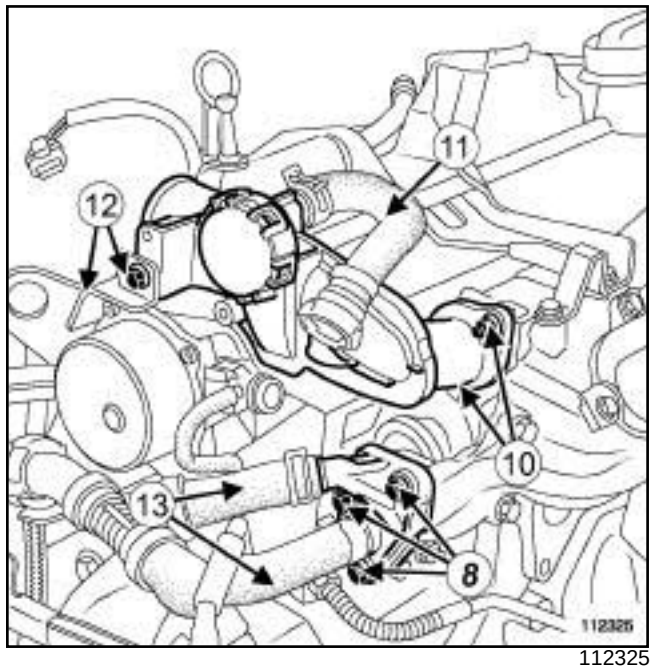
112812

❏ Disconnect the connector (**4**) from the exhaust gas recirculation solenoid valve.

❏ Disconnect the vacuum pump pipe.

K9K, and 764 or 766 or 768 or 772

K9K, and 764 or 772



112787

❏ Disconnect the connector from the cut-off valve (if equipped).

❏ Remove:

- the bolts (**5**) mounting the damper valve retaining bracket,
- the damper valve mounting bolts (**6**) ,
- the damper valve (**7**) (if equipped).

K9K, and 766 or 768

112325

❏ Disconnect the oil vapour recirculation pipe (**11**) .

❏ Remove:

- the oil vapour recirculation valve bolts (**10**) ,
- the oil vapour recirculation valve,
- the mounting bolts (**12**) of the oil vapour recirculation valve retaining bracket.

❏ Position the tools **(Ms. 583)** or the hose clamps on the coolant inlet and outlet hoses ***(13)*** of the exhaust gas cooler.

❏ Remove the mounting bolts ***(8)*** of the coolant circulation cover.

❏ Detach the coolant circulation cover.

Note:

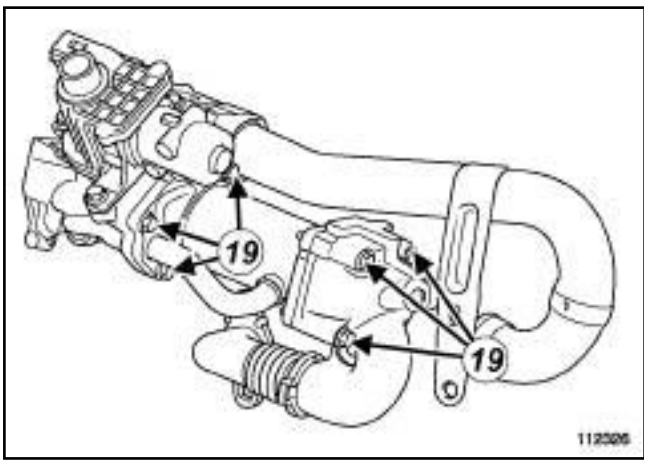
Be prepared for the escape of coolant.

K9K, and 764 or 766 or 768

❏ Remove the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

K9K, and 764 or 766 or 768 or 772

K9K, and 772



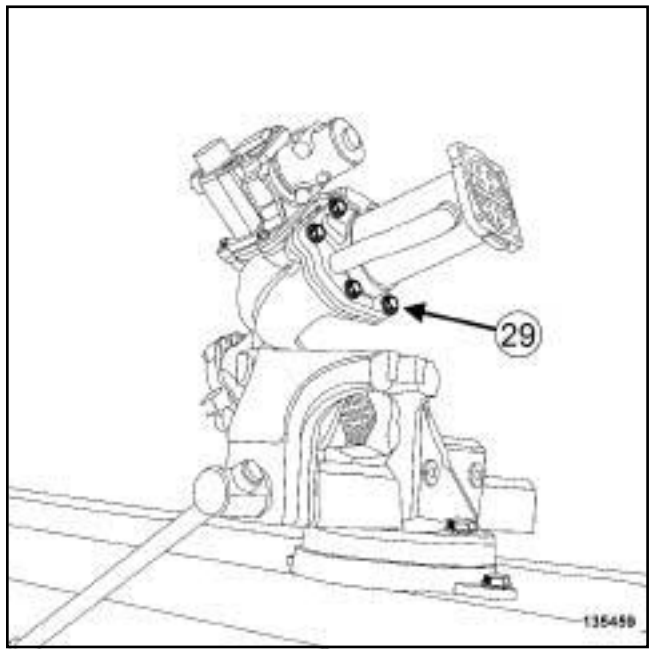
❑ Remove the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

❑ Remove:

- the exhaust gas recirculation rigid pipe (see **14A**, **Antipollution**, **Exhaust gas recirculation rigid pipe: Removal - Refitting**, page **14A-20**) ,
- the exhaust gas recirculation assembly (see **Exhaust gas recirculation assembly: Removal - Refitting**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - First fitting of the exhaust gas cooler recirculation assembly



112326

❑ Using the workbench, remove:

- the bolts (**19**) mounting the exhaust gas cooler on its two supports,
- the exhaust gas cooler.

2 - Second fitting of the exhaust gas cooler recirculation assembly

135459

❑ Remove:

- the bolts (**29**) of the cooler on the support,
- the seal of the cooler on the support,
- the cooler.

K9K, and 764 or 766 or 768 or 772

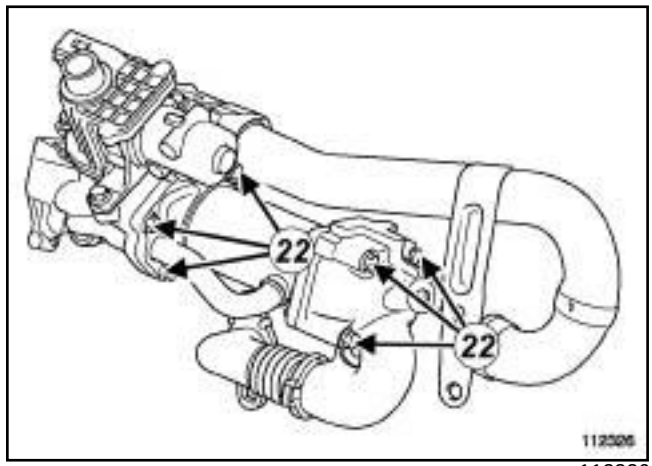
REFITTING

I - REFITTING PREPARATION OPERATION

❑ All the supporting surfaces on each removed part must be carefully cleaned.

WARNING
Take care not to damage the bearing faces to prevent any risk of coolant leaks.

WARNING



Always replace:

- the air inlet metal tube and its O-rings,
- the exhaust gas inlet pipe, its mounting bolts, its seal and its snap-on clip,
- the cooler seals on its mountings,
- the coolant circulation cover seals within the exhaust gas cooler,
- the seal between the cut-off valve downstream duct and the exhaust gas cooler mounting,
- the seal between the catalytic converter and the turbocharger.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit the exhaust gas cooler on its two mountings with new seals.

1 - First fitting of the exhaust gas cooler recirculation assembly

112326

❑ Position the cooler mounting bolts (**22**) , avoiding contact so that the cooler can move.

❑ Refit the exhaust gas recirculation unit assembly on the cylinder head with its cooler.

❑ Tighten the two mounting bolts on the exhaust gas cooler mountings until contact is made.

❑ Adjust the exhaust gas cooler in relation to its two mountings.

❑ Tighten the exhaust gas cooler mounting bolts on to its two mountings until contact is made and so that it is locked into place.

❑ Remove the exhaust gas recirculation unit and its cooler.

❑ On the workbench, torque tighten:

- the **bolts mounting the exhaust gas cooler on the timing end support (12 N.m)**,
- the **bolts mounting the exhaust gas cooler on the flywheel end support (12 N.m)**.

WARNING
Ensure that the seals between the cooler and its two supports are correctly positioned to avoid any coolant leaks.

K9K, and 764 or 766 or 768 or 772

2 - Second fitting of the exhaust gas cooler recirculation assembly

❑ Position the cooler mounting bolts on its support, avoiding contact so that the cooler can move.

❑ Refit the exhaust gas recirculation assembly equipped with the old exhaust gas recirculation rigid pipe on the cylinder head.

❑ Tighten the mounting bolts of the exhaust gas recirculation assembly on the cylinder head until contact is made.

❑ Adjust the exhaust gas cooler in relation to its support.

❑ Tighten the bolts mounting the exhaust gas cooler on its support until contact is made, in order to immobilise it.

❑ Remove the exhaust gas recirculation assembly.

❑ Remove the old exhaust gas recirculation rigid pipe and dispose of it in a waste bin.

❑ On the workbench, torque tighten the **mounting bolts of the exhaust gas cooler on the support at the flywheel end (12 N.m)**.

WARNING
Ensure that the seal between the cooler and its support is correctly positioned to avoid any coolant leaks.

III - FINAL OPERATION

❑ Refit:

- the exhaust gas recirculation assembly (see **Exhaust gas recirculation assembly: Removal - Refitting**) ,
- the exhaust gas recirculation rigid pipe (see **14A**, **Antipollution**, **Exhaust gas recirculation rigid pipe: Removal - Refitting**, page **14A-20**) .

K9K, and 764 or 766 or 768

❑ Refit the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) .

K9K, and 772

❑ Refit the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) .

❑ Torque tighten:

- the **coolant circulation cover mounting bolts (10 N.m)**,
- the **mounting bolts of the lifting bracket at the timing end (10 N.m)**.

WARNING
Make sure that the exhaust gas cooler coolant inlet and outlet hoses are correctly fitted so that they do not bend.

❑ Proceed in the reverse order to removal.

❑ Loosen the mounting nut of the air pipe at the intercooler inlet on the alternator.

❑ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❑ Snap the air duct to the turbocharger and to the air pipe at the intercooler inlet.

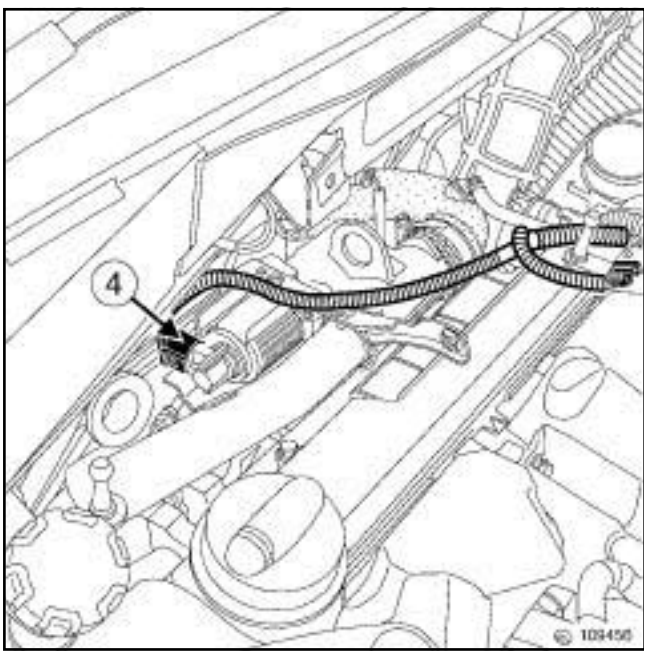
❑ Tighten the bolt of the air duct on the rocker cover.

❑ Torque tighten the **mounting nut of the pipe at the intercooler inlet on the alternator (8 N.m)**.

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Bleed the cooling circuit (see **Cooling system: Bleed**) .

❑ Clear any faults stored by the computer using the **Diagnostic tool**.

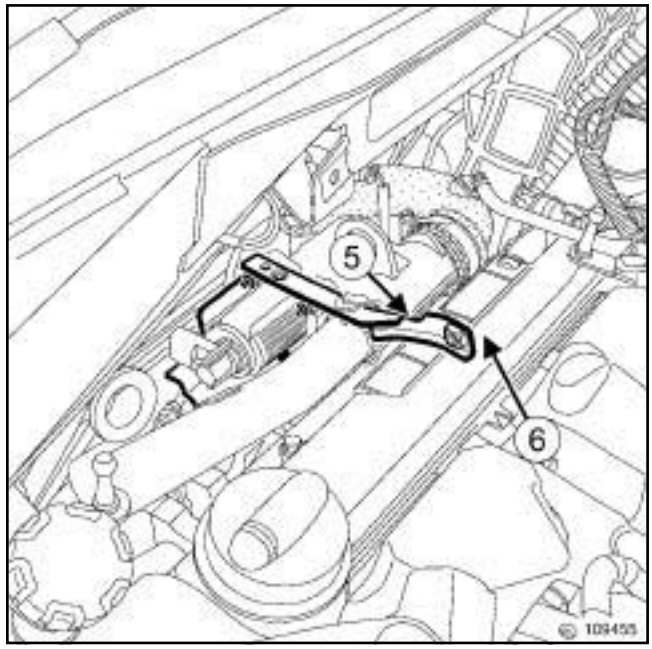


K9K, and 750 or 752

Tightening torques ▽	
exhaust gas recirculation unit mounting bolts	**21 N.m**
inlet air metal tube mounting bolts	**21 N.m**
lifting eye (timing end)	**21 N.m**
exhaust gas recirculation solenoid valve heat shield mounting bolts	**12 N.m**

REMOVAL

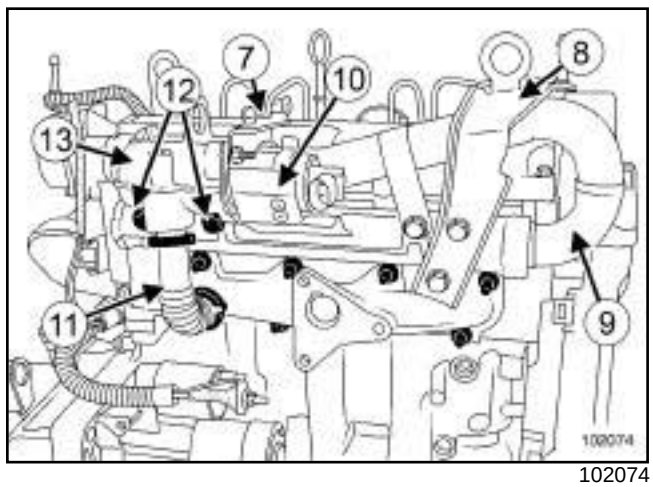
❏ Position the vehicle on a two-post lift.



❏ Remove the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) .

109456

❏ Disconnect the exhaust gas recirculation solenoid valve electrical wiring harness (**4**) .



❏ Detach the electric wiring harness.

109455

❏ Disconnect:

- the rubber pipe (**5**) from the air duct turbocharging pressure control valve,
- the turbocharging air duct (**6**) from the exhaust gas recirculation unit.

102074

❏ Remove:

- the bracket (**7**) ,
- the engine lifting eye (**8**) ,
- the air inlet metal tube (**9**) ,
- the exhaust gas recirculation solenoid valve heat shield (**10**) ,
- the exhaust gas recirculation pipe (**11**) ,
- the EGR unit mounting bolts (**12**) ,
- the exhaust gas recirculation unit (**13**) .

K9K, and 750 or 752

REFITTING

❏ Replace the exhaust gas recirculation tube complete with new clips.

❏ Fit the new clips

❏ Tighten the new clips using tool (**Mot 1567**).

❏ Replace the O-rings on the metal air inlet tube.

❏ Torque tighten:

- the **exhaust gas recirculation unit mounting bolts (21 N.m)**,
- the **inlet air metal tube mounting bolts (21 N.m)**,
- the **lifting eye (timing end) (21 N.m)**,
- the **exhaust gas recirculation solenoid valve heat shield mounting bolts (12 N.m)**.

❏ Proceed in the reverse order to removal.

❏ Connect the battery, starting with the positive terminal.

WARNING

Carry out the necessary programming ((see **Battery: Removal - Refitting**)).

❏ Refit the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) .

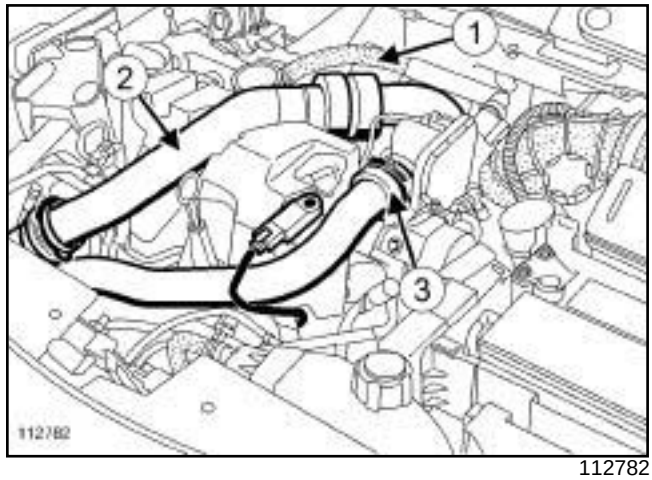
K9K

Special tooling required	
Ms. 583	Pipe clamps.

Tightening torques ▽	
EGR unit assembly mounting bolts	**25 N.m**
exhaust gas inlet pipe bolts	**35 N.m**
mounting bolts of the lifting bracket on the timing end	**10 N.m**
coolant circulation cover mounting bolts	**10 N.m**
nut mounting the intercooler air inlet pipe on the alternator	**8 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

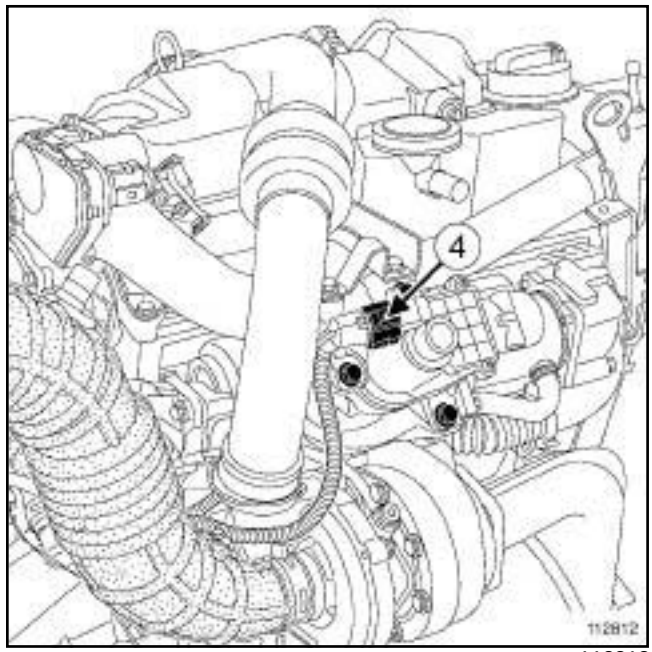


❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove the engine undertray.

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

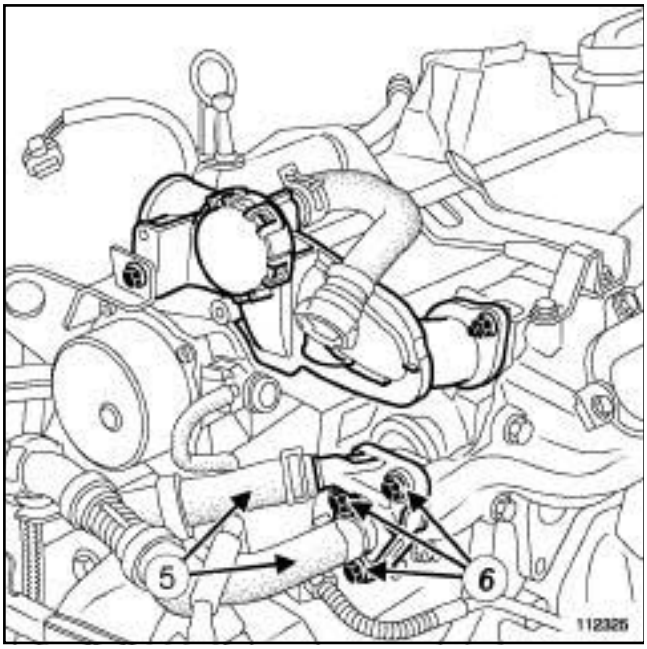


- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) (MR 392, 19A, Cooling).

112782

❏ Remove:

- the oil vapour rebreathing pipe (**1**) ,
- the air inlet duct (**2**) between the turbocharger and the intercooler,
- the air inlet duct clip (**3**) from the damper valve.



112812

❏ Disconnect the connector (**4**) from the exhaust gas recirculation solenoid valve.

❏ Remove the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (MR 392, 12A, Fuel mixture).

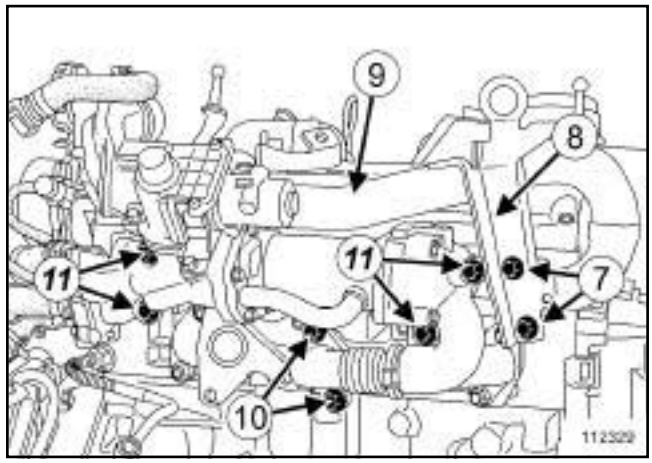
K9K

112325

❑ Position the tools **(Ms. 583)** or the hose clamps on the coolant inlet and outlet hoses (**5**) of the exhaust gas cooler.

❑ Remove:

- the coolant circulation cover mounting bolts (**6**) ,
- the coolant circulation cover,
- the seals of the coolant circulation cover.



❑

Note:

Prepare for the outflow of coolant.

❑ Remove the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) (MR 392, 19B, Exhaust).

II - OPERATION FOR REMOVAL OF PART CONCERNED

112329

❑ Remove:

- the lifting bracket mounting bolts (**7**) from the timing end,
- the lifting bracket (**8**) on the timing end,
- the air inlet metal tube (**9**) ,
- the mounting bolts (**10**) from the exhaust gas inlet pipe,
- the mounting bolts (**11**) from the exhaust gas recirculation unit assembly,
- the exhaust gas recirculation unit assembly.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ All the supporting surfaces on each removed part must be carefully cleaned.

WARNING

Take care not to damage the bearing faces to prevent any risk of coolant leaks.

Always replace:

- the air inlet metal tube and its O-rings,
- the seals of the coolant circulation cover,
- the seal between the cut-off valve downstream duct and the exhaust gas cooler mounting,
- the seal between the catalytic converter and the turbocharger.

K9K

II - OPERATION FOR REFITTING PART CONCERNED

❏ Refit the exhaust gas recirculation unit assembly.

❏ Torque tighten the **EGR unit assembly mounting bolts (25 N.m)**.

III - FINAL OPERATION

❏ Refit the mounting bolts of the exhaust gas inlet pipe.

❏ Torque tighten the **exhaust gas inlet pipe bolts (35 N.m)**.

❏ Refit:

- the air inlet metal tube,
- the lifting bracket on the timing end.

❏ Torque tighten the **mounting bolts of the lifting bracket on the timing end (10 N.m)**.

❏ Refit:

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) (MR 392, 19B, Exhaust),
- the coolant circulation cover.

❏ Torque tighten the **coolant circulation cover mounting bolts (10 N.m)**.

❏

WARNING

Ensure that the water inlet and outlet hoses of the exhaust gas cooler are correctly aligned so that they are not kinked.

❏ Refit the damper valve (see **12A**, **Fuel mixture**, **Damper valve: Removal - Refitting**, page **12A-31**) (MR 392, 12A, Fuel mixture).

❏ Connect the exhaust gas recirculation solenoid valve connector.

❏ Refit:

- the air inlet duct clip on the damper valve,
- the oil vapour rebreathing pipe,
- the water chamber (see **19A**, **Cooling**, **Water chamber: Removal - Refitting**, page **19A-63**) (MR 392, 19A, Cooling),
- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❏ Loosen the mounting nut of the air pipe at the intercooler inlet.

❏ Fit the air duct between the turbocharger and the intercooler air inlet pipe.

❏ Lock the air duct onto the turbocharger and the intercooler inlet air pipe.

❏ Tighten the bolt of the air duct on the rocker cover.

❏ Torque tighten the **nut mounting the intercooler air inlet pipe on the alternator (8 N.m)**.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery) (MR 392, 80A, Battery).

❏ Remove the engine undertray.

❏ Fill and bleed the cooling circuit (see **19A**, **Cooling**, **Cooling system: Draining - Refilling**, page **19A-16**) (MR 392, 19A, Cooling).

❏ Use the diagnostic tool to clear any faults which may be stored by the computer before restarting the engine.

K9K, and 764 or 766 or 768

REMOVAL

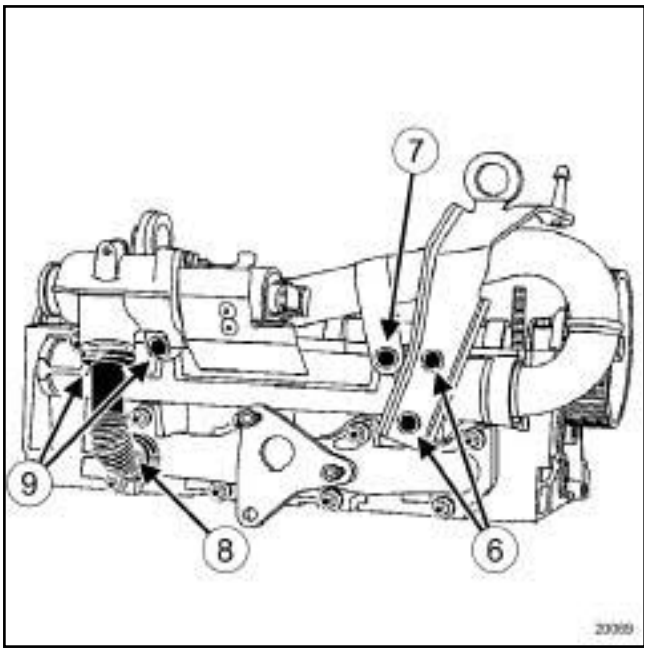
I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove the EGR solenoid valve (see **14A**, **Antipollution**, **Exhaust gas recirculation solenoid valve: Removal - Refitting**, page **14A-3**) .

118274

❏ Disconnect:



- the air temperature sensor connector (**1**) ,
- the vacuum pipe (**2**) between the turbocharger regulation valve and the turbocharger outlet air pipe,
- the vacuum pipe (**3**) between the air pressure sensor and the turbocharger outlet air pipe.

❏ Loosen the turbocharger outlet air pipe clips (**4**) .

❏ Remove the turbocharger outlet air pipe (**5**) .

K9K, and 750 or 752

II - OPERATION FOR REMOVAL OF PART CONCERNED

20069

❑ Remove:

- the bolts (**6**) from the engine lifting eye,
- the engine lifting eye,
- the bolt (**7**) from the air inlet metal tube,
- the air inlet metal tube,
- the clips of the exhaust gas recirculation pipe using the **(Mot. 1567)**,
- the exhaust gas recirculation rigid pipe (**8**) ,
- the bolts (**9**) from the EGR mounting,
- the EGR mounting.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the EGR mounting,
- the bolts to the EGR mounting.

❑ Torque tighten the **bolts for the EGR mounting (21 Nm)**.

❑ Refit:

- the exhaust gas recirculation rigid pipe,
- the clips of the exhaust gas recirculation pipe using the **(Mot. 1567)**,
- the air inlet metal tube,
- the air inlet metal tube bolt,
- the engine lifting eye,
- the engine lifting eye bolts,

❑ Torque tighten:

- the **air inlet metal tube bolt (21 Nm)**,
- the **engine lifting eye bolts (21 Nm)**.

II - FINAL OPERATION.

❑ Refit the turbocharger outlet air pipe.

❑ Torque tighten the **turbocharger outlet air pipe clips (5.5 Nm)**.

❑ Connect:

- the vacuum pipe between the air pressure sensor and the turbocharger outlet air pipe,
- the vacuum pipe between the turbocharger regulation valve and the turbocharger outlet air pipe,
- the air temperature sensor connector .

❑ Refit the EGR solenoid valve (see **14A**, **Antipollution**, **Exhaust gas recirculation solenoid valve: Removal - Refitting**, page **14A-3**) .

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

K9K, and 764 or 766 or 768 or 772

Special tooling required	
Mot. 1567	Remote pliers for exhaust gas recirculation pipe clamps.

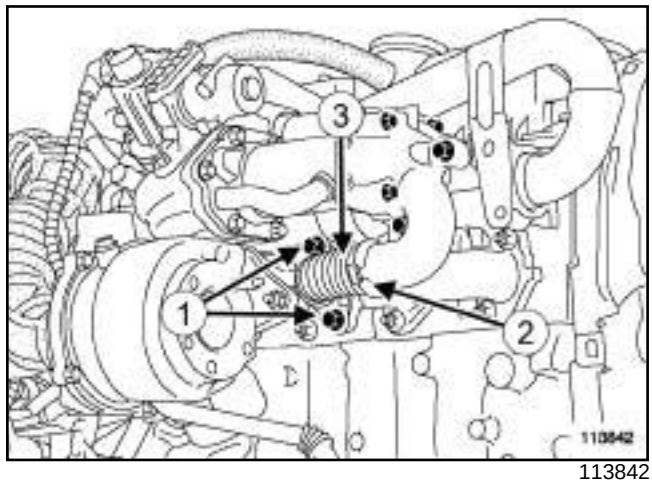
Tightening torques ▽	
rigid pipe bolts on the exhaust manifold	**36 N.m**
bolt of the clip on the rigid pipe	**5 N.m**
rigid pipe bolts on the exhaust manifold	**36 N.m**
bolts of the rigid pipe on the cylinder head	**25 N.m**
bolts of the rigid pipe on the exhaust gas cooler	**12 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Remove the engine style cover.



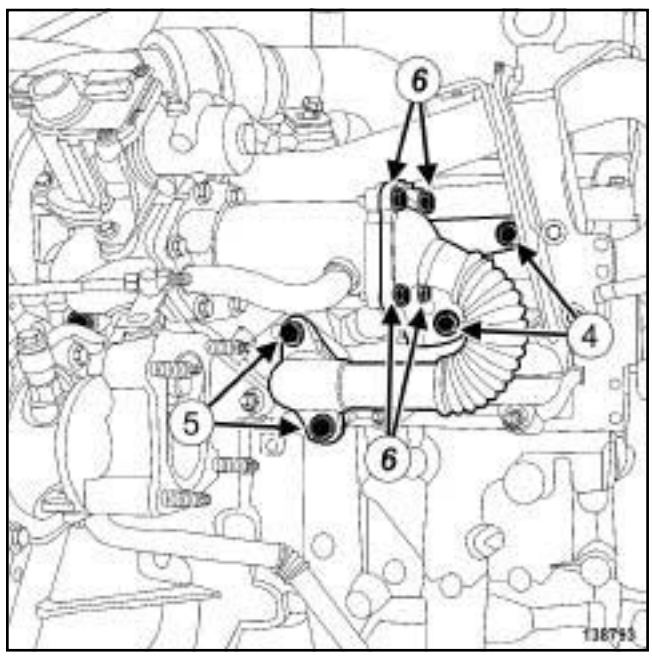
❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❏ Remove:

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment),
- the engine undertray,
- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,
- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) (K9K/760,762,764,766,768),
- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) (K9K772).

II - OPERATION FOR REMOVAL OF PART CONCERNED

1 - First fitting of the exhaust gas cooler recirculation assembly



113842

❏ Remove:

- the mounting bolts (**1**) from the rigid exhaust gas recirculation pipe,
- the snap-fit clamp (**2**) using the **(Mot. 1567)**,
- the rigid exhaust gas recirculation pipe (**3**) .

2 - Second fitting of the exhaust gas cooler recirculation assembly

138793

❏ Remove:

- the bolts (**4**) of the rigid pipe bracket from the cylinder head,

K9K, and 764 or 766 or 768 or 772

- the bolts (**5**) of the rigid pipe on the exhaust manifold then discard them in the waste bin,

- the bolts (**6**) of the rigid pipe on the exhaust gas cooler,

- the rigid pipe and its seal then discard them in the waste bin.

REFITTING

I - REFITTING PREPARATION OPERATION

❑ All the bearing faces must be carefully cleaned.

II - REFITTING OPERATION FOR PART CONCERNED

❑ Refit:

- the new rigid exhaust gas recirculation pipe with a new seal,

- the new exhaust gas recirculation pipe mounting bolts.

1 - First fitting of the exhaust gas cooler recirculation assembly

❑ **parts always to be replaced: Exhaust gas recirculation rigid pipe (11,07,01,08)parts always to be replaced: exhaust gas recirculation pipe bolt (11,07,01,18)parts always to be replaced: Exhaust gas recirculation pipe clip (11,07,01,14)**

❑ Refit the new rigid pipe, equipped with new bolts on the manifold, a new seal on the manifold and a new clip.

> Note:
>
> The Parts Department only supplies clips for the rigid pipe with a tangential bolt.

❑ Adjust the rigid pipe in its location by screwing, without tightening, the bolts on the manifold and centring the rigid pipe on the EGR support at the timing end.

❑ Torque tighten:

- the **rigid pipe bolts on the exhaust manifold (36 N.m)**,

- the **bolt of the clip on the rigid pipe (5 N.m)**.

2 - Second fitting of the exhaust gas cooler recirculation assembly

❑ **parts always to be replaced: Exhaust gas recirculation rigid pipe (11,07,01,08)parts always to be replaced: exhaust gas recirculation pipe bolt (11,07,01,18)parts always to be replaced: Exhaust gas recirculation pipe seal (11,07,01,15)**

❑ Fit the new rigid pipe equipped with a new seal and new bolts on the manifold.

❑ Fit without tightening:

- the bolts of the rigid pipe on the exhaust gas recirculation cooler,

- the bolts of the rigid pipe on the manifold,

- the bolts of the rigid pipe on the cylinder head.

❑ Torque tighten:

- the **rigid pipe bolts on the exhaust manifold (36 N.m)**,

- the **bolts of the rigid pipe on the cylinder head (25 N.m)**,

- the **bolts of the rigid pipe on the exhaust gas cooler (12 N.m)**.

III - FINAL OPERATION

❑ Refit:

- the catalytic pre-converter (see **19B**, **Exhaust**, **Catalytic pre-converter: Removal - Refitting**, page **19B-21**) (K9K/772),

- the catalytic converter (see **19B**, **Exhaust**, **Catalytic converter: Removal - Refitting**, page **19B-27**) (K9K/760,762,764,766,768),

- the engine tie-bar (see **19D**, **Engine mounting**, **Lower engine tie-bar: Removal - Refitting**, page **19D-13**) ,

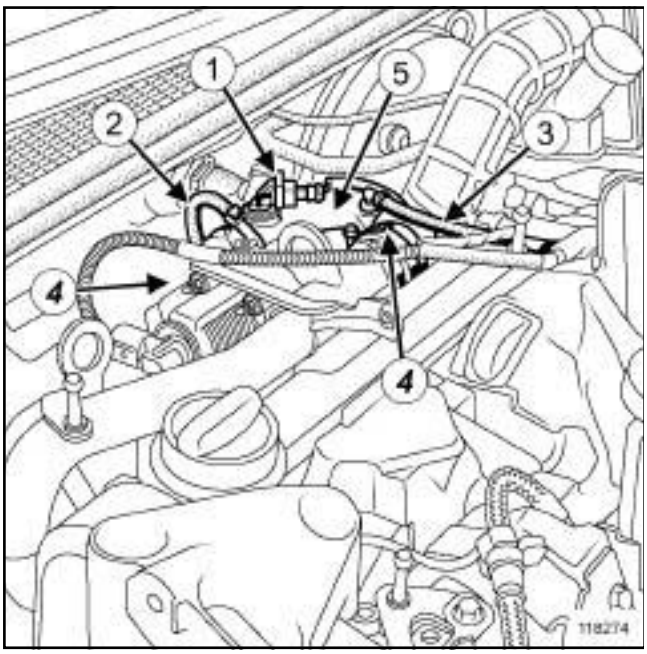
- the engine undertray,

- the scuttle panel grille (see **Scuttle panel grille: Removal - Refitting**) (MR 393, 56A, Exterior equipment).

❑ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

❑ Refit the engine style cover.

K9K, and 750 or 752



Special tooling required	
Mot. 1567	Remote pliers for exhaust gas recirculation pipe clamps.

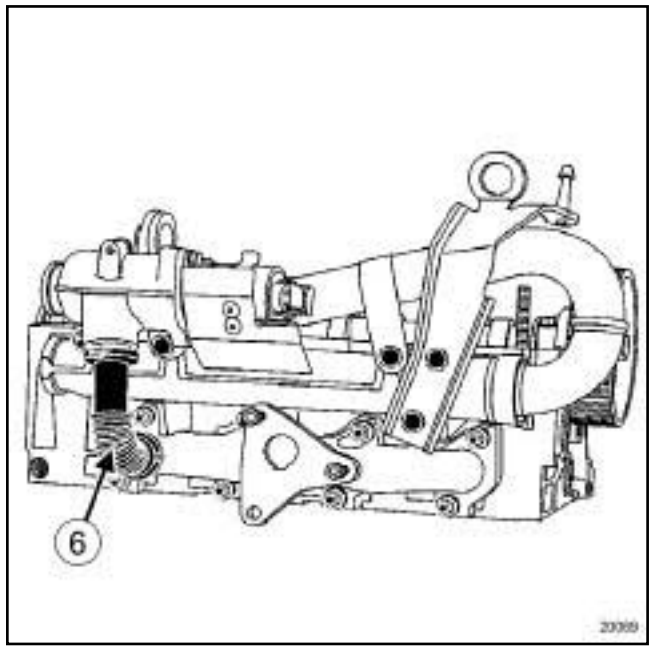
Tightening torques ▽	
turbocharger outlet air pipe clips	**5.5 N.m**

REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

118274



❏ Disconnect:

- the air temperature sensor connector (**1**) ,
- the vacuum pipe (**2**) between the turbocharger regulation valve and the turbocharger outlet air pipe,
- the vacuum pipe (**3**) between the air pressure sensor and the turbocharger outlet air pipe.

❏ Loosen the turbocharger outlet air pipe clips (**4**) .

❏ Remove the turbocharger outlet air pipe (**5**) .

II - OPERATION FOR REMOVAL OF PART CONCERNED

20069

❏ Remove:

- the clips of the exhaust gas recirculation pipe using the **(Mot. 1567)**,
- the exhaust gas recirculation rigid pipe (**6**) .

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit:

- the exhaust gas recirculation rigid pipe,
- the clips to the exhaust gas recirculation pipe using the **(Mot. 1567)**.

II - FINAL OPERATION

❏ Refit the turbocharger outlet air pipe.

❏ Torque tighten the **turbocharger outlet air pipe clips (5.5 N.m)**.

❏ Connect:

- the vacuum pipe between the air pressure sensor and the turbocharger outlet air pipe,
- the vacuum pipe between the turbocharger regulation valve and the turbocharger outlet air pipe,
- the air temperature sensor connector,
- the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

WARNING

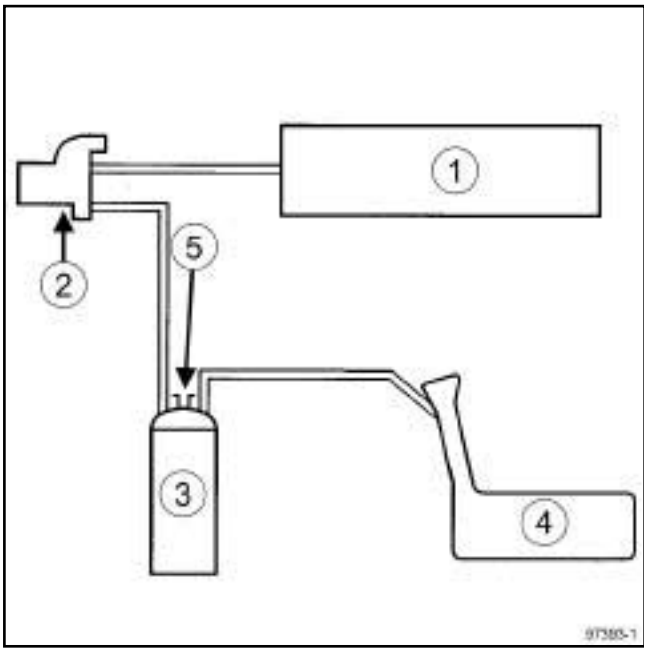
The breather must not be blocked during normal engine operation.

The tank is vented through the fuel vapour absorber.

Fuel vapour is trapped by the active carbon contained in the absorber as it passes through.

Fuel vapour trapped in the absorber is eliminated and burnt by the engine.

To do this, the solenoid valve is used to connect the fuel vapour absorber and the inlet manifold. This solenoid valve is located on the right-hand shock absorber turret or on the inlet manifold (M4R engine).



The principle behind the solenoid valve is to open a passage of variable size (according to the opening cyclic ratio signal sent by the injection computer).

The variation in the passage opened for fuel vapour in the solenoid valve results from the balance between the magnetic field created by the supply to the winding and the return spring force attempting to close the solenoid valve.

D4F or F4R or K4J or K4M or M4R

OPERATING DIAGRAM OF THE CIRCUIT

(**9**) Air filter box outlet air pipe

❑ Check the condition of the pipes to the tank.

II - FUEL VAPOUR ABSORBER BLEED CONDITIONS

❑ The fuel vapour absorber bleed solenoid valve is controlled by the petrol injection computer.

During « on board diagnostic » fault finding, fuel vapour absorber bleeding is not authorised.

The opening cyclic ratio of the fuel vapour absorber bleed solenoid valve can be viewed on the **Diagnostic tool** by reading parameter « fuel vapour absorber bleed solenoid valve OCR » .

The solenoid valve is closed for a value below **1.2%**.

D4F or F4R or K4J or K4M or M4R

IMPORTANT

During this operation, be sure to:

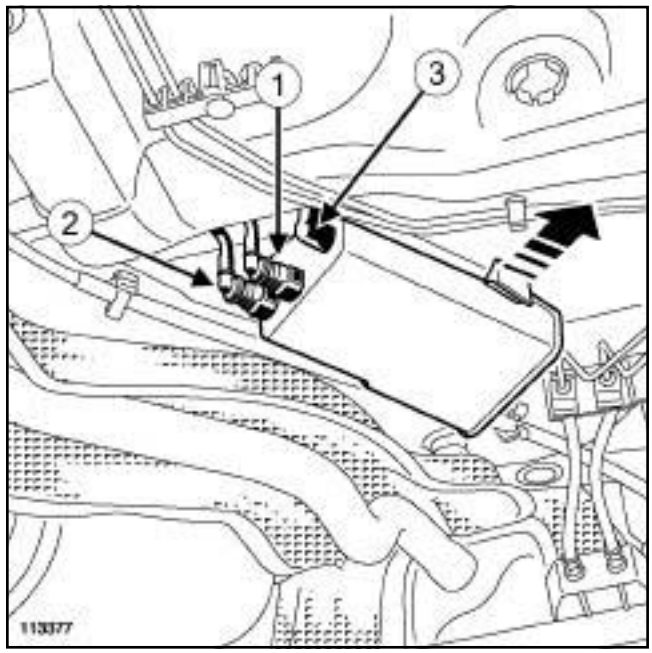
- refrain from smoking or bringing red hot objects close to the working area,
- be careful of fuel splashes when disconnecting the union.

IMPORTANT

Wear latex gloves during the operation.

WARNING

To avoid any corrosion or damage, protect the areas on which fuel is likely to run.



REMOVAL

I - REMOVAL PREPARATION OPERATION

❏ Position the vehicle on a two-post lift (see **Vehicle: Towing and lifting**) (MR 392, 02A, Lifting equipment).

❏ Disconnect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

II - OPERATION FOR REMOVAL OF PART CONCERNED

113377

❏ Remove the absorber from the fuel tank retaining notch by pushing it in the direction of the arrow.

❏ Disconnect:

- the tank vapour inlet pipe (**1**) ,
- the pipe (**2**) circulating vapours to the solenoid valve,
- the breather pipe (**3**) .

❏ Remove the fuel vapour absorber.

REFITTING

I - REFITTING OPERATION FOR PART CONCERNED

❏ Refit the fuel vapour absorber.

❏ Connect:

- the breather pipe,
- the pipe taking the fuel vapours to the solenoid valve,
- the pipe bringing the fuel vapour from the tank.

❏ Refit the absorber in the fuel tank retaining notch.

II - FINAL OPERATION.

❏ Connect the battery (see **Battery: Removal - Refitting**) (MR 392, 80A, Battery).

Fuel vapour absorber: Check

D4F or F4R or K4J or K4M or M4R

Equipment required
Diagnostic tool

I - CHECKING THE FUEL VAPOUR ABSORBER

❏ On the fuel vapour absorber, plug the circuit coming from the fuel tank.

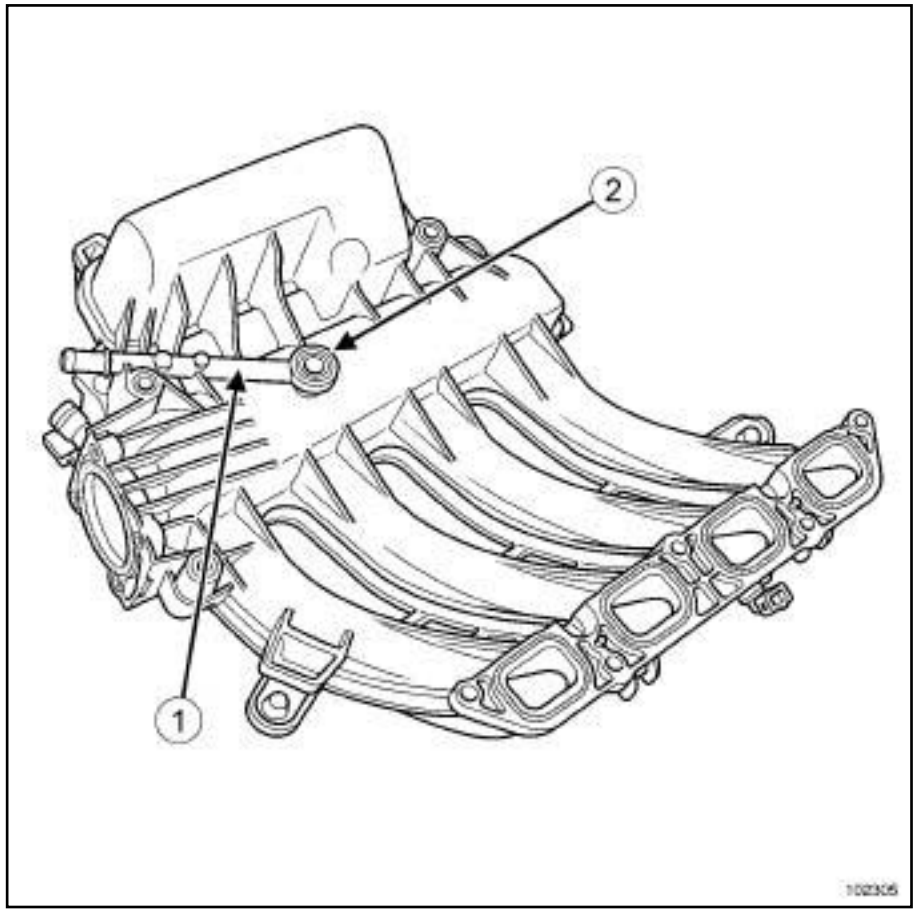
❏ Connect a pressure gauge on the **Mot. 1311-01** to the absorber breather outlet.

❏ With the engine at idle speed, check that no vacuum is present at the absorber breather outlet. In the same way, the control value read by the **Diagnostic tool** in parameter « fuel vapour absorber bleed solenoid valve OCR » remains at least **X less than or equal to 1.5 %**.

Is there a vacuum?

❏ **YES:** with the ignition off, use a vacuum pump to apply a vacuum of **500 mbar** to the solenoid valve outlet. The vacuum pressure should not vary by more than **10 mbar** over **30 seconds**.

Does the pressure vary?

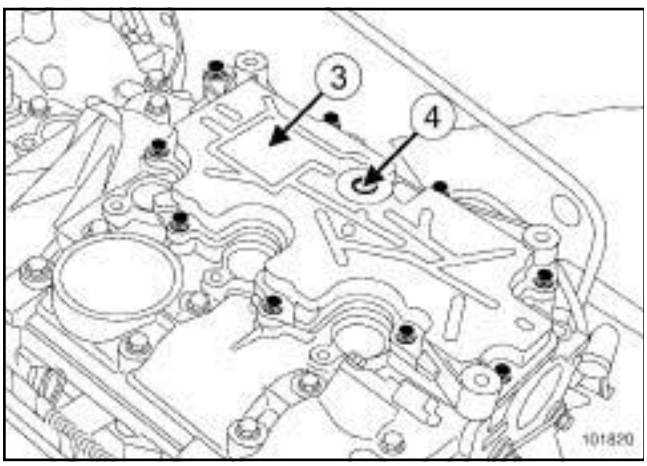


- Yes: the solenoid valve is faulty, replace it.
- No: there is an electrical fault, check the circuit.

❏ **NO:** in bleeding condition (see **14A**, **Antipollution**, **Fuel vapour recirculation circuit: Check**, page **14A-25**) , the vacuum must be increased. In the same time, the value of the parameter on the **Diagnostic tool** increases.

II - CHECKING THE FUEL VAPOUR ABSORBER TANK CONNECTION

❏ Check this connection by connecting a vacuum pump to the pipe going to the absorber.

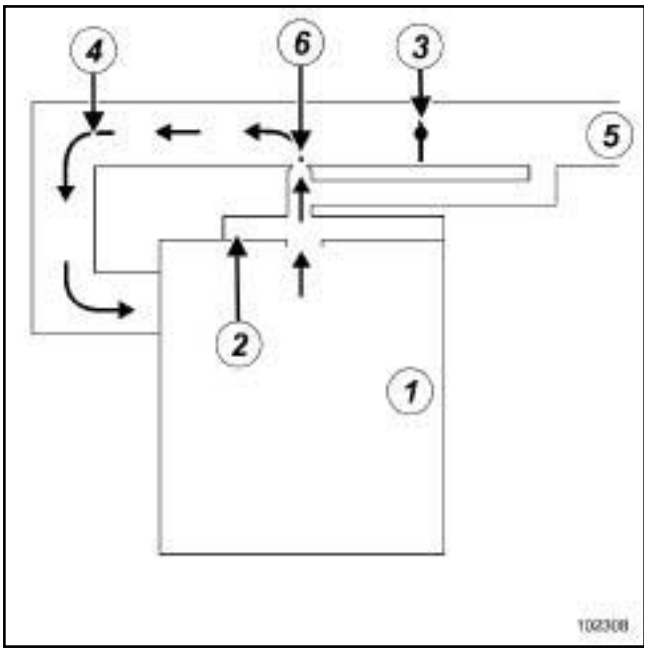


K4J or K4M, and 780 or 800 or 801

102305

(**1**) Oil vapour rebreathing duct

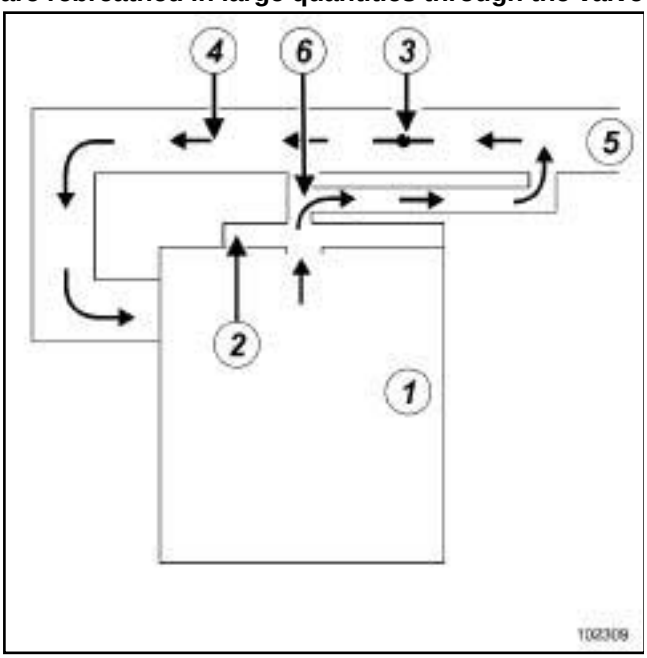
(**2**) Calibrated port



101820

(**3**) Oil vapour recovery plate located on the rocker cover

(**4**) Oil vapour rebreathing hole



K4J, and 780 – K4M, and 800 or 801

A: under low loads, the oil vapours are rebreathed in small quantities through the calibrated orifice (6).

102308

B: under medium and heavy loads, the oil vapours are rebreathed in large quantities through the valve

102309

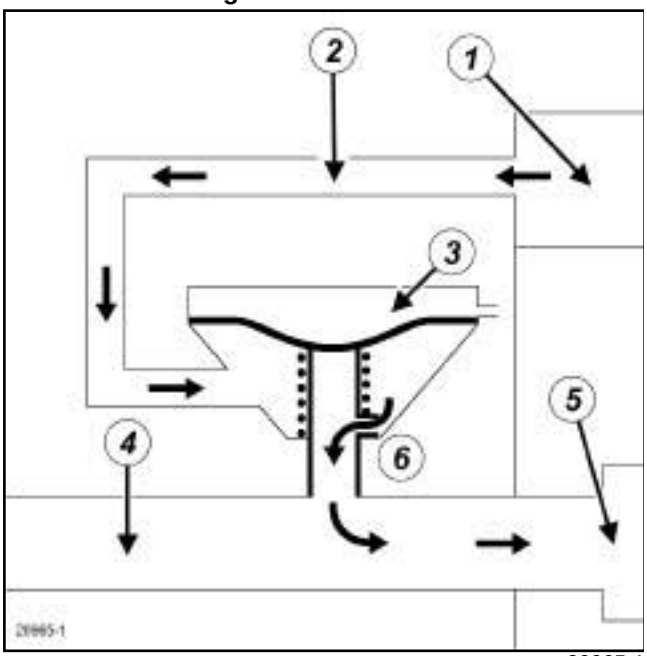
(**2**) Rocker cover
(**3**) Inlet manifold
(**4**) Air filter unit
(**5**) Motorised throttle valve



K9K, and 750 or 752 or 764 or 766 or 768

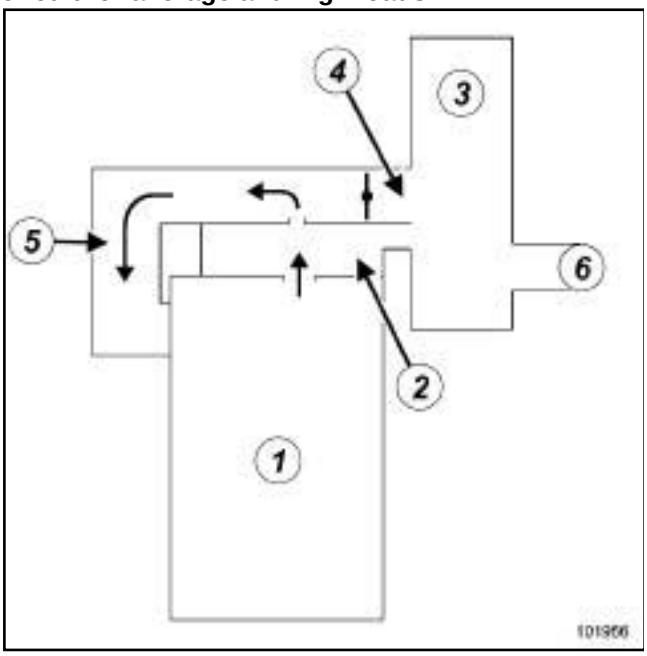
A: Low load

20965

B: Medium and high loads

20965-1

(**1**) Rocker cover
(**2**) Oil vapour rebreathing duct
(**3**) Oil vapour rebreathing valve
(**4**) Air inlet duct
(**5**) Turbocharger
(**6**) Atmospheric pressure



A: At low load, the vacuum pressure prevailing in the air inlet duct is below the spring calibration. Large quantities of oil vapour are sucked back in by the vacuum prevailing in the air inlet duct.

B: At medium or high load, the vacuum pressure prevailing in the air inlet duct pulls the valve diaphragm, small quantities of oil vapour are rebreathed in via a calibrated jet.

OPERATION

These vehicles are fitted with a built-in regulator and an instrument panel warning light which operates as follows:
